**The Perpetual Trouble Shooter's Manuals listed above are the "standard" of the radio service industry.**

Their absolute supremacy as sources of accurate—complete and detailed radio service data is established by their use by the world-famous tube manufacturing organizations, such as E. T. Cunningham, Inc., National Union Radio Corp., RCA Radiotron, Inc., Arcturus Radio Tube Co., Raytheon Production Corp., Hygrade Sylvania Corp.—the most famous service instrument manufacturers, like Weston, Hickok, Readrite and Supreme and their use and recommendation by the world's leading radio receiver manufacturers.

*The servicing data appearing on Philco, RCA, and other pages carrying individual copyright notices, are copyrighted by the respective companies and are reproduced herein with their permission.*

*Entire contents copyrighted 1939 by John F. Rider.*

MODEL 912  
Schematic, Socket, Trimmers  
Tuner Data, Alignment

MODEL 257  
Schematic, Voltage,  
Trimmers, Alignment  
Socket

**MODEL 912 AUTOMATIC TUNING CONTROL**  
Decide on station you wish to receive.  
Refer to the diagram underneath cabinet and see, which set of adjustment screws will have a tuning range that includes the frequency of the station desired. This is the pair of screws to be adjusted for this particular station. The ranges of the adjustment screws are divided into two groups, one group covering from 530-1100 kc., the other covering from 625-1600 kc.  
From the same diagram, after finding where the proper pair of adjustment screws are located, trace dotted line connecting these screws to one of the push buttons. This is the button which, after the adjustments are completed, will tune in the station.  
Push button located "IN."  
Turn volume control knob on full (to the extreme right) and adjust screw marked "O" until desired station is heard. (In this case until WJZ is heard.) If when making this adjustment, a number of stations can be brought in as the screw is turned and it is doubtful which station is the correct one, press button No. 6 (Manual Tuning) "IN" and move dial pointer by turning station selector knob, to the number on the dial that corresponds to the frequency of the station. (Turn pointer to 76 on the dial. This corresponds to WJZ's frequency 760 kc. The number on the dial must be multiplied by ten to give the frequency in kilocycles.) Listening to the program being broadcast will identify the station when adjusting screw "O."  
Adjust screw marked "A" for maximum volume, retarding the volume control and readjusting if necessary. This completes the adjustments for this particular station.  
Cut out name of station from list supplied and insert in button.  
Insert celluloid disc.  
In a like manner, select a station for each of the other buttons (four other buttons) and make necessary adjustments for each station.

**MODEL 3910**  
**Schematic, Socket**

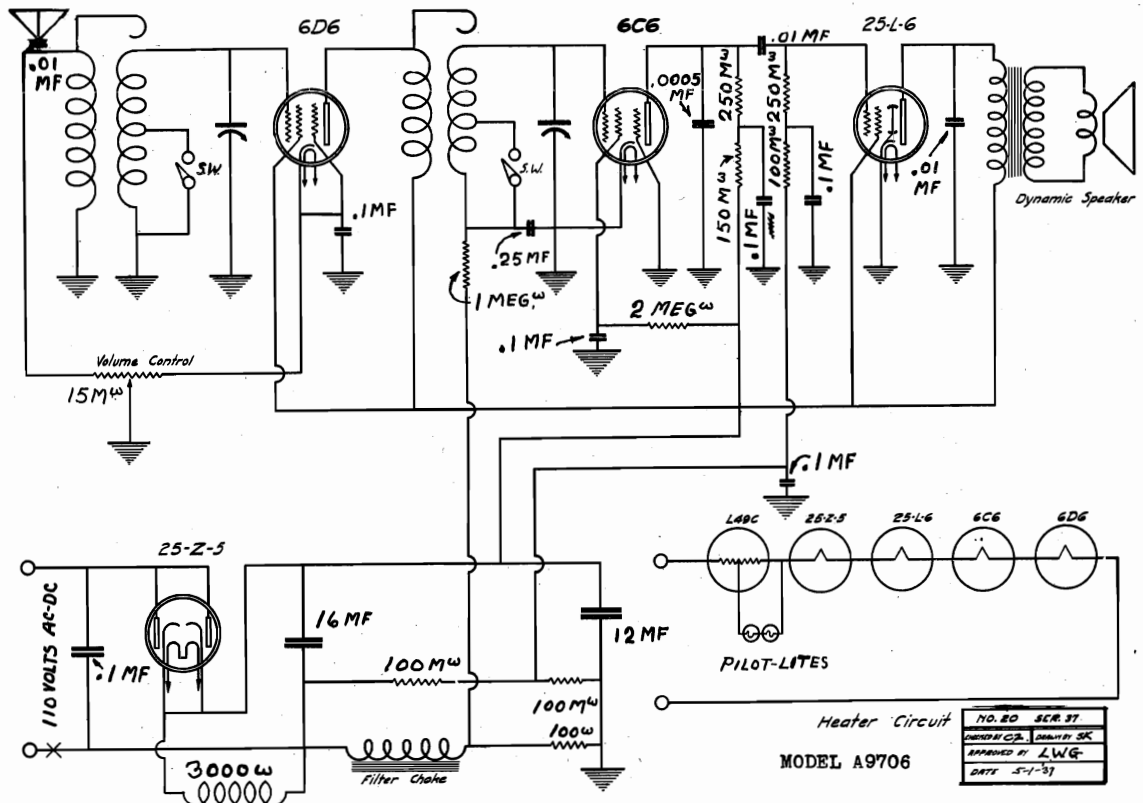

**MODEL 257**  
**AUTOMATIC TUNING:** There are four push buttons on the front panel which can be set so that by simply pushing the button marked with a station's call letters, any of four different stations may be received. Allow the receiver to warm up for 20 minutes before making the station adjustments. Decide on the station you wish to receive. Tune to this station as accurately as possible with the selector knob. Next, push in this button as far as possible, being careful not to disturb the station setting on the dial. Turn this push button knob about one turn to the left, or until it starts to unscrew easily. Holding the button at the "IN" position, screw the push button knob to the right until it is tight. Cut out name of station from list supplied and insert in face of button. Insert celluloid disk. This completes the adjustments for one station. The three other buttons may be set in a similar manner.

- CAPACITY WINDING

IF PEAK 175 KC.

ALIGNMENT

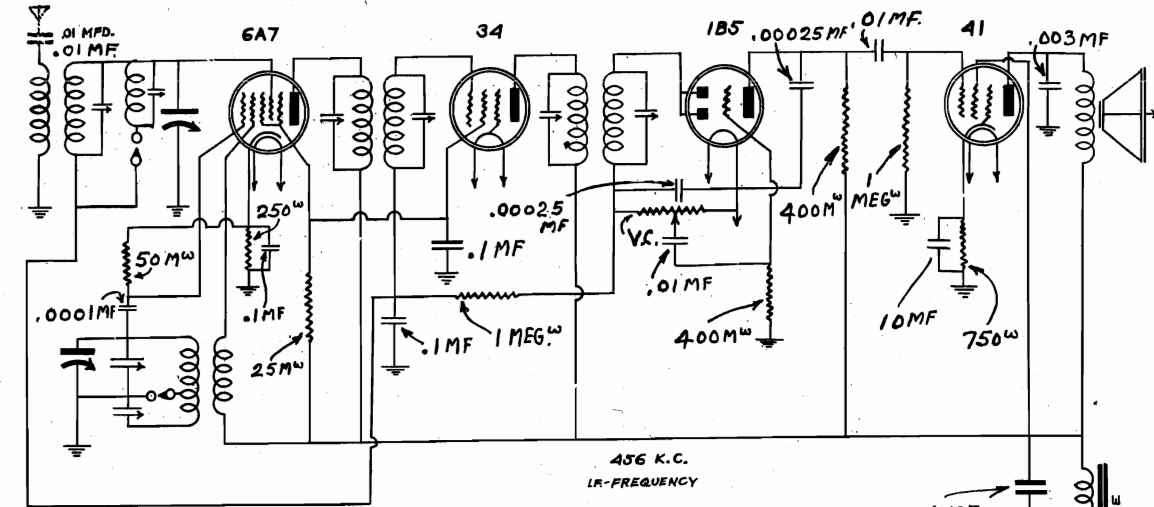

**I.F. ALIGNMENT.** Adjust the test oscillator to 175 K.C. and connect the output directly to the grid of the first detector tube (6A7), without the use of any series condenser or resistor; the omission of series condenser and resistor to block out the AVC action. The ground on the test oscillator can be connected to the chassis ground. Align the trimmers of the first and second I.F. transformers to peak or maximum reading on the output meter.

**OSCILLATOR ALIGNMENT.** Adjust the test oscillator to 1400 K.C. and connect the output to the antenna through a .0001 mfd. mica condenser to give the equivalent of a low capacity type average antenna. Set the dial pointer to 1400 K.C. and adjust the oscillator trimmer to peak. (Front section of gang condenser.)

**R.F. ALIGNMENT.** The next step is to adjust the center and rear trimmers of the gang condenser to peak. The center section of the gang condenser tunes the antenna amplifier stage (6D6 tube), and the rear condenser section tunes the detector grid coil of the 6A7 tube.

 ALLIED RADIO CORP. Chassis AM-4  
 Schematic, Socket, Trimmers  
 Alignment

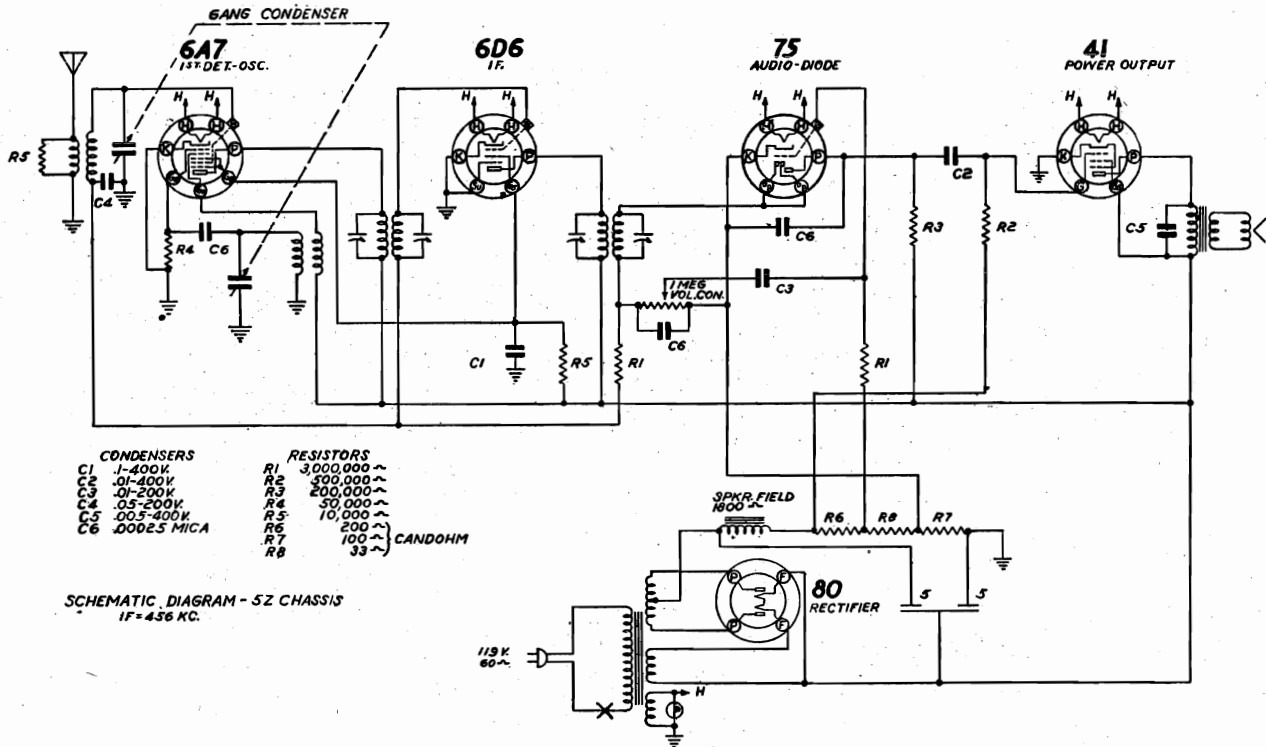

IF PEAK 456 KC.

**ALIGNMENT DATA**

- IF ALIGNMENT** - Wave change switch on BC position. Generator connected to grid of 6A8 thru a .05 MFD condenser, and align six IF trimmers to peak.
- BROADCAST** - Connect Generator to ANT lead thru 1000 MMFD condenser. Receiver, Generator set to 1400 KC, adjust Oscillator trimmer to peak, then RF trimmers. Pad the Oscillator circuit at 600 KC while rocking variable condenser.
- POLICE** - Replace 1000 MMFD condenser with 400 ohm resistor in series with 100 MMFD condenser and connect Generator to ANT lead. Generator and receiver set to 4000 KC, adjust Oscillator and ANT Police trimmers to maximum peak. Reset the Generator and receiver to 1800 KC, rock variable condenser while padding OSC.
- FOREIGN** - Set Generator and Receiver to 14000 KC, adjust Oscillator trimmer, and the Foreign ANT trimmer to peak. Readjust receiver to 13100 KC, generator still at 14000 KC and check for image response which should be weaker. Adjustments should be started with oscillator trimmer loose and ANT trimmer tight. Repeat all adjustments for maximum performance of the receiver.
- WAVE TRAP** - Used only in event of code interference, adjusted to 456 KC.

Alignment, Socket  
Trimmers, Tuner

8K-8T.

ALIGNMENT DATA

The alignment of this receiver will cover the frequencies of 435, 600, 1400, 1730, 1800, 4000, 5600, 6000, 16,000 and 18,100 KC and an output meter to be connected across the primary or secondary of the output transformer. The volume knob should be turned to the volume control maximum and the AVC control should be turned to the minimum, to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE

The intermediate frequency (I.F.) should be adjusted properly on the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast Band should always be the next procedure; after which, either or both of the Short Wave Bands may be aligned.

I.F. ALIGNMENT

With the wave switch in the Broadcast Band and the gang condenser set at minimum, adjust the first oscillator to 635 KC and the second oscillator to 1730 KC and adjust the "oscillator trimmer" to receive this signal. Make no other adjustments at this frequency. Then set the generator to 1400 KC and tune in this signal by adjusting the "police antenna trimmer" to give maximum output. Next, set the oscillator to 1800 KC and peak the circuit of this frequency as described in the instructions for peaking the broadcast circuit.

BROADCAST BAND ALIGNMENT

Connect the output of the signal generator to the antenna input of the receiver. Set the gang condenser to minimum and the oscillator to 1730 KC and adjust the "oscillator trimmer" to receive this signal. Make no other adjustments at this frequency. Then set the generator to 1400 KC and tune in this signal by adjusting the "police antenna trimmer" to give maximum output. Set the signal generator to 600 KC and tune in the signal on the receiver. Note: Approximately the same sensitivity should be noted at this point as was at 1400 KC. The

**HOW TO TUNE IN STATIONS ON THE TELEPHONE DIAL**  
Press in the button of the station desired tuned and rotate the dial slowly until a click is heard and the dial will not turn in either direction until the button is released. The station is now tuned in and can be adjusted to the volume desired by means of the volume control.

**PROCEDURE FOR ADJUSTING THE TELEPHONE DIAL BUTTONS**  
Shown in Fig. 1 is the approximate frequency range that each button will cover. Note: If 2 stations happen to fall within the range of one button, the station will necessarily have to be tuned in with the selector knob.

Figure 1

(1) Choose one of the stations out of the list of stations selected and by means of the station selector very carefully tune in this station, noting at the same time the exact pointer location on the dial.  
(2) Now select the proper button for the first station chosen by referring to Fig. 1 and noting the button into whose range the station falls. For example, station WGN with a frequency of 720 KC comes under the button whose frequency ranges from 670 to 755 KC. Usually the button nearest the tuning point or the bottom of the dial will be the proper button.  
(3) Loosen the button by unscrewing it (not the dial) 1/2 turn to the left. Now press the button in all the way and rock the dial back and forth a trifle until a click is heard. Do not release the button now but set the pointer to its former location and with the dial in this position, being careful not to move it, proceed to tighten the button by turning it in the opposite direction (to the right). Make sure the button is very securely tightened as it may get out of adjustment.

(4) From the station call sheet supplied remove the proper station disc and insert into the push button so that the wording is horizontal when the button is at the bottom, and then insert a clear celluloid insert. Follow this same procedure for the remaining buttons.

signal strength may sometimes be improved by peaking the circuit. This is done by slowly increasing or decreasing the oscillator coil turns, the antenna coil turns, continuously tuning back and forth across the signal until the maximum output reading is obtained on the output meter. This adjustment may seem a little complicated but is the easiest way to adjust the oscillator to the prescaler of the R.F. section. Return to 1400 KC and again go over the adjustments of this frequency to be certain that they were put slightly out of alignment when adjustment was made at 600 KC.

POLICE BAND ALIGNMENT

The police band is adjusted by first replacing the 2002 resistor with a 400-ohm resistor and setting the "police oscillator trimmer" to receive this signal, then set the signal generator to 4000 KC and adjust "police antenna trimmer" to give maximum output. Next, set the oscillator to 1800 KC and peak the circuit of this frequency as described in the instructions for peaking the broadcast circuit.

SHORT WAVE BAND ALIGNMENT

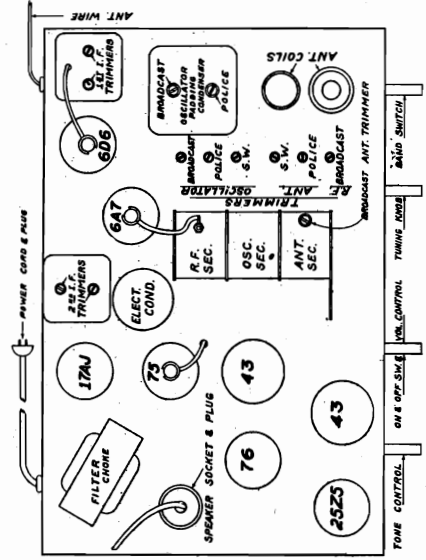

The short wave band is adjusted by setting the gang at minimum, adjust the "short wave oscillator trimmer" to receive this signal and adjust the "short wave antenna trimmer" to give maximum output. As there is no variable low frequency peaking condenser on this band, the sensitivity of the receiver should be checked at 6000 KC to determine whether the circuit are in line with the instructions. The antenna and oscillator coils, as well as the 0.04 microfarad condenser, should be tested for defects as sometimes these components become subject to mechanical or electrical injuries, despite their rugged construction and liberal ratings.

BALLAST TUBES

This receiver is designed to operate from any 60 cycle AC (alternating current) or DC (direct current) power supply main of 110 to 120 volts. However by the use of the proper tube (listed below) any one of the following line voltages can be employed: 115, 130, 150, 230.

Type Tube	Line Voltage
17A	115 Volts - 60 Cycle
35A1	130 Volts - 60 Cycle
M50E3J	150 Volts - 60 Cycle
M130E3J	230 Volts - 60 Cycle

6N7 Horizontal Oscillator	Insufficient width			Picture may appear as a vertical line.
6F8G Horizontal Deflection Amp.	Insufficient width			Picture may appear as a vertical line.
879 or 2Y2 High Voltage Rectifier	No picture	Sound O.K.		Centering controls have no effect.
5V4G Low Voltage Rectifier	No picture	No sound		Momentary picture, screen blooms, picture disappears.
1805-P4 Picture Tube	Momentary Spot			Yellow spot: burn, due to operation at excessive brightness.
	Dull			Dull picture due to long use of picture tube.
	Odd Size			Note: If faulty picture size can not be corrected by size or hold controls, look for open connection from cable to picture tube socket.

**Checking Tube Failures:** If you have de-service work. Different tubes display quite terminated that the fault lies in the set and definite symptoms of failure. With the Chart not in the antenna, the first source of trouble provided here, it is easy to locate the defec- to examine is the tubes. Consequently, a set of five tubes must be at hand for television

Picture O.K.	No sound
Sound I.F.	Microphonic howl
6S97 Detector and 1st Audio	No sound
	Distortion
	Noise in speaker
6V6G Audio Output	No sound
	Weak, distorted

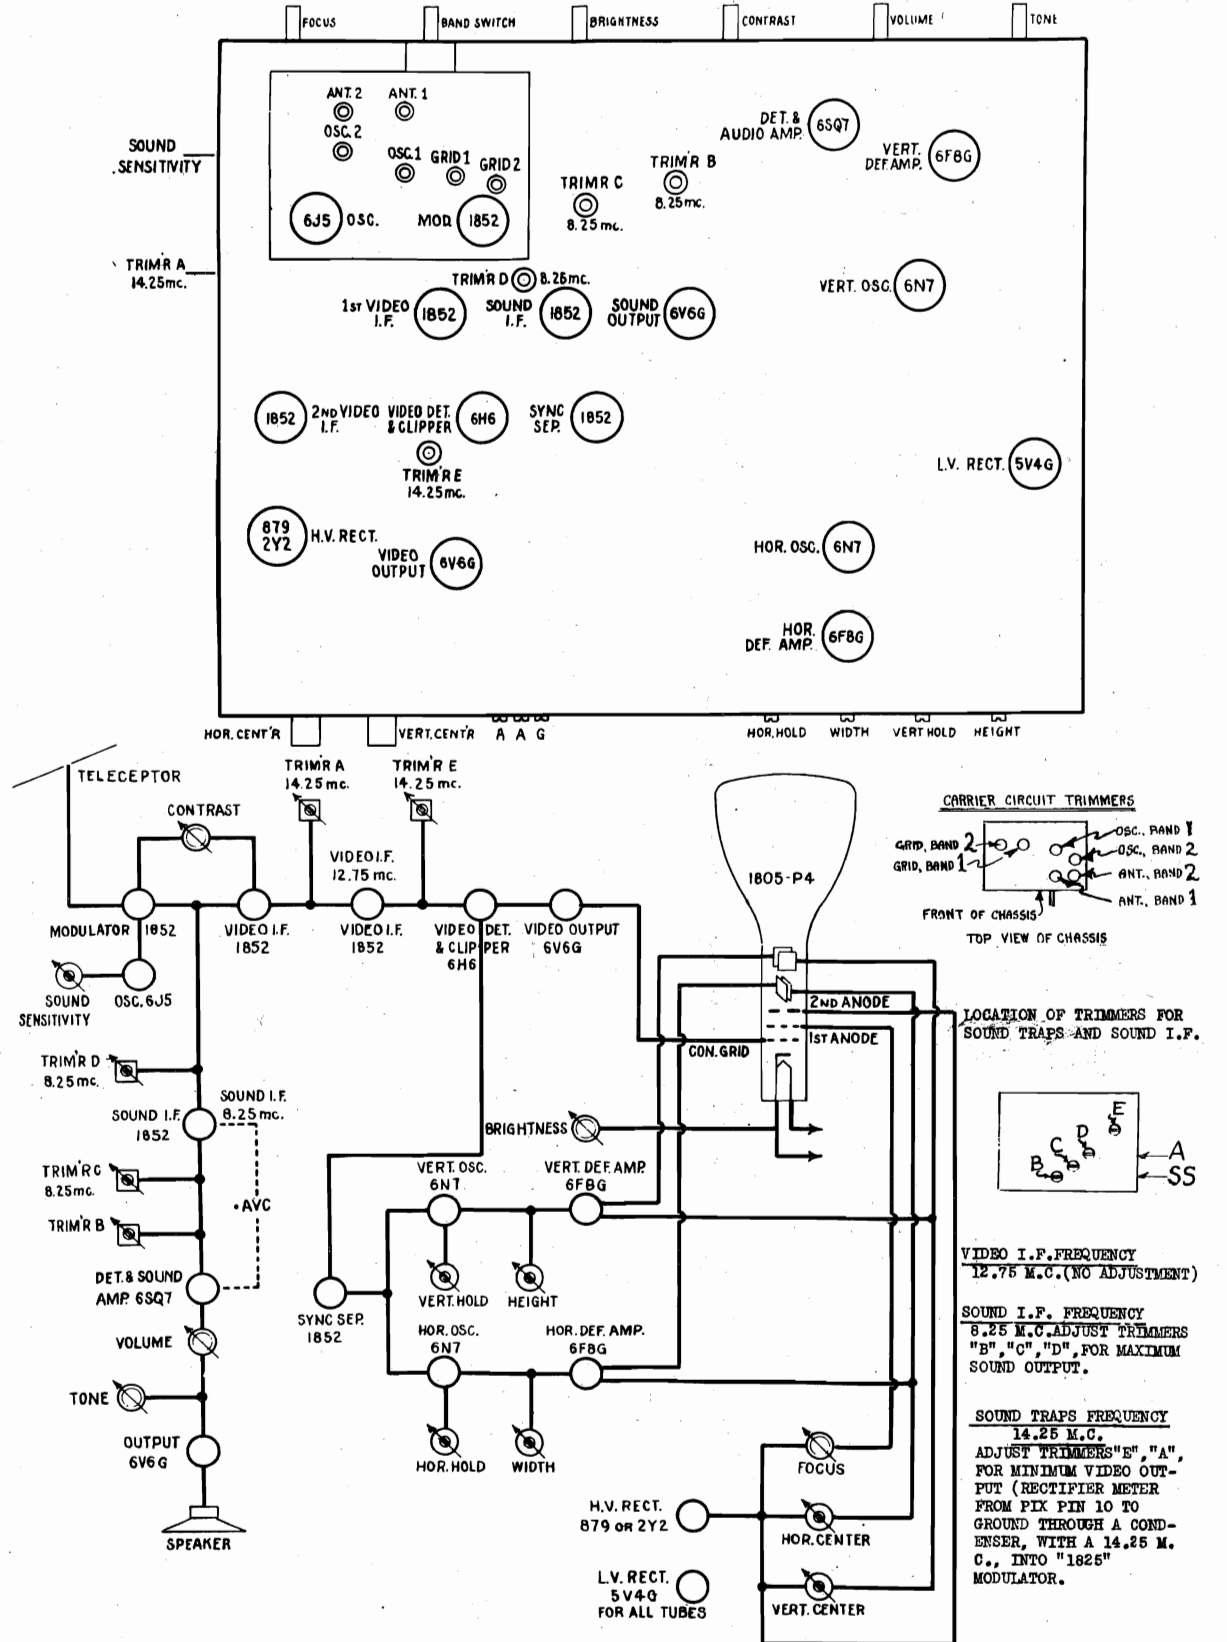

**Other Failures:** If, after checking the tubes, reception of pictures or sound is not satisfactory, go through the Sight and Sound Chart.

SIGHT AND SOUND CHART

SYMPTOM	REMEDY
Picture will not hold vertical sync	Adjust vertical hold control. Do this with contrast control as low as possible.
Picture tears	Insufficient Signal: Antenna must be oriented, moved to more favorable location, or raised in height. Ratio of signal to noise may be too low. Increase height of antenna. If lead is over 100 ft. long, coaxial cable may be required. Note: May be due to losses introduced by antenna leads to other television receivers. Remove such leads. Interference: Ratio of signal to noise may be too low. See Insufficient Signal notes above.
Picture shows horizontal distortion	Adjust horizontal hold control.
Picture is broken by angular pattern	Interference: Ignition interference may cause tearing in all or part of the picture area. See Insufficient Signal notes above.
Picture has white retrace lines	Interference: See Insufficient Signal notes above.
Picture is distorted by sound	Brightness control too high, contrast control too low. Insufficient signal: If contrast control is at maximum see Insufficient Signal notes above.
Pictures without sound	Transmitter adjustment is not correct.
Pictures and sound weak	Adjust trimmers A and E for minimum signal at 14.25 mc. Adjust trimmers B, C, and D for maximum audio output at 8.25 mc., and check adjustment of Sound Sensitivity trimmer at the side of the chassis. As a last resort, after you have checked everything else, realign R.F. plunger condensers.

Tuner Data

BELMONT RADIO CORP.

ALIGNMENT PROCEDURE

- The following equipment is required for aligning:
- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
  - Output indicating meter.
  - Non-metallic screwdriver.
  - Dummy antennas—1 mf., 200 mmf.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 1N5G I. F. Tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 1A7G	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1735 Kc.	200 mmf.	Antenna lead	Rotor full open (Plates out of mesh)	Trimmer—Top of rear section of gang (See Fig. 1)	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	200 mmf.	Antenna lead	Set dial at 1400 Kc.	Trimmer—Top of front section of gang (See Fig. 1)	Antenna Broadcast	Adjust to maximum output
SIGNAL GENERATOR							
BAND	Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 1A7G Tube	Rotor full open (Plates out of mesh)	Four trimmers on top (See Fig. 1)	Output and input I. F.	(See Note "A") Adjust to maximum output
BROAD-CAST BAND	1650 Kc.	200 mmf.	Grid of 1A7G Tube	Rotor full open (Plates out of mesh)	Trimmer (C3) front section of gang (See Fig. 4)	Oscillator	(See Note "A") Adjust to maximum output
	1400 Kc.	See Note "C"	See Note "C"	Set dial at 1400 Kc.	Trimmer (C2) rear section of gang (See Fig. 4)	Antenna	(See Note "B") Adjust to maximum output

NOTE "A"—A 1 megohm resistor must be connected between the two loop antenna leads from the chassis when aligning the I. F. transformers and setting the oscillator trimmer, (C3). The loop antenna must be disconnected from the chassis.

NOTE "B"—Remove the 1 megohm resistor from the loop antenna leads; mount the chassis and the loop antenna in the cabinet, connect the loop antenna to the chassis. Adjust trimmer (C2). (See note "C".)

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS: MODEL 418 SERIES A.

There are six levers on the front of the radio by means of which six stations may be selected. (See "B" Fig. 2). Make a list of local stations you tune in regularly; any number up to and including six.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

Above each automatic tuner lever an opening in the cabinet is provided for inserting the call letter tabs. (See "A" Fig. 2).

Insert the call letter tabs in the rectangular openings in the cabinet above each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 2) the station indicated on the station call letter tab above this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab above this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

BOTTOM VIEW OF CHASSIS

D.C. VOLTAGES MEASURED WITH 1000 OHM PER VOLT VOLTMETER BETWEEN SOCKET TERMINALS & CHASSIS. VOLUME CONTROL AT MINIMUM. ANTENNA GROUND. 1.5 VOLT "A" AND 90 VOLT "B" BATTERIES. A - CANNOT BE READ WITH VOLTMETER.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
  - Connect B - of radio chassis to ground post of signal generator through .1 Mfd. condenser.
  - Connect dummy antenna value in series with generator output lead.
  - Connect output meter across primary of output transformer.
  - Allow chassis and signal generator to "heat up" for several minutes.
- The following equipment is required for aligning:
- An all wave signal generator.
  - Output indicating meter.
  - Non-metallic screwdriver.
  - Dummy antennas—.1 Mfd.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 12A8GT	Rotor full open (Plates out of mesh)	Four Trimmers on Top (See Fig. 1)	Output and Input I.F.	Adjust to maximum output
BROADCAST BAND	1650 Kc.	.1 MFD.	Grid of 12A8GT	Rotor full open (Plates out of mesh)	Trimmer bottom of rear section of gang. (See bottom of radio)	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	See Note "A"		Set dial at 1400 Kc.	Trimmer bottom of front section of gang. (See bottom of radio)	Broadcast Antenna	Adjust to maximum output

NOTE "A" Lay the output lead from the generator in back of the loop antenna. Turn up the output of the generator, picking up the energy in the loop antenna without any electrical connection from the generator.

Power Consumption	40 Watts
Power Output	1.3 Watts Undistorted, 2.5 Watts Maximum Intermediate Frequency
	465 K.C.

FREQUENCY RANGE  
540 to 1650 K.C.

MODEL 519

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:

There are six levers on the front of the radio by means of which six stations may be selected, (See "B" Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including six.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

On the front of each automatic tuner button an opening is provided for inserting the call letter tabs. (See "A" Fig. 2).

Insert the call letter tabs in the rectangular openings in each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 2) the station you have assigned to this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station assigned to this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Now rotate the tuning knob (No. 2) to the right (clockwise) as far as it will turn, and with a coin (half dollar), tighten the special locking screw ("C") in the center of the tuning knob, (See Fig. 2).

It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, hold the tuning knob No. 2 securely and with a coin loosen the locking screw "C" one or two turns; select the new station as explained. Be sure to retighten the locking screw, otherwise the stations you have selected will not stay adjusted to the levers.

The automatic dial is now set up for quick tuning. Press down on the lever and—your favorite station is selected.

112336	Set of 2 Sheets of Station Call Letters
	Clear Pyralin Tabs for Station Call Letter Tabs

Tubes are coded and guaranteed by the tube manufacturer.

Prompter service can be rendered on adjustments if defective tubes are returned direct to the tube manufacturer rather than through our factory.

All resistors are RMA color coded—specify value and/or resistor number (per schematic diagram) and model number.

When ordering condensers, specify part number, model number and/or capacitor (per schematic diagram) and model number.

Mica condensers are coded with an additional dot indicating tolerance:

Tolerance percent	Color of Dot
2 1/2%	White
5%	Green
10%	Blue
15%	Yellow
20%	Red
More Than 20%	None

All prices quoted are list and are subject to the usual trade discounts. Shipments are F.O.B. our Factory. When remitting in advance, please include postage.

WE CANNOT SUPPLY SPEAKER, CONES OR FIELDS SEPARATELY, WE CAN REPLACE OR REPAIR A DAMAGED SPEAKER FOR \$1.00 NET, IF IT IS RETURNED TO OUR FACTORY, TRANSPORTATION CHARGES PREPAID.

PRICES SUBJECT TO CHANGE WITHOUT NOTICE.

BRC-CHGO

Form 5996 7M 9-38

**MODEL 521, Series A**  
**Socket, Trimmers, Voltage** BELMONT RADIO CORP.  
**Alignment, Tuner**  
**POWER SUPPLY:**

Caution:—This radio, unless otherwise marked, must be operated from 105-125 volts, A.C. or D.C. supply only. If you are in doubt as to the voltage rating of the power supply, consult your local power company before inserting plug. Do not insert plug unless all tubes are in their proper sockets.

Receivers of this model which are to be used on voltages other than 105-125 volts, 50/60 cycle, are so marked. The power consumption of this receiver is 45 watts.

**HOW TO REMOVE CABINET:**

CAUTION:—Always disconnect the line cord from the house current before removing the chassis from the cabinet.

To remove chassis from the cabinet unscrew the locking screw in the center of the tuning knob and pull tuning knob and volume knob off their shafts. Remove the back of the cabinet and the two screws that hold the chassis to the cabinet. Pull off the six buttons on the Automatic levers. Move the chassis toward back of cabinet so that control shafts and tuner assembly clear holes in cabinet, then chassis can be slipped out.

FIG. 3

FIG. 2 — FRONT VIEW

FIG. 1 — TOP VIEW

The procedure for setting the Automatic Tuning Levers in this receiver is the same as that for Model 633 with the exception that this receiver has six levers instead of five.

**ALIGNMENT PROCEDURE**

The following equipment is required for aligning:

- An all wave signal generator.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—1 mfd., 100 mmf.

- Volume control—Maximum all adjustments.
- Connect B - of radio chassis to ground post of signal generator.
- Connect .1 Mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

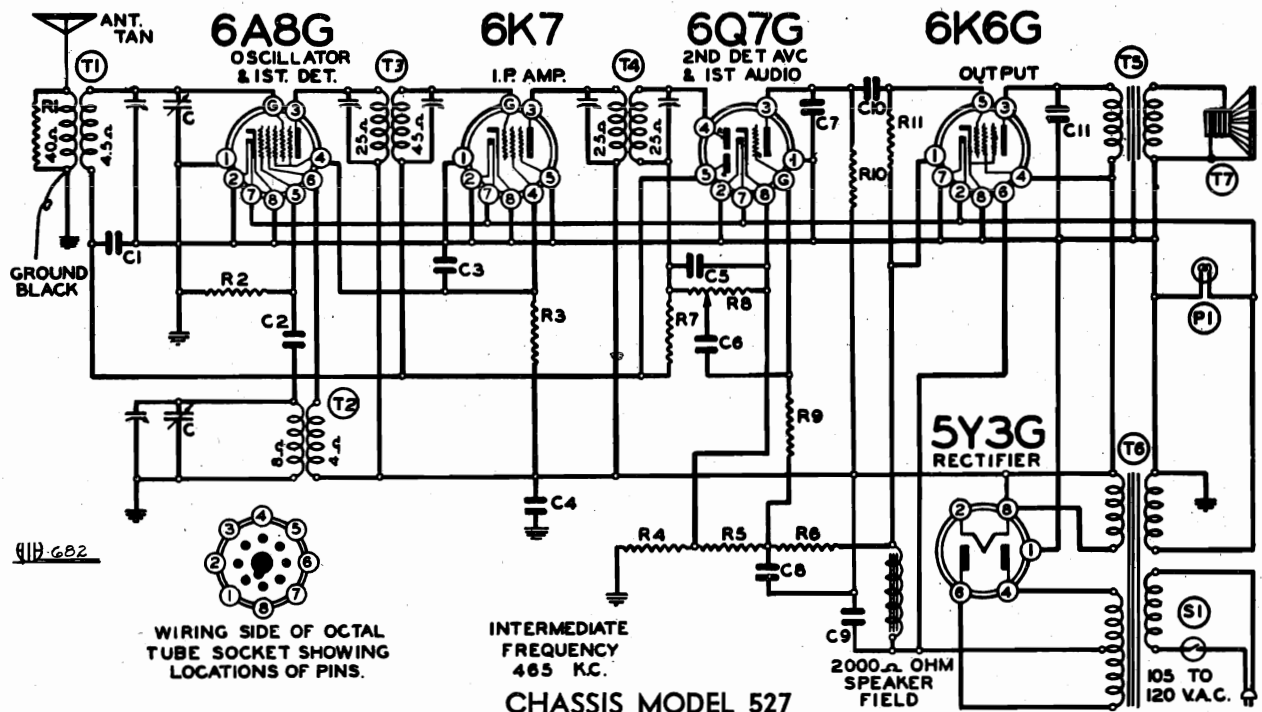

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6A8	Rotor full open (Plates out of mesh)	Two trimmers (See Fig. 3)	I. F.	Adjust to maximum output
BROADCAST BAND	1720 Kc.	100 mmf.	Antenna Lead	Rotor full open (Plates out of mesh)	Trimmer—Top of rear section of gang (See Fig. 1)	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	100 mmf.	Antenna Lead	Set dial at 1400 Kc.	Trimmer—Top of front section of gang (See Fig. 1)	Broadcast Antenna	Adjust to maximum output

**FREQUENCY RANGE**  
 530 to 1720 K.C.  
 45 Watts  
 800 Milliwatts Undistorted, 1300 Milliwatts Maximum  
 465 K.C.

Power Consumption.....45 Watts  
 Power Output.....800 Milliwatts Undistorted, 1300 Milliwatts Maximum  
 Intermediate Frequency.....465 K.C.

ALIGNMENT PROCEDURE

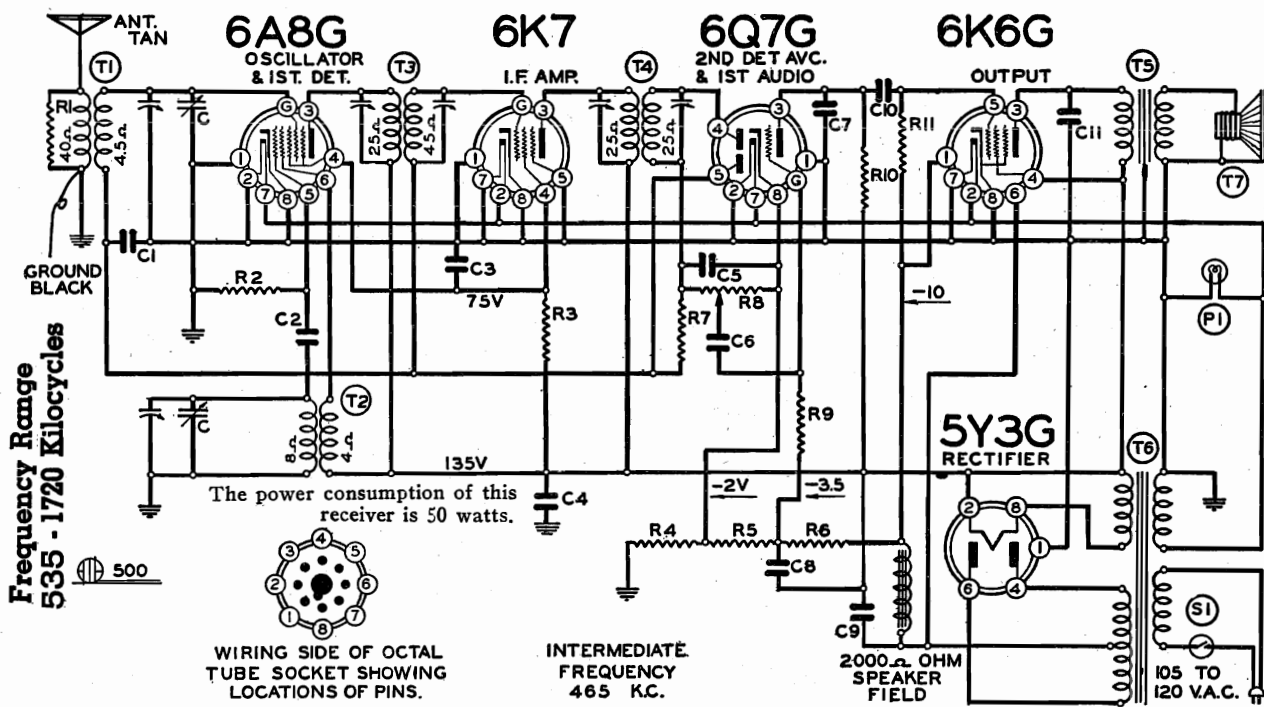

- The following equipment is required for aligning:
- An all wave signal generator.
  - Output indicating meter.
  - Non-metallic screwdriver.
  - Dummy antennas—1 mt., 100 mmi.

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

MODEL 529

Socket, Trimmers  
Alignment, Tuner Data

BELMONT RADIO CORP.

**SERVICE NOTES:**

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with 115 volts on the primary of the power transformer.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D.C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

Transformers are available and chassis are sometimes equipped with transformers for operation on 25, 40 and 60 cycles (see parts list).

**ALIGNING INSTRUCTIONS:**

**CAUTION:**—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet. Remove the knobs and the four bolts which are used to fasten the chassis.

All adjustments should be made with a non-metallic screwdriver.

**RESONANCE INDICATOR:**

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 6K6G output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

**ALIGNING I.F. TRANSFORMERS: (465 K.C.):**

- Part No. 108-95B Output I.F. Transformer
- Part No. 108-96 Input I. F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
  - (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-95B) to resonance.
  - (b) Move oscillator output clip from grid of 6K7 to grid of 6A8G and adjust input I.F. transformer (No. 108-96) to resonance.
  - (c) With oscillator still connected to 6A8G, readjust output I.F. transformer (108-95B) if necessary.

**1. R.F. ALIGNMENT: (535-1720 K.C.)**

1. With the gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 100 mmf. condenser to the antenna lead and chassis ground and make the following adjustments:
  - (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
  - (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
  - (c) Check sensitivity at 600 and 1000 kilocycles.

**PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:**

There are five levers on the dial by means of which five stations may be selected, (See "B" Fig. 2).

FIG. 1—TOP VIEW

FIG. 2—FRONT VIEW

Make a list of local stations you tune in regularly; any number up to and including five.

Numbers are placed on the cabinet above each automatic tuner lever. These numbers (1 to 5) are used to designate the stations you have chosen them to represent.

Any order of grouping can be used, either by assigning call letters for the levers numerically (1 to 5) or arranging them to correspond with the calibration on the dial scale, namely, starting with the lowest frequency station on the right and so on up in frequency to the highest frequency station on the left.

Press **DOWN ALL THE WAY** any one of the automatic tuner levers. Holding it down **FIRMLY**, tune in by means of the tuning knob (No. 2) the station you have assigned to this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down **FIRMLY**, carefully tune in the station assigned to this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Now rotate the tuning knob (No. 2) to the right (clockwise) as far as it will turn, and with a coin (half dollar), tighten the locking screw ("C") in the center of the tuning knob, (See Fig. 1).

It is **VERY IMPORTANT** that this locking screw is turned until it is **ABSOLUTELY TIGHT**.

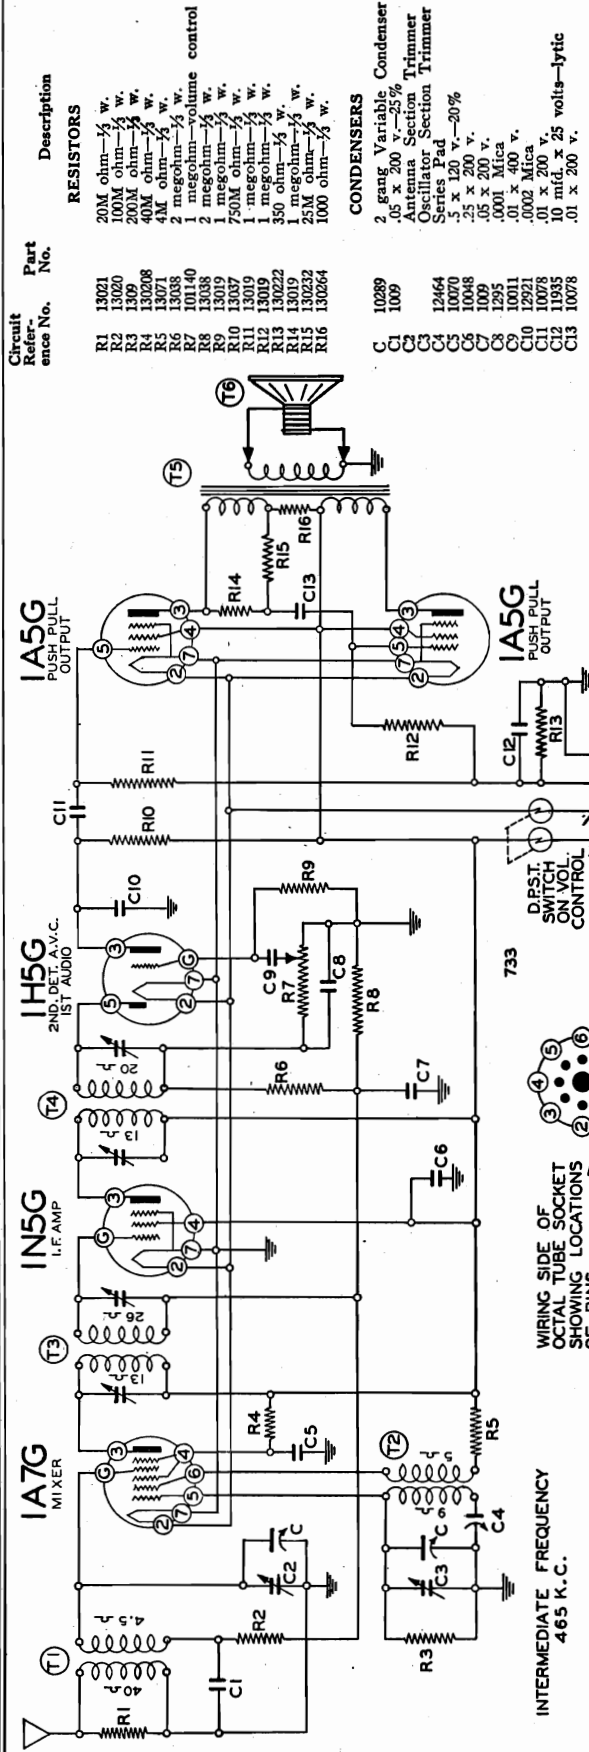

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, hold the tuning knob No. 2 securely and with a coin loosen the locking screw "C" one or two turns; select the new station as explained. **Be sure to retighten the locking screw**, otherwise the stations you have selected will not stay adjusted to the levers.

BELMONT RADIO CORP.

**Broadcast Band 1 1/2-Volt Battery Operated Superheterodyne Receiver**  
**MODEL 551 Series A**  
**5 TUBE Frequency Range—535 - 1735 Kilocycles**

**DESCRIPTION:**

**TUBES:**  
The tube complement of this chassis consists of the following tubes.

- The type and function of each tube is as follows:
- 1—Type 1A7G Mixer, First Detector-oscillator.
  - 1—Type 1N5G Remote Cut-Off Pentode, 1st I. F. Amplifier (465 K. C.)
  - 1—Type 1H5G Second Detector, A.V.C., 1st Audio.
  - 2—Type 1A5G Push-Pull Output Amplifier.

**SERVICE NOTES:**

Voltagcs taken from different points of circuit to chassis are measured with volume control full on, all

tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.  
All voltages as indicated on the voltage chart are measured with a new set of batteries.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

The approximate current consumption is as follows:  
"A"—ma., "B"—ma.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the

caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good.

**ALIGNING INSTRUCTIONS:**

**CAUTION:**—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low battery voltage, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet. Remove the knobs and the 3 bolts which are used to fasten the chassis.

All adjustments should be made with a non-metallic screw driver.

**ALIGNMENT PROCEDURE**

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—1 mf., 200 mmf.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 1N5G I.F. Tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 1A7G	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROADCAST BAND	1735 Kc.	200 mmf.	Antenna lead	Rotor full open (Plates out of mesh)	Trimmer—Top of rear section of gang (See Fig. 1)	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	200 mmf.	Antenna lead	Set dial at 1400 Kc.	Trimmer—Top of front section of gang (See Fig. 1)	Antenna Broadcast	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Set dial at 600 Kc.	B.C. Series Pad (See Fig. 1)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")

**NOTE "A":** Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

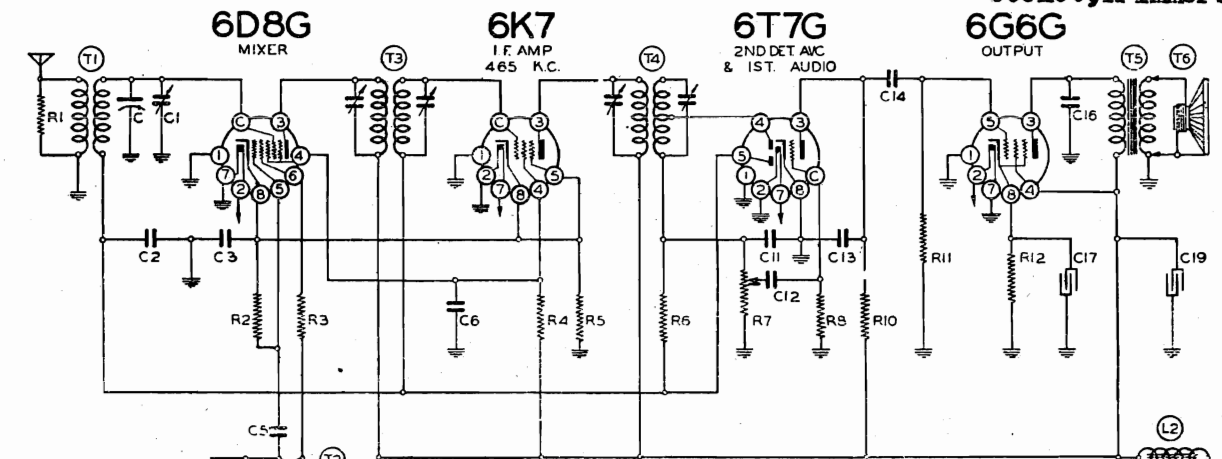

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.  
After each band is completed, repeat the procedure as a final check.

**FREQUENCY RANGE**  
535 to 1735KC.

- \*Power Output.....130 Milliwatts Undistorted, 270 Milliwatts Maximum
- Intermediate Frequency.....465 KC.
- \*Power Output Measured Across 3 Ohm Voice Coil.

DESCRIPTION

FACE VIEW OF POWER CORD SOCKETS

115 VOLT AC LINE SOCKET

6 VOLT BATTERY LINE SOCKET

1. For 6 volt storage battery operation:

- (a) Use cable No. 107128C.
  - (b) Connect the lead (containing the fuse receptacle) marked A negative (-) to the negative (-) post of the storage battery.
  - (c) Connect the lead marked A positive (+) to the positive (+) post of the storage battery.
2. For 105-115 volts, 60 cycle operation:
    - (a) Use special cable No. 107129.
    - (b) Plug receptacle of cable into power socket on chassis.

Broadcast Band A. C. and 6-Volt Storage Battery Operated Superheterodyne Receiver

BOTTOM VIEW OF CHASSIS

Alignment, Tuner Data  
Notes

BELMONT RADIO CORP.

**TO REMOVE CHASSIS FROM THE CABINET:**

Remove the four bolts which are used to fasten the chassis to the cabinet shelf; pull the knobs off their shafts and pull off the six button lever keys on front of dial.

**PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:**

There are six levers on the dial by means of which six stations may be selected, (See "B", Fig. 2).

FIG. 2.—FRONT VIEW

**SERVICE NOTES:**

Voltage taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages are to be measured with 6.3 volts input to receiver.  
Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good. If fuse blows out frequently and insulating sleeve has been properly placed over fuse, the trouble is probably in the vibrator, it should be replaced. Do not attempt to make any adjustments on the vibrators.

Excessive hum, stuttering, low volume and a reduction in all D. C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

**ALIGNING INSTRUCTIONS:**

**CAUTION:**—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low battery voltage, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet.

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna valve in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

MODEL 553  
SERIES A

FREQUENCY RANGE  
535 to 1735 KC.

Press down any one of the six Automatic levers. Holding it down, tune in by means of tuning knob No. 2 any one of your favorite stations. Turn the tuning knob very slowly back and forth until signal is clearest. The station will then be accurately tuned in.

Release this lever and press down any other Automatic lever. Hold this lever down and tune in by means of knob No. 2 another favorite station.

Follow this procedure until stations have been set on all the levers. Hold tuning knob securely with left hand to prevent it from turning and with a coin or screw driver, tighten the special locking screw ("C") in the center of the tuning knob, (See Fig. 2).

This screw will lock in place all stations you have selected on the Automatic levers. (Note: Locking Screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, hold the tuning knob securely and loosen locking screw ("C") one or two turns; select the new station as explained.

**BE SURE TO RETIGHTEN THE LOCKING SCREW,**  
otherwise the stations will not stay adjusted to the levers.

Above each Automatic lever an opening in the escutcheon is provided for inserting station call letters, (See "A", Fig. 2).

Punch the correct station call letter tabs from the set of sheets supplied and insert them into the rectangular openings in the escutcheon above each of the levers. One of the small, clear celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

The Automatic Tuner dial is now set up for quick tuning. Press down on the lever and your favorite station is selected.

The following equipment is required for aligning.

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—1 mf., 200 mmf.

**ALIGNMENT PROCEDURE**

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Condenser Setting	Variable Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6K7 I. F. Tube	Rotor full open (Plates out of mesh)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6D8G	Rotor full open (Plates out of mesh)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1730 Kc.	200 mmf.	Antenna Lead	Rotor full open (Plates out of mesh)	Set dial at 1400 Kc.	Trimmer—Top of rear section of gang (See Fig. 1)	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	200 mmf.	Antenna Lead			Trimmer—Top of front section of gang (See Fig. 1)	Antenna Broadcast	Adjust to maximum output
Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC. After each band is completed, repeat the procedure as a final check.								
Power Consumption—40 Watts (at 115 Volts 50/60 Cycles) or 2.5 Amperes at 6.3 Volts Power Output—6 Watts Undistorted, 1 Watt Maximum								

BELMONT RADIO CORP.

MODEL 577C  
Above Serial 203070  
Schematic, Voltage, Notes

**GENERATOR INTERFERENCE**

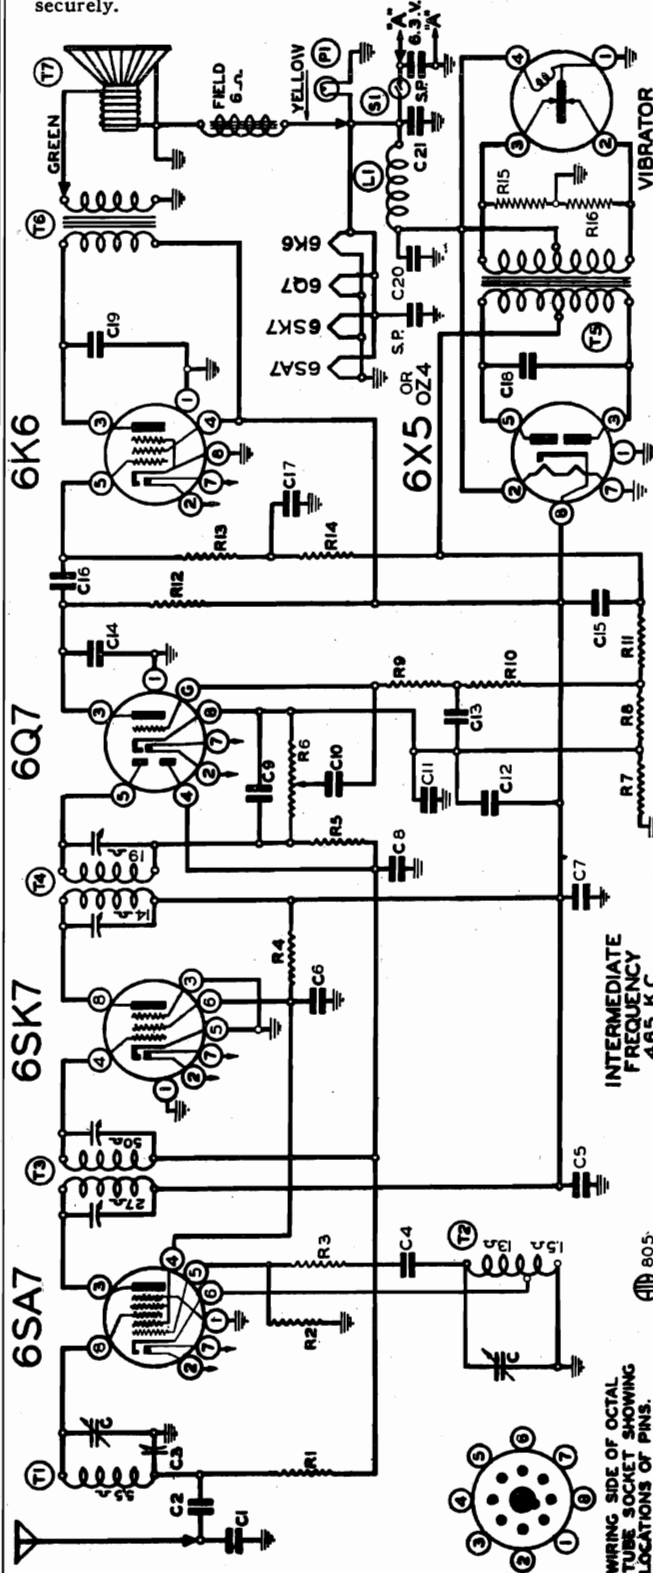

Remove the generator cutout mounting screw and fasten the condenser (100-81) bracket on the generator cutout mounting lug. Replace the cutout mounting screw and tighten down securely.

Connect the condenser lead to the battery terminal of the cutout. The generator condenser is absolutely necessary as it is used to eliminate a high pitched whining noise which would otherwise be heard as the motor is accelerated

**CONNECTIONS TO BATTERY**

The battery cable, number 107-82, (red wire with fuse receptacle at one end and terminal lug at other end) must be connected to battery terminal of ammeter. At the same time connect ammeter capacitor, number 100-82, to battery terminal of ammeter, other end of condenser to any convenient grounded screw on back of instrument panel. Make certain that insulating sleeve is slipped over fuse when fuse is placed in receptacle, before connecting to short battery cable from receiver.

When connected properly, the discharge due to current drawn by the receiver should not indicate on the ammeter. This is important, since if improperly connected, as shown by the deflection of ammeter, additional motor interference may be encountered.

**ADJUST ANTENNA TRIMMER**

Tune in a weak signal at approximately 600 K.C. with volume control about three-fourths on. Adjust trimmer screw "X" until maximum output is obtained. (See Fig. 1, Adjustment "X" on right side of radio)

Tuner Data

**SERVICE NOTES** Alignment, Socket, Trimmers  
Tuner Data

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the bottom view.

In order to prevent signal from acting upon A.V.C. and affecting accuracy of voltage measurements, aerial and ground leads should be short circuited while making measurements.

All voltages are to be measured with 6.3 volts input to receiver. Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good. If fuse blows out frequently and insulating sleeve has been properly placed over fuse, the trouble is probably in the vibrator, it should be replaced. Do not attempt to make any adjustments on the vibrators.

**ALIGNING INSTRUCTIONS**

All of the adjustments have been very carefully set with signal generators at the factory and require no further adjustment, unless it becomes necessary to replace a coil or transformer, or if the adjustments have been tampered with in the field. Under no circumstances attempt any adjustments without first making certain that adjustment is necessary and only after voltages, tubes and condensers have been checked and found to be normal. To properly re-align this receiver, a test oscillator, as well as an output meter, must be used.

**DUMMY ANTENNAS**

The dummy antennas referred to in the following instructions are:

- "I.F. Dummy" —A .5 mfd. condenser connected in series with the test oscillator output lead.
- "Broadcast Dummy"—A 125 mmfd. condenser connected in series with the output lead of the test oscillator.

**RESONANCE INDICATOR**

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 6K6 output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

**I.F. ALIGNMENT: (465 K.C.)**

1. With variable condenser in its minimum capacity position (plates entirely out of mesh) and with volume control full on, connect test oscillator set at 465 K.C. in series with I.F. dummy antenna, to grid of 6SK7 I.F. tube.
2. Adjust trimmer condensers of output I.F. transformer No. 108121 to resonance with oscillator.
3. Move test oscillator connection to grid of 6SA7 tube and adjust trimmer condensers of input I.F. transformer No. 108139 to resonance with oscillator. There are two adjustments on each and they are accessible from the top of the transformer shield and should be adjusted with an insulated screw driver. (See Fig. 3—top view, page 3.)

**BROADCAST ALIGNMENT**

1. With variable condenser in its minimum capacity position, connect test oscillator set at 1550 K.C. in series with broadcast dummy to the antenna lead of receiver.
2. Adjust oscillator trimmer of variable condenser to resonance. (This adjustment is the rear section of the two-gang condenser—see top view, Fig. 3).
3. Shift test oscillator to 1400 K.C. and pick up signal by rotating condenser and adjust antenna trimmer (front section of gang condenser) to resonance (see top view, Fig. 3).
4. Re-set test oscillator to 600 K.C. and rotate variable condenser to 600 K.C. Adjust series pad in the antenna cir-

cuit for maximum gain. This pad is mounted on the side of the antenna can, adjustment "X."

5. Go back and check 1400 K.C. If adjustment is made here, check 600 K.C. again.
6. Check for sensitivity at 1000 K.C. by setting test oscillator to this frequency and picking up the signal by rotating variable condenser. Under no circumstances bend plates of variable condenser sections to correct tracking.

FIG. 3—TOP VIEW

**PROCEDURE FOR SETTING THE AUTOMATIC LEVERS**

There are five levers on the dial by means of which five stations may be selected, (See "B" Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including five.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

On the front of each automatic tuner lever an opening is provided for inserting the call letter tabs, (See "A" Fig. 2).

Insert the call letter tabs in the rectangular openings of each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 1) the station you have assigned to this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station assigned to this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Now rotate the tuning knob (No. 1) to the right (clockwise) as far as it will turn, and tighten the special locking screw ("C") located on left side of tuner dial assembly (See Fig. 2).

It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, loosen the locking screw "C" one or two turns, select the new station as explained. Be sure to retighten the locking screw, otherwise the stations you have selected will not stay adjusted to the levers.

The automatic dial is now set up for quick tuning. Press down on the lever and your favorite station is selected.

MODEL 633, Series A  
Alignment, Tuner, Parts

BELMONT RADIO CORP.

**ALIGNMENT PROCEDURE**

- Volume control—Maximum all adjustments.
- Connect B - of radio chassis to ground post of signal generator through .1 Mfd. condenser.
- Connect dummy antenna valve in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—1 mf., 100 mmf.

BAND	SIGNAL GENERATOR		Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
	Frequency Setting	Dummy Antenna					
I. F.	470 Kc.	.1 MFD.	Grid of 6A8G	Rotor full open (Plates out of mesh)	Four trimmers (See Fig. 1)	Output and input I. F.	Adjust to maximum output
BROADCAST BAND	1720 Kc.	100 mmf.	Antenna Lead	Rotor full open (Plates out of mesh)	Trimmer—Top of rear section of gang (See Fig. 1)	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	100 mmf.	Antenna Lead	Set dial at 1400 Kc.	Trimmer—Top of front section of gang (See Fig. 1)	Broadcast Antenna	Adjust to maximum output

**FREQUENCY RANGE**  
535 to 1720 K.C.

Power Consumption ..... 45 Watts  
Power Output ..... 1.2 Watts Undistorted, 2.1 Watts Maximum  
Intermediate Frequency ..... 470 K.C.

**PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:**

There are five levers on the front of the radio by means of which five stations may be selected, (See "B" Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including five.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

Above each automatic tuner lever an opening in the cabinet is provided for inserting the call letter tabs, (See "A" Fig. 2).

Insert the call letter tabs in the rectangular openings in the cabinet above each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 2) the station indicated on the station call letter tab above this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab above this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Now rotate the tuning knob (No. 2) to the right (clockwise) as far as it will turn, and with a coin (half dollar), tighten the special locking screw ("C") in the center of the tuning knob, (See Fig. 2).

It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

**ALIGNING INSTRUCTIONS:**

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltage, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet.

**HOW TO REMOVE CABINET:**

CAUTION:—Always disconnect the line cord from the house current before removing the chassis from the cabinet.

To remove chassis from the cabinet unscrew the locking screw in the center of the tuning knob and pull tuning knob and volume knob off their shafts. Remove the back of the cabinet and the two screws that hold the chassis to the cabinet. Pull off the five buttons on the Automatic levers. Move the chassis toward back of cabinet so that control shafts and tuner assembly clear holes in cabinet, then chassis can be slipped out.

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:

There are five levers on the dial by means of which five stations may be selected, (See "A" Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including five.

Numbers are placed on the cabinet above each of the automatic tuner levers. These numbers (1 to 5) are used to designate the stations instead of station call letter tabs.

Assign Stations for the levers numerically letting the numbers represent the stations you have chosen.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 2) the station you have assigned to this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station assigned to this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Part No.	Circuit Diagram Reference	Description	List Price Each
<b>DIAL PARTS LIST</b>			
10794	PI	6-8 Volt Pilot Light Type T-44	.10
107201		Socket and Bracket for Pilot Light	.10
115224		Support Bracket for Automatic Tuning Mechanism (Mounts to Variable Condenser)	.10
115176		End Support Bracket for Automatic Tuning Mechanism	.10
117398		Brass Pulley (String Drive for Pointer; Mounts on Cam Shaft at Variable Condenser End)	.15
117399		Brass Pulley (String Drive for Pointer; Mounts on Right End of Cam Shaft with Spring Take-Up)	.15
120200		Take-Up Spring for Drive Spring Pulley	.03
117258		Tuner Cams (Five Used)	.05
131157		Keywashers (Used on Each Side of Tuner Cams)	.02
131157B		Keywashers (Two Used; Have Holes to Attach Take-Up Spring)	.02
115174		Lever Complete with 117337 Roller	.15

117390		Locking Screw (Lock Tuner Cams; Inserted through Center of Tuning Knob)	.10
120181		Hairpin Springs (for Tuner Levers)	.03
117256		Brass Spacer (Three Used on Cam Shaft)	.05
117340		Brass Spacer (One Used on Cam Shaft)	.05
115249		Bracket for Dial Scale Complete with Two Small Brass Pulleys and Bushing for Pointer Shaft	.20
117403		Threaded Pulley and Stud for Pointer	.10
112489		Pointer	.25
112487		Dial Scale Calibrated	.35
112488		Crystal (Cover for Dial Scale)	.25
13143		Cinch Buttons (Fasten Dial Scale to Bracket)	.01
128173BR		Brown Bakelite Buttons for Tuner Levers	.10

PRICES SUBJECT TO CHANGE WITHOUT NOTICE.

Now rotate the tuning knob (No. 2) to the right (clockwise) as far as it will turn, and with a coin (half dollar), tighten the special locking screw ("B") in the center of the tuning knob, (See Fig. 1).

It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "B" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, hold the tuning knob No. 2 securely and with a coin loosen the locking screw "B" one or two turns; select the new station as explained. Be sure to retighten the locking screw, otherwise the stations you have selected will not stay adjusted to the levers.

The automatic dial is now set up for quick tuning. Press down on the lever and your favorite station is selected.

RADIO-PHONOGRAPH SWITCH:

The knob for the Radio-Phonograph Switch is located in the front left hand corner of the phonograph compartment. It is marked with a pin and under the knob an escutcheon plate is marked as follows: "Radio"- "Phono Off"- "Phono On"

Rotating the knob so that the pin marker on the knob is in line with the word "Radio" the switch is in radio playing position; when the pin is in line with the word "Phono Off" the switch disconnects the radio and connects the phonograph pick-up; when the pin is in line with the word "Phono-On" the switch connects the phonograph motor and is in phonograph playing position. The motor must be started by hand. Press down on the turntable with the fingers, spread and give the record and turntable a quick spin in a clockwise direction. The motor can be started rotating in either direction. For proper operation, however, it must rotate in a clockwise (to the right) direction.

To stop the phonograph motor turn the switch knob to "Phono-Off" position.

To disconnect phonograph entirely turn switch knob to extreme left to "Radio" position.

Volume control knob No. 1 on front of the radio controls the volume in either case; for radio, or for phonograph.

BELMONT RADIO CORP.

### SERVICE NOTES

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

In order to prevent signal from acting upon A.V.C. and affecting accuracy of voltage measurements, aerial and ground leads should be short circuited while making measurements.

All voltages are to be measured with 6.3 volts input to receiver. Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good. If fuse blows out frequently and insulating sleeve has been properly placed over fuse, the trouble is probably in the vibrator, it should be replaced. Do not attempt to make any adjustments on the vibrators.

Fig. 2—Front View of Remote Tuner Unit

### ALIGNING INSTRUCTIONS

All of the adjustments have been very carefully set with signal generators at the factory and require no further adjustment, unless it becomes necessary to replace a coil or transformer, or if the adjustments have been tampered with in the field. Under no circumstances attempt any adjustments without first making certain that adjustment is necessary and only after voltages, tubes and condensers have been checked and found to be normal. To properly re-align this receiver, a test oscillator, as well as an output meter, must be used.

### DUMMY ANTENNAS

The dummy antennas referred to in the following instructions are:

"I.F. Dummy" —A .5 mfd. condenser connected in series with the test oscillator output lead.

"Broadcast Dummy"—A 125 mmfd. condenser connected in series with the output lead of the test oscillator.

### RESONANCE INDICATOR

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 6V6 output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

### I.F. ALIGNMENT: (465 K.C.)

#### IMPORTANT:

To align the output I.F. transformer without using a cathode ray oscillograph a 10M ohm resistor must be shunted across the tertiary coil of this unit.

Connect the resistor as indicated by points "Y" and "Z" on the circuit diagram as follows:

Locate the wires coming from the bottom of the output I.F. coil assembly on the underside of the radio chassis.

The white lead with green tracer which is connected to diode plate terminal No. 5 on the 6Q7 tube socket is one point

BACK VIEW

Fig. 4

and the white lead with brown tracer which is connected to the end terminal of the terminal strip is the other point. Proceed as follows:

1. With the dial of the Remote Tuner Unit set at 1400 K.C. and with volume control full on, connect test oscillator set at 465 K.C. in series with I.F. dummy to grid of 6K7 I.F. tube.
2. Adjust trimmers "H" and "I" of output I.F. transformer for maximum gain, (See Fig. 3, top view).
3. Disconnect the 10M ohm resistor which has been shunted across the tertiary winding and adjust trimmer "J" for maximum gain.

(a) This transformer is now correctly tuned. Under no circumstances re-adjust trimmers "H" and "I" after the 10M ohm resistor has been removed.

(b) For alignment of the output I.F. transformer using a cathode ray oscillograph the 10M ohm resistor is not used and the procedure is similar to the alignment of any two circuit I.F. transformer; merely tune for a symmetrical curve of maximum amplitude.

(c) Output connections for the cathode ray oscillograph should be made to pin No. 8 on 6Q7 tube socket and to the end terminal on the terminal strip; at this point the diode load resistors terminate.

4. Move test oscillator connection to grid of 6A8 tube and adjust trimmer condensers "F" and "G" of input I.F. transformer for maximum gain.

NOTE: A red dot on top of output I.F. can designates location of trimmer "H"

### BROADCAST ALIGNMENT:

1. With the dial on the Remote Tuner Unit set at 1560 K. C., connect test oscillator set at 1560 K. C. in series with broadcast dummy to the antenna lead of receiver.
2. Adjust oscillator trimmer (adjustment "D", on back of Remote Tuner Unit) to resonance. (See Fig. 4, back view).
3. Re-set test oscillator to 1400 K. C. and pick up signal by rotating dial on Remote Tuner Unit. Adjust R. F. Trimmer (adjustment "C", on back of Remote Tuner Unit), to resonance. (See Fig. 4, back view).

CAUTION: In order to realize maximum gain out of the antenna adjustments, back out antenna shunt trimmer (adjustment "B") on back of remote tuner unit all the way out and then adjust antenna series trimmer (adjustment "A") on side of remote tuner unit to resonance.

4. Re-set test oscillator to 600 K.C. and rotate Remote Tuner Unit dial to 600 K. C. Adjust shunt oscillator adjustment "E", rotating dial to and fro at the same time adjusting shunt oscillator for maximum gain. This adjustment is accessible from the top of the radio chassis, (See Fig. 3, top view).
5. Go back and check 1400 K. C. If adjustment is made here, check 600 K. C. again.

**ALIGNMENT PROCEDURE**

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good. If fuse blows out frequently, the trouble is probably in the vibrator, it should be replaced. Do not attempt to make any adjustments on the vibrators.

**ALIGNING INSTRUCTIONS:**

All of the adjustments have been very carefully set with signal generators at the factory and require no further adjustment, unless it becomes necessary to replace a coil or transformer, or if the adjustments have been tampered with in the field. Under no circumstances attempt any adjustments without first making certain that adjustment is necessary and only after voltages, tubes and condensers have been checked and found to be normal. To properly re-align this receiver, a test oscillator, as well as an output meter, must be used.

**SERVICE NOTES:**  
Voltages taken from different points of circuit to chassis are measured with volume control full on, all six tubes in their sockets and speaker connected, with a four volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the voltage chart.

In order to prevent signal from acting upon A.V.C. and affecting accuracy of voltage measurements, aerial and ground leads should be short circuited while making measurements.

All voltages are to be measured with 6.3 volts input to receiver. Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating which is known to be good, until the defective unit is located.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—1 ml., 125 mmf.

**DESCRIPTION:**  
Model 678 is a six tube superheterodyne receiver having a chassis are measured with volume control full on, all tuning range of 535 K. C. to 1565 K. C.; operates from a six volt storage battery and uses the automotive type 6.3 volt meter having a resistance of 1000 ohms per volt. The "B" supply is obtained from a synchronous type vibrator.

The I. F. frequency used is 465 K. C. The output I. F. coil has three tuned circuits giving superior band pass qualities and selectivity as compared to the conventional two tuned circuit coils. Antenna, R. F. and oscillator circuits are permeability tuned, offering automatic tuning applications that are both accurate and stable. The entire coil assembly is mounted in the Remote Tuner control head being connected to the oscillator and R. F. circuits by an R. F. transmission cable.

The R. F. oscillator, I. F. and audio amplifier including the power supply is contained in the speaker case.

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—1 ml., 125 mmf.

**SIGNAL GENERATOR**

BAND	Frequency Setting	Dummy Antenna	Connection to Radio	Remote Tuner Dial Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6SK7 I. F. Tube	Set dial at 1400 Kc.	Trimmers C19, C20 (See Fig. 3)	Output I. F.	See note "A" Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6SK7	Set dial at 1400 Kc.	Trimmer C21 (See Fig. 3)	Output I. F.	See note "B" Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6A8	Set dial at 1400 Kc.	Trimmers C14, C15 (See Fig. 2)	Input I. F.	Adjust to maximum output
BROAD CAST BAND	1565 Kc.	125 mmf.	Antenna lead	Set dial at 1565 Kc.	Trimmer C5 (See Fig. 4)	Oscillator	Adjust to maximum output
	1400 Kc.	125 mmf.	Antenna lead	Set dial at 1400 Kc.	Trimmers C1, C3 (See Fig. 4)	Antenna and R. F.	Adjust to maximum output
	600 Kc.	125 mmf.	Antenna lead	Set dial at 600 Kc.	Trimmer C2 (See Fig. 4)	Antenna series adj.	See note "C" ANTENNA SERIES TRIMMER C1, C2

**NOTE "A" IMPORTANT:** To align the output I. F. transformer without using a cathode ray oscillograph a 10M ohm resistor must be shunted across the diode tuned circuit. Connect the resistor as indicated by points "X" and "y" on the circuit diagram and the bottom view of the radio chassis Fig. 5. A red dot on top of output I. F. can designate location of trimmer "C19".

**NOTE "B":** Before adjusting trimmer C21 disconnect the 10M ohm resistor. Under no circumstances re-adjust trimmers C19 or C20 after the 10M ohm resistor has been removed. For alignment of the output I. F. transformer using a cathode ray oscillograph the 10M ohm resistor is not used.

**NOTE "C":** Maximum gain for this adjustment depends on the capacity of the antenna system of the car in which the radio is installed. For the proper alignment of this adjustment see "Adjusting Antenna Trimmer."

**ALIGNMENT OF THE IRON CORES**

The iron cores for the antenna, R. F. and oscillator permeability coils have been very carefully adjusted at the factory and require no further adjustment, unless it becomes necessary to replace a coil, or if the adjustments have been tampered with.

The procedure for aligning the iron cores will be supplied with replacement coils when ordered.

**TUBE COMPLEMENT:**

- 1—Type No. 6K7 R. F. Amplifier.
- 1—Type No. 6A8—Pentagrid Converter (composite first detector and oscillator).
- 1—Type No. 6SK7—Remote Cut-off Pentode as an I. F. Amplifier.

**IMPORTANT—ADJUSTING ANTENNA TRIMMER:**

Tune in any weak station between 600 and 800 kc.

Make sure that the antenna shunt trimmer on the Bottom of the Remote Tuner is turned all the way out (counter clockwise), (see adjustment "C1," Fig. 4.).

Adjust antenna series trimmer on the side of the remote Tuner Unit. For maximum output. (See adjustment "C2," Fig. 4.).

**NOTE:** If resonance (maximum output) cannot be obtained within the range of the antenna series trimmer "C2," turn the adjustment screw all the way out (counter clockwise) and then adjust the antenna shunt trimmer "C1" on the bottom of the remote tuner unit for a peak of maximum output.

The above arrangement will cover any antenna capacity that is now in use.

Fig. 4.—Bottom View of Remote Tuner

- 1—Type No. 6Q7—Duplex Diode Triode Second Detector, A.V.C. and First Audio.
- 1—Type No. 615G—Driver Amplifier.
- 1—Type No. 6N7—Push-Pull Output Amplifier.

MODEL 678, Issue A  
Tuner Data, Notes

- To release the last pushbutton push in very slightly, any one of the other pushbuttons. This will trip the latching mechanism.
- To lock the tuner mechanism push on the dial tuning knob to the right (clockwise) until the dial tuning knob can be turned any further without forcing it. (NOTE: All the pushbuttons must be in out position when locking the tuner mechanism.)

RADIO LOCATION AND MOUNTING:

Determine the most satisfactory mounting position. Lift the radio case up and temporarily hold it in the proposed position. The case should be mounted high enough to avoid interference with car controls and the location of the Remote Tuner unit in respect to the radio case should be considered. The limiting factor being the length of special conductor cable which connects the Remote Tuner unit to the vibrator. (This cable should be mounted in any manner.) Mark locations for the mounting bolt, drill one one-half inch (1/2") hole, making certain that the point around the hole on the engine side of the fire wall is scraped clean to insure a good ground connection between receiver and the frame of the car.

**CAUTION:** Before fastening the radio unit read very carefully the paragraph on "CONNECTIONS TO BATTERY" and be thoroughly understood as the radio will not operate unless the polarity of the vibrator unit corresponds with the polarity of the storage battery in the car.

**TUNER UNIT MOUNTING:** It may be necessary in some instances to move dash panel light switches or car heater control switches, however, in the majority of cases the Remote Tuner unit can be mounted in the location shown in Fig. 1B. Mount the unit as close to the left of the steering column as possible to allow clearance for the emergency brake which is mounted on the extreme left hand side of some makes of cars.

Details for mounting are shown in Fig. 1A and Fig. 1B, General Installation View. The bracket No. 115325 for mounting the Remote Tuner Unit is made of steel and is designed to facilitate the best mounting in all makes of cars. Use the bracket as a template, marking the lip of the dash for three mounting holes for the bracket and two clearance holes for the Remote Tuner unit mounting bolts. (See Fig. 1A.)

Mount the bracket using either the flat head self-tapping screws or the flat head machine screws, lockwashers and nuts. Insert the two Remote Tuner unit mounting bolts through the holes in the unit using the two fibre washers to hold the bolts in place while mounting the unit to the bracket. (See Fig. 1B.) Screw the mounting bolts up as tight as possible so that the remote unit can be mounted forward or further back as desired. Fasten the unit securely. Connect the battery cable, number 107237 coming from the radio case to the pin on the volume control assembly on the rear of the Remote Tuner Unit. Connect the R. F. cable assembly (cable number 107231) by inserting the R. F. cable into the hole in the side of the cap of the cable assembly to the threaded fitting on the radio case securely. (See Fig. 1A.)

**Important:** This cable should not be altered in any manner. This unit has been carefully designed to facilitate servicing. In case the unit cannot be removed by loosening three wing screws, exposing all tubes, vibrator and receiver circuits. All adjustments are accessible being located on the side and bottom of the Remote Tuner unit. (See Fig. 4), a full eight inch electro dynamic speaker is used. The output of the receiver is 9 watts.

- Push the dial tuning knob in hard enough to make it latch in.
- Rotate the dial tuning knob to the left (counterclockwise), until the knob can not be turned any further without forcing.

NOW, PROCEED AS FOLLOWS—

- Push in on the pushbutton which is latched in. Holding it in firmly, tune in by means of the dial tuning knob the station indicated on the station call letter tab on this pushbutton. Turn the dial tuning knob very slowly (counterclockwise) until the station is clear. The station will then be accurately tuned in.
- Push in all the way another pushbutton, at the same time holding the dial tuning knob in so that both the pushbutton and the dial tuning knob are latched in together. Holding the pushbutton in firmly, tune in the station indicated on the call letter tab on this pushbutton.
- Follow this procedure until you have tuned in all of your favorite stations.

When the last pushbutton has been properly set up, it is necessary to tune in from an unnumbered station to lock the tuner mechanism. To release this pushbutton, press in very slightly any one of the other pushbuttons. This will trip the latching mechanism and all the pushbuttons will be released to out position. Now, Press on the dial tuning knob hard enough to make it latch in. Rotate the dial tuning knob to the right (clockwise) until the knob can not be turned any further. This will lock the tuner mechanism and all the stations that have been set up on the pushbuttons and—YOUR FA-  
VORITE STATION IS SELECTED.

**IMPORTANT STEPS TO REMEMBER WHEN SETTING UP STATIONS ON THE PUSHBUTTONS FOR AUTOMATIC TUNING ARE:**

- To unlock the tuner mechanism press on the dial tuning knob hard enough to make it stay latched in. Rotate the dial tuning knob to the left (counterclockwise) until the knob cannot be turned any further without forcing it. To set a pushbutton, push in all the way and hold in firmly both the pushbutton and the dial tuning knob so that both latch in. Hold in firmly the pushbutton and tune in the station by means of the dial tuning knob. Set all the pushbuttons in the same manner.

Fig. 1B—Remote Mounting

Fig. 1A—General Installation View

**CONNECTIONS TO BATTERY:** Before making any battery connections, check the polarity of the storage battery. The positive (+) post of the storage battery is grounded to the frame of the car. In cars in which the negative (-) post of the storage battery is grounded to the frame of the car, the vibrator must be connected to the positive (+) post of the storage battery. (See Fig. 3, top view of radio chassis.)

Check the polarity of the storage battery in car either by using a voltmeter. The ammeter cable, number 107236 (red wire with fuse receptacle at one end and terminal lug at other end), must be connected to battery terminal of ammeter. At the same time, the other end of the ammeter cable must be connected to the terminal of ammeter on other end of capacitor to any convenient grounded screw on back of instrument dash panel. Make certain the fuse in the receptacle and the ammeter cable is properly connected to the short cable (number 107238) coming from the Remote Tuner Unit. (See Fig. 1A.)

In some installations it is advisable to connect the ammeter cable to terminal of ammeter on other end of capacitor to any convenient grounded screw on back of instrument dash panel. In some installations, as additional motor interference may be encountered. **GENERATOR INTERFERENCE:** Remove the generator mounting screw and fasten the generator mounting screw and tighten down securely. Connect the generator terminal of the antenna to the battery terminal of the antenna. The generator condenser is absolutely necessary as it is used to eliminate a high pitched, whining noise which would otherwise be heard as the motor is accelerated.

**ANTENNA CONNECTION:** Insert the antenna cable into the back of the remote tuner unit (see Fig. 1A). The wire at the other end of the antenna cable is connected to the lead-in wire from car wiring as possible and ground the pigtail of the antenna cable shield at the antenna end. A 36 inch shielded antenna cable is regularly supplied. If of other length, the shield should be cut to reach the corner post or column at which the antenna lead comes down. The shielded cable should be pushed up into the column as far as possible. The reason for this is that ignition interference may be picked up by any running board. If an antenna shield is used, the shield must be extended to the antenna in all cases. The pigtail on the end of the antenna cable shield must be well grounded at the extreme antenna end. If it is necessary to extend the antenna cable, be sure that a pigtail is put on the extreme antenna end and that it is well grounded at the antenna end.

To extend the antenna cable shielding, the antenna lead wire should be covered with heavy insulation, such as loom, to properly separate the shielding from the wire. Then connect the two wires together and connect the two shields together, care being taken that no strand of the shield touches the antenna shield.

Antennas suitable for steel roof and convertible cars can be purchased, from 39¢ to \$1.00. The majority of 1937, 1938 and 1939 cars have steel roofs, and the antenna cable can be run through the top of the pole, door hinges or over the top of the roof must be used. The Chrysler Motors cars (except Plymouth—but including Chrysler, Dodge and DeSoto) have a steel roof, separated from the body proper, which is used as an antenna. **PROCEDURE FOR SETTING THE AUTOMATIC PUSHBUTTONS:** There are six pushbuttons on the Remote Tuner Unit by means of which six stations may be set up for automatic tuning (see Fig. 4, Fig. 5).

Make a list of local stations you tune in regularly; any

 Tuner Data

**Model 751 Series A**

**SERVICE NOTES:**

Voltage taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

IN ORDER TO PREVENT SIGNAL FROM ACTING UPON AVC AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.

All voltages are to be measured with 115 volts A.C. line or a fully charged 6 volt storage battery.

Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagrams.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D.C. voltages is usually caused by a shorted electrolytic condenser, open by-pass condensers frequently cause oscillation and distorted tone.

**SETTING THE AUTOMATIC TUNER LEVERS:**

**IMPORTANT**—Read carefully before setting the automatic levers.

There are six levers by means of which six stations may be selected. Make a list of local stations or stations you tune in regularly; any number up to and including six.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

On the front of each automatic tuner lever button an opening is provided for inserting the call letter tabs.

Insert the call letter tabs in the rectangular openings of each of the automatic tuner buttons. One of the small celluloid tabs supplied should be inserted into place over each of the station call letter tabs.

**NOW. PROCEED AS FOLLOWS:—**

1. Pull the dial tuning knob all the way out (See Illus. "B," Fig. 3), and rotate the tuning knob to the left (counterclockwise) until it cannot be turned any further (See Illus. "D," Fig. 3). This will unlock the automatic tuner mechanism. (NOTE:—Automatic tuner mechanism is locked tight when radio is shipped from the factory.)

2. Press down all the way any one of the automatic tuner levers. Holding it down firmly, press in on the dial tuning knob No. 3 and tune in the station indicated on the station call letter tab on this lever. You will note that in order to

tune the station, the dial tuning knob will have to be pressed in (See Illus. "E," Fig. 3). Turn the dial tuning knob very slowly back and forth (while still holding the automatic tuner lever in downward position), noting the width of the shadow on the screen of the cathode-ray tuning indicator. Minimum width on the tuning indicator indicates the ideal tuning position (resonance). The station will then be clearest and accurately tuned in.

3. Press down another automatic tuner lever. Holding it down firmly, press in on the dial tuning knob and carefully tune in the station indicated on the call letter tab on this lever.

4. Follow this procedure until you have selected all of your favorite stations.

5. Pull the dial tuning knob all the way out (See Illus. "B," Fig. 3) and rotate the tuning knob to the right (clockwise) until it cannot be turned any further (See Illus. "C," Fig. 3). This will lock the automatic tuner mechanism and the stations you have set up for automatic tuning will be locked in place. After you have locked the tuner mechanism, push the dial tuning knob in.

6. If you should desire to change any station you selected to another, pull the dial tuning knob all the way out and rotate the knob to the left (counterclockwise) and unlock the tuner mechanism. Select the new station as explained.

**FIG. 2—FRONT VIEW**

(NOTE:—If the dial mechanism works hard when setting up a new station for one of the automatic tuner levers, it is due to the tuner mechanism not being unlocked all the way. Pull the dial tuning knob out all the way and rotate the knob to the left (counterclockwise) until it will turn no further. The dial mechanism should work freely with the tuner lever pressed down).

7. After you have selected the new station, pull the dial tuning knob all the way out and rotate the knob to the right (clockwise) to lock the tuner mechanism. Be sure the knob is turned until it will turn no further, then press the dial tuning knob in.

8. The automatic tuner levers are now set up for quick tuning. Press down the lever key and—YOUR FAVORITE STATION IS SELECTED!

The important steps to remember when setting up stations on the tuner levers for automatic tuning are:

1. To unlock the tuner mechanism pull the dial tuning knob all the way out. You may find it necessary to rotate the knob slightly when pulling it out to make certain that the gears mesh properly. Rotate the dial tuning knob to the left (counterclockwise) as far as it will turn without forcing.

2. To set a lever, press down all the way and hold in this position while tuning in by means of the dial tuning knob the station you want this lever to be tuned to. (NOTE:—you will notice that it will be necessary to keep pressing in on the dial tuning knob while tuning in the station as a spring tends to push the knob out.) Set all the levers in the same manner before locking the mechanism.

3. To lock the tuner mechanism pull the dial tuning knob all the way out. Rotate the dial tuning knob to the right as far as it will turn making certain that it is tight, but it is not necessary to use force.

4. After locking or unlocking the tuner mechanism always return the dial tuning knob to its normal position (pushed in).

MODEL 751, Series A  
Alignment, Socket  
Trimmers, Notes

BELMONT RADIO CORP.

ALIGNMENT PROCEDURE

- The following equipment is required for aligning:
- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
  - Output indicating meter.
  - Non-metallic screwdriver.
  - Dummy antennas—1 mf., 200 mmf. and 400 ohms.
- The following adjustments are required for aligning:
- Volume control—Maximum all adjustments.
  - Connect radio chassis to ground post of signal generator with a short heavy lead.
  - Connect dummy antenna value in series with generator output lead.
  - Connect output meter across primary of output transformer.
  - Allow chassis and signal generator to "heat up" for several minutes.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6K7	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6K8G	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1730 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Trimmer C10 (See Fig. 4)	Broadcast oscillator	Adjust to maximum output
	1500 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 1500 Kc.	Trimmer C3 (See Fig. 4)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 600 Kc.	Trimmer C6 (See Fig. 4)	Broadcast oscillator series pad	Adjust to maximum peak dial. (See note "A")
SHORT WAVE BAND	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 17 Mc.	Trimmer C9 (See Fig. 4)	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 17 Mc.	Trimmer C5 (See Fig. 4)	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 6 Mc.	Trimmer C7 (See Fig. 4)	Short Wave oscillator series pad	Adjust to maximum peak dial. (See note "A")

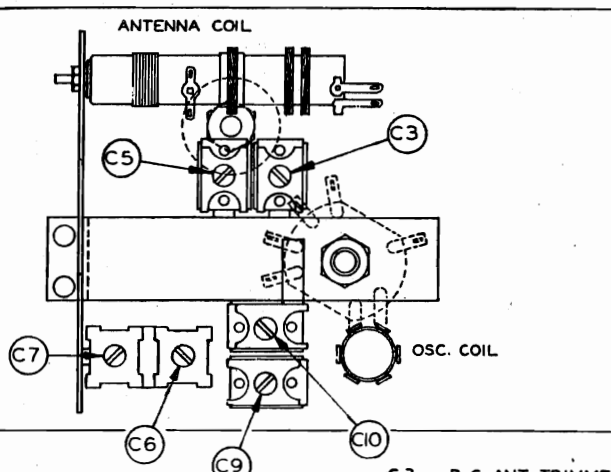

ALIGNING INSTRUCTIONS:

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all possible causes of trouble, such as poor installations, open or grounded antenna systems, low battery voltage, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet.

To remove the chassis from the cabinet, remove the four bolts which are used to fasten the chassis to the cabinet bottom; pull the knobs off their shafts and detach the pointer from the drive string (see Fig. 1, top view).

NOTE:—On the side of the string dial drum a calibrated scale is provided for aligning this chassis to the frequencies listed in the alignment procedure. Attach a pointer so that it will indicate proper dial setting in respect to the position of the variable condenser.

- For 6 volt storage battery operation:
  - Use cable No. 107128C.
  - Connect the lead (containing the fuse receptacle) marked A negative (—) to the negative (—) post of the storage battery.
  - Connect the lead marked A positive (+) to the positive (+) post of the storage battery.
- For 105-125 volts, 50/60 cycle operation:
  - Use special cable No. 107129.
  - Plug receptacle of cable into power socket on chassis.

MODEL 867, Series A  
Alignment, Socket  
Trimmers

BELMONT RADIO CORP.

**BAND SWITCH** Extreme Right Rotation  
Extreme Left Rotation

**BAND** Short Wave  
Broadcast

**FREQUENCY RANGE** 5.6 to 18 MC.  
540 to 1730 KC.

Power Consumption 80 Watts (At 115 volts 50-60 cycles)  
Power Output 5 Watts Undistorted, 7 Watts Maximum  
Intermediate Frequency 465 KC.

ALIGNMENT PROCEDURE

- The following equipment is required for aligning:
- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
  - Output indicating meter.
  - Non-metallic screwdriver.
  - Dummy antennas—1 mf., 200 mmf. and 400 ohms.

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6K7	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6K8G	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROADCAST BAND	1730 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Trimmer (C9) (See Fig. 4)	Broadcast oscillator	Adjust to maximum output
	1500 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 1500 Kc.	Trimmer (C6) (See Fig. 4)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 600 Kc.	Trimmer (C12C) (See Fig. 4)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")
	465 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 600 Kc.	Trimmer (C1) (See Fig. 4)	I. F. Wave Trap	Adjust for minimum output
IMAGE REJECTION ADJUSTMENTS	2330 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 1400 Kc. on dial	Trimmer (C3) (See Fig. 4)	Image rejection	Adjust for minimum output (See note "B")
SHORT WAVE BAND	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 17 Mc.	Trimmer (C8) (See Fig. 4)	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Dial Set at 17 Mc.	Trimmer (C7) (See Fig. 4)	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 6 Mc.	Trimmer (C13) (See Fig. 4)	Short Wave oscillator series pad	Adjust to maximum rock dial. (See note "A")

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.  
Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

NOTE "B" 1400KC is the image frequency of 2330KC. Adjust Trimmer (C3) until a minimum output is obtained.  
After each band is completed, repeat the procedure as a final check.

Medium Wave	Center Scale "MW"	1.66 to 5.5 MC. (Megacycles)
Short Wave	Lower Scale "SW"	5.5 to 18.0 MC (Megacycles)

ALIGNING INSTRUCTIONS:

**CAUTION:**—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet.

To remove the chassis from the cabinet, remove the four bolts which are used to fasten the chassis to the cabinet bottom; pull the knobs off their shafts and detach the pointer from the drive string (see Fig. 2, top view).

**NOTE:**—On the back of the string dial drum a calibrated scale is provided for aligning this chassis to the frequencies listed in the alignment procedure. Attach a pointer so that it will indicate proper dial setting in respect to the position of the variable condenser.

DIAL CALIBRATION:

To correct dial calibration rotate the tuning knob to the right until the dial pointer reaches the extreme end of the dial scale; then rotate the tuning knob to the left until the pointer reaches the other extreme end of the dial scale.

Stop clamps on the pointer slider bar make the pointer self aligning thereby correcting dial calibration.

POWER SUPPLY:

**Caution:**—This radio, unless otherwise marked, must be operated from 105-115 volts, 50-60 cycle A. C. supply only. If you are in doubt as to the voltage and frequency rating of the power supply, consult your local power company before inserting plug. Do not insert plug unless all tubes and speaker plug are in their proper sockets.

Receivers of this model which are to be used on voltages or frequencies other than 105-115 volts, 50-60 cycles are so marked. The power consumption of this receiver is 100 watts.

PHONOGRAPH CONNECTIONS:

A phonograph connector and switch are provided on the rear of the chassis. To operate; insert plug on end of phonograph pick-up lead into connector on chassis and move phonograph switch to "Phono" position. Volume and tone may be controlled by using the controls on the front of the radio.

MODEL 1075, Series A, B  
Tuner Data, Notes, Parts

BELMONT RADIO CORP.

**PROCEDURE FOR SETTING THE AUTOMATIC STATION PUSHBUTTONS:**

**Important:** Allow the radio to "warm up" for about 15 minutes before setting the station adjustment screws for the pushbuttons.

Only a single adjustment for each station is required in setting up your favorite stations for automatic pushbutton operation. These adjustments are located at the front of the chassis shown in Fig. 4 and are accessible through the station call letter tab holes. The only equipment needed is a small screw driver to make the adjustments.

Make a list of your favorite local stations, those which you tune in regularly. Put down the frequency (kilocycle number) of these stations. There may be 2, 3, 5 or any number up to and including six in this list.

If you do not know the broadcasting frequencies, consult your local newspaper or a radio log book. They can also be obtained by pressing the button marked "Broadcast" on the left and tuning in the stations manually, noting the numbers on the dial at which they are received.

The automatic station pushbuttons are grouped to cover specific frequency ranges.

The range of the frequencies covered by each button are given below and are also shown in Fig. 4. Only stations within the frequency ranges given can be obtained on a particular button. Counting the station buttons from left to right, looking at the front of the set, the frequency ranges are as follows:

1. 1550 to 1000 Kilocycles.
2. 1550 to 1000 Kilocycles.
3. 1100 to 680 Kilocycles.
4. 1100 to 680 Kilocycles.
5. 830 to 520 Kilocycles.
6. 830 to 520 Kilocycles.

This means that any station which has a kilocycle number lying between 1550 and 1000 K.C. can be set up on either Button 1 or Button 2. Any station which has a kilocycle number lying between 1100 and 680 K.C. can be set on either Button 3 or Button 4. Any station which has a kilocycle number lying between 830 and 520 K.C. can be set on either Button 5 or Button 6.

After you have made up your list of stations, press button marked "Broadcast" and tune set manually until station selected having the highest frequency is tuned in and the program noted. Press button covering frequency range in which station is located (See Fig. 4). Adjust screw through station tab opening above button pressed until the same station is heard clearly and tuning indicator indicates that it is correctly tuned.

112492		Moulded Escutcheon for Pushbuttons (10 Hole)	.50
12199		Pushbuttons	.10

Press pushbutton marked "Broadcast" and tune in next station selected. Press button covering frequency range in which station is located. Adjust screw through station tab opening above button pressed until the same station is heard clearly and with maximum volume.

Follow this procedure for each button until you have selected all of your stations. The automatic buttons are now set up for quick tuning and no further adjustment is necessary.

**NOTE:** In setting up the pushbuttons, station identification may require switching back and forth to button marked "Broadcast" until the same program is heard for both. If the same program is heard on more than one station, find the station on dial tuning and select the proper one on the pushbutton by comparing the order or sequence of programs with that on dial tuning.

Punch out the station call letter tabs of the stations you have set up for the automatic buttons from the set of sheets supplied and insert them into the rectangular openings in the escutcheon. One of the small, clear celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

**ANTENNA AND GROUND CONNECTIONS:**

Antenna connections are made on the terminal board, with terminals marked "A" and "D" on the rear of chassis. When using a conventional antenna connect the lead-in to terminal "A". The ground lead should be connected to Terminal "G". When using a Doublet Antenna, connect one lead-in of the doublet to "A" and the other lead-in to "D". Connect a ground wire to Terminal "G". (See Fig. 1).

\* Great caution should be exercised in checking high voltage circuits. It is best never to attempt to measure heater voltage on the 2V3G. If the tube lights brightly, it is sufficient indication that the heater voltage is correct. To measure high voltage, disconnect power supply and insert 0-5 m.a. meter in ground end of bleeder chain. (With protection fuse) current should read about 1 m.a. when power supply is reconnected. If bleeder current is appreciably off measure individual resistors in chain, to see if difficulty is there. Thus by replacing rectifier tubes an appropriate check of transformer the high voltage circuits can be checked without the use of dangerous probes.

## MODEL C-8

## CADILLAC DIV.—GEN. MOTORS Tuner, Alignment Notes

FEATURES

The 1939 Cadillac Automatic Radio is an 8-tube automobile radio covering the standard wave band incorporating the very latest developments in automobile radio engineering. The outstanding features are:

1. Permeability tuning, providing a dual input circuit to the 1st detector, one for manual tuning and one for automatic push button tuning, is used.
2. A new noise-limiting circuit in the audio system controlled by signal voltage developed by the 2nd detector and the AVC network, providing for the first time effective noise-limiting action without affecting sensitivity.
3. Two stages of Intermediate Frequency, increasing considerably Automatic Volume Control action.
4. A three-circuit Automatic Tuner, providing the same sensitivity on both manual and automatic tuning sections.
5. An Off-switch incorporated in the push button operating mechanism to provide practically complete automatic operation, making it necessary to push only one button to select a station, tune and turn on the radio.

MANUAL TUNING CIRCUIT

When the manual tuning button is depressed, the manual antenna tuning coil is connected to the grid of the 6SK7 R.F. amplifier tube through a series motor noise filter. The plate of the R.F. tube is fed through a resistor and is capacity coupled to the detector grid of the 6K8 tube through the manual intermediate tuning coil. This grid is also controlled by the AVC system through the manual intermediate tuning coil. The manual oscillator tuning coil is capacity coupled to the oscillator grid of the 6K8 tube in parallel with the fixed oscillator coil T7 which also functions as the low frequency adjustment.

All the automatic tuning coils are open circuited when the manual tuning button is depressed.

Manual tuning is accomplished by varying the inductance of the manual tuning coils by changing the permeability of the magnetic circuit. This is done by moving an iron core of special design in and out of the coil by rotating the manual station selector drum.

The extreme position of the iron cores within the coils has been precision adjusted at the factory and should not be disturbed.

AUTOMATIC TUNING CIRCUIT

Automatic tuning is accomplished by the use of a new and highly efficient three-circuit push button permeability tuner.

The tuning of the R.F., Interstage and Oscillator semi-fixed tuned circuits, is accomplished by varying the inductance of the coils, by changing the permeability of the intermediate circuit and by moving the iron core in and out of the coil. The iron cores within the coils are rigidly secured to a brass rod. This brass rod moves in and out of the coils as the adjustment screw is turned, changing the inductance of the coils, giving the same result as the variable tuning condenser across the coil except that this method is more precise and stable, and it is not affected by moisture or temperature changes as is the case with a normal tuning condenser.

ALIGNMENT

Alignment between the Oscillator, Antenna and Interstage automatic tuning coils is obtained by changing the Antenna (center) and Interstage (rear) coil positions while the iron cores are held stationary on the shaft. To describe the connections for automatic tuning, let us assume that button No. 1 is depressed

The automatic tuning antenna coil, No. 1, is connected to the grid of the R.F. tube. The plate of the R.F. tube is fed through a resistance and is capacity coupled to the automatic tuning interstage coil, No. 2, which is connected to the control grid of the 6K8 tube.

The manual Interstage tuning coil is short-circuited.

The automatic tuning Oscillator coil, No. 1, is capacity coupled to the Oscillator grid of the 6K8 tube.

Two stages of I.F. amplification are employed, using 6SK7 tubes. The primary and secondaries of each of the I.F. transformers are tuned by small trimmer condensers. Directly below the secondary of the 2nd I.F. is a third winding which couples the control grid circuit of the 2nd I.F. tube to the 2nd I.F. transformer.

The signal voltage across the secondary of the 2nd I.F. transformer is used to drive the plate of the AVC section of the 6H6 tube. AVC voltage is applied to the control grid circuits of the R.F., 1st detector and 1st and 2nd I.F. tubes. The rectified output of the 2nd detector section of the 6H6 tube is applied to the control grid of the 6J5 tube.

At no signal, the 6J5 tube is biased to cut off by virtue of the current flowing through resistor network R16 and 17. This gives a constant potential across R17, which keeps the tube biased to cut off when no signal is being received. When a station is being received, a positive voltage is applied to the control grid by both sections of the 6H6 tube through resistor networks R13, 14 and 15, and R18, 19 and 20, causing a very rapid reduction in bias so that the noise gate or noise limiter does not affect the sensitivity of the receiver. This is a very outstanding development in automobile radio circuit design and provides unusually quiet operation.

The 6J5 is resistance coupled to the 6V6G driver tube. The 6V6G is transformer coupled to the 6W7G output tube. This tube is a class "B" power amplifier and combines two triodes in one envelope. A 6" electro dynamic reproducer is employed.

Degeneration, or negative feed-back, is used in the audio amplifier. The voltage developed across the separate small secondary of the output transformer is fed back into the cathode circuit of the driver tube. The voltage fed back is of the proper phase to reduce the amplitude of certain frequencies. This results in a reduction in distortion.

A synchronous type vibrator is used in the power unit. This vibrator interrupts the current through the primary of the power transformer and also rectifies the current in the secondary circuit.

ALIGNMENT AND CALIBRATION PROCEDURE

The following equipment is required for proper alignment:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- An Output Indicating Meter.
- Non-metallic screwdriver.
- Dummy Antennas - .1mf., and 35 mmf.

The Radio Chassis must be removed from the case, but the front cover must remain on the chassis with all screws in place. **THIS IS ABSOLUTELY NECESSARY TO ALIGN.**

The Volume Control must be at maximum for all adjustments.

The Normal-Quiet Control must be in the Normal position for all adjustments.

The Antenna Capacity Switch (See Fig. 2,) screw should be in the maximum clockwise position for the Low Capacity (Vacuum Type) Antenna. The total capacity of the Low Capacity Antenna and the shielded lead is 59 mmf.

Connect Radio Chassis to Ground Post of Signal Generator with a short heavy lead.

Allow chassis and Signal Generator to "Heat Up" for several minutes.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

NOTE D - At the top of the automatic tuning unit can be seen ten round openings - See Fig. 3. Through these openings can be seen the ten "w" openings on the other side of the unit. Insert a thin blade screw driver through the round openings and in the "w" opening of the proper button and adjust the position of the coil by twisting the screw driver until maximum output is obtained.

ADJUSTING ANTENNA 1400 KC TRIMMER

After the radio is installed and the car antenna is connected, it is necessary to readjust the antenna 1400 KC trimmer.

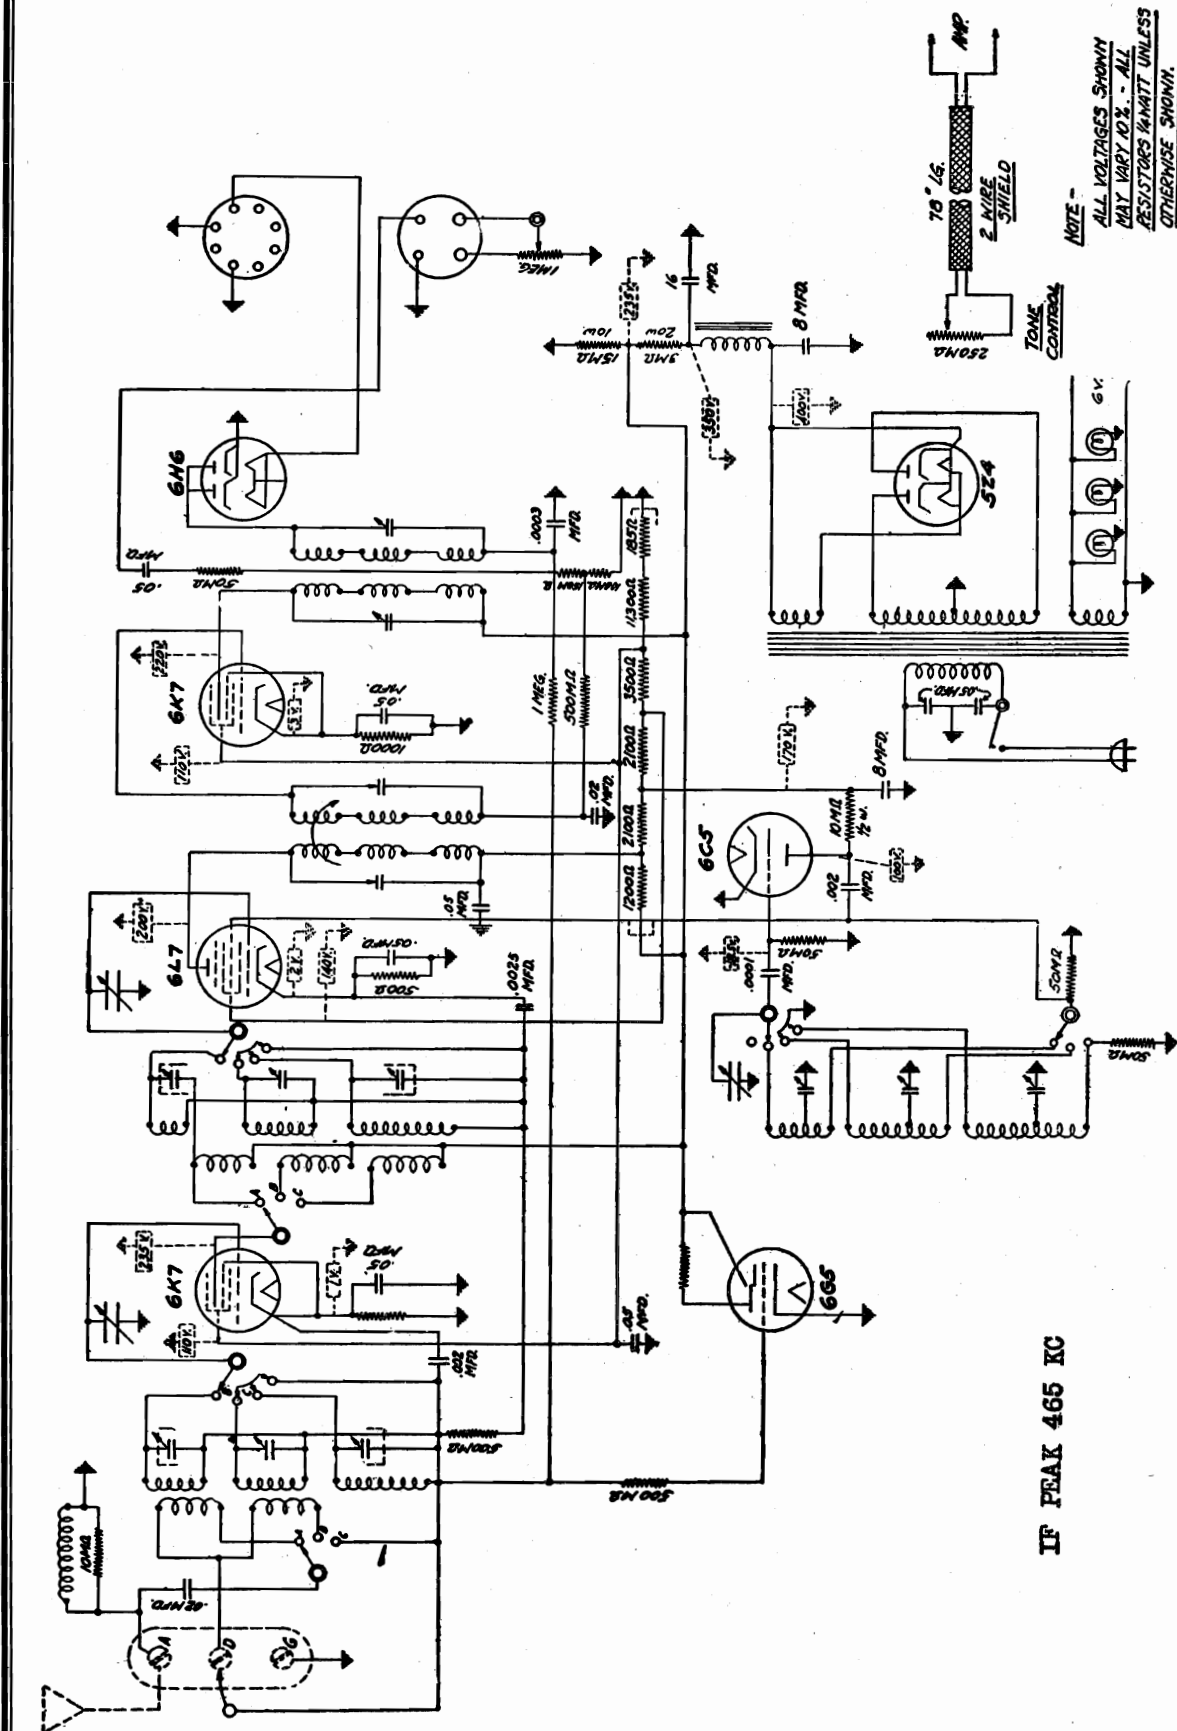

There are two small holes in the chassis case near the antenna connection through which the antenna capacity and antenna trimmer adjustments are to be made. See Fig. 2. With the Cadillac Vacuum Antenna, the screw marked "Capacity" should be set to the extreme clockwise position. With the Cadillac Under Car or Running Board Antenna, the screw marked "Capacity" should be set to the extreme counter clockwise or high capacity position.

To adjust trimmer, tune in a weak signal at approximately 1400 KC with the volume control about three-fourths on, turn the adjusting screw (marked trim) in or out until maximum output is obtained. On Vacuum Antenna this adjustment should be made with antenna fully extended.

Align the i-f stages at 465 kc after removing the 6C5 oscillator and with the test oscillator connected to the grid of the 6L7 first detector.

R-F Alignment: Replace the 6C5 and connect the test oscillator to the antenna post of the receiver. Start with the oscillator trimmer with the dial set on the high-frequency end of the band at the frequencies listed below:

Broadcast Band - 1400 kc    1st H-F Band - 5.0 mc    2nd H-F Band - 17 mc

After the oscillator trimmer has been adjusted, align the r-f trimmer of each band. Then set the oscillator padding condensers of the various bands at the following frequencies:

Broadcast Band - 550 kc    1st H-F Band - 2.0 mc    2nd H-F Band - 6.0 mc

Alignment

CAPEHART CORPORATION

Broadcast band ----- 1400 kc  
1st H-F band ----- 5.0 mc  
2nd H-F band ----- 17 mc

After the oscillator coil trimmer has been set, align the r-f trimmers. Next set the oscillator padding condensers of the various bands at the following frequencies:

Broadcast band ----- 550 kc  
1st H-F band ----- 2.0 mc  
2nd H-F band ----- 6.0 mc

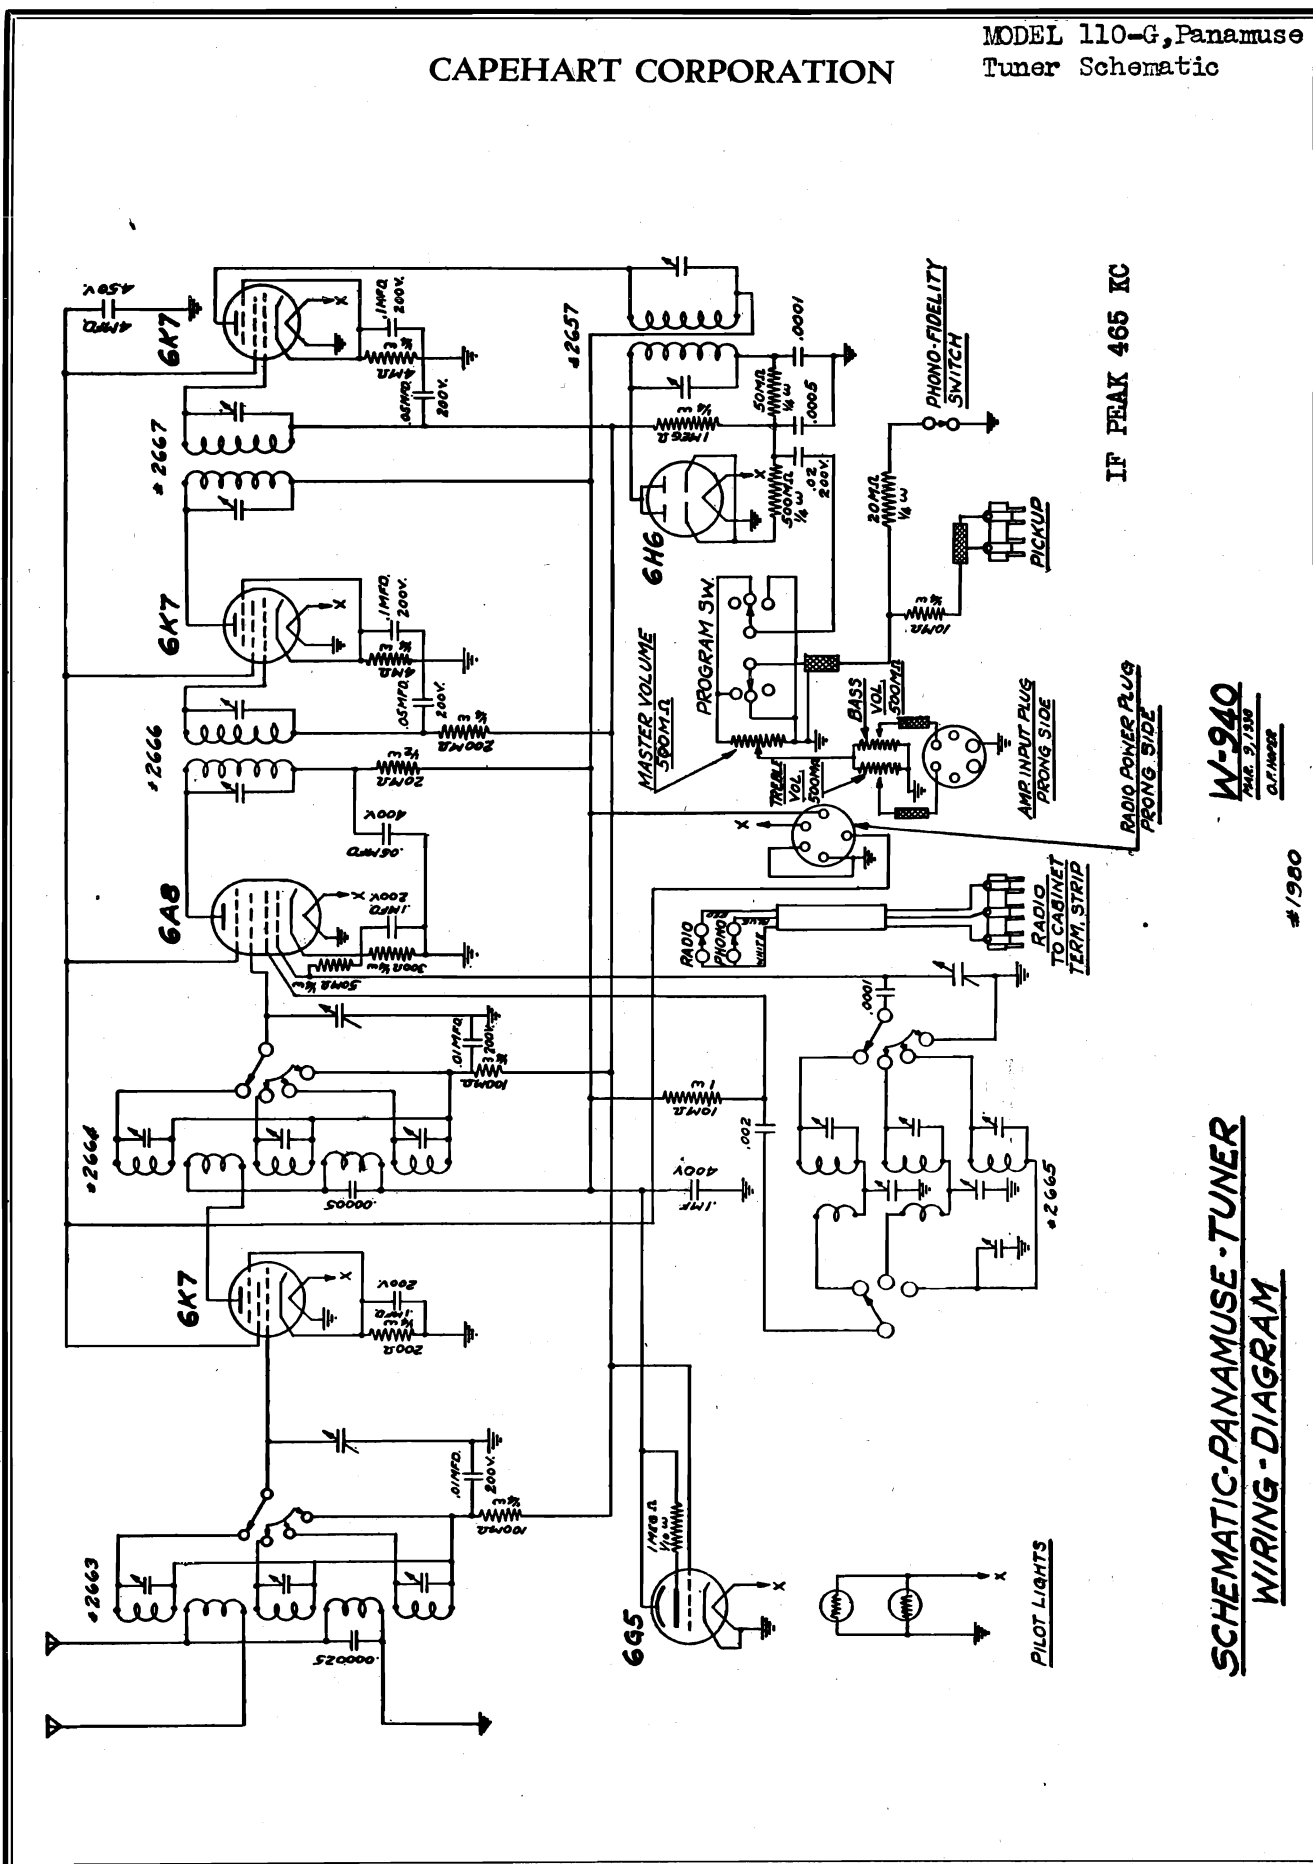

ALIGNMENT INSTRUCTIONS

When aligning the i-f stages, short the oscillator section of the tuning condenser to ground. Set test oscillator to 465 kc and connect to the grid of the 6A8 first detector. Set the i-f trimmers for maximum reading of the output meter connected across the voice coil.

When aligning the r-f amplifier, connect the test oscillator to the antenna post, after removing ground from the tuning condenser mentioned above. Regardless of which band is being aligned, start with the oscillator coil trimmer with the dial set on the high-frequency end of the band at the following frequencies:

Schematic, Voltage Alignment

ALIGNMENT PROCEDURE

When aligning the i-f stages at 465 kc, make certain the Selectivity Control is in the extreme counter-clockwise position, i.e. set to "sharp tuning". Remove the 6C5 oscillator tube and connect the output of the test oscillator to the grid of the 6L7 first detector. The bias of this tube is fixed, therefore it will be necessary to leave the grid cap on the tube and couple the oscillator through a .001 or .002-mf condenser. Adjust the trimmers on the three i-f transformers for maximum readings.

R-F Alignment: Replace the 6C5 oscillator tube. Connect the test oscillator to the antenna post with the dial set on the high-frequency end of the band at the following frequencies:

Long-Wave Band ... 400 kc	First H-F Band ... 5.0 mc
Broadcast Band ... 1400 kc	Second " " ... 17.0 mc

First adjust the oscillator trimmers and then the r-f trimmers. After the adjustments of these trimmers, set the oscillator padding condensers of the various bands at the following frequencies:

Long-Wave Band ... 200 kc	First H-F Band ... 2.0 mc
Broadcast Band ... 550 kc	Second " " ... 6.0 mc

**Alignment: I-F**

The i-f stages are peaked at 465 kc. Remove the 6J5 oscillator tube. Set the test oscillator at 465 kc and connect the output to the grid of the 6L7 first detector. Adjust the trimmers for maximum reading of the output meter.

**AFC :**

The AFC circuit is aligned when aligning the i-f amplifier at 465 kc. The primary of the discriminator transformer, marked DIODE transformer in the layout, is aligned at 465 kc. The secondary is aligned with the AFC switch closed on a broadcast or oscillator signal, using either the electric eye or output meter for checking resonance. The AFC switch should then be opened and the secondary re-aligned. If alignment has been made correctly, turning the AFC switch off and on should make no difference in the cathode-ray tuning tube.

**R-F :**

Replace the oscillator tube. Connect oscillator to antenna post. No matter what band is being aligned, start with the oscillator trimmer with the dial set to the high-frequency end of the band at the following frequencies:

- Broadcast Band ... 1400 kc
- First H-F Band ... 5.0 mc
- Second " " ... 17.0 mc

After the oscillator trimmer has been set for resonance, align the r-f trimmers. After these have been adjusted properly and checked, set the oscillator padding condensers of the bands at the following frequencies:

- Broadcast Band ... 550 kc
- First H-F Band ... 2.0 mc
- Second " " ... 6.0 mc

MODEL 400-G  
 Tuning Meter Adjustments CAPEHART CORPORATION  
 Chassis Assembly

TO ADJUST THE TUNING METERS  
 IN ORDER THAT THE CALIBRATION OF THE TUNING METERS IN THE REMOTE CONTROL STATIONS TO ADJUST A REMOTE CONTROL STATION, TUNE THE SET BY HAND, TO 560 KILOCYCLES, THEN MAY BE MADE TO AGREE WITH THE TUNING DIAL, A REHOSTAT IS PROVIDED. THIS REHOSTAT AT EACH STATION BOX, SET THE METER TO THIS FREQUENCY BY THE ZERO ADJUSTING SCREW ON IS MOUNTED ON THE RADIC CHASSIS DIRECTLY ABOVE THE ANTENNA GROUND TERMINAL STRIP. THE FACE OF THE METER. THEN TUNE THE SET, BY HAND TO 1600 KILOCYCLES, AND ADJUST THE THIS REHOSTAT IS USED TO COMPENSATE FOR THE VARIOUS LENGTHS OF CABLE REQUIRED. REHOSTAT UNTIL THE METERS INDICATE THIS FREQUENCY. AGAIN CHECK THE LOW FREQUENCY SETTING, MAKING THE NECESSARY ADJUSTMENTS BY THE ADJUSTING SCREW IN EACH BOX. IN THE DIFFERENT INSTALLATIONS, AND TO COMPENSATE IN THE DROP IN BATTERY VOLTAGE.

Trimmers, Chassis

MODEL 400-G, 500-G Series  
Mixing Panel Chassis  
Notes

CAPEHART CORPORATION

THE #1744 TRANSFORMERS, #1745 IF 25 CYCLE, ARE FOR THE PURPOSE OF ENERGIZING THE VARIOUS RELAYS NEEDED TO PERFORM THE NECESSARY SWITCHING OPERATIONS WHEN CUTTING IN OR OUT A GROUP OF SPEAKERS, CHANGING FROM RADIO TO PHONOGRAPH, ETC. ONE OF THESE TRANSFORMERS IS ALWAYS ON THE LINE, EXCEPT WHEN THE PLAY CONTROL IS AT ZERO, TO PROVIDE VOLTAGE FOR THE OFF-ON RELAY.

TRANSFORMER #1746, #1747 IF 25 CYCLE, IS EMPLOYED FOR THE PILOT LIGHT IN THE REMOTE CONTROL STATIONS. IF TRANSFORMER #1746 OR #1747 FAILS TO WORK, THE RESULT WILL BE NO PILOT LIGHT IN THE REMOTE STATIONS, THE OUTPUT VOLTAGE OF THESE TRANSFORMERS IS 6.3 VOLTS.

THE DRY CELL, #61213, IS TO SUPPLY A STEADY SOURCE OF DIRECT CURRENT TO OPERATE THE TUNING OR KILOCYCLE METERS IN THE REMOTE STATIONS. IF IT BECOMES IMPOSSIBLE TO BRING THE METERS IN THE REMOTE STATIONS INTO SYNCHRONISM WITH THE TUNING DIAL, BY ADJUSTING THE RHEOSTAT ON THE RADIO CHASSIS, A NEW BATTERY IS INDICATED.

IF THE OFF-ON BUTTON DOES NOT TURN THE INSTRUMENT ON AND OFF, IT MAY BE THAT THE COIL IN RELAY #61246, #61257 IF 25 CYCLE, IS OPEN, HOWEVER, IF THE COIL IS NOT OPEN, THE CONTACTS MAY NEED CLEANING, OR THE SPRINGS ADJUSTED.

# CAPEHART CORPORATION

MODEL 400-G, 500-G Series  
Mixing Panel Notes

## MIXING PANEL - C-SERIES

If any speaker button does not switch its associated speaker group on or off, the #61241 relay, #61255 if 25 cycle, #61242 60 cycle or #61256, 25 cycle if a Model-500 instrument, may be open, or the contacts in need of adjustment or cleaning. Low volume from one set of speakers, is probably due to lack of field current, due to defective field supply rectifier tube, or the 110-volt relay not making proper contact.

The 200-Ohm resistors, in series with the 0.1 Mfd. condensers, are across the points of some of the relays as thump filters to reduce the radio interference when the relays open or close.

If either the tuning or volume control knobs are ineffective, the trouble may be located in the #61243, #61244 if 25 cycle relay. In the "G" model remote control, the relays operate from 16-volts, instead of 110-volts, with a large reduction in radio interference.

The covers, for the unused 16-wire sockets of the face of the mixing panel, used to connect the remote cables to the instrument, should be left in place. These covers hold the jumpers in the sockets, which complete the tuning meter circuit. If any cover is removed, see that the tuning meter circuit is completed, as these meters operate in series and if a jumper is removed, all meters will fail to function.

When installing a remote control system, all control stations are wired in parallel, except the tuning meters, these meters are in series. The leads for the meters are coded red for one lead, and green for the other. In the event that one, or more station tuning meters read backward, the remedy is, of course, to reverse the polarity of the leads going to the meter.

If extra outlets are provided, it is necessary that some method be provided to close the meter circuit in the unused outlets, otherwise the meters will not function.

## TO REPLACE KILOCYCLE METER OR GLASS

Remove the station box rear cover, by removing the six screws from the back, thus exposing the bakelite meter cover. This cover has three solder lugs at the bottom edge, all leads to these lugs should be unsoldered. Extreme care should be used in removing the two leads going into the meter case. After the leads are free, remove the three screws holding the meter cover in the box, lift the meter cover and the pilot light, out. Check the position of the Zero adjuster in the face of the box. This is a bakelite part and its pin, which adjusts the meter hand, should be turned to the large opening, in the slot of the Zero correcting arm. Now remove the two screws holding the meter mounting bracket to the case. Care should be exercised when handling the meter, not to bend the hand or get any foreign bodies, especially steel particles, in its moving parts. The glue used to hold the glass in place, is water soluble, and any broken pieces of glass, remaining in the case, may be removed by soaking.

Linoleum cement may be used to hold the new glass in place. This cement requires a minimum of 36 hours to dry, due to the impervious nature of the box and glass. After the cement has hardened, clean the glass carefully, on the inside before remounting the meter. Also check the Zero adjuster before setting the meter into the box, to see that the pin will enter its slot without striking and bending the correcting arm.

When replacing the pointer, #8062, turn the shaft to the position where the switch is open, then turn the shaft ONE notch or step toward one hundred, at this point, set the indicator on Zero and set up the set screw, checking to see that the pointer does not ride on the dial at any point.

## TO SET STATION STOPS ON EXTENDED TUNING CHASSIS

Starting at the high frequency (shortest wave length) end of the broadcast band, with the AFC off, pick the desired station, nearest the end of the dial. Slide station stop #1 on the commutator, meanwhile holding button #1 down, until the station desired comes in best, then lock the station stop, by the thumb screw. The odd numbered stops are in the outer row and the even numbered stops in the inner row, (by having two rows of stops, stations on adjacent channels may be tuned in). Next, adjust stop #2 for the next low frequency station, using button #2 and so on, until all eight stops are adjusted. Always have the AFC switch in circuit when using extended tuning, except during the time the stops are being set. Proper call letter strips should be inserted in the buttons with the celluloid covers over them. These call letter slips and covers are packed in a manila envelope with each extended control instrument.

On the chassis, is a relay #61235, #61245 if 25 cycles, which is used to shift the clutch so that the meter may drive either the gang condenser or the volume control, a set of contacts is mounted on this relay to mute the speakers when the meter is tuned from station to station. If a station button is depressed, this relay should close, muting the speakers and shifting the clutch so as to engage with the condenser drive pulley, in the event of failure of the instrument to tune when a station button is depressed, failure may be traced to an open coil in this relay, if the meter operates properly.

Underneath the chassis is the program relay, #61240, #61258 if 25 cycle. Failure to change from radio to phonograph, or from phonograph to radio, may be due to an open coil or improper contact adjustment here.

In the bottom of the cabinet is the OFF-ON relay, #61246, #61257 if 25 cycle. Failure of the instrument to start or shut off when the corresponding buttons are pushed, may be due to failure of the relay coil or improper adjustment of the contacts.

In case a control button fails to operate from the control box, but the corresponding button on the instrument works, the trouble may be located in the cable.

**Data, Parts list**

The motor which operates the tuning and volume control mechanism has a thermostat on it. This thermostat will allow the motor to operate continuously for ten minutes before shutting off the motor.

If the motor fails to operate when the proper controls are used, the thermostat has undoubtedly shut off the motor. Allowing the tuning and volume control to remain unused for three or four minutes, will close the thermostat and the instrument can be used in the regular manner. This thermostat is placed on this motor as a safety device and if the above occurs, it is a normal function of this motor.

VOLUME CONTROL NO. 226 (CONSTANT IMPEDANCE)

THIS DIAGRAM AND VOLUME CONTROL ARE TO BE USED WHEN IT IS NECESSARY TO HAVE VOLUME CONTROL FOR EACH INDIVIDUAL REMOTE SPEAKER. ONE VOLUME CONTROL IS NEEDED FOR EACH SPEAKER TO BE CONTROLLED, THAT IS, TWO FOR EACH 400-G REMOTE SPEAKER INSTALLATION, AND THREE FOR EACH 500-G REMOTE SPEAKER INSTALLATION. THIS VOLUME CONTROL NO. 226, MAY ONLY BE USED IN LOW IMPEDANCE CIRCUITS, FROM 6 TO 10 OHMS. IT IS NOT SUITABLE FOR USE WITH HIGH IMPEDANCE SPEAKERS OF THE MAGNETIC TYPE, OR ELECTRODYNAMIC SPEAKERS, HAVING HIGH IMPEDANCE TRANSFORMERS.

THE OUTPUT TRANSFORMERS OF THE CAPEHART AMPLIFIERS MATCH TO 8 OHMS, AT 400 CYCLES.

CAPEHART CORPORATION

MODEL 400-G  
Play Control  
Assembly, Adjustments

66325-BRACKET ASSEMBLY FOR 16 E CHASSIS.  
6546 - COMPLETE PLAY CONTROL BRACKET FOR FIELD ASSEMBLY.

THE CAPEHART PLAY CONTROL

The play control allows the operator to set the phonograph to play a predetermined number of selections and have the instrument automatically stop when that number of selections have been played.

When the play control is set at Zero, all remote control and extended control stations are rendered ineffective. An off position is provided on the play control, so an indefinite number of selections may be played without the control operating.

In disconnecting the play control from the record changer, the two set screws on the cable and the cable housing, should be loosened and the cable and cable housing carefully removed. When the cable is removed from the plunger, see that the wire is not broken, and the kink, due to the set screw, should be straightened out before reinstalling the cable.

TO ADJUST THE PLAY CONTROL

When setting up a play control, the counter should be reset at Zero just as the needle touches the record. That is, the play control cam, on the record changer main shaft, should be from 1/4" to 1/2" beyond the plunger after the main clutch has disengaged. The control cable is put in the hole in the plunger and the set screw tightened, then the cable housing should be held in place by the set screw - do not set screw tight. Turn the pointer back and forth over the play control dial, if the pointer catches or binds, slip the cable housing away from the bracket slightly, until the pointer runs free, then run the changer through a cycle to see that the play control resets properly, then tighten the screw.

When adjusting the play control, which is in the record compartment, after removing the wood screws which mount the control to the shelf, remove the clips holding the 110-volt leads to the switch. Then remove the pointer and the two round head machine screws from the back. The stop spring of the stop spring and ball assembly, #65324, should be tangent to the gear and the ball should be in the space between the last and the next to the last tooth, before the blank space in the gear tooth. With the ball in this position, the set screw in the collar at the rear of the unit should be firmly against the stop pin. To make this adjustment, loosen the set screw, while holding the gear, move the collar, then tighten the set screw. In this position, the switch pin, #48202, should hold the switch open and permit the switch to close when the gear is advanced one tooth. The stop bracket #4450, for the resetting dog, should allow the dog to advance only one tooth at a time, if it picks up more than one tooth, move the stop toward the dog until it advances only one tooth at a time.

The resetting dog #3839, should not ride on the gear tooth, as this will prevent turning the pointer toward one hundred. Shift the stud, #4354 until the dog clears the tooth, then check the alignment of the plunger tube and the cable housing stud, for if the cable is bent here, the play control may fail to function.

**MODEL 400-G**  
**Remote Control**  
**Cable Notes**

**CAPEHART CORPORATION**

Note the Model-1600GR does not include any speakers. All speakers used with this model must be of the AC type, Models G2 or AG2. All remote speakers on the #400-GR Series are AC speakers, Models G2 and AG2. All remote speakers on the #500-GR Series are G3.

Note the Model 1600-GR does not include any speakers; while the Series #400-GR and #500-GR models include one set of DC speakers in the instrument cabinet. No DC speakers are required with the Model-1600GR and all speakers for this model and all remote speakers for the Series #400-GR and #500-GR are of the AC type.

Instruments equipped for four speakers or less (including the speaker in the instrument) contain one set of amplifiers. For five and including eight speakers, two sets of amplifiers are used, and for nine and including twelve speakers, three sets of amplifiers are used. These additional sets of amplifiers are not installed in the instrument cabinet and may be located in a closet or other convenient place, apart from the instrument.

In all models where additional sets of amplifiers are used, all speakers operating from these amplifiers are of the AC type. When ordering equipment calling for additional sets of amplifiers, specify length of cable necessary to connect additional amplifiers to the instrument.

**REMOTE CONTROL EQUIPMENT INCLUDES:**

- Instrument equipped for remote control operation.
- One remote control station with 20-ft. flat cable.
- Provision for attaching number of additional remote control stations as ordered.
- Provision for attaching number of auxiliary speakers as ordered.

Speaker push buttons will be engraved with any lettering desired as specified, maximum limit two lines of six letters each, or one line of seven letters. Unless otherwise specified, speaker push buttons will be engraved "spr. 1", "spr. 2", etc.

Plug #61106 and outlet box cover #66132, are used where the 24-wire remote control station cable enters and leaves the wall.

Plug #6194 and outlet box cover #66132, are used where the 16-wire remote control station enters and leaves the wall.

24-wire flat cable is used between each remote control station and the instrument, or between remote station and wall receptacle on instrument, or between remote station and wall receptacle on instruments having more than four remote stations and speakers.

16-wire flat cable is used between each remote control station and the instrument, or between remote station and wall receptacle on instruments having four or less remote stations and speakers.

Round Cable is used whenever the cable is concealed.

Standard Gem "Y" Outlet Box is used with #66197, #66264, #66132, #66131, #66104 and #66103 outlet box covers and is obtainable at any local electrical dealer.

Use standard house wire, approved by the Underwriters' Laboratories for connecting AC speaker fields.

REMOTE CONTROL CABLE BULLETIN

SERIES-G

TO SPEAKERS --

Speaker cable of size according to the charts below, must be run from the instrument to each individual speaker.

The 110-volt AC lead for the speaker fields may be run from any 110-volt AC line nearest, or most convenient to each individual speaker. The above is all the wiring necessary for remote speakers.

TO REMOTE STATIONS --

Remote station cable of size according to the chart below, may be run from the instrument to each individual remote station, or extended from one remote station to another in parallel. This one cable is all the wiring required for remote stations.

CABLE SIZES ON #500-GR (REMOTE CONTROL)

No. of Remote Control Stations and Speakers	Speaker Cable Sizes	Remote Control Cable Sizes
4 or less	6-Wire	To All Stations
5 to 13	8-Wire	To All Stations

CABLE SIZES FOR #400-GR and #1600-GR (REMOTE CONTROL)

No. of Remote Control Stations and Speakers	Speaker Cable Sizes	Remote Control Cable Sizes
4 or less	6-Wire	To All Stations
5 to 13	6-Wire	To All Stations

**MODEL 16-E DeLuxe  
Record Changer  
Adjustments, Part 1**

**CAPEHART CORPORATION**

**MECHANICAL INSTRUCTIONS**  
**No. 16-E De Luxe Record Changer**

**1. TO LOCATE AND ADJUST THE RECORD TRAY (6687) (Fig. 6).**

In assembling the record tray to the record changer, the first tooth of the driver quadrant (3551) (Fig. 5) should mesh with the second tooth of the driven quadrant of the tray as shown.

With the two gears properly meshed, loosen the Allen set screws which hold pins No. 34133, Fig. 1, in place. This will allow you to move the record tray sideways, adjust tray, sideways until the turntable spindle is exactly in the center of the 10" record level of the record tray. (The 10" record level is that part of the tray where the felts No. 4913 are indicated in Fig. 6).

With the control lever in the "one side" position, run the record changer through its cycle until the large hole in the main cam is exactly half way past the upper edge of the record tray cam follower, as shown at No. 5, figure 1. At this position, the points of the ten-inch felts (4913) (Fig. 6) should be level with the top of the turntable felt. If this tray is too low or too high, it may be adjusted to the proper level by loosening the eccentric screw (3237) (Fig. 1) No. 4 and turning this screw until the proper level is obtained. Be sure to tighten the lock nut after adjustment.

If the tray is too high, at this position, the ten-inch records will not be centered over the turntable spindle. If the record tray is too low, the ten-inch records will slide out over the ten-inch tray shoulder and not properly center.

**2. THE ADJUSTMENTS OF THE RECORD MAGAZINE.**

Before attempting to adjust the magazine, be sure that the center of the magazine pivot pins (34132) (Fig. 1) is  $8\frac{3}{8}$ " above the base plate. This height is very important and we recommend checking the height of the right hand pin, when looking at the magazine, before any adjustments are made.

The record magazine is positioned by moving it sideways on its bearing or pivot pins. The two set screws underneath the pivot pins lock the magazine in position. Loosen these set screws, then see that the left hand side of the record reverse assembly fork (part of 6228, Fig. 6) is between  $\frac{3}{32}$ " and  $\frac{1}{16}$ " inside the left hand side of the Reverse crank, when looking at the magazine. That is, the left hand edge of the record reverse fork is about  $\frac{3}{32}$ " or  $\frac{1}{16}$ " to the right of the left hand edge of the crank. After moving the magazine, lightly set up the set screws. Then with the selector arm in the "Repeat" position swing the record reverse arm around in front of the magazine, to see whether the record guide strikes either of the record support pins (34138) (Fig. 6). If the guide strikes either of the support pins it will be necessary to bend the pin away from the guide so they can not strike. If it is necessary to bend either pin, set the control lever in the "Repeat" position, then raise the record tray by hand, with a 10" record on it, observing the way the record strikes the support pins, the record should hit both pins about  $\frac{1}{16}$ " from the end of the pin; if it does not it will again be necessary to adjust the pin until the record hits both pins an equal distance from the ends. If it is necessary to bend the pins, check the clearance between the record guide arms and the pins and between the arm carrying the record guide and the right hand pin. Also if the magazine has been shifted it is necessary to see that the two points, which extend downward from the magazine, have ample clearance in the channels, in the record tray, which are provided for their passage. If there is possibility of the points striking it probably means the magazine has been shifted too much.

If the magazine has been adjusted, it is also necessary to see that the record separator hook (6226) (Fig. 1) does not bind in the slot in the end of the record separator arm (6445) (Fig. 6). If it does the section covering these parts give the adjustment.

**3. MAGAZINE STOP SCREW.**

The magazine stop screw No. 2, Fig. 5, should be adjusted so that the crank pin (part of 6230, Fig. 1) is approximately  $\frac{1}{16}$ " from the edge of the record reverse arm fork (part of 6228, Fig. 6) which is furthest from the magazine, when the record reverse guide is in front of the magazine, that is, in the reversing position.

**4. MAGAZINE LINK ADJUSTING SCREWS (No. 2) (Fig. 1).**

The record magazine should always come back snugly against the magazine stop screw, No. 2, Fig. 5. If it does not, it is necessary to loosen the two set screws (No. 2, Fig. 1) to a sliding tension and run the record changer through a cycle of change. When the magazine has reached the horizontal position, as shown in Fig. 1, press down on the lower end of the magazine; this will lengthen the link assembly. Then when the magazine returns to its normal position, the magazine link will adjust itself so that the magazine is snugly against the stop screw. Then tighten the magazine link screws.

**5. RECORD REVERSE GUIDE (6444) (Fig. 6).**

With a 12" record in the magazine the record reverse guide assembly (6444) (Fig. 6) should be parallel with the record when in the reversing position, in front of the magazine.

If the record reversing assembly is parallel with a 12" record as above, it should come around and lay against the reverse guide pin tubing (34134) (Fig. 6), if the eccentric cam (3825) (Fig. 6) is properly adjusted. This cam can be adjusted, by loosening the screw through the cam and turning it so that the record reversing assembly returns to the reverse guide pin tubing. Care should be taken when making this adjustment so that the crank pin (part of 6230, Fig. 1) does not hold the reverse guide away from the pin tubing. This cam should be turned so that the reverse guide assembly just touches the pin tubing; if the cam is turned too far it will allow the reverse guide assembly to hit the pin tubing, but in the reversing position the assembly will not be able to assume a position parallel with a 12" record.

**6. REVERSE ASSEMBLY LINK ROD.**

Loosen lock nut No. 9, Fig. 3, while the record changer is in the reversing position, that is, when the reversing assembly (6444) (Fig. 6) is in front of the magazine. Remove the screw (3241) (Fig. 8) holding the reverse segment link (34141) (Fig. 8) to the reverse segment (3550) (Fig. 8) and lengthen or shorten the link, by the link thread until the reversing crank (6230) (Fig. 1) stands with the crank pin just barely touching, but not binding, against the front side of the fork (6228) (Fig. 6). After the adjustment has been made, lock the link in place with the lock nut No. 9, Fig. 3.

**7. RECORD SEPARATOR ADJUSTMENT.**

The separator stop No. 3, Fig. 1, should be adjusted so that a small 10" record will positively clear the knife portion of the separator lever as shown in the following illustration. A standard to use is to make certain that there is approximately  $3\frac{1}{2}$ " clearance between the edge of the small record and the point of the separator lever, as shown at "A" in illustration below. However, it may be necessary to vary one way or the other from this measurement, depending on whether or not the slotted end of the record separator lever goes over the hook (6226) (Fig. 1) without binding.

**8. RECORD SEPARATOR HOOK ADJUSTMENT.**

After adjusting the record separator it will be necessary to check the record separator hook (6226) (Fig. 1) to see that it enters the slot in the record separator without binding. This hook is threaded and by loosening

## MODEL 16-E

## Adjustments, Part 2

## CAPEHART CORPORATION

stud whose nut is shown in Fig. 1 as No. 43159. This set screw is at the bottom of this stud. Adjust the hook so that it will pass through the notch in the pickup arm lever (64197) (Fig. 1) without binding against the top or bottom of the notch, when in the playing position. With a 12" record on the turntable, the rubber roller (5044) (Fig. 1) against the edge of the record and the stop lever hook (5658) against the blade of the stop lever (64197) the needle should stop on the record exactly  $\frac{3}{8}$ " from the edge of the record.

With the record changer in exactly the same position as described above, and with a 10" record on the turntable and the hook (5658) (Fig. 1) against the blade, the stop lever should allow the needle to stop on the record  $\frac{3}{4}$ " from the edge of the 10" record. A 6-32 screw shown in Fig. 1 is provided for making this adjustment, simply by screwing it in or out. A check should be made for clearance between the roller and the tray, this roller should never bind on the record tray. This can be taken care of by slightly bending the tone arm stop lever (64197) (Fig. 1) up or down. If it is necessary to bend the stop lever it will be necessary to readjust for 12" records.

#### 16. TO ADJUST THE CLUTCH THROWOUT LEVER AND CAM.

The clutch throwout lever cam is shown at 15 in Fig. 2 and is adjusted by loosening the shoulder screw (3317) (Fig. 2) to a sliding tension after the record changer has been stopped in the playing position. The clutch throwout lever cam should just clear the point of the turntable throwout cam (6448) (Fig. 10) with the clutch disengaged. Unless clearance between the turntable throwout cam and the clutch lever throwout cam is maintained the record changer will jam. If too much clearance is allowed the turntable throwout cam will disengage the clutch and the record changer will continue to change records without playing them.

#### 17. TO ADJUST SOLENOID WEDGE SPRING.

This phosphor bronze spring is located on one of the three spacers used to mount the solenoid plate bracket to the solenoid bracket. It is used to prevent clutch chatter or bounce when the clutch engages. The only adjustment is to bend the spring to a snug fit with a long screw driver so as to increase or decrease its pressure on the solenoid to clutch lever (6455) (Fig. 11).

#### 18. TO ADJUST THE REVERSE CAM SHIFT LEVER (5326) (Fig. 5).

This lever is moved by the record control shaft (3724) (Fig. 12) and is held in position by an Allen set screw. It should be positioned on its shaft so that the record reverse cam (6522) (Fig. 4) is firmly engaged with its pin (34144) (Fig. 8) in the "Both Sides" position. In the "One Side" and "Repeat" positions it should have good clearance with the pin. If any adjustment of this lever is made be sure to check the setting of the Reverse Cam Arm and Roller Assembly (6450) (Fig. 8) as instructed in Section 7 of the instructions on replacing a reverse cam.

#### 19. TO ADJUST THE RECORD REPEAT LOCK LEVER (5334) (Fig. 12).

The purpose of this lever is to prevent accidental shifting of the Selector Arm while the instrument is not in the playing position. In the "Repeat" position this lever is on the side of the Solenoid to Clutch Lever (6455) (Fig. 11) away from the main cam. In the "One Side" and "Both Sides" positions it is on the main cam side of the solenoid to clutch lever. With the tone arm in the playing position (Main Clutch Disengaged) this lock lever should clear the solenoid to clutch lever by approximately  $\frac{1}{16}$ " when moved under it.

#### 20. TO ADJUST THE REVERSE CAM LOCK LEVER (5339) (Fig. 12).

This lever should be on the main cam side of the solenoid to clutch lever when in the "Both Sides" position. And on the opposite side when in the "One Side" and "Repeat" positions. With the main clutch disengaged the lock lever should clear the solenoid to clutch lever by approximately  $\frac{1}{16}$ " when moving under it.

#### 21. TO ADJUST REVERSE CAM ARM AND ROLLER ASSEMBLY (6450) (Fig. 4).

See Section 7 under Instructions For Replacing a Reverse Cam.

#### 22. TO ADJUST RECORD REPEAT THROWOUT LEVER (4663) (Fig. 12).

No adjustment of this part is necessary.

#### 23. TO ADJUST RECORD REPEAT CLUTCH LEVER (5332) (Fig. 12).

The adjustment of this lever is made by loosening the Allen set screw to a sliding tension then moving the part along the shaft. The sliding clutch should engage in the "One Side" and "Both Sides" positions, but should be disengaged in the "Repeat" position. The fork of this lever should not bind the sliding clutch in either the "Repeat" or "Both Sides" position.

#### 24. LATERAL LOCATION OF THE MAIN CAM SHAFT.

Both end bearings of the main cam shaft are movable, and are used to locate the cam shaft in its proper lateral position, as well as adjust the amount of end play. The main cam shaft is located laterally so that the

ing the locknut the hook can be turned in either direction, to raise or lower it. After the correct adjustment is obtained, tighten the locknut.

It should never be necessary to change these adjustments on record changers unless they have been tampered with by an inexperienced person.

#### 9. SEPARATOR HOOK AND ARM (6226) (Fig. 12).

Be sure set screw No. 10 in Fig. 8 is screwed all the way in.

#### 10. RECORD MAGAZINE BUSHING (4020) (Fig. 1).

If a ringing noise is heard while the instrument is changing records, i. e., such a noise that might be made by a spring it will be found that the Durex bushing (4020) (Fig. 1) is too tight, in which case it will be necessary to loosen the lock nut of the holding bolt, and back the bolt out, from a quarter to a half turn, then tighten the lock nut.

#### 11. TO ADJUST THE TONE ARM HEIGHT.

To adjust the tone arm height, first place a 12" record on the turntable and adjust the tone arm stop lever (64197) (Fig. 1) so that the record hits the rubber roller (5044) (Fig. 1) in the center. Start the record changer through a cycle and stop it when the tone arm lever hook (5658) (Fig. 1) just touches the stop lever assembly. In this position adjust the tone arm height so that the top of the stop lever is the same height as the center of the hook. This adjustment is made by loosening the two Allen set screws at the rear of the tone arm. These Allen set screws are accessible by raising the tone arm by hand. After making the height adjustment it is necessary to make certain that there is a clearance of approximately  $\frac{1}{8}$ " between the pickup head and the record tray. This distance may be checked between the bottom of the record tray and the bottom of the pickup when the record tray is approximately parallel with the pickup.

#### 12. TO ADJUST THE PICKUP ELEVATION.

When the tone arm swings in towards the record, the pickup arm lever hook (5658) (Fig. 1) comes to rest against the pickup arm stop lever (64197) (Fig. 1) and when the tone arm lowers the pickup toward the record it pauses momentarily before the pickup arm lever hook goes through the stop lever. If the record changer is stopped during this pause, it will be found that the ball in the end of the pickup arm lift shaft (6457) (Fig. 9) is at the point marked "L" in Fig. 9 on the lift cam (6449) (Fig. 9). Now if the pickup, with a needle in the proper position, is moved beyond the edge of the record, the point of the needle will extend below the top surface of the record a distance equal to half the thickness of the record. The correct elevation of the pickup is made by the screw in the underside of the tone arm fork against which the pickup cover rests. Loosen the locknut, adjust the screw to bring the needle to the position mentioned above, then lock the locknut.

#### 13. PICKUP FEED IN ADJUSTMENT.

The collar of the pickup arm swing lever and collar assembly (6232) (Fig. 9) should ride on the leather facing of the friction cam (6691) (Fig. 10) until the pickup arm lever hook (5658) (Fig. 1) has engaged the stop lever (64197) (Fig. 7). Then a slight amount of friction should be maintained after the ball at the end of the pickup lift arm (6457) (Fig. 9) has engaged with the lift cam (6449) (Fig. 9). This friction should be maintained until the needle has touched the record, otherwise the pickup arm may move away from the stop lever and the needle miss the record. If the friction be maintained too long the needle may be forced beyond the first playing groove. To adjust this, the pin locking the friction cam to the main cam shaft should be driven out and the Allen set screw loosened to a sliding tension. The cam is rotated forward, in the direction of rotation of the main cam shaft, to maintain the friction a longer time and backward to maintain it for a shorter time.

#### 14. TO ADJUST THE PICKUP.

After removing the pickup cover, it should be noted whether the stylus (5610) (Fig. 10) is centrally located in respect to the pole pieces (569) (Fig. 10). To center the stylus loosen the lock-nuts (99-11-1) (Fig. 10), then loosen the two headless set screws (99-28-3) (Fig. 10). These set screws hold the spool assembly (6711) (Fig. 10). The spool assembly should be shifted until the stylus is centralized with the pole pieces, then tighten the set screws carefully, so as not to crack the spool, then tighten the lock nuts.

If for any reason it is necessary to shift the pole pieces, which are held to the back by two screws, the two set screws holding the spool should be loosened before attempting to move the pole pieces. If any adjustment of pole pieces, is made carefully check the centering of the stylus before replacing the cover by means of its three screws.

#### 15. TO ADJUST THE STOP LEVER HOOK (5658) (Fig. 1).

Always adjust the tone arm position on a 12" record before adjusting for a 10" record. Adjust the tone arm stop lever hook (5658) (Fig. 1) by moving it in or out. This hook is locked in place by a set screw in the

## CAPEHART CORPORATION

MODEL 16-E  
Adjustments, Part 3

ball in the end of the tone arm lift rod (6457) (Fig. 9) travels in the exact center of the tone arm lift cam (6449) (Fig. 9). As shown at H in Fig. 9.

#### 25. TO ADJUST THE STOP TRIP SWITCH (2792) (Fig. 7).

This switch is accessible by removing the turntable, which will expose the switch cover. To remove the switch cover it is necessary to remove the trip arm, which goes through the switch cover and the two flat head screws which hold the cover in place. The clearance between the contact points on the fixed and movable arms of the switch should be  $\frac{3}{32}$ ". After replacing the trip arm (6510) (Fig. 7) in the switch, after the switch cover has been removed, set the turntable on the spindle, push stop trip arm (4533) (Fig. 7) slowly about  $\frac{1}{16}$ " toward the magazine and then turn the turntable through one complete revolution. This will insure the five cam, on the turntable, resetting the trip switch, the clearance between the trip arm and the moveable arm of the switch should be  $\frac{3}{32}$ ". The distance between the trip arm and the switch trip guard finger should also be  $\frac{3}{32}$ ".

To adjust the clearance between the trip arm hook (6510) (Fig. 7) and the moveable switch arm, loosen the screw in the bakelite switch base, at the end nearest the tone arm. Move the switch until  $\frac{3}{32}$ " clearance is secured between the trip arm hook and the moveable arm of the switch, then tighten the screw holding the switch. In making this adjustment be sure that the stationary arm of the switch is not bent when tightening this screw.

On some models a headless set screw, near the end of the coil spring, is used to lock the switch in position; loosen this screw, adjust the switch, then tighten the set screw.

#### 26. TO ADJUST THE SOLENOID MOTOR SWITCH (2764) (Fig. 3).

After the switch cover has been removed the switch is exposed. The upper switch points should make good electrical contact, while the main clutch is disengaged, in this position the clearance between the bottom points should be approximately  $\frac{3}{32}$ ". While the clutch moves from the disengaged to the engaged position the upper switch points should remain closed until the lower set of points are closed. When the clutch is fully engaged the lower points should make good contact and the clearance between the upper points should be approximately  $\frac{3}{32}$ ".

To adjust the switch loosen the screw through the bakelite switch base at the rear of the switch assembly. After the position is found where proper clearance is secured with the clutch engaged and disengaged, the switch should be locked in position with the screw.

In some machines a headless set screw is used to lock the switch in position. This screw is near the point of the tapered bakelite insulating block. Loosen this screw and adjust switch to get proper clearance then lock the switch in position by the set screw.

The two upper contacts are in series with the auto trip switch and the two lower contacts are shunted across the motor switch. When the clutch is engaged the auto trip switch is out of circuit and the motor switch is shunted by the lower contacts thus insuring the completion of the change cycle even though the instrument is switched to radio or turned off.

#### 27. TO ADJUST THE FRICTION JOINT OF AUTOMATIC TRIP SWITCH.

The amount of friction necessary in the friction joint between the auto stop trip lever—long (6510) (Fig. 7) and the auto stop trip lever—short (4533) (Fig. 7) should be just sufficient to close the automatic stop trip switch (2792) (Fig. 7). The friction is regulated by adjusting the screw which tightens the flat spring (3998) (Fig. 7). If the tension is too great the instrument may trip before finishing a record, if not enough tension is had the instrument will not change records when the needle hits the automatic change groove.

#### 28. RECORD SIZE LIMIT.

The 16-E Series record changer will play any 10" or 12" record of standard size. The minimum size for 12" records is 11 $\frac{7}{8}$ ". The minimum size for 10" records is 9 $\frac{3}{8}$ ". Records smaller than these limits are very apt to miss centering over the turntable spindle and in most cases are broken.

These record changers will automatically trip on any record having an automatic stop change groove, either spiral or oscillating, where the blank space in the center of the record is not more than  $\frac{6}{16}$ " in diameter.

#### 29. RECORDS.

Always inspect the records to see that no rough edges are present. Occasionally you will find a record which has a rough outside edge. This rough edge will greatly interfere with the satisfactory performance of the record changer. A small piece of #00 sandpaper will assist you greatly in removing this rough edge.

#### 30. TO ADJUST THE VERTICAL BUMPER GUIDE (6693) (Fig. 6).

This guide is located back of the magazine cross bar (6685) (Fig. 6). After the records are separated from the magazine they are guided in dropping off the separator so they hit the center of the record bumpers

(5081) (Fig. 6). This vertical bumper guide also guides the records when the elevating hook, on the rear of the record tray lifts the record. The vertical bumper should be set back just far enough to allow a 12" record to drop onto the record bumpers freely. The lower part of the vertical bumper, which extends into the record well, should extend toward the center of the well rubber bumpers far enough to make sure that the upper edges of the records fall behind the points of the upper record support (5517) (Fig. 6). This adjustment is not critical. In most cases it will be found that the upper end of the vertical bumper will just clear the elevating hook on the rear of the tray. In cases where it is found that 10" records are chipping about the edges, due to bouncing against the points of the upper record support (5517) (Fig. 6) it will be necessary to bend the vertical bumper (6693) (Fig. 6) back at the top to a point where it just barely clears the elevating hook at the rear of the tray. It should never be bent back far enough to raise the front of the tray.

#### 31. CLUTCH CLEARANCE.

The clearance between the driven (6326) (Fig. 10) and driving (3630) (Fig. 10) members of the clutch should be approximately .020" (Twenty thousandths) and is adjusted by loosening screw No. 16 (Fig. 3 to a sliding tension and adjusting the clutch fork (5353) (Fig. 2) and the solenoid to clutch lever and pin assembly until the proper clearance is obtained. After adjustment is made lock the screw No. 16, Fig. 3.

#### 32. MOTOR CONNECTIONS (21131).

The 21131 motor is a synchronous motor and will run equally well in either direction, when properly connected. For this reason, all motors shipped from the factory are equipped with a terminal strip and cable. However, if it should ever be necessary to disconnect the leads from the terminal strip the leads should be replaced in the following order: With the cable extending to the right of the terminal strip and the mounting lugs pointing downward, and the soldering lugs towards you, the leads go on from left to right in the following order—small black, black with yellow tracer, blue and large black. In that order they are ground, one side of 110 volt line, one side of the condenser, and the remaining 110 volt and condenser leads. The motor terminal strip should be mounted to the cabinet terminal strip so that the cable extends to the right, with the soldering lugs towards you.

#### 33. OILING INSTRUCTIONS.

Due to its careful design and precise workmanship, the Capehart 16-E record changer requires a minimum of oiling.

About once each year a light coat of vaseline or petroleum jelly should be applied to all moving surfaces which were coated with graphite at the factory.

A very light coat of vaseline should be applied to the surfaces of the magazine, indicated at "A" in Figure 6. It is best to apply this coating every six months. The vaseline should be applied with, and removed by, the fingers, on the magazine faces. **DO NOT USE EXCESSIVE AMOUNTS OF LUBRICANT ANYWHERE ON THE RECORD CHANGER.**

A good grade of machine oil, not too light, should be used on the sliding clutches, reverse cam shaft and all eccentric and shoulder screws.

**NEVER OIL THE "DUREX" BUSHINGS, AS THIS WILL CAUSE THEM TO DISINTEGRATE.**

Once each year the motor oil cups should be oiled with a good grade of motor oil. At the same time the gear box should be inspected, and the grease replaced if it has become hard. A good mixture to use here is 75% vaseline and 25% SAE 40 motor oil.

#### 34. INSTRUCTIONS FOR REPLACING THE RECORD REVERSE CAM AND ITS ADJUSTMENTS.

1. Set record changer in the playing position. Carefully mark the drive gear (3516) (Fig. 10) on the main shaft and the driven gear shown as part of 623, Fig. 10, by prick punch marks or scriber, so that the same teeth can be engaged after reassembly, thus insuring proper timing.

2. Remove the two bolts, one (3238) (Fig. 4) securing the magazine slide and roller assembly to the magazine slide arm lever, and one (3237) (Fig. 1) securing the record slide arm and stud assembly to the record tray drive crank.

3. Looking in from the rear of the instrument, remove the Durex bushing from the end of the main cam shaft, nearest the motor drive shaft. This is accomplished by loosening the bolt to the right of the main shaft. Care should be taken when replacing this bushing so as not to tighten the bolt enough to crush the bushing; a snug fit only is required.

4. Remove lower half of bearing and Durex bushing from the other end of the main cam shaft and work the cam shaft out of the record changer. The same precaution against crushing this bushing should be taken with this one as with the one in the preceding section.

5. Remove taper pin from gear and loosen set screw in the collar, both shown as 6233 in Fig. 8, of the reverse cam shaft assembly, as well as the pin (34144) (Fig. 10) over which the reverse cam forks, when in

MODEL 16-E

Notes

CAPEHART CORPORATION

Remove the magazine link shoulder screw (3239) (Fig. 6). This will allow the magazine to be swung out of the way. As soon as the record reverse arm and fork assembly have cleared the reverse crank and pin (6230) (Fig. 1) it should be swung over the magazine and locked with the record reverse arm lock (4659) (Fig. 6), to keep it out of the way.

Lift the record changer up, until the tone arm just touches the top of the cabinet, carry it forward through the doors, tilting it to keep the main cam clear of the shelf.

All parts of the cabinet liable to damage should be protected by soft cloths while removing or installing the record changer.

It is not necessary that the above operations be carried out in the above sequence.

36. ALIGNMENT OF TRUE-TANGENT PICKUP.

When adjusting the TRUE-TANGENT pickup, the pickup head and tone arm should form a straight line, when the needle is exactly one and one half inches from the point of the turn table drive shaft cap (4320) (Fig. 6). To adjust the pickup angle, loosen the nut at the rear of the steering arm assembly (66234) (Fig. 1), turn the steering arm either right or left until the correct position for the pickup is found, then set the lock nut up tight. Then see that there still is  $\frac{5}{8}$ " clearance between the pickup and the record tray per Section 11.

Fig. 9

6232 Pickup Swing Lever and Collar Assembly  
6457 Pickup Arm Lift Shaft  
6449 Reverse Cam

the reversing position. After removing the collar and sliding the gear to one side, file all burrs from the edges of the holes in the reverse cam shaft. Slide the shaft through its Durex bushing toward the rear of the instrument far enough to allow the removal and replacement of the reverse cam (6525) (Fig. 10).

6. Reassemble the reverse cam shaft assembly, making certain that the taper pin holes in the shaft and gear are correctly aligned to permit the taper pins being properly inserted. The set screw in the collar at the end of the shaft should be properly tightened.

7. Remove the reverse cam arm and roller assembly (6450) (Fig. 2) and make sure that the roller pin and arm are not bent, if either of these items are found bent we suggest that you replace the reverse arm and roller assembly.

8. In reassembling the reverse cam arm and roller assembly (6450) (Fig. 2) in its proper position for alignment with the reverse cam, be sure the roller is about  $\frac{3}{8}$ " inside the ridge on the reverse cam, when the cam is in the reversing position.

9. Remove the taper pin from the gear (3516) (Fig. 10) on the main shaft, which drives the gear on the reverse cam shaft assembly (6255) (Fig. 10) and remount the main shaft to the record changer chassis, pushing the above gear, from which the pin was removed, to one side so that it will not mesh with its driven gear.

10. Locate the main shaft so that the lower end of the pickup arm lift shaft travels in the center of the pickup arm lift cam, as shown at "H" in Fig. 9. With the main shaft in this position, adjust the main shaft Durex bushings so that there is no end play in the main cam shaft assembly.

11. Rotate the main cam shaft to the playing position so that the pickup arm is lowered over the turntable.

12. Set the reverse cam in its lowest position, with the control lever in the "Both Sides" position, so that the fork of the reverse cam is meshed with the driving pin.

13. Mesh the reverse cam assembly driver gear (3516) (Fig. 10) with the reverse cam assembly driven gear so that the identifying punch marks correspond to the original position. The taper pin for the driver gear should be inserted next. If the assembly has been properly made there should be approximately  $\frac{3}{32}$ " clearance between the roller or the reverse cam arm and the reverse cam. See "A", Fig. 9.

14. Throw the control lever to the "One Side" position and rotate the reverse cam with the fingers until it is in the reversing position. Again throw the control lever to the "Both Sides" position. Now there should be approximately  $\frac{3}{32}$ " clearance between the reverse cam and the roller. See "B", Fig. 9. If the clearance is not approximately  $\frac{3}{32}$ " for both positions of the reverse cam it indicates either the gears are not properly meshed or the reverse segment link rod may be bent. A careful check of the latter while the main shaft is out will save time and trouble later.

35. INSTRUCTIONS FOR REMOVING THE 16-E RECORD CHANGER.

There is a great possibility when removing the chassis from the cabinet, to mar or scratch the cabinet. If you will place a piece of cardboard around the record changer it will eliminate, to a great extent, the possibility of marring the finish. A rubber auto mat, with a hole for the record changer, the same size as the one in the cabinet, makes an excellent pad. This pad can be split and is easily put in position and removed.

Remove the backs from the record changer, radio and amplifier compartments.

Remove the screws from the partition between the radio and record changer compartments, so it can be moved back out of the way.

Remove the wood screw, under the turntable, also the three bolts which hold the record changer down.

Remove the two wood screws that mount the play control.

Remove the female chassis plug, from the male chassis plug (6178) (Fig. 1) the pickup lead, which runs from the radio chassis to the terminal block, then dismount the terminal block by removing the wood screw in its center, the straps holding the shielded lead, which runs from the shorting switch, and the 110 volt leads to the Play Control.

Release the play control cable and cable housing from the bracket on the record changer chassis, by loosening the two set screws. Care should be taken to prevent breaking the control cable when removing it. The end which has been kinked by the set screw should be straightened before attempting to reinstall it.

Loosen the two Allen set screws in the flexible coupling and allow it to slide down the motor shaft, so as to clear the record changer shaft.

Move the play control as far into the radio compartment as possible.

Remove the screw marked "B" in the illustration on page 8. This is the middle one of the screws holding the upper record support.

PARTS LAYOUT—Top View

Peaking I. F. Stages at 262 K. C.

- (a) Connect the ground lead of the test oscillator to the chassis frame. Connect a 1 mfd. condenser in series with the other lead and connect this lead to the grid cap of the 6A7 tube leaving the tube's grid clip in place. The 1 mfd. condenser is necessary to prevent the oscillator circuit of the receiver from affecting the I. F. adjustments.
- (b) Set the test oscillator on 262 kilocycles.
- (c) Turn the volume control of the receiver on full.
- (d) Peak the I. F. trimmer P-3 located on the 2nd I. F. coil shown on Figure 2.
- (e) Then peak trimmers P-2 and P-1 located on the first I. F. Coil also shown on Figure 2.
- (f) In order to insure accurate settings of the I. F. trimmers the above adjustments should be repeated using the lowest oscillator output that will give a reasonable deflection of the output meter pointer. Make all adjustments for maximum output.

**GENERAL:** This auto radio is a six tube, two unit (dash speaker) superheterodyne receiver. It is equipped with a remote control and a plug-in vibrator of the full wave self-rectifying type.

**Circuit Changes**

A number of the early receivers have 1/4 mfd. tubular condenser mounted above the candohm resistor, illustration #42 of Figure 2 and connected in parallel with the 85 tube cathode by-pass section 20D of the #1209144 electrolytic condenser block. The use of the tubular condenser was necessary in production to reduce the R. F. resistance of the 85 cathode by-pass. A change has been made in the design of the condenser block, making the use of the tubular condenser unnecessary. All of the service parts replacement stock of #1209144 electrolytics are of the new design and it is immaterial whether or not the tubular condenser is left in the receiver when replacing the electrolytic condenser block.

It may be noted on some of the earlier receivers that there is a small condenser in a metal case mounted below the candohm resistor, Illus. #42, Figure 2, with two terminals that are not connected. This condenser was originally placed in the set to filter vibrator interference, but it was found after production started that two small condensers mounted in the vibrator unit were more effective and the external condenser was simply disconnected.

**Peaking Instructions**

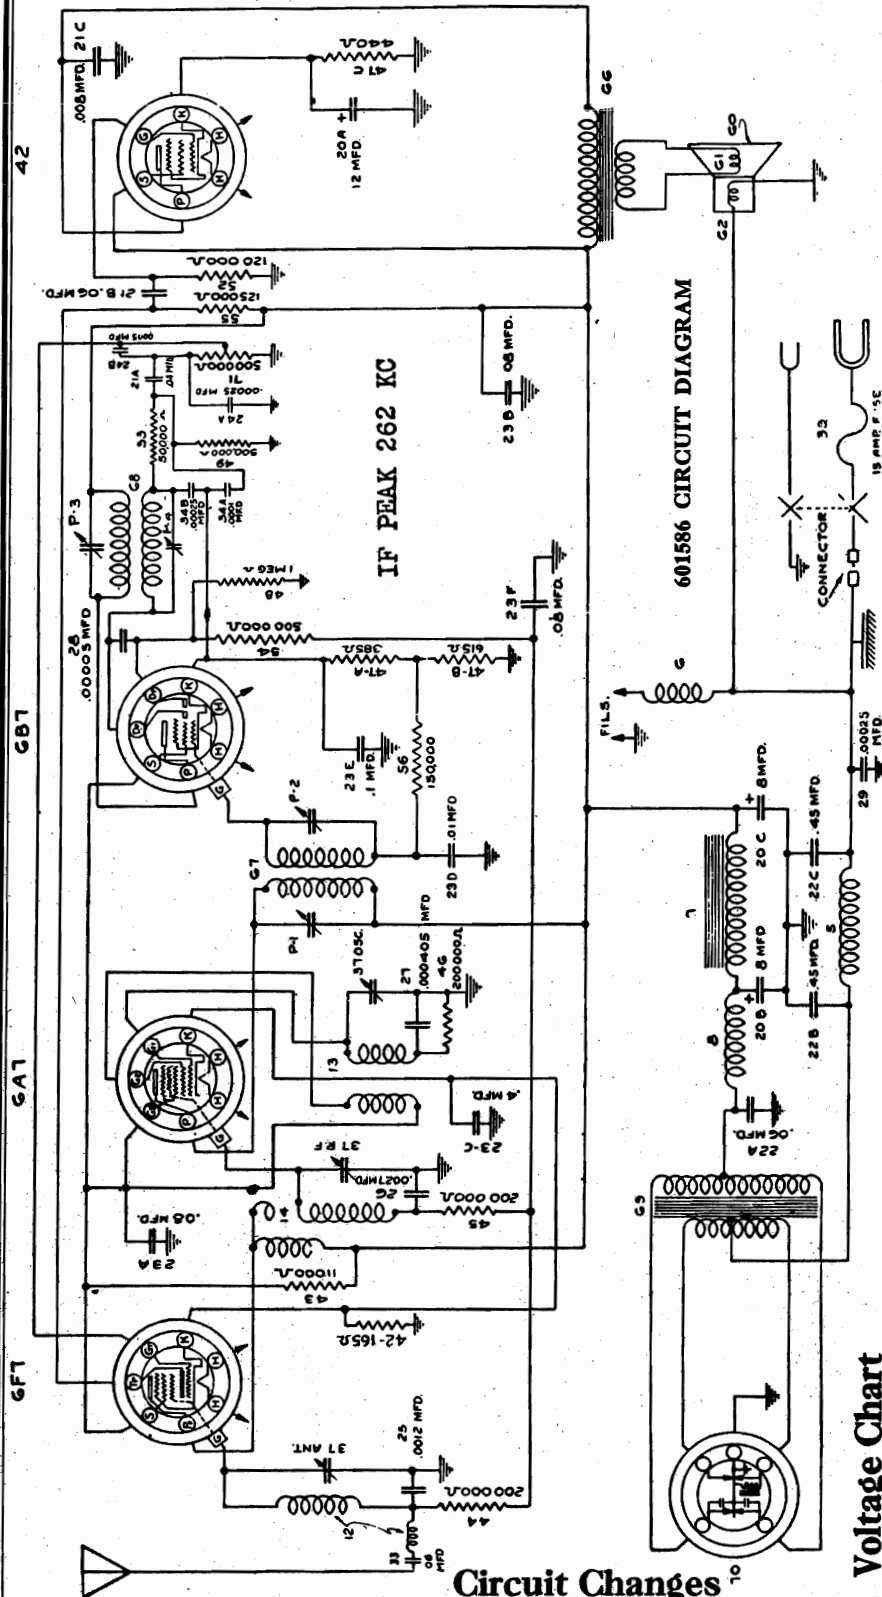

**Peaking Gang Condenser at 1530 and 1400 K. C.**

- (a) Connect the output of the test oscillator to the antenna connection of the receiver and to the chassis ground. Do not use the 1 mfd. condenser that was required in aligning the I. F. stages.
- (b) Turn the rotor plates of the gang condenser until they are COMPLETELY OUT OF MESH.
- (c) Set the test oscillator on 1530 kilocycles.
- (d) Adjust the trimmer condenser for the oscillator section (middle section) of the gang condenser CAREFULLY for maximum output. Then adjust the trimmers for the "R. F." and "ANT" sections of the gang condenser.
- (e) Set the test oscillator on 1400 kilocycles.
- (f) Turn the condenser rotor plates until the 1400 K. C. signal from the test oscillator is turned in with maximum output. (No calibration blocks should be used as the oscillator circuit is adjusted at 1530 K. C. on this set.)
- (g) Readjust the parallel trimmers for the "R. F." and "ANT" section of the gang condenser for maximum output. DO NOT disturb the oscillator trimmer (middle section) as this is adjusted at 1530 K. C. only and any further adjustments at this point will affect both the tuning range of the receiver and the tracking of its circuits.

**CAUTION:** Always use the lowest possible test oscillator output that will give a reasonable deflection of the output meter pointer in order to prevent the A. V. C. from leveling out the output as the adjustments are made.

Changes

Circuit Changes

A number of .05 mfd. tubular condensers were used at the factory in place of the .06 mfd. condenser part #1209213 condenser shown on Fig. 2 as Illus. #33. For Service Replacement purposes of any defective .05 mfd. condensers—use part #1209213 condenser.

Code for Symbols

MODEL 601586

Socket, Trimmers  
Chassis, Alignment  
Parts

CHEVROLET DIV.—GEN. MOTORS

**GENERAL:** This auto radio is a four tube, single unit superheterodyne radio. It was designed for the 1935 Standard Model Chevrolets. A tuning control of the type that mounts on the bottom flange of the instrument is used.

**Peaking Instructions**

**Peaking I. F. Stages at 262 K. C.**

- Connect the ground lead of the test oscillator to the chassis frame. Connect a .5 mfd. condenser in series with the other lead and connect this lead to the grid cap of the 6A7 tube, leaving the tube's grid clip in place. The .5 mfd. condenser is necessary to prevent the oscillator circuit of the receiver from affecting the I. F. adjustments.
- Set the test oscillator on 262 kilocycles.
- Turn the volume control of the receiver on full.
- Peak the I. F. trimmer P-3 for the 2nd I. F. coil shown on Fig. 3.
- Then peak trimmers P-2 and P-1 of the first I. F. coil also shown on Fig. 3.
- In order to insure accurate settings of the I. F. trimmers the above adjustments should be repeated using the lowest oscillator output that will give a reasonable output meter scale deflection. Make all adjustments for maximum output.

**Peaking Gang Condenser at 1530 and 1400 K. C.**

- Connect the output of the test oscillator to the antenna connection of the receiver and to the chassis ground. Do not use the .5 mfd. condenser that was required in aligning the I. F. stages.
- Turn the rotor plates of the gang condenser until they are COMPLETELY OUT OF MESH.
- Set the test oscillator on 1530 kilocycles.
- Adjust the oscillator section (middle section) of the gang condenser CAREFULLY for maximum output. Then adjust the trimmers for the "R. F." and "ANT" sections of the gang condenser.
- Set the test oscillator on 1400 kilocycles.
- Turn the condenser rotor plates until the 1400 K. C. signal from the test oscillator is tuned in with maximum output. (No calibration blocks should be used as the oscillator circuit is adjusted at 1530 K. C. on this set.)
- Readjust the parallel trimmers for the "R. F." and "ANT" sections of the gang condenser (shown on Fig. 2) for maximum output. DO NOT disturb the oscillator trimmer (middle section) as this is adjusted at 1530 K. C. only, and any further adjustments at this point will affect both the tuning range of the receiver and the tracking of its circuits.
- The capacity of the output circuit of the test oscillator may be slightly different than that of the under car antenna the receiver is to be used on. Therefore, it is advisable to readjust the "ANT" trimmer to the car antenna when reinstalling the receiver. This may be done by tuning the receiver to a broadcast station around 1400 K. C. and adjusting for maximum volume.

**CAUTION:** Always use the lowest possible test oscillator output that will give a reasonable deflection of the output meter pointer, in order to prevent the A. V. C. from leveling out the output as the adjustments are made.

CHEVROLET DIV.—GEN. MOTORS

MODEL 985200  
Schematic, Voltage

**Circuit Description**

The circuit used is of the conventional superheterodyne type and does not employ regeneration which might affect its stability. A high gain antenna circuit especially designed for use with an under car antenna is used. An antenna compensating condenser is provided in this circuit which can be adjusted so as to bring the antenna circuit of the receiver into resonance with the car antenna.

Peaking Procedure

Connect one terminal of the output meter to the plate and the other terminal to the screen of the 42 output tube.  
BE SURE the meter is protected from D. C. by connecting a condenser (.1 Mfd. or larger—not electrolytic) in series with one of the leads.

Peaking I. F. Stages at 262.5 K. C.

- Connect the ground lead of the signal generator to the chassis frame. Connect a .5 Mfd. condenser in series with the other lead and connect this lead to the grid cap of the 6A7 tube, leaving the tube's grid clip in place.
- Set the signal generator to 262.5 kilocycles.
- Turn the volume control of the receiver on full and turn the tone control to the treble position.
- Rotate the station selector until the tuning condenser plates are completely in mesh.
- Adjust the trimmer condensers located on top of the 2nd I-F coil (Fig. 00) for maximum reading on the output meter.
- Adjust the trimmer condensers located on top of the 1st I-F coil for maximum output.

NOTE: In order to insure accurate settings of the I-F trimmer condensers the above adjustments should be repeated using the lowest signal generator output that will give a reasonable scale deflection on the output meter. Make all adjustments for maximum output.

Peaking R. F. Stages

- Remove the .5 Mfd. condenser from the output lead of the signal generator and connect a .00025 Mfd. condenser in its place. Then, connect this lead to the antenna connection of the receiver.
  - Set the signal generator to 1400 kilocycles.
  - Rotate the station selector until the pointer points to 140 on the dial.
- NOTE: Special care should be exercised in making the adjustments at this frequency as the correct logging of stations on the dial is dependent upon these adjustments.

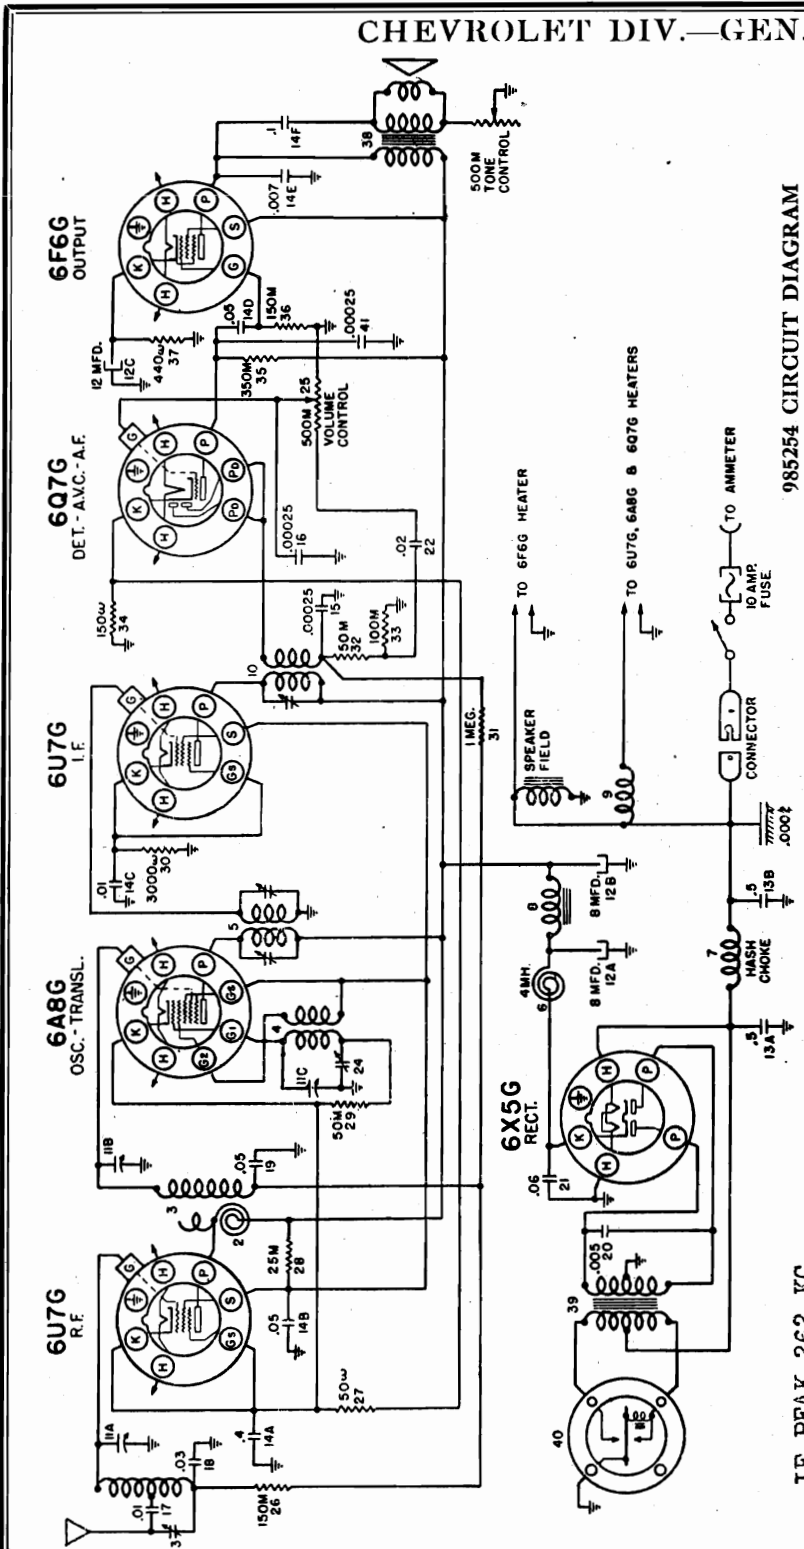

- Adjust the "Osc" trimmer of the tuning condenser (Fig. 2) for maximum output.
  - Adjust the "R-F" trimmer for maximum output.
  - Adjust the "ANT" trimmer for maximum output.
  - Repeat operations (e) and (f) using the lowest signal generator output that will give a reasonable scale deflection on the output meter.
- NOTE: The "Osc," "R-F," and "ANT" trimmers should not be adjusted at any frequency other than 1400 kilocycles.

- Set the signal generator to 600 kilocycles.
- Tune in the 600 kilocycles from the signal generator with the station selector for maximum output.
- Peak the antenna compensating condenser (Fig. 3) for maximum output.
- Repeat operation (j) and (k) alternately until no further improvement in output can be obtained.
- Set the signal generator to 1400 kilocycles again.
- Tune in the 1400 kilocycle with the station selector for maximum output.
- Readjust the "ANT" trimmer of the tuning condenser for maximum output.

IF PEAK 262 KC

**ANTENNA CIRCUIT:** The antenna circuit is directly coupled to the antenna in contrast with the capacity coupled circuit used in some Chevrolet Models. A small adjustable condenser is provided for adjusting the antenna circuit to the antenna. This adjustment is made near the high frequency end of the dial (1400 K.C.) instead of at the low frequency end as with the capacity coupled sets.

**POWER SUPPLY:** The power supply in this receiver differs from previous Chevrolet Models in that a rectifier tube (type 6X5G) is used in conjunction with a full wave, plug-in vibrator. The vibrator circuit is permanently connected for operation on negative battery ground as is the case on all Chevrolets.

NOTE: Above readings taken from tube socket contacts to ground with a D.C. voltmeter having a resistance of 1000 ohms per volt; "A" Batt 6 volts.

**Circuit Alignment**

**IMPORTANT:** Do not make any adjustments to this receiver with the chassis case removed from the receiver chassis or without the proper equipment. If maximum sensitivity is to be obtained from this receiver after realignment, it is very important that the following procedure be closely observed:

**1. Aligning I-F Stages at 262 Kilocycles**

- Connect the signal lead of the test oscillator to the grid cap of the 6A8G tube, through a .1 mfd. condenser, leaving the tube's grid clip in place.
- Connect the ground lead of the test oscillator to the chassis frame.
- Connect output meter in plate circuit of 6F6G output tube or across the voice coil of the speaker.
- Set the test oscillator to exactly 262 K.C.

(e) Adjust the trimmers on the I-F coils (Illus. 5 and 10) carefully for maximum output. These adjustments should be repeated several times and during alignment the test oscillator output should be kept to as low a value as is consistent with obtaining readable indication on the output meter.

**2. Aligning at 1530 Kilocycles**

- Leave the test oscillator leads connected the same as for aligning the I-F circuits.
- Turn the rotor plates of the gang condenser all the way out and against the high frequency stop.
- Set the test oscillator to 1530 kilocycles.

(d) Adjust the parallel trimmer for the oscillator section of the condenser gang (Illus. 11C, Fig. 2) for maximum output. It is very important that this frequency be set accurately as a slight missetting will cause the receiver to be out of track over the entire high frequency end of the dial.

**3. Aligning at 540 Kilocycles**

- Leave the test oscillator leads connected the same as before.
- Turn the rotor plates of the gang condenser all the way into mesh so that they rest against the low frequency stop.
- Set the test oscillator to 540 K.C.

(d) Adjust the oscillator tracking condenser (Illus. 24, Fig. 3) located on the underside of the receiver sub-panel to maximum output. (This adjustment sets the low frequency tuning range of the receiver to 540 K.C.)

**4. Aligning at 1400 Kilocycles**

- Remove the signal lead of the test oscillator from the grid of the 6A8G tube and connect to the antenna terminal of the receiver through a .002 mica condenser connected in place of the .1 mfd. condenser previously used.
- Set the test oscillator to 1400 K.C.
- Turn the condenser rotor plates until this frequency is tuned in with maximum output.
- Adjust the R-F parallel trimmer on the condenser gang (Illus. 11B, Fig. 2) located on the side of the receiver case for maximum output.

**5. Aligning at 600 Kilocycles**

The oscillator padding condenser was previously adjusted at 540 K.C.; however, it is necessary, in most cases, to repeak the oscillator tracking condenser at 600 K.C. in order to make the receiver track properly and to secure full sensitivity.

- Set the test oscillator on 600 K.C.
- Turn the condenser rotor plates until the signal from the test oscillator is tuned in with maximum output.
- Maintain a low output signal from the test oscillator and readjust the oscillator tracking condenser (Illus. 24, Fig. 3) while rocking the variable condenser gang tuning shaft back and forth through the signal. This operation should be continued until no further increase in output can be obtained.

**NOTE:** If the entire alignment procedure has been accomplished correctly, the receiver should be very nearly uniformly sensitive over the entire frequency range.

**Visual Alignment**

If the visual method of alignment is preferred to the method outlined above, the vertical input terminals of the cathode ray oscillograph should be connected to the second detector output with the high side connected between the junction of the 50,000 ohm resistor (Illus. 32, Fig. 1) and the secondary of the second I.F. transformer (Illus. 10, Fig. 1).

MODEL 985283  
Tuning Unit Notes  
Part 1

## CHEVROLET DIV.—GEN. MOTORS

### SUBJECT: Service Hints On Tuning Unit For 985283 Radio—Cont'd

### SUBJECT: Service Hints On Tuning Unit For 985283 Radio

FOR OTHER DATA, SEE VOL. IX

#### 1. Motor does not run

- Press button down and check motor terminals for voltage. The voltage on the motor must be measured across the terminals because a voltage reading will show at all times from any one of the four motor terminals to ground or chassis. The voltage across the motor terminal should read 5.5 volts with 6 volts on the radio set, and will only show a reading when a button is pressed down and the relay is operating.
- If no voltage reading is obtained at the motor terminals to ground, check high "A" wiring from spark plate to motor terminals for open circuit. This check is made with no buttons down.
- When there is a voltage reading on some of the motor terminals to ground with no buttons down and not on other terminals, check motor fields and armature for open circuit. This is done with the regular continuity test.
- Check all motor terminals for ground with high "A" disconnected from the motor.
- Check the brushes on motor to make sure that they are seating properly on the commutator.
- Polish commutator with very fine emery paper, then wipe with a clean rag. Be sure that no abrasive is left on the commutator.

#### 2. Motor stalls or does not pull condenser gang, but still motor checks okeh under No. 1

- Rotate armature of motor with finger to see if motor bearings are not frozen up. If the armature has a slight drag, it may be caused by the following:
  - Tight motor bearings.
  - Improper adjustment of motor worm with respect to the motor worm gear.
- Rotate condenser gang coupling if chassis is out of case and make sure that all moving parts rotate freely. Check remote control and be sure that all moving parts rotate freely.
- Hold clutch armature from engaging clutch and run motor by pressing button. Motor should run at very high speed with no load on it. This will check the motor and motor worm gear for freeness.
- Check remote control for binding either in the control head or in drive cables. Make sure that there are no sharp bends in control cables when installed in the car.
- Check motor armature for proper end play.
- If any bearings or gears appear to be running tight, oil only with 3 in 1 oil or its equivalent. This is very important, and only a very light grade of oil should be used, otherwise motor unit will not operate properly under low temperature conditions.  
**Caution:** Do not oil motor bearings excessively because the motor used on this unit has oil-less bearings and should require very little oil. If an excessive amount of oil is used on the bearings it may get on the commutator or windings and cause damage to the motor. Do not oil the commutator under any circumstances.

#### 3. If motor unit runs slow in both directions

- The same checks as outlined in Nos. 1 and 2 will apply to a slow running motor.

#### 4. Motor unit runs slow in one direction

- Check motor brushes for proper fit to commutator.
- Check motor worm for proper adjustment. Motor worm should be exactly on a center with motor worm gear, with about .002 inch of backlash to worm gear when motor armature is held rigid.
- Check remote control and gang condenser assembly for binding in one direction or both.

#### 5. Noisy motor unit mechanically

- Check remote control for grinding or squeaking by spinning remote control knob.
- Check all gear adjustments for proper backlash and alignment.
- Check gears for proper lubrication. Use a light grade of vaseline on gears.
- Check gears and bearings for worn parts or poor bearing fits and lack of lubrication. Refer to No. 2 for oiling.
- Check motor brushes for noise.

#### 6. Set noisy when jarred. This deals only with troubles in the motor unit that may cause the above trouble

- Relay armature bouncing on relay contacts. To remedy this condition adjust relay spring if weak and relay spring contacts for a wider gap.
- Push button cable plug not pushed in socket far enough.
- Weak push button springs in push button box. This will be noticeable only when the button box itself is jarred.

#### 7. Motor runs but condenser gang and dial pointer do not move

- Check the set screw in rear of gang condenser worm gear that locks the drive shaft to the gang condenser worm. The drive shaft may be turning free and not driving the gang. The drive shaft is adjustable endwise for the clutch armature adjustment only, and not for the motor worm gear. If this set screw has come loose the drive shaft will be out of adjustment and the clutch and motor worm will have to be adjusted in the order named.
- Clutch armature not operating. Check voltage across the clutch coil and also check the clutch coil for continuity.
- If the clutch armature is operating, the clutch arm on the drive shaft may not be engaging the pin and roller on the motor worm gear. Adjustment can be made by moving the drive shaft endwise, but be sure to adjust motor after moving the drive shaft.

#### 8. Motor unit operates and gang condenser oscillates but remote control does not operate

- This condition will be caused by the bakelite gang condenser coupling slipping in the gang condenser worm. This coupling is a friction drive and is pushed inside the gang condenser worm with spring pressure exerted outwards on the worm. Do not oil this friction drive. To tighten this friction drive, pull coupling out and spread the split shaft with a small screwdriver. A very small spread is all that is required. Be sure to clean off all grease on split shaft and inside of hole in gang condenser worm gear, then replace the coupling.
- Check remote control for any faults.

#### 9. Push buttons do not release when one button is pressed at a time

- Buttons may be binding on control panel plate. Loosen the nuts holding push button box and adjust box so that buttons are free to move in and out.
- Buttons may be binding on top plate of button box. Adjust box plate so that buttons are free.
- Rubber bands around buttons may be causing the buttons to bind.
- Push button box may be defective. Try a new box. Do not repair push button box internally.  
**Caution:** Remember, the push buttons will not release until the proper station is tuned in and the motor unit has ceased to run.

MODEL 985283

Tuning Unit Notes  
Part 2

## CHEVROLET DIV.—GEN. MOTORS

## SUBJECT: Service Hints On Tuning Unit For 985283 Radio—Cont'd

## SUBJECT: Service Hints On Tuning Unit For 985283 Radio—Cont'd

10. Push buttons do not release when two or more buttons are pressed at the same time. This is a fault that should seldom be complained about because it is not the correct way to operate the tuning unit, but provision has been made in the design to eliminate continuous oscillation of the tuning unit when two or more buttons are pressed at the same time. Three or four oscillations are permissible before buttons release. If the buttons do not release, proceed as follows:
- Try a new push button box.
  - Check adjustment of relay spring contacts for proper gap.
  - Check relay control arm for free operation and also for proper spring tension. Make sure that relay control arm is returning to normal position after relay operates.
  - Check instrument panel plate and button box as outlined in No. 9.
11. Dial pointer slides past the proper station or setting and then returns to station when the corresponding button is pressed the second time
- This is a fault of the clutch which is not releasing fast enough or is not releasing at all. If the clutch does not release, the momentum of the locating motor will carry the gang condenser past the required setting. Check the clutch armature for free operation.
  - Check the clutch arm on drive shaft for free operation.
  - Check the clutch arm spring on drive shaft for proper tension.
  - Check the small roller on motor worm gear for free operation on its retaining pin.
  - Check the motor worm gear for free rotation on drive shaft when clutch arm is disengaged from the clutch pin.
  - Check the clutch magnet gap clip for proper tension.
  - Check the clutch arm spring for proper tension.
  - Check the clutch arm for proper alignment with control shaft.
12. Stations do not log properly when dial pointer comes towards the station from the high frequency end—in other words, rotating in a counter clockwise direction
- Bakelite control disc for that particular station has not been set accurately. Adjust as per instructions.
  - This condition may also be caused by fault No. 11. Check as per instructions in No. 11.
13. Stations do not log properly when dial pointer comes towards station from the low frequency end of dial—in other words, rotating in a clockwise direction. Under this fault, it is assumed that fault No. 12 has been checked
- The contact spring on control switch corresponding to the particular button under question may not be adjusted properly. If dial is over-riding on station it means that the contact spring is too close to the contact arm. To correct this condition it is necessary to loosen the screw on the discriminator switch to give contact spring a wider gap. If dial is under-shooting the station, that is, not dialing entirely to the station, it means that the contact spring is too far from the contact arm. To correct this condition, it is necessary to tighten the adjusting screw on the discriminator switch. Be sure that none of the other adjusting screws are disturbed.
14. Set very noisy when motor unit is running. This would be electrical noise from the speaker
- Improper adjustment of the silencing contact on the relay. This silencing contact is the back contact, or the one nearest the condenser gang. The lead running from this contact is connected to the tab of the push-pull input choke and hence when the relay is operated to either side, the input choke tab is then grounded, silencing the audio of the set. Check wiring, soldered joints and contact resistance of silencing contact on relay. Polish relay contacts with very fine emery paper to remove dirt and grease. This will assure a good contact.
15. Set noisy immediately after motor unit has ceased to operate dial pointer
- This noise will only last for one or two seconds after the unit has stopped running and is caused by a voltage being generated in the motor and hence the "A" circuit by the rotation of the armature in a small residual field of the pole pieces. Check motor brushes and commutator for high resistance. Polish commutator as previously outlined.
  - Check the .01 mfd. condenser across motor terminals for open.
16. Push buttons do not hold down when pressed
- Check the voltage between the black and yellow leads on push button cable socket.
  - Make sure that push button cable plug is making good contact to the socket.
  - Try a new push button box.
17. Calibrating light inside of case lights when calibrating switch is closed and push button is pressed. Motor will not run when this happens
- This condition is due to a faulty calibrating switch. Bend the switch arm down slightly so that a good contact is assured. This light is in series with relay coils and when light is not shorted out with calibrating switch the relay will not operate.
18. Calibrating light inside of case does not light when calibrating switch is open and push button is pressed
- Be sure calibrating light is not burned out.
  - Check the voltage on relay coils.
  - Check the relay coils for continuity.
  - Check the calibrating switch contact for grounded connection.
19. Shift in station logging
- Check bakelite control discs for being loose on shaft. Discs are not supposed to slip when unit operates. This is a friction fit on the control shaft and should never be oiled.
  - Check the oscillator circuit for shift.
- (b) Check idler gear between control disc shaft and gang condenser worm gear for proper adjustment and also for being loose.
- Caution: If the idler gear is moved from its original position for any reason or for any cause, it will be necessary to readjust all eight contact springs on control switch, and also to reset all eight bakelite control discs. Under no condition make any adjustment to any of the spring adjusting screws or to the idler gear unless all other remedies have been tried.

## Alignment

## CHEVROLET DIV.—GEN. MOTORS

## Circuit Alignment

If alignment is found necessary the circuits can be adjusted only with the use of a calibrated test oscillator or signal generator and an output meter. The signal generator output should be adjusted to give a reasonable scale deflection on the output meter. Before turning the receiver on or making any adjustments, a speaker similar to the one used with the receiver or a universal test speaker, should be connected to the chassis. It is also possible to use an 8000 ohm load connected across the primary of the output transformer.

(h) Readjust the middle trimmer on the 1st I. F. transformer for maximum symmetry above the vertical resonance line in the center of the celluloid scale. The hump or shoulder appearing on each side of the wave form will be equal distance from the nose of the curve when maximum symmetry is reached.

## 3. Aligning the R. F. Amplifier

- Connect the output of the signal generator through a .00016 mfd. condenser and Chevrolet shielded antenna lead-in to the antenna connection of the receiver. Connect the ground lead to the frame of the receiver chassis.
- Adjust the signal generator to 1400 kilocycles.
- Adjust the station selector to 140 on the dial logging the dial from the low frequency end.
- Adjust the trimmer on the oscillator section of the condenser gang for maximum reading on the output meter.
- Adjust the trimmer on the R. F. trimmer gang for maximum reading on the output meter.
- Adjust the trimmer on the antenna gang for maximum reading on the output meter.
- Readjust the station selector for maximum reading on the output meter.

Note: Do not readjust the oscillator trimmer.

(h) Repeat operations (c) and (f) for more accurate adjustments.

## 4. Adjusting Antenna Compensating Condenser

- Adjust the signal generator to 600 kilocycles.
- Tune in the 600 kilocycle signal with the station selector for maximum reading on the output meter.
- Adjust the antenna compensating condenser for maximum reading on the output meter.
- Repeat operations (b) and (c) alternately until no further improvement in output can be obtained.
- Readjust the signal generator to 1400 kilocycles.
- Tune in the 1400 kilocycle signal with the station selector for maximum output.
- Readjust the trimmer on the antenna section of the condenser gang for maximum reading on the output meter.

## 5. Adjusting the Antenna Compensating Condenser When Set Is Installed on Car

- After installation is complete, tune-in a weak station between 55 and 65 on the dial that is just audible with volume control on full.
- Adjust the antenna compensating condenser for maximum volume in the speaker.

## 6. Setting the Push-Buttons

The order in which the stations are set-up on the push-buttons will in no way affect the operation of the tuning unit. To set the push-buttons no tools are required, but an understanding of the operation of the push-button switch is essential. There are two definite pressures and movements required to actuate the switch. First, a slight touch and a movement of less than one-eighth of an inch is all that is required to tune the receiver with a push-button after the button has been adjusted. Second, a heavier pressure and a movement of about one-quarter of an inch is required when the push-button is to be set to the station selected. To adjust the button, push the button all the way down (a slight snap will be felt when going past first stop position), and hold it in that position while you tune-in as accurately as possible with the manual tuning knob, setting the remaining buttons.

Note: The accuracy of the push-buttons depends upon how accurate you tune-in the station while setting them.

## 1. Aligning I. F. Stages at 262.5 Kilocycles

The I. F. amplifier may best be aligned by first using a modulated signal generator and an output meter in the conventional manner, and then making the final adjustment with a radio frequency modulator signal generator and oscillograph. The accuracy of the push-button tuning system partially depends upon the symmetry of the I. F. wave form. In most cases the symmetry is only approximate without the aid of the oscillograph equipment.

- Connect one terminal of the output meter to the plate of one of the 6V6G output tubes and connect the other terminal through a .1 mfd. condenser (not electrolytic) to the plate of the other 6V6G output tube.
- Connect the output of the signal generator through a .02 mfd. condenser to the grid of the 6K7 I. F. amplifier tube leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the frame of the receiver chassis.
- Turn the volume control on full. Adjust station selector so that the rotor plates of the condenser gang are completely in mesh and turn the audio fidelity control to the treble position. The music-speech control should be in the "music" position.
- Adjust the signal generator to 262.5 kilocycles.
- Adjust both transformers located on the 2nd I. F. transformer to maximum reading on the output meter.
- Always use the lowest signal generator output that will give a reasonable reading on the output meter.
- Connect the output of the signal generator to the grid of the 6A8 tube leaving the tube's grid clip in place.
- Open the middle trimmer on the 1st I. F. transformer two or three turns of the adjustment screw. Care should be taken that the adjustment screw does not become dislodged from the nut.
- Adjust the other two trimmers on the 1st I. F. transformer for maximum reading on the output meter.
- Adjust the middle trimmer on the I. F. transformers for maximum reading on the output meter.

Caution: Do not readjust the trimmers on the 2nd I. F. transformer.

## 2. Oscillograph Alignment

For more accurate adjustment of the I. F. amplifier a cathode ray oscillograph in conjunction with a radio frequency modulated signal generator may be used to obtain a visual alignment. It will allow adjusting for a more symmetrical wave form.

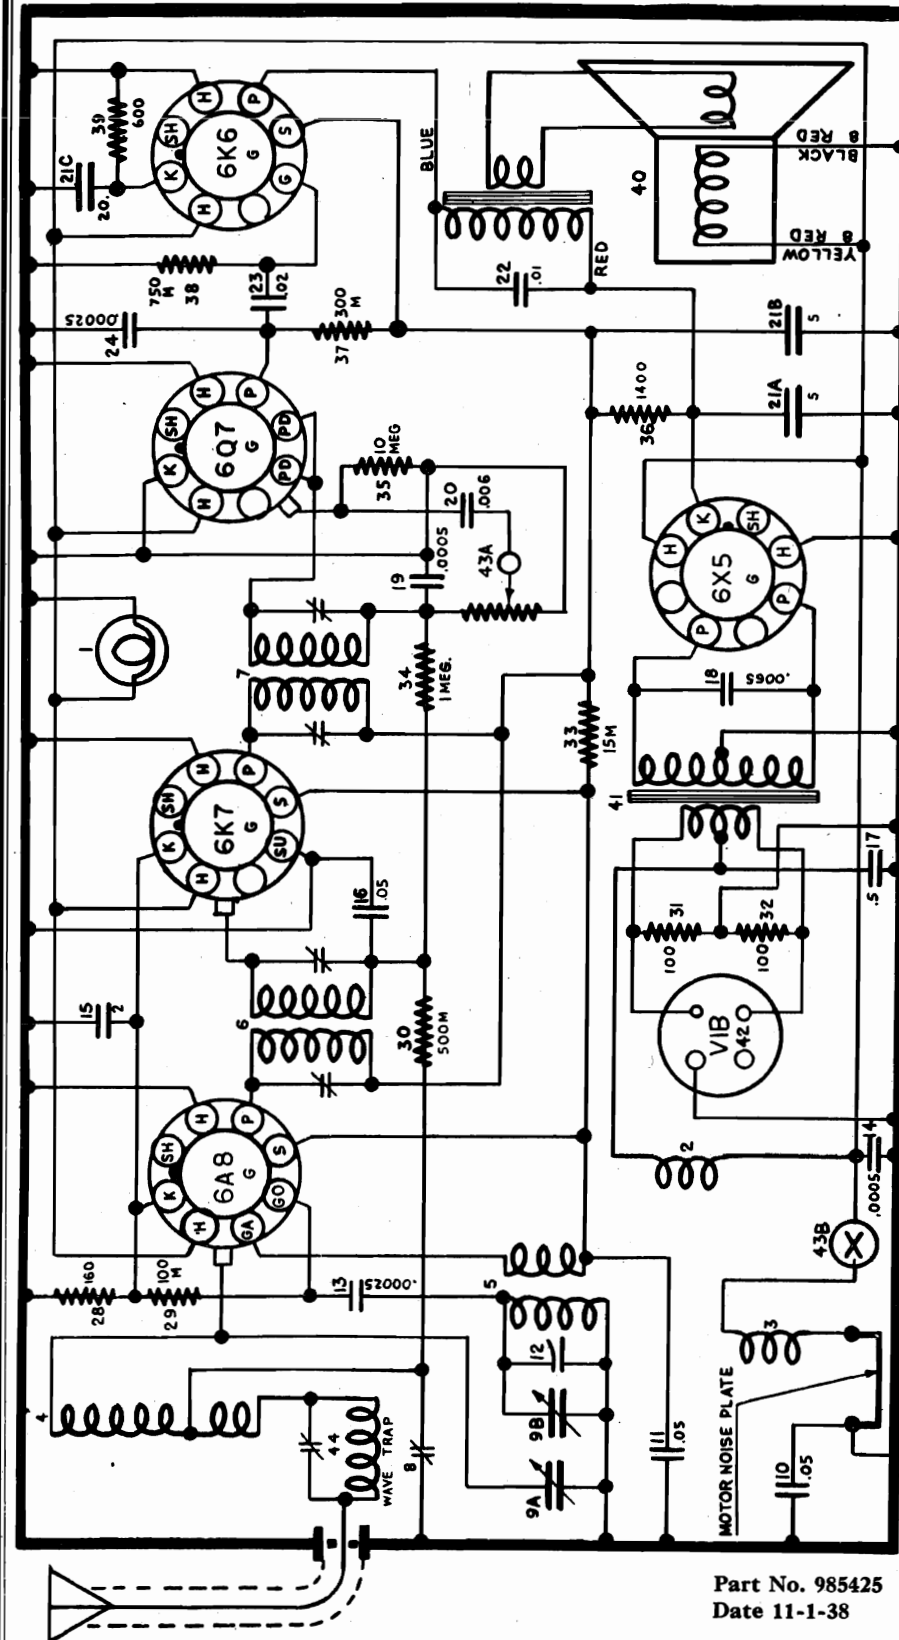

- Disconnect the conventional signal generator from the receiver.
- Connect the vertical plates of the oscillograph to the receiver connecting the (HI) terminal through a .02 mfd. condenser to the grid cap of the 6K7 tube leaving the tubes grid clip in place. (Condenser is built into most oscillographs.) Connect the ground terminal to the frame of the receiver chassis.
- Connect the output of the R. F. modulated signal generator also through a .02 mfd. condenser to the grid cap of the 6A8 tube leaving the tube's grid clip in place. Connect the ground lead to the frame of the receiver chassis.
- Adjust the signal generator to 262.5 kilocycles.
- With the modulator switch of the signal generator turned off, a horizontal line will appear on the window of the oscillograph by means of the amplitude control on the oscillograph. Adjust the length of this line so that it is equal to the width of the celluloid scale supplied with the oscillograph.
- Turn the frequency modulator switch of the signal generator on.
- Adjust the vertical control of the oscillograph so that the image is just within the top and bottom lines of the oscillograph scale.

Note: Use the lowest signal generator output that will give a stable image on the oscillograph window. If too much signal input is used; the humps desired on the wave form will not be visible even at perfect alignment.

CHEVROLET DIV.—GEN. MOTORS

MODEL 985425  
Schematic

985425 CIRCUIT DIAGRAM

455 K.C. I.F.

Adjusting Antenna Compensating Condenser After Radio Is Installed

- (a) After installation, tune-in a weak station between 55 and 65 on the dial that is just audible with the volume control on full.
- (b) Adjust the antenna compensating condenser for maximum volume in the speaker.

**ANTENNA SYSTEM:** There are three antenna systems available for use with this receiver: The under-car; the turret top, or the telescopic cowl antenna. Any one of these antennas will operate very efficiently with this receiver.

Tube Complement

Type	Function
6A8G	Oscillator-Modulator
6K7	I. F. Amplifier
6Q7G	2nd Det. A. V. C.
6K6G	1st A. F. Amplifier
6X5G	Power Output Rectifier

Part No. 985425  
Date 11-1-38

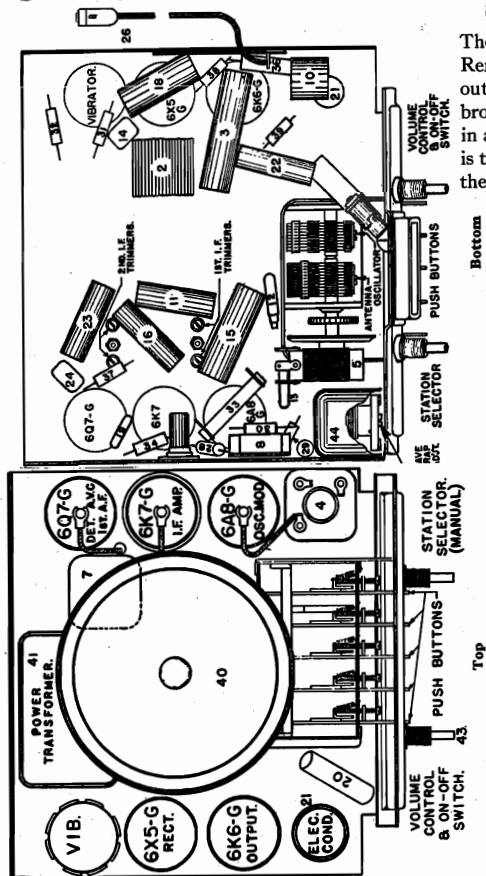

A highly efficient superheterodyne circuit is used. Bias for the 6A8G and 6K7 tubes is obtained across the 160 ohm resistor, item No. 28. Bias for the 6K6G tube is obtained across a 600 ohm resistor, item No. 39.

 Voltage, Chassis  
 Alignment, Tuner

CHEVROLET DIV.—GEN. MOTORS

Setting the Push-Buttons

The push-button can be quickly and accurately set from the front of the receiver. Remove the push-button to be set (clasp between forefinger and thumb and pull straight out) and loosen the set screws that are concealed by the buttons. Determine the five broadcasting stations that are to be set up. By means of a manual tuning knob, tune in as accurately as possible, the station desired. Push the button on which that station is to be set up on and hold in that position, then securely tighten the set screw. Replace the button on that key and adjust the remaining buttons in the same manner.

985425 TUBE SOCKET LAYOUT and VOLTAGES

Circuit Alignment

1. Aligning the I. F. Stage at 455 Kilocycles

- (a) Connect the output meter to the plate and screen of the 6K6G output tube. Be sure the meter is protected from D. C. by connecting a .1 mfd. condenser (not electrolytic) in series with one of the leads.
- (b) Connect the output of the signal generator through a .02 mfd. condenser to the grid of the 6K7 I. F. tube leaving the tubes grid clip in place. Connect the ground lead from the signal generator to the receiver chassis frame.
- Note: Keep the generator leads as far as possible from the grid leads of the other screen grid tubes.
- (c) Adjust the station selector so that the rotor plates of the tuning condenser are completely disengaged and turn the volume control to the maximum position.
- (d) Adjust the signal generator to 455 kilocycles.
- (e) Adjust both 2nd I. F. trimmer condensers for maximum output.
- (f) Transfer generator lead to the grid of the 6A8G tube leaving the tube's grid clip in place.
- (g) Adjust both trimmers located on the 1st I. F. transformer for maximum output.
- Note: Repeat operations (e) and (g) for more accurate adjustments.
- Note: In order to prevent A. V. C. action always use the lowest signal generator output that will give a reasonable output meter reading.

2. Aligning the R. F. Amplifier

To obtain the greatest gain from the antenna system, the capacity of the dummy antenna should be accurate to the capacity of the antenna with which the receiver is to be used. The capacities of auto radio antennas range from 65 mmf. to 250 mmf., depending upon the size and type. If the receiver is adjusted for maximum efficiency when used with an antenna having a high capacity, it will not operate at its maximum efficiency on an antenna having a much lower capacity or vice versa.

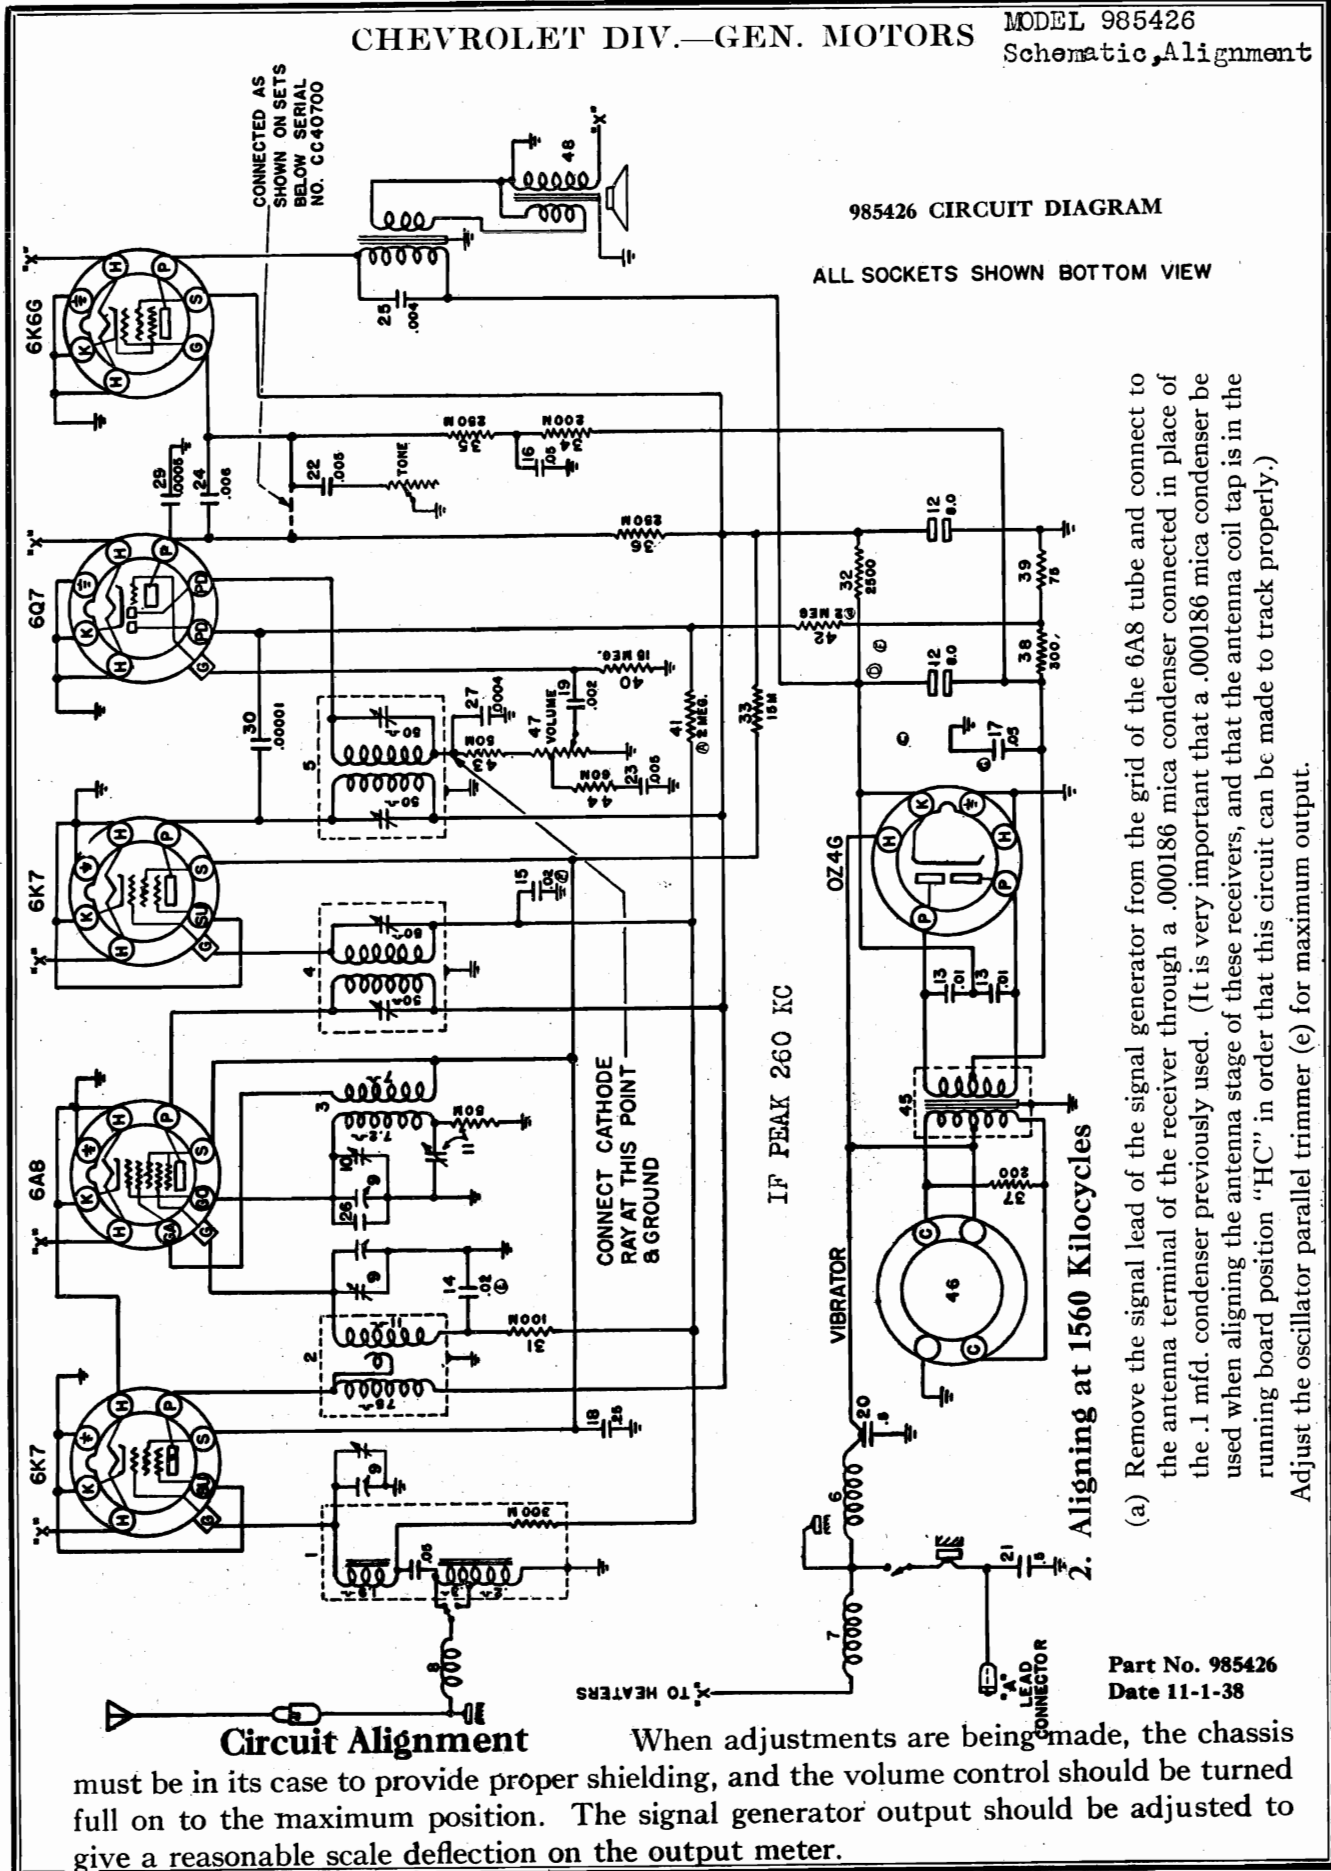

- (a) If the receiver is to be used with a turret-top antenna or a telescopic cowl antenna, the output lead from the signal generator should be connected through a .00005 mfd. condenser, and shielded lead, to the antenna connection of the receiver. If a large antenna such as the running board type is used, a .00016 mfd. condenser should be used and a long shielded lead in place of the .00005 mfd. condenser and short shielded lead.
- (b) Adjust the signal generator to 1400 kilocycles.
- (c) Adjust the station selector to 140 on the dial.
- (d) Adjust the trimmer on the oscillator section of the tuning condenser for maximum output.
- (e) Adjust the trimmer on the antenna section of the tuning condenser for maximum output.
- (f) Readjust the station selector for maximum output.
- Note: Do not readjust the oscillator trimmer.
- (g) Repeat operation (e) for more accurate adjustment.

Adjusting Antenna Compensating Condenser

- (a) Set the signal generator to 600 kilocycles.
- (b) Tune-in the 600 kilocycle signal with the station selector for maximum output.
- (c) Adjust the antenna compensating condenser for maximum output.
- (d) Repeat operations (b) and (c) alternately until no further improvement can be obtained.
- (e) Set the signal generator to 1400 kilocycles.
- (f) Tune-in the 1400 kilocycle signal with the station selector for maximum output.
- (g) Readjust the trimmer on the antenna section of the tuning condenser for maximum output.

CHEVROLET DIV.—GEN. MOTORS

MODEL 985426  
Schematic, Alignment

**Circuit Alignment**

When adjustments are being made, the chassis must be in its case to provide proper shielding, and the volume control should be turned full on to the maximum position. The signal generator output should be adjusted to give a reasonable scale deflection on the output meter.

**2. Aligning at 1560 Kilocycles**

- (a) Remove the signal lead of the signal generator from the grid of the 6A8 tube and connect to the antenna terminal of the receiver through a .000186 mica condenser connected in place of the .1 mfd. condenser previously used. (It is very important that a .000186 mica condenser be used when aligning the antenna stage of these receivers, and that the antenna coil tap is in the running board position "HC" in order that this circuit can be made to track properly.) Adjust the oscillator parallel trimmer (e) for maximum output.

Part No. 985426  
Date 11-1-38

MODEL 985426  
Voltage, Socket  
Trimmers, Alignment  
Chassis

CHEVROLET DIV.—GEN. MOTORS

FOR CONVENTIONAL ALIGNMENT PROCEDURE, SEE SPECIAL SECTION VOL. VIII.

ALIGNMENT:

1. IF 260kc. Connect output meter through .25 mfd. condenser to screen grid prongs of 6I6G tube. Signal generator through .1 mfd condenser to grid of 6A8 tube. Generator ground lead to chassis. Variable out of mesh. Adjust trimmers A, B, C, D for maximum output. Check IF band spread with oscillograph.
2. AT 1560 kc, see "ALIGNING AT 1560 KILOCYCLES" with schematic.
3. With connections as in 2. Generator and variable tuned to 1400 kc Adjust parallel trimmers on top and bottom sections of variable for maximum output.
4. At 600 kc. Tune variable to 600 kc Adjust oscillator padder (x) to maximum output while rocking variable.

5. Adjustment of the Receiver to the Car Antenna

When the receiver leaves the factory the antenna circuit is properly aligned to match the under running board type of antenna. Therefore when the receiver is installed in a car and connected to the standard Chevrolet running board antenna, only a slight adjustment of the antenna circuit is required. If the receiver is connected to a turret top antenna or a telescopic cowl antenna, proceed as follows to properly adjust the receiver:

- (a) Tune in a weak station about 1400 kilocycles, which is barely audible, with the volume control full on.
- (b) If the turret-top antenna or the telescopic cowl antenna is used, remove the bottom tube cover and change the position of the antenna plug from the hole marked "HC" to the hole marked "LC," and replace the cover.
- (c) Adjust the antenna trimmer condenser for maximum volume.

Socket, Trimmers  
Alignment, Chassis

**Peaking I-F Stages at 262 K.C.**  
Part No. 985400  
Date 1-1-36

- (a) Connect the ground lead of the test oscillator to the chassis frame. Connect the output of the test oscillator through an .02 mfd. condenser to the grid cap of the 6A7 tube (1st detector-oscillator) leaving the tube's grid clip in place. Keep the leads of the test oscillator as far as possible from the grid wires of the other screen grid tubes.
- (b) Set the test oscillator to 262 kilocycles.
- (c) Adjust the station selector so that the plates of the tuning condenser are completely in mesh.
- (d) Turn the volume control on full and turn the tone control to the treble position.
- (e) Adjust both trimmer condensers located on top of the second I. F. coil. Illustration No. 10—Fig. 1, for maximum output.
- (f) Adjust both trimmer condensers located on top of the first I. F. coil. Illustration No. 9—Fig. 1, for maximum output.
- (g) Repeat operations (c) and (f) for more accurate adjustments.

**Peaking R. F. Stages**  
Always use the lowest signal generator output that will give a reasonable output meter reading.

- (a) Remove the .02 mfd. condenser from the output lead of the test oscillator and connect a .00025 mfd. condenser in its place. Then, connect this lead to the antenna connection of the receiver.
- (b) Set the signal generator to 1400 kilocycles.
- (c) Adjust the station selector to 140 on the dial.
- (d) Adjust the trimmer on the "Osc" section of the tuning condenser for maximum output. (Fig. 1.)
- (e) Adjust the trimmer on the "R-F" section of the tuning condenser for maximum output. (Fig. 1.)
- (f) Adjust the trimmer on the "ant" section of the tuning condenser for maximum output. (Fig. 1.)
- (g) Readjust the station selector for maximum output. Do not readjust the "Osc" trimmer.
- (h) Repeat operations (e) and (f) for more accurate adjustments.

**Adjusting Antenna Compensating Condenser**

- (a) Set the signal generator to 600 kilocycles.
- (b) Tune in the 600 kilocycle signal with the station selector, for maximum output.
- (c) Adjust the antenna compensating condenser, Illustration No. 11, for maximum output.
- (d) Repeat operations (b) and (c) alternately until no further improvement in output can be obtained.
- (e) Set the signal generator to 1400 kilocycles again.
- (f) Tune in the 1400 kilocycle signal with the station selector for maximum output.
- (g) Readjust the trimmer on the "ant" section of the tuning condenser, for maximum output. It will be necessary to adjust the antenna compensating condenser to the car antenna after the receiver has been installed in the car.

- (a) After the installation is complete, tune in a weak station between 55 and 65 on the dial.
- (b) Adjust the antenna compensating condenser for maximum volume in the speaker.

**Voltage**

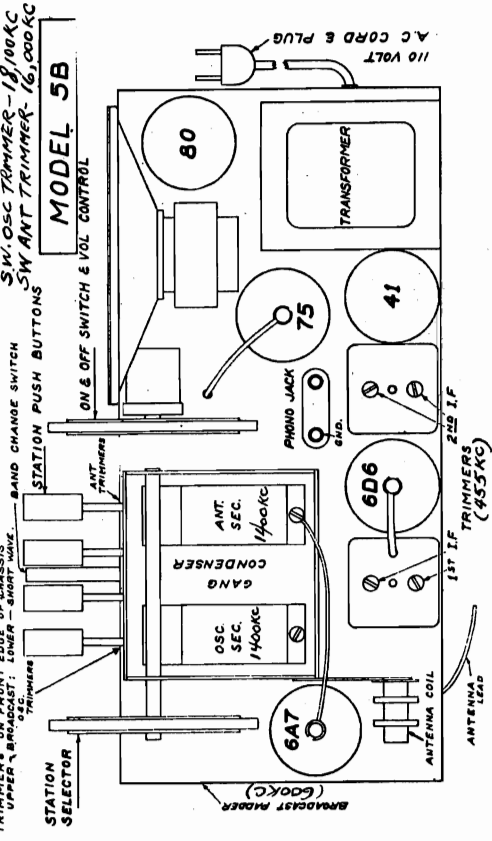

**PHONOGRAPH MODEL 5B** This receiver is provided with a phono jack (see chassis layout) and connection may be made from the phonograph to this jack by means of phone tips. It is necessary that the phonograph be equipped with a volume control and a switch to break connection between the phonograph and the set as the radio will not operate properly if a permanent connection is made. When the phonograph is in use the volume control of the set will act to some extent as a tone control. Best results will be obtained with the volume control of the set near maximum and no station tuned in.

**MODEL 5B VOLTAGE READINGS—LINE VOLTAGE 115**

Volume control minimum, antenna shorted to ground and band switch in broadcast position. Meter 1,000 ohms per volt.

Filament of 80 tube to ground.....	253 Volts

Cathode of 41 tube to ground.....	13 Volts
Cathode of 6A7 tube to ground.....	2.75 Volts

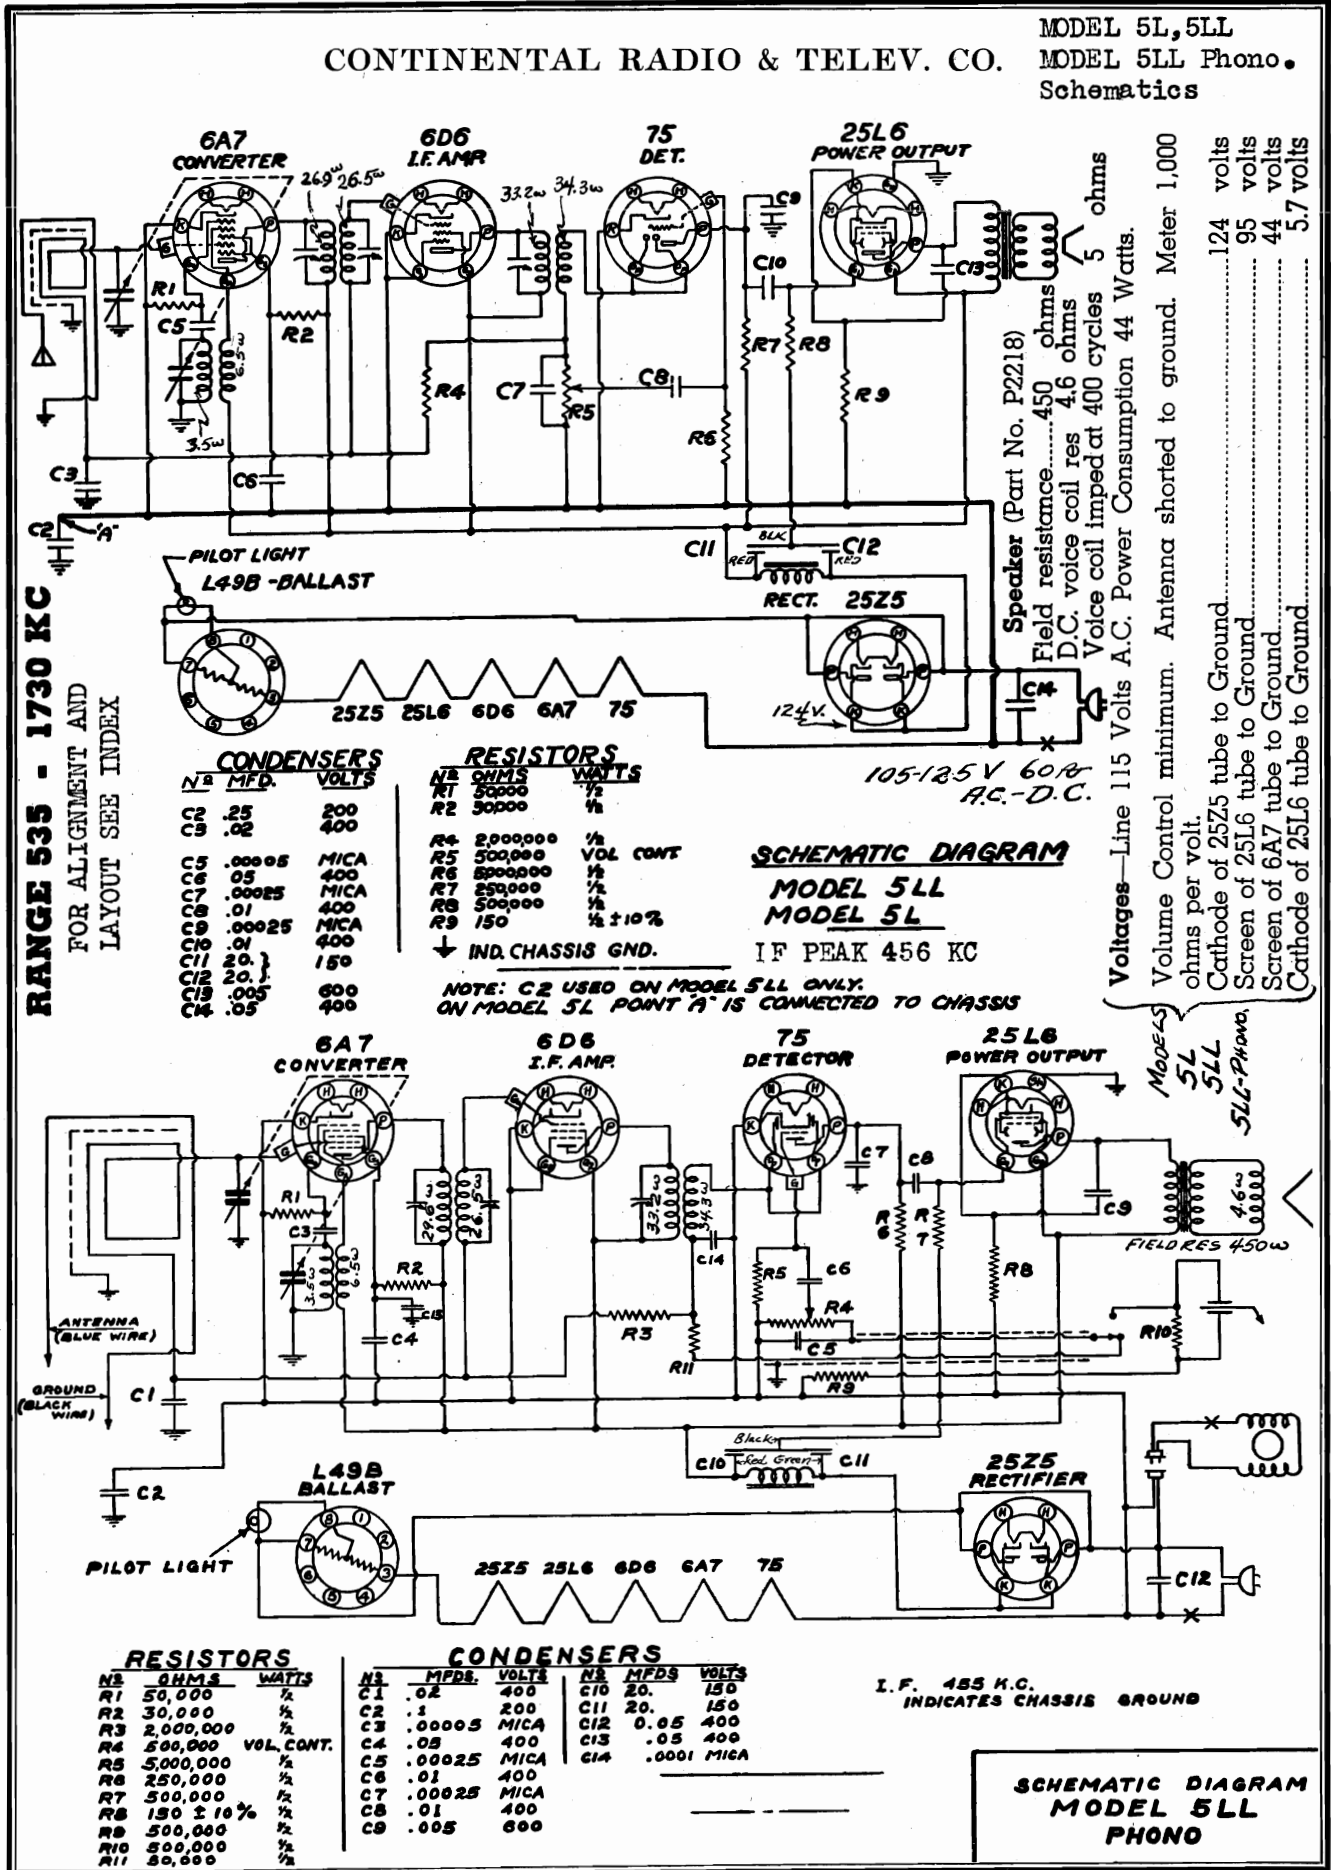

**PROCEDURE FOR SETTING UP PUSH BUTTONS**

**MODEL 5B**

There are four push buttons by means of which four stations may be selected (see Fig. 1). Make a list of four stations tuned in regularly. Loosen any of the push buttons by turning the push button proper, counter clockwise a few turns. Holding it in, tune in any one of your favorite stations by means of the station selector. Turn the selector very slowly back and forth until the signal is clearest. Now tighten the push button knob by turning clockwise. Release the push button and loosen another push button. Holding it in, tune in another favorite station using the station selector. Turn the selector wheel very slowly back and forth until the signal is clearest. Now tighten the push button by turning it clockwise. Repeat this operation for the remaining two buttons, tightening each button securely as it is set.

If it is desired to change a station, simply loosen the push button and re-set. Punch the correct station call letter tabs from the set of sheets supplied and insert them into the windows above the push buttons. The dial is now set up for quick tuning.

MODEL 6C  
MODEL 6G

Tuner Data **MODEL 6B**

**ELECTRIC MOTOR**

The power for this tuner is provided by a small, efficient electric motor, of the brushless variety. It is fitted with an automatic clutch and a silent gear train. The bearings and the oil retainer hold sufficient oil to lubricate the motor for a lifetime.

**SETTING UP SELECTOR MECHANISM**

List six (6) strong local stations which are free from excess fading. The station on your list that comes in nearest the left hand end of the dial should be called station No. 1 and should be set up on button No. 1. (See Figure 1.) Located on the back of the receiver is the thumb screw bracket and six (6) thumb screws whose positioning determines the points at which the pointer will stop when the buttons are being used. Figure 2 shows a detail of the thumb screws numbered for reference to the push buttons.

Located on the rotating selector plate is a fibre dead spot which locates the position at which station selector contacts should be set in order to have the selector plate stop for a certain station. Follow closely the steps listed below:

1. Using the manual selector knob, tune in station No. 1, the station near the left hand end of the dial—the 170 K.C. end. Make certain that the station is properly tuned in.
2. From the back of the receiver loosen thumb screw No. 1 (See Figure 2) just enough to allow it to slide freely in the groove.
3. Now adjust the thumb screw until the contact is resting directly on the fibre dead spot.
4. Tighten thumb screw securely, making sure that in tightening you do not move the contact off the fibre dead spot.
5. Check the above operation by pressing button No. 1 and note if there is any pointer movement. If there is no pointer movement, the contact is properly set. If the pointer moves, the contact was not set directly on fibre dead spot. In this case, the station should be re-tuned manually, and procedure No. 3 should be repeated.

Fig. 2

6. Using the same procedure, set up the remaining five stations, in each case using the station of the next highest frequency and the thumb screw having the same number as the corresponding button. Never skip buttons, always set up in numerical order from button 1 to 6 from left to right.

7. After all the stations have been set up, insert the proper station call tabs (found with the instructions) into the recesses of their respective buttons.

8. To receive any of the six stations set up as described above turn receiver "ON" by rotating the left hand knob to the right until the switch clicks. Allow the tubes to heat up, press the buttons designated by the call letter of the station desired and hold the button in until the pointer stops moving and the station comes in. Adjust tone and volume. **IMPORTANT:** Be sure the band switch is in the position for Standard Broadcast Reception.

**AUTOMATIC PUSH BUTTONS**

MODELS 6C and 6G

A glance at Fig. 1 will show that there are eight (8) push buttons, six (6) of which are for automatic use; the adjusting screws are located directly below these push buttons. Fig. 1 also shows the tuning range or frequencies covered by each button.

Fig. 1

The remaining two (2) push buttons located at the extreme right hand end of the push button plate are for short wave and manual tuning. See Fig. 1. Short wave tuning is accomplished by pressing "short wave" button and tuning with the selector knob. By pressing "manual tuning" button, the automatic disconnects and the selector knob becomes active for the broadcast band.

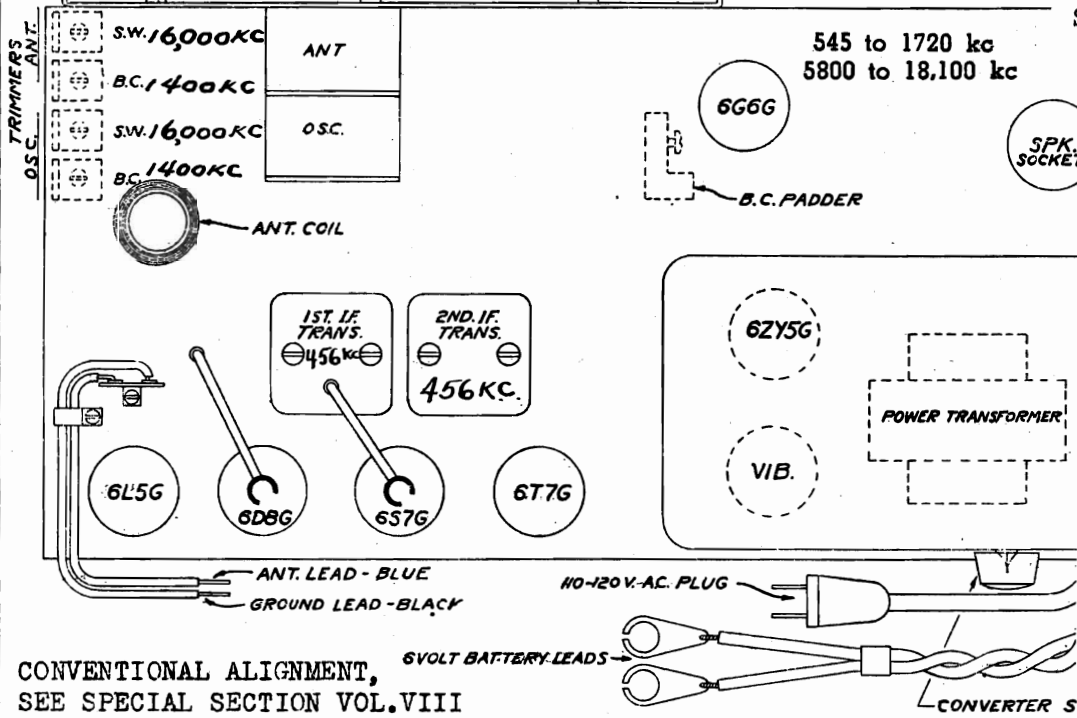

1. Choose a station having a frequency within the range of button No. 1 (540 to 980 kc).
2. Press "Manual Tuning" button and tune this station conventionally by using the selector knob.
3. Now press button No. 1 and turn adjusting screw in either direction until the previously selected station is heard. Adjust the screw until the station is received with maximum volume.
4. Remove the call letters of the station from the call letter sheet furnished and insert in the window of the adjusting screw.
5. Repeat the above procedure for the remaining five (5) stations.

MODEL 6C  
CONTINENTAL RADIO & TELEV. CO. Schematic, Socket  
Trimmers, Alignment

**Six Tube Combination 6 Volt Battery, and 110-120 Volt AC**  
**60 Cycle Dual Wave Superheterodyne**

FOR TUNER DATA  
SEE INDEX

**POWER SUPPLY**  
Never plug into a D.C. outlet. In order to adapt the receiver to either type of current (6 volt or 110-120 volt A.C.) simply insert a screw driver into the slot in the hole located on the back of the can, which is mounted on the chassis, and turn to the left or counter-clockwise for 110-120 volt A.C. 60 cycle current; turn to the right or clockwise for 6 volt battery operation.

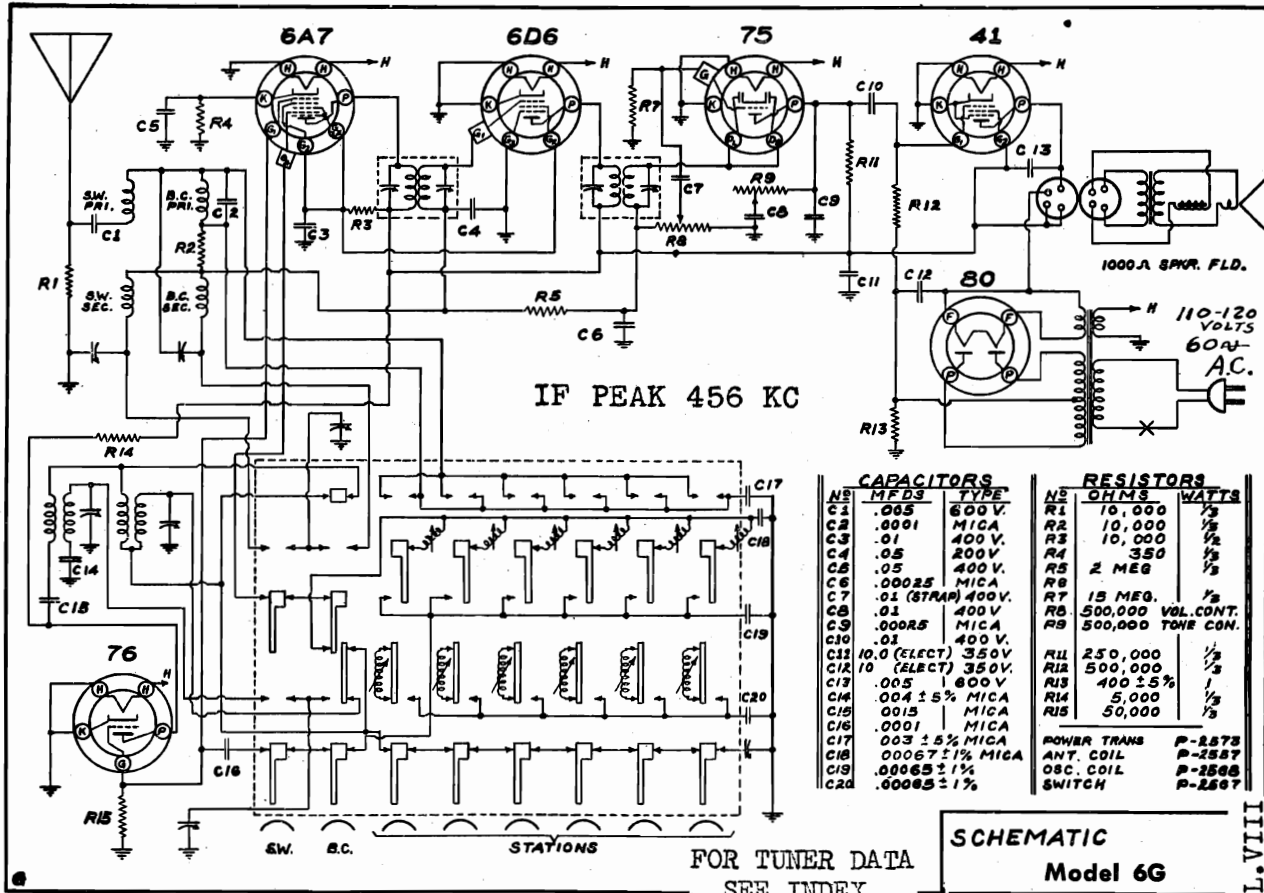

CONVENTIONAL ALIGNMENT,  
SEE SPECIAL SECTION VOL.VIII

MODEL 6G

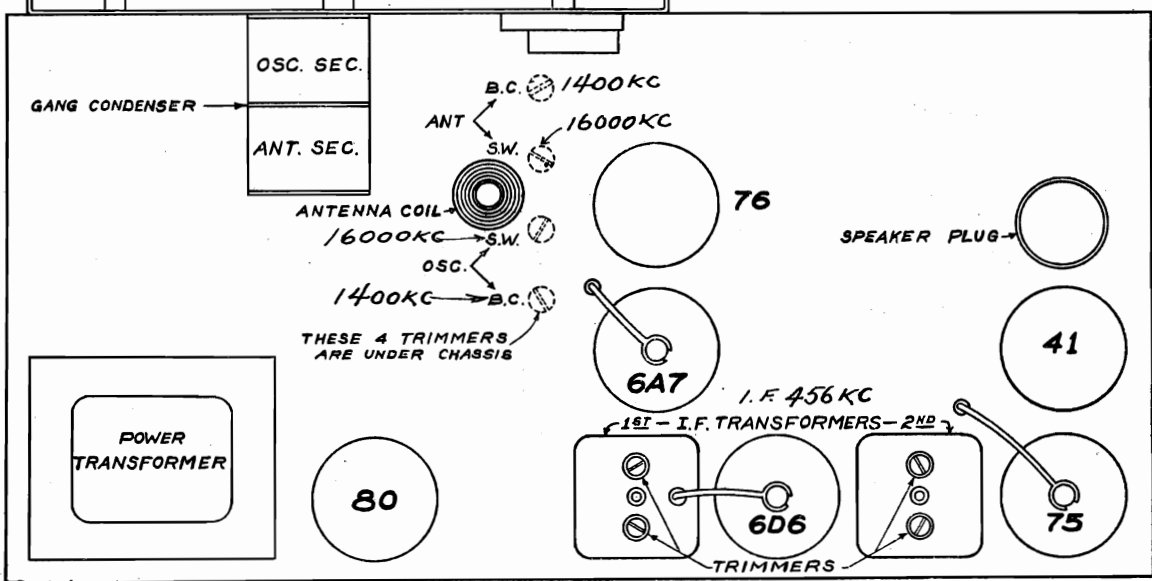

Schematic, Socket Trimmers, Alignment CONTINENTAL RADIO & TELEV. CO.

Trimmers, Alignment

This receiver is designed to operate over two tuning ranges; the broadcast range which extends from 545 to 1720 kc (174.4 to 550.4 meters) and the international short wave band which extends from 5800 to 18,100 kc (16.5 to 51.7 meters). This latter range is the one which includes the 5 internationally assigned bands—the 16, 19, 25, 31 and 49 meter bands.

**POWER SUPPLY**

This receiver is designed to operate from a power supply main of 110-120 volts, 60 cycles alternating current (AC). Never plug into a DC outlet.

**ALIGNMENT DATA AND SERVICING**

**GENERAL DATA**

The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400, 1730, 1800, 4000, 5600, 6000, 16,000 and 18,100 KC and an output meter to be connected across the primary or secondary of the output transformers. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible, to prevent the AVC from operating and giving false readings.

**CORRECT ALIGNMENT PROCEDURE**

The intermediate frequency (I.F.) stage should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast Band should always be the next procedure, after which, either or both of the Short Wave Bands may be aligned.

**I.F. ALIGNMENT**

With the wave switch in the Broadcast Band and the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (6A7) through a .05 or .1 mfd. condenser. The ground on the test oscillator can be connected to the chassis ground if the test oscillator is not grounded to one side of the power line. In case one side is connected to ground, connect a large condenser from ground on the test oscillator to ground of the chassis. Align all four I.F. trimmers to peak or maximum reading on the output meter.

**BROADCAST BAND ALIGNMENT**

Connect the output of the signal generator to the antenna lead (blue) through at .0002 mfd. mica condenser. Set the gang condenser to minimum and the oscillator to 1730 KC and adjust the "oscillator trimmer" to receive this signal. Make no other adjustments at this frequency. Then set the generator to 1400 KC and tune in this signal by rotating the gang to 1400 on the dial. Adjust the "preselector" and "antenna" trimmer to maximum signal. Set the signal generator to 600 KC and tune in the signal on the receiver. **Note:** approximately the same

sensitivity should be noted at this point as was at 1400 KC. The signal strength may sometimes be improved by padding the circuits. This is done by slowly increasing or decreasing the oscillator padding condenser and, at the same time, continuously tuning back and forth across the signal with the receiver until the maximum reading is obtained on the output meter. This adjustment may seem a little complicated but is the easiest way to adjust the oscillator to the preselector of the R.F. section. Return to 1400 KC and again go over the adjustments of this frequency to be certain that they were not put slightly out of alignment when adjustment was made at 600 KC.

**POLICE BAND ALIGNMENT**

The police band is adjusted by first replacing the .0002 dummy with a 400 ohm resistor and setting the generator to 5600 KC. With the gang set at minimum, adjust the "police oscillator trimmer" to receive this signal, then set the signal generator to 4000 KC and adjust "police antenna trimmer" to give maximum output. Next, set the oscillator to 1800 KC and "pad" the circuit of this frequency as described in the instructions for padding the broadcast circuits.

**SHORT WAVE BAND ALIGNMENT**

The short wave band is adjusted by setting the generator to 18,100 KC and with the gang at minimum, adjust the "short wave oscillator trimmer" to receive the signal. Set the generator at 16,000 KC, tune in the signal and adjust the "short wave antenna" trimmer to give maximum output. As there is no variable low frequency padding condenser on this band, the sensitivity of the receiver should be checked at 6000 KC to determine whether the circuits are in line at this frequency. Should the receiver lack sensitivity at 6000 KC, the antenna and the oscillator coils, as well as the .004 mica padding condenser, should be tested for defects as sometimes these components become subject to mechanical or electrical injuries, despite their rugged construction and liberal ratings.

Eight Tube AC Automatic Tuning

This receiver is designed to operate over three tuning ranges; the broadcast range which extends from 535 to 1730 K.C. (173 to 560 meters), police and aviation band which extends from 1700 to 5600 K.C. (53 to 176 meters) and the international short wave band which extends from 5600 to 18,100 K.C. (16.5 to 53 meters). This latter range is the one which includes the five internationally assigned bands — the 16, 19, 25, 31, and 49 meter bands.

PROCEDURE FOR SETTING UP AUTOMATIC PUSH BUTTONS

A glance at Fig. 1 will show that there are eight (8) push buttons, six (6) of which are for automatic use; the adjusting screws are located directly below these.

Fig. 1 also shows the tuning range or frequencies covered by each button.

The remaining two (2) push buttons, located at the extreme left hand end of the push button plate are for tone control.

1. Choose a station having a frequency within the range of button No. 1 (540 K.C. to 930 K.C.)
2. With the middle knob in the "broadcast" position, tune this station conventionally by using the selector knob.
3. Now turn the middle knob to the "automatic" position and press button No. 1 and turn the adjusting screw in either direction until the previously selected station is heard. Adjust the screw for maximum volume and sensitivity.
4. Remove the call letters of the station from the call letter sheet furnished and insert in the window of the adjusting screw. Insert "Med" and "Bass" tabs in windows as shown in Fig. 1.
5. Repeat the above procedure for the remaining five (5) stations.

NOTE: It is advisable to retain the call letter sheet in case of station change later on.

SPKR FIELD 1500 OHMS  
I.F. 456 K.C.  
**SCHEMATIC DIAGRAM  
MODEL 8AU**

This receiver is designed to operate over four tuning ranges; **long wave** 150 to 350 K.C. (2000 to 857 meters); **broadcast** 535 to 1730 K.C. (173 to 561 meters); **medium short wave band** 2350 to 7100 K.C. (127.6 to 42 meters); **international short wave** 7000 to 22,000 K.C. (13.6 to 42.8 meters), which includes five—5 internationally assigned bands—16, 19, 25, 31 and 49 meter bands.

**PROCEDURE FOR SETTING UP AUTOMATIC PUSH BUTTONS** See Model 8A.  
**ALIGNMENT**

Align I F and Broadcast Bands using the procedure for Model 8A. Using this procedure align Med. S.W. and S.W. Band likewise, using the following frequencies; Med. S.W., 7000 KC Osc. Trimmer, 6000Kc Ant. Trimmer, 2500 Kc "pad". S.W., 22000 KC S.W. Osc Trimmer, 18000 KC S.W. Ant Trimmer, 8000 KC "pad". Align L.W. Band as below;

**LONG WAVE BAND ALIGNMENT**

The long wave band is adjusted by connecting the output of the signal generator through a .0002 Mfd. mica condenser to the blue antenna lead. Then set the gang to minimum and the generator to 360 KC and adjust the long wave oscillator trimmer to receive this signal. Then set the generator to 325 KC and adjust the long wave antenna trimmer to give maximum output. Next set generator to 160 KC and pad the circuits to maximum output. Owing to the nature of the long wave band, the trimmer and padding condensers react upon each other to quite a degree; consequently, several re-adjustments at the trimming and padding positions are required before the circuits are adjusted properly.

INSTRUCTIONS FOR ADJUSTMENT AND OPERATION  
OF THE ELECTRIC TUNER

It is very important to read the following instructions carefully before attempting to adjust the electric tuner. The electric tuner is made up of three integral units:

**PUSH BUTTON SWITCH:** The push button switch consists of eight (8) brown push buttons flanked on either side by three (3) white push buttons.

**SELECTOR MECHANISM:** The selector mechanism is made up of the selector plate, eight (8) thumb screws, and the adjustment light bulb.

**ELECTRIC MOTOR:** The power for this tuner is provided by a small, efficient electric motor, of the brushless variety. It is fitted with an automatic clutch. The bearings and the oil retainer hold sufficient oil to lubricate the motor for a lifetime.

SETTING UP STATIONS

The first step to take in adjusting the electric push button device incorporated into this receiver is to choose eight (8) of the most powerful local stations, stations which are free from excess fading. Turn on the receiver (broadcast band) and press in the dial tuning button; tune in the station of the lowest frequency, using the station selector knob. Now hold the dial tuning button in and press in button number one (1). (See Figure 1). Both buttons are now locked into place; a small pilot lamp located at the rear of the chassis will light up unless the thumb screw at the rear accidentally happens to be correctly set. Loosen thumb screw number one (See Figure 2 for order of thumb screws) enough to allow it to slide freely back and forth until the light goes out. Now tighten the thumb screw; the adjustment for the first station is now complete. Out of the station call letter sheet supplied remove the proper station call disc and insert into the recess of button number one. Push one of the clear celluloid discs into the recess also, over the station call disc. Now release button number one by pressing the dial tuning button in as far as it will go.

With the white button still in, tune in the station of the next highest frequency and holding the white button, press in button number two. Both buttons are now locked into place. Loosen thumb screw number two (see Figure 2) and slide back and forth until a point is reached at which the pilot lamp in the rear goes out; tighten the thumb screw. Insert the proper station call disc and celluloid disc into the window of button number two.

Follow this same procedure for the remaining stations, always choosing the station with the next highest frequency. After all eight (8) stations have been adjusted, check each adjustment by tuning in each station. Note: In the window above the white button, insert the word "OFF" found in the call letter sheet.

**NOTE:** In the recesses of the white push buttons insert the words found in the call letter sheet as shown in Figure 1.

HOW TO TUNE IN STATIONS USING THE ELECTRIC PUSH BUTTON TUNER

In order to operate the receiver satisfactorily—using the electric push button tuner, the dial tuning button must be in released position, that is, all the way out. To tune in a station, merely press the selector button which designates the station desired. Note: Should the station fail to come in clearly, check the adjustment by following the adjustment procedure described in the paragraph above.

To change from electric tuning to manual selecting, simply press in the dial tuning button. When the dial tuning button is in, the set may be tuned as a conventional receiver.

**MICROPHONE**

It will be noticed that the unit is provided with a sliding switch to change from phono pickup to microphone. Before attempting to use the Mic the switch should be set in the proper position.

The wireless record player unit is shipped from the factory, connected for use with a Brush type SM-37 crystal microphone, and **Quam Permac** microphones. Insert pin tip connectors into microphone jacks. For use with other types of microphones, schematic diagrams are enclosed wherein the necessary wiring changes are shown.

The high impedance carbon microphone is the type usually recommended for home use and is connected in the plate circuit of the audio tube. Such microphones as the Philmore, I.R.C. and others fall into this group.

The low impedance microphones include the single and double button types and are as a rule the most satisfactory for use with the wireless unit. These are usually of a higher grade and are recommended for use when maximum output and tone quality is required. With such a microphone and a receiver having sufficient power output, a very simply installed and effective P.A. system may be had.

Parts

CONTINENTAL RADIO & TELEV. CO.

This receiver is designed to operate over three tuning ranges with a Horizontal Pointer movement; the broadcast band which extends from 535 to 1730 Kilocycles (KC) (173 to 560 Meters), Police and Aviation Band which extends from 1.7 to 5.6 Megacycles (MC) (53 cycles (MC) (16.5 to 53 Meters). This latter range is the one which includes the four internationally assigned bands—the 19, 25, 31 and 49 meter bands.

This receiver is designed to operate from a power supply main of 110-120 volts, 60 cycles alternating current (A.C.). Never plug into a DC outlet.

**FLOATING CHASSIS (IMPORTANT)**  
Loosen the four (4) mounting screws and two (2) hook bolts that secure the chassis to the cabinet and remove the two (2) wooden strips that are underneath the chassis. This allows the chassis to float and rest on the rubber pads used for this purpose. After the strips have been removed, adjust the chassis in the cabinet so that the dial will be in the center of the front escutcheon plate. Do not retighten the mounting screws. NOTE: Save the mounting screws and wooden strips to use in case the set is re-shipped or moved, otherwise damage may be done to the instrument cabinet or tubes.

Wherever possible, a good ground should be employed. Water pipes and steam or hot water radiators make a very desirable ground connection. The ground wire should be connected to the ground lead (Black).  
Where the above mentioned ground facilities are not available, a good outside ground rod about six feet into sinking a metal pipe or ground rod about six feet into digging a hole and filling with charcoal, in which the ground rod is placed. The charcoal bed surrounding the ground rod will maintain a moist condition throughout the year.

5Y3G	Rectifier	4.1	175	100	-3	-10	---

negative end of spk. fld. to No. 8 pin 225 volts  
Voltage drop across speaker field 40 volts.  
Max. power consumption at 117.5 line approx. 36 watts. Phono—15 watts additional.

**SPECIFICATIONS**

This model combination consists of a four-tube T. R. F. radio receiver and Record Player in a console cabinet, designed for operation on electric circuits as specified on the Model and License Notice Label.

Incorporated in the receiver design is, a mechanical Push Button tuning system, an iron cored antenna coil with antenna to match, A.V.C., beam power output and dynamic speaker.

The frequency range of the receiver is from 1725 to 540 kilocycles. The tubes used and their function are as follows: one 6U7G as R-F amplifier, one 6Q7G as detector, A.V.C. and 1st audio amplifier, one 6V6G as beam power and one 5Y3G as rectifier.

The bias for the 6U7G is obtained from the voltage drop across a 60 ohm resistor (item 22) and is measured from the chassis to the Cathode of the 6Q7G. The bias for the 6Q7G is obtained from the drop across a 32 ohm resistor (item 23) and is measured from the cathode of the 6Q7G to the junction of items 23 (32 ohm)—24 (3 meg) and 26 (140 ohm). The 6V6G bias is obtained from the total drop across items 22 (60 ohm., 23 (32 ohm) and 26 (140 ohm) resistors which are in series with the speaker field that is in the negative leg of the power supply. The bias is measured from chassis to the junction of items 26, 27 and speaker field.

**CONNECTING OUTPUT METER**

Connect one terminal of the output meter to the plate and the other terminal to the screen of the 6V6G output tube. Be sure the meter is protected from D.C. by connecting a condenser (.1 mfd., or larger—not electrolytic) in series with one of the leads.

**ALIGNMENT PROCEDURE**

The signal generator high side should be connected to the antenna through a .0001 Mf. condenser, after the antenna has been completely uncoiled. The low side of the signal generator is connected to chassis.

- First check to see that the pointer makes a complete trip both ways.
- Set the signal generator to 1400 kilocycles.
- Set the pointer of receiver to 140 on the dial.
- Adjust trimmer condensers on the gang for maximum output.
- Check to see that set will tune to 1725 kilocycles, it does not have to tune through a peak at this frequency.

Any large discrepancy in tracking may be compensated for by slight adjustments of the split end plates of the condenser gang.

**SETTING THE PUSH BUTTONS**

The push buttons may be quickly and accurately set

from the front of the receiver. Insert a small screw driver in the whole in the front of each push button to be set and loosen (DO NOT REMOVE) the set screw at the bottom of the hole.

Determine the favorite broadcasting stations whose call letters are to be placed in the push buttons. By means of the station selector knob, tune-in AS ACCURATELY AS POSSIBLE the station having the highest frequency (kilocycles), that is the one nearest the 150 marking on the knob. Completely depress and hold the right hand push button in that position, while you SECURELY TIGHTEN THE SET SCREW.

The push button system is now set for the first station. Follow through with this same procedure, setting the other stations in the order of their frequency (kilocycles.)

Cut the call letters of the stations selected, from the list supplied with your receiver and press them into the openings in the front of the push buttons. Four pieces of clear celluloid are supplied in a small envelope and should be snapped into place over the call letters to protect and hold them in place.

**REPLACING DRIVE CORD**

- Remove the chassis from the cabinet.
- Remove the broken drive cord, first from the pointer then from the pulleys. Remove the cord tension spring.
- Remove the dial (glass and mask) and the manual tuning shaft bracket.
- Cut a piece of drive cord 44 inches in length (G2-41582).
- Tie the cord tension spring approximately 1 1/2 inches from the one end of the cord. Open gang condenser, this should place the eyelet in the pulley up. Insert the end of the cord through eyelet, from the inside of pulley. Hook end of the tension spring on the catch in pulley, opposite the eyelet.
- Bring the cord forward and down, then around lower idler pulley, (on gang bracket) on the underside, continue over to the left hand idler pulley. Bring around and over in a clockwise direction. Continue on over to top of right hand idler pulley, then straight down to and around pulley on drive shaft. Make two complete turns around drive shaft pulley in a clockwise direction. Then bring cord up and over top idler pulley on gang bracket, making 1/2 turn in a counter clockwise direction. Continue cord straight down then back and around large pulley on the gang, in a counter clockwise direction to eyelet. Insert end of cord through eyelet (top down). Pull cord until tension spring is stretched to about 3/4 inches in length. Loop cord in tension spring and tie in knot. Clamp cords together with cord clamp (W-46290) approximately 1/8 inch from inside rim of large pulley.

Fig. 5 Phono Wiring Diagram

**TUBES AND VOLTAGE LIMITS**  
The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and chassis. Voltage readings should be taken with a 1000 ohm per volt, 250 volt voltmeter (except filament), with volume control on and no signal input. The filament voltages should be measured with an accurate low range voltmeter. Voltage limits may vary plus or minus 10% of values given.

- Replace manual drive shaft bracket, dial mask and dial.
- Close condenser gang, place pointer at 540 on dial and then insert drive cord in pointer. Check pointer travel before cementing the cord to pointer.

**PHONO**

The motor is mounted in such a manner that it will swing up and down a short distance. The reason for this is, that when the turntable is in operating position the weight of the motor is applied to the friction drive and against the inside surface of the turn-table rim. The amount of friction obtained is just right for proper operation. When placing the turn-table in position, first hook the rim over the friction drive on the motor shaft then carefully place the center hole in the turn-table on the record guide (spindle). During this operation you should be very careful to see that the friction drive is completely under the rim and that the turn-table is all the way down on the record guide (spindle).

The Radio-Phono Switch (Fig. 4) when turned to the left is for radio broadcast reception and when turned to the right cuts off the radio signals and starts the phonograph motor.

The Volume Control and Line Switch of the receiver must be turned on before the motor will operate. This volume control also controls the output level of the phonograph.

6C6	Detector	6.3	20	10	7	—	—
25L6-G	Output	25	85	98	6	—	—
25Z6-G	Rectifier	25	—	—	126	—	—

Power output approximately 2 watts.  
Power consumption at 117.5 volts line 45 watts. Phono. Motor 15 watts additional.  
Drop across field 28 volts.

SPECIFICATIONS

The receiver is a four-tube Tuned Radio Frequency receiver designed for operation on A. C. circuits as specified on Model Sticker. Push Button tuning, Beam power output, Dynamic Speaker are a few of the features incorporated in this receiver. The frequency range is from 1725 to 540 Kc. The tubes used and their functions are as follows: one 6D6 as R-F amplifier, one 6C6 as biased detector, one 25L6G as beam power output and one 25Z6G as rectifier. The volume control varies the bias on the 6D6 and at the same time the amount of signal fed to the antenna coil primary. The bias for the 6C6 is obtained from the voltage drop across item 19 (25000 ohm resistor) and for the 25L6G from the drop across item 23 (110 ohm resistor).

This receiver incorporates a certain amount of fixed regeneration to improve selectivity and sensitivity. With a normal antenna the receiver is stable and the performance approaches that of a three gang T. R. F. receiver in spite of the fact that only a two gang condenser is used. However with no antenna or a very small antenna the receiver will oscillate but this oscillation can readily be controlled by the volume control.

TUBES AND VOLTAGE LIMITS

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and chassis. Voltage readings should be taken with a 1000 ohm per volt, 250 volt voltmeter (except filaments) with volume control full on and no signal input. The filament voltages should be measured with an accurate low range voltmeter. Voltage limits may vary plus or minus 10% of values given.

NOTE: The RED and BLACK terminals on the phono terminal board supply the current for the phono motor, therefore HAVE 110 VOLTS ACROSS THEM WHEN THE RECEIVER IS IN OPERATING POSITION. BE CAREFUL NOT TO TOUCH OR SHORT CIRCUIT THEM WHILE WORKING ON THE CHASSIS.

CONNECTING OUTPUT METER

Connect the one terminal of the output meter to the plate and the other terminal to the screen of the 25L6G Output tube. Be sure the output meter is protected from D. C. by connecting a condenser (.1 mfd. or larger —NOT electrolytic) in series with one of the leads.

ALIGNMENT PROCEDURE

The chassis of this receiver is connected to one side of the power line, therefore when using an A. C. operated signal generator for alignment the following precaution should be taken.

- Connect the output lead of the signal generator through a .0001 Mf. condenser to the antenna lead on the receiver (after the antenna has been completely unrolled. The ground lead of the generator should be connected through a .001 Mf. condenser to the chassis.
- Open the gang condenser all the way.
- Set the generator to 1725 Kilocycles.
- Adjust the trimmer condensers on the gang until the 1725 Kc signal is heard. The gang does not have

- tune through this signal.
- Set the generator to 1400 Kc.
- Tune the set to the 1400 Kc. signal, then alternately adjust the trimmers on the gang until no further improvement can be noticed on the output meter.

NOTE: Always use the lowest signal generator output that will give a reasonable indication on the output meter.

Keep the two grid leads as far as possible from each other.

If the receiver has been re-aligned it may be necessary to readjust the setting of the push buttons.

SETTING THE PUSH BUTTONS

The push buttons may be quickly and accurately set from the front of the receiver. Insert a small screw driver in the hole in the front of each push button to be set and loosen (DO NOT REMOVE) the set screw at the bottom of the hole.

Determine the favorite broadcasting stations whose call letters are to be placed in the push buttons. By means of the station selector knob, tune-in AS ACCURATELY AS POSSIBLE the station having the highest frequency (kilocycles), that is the one nearest the 150 marking on the knob. Completely depress and hold the right hand push button in that position, while you SECURELY TIGHTEN THE SET SCREW.

The push button system is now set for the first sta-

tion. Follow through with this same procedure, setting the other stations in the order of their frequency (kilocycles).

Cut the call letters of the stations selected, from the list supplied with your receiver and press them into the openings in the front of the push buttons. Four pieces of clear celluloid are supplied in a small envelope and should be snapped into place over the call letters to protect and hold them in place.

RECORD PLAYER ASSEMBLY

The record player assembly consists of a small self-starting motor, Phono-Radio switch, magnetic pickup and a separate volume control mounted on a metal base plate.

Connections—

A three lead cable is used for connecting the Phono Unit to the Radio receiver. The green lead is the high side of the magnetic pickup and is connected to the 6C6 cathode through a .25 Mf. 160 V. condenser. The red lead is the high side of the 110 volt circuit for the motor. The black lead is connected to the receiver chassis and is the low side of the pickup and motor.

Operation—

Place turn table in position by hooking the rim over the rubber friction drive on the motor shaft, then carefully placing center hole over record guide spindle. Be sure that the table is all the way down on the spindle and that the friction drive is riding full on the inside surface of the rim.

JANUARY, 1939

**MODEL 458, Battery Vanity  
Alignment, Tuner, Notes  
Parts**

**CROSLLEY CORP.**

**MODEL 458 (Battery Vanity)**

**SPECIFICATIONS**

The Crosley Model 458 radio is a four-tube superheterodyne receiver designed for operation from batteries. The method of connecting the battery cable to the batteries is shown on the Wiring Diagram. The batteries required are: one 1.5 volt "A" (EVEREADY NO. 740 or equivalent) or 3 or 4 No. 6 DRY CELLS in parallel, and two plug-in type 45 volt "B" batteries.

**TUBES AND VOLTAGE LIMITS**

The table gives the function of the tubes used, together with the voltage readings between the tube socket contacts and the negative side of the "A" battery circuit. Voltage readings should be taken with a 1000 ohm per volt, 250 volt voltmeter (except filaments) with receiver in operating condition and the volume control full on and no signal input. The filament voltages should be measured with an accurate low range DC voltmeter (approximately 0 to 10 volts). Voltage limits may vary plus or minus 10% of values given.

**ALIGNMENT PROCEDURE**

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary, the circuits can best be properly aligned with the use of a modulated signal generator and an output meter.

**CONNECTING OUTPUT METER**

Connect the output meter across the "P" and "S" terminals of the 1C5G output tube. Be certain that the meter is protected from DC by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

**1. Tuning I-F Amplifier To 455 Kilocycles.**

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 1A7G tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the "GND" terminal of the receiver. **KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.**

(b) Set the station selector so that the tuning condenser plates are completely in mesh and turn the volume control knob to the right (ON).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust both 2nd I-F trimmers (located through rear of chassis flange) for maximum reading on the output meter. (Fig. 3).

(e) Adjust both trimmers located on the 1st I-F transformer (right end) for maximum output. (Fig. 2).

(f) Check operations (d) and (e) for more accurate adjustments.

**ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.**

**2. Aligning R-F Amplifier.**

When aligning the R-F amplifier the output lead from the signal generator should be connected through a .0002 mfd. condenser to the "ANT" terminal of the receiver.

(a) Set the signal generator to 1725 kilocycles.

(b) Open the condenser gang all the way.

(c) Adjust the "OSC" trimmer condenser on gang for maximum output.

(d) Set the signal generator to 1400 kilocycles.

(e) Tune the receiver to the generator signal for maximum output (approximately 140 on the dial).

(f) Adjust the "ANT" trimmer condenser on gang for maximum output. **DO NOT READJUST THE "OSC" TRIMMER AT 1400 KILOCYCLES.**

(g) Repeat operations (e) and (f) alternately until no further improvement in output can be obtained.

If any of the circuits have been re-adjusted it may be necessary to reset the push buttons.

**SETTING THE PUSH BUTTONS**

With a small screw driver or pen knife remove celluloid cover and the call letters. Insert screw driver in the hole in the front of the button and loosen the set screw a turn or two. With the manual tuning knob tune-in as **ACCURATELY AS POSSIBLE** the station for which the button is to be set. Then push the button all the way down and while you hold it in that position **SECURELY TIGHTEN** the set screw. Replace the call letter and call letter cover. Use same procedure in resetting or adjusting the rest of the push buttons.

**CROSLLEY CORP.**

**SPECIFICATIONS**

This model Crosley radio chassis is especially designed for installation in Crosley Shelvador electric refrigerators. It should be operated only from an **ALTERNATING CURRENT** power supply as specified on the rear of the receiver.

The tuning range of the receiver is from 540 to 1725 kilocycles or 555 to 173 metres.

**TUBES AND VOLTAGE LIMITS**

The following table gives the functions of the tubes used, together with the voltage readings between tube socket contacts and chassis. Voltage readings taken with a 1000 ohm per volt, 500 volt voltmeter (except filaments) with receiver in operating condition and no signal input. The filament voltages should be measured with an accurate low range A. C. voltmeter (approximately 0-10 volts). Voltage limits may vary plus or minus 10% of values given.

Power output approximately 2 watts.  
Power consumption at 117.5 volts line 45 watts (A.C.).  
All readings except filaments will be approximately 10% lower on 117.5 D. C.  
Drop across field 28 volts.

TUBES AND VOLTAGE LIMITS

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and chassis. Voltage readings should be taken with a 1000 ohm per volt, 250 volt voltmeter (except filaments) with volume control full on and no signal input. The filament voltages should be measured with an accurate low range voltmeter. Voltage limits may vary plus or minus 10% of values given.

Parts

CROSLLEY CORP.

CHASSIS NO. 568 (TROUPER)

SPECIFICATIONS

This model Crosley employs four tubes in a highly efficient T. R. F. circuit and on Ballast tube for dropping the line voltage instead of resistance in the power cord.

The frequency range is from 1725 to 540 kilocycles.

The tubes used are of the new Bantam type. Their functions are as follows, one 6K7-GT as R-F amplifier, one 6J7-GT as detector, one 25L6-GT as beam power output, one 25Z6-GT as rectifier. The all metal ballast tube has approximately 200 ohms resistance when cold.

The volume control varies the bias on the 6K7-GT and at the same time the amount of signal fed to the primary of the antenna coil. The bias for the 6J7-GT is obtained from the drop across item 14, a 25,000 ohm resistance and for the 25L6-GT, the drop across item 18, a 110 ohm resistance. The speaker field (450 ohms), is used for filtering in the high side of the "B" supply.

This receiver incorporates a certain amount of fixed regeneration to improve selectivity and sensitivity. With a normal antenna the receiver is stable and the performance approaches that of a three gang T. R. F. receiver in spite of the fact that only a two gang condenser is used. However with no antenna or a very small antenna the receiver will oscillate but this oscillation can readily be controlled by the volume control.

CONNECTING OUTPUT METER

Connect the one terminal of the output meter to the plate and the other terminal to the screen of the 25L6-G Output tube. Be sure the output meter is protected from D. C. by connecting a condenser (.1 mfd. or larger —NOT electrolytic) in series with one of the leads.

ALIGNMENT PROCEDURE

The chassis of this receiver is connected to one side of the power line, therefore when using an A. C. operated signal generator for alignment the following precaution should be taken.

- (a) Connect the output lead of the signal generator through a .0001 Mf. condenser to the antenna lead on the receiver. The ground lead of the generator should be connected through a .001 Mf. condenser to the chassis.
- (b) Open the gang condenser all the way.
- (c) Set the generator to 1725 Kilocycles.
- (d) Adjust the trimmer condensers on the gang until the 1725 Kc signal is heard. The gang does not have to tune through this signal.
- (e) Set the generator to 1400 Kc.
- (f) Tune the set to the 1400 Kc. signal, then alternately adjust the trimmers on the gang until no further improvement can be noticed on the output meter.

NOTE: Always use the lowest signal generator output that will give a reasonable indication on the output meter.

Keep the two grid leads as far as possible from each other.

Fig. 2—Top View Models 587 and 5587

**TUBES AND VOLTAGE LIMITS**

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and chassis. Voltage readings should be taken with a 1000 ohm per volt, 250 volt voltmeter (except filaments) with the volume control full "ON" and no signal input. The filament voltages should be measured with an accurate low range voltmeter. Voltage limits may vary plus or minus 10% of values given.

**SPECIFICATIONS**

These model Crosley radios are designed for operation on 110-volt, 60 cycle A. C. power lines or on a six-volt storage battery. No "B" or "C" batteries are required. The tuning range is from 535 to 1725 kilocycles (500 to 175 Metres). Model 5587 is identical with Model 587 except that it has a larger dial assembly, an 8" speaker, larger electrolytic condenser, and is mounted in a console cabinet.

**CIRCUIT DESCRIPTION**

Five octal base glass tubes are employed in a super-heterodyne circuit which consists of an oscillator-modulator tube, 455 kilocycle I. F. amplifier, composite detector—AVC and A. F. amplifier tube, pentode output and power supply. An AC-DC switch is located on the rear of the chassis and must be set according to the power supply the receiver is to be used on. The 6Q7C tube supplies AVC voltage to the grids of the 6A8C and 6U7C tubes through items 22 and 25A. The initial bias for the 6A8C and 6U7C tubes is developed across a 75 ohm resistor, item 27. The bias for the 6Q7C tube is developed across a 40 ohm resistor, item 26. The bias for the output tube is obtained by the combined voltage drop across items 6 ("B" filter choke), 26 (40 ohms), 27 (75 ohms) and 28 (100 ohms). The speaker is a permanent magnet type dynamic.

Fig. 3—Bottom View Models 587 and 5587

**ALIGNMENT PROCEDURE**

All the circuits in this receiver were very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits may be properly aligned with the use of a modulated signal generator and an output meter.

**CONNECTING OUTPUT METER**

Connect one terminal of the output meter to the plate and the other terminal to the screen of the 6K6G output tube. Be certain that the meter is protected from D. C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

**Tuning The I-F Amplifier To 455 Kilocycles.**

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6A8C tube, leaving the tube's grid clip in place. Connect the ground lead of the signal generator to the ground terminal of the receiver. (KEEP THE SIGNAL GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES).

(b) Set the station selector so that the plates of the condenser gang are completely out of mesh and turn the volume control to the right (ON).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust the trimmer condensers located on the 2nd I. F. transformer, item 4—fig. 2, for maximum reading on the output meter.

(e) Adjust the trimmer condensers located on the 1st I. F. transformer, item 3—fig. 2, for maximum output.

(f) Repeat operations (d) and (e) for more accurate adjustments.

**ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.**

**Aligning The R-F Amplifier.**

(a) Connect the output of the signal generator through a .00025 mfd. condenser to the antenna terminal of the receiver.

(b) Set the signal generator to 1725 kilocycles.

(c) With the condenser gang rotated to the minimum capacity position, adjust the "OSC" SHUNT TRIMMER so that the 1725 kilocycle signal is heard. It is not necessary that the receiver tune through this signal.

(d) Set the signal generator to 1400 kilocycles.

(e) Tune-in the 1400 kilocycle signal, in the region of 140 on the dial, for maximum output.

(f) Adjust the "ANT" SHUNT TRIMMER for maximum output. NOTE: Do not readjust the "OSC" SHUNT TRIMMER.

(g) Repeat operations (e) and (f) for more accurate adjustments.

455 Kc. I.F.

MODELS 597, 5597  
Socket, Trimmers, Chassis  
Alignment, Voltage, Data

CROSLLEY CORP.

CHASSIS NO. 597-5597

**SPECIFICATIONS**

These model Crosley radios are designed for operation on 100 to 125 volt electric circuits, either AC or DC. The tuning range is from 535 to 1725 kilocycles (550 to 173 metres). Model 5597 is identical with Model 597 except that it has an illuminated dial and a different cabinet.

**CIRCUIT DESCRIPTION**

Five metal tubes are employed in a superheterodyne circuit which consists of a combination oscillator-modulator tube, 455 kilocycle I-F amplifier, pentode output and power supply. The 6Q7 tube serves as the detector and I-F amplifier and supplies AVC voltage to the grid of the 6A8 tube. The bias voltage for the 6A8 and 6K7 tubes is obtained across a 75 ohm resistor, item 25. The bias for the 6Q7 and 25A6 tubes is obtained across

the speaker field. A resistance type power supply cord is used to provide the proper heater voltage to the tubes. The filaments of the tubes are wired in series. A .05 mfd. condenser, item 11, is connected across the power supply leads to reduce electrical interference from that source.

**TUBES AND VOLTAGE LIMITS**

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and chassis. Voltage readings should be taken with a 1000 ohm per volt, 250 volt voltmeter (except filaments) with the volume control full "ON" and no signal input. The filament voltages should be measured with an accurate low range voltmeter. When measured on a 117.5 volt AC line voltage limits may vary plus or minus 10% of the values given.

**TUBE SOCKET VOLTAGE READINGS**

Tube	Function	H	P	S	Su	K	G <sub>o</sub>	G <sub>a</sub>
6A8	Oscillator-Modulator	6.3	105	65	—	3	-10	105
6K7	I-F Amplifier	6.3	105	105	0	3	—	—
6Q7	Det., AVC, A-F Amplifier	6.3	50	106	—	0	—	—
25A6	Output	25.1	100	—	—	0	—	—
25Z6	Rectifier	25.1	117.5	—	—	11.0	—	—

Power output approximately 1 watt.  
Power consumption approximately 55 watts.  
Voltage drop across speaker field 18 volts.  
All voltages except filaments will be approximately 10% lower if measured on 117.5 volts DC power supply.

**ALIGNMENT PROCEDURE**

The chassis of this receiver is connected to one side of the power supply and for this reason all test equipment should be thoroughly insulated in order that the power supply will not become short circuited while aligning the receiver.

**CONNECTING OUTPUT METER**

Connect one terminal of the output meter to the plate and the other terminal to the screen of the 25A6 output tube. Be certain that the meter is protected from DC by connecting a condenser (.1 mfd. or larger—500 electrolytic) in series with one of the leads.

**Tuning The I-F Amplifier To 455 Kilocycles.**

- Disconnect the antenna roll from the receiver and connect the output of the signal generator through a 50 mfd. condenser to the antenna connection on the receiver. Do not use a ground return from the signal generator unless it is found to be absolutely necessary. If it is found to be necessary, a small condenser (approximately .001 mfd.) should be connected in series with the ground terminal of the signal generator and the receiver chassis. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.
- Set the station selector so that the plates of the condenser gang are completely out of mesh and turn the volume control to the right (ON).
- Set the signal generator to 455 kilocycles.
- Adjust the 2nd I-F trimmer condenser, item 14, located beneath the edge of speaker field, for maximum

reading on the output meter.

- Adjust the 1st I-F trimmer condensers, located on back flange of the chassis, for maximum output.
- Repeat operations (d) and (e) for more accurate adjustments.

**ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.**

**Aligning The R-F Amplifier.**

- Set the signal generator to 1725 kilocycles.
- With the condenser gang turned to the minimum capacity position, adjust the trimmer condenser on the "OSC" section of the gang so that the 1725 kilocycle signal is heard. It is not necessary that the receiver tune through this signal.
- Set the signal generator to 1400 kilocycles.
- Tune-in the 1400 kilocycle signal in the region of 140 on the dial for maximum output.
- Adjust the trimmer condensers located on the "ANT" section of the gang for maximum output.

Note: Do not readjust the "OSC" trimmer.

- Repeat operations (d) and (e) for more accurate adjustments.

**WAVE TRAP**

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the underneath side of the chassis and consists of a coil and a fixed condenser as illustrated by dotted lines in the Wiring Diagram.

MODEL -- 648

SPECIFICATIONS

This model Crosley radio is designed for operation on 100 to 125 volt electric circuits, either AC or DC. The tuning range is from 540 to 1725 kilocycles (555 to 173 metres).

CIRCUIT DESCRIPTION

Five Octal Glass tubes and one metal Ballast tube are employed in a superheterodyne circuit which consists of a combination oscillator-modulator tube, 455 kilocycle I-F amplifier, Beam Power output and power supply. The 6Q7 tube serves as the detector and 1st A-F amplifier and supplies AVC voltage to the grid of the 6A8-G and 6U7-G tubes. The bias for the 25L6-G tube is obtained from item 25 a 140 ohm resistor. A

FIG. 1—WIRING DIAGRAM

Ballast tube is used to provide the proper heater voltage to the tubes. The filaments of the tubes are wired in series. A .05 mfd. condenser, item 12, is connected across the power supply leads to reduce electrical interference from that source.

TUBES AND VOLTAGE LIMITS

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and chassis. Voltage readings should be taken with a 1000 ohm per volt, 250 volt voltmeter (except filaments) with the volume control full "ON" and no signal input. The filament voltages should be measured with an accurate low range voltmeter. When measured on a 117.5 volt AC line voltage limits may vary plus or minus 10% of the values given.

CHASSIS NO. 648 (Super Sextette)

JANUARY, 1939

MODEL 648, Super Sexette  
Socket, Trimmers, Chassis  
Alignment, Notes, Parts

CROSLLEY CORP.

Loosen forefinger and thumb and pulling straight up. Loosen the set screws on the keys but do not remove them. Determine the favorite broadcasting stations whose call letters are to be placed in the buttons. By means of the manual tuning knob, tune-in AS ACCURATELY AS POSSIBLE the station having the highest frequency—that is the station that is tuned-in nearest the 1500 Kc. end of the dial. Then push the front key all the way down, and while you hold it in that position SECURELY TIGHTEN THE SET SCREW. Replace push button on key.

The push button tuning system is now correctly set for the 1st station. Follow through with this same procedure, setting the other stations in the order of their frequency (kilocycles). Detach the call letters of the favorite stations from the list supplied with your receiver and press them into the openings in the front of the push buttons. Thin pieces of clear celluloid are supplied in a small envelope and should be snapped in place over the call letters to protect and hold them in place. Figures in first column refer to parts in Diagrams.

If it is found to be necessary, a small condenser (approximately .001 mfd.) should be connected in series with the ground terminal of the signal generator and the receiver chassis. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the plates of the condenser gang are completely out of mesh and turn the volume control to the right (ONV).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust the 2nd I.F. trimmer condensers, Fig. 2, located between Push Button Assembly and speaker field, for maximum reading on the output meter.

(e) Adjust the 1st I.F. trimmer condensers for maximum output.

(f) Repeat operations (d) and (e) for more accurate adjustments.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

Aligning The R-F Amplifier.

Connect output of signal generator through a .0001 condenser to the antenna lead of receiver.

(a) Set the signal generator to 1725 kilocycles.

(b) With the condenser gang turned to the minimum capacity position, adjust the trimmer condenser on the "OSC" section of the gang so that the 1725 kilocycle signal is heard. It is not necessary that the receiver tune through this signal.

(c) Set the generator to 1400 kilocycles.

(d) Tune-in the 1400 kilocycle signal in the region of 140 on the dial for maximum output.

(e) Adjust the trimmer condenser located on the "ANT" section of the gang for maximum output.

NOTE: Do not readjust the "OSC" trimmer.

(f) Repeat operations (d) and (e) for more accurate adjustments.

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the underneath side of the chassis and consists of a coil and a fixed condenser as illustrated by dotted lines in the Wiring Diagram.

If any of the circuits have been re-aligned, check push buttons to see if they need resetting.

SETTING THE PUSH BUTTONS

The push buttons are easily and accurately set from the top of the receiver. It is not necessary that all the buttons be set at the same time. Remove the push buttons to be set by grasping the button between the

OCTOBER, 1938 CHASSIS MODEL 628-638-5628

50 CYCLE POWER TRANSFORMER  
ADJUSTMENT

Receivers equipped with a 50 cycle power transformer have a "high" and "low" voltage tap on the under side of the chassis. The "high" voltage lead (BLACK) and the "low" voltage lead (ORANGE) are connected to a terminal strip near the transformer. The voltage range of the "low" tap of the 95-130 volt

transformer is from 95 to 112½ volts and of the "high" tap is from 112½ to 130 volts.

The accompanying illustration shows the connections for changing from high to low or low to high line voltage. Note the "jumper" wire which is attached to the terminal at which one side of the power cord is attached. The other end of this jumper wire should be connected to the ORANGE or BLACK lead of the transformer primary, according to the line voltage the receiver is to be used on.

NOTE: Any change made in the power supply circuit of the receiver should be plainly stamped or otherwise permanently recorded on the rear of the chassis.

CROSLLEY CORP.

CHASSIS NO. 667

DECEMBER, 1937

**BROWN to BLACK** winding of the power transformer serves as the primary and the filament voltage is taken direct from the storage battery. When the switch is thrown to the "AC" position, the BLACK to BLACK winding with RED tracer winding serves as the primary and the filament voltage is obtained across the GREEN and BROWN leads.

**SOCKET VOLTAGES**

The tube socket voltages are measured from the tube prongs to the chassis with a 1000 ohm per volt, 500 volt voltmeter (except filaments) with the receiver in operating condition and the volume control full on but with no signal input. The filament voltages should be measured with a low range voltmeter (approximately 0-10 volts). Readings may vary plus or minus 10% of values given.

**CIRCUIT DESCRIPTION**  
Six octal base glass tubes are employed in a super-heterodyne circuit which consists of an oscillator-modulator tube, two-stage 455 kilocycle I-F amplifier, composite detector, AVC and 1st A.F. amplifier tube, pentode output and power supply. Items 45B, 46 and 50 serve as a voltage divider. The initial bias for the 6A8C and 6ST7 1st I-F tubes is obtained by the voltage drop across item 45B, measured with a vacuum tube voltmeter or 20,000 ohms per volt voltmeter. The bias for the 6S7C 2nd I-F and 6T7C tubes is developed across item 48. The bias for the output tube is obtained by the voltage drop across items 45B and 46, also measured with a vacuum tube voltmeter or 20,000 ohms per volt voltmeter.  
When the AC-DC change-over switch is turned to the "6 volt" position as shown in the wiring diagram, the

**ALIGNMENT PROCEDURE**

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits may be properly aligned with the use of a modulated signal generator and an output meter.

**CONNECTING OUTPUT METER**

Connect the output meter to the plate and screen of the 6K6G output tube. Be certain that the meter is protected from D. C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

**Tuning the I-F Amplifier to 455 Kilocycles.**

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6A8C tube, leaving the tube's grid pin in place. Connect the ground lead from the signal generator to the ground terminal (C) of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control knob to the right, (ON).

(c) Turn the band selector switch to the Standard Broadcast Band.

(d) Set the signal generator to 455 kilocycles.

(e) Adjust both trimmers located on top of the 3rd I-F transformer for maximum output.

(f) Adjust both trimmers located on top of the 1st I-F transformer for maximum output.

(g) Check operations (e) and (f) for more accurate adjustments.

**ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.**

**Aligning the R-F Amplifier.**

When aligning the R-F amplifier, the output lead

- Standard Broadcast Band 172.5 Kilocycles
- Police Band 6.5 Megacycles
- Short Wave Band 22.5 Megacycles

- Shunt Align. 140 Kilocycles
- Series Align. 600 Kilocycles
- 18 Megacycles

No "B" or "C" batteries are required when the receiver is operated from a storage battery. The tuning range is divided into three bands as follows:

535-1725 Kilocycles or 560-1775 Metres (Standard Broadcast)  
 1.4- 5.5 Megacycles or 20-21.3 Metres (Short Wave)  
 6.4- 22 Megacycles or 13.3-13.8 Metres (Short Wave)

Maximum power output approximately 5 watts.  
Voltage across speaker field 37 volts.  
Power consumption approximately 52 watts at 117.5 line.

OCTOBER, 1938 FOR SCHEMATIC CHASSIS MODEL 718  
SEE INDEX

FIG. 3 Bottom View Model 718

The features included in its design consist of a Mechanical Push Button Tuning System, Beam Power Output Tube, Radio-Log Dial, Tuning Indicator Tube, Bass Compensation and a moving coil dynamic speaker. The Tuning Range is divided into two bands as follows:

540-1725 Kilocycles or 555-173 Meters (American and some Police)  
5.7-18.3 Megacycles or 52.6-16.4 Meters (Foreign)

The tubes used and their functions are as follows: one 6J8G as Oscillator-Modulator, one 6U7G as I-F amplifier, one 6P5G as Detector, A. V. C. diode, one 6F5G as first Audio amplifier, one 6V6G as Beam Power output, one 5Y3G as Rectifier and one 6U5 as eye Tuning Indicator.

The initial bias for the 6J8G and 6U7G (drop across item 34 a 60 ohm resistor) is measured from chassis to the low end of the volume control. For the 6P5G, (drop across item 35 a 32 ohm resistor) is measured from the low end of the 10 megohm resistor to the cathode of the 6F5G. The bias for the 6V6G is obtained from the drop across items 34, 35, 32, 60 ohms, 32 ohms, 100 ohms respectively, measured from the junction of

TUBES AND VOLTAGE LIMITS

The following table gives the functions of the tubes used, together with the voltage readings between tube socket contacts and chassis. Voltage readings taken with a 1,000 ohm per volt, 500 volt voltmeter (except filaments) with receiver in operating condition and no signal input. The filament voltages should be measured with an accurate low range A-C voltmeter (approximately 0 to 10 volts). Voltage limits may vary plus or minus 10% of values given.

**SPECIFICATIONS**

This model Crosley is a compact seven-tube super-heterodyne receiver designed for operation on ALTERNATING CURRENT as specified on the Model and License sticker.

## MODEL 718

## Alignment, Drive Data

## CROSLLEY CORP.

adjustments have been made. To adjust, feed a 455 Kc. signal through a .0002 Mf. condenser to the antenna terminal of the receiver. With the band selector turned to the broadcast band and the condenser gang closed and the volume control on full, adjust the trimmer condenser on the wave-trap for MINIMUM SIGNAL.

Should the interfering station be operating on a frequency of slightly more or less than 455 Kc., the exact frequency should be determined with the aid of a signal generator by the beat note method. Then instead of feeding a 455 Kc. signal through, the exact frequency of the interfering station should be used. If it is not possible to determine the exact frequency of the interfering signal, the antenna may be attached to the receiver tuned to the position where the interfering signal is most noticeable. Then adjust the wave-trap for minimum interference.

**REPLACING DIAL DRIVE CORD**

To replace a broken drive cord proceed as follows:  
1—Remove broken cord from dial pointer and the cord tension spring from the large pulley on the condenser gang.

2—Remove complete dial assembly, fastened with two P. K. screws to top of chassis.

3—Remove screw and washer that fastens felt key mask to chassis and fold felt to one side.

4—Remove manual drive shaft bracket, fastened with two P. K. screws.

5—Place ends of replacement drive cord (G3-41582) together and tie a knot about 1 1/4 inches from the end. Slip tension spring through knot. Fasten the other end of spring on hook in large pulley on gang.

6—Close the gang then thread loop through the eye-let in pulley rim.

7—Bring one side of drive cord loop forward over pulley and around (1/4 turn) horizontal idler pulley, then under and over the right hand idler pulley (counter-clockwise).

8—Loop the other side of drive cord over large pulley on gang in a clockwise direction, continue around and up and over the small idler pulley.

9—Then remove drive shaft from chassis, wrap two complete turns around pulley on the shaft, taking the cord coming over the small idler pulley and wrapping in a clockwise direction while holding shaft in right hand.

10—Replace drive shaft in position, taking care that the drive cord coming down to the pulley goes between the 4th and 5th keys and the cord going up from the pulley goes between the 1st and 2nd keys.

11—Hook drive cord over left hand idler pulley. Mount drive shaft bracket in position. Check to see that cord is running on all pulleys, and tension spring is stretched to approx. one inch in length.

12—Place drive cord clamp (W-46290) on drive cord approx. 1/8 inch from inside edge of large pulley rim.

13—Replace key felt, rubber bands and dial assembly.

14—Close gang, set the pointer at 540 Kc., place cord in pointer, check pointer travel from end to end before gluing cord to pointer.

.0002 Mf. condenser.

Align the "Foreign" band first.

(a) Set band selector to "Foreign" band, right.

(b) Set signal generator to 18.3 Megacycles.

(c) Open gang all the way. Minimum capacity.

(d) Tune-in with H.F. Osc. shunt trimmer 18.3 signal. This signal will be heard at two settings of this trimmer, always choose the setting furthest open.

(e) Set signal generator to 18.0 Megacycles.

(f) Tune-in 18.0 Mc. signal with station selector, then align the H-F ANT. trimmer condenser for maximum output. DO NOT ADJUST OSC. TRIMMER AT THIS FREQUENCY.

(g) Repeat operations (d), (e) and (f) until no further improvement can be obtained.

(h) Set the band selector to the American Broadcast band.

(i) Set the signal generator to 1795 Kilocycles.

(j) Open the gang all the way. Minimum capacity.

(k) Adjust B-C OSC. trimmer for maximum output.

(l) Set signal generator to 1400 Kc.

(m) Tune receiver for maximum general signal (approx. 140 on the dial).

(n) Adjust B-C ANT. trimmer for maximum output. DO NOT RE-ADJUST OSC. TRIMMER AT 1400 Kc.

(o) REPEAT operations (m) and (n) alternately until no further improvement in output can be obtained.

NOTE: If at any time the H-F coils in this receiver are replaced, it may be necessary to vary the inductance of the "OSC" coil by moving the cross-over turn of wire at the gap to make the set track at the 6 megacycle end. Moving the turn toward the short end of the coil will decrease the inductance and moving it toward the long end will increase the inductance. If the signal is weak at 6 megacycles, a similar slight change in the inductance at the "ANT" coil should bring up the signal strength. THIS IS A CRITICAL OPERATION AND SHOULD NOT BE DONE ON ANY SET UNLESS CHANGING COILS MAKES IT NECESSARY.

NOTE: When aligning the high frequency band care should be exercised so that the circuits will be aligned on the fundamental frequency rather than on the image frequency which is approximately 910 kilocycles less than the fundamental. To check on this, increase the output of the signal generator approximately 10 times and try to tune-in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles below the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct dial setting.

**WAVE TRAP**

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 Kc. This assembly is located on the underneath side of the chassis and consists of a coil and a trimmer condenser as indicated by item 48 in the wiring diagram.

The wave trap should not be adjusted until all other

**ALIGNMENT PROCEDURE**

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits can best be properly aligned with the use of a modulated signal generator and an output meter.

**SETTING THE PUSH BUTTONS**

Should it become necessary to realign the various circuits of this receiver, it may be necessary to reset the Push Button Tuning System.

The buttons are set by means of a set screw that is accessible through the front of the push button. Loosen set screw, tune-in with the manual tuning knob the station whose call letters are to be placed in that button.

**PUSH THAT BUTTON ALL THE WAY DOWN, AND WHILE YOU HOLD IT IN THAT POSITION, SECURELY TIGHTEN THE SET SCREW.**

The first button is now set, follow the same procedure with the rest of the push buttons.

The accuracy of the buttons depends on how accurately the station is tuned-in while setting them.

**CONNECTING OUTPUT METER**

Connect the output meter to P and S of the 6V6G Output Tube. Be sure the meter is protected from D.C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

**1. Tuning I-F Amplifier To 455 Kilocycles**

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6J8G tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the "GND" terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh and turn the volume control to the right (ON).

(c) Turn the band selector switch to the left (American Broadcast Band).

(d) Set the signal generator to 455 kilocycles.

(e) Adjust both trimmers located on top of the 2nd I-F Transformer for maximum output. (Fig. 2).

(f) Adjust both trimmers located on top of the 1st I-F Transformer for maximum output.

(g) Check operations (c) and (f) for more accurate adjustments.

**ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.**

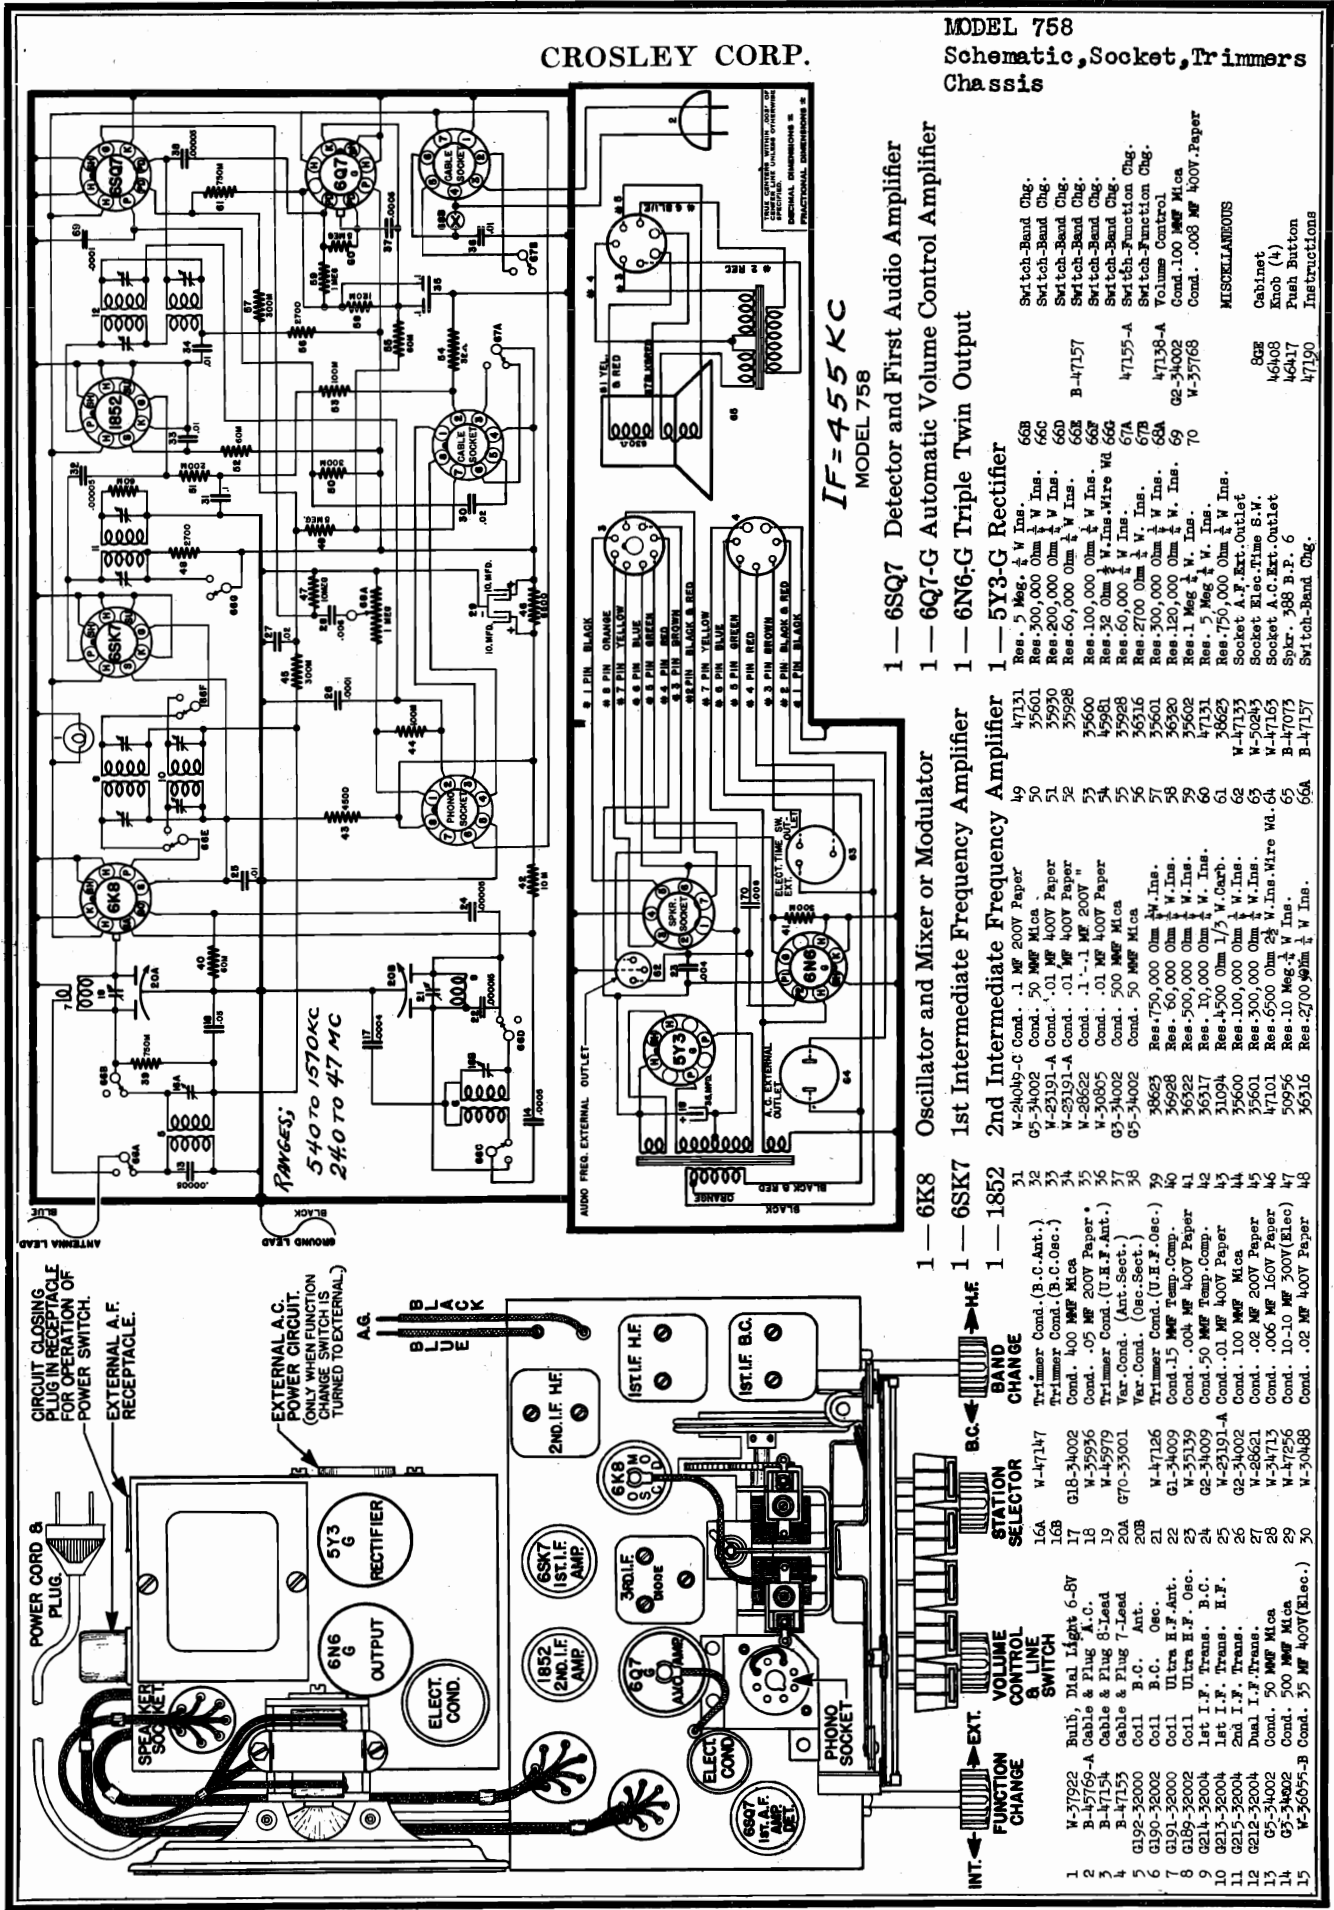

**2. Aligning R-F Amplifier**

When aligning the R-F amplifier the output of the modulated signal generator should be fed through a dummy antenna and connected to the "ANT" terminal of the receiver.

For the "Foreign" band use a 250 ohm carbon resistor for dummy and for the "American" band use a

Alignment, Notes, Parts

CROSLLEY CORP.

the pointer shaft pulley and back to the eyelet. Thread the lead to outer end of the eyelet. Hook the lead to the ends of the cord is drawn taught. Hook the lead to the eyelet when the cord is drawn taught. Hook the lead to the tension spring over the knot and hook the lead to the end of the cord provided opposite the eyelet. Cut off the excess cord and if bees' wax is available, apply a small amount to the knot as an added protection against slipping.

to the top of the pulley shaft so that its eyelet (3/4 turn) with the pointer shaft pulley set so that its eyelet is in the "up" position, thread the cord through the eyelet. (6) Bring the other end of the cord back and over the condenser gang pulley. Continue it down and over the lower idler pulley to the left-hand side of the rubber grommet and then over the top of the pointer shaft pulley. This lead should cross behind the down lead to the rubber grommet. Make one complete loop around

PARTS LIST—MODEL 818

Table with columns: Item No., Part No., Description, Part No., Description. Lists various electronic components like capacitors, resistors, and mechanical parts.

50 CYCLE POWER TRANSFORMER Receivers equipped with a 50 cycle power transformer have a high and low voltage tap on the under side of the transformer. The "high" voltage lead (BLACK) and the "low" voltage lead (ORANGE) are connected to a terminal strip near the transformer. The voltage range of the "low" tap of the 95-130 volt transformer is from 95 to 112 1/2 volts and of the "high" tap is from 112 1/2 to 130 volts. The range of the "low" tap of the 190-260 volt transformer is from 190 to 225 volts and of the "high" tap is from 225 to 260 volts. The accompanying illustration shows the connections

Aligning The R-F Amplifier.

When aligning the R-F amplifier, the output lead from the signal generator is connected to the "ANT" terminal of the receiver. For the Broadcast and Police Bands a .00025 mfd. condenser should be connected in series with the output lead of the signal generator and for the High Frequency band a 400 ohm carbon resistor should be used in place of the condenser.

Each band should first be SHUNT ALIGNED and then SERIES ALIGNED where provision is made for series alignment (Broadcast Band). The band selector switch should be set for the band being aligned and the station selector and signal generator should be set to the frequency indicated for each adjustment, f (C) below.

- (a) Adjust the "OSC" and "ANT" shunt trimmers in the order given for maximum output. Readjust the station selector slightly so that the generator signal is tuned in with maximum output and then check the adjustment of the "ANT" trimmer. DO NOT READJUST THE "OSC" TRIMMER. NOTE: When shunt aligning the Police and High Frequency Bands care must be exercised so that the circuits which are aligned on the correct frequency rather than the design frequency, which is approximately 910 kilocycles less than the design frequency. To check on this increase the output of the signal generator both at the times, or more, to try to tune-in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct frequency.

- (b) To align the B. C. OSC. series trimmer (Fig. 2), set the signal generator to the frequency indicated below and then tune-in this signal with the station selector for maximum output. To obtain the best adjustment for the series trimmer, it will be necessary to retune the station selector back and forth slightly while adjusting the trimmer for maximum output.

(C) SIGNAL INPUT FREQUENCIES

Table with columns: Shunt Align., Broadcast Band, Police, Aircraft Band, Foreign Band, Series Align., 800 Kilocycles, 18 Megacycles.

WAVE TRAP

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the underneath side of the chassis and consists of a coil, a fixed condenser and a trimmer condenser as illustrated by dotted lines in Fig. 2. Do not adjust until all other adjustments have been made. To make the adjustment, feed a 455 kilocycle signal from the signal generator through a .00025 mfd. condenser into the antenna terminal of the receiver. With the band selector switch turned to the Broadcast Band position, the gang condenser open and the volume control full on, adjust the trimmer condenser on the wave trap for MINIMUM output.

Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles, the exact frequency should be determined with the aid of the signal generator. Then, insert a .00025 mfd. condenser in series with the exact frequency of the interfering signal into the antenna terminal of the receiver. With the antenna switch set to the Broadcast Band position, the gang condenser open and the volume control full on, adjust the trimmer condenser on the wave trap for MINIMUM interference. Then adjust the wave trap for minimum interference.

SETTING PUSH BUTTONS

The push buttons may be quickly and accurately set for the front panel trimmer. It is not necessary that all the push buttons be set at the same time. Insert a small screw driver in the hole in the front of each push

button and loosen (DO NOT REMOVE) the screw that is located in the bottom of each hole.

Determine the favorite broadcasting stations whose call letters are to be placed in the push buttons. By means of the signal generator, tune in the high cycle end of the dial. COMPLETELY DEPRESS AND HOLD No. 1 push button and SECURELY TIGHTEN THE SET SCREW. No. 1 push button is the one toward the high frequency end of the dial.

The push button system is now set for the first station. Follow through with this same procedure, setting the other stations in the order of their frequency (kilocycles).

If the receiver has been re-aligned it may be necessary to reset the push button system.

REPLACING DIAL DRIVE CORD

To replace the dial drive cord, the following procedure should be carefully followed.

- (1) Remove the chassis from the cabinet. (2) Remove the dial glass, pointer and dial mounting bracket. (3) Remove the broken cord and the tension spring. (4) Double a 48" length of drive cord. Insert the doubled end through the eyelet (from the outside) in the pulley on the end of the tuning condenser gang. (5) Cut in the cord so as to form a loop. (6) The loop will be "closed" through the looped cord over the catch provided in the pulley opposite the eyelet. (7) Bring one end of the cord forward and around the top idler pulley. Continue the cord under and around

MODEL -- 828  
455 K. C. I. F.  
DECEMBER, 1938

This model Crosley is an eight-tube receiver designed for operation on A.C. circuits as specified on the model and license label. Features include: large sloping rectangular dial, three tuning ranges, continuous variable tone control, separate oscillator, bass compensation, push pull pentode output, phase inversion and the famous CROSLLEY mechanical push button tuning system. The tuning range is from 540 kilocycles and divided into three bands as follows:  
1.9- 6.4 Megacycles or 158-46.8 Meters (American Broadcast Band)  
5.40-17.25 Kilocycles or 555-173 Meters (Police and Amateurs)  
6.2- 20 Megacycles or 48.4-15 Meters (Foreign or High Frequency Band)

(bracket mounted on the gang) then over to the left hand idler, around idler and over to lower right hand idler pulley, over pulley and down and around (counter clockwise) the large pulley on the gang. Insert end of cord through eyelet. Stretch tension spring until it is approximately one inch in length, tie ends of cord securely. Place cable clamp (W-46290) on the cable approximately 3/4 inch from the inside of the pulley rim.  
8—Replace manual drive shaft bracket, dial rusk and dial. Insert drive cord in pointer. Check pointer travel before cementing cord to pointer.

**SOCKET VOLTAGES**  
The tube socket voltages are measured from the tube socket center tap (except filament) with respect to the chassis ground and no signal input. The filament voltages should be measured with an accurate low range A. C. voltmeter (approximately 0-10 volts). Readings may vary plus or minus 10% of values given.

**Aligning R-F Amplifier.**  
When aligning the R-F amplifier the output lead from the signal generator is connected to the "ANT" terminal of the receiver. For the Broadcast and Police Bands a .00025 mfd. condenser should be connected in series with the output lead of the signal generator and for the High Frequency band a 280 ohm resistor should be connected in series with the condenser. Each band should first be shunt aligned and then series aligned where provision is made for shunt alignment (Broadcast Band) and the station selector switch should be set for the band being aligned and the station selector and signal generator should be set to the frequency indicated for each adjustment, paragraph (c) below.  
(a) Adjust the "OSC" and "ANT" shunt trimmers in the order given for maximum output. Readjust the station selector slightly so that the generator signal is tuned-in with maximum output and then check the adjustment of the "ANT" trimmer. **DO NOT READJUST THE "OSC" TRIMMER.**  
(b) When shunt aligning the Police and High Frequency Bands care must be exercised so that the circuits will be aligned in the same manner as the Broadcast Band. The station selector dial which is approximately 910 kilocycles on the signal generator dial. To check on this, increase the output of the signal generator ten times, or more, to try to tune-in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct frequency.  
(c) To align the B. C. OSC. series trimmer (Fig. 2), set the signal generator to the frequency indicated below and then tune-in this signal with the station selector for maximum output. To obtain the best adjustment for the series trimmer, it will be necessary to rotate the station selector back and forth slightly while adjusting the trimmer for maximum output.

**(C) SIGNAL INPUT FREQUENCIES**

Shunt Alignment	Series Align.
American Broadcast Band 1400 Kilocycles	600 Kilocycles
Police and Amateur Band 6000	18 Megacycles
Foreign Band	

**WAVE TRAP**  
Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the underneath side of the chassis and consists of a coil, a fixed condenser and a trimmer condenser as illustrated by dotted lines in the Wiring Diagram (item 60).  
The wave trap should not be adjusted until all other adjustments have been made. To make the adjustment, feed a 455 kilocycle signal from the signal generator through a .00025 mfd. condenser into the antenna terminal of the receiver. The band selector switch should be set to the Broadcast Band, position the trimmer condenser open and the volume control full on, adjust the trimmer condenser on the wave trap for minimum output.  
Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles, the exact frequency should be determined with the aid of the signal generator. Then, instead of feeding a 455 kilocycle signal into the receiver the exact frequency of the interfering signal should be used. If it is not possible to determine the exact frequency of the interfering signal the antenna may be attached to the receiver and the receiver tuned to the position where the interfering signal is most noticeable. Then adjust the wave trap for minimum interference.

**REPLACING THE DIAL DRIVE CORD**  
1—Remove the chassis from the cabinet.  
2—Remove the broken drive cord, first from the pointer then from pulleys. Remove the cord tension spring and cable clamp. Shift bracket to the dial (glass and mesh) and the manual tuning shaft.  
3—Cut a piece of dial cord 58 inches in length (CS-41582) from one end of the cord. Open the gang condenser, this should place the eyelet in the pulley up. Insert the cord through the eyelet, from the inside of pulley. Hook end of tension spring on the catch in the pulley opposite eyelet.  
4—Bring the cord forward and down, over small brass idler pulley to the manual shaft pulley, wrap the cord around the manual shaft pulley in a counter clockwise direction. Continue cord up and over small brass idler pulley to the top idler pulley

**CIRCUIT DESCRIPTION**  
The tubes used and their functions are as follows: one 6J5 G as oscillator, one 6A8 G (early models have a 6I8 G) as modulator, one 6U7 G as I-F amplifier, one 6Q7 G as diode detector, A.V.C. and first A-F amplifier, one 6J5 G as phase inverter, two 6K6 G's as push pull pentode output and one 5Y3 G as rectifier.  
The fixed bias for the 6A8 G, 6U7 G and 6Q7 G is obtained from the drop across item No. 46 a 32 ohm resistor. The voltage is measured from the chassis to the low side of the speaker field. Bias for the 6J5 G phase inverter is measured across item No. 49 a 5,000 ohm resistor. The bias for the output tubes is measured across item No. 54 a 220 ohm resistor.  
The speaker field (525 ohm) is in the negative leg of the power supply.

**50 CYCLE POWER TRANSFORMER ADJUSTMENT**  
Receivers equipped with a 50 cycle power transformer have a "high" and "low" voltage tap on the under side of the chassis. The "high" voltage lead (BLACK) and the "low" voltage lead (ORANGE) are connected to a terminal strip near the transformer. The voltage range is 112 to 127 volts. The "high" tap is for 112-127 volt transformer. The range of the "low" tap of the 190-260 volt transformer is from 190 to 225 volts and of the "high" tap is from 225 to 260 volts.  
The accompanying illustration shows the connections for changing from high to low or low to high voltage. Note the "jumper" wire which is attached to the terminal at which one

side of the power cord is attached. The other end of this jumper wire should be connected to the ORANGE BLACK end of the transformer primary, according to the line voltage the receiver is to be used on.  
**NOTE: Any change made in the power supply circuit of the receiver should be plainly stamped or otherwise permanently recorded on the rear of the chassis.**

**ALIGNMENT PROCEDURE**  
All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits may be properly aligned with the use of a modulated signal generator and an output meter.

**CONNECTING OUTPUT METER**  
Connect the output meter to the plates of the two 6K6G Output tubes. Be certain that the meter is protected from D. C. by connecting a condenser (1 mfd. or larger—not electrolytic) in series with the meter.  
(a) Connect the meter to the plates of the 6A8G tube, leaving the tube's grid lead in place. Connect the ground lead from the signal generator to the ground terminal of the receiver. **KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.**  
(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control knob to the right (ON) and turn the tone control knob to the left (TREBLE).  
(c) Turn the band selector switch to the Broadcast Band. Right.

(d) Set the signal generator to 455 kilocycles.  
(e) Adjust both trimmers (located on Fig. 2) to the 10.0 position for maximum output.  
(f) Adjust both trimmers located on top of the 1st I-F assembly for maximum output. (Item 9, Fig. 2)  
(g) Check operations (e) and (f) for more accurate adjustment. **ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.**

Drive Data, Notes, Tuner

CROSLLEY CORP.

WAVE TRAP

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the underside of the chassis and consists of a coil, a fixed condenser and a trimmer condenser as illustrated by dotted lines in the Wiring Diagram, Item 63, Fig. 1. The wave trap should not be adjusted until all other adjustments have been made. To make the adjustment, feed a 455 kilocycle signal from the signal generator through a .00025 mfd. condenser into the antenna terminal of the receiver. With the band selector switch turned to the Broadcast Band position, the gang condenser open and the volume control full on, adjust the trimmer condenser on the wave trap for minimum output.

Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles, the exact frequency should be determined with the aid of the signal generator. Then, instead of feeding a 455 kilocycle signal into the receiver, the exact frequency of the interfering signal should be used. If it is not possible to determine the exact frequency of the interfering signal, the antenna may be attached to the receiver and the receiver tuned to the position where the interfering signal is most noticeable. Then adjust the wave trap for minimum interference.

REPLACING DIAL DRIVE CORD

To replace the dial drive cord the following procedure should be carefully followed:

- 1-Remove the chassis from the cabinet.
- 2-Remove the dial glass, the pointer, then the dial mounting bracket.
- 3-Remove the broken cord and the tension spring.
- 4-Double a 48" length of drive cord. Tie a knot in the cord to form a loop about 3/4" long. Insert the two ends through the eyelet in the pulley on the gang from the inside. Hook the small loop over the catch in the pulley opposite the eyelet, then close the gang.
- 5-Bring one end of the cord forward and down over the top of the lower idler pulley. Continue the cord on down to the left of the manual drive shaft, then under and around to the top of the pointer shaft pulley, crossing in front of cord to manual drive shaft. Make one and one half turns around pulley in a counterclockwise direction. Insert end of cord through eyelet in pulley rim, eyelet should be to the left and in line with the pointer shaft.
- 6-Bring the other end of drive cord back and under pulley on the gang, then up and over the top idler pulley. Continue down and under pointer drive pulley for 1/2 turn, insert end through eyelet. Tie ends in a secure knot, then hook one end of tension spring through knot and hook the other end on catch in pulley. The tension spring should be stretched to approximately 3/4" length. Retie knot if necessary to give proper tension on drive cord.

Cut off excess cord and if any bees wax is available apply a small amount to the knot as an added precaution against slipping.

MODEL 1018

Series Align.  
600 Kilocycles

(D) SIGNAL INPUT FREQUENCIES

Shunt Align.  
1400 Kilocycles  
6000  
18 Megacycles

.00025 mfd. condenser should be connected in series with the output lead of the signal generator and for the High Frequency and Police Bands, a 400 ohm carbon resistor should be used in place of the condenser.

Each band should first be SHUNT ALIGNED and then SERIES ALIGNED where provision is made for series alignment (Broadcast Band). The band selector switch should be set for the band being aligned and the signal generator should be set to the frequency indicated for each adjustment, (d) below.

(a) With the station selector adjusted so that the tuning condenser plates are completely out of mesh, adjust the "OSC" shunt trimmer until the MINIMUM CAPACITY SIGNAL (d) is heard (it is not necessary that the receiver tune through this signal).

(b) Adjust the station selector so that the SHUNT ALIGNMENT SIGNAL (d) is heard with maximum output. Then adjust the "ANT" shunt trimmer for maximum output. Readjust the station selector slightly so that the generator signal is tuned-in with maximum output and check the adjustment of the "ANT" trimmer. DO NOT READJUST THE OSCILLATOR TRIMMER.

NOTE: When shunt aligning the Police and High Frequency Bands care must be exercised so that the circuits will be aligned on the correct frequency rather than on the image frequency which is approximately 910 kilocycles less than the fundamental. To check on this, increase the output of the signal generator ten times, or more, and try to tune in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct frequency.

(c) To align the series trimmer (See Fig. 2), set the signal generator to the frequency indicated below (d) and then tune in this signal with the station selector for maximum output. To obtain the best adjustment for the series trimmer, it will be necessary to rotate the station selector back and forth slightly while adjusting the trimmer for maximum output. Minor tolerances variations in series alignment at 2500 kilocycles in the Police Band and a 6000 kilocycles in the High Frequency Band may be compensated for by slight repositioning of the grid lead of the antenna coil in the Band affected.

If the various circuits of this receiver have to be adjusted it may be necessary to reset the push button tuning system, after the adjustments have been made. The push buttons are set from the front of the receiver. To reset a push button remove the call letter and celluloid protector from the front of the button.

Loosen the set screw at the bottom of the hole. Tune-in with the manual tuning knob AS ACCURATELY AS POSSIBLE the station whose call letters were in that button.

Push the button all the way down and while you hold it in that position securely tighten the set screw.

Replace station call letter and celluloid protector in button. Repeat the above procedure for the rest of the push buttons that have to be set.

Remember—The accuracy of the push buttons depend entirely upon HOW ACCURATE YOU TUNE-IN THE STATION WHILE SETTING THEM.

(D) SIGNAL INPUT FREQUENCIES  
Min. Cap. Signal  
1725 Kilocycles

Police & Amateur Band  
High Frequency Band

SOCKET VOLTAGES

The tube socket voltages are measured from the tube socket contacts to the chassis with 1000 ohm per volt, 500 volt D. C. voltmeter (except filaments) with the receiver in operating condition and no signal input. The volume control should be turned full on, the tone control should be turned to the TREBLE position (counterclockwise) and the tuning condenser should be turned to the minimum capacity position. The filament voltages should be measured with an accurate low range A. C. voltmeter (approximately 0-10 volts). Readings may vary plus or minus 10% of values given.

TUBE SOCKET VOLTAGE READINGS

Tube	Function	H	P	S	G	K	G <sub>o</sub>	G <sub>a</sub>
6K56C	Oscillator	6.3	147	—	-36	0	—	110
6A8C	Modulator	6.3	224	110	—	0	-36	—
6U7G	1st I-F Amplifier	6.3	174	110	—	0	—	—
6C5G	Diode Detector	6.3	270	—	—	0	—	—
6K56G	1st A-F Amplifier	6.3	—	—	—	0	—	—
6K56G	Output	6.3	190	250	0	22	—	—
6K56G	Output	6.3	263	270	0	22	—	—
5Y3G	Rectifier	5.0	—	—	—	270	—	—

Power consumption approximately 85 watts at 117.5 volts. Power output approximately 10 watts. Voltage drop across speaker field 60 volts.

50 CYCLE POWER TRANSFORMER

Receivers equipped with a 50 cycle power transformer have a "high" and "low" voltage tap on the under side of the chassis. The "high" voltage lead (BLACK) and the "low" voltage lead (ORANGE) are connected to a terminal strip near the transformer.

The voltage range of the "low" tap of the 95-130 volt transformer is from 95 to 112 1/2 volts and of the "high" tap is from 112 1/2 to 130 volts. The range of the "low" tap of the 190-260 volt transformer is from 190 to 225 volts and of the "high" tap is from 225 to 260 volts.

The accompanying illustration shows the connections for changing from high to low or low to high line voltage. Note the "jumper" wire which is attached to the terminal at which one side of the power cord is attached. The other end of this jumper wire should be connected to the ORANGE or BLACK lead of the transformer

primary, according to the line voltage the receiver is to be used on.  
NOTE: Any change made in the power supply circuit of the receiver should be plainly stamped or otherwise permanently recorded on the rear of the chassis.

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately

aligned at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits may be properly aligned with the use of a modulated signal generator and an output meter.

CONNECTING OUTPUT METER

Connect the output meter to the plates of the two 6K6C output tubes. Be certain that the meter is protected from D. C. by a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning I-F Amplifier To 455 Kilocycles

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6A8C tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the ground terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control knob to the right (ON) and turn the tone control knob to the left (TREBLE).

(c) Set the band selector switch on the Broadcast Band.

(d) Set the signal generator to 455 kilocycles.

(e) Adjust both trimmers located on top of the 2nd I-F transformer for maximum output.

(f) Adjust both trimmers located on top of the 1st I-F transformer for maximum output.

(g) Check operations (e) and (f) for more accurate adjustment.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE ALIGNING R. F. Amplifier

When aligning the R. F. amplifier the output lead from the signal generator is connected to the "ANT" terminal of the receiver. For the Broadcast Band a

**SPECIFICATIONS**

This model Crosley is a ten-tube superheterodyne receiver featuring Push Button Tuning, temperature compensated B-C oscillator, (to prevent station drift) push pull output and many of the latest improvements in circuit design. It is designed for operation on A. C. circuits as specified on the model label.

The tuning range is from 535 to 20,000 kilocycles and 455 K.C. I.F. is divided into three bands as follows:

- 535-1725 Kilocycles or 560-174 Meters (American Broadcast Band)
- 1900-6400 Kilocycles or 158-46.8 Meters (Police & Amateur Band)
- 6.2-20.0 Megacycles or 48.8-15.0 Meters (Foreign Band)

CHASSIS MODEL  
1118 AND 1128

**SPECIFICATIONS**  
This model Crosley radio is an 11-tube AC receiver and parallel pentode output. The tuning range is from 540-1850 Kilocycles or 555-162 Metres designed for American and Foreign broadcast reception. 540 kilocycles to 22 megacycles and is divided into 1.9- 6.6 Megacycles or 158-45.5 Metres. It incorporates such features as push-button electric tun-three bands as follows:

MODELS 1118, 1128  
Alignment, Tuner  
Notes

## MODEL 1118 AND 1128

## CIRCUIT DESCRIPTION

Eleven tubes are employed in a superheterodyne circuit which consists of separate oscillator and modulator tubes, 455 kilocycle I-F amplifier—one stage of which is resistance coupled, separate AVC and detector diodes, two stages of audio amplification and power supply. The 1st I-F transformer is a triple-tuned unit, which in conjunction with the Local-Distance switch, controls the selectivity of the receiver. Inter-station noise suppression is accomplished while tuning by means of the push buttons due to the action of the 6C5-G "squelch" tube. When a push button is depressed, this tube supplies sufficient voltage to the cathodes of the output tubes to bias them beyond "cut-off." It also supplies voltage to the AVC circuit through a 250,000 ohm resistor, item 38. The speaker field is located in the negative leg of the power supply. The bias for all tubes except the three type 6C5-G and the two output tubes is developed across a 32 ohm resistor, item 46, located between the speaker field and ground. The bias for the output tubes is developed across a 220 ohm resistor, item 47.

SPECIAL POWER TRANSFORMER  
ADJUSTMENT

In localities where the voltage variation on 50 or 60 cycle power supply lines is greater than customary commercial limits, special 50-60 cycle power transformers are available. These transformers have a "high" and "low" voltage tap on the under side of the chassis. The "high" voltage lead (BLACK) and the "low" voltage lead (ORANGE) are connected to a terminal strip near the transformer.

The voltage range of the "low" tap of the 95-130 volt transformer is from 95 to 112½ volts and of the "high" tap is from 112½ to 130 volts. The range of the "low" tap of the 190-260 volt transformer is from 190 to 225 volts and of the "high" tap is from 225 to 260 volts.

The accompanying illustration shows the connections for changing from high to low or low to high line voltage. Note the "jumper" wire which is attached to the

terminal at which one side of the power cord is attached. The other end of this jumper wire should be connected to the ORANGE or BLACK lead of the transformer primary, according to the line voltage the receiver is to be used on.

NOTE: Any change made in the power supply circuit of the receiver should be plainly stamped or otherwise permanently recorded on the rear of the chassis.

## ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits may be properly aligned with the use of a modulated signal generator and an output meter.

## Connecting Output Meter

Connect the output meter to the plate and screen of one of the 6K6G output tubes. Be certain that the meter is protected from D.C. by a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

## Tuning The I-F Amplifier To 455 Kilocycles

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6U7G 1st I-F Amp. tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the ground terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control knob to the right (ON) and turn the tone control knob to the left (TREBLE).

(c) Set the band selector switch on the Broadcast Band.

(d) Turn the Local-Distance Switch to the "Dis-

tance" position.

(e) Set the signal generator to 455 kilocycles.

(f) Adjust both trimmer condensers located on top of the 2nd I-F transformer for maximum output. DO NOT ADJUST THE TRIMMER CONDENSERS LOCATED ON THE 2ND I-F TRANSFORMER WITH THE SIGNAL GENERATOR LEAD CONNECTED TO THE 6A8G TUBE.

(g) Transfer the signal generator lead to the top cap of the 6A8G tube, leaving the tube's grid clip in place.

(h) Close the middle trimmer of the 1st I-F transformer. (Do not force adjustment screw).

(i) Adjust the top and then the bottom trimmers of the 1st I-F transformer for maximum output.

(j) Adjust the middle trimmer of the 1st I-F transformer for maximum output.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.

## Aligning The R-F Amplifier

When aligning the R-F amplifier the output lead from the signal generator is connected to the "ANT" terminal of the receiver. For the Broadcast Band a 200 mmf. condenser should be connected in series with the output lead of the signal generator and for the High Frequency and Police Bands a 400 ohm carbon resistor should be used in place of the condenser.

Each band should first be SHUNT ALIGNED and then SERIES ALIGNED where provision is made for series alignment (Broadcast Band). The band selector switch should be set for the band being aligned and the signal generator should be set to the frequency indicated for each adjustment, ¶ (D) below.

(a) With the station selector adjusted so that the tuning condenser plates are completely out of mesh, adjust the "OSC" shunt trimmer until the MINIMUM CAPACITY SIGNAL (D) is heard (it is not necessary that the receiver tune through this signal).

(b) Adjust the station selector so that the SHUNT ALIGNMENT SIGNAL (D) is tuned-in with maximum output. Then adjust the "R-F" and "ANT" shunt trimmers for maximum output. Readjust the station selector slightly so that the generator signal is tuned-in with maximum output and check the adjustment of the "R-F" and "ANT" trimmers. DO NOT READJUST THE OSCILLATOR TRIMMER.

NOTE: When shunt aligning the Police and High Frequency Bands care must be exercised so that the circuits will be aligned on the correct frequency rather than on the image frequency which is approximately 910 kilocycles less than the fundamental. To check on this, increase the output of the signal generator ten times, or more, and try to tune-in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct frequency.

(c) To align the series trimmer (See Fig. 2), set the signal generator to the frequency indicated below (D) and then tune-in this signal with the station selector for maximum output. To obtain the best adjustment for the series trimmer, it will be necessary to rotate the station selector back and forth slightly while adjusting the trimmer for maximum output. Minor tolerance variations in series alignment at 2500 kilocycles in the Police Band and at 7000 kilocycles in the High Frequency Band may be compensated for by slight repositioning of the grid lead of the antenna coil in the Band affected.

## PUSH BUTTON TUNING SYSTEM

The push button electric tuning system employed in this receiver incorporates eight push buttons on the Model 1118 and nine on the Model 1128, a selector switch and a motor. The discriminator switch, item 59—also Figs. 5 and 6, incorporates eight metallic discs, each of which operates in conjunction with a different push button to tune-in some favorite station. That is, the 1st push button on the left as you face the front of the cabinet works with No. 1 disc, and the 2nd push button works with No. 2 disc, etc.

## SETTING PUSH BUTTONS

To set the electric tuning system, turn the receiver "ON" and depress No. 1 push button. When the dial pointer stops rotating, the key slot in No. 1 disc on the selector switch will be in the "UP" position. Remove the key from its mounting and place it (knob up) through No. 1 hole in the disc identification bracket. If it does not drop into the slot in the disc, push it in with the fingers.

Turn the Local-Distance switch to the "Distance" position. By means of the station selector knob, tune-in AS ACCURATELY AS POSSIBLE, the station whose call letters have been placed in No. 1 push button.

Then remove the key.

NOTE: On Model 1128 the push button on the extreme right (manual) serves as a release for all other push buttons and should be depressed before operating the manual tuning control.

NOTE: On Model 1118 the push button which will ordinarily be used for Police calls does not lock in the depressed position. It serves as a release for all other buttons and should be depressed before operating the manual tuning control.

By means of the manual tuning knob, turn the dial pointer to some other position. Then check the setting by pressing the button which has been set. If the pointer stops too soon or goes too far, a second setting will be necessary.

To make the second setting, observe how far the pointer stops from the correct position for that station. Replace the key in the disc and tune far enough to one side of the correct position to make allowance for the difference noted in the first setting.

The electric tuning system is now correctly set for the 1st station. Follow through with this same procedure until the proper adjustments have been made for all eight of the favorite stations. When tuning the receiver by means of the push buttons, the Local-Distance switch should be turned to the "Local" position. Selector Switch

Should the selector switch become inoperative in the field, it should not be disassembled for repair, but should be returned to the factory via an authorized Crosley Distributor.

## REPLACING DRIVE CORD ON THE 1128

To replace the dial drive cord, the following procedure should be carefully followed.

1.—Remove the knobs, plugs, and hold down screws from the chassis then remove the chassis from the cabinet.

2.—Remove the drive cord from the pointer, the dial light sockets from the dial bracket, then the complete dial assembly.

3.—Remove the broken cord and tension spring.

4.—Cut a piece of drive cord exactly 50 inches in length. Fold double then tie the tension spring approximately one inch from the end, this gives you a loop 24 inches long.

5.—Close the condenser gang, this should place the eyelet in the pulley on top.

6.—Insert the cord through the eyelet in the large pulley from the inside. Hook the loose end of tension spring on catch in pulley.

7.—Remove double brass pulley from front of chassis.

8.—Take one side of drive cord and make one half turn in a counter-clockwise direction around large pulley.

9.—Hold brass pulley in left hand and make two complete turns in a clockwise direction around small end. While keeping tension on cord mount pulley to chassis. Then continue cord up and over the right hand idler pulley in a counter clockwise direction (¼ turn). Continue across to left hand idler pulley and on around and down to bottom of large pulley. Stretch tension spring and snap cord over pulley rim.

Place cord clamp (W-46290) on drive cord approximately ¼ inch from inside edge of pulley rim.

10.—Replace drive belt, dial assembly and dial lights.

11.—Place pointer at extreme left end of dial, close condenser gang. Hook drive cord in pointer, check pointer travel before cementing cord to pointer.

Fig. 4 Phonograph Pickup

## SOCKET VOLTAGES

The tube socket voltages are measured from the tube socket contacts to the chassis with a 1000 ohm per volt, 500 volt D. C. voltmeter (except filaments) with the receiver in operating condition and no signal input. The volume control should be turned full "ON," the tone control should be turned to the "TREBLE" position (counter-clockwise), the Local-Distance switch should be turned to the "Distance" position and the condenser gang should be rotated to the minimum capacity position. The filament voltages should be measured with an accurate low range A. C. voltmeter (approximately 0-10 volts). Readings may vary plus or minus 10% of values given.

W	Push Button only (1227)
W	Push Button Escutcheon (2) (1217 and 1227)

**PUSH BUTTON TUNING SYSTEM**  
The push button electric tuning system employed in this receiver incorporates eight push buttons, a selector switch and an electric motor. The discriminator switch, item 65—also Fig. 5, incorporates eight metallic discs, each of which operates in conjunction with a different push button to tune-in some favorite station. That is, the 1st push button on the left as you face the front of the cabinet work with No. 1 disc, and the 2nd push button works with No. 2 disc, etc.

**SETTING PUSH BUTTONS**  
To set the electric tuning system, turn the receiver "ON" and depress No. 1 push button. When the dial pointer stops rotating, the key slot in No. 1 disc on the selector switch will be in the "UP" position. Remove the key from its mounting and place it (knob up) through No. 1 hole in the disc identification bracket. If it does not drop into the slot in the disc, push it in with the fingers.

Turn the Local-Distance switch to the "Distance" position. By means of the station selector knob, tune-in AS ACCURATELY AS POSSIBLE, the station whose call-letters have been placed in No. 1 push button. Then remove the key.  
NOTE: The push button which will ordinarily be used for POLICE calls does not lock in the depressed position. It serves as a release for all other push buttons and should be depressed before operating the manual tuning control. (The first sets of this model were built with non-lock type push buttons).

By means of the manual tuning knob, turn the dial pointer to some other position. Then check the setting by depressing the button which has been set. If the pointer stops too soon or goes too far, a second setting will be necessary.  
To make the second setting, observe how far the pointer stops from the second position for that station. Replace the key in the disc and tune far enough to one side of the correct position to make allowance for the difference noted in the first setting.

The electric tuning system is now correctly set for the 1st station. Follow through with this same procedure until the proper adjustments have been made for all eight of the favorite stations. When tuning the receiver by means of the push buttons, the Local-Distance switch should be turned to the "Local" position.

**Tuning Motor**  
Should the clutch on the tuning motor fail to operate satisfactorily, either by not engaging or not releasing when it should, the two tension springs located on the back of the motor should be readjusted.  
With the receiver sitting in its normal operating position, bend both tension springs until the clutch will not engage. Slowly decrease the tension on both springs until the clutch engages and releases satisfactorily. Check the operation of the motor several times to be certain that the tension is correct.

**Selector Switch**  
Should the selector switch become inoperative in the field, it should not be disassembled for repair, but should be returned to the factory via an authorized Crosley distributor.

MODELS 1217, 1227  
Voltage, Alignment  
Notes

CROSLLEY CORP.

NOVEMBER, 1937 CHASSIS MODELS 1217 & 1227

These model Crosley radios are 12-tube AC receivers designed for Standard Broadcast and Short Wave reception. They incorporate such features as push buttons, 535-1725 Kilocycles or 555-173 Metres (American Broadcast Band) 2.0- 6.8 Megacycles or 150-44.5 Metres (Police & Amateur Band) 6.6- 22 Megacycles or 45.5-13.5 Metres (High Frequency or Foreign Band)

CIRCUIT DESCRIPTION

Twelve tubes are employed in a superheterodyne circuit which consists of an R. F. amplifier, separate oscillator and modulator tubes, 455 kilocycle I. F. amplifier, a composite detector, AVC and quiet or "squelch" tube, two stage audio amplifier—the output of which uses four pentode tubes in push pull parallel and power supply.

The 1st I. F. transformer is a triple-tuned unit, which in conjunction with the Local-Distance switch, controls the selectivity of the receiver. Quiet tuning is accomplished while tuning by means of the push buttons due to the action of the 6Q7G tube, item 55A, on the audio amplifier. When any push button is depressed, A. C. voltage is impressed upon the control grid of this tube through one or the other of condensers 20B or 20C. A portion of this voltage is rectified and passed on to the control grid of the 6Q7G A. F. tube through resistors 42B and 40, the effect being to bias the tube beyond cutoff.

The diode plates of the 6Q7G A. F. tube have no effect.

ion electric tuning, automatic volume control, Local-Distance switch and push pull parallel output. The tuning range is divided into three bands as follows: (American Broadcast Band) (Police & Amateur Band) (High Frequency or Foreign Band)

upon the circuit and the socket terminals for these two elements are only used for junction blocks. The 450 ohm field of the speaker is located in the negative leg of the power supply.

The bias voltage for the 6U7G I. F. amplifier tube is obtained across a 250 ohm resistor, item 47, located between the speaker field and ground.

SOCKET VOLTAGES

The tube socket voltages are measured from the tube socket contacts to the chassis with a 1000 ohm per volt, 500-volt D. C. voltmeter (except filament) with the receiver in operating condition and no signal input. The volume control should be turned full "ON", the tone control should be turned to the "TREBLE" position (counter-clockwise), the Local-Distance switch should be turned to the "Distance" position and the condenser gang should be rotated to the minimum capacity position. The filament voltages should be measured with an accurate low range A. C. voltmeter (approximately 0-10 volts). Readings may vary plus or minus 10% of values given.

TUBE SOCKET VOLTAGE READINGS

Tube	Function	H	F	S	Sr	K	Go	Ga
6U7G	R. F. Amplifier	6.3	255	0	0	0	95	95
6X3G	Modulator	6.3	255	0	0	0	95	95
6X3G	Oscillator	6.3	125	3	3	0	—	—
6U7G	I. F. Amplifier	6.3	255	0	0	0	—	—
6Z7G	Det., AVC & "Squelch"	6.3	185	0	0	0	—	—
6Q7G	1st. A. F. Amplifier	6.3	185	0	0	0	—	—
6Q7G	2nd. A. F. Amplifier	6.3	240	0	0	0	—	—
5Y3G	(2) Rectifier	5.0	—	—	—	255	—	—

Power consumption approximately 120 watts at 117.5 volts. Voltage drop across speaker field 12 volts.

SPECIAL POWER TRANSFORMER

In localities where the voltage variation on 50 or 60 cycle power supply lines is greater than customary commercial limits, special 50/60 cycle power transformers are available. These transformers have a "high" and "low" voltage tap on the upper side of the chassis. The "high" voltage lead (BLACK) and the "low" voltage lead (ORANGE) are connected to a terminal strip near the transformer.

The voltage range of the "low" tap of the 95-130 volt transformer is from 95 to 112½ volts and of the "high" tap is from 112½ to 130 volts. The range of the "low" tap of the 190-260 volt transformer is from 190 to 225 volts and of the "high" tap is from 225 to 260 volts. The accompanying illustration shows the connections for changing from high to low or low to high line voltage. Note the "jumper" wire which is attached to the

terminal at which one side of the power cord is attached. The other end of this jumper wire should be connected to the ORANGE or BLACK lead of the transformer

TOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.

Aligning the R-F Amplifier. When aligning the R-F amplifier the output lead from the signal generator is connected to the "ANT" terminal of the receiver. For the Broadcast Band a 200 mmf. condenser should be connected in series with the output lead of the signal generator and for the High Frequency and Police Bands a 400 ohm carbon resistor should be used in place of the condenser.

Each band should first be SHUNT ALIGNED and then SERIES ALIGNED where provision is made for series alignment (Broadcast Band). The band selector switch should be set for the band being aligned and the signal generator should be set to the frequency indicated for each adjustment, ¶ (D) below.

(a) With the station selector adjusted so that the tuning condenser plates are completely out of mesh, adjust the "OSC" shunt trimmer until the MINIMUM CAPACITY SIGNAL (D) is heard (it is not necessary that the receiver tune through this signal).

(b) Adjust the station selector so that the SHUNT ALIGNMENT SIGNAL (D) is tuned-in with maximum output. Then adjust the "R.F." and "ANT" shunt trimmers for maximum output. Readjust the station selector slightly so that the generator signal is tuned-in with maximum output and check the adjustment of the "R.F." and "ANT" trimmers. DO NOT READJUST THE OSCILLATOR TRIMMER.

NOTE: When shunt aligning the Police and High Frequency Bands care must be exercised so that the circuits will be aligned on the correct frequency rather than on the image frequency which is approximately 910 kilocycles less than the fundamental. To check on this, increase the output of the signal generator ten times, or more, and try to tune-in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct frequency.

(c) To align the series trimmer (See Fig. 2), set the signal generator to the frequency indicated below (D) and then tune-in this signal with the station selector for maximum output. To obtain the best adjustment for the series trimmer, it will be necessary to rotate the station selector back and forth slightly while adjusting the trimmer for maximum output. Minor tolerance variations in series alignment at 2500 kilocycles in the Police Band and at 7000 kilocycles in the High Frequency Band may be compensated for by slight repositioning of the grid lead of the antenna coil in the Band affected.

primary, according to the line voltage the receiver is to be used on.

NOTE: Any change made in the power supply circuit of the receiver should be plainly stamped or otherwise permanently recorded on the rear of the chassis.

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits may be properly aligned with the use of a modulated signal generator and an output meter.

Connecting Output Meter.

Connect the output meter to the plates of the two 6K6G output tubes. Be certain that the meter is protected from D. C. by a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning The I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6U7G 1st I-F Amp. tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the ground terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control knob to the right (ON) and turn the tone control knob to the left (REBLE).

(c) Set the band selector switch on the Broadcast Band.

(d) Turn the Local-Distance Switch to the "Distances" position (Right).

(e) Set the signal generator to 455 kilocycles.

(f) Adjust both trimmer condensers located on top of the 2nd I-F transformer for maximum output.

(g) Transfer the signal generator lead to the top cap of the 6A8G tube, leaving the tube's grid clip in place.

(h) Close the middle trimmer of the 1st I-F transformer. (Do not force adjustment screw).

(i) Adjust the top and then the bottom trimmers of the 1st I-F transformer for maximum output.

(j) Adjust the middle trimmer of the 1st I-F transformer for maximum output.

DO NOT ADJUST THE TRIMMER CONDENSERS LOCATED ON THE 2ND I-F TRANSFORMER WITH THE SIGNAL GENERATOR LEAD CONNECTED TO THE 6A8G TUBE.

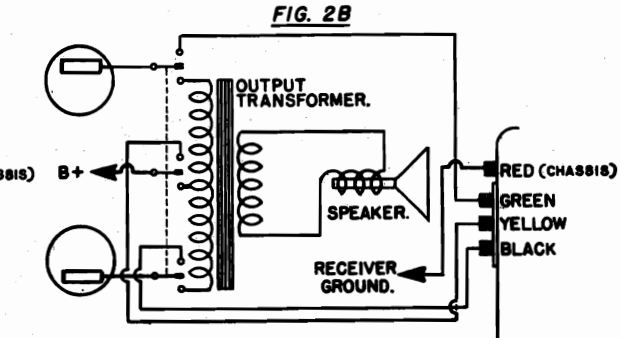

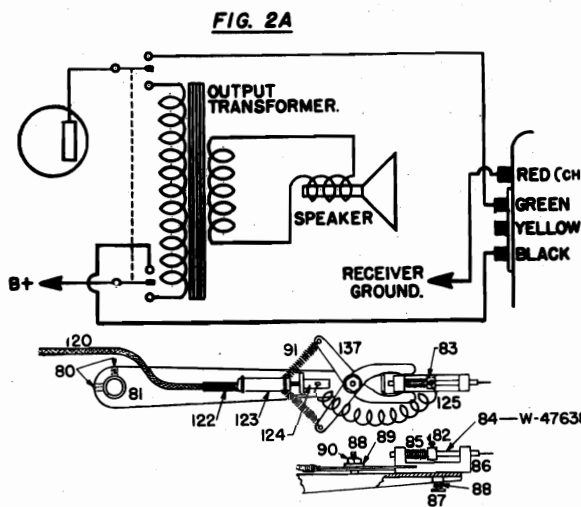

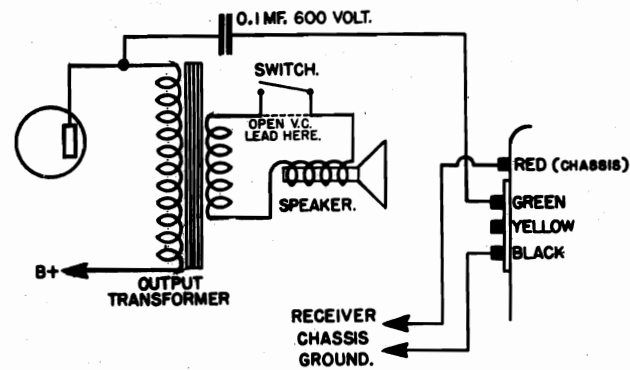

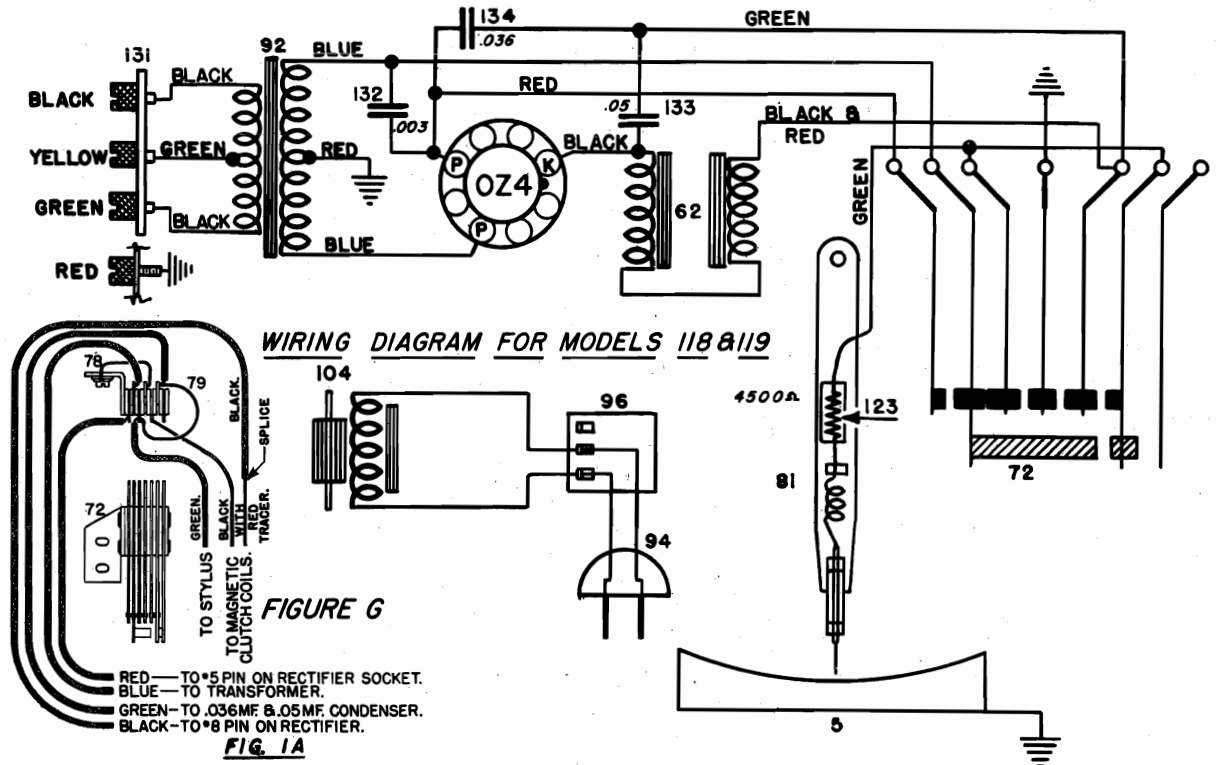

ALWAYS USE THE LOWEST SIGNAL GENERA-

MODELS 118,119  
Reado Printers  
Operating and  
Service DataINSTRUCTIONS FOR ELECTRICALLY CHECKING  
MODELS 118 AND 119 CROSLLEY READO PRINTERS.

To electrically check the operation of the 118 and 119 printer, it should be connected to a receiver as shown in attached bulletin. Connect a signal generator modulated with any audio frequency less than 500 cycles to the antenna of the receiver and switching the output from the receiver to the printer, with the motor running, turn up the level control on the receiver slowly until sufficient voltage appears across the synchronizing coils on printer to actuate the clutch release. This will release the stylus arm at this same level setting and the modulation should mark lightly on the paper. Increasing the level setting should bring up the blackness of printing to the point just below where the paper begins to smoke which is the desirable printing level. As the level of the receiver is reduced the printing should become lighter and lighter and as the level is further reduced the clutch pawl will hold in and the arm should stop over at the left side of the paper.

Measuring across the relay solenoid with a 1000 ohm per volt D.C. meter synchronization should occur between 45 and 55 volts. In cases where this does not hold true the 02k rectifier should be checked as it will be noted from circuit diagram this tube is switched in the circuit only for synchronization, that is, to rectify the 500 cycle pulse for the relay coils. If the trouble is not found in the tube, the circuit should be checked for opens or shorts and the switch points inspected and cleaned. If circuit and voltages are found okay and printer still refuses to operate properly, the clutch arm should be adjusted according to instructions.

To measure the printing signal, connect a 1000 ohm per volt A.C. meter across the stylus to ground at the switch and advance the level control of the receiver until the stylus is sweeping back and forth across the paper. When printing at desired level on average paper, the voltage reading should pick up to between 200 and 250 volts. If the paper is in doubt, turn the stylus so that it does not touch the paper and connect 18000 ohms from stylus to ground, turn motor off and rotate shaft by hand until stylus arm is half way across on its way from left to right and measure the voltage across this resistor. The voltage should read between 200 and 250 volts as above.

Wherever possible it is advisable to check the operation with a phonograph and a record containing facsimile copy. Such a record may be obtained from The Crosley Corporation for operation on a 33-1/3 R.P.M. turntable.

**1. INSERTING PAPER****TO PREPARE FOR OPERATION**

- The roll of paper should be placed on the roller (129) so that if you were to pull on the end, it would unroll toward you.
- Insert paper between the lower roller and the base (white surface up).
- Push lever, on back of platen bar (5), to the left. (Platen is the center bar that supports paper for the stylus.) This springs open the paper gate (12) Pull paper up between gate and platen.
- Lift bar (20) with the roller paper guides.
- Place paper over paper cylinder. Be sure the paper is lined up and fits over pins in cylinder.
- Release catch holding lever on platen bar, then push roller guides down on the paper.
- Place cleaning brush so that the bristles just bear lightly on the paper, with the bristles toward the stylus.

**2. STYLUS**

VERY CAREFULLY, spread metal fingers (137) and turn the stylus assembly (86) so that the point is toward the paper (BE SURE NOT TO BEND POINT) then release fingers (137). The metal fingers should hold the stylus assembly in line with the stylus arm.

- Turn the motor over by hand. To do this, turn the rubber coupling away from you (clockwise direction) until stylus comes to rest at the left hand side of the paper.
- While turning the motor by hand, depress the magnetic clutch. The stylus will move across the paper. Check the stylus pressure against paper by listening for a slight rub as stylus crosses paper. The correct pressure is indicated by a slight rub but not sufficient to leave a mark on the paper.

**3. RATCHET AND PAWL**

By turning the motor over by hand the operation of the ratchet and pawl (which moves the paper cylinder) can be checked.

- While turning motor by hand and depressing the magnetic clutch as before; turn motor until the stylus arm is at the right hand side of the paper. While the arm is traveling back to the left side of paper, the ratchet moves up ONE tooth and is locked by the pawl (30). This movement of one tooth acts through the gear train and turns the paper cylinder, so that the paper moves up 1/100 of an inch.

If everything checks normal up to this point, plug the power cord into a convenient receptacle (110 volts, 60 cycles).

With motor running, listen carefully for any excessive mechanical vibrations. If present they may be minimized by adjusting the four bolts that mount the motor bracket and the four bolts that mount the sub-chassis to the base.

**CONNECTING TO RECEIVER**

For best results from the READO, (Model 119), the receiver or source of A-F supply should be designed to give the required electrical characteristics that are necessary for the correct operation of the READO, namely:

- At least 5 watts output (clean audio).
- A very good A.V.C. circuit.
- Good sensitivity and selectivity.
- A well filtered power supply (NO HUM).

Figures 1 A & B and 2 A & B show how to connect 119 Printer to Receiver. The switching arrangement is up to the individual, likewise the connection may be varied as in Figure 1 or 2, use the connection that gives the best results.

**CAUTION: NEVER WORK ON PRINTER CONNECTIONS WITH RECEIVER TURNED ON.**

We recommend the Crosley Model 758 Receiver as an exceptional radio receiver, in that the circuit incorporates many new developments that are essential for producing the excellent job of printing of which this READO is capable.

**OPERATION**

If the preceding instructions have been carefully followed, the operation of the READO is practically automatic with the exception of turning ON and OFF.

**TUNING-IN FACSIMILE SIGNAL**

The IMPORTANCE OF ACCURATE tuning of the radio receiver to the station broadcasting Facsimile signal cannot be emphasized enough. Good copy cannot be realized unless the station is tuned-in right on the nose, as the form of printing depends almost entirely on the READO being synchronized with the transmitting equipment.

The procedure for accurate tuning is as follows: Locate desired station on the dial, then tune to each side, then bring pointer back to the exact center of that portion of the dial that the station covers. It will be found much easier to tune-in accurately (Facsimile signals) by tuning to the station that is to broadcast Facsimile signals, WHILE THE STATION IS BROADCASTING A REGULAR RADIO PROGRAM.

**ADJUSTING THE DENSITY OF PRINTING (Blackness)**

First, the receiver must have sufficient output (5 watts or more). The blackness of the printing is regulated by increasing or decreasing the setting of the volume or level control.

**MAINTENANCE**

- Care of the Stylus.  
The stylus may tend to bind in the bakelite block after considerable service due to small particles of carbon collecting on shaft. If this occurs, loosen collar and remove shaft and clean. Replace and adjust as stated in paragraph under "Stylus"
- Care of the Platen Track.  
The platen track is a strip of spring steel that is back of paper gate and is between paper and the platen bar. Due to the method of printing this track collects deposits of carbon after quite a few hours of service and will cause the stylus to stick or the printing density to vary in shade for one sweep. To clean, carefully turn stylus assembly at right angles with the stylus arm. This is done so as to prevent possible damage to the stylus point when removing paper gate. Then push lever back on platen bar and carefully remove paper gate. With a VERY FINE sand paper using a wiping motion from one side to the other, polish the platen track. Replace paper gate. Replace stylus to printing position.

**MOTOR**

The motor should be oiled (each bearing) about once in every three hundred hours of service with a high grade of light lubricating oil. Motor will not run properly on less than 105V.

**CLUTCH**

It is essential that the clutch plate be thoroughly lubricated at all times, check at least once a week. Use a high grade of machine oil for this purpose.

**SERVICE HINTS**

Variations in density or blackness of printing may be due to:

- Receiver may not have the A.V.C. circuit capable of keeping the output constant over wide variations of incoming signal strength.
- Receiver may not have sufficient output.
- Stylus may be stuck in bakelite bracket.
- Stylus may be worn.
- Platen track may have small deposits of carbon on it.

**NOBBLY PRINTING --**

- Receiver not tuned properly (Printer not synchronized with transmitter).
- Bent or loose stylus point.
- Definite vertical light streaks uniformly spaced across the printer matter is an indication of insufficient filtering in the receiver, permitting hum voltage to reach printer.

**NOT PRINTING --**

- Power off.
- Loose or open connection between receiver and printer.
- Stylus stuck.

**STYLUS ARM KEEPS MOVING --**

The stylus arm should come to rest at the left hand side of paper when the volume or level control is reduced appreciably. If it keeps moving back and forth, the end of the magnetic clutch arm that engages the dog on the clutch plate may be slightly worn. If this is the case it may be compensated for by a slight adjustment of the magnetic clutch stop screw. (See illustration) Loosen the stop screw lock nut, then turn screw to the left (counter-clockwise) about a quarter turn or just enough to cause the magnetic clutch arm to engage dog on clutch plate.

CROSLLEY CORP.

**REMEDY**

A1. Gate not holding paper against platen properly.

A1(a) Check gate latch making sure gate is closed.

A1(b) Check gate hold-down lugs on left and right side of platen holder which should prevent gate from crawling up as paper goes through machine.

A1(c) Gate should not be kinked or twisted.

A2. Stylus pressure too light.

A2. Adjust collar on stylus holder.

A3. Platen carbonized.

A3. Clean with light emery paper. To prevent carbonizing do not print too black.

A4. Stylus does not move freely in holder.

A4. Burnish stylus lengthwise with fine emery paper.

A5. Paper

A5. Try new paper.

B1. Carbonized stylus.

B1. Clean stylus; lighten pressure, adjust blackness.

B2. Platen carbonized.

B2. See A3.

B3. Not synchronizing cleanly.

B3(a) Adjust clutch arm and air gap.

B3(b) Check clutch arm point for squareness.

B4. See A4.

C1. Paper not feeding through gate and platen properly.

C1. See A1(a) and A1(b).

C2. Ratchet not working properly.

C2(a) Check ratchet assembly for binding.

C2(b) Adjust ratchet push rod so that pawl has from 1 to 1 1/2 tooth movement each stroke.

D1. Stylus arm not centered.

D1. Re-center stylus arm by adjusting arm on shaft by two set screws.

E. Light or no printing with horizontal lines or streaks, usually accompanied by a black vertical line on one or both sides.

E. Use better antenna remove local interference.

F. Wavy characters; some leaning to the right, others to the left.

F. Wavy characters; some leaning to the right, others to the left.

G. Short dash lines of increasing and then decreasing length appear across paper accompanied by stylus arm not stopping when volume control is turned down.

G. Short dash lines of increasing and then decreasing length appear across paper accompanied by stylus arm not stopping when volume control is turned down.

MODEL 118 READO TROUBLE CHART

CAUSE

TROUBLE

A. Uneven density of print. Light streaks through copy, particularly noticeable on solid black areas.

B. Fuzzy printing. Characters lined up straight and of correct height, but with staggered outlines.

C. Height of characters varies from line to line.

D. Stylus sticks in holes in side of paper.

E. Light or no printing with horizontal lines or streaks, usually accompanied by a black vertical line on one or both sides.

F. Wavy characters; some leaning to the right, others to the left.

G. Short dash lines of increasing and then decreasing length appear across paper accompanied by stylus arm not stopping when volume control is turned down.

H. Paper burns.

I. Paper burns.

J. Paper not set up properly.

K. Paper creased or torn at edges.

L. Too much pressure on gate.

M. Printing too black due to volume being too high.

N. Prints light on records, but O.K. on air.

O. Prints uneven on record, but O.K. on air.

P. Motor will not start.

Q. Motor mounted too rigidly.

R. Record worn out.

S. Change paper.

T. Lap thrust bearing washer with a rotary motion until all radial marks are erased.

U. Lap thrust bearing on turntable same as thrust washer.

V. Loosen mounting nuts under turntable one turn.

W. Use new hard needle.

X. Use new record.

**ALINEMENT PROCEDURE MODELS 233, 251, 256.**

Connect a high impedance AC voltmeter across loud-speaker terminals. Volume control should be set a few-degrees back of maximum volume position. Use a weak signal from generator, strong signals tend to cause improper adjustments.

I.F.: Connect the generator ground to receiver chassis. Using .1 mfd. condenser in series with high side of generator, apply 456 kc. signal to grid of 6D6 I.F. amplifier tube, and aline transformer No. 2. Connect generator to grid of 6A7 tube and aline transformer No. 1.

RF. (See above diagram for location of trimmers.)

Using a 200 MMF. condenser in series with the high side of the generator, turn band selector switch to left hand position and the tuning condenser to about 600 kc. Feed a 456 kc. signal to the antenna and adjust wave trap trimmer for minimum response. With the tuning condenser at minimum capacity feed 1660 kc. signal to the antenna and adjust broadcast antenna trimmer. Set generator for 600 kc. tune receiver to signal and adjust the padder. The tuning condenser should be rocked back and forth through the signal while varying the padder in order to assure perfect alinement.

Using 400 ohm resistor in series with generator, set band selector in center position, set generator to 5400 kc and adjust oscillator trimmer for top frequency. Set generator to 5000 kc, tune receiver to signal and adjust antenna trimmer.

Turn band selector to extreme clockwise position. Using 400 ohm resistor in series with generator, set oscillator top frequency for 16,500 kc—screw trimmer down tight, then unscrew to second peak. Set generator to 15,000 kc, tune receiver to signal and adjust antenna trimmer—Screw trimmer down tight, then unscrew to first peak, rocking the tuning condenser back and forth through the signal while the adjustment is being made. Above procedure for alinement at 15,000 kc must be followed exactly to insure proper tracking. A dead spot at about 12,000 kc will result if antenna and oscillator circuits are not set in proper relation to each other.

**Adjustment of Mechanical Automatic Tuning System**

Any of your favorite stations may be set up on any button, but it is recommended that they be set up in the same sequence as they are received on the dial. Loosen one of the buttons by turning it to the LEFT. A slot is provided in the button into which a coin may be inserted to facilitate turning. After turning the button a few turns to the LEFT, press it in as far as it will go. While holding the button in this position, tune in the station desired very carefully in the usual manner with the manual tuning knob. While still holding the button in, fix the adjustment by turning the button to the RIGHT until tight. Thereafter the station set up on this button will be received whenever this button is pressed in AS FAR AS IT WILL GO.

MODEL 258  
MODEL 259  
Socket, Trimmers  
Alignment, Tuner

DETROLA CORP.

MODEL 270  
Alignment, Tuner

**MODELS 258, 259, 270.**  
**ALIGNMENT PROCEDURE**  
Connect a high impedance AC voltmeter across loud-speaker terminals. Volume control should be set a few degrees back of maximum volume position. Use a weak signal from generator, strong signals tend to cause improper adjustments.

I.F.: Connect the generator ground to receiver chassis. Using .1 mfd. condenser in series with high side of generator, apply 456 kc. signal to grid of 6D6 I.F. amplifier tube, and aline transformer No. 2. Connect generator to grid of 6A7 tube and aline transformer No. 1.

RF. (See above diagram for location of trimmers.)  
Using a 200 MMF. condenser in series with the high side of the generator, turn band selector switch to center (B) position and the tuning condenser at minimum capacity feed 1720 kc. signal to the antenna and adjust broadcast oscillator trimmer for top frequency. Set generator frequency at about 1400 kc. Adjust broadcast antenna trimmer. Set generator for 600 kc. tune receiver to signal and adjust the paddler. The tuning condenser should be rocked back and forth through the signal while varying the paddler in order to assure perfect alignment.

Using 400 ohm resistor in series with generator, set band selector in right hand (F) position, set generator to 6300 kc. and adjust oscillator trimmer for top frequency. Set generator to 5000 kc., tune receiver to signal and adjust antenna trimmer.

**Setting Up the Push Button Station Selector**  
First select six favorite local or strong nearby stations, listing them according to frequency or position on the dial. Setting up weak or distant stations is not recommended. Call the station nearest the left hand end of the dial (nearest 1600 kc.) the No. 1 station and number the other five stations consecutively as they are tuned in on the dial, tuning from left to right. For example assume your selected stations operate on frequencies of 1500 kc., 1300 kc., 1100 kc., 900 kc., 700 kc., and 600 kc. The 1500 kc. station should be listed as No. 1, the 1300 kc. station would be No. 2, and so on through the list with the 600 kc. station becoming No. 6. In setting up the buttons, the 1500 kc. station should be set up on No. 1 button, or the first button from the left, the 1300 kc. station on the second button from the left, and so on until the 600 kc. station is finally set up on the button farthest to the right.

With the band selector set at "B," or the second position from the left, tune in station No. 1. Observe the program in progress, then turn the band selector knob to the extreme left position (A). Push the No. 1 button in as far as it will go; when the proper operating position is reached the button will lock in. Then insert the screw driver through the opening directly above the No. 1 button and turn the larger headed screw until the same program is heard. **Do not force this screw. It should turn very easily and if the station is not heard when the screw is turned all the way in one direction, reverse the direction of rotation until the station is found.** When the station is located, turn the screw back and forth through the station slowly and observe when the station is accurately tuned in, indicated by a minimum of noise or hiss, or by watching the tuning eye on the models so equipped. Inserted in one side of the larger screw head is a smaller screw. This screw is for fine adjustment, and should be turned in and out until position of least hiss is found, or until the tuning eye, on models so equipped, shows the least shadow. It will not be necessary to turn this small screw more than one full turn from the factory adjusted position. As a definite check that the desired station has been tuned in, listen for the station announcement. Set up the remaining buttons in the same manner, and after all stations have been set up, locate the call letters of the stations on the printed sheets supplied with the receiver. Remove the desired call letter blocks from the sheets and insert them in the escutcheon according to the directions on the envelope.

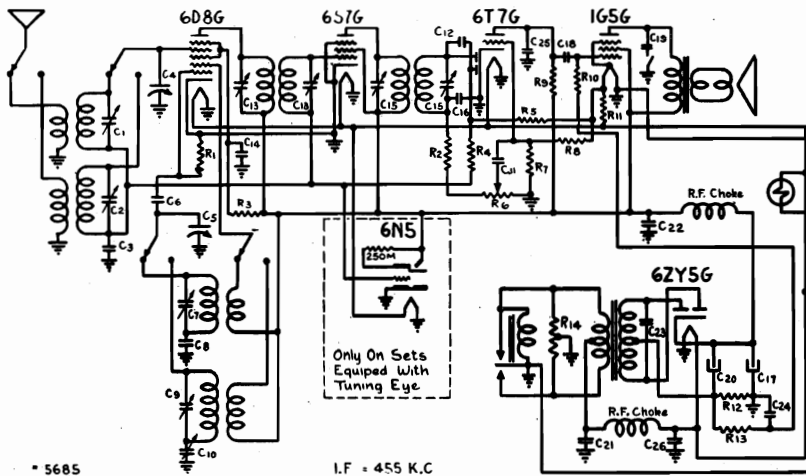

**On Sets Equipped with Phonograph**  
Phono Radio Switch: The Left Hand Position is for Radio Only. The Right Hand Position connects the pick-up and turns on the power for the phonograph motor.

Tubes

- Tubes required are:
- 1—6D8G Oscillator-Translator.
  - 1—6S7G Intermediate frequency amplifier.
  - 1—6T7G Detector—automatic volume control—first audio amplifier.
  - 1—1G5G Power output
  - 1—6ZY5G Rectifier

Do not use tubes of types different from those shown above.

ALINEMENT PROCEDURE

Connect a high impedance AC voltmeter across loud-speaker terminals. Volume control should be set a few degrees back of maximum volume position. Use a weak signal from generator, strong signals tend to cause improper adjustments.

IF. Connect generator ground to receiver ground. Using .1 mfd condenser in series with "high" side of generator, apply 456 kc signal to grid of 6S7G and adjust second IF transformer; same for first IF, applying signal to grid of 6D8G. (See above diagram for location of tubes and transformers.)

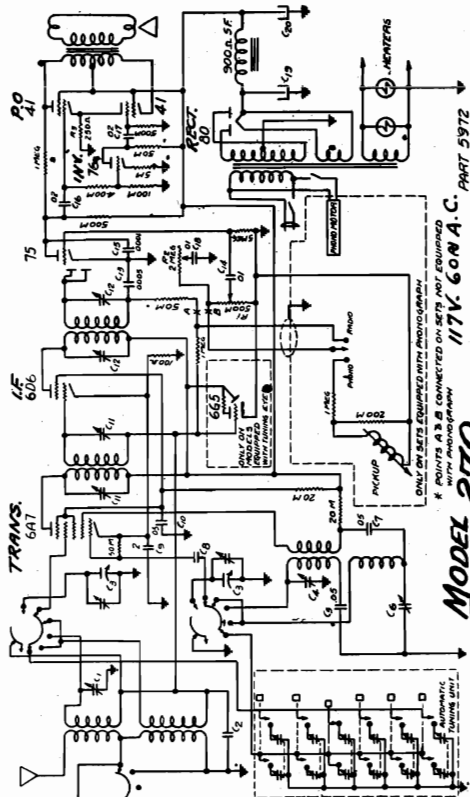

RF. (See circuit diagram for location of trimmers.) Using 200 mmf condenser in series with generator, feed 1725 kc signal to antenna lead and adjust oscillator top frequency. Set generator at 1400 kc, tune receiver to signal and adjust broadcast antenna trimmer. Set generator to 600 kc, tune receiver and adjust padder. The tuning condenser should be rocked back and forth through the signal while the padder is being adjusted in order to obtain perfect alinement.

Using 400 ohm resistor in series with generator, set band selector in short wave (right) position, feed 15,600 kc signal to antenna and adjust oscillator trimmer—screw trimmer down tight and unscrew to SECOND peak. Set generator to 15,000 kc, tune receiver and adjust antenna trimmer—screw trimmer down tight and unscrew to FIRST peak, rocking the condenser back and forth through the signal while the adjustment is being made. Above procedure for alinement at 15,000 kc must be followed exactly to insure proper tracking. A 'dead spot' at about 12,000 kc will result if antenna and oscillator are not set in proper relation to each other.

IF PEAK 456 KC

Models 282 — 288  
 550 to 1600 kilocycles.

Connect the "A" and "B" plugs as shown in the illustration. It makes no difference which socket on the "B" pack, the three prong "B" plugs are inserted.

**BATTERY INSTALLATION**

Remove the batteries from the shipping carton, save the small piece of cardboard packing. Place the "B" pack in the cabinet as shown in the illustration. Then put in the "A" pack. Take the small piece of cardboard packing and fold to a size that will wedge the "A" pack between the shelf and bottom of case. (See illustration.) The packing is used to prevent the "A" pack from being loose in the case.

IF PEAK 455 KC

MODEL 286

**MODELS 282, 286, 288, ALIGNMENT PROCEDURE**

I.F. Frequency 455 KC. Set Range 540-1580 KC. Connect the test oscillator, or signal generator, to the set as follows: Connect the "hot" side of the signal generator to the grid of the 1A7 tube, and the ground side to the terminal on the back of the chassis. An output meter should be connected across the voice coil leads of the speaker to indicate resonance. Align the I.F. trimmers at 455 KC for maximum meter reading. Adjust the trimmer on the back of the variable condenser at or near 1400 KC at full volume on a weak broadcast signal. When aligning the set do not set the receiver on or near a metal work bench or other large metal object, as it will affect the tracking of the receiver.

MODELS 406R, 412  
MODEL 408R  
Schematics

This is a battery operated superheterodyne receiver with full automatic volume control. A self-contained loop is incorporated which makes the use of an antenna unnecessary. It is designed to function with an "A" supply of 1.5 volts and a "B" supply of 90 volts. The broadcast range coverage is 540-1600 kilocycles.

**MODEL A Phono Converter**  
**MODEL 411 Phonoscope DEWALD RADIO MFG. CORP.**  
**Schematics, Data**

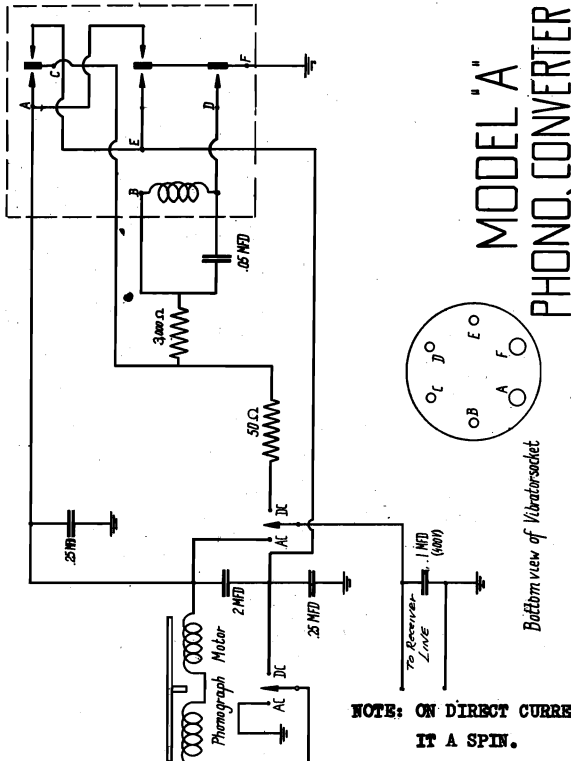

The "PHONOSCOPE" is a combination audio and wireless playback. Disc recordings may be played directly through this unit, or may be reproduced through a remote radio receiver. A microphone may also be used instead of disc recordings. The unit has been designed to operate on 105-125 volts 60 cycles A.C. unless otherwise specified.

**PHONOGRAPH** The phonograph motor and unit is turned "on" by rotating the knob **OPERATION** on the right in a clockwise direction. Further rotation in this direction increases the volume. Turn the knob on the left side to the clockwise position. Allow about a minute for the tubes to become sufficiently heated. Disc recordings may now be played through the speaker in the PHONOSCOPE.

**MICROPHONE** A high impedance magnetic or crystal microphone may be used in place **OPERATION** of phonograph recordings. The two pin tips should be inserted in the microphone jack in the rear of the cabinet. The microphone may be used as a means of speaking or entertaining through the unit.

**WIRELESS** Wireless reproduction is a method by which signals from the PHONO-  
**REPRODUCTION** SCOPE may be picked up in a remote radio receiver. This is ac-  
 completed by rotating the knob on the left in the counterclockwise position. The receiver through which the recordings or microphone reproduction is to be heard must be turned "on". The volume control should be turned to nearly maximum position; and the dial should be adjusted for approximately 550 K. C. The tuning trimmer which is located under the motor board of the cabinet of the PHONOSCOPE should be adjusted until the loudest "swish" or "hiss" noise is heard through the remote radio receiver speaker. After this adjustment has been made any form of reproduction in the PHONOSCOPE will be heard in the remote unit. Once the trimmer has been adjusted it is advisable to tune the remote receiver in order to pick-up the signals being reproduced. This unit when reproducing through the radio receiver will operate at a distance of fifty feet.

This converter is used with radio and phonograph combinations. The purpose of the unit is to enable the phonograph motor to operate on direct current. Although the radio receiver will operate A.C. or D.C., care must be taken when operating the phonograph, that the converter switch is in the proper position.

**ALTERNATING CURRENT OPERATION**  
 Push the slide button switch to the position marked D.C. The phonograph turn table will spin when the phonograph switch is turned to the phonograph position.

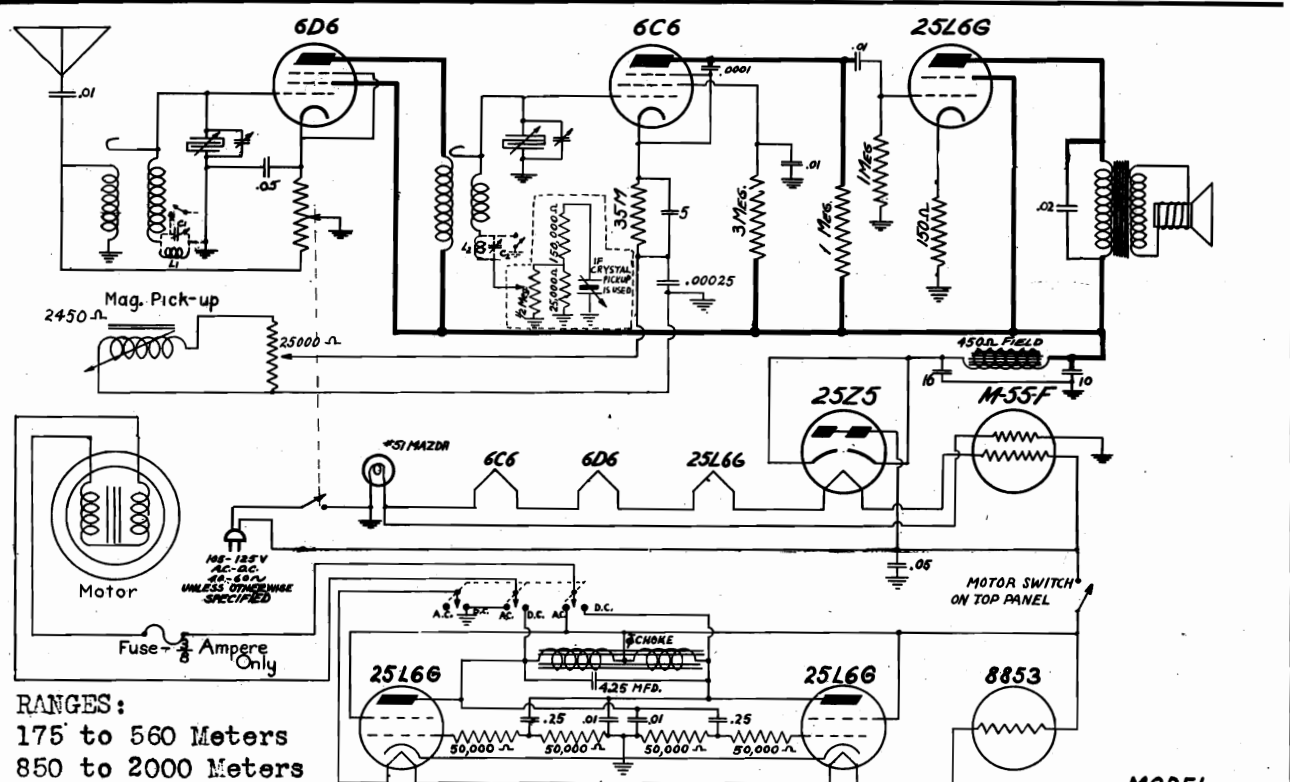

**DIRECT CURRENT OPERATION**  
 Push the slide button switch to the position marked D.C. The phonograph turn table will spin when the phonograph switch is turned to the phonograph position.

**NOTE: ON DIRECT CURRENT IT MAY BE NECESSARY TO START THE MOTOR BY GIVING IT A SPIN.**

**WARNING**  
 ALWAYS BE SURE THAT THE POSITION OF THE CONVERTER SLIDE SWITCH IS IN THE POSITION CORRESPONDING TO THE LINE CURRENT AT THE OUTLET. FOR INSTANCE, IF THE OUTLET IS A.C. THE SLIDE SWITCH MUST BE ON THE A.C. SLIDE. FAILURE TO OBSERVE THIS WHILE OPERATING THE PHONOGRAPH MOTOR, MAY RESULT IN DAMAGE TO THE UNIT.

## Circuit Data, Controls Trouble Chart

### GENERAL FEATURES

These receivers are classed as "Electrostatic and Direct Vision." Electrostatic indicates that the entire deflection system is electrostatic and since the picture is viewed direct, without the use of a mirror, lens or other device, it is referred to as Direct Vision. The latter ensures clarity, brilliance and the widest angle of vision. Steady, clear cut, black and white pictures that are large enough for all the family to enjoy at one time are secured by the use of a fourteen inch cathode-ray tube which furnishes a picture eight by ten inches. A separate high fidelity section brings superb reproduction of the sound channel which is associated with the picture. A single control tunes both the sight and the sound channels so the receiver is no more difficult to operate than an ordinary broadcast receiver. To the above features add its compact size, minimum number of controls and simple straight forward layout and you will have an idea of the first commercial television receiver which we believe you will find easy to install and service in spite of the apparent complexity of the subject Television.

### CIRCUIT ARRANGEMENT

A simple straight line layout is used in these receivers that should prove extremely helpful to the serviceman. Viewed from the front the video receiver is on the left side of the chassis and the sound receiver is on the right. Fig. No. 1 shows the front controls and the sound receiver while Fig. No. 2 shows the rear adjustments and the video receiver. The top portion of the chassis contains both sweep circuits along with the modulating circuits of the cathode-ray tube. To prevent confusion each side is considered separately, half appearing in Fig. No. 1 and the remainder in Fig. No. 2. The seven auxiliary controls shown in Fig. No. 2 are provided for the use of the installer and serviceman. These controls are necessary to make the final alignment of picture size and positioning when the receiver is installed under the operating conditions imposed by the earth's magnetic field and the power supply line voltages. Once properly set these controls do not need adjustment and since they were not provided for the owner's use we suggest that the dealer or serviceman seal the back of the cabinet as it is not possible to tamper with the controls when the back is in place. The use of the parts and tubes shown in Fig. No. 1 and Fig. No. 2 can be checked by comparing the "V" numbers, etc., with the schematic drawings.

#### Operating Controls of the Receiver (Front)

First, become familiar with the controls on the front of the receiver. Since the receiver has been tested before shipment, probably only a few minor adjustments will be necessary. Therefore before touching the adjustments in the rear attempt to operate the set according to the instruction sheet supplied the purchaser and make only the adjustments required. These instructions are repeated here to cover the possible loss of this sheet. Figure No. 1 shows the front of the receiver with the controls numbered and the use and the purpose of these controls is as follows.

#### 1. Marked CONTRAST, ON and OFF

This is a power switch for starting and stopping a set. It also is the volume control of the picture signal. It should be adjusted in conjunction with the intensity control (No. 4) to produce a picture of pleasing contrast to the user. If the location is such that the signal received is very small, it may be necessary to use the full gain of this control, while in a good location it may have to be retarded considerably. If the picture is not satisfactory the rear controls must be adjusted as covered in a following section.

#### 2. Marked SELECTOR

This control is a four position switch provided for covering four television channels.

#### 3. Marked TUNING

Only one control is necessary to properly tune both the sight and sound channels. Simply adjust this control until the best reception of the sound is secured and at this point the picture signal will be correctly tuned.

#### 4. Marked INTENSITY

The intensity or brightness of the picture is controlled by this knob. It should be adjusted in conjunction with Control No. 1 to get the best picture. Note: It is a good plan to retard (turn to the left) this control when starting the set. If about 15 seconds is allowed to elapse before advancing this control it will prevent a small bright spot from appearing on the screen which might eventually darken the screen.

#### 5. Marked FOCUS

This control is used to sharpen the individual lines of the pattern and once set seldom requires further adjustment.

#### 6. Marked VOLUME

This volume control adjusts the audio volume and has no effect whatever upon the picture.

#### Rear Controls of the Receiver

As previously stated, the adjustment of these controls is necessary for the final alignment of picture size and positioning, as the earth's magnetic field and power supply line voltages vary with locations. The location of these controls is shown in Figure No. 2 and their use will be covered in numerical order. Proceed as follows: remove the wood screws holding in the back of the cabinet and pull out the back. The safety switch will open, turning the set off and since it is necessary to have the set in operation while making these adjustments the switch can be made temporarily inoperative. (A large battery clip is convenient for this purpose.) Do not reach into the set with the voltages on. (See Cautions and Warning.) There is one adjustment that cannot be made by these controls, that

of rotating the Cathode-ray tube to cause the picture to properly line up with the viewing opening. To remedy this, turn the set off, remove the elastic band that grips the rear support and rotate the tube by hand in the correct direction.

The function of the seven rear controls are as follows:

#### 1. Vertical Frequency Control

This controls the frequency of the vertical sweep. If the picture is not steady and slips past at intervals, vertically, this control should be adjusted until a steady picture is secured.

#### 2. Vertical Size Control

If the picture is too narrow and out of proportion vertically, this control will remedy the trouble.

#### 3. Vertical Positioning Control

As its name indicates, this control will move the pattern vertically, allowing the picture to be placed directly in the center of the opening.

#### 4. Astigmatic Positioning Control

This is adjusted in conjunction with Control No. 5 to give the best possible focus on the corners of the picture.

#### 5. Horizontal Positioning Control

This control positions the picture horizontally.

#### 6. Horizontal Size Control

The width of the picture is adjusted by this control.

#### 7. Horizontal Frequency Control

If no picture can be secured but modulation (dark and light spaces) can be seen on the screen, the setting of the horizontal frequency control is probably incorrect. Adjust this control until the picture forms.

With the adjustment of these controls the installation should be satisfactory. However, if the signal is weak or if ghosts or noise is present, return to the dipole antenna and make changes as previously suggested until the best position for it is secured.

### LOCATION OF TROUBLE

FAULT	POSSIBLE CAUSES
No picture.	<ol style="list-style-type: none"> <li>1. Power supply trouble in any or all three sources.</li> <li>2. Too much bias on modulator electrode.</li> <li>3. Defective cathode-ray tube.</li> </ol>

It is better to shut the set completely off between adjustments than to suffer a painful or even a dangerous burn. The set is equipped with a safety switch which automatically opens upon the removal of the back of the cabinet. This protects the operator from dangerous high voltages which would otherwise be exposed.

The high voltages that are necessary in this type of equipment are very dangerous and should not be approached in a careless manner.

The serviceman that is engaged in installing or servicing television receivers is urged to take all precautions and run no unnecessary risks.

Voltage Notes

**CAUTION AND WARNING**

Large cathode-ray tubes operate at high voltages and hence are evacuated to a very high degree of vacuum. Therefore the atmospheric pressure on the glass can run into tons depending on the size of the tube. A collapse therefore is as bad as an explosion and all cathode-ray tubes should be handled with care. The Du Mont Laboratories have gone to great expense to provide a cathode-ray tube that is safe for the home and the structural design results in its ability to stand tests nearly twice as severe as usually employed. The serviceman, however, should observe the following rules as he will probably be the only one to handle the average tube.

1. Be careful in handling the tube.
2. Watch the use of tools near the tube.
3. Don't scratch the surface of the glass.
4. Don't stand the tube on a metal surface or in any other way cause certain parts to be quickly heated or cooled.

**TERMINAL VOLTAGES**

Using Weston Model 772 20,000 Ohms per Voltmeter  
(with Televerter)

Tube	Plate	Screen	Grid (Control)	Notes

RESISTOR VALUES

EARLY PRODUCTION

CONDENSER VALUES

Table with columns for Resistor Values (R, Ohms, Watt, Class, R, Ohms, Watt, Class) and Condenser Values (C, Mfd., Voits, C, Mfd., Voits). Includes a legend for R (Regular), S (Special), W (Wire).

SERVICE

While the technique employed in servicing television receivers is similar to ordinary radio practice, there is a greater need for basic knowledge and the time will be well spent that is used to study the fundamental principles of television before attempting actual service work.

Let us consider first the low frequency vertical circuit. Condenser C76 is charged from the power supply through the resistor consisting of R64, R65 and R66 functions mainly as an amplitude or size control, although it has some effect upon the frequency of operation. Condenser C76 charges to practically full power supply potential.

In Fig. 6 the use of a copper oxide rectifier and neon lamp can be explained as follows. The D.C. component necessary for background level, is introduced by the action of the copper oxide (Westector) V24. The neon lamp V23 is provided to protect the equipment in case the controls are properly set and handled the step will be to determine the location of the trouble and eliminate the defective portion. In this case will be aided by the design of the receiver, for as previously pointed out, the various sections are separately located.

The following brief outline, while by no means complete, will serve to point out possible causes and location. While no fast rule can be laid down, once the section failing has been decided on it will generally be found that a systematic check correctly interpreted will locate the fault. A voltage check of the suspected circuit along with the checking of the tubes employed will usually be the next step. Then, if the voltage graph is available and a cathode-ray oscilloscope is available it can be used to trace the source of the trouble.

It is quite probable that the majority of service problems will fall within this range in spite of this limitation, as the correct adjustment of the regular control knobs along with the replacement of tubes and parts will provide the answer to nearly all troubles.

Since the high frequency or horizontal sweep operates in the same manner it will be necessary to repeat the above description. The critical part of the circuit and it is almost essential to keep the various capacities of the horizontal oscillator and amplifier at a minimum in order to keep the return trace time at a minimum. Therefore, if repairs are ever necessary on this circuit care must be taken not to increase the capacity of the circuit.

In Fig. 6 the use of a copper oxide rectifier and neon lamp can be explained as follows. The D.C. component necessary for background level, is introduced by the action of the copper oxide (Westector) V24. The neon lamp V23 is provided to protect the equipment in case the controls are properly set and handled the step will be to determine the location of the trouble and eliminate the defective portion. In this case will be aided by the design of the receiver, for as previously pointed out, the various sections are separately located.

The following brief outline, while by no means complete, will serve to point out possible causes and location. While no fast rule can be laid down, once the section failing has been decided on it will generally be found that a systematic check correctly interpreted will locate the fault. A voltage check of the suspected circuit along with the checking of the tubes employed will usually be the next step. Then, if the voltage graph is available and a cathode-ray oscilloscope is available it can be used to trace the source of the trouble.

It is quite probable that the majority of service problems will fall within this range in spite of this limitation, as the correct adjustment of the regular control knobs along with the replacement of tubes and parts will provide the answer to nearly all troubles.

Figure 3  
Simple Dipole Antenna

ing results are often secured on these high frequencies and no concise rules can be assigned to this work. If the location is on a street having heavy traffic there may be considerable noise level due to automobile ignition systems. In this case, locate the Dipole to the rear of the building and away from the source of the noise as far as possible. In the case of electrical machinery over which you have no control, the same method can be employed along with the utilization of the directional effects of the aerial which will be covered later.

**Room Illumination**  
Wherever possible the receiver should be so placed in the home that a direct glare from either natural or artificial light does not fall upon the face of the cathode-ray tube. The received pictures may be viewed under a variety of conditions where it is not always convenient to darken the room completely. Adjustments made to meet these conditions will not cause damage to the receiver. Viewing the pictures in as dark a room as possible is always at an advantage as it permits the setting of the Intensity and Contrast controls in a manner that will give picture tone values more correctly relating to those actually used in the studio from which the picture is transmitted.

**Installation Process**  
It is a good plan to proceed as follows with the installation.  
1. Erect the Dipole antenna in the clear. Start by using horizontal polarization (mount the rods horizontally) and turn them until their plane is at right angles with the location of the transmitter.  
2. Adjust the receiver to produce a picture.  
3. Return to the antenna and make final adjustments for best signal strength and removal of ghosts, etc.

**Ghost Effects**  
Where the picture appears to be duplicated and slightly displaced, the additional picture is referred to as a ghost. This effect is usually due to the reflection of the signals and can be cured by the slanting or rotating of the Dipole or the use of a reflector or reflectors. If, after all possible positions have been tried, the ghost still exists it will be necessary to change the location of the antenna and try again.

**Directional Effects**  
In the simple Dipole, directional effects are not very pronounced, but it does have a rather sharp no-signal radius and it is possible in some instances to materially reduce interference by placing the offending source in this area. If the installation of the receiver is being made at quite a distance from the transmitter or if the signal level is very low due to local conditions, it is well to consider the use of a reflector. This is done by placing a rod, about ten feet long, parallel with the Dipole and about five feet in back of it. The directional effect of the Dipole remains the

Figure 4  
Dipole Antenna with Reflector

**Antenna Installation**  
In the installation of television receivers the proper antenna is a necessity. Successful installations will result from attention to details, while slipshod and careless work will bring only poor customer satisfaction and repeat calls. There is nothing difficult about the installation of television aerials, a little patience and experience is all that is required. Regular broadcast aerials in the majority of cases will be found useless. Impress this upon the owner and make a satisfactory installation regardless of what other equipment he already has. Satisfactory picture reception is what both of you require for the completion of the installation.

**The Dipole Antenna**  
The Dipole form of aerial is generally satisfactory; it consists of two metal rods, each approximately five feet long and placed on a line with each other. Extreme accuracy in the length of these rods is usually not necessary and if the receiver is located very close to the transmitting station it may be found advisable to cut down the length of each rod. The simple dipole aerial is shown in Fig. No. 3.

**The Lead-In**  
The most popular lead-in from the dipole to the television receiver will be a twisted pair as it is inexpensive and generally satisfactory in locations where the signal is strong. The length of this lead is usually not of extreme importance. It is better to get the Dipole located in the clear and as far from electrical interference as possible than to limit its location by using a theoretical, exact length feeder. The twisted pair should be soldered to the lugs on the Dipole as a good connection is essential and necessary since several changes in the position of the antenna may be required for best results.

The other form of lead-in is the coaxial line such as the Amphenol No. 72. This form of feeder should be used in installations where the length of the lead-in is too long for satisfactory work with the twisted pair and again where the installation is at an extreme distance and every bit of energy picked up must be delivered to the receiver.

**Polarization**  
If the dipole is mounted horizontally it is said to be horizontally polarized, and if vertical it is vertically polarized. Since the physical location materially affects the aerial no specific form can be advised and we can merely suggest that you start by using horizontal polarization and change if necessary to produce the best results.  
**Location of the Antenna**  
Whenever possible the Dipole should be erected so that it is in line of sight with the transmitter. This does not mean that no signals can be secured where a direct view of the transmitter cannot be obtained. Surpris-

same, namely at right angles to the plane. Signals coming from the front will be greatly increased. In using reflectors it is well to bear in mind, however, that any signal approaching from the rear (where the reflector is located) will be greatly attenuated. Fig. No. 4 shows the reflector added to the simple Dipole.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with volume control turned on full and no signal. The line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale.

Tube	Plate	Screen	Cathode	Fil.
6D6	100	100	2.3	6.3
6C6	20	15	2.1	6.3
25L6G	93	100	6	25.0

Voltage across speaker field—26 volts.  
25Z5 cathode to ground—126 volts.

ALIGNMENT PROCEDURE

An oscillator with frequencies of 1500 kc and 350 kc is required. Use as weak a test signal as possible. An output meter should be used across the voice coil or output transformer for observing maximum response.

Rotate variable condenser to the maximum capacity position and set the pointer at the next calibration mark beyond 550. Rotate band-switch clockwise to broadcast (medium-wave) position. Then rotate the variable condenser until the pointer is at 200 and feed 1500 kc to the antenna through a .0001 mf mica condenser and adjust both trimmer condensers on the variable condenser for maximum response.

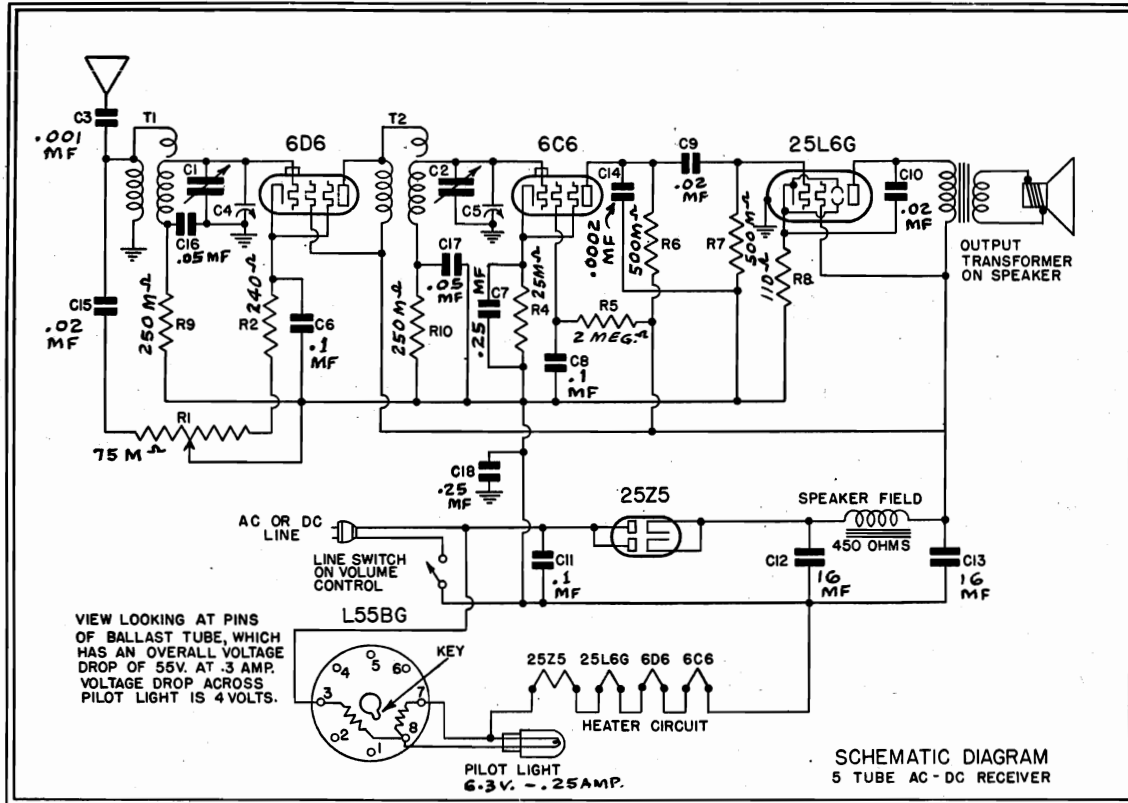

Turn wave-band switch counter-clockwise to long-wave position. Rotate variable condenser until pointer is at 350 and feed 350 kc to antenna. Adjust the long-wave interstage coil trimmer for maximum output. Return to broadcast and repeat entire procedure. The long-wave trimmer is located beneath the chassis and is reached from the right end of the chassis.

Tube Data

The tube complement is as follows:  
1—6D6, r-f amplifier.  
1—6C6, biased detector.  
1—25L6G, beam power output.  
1—25Z5, dual half-wave rectifier.  
1—L55BG, ballast tube.  
Note: Octal-base tubes may be replaced with either metal tubes or equivalent octal-base glass tubes.

SCHMATIC DIAGRAM FOR MODELS BX-208 and BX-209

PREADJUSTMENT OF STATION BUTTONS

For complete instruction for "Preadjustment of Station Buttons" see MODEL CA-208

### TUBE DATA

The tube complement is as follows:

- 1—6D6, r-f amplifier.
- 1—6C6, biased detector.
- 1—25L6G, beam power output.
- 1—25Z5, dual half-wave rectifier.
- 1—L55BG, ballast tube.

Voltage rating .....105 to 125 volts, a.c. or d.c.  
Power consumption ..... 45 watts.  
Frequency range ..... 540 to 1730 kc.

Note: Octal-base tubes may be replaced with either metal tubes or equivalent octal-base glass tubes.

### VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with volume control turned on full and no signal. The line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale.

Tube	Plate	Screen	Cathode	Fil.
6D6	100	100	2.3	6.3
6C6	20	15	2.1	6.3
25L6G	93	100	6.0	25.0

Voltage across speaker field—26 volts.

25Z5 cathode to ground—126 volts.

Voltage across ballast tube (pins 3, 7)—55 volts.

Voltage across pilot light section (pins 7, 8)—4 volts.

The ballast resistor (L55BG on schematic) is in a special tube at the rear of the chassis. In normal operation this tube will become quite hot. For voltage drop specifications, see "Voltage Analysis" above.

### ALIGNMENT PROCEDURE

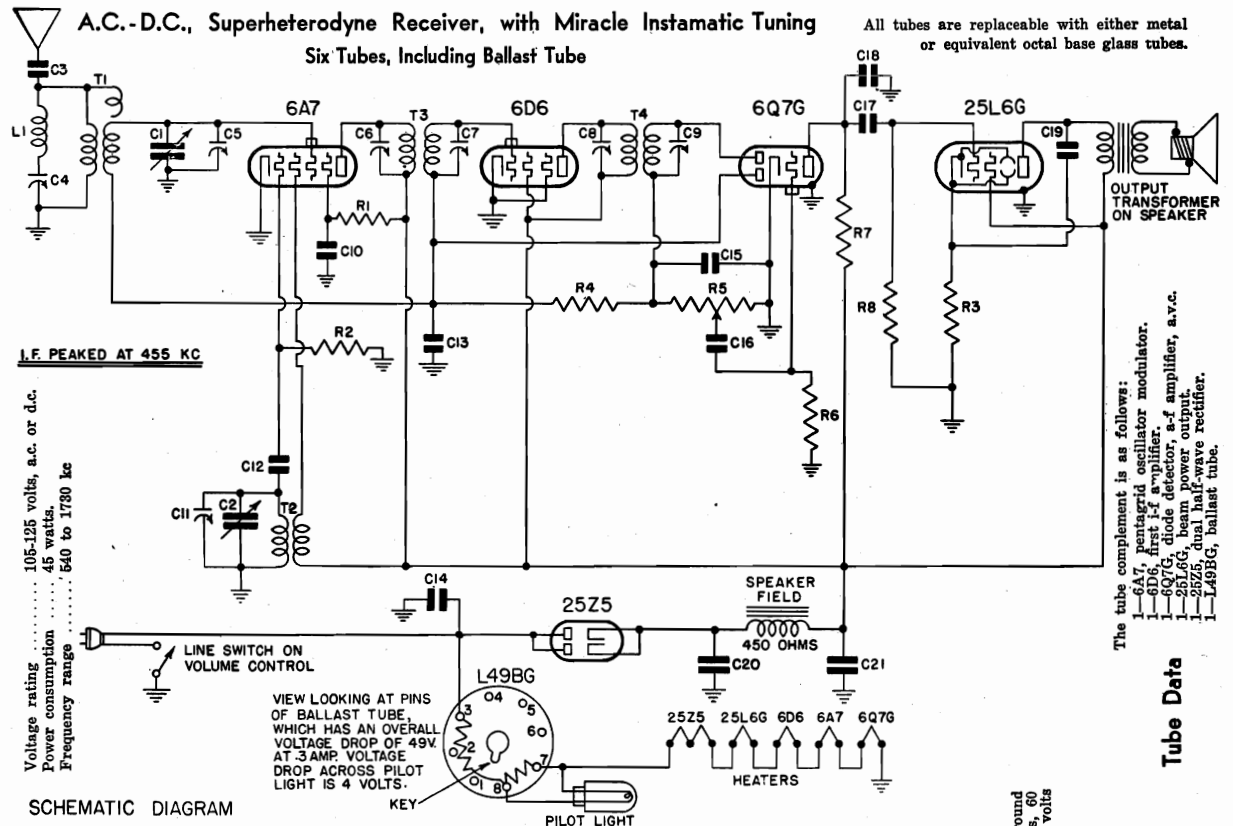

An oscillator with a frequency of 1400 kc is required.

Use as weak a test signal as possible. An output meter should be used across the voice coil or output transformer for observing maximum response.

Rotate variable condenser to the maximum capacity position and set the pointer at the next calibration mark beyond 55. Then rotate the variable condenser until the pointer is at 140 and feed 1400 kc to the antenna through a .0001 mf mica condenser and adjust both trimmer condensers on the variable condenser for maximum response.

MODELS CA208  
CA209, CA234  
Chassis CA

SCHEMATIC DIAGRAM

MODELS CA-208, CA-209 and CA-234

CHASSIS MODEL CA

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. One side of the power line is directly grounded to the chassis base. Under no circumstances, therefore, should a ground wire be permitted to come in contact with any metal part of the receiver.
3. In operating the receiver on d.c. it may be necessary to reverse the line plug for correct polarity.
4. The color coding of the i-f transformer leads is as follows:  
Grid—green  
Plate—blue  
Grid return—black  
B plus—red.
5. In congested areas where the installation of a large antenna is not desirable we recommend the use of the Emerson Flexible Mast Antenna, Model W-82. Instructions for the installation of this compact and efficient antenna are supplied with each kit.  
Where the Flexible Mast is installed permanently, it is urgently recommended that the receiver antenna wire be cut. Leave just enough of this wire to reach from the receiver to the window strip connector.
6. The wave-trap in the receiver has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.

ADJUSTMENTS

An oscillator with frequencies of 455 and 1400 kc is required.  
An output meter should be used across the voice coil or output transformer for observing maximum response.  
Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The two i-f transformers are in oblong coil cans located on top of the chassis deck. The first i-f transformer is the one behind the variable condenser. The trimmers for these transformers are accessible through holes in the tops of the cans.

The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil.

The 455 kc wave-trap is mounted on the same form as the antenna coil on the top of the chassis beside the variable condenser. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible from the side of the chassis. The oscillator coil is located underneath the chassis, beneath the first i-f transformer.

I-f and Wave-Trap Alignment

Swing the variable condenser to the minimum capacity position. Feed 455 kc to the grid cap of the 6A7 tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response. Feed 455 kc through a .0001 mf condenser to the antenna lead and adjust the wave-trap for minimum response. (See General Notes, paragraph No. 6.)

R-f Alignment

Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

Tube Data

\*Item number locates the article on the schematic diagram.

†These condensers cannot be supplied separately.

PREADJUSTMENT OF STATION BUTTONS

Select four nearby stations desired for automatic tuning. Choose one of these stations and any button to be adjusted for it. Follow the procedure outlined below.

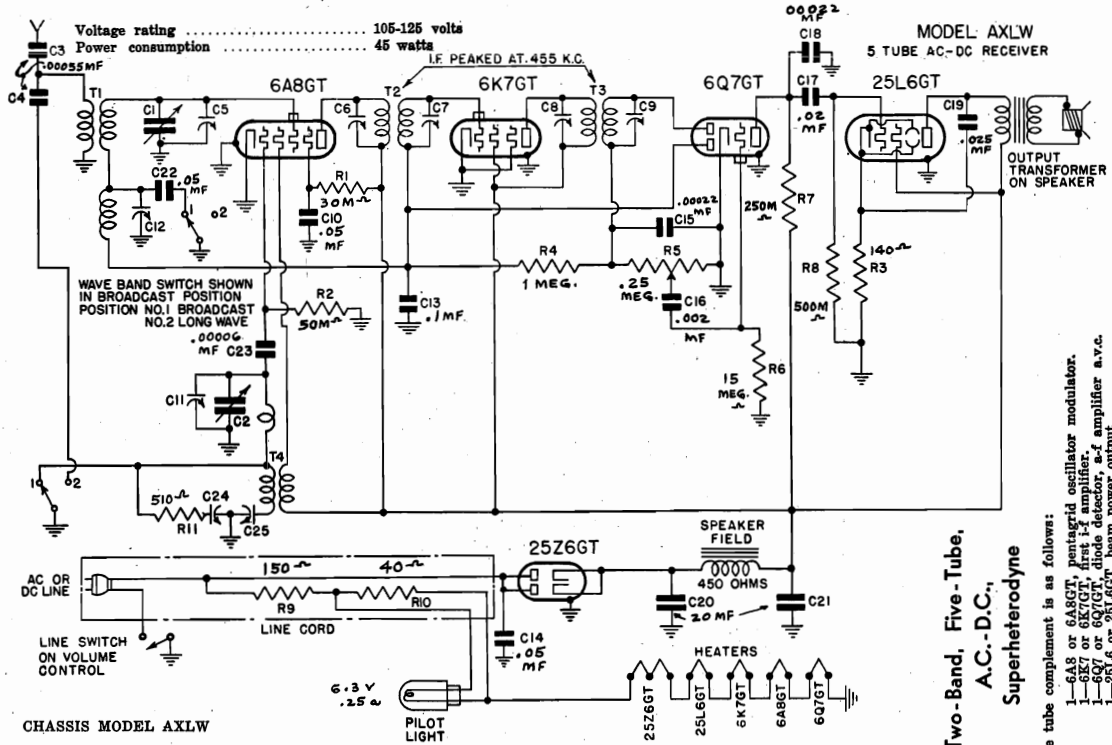

1. Loosen the push-button to be adjusted by rotating it counter-clockwise from 1/4 to 1/2 turn. See Fig. 2.
2. Push the button in as far as it will go and, holding it in firmly, tune in the desired station by means of the selector knob. See Fig. 3.
3. Hold button in with finger of one hand and tighten securely with the other hand. Release the button and tighten it further if possible. See Fig. 4.
4. Remove the tab bearing the station call letters from one of the cards supplied in a separate envelope with the receiver. Insert the tab in the button, pressing it in firmly. Four celluloid caps are supplied in a separate envelope with the receiver. Snap one of these caps into the button over the station tab.

Check the adjustment of the button by detuning the station by means of the selector knob and then pressing the push-button in as far as it will go. The station should come back in clearly and with maximum volume.

Frequency range  
540 to 1650 kc (555 to 182 meters)  
157 to 370 kc (1910 to 810 meters)

Two-Band, Five-Tube, A.C.-D.C., Superheterodyne

- The tube complement is as follows:
- 1-6A8 or 6A8GT, pentagrid oscillator modulator.
  - 1-6K7 or 6K7GT, diode detector, a-f amplifier a.v.c.
  - 1-6Q7 or 6Q7GT, beam power output.
  - 1-25L6 or 25L6GT, beam power output.
  - 1-25Z6 or 25Z6GT, dual half-wave rectifier.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. One side of the power line is directly grounded to the chassis base. Under no circumstances, therefore, should a ground wire be permitted to come in contact with any metal part of the receiver.
3. The filament dropping resistor (R-9—see schematic) is a resistance wire in the special line cord. The cord will, therefore, become warm under normal use. To insure good heat radiation stretch out the line cord to its full length. Do not attempt to shorten it by cutting.
4. In operating the receiver on d.c. it may be necessary to reverse the line plug for correct polarity.
5. The color coding of the i-f transformer leads is as follows:  
Plate—blue  
Grid—green  
Screen—black  
B plus—red.
6. In congested areas where the installation of a large antenna is not desirable we recommend the use of the Emerson Flexible Mast Antenna, Model W-82. Instructions for the installation of this compact and efficient antenna are supplied with each kit.  
Where the Flexible Mast is installed permanently it is urgently recommended that the receiver antenna wire be cut. Leave just enough of this wire to reach from the receiver to the window strip connector.
7. To remove the 6A8 tube from its socket, push up on its center pin from beneath the chassis.

TUBE DATA

All tubes are replaceable with either metal or equivalent bantam glass tubes. The letters "GT" at the end of the tube number indicate that the tube has a minimum size glass envelope. In all other respects it is the same as the metal tube bearing the same number without the "GT".

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohm-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	Plates	Screen	Cathodes	Occ. Plates	Fil.
6A8	100	55	0	100	6.3
6K7	100	100	0	—	6.3
6Q7	43	0	0	—	6.3
25L6	92	100	0	—	25.0

Voltage at 25Z6 cathode—125 volts.  
Voltage across speaker field—28 volts.

ADJUSTMENTS

- An oscillator with frequencies of 455, 1500, 350 and 172 kc is required.
- An output meter should be used across the voice coil or output transformer for observing maximum response.
- Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck beside the speaker. The trimmers are accessible through holes in the top of the can.  
The second i-f transformer is mounted underneath the chassis beneath the variable condenser. The trimmers are accessible through holes in the top of the chassis directly beneath the variable condenser.  
The two-band antenna coil is located directly behind the speaker. The trimmer for the broadcast antenna coil is located on the front section of the variable condenser. The trimmer for the long wave antenna coil is mounted on the top of the antenna coil form. The two-band oscillator coil is located underneath the chassis below the first i-f transformer. The trimmer for the broadcast oscillator coil is located on the rear section of the variable condenser. The antenna trimmer is located on the chassis below the speaker. The section toward the rear of the chassis is C25, the shunt trimmer. The section toward the front of the chassis is C26, the series padding condenser.

i-f Alignment

Turn the band switch clockwise to broadcast position and swing the variable condenser to the maximum capacity position. Feed 455 kc to the grid-cap of the 6A8 tube through a .01 mfd condenser and adjust the four i-f trimmers for maximum response.

Broadcast Alignment

With the band switch in broadcast position set the dial pointer at 200. Feed 1500 kc through a .0001 mfd condenser to the antenna lead and adjust the antenna trimmer (on front section of variable condenser) then the antenna trimmer (on rear section of variable condenser) for maximum response.

Long Wave Alignment

Turn the band switch counter-clockwise to the long wave position. With the dial pointer set at 850, feed 350 kc through 1000 ohm resistor to the antenna lead and adjust the antenna trimmer (on antenna coil) for maximum response. Move the pointer to 1750, feed 172 kc, and adjust the series paddler (trimmer on antenna coil) for maximum response. Rock the variable condenser back and forth while adjusting for maximum response. Return to 850 kc and repeat alignment.

Location of Coils and Trimmer Adjustments

The two i-f transformers are located on top of the chassis deck. The first i-f transformer is the one directly behind the variable condenser. The trimmers for the two i-f transformers are available through holes in the tops of the cans.

The trimmers for the antenna and oscillator are located on the variable condenser. The trimmer on the front section is for the antenna.

The 455 kc wave-trap is mounted on the front chassis wall beneath the variable condenser. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible from the bottom of the chassis.

The color coding of the i-f transformer leads is as follows:  
Grid—green  
Grid return—black  
Plate—blue  
B plus—red

I-f and Wave-trap Alignment

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 455 kc, through a .002 mf paper condenser, to the grid cap of the 6A7 tube (do not remove the grid clip from the tube). Adjust the four i-f trimmers for maximum response. Feed 455 kc to the antenna through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) and adjust the wave-trap trimmer for minimum response. (See General Note No. 7.)

R-f Alignment

With the wave-band switch in the broadcast position, clockwise, set the dial pointer at 140. Feed 1400 kc through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

The police band is self-tracking and does not require any adjustment.

NOTE: The Model BJ-200 should be aligned with the chassis bottom plate in place.

The tube complement is as follows:  
1—6A7 pentagrid oscillator-modulator.  
1—6D6 first i-f amplifier.  
1—6Q7G diode detector, a-f amplifier, a.v.c.  
1—25L6G beam power output.  
1—25Z5 dual half-wave rectifier.  
1—L-49B

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except cathodes and heaters were taken on 250 volt scale.

MODELS BJ-218 and 220

Plate	Screen	Cathode	Osc. Plate	Heaters	
84	46	2.0	84	6.3	Voltage at 25Z5 cathode—130 volts.
84	84	2.8	—	6.3	Voltage across speaker field (Models BJ-200, 210 and 214)—28 volts.
35	—	1.0	—	6.3	Voltage drop across ballast tube L-49BG (pins nos. 3, 7)—49 volts.
115	84	5.5	—	25	Voltage drop across pilot light section (pins nos. 7, 8)—4 volts.

MODELS BL218, BL220

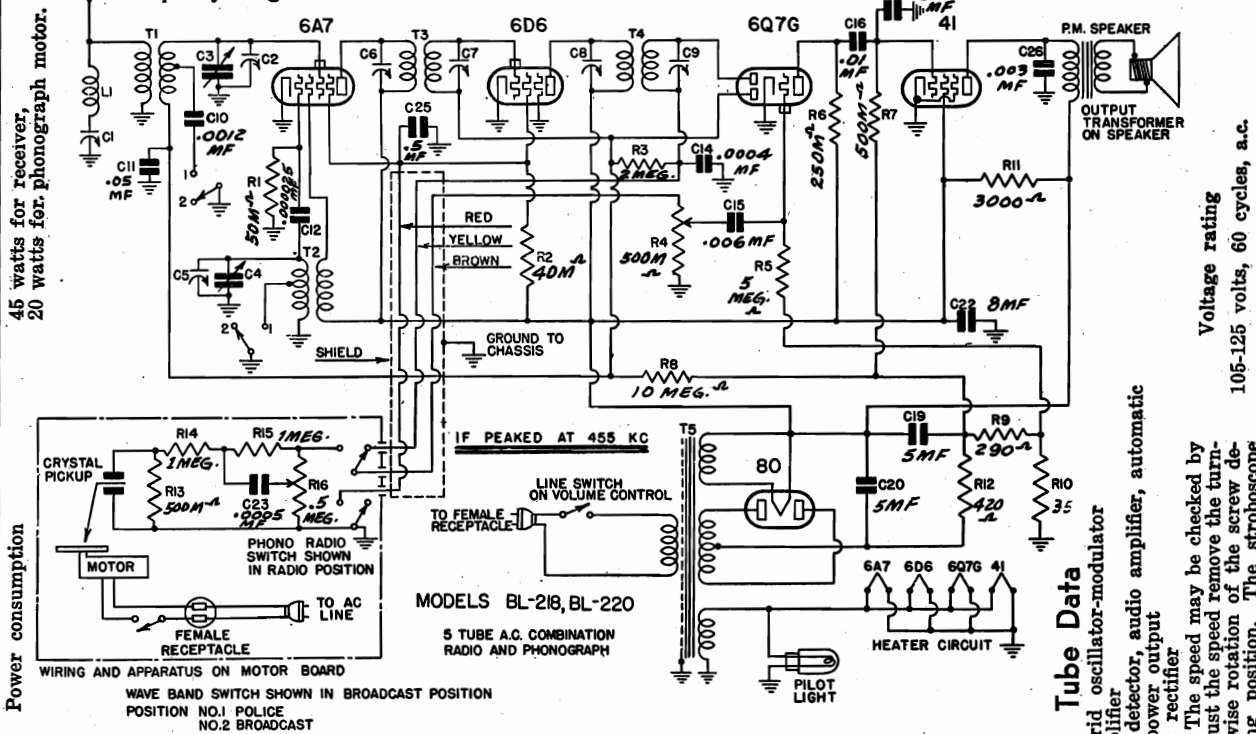

EMERSON RADIO & PHONOGRAPH CORP. Changes, Alignment

Chassis BL  
Schematic, Voltage

- 1.** In receivers used in phonograph combinations: R2 is 40,000 ohms 1 watt, part No. 2NR-217.
- 2.** Receivers bearing serial numbers below 1,802,875 used a 0.0006 mf mica condenser, part No. 4XC-393A, at C12.
- 3.** Receivers bearing serial numbers below 1,800,200 used dial drive shaft and pulley, part No. 5JZ-822.

PRODUCTION CHANGES

Frequency ranges ..... 540 to 1580 kc. and 1580 to 4200 kc.

Power consumption  
45 watts for receiver,  
20 watts for phonograph motor.

Voltage rating  
105-125 volts, 60 cycles, a.c.

Tube Data

- 1-6A7 pentagrid oscillator-modulator
- 1-6D6 i-f amplifier
- 1-6Q7G diode detector, audio amplifier, automatic
- 1-41 pentode power output
- 1-80 full-wave rectifier

The color coding of the leads of the i-f transformers, is as follows:  
Grid—green Plate—blue  
Grid return—black B plus—red

The color coding of the power transformer leads is as follows:  
Primary—two black leads  
High voltage sec.—two red leads  
High voltage sec. center tap—red and yellow lead

With a few exceptions, the color coding of the general wiring is as follows:  
Plate—blue A.v.c. and cathode—white or yellow  
B plus—red Grid—green  
Screen—brown Filament and ground—black

6.3 v. sec.—two heavy green leads  
5 v. sec.—two heavy yellow leads

Location of Coils and Trimmer Adjustments

The two i-f transformers are located on top of the chassis deck. The first i-f transformer is the one directly behind the variable condenser. The trimmers for the two i-f transformers are available through holes in the tops of the cans.

The trimmers for the antenna and oscillator are located on the variable condenser. The trimmer on the front section is for the antenna.

The 455 kc wave-trap is mounted on the front chassis wall beneath the variable condenser. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible from the bottom of the chassis.

I-f and Wave-trap Alignment

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 455 kc, through a 0.02 mf paper condenser, to the grid cap of the 6A7 tube (do not remove the grid clip from the tube). Adjust the four i-f trimmers for maximum response. Feed 455 kc to the antenna through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) and adjust the wave-trap trimmer for minimum response. (See General Note No. 1.)

R-f Alignment

With the wave-band switch in the broadcast position, clockwise, set the dial pointer at 140. Feed 1400 kc through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

VOLTAGE ANALYSIS

The police band is self-tracking and does not require any adjustment. Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters were taken on 250 volt scale.

Tube	Plate	Screen	Cathode	Osc. Plate	Fil.
6A7	182	70	0	182	6.3 a.c.
6D6	182	70	0	—	6.3 a.c.
6Q7	87	—	0	—	6.3 a.c.
41	*165	182	0	—	6.3 a.c.

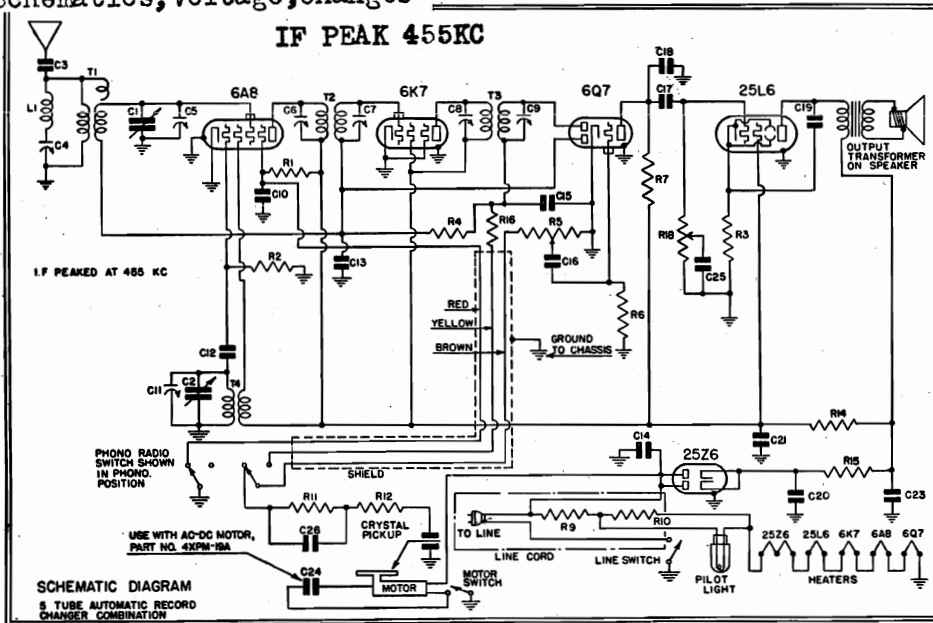

Voltage across speaker field (Models 200, 210 and 214)—70 volts.  
Voltage from B minus to chassis (Models 200, 210 and 214)—80 v  
Voltage from B minus to chassis (Models 218 and 220)—54 volts.  
B plus at 80 tube filament (Models 200, 210 and 214)—182 v  
B plus at 80 tube filament (Models 218 and 220)—232 volts.  
\*Voltage at 41 tube plate in Models 218 and 220 is 220 volts

The phonograph motor has been adjusted at the factory to turn at a speed of 78 r.p.m. The speed may be checked by counting the turns per minute or by using a stroboscope disc and a neon light. To readjust the speed remove the turn-table and turn the speed adjusting screw (located near the turn-table shaft). A clockwise rotation of the screw decreases the speed. The speed should be checked with the pick-up and record in playing position. The stroboscope method will work only when the neon lamp is connected to a 60 cycle, a.c. supply.

CHASSIS MODEL AX

Tube Data

The tube complement is as follows:

- 1-6A8 or 6A8GT, pentagrid oscillator modulator.
- 1-6K7 or 6K7GT, first i-f amplifier.
- 1-6Q7 or 6Q7GT, diode detector, a-f amplifier, a.v.c.
- 1-25L6 or 25L6GT, beam power output.
- 1-25Z6 or 25Z6GT, dual half-wave rectifier.

All tubes are replaceable with either metal or equivalent bantam glass tubes.

PRODUCTION CHANGES

AX-221 and AX-222 chasses bearing serial numbers below 1,890,976 do not have R16, 100,000 ohm resistor, connected in series with the yellow lead to phono-radio switch.  
AX-221 and AX-222 chasses bearing serial numbers below 1,914,451 do not contain resistor R17.  
On model AX-222 a 0.01 mf, 400 volt condenser is connected from B plus to the speaker frame. Another 0.01 mf condenser is connected from the motor mounting plate to ground.  
AX-221 and AX-222 chasses below serial number 1,921,165 have a 210 ohm, 1/2 watt wire-wound resistor at R15.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. Measurements made with 117.5 volts d.c. will be lower than those given below.

- GENERAL NOTES**
- If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
  - One side of the power line is directly grounded to the chassis base. Under no circumstances, therefore, should a ground wire be permitted to come in contact with any metal part of the receiver.
  - The filament dropping resistor (R-9—see schematic) is a resistance wire in the special line cord. The cord will, therefore, become warm under normal operating conditions. To insure good heat radiation stretch out the line cord to its full length. Do not attempt to shorten it by cutting.
  - In operating the a.c.-d.c. combinations on d.c. it may be necessary to reverse the line plug for correct polarity.
  - The color coding of the i-f transformer leads is as follows:  
Grid—green Plate—blue  
Grid return—black B plus—red
  - In congested areas where the installation of a large antenna is not desirable we recommend the use of the Emerson Flexible Mast Antenna, Model W-82. Instructions for the installation of this compact and efficient antenna are supplied with each kit.  
Where the Flexible Mast is installed permanently, it is urgently recommended that the receiver antenna wire be cut. Leave just enough of this wire to reach from the receiver to the window strip connector.
  - The wave-trap in the receiver has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.
  - The receivers in these combinations are of the a.c.-d.c. type. The motors, however, in models 219, 221AC and 232AC are of the AC ONLY type and will be damaged if the combination is used on direct current.
  - To remove the 6A8 tube from its socket, push up on its center pin from beneath the chassis.

ADJUSTMENTS

An oscillator with frequencies of 455 and 1400 kc is required.  
An output meter should be used across the voice coil or output transformer for observing maximum response.  
Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck beside the speaker. The trimmers are accessible through holes in the top of the can.  
The second i-f transformer is mounted underneath the chassis beneath the variable condenser. The trimmers are accessible through holes in the top of the chassis directly beneath the variable condenser.  
The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil.  
The 455 kc wave-trap is mounted on the same from as the antenna coil directly behind the speaker. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible from the rear of the chassis. The oscillator coil is located underneath the chassis, beneath the first i-f transformer.

I-f and Wave-Trap Alignment

Swing the variable condenser to the maximum capacity position. Feed 455 kc to the grid-cap of the 6A8 tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response. Feed 455 kc through a .0001 mf condenser to the antenna lead and adjust the wave-trap for minimum response. (See General Notes, paragraph No. 7.)

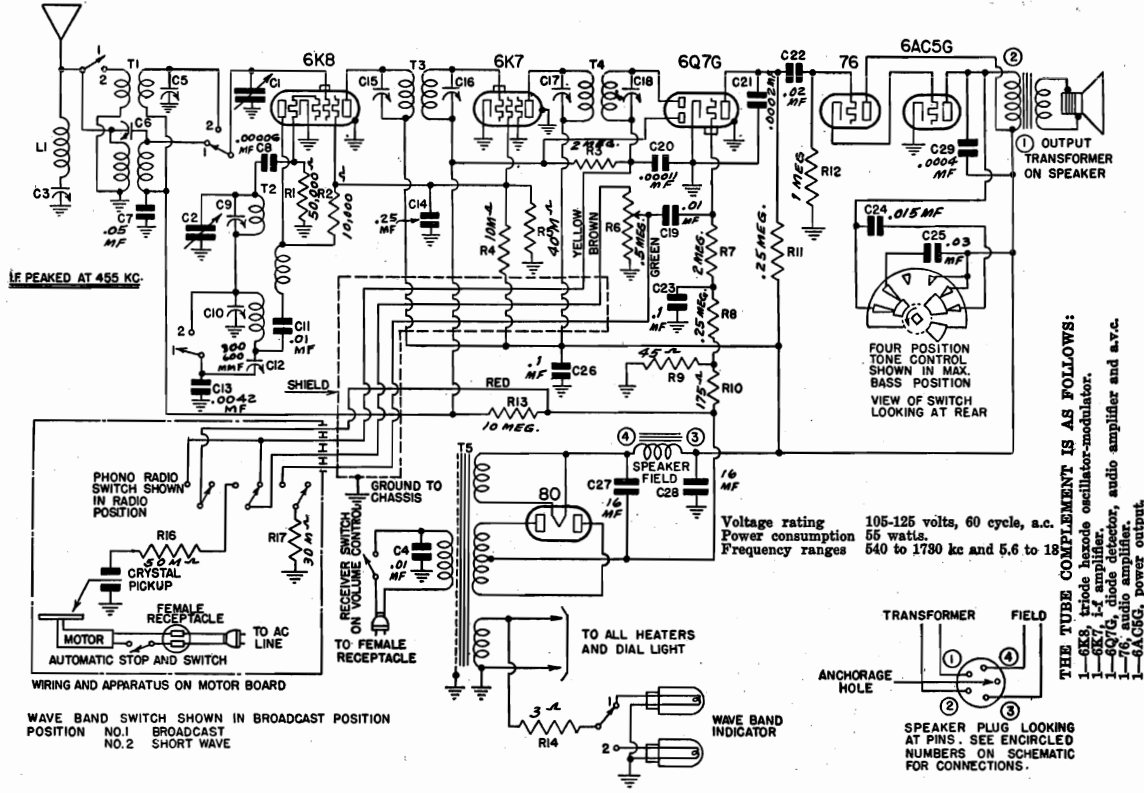

R-f Alignment

Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

- 1-1000, full-wave rectifier.

**PRODUCTION CHANGE**

The colors of leads in the cable to the phono-radio switch on chassis bearing serial numbers below 1876210 are as follows: blue to diode; red to high side of volume control; green to arm of volume control; black to B minus. These changes are easily distinguishable by the presence of a blue lead in the cable.

The color coding of the I-F transformers is as follows:

- Grid—green
- Grid—return—black
- Plate—blue.

The color coding of the power transformer is as follows:

- Primary—two black leads
- High-voltage secondary—two red leads
- High-voltage secondary center tap—red and yellow lead
- 6.3 volt secondary—two green leads
- 6.3 volt secondary—two yellow leads

The adjustable padding condenser for the broadcast band is mounted underneath the chassis (in the corner near the wave-hand switch) with the screw adjustment accessible through a hole in the top of the chassis. The short-wave band has a fixed paddler. When replacing this fixed paddler be careful to use a condenser which has a capacity within 2% of the specified value, otherwise the short-wave coils may not track.

The phonograph motor has been adjusted at the factory to turn at a speed of 78 r.p.m. The speed may be checked by counting the turns per minute or by using a stroboscope disc and a neon light. To readjust the speed remove the turntable and lock the motor (locked near the turntable shaft). A clockwise rotation of the screw decreases the speed. The speed should be checked with the pick-up and record in playing position.

**VOLTAGE ANALYSIS**

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except B plus at rectifier, heaters, and cathode voltages were taken on 250 volt scale.

Point	Screen	Control	Cathode	Plate
6K8	215	215	0	10
6K7	100	100	0	10
6Q7G	100	100	0	10
6AC5G	196	196	0	10

Voltage at 80 ohm tap to B minus (center tap of high voltage winding on power transformer)—300 volts.

Voltage across speaker field—70 volts.

The grid bias for all tubes is developed across resistors R-9 and R-10 (see schematic). The total voltage measured across R-9 and R-10 should be 12 volts.

**Location of Coils and Trimmer Adjustments**

The two I-F transformers are located on top of the chassis deck. The second I-F is the one directly behind the variable condenser. The four trimmers, two for each transformer, are accessible through holes in the tops of the cans. The antenna coil and the broadcast band coils are mounted underneath the chassis (in front of the 76 tube). The antenna coils for the broadcast and short-wave bands and the 455 kc wave-trap are wound on one form and mounted underneath the chassis deck near the 76 tube socket. The trimmers for these coils are accessible through holes in the top of the chassis. The trimmer nearest the front of the chassis is the short-wave antenna trimmer. The central trimmer is the broadcast antenna trimmer. The trimmer nearest the rear of the chassis is the 455 kc wave-trap. The antenna coils for the short-wave bands are wound on one form and are mounted on the inside of the rear chassis. The trimmer for these coils is accessible through the hole in the chassis. The trimmer farthest from the end of the chassis is for short-wave and trimmer closest to the end of the chassis is for broadcast.

**I-f and Wave-Trap Alignment**

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 455 kc through a 0.02 mf paper condenser, to the grid cap of the 6K8 tube (do not remove the grid clip from the tube). Adjust the four I-F trimmers for maximum response. Feed 455 kc to the antenna through a standard dummy antenna (a 0.0002 mica condenser may be substituted) and adjust the wave-trap trimmer (farthest from front on right side of the chassis) for minimum response. (See General Note No. 6.)

**Short-wave Alignment** (Alignment of the short-wave band should precede broadcast alignment.)

Since the dial indicator is fastened to the cabinet, a piece of stiff wire should be fastened to the dial assembly plate and bent over to form a dial pointer when the chassis is removed from the cabinet. Set pointer at extreme low-frequency end of dial with condenser closed.

Use a 400 ohm non-inductive resistor in series with the test oscillator antenna lead when aligning the short-wave coils. Rotate the wave-band switch to the short-wave (counter-clockwise) position, and set the dial at 160 kc. Adjust the broadcast antenna trimmer (closest to end on rear chassis wall) for maximum response and then adjust the broadcast antenna trimmer (central trimmer at right side of chassis). Return dial to 60, feed 600 kc and readjust the broadcast antenna trimmer, rocking the variable condenser (rotate the variable condenser shaft back and forth through a small arc) for maximum response.

**Broadcast Alignment**

By adding a cipher to each figure on the broadcast band calibration, this scale can be made to read directly in kilocycles.

Use a standard dummy antenna in aligning the broadcast coils. (A .0002 condenser may be substituted.) Rotate the dial to 600 kc and set the broadcast antenna trimmer (in corner near 76 tube) for maximum response. Move the dial to 160 and set 160 kc. Adjust the broadcast oscillator trimmer (closest to end on rear chassis wall) for maximum response and then adjust the broadcast antenna trimmer (central trimmer at right side of chassis). Return dial to 60, feed 600 kc and readjust the broadcast antenna trimmer, rocking the variable condenser (rotate the variable condenser shaft back and forth through a small arc) for maximum response.

MIRACLE INSTAMATIC TUNING  
Preadjustment of Station Push-buttons  
FOR CHASSIS BQ

The six push-buttons provide a choice of six favorite broadcast stations for Miracle Instamatic Tuning. Adjustments for any particular station must be made by means of the small cross-slotted button immediately below the chosen push-button. The following procedure must be carefully observed in making these adjustments:

1. Insert the line plug in the electrical outlet. Turn the receiver on by rotating the tone control knob clockwise until the switch is heard to click and then rotate this knob to the extreme clockwise position. Wait about a minute for the tubes to warm up. Turn the volume control knob clockwise until the volume control knob is to about half of its full rotation.
2. Select six nearby stations desired for automatic tuning. Choose one of these stations and any button to be adjusted for it. Find the station call letters on one of the four cards supplied in an envelope with the receiver. Push the call letters from the card and press it in the depression on the front face of the push-button. Insert one of the clear celluloid discs, which are supplied in a separate envelope, over the station tab in the push-button. Press this disc in firmly. See Fig. 4.
3. Push in the manual selector knob (second from left). When push buttons in the selector knob or one of the push-buttons best results are obtained by using a firm rapid action.
4. With the selector knob depressed tune in the desired station. Rotate the selector knob until the mark on the dial face corresponding approximately to the frequency of the station appears in the frequency window. Turn the conical escutcheon window. Identify the station and note the approximate position of the dial face.
5. Push in the button to be adjusted for this station. See Fig. 1.
6. Insert a small thin coin in one of the slots of the adjusting button immediately below the push-button. Turn the adjusting button until the mark on the dial face corresponding approximately to the frequency of the station again appears at the frequency of the station line on the conical escutcheon window. Once the station is heard, tune it in carefully by turning the adjusting button back and forth until the maximum amount of performance is obtained. Repeat this procedure to tune in the station accurately. See Fig. 2.
7. It is very important, when tuning in a station by means of the adjusting button, that the last turning motion of the adjusting button be in the counter-clockwise direction, as indicated in Fig. 3.
8. Check the results by moving the dial face, using the selector knob, to a different position and then pushing in the button. The station should be received clearly and with maximum volume.
9. Adjust the remaining buttons, one at a time, following the procedure outlined above.

VOLTAGE ANALYSIS

CHASSIS BR

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with volume control full on, band-switch in short-wave position (counter-clockwise) and no signal. Voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings below 250 volts, except heaters and cathodes, were taken on 250 volt scale.

Tube	Plate	Screen	Osc. Plate	Cathode	F.V.
6K7 r-f amplifier	280	1100	100	5	6.8 a.c.
6X5 oscillator/modulator	225	1100	100	4.2	6.8 a.c.
6X4 antenna	225	1100	100	4.5	6.8 a.c.
607 diode detector, a.v.c. first audio	170	—	—	4.1	6.8 a.c.
6J5 first audio driver	180	—	—	4.2	6.8 a.c.
6J5 inverted audio driver	280	—	—	9	6.8 a.c.
4-6AC5G's output	275	—	—	0	6.8 a.c.

Voltage across speaker field—65 volts.

Model BR chassis using 3XS-237 speaker will have voltages approximately 10 percent lower. Voltage across this tube will be slightly higher. When band-switch is in broadcast and police positions the screen voltages will read 65 volts. Bias readings on these tubes will be slightly lower.

Location of Coils and Trimmer Adjustments

The i-f transformers are located at the back of the chassis. The first i-f transformer is the one near the electrolytic condenser. The antenna coils for the three bands are wound on one form located on the front wall of the chassis with the trimmers accessible through holes in the chassis. The right-hand trimmer is for the broadcast band, the left-hand trimmer is for the short-wave band and the central trimmer is for the police band. The r-f interstage coils are wound on one form and are mounted underneath the chassis to the left of the wave-band switch. The trimmers are available through holes in the top of the chassis. The trimmer closest to the front of the chassis is for the broadcast band. The trimmer farthest from the front is for the short-wave band. The central trimmer is for compensating the short-wave band at 6 mc. The oscillator coils are wound on one form and mounted underneath the chassis directly behind the wave-band switch. The trimmer closest to the front of the chassis is for the broadcast band, the trimmer farthest from the band-switch is for the short-wave band and the central trimmer is for the police band. The oscillator series padder for the broadcast and police bands are mounted underneath the chassis near the interstage coils. The adjusting screws are available through holes in the top of the chassis. The padder nearest the front of the chassis is for the police band. The padder for the short-wave band is a fixed mica condenser, C9 on the schematic diagram. If this condenser is to be replaced use a condenser with a value within 2% of that specified.

I-f Alignment

Set the wave-band switch at the broadcast (clockwise) position, and the variable condenser at minimum capacity. Feed 455 kc to the grid of the 6K7 i-f amplifier tube through a .02 mf condenser. (Do not remove the grid clip from the tube.) Examine the trimmer screws and locate the screw which is painted red. Screw this trimmer down as far as it will go. Adjust the other two trimmers for maximum response and then adjust the red trimmer for maximum response. Do not readjust the other two trimmers. Now feed 455 kc to the grid of the 6K8 tube and repeat same procedure on the first i-f transformer. Do not touch the adjustment of the second i-f transformer. Failure to follow this procedure may result in impairment of the fidelity of the receiver.

Broadcast Alignment

Since the indicator is fastened to the cabinet, a piece of stiff wire should be fastened to the dial drive assembly-plate and bent over to form an indicator when the chassis is removed from the cabinet. Set indicator at extreme low frequency end of dial with condenser closed. Set the wave-band switch at the broadcast (clockwise) position, and the dial at 60. Feed 600 kc to the antenna (using a 4001 mf dummy antenna) and adjust the broadcast-band series padder for maximum response. Move the dial to 1600 and adjust the antenna trimmer for maximum response. Reset the dial at 60, feed 600 kc and rock the variable condenser while adjusting the series padder for maximum response. Return to 1600 and check alignment. If readjustment is necessary return to 600 and repeat entire procedure.

Police Alignment

Set the wave-band switch at the police-band (central) position and the dial at 1.8. Feed 1800 kc to the antenna (using a 4001 mf dummy antenna) and adjust the police-band series padder for maximum response. Move the dial to 6.0, feed 6000 kc and adjust the oscillator trimmer for maximum response. Then adjust the antenna trimmer for maximum response. Note the interstage coil on this band has no trimmer adjustment. Return the dial to 1.8, feed 1800 kc to the antenna and rock the variable condenser while readjusting the series padder for maximum response. Return to 6000 kc and check alignment. If readjustment is necessary return to 1800 kc and repeat entire procedure.

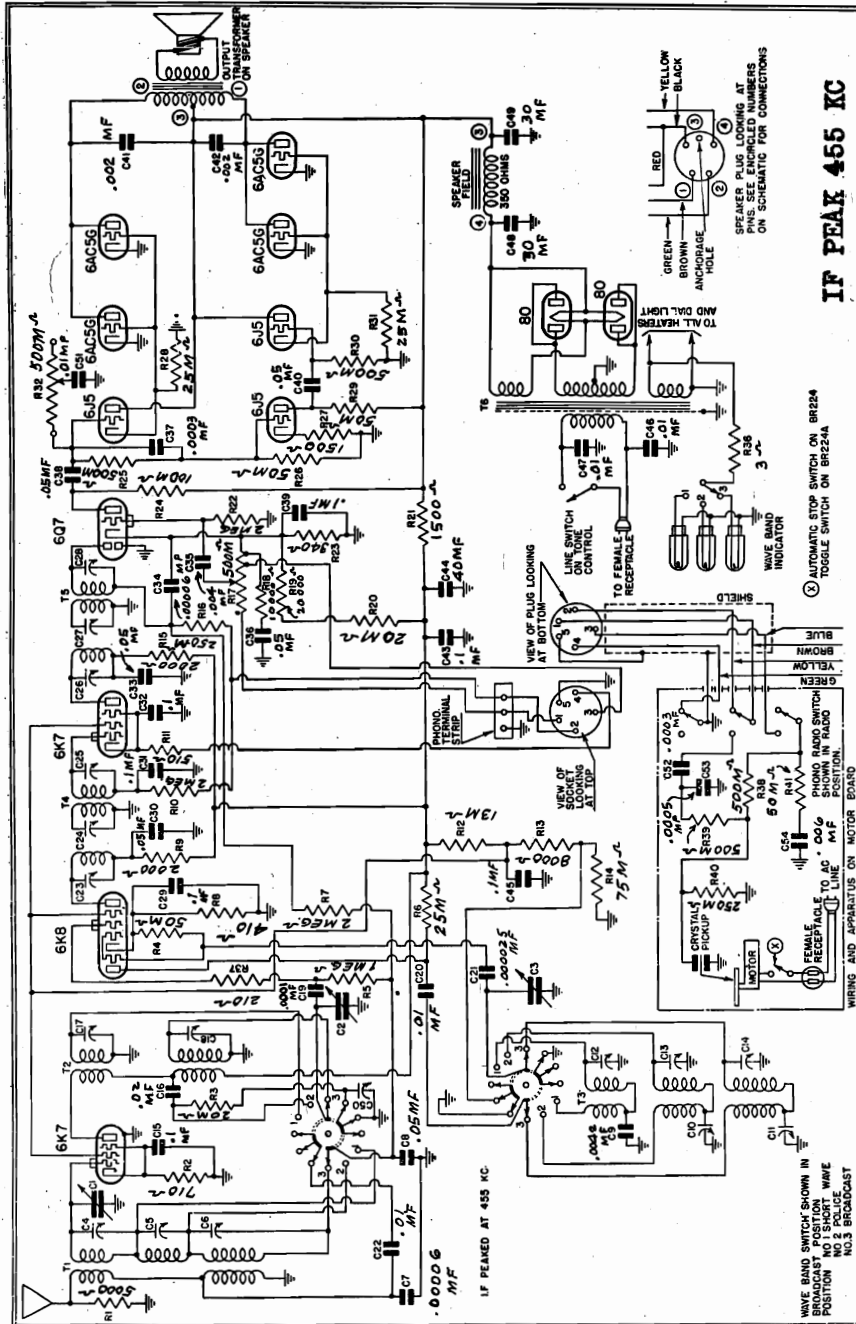

Short-Wave Alignment

Set the wave-band switch at the short-wave (counter-clockwise) position. Move the dial to 20 and feed 20,000 kc to the antenna (using a thin dummy antenna) and adjust the short-wave oscillator trimmer for maximum response. If two peaks are obtained choose the maximum capacity peak. Then an antenna capacity peak. Move the dial to 6 mc, feed 6000 kc to the antenna and adjust the r-f interstage trimmer (central trimmer at left of band-switch) for maximum response.

EMERSON RADIO & PHONOGRAPH CORP. BR224A

MODELS BR224

Chassis BR  
Schematic, Notes

GENERAL NOTES

1. In replacing chassis in cabinet do not tighten mounting screws so much that chassis will not float freely, and do not allow any part of the dial assembly to touch the cabinet. Do not push control knobs on so far that they touch the cabinet front panel. If these precautions are not observed the receiver may become microphonic.
2. The color coding of the power transformer leads is as follows:  
Primary—two black leads  
High voltage sec.—two red leads  
High voltage secondary center tap—red and yellow lead
3. The phonograph motor has been adjusted at the factory to turn at a speed of 78 r.p.m. The stroboscope method will work only when the neon bulb is lighted from a 60 cycle a.c. supply. To readjust the speed on Model BR-224, remove the turntable and turn the speed adjusting screw (located near the turntable shaft). A clockwise rotation of the screw decreases the speed. The speed should be checked with the pickup and record in playing position. To readjust the speed on Model BR-224A, remove the record and set the turntable by turning it slowly to give access to the speed regulator screw through a hole in the turntable. Adjust in same manner as BR-224.

TUBE DATA

Voltage rating	105-125 volts, 60 cycles, a.c.
Power consumption	135 watts at 117.5 volts. 20 watts for phonograph motor.
Frequency ranges	540 to 1800 kc, 1800 to 6,250 kc and 5.8 to 22.0 megacycles.

- 1—6K7, R-f amplifier (behind right-hand section of variable condenser).
- 1—6K8, Triode-hexode, oscillator-modulator (behind left-hand section of variable condenser).
- 1—6K7, I-f amplifier (between the two i-f transformers).
- 1—6Q7, Diode detector, audio amplifier, a.v.c. (left rear corner of chassis).
- 1—6J5, Phase inverter (left side of chassis, third from rear).
- 2—6J5, Second audio amplifiers (left side of chassis, second from rear, and right side of chassis beside electrolytic condensers).
- 4—6AC5G, Dynamic coupled, power output (two are in front of power transformer; other two are alongside power transformer near variable condenser).
- 2—80, Rectifiers (beside power transformer, at rear of chassis).

Part No. 4XPM-18 used with

**MODEL BR-224A**

Thirteen-tube A.C. Radio-Phonograph Combination

### AUTOMATIC OPERATION

1. Turn the receiver "on" in the usual way.
2. Rotate the phono-radio switch knob counter-clockwise to the phonograph position. Wait about a half-minute for the tubes in the receiver to warm up.
3. See that the pick-up is over the needle gauge plate with needle properly in place. If not, complete a *cycle* as follows: Throw the turntable switch "on." The turntable will start to revolve and the cycle of motion on the pick-up arm will follow through. When the pick-up arm comes down (and it can be moved by hand) the cycle is completed. Turn off the turntable switch.
4. The Index and Record Reject Lever are located near the right front corner of the motor board. With this lever at "Manual" position place the records on the record holder shelves. The records should be arranged in the desired order with the desired selection face up and the last selection on top. The first record to be played will rest directly on the shelves. The turntable should be empty.
5. Throw the turntable switch to the "on" position. The turntable should start to revolve.
6. While the turntable is revolving, push the Index and Record Reject Lever to the "Reject" position and let go. When the lever is released, after it has been pushed to "Reject," it will return automatically to the "10" position. If all the records to be played are 12 inch, return the lever to the "12" position. The changer will then begin to go through its cycle and the first record will drop on the turntable. The entire series of records will then be played automatically in sequence.
7. Adjust to the desired volume by means of the regular receiver volume control.
8. Close the cabinet lid to eliminate normal mechanical noises due to needle vibration.

The whole series of records will now play without further attention, and the last record will repeat until the turntable switch is turned off. Allow the record-changing mechanism to complete its cycle before the turntable is stopped. Then lift the pick-up, swing the arm to the right beyond the edge of the record and lower it onto the pick-up rest with pick-up over needle gauge plate. The record player is then ready for reloading, or for manual operation.

### MANUAL OPERATION

1. Proceed as in steps 1, 2 and 3 under Automatic Operation.
2. Place record on turntable with desired selection upwards.
3. Set Index and Record Reject Lever to "Manual" position. The lever should be kept in this position when not actually playing records automatically.
4. Throw the turntable switch on and when turntable has attained speed, lift pick-up and gently lower onto the record, so that the needle point enters the outside groove.
5. Proceed as in steps 7 and 8 under Automatic Operation.

### SPECIAL PRECAUTIONS

1. This instrument is not recommended for playing 10 inch and 12 inch records in mixed sequence. If the user desires this service he must be positive that all records are perfectly flat and free from warp. The Index and Record Reject Lever must be set at "10" and after playing the last selection the pick-up will come down in position for a 10 inch record and repeat the playing of the record on a 10 inch diameter unless the turntable switch is turned off. Any jamming of the mechanism under these conditions indicates that the records used are not perfectly flat or that their edges are not sufficiently smooth to permit normal operation of the separators in dropping each record in sequence onto the turntable.
2. Do not handle or move manually the pick-up or any part of the mechanism while it is going through the record-changing operation.
3. Do not use force in handling the mechanism at any time.
4. Warped or thick records should not be used for automatic operation.
5. Do not leave records on record holder posts except when needed for immediate operation, as they will warp and sag if left in this manner for a long period of time. Records can be straightened, however, by placing them on a flat surface and resting heavy flat articles, such as books, over them.
6. During automatic operation, the needle is fed automatically into the starting groove of the next record. If the needle fails to enter the starting groove, this is an indication that the cabinet is not level. Raise the right hand side of the cabinet, by inserting several thin spacers beneath it on that side. If the needle slides over a few grooves, raise the left hand side of the cabinet in a similar manner.
7. Never leave pick-up with needle resting on a record or on the turntable. When finished playing, be sure that the turntable has stopped and the pick-up is in the rest position over needle gauge plate.

Replacements should be made with genuine Emerson parts for best results.

## Record Changer Adjustments

EMERSON RADIO & PHONOGRAPH CORP. MODEL BR224A  
MODELS AX232 AC,  
AX232 AC-DC

### Automatic Record Changer

#### GENERAL INFORMATION

Before servicing the automatic record changer, inspect the assembly to see that all levers, parts, gears, springs, etc. are in good order and are correctly assembled.

A bind or jam in the mechanism can usually be relieved by rotating the turntable in the reverse direction.

The changer can be conveniently rotated through its change cycle by pushing the index lever to "Reject" and revolving the turntable by hand. Six turntable revolutions are required for one change cycle.

The turntable, spindle, and pinion gear are assembled by means of a 3/32 inch straight pin. This pin may be removed by gently driving with a standard pin punch.

If the record changer or cabinet is not perfectly level, normal operation is likely to be affected.

The 10 and 12 inch records must be absolutely flat for smooth operation when using a mixture of the two sizes.

#### ADJUSTMENTS

**A. Main Lever.**—This lever is basically important in that it interlinks the various individual mechanisms which control needle landing, tripping, record separation, etc. One adjustment is provided for the main lever. Rotate the turntable until the changer is out-of-cycle; and adjust rubber bumper bracket (A) so that the roller clears the nose of the cam plate by 1/16 inch.

**B. Friction Clutch.**—The motion of the tone arm toward the center of the record is transmitted to the trip pawl "22" by the trip lever "7" through a friction clutch "5." If the motion of the pickup is abruptly accelerated or becomes irregular due to swinging in the eccentric groove, the trip finger "7" moves the trip pawl "22" into engagement with the pawl on the main gear, and the change cycle is started. Proper adjustment of the friction clutch "5" occurs when movement of the tone arm causes positive movement of the trip pawl "22" without tendency of the clutch to slip. The friction should be just enough to prevent slippage, and is adjustable by means of screw "B." If adjustment is too tight, the needle will repeat grooves; if too loose, tripping will not occur at the end of the record.

**C. Pickup Lift Cable Screw.**—During the record change cycle, lever "16" is actuated by the main lever "15" so as to raise the tone arm clear of the record by means of the pickup lift cable. To adjust pickup for proper elevation, stop the changer "in-cycle" at the point where pickup is raised to the maximum height above turntable plate, and has not moved outward; at this point adjust locknuts "C" to obtain 1 inch spacing between needle point and turntable top surface.

**D. & E. Needle Landing on Record.**—The relation of coupling between the tone arm vertical shaft and lever "20" determines the landing position of the needle on a 10 inch record. Position of eccentric stud "E" governs the landing of the needle on a 12 inch record; this, however, is dependent on the proper 10 inch adjustment.

To adjust for needle landing, place 10 inch record on turntable; push index lever to reject position and return to the 10 inch position; see that pickup locating lever "17" is tilted fully toward turntable; rotate mechanism through cycle until needle is just ready to land on the record; then see that pin "V" on lever "14" is in contact with "Step T" on lever "17." The correct point of landing is 4-11/16 inches from the nearest side of the turntable spindle; loosen the two screws "D" and adjust horizontal position of tone arm to proper dimension, being careful not to disturb levers "14" and "17." Leave approximately 1/32 inch end play between hub of lever "20" and pickup base bearing, and tighten the blunt nose screw "D"; run mechanism through several cycles as a check, then tighten cone pointed screw "D".

After adjusting for needle landing on a 10 inch record, place 12 inch record on turntable; push index lever to reject and return to 12 inch position; rotate mechanism through cycle until needle is just ready to land on the record; the correct point of landing is 5-11/16 inches from nearest side of spindle. If the landing is incorrect, turn stud "E" until the eccentric end adjusts lever "14" to give correct needle landing. The eccentric end of the stud must always be toward the rear of the motor board, otherwise incorrect landing may occur with 10 inch records.

**F. & G. Record Separating Knife.**—The upper plate (knife) "25" on each of the record posts serves to separate the lower record from the stack and to support the remaining records during the change cycle. It is essential that the spacing between the knife and the rotating record shelf "27" be accurately maintained. The spacing for the 10 inch record is nominally .055 inch, and for the 12 inch record is .075 inch.

To adjust, rotate the knife to the point of minimum

vertical separation from the record shelf and turn screw and locknut "F" to give .052—.058 inch separation. Screw "G" must not be depressed during this adjustment. After setting screw "F" adjust screw "G" so that when its tip is depressed flush with top of record shelf, the vertical spacing between the knife, in its lowest rotational position, and the shelf, is .072—.078 inch.

**H. Record Support Shelf.**—The record shelf revolves during the change cycle to allow the lower record to drop onto the turntable. Both posts are rotated simultaneously by a gear and rack coupled to the main lever "15," and it is necessary that adjustments be such that the record is released from both shelves at the same instant. To adjust, place a 12 inch record on the turntable, rotate mechanism into cycle to the point where tone arm is at maximum distance outward from turntable; lift record upward until it is in contact with both separating knives, then loosen screws "H" and shift record shelves so that the curved inner edges of the shelves are uniformly spaced at least 1/16 inch from record edge. Tighten the blunt nose screw "H," run mechanism through cycle several times to check action, then tighten cone pointed screw "H".

*If record shelves or knives are bent, or not perfectly horizontal, improper operation and jamming of mechanism will occur.*

**J. Tone Arm Rest Support (not shown).**—When the changer is out-of-cycle, the front lower edge of the pickup head should be 5/16 inch above surface of motor board. This may be adjusted by bending the tone arm support bracket, which is associated with the tone arm mounting base, in the required direction.

**K. Trip Pawl Stop Pin.**—The position of the trip pawl stop pin "K" in relation to the main lever "15" governs the point at which the roller enters the cam. By bending the pin support either toward or away from trip pawl bearing stud, the roller can be made to enter the cam later or earlier, respectively. This adjustment should be made so that the roller definitely clears the cam outer guide as well as the nose of the cam plate.

**Lubrication.**—Petrolatum or petroleum jelly should be applied to cam, main gear, spindle pinion gear, and gears of record posts.

Light machine oil should be used in the tone arm vertical bearing, record post bearings, and all other bearings of various levers on underside of motor board.

The felt washer between the turntable and spindle bearing should be soaked in light engine oil whenever the turntable is removed, or as required for proper operation.

Do not allow oil or grease to come in contact with, rubber mounting of tone arm base, rubber bumper, or flexible coupling of drive motor.

#### MISCELLANEOUS SERVICE HINTS

Incorrect adjustment of a particular mechanism of the changer is generally exhibited in a specific mode of improper operation. The following relations between effects on operation and the usual mis-adjustments will enable ready adjustment in most cases.

1. For any irregularity of operation, the adjustment of the main lever "15" should be checked first as in "A".
2. Needle does not land properly on both 10 and 12 inch records—Make complete adjustments "D" and "E".
3. Needle does not land properly on 12 inch record but correct on 10 inch—Effect adjustment "E".
4. Failure to trip at end of record—Increase clutch "5" friction by means of screw "B". Also, see that levers "7" and "12" are free to move without touching each other.
5. Pickup strikes lower record of stack or drags across top record on turntable—Adjust lift cable per adjustment "C".
6. Needle does not track after landing—Friction clutch "5" adjustment "B" may be too tight; bind in tone arm vertical bearing; levers "7" and "12" fouled; or pickup output cable twisted.
7. Cycle commences before record is complete—Record is defective, or adjustment "B" of friction clutch "5" is too tight.
8. Wow in record reproduction—Record is defective; flexible coupling between motor and changer mechanism not correctly assembled; or instrument is not being operated at normal room temperature (65° F)
9. Record knives strike edge of records—Records warped; record edges are rough; or knife adjustments "F" and "G" are incorrect.
10. Record not released properly—Adjust record shelf assemblies in respect to shaft by means of adjustment "H".
11. Needle lands in 10 inch position on 12 inch record or misses record when playing both types mixed—Increase tension of pickup locating lever spring "30"

MODEL BR224A EMERSON RADIO & PHONOGRAPH CORP.  
 MODELS AX232 AC, AX232 AC-DC  
 Record Changer, Diagrams, Notes

Bottom View of Automatic Record Changer

Top View of Automatic Record Changer

**AUTOMATIC RECORD CHANGER**

**GENERAL NOTES**

1. The pick-up must be over the needle gauge plate to insert or change needles. To insert a needle initially, loosen the needle screw on the front of the pick-up, place needle in hole at the top so that it drops down against the needle gauge plate and then tighten up the needle screw.
2. The phonograph motor has been adjusted at the factory to turn at a speed of 78 r.p.m. The speed may be checked by connecting the motor to a stroboscope disc and a neon light. (The stroboscope method will only work when neon bulb is lighted.) To adjust the speed lift off the record and set the turntable by turning it slowly to give access to the speed regulator. Turn the speed regulator screw and turn to right (clockwise) to decrease speed, or to the left (counter-clockwise) to increase speed. Replace and replay record and adjust until speed is checked at 78 r.p.m.
3. A few drops of good quality light machine oil should be applied in the oil holes at regular intervals, about once every six months. The three holes in the top of the turntable give access to the oil holes in the motor mechanism beneath. Remove the turntable slowly until the oil holes can be seen through the turntable, then apply the oil.
4. Model AX-232, AC-DC portable automatic combination carries an a.c.-d.c. switch at the left of the turntable to switch the motor for a.c. or d.c. supply. It is important that this switch be in the proper position for the power-supply available.

**CONTROLS AND MOVING MECHANISM**

**INDEX AND RECORD REJECT LEVER.**—This lever is located near the right front corner of the motorboard with its insertion plate marked for four positions—"Manual," "12," "10," and "Reject." When you desire to change records manually, this lever should be set in the "Manual" position. With the lever in the "12" position, the machine will automatically play a series of 12-inch records automatically. To play either a series of 10-inch records, or 10- and 12-inch records, the lever should be set at the "10" position.

To reject a record being played, or to start the record-changing cycle in case the record just played does not have the standard eccentric or spiral stopping groove, simply push the lever to the "Reject" position and let go. The pick-up will stop the record and return to the "Manual" position. Upon releasing the lever, it will automatically return to the "10" position. If you are playing a series of 12-inch records, the lever should be returned to the "12" position after rejecting a record. Keep the lever in its "Manual" position when not actually playing records automatically.

**TURNTABLE SWITCH.**—The toggle switch located just in front of the Index and Record Reject Lever controls the current to the turntable motor. To start the turntable, throw the switch to the "ON" position. To stop the turntable throw the switch to the "Off" position.

**PICK-UP AND TOP-LOADING NEEDLE SOCKET.**—The pick-up is the new crystal type, with a hole in the top for insertion of needles. When not playing records, the pick-up arm should be moved out to the right beyond the turntable and placed at rest on the support with the edge of the pick-up arm in the groove and the pick-up over the needle gauge plate. The pick-up must be in this position to change needles.

To insert a needle initially, loosen the needle screw on the front of the pick-up, place needle in hole at top so that it drops down against the needle gauge plate and then tighten up the needle screw.

**NEEDLE EJECTOR.**—The extending tab on the needle gauge plate operates the needle ejector. To change a needle, place pick-up in rest position, loosen needle screw and press the extending tab on the needle gauge plate to drop the used needle into the box below. Release tab, allowing the needle gauge plate to swing back, and then insert a new needle in the pick-up as described above.

**RECORD HOLDER SHELVES.**—To place a record on the turntable or to remove records, raise the record holder shelves, by lifting with the fingers under the shelf, and swing clear of outer edge of record. Also push back vertical lever adjacent to the rear record holder post. You now have clear access to the turntable. Before loading the magazine for Automatic Operation swing the record holder shelves back into position.

Note: Numbers refer to parts—letters refer to adjustments.

Details of Record Shelf Posts, and Lever Assemblies

Motor Data and Coupling

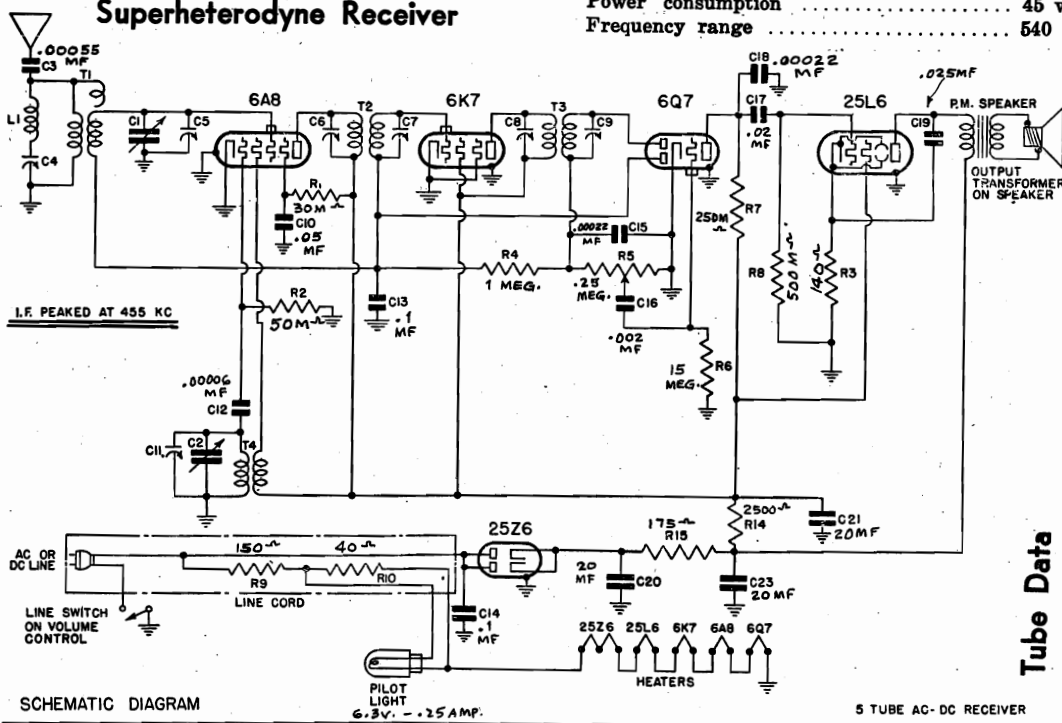

EMERSON RADIO & PHONOGRAPH CORP.

MODEL AX240  
Chassis AX  
Schematic, Voltage  
Alignment, Changes

Five-Tube, A.C.-D.C.,  
Superheterodyne Receiver

Voltage rating ..... 105-125 volts  
Power consumption ..... 45 watts  
Frequency range ..... 540 to 1730 kc.

Tube Data

The tube complement is as follows:  
1-6A8 or 6A8GT, pentagrid oscillator modulator.  
1-6K7 or 6K7GT, first i-f amplifier.  
1-6Q7 or 6Q7GT, diode detector, a-f amplifier, a.v.c.  
1-25L6 or 25L6GT, beam power output.  
1-25Z6 or 25Z6GT, dual half-wave rectifier.

All tubes are replaceable with either metal or equivalent bantam glass tubes. The letters "GT" at the end of the tube number indicate that the tube has a bantam size glass envelope. In all other respects it is exactly the same as the metal tube bearing the same number without the "GT."

SCHEMATIC DIAGRAM FOR MODEL AX-240  
(See Production Change, No. 1).

PRODUCTION CHANGE

1. A resistor 100,000 ohms, part no. KR-54, (not shown in schematic for AX-240) is connected in series with the high side of the volume control.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	Plate	Screen	Cathode	Osc. Plate	Fil.
6A8	100	55	0	100	6.3
6K7	100	100	0	—	6.3
6Q7	43	—	0	—	6.3
25L6	92	100	5.5	—	25.0

Voltage at 25Z6 cathode—128 volts.  
Voltage across speaker field—23 volts.

The color coding of the i-f transformer leads is as follows:  
Grid—green  
Grid return—black  
Plate—blue  
B plus—red.

Location of Coils and Trimmer Adjustments

- The first i-f transformer is mounted on top of the chassis deck beside the speaker. The trimmers are accessible through holes in the top of the can.
- The second i-f transformer is mounted underneath the chassis beneath the variable condenser. The trimmers are accessible through holes in the top of the chassis directly beneath the variable condenser.
- The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil.
- The 455 kc wave-trap is mounted on the same form as the antenna coil directly behind the speaker. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible from the rear of the chassis. The oscillator coil is located underneath the chassis, beneath the first i-f transformer.

I-f and Wave-Trap Alignment

Swing the variable condenser to the maximum capacity position. Feed 455 kc to the grid-cap of the 6A8 tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response. Feed 455 kc through a .0001 mf condenser to the antenna lead and adjust the wave-trap for minimum response. (See General Notes, paragraph No. 7.)

R-f Alignment

Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

Voltage at 25Z6 cathode—125 volts.

Voltage across speaker field—28 volts.

ADJUSTMENTS

An oscillator with frequencies of 455 and 1400 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck beside the speaker. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is mounted underneath the chassis beneath the variable condenser. The trimmers are accessible through holes in the top of the chassis directly beneath the variable condenser.

The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil.

The 455 kc wave-trap is mounted on the same form as the antenna coil directly behind the speaker. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible from the rear of the chassis. The oscillator coil is located underneath the chassis, beneath the first i-f transformer.

I-f and Wave-Trap Alignment

Swing the variable condenser to the maximum capacity position. Feed 455 kc to the grid-cap of the 6A8 tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response. Feed 455 kc through a .0001 mf condenser to the antenna lead and adjust the wave-trap for minimum response. (See General Notes, paragraph No. 7.)

R-f Alignment

Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

TUBE DATA

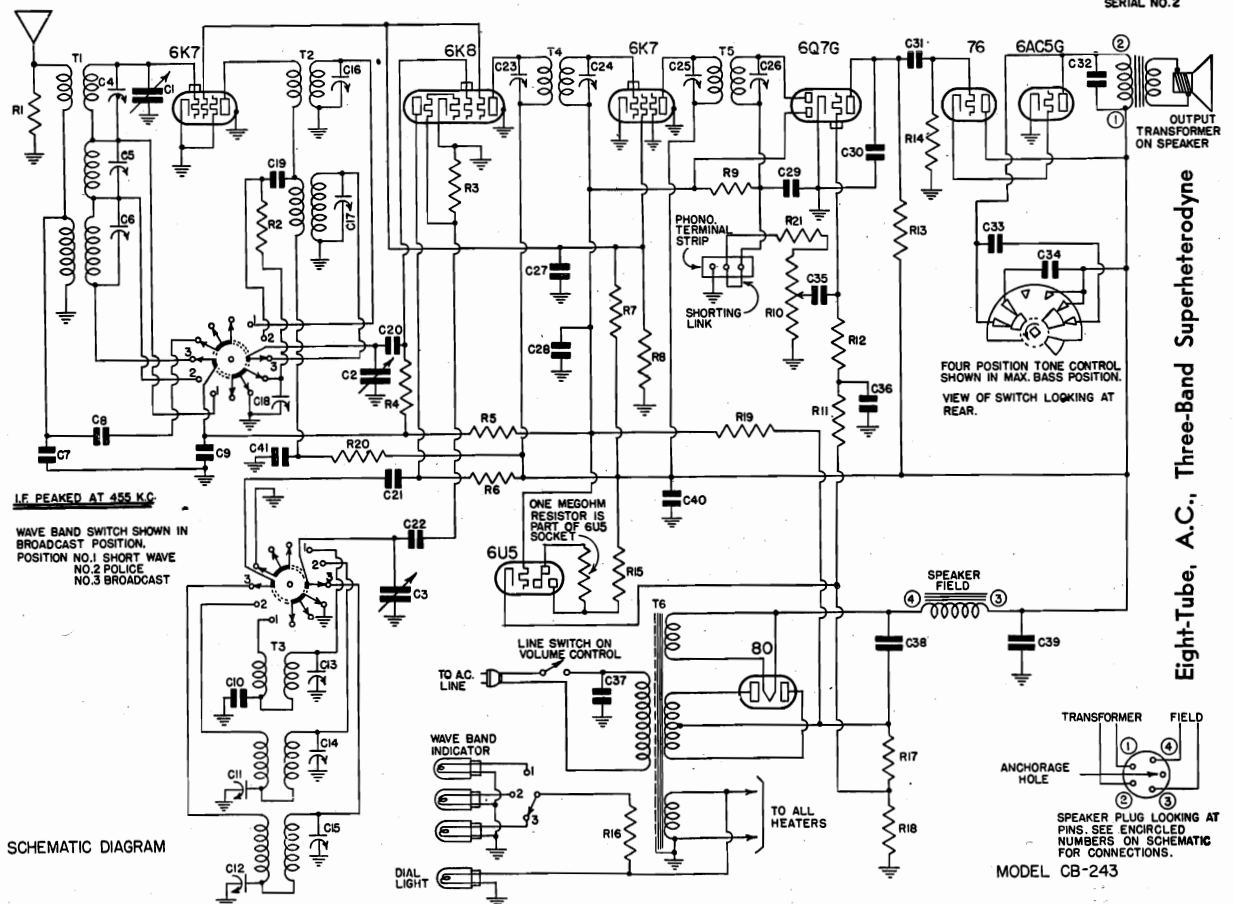

The tube complement is as follows:

- 1—6A8 or 6A8GT, pentagrid oscillator modulator.
- 1—6K7 or 6K7GT, first i-f amplifier.
- 1—6Q7 or 6Q7GT, diode detector, a-f amplifier a.v.c.
- 1—25L6 or 25L6GT, beam power output.
- 1—25Z6 or 25Z6GT, dual half-wave rectifier.

All tubes are replaceable with either metal or equivalent bantam glass tubes. The letters "GT" at the end of the tube number indicate that the tube has a bantam size glass envelope. In all other respects it is the same as the metal tube bearing the same number without the "GT."

SCHMATIC DIAGRAM

Eight-Tube, A.C., Three-Band Superheterodyne

Voltage rating ..... 105-125 volts, 60 cycle, a.c. (unless otherwise specified)  
 Power consumption ..... 60 watts  
 Frequency ranges ..... 540 to 1800 kc, 1800 to 6250 kc and 5.8 to 22 megacycles

**GENERAL NOTES**

- The receiver should never be turned on with either the speaker plug or the 6AC5G tube out of their respective sockets, since the rapid rise in rectifier voltage will damage the electrolytic condenser.
- When replacing the chassis in the cabinet take precautions to keep any part of the dial and condenser assembly from touching the cabinet, otherwise microphonism will result.
- The color coding of the i-f transformers is as follows:  
 Grid—green  
 B plus—red  
 Grid return—black  
 Plate—blue.
- The color coding of the power transformer is as follows:  
 Primary—two black leads  
 High-voltage secondary—two red leads  
 High-voltage secondary center tap—red and yellow lead  
 6.3 volt secondary—two green leads  
 5 volt secondary—two yellow leads.
- The adjustable padding condensers for the broadcast and police bands are mounted on the rear chassis wall with the screw adjustment accessible through holes in the rear of the chassis. The short-wave band has a fixed padder, C10 on schematic. When replacing this fixed padder be careful to use a condenser which has a capacity within 2% of the specified value, otherwise the short-wave coils may not track.
- An efficient antenna system is necessary to enable a full realization of the merits of the receiver. For reduction of noise and achievement of high efficiency on all frequency ranges the Emerson All-Wave High-Fidelity Antenna, Model W-78, and the Emerson All-Wave Antenna System, Model W-89, are recommended. Instructions for the installation of these antennas are supplied with each kit.  
 In congested areas where the installation of a large antenna is not desirable we recommend the use of the Emerson Flexible Mast Antenna, Model W-82. Instructions for the installation of this compact and efficient antenna are supplied with each kit.

**VOLTAGE ANALYSIS**

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 110 volts, 60 cycles, a.c. All readings except B plus at rectifier, heaters, and cathode voltages were taken on 250 volt scale.

Tube	Plate	Screen	Cathode	Osc. Plate	Fil.
6K7 (r-f)	170	85	0	—	6.3 a.c.
6K8	206	85	0	77	6.3 a.c.
6K7 (i-f)	206	85	0	—	6.3 a.c.
6Q7G	100	—	0	—	6.3 a.c.
76	206	—	10.8	—	6.3 a.c.
6AC5G	195	—	0	—	6.3 a.c.

Voltage at 80 filament to B minus (center tap on high voltage winding)—300 volts.  
 Voltage across speaker field—86 volts.  
 The grid bias for all tubes is developed across resistors R17 and R18. This voltage should measure 10.8 volts.

**Tube Data**

- The tube complement is as follows:
- 1-6K7 r-f amplifier (to left of variable condenser)
  - 1-6K8 i-f detector and first i-f amplifier
  - 1-6K7 i-f amplifier (behind variable condenser)
  - 1-6Q7G diode detector, audio amplifier and a.v.c.
  - 1-76 audio amplifier
  - 1-6AC5G, power output
  - 1-6U5, electron-ray tuning indicator
  - 1-80, full-wave rectifier.

Note: The following special voltage transformers are also available:  
 6BT-455 Universal power transformer: 110, 130, 210 and 225 volts, 40-60 cycles.  
 6BT-456 Power transformer: 110 and 127 volts, 50 cycles.

- 8" dynamic speaker
- Wave-band switch
- Tone-control switch
- Pilot light 6.3 volt 25 amp Mazda No. 44
- Conical dial face
- Conical crystal and escutcheon
- Molded escutcheon for electron ray indicator tube
- Electron ray tube socket and cable assembly
- Dial drive cord
- Dial drive cord spring
- Dial drive pulley

ADJUSTMENTS

An oscillator with frequencies of 455, 600, 1600, 6000 and 20,000 kc should be used. An output meter should be used across the voice coil or speaker output transformer for observing maximum response. Use a dummy antenna for aligning any of the three bands. A .0002 mf condenser may be used for broadcast band dummy antenna and .0001 mf condenser for the police band dummy antenna and a 400 ohm non-inductive resistor for the short-wave band dummy antenna. Always use as weak a test signal as possible during alignment. The set's oscillator is higher in frequency than the signal on all three bands, so images should be observed on the low frequency side of the signals. Always choose the minimum capacity peak on oscillator trimmers and maximum capacity peaks on antenna trimmers. The last motion in adjusting trimmers should always be a tightening one, not a loosening one. Never leave a trimmer with the outside plate so loose that there is no tension on the screw. Either bend the plate up or remove the screw entirely. Loose screws are a sure source of noise, drifting, and microphonism. In aligning antenna trimmers on the high-frequency signals there is always a tendency for the oscillator to drift, due to interlocking. To compensate for this always keep tuning the variable condenser as the trimmers are being adjusted.

I-f Alignment

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 455 kc through a 0.02 mf paper condenser, to the grid cap of the 6K8 tube (do not remove the grid clip from the tube). Adjust the four i-f trimmers for maximum response.

Broadcast Alignment

Since the indicator is fastened to the cabinet, a piece of stiff wire should be fastened to the variable condenser and bent over to form an indicator when the chassis is removed from the cabinet. Set indicator at extreme low frequency end of dial with condenser closed. Set the wave-band switch at the broadcast (clockwise) position, and the dial at 60. Feed 600 kc to the antenna (using a standard dummy antenna) and adjust the broadcast-band series padder for maximum response. Move the dial to 160, feed 1600 kc and adjust the oscillator coil trimmer for maximum response, then adjust the interstage and antenna coil trimmers for maximum response. Keep the dial at 60, feed 600 kc and rock the variable condenser while adjusting the series padder for maximum response. Return to 1600 and check alignment. If readjustment is necessary return to 600 and repeat entire procedure.

Police Alignment

Set the wave-band switch at the police-band (central) position and the dial at 1.8. Feed 1800 kc to the antenna (using a 400 ohm dummy antenna) and adjust the police-band series padder for maximum response. Move the dial to 6.0 and feed 6000 kc and adjust the antenna coil trimmer. The adjustment is made by adjusting the dial to 1.8, feed 1800 kc to the antenna and rock the variable condenser while readjusting the series padder for maximum response. Return to 6000 kc and check alignment. If readjustment is necessary return to 1800 kc and repeat entire procedure.

Short-Wave Alignment

Set the wave-band switch at the short-wave (counter-clockwise) position. Move the dial to 20 and feed 20,000 kc to the antenna (using a 400 ohm dummy antenna) and adjust the short-wave oscillator trimmer for maximum response. If two peaks are obtained choose the minimum capacity peak. Then adjust the interstage and antenna coil trimmers for maximum response. If two peaks are obtained choose the maximum capacity peak. Move the dial to 6 mc, feed 6000 kc to the antenna and adjust the i-f interstage trimmer for maximum response.

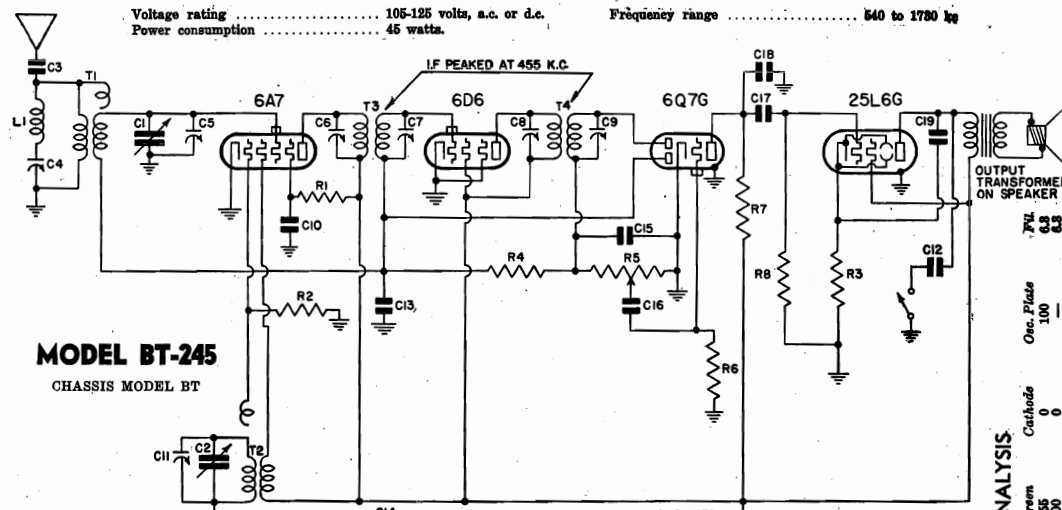

Replacements should be made with genuine Emerson parts for best results.

**GENERAL NOTES**

- If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
- One side of the power line is directly grounded to the chassis base. Under no circumstances, therefore, should a ground wire be permitted to come in contact with any metal part of the receiver.
- In operating the receiver on d.c. it may be necessary to reverse the line plug for correct polarity.
- The color coding of the i-f transformer leads is as follows:  
 Grid—green  
 Plate—blue  
 B plus—red  
 Grid return—black

**ADJUSTMENTS**

An oscillator with frequencies of 485 and 1400 kc is required.  
 An output meter should be used across the voice coil or output transformer for observing maximum response. Always use as weak a test signal as possible when aligning the receiver.

**Location of Coils and Trimmer Adjustments**

The first and second i-f transformers are mounted on the left hand inside wall of the chassis. The trimmers for the first i-f transformer are accessible through the lower pair of holes in the side of the chassis. The trimmers for the second i-f transformer are accessible through the upper pair of holes in the chassis. The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil.  
 The 455 kc wave-trap is mounted on the same form as the antenna coil. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible through a hole in the right side of the chassis.

**I-f and Wave-Trap Alignment**

Rotate the variable condenser to the minimum capacity position. Feed 455 kc to the grid-cap of the 6A7 tube through a .0001 mf trimmer for maximum response. Feed 455 kc through a .0001 mf trimmer to the antenna lead and adjust the wave-trap trimmer for minimum response. (See General Notes, paragraph No. 6.)

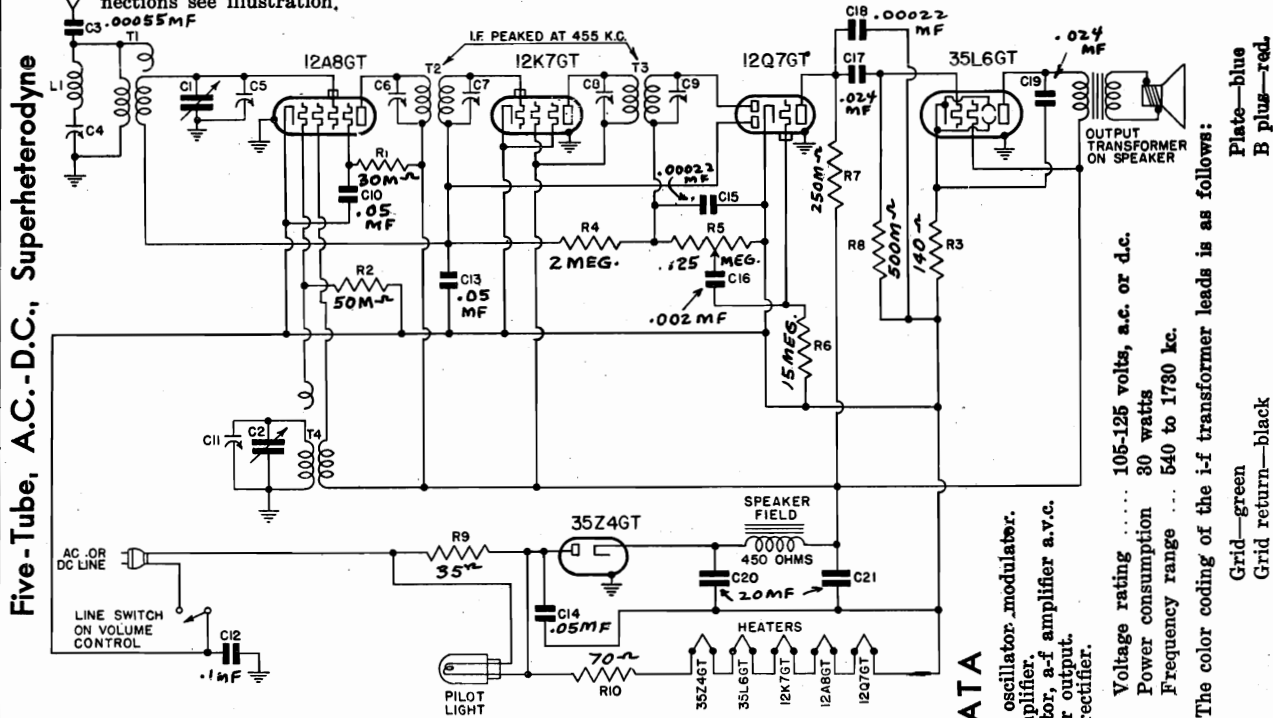

**R-f Alignment**

Set the dial pointer at 140, feed 1400 kc through a .0001 mf condenser to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

PRODUCTION CHANGE

CL chassis which use oscillator coil 6JT-466 or 4XT-458 may use 6JT-466A for replacement. For correct lug connections see illustration.

Five-Tube, A.C.-D.C., Superheterodyne

The color coding of the i-f transformer leads is as follows:  
Plate—blue  
B plus—red  
Grid—green  
Grid return—black

Voltage rating . . . . . 105-125 volts, a.c. or d.c.  
Power consumption . . . . . 30 watts  
Frequency range . . . . . 540 to 1730 kc.

VIEW LOOKING AT BOTTOM OF CHASSIS SHOWING LEADS TO OSCILLATOR COILS

MOUNTING FOOT IS GROUND CONNECTION FOR ALL COILS

TUBE DATA

12A8 or 12A8GT, pentagrid oscillator modulator.  
12K7 or 12K7GT, first i-f amplifier.  
12Q7 or 12Q7GT, diode detector, a-f amplifier a.v.c.  
35L6 or 35L6GT, beam power output.  
35Z4 or 35Z4GT, half-wave rectifier.

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck beside the speaker. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is mounted underneath the chassis beneath the variable condenser. The trimmers are accessible through holes in the top of the chassis directly beneath the variable condenser.

The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil.

The 455 kc wave-trap is mounted on the same form as the antenna coil directly behind the speaker. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible from the rear of the chassis. The oscillator coil is located underneath the chassis, beneath the first i-f transformer.

I-f and Wave-Trap Alignment

Swing the variable condenser to the maximum capacity position. Feed 455 kc to the grid-cap of the 12A8 tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response. Feed 455 kc through a .0001 mf condenser to the antenna lead and adjust the wave-trap for *minimum* response. (See General Notes, paragraph No. 5.)

R-f Alignment

Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	Plate	Screen	Cathode	Osc. Plate	Fil.
12A8	94	50	0	94	12
12K7	94	94	0	—	12
12Q7	40	—	0	—	12
35L6	87	94	5.2	—	35

Voltage at 35Z4 cathode—121 volts.  
Voltage across speaker field—27 volts.

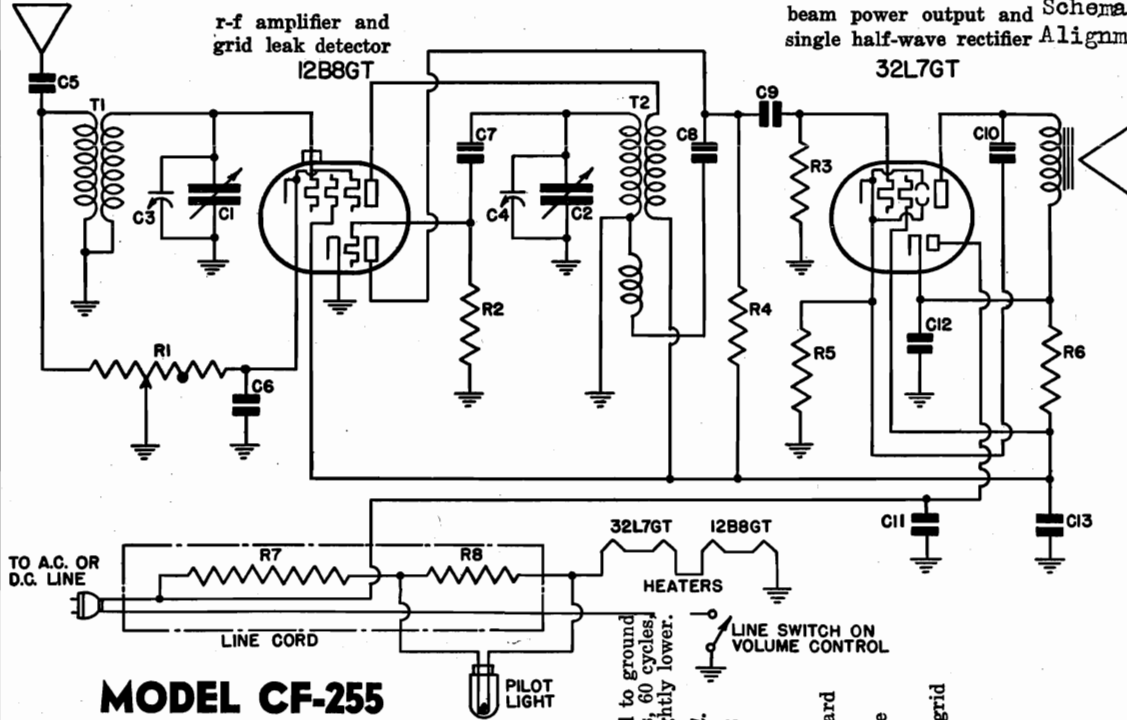

Voltage across pilot light section of ballast resistor (R9)—3.5.  
Voltage drop across entire ballast resistor (R9 and R10)—13.5.

\*Item number locates the article on the schematic diagram. †These condensers cannot be supplied separately.

**VOLTAGE ANALYSIS**

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with volume control turned on full and no signal. The line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except cathodes and heaters were taken on 250 volt scale. Readings taken on d.c. will be slightly lower.

Tube	Plate	Screen	Fil.	Cathode
12B8GT { Pentode	95 (pin no. 3)	95 (pin no. 4)	12	2.1 (pin no. 1)
{ Triode	40 (pin no. 5)			0.0 (pin no. 6)
32L7GT Output	125 (pin no. 3)	95 (pin no. 4)	32	4.5 (pin no. 8)

Voltage at rectifier cathode—130 (pin no. 1)

The socket connections of the tubes used in the CF chassis are as follows, the numbering following standard designation R.M.A.

Tube 12B8GT: pin 1—r-f amplifier cathode  
pin 2—heater  
pin 3—r-f amplifier plate  
pin 4—r-f amplifier screen grid  
pin 5—detector plate  
pin 6—detector cathode  
pin 7—heater  
pin 8—detector grid

Tube 32L7GT: pin 1—rectifier cathode  
pin 2—heater  
pin 3—output plate  
pin 4—output screen grid  
pin 5—output grid  
pin 6—rectifier plate  
pin 7—heater  
pin 8—output cathode

R-f amplifier grid connection is made to grid cap.

**ALIGNMENT PROCEDURE**

An oscillator with a frequency of 1600 kc is required.

Use as weak a test signal as possible. An output meter should be used across the voice coil or output transformer for observing maximum response.

Examine the condenser drive assembly bracket and locate five dots embossed along the front. Rotate the variable condenser to maximum capacity and set the pointer just below the bottom dot. Then rotate the condenser until the pointer is just below the second dot from the top. Feed 1600 kc to the antenna through a .0001 mf condenser and adjust both trimming condensers for maximum response.

**A.C.-D.C. T.R.F. Receiver—Two Tubes**

Voltage rating . . . . . 105 to 125 volts, a.c. or d.c.  
Power consumption . . . . . 40 watts.

Alignment, Changes  
Parts list**

**GENERAL NOTES**

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully re-aligned.
2. In operating the receiver on d.c. it may be necessary to reverse the line plug for correct polarity.
3. The color coding of the i-f transformer leads is as follows:  
Grid—green  
B plus—blue  
Plate—black
4. Models CM-260, 266 and 267 have self-contained antennas and do not require additional antenna connections. For models with external antennas, the antenna should be connected to the antenna terminals on the chassis. The screw for antenna connection. It is not necessary to remove the chassis from the cabinet to make this connection. The screw is easily reached through a hole in the bottom of the cabinet.
5. The self-contained loop antenna operates at maximum efficiency when its position is at right angles to the broadcast- ing source. If it is important, therefore, once the station is tuned in, rotate the cabinet back and forth through a quarter of a circle (90 degrees), leaving it at the position where the station is received with maximum volume.
6. This plate must be unsoldered and removed.

**ADJUSTMENTS**

An oscillator with frequencies of 455 and 1400 kc is required.  
An output inductor should be used across the voice coil or output transformer for observing maximum response.  
Always use as weak a test signal as possible when aligning the receiver.

**Location of Coils and Trimmer Adjustments**

The first i-f transformer is mounted on top of the chassis deck to the right of the speaker. The trimmers are accessible through holes in the top of the can.  
The second i-f transformer is mounted on top of the chassis behind the speaker. The trimmers are accessible through holes in the top of the can.  
The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil.  
The oscillator coil is located underneath the chassis, beneath the speaker. The loop antenna acts as the antenna coil.

**I-f and Wave-Trap Alignment**

Swing the variable condenser to the minimum capacity position. Feed 455 kc to the grid-cap of the 12A8 tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response.

**R-f Alignment**

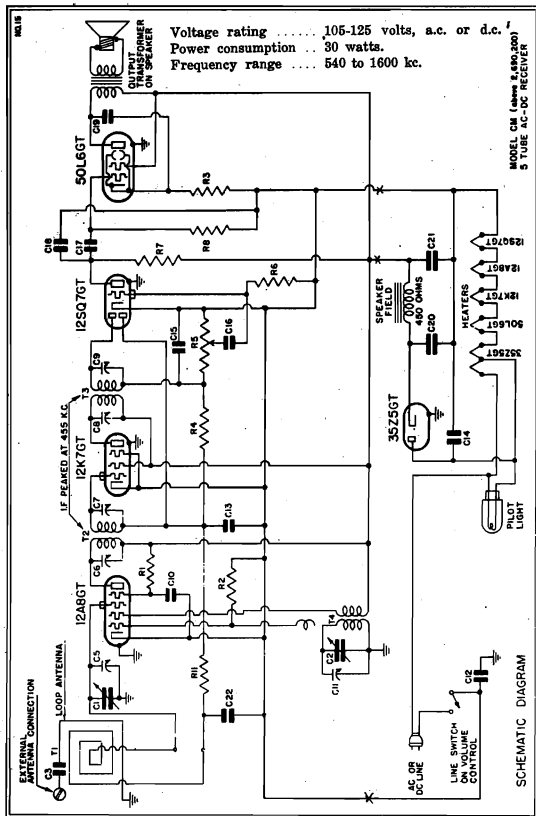

Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna connection and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

\* Item number locates the article on the schematic diagram. † Not supplied separately.

**PRODUCTION CHANGES**

1. Chassis bearing serial numbers below 2,690,200 use R7—250,000 ohm 1/2 watt carbon resistor
2. Resistor R9—R10, part no. 6JR-353, is not used on chassis bearing serial numbers above 2,690,200.

**SCHEMATIC DIAGRAM MODEL CM (Above Serial No. 2,690,200)**

NOTE: A 35Z5GT output tube is used for sets of lower serial numbers.

**SCHEMATIC DIAGRAM MODEL CM (Below Serial No. 2,690,200)**

**THE TUBE COMPLEMENT IS AS FOLLOWS:**

- For serial numbers below 2,690,200:  
 1—12A8 or 12A8GT pentagrid oscillator modulator.  
 1—12K7 or 12K7GT first i-f amplifier.  
 1—12SK7 or 12SK7GT diode detector, a-f amplifier, a.v.c.  
 1—35Z5 or 35Z5GT half-wave rectifier.  
 1—35Z4 or 35Z4GT
- For serial numbers above 2,690,200:  
 1—12A8 or 12A8GT pentagrid oscillator modulator.  
 1—12K7 or 12K7GT first i-f amplifier.  
 1—12SK7 or 12SK7GT diode detector, a-f amplifier, a.v.c.  
 1—35Z5 or 35Z5GT half-wave rectifier.  
 1—35Z4 or 35Z4GT

All tubes are replaceable with either metal or equivalent bakelite glass tubes. The letters "GT" at the end of the tube bearing the same number without the "GT" are the same as the "GT" tube bearing the same number without the "GT".

**VOLTAGE ANALYSIS**

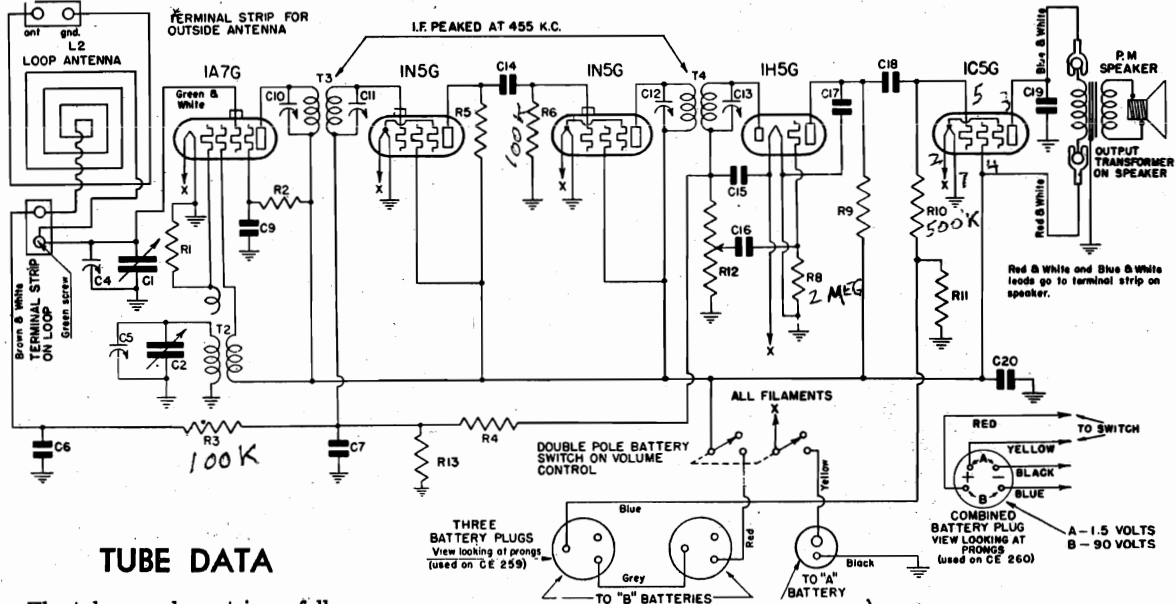

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, and the cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	For serial numbers below 2,690,200:		For serial numbers above 2,690,200:	
	Plate	Cathode	Plate	Cathode
12A8	94	50	88	45
12K7	94	50	88	45
12SK7	94	50	88	45
35Z5	87	5.2	88	45
35Z6	87	5.2	88	45

Voltage at 35Z4 cathode—121 volts.  
 Voltage across speaker field—27 volts.  
 Voltage across pilot light section of ballast resistor (R9)—3.5.  
 Voltage drop across entire ballast resistor (R9 and R10)—13.5.

CHASSIS MODEL CE

Current drain . . . . "A" battery—0.3 amps.  
 "B" battery—0.010 amps. with no signal  
 Frequency range 540 to 1730 kc on early Model CE-259  
 530 to 1600 kc on all Model CE-260  
 and later Model CE-259

CUT-AWAY VIEW SHOWING BATTERY LOCATIONS AND WIRE CONNECTIONS

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed are from point indicated to chassis with volume control turned on full and no signal. The battery voltages for these readings were: "A" 1.5 volts, "B" 90 volts.

Tube	Plate	Screen	Osc. Plate	Fil.
1A7G	82	52	82	1.5
1N5G 1st i-f	70	70	—	1.5
1N5G 2nd i-f	82	82	—	1.5
1H5G	25	—	—	1.5
1C5G	77	82	—	1.5

Bias for the 1C5G tube is obtained across the resistor R11. The voltage drop across this resistor should be 7.8 volts. 1.5V @ .05A

PRODUCTION CHANGES

1. Chassis bearing serial numbers below 2,319,650 use:
  - (a) Double-tuned 455 kc first i-f transformer, part no. 4XT-484A
  - (b) Double tuned 455 kc diode i-f transformer, part no. 4XT-435B
  - (c) Oscillator coil, Part No. 4XT-433
  - (d) The low side of the volume control (R12) is connected to A minus instead of A minus (chassis) as shown in the schematic.
  - (e) Condenser C19 is connected from plate to B plus instead of from plate to ground as shown in the schematic.
  - (f) Resistor R2 is 50,000 ohms, Part No. KR53, instead of 30,000 ohms.
2. Chassis bearing serial numbers below 2,408,049 use dial face, part no. 4XD-51
3. On Model CE-260 the antenna trimming condenser (C4) is mounted on the loop antenna frame instead of on the variable condenser.
4. In chassis bearing serial numbers above 2,319,650 condenser C15 is connected from the high side of the volume control to ground instead of to A plus as shown in the schematic.

Socket, Trimmers  
Alignment, Parts

MODELS CE-259 AND CE-260

GENERAL NOTES

- Batteries: The Models CE-259 and CE-260 are designed to house the complete set of batteries within the cabinet. The battery complement should be as follows:
 

FOR MODEL CE-259 (Portable)			
Types Battery	No. Req.	Eveready Part No.	Ray-o-vac Part No.
1½ volt "A"	1	742 (plug-in type)	P-94A (plug-in type)
45 volt "B"	2	762 (plug-in type)	P-5303 (plug-in type)
FOR MODEL CE-260			
Combined "A" and "B" Pack	1	748 (plug-in type)	AB82 (plug-in type)

(Also Burgess No. 17G-D60)
- The color coding of the i-f transformer leads is as follows:
 

Grid—green	Plate—blue
Grid return—black	B plus—red
- The color coding of the battery cable is as follows:
 

Red—B plus, 90 volts	Yellow—A plus, 1.5 volts
Blue—B minus	Black—A minus
- If replacements are made in the r-f section of the circuit, the receiver should be carefully re-aligned.
- Models CE-259 and CE-260 have self-contained antennas and do not require additional antenna or ground connections. For permanent home installations of either model, however, if it is desired to improve reception of weak stations, an additional outdoor antenna should be used. For this purpose a terminal strip is provided in the cabinet for antenna and ground connections. (See diagram on next page.)
- The self-contained loop antenna operates at maximum efficiency when its position is at right angles to the broadcasting source. It is important, therefore, once the station is tuned in, rotate the cabinet back and forth through a quarter of a circle (90 degrees), leaving it at the position where the station is received with maximum volume. This procedure is not necessary for receivers with outside antennas.

ADJUSTMENTS

An oscillator with frequencies of 455 and 1400 kc is required. An output meter should be used across the voice coil or output transformer for observing maximum response. Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The oscillator coil is located beneath the chassis. The trimmer for the oscillator is on the rear section of the variable condenser. The loop antenna acts as the antenna coil. The trimmer for the loop, when provided, is on the front section of the variable condenser. (See Production Change No. 3)

i-f Alignment

Model CE-259 (below serial number 2,319,650). Swing variable condenser to maximum capacity position. Model CE-259 (above serial number 2,319,650) and CE-260. Swing variable condenser to minimum capacity position. Feed 455 kc to the grid of the 1A7G tube through a 0.01 mf condenser. Adjust the four i-f trimmers for maximum response.

r-f Alignment

Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna connection and adjust first the antenna trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

Battery Installation for Model CE-259

To install and connect the batteries in the portable cabinet observe the following procedure:

- Open the end side of the cabinet (side with speaker grille) by removing the two wood screws in the top corners of the panel. The panel is hinged at the bottom. Open the panel by pulling the small leather tab at the top edge.
- A small wood cleat is fastened to the bottom of the cabinet directly below the two large wood rails. Remove this cleat by taking out the small wood screws.
- The three-prong plugs on the battery cable from the receiver should be plugged into the two "B" batteries.
- Slide the "B" batteries, one at a time, in an upright position between the two wood rails in the cabinet, as indicated in the diagram.
- Replace the small wood cleat in front of the second battery and fasten it securely with the wood screws.
- The small two-prong plug in the battery cable should be plugged into the "A" battery. Place the "A" battery in the front corner of the cabinet, as shown in the diagram.
- Be sure that all of the cable wires are free and clear of the receiver. Care should be taken also to keep the wires from jamming between the wood rails and the batteries.
- Close the end panel and replace the wood screws, fastening them securely.

Battery Installation for Model CE-260

The cabinet for this model is designed to house completely the combined "A" and "B" pack. Place the battery pack in the cabinet at the rear of the receiver and insert the four-prong plug of the battery cable into the socket on the top of the battery.

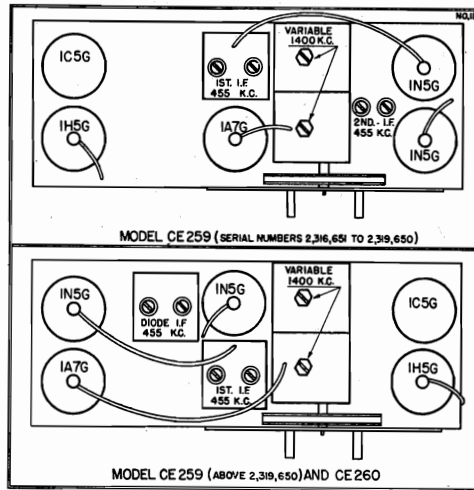

If it is desired to use separate "A" and "B" plug-in type batteries, a special cable harness is available for connecting the batteries together. The receiver battery cable then may be plugged into the socket on the special cable harness.

When ordering replacement parts specify part numbers.

**to ant. lead. Adjust osc. trimmer (rear section of**  
**variable), then ant. trimmer (front section of var-**  
**iable) for maximum response.**

#### GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully re-aligned.
2. In operating the receiver on d.c. it may be necessary to reverse the line plug for correct polarity.
3. The color coding of the i-f transformer leads is as follows:
 

Grid—green	Plate—blue
Grid return—black	B plus—red
4. The wave-trap in the receiver has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.

#### VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	Plate	Screen	Cathode	Osc. Plate	Fil.
12A8GT	88	45	0	88	12
12K7GT	88	88	0	—	12
12SQ7GT	40	—	0	—	12
50L6GT	82	88	5.7	—	50

Voltage at 35Z5 cathode—115 volts. Voltage across speaker field—27 volts. Voltage across pilot light—4.5 volts.

MODEL CT-275  
 CUT-AWAY VIEW SHOWING BATTERY LOCATIONS AND WIRE CONNECTIONS

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed are from point indicated to chassis with volume control turned on full and no signal. The battery voltages for these readings were: "A" 1.5 volts, "B" 90 volts.

Tube	Plate	Screen	Osc. Plate	Fil.
1A7G	82	52	82	1.5
1N5G	48	82	—	1.5
1N5G	82	82	—	1.5
1H5G	25	—	—	1.5
1Q5G	77	82	—	1.5

Bias for the 1Q5G tube is obtained across the resistor R11. The voltage drop across this resistor should be 7.0 volts.

Batteries: The Model CT-275 is designed to house the complete set of batteries within the cabinet.

The battery complement should be as follows:

Type Battery	No. Req.	Eveready Part No.	Rayovac Part No.	Burgess Part No.
1½ volt "A"	1	741 (plug-in type)		8F (plug-in type)
45 volt "B"	2	762 (plug-in type)	P-5303 (plug-in type)	B30-P1 (plug-in type)

The color coding of the i-f transformer leads is as follows:

Grid—green  
 Grid return—black  
 Plate—blue  
 B plus—red

The color coding of the battery cable is as follows:

Red—B plus, 90 volts  
 Blue—B minus  
 Yellow—A plus, 1.5 volts  
 Black—A minus

Location of Coils and Trimmer Adjustments

The i-f transformers are located in cans mounted on top of the chassis. The first i-f transformer is the one between the speaker and the variable condenser. The diode i-f transformer is the one behind the speaker. The trimming condensers for both transformers can be reached through holes in the tops of the cans.

I-f Alignment

The oscillator coil is located beneath the chassis. The trimmer for the oscillator is on the rear section of the variable condenser.

Swing variable condenser to minimum capacity position.

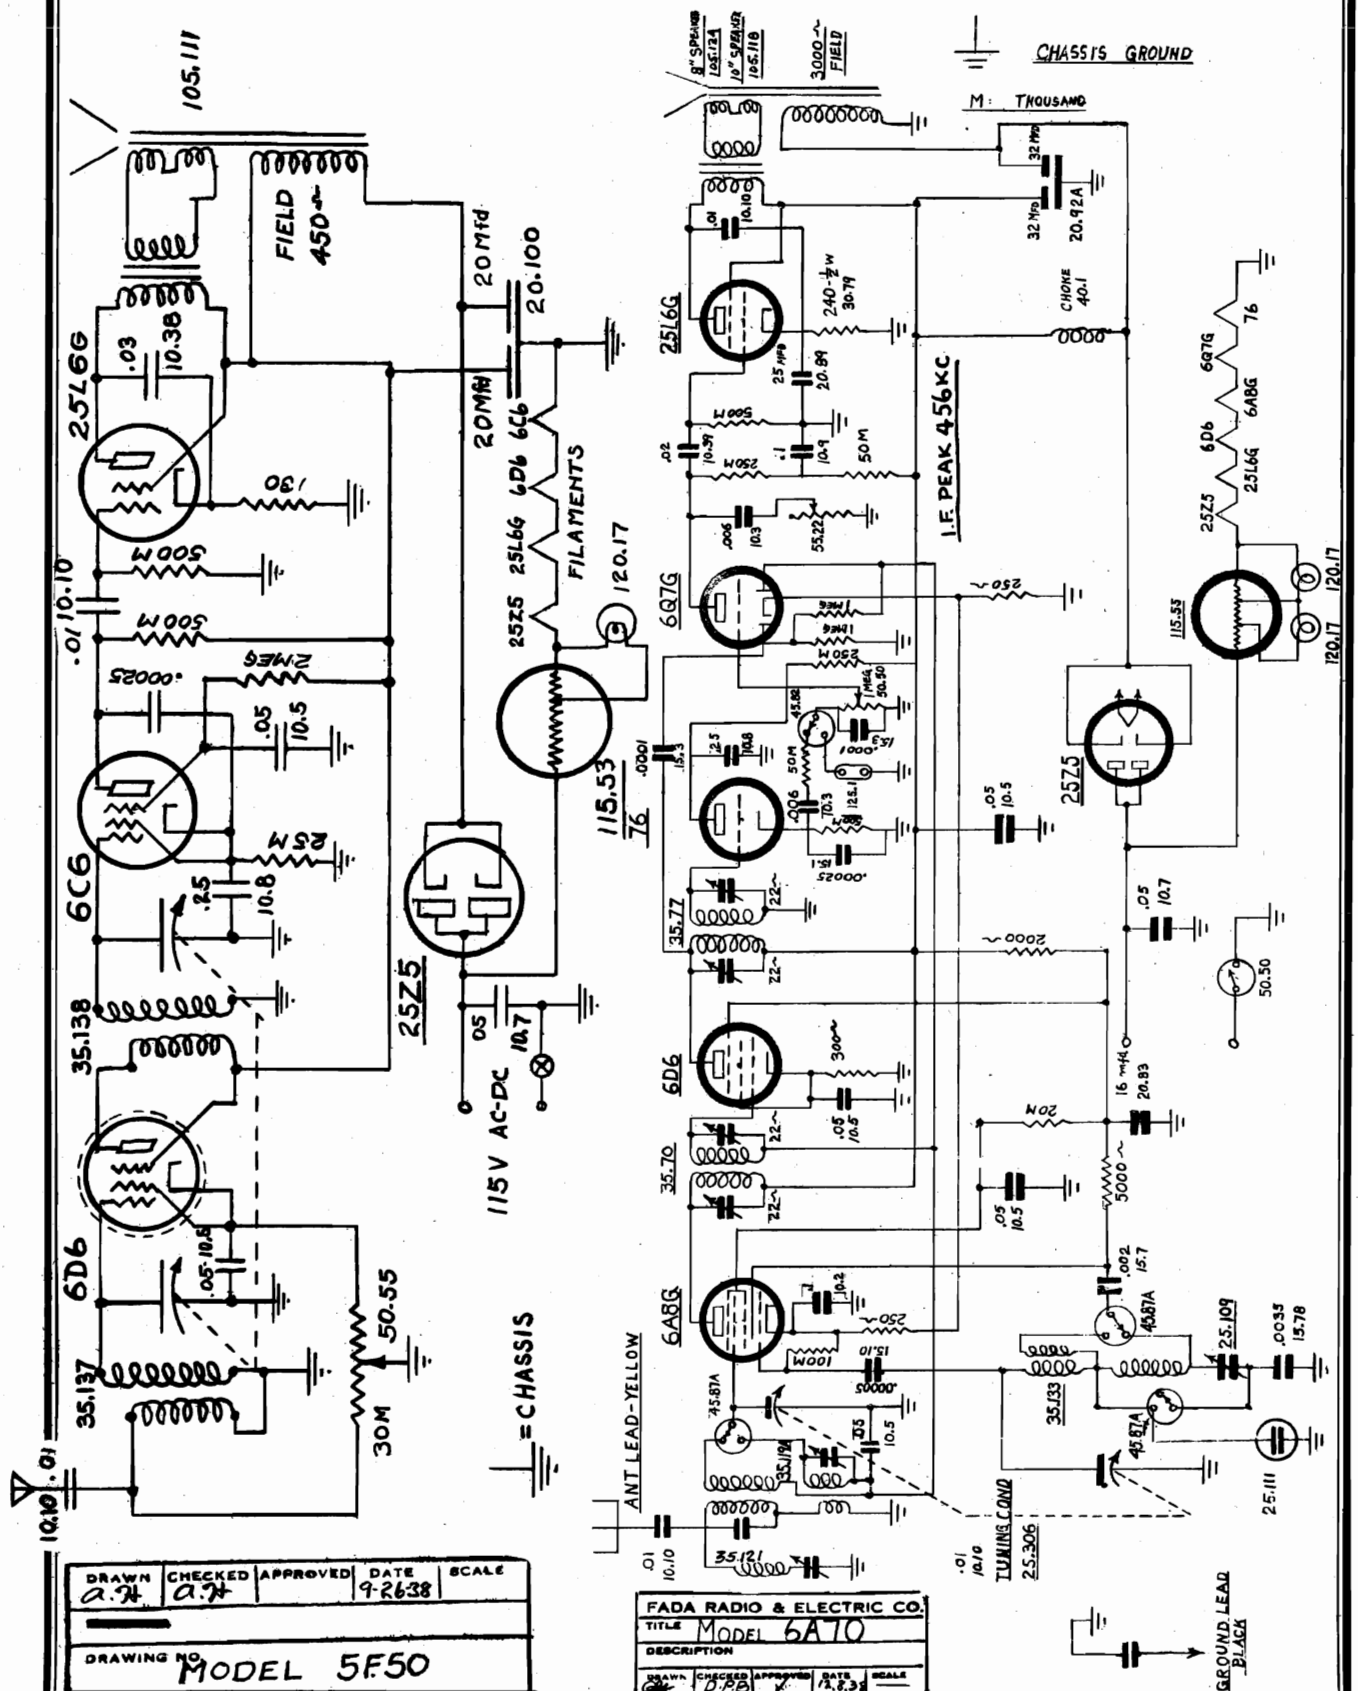

Feed 455 kc to the grid of the 1A7G tube through a 0.01 mf condenser. Adjust the four i-f trimmers for maximum response.

R-f Alignment

Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna connection and adjust the oscillator trimmer (on rear section of variable condenser) for maximum response. No alignment necessary on antenna circuit.

FOR OTHER DATA SEE INDEX

MODEL 5F60 MODEL 460 - 115 VOLTS AC-DC - Tuning Range 540-1720 K.C. - 6 Tube Super-heterodyne. Tubes required - 6A8G-6K7-6Q7G-25L6G-25Z5-1L5.4L.

Alignment Instructions: Do not attempt to align receiver until all other causes of trouble are checked then proceed as follows:--Remove chassis from case and connect output meter across voice coil of speaker. Set dial pointer at 1000 K.C. and turn volume control to maximum position. Connect modulated oscillator to grid of 6A8G tube in series with a .1 condenser. Adjust trimmers 1-2-3-4 for maximum reading at 456 K.C. reducing input signal of oscillator as required. Check pointer with condenser fully meshed. Turn pointer to 1500 K.C. Connect oscillator to antenna lead using a .0002 condenser as dummy antenna. With a 1500 K.C. signal adjust trimmers 5 & 6 to give maximum output. Check sensitivity at 1000 and 600 K.C. with magic wand.

Flash-O-Matic Data

## FADA RADIO &amp; ELECTRIC CO

## FADA FLASH-O-MATIC SIX

**INTRODUCTION:** FADA Flash-o-Matic Six is an electrical type automatic tuning system that, once adjusted, will automatically "tune in" any one of six local broadcast stations operating between 540 and 1500 kilocycles (K. C.). While the Flash-o-Matic is not confined to local reception, it should be adjusted for stations affording the best reception and most frequently "tuned in."

**ALIGNING PROCEDURE:** It is advisable that the receiver remain in operation for fifteen minutes or more before attempting any adjustments. Now that the receiver has reached constant temperature the following adjustments are to be made to the trimmer condenser set screws located on the Flash-o-Matic tuning panel at the rear of the receiver.

(a) Select six local broadcast stations whose programs are preferred; then, detach the station call letters from the station call letter tab sheets, which are supplied with each receiver.

(b) The six Flash-o-Matic positions are numbered and arranged according to frequency limits.

There are number tabs (1 to 6) in the Flash-o-Matic escutcheon as shipped from the factory. These tabs show the relation between the Flash-o-Matic escutcheon and the Flash-o-Matic tuning panel positions and are to be removed, one at a time (with the aid of a pin) when inserting the station call letters.

The six call letter tabs corresponding to the six broadcast stations which have been chosen, must be arranged in the Flash-o-Matic escutcheon so that the frequency in kilocycles of each station will fall within the frequency limits of the proper group.

If one of the chosen stations has an operating frequency of 550 K.C., it should be placed in the No. 1 (530 to 710 K.C.) group, a station of 600 K.C. should be placed in the No. 2 group, etc.

Each group has considerable overlap to allow for the selection of six stations which may have frequency assignments comparatively close together.

Having inserted the call letter tabs, cover each tab with a celluloid disc furnished with your receiver.

(c) Two trimmer condenser set screws are provided for each one of the six station positions and are accessible at the rear of the receiver. All trimmer condenser set screw adjustments are marked as to their group number and frequency range coverage.

(d) Tune in the station in the usual manner, using manual tuning, and determine the program.

(e) Turn the wave band switch completely to the right (clockwise).

(f) Turn the Flash-o-Matic selector switch to the position that corresponds to the group in which the desired station falls. This can be readily determined, for as the Flash-o-Matic selector switch is turned the various call letters will light up.

(g) The toggle switch (SEE ILLUSTRATION) near the center of the Flash-o-Matic tuning panel should be thrown to the "UP" position during the following adjustments.

(h) With the aid of a screwdriver adjust (by turning clockwise or counter-clockwise) the OSC. trimmer condenser set screw (SEE ILLUSTRATION) corresponding to the proper station, until the same station that was tuned in manually is heard. Turn the volume control down so that any variation in sound output can be noted and readjust set screw for maximum sound output. **TAKE PARTICULAR CARE WHILE MAKING THIS ADJUSTMENT THAT THE SAME STATION IS HEARD AND NOT A NETWORK STATION BROADCASTING THE SAME PROGRAM.**

(i) Now adjust the ANT. trimmer condenser set screw (SEE ILLUSTRATION) having the same position number, for maximum sound output.

(j) Repeat the same procedure as outlined above for each of the remaining five stations.

(k) To insure accurate adjustment, it may be found advisable to repeat the operations outlined in paragraphs (h), (i) and (j).

(l) Having completed the adjustments for the desired stations throw the toggle switch (SEE ILLUSTRATION) to "DOWN" position. The receiver is now ready for Flash-o-Matic operation and any one of the six stations to which the Flash-o-Matic has been adjusted, may be instantly "tuned in" by merely rotating the Flash-o-Matic selector knob to the desired station position.

(m) In order to reset one or more positions of the Flash-o-Matic tuning to other stations, it is merely necessary to follow the instructions outlined above; additional celluloid discs are supplied for this purpose.

**OPERATING PROCEDURE:** For Flash-o-Matic tuning turn the wave band switch completely to the right (clockwise); this will reduce the illumination of the station selector dial. Then, turn the Flash-o-Matic selector switch until the call letters of the desired station are illuminated. To return to standard or manual tuning simply turn the wave band selector switch toward the left (counter-clockwise) to the desired wave band.

## ALIGNMENT MODEL 6A80

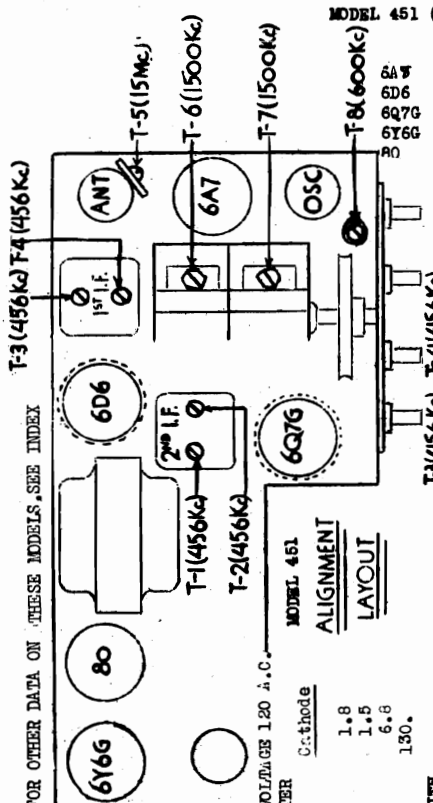

Tuning ranges 535-1730 K.C., 1.71-5.7 M.C. and 5.67 and 18.1 M.C. Tubes 5-6K7G-6A8G-6E5-6V6G-80.

Remove chassis and connect output meter across voice coil of speaker. Set dial pointer at 1000 K.C. Turn volume control to maximum. Tone switch to high end. Band switch to broadcast. Connect modulated oscillator to grid of 6A8G in series with a .1 condenser and adjust trimmers 1-2-3-4-5-6 for maximum output at 456 K.C. reducing input signal of oscillator as required. Check pointer with condenser fully meshed. Turn pointer to 1500 K.C. Connect oscillator to antenna lead using a .0002 condenser as dummy antenna. With a 1500 signal adjust trimmers 7-8-9 for maximum output, reducing input signal as required. Turn pointer to 600 K.C. Shift oscillator to 600 K.C. and adjust padder 16 for maximum while rocking gang condenser. Check alignment at 1000 K.C. Turn band switch to position 2 - turn pointer to 5 M.C. Use a 400 ohm carbon resistor for dummy antenna. Adjust trimmers 10-11-12 for maximum output. Check output at .8 and 2.4. Make sure 5 M.C. was aligned on fundamental and not image. Turn band switch to position 3 - turn pointer to 15 M.C. Adjust trimmers 13-14-15 for maximum. Check image at 14.1. Check sensitivity at 6 M.C.

FADA RADIO MODEL 450 - 115 AC-DC - Tuning Range 545-1720 K.C. - 5 Tube Tuned Radio Frequency. Tubes required-6D6-6C6-25L6G-25Z5-115,53.

Alignment Instructions:  
--Turn volume control to maximum position. Connect a modulated oscillator to antenna bank using a .0001 condenser as a dummy antenna. Turn condenser to minimum position. Roughly adjust to 1720 K.C. Set oscillator at 1500 K.C. Turn condenser until signal is loudest, then adjust trimmers 1 & 2 for maximum signal reducing output of oscillator as required. Check alignment at 600 & 1000 K.C. using magic wand. Slight adjustments can be made at 600 K.C. by adjusting rotor plates.

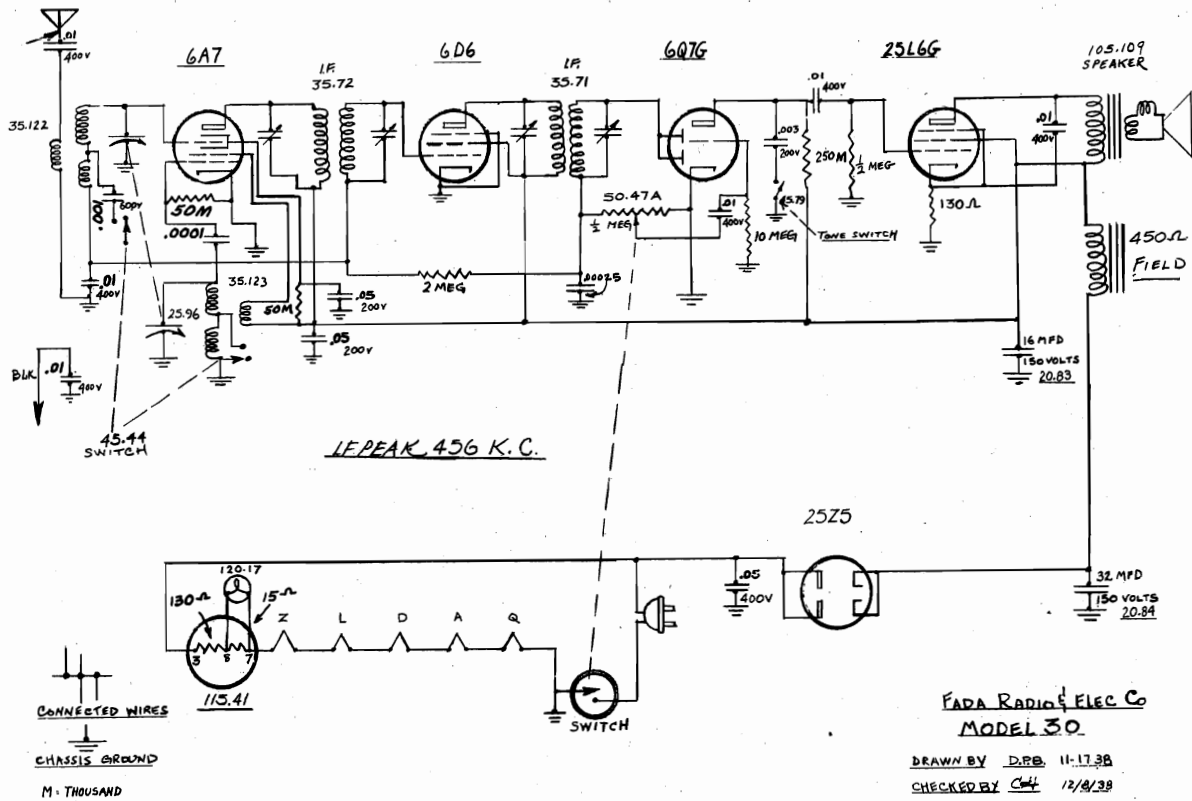

FADA RADIO MODEL 451 - 115 VOLTS - 50-50 CYCLES A.C. - Tuning Range 545-1720 K.C. and 5.8-18.4 Megacycles - 5 Tube Superheterodyne. Tubes required-6A7-6D6-6Q7G-6Y6G-80. Alignment Instructions: Do not attempt to align receiver until all other causes of trouble are checked, then proceed as follows:--Remove chassis and connect output meter across voice coil of speaker. Set dial pointer at 1000 K.C. and turn volume control to maximum position. Tune control to high end. Band switch to broadcast position. Connect modulated oscillator to grid of 6A7 tube in series with a .1 condenser and adjust trimmers 1-2-3-4 for maximum output at 456 K.C. reducing input signal of oscillator as required. Check pointer with condenser fully meshed. Turn pointer to 1500 K.C. Connect oscillator to antenna lead using a .0002 condenser as dummy antenna. With a 1500 K.C. signal adjust trimmers 5 & 6 for maximum output. Turn dial pointer to 600 K.C. Adjust padding TB rocking gang condenser for maximum output. Recheck alignment at 1500 K.C. Shift oscillator to 456 K.C. and set trimmer on wave trap for minimum signal. Check sensitivity at 1000 K.C. using magic wand. Turn band switch to Short Wave position. Set dial at 15 M.C. Use a 400 ohm carbon resistor for dummy antenna. With a 15 M.C. signal adjust T-5 for maximum output. Check image at 14.1 M.C. Increasing input signal if necessary. Check sensitivity at 10 M.C. and 6 M.C.

ALIGNMENT LAYOUT

FADA RADIO MODEL 54 - 115 VOLTS - 50-60 CYCLES A.C. - Tuning Range 540-1720 and 1550-4000 K.C. - 5 Tube Superheterodyne. Tubes required-6A7-6D6-6Q7G-6Y6G-80. Alignment Instructions: Do not attempt to align receiver until all other causes of trouble are checked, then proceed as follows:--Remove chassis and connect output meter across voice coil of speaker. Set dial pointer at 1000 K.C. and turn volume control to maximum position. Band switch in broadcast position. Connect modulated oscillator to grid of 6A7 tube in series with a .1 condenser. Adjust trimmers 1-2-3-4 for maximum reading at 456 K.C. reducing input signal of oscillator as required. Check pointer with condenser fully meshed. Turn pointer to 1500 K.C. Connect oscillator to antenna lead using a .0002 condenser as dummy antenna. With a 150Q K.C. signal adjust trimmers 5 & 6 to give maximum output. Check sensitivity at 1000 and 600 K.C. using magic wand. Set band switch in police band position and check sensitivity at 2800 K.C. Do not disturb trimmers for this operation.

Prices subject to change without notice.

AND COMPONENT PARTS

MODEL 7A

Alignment, Voltage Tuner, Phono

FAIRBANKS, MORSE & CO.

The model 7A chassis is an AC operated superheterodyne with automatic volume control, audio inverse feedback, permeability push button tuning and tuning eye. It incorporates three wave bands, broadcast, police-amateur and short wave. It is also equipped with a phono connection which permits the use of an external phonograph pickup.

THE PUSH BUTTON TUNER

It will be noted that only one operation is required for the setting of each push button. This simplicity of operation is made possible by the use of permeability tuned coils which have been accurately tracked at the factory so that it is not necessary to adjust external trimmer condensers. In order to "set" a station, tracking is accomplished by the careful spacing of the iron cores on their common shaft so that for all settings of the adjusting screws the coils are in perfect alignment. The capacitance in the oscillator circuit is fixed and may not be adjusted. This condenser (corresponding to the tuning condenser in a manually tuned receiver) is shown as number 42 on the schematic diagram and has a value of 150 micro-microfarads. The capacitance in the antenna circuit consists of two condensers, number 20 and number 43. Condenser number 20 must be adjusted when the initial alignment is made, but does not have to be touched at the time the buttons are "set" for their individual stations. Its use is covered in the alignment instructions. Instructions for "setting-up" the push buttons are covered in detail in the instruction book which accompanies each receiver.

THE AUDIO CIRCUIT

The audio circuit is of conventional design with the exception of the inverse feedback circuit consisting of resistors number 56 and number 57 and condenser number 36. By means of this network a certain amount of the voltage present at the plate of the 6V6G tube is fed back to the grid circuit of that tube. This voltage is, of course, out of phase with the input voltage and degeneration is the result.

Any audio amplifier employing a loud speaker as the load will have a certain amount of distortion introduced due to the fact that the impedance varies with the audio frequency changes in the plate circuit of the output tube. This condition is more pronounced in amplifiers using an output tube of the high impedance type such as the beam pentodes. Inverse feedback effectively reduces the plate impedance of the tube and helps to smooth out these variations thus reducing distortion to a marked degree.

The subject cannot be treated more fully here due to space limitations and has been mentioned merely to give the serviceman a brief explanation of the feedback circuit.

PHONO CONNECTIONS

The input circuit for the phonograph section of this receiver is designed for the use of a pickup of the high impedance type, although fair success may be obtained by the use of a unit of fairly low impedance. Should any difficulty be encountered with hum in the set when a pickup is being used, it is probably due to the fact that the shield side of the lead is not connected to the ground side of the terminal strip. Reversing the leads (after making sure that one side of the phono lead is a shield) should remedy complaints of this kind.

ALIGNMENT PROCEDURE

Alignment procedure is given in diagrammatic and chart form. Make adjustments in the order given. Any reliable low range AC voltmeter, preferably 0-5 volts may be used as an output meter. It should be connected across the speaker coil for best results. The volume control should be set at maximum during the alignment and the output from the signal generator should be decreased as the meter pointer tends to go off scale. If too strong a signal is used and the volume control is used to keep the pointer on scale, the AVC will operate and inaccurate alignment will result.

When aligning the police and short wave bands, care must be taken to see that the trimmers are set on the proper frequency and not on the image. The image falls 910 kilocycles below the fundamental signal, so at 20 megacycles the image should be heard at 20 megacycles minus .910 megacycle or 19.1 megacycles approximately.

After setting the oscillator trimmer, increase the input from the signal generator and make sure that the image comes in at the proper point. When you can hear one signal at the frequency to which your generator is set, and one at about 1 megacycle below it, you are ready to finish the alignment. Go back to the fundamental frequency and start peaking the antenna trimmer, rocking the tuning condenser slightly as you do so. When you reach a peak, compare the strength of the fundamental signal and the image. If the image is the stronger, you have the wrong peak on the antenna trimmer. Find the other peak and again compare the two signals. You will probably find it necessary to increase the generator output greatly in order even to hear the image when you have found the right peak.

ALIGNMENT PROCEDURE CHART

- While rocking, repeat 13, 14 and 15 until no change is noticed.
- The performance obtained with this adjustment when push button tuning is employed is suitable, as a rule, only when a conventional antenna system is used. The use of extremely long or short antennae, may necessitate a minor change in this adjustment for best results.
- Check calibration at 2.5 MC. Padder is fixed.
- Check for image at 19.1 MC approximately.
- Check for image response.
- Check calibration at 8.0 MC. Padder is fixed.

VOLTAGE AND RESISTANCE DATA

ALL READINGS MEASURED ON MODEL 1200A, 2000 OHMS PER VOLT, TRIPLETT VOLT OHMMETER, AS NEAR HALF SCALE AS POSSIBLE AND WITH 117 VOLTS, LINE VOLTAGE.

ALL READINGS FROM SPECIFIED POINT TO GROUND (CHASSIS FAN) WITH VOLUME AND TONE CONTROL ADVANCED TO MAXIMUM, VOLUME NATURALIZER "IN", RANGE SWITCH ON BC POSITION, GANG CONDENSOR IN FULL MESH, NO ANTENNA AND CHASSIS GROUNDED.

FRONT, SIDE, AND TOP VIEWS OF THE CHASSIS SHOWING TRIMMER LOCATIONS, TUBE LOCATIONS AND COMPONENT PARTS

IF PEAK 455 KC

The model 12B chassis is an AC operated superheterodyne with automatic volume control, push-pull output with inverse feedback, permeability push button tuning, volume naturalizer, and tuning eye. It incorporates three wave bands, broadcast, police-amateur, and short wave. It is also equipped with a phono connection which permits the use of an external phonograph pickup.

**PHONO CONNECTIONS**

The input circuit for the phonograph section of this receiver is designed for the use of a pickup of the high impedance type, although fair success may be obtained by the use of a unit of fairly low impedance. Should any difficulty be encountered with hum in the set when a pickup is being used, it is probably due to the fact that the shield side of the lead is not connected to the ground side of the terminal strip. Reversing the leads (after making sure that one side of the phono lead is a shield) should remedy complaints of this kind.

FAIRBANKS, MORSE & CO.

MODEL 12B Alignment

ALIGNMENT PROCEDURE

Alignment procedure is given in diagrammatic and chart form (see figure 3 and 4). Make adjustments in the order given. Any reliable low range AC voltmeter, preferably about 0-5 volts may be used as an output meter. It should be connected across the speaker voice coil for best results. The volume control should be set at maximum during the alignment and the output from the signal generator should be decreased as the meter pointer tends to go off scale. If too strong a signal is used and the volume control is used to keep the pointer on scale, the AVC will operate and inaccurate alignment will result.

When aligning the police and short wave bands, care must be taken to see that the trimmers are set on the proper frequency and not on the image. The image falls 910 kilocycles below the fundamental signal on the dial, so at 20 megacycles the image

should be heard at 20 megacycles minus .910 megacycle or 19.1 megacycles approximately.

After setting the oscillator trimmer, increase the input from the signal generator and make sure that the image comes in at the proper point. When you can hear one signal at the frequency to which your generator is set, and one at about 1 megacycle below it, you are ready to finish the alignment. Go back to the fundamental frequency and start peaking the RF trimmer, rocking the tuning condenser slightly as you do so. When you reach a peak, compare the strength of the fundamental signal and the image. If the image is the stronger, you have the wrong peak on the RF trimmer. Find the other peak and again compare the two signals. You will probably find it necessary to increase the generator output greatly in order even to hear the image when you have found the right peak.

Repeat this operation for the antenna trimmer.

Table with 10 columns: Step No., Connect Signal Generator To, Signal Generator Frequency, Dummy Antenna, Range Switch Position, Dial Setting, Section, Adjusting Screw No., Peak For, Volume Nat.-R.L. Switch. It lists 21 steps for aligning various components like grids, condensers, resistors, and oscillators.

- (1) While rocking. Repeat 7, 8, 9 and 10 until no change is noted.
(2) To check volume naturalizer operation, turn to "On" or "In" position. If functioning normally, volume level will drop quite noticeably, under normal output volume.
(3) The performance obtained with this adjustment when push button tuning is employed is suitable, as a rule, only when a conventional antenna system is used. The use of extremely long or short antennae, may necessitate a minor change in this adjustment per best results.
(4) Check calibration at 2.5 MC. Padder is fixed.
(5) Check for image at 19.1 MC on dial approximately.
(6) Check for image response.
(7) Check calibration at 8.0 M.C. Padder is fixed.

ALIGNMENT PROCEDURE CHART

MODEL 12B Tuner Data, Parts Naturalizer Notes

FAIRBANKS, MORSE & CO.

THE PUSH BUTTON TUNER

It will be noted that only one operation is required for the setting of each push button. This simplicity of operation is made possible by the use of permeability tuned coils which have been accurately tracked at the factory so that it is not necessary to adjust external trimmer condensers in order to "set" a station. Tracking is accomplished by the careful spacing of the iron cores on their common shaft so that for all settings of the adjusting screws the coils are in perfect alignment. The capacitance in the oscillator circuit is fixed and may not be adjusted. This condenser (corresponding to the tuning condenser in a manually tuned receiver) is shown as number 11 on the schematic diagram and has a value of 140 micro-microfarads. The capacitance in the antenna and RF circuits consists in each case of two condensers, number 19 and 20 for the antenna, and number 21 and 22 for the RF. Condensers 19 and 21 must be adjusted when the initial alignment is made, but do not have to be touched at the time the buttons are "set" for their individual stations. Their use is covered in the alignment instructions in Figure 4. Instructions for setting-up the push buttons are covered in detail in the instruction book which accompanies each receiver.

THE AUDIO CIRCUIT

The audio circuit is of conventional design with the exception of the inverse feedback circuit consisting of resistors number 114 and 115, and condensers 116 and 122. By means of this network a certain amount of the voltage present at the plate of each 6V6 tube is fed back to the grid circuit of that tube. This voltage is, of course, out of phase with the input voltage and degeneration is the result.

Any audio amplifier employing a loud speaker as the load will have a certain amount of distortion introduced due to the fact that the impedance varies with the audio frequency changes in the plate circuit of the output tube or tubes. This condition is more pronounced in amplifiers using an output tube of the high impedance type such as the beam pentodes. Inverse feedback effectively reduces the plate impedance of the tube and helps to smooth out these variations thus reducing distortion to a marked degree.

The subject cannot be treated more fully here due to space limitations and has been mentioned merely to give the serviceman a brief explanation of the feedback circuit.

PURPOSE AND OPERATION OF VOLUME NATURALIZER

In most transmitting stations, the operators attempt to keep the modulation percentage high at all times in order to increase the area in which acceptable reception of their programs is possible. In so doing, a considerable portion of the volume range present in the studio program may be lost due to the fact that the lower volume portions of the program are raised to maintain coverage and thus require that the higher volume portions be relatively attenuated to prevent over-modulation of the transmitter.

The volume naturalizer is designed to compensate, in part, for this evil that often exists under present broadcasting conditions but should not be used indiscriminately. In general, its use is not justified on oral programs although occasionally a listener may prefer it. On some popular musical selections, the volume range is so restricted that no appreciable difference will be noticed except as the frequency response is influenced by the naturalizer circuit. Of course the volume control should be reset, each time the naturalizer is switched in and out, to keep the reference volume approximately the same for more accurate comparison. This will not be necessary at relatively high volume, because the volume will not change appreciably as the naturalizer is switched in or out, under these conditions.

On modern phonograph records, its use is not often desirable as the volume range is generally acceptable. On older records, no definite recommendation can be made because great variations will be found, especially between recordings by different manufacturers.

The method by which the volume naturalizer operates, can be simply described as controlled degeneration, whereby a portion of the audio signal from the plate circuit of the 6J5 first audio tube, is used to vary the bias voltage of preceding and interconnected tubes, in such a manner as to increase the volume level on signals that were originally suppressed at the transmitting station, and to decrease the volume level on signals that were increased in intensity at the transmitter, thus restoring in part, the original volume range present, for example, during a symphonic orchestra broadcast.

PARTS AND PRICE LIST MODEL 12B

\*A\* BATTERY = 6 VOLTS.  
CURRENT DRAIN = 7.4 AMPERES

ANTENNA CIRCUIT: The antenna circuit is directly coupled to the antenna in contrast with the capacity coupled circuit used in some previous Firestone auto receivers. A small adjustable condenser is provided for adjusting the antenna circuit to the antenna. This adjustment is made near the high frequency end of the dial (1400 K.C.) instead of at the low frequency end, as with the capacity coupled sets. There are two taps provided on the antenna coil. One for use with whip or low capacity type antenna, and the other for running board or high capacity type antenna. The antenna coil is set at the low capacity tap at the factory and must be changed (by means of the small tip jack located in the receiver at the antenna coil) if a high capacity antenna is used. This is done by merely removing the small tip jack from its present tap on the antenna coil and inserting the jack in the other receptacle provided.

**SETTING UP THE MONOMATIC TUNING MECHANISM:**

Remove the plate that covers the Monomatic tuning adjustments on the receiver case.

Operate the Monomatic button (marked "Push") until the dial becomes illuminated, indicating that the receiver is adjusted for Dial Tuning. Then tune in your #1 station, using the Station Selector knob.

Operate the Monomatic button until the #1 station indicator (furthest left of the five indicators) becomes illuminated.

Turn the #1 station screw marked "OSC" (see Fig. 3) until your #1 station is tuned in. Other stations may be heard during this operation. If in doubt whether you have your desired #1 station, compare it with the original station by operating the Monomatic button until the Dial Tuning position is reached.

After adjusting the "OSC" screw as carefully as possible, adjust the "ANT" screw for maximum volume and best reproduction. After having done so, it is advisable to re-check the adjustment of the "OSC" screw and then the "ANT" one again to insure greatest accuracy.

Tune in your #2 station and operate the Monomatic button until the #2 indicator becomes illuminated. Then proceed to adjust the two screws for this station in the same manner as was just done for the #1 station. Always adjust the "OSC" screw before adjusting the "ANT" one, and then repeat the adjustments for greater accuracy.

Proceed in the same manner for the remaining stations on your list. Then replace the cover in the receiver case. Insert the proper call letters, cut from the sheets supplied, in the indicator button slots.

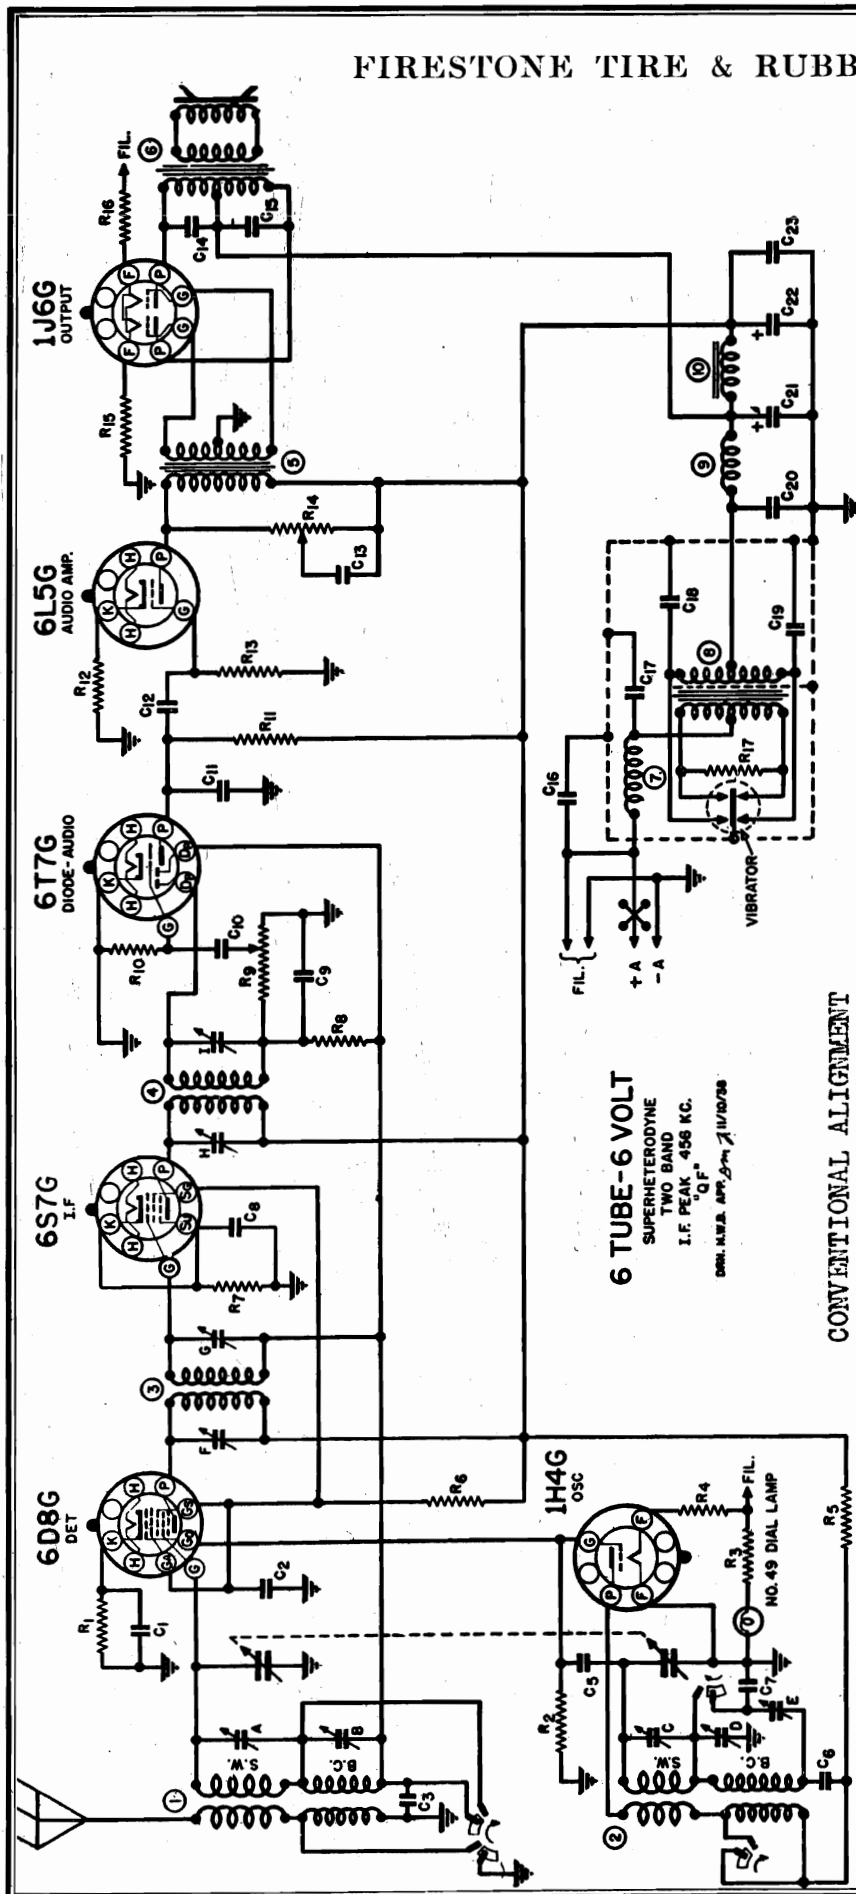

Fig. 3

**MATCHING THE ANTENNA:**

An adjusting screw, accessible to a screw-driver through a hole in the side of the case is provided to match the receiver to the car antenna. Using the Station Selector knob, tune in a very weak station at about 600 kilocycles. Then turn the adjusting screw to the point affording maximum volume.

MODEL S-7426-7

**CORRECT ALIGNMENT PROCEDURE.** The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

**I. F. ALIGNMENT.** With the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (1A7G) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the chassis

ground. Align all four I.F. trimmers to peak or maximum reading on the output meter.

**BROADCAST BAND ALIGNMENT.** Connect the antenna terminal to the generator through a 200 MMF dummy and the ground terminal to the generator ground. Set the dial and generator at 1720 KC (gang at minimum capacity). Align the BC oscillator trimmer for maximum output. Set the test oscillator at 1400 KC and tune in the signal with the dial and adjust the antenna trimmer for maximum output. Check the sensitivity at 600 to determine if the gang or the coils have been damaged.

TUBE AND TRIMMER LOCATIONS

**GENERAL DATA.** The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600 and 1400 KC. and an output meter to be connected across the primary or secondary of the output transformers. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible, to prevent the AVC from operating and giving false readings.

**CORRECT ALIGNMENT PROCEDURE.** The intermediate frequency (I.F.) stage should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast Band should be aligned.

**I.F. ALIGNMENT.** With the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (6D8G) through a .05 or .1 mfd. condenser. The ground on the test oscillator can be connected to the chassis ground. Align all four I.F. trimmers to peak or maximum reading on the output meter.

**BROADCAST BAND ALIGNMENT.** Connect the antenna to the generator through a 200 MMF dummy and set the dial and generator at 1400 KC. Align the BC oscillator trimmer and BC antenna trimmer. Set the generator at 600 KC and tune in the signal to check sensitivity at this point to determine if coils or gang condenser have not been damaged.

Elec. Automatic Tuner

MODELS 22-S, 25-N (E6T)

# ELECTRIC AUTOMATIC TUNER

Types E5T, E6T and E7T

- Proceed to set the remaining five stations. For each station follow steps 3, 4, 5, and 6 as described in this manual. THE TUNING KNOB BE PERMITTED TO RUN FREELY. THE TUNING KNOB SHOULD BE PERMITTED TO RUN FREELY.
- Tighten the automatic locking screw very securely. Do not hold the tuning knob while locking the automatic, but allow the mechanism to turn to its natural stop.
- Push the plug all the way into the receptacle on the receiver housing so the short motor pin will also make contact.

Figure 1.

- press hand against one side of the notch and may prevent it from releasing as the magnet is de-energized.
- LATCH BAR SPRING WEAK.** Check latch bar tension springs to make sure they will pull the latch bar from the magnet with sufficient force. Spring tension is adjustable.
- MAGNET CONTACT IN CONTROL HEAD STUCK.** Check magnet contact in control head. Make sure it does not break contact when pressure is released on the bottom. Check for frozen contact points, or for sticking button.
- ARMATURE RIVET WORK.** There is a brass rivet at the tip of the armature, to prevent the armature from vibrating to the magnet. If this rivet is worn down, permitting the steel armature to actually touch the magnet pole, it may freeze in that position.
- BURR ON TIP OF LATCH.** Latch tip should be smooth and shiny.
- RINDING IN LATCH BEARINGS.** Latch must move freely but not sloppy.
- LATCH TIPS NOT CENTERED ON LATCH RINGS.** Latch tips must not rub delicate guide rings. The latch bar bearing shaft is adjustable.
- FRICITION CLUTCH TOO TIGHT.** A tension washer between the motor pinion and the brass pinion collar acts as a friction clutch to absorb the shock of the clutch when the motor starts. If the station is tuned, if the tension is too tight, the torque of the stopped motor will hold the latch bar tip in the notch.
- MOTOR BRUSHES TOO TIGHT.** Too much friction between the motor brushes and the commutator will cause the same thing.

**TO SET AUTOMATIC TUNER**

NOTE: Before setting any station, let the set warm up for not less than ten minutes. If you wish you can "set" the automatic tuner on the carry-over bench before installing the set in the car. Use the trimmer to adjust the station, then trimmer to it. Then readjust the antenna trimmer after the installation in the car.

**PREPARATION.** You will note that the 9-contact plug is shorter than the others. For the "setting up" procedure, this plug should be inserted in its receptacle on the receiver only half way. This will cause all of the magnet terminals to be energized during the adjustment since the motor will run during the adjustment since the short pin will not make contact, thereby holding the motor circuit open. The motor should not run at any time during the "setting up" procedure.

- From the set of call letter tabs provided, detach the proper ones for the six stations. The station tabs should then be inserted in the space provided in the face of station tuning buttons. Connect the tabs with a small rectangular piece of cardboard. Both tabs and cardboard snap into position.
- Loosen the AUTOMATIC LOCKING SCREW. This screw should be turned counter-clockwise four or five revolutions—far enough to assure plenty of looseness.
- Turn the dial all the way to the low frequency end (835 K.C.).
- Press the first button and hold it down. A faint "click" should be heard, indicating that the tuning magnet has attracted the latch bar.
- Holding the magnet energized, turn the dial manually all the way back to the low frequency end (835 K.C.) and then all the way back to the high frequency end (1300 K.C.).
- Still pressing on the button, tune in the station to be set on that button.

**REVERSING SWITCH AND MUTING RELAY ADJUSTMENT**

- NOTE: Four adjusting screws extend upward through the switch mounting plate, three of them in line, and one set off by itself. (See Fig. 1).
- Turn the rotor assembly until the HIGH sides of all latch rings rest opposite the latch tips.
  - Turn screw "A" in until all latch bar tips touch HIGH side of ring, and the other side of each back one half turn. (Spacing between latch tip and high side of ring at point "A" should be 8 to 12 thousandths of an inch.)

**NOTE:** All three tuners are identical in construction, except for the condenser gang. E5T has a 3-gang condenser and is used in Models 9-49 and 9-69. E6T has a 2-gang condenser and is used in Models 15-F, 20-P, 21-L, 22-S, 24-K, and 25-N. E7T has a special high frequency condenser gang and is used in Police Cruiser Models 14-69-14.

**SERVICE SUGGESTIONS**

- FAILS TO RETAIN ORIGINAL SETTING**
- LATCH RINGS NOT LOCKED SECURELY. The locking screw must be pulled down securely, otherwise the shock of the sudden stopping will tend to slide the rings away from the original setting.
  - ORIGINAL SETTING NOT ACCURATE. Resetting of magnets may be necessary after several days' use, during which time the mechanism goes through a "shaking down" process.
  - ELECTRICAL DRIFT. This is usually the result of a great change in temperature. Automatic compensation is provided in the circuit to take care of the normal operating temperature range. The set on and permit it to play long enough to arrive at a constant operating temperature. In zero weather do not expect the set to tune "on the nose" until after a constant temperature has been reached. In severe cases of electrical drift, in addition to setting temperature, change the compensating condensers.
- IMPOSSIBLE TO SET UP STATIONS**
- TOO MUCH TENSION ON LOCKING LEVERS. When the automatic locking screw is loose, the station rings should move freely. If the levers still hold the station rings partially locked, the mechanism will not tune in stations in position. Should be loosened one-quarter to one-half turn.
  - LATCH RINGS "OUT OF RANGE". If the loosened automatic locking screw draws into the notch falls out of each of the latch bars. The notch should be brought back to position by following exactly the "setting procedure" outlined elsewhere in this book.
- FAILS TO STOP AT STATION**
- OPEN MAGNET WINDING. Check for continuity and replace if necessary.
  - MAGNET CONTACTS IN CONTROL HEAD NOT CLOSING. Inspect contacts. Adjust or clean if necessary.
  - LATCH BAR DEFECTIVE. Inspect latch bar to make sure that it has not been damaged. Replace latch bar, if required.
  - POOR CONTACT IN PUSH-BUTTON PLUG. A poor contact between the push-button plug, which reduces the pulling power of the magnet.
  - IMPROPER SPACING OF MAGNET. Check the spacing between the latch bar structure and the magnet pole. The magnet pole should be adjusted so that all the way down in the notch in the latch ring, the armature should not quite touch the magnet pole. A hair line of light should be visible between them.
  - LATCH RINGS NOT LOCKED SECURELY. If the latch rings are very loose the motor will continue to turn the gang until the plates are completely meshed.
- LATCH BAR STICKS IN NOTCH**
- MANUAL TUNING SHAFT BINDS. Binding in the tuning control shaft causes the latch bar to

**MOTOR DOES NOT RUN**

- MOTOR CONTACTS IN CONTROL HEAD NOT CLOSING. Open the control head and inspect the motor contacts. If the gap is too great, contact may be made by bending carefully.
- POOR CONTACT AT PUSH-BUTTON PLUG. Inspect the contacts between the plug and the receptacle on the chassis.
- OPEN CIRCUIT IN MOTOR. Check all connections to motor and check motor winding for continuity.
- MOTOR BRUSHES NOT MAKING CONTACT. Check contact between brushes and commutator. Clean dirty commutator with carbon tetrachloride.
- LOW BATTERY VOLTAGE. A weak or defective battery in the set would not deliver sufficient voltage to run the motor.
- FLEXIBLE TUNING SHAFT BINDS. Binding in the flexible tuning shaft places an additional load on the motor. Check for binding and it will prevent the motor from turning the mechanism.
- MAGNET FAILS TO RELEASE. If the magnet which holds the latch bar for any reason, the motor cannot turn the mechanism.

**MECHANISM RUNS SLOUGHLISLY**

- LOW BATTERY VOLTAGE. A weak or defective battery will not deliver sufficient voltage to turn the motor at normal speed.
- HIGH RESISTANCE CONTACT IN CONTROL HEAD. High resistance at the push-button contacts will cause a voltage drop which will prevent the motor from turning at normal speed.
- POOR CONTACT BETWEEN PUSH-BUTTON PLUG AND RECEPTACLE. This will also result in voltage drop, and loosened motor power.
- BINDING IN TUNING SHAFT. Binding in the flexible tuning shaft will place an additional load on the motor. Check for binding and it will prevent the motor from turning the mechanism. Check all gears in assembly for binding due to improper meshing.
- DEFECTIVE MOTOR. - Replace.

**MOTOR FAILS TO REVERSE**

- REVERSING SWITCH NOT PROPERLY ADJUSTED. See instructions elsewhere in this book.
- OPEN CIRCUIT IN MOTOR. If one side of motor circuit is open, motor will run in one direction only.
- OPEN MAGNET WINDING. An open magnet will not pull latch down; consequently will not cause motor switch to reverse.
- LATCH BAR SPRING TOO TIGHT. If the latch bars cannot be pulled down, the magnet will not be able to pull the latch down.

GALVIN MFG. CORP.

Procedure, Part 2  
 Schematic of Tuner  
 Assembly, Parts List

AUTOMATIC SERVICE PROCEDURE--Continued

3. Hold any latch bar tip down on HIGH side of ring and adjust screw "C" (center screw) until the bakelite insulator on the center switch leaf just barely misses touching the heel of the latch bar at point "Y". (Check adjustment by pressing other latch bars. The depressed latch bar must not lift the center contact even slightly.)

4. With latch bar at rest position adjust screw "B" (front screw) until top motor contact is lifted from center contact by 12 to 15 thousandths of an inch at point "Z". (15 thousandths = 1/64").

5. Turn rotor until LOW side of ring rests under latch tip. Press any latch bar down and make sure switch actually reverses. (Bottom contact must break and top contact make sufficiently to lift the top switch leaf slightly from the bakelite spacer.)

6. Turn screw "D" (rear screw) until mating relay armature rests 15 to 20 thousandths of an inch from the magnet pole. (Too close spacing will cause intermittent muting due to vibration.) (15 thousandths = 1/64").

TO REMOVE LATCH BAR ASSEMBLY

1. Back up on front switch adjustment screw (A) until latch tips rest outside the diameter of the bakelite ring separators.

2. Remove comb shaped latch tension spring.

3. Remove the hex-head machine screw which extends through the small angle bracket into the brass latch bar bearing shaft underneath the tuner. (Screw not visible in photo.)

4. Pull out latch and shaft assembly. (F)

NOTE: To re-assemble, reverse the above procedure, and take particular care that:

1. Latch bar tips center on latch rings. They should not rub bakelite ring separators. (Spacing is adjustable through elongated hole in small bracket under tuner.)

2. When readjusting screw (A), turn it all the way in until latch tips touch high side of rings; then back screw up one-half turn (See reversing switch adjustment on Page .)

TO REMOVE LATCH RING ASSEMBLY

1. Back up on switch adjustment screw (A) until latch tips rest outside the diameter of the bakelite ring separators.

2. Remove locking screw. (G)

3. Remove the three locking levers. (H)

4. Lift the locking nut off the end of the rotor shaft.

5. Carefully loosen the three screws (J) which hold the ring assembly to the rotor hub, and remove all rings and separators as a unit, being careful to keep the three screws in position through the assembly.

NOTE: To reassemble, reverse the above procedure. Work carefully - do not let the rings and separators get off the screws.

TO REPLACE DEFECTIVE LATCH RING

1. Remove the entire latch ring assembly from the rotor hub. (See instructions above.)

2. Lay assembly on flat surface with screw heads down.

3. Remove rings, separators and brass spacing collars, one at a time, until the defective ring is exposed.

NOTE: Reassemble parts one at a time, being careful that rings, separators, and spacers are in the correct position.

CAUTION: Be careful to replace rings in original position. Turning the ring over will reverse the position of the notch and will result in faulty tuning.

TO REMOVE DEFECTIVE HUB AND GEAR

1. Remove the entire latch ring assembly from the rotor hub. (See instructions above.)

2. Loosen the four Bristo set screws in the rotor hub.

3. Loosen the one Bristo set screw in the bakelite flexible shaft coupling.

4. Pull the rotor hub off the gang shaft. The manual tuning gear and coupling will have to be removed at the same time. The brass collar on the motor shaft may also need to be removed.

NOTE: When installing a new hub, turn the gang to full mesh and the hub gear against its stop before tightening set screws.

Dial Cord Data

Figure 1 - Trimmer Locations

DIAL DRIVE CORD ASSEMBLY - PART NO. IX14731

1. Remove broken cord, dial scale and dial pointer.  
2. If exact Motorola assembly is not available, cut a piece of 30 lb. silk fish cord 32 inches long. CONDENSER GAIN MUST BE NEEDED.

3. Double the cord at a point 11 inches from one end and thread the loop through the hole in the drive raceway. See Fig.

4. Tie a large knot in the cord or use an eyelet large enough to prevent the cord from slipping through the hole in the raceway. You will now have cord (A) 21 inches long, and cord (B) 11 inches long extending from the raceway as in Fig. 3.

5. Loop cord (A) under and over idler pulley No. 1, as shown in Fig. 4 and holding the end of cord (B) under raceway 22 turns of right (clockwise) thereby winding 24 turns of cord (A) on the raceway.

FIG. 3

FIG. 4

DIAL CORD INSTRUCTIONS  
MISALIGN CORD AND SPRING ASSEMBLY - PART NO. IX14730

NOTE: If exact Motorola assembly is not available use original spring and 30 lb. silk fish cord to make up assembly to dimensions as shown at the top of Fig. 2.

- Turn gang to fully meshed position.
- Loop long end of cord around set screw (A) in condenser gear and hook around third tooth of gear ahead of set screw.
- Make one complete turn around condenser rotor shaft.
- Stretch spring and loop other end around set screw (B) in tuner gear.

NOTE: Spring tension must be sufficient to take up all backlash in gear train. To increase tension, hook cord around fourth tooth in Step 2. To decrease tension, hook around second tooth.

FIG. 5

Figure 2.

ALIGNMENT PROCEDURE

Remove the chassis from its housing and place it on the service bench. Connect the speaker and battery.

Turn the volume control to maximum position and leave it there throughout the alignment, reducing the signal generator output if necessary.

R. F. ALIGNMENT

- Change to 40 MF condenser in signal generator lead. Set signal generator at 1850 K.C. and with the condenser gang still completely out of mesh, adjust the oscillator trimmer to the point showing the highest output reading.

- Set the signal generator at 1400 K.C. and turn the condenser gang to the signal at 1400 K.C. Adjust the antenna trimmer on the condenser gang to the point showing the highest output reading.

- Set the signal generator at 600 K.C. and rock the pointer at the 600 K.C. position on the dial scale, while adjusting the antenna paddler, until a combination is found which gives highest output reading.

NOTE: The antenna paddler is reached through a hole in the bottom of the chassis base, directly under the antenna coil can.)

SENSITIVITY AND STAGE GAIN MEASUREMENTS

These stage gain measurements will, if properly used, enable you to localize trouble quickly. They are intended for use with a signal generator that is accurately calibrated in microvolts.

Starting with the second detector - first audio stage, and working back step by step to I.F. Osc., Mod., R.F. and finally to the antenna terminal, the circuit in which the trouble exists will quickly be determined by evidence of low gain, when signal generator attenuation readings are compared to the normal values as shown in the table.

All stage gain measurements must be made with the volume control set for full volume. The shielded lead from the signal generator is connected to the grid terminal of the tube through a .1 MF condenser, with a 50K ohm resistor connected as a leak resistance between the grid of the tube and the grid lead which has been removed.

When measuring over-all sensitivity at the antenna terminal, use a 40 MF condenser in place of the .1 MF. It must be remembered that the figures in the table are average and allowance must be made for variations between two sets of the same general type, due to difference of tube characteristics, etc.

Average Microvolt Input *	Generator Swt. at	Generator Connected to	Dummy Antenna Capacity	Leak Resistance	Output Meter Reading **
20,000	455 K.C.	IF Grid	.1 MF	.5 Meg	1.87 Volts
200	455 K.C.	Mod. Grid	.1 MF	.5 Meg	1.87 Volts
250	600 K.C.	Mod. Grid	.1 MF	.5 Meg	1.87 Volts
125	600 K.C.	RF Grid	.1 MF	.5 Meg	1.87 Volts
10	600 K.C.	Ant. Lead	40 MF	None	1.87 Volts

7B5 or 6X0GT	Output	225	180	0	-
6Z4 or 6X5	Rect.	AC	-	250	-

All measurements from chassis ground to socket terminal using 1000 ohms per volt meter. Current Consumption 6.5 Amps.  
Maximum Power Output 5 Watts.

I. F. ALIGNMENT

- Connect the signal generator to the antenna lead through a .1 MF condenser and to chassis ground. Turn the condenser gang completely out of mesh. Connect an output meter across the speaker voice coil.
- Set the signal generator at 455 K.C. and carefully adjust the single trimmer in the Diode coil can to the point showing the highest reading on the output meter. (Advance the signal generator attenuator if necessary to pick up signal.)
- Adjust the two trimmers in the I.F. coil can to the point showing the highest output reading.

- Repeat the I.F. and Diode adjustment several times for maximum accuracy.

- Use a common ordinary paper clip to clip the loose end of cord (A) to front of chassis, so you can work on cord (B) for a while.
- Take cord (B) and bring it over the raceway and under idler pulley No. 2 as shown in Fig. 5.
- Make one complete turn around drive pulley as shown in Fig. 5.
- Remove the paper clip holding cord (A) and idler pulley No. 2. Turn around the drive pulley as shown in Fig. 5.
- Bring both loose ends of cord through the slot in the chassis and tie them together tightly inside the slot.
- Then tie in one end of the tension spring, Part No. 41A2854 and hook the other end of the spring to the ear stamped out of the washer. Cut off surplus cord.

- Replace pointer and dial scale.
- To set pointer to correct frequency tune in a station of known frequency and adjust position of pointer on string.
- Secure pointer to string with a drop of shellac.

Alignment  
Trimmers

GALVIN MFG. CORP.

MODEL 9-29  
Schematic, Socket

Figure 1.

**I.F. ALIGNMENT**

Place the radio on the service bench with the front cover removed, but with the speaker and battery connected to it.

Turn the volume control to maximum position and leave it there throughout the alignment, reducing the signal generator output if necessary.

**NOTE:** Do not adjust the trimmer in the oscillator coil can that is covered with Scotch tape. The original adjustment, made in the factory, should not be tampered with. (Fig. 2 below, shows all trimmer locations.)

**I.F. ALIGNMENT**

1. Connect the signal generator to the control grid of the Osc.-Mod. tube (6A7) through a .1 MF condenser, having first removed the grid cap from the top of the tube. Connect a 500,000 ohm grid resistor from the grid of the tube to the MF condenser lead cap just removed from the tube. (See Fig. 1.) Turn the condenser gang completely out of mesh. Connect an output meter across speaker voice coil.
2. Set the signal generator at 262 K.C. and carefully adjust the single trimmer in the Diode section of the I.F. coil can to the point showing the highest output reading on the output meter.
3. Adjust the two trimmers in the I.F. coil can to the point showing the highest output reading.
4. Repeat the I.F. and Diode adjustment several times for maximum accuracy.

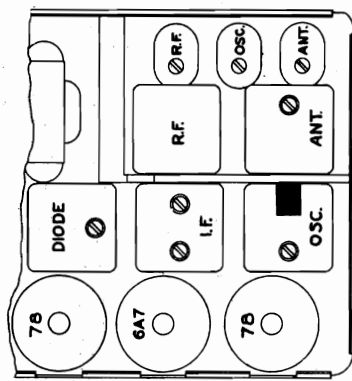

Figure 2. 9-29 TRIMMERS

**SETTING THE RANGE**

1. Connect the signal generator to the control grid of the R.F. tube (78) using the same .1 MF condenser and the same 500,000 ohm leak resistor.
2. Set the signal generator at 1560 K.C. and turn the condenser gang completely out of mesh and adjust the trimmer on the oscillator section of the highest output reading.
3. Set the signal generator at 535 K.C. Turn the condenser gang completely in mesh and adjust the 600 K.C. trimmer in the oscillator coil can to the point showing the highest output reading.

**Model 9-29**

**R.F. AND ANTENNA ALIGNMENT**

1. Connect the signal generator to the antenna lead through a 40 MF condenser and to chassis and ground. Set the signal generator at 600 K.C. and turn the condenser gang until the signal is heard. Adjust the trimmer on the antenna coil can for the maximum output reading.
2. Set the signal generator at 1400 K.C. Turn the condenser gang until the signal is heard. Adjust just the trimmer on the antenna section of the condenser gang for maximum output reading.
3. Adjust the trimmer on the R.F. section of the condenser gang for maximum output reading.
4. Recheck steps 1, 2, and 3, for accuracy.

**NOTE:** The adjustments above set the range so the receiver will track with the calibrations in the control head.

SENSITIVITY AND STAGE GAIN MEASUREMENTS

These stage gain measurements will, if properly used, enable you to localize trouble quickly. They are intended for use with a signal generator that is accurately calibrated in microvolts.

Starting with the second detector - first audio stage, and working back step by step to I.F., Osc., Mod., R.F. and finally to the antenna terminal, the circuit in which the trouble exists will quickly be determined by evidence of low gain, when signal generator attenuation readings are compared to the normal values as shown in the tables.

All stage-gain measurements must be made with the volume control set for full volume. The shielded lead from the signal generator is connected to the grid terminal of the tube through a .1 MF condenser, with a 500 M Ohm resistor connected as a leak resistance between the grid of the tube and the grid lead which has been removed.

When measuring over-all sensitivity at the antenna terminal, use a 40 MF condenser in place of the .1 MF.

It must be remembered that the figures in the table are average and allowance must be made for variations between two sets of the same general type, due to difference of tube characteristics, etc.

Table with 6 columns: Average Microvolt Input, Generator Set at, Generator Feeder Connected to, Dummy Antenna Capacity, Leak Resistance, Output Meter Reading. Rows list various tube types (7A7, 7B8, 7C5) and their corresponding settings and readings.

1.74 Volts equals 1 Watt output.  
V.C. resistance - 3 ohms.

\* For 1 Watt output.

\*\* Output meter connected across voice coil.

VOLTAGE CHART - MODEL 9-49

Table with 5 columns: TUBE, POSITION, PLATE, SCREEN, CATHODE, OSC. PLATE. Lists tube types and their electrical connections.

All voltages measured from socket terminal to chassis ground using 1000 Ohms per volt meter.

CAUTION

If you use a screw driver to pry out Loktal tubes, be careful that you do not crack the glass bead around the tube pins.

ALIGNMENT: To align, follow procedure of Model 9-44.

Figure 1 - Trimmers

1. Control grid of the R.F. tube (7B), using the same .1 MF condenser.

2. Set the signal generator at 1550 K.C. and with the condenser gang completely out of mesh adjust the oscillator trimmer on the middle section of the condenser gang to the point showing the highest output reading.

3. Set the signal generator at 525 K.C. Turn the condenser gang completely in mesh and adjust the 600 K.C. padder in the oscillator coil can for the highest output reading.

NOTE: Adjustments above set the range so the receiver will track with the calibrations in the control head.

RF AND ANTENNA ALIGNMENT

1. Connect the signal generator to the antenna lead through a .1 MF condenser at 600 K.C. basis. Turn the condenser gang until the signal is heard. Adjust the 600 K.C. padder in the antenna coil can for maximum output reading, while slightly rocking the condenser gang.

2. Set the signal generator at 1400 K.C. Turn the condenser gang until the signal is heard. Adjust the 1400 K.C. trimmer in the antenna coil can for maximum output reading.

3. Adjust the 1400 K.C. R.F. trimmer on the inside end of the condenser gang for maximum output reading.

4. Recheck steps 1, 2, and 3, for accuracy.

TO RESTRICT BOOST-O-MATIC DRIVE

7. Loosen the set screws in worm gear #1 and hook the knot in Cord 'A' in the slot in the end of the worm drive.

8. Turn the worm drive towards you just enough to take up the slack in Cord 'A' and tighten on the set screws.

9. Hold Cord 'B' in your left hand and turn the tuning shaft manually until the condenser gang is closed. This will wind Cord 'A' on worm drive #1.

10. Loosen the set screws in worm drive #2 and hook the knot in Cord 'B' in the slot in the end of worm drive #2.

11. Turn worm drive #2 away from you just enough to take up the slack in Cord 'B' and tighten on the set screws.

12. Hook the end of the cord tension spring under the ear stamped out of the pulley.

NOTE: You can see by studying Fig. 2 how Cord 'A' passes over worm drive #1, whereas, Cord 'B' passes under worm drive #2.

Figure 2

Figure 1 - Trimmers

ALIGNMENT FOR MODELS 9-44, 9-49 & 9-69 Place the radio on the service bench with the front cover removed, but with the speaker and battery connected to it.

Turn the volume control to maximum position and leave it there throughout the alignment, reducing the signal generator output, if necessary.

NOTE: Do not adjust trimmer in the oscillator coil can that is covered with Scotch tape. The original adjustment made in the factory should not be tampered with.

Fig. 1 shows all trimmer locations.

I.F. ALIGNMENT

1. Connect the signal generator to the control grid of the Osc.-Mod. tube (6A7). Turn the condenser gang completely out of mesh. Connect an output meter across the speaker voice coil.

2. Set the signal generator at 262 K.C. and carefully adjust the two trimmers in the Diode can to the point showing the highest reading on the output meter.

3. Adjust the two trimmers in the I.F. coil can to the point showing the highest output reading.

4. Repeat the I.F. and Diode adjustments several times for maximum accuracy.

SETTING THE RANGE

1. Connect the signal generator to the control grid of the oscillator.

2. Turn the condenser gang to the fully open position.

3. Turn the booster pulley and cam assembly until the forked slider has been drawn all the way in and the hole in the rim of the drive pulley is at the top, lining up with the pulley stud and the slider, as indicated in Fig. 2.

4. If the old string is broken, cut a new piece of 30 pound test silk fish cord, 31" long, and tie knots or eyelets in both ends so the length between the knots is exactly 28".

5. Double the cord at its exact center and push the cord through the hole in the rim of the drive pulley.

6. Tie the tension spring in the loop, thus formed, but do not hook it under the ear stamped out of the pulley. Hook it under the hole in the pulley which we shall call Cord 'A' and Cord 'B', as indicated in Fig. 2.

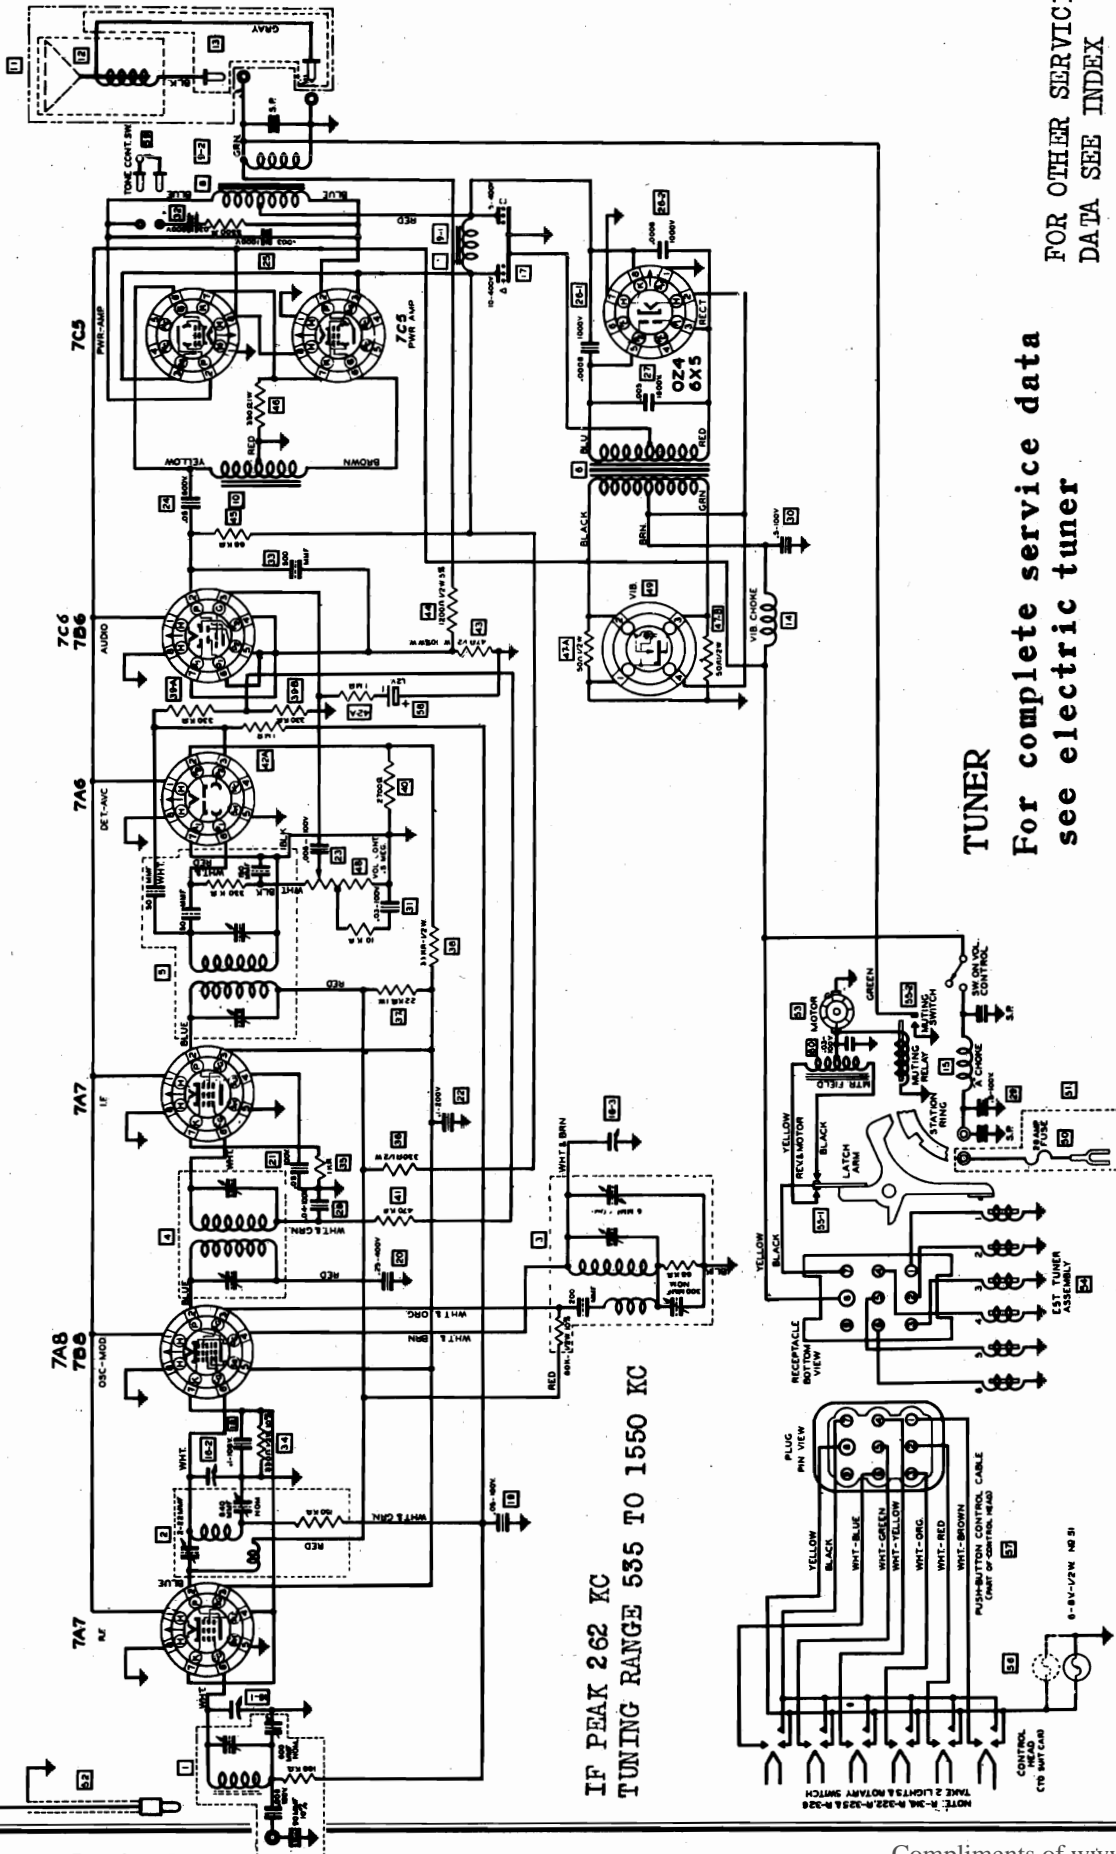

7. Take Cord 'A' and wind it clockwise one complete revolution around the drive pulley, com-

Sensitivity, Gain, Voltage Alignment, Socket, Trimmers

ALIGNMENT PROCEDURE

Remove the chassis from its housing and place it on the service bench. Connect the speaker and battery.

Turn the volume control to maximum position and leave it there throughout the alignment, reducing the signal generator output if necessary.

I. F. ALIGNMENT

1. Connect the signal generator to the antenna lead through a .1 MF condenser and to chassis ground. Turn the condenser gang completely out of mesh. Connect an output meter across the speaker voice coil.

2. Set the signal generator at 455 K.C. and carefully adjust the single trimmer in the Diode coil can to the point showing the highest reading on the output meter. (Advance the signal generator attenuator if necessary to pick up signal.)

3. Adjust the two trimmers in the I.F. coil can to the point showing the highest output reading.

4. Repeat the I.F. and Diode adjustment several times for maximum accuracy.

R. F. ALIGNMENT

1. Change to 40 MMF condenser in signal gen-

erator lead. Set signal generator at 1550 K.C. and with the condenser gang still completely out of mesh, adjust the oscillator trimmer to the point showing the highest output reading.

2. Set the signal generator at 1400 K.C. and turn the condenser gang to the signal at 1400 K.C. Adjust the antenna trimmer on the condenser gang to the point showing the highest output reading.

3. Set the signal generator at 600 K.C. and rock the pointer at the 600 K.C. position on the dial scale, while adjusting the antenna padder, until a combination is found which gives highest output reading.

Figure 1 - Trimmers

SENSITIVITY AND STAGE GAIN MEASUREMENTS

These stage gain measurements will, if properly used, enable you to localize trouble quickly. They are intended for use with a signal generator that is accurately calibrated in microvolts.

Starting with the second detector - first audio stage, and working back step by step to I.F., Osc., Mod., R.F. and finally to the antenna terminal, the circuit in which the trouble exists will quickly be determined by evidence of low gain, when signal generator attenuation readings are compared to the normal values as shown in the table.

All stage gain measurements must be made with the volume control set for full volume. The shielded lead from the signal generator is connected to the grid terminal of the tube through a .1 MF condenser, with a 500M ohm resistor connected as a leak resistance between the grid of the tube and the grid lead, which has been removed.

When measuring over-all sensitivity at the antenna terminal, use a 40 MF condenser in place of the .1 MF. It must be remembered that the figures in the table are average and allowance must be made for variations between two sets of the same general type, due to difference of tube characteristics, etc.

Average Microvolt Input *	Generator Set at	Generator Feeder Connected to	Dummy Antenna Capacity	Leak Resistance	Output Meter Reading **

DIAL CORD INSTRUCTIONS

BACKLASH CORD AND SPRING ASSEMBLY

NOTE: If exact Motorola assembly is not available, use original spring and 30 lb. silk fish cord to make up assembly to dimensions as shown at the top of Fig. 2.

1. Turn gang to fully meshed position.
  2. Loop short end of cord around set screw (A) in condenser gear.
  3. Make one complete turn clockwise around condenser gear hub.
  4. Stretch spring and make one complete turn around the tuner gear hub with the long end of the backlash cord.
  5. Loop the end of the cord around drive pin 'B'.
- NOTE: Spring tension must be sufficient to take up all backlash in gear train.

Figure 2

ALIGNMENT PROCEDURE

Remove the chassis from its housing and place it on the service bench. Connect the speaker and battery.

Turn the volume control to maximum position and leave it there throughout the alignment, reducing the signal generator output if necessary.

I. F. ALIGNMENT

1. Connect the signal generator to the antenna lead through a .1 MF condenser and to chassis ground. Turn the condenser gang completely out of mesh. Connect an output meter across the speaker voice coil.
2. Set the signal generator at 455 K.C. and carefully adjust the single trimmer in the Diode coil can to the point showing the highest reading on the output meter. (Advance the signal generator attenuator if necessary to pick up signal.)
3. Adjust the two trimmers in the I.F. coil

to the point showing the highest output reading.

4. Repeat the I.F. and Diode adjustment several times for maximum accuracy.

R. F. ALIGNMENT

1. Change to 40 MF condenser in signal generator lead. Set signal generator at 1550 K.C. and with the condenser gang still completely out of mesh, adjust the oscillator trimmer to the point showing the highest output reading.
2. Set the signal generator at 1400 K.C. and turn the condenser gang to the signal at 1400 K.C. Adjust the antenna trimmer on the condenser gang to the point showing the highest output reading.
3. Set the signal generator at 600 K.C. and rock the pointer at the 600 K.C. position on the dial scale, while adjusting the antenna paddler, until a combination is found which gives highest output reading.

DIAL DRIVE CORD ASSEMBLY

1. Remove broken cord.
2. If exact Motorola assembly is not available, cut a piece of 30 lb. silk fish cord 30 inches long. CONDENSER GANG MUST BE MESHED.
3. Double the cord in the middle and thread the loop through the hole in the drive raceway. See Fig. 3.
4. Tie a large knot in the cord or use an eyelet large enough to prevent the cord from passing through the hole in the raceway. You will now have cord (A) and cord (B) each 15 inches long extending from the raceway as in Fig. 3.
5. Loop cord (A) under idler pulley No. 1, and across the chassis to idler pulley No. 2.
6. Holding the end of cord (A) tight, turn the raceway two and one half turns to the right (clockwise), thereby winding two and one half turns of cord (A) on the raceway. (Stop when the hole is at the top.)
7. Use a common paper clip to clip the loose end of cord (A) to the chassis, so you can work on cord (B) for a while.
8. Take cord (B) and bring it over to idler pulley No. 3, as shown in Fig. 4.
9. Continue cord (B) around the drive pulley to the hole in the drive pulley. Thread the end of the hole, after which it should be clipped to the chassis.
10. Remove the paper clip holding cord (A) and continue its routing around idler pulley No. 2 to the hole in the drive pulley. Thread the end of the cord through the hole.
11. Tie the loose ends of both cords tightly together inside the hole in the pulley. Then tie in the tension spring and hook the other end around the ear stamped out of the pulley. Cut off surplus cord.
12. To set pointer to correct frequency, tune in a station of known frequency and adjust position of pointer on string.
13. Secure pointer to string with a drop of shellac. Add auxiliary tension spring between cord (A) and cord (B), as shown in Fig. 4.

All measurements from chassis ground to socket terminal using 1000 ohms per volt meter.  
Battery voltage 6.3 V.  
Current Consumption 7.5 Amps.  
Maximum Power Output 8 Watts.

8. Continue cord "B" to idler pulley No. 3 and down to the drive pulley, making one-half turn around the pulley to the slot.
9. Clip cord "B" to the chassis and continue to the slot around the drive pulley one complete turn to dimensions as shown at the bottom of Fig. 2.
10. Bring cord "A" and cord "B" both inside the slot and tie them together securely.
11. Then tie in the tension spring and hook it on the stud in the drive pulley as shown in gear Fig. 5.
12. Make one complete turn counter-clockwise around tuner gear hub.
13. Set pointer to correct frequency, gear hub.
14. Stretch spring and make one complete turn counter-clockwise around pulley "B".
15. Hook the loop in the end of the cord on gear tooth "C" of condenser gear.

NOTE: If exact Motorola assembly is not available, use original spring and 30 lb. silk fish cord to make up assembly to dimensions as shown at the bottom of Fig. 2.

1. Turn gear to open position.  
2. Loop short end of cord around set screw "A" in tuner gear.  
3. Make one complete turn counter-clockwise around tuner gear hub.  
4. Stretch spring and make one complete turn counter-clockwise around pulley "B".  
5. Hook the loop in the end of the cord on gear tooth "C" of condenser gear.

NOTE: Spring tension must be sufficient to take up all backlash in gear train. Regulate tension through selection of gear tooth in Step 5 above.

1.74 volts equals 1 watt output.

FIG. 5

FIG. 6

ALIGNMENT PROCEDURE

Remove the chassis from its housing and place it on the service bench. Connect the speaker and battery.

Turn the volume control to maximum position and leave it there throughout the alignment, reducing the signal generator output if necessary.

I. F. ALIGNMENT

1. Connect the signal generator to the antenna lead through a .1 MF condenser and to chassis ground. Turn the condenser gang completely out of mesh. Connect an output meter across the speaker voice coil.

2. Set the signal generator at 455 K.C. and carefully adjust the single trimmer in the diode coil can to the point showing the highest reading on the output meter. (Advance the signal generator attenuator if necessary to pick up signal.)

3. Adjust the two trimmers in the I.F. coil can to the point showing the highest output reading.

DIAL DRIVE CORD ASSEMBLY - PART NO. 1X14745

1. While not essential, you will find it easier to work if you remove the front plate from the chassis. This requires removal of the dial light bracket, the broad band coil bracket, the volume control, and the unsoldering of the ground connection of EX14120 condenser.

2. If the exact Motorola assembly is not available, cut a piece of 30 lb. test silk fish cord 43 inches long.

3. The condenser gang must be open.

4. Double the cord in the middle and thread the loop through the hole in the drive raceway. See Fig. 3.

5. Tie a large knot in the cord or use an eyelet large enough to prevent the cord from passing through the hole. You will now have cord "A" and cord "B" as shown in Fig. 3. Cord "A" is the portion extending from the raceway as in Fig. 3. Cord "B" is the portion extending from the raceway as in Fig. 3.

6. Loop cord "A" over idler pulley No. 1 and across the chassis to idler pulley No. 2 and holding the end of the cord tight, turn the raceway 24 turns to the right (clockwise), thereby winding 24 turns of cord "A" on the raceway.

7. Use a paper clip to clip the loose end of cord "A" to the front plate so you can work on cord "B" for a while.

8. Loop cord "B" over idler pulley No. 3, and across the chassis to idler pulley No. 4.

9. Both cords should now be clipped to the front plate while the plate is reinstalled on the chassis.

10. Continue cord "B" down to the drive pulley and make 14 turns around the pulley to the slot in the rim.

11. Continue cord "A" down to the slot in the rim of the drive pulley.

12. Bring both loose ends of cord through the slot in the drive pulley and tie them together tightly inside the slot.

13. Then tie in one end of the tension spring and hook the other end over the stud as shown in Fig. 4.

14. To set the pointer to correct frequency, tune in a station of known frequency and adjust the position of the pointer on the string, securing it with a drop of shellac.

NOTE: The antenna paddler is reached through a hole in the bottom of the chassis base, directly under the antenna coil can.)

NOTE: If exact Motorola assembly is not available, use original spring and 30 lb. silk fish cord to make up assembly to dimensions as shown at the top of Fig. 2.

1. Turn gang to fully meshed position.

2. Loop long end of cord around set screw (A) in tuner gear.

3. Make one complete turn around tuner gear hub.

4. Stretch spring and loop other end around set screw (B) in condenser gear.

NOTE: Spring tension must be sufficient to take up all backlash in gear train.

Starting with the second detector - first audio stage, and working back step by step to I.F., Osc., Mod., R.F. and finally to the antenna terminal, the circuit in which the trouble exists will quickly be determined by evidence of low gain, when signal generator attenuation readings are compared to the normal values as shown in the tables.

All stage-gain measurements must be made with the volume control set for full volume. The shielded lead from the signal generator is connected to the grid terminal of the tube through a .1 MF condenser, with a 500 M Ohm resistor connected as a leak resistance between the grid of the tube and the grid lead which has been removed.

When measuring over-all sensitivity at the antenna terminal, use a 40 MUF condenser in place of the .1 MF.

It must be remembered that the figures in the table are average and allowance must be made for variations between two sets of the same general type, due to difference of tube characteristics, etc.

Average Microvolt Input *	Generator Set at	Generator Feeder Connected to	Dummy Antenna Capacity	Leak Resistance	Output Meter Reading **

**ALIGNMENT PROCEDURE**

can to the point showing the highest output reading.

4. Repeat the I.F. and Diode adjustment several times for maximum accuracy.

**R. F. ALIGNMENT**

1. Change to 40 MUF condenser in signal generator lead. Set signal generator at 1800 K.C. and with the condenser gang still completely out of mesh, adjust the oscillator trimmer to the point showing the highest output reading.

2. Set the signal generator at 1400 K.C. and turn the condenser gang to the signal at 1400 K.C. Adjust the antenna trimmer on the condenser gang to the point showing the highest output reading.

3. Set the signal generator at 600 K.C. and rock the pointer at the 600 K.C. position on the dial scale, while adjusting the antenna paddler, until a combination is found which gives highest output reading.

**DIAL DRIVE COORD ASSEMBLY - PART NO. IX14731**

7. Take cord (B) and bring it over the raceway and under idler pulley No. 3, as shown in Fig. 8. Continue cord (B) across the front of the chassis, around idler pulley No. 4, and make one complete turn around the drive pulley, after which the end of the cord should be clipped to the chassis.

9. Remove the paper clip holding cord (A) and continue its routing to the drive pulley, making 1/2 turn around it to the slot.

10. Bring both loose ends of cord through the slot in the drive pulley and tie them together tightly inside the slot.

11. Then tie in one end of the tension spring, Part No. 414285 and hook the other end of the spring on the small stud as shown in Fig. 6.

12. To set pointer correct frequency tune in a station of known frequency and adjust position of pointer on string.

14. Secure pointer to string with a drop of shellac.

FIG. 2

**DIAL COORD INSTRUCTIONS**

**BACKLASH COORD AND SPRING ASSEMBLY - PART NO. IX14730**

NOTE: If exact Motorola assembly is not available, use original spring and 30 lb. silk fish cord to make up assembly to dimensions as shown at the top of Fig. 2.

1. Turn gang to fully meshed position.
2. Loop long end of cord around set screw (A) in tuning unit.
3. Make one complete turn around gear hub.
4. Stretch spring and loop other end around set screw (B) in condenser gear.

NOTE: Spring tension must be sufficient to take up all backlash in gear train.

SENSITIVITY AND STAGE GAIN MEASUREMENTS

These stage gain measurements will, if properly used, enable you to localize trouble quickly. They are intended for use with a signal generator that is accurately calibrated in microvolts.

Starting with the second detector - first audio stage, and working back step by step to I.F., Osc. - Mod., R.F. and finally to the antenna terminal, the circuit in which the trouble exists will quickly be determined by evidence of low gain, when signal generator attenuation readings are compared to the normal values as shown in the table.

All stage gain measurements must be made with the volume control set for full volume. The shielded lead from the signal generator is connected to the grid terminal of the tube through a .1 MF condenser, with a 500M ohm resistor connected as a leak resistance between the grid of the tube and the grid lead which has been removed.

When measuring over-all sensitivity at the antenna terminal, use a 40 MMF condenser in place of the .1 MF. It must be remembered that the figures in the table are average and allowance must be made for variations between two sets of the same general type, due to difference of tube characteristics, etc.

Average Microvolt Input *	Generator Set at	Generator Feeder Connected to	Dummy Antenna Capacity	Leak Resistance	Output Meter Reading **

\*\* Bias -3.5 V. from B stick Maximum power output 4.5 Watts  
All readings from chassis ground with 1000 ohms per volt meter.

ALIGNMENT PROCEDURE

Remove the chassis from its housing and place it on the service bench. Connect the speaker and battery.

Turn the volume control to maximum position and leave it there throughout the alignment, reducing the signal generator output if necessary.

I. F. ALIGNMENT

1. Connect the signal generator to the antenna lead through a .1 MF condenser and to chassis ground. Turn the condenser gang completely out of mesh. Connect an output meter across the speaker voice coil.  
2. Set the signal generator at 455 K.C. and carefully adjust the single trimmer in the Diode coil can to the point showing the highest reading on the output meter. (Advance the signal generator attenuator if necessary to pick up signal.)

3. Adjust the two trimmers in the I.F. coil can to the point showing the highest output reading.  
4. Repeat the I.F. and Diode adjustment several times for maximum accuracy.

FIGURE 1. TRIMMERS  
R. F. ALIGNMENT

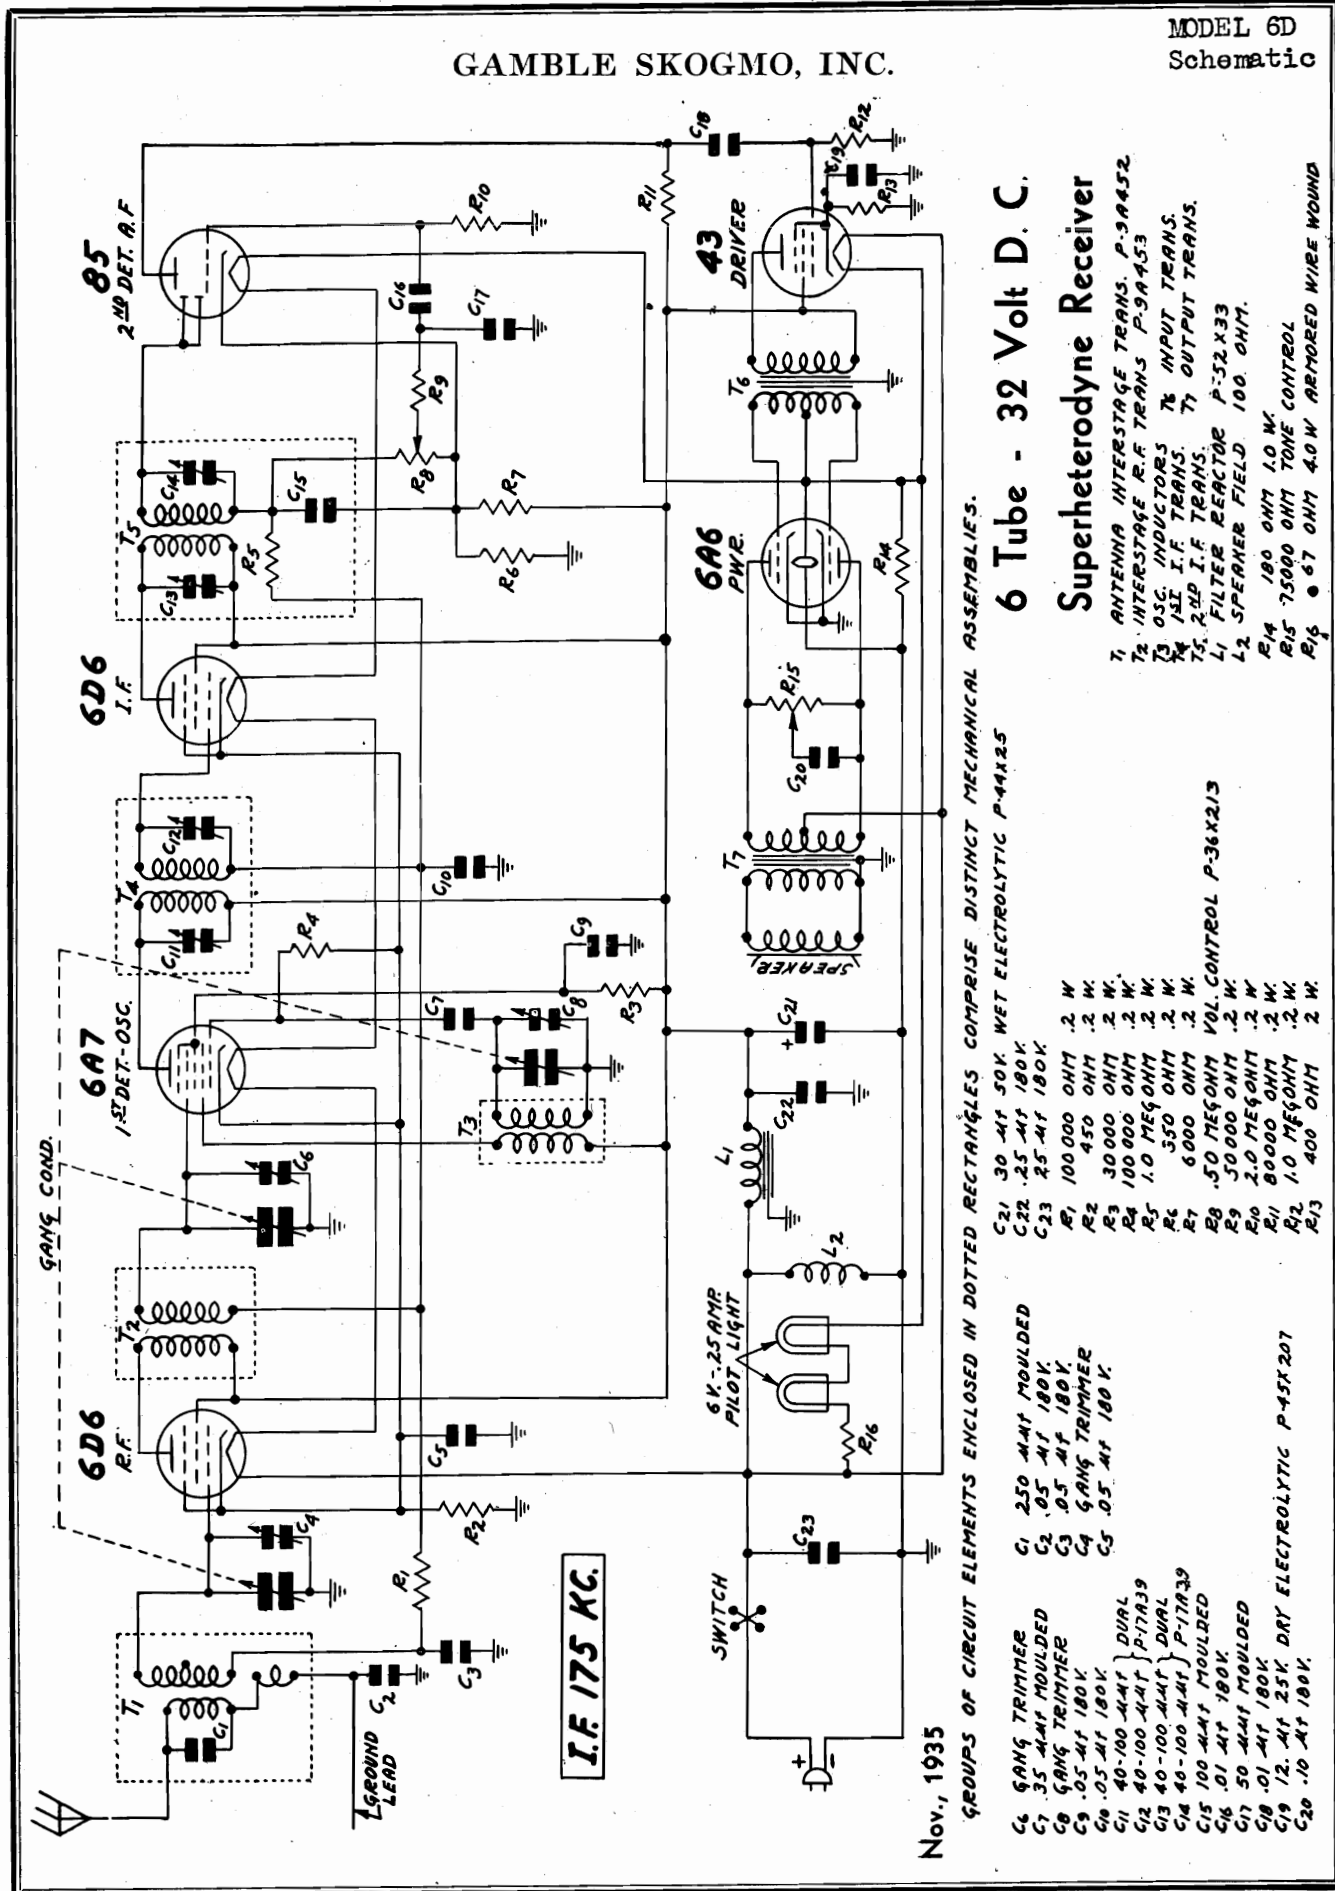

1. Change to 40 MMF condenser in signal generator lead. Set signal generator at 1550 K.C. and with the condenser gang still completely out of mesh, adjust the oscillator trimmer to the point showing the highest output reading.

2. Set the signal generator at 1400 K.C. and turn the condenser gang to the signal at 1400 K.C. Adjust the antenna trimmer on the condenser gang to the point showing the highest output reading.

3. Set the signal generator at 600 K.C. and rock the pointer at the 600 K.C. position on the dial scale, while adjusting the antenna padder, until a combination is found which gives highest output reading.

MODEL 15C6

Alignment, Drive Data  
Changes, Notes, Socket

GAMBLE SKOGMO, INC.

Alignment Procedure

Remove the bottom and front chassis covers. Directions for removing the bottom cover are in the instruction book.

To remove the front cover, first pull the knobs and buttons off the shafts. Remove the 2 screws at the top and the 2 screws at the sides of the front cover. Press in the sides of the chassis case to release the lugs at the sides of the front cover. Pull outward on the bottom of the front cover and then push the cover up until the lugs at the top are released.

Do not remove the back of the chassis case. This back can be taken off of the No. 2 and later issue sets.

Set the signal generator for 456 KC and connect the output of the signal generator through a .05 mf. condenser to the control grid of the 1st Detector. Connect the ground lead of the signal generator to the chassis. Set the volume control at maximum. Attenuate the signal from the signal generator to prevent the leveling off action of the AVC.

Then adjust the 4 I.F. trimmers until maximum output is obtained. These trimmers can be reached through the 4 holes in the back wall of the chassis case. It will be necessary to pull out the fiber insulating sheet a slight amount.

Insert the antenna cable plug in the antenna socket on the chassis.

**Rotating Pointer Models**—If the antenna is connected at the HC terminal and the entire 60-inch shielded cable (70 mmf.) is being used, connect the antenna wire at the other end through a 120 mmf. condenser to the antenna post of the signal generator.

If the antenna is connected at the LC terminal, the antenna cable has been cut as explained in the instruc-

Fig. 4—Location of Tubes

tions. If cut in half (30-inch length), the capacity of the antenna cable is approximately 35 mmf. Connect the antenna wire, in this case, through a 25 mmf. condenser to the antenna post of the signal generator.

**Sliding Pointer Models**—If the antenna is connected at the HC terminal and the 60-inch shielded cable (70 mmf.) is being used, connect the antenna wire at the other end through a 230 mmf. condenser to the antenna post of the signal generator.

If the antenna is connected at the LC terminal and the short shielded cable (19 mmf.) is being used, connect the antenna wire, in this case, through a 20 mmf. condenser to the antenna post of the signal generator. If the long cable has been cut to length and is being used, the total capacity of the cable and the series condenser should be 38 to 40 mmf.

**Both Models**—Set the signal generator for 1550 KC. Turn the rotor of the tuning condenser to the full open position. Adjust the trimmer of the oscillator section of the gang condenser until maximum output is obtained. See Fig. 4 for location of this trimmer.

Set the signal generator for 1400 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained. Adjust the trimmer of the antenna section of the gang condenser for maximum output.

**Calibration—Rotating Pointer Models**—To obtain dial scale calibration, tune in an 800 KC signal. Hold the tuning shaft and turn the pointer disc until the pointer is at the correct position when the chassis front cover is put back in place.

**Calibration—Sliding Pointer Models**—The pointer assembly is clamped to the drive cord and it is seldom necessary to reset it to obtain proper dial calibration. If re-calibration is required, loosen the clamps with a screw driver, bringing the pointer assembly first down to one end of the dial scale and then down to the other end. Tune in a signal of known frequency near one end of the dial scale. Move the pointer assembly to this frequency on the scale and tighten the clamps with long nose pliers.

Drive Cord Replacement—Rotating Pointer Models

Tie a knot with a small loop at one end of the new drive cord. The free end of the drive cord is tied to the tension spring. The distance between knots should be 2 3/4 inches.

Turn the gang condenser to full open position.

Place the looped end of the drive cord over the hook on condenser drive drum A—See Fig. 2 (Shown with gang condenser half open). Bring the cord up through the slot in the drum rim and wind one-half turn to the rear (from front of chassis) around the drive drum. Pass cord around the pulley B as shown. Wind one turn clockwise (from front of chassis) around pointer disc pulley C. Loop cord through the notches on the outside rim of the pointer disc pulley as shown. Wind 2 1/2 turns clockwise, progressing from a point midway between the bracket arms toward the chassis, on tuning control shaft D. Bring cord to the left under pointer disc pulley C and around pulley E as shown. Pass cord to top of drive drum A and wind one turn to the rear around the drum rim.

Pass the remaining drive cord and tension spring through the slot in the drum rim. Place free end of spring over the hook on the condenser drive drum.

**Setting Pointer Disc**—Tune in an 800 KC signal. Hold the tuning shaft and turn the pointer disc until the pointer is at the correct position when the chassis front cover is put back in place.

Fig. 3—Replacing Drive Cord—Sliding Pointer Models

Fig. 2—Replacing Drive Cord—Rotating Pointer Models

Drive Cord Replacement—Sliding Pointer Models

Remove the celluloid dial scale. Open the clamps on the back of the dial pointer in order to remove the old drive cord.

It is not necessary to remove the dial and drive bracket assembly in order to replace the drive cord.

Tie a knot with a small loop at one end of the new drive cord. Slide a 1/2 inch length of fabric tubing on the cord. Tie the free end of the drive cord to the tension spring. The distance between knots should be 2 3/4 inches.

Turn the gang condenser to full open position.

Place the looped end of the drive cord over the hook on condenser drive drum A—See Fig. 3. Bring the cord up through the slot in the drum rim.

Turn the drive-drum to the position shown in Fig. 3.

Wind one turn down and around drive drum A and around pulley B as shown. Wind 3 1/2 turns on tuning control shaft C, progressing from a point midway between the two bracket arms toward the chassis. Bring cord under pulley D and around pulleys E and F as shown. See that the fabric tubing is now between pulleys E and F. Bring the drive cord to the rear around drive drum A and through the slot in the drum rim as shown.

Turn the gang condenser to full open position and place the free end of the tension spring over the hook on drive drum A.

**Dial Pointer Adjustment**—Mount the celluloid dial scale on the dial bracket. Tune in a signal of known frequency near one end of the dial scale. Move the pointer assembly to this frequency on the dial scale and tighten the clamps with long nose pliers.

Inserting Vibrator Unit

**IMPORTANT**—The vibrator unit can be inserted in two ways. The proper method of insertion will depend on which terminal of the car battery is grounded. If the POSITIVE (+) terminal of the car battery is grounded, line up the + mark on the top of the vibrator with the arrow on the chassis base. If the NEGATIVE (-) terminal of the car battery is grounded, line up the - mark on the top of the vibrator with the arrow on the chassis base.

Antenna Capacity

**Rotating Pointer Models**—The antenna coil is designed for car antennas with a capacity of 190 mmf. for the HC connection and 60 mmf. for the LC connection. This capacity is the total capacity of the antenna and the shielded lead.

Complete information regarding car antenna installation will be found in the instruction book packed with the radio.

**Sliding Pointer Models**—The information for this type of radio is the same as above except that the HC capacity is 300 mmf. and the LC capacity is 38 mmf.

Two Models

One model has a rectangular dial scale with a sliding pointer.

The other model has a circular dial scale with a rotating pointer disc.

The 2 models also differ in the capacities of the antennas which may be used. The values are shown in article "Antenna Capacity."

Issue No. 1

**Mechanical Assembly**—The 2 front mounting studs are attached to the top of the chassis case.

The I.F. coil cans have a spring clip by means of which they are secured to the chassis.

The back of the chassis case is not removable.

**Electrical Assembly**—See electrical changes under "Issue No. 2."

Issue No. 2

**Mechanical Changes**—The chassis case is supplied with a front mounting bracket and this bracket is secured to the instrument panel of the car by means of 2 separate bolts.

The I.F. cans use a threaded spade lug which extends through the chassis base and is secured in place with nuts and lock washers.

The back of the chassis case can be removed.

**Electrical Changes**—The following changes are all illustrated in the schematic—Fig. 1.

The 6H6 tube plate No. 1, which was connected originally to-ground is removed from ground and connected as shown in the schematic.

Condenser C20 is removed.

The position of condenser C21 is changed as shown.

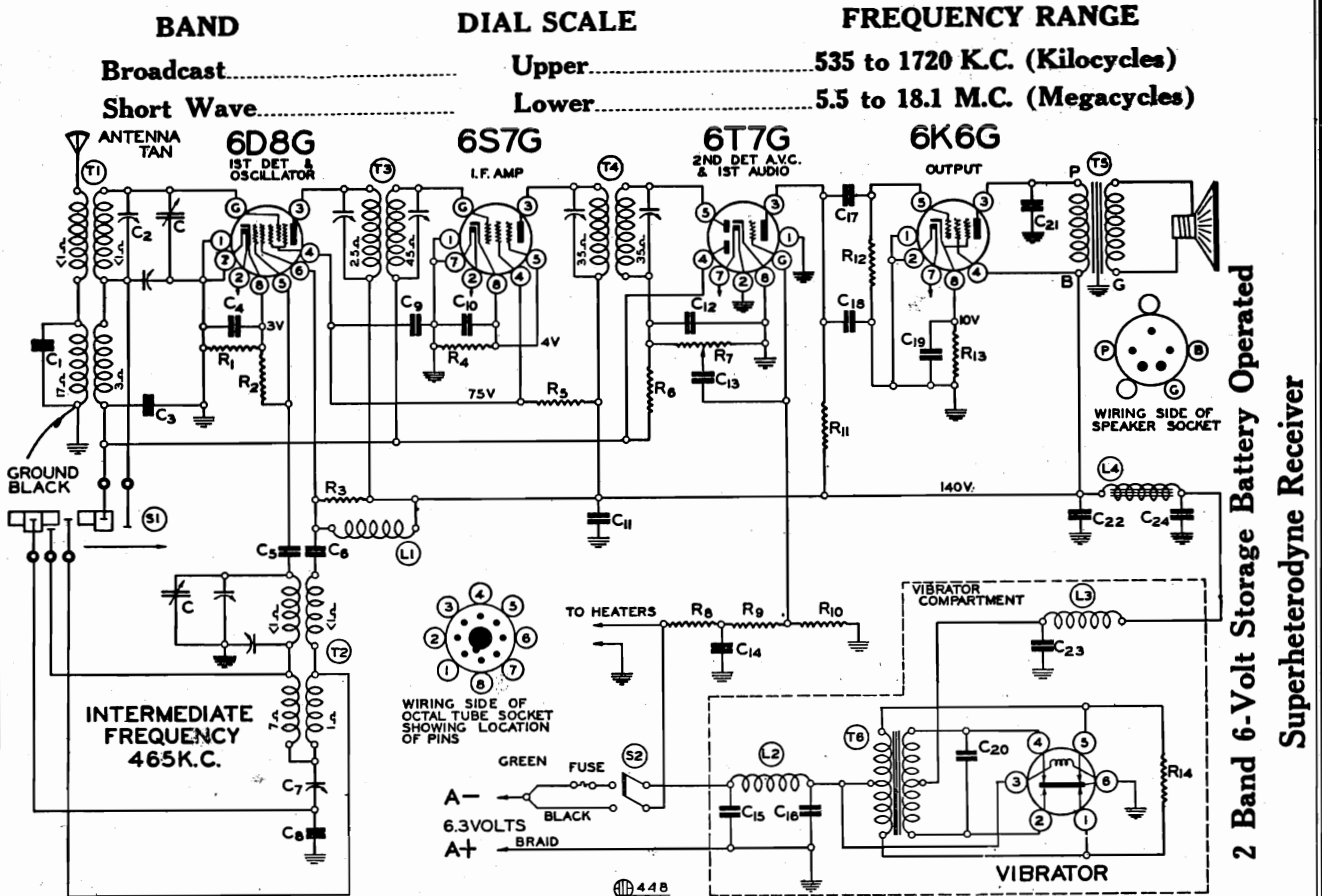

Resistor R15 (200 ohms) is removed and replaced by choke L4.

**BATTERY CONNECTIONS:**

Referring to Fig. 1, connect the battery cable to the storage battery in the following manner:

- The storage battery should be located as far from the receiver as the battery cable will permit.
- Connect the lead (containing the fuse receptacle) marked A negative (-) to the negative (-) post of the storage battery.
- Connect the lead marked A positive (+) to the positive (+) post of the storage battery.

FIG. 1—TOP VIEW

MODEL 489 Alignment, Trimmers MODEL 761A Alignment, Tuner

MODEL 761A

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as Dummy 1, Dummy 2, and Dummy 3.

Dummy 1: (I.F.)—Consists of a 200 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a 1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (466 K.C.)

Part No. 108-105B Output I.F. Transformer

Part No. 108-105B Input I.F. Transformer

The I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view, Fig. 1).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser in its minimum capacity position, plates entirely out of mesh, make the following adjustments:

(a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6S7G tube, and adjust the output I.F. transformer (No. 108-105B) to resonance.

(b) With "Dummy 1" still connected, move oscillator output clip from grid of 6S7G to grid cap of 6A8 and adjust input I.F. transformer (No. 108-105) to resonance.

BROADCAST BAND ALIGNMENT: 540 to 1750 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with "Dummy 2" to an antenna lead and black ground lead, make following adjustments:

(a) Set external oscillator to 1750 K.C. and adjust broadcast oscillator trimmer to resonance (adjustment E); see top view, Fig. 1.

(b) Re-set external oscillator to 1400 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (Adjustment A) to resonance; also adjust prescaler trimmer which is mounted on the top of the rear section of the three gang variable tuning capacitor (see Fig. 1, for location of this adjustment).

(c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (Adjustment F) to resonance by rotating capacitor by adjusting series pad maximum output is attained.

(d) Repeat adjustments "a" and "c" until sensitivity is at its maximum.

(e) Check for tracking and sensitivity at 1000 kilocycles. Under no circumstances bend plates of variable condenser sections to correct tracking.

SHORT WAVE BAND ALIGNMENT: 35 to 181 Megacycles

1. With band changing switch in the short wave position, extreme left of its rotation, and with external oscillator set at 17 megacycles and connected to antenna lead and black ground lead, make the following adjustments:

(a) Move dial pointer to 17 megacycles and adjust short wave oscillator (Adjustment G) and short wave antenna trimmer (Adjustment C) to resonance.

(b) Re-set external oscillator to 17 megacycles, and pick up signal by rotating variable condenser and check sensitivity.

(c) Set external oscillator and check set at 181 megacycles and 55 megacycles for band coverage.

NOTE: It is extremely necessary in making all of these adjustments that the signal be tuned in and not the image frequency which will fall within the pass band of the oscillator. An example of this is an image of a fundamental 17 megacycle signal appears near 161 megacycles.

MIDDLE WAVE BAND ALIGNMENT: 1730 to 5800 Kilocycles

1. With band changing switch in the middle wave position, extreme left of its rotation, and with external oscillator set at 5000 kilocycles, and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:

with each other and in series with the external oscillator.

Dummy 3: (Short Wave)—Consists of a 1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (466 K. C.)

Part No. 108-105B Output I.F. Transformer

Part No. 108-105B Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser in its minimum capacity position, plates entirely out of mesh, make the following adjustments:

(a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6S7G tube, and adjust the output I.F. transformer (No. 108-105B) to resonance.

(b) With "Dummy 1" still connected, move oscillator output clip from grid of 6S7G to grid cap of 6A8C and adjust input I.F. transformer (No. 108-105B) to resonance.

SHORT WAVE BAND ALIGNMENT: 35 to 181 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the antenna and ground leads, make the following adjustments:

(a) Move dial pointer to 17 megacycles and adjust short wave oscillator trimmer to resonance.

This adjustment is the trimmer mounted on the top of rear section of the variable gang condenser (see Fig. 1, top view).

(b) Adjust short wave antenna trimmer (Adjustment Number 1), to resonance (see Fig. 3, bottom view).

BROADCAST BAND ALIGNMENT: 540 to 1750 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with "Dummy 2" to antenna and ground leads make following adjustments:

(a) Set external oscillator to 1750 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment number 3, see bottom view of chassis, Fig. 3).

(b) Re-set external oscillator to 1400 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (adjustment number 2), to resonance.

(c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (adjustment number 4), to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to fit until by adjusting series pad maximum output is attained.

(d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.

(e) Check for tracking and sensitivity at 1400, 1000, and 600 kilocycles. Under no circumstances bend plates of variable condenser sections to correct tracking.

MODEL 489

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume equalizer fully open, meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

IN ORDER TO PREVENT SIGNAL FROM ACTING UPON A/V C AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.

All voltages are to be measured with 6.3 volts input to receiver. Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in D.C. voltage is usually caused by a shorted electrolytic condenser, open by-pass condensers frequently cause oscillation and distorted tone.

ALIGNING INSTRUCTIONS:

CAUTION: No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as defective tubes, poor installations, open or ground antenna systems, defective condensers and resistors in order to properly align this chassis, an oscillator generator is necessary.

All adjustments should be made with a non-metallic screw driver.

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer or by means of an adapter between the plate and screen terminals of the type 6K5G output tube. Maximum deflection of the meter indicates resonance. Use only enough output to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

DUMMY ANTENNAS:

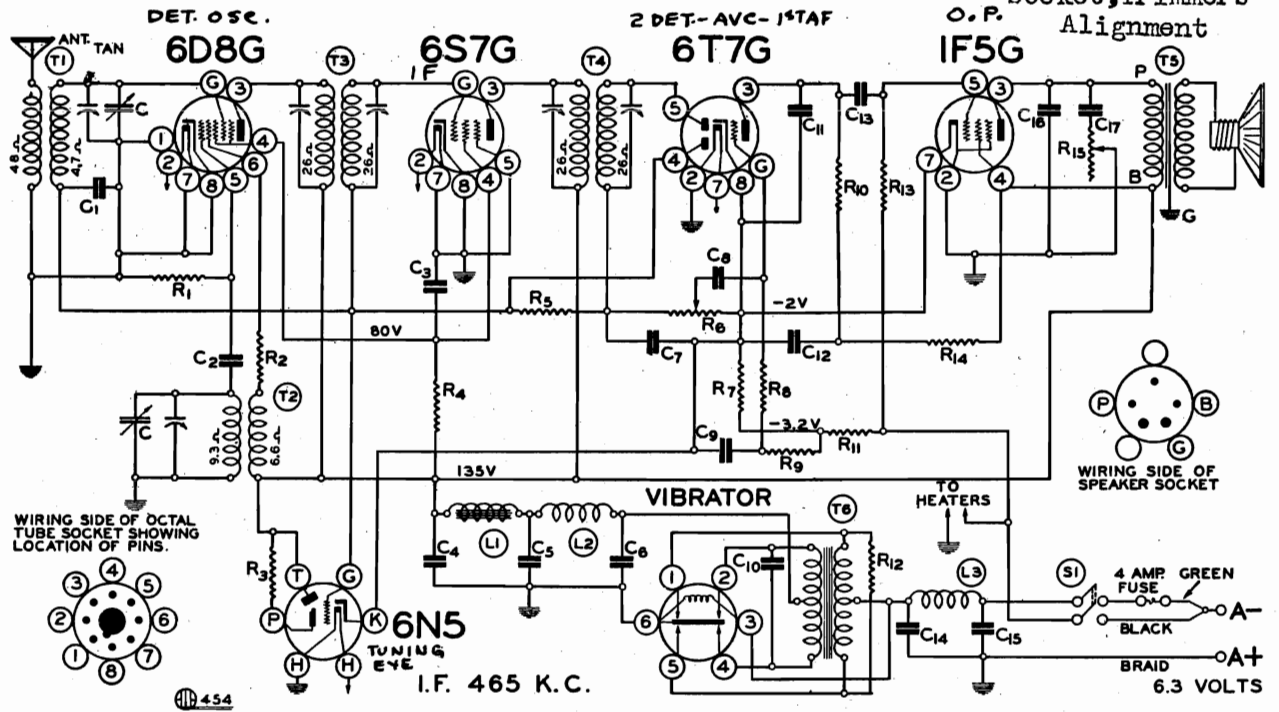

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a 1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mfd. condenser and a 20 ohm resistor connected in series

BATTERY CONNECTIONS:

Referring to Fig. 1, connect the battery cable to the storage battery in the following manner:

- (a) The storage battery should be located as far from the receiver as the battery cable will permit.
- (b) Connect the lead (containing the fuse receptacle) marked A negative (-) to the negative (-) post of the storage battery.
- (c) Connect the lead marked A positive (+) to the positive (+) post of the storage battery.

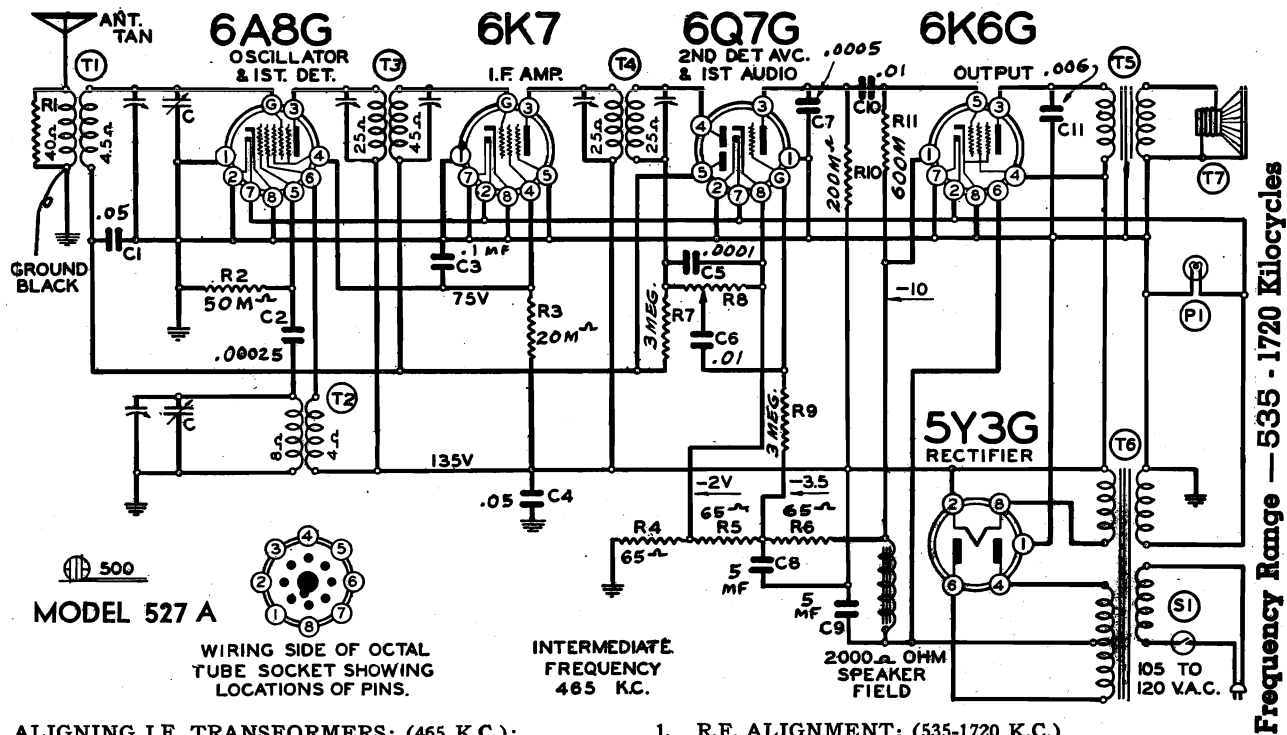

FIG. 1—TOP VIEW

MODEL 527A  
Schematic, Voltage, Alignment  
Socket, Trimmers,

GAMBLE SKOGMO, INC.

Frequency Range — 535 - 1720 Kilocycles

**ALIGNING I.F. TRANSFORMERS: (465 K.C.):**

Part No. 108-95B Output I.F. Transformer  
Part No. 108-96 Input I. F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
  - (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-95B) to resonance.
  - (b) Move oscillator output clip from grid of 6K7 to grid of 6A8G and adjust input I.F. transformer (No. 108-96) to resonance.
  - (c) With oscillator still connected to 6A8G, readjust output I.F. transformer (108-95B) if necessary.

**1. R.F. ALIGNMENT: (535-1720 K.C.)**

1. With the gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 100 mmf. condenser to the antenna lead and chassis ground and make the following adjustments:
  - (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
  - (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
  - (c) Check sensitivity at 600 and 1000 kilocycles.

FIG. 1—TOP VIEW

FIG. 2—FRONT VIEW

**SERVICE NOTES:**

Volts taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with 115 volts on the primary of the power transformer.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

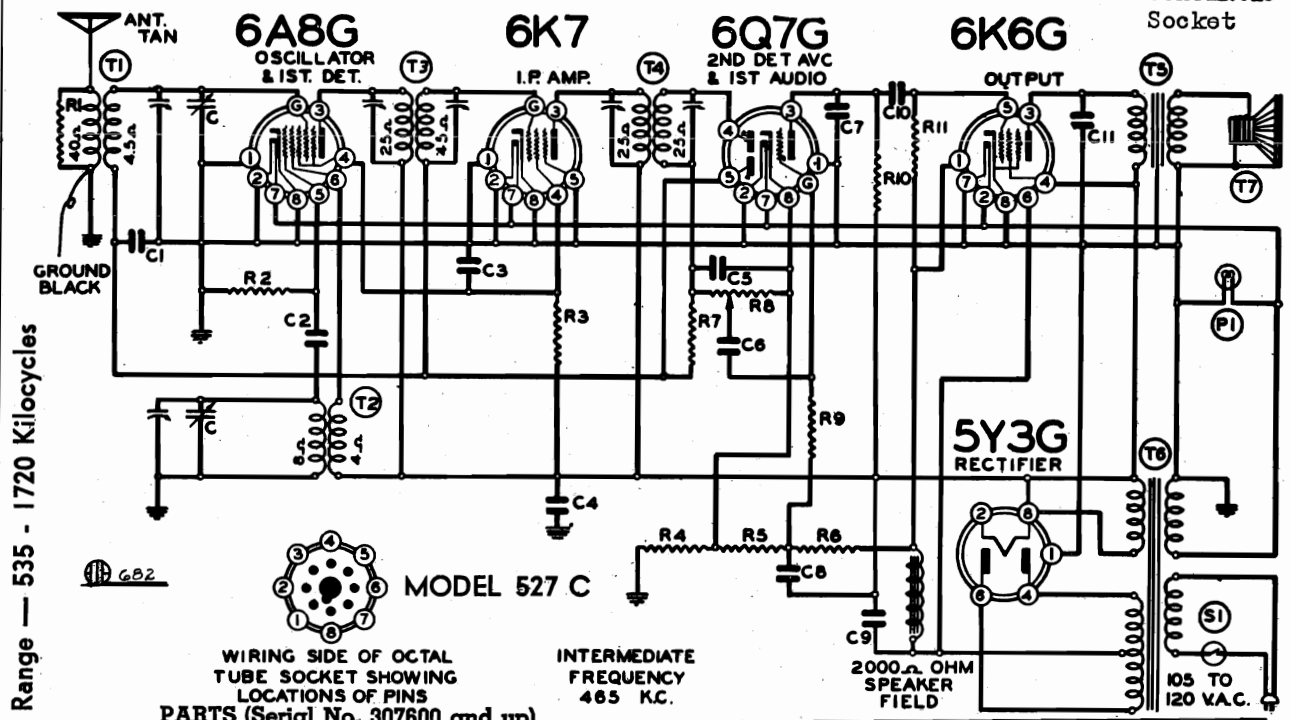

Excessive hum, stuttering, low volume and a reduction in all D.C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

**DESCRIPTION:**

The tube complement of this chassis consists of the following octal base glass and metal tubes.

The type and function of each tube is as follows:

- 1—Type 6A8G Pentagrid Mixer, First Detector-oscillator.
- 1—Type 6K7 Remote Cut-off Pentode, I.F. Amplifier (465 K.C.)
- 1—Type 6Q7G Duplex Diode Triode Second Detector, A.V.C. and First Audio.
- 1—Type 6K6G Pentode Output Amplifier.
- 1—Type 5Y3G High Vacuum Rectifier.

**ALIGNMENT PROCEDURE**

- Volume control—Maximum all adjustments.
  - Connect radio chassis to ground post of signal generator with a short heavy lead.
  - Connect dummy antenna value in series with generator output lead.
  - Connect output meter across primary of output transformer.
  - Allow chassis and signal generator to "heat up" for several minutes.
- The following equipment is required for aligning:
- An all wave signal generator.
  - Output indicating meter.
  - Non-metallic screwdriver.
  - Dummy antennas—.1 mf., 100 mmf.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6A8G	Rotor full open (Plates out of mesh)	Four trimmers (See Fig. 1)	Input I. F. and Output I. F.	Adjust to maximum output
BROAD-CAST BAND	1720 Kc.	100 mmf.	Antenna Lead	Rotor full open (Plates out of mesh)	Trimmer—Top of rear section of gang (See Fig. 1)	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	100 mmf.	Antenna Lead	Set dial at 1400 Kc.	Trimmer—Top of front section of gang (See Fig. 1)	Broadcast Antenna	Adjust to maximum output

**FREQUENCY RANGE**  
535 to 1720 K.C.  
Power Consumption..... 50 Watts  
Power Output..... 1 Watt Undistorted, 1.7 Watts Maximum  
Intermediate Frequency..... 465 K.C.

Alignment

GAMBLE SKOGMO, INC.

MODEL 527C

FIG. 1—TOP VIEW

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:

There are five levers on the dial by means of which five stations may be selected. (See "B", Fig. 2.) Make a list of local stations you tune in regularly; any number up to and including five.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

On the front of each automatic tuner button an opening is provided for inserting the call letter tabs. (See "A", Fig. 2.)

Insert the call letter tabs in the rectangular openings of each of the automatic tuner buttons. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Turn DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 2) the station indicated on the station call letter tab on this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever button. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab on this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Now rotate the tuning knob (No. 2) to the right (clockwise) as far as it will turn, and with a coin (half dollar), tighten the special locking screw ("C"), in the center of the tuning knob. (See Fig. 2).

It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, hold the tuning knob No. 2 securely and with a coin loosen the locking screw "C" one or two turns; select the new station as explained. Be sure to retighten the locking screw, otherwise the stations you have selected will not stay adjusted to the levers.

The automatic dial is now set up for quick tuning. Press down on the lever and—your favorite station is selected.

BROADCAST BAND OSCILLATOR ADJUSTMENT:

1. With band switch in the broadcast position, extreme left of its rotation, and with the gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 1" to grid cap of the 6A8 tube, make the following adjustment:

(a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance. This adjustment is the trimmer mounted on the front section of the variable gang condenser.

BROADCAST BAND ANTENNA ADJUSTMENT:

1. With the band switch still in the broadcast position, move the external oscillator from the grid cap of the 6A8 tube to the tan antenna lead and black ground lead, in series with "Dummy 2", and make the following adjustments:

(a) Set external oscillator to 1550 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer to resonance. This adjustment is marked "B.C. Ant." (See top view of chassis, Fig. 1, for location of this adjustment.)

(b) Re-set external oscillator to 600 K.C. and adjust broadcast series pad to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until, by adjusting series pad, maximum output is attained. This adjustment is located on the top of the chassis directly in front of the antenna coil. (See top view of chassis, Fig. 1).

(c) Repeat adjustments "a" and "b" until sensitivity is at its maximum.

SHORT WAVE BAND ANTENNA ADJUSTMENT:

1. With the band switch in the short wave position, and with external oscillator connected in series with "Dummy 3" to the tan antenna lead and black ground lead, make the following adjustment:

(a) Set external oscillator to 6 megacycles and adjust the short-wave antenna trimmer to resonance. This adjustment is the trimmer mounted on the rear section of the variable gang condenser.

676

OFF ON VOLUME CONTROL FIG. 2—FRONT VIEW MODEL 527C

MODEL 587 - Series A  
DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3."

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-76A Output I.F. Transformer  
Part No. 108-76A Input I.F. Transformer.

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:

(a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-76A) to resonance.

(b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap to 6A8 and adjust input I.F. transformer (No. 108-76A) to resonance.

(c) With oscillator still connected to 6A8, readjust output I.F. transformer (108-76A) if necessary.

BROADCAST AND SHORT WAVE BAND ALIGNMENT

Broadcast Band—535 to 1720 Kilocycles.  
Short Wave Band—2280 to 8600 Kilocycles.

Important—These adjustments must be made in the following order:

SHORT WAVE OSCILLATOR ADJUSTMENT:

1. With band switch in the short wave band position, extreme right of its rotation, and with the gang condenser in its minimum capacity position, plates entirely out of mesh, and with the external oscillator connected in series with "Dummy 1" to grid cap of the 6A8 tube, make the following adjustment:

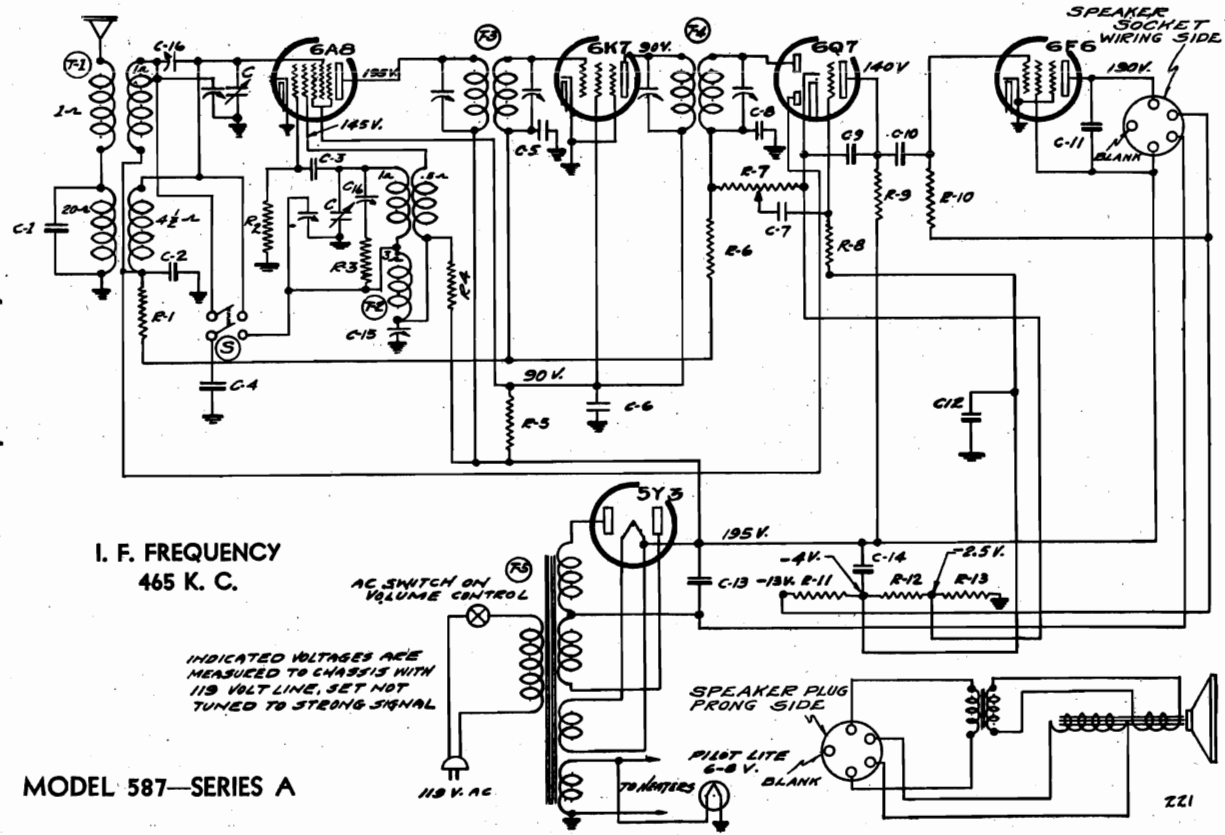

(a) Set external oscillator to 6.6 megacycles and adjust short wave oscillator trimmer to resonance. This adjustment is marked "S.W. Osc." (see top view of chassis, Fig. 1, for location of this adjustment).

NOTE: Make certain that the fundamental 6.6 megacycles signal has been tuned in and not the image frequency, noting that the image appears when the tuning knob is moved to approximately 5.7 megacycles.

DESCRIPTION:

TUBES:

The tube complement of this chassis consists of the following tubes.

The type and function of each tube is as follows:

- 1—Type 6A8 Pentagrid Mixer, First Detector-oscillator
- 1—Type 6K7 Remote Cut-Off Pentode, I. F. Amplifier (465 K.C.)
- 1—Type 6Q7-G Duplex Diode Triode Second Detector, A.V.C. and First Audio.
- 1—Type 6F6-G Pentode Output Amplifier.
- 1—Type 5Y3 High Vacuum Rectifier.

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 40 and 60 cycles and with primary taps for 108, 125, 150, 220 and 250 volts (see parts list) and also sometimes equipped with 25 cycle transformers with 105-115 volt or 220 volt primaries, not universals.

**SERVICE NOTES:**

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with 119 volt A.C. or D.C. line.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D.C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

**RESONANCE INDICATOR:**

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer or by means of an adapter between the plate and screen terminals

**MODEL 602**

**Range 535-1720 Kilocycles**

of the type 25L6G output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

**I.F. ALIGNMENT - 465 KC - Model 602**

**I.F. ALIGNMENT -470 KC - Models 602 B & C**

Part No. 108-83B Output I.F. Transformer

Part No. 108-82B Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:

- (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6K7G tube, and adjust the output I.F. transformer (No. 108-83B) to resonance.
- (b) Move oscillator output clip from grid of 6K7G to grid of 6A8G and adjust input I.F. transformer (No. 108-82B) to resonance.
- (c) With oscillator still connected to 6A8G, readjust output I.F. transformer (108-83B) if necessary.

**Models 602, 602B & 602C**

**R.F. ALIGNMENT: (535-1720 K.C.)**

1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmf. condenser to the antenna lead and chassis ground and make the following adjustments:

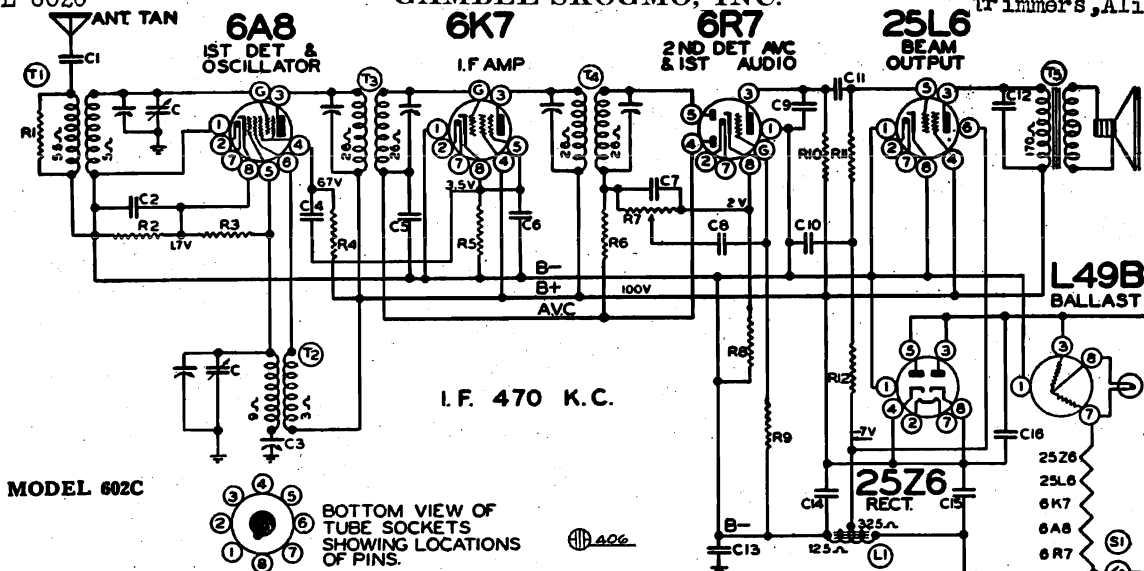

- (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
- (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
- (c) Check sensitivity at 600 and 1000 kilocycles.

DESCRIPTION:

Model No. 666 is a six-tube superheterodyne receiver having a tuning range of 530 K.C. to 1550 K.C., operates from a 6.0 volt storage battery and uses the automotive type 6.3 volt tubes. The "B" supply is obtained from a vibrator with a tube rectifier.

The I.F. frequency used is 465 K.C., the R.F. end of the receiver consisting of a high gain iron core antenna coil which gives high signal to noise ratio and an R.F. stage especially designed to give high image rejection and high I.F. attenuation. The I.F. transformers are designed to give high gain and selectivity and yet to have a broad nose for ease of tuning and hi-fidelity response. They are of the air core type and wound with solid wire to give minimum drift and variation of gain due to climatic changes.

The receiver is so designed that it may be used as either a single or two unit installation. Taps are provided on the output transformer to a pin jack terminal board, a red dot distinguishing dual speaker tap and green dot for single speaker operation. For complete details see illustration and Header speaker data chart.

Dash kits for the remote control head are available for 1936 cars drilled for dash plates.

This receiver has been carefully designed to facilitate servicing, the top and bottom covers are both removable and are fastened in place by spring clips, self tapping screws and trimount buttons.

All adjustments are accessible and any part replaceable without removing the chassis from the case.

MODEL 666  
Speaker Data,  
Alignment

GAMBLE-SKOGMO, INC.

**DIAL ADJUSTMENT**  
Tune set to some station of a known frequency (between 800 and 1200 K.C.), hold selector knob, then remove pilot light assembly from back of remote head and with a screw driver adjust the slotted screw through this opening and in this way adjust the dial pointer to the correct frequency setting.

**SINGLE HEADER SPEAKER CONNECTIONS**

Consult Fig. No. 1. On this application, all that is required is to remove speaker from receiver case and place in header board of car. Install the special seven foot shielded speaker cable and header filter plate assembly and insert the three leads. (which formerly connected the radio to the speaker) to the pin jacks on the header filter plate assembly. Remove the three short pigtail leads from the header filter plate assembly, namely, black, green and blue. These leads are only used when dual (two) speakers are to be used, one in the header and the other in the receiver case.

**DUAL SPEAKER CONNECTIONS**

Consult Fig. No. 1. On this application, leave speaker in receiver case, install a complete header speaker in the header board of the automobile and assemble header filter plate assembly and seven foot shielded cable to front cover of receiver case.

The speaker leads from the radio are removed from the terminal board of the set speaker and plugged into the pin jacks of the header filter plate assembly, making certain to match the colors of the leads with the color dots on the pin jacks. The three short pigtail leads from the header filter plate assembly are then connected to the set speaker. Shift the green lead which runs to the output transformer (No. 105-27) to the pin jack with red dot for dual speaker operation.

For further explanation, consult Fig. No. 2 Single Header Speaker schematic diagram, and Fig. No. 3, Dual Speaker schematic diagram.

A more technical explanation of the manner of interconnecting the set speaker with the header speaker and header filter plate is that for dual speaker operation the two speakers are connected in parallel and for single header speaker operation, three pigtail leads from the header filter plate terminal assembly are cut off. All leads are color-coded and correspond to color dots on the pin jacks mounted on the speakers and the terminal board of the header filter plate assembly. A tapped output transformer is provided for impedance matching.

The dummy antennas referred to in the following instructions are:

- "I.F. Dummy" —A .1 mfd. condenser connected in series with the test oscillator output lead.
- "Broadcast Dummy"—A 175 mmfd. condenser connected in series with the output lead of the test oscillator.

**I.F. ALIGNMENT**

1. With variable condenser in its minimum capacity position (plates entirely out of mesh) and with volume control full on, connect test oscillator set at 465 K.C. in series with I.F. dummy antenna, to grid of 6K7 I.F. tube.
2. Adjust trimmer condensers of output I.F. transformer No. 108-72 to resonance with oscillator.
3. Move test oscillator connection to grid of 6A8 tube and adjust trimmer condensers of input I.F. transformer No. 108-69 to resonance with oscillator. See top view for location of these transformers. There are two adjustments on each and they are accessible from the top of the transformer shield and should be adjusted with an insulated screw driver.

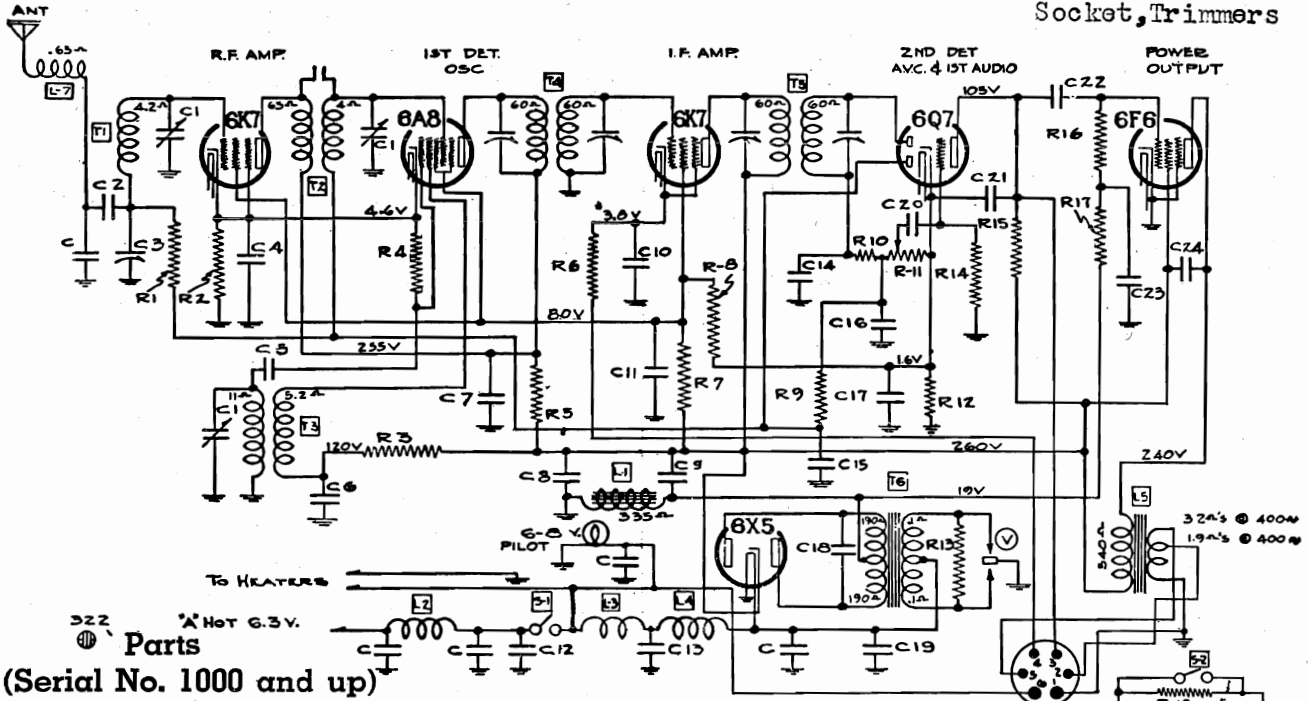

**BROADCAST ALIGNMENT**

1. With variable condenser in its minimum capacity position, connect test oscillator set at 1550 K.C. in series with broadcast dummy to the antenna lead of receiver.
2. Adjust oscillator trimmer of variable condenser to resonance. (This adjustment is on the middle section of the three-gang condenser—see top view.)
3. Shift test oscillator to 1400 K.C. and pick up signal by rotating condenser and adjust R.F. and antenna trimmers to resonance (see top view).
4. Re-set test oscillator to 600 K.C. and rotate variable condenser to 600 KC. Adjust series pad rocking-gang condenser to and fro at the same time adjusting series pad for maximum gain. This adjustment is accessible from the top of chassis (see top view).
5. Go back and check 1400 K.C. If adjustment is made here, check 600 K.C. again.
6. Check for sensitivity at 1000 K.C. by setting test oscillator to this frequency and picking up the signal by rotating variable condenser. Under no circumstances bend plates of variable condenser sections to correct tracking.

 Automatic Tuner Procedure

MODEL 527A  
 Tuner Procedure

**PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:**

There are six levers on the dial by means of which six stations may be selected. (See "B" Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including six.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

Above each automatic tuner lever an opening in the escutcheon is provided for inserting the call letter tabs, (See "A" Fig. 2).

Insert the call letter tabs in the rectangular openings in the escutcheon above each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 2) the station indicated on the station call letter tab above this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab above this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Now Rotate the turning knob (No. 2) to the left (counter clockwise) as far as it will turn, and tighten the special reset lock screw ("C") located on left side of remote tuner unit. (See Fig. 2).

Fig. 2—Front View of Remote Tuner Unit

It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Reset lock screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, loosen the locking screw "C" one or two turns; select the new station as explained. Be sure to retighten the locking screw, otherwise the stations you have selected will not stay adjusted to the levers.

The automatic dial is now set up for quick tuning. Press down on the lever and Presto!—your favorite station is selected.

Fig. 3

**I.F. ALIGNMENT: (465 K.C.)**

**IMPORTANT:**

To align the output I.F. transformer without using a cathode ray oscillograph a 10M ohm resistor must be shunted across the tertiary coil of this unit.

Connect the resistor as indicated by points "Y" and "Z" on the circuit diagram as follows:

Locate the wires coming from the bottom of the output I.F. coil assembly on the underside of the radio chassis.

The white lead with green tracer which is connected to diode plate terminal No. 5 on the 6Q7 tube socket is one point and the white lead with brown tracer which is connected to the end terminal of the terminal strip is the other point. Proceed as follows:

1. With the dial of the Remote Tuner Unit set at 1400 K.C. and with volume control full on, connect test oscillator

Fig. 4 SIDE VIEW

BACK VIEW

set at 465 K.C. in series with I.F. dummy to grid of 6K7 I.F. tube. (.5MF COND.)

2. Adjust trimmers "G" and "H" of output I.F. transformer for maximum gain, (See Fig. 3, top view).
3. Disconnect the 10M ohm resistor which has been shunted across the tertiary winding and adjust trimmer "I" for maximum gain.
  - (a) This transformer is now correctly tuned. Under no circumstances re-adjust trimmers "G" and "H" after the 10M ohm resistor has been removed.
  - (b) For alignment of the output I.F. transformer using a cathode ray oscillograph the 10M ohm resistor is not used and the procedure is similar to the alignment of any two circuit I.F. transformer; merely tune for a symmetrical curve of maximum amplitude.
  - (c) Output connections for the cathode ray oscillograph should be made to pin No. 8 on 6Q7 tube socket and to the end terminal on the terminal strip; at this point the diode load resistors terminate.
4. Move test oscillator connection to grid of 6A8 tube and adjust trimmer condensers "E" and "F" of input I.F. transformer for maximum gain.

NOTE: A red dot on top of output I.F. can designates location of trimmer "G"

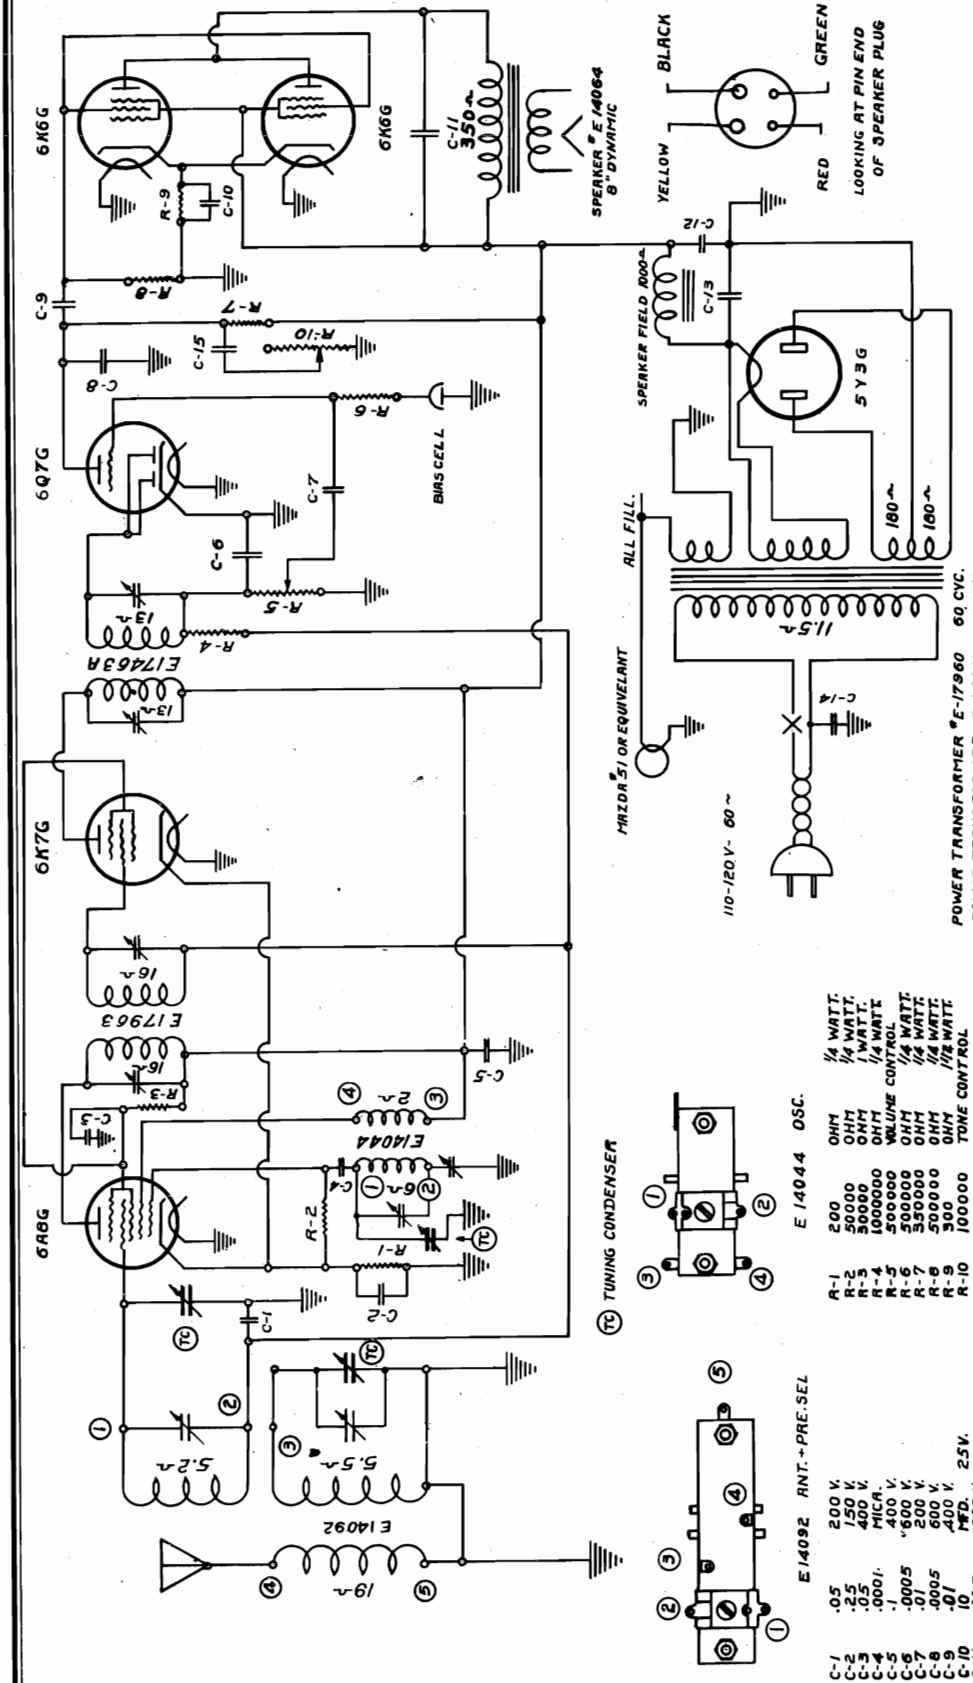

**BROADCAST ALIGNMENT:**

1. With the dial on the Remote Tuner Unit set at 1560 K. C., connect test oscillator set at 1560 K. C. in series with broadcast dummy to the antenna lead of receiver.
2. Adjust oscillator trimmer (adjustment "C", on back of Remote Tuner Unit) to resonance. (See Fig. 4, back view).
3. Re-set test oscillator to 1400 K.C. and pick up signal by rotating dial on Remote Tuner Unit. Adjust R. F. trimmer (adjustment "B", on back of Remote Tuner Unit), and Antenna Trimmer (adjustment "A", on side of Remote Tuner Unit), to resonance.
4. Re-set test oscillator to 600 K.C. and rotate Remote Tuner Unit dial to 600 K. C. Adjust shunt oscillator adjustment "D", rotating dial to and fro at the same time adjusting shunt oscillator for maximum gain. This adjustment is accessible from the top of the radio chassis, (See Fig. 3, top view).
5. Go back and check 1400 K. C. If adjustment is made here, check 600 K. C. again.

TUBE FUNCTIONS: "6A8G" First detector - oscillator, "6K7G" Intermediate amplifier, "6Q7G" Second detector and first audio, two "6K6G" as parallel power tubes, "5Y3G" rectifier.

IF ALIGNMENT: Connect signal generator to grid of 6A8G tube, through a .01 condenser, leave grid cap in place and turn tuning condenser open - peak IF transformers at 456 KC.

BROADCAST ALIGNMENT: Check pointer setting - should reach end of scale with condenser closed - may be changed slightly by loosening set screw on lower pulley and slipping pulley around on tuning shaft. Connect signal generator to antenna terminal through .00025 condenser. Trim oscillator at 1400 KC-- this trimmer is reached through hole in top of chassis to the right of antenna coil. Pad at 540 KC, recheck at 1400, and trim preselector trimmer on coil on top of chassis, and antenna trimmer on gang condenser at 1400 KC. Use as low output from generator as possible for final adjustments and it is best to use an output meter connected across speaker to indicate "peak".

I.F. 456 KC.  
B.C. 540 - 1725 K. G.

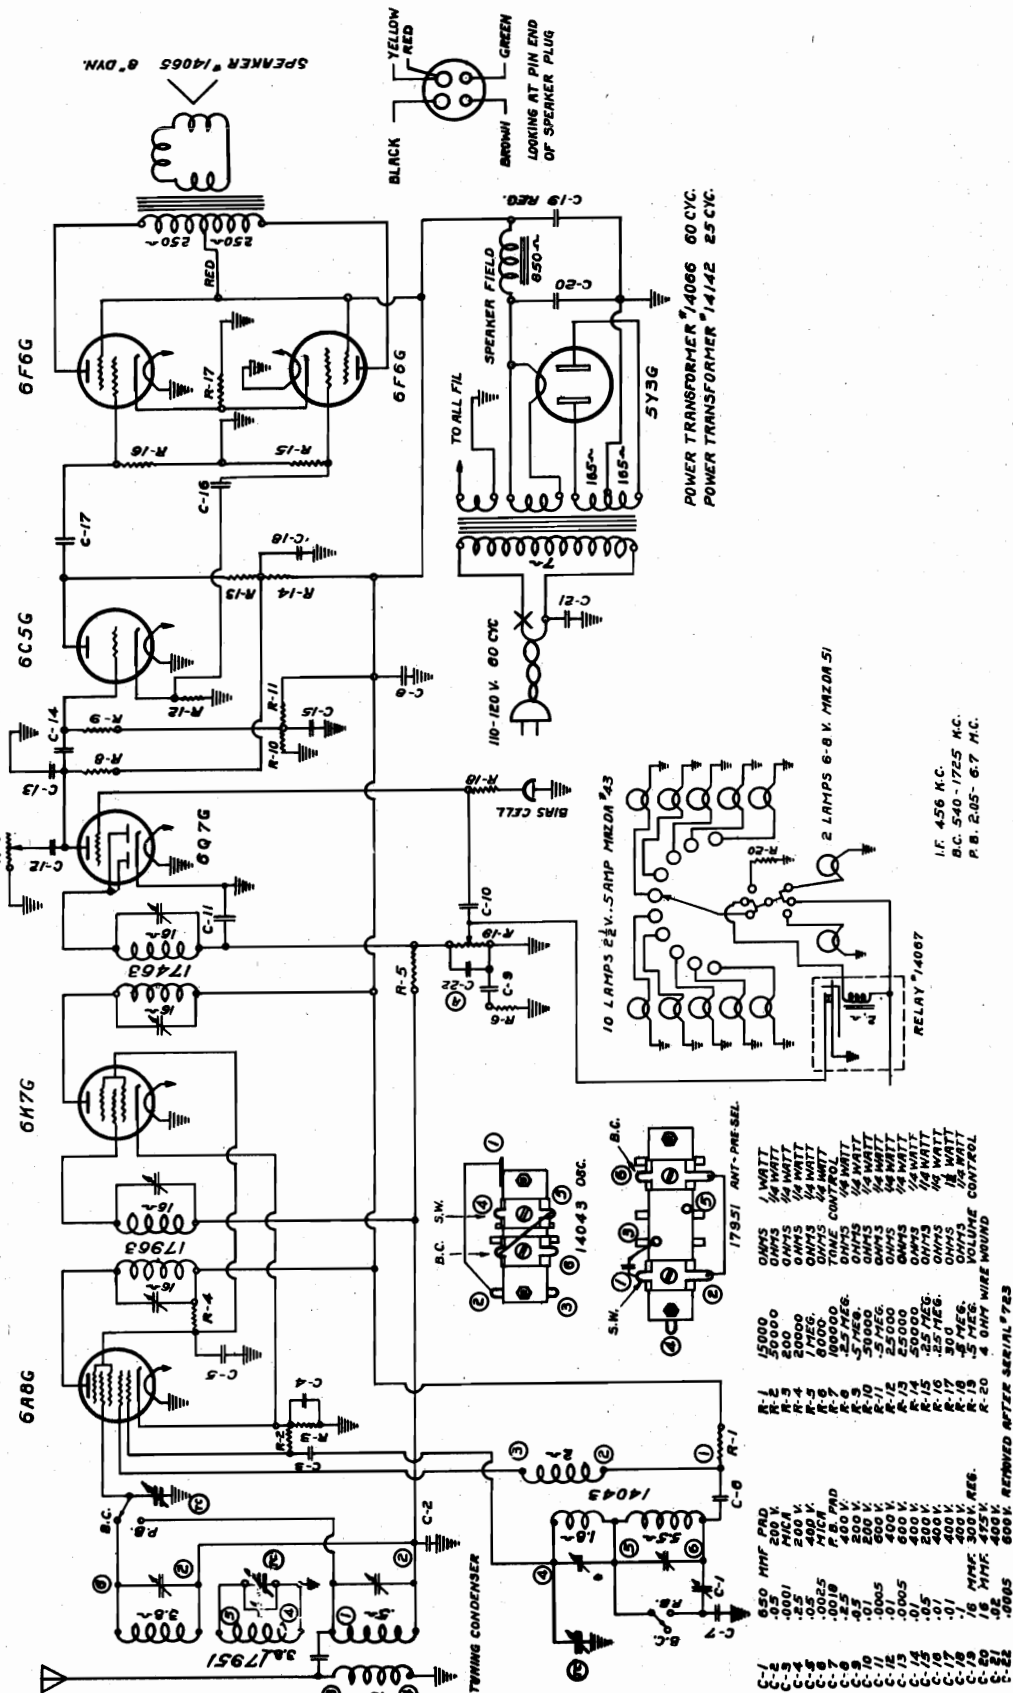

MODEL 715B  
Schematic  
Alignment

GAMBLE-SKOGMO, INC.

**IF ALIGNMENT:** Connect signal generator to grid of 6A8G tube, through a .01 condenser, leave grid cap in place and turn tuning condenser open - peak IF transformers at 456 KC.

**BROADCAST ALIGNMENT:** Connect signal generator to antenna terminal through a .00025 condenser. Trim oscillator at 1400 KC (see picture of coil on circuit diagram for location of trimmer). Adjust padder condenser at 540 KC, recheck at 1400 KC, then peak antenna and preselector trimmers at 1400 KC. (See picture on diagram for location of antenna trimmer, preselector trimmer is on gang condenser.)

**SHORT WAVE ALIGNMENT:** Connect signal generator to antenna terminal through a 300 or 400 ohm resistor. Be sure wave switch is to the "left". Trim SW oscillator at 6 MC., also SW antenna coil at same frequency. The SW pad condenser is fixed for proper range.

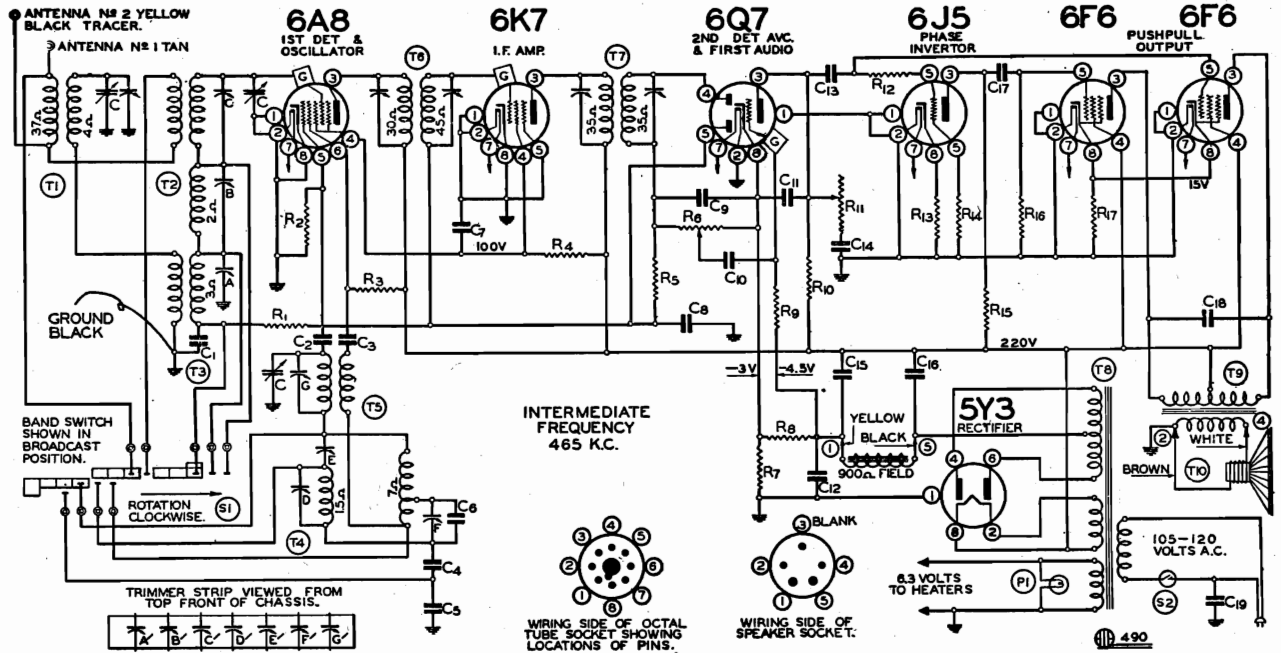

**TUBE FUNCTIONS & CIRCUIT:** "6A8G" First detector - oscillator, "6K7G" Intermediate amplifier, "6Q7G" Second detector and first audio, "6C5G" Phase inverter, two "6F6G" as push-pull power tubes, "5Y3G" Rectifier.

MODEL 776

GAMBLE SKOGMO, INC.

Telephone Dial  
Adjustments, Data

dial scale pointer is removed by unhooking it from the center stud. Unscrew and remove center stud, washers, and dial scale. Slide pulley ring assembly off the center shaft.

On the No. 10 dial, two strips of celluloid between the escutcheon ring and the glass crystal will have to be removed.

To replace the pulley ring assembly, proceed as follows: Lay the assembly face down and adjust the stop pin. The stop pin (Fig. 2) is directly in back of the wide spacer on the dial button ring. Pull this pin back and adjust it to the center position—See Fig. 2.

Rotate tuning condenser rotor counter-clockwise (from front) as far as possible—See Fig. 2.

Place the pulley ring assembly on the shaft with the knot of the dial lamp lead at the top—do not engage the gears.

Pull the dial lamp lead through the slot in the pulley ring gear and through the long slot in the dial support casting. Then place this lead through the clip under the dial support brace and out through the opening in the back of this brace.

With the gears still disengaged, rotate the pulley ring clockwise (from front) 1/2 revolution until the stop pin passes over the right gate and comes to rest against the left gate—See Fig. 2.

With the condenser rotor fully closed, push the pulley ring on the shaft until the pulley ring gear engages the fixed gear only (front) of the condenser drive gear assembly. Hold the pulley ring assembly and with a fine blade screw driver, move the movable (back) gear clockwise one tooth relative to the fixed gear—See Fig. 2. Then push the pulley ring all of the way on, engaging the movable gear.

Now lay the chassis on its back. Replace in the order given the large washer with rectangular hole, dial scale, washers, center stud, dial pointer, glass crystal, and escutcheon. Resolder the lamp lead.

For the No. 10 dial, before putting the escutcheon on, lay the two celluloid strips on the glass crystal with the inside flange facing away from the glass. Then lay the escutcheon on top of the celluloid strips. The section not cut out for station call letters should be at the wide spacer in the button spacer ring. Center the small holes in the celluloid discs in the station call letter openings and then tighten the escutcheon screws.

The stop pin must now be adjusted, as explained in article "Position of Stop Pin," until the condenser does not open or close fully. Injury to the condenser will result if allowed to open or close fully.

Replace the drive cord as explained in the article "Replacing Drive Cord."

Replacing Gates

After a great amount of use, one or both of the stop gates may wear, making it necessary to replace the stop gate assembly. This is done by first removing the pulley ring assembly as explained in the article "Replacing Pulley and Button Ring Assembly."

The stop gate assembly is then removed by taking out the two screws at the bottom of the assembly

Telephone Dial

Replacing Complete Dial and Condenser Assembly

Remove the grid lead clip from tube grid cap.

Remove silencer cable from the contact spring assembly. Unsolder dial lamp lead from terminal of tube socket.

Unsolder the three stator section connections of the gang condenser. Unsolder the three braided shield leads which ground the gang condenser frame to the chassis, taking care not to loosen the connections of any other units which are grounded at these common points.

At the back of the gang condenser is a stud which secures the assembly to an "L" bracket which is secured to the chassis.

Through this stud is a cotter pin. Remove only the cotter pin, metal washer, and rubber washer.

Viewing the assembly from the back, on the left is a brass bolt which holds the dial support bracket to the chassis—remove this bolt from underneath the chassis.

Grasp the dial support brace and move entire assembly toward the front of the chassis. When the support casting rubber cushions slip clear of the slot in front of chassis, lift entire assembly clear of chassis.

To replace this assembly, reverse the procedure as given above.

Replacing Pulley and Button Ring Assembly Only

Remove drive cord.

From underneath the chassis, unsolder the dial lamp lead from prong of the tube socket. Pull this lead through and out to the front of the assembly.

Remove the four escutcheon screws which hold the escutcheon ring and glass crystal in place. The

Fig. 2—Replacing Pulley Ring Assembly

NOS. 9, 10, & 11—17 BUTTON TELEPHONE DIAL

NOS. 3 & 7—PHANTOM LIGHT DIAL

Identification of Dial and Chassis

The following description will identify the different dials:

No. 9 Dial—17 Button Telephone Dial—Station call letters in black push buttons.

No. 11 Dial—Same as No. 9 Dial except push buttons are brown.

No. 10 Dial—17 Button Telephone Dial—Station call letters are rectangular in shape and are mounted in rectangular openings in escutcheon ring. Equipped with visible tone and volume indicators.

No. 3 Dial—Glass dial—Moving beam of light indicators—Tone and volume indicated by series of circles.

No. 7 Dial—Glass dial—Moving beam of light indicators—Tone and volume indicated by slanting lines.

The telephone dial assembly provides a means of pre-tuning a number of broadcasting stations and tuning in these stations at any time by depressing a button and rotating the dial to a stop position.

The apparatus is mounted on an assembly attached at the front of the chassis. An examination of this assembly will clearly show the method of operation.

Silencer Circuit—A silencer circuit is provided which results in silent tuning between stations when using the telephone dial buttons.

When a telephone dial button is depressed, a circuit is established between the ungrounded end of the volume control and the chassis ground.

Referring to Fig. 1 it will be noted that contact is made between the line from the volume control, contact ring, contact washer arm (when button is depressed), spring and pulley ring stud. Since the pulley ring is at ground potential, this grounds the audio voltage and no signal will be heard until the button is released to break the contact.

It should be noted that the contact ring is part of the pulley ring assembly, but is insulated from it.

In the case of powerful local stations a slight amount of signal may be heard when the button is depressed.

Telephone Dial Adjustments

Noise When Tuning in a Signal with a Telephone Dial Button

As explained in the article on "Silencer Circuit" in this manual, no noise or signal should be heard when tuning in a signal with a telephone dial button until the button is released. If noise is heard while tuning in a signal with one of these buttons, it can be corrected as follows:

APRIL, 1937

If Noise Occurs on All Buttons—This is probably due to a poor contact between the flat contact spring and the contact ring—See Fig. 1. Clean the flat contact spring and contact ring to insure a good electrical connection. Ordinary cleaning fluid may be used and will be effective in most cases in cleaning the surface without affecting the plating. If the contact is still not satisfactory, a piece of fine emery cloth may be used.

Fig. 1—Silencer Assembly

If Noise Occurs on One Button Only—This is due to a poor contact between the pulley ring stud, spring, contact washer, and contact ring—See Fig. 1. Clean all of these items of the particular button, in the same manner as mentioned previously, so as to provide a good electrical connection.

Telephone Dial Drive Cord Slipping

If the telephone dial drive cord slips on the tuning shaft pulley, this may be remedied by adjusting the drive cord tension pulley. Loosen the tension pulley bracket screw and adjust pulley assembly until the desired tension is obtained.

Position of Stop Pin

When the telephone dial assembly is on the chassis, the gang condenser rotor should not completely open or close. The travel of the rotor in this respect is controlled by the gang stop pin on the pulley ring—See Fig. 4. This is necessary to protect the gang condenser in case the telephone dial is swung rapidly to either of the extreme positions. When the gang stop pin is properly set, it will serve as the stop at both extreme positions. If the rotor is seen to open completely or close completely, the stop pin should be pulled back and re-set to overcome this condition.

Greasing and Oiling

After a period of time, put some light grease on the pulley ring shaft and on the teeth of the pulley ring. Use light oil on the drive shaft assembly bearing, care being taken not to get any on the drive cord.

Phantom Light Dial - Replacing Drive Cord

to remove the volume control and tone control indicator screws.

Remove the phantom light assembly from the drive drum by taking out the screw.

Take off the old cord and tension spring. Tie a knot with a small loop in it in one end of the new cord. Then tie the other end of this cord to the hook on the tension spring. The distance from the loop on one end to the tension spring is 17/4 inches.

From the front of the chassis, place the looped end of the cord through the drum hole located near the cord track opening, and hook it over the hook provided for it at the back of the drum.

Bring the cord up and around the right side of the drum, keeping the cord in the grooved track of the drum.

Bring the cord down to the right side of the drive shaft and wind it three and one-third times around this shaft progressing toward the back.

Then bring the cord up and around the left side of the drive drum. Hook the tension spring on the hook of the drive drum.

Replace the phantom light and the dial assembly.

Remove the dial assembly as follows: Take out the screw which secures the dial frame brace to the back of the gang condenser. Take out the two screws which secure the brackets on the bottom of the dial frame to the chassis. Lay the dial assembly face down in front of the chassis—it is not necessary

Fig. 6—Drive Cord Replacement, Phantom Light Dial

Fig. 4—Holding a Push Button Shaft in Place

Fig. 3—Drive Cord Replacement—Telephone Dial

Replacing a Telephone Dial Button or Button Shaft

A telephone dial button or button shaft may be replaced without removing the chassis from the cabinet.

Rotate the dial until the button shaft to be replaced is in the position shown in Fig. 4. Using a wooden wedge block or any other wedge, hold this button shaft in place as shown. Remove the clear celluloid disc and the call letter disc with the point of a pin from the button of the shaft to be replaced (No. 10 dial—brown opaque celluloid disc only).

Remove the hairpin spring from the front of this shaft, spreading it with an ice pick or screwdriver. Take off the button, metal washer, molded bushing, and spring. Take out the wedge block, remove the button shaft to be replaced from the back of the dial assembly and put in the new one. Then put the wedge block back in place again as illustrated.

Lay the cabinet back down against a chair so that it will be about 30 degrees from the vertical position.

Assemble the spring, molded bushing, metal washer, and button in the order shown in Fig. 5. (Last three items may be in one unit.) Push the button and spring assembly over the button shaft with the tab of the metal washer in the normal

FRONT VIEW OF BUTTON

Fig. 5—Putting a Hair Spring on a Push Button Shaft

position—See illustration in instruction book. Hold the tab and rotate the button until the flat in the shank coincides with the flat on the shaft. Push the button all of the way on.

Put the hairpin spring in place, as shown in Fig. 5, with the upper part of the slot near the end of the button shaft and the lower part over the end of the shaft. Place the blade of a screwdriver at the center of the lower part of the spring and push down until the spring snaps into place in the slot on the shaft. Remove the wedge block.

DESCRIPTION

DIAL ASSEMBLY

Dial Assembly, Complete with Dial Glass, Dial Assembly Mounting Plate, Base, Support Bracket, Celluloid Dial Background, Indicator Side Reflector, Lamp Sockets and Cord Springs, and Light Shield  
Dial Glass Only  
Dial Glass Background for Dial  
Celluloid Dial Background (Series AI-45)  
Celluloid Dial Background (Series AI-45)  
Dial Assembly Mounting Plate with Tone & Volume Indicators, and Indicator Pulleys  
Dial Assembly Brace (Attached to Gang Condenser)  
Tension Spring for Tone and Volume Indicators  
Fibre Strip (At Back of Tone and Volume Indicator Lamps)  
Back Card for Indicators  
Dial Lamp Reflector (Right From Front)  
Dial Lamp Reflector (Left From Front)  
Dial Lamp Sockets and Clips (For Edge Lighting of Dial and Tone & Volume Indicators)  
Dial Lamp Socket Assembly (4 Sockets) Less Lamps  
Dial Lamp (No. 5) Bicolor Type  
Dial Lamp (No. 5) Complete with Lamps  
Phantom Light Assembly Complete with Lamps  
Spring for Lamps of Above Assembly  
Brass Collars for Lamps of Above Assembly  
Bracket (To secure Phantom Light Assembly to Drum)  
Fibre Strip (At Bottom of Dial Glass)

DRIVE ASSEMBLY

Tuning Shaft Only  
Tuning Drive Cord—20"  
Tension Spring for Above Cord  
Drive Drum & Hub  
Rubber Cushion (Front) for Assembly Mounting  
Rubber Cushion (Rear)—Gang Mounting  
Rubber Cushion (Rear)—Gang Mounting  
Support Bracket and Drive Shaft Bushing for Gang Condenser

Phantom Light Dial Parts

See article "Identification of Dial and Chassis" in this manual in order to determine the correct dial and chassis assembly number.

Telephone Dial Replacement Parts

See article "Identification of Dial and Chassis" in this manual in order to determine the correct dial and chassis assembly number.

Replacing Drive Cord

Remove the old drive cord and tension spring. Rotate telephone dial clockwise (from back of chassis) as far as it will go.

Viewing the pulley ring drum from above and to the back, place the knotted end of the drive cord in the slot provided for it, catching the knot in back of the rib as shown in Fig. 3.

Bring the cord down and around the right side

(from back) of the drum at front part of groove in pulley ring drum and under the drive shaft pulley making one-half turn on this pulley. Then bring the cord around the right side (from back) of the adjustable tension pulley and up to the upper left side of the pulley ring drum in front of the cord already on.

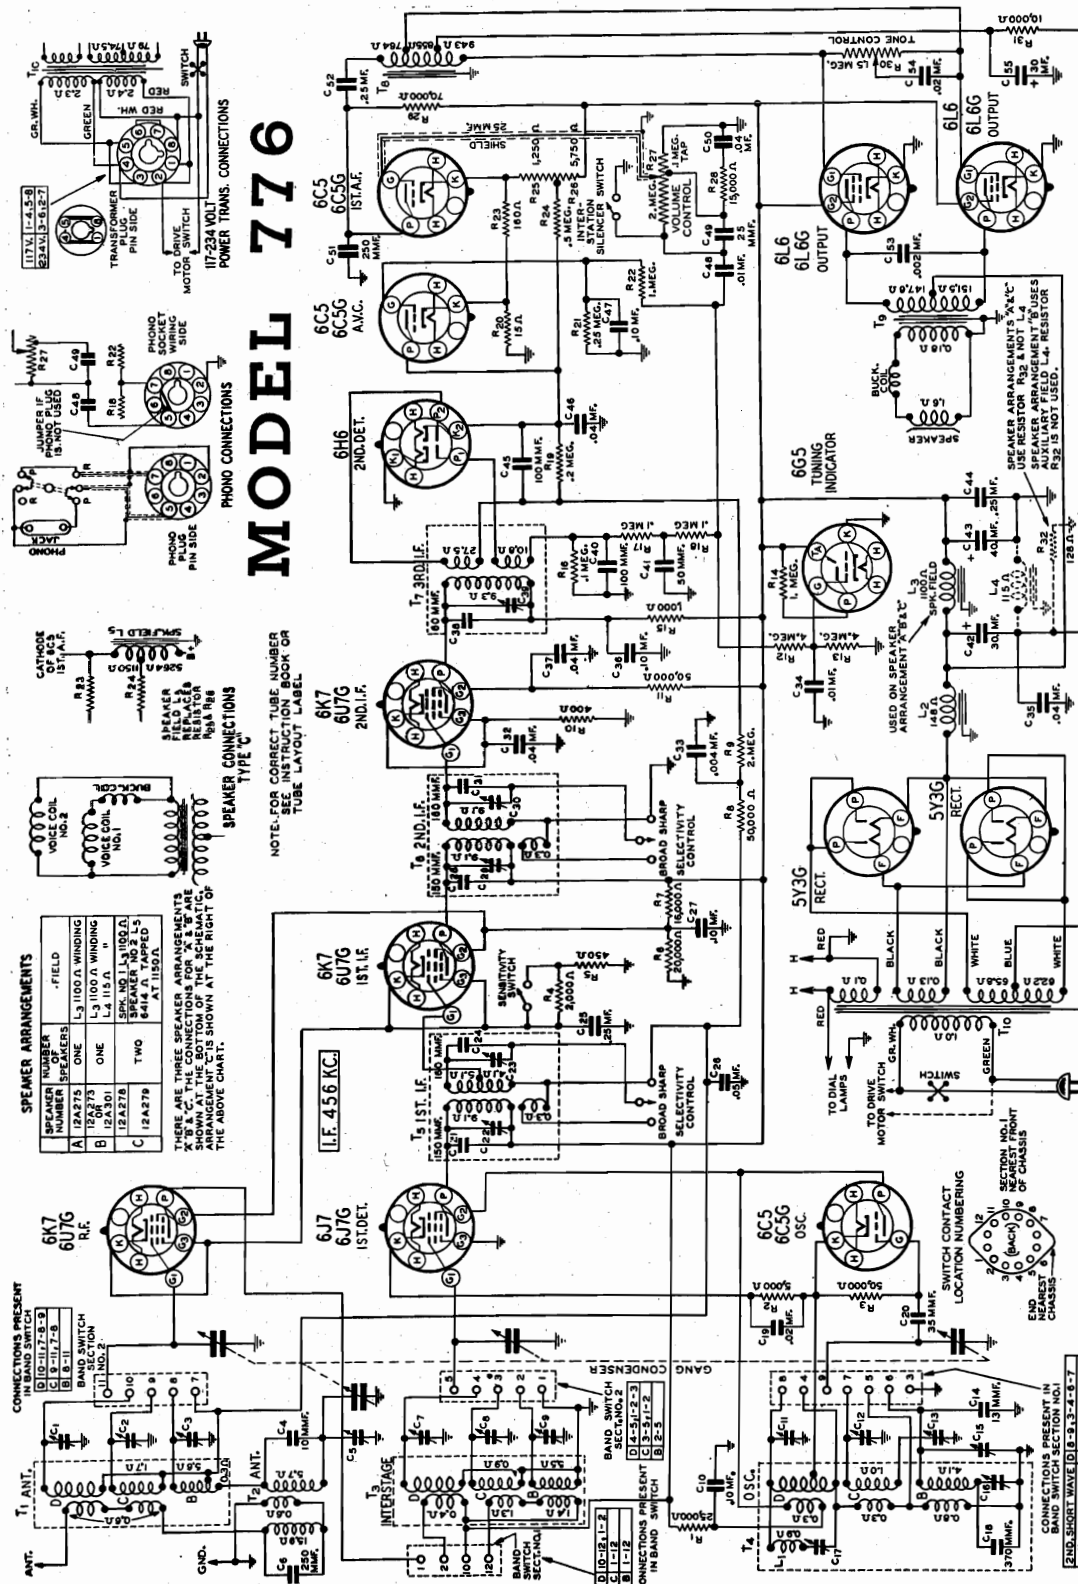

Hold the cord in the left hand and rotate the dial counter-clockwise with the right hand. Feed the cord on the drum in such a way that after passing the two openings at the top of the pulley ring drum, it passes to the back of the groove in the drum. After the pulley ring drum makes one complete revolution, place the cord through the left drum opening into the slot and secure the tension spring hook over the pin provided for it—See Fig. 3.

- B Range (Manual Tuning).....538 to 1700 KC (Kilocycles)
- D Range (Manual Tuning).....5750 to 18000 KC (Kilocycles)
- Buttons 1 and 2 (Automatic Tuning).....820 to 1800 KC
- Buttons 3 and 4 (Automatic Tuning).....864 to 1280 KC
- Buttons 5 and 6 (Automatic Tuning).....520 to 980 KC

JUNE, 1938  
Model 810

Fig. 1—Location of Controls and Push Buttons—No. 11 Dial Escutcheon

Fig. 3—Schematic Circuit Diagram

The oscillator coil assembly B and D band grid coils are open circuited. Tuning of the R.F. and oscillator fixed tuned circuits to the desired frequency is accomplished by varying the inductance of the tuning coils by changing the permeability of the magnetic circuit. This is done by moving an iron core in and out of the coil. The iron cores within the antenna and oscillator automatic tuning coil forms are secured to a brass rod. This rod is moved back and forth by a screw located at the front of the radio.

Alignment between the oscillator and antenna tuning coils is obtained by moving the antenna (rear) coil position while the iron core remains stationary.

This model is a two band 32 Volt DC operated radio. A 6 button inductive type automatic tuning system is employed. This system is separate from the variable condenser tuned circuits which are used for the 2 manual tuning ranges.

A 3 position rotary switch is used to switch the tuning circuits from automatic (push button) tuning to either of the 2 manual tuning ranges.

In AUTOMATIC TUNING, the gang condenser is not used. A single tuned circuit is used before the 1st detector.

The antenna circuit is connected to the automatic tuning antenna coils numbered 1 to 6 on the schematic. When the band switch is in the automatic tuning position and one of the automatic tuning buttons is depressed, the coil corresponding to the button depressed is connected to the control grid circuit of the 1st detector tube. The antenna coil is tuned by fixed condensers C7 and C15. The antenna transformer B band No. 1 secondary is short circuited and the secondary is open circuited. The antenna transformer D band No. 2 secondary is open circuited. The primary of the automatic tuning oscillator tracking coil assembly T3 is connected to the B+ line. The secondary of this assembly is connected through the band switch to the control grid circuit of the oscillator tube. This secondary coil is tuned by fixed condenser C16 and the inductance of one of the automatic tuning oscillator coils numbered 1 to 6 on the schematic.

MODEL 810(1938)  
Alignment, Trimmers

GAMBLE-SKOGMO, INC.

### ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:

An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 200 mmf., and 400 ohms.

SIGNAL GENERATOR		DUMMY ANTENNA	BAND SWITCH	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (Unless otherwise specified)
FREQUENCY SETTING	CONNECTION AT RADIO				
<b>I. F.</b>					
456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C17) & (C18) 2nd I.F. (C20) & (C21) 3rd I.F. (C26)
<b>WAVE TRAP</b>					
456 KC	Antenna Lead	200 mmf.	Push Button Position Button No. 6 Depressed		Wave Trap (C5) Adjust for MINIMUM Output
<b>RANGE B</b>					
1730 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C12)
1500 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1500 KC— See Note A	1st Ant. Range B (C2) 2nd Ant. Range B (C1)
600 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C11) Rock Rotor—See Note B
<b>RANGE D</b>					
18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C13)
15,000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Ant. Range D (C3) Rock Rotor—See Note B
6000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	6000 KC (C9) Rock Rotor—See Note B
<b>PERMEABILITY TUNING UNIT</b>					
			<b>BUTTON DEPRESSED</b> (Band Switch in Push Button Position)	<b>TURN SETTING SCREW TO MAXIMUM OUTPUT</b> —See Instruction Book	<b>ADJUST COIL POSITION TO MAXIMUM OUTPUT</b> —See Note C
1100 KC	Antenna Lead	200 mmf.	No. 1	Setting Screw No. 1	Antenna Coil No. 1
1100 KC	Antenna Lead	200 mmf.	No. 2	Setting Screw No. 2	Antenna Coil No. 2
850 KC	Antenna Lead	200 mmf.	No. 3	Setting Screw No. 3	Antenna Coil No. 3
850 KC	Antenna Lead	200 mmf.	No. 4	Setting Screw No. 4	Antenna Coil No. 4
700 KC	Antenna Lead	200 mmf.	No. 5	Setting Screw No. 5	Antenna Coil No. 5
700 KC	Antenna Lead	200 mmf.	No. 6	Setting Screw No. 6	Antenna Coil No. 6

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

**NOTE A**—If the pointer is not at 1500 KC on the dial, loosen the 2 clamps which hold the pointer assembly on the cord, move the pointer to the 1500 KC mark, and tighten the clamps.

**NOTE B**—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

**NOTE C**—At the top of the permeability tuning unit can be seen six "W" openings. Insert the end of a pair of long nose pliers or a screwdriver in the "W" opening of the proper button and adjust the position of the antenna (rear) coil by twisting the pliers or screwdriver until maximum output is obtained.

**CAUTION**—When aligning the short wave band, be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for

15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at

15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

ALIGNMENT PROCEDURE

- The following equipment is required for aligning:
- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
  - Output indicating meter.
  - Non-metallic screwdriver.
  - Dummy antennas—1 mf., 200 mmf. and 400 ohms.

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a snort heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6K7	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6K8G	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
	1730 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Trimmer (C9) (See Fig. 4)	Broadcast oscillator	Adjust to maximum output
	1500 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 1500 Kc.	Trimmer (C6) (See Fig. 4)	Broadcast antenna	Adjust to maximum output
BROAD-CAST BAND	600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 600 Kc.	Trimmer (C12C) (See Fig. 4)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")
	465 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 600 Kc.	Trimmer (C1) (See Fig. 4)	I. F. Wave Trap	Adjust for minimum output
	2330 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 1400 Kc. on dial	Trimmer (C3) (See Fig. 4)	Image rejection	Adjust for minimum output (See note "B")
SHORT WAVE BAND	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 17 Mc.	Trimmer (C8) (See Fig. 4)	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Dial Set at 17 Mc.	Trimmer (C7) (See Fig. 4)	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 6 Mc.	Trimmer (C13) (See Fig. 4)	Short Wave oscillator series pad	Adjust to maximum rock dial. (See note "A")

GAMBLE SKOGMO, INC.

MODEL 867A  
Socket, Trimmers  
Tuner Data, Notes

**PROCEDURE FOR SETTING THE AUTOMATIC TUNER LEVERS:**

**IMPORTANT**—Read carefully before setting the automatic levers.

There are six levers by means of which six stations may be selected. Make a list of local stations or stations you tune in regularly; any number up to and including six.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

On the front of each automatic tuner lever button an opening is provided for inserting the call letter tabs.

Insert the call letter tabs in the rectangular openings of each of the automatic tuner buttons. One of the small celluloid tabs supplied should be inserted into place over each of the station call letter tabs.

**NOW, PROCEED AS FOLLOWS:—**

1. Pull the dial tuning knob all the way out (See Illus. "B," Fig. 3), and rotate the tuning knob to the left (counterclockwise) until it cannot be turned any further (See Illus. "D," Fig. 3). This will unlock the automatic tuner mechanism. (NOTE:—Automatic tuner mechanism is locked tight when radio is shipped from the factory.)

2. Press down all the way any one of the automatic tuner levers. Holding it down firmly, press in on the dial tuning knob No. 3 and tune in the station indicated on the station call letter tab on this lever. You will note that in order to tune the station, the dial tuning knob will have to be pressed in (See Illus. "E" Fig. 3). Turn the dial tuning knob very slowly back and forth (while still holding the automatic tuner lever in downward position), noting the width of the shadow on the screen of the cathode-ray tuning indicator. Minimum width on the tuning indicator indicates the ideal tuning position (resonance). The station will then be clearest and accurately-tuned in.

3. Press down another automatic tuner lever. Holding it down firmly, press in on the dial tuning knob and carefully tune in the station indicated on the call letter tab on this lever.

4. Follow this procedure until you have selected all of your favorite stations.

5. Pull the dial tuning knob all the way out (See Illus. "B," Fig. 3) and rotate the tuning knob to the right (clockwise) until it cannot be turned any further (See Illus. "C," Fig. 3).

This will lock the automatic tuner mechanism and the stations you have set up for automatic tuning will be locked in place. After you have locked the tuner mechanism, push the dial tuning knob in.

6. If you should desire to change any station you selected to another, pull the dial tuning knob all the way out and rotate the knob to the left (counterclockwise) and unlock the tuner mechanism. Select the new station as explained. (NOTE:—If the dial mechanism works hard when setting up a new station for one of the automatic tuner levers, it is due to the tuner mechanism not being unlocked all the way. Pull the dial tuning knob out all the way and rotate the knob to the left (counterclockwise) until it will turn no further. The dial mechanism should work freely with the tuner lever pressed down.)

7. After you have selected the new station, pull the dial tuning knob all the way out and rotate the knob to the right (clockwise) to lock the tuner mechanism. Be sure the knob is turned until it will turn no further, then press the dial tuning knob in.

8. The automatic tuner levers are now set up for quick tuning. Press down the lever key and—YOUR FAVORITE STATION IS SELECTED!

The important steps to remember when setting up stations on the tuner levers for automatic tuning are:

1. To unlock the tuner mechanism pull the dial tuning knob all the way out. You may find it necessary to rotate the knob slightly when pulling it out to make certain that the gears mesh properly. Rotate the dial tuning knob to the left (counterclockwise) as far as it will turn without forcing.

2. To set a lever, press down all the way and hold in this position while tuning in by means of the dial tuning knob the station you want this lever to be tuned to. (NOTE:—you will notice that it will be necessary to keep pressing in on the dial tuning knob while tuning in the station as a spring tends to push the knob out.) Set all the levers in the same manner before locking the mechanism.

3. To lock the tuner mechanism pull the dial tuning knob all the way out. Rotate the dial tuning knob to the right as far as it will turn making certain that it is tight, but it is not necessary to use force.

4. After locking or unlocking the tuner mechanism always return the dial tuning knob to its normal position (pushed in).

**SERVICE NOTES:**

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on the voltage chart are measured with 115 volts A. C. on the primary of the power transformer.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D. C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

**DIAL CALIBRATION:**

To correct dial calibration rotate the tuning knob to the right until the dial pointer reaches the extreme end of the dial scale; then rotate the tuning knob to the left until the pointer reaches the other extreme end of the dial scale.

Stop clamps on the pointer slider bar make the pointer self-aligning, thereby correcting dial calibration.

## GAROD RADIO CORP.

MODEL 100  
Circuit Data  
Assembly, Wiring Notes

Note that the I.F. as well as R.F. circuits are very heavily loaded, so as to broaden the response curves sufficiently to pass the wide band required for good definition.

## ASSEMBLY AND WIRING

The assembly of the component parts may be seen from the photographs FIGS 2 and 3 and diagrams 4, 4A and 5. All parts should be assembled as shown and checked against the circuit diagram to prevent any possibility of error. The dial assembly is shown in the sketch. (FIG. 6) The 2 angle brackets which hold the dial to the chassis are fastened with Self-Tapping screws, which are provided. The cord is strung as indicated. The dial crystal is held by 2 TRIMMOUNTS which are also provided. These are simply pressed into the holes, and may be removed to calibrate the scale by pushing them out from the rear. The pointer is fastened to the dial cord by pressing the prongs together over the piece of sleeving, which has been slipped over the cord to prevent chafing.

Note that the end of the shield on the underside of the chassis is soldered to a lug fastened under one of the screws which holds the gang condenser. (See FIG 4) The large rubber grommet is slipped into the hole in the REAR picture tube support bracket and serves to insulate the leads from the tube socket.

Other grommets are located as shown in the various figures.

Coils L1, L2, L3, and L16 are wound with #16 bare wire (supplied with kit). A  $\frac{1}{8}$ " diameter form is used and removed after winding. Turns are spaced approximately  $\frac{1}{8}$ ". The number of turns is indicated in the diagram.

It is important that the wiring shown in FIGS 4 and 4A be followed carefully. AS each wire or component is put in, it should be checked off on both schematic and picture diagrams. The grounds and heaters should be wired first, then the various 8 voltages, I.F. transformers; then resistors, mica and tubular condensers. All wiring should be as short and direct as possible. Particular care should be taken in wiring the Video Amplifier to avoid high Grid or Anode capacities to ground, since this will result in a loss of high frequencies with consequent poor coupling condenser from 1852 to 6V6 as well as wiring from L 11. These should be lifted away from the chassis  $\pm$  to  $\frac{1}{2}$  inch. Do not fasten the GRID LEAD from the picture tube to the chassis or wrap it around the other leads in the cable.

After the receiver has been assembled and wired it should be very carefully checked over, to see that it is wired in exact accordance with the schematic and pictorial diagrams. When this has been ascertained, insert all tubes into their respective sockets, as shown in the photograph.

## CAUTION

Approximately 1400 volts is supplied to the high voltage Anode. This voltage should be treated with great respect, since under certain conditions it may be DANGEROUS. Be sure that the power switch is OFF or better still, remove the line cord from the outlet, when making any changes, or touching any parts, other than the control knobs.

With a High Resistance (1000 ohms per volt) Voltmeter, measure all voltages, with respect to the chassis. Results should be approximately as tabulated. Variations will occur due to line voltage conditions and tubes. If there is any SUBSTANTIAL deviation in voltage from that given in this table, ascertain the reason, and correct it before proceeding further, or damage to tubes or other components may result.

## WARNING

Be sure that the Voltmeter prongs are well insulated and use great care in making these measurements to avoid shock from the High Voltage supply.

Fig. 1 shows the Schematic circuit. It will be noted that is of the Superheterodyne type. The antenna primary L 16 is connected to the Dipole (or other type) antenna thru a twisted pair. The secondary is tuned to the carrier frequency by the first section of the three gang condenser, and is fed into the grid of the 1852 R.F. amplifier. The plate circuit feeds thru inductor L 2 as a plate load into the control grid of the 6K8 converter (thru the .0001 mfd coupling condenser). The oscillator is of the Hartley type, although the elements have been used in a somewhat unconventional manner. Note that the oscillator plate (#6 pin) is not used. It was found that better stability was obtained with the circuit as shown, than with the conventional arrangement. The converter is followed by three I.F. stages operating at 12 M.C. The 6H6 is used as a diode detector in the usual way. The two chokes L8 - L9 together with the .00003 mfd condenser serve as a filter to remove the I.F. component from the VIDEO channel. The 1852 and 6V6 act as 1st and 2nd /VIDEO AMPLIFIERS respectively for the picture signal. A single 14volt cell such as is used for Pen-Lite flashlights supplies the "C" bias for the 1852 first video stage. This cell is not supplied with the kit, but can be obtained at any Five and Ten Cent store or hardware store. This cell will last for a considerable period, since no current is drawn. The output of the 6H6 is connected to the control grid of the Cathode Ray tube as well as the SYNCH. SEPARATOR.

A second 6H6 serves as a SYNCH. SEPARATOR. This function is accomplished by putting a negative bias on the DIODE plate. This bias may be varied by means of the 100,000 POT. (R36). Thus, since no current can flow until this negative bias is overcome, we have a means of selecting a part of the incoming wave, by adjusting this bias. Since the synchronizing impulses are of considerably higher amplitude than the picture signals, we can adjust our bias so as to bar the passage of these picture signals and permit only the high amplitude Synch. signals to come thru the diode.

The Low and High Frequency SYNCH impulses are then separated by frequency discrimination. The low frequency pulses cannot pass thru the .0001 condenser which couples to the high frequency sweep, but are attenuated very little by the .005 leading to the Low Frequency sweep oscillator.

The Sweep circuit oscillators are of the multi-vibrator type, are very stable in operation, and can be readily controlled by the SYNCH. pulses, which are introduced into the respective grids of the 6L7 tubes. Both sweeps utilize the same circuit arrangement, except of course, that different constants are used for the horizontal (HIGH) and vertical (LOW) sweep frequencies. The saw-tooth waves generated in such a multi-vibrator, are, if no compensating means is used, logarithmic in form. Chokes L12 and L13 are therefore inserted to correct this deficiency and produce a saw-tooth, substantially linear, so that the Electron beam is carried across the tube at a uniform rate.

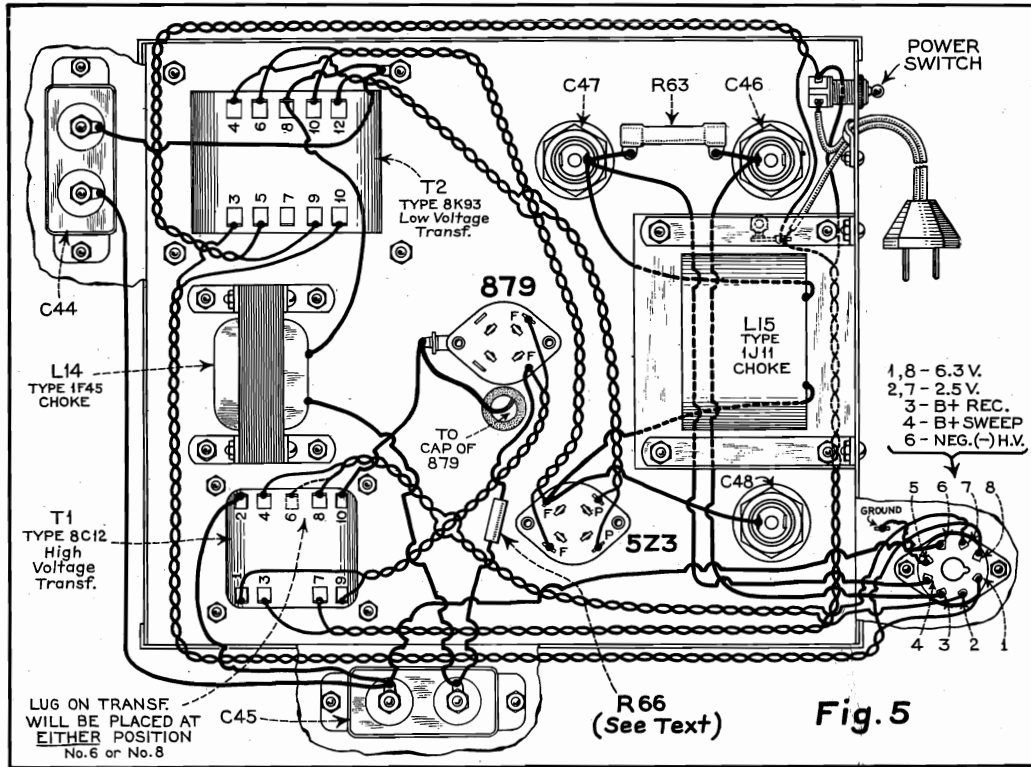

The synchronized saw-tooth pulses are then fed to the two sets of deflecting plates to scan the face of the Picture tube by means of the Electron Beam emitted by the Electron Gun in the neck of the tube. This beam is in turn modulated thru the control grid by the picture impulses obtained from the output of the 6V6.

An 875 Rectifier fed by a separate transformer supplies the High Voltage for the Cathode Ray tube. The 8Z3 serves as a full wave rectifier for the sweep circuits, and other receiver functions. Adequate filtering is used to eliminate any hum voltages that might otherwise interfere with proper operation.

Means are provided for centering the picture by varying the fixed positive potential on the two sets of deflecting plates. Other controls focus the beam by changing the potential on the focusing electrode (R59) and adjust the bias on the Cathode Ray tube (R56) to set the average brightness. (CONTRAST)

MODEL 100  
Alignment, Operating  
Antenna Notes

## ALIGNMENT AND OPERATION

Set the Picture Tube bias control (#1) all the way to the right. Set the Horizontal and Vertical Sweep (#6 and 7) controls approximately half way.

Now turn the Spot locating control (#3) all the way to the left and rotate the other spot control (#4) thru its entire range. If neither a spot nor a Raster (the scanning pattern) appears, move the first spot locating control (#3) slightly to the right and rotate the other locating control thru its entire range again. Continue this procedure step by step until something appears upon the viewing screen of the Cathode Ray Tube.

Now adjust the Vertical and Horizontal Sweep controls until a complete raster appears. This should be approximately 4" square (The actual picture will be somewhat smaller due to the presence of the Blanking and Sync pulses in the station carrier). By means of the Spot Location controls (#3 and #4) this Pattern may now be centered on the tube face. The Cathode Ray Tube socket can be rotated to level the Raster.

The size of the picture is determined by two factors, namely; the sweep circuit voltage and the voltage applied to the second anode. The picture increases with increase in sweep voltage and decreases INVERSELY as the square of the second or High voltage Anode potential. The saw-tooth voltage developed by the multi-vibrators is a function of the "B" voltage applied to the plates. Since we are operating near the voltage limit of the 5Z3 rectifier tube, it is impractical to obtain any improvement in this direction. Amplifiers could be used to increase the sweep voltages, but this would complicate matters greatly. The other alternative is to reduce the 2nd Anode voltage. Referring to the circuit diagram, a 100,000 ohm (R66) dropping resistor is indicated in series with the low voltage filter system. This results in a larger picture, at only a slight sacrifice in brilliance. The use of this resistor is optional, depending upon which characteristic is the more desirable.

The Image Ratio should be 4:3. If the picture does not conform to this ratio, a rearrangement of resistors in the sweep plate and screen circuits will correct this; Potentiometers could be inserted to control the voltages applied to the deflection plates, but these additional controls are hardly necessary, since once this adjustment is made, it need not be changed, for a given set of tubes.

After this has been satisfactorily checked, we may proceed to the I.F. amplifier adjustments. An output meter or preferably an Oscilloscope is connected across the output of the Video amplifier (6V6 plate). A signal from a Signal Generator or equivalent source is now introduced at the converter grid (6K8). The intermediate Frequency is 12Mc. The I.F. transformers are now adjusted for maximum output in the conventional way.

Now introduce a signal, whose frequency is approximately that of the principal station to be received, into the antenna circuit. Tune this signal by rotating the dial, then align the antenna and R.F. circuits for maximum output by means of the trimmers on the variable condenser.

After this has been done, the receiver is ready for a test on the air. It is best to make adjustments on the fixed pattern transmitted by Television stations during test periods preceding the regular scheduled programs. The I.F. system should now be readjusted by staggering the peaks to accept a wide band of frequencies (2 Megacycles). This will result in considerable improvement in picture detail, with relatively slight loss in gain.

The I.F. transformers are heavily loaded (with 1500 ohms across each secondary). It is possible to omit these, with an increase in gain if they are carefully realigned so as to stagger the peaks, with a resultant "square top" resonance curve over the desired band.

The R.F. circuits should now be realigned for best tracking. It may be necessary to adjust the R.F. coil inductances slightly to obtain the proper range and tracking. If necessary the end plates of the variable condenser may be bent to accomplish this. About 20 Volts at the Control Grid of the Cathode Ray Tube is necessary in order to obtain a good picture. If everything is functioning properly this should be easily obtained from stations within range. This can be checked with a vacuum tube volt-meter or calibrated oscilloscope.

A little experience will enable the user to tune in a station quickly and clearly. Proper manipulation of the controls is important, and the function of each should be studied carefully and thoroughly understood. A cathode bias control in the first I.F. stage sets the over-all gain. Other controls locate the pattern, Vertically and Horizontally; set the Vertical and Horizontal Sweep Frequencies; adjust Focus of the Picture Tube, fix the Average Brightness (Contrast); and adjust the Sync Separator and Selector. See Illustration.

## RECEIVING ANTENNA

The installation of an antenna for Television reception is extremely important. In residential locations, the antenna should be elevated as high as possible and located in such a way as to be furthest from sources of interference. Automobile ignition systems cause considerable interference, as do electrical devices having sparking or intermittent contacts. Reflections from buildings, bridges and steel or other metal structures may result in multiple transmission, thereby producing 2 or more images superimposed upon each other, due to the slight time difference in the arrival of the several reflected waves.

This effect may become extremely critical in large cities where a great number of these high structures are present. If possible a "line of sight" transmission path from the transmitter antenna should be selected. Again, care must be taken to obtain the maximum freedom from electrical interference, since this will result in spotting and blotching of the picture.

It is noticed that less of this "noise" interference, from automobile ignition systems particularly, is picked up when using a Horizontally polarized antenna than with a vertical antenna. Since, from all other considerations, it is equally as effective it is therefore desirable to use such an antenna for our Television receiver, when the field strength is sufficient to give us the necessary signal for satisfactory operation.

A simple dipole with twisted-pair lead-in (or a transposed lead-in) will usually give satisfactory results. These dipoles are available with arms of adjustable length and so arranged that they can be rotated. For a given station, maximum pickup will be obtained when the dipole is at right angles to the signal path from the transmitter. Where several stations are to be received, or the field strength is inadequate, more complicated forms of antennae may be required, or in the case of a directive antenna, a compromise may have to be reached so as to include all the desired stations within range. The length of the dipole is adjusted for maximum pickup from desired stations. An overall length of 120 inches is suggested for a start. In some cases, it may be desirable to use separate antennae facing in different directions for different stations.

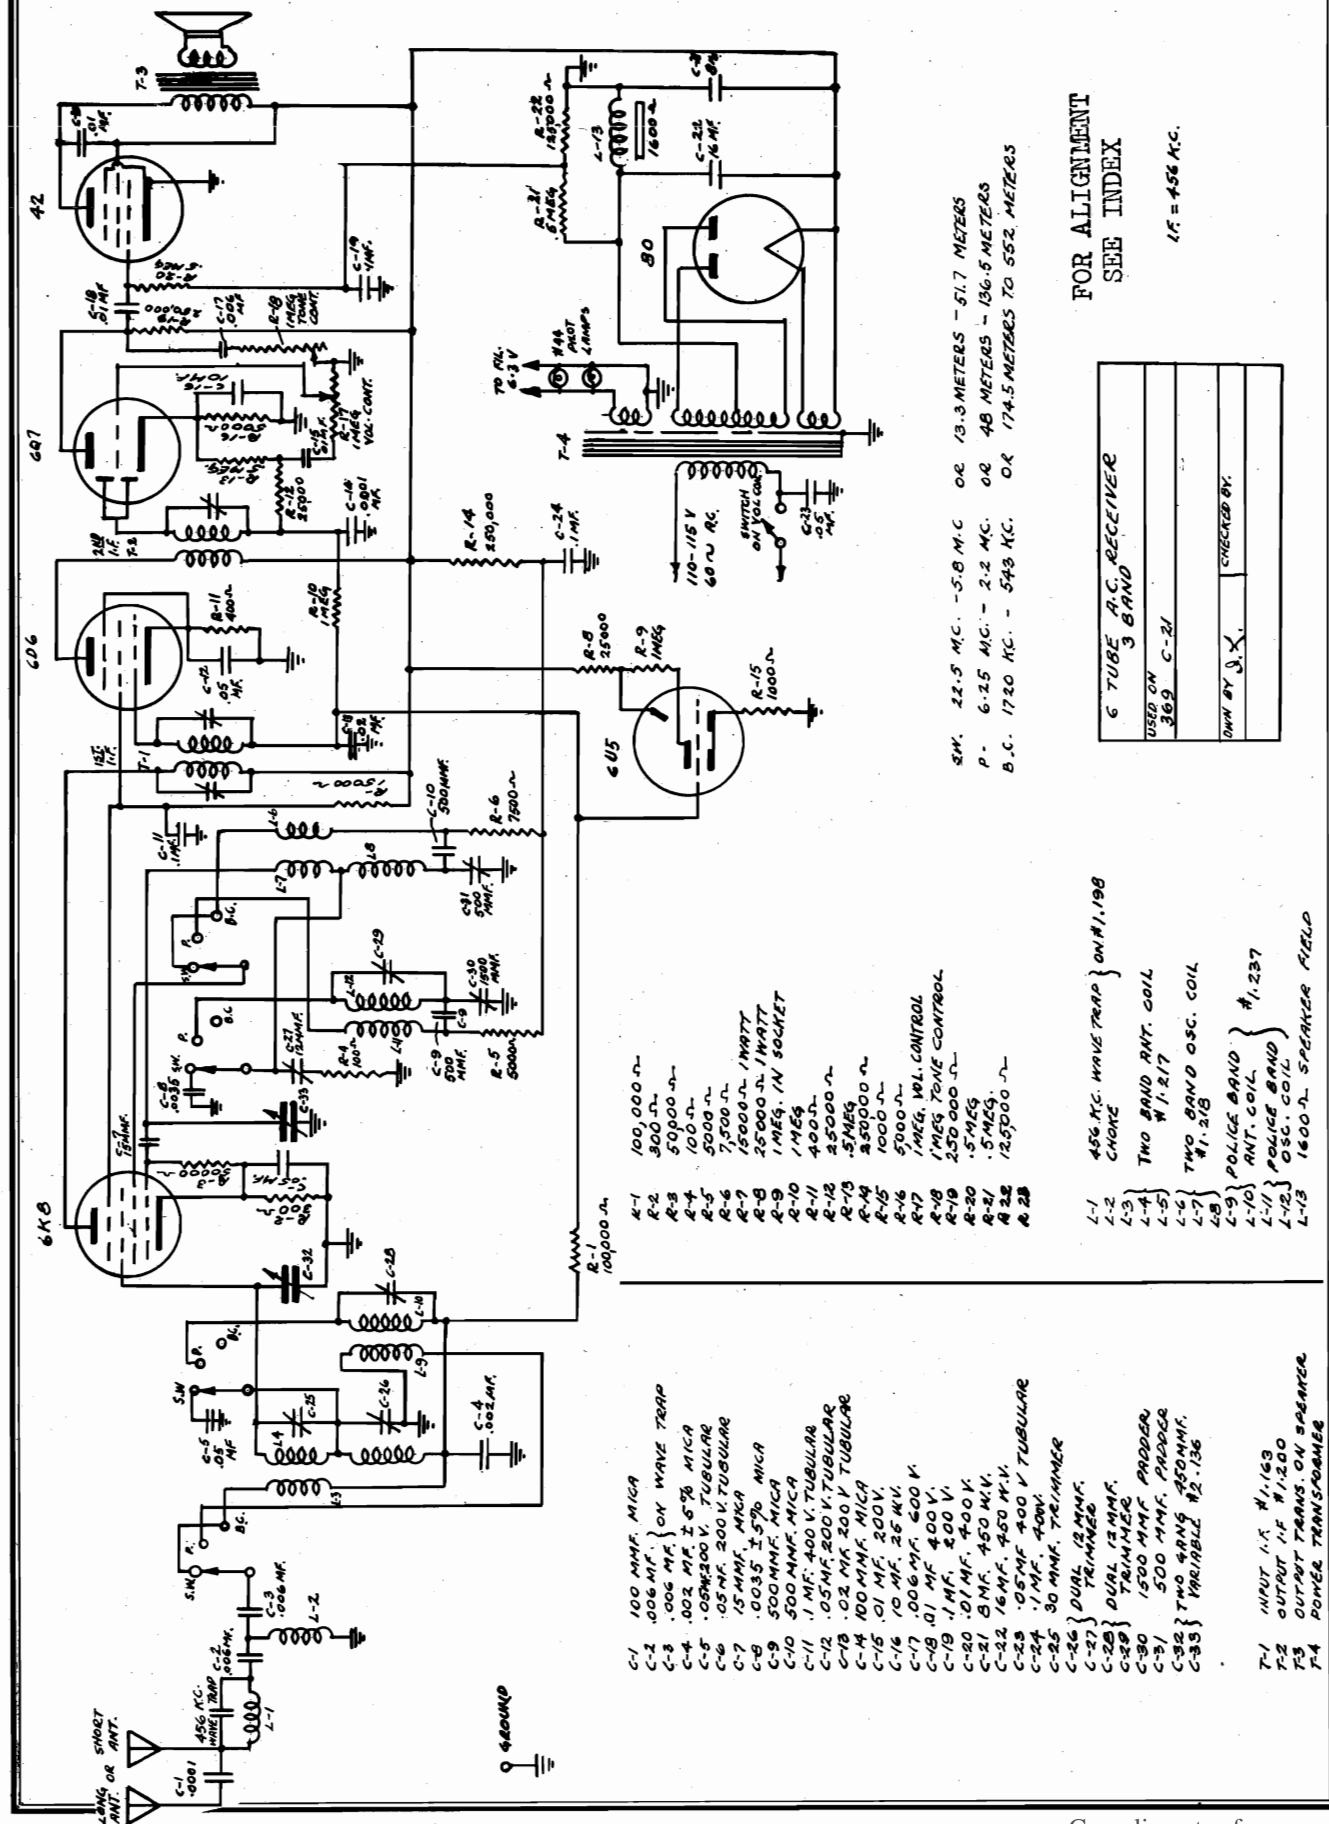

It is extremely important that the antenna be securely fastened so as to prevent swinging of either the antenna itself, or the transmission line, since this may result in intermittent blurring or loss of the picture. (To avoid complications, no A.V.C. system has been incorporated in this receiver.)

It is strongly recommended that the builder study all literature available on Television and Ultra Short waves before attempting to go ahead with the construction so as to enable him to proceed intelligently. A knowledge of the exact function of each component will help greatly towards the successful accomplishment of the desired results.

 MODEL 7390

## GAROD RADIO CORP.

ALIGNMENT - MODELS 259,269,629,729,739,7390, and 369.

Re-alignment of this receiver should not be attempted unless all other possible causes have been thoroughly investigated. An accurately calibrated signal generator which will cover the necessary wave bands, and an output meter for indicating the effect of adjustments are required.

Line voltage as indicated on instruction sheet  
 Volume and tone control at maximum volume positions.  
 Minimum input from signal generator.  
 If this procedure is not adhered to, all adjustments will appear very broad. This is due to the action of the automatic volume control.

**I.F. ADJUSTMENT** The signal generator is set at 456 KC and is connected to the grid of the converter tube (6K8) through a .5 MFD condenser. Be sure to connect a resistor of approximately 25,000 ohms between the converter grid and ground so that the grid circuit is at ground potential for D.C.

The Band switch should be set on Broadcast and the pointer set at 550 kc. The Input I.F. transformer trimmers are located on the rear chassis apron, between the variable condenser and the 6D6 I.F. tube. Both screws are adjusted for maximum output as indicated by the output meter connected across either the voice coil or the primary coil of the loud speaker output transformer.

The output I.F. transformer trimmer is located on the rear chassis apron, under the power transformer adjust the trimmer for maximum output as indicated on the output meter. The Input I.F. should now be re-checked for maximum output.

BROADCAST BAND

The dummy antenna for this band consists of only a 250 MMFD condenser. Set the band Switch in the Broadcast position and condenser plates completely out of mesh.

MODEL -259,269.

Set the signal generator at 1720 KC and adjust the broadcast oscillator trimmer located on top of the chassis (it is the trimmer to the rear of the chassis) until a response is indicated on the output meter. The generator is now set at 1500 KC. Turn the variable condenser until a response is indicated. The dial pointer should now co-incide with the 1500 KC mark on the dial. Adjust the 1500 KC Antenna trimmer (located on top of the chassis, near the variable condenser. It is the trimmer to the front of the chassis.) for maximum output.

MODEL-629,729.

Set the signal generator at 1770 KC and adjust the broadcast oscillator trimmer on top of the chassis, to the right of the gang condenser. The oscillator trimmer is the front adjustment, until a response is indicated. The dial pointer should now co-incide with the 1500 KC mark on the dial. Adjust the 1500 KC Antenna for maximum output.

MODEL 739,7390

Set the signal generator at 1720 KC and adjust the broadcast oscillator trimmer (under the chassis, behind the tone control. The oscillator trimmer is the one nearest the band switch) until a response is indicated on the output meter. The generator is now set at 1500 KC. Turn the variable condenser until a response is indicated. The dial pointer should now coincide with the 1500 KC mark on the dial. Adjust the 1500 KC Antenna trimmer (located adjacent to the oscillator trimmer, under the chassis) for maximum output.

Set the generator at 600 KC and turn the variable condenser control until a response is indicated. Adjust the broadcast oscillator padder condenser (located directly behind the variable condenser) for maximum response while "rocking" the gang condenser. The high frequency adjustments should now be rechecked.

SHORT-WAVE BAND #1 ADJUSTMENT.

Set the band switch to the extreme (left hand position) which is short wave band #1. Turn the dial control knob to the extreme high frequency end so that the condenser plates are entirely out of mesh. The signal generator is connected to the "short-antenna" lead through a dummy antenna consisting of a 250 MMFD condenser and a 400 ohm non-inductive resistor in series. With the generator set at 22MC (22.5MC) the short wave oscillator trimmer is opened until a response is heard. The trimmer condenser is then opened further (capacity reduced) until a second response is heard. This response (with trimmer at low capacity) is the correct response to use, the other being the image.

With the generator set at 23MC—FOR MODELS 629,729.

Set the generator at 19MC Turn the condenser until a response is indicated. The pointer should coincide with the 19MC mark on the dial. Adjust the antenna trimmer for the short-wave band (located under the chassis, on the antenna coil) for maximum output while rocking the condenser gang from left to right.

SHORT WAVE BAND #2 MODEL 369 only

Set the band switch to the middle position. Turn the dial control knob to the extreme high frequency end so that the condenser plates are entirely out of mesh. The signal generator is left connected as for band #1. The generator is set at 6.25 MC and the Band #2 oscillator trimmer is opened until a response is indicated at the lower capacity setting of the trimmer. (Located on top of the chassis, behind the dial bracket. The one is the front trimmer). Set the generator at 6MC and turn the variable condenser until a response is indicated. The pointer should now co-incide with the 6 MC mark on the dial. The antenna trimmer is then adjusted for maximum output while the condenser gang is rocked from right to left. The antenna trimmer is located on the top of the chassis, in line with and directly behind the oscillator trimmer. Set the generator at 2.4 MC and turn the variable condenser knob until a response is indicated. The padder for this band, which is located on top of the chassis and is the projecting adjacent screw to the right of the oscillator trimmer, is now adjusted for maximum output while rocking the condenser gang from left to right. The high frequency adjustments should then be rechecked.

LONG WAVE BAND MODEL 7390 only

The dummy antenna for this band is the same one used in aligning the broadcast band.

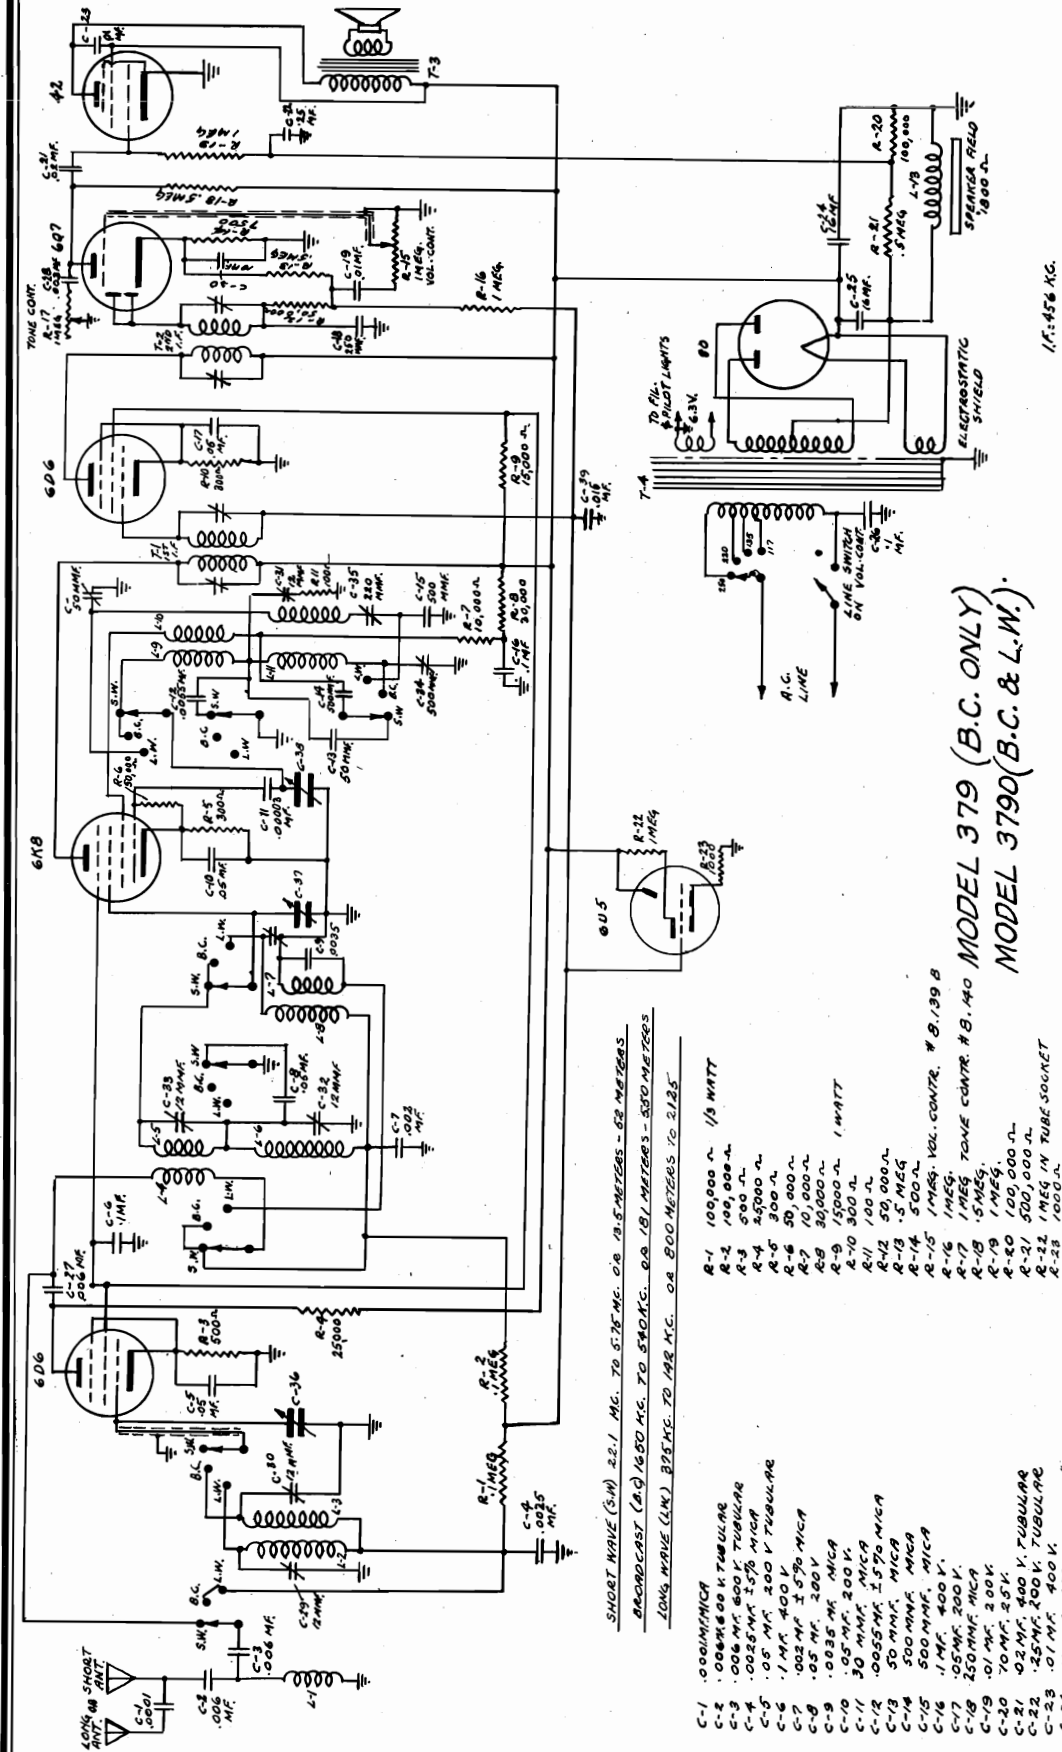

Set the generator at 300 KC. Set the dial pointer so as to coincide with the 300 KC mark on the dial. The long-wave oscillator trimmer (located on top of chassis, right hand side, behind the right hand dial bracket. The oscillator is the rear trimmer) is now adjusted until a response is indicated. The long wave antenna trimmer (located adjacent to the oscillator trimmer) is now adjusted for maximum output.

Set the generator at 150 KC and tune for a response. Adjust the Long-Wave padding condenser (located on top of chassis to the right and forward of the oscillator antenna trimmers for maximum output while "rocking" the gang condenser. The high frequency adjustments should now be rechecked.

Now set the signal generator at about 1200 kc and leave THE BAND SWITCH ON THE LONG WAVE POSITION. Adjust the generator output voltage until a response is heard. The 1200 kc wave trap on top right of the chassis is now adjusted for MINIMUM response.

**PROCEDURE FOR SETTING STATION BUTTONS**

Select the six favorite broadcast stations which you wish to set up for automatic tuning. The stations chosen should be from amount those received most clearly when using dial tuning. It is not advisable to use this system of tuning for short wave or distant broadcast stations.

Although each button will cover the entire dial range it may be most advisable, from the standpoint of convenience, to arrange the stations chosen in order of frequency.

**SETTING THE STATION BUTTONS:** The proper procedure is as follows-- grasp the first button to be set with the finger tips and loosen it by unscrewing it about one-half turn to the left or in a counter clockwise direction. Now tune in the station which you desire to set on this button, using the regular tuning knob. After the station is perfectly tuned, hold the knob firmly with one hand and depress the button just loosened as far as it will go. Then tighten it gently by turning it to the right, or in a clockwise direction. The button should be kept depressed in the meantime, and the dial knob should be held firmly so that the station does not become detuned.

Now release the push button and turn it again in a clockwise direction to make sure it is firmly tightened. Then tune the dial off the station and try depressing the push button as far as it will go. The station should then be perfectly returned. If it is not tuned properly that is, if you are able to retune it better with the dial, it will be necessary to repeat the above procedure.

The other five buttons may now be set up in the same manner as described above, tuning each to one of the favorite stations which you have selected.

The tabs bearing the station call letters may now be removed from the sheet provided, and placed in the slots below the pushbuttons.

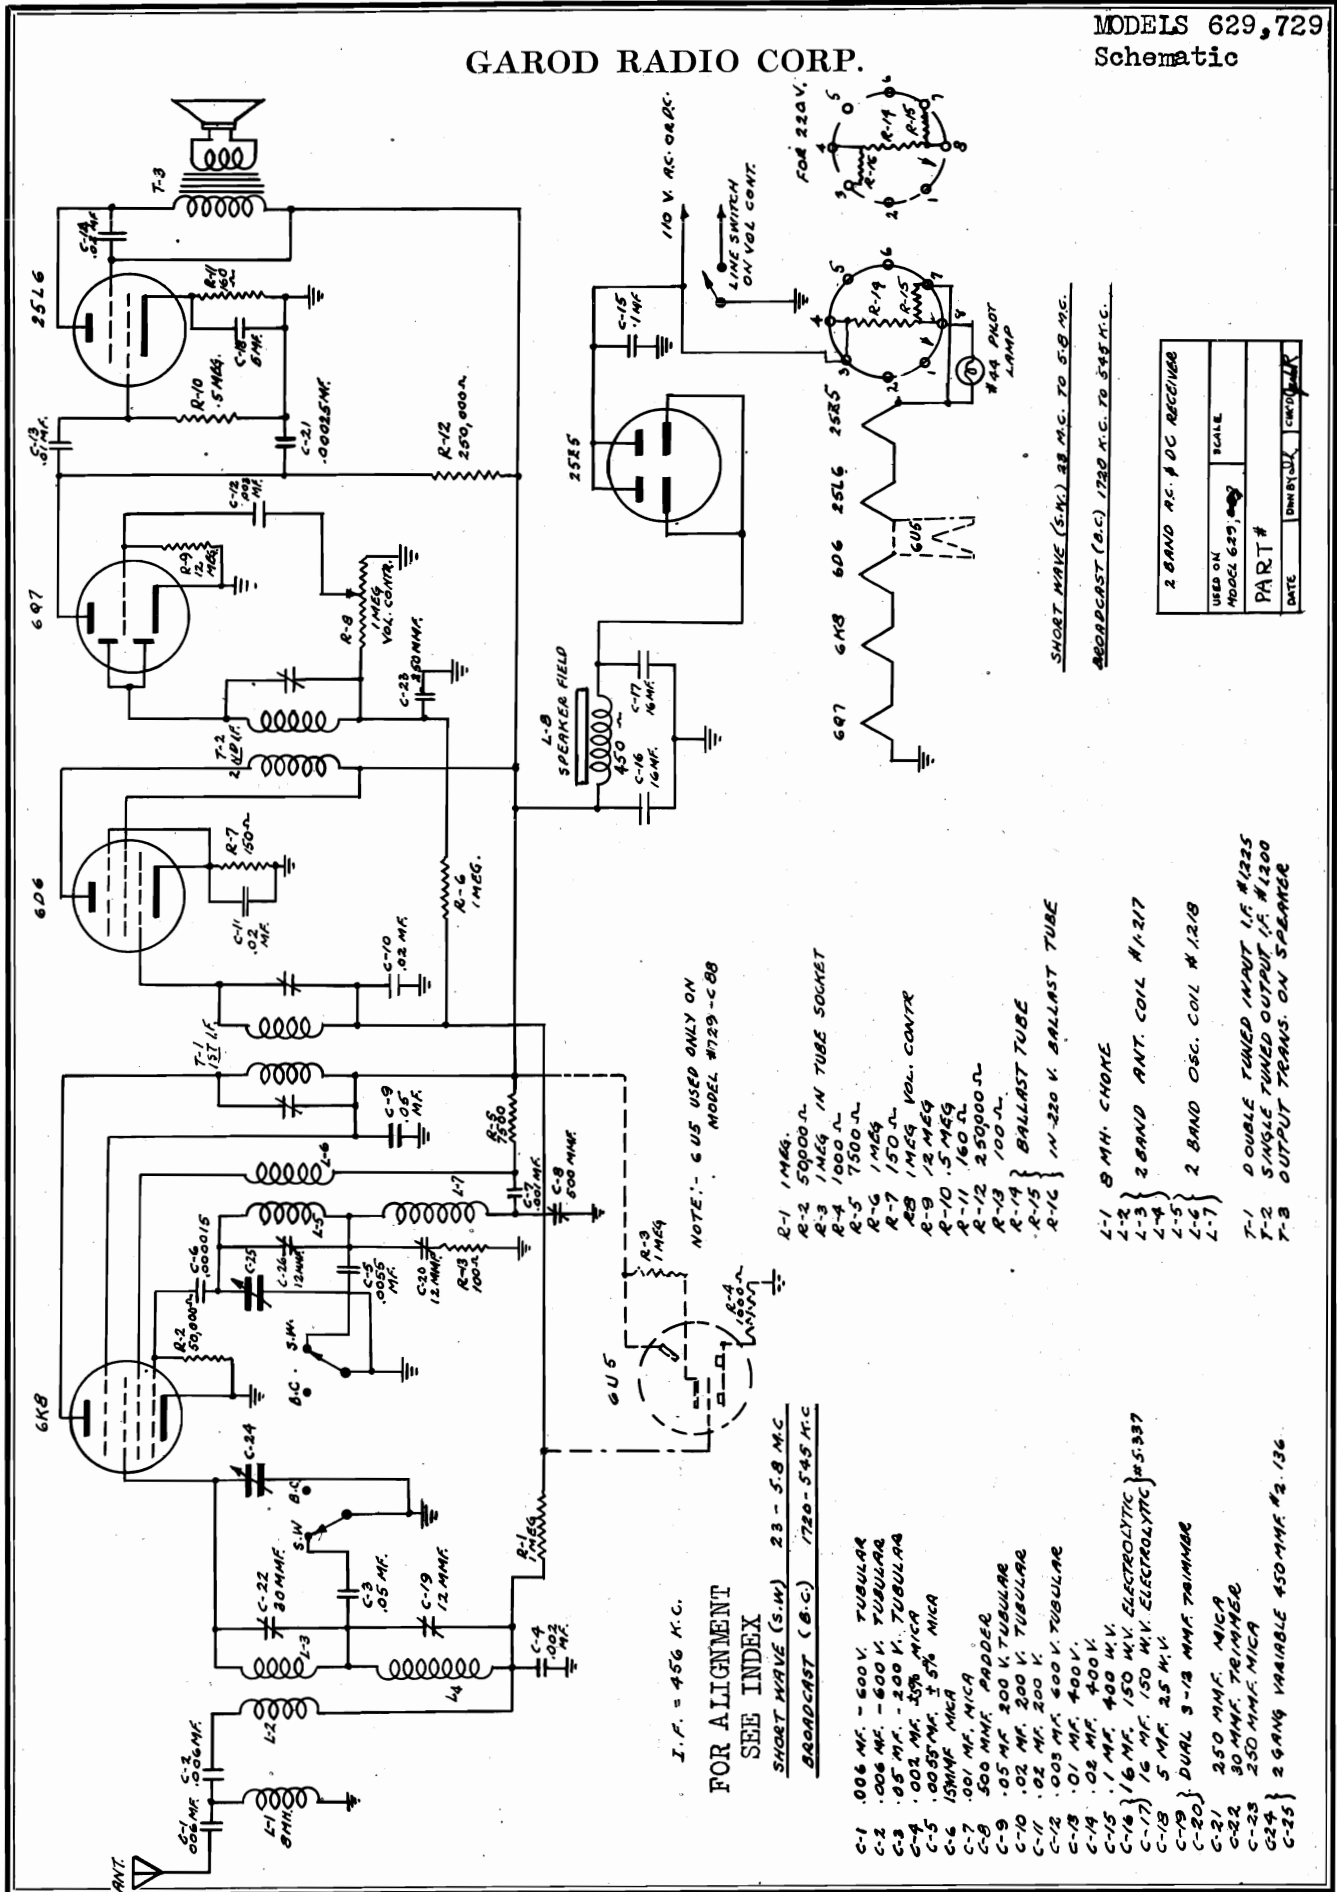

When tuning with the pushbuttons, it must be remembered that this is a mechanically driven device, depending upon pressure for proper operation. For this reason, the pushbuttons must be depressed firmly. Otherwise the dial may not come to the correct setting before the button is released.

If at any time it is desired to change one of the stations which is set up for automatic tuning, this may be done without disturbing the settings of the other stations. Merely set up the new station on the button which was used for the station no longer desired.

Alignment, Trimmers

GAROD RADIO CORP.

16 TUBE . . . 4 BAND . . . AC - DC RECEIVER  
MODEL #1649 C 14

Realignment of this receiver should not be attempted unless all other possible causes of faulty operation have been thoroughly investigated. An accurately calibrated signal generator which will cover the necessary wave-bands and an output meter for indicating the effect of adjustments are required.

It is important to remember that in receivers of this kind which are equipped with automatic volume control it is necessary to use the minimum possible signal from the signal generator; otherwise the A.V.C. action will tend to nullify the variations in output as the trimmers are adjusted.

**I.F. Adjustment:** The signal generator is set at 456 kc and is connected through a .5 mμfd condenser to the grid of the first detector (8K6). With the band switch set on "Broadcast", the pointer set at 550 kc and the receiver volume control at its maximum position, the I.F. trimmers are adjusted for maximum output. These trimmers may be found on tops of the I.F. transformer shield cans.

**Band #1 Adjustment:** Turn the dial control knob so that the condenser plates are entirely out of mesh. Set the band switch to band #1. The signal generator should be connected to the short-antenna binding post through the dummy antenna consisting of a 250 mμfd mica condenser and a 400 ohm non-inductive resistor. The oscillator trimmer condenser should be opened to minimum capacity and the signal generator then set to 23 mc/cycles. The oscillator trimmer is then increased in capacity until maximum response is obtained. Two responses are possible and it is important that the high frequency response (oscillator trimmer low capacity) be used. The signal generator is then set to 21 MC and the variable condenser turned until a response is obtained. The pointer should coincide with the 21 MC mark on the dial. The antenna preselector and first detector trimmers are then adjusted in the order named, for maximum output. The variable condenser should be rocked slightly during this last adjustment. The signal generator is now set at 7.2 mc and the signal tuned in on the dial. The padder condenser for this band is adjusted for maximum reading of the output meter while the generator tuning condenser is rocked slightly to right and left. The high frequency adjustment should then be rechecked.

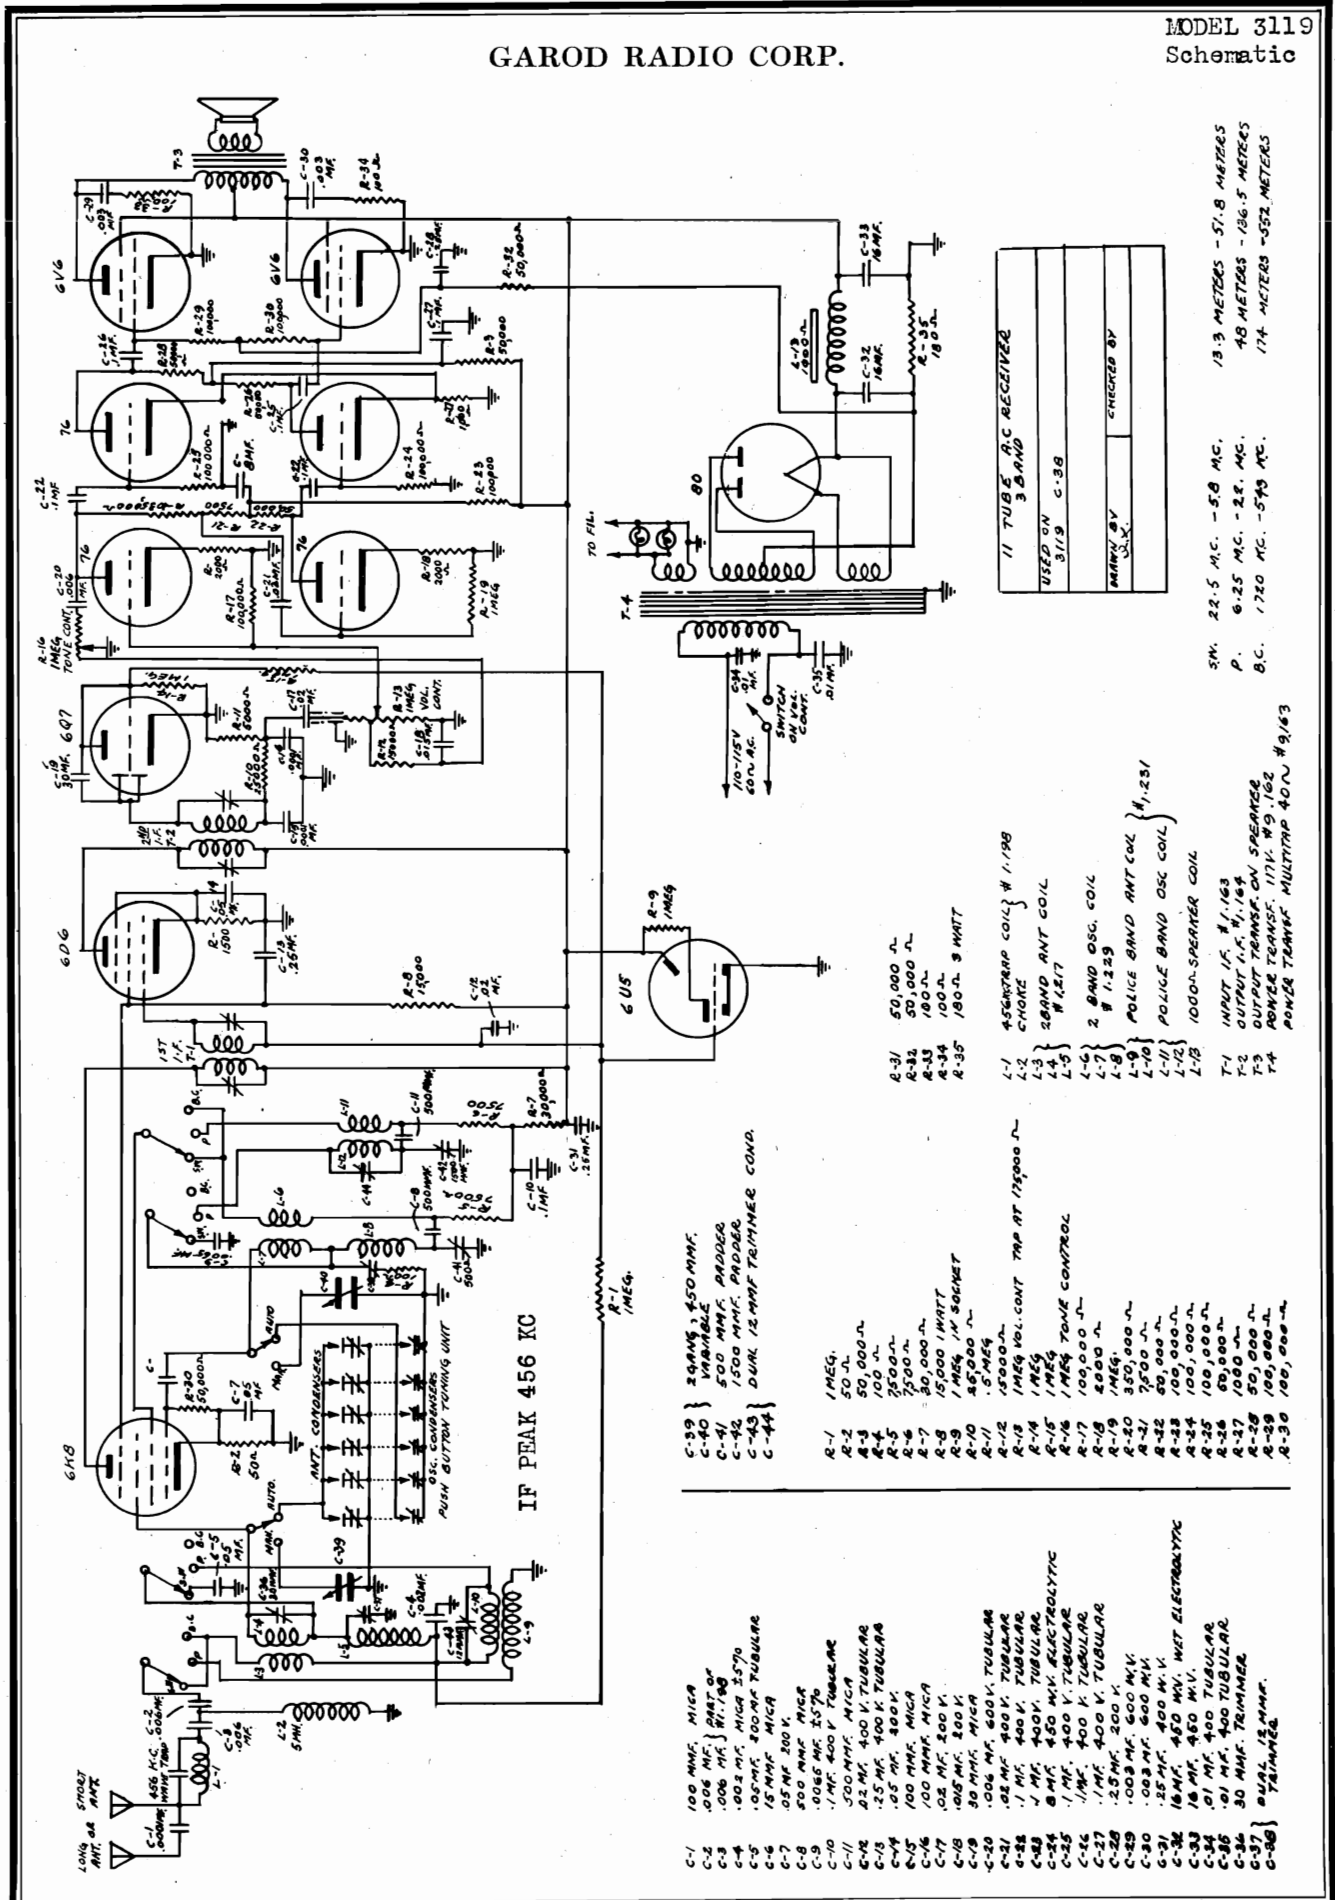

**Band #2:** The band selector switch is set in position for operation on short wave band #2. The variable condenser is opened so that the plates are completely unmeshed and the oscillator trimmer is opened to minimum capacity. The signal generator is set to 7.4 mc and the oscillator trimmer condenser is increased in capacity until a response is heard. Two responses are possible and it is important that the higher frequency response (oscillator trimmer low capacity) be used. Set the signal generator at 7 mc and turn the tuning control until a response is indicated on the output meter. The pointer should now coincide with the 7 mc marker on the dial. The antenna preselector and first detector trimmers are then adjusted in the order named for maximum output. After high frequency adjustments have been made set the signal generator at 2.5 mc and turn the variable gang condenser until a response is observed. Adjust the padding condenser for this band for maximum gain while rocking the tuning condenser slightly to the right and the left. The higher frequency adjustment should then be rechecked.

**Broadcast Band:** The dummy antenna for this band should consist of a 250 mμfd condenser only. The signal generator is set at 1720 kc, the band switch set at broadcast position. The variable condenser should be opened so that the plates are entirely out of mesh. The oscillator trimmer is then adjusted for maximum response on that frequency (1720kc). Set the signal generator at 1500 kc and tune the receiver until a response is indicated. The dial pointer should coincide with the 1500 kc mark on the dial. Then adjust the antenna and detector trimmers in the order indicated for maximum output. The signal generator is then set at 600 kc and the receiver tuned until a response is indicated. The padder condenser is then adjusted for maximum gain while the tuning gang condenser is rocked slightly to the left and right. The 1500 kc adjustment should then be rechecked.

**Long Wave Band:** The band selector switch is set in position for operation on the long wave band. The receiver and generator are both tuned to 300 kc and the oscillator trimmer is adjusted for maximum response. The antenna and first detector trimmers are adjusted in the order named for maximum output. The signal generator is then set at 150 kc and the signal is tuned in. The long wave padder condenser is adjusted for maximum response while the gang tuning condenser is rocked slightly to the left and right. The 300 kc adjustment should then be rechecked.

**MODEL 4159**  
**Alignment, Tuner**

**GAROD RADIO CORP.**

**MODEL 1649**  
**Tuner Data**

With a small screw driver slowly turn the setting screw below button 1, until the desired station, the one previously heard, is tuned in. Be sure not to tune in some other station which is broadcasting the same program. Use the tuning eye as a guide for tuning in the station accurately. During this process, you will be able to check back by pressing the dial button and listening to the original station. The method of tuning will be exactly the same as with the dial except that the screw driver is used instead of the tuning knob.

The remaining buttons may be set up in the same manner. Once the adjustments have been made, no further changes will be necessary. The station markers may now be removed from the sheets provided, and inserted in the circular depressions below the corresponding buttons. Blank tabs may be used below buttons on which stations are not set.

**ALIGNMENT FOR MODEL 4159**

Realignment of this receiver should not be attempted unless all other possible causes of faulty operation have been thoroughly investigated. An accurately calibrated signal generator which will cover the necessary wave-bands and an output meter for indicating the effect of adjustments are required.

It is important to remember that in receivers of this kind which are equipped with automatic volume control it is necessary to use the minimum possible signal from the signal generator; otherwise the A.V.C. action will tend to nullify the variations in output as the trimmers are adjusted.

**I.F. Adjustment:** The signal generator is set at 456 kc and is connected through a .5 mfd condenser to the grid of the first detector (6BX). With the band switch set on "Broadcast", the pointer set at 550 kc and the receiver volume control at its maximum position, the I.F. trimmers are adjusted for maximum output. These trimmers may be found on tops of the I.F. transformer shield cans.

**Band #1 Adjustment:** Turn the dial control knob so that the condenser plates are entirely out of mesh. Set the band switch to band #1. The signal generator should be connected to the short-antenna binding post through the dummy antenna consisting of a 250 mfd mica condenser and a 400 ohm non-inductive resistor. The oscillator trimmer condenser should be opened to minimum capacity and the signal generator then set to 23 megacycles. The oscillator trimmer is then increased in capacity until maximum response is obtained. Two responses are possible and it is important that the high frequency response (oscillator trimmer low capacity) be used. The signal generator is then set to 21 MC and the variable condenser turned until a response is obtained. The pointer should coincide with the 21 MC mark on the dial. The antenna preselector and first detector trimmers are then adjusted in the order named for maximum output. The variable condenser should be rocked slightly during this last adjustment. The signal generator is now set at 7.2 mc and the signal tuned in on the dial. The rotor tuning condenser is rocked slightly to right and left. The high frequency adjustment should then be rechecked.

**Band #2:** The band selector switch is set in position for operation on short wave band #2. The variable condenser is opened so that the plates are completely unmeshed and the oscillator trimmer is increased in capacity until a response is heard. Two responses are possible and it is important that the higher frequency response (oscillator trimmer low capacity) be used. Set the signal generator at 7 mc and turn the tuning control until a response is indicated on the output meter. The pointer should now coincide with the 7 mc marker on the dial. The antenna preselector and first detector trimmers are then adjusted in the order named for maximum output. After high frequency adjustments have been made set the signal generator at 2.5 mc and turn the variable gang condenser until a response is observed. Adjust the padding condenser for this band for maximum gain while rocking the tuning condenser slightly to the right and the left. The higher frequency adjustment should then be rechecked.

**Broadcast Band:** The dummy antenna for this band should consist of a 250 mfd condenser only. The signal generator is set at 1720 kc, the band switch set at broadcast position. The variable condenser should be opened so that the plates are entirely out of mesh. The oscillator trimmer is then adjusted for maximum response on that frequency (1720kc). Set the signal generator at 1500 kc and tune the receiver until a response is indicated. The dial pointer should coincide with the 1500 kc mark on the dial. Then adjust the antenna and detector trimmers in the order indicated for maximum output. The signal generator is then set at 900 kc and the receiver tuned until a response is indicated. The padding condenser is then adjusted for maximum gain while the tuning gang condenser is rocked slightly to the left and right. The 1500 kc adjustment should then be rechecked.

**Long Wave Band:** The band selector switch is set in position for operation on the long wave band. The receiver and generator are both tuned to 300 kc and the oscillator trimmer is adjusted for maximum response. The antenna and first detector trimmers are adjusted in the order named for maximum output. The signal generator is then set at 150 kc and the signal is tuned in. The long wave padding condenser is adjusted for maximum response while the gang tuning condenser is rocked slightly to the left and right. The 300 kc adjustment should then be rechecked.

**PUSH BUTTON TUNING FOR MODELS 1649 & 4159**

Line Voltage - 105/125 Volts  
Line Frequency - 50/60 Cycles

**CAUTION: THIS RECEIVER MUST NEVER BE USED ON VOLTAGES AND FREQUENCIES OTHER THAN THOSE GIVEN ABOVE. IF IN DOUBT ABOUT THE POWER IN USE IN YOUR LOCATION CONSULT YOUR LOCAL POWER COMPANY BEFORE PLUGGING IN THE RECEIVER.**

**NOTE:** Universal models supplied with tapped transformers may be used on 117, 135, 220 and 250 volts, 40 to 60 cycles alternating current. These may be identified by the cylindrical cap on the top of the power transformer, which covers the taps for the various voltages. To set the transformer for the voltage to be used, pull off the cap and clip the flexible lead to the lug marked for the desired voltage.

**PROCEDURE FOR SETTING STATION BUTTONS**

**SELECTING THE STATIONS TO BE SET:** Make a list of the six favorite stations which you wish to set up for automatic tuning, and arrange them in order of frequency. They should be broadcast stations capable of putting in good signal strength at your locality as shown by the deflection of the tuning eye. It is not advisable to attempt the use of these buttons for tuning weak or distant stations. Next, consult the frequency chart below, in order to determine which button should be used for each station. For convenience in operating, arrange the stations in order of frequency from high to low frequency.

**FREQUENCY RANGE OF PUSHBUTTONS**

1	- 955 to 1560 Kilocycles
2	- 955 to 1560 "
3	- 685 to 1125 "
4	- 685 to 1125 "
5	- 520 to 840 "
6	- 520 to 840 "

**SETTING THE STATION BUTTONS:** The push-button frequency adjusting screws are accessible from the front panel. Under each of the tuning buttons you will find a circular pit with a hole in the center. Looking through this hole you should be able to see the slot of a screw. This is the adjusting screw for station setting.

After deciding which station is to be set up on the first button, tune in this station on the dial, using manual tuning. This is for identification only, and does not affect the button tuning. Then press in the button which you desire to set for automatic operation, until it remains depressed; the station which was tuned in will probably disappear and a different station or none at all will be heard.

MODEL GM11  
Wireless Record Player  
Schematic,  
Operating Notes

SERVICE DATA

Physical Specifications

Model.....	GM-11
Height.....	8 inches
Width.....	15 1/8 inches
Depth.....	13 1/4 inches

Electrical Specifications

115-125 volts.....	60 cycles*	25 watts
* Is also furnished in 50 and 25 cycle models. The operating frequency is shown on the label.		

Record Player Oscillator

Frequency (Adjustable).....	1400-1600 K.C.
Oscillator tube.....	Type 12A7

Phonograph Mechanism

Motor.....	Self-starting, induction
Pickup.....	Crystal

Impedance (pickup).....	80,000 ohms at 1,000 cycles
Record capacity.....	Manual—10 or 12 inch
Turntable speed.....	78 rpm.

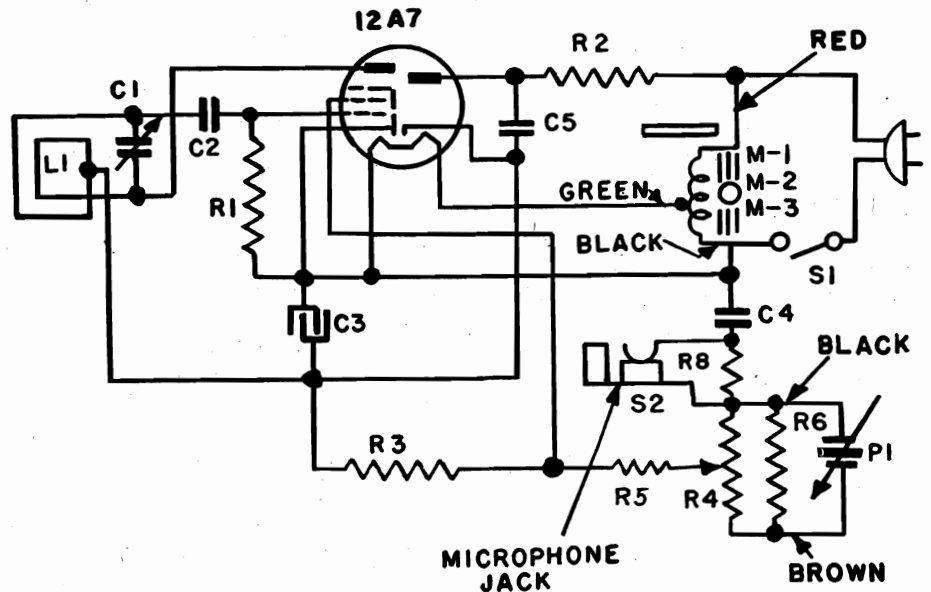

GENERAL INFORMATION

The Model GM-11 Wireless Record Player uses a Type 12A7 tube as combined rectifier and oscillator working directly from the A.C. power supply. The oscillator section of the 12A7 is modulated with audio from the phonograph recordings by means of a crystal pickup and its associated mechanism. The oscillator operates over a range of 1400-1600 kilocycles and the frequency is adjusted by the tuning trimmer (C-1). This is set at the factory to operate at 1500 K.C.

The turntable is driven at 78 revolutions per minute by a constant speed, self-starting induction motor. The motor is properly lubricated at the factory for long operation and should not require attention under normal weather conditions.

Symbol	Description
C1	160-375 mmf., padder
C2	47 mmf., mica capacitor
C3	8 mfd., dry electrolytic
C4	.02 mfd., molded capacitor
C5	.01 mfd., molded capacitor

Symbol	Description
R1	470,000 ohm, carbon resistor
R2	15,000 ohm carbon resistor
R3	3.3 megohm carbon resistor
R4	Volume control, 0.5 meg.
R5	33,000 ohm carbon resistor
R6, 8	220,000 ohm carbon resistor
L1	Oscillator coil
M1, 2, 3	Phonograph motor
P1	Crystal pickup

Tuning Trimmer

This adjustment changes the frequency of the Wireless Record Player Signal. It is adjusted at the factory for approximately 1500 kilocycles and has a range of 1400-1600 kilocycles.

If the record player signal interferes with some local station (characterized by a whistle or low frequency beat note) or the receiver does not tune quite high enough to receive the record player signal, it will be necessary to adjust the tuning trimmer described in a previous paragraph. Proceed by tuning the radio to a quiet point above 1400 K.C. on the dial, then, using a small screw driver, turn the tuning trimmer until the record player is tuned to

the dial setting of the receiver. Clockwise rotation of the trimmer lowers the frequency; while counterclockwise rotation raises the frequency.

Microphone Connections

A suitable microphone (G-E No. GM-1) may be connected into the circuit of the record player by merely inserting the plug in the microphone jack (location shown in Fig. 1.)

A carbon microphone may be used provided a suitable step-up transformer is used. A suggested circuit is shown in Fig. 2.

Operating Notes

1. If a hum is noted when the pickup case is touched by the hand, merely reverse the power plug in the A.C. outlet.
2. If you are unable to receive the signal from the record player on the radio, it is possible that the oscillator tube in

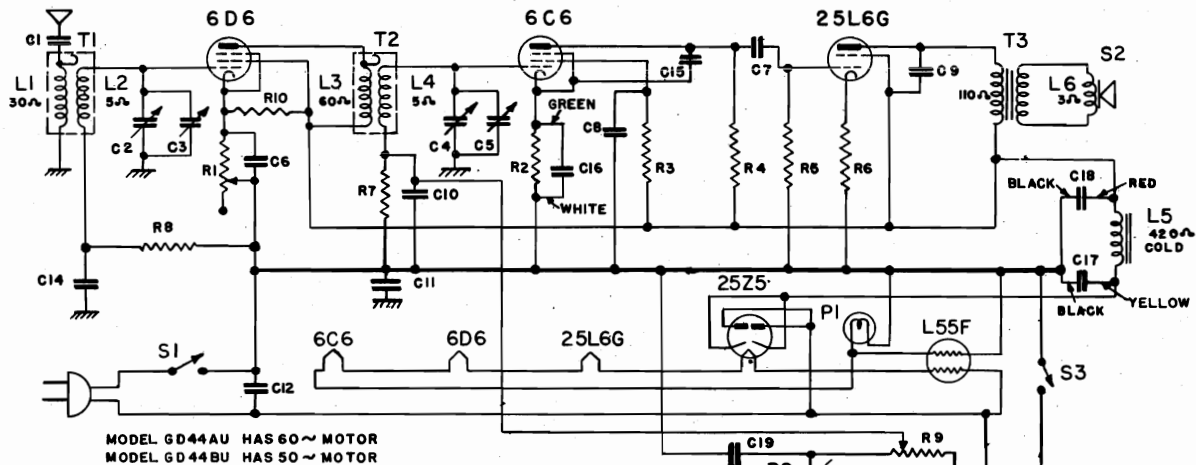

Fig. 2. Microphone Connections

the record player is defective. When replacing, it is advisable to use only a General Electric Type 12A7 tube; otherwise a proper hum balance might not be obtained.

3. A microphonic feedback may be noticed if the record player is located on top or too close to the receiver when the volume is turned up. For this reason it may be desirable and more convenient to operate the record player from a nearby point.

**Tuning Frequency**

Band "B" ..... 540-1800 kc.  
Alignment Frequency ..... 1500 kc.

**Electrical Power Output**

Undistorted ..... 1.0 watt  
Maximum ..... 2.0 watts

**Loud-speaker—Electrodynamic**

Outside Cone Diameter ..... 5 inches  
Voice Coil Impedance ..... 3.5 ohms at 400 cycles  
Field Coil Resistance ..... 420 ohms (cold)

Models GD-44A and GD-44B are compact four tube AC-DC tuned radio frequency receivers that operate in the broadcast band of frequencies. In addition they have facilities for the reproduction of phonograph recordings. Condensers are used to isolate the power supply voltage from the chassis frame.

**Phonograph Mechanism**

The record reproducing facilities consist of a high impedance crystal pick-up with its associated balanced tone arm connected across the grid resistor (R-7) of the 6C6 tube. When using the phonograph, the volume control (R-1) should be set at a minimum and control (R-9) used for the desired volume level.

**Electrical Specifications**

Rating Label	Power Supply (Volts)	Frequency (Cycles)	Power Consumption (Volts)
GD-44A	105-125	60	48
GD-44B	105-125	50	48

**ALIGNMENT**

Connect the high side of the signal generator through a 250 mmf. condenser to the antenna lead. The low side of the signal generator output should be connected to the receiver chassis through a .05 mfd. condenser. Connect a suitable output meter across the voice coil leads; then proceed as follows:

1. With gang condenser plates completely closed, the dial pointer should coincide with the horizontal dial line.
2. Tune receiver to the 1500 kc. point on the dial; then align trimmers (C-3 and C-5) on the gang condenser at 1500 kc. for a maximum output meter reading.

VOLTAGE CHART

Tube No.	6A8G	6K7	6Q7G	25L6G	25Z5
Plate to -B volts	115	115	55*	110	..
Screen to -B volts	75	75	..	115	..
Cathode to -B volts	0	0	0	0	115
Cathode Current MA	6.6	1.4	0.5	37	47
Filament Volts	6.0	6.0	6.1	24.5	24.0

Line Voltage—120 AC. No signal input  
\* Measured on 250-volt scale.  
On DC, voltages are about 15 per cent lower.

When operating from a DC source of power, it is necessary to insert the power plug with proper polarity; otherwise, the receiver will fail to function. If excessive hum is noticed when the receiver is used on AC, reverse the power plug in the receptacle.

GENERAL INFORMATION

GD-60;GD-52; is a compact, five-tube AC-DC superheterodyne receiver, employing five General Electric Pre-tested Tubes as described above, in a superheterodyne circuit. It incorporates a simplified trimmer tuned "Touch-Tuning" system, allowing a set up of five stations for automatic tuning. Other features of design include I.F. wave trap, automatic volume control and an improved dustproof speaker.

I.F. Alignment

Connect an output meter across the voice coil. Set the volume control for maximum.  
Set test oscillator to 455 and apply signal to the control

grid of the 6A8G tube through a .05 mfd. capacitor. Do not remove the grid lead from the 6A8G and keep the test oscillator output as low as possible to give a readable output. Adjust all four I.F. trimmers for maximum output.

Wave Trap Alignment

Leave the test oscillator set to 455 K.C. and connect one output lead to the receiver chassis and the other through a 250 mmf. capacitor in series with 200 ohms to the receiver antenna lead. Adjust (C-1) for minimum output.

R.F. Alignment

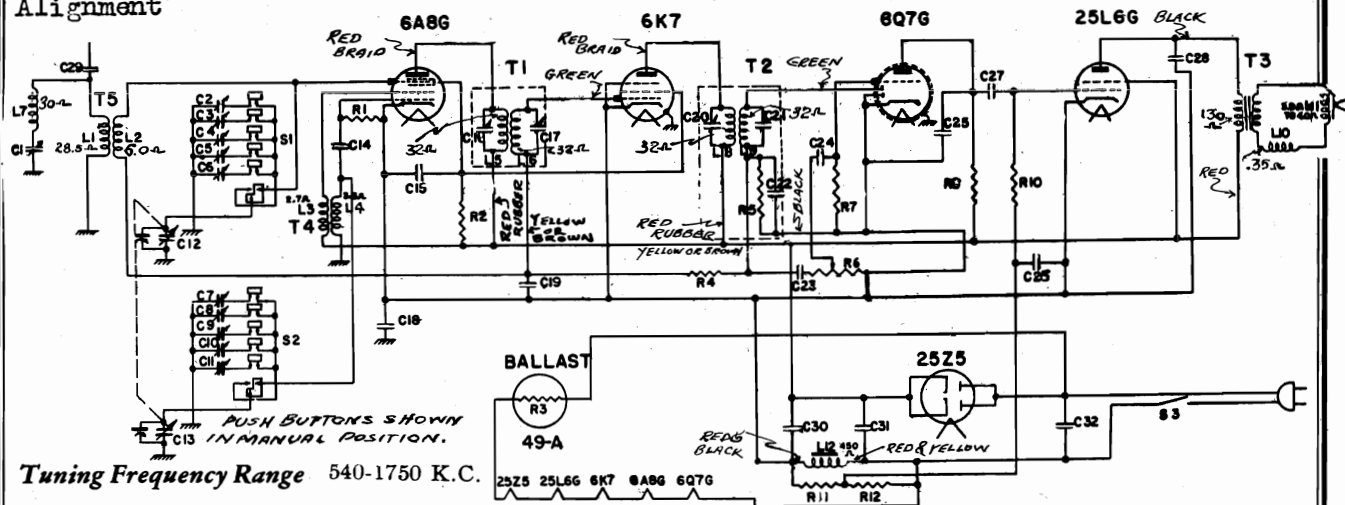

Use the same dummy antenna (250 mmf. and 200 ohms) with 1500 K.C. input, adjust the oscillator trimmer (C-13) and antenna trimmer (C-12) for a maximum output.

Precaution—One side of the power supply is connected to the chassis through a .25 mfd. capacitor. If signal generator is AC operated, connect a .05 mfd. capacitor in the ground side before connecting it to the receiver chassis.

Tube No.	6A8G	6K7	6Q7G	25L6G	25Z5
Plate to -B volts	115	115	55*	110	
Screen to -B volts	75	75		115	
Cathode to -B volts	0	0	0	0	115
Cathode Current MA	6.6	1.4	0.5	37	47
Filament Volts	6.0	6.0	6.1	24.5	24.0

Line Voltage—120 AC. No signal input

\* Measured on 250-volt scale.

On DC, voltages are about 15 per cent lower.

When operating from a DC source of power, it is necessary to insert the power plug with proper polarity; otherwise, the receiver will fail to function. If excessive hum is noticed when the receiver is used on AC, reverse the power plug in the receptacle.

ALIGNMENT PROCEDURE

Alignment Frequencies

I.F.—455 K.C. Broadcast—1500

The location of all trimmers is shown in Fig. 1.

I.F. Alignment

Connect an output meter across the voice coil. Set the volume control for maximum.

Set test oscillator to 455 and apply signal to the control grid of the 6A8G tube through a .05 mfd. capacitor. Do not remove the grid lead from the 6A8G and keep the test oscillator output as low as possible to give a readable output. Adjust all four I.F. trimmers for maximum output.

Wave Trap Alignment

Leave the test oscillator set to 455 K.C. and connect one output lead to the receiver chassis and the other through a 250 mmf. capacitor in series with 200 ohms to the receiver antenna lead. Adjust (C-1) for minimum output.

R.F. Alignment

Use the same dummy antenna (250 mmf. and 200 ohms) with 1500 K.C. input, adjust the oscillator trimmer (C-13) and antenna trimmer (C-12) for a maximum output.

Precaution—One side of the power supply is connected to the chassis through a .25 mfd. capacitor. If signal generator is AC operated connect a .05 mfd. capacitor in the ground side before connecting it to the receiver chassis.

## GENERAL ELECTRIC CO.

MODEL G69  
Automatic Record  
Changer Data

## AUTOMATIC RECORD CHANGER (G-69)

**General Information**

Before servicing the automatic record changer, inspect the assembly to see that all levers, parts, gears, springs, etc., are in good order and are correctly assembled.

A bind or jam in the mechanism can usually be relieved by rotating the turntable in the reverse direction.

The changer can be conveniently rotated through its change cycle by pushing the index lever to "Reject" and revolving the turntable by hand. Six turntable revolutions are required for one change cycle.

The turntable, spindle, and pinion gear are assembled by means of a 3/32 inch straight pin. This pin may be removed by gently driving with a standard pin punch.

If the record changer or cabinet is not perfectly level, normal operation is likely to be affected.

**Adjustments**

**A. Main Lever**—This lever is basically important in that it interlinks the various individual mechanisms which control needle landing, tripping, record separation, etc. One adjustment is provided for the main lever. Rotate the turntable until the changer is out-of-cycle; and adjust rubber bumper bracket (A) so that the roller clears the nose of the cam plate by 1/16 inch.

**B. Friction Clutch**—The motion of the tone arm toward the center of the record is transmitted to the trip pawl "22" by the trip lever "7" through a friction clutch "5." If the motion of the pick-up is abruptly accelerated or becomes irregular due to swinging in the eccentric groove, the trip finger "7" moves the trip pawl "22" into engagement with the pawl on the main gear, and the change cycle is started. Proper adjustment of the friction clutch "5" occurs when movement of the tone arm causes positive movement of the trip pawl "22" without tendency of the clutch to slip. The friction should be just enough to prevent slippage, and is adjustable by means of screw "B." If adjustment is too tight, the needle will repeat grooves; if too loose, tripping will not occur at the end of the record.

**C. Pick-up Lift Cable Screw**—During the record change cycle, lever "16" is actuated by the main lever "15" so as to raise the tone arm clear of the record by means of the pick-up lift cable. To adjust pick-up for proper elevation, stop the changer "in-cycle" at the point where pick-up is raised to the maximum height above turntable plate, and has not moved outward; at this point adjust locknuts "C" to obtain 1 inch spacing between needle point and turntable top surface.

**D. & E. Needle Landing on Record**—The relation of coupling between the tone arm vertical shaft and lever "20" determines the landing position of the needle on a 10-inch record. Position of eccentric stud "E" governs the landing of the needle on a 12-inch record; this, however, is dependent on the proper 10-inch adjustment.

To adjust for needle landing, place 10-inch record on turntable; push index lever to reject position and return to the 10-inch position; see that pick-up locating lever "17" is tilted fully toward turntable; rotate mechanism through cycle until needle is just ready to land on the record; then see that pin "V" on lever "14" is in contact with "Step T" on lever "17." The correct point of landing is 4-11/16 inches from the nearest side of the turntable spindle; loosen the two screws "D" and adjust horizontal position of tone arm to proper dimension, being careful not to disturb levers "14" and "17." Leave approximately 1/32 inch end play between hub of lever "20" and pick-up base bearing, and tighten the blunt nose screw "D"; run mechanism through several cycles as a check, then tighten cone-pointed screw "D."

After adjusting for needle landing on a 10-inch record, place 12-inch record on turntable; push index lever to reject and return to 12-inch position; rotate mechanism through cycle until needle is just ready to land on the record; the correct point of landing is 5-11/16 inches from nearest side of spindle. If the landing is incorrect, turn stud "E" until the eccentric end adjusts lever "14" to give correct needle landing. The eccentric end of the stud must always be toward the rear of the motor board, otherwise incorrect landing may occur with 10-inch records.

**F. & G. Record Separating Knife**—The upper plate (knife) "25" on each of the record posts serves to separate the lower record from the stack and to support the remaining records during the change cycle. It is essential that the spacing between the knife and the rotating record shelf "27" be accurately maintained. The spacing for the 10-inch record is nominally .065 inch, and for the 12-inch record is .075 inch.

To adjust, rotate the knife to the point of minimum vertical separation from the record shelf and turn screw and locknut "F" to give .052—.058 inch separation. Screw "G"

must not be depressed during this adjustment. After setting screw "F" adjust screw "G" so that when its tip is depressed flush with top of record shelf, the vertical spacing between the knife, in its lowest rotational position, and the shelf, is .072—.078 inch.

**H. Record Support Shelf**—The record shelf revolves during the change cycle to allow the lower record to drop onto the turntable. Both posts are rotated simultaneously by a gear and rack coupled to the main lever "15," and it is necessary that adjustments be such that the record is released from both shelves at the same instant. To adjust, place a 12-inch record on the turntable, rotate mechanism into cycle to the point where tone arm is at maximum distance outward from turntable; lift record upward until it is in contact with both separating knives, then loosen screws "H" and shift record shelves so that the curved inner edges of the shelves are uniformly spaced at least 1/16 inch from record edge. Tighten the blunt nose screw "H," run mechanism through cycle several times to check action, then tighten cone-pointed screw "H."

*If record shelves or knives are bent, or not perfectly horizontal improper operation and jamming of mechanism will occur.*

**J. Tone Arm Rest Support (not shown)**—When the changer is out-of-cycle, the front lower edge of the pick-up head should be 5/16 inch above surface of motor board. This may be adjusted by bending the tone arm support bracket, which is associated with the tone arm mounting base, in the required direction.

**K. Trip Pawl Stop Pin**—The position of the trip pawl stop pin "K" in relation to the main lever "15" governs the point at which the roller enters the cam. By bending the pin support either toward or away from trip pawl bearing stud, the roller can be made to enter the cam later or earlier, respectively. This adjustment should be made so that the roller definitely clears the cam outer guide as well as the nose of the cam plate.

**Lubrication**—Petrolatum or petroleum jelly should be applied to cam, main gear, spindle pinion gear, and gears of record posts.

Light machine oil should be used in the tone arm vertical bearing, record post bearings, and all other bearings of various levers on underside of motor board.

The felt washer between the turntable and spindle bearing should be soaked in light engine oil whenever the turntable is removed, or as required for proper operation.

Do not allow oil or grease to come in contact with rubber mounting of tone arm base, rubber bumper, or flexible coupling of drive motor.

**Miscellaneous Service Hints**

Incorrect adjustment of a particular mechanism of the changer is generally exhibited in a specific mode of improper operation. The following relations between effects on operation and the usual misadjustments will enable ready adjustment in most cases.

1. For any irregularity of operation, the adjustment of the main lever "15" should be checked first as in "A."
2. Needle does not land properly on both 10- and 12-inch records—Make complete adjustments "D" and "E."
3. Needle does not land properly on 12-inch record but correct on 10-inch—Effect adjustment "E."
4. Failure to trip at end of record—Increase clutch "5" friction by means of screw "B." Also, see that levers "7" and "12" are free to move without touching each other.
5. Pick-up strikes lower record of stack or drags across top record on turntable—Adjust lift cable per adjustment "C."
6. Needle does not track after landing—Friction clutch "5" adjustment "B" may be too tight; bind in tone arm vertical bearing; levers "7" and "12" fouled; or pick-up output cable twisted.
7. Cycle commences before record is complete—Record is defective, or adjustment "B" of friction clutch "5" is too tight.
8. Wow in record reproduction—Record is defective; flexible coupling between motor and changer mechanism not correctly assembled; or instrument is not being operated at normal room temperature (65° F).
9. Record knives strike edge of records—Records warped; record edges are rough; or knife adjustments "F" and "G" are incorrect.
10. Record not released properly—Adjust record shelf assemblies in respect to shaft by means of adjustment "H."
11. Needle lands in 10 inch position on 12 inch record—Increase tension of pick-up locating lever spring "30."

Data, Assembly of Changer

GENERAL ELECTRIC CO.

PHONOGRAPH MECHANISM (G-68)

Motor Adjustments

The speed of the turntable is controlled by a governor which allows correct adjustment of the turntable rotation to 78 revolutions per minute. The speed may be checked by placing a piece of paper under a record and counting the number of revolutions in a minute while the record is being played. If adjustment is necessary lift up the turntable and the speed regulator setscrew will be found adjacent to the turntable hub of the motor. Clockwise rotation of this setscrew reduces speed.

The motor bearings and gears are properly lubricated for long operation under normal weather conditions. If the motor chatters or runs unevenly, place a few drops of light machine oil on the governor felt.

Trip Mechanism

The trip mechanism is of simple design and consists of a latch bar connected to the motor switch and a trip lever. The latch is held closed by means of a spring between the latch bar and the trip lever. The motor switch is mechanically connected to the latch bar so that when the trip mechanism is released the motor switch is in the "off" position. Be sure this latch bar mechanism works freely without binding.

The trip is actuated by an adjustable arm on the trip lever. When the eccentric groove in the record swings the tone arm back and forth, it pushes the latch out of engagement.

Phonograph Connections (G-61 and G-66)

Fig. 1 shows a simple sketch for connecting a crystal or high impedance magnetic pick-up into the G-61 or G-66 circuit for the reproduction of phonograph recordings. This

method uses a two circuit jack and is connected into the receiver by opening the circuit at C-D at the output of the 2nd IF transformer; and connecting the jack terminals as shown. A telephone plug is attached to the pick-up leads; and for phonograph operation, it is merely necessary to insert this plug into the jack. The jack may be mounted on the rear chassis deck and all connecting leads should be well shielded.

When the pick-up is connected as suggested, the regular radio volume and tone controls work for both radio and phonograph reproduction.

NOTE.—A suitable load consisting of a 300,000 ohm resistor should be connected across the pick-up leads when using a crystal type unit.

Model GD-51 is a compact, five-tube AC-DC superheterodyne receiver employing four General Electric tubes plus a ballast tube, as described above in a superheterodyne circuit. It incorporates a simplified mechanically tuned "Touch Tuning" system allowing a set up of five stations for automatic tuning. Other features of design include I.F. wave trap, automatic overload control and an efficient electrodynamic speaker.

**Alignment Frequencies**  
I.F.—455 K.C. Broadcast—1500 K.C.  
The location of all trimmers is shown in Fig. 1.

**I.F. Alignment**  
Connect an output meter across the voice coil. Set the volume control for maximum.

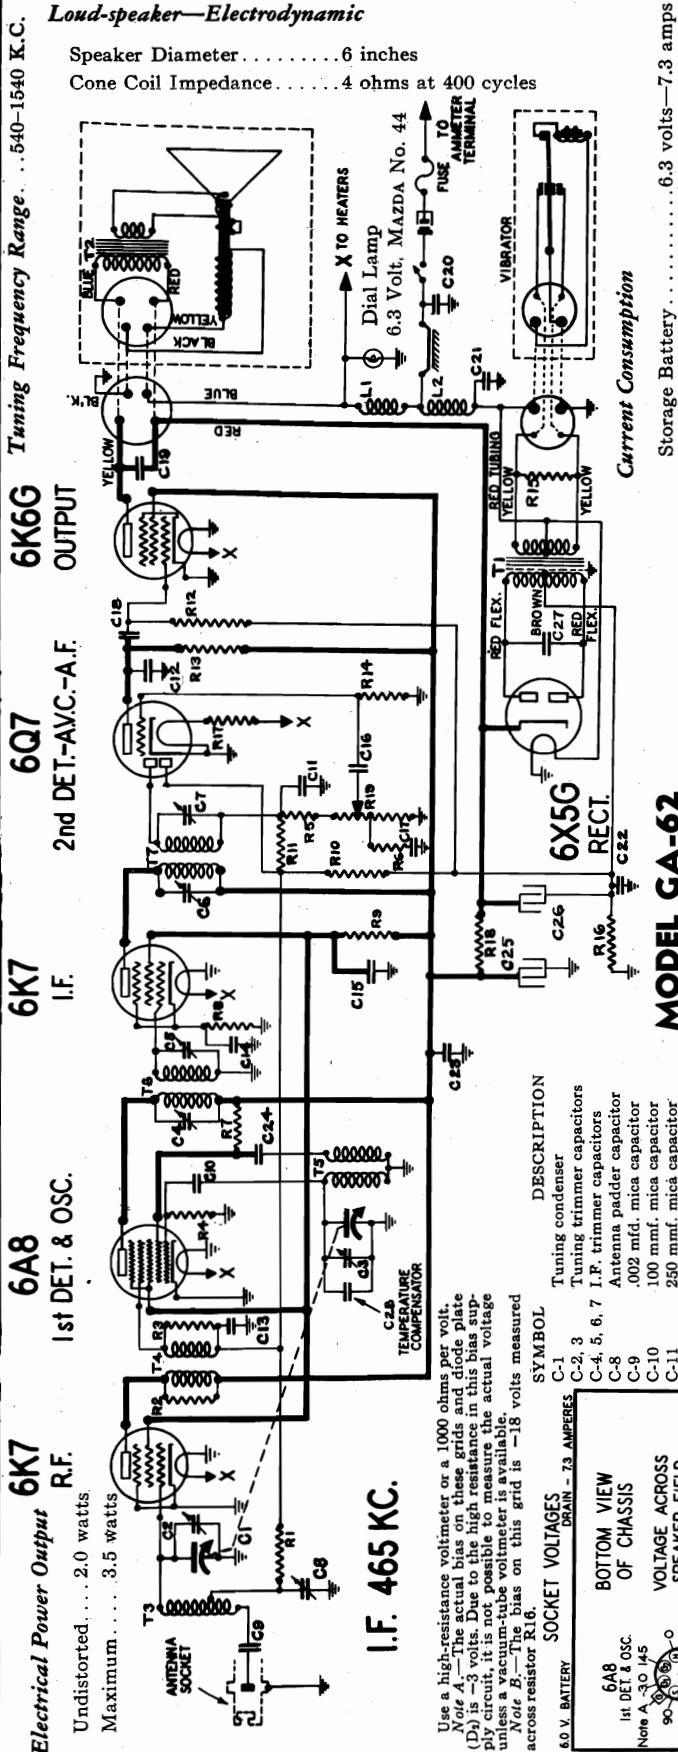

Set test oscillator to 455 and apply signal to the control grid of the 6A8G tube through a .05 mfd. capacitor. Do not remove the grid lead from the 6A8G. Keep the test oscillator output as low as possible to give a readable output. Adjust the two I.F. trimmers (C9 and C10) for maximum output.

**Wave Trap Alignment**  
Leave the test oscillator set to 455 K.C. and connect one output lead to the receiver chassis and the other through a 250 mmf. capacitor in series with 200 ohms to the receiver antenna lead. Adjust (C-21) for minimum output.

**R.F. Alignment**  
Use the same dummy antenna (250 mmf. and 200 ohms) with 1500 K.C. input, adjust the oscillator trimmer (C-5) and antenna trimmer (C-4) for a maximum output.  
**Precaution**—One side of the power supply is connected directly to the chassis. If the signal generator is AC operated, connect a .05 mfd. capacitor in the ground side before connecting it to the receiver chassis.

MODEL GA62

GENERAL ELECTRIC CO.

Storage Battery ..... 6.3 volts—7.3 amps

Current Consumption

GENERAL INFORMATION

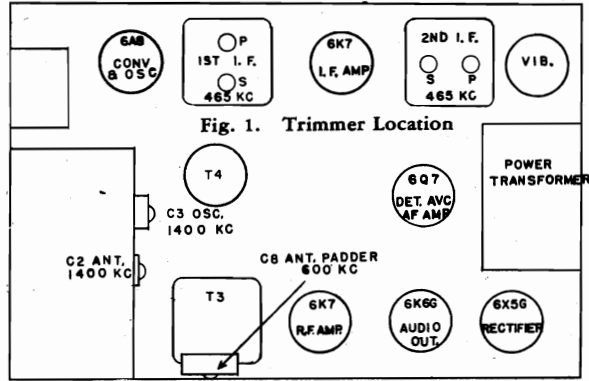

Model GA-62 is a compact, six-tube superheterodyne receiver, employing six General Electric Pre-tested Tubes as described previously. The power supply consists of a non-synchronous type vibrator and full-wave high-vacuum rectifier operating in a conventional rectifier circuit. The receiver incorporates a simplified mechanically adjusted "Touch-Tuning" system, allowing a setup of five stations for automatic tuning. The use of an antenna-matching trimmer results in the maximum transfer of energy from the antenna to the control grid of the 6K7 R.F. tube, providing a high signal-to-noise ratio.

ALIGNMENT

- IF ALIGNMENT - Adj. 4 trimmers at 465 KC thru .1 mf cond.
- RF ALIGNMENT - Adj. osc. and Ant. trimmers C-3 and C-2 at 1400 KC. thru 100 mmf cond. - PEAK C-8 at 600 KC.

VOLTAGE CHART

Tube No.	6A7	6D6	75	25L6G	25Z6G
Plate to -B Volts	115	115	50*	105	120 V. A.C.
Screen to -B Volts	70	115		115	
Cathode to -B Volts	3.0	3.0	0.5	8.5	115
Filament Volts	6.4	6.4	6.4	23.0	24.0

\*Measured on 250-volt scale.  
Line Voltage—120 A.C. No signal input.  
On DC, voltages are about 15 per cent lower.

When operating from a DC source of power, it is necessary to insert the power plug with proper polarity; otherwise, the receiver will fail to function. If excessive hum is noticed when the receiver is used on AC, reverse the power plug in the receptacle.

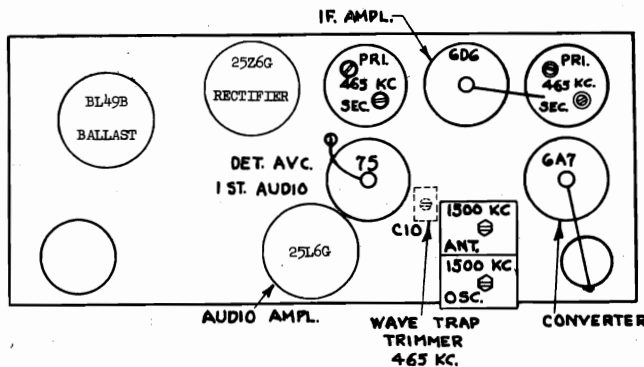

Fig. 1. Trimmer Location

Touch-Tuning Mechanism

The dial mechanism is a very simple arrangement and should not require service. The frequency range of each of the automatic tuning buttons is as follows:

Button No.	Frequency Range (Kilocycles)	Button No.	Frequency Range (Kilocycles)
1	540-590	5	830-1150
2	570-670	6	1020-1400
3	630-780	7	1220-1700
4	710-940	8	1580-1800

Tuning Frequency Range.....540-1800 K.C.

Intermediate Frequency.....465 K.C.

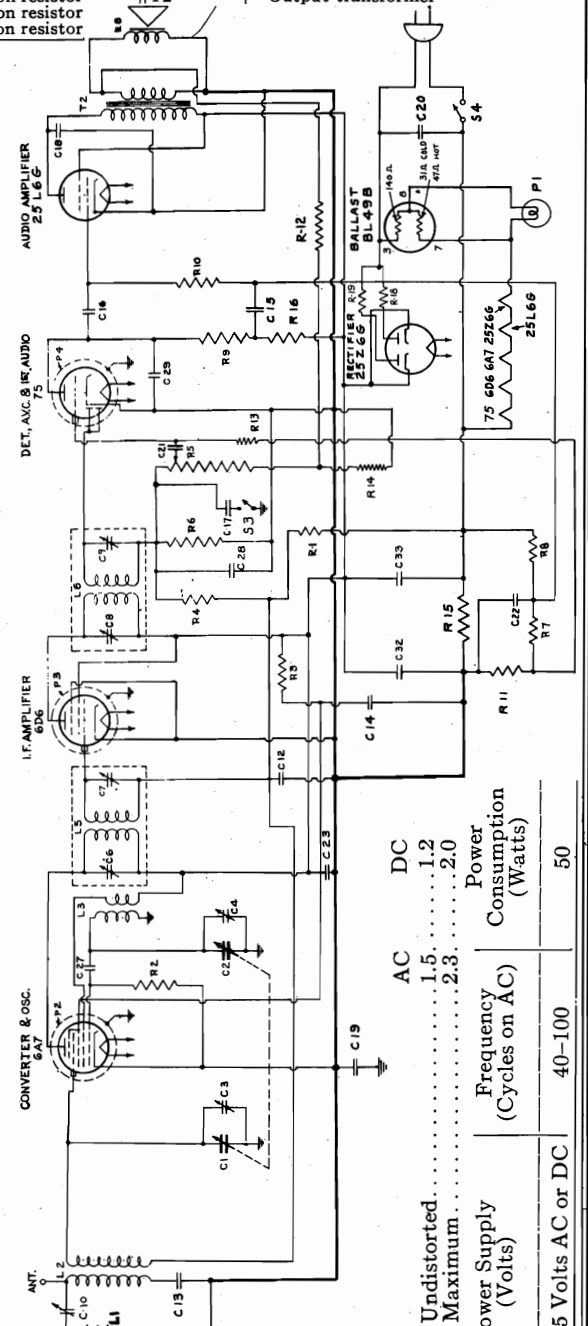

**IF ALIGNMENT** - Adj. 4 trimmers at 465 KC thru .05 mf condenser.

**WAVE TRAP** - Adj. C10 cond. at 465 KC thru 250 mmf and 200 ohms series.

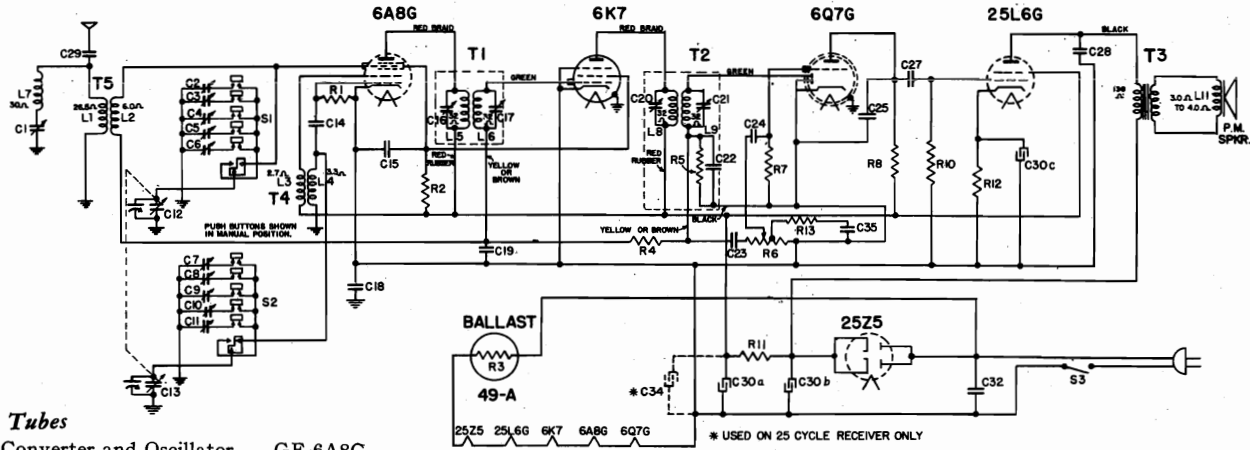

**RF ALIGNMENT** - Thru a 250 mmf and 200 ohm series :-Adj. C4 cond. osc. trimmer at 1830 KC - Adj. C3 Ant. trimmer at 1500 KC.

Pwr. Supply connection to chassis is thru .25 mf cond. If Sig. gen. is AC, connect .05 mf cond. in grd. side before chassis connection.

FOR CONVENTIONAL ALIGNMENT - SEE SPECIAL SECTION VOLUME VIII.

**ALIGNMENT PROCEDURE**

**Alignment Frequencies**  
 I.F.—455 K.C.      Broadcast—1500 K.C.  
 The location of all trimmers is shown in Fig. 1.

**I.F. Alignment**  
 Connect an output meter across the voice coil. Set the volume control for maximum.  
 Set test oscillator to 455 and apply signal to the control grid of the 6A8G tube through a .05 mfd. capacitor. Do not remove the grid lead from the 6A8G. Keep the test oscillator output as low as possible to give a readable output. Adjust all four I.F. trimmers for maximum output.

**Wave Trap Alignment**  
 Leave the test oscillator set to 455 K.C. and connect one output lead to the receiver chassis and the other through a 250 mmf. capacitor in series with 200 ohms to the receiver antenna lead. Adjust (C-1) for minimum output.

**R.F. Alignment**  
 Use the same dummy antenna (250 mmf. and 200 ohms) with 1500 K.C. input, adjust the oscillator trimmer (C-13) and antenna trimmer (C-12) for a maximum output.  
**Precaution**—One side of the power supply is connected to the chassis through a .25 mfd. capacitor. If signal generator is AC operated, connect a .05 mfd. capacitor in the ground side before connecting it to the receiver chassis.

Fig. 1. Trimmer Location

**GENERAL INFORMATION**

Model GD-63 is a compact, six-tube AC-DC superheterodyne receiver, employing six General Electric Pre-tested Tubes as described above, in a superheterodyne circuit. It incorporates a simplified trimmer tuned "Touch-Tuning" system, allowing a set up of five stations for automatic tuning. Other features of design include I.F. wave trap, automatic volume control and an improved dustproof speaker.

**Electrical Specifications**

Power Supply (Volts)	Frequency (Cycles on AC)	Power Consumption (Watts)
110-125 Volts AC or DC	40-100	50

**Electrical Power Output (120-line volts)**

	AC	DC
Undistorted.....	1.2	1.0
Maximum.....	2.5	2.0

**Loud-speaker—Permanent Magnet**

Outside Cone Diameter.....5-inch  
 Voice Coil Impedance.....4.0 ohms at 400 cycles

**VOLTAGE CHART**

Tube No.	6A8G	6K7	6Q7G	25L6G	25Z5
Plate to -B volts	112	112	55*	130	..
Screen to -B volts	75	75	..	115	..

ALIGNMENT WITH OSCILLOSCOPE

I.F. ALIGNMENT WITH OSCILLOSCOPE

Band Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"	455 K.C. Sweep	I.F. Grid	.05 Mfd. or Larger	2nd I.F. Sec. (C-12) 2nd I.F. Pri. (C-11)	Gang condenser plates wide open—connect audio input across voice coil—keep input signal low and volume control on its far as possible. Adjust all trimmers for maximum output.
2. Band "B"	455 K.C. Sweep	Converter Grid	.05 Mfd. or Larger	1st I.F. Sec. (C-10) 1st I.F. Pri. (C-9)	Adjust trimmer for minimum amplitude.
3. Band "B"	455 K.C. Sweep	Antenna Post	250 Mmf. 200 Ohms	Wave Trap Trimmer (C-7)	

I.F. ALIGNMENT WITH OUTPUT METER

I.F. ALIGNMENT WITH OUTPUT METER

1. Band "B"	455 K.C. with Modulation	I.F. Grid	.05 Mfd. or Larger	2nd I.F. Sec. (C-12) 2nd I.F. Pri. (C-11)	Gang condenser plates wide open—connect output meter across voice coil—keep input signal low and volume control on its far as possible. Adjust all trimmers for maximum output.
2. Band "B"	455 K.C. with Modulation	Converter Grid	.05 Mfd. or Larger	1st I.F. Sec. (C-10) 1st I.F. Pri. (C-9)	Adjust trimmer for minimum output.
3. Band "B"	455 K.C. with Modulation	Antenna Post	250 Mmf. 200 Ohms	Wave Trap Trimmer (C-7)	

R.F. ALIGNMENT

R.F. ALIGNMENT

1. Band "B"	1500 K.C. with Modulation	Antenna Post	250 Mmf. 200 Ohms	Repeat Operation 2	Close gang condenser plates. Adjust pointer to first line at left end of tuning scale.
2. Band "B"	1500 K.C. with Modulation	Antenna Post	250 Mmf. 200 Ohms	Repeat Operation 2	Adjust output meter across voice coil—tone control on with a low input signal. Trimmers for maximum output with a maximum output meter indication.
3. Band "B"	1500 K.C. with Modulation	Antenna Post	250 Mmf. 200 Ohms	Repeat Operation 2	Adjust pad for a maximum output meter indication in vicinity of 800 kc. while rocking the gang condenser.
4. Band "B"	18 M.C. with Modulation	Antenna Post	250 Mmf. 200 Ohms	Repeat Operation 2	Peak C-5 for maximum output, while rocking the gang condenser. When proper peak is obtained on oscillator trimmer C-6, Example: 12 mc. image—11.09 mc.

Use a dummy antenna in making all alignments. The grid lead should not be removed from the tube to which the input signal is applied when aligning the I.F. amplifier.

GENERAL INFORMATION

**Coil System**  
 The "B" and "D" band antenna coils are wound on a single coil form (T-3) as shown in Fig. 2. T-4 is the oscillator transformer for both the "B" and "D" bands. All coil terminals are numbered in Fig. 2 and 3 to facilitate in service by using a common point in the schematic diagram, Fig. 2, and the pictorial wiring diagram, Fig. 3.

**Phonograph Connections**  
 Fig. 1 shows a simple sketch for connecting a crystal or vacuum capacitor (C-22) and phonograph pickup to the tone control section of the chassis. A suitable loading circuit consisting of a resistor or resistor and capacitor network should be used across the pick-up leads when using a crystal type unit. It is very important that the pick-up leads should be connected to the chassis ground.

The circuit should be opened between the top end of the volume control (C-27) and the phonograph pickup terminal of the chassis from the cabinet.  
 When the pick-up is connected as shown, the regular radio volume and tone controls work for both radio and phonograph reproduction. The parts suggested are:  
 S-1 Phono Switch  
 S-2 330,000 Ohm Resistor  
 RQ-1319

Fig. 4. Trimmer Location

Alignment, Dial, Phono.

GENERAL ELECTRIC CO.

Fig. 5. Over-all I. F. curve taken on G-E oscilloscope OFM-1

Fig. 1. Pickup Connections

ALIGNMENT PROCEDURE

I. F. ALIGNMENT WITH OSCILLOSCOPE

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"	455 K.C. Sweep	I.F. Grid	.05 Mfd. or Larger	2nd I.F. Sec. (C-15) 2nd I.F. Pri. (C-14)	Gang condenser plates closed—"manual" key depressed—connect audio input of oscilloscope to ground and to the junction of C-19 and R-20 of the 2nd I.F. transformer. Adjust trimmers in order mentioned for a single symmetrical curve of maximum amplitude. The resultant curve is shown in Fig. 5.
2. Band "B"	455 K.C. Sweep	Converter Grid	.05 Mfd. or Larger	1st I.F. Sec. (C-13) 1st I.F. Pri. (C-12)	Adjust trimmer for minimum amplitude.
3. Band "B"	455 K.C. Sweep	Antenna Post	250 Mmf. 200 ohms	Wave Trap Trimmer (C-4)	

I. F. ALIGNMENT WITH OUTPUT METER

1. Band "B"	455 K.C. with Modulation	I.F. Grid	.05 Mfd. or Larger	2nd I.F. Sec. (C-15) 2nd I.F. Pri. (C-14)	Gang condenser plates closed—connect output meter across voice coil—keep input signal low and volume control on as far as possible. Adjust all trimmers for maximum output.
2. Band "B"	455 K.C. with Modulation	Converter Grid	.05 Mfd. or Larger	1st I.F. Sec. (C-13) 1st I.F. Pri. (C-12)	Adjust trimmer for minimum output.
3. Band "B"	455 K.C. with Modulation	Antenna Post	250 Mmf. 200 ohms	Wave Trap Trimmer (C-4)	

R. F. ALIGNMENT

1. Band "B"	18 M.C. with Modulation	Antenna Post	250 Mmf. 200 ohms	Osc. (C-6) Ant. (C-2)	Close gang plates—adjust pointer to first line at left end of tuning scale.
2. Band "D"	18 M.C. with Modulation	Antenna Post	250 Mmf. 200 ohms	Osc. (C-6) Ant. (C-2)	Connect output meter across voice coil—tone control on "Bass" position. The image of any "D" band signal should be heard 930 K.C. below signal input when (C-6) is on proper peak. Example: 15 M.C. image—14.09 M.C. Peak (C-2) while rocking the gang condenser.
3. Band "C"	No adjustments necessary.	Antenna Post	250 Mmf. 200 ohms	Osc. (C-7) Ant. (C-3)	Peak trimmers for maximum output with a low input signal.
4. Band "B"	1500 K.C. with Modulation	Antenna Post	250 Mmf. 200 ohms	Osc. (C-10) Ant. (C-3)	Adjust peadder for maximum output in vicinity of 580 K.C. while rocking the gang condenser.
5. Band "B"	580 K.C. with Modulation	Antenna Post	250 Mmf. 200 ohms	Osc. (C-10) Ant. (C-3)	Retrim for maximum output with a low input signal.
6. Band "B"	1500 K.C. with Modulation	Antenna Post	250 Mmf. 200 ohms	Osc. (C-7) Ant. (C-3)

C	115-125	25-60	75

GENERAL INFORMATION

**Coil System**  
 T-5 and T-6 are the antenna and oscillator transformers respectively for the "B", "C", and "D" bands. All band switch terminals are numbered in Fig. 2 and Fig. 3 to facilitate circuit tracing by showing common points on the schematic diagram, Fig. 2 and the pictorial wiring diagram, Fig. 3. The following table shows the coils in use for various positions of the band change switch.

Band Position	Antenna Primary	Antenna Secondary	Oscillator Grid Coil	Oscillator Plate Coil	Remarks
Band "B"	L-4	L-1+L-3	L-10	L-7	
Band "C"	Part of L-2	L-1+Part of L-3	L-9	L-6	Part of L-3 shorted.
Band "D"	L-2	L-1	L-8	L-5	L-9, L-10 shorted.
Automatic Tuning	L-4	L-1+L-3	L-10	L-7	L-3 shorted.

Tuned by fixed trimmers

**12-inch speaker**

To center the voice coil, remove dust cover by softening with acetone. Loosen the two clamping screws and place three 1 in. by 3/4 in. by 0.010 in. paper or celluloid strips equally spaced around pole piece for clearance—then tighten clamping screws. Remove strips and cement the dust cap back in place with Glyptal cement.

**Phonograph Connections**

Fig. 1 shows a simple sketch for connecting a crystal or high impedance magnetic pickup into the G-78 circuit for the reproduction of phonograph recordings. Sp is a rotary triple-pole, double-throw switch. A suitable loading circuit should be used across the pickup and capacitor network consisting of a resistor or resistor and capacitor network should be used across the pickup and capacitor network. It is recommended that the pickup be connected to the shield such as copper braid to prevent hum interference. This lead should be connected to the chassis ground on the schematic. Also open the circuit between C-D in the diode circuit and make connections of phono switch as indicated in Fig. 1.

When the pickup is connected as suggested, the regular radio volume and tone controls work for both radio and phonograph reproduction. The following are suggested parts:

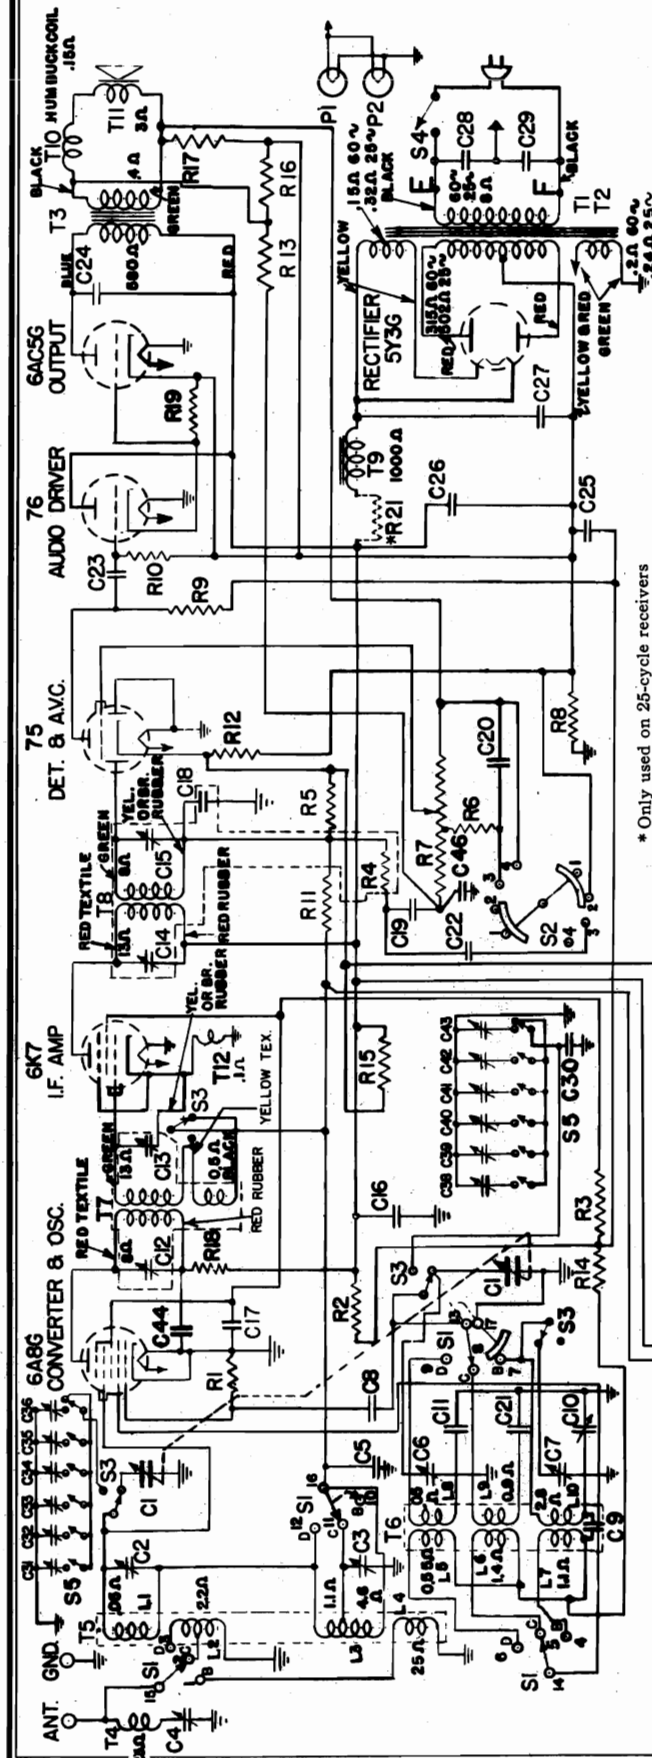

Symbol	Description	Stock No.
Sp	Triple-pole, double-throw switch.....	RS-3013
Rp	330,000-ohm carbon resistor.....	RQ-1319

C30	270 ohm carbon resistor			T4	Wave trap coil

**ALIGNMENT**  
Align the I.F. at 455 K.C. by visual or output meter method.  
Align wave trap trimmer C-4 at 455 K.C. by peaking for a minimum output.  
Band change switch on "D" band, align C-6 at 18 M.C. Rock the gang condenser when peaking C-2 for maximum output. The image of any signal on the "D" band should be heard 910 K.C. below input signal. Example: 18 M.C. On Broadcast band, align trimmers C-7 and C-3 at 1500 K.C. Align C-10 at 580 K.C. while rocking the gang condenser.

**"B" Band**  
1500 K.C. and 580 K.C.

**"D" Band**  
455 K.C. 18.0 M.C.

CHASSIS VIEWED FROM BOTTOM

Fig. 4. Chassis Parts Layout Coil System

The "B," "C" and "D" band antenna coils are wound on a single coil form, T-1 as shown in Fig. 2. T-2 is the oscillator transformer for all three bands. All switch points are numbered in Fig. 2 to facilitate in locating these switch points on the pictorial wiring diagram, Fig. 4.  
The following table gives the coils in use for the various positions of the wave change switch.

Rating Label	Power Supply (Volts)	Frequency (Cycles)	Power Consumption (Volts)
A	115-125	50-60	70
C	115-125	25-60	75

Parts List

GENERAL ELECTRIC CO.

Band Switch Setting	Input Frequency	Point of Input	Dummy Ant.	Trimmer	Remarks
1. Band "B"	455 K.C. Sweep	2nd I.F. Grid	.05 Mfd. (C-20)	1st I.F. Post. (C-19)	Manual key depressed—gang condenser plates closed—connect vertical input of oscilloscope to ground and the junction of R-9 and R-11 on 3rd I.F. transformer. Adjust trimmer (C-19) until symmetrical curve of maximum amplitude. The resulting curve with input at converter grid is shown in Fig. 5.
2. Band "B"	465 K.C. Sweep	1st I.F. Grid	.05 Mfd.	1st I.F. Post. (C-17)	
3. Band "B"	465 K.C. Sweep	Converter Grid	.05 Mfd.	1st I.F. Post. (C-16)	
4. Band "B"	455 K.C. Sweep	Antenna Post	250 Mmf. 200 Ohms	Wave trap trimmer (C-37)	Adjust trimmer for minimum amplitude.

I.F. Alignment with Output Meter	Remarks
1. Band "B"	465 K.C. Modulation 2nd I.F. Grid 1st I.F. Post. (C-20) 1st I.F. Post. (C-19)
2. Band "B"	465 K.C. Modulation 1st I.F. Grid 1st I.F. Post. (C-18) 1st I.F. Post. (C-17)
3. Band "B"	465 K.C. Modulation Converter Grid 1st I.F. Post. (C-16) 1st I.F. Post. (C-15)
4. Band "B"	465 K.C. Modulation Antenna Post Wave trap trimmer (C-37)

R.F. Alignment	Remarks
1. Band "B"	Close gang plates—adjust pointer to first line at left end of tuning scale.
2. Band "D"	18 M.C. with Modulation Antenna Post Osc. (C-12) 250 Mmf. 200 Ohms Ant. (C-10)
3. Band "C"	No adjustment necessary
4. Band "B"	1500 K.C. with Modulation Antenna Post Osc. (C-13) 250 Mmf. 200 Ohms Ant. (C-11)
5. Band "B"	580 K.C. with Modulation Antenna Post Osc. padder (C-14)
6. Band "B"	Repeat operation 4

**ALIGNMENT PROCEDURE**

MODEL G-86

**I.F. Alignment with Oscilloscope**

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"	455 K.C. Sweep	I.F. Grid	.05 Mfd. or Larger	2nd I.F. Sec. (C-15) 2nd I.F. Pri. (C-14)	Gang condenser plates closed—"manual" key depressed—connect audio input of oscilloscope to ground and to the junction of R-11 and R-4 of the 2nd I.F. transformer. Adjust trimmers in order mentioned for a single symmetrical curve of maximum amplitude. The resultant curve is shown in Fig. 3. When a station key is depressed, this I.F. curve should expand considerably.
2. Band "B"	455 K.C. Sweep	Converter Grid	.05 Mfd. or Larger	1st I.F. Sec. (C-13) 1st I.F. Pri. (C-12)	

**I.F. Alignment with Output Meter**

1. Band "B"	455 K.C. with Modulation	I.F. Grid	.05 Mfd. or Larger	2nd I.F. Sec. (C-15) 2nd I.F. Pri. (C-14)	Gang condenser plates closed—connect output meter across voice coil—keep input signal low and volume control on as far as possible. Adjust all trimmers for maximum output.
2. Band "B"	455 K.C. with Modulation	Converter Grid	.05 Mfd. or Larger	1st I.F. Sec. (C-13) 1st I.F. Pri. (C-12)	

**R.F. Alignment**

1. Band "B"					Close gang plates—adjust pointer to first line at left end of tuning scale.
2. Band "D"	18 M.C. with Modulation	Antenna Post	250 Mmf. 200 ohms	Osc. (C-6) Ant. (C-2)	Connect output meter across voice coil—tone control on "Bass" position. The image of any "D" band signal should be heard 910 K.C. below signal input when (C-6) is on proper peak. Example: 15 M.C. image—14.09 M.C. Peak (C-2) while rocking the gang condenser.
3. Band "C"	No adjustments necessary.				
4. Band "B"	1500 K.C. with Modulation	Antenna Post	250 Mmf. 200 ohms	Osc. (C-7)	Peak oscillator trimmer C-7 for maximum output in vicinity of 1500 K.C. while rocking the gang condenser.
5. Band "B"	580 K.C. with Modulation	Antenna Post	250 Mmf. 200 ohms	Osc. Padder (C-10)	Adjust padder for maximum output in vicinity of 580 K.C. while rocking the gang condenser.
6. Band "B"	1500 K.C. with Modulation	Antenna Post	250 Mmf. 200 ohms	Osc. (C-7)	Retrim for maximum output as described in step No. 4.

Use a "dummy" antenna in making all alignments. The grid lead should not be removed from the tube to which the input signal is applied when aligning the I.F. amplifier.

13:1

**GENERAL INFORMATION**

The Model G-86 is a three-band A-C operated receiver, employing eight General Electric Pre-tested tubes in a super-heterodyne circuit as described above. It incorporates a simplified trimmer tuned "Touch Tuning" system; and the new and exclusive self-contained antenna system, "Beam-a-Scope." Other features of design include I.F. band expansion when using Touch Tuning, degenerative audio feedback, and an improved dustproof electrodynamic speaker.

**BEAM-A-SCOPE**

The "Beam-a-Scope" is essentially a tuned coil antenna wound on an impregnated frame and shielded by a Faraday screen against electrostatic disturbances. This construction discriminates in favor of the desired signal as against a local man-made noise source in three ways. First, since any noise source is composed of two components—electrostatic and magnetic fields—the "Beam-a-Scope" may be revolved so that a null point is found where no voltage is produced from these two components in the direction where the noise originates. Due to the fact that this null point is very sharp, it is very unusual that any desired station will be in a direct line with the rejected noise signal and thereby have its signal strength reduced appreciably. In the second place, the "Beam-a-Scope" eliminates the external return path to ground present in the case of an unshielded antenna. This reduces or eliminates local man-made noise sources in much the same way as a shielded antenna lead-in does in an ordinary antenna installation. In the third place, the "Beam-a-Scope" discriminates against the electrostatic component of an incoming wave in comparison with the magnetic component, because of the Faraday shield. Since the electrostatic component of a local noise source is a great deal larger than the magnetic component, this rejection property brings about an enormous increase in signal-to-noise ratio.

The above operation is only available on the broadcast band and in this position the Beam-a-Scope is also the first tuned grid circuit. On the "C" and "D" bands, the Beam-a-Scope is connected to operate as a capacity type antenna. When an outside antenna is connected to the receiver, it is tapped in on the grid coil (Beam-a-Scope L-1) when operating on the "B" band. On the "C" and "D" bands the outside antenna is connected through the Beam-a-Scope to the "C" and "D" band primaries of the antenna coil.

**Loud-speaker**

To center the voice coil, remove the dust cover by softening with acetone. Loosen the two spider clamping screws and place three 1 in. by 1/4 in. by 0.010 in. paper or celluloid strips equally spaced around pole piece for clearance; then tighten clamping screws. Remove centering strips and cement the dust cap in place with Glyptal cement.

**Coil System**

The "C" and "D" band antenna coils are wound on a single coil form as shown in Fig. 2. T-6 is the oscillator transformer for all three bands. All switch points are numbered in Fig. 2 and Fig. 4 to facilitate in service by showing common points on the schematic diagram, Fig. 2, and the pictorial wiring diagram, Fig. 4.

**Phonograph Connections**

Fig. 1 shows a simple sketch for connecting a crystal or high-impedance magnetic pick-up into the G-86 circuit for the reproduction of phonograph recordings. SP is a rotary triple-pole, double-throw switch. A suitable loading circuit consisting of a resistor or resistor and capacitor network should be used across the pick-up leads when using a crystal type unit. It is very important that the pick-up leads have a shield such as copper braid to prevent hum interference. This lead should be connected to chassis ground.

The 6A8G cathode circuit should be opened between A-B as shown on the schematic. Also open the circuit between C-D in the diode load and make connections to phonograph switch as indicated in Fig. 1.

When the pick-up is connected as suggested, the regular radio volume and tone controls work for both radio and phonograph reproduction. The following are suggested parts:

Symbol	Description	Stock No.
SP	Triple-pole, double-throw switch	RS-3013
RP	330,000-ohm carbon resistor	RQ-1319

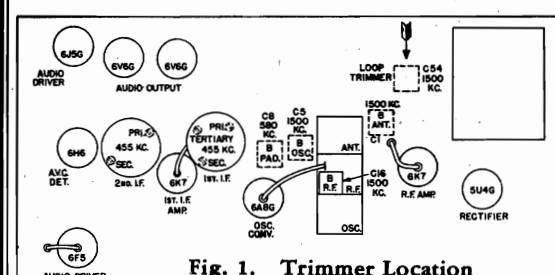

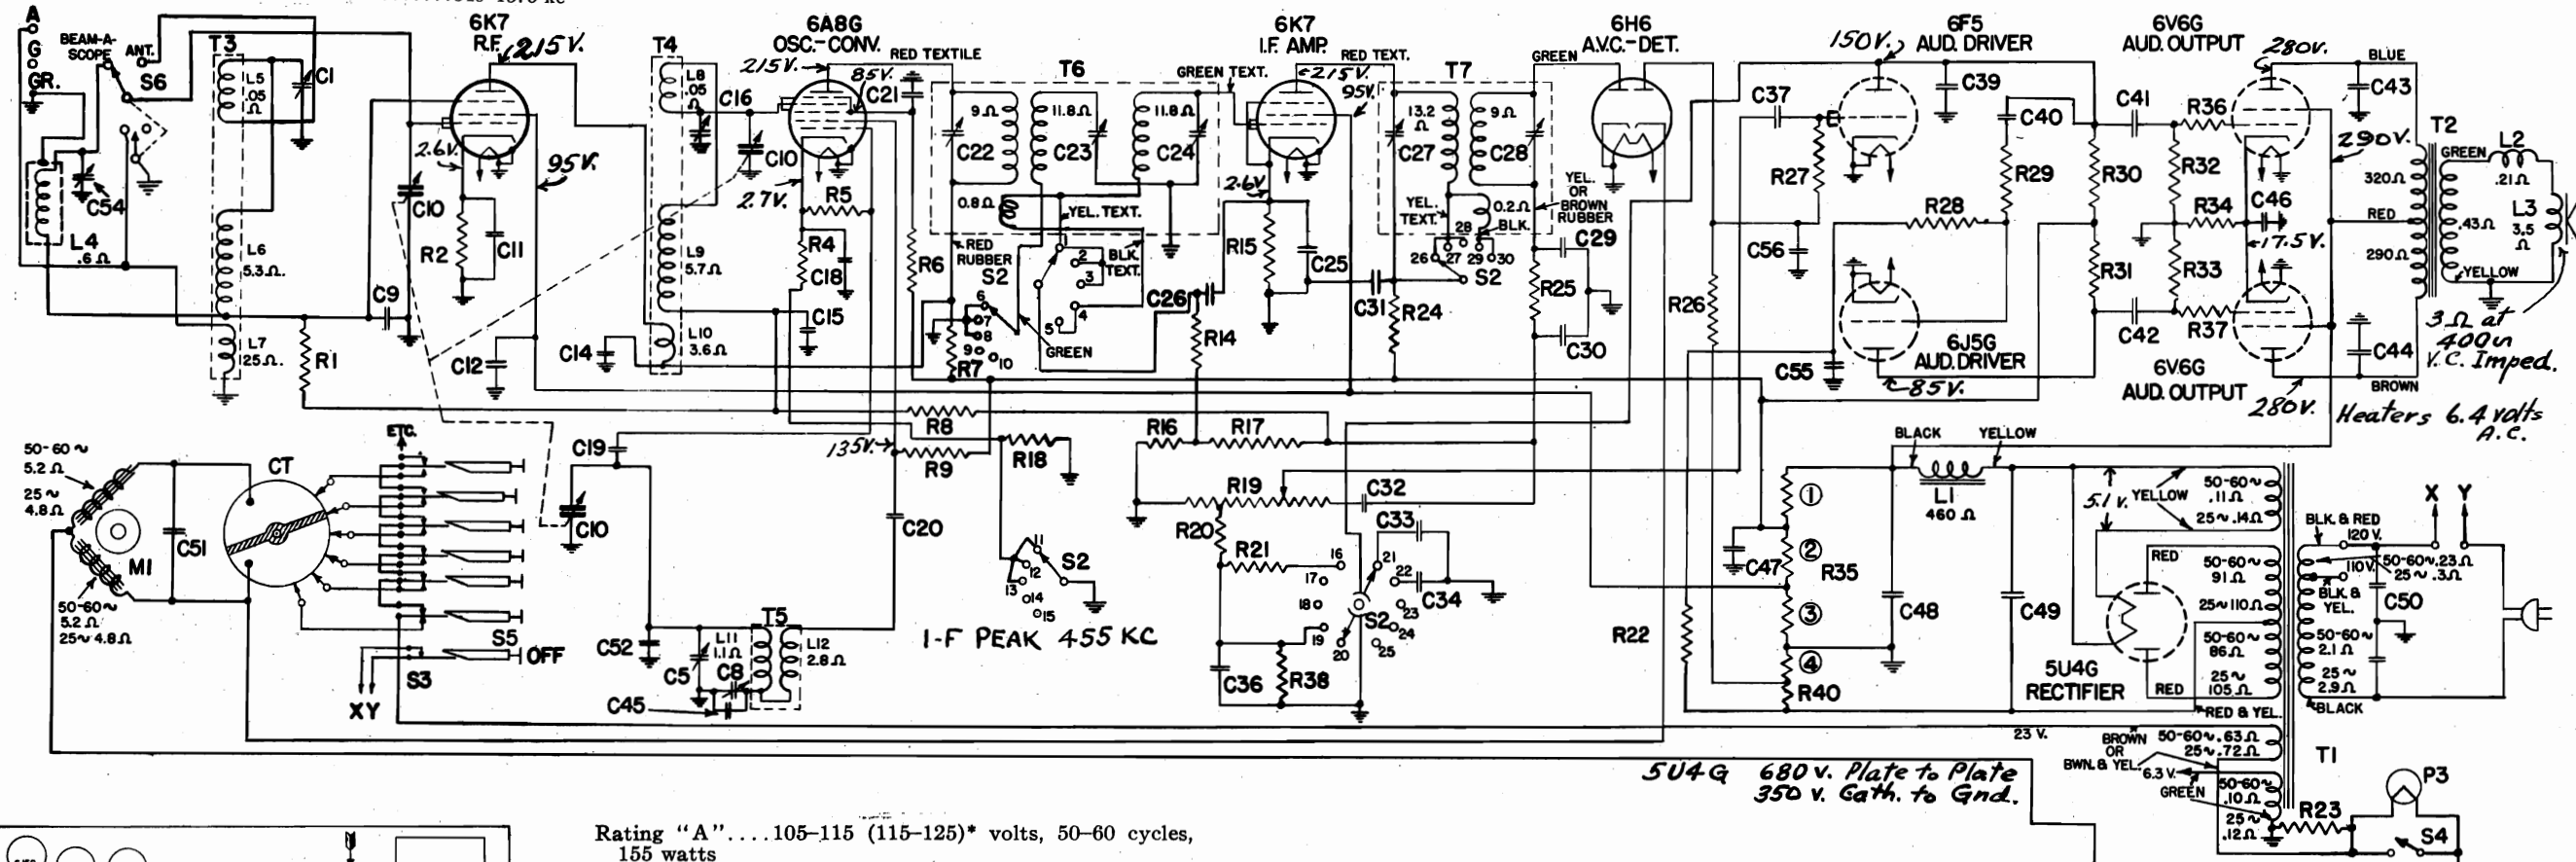

GENERAL ELECTRIC CO.

Schematic, Chassis Wiring  
Socket, Trimmers, Voltage

Tuning Frequency Range

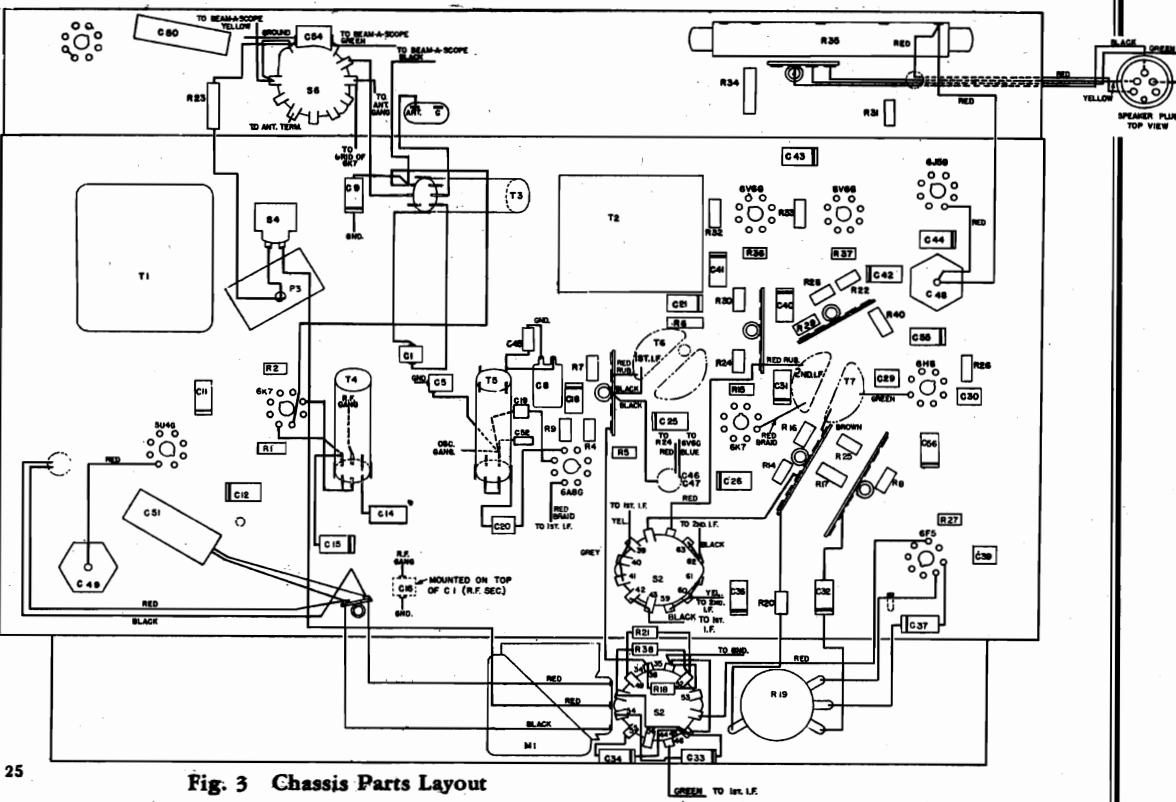

Band "B" ..... 540-1575 kc

Rating "A"....105-115 (115-125)\* volts, 50-60 cycles, 155 watts  
Rating "C"....105-115 (115-125)\* volts, 25-60 cycles, 160 watts

\* The receivers as shipped from the factory have the power cord connected to the 115-125-volt tap of the transformer (black and red lead). If the normal voltage of the power supply is always below 110 volts, the connection of the power cord should be removed from this lead and soldered to the 105-115-volt tap (black and yellow lead). After changing the connection, tape the soldered joint as well as the exposed end of the unused lead. This change requires removal of the chassis from the cabinet.

Notes: In most cases a suitable loading circuit composed of a resistor and capacitor network should be used across the pickup leads when using a crystal type unit.

MODEL G95, Radioforte Tuner and Remote Cont. Schematics, Data GENERAL ELECTRIC CO.

Fig. 8. Drive Mechanism

All keys of the remote control key assembly are wired in series to avoid possibility of two keys completing the circuit to the motor at the same time.

The remote volume control motor uses a phase shifting resistor in place of a condenser as used on the tuning motor.

The mechanical installation of the volume control motor is shown in Fig. 9. Full installation instructions refer to service notes RGM-8.

Fig. 10. Remote Control Schematic

Fig. 9. Volume Control Motor Mounting

Lubrication: For smooth and noiseless operation of the tuning system, it is absolutely necessary to keep it well lubricated.

Remote Control: The GM-8 Remote Control is merely another station key. In addition, a remotely controlled motor is used to either raise or lower the volume at the receiver.

Stopping Accuracy: The exact location at which the drive mechanism will come to rest is determined by the position of the contact segment (X) on the contact drum.

Fig. 7. Keyboard Wiring Diagram

Fig. 5. Schematic of Touch-Tuning System

causes the motor to reverse. The brake on the dial drive wheel does not allow the tuning system to store up enough inertia to allow the station button to come to rest on the narrow insulated segment, thus stopping the tuning operation to this pre-set position.

Station Selection: During period of motor operation, either for automatic station selection or for scanning, silent tuning is incorporated.

Stopping Accuracy: This adjustment should be made under an average operating line voltage and allowance made for changes in voltage over the 24-hour period.

Stopping Accuracy: The exact location at which the drive mechanism will come to rest is determined by the position of the contact segment (X) on the contact drum.

Fig. 6. Keyboard Wiring Diagram

TOUCH-TUNING

The General Electric "Touch-Tuning" system consists of three essential units: the keyboard assembly of fourteen keys, used for touch-tuning control; the motor and drive mechanism; and the volume control motor.

The tuning motor is operated as a 23-volt split phase motor. The 23 volts is supplied directly from the receiver power transformer.

The other winding on the motor is energized through the contact segment (CT) and energizes one winding of the motor.

The station button first energizes. When voltage is applied to the motor, the rotor is pulled further into motor field, and engages its rubber contact with the contact segment (CT).

The operation continues until the insulated segment (I) breaks the station button circuit to the contact segment and removes voltage from the motor. The station button then makes contact with the other half of the motor and segment. This energizes the other winding of the motor and makes contact with the other half of the motor and segment.

(Prices subject to change without notice)

When the pick-up is connected as suggested, the regular ohm resistor is used for both radio and phonograph reproduction.  
NOTE—A suitable loading circuit consisting of a 300,000 ohm resistor should be connected across the pick-up leads when using a crystal type unit.

ALIGNMENT PROCEDURE

I.F. Alignment with Oscilloscope

Band	Input Frequency	Point of Input	Trimmer	Remarks
1. Band "B"	455 K.C. Sweep	2nd I.F. Grid	3rd I.F. Sec. (C-20)	Manual key depressed—gang condenser plates closed—connect vertical input of oscilloscope to ground and junction of R-9 and R-11 on 3rd I.F. transformer. Adjust trimmer for a single symmetrical curve of maximum amplitude. The focusing curve with input at converter Pri. (C-17) is not necessary. Key is pressed this I.F. curve should expand considerably.
2. Band "B"	455 K.C. Sweep	1st I.F. Grid	2nd I.F. Pri. (C-19)	
3. Band "B"	455 K.C. Sweep	Converter Grid	1st I.F. Sec. (C-17)	
1. Band "B"	455 K.C. Modulation	2nd I.F. Grid	3rd I.F. Sec. (C-20)	I.F. Alignment with Output Meter
2. Band "B"	455 K.C. Modulation	1st I.F. Grid	2nd I.F. Pri. (C-19)	Manual key depressed—gang condenser plates closed—connect output meter across voice coil—turn volume trimmer in order mentioned for maximum output. Do not attempt an over-all realignment after stage by stage alignment has been accomplished.
3. Band "B"	455 K.C. Modulation	Converter Grid	1st I.F. Sec. (C-17)	

R.F. Alignment

1. Band "B"	18 M.C. Modulation	Antenna Post	Close gang plates—adjust pointer to first line at left end of tuning scale.
2. Band "D"	18 M.C. Modulation	Antenna Post	Connect output meter across voice coil—manual key depressed—turn volume trimmer in order mentioned for proper peak. Example: 15 M.C. image—14.09 K.C. Peak (C-11) while rocking the gang condenser.
3. Band "C"	1500 K.C. Modulation	Antenna Post	Peak oscillator trimmer (C-13) for maximum output in vicinity of 1500 K.C. while rocking the gang condenser.
4. Band "B"	580 K.C. Modulation	Antenna Post	Adjust padder for maximum output in vicinity of 580 K.C. while rocking the gang condenser.
5. Band "B"	580 K.C. Modulation	Antenna Post	
6. Band "B"	580 K.C. Modulation	Antenna Post

Phonograph Connections

Fig. 1 shows a simple sketch for connecting a crystal or high impedance magnetic pick-up into the G-99 circuit. This method is merely necessary to insert it into the jack. The jack may be mounted on the rear chassis deck and all connecting leads should be properly shielded to prevent interference.

the direction of the transmitter.

For greater distances, somewhat better results may be obtained by using a reflector in conjunction with the antenna described and shown in Fig. 2. A suggested system is to use a 1-inch diameter copper pipe similar to the antenna, running parallel to the regular antenna and located farthest from the direction of the received signal. Fig. 3 shows a diagram looking from top and dimensions should be followed very carefully. By experimenting, however, with the distance between reflector and antenna, improvement in the individual installation may be noted.

Fig. 3

Note - The reflector is a floating copper bar and there are no external connections. Connect and install the regular antenna as shown in Fig. 2.

Cone - Outside Diameter .....	10 inches
Voice Coil Impedance (400 cycles) .....	3.5 Ohms
Field Resistance .....	450 Ohms (cold)

**Antenna and Ground**

Since this receiver operates at a relatively high radio frequency, it is very essential to construct a good antenna and ground system in order to obtain maximum results.

For distances up to within thirty miles from the transmitter, a simple horizontal di-pole as shown in Fig. 1 should give excellent results. It should be located free from all obstructions and placed as high from the earth as possible. Make sure it is run approximately at right angles to the direction of the transmitter: i.e., if the transmitter is located due west, run the horizontal doublet in a north and south direction. The horizontal flat top has an effective antenna length of 10-feet, 8-inches and consists of #12 or #14 bare copper wire (preferably stranded), cut in the middle and the two halves insulated by glass insulators. A twisted lead-in wire is then soldered to each side of the doublet as shown, and the other two ends of the transmission line are connected to the #1 and #2 terminals on the receiver chassis. The lead-in transmission line may be of any length up to 100 feet and should consist of low loss antenna lead-in wire. A good ground connection to a water pipe is connected to the terminal marked "G".

Fig. 1

Somewhat better results may be obtained by constructing the antenna shown in Fig. 2. This varies somewhat from the di-pole antenna and is more efficient due to the fact that the transmission line has very little loss.

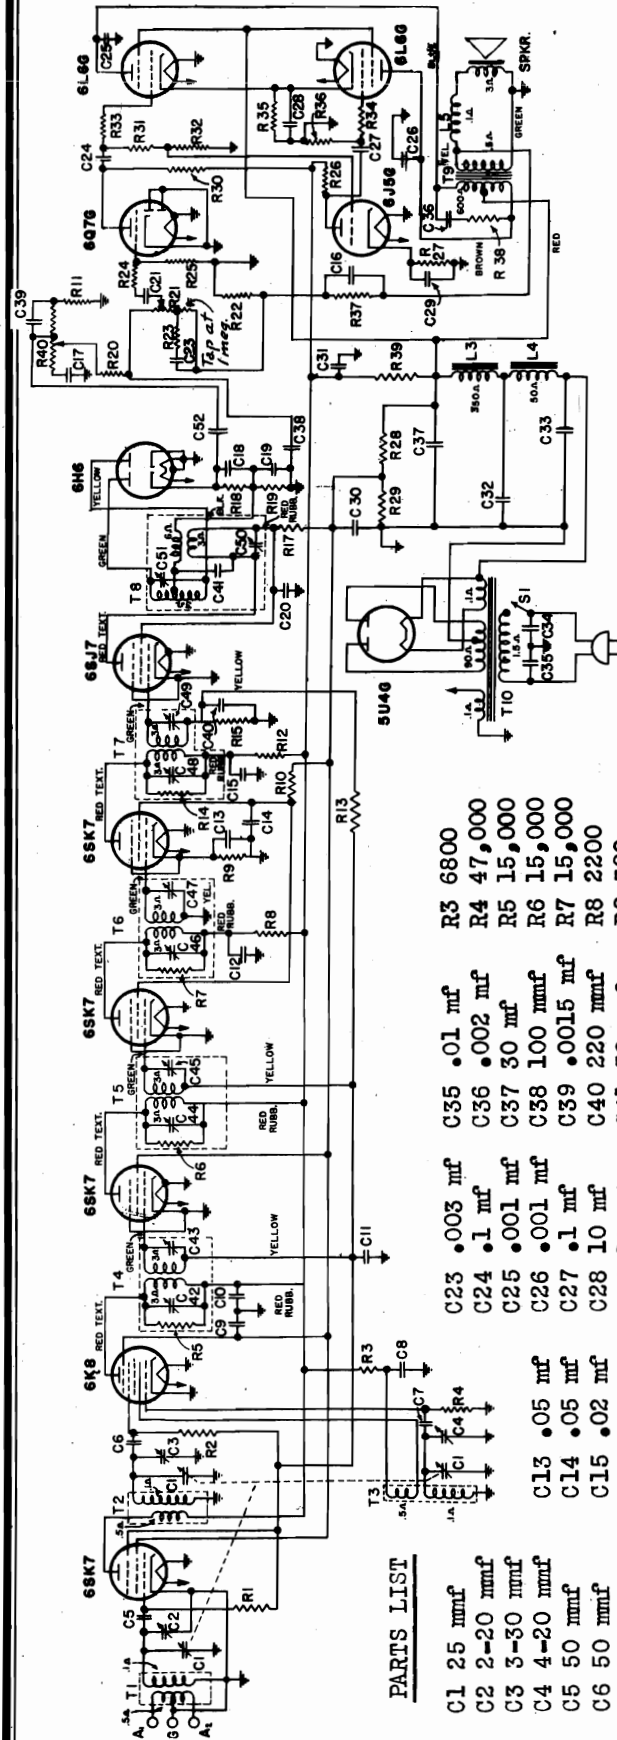

Fig. 2

The antenna proper consists of a 10-foot, 8-inch length of 1-inch diameter copper pipe supported at the middle by a pole located as high above ground as possible. The transmission line is made up of two #12 or #14 copper wires, spaced about 2-inches apart and transposed every two or three feet. The antenna end of the transmission line is soldered 13-1/2 inches each side of the center of the copper pipe and should form a triangle, 27 inches on all sides. As in the previous installation, the horizontal flat-top should run approximately at right angles to

MODEL GML25  
Socket, Trimmers  
Alignment

GENERAL ELECTRIC CO.

TUBE AND TRIMMER LOCATION

CIRCUIT ALIGNMENT

IF Amplifier

Due to the good stability of components and the wide band characteristics of this amplifier, alignment should be unnecessary under normal operating conditions. Should it become imperative that an IF alignment is desirable, it will be necessary to use a cathode ray oscilloscope in conjunction with a 3.0 megacycle signal generator with a superimposed 300 K.C. sweep frequency. This generator may be built up by constructing an oscillator with the tank condenser semi-fixed and variable, the variable portion being designed to be rotated by a motor and of proper capacity to give 1500 K.C. variation of the 3.0 megacycle mid-frequency. Connect the vertical plates of the oscilloscope across the resistor R-15 of the 4th IF stage and align transformers T-7, T-6, T-5 and T-4 in a progressive step by step method.

Frequency Demodulator

With the same oscillator and sweep signal as used above, connect the vertical oscilloscope plates across the resistors, R-18 and R-19, then align the transformer T-8 for a cross-over curve as shown in Fig. 4. Proper alignment of trimmer C-51 is indicated when the curve crosses about mid-way in a vertical plane. Proper alignment of C-50 is indicated when the sides of the curve near cross-over are nearest to a straight line.

Note - Keep signal input high enough so that noise limiter is functioning. This point is indicated when an increase in signal input no longer changes the size of the curve.

RF Alignment

Make sure the last division on the low frequency end of the drum dial coincides with the oscilloscope mark when the gang condenser is completely closed; then, proceed as follows:

1. Connect a high resistance 0-10 V D.C. voltmeter across R-15.
2. Apply a 42.8 megacycle unmodulated signal to the antenna terminal board.
3. Set dial scale so it is tuned to 42.8 megacycle and peak oscillator trimmer C-4 for maximum voltage reading on the meter.
4. Peak the antenna (C-2) and RF (C-5) trimmers for maximum voltage output on meter.

Note - The proper location of the trimmers is shown on a following page.

Detector and 1st Audio.....	GE-1H5G
Power Amplifier.....	GE-1C5G

**GENERAL INFORMATION**

The Model GB-400 is a compact and portable battery-operated receiver that employs four tubes in a superheterodyne circuit. Features of design include self-contained "A" and "B" battery supply, an efficient loop antenna built inside of the cabinet, and an efficient P.M. speaker.

**ALIGNMENT PROCEDURE**

*Alignment Frequencies*

IF—455 kc. Broadcast—1500 kc. and 600 kc.

*NOTE—Do not rest the chassis on any of its sides when attempting to align; place in either an inverted or upright position.*

*IF Alignment*

To align the IF, it will be necessary to remove the chassis from the cabinet. Connect an output meter across the voice coil. Set the volume control for maximum.

Adjust the test oscillator to 455 kc. and apply the signal to the control grid of the 1A7G tube through a .05 mfd. capacitor. Do not remove the grid lead from the 1A7G tube. Keep the test oscillator output as low as possible to give a readable output. Adjust all four IF trimmers for maximum output.

*RF Alignment*

The following alignment should be made with the receiver fastened in the case. Turn the receiver to its inverted position and make trimmer and padder alignments through the holes provided in the bottom of the case.

Connect the ground lead of the signal generator to the receiver chassis and the other lead to the receiver antenna terminal (located underneath cabinet). A dummy antenna consisting of a 250 mfd. capacitor in series with 200 ohms should be connected in the antenna lead of the signal generator. Apply a 600 kc. modulated signal and adjust the oscillator padder for a maximum output while rocking the gang condenser in vicinity of 600 kc. mark on the dial.

Using the same dummy antenna with a 1500 kc. signal generator input, adjust the oscillator trimmer for a maximum output. Now remove signal generator leads, tune in a station at approximately the 1500 kc. point on dial and then peak the RF trimmer for a maximum signal.

Voice Coil Impedance (400 cycles) . . . . . 3.5 ohms

**GENERAL INFORMATION**

Model GD-500 is a compact five-tube AC-DC tuned radio frequency receiver that tunes the broadcast band of frequencies. One side of the power line is connected directly to the chassis ground, therefore, caution should be exercised in servicing.

When operating from a DC source of power, it is necessary to insert the power plug with proper polarity; otherwise, the receiver will fail to function. If any hum is noticed when the receiver is used on AC, reverse the power plug in the receptacle.

**ALIGNMENT**

Connect the high side of the signal generator through a 250 mmf. condenser to the antenna lead. The low side of the signal generator output should be connected to the receiver chassis through a .05 mfd. condenser. Connect a suitable output meter across the voice coil leads; then proceed as follows:

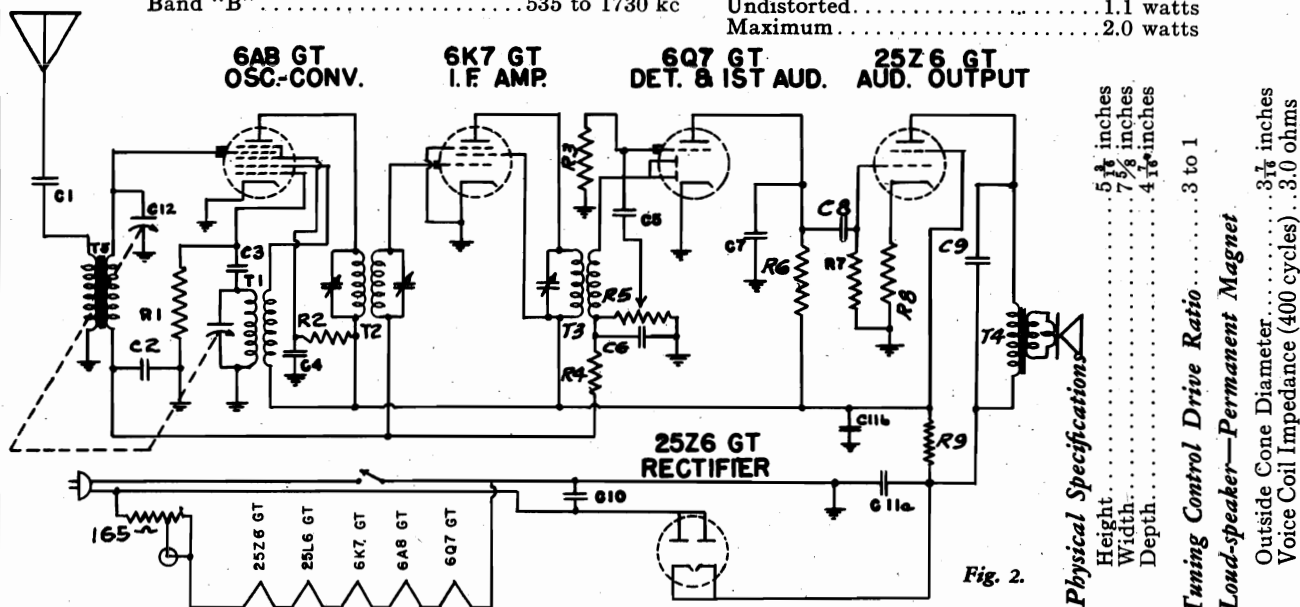

1. With gang condenser plates completely closed, the tuning mark should be over the last mark on the dial.
  2. Tune receiver to the 1500 KC point on the dial; then align trimmers on the gang condenser at 1500 KC for a maximum output meter reading.
- Precaution—One side of the power supply is connected to the chassis. Do not connect chassis to any external ground.

**MODELS GD-520 AND GD-521**  
**GENERAL INFORMATION**

Models GD-520 and GD-521 are compact five-tube AC-DC superheterodyne receivers, employing five General Electric Pre-tested Tubes. One side of the power line is connected directly to the chassis ground in either receiver; therefore, caution should be exercised in servicing.

When operating from a D-c source of power, it is necessary to insert the power plug with proper polarity; otherwise, the receiver will fail to function. If any hum is noticed when the receiver is used on AC, reverse the power plug in the receptacle.

**Alignment Frequencies**

I.F.—456 kc. .... Broadcast—1500 kc  
 The location of all trimmers is shown in Fig. 1.

**I.F. Alignment**

Connect an output meter across the voice coil. Set the volume control for maximum.

Set test oscillator to 456 kc and apply signals to the control grid of the 6A8GT tube through a .05 mfd. capacitor. Do not remove the grid lead from the 6A8GT. Keep the test oscillator output as low as possible to give a readable output. Adjust all three I.F. trimmers for maximum output.

**R.F. Alignment**

Set test oscillator to 1500 kc and connect one output lead to the receiver chassis† and the other through a 250 mmf. capacitor in series with 200 ohms to the receiver antenna lead. Adjust the oscillator trimmer (C-13) and the antenna trimmer (C-14) for a maximum output.

†Precaution. One side of the power supply is connected to the chassis. Do not connect chassis to any external ground. If signal generator is A-c operated, connect a .05 mfd. capacitor in the ground side before connecting it to the receiver chassis.

Power Supply	Frequency	Power Consumption
105-125 Volts AC or DC	60 Cycles	45 Watts

**VOLTAGE CHART**

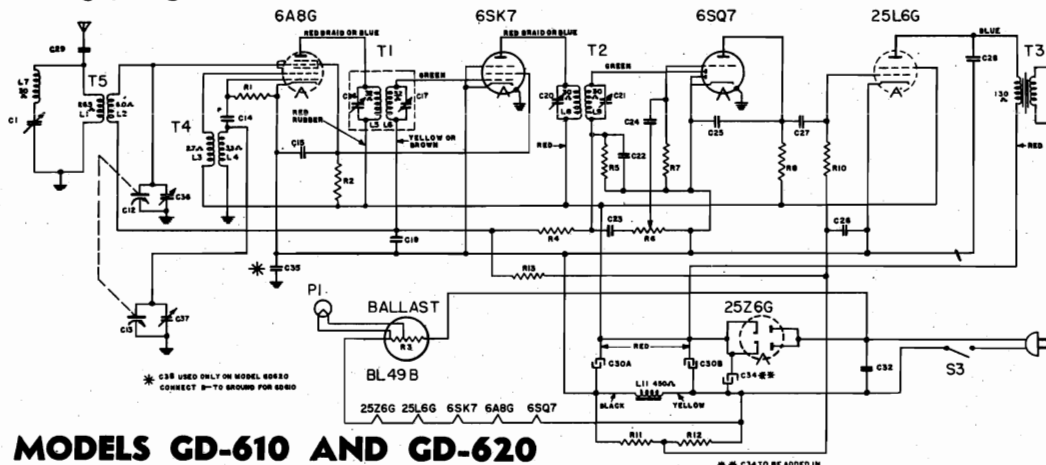

Tube No.	6A8GT	6K7GT	6Q7GT	25L6GT	25Z6GT

Line Voltage—120 V. AC. Volume control at maximum.  
\* Measured on 250 volt scale.  
On DC, voltages are about 15 per cent lower.

When operating from a DC source of power, it is necessary to insert the power plug with proper polarity; otherwise the receiver will fail to function. If excessive hum is noticed when the receiver is used on AC, reverse the power plug in the receptacle.

**ALIGNMENT PROCEDURE**

**Alignment Frequencies**

I.F.—455 K.C. Broadcast—1500 K.C.  
The location of all trimmers is shown in Fig. 1.

**I.F. Alignment**

Connect an output meter across the voice coil. Set the volume control for maximum.

Set test oscillator to 455 K.C. and apply signal to the control grid of the 6A8G tube through a .05 mfd. capacitor. Do not remove the grid lead from the 6A8G. Keep the test oscillator output as low as possible to give a readable output. Adjust all four I.F. trimmers for maximum output.

**Wave Trap Alignment**

Leave the test oscillator set to 455 K.C. and connect one output lead to the receiver chassis and the other through a 250 mmf. capacitor in series with 200 ohms to the receiver antenna lead. Adjust (C-1) for minimum output.

**R.F. Alignment**

Use the same dummy antenna (250 mmf. and 200 ohms) with 1500 K.C. input, adjust the oscillator trimmer (C-37)

and antenna trimmer (C-36) for a maximum output.  
**Precaution**—On the Model GD-610 one side of the power supply is connected to the chassis. If signal generator is AC operated, connect a .05 mfd. capacitor in the ground side before connecting it to the receiver chassis.

Power Supply (Volts)	Frequency (Cycles on AC)	Power Consumption (Watts)
100-125 Volts AC or DC	40-60	50

Tuning Frequency Range..... 540-1750 K.C.

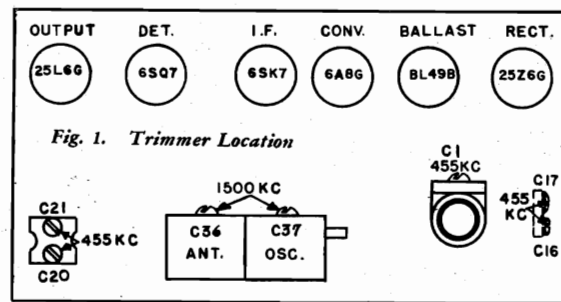

Intermediate Frequency..... 455 K.C.

Electrical Power Output (120-line Volts)

	A-C	D-C
Undistorted.....	1.0	0.9
Maximum.....	1.8	1.5

**Load-speaker—Electrodynamic**

Outside Cone Diameter..... 5 inches  
Voice Coil Impedance (400 cycles)..... 4.0 ohms  
Field Coil Resistance..... 420 ohms

**Production Change**

On a number of receivers, substitute electrolytic capacitor RC-5113 is used for C30b with both sections tied in parallel and RC5114 is used for C30a.

**GENERAL INFORMATION**

The models GD-610 and GD-620 are compact six tube AC-DC superheterodyne receivers employing five General Electric tubes plus a ballast tube, described above in a superheterodyne circuit. Features of design include I.F. wave trap, automatic volume control, and an efficient electrodynamic speaker. Model GD-620 is fully approved by Underwriters Laboratories.

When operating from a DC source of power, it is necessary to insert the power plug with proper polarity; otherwise the receiver will fail to function. If excessive hum is noticed when the receiver is used on AC, reverse the power plug in the receptacle.

ALIGNMENT PROCEDURE

Alignment Frequencies

I.F.—455 K.C. Broadcast—1500 K.C.  
 The location of all trimmers is shown in Fig. 1.

I.F. Alignment

Connect an output meter across the voice coil. Set the volume control for maximum.

Set test oscillator to 455 K.C. and apply signal to the control grid of the 6A8G tube through a .05 mfd. capacitor. Do not remove the grid lead from the 6A8G. Keep the test oscillator output as low as possible to give a readable output. Adjust all I.F. trimmers for maximum output.

Wave Trap Alignment

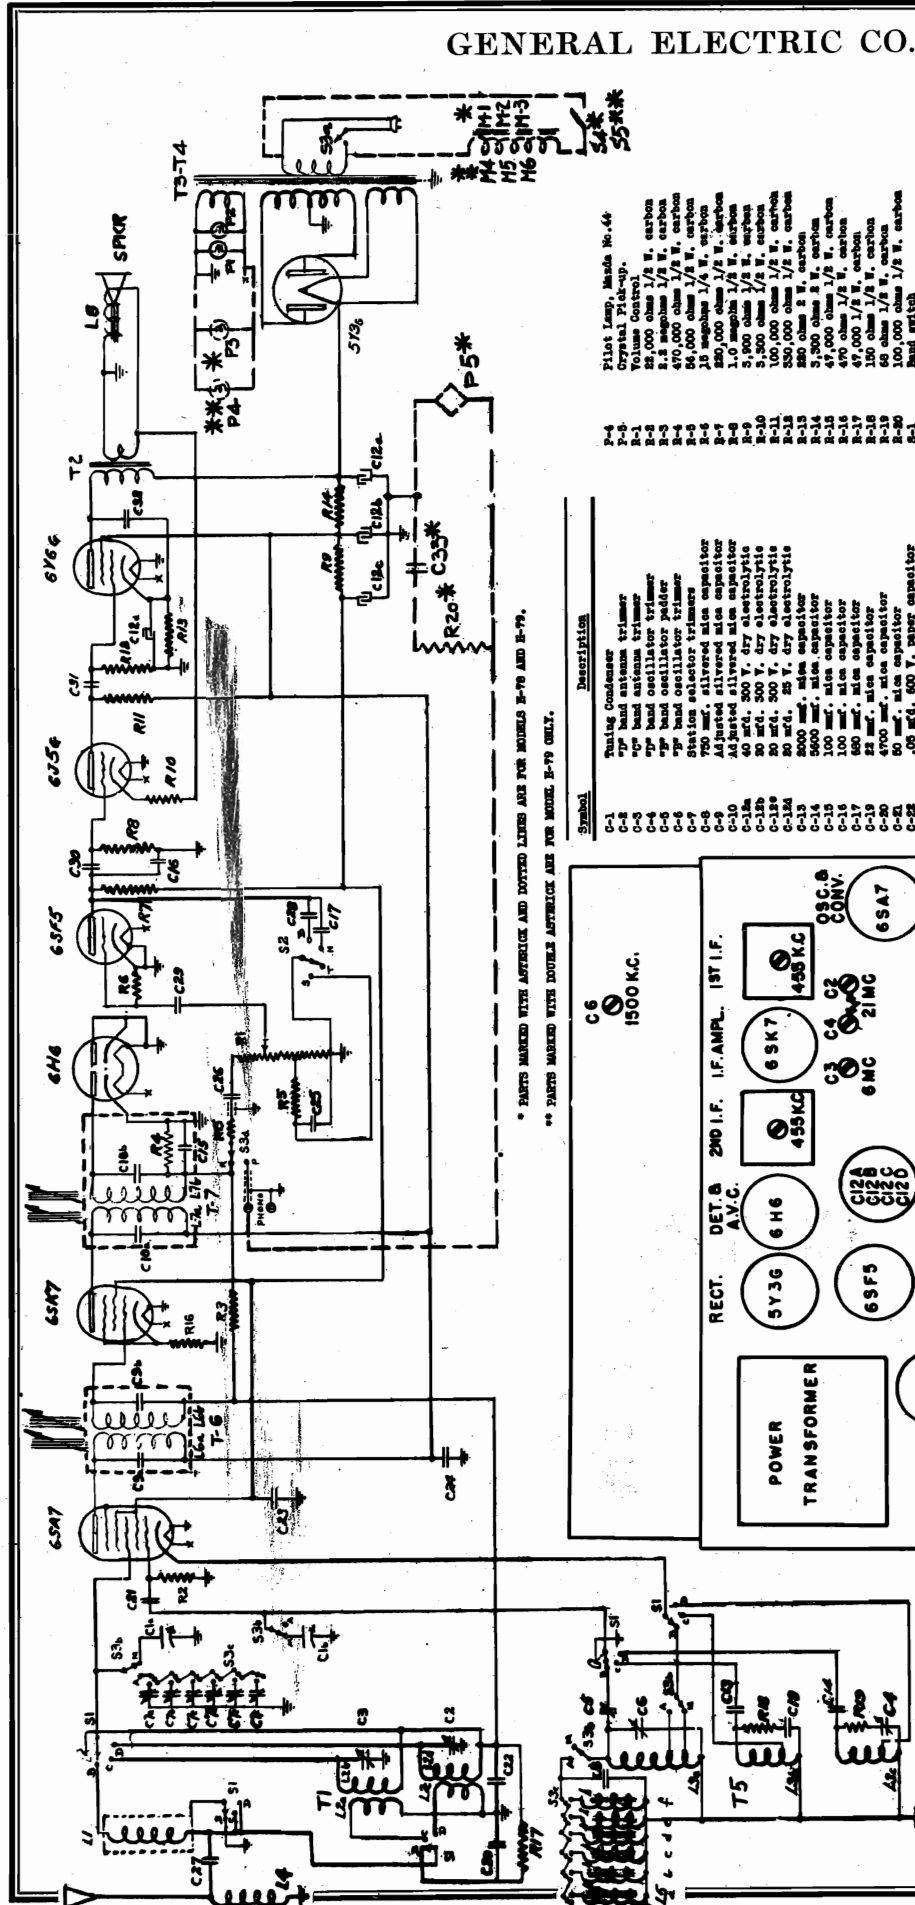

Leave the test oscillator set to 455 K.C. and connect one output lead to the receiver chassis and the other through a 250 mmf. capacitor in series with 200 ohms to the receiver antenna lead. Adjust (C-1) for minimum output.

R. F. Alignment

Use the same dummy antenna (250 mmf. and 200 ohms) with 1500 K.C. input, adjust the oscillator trimmer (C-37) and antenna trimmer (C-36) for a maximum output.

GENERAL ELECTRIC CO.

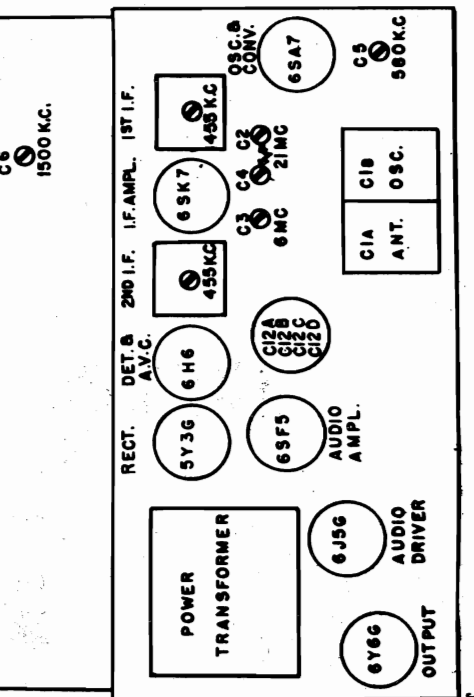

MODELS H73, H77, H79 Preliminary Schematic, Socket Alignment, Trimmers

\* PARTS MARKED WITH APOSTROPHE AND DOTTED LINES ARE FOR MODELS H-78 AND H-79. \*\* PARTS MARKED WITH DOUBLE APOSTROPHE ARE FOR MODEL H-79 ONLY.

Table with 2 columns: Part Number and Description. Includes items like Pilot Lamp, Crystals, and various resistors.

Table with 2 columns: Symbol and Description. Lists components such as Tuning Condenser, RF hand antenna trimmer, and various capacitors.

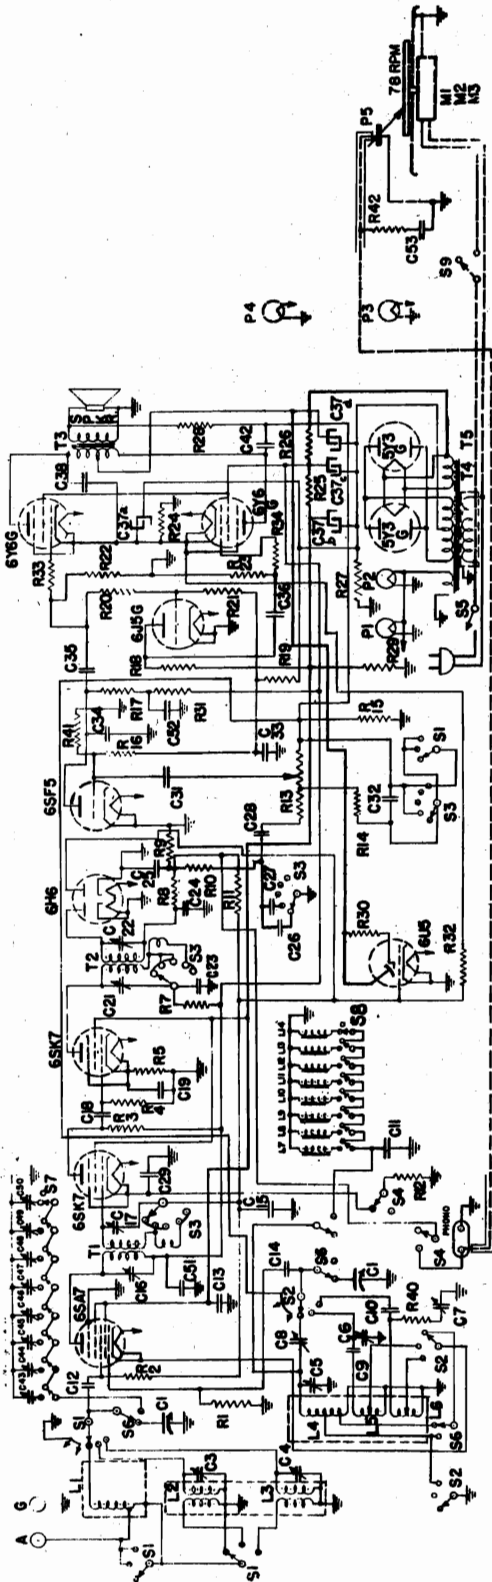

ALIGNMENT

- 1. Set dial pointer to first line at left end of scale with gang condenser plates completely closed.
2. Turn band switch to 'w' band end, using non-metallic screwdriver, align I.F. at 455 K.C. by visual or output meter method.
3. On 'r' band, set dial pointer to 580 K.C. mark and tune in 580 K.C. signal with (C5). Then peak (C6) on 1500 K.C. while rocking gang condenser.
4. On 'p' band, align (C4) at 21 MC. Peak (C2) for maximum output by rocking gang condenser.

ALIGNMENT

- Set dial pointer to first line at left end of scale with gang condenser plates completely closed.
- Turn band switch to "P" band and, using non-metallic screw-drivers, align I.F.'s at 455 KC by visual or output meter method. I.F. transformers are double, permeability tuned with adjusting shafts at top and bottom of shield cans.
- On "P" band, set dial pointer to 560 KC mark and tune in 560 KC signal with (C-8). Then peak (C-5) on 1500 KC while rocking gang condenser. Re-peak (C-8) on 560 KC and end by re-peaking (C-5) on 1500 KC.
- On "W" band, set pointer to 680 mark and align (C-6) to 680. Peak (C-3) for maximum output.
- On "D" band, align (C-7) at 21 MC. Peak (C-4) for maximum output by rocking gang condenser. The image of the 21 MC signal should be heard at approximately 20 MC.

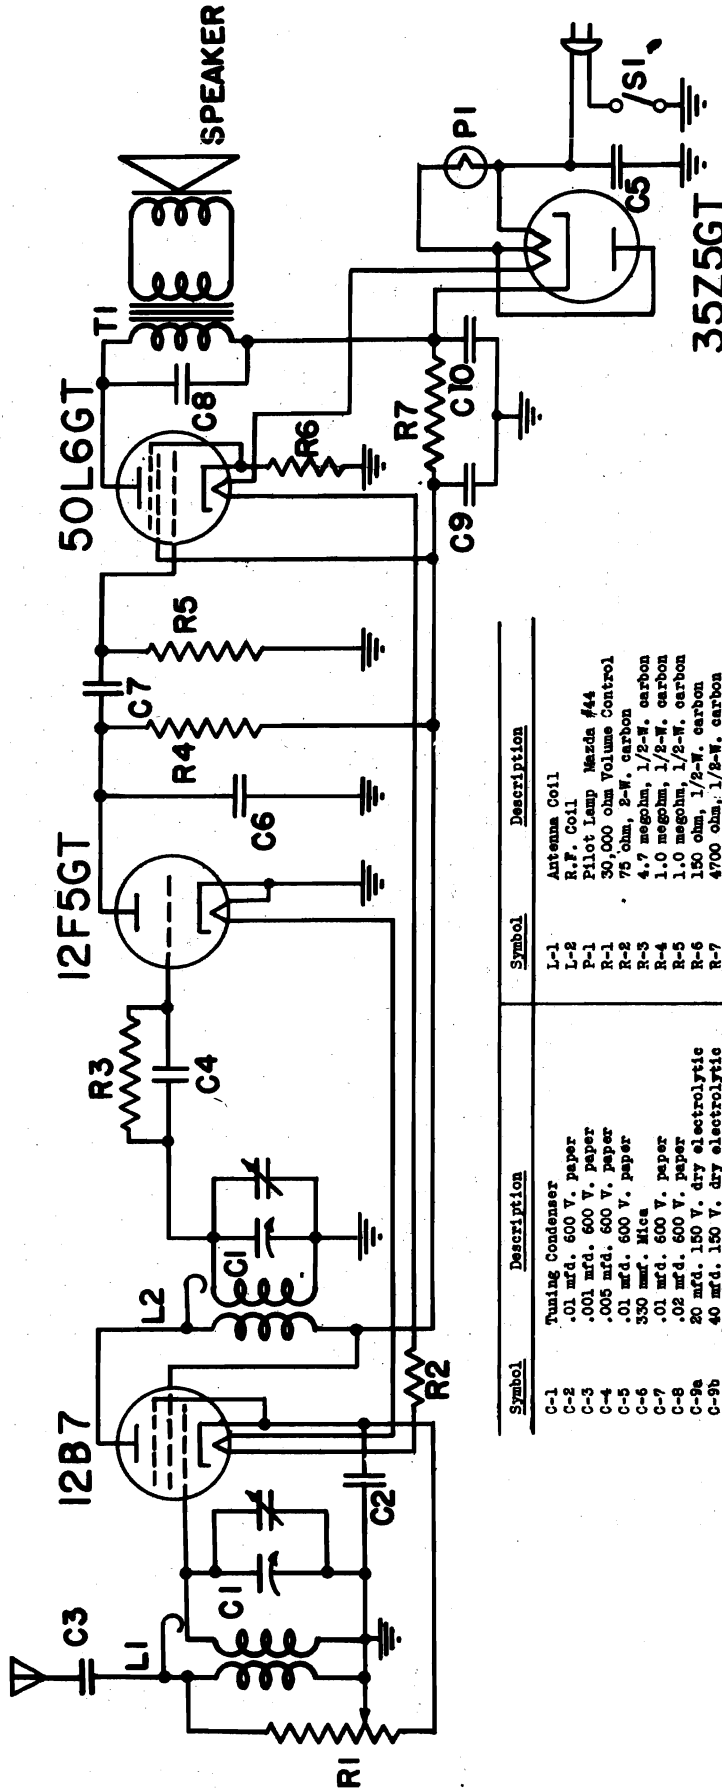

PARTS AND COMPONENTS SHOWN WITH DASH LINES ARE FOR H-118 ONLY.

C-9b	40 mfd. 150 V. dry electrolytic	R-7	4700 ohm, 1/2-W. carbon

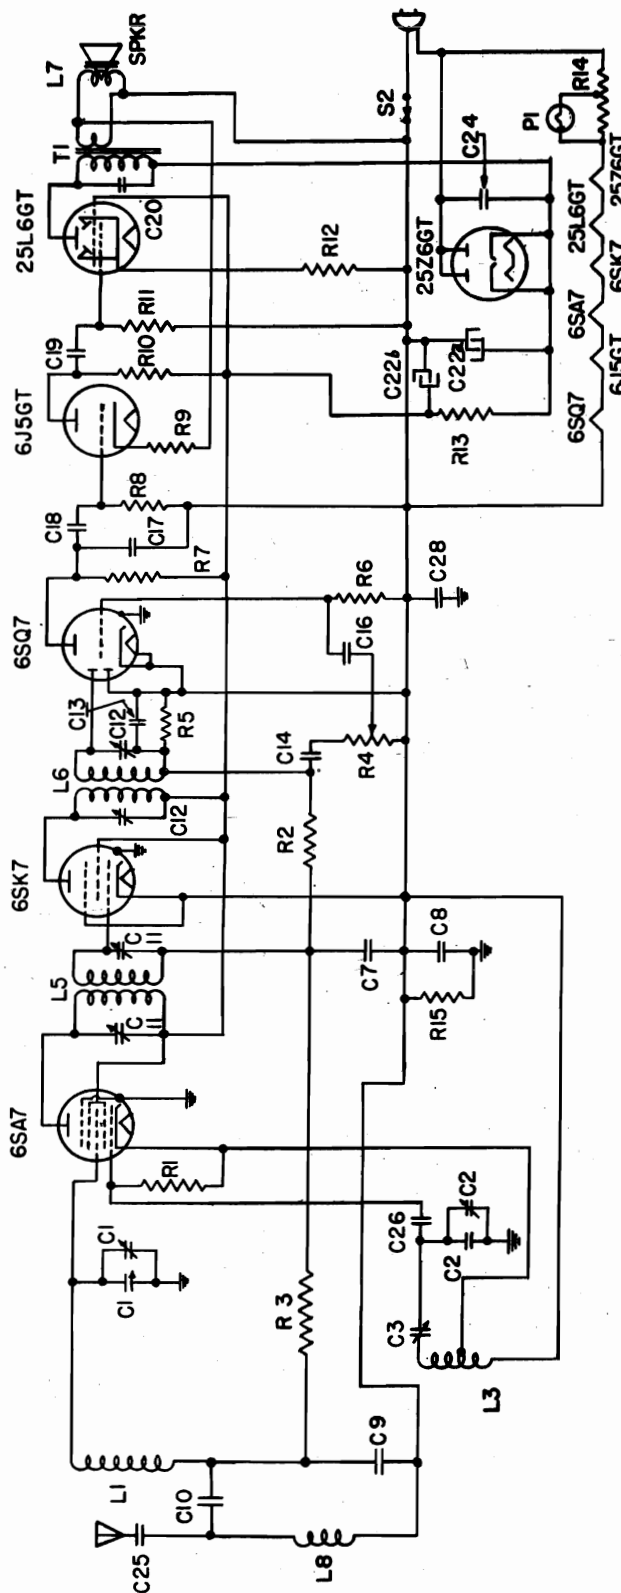

ALIGNMENT

Connect the high side of the signal generator through a 100 mfd. capacitor to the terminal to which the antenna bank is soldered. The low side of the signal generator output should be connected to the receiver chassis through a .05 mfd. condenser. Connect a suitable output meter across the voice coil leads; then proceed as follows:

1. With gang condenser plates completely closed, the tuning meter should be over the last mark on the dial.
  2. Set volume control to about 3/4 maximum.
  3. Rotate gang to minimum capacity and tune trimmers on the gang condenser to 1750 K.C. signal. Re-tune gang to 1500 K.C. signal and peak trimmers by alternate adjustment.
- Precaution--one side of the power supply is connected to the chassis. Do not connect the chassis to any external ground.

H611, Preliminary  
Schematic, Socket  
Alignment, Trimmers

GENERAL ELECTRIC CO.

ALIGNMENT

With gang condenser plates completely closed, set dial pointer to first line at left-end of dial.

1. Align I. F.'s at 455 K.C. by visual or output meter method.
2. Apply a 1500 K.C. signal either through a standard I.F. dummy antenna terminal or by a loop coupling arrangement using an additional loop at the signal generator into which the 1500 K.C. signal is fed and which magnetically couples to the receiver beam-oscope. Align C-7 at 1500 K.C. and peak (C-1) capacitor. Retune at 455 K.C. while routing the gang condenser. Retune at 1500 K.C.

 REPLACEMENT PARTS LIST  
 MODELS H-500, 501, 510, 511, 520, 521  
 (W & X MODELS INC.)

Stock No.	Description	List Price	Stock No.	Description	List Price
*RB-008	BOARD - Terminal board (8 lug)	.10	RK-206	KEY - Station selector key for models H-510, 511, 520, 521	
*RB-013	BOARD - Terminal board (8 lug) for models H-500, 501, 510, 511	.10	RK-207	KEY - Station selector key for models H-510W, H-511W, H-520W, H-521W	
*RB-070	BOARD - Terminal board (8 lug) for models H-520 and H-521	.10	RK-208	KEY - Station selector key for models H-510X, H-511X, H-520X, H-521X	
RB-179	BRACKET - Bracket for beam-a-scope frame for models H-520 and H-521		RL-085	COIL - Antenna coil for models H-500, 501, 510, 511 (L-1)	
RB-914	BACK COVER - Cabinet back for models H-500, 501, 510, 511 (W and X models included)		RL-290	COIL - Oscillator coil for models H-500, 501, 510, 511 (L-2)	
RB-915	BACK COVER - Plastic cabinet back for models H-520 and H-521		RL-291	COIL - Oscillator coil for models H-520 and H-521 (L-2)	
RB-916	BACK COVER - Plastic cabinet back for models H-500W and H-501W		RL-344	CHEKE - RF choke for models H-520 and H-521 (L-6)	
RB-917	BACK COVER - Plastic cabinet back for models H-520X and H-521X		RL-510	LOOP - Beam-a-scope assembly for models H-520 and H-521 (L-1)	
RC-016	CAPACITOR -.005 mfd. 600 V. paper (C-1, 11, 12)	.25	RP-154	PIV - Key pin for models H-510, 511, 520, 521	
*RC-023	CAPACITOR -.005 mfd. 600 V. paper (C-15)	.25	*RQ-1215	RESISTOR - 15 ohms, 1/2-W. carbon (Fig. 5)	.70
*RC-029	CAPACITOR -.01 mfd. 600 V. paper (C-15)	.25	*RQ-1219	RESISTOR - 22 ohms, 1/2-W. carbon (R-11) (Fig. 5)	.70
*RC-072	CAPACITOR -.05 mfd. 600 V. paper (C-10, 12)	.25	*RQ-1239	RESISTOR - 150 ohms, 1/2-W. carbon (R-2) (Fig. 5)	.70
*RC-082	CAPACITOR -.05 mfd. 600 V. paper (C-16)	.30	*RQ-1261	RESISTOR - 1800 ohms, 1/2-W. carbon (R-3) (Fig. 5)	.70
*RC-130	CAPACITOR -.8 mfd. 400 V. paper for models H-501, H-511, H-521 (C-15)	.30	*RQ-1281	RESISTOR - 8200 ohms, 1/2-W. carbon (R-12) (Fig. 5)	.70
*RC-216	CAPACITOR - 47 mmf. mica (C-4)	.25	*RQ-1283	RESISTOR - 10,000 ohms, 1/2-W. carbon (R-13) (Fig. 5)	.70
*RC-274	CAPACITOR - 250 mmf. mica (C-14)	.50	*RQ-1289	RESISTOR - 47,000 ohms, 1/2-W. carbon (R-1) (Fig. 5)	.70
*RC-294	CAPACITOR - 470 mmf. mica (C-9)	.30	*RQ-1323	RESISTOR - 470,000 ohms, 1/2-W. carbon (R-5, 6, 7) (Fig. 5)	.70
*RC-348	CAPACITOR - 1600 mmf. mica for models H-520, 521	.55	*RQ-1359	RESISTOR - 2.2 megohms, 1/2-W. carbon (R-8) (Fig. 5)	.70
*RC-390	CAPACITOR - 3900 mmf. mica for models H-520 and H-521 (C-2)	.55	*RQ-1366	RESISTOR - 15 megohms, 1/4 W. carbon (R-5) (Fig. 5)	.70
*RC-365	CORD - Power Cord	.65	RS-251	SOCKET - Octal tube socket	.15
RC-1990	CLAMP - Antenna coil clamp for models H-500, 501, 510, 511		RS-256	SOCKET - Electrolytic mounting socket for models H-501, 511, 521	
RC-5125	CAPACITOR - 30 mfd. 150 V; 40 mfd. 150 V; 20 mfd. 25 V; dry electrolytic (C-17a, 17b, 17c)		RS-257	SOCKET - Electrolytic mounting socket for models H-500, 510, 520	
RC-7012	CONDENSER - Tuning condenser for models H-510, 511, 520, 521 (C-2a, 2b)		RS-258	SOCKET - Pilot lamp socket	
RC-7013	CONDENSER - Tuning condenser for models H-500 and H-501 (C-2a, 2b)		RS-261	SPACER - Speaker cabinet spacer	
RC-8008	CARDS - Station letter cards for models H-510, 511, 520, 521		RS-1014	SPRAKER - 4-inch speaker for models H-501, 511, 521 (L-5)	
RC-9013	COSE ASSEMBLY - Case assembly for all models		RS-1017	SPRAKER - 4-inch speaker for models H-500, 510, 520 (L-5)	
RD-111	DIAL - Dial scale for models H-500, 501, 510, 511		RT-321	TRANSFORMER - 1st IF transformer (L-3) for models H-520 and H-521 (W and X models included)	
RD-112	DIAL - Dial scale for models H-520 and H-521		RT-322	TRANSFORMER - 2nd IF transformer (L-4)	
RD-410	DRUM - Tuning condenser drive drum assembly for models in brown		RT-323	TRANSFORMER - 1st IF transformer for models H-500, H-501, H-510, H-511 (W and X models included)	
RD-411	DRUM - Tuning condenser drive drum assembly for all models in white and onyx		RT-465	TRANSFORMER - Output transformer (T-1)	
*RG-016	GRID CLIP - Tube control grid clip (Fig. 5)	.10	RV-070	VOLUME CONTROL - 2 meg. volume control (R-4)	
RE-007	BASE - Antenna base for models H-500, 501, 510, 511		RW-039	WINDOW - Celluloid station letter window for models H-510, 511, 520, 521	
RE-048	KNOB - Control knob for all white models		RE-152	CABINET - Cabinet for models H-510, 511, 520, 521	
RE-051	KNOB - Control knob for all models except white		RE-153	CABINET - Cabinet for models H-510W, H-511W, H-520W, H-521W	
			RE-154	CABINET - Cabinet for models H-510X, H-511X, H-520X, H-521X	
			RE-155	CABINET - Cabinet for models H-500, H-501	
			RE-156	CABINET - Cabinet for models H-500W, H-501W	
			RE-157	CABINET - Cabinet for models H-500X, H-501X

ALIGNMENT FOR  
 MODELS  
 H-500, H-501, H-510, H-511  
 H-520, H-521  
 (W and X Models incl.)

I-F ALIGNMENT:

Apply a 455-ke signal to the grid of the 12SK7 and align the 2nd i-f transformer by visual or output meter method. Repeat the procedure, applying the 455-ke signal to the grid of the 12A8GT and aligning the 1st i-f transformer.

R-F ALIGNMENT:

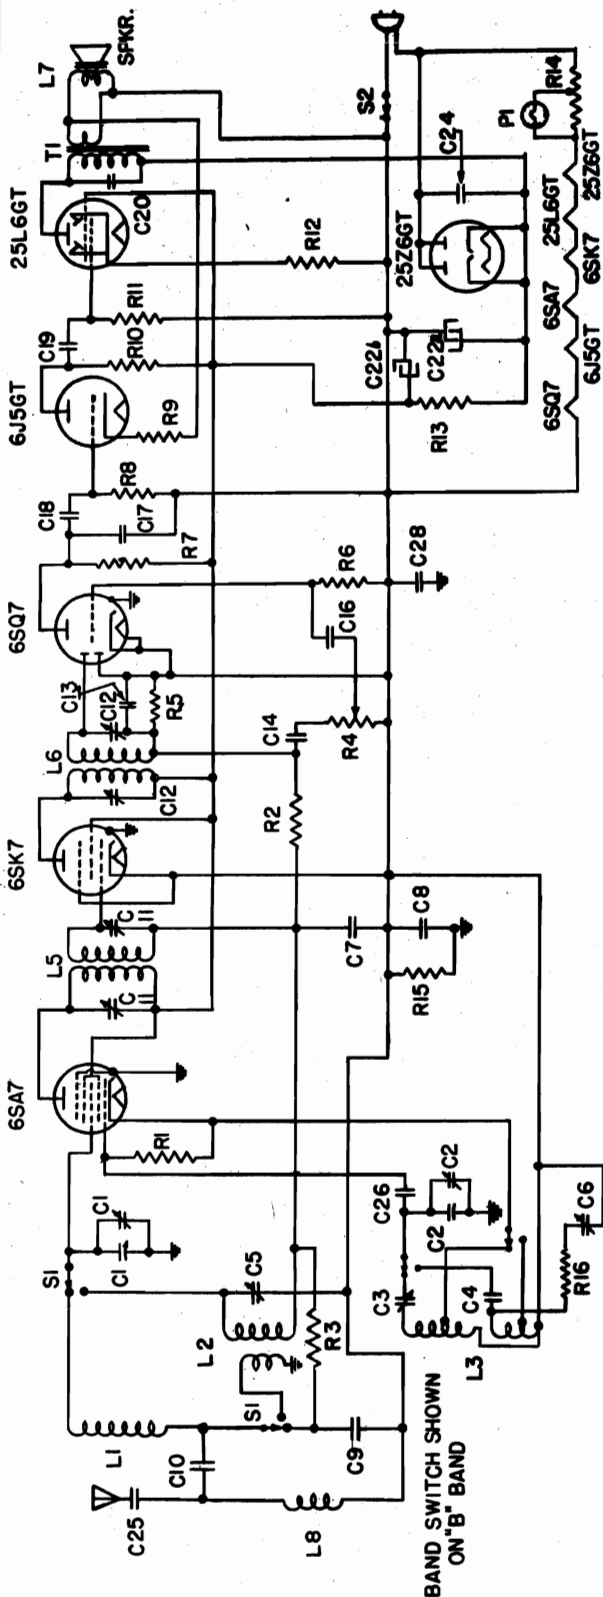

On Models H500, H501, H510 and H511 (W and X models incl.) apply a 1500-ke signal through a 100 mmf mica condenser to the antenna terminal. Align C-2b. Peak C-2a for maximum output.

On Models H-520 and H-521 (W and X models incl.), apply a 1500-ke signal either through a standard I.R.E. dummy to the antenna terminal or by a loop coupling arrangement using an additional loop at the signal generator into which the 1500-ke signal is fed and which magnetically couples to the receiver Beam-a-scope. Align C-2b. Peak C-2a for maximum output.

ALIGNMENT

- With gang condenser plates completely closed, set dial pointer to first line at left-end of scale.
1. Turn band switch to "B" band, if the receiver has two bands, and align I.F.'s at 455 K.C. by visual or output meter method.
  2. Apply a 1500 K.C. signal either through a standard I.R.B. dummy to the antenna terminal or by a loop coupling arrangement using an additional loop at the signal generator into which the 1500 K.C. signal is fed and which magnetically couples to the receiver beam-a-scope. Align (C-2) at 1500 K.C. and peak (C-1) for maximum output. Then peak (C-3) on 580 K.C. while rocking the gang condenser. Retrim at 1500 K.C.
  3. Turn band switch to "P" band, align (C-6) at 18 M.C. and peak (C-5) while rocking the gang condenser. The image of the 18 M.C. signal should be heard at approximately 17 M.C.

ALIGNMENT

1. With gang condenser plates completely closed, set dial pointer to first line at left-end of scale.  
 Turn band switch to "B" band and align I.F.'s at 455 KC by visual or output meter method.
2. Apply a 1500 KC signal either through a standard I.R.Z. dummy to the antenna terminal or by a loop coupling arrangement, using an additional loop coil. Tune the 6SK7 I.F. transformer to the signal by adjusting the trimmer which magnetically couples to the receiver. Then align the 6SQ7 at 1500 KC and peak (C-1) for maximum output. Then peak (C-3) on 580 KC while rocking the gang condenser. Retain at 1500 KC.
3. Turn band switch to "D" band, align (C-6) at 18 MC and peak (C-5) while tuning the gang condenser. The range of the 18 MC signal should be heard at approximately 17 MC.

Power Consumption at 115 Volts, 60 Cycles is 33 Watts.  
All voltages measured to ground with 115 Volts 60 cycles applied to transformer primary.

**SETTING PUSH BUTTONS MODELS 56-S, 66-S.**

To set push button station selector proceed as follows:

1. Release mechanism by turning screw "B" in center of manual control knob "A" approximately three turns to the left.
2. Manually tune the radio set by means of turning knob "A" until the pointer is at the bottom end of the dial scale (so that it is pointed at 170). Starting from this point tune the desired station you want to hear (on No. 1 button)
3. Press button marked 1 all the way in, then release. Tune the next station desired manually, then press button No. 2 all the way in, then proceed progressively until all six buttons have been tuned.
4. Turn screw "B" in center of manual control "A" to right until tight, locking the selector mechanism. Any of the stations selected can now be received by depressing its corresponding push button. **BE SURE SELECTOR BUTTON IS PUSHED ALL THE WAY IN**, both when setting selector to a station and when using push button tuning to receive that station.

  - 1.....7½ Volt "C" Battery.
  - 1.....3 Volt Dry "A" Battery or 2 Volt Storage Battery.

MODEL 504

Schematic, Voltage Socket, Trimmers Alignment  
**GOODYEAR TIRE & RUBBER CO., INC.**

IN ORDER TO PREVENT SIGNAL FROM ACTING UPON AVC AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.

All voltages are to be measured with 6.3 volts input to receiver. Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

**ALIGNING I.F. TRANSFORMERS: (465 K. C.):**

- Part No. 108-85 Output I.F. Transformer.
- Part No. 108-84 Input I.F. Transformer.

These I.F. Transformers have two adjustments, both of which are accessible from the top of chassis (see fig. 1, top view).

- With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments.
  - Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6S7G tube, and adjust the output I.F. transformer (No. 108-85) to resonance.
  - Move oscillator output clip from grid of 6S7G to grid cap of 6D8G and adjust input I.F. transformer (No. 108-84) to resonance.
  - With oscillator still connected to 6D8G readjust output I.F. transformer (108-85) if necessary.

**R. F. ALIGNMENT: (535-1720 K.C.)**

- With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmf. condenser to an antenna and black ground leads and make the following adjustments:
  - With external oscillator set at 1720 kilocycles, adjust oscillator trimmer (rear of gang condenser).
  - Re-set external oscillator to 1400 kilocycles, rotate condenser, pick-up oscillator signal and adjust antenna trimmer to resonance (front section of gang condenser)
  - Check sensitivity at 600 and 1000 kilocycles.

IF PEAK 456 KC

\* R. 2, R. 4, R. 5, R. 6, R. 7 & R. 8 IN ONE UNIT P-1012  
\* C. 1, 6 & C. 17 IN ONE UNIT P-1005  
\* X. R. 9, R. 10, R. 11, C. 8, C. 9 & C. 10 IN I.F. CAN P-1005

To peak I.F. transformers connect oscillator (set at 456 KC) to grid of 2A7 tube and (Black) ground wire. With variable condenser set at minimum capacity, (extreme left of its rotation) adjust four trimmers (one nut and one screw on each transformer trimmer) to resonance (maximum deflection on an output meter connected across the primary of the speaker input transformer).

To align Broadcast band, set wave changing switch to Green (right turn) and with variable condenser at minimum capacity disconnect antenna wire and connect 1550 KC oscillator to antenna coil in series with a 75 MFD condenser. Adjust oscillator (front) section trimmer to resonance. Set oscillator to 1400 KC, rotate variable condenser until signal is tuned in, then adjust R.F. (rear) section trimmer to resonance. Check output at 1200, 1000, 800, and 600 Kilocycles if necessary bend plates (of rear R.F. section of variable only).

To align Short wave band, set wave changing switch to RED (left turn) and with input oscillator connected as above and set at 1720 KC, tune in signal, adjust padding condenser on rear of chassis to resonance. Check for output at 1550 KC and at harmonics of 1000 KC (2000 KC), of 1200 KC (2400 KC), of 1400 KC (2800 KC), and of 1720 KC (3440 KC). **DO NOT BEND PLATES.**

For failure to operate over both bands check 2A7 tube and connections to and contacts of wave changing switch.

**C.5—C.6 One Unit P-118-1**

**VOLTAGES TAKEN FROM POINTS INDICATED TO CHASSIS GRD. VOL. CONT. ON FULL.**

**NUMBERS PREFIXED BY LETTER "P" ARE PART NUMBERS.**

**I. F. FREQUENCY: 465 K.C.**

**NOTE:—**

Beginning with 5K173250A, Antenna Coil No. 111-44 replaced No. 111-33, and capacities C1—00385 mfd. and C14—00011 mfd. were eliminated. Note: On early models C14 was a capacity winding on the primary of the No. 111-33 Antenna Coil.

See revised diagram

**Tubes**

The Tube complement of this chassis is as follows:

- 1 Type 6A7—pentagrid electron coupled oscillator and first detector.
- 1 Type 6D6—remote cut-off pentode as I.F. amplifier.
- 1 Type 6B7—duplex diode pentode as diode detector, A.V.C. and A.F.
- 1 Type 42—pentode output tube.
- 1 Type 80—high vacuum rectifier.

**Aligning I. F. Transformers**

1. With volume control full on, the extreme right of its rotation, and with variable condenser at its minimum capacity position, plates entirely out of mesh, adjust the I.F. transformers (two adjustments at the top of parts number 108-53 and 108-47)
  - (a) Connect external oscillator which has been adjusted to 465 kilocycles in series with I.F. dummy antenna, to the control grid cap of the type 6D6 tube and chassis ground. Adjust output I.F. transformer, part number 108-47, to resonance.
  - (b) Move generator output clip from grid of 6D6 tube to grid cap of 6A7 tube and align input I.F. transformer, part number 108-53.
  - (c) With generator connected to grid of type 6A7 tube, readjust output I.F. transformer, part number 108-47, to resonance.

**R. F. Alignment—**

(530 - 1720 Kilocycles)

1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with broadcast dummy antenna to tan antenna and black ground leads and make the following adjustments:
  - (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer, (rear of gang condenser).
  - (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance, (front section of gang condenser).
  - (c) Re-set external oscillator to 600 kilocycles and adjust series pad to resonance, rotate condenser and move dial pointer to 600 kilocycles by gently rocking condenser to and fro. Pick up oscillator signal while adjusting series pad to resonance, maximum deflection on an output meter. This adjustment is accessible from the top of the chassis and is located between variable condenser and power transformer.

25 Cycle Chassis differ only from 60 cycle chassis in that part number 104-18 transformer is used in place of 50/60 cycle transformer, part number 104-14.

**ALIGNING INSTRUCTIONS**

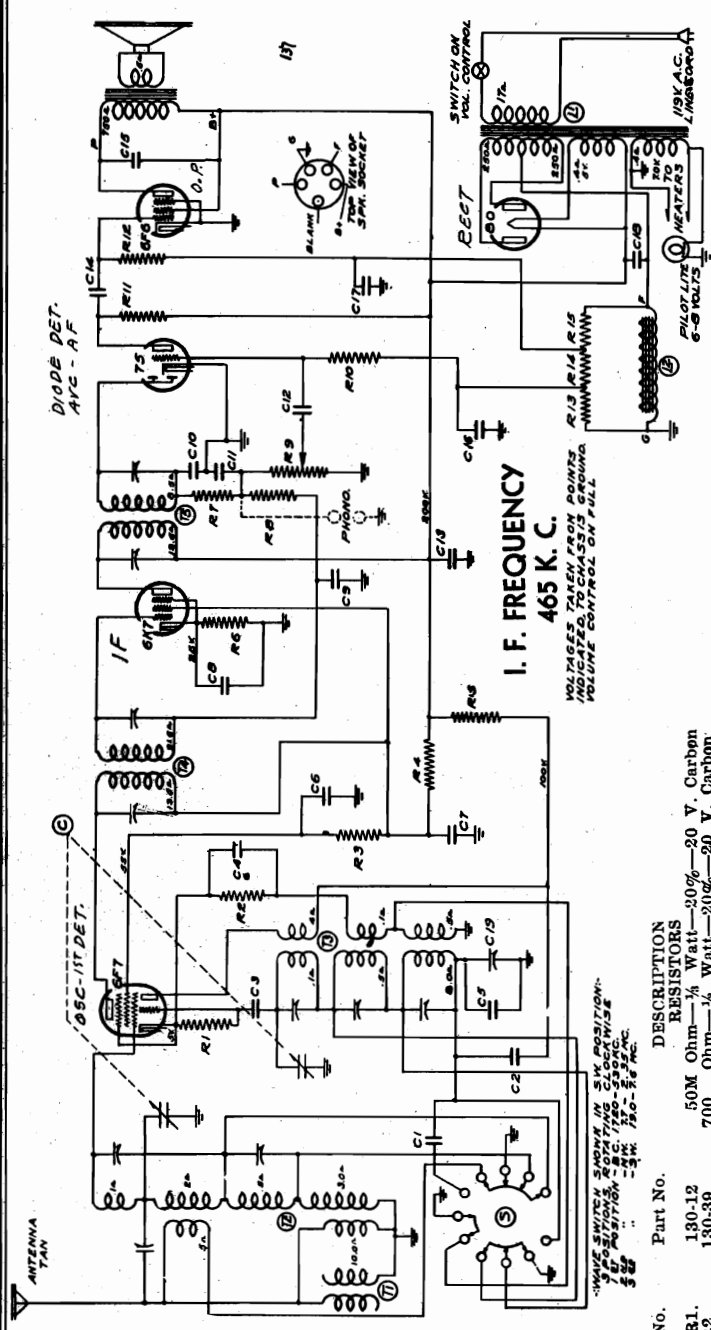

Description of various dummy antennas used and referred to in these instructions:

- (1) I.F. Dummy—Consists of a .1 mfd. condenser connected in series with the external oscillator.
- (2) Broadcast Dummy—Consists of a 200 mfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

**ALIGNING I.F. TRANSFORMERS: (465 K.C.):**

Part No. 108-83 Output I.F. Transformer  
Part No. 108-82 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:

- (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 78 tube, and adjust the output I.F. transformer (No. 108-83) to resonance.
- (b) Move oscillator output clip from grid of 78 grid cap of 6A7 and adjust input I.F. transformer (No. 108-82) to resonance.
- (c) With oscillator still connected to 6A7, readjust output I.F. transformer (108-83) if necessary.

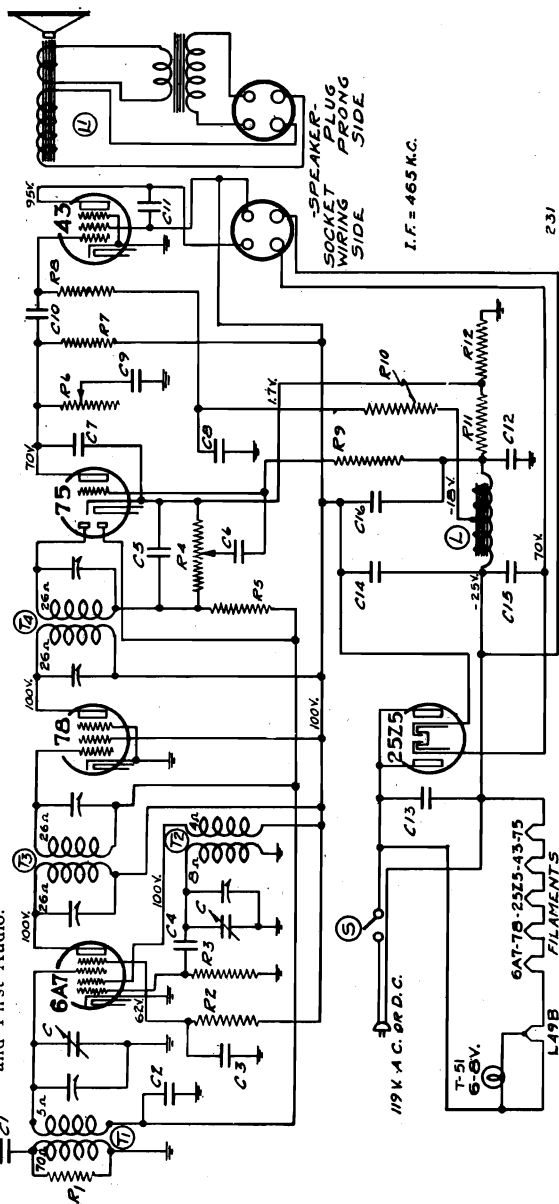

**R.F. ALIGNMENT: (535-1720 K.C.)**

1. Unsolder the antenna wire from its terminal on the antenna coil and with gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 50 mmf. condenser to the antenna terminal on the antenna coil and chassis ground and make the following adjustments:

- (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer (rear of gang condenser).
- (b) Re-set external oscillator to 1550 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance (front section of gang condenser).
- (c) Check sensitivity at 600 and 1000 kilocycles.

Type 43 Pentode Output Amplifier  
Type 25Z5 High Vacuum Rectifier.  
Type L49B Ballast Tube.

Type 6A7 Pentagrid Mixer, First Detector-oscillator  
Type 78 Remote Cut-Off Pentode, I.F. Amplifier (465 K.C.)  
Type 75 Duplex Diode Triode Second Detector, A.V.C. and First Audio.

MODEL 666, Runs 1,2

Speaker Connections GOODYEAR TIRE & RUBBER CO., INC.

Alignment

**NO SPARK PLUG SUPPRESSORS ARE REQUIRED**

**DESCRIPTION:**

Model No. 666 is a six-tube superheterodyne receiver having a tuning range of 530 K.C. to 1550 K.C., operates from a 6.0 volt storage battery and uses the automotive type 6.3 volt tubes. The "B" supply is obtained from a vibrator with a tube rectifier.

The I.F. frequency used is 465 K.C., the R.F. end of the receiver consisting of a high gain iron core antenna coil which gives high signal to noise ratio and an R.F. stage especially designed to give high image rejection and high I.F. attenuation. The I.F. transformers are designed to give high gain and selectivity and yet to have a broad nose for ease of tuning and hi-fidelity response. They are of the air core type and wound with solid wire to give minimum drift and variation of gain due to climatic changes.

The receiver is so designed that it may be used as either a single or two unit installation. Taps are provided on the output transformer to a pin jack terminal board, a red dot distinguishing dual speaker tap and green dot for single speaker operation.

For complete details see illustration and Header speaker data chart.

Dash kits for the remote control head are available for 1936 cars drilled for dash plates.

This receiver has been carefully designed to facilitate servicing, the top and bottom covers are both removable and are fastened in place by spring clips, self tapping screws and trimount buttons.

All adjustments are accessible and any part replaceable without removing the chassis from the case.

**TUBE COMPLEMENT**

- 1—Type No. 6K7—Remote Cut-off Pentode as an R.F. Amplifier
- 1—Type No. 6A8—Pentagrid Converter (composite first detector and oscillator)
- 1—Type No. 6K7—Remote Cut-off Pentode as an I.F. Amplifier (465 K.C.)
- 1—Type No. 6Q7—Duplex Diode Triode Second Detector, A.V.C. and First Audio
- 1—Type No. 6N6—Twin Triode Output Amplifier
- 1—Type No. 6X5—High Vacuum Rectifier

The tube complement consists of the latest "Metal-Glass" tubes which are interchangeable with metal tubes.

Cars with floating power must have the motor bonded to the bulkhead and again to the frame to provide a direct path for the high frequency interference developed in the ignition system. 5/8" copper braid will be necessary, SMALL DIAMETER WIRE WILL NOT DO. Bond flexible shaft leads, such as free wheeling, choke wires, etc., which pick up motor noise and reradiate it into the car. Free wheeling cables should be grounded at the point at which they go through the fire wall of the car. In extreme cases it has been found necessary to ground the steering column.

**I.F. ALIGNMENT**

1. With variable condenser in its minimum capacity position (plates entirely out of mesh) and with volume control full on, connect test oscillator set at 465 K.C. in series with I.F. dummy antenna, to grid of 6K7 I.F. tube.
2. Adjust trimmer condensers of output I.F. transformer No. 108-72 to resonance with oscillator.
3. Move test oscillator connection to grid of 6A8 tube and adjust trimmer condensers of input I.F. transformer No. 108-69 to resonance with oscillator. See top view for location of these transformers. There are two adjustments on each and they are accessible from the top of the transformer shield and should be adjusted with an insulated screw driver.

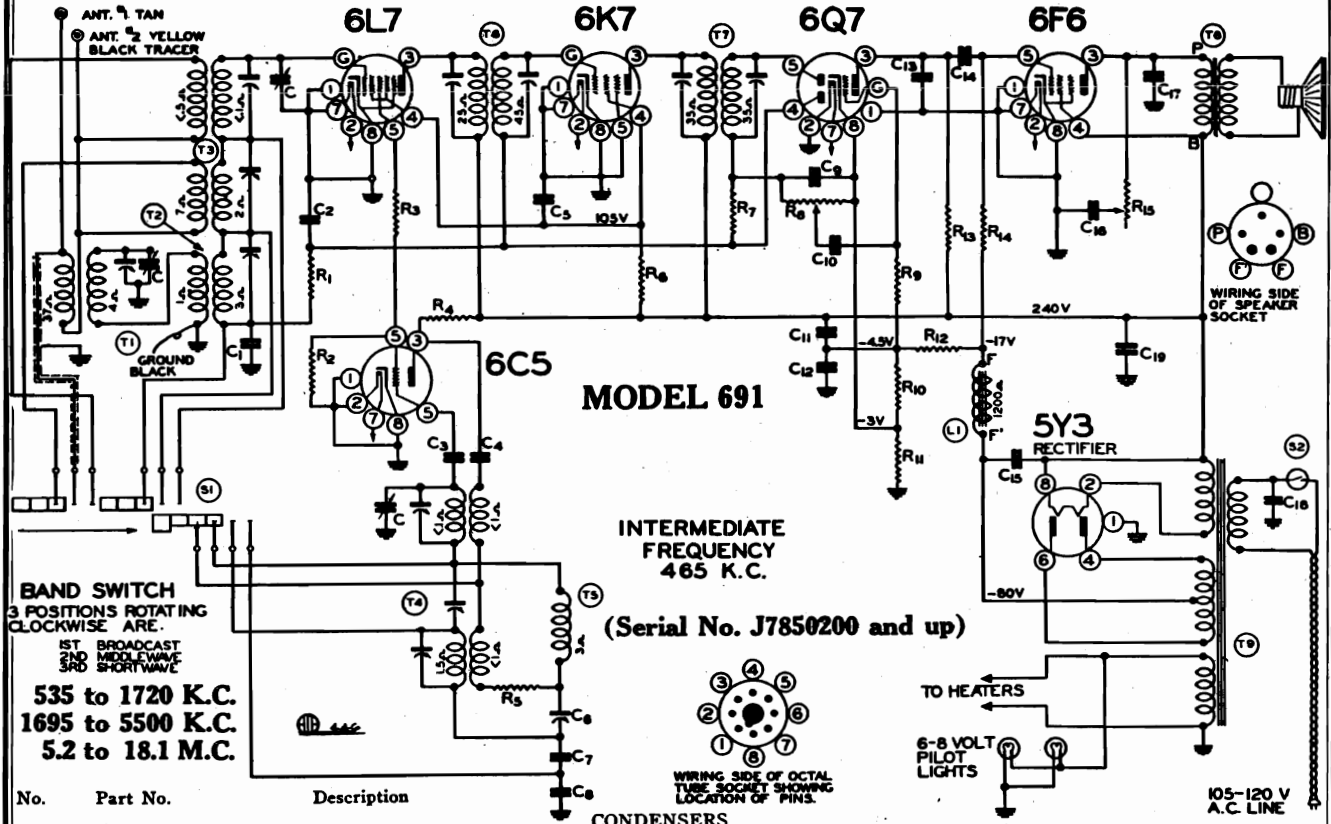

**BROADCAST ALIGNMENT**

1. With variable condenser in its minimum capacity position, connect test oscillator set at 1550 K.C. in series with broadcast dummy to the antenna lead of receiver.
2. Adjust oscillator trimmer of variable condenser to resonance. (This adjustment is on the middle section of the three-gang condenser—see top view).
3. Shift test oscillator to 1400 K.C. and pick up signal by rotating condenser and adjust R.F. and antenna trimmers to resonance (see top view).
4. Re-set test oscillator to 600 K.C. and rotate variable condenser to 600 KC. Adjust series pad rocking gang condenser to and fro at the same time adjusting series pad for maximum gain. This adjustment is accessible from the top of chassis (see top view).
5. Go back and check 1400 K.C. If adjustment is made here, check 600 K.C. again.
6. Check for sensitivity at 1000 K.C. by setting test oscillator to this frequency and picking up the signal by rotating variable condenser. Under no circumstances bend plates of variable condenser sections to correct tracking.

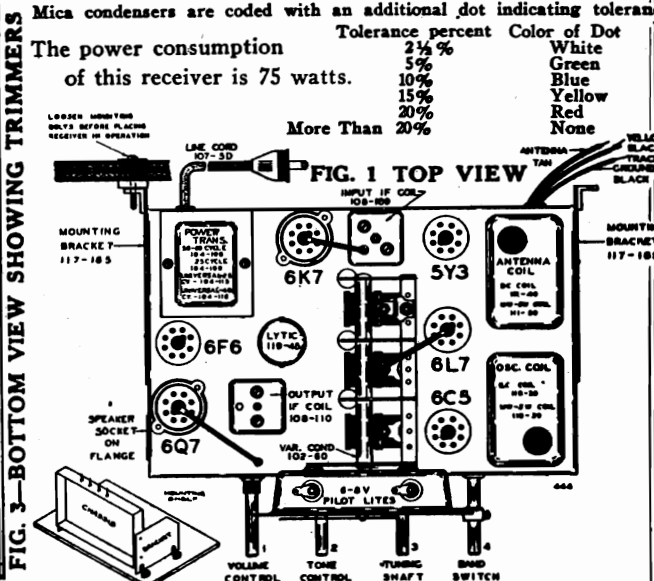

*Make certain that the instrument panel has a ground connection to the frame of the car.*

NOTE—Where ignition coils are mounted in motor compartments a .5 mfd cond (148-1 or 148-3) connected between primary coil terminal and receiver mounting bolt will often reduce motor noise.

MODEL 787  
Alignment

GOODYEAR TIRE & RUBBER CO., INC.

**ALIGNING I.F. TRANSFORMERS; (465 K.C.):**

- Part No. 108-73 Output I.F. Transformer.  
Part No. 108-74 Input I.F. Transformer.
- These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view, Fig. 3).
1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
    - (a) Connect external oscillator set at 465 kilocycles. In series with "Dummy 1," to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-74) to resonance.
    - (b) With "Dummy 1" still connected, move oscillator pickup from grid of 6K7 to grid cap of 6L7, and adjust input I.F. transformer (No. 108-73) to resonance.
    - (c) With oscillator still connected to 6L7, re-adjust output I.F. transformer (No. 108-74) if necessary.

**BROADCAST BAND ALIGNMENT:**

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of contact, connect external oscillator in series with "Dummy 2," to the tan antenna and black ground lead. Make following adjustments:
  - (a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance (adjustment number 1; see bottom view of coil assembly, Fig. 3).
  - (b) Re-set external oscillator to 1550 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (Adjustment number 2) to resonance, also adjust preslector trimmer which is on the rear section of the chassis, and adjust the three gang variable tuning condenser to resonance. (See top view of chassis, Fig. 1, for location of this adjustment.)
  - (c) Re-set external oscillator to 600 K.C., and adjust external oscillator trimmer to resonance (adjustment number 3; see bottom view of chassis, Fig. 3). Re-set external oscillator to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located in the bottom section of the chassis directly under the variable wave antenna condenser. (See bottom view of chassis, Fig. 3).
  - (d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.
  - (e) Check for tracking and sensitivity at 1000 kilocycles. Under no circumstances alter plates of variable condenser to correct tracking.

**SHORT WAVE BAND ALIGNMENT:**

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3," to the tan antenna and black ground lead, make the following adjustments:
  - (a) Move dial pointer to 17 megacycles and adjust short wave oscillator (Adjustment number 3) and resonance.
  - (b) Re-set external oscillator to 5 megacycles and pick up signal by rotating variable condenser and check sensitivity.
  - (c) Re-set external oscillator and check set at 18.1 megacycles and 5.3 megacycles for band coverage. It is extremely necessary in making all of these adjustments to check the frequency, which will be traced in and not the line frequency, which will fall below the fundamental. An example of this is an image of a fundamental 18.3 megacycle signal appears near 17.4 megacycles.

**MIDDLE WAVE BAND ALIGNMENT:**

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 1695 kilocycles and connected in series with "Dummy 2," to the tan antenna and black ground lead, make the following adjustments:
  - (a) Move dial pointer to 5000 kilocycles and adjust middle wave oscillator (Adjustment number 2) to resonance.
  - (b) Re-set external oscillator to 1600 kilocycles and pick up signal by rotating variable condenser and check sensitivity.
  - (c) Re-set external oscillator and check set at 5400 kilocycles and 1700 kilocycles for band coverage.

to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3.)

- (d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.
- (e) Check for tracking and sensitivity at 1000 kilocycles. Under no circumstances alter plates of variable condenser sections to correct tracking.

**SHORT WAVE BAND ALIGNMENT:**

52 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
  - (a) Move dial pointer to 17 megacycles and adjust short wave oscillator (Adjustment number 3) and resonance.
  - (b) Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check sensitivity.
  - (c) Re-set external oscillator and check set at 18.1 megacycles and 5.2 megacycles for band coverage.

**NOTE:** It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental. An example of this is an image of a fundamental 17 megacycle signal appears near 16.1 megacycles.

**MIDDLE WAVE BAND ALIGNMENT:**

1695 to 5500 Kilocycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5000 kilocycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
  - (a) Move dial pointer to 5000 kilocycles and adjust middle wave oscillator (Adjustment number 2) and resonance.
  - (b) Re-set external oscillator to 1800 kilocycles and pick up signal by rotating variable condenser and check sensitivity.
  - (c) Re-set external oscillator and check set at 5500 kilocycles and 1695 kilocycles for band coverage.
  - (d) Recheck broadcast band alignment.

**MODEL 787**

Volts taken from different points of circuit to check alignment with volume control full on, all tubes in their sockets, and with a 20 ohm resistor connected in series with a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with 119 volts on the primary of the power transformer. Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

**DUMMY ANTENNAS:**

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1," "Dummy 2," and "Dummy 3."

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator and a 20 ohm resistor connected in series with each antenna and in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each antenna and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

**MODEL 691 (Serial No. J7850200 and up)**

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

**IN ORDER TO PREVENT SIGNAL FROM ACTING UPON AVC AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS: AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.**

All voltages are to be measured with 115 volts on the primary of the power transformer.

**DUMMY ANTENNAS:**

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1," "Dummy 2," and "Dummy 3."

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

**ALIGNING I.F. TRANSFORMERS; (465 K.C.):**

Part No. 108-110 Output I.F. Transformer  
Part No. 108-109 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
  - (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1," to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-110) to resonance.
  - (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap of 6L7 and adjust input I.F. transformer (No. 108-109) to resonance.

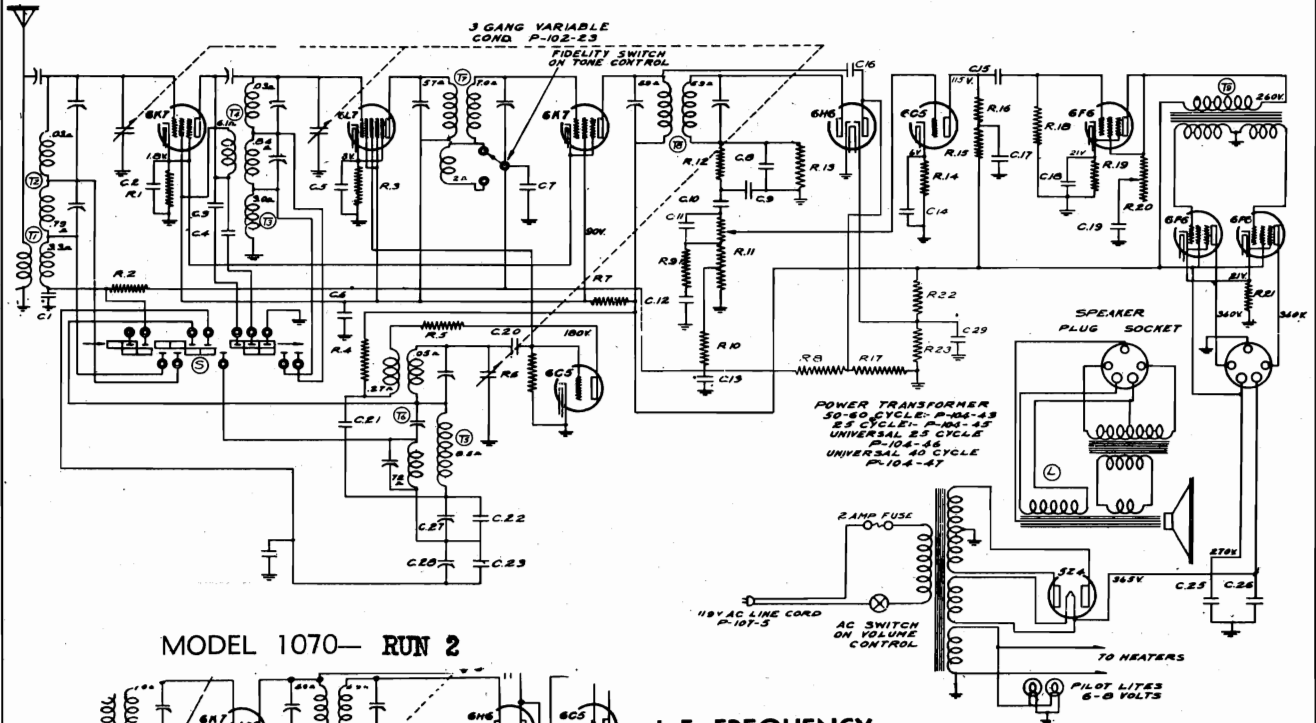

**BROADCAST BAND ALIGNMENT:**

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of contact, connect external oscillator in series with "Dummy 2," to the tan antenna, lead and black ground lead, make following adjustments:
  - (a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance (adjustment number 1; see bottom view of coil assembly, Fig. 3).
  - (b) Re-set external oscillator to 1550 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (Adjustment number 2) to resonance; also adjust preslector trimmer which is mounted on the top of the rear section of the three gang variable tuning condenser to resonance. (See top view of chassis, Fig. 1, for location of this adjustment.)
  - (c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad to resonance by rotating condenser to approximately 600 K.C., rocking it slowly

Table of parts and their descriptions, organized by assembly area such as 'CATHODE-RAY TUNING INDICATOR PARTS', 'DIAL PARTS LIST', and 'REPAIR PARTS LIST'. Includes part numbers, descriptions, and quantities.

(a) Adjust broadcast series pad to resonance with oscillator. Keep set in tune with oscillator by slowly rocking to find the variable condenser until maximum output is obtained. ... (b) Repeat adjustments "a" and "b" until sensitivity is at its maximum.

NOTE: THESE ADJUSTMENTS ARE MADE WHILE THE TUNING INDICATOR SIGNAL IS ON. THE TUNING INDICATOR SIGNAL MUST BE TUNED IN AND NOT THE IMAGE FREQUENCY WHICH WILL FALL BELOW THE FUNDAMENTAL. SHORT WAVE BAND ALIGNMENT: 1. With wave changing switch in the intermediate wave position, ... (a) Rotate variable condenser to approximately 1800 K.C. ... (b) Set external oscillator to 6 mcgacycles and pick up signal by rotating variable condenser and check for resonance.

ALIGNING I.F. TRANSFORMERS (465 K.C.) Part No. 108-92 Output I.F. Transformer Part No. 108-95 Input I.F. Transformer These I.F. transformers have two adjustments, both of which are accessible from the underside of chassis (see bottom view). 1. With volume control full on, (the extreme right of its rotation), the wave changing switch in the broadcast position, ... (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6L7 ... (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap of 6L7 and adjust input I.F. transformer to resonance. ... ALIGNMENT PRECEDURE The following adjustments to be made after the I.F.'s have been aligned as explained above. BROADCAST BAND ALIGNMENT: 1. With wave changing switch in the broadcast position, ... (a) Connect external oscillator set at 600 kilocycles, in series with "Dummy 2" to the tan chassis ground lead, make the following adjustments: ...

REPAIR PARTS LIST—MODEL 1070—RUN 1 REPAIR PARTS LIST—MODEL 1070—RUN 2

CAUTION: No adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna elements, line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is added in which the frequency adjustments should be accomplished with the necessary care. No slipping of adjustments should be attempted off and to take the chassis out of the cabinet, remove the four bolts by which it is fastened. ALIGNING I.F. TRANSFORMERS (465 K.C.) Part No. 108-92 Output I.F. Transformer Part No. 108-95 Input I.F. Transformer These I.F. transformers have two adjustments, both of which are accessible from the underside of chassis (see bottom view). 1. (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6L7 ... (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap of 6L7 and adjust input I.F. transformer to resonance. ... ALIGNMENT PRECEDURE The following adjustments to be made after the I.F.'s have been aligned as explained above. BROADCAST BAND ALIGNMENT: 1. With wave changing switch in the broadcast position, ... (a) Connect external oscillator set at 600 kilocycles, in series with "Dummy 2" to the tan chassis ground lead, make the following adjustments: ...

DESCRIPTION The tube complement of this chassis is as follows: 1—Type 6K7 Remote cut-off pentode R.F. amplifier 1—Type 6C5 Cathode ray tuning indicator 1—Type 6B7 Remote cut-off pentode I.F. amplifier (465 K.C.) 1—Type 6C5 First audio amplifier 1—Type 6B7 Pentode driver stage 1—Type 6B7 Pentode driver stage 1—Type 5Z4 High vacuum rectifier Transformers are available and chassis are sometimes equipped with universal transformers for operation on 40 and 60 cycles and with primary taps for 108, 125, 150, 200 and 250 volts (see instructions and also sometimes equipped with 25 cycle transformers with 105-115 volt or 220 volt primaries, not universal. SERVICE NOTES Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their socket and speaker connected with volt meter being used on the 1000 ohm scale. The voltages are clearly indicated on the circuit diagram of series A. IN ORDER TO PREVENT SIGNAL FROM ACTING UPON A.V.C. AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS. All voltages are to be measured with 110 volts on the primary of the power transformer. Resistance of coils and transformer windings are indicated in ohms on schematic circuit diagrams. To check for open by-pass condensers, shunt each condenser with

10-Tube A. C. All Wave 3-Band High Fidelity Supheterodyne Receiver with Cathode Ray Tuning Indicator

MODEL 1070 - RUN 2

NOTE.—Operation of Cathode-Ray Tuning Indicator Due to satisfactory indication of the cathode-ray tuning indicator on weak signals in some territories, a change was made in the circuit to correct this condition and still allow the tube to operate correctly on a strong signal. Referring to the circuit diagram, resistors R2k, R7 and condenser C3 were added and connected to the green wire from the cathode-ray tuning indicator as shown. The green wire on the first unit diagram indicates the tuner in which the wire was formerly connected, before resistors R2k, R7 and condenser C3 were added.

1—Type 6G5 Cathode ray tuning indicator.

**FIG. 3.—BOTTOM VIEW SHOWING TRIMMERS**

**FIG. 2.—FRONT VIEW**

**FIG. 1.—TOP VIEW**

**PROCEDURE FOR SETTING THE AUTOMATIC TUNER LEVERS:**

**IMPORTANT—READ CAREFULLY BEFORE SETTING THE AUTOMATIC LEVERS:**

A mute feature has been incorporated in the automatic tuning mechanism of the Model 1175. The function of this feature is to permit SILENT TUNING from one station to another by means of the automatic tuning levers. When any one of the levers are pressed down, the speaker is automatically disconnected from the radio and NO SIGNAL is heard until the lever is RELEASED.

To facilitate an accurate adjustment of the levers it is desirable to hear the station being tuned in while the lever is being adjusted; therefore a MUTE SWITCH is provided to manually connect or disconnect the silent tuning feature.

Referring to the top view of the radio (Fig. 1 in this manual), THE POSITION OF THE SWITCH (located on the top of the radio chassis alongside the power transformer), IS IMPORTANT.

Set the switch as follows:

**WHILE SETTING THE AUTOMATIC LEVERS:**

Switch should be snapped to the right (white dot not visible).

**AFTER AUTOMATIC LEVERS HAVE BEEN SET:**

Switch should be snapped to the left (white dot showing).

There are eight levers on the dial by means of which eight stations may be selected, (See "B", Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including 8.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

Above each automatic tuner lever an opening in the escutcheon is provided for inserting the call letter tabs, (See "A" Fig. 2). Any order of grouping may be used, however, it is recommended that the left hand four automatic levers be used for high frequency stations (1750 to 1000 K.C.) and the right hand four automatic levers for low frequency stations (1000 to 540 K.C.).

Insert the call letter tabs in the rectangular openings in the escutcheon above each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob No. 4 the station indicated on the station call letter tab above this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position), noting the width of the shadow indicated on the screen of the cathode-ray tuning eye. Minimum width on the eye indicates the ideal tuning position (resonance). The station will then be clearest and accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab above this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Rotate the tuning knob No. 4 to the right (clockwise) as far as it will turn. Now remove from the right side of the cabinet the metal button, and, with a screw driver inserted through the hole, tighten the locking adjustment screw "C". It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT. If a screw driver is not available, the locking screw can be tightened by reaching in from the back of the cabinet, and, by means of the pin "D" (see Fig. 1), rotate the locking screw shaft to the right (clockwise) until thoroughly tight.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory.)

If you should desire to change any station you selected to another, loosen the locking screw "C" four or five complete turns; select the new station as explained. (Note: If the dial mechanism works hard when setting up a new station for one of the automatic tuner levers, it is due to the locking screw being too tight. Loosen the locking screw "C" until the dial mechanism works freely with the tuner lever pressed down.)

BE SURE TO RETIGHTEN THE LOCKING SCREW; otherwise the stations you have selected will not stay adjusted to the levers.

Snap mute switch to silent tuning position (white dot showing)

## GOODYEAR TIRE &amp; RUBBER CO., INC.

MODEL 1175  
Alignment  
MODEL 01029  
Tuner, Alignment

## MODEL 1175

## DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1," "Dummy 2," and "Dummy 3."

**Dummy 1: (I.F.)**—Consists of a .1 mfd. condenser connected in series with the external oscillator.

**Dummy 2: (Broadcast)**—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

**Dummy 3: (Middle and Short Wave)**—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

## ALIGNING I.F. TRANSFORMERS (465 K.C.)

Part No. 108-114 Output I.F. Transformer

Part No. 108-113 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view Fig. 1).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), the tone control on "Hi" part of the sharp position (as much right rotation as possible without operating the Hi Fidelity switch), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:

- Connect external oscillator set at 465 kilocycles, in series with "Dummy 1." to the control grid cap of the type 6K7 I.F. tube and adjust the output I.F. transformer 108-114 to resonance.
- With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap to 6J7 and adjust input I.F. transformer (108-113) to resonance.
- With oscillator still connected to 6J7, re-adjust output I.F. transformer if necessary.

## BROADCAST BAND ALIGNMENT:

535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with external oscillator set at 1720 Kilocycles and connected in series with "Dummy 2" to the tan antenna and black ground lead, make the following adjustments:

- Move dial pointer to 1720 Kilocycles and adjust broadcast oscillator trimmer (adjustment I) to resonance. See bottom view, Fig. 3.
- Re-set external oscillator to 1400 Kilocycles, move dial pointer to 1400 Kilocycles and adjust broadcast antenna

trimmer, (adjustment A) and broadcast R.F. trimmer (adjustment D) to resonance.

- With external oscillator set at 600 K.C. adjust broadcast series pad (adjustment J) to resonance with oscillator. Keep set in tune with oscillator by slowly rocking to and fro the variable condenser until maximum output is obtained.
- Repeat adjustments (a) and (c) until sensitivity is at its maximum.
- Check for tracking and sensitivity at 1000 Kilocycles. UNDER NO CIRCUMSTANCES BEND PLATES OF VARIABLE CONDENSER TO CORRECT TRACKING.

## SHORT WAVE BAND ALIGNMENT:

5.35 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 Megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:

- Move dial pointer to 17 Megacycles and adjust short wave oscillator (adjustment G), short wave R.F. (adjustment F) and short wave antenna (adjustment C) to resonance.
- Re-set external oscillator to 6 Megacycles and pick up signal by rotating variable condenser and check for sensitivity.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental. As an example of this a fundamental 17 megacycle signal can be tuned in not only at 17 on the dial, but also at approximately 16.1 megacycles.

## MIDDLE WAVE ALIGNMENT:

1695 to 5500 Kilocycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5 Megacycles connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:

- Rotate condenser, pick up signal and adjust middle wave oscillator (adjustment H), middle wave R.F. (adjustment E) middle wave antenna (adjustment B) to resonance.
- Re-check broadcast alignment and if it is found necessary; re-adjust either R.F. or antenna trimmers. Repeat the 17 megacycles short wave and 5 megacycles middle wave adjustments.

## MODEL 01029 CHASSIS 860

(Serial No. 7L897400 and up)

## PROCEDURE FOR SETTING THE AUTOMATIC TUNER LEVERS:

There are eight levers on the dial by means of which eight stations may be selected. (See "B", Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including 8.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

Above each automatic tuner lever an opening in the escutcheon is provided for inserting the call letter tabs. (See "A", Fig. 2). Any order of grouping may be used, however, it is recommended that the left hand four automatic levers be used for high frequency stations (1750 to 1000 K.C.) and the right hand four automatic levers for low frequency stations (1000 to 540 K.C.).

Insert the call letter tabs in the rectangular openings in the escutcheon above each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 4) the station indicated on the station call letter tab above this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) noting the width of the shadow indicated on the screen of the cathode-ray tuning eye. Minimum width on the eye indicates the ideal tuning position (resonance). The station will then be clearest and accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab above this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Rotate the tuning knob (No. 4) to the right (clockwise) as far as it will turn. Now remove from the right side of the cabinet the metal button, and, with a screw driver inserted through the hole, tighten the locking adjustment screw "C". It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT. If a screw driver is not available, the locking screw can be tightened by reaching in from the back of the cabinet, and, by means of the pin "D" (see Fig. 1), rotate the locking screw shaft to the right (clockwise) until thoroughly tight.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, loosen the locking screw "C" four or five complete turns; select the new station as explained. (Note: If the dial mechanism works hard when setting up a new station for one of the automatic tuner levers, it is due to the locking screw being too tight. Loosen the locking screw "C" until the dial mechanism works freely with the tuner lever pressed down.)

BE SURE TO RETIGHTEN THE LOCKING SCREW; otherwise the stations you have selected will not stay adjusted to the levers.

## DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1," "Dummy 2," and "Dummy 3."

**Dummy 1: (I.F.)**—Consists of a .1 mfd. condenser connected in series with the external oscillator.

**Dummy 2: (Broadcast)**—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

**Dummy 3: (Middle and Short Wave)**—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

## ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-106E Output I.F. Transformer

Part No. 108-105D Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view, Fig. 1).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:

- Connect external oscillator set at 465 kilocycles, in series with "Dummy 1," to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-106E) to resonance.
- With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap of 6A8G and adjust input I.F. transformer (No. 108-105D) to resonance.

## BROADCAST BAND ALIGNMENT:

540 to 1750 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to tan antenna lead and black ground lead, make following adjustments:

- Set external oscillator to 1750 K.C. and adjust broadcast oscillator trimmer to resonance (adjustment E); see top view, Fig. 1.

(b) Re-set external oscillator to 1400 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (Adjustment A) to resonance; also adjust preselector trimmer which is mounted on the top of the rear section of the three gang variable tuning condenser to resonance. (See top view of chassis, Fig. 1, for location of this adjustment.)

(c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (Adjustment F) to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained.

(d) Repeat adjustments "a" and "c" until sensitivity is at its maximum.

(e) Check for tracking and sensitivity at 1000 kilocycles. Under no circumstances bend plates of variable condenser sections to correct tracking.

## SHORT WAVE BAND ALIGNMENT:

5.5 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:

- Move dial pointer to 17 megacycles and adjust short wave oscillator (Adjustment G) and short wave antenna (Adjustment C) to resonance.
- Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check sensitivity.
- Re-set external oscillator and check set at 18.1 megacycles and 5.5 megacycles for band coverage.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental. An example of this is an image of a fundamental 17 megacycle signal appears near 16.1 megacycles.

## MIDDLE WAVE BAND ALIGNMENT:

1750 to 5000 Kilocycles

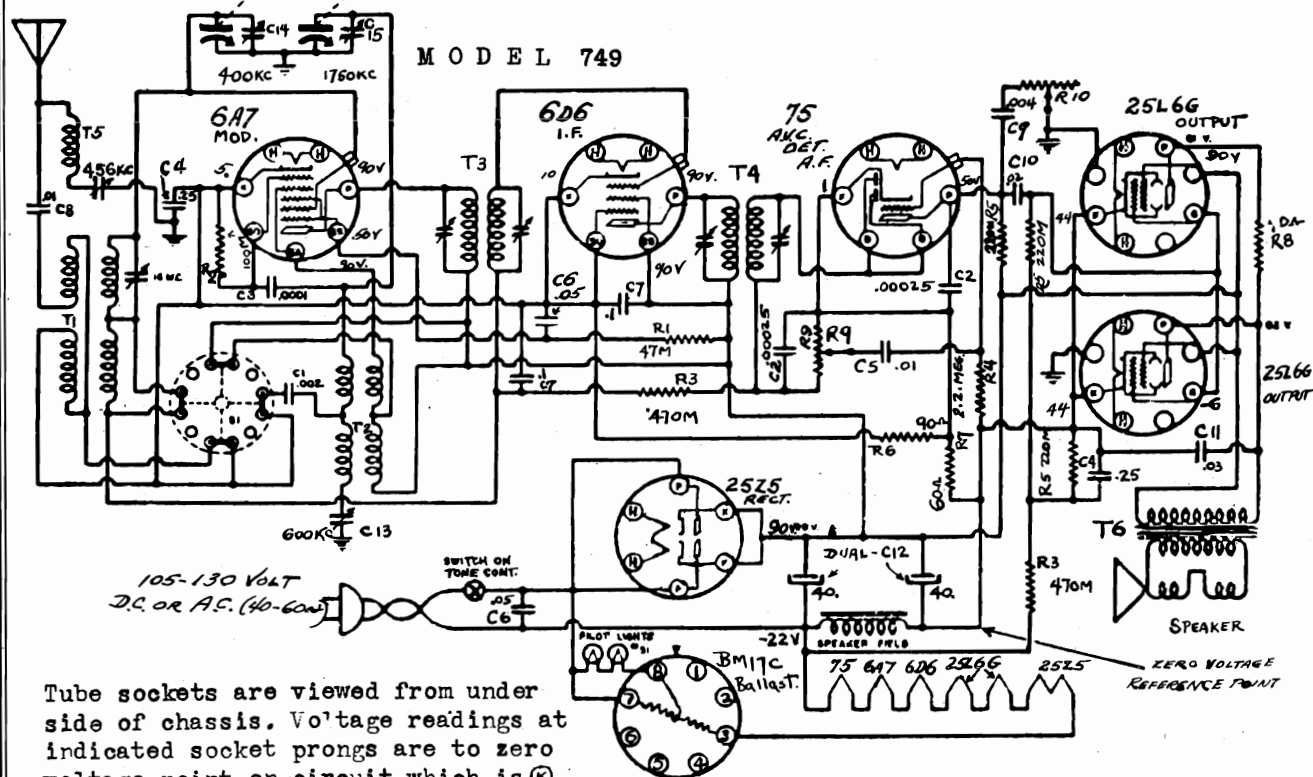

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5000 kilocycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:

- Move dial pointer to 5000 kilocycles and adjust middle wave oscillator (Adjustment D) and middle wave antenna (Adjustment B) to resonance.
- Re-set external oscillator to 1900 kilocycles and pick up signal by rotating variable condenser and check sensitivity.
- Re-check broadcast band alignment.

MODEL 749

Schematic, Voltage GOODYEAR TIRE & RUBBER CO., INC.

Socket, Trimmers  
Tuner

Tube sockets are viewed from under side of chassis. Voltage readings at indicated socket prongs are to zero voltage point on circuit which is ⊙ on 25L6G tube. Voltages must be measured with no signal. Alignment is to be made at the frequencies shown on the trimmer condensers.

Figures at cathodes are cathode currents in milliamperes. Capacity values are in microfarads.

Wave trap adjustment at 456 KC. Input is made to provide maximum reduction of signal. Where no voltage reading is shown at socket prongs, it indicates zero voltage or very low reading.

LOCATION OF PARTS ON TOP OF CHASSIS

IF PEAK 456 KC

**SETTING PUSH-BUTTONS**

1. By means of the Station Selector Knob, tune in **WITH THE RIGHT HAND AS ACCURATELY AS POSSIBLE** the station having the lowest frequency—that is, your selected station which is tuned in nearest the right-hand side of the dial.
2. After the station has been tuned in accurately with the right hand, continue to hold it in its exact position firmly, and with the left hand loosen the Push-Button to be set up for that station by unscrewing the Push-Button about one turn to the left (counter-clockwise).
3. Continuing to hold the Station Selector Knob in its exact position, **PUSH THE PUSH-BUTTON IN ALL THE WAY** with the left hand.
4. After the Push-Button has been depressed all the way, tighten it gently toward the right (clockwise). Release Push-Button slowly and when in normal position grip button and tighten firmly.

The Push-Button tuning system is now correctly set up for your first selected station of lowest frequency and the Call Letter Tab for this station should be at the extreme right of the Call Letter Holder.

Follow through with this same procedure, setting up the other 5 stations in the order of their frequency—that is, the second station set up will be second lowest in frequency and the third station set up will be third lowest in frequency.

Carefully check each Push-Button for the accuracy of its setting. If, when tuning in any station with its Automatic Push-Button it does not have equal volume or clarity to that obtained with manual tuning, this may indicate the automatic adjustment for that station was not made accurately. Should there be any inaccuracy in any one of the Push-Button adjustments, correction can be made by repeating the above procedure for that button only. Do not reset those Push-Buttons that are accurately adjusted.

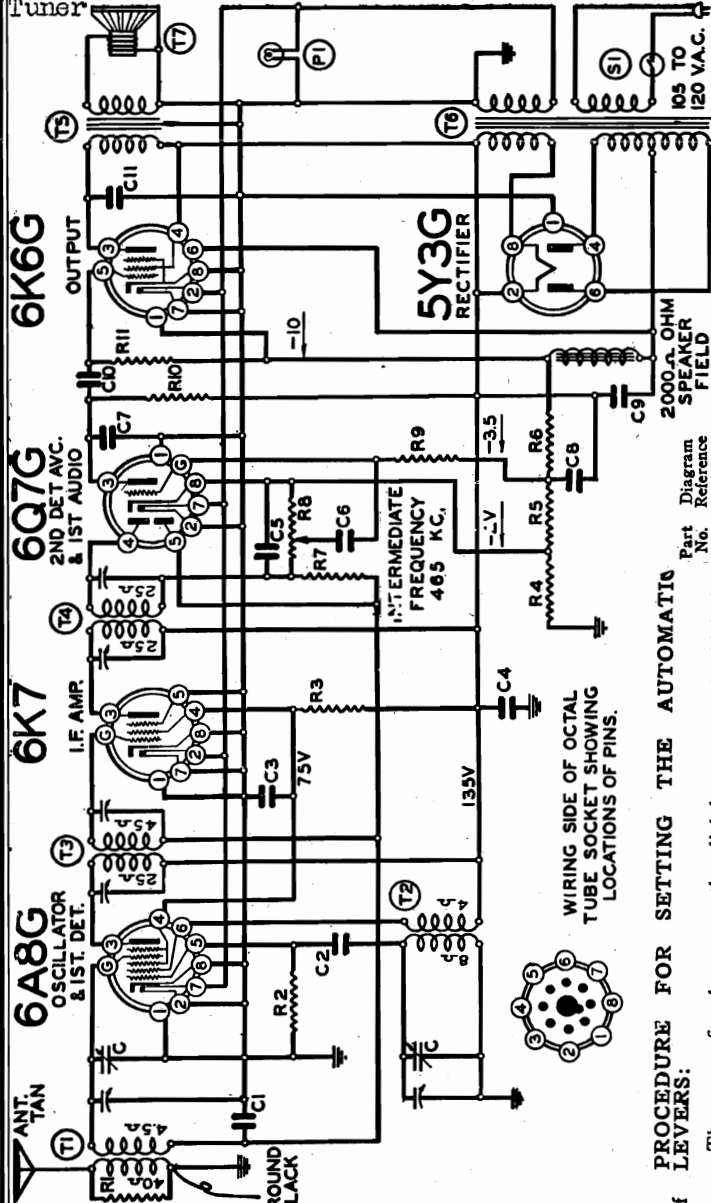

No further adjustments are necessary to operate your radio automatically or manually. To receive any one of your six selected stations for automatic operation, merely push in **ALL THE WAY** the Button set up for that station.

To receive all other stations in the regular manner, push in the Station Selector Knob and turn it to the frequency of the station desired.

Voltage, Trimmers

**PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:**

There are five levers on the dial by means of which five stations may be selected. Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 2) the station indicated on the call letter tab above this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab above this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Now hold tuning knob securely with left hand to prevent it from turning, or Rotate the tuning knob (No. 2) to the right (clockwise) as far as it will turn, and with a coin (half dollar), tighten the special locking screw ("C") in the center of the tuning knob, (See Fig. 1).

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, hold the tuning knob No. 2 securely and with a coin loosen the locking screw "C" one or two turns; select the new station as explained. Be sure to retighten the locking screw, otherwise the stations you have selected will not stay adjusted to the levers.

**ALIGNING I.F. TRANSFORMERS: (465 K.C.):**

- Part No. 108-95B Output I.F. Transformer
  - Part No. 108-96 Input I.F. Transformer
- These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).
- With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
    - Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-95B) to resonance.
    - Move oscillator output clip from grid of 6K7 to grid of 6A8G and adjust input I.F. transformer (No. 108-96) to resonance.
    - With oscillator still connected to 6A8G, readjust output I.F. transformer (108-95B) if necessary.

**R.F. ALIGNMENT: (535-1720 K.C.)**

- With the gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 100 mmf. condenser to the antenna lead and chassis ground and make the following adjustments:
  - With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
  - Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
  - Check sensitivity at 600 and 1000 kilocycles.

**DUMMY ANTENNAS:**

The dummy antennas referred to in the following instructions are:  
 "I.F. Dummy" —A .1 mfd. condenser connected in series with the test oscillator output lead.  
 "Broadcast Dummy"—A 200 mmfd. condenser connected in series with the output lead of the test oscillator.

**I.F. ALIGNMENT:**

1. With variable condenser in its minimum capacity position (plates entirely out of mesh) and with volume control full on, connect test oscillator set at 465 K.C., in series with I.F. dummy antenna, to the grid cap of the type 6A7 tube.
2. Adjust trimmer condensers of both input (108-56) and output (108-57) I.F. transformers to resonance with oscillator. See top view for location of these transformers. There are two adjustments on each and they are accessible from the top of the transformer shield and should be adjusted with an insulated screw driver.

**BROADCAST ALIGNMENT:**

1. With variable condenser in its minimum capacity position, connect test oscillator set at 1550 K.C. and in series with broadcast dummy, to the antenna lead of receiver.
2. Adjust oscillator trimmer of variable condenser to resonance (this adjustment is on the end section of the three gang condenser—see top view).
3. Shift test oscillator to 1400 K.C. and pick up signal by rotating condenser and adjust R.F. (center) and antenna (front) trimmers to resonance, see top view.
4. Re-set external oscillator to 600 K.C. and adjust series pad to resonance, rotate condenser and move dial pointer to 600 K.C. by gently rocking condenser to and fro. Pick up oscillator signal while adjusting series pad to resonance. This adjustment is accessible from the bottom of the chassis.
  - (a) Check for sensitivity at 1000, 800 and 600 K.C. by setting test oscillator to these frequencies and picking up the signal by rotating variable condenser. Under no circumstances bend plates of oscillator section, bend R.F. and antenna plates only if absolutely necessary.

NOTE—I.F. FREQ. 465 K.C.  
 ALL VOLTAGES MEASURED FROM  
 B- WITH A 1000 OHM PER  
 VOLT VOLTMETER. ANTENNA  
 GROUNDED TO CHASSIS 352

- With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
- Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
- Check sensitivity at 600 and 1000 kilocycles.

**SERVICE NOTES:**

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with 119 volt A.C. or D.C. line.

**ALIGNING I.F. TRANSFORMERS: (465 K.C.):**

- Part No. 108-83B Output I.F. Transformer
- Part No. 108-82B Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

- With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
  - Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6K7G tube, and adjust the output I.F. transformer (No. 108-83B) to resonance.
  - Move oscillator output clip from grid of 6K7G to grid of 6A8G and adjust input I.F. transformer (No. 108-82B) to resonance.
  - With oscillator still connected to 6A8G, readjust output I.F. transformer (108-83B) if necessary.

**R.F. ALIGNMENT: (535-1720 K.C.)**

- With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmf. condenser to the antenna lead and chassis ground and make the following adjustments:

NOTE: R11, Part No. 101-44 Variable Filament Rheostat is adjusted at the factory to keep the filament voltage of the tubes at 2 volts.

**TUBES:**

The tube complement of this chassis consists of the following tubes:

- The type and function of each tube is as follows:
- 1—Type 1A6 Pentagrid Mixer, First Detector-oscillator.
  - 1—Type 1A4 Super Control R. F. Tetrode I. F. Amplifier (465 K.C.)
  - 1—Type 1F6 Duplex Diode Pentode, Second Detector, A.V.C. and First Audio.
  - 1—Type 1F4 Pentode Output Amplifier.

**ALIGNING I.F. TRANSFORMERS: (465 K. C.):**

- Part No. 108-85 Output I.F. Transformer.
- Part No. 108-84 Input I.F. Transformer.

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view)

- With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
  - Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 1A4 tube, and adjust the output I.F. transformer (No. 108-85) to resonance.
  - Move oscillator output clip from grid of 1A4 to grid cap of 1A6 and adjust input I.F. transformer (No. 108-84) to resonance.
  - With oscillator still connected to 1A6, readjust output I.F. transformer (108-85) if necessary.

**R.F. ALIGNMENT: (535-1720 K.C.)**

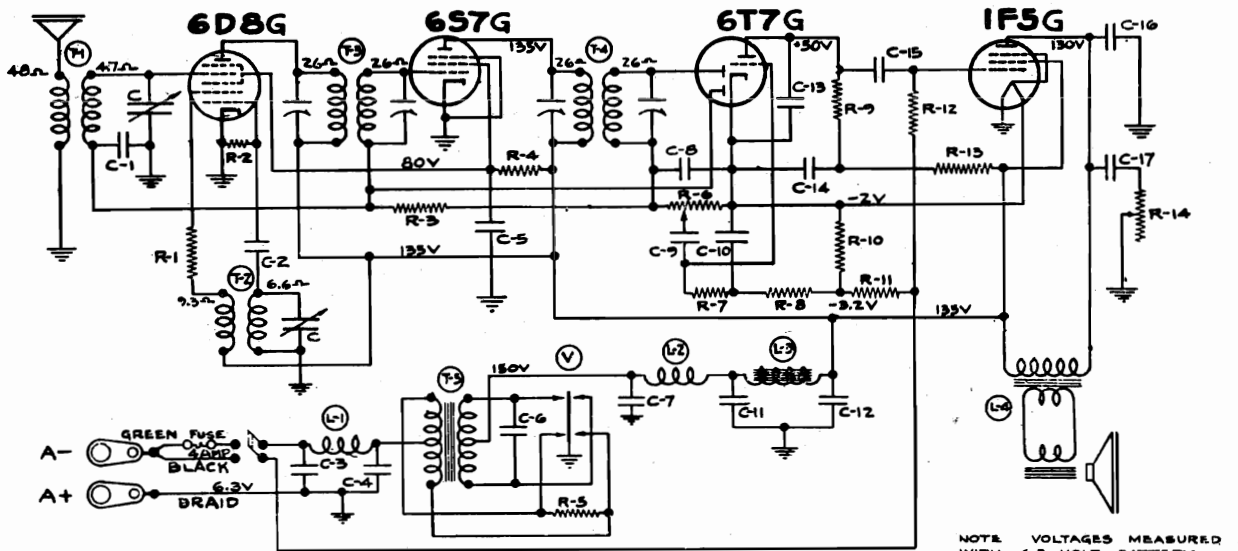

- With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmf. condenser to tan antenna and black ground leads and make the following adjustments:
  - With external oscillator set at 1720 kilocycles, adjust oscillator trimmer (rear of gang condenser).
  - Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance (front section of gang condenser).
  - Check sensitivity at 600 and 1000 kilocycles.

NOTE VOLTAGES MEASURED WITH 6.3 VOLT BATTERY. ALL VOLTAGES TAKEN FROM GROUND WITH 1000-ohm PER VOLT METER. \* MEASURED WITH 0-300V SCALE.

ALIGNING I.F. TRANSFORMERS: (465 K. C.):

Part No. 108-85 Output I.F. Transformer.  
Part No. 108-84 Input I.F. Transformer.

These I.F. Transformers have two adjustments, both of which are accessible from the top of chassis (see fig. 1, top view page 2).

- With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments.
  - Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6S7G tube, and adjust the output I.F. transformer (No. 108-85) to resonance.
  - Move oscillator output clip from grid of 6S7G to grid cap of 6D8G and adjust input I.F. transformer (No. 108-84) to resonance.
  - With oscillator still connected to 6D8G readjust output I.F. transformer (108-85) if necessary.

R. F. ALIGNMENT: (535-1720 K.C.)

- With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmf. condenser to an antenna and black ground leads and make the following adjustments:
  - With external oscillator set at 1720 kilocycles, adjust oscillator trimmer (rear of gang condenser).
  - Re-set external oscillator to 1400 kilocycles, rotate condenser, pick-up oscillator signal and adjust antenna trimmer to resonance (front section of gang condenser).
  - Check sensitivity at 600 and 1000 kilocycles.

The type and function of each tube is as follows:

- 1—Type 6D8G Pentagrid Mixer, First Detector-oscillator.
- 1—Type 6S7G Remote Cut-off Pentode I. F. Amplifier (465 K.C.)
- 1—Type 6T7G Duplex Diode Triode, Second Detector, A.V.C. and First Audio.
- 1—Type 1F5G Pentode Output Amplifier.

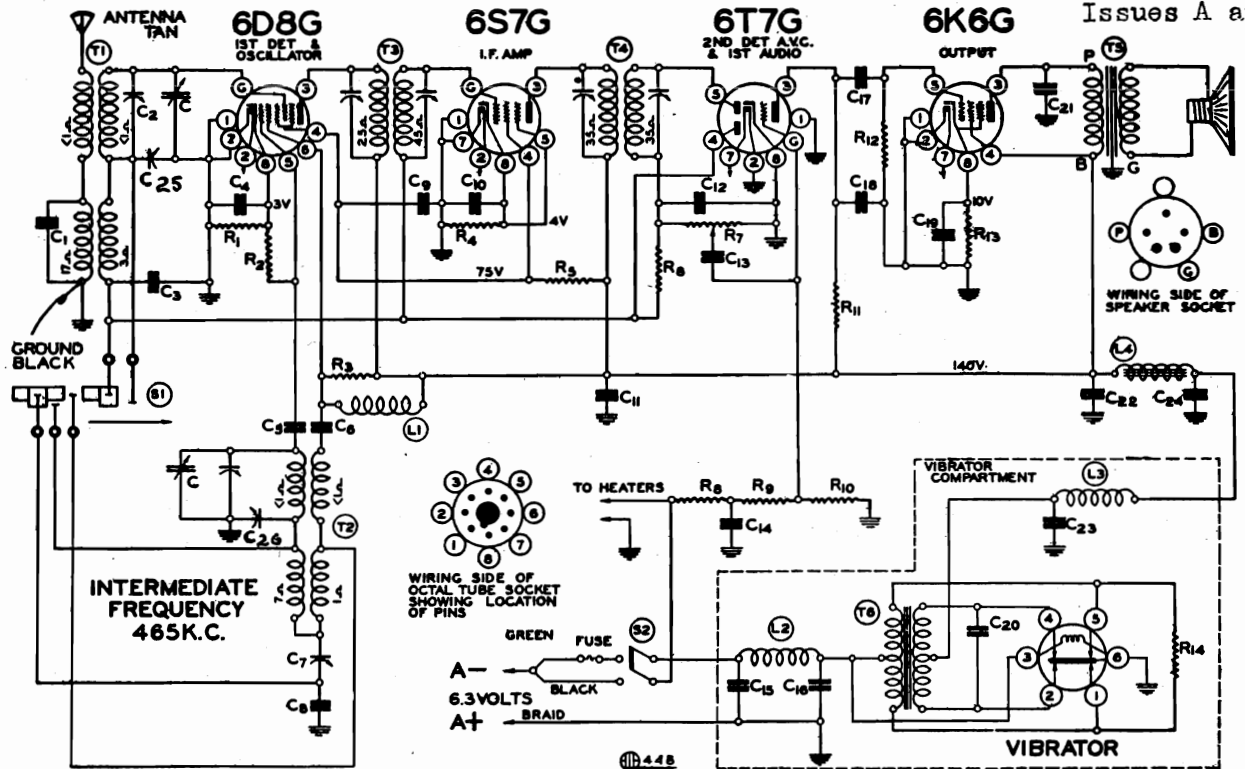

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 1F5G output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

FIG 3.—BOTTOM VIEW

FIG 3.—BOTTOM VIEW

(Serial No. 8C136800 and up)

**DUMMY ANTENNAS:**

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

**ALIGNING I.F. TRANSFORMERS: (465 K. C.):**

Part No. 108-106B Output I.F. Transformer

Part No. 108-105B Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser in its minimum capacity position, plates entirely out of mesh, make the following adjustments:
  - (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6S7G tube, and adjust the output I.F. transformer (No. 108-106B) to resonance.
  - (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6S7G to grid cap of 6D8G and adjust input I.F. transformer (No. 108-105B) to resonance.

**SHORT WAVE BAND ALIGNMENT:**

5.5 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the antenna and ground leads, make the following adjustments:
  - (a) Move dial pointer to 17 megacycles and adjust short wave oscillator trimmer to resonance.
 

This adjustment is the trimmer mounted on the top of rear section of the variable gang condenser (see Fig. 1, top view).
  - (b) Adjust short wave antenna trimmer (Adjustment Number 1), to resonance (see Fig. 3, bottom view).

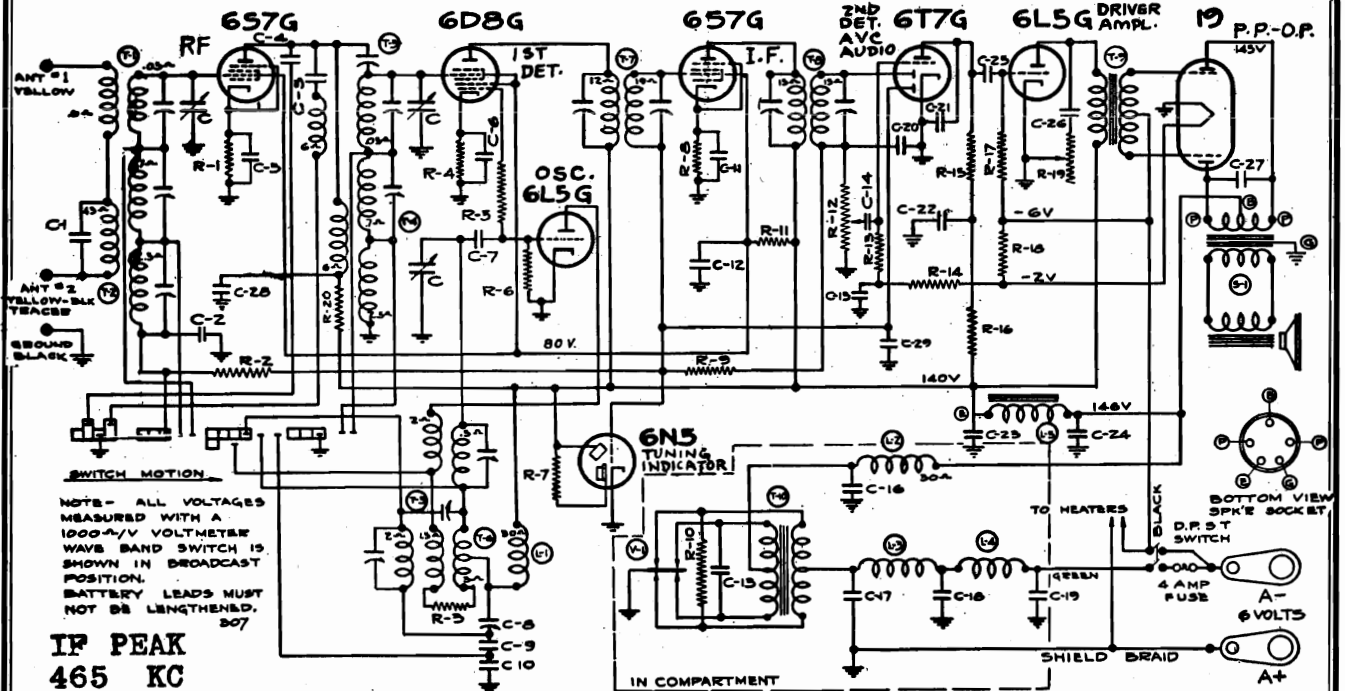

**BROADCAST BAND ALIGNMENT:**

535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to antenna and ground leads make following adjustments:
  - (a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment number 3, see bottom view of chassis, Fig. 3).
  - (b) Re-set external oscillator to 1400 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (adjustment number 2), to resonance.
  - (c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (adjustment number 4), to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3).
  - (d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.
  - (e) Check for tracking and sensitivity at 1400, 1000, and 600 kilocycles. **Under no circumstances bend plates of variable condenser sections to correct tracking.**

MODEL 010221

Chassis 804

GOODYEAR TIRE &amp; RUBBER CO., INC.

Trimmers, Alignment

**SERVICE NOTES:**

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

In order to prevent signal from acting upon A.V.C. and affecting accuracy of voltage measurements, aerial and ground leads should be short circuited while making measurements.

All voltages are to be measured with 6.3 volts input to receiver. Resistances of coils and transformer windings are indicated in ohms, on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

**RESONANCE INDICATOR:**

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the two plate terminals of the type 19 output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

**DUMMY ANTENNAS:**

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

**ALIGNING I.F. TRANSFORMERS: (465 K.C.):**

Part No. 108-92 Output I.F. Transformer  
Part No. 108-93 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:

- Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6S7G tube, and adjust the output I.F. transformer (No. 108-92) to resonance.
- With "Dummy 1" still connected, move oscillator output clip from grid of 6S7G to grid cap to 6D8G and adjust input I.F. transformer (No. 108-93) to resonance.

**SHORT WAVE BAND ALIGNMENT:**

5.35 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 18 megacycles and connected in series with "Dummy 3" to the antenna and ground posts, make the following adjustments:

- Move dial pointer to 18 megacycles and adjust short wave oscillator trimmer (adjustment number 1) to resonance.
- Re-set external oscillator to 17 megacycles and pick up signal by rotating variable condenser and adjust short wave R.F. trimmer (adjustment number 8), and short wave antenna trimmer (adjustment number 9), to resonance.
- Re-set external oscillator and check set at 18.1 megacycles and 6 megacycles for band coverage and sensitivity.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental on the receiver dial. As an example of this a fundamental 18.3 megacycle signal can be tuned in not only at 18.3 on the dial but also at approximately 17.4 megacycles.

**MIDDLE WAVE BAND ALIGNMENT:**

1690 to 5500 Kilocycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5.5 megacycles and connected in series with "Dummy 3" to the antenna and ground posts make the following adjustments:

- Move dial pointer to 5.5 megacycles and adjust middle wave oscillator trimmer (adjustment number 2) to resonance.
- Re-set external oscillator to 5 megacycles and pick up signal by rotating variable condenser and adjust middle wave R.F. trimmer (adjustment number 10), and middle wave antenna trimmer (adjustment number 5), to resonance.
- Re-set external oscillator and check sensitivity at 1700 kilocycles.

**BROADCAST BAND ALIGNMENT:**

540 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to antenna and ground posts, make following adjustments:

- Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment number 4; see bottom view of coil assembly, Fig. 3)
- Re-set external oscillator to 1400 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast R.F. trimmer (adjustment number 6) and broadcast antenna trimmer (adjustment number 7) to resonance.
- Re-set external oscillator to 600 K.C., and adjust broadcast series pad (adjustment number 3), to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3).
- Repeat adjustments "a" and "b" until sensitivity is at its maximum.
- Check for tracking and sensitivity at 1400, 1000, and 600 kilocycles. Under no circumstances bend plates of variable condenser sections to correct tracking.

**ALIGNING I.F. TRANSFORMERS: (465 K.C.)**

- With volume control full on and with variable condenser at its minimum capacity position, plates entirely out of mesh, and with external oscillator set at 465 K.C. connected in series with a .1 mfd. condenser, to the grid of the 1A6 tube (cap at top of tube), adjust I.F. transformers, parts number 108-67 and 108-68, to resonance. Both of these transformers have two (2) adjustments each, they are accessible from the tops of the cans (for location see top view).  
 Use as a resonance indicator an output meter connected across the outside terminals of the speaker or by means of an adapter to the plate and screen of the type 1G5G output tube. Maximum deflection of the volt meter indicates resonance. Use only enough signal to get a readily readable output.  
 A low range output meter or the low scale of a multi-range meter should be used.

**BROADCAST BAND ALIGNMENT:**

- Set external oscillator to 1720 K.C. and connect it in series with a 200 mmfd. condenser to the antenna and ground posts.
  - With variable condenser in its minimum capacity position, plates entirely out of mesh, adjust oscillator trimmer (rear section of variable condenser) to resonance.
  - Re-set external oscillator to 1400 K.C. Rotate variable condenser, pick up signal and adjust antenna trimmer (front section of variable condenser) to resonance.
  - Re-set external oscillator to 600 K.C., move dial pointer to 600 K.C., and adjust series pad, part number 124-14 (see top view), to resonance. While making this adjustment, slowly rock variable condenser to and fro until maximum output is obtained.
  - Check for sensitivity at 1400, 1000, 600 K.C. DO NOT BEND PLATES.

FOR BEST OPERATION THIS RECEIVER MUST HAVE AN OUTSIDE AERIAL NOT OVER FIFTY FEET LONG INCLUDING THE LEAD IN.

**Frequency Range 535-1720 Kilocycles**

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

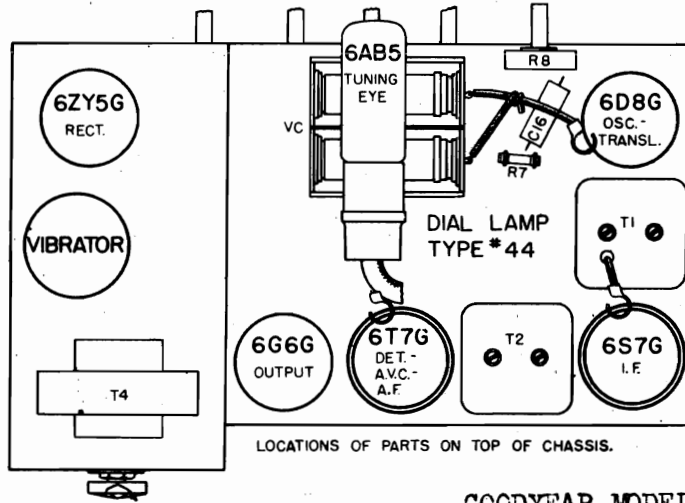

All voltages are to be measured with 115 volts on the primary of the power transformer.

POWER SUPPLY

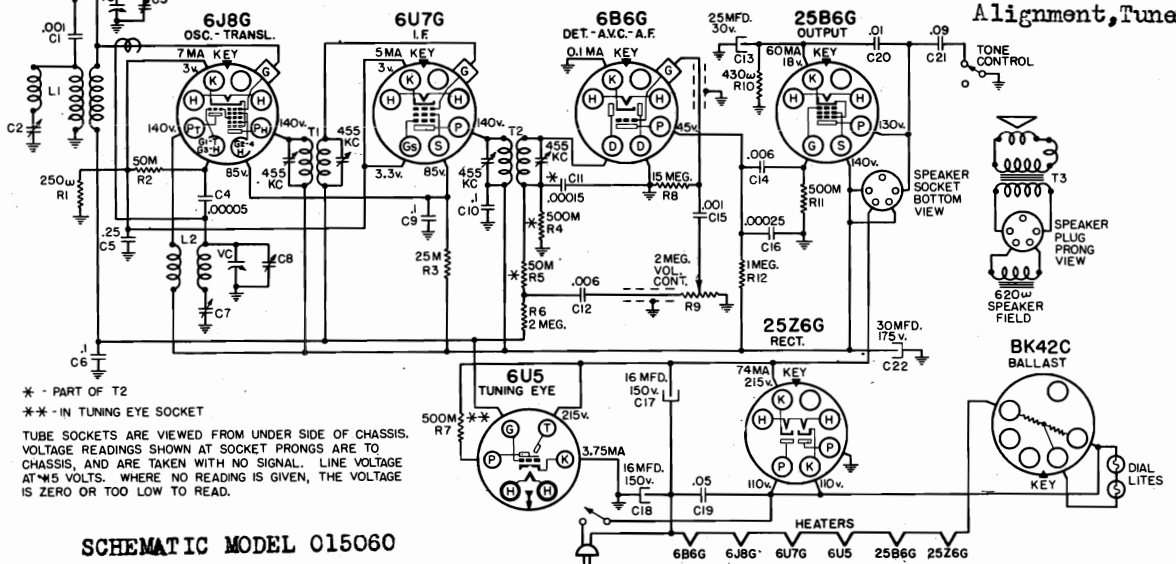

The receiver is designed for operation from 105-130 volt Alternating Current (A.C.) supply or a 105-130 volt Direct Current (D.C.) supply. Never connect the receiver to any supply having a higher voltage than that specified on the sticker. If you are not sure of the power supply voltage at your home, your Power Company will furnish the information.

When using a D.C. supply allow sufficient time for tubes to warm up (approximately 1½ minutes), and if at that time the receiver does not operate, remove the line cord plug from the socket and reverse. Replace plug in the reverse position and allow tubes to warm up, at which time the receiver will operate.

PUSH BUTTON TUNING FOR MODELS 015040, 015050, 015100, 015110

SETTING PUSH-BUTTONS

1. By means of the Station Selector Knob, tune in WITH THE RIGHT HAND AS ACCURATELY AS POSSIBLE the station having the highest frequency—that is, your selected station which is tuned in nearest number 160 on the Station Selector Knob.
2. After the station has been tuned in accurately with the right hand, continue to hold it in its exact position firmly, and with the left hand loosen the Push-Button to be set up for that station by unscrewing the Push-Button about one turn to the left (counter-clockwise).
3. Continuing to hold the Station Selector Knob in its exact position, PUSH THE PUSH-BUTTON IN ALL THE WAY with the left hand.
4. After the Push-Button has been depressed all the way, tighten it gently toward the right (clockwise). Release Push-Button slowly and when in normal position grip button and tighten firmly.

The Push-Button tuning system is now correctly set up for your first selected station of highest frequency and the Call Letter Tab for this station should be in the Push-button nearest the rear of the receiver.

Follow through with this same procedure, setting up the other 3 stations in the order of their frequency—that is, the second station set up will be second highest in frequency and the third station set up will be third highest in frequency.

Carefully check each Push-Button for the accuracy of its setting. If, when tuning in any station with its Automatic Push-Button it does not have equal volume or clarity to that obtained with manual tuning, this may indicate the automatic adjustment for that station was not made accurately. Should there be any inaccuracy in any one of the Push-Button adjustments, correction can be made by repeating the above procedure for that button only. Do not reset those Push-Buttons that are accurately adjusted.

No further adjustments are necessary to operate your radio automatically or manually. To receive any one of your selected stations for automatic operation, merely push in ALL THE WAY the Button set up for that station.

To receive all other stations in the regular manner turn the tuning knob to the frequency of the station desired.

PUSH BUTTON TUNING FOR MODELS 015060, 015120, 015130

SETTING UP:

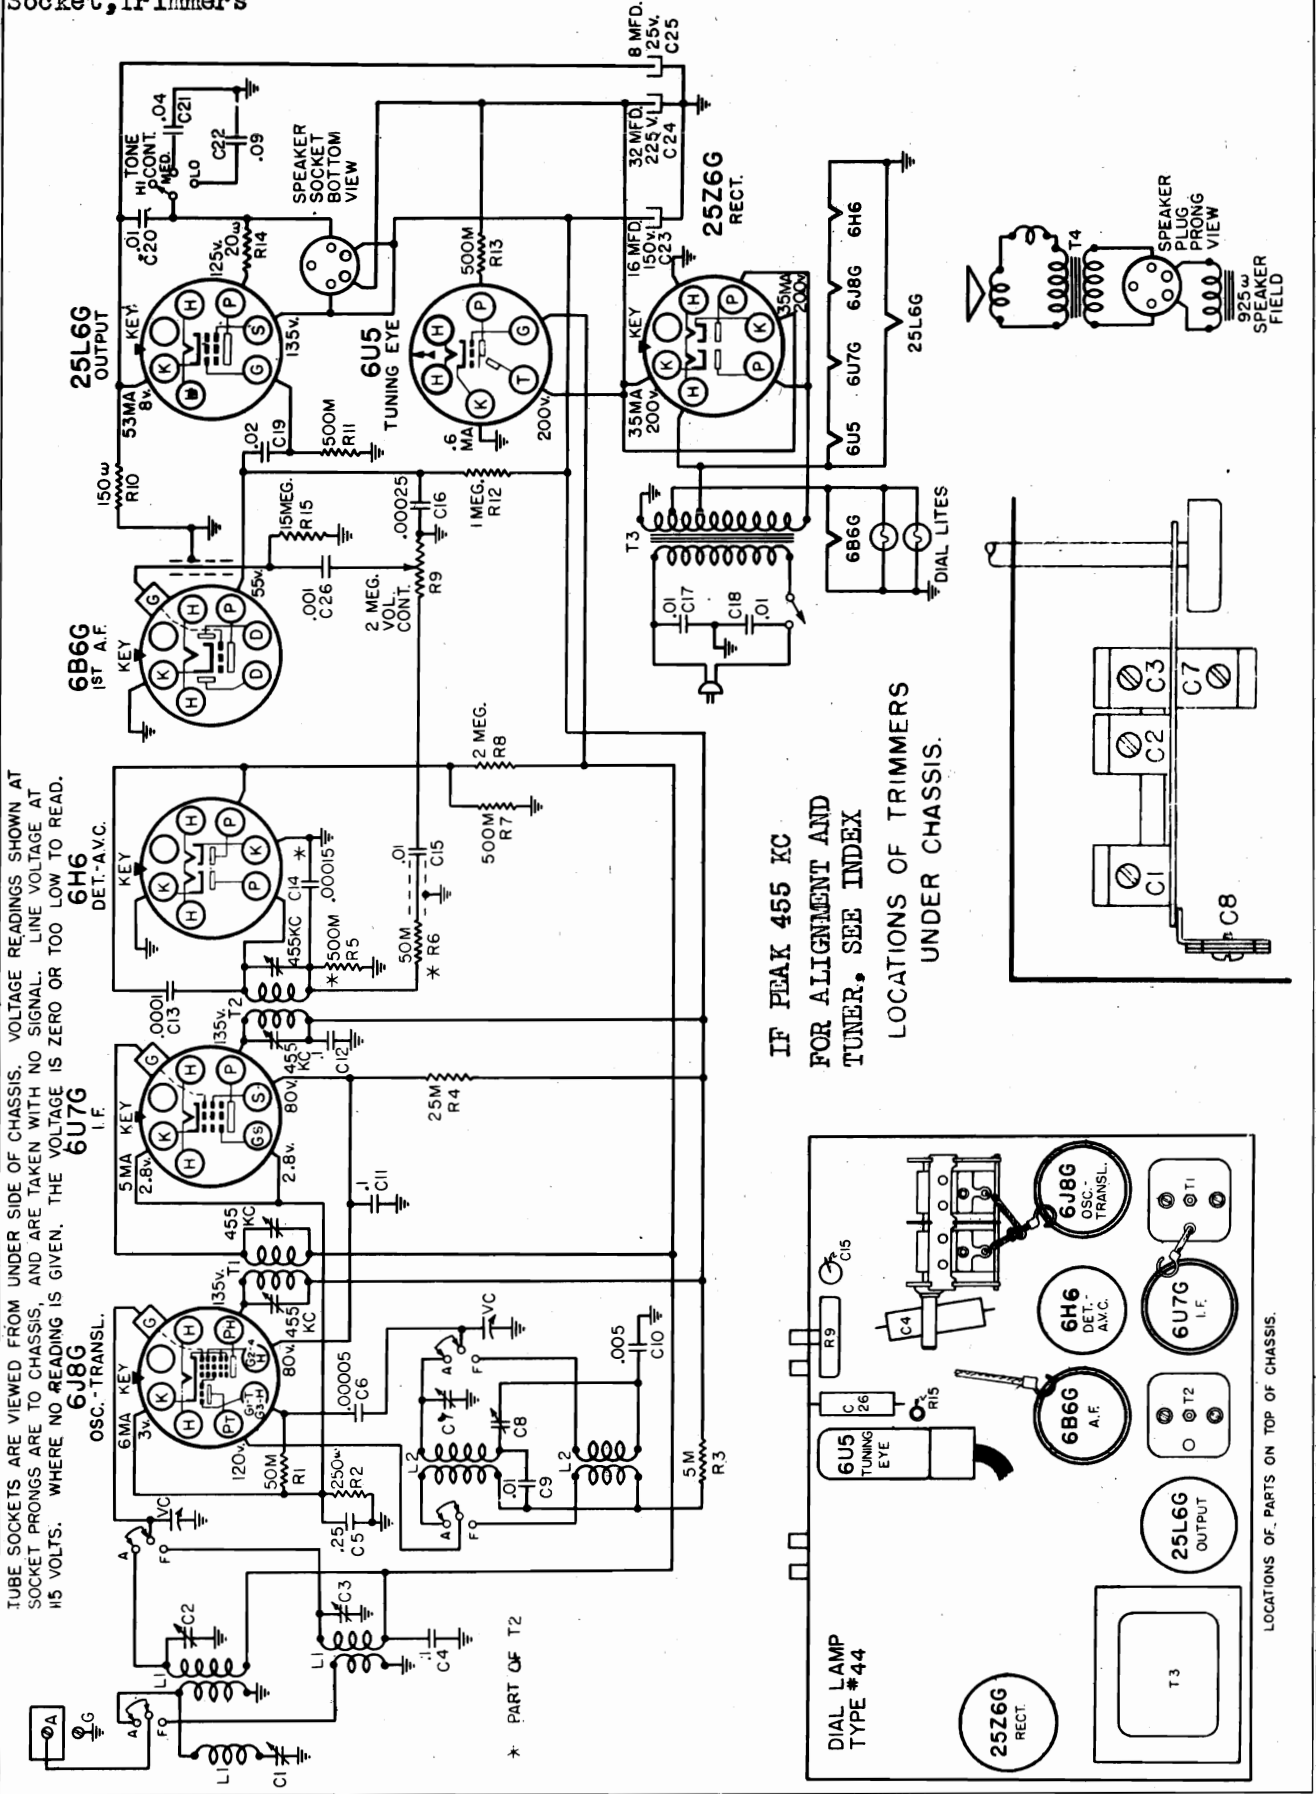

Unscrew (turn counter-clockwise) the push button two or three turns. (Use a token or screwdriver in the button slot to unscrew it, if necessary.) Push the button all the way in. Hold it in firmly and at the same time tune in your desired station. With your station tuned in, lock the adjustment by securely tightening (turn clockwise) the push button knob, using token or screwdriver. Hold the button in while tightening it. Unless the button is tightened securely, the adjustments may slip. Punch out the station's call letters from the sheet supplied and insert the call letters in the recess in the button. Then cover the call letters with one of the clear celluloid discs supplied.

Proceed in the same manner for the remaining buttons. If a change in selection of stations is desired, the old call letters can be removed with a pin inserted in the slot under the call letters.

GOODYEAR MODEL 015120

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection . . . . . Across loud speaker voice coil  
 Output meter reading to indicate 50 milliwatts . . . . . 0.37 volts  
 Generator ground lead connection . . . . . Receiver chassis  
 Dummy antenna value to be in series with generator output . . . . . See chart below  
 Connection of generator output lead . . . . . See chart below  
 Generator modulation . . . . . 30%, 400 cycles  
 Position of Volume Control . . . . . Fully clockwise  
 Position of Tone Control . . . . . HI  
 Position of Dial Pointer with variable fully closed . . . . . Horizontal

WAVE BAND SWITCH POSITION	POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	TRIMMERS ADJUSTED (IN ORDER SHOWN)	TRIMMER FUNCTION
"AM"	Closed	455 kc	.1 mfd.	1070 Grid	T2, T1	IF Output IF Input
"AM"	800 kc	455 kc*	.0002 mfd.	Ant. Term.	O1*	Wave Trap
"AM"	1400 kc	1400 kc	.0002 mfd.	Ant. Term.	O6, O2	Osc., Transl.
"AM"	800 kc(rook)	800 kc	.0002 mfd.	Ant. Term.	O7	Padder
"SW"	15 mc(rook)	15 mc	400 ohms	Ant. Term.	O4	Transl.

IMPORTANT ALIGNMENT NOTES

\* The generator should be adjusted for high output. The trimmer should be adjusted for minimum output meter reading instead of the usual maximum reading. If the frequency of an interfering station around 455 kc is known, the generator should be adjusted to the frequency of that station instead of to 455 kc.

Where indicated by the word, "Roak", the variable should be roaked back and forth a degree or two while making the adjustment.

The alignment procedure should be repeated stage by stage, in the original order, for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

FIG. 1

MODELS 015080 and 015090

PUSH BUTTON TUNING

SETTING UP:

Leave the radio turned on for about 15 minutes before adjusting the push buttons. This "warming up" period will insure permanent and accurate settings.

1. Make a list of the stations that you want to set up for push button tuning. It is helpful to arrange the stations in the order of their frequency (kilocycles). That is, the station of lowest frequency will be #1, the station of next higher frequency #2, etc. The top left push button can be used for station #1, the lower left one for station #2, the next upper one for station #3, etc. If you wish, short wave stations that can be tuned in on a SPREAD BAND scale can be set up for push button tuning. The stations selected must give strong and reliable reception.

2. Remove the four screws that hold the plate through which the push buttons protrude, and remove the plate. (This plate is called the "escutcheon".)

3. Push the tuning knob in and turn it so that the dial pointer comes to the left end of the dial. Engage the small screw driver with the slotted shaft that is between the tuning knob and the mechanism. Unlock the mechanism by turning the dial in and unscrewing it (turn counter-clockwise) about four turns. Then remove the screw driver.

4. Push the button that you wish to use for your #1 station, all the way in and hold it in firmly. Push the tuning knob in and turn it until your #1 station is tuned in exactly as indicated by the tuning eye. Be as exact as possible in tuning your station since this will determine how accurately your station will be tuned whenever you use the push button. Then let go of the push button before turning the tuning knob again. If properly done, the tuning eye indication will not change when you let go of the push button.

5. Push in your #2 button. Hold it in firmly and tune in your #2 station accurately. Then let go of the push button; then the tuning knob. Proceed in the same manner for the other stations on your list.

**CAUTION:** Use the small screw driver supplied for performing the next operation. Use of a larger screw driver than this one will result in a high torque being applied to the locking mechanism and the mechanism may be damaged. Otherwise it may be impossible to obtain proper operation of the push buttons and the mechanism is liable to be permanently damaged.

6. After the last station has been set up, lock the mechanism by pushing the slotted shaft in and securely tightening it (turn clockwise), using the small screw driver, supplied (Pushing the slotted shaft in will release the last push button. The dial pointer will move to the right end of the dial as the slotted shaft is turned.) Then remove the screw driver. If the slotted shaft remains pushed in when the screw driver is removed, turning it back and forth very slightly will release it.

After locking the mechanism, test the setting of each button by pushing it in. Then see if the station can be accurately tuned by using the tuning knob. Increased accuracy of tuning with the knob will be indicated by the tuning eye shading. If you find any stations that have not been correctly set up, unlock the mechanism as described in Step 3, and readjust the setting. Be sure to lock the mechanism again before tuning any stations.

7. Punch out the call letters of your desired stations from the call letter sheets supplied. Insert the call letters in the recesses in the front of the push buttons. Cover the call letters with the clear celluloid tabs supplied. Replace the escutcheon.

8. You may change your choice of stations at any time by unlocking the mechanism as described in Step 3 and adjusting the button to the new station, as described in Step 4. Then relock the mechanism as described in Step 5. The call letters of the new station should be inserted in the proper push button.

OPERATION:

Push the button, indicated for your desired station, all the way in. Your station then will be tuned in. If you have selected short wave stations for push button tuning, be sure the band switch is turned to the proper band. The button will remain part way in, indicating what station is tuned in, until you push another button or until you push the tuning knob.

SETTING UP:

Leave the radio turned on for about 15 minutes before adjusting the push buttons. This "warming up" period will insure permanent and accurate settings.

1. Make a list of the stations that you want to set up for push button tuning. It is advisable, but not necessary, to arrange the stations in the order of their frequency (kilocycles); that is, the station of lowest frequency will be #1, the station of next higher frequency #2, etc. The top left push button can be used for station #1, the lower left one for station #2, the next upper one for station #3, etc. If you wish, short wave stations can be set up for approximate push button tuning and then tuned accurately with the tuning knob. The stations selected must give strong and reliable reception.

2. Remove the four screws that hold the plate through which the push buttons protrude, and remove the plate. (This plate is called the "escutcheon".) If your radio is a table model (not a console), remove the snap-in button at the right side of the cabinet. See Fig. 1.

3. Push the tuning knob in and turn it so that the dial pointer comes to the right end of the dial. If your radio is a table model, a key, illustrated in Fig. 3, will be found in the instruction Leaflet envelope. Insert this key in the hole in the side of the cabinet from which the snap-in button was removed and engage the key with the slot at the end of the dial. Turn the dial clockwise until the dial pointer is in the position of the tuning eye. Lock the mechanism. (A screw driver can be used for unlocking the mechanism instead of the key supplied.)

If yours is a console model, the mechanism can be unlocked by reaching in from the back of the cabinet and unscrewing (turning counter-clockwise) the wing nut, at the end of the mechanism, a few turns. (This can be done by hand.)

4. Push the button that you wish to use for your #1 station, all the way in and hold it in firmly. Push the tuning knob making sure not to turn the tuning knob until you have let go of the button. Turning the knob while the button is pushed in would spoil the accuracy of the adjustment.) Be as exact as possible in tuning your station since this will determine how accurately your station will be tuned whenever you use the push button.

5. Push in your #2 button. Hold it in firmly and tune in your #2 station accurately. Then let go of the push button and then the tuning knob. Proceed in the same manner for the other stations on your list.

6. When all of the stations have been set up, push the tuning knob in and turn it so that the dial pointer comes to the left end of the dial. Then lock the mechanism by tightening (turning clockwise) the wing nut for console models or by using the key for table models. If yours is a table model, replace the snap-in button in the side of the cabinet.

7. Punch out the call letters of your desired stations from the call letter sheets supplied. Insert the call letters in the celluloid holders at the back of the escutcheon. Be sure to insert the call letters so that they are opposite their respective push buttons. Then replace the escutcheon.

8. You may change your choice of stations at any time by unlocking the mechanism as described in Step 3 and adjusting the button to the new station, as described in Step 4. Then relock the mechanism as described in Step 5. The call letters of the new station should be inserted in the call letter holder in their proper position.

**IMPORTANT ALIGNMENT NOTES**

The alignment must be done in the order given.

\*Two peaks can be had, one with the trimmer screwed further out than the other. The correct adjustment is with the trimmer screwed further out. The other peak is the image.

Where indicated by the word, "Rock", the variable should be rocked back and forth a degree or two while making the adjustment.

The alignment procedure should be repeated stage by stage, in the original order, for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

 Schematic, Changes, Tuner

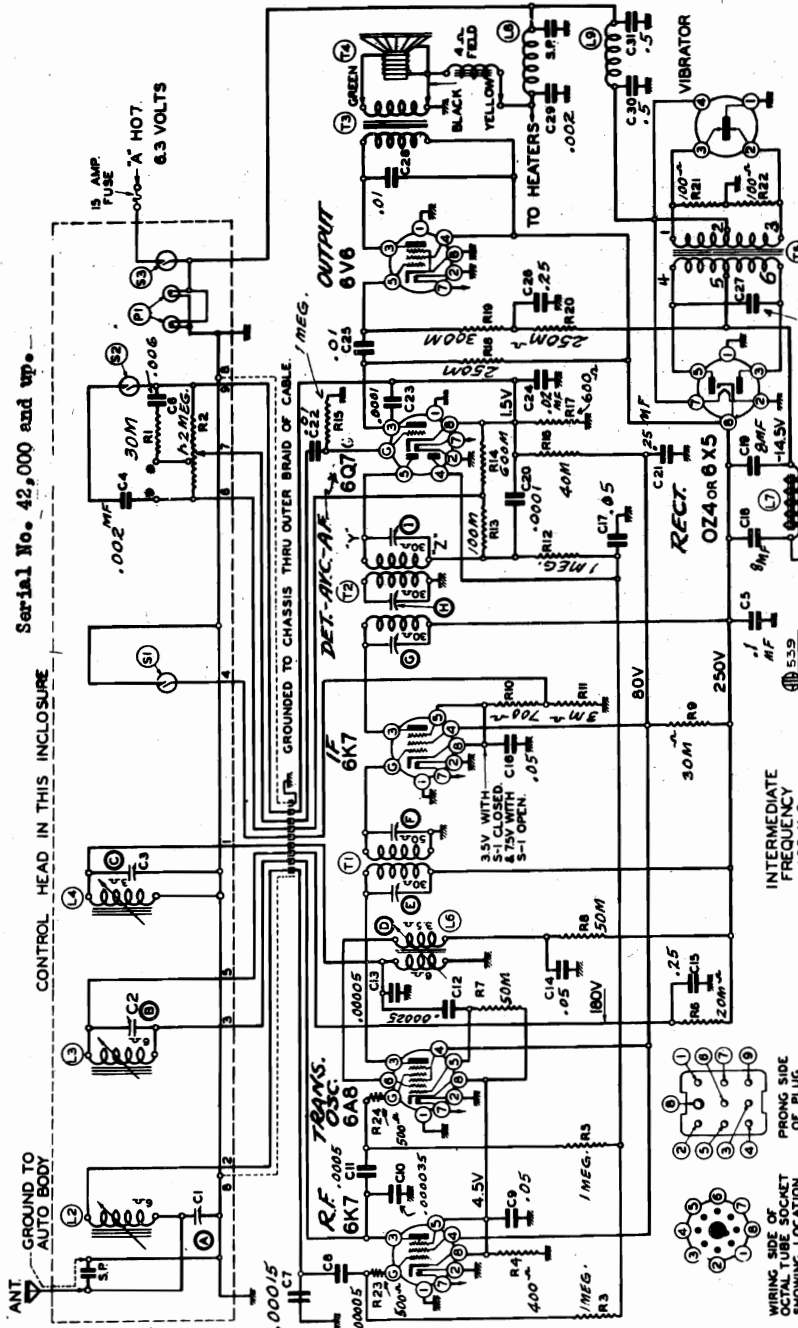

**SETTING THE AUTOMATIC TUNER LEVERS TO STATIONS:**

When setting up stations for the tuner levers it is important that the lever is pressed all the way down and held firmly in this position until the station is carefully selected by means of the manual tuning control.

This same procedure is followed until all the levers have been set up for stations, then the locking screw should be turned until it is absolutely tight. This is extremely important inasmuch as if the locking screw is not tight the cams on the cam shaft will slip and the stations will not stay adjusted to the tuner lever settings.

To reset one or more tuner levers to other stations it is only necessary to loosen the locking screw sufficiently to permit the mechanism to turn freely when the lever is pressed down as explained above and select the new station for the particular lever, however, make sure to re-tighten the locking screw again to lock the cams back in place.

R.F. Trimmer	600 kc

**CHANGE NOTICE**

The antenna tuning coil assembly and oscillator tuning coil assembly contained in the remote tuner unit on all models, starting with serial No. 42,000, were revised slightly from the coils used on radios serial numbered from 30,000 to 40,500.

The two groups of coils are interchangeable, however, it is recommended that in cases where replacement of a coil is necessary, that the early type coils be used on radios serial numbered from 30,000 to 40,500 and the later type coils on radios serial numbered from 42,000 up, it is apparent that L1 and L5 have been eliminated in the later type coils.

The part numbers of the coils were changed and following is a list giving the part number for both groups of coils.

Schematic Location	Part Number	Description	Selling Price Each
L1, L2	100181196	Antenna tuning coil assembly complete with antenna trimmer assembly, antenna choke coil, iron slug and shield can	2.60
L4, L5	1001811077	Oscillator tuning coil assembly, complete with trimmer assembly, series oscillator coil, iron slug and shield can	2.60
L2	1001811100	Antenna tuning coil assembly, complete with antenna trimmer assembly, iron slug and shield can	2.60
L4	1001811084	Oscillator tuning coil assembly, complete with trimmer assembly, iron slug and shield can	2.60

600 K.C.	600 K.C.	.000175 mfd.	Antenna Lead	D See Fig. 10	Shunt oscillator Series adjustment	Adjust to maximum output Rock dial See note "C"	1.5

**IMPORTANT ALIGNMENT NOTES**

A- To align the output I.F. transformer without using a cathode ray oscillograph, a 10M ohm resistor must be shunted across one winding of the output I.F. coil assembly while adjustment to trimmers G and H are being made.

Connect the resistor as indicated by points "Y" and "Z" on the circuit diagram as follows:

Locate the wires coming from the bottom of the output I.F. coil assembly on the underside of the radio chassis.

The white lead with green tracer which is connected to diode plate terminal No. 5 on the 6Q7 tube socket is one point and the white lead with brown tracer which is connected to the end terminal of the terminal strip is the other point.

B- Disconnect the 10M ohm resistor before adjusting trimmer "I". If a cathode ray oscillograph is used it will not be necessary to connect a 10M ohm resistor across a portion of the I.F. coil as explained.

C- When adjusting the shunt oscillator trimmer "D", which is mounted on the base of the radio receiver unit (See Fig. #10), the dial on the remote tuner unit should be rotated slightly to and fro at the same time adjusting trimmer "D" for maximum gain.

It is advisable to repeat the entire alignment procedure to insure greater accuracy.

Always keep the output from the test generator (oscillator) at its lowest possible value. As the sensitivity is increased by alignment, the generator output should be reduced correspondingly.

THE HALLICRAFTERS INC.

ALIGNMENT & SERVICING INSTRUCTIONS  
FOR  
SEVIER DIVERSITY RECEIVER  
MODEL DD1

SWITCHING ARRANGEMENT

For speed, ease and accuracy in aligning the Dual Diversity receiver, it is recommended that the output of the signal generator be terminated in a switching box in which you have installed a double throw single pole switch. From this switching box enclosed in a shielded cable which will serve as ground, run two leads one of which is connected appropriately to section "A" and the other to Section "B". Operation of the switch will readily allow you to switch the signal generator to either receiver section being aligned for a quick comparative check.

INTERMEDIATE FREQUENCY ALIGNMENT

Have controls set as follows:-  
Have I. F. gain switch in NORMAL position.  
Receiver switch to "A" side.  
All other gain controls adjusted for maximum gain.

IN ALIGNING "A" SECTION:-

Connect signal generator to the grid of the "A" section 6L7 converter (see diagram for location.) Adjust the signal generator for 455 KC output. Adjust I. F. transformers in the "A" receiver until they are peaked for maximum gain.

In Aligning "B" Section:-

Connect the signal generator as indicated above to the 6L7 converter tube in the "B" receiver and duplicate the adjustments done to the I. F. transformers of section "A". The receiver switch will necessarily be switched to the "B" side.

REJECTOR ADJUSTMENT

Before aligning the I. F. Rejector Circuit, the variable rejector condensers found below the chassis and driven by the long flexible copper cable, should be set as follows: With the rejector pointer set at  $\pm 3$  KC, check the first rejector condenser (closest to front panel in each I. F. section). It should have its rotor plates about 80% in mesh. The second rejector condenser (farthest from front panel) should have its plates about 20% in mesh. The same relationship should also exist between the condensers in the other I. F. section. When turning the rejector control from  $\pm 3$  KC toward  $\pm 18$  KC, the plates on the first rejector condenser should unmesh at the same time the plates on the second rejector condenser are meshing.

To correctly adjust the rejector circuit it is necessary to have two signals available which are accurately removed from the 455 KC fundamental by 3 KC on each side. The most satisfactory way to accomplish this is to use two crystals, one for 452 KC output and the other for 458 KC output. In the event, however, that crystals of those frequencies are not available, a satisfactory substitute can be used which consists of the following procedure: Put the BFO switch in the heterodyne position. Feed 455 KC from the signal generator into either 6L7 converter. Remove modulation from the signal being delivered by the generator. Obtain zero beat on the B. F. O. by operating the pitch control knob. Tune the generator slowly away from the 455 KC setting until a beat note of 3000 cycles (+ or - of 455 KC) is heard. Remember the pitch of that note. It will be necessary in adjusting the signal generator to a frequency 3000 cycles on the other side of 455 KC. A little practice will enable you to reset to each side of 455 KC by the 3 KC difference quite accurately and when signals of 452 and 458 KC are then available by this method, these signals should be used to properly peak the rejection circuit. This method is recommended only when a closely calibrated signal generator or a crystal controlled signal generator are not available.

Begin with receiver B. Set signal generator to 458 KC output. Adjust the 2nd Re-jector Control (shown in the top chassis view) for minimum response. There should be two points of minimum output. If there is only one minimum point, rotate the adjusting nut on this control approximately 1/4 turn from the minimum, and very carefully adjust the 1st rejector control until a minimum occurs. After this has been accomplished, adjust the 2nd rejector control for minimum response. Now adjust the first phasing control (screw driver shaft nearest front panel), for minimum response. Readjust the 2nd rejector control carefully for minimum response. Repeat with "A" side without changing setting of the signal generator, connecting the signal generator to the "A" side 6L7, and switching the receiver to the "A" side. Readjust signal generator to 452 KC. Make similar adjustments on Rejector Controls 3 and 4 and the rear phasing control. Switch over to the "B" receiver and repeat these adjustments on the "B" side.

Now retune signal generator to 455 KC (still connected to "B" side). Carefully repeat each of the I. F. transformer trimming condensers. Switch signal generator output to 6L7 in "A" side and repeat the above operation.

NOTE: The gain of each receiver should be approximately the same, variation between receiver sections should not exceed 25% as shown on output meter readings. If gain-balance is far off, interchanging the 6L7 I. F. amplifier tubes sometimes improves it.

R. F. ALIGNMENT

Adjust receiver to Band 1, set "A". Have all gain controls at maximum, balance control in center position.

Now connect signal generator to antenna post of "A" receiver section through a 400 ohm resistor. Be sure shorting strap from M2 to G remains connected. During all adjustments the grounded side of the generator should be connected to the ground post on the receiver.

Set band spread dial to "0" and leave it there during entire alignment. Adjust generator to 1400 KC. Set dial on receiver to that frequency. Align oscillator, 2nd R. F., 1st R. F. and antenna trimmers in the order named for maximum gain. Switch over to Receiver "B" and repeat the above operations with the exception of the oscillator section which does NOT require readjustment this time. Set generator and receiver to 600 KC. Adjust oscillator padder for maximum response. Retrim oscillator at 1400 KC. Repeat the above procedure on the remaining bands, except that on bands 3-4-5-6 the R. F. padders should also be adjusted for maximum response at the low frequency ends of each band.

Care should be exercised in avoiding alignment on the image frequency. In every case, the image will be heard approximately 1 megacycle lower in frequency when adjusting the main tuning dial.

The greatest caution should be taken when adjusting the No. 6 hand oscillator pad-der because only a slight change causes a large variation in frequency and may throw the oscillator frequency completely out of the band. The relative sensitivi-ties of receivers "A" and "B" should not vary more than 50%. A frequent cause of unbalance between receivers is defective 1B51 tubes or R. F. coils.

POWER PACK  
DD-P

MODEL DD-1, Dual Diversity  
 Socket, Trimmers  
 Alignment, Part 2

THE HALLICRAFTERS INC.

**BEAT FREQUENCY OSCILLATOR ADJUSTMENTS**

Place the B.F.O. Key in the Heterodyne position.

With 455 KC signal from generator feeding into the "A" 6L7 converter and receiver "A" functioning, and the chassis standing on its left end (looking at set from the front) adjust the padding condenser inside the B.F.O. Shield can until zero beat is reached. The B.F.O. shield can is located directly behind the pitch control. Prior to making this adjustment assure yourself that the PITCH CONTROL condenser is at 50% capacity pointer on control positioned vertically). When properly adjusted, rotation of the pitch control condenser will show two beat note signals 180 degrees apart.

**S METER ADJUSTMENT**

Push in No. 6 Band Button. With gain controls at maximum, adjust the zero reset control on all meters for zero.

**NOTES:**

If overload occurs on the broadcast band it might be advisable to shorten the length of the receiving antennas. If this recommendation is of little help check for a short to ground in the A.V.C. circuit.

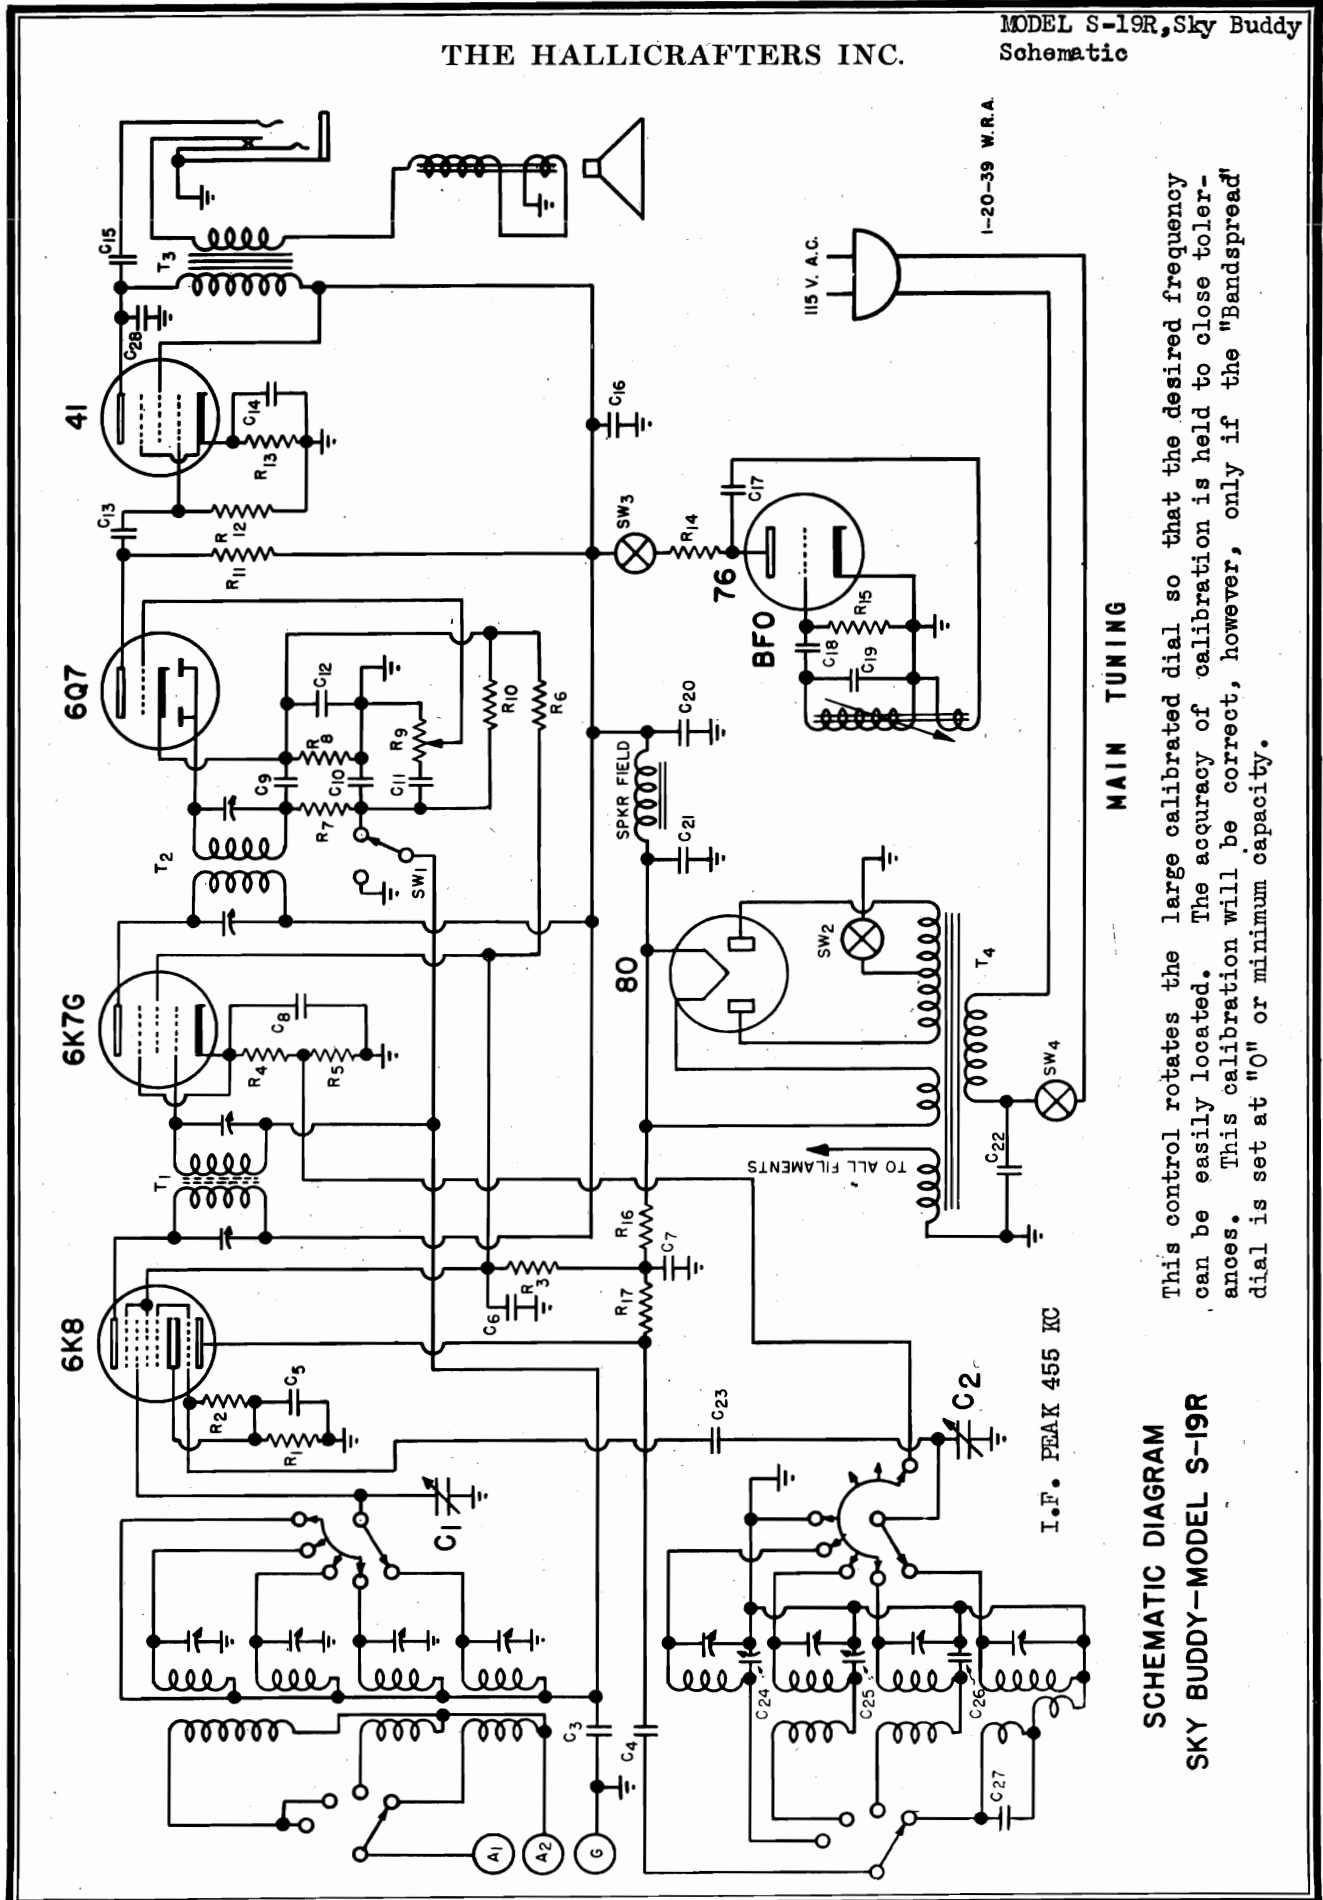

Should the occasion of examining the coil units arise, exercise extreme care in moving the heavy leads attached to the switch terminals. Excessive movement of one of these leads may cause the contacting portion of the switch to be thrown out of alignment and provide improper contact.

If it becomes difficult to properly heterodyne a strong signal when listening to C. W. reception, reduce the overall gain with the master gain control 'till a satisfactory note is obtained.

THE HALLICRAFTERS INC.

MODEL S-19R, Sky Buddy  
Schematic

MAIN TUNING

This control rotates the large calibrated dial so that the desired frequency can be easily located. The accuracy of calibration is held to close tolerances. This calibration will be correct, however, only if the "Bandspread" dial is set at "0" or minimum capacity.

The tube lineup of the S19-R Sky Buddy is as follows:

- 6K8 1st Detector - mixer
- 6K7G IF Amplifier
- 6Q7G 2nd Detector - 1st stage of audio
- 41 2nd Audio Amplifier
- 76 BFO
- 80 Rectifier

The Sky Buddy, model S19-R draws 50 watts at 117 volts, 60 cycles A.C.

## THE HALLICRAFTERS INC.

MODEL S-19R, Sky Buddy  
Alignment Notes

A Headphone Jack is mounted on the panel to the right of the Pitch Control Knob. When headphones are used, inserting the phone plug in the Jack automatically disconnects the speaker.

## ALIGNMENT PROCEDURE FOR SKY BUDDY MODEL S19-R

## I. F. ALIGNMENT

Have the controls set as follows:

Audio gain control at maximum

A.V.C. switch "on".

Range switch on Band #2.

Set main dial to minimum capacity 5.5 M.C. position

Remove 6K8 grid cap and connect signal generator to this tube.

Set signal generator for 455 KC output.

Adjust trimmers on transformers T1, T2 for maximum output.

For adjustment of the B.F.O., place the BFO switch in the "on" position. Remove the knob from the pitch control shaft. You will see a small adjustment screw in the center of this shaft. On the under-chassis side of this shaft you will see a set screw which should be loosened in order to allow adjustment of the screw in the center of the pitch control shaft. Adjust to zero beat. Tighten the set screw and replace the knob. Should the BFO still fail to operate check the .0005 condenser in the BFO circuit, or the 76 BFO tube.

## R. F. ALIGNMENT

Connect the generator to the A1 terminal on the antenna terminal strip found on the rear apron of the chassis through a 400 ohm resistor. Leave the jumper connected between A2 and G. The trim and pad points for the 4 bands are indicated below:

Trim	Band 1	Band 2	Band 3	Band 4
400 KC Adjust C <sub>A</sub>	600 KC Adjust C <sub>24</sub>	4 MC Adjust C <sub>B</sub>	14 MC Adjust C <sub>C</sub>	None-check at 7 MC
C <sub>E</sub>	C <sub>F</sub>	C <sub>D</sub>	C <sub>H</sub>	None-check at 14 MC

On the two high frequency bands where no padding adjustments are found, the checking frequencies should fall within 1 division of the dial calibration with no further adjustments.

During the R.F. alignment process it is advisable to "lock" the main tuning condenser across the frequency on which you are making adjustments to the receiver. Once the exact point of maximum output is obtained further adjustment is unnecessary.

## ANTENNA

For successful operation of the receiver throughout its tuning range very satisfactory results can be obtained with an inverted "J" type antenna 75 feet long overall. When this type of antenna is used the jumper should remain connected between A2 and G.

If the operator should wish to obtain the maximum in performance from the receiver on any one frequency, it is suggested that a half wave doublet antenna cut for that frequency be installed.

The formula for calculating the overall length of this antenna is:

$$\text{Length in feet} = \frac{463}{\text{Frequency in megacycles}}$$

The antenna is cut in the center and connected to a twisted pair transmission line having a characteristic impedance of 75 ohms. The other end of this line is connected to the A1 and A2 antenna posts.

This antenna will not perform well at harmonic frequencies but should be better than the inverted "J" on the frequency for which it has been designed. Performance on the #2 band, even with a suitable antenna, is subject to varying conditions of the time of the day and year.

A ground is usually not necessary for satisfactory performance of the model S19-R Sky Buddy receiver. If a ground does prove helpful it is connected to the "G" post of the antenna terminal strip.

## "BANDSPREAD"

In no other similar receiver but the S19-R Sky Buddy can be found such extremely smooth and satisfactory electrical bandspread action. The stator plates are an integral part of the main condenser and the separate rotor sections are driven by a gearless mechanism through the separate bandspread knob.

The controls along the bottom edge of the receiver are:

SEND-RECEIVE SWITCH which, when in the "send" position, removes plate voltage from the tubes.

THE BAND SWITCH allows selection of any one of the four ranges covered by the receiver. The newly incorporated 10 meter band will prove to be most interesting when conditions are favorable for reception on that range.

THE B.F.O. "ON-OFF" SWITCH allows optional use of the Beat Frequency Oscillator and is used when the operator is copying code signals. It will be of additional help in locating weak fone signals by first locating their carrier. Once located, the B.F.O. may then be turned off to eliminate the whistle.

THE PITCH-CONTROL Knob allows the operator to vary the pitch of the beat note when the BFO switch is in the "on" position. Selection of the pitch of the beat note most pleasing to the operator will be of help in copying through interference. The A.V.C. "OFF" and "ON" Switch is for optional use of automatic volume control. Should the strength of the telephone signal be so strong as to block the receiver the A.V.C. switch should be "on". For maximum sensitivity leave the AVC switch "off" and manually adjust the gain of the receiver with the audio gain control.

The receiver is turned on and off with this control and additionally provides variation of the volume delivered by the receiver to suit the requirements of the listener.

**MODEL SX23**  
**Super Skyrider**  
**Operating Data**  
**Antenna Notes**

**THE HALLICRAFTERS INC.**

**MODEL SX24**  
**Skyrider Defiant**  
**Antenna Notes**

The "RF Gain" control adjusts the sensitivity of the receiver by varying the cathode bias on the RF and IF amplifiers. Maximum sensitivity will be obtained with this control rotated clockwise as far as it will go. When this is done a switch will be operated, the function of which will be described under S meter.

When using the receiver under varying local conditions of noise, it will be advisable to adjust both the "RF" and "AF" gain controls until the most favorable signal to noise ratio is found. Until such a time as you have become thoroughly familiar with the function of all controls it is suggested that the R. F. gain be advanced until the white dot on the knob is pointing approximately at the "9" on SKYRIDER. Later experiment to find the best position for a given signal bearing in mind that with the selectivity switch in any of the

**CRYSTAL OPERATION**

There are three controls which must be properly adjusted for most satisfactory crystal filter operation. Their operation shall be treated in the order in which they are called upon to perform their functions in the receiver.

**Selectivity Switch -**

There are three positions of selectivity with the Automatic Volume Control circuit operating. For high fidelity broadcast reception the selectivity switch should be rotated to the "IF Broad" position.

With the switch placed in the "IF Sharp" position the selectivity is greatly increased at no apparent sacrifice in tone reproduction.

The "Phone Crystal" position affords maximum selectivity with automatic volume control. The receiver will have to be accurately resonated on each desired signal because this step of selectivity greatly attenuates the side-bands of a modulated carrier. You will notice the apparent slot into which the signal falls, only in the exact center of which will intelligibility of a good order be maintained. The "Phone Crystal" position is recommended under conditions of extreme interference where adjacent channels are causing objectionable heterodynes.

Rotating the switch in a counter-clockwise position still farther allows the receiver to be used in the three selectivity positions with the A.V.C. circuit disconnected. When the selectivity switch is so adjusted it is then necessary to manually adjust the "RF Gain" to keep the signal under control.

In the "CW Crystal" position the maximum selectivity of the set is obtained. The drop in background noise is immediately apparent. This position is recommended only for the reception of CW or code signals because the selectivity is so great phone signals are practically unusable. To realize the maximum in performance from the SKYRIDER 23 crystal circuit, the following two controls should be adjusted as described. First tune in an extremely strong CW signal.

The "Pitch Control" should be turned until a beat note is audible. Then adjust the main tuning control and go across the signal. Two distinct signals will be heard either side of zero beat, or the null position in the center tuning through which no signal is audible. See whether the low or the high frequency side of the signal (that which appears either side of zero beat) is the weaker. Leave the receiver set on whichever of the two signals is the weaker. Now very carefully adjust the "Pitching Control" until you have eliminated that signal as much as possible. As an additional step to see whether you have eliminated proper low or high frequency image to reject, rotate the "Pitch Control" through zero beat to the other side so that a beat note of approximately the same pitch as before is obtained. Now return the receiver and it will be apparent that the signal on the other side of zero beat (as referred to the markings on the dial at which this signal was first tuned in) is reduced in volume. Again carefully adjust the "Pitching Control" and compare the strength of the audio image when this side has been phased out, or rejected. When you have demonstrated that the phasing or rejection is better on either the low or high frequency audio image the phasing control is left in that position and you then have the SKYRIDER 23 adjusted for the extremely selective crystal action for which it is noted.

The "Pitch and Phasing Controls" should be called upon frequently to demonstrate how, through proper adjustment, extreme conditions of interference can be coped with. Frequently, a slight adjustment of the pitch control will place a desired signal in the clear when the two signals differ in frequency by only a few hundred cycles. Minute adjustment of the phasing control will frequently obliterate an interfering signal by dropping it in the crystal slot.

**ANTENNA:**

**SUPER SKYRIDER**

**MODEL SX23**

The SKYRIDER 23 has an antenna input circuit which will allow the use of either a doublet or Marconi (inverted "T") antenna. The approximate antenna input impedance of the SKYRIDER 23 is 400 ohms.

A very serviceable antenna will be the inverted "T", or Marconi type. This antenna should be approximately 75 feet long overall, including the lead-in to the set. Satisfactory operation of the SKYRIDER 23 is obtained throughout its tuning range with this type of antenna and because of that fact as well as its ease of construction it is highly recommended. Should a doublet antenna be used it is suggested that a transmission line of 400 ohms value of impedance be constructed so that a most efficient transfer of energy is obtained. The commercially available all wave doublet antennas are usually provided with a coupling transformer which matches the transmission line to the receiver. This transformer connects to the A1 and A2 terminals on the antenna strip. The half-wave length-doublet antenna cut for a particular frequency can be computed by the following formula:

$$\text{Length in feet} = \frac{493}{\text{Frequency in megacycles}}$$

This type of antenna is broken in the center with an insulator and has the transmission line connected to each resulting quarter wave section at that point. This antenna is a very good performer, in a direction broadside to its length, only on the relatively narrow group of frequencies for which it was cut. It does not function well on harmonic frequencies.

When using either type of doublet antennas the transmission line should be connected to A1 and A2 binding posts. The wire connecting the A2 to ground or G can be left connected if the performance of the receiver is improved.

**CONTROLS AND OPERATION**

Each of the controls is identified by appropriate marking on the panel. The "Tone Control" turns the receiver "on" and "off", and also allow the operator to make adjustments for the type of reproduction most pleasing to him. Treble reproduction is to the far left position, just after the set is turned on, while the base is at the extreme right. Intermediate positions allow for any desired degree of mixing.

The "Pitch Control" is to be used when code or CW signals are being received. In its counter clockwise position the Beat Frequency Oscillator is "off". Rotating the control clockwise turns on the B.F.O. in addition to varying the pitch of the beat note to the operator's taste.

Directly below the two controls mentioned will be found the "Phone Jack". Any type of high impedance headphones may be used because no direct current flows in the headphone circuit. The strength of the signal in the headphones will be found to be at the proper level for most comfortable headphone reception. When headphones are used the speaker is automatically disconnected.

The "AF Gain" control adjusts the volume of the receiver by varying the output of the audio amplifier. Volume is controlled in both the headphone and loud speaker circuits and the setting of this control is optional with the user of the receiver for the amount of volume desired.

"AVC Off" positions, an extremely strong signal will cause the receiver to block. Because of the unusually low residual noise level of the SKYRIDER 23 it is advised to adjust all controls carefully in familiarizing yourself with their functions and effects.

The "Stand-By" or "Send-Receive" switch when in the "Send" position removes plate voltage from the tubes. This allows the receiver to be made temporarily inoperative should it be used in conjunction with a transmitter.

The hand-wheel marked "Tuning", is for adjusting the main dial to the frequency desired. The mechanism is quiet in operation and free from back lash. The conveniently located control will give the greatest tuning ease after continued hours of operation.

The "AME" or Automatic Noise Limiter control turns the noise limiter "on" or "off". No modern communications receiver is complete without an effective noise limiter. With the A.M.L. switch in the "on" position the noise limiter will prove to be of great assistance and frequently mean the difference between hearing a signal which otherwise would be inaudible on the higher frequencies where ignition and other pulsating types of interference are most aggravating.

- 80 Rectifier

S METER

Close to the license tag on the rear of the receiver will be found a knurled shaft which is to be used in adjusting the "S" meter. Prior to adjusting this control the R. F. gain control must be in the maximum gain position, or rotated clockwise until a switch which is mounted on this control, is heard to operate. Additionally, the Selectivity Switch must be in any one of the three "A.V.C. On" selectivity positions. When the above two conditions are filled the meter is in the circuit and should be adjusted as follows: Disconnect the antenna from the receiver, being sure no strong local signal is being picked up by the receiver with the antenna removed. Now adjust the S meter shaft until the meter rests at zero. Reconnecting the antenna will then show the meter indicating relative carrier strength in both S units as well as DB's or decibels. Should most accurate S meter indication be desired, it is recommended that the meter be adjusted with the Selectivity Switch in the step of selectivity most frequently used.

The S meter does not function with the Selectivity Switch in the "A.V.C. Off" position because the meter is connected in the A.V.C. circuit which preferably is used for telephone reception.

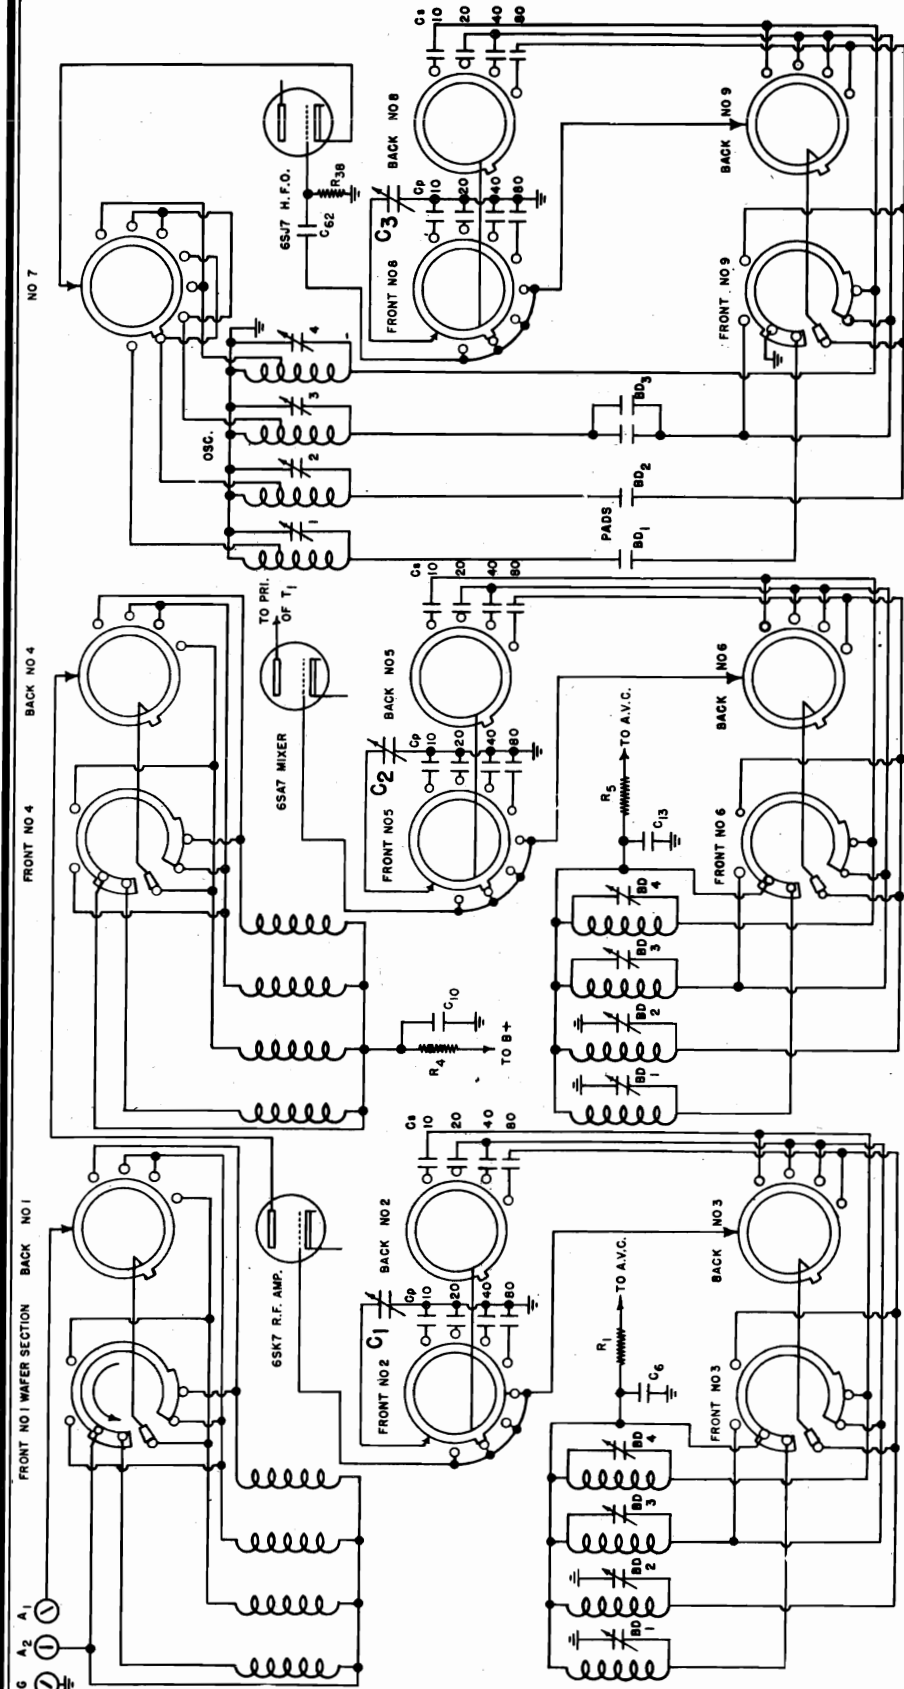

© Hallcrafters Inc.

SCHEMATIC DIAGRAM - SKYRIDER 23

The SKYRIDER 23 draws 110 watts at 115 volts 60 cycles alternating current.

**DETAILED SCHEMATIC R.F. SWITCHING SECTION**

On the rear apron of the chassis you will find output terminal strips marked 500 and 5000 ohms. The Hallcrafters permanent magnet dynamic matching S23 speaker should be connected to the 5000 ohm terminals. The 500 ohm contacts can be connected to a separate speaker or a load of that impedance value. The terminals marked "EXT SW" should be connected to an external switch, a portion of which is used to turn "on" and "off" your transmitter. The "EXT SW" terminals are paralleled with the front panel "Send Receive" switch. In order to make the external switch operate the "Send Receive" switch must be left in the "send" position. In viewing the receiver from the back the right hand "EXT SW" contact is grounded. When connecting to associated equipment this point should be borne in mind so that no potential difference will arise between it and the receiver.

Unless otherwise specified the SKYRIDER 23 operates on 110-125 volts 60 cycle alternating current. A universal transformer model is available which will operate on 25-60 cycle current. This transformer is provided with taps to cover in 5 steps a voltage range from 110 to 250 volts. Actual operation is identical with either the 25 or 60 cycle transformer.

MODEL SX23, Super Skyriders  
Alignment, Notes

THE HALLICRAFTERS INC.

Notes: A5 is a coupling condenser which should never need adjustment as it will not effect the alignment of the set but only vary the gain of the I. F. unit.

No. 7 - To adjust the AVC, turn the BFO pitch control to "off" position, the selectivity switch to AVC on I. F. Sharp position. Adjust the frequency of the modulated signal source to the resonant frequency of the I. F. unit with the signal strength sufficient to set up about 500 milliwatts in output meter. Now adjust A5 until the output is reduced to a minimum, which is the point where the AVC is resonant and operating properly.

Resolder the grid wire of the 68A7 to the switch section contact and replace the R.F. coil shield bottom.

R. F. ALIGNMENT

The holes in the "RF Coil Box Cover" marked "W" as shown in the instruction book are to permit the insertion of a "wand" into the coil forms for checking of alignment. The "wand" is a rod of insulating material having a brass slug in one end and a powdered iron slug in the other. When the iron slug is placed in field of coil the inductance is increased, and when the brass slug is used, the inductance is decreased.

NOTE: When checking points of alignment the meter deflection should decrease when either end of "wand" is used, if the set is properly aligned. If the meter deflection increases when the "Iron" end of "wand" is in the field then the trimmer capacity should be increased. If, however, the meter reading increases when the "Brass" end of "wand" is used then the trimmer capacity will have to be reduced.

When the condenser gang is fully closed be certain that the indicating line on the dial window is in line with the zero mark on the band spread calibration and the small line below the 550 KC calibration point. Place selectivity control in the "I. F. Sharp-AVC off" position. R. F. and Audio gain controls adjusted for maximum gain and signal of sufficient strength fed to the receiver to give approximately 500 milliwatts output.

Band No. 1 - "645 KC to 1700 KC"

Connect a wire between A2 and ground terminal or "G" on the antenna strip. Connect the ground side of the signal generator to the ground terminal of antenna strip and connect the high side of signal generator to A1 thru a 200 mfd condenser. Set the receiver dial and signal generator dial to 1800 KC - align trimmer indicated as Qcc. 1 to resonance with this signal frequency and then adjust RF trimmer and antenna trimmer as indicated Band No. 1 to obtain maximum deflection on output meter. Next set the generator signal and receiver to 600 KC and while rotating the main tuning knob adjust low frequency pad (indicated as Pad B1) until the output is maximum. Recheck alignment at 1800 KC and then the 600 KC position again for precise alignment.

Band No. 2 - "1700 KC to 5.2 Megacycles"

NOTE: Replace the 200 mfd condenser with a 400 ohm resistor for alignment of Bands Nos. 2, 4 and 5.

Following same procedure as Band No. 1, align first at 4000 KC, using trimmers indicated as "Qcc. 2" and R. F. trimmers "Band 2". The low frequency end is checked at 1800 KC by rotating condenser gang while adjusting pad B2 until maximum output is obtained.

Band No. 3 - "5.2 Megacycles to 16 Megacycles"

The high frequency end of this band is aligned at 14 megacycles, using oscillator Trimmer "Osc. 3" and RF trimmers indicating Band 3. The low frequency end is padded at 7. megacycles using series pad indicated "Pad E3".

Band No. 4 - "10 Megacycles to 34. Megacycles"

This band is aligned at 30 megacycles first by setting dial at 30 megacycles and adjust Osc. 4 until signal is received, then by "padding" condenser gang slightly and adjusting "Band 4" RF trimmer until maximum output is obtained. Antenna trimmer, Band 4, is not aligned until the oscillator and R. F. trimmers are first adjusted for maximum output. It is not necessary to adjust the oscillator for low frequency tracking as this is adjusted at factory and should be permanent.

The band spread positions do not require alignment as the alignment for band coverage position also takes care of band spread alignment.

**BAND SPREAD**

Realizing that reset accuracy is a very desirable feature the SKYRIDER 23 was designed so that only the amateur bands from 10 to 80 meters could be bandspread. The switch mechanism and associated temperature compensated condensers are unique and eliminate the necessity of accurately resetting the main tuning dial whenever it is desired to band spread the amateur frequencies.

The four "Band Spread" positions found on the SKYRIDER 23 cover the frequencies indicated below:

Band 10 - 28 MC to 30 MC	40 - 7 MC to 7.80 MC
Band 20 - 14 MC to 14.4 MC	80 - 3.50 MC to 4.00 MC

When operating the receiver in the band spread position it will be noticed that more than just the frequencies of each amateur band are covered. This has been found advisable for the reception of signals being sent on frequencies outside the amateur bands, as well as the reception of commercial stations for marker purposes, inasmuch as their exact frequency is usually known.

Each amateur band is spread over a sufficient number of divisions on the band spread scale to make tuning on that particular band effortless and accurate.

In addition to the frequency range in the circuit being identified by the Hallcrafters band switch knob under the main tuning dial, that particular band is also shown by referring to the illuminated indicator directly to the right of the main dial.

ALIGNMENT PROCEDURE

The alignment of the S23 is straightforward and requires no equipment other than the usual signal generator, or other signal source, and an output meter.

I. F. ALIGNMENT

No. 1 - Remove the "Bottom Pan" from the cabinet and then the square "RF Coil Shield Bottom" so that the RF oscillator and mixer tube bases, switch and coils are accessible.

No. 2 - Unsolder the control grid wire from 68A7 tube base at the point at which it connects to switch section No. 6. Signal is applied to this grid for alignment of I. F. AVC and BFO circuits. An output meter is connected across 5000 ohm speaker terminals.

No. 3 - Connect the signal generator to the control grid of the 68A7 mixer through a .01 mfd condenser. Now connect a 100,000, 1/3 watt, resistor from the control grid of the 68A7 to AVC Return on the mixer RF coil form. (See note "A" Schematic).

No. 4 - Place the selectivity switch in "AVC Off IF Sharp" position; the wave band switch in #5.2-16.0 megacycle position or #6 band, volume and RF controls in maximum gain position.

No. 5 - Apply 455 KC signal of sufficient strength to give an approximate output of 500 milliwatt and adjust trimmers A1, A2, A4, A5, A6, A7 and A8 to maximum deflection of output meter.

B. F. O. ADJUSTMENT

Turn the BFO control so that the dot on the knob is pointing to the top of the cabinet and then adjust A10 until the beat note is zero frequency.

CRYSTAL ALIGNMENT

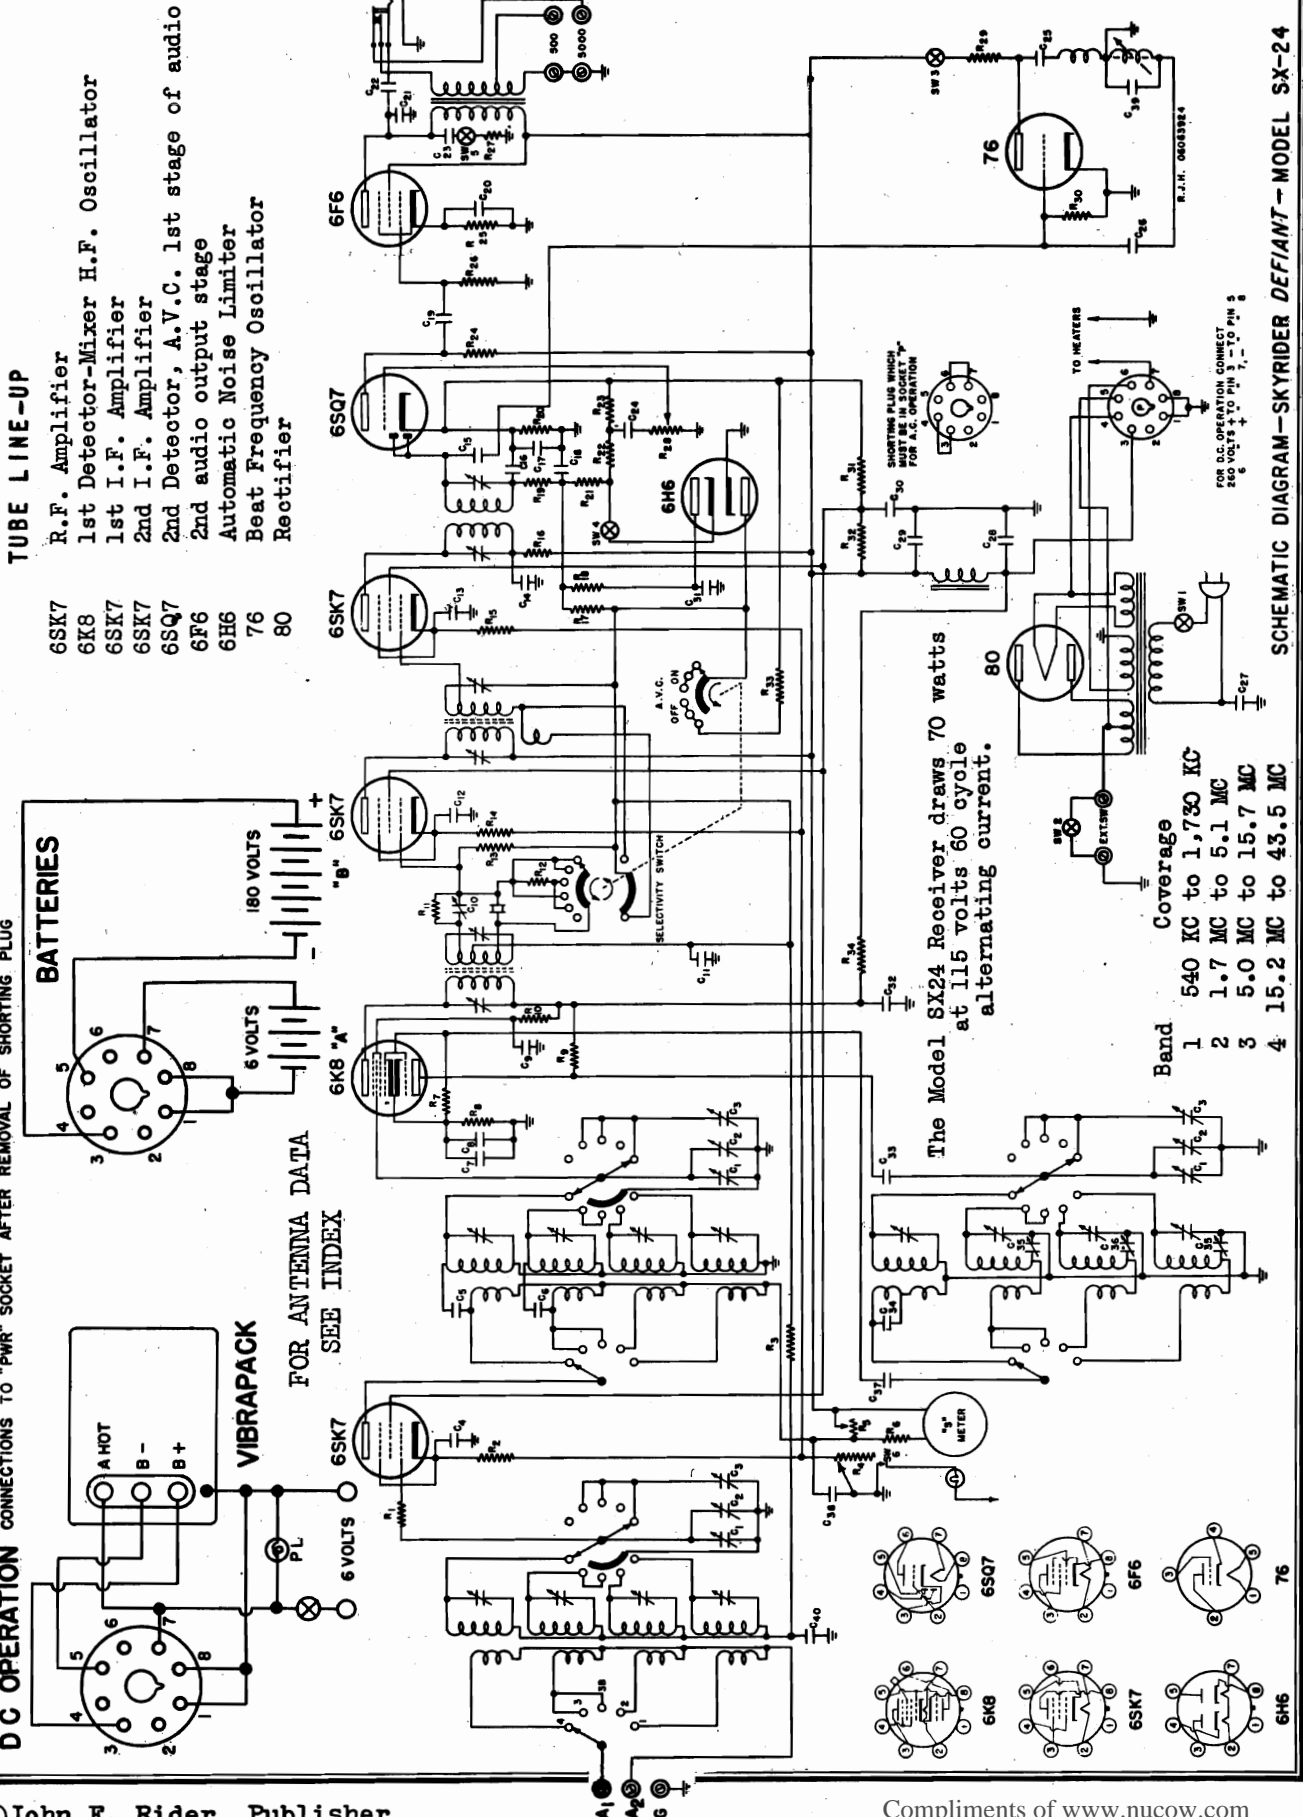

No. 6 - For alignment of crystal, place selectivity switch in CW crystal position, remove modulation from signal source, adjust BFO pitch control until a beat note of approximately 1000 cycles is obtained. Detune the signal source from 455 KC and then adjust the crystal phasing control to a point where the hiss noise from the speaker is reduced to a minimum. Now vary the frequency of the signal source from about 455 to 457 KC. At some frequency between these points a sharp increase in speaker output will be noted. This is the resonant frequency of the crystal. The signal generator should be adjusted to this point of crystal resonance for maximum meter deflection. Touch up all trimmers, No. A2, A4, A5, A6, A7 and A8 for precise alignment to the crystal frequency. Assuming the output beat note is still set at approximately 1000 cycles, and leaving all controls on the receiver as previously adjusted, change the frequency of the signal generator until the output beat note is reduced from 1000 cycles down thru zero beat and up to the other side to frequency of approximately 400 cycles. Now balance A1 and the crystal phasing control until the deflection slot is at minimum. It will be necessary to increase the output of the signal generator for this adjustment in order to obtain a satisfactory output level.

**ALIGNMENT PROCEDURE**

455 KC, Intermediate-Frequency Alignment.  
Have the controls set as follows:  
AF and RF gain controls for maximum volume.  
Remove 6K3 grid cap and connect the hot side of the generator to this tube. Connect the ground terminal of the signal generator to the chassis of the receiver. Now feed a 455 KC signal into the receiver and set the pitch control to give a beat note of approximately 1000 cycles. Adjust all I.F. transformer trimmers for maximum gain with the exception of the secondary trimmer on transformer T1. In adjusting this trimmer it will be noted that the output reaches a maximum goes through a dip and then back to maximum again. Wobulate the IF frequency and align to the dip between the two maximum points. A distinct change in the crystal note sounding like an apparent broadening of the crystal action will be noted when the correct adjustment has been reached. Now repeat carefully the other trimmers for maximum gain.

B.F.O. switch in the "on" position.  
Set band switch to #2 band.  
Set main dial to 2 megacycles, band spread to zero.  
Selectivity switch in "W Sharp" position.

**R. F. ALIGNMENT**

Re-connect the grid cap to the 6K3 tube. Connect the hot side of the generator to the A1 antenna terminal on the rear of the chassis. Be sure a jumper is connected to A2 and G. Leave signal generator ground connected to the chassis of the receiver.

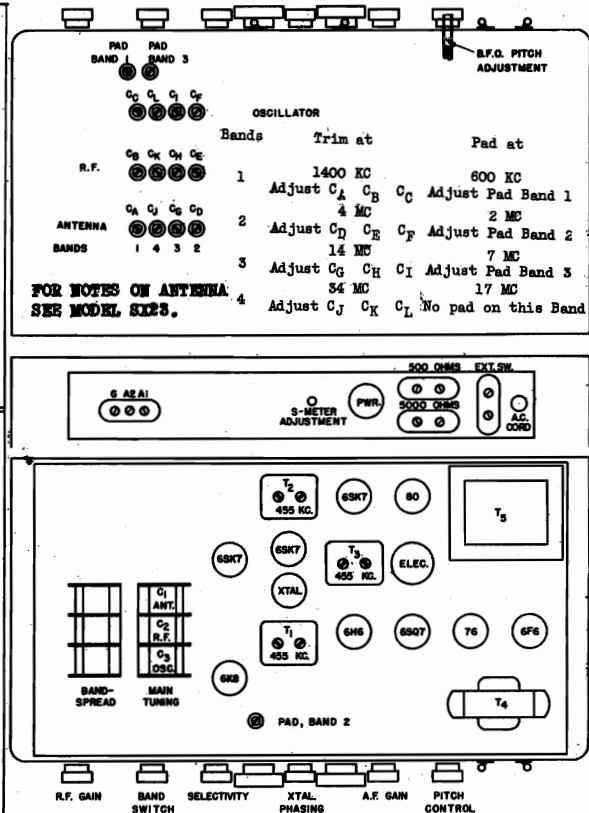

The location of the following trimmers and padders can be determined by referring to the top and bottom chassis views. All pad adjustments are for the low frequency end of each band while the trimmers are for the high frequency ends.

In order to get at the RF trimmers the guarantee card can be removed by placing a knife under the small snap fasteners holding it in place. So that most satisfactory adjustment of the trimmers and padders can be made, it is advisable to "hook" the condenser gang across the signal being delivered by the generator until that particular circuit has been accurately peaked.

**"S" METER**

When the R.F. gain control is advanced until a switch is heard to operate, a light will appear behind the translucent scale of the meter itself. Only when this light is on will the meter indicate in "S" units. With the R.F. gain control backed off from maximum the meter is still in the circuit but will not indicate carrier level accurately. When so adjusted the meter can be used as a resonance indicator. On the rear apron of the chassis is the "S" meter adjustment screw. To set the "S" meter, disconnect the antenna and have the R.F. Gain Control on full and the selectivity switch in the "I.F. sharp A.V.C. on" position. Now adjust this knurled knob until the meter reads zero. Reconnecting the antenna and tuning in a station will show its relative carrier intensity.

The 500 and 5000 ohm terminals are for connections to a loud speaker or other load of those impedance values. The matching SX25 speaker should be connected to the 5000 ohm strip. When headphones are plugged into the phone jack the 5000 ohm speaker connection is automatically disconnected.

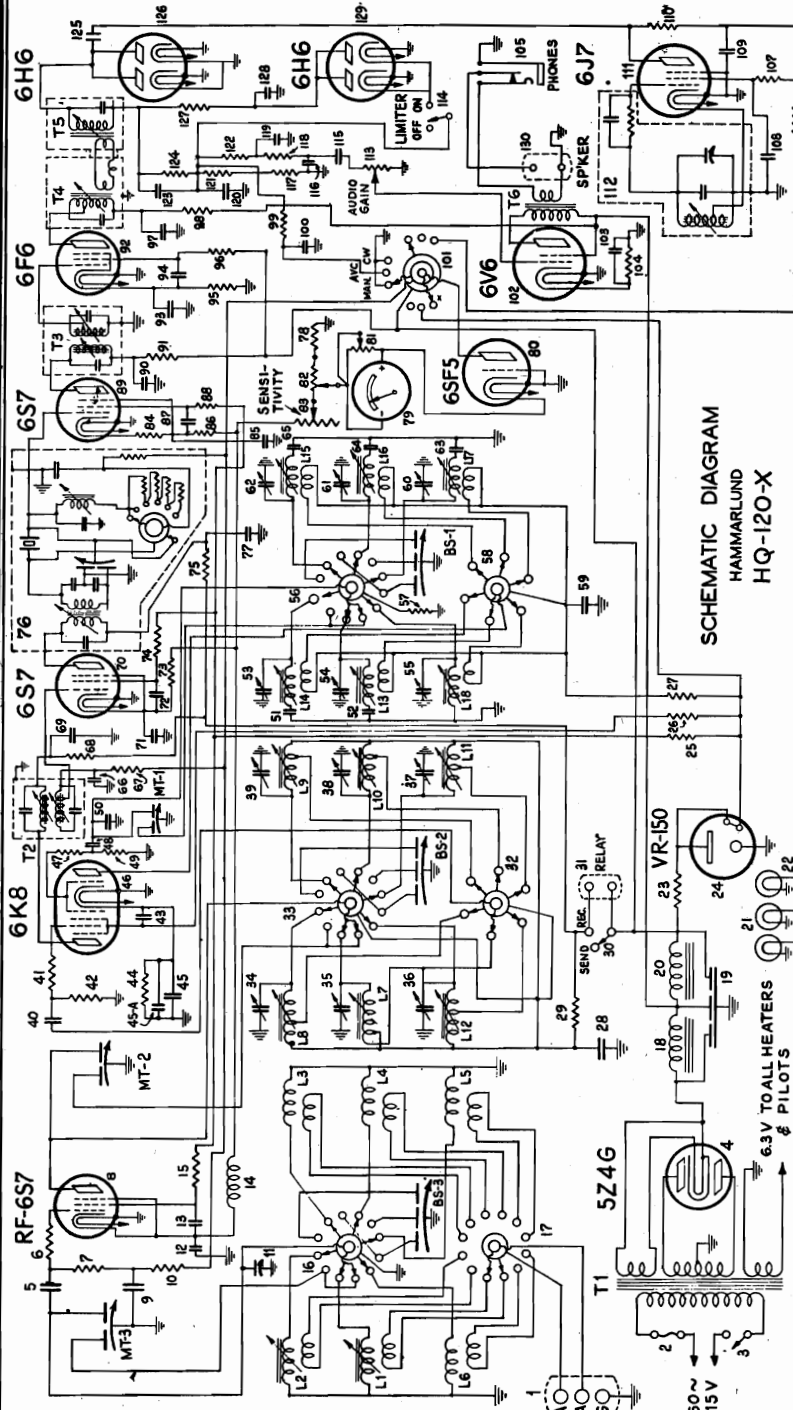

Notes: The accuracy of the main dial calibration will hold only if the BAND SPREAD condenser is set at minimum capacity, or the position indicated by "0" on the Band Spread dial which has been approached by turning the Band Spread Knob in a clockwise direction, or to the right, as far as it will go.

HAMMARLUND MFG. CO.

MODEL HQ-120X, Crystal Schematic, Socket Trimmers, Notes

12-tube superheterodyne covers a continuous range of from 31 to .54 mc. (9.7 to 555 meters) in 6 steps, thus taking in all important communication, amateur and broadcast bands.

SCHEMATIC DIAGRAM  
HAMMARLUND  
HQ-120-X

FIG. 10—Chart for R.F. alignment.

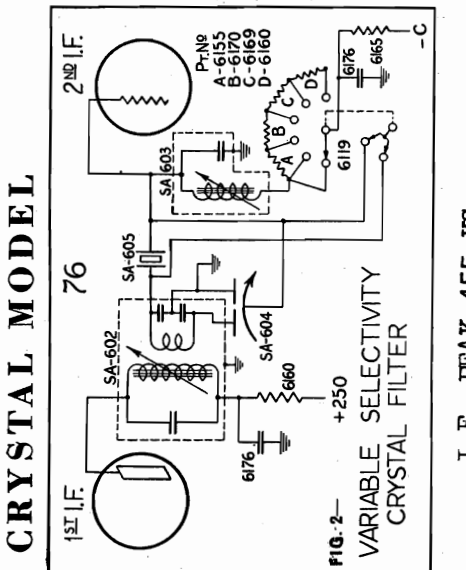

FIG. 2—VARIABLE SELECTIVITY CRYSTAL FILTER

I.F. PEAK 455 KC.

ANTENNA REQUIREMENTS

The input of the "HQ-120" is arranged so that various types of antennas may be employed. The average input impedance is 400 to 600 ohms. The most common type of antenna used generally by the amateur and short wave listener is the Marconi, consisting of a single wire and ground connection.

HQ-120-X

MODEL HQ-120X, Crystal Circuit Data, Voltage Alignment

HAMMARLUND MFG. CO.

(Fig. 10). On the bands from 3.2 mc. to 31 mc. it is extremely important to have the band spread dial set at 200, since that is the setting at which the main dial has been calibrated. Naturally, the alignment of the receiver cannot be more accurate than the accuracy of the dial setting. The alignment of the receiver cannot be more accurate than the accuracy of the dial setting.

FIG. 1.—Fundamental R.F. amplifier diagram showing antenna compensating condenser.

FUNDAMENTAL R.F. AMP. CIRCUIT

This chart provides information as to the various voltages which will appear between certain tube socket prongs and to ground or B-negative side of the circuit. A meter reading on the chart might be in ground or B-negative side of the circuit. A meter reading on the chart might be in ground or B-negative side of the circuit.

Table with columns: TUBE, RF, Conv., 1-IF, 2-IF, 3-IF, 9-IF, Audio, REG, Meter, SWITCH ON MAN., SWITCH ON CW AVC.

either on or off and is so arranged that the operation does not affect the intelligibility of the received signal by altering the audio form. Its effect on modulation is negligible. There is a switch on the panel for cutting out the noise limiter when it is not required, although it can be left in the circuit permanently without ill effects.

REALIGNMENT PROCEDURE

L. F. AMPLIFIER: The "HQ-120-X" receiver is aligned by the usual oscillographic method during final inspection. Its I. F. circuits are of an extremely stable type employing high grade silver-plated mica fixed condensers which are practically unaffected by even extreme changes in temperature or humidity.

TO PERFECTLY align the upper, or grid circuit of the crystal filter, 76 an oscillograph and sweep oscillator are required. When such equipment is available the Crystal Selectivity switch may be set on No. 3 or No. 4 and the sweep frequency oscillator adjusted to coincide with the quartz crystal resonant frequency (phasing oscillator scale).

PRE-SELECTION: The pre-selector stage in this receiver is extremely high in gain due to its tuned grid and tuned plate circuits. An additional feature which may be included in this stage in order to compensate for various types of antennas which may be used with the receiver.

BAND SPREAD: Much of the detail as to the hand-spread arrangement has been covered in the introduction of this book. The hand-spread control has five scales. The first is an arbitrary scale reading 0 to 200 for calibration in any of the bands covered by the receiver.

CRYSTAL FILTER: The crystal filter included in the "HQ-120-X" is an outstanding HAMMARLUND development. Unlike most other crystal filters, this one has five ranges of selectivity. These five degrees of selectivity are controllable directly from the panel by operation of a rotary switch.

CRYSTAL FILTER: The crystal filter included in the "HQ-120-X" is an outstanding HAMMARLUND development. Unlike most other crystal filters, this one has five ranges of selectivity. These five degrees of selectivity are controllable directly from the panel by operation of a rotary switch.

FIG. 2.—Overall selectivity curves for 485 kc. I.F. amplifier and crystal filter. Leading edge of the curves corresponds to the markings on the panel.

I. F. AMPLIFIER: The intermediate frequency amplifier consists of three stages employing iron core permeability-tuned transformers. The intermediate frequency is 485 kc. which has now become the R.M.A. standard.

NOISE LIMITER: The automatic noise limiter faithfully follows the carrier signal strength. It is intended to eliminate audio-modulation interference and other similar disturbances. It works with the A.V.C.

HAMMARLUND MFG. CO.

MODEL HQ-120X, Crystal  
Operating Notes, Parts

HO-120-X

OPERATION

After unpacking the receiver check the chassis carefully to determine that all tubes are properly fitted into their respective sockets. Also, be certain that all grid clips are in place on the tops of the tubes. It is possible that the grid clips or tubes may have been dislodged during transportation.

This receiver, unless it is a special model, operates on 105 to 125 volts AC at 50 to 60 cycles. If you are uncertain as to the type of power available for operating the receiver, check with your local power company office. An attempt to operate the set on other types of power is liable to ruin it. Next, connect the speaker to the receiver. Two wires from the permanent magnetic dynamic speaker connect to the two terminals on the rear edge of the chassis marked "speaker." The main power supply switch that turns the receiver on and off is operated in conjunction with the "audio gain" control. When this control is in the "off" position, the receiver is completely inoperative. So, the next operation is to turn this control on slightly and wait for the tubes to heat up to their operating temperature. In the meantime, set the band selector switch in the .54-1.32 megacycle position; this is the major part of the standard broadcast band, the remainder is covered in the 1.32 to 3.2 mc. band. Also, set the control marked "MAN-AVC-BFO." in the AVC position. The crystal selectivity control knob should be set in the "off" position. This is the broadest setting. The control in the lower left-hand corner of the panel should be set in the "REC." position. This latter control turns the receiver on and off for stand-by and transmitting periods during communication, but does not disconnect the receiver from the power line thus leaving the tubes heated and ready for instant use. By this time, the receiver is in operation—tubes having had ample time to heat up. We can now tune in broadcast stations by turning the sensitivity control full on and advancing the audio gain control to the point permitting the desired volume. All tuning in the broadcast band is done with the "main tuning" control. The hand-spread control does not operate in the first two ranges. For accurate tuning, it will be necessary to watch the "S" meter. At this point it might be well to mention that it is possible that the meter may not be operating properly and may require adjustment. Along the rear edge of the chassis we find two screw driver adjustments (see Fig. 11) marked "A" and "B." These are for aligning the meter so that it operates properly. First, with the receiver turned off the indicator on the meter should rest to the extreme left, at the beginning of the scale to the left of the first arrow. If not, the zero adjustment on the meter (the small screw in the lower central portion) should be adjusted and the receiver turned on again. Also, it might be wise to short-circuit the two antenna posts to ground in order to eliminate signal pickup because in adjusting the meter no signal should be present. With the receiver in the AVC position and the sensitivity control set on zero, the screw driver adjustment "A" on the rear of the chassis should be adjusted so that the indicating needle of the meter is opposite the arrow at the extreme right of the scale. With the "sensitivity" control turned to 10, adjust "B" so that the meter needle is opposite the small arrow at the left of the scale. This should be rechecked because there is a slight interlocking of these controls. It may be necessary to repeat the operation two or three times.

After the meter circuit has been properly aligned and the antenna system connected to the receiver (see chapter on antenna requirements) the main tuning control should be adjusted for maximum reading of the meter on any particular station. The antenna compensating control is the final tuning adjustment. This should be set also for maximum meter reading. If, for any reason, automatic volume control is not desired, the switch so marked should be set in the "MAN" (or manual) position. In this case, sensitivity is controlled with the control thus marked and then the audio control should be turned all the way on.

A jack is provided in the lower right-hand corner of the panel for those who desire to use head-phones. This jack cuts the speaker out of the circuit. On the rear of the chassis, will be found terminals marked "relay." These pin jacks are in parallel with the "send-receive" switch and can be connected to a send-receive relay for break-in operation.

Operation on the remaining high frequency bands is essentially the same, except that the hand spread dial comes into use. There are five scales on the hand-spread dial. The 0-200 scale is for general coverage and is an arbitrary scale for accurately logging in any one of the various short wave broadcast bands. The other scales are for each of the amateur bands from 80 to 10 meters inclusive, and are calibrated in megacycles. The main tuning dial is also calibrated in megacycles and this calibration holds true when the hand-spread dial is set at 200 on the arbitrary scale.

In short wave reception of either amateur or short wave broadcast stations, other features of the receiver are brought into use. For instance, the beat frequency oscillator is used for CW code reception and also for logging weak phone stations. This oscillator is only available without the AVC action and, when turned on, brings the main sensitivity control into operation. The beat oscillator tuning control provides wide variety of tones—the selection of which will depend upon the operator. Also in short wave reception we may need the noise limiter. There is a switch on the panel which provides this feature. The noise limiter operates independent of the setting of any of the other controls on the panel. Its purpose is to limit the interference caused by automobile ignition and similar disturbances.

The next important feature is the crystal filter. Detailed description and diagram can be found under "Circuit Arrangement." The variable feature permits the operator to select the band width that best suits receiving conditions. Normally, the phasing control should be set at the arrow in the center of its scale. Adjustment of this control will cut out interference from stations on either side of the desired signal in any of the five selectivity ranges of the crystal filter. When using the crystal filter, select the band width that provides the greatest fidelity with a minimum of interference. The selectivity of the filter increases as the switch is rotated clockwise. The first three positions of the selectivity control are intended for phone reception, although they can also be used for code in cases where interference is not too severe. The remaining positions are, of course, for single signal code reception in extremely crowded bands.

MODEL 4B  
Schematic, Voltage  
Notes

MODEL 4B - BATTERY RECEIVER

This model must not be confused with the Model 4BT. Electrically they are much the same but the Model 4B is built into an upright table cabinet with an oval dial, whereas the 4BT is a flat type cabinet with straight line dial.

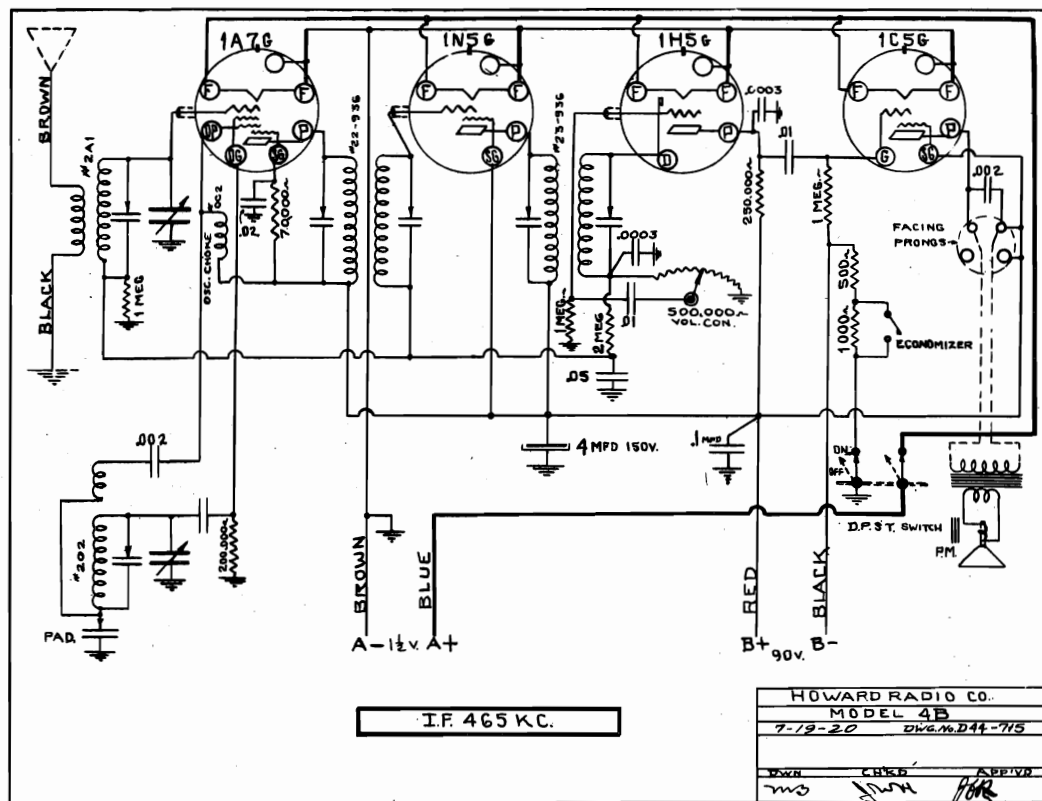

The function of the tubes is as follows: 1A7G - Modulator, 1N5G - IF Amplifier, 1H5G - Diode Det. AVC, 1C5G - Output.

The trimmers for the antenna and oscillator coils are mounted directly on each coil.

The output is rated at .180 to .360 milliwatts.

"A" Battery Drain at 1 1/2 volts - .25 amps.

"B" Battery Drain at 90 volts - .012 mls., or 7 mls. when using the "Economizer".

Notes

HOWARD RADIO CO.

MODEL 4BT - BATTERY RECEIVER

This receiver is designed on the 220 style chassis.

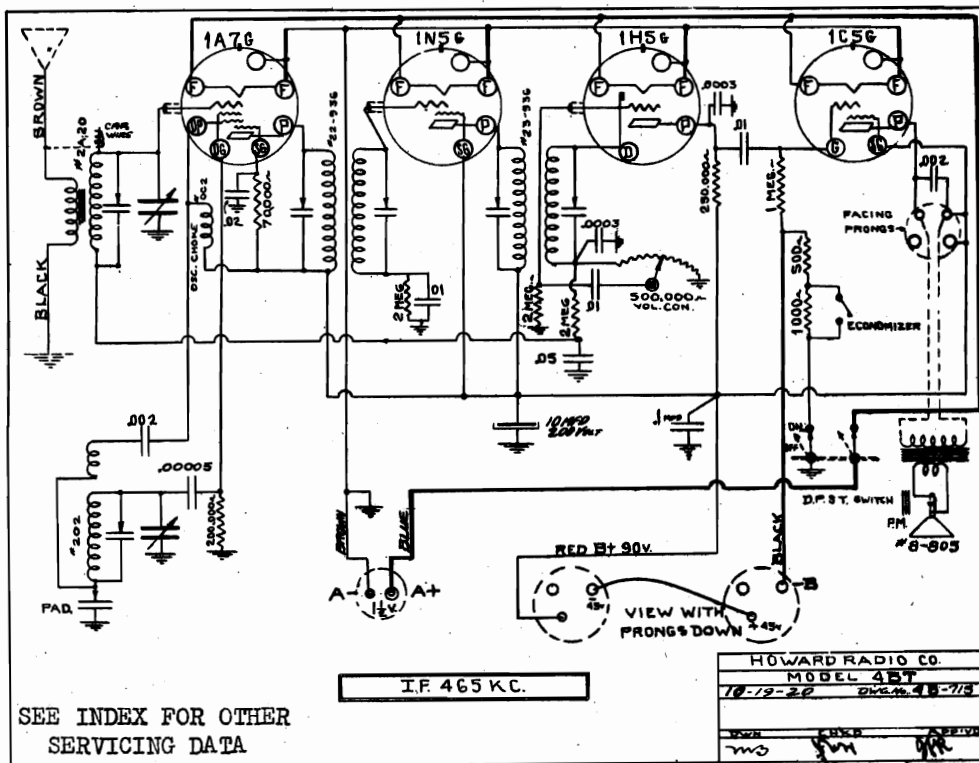

"A" Battery Drain at 1 1/4 volts - .25 amps.

"B" Battery Drain at 90 volts - .012 mils., or 7 mils. when using the "Economizer".

Output - .180 to .360 milliwatts, maximum.

The set is equipped with plugs that are inserted directly into the "A" and "B" batteries of the socket type construction since most all batteries are made that way at this time.

BATTERY RECOMMENDATIONS

The color code for the battery leads for the Models 4B or 4BT

- Red B+ 90 volts
- Black B- 90 volts
- Blue A+ 1 1/2 volts
- Brown A- 1 1/2 volts

- NOTE 1:** When aligning the I.F. channel, a condenser of .05 MFD may be used in series with the generator lead.
- NOTE 2:** When aligning the broadcast band, a 250 MMFD condenser may be used in series with the signal generator.
- NOTE 3:** When aligning the short wave bands, a 400 ohm resistor may be used in series with the signal generator.
- NOTE 4:** Check for an image signal about .9 mc. lower in frequency. For example:- If a peak has been made at 6 mc. an image should be heard at about 5.1 mc. Otherwise the original setting was not correct.

SET-UP INSTRUCTIONS—HOWARD AUTOMATIC

MODELS 210 & 211

MOVE THE SCREW ADJUSTMENT DIRECTLY ABOVE THE DEPRESSED BUTTON UNTIL TUNING EYE, OR TUNING INDICATOR REGISTERS MAXIMUM DEFLECTION. NOW RE-ADJUST THE SCREW MENTIONED IN [SECOND] OPERATION FOR MAXIMUM TUNING INDICATION.

**FOURTH** Inset the station call letter tab over button number just selected. Repeat this procedure for the remaining buttons. Replace trim.

TO USE RADIO IN THE CONVENTIONAL MANNER, DEPRESS BUTTON MARKED "AUTOMATIC OFF".

EXAMPLE

Station desired, WGN: Frequency is 720 KC, therefore button 2, 3, or 4 can be used. Button 3 is depressed, the lower adjustment is moved until WGN is heard. The adjustment above #3 button is then adjusted for maximum eye deflection. The lower adjustment is again checked for maximum deflection. WGN tab is removed from tab sheet and inserted in escutcheon over #3. Inset tab by pushing in place with finger-tip.

SUGGESTIONS

- FIRST:** Do not try to extend the adjustments beyond their frequency rating.
  - SECOND:** Move adjustments slowly.
  - THIRD:** Double-check before moving any adjustment to make sure the adjustment about to be moved corresponds to the depressed button. Carelessness will cause you to misadjust adjustments already completed.
  - FOURTH:** Check adjustments occasionally for maximum deflection of eye or tuning indicator, while receiver is always tuned perfectly.
- A good method to identify the station being set up, is to tune the station in by dial on and to set, then switch to automatic by depressing the button on which set-up is being made and tune in by adjustment same program as heard when tuned in by dial as mentioned above. When selecting a station automatically it is only necessary to depress button carrying the desired station call letters.
- To use manual tuning depress "Automatic Off" button.

 MODELS 221,271

HOWARD RADIO CO.

Socket, Trimmers  
 Tuner Data, Dial

MODELS 220, 270

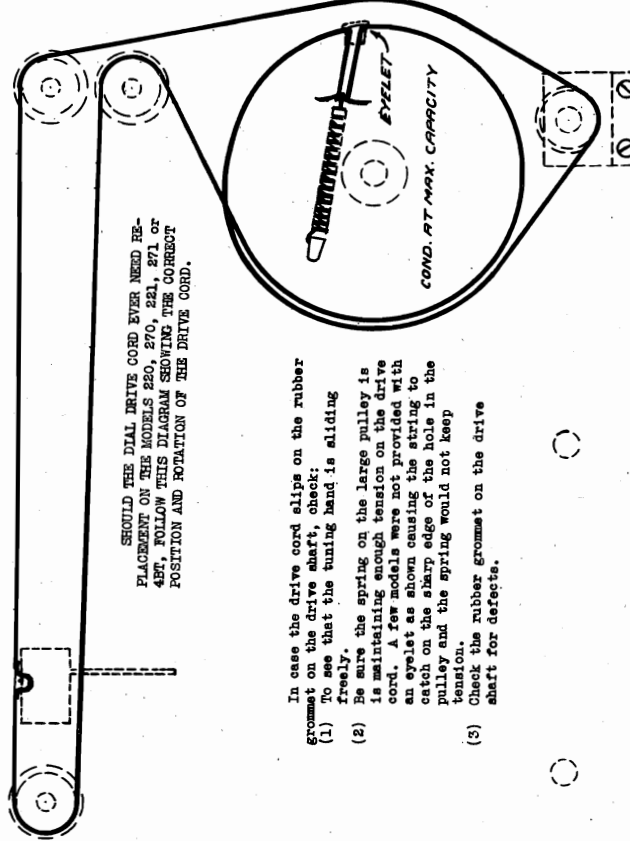

**HOW TO SET AUTOMATIC TUNING BUTTONS**

- (1) From the rear of the tuning mechanism within the cabinet extends a slotted screw; loosen this screw by turning it to the left.
- (2) Tune set in the regular way and decide upon what four stations are used the most in your locality.
- (3) With a station exactly in tune press one button ALL THE WAY DOWN which will set the adjustment, then the button will spring back in its original position.
- (4) Repeat this procedure for each of the remaining three buttons, being careful not to touch any other buttons while pressing down on one.
- (5) Now tighten the rear screw, using a coin in the slot when tightening, if necessary, to make sure it will not loosen. Insert station letters into top of buttons.

THE GEAR ADJUSTMENT between the gear on the selector unit and the gear on the variable condenser is located on the top of the variable condenser in the form of a screw. The selector unit always tends to press against this screw head due to the mounting at point "A". See Fig. 2

To lower or raise the selector unit to change the gear spacing, loosen the hex nut that locks the adjustment screw and adjust as required.

- In case the drive cord slips on the rubber grommet on the drive shaft, check:
- (1) To see that the tuning hand is sliding freely.
  - (2) Be sure the spring on the large pulley is maintaining enough tension on the drive cord. A few models were not provided with an eyelet as shown causing the string to catch on the sharp edge of the hole in the pulley and the spring would not keep tension.
  - (3) Check the rubber grommet on the drive shaft for defects.

HOWARD RADIO CO.

MODELS 220,270  
Schematic, Voltage  
Notes

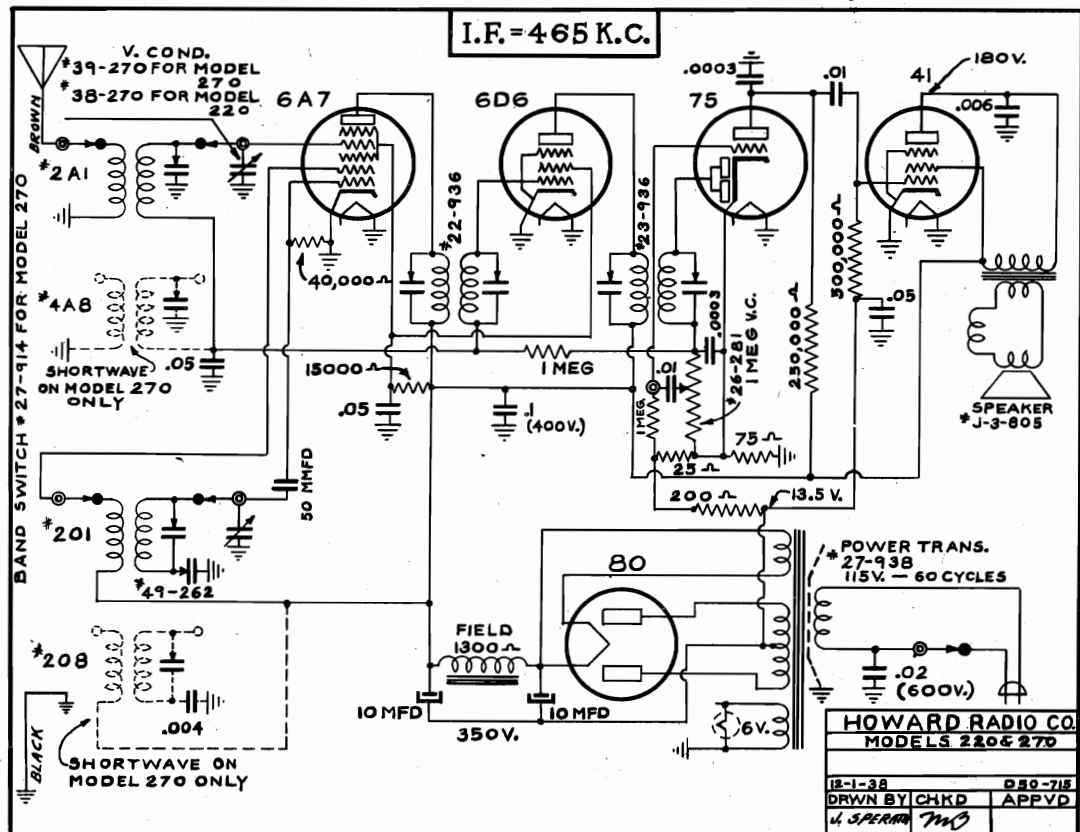

GENERAL DESCRIPTION - MODELS 220 and 270  
FOR USE ON ALTERNATING CURRENT ONLY

The schematic diagram below covers both models 220 and 270, the main difference being the use of the short wave band for Model 270. The circuit is conventional with 6A7 mixer, 6D6, IF amplifier, 75 Diode Det. AVC, 41 Output, 80 Rectifier. The cathode circuit of the filter system is not grounded direct, the bias voltages are obtained by resistors from C.T. of high voltage to ground.

The output to be obtained will be from 1-1/2 to 2/25 watts, maximum.

For the models having four push buttons, a mechanical type tuner, the proper set-up is given on the following page.

GENERAL DESCRIPTION - MODELS 221 and 271  
FOR USE ON EITHER DIRECT OR ALTERNATING CURRENT

The schematic diagram below covers both 221 and 271 AC-DC Models, the main difference being that the 271 has a short wave band. Mechanical specifications are similar to the 220 - 270 series.

The maximum power output to be obtained is 2.7 watts, 1.7 watts undistorted.

HOWARD RADIO CO.

MODEL X275  
Schematic, Voltage

Each of the three bands has a separate antenna and oscillator coil.

The intermediate frequency stages are tuned to 465 KC and have a sensitivity of about 27 microvolts. (for 50 milliwatt output)

The maximum output is rated at about 5 watts, and 3.5 watts undistorted.

connected to Nos. 1 and 2 terminals, with the overall wire shield grounded to No. 3 terminal. A single pole double throw switch may be used to change from Radio to "Phono". See Fig. 2.

BOTTOM VIEW

MODEL X275, 285  
ALIGNMENT

No change should be made with the I.F. or R.F. adjustments unless it is certain that such adjustments are necessary.

The following instructions are given with the assumption that the service station has the proper generator, means of measuring the output and proper input connections. The following circuit is recommended for the input from the signal generator.

See that the dial hand is straight across when the condenser is at full capacity.

After aligning the four trimmers of the IF system to 465 KC, refer to Fig. 5 showing the position of the R.F. trimmer and the frequency to which they are to be adjusted. Although the dial is calibrated in meters, there will be found on the dial extra points representing the frequency in kilocycles corresponding to the trimmer adjustments as shown in Fig. 5.

NOTES:

Always peak the oscillator circuit first and recheck after the antenna circuit is adjusted.

Be certain the alignment is not made at an image frequency.

Seal trimmers after final adjustment.

The normal voltages are shown on the schematic circuit taken from the various points to ground.

THE ADAPTATION OF THE SET FOR USE WITH PHONOGRAPH

Out of the back of the chassis there extends three lugs labeled "Phono" 1-2-3. For phonograph use, the jumper is removed and the pick-up leads from the pick-up are

FIG. 2

NOTE: With certain models, the chassis is floated on cushion rubber. In shipment the chassis is tightened on corner wood strips. To release, loosen the four bottom screws, remove strips and let chassis float free. REPLACEMENT PARTS LIST MODEL 285

Socket, Trimmers  
Alignment

The Model 377 is designed as a single band for Broadcast reception. Three gang condenser is used to tune the Antenna, R.F. and Oscillator circuits. The Intermediate Frequency is 262 KC. The bias voltages are obtained by series resistors from the high voltage center tap to ground. The negative side of the filter is not grounded.

The maximum output obtainable is 2½ watts.

The variable condenser section for the oscillator circuit is the cut-plate type. See circuit diagram for other specifications.

MODELS 1 and 2  
Perm-A-Matic Tuners  
Adjustments

HOWARD RADIO CO.

**SET-UP INSTRUCTIONS FOR HOWARD PERMA-MATIC AUTOMATIC TUNER NO 1**  
**NOTE-DO NOT ATTEMPT ANY ADJUSTMENTS UNTIL THE SET HAS BEEN TURNED ON AT LEAST 20 MINUTES.**  
(1) Remove the push-button escutcheon plate by prying forward from ends, taking care not to scratch cabinet.

(2) Depress any one of the selector buttons, tune the desired station in by turning slotted screw with small screw-driver (this screw is numbered 1 in the illustration and is always the screw adjacent to and right of depressed button.) This moves the iron core in oscillator circuits.  
(3) Adjust the screw with slotted head for maximum electric eye deflection. This adjustment is numbered 2 in illustration and always the one directly above the station selector adjustment mentioned in above paragraph. If electric eye overlaps on strong stations, adjust for maximum overlap. When making the two adjustments it is possible to obtain a strong deflection of the tuning eye apparently for a station and yet no station is present. THIS IS A NORMAL CONDITION and just means that the two adjustments are not close enough in relation to each other and can be corrected by varying the two adjustment screws.

THERE IS NO FREQUENCY DISCRIMINATION BETWEEN BUTTONS. ANY ONE OF SELECTORS WILL TUNE THE ENTIRE BROADCAST BAND (1600-540 KC).  
NOTICE: DO NOT FORCE ANY ADJUSTMENTS if they tighten up in the course of adjustment, either the maximum or minimum has been reached and the adjustment should be made in opposite rotation.

It will be found easier to adjust if the low frequency stations are started on right side and progress toward high frequency stations to left. IN SAME ORDERS AS MAIN DIAL.  
However, the above procedure is not absolutely necessary if there should be some preference for arranging stations otherwise.

AFTER ALL ADJUSTMENTS HAVE BEEN MADE -- GO OVER EACH ADJUSTMENT THE SECOND TIME TO MAKE CERTAIN THEY ARE CORRECT AND TO COMPENSATE FOR SUBSEQUENT ADJUSTMENTS.  
It is a big help to tune the desired station in on main dial while making adjustments, in order that the station can be quickly recognized by switching from manual back to button being adjusted.

It is not necessary to lock any of the adjustments as they are automatically locked.  
Place station call letter tabs in escutcheon and replace escutcheon by it in place.

NOTICE: Turning station selector screw clockwise lowers the frequency. Best results will be had when band switch is in broadcast position when using automatic tuning.

MECHANICAL ACTION OF THE HOWARD PERMA-MATIC TUNER NO. 2  
8-966  
WITH SLIDE TYPE CONTACTS  
USED IN MODELS 318D, 525D  
375, 418, 468 AND 525

Fig. 1 shows one of the buttons depressed for a station. The trimmer panel assembly (for the antenna circuit) is designed with spring fingers "S" that make contact with cross bar "B" completing the ground circuit of the R.F. Trimmer.

When making the original set-up, the adjusting screw may indicate two positions for resonance. This is due to the possibility of the small amount of play in the screw thread and is of no concern as long as it is set to the exact resonance point.

The jumper contact "J" connects C1 contact to C2 contact with the button "IN". This completes the oscillator circuit for that particular button.

Fig. 2 shows the jumper position with the button "OUT".

Fig. 3 shows the manual OFF-ON button in the "OUT" position.

The "I" shaped sliding contact is the common cathode return circuit and alternates the bias on the 6K8 for manual tuning or on the 6A7 for push button tuning.

Fig. 4 shows the iron core movement within the oscillator coil. Its position is held stationary by the small spring wire across the coil form. The position of this spring must be such that no spring action is apparent from the end of the adjustment stud due to pressure with a screwdriver. Otherwise, when the screwdriver is removed, the core will shift out of position.

The button is held down by action of the latch bar and is released when another key raises the latch bar on its way down.

If it is necessary to replace a coil, mount it in line with the other coils and cement it in place.

WHEN ORDERING ANY PARTS, SPECIFY PART NUMBER AND DETERMINE WHETHER THE PART IS FOR PERMA-MATIC TUNER NO. 1 OR NO. 2. TUNER NO. 1 WAS CONSTRUCTED WITH THE SLOTTED BRASS SCREW FOR CORE ADJUSTMENT, WHEREAS TUNER NO. 2 CONSISTED OF THE BLACK RUBBER STUD AS SHOWN IN FIG. 4.

HOWARD RADIO CO.

MODEL Perm-A-Matic Tuner  
No. 9-966 Changes

REPLACE HOWARD PERM-A-MATIC TUNERS #7-966 or #8-966 WITH PERM-A-MATIC TUNER #9-966 WHICH REQUIRES THE CHANGE OF THE ANTENNA COIL ON THE CHASSIS AS EXPLAINED AT THE BOTTOM OF THIS PAGE.

There are six leads between the tuner and the receiver circuits to be unsoldered. UNSOLDER THE CONNECTIONS FROM THE RECEIVER TERMINALS AND NOT FROM THE TUNING UNIT AS THE NEW TUNER WILL HAVE THE NECESSARY LEADS.

Mechanically, it is only necessary to remove two screws from the front plate to release the tuner.

Due to the fact that the two ceramic condensers (green in color), one each in the grid and plate circuits of the oscillator, are now a part of the new Tuner, they must be removed from within the receiver and returned with the tuner being replaced.

Since the colors of the leads are different in the two type tuners, it is advisable to follow the schematic diagram together with the following chart.

<u>TUNER NO. 1 (7-966)</u>		<u>TUNER NO. 2 (8-966)</u> <u>TUNER NO. 3 (9-966)</u>
LEAD COLOR	CIRCUIT	LEAD COLOR
Unsolder from ANTENNA COIL 2A17	GRID 6A7	SAME
WHITE WITH BLUE TRACER	CATHODE BIAS SWITCH	SAME
GREEN Unsolder from .0005 Condenser	OSCILLATOR GRID 6A7	SAME
GREEN Unsolder from .0003 Condenser	OSCILLATOR PLATE 6A7	BLUE
BROWN Unsolder from 6K8 Cathode	CATHODE RETURN FOR 6K8	BROWN WITH WHITE TRACER
BLUE	CATHODE RETURN FOR 6A7	GREEN WITH WHITE TRACER

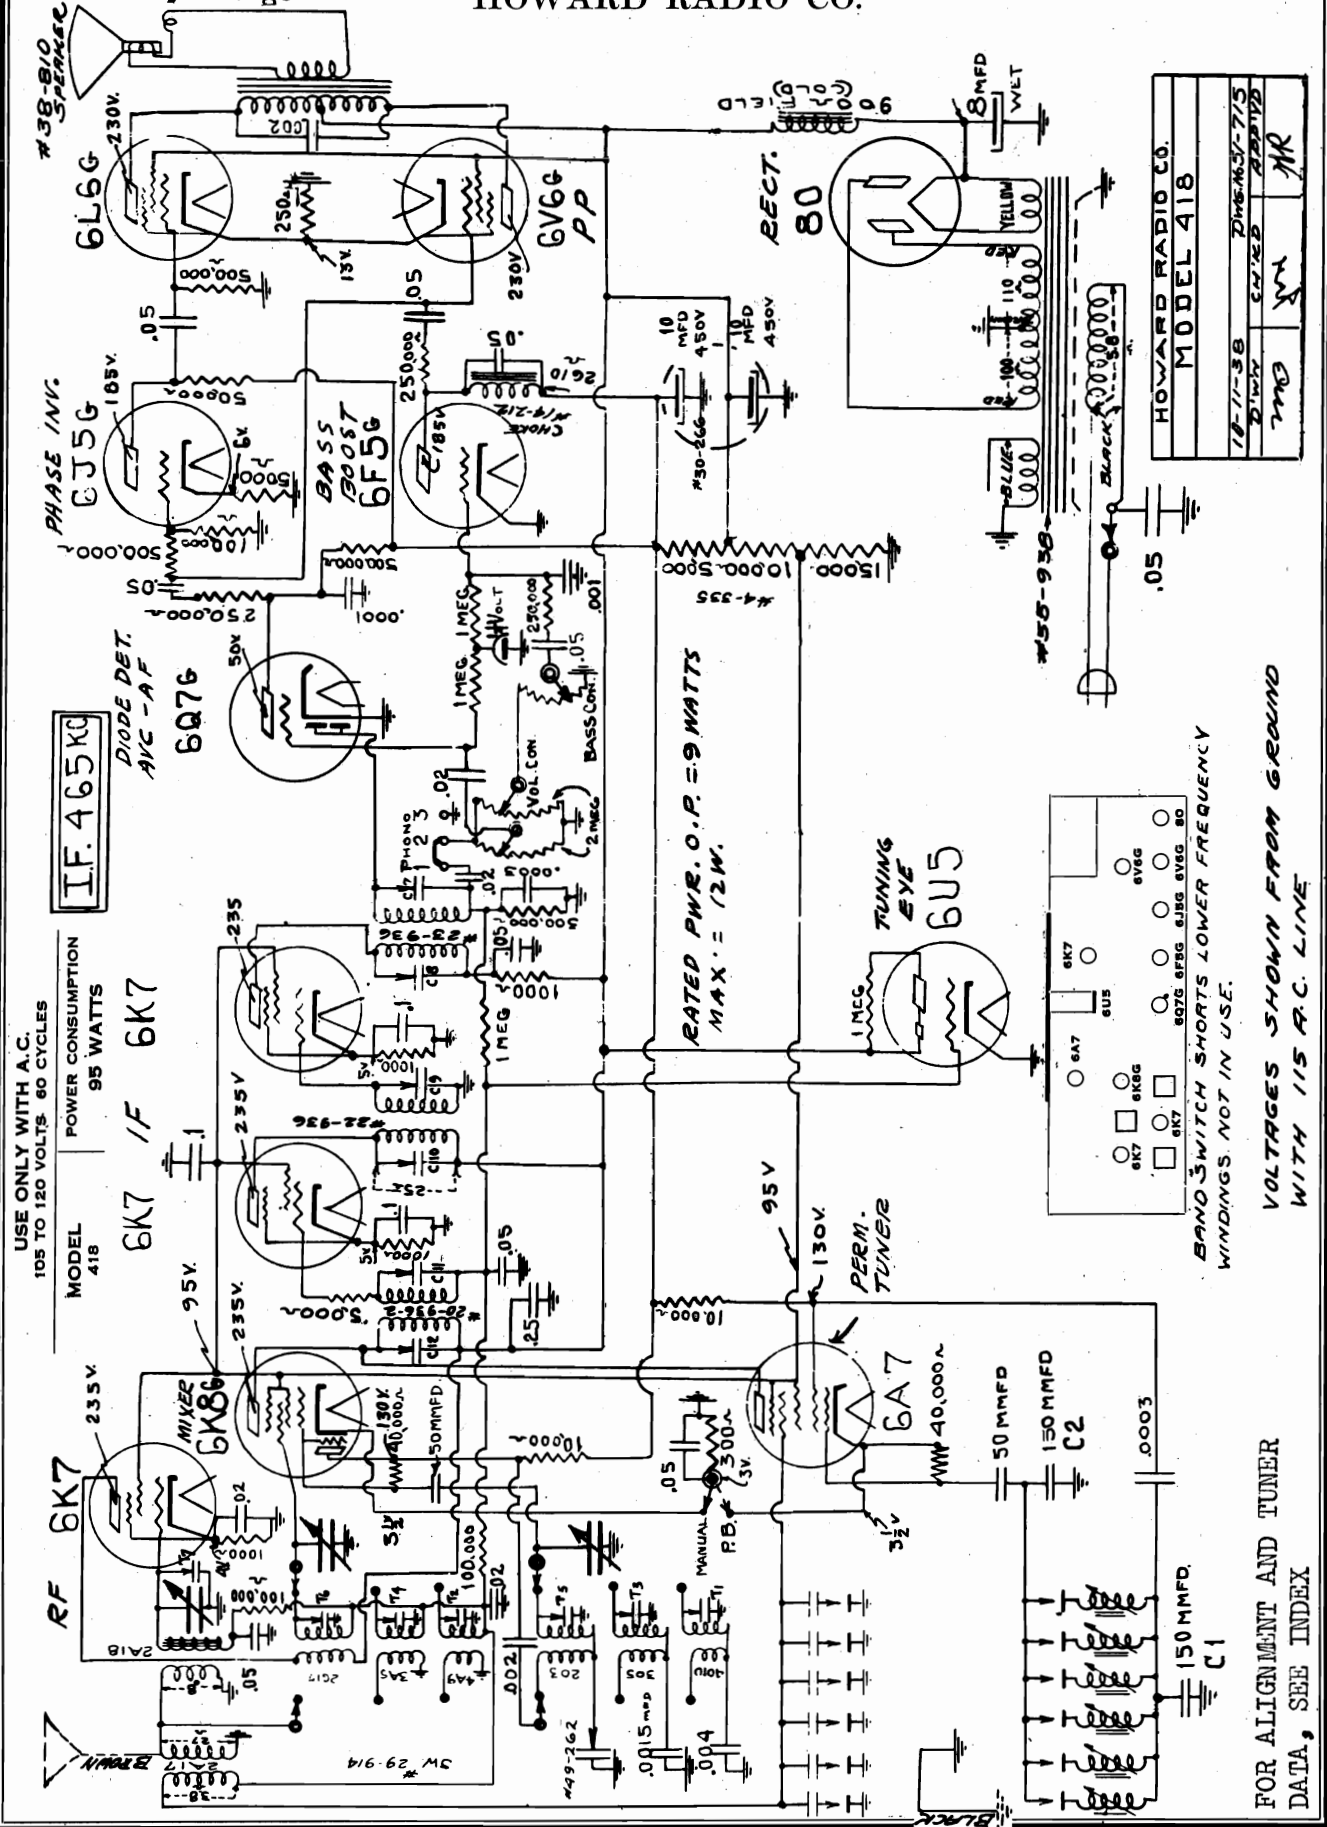

DUE TO THE FACT THAT THIS NEW UNIT, #9-966, HAS A DIFFERENT TRIMMER CAPACITY RANGE, THE ASSOCIATED ANTENNA COIL, 2A17, IN THIS CIRCUIT MUST BE CHANGED TO 2A23. THIS IS THE COIL ON THE LEFT SIDE WHEN FACING FRONT OF SET. FOLLOW DIAGRAM FOR TERMINAL ARRANGEMENT.

FOR ALL MODELS ADAPTABLE TO PHONOGRAPH CONNECTION

Out of the back of the chassis there extends three lugs as shown in Diagram Fig. 1. For phono use, the jumper is removed and a single pole, double throw switch is connected as shown in Fig. 2. The pick-up leads from the pick-up are connected to Nos. 1 and 2 terminals, with the overall shield grounded to No. 3 terminal.

- NOTE 1 - When aligning the I.F. channel, a condenser of .05 MFD may be used in series with the generator lead.
- NOTE 2 - When aligning the broadcast band, a 250 MMFD condenser may be used in series with the signal generator.
- NOTE 3 - When aligning the short wave bands, a 400 ohm resistor may be used in series with the signal generator.
- NOTE 4 - When aligning the short wave band, be sure not to adjust at the image frequency. This can be checked as follows: If the signal generator is set for 21,000 KC, the signal will be heard at 21,000 KC on the dial. The image signal, which is much weaker, will be heard at 21,000 less 2 times the IF, 465, (.930KC) or 20,070 KC on the dial. It may be necessary to increase the input to hear the image. If the image is not heard then, the original alignment was not made at the right peak.
- NOTE 5 - If there is an apparent lack of sensitivity, especially on the short wave bands, first check the 6K8G tube by substituting one or more in its place.

REFER TO SCHEMATIC DIAGRAM FOR REPLACEMENT PARTS NOT SHOWN IN ABOVE LIST.

THE POWER OUTPUT for the Model 430 is about 1 1/2 Watts, undistorted. Ceramic coil forms are used on the high frequency band. Ceramic trimmers are used throughout. The unused secondaries of the lower frequency bands are shorted as the band switch is shifted toward the higher frequency bands.

The frequency coverage from .55 to 42 megacycles is divided into four bands. The lower scale from 0 to 100 is for logging purposes. The left hand pointer indicates the band in operation. For correct tuning calibration, the Band Spread pointer must be at 100.

MODEL 438  
Alignment, Socket  
Trimmers

HOWARD RADIO CO.

MODEL 440, Series 1,2  
Crystal Alignment

NOTE: When using a Crystal set Phasing Control to almost minimum capacity. See special alignment instructions below for Crystal.

NOTE 1: When aligning the I.F. channel, a condenser of .05 MFD may be used in series with the generator lead.  
NOTE 2: When aligning the broadcast band, a 250 MMFD condenser may be used in series with the signal generator.  
NOTE 3: When aligning the short wave bands, a 400 ohm resistor may be used in series with the signal generator.

NOTE 4: After the chassis has been removed from the cabinet, be sure when it is again assembled that the speaker plug is in place in the socket on top of the chassis and that the speaker cable wires do not lay back near the RF circuit, thus causing howling.

NOTE 5: Check for an image signal about .9 mc. lower in frequency. For example: If a peak has been made at 6 mc. an image should be heard at about 5.1 mc. Otherwise the original setting was not correct.

ALIGNMENT CHART.

ALIGNMENT INSTRUCTIONS - FOR RECEIVERS EQUIPPED WITH CRYSTALS

- (1) REMOVE CRYSTAL; set crystal phasing condenser to almost minimum capacity and throw "XTAL" switch to "IN" position.
- (2) With the 465 KC signal, re-adjust the I.F. Trimmer C-6 by turning the screw counterclockwise. The signal now may be slightly weaker than before and sound "off-side". This, however, is a normal condition.
- (3) REPLACE THE CRYSTAL - A very noticeable drop in signal strength may be noted due to the filtering action of the crystal and the frequency control of the signal generator must be "rocked" slowly back and forth until the increase in signal strength indicates the exact frequency of the crystal being used. Now re-align the entire I.F. system to this frequency.
- (4) Adjust "XTAL" phasing condenser for the lowest pitched note possible and re-adjust signal generator frequency. Repeat and continue to repeat this alignment procedure until no further improvement in the alignment can be accomplished.

NOTE: If the "XTAL" switch should now be thrown to another position, an apparent rise in gain will be noticed, which is caused by the addition of higher frequencies and background noise, so it does not mean that the sensitivity of this set is impaired in any way by use of the crystal.

 Undistorted . . . . . 9 Watts  
 Maximum . . . . . 15 Watts

SPECIFICATIONS FOR A 5 METER ANTENNA

On the "F" band, we have found very good results by the use of a vertical rod 3/16" in diameter and about 56" long. Note that the lead from the base of this rod to the antenna terminal of the set should not be more than about eight inches.

The "G" terminal is for the connection to ground.

THE THREE TERMINALS - A, D, and G in the middle back of the chassis are for the ANTENNA AND GROUND connections. When using the conventional flat-top and lead-in type of antenna, CONNECT THE LEAD-IN TO THE TERMINAL MARKED "A", being sure that a wire jumper connects from D to G terminals. The G terminal is for the ground connection.

For any DOUBLET TYPE of antenna, remove the shorting jumper from D to G and connect the two leads of the doublet system to A and D.

Note\* For maximum performance on short waves especially the two highest bands, a little experimenting can be done regarding the antenna location, length and type which is very important.

THE TERMINALS MARKED 500 OHMS which are connections from the out-put transformer can be connected when and if desired to any output load having 500 ohms impedance.

THE TERMINALS MARKED S W are for use of an external switch to turn the set on or off for a stand by. This set of contacts may be connected to a relay or separate switch. Since these terminals are in the circuit across the panel switch for SEND and RECEIVE the switch would therefore have to be in the SEND position if the back CONTACTS are used in any way.

HOWARD RADIO CO.

MODEL 450  
MODEL 450A  
Alignment

PRELIMINARY:

ALIGNMENT PROCEDURE

- Output meter connection.....4,000 ohm or more copper oxide meter across 5 ohm terminals. Shunt with speaker
- Output meter reading to indicate .5 watt.....1.575 V.
- Average sensitivity in microvolts for .5 watt output.....See chart below
- Generator ground lead connection.....Direct to chassis
- Dummy antenna value in series with generator output..... See Note 1 below
- Connection of generator output lead.....See Chart Below
- Generator modulation.....30%, 400 cycles
- Position of volume control A.F. gain.....Full on
- Position of volume control R.F. gain.....Full on
- A.V.C. Switch.....On
- Band spread dial set at 100.....Min. Capacity

NOTE 1 When aligning the two I.F. channels a condenser of .05 Mfd. may be used in series with the generator lead. For the other bands the following circuit is shown with the values that make a universal dummy antenna system for all bands.

NOTE 2: When using a CRYSTAL, set PHASING CONTROL to almost minimum capacity. See special alignment instructions below for Crystal. Align set in "sharp" position if set is without crystal.

ALIGNMENT INSTRUCTIONS - FOR RECEIVERS EQUIPPED WITH CRYSTALS

- (A) REMOVE CRYSTAL, set crystal phasing condenser to almost minimum capacity and throw IF switch to "XTAL" position.
- (B) With the 465 KC signal, re-adjust the I.F. Trimmer C-46 - the one nearest the front panel of the receiver - by turning the screw counter-clockwise. The signal now may be slightly weaker than before and sound "off-side". This, however, is a normal condition.
- (C) REPLACE THE CRYSTAL - A very noticeable drop in signal strength may be noted, due to the filtering action of the crystal, and the frequency control of the signal generator must be "rocked" slowly back and forth, until the increase in signal strength indicates the exact frequency of the crystal being used. Now re-align the entire I.F. system to this frequency.
- (D) Adjust "XTAL" phasing condenser for the lowest pitched note possible and re-adjust signal generator frequency. Repeat and continue to repeat this alignment procedure until no further improvement in the alignment can be accomplished.

NOTE: If the IF switch should now be thrown to another position, an apparent rise in gain will be noticed, which is caused by the addition of higher frequencies and background noise, so it does not mean that the sensitivity of this set is impaired in any way by use of the crystal.

NOTE 3: THE BEAT FREQUENCY OSCILLATOR is adjusted for the A, B, C, D, Bands with Trimmer C31. With models having an "E" & "F" Band B.F.O.—Adjust C32 with dial at 1560 on Band D to 1560 KC. Recheck C31. Set pitch control to half capacity.

(56-60 MC = 1440)  
(7-7.5 MC = 1500 + 1860)  
(28-30 MC = 1600)

SINCE THE BAND SPREAD SYSTEM is accomplished by means of a separate three-gang condenser, the spread in degrees over the assigned amateur bands is as follows:—

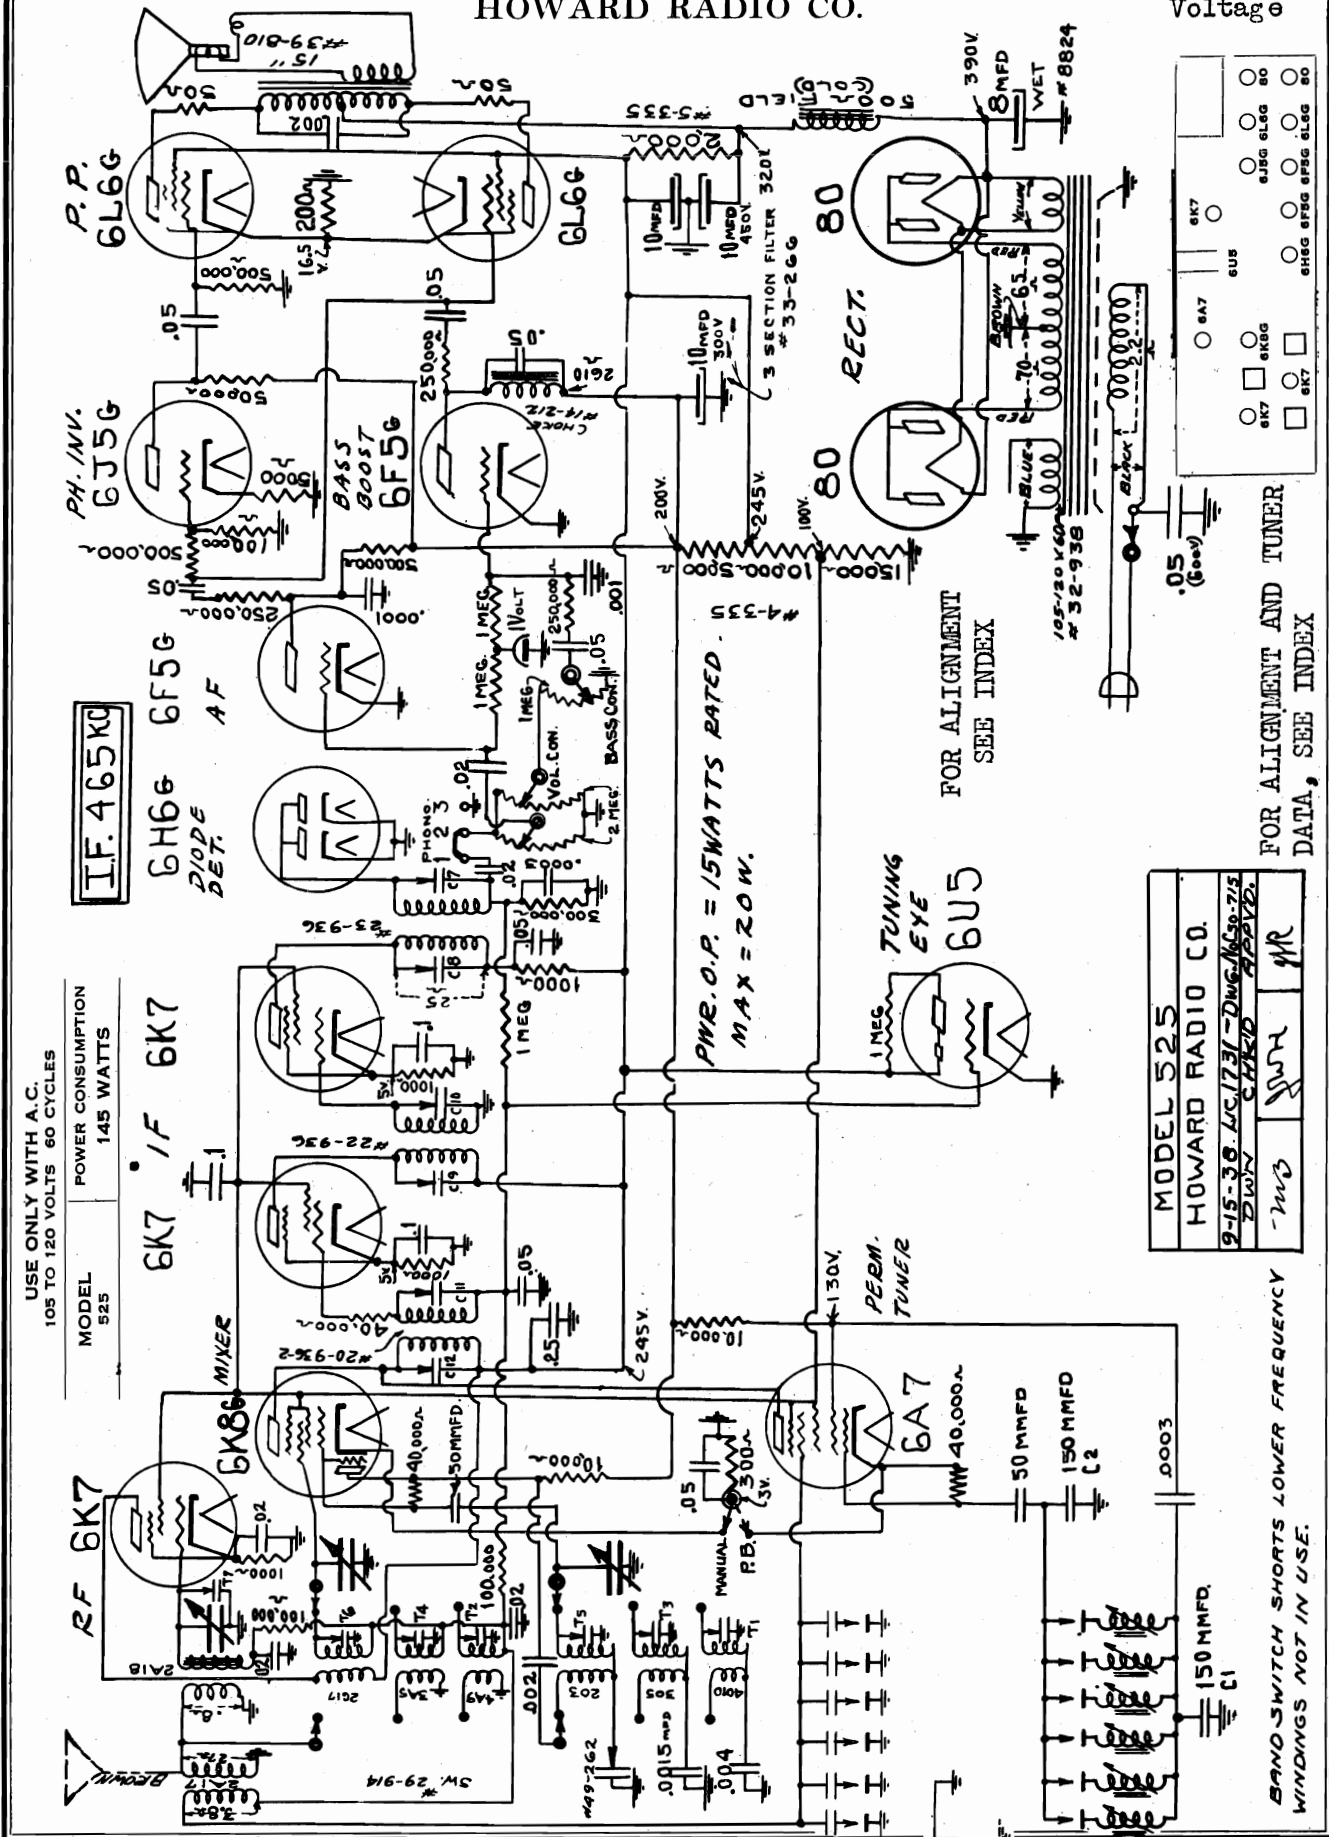

However, for those who wish to DOUBLE the amount of band spread, it is only necessary to remove one ROTOR plate from each section of the BAND SPREAD CONDENSER. This accomplished by merely cutting the separating link holding the two plates together and pulling the plate from the rotor shaft.

(3.5-4 MC = 5400 + 1860)  
(14.005-14.395 MC = 810)  
(1.716-8 MC = 360 + 1680)

## HUDSON MOTOR CAR CO.

Alignment Procedure

**ALIGNMENT PROCEDURE**

In readjusting the tuned circuits, it is important to apply a definite procedure and to use adequate and reliable test equipment. A standard test oscillator will be required as the source of signal at the specified alignment frequencies. Means for indication of the receiver output during alignment is also necessary to show accurately when the correct point of adjustment is reached. Two indication methods are applicable. One requires use of cathode-ray oscillograph equipment, and the other requires a voltmeter or output indicator. The cathode-ray alignment method is advantageous in that the indication provided is in the form of a wave image which represents the resonance characteristics of the circuits being tuned.

Adjust the control box by turning the tuning knob clockwise until a definite stop is reached at the high-frequency end of the dial-scale. Then turn the tuning knob counter-clockwise until a definite stop is reached at the low-frequency end of the dial scale.

Figures 2235 and 2236 give the locations of the tubes and trimmer screws for adjustable capacitors and magnetite cores for models SA-38 and DB-38 respectively.

Place the receiver in operation with its two covers removed. Attach the output indicator across the loudspeaker voice coil circuit and advance the receiver volume control to full volume position. (If cathode-ray oscillograph is used for output indication, the vertical input terminals should be connected between the i-f transformer side of R15 (Figure 2240) and the receiver chassis for the DB-38 model, and between the high side of the volume control R7 (in control unit) (Figure 2238) and the receiver chassis for model SA-38. The cathode-ray oscillograph method of i-f alignment requires the conventional cathode-ray oscillograph, frequency modulator and signal generator set-up.)

For each adjusting operation, regulate the test oscillator output control so that the signal level is as low as possible and still observable on the indicating device. Use of such small signal will obviate broadness of tuning which would otherwise result from a.v.c. action on a stronger one.

**I-F ADJUSTMENTS**

1. Connect the "high" output of the test oscillator to the control grid cap of the i-f tube (6K7-G) through a 0.25 mfd. capacitor and connect the ground of the test oscillator to the receiver chassis. Adjust the frequency of the test oscillator to 260 kc. Tune the receiver to a point where no interference is received from the heterodyne oscillator or local stations.

2. Adjust the two screws L8 and L9 (attached to magnetite cores) of the second i-f transformer, one on top and one on bottom, until maximum output is produced on the indicating device.

3. Remove the test oscillator from the i-f tube input and connect it between the control grid cap of the first detector tube (6A8-G) and chassis ground, using the 0.25 mfd. capacitor as previously. Allow its tuning to remain at 260 kc. Tune the receiver to avoid interference as in 1.

4. Adjust the two screws L4 and L5 of the first i-f transformer for maximum (peak) receiver output.
5. Repeat procedures 1, 2, 3 and 4 as a check.

**R-F ADJUSTMENTS**

6. Connect the "high" output of the test oscillator to the antenna plug of the receiver through a 100 mmfd. capacitor, leaving the test oscillator ground connected to the receiver chassis. If the antenna lead-in is used, the value of this capacitor should be 50 mmfd. Tune the test oscillator to 1400 kc. Allow the output indicator to remain attached to the receiver as for i-f alignment.

7. Tune the receiver so that the dial reading is approximately halfway between 1300 and 1500 kc., which gives a 1400 kc. setting. Then adjust the oscillator, detector and antenna coil trimmers, C10, C5, and C3 respectively, adjusting each to the point producing maximum indicated receiver output.

8. Shift the test oscillator frequency to 600 kc. and tune the receiver to pick up this signal, disregarding the dial reading at which it is received. The oscillator series trimmer C11 should then be adjusted, simultaneously rocking the receiver tuning control backward and forward through the signal until maximum (peak) receiver output results from these combined operations.

9. The adjustment of C10, C5 and C3 should then be repeated as in operation 7 to correct for any change in their alignment due to the adjustment of C11.

NOTE: The antenna coil L1 has a magnetite core which is adjusted at the factory for the correct inductance. This adjustment should not be disturbed.

**DB-38**

Speaker:

Type: Electrodynamic 8"

Impedance (v.c.) 3 ohms. at 400 cycles

Vibrator: Synchronous

Power Output: Undistorted, 6 watts; maximum, 9 watts

Power Rating: Supply voltage 6.3 volts (storage battery)  
Current drain 8.25 amperes at 6.3 volts  
Fuse protection 15 amperes

R-F Alignment Frequencies:

Antenna coil 1400 kc.

Oscillator coil 600 kc. and 1400 kc.

Detector coil 1400 kc.

**SA-38**

Speaker:

Type: Six Inch Dynamic

Impedance (v.c.) 3 ohms. at 400 cycles

Vibrator: Non-synchronous

Power Output: Undistorted, 2.6 watts; maximum, 4 watts

Power Rating: Supply voltage 6.3 volts (storage battery)

Current drain 6.0 amperes at 6.3 volts

Fuse protection 15 amperes

R-F Alignment Frequencies:

Antenna coil 1400 kc.

Oscillator coil 600 and 1400 kc.

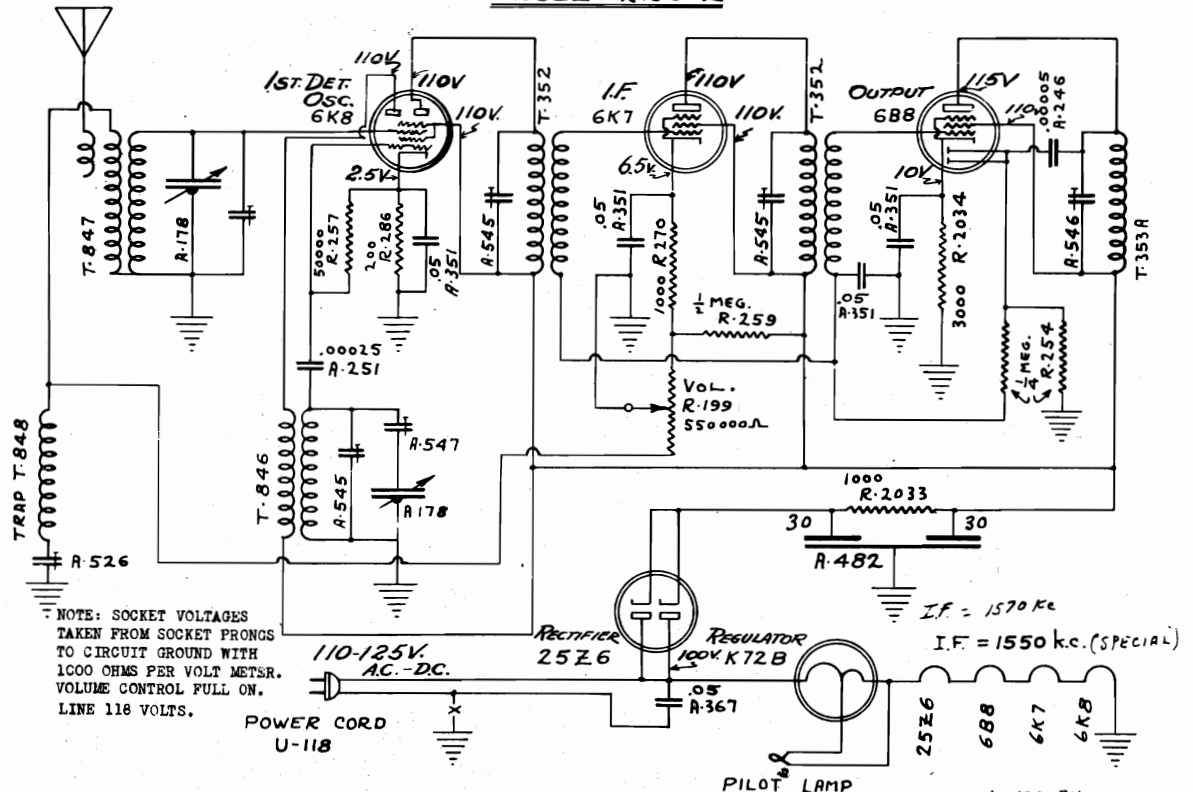

Detector coil 1400 kc.

NOTE: SOCKET VOLTAGES TAKEN WITH 1000 OHMS PER VOLT METER FROM TUBE PRONGS TO CIRCUIT GROUND.  
LINE 116 VOLTS. VOLUME CONTROL FULL ON 10% VARIATION ALLOWABLE.

**CONNECTIONS:**  
1 - 30 μfd - TO RECTIFIER CATHODE  
2 - 8 μfd. - TO B+  
3 - NEGATIVE - TO GROUND.

**NOTE:**  
THESE PARTS ARE INTERCHANGABLE ON MODEL KR-20, BUT MUST BE CONNECTED AS SHOWN.

**ALIGNMENT MODEL KRC-2**

**I. F. TRIMMERS:** Feed 1570 Kc. modulated signal from signal generator directly to antenna of Tunemaster. Adjust both I.F. trimmers to maximum reading on output meter. Then adjust output coil trimmer to maximum.  
**R. F. TRIMMERS:** Set Tunemaster dial at 1500 Kc. and feed 1500 Kc. signal from signal generator to antenna of Tunemaster. Set antenna trimmer approximately 1/4 turn from tight. Peak oscillator trimmer at 1500 Kc. Set dial at 600 Kc. and peak series oscillator trimmer. Move dial and series trimmer simultaneously by small amounts so as to get maximum output at 600 Kc. Tune back to 1500 Kc. and peak oscillator trimmer. Repeat previous peaking of series trimmer at 600 Kc. Return to 1500 Kc. and peak oscillator trimmer. Set dial at approximately 1400 Kc. Tune signal generator to resonance with Tunemaster. Then peak antenna trimmer.

**ALIGNMENT MODEL KR 20**

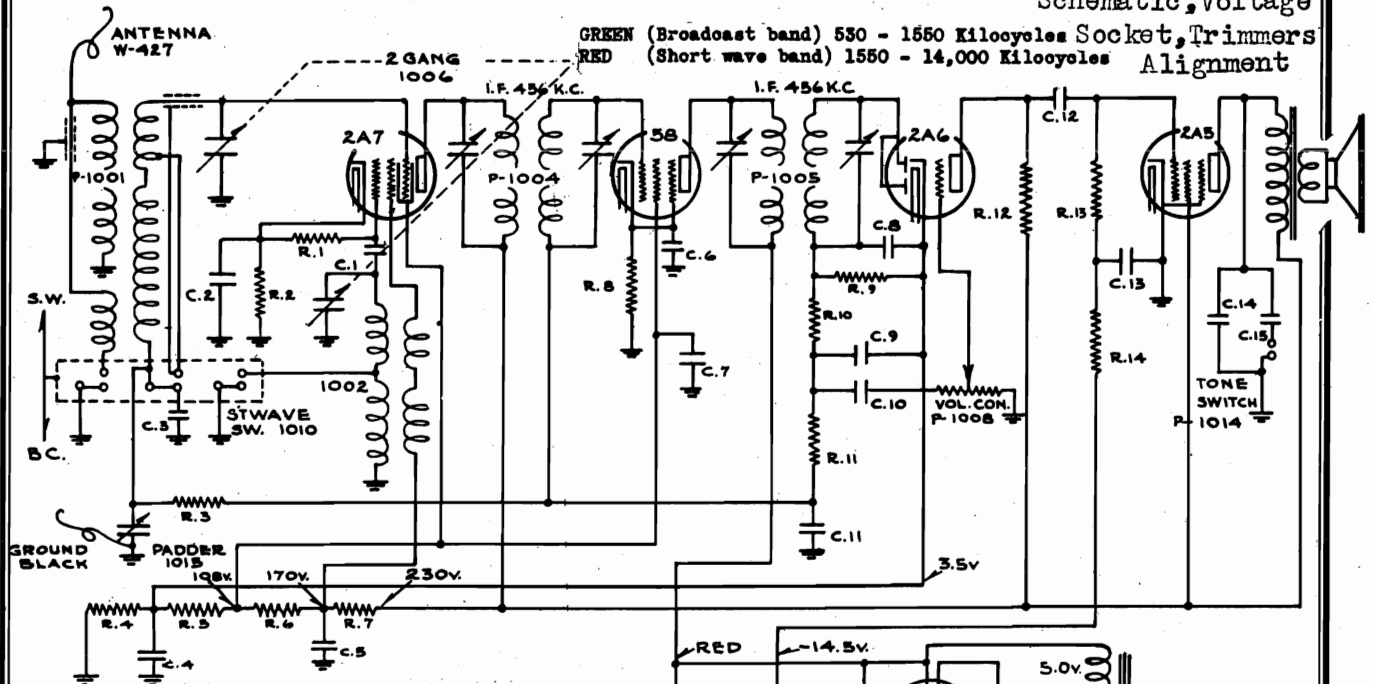

**I. F. TRIMMERS:** To align the I.F. circuits, set the signal generator to 448 Kc. and feed its modulated signal direct to the antenna. Adjust the first I.F. transformer trimmers for maximum meter reading. Go over both adjustments at least three or four times for accuracy. Repeat this process on the second I. F. transformer. If adjustments are not made accurately, selectivity will be poor and I. F. oscillation may result.  
**R. F. TRIMMERS:** Turn the dial to 1500 Kc. and feed a very weak 1500 Kc. modulated signal from your signal generator to the antenna. Adjust the oscillator trimmer for maximum reading. Then peak the antenna trimmer to this setting. Aligning of broadcast band should be done on 1500, 1000 and 600 kilocycles. There is no adjustable paddler condenser in this model so resonance on lower frequencies is accomplished by bending plates on tuning condensers.

**ALIGNMENT**

Connect oscillator at 456 KC to grid of 2A7 tube and ground wire. Variable condenser at minimum capacity, adjust four trimmers (one nut and one screw on each transformer trimmer) to resonance.

Broadcast band, wave changing switch to Green, variable condenser at minimum capacity. Disconnect antenna wire, connect 1550 KC oscillator to antenna coil in series with a 75 MMFD condenser. Adjust oscillator (front) section trimmer to resonance. Set oscillator to 1400 KC, rotate variable condenser until signal is tuned in, then adjust R.F. (rear) section trimmer to resonance. Check output at 1200, 1000, 800, and 600 Kilocycles if necessary bend plates (of rear R.F. section of variable only).

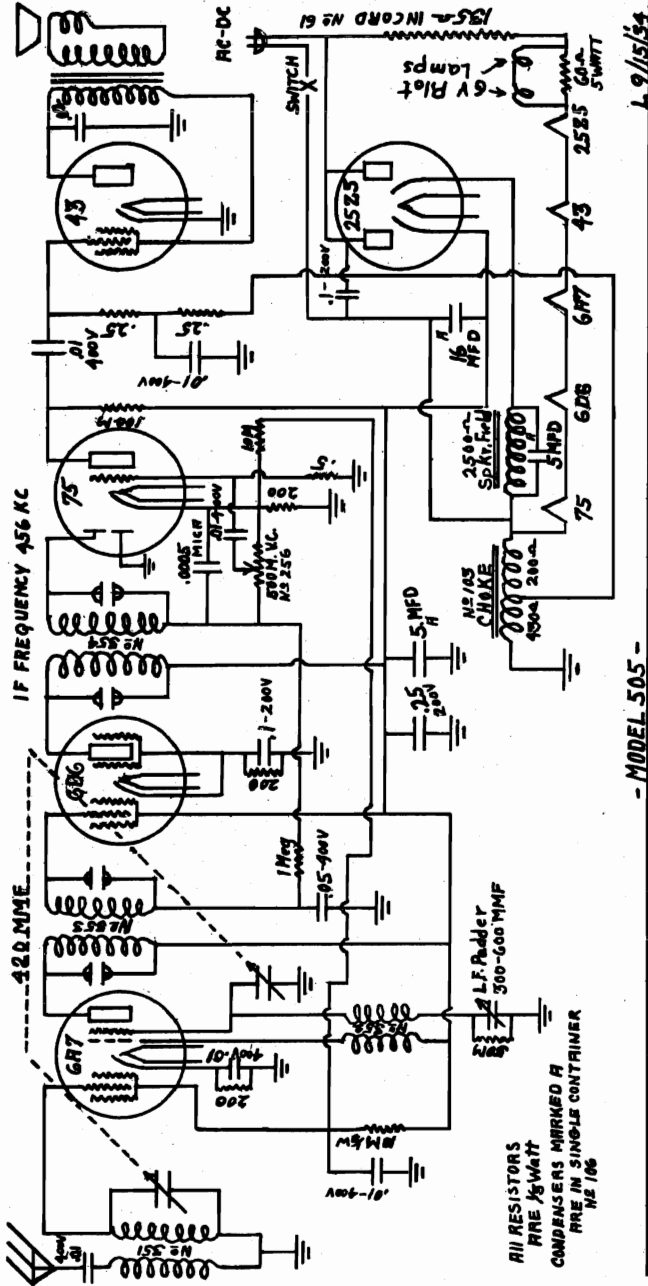

Short wave band, set wave changing switch to RED and with input oscillator connected as above and set at 1720 KC and at harmonics of 1000 KC (2000 KC), of 1200 KC (2400 KC), of 1400 KC (2800 KC), and 1720 KC (3440 KC). **DO NOT BEND PLATES.**

For failure to operate over both bands check 2A7 tube and connections to and contacts of wave changing switch.

MODEL 204  
Schematic, Socket  
Trimmers, Voltage  
Alignment

MODEL 505

1. I.F. Alignment -

To peak I.F. transformers, apply an oscillator note of 456 KC to the grid of the 6A7 tube and adjust screws seen in tops of I.F. transformers until maximum peak is obtained.

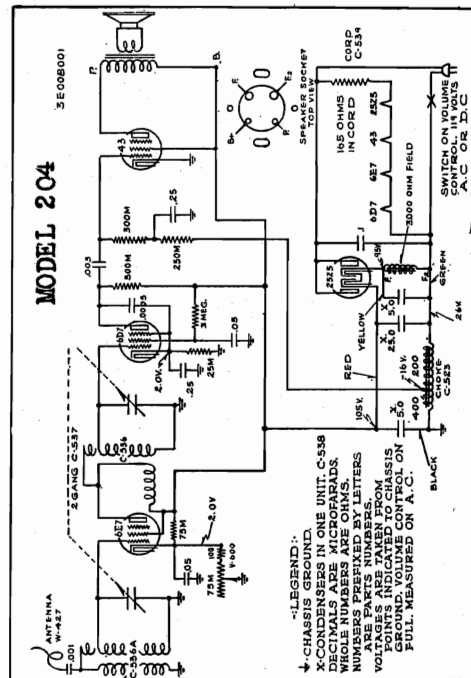

2. Broadcast -

Connect an oscillator adjusted to 1720 KC, to the antenna of set, then adjust trimmer of oscillator section first with variable condenser way open to peak output, next adjust antenna section trimmer on variable condenser to peak output.

3. Low Frequency Padder -

Next apply a 600 KC note from oscillator and while rocking variable condenser back and forth across signal, adjust padder to maximum output.

4. Check alignment again at 1400 KC; 1000 KC and 800 KC. It will not be necessary to bend plates to align this receiver.

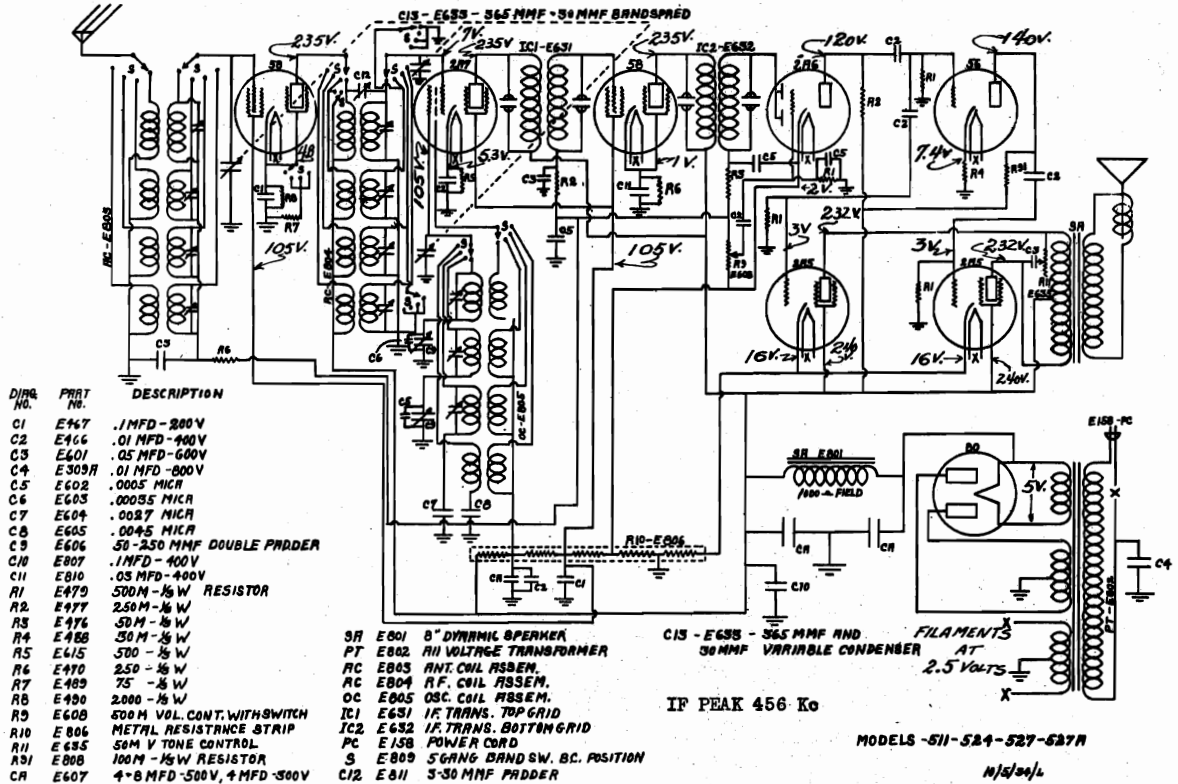

Should it be necessary at any time to rebalance this set the procedure is as follows: Disconnect antenna wire and attach an oscillator in series with a 50 mmfd. condenser to the antenna coil. With variable condenser at its minimum capacity position—at the extreme left of its rotation—adjust trimmer condensers for maximum deflection on an output meter connected across the antenna terminals. Then adjust the antenna trimmer for maximum deflection. Then align at 1200-1000-800-600-540 kilocycles, bend slotted plates of variable condenser if necessary.

Alignment and Calibration

Correct alignment is extremely important in connection with all wave receivers. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment.

A signal generator that will provide an accurately calibrated signal at 456, 1730, 1500, 600, 5800, 5000, 18,300, 15,000 and 6000 KC and an output indicating meter are required. It will be practically impossible to align the receiver if unsatisfactory apparatus is used. If a station is tuned in with the selectivity control in the broad position and this control is then turned to the sharp position, the station may disappear. This is not an indication that the receiver is out of alignment.

Use a non-metallic screwdriver for the adjustments. The complete procedure is as follows:

**I. F. Adjustment**  
Set the signal generator for a signal of 456 KC. Connect the output of the signal generator to the grid of the 1st detector through a 0.1 MF condenser. Connect the ground lead of the receiver to the ground post of the signal generator.  
Turn the band selector to the Range B position (standard wave band—purple dial color).  
Turn the selectivity control to the sharp position and keep it in this position for all adjustments.  
Turn the volume control to the maximum position. Attenuate the signal from the signal generator to prevent the levelling-off action of the A.V.C.  
Then adjust the five I.F. trimmers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis, and the location is shown in Fig. 5.

**1500 KC Adjustment**  
Set the signal generator for 1500 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.  
Loosen the pointer set screw and set the large pointer at the 1500 KC mark on the standard wave band scale. Retighten the set screw.  
Adjust the 1st and 2nd interstage Range B trimmers (C8 and C13) and antenna Range B trimmer (C2) to maximum.  
Do not change the setting of the oscillator Range B trimmer.

**600 KC Adjustment**  
Set the signal generator for 600 KC. Turn the tuning condenser rotor until maximum output is obtained.  
Turn the rotor slowly back and forth at the same time adjusting the 600 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.  
Be sure to use a non-metallic screwdriver for this adjustment.

**Range C Alignment**  
**5800 KC Adjustment**  
Set the signal generator for 5800 KC. Connect the antenna lead of the receiver through a 400 ohm resistor to the output of the signal generator.  
Turn the rotor of the tuning condenser to the full open position.  
Turn the band selector to the Range C position (1st short wave band—green dial color).  
As mentioned above, keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent A.V.C. action.  
Adjust the oscillator Range C trimmer (C40) until maximum output is obtained. See Fig. 3 for location of this trimmer.

**5000 KC Adjustment**  
Set the signal generator for 5000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.  
Adjust the 1st and 2nd interstage Range C trimmers (C9 and C12) and antenna Range C trimmer (C3) to maximum.  
Do not change the setting of the oscillator Range C trimmer.

**18,300 KC Adjustment**  
Set the signal generator for 18,300 KC. Keep the antenna lead of the receiver connected through the 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.  
Turn the band selector to the Range D position (2nd short wave band—red dial color).  
As mentioned above, keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent A.V.C. action.  
Adjust the oscillator Range D trimmer (C41) until maximum output is obtained. See Fig. 3 for location of this trimmer.  
Do not make any further change in the setting of the oscillator Range D trimmer.

**6000 KC Adjustment**  
Set the signal generator for 6000 KC. Turn the tuning condenser rotor until maximum output is obtained.  
Turn the rotor slowly back and forth at the same time adjusting the 6000 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.  
Use a non-metallic screwdriver for this adjustment

**20,000 KC Adjustment**  
Set the signal generator for 20,000 KC. Turn the tuning condenser rotor until maximum output is obtained.  
Adjust the 1st and 2nd interstage Range D trimmers (C10 and C11) and antenna Range D trimmer (C4) to maximum.  
When adjusting the 2nd interstage Range D trimmer, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.  
Then go back and repeat the procedure as given for the 18,300 KC adjustment. If it is found necessary to make any appreciable change in the setting of the oscillator Range D trimmer, the 15,000 KC adjustment must be repeated.  
Do not make any further change in the setting of the oscillator Range D trimmer.

**20,000 KC Adjustment**  
Set the signal generator for 20,000 KC. Turn the tuning condenser rotor until maximum output is obtained.  
Adjust the 1st and 2nd interstage Range D trimmers (C10 and C11) and antenna Range D trimmer (C4) to maximum.  
When adjusting the 2nd interstage Range D trimmer, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.  
Then go back and repeat the procedure as given for the 18,300 KC adjustment. If it is found necessary to make any appreciable change in the setting of the oscillator Range D trimmer, the 15,000 KC adjustment must be repeated.  
Do not make any further change in the setting of the oscillator Range D trimmer.

**Range D Alignment**  
**15,000 KC Adjustment**  
Set the signal generator for 15,000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.  
Adjust the 1st and 2nd interstage Range C trimmers (C9 and C12) and antenna Range C trimmer (C3) to maximum.  
Do not change the setting of the oscillator Range C trimmer.

**20,000 KC Adjustment**  
Set the signal generator for 20,000 KC. Turn the tuning condenser rotor until maximum output is obtained.  
Adjust the 1st and 2nd interstage Range D trimmers (C10 and C11) and antenna Range D trimmer (C4) to maximum.  
When adjusting the 2nd interstage Range D trimmer, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.  
Then go back and repeat the procedure as given for the 18,300 KC adjustment. If it is found necessary to make any appreciable change in the setting of the oscillator Range D trimmer, the 15,000 KC adjustment must be repeated.  
Do not make any further change in the setting of the oscillator Range D trimmer.

**20,000 KC Adjustment**  
Set the signal generator for 20,000 KC. Turn the tuning condenser rotor until maximum output is obtained.  
Adjust the 1st and 2nd interstage Range D trimmers (C10 and C11) and antenna Range D trimmer (C4) to maximum.  
When adjusting the 2nd interstage Range D trimmer, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.  
Then go back and repeat the procedure as given for the 18,300 KC adjustment. If it is found necessary to make any appreciable change in the setting of the oscillator Range D trimmer, the 15,000 KC adjustment must be repeated.  
Do not make any further change in the setting of the oscillator Range D trimmer.

**20,000 KC Adjustment**  
Set the signal generator for 20,000 KC. Turn the tuning condenser rotor until maximum output is obtained.  
Adjust the 1st and 2nd interstage Range D trimmers (C10 and C11) and antenna Range D trimmer (C4) to maximum.  
When adjusting the 2nd interstage Range D trimmer, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.  
Then go back and repeat the procedure as given for the 18,300 KC adjustment. If it is found necessary to make any appreciable change in the setting of the oscillator Range D trimmer, the 15,000 KC adjustment must be repeated.  
Do not make any further change in the setting of the oscillator Range D trimmer.

**20,000 KC Adjustment**  
Set the signal generator for 20,000 KC. Turn the tuning condenser rotor until maximum output is obtained.  
Adjust the 1st and 2nd interstage Range D trimmers (C10 and C11) and antenna Range D trimmer (C4) to maximum.  
When adjusting the 2nd interstage Range D trimmer, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.  
Then go back and repeat the procedure as given for the 18,300 KC adjustment. If it is found necessary to make any appreciable change in the setting of the oscillator Range D trimmer, the 15,000 KC adjustment must be repeated.  
Do not make any further change in the setting of the oscillator Range D trimmer.

**20,000 KC Adjustment**  
Set the signal generator for 20,000 KC. Turn the tuning condenser rotor until maximum output is obtained.  
Adjust the 1st and 2nd interstage Range D trimmers (C10 and C11) and antenna Range D trimmer (C4) to maximum.  
When adjusting the 2nd interstage Range D trimmer, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.  
Then go back and repeat the procedure as given for the 18,300 KC adjustment. If it is found necessary to make any appreciable change in the setting of the oscillator Range D trimmer, the 15,000 KC adjustment must be repeated.  
Do not make any further change in the setting of the oscillator Range D trimmer.

MODELS B35, B36  
Alignment, Changes  
DC Resistances

## Alignment and Calibration

Correct alignment is extremely important in connection with all wave receivers. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment.

A signal generator that will provide an accurately calibrated signal at 456, 1730, 1500, 600, 5800, 5000, 18,300, 15,000 and 6000 KC and an output indicating meter are required. It will be practically impossible to align the receiver if unsatisfactory apparatus is used. If a station is tuned in with the selectivity control in the broad position and this control is then turned to the sharp position, the station may disappear. This is not an indication that the receiver is out of alignment.

Use a non-metallic screwdriver for the adjustments. The complete procedure is as follows:

### I. F. Adjustment

Set the signal generator for a signal of 456 KC. Connect the output of the signal generator through a (1) mf. condenser to the grid of the 1st. detector. Connect the ground lead of the receiver to the ground post of the signal generator. Turn the band selector to the Range B position (standard wave band—purple dial color). Turn the selectivity control to the sharp position and keep it in this position for all adjustments. Turn the volume control to the maximum position. Attenuate the signal from the signal generator to prevent the leveling-off action of the A.V.C.

Then adjust the five I.F. trimmers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis, and the location is shown in Fig. 5.

### Range B Adjustment

Set the signal generator for 1730 KC. Turn the rotor of the tuning condenser to the full open position. Keep the band selector in the standard wave position. Connect the antenna lead of the receiver through a 200 mf. condenser to the output of the signal generator.

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent A.V.C. action. Adjust the oscillator Range B trimmer (C32) until maximum output is obtained. The location of this trimmer is shown in Fig. 3.

### 1500 KC Adjustment

Set the signal generator for 1500 KC. Turn the rotor of the tuning condenser carefully until maximum output

Loosen the pointer set screw and set the large pointer at the 1500 KC mark on the standard wave band scale. Retighten the set screw.

Adjust the interstage Range B trimmer (C7) and antenna Range B trimmer (C3) to maximum. Do not change the setting of the oscillator Range B trimmer.

### 600 KC Adjustment

Set the signal generator for 600 KC. Turn the tuning condenser rotor until maximum output is obtained. Turn the rotor slowly back and forth at the same time adjusting the 600 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

### Range C Alignment

#### 5800 KC Adjustment

Set the signal generator for 5800 KC. Connect the antenna lead of the receiver through a 400 ohm resistor to the output of the signal generator. Turn the rotor of the tuning condenser to the full open position. Turn the band selector to the Range C position (1st short wave band—green dial color). Adjust the oscillator Range C trimmer (C30) until maximum output is obtained. See Fig. 3 for location of this trimmer.

#### 5000 KC Adjustment

Set the signal generator for 5000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained. Adjust the interstage Range C trimmer (C8) and antenna Range C trimmer (C3) to maximum. Do not change the setting of the oscillator Range C trimmer.

### Range D Alignment

Set the signal generator for 18,300 KC. Keep the antenna lead of the receiver connected through the 400 ohm resistor to the output of the signal generator. Turn the rotor of the tuning condenser to the full open position. Turn the band selector to the Range D position (2nd short wave band—red dial color). Adjust the oscillator Range D trimmer (C29) until maximum output is obtained. See Fig. 3 for location of this trimmer.

### 15,000 KC Adjustment

Set the signal generator for 15,000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained. Adjust the interstage Range D trimmer (C9) and antenna Range D trimmer (C4) to maximum. When adjusting the interstage Range D trimmer, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.

Then go back and repeat the procedure as given for the 18,300 KC adjustment. If it is found necessary to make any appreciable change in the setting of the oscillator Range D trimmer, the 15,000 KC adjustment must be repeated. Do not make any further change in the setting of the oscillator Range D trimmer.

Turn the rotor slowly back and forth at the same time adjusting the 6000 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

### 6000 KC Adjustment

Set the signal generator for 6000 KC. Turn the tuning condenser rotor until maximum output is obtained. Turn the rotor slowly back and forth at the same time adjusting the 6000 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

## D. C. Resistance of Windings

Refer to Fig. 4. Following are the D. C. resistances of the various windings in the chassis. The values given below will vary slightly in different sets.

Part No.	Winding	Code	D. C. Resistance in Ohms
P-9A40	Antenna K. Transformer	T1	21.8
	Range B Primary Winding		0.2
	Range B Secondary Winding		0.2
	Range C Primary Winding		0.3
	Range C Secondary Winding		0.3
P-9A42	Interstage K. F. Transformer	T2	25
	Range C Primary Winding		1.4
	Range C Secondary Winding		0.4
	Range D Primary Winding		2.0
	Range D Secondary Winding		0.4
P-9A46	Oscillator B. Grid Coil	T3	Small
	Red White Tap to White		3.0
	Green White Tap to Green		1.0
	Range C Grid Coil		0.2
	Range D Grid Coil		0.5
	Black White Tap to Black		Small
	White Tap to Ground		Small
	Oscillator Plate Coil		0.2
P-9A39 1st	I. F. Transformer	T3	4.6
	Primary Winding		1.4
	Secondary Winding		0.2
P-9A39 2nd	I. F. Transformer	T4	9.0
	Primary Winding		0.5
	Secondary Winding		0.5
P-9A39 3rd	I. F. Transformer	T5	10.2
	Primary Winding		2.4
	Secondary Winding		0.2
P-50X16	Audio Output Transformer	T7	230.
	Primary Winding		200.
	Secondary Winding		200.
P-51X32	Audio Output Transformer	T6	230.
	Primary Winding		200.
	Secondary Winding		200.
P-12A208	Dyn. Speaker Voice Coil		198.
	Center Tap to Outside		22.

P-51X4 115	Speaker Voice Coil		570.
	Primary Winding		1.6
	Secondary Winding		1.6
	Tube Filament Secondary (A)		4.8
	Tube Filament Secondary (B)		0.2
	Rectifier Filament Secondary		0.1
	High Voltage Secondary Winding		61
	Center Tap to Outside		128.
P-9A40 2nd	I. F. Plate Isolating Reactor	L1	36.
P-9A391	High Frequency Oscillator Tracking Coil	L3	1.2

**Twenty-five Cycle Receivers**  
The twenty-five cycle receiver differs from the sixty cycle receiver only in the fact that a different power transformer is used. The correct power transformer is shown in the parts list.

The twenty-five cycle receiver can be operated satisfactorily from a sixty cycle power supply. However, the reverse is not true, the sixty cycle receiver cannot be operated from a twenty-five cycle power supply.

A 115-230 Volt, 40 to 60 cycle as well as other power transformers with special power ratings are also available for this model.

### Changes in Early Models

In the early models of this receiver the tone control resistor (R11) was connected as a series variable resistor connecting in series through the condenser C2 between the grids of the 43 tubes in the audio output stage. In the later models it is employed as a potentiometer in the manner shown in Fig. 7.

The 100,000 ohm resistor (R18) was not used in the early models. Condenser C21 was connected directly to resistor R7.

The type 6K7 metal tubes replace the type 6D6 glass tubes which were used in the early models. Condenser C33 was added to the oscillator coil standard wave section in later models. It is not, however, used in all cases but only when this capacity is required in this circuit.

Fig. 5—Details of Panel Drilling for Phono Assembly

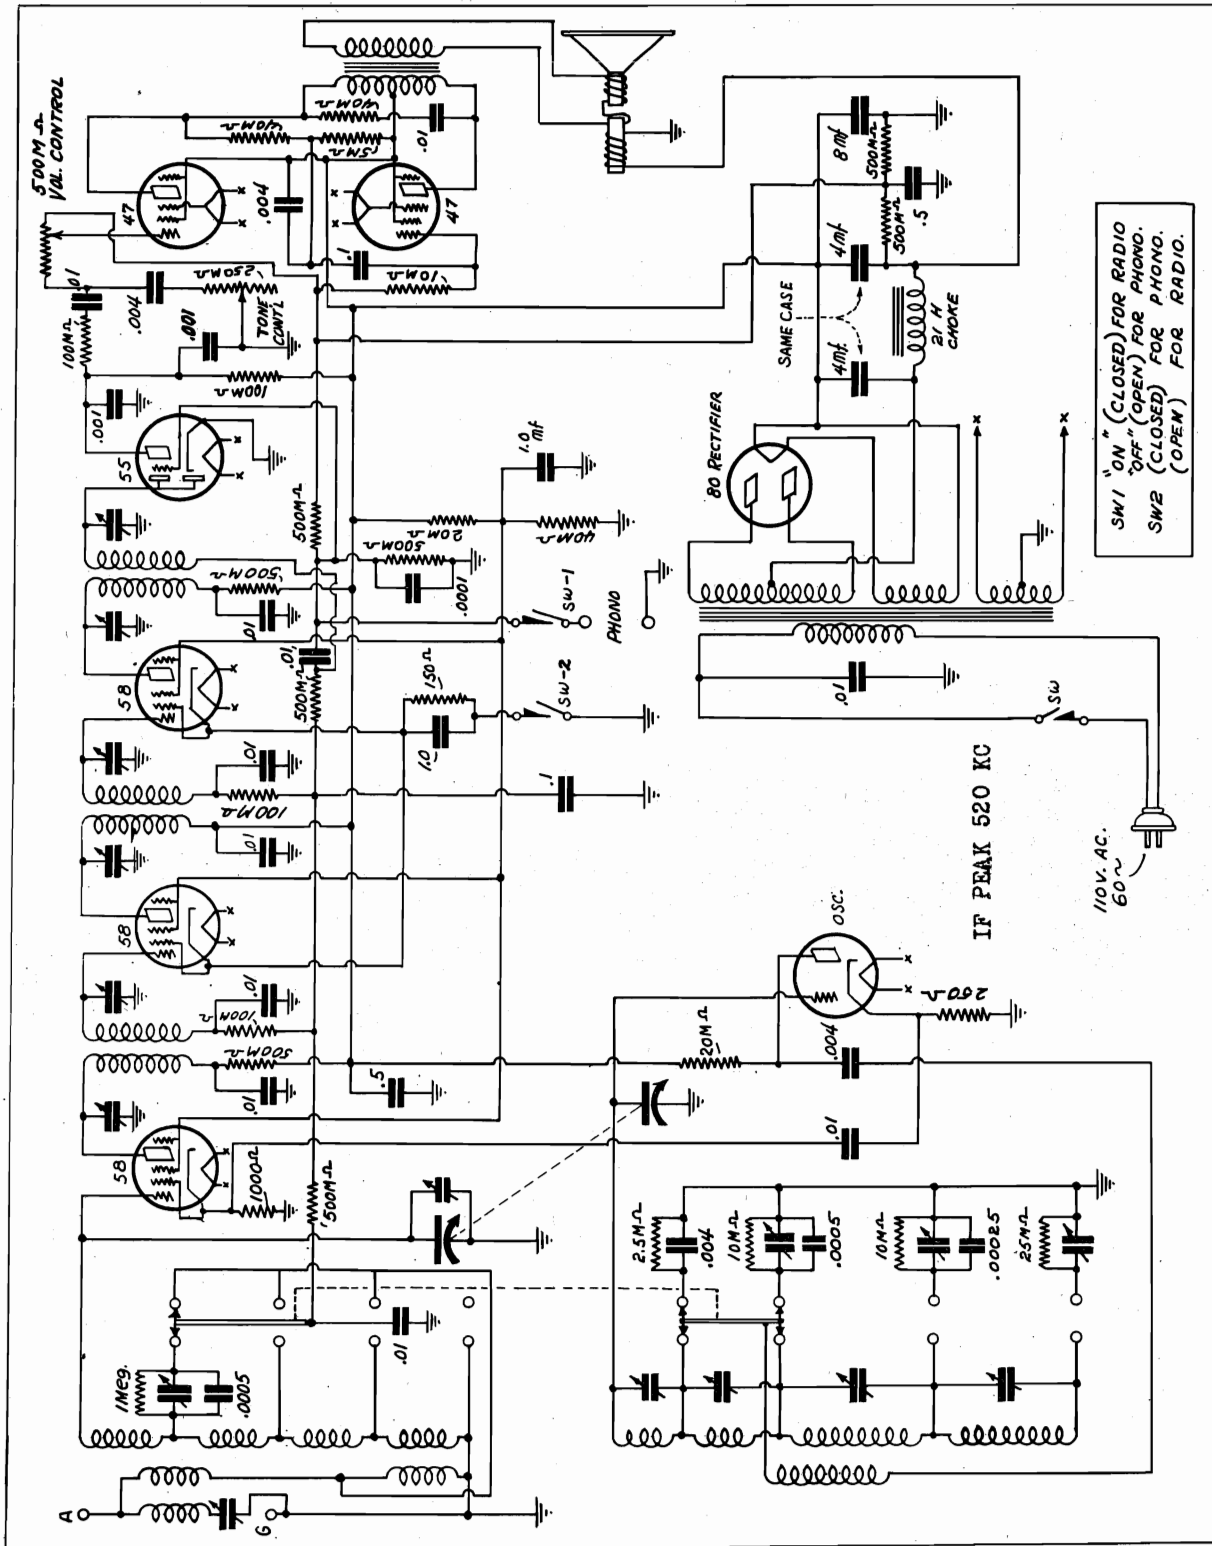

## Phonograph Connections

Phonograph connections can be made as shown in Fig. 7. The parts required to make this installation are shown in the parts list.

To mount the phono switch and phono jack, drill holes of a size and in the position shown in Fig. 8 at the left hand side (from back) of the rear panel of the chassis.

LAFAYETTE RADIO MFG. CO.

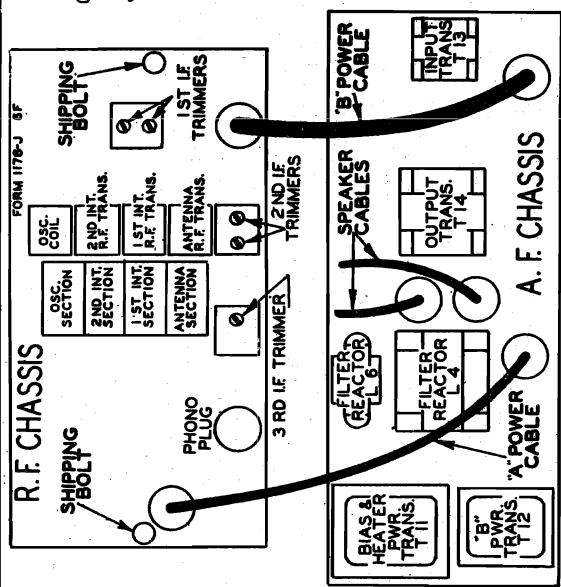

Fig. 4—Top View of Chassis Showing Location of Units

Changes in Early Models

In the early models condenser C65, shown in the R.F. Schematic Fig. 2, was not used. A 20 mmf. condenser, also designated as C65, was connected in parallel with condenser C14.

Capacitor C10 from B+ to ground was not used in early models. Another condenser in the early models, also designated as C10 and 250 mmf. in value, was connected from the A.V.C. amplifier plate to ground. Resistor R38 was not used in early models.

On the A.F. chassis the speaker sockets were wired with ground to the opposite side of voice coil.

## Photograph in Separate Cabinet

For this assembly, a 5 conductor cable and a small metal panel assembly are supplied. This assembly has the radio-phonograph switch, tip jacks for pick-up leads and terminal plate for phono cable.

The phono panel is mounted at the most convenient place in the cabinet at which connections can be completed. The switch is secured to the motor board as illustrated in Fig. 14.

The socket at the end of the cable is secured to the terminal plate on the panel and the plug at the other end of the cable is inserted into the phono socket on the R.F. chassis.

When the switch is thrown to the radio side, the phono pickup is excluded from the signal diode circuit. When it is thrown to the phono side, the signal diode circuit is opened and the phonograph connections completed to this circuit. Resistor R23 is short circuited. This brings the grid and cathode of the 76 A.V.C. amplifier to the same potential and causes a plate-current in this tube of sufficient intensity to bring the R.F. and 1st I.F. tubes to the point of cut off (See article on circuit for further information regarding operation of A.V.C. system).

## Photograph and Radio in Combination Cabinet

For this assembly, a number of separate items as shown in the parts list are supplied. The phono short circuiting plug supplied with the receiver is used after certain changes have been made.

First take off the shell of this plug by twisting the shell in either direction. The shell is then drilled and equipped with a rubber grommet as shown in Fig. 12 (B). Next unsolder and remove the jumper wire from the plug as shown in Fig. 13 (A). Extend the leads through the hole in the shell and solder the leads to the prongs on the plug as illustrated. Complete the connections to the switch and tip jacks as shown. The switch is mounted on the motor board and the tip jacks at the nearest convenient place.

The description of the connections as given for the separate photograph cabinet also applies to the combination.

## Alignment and Calibration

Correct alignment is extremely important in connection with all-wave receivers. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment.

A signal generator that will provide an accurately calibrated signal at 476, 1730, 1500, 600, 5800, 5000, 18,300, 15,000, 6000, 48,000 and 40,000 KC and an output indicating meter are required. It will be practically impossible to align the receiver if unsatisfactory apparatus is used. If a station is tuned in with the selectivity control in the broad position and this control is then turned to the sharp position, the station may disappear. This is not an indication that the receiver is out of alignment.

Use a non-metallic screwdriver for the adjustments. The complete procedure is as follows:

## I. F. Adjustment

Set the signal generator for a signal of 476 KC. Connect the output of the signal generator to the grid of the 1st detector through a 0.1 mf. condenser.

Connect the ground lead of the receiver to the ground post of the signal generator.

Turn the band selector to the Range B position (standard wave band—purple dial color).

Turn the selectivity control to the sharp position and keep it in this position for all adjustments.

Turn the volume control to the maximum position. Attenuate the signal from the signal generator to prevent the leveling-off action of the A.V.C.

Then adjust the five I.F. trimmers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis, and the location is shown in Fig. 4.

## Range B Alignment

## 1730 KC Adjustment

Set the signal generator for 1730 KC. Turn the rotor of the tuning condenser to the full open position.

Keep the band selector in the standard wave position. Connect the antenna lead of the receiver through a 200 mf. condenser to the output of the signal generator.

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent A.V.C. action.

Adjust the oscillator Range B trimmer (C14) until maximum output is obtained. The location of this trimmer is shown in Fig. 6.

## 1500 KC Adjustment

Set the signal generator for 1500 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Loosen the pointer set screw and set the large pointer at the 1500 KC mark on the standard wave band scale. Re-tighten the set screw.

Adjust the 1st and 2nd interstage Range B trimmers (C17 and C18) and antenna Range B trimmer (C3) to maximum.

Do not change the setting of the oscillator Range B trimmer.

## 600 KC Adjustment

Set the signal generator for 600 KC. Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 600 KC trimmer until the peak of greatest intensity is obtained. See Fig. 6 for location of this trimmer.

Be sure to use a non-metallic screwdriver for this adjustment.

## Range C Alignment

## 5800 KC Adjustment

Set the signal generator for 5800 KC. Connect the antenna lead of the receiver through a 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band selector to the Range C position (1st short wave band—green dial color).

As mentioned above, keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent A.V.C. action.

Adjust the oscillator Range C trimmer (C16) until maximum output is obtained. See Fig. 6 for location of this trimmer.

## 5000 KC Adjustment

Set the signal generator for 5000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the 1st and 2nd interstage Range C trimmers (C16 and C19) and antenna Range C trimmer (C4) to maximum.

Do not change the setting of the oscillator Range C trimmer.

## Range D Alignment

## 18,300 KC Adjustment

Set the signal generator for 18,300 KC. Keep the antenna lead of the receiver connected through the 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band selector to the Range D position (2nd short wave band—red dial color).

As mentioned above, keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent A.V.C. action.

Adjust the oscillator Range D trimmer (C17) until maximum output is obtained. See Fig. 6 for location of this trimmer.

## 15,000 KC Adjustment

Set the signal generator for 15,000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the 1st and 2nd interstage Range D trimmers (C11 and C10) and antenna Range D trimmer (C7) to maximum.

When adjusting the 2nd interstage Range D trimmer, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.

Then go back and repeat the procedure as given for the 18,300 KC adjustment. If it is found necessary to make any appreciable change in the setting of the oscillator Range D trimmer, the 15,000 KC adjustment must be repeated.

Do not make any further change in the setting of the oscillator Range D trimmer.

## 6000 KC Adjustment

Set the signal generator for 6000 KC. Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 6000 KC trimmer until the peak of greatest intensity is obtained. See Fig. 6 for location of this trimmer.

Use a non-metallic screwdriver for this adjustment.

## Range E Alignment

## 48,000 KC Adjustment

Set the signal generator for 48,000 KC. Keep the antenna lead of the receiver connected through the 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band selector to the Range E position (3rd short wave band—brown dial color).

Adjust the oscillator Range E trimmer (C50) until maximum output is obtained. See Fig. 6 for location of this trimmer.

## 40,000 KC Adjustment

Set the signal generator for 40,000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the interstage Range E trimmer (C14) and antenna Range E trimmer (C6) to maximum.

Do not change the setting of the oscillator Range E trimmer.

## Switch Contact Location Numbering

A standard arrangement for switch contact location numbering has been adopted. This numbering is illustrated in Fig. 9. In contact locations not used, the number applying to that particular location is not employed.

## Twenty-five Cycle Receivers

The twenty-five cycle receiver differs from the sixty cycle receiver in the fact that special twenty-five cycle filament and "B" power transformers must be used. It also has two additional condensers in the power unit—C27 and C28 as illustrated in Fig. 3.

The twenty-five cycle transformers and the condensers are shown in the parts list.

The twenty-five cycle receiver can be operated satisfactorily from a sixty cycle power supply if the two condensers C27 and C28 are removed. However, the reverse is not true, that is, a sixty cycle receiver cannot be operated from a twenty-five cycle power supply.

115-230 Volt, 40 to 60 cycle filaments and "B" power transformers are also available for this model.

MODEL B90(N) Late Voltage, Alignment Coils, Resistances

Fig. 3—R. F. and Oscillator Coil Base Terminal Arrangement and D. C. Resistance of Windings

**Calibrating the Receiver**  
To calibrate the receiver, tune in a station of known frequency. At the back of the control head is the calibration screw. Remove the pilot lamp assembly. Insert a fine blade screwdriver and turn this screw until the pointer on the dial scale is at the frequency of the station being received. The knob must be held during this adjustment.  
If the control head is inaccessible it may be calibrated by setting the pointer from the front. Remove the crystal by inserting a knife blade under the lower edge. Loosen the pointer screw, set the pointer and retighten.

**D. C. Resistance of Windings**

Following are the D. C. resistances of the various windings in the chassis. The values given below will vary slightly in different sets.

Code	Winding	D. C. Resistance in Ohms
T1	Antenna Transformer	
	Primary Winding	
	Long Portion	5.1
	Short Portion	3.2
	Secondary Winding—Either Portion	1.0
T2	Interstage Transformer	
	Primary Winding	41.5
	Secondary Winding	
	No. 1	1.6
	No. 2	1.8
T3	1st I. F. Transformer	
	Primary Winding	88.0
	Secondary Winding	87.0
T4	2nd I. F. Transformer	
	Primary Winding	43.0
	Secondary Winding	48.2

Code	Winding	D. C. Resistance in Ohms
T5	Dynamic Speaker	
	Output Transformer	
	Primary	416.6
	Secondary	Small
L3	Speaker Field	5.3
	Speaker Voice Coil	Small
T6	Oscillator Coils

75	2nd Det.	5.8	120(1)		1.4	0.14
41	Power	5.8	235	245	15.0(2)	30.0
84	Rectifier	5.8				52.0

**I. F. Adjustment**  
Set the signal generator for a signal of 175 KC. Connect the antenna lead of the signal generator thru a .05 mf. condenser to the stator of the 1st detector section of the tuning condenser. (See Fig. 2 for location of this section.) This can be done by pushing a wire or conductor between the stator plates or by extending an insulated wire thru the hole in the shield over the stator and pushing the wire thru the hole in the lug which extends up from the insulated stator assembly.  
Connect the ground lead of the signal generator to the chassis ground.  
Short out the oscillator section of the tuning condenser.  
Set the volume control at the maximum position. Attenuate the signal from the signal generator to prevent the levelling-off action of the AVC.  
Then adjust the three I.F. trimmers until maximum output is obtained. The location of these trimmers is shown in Fig. 2.

**1400 KC Adjustment**  
Set the signal generator for 1400 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.  
Adjust the 1st detector and antenna trimmers for maximum output.  
Do not change the setting of the oscillator trimmer.

**Adjusting Antenna Trimmer**  
After the receiver is installed and the car antenna is connected it will be necessary to adjust the antenna trimmer. Tune in a weak signal between 1200 and 1400 KC with the volume control about three-fourths on. Remove the cover of the chassis case. The antenna trimmer is on the center tuning condenser section—see Fig. 2. Turn the adjusting screw of this condenser up or down until maximum output is obtained. CAUTION—Do not turn any of the other trimmer adjusting screws for this adjustment.

(1) With 250,000 Ohm Meter  
(2) Read Across Filter Choke

**Antenna**

**IMPORTANT**—If the car antenna is of high capacity (600 mmf. or higher) insert the antenna plug with the mark on the HC side—See Fig. 10. If it is a low capacity antenna, insert the plug with the mark on the LC side.

The General Motors cars have steel roofs, and a running board or other under car antenna must be used. These are low capacity antennas. The Chrysler motor cars (except Plymouth) have a steel roof separated from the body proper, which is used as an antenna. These are high capacity antennas. Other cars without steel roofs such as Ford and Plymouth have a built-in roof antenna which is of low capacity.

If a running board or under-car antenna is used, it must be one which is covered with a suitable insulation, to prevent short circuiting in wet weather.

Fig. 10—Antenna Plug Insertion

MODEL B92(K) Early Schematic, Socket

LAFAYETTE RADIO MFG. CO.

Coils, Alignment Voltage, Trimmers

Fig. 3—Antenna Plug Insertion

Adjusting Antenna 600 KC Trimmer

After the receiver is installed and the car antenna is connected, it will be necessary to adjust the antenna trimmer. Tune in a weak signal at approximately 600 KC with the volume control about three-fourths on. Turn the adjusting screw of the antenna

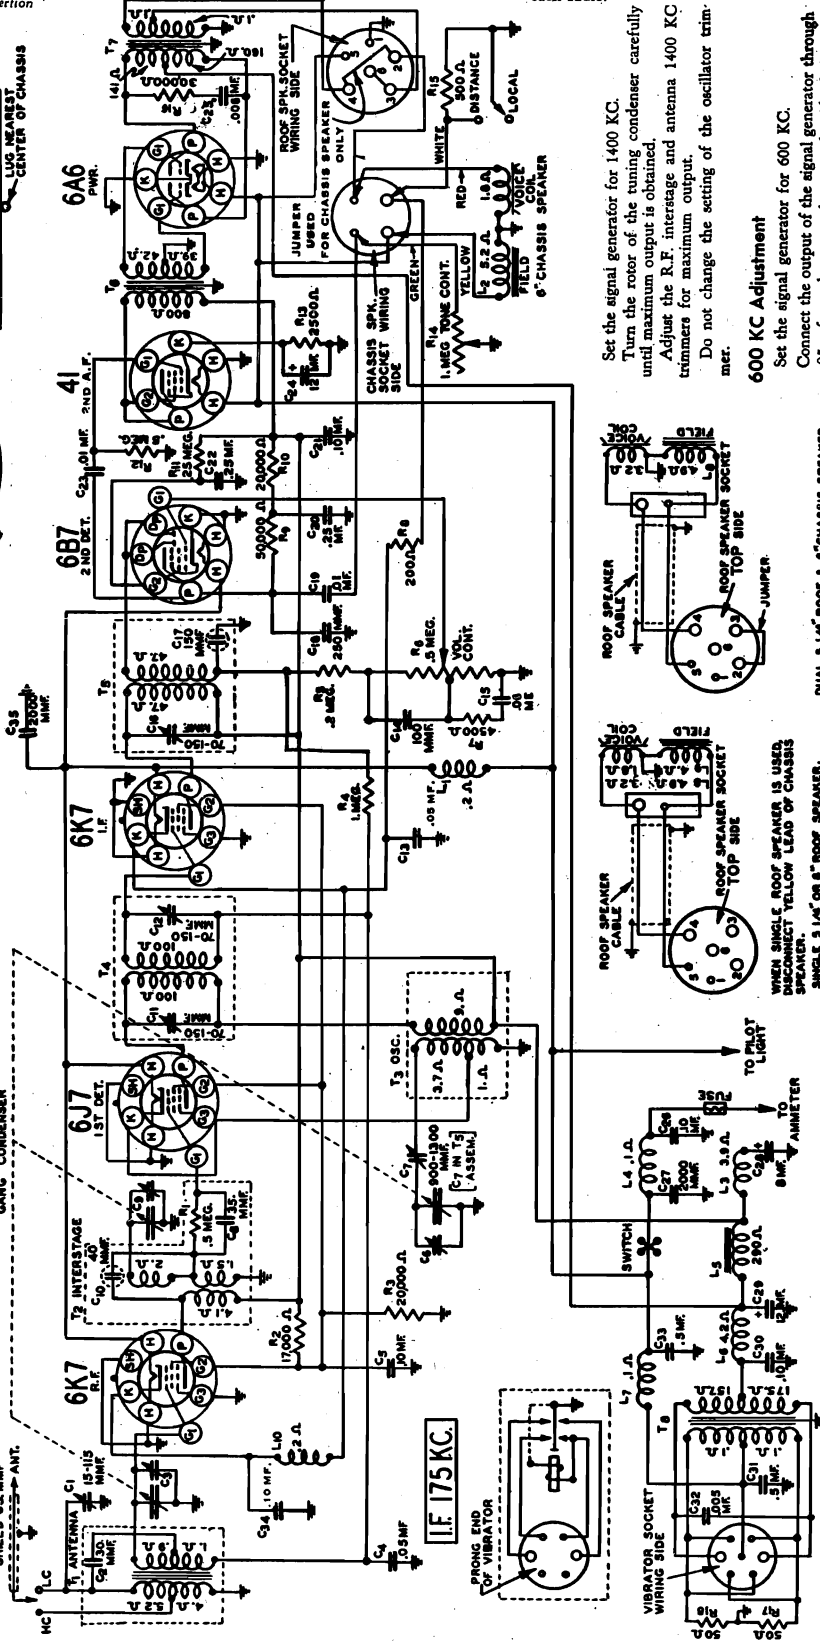

600 KC trimmer up or down until maximum output is obtained. See Fig. 3 for location of this trimmer.

As shown in this illustration, the antenna plug is inserted in one of two ways, depending on whether the car has a high or low capacity antenna. Full instructions are in the installation manual packed with each radio.

**VOLTAGES AT SOCKETS**  
L.P. Switch in Patent Position  
Battery 6.5 Volts under Load

Type	Function	Across Heater	Screen Ground	Control Grid Ground	Carbide Ground
6K7	R.F.	5.6	260	110	3
6J7	1st Det.	5.6	260	110	3
6K7	I.F.	5.6	260	110	3
6B7	2nd Det.	5.6	260	55	30
41	2nd A.F.	5.7	255	55	30
6A6	P.W.	5.7	275		

**600 KC Adjustment**  
Set the signal generator for 1400 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained. Adjust the R.F. interstage and antenna 1400 KC trimmers for maximum output. Do not change the setting of the oscillator trimmer.

**600 KC Adjustment**  
Set the signal generator for 600 KC. Connect the output of the signal generator through a .05 mf. condenser to the control grid of the 6K7 R.F. tube. Turn the tuning condenser rotor until maximum output is obtained. Then turn the tuning condenser rotor back and forth, at the same time adjusting the 600 KC paddler (see Fig. 2) until the peak of greatest intensity is obtained. Re-connect the output of the signal generator to the shielded antenna lead through a 150 mmf. condenser (1500 mmf. if antenna is high capacity). Adjust the 600 KC antenna trimmer to maximum. This trimmer is reached from the outside of the case

**1400 KC Adjustment**  
If a low capacity antenna is used, connect the shielded antenna lead from the chassis through a 150 mmf. condenser to the antenna post of the signal generator. (If high capacity, use 1700 mmf.) The antenna plug must be correctly inserted, dependent on the capacity of the antenna used. Adjust the trimmer of the oscillator section of the three gang condenser until maximum output is obtained—see Fig. 2 for location of this trimmer.

**1575 KC Adjustment**  
Set the signal generator for 1575 KC. Turn the rotor of the tuning condenser to the full open position.

**I. F. Adjustment**  
Set the signal generator for a signal of 175 KC. Connect the output of the signal generator through a .05 mf. condenser to the stator of the R.F. interstage section of the tuning condenser. (See Fig. 2 for location of this section.) Connect the ground lead of the signal generator to the chassis ground. Turn the Local Distance switch to the Distance position and keep it in this position for all adjustments.

It is important that EXACT replacement parts be used when necessary and these parts must be located in exactly the same way that the original part was located and connected. This applies particularly to ground points.

## THE MAGNAVOX CO., INC.

## ALIGNMENT PROCEDURE

It is absolutely necessary that an accurately calibrated test oscillator with some type of output measuring device be used when aligning the receiver.

## ALIGNING THE I. F. STAGES AT 465 KILOCYCLES

1. Use a .00025 mfd. condenser in series with the signal generator output.
2. Connect an output meter across the voice coil of the speakers.
3. Turn the tone equalizer to the "sharp-tune" position.
4. Turn the volume control up to 10 or more, and adjust the signal generator output until a reading of one volt is obtained when a signal is applied.
5. Align the third I.F. transformer first by connecting the signal generator to the grid of the 6D6 second I.F. tube. Now adjust the third I.F. transformer until a maximum deflection is obtained on the output meter.
6. Align the second I.F. transformer by connecting the output of the signal generator to the grid of the 6D6 first I.F. tube. Readjust the output of the signal generator so that the output meter reading does not exceed one volt and adjust the second I.F. transformer until a maximum deflection of the output meter is obtained.
7. Connect the output of the signal generator to the grid of the 6A7 tube. Readjust the output of the signal generator so that the output meter reading does not exceed one volt and adjust the first I.F. transformer until a maximum deflection of the output meter is obtained.

## ALIGNING THE 540-1700 KILOCYCLE BAND

1. Use a .00025 Mfd. condenser in series with the signal generator output.
2. Set the wave band switch for reception on the broadcast band.
3. Run the dial pointer to the extreme left position. This will adjust the tuning condensers to maximum capacity.
4. Holding the tuning condensers at maximum capacity, adjust the dial pointer to a position at the end of the horizontal scale. This is done by sliding the pointer on the dial string.
5. Connect the signal generator output to the grid of the 6A7 tube, tune the radio and signal generator to 500 KC and adjust the 500 KC padder for maximum deflection of the output meter.
6. Turn the signal generator and radio to 1400 KC and adjust the 1400 KC oscillator trimmer for maximum deflection of the output meter.
7. Leave the signal generator and radio set at 1400 KC, connect the signal generator output to the antenna binding post "A1", connect binding post "A2" to ground and adjust the 1400 KC R.F. trimmer and the 1400 KC antenna trimmer for maximum deflection of the output meter.

## ALIGNING THE 1680-5350 KILOCYCLE BAND

1. Use a 400 ohm resistor in series with the signal generator output when connecting to the antenna binding post. Use both this resistor and a .00025 mfd. condenser when connecting to the 6A7 grid.
2. Set the band switch for reception on the foreign band.
3. Connect the output of the signal generator to the grid of the 6A7 tube, set the signal generator and the radio to 1700 KC and adjust the 1700 KC padder for maximum deflection on the output meter.
4. Set the signal generator and radio to 5000 KC and adjust the 5000 KC oscillator trimmer for maximum deflection of the output meter.
5. Leave the signal generator and radio set at 5000 KC, connect the signal generator output to the antenna binding post "A1" and adjust the 5000 KC R.F. trimmer and the 5000 KC antenna trimmer for maximum deflection of the output meter.

## ALIGNING THE 5.6-18.0 MEGACYCLE BAND

1. Use a 400 ohm resistor in series with the signal generator when connecting to the antenna post. Use both this resistor and a .00025 mfd. condenser when connecting to the 6A7 grid.
2. Set the band switch for reception on the foreign band.
3. Connect the signal generator output to the grid of the 6A7 tube, set the signal generator and the radio to 15 megacycles and adjust the 15 megacycle oscillator trimmer for maximum deflection of the output meter.
4. Leave the signal generator and radio set for 15 megacycles, connect the signal generator output to the antenna binding post "A1" and adjust the 15 megacycle R.F. trimmer and the 15 megacycle antenna trimmer for maximum deflection of the output meter.

## RESTRINGING THE DIAL CABLE

To restring the cable on this model, it is necessary first to remove the glass dial. Bend back the small metal ears that hold the glass in place, on the left and lower sides only. Slip the three dividing strips from the assembly and the four glass strips will be easily removable. Slip the brown backing from the assembly exposing the cable tension spring inside the disc. Remove the spring "A" from the small hook "B", and tie one end of cable to the spring, facing it through the opening in the groove of the disc, allowing about 1/2 inch between the end of the spring and the inside edge of the groove. Proceed around the disc in a clockwise direction for one complete revolution, continue around the drive shaft "C" for 2 1/2 turns in a clockwise direction up through the left-hand idler pulley "D", across the top and around the right-hand idler pulley "E", downward around the disc in a clockwise direction, through the opening in the groove and secure it to the spring, until the other end can be secured to the hook. Replace the dial strips in their original locations and the operation is completed.

MISCELLANEOUS NOTES

The radio chassis must "float" freely and it is, therefore, important that none of the knobs touch the panel. The four holes in the radio support bracket "C" Fig. 1, are sufficiently large to permit adjustment of the chassis until it "floats" properly. Be sure that this "floating" condition exists before attempting to tighten the screws "A" Fig. 1, after replacing the chassis in the cabinet.

If one of the push-button switches does not function, remove the radio panel in the manner outlined in the foregoing instructions, and check the switch contacts. It is entirely probable that the trouble can be corrected by either cleaning the contacts or by bending them so that they form a solid connection.

When the release button on the radio push-button assembly is depressed, the switch arm nearest the end of the assembly must break one contact before making the other contact. Failure of the release button switch to operate in this manner will cause the "set-up" pilot lamp to burn out, in which case the arm of the switch should be bent until the "break-before-make" action is obtained.

Due to the extremely high sensitivity of the receiver, it is possible for some excessively strong signals to overload and cause distortion in the radio. This condition is very rare and occurs only on a very strong signal when the receiver has a very efficient antenna. This difficulty is recognized by distortion on a strong signal and being absent on weak signals. To correct this trouble, it is necessary to connect a 500 ohm resistor across the broadcast antenna primary to ground. The terminal for making this connection is available at the rear of the R.F. transformer on the top of the chassis. Connect the resistor from the lug having the red-with-blue tracer lead connected to it, to the ground bus wire which ties the three trimmer condensers together.

It is possible for the distortion mentioned above, to occur due to defective 6D6 I.F. tubes. The second I.F. tube is more susceptible to this difficulty and should be replaced before checking the first I.F. tube.

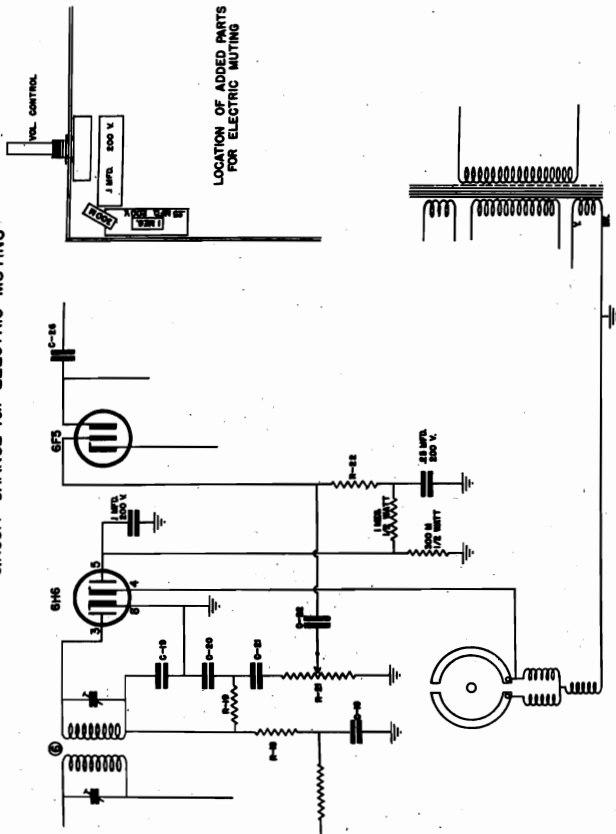

When push-button tuning is used, the dial pointer may have a tendency to "hunt" on either side of the desired frequency before coming to rest. This condition is caused by insufficient pressure of the small spring at the rear of the tuning motor, against the armature shaft. The spring should be "kinked" slightly to provide additional pressure, using a pair of long-nosed pliers to make the adjustment.

If a distinct hum is heard in the speakers when using the radio, the 6F5 tube should be replaced as a possible cure. It is extremely important that the grid lead of the 6F5 tube is shielded as near to the cap of the tube as is possible, or hum will be picked up in this lead.

The two .05 Mfd. condensers connected across the two motor push-button switches should be removed to prevent a "scraping" noise that may be apparent when the receiver is tuned manually.

The 1000 ohm bias resistor in the cathode circuit of the 6A7 tube should be replaced with a 300 ohm resistor to increase the stability of the receiver.

CIRCUIT CHANGE FOR ELECTRIC MUTING

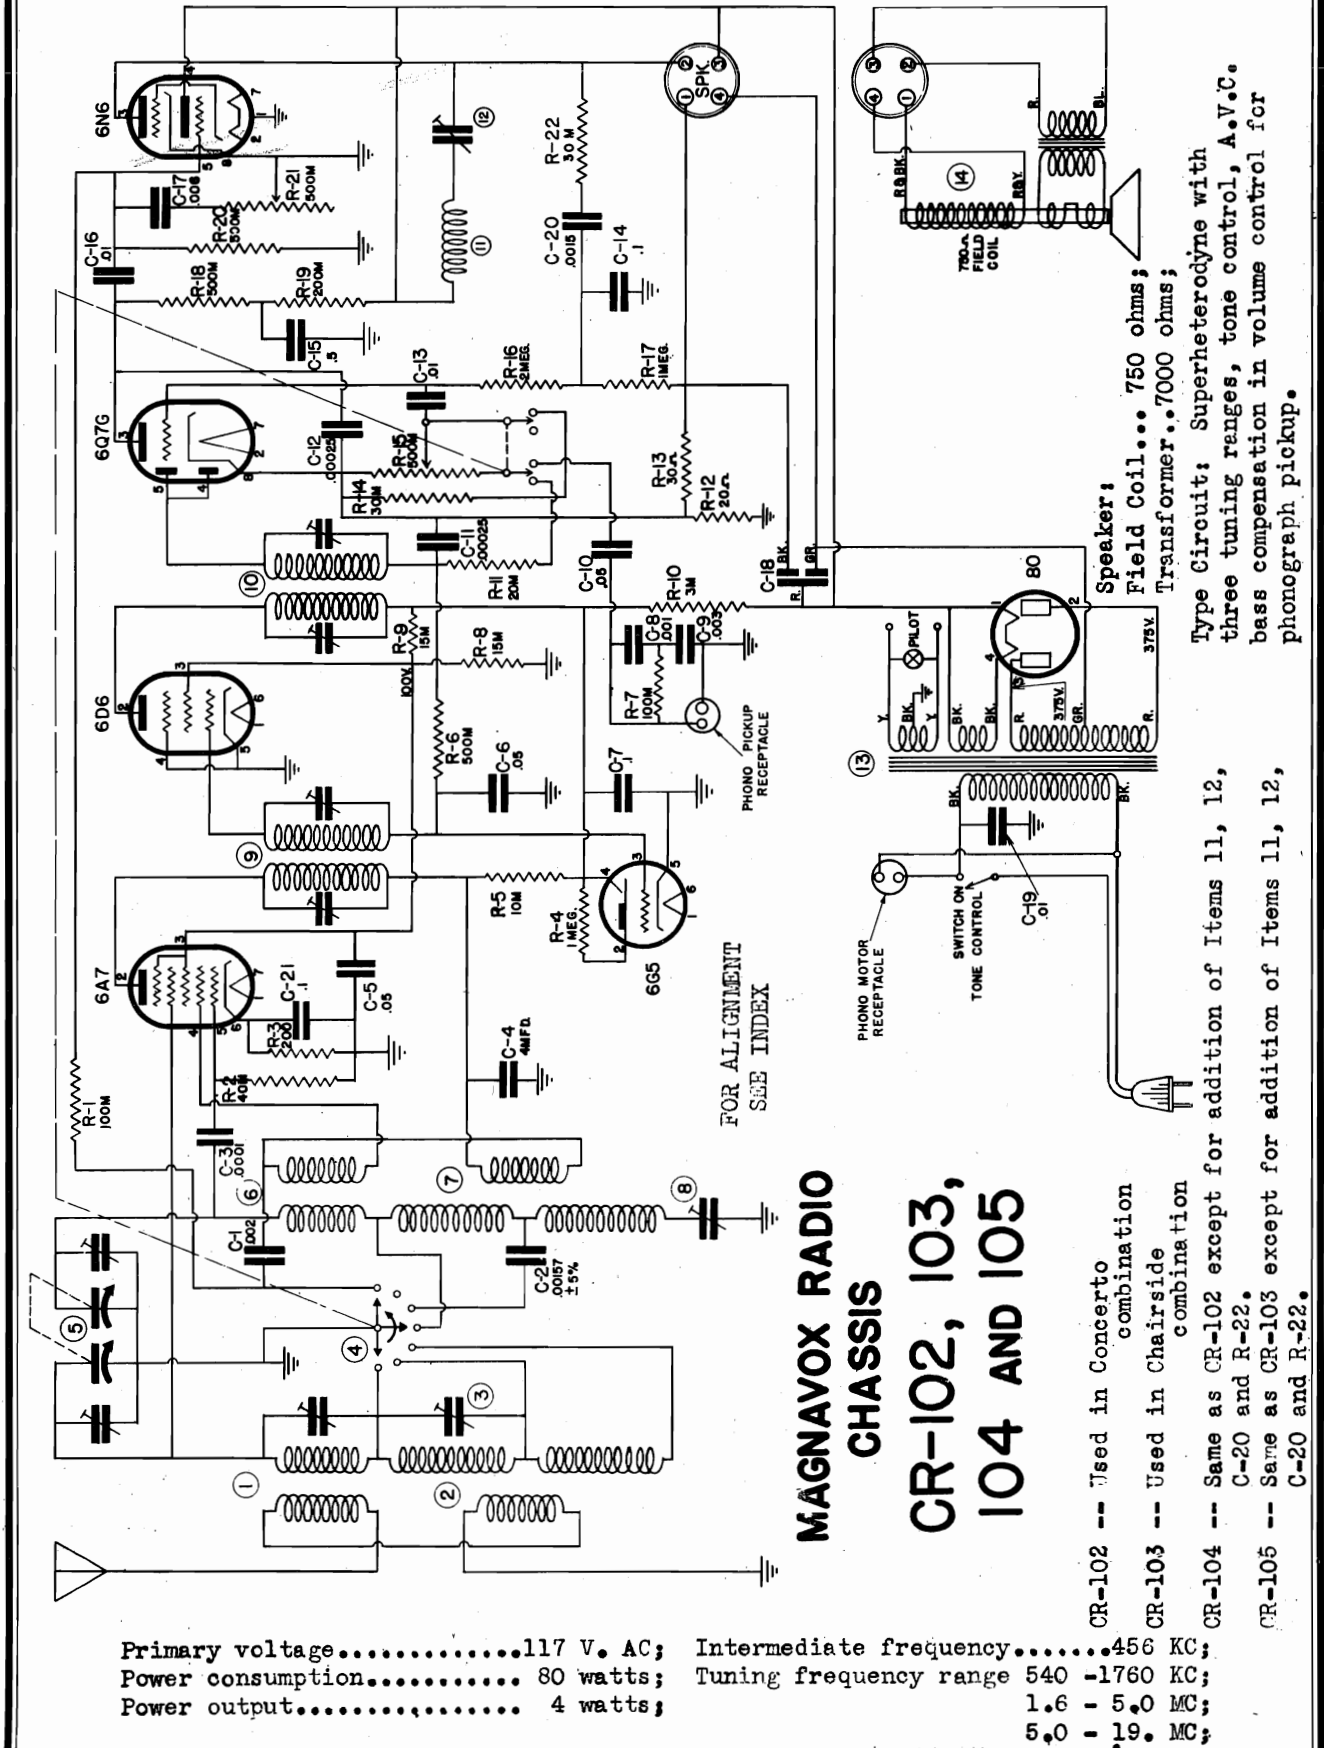

Some of the earlier models were not equipped with electric muting. This feature may be incorporated by following the instructions outlined below.

1. Remove the two jumpers shunting the cathodes and plates of the 6H6 tube.
2. One cathode (8) is left at ground potential and the other cathode (4) is connected to the tuning motor as shown in the above schematic.
3. One plate (3) is left in its original circuit connection and the other plate (5) is connected to the junction of the 1 megohm and 300,000 ohm resistors that have been inserted in series with R-22 to ground.
4. Install one .25 Mfd. condenser from the junction of R-22 and the 1 megohm resistor to ground.
5. Ground the side of the transformer winding that connects to the tuning motor, completing the operation.

  - CR-112 -- Has brackets insulated from chassis for mounting in Berkeley cabinet.
  - CR-120 -- Speaker mounted on the chassis for use in AC-DC Playfellow combination.
  - CR-126 -- Has brackets for mounting in Berkeley cabinet.
  - CR-127 -- Has brackets for mounting in Hepplewhite cabinet.
- It is important that EXACT replacement parts be used when necessary and these parts must be located in exactly the same way that the original part was located and connected. This applies particularly to ground points.

CR-108M - Nine-tube superheterodyne

## ALIGNMENT PROCEDURE

It is absolutely necessary that an accurately calibrated test oscillator with some type of output measuring device be used when aligning the receiver.

### ALIGNING THE I. F. STAGES AT 455 KILOCYCLES

1. Connect an output meter across the voice coil of the speakers.
2. Turn the tone equalizer to the sharp-tune position.
3. Turn the volume control up to 7 or more, and adjust the signal generator output until a reading of one volt is obtained on the output meter when a signal is applied.
4. Align the third I.F. transformer first, by connecting the signal generator to the grid of the 6A5, second I.F. tube; now adjust the third I.F. transformer until a maximum output meter deflection is obtained. THE OUTPUT OF THE SIGNAL GENERATOR IS TO BE CONNECTED THROUGH A .00025 MFD. CONDENSER AT ALL TIMES.
5. Align the second I.F. transformer first, by connecting the signal generator to the grid of the 6D6 first I.F. tube. Readjust the output of the signal generator so that the output meter reading does not exceed one volt and adjust the second I.F. transformer until a maximum deflection of the output meter is obtained.
6. Connect the output of the signal generator to the grid of the 6A7 tube. Readjust the output of the signal generator so that the output meter reading does not exceed one volt, and adjust the first I.F. transformer until a maximum deflection of the output meter is obtained.

### ALIGNING THE 540-1730 K. C. BAND

1. Set the wave-band switch for reception on the broadcast band.
2. Run the dial pointer to the extreme left position. This will adjust the tuning condensers to maximum capacity.
3. Holding the tuning condensers at maximum capacity, adjust the dial pointer to a position at the end of the horizontal scale. This is done by sliding the pointer on the dial string.
4. Connect the signal generator output to the grid of the 6A7 tube, tune the radio and signal generator to 600 KC and adjust the 600 KC padder for maximum deflection of the output meter.
5. Turn the radio and signal generator to 1400 KC and adjust the 1400 KC trimmer for maximum deflection of the output meter.
6. Leave the signal generator and radio switch at 1400 KC, connect the signal generator output to the antenna binding post "A1" and adjust the 1400 KC R.F. stage trimmer for maximum deflection of the output meter.

### ALIGNING THE 1660-5800 K. C. BAND

1. Set the band switch for reception on the police band.
2. Connect the output of the signal generator to the grid of the 6A7 tube, set the signal generator and radio to 1800 KC and adjust the 1800 KC padder for maximum deflection of the output meter.

3. Set the radio and the signal generator to 5000 KC and adjust the 5000 KC oscillator trimmer for maximum deflection of the output meter.
4. Leave the radio and signal generator set at 5000 KC, connect the signal generator output to the antenna binding post "A1", and adjust the 5000 KC first detector trimmer and the 5000 KC R.F. trimmer for maximum deflection of the output meter.

### ALIGNING THE 5700-18300 K. C. BAND

1. Set the band switch for reception on the foreign band.
2. Connect the signal generator output to the grid of the 6A7 tube, set the radio and the signal generator to 15 megacycles and adjust the 15 megacycle oscillator trimmer for maximum deflection of the output meter.
3. Leave the signal generator and the radio set for 15 megacycles, connect the signal generator output to the antenna binding post "A1" and adjust the 15 megacycle first detector trimmer and the 15 megacycle oscillator trimmer for maximum deflection of the output meter.

## MISCELLANEOUS NOTES

The radio chassis must "float" freely and it is therefore important that none of the knobs touch the panel. The four holes in the radio support bracket "C" Fig. 1, are sufficiently large to permit adjustment of the chassis until it "floats" properly. Be sure that this "floating" condition exists before attempting to tighten the screws "A" Fig. 1, after replacing the chassis in the cabinet.

If one of the push-button switches does not function, remove the radio panel in the manner outlined in the foregoing instructions, and check the switch contacts. It is entirely probable that the trouble can be corrected by either cleaning the contacts or by bending them so that they form a solid connection.

When the release button of the radio push-button assembly is depressed, the switch arm nearest the end of the assembly must break one contact before making the other contact. Failure of the release button to operate in this manner will cause the setup pilot lamp to burn out, in which case the arm of the switch should be bent until the "break-before-make" action is obtained.

Due to the extremely high sensitivity of the receiver, it is possible for some excessively strong signals to overload and cause distortion in the radio. This condition is very rare and occurs only on a very strong signal when the receiver has a very efficient antenna. This difficulty is recognized by distortion on a strong signal and being absent on weak signals. To correct this trouble, it is necessary to connect a 500 ohm resistor across the broadcast antenna primary to ground. The terminal for making this connection is accessible at the rear of the R.F. transformer on the top of the chassis. Connect the resistor from the lug having the red-with-blue tracer lead connected to it, to the ground bus wire which ties the three trimmer condensers together.

It is possible for the distortion mentioned above, to occur due to defective 6D6 I.F. tubes. The second I.F. tube is more susceptible to this difficulty and should be replaced before checking the first I.F. tube.

**MISCELLANEOUS NOTES (continued)**  
The tuning shaft "A" Fig. 2, can be bent very easily when the chassis is out of the cabinet if extreme care is not exercised. If the shaft is bent only slightly, it can possibly be bent back to its original shape, otherwise it should be replaced.

To replace the tuning shaft, first slip the dial cable from the front groove of the disc "B" Fig. 2, by releasing the spring holding the cable in place. Now rotate the disc until the dial pointer is at the extreme right end of the scale, at which point the hole "C" in the disc is in line with the hole in the shaft support bracket. Insert a small screw driver through the two holes and remove the motor mounting screw. Remove the other two motor mounting screws and lift the motor from the chassis.

Now remove the "C" washer from the shaft immediately to the front of the shaft support bracket, and slide the shaft toward the inside of the chassis. Insert a new shaft and gear, wrap 2 1/2 turns of the dial cable in the groove provided, and fasten the "C" washer in place. The method of properly stringing the dial cable is shown in detail in Fig. 2 and is fully described in the following paragraphs. Remount the motor with the three mounting screws. The holes through which these screws pass, are sufficiently large to permit adjustment of the motor so that the gears mesh properly. The procedure outlined above for replacing a tuning shaft may also be used in replacing a tuning motor.

To adjust the position of the volume or tone compensator semaphore discs, loosen the small set-screw on the brass bushing behind the disc, and slide the disc until the proper setting is obtained. Tighten the set-screw, and the operation is completed.

When push-button tuning is used, the dial pointer may have a tendency to "hunt" on either side of the desired frequency before coming to rest. This condition is caused by insufficient pressure of the small spring at the rear of the tuning motor against the armature shaft. The spring should be "re-tensioned" slightly to provide additional pressure, using a pair of long-nosed pliers to make the adjustment.

If a distinct hum is heard in the speakers when using the radio, the 6F5 tube should be replaced as a possible cure. It is extremely important that the grid lead of the 6F5 tube is shielded as near to the cap of the tube as is possible or hum will be picked up in this lead.

The shell of the cap on the phonograph input plug should not be allowed to contact the chassis or else a hum will be heard in the speakers with phonograph operation. A small felt washer is used between the plug and the receptacle to prevent this and should be replaced at any time that it is necessary to remove this plug from its receptacle.

### RESTRINGING THE DIAL CABLE

To restring the pointer cable, first tie one end of the cable to the pointer tension spring, Fig. 2, after the spring has been removed from the small hook on disc "B". Lace the cord through the eyelet in the rear groove, allowing about 1/2 inch between the spring and the inside edge of the groove. Proceed around the idler pulley at the left end of the dial, across the front of the disc "B", through the back of the pointer clamp (see inset Fig. 2), around the right-end idler pulley and around the rear disc groove in a counter-clockwise direction, threading it into the eyelet mentioned above. Knot the cable to the spring, bringing the spring toward the inside rim of the disc as close as possible. Now stretch the spring until the other end can be secured to the hook, completing the operation.

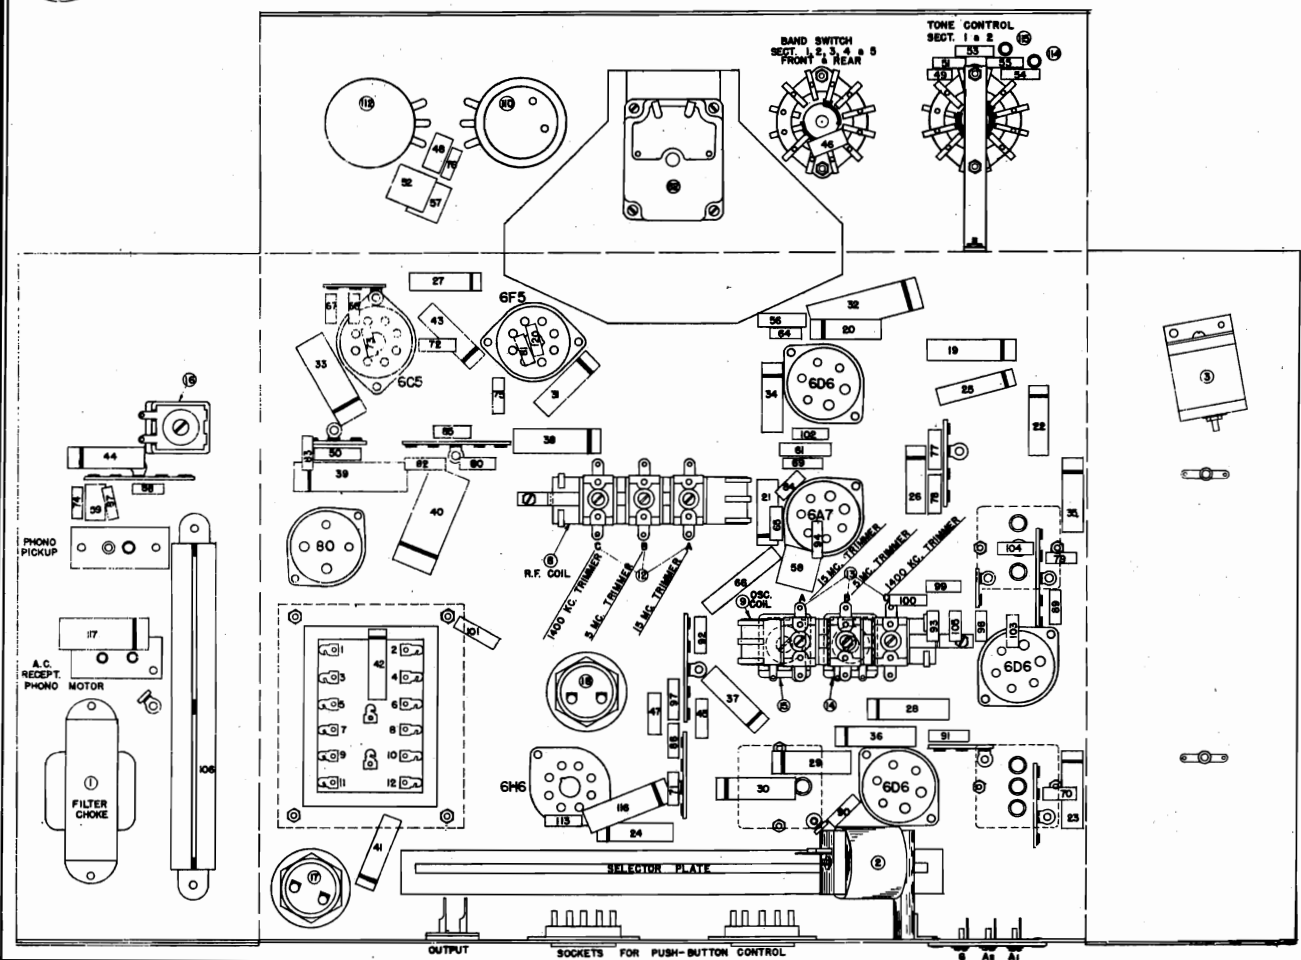

To restring the drive shaft cable, first tie one end of the cable to the drive shaft cable tension spring, after the spring has been removed from the small hook on disc "B". Lace the cord through the eyelet in the front groove allowing about 1/2 inch between the end of the spring and inside edge of the groove. Proceed around the disc in a counter-clockwise direction, wrap two and one-half turns around shaft "A" Fig. 2, in a clockwise direction and from front to rear. Continue around the groove in a counter-clockwise direction threading the cable through the eyelet near the spring. Knot the cable to the spring, bringing the spring toward the inside rim of the disc as close as possible. Stretch the spring until the other end can be secured to the hook, and the operation is completed.

 Alignment

MODELS CR102, 103, 104, 105

**ALIGNING THE I. F. AT 456 KILOCYCLES**

1. Connect the ground lead of the test oscillator to the chassis or set ground lead (black). Connect the other lead of the test oscillator to the grid cap of the 6A7 tube through a .00025 Mfd. condenser.
2. Set the band switch for reception on the broadcast band and set the dial pointer to 1,000 kilocycles, adjusting the receiver volume control to its maximum setting.
3. Now feed a 456 kilocycle signal from the test oscillator and peak each of the second I.F. trimmer condensers.
4. Peak each of the first I.F. trimmer condensers, repeating the adjustments several times for most accurate setting.

**ALIGNING THE 540-1760 KILOCYCLE BAND**

1. Remove the test oscillator lead from the grid of the 6A7 tube and connect it to the receiver antenna lead (blue) through a .00025 mfd. condenser.
2. Check the tuning dial adjustment by turning the gang condenser until the plates are completely meshed at which point the dial pointer must be exactly even with the last line at the low frequency end of the band (840 KC).
3. With the band selector set for reception on the broadcast band, set the dial pointer to the extreme high frequency end of the band (1760 KC) and feed a 1760 KC signal from the signal generator, adjusting the 1760 kilocycle oscillator trimmer for maximum output.
4. Now set the receiver and test oscillator frequency to 1500 KC and adjust the 1500 KC antenna trimmer for maximum output.
5. Set the receiver and test oscillator frequency to 800 KC and adjust the 600 KC oscillator padder to maximum output while tuning the receiver back and forth across the signal. This completes the alignment of the broadcast band.

**ALIGNING THE 1600-5000 KILOCYCLE BAND**

1. Set the band selector for operation on the police band.
2. Set the receiver and test oscillator frequency to 4 megacycles and adjust the 4 megacycle antenna trimmer for maximum output.

**ALIGNING THE 4.0-19.0 MEGACYCLE BAND**

1. Set the band selector for operation on the foreign band.
2. Set the receiver and test oscillator frequency to 15 megacycles and adjust the 15 megacycle antenna trimmer for maximum output.

**10 KILOCYCLE FILTER ADJUSTMENT**

With the tone control set for maximum treble response, tune the receiver to a point between two stations of about the same signal strength on adjacent channels. If a 10,000 cycle heterodyne is heard as the beat note between the two carriers, it may be eliminated by returning the 10 KC output filter by means of the 10 KC trimmer condenser on the rear of the chassis adjacent to the speaker socket.

MODELS CR106, 109, 111, CR107, 110, 112, 119, 120, 126, 127;  
 CR113, 114, 115, 118, 125, CR121, 124

**ALIGNING THE I. F. STAGES AT 465 KC.**

1. Connect the ground lead of the test oscillator to the chassis or radio ground lead. Connect the other lead of the test oscillator to the grid cap of the 6A7 tube through a .00025 mfd. series condenser. **DO NOT REMOVE THE GRID CLIP.**
2. Set the test oscillator to EXACTLY 455 kilocycles and turn the receiver volume to its maximum setting.
3. Peak each of the second I.F. transformer trimmer condensers.
4. Peak each of the first I.F. transformer trimmer condensers.

**ALIGNING THE 540-1730 K.C. BAND**

Remove the test oscillator lead from the grid of the 6A7 tube and connect it to the receiver antenna lead (blue) through a .00025 mfd. series condenser.  
 Set the test oscillator frequency and receiver dial to EXACTLY 1730 kilocycles. Adjust the 1730 kilocycle oscillator trimmer to bring in 1730 kilocycle test oscillator signal to maximum output.

Tune the receiver and test oscillator frequency to EXACTLY 1400 kilocycles and adjust the 1400 kilocycle antenna trimmer for maximum output as indicated on the output meter.

Set the test oscillator and receiver frequency to approximately 600 kilocycles. While rocking the gang condenser slightly to the right and to the left, adjust the 600 kilocycle oscillator padder for maximum signal.

**ALIGNING THE 1.7-5.8 M.C. BAND**

Substitute a 400 ohm resistor for the .00025 mfd. condenser in series with the antenna lead.  
 Tune the receiver and test oscillator frequency to EXACTLY 5 megacycles and adjust the 5 megacycle antenna trimmer for maximum output.

**ALIGNING THE 5.7-18.3 M.C. BAND**

Leave the 400 ohm resistor in series with the test oscillator lead and set the band selector switch for operation on the 5.7 - 18.3 megacycle band (short wave).  
 Set the receiver and test oscillator frequency to EXACTLY 18.3 megacycles.

Adjust the 18.3 megacycle oscillator trimmer for maximum signal as indicated on the output meter.

When adjusting this trimmer two peaks may be noticed, in which case CARE MUST BE TAKEN THAT THE PROPER PEAK IS USED FOR ALIGNING THE RECEIVER AT 18.3 MC. Always back off the trimmer to minimum capacity, then screw down the trimmer (add capacity) until the second peak -- if more than one is noticed -- which is the correct one to use, is tuned in.

Set the receiver and test oscillator frequency to EXACTLY 15 megacycles.

Rock the gang condenser slightly to the right and to the left, adjusting the 15 megacycle antenna trimmer for maximum signal as indicated on the output meter.

TUBE LOCATION CHART

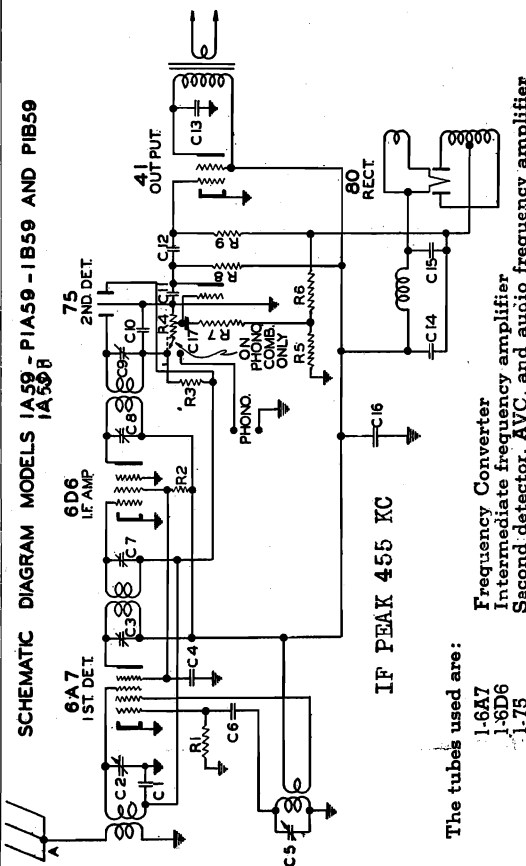

TUBE LAYOUT

This receiver is a 5-tube, super-heterodyne using two double purpose tubes. It operates on either AC or DC current, of 105 to 125 volts. It receives stations lying between 535 and 1750 Kilocycles. This includes standard broadcast and most police stations.

The tubes used are:

- 1-12A8GT Combined oscillator and first detector
- 1-12K7GT Intermediate frequency amplifier
- 1-12Q7GT Second detector, automatic volume control, gas gate, and audio amplifier
- 1-35L6GT Beam power output
- 1-35Z4GT Rectifier

This receiver is a 5 tube AC-DC compact type radio receiver employing tuned radio frequency circuit. The tuning range covers all frequencies between 528 kilocycles and 1750 kilocycles (171 meters to 565 meters). These frequencies cover the standard broadcast band and in addition police calls and some amateur transmitters. This receiver is designed to operate on 50-60 cycle AC or DC at voltages between 105 and 130. These are standard voltages used practically all over the United States and in some foreign countries. The audio power output of the receiver is a maximum of 2 watts. The receiver should not be connected to any power line having higher voltage than mentioned above. On DC operation reverse plug if receiver does not commence operating one minute after switch is turned on. On AC operation reversal of the plug in some cases may reduce hum.

The following tube numbers are employed:

In a super-heterodyne it is very important when realigning the receiver, to use the same frequencies as are used at the factory. Alignment is best accomplished by using an output meter across the voice coil and aligning for maximum. The I. F. frequency is 455 K. C. The short wave must be aligned before the broadcast band. This is done at only one frequency, 6 megacycles. On the broadcast band the alignment frequencies are 1500 and 600 K. C. 1500 K. C. is the first to be aligned using the shunt trimmers. When aligning 600 K. C., adjust the series pad, rocking the gang condenser to assure proper alignment.

IF PEAK 455 KC

SHORT WAVE BAND

Rotate the wave band switch to full clock wise position. Connect high side of generator output to antenna lead through a 400 ohm dummy antenna. Completely disengage variable condenser. Apply 18.5 meg. signal. Unscrew trimmer C26 to a minimum capacity, slowly turn the screw so that the trimmer capacity increases until the signal is heard. Apply 16 meg. signal, rotate gang condenser until this signal is heard. Adjust C23 for maximum response. It may be found advisable to "rock" generator frequency back and forth through signal to offset detuning effect from inter action between input and oscillator circuits at high frequencies. Check alignment through medium of sensitivity at 11 meg. and 6

Correct alignment is extremely important. The receiver is properly aligned at the factory and should not be disturbed unless it is absolutely necessary. The procedure is as follows: Turn wave change switch to broadcast position (full counter clock wise) and rotate variable condenser until it is about 50% engaged. Apply a 455 KC signal to the grid of 6A8G mixer tube through a tubular condenser on the order of .1 MFD. Referring to chassis layout, adjust C30, C29, C31 and C32 for maximum signal using of course some sort of indicating device such as an AC volt meter or output meter across the voice coil of the speaker. It may be necessary to apply a very strong signal to "find" the signal until alignment is approached. It is advisable to maintain as low a signal input as conveniently possible in order to minimize the possibility of misalignment resulting from A.V.C. and overload effects. If a squeal is heard while tuning, rotate the gang condenser slightly and it should disappear. Naturally, the ground side of the generator should be connected to the chassis either directly or through the .1 MFD. condenser.

						R9	Y-VC-21	Candohm 20 ohms
						R10		Candohm 50 ohms
								Volume control 500K

I.F. PEAK 455 KC.

The tubes used are:

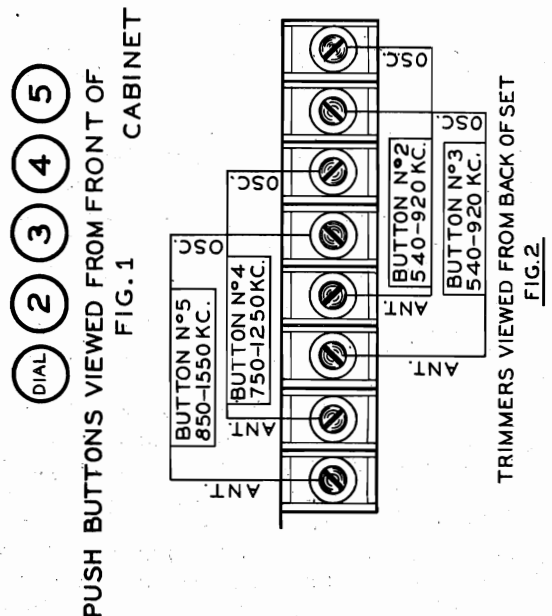

- 1—Determine which four stations you desire to set up on the push buttons.
- 2—Determine the frequency of these stations.
- 3—Determine the proper push button on which these stations should be set up from the following table.

- |       |  |
|-------|--|
| No. 1 | Push button is for manual tuning.                    |
| No. 2 | " " is for stations lying between 540 and 920 KC's.  |
| No. 3 | " " is for stations lying between 540 and 920 KC's.  |
| No. 4 | " " is for stations lying between 750 and 1200 KC's. |
| No. 5 | " " is for stations lying between 850 and 1550 KC's. |

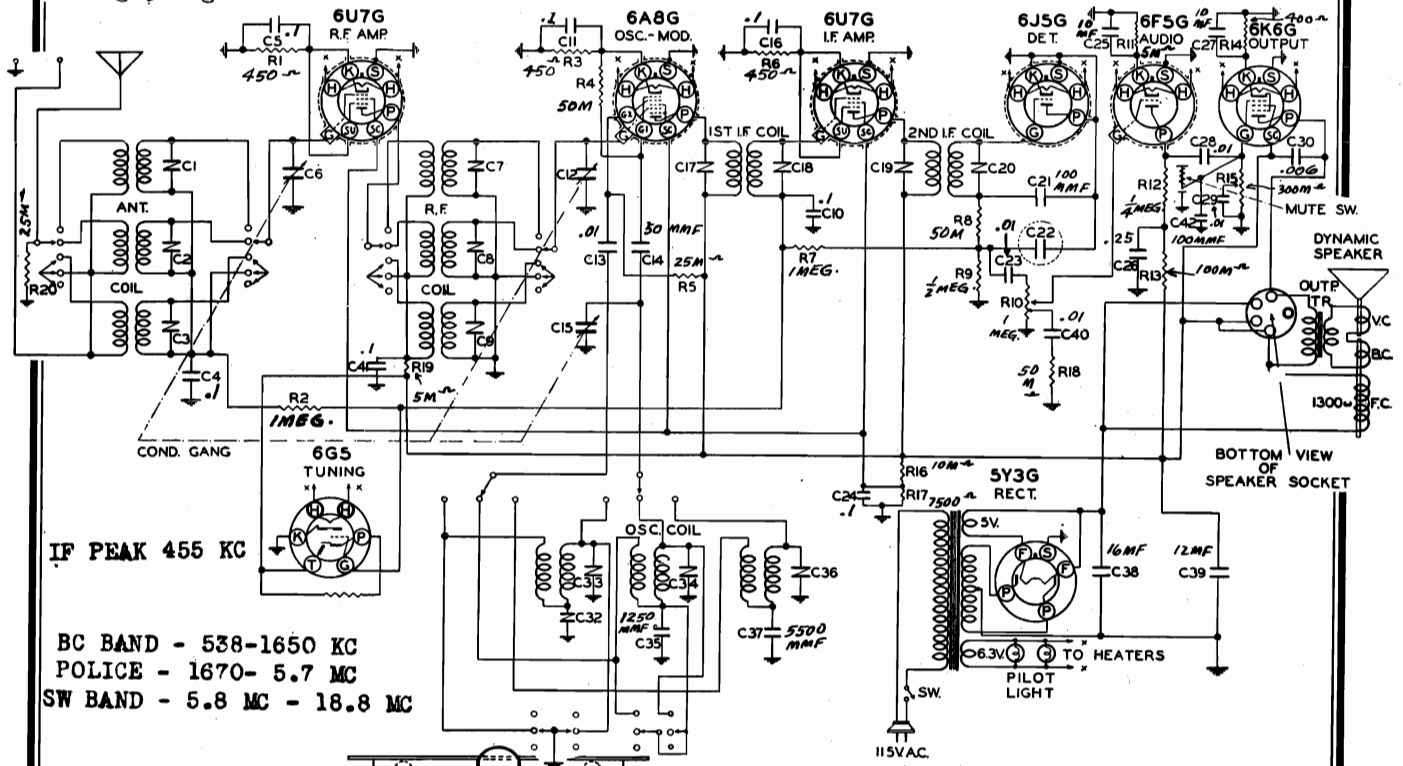

- 4—Push the proper push button.
  - 5—Using an insulated screw driver adjust the oscillator trimmer corresponding to the proper push button as shown in Fig. 2 until your station is tuned in with best tonal response.
  - 6—Adjust the antenna trimmer corresponding to the proper push button until the station already heard is received with maximum volume.
  - 7—Repeat steps 4, 5, and 6 for the other push buttons.
- It may be desirable to check the push buttons occasionally for proper adjustment as extreme climatic variations may affect the push buttons set on high frequency stations.

- |         |  |
|---------|--|
| 1-6A7   | Frequency Converter                    |
| 1-6D6   | Intermediate frequency amplifier       |
| 1-75    | Second detector, AVC, and audio driver |
| 1-25L6G | Beam power output                      |
| 1-25Z5  | Rectifier                              |

ADJUSTMENT OF PUSH BUTTONS

Chassis 1870  
 Schematic, Socket, Trimmers MAJESTIC RADIO & TELEV. CORP.  
 Voltage, Alignment

IF PEAK 455 KC  
 BC BAND - 538-1650 KC  
 POLICE - 1670- 5.7 MC  
 SW BAND - 5.8 MC - 18.8 MC

**ALIGNMENT** - Turn wave change switch to BC pos. and rotate var. cond. until about 50 percent engaged. Apply a 455 KC sig. to 6A8G thru a .1 mf cond. Adjust trimmers marked "Trim 455 KC" for maximum signal.

**SHORT WAVE BAND** - Rotate wave band switch to full clockwise pos. Connect high side of gen. o.p. to ant. lead thru 400 ohm dummy ant. Set dial at 18 MC - Apply 18 MC signal. Adj. C36 trim. to min. cap., slowly turn screw so trim. cap. increases until signal is heard. Apply 18 MC sig. and adj. C7 and C1 for max. - Check align. thru medium of sensitivity at 11 meg. and 6 meg. resp. - When align. at 18 MC the C7 trim. may indicate 2 maxima. Maxima obtained with trimmer tighter is the desired one. Check by leaving gang cond. set and shifting to higher freq. : 19 meg. where image should appear. If properly aligned it should require about 10 times six. volt. for image to give same O.P. as real signal.

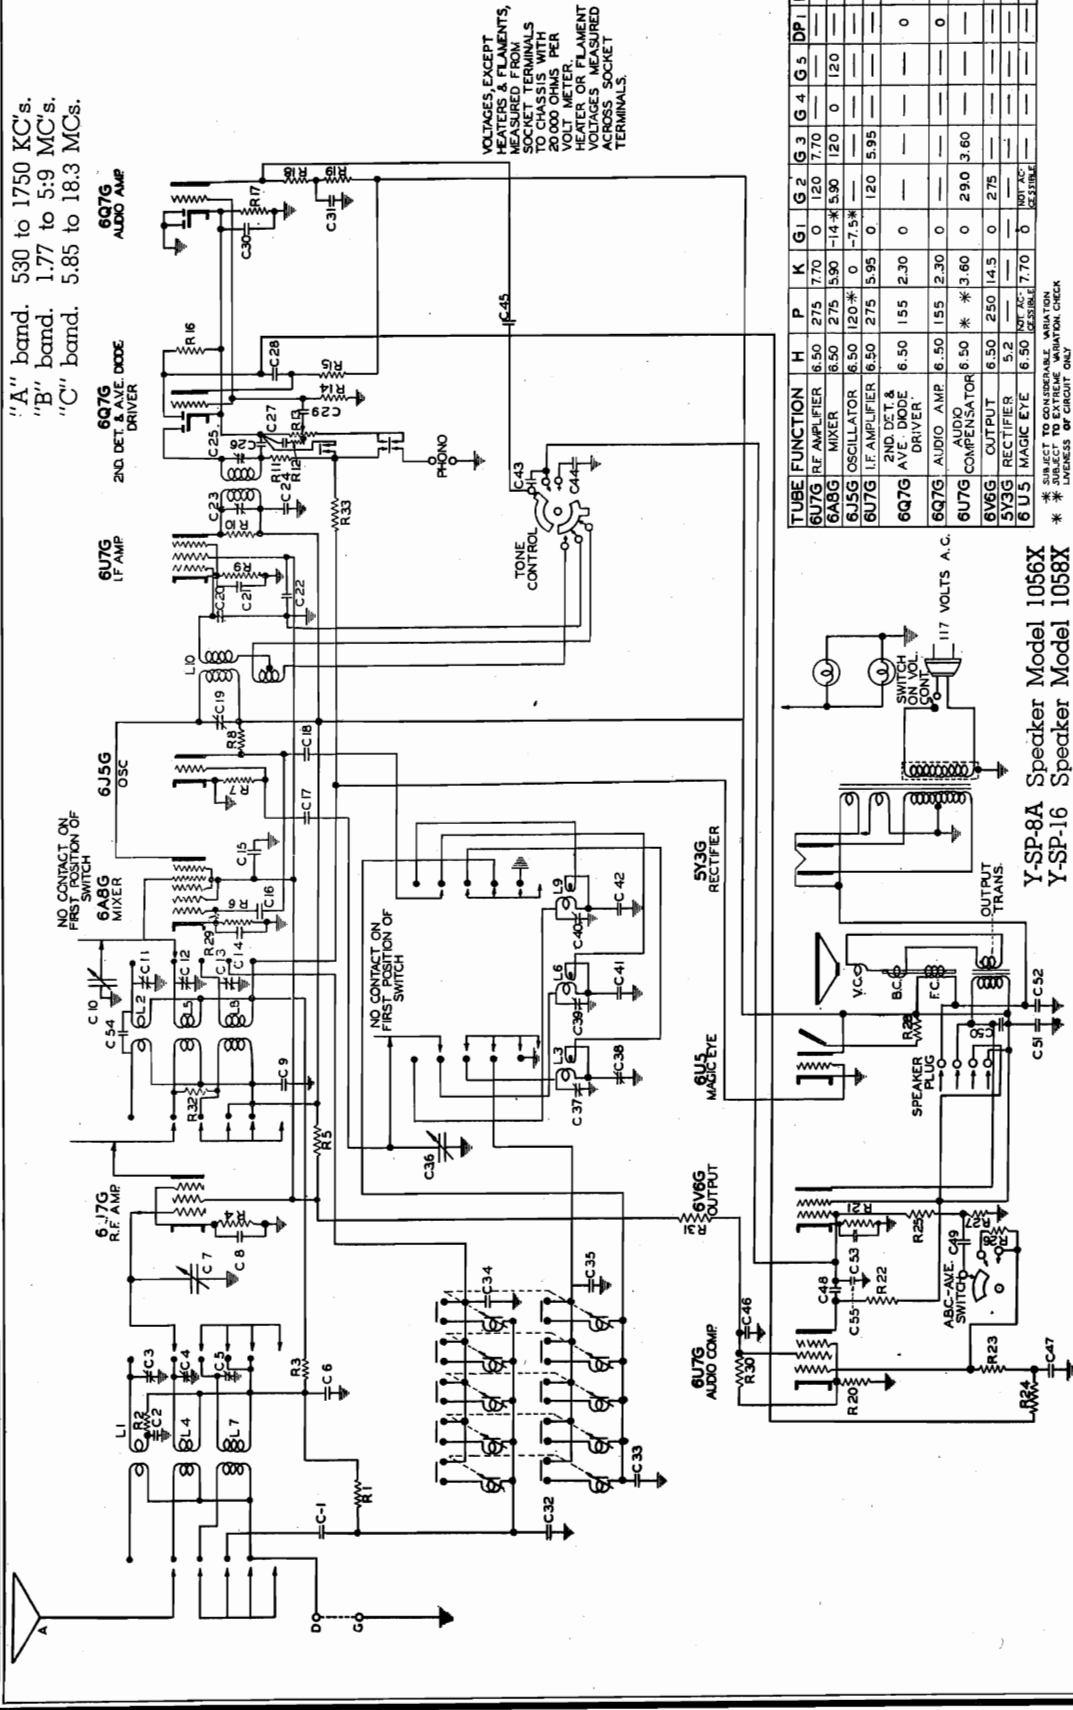

**POLICE BAND** - Shift waveband switch to middle pos. - Apply 5 MC sig. - Dial at 5 Mc. - Adj. C34 trim. as previous band until max. sig. is heard. Apply 5 meg. sig. and adj. Check alignment at 3.5 and 2 MC resp. Check for image same as previous band.

**BROADCAST BAND** - Use a 200 mmf cond. for dummy ant. on this band. Shift wave band sw. to full counter clockwise. Adj. trims. C3 and C9 to medium tight pos. - Dial at 600 KC. Apply 600 KC sig. and adj. padder C32 for max. - Dial at 1500 KC and 1500 KC sig. adj. C33 for same. Then adj. trims. C3 and C9 for max. - Shift gang to 600 KC and apply 600 KC sig. - Adjust C4 for max. sig. - Recheck 1500 KC trimming.

CHASSIS LAYOUT  
 (TOP VIEW)

Antenna

There are three terminals on back of chassis marked A D G. Terminal A is for use with ordinary outdoor antennas from 30 to 50 feet in length. Terminal G is for connection to a suitable ground such as a water pipe, although radiators or other type grounds are often used successfully. Terminal D is to be used in combination with A when a doublet type antenna is used and under these conditions there should be no connection between terminals D and G.

**PHONOGRAPH**—For phonograph, you can use the MAJESTIC Wireless record player, Model 3 PW, or any standard record player. When using a standard record player, plug in the pick-up tips in the jacks marked "PHONO" at the rear of the receiver. If you get undue hum, reverse these pick-up tips. Push the push-button marked "PHONO" and adjust the Volume, Tone, Volume Expansion and Bass Compensation by means of the controls on the receiver.

**AUTOMATIC FREQUENCY CONTROL**—Model 1656X.

When tuning manually on the broadcast or "A" band, the station may be pulled and held into proper tuning by using the AFC. This is done by pushing the first button from the left. If the station is approximately tuned, the AFC will do the rest and insure proper tuning.

This should be used only on local or strong stations as the AFC will cause the set to tune itself to the strongest stations within its range.

To release the AFC, push the AFC button slightly upward. This will cause it to come out in the same manner as the "PHONO" button.

**SETTING UP OF PUSH BUTTONS**

To adjust the push buttons, turn the band switch knob, the second one from the left, all the way to the left, to the position marked "E" on the cabinet. Going to the back of the receiver, adjust the coil marked No. in figure two (2), by turning the screw in the center of the coil by means of a screw driver, until the station you desire to hear is heard with maximum volume and best tone.

It is desirable to turn the tone control to high fidelity when listening on the push-buttons. Only local or strong stations should be set up on the push-buttons.

Push button Number	Model 1356X	Model 1656X
1	1250 and 1750 KC's	AFC
2	950 and 1560 KC's	1250 and 1750 KC's
3	950 and 1560 KC's	950 and 1560 KC's
4	680 and 1110 KC's	950 and 1560 KC's
5	680 and 1110 KC's	680 and 1110 KC's
6	680 and 1110 KC's	680 and 1110 KC's
7	540 and 720 KC's	680 and 1110 KC's
8	540 and 720 KC's	680 and 1110 KC's
9	540 and 720 KC's	540 and 720 KC's
10	540 and 720 KC's	540 and 720 KC's
11	540 and 720 KC's	540 and 720 KC's
12	540 and 720 KC's	540 and 720 KC's

When the buttons are set up and the wave band switch is turned all the way to the left, counter clockwise, pushing any one of the buttons will cause the receiver to receive the station set up on that particular button.

**WARNING**

When operating this set on "RADIO," make certain that the phonograph push-button is out. If it is not, pushing slightly upwards on this push-button will cause it to be released and come out.

Push-Button Number	1056X	1058X
1	980 KC's to 1600 KC's	980 KC's to 1600 KC's
2	680 KC's to 1150 KC's	980 KC's to 1600 KC's

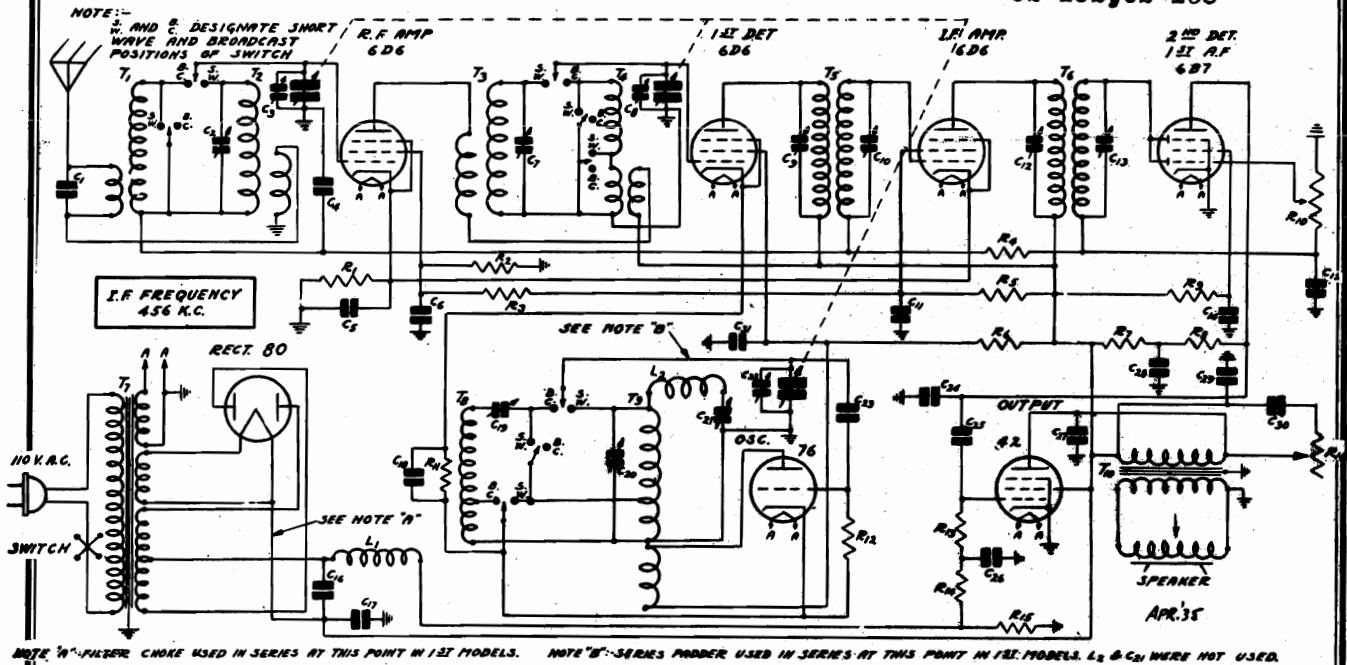

Fig. 1—Schematic Circuit Diagram

Condenser Alignment

Correct alignment is extremely important in connection with all wave receivers. The receivers are all properly aligned at the factory with precision instruments and re-alignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment. A signal generator that will provide an accurately calibrated signal of 456 K. C. and accurately calibrated signals over the broadcast and short wave bands, 530-1740 K. C. and 5.8-18.3 M. C., is required. An output indicating meter is also necessary. It will be practically impossible to align the receiver if unsatisfactory apparatus is used.

Use a non-metallic screw driver for the adjustments. The complete procedure is as follows:

Intermediate Frequency Adjustment

Set the signal generator for 456 K. C. Connect the antenna lead of the signal generator to the grid of the 1st detector through a .05 mfd. condenser. Turn the tuning condenser rotor until the plates are completely out. The ground lead from the signal generator goes to the ground lead of the receiver. The volume control should be at the maximum position. Attenuate the signal so that A. V. C. action is not obtained.

Then adjust the four I. F. trimmer condensers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis and are in the round I. F. cans—See Fig. 2. The openings to the trimmer condensers are covered over by a small cover plate which is held in position by a screw. Loosen these screws until the cover plates can be swung around.

Broadcast Band Adjustment

The broadcast short wave switch should be in the broadcast position. Set the signal generator for 1740 K. C. Turn the rotor to the full open position. The antenna lead from the signal generator is in this instance connected to the antenna lead of the receiver. Attenuate the signal so that A. V. C. action is not obtained. Adjust the oscillator broadcast trimmer until maximum output is obtained. This trimmer is on the tuning condenser and its location is shown in Fig. 2.

Then set the signal generator for 1500 K. C. Turn the rotor until maximum output is obtained. Loosen the pointer

Fig. 2—Tube Arrangement and Location of Trimmers

screw and set the pointer at the 1500 K. C. mark on broadcast band scale. Retighten pointer screw. Then adjust the antenna and 1st detector broadcast trimmers until maximum output is obtained.

Next set the signal generator for 600 K. C. and adjust the 600 K. C. trimmer. The adjusting screw is reached through a hole in the front panel of the chassis as shown in Fig. 2. Turn the tuning condenser rotor until maximum output is obtained. Then turn the rotor slowly back and forth over

Replace the dial assembly and pointer. Replace the pilot light assembly after which the chassis may be reinstalled in the cabinet.

**Changes in Early Models**  
There are two points at which the early models of this receiver differ from the present models. These points are indicated in Fig. 1 and described below.

**Power Unit**  
In the early models a separate filter choke was used in series at the point indicated in note A in Fig. 1. This is one of the two filter condensers C16 and C17 were less than as used at present. The values of the old and new condensers are shown in the parts list. A different power transformer was also used with the early filter system and this is likewise shown in the parts list.

The two power transformers are not interchangeable and care must be taken in ordering for replacement purposes to obtain the correct one. The original chassis can be identified by the separate filter choke.

**Short Wave Oscillator**  
Referring to Fig. 1 it will be noted that there is a tracking coil L2 and a trimmer condenser C21 connected in series between the short wave oscillator coil and ground. In the first models of this receiver these two units, which are required for tracking the short wave oscillator, are not used. Instead a series padding condenser was used at the point indicated in the circuit indicated by note B in Fig. 1.

At the time this change was made a change was also made in the oscillator assembly and care must be taken in ordering for replacement purposes to order the correct one. Early models with the original oscillator assembly, have no spot of paint or a green spot of paint on the 80 socket rivet. Later models with the new oscillator assembly and new tracking system have a red spot of paint on the 80 socket rivet.

**Twenty-five Cycle Receivers**  
The twenty-five cycle receiver differs from the sixty-cycle receiver only in the fact that a different power transformer is used. The correct power transformer is shown in the parts list.

The twenty-five cycle chassis can be operated satisfactorily on a sixty-cycle power supply. However, the reverse is not true, the sixty-cycle receiver cannot be operated from a twenty-five cycle power supply.

A 110-220 Volt, 40-60 cycle Power Transformer is also available for this model.

**REPAIR PARTS LIST FOR 7 TUBE BROADCAST AND SHORT WAVE RECEIVER**  
When ordering parts be sure and give the part number. Also give the series number which will be found in the License Notice label. If there is a spot of paint on the chassis, give this color.

P-216	Pilot Lamp Socket & Clip Assembly	.10
P-217	Broadband-Short Wave Switch	1.00

**Aligning the short wave band of the receiver, it will be noted that the signal will be heard with the signal generator set at two points 912 K. C. apart. That is, if the receiver signal generator is tuned to 15,000 K. C. a signal will be heard at approximately 15,912 K. C. This is due to image reception of 450 K. C. that is, the beat is obtained at the oscillator and also when the signal is taken to the receiver oscillator. Care should be taken to see that the receiver is tracked with the signal generator adjusted to the lower of the two frequencies at which a signal is heard, in order that the oscillator in the receiver will be 450 K. C. higher in frequency than the signal.**

Next set the signal generator for 6,000 K. C. and adjust the 6,000 K. C. trimmer. In the first models of this receiver, this condenser was located at the point shown in Fig. 2 in dashed lines. In the later models it is reached through a hole in the front panel of the chassis as shown in the same illustration. Turn the tuning condenser rotor until maximum output is obtained. Then turn the rotor slowly back and forth over this setting, at a speed of about 1/2 revolution per second, until the highest output is obtained. In the early models this adjustment is broad white in the later models it is more critical.

**Caution**  
The can of electrolytic condenser C16 is not at ground potential. Therefore in any work on the chassis, care should be taken not to touch this condenser and other grounded point such as the other electrolytic condenser can.

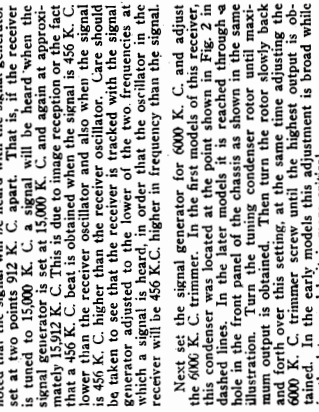

**Replacing Drive Cord**  
Remove chassis from cabinet. Take off the pilot light assembly by lifting off the two sockets and spring clips. Detach the large pointer by removing the screw at the center of the dial assembly by taking out the two screws which secure the bottom of this assembly to the chassis. Then lay the complete dial assembly face downward in front of the chassis. It is not necessary to remove the volume control and tone control collars which hold the indicator cords of these two controls in position. Turn the drive drum until the opening in this drum is approximately vertical and with the hole at the top as shown in Fig. 3.

Remove the tension spring and the old drive cord. See how the eyelet is in the hole in the drive drum as shown in Fig. 3. Insert one end of the drive cord from the outside through the hole in the eyelet in the drive drum.

**Volts at Sockets**  
LINE VOLTAGE - 115

Wrap the cord in a clockwise direction (facing front of chassis) around the drive drum approximately one-half turn. Then tilt the chassis up on its back panel and bring the cord mentioned in the previous paragraph down to the drive shaft. Wrap it two and one-half times around the drive shaft as shown in Fig. 3.

Then bring this cord up from the drive shaft and wrap it around the drive drum approximately one and one fifth turns in a clockwise direction until it is up to the hole in this drum as illustrated.

Insert the free end of the cord through the hole in the eyelet and tie it to the end of the tension spring. The end of the spring, when hanging free, should be approximately 3/4 inch from the flange of the drum as shown in Fig. 3. Cut off the surplus length of cord after it is knotted.

Then secure the other end of the tension spring over the spur on the drive drum.

**Short Wave Oscillator**  
Referring to Fig. 1 it will be noted that there is a tracking coil L2 and a trimmer condenser C21 connected in series between the short wave oscillator coil and ground. In the first models of this receiver these two units, which are required for tracking the short wave oscillator, are not used. Instead a series padding condenser was used at the point indicated in the circuit indicated by note B in Fig. 1.

At the time this change was made a change was also made in the oscillator assembly and care must be taken in ordering for replacement purposes to order the correct one. Early models with the original oscillator assembly, have no spot of paint or a green spot of paint on the 80 socket rivet. Later models with the new oscillator assembly and new tracking system have a red spot of paint on the 80 socket rivet.

**REPAIR PARTS LIST FOR 7 TUBE BROADCAST AND SHORT WAVE RECEIVER**  
When ordering parts be sure and give the part number. Also give the series number which will be found in the License Notice label. If there is a spot of paint on the chassis, give this color.

MODELS 62-280, 62-282, 62-284 Series B, Above Ser. 439000

**ALIGNING I.F. TRANSFORMERS: (465 K.C.):**  
 These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).  
 1. With volume control full on (extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:  
 (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6S7G tube, and adjust the output I.F. transformer (No. 108-83D) to resonance.  
 (b) Move oscillator output clip from grid of 6S7G to grid of 6D8G and adjust input I.F. transformer (No. 108-82C) to resonance.  
 (c) With oscillator still connected to 6D8G, readjust output I.F. transformer (108-83D) if necessary.

**ALIGNING R.F. TRANSFORMERS: (535-1720 K.C.):**  
 1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmi. condenser to the antenna lead and chassis ground and make the following adjustments:  
 (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).  
 (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).  
 (c) Check sensitivity at 600 and 1000 kilocycles.

TUNER DATA

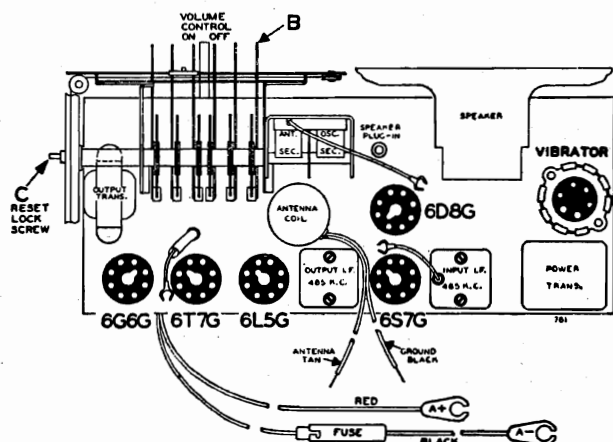

FIG. 1—TOP VIEW

FIG. 2—FRONT VIEW

**OPERATION:**

The two control knobs in sequence from left to right are (see Fig. No. 2)

- Knob 1, Volume Control and On-Off Switch.
- Knob 2, Tuning Knob. (Side of Cabinet).

**KNOB 1. VOLUME CONTROL AND "ON"- "OFF" SWITCH ARE COMBINED:**

When turning on, a click will be heard and the dial will light. Wait approximately 45 seconds for the tubes to heat up. Turn knob all the way to the left to turn set off.

**KNOB 2. MANUAL TUNING:**

This radio may be used to tune in stations either by the conventional manual method or by using the Automatic levers. The tuning range of the radio is from 535 to 1735 kilocycles, the dial being calibrated in channel numbers. It covers all standard broadcast channels and one police band.

To convert channel numbers to kilocycles, add one zero. For example, 170 is 1700 kilocycles.

**PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:**

There are six levers on the dial by means of which six stations may be selected, (See "B," Fig. 2).

TYPICAL TUNING DATA

The procedure for setting the Automatic Levers is the same for all the above mentioned models. However, the number of Automatic Levers may differ.

The locking screw "C" and automatic levers shown in both figs 1 and 2 are for the Model 62-552 receiver. However, this is a typical receiver.

Press down any one of the six Automatic levers. Holding it down, tune in by means of tuning knob No. 2 any one of your favorite stations. Turn the tuning knob very slowly back and forth until signal is clearest. The stations will then be accurately tuned in.

Release this lever and press down any other Automatic lever. Hold this lever down and tune in by means of knob No. 2 another favorite station.

Follow this procedure until stations have been set on all the levers. Hold tuning knob securely with left hand to prevent it from turning and with a coin or screw driver, tighten the special locking screw ("C") in the center of the tuning knob, (See Fig. 2).

This screw will lock in place all stations you have selected on the Automatic levers. (Note: Locking Screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, hold the tuning knob securely and loosen locking screw ("C") one or two turns; select the new station as explained.

**BE SURE TO RETIGHTEN THE LOCKING SCREW, otherwise the stations will not stay adjusted to the levers.**

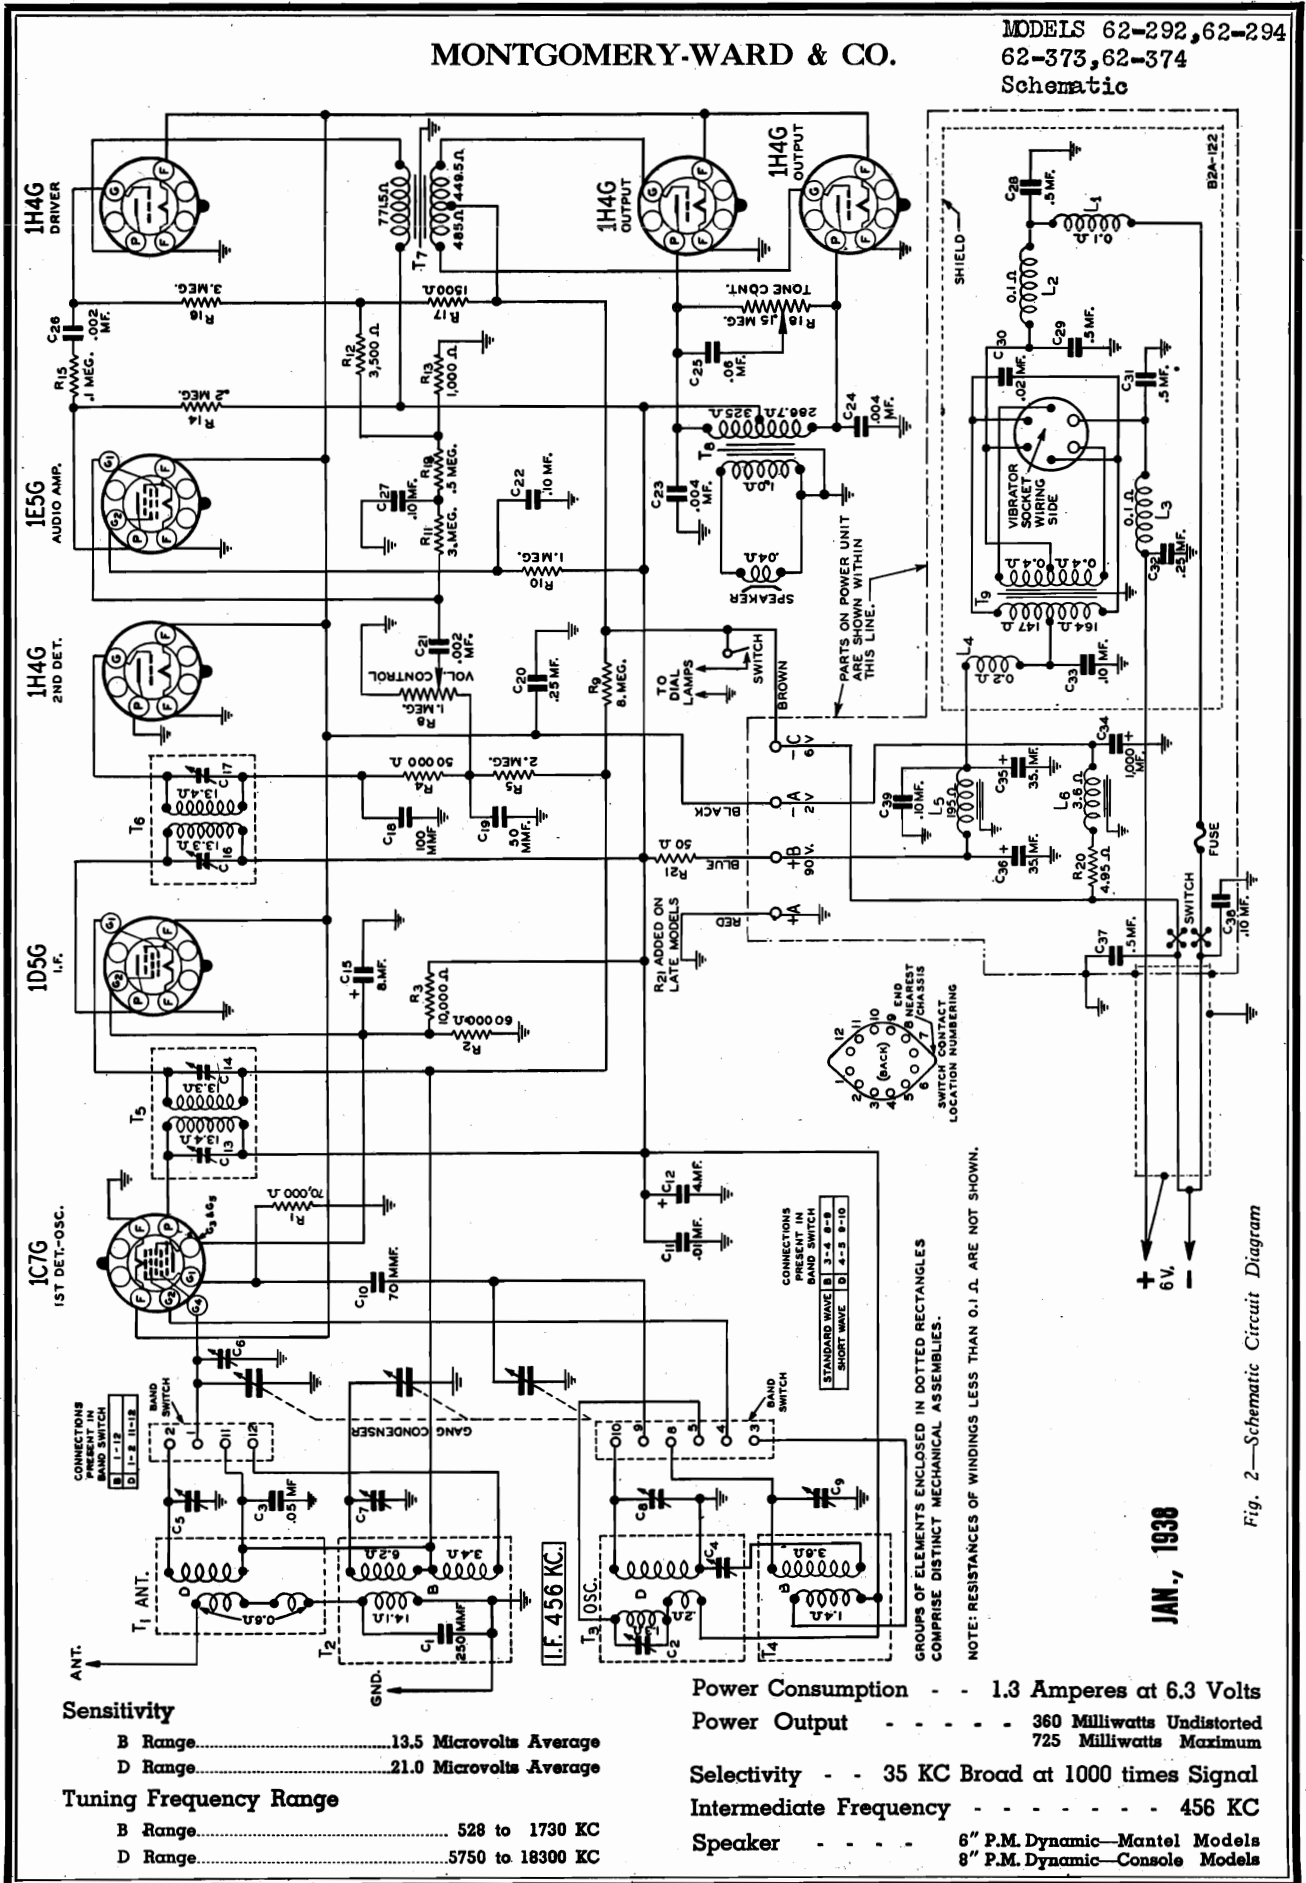

Above each Automatic lever an opening in the escutcheon is provided for inserting station call letters, (See "A," Fig. 2).

Punch the correct station call letter tabs from the set of sheets supplied and insert them into the rectangular openings in the escutcheon above each of the levers. One of the small, clear celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

The Automatic Tuner dial is now set up for quick tuning. Press down on the lever and your favorite station is selected.

ALIGNMENT PROCEDURE

The following equipment is required for aligning:  
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.  
Output Indicating Meter: Non-Metallic Screwdriver.  
Dummy Antennas — .1 mf., 200 mmf., and 400 ohms.

STEP (Follow Order)	BAND SWITCH SETTING	DUMMY ANTENNA SETTING	SIGNAL GENERATOR FREQUENCY SETTING	TRIMMERS ADJUSTED See illustration	PROCEDURE	
					INITIAL STEPS	ADJUSTMENT
I.F.						
RANGE B						
1730 KC	Range B	.1 mf.	456 KC	1st I.F. (C13) & (C14) 2nd I.F. (C16) & (C17)	Turn Rotor to Full Open	Adjust to Maximum Output
1800 KC	Range B	200 mmf.	1730 KC	Oscillator Range B (C9)	Turn Rotor to Full Open	Adjust to Maximum Output
1800 KC	Range B	200 mmf.	1500 KC	1st Ant. Range B (C7) 2nd Ant. Range B (C4)	Turn Rotor to Max. Output Set Indicator to 1500 KC— See Note A	Adjust to Maximum Output
600 KC	Range B	200 mmf.	600 KC	Antenna Lead	Turn Rotor to Max. Output	Adjust to Maximum Output Rock Rotor—See Note B
RANGE D						
18300 KC	Range D	400 Ohm	18300 KC	Oscillator Range D (C8)	Turn Rotor to Full Open	Adjust to Maximum Output
15000 KC	Range D	400 Ohm	15000 KC	Ant. Range D (C5)	Turn Rotor to Max. Output	Adjust to Maximum Output Rock Rotor—See Note B
6000 KC	Range D	400 Ohm	6000 KC	Antenna Lead	Turn Rotor to Max. Output	Adjust to Maximum Output Rock Rotor—See Note B

NOTE A—In sets using the finger tip tuning dial, remove the retaining ring which holds the dial in position. Readjust rotor to maximum output. Hold the station selector ring and turn the dial scale until the pointer is at the 1500 KC mark. Replace the retaining ring.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

After alignment of Range D has been completed, do not make any adjustments of the Range B trimmers. If this is done, it will be necessary to realign Range D.

CAUTION—When aligning the short wave band be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

A synchronous type vibrator is used in the power unit. This vibrator interrupts the current through the primary of the power transformer and also rectifies the current in the secondary circuit.

If, after a new 2 section dry electrolytic condenser has been installed, vibrator hash is encountered, reverse the connections of the 2 sections.

NOTE: RESISTANCES OF WINDINGS LESS THAN 10 ARE NOT SHOWN

Trimners

**SERVICE NOTES:**  
Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.  
All voltages as indicated on the voltage chart are measured with 115 volts on the primary of the power transformer.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.  
To check for open by-pass condensers, short each condenser with another condenser of the same capacity and voltage rating which is known to be good, until the defective unit is located.

Excessive hum, sputtering, low volume and a reduction in all D.C. voltages may be caused by a shorted electrolytic condenser or by-pass condensers frequently cause oscillation and distorted tone.  
Transformers are available and chassis are sometimes equipped with universal transformers for operation on 25, 40 and 60 cycles and with primary taps for 110, 130, and 230 volts.

**ALIGNING INSTRUCTIONS:**

**CAUTION:**—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or arccident

FIG. 3—BOTTOM VIEW SHOWING TRIMMERS

FIG. 1—TOP VIEW

MODELS 62-323, and 62-353 Series A, Issues A & B  
**ALIGNMENT PROCEDURE**

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna valve in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

BAND	Frequency Setting	SIGNAL GENERATOR Dummy Antenna to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6K7 (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6K8 (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 2)	Input	Adjust to maximum output

**Socket, Trimmers Alignment**

**MONTGOMERY-WARD & CO.**

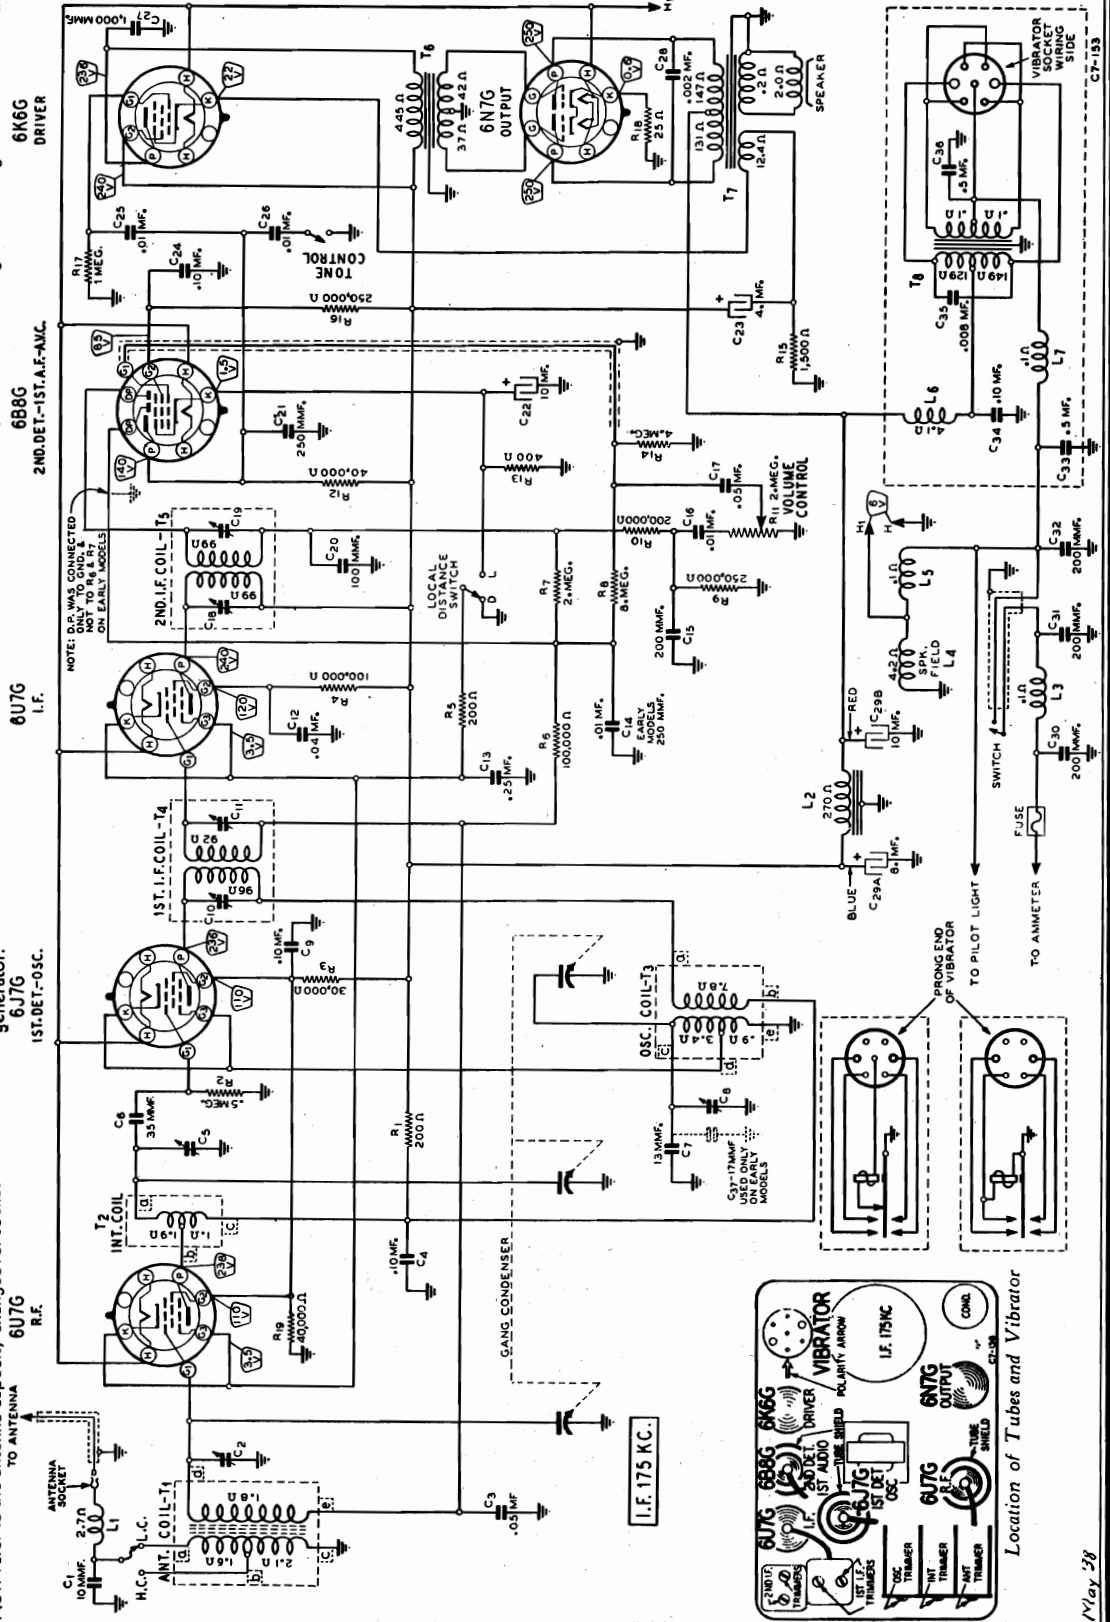

**MODEL 62-364 Schematic Voltage**

Set the signal generator for 175 KC and connect the output of the signal generator through a .05 mf. condenser to the stator of the interstage section (middle) of the tuning condenser. Connect the ground lead of the signal generator to the chassis. Set the volume control at maximum and the L-D switch in the distance position. Attenuate the signal from the signal generator to prevent the levelling off action of the AVC. Then adjust the 4 if trimmers until maximum output is obtained. Insert the antenna cable plug in the antenna socket on the chassis. Now refer to the antenna capacity changeover switch.

If the jumper is inserted between the HC holes of this socket and the entire 60-inch shielded cable (70 mmf.) is being used, connect the antenna wire at the other end through a .120 mmf. condenser to the antenna post of the signal generator. If the jumper is inserted between the LC holes of this socket, the antenna cable has been cut as explained in the instructions. If cut in half (30-inch length), the capacity of the antenna cable is approximately 35 mmf. Connect the antenna wire, in this case, through a .25 mmf. condenser to the antenna post of the signal generator.

Set the signal generator for 175 KC. Turn the rotor of the tuning condenser to the full open position. Adjust the trimmer of the oscillator section of the gang condenser until maximum output is obtained. See Fig. 4 for location of this trimmer. Set the signal generator for 1400 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained. Adjust the interstage and antenna 1400 KC trimmers for maximum output. Do not change the setting of the oscillator trimmer.

After the antenna is connected, tune in a weak signal at approximately 1400 KC with the volume control about three-fourths on. Turn the adjusting screw of the antenna 1400 KC trimmer up or down until maximum output is obtained.

MODEL 62-369  
Schematic, Socket

MONTGOMERY-WARD & CO.

Trimmers, Alignment

Location of Tubes and Vibrator.

Set the signal generator for 600 KC. Connect the output through a .05 mf. condenser to the control grid of the 6K7 R. F. tube. Rock the tuning condenser rotor and adjust the 600 KC oscillator padder (See Fig. 2) until the peak of greatest intensity is obtained. (See Fig. 2) until the peak of greatest intensity is obtained. Leave the signal generator set for 600 KC and re-connect the output to the shielded antenna lead through a 120 mmf. condenser. Adjust the 600 KC antenna trimmer to maximum. (This trimmer is reached from outside of the case - See Fig. 1.) After the alignment procedure is completed, the antenna plug may be withdrawn and reinserted on the LG side if a low capacity (70 mmf.) car antenna is used.

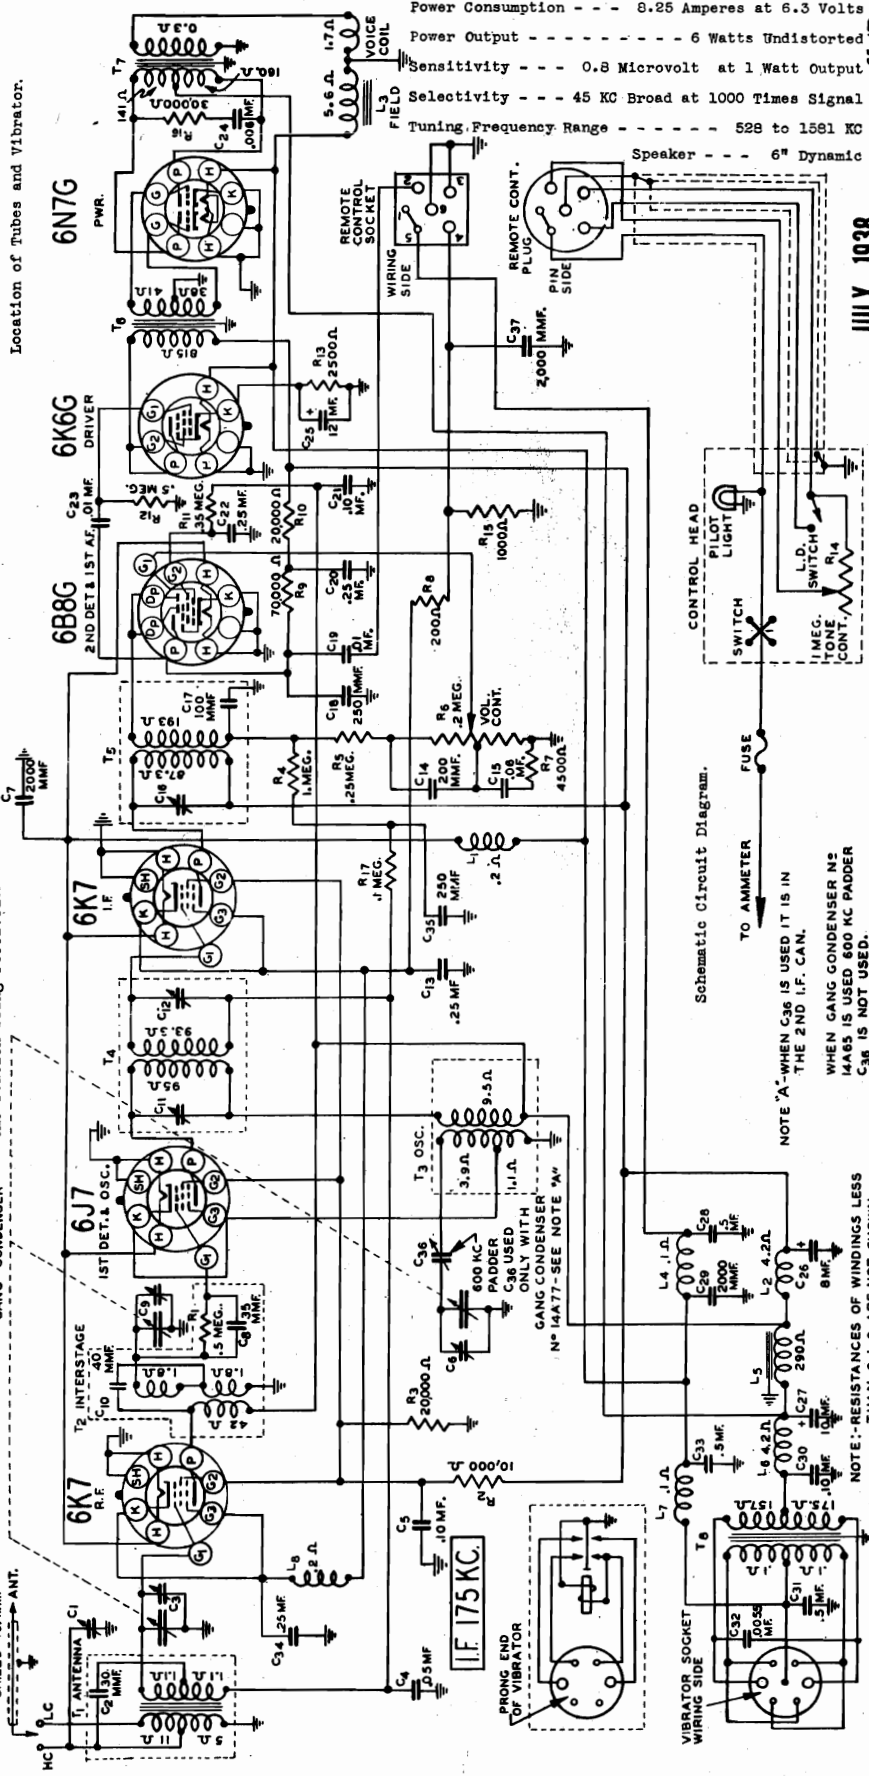

**Alignment and Calibration**  
Set the signal generator for 175 KC and connect the output of the signal detector section of the tuning condenser. Connect the ground lead of the signal generator to the chassis. The maximum should be in the case. Set the volume control at maximum and the L-D switch in the distance position. The leading edge signal from the signal generator should be prevented by the action of the AVC. When adjusting the three I.F. trimmers until maximum output is obtained - See Fig. 2.

**Adjusting Antenna 600 KC Trimmer** - After the radio is installed and the car antenna is connected, it will be necessary to readjust the antenna trimmer. Tune in a weak signal at approximately 600 KC with the volume control about three-fourths on. Turn the adjusting screw of the antenna about three-fourths on or down until maximum output is obtained.

**Calibrating the Radio** - To calibrate the radio, tune in a station of known frequency. Remove the dial lamp assembly from the back of the dial unit. The calibration screw is at the bottom of the dial lamp tube. Hold the tuning knob. Insert a fine blade screwdriver and turn this screw so that the POINTER travels in a clockwise direction until it is at the frequency of the station being received.

Turn the rotor of the tuning condenser to the full open position. Insert the antenna plug with the mark on the high capacity (HC) side. Connect the shielded antenna lead from the chassis through a 120 mmf. condenser to the antenna post of the signal generator. Adjust the trimmer of the oscillator section of the three gang condenser until maximum output is obtained.

Set the signal generator for 1400 KC. Carefully turn the rotor of the tuning condenser until maximum output is obtained. Adjust the 1st detector and antenna 1400 KC trimmers for maximum output. Do not change the setting of the oscillator trimmer.

Schematic Circuit Diagram.

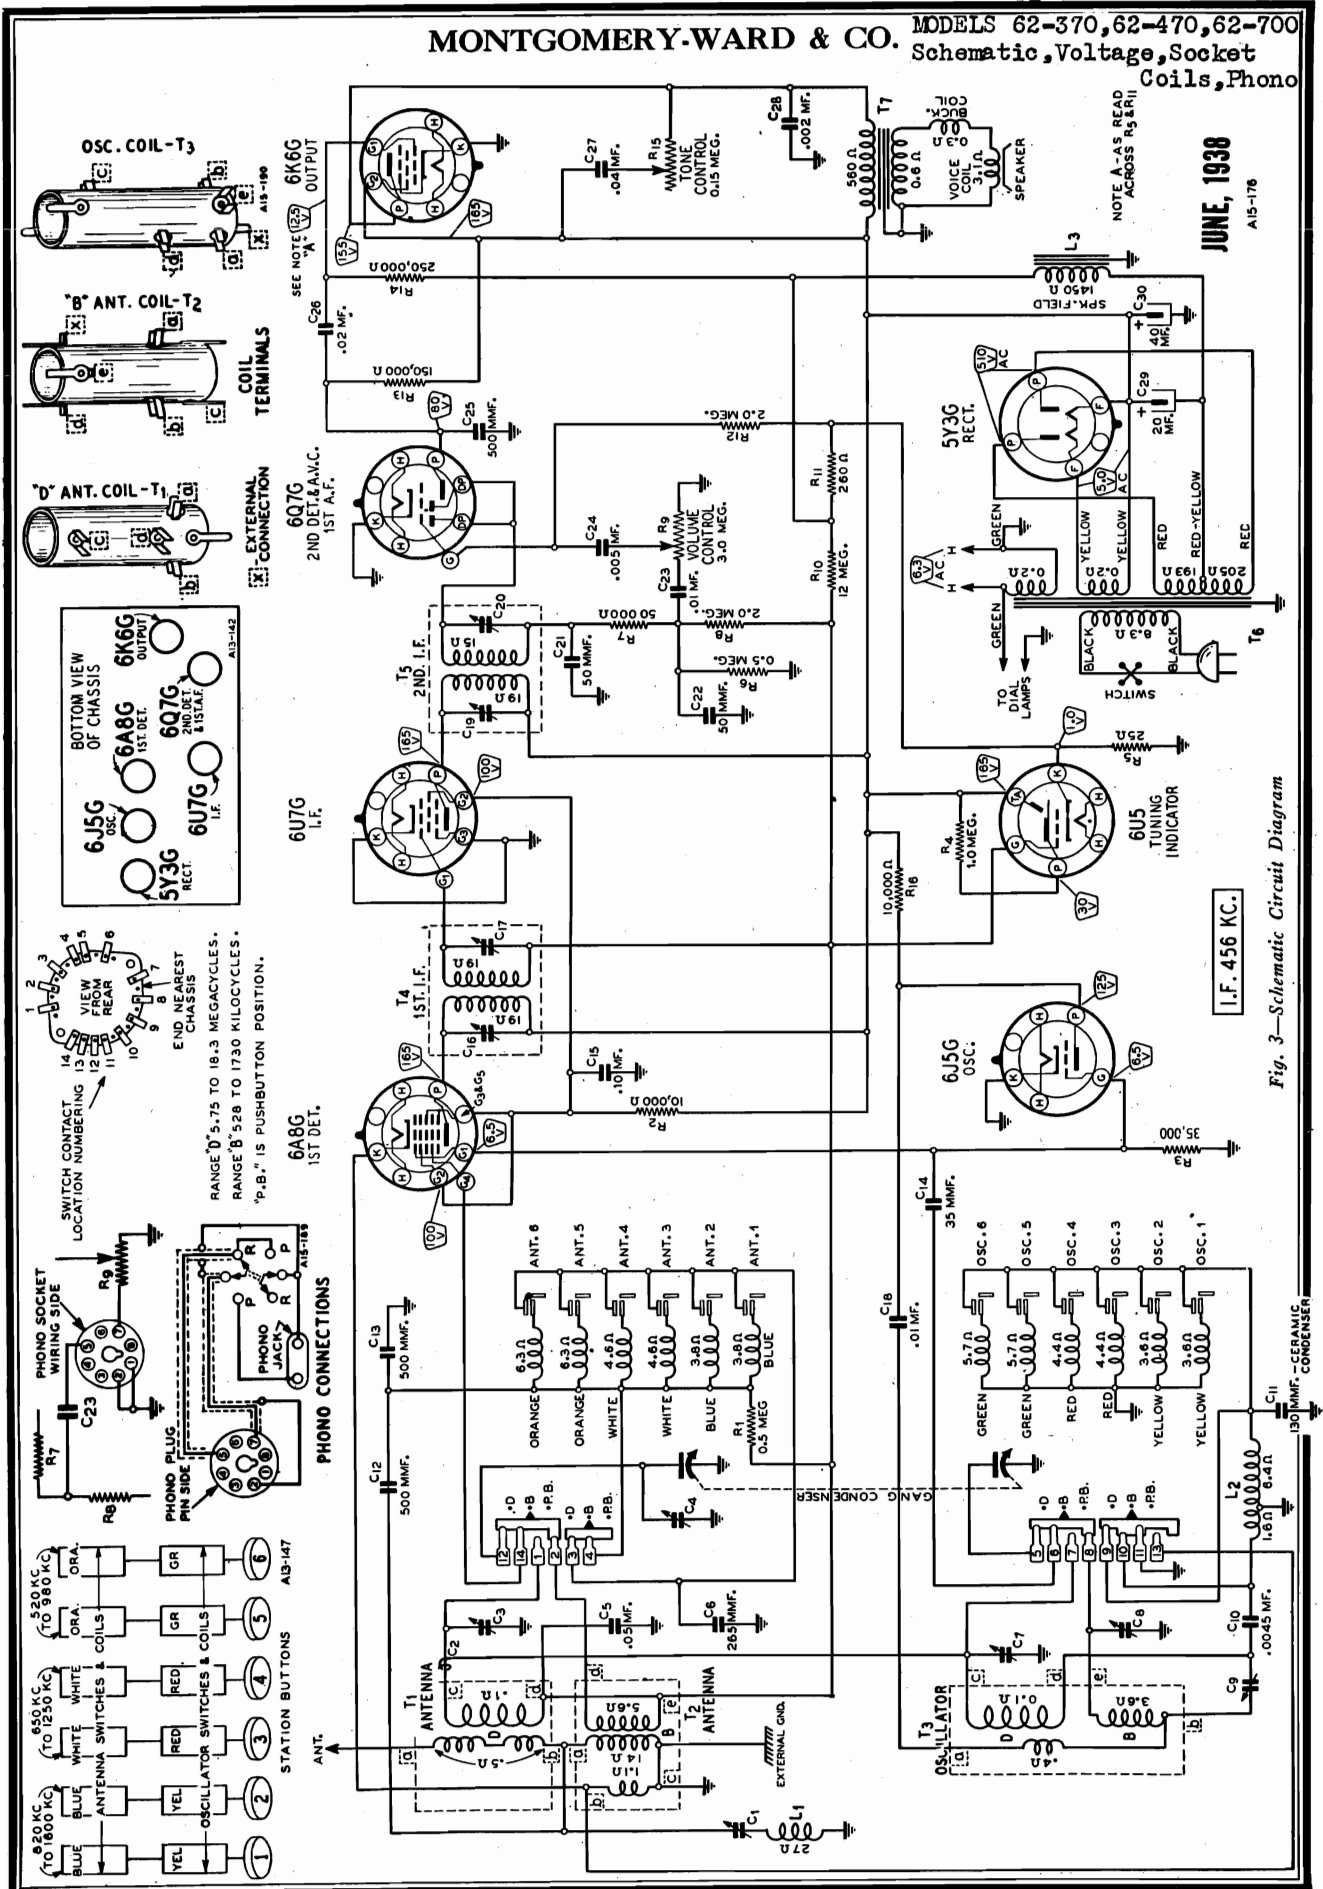

NOTE "A" - WHEN C36 IS USED IT IS IN THE 2ND I.F. CAN.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

The following equipment is required for aligning:

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

Output Indicating Meter—Non-Metallic Screwdriver.  
 Dummy Antennas—.1 mf., 200 mmf., and 400 ohms.

SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (Unless otherwise specified)
<b>I. F.</b>					
456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C16) & (C17) 2nd I.F. (C19) & (C20)
<b>RANGE B</b>					
1730 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C8)
1500 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1500 KC— See Note A	Ant. Range B (C4)
600 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C9) Rock Rotor—See Note B
<b>WAVE TRAP</b>

<b>RANGE D</b>					
18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C7)
15,000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Ant. Range D (C3) Rock Rotor—See Note B
<b>PERMEABILITY TUNING UNIT</b>					
			BUTTON DEPRESSED (Band Switch In Push Button Position)	TURN SETTING SCREW TO MAXIMUM OUTPUT —See Instruction Book	ADJUST COIL POSITION TO MAXIMUM OUTPUT —See Note D
1100 KC	Antenna Lead	200 mmf.	No. 1	Setting Screw No. 1	Antenna Coil No. 1
1100 KC	Antenna Lead	200 mmf.	No. 2	Setting Screw No. 2	Antenna Coil No. 2
850 KC	Antenna Lead	200 mmf.	No. 3	Setting Screw No. 3	Antenna Coil No. 3
850 KC	Antenna Lead	200 mmf.	No. 4	Setting Screw No. 4	Antenna Coil No. 4
700 KC	Antenna Lead	200 mmf.	No. 5	Setting Screw No. 5	Antenna Coil No. 5
700 KC	Antenna Lead	200 mmf.	No. 6	Setting Screw No. 6	Antenna Coil No. 6

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1500 KC on the dial, loosen the 2 clamps which hold the pointer assembly on the cord, move the pointer to the 1500 KC mark, and tighten the clamps.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

NOTE C—Leave condenser rotor at the 600 KC setting and adjust the signal generator until maximum output is obtained at or near 456 KC.

NOTE D—At the top of the permeability tuning unit can be seen six "W" openings. Insert the end of a pair of long nose pliers or a screwdriver in the "W" opening of the proper button and adjust the position of the antenna (rear) coil by twisting the pliers or screwdriver until maximum output is obtained.

CAUTION—When aligning the short wave bands be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for

15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at

15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

MODELS 93BR560A, 93BR657A, 93BR713A

**PROCEDURE FOR SETTING THE AUTOMATIC TUNER PUSHBUTTONS NOW, PROCEED AS FOLLOWS—**

Unlock the tuner mechanism. (NOTE—The automatic tuner mechanism is locked tight when radio is shipped from the factory.)

1. Remove the snap-in button from the dial escutcheon plate on the front panel of the radio (see "C", Reset Lock Screw, Fig. 2). Use the snap-in button which will not come out easily using your fingers, pry it off with a screwdriver or a knife, being careful not to mar the finish on the escutcheon plate.

2. Unlock the tuner mechanism by inserting a screwdriver through the hole in the panel. Press in and loosen the locking screw by turning it to the right as far as it will turn without forcing. You will note that as the locking screw is turned it will turn easily until the dial reaches its stop and then a slight amount of force will be required to actually start unlocking the tuner mechanism. Beyond this point, the locking screw will turn quite easily again until the tuner mechanism is completely unlocked. At this point do not force the locking screw any further. The tuner mechanism is now unlocked.

**SETTING PUSHBUTTONS:**

1. Press in all the way any one of the automatic tuner pushbuttons. Holding it in firmly, press on the Dial Tuning Control, No. 4, and tune in the station indicated on the station call letter tab on the pushbutton. You will note that the call letter tab on the station call letter tab will have to be pressed slightly. Move the Dial Tuning Control very slowly up and down (while still holding the automatic tuner pushbutton in firmly), noting the width of the shadow on the screen of the cathode-ray tuning eye. Minimum width on the tuning eye indicates the ideal tuning position (resonance). The station will then be clearest and accurately tuned in.
2. Press in another tuner pushbutton. Holding it in firmly, press on the Dial Tuning Control and carefully tune in the station indicated on the call letter tab on this pushbutton.
3. Follow this procedure until you have selected all of your favorite stations. (NOTE—If the dial mechanism works hard or has a tendency to slip when setting up a station for one of the pushbuttons, it is due to the tuner mechanism not being unlocked all the way. Loosen the reset locking screw. The Dial Tuning Control should turn the dial drum freely with a pushbutton pushed in.)

**LOCKING THE TUNER MECHANISM**

1. To lock the tuner mechanism insert a screwdriver through the hole in the escutcheon panel and press in and turn the reset locking screw to the left, until it cannot be turned any further without forcing it.
2. This will lock the tuner mechanism and all the stations that have been set up on the pushbuttons will be locked in place for automatic tuning. Press in any one of the pushbuttons and—YOUR FAVORITE STATION IS SELECTED.

**Procedure for Setting the Station Buttons**

MODELS 62-370, 62-470, 62-700, 62-902, 62-905; 62-704 to 62-712

To determine whether the correct station has been set, turn the band switch knob back to the BROADCAST position. The same station should be heard (provided the tuning knob has not been turned). If it is not, turn the band switch knob to the PUSH BUTTON TUNING position again and retune with the setting screw.

Remove the station call letter tab from the sheets provided and push the tab all the way to the bottom of the rectangular space above the correct station button opening in the escutcheon plate. Then cover the call letter tab with one of the clear celluloid tabs.

Proceed in the same manner to set stations on any of the remaining buttons. Use blank tabs above buttons on which stations are not set.

After all of the stations have been set, carefully replace the escutcheon plate.

If at any time you wish to change the setting of a button from one station to another, repeat the above procedure. Changing the setting of one button will not affect the setting of any of the other buttons. The old call letter tab may be removed by sticking a pin through the notch in the celluloid tab and through the call letter tab.

When this is done, the setting screws above the six buttons will be exposed.

Turn the band switch knob to the PUSH BUTTON TUNING position.—See Fig. 2. The station tuned in previously will probably disappear.

If the kilocycle number of the station tuned in is within the range of button No. 1, push this button in. The same station or a different station may be heard.

With a small screw driver, slowly turn the setting screw above button No. 1 in or out until the desired station (the one previously tuned in) is heard. Turning the screw in (clockwise) will tune in stations with higher kilocycle numbers while turning the screw out (counter-clockwise) will tune in stations with lower kilocycle numbers. Be sure not to tune in some other station broadcast in the same program. Using the tuning eye as a guide, accurately tune in this station. The station is now set on this button.

There are 6 buttons on the push button tuning dial by means of which 6 stations may be set for quick tuning. They are numbered 1 to 6 in Fig. 2.

Make a list of your favorite stations, those which you tune in regularly. There may be any number up to and including 6 in this list.

It is better to list the station with the highest kilocycle number first, the station with the next lower kilocycle number next, and so on.

**Frequencies Covered by Each Button**

The frequency range of each station button is shown in Fig. 2. Any station within the range of a button may be set. Although, in some cases, it may be possible to set a certain station on several buttons, it is better to set the stations so that the kilocycle numbers decrease from buttons 1 to 6.

**Setting a Station Button**

Select a station from the list you have prepared, preferably the station with the highest kilocycle number set on this button.

- R.F. ALIGNMENT (535-1720 K.C.):**  
With the gang condenser in a minimum position (plates entirely out of mesh) the dial reading should be at the end marking of the scale.
1. Connect the test oscillator in series with a 200 mmf. condenser to the tan antenna lead from the chassis.
  2. Set the oscillator and gang condenser to 1500 K.C. and adjust oscillator trimmer No. 29 (rear section of condenser gang).
  3. Set the test oscillator and gang to 1400 K.C. and adjust antenna trimmer No. 5 (front section of condenser gang).
  4. Check sensitivity at 1000 and 600 K.C.

- Frequency Range**  
535 - 1720 Kilocycles
- ALIGNING I.F. TRANSFORMERS (465 K.C.):**
1. Connect an output meter across the voice coil of the speaker or across the primary of the output transformer.
  2. Connect an external oscillator which has been adjusted to 465 K.C. in series with a .1 mfd. condenser, to the control grid of the 6A8-G tube.
  3. Connect the oscillator ground to the black chassis ground lead.
  4. Adjust I.F. trimmers Nos. 6, 8, 9 and 11 to resonance, at the same time reducing the output of the oscillator as required.

FIG. 1—TOP VIEW

D.C. VOLTAGES MEASURED WITH 1000 OHM PER VOLT VOLTMETER BETWEEN SOCKET TERMINALS AND CHASSIS.  
 VOLUME CONTROL AT MIN., ANT. GROUNDING.  
 2 VOLT "A" AND 90 VOLT "B" BATTERIES CANNOT BE READ WITH VOLTMETER

The following batteries are required:

- 2-45 Volt "B" Batteries.
- 1-3 Volt Dry "A" Battery or 2 Volt Storage Battery.

Check the Position of the Knob on the Back of the Radio Before Making any Battery Connections

**ALIGNMENT PROCEDURE**

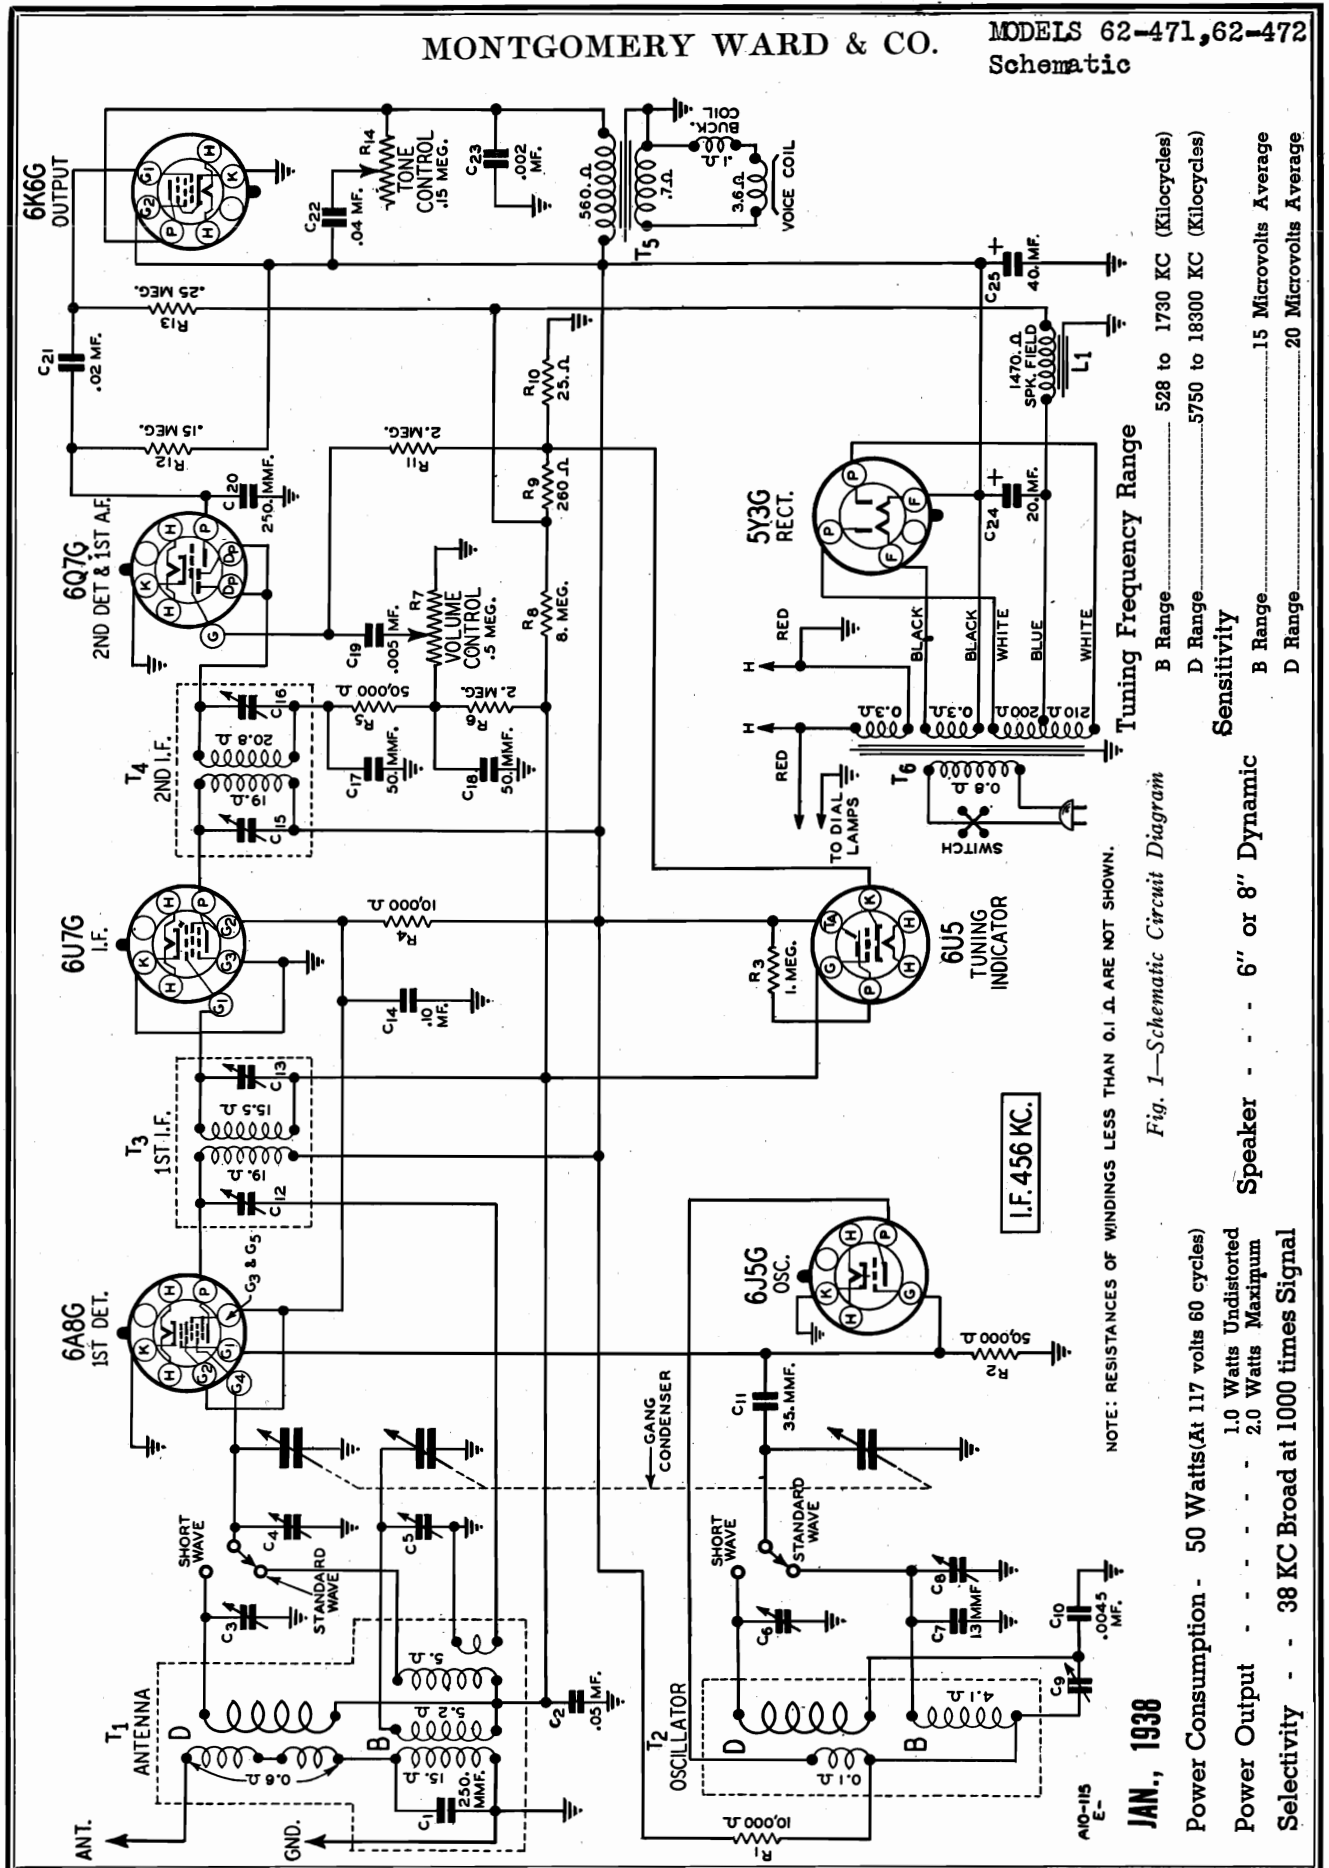

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

BAND	Frequency Setting	SIGNAL GENERATOR Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of last I. F. Tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of first I. F. (Mixer Tube).	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1735 Kc.	200 mmf.	Antenna Lead	Rotor full open (Plates out of mesh)	Trimmer—Top of rear section of gang (See Fig. 1)	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	200 mmf.	Antenna Lead	Set dial at 1400 Kc.	Trimmer—Top of front section of gang (See Fig. 1)	Broadcast Antenna	Adjust to maximum output

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC. After each band is completed, repeat the procedure as a final check.

**MONTGOMERY-WARD & CO.**

**ALIGNMENT PROCEDURE**

Volume Control—Maximum All Adjustments.  
 Connect Radio Chassis to Ground Post of Signal Generator With a Short Heavy Lead.  
 Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following equipment is required for aligning:  
 An all Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.  
 Output Indicating Meter; Non-Metallic Screwdriver,  
 Dummy Antennas—1 mf., 200 mmf., and 400 ohms.

STEP (Follow Order as Given)	BAND SWITCH SETTING	DUMMY ANTENNA	SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	TRIMMERS ADJUSTED (See Illustration)	INITIAL STEPS	PROCEDURE ADJUSTMENT
I.F.	456 KC	Range B	.1 mf.	456 KC	Grid of 1st Det.	1st I.F. (C12) & (C13) 2nd I.F. (C15) & (C16)	Turn Rotor to Full Open Adjust to Maximum Output
<b>RANGE B</b>	1730 KC	Range B	200 mmf.	1730 KC	Antenna Lead	Oscillator Range B (C8)	Turn Rotor to Full Open Adjust to Maximum Output
	1500 KC	Range B	200 mmf.	1500 KC	Antenna Lead	1st Ant. Range B (C5) 2nd Ant. Range B (C4)	Turn Rotor to Max. Output Set Indicator to 1500 KC— See Note A
	600 KC	Range B	200 mmf.	600 KC	Antenna Lead	600 KC (C9)	Turn Rotor to Max. Output Adjust to Maximum Output Rock Rotor—See Note B
<b>RANGE D</b>	18300 KC	Range D	400 Ohm	18300 KC	Antenna Lead	Oscillator Range D (C6)	Turn Rotor to Full Open Adjust to Maximum Output
	15000 KC	Range D	400 Ohm	15000 KC	Antenna Lead	Ant. Range D (C3)	Turn Rotor to Max. Output Adjust to Maximum Output Rock Rotor—See Note B

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.  
 After each range is completed, repeat the procedure as a final check.  
 After alignment of Range D has been completed, do not make any adjustments of the Range B trimmers. If this is done, it will be necessary to realign Range D.

NOTE A—After the 1500 KC adjustment is made, the dial indicator should be at the 1500 KC mark on the dial scale. If it is not, the position of the indicator on the drive cord must be changed. This procedure, however, should not be followed unless it is absolutely necessary as there is danger of breaking the clamp which holds the indicator in place.

If the indicator must be moved, loosen the clamp at the back which holds it in place, move the indicator to the correct position, and bend the clamp back into place again.  
 NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

CAUTION—When aligning the short wave band, be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 18,300 KC. The signal will then be heard

Fig. 2—Location of Trimmers

**VOLTAGES AT SOCKETS**

Line Voltage: 117—Volume Control: Maximum. Antenna Shorted to Ground.  
 Readings taken with a 1000 Ohm-per-volt meter. Position of Band Switch: Standard Wave.

- (3) Bias voltage as read across R9 and R10.
- (4) A.C. voltage as read across filament terminals 2 and 8.
- (5) A.C. voltage as read across terminals 4 and 6.

**Replacing Drive Cords**

Three drive cords, Nos. 1, 2, and 3, as shown in Fig. 5, are used. To replace any of these cords, proceed as follows:

**Cord No. 1**

Turn the gang condenser to full open position.

Turn the drive shaft so that the holes for the cord are vertical. The positions of the drive shaft and drive drum are shown in Fig. 5.

Tie a double knot in one end of the cord. From the bottom of hole (A) in the drive shaft, thread the other end of the cord through the hole.

Slide a 1/2 inch length of fabric tubing on the cord, placing it near the free end. Fasten the shorter of the two springs used to the free end of the cord, making the distance between the two knots 2 7/8 inches.

Starting at the point where the cord leaves hole (A), wind it around the shaft 3/4 of a turn as shown in Fig. 5. Bring the end up to the wide groove (B) in the drive drum and wind on 2 1/4 turns, progressing toward the edge of the groove. Pass the cord through the slot at (C), placing the fabric tube (F) in position to protect the cord from being cut, and hook the spring to the pin at (D).

**Cord No. 2**

The gang condenser and tuning shaft should be in the same position as explained for Cord No. 1.

Tie a double knot in one end of the cord. From the top of hole (E) in the drive shaft, thread the other end of the cord through the hole.

Slide a 1/2 inch length of fabric tubing on the cord, placing it near the free end. Tie a slip knot with a small loop in the free end of the cord so that the length of the cord is 12 inches between the knots.

Starting at the point where the cord leaves hole (E), wind it around the shaft 3/4 turns as shown in Fig. 5. Do not attempt to wind the cord on the drive drum, but put the loop in the slip knot over pin (G). Rotate the drive drum clockwise about 1/2 a turn. This will unwind the cord on the drive shaft at (E).

Pass the cord through the slot at (C), placing the fabric tube (F) in position to protect the cord from being cut. While holding the cord on the wide flange, rotate the drive drum counterclockwise. The cord will be pulled into position in the groove.

**Cord No. 3**  
 The gang condenser and drive drum should be in the same position as explained for Cord No. 1.

Tie one end of the cord on hook (H).

Slide a 1/2 inch length of fabric tubing over the cord. Place this tubing approximately 13 1/2 inches from the end of the cord to be attached to the spring.

Tie the other end of the cord to the longer of the two springs used. The length of the cord between the knots should be 3 3/4 inches.

Pass the cord through slot (J) in groove (P) of the drive drum. Bring the cord up to pulley (K), around the other pulleys as shown in Fig. 5, and down to groove (F). After passing the cord around the drive drum 1/2 turn in groove (P), fasten the spring to hook (Q).

**Attaching Dial Pointer**—Tune in a station of known frequency. Move the pointer to this frequency on the dial scale. After the pointer has been moved to the correct position, clamp it tightly over the fabric tubing on the cord—See Fig. 5.

**Lever Tuning Assembly Adjustments**

**Pressure of Spacers on Heart Cams**—The heart cams must rotate freely relative to the shaft spacers when the tightening lever is in the "loose" position and must not rotate relative to the shaft spacers when this lever is in the "tight" position.

Pressure of the spacers against the heart cams is determined by the position of nut (R) on the threaded shaft—See Fig. 5. If, after the tightening lever is turned to the "tight" position, the cams can turn relative to the shaft, this nut must be tightened.

Bend back the ears of washer (S)—See Fig. 5, and tighten nut (R) about 1/2 turn. Bend the ears of the washer down again on nut (R). Tighten the tightening lever and see if the cams are sufficiently tight.

In general, nut (R) should be at such a position on the threaded shaft that the stop on the tightening lever moves to about 1/4 inch from the end of the slot in the tightening washers when a reasonable amount of pressure is exerted on this lever.

**Connection between Gang Condenser and Cam Shaft**—One screw only should be used in the universal joint connection between the condenser shaft and the cam shaft. If 2 screws are used, considerably more pressure must be exerted on the station levers to rotate the cam shaft.

Fig. 4—Location of Tubes

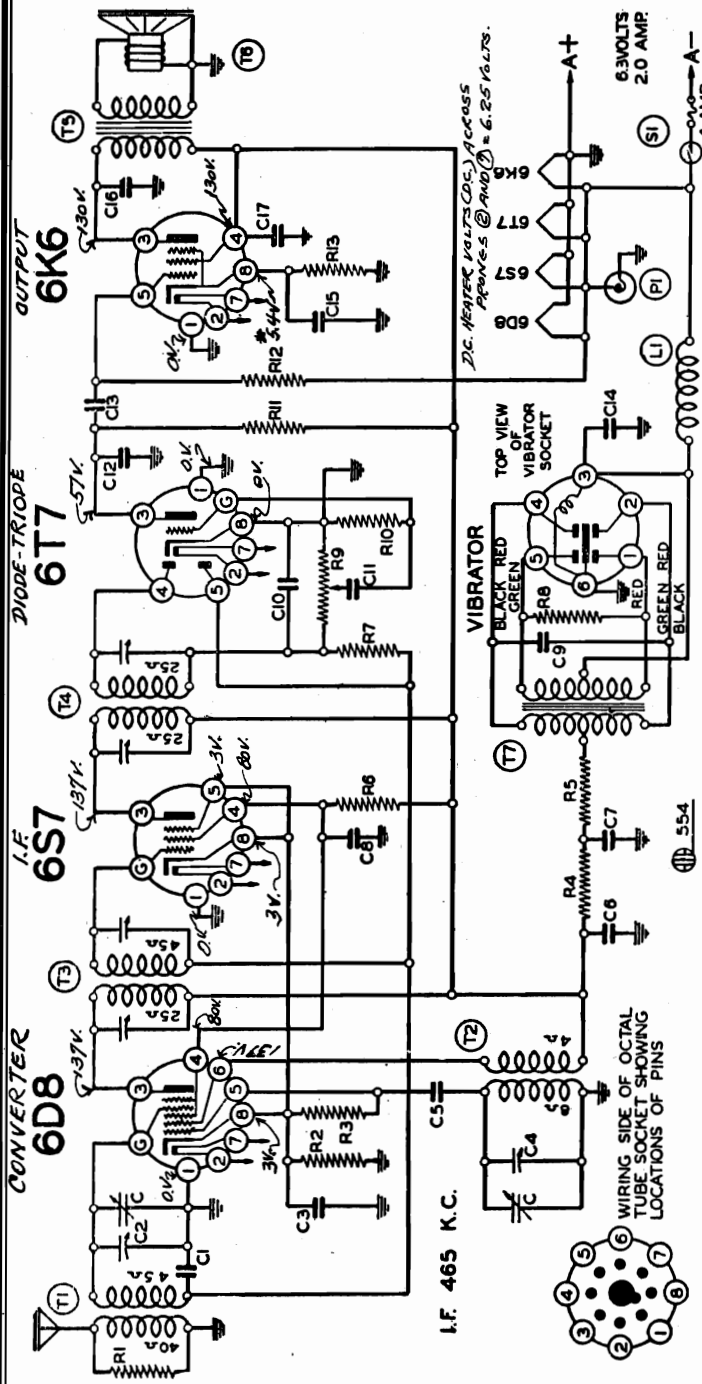

Fig. 5—Replacement of Drive Cords

Schematic, Voltage  
Socket, Trimmers

MONTGOMERY WARD & CO.

MODEL 62-459  
Series A

**TO REMOVE CHASSIS FROM THE CABINET:**  
To remove chassis from the cabinet unscrew the locking screw in the center of the tuning knob and pull tuning knob and volume knob off their shafts. Remove the four mounting screws that hold the bottom plate and chassis to the cabinet. Pull off the five buttons on the levers. Move the chassis toward back of cabinet so that control shafts and dial assembly clear holes in cabinet. then chassis can be slipped out.

**VOLTAGES AT SOCKETS**

Supply Voltage 6.3 DC—Volume Control: Maximum  
Readings taken with 1000 ohm-per-volt meter  
Antenna Shorted to Ground

**FREQUENCY RANGE**

535 to 1720 KC.  
Bias (11.6 volts) as read across terminals 8 to 7.  
Power Consumption: 2 Amperes at 6.3 Volts  
Power Output: .4 Watts Undistorted, 1 Watt Maximum

In case of difficulty, the fuse contained in the metal fuse receptacle should be checked. A 4 ampere Type 3AG fuse (Part No. BE13179) should be used.

**ALIGNMENT PROCEDURE**

The tube complement of this chassis consists of octal base glass and metal tubes.

- Volume control—Maximum all adjustments.
- Connect B - of radio chassis to ground post of signal generator through .1 Mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mf., 100 mmf.

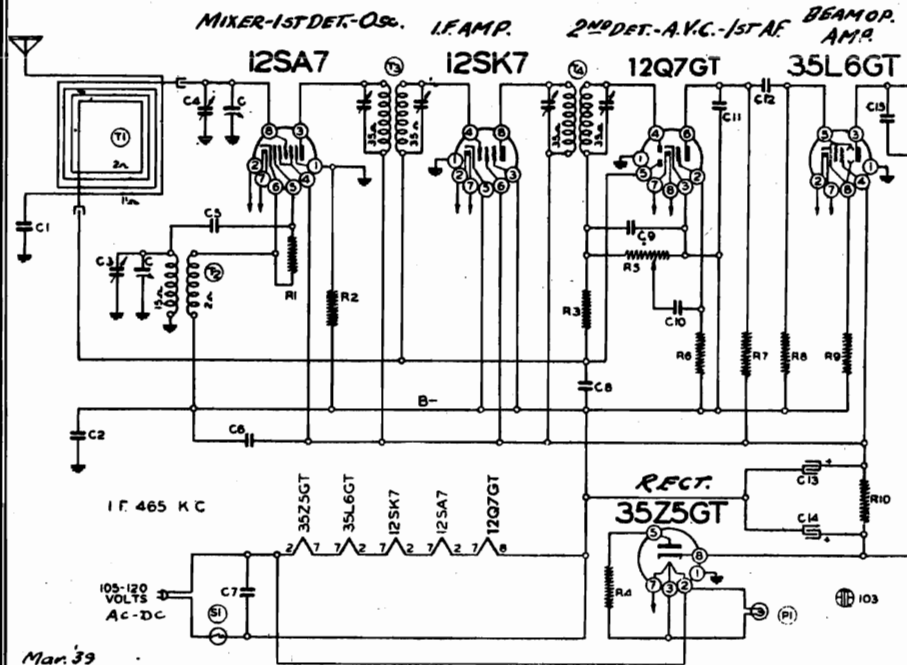

BAND	Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6A8	Rotor full open (Plates out of mesh)	Two trimmers	I. F.	Adjust to maximum output
BROAD-CAST BAND	1720 Kc.	100 mmf.	Antenna Lead	Rotor full open (Plates out of mesh)	Trimmer—Top of rear section of gang	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	100 mmf.	Antenna Lead	Set dial at 1400 Kc.	Trimmer—Top of front section of gang	Broadcast Antenna	Adjust to maximum output

- S1 Off-on switch on vol. control
- P1 BE107249 6.3 volt Pilot Light

BOTTOM VIEW OF CHASSIS

FOR SETTING AUTOMATIC TUNING LEVERS, SEE INDEX

ALIGNMENT PROCEDURE

Do not remove the back cover of the radio which contains the loop antenna from the chassis. It is important during alignment that the same distance between the loop antenna and the chassis be maintained as when the chassis is installed in the cabinet.

Slight adjustments to the oscillator and antenna circuits can be made without removing the chassis from the cabinet through two holes which are provided on the bottom of the cabinet.

The two adjustments on the variable gang condenser can be reached with a long insulated type screw driver through these two holes.

- Volume control—Maximum all adjustments.
- Connect B - of radio chassis to ground post of signal generator through .1 Mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

Frequency Range 540-1650 Kilocycles  
I. F. Frequency 465 K. C.

NOTE:- In ISSUE A, a 12SQ7 is used as 2nd Det.-A.V.C.-1st. Audio; Resistor, R 10, part BE 130282, 2000 ohm 1 watt, and P1, part BE 10794, 6.8 v. Pilot Light are used. For all other parts see parts list.

BAND	SIGNAL GENERATOR			Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
	Frequency Setting	Dummy Antenna	Connection to Radio				
I. F.	465 Kc.	.1 MFD.	Grid of 12SA7	Rotor full open (Plates out of mesh)	Four Trimmers on Top (See Fig. 1)	Output and Input I.F.	Adjust to maximum output
BROADCAST BAND	1650 Kc.	.1 MFD.	Grid of 12SA7	Rotor full open (Plates out of mesh)	Trimmer—Bottom of rear section of gang (See Bottom of Radio)	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	See Note "A"		Set dial at 1400 Kc.	Trimmer—Bottom of front section of gang (See Bottom of Radio)	Broadcast Antenna	Adjust to maximum output

NOTE "A" Lay the output lead from the generator in back of the loop antenna. Turn up the output of the generator, picking up the energy in the loop antenna without any electrical connection from the generator.

Power Consumption.....40 Watts  
Power Output.....1.3 Watts Undistorted, 2.5 Watts Maximum  
Intermediate Frequency.....465 K.C.

Alignment

MONTGOMERY WARD & CO.

MODELS 62-558, 62-1558  
62-2558  
MODEL 62-653  
Alignment, Trimmers

**ALIGNMENT PROCEDURE**

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

- The following equipment is required for aligning:
- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
  - Output indicating meter.
  - Non-metallic screwdriver.
  - Dummy antenna—1 mf., 200 mmf.
- MODELS 62-550, 62-1550, 62-2550  
Series A

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 1DSG L.F. Tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 1D7G	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1735 Kc.	200 mmf.	Antenna lead	Rotor full open (Plates out of mesh)	Trimmer—Top of rear section of gang (See Fig. 1)	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	200 mmf.	Antenna lead	Set dial at 1400 Kc.	Trimmer—Top of front section of gang (See Fig. 1)	Antenna Broadcast	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Set dial at 600 Kc.	R.C. Series Pad (See Fig. 1)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.  
Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.  
After each band is completed, repeat the procedure as a final check.

Power Output—150 Milliwatts Undistorted, 250 Milliwatts Maximum  
Intermediate Frequency—465 KC.  
FREQUENCY RANGE 535 to 1735KC.

SHORT WAVE BAND	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 17 Mc.	Trimmer C6—Top of front section of gang (See Fig. 1)	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 17 Mc.	Trimmer C2 (See Fig. 4)	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 6 Mc.	Trimmer C7 (See Fig. 4)	Short Wave oscillator series pad	Adjust to maximum rock dial. (See note "A")
BROAD-CAST BAND	1750 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Trimmer C3 (See Fig. 4)	Broadcast oscillator	Adjust to maximum output
	1400 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 1400 Kc.	Trimmer C3 (See Fig. 4)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 600 Kc.	Trimmer C9 (See Fig. 4)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.  
After each band is completed, repeat the procedure as a final check.

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

**ALIGNMENT PROCEDURE Model 62-653**

Fig. 6—Location of 1st I.F. Trimmer in Tuning Unit

Remove grille and speaker from speaker unit.

Remove the chassis from tuning unit case in accordance with the article under "General Installation Items" in this manual.

Set the signal generator for 456 KC and connect the output of the signal generator through a .05 mf. condenser to the control grid of the 6SA7 1st detector tube (prong No. 8). Connect the ground lead of the signal generator to the tuning unit chassis. Set the volume control at maximum and the Local-Distance

switch to the distance position. Attenuate the signal from the signal generator to prevent the leveling off action of the AVC.

Then adjust the 4 I.F. trimmers until maximum output is obtained. Three of the trimmers are in the speaker unit—See Fig. 2. One trimmer is at the top of the tuning unit—See Fig. 6.

Insert the antenna cable plug in the antenna socket on the tuning unit. The total capacity of the antenna cable and dummy antenna should be 60 mmf. If the cable, for example, has a capacity of 25 mmf., use a 35 mmf. condenser for a dummy antenna. Connect the other end of the antenna cable through the dummy antenna capacity to the output of the signal generator.

Set the signal generator for 1500 KC. Turn the tuning knob until the iron cores are as far out of the tuning coils as they will go. Then adjust the oscillator trimmer C6

(Fig. 1) until maximum output is obtained.

Set the signal generator for 1000 KC. Turn the tuning knob until maximum output is obtained. Adjust interstage trimmer C7 and antenna trimmer C2 for maximum output—See Fig. 1.

Reassemble the radio and install it in the automobile. Insert the car antenna cable. Tune in a weak signal near 1000 KC and readjust the antenna trimmer C2 for maximum output.

Calibration—If it is necessary to calibrate the radio, remove the chassis from the tuning unit case—See article on that subject in this manual. Accurately tune in a signal of known frequency near 1000 KC. Loosen the set screw of the large gear that drives the dial drum. Turn the dial drum until the indicator line is at the frequency of the station tuned in. Tighten the set screw and reassemble.

MODELS 62-558, 62-1558  
62-2558  
Series A

**ALIGNMENT PROCEDURE**

Models 93WG602 and 93WG603

Volume Control—Maximum All Adjustments. Allow Chassis and Signal Generator to "Heat Up" for several Minutes. Connect Ground Post of Signal Generator to 8—(12SK7—Prong No. 3) in Chassis.

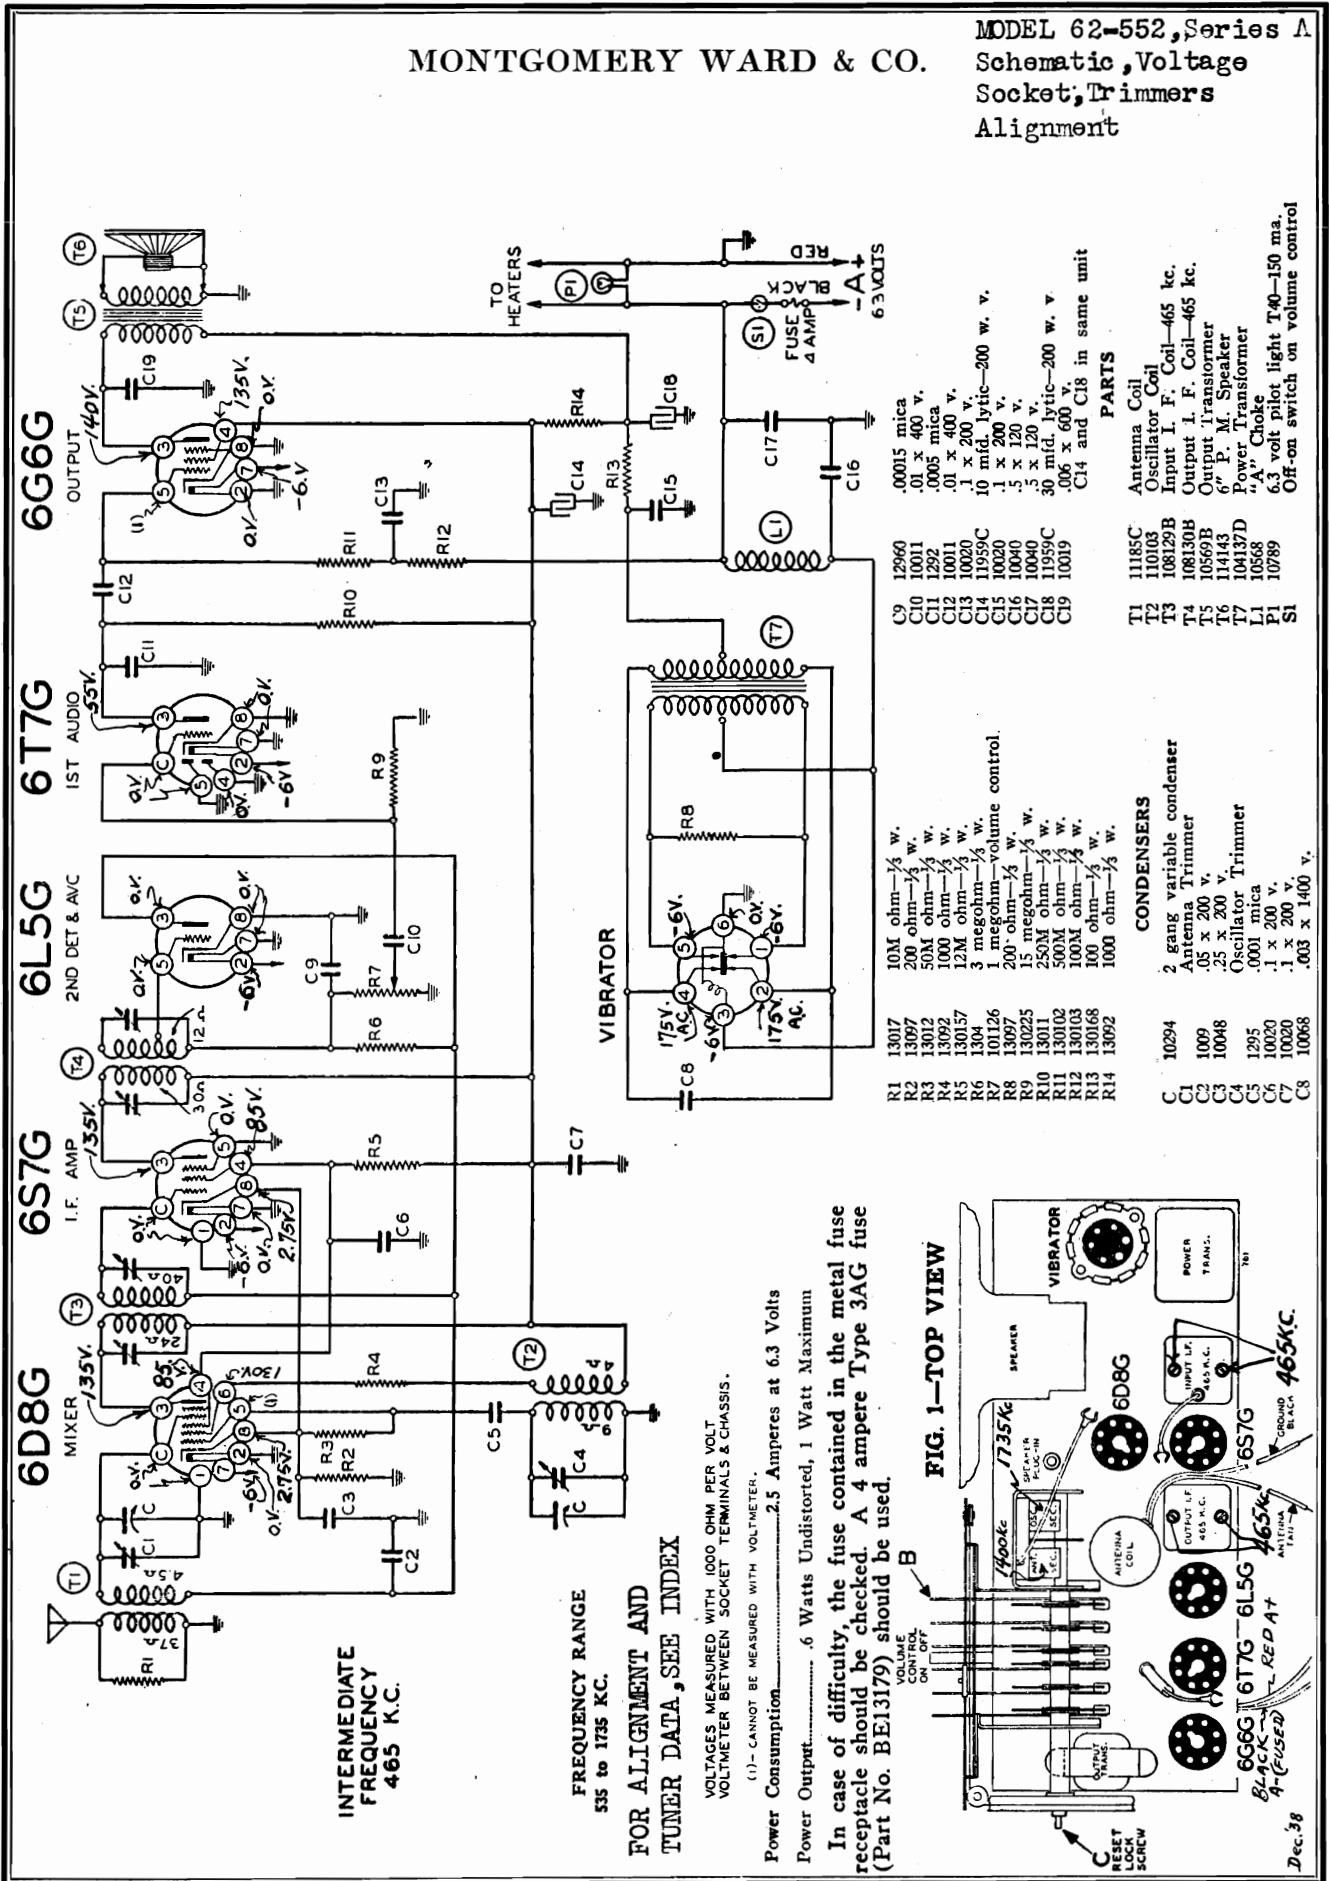

SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
456 KC	Signal Grid of 1st Det. Connect at Stator of Large Gang Section.	.1 mf.	Turn Rotor to full open	1st I.F. (C7) & (C8) 2nd I.F. (C9) & (C10)
1730 KC	Signal Grid of 1st Det.	.1 mf.	Turn Rotor to full open	Oscillator (C2)
1500 KC	None—See Note		Turn Rotor to max. output	Antenna (C3)

CALIBRATION—If it is necessary to calibrate the radio, remove the back cover. Turn the tuning control drum until the 2 set screws on the dial hub near the volume control can be reached with a screwdriver. Loosen the 2 set screws by turning them about 1/8th turn in a counter-clockwise direction. Tune in an 800 KC signal. Hold the tuning control motionless and at the same time turn the dial drum until the dial is in calibration. Then slowly turn the tuning control drum until the 2 set screws can be reached and re-tightened with a screwdriver. Check to see that the dial has remained in calibration.

Dummy Antenna—1 mf.  
NOTE—Connect a loop approximately one foot in diameter across the antenna and ground posts of the signal generator. Secure the back in place on the cabinet. Place radio approximately 3 feet from loop so as to pick up signal. Radio should not be in proximity to any metal (metal bench, etc.).

- OPERATION:**
- For 6 volt storage battery operation: Use cable No. BE107128C.
  - For 105-115 volts, 60 cycle operation:
    - Use special cable No. BE107129.
    - Plug receptacle of cable into power socket on chassis.

Vibrator Location

Schematic Circuit Diagram

**IF ALIGNMENT**  
Adjust at 456 KC through 0.05 mfd. condenser.  
**BC ALIGNMENT**  
Adjust oscillator trimmer C8 at 1560 KC.  
Adjust C6 and C2 trimmers at 1000 KC.

**FOR CONVENTIONAL ALIGNMENT, SEE SPECIAL SECTION  
OF VOLUME VIII**

**FOR SETTING PUSH BUTTONS,  
SEE INDEX.**

### Battery Cable and Fuse

The battery connection is made at the ammeter. The end of the battery cable with the connecting lug is secured to one of the posts at the back of the ammeter in the instrument panel. The other end of the cable with the fuse receptacle connects to the battery cable from the radio after the fuse has been inserted.

**A 9 ampere automobile fuse is used.**

## Procedure for Setting the Station Buttons

**TYPICAL TUNING DATA (FOR NUMBER OF BUTTONS AND LOCATION OF LOCKING SCREWS -SEE FIGURES).**

There are 5 buttons on the automatic tuning dial by means of which 5 stations may be set.

Any button may be used for any station you can receive.

Depress the manual tuning button AND KEEP IT DEPRESSED DURING THE ENTIRE SETTING OPERATION AS DESCRIBED BELOW. See Fig. 1 for location of buttons. Turn the manual tuning knob so that the indicator moves toward the 1500 KC end of the dial until the stop is reached.

**UNLOCK THE TUNING MECHANISM** by inserting a SMALL HANDLE screwdriver, as shown in Fig. 1, in the locking screw opening at the bottom of the tuning unit. Loosen the locking screw by turning it counter-clockwise as far as it will go.

**TO SET STATIONS ACCURATELY, DO NOT JAR THE RADIO OR BUTTONS WHILE THE MECHANISM IS UNLOCKED.**

Insert a celluloid reinforcement tab half-way in the slot at the front of station button No. 1—See Fig. 3.

**REINFORCEMENT TAB** Remove the correct station call letter tab for button No. 1 from the sheet supplied by bending the sheet back and forth at the score

Fig. 3—Inserting Station Tab

marks. Place the call letter tab in front of the celluloid reinforcement tab and insert it in slot. Push both tabs all the way in the button slot. Follow the same procedure for inserting the station call letter tabs in any other buttons.

After the stations are set and the mechanism is locked, tune in each of them by depressing the proper button. If any of them does not appear to be properly tuned in after the button has been depressed, reset the station for that button following the procedure outlined above. Changing the setting of one button will not affect the setting of the others.

**KEEP THE MANUAL TUNING BUTTON DEPRESSED WITH ONE HAND** and with the other hand, depress the first (left hand) station button. Both will remain depressed. Select the first station from the list you have made and tune in this station by means of the manual tuning knob.

**TURN THE MANUAL TUNING KNOB CAREFULLY BACK AND FORTH UNTIL THE ABOVE MENTIONED STATION IS ACCURATELY TUNED IN TO THE LOUDEST POINT.** This station is now set on button No. 1.

**CAUTION**—Do not touch this button again while the mechanism is unlocked as the setting may be altered.

Next **KEEP THE MANUAL TUNING BUTTON DEPRESSED WITH ONE HAND** and, with the other hand, depress the second station button **FIRMLY AND GENTLY**. Then proceed to set the second station on your list in the same manner as described above.

Then continue to set any additional stations on your list on the remaining buttons.

After all desired stations have been set, release any station button which is depressed as follows: **KEEP THE MANUAL TUNING BUTTON DEPRESSED WITH ONE HAND** and, with the other hand, push in the OFF button a slight amount—only enough to release any station button which is depressed. Should the OFF button be pushed all the way in to the depressed position, no harm will be done except that the dial will not be illuminated.

Turn the manual tuning knob so that the indicator moves toward the 1500 KC end of the dial, until the stop is reached.

**NOW LOCK THE TUNING MECHANISM** by inserting the SMALL HANDLE screwdriver, as shown in Fig. 1, in the locking screw opening. Turn the locking screw in a clockwise direction until it is tight. **DO NOT** tighten too much to avoid stripping the threads.

Intermediate Frequency - - - - - 456 KC.

Speaker - - - - - 6" P.M. Dynamic

Tuning Frequency Range - - - 540 to 1600 KC.

Sensitivity (For .05 Watt Output)

Table Model.....10.5 Microvolts Average  
Portable Model.....20 Microvolts Per Meter Average

JAN., 1939

Dummy Antennas—1 mf. and 200 mmf.  
NOTE—Connect a loop approximately one foot in diameter across the antenna and ground posts of the signal generator. Secure the back in place on the cabinet. Connections for the output meter may be made through the opening for the outside antenna and ground connecting posts. This opening is at the bottom of the cabinet near the back. Place radio approximately 3 feet from loop so as to pick up signal. Radio should not be in proximity to any metal (metal bench, etc.).  
CALIBRATION—To obtain dial scale calibration, tune in an 800 KC signal. The pointer should be at the 800 KC mark on the dial. If it is not, loosen the pointer screw, set the pointer at the 800 KC mark and retighten the pointer screw.

Volume Control—Maximum All Adjustments. Allow Chassis and Signal Generator to "Heat Up" for several Minutes

Tuner Data

FIG. 2—FRONT VIEW

FIG. 3

**PROCEDURE FOR SETTING THE AUTOMATIC TUNER LEVERS:**

**IMPORTANT**—Read carefully before setting the automatic levers.

There are six levers by means of which six stations may be selected. Make a list of local stations or stations you tune in regularly; any number up to and including six.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

On the front of each automatic tuner lever button an opening is provided for inserting the call letter tabs.

Insert the call letter tabs in the rectangular openings of each of the automatic tuner buttons. One of the small celluloid tabs supplied should be inserted into place over each of the station call letter tabs.

**NOW, PROCEED AS FOLLOWS:—**

1. Pull the dial tuning knob all the way out (See Illus. "B," Fig. 3), and rotate the tuning knob to the left (counterclockwise) until it cannot be turned any further (See Illus. "D," Fig. 3). This will unlock the automatic tuner mechanism. (NOTE:—Automatic tuner mechanism is locked TIGHT when radio is shipped from the factory.)
2. Press down all the way any one of the automatic tuner levers. Holding it down firmly, press in on the dial tuning knob No. 3 and tune in the station indicated on the station call letter tab on this lever. You will note that in order to tune the station, the dial tuning knob will have to be pressed in (See Illus. "E," Fig. 3). Turn the dial tuning knob very slowly back and forth (while still holding the automatic tuner lever in downward position), noting the width of the shadow on the screen of the cathode-ray tuning indicator. Minimum width on the tuning indicator indicates the ideal tuning position (resonance). The station will then be clearest and accurately tuned in.
3. Press down another automatic tuner lever. Holding it down firmly, press in on the dial tuning knob and carefully tune in the station indicated on the call letter tab on this lever.
4. Follow this procedure until you have selected all of your favorite stations.
5. Pull the dial tuning knob all the way out (See Illus. "B," Fig. 3) and rotate the tuning knob to the right (clockwise) until it cannot be turned any further (See Illus. "C," Fig. 3).

**TYPICAL TUNING DATA**

The procedure for setting the Automatic Levers is the same for all the above mentioned models. However, the number of Automatic Levers may differ.

This will lock the automatic tuner mechanism and the stations you have set up for automatic tuning will be locked in place. After you have locked the tuner mechanism, push the dial tuning knob in.

6. If you should desire to change any station you selected to another, pull the dial tuning knob all the way out and rotate the knob to the left (counterclockwise) and unlock the tuner mechanism. Select the new station as explained. (NOTE:—If the dial mechanism works hard when setting up a new station for one of the automatic tuner levers, it is due to the tuner mechanism not being unlocked all the way. Pull the dial tuning knob out all the way and rotate the knob to the left (counterclockwise) until it will turn no further. The dial mechanism should work freely with the tuner lever pressed down).

7. After you have selected the new station, pull the dial tuning knob all the way out and rotate the knob to the right (clockwise) to lock the tuner mechanism. Be sure the knob is turned until it will turn no further, then press the dial tuning knob in.

8. The automatic tuner levers are now set up for quick tuning. Press down the lever key and—YOUR FAVORITE STATION IS SELECTED!

The important steps to remember when setting up stations on the tuner levers for automatic tuning are:

1. To unlock the tuner mechanism pull the dial tuning knob all the way out. You may find it necessary to rotate the knob slightly when pulling it out to make certain that the gears mesh properly. Rotate the dial tuning knob to the left (counterclockwise) as far as it will turn without forcing.
2. To set a lever, press down all the way and hold in this position while tuning in by means of the dial tuning knob the station you want this lever to be tuned to. (NOTE:—you will notice that it will be necessary to keep pressing in on the dial tuning knob while tuning in the station as a spring tends to push the knob out.) Set all the levers in the same manner before locking the mechanism.
3. To lock the tuner mechanism pull the dial tuning knob all the way out. Rotate the dial tuning knob to the right as far as it will turn making certain that it is tight, but it is not necessary to use force.
4. After locking or unlocking the tuner mechanism always return the dial tuning knob to its normal position (pushed in).

**BATTERY CONNECTIONS:**  
Referring to Fig. 1, connect the battery cable to the storage battery in the following manner:  
(a) The storage battery should be located as far from the receiver as the battery cable will permit.  
(b) Connect the lead (containing the fuse receptacle) marked A negative (-) to the negative (-) post of the storage battery.  
(c) Connect the lead marked A positive (+) to the positive (+) post of the storage battery.

**FUSE:**  
In case of difficulty, the fuse contained in the metal fuse receptacle should be checked. A 4 ampere Type 3AG fuse (Part No. BE13179) should be used.

	600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 600 Kc.	Trimmer (C5) (See Fig. 4)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")
SHORT WAVE BAND	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 17 Mc.	Trimmer (C9) (See Fig. 4)	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Dial Set at 17 Mc.	Trimmer (C5) (See Fig. 4)	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 6 Mc.	Trimmer (C7) (See Fig. 4)	Short Wave Oscillator series pad	Adjust to maximum rock dial. (See note "A")

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

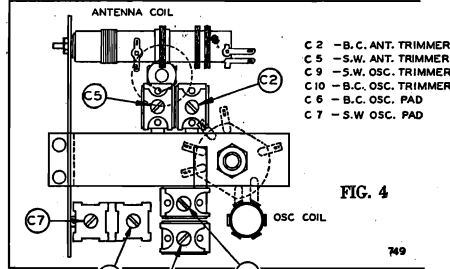

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each band is completed, repeat the procedure as a final check.

Power Consumption 2.8 Amperes at 6.3 Volts

Power Output 6 Watts Undistorted, 11 Watts Maximum

Intermediate Frequency 465 KC.

ALIGNMENT SOCKET VOLTAGE TRIMMERS

MODELS 62-651, 62-652 Series A

ALIGNMENT TRIMMERS

MODELS 62-750, 62-751

To remove the chassis from the cabinet, remove the four bolts which are used to fasten the chassis to the cabinet bottom; pull the knobs off their shafts and detach the pointer from the drive string (see Fig. 1, top view).

NOTE:—On the side of the string dial drum a calibrated scale is provided for aligning this chassis to the frequencies listed in the alignment procedure. Attach a pointer so that it will indicate proper dial setting in respect to the position of the variable condenser.

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna valve in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

- The following equipment is required for aligning.
- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—1 mf., 200 mmf. and 400 ohms.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 1D5G-P 2nd I. F.	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 1D5G-P 1st I. F.	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Intermediate I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 1C7G Mixer	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROADCAST BAND	1730 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Trimmer C8 (See Fig. 4)	Broadcast oscillator	Adjust to maximum output
	1500 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 1500 Kc.	Trimmer C2 (See Fig. 4)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 600 Kc.	Trimmer C11 (See Fig. 4)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")
SHORT WAVE BAND	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 17 Mc.	Trimmer C7 (See Fig. 4)	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 17 Mc.	Trimmer C5 (See Fig. 4)	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 6 Mc.	Trimmer C6 (See Fig. 4)	Short Wave oscillator series pad	Adjust to maximum rock dial. (See note "A")

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each band is completed, repeat the procedure as a final check.

### Inserting Vibrator Unit

**IMPORTANT**—The vibrator unit can be inserted in two ways. The proper method of insertion will depend on which terminal of the car battery is grounded. If the POSITIVE (+) terminal of the car battery is grounded, line up the + mark on the top of the vibrator with the arrow on the chassis base. If the NEGATIVE (-) terminal of the car battery is grounded, line up the - mark on the top of the vibrator with the arrow on the chassis base.

### Adjusting Antenna Trimmer

After the antenna is connected, tune in a weak signal at approximately 1000 KC with the volume control about three-fourths on. Turn the adjusting screw of the antenna trimmer (C2) up or down until maximum output is obtained. See Fig. 1 for location of this trimmer.

Alignment

MODELS 62-656, 62-1656, 62-2656  
Series A

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with 4 short heavy lead.
- Connect dummy antenna valve in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

- The following equipment is required for aligning.
- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
  - Output indicating meter.
  - Non-metallic screwdriver.
  - Dummy antennas—1 ml., and 200 mmf. and 400 ohms.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 1N5G 2nd I. F.	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 1N5G 1st I. F.	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Interstage I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 1A7G Mixer	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set dial at 17 Mc.	Trimmer C7 (See Fig. 4)	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set dial at 17 Mc.	Trimmer C5 (See Fig. 4)	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set dial at 6 Mc.	Trimmer C8 (See Fig. 4)	Short Wave oscillator series pad	Adjust to maximum rock dial. (See note "A")
BROAD-CAST BAND	1730 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Trimmer C9 (See Fig. 4)	Broadcast oscillator	Adjust to maximum output
	1400 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set dial at 1400 Kc.	Trimmer C4 (See Fig. 4)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set dial at 600 Kc.	Trimmer C10 (See Fig. 4)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")

BAND SWITCH	BAND	FREQUENCY RANGE
Extreme Right Rotation	Short Wave	5.6 to 18.1 MC.
Extreme Left Rotation	Broadcast	535 to 1730 KC.

Power Consumption— "A"—350 Ma., "B"—15 Ma.  
Power Output—200 Milliwatts Undistorted, 350 Milliwatts Maximum  
Intermediate Frequency—465 K.C.

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.  
Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.  
After each band is completed, repeat the procedure as a final check.

Connecting A Battery

First—Place the A Battery in the cabinet as shown.  
NEXT—Insert the special two-prong connector plug into the socket on the A batteries as shown in illustration.

Connecting B Batteries

First—Place both B Batteries in the cabinet exactly as shown.  
NEXT—Insert the special three-prong connector plugs into the sockets on the B batteries as shown in illustration.

NOTE: The above procedure and illustration pertains to the new style B batteries which have sockets; however, the old style B batteries which have terminals can be used by connecting them as follows.

FIRST—Remove the special plugs by cutting the wires off at the plugs.

NEXT—Connect gray colored B minus (—) wire to minus (—) terminal of battery on left side of receiver (marked Battery No. 1 in illustration).

NEXT—Connect one end of green connecting wire to plus (+45) terminal of battery No. 1 and other end to the minus (—) terminal of Battery No. 2.

NOW—Connect blue B plus (+) wire to the plus (+45) terminal of Battery No. 2.

MODELS 93BR-454A & 93BR-1455A

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 1A7G Tube	Rotor full open (Plates out of mesh)	Four trimmers on top (See Fig. 1)	Output and input I. F.	(See Note "A") Adjust to maximum output
BROAD-CAST BAND	1650 Kc.	200 mmf.	Grid of 1A7G Tube	Rotor full open (Plates out of mesh)	Trimmer (C3) front section of gang (See Fig. 4)	Oscillator	(See Note "A") Adjust to maximum output
	1400 Kc.		See Note "C"	Set Dial at 1400 Kc.	Trimmer (C2) rear section of gang (See Fig. 4)	Antenna	(See Note "B") Adjust to maximum output

NOTE "A" — A 1 megohm resistor must be connected between the two loop antenna leads from the chassis when aligning the I. F. transformers and setting the oscillator trimmer, (C3). The loop antenna must be disconnected from the chassis.  
NOTE "B" — Remove the 1 megohm resistor from the loop antenna leads; mount the chassis and the loop antenna in the cabinet, connect the loop antenna to the chassis. Adjust trimmer (C2). (See note "C")  
NOTE "C" — Lay the output lead from the signal generator in back of the loop antenna. Turn up the output of the generator, picking up the energy in the loop antenna without any electrical connection from the signal generator.

FREQUENCY RANGE  
545 to 1650 KC.

Power Output—200 Milliwatts Undistorted, 300 Milliwatts Maximum  
Intermediate Frequency—465 KC.

CHASSIS No. 93BR713A

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6SK7	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6SA7	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1730 Kc.	200 mmf.	Antenna lead	Broadcast	Rotor full open (Plates out of mesh)	Trimmer (C13) (See Fig. 4)	Broadcast oscillator	Adjust to maximum output
	1500 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 1500 Kc.	Trimmer (C7) (See Fig. 3)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 600 Kc.	Trimmer (C10) (See Fig. 3)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")
	465 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 600 Kc.	Trimmer (C1) (See Fig. 4)	I. F. Wave Trap	Adjust for minimum output
IMAGE ADJUSTMENT	2430 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 1500 Kc. on dial	Trimmer (C6) (See Figs. 1 and 4)	Image rejection	Adjust for minimum output (See note "B")
SHORT WAVE BAND	17 Mc.	400 ohms	Antenna lead	Short Wave	Set Dial at 17 Mc.	Trimmer (C12) (See Fig. 4)	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 ohms	Antenna lead	Short Wave	Dial Set at 17 Mc.	Trimmer (C8) (See Fig. 3)	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 ohms	Antenna lead	Short Wave	Set Dial at 6 Mc.	Trimmer (C11) (See Fig. 3)	Short Wave oscillator series pad	Adjust to maximum rock dial. (See note "A")

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

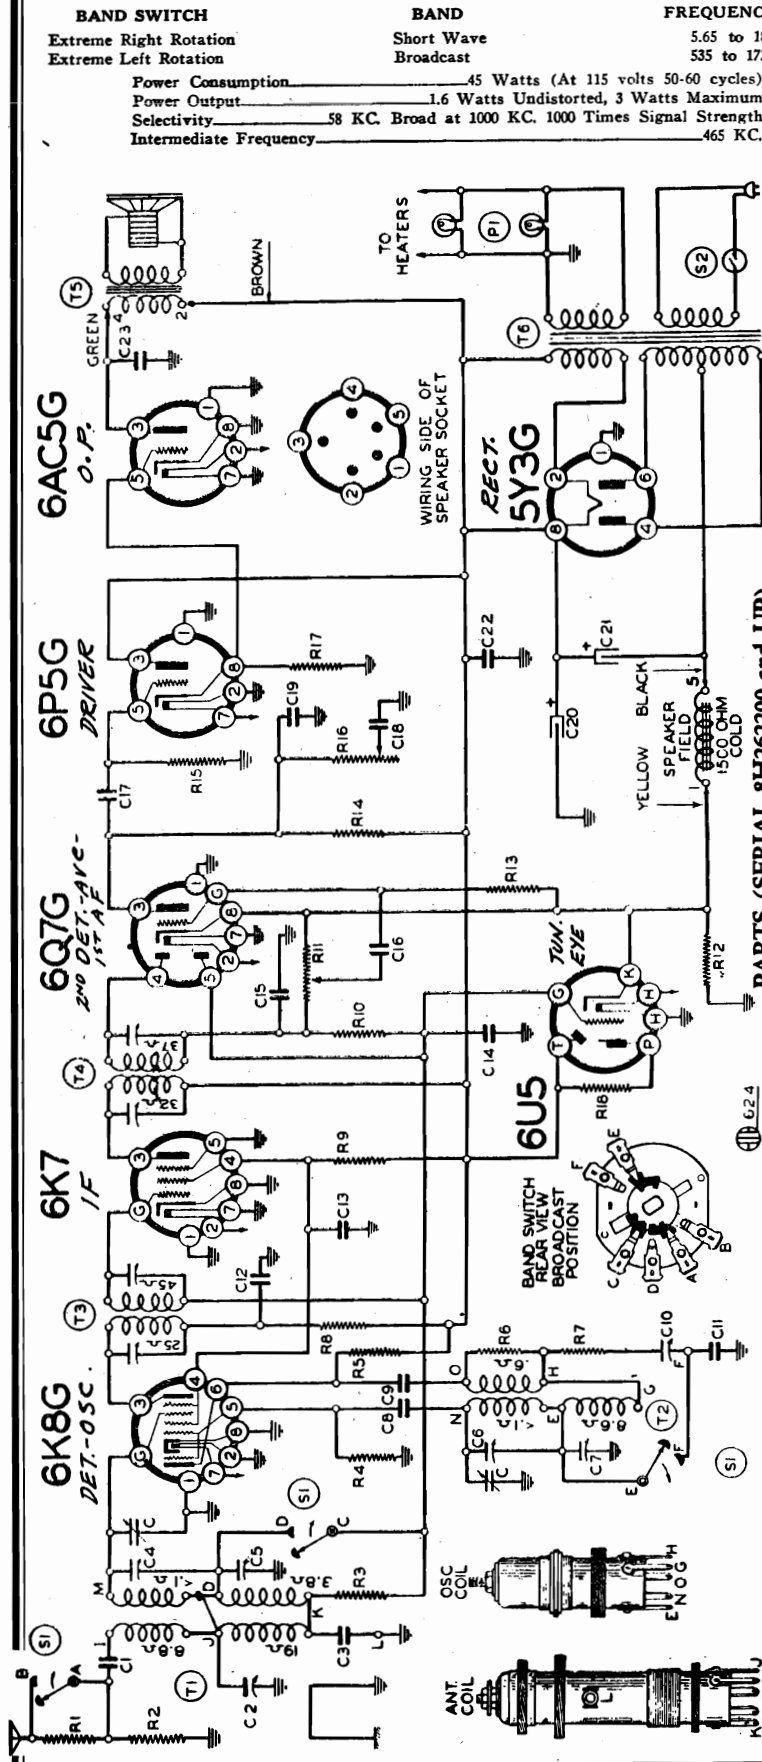

NOTE "B" 1500 KC. is the image frequency of 2430 KC. Adjust Trimmer (C6) until a minimum

output is obtained. Trimmer (C6) is mounted on the bottom of the chassis.  
Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.  
After each band is completed, repeat the procedure as a final check.

Alignment

MONTGOMERY WARD & CO.

MODEL 62-901  
Alignment, Trimmers  
Dial Data, Phono.

MODELS 62-702, 62-703 Series A Issue B

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna valve in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

- The following equipment is required for aligning:
- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
  - Output indicating meter.
  - Non-metallic screwdriver.
  - Dummy antennas—1 mf., 200 mmf. and 400 ohms.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6K7	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6K8	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 17 MC	Trimmer (C6) Top of Chassis (See Fig. 1)	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Dial Set at 17 MC	Trimmer (C4) (See Fig. 1)	Short Wave antenna	Adjust to maximum output
BROADCAST BAND	1720 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Trimmer (C7) (See Fig. 1)	Broadcast oscillator	Adjust to maximum output
	400 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 1400 Kc.	Trimmer (C5) (See Fig. 1)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 600 Kc.	Trimmer (C10) (See Fig. 1)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")
IMAGE REJECTION ADJUSTMENTS	2330 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 1400 kc. on dial	Trimmer (C2) (See Fig. 1)	Image rejection	Adjust for minimum output. (See note "B")

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

NOTE "B" 1400KC is the image frequency of 2330KC. Adjust Trimmer (C2) until a minimum output is obtained.

NOTE "C" Trimmer (C1) is preadjusted at factory and should not be tampered with.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC. After each range is completed, repeat the procedure as a final check.

MONTGOMERY WARD MODEL 62-901

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.  
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.  
Allow Chassis and Signal Generator to "Heat Up" for several minutes.  
IMPORTANT—Follow procedure in the order shown.

The following equipment is required for aligning:  
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.  
Output Indicating Meter—Non-Metallic Screwdriver.  
Dummy Antennas—1 mf., 200 mmf., and 400 ohms.

SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (Unless otherwise specified)
I. F. 456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	2nd I.F. (C16) & (C17) 1st I.F. (C14) & (C15)
WAVE TRAP 456 KC	Antenna Lead	200 mmf.	B Range	600 KC	Wave Trap (C5) Adjust for MINIMUM Output
RANGE B 1730 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C11)
1500 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1500 KC— See Note A	Ant. Range B (C3)
600 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C9) Rock Rotor—See Note B
RANGE D 18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C8)
15,000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Ant. Range D (C1) Rock Rotor—See Note B

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1500 KC on the dial, loosen the 2 clamps which hold the pointer assembly on the cord, move the pointer to the 1500 KC mark, and tighten the clamps.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

CAUTION—When aligning the short wave bands, be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

Fig. 4—Drive Cord Replacement

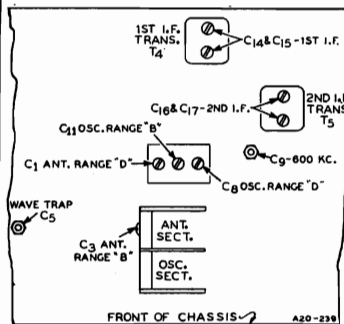

Fig. 2—Location of Trimmers

Drive Cord Replacement

Tie a knot with a small loop at one end of the new drive cord. Slide a 1 3/4 inch length of fabric tubing on the cord. Tie the free end of the drive cord to the tension spring. The distance between knots should be 48 1/2 inches.

Arrange to keep the gang condenser in the completely closed position.

Place the looped end of the drive cord over hook A on condenser drive drum B (See Fig. 4). Pass the cord through slot C in the drum rim and wind one turn in a clockwise direction (from front of chassis) on condenser drive drum. Pass drive cord over pulleys D and E as shown. See that the fabric tubing is now between pulleys D and E. Continue cord down to shaft F and wind 2 1/4 turns clockwise, progressing towards the chassis. Bring cord over pulley G to bottom of condenser drive drum B as shown. Wind drive cord clockwise (from front of chassis) around condenser drive drum B to slot C. See that the drive cord does not cross in groove of condenser drive drum. Pass the remaining drive cord and tension spring through slot C and secure the free end of the spring on hook A.

DIAL POINTER ATTACHMENT

—Tune in a station of known frequency. Move the pointer to this frequency on the dial scale. Clamp pointer tightly over the fabric tubing on the cord—See Fig. 4.

Phonograph Connections

Phonograph connections are made as shown in the schematic circuit diagram—Fig. 3. On the back panel of the chassis base is a round knockout 1-9/64 inches in diameter. An octal base socket is mounted in this knockout opening and wired as shown in the schematic.

A phono cable assembly may then be purchased (See parts list). On one end of this cable is an octal plug and on the other end is a phonograph-radio switch and double tip jack.

MODELS 62-752, 62-753  
Schematic, Voltage  
Socket, Trimmers, Notes

**Line Voltage Range**

The radio will operate satisfactorily within a line voltage range of 25 to 42 volts. If the line voltage is higher than 42, it will be necessary to use a series resistor to cut it down. If the voltage varies, a variable resistor may be required.

**Starting Current**

When first turned on for a few seconds the drain is slightly higher than normal until the tubes heat up. Some automatic plants are adjusted to start under a load of 200 to 300 watts. If a number of devices such as lights or motors are being used and the radio set is turned on the total drain may be sufficient to start the plant.

This radio is designed for use on farms and in those places where the power supply consists of a 32 volt direct current generating plant.

**Polarity of Power Supply**

There is a red mark on the plug at the end of the power supply cord of the radio. The prong of the plug at which the red mark is placed must be plugged into the positive side of the line.

**Caution**

If used on any other type of power supply than 32 volt DC, severe damage may be done to the receiver.  
Do not turn the radio on unless all of the tubes and the dial lamps are in the proper sockets. Use only No. 51 dial lamps.

**32 Volt Power Supply**

Power Consumption - 1.45 Amperes at 32 Volts DC Intermediate Frequency - - - - - 456 KC

EXTENSION

MODELS 62-752 and 62-753

**ALIGNMENT PROCEDURE**

The following equipment is required for aligning:  
 An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.  
 Output Indicating Meter--Non-Metallic Screwdriver.  
 Dummy Antennas--1 mf., 200 mmf., and 400 ohms.

SIGNAL GENERATOR FREQUENCY CONNECTION AT RADIO SETTING	DUMMY ANTENNA	BAND SWITCH	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I. F.	.1 mf.	B Range	Turn Rotor to Full Open	
<b>RANGE B</b>				
1790 KC	Antenna Lead	B Range	Turn Rotor to Full Open	Oscillator Range B (C12)
1500 KC	Antenna Lead	B Range	Turn Rotor to Max. Output Set Indicator to 1500 KC--See Note A	1st Ant. Range B (C2)
600 KC	Antenna Lead	B Range	Turn Rotor to Max. Output	800 KC (C11) Rock Rotor--See Note B
<b>RANGE D</b>				
18300 KC	Antenna Lead	D Range	Turn Rotor to Full Open	Oscillator Range D (C13)
15000 KC	Antenna Lead	D Range	Turn Rotor to Max. Output	Ant. Range D (C3) Rock Rotor--See Note B
6000 KC	Antenna Lead	D Range	Turn Rotor to Max. Output	6000 KC (C9) Rock Rotor--See Note B

NOTE A--If the pointer is not at 1500 KC on the dial, hold the drive cord and move the pointer to this mark.

NOTE B--Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

Dial Pointer Attachment-- Tune in a station of known frequency. Move the pointer to the approximate frequency on the dial scale. Pass the cord through the slotted head--See Fig. 4. Hold the drive cord and slide the pointer to the exact frequency on the dial scale.

CAUTION--When aligning the short wave band, be sure NOT to adjust at the image frequency. The signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is 25,000 KC, will be heard at 10,000 on the dial. If necessary to increase the input signal to hear the image.

**Drive Cord Replacement**

The knot with a small loop at one end of the new drive cord. Tie the free end of the drive cord to the tension spring. The distance between knots should be 4 3/4 inches.

Arrange to keep the gang condenser in the completely closed position.

Place the looped end of the drive cord over hook A on condenser drive drum B (See Fig. 4). Pass the cord through slot C in the drum rim and wind one turn in a clockwise direction (from front of chassis) on condenser drive drum B.

Pass drive cord over pulleys D and E as shown. Continue cord down to shaft F and wind 4 turns clockwise, progressing towards the chassis. Bring cord over pulley G to bottom of condenser drive drum B as shown. Wind drive cord clockwise (from front of chassis) around condenser drive drum B to slot C. See that the groove of condenser drive drum B to slot C. See that the groove of condenser drive drum B to slot C. See that the groove of condenser drive drum B to slot C.

Pass the remaining drive cord and tension spring through slot C and secure the free end of the spring on hook A.

"B" Issue Models

The issue letter is the last letter of the chassis number on the chassis number label.

In "B" issue models, the screen grid circuits of the 1st Detector and I.F. tubes are supplied through separate resistors as shown in the schematic.

If distortion is encountered at high signal levels in the "A" issue models, change the screen grid circuits of the 1st Detector and I.F. tubes according to the schematic.

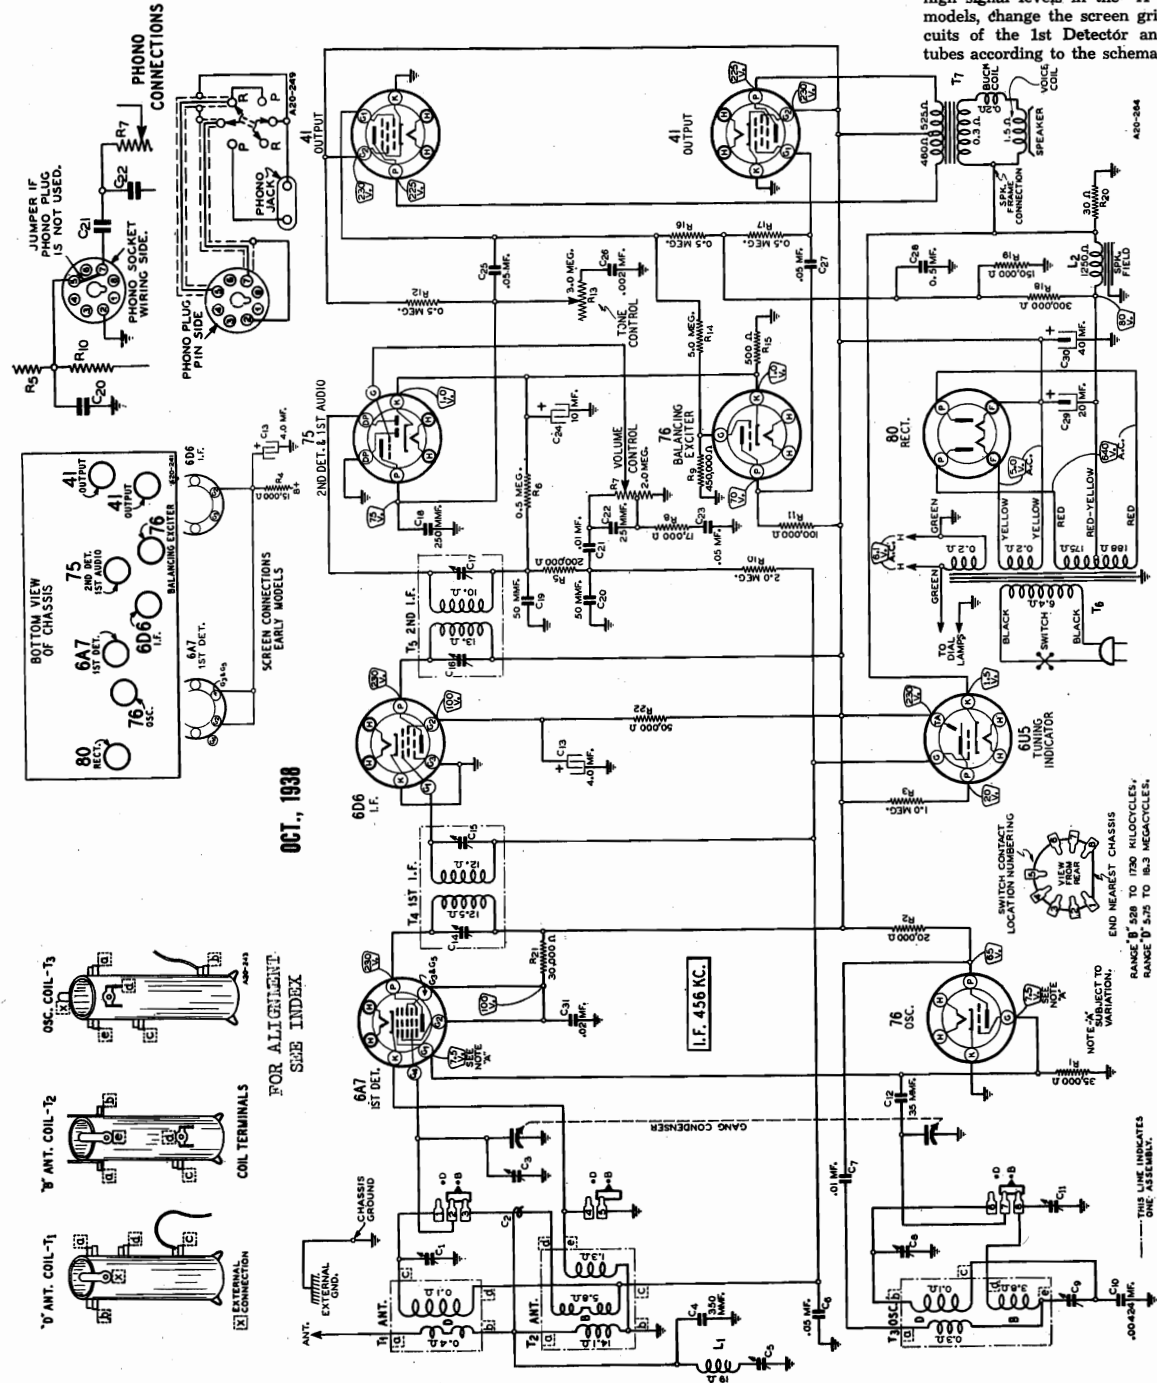

Fig. 3—Schematic Circuit Diagram

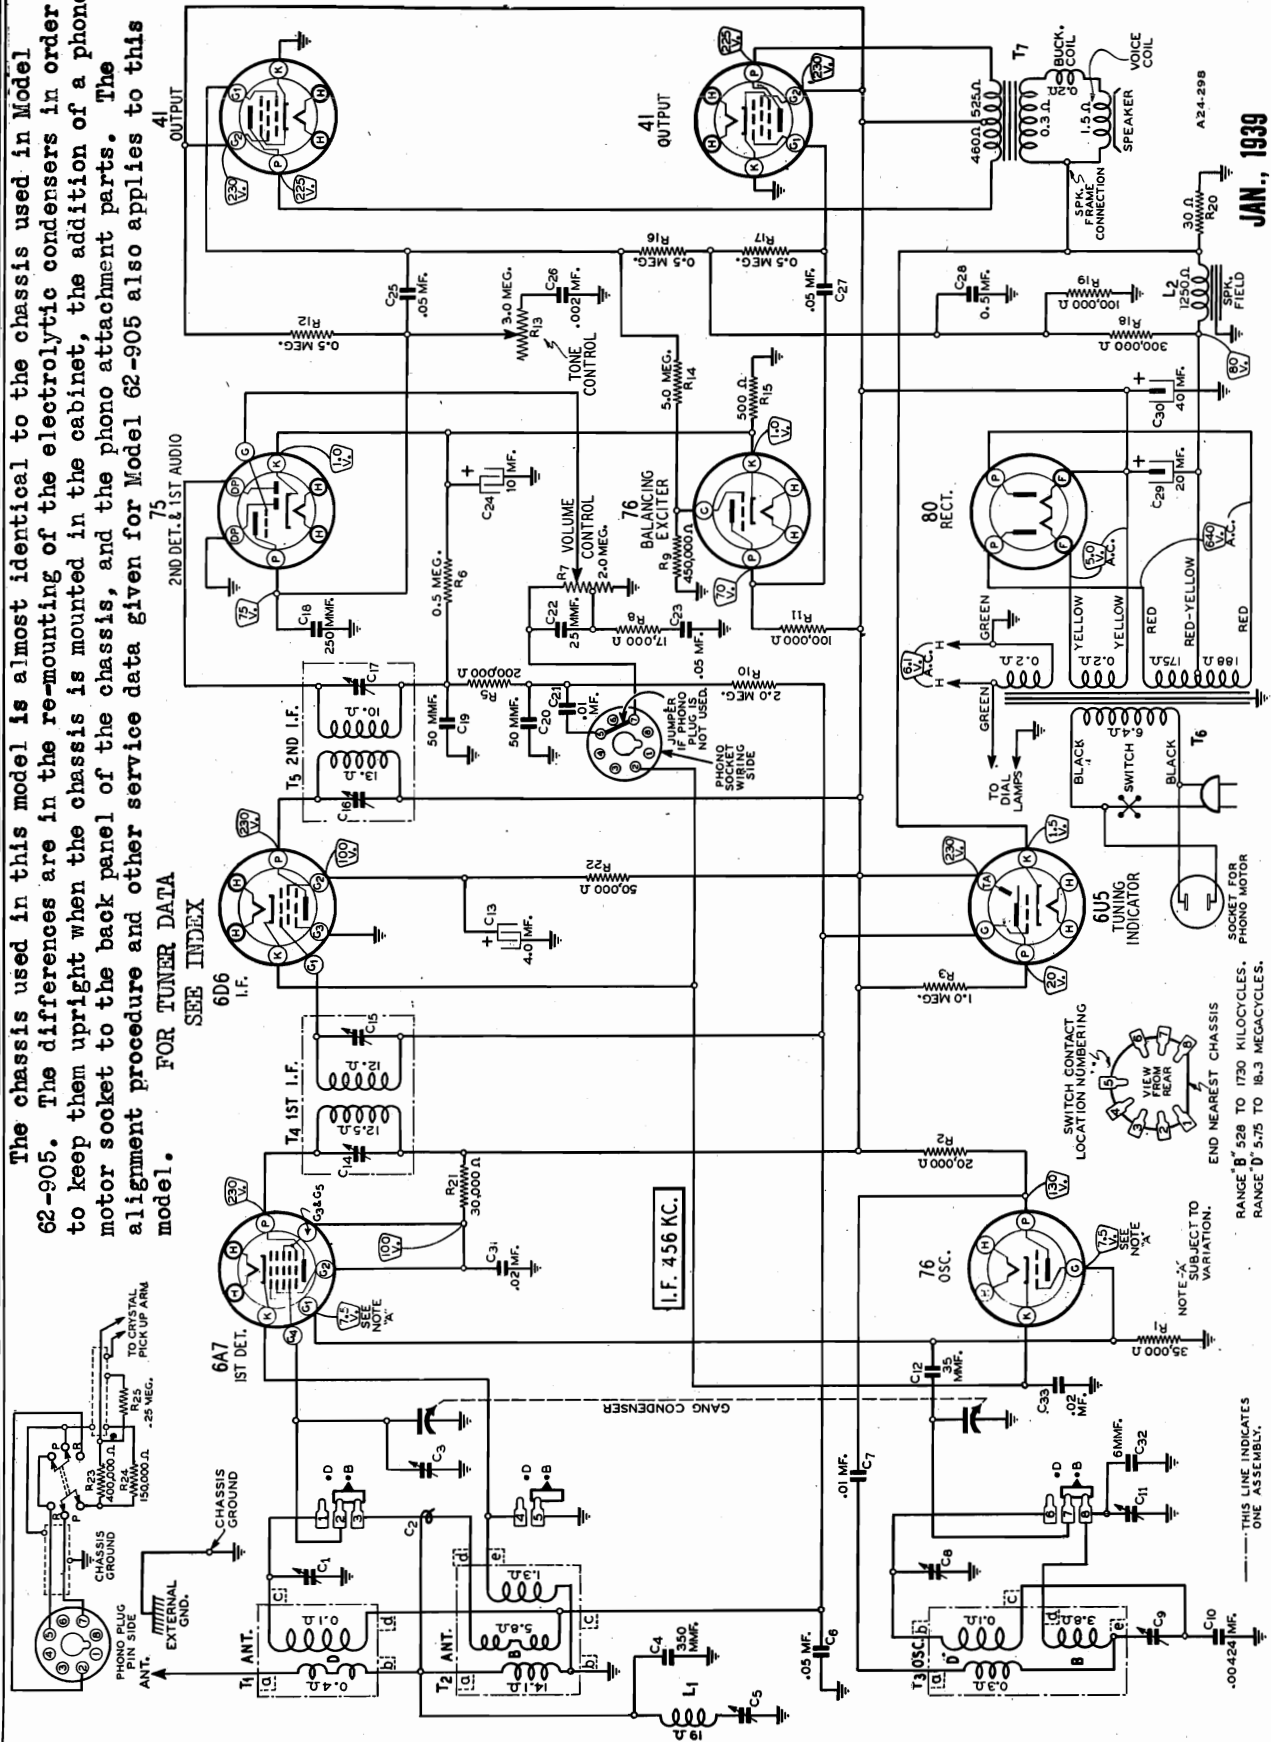

MODEL 62-902  
Schematic, Voltage  
Notes, Phono.

MONTGOMERY WARD & CO.

JAN., 1939

The chassis used in this model is almost identical to the chassis used in Model 62-905. The differences are in the re-mounting of the electrolytic condensers in order to keep them upright when the chassis is mounted in the cabinet, the addition of a phono motor socket to the back panel of the chassis, and the phono attachment parts. The alignment procedure and other service data given for Model 62-905 also applies to this model.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.  
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

IMPORTANT—Follow procedure in the order shown.

SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER OR DIAL SETTING	ADJUST TRIMMERS TO MAXIMUM (Unless otherwise specified)
I. F. 456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	2nd I.F. (C16) & (C17) 1st I.F. (C14) & (C15)
WAVE TRAP 456 KC	Antenna Lead	200 mmf.	B Range	600 KC	Wave Trap (C5) Adjust for MINIMUM Output
RANGE B				Turn Rotor to Full Closed Position. Pointer should be at low frequency end mark on scale—See Note A.	
1500 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor until dial pointer is at 1500 KC	Oscillator Range B (C11)
1500 KC	Antenna Lead	200 mmf.	B Range	Leave Rotor at above setting	Ant. Range B (C3)
600 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C9) Rock Rotor—See Note B
RANGE D					
18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C8)
15,000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Ant. Range D (C1) Rock Rotor—See Note B

NOTE A—The low frequency end mark is a small dot at the left side of the short wave scale under the "5." of the number 5.8 and to the right of the "C" of the letters MC. If the pointer is not at this mark on the dial, move the pointer to this mark.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

CAUTION—When aligning the short wave bands, be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

General Service Data

Drive Cord Replacement

Tie a knot with a small loop at one end of the new drive cord. Tie the other end to the tension spring, leaving a distance of 6 1/4 inches between the knots.

Turn the gang condenser to the full open position. Secure the free end of the spring over hook A—See Fig. 4. Turn the gang condenser to the completely closed position.

Pass the cord through slot B and, guiding the cord in the groove of the drive drum, turn the gang condenser to the full open position. Hook the cord in slot B and turn the gang condenser to the completely closed position. Unhook the cord from slot B and pass over pulleys C, D, and E as shown. Pass the cord in front of idler pulley F. Wind 2 1/2 turns counter-clockwise (from front of chassis)

around the drive shaft spool, progressing away from the chassis. Pass cord up and over the drive drum. Guiding the cord in the groove of the drive drum, turn the gang condenser to the full open position. If necessary, stretch the tension spring and pull the drive cord taut. Pass drive cord through slot B and secure the loop to the tension spring at point G.

EARLY MODELS—In the early models using a larger drive shaft spool (See Fig. 4), there should be a distance of 6 1/2 inches between the knots.

DIAL POINTER ATTACHMENT—Tune in a station of known frequency. Move the pointer to the approximate frequency on the dial scale. Pass the cord through the slotted head—See Fig. 4. Hold the drive cord and slide the pointer to the exact frequency on the dial scale

Rack and Pinion Assembly

If it is ever necessary to re-assemble the automatic tuning unit, proceed as follows: The pinion gear shaft should be held in such a position that the flat portion is vertical or turned slightly counter-clockwise from the vertical as shown in Fig. 5.

The lower rack should be meshed with the pinion gear so that the 8th tooth from the front on each side of the rack is in line with the axis of the pinion gear shaft—See Fig. 5. The upper rack should then be lined up with the lower rack and meshed with the pinion gear. The 8th tooth from the front on each side of the upper rack will then line up with the axis of the pinion gear shaft.

The rear and side brackets can then be mounted on the rack and pinion assembly.

REAR OF CHASSIS

The tube complement of this chassis consists of the following octal base glass and metal tube.  
The type and function of each tube is as follows.  
1—Type 12SA7 Mixer, First Detector-oscillator.  
1—Type 12SK7 I. F. Amplifier.  
1—Type 12Q7GT Second Detector, A.V.C. and First Audio.  
1—Type 35L6GT Beam Output Amplifier.  
1—Type 35Z5GT High Vacuum Rectifier.

 MODEL 93BR564A  
 Alignment

MONTGOMERY WARD & CO.

CHASSIS No. 93-BR-508A and 93-BR-509A

Power Consumption . . . . . 40 Watts  
 Power Output . . . . . 800 Milliwatts Undistorted  
 Sensitivity (for .05 Watts Output) - 250 Microvolts  
 Per Meter at 1000 KC.  
 (For Loop Antenna)

Selectivity - 70 KC Broad at 1000 Times Signal at 1000 KC  
 Tuning Frequency Range . . . . . 540 to 1650 KC  
 Intermediate Frequency . . . . . 465 KC  
 Speaker . . . . . 5 in. P. M. Dynamic

**ALIGNMENT PROCEDURE**

**IMPORTANT: See Aligning Instructions on Page 4.**

- Volume control—Maximum all adjustments.
- Connect B of radio chassis to ground post of signal generator through .1 Mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning.

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver
- Dummy antennas—1 Mfd.

BAND	SIGNAL GENERATOR Frequency Setting	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc. 465 Kc.	Grid of 12SK7 I. F. Tube Grid of 12SA7	Rotor full open (Plates out of mesh) Rotor full open (Plates out of mesh)	Two trimmers on top Two trimmers on top	I. F. Output I. F. Input	(See Note "A") Adjust to maximum output (See Note "A") Adjust to maximum output
BROAD-CAST BAND	1650 Kc. 1400 Kc.	Grid of 12SA7 (See Note "B" and "C")	Rotor full open (Plates out of mesh) Set dial at 1400 Kc.	Trimmer—Bottom of rear section of gang (See Bottom of Radio) Trimmer—Bottom of front section of gang (See Bottom of Radio)	Oscillator Antenna	(See Note "A") Adjust to maximum output (See Note "B") Adjust to maximum output

MODEL 93BR508A  
 " 93BR509A

**NOTE "A"**—A 200M ohm resistor must be connected between the two loop antenna leads from the chassis when aligning the I. F. transformers and setting the oscillator trimmer. The loop antenna must be disconnected from the chassis.  
**NOTE "B"**—Remove the 200M ohm resistor from the loop antenna leads; mount the chassis and the loop antenna on the chassis. Connect the loop antenna to the chassis. Adjust the antenna trimmer through hole in bottom of cabinet.  
**NOTE "C"**—Lay the output lead from the signal generator in back of the loop antenna. Turn up the output of the generator, picking up the energy in the loop antenna without any electrical connection from the signal generator.

**ALIGNMENT PROCEDURE**

Model No. 93BR-564A

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning.

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—1 mfd., 200 mmi.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc. 465 Kc.	.1 MFD. .1 MFD.	Grid of 6K7 I. F. Tube Grid of 6D8G	Rotor full open (Plates out of mesh) Rotor full open (Plates out of mesh)	Two trimmers on top Two trimmers on top	Output I. F. Input I. F.	Adjust to maximum output Adjust to maximum output
BROAD-CAST BAND	1750 Kc. 1400 Kc.	200 mmi. 200 mmi.	Antenna Lead Antenna Lead	Rotor full open (Plates out of mesh) Trimmer—Top of front section of gang (See Fig. 1) at 1400 Kc.	Trimmer—Top of rear section of gang (See Fig. 1) Trimmer—Top of front section of gang (See Fig. 1)	Broadcast Antenna Broadcast	Adjust to maximum output Adjust to maximum output

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each band is completed, repeat the procedure as a final check.

Power Consumption . . . . . 40 Watts (at 117 Volts 50/60 Cycles)  
 Power Output . . . . . 2.5 Amp. at 6.3 Volts  
 Sensitivity (for .05 Watts Output) . . . . . .6 Watts Undistorted  
 . . . . . 25 Microvolts Average

Selectivity - 45 KC Broad at 1000 Times Signal at 1000 KC  
 Tuning Frequency Range . . . . . 535 to 1735 KC  
 Intermediate Frequency . . . . . 465 KC  
 Speaker . . . . . 6 in. P. M. Dynamic
