Just what the Servicing Industry ordered!—

**RIDER'S
"Automatic
Record Changers
and Recorders"**

800,000 record changers are providing an important source of profit for the wide-awake service shops of the country and creating a need for adequate and ready reference data to speed up trouble shooting and repair. Rider anticipated this need and has prepared—just when you need it—a sturdily bound volume containing everything you need know on any automatic record changer or recorder coming to your shop.

Heretofore, the serviceman's prime interest has revolved around the invisible defects which accompany the operation of electrical devices. Mechanics in radio receivers was limited to a lesser degree. However, with the introduction of the automatic record changer, some knowledge of the development of motion by means of gears, levers and cams has be-

come necessary. Hence the birth of Automatic Record Changers and Recorders. Printed on 8½ x 11 paper, the same size as Rider Manuals, the book covers, by means of explanatory text, mechanical and electrical diagrams, all the information you must have to service these high cost instruments quickly and profitably.

CONTENTS

Chapter I—MOTORS AND DRIVES. D-C Motors. A-C Motors. Universal Motors. Maintenance of Motors. Commonplace Troubles. SPEED REGULATORS and REDUCTION DRIVES. Chapter II—RECORDERS AND PHONOGRAPHS. The Cutting Head. The Groove. Recording Needles. Pick-ups. Phonograph Needles. Chapter III—AUTOMATIC RECORD CHANGERS. Mechanisms. Troubles. Chapter IV—ANALYSIS OF RCA MODEL RP-152-C RECORD CHANGER. MANUFACTURERS' SERVICE DATA.

744 PAGES BOUND IN BUCKRAM \$6.00

SERVICING BY SIGNAL TRACING

Signal Tracing is destined to become the universally adopted method of locating defects in communication systems, no matter what the nature of the system—if it is a home broadcast receiver, auto-radio receiver, police receiver, commercial, marine, navy or army receiver. Every public address system, every centralized radio system comes within the capabilities of signal tracing. . . . Television receivers, facsimile receivers and other systems intended for special application can be serviced with equal ease. . . . Signal Tracing, founded upon the signal itself, is the most basic, most fundamental method of trouble shooting ever devised. . . . It is free of every limitation which in the past has

hindered speedy service operations. . . . You can't afford to be without this book. . . . We mean every word of this statement. . . . It is vital to your immediate welfare—to your future. . . . Get your copy today—NOW!

CONTENTS

Chapter I—Introduction to Signal Tracing. Chapter II—Amplifier Operation and The Signal. Chapter III—Diode Detector Tube Systems. Chapter IV—Multi-Element Detector Systems. Chapter V—Oscillator Tube Systems. Chapter VI—Mixer Tube Systems. Chapter VII—Control Circuits and Voltages. Chapter VIII—Coupling Devices. Chapter IX—The T-R-F Receiver. Chapter X—The Superheterodyne Receiver. Chapter XI—Television and Facsimile Receivers. Chapter XII—Public Address Systems. Chapter XIII—Localizing Defects by Signal Tracing. Chapter XIV—Signal Tracing in Receiver Design.

SPANISH EDITION . . . \$3.50

VACUUM TUBE VOLTMETERS

The vacuum-tube voltmeter has been rapidly forging to the front as a favorite tool of engineers, research workers and servicemen. By its proper use, dynamic measurements can be made under any and all conditions with a minimum of effort and time. Here is a book that is a perfect mine of information for everybody who wants to know all about these important instruments. Not only is the theory explained upon which the functioning of the different types of v-t voltmeters is based, but the practical applications of these instruments are completely described. Like nearly all types of voltmeters, multipliers and shunts are employed with vacuum-tube voltmeters to extend their ranges. These and their uses are explained, as is the calibration of the different types.

For those men who are interested in the construction of v-t voltmeters, adequate information will be found for v-t voltmeters were built in the author's laboratory, and constants are given for the components of many types, as well as a wealth of other useful data.

CONTENTS

Chapter I. Fundamentals of Vacuum-Tube Voltmeter. Chapter II. Diode Vacuum-Tube Voltmeters. Chapter III. Triode Vacuum-Tube Voltmeters. Chapter IV. Slide-Back Vacuum-Tube Voltmeters. Chapter V. Rectifier-Amplifier Vacuum-Tube Voltmeters. Chapter VI. Tuned Vacuum-Tube Voltmeters. Chapter VII. Audio-Frequency and Logarithmic Vacuum-Tube Voltmeters. Chapter VIII. Vacuum-Tube Voltmeters for D-C Voltage, Current, and Resistance Measurements. Chapter IX. Design and Construction of Vacuum-Tube Voltmeters. Chapter X. Calibration and Testing of V-T Voltmeters. Chapter XI. Applications of V-T Voltmeters. Bibliography.

180 PAGES . . . 111 ILLUSTRATIONS . . . \$2.00

MAKE SERVICING EASY

RIDER MANUALS

The greatest collection of servicing data ever assembled. No serviceman can anticipate the year, make and model of the next set that will come to his bench. For this reason you **must** have the volume of Rider Manuals that contains the servicing information on that particular set. Benefit from the **complete** servicing information that only Rider Manuals can give you: Data on alignment, I-F peaks, operating voltages, parts lists and parts values, voltage ratings of condensers,

wattage ratings of resistors, coil resistance data, and all the other information that is vital if you are to know exactly what the manufacturer put in that receiver. No more new receivers after April 22nd! The old sets will now come into the service shop. **So be prepared!**

ABRIDGED MANUAL

Volumes I-V

The servicing information you need to service the old receivers will be found in the Abridged Manual, Volumes I-V. It is a compilation of the most widely distributed receivers released after 1929 that formerly appeared in Volumes I-V.

As can be readily appreciated, it is by no means as complete as the original first five individual volumes; these contained a total of approximately 5000 pages, whereas the Abridged Volume contains 2000 pages.

In order to select the proper receivers for inclusion in the Abridged Manual, all the manufacturers who were responsible for the sale of the greatest number of sets between 1930 and 1935 were contacted, and information was obtained as to the most widely distributed receivers. The Abridged Manual was then compiled.

2,000 Pages Net Price \$12.50

- VOL. XIII. This newest Rider Manual covers the servicing data on receivers manufactured as late as March, 1942. Because of the curtailment of receiver manufacturing, every effort was made to include information on those receivers produced during the latter months of 1941 and the early months of 1942. This addition of Rider's Volume XIII makes available to the radio industry more than 18,000 pages of authentic servicing information.1672 pages, Net Price \$11.00
- VOL. XII. Covers receivers manufactured up to April 1941. . . . New arrangement provides for maximum number of sets. Clarified schematics give breakdowns of complicated r-f and a-f switching circuits. Also double spread pages for complicated diagrams and cumulative index for Volumes XI and XII.1,648 pages, Net Price \$11.00
- VOL. XI. Covers receivers manufactured up to June 1940. Includes vest pocket manual containing push-button frequency ranges of all automatically tuned receivers and other handy servicing data. Also double-spread pages and new How It Works section devoted to explanations of the electrical and mechanical operations of the more complicated 1940 receivers including television, facsimile, and frequency modulation.1,652 pages, Net Price \$11.00
- VOL. X. Complete information on receivers manufactured up to August, 1939. Also a special 64-page How It Works Section and double-spread pages for the complicated diagrams. Includes a separate 188-page index with lists of exactly what appears on every page in Volume X and all preceding volumes.1,664 pages, Net Price \$11.00
- VOL. IX. Contains installation and servicing instructions on 1889 models manufactured up to October, 1938. Also a special 36-page "How It Works" section and double-spread pages for the complicated diagrams1,672 pages, Net Price \$11.00
- VOL. VIII. Receivers manufactured up to October, 1937 will be found in this volume. Contains installation and servicing instructions on many types of intercommunication systems. Also a special 64-page "How It Works" section and double-spread pages for the complicated diagrams.1,650 pages, Net Price \$11.00
- VOL. VII. In this volume will be found sets manufactured up to October, 1936, together with data on older receivers hitherto unavailable. Data on more than 1,700 models—complete information.1,600 pages, Net Price \$11.00
- VOL. VI. In this volume will be found sets manufactured up to November, 1935, together with data on older receivers hitherto unavailable. Data on more than 950 models—complete information.1,240 pages, Net Price \$8.25
- VOL. V. In this volume will be found sets manufactured up to October, 1934, together with data on older models, hitherto unavailable. Data on more than 940 models are presented—not only electrical data, but information on the mechanical intricacies of the sets.1,200 pages, Net Price \$8.25
- VOL. IV. Receivers manufactured up to March, 1934, will be found in this volume. Herein will be found the more complicated superhets with QAVC, noise gates, duo-diode pentodes, automatic tone controls, and all the other new designs. A special 24-page section explains some of the more complicated sets1,060 pages, Net Price \$8.25
- VOL. III. The receivers produced between the middle of 1932 up to June, 1933, are included in Volume III. Herein will be found the early Superheterodyne receivers, which were introduced in this period.1,070 pages, Net Price \$8.25

Vol. I and Vol. II out of print—no longer available

RIDER'S MANUALS HAVE more schematics . . . more I.F. peaks . . . more alignment data . . . more circuit descriptions. . . . MORE EVERYTHING THAN ANY OTHER MANUALS.

FOR SPRING PUBLICATION

INSIDE THE VACUUM TUBE

A complete elementary explanation of vacuum tube fundamentals written especially for the man who wants to know how all types of vacuum tubes function. The electron viewpoint is used consistently throughout the book. The illustrations are of a new kind, greatly simplifying the understanding of tube behavior.

FREQUENCY MODULATION

The latest development in radio—**FREQUENCY MODULATION**—is on the air. More and more stations all over the country are making provision for “staticless” broadcasting and the number of F-M receivers on the market is increasing. . . . Here is your chance to get in at the start—Rider’s newest book explains the transmission and reception of frequency-modulated signals with especial attention given to the different types of f-m receivers now available—their adjustments and maintenance. . . . This is a “must” for every serviceman who has an eye on the future. . . . It is an investment that will pay real dividends!

CONTENTS

Chapter I. Frequency Modulation.—An introduction to the subject with comparisons drawn between the frequency-modulation and amplitude-modulation forms of transmission and reception. **Chapter II. What Happens at the Transmitter.**—A non-mathematical explanation of how frequency-modulated signals are broadcast, including a discussion of phase modulation. **Chapter III. What Happens in the Receiver.**—How the f-m signal progresses through the receiver and how it is affected by the limiter discriminate tubes. **Chapter IV. Wave Propagation and Service Areas.**—How the ultra-high frequency waves are used for f-m transmission and the area covered. **Chapter V. F-M Receiving Antennas.**—Explanations and data concerning the best types of antennas for the reception of f-m signals. **Chapter VI. Servicing F-M Receivers.**—Valuable instructions for the adjusting and maintenance of the receiver including numerous oscillograms that will guide you in your servicing problems.

136 PAGES TYPE SET FLEXIBLE CLOTH PROFUSELY ILLUSTRATED NET PRICE \$1.50

THE METER AT WORK

Here is a practical book for all who employ electric meters in radio and the allied electronic arts.

It is only through knowledge of the principles underlying the functioning of any piece of apparatus that a man can get the utmost use from it. To that end, it will be found that the subject matter of this book is treated from an entirely new angle, the theory upon which each meter is based is separate and distinct from any other type and complete in itself.

Inasmuch as some types of meters can do several jobs, the practical aspects of the meter are confined to the latter portion of the book. Thus, you can cover whichever phase of the subject you are interested in, and with the new construction of the book—the separation of text and illustrations—you will be able to obtain the information quickly and with the minimum of effort.

CONTENTS

I—General Considerations. II—Moving-Iron Meters. III—Moving-Coil Meters. IV—Electrodynamometer Meters. V—The Electrostatic Meter. VI—Thermal Meters. VII—Components of Meters. VIII—Characteristics of Meters. IX—Rectifiers and Thermocouples. X—Practical Applications of Meters.

152 Pages 138 Illustrations \$1.50

THE OSCILLATOR AT WORK

Do you get your money’s worth out of your present-day oscillator? Do you derive maximum utility from that unit? Do you know how to test your oscillator and establish if it is working properly? Would you know how to repair it if it went bad? Do you know how many different types of oscillators can be used in the servicing field?

Here is your opportunity to get the true facts about oscillators! Rider’s “The Oscillator at Work” is worth many times the price asked because it helps protect the investment you have made in oscillator equipment.

CONTENTS

I—How an oscillator works. II—Alternating Currents. III—Triode Oscillators. IV—Electron-Coupled Oscillators. V—Ultra-High Frequency Oscillators. VI—Negative-Resistance Oscillators. VII—Electro-Mechanical Oscillators. VIII—Relaxation Oscillators. IX—Superheterodyne Oscillators. X—R-F Signal Generators. XI—Audio-Frequency Oscillators. XII—Modulation of Oscillators. XIII—Wobblers. XIV—Adjustment of Transmitters. Bibliography.

256 Pages 167 Illustrations \$2.00

FOR SPRING PUBLICATION

A.C. CALCULATION CHARTS

146 charts 7" x 11" printed in two colors, covering all alternating current calculations from 10 cycles to 1000 megacycles. A tremendous time saver for all engineers and others who work on power, audio, supersonic, high frequency and ultra high frequency problems. Eliminates the slide rule.

THE CATHODE-RAY TUBE AT WORK

A new era in the servicing of radio receivers, public-address systems, transmitters, etc., is in the offing. It is the use of the cathode-ray tube and the progressive serviceman will prepare himself now for the change that is coming. The theory underlying the functioning of the cathode-ray tube and the circuits that accompany it receives full consideration in this book. The second half of the volume is devoted to specific and practical applications of commercial oscilloscopes to servicing and adjustment problems. Order your copy today!

to servicing and adjustment problems. Order your copy today!

CONTENTS

I—The Theory of the Tube. A complete explanation of the different types of cathode-ray tubes. How the spot is focussed and how the beam of electrons is deflected. II—Sweep Circuits. How and why the spot moves across the screen and forms the image. III—A-C Voltages on Both Sets of Plates. An explanation of the patterns formed on the cathode-ray tube screen when a.c. voltages are applied. IV—Commercial Cathode-Ray Oscillographs. A detailed description of the various cathode-ray oscillographs that are on the market. V—Practical Application of the Cathode-Ray Oscillograph. General directions for adjusting the cathode-ray oscillograph for all tests. VI—Alignment of Tuned Circuits. Understandable explanation of the theory of the frequency modulated oscillator and how it is used in testing with the cathode-ray oscillograph. VII—The A-F. Frequency Modulator. How overall a-f. response curves of audio units are developed and what they mean. VIII—Auto Radio Vibrator Testing. The connections for testing vibrators with the cathode-ray tube oscillograph. IX—Transmitter Adjustment. How the modulation of a wave is measured and the trapezoidal pattern is developed on the screen. X—Other Applications of the Cathode-Ray Oscillograph. Beat patterns, c-w. reception and detection.

338 Pages . . Profusely Illustrated . . Net Price \$3.00

SERVICING SUPERHETERODYNES

No other circuit in the radio field has undergone all the changes that have been incorporated in the superheterodyne. In order to service these receivers with profitable speed, you must be able to analyze the different portions of the circuit quickly and this is just what Rider tells you how to do in this book. Not only is the theory of all types of Superhets thoroughly covered, but actual servicing details are most complete. Many thousands of Servicemen are using "Servicing Superheterodynes" daily and are finding the investment one that paid dividends in increased profits.

CONTENTS

I—The Principles Underlying the Operation of the Superheterodyne Receiver. II—The Generation of and the Relation Between Harmonics. III—Explanation of the Different Types of Superheterodyne Circuits. IV—Function and Characteristics of Individual Parts of the Superheterodyne Receiver. V—Special Circuits and Tube Applications. VI—Troubles and Symptoms Encountered in Superheterodynes. VII—Application of Test Oscillators. VIII—Vibrator Units. Appendix—Intermediate Peak Frequencies of Commercial Receivers with Model Numbers.

288 Pages . . Profusely Illustrated . . Net Price \$1.00

Alternating Currents in Radio Receivers

Are you familiar with the different forms of alternating currents which are present in a radio receiver? When once you understand the basic facts relating to the cycle—frequency—sine waves—harmonics—complex waves—modulated waves—phase relations—you will have no trouble in understanding the servicing problems which involve these factors.

D.C. Voltage Distribution

Only a casual glance at the schematics of some of the 1939 multi-tube sets will convince you that the distribution of the D.C. voltage to the tube elements is complicated. The many different forms these systems take should be recognized at a glance and understood. You should know thoroughly how the value of resistance and wattage rating of each resistor is calculated and why.

96 Pages Each
Net Price 90c Each

Resonance and Alignment

Do you know what happens when you tune a circuit to resonance? In order to align a receiver, oscillator, or transformer properly, so that maximum efficiency is attained, you must be familiar with more than just the mechanical operation. Are you familiar with I.F., oscillator, R.F. and detector alignment for all types of circuits—single, double and triple tuned systems?

Automatic Volume Control

Automatic volume control has now become a standard feature of every well made receiver. Are you familiar with every type in use and can you recognize one system from another by examining the schematic? Do you know how various types of tubes are used in each circuit? Noise suppression systems, time delay circuits—audio-frequency volume expander systems and other such networks have greatly increased servicing problems.

HARD COVERS TYPE SET PROFUSELY ILLUSTRATED HANDY POCKET SIZE

SERVICING RECEIVERS BY MEANS OF RESISTANCE MEASUREMENT

Take the guesswork out of servicing by using an ohmmeter in your trouble shooting. This book tells you how to make and correctly interpret point to point resistance measurements. It will simplify your servicing problems and enable you to use the resistance data furnished in RIDER MANUALS to the best advantage. Now that more and more manufacturers are supplying resistance data, you need this book to speed up your servicing with greater accuracy. Let Rider show you how to use a modern servicing procedure on the complicated receivers—you will find in this book the usual Rider clarity of explanation of how theory is applied to practice.

203 Pages Net Price \$1.50

ALIGNING PHILCO RECEIVERS Two Volumes

Everything you need for aligning Philco receivers—I.F. peaks—adjustment frequencies—trimmer and padder locations—complete and detailed information for aligning every Philco model from 1929 to 1941. These two volumes, prepared with the cooperation of the engineering staff of the Philco Radio & Television Corp., are the authentic source of alignment information and the data are presented in a brand new way that makes alignment easier and quicker. You will find all the necessary data arranged so that every step in the alignment procedure is carried out in a definite systematic time-saving manner. The necessity for referring back and forth is eliminated completely in this radically new style of presenting alignment data.

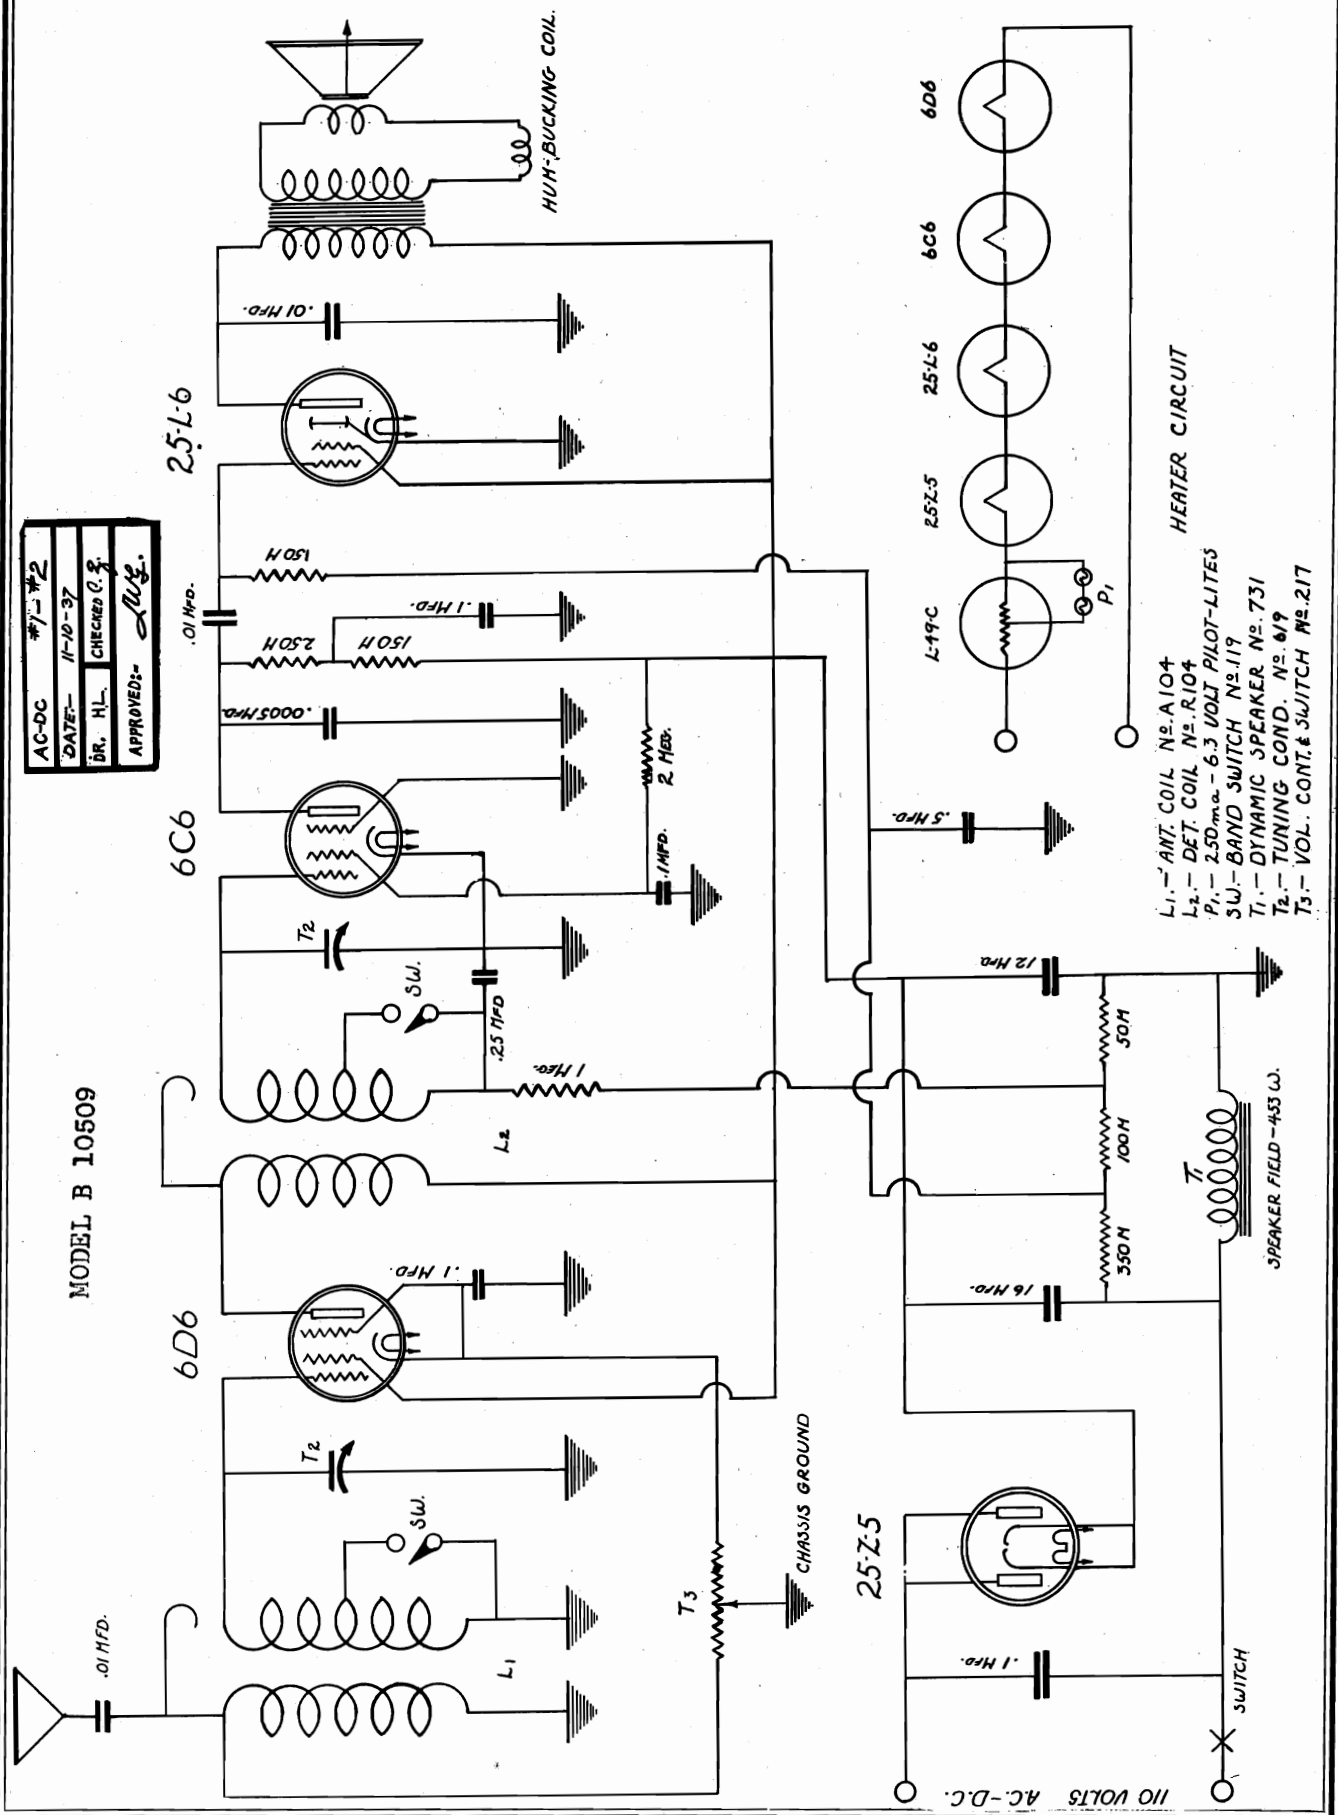

Vol. I — 1929 to 1936 — 176 pages — \$1.50
Vol. II — 1937 to 1941 — 200 pages — \$1.75

AUTOMATIC FREQUENCY CONTROL SYSTEMS

From the simplest type of A.F.C. circuit to the most complicated push pull control circuit . . . you will find them all clearly explained in Rider's book. The first part of the book is devoted to a review of the combination of D.C. voltages, the phase relations in inductive, capacitive, and transformer circuits, with particular reference to the manner in which these principles appear in A.F.C. circuits. The remaining chapters cover the operation of all types of discriminator circuits, the operation of the various types of control tube circuits, including the push-pull type, the reflected reactance type, and the mutual inductance type. Let Rider tell you all about A.F.C. in this up-to-the-minute book that combines theory and practice.

ALIGNMENT DATA

INTERMEDIATE FREQUENCY: Set oscillator to 465 KC. Feed this to the grid of the pentagrid (6A7) converter tube. Adjust trimmers on the intermediate frequency transformers for peak readings as indicated on the output meter which is to be placed across the output transformer.

BROADCAST BAND: Set the band switch for broadcast reception. Adjust oscillator to 1400 KC and connect the output of the generator to the antenna connection at the rear of the chassis through a .0002 mfd. mica condenser. Set the pointer on the dial to 1400 KC making sure that the volume control is set at its maximum position. Adjust the broadcast antenna and broadcast oscillator trimmers for maximum signal (as indicated on the output meter). Re-set the dial pointer on the receiver and on the test oscillator to 600 KC. Slowly increase or decrease the broadcast padding condenser while tuning back and forth across the signal with the station selector knob until the maximum reading is obtained on the output meter. Re-check the 1400 KC alignment as the adjustment at 600 KC may have slightly disturbed the original 1400 KC setting.

SHORT WAVE: Set band switch on short wave position. Connect the antenna of the radio receiver to the output of the test oscillator through a 400 ohm carbon resistor. Set oscillator and receiver dial at 15 megacycles. Adjust the short wave antenna and short wave oscillator trimming condensers for maximum output as indicated by readings on the output meter. No other adjustments are necessary for aligning this band.

It is advisable to check the sensitivity at 6000 KC to determine whether the circuits are properly aligned. Should the receiver lack sensitivity at this frequency check the .0035 mica condenser for short circuit.

©John F. Rider

- (e) Tune receiver dial and set test oscillator frequency to EXACTLY 1400 kilocycles. Adjust 1400 K.C. R.F. and antenna trimmers for maximum sensitivity.
- (f) Set test oscillator frequency and receiver dial to approximately 600 kilocycles. Then, while rocking gang condenser slightly to right and left, adjust 600 K.C. oscillator paddler for maximum signal response.

ALIGNING 1.69-5.6 MEGACYCLE BAND:

- (a) Replace .0025 Mfd. test oscillator antenna lead series condenser with a 400 ohm resistor.
- (b) Adjust band selector switch to 1.69-5.6 megacycles, tune receiver dial and set test oscillator frequency to EXACTLY 5.6 megacycles. Bring in 5.6 megacycle test signal to maximum output by adjusting 5.6 M. C. oscillator trimmer.
- (c) Tune receiver dial and test oscillator frequency to EXACTLY 5 Megacycles and adjust 5 M.C. antenna trimmer for maximum sensitivity.

ALIGNING 5.55-18.5 MEGACYCLE BAND:

- (a) Leave 400 ohm resistor in series with test oscillator lead and place band selector switch for operation on 5.55-18.5 megacycle band, tune receiver dial and set test oscillator frequency to EXACTLY 18.5 megacycles.
- (b) Adjust 18.5 M.C. oscillator trimmer to bring in 18.5 megacycle test signal to maximum output.

NOTE: When adjusting this trimmer two peaks, the fundamental and the image peak will be noticed. CARE MUST BE TAKEN THAT THE FUNDAMENTAL PEAK AND NOT THE IMAGE PEAK IS USED FOR ALIGNING THE RECEIVER AT 18.5 MEGACYCLES. Always back off the trimmer to minimum capacity, then screw down the trimmer (add capacity) until the FIRST peak which is the fundamental and the proper one to use is tuned in. If the trimmer is screwed down beyond the point where the first peak is received the incorrect image peak will be tuned in. After completing adjustment of the oscillator trimmer at 18.5 megacycles, always check to see if the proper peak has been used. To do this leave test oscillator frequency at 18.5 megacycles, increase the output of the test oscillator and tune receiver dial to approximately 17.5 megacycles. Then vary the receiver dial slightly to the right and left of 17.5 megacycles, and if the fundamental peak was used in aligning at 18.5 megacycles the test oscillator signal will be heard at approximately 17.5 megacycles on the receiver dial.

- (c) Tune receiver dial and set test oscillator frequency to EXACTLY 15 megacycles. Rock gang condenser slightly to right and left and adjust 15 M.C. antenna trimmer for maximum 15 megacycle test signal response.

To assure more accurate trimmer setting, repeat all above adjustments several times always using lowest possible test oscillator output consistent with readable output meter scale deflection.

- (c) Turn receiver on, place A.F.C. switch knob in left position and if meter needle jumps off scale adjust output of test oscillator until an approximate 2 M.A. deflection is obtained on the 0 to 5 milliammeter scale.
- (d) Place band selector switch for operation on 1720-540 K.C. broadcast band—and set receiver dial somewhere near 1000 kilocycles at a point where no station is heard.
- (e) Rotate A.F.C. switch knob from maximum left hand to middle position and note whether the milliammeter reading changes as the position of the A.F.C. switch is changed. No change in reading indicates probable proper discriminator trimmer adjustment, while a noticeable change indicates improper discriminator trimmer adjustment.
- (f) **IMPORTANT: DO NOT ADJUST DISCRIMINATOR TRIMMER UNLESS IT IS ABSOLUTELY NECESSARY.** Place A.F.C. switch in middle position and note milliammeter reading, then place A.F.C. switch in maximum left hand position. With A.F.C. switch in maximum left hand position, CAREFULLY ADJUST DISCRIMINATOR TRIMMER UNTIL MILLIAMMETER READING IS EXACTLY THE SAME IN BOTH POSITIONS.

NOTE: As the discriminator trimmer screw is screwed in (increasing capacity) the milliammeter reading should decrease and as the discriminator trimmer is unscrewed (decreasing capacity) the milliammeter reading should increase. IF WHEN ADJUSTING THE DISCRIMINATOR TRIMMER THE MILLIAMMETER READING DOES NOT SHARPLY INCREASE OR DECREASE AS THE TRIMMER IS ADJUSTED EVEN AFTER SEVERAL TURNS OF THE TRIMMER SCREW, THIS DOES NOT INDICATE PROPER BALANCING BUT DOES INDICATE INCORRECT ADJUSTMENT AND THE DISCRIMINATOR TRIMMER SHOULD BE SET TO ABOUT 1/2 CAPACITY AND THE ADJUSTMENT OF THE DISCRIMINATOR TRIMMER MADE ALL OVER AGAIN.

ALIGNING 1720-540 KILOCYCLE BAND:

- (a) Check tuning dial adjustment by turning gang condenser until plates touch maximum capacity stop (completely in mesh), at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If the dial needle does not point exactly at the last line, move needle to correct position.
- (b) Remove test oscillator lead from grid of 6A8 tube and connect to receiver "A" antenna post through a .0025 Mfd. condenser.
- (c) Place A.F.C. control knob in middle A.F.C. "off" position. Adjust band selector switch for operation on the 1720-540 kilocycle band.
- (d) Set test oscillator frequency and receiver dial to EXACTLY 1720 kilocycles, and BRING IN 1720 KILOCYCLE TEST OSCILLATOR SIGNAL TO MAXIMUM OUTPUT BY ADJUSTING 1720 KILOCYCLE OSCILLATOR TRIMMER.

BOTTOM VIEW OF CHASSIS

- (d) Remove shields held in position by snap fasteners over A.F.C. test jack and over trimmer screw holes in the first and second I.F. transformer shield cans.
- (e) Peak second I.F. transformer trimmers for maximum 465 kilocycle output by adjusting the two trimmers accessible through the two top holes in the second I.F. transformer shield can. DO NOT TOUCH DISCRIMINATOR (BOTTOM) SCREW.
- (f) Peak each of the first I.F. transformer trimmers for maximum 465 kilocycle signal output.

ALIGNING DISCRIMINATOR CIRCUIT:

- (a) Place switch underneath push button plate assembly (above gang condenser) in A.F.C. "on" position. Leave test oscillator set to EXACTLY 465 KILOCYCLES and connect to grid of 6A8 tube through a .02 Mfd. Condenser—insert lead of double scale 0 to 1 and 0 to 5 milliammeter into A.F.C. test jack located on top of chassis adjacent to the 6A7 tube. To avoid possibility of damaging the meter should one of the milliammeter leads short to the metal chassis, ALWAYS TURN OFF RECEIVER WHEN INSERTING OR REMOVING MILLIAMMETER LEADS FROM A.F.C. TEST JACK.
- (b) Short out A.F.C. mute switch by grounding the second from the left (looking at the front of the chassis) of the four lugs mounted on top of the dial assembly. The proper lug to ground is indicated in the "Note X" on chassis top parts view.

ALIGNING I.F. STAGE AT 465 KILOCYCLES:

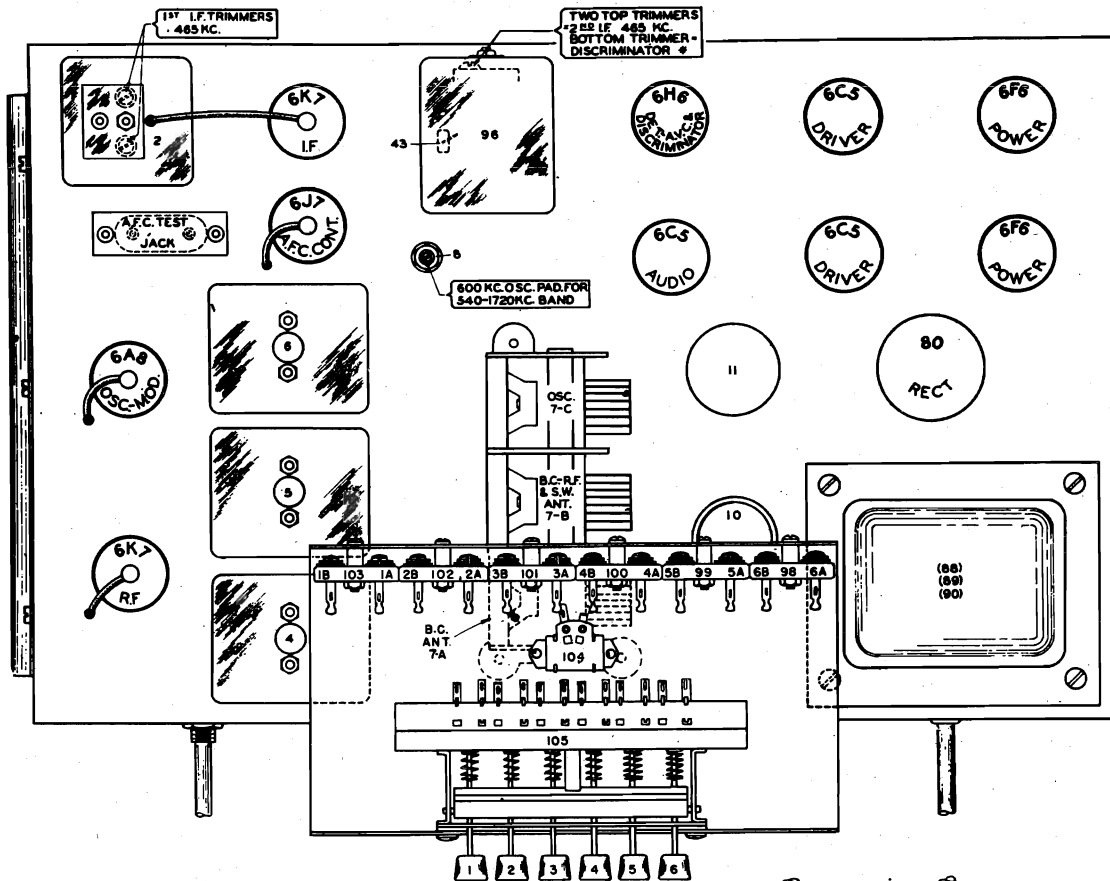

- (a) Place automatic frequency control knob in the middle A.F.C. "off" position.
- (b) Attach the ground lead of the test oscillator to the chassis. Connect the other lead to the grid cap of the 6A8 tube through a .02 Mfd. series condenser. DO NOT REMOVE GRID CLIP.
- (c) Set test oscillator to EXACTLY 465 kilocycles and turn volume control on full.

ALIGNMENT PROCEDURE:

SHOULD REALIGNMENT BE NECESSARY, THERE ARE SEVERAL PRECAUTIONS THAT MUST BE CAREFULLY OBSERVED, THESE ARE:

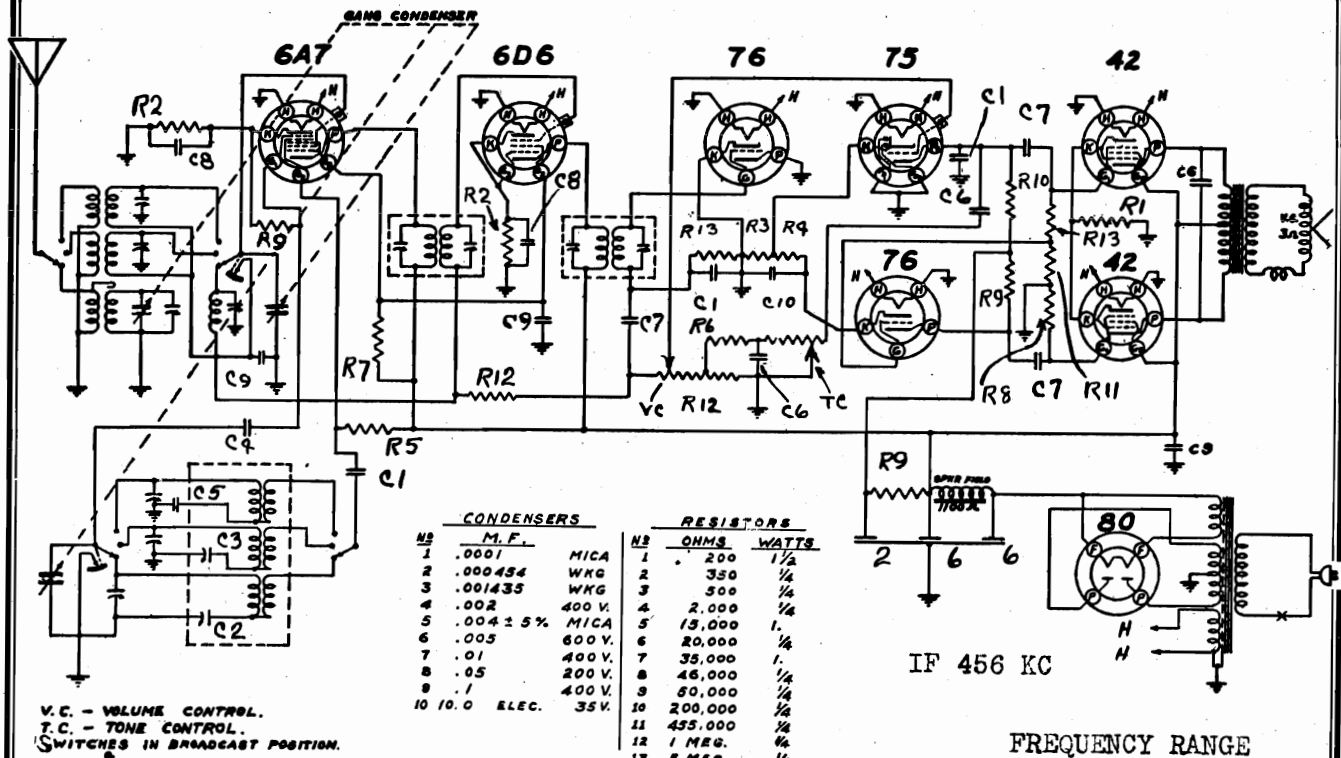

1. Do not align set until it has reached normal operating temperature. Place the receiver in operation at least 15 minutes before attempting to realign the set.
2. The importance of using the proper type of test equipment and FOLLOWING THE ALIGNMENT PROCEDURE EXACTLY AS GIVEN CANNOT BE TOO STRONGLY EMPHASIZED—failure to do so will result in low sensitivity, poor selectivity, incorrect dial calibration, distortion and unsatisfactory operation of the automatic frequency control.
3. It is absolutely necessary that an accurately calibrated test oscillator with some type of output measuring device and a double scale milliammeter—0 to 1 M.A. and 0 to 5 M.A. be used.

Eight Tube AC Superheterodyne

ALIGNMENT DATA AND SERVICING

GENERAL DATA

The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400, 1730, 1800, 4000, 5600, 6000, 16,000 and 18,100 KC and an output meter to be connected across the primary or secondary of the output transformers. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible, to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE

The intermediate frequency (I.F.) stage should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast Band should always be the next procedure; after which, either or both of the Short Wave Bands may be aligned.

I.F. ALIGNMENT

With the wave switch in the Broadcast Band and the gang condenser set at minimum. Adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (6A7) through a .05 or .1 mfd. condenser. The ground on the test oscillator can be connected to the chassis ground. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT

Connect the output of the signal generator to the antenna lead (blue) through a .0002 mfd. mica condenser. Set the gang condenser to minimum and the oscillator to 1730 KC and adjust the "oscillator trimmer" to receive this signal. Make no other adjustments at this frequency. Then set the generator to 1400 KC and tune in this signal by rotating the gang to 1400 on the dial. Adjust the "preselector" and "antenna" trimmer to maximum signal. Set the signal generator to 600 KC and tune in the signal on the receiver. **Note:** approximately the same sensitivity should be noted at this point as was at 1400 KC. The

signal strength may sometimes be improved by padding the circuits. This is done by slowly increasing or decreasing the circuit padding condenser and, at the same time, continuously tuning back and forth across the signal with the receiver until the maximum reading is obtained on the output meter. This adjustment may seem a little complicated but is the easiest way to adjust the oscillator to the preselector of the R.F. section. Return to 1400 KC and again go over the adjustments of this frequency to be certain that they were not put slightly out of alignment when adjustment was made at 600 KC.

POLICE BAND ALIGNMENT

The police band is adjusted by first replacing the .0002 dummy with a 400 ohm resistor and setting the generator to 5600 KC. With the gang set at minimum, adjust the "police oscillator trimmer" to receive this signal, then set the signal generator to 4000 KC and adjust "police antenna trimmer" to give maximum output. Next, set the oscillator to 1800 KC and "pad" the circuit of this frequency as described in the instructions for padding the broadcast circuits.

SHORT WAVE BAND ALIGNMENT

The short wave band is adjusted by setting the generator to 18,100 KC and with the gang at minimum, adjust the "short wave oscillator trimmer" to receive the signal. Set the generator at 16,000 KC, tune in the signal and adjust the "short wave antenna" trimmer to give maximum output. As there is no variable low frequency padding condenser on this band, the sensitivity of the receiver should be checked at 6000 KC to determine whether the circuits are in line at this frequency. Should the receiver lack sensitivity at 6000 KC, the antenna and oscillator coils, as well as the .004 mica padding condenser, should be tested for defects as sometimes these components become subject to mechanical or electrical injuries, despite their rugged construction and liberal ratings.

ALLIED RADIO CORP.

**PROCEDURE FOR SETTING TELEPHONE DIAL STATIONS
CHOOSING THE STATIONS TO BE USED**

The telephone dial has 10 buttons located in a ring within the dial scale. Make a list of 10 of your favorite stations, stations which are tuned in regularly. Shown in Fig. 1 is the approximate frequency

range that each button will cover. **Note:** If 2 stations happen to fall within the range of one button, one station will necessarily have to be tuned in with the selector knob.

PROCEDURE FOR ADJUSTING THE TELEPHONE DIAL BUTTONS

(1) Choose one of the stations out of the list of stations selected and by means of the station selector very carefully tune in this station, noting at the same time the exact pointer location on the dial.

(2) Now select the proper button for the first station chosen by referring to Fig. 1 and noting the button into whose range the station falls. For example, station WGN with a frequency of 720 KC comes under the button whose frequency ranges from 670 to 755 KC. Usually the button nearest the tuning point or the bottom of the dial will be the proper button.

(3) Loosen the button by unscrewing it (not the dial) 1/2 turn to the left. Now press the button in all the way and rock the dial back and forth a trifle until a click is heard. Do not release the button now but set the pointer to its former location and with the dial in this position, being careful not to move it, proceed to tighten the button by turning it in the opposite direction (to the right). Make sure the button is very securely tightened as it may get out of adjustment.

(4) From the station call sheet supplied remove the proper station disc and insert into the push button so that the wording is horizontal when the button is at the bottom, and then insert a clear celluloid insert. Follow this same procedure for the remaining buttons.

(5) If for any reason it is necessary to remove a station call letter disc, the use of a pen knife or any sharp pointed instrument will facilitate the removal.

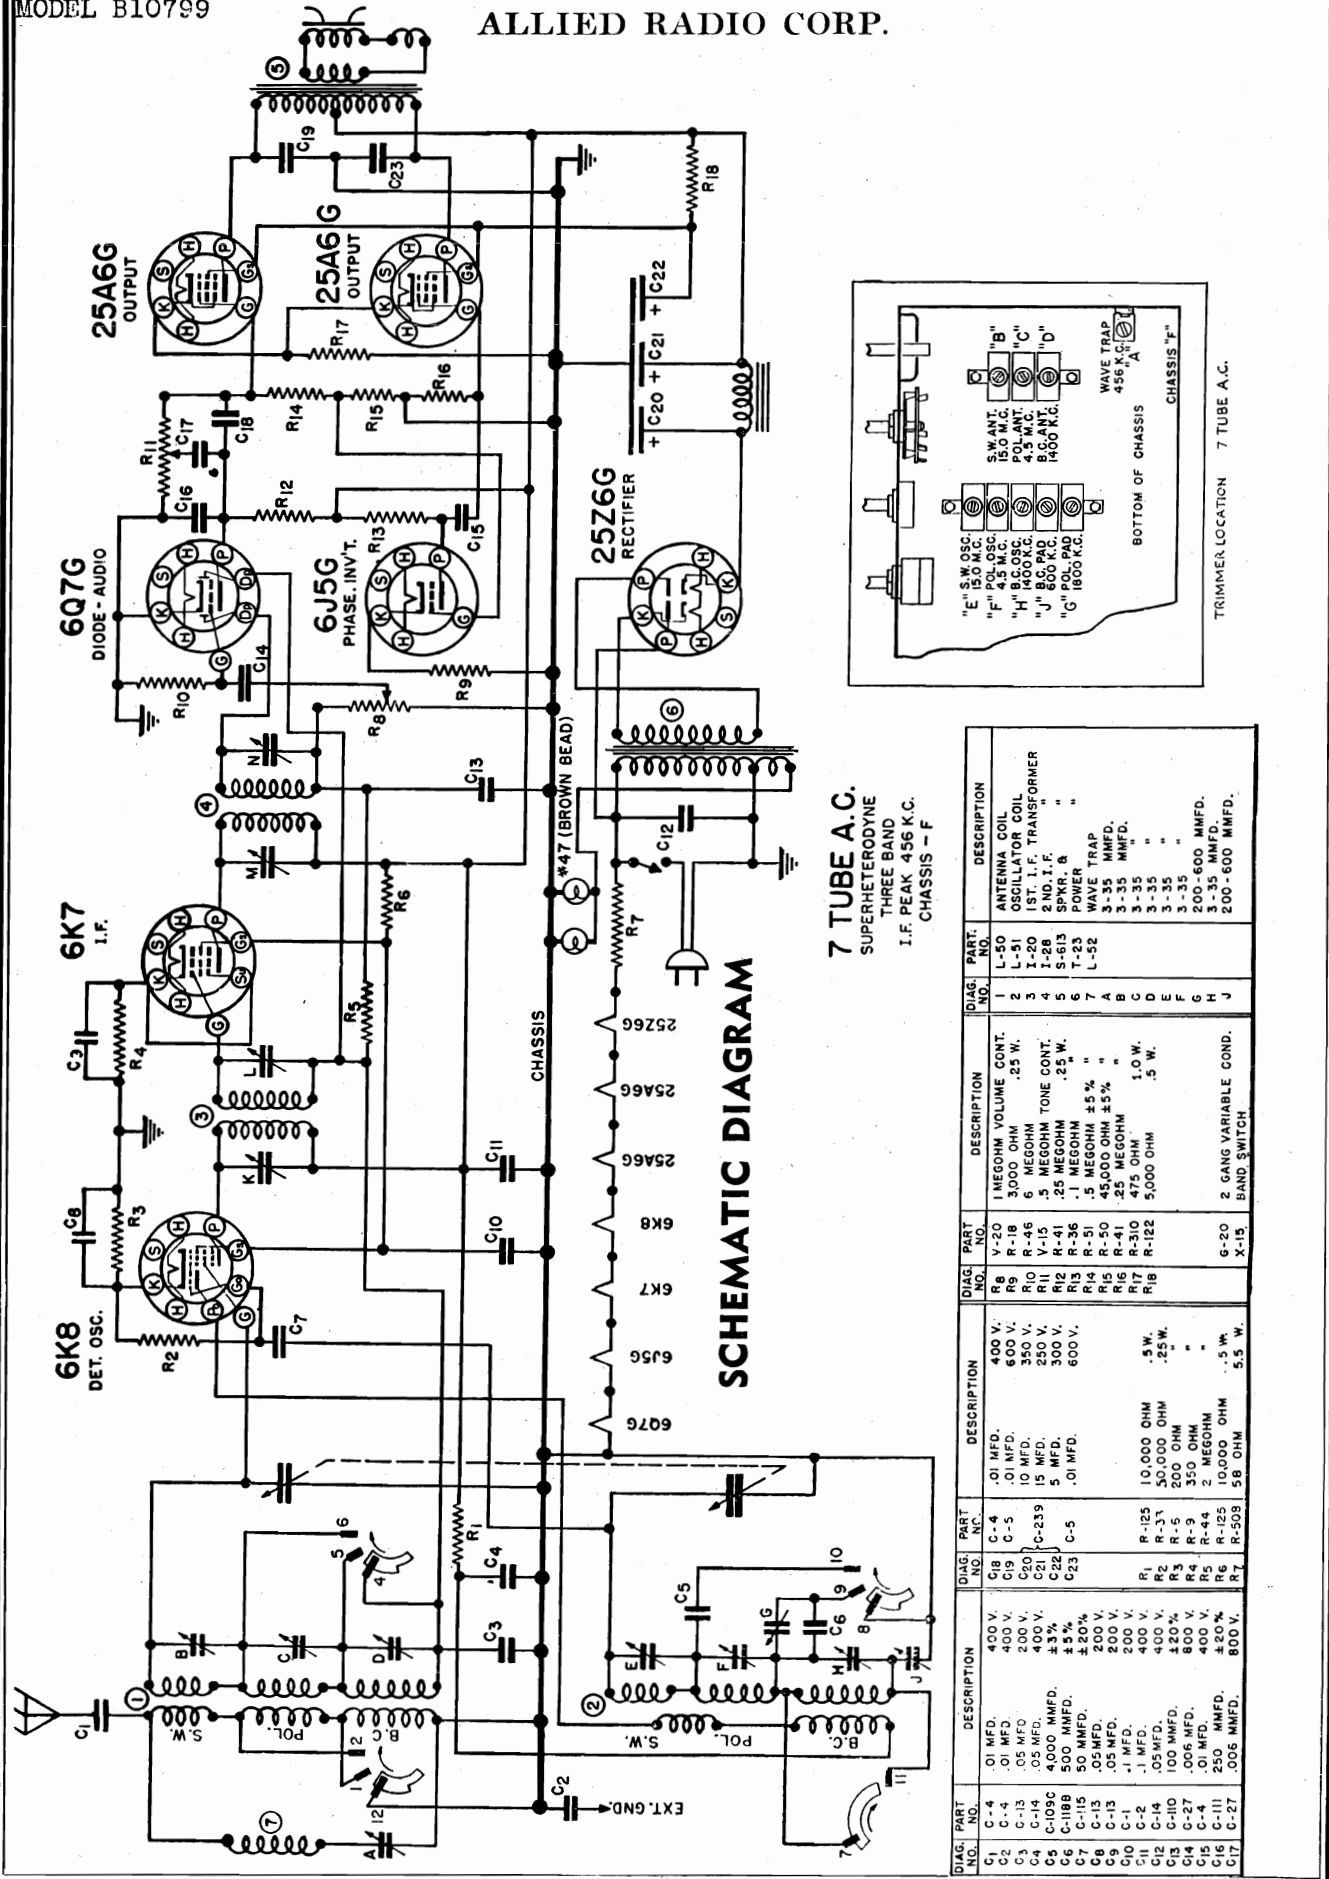

Figure 1

Press in the button of the station desired tuned and rotate the dial slowly until a click is heard and the dial will not turn in either direction until the button is released. The station is now tuned in and can be adjusted to the volume desired by means of the volume control. The proper direction of rotation of the dial can be determined by turning the dial in the direction which will not allow the wide space adjacent to the pointer to converge into the space at the bottom of the dial. See Fig. (1).

AUTOMATIC TUNING

ADJUSTMENT. All adjustments are simply made from the front of the cabinet without the use of tools since the push-button knobs serve this purpose.

To make adjustments, turn each knob to the left about 1 complete turn. The knob is knurled to provide a positive grip for this purpose. A groove is also provided across the knob for use of a small coin to lock each setting with ease and surety.

With the knob turned free, depress as far as possible and hold down, meanwhile tune to any desired station with the manual tuning control. At this point, the automatic push button knob should be turned to the right until securely tightened. Be sure the knob is being held down in position while it is being tightened. To assure accurate adjustment, the volume control should be set at a moderate level and the station tuned in slowly to a point of maximum volume and clarity. It is not necessary to follow any particular sequence of stations since each button is adjustable to any station.

ALIGNMENT DATA AND SERVICING

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400, 1800, 4500, 6000 and 15000 KC and an output meter to be connected across the primary or secondary of the output transformers. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the wave trap and then the Short Wave, Police and Broadcast bands in the order given, should be the next procedure.

I. F. AND WAVE TRAP ALIGNMENT. With the wave switch in the Broadcast Band and the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (6K8) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the chassis ground. Align all four I.F. trimmers to peak or maximum reading on the output meter. After aligning the I.F.'s, have the band switch in the broadcast band and the generator set at 456 KC. Connect the antenna lead to the generator through a 200 MMF condenser. Adjust the wave trap trimmer to give a minimum signal. It will be necessary to increase the output of the generator to secure an accurate minimum with the wave trap. (A)

SHORT WAVE BAND ALIGNMENT. Change the band switch to the S. W. position and connect the generator to the antenna with a 400 ohm dummy. Adjust the S. W. oscillator to give a maximum output with the dial at 1500 KC. Next adjust the S. W. antenna to give a maximum peak and check dial to prevent alignment on the image frequency. With a strong signal input turn the dial to approximately 1 M. C. lower in frequency and pick up the image frequency. If the image is not received, it will be necessary to return the dial to 15000 KC to reduce the capacity in the oscillator trimmer until a second signal is received. Proceed as before with the alignment of the antenna and recheck for image frequency. Check the sensitivity at 6000 KC to determine if the coils and mica pad are not defective.

POLICE BAND ALIGNMENT. Change the band switch to the police position and, with the same dummy antenna, line up the police oscillator trimmer and police antenna trimmer in the same way as for the short wave band, setting the dial at 4500 KC and the generator at the same frequency. Check for image frequency at approximately 1 MC lower on the dial as described for the short wave band. Next, set the generator at 1800 KC and tune in the signal with the dial. Adjust the police pad by rocking the gang back and forth while adjusting the pad until maximum output is obtained. Recheck the adjustment at 4500 KC as the pad adjustment may have caused misalignment.

BROADCAST BAND ALIGNMENT. With the switch turned to the broadcast position, connect the antenna to the generator through a 200 MMF dummy and set the dial and generator at 1400 KC. Align the BC oscillator trimmer and BC antenna trimmer. Set the generator at 600 KC and adjust the BC pad as described for the police band. Return to 1400 KC and recheck alignment at this point.

I.F. ALIGNMENT

With the wave switch in the broadcast band and the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output of test oscillator or signal generator to the grid of the first detector tube (6A8G) through a .05 or .1 mfd. condenser. The ground on the test oscillator can be connected to the chassis ground. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT

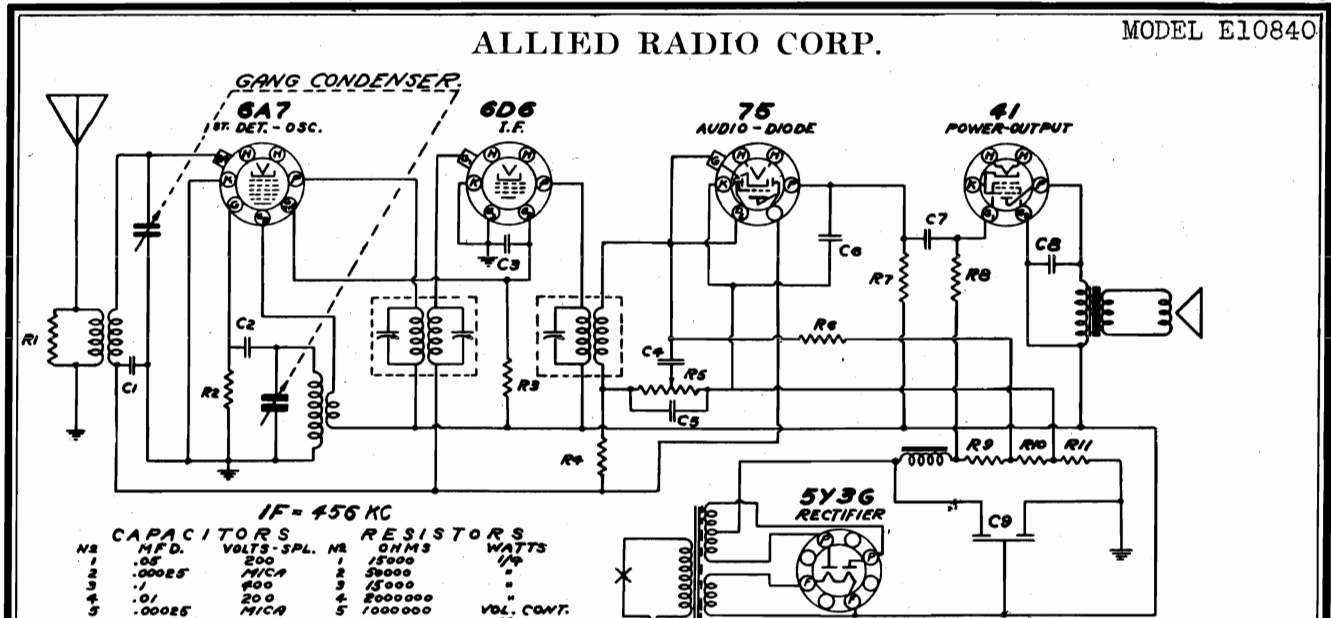

Connect the output of the signal generator to the antenna lead (blue) through a .0002 mfd. mica condenser. Set the gang condenser to minimum and the oscillator to 1730 KC and adjust the Broadcast "oscillator trimmer" to receive this signal. Make no other adjustments at this frequency. Then set the generator to 1400 KC and tune in this signal by rotating the gang to 1400 on the dial. Adjust the Broadcast "antenna" trimmer to a maximum signal. Set the signal generator to 600 KC and tune in the signal

on the receiver. Note: Approximately the same sensitivity should be noted at this point as was at 1400 KC. The signal strength may sometimes be improved by padding the circuits. This is done by slowly increasing or decreasing the oscillator padding condenser and, at the same time, continuously tuning back and forth across the signal with the receiver until the maximum reading is obtained on the output meter. This adjustment may seem a little complicated but is the easiest way to adjust the oscillator to the antenna. Return to 1400 KC and again go over the adjustments of this frequency to be certain that they were not put slightly out of alignment when adjustment was made at 600 KC.

SHORT WAVE BAND ALIGNMENT

The short wave band is adjusted by setting the generator to 16,000 KC and tuning in the signal. Adjust the "short wave antenna" to give maximum output. As there is no variable low frequency padding condenser on this band, the sensitivity of the receiver should be checked at 6000 KC to determine whether the circuits are in line at this frequency. Should the receiver lack sensitivity at 6000 KC, the antenna and oscillator coils, as well as the .004 mica padding condenser, should be tested for defects as sometimes these components become subject to mechanical or electrical injuries, despite their rugged construction and liberal ratings.

 - P2393 Antenna Coil

CORRECT ALIGNMENT PROCEDURE

The intermediate frequency (I.F.) stage should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast Band alignment should be the next procedure.

I.F. ALIGNMENT

Adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (6A7) through a .05 or .1 mfd. condenser. The ground on the test oscillator can be connected to the chassis ground. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT

Adjust the oscillator to 1730 KC and connect the output to the antenna lead (Blue) through a .0002 mfd. mica condenser. Set the gang condenser to minimum capacity and adjust the gang condenser trimmer (oscillator) to receive this signal. After this has been carefully done, the next step is to set the generator to 1400 KC and after tuning in the signal adjust the antenna trimmer to peak. This is all that is necessary for the alignment unless the plates of the gang condenser have been bent out of shape. In case of bent plates, set the test oscillator and the receiver to 600 KC and bend the plates into the position for maximum output.

PROCEDURE FOR SETTING UP AND OPERATING AUTOMATIC PUSH BUTTONS

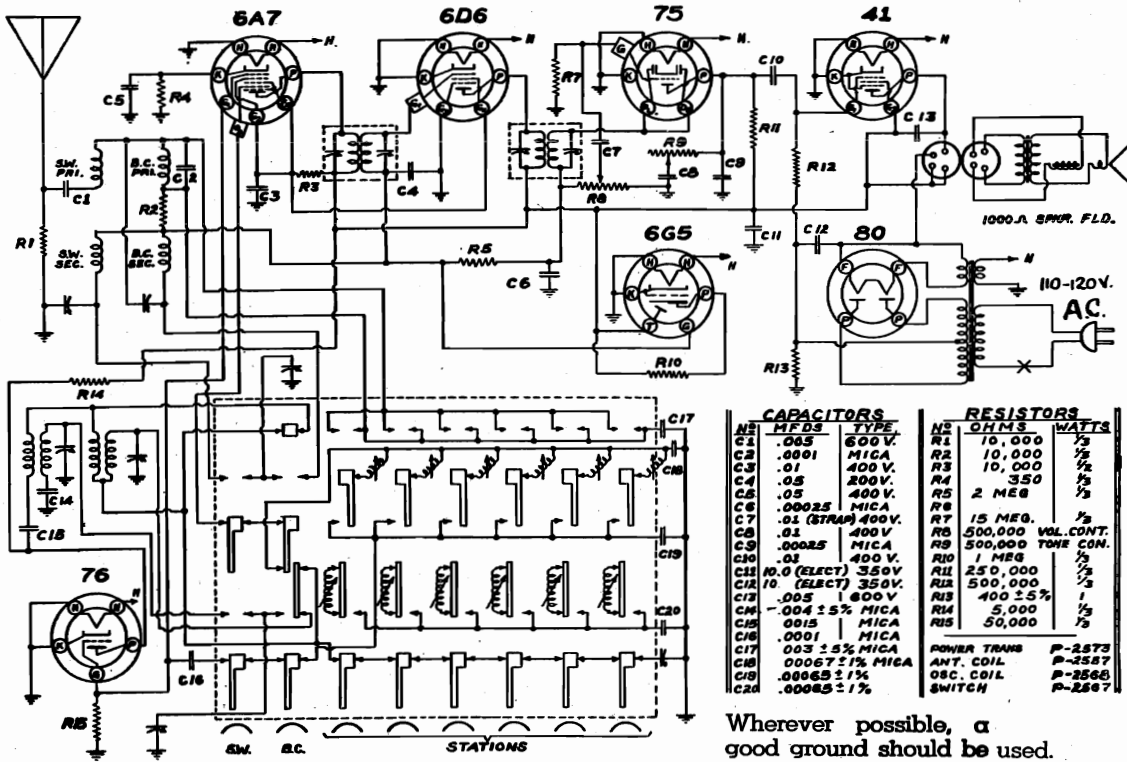

Select four strong local stations tuned in regularly. Now loosen **Locking Screw** (see chassis layout) several turns with a coin or a screw driver and **press** in any one of the four push buttons. Holding the button down, tune in any one of four selected stations by rotating the tuning knob (side knob) slowly back and forth until the signal is cleared.

Release the push button and press in another button and hold down, tuning in another favorite station with tuning knob. Follow the same procedure for the remaining stations. Now hold tuning knob (side knob) securely and with coin or screw driver, tighten locking screw. This screw holds all stations in adjustment.

In order to change any station already set up, to another, hold tuning knob securely, loosen locking screw and select the new station as explained above. Tear the correct station call letter tabs from the set of sheets supplied and push them into rectangular windows above each push button.

The automatic push button dial is now set up for quick tuning.

IF PEAK
456 KC

This receiver is designed to operate over two tuning ranges; the broadcast range which extends from 545 to 1720 kc (174.4 to 550.4 meters) and the international short wave band which extends from 5800 to 18,100 kc (16.5 to 51.7 meters). This latter range is the one which includes the 5 internationally assigned bands—the 16, 19, 25, 31 and 49 meter bands.

Wherever possible, a good ground should be used.

CONVENTIONAL ALIGNMENT, SEE SPECIAL SECTION, VOL. VIII.

PROCEDURE FOR SETTING UP AUTOMATIC PUSH BUTTONS

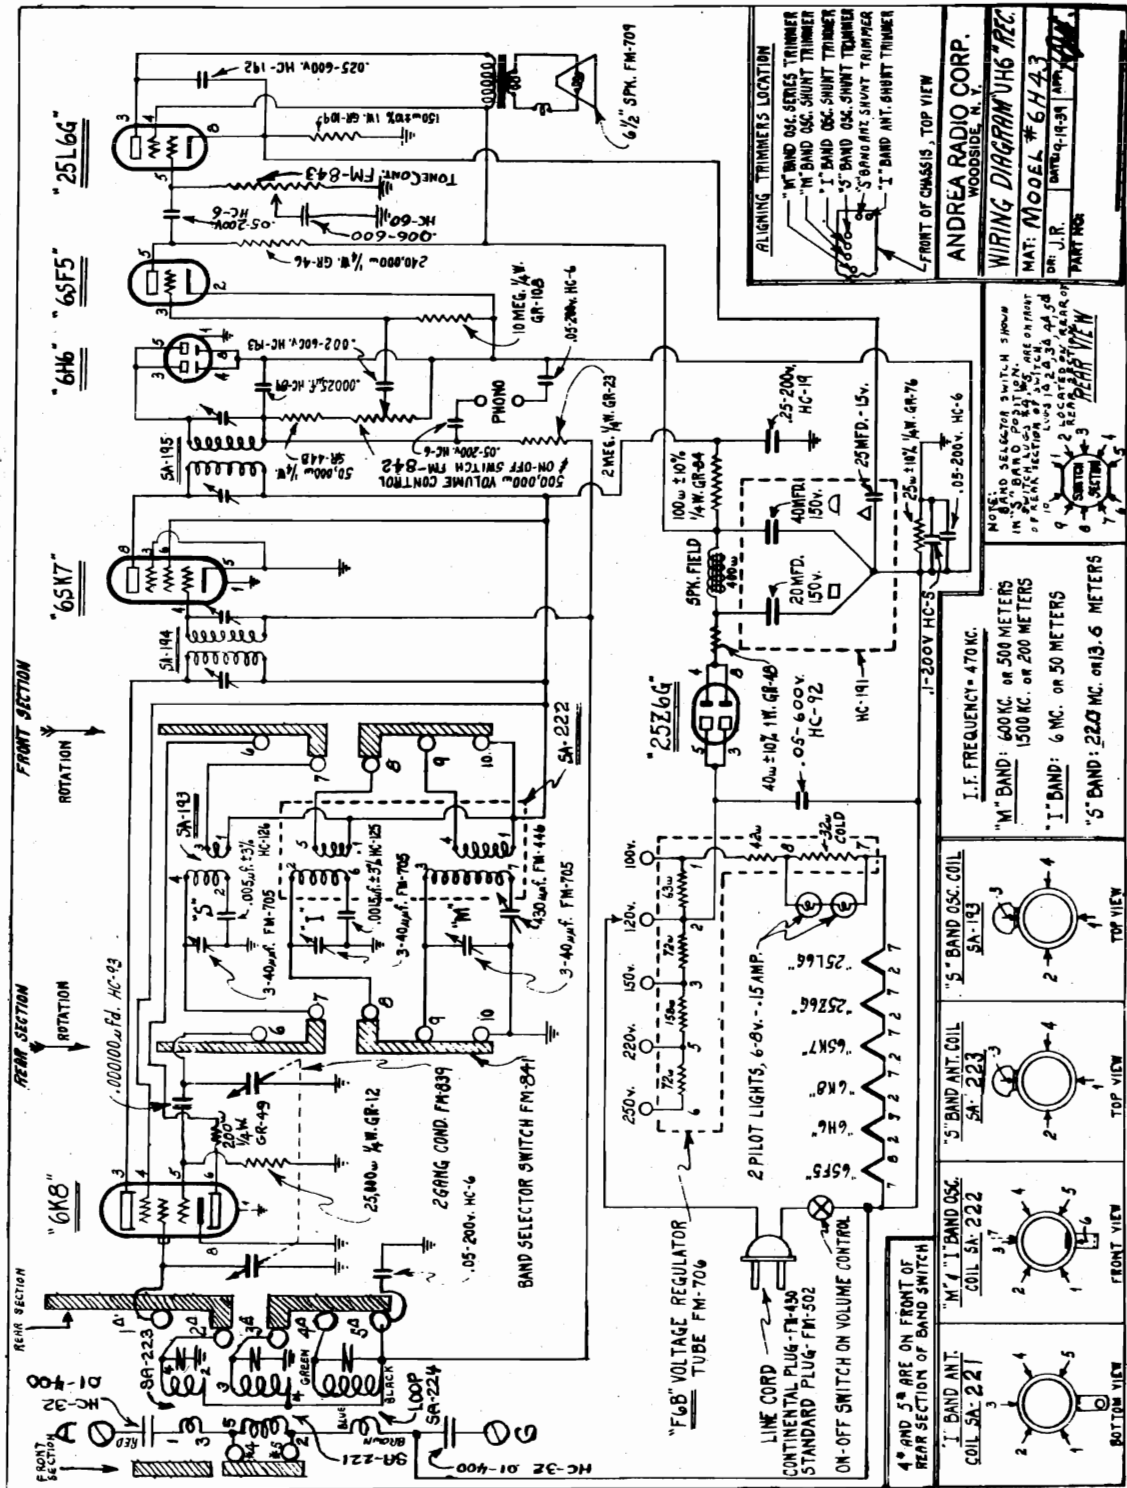

1. Choose a station having a frequency within the range of button No. 1 (540 to 980 kc).
2. Press "Manual Tuning" button and tune this sta-

- tion conventionally by using the selector knob.
3. Now press button No. 1 and turn adjusting screw in either direction until the previously selected station is heard. Adjust the screw until the dark area of the "electric eye" is smallest. This setting will give the best tonal response with maximum sensitivity.
4. Remove the call letters of the station from the call letter sheet furnished and insert in the window of the adjusting screw.
5. Repeat the above procedure for the remaining five (5) stations.

NOTE: It is advisable to retain the call letter sheet in case of station change later on.

ANDREA RADIO CORP.

TUBES: The following tubes are required for this receiver: 6K8 oscillator and modulator, 6SK7 I.F. amplifier, 6H6 2nd detector and AVC, 6F5 1st audio, 25L6G beam power output, 25Z6G rectifier, F6B ballast tube.

MODEL 6H43
MODEL 6H44

ANDREA RADIO CORP.

"S" BAND ALIGNMENT: Connect the high-potential lead from the generator in series with a 400-ohm resistor to the antenna (red) lead of the set, and the low side of the generator to the ground (black) lead of the set. Put the wave band switch at the S position, adjust the generator to 22,000 kc., and the receiver to 22.0 mc. Vary the S band oscillator shunt trimmer slowly from maximum to minimum. You will hear the signal at two settings of the trimmer, one nearer the minimum capacity (plates open) and one near the maximum capacity (plates closed). The setting near minimum capacity is correct, because the setting near maximum capacity is at the image frequency.

Now adjust the antenna shunt trimmer. During this adjustment, be sure to rock the gang condenser back and forth slowly each time you make an adjustment of the trimmer. As you continue to do this, you will reach a point where further turning of the trimmer screw, while rocking the gang condenser, will not increase the signal response. This is the correct adjustment.

A simple method of determining if the receiver and generator are tuned for correct alignment is as follows:

Set the signal generator at 22,000 kc. and tune the receiver slowly from 21,000 to 23,000 kc. Two signals should be heard, 940 kc. apart. One will be lower in frequency than 22,000 kc. and the other will be higher. The higher frequency, as indicated on the dial, is the correct aligning frequency, and the lower one is the image.

As a further check, leave the receiver tuned to the higher frequency. Very slowly, increase the generator frequency from 22,000 kc. to about 23,000 kc.

A signal will be heard near 23,000 kc. if all the settings are correct for alignment. If there is no signal, the original settings were on the image frequency. In that case, you must start again from the beginning, in order to be sure of accurate results.

After you have found the correct settings, the image, or lower, frequency response on the receiver will always sound weaker than the true signal.

"I" BAND ALIGNMENT: With the signal generator connected in accordance with the preceding instructions, set the generator at 6,000 kc., turn the wave band switch to the I position, and adjust the dial to 6 mc. Following the procedure just described, adjust the I band oscillator shunt trimmer for maximum signal response. Next, adjust the I band antenna shunt trimmer. Rock the gang condenser back and forth slowly as you adjust the trimmer, in accordance with the instructions for the S band adjustment. This completes the adjustment for the I band.

"M" BAND ALIGNMENT: Replace the 400-ohm resistor in the generator lead by a .00025 mfd. condenser. Set the generator at 1,500 kc., turn the wave band switch to the M position, and set the dial of the receiver at 1,500 kc. Adjust the M band oscillator shunt trimmer for maximum signal response. Next adjust the antenna shunt trimmer for maximum response.

This band must be aligned at 600 kc. also. Set the generator accordingly, and tune the receiver to 600 kc. Adjust the M band oscillator series trimmer for maximum response. During this adjustment, be sure to rock the gang condenser for each small change of capacity of the series trimmer. When this adjustment has been completed, recheck the antenna adjustment at 1,500 kc. This completes the adjustment of the M band.

WARNING! Always remove the line plug from the electric outlet before removing the chassis from the cabinet. Also—connect the speaker plug to the receiver before switching on the power. Otherwise, damage will result.

I. F. REALIGNMENT GENERALLY SUFFICIENT: As a rule, it is not necessary to readjust the short wave oscillator and antenna shunt and series trimmers unless they have been tampered with, or require replacing. Consequently, careful realignment of the I.F. system is all that requires attention, ordinarily. Before making any adjustments, tune in one particular station and note the quality of reception so that you can check the improvement after the I.F. system has been realigned.

USE SIGNAL GENERATOR AND OUTPUT VOLTMETER: For realigning, use a signal generator to supply a modulated carrier of 470, 600, 1,500, 6,000, and 22,000 kc., plus an output voltmeter. Alignment by any other means is not recommended. Your service test generator should be checked frequently for change in calibration by getting a zero beat between the generator and broadcast stations of known frequency.

SPECIAL NOTES: Always check the pointer setting with the alignment scale located on the top rear flocked plate before you start alignment adjustments. Otherwise, inaccuracies will be introduced.

When the variable plates are completely closed, the back extension of the pointer should be exactly in line with the end of the vertical marking at the left side of the alignment scale looking from the front of the chassis.

After installing the chassis in the cabinet, it is essential that you check the pointer alignment with the glass scale on the cabinet by turning the pointer fully to the left. Then clamp the chassis loosely in position so that the pointer lines up with the left end of the calibration line on the glass scale. Tighten the chassis firmly in the cabinet, making certain that the chassis does not move its position, and thereby cause the pointer position to shift with respect to the calibrated scale on the cabinet. Otherwise, poor calibration will result.

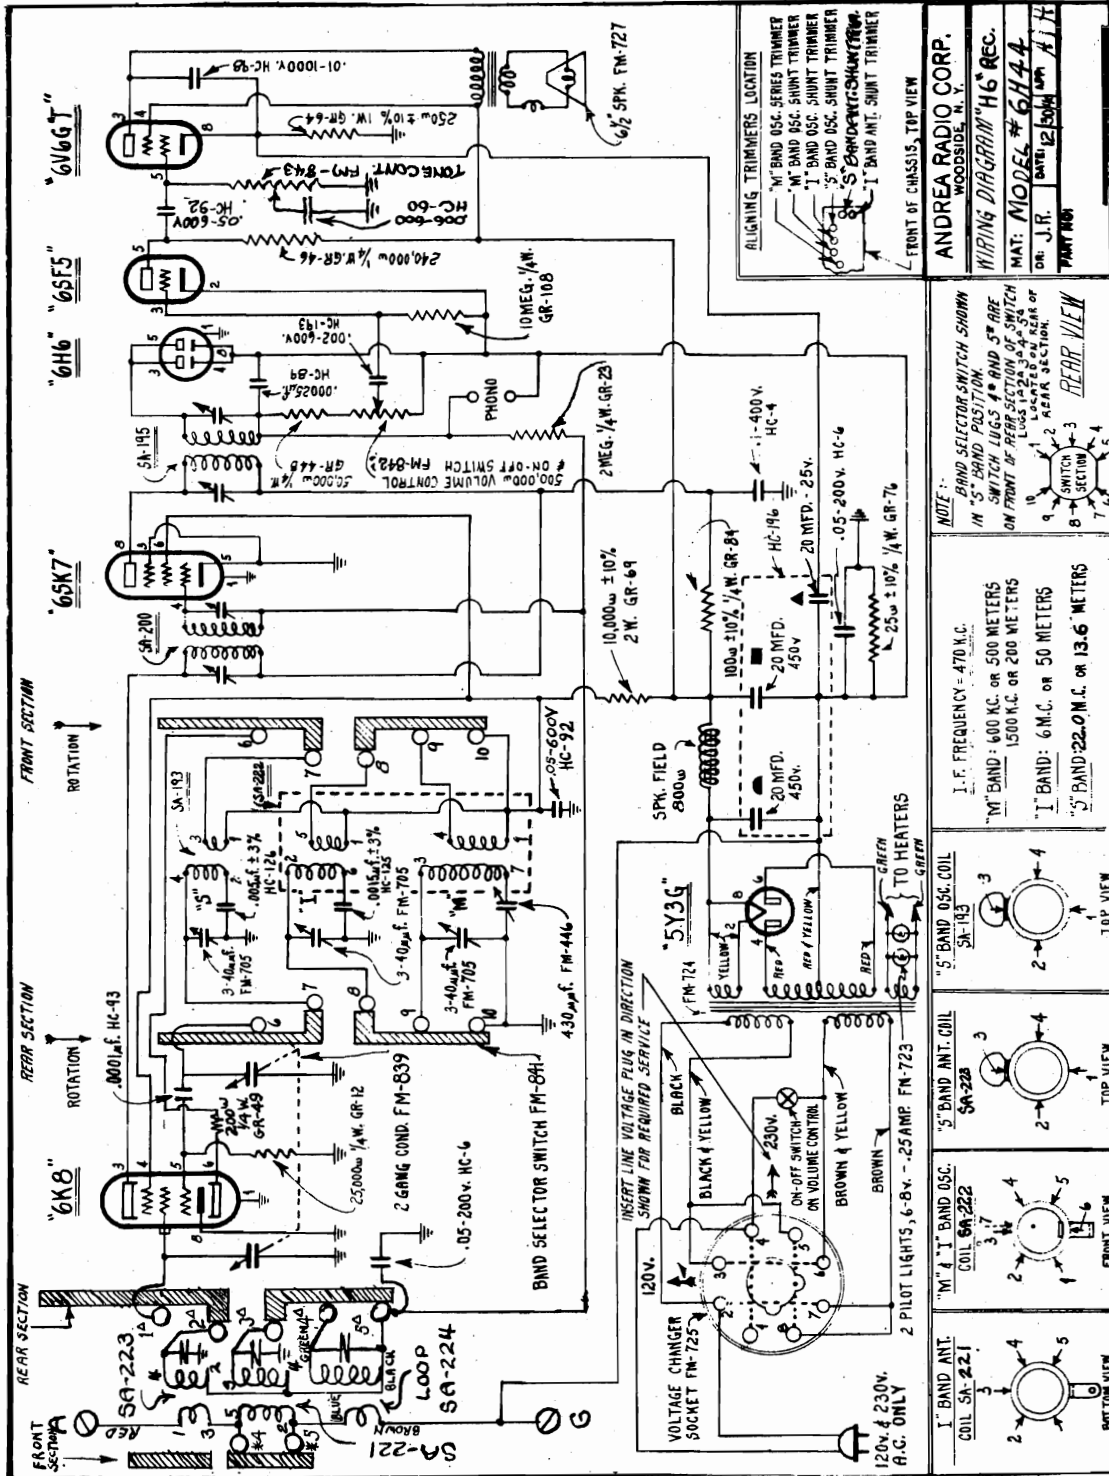

NOTES ON REALIGNING THE BANDS: During the aligning measurements, the output of the signal generator must be kept so low that it will not cause the AVC circuit in the set to function. In other words, when the volume control on the set is turned to maximum, the output should not show more than .5 volt across the voice coil, or 50 milliwatts in the plate circuit of the output tube.

Generally, at frequencies above 7,000 kc., the signal generator frequency will change with each adjustment of the generator output attenuator control. Hence, the receiver must be retuned each time the attenuator is adjusted.

Some generators cause trouble by direct radiation to the set at frequencies above 8 mc. Experience indicates that more accurate alignment is possible when the generator is separated by several feet from the receiver under test, in order to eliminate this direct pickup.

470 KC. I. F. ALIGNMENT: Connect the high-potential lead of the signal generator in series with a .1 mfd. condenser to the grid of the 6K8 tube. Set the output meter. Adjust the trimmer condensers on the top of the 1st and 2nd I.F. transformers (see circuit diagram) for maximum deflection on the output meter. After this adjustment has been made, disconnect the generator from the grid of the 6K8 tube. This completes the alignment of the I.F. system.

BAND	SIGNAL GENERATOR			Position of Iron Cores (Dial Setting)	Trimmers Adjusted to Maximum (in Order Shown)
	Frequency Setting	Dummy Antenna	Connection to Radio		
I. F.	455 Kc.	.1 MFD.	Connect to Antenna Plate	Iron Cores All the way out	Two trimmers on top of output I.F. (See Chassis View)
	455 Kc.	.1 MFD.	Connect to Antenna Plate	Iron Cores All the way out	Two trimmers on top of input I.F. (See Chassis View)
	1690 Kc.	.1 MFD.	Connect to Antenna Plate	Iron Cores All the way out.	Oscillator trimmer (C5) (See Chassis View)
BROAD-CAST BAND	1690 Kc.	200 MMF.	Connect to Antenna Plate	Iron Cores All the way out	Antenna trimmer (C3) (See Chassis View)
	1400 Kc.	200 MMF.	Connect to Antenna Plate	Turn Dial to 1400 Kc.	Adjust position of antenna coil right or left. (See Note "A")
	1690 Kc.	200 MMF.	Connect to Antenna Plate	Turn Dial to 1690 Kc.	Adjust antenna trimmer (C3) (See Chassis View) (See Note "B")

NOTE "A"—The antenna coil assembly is made so that it is movable right or left. When making the adjustment as given in the alignment procedure move the coil assembly very slowly. It can be moved by hand or by pivoting one edge of the blade of a screwdriver in the hole and engaging the blade in the gear teeth of the coil form.

NOTE "B"—After the antenna coil has been tracked at 1400 Kc. it is necessary to check the antenna trimmer (C3) adjustment again at 1690 Kc. If no appreciable change in trimmer adjustment is made, the coil is in track, if the trimmer requires considerable change it will be necessary to again adjust the position of the antenna coil at 1400 Kc. These two adjustments should be tried several times until no change of trimmer adjustment is required at 1690 Kc.

ALIGNMENT PROCEDURE

The following equipment is required for aligning.
● Dummy antenna .1 mfd. and 200 mmf.

● Volume control—Maximum all adjustments.
● Connect B— of radio chassis to ground post of signal generator.

BAND	SIGNAL GENERATOR		Connection to Radio	Dial Setting	Trimmers Adjusted (in Order Shown)	Adjustment
	Frequency Setting	Dummy Antenna				
455 Kc. I. F.	455 Kc.	.1 MFD.	Connect to Grid of 1A7	Rotor full open (Plates out of mesh)	Input and Output Trimmers on Top of I. F. cans	Maximum output (See Note "A")
BROAD-CAST BAND	1600 Kc.	.1 MFD.	Connect to Grid of 1A7	Rotor full open (Plates out of mesh)	Osc. Trimmer on gang (See chassis view)	Maximum output (See Note "A")
	1400 Kc.	200 MMF.	Connect to Antenna Clip	Set dial at 1400 Kc.	Ant. Trimmer on gang (See chassis view)	Maximum output (See Note "B")

NOTE "A"—The loop antenna need not be connected to the radio when making these adjustments, but a 1. Meg. Resistor must be substituted across the loop clips. The ground of the signal generator is connected to the B— and the other lead from the signal generator is connected in series with .1 MFD. dummy to the grid of the 1A7GT tube.

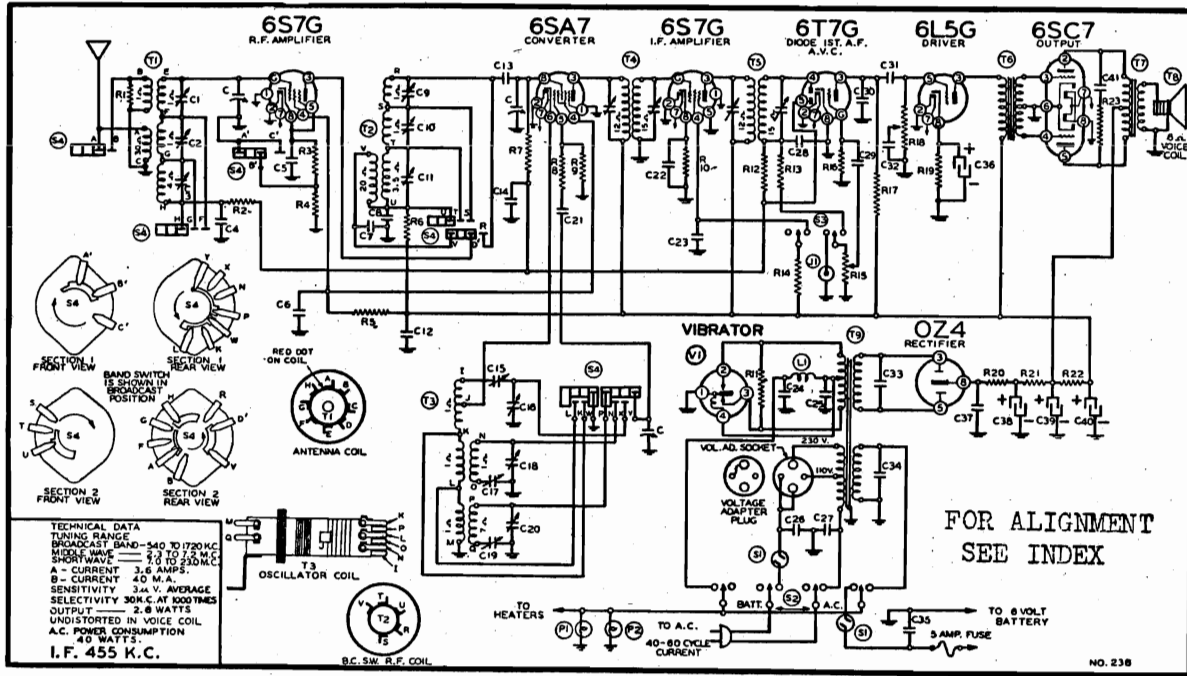

NOTE "B"—This adjustment should be made with the ground lead of the signal generator connected to the external ground terminal. The other lead of the signal generator is connected in series with a 200 Mmf. dummy to the external antenna terminal.

CHASSIS VIEW showing tube location and battery cables.
NOTE: To operate on battery, line cord must be plugged into AC-DC battery switch shown in view above.

 MODEL 590

BELMONT RADIO CORP.

ALIGNMENT PROCEDURE MODEL 7D22

- Volume control—Maximum all adjustments.
- Connect B—of radio chassis to ground post of signal generator through .1 Mfd. condenser.

BAND	SIGNAL GENERATOR			Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted to Maximum
	Frequency Setting	Dummy Antenna	Connection to Radio			
I. F.	455 Kc.	.1 MFD.	Grid of 12SK7 I. F.	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top of Output I. F.
	455 Kc.	.1 MFD.	Grid of 12SJ7 Mixer	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top of Input I. F.
SHORT WAVE BAND	12 Mc.	400 Ohms	External Antenna and B—	Short Wave	Set Dial at 12 Mc.	S.W. Osc. trimmer C10 S.W. Ant. trimmer C3
BROADCAST BAND	1600 Kc.	.1 mmf.	Grid of 12SJ7	Broadcast	Rotor full open (Plates out of mesh)	B.C. Osc. trimmer C12 on Gang
	1400 Kc.	200 mmf.	External Antenna and B—	Broadcast	Set Dial at 1400 Kc.	B.C. Ant. trimmer C6

NOTE: The Oscillator Frequency is lower than the signal frequency and should be aligned accordingly. The loop antenna should be connected to the radio when making all adjustments.

ALIGNMENT PROCEDURE MODEL 7H31

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator.

BAND	SIGNAL GENERATOR			Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted to Max.
	Frequency Setting	Dummy Antenna	Connection to Radio			
I. F.	455 Kc.	.1 MFD.	Grid of 6S7 I. F.	Broadcast	Tuning & Bandsread Plates out of mesh	Two trimmers on top of Output I. F.
	455 Kc.	.1 MFD.	Grid of 6SA7 I. F.	Broadcast	Tuning & Bandsread Plates out of mesh	Two trimmers on top of Input I. F.
SHORT WAVE BAND	17 Mc.	400 ohms	Antenna lead	Short Wave	Set Dial at 17 Mc.	Trimmer C16—S. W. osc. (See Note A)
	17 Mc.	400 ohms	Antenna lead	Short Wave	Set Dial at 17 Mc.	Trimmer C1-C9 S. W. ant. and R. F.
	8 Mc.	400 ohms	Antenna lead	Short Wave	Set Dial at 8 Mc.	Trimmer C15 S. W. osc. series pad (See note "B")
MEDIUM WAVE BAND	6 Mc.	400 ohms	Antenna lead	Medium Wave	Set Dial at 6 Mc.	Trimmer C18 M. W. osc.
	6 Mc.	400 ohms	Antenna lead	Medium Wave	Set Dial at 6 Mc.	Trimmer C2-C10 ant. and R. F.
	2.5 Mc.	400 ohms	Antenna lead	Medium Wave	Set Dial at 2.5 Mc.	Trimmer C17 osc. series pad (See note "B")
BROADCAST BAND	1720 Kc.	200 mmf.	Antenna lead	Broadcast	Tuning & Bandsread Plates out of mesh	Trimmer C20 B. C. osc.
	1400 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 1400 Kc.	Trimmer C3-C11 B. C. ant. R. F.
	600 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 600 Kc.	Trimmer C19 B. C. osc. series pad (See note "B")

NOTE "A"—It is extremely necessary that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental.

NOTE "B"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained. After each range is completed, repeat the procedure as a final check.

ALIGNMENT PROCEDURE MODEL 590

The following equipment is required for aligning.

- Dummy antenna .1 mfd. and 200 mmf.

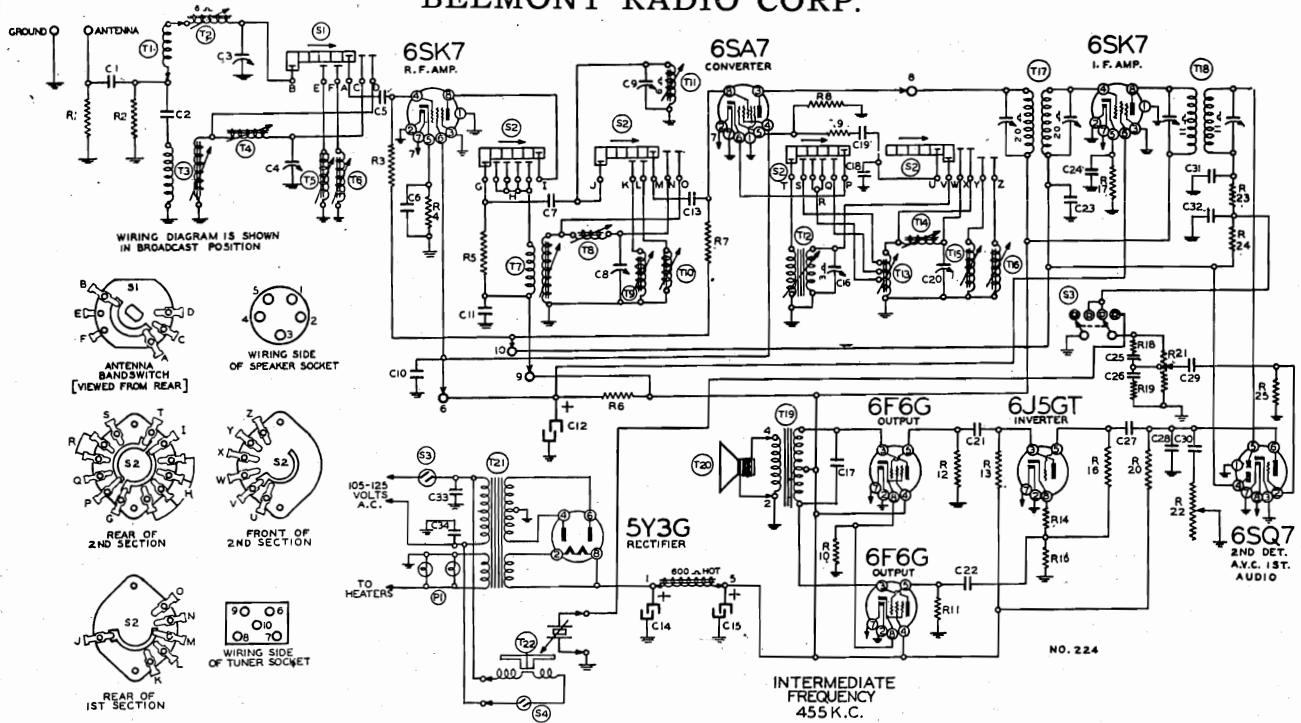

- Volume control—Maximum all adjustments.
- Connect ground lead of radio chassis to ground post of signal generator.

BAND	SIGNAL GENERATOR			Position of Iron Cores (Dial Setting)	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
	Frequency Setting	Dummy Antenna	Connection to Radio				
455 Kc. I. F.	455 Kc.	.1 MFD.	Connect to Grid of 1A7	Rotor full open (Plates out of mesh)	Trimmers on top of I. F. cans	Output and input I. F.	maximum output (See Note "A")
BROADCAST BAND	1600 Kc.	.1 MFD.	Connect to Grid of 1A7	Rotor full open (Plates out of mesh)	Trimmer on gang (See chassis view)	Oscillator	maximum output (See Note "A")
	1400 Kc.	200 MMF.	Connect to Antenna Clip	Set dial at 1400 Kc.	Trimmer on gang (See chassis view)	Antenna	maximum output (See Note "B")

NOTE "A"—The loop antenna need not be connected to the radio when making these adjustments, but a 1. Meg. Resistor must be substituted across the loop clips. The ground of the signal generator is connected to the chassis and the other lead from the signal generator in series with .1 MFD. dummy to the grid of the 1A7GT tube.

NOTE "B"—This adjustment should be made with the ground lead of the signal generator connected to the external ground terminal. The other lead of the signal generator is connected in series with a 200 Mmf. dummy to the external antenna terminal.

MODEL 8AE1

BELMONT RADIO CORP

- The following equipment is required for aligning:
- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
 - Output indicating meter.
 - Non-metallic screwdriver.
 - Dummy antennas—1 ml., 200 mmf., and 400 ohms.

- Tone control—Treble.
- Volume control—Maximum all adjustments.
 - Connect radio chassis to ground post of signal generator with a short heavy lead.
 - Connect dummy antenna value in series with generator output lead.
 - Connect output meter across primary of output transformer.
 - Allow chassis and signal generator to "heat up" for several minutes.

BELMONT RADIO CORP.

Automatic Record Changer--Operating Instructions

Setting for Size of Record

The Changer plays up to fourteen 10" or ten 12" records at one loading. All records must be the same size for each loading.

On each post you will see selecting arms. The position of these arms determines the setting for different size records. To set for 10 or 12 inch records, it is merely necessary to grasp the posts by the knobs at the top, lift, and turn until the 10" or 12" arrows are pointing toward the center of the turntable. When in either the 10" or 12" position, the posts will snap into place except when they are lifted by hand. Be sure to set both posts for the same size record.

Loading

See that the selecting arms of both posts are turned toward the center of the turntable as indicated by the engraved arrows, and that both sets of arms are set for the same size (10" or 12") records as described in the preceding paragraph.

Place the stack of records (up to fourteen 10" or ten 12") over the center

pin so that they will rest on the selecting arms.

Starting the Changer

1. Turn on the radio (allowing approximately 30 seconds for the tubes to warm up) and turn the phonograph-radio knob, to the phonograph position.

2. Turn the switch knob on the Record Changer panel to "ON". The motor will then start and the record changer will go into automatic operation of its own accord.

How to Reject a Record

Merely press the switch knob on the Changer panel. You can do it any time after the needle has come into contact with that record.

Automatic--Manual Switch

When this switch is pushed towards the manual position the selector arms can be turned out of the way and individual records played without the automatic changer working--To operate the changer again push the switch to automatic, start the motor and press the reject button.

Unloading

First switch off the motor. Grasp each post by its knob at the top and turn them out of the way.

Lift the played records from the turntable. Then return the posts to the proper playing position as indicated by the arrows on the selecting arms.

The Changer may then be loaded with a new stack of records according to the size shown on the selecting arms.

Turning Off Changer

Throw Changer switch knob to "OFF" position.

Lift tone arm and place it in the rest position. (If you happen to turn off the Changer switch while the mechanism is going through a "change cycle," you will notice that it does not stop until the cycle has been completed, and the tone arm is again in playing position, at which point it is ready to be lifted to the rest position. If you prefer to turn off your Changer with the radio switch, be sure to turn it off while needle is resting upon a record; otherwise, the selecting arms cannot be correctly reset.

To avoid warping of records, never leave records resting on posts.

If Changer is Left Running

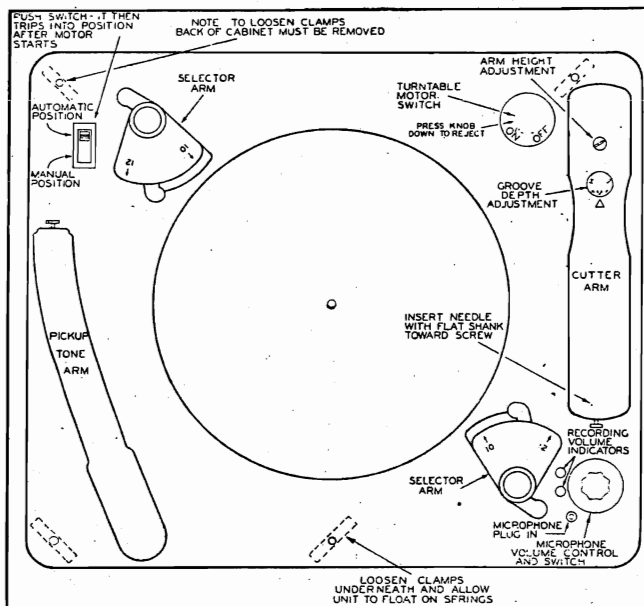

No damage will be done if you forget to turn off Changer after it has played its entire load of records. It will simply repeat the last record until stopped or reloaded.

Phonograph Needles

In general there are two types of needles which can be satisfactorily used on an Automatic Record Changer: those which require changing after approximately 12 records, and the so-called permanent type needles which are rated in terms of "hours of service." In no case, should the manufacturers' claims for these needles be exceeded, since in all probability the needles are rated in terms of their maximum life.

MODEL 11AE2

BELMONT RADIO CORP.

Operating the Phono on Home Recordings

Turn radio on. Put phono switch in "Phono" position.

Push manual switch toward manual side to play home recordings.

Put your record on turntable and start motor. Place playback arm on record and control tone and volume with the radio volume and tone control knobs.

Be sure mike control is turned off when playing records.

Recording Radio Programs

Turn the radio on and tune in the program you wish to record. Put manual switch in manual position. Start motor and then gently lower cutting needle onto blank record, about $\frac{1}{4}$ " from outer edge. Radio Volume will drop—Adjust volume control so red volume indicator light is off and white indicator light continues to flicker.

NOTE—Some radios of this model are equipped with a recording arm on the record changer with which you can make your own records. If your radio has the recording unit follow the instructions below for making records.

The Mike volume control must be turned off (all the way left) except when recording with the microphone.

The two volume indicator lights along side the microphone volume control are used for setting the proper recording level. When recording radio programs the radio volume control should be adjusted so that the red indicator light remains off while the white continues to flicker. When recording with the microphone the lights should be adjusted in the same manner but using the microphone volume control.

Microphone Recording

Turn the mike volume control well up. Phono pushbutton should be in "Phono" position. Put manual switch in manual position. Start motor, and set cutting needle gently on start of record. Adjust volume indicator lights the same as in recording radio programs.

NOTE: The cutting arm must be raised about three inches to move it freely across the record.

How to Make Perfect Recordings

Cutting Needle

The cutting stylus is razor sharp and must not be dropped on the record or allowed to rest on the turntable.

For best operation, the instrument should be level in all directions. To check this, place a small level, if you have one, on the turntable. If you do not have a level, a marble will do. If the marble rolls off the turntable, it is low in the direction in which it rolls. Place something under the cabinet until the machine is reasonably level.

Shavings

The cutting stylus cuts out a fine shaving that is just a little thicker than a human hair. These shavings should not be allowed to gather under the cutting stylus.

While cutting, gently brush the shavings from the left side of the record in, toward the center pin, allowing them to

collect there until the recording is completed.

Do Not Use Too Much Volume

The most frequent cause of poor recordings is too much volume or overloading. If some passages of your recording are smooth and clear while others are raspy, rough and distorted, you are probably using too much volume. Overloading occurs most often on strong passages. The remedy is to reduce the volume slightly and watch the volume indicator lights.

Too little volume will show up when you play the record back. The volume control on playbacks will have to be turned up quite high and needle scratch will be excessive.

Cutting Arm Adjustments

The cutting arm is adjusted at the factory for proper operation, however,

with various types of blanks this adjustment may sometimes have to be altered. With a blank record on the table, the height adjustment on the cutter arm should be adjusted so that the needle screw is centered in the slot when the needle rests on a blank record.

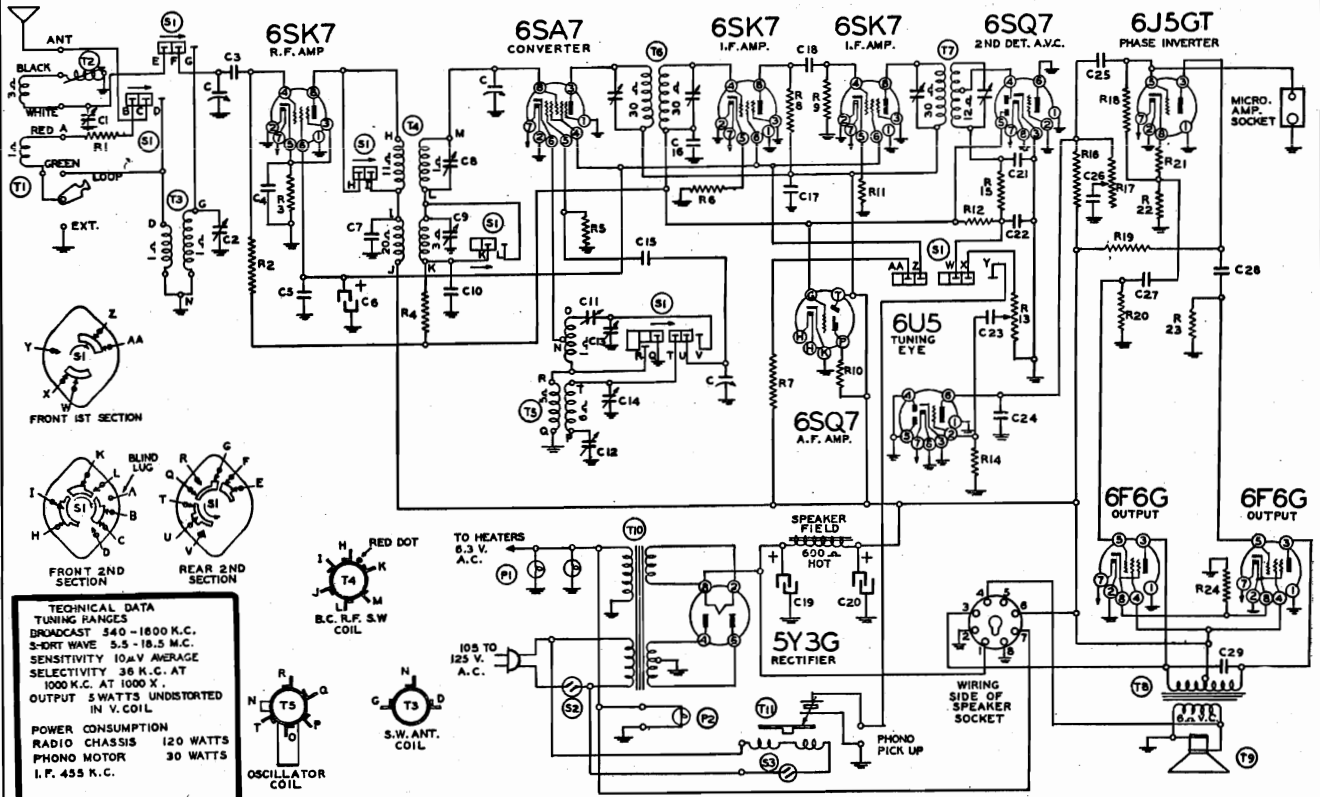

Several blank grooves should now be cut to see if the groove is the proper depth. The depth adjustment screw on the cutter arm will increase the depth of the groove if turned to the letter "H" and will decrease the groove if turned to the letter "L"—For a medium groove turn to "M".

If the groove is too shallow, the playback needle will not stay in the groove. If it is too deep, not enough wall will be left between grooves and the playback needle will break through from one track to the next after a few playings.

A properly cut groove will leave a shaving just a little heavier than a human hair.

CHASSIS VIEW ANTENNA AND GROUND TERMINALS

When using an external antenna and ground, move the metal strap (connector bar) from terminal marked LOOP and connect it to terminal marked EXT.

The antenna and ground wires should then be connected to the terminals marked "Ant." - "Gnd."

MODEL 5D16
MODEL 11A24

BELMONT RADIO CORP.

MODEL 5D16

NOTE: THE ANTENNA COIL ASSEMBLY IS MADE SO THAT IT IS ADJUSTABLE LEFT OR RIGHT WHEN MAKING THE ALIGNMENT AS GIVEN IN THE ALIGNMENT PROCEDURE. MOVE COIL ASSEMBLY VERY SLOWLY.

COIL ASSEMBLY VIEW

MODEL 11A24

Alignment Procedure

- Volume control—Maximum all adjustments.
- Connect dummy antenna value in series with generator output lead.

BAND	SIGNAL GENERATOR		Connect on to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted to Maximum (in Order Shown)	
	Frequency Setting	Dummy Antenna				Output I. F.	Input I. F.
I. F.	455 Kc.	.1 MFD.	Grid of 6SK7 I. F. Mixer	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top	
	455 Kc.	.1 MFD.	Grid of 6SA7 Mixer	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top	
SHORT WAVE BAND	17 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 17 Mc.		C13, S.W. Osc.
	17 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 17 Mc.		C8, S.W. R.F., C2 S.W. Antenna
	6 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 6 Mc.		C11 S.W. Osc. Series Pad See Note "A"
BROADCAST BAND	1580 Kc.	200 mmf.	Grid of 6SK7 R. F. Tube	Broadcast	Rotor full open (Plates out of mesh)		C14 B.C. Osc.
	540 Kc.	200 mmf.	Grid of 6SK7 R. F. Tube	Broadcast	Set Dial at 540 Kc. (Plates in Mesh)		C12 B.C. Osc. Series Pad
	1400 Kc.	200 mmf.	Grid of 6SK7 R. F. Tube	Broadcast	Set Dial at 1400 Kc.		C9 B.C. R.F.
LOOP ALIGNMENT	1400 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 1400 Kc.		C1 B.C. Ant.
	600 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 600 Kc.		T2 Iron Core Tracking Coil

NOTE "A"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

After each band is completed, repeat the procedure as a final check.

VIEW LOOKING AT BOTTOM OF CHASSIS

IRON CORE ADJUSTMENT VIEW

Aligning Instructions

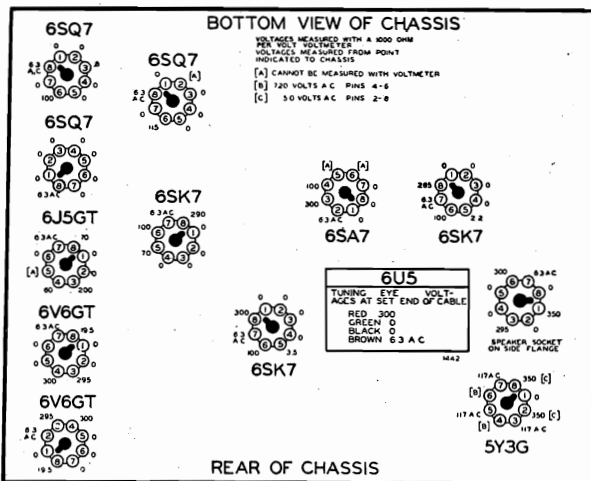

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltage, defective tubes, condensers and resistors. In order to properly align this radio, the chassis should be removed from the cabinet. Although the short wave bands on this radio are of the band spread type the Alignment Procedure is not difficult. However because each short wave scale covers only a small portion of the short wave spectrum you must do the work carefully and your oscillator must be accurate.

Do not realign the band spread scales unless you are positive they are out of adjustment. When adjustment is necessary proceed as follows.

Tune set to high frequency end of dial scale on any band.

Rotate each iron core until the fine score marks are even with the edge of the coil forms.

You are now ready to continue with the trimmer adjustments as shown on the alignment chart.

REAR OF CHASSIS

VOLTAGE CHART

TRIMMER VIEW

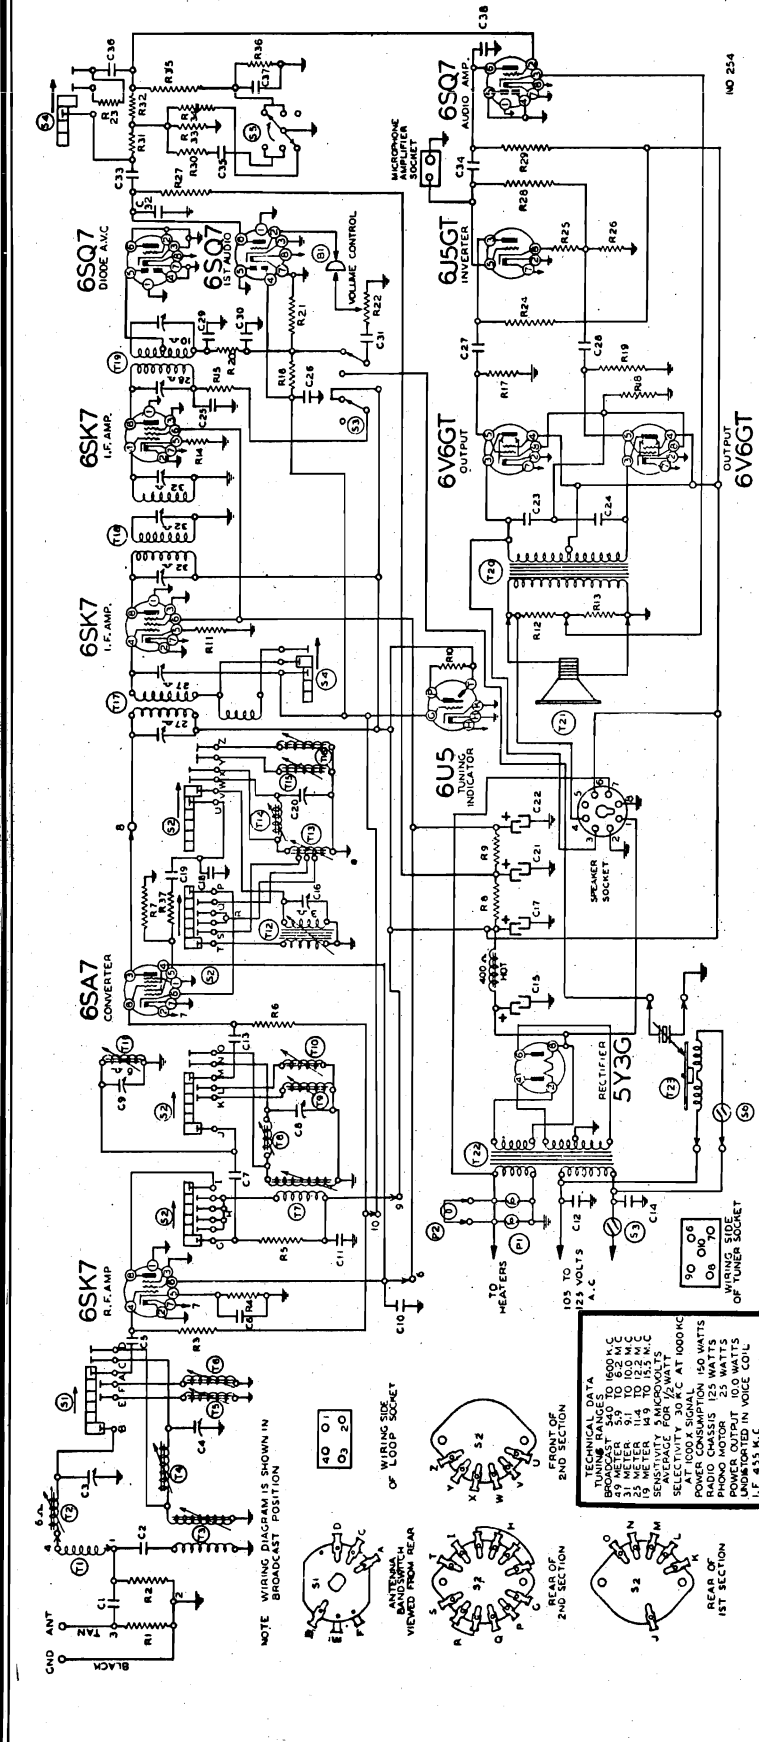

ALIGNMENT PROCEDURE

- Tone control—Treble.
- Volume control—Maximum all adjustments.
- Connect dummy antenna value in series with generator output lead.

- Use an all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.

BAND	SIGNAL GENERATOR			Position of Band Switch	Dial Pointer Setting	Trimmers Adjusted To Maximum
	Frequency Settng	Dummy Antenna	Connection to Radio			
I. F.	455 Kc.	.1 MFD.	Grid of 6SK7 (I.F.)	Broadcast	Set Dial at 1600 Kc.	On Top of Output I. F.

ALIGNMENT PROCEDURE

October, 1941

- Tone control—Treble.
- Volume control—Maximum all adjustments.
- Use an all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Dial Pointer Setting	Trimmers Adjusted To Maximum
I. F.	455 Kc.	.1 MFD.	Grid of 6SK7 (I.F.)	Broadcast	Set Dial at 1600 Kc.	On Top of Output I.F.
	455 Kc.	.1 MFD.	Grid of 6SA7	Broadcast	Set Dial at 1600 Kc.	On Top of Input I.F.
31 METER BAND	9.6 Mc.	400 ohms	Antenna lead	31M	Set Dial at 9.6 Mc.	(See Trimmer View) C21—Osc. (See Trimmer View) C12—R.F. (See Chassis View) C4—Ant.
49 METER BAND	6.1 Mc.	400 ohms	Antenna lead	49M	Set Dial at 6.1 Mc.	(See Trimmer View) T14—Osc. (See Trimmer View) T8—R.F. (See Trimmer View) T4—Ant.
25 METER BAND	11.8 Mc.	400 ohms	Antenna lead	25M	Set Dial at 11.8 Mc.	(See Trimmer View) T15—Osc. (See Trimmer View) T9—R.F. (See Trimmer View) T5—Ant.
19 METER BAND	15.2 Mc.	400 ohms	Antenna lead	19M	Set Dial at 15.2 Mc.	(See Trimmer View) T16—Osc. (See Trimmer View) T10—R.F. (See Trimmer View) T6—Ant.
BROAD-CAST BAND	1600 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 1600 Kc.	(See Trimmer View) C18—Osc. (See Trimmer View) C13—R.F. (See Chassis View) C3—Ant.
	1400 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 1400 Kc.	Rotate Core T11—R.F. Rotate Core T2—Ant. (See Iron Core Adjustment View)

IMPORTANT: Before removing chassis, remove the escutcheon and dial scale and then the pointer which is fastened to the pointer carriage by a small screw.

Setting the Pushbuttons

Make a list of your 6 favorite stations. Push out the call letters of these stations from the call letter sheets supplied. Insert a call letter in the slot on top of each pushbutton.

Next pull one of the pushbuttons all the way out as far as it will come. Now tune in the station you want with the tuning knob—Tune back and forth until the station is clear and distinct. Now push the button hard all the way in to lock the station in place, (push directly on front of button). Continue setting each pushbutton in the same way. Pressing the proper button will now tune the station you want. If it does not do so you did not push the button hard enough to lock it in place when setting up the station.

Radio Only 70 Watts
Power Consumption Motor Only 20 Watts
Power Output 2.1 Watts Undistorted
Sensitivity for 500 Milliwatt Output: 15 Microvolts Average
Selectivity - 51 KC Broad at 1000 Times Signal at 1000 KC
Tuning Frequency Range Broadcast Band - 530 to 1600 KC
Shortwave Band - 5.46 to 18.3 MC
Intermediate Frequency 455 KC
Speaker 8 in. Electro Dynamic or 10 in. Electro Dynamic

BELMONT RADIO CORP.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio ground to ground post of signal generator with a short heavy lead.
- Connect dummy antenna in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—1-mf., 200 mmf., 400 ohms.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	455 Kc.	.1 MFD	Grid of 6SA7 Mixer	Broadcast	Rotor full open (Plates out of mesh)	Trimmers on top (See Top View)	Input and Output I. F.	Adjust to maximum output
SHORT WAVE BAND (See Note A)	17 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 17 Mc.	Trimmer C4	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 17 Mc.	Trimmer C1	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 6 Mc.	Trimmer C7	Short Wave oscillator series pad	Adjust to maximum rock dial. (See note "C")
BROADCAST BAND (See Note A)	1600 Kc.	200 mmf.	Grid of 6SA7	Broadcast	Rotor full open (Plates out of mesh)	Trimmer C3	Broadcast oscillator	Adjust to maximum output
	530 Kc.	200 mmf.	Grid of 6SA7	Broadcast	Rotor full closed	Trimmer C6	Broadcast oscillator series pad	Adjust to maximum output
LOOP ALIGNMENT (See Note B)	1400 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 1400 Kc.	Trimmer C2 (See Top View)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 600 Kc.	Trimmer C6 (See Top View)	Broadcast oscillator series pad	Adjust to maximum output

NOTE "A"—The signal generator is connected to the "ANT." and "GND." leads when aligning the Short Wave Band and to the grid of the 6SA7 tube and ground terminal when setting the Broadcast Band oscillator end frequencies, (1600 and 530 K. C.).

The loop antenna should be connected to the radio when making these adjustments.

NOTE "B"—Loop alignment is made with the chassis mounted in the cabinet and the loop antenna connected. The signal generator is connected to the "ANT." and "GND." leads.

NOTE "C"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each band is completed, repeat the procedure as a final check.

Automatic Record Changer--Operating Instructions

General

This Record Changer will play automatically a series of standard 10- or 12 inch records of the type generally available today, or records of any size up to 12 inches changed manually. This Changer does not require any adjustment by operator for playing different size records. Stacks of mixed sizes may be played but this is not recommended or guaranteed. Records of the last few years with the standard eccentric or spiral finishing groove will operate the automatic mechanism.

Controls and Moving Mechanism

Index and Record Reject Lever: This lever is located near the right front corner of the phonograph with its index plate marked for four positions—OFF-MAN-AUT-REJ.

When you desire to change record selections manually, this lever should be set in the "MAN." (MANUAL) position.

To play a series of records, the lever should be set at the "AUT." (AUTOMATIC) position.

To reject a record being played, or to start the record-changing cycle, in case the record just played does not have the standard eccentric or spiral stopping groove; simply push the lever to the "REJ." (REJECT) position and let go. The pickup arm will raise up and swing outwards and the next record will drop.

Keep the lever in its "MAN." position when not actually playing records automatically.

To start the turntable set the switch to the "MAN." or "AUT." position. To stop the turntable, set the switch to the "OFF" position.

Manual Operation

1. Insert Needle in pickup and clamp securely with needle screw protruding from front of pickup arm.
2. Lift record platforms and rotate away from turntable.
3. Place record to be played on turntable.
4. Advance index and reject lever to "MAN."
5. Place needle on blank edge of record and push pickup arm gently toward center to start needle in groove.
6. When playing is completed lift pickup arm slightly to clear record and replace same on rest.
7. Return index and reject lever to "OFF".

Automatic Operation

1. Insert long playing needle in pickup and clamp securely with needle screw protruding from front of pickup arm. Return arm to rest.
2. Rotate record platforms to index position (locked in place by pin).
3. Place records to be played over the turntable spindle and on the record platforms.
4. Push index and reject lever to "REJ." position and release. The first record will then feed and play thru, followed by the balance of the records.
5. After last record has been played, allow pickup arm to reset on record. Return arm to rest and push lever to "OFF".
6. Raise and turn record platforms away from turntable.
7. Remove records carefully from turntable. Be careful not to strain spindle.

CAUTION—This Changer is designed and built to play standard 10- and 12-inch records in good condition automatically. To obtain the benefit of satisfactory operation it is necessary that instructions be followed explicitly and in no case use force, as this may cause damage.

Mechanism

Do not rotate turntable in reverse direction or bend or strain turntable spindle when loading or unloading records.

Do not overload with records. The maximum load is either:

- 10 - 12 inch records
- 12 - 10 inch records
- 10 - 10 and 12 inch records mixed

Do not touch pickup arm when it is in motion during automatic function or stop the mechanism until pickup arm reaches playing position and is returned to rest provided.

Do not move platforms by selector. Always raise and turn by hub of record platform.

Records

Do not use warped records; records with rough, square, or uneven edges; records that are extra thin or extra thick.

Do not use other than standard 10 inch or 12 inch records.

Do not leave records on record platforms. This will cause warpage.

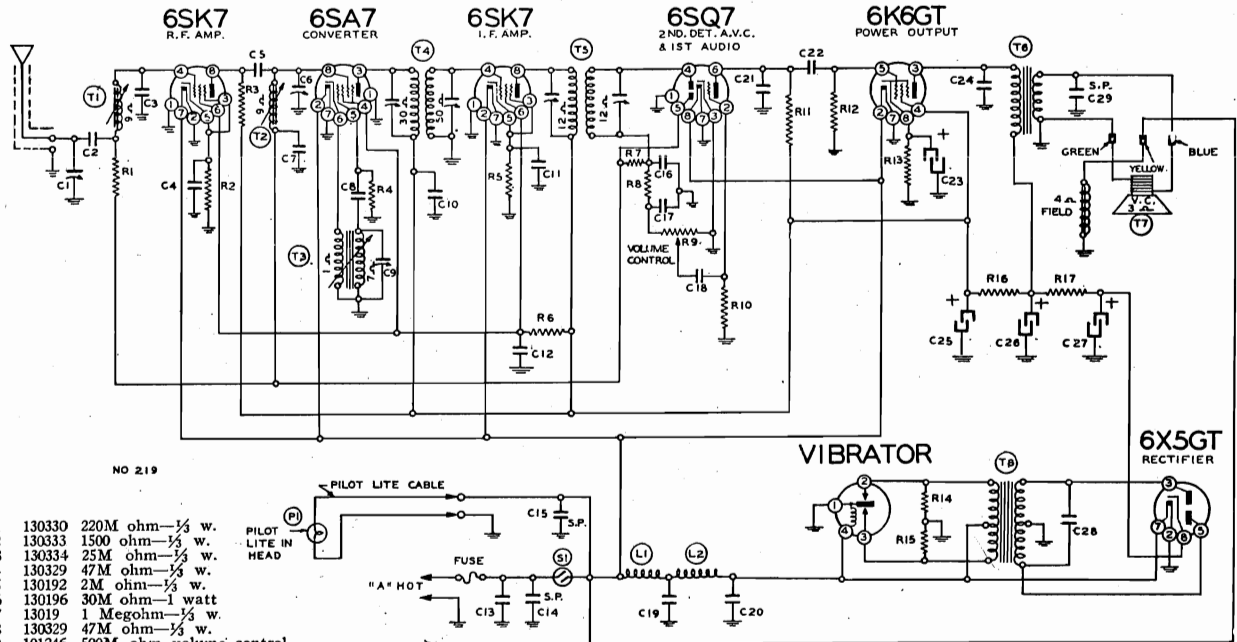

Needles

Single-playing needles may be used for manual operation, but they are somewhat inconvenient.

Multiple-playing needles are essential for automatic operation to conserve record life, as well as being a convenience for manual operation.

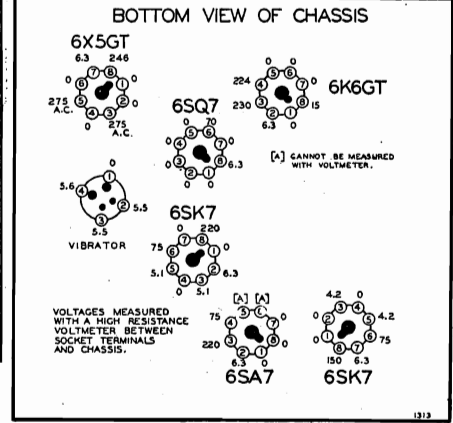

NEVER put a needle into pickup, once it has been removed, since this will result in unnecessary wear on the records—many times that resulting from normal use.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio ground to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- The following equipment is required for aligning.
 - An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
 - Dummy antennas—1 mf., 200 mmf., 400 ohms.

SIGNAL GENERATOR			
BAND	Frequency Setting	Dummy Antenna	Adjustment
I. F.	455 Kc.	.1 MFD.	Adjust to maximum output
	455 Kc.	.1 MFD.	Adjust to maximum output
SHORT WAVE BAND (See Note A)	17 Mc.	400 Ohms	Adjust to maximum output
	17 Mc.	400 Ohms	Adjust to maximum output
BROAD-CAST BAND (See Note A)	1580 Kc.	200 mmf.	Adjust to maximum output
	540 Kc.	200 mmf.	Adjust to maximum output
	1400 Kc.	200 mmf.	Adjust to maximum output
LOOP ALIGNMENT (See Note B)	1400 Kc.	200 mmf.	Adjust to maximum output
	600 Kc.	200 mmf.	Adjust to maximum output

NOTE "A"—The signal generator is connected to the "ANT." and "GND." terminals on the rear of the chassis when aligning the Short Wave Band and to the grid of the 6SK7 R. F. Tube and ground terminal when setting the Broadcast Band oscillator end frequencies, (1580 and 540 K. C.).

The loop antenna need not be connected to the radio when making these adjustments.

NOTE "B"—Loop alignment is made with the chassis mounted in the cabinet and the loop antenna connected to the terminal board. The signal generator is connected to

ANT. & GROUND TERMINALS—When using an external antenna and ground, move the metal strap shown above and fasten it under the screw marked "Ext."

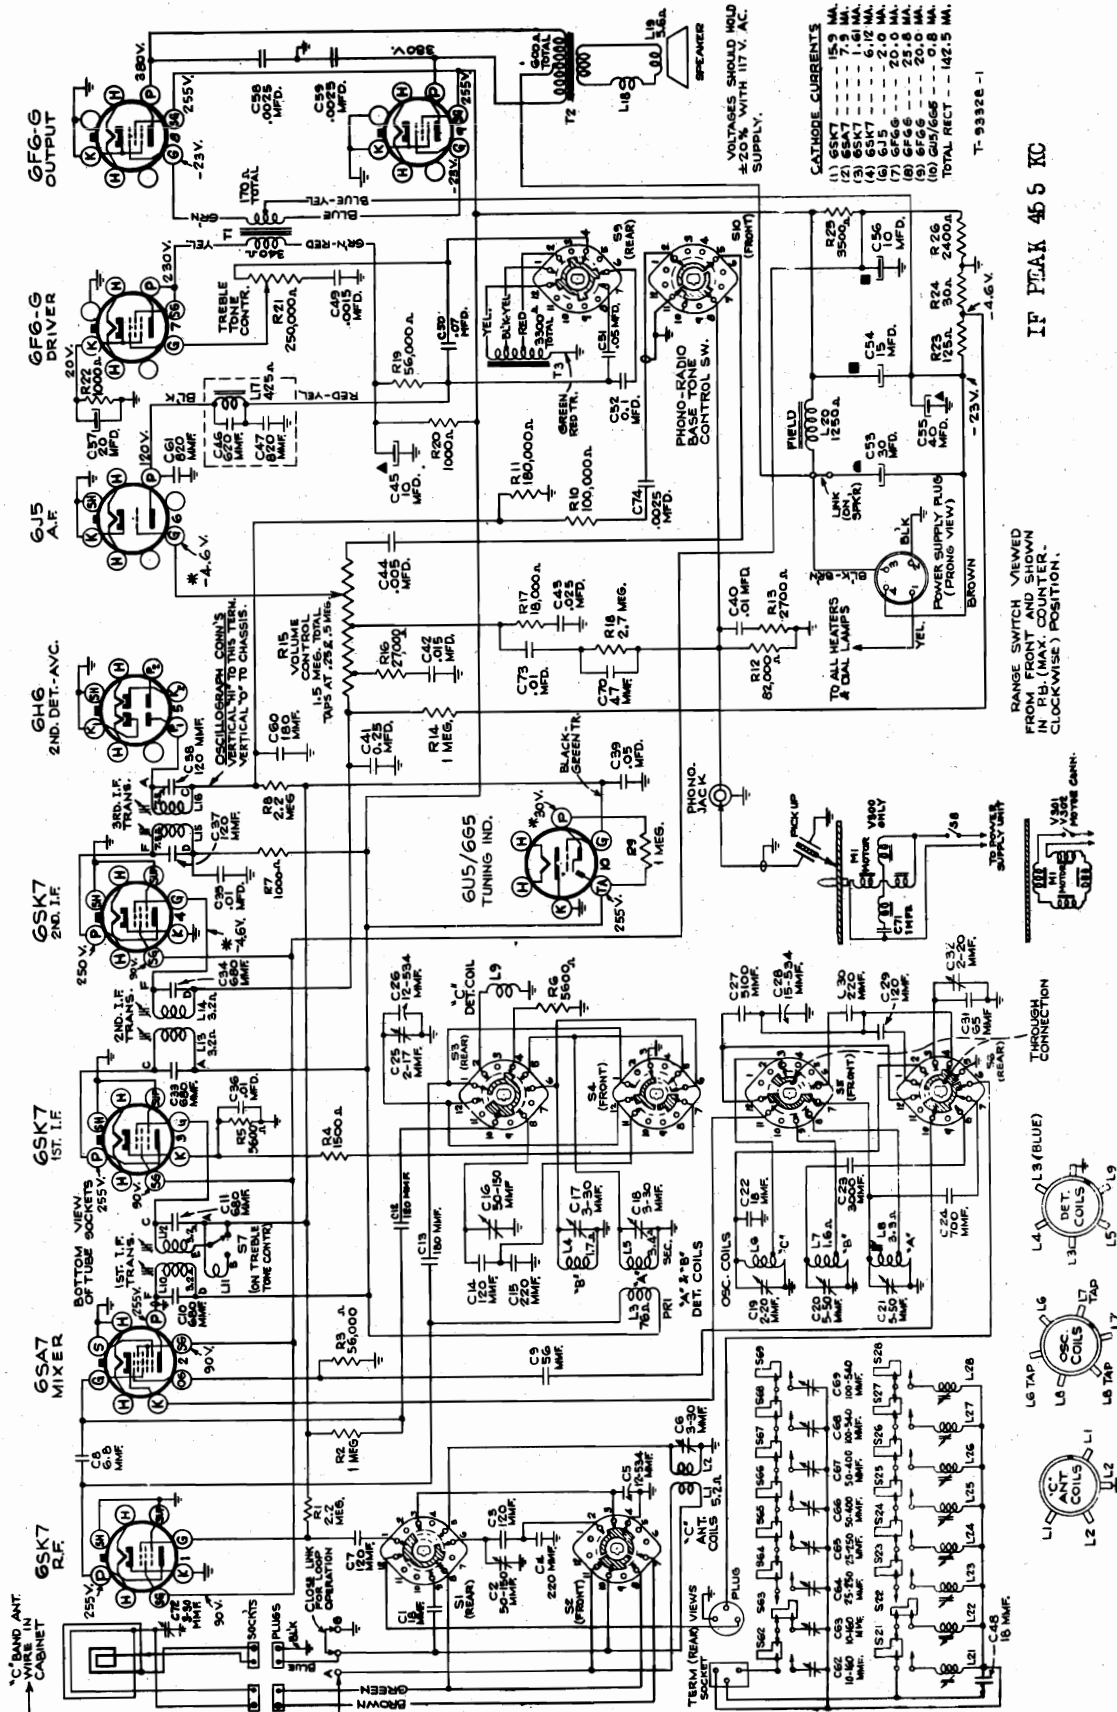

The antenna and ground wires should then be connected to the terminals marked "Ant." — "Grnd."

TRIMMER VIEW—FRONT OF CHASSIS

• Voltages marked with star are actual operating values. The measured voltages will be lower, depending on the voltmeter loading.

MODELS 275, 276, 277

BRUNSWICK RADIO DIV. RADIO & TELEVISION, INC.

Alignment Procedure

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the chassis for quick reference during alignment. In the event that only the chassis is returned for service, and the cabinet with its tuning dial is left in the customer's home, the calibration scale printed in this service note can be used in conjunction with an ordinary 12-inch ruler as an accurate and convenient substitute for the regular dial.

Each method is described below.

Using Tuning Dial.—

1. Slide out the flat spring clamp at each end of the dial, and remove the glass dial from the cabinet.
2. With gang in full mesh, move the dial pointer to the reference mark at the left-hand end of the dial backing plate.
3. Place the glass dial under the pointer so that the extreme left scale graduations coincide with the pointer. Use scotch tape to hold the glass dial in this position.

Using Calibration Scale.—

1. With gang in full mesh, move the dial pointer to the reference mark at the left-hand end of the dial backing plate.
2. Place a flat 12-inch ruler on the dial backing plate so the left-end of ruler is at the reference mark at left-end of backing plate. Temporarily fasten the ruler with scotch tape to the backing plate.
3. Refer to calibration scale printed in this service note. This is a reduced reproduction of the dial with an inch-scale drawn at top and bottom. To find the correct pointer position in inches for any desired frequency, draw a vertical line through this frequency on the calibration scale.

Dial-Pointer Adjustment.—After the chassis is replaced in cabinet, move the dial pointer (if necessary) so that it is at the left-hand graduation on the dial with the gang in full mesh.

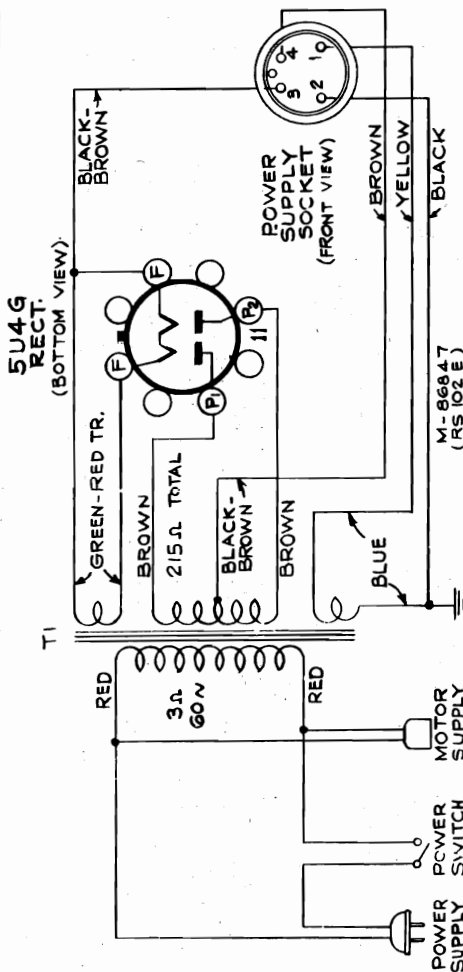

Steps	Connect the high side of the test-osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	Turn "Treble Tone Control" (center knob) counter-clockwise so that I-F is in "Sharp" position.			
2	2nd I-F grid, in series with .01 mfd.	455 kc	"A" Band Quiet Point at HF end	L15 and L16* (3rd I-F Trans.)
3	1st I-F grid, in series with .01 mfd.			L13 and L14* (2nd I-F Trans.)
4	1st-Det. grid, in series with .01 mfd.			L10 and L12* (1st I-F Trans.)
5	Turn Treble Tone Control full clockwise to "Broad" position. Response on CRO should be the conventional double-humped type. If necessary, retouch 3rd I-F transformer slightly (so as not to disturb the "Sharp" curve appreciably). Leave control in sharp position for the following steps.			
6	Ant. terminal, in series with 47 mmfd. (link closed)	15.2 mc	"C" Band 15.2 mc	C19 (osc.)** C25 (det.) C6 (ant.)
7		9.5 mc	"31M" Band 9.5 mc	C32 (osc.)** C18 (det.) C2 (ant.)
8	Rear stator of gang, in series with .01 mfd.	2.44 mc	"B" Band 2.44 mc	C20 (osc.) C17 (det.)
9		600 kc	"A" Band 600 kc	L8 (osc.) Rock in
10		1,500 kc	"A" Band 1,500 kc	C21 (osc.) C18 (det.)
11	Repeat steps 9 and 10.			
12	Install and connect chassis in cabinet. Tune in a radiated oscillator signal at 1,500 kc and peak the "A" band trimmer C72 (on loop). Rock in L8 for peak output.			

* Adjust for coincidental curves and maximum gain.
 ** Use minimum capacity peak if two peaks can be obtained. (Check for correct peak on "C" band by tuning receiver to 14.29 mc, where a weaker signal should be received.)

Push Button Adjustment

880 KC	1450 KC	610 KC	1450 KC
9	7	4	2
10	8	5	3
11	9	6	4
12	10	7	5
		8	6
		9	7
		10	8
		11	9
		12	10

The station push buttons connect to separate magnetite-core oscillator coils and separate antenna trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool. Allow at least five minutes warm-up period before making adjustments.

In the event that the receiver is to be used with an external antenna use one or two feet of wire (as an antenna) to ensure sharp peaking during the final adjustment procedure. For loop operation, the link should be strapped across terminals on back of set. In either case the procedure is as follows:

1. Make a list of the desired stations, arranged in order from low to high frequencies.
2. Turn the range selector to "A" band, and manually tune in the first station on the list.
3. Turn range selector to "Electric Tuning" (PB) position, push in station button No. 1 (extreme left). Then adjust the No. 1 oscillator core to receive the station.
4. After oscillator core is set correctly, adjust No. 1 antenna trimmer for maximum output.
Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.
5. Adjust for each of the remaining stations in the same manner.
6. Make a final careful adjustment of the oscillator cores and antenna trimmers.

On the 880 to 1,550 kc push-buttons the higher frequency stations may be received with No. 7 or 8 either in or out (oscillator frequency either 455 kc below or 455 kc above the station frequency). The adjustment with this core in its out position (oscillator frequency 455 kc above the station frequency) is the correct one.

BRUNSWICK RADIO DIV.—
RADIO & TELEVISION, INC.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the chassis for quick reference during alignment. Or, if necessary, the calibration scale printed in this service note can be used in conjunction with an ordinary 12-inch ruler as an accurate and convenient substitute for the regular dial.

Each method is described below.

Using Tuning Dial.—

- Slide out the flat spring clamp at each end of the dial, and remove the glass dial from the cabinet.
- With gang in full mesh, move the dial pointer to the reference mark at the left-hand end of the dial backing plate.
- Place the glass dial under the pointer so that the extreme left scale graduations coincide with the pointer. Use scotch tape to hold the glass dial in this position.
- After completion of the alignment, replace the glass dial

in cabinet, taking care that the fibre light shields are in correct position at ends of dial.

Using Calibration Scale.—

- With gang in full mesh, move the dial pointer to the reference mark at the left-hand end of the dial backing plate.
- Place a flat 12-inch ruler on the dial backing plate so the left-end of ruler is at the reference mark at left-end of backing plate. Temporarily fasten the ruler with scotch tape to the backing plate.
- Refer to calibration scale printed in this service note. This is a reproduction of the dial with an inch-scale drawn at top and bottom. To find the correct pointer position in inches for any desired frequency, draw a vertical line through this frequency on the calibration scale. For example, 1,500 kc is approximately 4 inches from the reference mark.

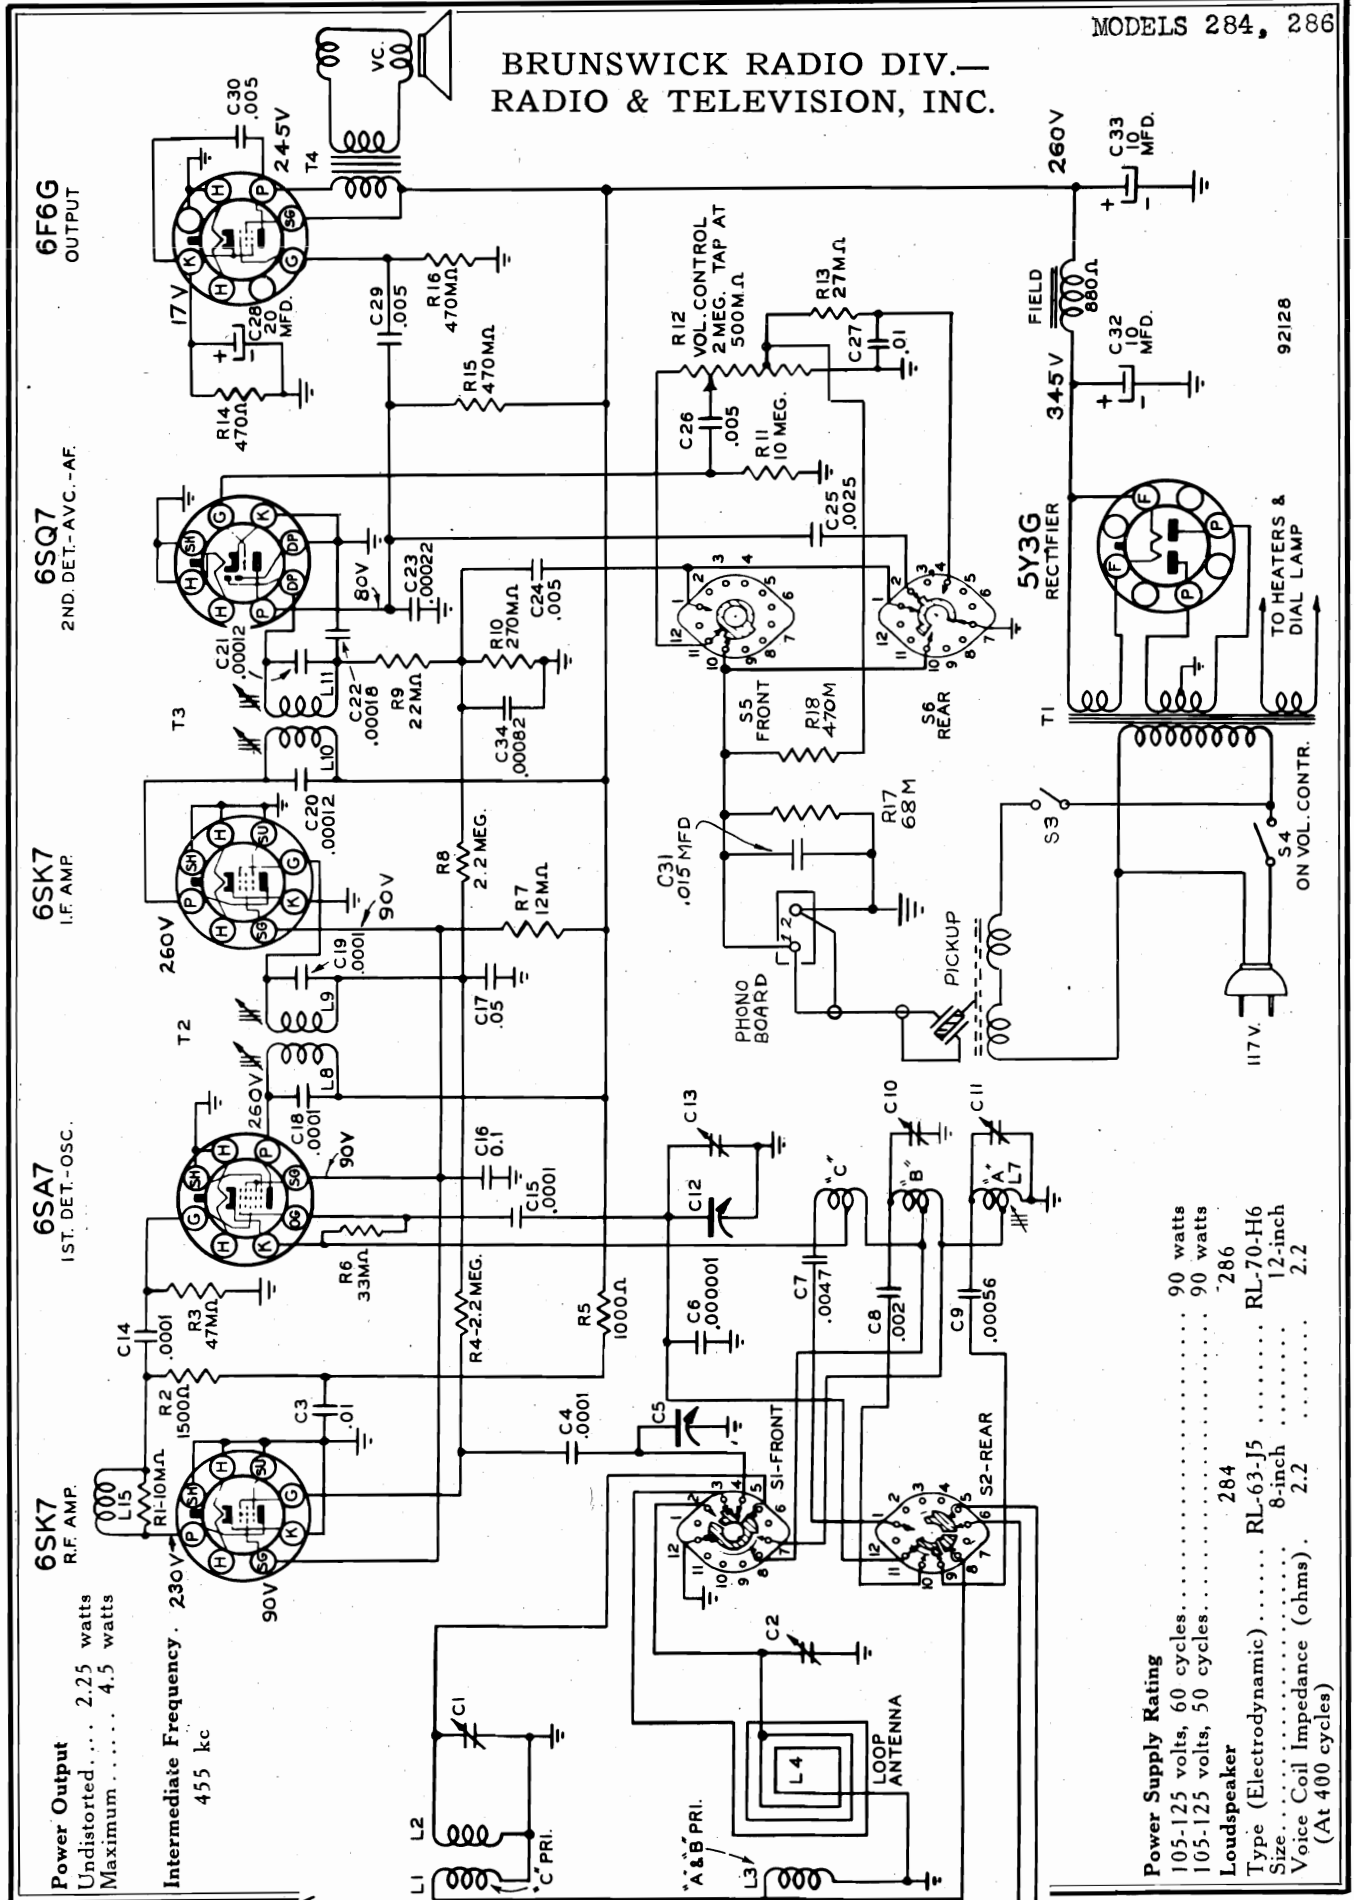

Dial-Pointer Adjustment.—After the chassis is replaced in cabinet, move the dial pointer (if necessary) so that it is at the left-hand graduation on the dial with the gang in full mesh.

Steps	Connect the high side of the test-osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for maximum peak output—
1	I-F grid, in series with .01	455 kc	"A" band, Quiet point at 1,500 kc end of dial	L3 and L4 (2nd I.F. trans.)
2	1st-Det. grid, in series with .01			L1 and L2 (1st I.F. trans.)
3	Antenna terminal, in series with 300 ohms (link open)	15.2 mc	15.2 mc "C" band	C1 (osc.)* C2 (ant.)
4		2.44 mc	2.44 mc "B" band	C3 (osc.) Rock in
5	Antenna terminal, in series with 200 mmfd. (link open)	1,500 kc	1,500 kc "A" band	C4 (osc.) C5 (ant.)
6		600 kc	600 kc "A" band	L5 Rock in
7	Repeat steps 5 and 6.			

* Use minimum capacity peak if two peaks can be obtained. Check to determine that the correct peak has been used, by tuning receiver to 14.29 mc, where a weaker signal should be received.

Note: Oscillator tracks above signal on all bands.

Alignment Procedure

Steps	Connect the high side of the test-osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	6SK7 grid in series with .01 mfd.	455 kc	"A" band Quiet point between 550-750 kc	L10 and L11 (2nd I-F trans.)
2	6SA7 grid in series with .01 mfd.			L8 and L9 (1st I-F trans.)
3	Ant. terminal in series with 47 mmfd.	15 mc	15 mc "C" band	C13 (osc.)* C1 (ant.)
4	Ant. terminal in series with 300 ohms	2.44 mc	2.44 mc "B" band	C10 (osc.)*
5	Ant. terminal in series with 200 mmfd.	1,500 kc	1,500 kc "A" band	C11 (osc.) C2 (ant.)
6		600 kc	600 kc "A" band	L7 (osc.) Rock gang
7	Repeat steps 5 and 6.			

* Use minimum capacity peak if two peaks can be obtained.
The oscillator tracks above the signal frequency on all bands.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the chassis for quick reference during alignment. Or, if necessary, the calibration scale printed in this service note can be used in conjunction with an ordinary 6-inch ruler as an accurate and convenient substitute for the regular dial.

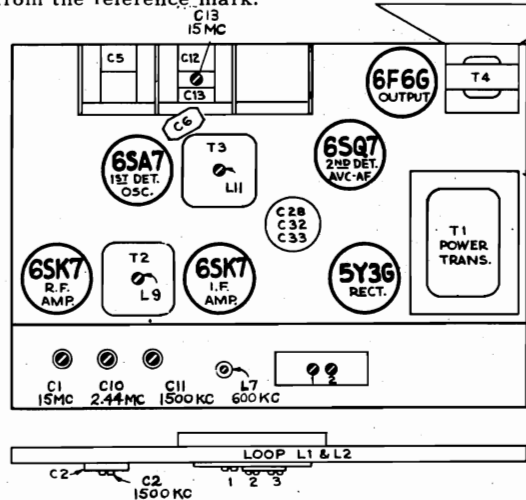

Using Calibration Scale:

1. With gang in full mesh, move the dial pointer to the reference mark at the left-hand end of the dial backing plate.
2. Place a flat 6-inch ruler on the dial backing plate so the left-end of the ruler is at the reference mark at the left-end of backing plate. Temporarily fasten the ruler with scotch tape to the backing plate.
3. Refer to calibration scale printed in this service note. This is a reduced reproduction of the dial with an inch-scale drawn at top and bottom. To find the correct

Frequency Range

Standard Broadcast (A)..... 540-1,600 kc
Medium Wave (B)..... 1.6-4.5 mc
Short Wave (C)..... 5.8-18 mc

pointer position in inches for any desired frequency, draw a line through this frequency on the calibration scale. For example, 1,500 kc is approximately 3 3/4 inches from the reference mark.

A station may be changed at any time by following the above information.

The push-buttons should be adjusted for six favorite stations after the receiver has been operating for a brief warm-up period. Each button may be set up to any standard broadcast station. The preferable arrangement is to adjust for stations in the order of frequency, from low to high. Proceed as follows:

Cut out the tabs for your six favorite stations and arrange them in order of frequency in the recesses in the push-buttons.

Press down on the first push-button and hold it down. The screw in back of the push-button is now accessible and should be loosened one or two turns with a screw-driver.

While still holding down the push-button, tune in the first station represented by the station tab with the tuning knob, by Dial Tuning. When the station is heard at its best, tighten up the screw in back of the push-button. Now let go of the push-button, turn the tuning knob in order to detune and again press down the button and let go. The station should be heard again. If not, repeat the above adjustment process until reception is satisfactory.

Proceed to set up the other five push-buttons in a similar manner.

MODELS 289, 291, 294

BRUNSWICK RADIO DIV.— RADIO & TELEVISION, INC.

RADIO-PHONOGRAPH COMBINATIONS MODELS 289-291-294

These models employ a 9 tube radio chassis in conjunction with a new type automatic record changer, using a feather-weight pickup which reduces record wear and objectionable needle scratch. A permanent needle is built into the phono pickup so that no other needles need be used.

This combination will operate only on 105-125 volt, 60 cycle current.

For PHONOGRAPH operation, the band switch knob is rotated all the way to the left (counter-clockwise). The records are stacked up on the changer, and the turntable switch is slid to the "on" position. Push the lever adjacent to it, momentarily to "start", and operation will commence. The Volume and Tone controls are then set as desired.

For PUSH BUTTON operation, the Band Switch is turned to the second position. Any of the six pre-set stations may now be tuned in by depressing the corresponding button. The procedure for setting up these buttons will be described later.

The Short Wave band covers the frequencies from 5.5 to 18.5 Megacycles. The channels used for local and international short wave broadcasts are indicated by meter blocks and are designated on the lower part of the dials as 1EM, 19M, 25M, 31M, 39M and 49M. Tuning is the same as for the regular broadcasts except that greater care must be exercised since tuning is extremely sharp and many stations may be passed over if the tuning knob is rotated too rapidly.

The Broadcast band covers the range from 535 to 1650 kilocycles. All of the American broadcast stations and some police calls may be heard on this band.

In tuning on either band, for best results, the station should be tuned for maximum. The volume is then reduced to the desired level. Never reduce volume by detuning, as distortion and noisy reception may result.

Push Button Alignment

To set up the receiver for push button operation, proceed as follows:

Looking into the back of the cabinet directly behind the buttons, above the dial will be seen two rows of screws. These are painted in various colors. Viewed from the rear these are: from left to right, YELLOW, BLUE, BROWN, BROWN, and ORANGE. Each of these may be adjusted to cover a band of frequencies as tabulated below:

Yellow	- 850 to 1570 kilocycles
Blue	- 550 to 1450 kilocycles
Brown	-- 570 to 1250 kilocycles
Orange	- 535 to 950 kilocycles

The bottom row of adjusting screws are the oscillator trimmers which determine the frequency of the station to be received. The upper row is for the antenna adjustment.

The simplest procedure, when a suitable oscillator is available, is to feed the desired frequency into the antenna, depress the button; turn the oscillator trimmer till the signal is picked up, then reduce the output from the oscillator so that it is just audible. Now adjust the antenna trimmer for maximum. Proceed to the next button and repeat the operation.

In the absence of such equipment, turn the Band Switch all the way to the right for dial tuning of broadcast stations. Start at the low frequency end of the band and tune in the program of the station it is desired to receive. Note the frequency of this station. Without touching the tuning, throw the Band Switch over to the second or Push Button position. Depress the first button, corresponding to the orange screws. Slowly

rotate the lower (oscillator) orange screw till the same program is received. Check this by switching back to dial tuning. (Broadcast position on the band switch). When this has been determined, the signal may now be clarified by carefully adjusting the trimmer of the same color (orange) directly above it. Now repeat the operation by turning in, on the dial, the next station, of a higher frequency that it is desired to set up; and so on until all six have been aligned. Note that there are two BLUE and two BROWN SETS of screws. Each button will cover only a range of frequencies as noted above, and therefore a group of stations falling within these limits must be selected. The antenna trimmer in each case is directly over the corresponding oscillator.

The station markers may now be inserted into the recesses in the buttons and the ceiling covers forced in over them.

ALIGNMENT INSTRUCTIONS

Re-alignment of this receiver should not be attempted unless all other possible causes of faulty operation have been thoroughly investigated. An accurately calibrated signal generator which will cover the necessary wave bands, and an output meter for indicating the effect of adjustments are required.

During the alignment procedure all adjustments should be made under the following conditions:

- 1) Line Voltage as indicated on instruction sheet.
- 2) Volume & Tone control at maximum volume positions.
- 3) Minimum Input from signal generator.

If this procedure is not adhered to, all adjustments will appear very broad. This is due to the action of the automatic volume control.

I. F. Adjustment - The signal generator is set at 455 KC and is connected to the grid of the converter tube (6SA7) through a .5MFD condenser. Be sure to connect a resistor of approximately 25,000 Ohms between the converter grid and ground so that the grid circuit is at ground potential for D. C. It is unnecessary to disconnect the grid from the rest of the circuit.

The input I. F. Transformer trimmers - are both adjusted for maximum output as indicated by the output meter connected across either the voice coil or the primary coil of the loud speaker.

The Output I. F. Transformer trimmers - are adjusted for maximum output as indicated on the output meter. The Input I. F. should now be rechecked for maximum output.

Short Wave - Set the band switch to the third position which is the short wave band. Connect the signal generator thru a standard dummy antenna to the antenna and ground leads of the receiver. Set the generator at 17 MC; turn the condenser until a response is indicated. The pointer should coincide with the 17 MC mark on the dial. Adjust the short wave antenna trimmer (#5, see diagram) for maximum output while rocking the condenser gang from left to right.

Broadcast Band

It is desirable to align this band on the loop. The signal generator is coupled to the receiver by means of a 2 or 3 turn loop. Set the band switch in the broadcast position and condenser plates completely out of mesh. Set the signal generator at 1650 KC and adjust the broadcast oscillator trimmer (#3, see diagram) until a response is indicated on the output meter. The generator is now set at 1400 KC. Turn the variable condenser until a response is indicated. The dial pointer should now coincide with the 1400 KC mark on the dial. Now adjust the broadcast inter-stage trimmer (#2) for maximum. This trimmer is located on the right side of the front section of the variable condenser. Set the generator at 600 KC and rotate the variable condenser until a response is indicated. Adjust the broadcast oscillator padder condenser (#4) for maximum response while "Rocking" the gang condenser. The High frequency adjustment should now be re-checked.

ANTENNA SYSTEM: The 1941 Buick uses a roof peak antenna as standard equipment.

TUNING CONTROLS: Tuning is accomplished by means of the conventional manual tuning control or by means of a five push button mechanical tuner which may be set up for any desired group of stations.

An electric clutch is provided which automatically disconnects the manual tuning mechanism when any one of the buttons is pressed.

NOTE: Do not attempt to operate the push button tuning unless the set is connected to a six volt battery and turned on.

MODEL 980650

BUICK MOTOR

CIRCUIT ALIGNMENT

Should realignment be necessary, the circuits can be properly adjusted only by the use of a calibrated test oscillator or signal generator and an output meter.

1. Aligning I-F Stages at 260 Kilocycles

- (a) Connect the ground lead of the signal generator to the chassis.
- (b) Connect the signal lead of the signal generator to the R.F. section of the gang condenser (Illus. F, Fig. 3) through a .1 mfd. condenser.
- (c) Connect the output meter from the plate prong of one 6V6GT tube to the plate prong of the other 6V6GT tube.
- (d) Set the signal generator to 260 Kilocycles and turn volume control on full.
- (e) Set the condenser gang to a point around 600 Kilocycles where no station is received.
- (f) Adjust the four screws on the two I.F. coils (Illus. A,B,C & D, Figs. 3 & 4) until maximum output is obtained. Repeat these adjustments with as low an output from the signal generator as possible for a readable indication on the output meter.

2. Aligning at 1560 Kilocycles

- (a) Leave the signal generator connected as before.
- (b) Turn the tuning condenser plates all the way out and against the high frequency stop.
- (c) Set the signal generator to 1560 Kilocycles.
- (d) Adjust the trimmer (Illus. E, Fig. 3) for maximum output.

3. Aligning at 1400 Kilocycles

- (a) Connect the signal lead of the signal generator to the antenna connection of the receiver through a .00005 mfd. mica condenser.
- (b) Set the signal generator to 1400 Kilocycles.
- (c) Rotate the variable plates of the gang condenser until the signal is tuned for maximum output.
- (d) Adjust the trimmers (Illus. F, G, Fig. 3) for maximum output.

4. Aligning at 600 Kilocycles

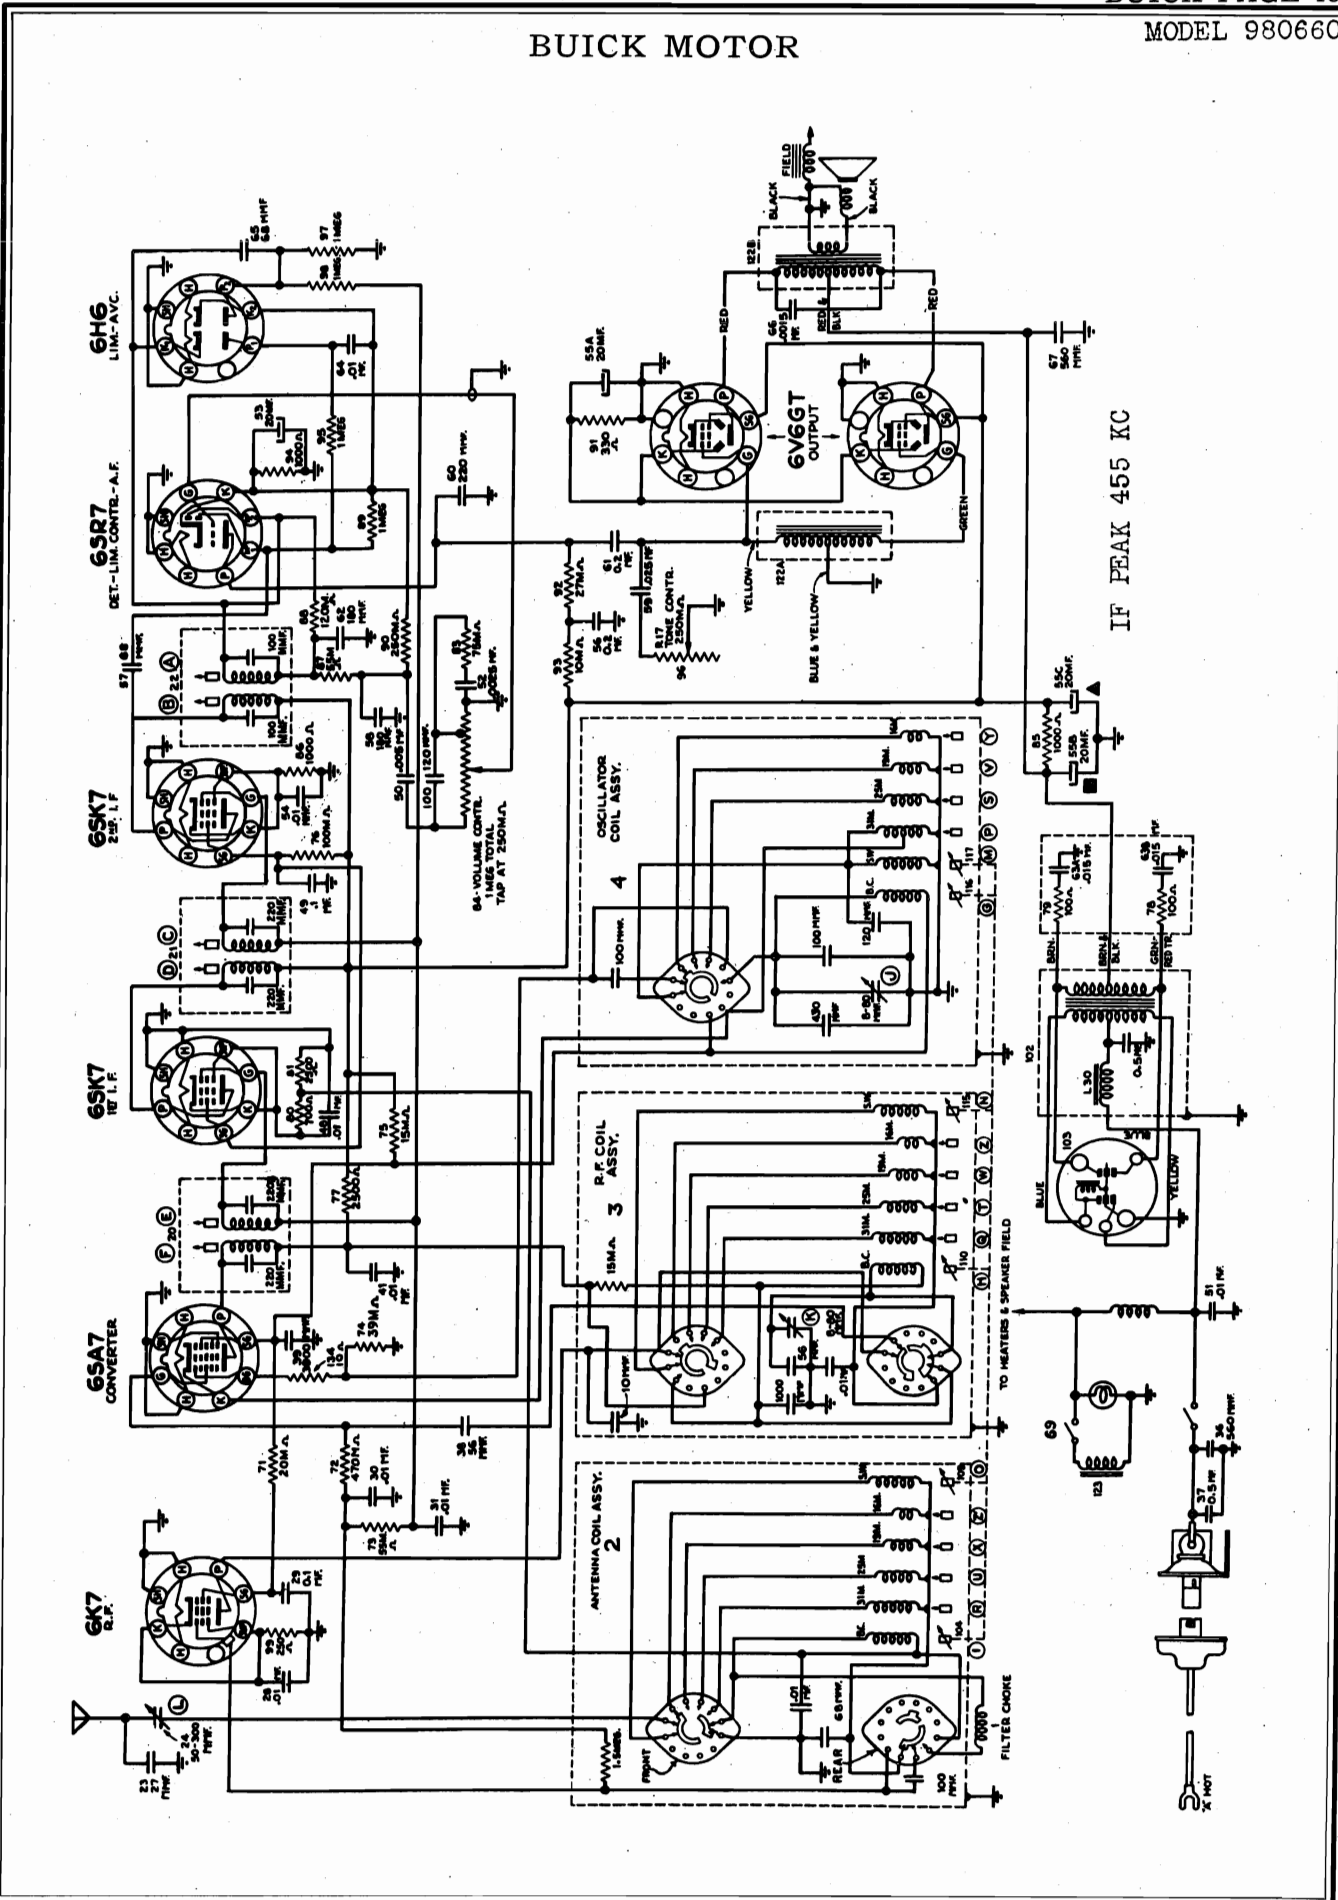

- (a) Leave the signal generator connected as before.
- (b) Set the signal generator to 600 Kilocycles.
- (c) Tune this signal in on the set.
- (d) Adjust the oscillator coil iron core aligning screw (Illus. H, Fig. 3) while rocking the condenser gang back and forth through the signal until maximum output is obtained.
- (e) Adjust screw (Illus. J, Fig. 4) for maximum output.
- (f) Repeat adjustments made under 3 and 4 above.

5. Adjustment of Radio to Car Antenna

The radio should be adjusted to the car antenna after mounting in the car. The following adjustment should be made:

- (a) Tune in a weak station near the high frequency end of the dial (approximately 1400 KC.)
- (b) Adjust the antenna trimmer (Illus. G, Fig. 3) for maximum output.

BUICK MOTOR

BUICK MOTOR

FIG. 4--PARTS LAYOUT--Bottom View

**TUBE VOLTAGE CHART
BOTTOM VIEW**

* ALL VOLTAGES GIVEN SHOULD BE CHECKED WITH BAND SELECTOR SWITCH SET IN THE BROADCAST BAND POSITION EXCEPT (6SK7, TUBE No.3) AS NOTED ON SKETCH.

FIG. 1--TUBE SOCKET VOLTAGES

BUICK MOTOR

MODEL 980660

CIRCUIT ALIGNMENT

ALIGNMENT PROCEDURE: The adjustable trimmers and iron cores in this receiver have been very carefully adjusted at the factory and should require no further adjustment (except the antenna trimmer item L), unless tampered with or a defective unit has been replaced. It is, therefore, advisable not to attempt any adjustment unless it is definitely known that an adjustment is necessary.

Should realignment be necessary the circuits can be properly adjusted only by the use of a calibrated test oscillator or signal generator and an output meter.

To align the circuits of this receiver correctly, an accurately calibrated oscillator or signal generator and an output meter must be used. In aligning this receiver it is very important that the correct frequencies be used and that all alignment adjustments be made in sequence specified below starting with the I.F. Amplifier, then aligning the broadcast band and finally the short wave bands. Slight misalignment of either the I.F. or R.F. circuits will result in a loss of sensitivity over most of the dial.

All R.F. and I.F. adjustments are accessible after removing the speaker cover and rear cover. The I.F. primary windings are adjusted by iron core screws B, D, F, located on top of the I.F. transformers, Fig. 3, and the secondary windings A, C, E are adjusted by core screws located at the bottom of each I.F. transformer, Fig. 4.

FIG. 5--DIAL CORD LAYOUT

FIG. 6--TRIMMER LOCATIONS

1. Aligning I.F. Stages at 455 K.C.

- (a) Connect output meter across the voice coil of the speaker.
- (b) Connect the high side of the signal generator to the grid of the second I.F. tube 6SK7, (Pin #4, Fig. 2) through a .01 mfd. condenser and the low side of the signal generator should be connected to the frame of the chassis.
- (c) Turn the volume control on full.
- (d) Adjust signal generator to 455 K.C.
- (e) Adjust core screws (illus. A & B, Figs. 4 & 3) on the 3rd I.F. transformer for maximum reading on the output meter.
- (f) NOTE: Always use the lowest signal generator output that will give a reasonable deflection on the output meter. Connect the signal generator lead through the .01 condenser to the grid of the first I.F. tube--6SK7, Pin #4--and adjust core screws (illus. C & D, Figs. 4 & 3), in the 2nd I.F. transformer for maximum output as in (e).
- (g) Connect the signal generator lead through the .01 condenser to the grid of the tube 6SA7, (Pin #9) and adjust core screws (illus. E & F, Figs. 4 & 3) in the first I.F. transformer for maximum output.

NOTE: These adjustments should be repeated several times and during alignment, the signal generator output should be kept to as low a value as is consistent with obtaining a readable indication on the output meter.

2. Broadcast Band Alignment

Six trimming adjustments are provided which include trimmers L, K, J, associated with illus. #2, 3, 4 and the three iron cores I, H, G, which are mounted in front of the coil assemblies in conjunction with the core draw bar. If realignment is found necessary, the R.F. circuits should be adjusted in the following sequence:

- (a) Tune the receiver to the extreme high frequency end of the dial and against the stop.

2. Broadcast Band Alignment--Cont'd.

- (b) Turn each of the three core screws (Illus. G, H, & I, Fig. 6) in a counter-clockwise direction 8 TURNS. (This is done in order to separate the cores from the coil windings far enough so that the cores will have no effect on the frequency of the circuits.)
- (c) Connect the "high" side of the signal generator, through a 30 mmf. condenser, to the Buick shielded antenna lead-in cable, (Part No. 1321036), and the "low" side to the shield of the cable.
- (d) Connect the output meter across the voice coil and turn the volume control to maximum.
- (e) Adjust the frequency of the signal generator to exactly 1590 K.C. and peak trimmers (Illus. J, K & L, Fig. 6) for maximum signal output, at the same time reducing the signal generator output to as low a value as is consistent with a reliable indication on the output meter.
- (f) Change the frequency of the signal generator to 1560 K.C. and turn the oscillator core screw (Illus. G, Fig. 5) clockwise until maximum output is obtained.
- (g) Change the frequency of the signal generator to 1200 K.C. and TUNE the RECEIVER by means of the manual tuning knob for maximum signal at approximately 1200 K.C. Check the dial calibration at 1200 K.C. (between 110 and 150 on the dial) and if the receiver does not appear to track at this point repeat paragraph F.
- (h) Adjust the core screws (Illus. H & I, Fig. 5) for maximum signal output.
- (i) Change the frequency of the signal generator to 600 K.C.
- (j) TUNE the RECEIVER by means of manual tuning knob for maximum signal at 600 K.C.
- (k) Adjust the antenna and R.F. trimmers (Illus. L & K, Fig. 6) for maximum output.
- (l) Reset signal generator to 1200 K.C. and tune receiver for maximum output at 1200 K.C.
- (m) Adjust antenna and R.F. cores (Illus. H & I, Fig. 5) for maximum output.
- (n) Adjust core screw (Illus. S, Fig. 6) as in (g) above.
- (o) Adjust core screws (Illus. W & X, Fig. 6) as in (h) above.
- (p) Change the signal generator frequency to 17.8 MC, the band indicator to "16 METERS", and move the pointer to 17.8 MC. on the dial scale.
- (q) Adjust core screw (Illus. V, Fig. 6) as in (g) above.
- (r) Adjust core screws (Illus. Y, Fig. 6) as in (h).
- (s) Repeat operations e, f, g, h, i, j, k, l, m, n, o, p, q, and r, described above at least three times.

4. General Alignment Information

Alignment of the short wave bands should never be attempted without first completing the broadcast alignment.

The most satisfactory method of aligning or checking the "Spread-Band" ranges is on actual reception of short wave stations of KNOWN FREQUENCY, by adjusting the iron oscillator coil for each band (Illus. P, S, V & Y, Fig. 6) so that these stations come in at the correct points on the dial. (Note: Repeat R, F & Ant.)

In exceptional cases, when the set is being serviced in a location where the noise level is high enough to prevent reception of short wave stations, a signal generator should be used for alignment, but an extremely high degree of accuracy is required in the frequency settings of the signal generator, as a slight error will produce considerable inaccuracy on the spread-band dial.

3. Short Wave Alignment

Because of the extensive frequency range of this receiver it is necessary that the short wave bands be aligned in exact accordance with the following procedure. Be sure to make all adjustments in the order specified below.

- (a) Do not attempt to align the short wave bands without having first completed the broadcast alignment.
NOTE: THIS IS VERY IMPORTANT.
- (b) Turn the band indicator to "31 METERS", and the volume control to maximum.
- (c) Tune the receiver so that the dial pointer is at the extreme high frequency end of the 31 meter band and adjust iron core screws (Illus. M, N & O, Fig. 5) so that each core end is flush with the coil forms, which extend beyond the shield.
- (d) Turn iron trimmer core screws (Illus. R, U, X, Z, Q, T, W, Z, P, S, V, Y, Fig. 6) in a counter-clockwise direction as far as they will go.
NOTE: Do not force the cores against their stops as too much force may fracture the core.

Adjust trimmer G to match car antenna (1450 KC) when radio is installed.
 Rock gang condenser back and forth through signal during 600 K.C. adjustment of screws H & J. See Bulletin 6D-2 for complete Alignment Procedure.

PUSH BUTTON SET-UP

Release holding spring in bottom of button, pull button off. Loosen re-set screw, tune in desired station. Push in re-set screw until it bottoms. Release and tighten screw. Replace button.

MODEL 980660

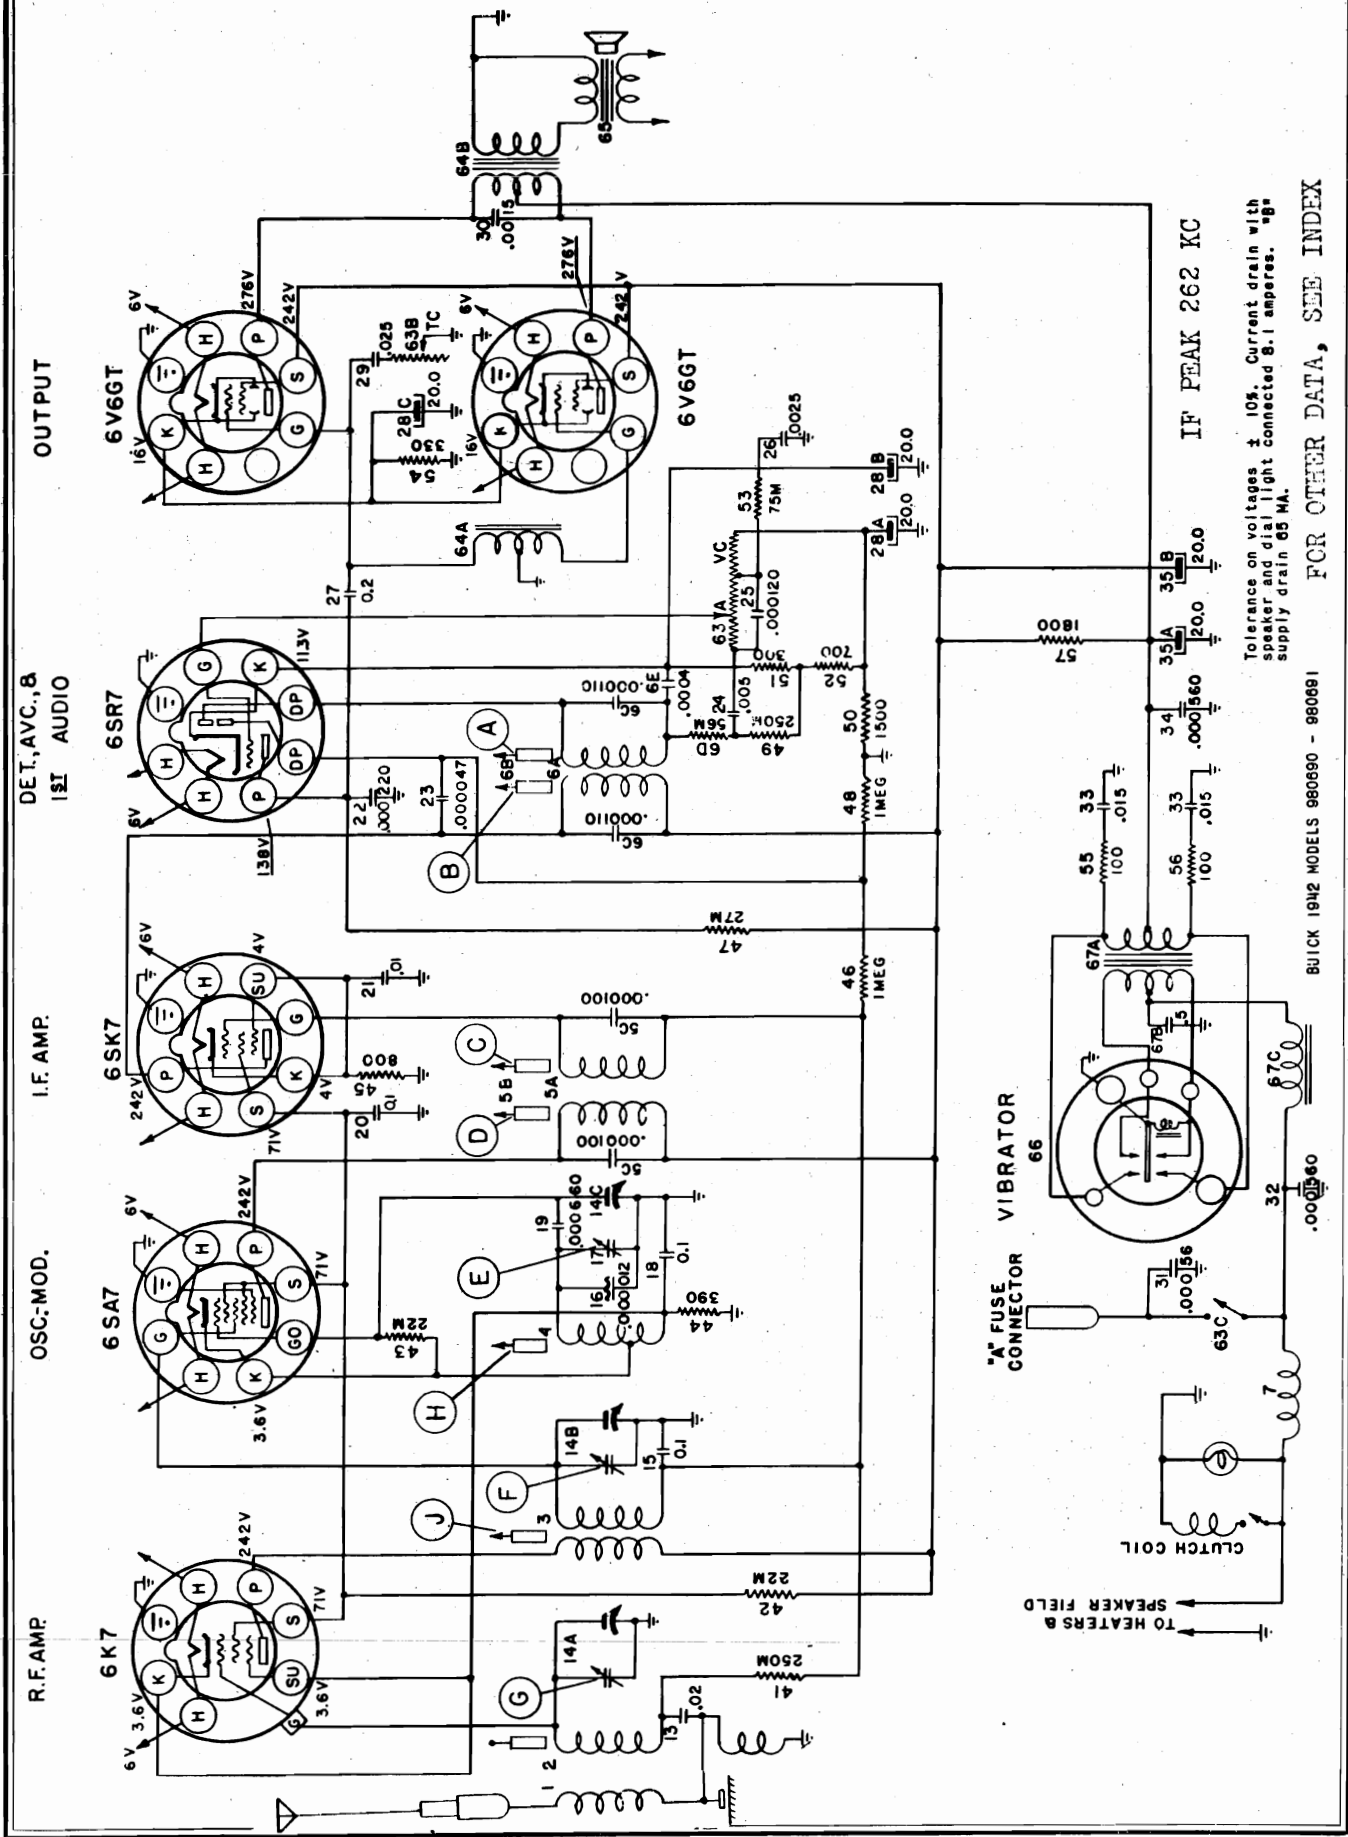

5. Adjusting Antenna Compensating Condenser

- This adjustment should only be made after the receiver has been properly installed in the car with the antenna connected to the receiver. Tune the receiver to a weak signal at the high frequency end of the broadcast band at about 1200 K.C. and with the antenna fully extended, adjust the antenna compensating trimmer (illus. 1, Fig. 6) for maximum signal strength.
 Do not attempt to make any other alignment adjustments with the receiver installed in the car.
- Remove speaker (front) cover, rear cover and the bottom of tuner section. Unsolder the connecting leads from the volume control and other points in the chassis.
 - Remove the link and arm arrangement that operates the band switches by first removing the two units, (A), holding the short link arm (B) to the band indicator shaft.
 - Remove screws (C) and link arms (D) from each of the band switch shafts, but in removing the center one, care should be taken not to lose the two steel rollers and "S" spring (which are loose on the assembly) from the detent device at the base of the center coil unit.
 - Remove the four units (E) which hold the coil plate (F) to the tuner assembly and withdraw the coil plate from the assembly, being careful to prevent the coil cores from striking any part of the assembly which may result in breakage of the core.
 - After removing the two small screws located at the base of each coil unit, the coil units can then be removed from the coil plate.
 - In re-assembling the cores into the coil units, hold the coil plate (F) slightly "off-square" from the cores, then insert the core nearest its coil, one by one, as the coil plate is brought square with the tuner assembly frame.

REMOVAL OF COIL UNIT

Should it become necessary to remove a coil unit, the following procedure should be followed:

IF PEAK 262 KC

Tolerance on voltages ± 10%. Current drain with speaker and dial light connected 8.1 amperes. *8" supply drain 65 MA.

BUICK MOTOR

AMPLIFIER UNIT ' FIG. 2--BUICK MODEL 1323457 CIRCUIT DIAGRAM

GENERAL: The Buick model 1323457 is a 7 tube three unit radio built especially for 1941 Buick cars. It is arranged with an arm rest mounting tuner, and amplifier unit for trunk mounting and a header speaker to be mounted in the rear of the car.

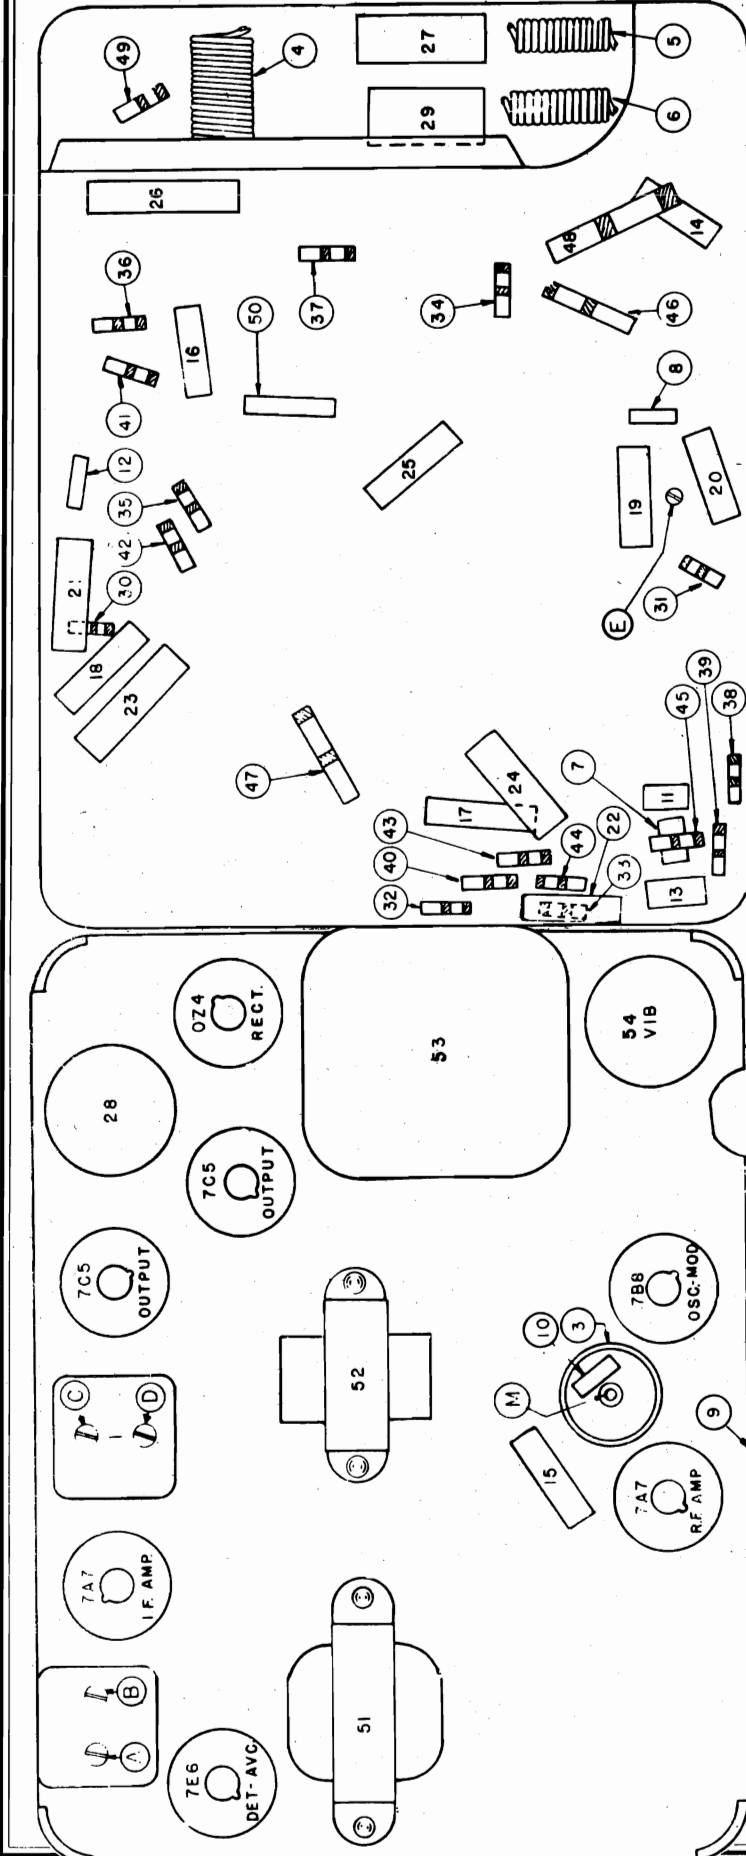

FIG. 3--PARTS LAYOUT--Top View

FIG. 4--PARTS LAYOUT--Bottom View

TUNING CONTROL: Tuning is accomplished by means of a manual tuning control or by means of five push buttons each of which adjusts the position of three iron cores in the tuning unit to preselected frequencies.

Setting up the push buttons for any desired station is accomplished by pressing the button into its latched position and rotating in the manner of a manual tuning control until the desired station is tuned in. No locking device is required to retain this setting.

Note: Do not hold button in beyond its normal latching position when setting up station.

The manual control operates by pressing the tuning knob into its latched position and tuning in the conventional manner.

BUICK MOTOR

CAPACITY ALIGNMENT

1. Aligning I.F. stages at 455 K.C.
 - (a) Connect the ground lead of the signal generator to the chassis frame.
 - (b) Connect the signal lead of the signal generator to the grid of the 7B8 tube (Grid side of condenser 12) through a 0.1 mfd. condenser.
2. Mechanical alignment of cores--Cont'd.
 - (b) Remove the pointer plate (note insulating washers under mounting screw) without disturbing the tuning mechanism.
 - (c) Using a spare core as a gauge, adjust the oscillator core K so that its rear surface is exactly flush with the front end of the oscillator coil winding.
 - (d) Manually tune the set to a point where the front surface of the oscillator core is flush with the front end of the oscillator coil fiber mounting bushing.
 - (e) Adjust the antenna and R.F. cores (Illus. J, L, Fig. 5) so that the front surfaces of these cores are flush with the front ends of the coil fiber mounting bushing. Paragraphs (c), (d) and (e) mechanically align the cores so that all three are just at the point of entering their respective windings when the tuning mechanism is against the high frequency stop.
 - (f) Replace the pointer plate assembly.
3. Aligning at 1560 K.C.
 - (a) Connect the signal lead of the signal generator to the antenna connection of the receiver through an .000075 mfd. condenser.
 - (b) Turn the manual control of the set to the high frequency end against stop.
 - (c) Set signal generator to 1560 K.C.
 - (d) Adjust the oscillator trimmer (Illus. F, Fig. 5) for maximum output.
4. Aligning at 600 K.C.
 - (a) Leave the signal generator connected the same as before and set frequency to 600 K.C.
 - (b) Tune in this frequency on the set.
 - (c) Adjust the R.F. trimmer (Illus. G, Fig. 5) for maximum output.
 - (d) Adjust the antenna trimmer (Illus. H, Fig. 5) for maximum output.
5. Aligning at 1400 K.C.
 - (a) Set the signal generator to 1400 K.C. and tune set to this signal.
 - (b) Adjust the antenna core (Illus. J, Fig. 5) and the R.F. core (Illus. L, Fig. 5) for maximum output.
6. Realigning at 600 and 1400 K.C.
 - (a) Repeat the alignment outlined under paragraphs 4 and 5 with as low an output from the signal generator as possible.
 - (b) Apply cement to the core screws to prevent their changing alignment.
7. Adjusting receiver to car antenna.

After the receiver is installed in the car readjust the antenna trimmer (Illus. H, Fig. 5) on a weak station near 1400 K.

CIRCUIT ALIGNMENT

If realignment is found necessary, the circuits can be properly aligned only with the use of a calibrated test oscillator or signal generator and an output meter. Extreme care should be exercised in following the alignment instructions in order to obtain the best performance possible.

ALIGNMENT PROCEDURE

Two separate alignment procedures are included in these instructions. The first or capacity alignment is to be considered the usual alignment procedure and the second or circuit and inductance alignment is to be used only when there is definite evidence that the iron cores of the tuning coils are out of alignment.

CAPACITY ALIGNMENT

1. Aligning I.F. stages at 455 K.C.
 - (a) Connect the ground lead of the signal generator to the chassis frame.
 - (b) Connect the signal lead of the signal generator to the grid of the 7B8 tube (Grid side of condenser 12) through a 0.1 mfd. condenser.
 - (c) Connect an output meter across the speaker voice coil. (If speaker is disconnected a 4 ohm load may be used instead.)
 - (d) Set signal generator to 455 K.C.
 - (e) Turn the set volume control on full and tune the set to a position where no squeals or beat notes may be heard, and so that when the tuning control knob is rotated within narrow limits there is no appreciable change in output. The tone control should be rotated to its extreme high position (clockwise.)
 - (f) Adjust the I.F. trimmers (Illus. A, B, C, D, Fig. 3) and the I.F. core adjustment (Illus. E, Fig. 4) until maximum output is obtained.
 - (g) Repeat these adjustments with as low an output from the signal generator as possible for more accurate alignment.
 - (h) Connect the signal generator to the antenna connection of the set through an 80 mmfd. condenser.
 - (i) Adjust the I.F. trap adjustment (Illus. M, Fig. 3) for MINIMUM output.
2. Alignment at 1560 K.C.
 - (a) Leave signal generator connected the same as for the I.F. trap adjustment.
 - (b) Tune the set to the extreme high frequency position against the stop.
 - (c) Set the signal generator to 1560 K.C.
 - (d) Adjust the oscillator trimmer (Illus. F, Fig. 5) for maximum output.
3. Alignment at 600 K.C.
 - (a) Set the signal generator to 600 K.C. and tune the set to this signal.
 - (b) Adjust the R.F. trimmer (Illus. G, Fig. 5) and the antenna trimmer (Illus. H, Fig. 5) for maximum output.

To Control the Vacuum Aerial (Cont'd.)

within the other. For maximum reception both rods should be extended to their full height, the inner rod being extended manually.

TO CHANGE STATION SETTING OF PUSH BUTTONS

The five push buttons should be set up for five stations which are received favorably in your vicinity. The procedure for setting up the push buttons is as follows:

1. Turn on the radio and allow it to warm up from ten to fifteen minutes.
2. Depress button to be set up until it latches and remains depressed.
3. Without pressing or holding the button down, turn it, as in manual tuning, until the desired station is tuned in. This should be done very carefully until the station comes in sharp and clear, free from background noise.
4. Repeat this process for any other buttons which you wish to change.

The setting of any button may be changed at any time by following this procedure.

CAUTION: TURNING ANY OF THE PUSH BUTTONS CHANGES ITS STATION SETTING. DO NOT TURN ANY BUTTON UNLESS YOU WISH TO CHANGE THE SETTING.

This model is a 7-tube three unit radio covering the standard broadcast band and designed for installation in the rear trunk compartment with the remote control in the right rear arm rest. The speaker is mounted in the trunk on the ledge behind the rear seat back, the sound being projected through an opening in this ledge.

The permeability tuned remote control unit contains the complete tuning and control mechanism and coils.

The receiver unit contains the RF tubes, the IF amplifier, audio system and power supply. This unit is connected to the remote tuner unit by a shielded plug-in cable.

Tuning is accomplished by means of the conventional manual control or by means of five push buttons. Pushing any of the buttons operates a small mechanical motor which moves the tuning cores in or out of the coils to a pre-selected position.

The separate rear compartment speaker is a new elliptical design and is 6-1/4" x 9-1/4". The speaker's 21 ounce permanent magnet insures excellent tone quality under all operating conditions.

TO CONTROL THE VACUUM AERIAL

To the left of the volume control rod is the knob which controls the vacuum aerial. Pulling this button upward will raise the aerial and pushing it downward will lower the aerial. The vacuum aerial has two rods, one sliding

CIRCUIT

If realignment is found necessary, the circuits can be properly aligned only with the use of a calibrated test oscillator or signal generator and an output meter. Extreme care should be exercised in following the alignment instructions in order to obtain the best performance possible.

ALIGNMENT PROCEDURE

Two separate alignment procedures are included in these instructions. The first or capacity alignment is to be considered the usual alignment procedure and the second or capacity and inductance alignment is to be used only when there is definite evidence that the iron cores of the tuning coils are out of alignment.

CAPACITY ALIGNMENT

1. Aligning I.F. stages at 455 KC.
 - (a) Connect the ground lead of the signal generator to the chassis frame.
 - (b) Connect the signal lead of the signal generator to the grid of the 7B3 (Grid side of condenser 56) through a 0.1 mfd condenser.
 - (c) Connect an output meter across the speaker voice coil. (If speaker is disconnected a 4 ohm load may be used instead).
 - (d) Set signal generator to 455 KC.
 - (e) Turn the set volume control on full and tune the set to a position

CADILLAC DIV.—GEN. MOTORS

Capacity Alignment (Cont'd.)

where no squeals or beat notes may be heard, and so that when the tuning control knob is rotated within narrow limits there is no appreciable change in output. The tone control should be rotated to its extreme high position (clockwise).

- (f) Adjust the I.F. trimmers A, B, C, and D, and the I.F. core adjustment E until maximum output is obtained.
- (g) Repeat these adjustments with as low an output from the signal generator as possible for more accurate alignment.
- (h) Connect the signal generator to the antenna connection of the set through a 70 mmfd. condenser.

- (i) Adjust the I.F. trap adjustment M for minimum output.

2. Alignment at 1615 KC.

- (a) Leave signal generator connected the same as for the I.F. trap adjustment.
- (b) Tune the set to the extreme high frequency position against the stop.
- (c) Set the signal generator to 1615 KC.
- (d) Adjust the oscillator trimmer F for maximum output.

3. Alignment at 600 KC.

- (a) Set the signal generator to 600 KC and tune the set to this signal.
- (b) Adjust the R.F. trimmer G and the antenna trimmer H for maximum output.

CAPACITY AND INDUCTANCE ALIGNMENT1. Aligning I.F. stages at 455 KC.

Align the I.F. stages as outlined under paragraph 1 under "Capacity Alignment".

2. Mechanical Alignment of Cores.

- (a) Turn the manual control of the set to the high frequency end, against stop.
- (b) Remove the pointer plate (note insulating washers under mounting screws) without disturbing the tuning mechanism.
- (c) Using a spare core as a gauge, adjust the oscillator core K so that its rear surface is exactly flush with the front end of the oscillator coil winding.
- (d) Manually tune the set to a point where the front surface of the oscillator core is flush with the front end of the oscillator coil fibre mounting bushing.

Capacity and Inductance Alignment (Cont'd.)

- (e) Adjust the antenna and R.F. cores J and L so that the front surfaces of these cores are flush with the front ends of the coil fibre mounting bushing. Mechanically align the cores so that all three are just at the point of entering their respective windings when the tuning mechanism is against the high frequency stop.

- (f) Replace the pointer plate assembly.

3. Aligning at 1615 KC.

- (a) Connect the signal lead of the signal generator to the antenna connection of the receiver through a 70 mmfd. condenser.
- (b) Turn the manual control of the set to the high frequency end against stop.
- (c) Set signal generator to 1615 KC.
- (d) Adjust the oscillator trimmer "F" for maximum output.

4. Aligning at 600 KC.

- (a) Leave the signal generator connected the same as before and set frequency to 600 KC.
- (b) Tune in this frequency on the set.
- (c) Adjust the R.F. trimmer G for maximum output.
- (d) Adjust the antenna trimmer H for maximum output.

5. Aligning at 1400 KC.

- (a) Set the signal generator to 1400 KC and tune set to this signal.
- (b) Adjust the antenna core J and the R.F. core L for maximum output.

6. Realigning at 600 and 1400 KC.

- (a) Repeat the alignment outlined under paragraphs 4 and 5 with as low an output from the signal generator as possible.
- (b) Apply cement to the core screws to prevent their changing alignment.

7. Adjusting receiver to car antenna.

After the receiver is installed in the car, readjust the antenna trimmer H on a weak station near 1400 KC.

Capacity Alignment (Cont'd.)

(b) Tune the receiver to the signal and adjust the trimmers F and G for maximum output. Signal generator signal should be as low as possible and still give a satisfactory meter reading.

This type of tuning circuit does not require alignment at 600 KC.

4. Alignment with Car Antenna

Antenna trimmer G must be adjusted to match car antenna when receiver is installed; use a weak station signal between 1000 and 1500 KC. The antenna should be fully extended when making this adjustment.

CAPACITY AND INDUCTANCE ALIGNMENT

1. I.F. Alignment at 262 KC.

Follow the procedure as outlined under I.F. Alignment at 262 KC Capacity Alignment.

2. Alignment at 1615 KC.

(a) Connect the signal lead of the signal generator to the antenna connection of the set through a .000070 mfd condenser.

(b) Set signal generator to 1615 kilocycles.

(c) Rotate the manual tuning mechanism until the high frequency stop is reached. Mechanically align the iron cores K, H, & J by setting the oscillator core H so that its front edges project out 1-5/32" from the end of the coil form and the antenna and R.F. cores K & J project 1-5/32" from the end of their respective coil forms.

(d) Adjust the oscillator trimmer E, R.F. trimmer F, and antenna trimmer G for maximum output.

3. Alignment at 1400 KC.

(a) Set signal generator to 1400 K.C. and tune set to this signal.

(b) Adjust the R.F. core J for maximum output.

(c) Adjust the antenna core K for maximum output.

4. Realignment at 1615 and 1400 KC.

(a) Repeat alignment of trimmer E and trimmers F and G at 1615 KC.

(b) Repeat alignment of cores K and J at 1400 KC. Apply shellac to the core screws to seal the adjustment.

5. Alignment with car antenna.

Antenna trimmer G must be adjusted to match car antenna when receiver is installed; use a weak station signal between 1000 and 1500 KC. The antenna should be fully extended when making this adjustment.

CIRCUIT ALIGNMENT

Alignment Procedure: The trimmer condensers in this receiver have been carefully adjusted at the factory and should require no further adjustment (except the antenna trimmer) unless tampered with or unless a defective coil has been replaced. It is advisable not to attempt any adjustment unless it is definitely known that an adjustment is necessary.

An accurately calibrated test oscillator or signal generator and an output meter must be used to align the receiver circuits correctly. To make all alignment adjustments, the front and back covers must be removed. All trimmers are readily accessible. The antenna trimmer is adjusted in the rear of the case near the antenna socket.

Due to the fact that the iron cores have been sealed in place at the factory, only the trimmer adjustments as outlined under capacity alignment should be made unless the coils of the iron cored tuning unit are changed.

CAPACITY ALIGNMENT

1. I.F. Alignment at 262 KC

(a) Connect an output meter across the voice coil terminals of the speaker leaving the speaker connected.

(b) Connect the ground lead of the signal generator to the chassis frame.

(c) Connect the signal lead of the signal generator to the grid of the 6SA7 tube through the 0.1 mfd condenser.

(d) Turn set volume control on full and tone control to the extreme treble end. Set the signal generator at 262 KC. Tune the receiver to a frequency where no squeals or beat notes may be heard and so that when the tuning control is moved in narrow limits no appreciable change in output may be noted.

(e) Adjust the I.F. trimmers A, B, C, & D for maximum output, beginning with trimmer A.

2. Alignment at 1615 KC

(a) Connect the signal lead of the signal generator to the receiver antenna connection through a .000070 mfd condenser or 7241619 alignment dummy.

(b) Turn the manual tuning control of the receiver to the stop at the extreme high frequency end of the dial.

(c) Set the signal generator to 1615 KC.

(d) Adjust the oscillator trimmer E for maximum output.

3. Alignment at 1400 KC

(a) Set the signal generator to 1400 KC.

CHEVROLET DIV.—GEN. MOTORS

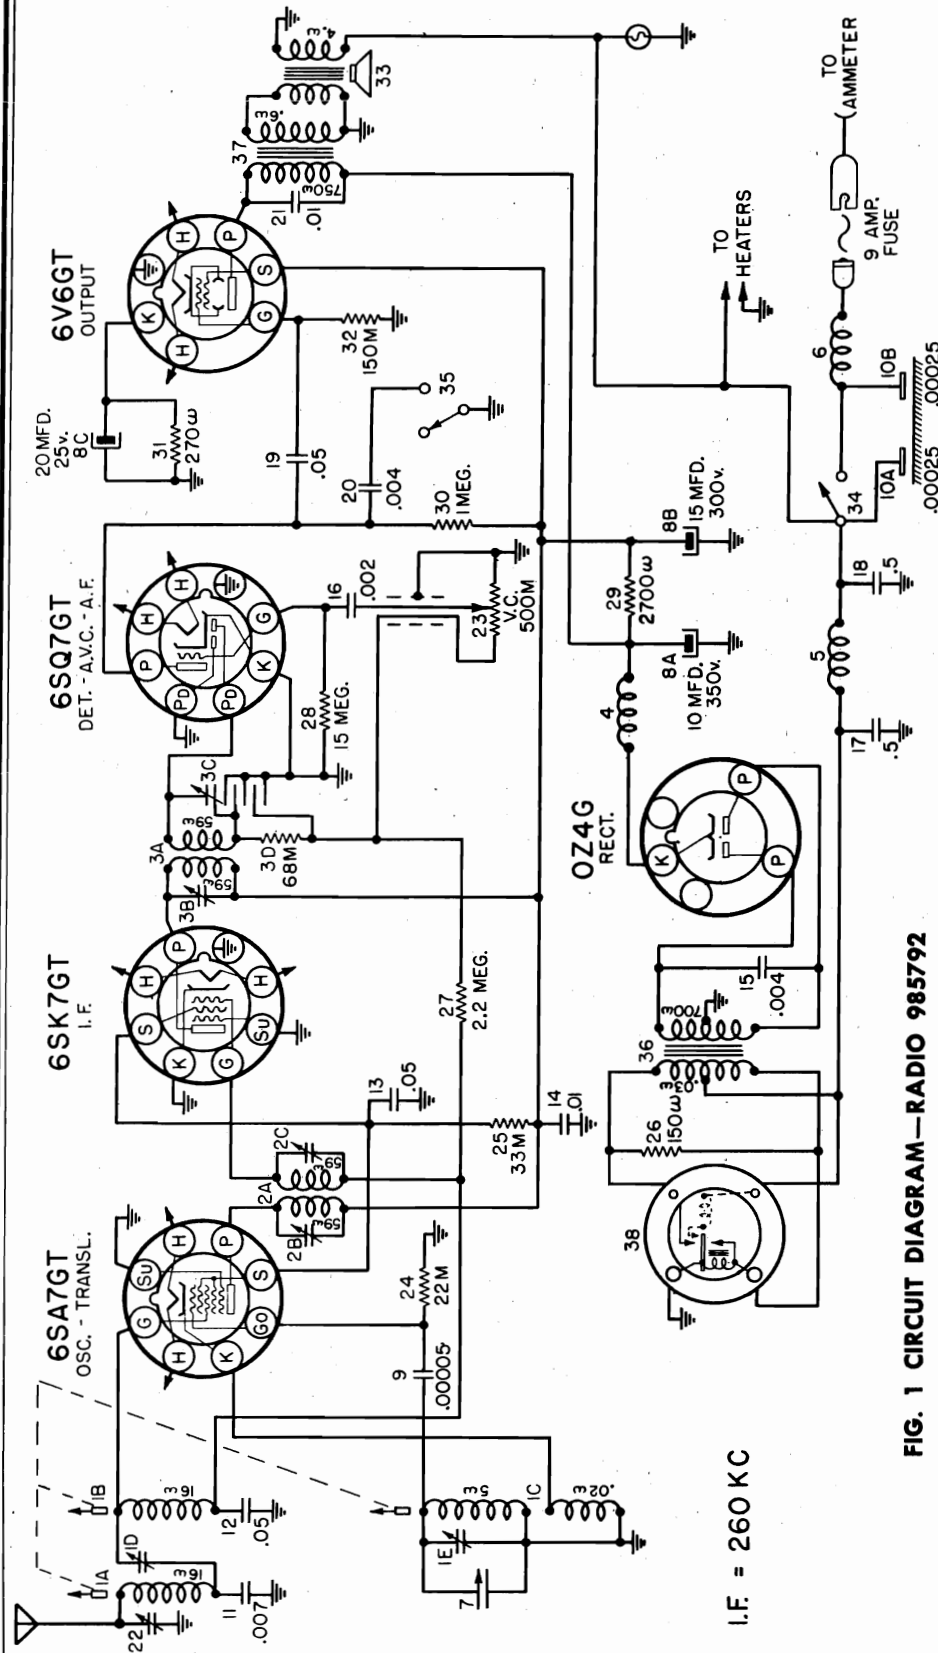

FIG. 1 CIRCUIT DIAGRAM—RADIO 985792

GENERAL: This auto radio is a five-tube single unit universal receiver with automatic push-button tuning. The power supply consists of an OZ4G rectifier tube used in conjunction with a full wave plug-in vibrator. The receiver is designed to mount through the instrument panel in all 1942 Chevrolet cars, and may be mounted under the instrument panel in other cars and trucks.

Antenna System: The antenna system used with this receiver consists of a rod-type antenna with a specially designed low capacity lead-in.

CHEVROLET DIV.—GEN. MOTORS

RADIO BULLETIN 3-37
 Part No. 985792
 Date 10-1-41

CHEVROLET DIV.—GEN. MOTORS

- (c) Tune the receiver until this frequency is tuned in with maximum output.
- (d) Adjust the antenna compensating condenser "G" (see parts layout) for maximum output.
- (e) Adjust the grid coil trimmer condenser "F" for maximum output.

NOTE: With permeability tuning it is necessary to adjust the capacity at only one frequency. The coils are so wound that tracking is automatic and the usual low frequency adjustments are not necessary. If the entire alignment procedure has been accomplished accurately, the receiver should be uniformly sensitive over the entire frequency range.

Instructions for the Replacement of Tuning Core Assembly Part No. 1216034

1. Remove broken or defective core assembly (part No. 1216034) consisting of the three cores. This is accomplished by removing the coupling springs (two part Nos. 1216036) and sliding the cores out (as a complete unit) of the coils.
2. Install new core assembly, using the reverse of procedure No. 1.
3. Tune receiver to high frequency stop position by turning manual station selector control. With cores at high frequency stop position make sure that the dial is correctly set to the reference line above the 1600 kilocycle graduation line.
4. Connect the signal generator to the antenna terminal of the receiver and the output meter to the output of the receiver as outlined in the Alignment Instructions.
5. Set the signal generator to exactly 1610 kilocycles, **taking care not to change the receiver dial position.**
6. Adjust the oscillator and grid coil trimmers (see Parts Layout—"E" and "F") for maximum output meter indication.
7. Set the receiver dial to the 1300 kilocycle graduation line. (In order to make certain that the 1300 kilocycle point on the dial will be used for reference throughout this procedure it is suggested that one of the push buttons be set up for this position.)
8. Set signal generator to exactly 1300 kilocycles, **taking care not to change the receiver dial position.**
9. Align the oscillator core (see Parts Layout—"I") for maximum output. Then adjust the other two cores for maximum output indication (see Parts Layout—"H" and "J").
10. Repeat operations 3, 5, 6, 7, 8 and 9 until no further improvement can be made.

IMPORTANT NOTE: Never attempt to remove or replace one core at a time. The entire assembly (Part No. 1216034) should be removed and replaced as such.

Circuit Alignment

All of the adjustable condensers in this receiver are very accurately adjusted at the factory and will need no further adjustment (excepting antenna trimmer condenser), unless tampered with or a defective coil has been replaced. If realignment is found to be necessary, the circuits can be properly adjusted only with the use of a calibrated test oscillator or signal generator and output meter. **NOTE:** Do not attempt to align this receiver without carefully noting the following instructions.

1. Aligning I.F. Stage at 260 Kilocycles

Turn volume control to the maximum position.

- (a) Connect the signal lead of the test oscillator to terminal "X" (see parts layout), which is the control grid lead of the 6SA7GT tube, through a .1 mfd. condenser.
- (b) Connect the ground lead of the test oscillator to the chassis frame.
- (c) Connect the output meter from the plate prong of the 6V6GT output tube to ground. Care should be taken when connecting the output meter to insert a series condenser to protect the meter from d.c. voltages.
- (d) Set the test oscillator to exactly 260 kilocycles.
- (e) Adjust the trimmers "A," "B," "C" and "D" on the I.F. transformers for maximum output (see parts layout). These adjustments should be repeated several times and during alignment the test oscillator output should be kept to as low a value as is consistent with obtaining a readable indication on the output meter.

2. Aligning at 1610 Kilocycles

- (a) Leave the test oscillator leads connected the same as for aligning the I.F. circuits.
- (b) Set the test oscillator to 1610 kilocycles.
- (c) Adjust the condenser "E" (see parts layout) for maximum output. It is very important that this frequency be set accurately as a slight missetting will cause the receiver to be out of track over the high frequency end of the dial.

3. Aligning at 1400 Kilocycles

- (a) Remove the signal lead of the test oscillator from the grid of the 6SA7GT tube and connect to the antenna terminal of the receiver THROUGH A .000075 MFD. MICA CONDENSER connected in place of the .1 mfd. condenser previously used. (It is very important that a .000075 mfd. mica condenser be used when aligning the antenna stage of these receivers in order that this circuit can be made to track properly.)
- (b) Set the test oscillator to 1400 kilocycles.

CHEVROLET DIV.—GEN. MOTORS

FIG. 6 PERMEABILITY COIL ASSEMBLY PARTS—RADIO 985792

Tube Complement	
Type	Function
6SA7GT	Oscillator-Modulator
6SK7GT	I.F. Amplifier
6SQ7GT	Detector A.V.C.—1st Audio
6V6GT	Audio Output
0Z4G	Rectifier

Circuit Description

The circuit used in this receiver is the superheterodyne type, employing the permeability method of tuning. An adjustable condenser is provided for matching the antenna circuit to the antenna. This adjustment is made near the high frequency end of the band (1400 kilocycles).

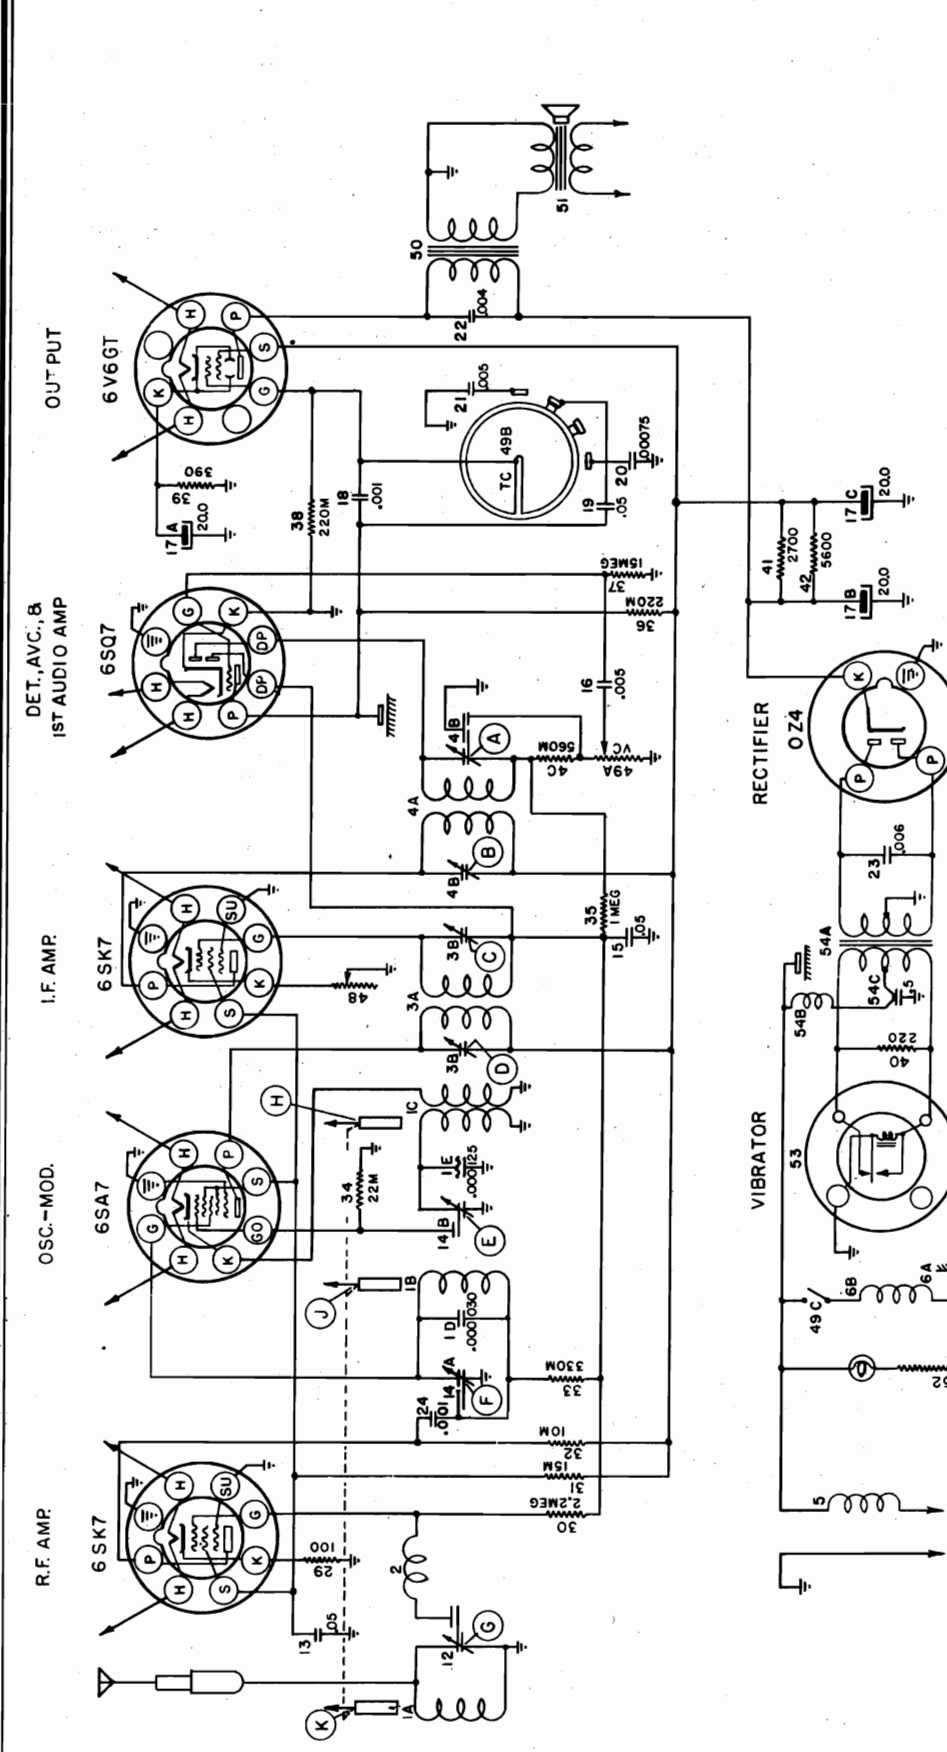

TO RECALIBRATE AFTER REPLACING DRIVE STRING, TURN COIL CORES FULLY IN, THEN HOLD SHAFT STATIONARY WITH PLIERS, AND REVOLVE DIAL WITH FINGERS UNTIL THE 60 CALIBRATION LINE IS IN RELATION SHOWN TO BRACKET.

FIG. 4 DIAL CORD HOOK-UP—RADIO 985792

FIG. 5 POWER PACK PARTS LAYOUT RADIO 985792

CHEVROLET DIV.—GEN. MOTORS

This auto radio is a six-tube single unit radio designed expressly for 1942 Chevrolet automobiles. The complete radio mounts behind the instrument panel and has five push-buttons. The manual tuning control, volume and tone control knobs, dial and push-buttons extend through the instrument panel, blending with the design of the car interior. An elliptical speaker is used and is mounted in the front of the receiver, projecting sound through the ornamental grille of the instrument panel. Tuning is accomplished by a mechanical unit of rugged construction assuring accuracy. A special compensating condenser in the oscillator circuit minimizes tuning circuit changes due to normal variations in car voltages and temperature ranges. The power supply consists of a full wave primary type vibrator, a power transformer and an 0Z4 rectifier tube.

FIG. 1 CIRCUIT DIAGRAM—RADIO 985793

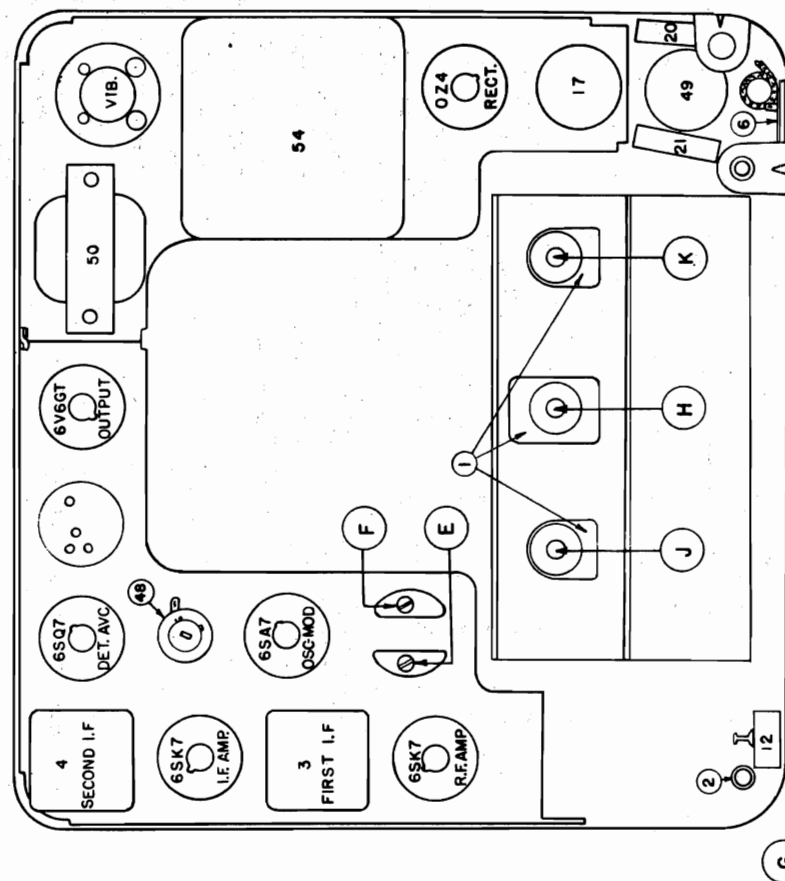

FIG. 3 PARTS LAYOUT—RADIO 985793

Circuit Description

The circuit used in this receiver is the conventional superheterodyne type and uses no regeneration. The tuning circuits are tuned by varying the inductance of the antenna, R.F. and oscillator coils by means of iron cores which slide in and out of the coils like pistons. The alignment of the cores has been sealed at the factory and further adjustment should not be required unless the coils have been changed or an iron core has been replaced. A special tone control circuit is employed to give the desired tone without distortion.

Antenna Circuit: The antenna circuit is directly coupled to the antenna. The antenna, oscillator and R.F. circuits are tuned by means of iron cores. The antenna circuit is adjusted for slight variations in antenna capacity by means of an antenna trimmer located on the bottom of the receiver case.

PARTS LAYOUT—TUBE VIEW.

FIG. 5 ESCUTCHEON CROSS SECTION—RADIO 985793

MODEL 985793

CHEVROLET DIV.—GEN. MOTORS

Capacity Alignment**1. I.F. Alignment at 262 Kilocycles**

- (a) Connect a 0.1 mfd. condenser between the plate prong of the 6V6GT output tube and one terminal of the output meter, to protect the meter from DC voltages. Connect the other terminal of the output meter to ground.
- (b) Connect the ground lead of the signal generator to the chassis frame.
- (c) Connect the signal lead of the signal generator to the grid (G) prong of the 6SA7 tube socket through a 0.1 mfd. condenser.
- (d) Turn the set volume control on full and rotate the tone control knob to the center (Music) position. Adjust the signal generator to 262 kilocycles, and tune the receiver to a frequency where no squeals or beat notes may be heard and so that when the tuning control is moved through narrow limits no appreciable change in output is noticeable.
- (e) Adjust the I.F. trimmers A, B, C, and D for maximum output.

2. Aligning at 1615 Kilocycles

- (a) Connect the signal lead of the signal generator to the receiver antenna connection through a .000070 mfd. condenser.
- (b) Turn the manual control of the receiver to the stop at the extreme high frequency end of the dial.
- (c) Set the signal generator to 1615 kilocycles.
- (d) Adjust the oscillator trimmer "E" for maximum output.
- (e) Adjust the R.F. trimmer "F" for maximum output.
- (f) Adjust the antenna trimmer "G" for maximum output.

3. Aligning at 1400 Kilocycles

- (a) Set the signal generator frequency to 1400 kilocycles.
- (b) Tune the receiver to this signal and readjust the R.F. trimmer "F" and antenna trimmer "G" for maximum output. The signal generator output should be as low as possible and still give a satisfactory output meter reading.

NOTE: This type of tuning circuit does not require alignment at 600 kilocycles.

4. Alignment with Car Antenna

Antenna trimmer "G" must be adjusted to match the car antenna when receiver is installed. With the antenna fully extended tune in a weak station near 1400 on the dial and adjust the antenna trimmers for maximum volume.

Capacity and Inductance Alignment

This alignment should be used only when there is definite evidence that the iron cores are out of adjustment.

1. I.F. Alignment at 262 Kilocycles

The same procedure as previously outlined should be followed.

2. Aligning at 1615 Kilocycles

- (a) Connect the signal lead of the signal generator to the antenna connection of the set through a .000070 mfd. condenser.
- (b) Set the signal generator to 1615 kilocycles.
- (c) Rotate the manual tuning knob until the pointer is against the high frequency stop. Mechanically align the iron cores H, J and K by setting the oscillator core "H" so that its front edge sticks out $\frac{1}{16}$ " from the end of the coil form. The antenna core "K" and the R.F. core "J" should be approximately lined up with the oscillator core by aligning their front edge with that of the oscillator core.
- (d) Adjust the oscillator trimmer "E," the R.F. trimmer "F" and the antenna trimmer "G" for maximum output.

3. Aligning at 1400 Kilocycles

- (a) Adjust the signal generator to 1400 kilocycles and tune set to this signal.
- (b) Adjust the R.F. core "J" for maximum output.
- (c) Adjust the antenna core "K" for maximum output.

NOTE: When checking maximum output remove hand from the vicinity of the cores as body capacity will affect reading.

4. Realignment at 1615 and 1400 Kilocycles

- (a) Repeat alignment of trimmers "F" and "G" at 1615 kilocycles.
- (b) Repeat alignment of cores "K" and "J" at 1400 kilocycles. Do not change adjustment of oscillator core "H." Make sure insulated core spring is properly in place.

5. Alignment with Car Antenna

Antenna trimmer "G" must be adjusted to match the car antenna when receiver is installed. With the antenna fully extended tune in a weak station near 1400 on the dial and adjust the antenna trimmer for maximum volume.

Service Parts List—Cont'd

Pro-duction Part No.	Service Part No.	Part Name	Description—Function	Illus. No.
7242582	7242583	Resistor	Insulated—180,000 ohms, ¼ watt, Audio Diode Filter.	97
1214551		Resistor	Insulated—27,000 ohms, ¼ watt, 6SR7 Plate.	98
7236701	1210834	Resistor	Insulated—10,000 ohms, ¼ watt, 6SR7 Plate Filter.	99
7236684	1211085	Resistor	Insulated—1000 ohms, ¼ watt, 6SR7 Cathode.	100
7236832	7236248	Resistor	Insulated—56,000 ohms, ¼ watt, Compensation.	101
1215182		Resistor	Insulated—22,000 ohms, ¼ watt Tone Control, (Fig. 13).	102
1213488		Resistor	Insulated—680,000 ohms, ¼ watt Limited Bias Load.	103
1213488		Resistor	Insulated—680,000 ohms, ¼ watt Limiter Filter.	104
1214572		Resistor	Insulated—330 ohms, 2 watt—6V6 Cathode.	105
1215610		Control	Steering post volume control and power switch.	106
1216062		Switch	Antenna coil switch wafer.	115
1215094		Switch	R.F. coil switch wafer.	116
1216063		Switch	Oscillator coil switch wafer.	117
1215612		Switch	Tone control switch (in radio set), (Fig. 13-14).	118
1216064		Switch	Steering post tuning switch.	119
1215613		Switch	Tuning switch and arm complete (in radio set), (Fig. 13-14).	120
1215608		Transformer	First I.F. transformer.	125
1215608		Transformer	Second I.F. transformer.	126
1215609		Transformer	Third I.F. transformer.	127
1215611		Transformer	Vibrator transformer.	128
1215091		Transformer	Audio pack.	129
			A—Driver	
			B—Output	
1216065		Core	Tuning core for "A" band antenna coils—"Red".	135
1216066		Core	Tuning core for "A" band antenna coils—"Green".	135
1216067		Core	Tuning core for "A" band antenna coils—"Yellow".	135
1215089		Core	Tuning core for S.W. Antenna coil, (Fig. 13).	136
1215090		Core	Trimmer, for antenna coil—31 meter band.	137
1215090		Core	Trimmer, for antenna coil—25 meter band.	138
1215090		Core	Trimmer, for antenna coil—19 meter band.	139
1215090		Core	Trimmer, for antenna coil—16 meter band.	140
1216065		Core	Tuning core for "A" band R.F. coils—"Red".	141
1216066		Core	Tuning core for "A" band R.F. coils—"Green".	141
1215089		Core	Tuning core for "A" band R.F. coils—"Yellow".	141
1215089		Core	Tuning core for S.W.—R.F. coil.	142
1215090		Core	Trimmer, for R.F. coil—31 meter band.	143
1215090		Core	Trimmer, for R.F. coil—25 meter band.	144
1215090		Core	Trimmer, for R.F. coil—19 meter band.	145
1215090		Core	Trimmer, for R.F. coil—16 meter band.	146
1216065		Core	Tuning core for "A" band oscillator coil—"Red".	147
1216066		Core	Tuning core for "A" band oscillator coil—"Green".	147
1216067		Core	Tuning core for "A" band oscillator coil—"Yellow".	147
1215089		Core	Tuning core for S. W. oscillator coil.	148

Pro-duction Part No.	Service Part No.	Part Name	Description—Function	Illus. No.
1215090		Core	Trimmer, for oscillator coil, 31 meter band.	149
1215090		Core	Trimmer, for oscillator coil, 25 meter band.	150
1215090		Core	Trimmer, for oscillator coil, 19 meter band.	151
1215090		Core	Trimmer, for oscillator coil, 16 meter band.	152
1215084	1214923	Speaker	Complete elliptical speaker.	
1215615		Coil	Antenna coil, switch, and can assembly.	
1215616		Coil	R.F. coil, switch, and can assembly.	
1215614		Coil	Oscillator coil, switch, and can assembly.	
1215198	7239439	Vibrator	Plug-in-Unit.	160

Tuner Unit Parts

Pro-duction Part No.	Service Part No.	Part Name	Description—Function	Illus. No.
1216045		Unit	Tuner—mechanical staked assy. (includes push arm and reset screws), (Fig. 13-14).	
1216101		Arm	Pawl arm—operates push bar indicator.	170
1216102		Arm	Push arm assembly and set-up sleeve (Fig. 13).	170
1215097		Arm	Selector arm and link assembly, (Fig. 13).	171
145635		Ball	½" dia.—steel ball for worm gear.	
1215099		Bar	Pointer slide bar.	
1215100		Bar	Rocker bar, gear sector, and core rail assy., (Fig. 14).	172
1216103		Bracket	Solenoid coil holder (plunger end), (Fig. 13).	173
1216104		Bracket	Solenoid coil holder (pole piece end), (Fig. 13).	174
1215102		Bracket	Solenoid mounting bracket, (Fig. 13).	175
1214822		Clip	Retaining clip for selector arm shaft.	
1216105		Cord	Pointer cord, (Fig. 13).	176
1214464		Cover	Clutch coil cover.	
7235945		Disc	Rubber disc for clutch.	
1215104		Drum	Pointer drive cord and clutch disc, (Fig. 13).	177
1216106		Gear	Clutch pinion gear and spindle, (Fig. 13).	178
1216092		Gear	Scissors gear and disc for clutch, (Fig. 13).	179
1215106		Gear	Worm gear, (Fig. 14).	180
7239267		Guide	Dial pointer guide (carriage).	
1216107		Guide	Pointer cord guide.	
368319		Nut	¾—32 hex. nut for clutch spindle sleeve.	
7231480		Nut	¾—32 hex. nut for dimmer control.	
1305217		Nut	Locknut for solenoid pole piece, (Fig. 13).	181
1214821		Nut	Locknut for worm gear bearing screw.	
1216108		Plate	Front bearing plate.	
1215111		Plate	Push arm stop plate, (Fig. 13).	182
1216109		Plate	Rear bearing plate, (Fig. 13).	183
1216110		Plate	L.H. end plate, (Fig. 13).	184
1216200		Plate	R.H. end plate, (Fig. 13).	185
1216201		Plunger	Solenoid plunger and stud, (Fig. 13).	186
1216202		Pointer	Dial pointer only, (Fig. 14).	187
1214452		Pole	Solenoid pole piece, (Fig. 13).	188

CHEVROLET DIV.—GEN. MOTORS

Tuner Unit Parts—Cont'd

Pro-duction Part No.	Service Part No.	Part Name	Description—Function	Illus. No.
1216203		Pulley	L.H. pulley and bracket assembly (1 pulley), (Fig. 14)	189
1215114		Pulley	R.H. pulley and bracket assembly (2 pulleys) (see Illus.), (Fig. 13)	
7232972		Retainer	Clip to fasten cam shaft pawl arm to selector arm.	
1216206		Screw	Push arm set-up screw and sleeve assembled (Fig. 13-14)	192
1214845		Screw	No. 6—32x $\frac{1}{4}$ self-tapping, for tuner frame.	
1215127		Screw	No. 8—32x $\frac{1}{4}$ self-tapping, for solenoid bracket.	
1215126		Screw	No. 10—32x $\frac{3}{8}$ hex. head, for solenoid coil.	
7240316		Screw	No. 10—32x $\frac{3}{8}$ screw for worm gear bearing.	
1275555	128036	Screw	Set screw for worm gear.	
1216205		Shaft	Camshaft (See Illus.), (Fig. 14)	191
1215116		Shaft	Selector arm and link pivot shaft, (Fig. 13)	
1214466		Spring	Clutch spring.	
1215120		Spring	Core rail tension spring—L.H.	
1215234		Spring	Core rail tension spring—R.H.	
1216207		Spring	Pawl arm spring.	193
1216208		Spring	Pointer cord spring, (Fig. 14)	194
1214844		Spring	Push arm return spring, (Fig. 13)	
1215235		Spring	Rocker bar gear sector spring.	
1216209		Spring	Rocker bar tension spring.	
1214826		Spring	Selector arm and link spring, (Fig. 13)	195
7236121		Spring	Tension spring for clutch scissors gear.	
1215115	Not Serviced	Spring	Tuning core holding spring, (Fig. 14)	196
1216210		Washer	"C" washer for pawl arm.	
1214609		Washer	S.W. washer to hold indicator drum pawl arm.	
7235892		Washer	Fibre washer for worm gear bearing.	
1214837		Washer	Flat washer for selector arm shaft.	
1213909		Washer	Rubber, for push arm.	
1214823		Washer	Spring washer for worm gear bearing.	

Chassis Parts—Miscellaneous

Pro-duction Part No.	Service Part No.	Part Name	Description—Function	Illus. No.
169066		Ball	$\frac{3}{8}$ " dia. steel ball for switch detent.	
1216068		Bar	Tuning push bar.	
1216069		Board	Terminal board for antenna coil shield can.	
1215123		Bracket	S.W. shunt coil mounting bracket.	
1216070		Bushing	Tuning shaft bushing.	
1215130		Cable	Antenna cable and socket.	165
1216071		Can	Antenna coil assembly shield can.	
1216072		Can	R.F. or oscillator coil assembly shield can.	
1216073		Case	Receiver case—less control panel.	
1216074		Clip	Mounting clip for shunt coils.	
1215134		Clip	Retaining clip for coil shield can (fastens on end of coil bracket).	
1215199		Cord	Band indicator drive cord (See Illus.), (Fig. 14)	
1216075		Dial	Dial cylinder and band indicator strip (See Illus.), (Fig. 14)	

Chassis Parts—Miscellaneous—Cont'd

Pro-duction Part No.	Service Part No.	Part Name	Description—Function	Illus. No.
1216076		Drum	Range switch intermediate shaft drive cord drum.	
1216077		Escutcheon	Control panel escutcheon and window.	
1215143		Gasket	Rubber gasket for speaker cover.	
1216078		Gear	Range switch intermediate shaft gear—less set screws	
1216079		Gear Assy.	Tone control, drum drive gear (See Illus.), (Fig. 14)	
			Includes: 1—gear 1—stud 1—washer	
1216080		Gear	Tone control intermediate gear (See Illus.), (Fig. 14)	
1216081		Grommet	Rubber grommet for "A" band antenna or R.F. coil can opening.	
1216082		Grommet	Rubber grommet for "A" band antenna or R.F. coil mounting.	
1215147		Grommet	Rubber grommet "A" band oscillator coil can opening.	
1216083		Grommet	Rubber grommet for "A" band oscillator coil mounting.	
1215148		Grommet	Rubber grommet for S.W. band antenna, R.F. or oscillator coil can opening.	
7232948		Grommet	Rubber grommet for S.W. band antenna R.F. or oscillator coil mounting.	
1216084		Indicator	Push bar tuning indicator drum (See Illus.), (Fig. 14)	
1216085		Indicator	Tone indicator drum (See Illus.), (Fig. 14)	
125588		Lamp	Dial lamp—Mazda No. 55.	
1216086		Link	Coil switch link and arm assembly.	
7238510		Nut	Hex nut for volume control or tuning shaft bushing	
1216227		Nut	No. 5-40 nut for tone control switch.	
1216087		Panel	Control panel, bracket and pulleys, and gear assembled.	
1216088		Plate	Coil mounting and range switch detent plate assembly.	
1215154		Pulley	Bracket and 2 pulleys for control panel.	
1215157		Screw	Guide screw for tuning knob shaft.	
1216229		Screw	No. 6-32x $\frac{3}{8}$ " screw for push bar indicator drum index spring.	
1215160		Screw	No. 6-32x $\frac{1}{2}$ " hex head for coil switch link.	
1216047		Screw	No. 8-32x $\frac{1}{2}$ " set screw for range switch shaft cord drum or gear.	
1215161		Shaft	Coil assembly switch shaft.	
1215162		Shaft	Dial shaft.	
1216089		Shaft	Manual tuning flexible shaft.	
1216090		Shaft	Pivot shaft for push bar indicator drum.	
1215165		Shaft	Range switch intermediate shaft.	
1216091		Shaft	Range switch knob shaft and gear.	
1216093		Socket	Dial lamp socket and lead.	
1215174		Socket	Speaker plug socket.	
1213439		Socket	Tube socket.	

CHEVROLET DIV.—GEN. MOTORS

Circuit Description—Cont'd

circuit arrangement formed by the main tuning inductance (item 16) 2200 mmf. condenser (item 40) and condensers consisting of items 52, 53 and 54 in which item 53 is the negative temperature coefficient condenser.

The two 6SK7 tubes are used in the two stage I.F. amplifier. In the short wave position, both tubes get their bias from the 560 ohm resistor (item 86), but in the broadcast position a 1200 ohm variable resistor (item 87) is connected in series with the 560 ohm resistor and is adjusted in the factory for uniform sensitivity. The variable resistor (item 87) increases the bias on the 6SK7 tubes, therefore, the I.F. stage gain in the broadcast position is less than that in the short wave position so that the desired sensitivity is obtained on all bands.

The 6SR7 tube serves three distinct functions. The diode plate No. 2 is used for signal detection. Diode No. 1 is used for supplying bias for the noise limiter circuit, while the triode part is used for the audio amplifier. Diode plate No. 1 gets its signal from the primary of the 3rd I.F. transformer through the 68 mmf. condenser (item 56) and inasmuch as the secondary of the transformer is tapped down the bias for the noise-limiter circuit is greater than the DC voltage of the rectified signal. The bias for the tube is developed across the 1000 ohm resistor (item 100).

The 6H6 tube performs two functions: plate No. 1 is used in the noise limiter circuit and plate No. 2 is used for providing A.V.C. delay. A.V.C. is derived from the high end of diode load resistor (item 97) and the delay is provided by means of a bleeding resistor (item 93) from +B. For signals below the A.V.C. level, diode plate No. 2 of the 6H6 is conducting because of the + voltage from resistors 93 and 94. Under these conditions the A.V.C. line is therefore at essentially zero potential, but as signal input increases the junction of resistor 97 and the low side of the 3rd I.F. transformer secondary assumes a negative potential and when this counteracts the positive voltage from resistors 93 and 94 on 6H6 diode plate No. 2 this diode ceases to conduct. As signal input increases further, A.V.C. is applied to the R.F. and I.F. tubes.

The noise limiter functions automatically whenever a noise pulse appearing at the 3rd I.F. transformer exceeds 100 per cent modulation. Cathode No. 1 of the 6H6 is connected to the second detector diode (No. 2 of the 6SR7) and diode plate No. 1 of the 6H6, does not conduct in the absence of noise because of the negative control voltage applied through resistor 104 to diode plate No. 1 of the 6H6. This voltage is derived from the primary of the 3rd I.F. transformer by diode No. 2 of the 6SR7 and varies with the signal input in such a way that the ratio of control voltage to the second detector diode voltage is constant. This ratio determines the modulation percentage at which the noise limiter functions. If the ratio is too low, the noise limiter will cut modulation peaks and if the ratio is too high the limiter will not eliminate noise as effectively as it could. The voltage ratio is determined by the design of the complete 3rd I.F. transformer circuit and should not be changed.

Mounting and Installation Parts

Pre- dication Part No.	Service Part No.	Part Name	Description—Function	Illus. No.
605302	Condenser	.5 mfd., generator (1).....
1882272	Condenser	.5 mfd., ignition coil (1).....

606218	Cover	Cable Cover (1).....
606347	Spring	Cable cover spring (1).....

Circuit Description

The circuit used in this receiver is the conventional superheterodyne type with two stages of I.F. and six tuned I.F. circuits. In the short wave position the band switch operates by shunting respective coils (with their magnetite trimmer cores) across the main variable tuning inductances in the antenna, R.F. and oscillator circuits. When tuning either of the four short wave bands the signal is fed to the grid of the R.F. amplifier tube 6SK7 which also receives its A.V.C. bias through the 1.5 megohm resistor (item 75).

In the broadcast band position the filter choke (item 1) is included in the circuit and in conjunction with the input capacity of the tube constitutes a low-pass filter which effectively prevents unwanted disturbances from reaching the R.F. tube. The variable trimmer (item 31) is used for compensating the slight variations in the effective capacities of the antenna and the shielded lead-in cable. Bias for the 6SK7 tube is developed across the 560 ohm resistor (item 76).

The 6SA7 tube serves the combined functions of 1st detector and oscillator. In the short wave position the oscillator section of 6SA7 uses the conventional Hartley circuit, however the band switching arrangement of this section differs slightly from that of the antenna and R.F. sections, in that a 31-meter auxiliary oscillator coil (item 17) is permanently shunted across the main tuning coil (item 21) and a tap is brought out for return to the cathode. In changing to the 25, 19 and 16 meter bands, the respective auxiliary oscillator coils (items 18, 19 and 20) are shunted in parallel to the previous combination. The negative coefficient 120 mmf. condenser (item 60) in parallel to the main tuning coil (item 21) constitutes the temperature compensating arrangement for the short wave bands. In the broadcast band the oscillator uses a modified Colpitts

CHEVROLET DIV.—GEN. MOTORS

MODEL 985794

Circuit Alignment

The adjustable condensers and magnetite cores in this receiver have been very carefully adjusted at the factory and should require no further adjustment (except antenna compensating condenser, item 31) unless tampered with or a defective unit has been replaced. It is advisable not to attempt any adjustment unless it is definitely known that an adjustment is necessary.

To align the circuits of this receiver correctly a signal generator and an output meter must be used. In aligning the receiver it is very important that the correct frequencies be used and that all alignment adjustments be made in sequence, starting with the I.F. amplifier, then aligning the broadcast band, and finally the short wave bands. Slight misadjusting of either the I.F. or R.F. circuits will result in a weak set over most of the dial. All R.F. and I.F. adjustments are accessible after removing the speaker cover, top cover and rear bottom cover. The I.F. primary windings are adjusted by magnetite core screws Nos. 153, 155 and 157, located on top of the I.F. transformers (Fig. 1); and the secondary windings are adjusted by core screws Nos. 154, 156 and 158, located at the bottom of each I.F. transformer (Fig. 1).

1. Aligning I.F. Stages at 455 Kilocycles

- Connect one terminal of the output meter to the plate of one of the 6V6GT output tubes and connect the other terminal through a .1 mfd. condenser to the plate of the other 6V6GT output tube.
- Connect the output of the signal generator through a .01 mfd. condenser to the grid of the 2nd I.F. tube, 6SK7 (Pin No. 4). Connect the ground lead from the signal generator to the frame of the receiver chassis.
- Turn the volume control on full.
- Adjust the signal generator to 455 kilocycles.
- Adjust core screws (157 and 158) on the 3rd I.F. transformer for maximum reading on the output meter.

NOTE: Always use the lowest signal generator output that will give a reasonable deflection on the output meter.

- Connect the signal generator lead through the .01 condenser to the grid of the 1st I.F. tube, 6SK7 (Pin No. 4), and adjust core screws (155 and 156) in the 2nd I.F. transformer for maximum output.
- Connect the signal generator lead through the .01 condenser to the grid of the 6SA7 tube (Pin No. 8) and adjust core screws (153 and 154) in the 1st I.F. transformer for maximum output.

2. Aligning the R.F. Amplifier

The main tuning cores should never be touched unless a coil or core is replaced. Where one of these parts has been replaced the complete broadcast band alignment procedure (No. 3) should be followed. Generally when checking the R.F. circuits for proper peak-

ing the following procedure and sequence must be used. There are fifteen trimmer screws properly labeled "Antenna," "Oscillator," and "R.F." The broadcast band is designated by the letter "A" and the four short wave bands are designated by the numbers indicating the bands—31, 25, 19 and 16. The labels all appear on the coil assembly shields.

(a) "A" Band, or Broadcast:

If the dial pointer is right on calibration, merely trim the "A" band, antenna and R.F. trimmers at 1200 kilocycles. If the pointer is slightly off calibration, it can be corrected by bending.

NOTE: When the radio is installed in the car the antenna trimmer should be aligned on the "A" band between 1000 and 1200 kilocycles.

(b) 31 Meter Band:

Using a signal of 9.6 megacycles, tune in the signal with the receiver. If the pointer is slightly off calibration readjust the oscillator trimmer and then trim antenna and R.F. trimmers for maximum output at 9.6 megacycles.

(c) 25 Meter Band:

Using a signal of 11.8 megacycles tune in the signal with the receiver. If the pointer is slightly off calibration readjust the oscillator trimmer and then trim the antenna and R.F. trimmer for maximum output at 11.8 megacycles.

(d) 19 Meter Band:

Using a signal of 15.2 megacycles tune in the signal with the receiver. If the pointer is slightly off calibration readjust the oscillator trimmer and then trim the antenna and R.F. trimmers for maximum output at 15.2 megacycles.

(e) 16 Meter Band:

Using a signal of 17.8 megacycles tune in the signal with the receiver. If the pointer is slightly off calibration readjust the oscillator trimmer and then trim the antenna and R.F. trimmers for maximum output at 17.8 megacycles.

NOTE: The 31-meter band affects the tuning of the other short wave bands, therefore it must always be aligned first. It is equally important that the antenna trimmer (item 31) be aligned first on the broadcast band for proper tracking.

3. Broadcast Band Alignment

Six adjustments are provided which include trimmers Nos. 31, 45 and 52 associated with circuits Nos. 2, 10, 16 and the three iron cores Nos. 135, 141, and 147, which are mounted in front of the coil assemblies in conjunction with the core draw-bar No. 172. If complete realignment is found necessary the R.F. circuits should be adjusted in the following sequence.

(a) Tune the receiver to the extreme high frequency end of the band.

(b) Turn each of the three core screws (135, 141 and 147) in a counterclockwise direction ten turns.

NOTE: This is done in order to separate the cores from the coil windings far enough so that the cores will have no effect on the frequency of the circuits.

MODEL 985794

CHEVROLET DIV.—GEN. MOTORS

Circuit Alignment—Cont'd

- (c) Connect the signal generator through a 35 mmf. condenser to the standard Chevrolet shielded antenna lead-in. Connect the ground lead from the signal generator to the shield of the antenna lead-in cable.
- (d) Connect one terminal of the output meter to the plate of one of the 6V6GT output tubes, and connect the other terminal through a .1 mfd. condenser to the plate of the other 6V6GT output tube.
- (e) Adjust the frequency of the signal generator to 1645 kilocycles and peak trimmers Nos. 31, 45 and 52 for maximum signal output, at the same time reducing the signal generator output to as low a value as is consistent with a reliable indication on the output meter.
- (f) Change the frequency of the signal generator to 1620 kilocycles and turn the oscillator core screw (147) clockwise until maximum output is obtained.
- (g) Change the frequency of the signal generator to 1200 kilocycles and tune the receiver for maximum signal at 1200 kilocycles.
- (h) Adjust core screws (135 and 141) for maximum signal output.
- (i) Change the frequency of the signal generator to 600 kilocycles.
- (j) Tune the receiver for maximum signal output at 600 kilocycles.
- (k) Adjust the antenna and R.F. trimmers (31 and 45) for maximum output.
- (l) Reset the signal generator to 1200 kilocycles and tune the receiver for maximum output at 1200 kilocycles.
- (m) Adjust the antenna and R.F. cores (135 and 141) for maximum output.

4. Complete Short Wave Alignment

Because of the extensive range of this receiver, it is necessary that the short wave bands be completely aligned in exact accordance with the following procedure. Be sure to make all adjustments in the order specified.

- (a) Check broadcast band antenna trimmer (item 31) for maximum peaking at 1200 kilocycles. This is very important.
- (b) Tune the receiver so that the dial pointer is at the extreme high frequency end of the 31-meter band, and adjust the magnetite core screws (136, 142 and 148) so that each core end is flush with the coil forms (items No. 7, No. 15 and No. 21) which extend beyond the shield.
- (c) Turn the magnetite trimmer core screws (137, 138, 139, 140, 143, 144, 145, 146, 149, 150, 151 and 152) in a counter-clockwise direction, as far as they will go.

NOTE: Do not force the cores against their stops as too much force may fracture the core.

- (d) Connect the signal generator through a 35 mmf. condenser and the Chevrolet shielded antenna lead-in, to the antenna connection of the receiver. Connect the ground lead from the signal generator to the shield of the lead-in.
- (e) Turn the band indicator to 31 meters and turn the volume control to the maximum position.
- (f) Adjust the signal generator frequency to 9.6 megacycles and move the pointer to 9.6 megacycles on the dial scale.

- (g) Turn the core screw (149) in a clockwise direction until the first peak is obtained, and then adjust carefully for maximum reading on the output meter.
- (h) Turn the core screw (143) in a clockwise direction until the 2nd peak is obtained, if more than one peak can be found, and adjust for maximum reading on the output meter at the same time reducing the signal generator output to as low a value as is consistent with a reliable indication on the output meter.
- (i) Turn the core screw (137) in a clockwise direction or until 2nd peak is obtained, and adjust for maximum reading on the output meter.
- (j) Change the signal generator frequency to 11.8 megacycles, the band indicator to 25 meters, and move the pointer to 11.8 megacycles on the dial scale.
- (k) Turn the core screw (150) in a clockwise direction, until 1st peak is obtained, and adjust for maximum reading on the output meter.
- (l) Turn core screws (144 and 138) in a clockwise direction until 2nd peak is obtained, and adjust for maximum reading on output meter.
- (m) Change the signal generator frequency to 15.2 megacycles, the band indicator to 19 meters, and move the dial pointer to 15.2 megacycles on the dial scale.
- (n) Turn core screw (151) in a clockwise direction until the 1st peak is obtained and adjust for maximum reading on the output meter.
- (o) Turn core screws (145 and 139) in a clockwise direction until 2nd peak is obtained, and adjust for maximum reading on output meter.
- (p) Change the signal generator frequency to 17.8 megacycles, the band indicator to 16 meters, and move the pointer to 17.8 megacycles on the dial scale.
- (q) Adjust core screw (152) by turning in a clockwise direction until 2nd peak is obtained and adjust for maximum output.
- (r) Adjust core screws (146 and 140) by turning in a clockwise direction until 1st peak is obtained and adjust for maximum reading on output meter.
- (s) Repeat all operations starting with (e) until no further improvement can be obtained.

5. General Alignment Information

Alignment of the short wave bands should never be attempted without first peaking trimmer condenser No. 31 in accordance with the procedure outlined under "Broadcast Band Alignment" (3). A slight misalignment of this trimmer condenser will result in unsatisfactory short wave operation, the reason being that trimmer condenser No. 31 is in the circuit on all bands but it should be peaked on the broadcast band only.

The most satisfactory method of aligning or checking the spread band ranges is on actual reception of short wave stations of known frequency by adjusting the magnetite core oscillator coil for each band, so that the short wave stations come in at the correct points on the dial. In exceptional cases, when the set is being serviced in a location where the noise level is high enough to prevent reception of short wave stations a signal

CHEVROLET DIV.—GEN. MOTORS

Circuit Alignment—Cont'd

generator should be used for alignment, but an extremely high degree of accuracy is required in the frequency settings of the signal generator as a slight error will produce considerable inaccuracy on the spread band dial.

When adjusting the magnetite core trimmer in the auxiliary short wave coils, if more than one peak is found, select the peak specified in the alignment procedure for each band.

6. Adjusting Antenna Compensating Condenser

This adjustment should be made after the receiver has been properly installed in the car. Tune the receiver to a weak signal at the high frequency end of the broadcast band at about 1200 kilocycles. This signal should be just audible with volume control on full. Adjust the antenna compensating condenser for maximum signal strength.

NOTE: When aligning the antenna trimmer condenser, be sure that the antenna is fully extended.

7. Instructions for Removal of Coil Unit

- (a) Remove the top, rear bottom, and speaker cover from the receiver.
- (b) Remove the row of tubes immediately behind coil unit assembly.
- (c) Remove the two No. 8 self-tapping screws that hold the antenna connector to the side of the case, then unsolder the antenna cable shielding from the two grounding lances which will leave this part entirely free. Remove cable clamps which hold the leads from the oscillator coils to the chassis. Free these leads. Unsolder the leads from the antenna, R.F. and oscillator coil assembly whichever is to be removed.
- (d) Remove the two No. 8 screws which hold the solenoid mounting bracket to the main tuner frame. Place the solenoid out of the way, taking care that the armature does not get damaged. Unsolder the small condenser (item 30) from the case. Remove No. 8 self-tapping screw which anchors the coil mounting bracket to the side of the case.

(e) Remove the $\frac{1}{2}$ hex. head screw from the end of the switch shaft to be found at the center of the coil unit base. Remove the two nuts from the end of the band indicator shaft. The short link arm which is retained by these nuts is to be removed after the main assembly is free. Remove the two $\frac{1}{2}$ hex. head screws that hold the coil unit base to the main coil assembly bracket.

(f) Turn the tuning indicator to the high frequency end of the band, then remove the three No. 8 self-tapping screws and the two No. 8 machine screws that hold the coil unit mounting bracket to the chassis. Remove the sleeve covered tension wire on the core bar, part No. 1215116, and back out the threaded portion of the two cores. This will leave the wire only passing through the threaded holes in the core bar. Carefully pull the cores from the coil forms by drawing the whole assembly towards the I.F. transformers. With the coil unit assembly in this position the affected coil can be removed by first moving it away from the coil unit assembly bracket until the projections at its base just clear the bracket, then raising the base

end and withdrawing the unit over the I.F. transformer. **CAUTION:** When performing this operation take care that the band indicator shaft is not withdrawn with the coil unit assembly bracket, and that shield can is disengaged from the spring clip on the chassis at the front end of the coil can.

8. To Disassemble Coil Units

- (a) Turn all trimmer screws until they are within the coil unit cover.
- (b) Remove the small spring steel clip, part No. 1215134, which anchors the coil bracket to the end of the cover. Two corners of this clip dig into the metal of the cover and care must be exercised when removing it so that no damage is done to the protruding coil tubes.
- (c) Remove the two $\frac{1}{2}$ nuts holding the shield can in place and slide the cover off.

9. Reassembling Coil Units

- (a) Replace the cable clamp which holds the coil leads located between the 6SK7 and the 6SR7.
- (b) In replacing the cores into the coil tubes, grasp the threaded stud end, raise the core and work it into the coil tube.
- (c) When the oscillator coil is removed be sure that the two detent balls at the switch shaft do not get lost.
- (d) The two nuts which hold the short link arm to the band indicator shaft must be taken up tight.
- (e) While replacing the coil unit mounting bracket be sure that the three spring clips enter their slots in the shield cans properly.

10. Stiff Manual Tuning

Excessive stress on the worm bearing caused by tension or compression in the flexible manual tuning shaft may cause stiff manual tuning. Such stress can readily be eliminated by loosening and retightening the set screw in the worm.

11. Tone Control

The four positions of the tone control are: Bass, Soft, Music and Voice. The tone control and its tone compensating network in the circuit are between the audio amplifier and the output stage. When the switch is in the "bass" position, a .035 mfd. condenser (item 64) shunts the output of the 6SR7 audio frequency amplifier stage resulting in minimum highs, since a large portion of the high audio frequencies are by-passed to ground. In the "soft" position, a .01 mfd. condenser (item 63) shunts the output of the 6SR7 audio frequency amplifier stage to ground (the same as item 64 does in the "bass" position), but because the shunting capacity is less, the reduction of high frequencies will not be so pronounced as in the "bass" position. Neither high nor low frequencies are attenuated over the normal amplifier response in the "music" position, resulting in a maximum high and low frequency response.

CHEVROLET DIV.—GEN. MOTORS

Circuit Alignment—Cont'd

With the tone control in the "voice" position, the output of the 6SR7 audio amplifier stage is shunted to ground with a .01 mfd. condenser (item 63) thus by-passing some of the high frequencies. A parallel combination consisting of a 22,000 ohm resistor (item 102) and a .085 mfd. condenser (item 64) is connected in series with the output of the 6SR7 audio amplifier stage, resulting in a reduced low frequency response since this combination has a higher impedance at low frequencies than at high frequencies, thus both the high and the low frequencies are attenuated resulting in optimum tone balance for speech programs.

12. Band Switching Circuits

The two switch sections as shown on the schematic diagram in the antenna stage and in the R.F. stage are actually one switch wafers in each case. The top section on the diagram is that set of contacts toward the coils as viewed from the coils. The lower set of contacts is that set of contacts away from the coils. The switch sections are all shown in the 16-meter band position. Referring to the top wafers sections, when the upper rotor fingers touch terminals No. 2, the 16-meter band is in the circuit. Terminals No. 3 are the 19-meter band contacts. Terminals No. 4 are the 25-meter band contacts. Terminals No. 5 are the 31-meter band contacts. Terminals No. 6 are the "A" band or broadcast band contacts.

The "A" band coil circuit shows the actual simplified circuit diagram for the "A" band without the switch contacts being shown. The same applies to the 31-meter band coil circuit. Coils 7, 15, 21 and 17 remain in the circuit at all times for short wave operation. When switching to the 25-meter band, coil No. 3 is replaced by coil No. 4. Coil No. 11 is replaced by coil No. 12. Coil No. 18 is switched across coils Nos. 21 and 17, thus on each of the 25, 19 and 16-meter bands there are three oscillator coils in parallel at the same time. The sensitivity control is removed from the circuit for short wave operation thereby giving full sensitivity on short waves.

In order to provide good tracking sensitivity only perfectly matched main tuning cores are used in the receivers on the "A" band (Nos. 135, 141 and 147). The cores are color coded with a spot of red, yellow or green paint on the stud-end of the core. Only one particular color will be used in each receiver. When servicing one of these cores always replace the defective core assembly with a replacement core bearing the exact color coding, or replace all three cores with a new set of cores of another color code.

13. Adjustment of Clutch Assembly

- (a) Remove bottom covers (front and rear).
- (b) Loosen both set screws on hub of pointer drive cord drum (item 177, Fig. 13).
- (c) Move core bar (item 172, Fig. 14) against stop pin with tuning cores all the way inside the coils.
- (d) Scissors bakelite gear and clutch assembly (item 179, Fig. 13) counter-clockwise one tooth and engage with worm (item 180, Fig. 14), taking care not to lose scissors action.

- (e) Rotate drum (item 177, Fig. 13) until dial pointer (item 187, Fig. 14) lines up with the last mark at the low frequency end of the dial drum.

- (f) Insert a .010 metal shim between brass gear and clutch lining. Press entire assembly firmly together and tighten set screws on drum hub after which remove the metal shim.

CAUTION: During the preceding steps of adjustment, it is very important that the core bar position is maintained and that neither the bakelite nor the brass gear become disengaged from the worm.

14. Solenoid Pole Piece Adjustment

- (a) Insert plunger (item 186, Fig. 13) all the way in solenoid assembly until link strikes extruded lip on end of solenoid. (No push arm engaged to selector bar.)

- (b) Loosen lock nut (item 181, Fig. 13) and screw in pole piece until it touches the plunger.

- (c) Back off pole piece 1 1/2 turns and tighten lock nut in place.

GENERAL: This auto radio is a nine tube self-contained receiver built expressly for installation in 1942 Chevrolet automobiles. Special features incorporated in this receiver are: automatic tuning; single band sequence tuning from instrument panel; steering column station selection and volume control; elliptical speaker; permeability tuning; sensitivity control; automatic noise limiter circuit; four position tone control; 0Z4 rectifier; and a primary type vibrator.

Antenna System: There are two antenna systems available for use with this receiver; the cowl rod antenna, and the telescopic reel type antenna. Either of the antennas will operate very efficiently with this Chevrolet radio.

PORTABLE RADIO #985866

CHEVROLET DIV.—GEN. MOTORS

SUBJECT: TECHNICAL SERVICE INSTRUCTIONS

GENERAL: This Plug-in Portable radio is a five tube receiver designed to operate from either self-contained dry batteries or from 105-125 volt, 50/60 cycle A.C. or D.C. house lighting current.

ANTENNA: The antenna is a loop type inside the cabinet and, under normal operating conditions, no other antenna is necessary. For remote locations, where reception may be weak, provision is made for attachment of an outside antenna to a wire extending from the back of the cabinet.

TUBE COMPLEMENT

TYPE	FUNCTION	TYPE	FUNCTION
1A7GT	Mixer, 1st Detector-Oscillator	1W5GT	2nd Det.-A.V.C.-1st A.F. Amplifier
1W5GT	I.F. Amplifier	35Z5GT	Power Output Rectifier

CIRCUIT DESCRIPTION

The circuit used in this receiver is the conventional superheterodyne type designed for loop antenna operation.

The range of frequencies covered is from 540 to 1620 kilocycles.

POWER SUPPLY: This radio is designed to operate from either batteries or from 105-125 volts A.C. (50/60) or D.C. supply line.

A switch accessible from the rear of the radio switches the radio for either battery or A.C.-D.C. operation.

CIRCUIT ALIGNMENT

The adjustable condensers in this receiver have been very carefully adjusted at the factory and will require no further adjustment unless tampered with or a defective coil has been replaced. If re-alignment is found necessary, the circuits can be adjusted only with the use of a calibrated test oscillator or signal generator and an output meter.

IMPORTANT: If maximum sensitivity is to be obtained from this receiver, after re-alignment, it is very important that the following procedure be closely observed:

1. Aligning I.F. stages at 455 kilocycles.

- a. Connect the signal lead of the test oscillator to the grid of the 1A7GT tube, through a .1 mfd. condenser.
- b. Connect the ground lead of the test oscillator to the chassis.

CIRCUIT ALIGNMENT (Cont'd)

- c. Connect the output meter across primary winding of the output transformer.
- b. Set the test oscillator to exactly 455 kilocycles.
- e. Adjust the trimmers on the 1st and 2nd I.F. transformers carefully for maximum output.

These adjustments should be repeated several times and during the alignment the test oscillator output should be kept to as low a value as is consistent with obtaining readable indication on the output meter.

2. Alignment at 1620 kilocycles.

- a. Leave the test oscillator leads connected the same as for aligning the I.F. circuits.
- b. Turn the rotor plates of the gang condenser all the way out and against the high frequency stop.
- c. Set the test oscillator to 1620 kilocycles.

d. Adjust the trimmer of the oscillator section of the condenser gang for maximum output. It is very important that this frequency be set accurately as a slight mis-setting will cause the receiver to be out of track over the entire high frequency end of the dial.

3. Aligning at 1400 kilocycles.

- a. This adjustment should be made with the chassis, loop antenna, and batteries installed in the cabinet.
- b. Connect the signal lead of the test oscillator to the external antenna terminal on the loop antenna through a 200 mmfd. dummy.
- c. Connect the ground lead of the test oscillator to the chassis.
- d. Set the test oscillator to 1400 K.C.
- e. Turn the condenser rotor plates until this frequency is tuned in with maximum output.
- f. Adjust the trimmer on the condenser gang for maximum output.

MODEL D3

COLUMBIA

INSTRUCTIONS FOR OPERATING

MODEL D1 COUNTER DEMONSTRATOR
OPERATE ON 110-120 VOLTS A. C. 60 CYCLES ONLY

To turn the amplifier on, rotate the knob marked "Volume" in a clockwise position until a click is heard. After about thirty seconds the machine will be ready to operate. This knob can then be used to control the volume required.

The toggle switch is for starting and stopping the motor without turning the amplifier off.

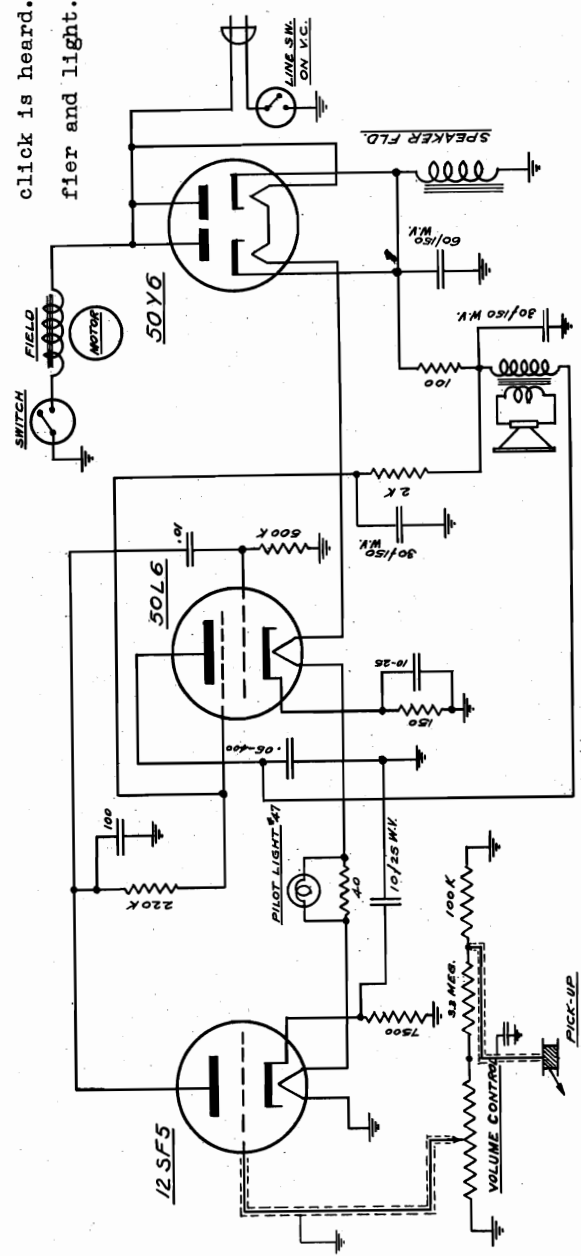

When the demonstrator is not being used, turn the "Volume" knob counter-clockwise until a click is heard. This will turn off the amplifier and light.

MODEL K63

ments should be made with the volume control on maximum and the signal generator output as low as possible, to prevent the AVC from operating and giving false readings. Adjust the signal generator to 455 K.C. and connect the output to the grid of the first detector tube (6SA7) through a .05 or .1 mfd. condenser. Align all I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT
Adjust the signal generator to 1630 K.C. and connect the output to the antenna lead, through a .0002 mfd. mica condenser. Set the gang condenser to minimum capacity and adjust the B.C. oscillator trimmer to receive this signal. After this has been carefully done, the next step is to set the signal generator to 1400 K.C. and after tuning in the signal adjust the B.C. antenna trimmer to peak. Set the signal generator to 600 K.C., tune the signal and then slowly increase or decrease the B.C. oscillator padding condenser and at the same time continuously tune back and forth across the signal with the receiver until the maximum reading is obtained on the output meter.

Return to 1400 K.C. and again go over the adjustments of this frequency to be certain that they were not put slightly out of alignment when adjustment was made at 600 K.C.

SHORT WAVE BAND ALIGNMENT
Adjust the signal generator to 18,100 K.C. and connect the output to the antenna lead, through a 400 ohm resistor. Set the gang condenser to minimum capacity and adjust the S.W. oscillator trimmer to receive this signal. Set the signal generator to 16,000 K.C., tune signal and adjust the S.W. antenna trimmer to peak.

NOTE I —Chassis may be connected or disconnected from cabinet loop during these adjustments.

NOTE II —Trimmer B not in later production models.

NOTE III—Chassis must be connected to cabinet loop. Use Aerometer or 10" diameter one turn loop on signal generator.

ALIGNMENT PROCEDURE

STEP	Connect Signal Generator to—	Dummy Antenna Between Radio and Generator	Set Generator Controls to—	Set Radio Controls to—	Adj. Following Trimmers to Max. Output
1	Tuning Cond. Ant. Stator	.1	455 Kc.	1630 Kc.	A, B, C, D, I. F.
2	Tuning Cond. Ant. Stator	.1	1630 Kc.	1630 Kc.	E Osc.
3	Tuning Cond. Ant. Stator	.1	1400 Kc.	1400 Kc.	F R. F.
4	Loop Radiator	Two feet from Radio No Connection	1400 Kc.	1400 Kc.	G Ant.

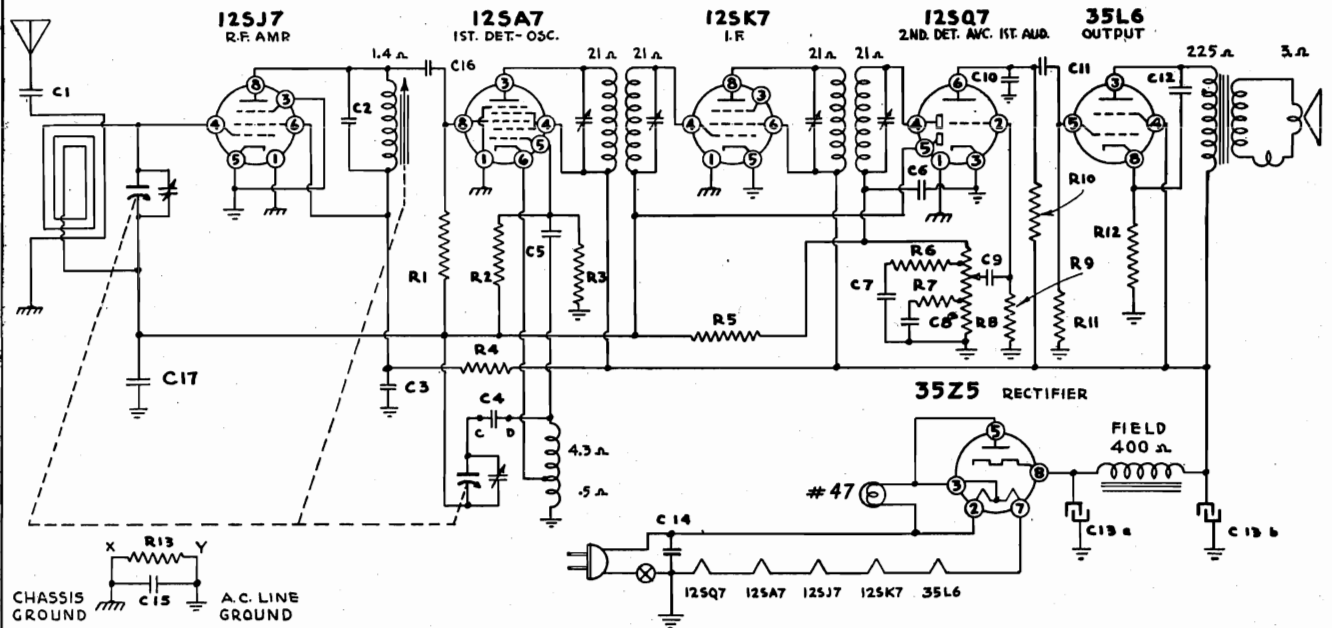

Use Aerometer or 10" diameter one turn loop on Signal Generator in Step 4.

STEP	Connect Signal Generator To—	Dummy Antenna Between Radio and Generator	Set Generator Controls To—	Set Radio Controls To—	Adj. Following Trimmers to Max. Output	Special Instructions
1	Tuning Cond. Ant. Stator	.1 mfd.	455 Kc.	1630 Kc. BC Range	A, B, C, D, I.F.	Note A
2	Tuning Cond. Ant. Stator	.1 mfd.	1630 Kc.	1630 Kc. BC Range	E Bc. Osc.	Note A
3	Green Loop Lead	400 ohms	9.5 Mc.	9.5 Mc. SW Range	G Sw. Osc.	Note A
4	Green Loop Lead	400 ohms	9.5 Mc.	9.5 Mc. SW Range	H Sw. Ant.	Note A
5	Loop Radiator	Two Feet From Radio No Connection	1400 Kc.	1400 Kc. BC Range	F Bc. Ant.	Note B

NOTE A—Chassis may be connected or disconnected from cabinet loop during these adjustments.

NOTE B—Chassis must be connected to cabinet loop. Use Aerometer or 10" diameter one turn loop on signal generator.

CONTINENTAL RADIO & TELEV. CORP.

In model B6 only, X and Y are connected together. R13, C15, and C4 are not used. C is connected to D.

Bottom View—Voltage Chart

Voltages are positive D. C. unless noted. Measured from chassis with 20,000 ohm per volt meter. On XB6 Series use floating ground instead of chassis.

Line—117 volts, 60 cycle A.C. Volume control at maximum. No station tuned in.

To simplify chassis alignment out of the cabinet dial frame is marked as shown.

On models with a SINGLE drive pulley. The dial cord is strung, with the gang closed, by starting at 1 and continuing in rotation through 20. A piece of cord 46" long is necessary, which length allows 3" at each end for tying knot.

On models with DOUBLE drive pulley the dial cord is in two pieces. The pointer cord is on the large pulley starting at 1 and continuing through 20 BUT in the following special order, 1, 2, 3, 4, 18, 19, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20. The drive cord is on the smaller dotted pulley, in the dotted position.

To clarify dial cord arrangement the dial frame is shown as transparent.

TUNING RANGES

- American Broadcast Band—540 to 1630 KC (555 to 184 Meters)
- Police, Amateur, etc.—1600 to 5200 KC (187 to 57.5 Meters)
- Short Wave (Foreign)—5.2 to 18.0 MC (57.5 to 16.6 Meters)

TUBES

2—6SK7, 1—6SA7, 1—6SQ7, 3—6J5, 2—6AC5GT, and 1—5Y3G. (Tubes may be metal or Bantam (GT) equivalents.)

TUBE AND TRIMMER LAYOUT

MODELS 02CA, 02CB, Chassis 55 THE CROSLLEY CORP.

Preliminary

- Output Meter Connections.....Plate to Plate of 6AC5G's
- Generator Ground Connection.....To chassis or Ground Lead
- Dummy Antenna to be in series with generator output.....See Chart Below
- Position of Volume Control.....Fully On
- Position of Master Tone Control.....All Buttons Out

ALIGNMENT PROCEDURE CHART

Signal Generator							
Align-ment Sequence	Dummy Antenna	Frequency Setting	Input Connection to Receiver	Band Switch	Tuning Cond. Setting	Trimmer Adjusted	Remarks
1.	.02 MF.	455 Kc.	Stator lug Rear section of Gang Cond.	B. C.	Fully open	2nd I-F (2) 1st I-F (2)	Adjust for Maximum. Adjust for Maximum.
2.	.0002 MF.	1630 Kc.	Ant. Terminal	B. C.	Fully open	B. C. "OSC" Trimmer	Adjust for peak; gang does not have to tune thru signal. Loop must be connected.
3.	.0002 MF.	600 Kc.	Ant. Terminal	B. C.	Approx. 60 on dial	B. C. "OSC" Series Trimmer	Adjust for maximum output while rock- ing gang thru signal.
4.	Repeat Step No. 2 to check possible shift due to series adjustment.						
5.	.0002 MF.	1400 Kc.	Ant. Terminal	B. C.	Approx. 140 on dial	B. C. "ANT" Trimmer B. C. "R-F" Trimmer	Adjust for maximum output do not touch B. C. Osc. Trimmer. Adjust for maximum output.
6.	400 ohm (carbon)	5.3 Mc.	Ant. Terminal	Police	Fully open	Pol "OSC"	Adjust for peak; gang does not have to tune thru signal.
7.	400 ohm (carbon)	5.0 Mc.	Ant. Terminal	Police	Approx. 5.0	Pol "ANT" Trimmer	Adjust for maximum output.
8.	400 ohm (carbon)	18.3 Mc.	Ant. Terminal	S. W.	Fully open	S. W. "OSC"	Adjust for peak. Gang does not have to tune thru signal.
9.	400 ohm (carbon)	18.0 Mc.	Ant. Terminal	S. W.	Approx. 18	S. W. "ANT" Trimmer	Adjust for maximum output while rocking gang thru signal.
10.	Repeat the above alignment procedure for more accurate adjustments. Always keep signal generator output as low as possible to prevent action of the A. V. C. circuit.						

IMPORTANT ALIGNMENT NOTES

When aligning the shortwave bands "OSC" trimmers care must be exercised to see that the circuits are aligned on the correct frequency and not on the image which is approximately 910 kilocycles less as indicated on the Receiver dial. To check, increase generator output, tune-in the generator frequency and then tune-in the image frequency which should be weaker than the fundamental and come in approximately 910 kilocycles lower on the Receiver dial than the fundamental. If image cannot be tuned-in, the "OSC" trimmer is adjusted to the wrong peak. (Correct peak is the second peak on trimmer from the closed position).

THE CROSLEY CORP.

SETTING THE PUSH BUTTONS (Station Selector)

The six station selector push buttons are set up by means of two adjusting screws per button. These adjusting screws are made accessible by removing the station selector push button escutcheon. Pry off carefully being carefully not to scratch the main escutcheon.

Select the call letter tabs of your six favorite broadcast stations from the station call letter sheets supplied. Place the call letter tabs in the window above that push button which is to be adjusted for that station. It is not essential that all push buttons be set at one time.

Note: When placing call tabs in the window be sure to arrange them according to their frequency (kilocycles) that is: the station whose frequency

is well within the range covered by the No. 1 button, should be placed above that button and so on with the rest of the buttons to be set. After tabs are in place break off the celluloid covers from the strip furnished and snap in place over the call letters to protect and hold them in place.

The frequencies of your favorite stations may be found in your local paper or by consulting a station listing sheet.

**SET-UP PROCEDURE**

Remove station selector push button escutcheon. Turn the receiver on and let it operate for a sufficient length of time to permit the tubes to reach their normal operating conditions.

Note: To simplify the set up and insure accurate adjustments the following pre-adjustments should be made.

Tighten all Antenna Trimmer screws moderately tight. See Fig. 1. Turn the Oscillator adjusting screws to the left (counter clockwise) until the threaded portion extends approximately $\frac{1}{2}$ inch. Note: Care should be taken when adjusting the oscillator screws so that the selected station is not passed over. Turn the screws slowly.

It is essential that the frequency (kilocycles) of the station selected is within the range of the push button to be set for that station. See Fig. 1.

1. Turn the band change switch to the "American" position. Using the station selector knob, carefully tune in the station to which the No. 1 push button is to be set. Note program.
2. Turn the band change switch to the "Automatic" position and using a small screw driver, carefully turn in a clockwise direction the Oscillator adjusting screw until the station previously tuned in manually is heard again. Adjust for maximum output in the speaker.
3. Adjust the Antenna adjusting screw for maximum volume in the speaker.
4. Turn band change switch from "Automatic" to "American" and back again to check if adjustment has been correctly made. There should be no change in tone quality when switched from one to the other.
5. Repeat above procedure for the remaining push buttons.

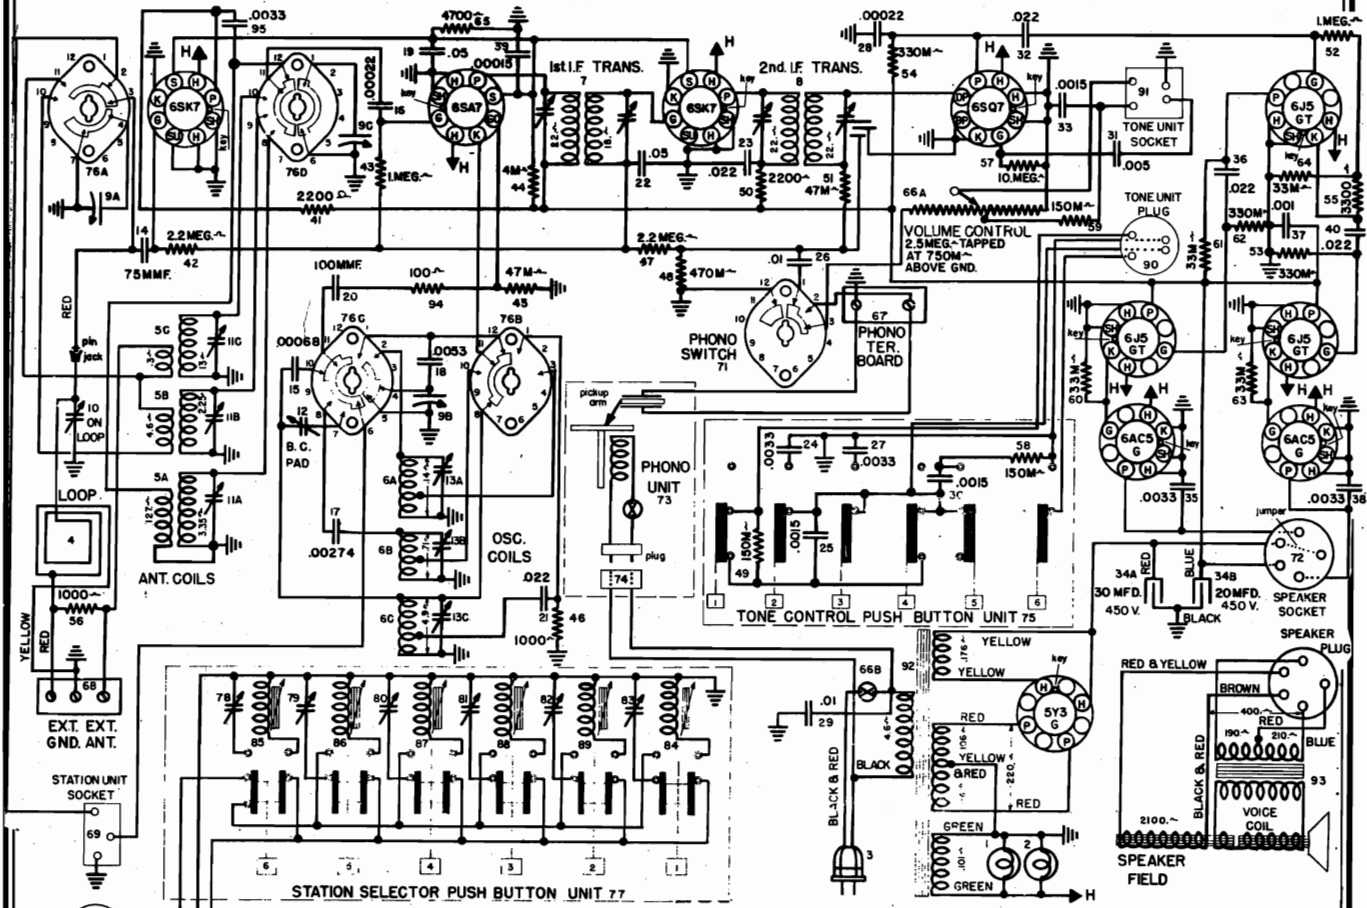

To tune the receiver with the push buttons, set the band change switch on "Automatic" and depress completely the button corresponding to the station you wish to hear.

TUNING RANGES

- American Broadcast Band—540 to 1630 KC (555 to 184 Meters)
- Police, Amateur, etc.—1600 to 5200 KC (187 to 57.5 Meters)
- Short Wave (Foreign)—5.2 to 18.0 MC (57.5 to 16.6 Meters)

FEATURES

Some of the features of these outstanding phono-combinations that will add greatly to your enjoyment are as follows: a large efficient built-in antenna; Litz wound coils; a three gang tuning condenser providing maximum selectivity and sensitivity; push-pull audio tubes, dynamically coupled to push-pull triode output for maximum distortionless reproduction; six station selector push-buttons; a full twelve inch concert dynamic speaker; six push buttons controlling a "Master Tone Control" system which provides more than 60 different combinations of bass and high notes; and an extremely high quality unit for the reproduction of phonograph records, including the "Floating Jewel Tone System" (a Crosley invention) which assures a quality of reproduction never before obtainable.

THE CROSLEY CORP.

MODEL CA12

PHONO CONNECTIONS

This chassis is so constructed as to be adaptable to a phonograph pick-up (high impedance type) for the reproduction of recordings. The terminals may also be used for the reproduction of television sound as supplied by a suitable television converter unit. The double pole double throw switch for changing from Radio to Phono or television sound, should be connected as shown in the diagram. The terminals are coded as follows: 1, 2, 3, respectively. The No. 2 terminal connects to the high side of the phono pick-up or television A-F connections.

NOTE: The jumper wire between No. 1 and No. 2 terminals must be removed when phono-radio switch is connected. If phono switch is removed, it is absolutely essential that the jumper wire between No. 1 and No. 2 terminals be replaced. Be sure all connections are tight.

The No. 3 terminal is the ground or low side connection. The No. 1 terminals should be connected to the No. 3 terminals by some means (as indicated in the above diagram). This prevents any radio signals from the receiver proper interfering with the Phono or Television sound reproduction.

MODEL CR26, Wireless
Record Player

THE CROSLEY CORP.

THE CROSLEY AUTOMATIC WIRELESS RECORD PLAYER MODEL CR26

The Crosley Automatic Wireless Record Player Model CR26, with the automatic record changer will enable one to greatly increase his enjoyment of recorded music.

After correct adjustments have been made, it will be possible to place the Record Player in any part of the room, place the selected recordings on the changer, set the volume control of the receiver at the desired level, and enjoy your favorite recorded music.

RECORDED MUSIC

Modern records are made by electrical processes and the bringing out of their full tonal perfection requires a well-designed electrical tone arm such as is provided in this Record Changer Model CR26.

Fully as remarkable is the wide variety of selections that are obtainable. They range from the latest hit tunes played by the most popular bands, to complete operas and symphonies recorded by the world's leading artists. These longer works are to be had in the form of a set of double sided records so arranged that the first half of the work is heard by playing one side of all the records, and the last half by playing the other side. Be sure to purchase records so arranged if it is desired to use them on an Automatic Changer.

POWER SUPPLY FOR AUTOMATIC WIRELESS RECORD CHANGER

The Changer is equipped with a constant-speed self-starting motor. Under all normal conditions it starts automatically and runs at correct speed.

Each Changer is designed to operate on a certain voltage and frequency (cycles) only. Be sure to look at your radio nameplate and see that the instrument you have conforms to your power supply before plugging in cord. The rating of your power supply can be determined by calling the local electric company.

PLACING UNIT IN OPERATION

The Crosley Automatic Wireless Record Player will operate on 850 to 600 Kilocycles (usually 85 to 60 on the radio dial). Turn the receiver "ON" and adjust the dial pointer to a position between 85 and 60 where there is no station interference. Turn volume control fully on. Plug the unit power cord into a convenient wall receptacle. Place a 10-inch record on turntable of unit and turn "OFF-ON" motor switch to "ON" position (Fig. 1). Allow approximately 30 seconds for the unit to warm up, then gently lift tone arm onto recording, or merely depress "Reject" knob.

Turn the adjusting screw (Fig. 1) until record being played is heard through the receiver. Turning the adjustment screw to the left increases the frequency, that is, the signal from unit will be picked up closer to 85 on the dial of the receiver. Turning to the right decreases the frequency and the signal will be picked by the receiver closer to 60 on the dial.

The adjusting screw should be turned so as to obtain the sharpest signal. Adjust radio volume control to desired level for recordings being played.

SETTING FOR SIZE OF RECORD

The Changer plays up to fourteen 10" or ten 12" records at one loading. All records must be the same size for each loading.

On each post you will see selecting arms. The position of these arms determines the setting for different size records. To set for 10 or 12-inch records, it is merely necessary to grasp the posts by the knobs at the top, lift, and turn until the 10" or 12" arrows are pointing toward the center of the turntable. When in either the 10" or 12" position, the posts will snap into place except when they are lifted by hand. Be sure to set both posts for the same size record.

Figure (1) shows the Changer with the selecting arms set for 10" records and ready to be loaded; the tone arm in the rest position.

Figure (2) shows the Changer set for 12" records and ready to be loaded the tone arm in the rest position.

Fig. 1

THE CROSLEY CORP.

TURNING OFF CHANGER

- (1) Throw Changer switch knob to "OFF" position.
- (2) Lift tone arm and place it in the rest position. (If you happen to turn off the Changer switch while the mechanism is going through a "change cycle", you will notice that it does not stop until the cycle has been completed, and the tone arm is again in playing position, at which point it is ready to be lifted to the rest position. If you prefer to turn off your Changer by the use of any other switch than the one on the Changer itself, be sure to turn it off while needle is resting upon a record; otherwise, the selecting arms cannot be correctly reset.
- (3) To avoid warping of records, never leave records resting on the posts.

IF CHANGER IS LEFT RUNNING

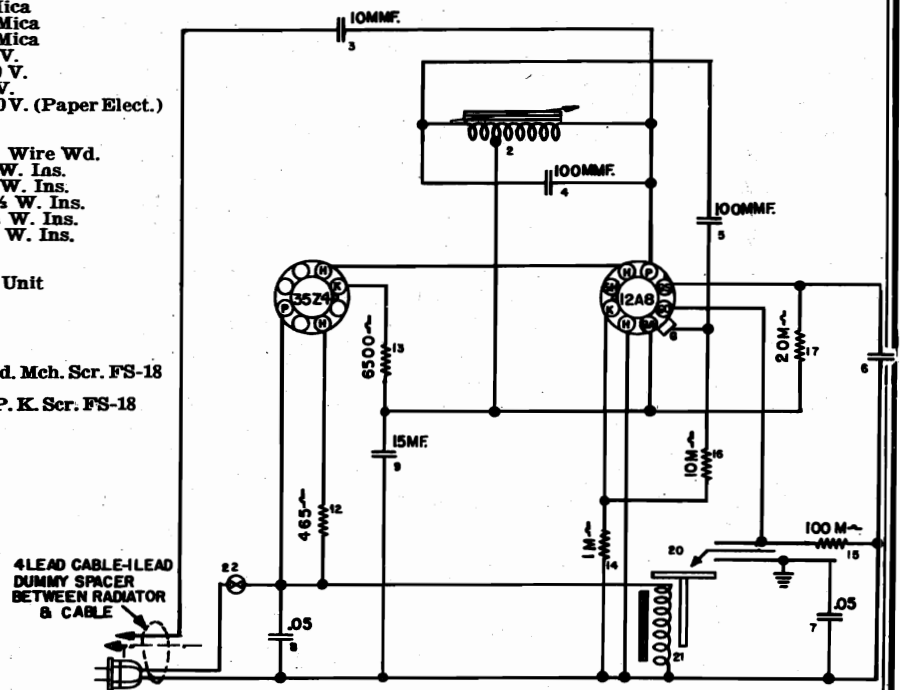

No damage will be done if you forget to turn off Changer after it has played its entire load of records. It will simply repeat the last record until stopped or reloaded.

FAILURE TO PLAY THE NEXT RECORD

An old record may occasionally be found (made before the introduction of automatic changers) which does not carry the needle close enough to center-pin of turntable, to set the changer mechanism in operation. Should one of these old records be found in the stack, merely depressing the button will instantly set the Changer mechanism in action again. Any need for doing this can be avoided by placing the old record at top of stack to be played, so that it will come into position last.

WIRING DIAGRAM — MODEL CR26

CAUSE OF NOISY RECORDS

A background of noise and scratching indicates worn records. Poor tone may be evidence of a worn needle. Some records will wear longer than others, even if kept equally clean. This is due not only to quality of manufacture, and care given the records, but also to the kind of music recorded.

MODEL CR26, Wireless
Record Player

THE CROSLEY CORP.

LOADING

See that the selecting arms of both posts are turned toward the center of the turntable as indicated by the engraved arrows, and that both sets of arms are set for the same size (10" or 12") records as described in the preceding paragraph. Place the stack of records (up to fourteen 10" or ten 12") over the center pin so that they will rest on the selecting arms.

STARTING THE CHANGER

Turn the "OFF-ON" motor switch knob to the "ON" position (Fig. 1), the motor will then start and the record changer will go into automatic operation of its own accord.

HOW TO REJECT A RECORD

Merely press the switch knob on the Changer panel. You can do it any time after the needle has come into contact with that record.

PLAYING INDIVIDUAL RECORDS

Should it be desired to play an individual record merely set up the machine as described above for the proper size (10" or 12" as indicated on the selecting arms), place the record on top of the arms as described under "Loading", and set the machine in operation by means of the switch knob described under "Starting the Changer". In other words, play an individual record in the same manner as you would play a stack of that size.

NOTE: If the record player refuses to operate, CHECK the tubes to be sure they are pushed well down into their respective sockets. The tubes are accessible by removing the bottom of the Record Player. After correct adjustments have been made it is necessary only to turn "ON" the receiver and tune-in on the frequency setting the Record Player, just as though you are tuning-in a regular broadcasting station, provided, of course, the Record Player is in operating condition.

If at any time extremely noisy conditions are encountered, wind a lead from the radio receiver antenna around the Record Player Power Cord.

UNLOADING

First switch off the motor. Grasp each post by its knob at the top and turn them out of the way. (See Figure 3).

This view shows the Changer with the tone arm in the rest position, and the selecting fingers turned for unloading.

Lift the played records from the turntable. Then return the posts to the proper playing position as indicated by the arrows on the selecting arms. (See Fig. 1 and 2). The Changer may then be loaded with a new stack of records according to the size shown on the selecting arms.

USE OF TONE CONTROL

If the radio through which this Changer is being played has a tone control switch, do not forget to adjust it, as well as the volume control, to the position which best brings out the tonal qualities of the kind of records being played.

NOTE-ON 52TD-U, 52TE-U & 52TF-U, ITEM 36 (SPEAKER) BECOMES G3-49675, ALL OTHER PARTS & CONNECTIONS REMAIN THE SAME

NOTE-ON 52TF, ITEM 3 (LOOP ANT.) BECOMES GB132245-1 ALL OTHER PARTS & CONNECTIONS REMAIN THE SAME.

The back on receivers employing the 77 chassis is part of the loop antenna assembly. To gain access to the tubes, carefully pry out two trimount studs which fasten back to top of cabinet. Then remove the two screws at lower edge and carefully lay loop on table. Do not disconnect lead wires to the loop.

The back on receivers employing the 76 chassis is fastened with wood screws. Remove the back, then remove the two screws at lower edge of loop support and carefully lay loop back to gain access to the tubes.

THE CROSLEY CORP.

MODELS 52TD, 52TD-U, 52TE, 52TE-U, Chassis 77; 52TF 52TF-U, Chassis 76

Chassis No. 76 and No. 77 are identical electrically in that they are both five-tube, two band, superheterodyne receivers, designed to operate on either A.C. or D.C. electric circuits, as specified on model label.

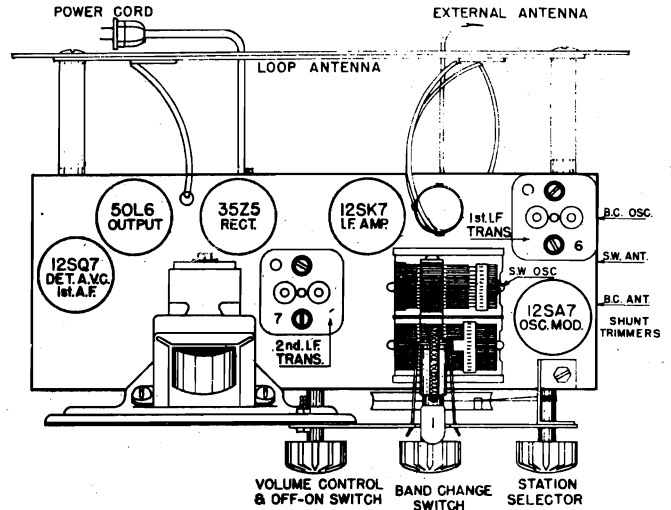

TUNING RANGE

Broadcast Band—1600 to 540 kilocycles, or 18.75 to 555 meters
Short Wave Band—15 to 6 megacycles, or 20 to 50 meters.

TUBES

FUNCTION

- 1 — 12SA7 Oscillator Modulator
- 1 — 12SK7 Intermediate Frequency Amplifier
- 1 — 12SQ7 Detector, A.V.C. and 1st Audio Amplifier
- 1 — 50L6GT Beam Power Output
- 1 — 35Z5GT Rectifier

ALIGNMENT PROCEDURE

Prehliminary

- Output Meter Connections Plate and screen of 50L6
- Generator Ground Connections Ground Lead and Chassis
- Dummy Antenna to be in series with generator output
- Position of Volume Control Fully on

VOLTAGES MEASURED BETWEEN SOCKET PIN & GND. SIDE OF VOL. CONT. WITH 250VOLT, 1000 OHMS. PER. VOLT METER. READINGS MAY VARY 10%

POWER SUPPLY

Make certain that the power rating on the model and license label is the SAME as your lighting circuit BEFORE plugging the receiver power cord into a convenient receptacle. Never put your hand in the receiver cabinet without first disconnecting receiver plug from the electric circuit.

ALIGNMENT PROCEDURE CHART

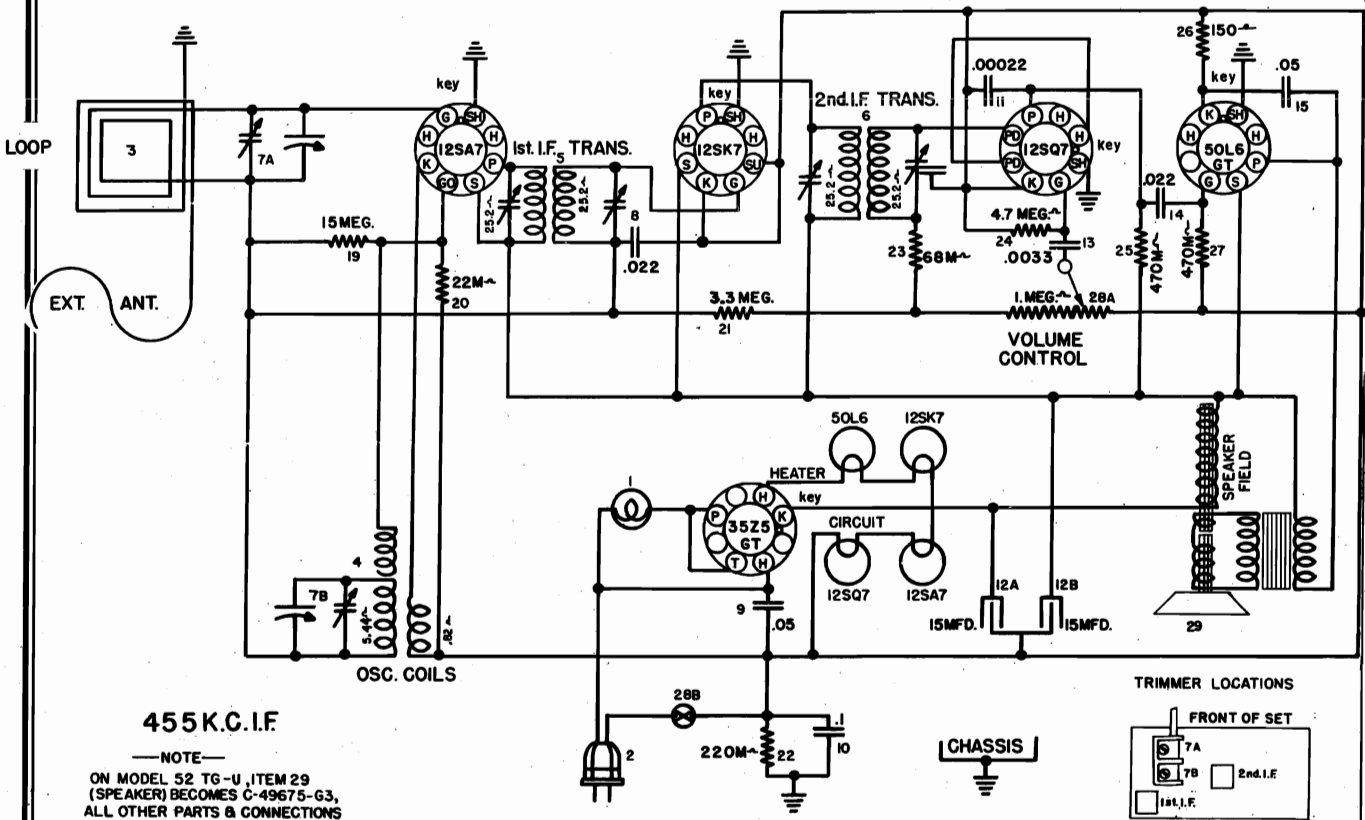

Alignment Sequence	Dummy Antenna	Frequency Setting	Input Connection to Receiver	Band Switch	Tuning Cond. Setting	Trimmer Adjusted	Remarks
1.	Signal Generator .0001 MF.	455 KC.	Antenna Lead	BC	Fully Open	2nd I-F(2) 1st L-F(2)	Adjust for maximum signal. Adjust for maximum signal.
2.	400 ohm Carbon Resistor	15.3 MC.	Antenna Lead (red)	S.W.	Fully Open	S.W. "Osc."	Adjust for maximum output.
3.	400 ohm Carbon	15.0 MC.	Antenna Lead (red)	S.W.	15 on Dial	S.W. "Ant."	Adjust for maximum signal while rocking gang through it.
4.	.0001 MF.	1650 KC.	Antenna Lead (red)	BC	Fully Open	B.C. "Osc."	Adjust for maximum output. Gang does not have to tune through signal.
5.	.0001 MF.	1400 KC.	Antenna Lead (red)	BC	140 Dial	B.C. "Ant."	Adjust for maximum output.

When aligning the shortwave band "OSC" trimmer, care must be exercised to see that the circuit is aligned on the correct frequency and not on the image which is approximately 910 kilocycles less as indicated on the dial. To check, increase generator output, tune in the generator frequency and then tune in the image frequency which should be weaker than the fundamental and come in approximately 910 kilocycles lower on the dial than the fundamental. If image cannot be tuned in, the "OSC" trimmer is adjusted to the wrong peak. (Correct peak is the second peak on trimmer from the closed position.)

Repeat the original alignment procedure for more accurate adjustments. Always keep signal generator output as low as possible to prevent action of the A.V.C. circuit.

THE CROSLEY CORP.

455 KC. I.F.

MODELS TK52, TK52W

Chassis 64

"Set-Up Procedure"

ALIGNMENT CHART

CHASSIS 63 and 64

Sequence	SIGNAL GENERATOR			Band Switch	Tuning Cond. Setting	Trimmer Cond. Adjusted	Remarks
	Dummy Antenna	Frequency Setting	Input Connection To Radio				
1.	.05 Mf.	456 Kc.	Antenna	S. B.	Fully on	2nd I-F (2) 1st I-F (2)	Adjust for maximum output. Adjust for maximum output.
2.	400 Ohm carbon	15.4 Mc.	Antenna	S. W.	Fully open	S. W. "OSC" (Rear section tuning cond.)	Adjust for maximum output.
3.	400 Ohm carbon	15.0 Mc.	Antenna	S. W.	Approx. 15 on dial	S. W. "ANT" (Center trimmer right end of chassis)	Adjust for maximum output while rocking gang thru signal.
4.	.0002 Mf.	1600 Kc.	Antenna	S. B.	Fully on	B. C. "OSC" (Front trimmer right end of Chassis)	Adjust for maximum output. Gang does not have to tune thru signal.
5.	.0002 Mf.	1400 Kc.	Antenna	S. B.	Approx. 140 on dial	B. C. "ANT" (Rear trimmer right end of chassis)	Adjust for maximum output.

(Foot Note) (1). Do not use a ground return from the signal generator unless it is found to be absolutely necessary. If necessary a small condenser (approx. .001 mf. 400 V) should be connected in series with the ground lead of the generator and receiver chassis.

When aligning the short wave band "OSC" trimmer, care must be exercised to see that the circuits are aligned on the correct frequency and not on the image which is approximately 910 kilocycles less as indicated on the dial. To check, increase generator output, tune in the generator frequency and then tune in the image frequency which should be weaker than the fundamental and come in approximately 910 kilocycles lower on the dial than the fundamental. If the image cannot be tuned in, the "OSC" trimmer is adjusted to the wrong peak. (Correct peak is the second peak on trimmer from the closed position.)

Repeat the original alignment procedure for more accurate adjustments. Always keep signal generator output as low as possible to prevent action of the A. V. C. circuit.

WAVE TRAP

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly consists of a coil, and a trimmer condenser as illustrated by the dotted lines in the Wiring Diagram. The wave trap should not be adjusted until all other adjustments have been made. To make the adjustment, feed a 455 kilocycle signal from the signal generator through a 50 mmf. condenser into the antenna terminal of the receiver. With the gang condenser open and the volume control fully on, adjust the trimmer condenser on the wave trap for MINIMUM output.

Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles, the exact frequency should be determined with the aid of the signal generator. Then instead of feeding a 455 kilocycle signal into the receiver the exact frequency of the interfering signal should be used. If it is not possible to determine the exact frequency of the interfering signal the antenna may be attached to the receiver and the receiver tuned to the position where the interfering signal is most noticeable. Then adjust the wave trap for minimum interference.

THE SETTING AND OPERATION OF THE ELECTRIC PUSH BUTTONS

Select and remove the call letter tabs of your four favorite local broadcast stations from the station call letter sheets supplied. Place them in the windows above the push buttons, in the order of their frequency (Kilocycles). That is, the station whose frequency is within the frequency range of the left hand button should be inserted (from top) in the window directly above that button and so on for the following three. The push button on the right MUST be depressed when receiver is to be tuned with the station selector knob. Place the "Manual" or "Dial" tab in window above this button.

The frequencies (Kilocycles) of your local stations may be found in your daily paper or by referring to any station list.

THE CROSLY CORP.

MODELS TK52, TK52W
Chassis 64

NOTE: To simplify the set-up and insure correct adjustments of push buttons the following pre-adjustments should be made:

1. Tighten all the padder condensers' screws.
2. Then loosen each "ANT" padder screw approximately two turns.

While adjusting "OSC" padder screws always turn very slowly as they tune very sharp and it is possible to tune past station without hearing the signal.

SET-UP PROCEDURE

1. Turn the set on and leave operate for about ten or twenty minutes before attempting to set the push buttons.
2. Due to the wide range to which each button will tune it is essential that the stations selected are well within each buttons tuning range.
3. Push in the "Manual" button (extreme right) and using the station selector knob, tune in the station to which the No. 1 button is to be set.
4. Push in the No. 1 button and using a long, thin screw driver adjust the "OSC"/A padder screw, turning slowly (extreme right looking at rear of cabinet) until the station you tuned in (MANUALLY) is heard again. The padder condensers are accessible through the long horizontal opening in the upper left side of cabinet back. Be sure to adjust for maximum volume in speaker.
5. Adjust the No. 1 push button "ANT"/AA padder condenser for maximum volume in speaker.
6. Push in "Manual" push button and re-check station to make sure button is correctly set. There should be no change in volume when switched from push button to manual.
7. The set up for No. 1 button is then complete. Set up remaining buttons, using same procedure; adjust the "OSC" padder first, then the "ANT" padder, etc.

To tune the receiver with the push buttons, simply press in the button which corresponds to the call letters of the desired station: The volume may be adjusted to suit.

Tubes Used	Functions
12SA7	Oscillator—Modulator
12SK7	Intermediate Frequency Amplifier
12SQ7	Detector, A.V.C. 1st Audio Amplifier
50L6	Beam Power Output
35Z5	Rectifier

Tube may be GT (Bantam) or metal equivalents.

Fig. 4—Socket Voltage Chart

Fig. 3—Front View

THE CROSLEY CORP.

Model No. 52-TP is a Table Model Phono-Combination incorporating a five-tube, two-band superheterodyne receiver and a sensitive and efficient unit for the reproduction of phonograph recordings. Designed to operate on A.C. electric circuits as specified on model label.

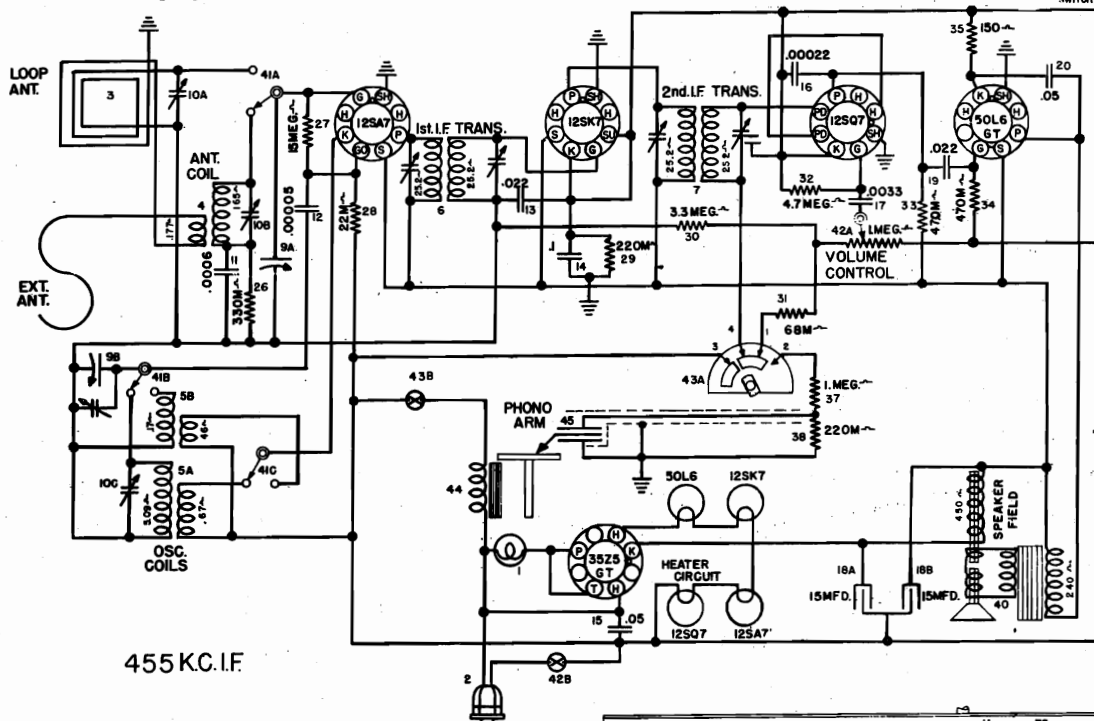

TUNING RANGE—Broadcast Band—1600 to 540 kilocycles, or 18.75 to 555 meters. Short Wave Band—15 to 6 megacycles, or 20 to 50 meters.

TUBES—1—12SA7, 1—12SK7, 1—12SQ7, 1—50L6GT, 1—35Z5GT. Tubes must be GT (Bantam) or metal equivalent.

ANTENNA—This model has a built-in loop antenna. Under normal conditions this loop antenna will provide sufficient pickup for satisfactory reception from nearby and powerful stations, whose operating frequency is between 1600 and 540 kilocycles. Due to the slightly directional effect of the loop antenna, reception from some stations may be improved by turning the receiver. For Short Wave or distant reception on the broadcast band, an outdoor antenna should be installed. Connect the antenna lead-in wire to the red lead extending from the rear of the cabinet.

GROUND—NEVER ATTACH A GROUND WIRE TO THIS RECEIVER.

POWER SUPPLY—Make certain that the power rating on the model and license label is the SAME as your lighting circuit BEFORE plugging the receiver power cord into a convenient receptacle. Never put your hand in the receiver cabinet without first disconnecting receiver plug from the electric circuit.

455 KC. I.F.

ALIGNMENT PROCEDURE

Preliminary

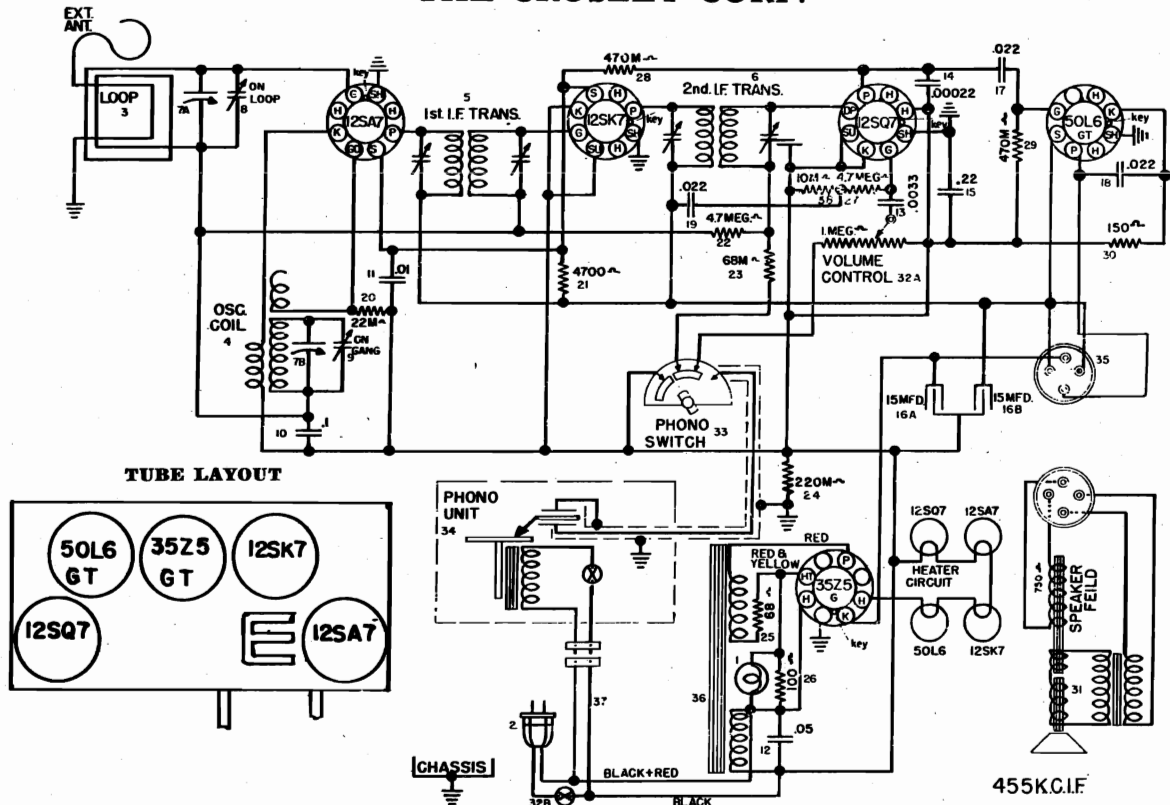

- Output Meter Connections Plate and screen of 50L6
- Generator Ground Connections Ground Lead and Chassis
- Dummy Antenna to be in series with generator output
- Position of Volume Control Fully on

Alignment Sequence	Dummy Antenna	Frequency Setting	Input Connection to Receiver	Band Switch	Tuning Cond. Setting	Trimmer Adjusted	Remarks

Broadcast Band—550 Kc. to 1600 Kc.
 Short Wave Band—5.2 Mc. to 18.0 Mc.

ALIGNMENT PROCEDURE

- Output Meter Connections.....Plate and Screen of 6K6G
- Generator Ground Connection.....To Chassis or Ground Lead
- Dummy Antenna to be in series with generator output.....See Chart Below
- Position of Volume Control.....Fully On

ALIGNMENT PROCEDURE CHART

Align-ment Sequence	Signal Generator Dummy Antenna	Frequency Setting	Input Connection to Receiver	Band Switch	Tuning Cond. Setting	Trimmer Adjusted	Remarks
1.	.02 MF.	455 Kc.	Stator lug Rear section of Gang Cond.	B. C.	Fully open	2nd I-F (2) 1st I-F (2)	Adjust for Maximum. Adjust for Maximum.
2.	400 ohm (carbon)	18.3 Mc.	Ant. Terminal	S. W.	Fully open	S. W. "OSC"	Adjust for peak. Gang does not have to tune thru signal.
3.	400 ohm (carbon)	18.0 Mc.	Ant. Terminal	S. W.	Approx. 18	S. W. "ANT" Trimmer	Adjust for maximum output while rocking gang thru signal. do not touch B. C. Osc. Trimmer.
4.	.0002 MF.	1650 Kc.	Ant. Terminal	B. C.	Fully open	B. C. "OSC" Trimmer	Adjust for peak; gang does not have to tune thru signal. Loop must be connected.
5.	.0002 MF.	600 Kc.	Ant. Terminal	B. C.	Approx. 60 on dial	B. C. "OSC" Series Trimmer	Adjust for maximum output while rocking gang thru signal.
6.	.0002 MF.	1400 Kc.	Ant. Terminal	B. C.	Approx. 140 on dial	B. C. LOOP "ANT" Trimmer	Adjust for maximum output do not touch B. C. Osc. Trimmer.
7.	Repeat the above alignment procedure for more accurate adjustments. Always keep signal generator output as low as possible to prevent action of the A. S. C. circuit.						

IMPORTANT ALIGNMENT NOTES — When aligning the shortwave band "OSC" trimmer care must be exercised to see that the circuit is aligned on the correct frequency and not on the image which is approximately 910 kilocycles less as indicated on the Receiver dial. To check, increase generator output tune-in the generator frequency and then tune-in the image frequency which should be weaker than the fundamental and come in approximately 910 kilocycles lower on the Receiver dial than the fundamental. If image cannot be tuned-in, the "OSC" trimmer is adjusted to the wrong peak. (Correct peak is the second peak on trimmer from the closed position.)

ALIGNMENT PROCEDURE

Preliminary

Output Meter Connections.....Plate and Screen 25L6GT
 Generator Ground Connections.....See foot note (1)
 Dummy Antenna in series with Generator output.....See Chart below
 Position of Volume Control.....Fully on
 Depress Manual Push-Button

Signal Generator							
Sequence	Dummy Antenna	Frequency Setting	Input Connection for Radio	Band Switch	Tuning Cond. Setting	Trimmer Adjusted	Remarks
1	.05 Mf.	456 Kc.	Antenna	S. B.	Fully open	2nd I-F (2) 1st I-F (2)	Adjust for maximum output. Adjust for maximum output.
2	400 ohm carbon	15.4 Mc.	Antenna	S. W.	Fully open	S. W. "OSC" (rear section of tuning condenser)	Adjust for maximum output.
3	400 ohm carbon	15.0 Mc.	Antenna	S. W.	Approx. 15 on dial	S. W. "Ant." (center trimmer right end of chassis)	Adjust for maximum output while rocking gang thru signal.
4	.0002 Mf.	1600 Kc.	Antenna	S. B.	Fully open	B. C. "OSC" (front trimmer right end of chassis)	Adjust for maximum output. Gang does not have to tune thru signal.
5	.002 Mf.	1400 Kc.	Antenna	S. B.	Approx. 1400 on dial	B. C. "ANT" (rear trimmer right end of chassis)	Adjust for maximum output.

(1) Do not use a ground return from the signal generator unless it is found to be absolutely necessary.

If necessary a small condenser (approx. a .001 mf.—400 Volt) should be connected in series with the ground lead of the generator and receiver chassis.

IMPORTANT ALIGNMENT NOTES

When aligning the shortwave band "OSC" trimmer care must be exercised to see that the circuits are aligned on the correct frequency and not on the image which is approximately 910 kilocycles less as indicated on the dial. To check, increase generator output, tune-in the generator frequency and then tune-in the image frequency which should be weaker than the fundamental and come in approximately 910 kilocycles lower on the dial than the fundamental. If image cannot be tuned in, the "OSC" trimmer is adjusted to the wrong peak. (Correct peak is the second peak on trimmer from the closed position).

Repeat the original alignment procedure for more accurate adjustments. Always keep signal generator output as low as possible to prevent action of the A.V.C. circuit.

WAVE TRAP W MODELS

The Wave Trap should not be adjusted until all other adjustments have been made. To make the adjustment feed a 455 kilocycle signal from the signal terminal of the receiver. With the gang condenser open and the volume control fully on, adjust the trimmer condenser on the wave trap for MINIMUM output.

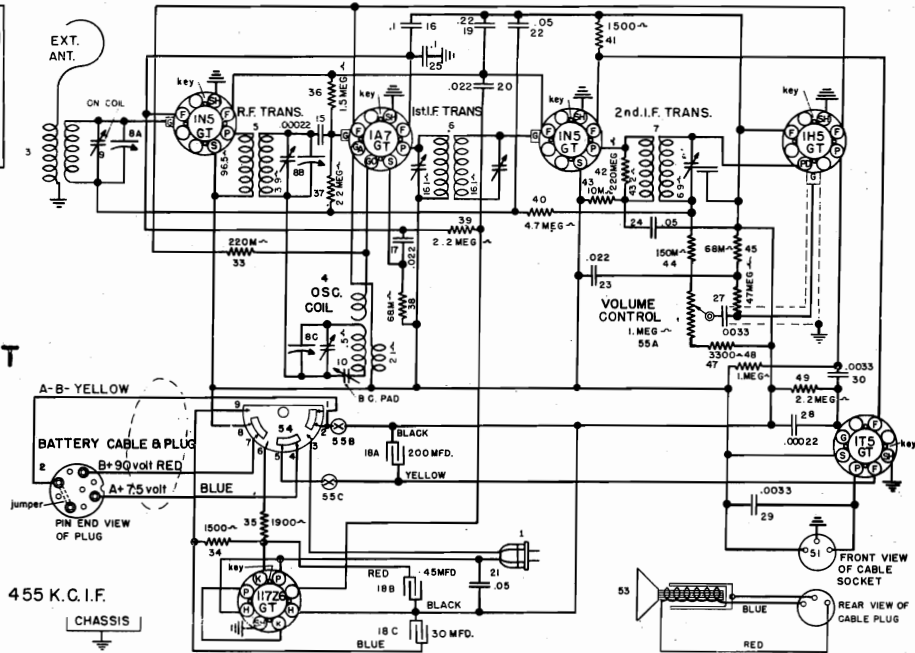

Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles the exact frequency should be determined with the aid of the signal generator. Then instead of feeding a 455 kilocycle signal into the receiver the exact frequency of the interfering signal should be used. If it is not possible to determine the exact frequency of the interfering signal the antenna may be attached to the receiver and the receiver tuned to the position where the interfering signal is more noticeable. Then adjust the wave trap for minimum interference.

SETTING THE PUSH BUTTONS

The six station selector push buttons are set up by means of two adjusting screws per button. These adjusting screws are made accessible by removing the push button escutcheon.

Select the call letter tabs of your six favorite broadcast stations from the station call letter sheets supplied. Place the call letter tabs in the window above that push button which is to be adjusted for that station. It is not essential that all push buttons be set at one time.

Note: When placing call tabs in the window be sure to arrange them according to their frequency (kilocycles) that is: the station whose frequency is well within the range covered by the No. 1 button, should be placed above that button and so on with the rest of the buttons to be set. After tabs are in place break off the celluloid covers from the strip furnished and snap in place over the call letters to protect and hold them in place.

The frequencies of your favorite stations may be found in your local paper or by consulting a station listing sheet.

Fig. 1

TUNING THE RECEIVER-MANUAL OPERATION

Turn the band change switch knob to the desired frequency band. Turn the volume control knob approximately half way in a clockwise direction. Rotate the station selector knob (right hand knob) slowly until a station is heard. Increase or decrease the volume as desired by readjusting the volume control knob. For best quality of reception always adjust the station selector to the middle of the range on the dial within which the program is being received. It should be remembered in tuning in stations on the Shortwave band that tuning is much sharper and greater care must be exercised when adjusting the station selector.

SET-UP PROCEDURE

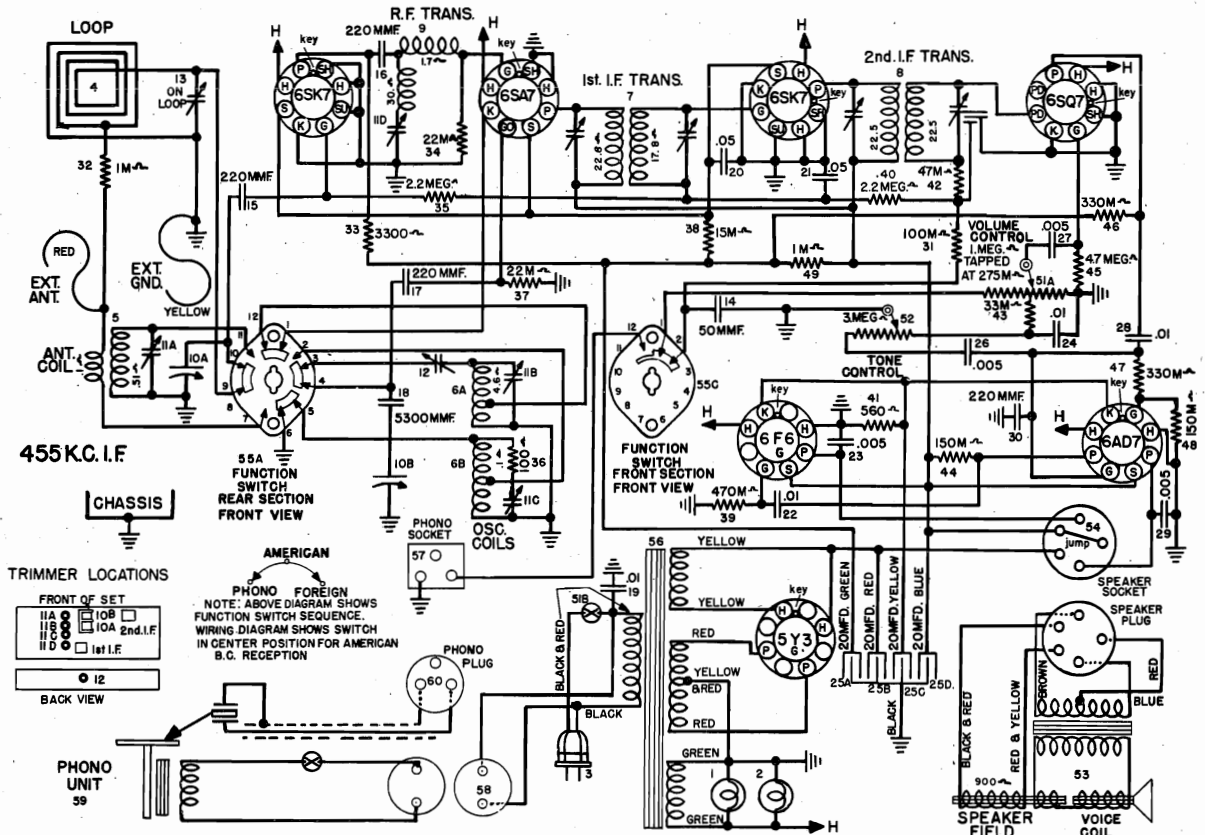

Remove station selector push button escutcheon. Turn the receiver on and let it operate for a sufficient length of time to permit the tubes to reach their normal operating conditions.

It is essential that the frequency (kilocycles) of the station selected be within the range of the push button to be set for that station. See Fig. 1.

1. Turn the band change switch to the "American" position. Using the station selector knob, carefully tune in the station to which the No. 1 push button is to be set. Note program.
2. Turn the band change switch to the "Automatic" position and using a small screw driver, carefully turn in a clockwise direction the Oscillator adjusting screw until the station previously tuned in manually is heard again. Adjust for maximum output in the speaker.
3. Adjust the Antenna adjusting screw for maximum volume in the speaker.
4. Turn band change switch from "Automatic" to "American" and back again to check if adjustment has been correctly made. There should be no change in tone quality when switched from one to the other.
5. Repeat above procedure for the remaining push buttons.

To tune the receiver with the push buttons, set the band change switch on "Automatic" and depress completely the button corresponding to the station you wish to hear.

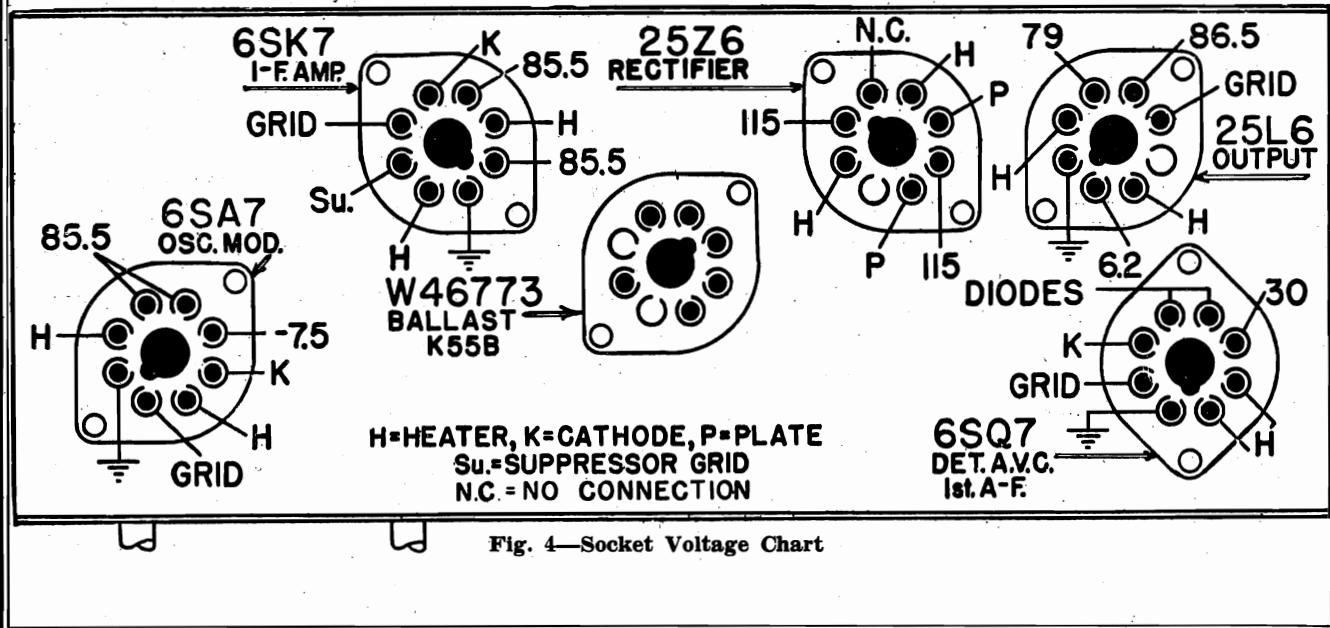

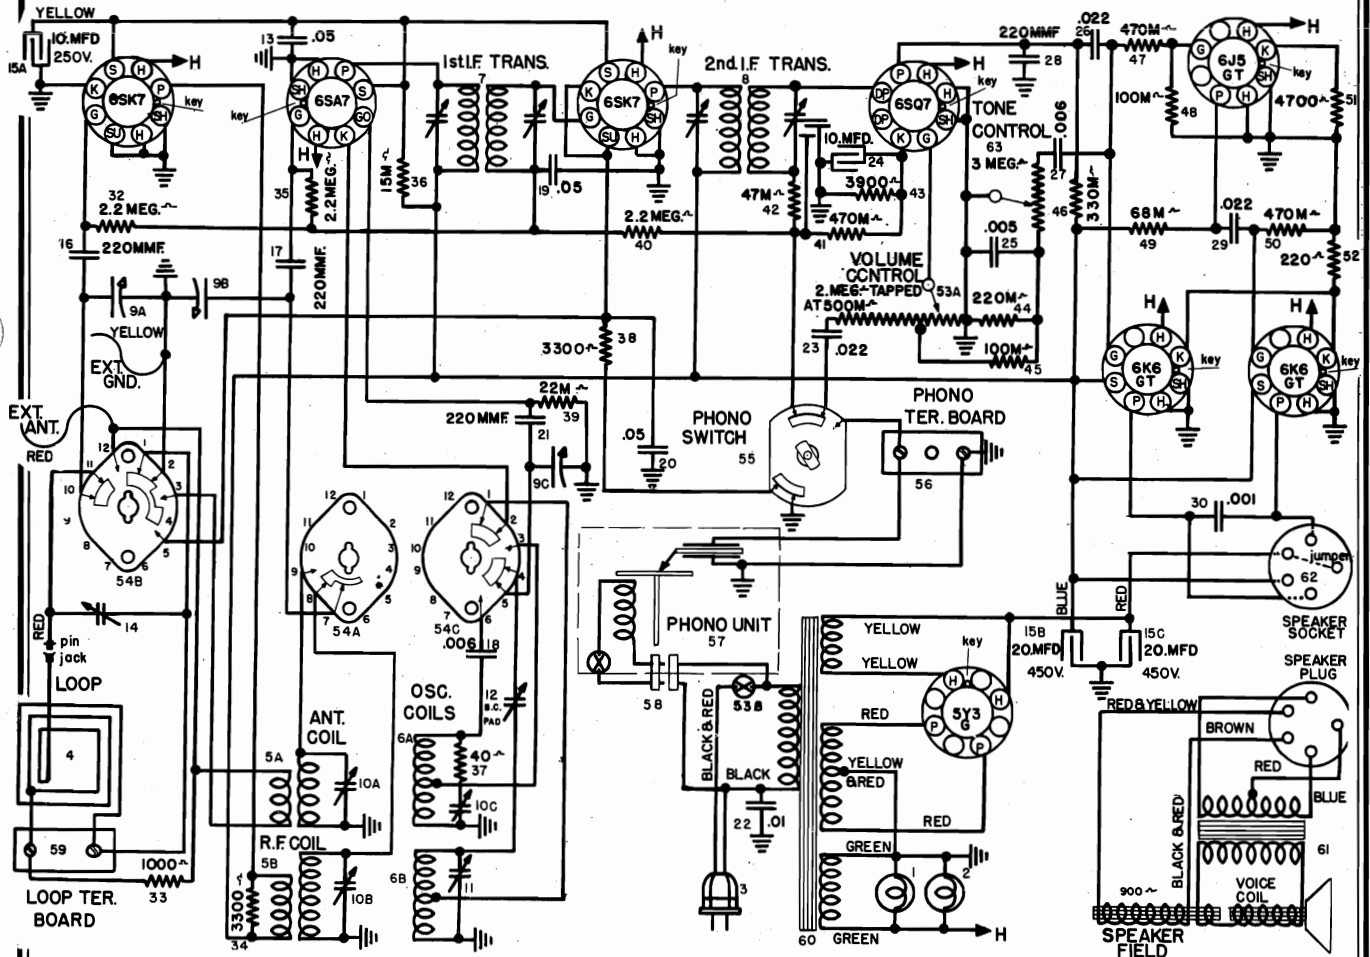

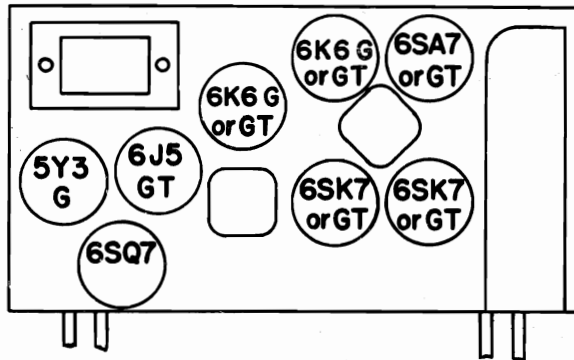

Fig. 4—Socket Voltage Chart

THE CROSLY CORP.

MODELS 82CP, 82CQ
Chassis 75

455K.C.I.F

TRIMMER LOCATIONS

PHONO TERMINAL STRIP—The two terminals located on the rear of the chassis and marked 1 and 2 provide connections for the phonograph and automatic record changer assembly. After disconnecting this cable from the terminals they may be used for connecting to the set, adapter units for the reproduction of television sound or F-M programs.

THE DIAL—The tuning range of these receivers is approximately from 540 to 1630 Kilocycles, and from 6000 to 18000 Kilocycles and is divided into two bands. The upper numbers on the Dial are to be used when tuning stations in the American Broadcast Band. Add one zero (0) to these numbers to read directly in kilocycles. The lower numbers on the Dial are for International Short Wave Stations. Short Wave calibrations are directly in megacycles.

ANTENNA—These receivers incorporate an efficient built-in antenna system and under normal operating conditions no outside antenna will be required. When installing the receiver DO NOT place near large metal objects such as metal partitions, radiators, etc. since if this is done reception efficiency may be greatly reduced. For most efficient Short Wave reception, or if it is necessary to install the receiver in a shielded location, the installation of an outdoor antenna is recommended. The antenna lead-in wire is to be attached to red lead extending from rear of chassis. Reception may sometimes be improved by connecting a ground wire to the yellow lead extending from the rear of the chassis.

Position of Tone Control.....Treble or Speech

ALIGNMENT PROCEDURE CHART

Signal Generator							
Alignment Sequence	Dummy Antenna	Frequency Setting	Input Connection to Receiver	Band Switch	Tuning Cond. Setting	Trimmer Adjusted	Remarks
1.	.02 MF.	455 Kc.	Stator lug Rear section of Gang Cond.	B. C.	Fully open	2nd I-F (2) 1st I-F (2)	Adjust for Maximum. Adjust for Maximum.
2.	.0002 MF.	1650 Kc.	Ant. Terminal	B. C.	Fully open	B. C. "OSC" Trimmer	Adjust for peak; gang does not have to tune thru signal. Loop must be connected.
3.	.0002 MF.	600 Kc.	Ant. Terminal	B. C.	Approx. 60 on dial	B. C. "OSC" Series Trimmer	Adjust for maximum output while rocking gang thru signal.
4.	Repeat Step No. 2 to check possible shift due to series adjustment.						
5.	.0002 MF.	1400 Kc.	Ant. Terminal	B. C.	Approx. 140 on dial	B. C. "ANT" Trimmer B. C. "R-F" Trimmer	Adjust for maximum output do not touch B. C. Osc. Trimmer. Adjust for maximum output.
6.	400 ohm (carbon)	18.3 Mc.	Ant. Terminal	S. W.	Fully open	S. W. "OSC"	Adjust for peak. Gang does not have to tune thru signal.
7.	400 ohm (carbon)	18.0 Mc.	Ant. Terminal	S. W.	Approx. 18	S. W. "ANT" Trimmer	Adjust for maximum output while rocking gang thru signal.
8.	Repeat the above alignment procedure for more accurate adjustments. Always keep signal generator output as low as possible to prevent action of the A. V. C. circuit.						

IMPORTANT ALIGNMENT NOTES—When aligning the shortwave bands "OSC" trimmers care must be exercised to see that the circuits are aligned on the correct frequency and not on the image which is approximately 910 kilocycles less as indicated on the Receiver dial. To check, increase generator output; tune-in the generator frequency and then tune-in the image frequency which should be weaker than the fundamental and come in approximately 910 kilocycles lower on the Receiver dial than the fundamental. If image cannot be tuned-in, the "OSC" trimmer is adjusted to the wrong peak. (Correct peak is the second peak on trimmer from the closed position).

TUBE VOLTAGE CHART

SOCKET VOLTAGES MEASURED AT 117.5 V. LINE (BETWEEN SOCKET PIN AND CHASSIS) WITH 1000 OHM PER VOLT, 500 V. RANGE VOLTMETER (D. C.)

Voltages may vary 10% of values given.

THE AUTOMATIC RECORD CHANGER—This record changer will automatically play a series of twelve 10" or ten 12" records of the standard 78 R. P. M. type. The records must be all one size when loading, and may consist of less records than listed above. Records of any size up to 12" may be played manually.

FEATURES—Some of the features of these outstanding phono-combinations that will add greatly to your enjoyment are as follows: a large efficient built-in antenna; Litz wound coils; a three gang tuning condenser providing maximum selectivity and sensitivity; push-pull output tubes for maximum distortionless reproduction; continuously variable tone control; ten inch concert dynamic speaker; and an extremely high quality unit for the reproduction of phonograph records, including the "Floating Jewel Tone System" (a Crosley invention) which assures a quality of reproduction never before obtainable.

ALIGNMENT PROCEDURE CHART

Signal Generator							
Align-ment Sequence	Dummy Antenna	Frequency Setting	Input Connection to Receiver	Band Switch	Tuning Cond. Setting	Trimmer Adjusted	Remarks
1.	.02 MF.	455 Kc.	Grid of 6A8GT	B. C.	Fully open	2nd I-F (2) 1st I-F (2)	Adjust for Maximum. Adjust for Maximum.
2.	.0002 MF.	1650 Kc.	Ant. Lead (Blue)	B. C.	Fully open	B. C. "OSC" Trimmer	Adjust for peak; gang does not have to tune thru signal.
3.	.0002 MF.	600 Kc.	Ant. Lead (Blue)	B. C.	Approx. 60 on dial	B. C. "OSC" Series Trimmer	Adjust for maximum output while rocking gang thru signal.
4.	Repeat Step No. 2 to check possible shift due to series adjustment						
5.	.0002 MF.	1400 Kc.	Ant. Lead (Blue)	B. C.	Approx. 140 on dial	B. C. "ANT" Trimmer B. C. "PRE" Trimmer	Adjust for maximum output to not touch B. C. Osc. Trimmer. Adjust for maximum output.
6.	400 ohm (carbon)	5.3 Mc.	Ant. Lead (Blue)	Police	Fully open	Pol "OSC"	Adjust for peak gang; does not have to tune thru signal.
7.	400 ohm (carbon)	5.0 Mc.	Ant. Lead (Blue)	Police	Approx. 5.0	Pol "ANT"	Adjust for maximum output while rocking gang thru signal.
8.	400 ohm (carbon)	18.3 Mc.	Ant. Lead (Blue)	S. W.	Fully open	S. W. "OSC"	Adjust for peak. Gang does not have to tune thru signal.
9.	400 ohm (carbon)	18.0 Mc.	Ant. Lead (Blue)	S. W.	Approx. 18	S. W. "ANT"	Adjust for maximum output while rocking gang thru signal.

IMPORTANT ALIGNMENT NOTES

When aligning the shortwave bands "OSC" trimmers care must be exercised to see that the circuits are aligned on the correct frequency and not on the image which is approximately 910 kilocycles less as indicated on the dial. To check, increase generator output, tune-in the generator frequency and then tune-in the image frequency which should be weaker than the fundamental and come in approximately 910 kilocycles lower on the dial than the fundamental. If image cannot be tuned-in, the "OSC" trimmer is adjusted to the wrong peak. (Correct peak is the second peak on trimmer from the closed position).

Repeat the original alignment procedure for more accurate adjustments. Always keep signal generator output as low as possible to prevent action of the A.V.C. circuit.

J. B.—JUNCTION BLOCK

N. C.—NO CONNECTION

THE CROSLLEY CORP.

MODEL 494 Record
Player for Model
758 Receiver

Model 758 Receiver.
remove the jumper wire from the "PHONO SOCKET" (see Diagram of Connections in the receiver instruction booklet) and insert plug (eight prong) from the Record Player.

If it is desired to change over to 78 R.P.M. records other is accomplished by changing the drive pinion on the motor shaft. The large pinion is for 78 R.P.M. and the small pinion is for 33 1/3 R.P.M. A special wrench is supplied to fit the set screws that hold pinions on motor shaft. The special friction drive takes up the difference in pinions automatically.

CONTROLS

The Phono-Radio Switch when turned to the right (clockwise) connects the pickup to the radio receiver and at the same time shorts radio signals, when turned to the left (counter clockwise) it disconnects the pickup and permits the radio to function normally.

The motor switch is controlled by the starting and stopping lever. This lever, through cam action engages and disengages the special friction drive pulley at the same time it throws the motor switch "On" and "Off". The Phono Record Player is so wired that the volume control of the receiver is used to vary the amount of output.

OPERATION

After all connections have been made, the Phono Record Player should be placed upon a solid stand and set so that the turn table is level.

Place selected record on the turn table. (33 1/3 R.P.M. See note for information on 78 R.P.M.)

Loosen the Pickup rest bracket by rolling the rubber locking ring down. Insert needle in pickup.

Turn Phono-Radio Switch to the right, Phono position.

Pull starting level forward.

Lift pickup and gently lower it on the record so that the needle point enters the outside groove.

Adjust volume control (on receiver) to the desired level.

CARE OF RECORD PLAYER

1—Never leave Pickup set on the record when not in use. Lock in stand with rubber lock ring.

2—Do not rotate needle in the pickup after once used, as this causes excessive record wear, resulting in poor reproduction.

3—Oil the motor once, for about every 200 hours of service. Be sure that the wick in the oil well is saturated but not to the extent that the oil overflows.

4—The friction drive pulley bearing is provided with an oil hole on the top of the bearing stud. Oil as needed.

5—The turn table spindle is provided with an oil hole on top. To oil turn table spindle, remove the turn table and clean bearing, then oil surface of bearing. Replace turn table and fill oil hole in top of spindle.

6—It may be advisable to apply a little light grease to the slide bar studs at least once a year.

DETROLA CORP.

TUBE LAYOUT and CONNECTION DIAGRAM

PART No. 8600

ALIGNMENT OF SHORT WAVE BANDS

S. W. Band No. 1

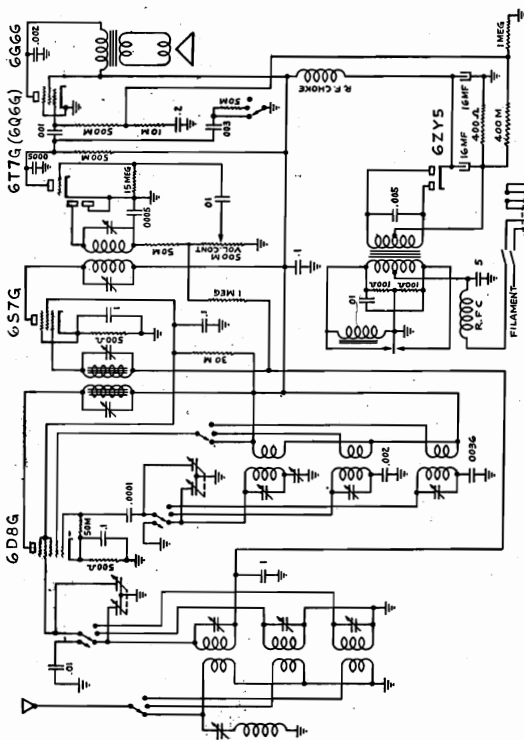

Rotate the band selector switch to the center position (No. 1 on band selector knob). Disconnect the 200 mmf. condenser from the output of the signal generator and in its place substitute a 400 ohm resistor which serves as a dummy antenna for aligning both short wave bands. The other end of the 400 ohm resistor is connected to the antenna lead of the receiver. Set the tuning condenser of the receiver at minimum capacity (plates all the way out). Produce a weak signal of 10,200 KC in the signal generator. Screw the S. W. No. 1 OSCILLATOR TRIMMER all the way down and then unscrew it to the second peak at which the signal is heard. If the trimmer is not unscrewed to the second peak, the circuits will not be in proper relation and the calibration will be incorrect and there may also be a dead spot on some position on the dial. Next produce a signal of 10,000 KC in the signal generator and tune this signal carefully in the receiver. If the signal can be heard at two places, the proper signal to tune is the one which is closest to the 10.2 mark on the dial chart of the receiver. Adjust the S. W. No. 1 ANTENNA TRIMMER until a definite peak is noted in the output meter. During this adjustment, rock the tuning condenser back and forth through the signal, while adjusting this trimmer in order to assure perfect alignment.

S. W. Band No. 2

Using exactly the same procedure and taking the same precautions as for S. W. Band No. 1, turn the band selector switch to the No. 2 position. Align the S. W. No. 2 OSCILLATOR TRIMMER at 22,200 KC, with the signal generator producing a signal of 22,200 KC and with the tuning condenser set at minimum capacity (plates all the way out). Align the S. W. No. 2 ANTENNA TRIMMER at 22,000 KC with the signal generator producing a 22,000 KC signal and be sure to tune the receiver to the signal nearest the 22 mark on the dial chart. The same procedure of screwing the oscillator trimmer all the way down and then unscrewing to the second peak and the same precautions of rocking the tuning condenser back and forth through the signal are followed to secure a proper alignment of this band.

TUBES

- Tubes required are:
- 1—6D8G Oscillator Transformer
- 1—6S7G I.F. Amplifier
- 1—6T7G Detector AVC Audio
- 1—6G6G Power Output
- 1—6Z5G Rectifier

PART No. 8584

ALIGNMENT PROCEDURE

Intermediate Frequency Alignment

Turn the band selector switch to the broadcast position ("B" on the band selector knob). Connect a .1 mfd. condenser to the output terminal of the signal generator and connect the other end of this condenser to the control grid of the 6S7G tube. Do not disconnect the grid clip on the tube. Generate a weak 455 KC signal in the signal generator, and adjust the trimmer of the second I.F. transformer for maximum response in the output meter. If the signal measures above 1/2 volt during the adjustment, reduce its strength. Now transfer the connection of the signal generator through the .1 mfd. condenser to the grid of the 6D8G tube and align the trimmers of the first I.F. transformer.

R. F. ALIGNMENT

Broadcast Band

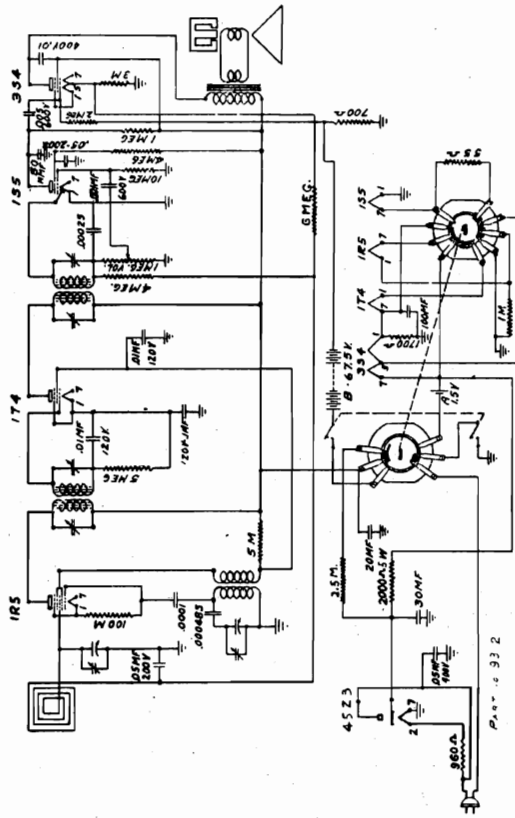

Disconnect the .1 mfd. condenser from the output of the signal generator and in its place substitute a 200 or 250 mmf. condenser, connecting the other end of this condenser to the ANTENNA LEAD of the receiver. Turn the tuning condenser to about 600 KC. With the generator producing a fairly powerful signal of 455 KC, adjust the WAVE TRAP trimmer for MINIMUM RESPONSE. Set the tuning condenser of the receiver at minimum capacity (plates all the way out). Generate a weak signal of 1680 KC in the signal generator. Adjust the BROADCAST OSCILLATOR TRIMMER until the signal is tuned in. Next produce a weak signal of 1400 KC in the signal generator. Tune the receiver very carefully to the signal and adjust the BROADCAST ANTENNA TRIMMER for maximum response in the output meter. Produce a 600 KC signal in the signal generator and tune the receiver carefully to this signal, adjust the BROADCAST OSCILLATOR PADDER for maximum response. The tuning condenser of the receiver should be rocked back and forth through the signal while varying the padder in order to assure perfect alignment. The last three adjustments should be repeated two or three times for perfect alignment.

Tune in a broadcast station of known frequency between 1200 and 800 KC and set the pointer to the proper calibration on the dial chart. Be sure to use a station whose frequency is reliable as the accuracy of calibration depends on this setting. Note that the square dots in the upper half of the black band are accurately calibrated for the frequencies of the broadcast band.

ALIGNMENT PROCEDURE

I.F. Frequency 455 KC. Set Range 510-1580 KC.
 Connect the test oscillator, or signal generator, to the set as follows: Connect the "hot" side of the signal generator to the grid of the 1A7GT tube, and the ground side to the chassis. If the set is aligned on AC or DC be sure that the test oscillator or signal generator is isolated from the receiver and line by either a transformer or .2MFD condensers in both test leads. An output meter should be connected across the voice coil leads of the speaker to indicate resonance. Align the I.F. trimmers at 455 KC. for maximum meter reading.

Turn the condenser plates all the way out. Set the test oscillator to 1580 KC and adjust the oscillator trimmer for maximum signal. Disconnect the test oscillator and tune in a weak station near 1400 KC. at full volume. Adjust the trimmer on the front of the variable condenser for maximum signal. When aligning the set do not set the receiver on or near a metal work bench or other large metal object, as it will affect the tracking of the receiver.

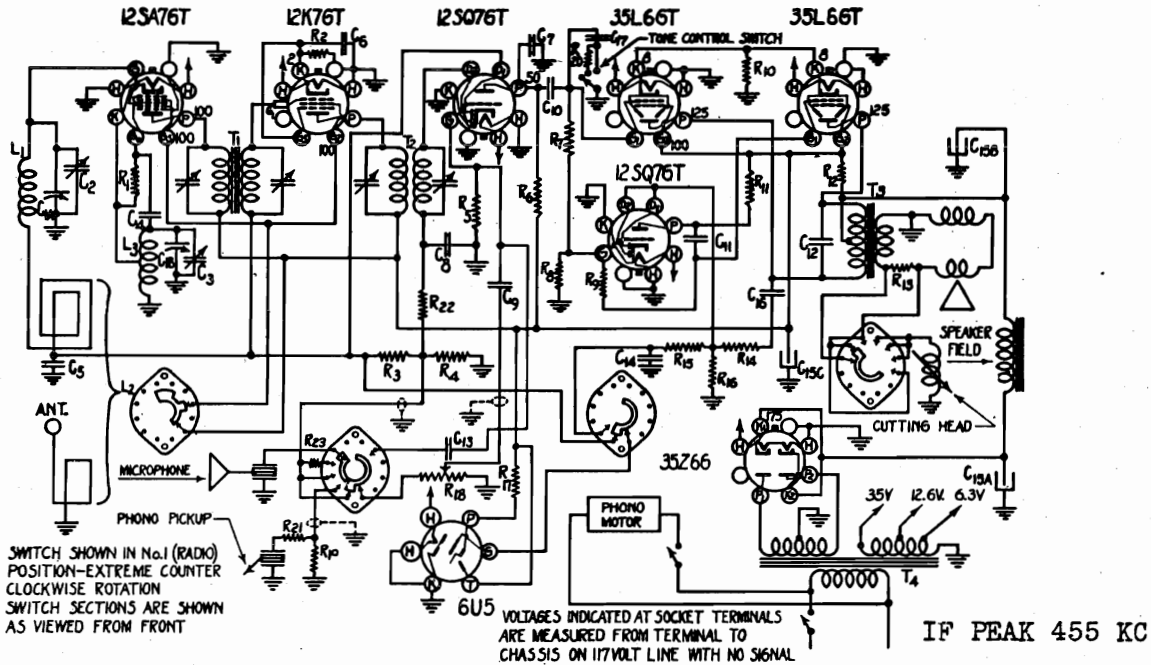

The following tubes are used in this receiver.
 12SA7 Translater 12SQ7 Detector AVC
 12SK7 IF amplifier 50L6GT Output
 35Z5GT Rectifier

DETROLA CORP.

Voltages indicated at socket terminals are measured with 1000 ohm per volt meter, on 117 volt line, no signal.

ALIGNMENT PROCEDURE

Output meter connection Across speaker voice coil
 Connection of generator ground lead To Chassis
 Connection of generator output lead See chart below
 Dummy antenna value to be used in series with generator See chart
 Position of volume control Full on (Clockwise)

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	TRIMMERS ADJUSTED (IN ORDER SHOWN)
Open (Min. capacity)	455 kc.	.1 mfd.	Ant. section of variable	T2, T1.
Min. capacity	1720 kc.	50 mmf.	Ant. Terminal	Oscillator Trimmer
Tune in signal from generator	1400 kc.	50 mmf.	Ant. Terminal	Antenna Trimmer

ALL ALIGNMENT OPERATIONS MUST BE DONE WITH THE MASTER CONTROL SWITCH IN THE NO. 1 (RADIO) POSITION.

LOOP ANTENNA

This receiver is equipped with a loop antenna. This antenna is somewhat directional in its reception characteristics, therefore turning the receiver to a particular position will often improve reception or reduce interference.

ANTENNA AND GROUND CONNECTIONS

When this receiver is used inside a building which has metal lath or a large amount of steel in it, or in a location where reception conditions are poor, an outdoor antenna and a ground may be necessary.

Two terminals are provided on the back of the cabinet for connection of antenna and ground.

RECORDING ARM ADJUSTMENTS

The recorder arm and recording head are adjusted at the factory for best operation. The following paragraph tells how to correct these adjustments should they, for any reason, become changed from their factory setting.

The bottom of the recording arm should be exactly 1/4 inch from the surface of the record. This should be measured beside the needle retaining screw on the end of the arm. The screw for making this adjustment can be found when the arm is raised, on a small platform near the hinge. Turning the adjusting screw to the left raises the arm, turning to the right lowers it. In making an adjustment turn the screw only a small fraction of a turn at a time.

Make a cut of at least ten or fifteen turns to see whether or not the needle is exerting the correct pressure on the record. This is correct when the groove cut by the needle is of approximately the same width as the space between grooves. On top of the cutting arm is a flat head screw. Turning this screw to the right increases the depth of cut, to the left decreases it. This adjustment is quite critical and the screw should be turned not more than 1/4 turn at a time.

PHONO OPERATION

Turning the Master Control Switch to the No. 2 or Phono position, connects the phono pickup to the audio amplifier of the receiver and disconnects the radio. The Volume control acts for phono the same as for radio.

Always place the pickup arm on the rest provided when not in use.

RECORDING

The recording mechanism will cut records up to 10 inches in diameter. Recordings of excellent quality can be made if the instructions in the following paragraphs are very carefully followed.

INSERTING THE RECORDING NEEDLE IN THE HEAD OF THE RECORDER ARM

Notice that the shank of the recording needle is ground flat on one side. Loosen the screw in the end of the Recorder Arm. Insert the needle into the hole in the under side so that the flat side is towards the front of the cabinet. Tighten the retaining screw so that the needle is held firmly. Check to make sure that the recording needle is tight each time a recording is made.

TO RECORD A RADIO PROGRAM

Place a blank record on the turntable making sure that the small pin on the turntable projects through the hole provided for it in the record. This is necessary to prevent the record from slipping and ruining the recording.

Turn the Master Control Switch to the No. 1 (Radio) position. Tune in the program you desire to record. Observe the tuning eye carefully and be sure that the station is tuned in perfectly.

Turn the Master Control Switch to the "Record Radio" (No. 3) position. Notice that the shadow on the tuning eye screen now varies in width with the volume of sound.

Adjust the Volume Control so that the eye just closes (See paragraph titled "THE TUNING EYE").

Turn the phono motor ON. Raise the Recorder Arm and move it so that the needle is just inside the edge of the record. Lower the arm carefully on the record.

When the recording arm is lowered on the record an arm on the under side of the recorder unit engages the lead screw which moves the arm across the record. The arm must be raised about three inches to disengage the lead screw so that the arm can be moved.

As the recording is being made, a small shaving is cut out of the record by the recording needle. This piles up in the center of the record.

After the record has been cut, raise the recorder arm, swing it outwardly and place it on the rest. Stop the turntable and remove the shaving which has been cut out of the record.

The record may now be played in the normal manner.

TO RECORD WITH THE MICROPHONE

Plug the Microphone into the socket provided on the rear of the cabinet.

Turn the Master Control Switch to the No. 5 position.

Speak into the microphone and adjust the volume control until the eye just closes as described in the preceding paragraph. Whatever sound is picked up by the microphone will be recorded on the record. Keep the microphone some distance away from the receiver, preferably to one side so that it does not pick up the sound from the speaker. Keep the microphone at least six inches from your mouth and try to keep the same voice level as used initially in setting the volume.

Place the recording arm on the record as described above.

TO RECORD WITH MICROPHONE AND RADIO AT THE SAME TIME

Position No. 4 of the Master Control Switch arranges the circuits so that it is possible to make a recording from a radio program and with the microphone at the same time.

Tune in the program you desire to record exactly as described under "Recording Radio Programs".

Turn the Master Control Switch to the No. 4 position. Adjust eye so that it does not completely close at maximum radio signal.

Speak into the microphone with sufficient volume so that the eye just closes at the maximum combined radio and voice signal. To make the voice predominate, retard the volume setting which reduces the radio volume, and speak a little closer to the microphone.

Place the recorder arm on the record and proceed with the recording.

PUBLIC ADDRESS

The No. 6 position of the Master Control Switch connects the circuits so that the microphone, and the audio amplifier and speaker of the receiver may be used as a small public address system. Keep the microphone as far as possible from the speaker so that the sound from the speaker will not reach the microphone, causing a "howl" or whistle.

GENERAL INFORMATION

In the recording positions (Positions 3, 4 and 5 of the Master Control Switch) the volume from the speaker is reduced. This is done automatically by the switch for three reasons, some of the power from the output tube is needed for operating the recording head, the volume level necessary for recording is too high for the average size room, and to prevent the sound from the speaker from reaching the microphone.

If the recording needle is not very sharp, the quality of the recording will be poor. A needle which has become dull through use or which has been otherwise damaged should be replaced.

The Master Control Switch should always be turned to the No. 1 (Radio) position when listening to radio programs.

The pickup and the recording arms should always be placed on the rests provided for them when they are not in use, to protect them from damage.

MODEL 564

TO CALIBRATE RECEIVER

Attach the hot side of signal generator to one of the flexible antenna loop leads. Connect the ground side to the other flexible lead. Adjust the signal generator to 455 KC and peak the I.F. trimmers for maximum signal. Adjust the receiver dial and generator to 1500 KC peak the variable condenser trimmer screws for maximum gain.

BROADCAST RANGE 540-1700 KILOCYCLES
SHORT WAVE RANGE 4.7-16.7 MEGACYCLES

Remove short from variable condenser. Have the wave band switch on broadcast position. Adjust the generator and receiver to 1500 K.C. Peak trimmers for maximum signal. Adjust generator and receiver to 600 K.C. and peak the broadcast padder for maximum signal. The variable condenser should be "rocked" during this operation.

For 4.7-10 M.C. Turn wave band switch knob to this band. Adjust the generator and receiver to 10 M.C. and peak the trimmers for maximum signal. The low frequency is automatically adjusted by a fixed calibrated padder. For 11.5-24 M.C. Turn wave band switch knob to this band. Adjust the generator and receiver to 22 M.C. Peak trimmers for maximum signal. Adjust the generator and receiver to 12 M.C. Peak the short wave padders (located underneath chassis) for maximum signal.

DeWALD RADIO MFG. CORP.

MODEL 568

BROADCAST RANGE 540-1700 KILOCYCLES
SHORT WAVE RANGE 4.7-16.7 MEGACYCLES

BROADCAST ALIGNMENT

Set the signal generator and receiver dial to 1500 kilocycles. Adjust the broadcast oscillator trimmer screw until the signal from the generator is heard. Peak the antenna trimmer screw for maximum output. Now, set the signal generator and receiver dial to 600 kilocycles. Peak the broadcast padder for maximum output. The variable condenser should be "rocked" during this operation.

SHORT WAVE OPERATION

Slide the wave band switch button to the short wave position. Set the signal generator and receiver to 16 megacycles. Adjust the short wave oscillator coil trimmer until the generator signal is heard. Peak the short wave antenna coil trimmer for maximum output. The low frequency end of the dial is automatically adjusted.

MODEL 666-T

IF peaked at 455 KC.

TO CALIBRATE RECEIVER

Attach the antenna side of the signal to one of the leads extending from the rear of the cabinet. Connect the ground side to the other lead. Adjust the signal generator to 455 KC and peak the I.F. trimmers for maximum signal. Set the signal generator and the receiver condenser trimmers for maximum signal. The low frequency end of the dial is automatically calibrated by a cut section variable condenser.

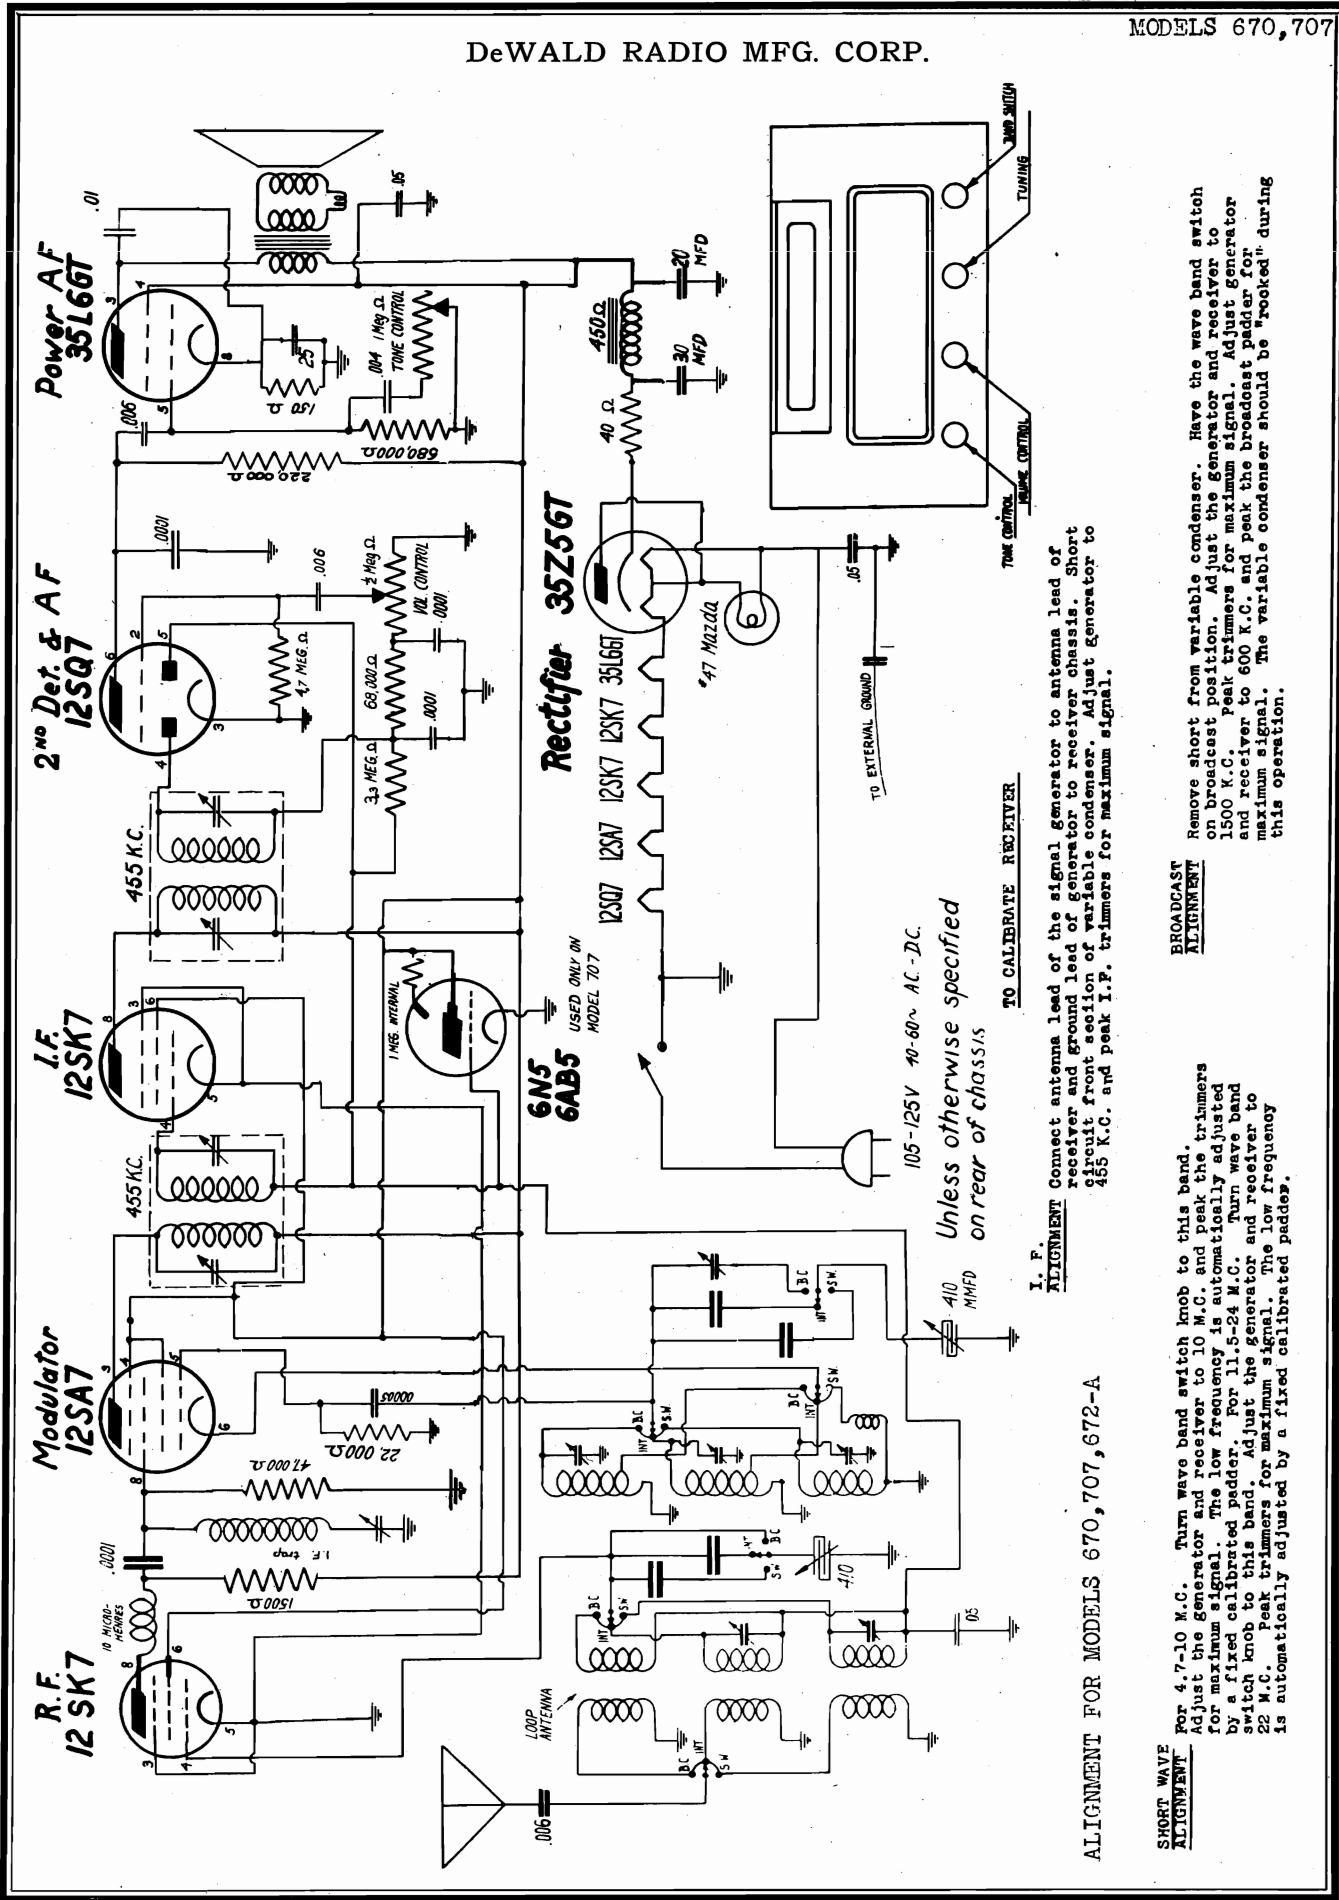

IMPORTANT

Since the loop used has a directional effect, it may be found that it is necessary at times to turn the receiver for best reception on weaker stations.

MODEL 666T

This model is a six tube superheterodyne receiver with full automatic volume control. A self-contained loop is incorporated which makes the use of an antenna unnecessary. The range coverage is 540-1700 kilocycles. The receiver has been designed to operate on 105-125 volts, 40-60 cycles A.C.-D.C. unless otherwise specified.

DeWALD RADIO MFG. CORP.

Unless otherwise specified on rear of chassis

TO CALIBRATE RECEIVER

I. F. ALIGNMENT

Connect antenna lead of the signal generator to antenna lead of receiver and ground lead of generator to receiver chassis. Short circuit front section of variable condenser. Adjust generator to 455 K.C. and peak I.F. trimmers for maximum signal.

BROADCAST ALIGNMENT

Remove short from variable condenser. Have the wave band switch on broadcast position. Adjust the generator and receiver to 1500 K.C. Peak trimmers for maximum signal. Adjust generator and receiver to 600 K.C. and peak the broadcast pad for maximum signal. The variable condenser should be "rooked" during this operation.

ALIGNMENT FOR MODELS 670, 707, 672-A

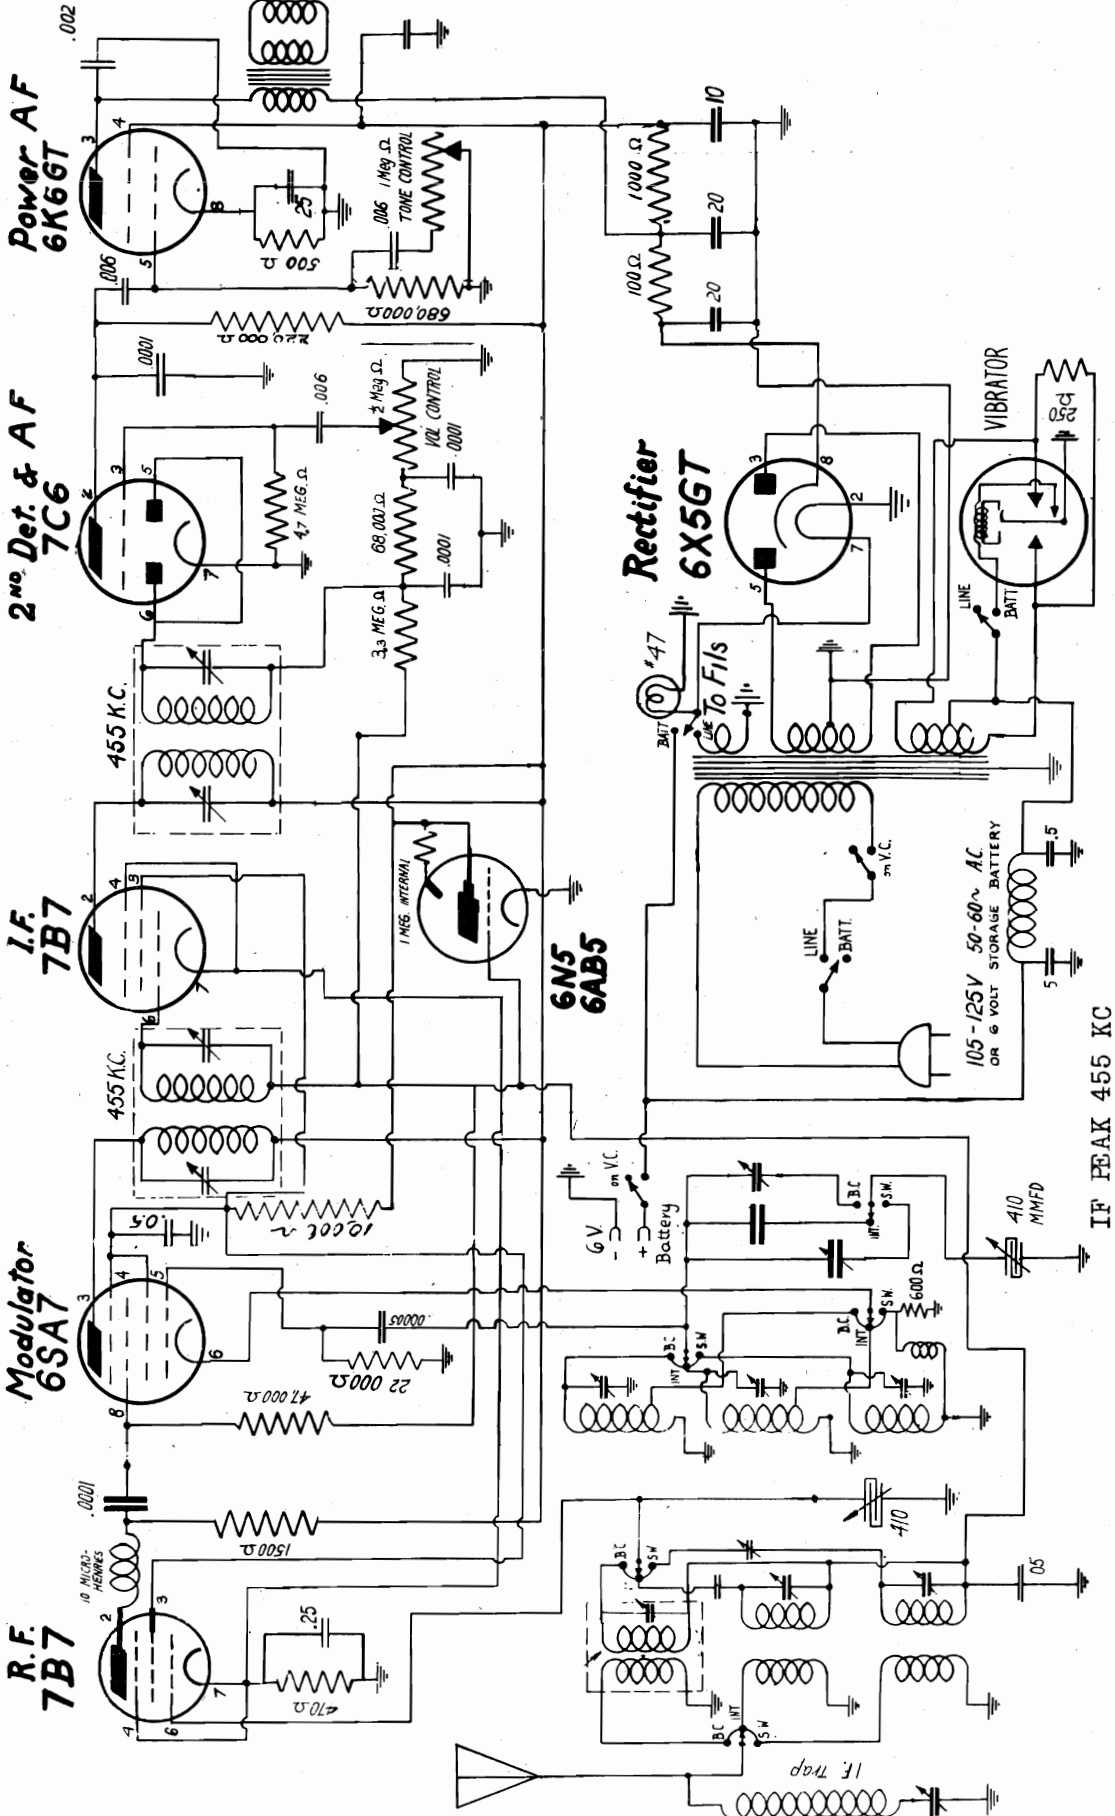

SHORT WAVE ALIGNMENT

For 4.7-10 M.C. Turn wave band switch knob to this band. Adjust the generator and receiver to 10 M.C. and peak the trimmers for maximum signal. The low frequency is automatically adjusted by a fixed calibrated pad. For 11.5-24 M.C. Turn wave band switch knob to this band. Adjust the generator and receiver to 22 M.C. peak trimmers for maximum signal. The low frequency is automatically adjusted by a fixed calibrated pad.

BOTTOM VIEW OF CHASSIS

ALL ABOVE VOLTAGES MEASURED FROM SOCKET TERMINAL TO CHASSIS WITH A 1000 Ω PER VOLT VOLTMETER

MODEL 674 INSTRUCTION SHEET

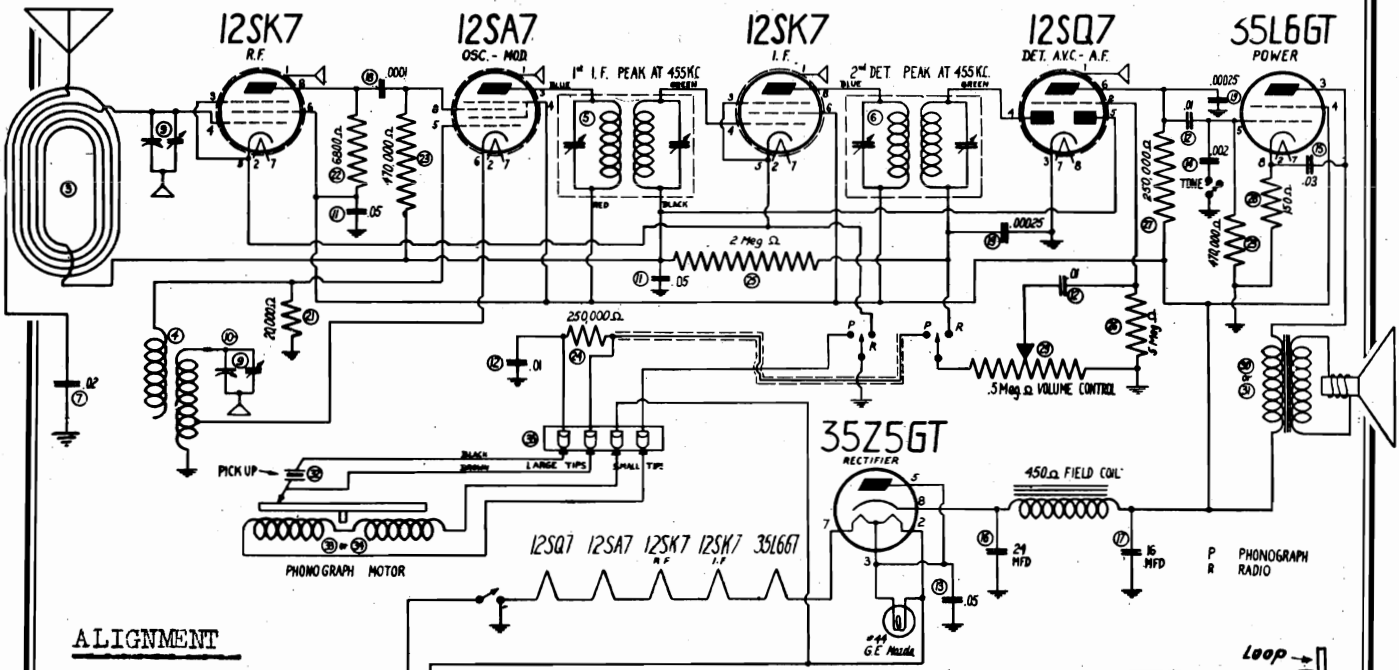

The model 674 is a RADIO-PHONO combination that provides reproduction of recordings with good fidelity as well as regular radio broadcast reception. All types of records up to 12 inches may be played with the lid closed. A self-starting motor together with a crystal pick-up are used for phonograph reproduction. The radio receiver employs a superheterodyne circuit using the latest low drain tubes for low power consumption. A self-contained loop-tenna is incorporated which makes the use of an outside antenna unnecessary in most localities. It will function on 105-125 volts, 60 cycles A.C. puly, unless otherwise specified. A range of 540-1700 kilocycles is covered by the receiver.

RADIO-PHONOGRAPH SWITCH

The control on the extreme right is used to operate either the radio or play phonograph disc recordings. When the knob is in the counterclockwise direction, the radio receiver will function. To play records, turn the knob clockwise. This will adjust the instrument for phonograph operation. If a rise in hum level is noticed when handling the phonograph pick-up, reverse the line cord plug in the electric outlet.

SERVICE INFORMATION

Voltages--Line 117 Volts AC--Power Consumption 40 Watts including Phono-graph Motor. Volume Control maximum. Meter 1000 ohms per volt, 250 volt

R.F. Alignment

Connect an output meter across the voice coil. Rotate the volume control to maximum. Set test oscillator to 455 kilocycles and apply signal to control grid of 12SK7 R.F. through a .05 mfd. capacitor. Align the second I.F. transformer trimmers, next adjust the first I.F. transformer trimmers. Keep the test oscillator output to a level that will give a good meter reading.

R.F. Alignment

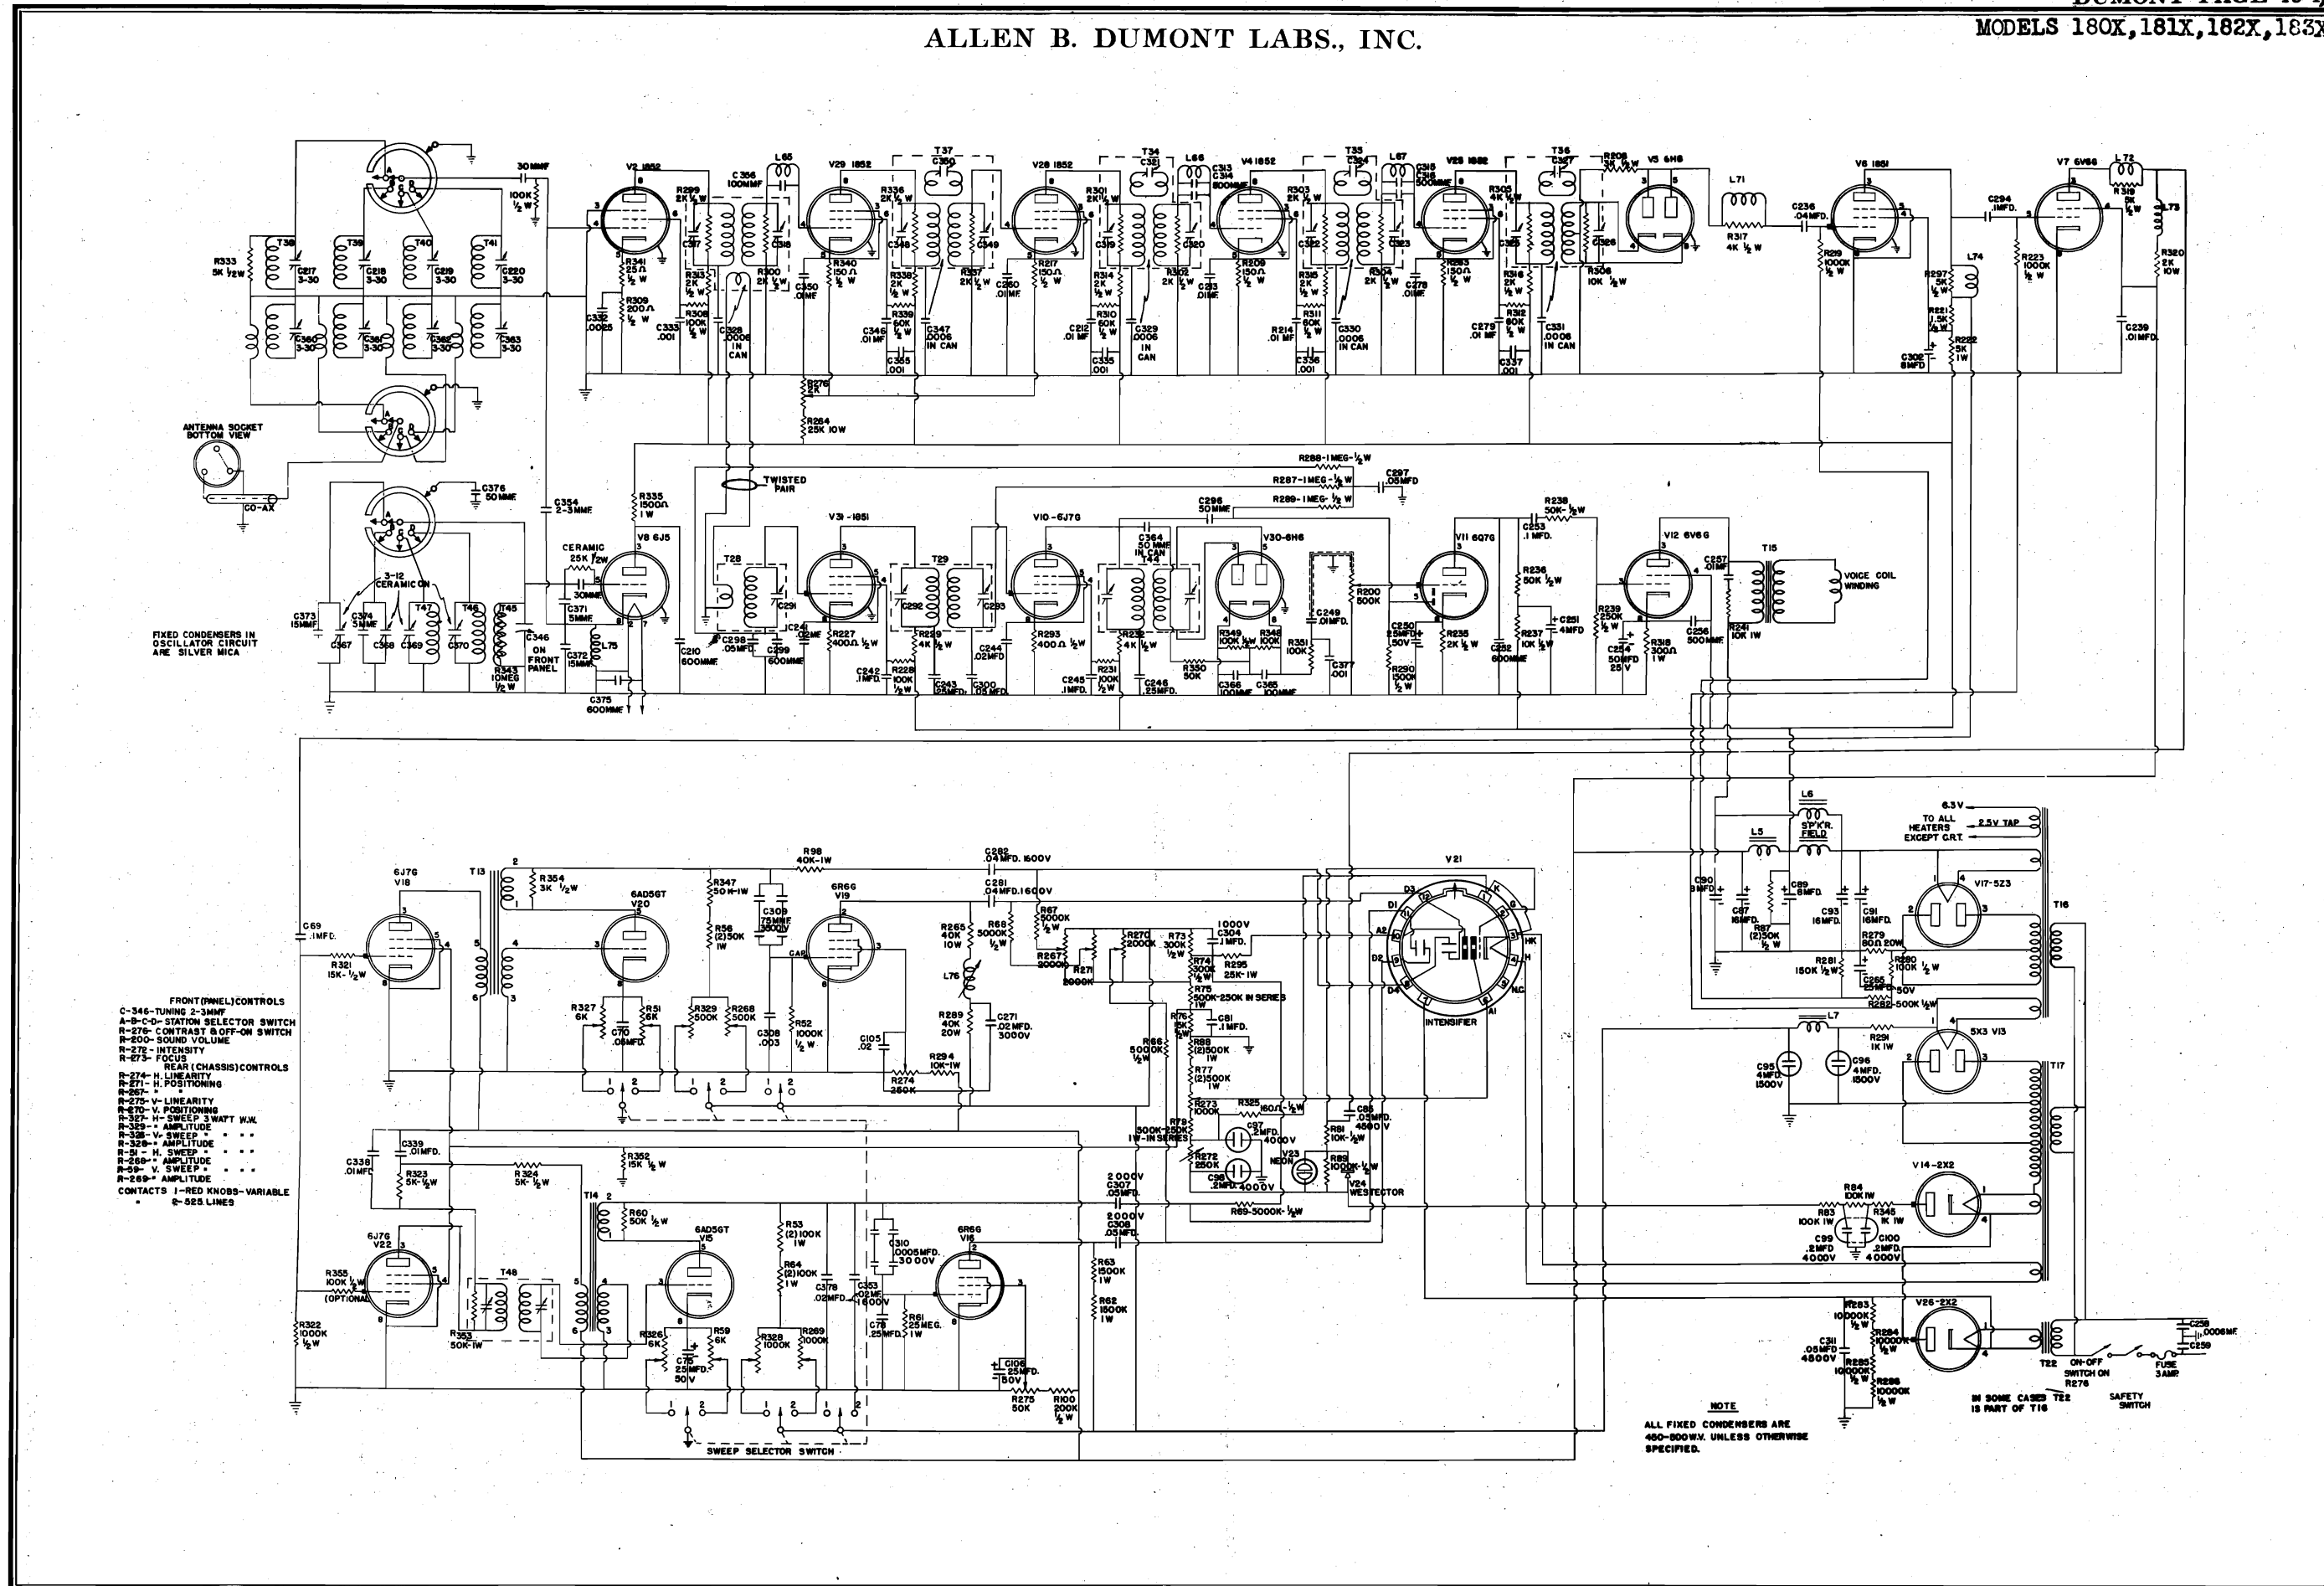

Attach high side of test oscillator to flexible lead extending from rear of chassis through a .00025 mfd. condenser. Connect the low side to the receiver chassis. Adjust the test oscillator and receiver to 1700 kilocycles. Peak 1700 kilocycles oscillator trimmer for maximum output. Change test oscillator signal and receiver dial to approximately 1400 kilocycles. Then trim 1400 kilocycles antenna trimmer for maximum output.

BOTTOM VIEW OF CHASSIS
ALL ABOVE VOLTAGES MEASURED FROM SOCKET TERMINAL TO CHASSIS WITH A 1000 Ω PER VOLT VOLTMETER

BOTTOM VIEW OF CHASSIS

1. AUDIO CIRCUITS

Operation of the audio frequency amplifier may be checked by touching the grid of the 6G7 and noting hum pickup in the speaker. The first video IFT should be adjusted roughly as it affects the sound I.F. characteristic.

Next, the I.F. amplifier should be aligned, using an oscillograph connected to the screen of the 2nd I.F. tube (screen by pass removed) and a wobulator connected to the proper points to indicate the desired characteristic. The 2nd I.F.T. should be adjusted first with the wobulator connected to the grid of the first I.F. tube (185L), and then the first I.F.T. adjusted with the wobulator connected to the converter grid. Next the 6J7 screen by pass should be put back, the oscillograph shifted to the diode output at the first audio coupling condenser, the .001 de-emphasis condenser opened, and the discriminator transformer adjusted.

The output of the wobulator should be of the order of 5000 microvolts which may be obtained from the RCA wobulator using the low tap with a 10 ohm resistor shunting it to ground. A Ferris signal generator may be used as a marker connecting it to the wobulator output (low tap) through a 100 ohm resistor.

The appearance of the characteristics are indicated by the sketches below. The exact shape of these curves will vary somewhat with individual receivers.

A check on alignment should be made using a Ferris signal generator with about 5000 microvolts output. Tuning the signal generator through the band two equal peaks (+10%) and a null point should be observed. The null point should be at 8.25 mc (+15 Kc).

Sensitivity should then be checked using the Ferris signal generator connected to the converter grid, and the oscillograph connected to the plate of the 6V6G audio output tube. The input for an average output for the two peaks of 50 V. p. to p. (1" direct on 188) should be from 30 to 100 microvolts. (At this low input level effects may not be exactly equal due to the fact that signal level affects the I.F. tuning to some extent.)

2. VIDEO I.F. CIRCUITS

An oscillograph is attached to the 6H6 video detector load. An I.F. wobulator is connected successively to the last I.F. stage, next to the last, and so on, back to the mixer grid with adjustment of the corresponding I.F. transformer at each step. In this sketch is illustrative of several receivers but the exact amount of dip is somewhat variable and the final adjustment generally involves use of an actual test pattern received by R.F. It

is desirable that the video I.F. alignment shall have the 6db attenuation at the carrier to provide successful reception of the single side band transmission. 4 of the 5 picture I.F. transformers are triple tuned while the first I.F. transformer is a double tuned unit. When tuning the video I.F. transformer in the plate of the mixer tube, the R.F. circuits should be disconnected from the grid of the mixer before attaching the I.F. signal wobulator to this grid so as to insure flat input.

The trap to reject the adjacent channel picture carrier and the traps to reject the associated sound carrier are all pre-tuned and need no further adjustment. These traps are tuned in manufacture using a Q-meter.

3. R.F. CIRCUITS

The R.F. circuits are aligned by using an input wobulator having relatively high voltage of the order of 1 volt covering the channels as follows:

- 1 50-56 Mc
- 2 60-66 Mc
- 4 78-84 Mc
- 6 96-102 Mc

To determine the characteristic of these R.F. circuits independent of I.F. response, an oscillograph is connected with its grounded terminal to the B plus supply (using care not to touch the oscillograph) and with its vertical input amplifier connected to the mixer screen. In this way the mixer screen response represents quite adequately the band pass characteristics of the R.F. circuits. This high level wobulator is applied to the antenna terminals, following which the R.F. antenna coil and the mixer grid coil are tuned with the corresponding condensers for each band. The response curve for each band is represented by the sketch above, showing the response for one of the bands which is typical of all of them. The higher channels are somewhat broader than this. During this alignment the oscillator tube has been removed.

Alignment of the oscillator itself is made by using a signal generator tuned to the carrier frequency for the sound channel. Then the oscillator trimmers are adjusted for each of the 4 channels mentioned above so that the sound carrier is received as indicated by the loud speaker. To insure that the oscillator is tuned above the desired carrier the signal generator is then tuned to the picture carrier and a check of received signal is made through the video channel. Another check is to see that the minimum capacity of the oscillator trimmer is used where it is possible to get 2 oscillator frequencies which pass a sound signal. This adjustment of the oscillator is made with the front knob trimmer set at 3/4 capacitance. A final sensitivity measurement is now made using the signal generator on the carrier frequencies for sight and sound for all 4 channels.

with the two linearity controls on the sweep deck. In case these adjustments do not cover a sufficient range additional small capacitors are placed in parallel with the bottom condenser of the potential divider which feeds the grid of the sweep amplifier tube. This added condenser is actually placed from grid to ground of the sweep amplifier tube. In this way the ratio of signal from the oscillator to the signal from the amplifier will be controlled, thus correcting the linearity so that an overall linear sawtooth is produced by combination of a sweep oscillator output which is exponential and a sweep amplifier output which by its grid characteristic produces a reverse curvature.

After linearity has been adjusted the horizontal amplitude control should have at least one inch additional amplitude available. The vertical amplitude control should have several inches of additional amplitude available.

The black sweep control knobs, which are connected by turning the sweep selector switch on the front panel counter-clockwise (to position 2), should be checked to insure that the vertical frequency range includes 30 and 60 fields per second with adequate overlap, and that the horizontal frequency range includes 8000 and 15,750 lines per second with adequate overlap. The black knobs should be set up at the standard 525 lines 30 frames.

The red sweep control knobs, which are connected by turning the sweep selector switch clockwise (to position 1) should be capable of being adjusted to the following color combinations:

(a) CBS color pictures use 375 lines per frame at 60 frames per second which requires a horizontal scanning rate of 22,500 lines per second, and a vertical scanning rate of 120 field scans per second.

(b) NBC has transmitted color with 441 lines per frame and 60 frames per second, requiring 26,460 scanning lines per second, and 120 vertical fields per second.

The Du Mont sync transformer should be adjusted as follows:

A Du Mont picture signal should be applied to the 185L first video grid in accordance with the previous instructions, or received over the air. A diode rectifier with its output connected to an oscillograph should be very loosely coupled to the grid of the horizontal oscillator (green lead on Du Mont sync transformer). This may be done by clipping a battery clip around an insulated portion of the green lead. The oscillograph sweep should be synchronized to the 60 cycle power line, the beam of the CRT should be cut off, and the sweep oscillator tubes of the television receiver removed. The Du Mont sync transformer should then be adjusted for maximum amplitude of the envelope of the H.F. burst pulse as indicated on the oscillograph.

The test pattern should be clean and crisp with no signs of any breakdown visible. Breakdown will cause intermittent black lines which jump back and forth vertically or horizontally tear out similar to that produced by noise, which is particularly noticeable at the black circle of the test pattern.

Very often faulty coupling condensers in the deflection circuits will cause this trouble and tapping them with an insulated red will help locate the faulty part.

The picture sensitivity should be approximately 200 microvolts input signal on all channels to yield 15 volts peak to peak at the final video 6V6 amplifier plate, using an oscillograph for measurement and using a signal generator with 30% modulation. 4

Sound Rejection

While an attenuation ratio of 100 at the sound carrier was sufficient with A.M. sound, it is not adequate with F.M. sound. The signal generator should be tuned through the sound band which is 150 Kc (+75 Kc) and the attenuation ratio should be at least 100 throughout this band at R.F.

Adjacent Channel Sound Rejection

Previously rejection ratios of 1000 to 1 at R.F. was attained, measurements should be made by tuning through the band as above and the ratio should be over 500 throughout the band.

The sound sensitivity at R.F. should be approximately the same as at I.F.

4. VIDEO AND SWEEP CIRCUITS

This alignment of the video amplifier and the sweep circuits can be made either with an over-the-air test pattern or with a test pattern from a coaxial line. When an over-the-air transmission is used the signal is applied to the antenna terminals.

However, when a coaxial line signal is used, it is necessary to observe the precaution of a suitable input network for applying the signal to the grid of the 185L first video amplifier tube. This tube has a fixed bias within the set to which its grid lead is returned and its cathode is grounded. It is therefore desirable to insert a coupling condenser of at least 0.1 ufd from the coaxial line and supply a grid leak from the 185L grid lead of at least 1/2 megohm between the 185L grid cap and the lead wire from beneath the chassis which would otherwise normally be connected to the 185L. In this way the proper fixed bias is still applied to this tube.

After alignment has been made as outlined above there are certain tests and precautions that should be followed closely in order to eliminate the possibility of shipping either defective receivers or those that are not up to standard in efficiency and quality. A co-ax line carrying a composite video signal to be used for checking video amplifier and sync circuits should be monitored to make sure that Horizontal Blanking is no more than 16% and front porch comprises 2% of total. Vertical Blanking should be from 7 to 8%.

The 185L tube and 6V6 tube of the 2 stage video frequency amplifier have their frequency constants such that the overall response to the cathode-ray tube grid is essentially flat from 30 cps to 3 1/2 megacycles with a gradual drop to approximately 4 1/2 megacycles at which time the response is down to about 30%. This original design was checked with the video frequency wobulator and it has been found unnecessary to check each receiver individually except for general observation of a test pattern which is adequate to show up any actual mistake in the circuit wiring of the peaking coils, etc.

The sweep circuits are tested to determine the adequacy of amplitude and frequency range. Linearity adjustment is made

to 183X

SERVICE NOTES

DUMONT TELEVISION RECEIVERS

THE FOLLOWING information was compiled by the Service Department and is based on actual experience acquired in the field over the last three years.

ANTENNA INSTALLATION

ERECT the antenna in the clear whenever possible, as high and as far back from the street as possible.

ANTENNAS over 15 feet high should be guyed securely. Mount antenna securely on a chimney or wall, using the hardware and mounting brackets supplied by the antenna manufacturer.

INSTALLATION crew should consist of two men. One man on the roof to rotate the antenna and locate the position. Another man at the set to watch the results. These two men should be in constant communication. Philco phones will serve the purpose. Connect the speaker of the Philco phones to 25 feet of transmission wire with a pair of insulation-piercing clips - this enables you to clip on the lead-in wire without breaking the insulation. Connect the master station in series with the antenna lead-in wire and antenna plug at the set, thereby giving constant communication with the operator on the roof without using extra lead-in wire for the phones.

DIPOLE

THE DIPOLE (both rods) should be equal to one-half wave-length of the radiation to be received, for maximum result, and connected to the receiver by means of a transmission line - twin conductor.

FREQUENCIES assigned to each of the New York stations and dipole needed to match the wave length are listed below:

Station	Frequency in M.C.	Length of Dipole	Length of Reflector
WNBT	50-56	100"	112"
WCBW	60-66	90"	96"
WARD	78-84	72"	76"

THIS does not necessarily mean that a separate antenna is required for each station. It has been found that in most parts of the Metropolitan area, a satisfactory signal can be picked up from all three stations on an antenna tuned to WCBW's frequency, 90 inch dipole (45 inches each rod) with reflector. HOWEVER, in some of the outlying points in Long Island, Westchester, and New Jersey it may be necessary to erect a second antenna tuned to WARD's frequency, 72 inches (36" each rod) to pick up their signal, until such time as WARD's power is raised to normal strength.

REFLECTOR

WHEN the receiver is located at a considerable distance from the transmitter, better pick-up and directional properties are required, and a second rod connected parallel to, and 1/4 wave length behind the dipole will reflect the signal back and aid signal strength considerably. The reflector will also help reduce reflections.

THE LENGTH of the reflector rod should be slightly over the overall length of the dipole (see table).

WHEN two antennas of varying lengths are used, remember that the distance between the dipole and the reflector rod of each antenna should approximate 1/4 wave length of the transmitted signal, or 1/2 the length of the dipole.

REFLECTIONS

METAL structures, large buildings in the path of the signal, will reflect the transmitted waves and cause multiple "ghost" images on the screen of the receiver. These "ghosts" are very annoying and should be eliminated by rotating the antenna or changing the location. The use of reflector rods may at times serve the purpose.

SOMETIMES, however, the reflected waves are a blessing in disguise, especially in large cities where low buildings are sandwiched in between high buildings. Very often it is possible to pick up a reflected signal below the line-of-sight, or turn the dipole completely away from the line-of-sight to eliminate "ghosts" and pick up a reflected signal with better results than on a direct pick-up.

IN CERTAIN locations, in large cities, signals radiated by the various stations are reflected from many angles and it will be impossible to eliminate "ghosts" on all stations. In such cases, a second antenna will have to be erected. But, bear in mind that a satisfactory signal either direct or reflected, can always be picked up within the transmission radius with the proper equipment.

TRANSMISSION LINE

THE TWISTED pair transmission line or lead-in wire used should have an impedance of 72 ohms per 100 feet. This type of transmission line can be used in most installations, but it must be remembered that there is an appreciable loss of signal strength in ordinary twisted wires - approximating 20% for lengths from 100 feet to 200 feet.

IN CASES where the signal strength is low to begin with, or where an exceptionally long lead-in is required, co-axial cable is recommended. There is very little loss in comparatively long lengths of co-axial cable.

WHEN the signal level is weak the contrast or sensitivity control of the set has to be turned on "full" and all kinds of noises will be picked up, interfering with the picture. This kind of interference will cause small white spots and flashes similar to a snow storm on the screen, and is known as "snow in the picture".

IF CO-AXIAL cable is used in such cases, the signal level will be raised and the noise level lowered proportionately, giving a clear picture at all times.

SERVICE NOTES

HERE are some of the most common service problems encountered in the field:

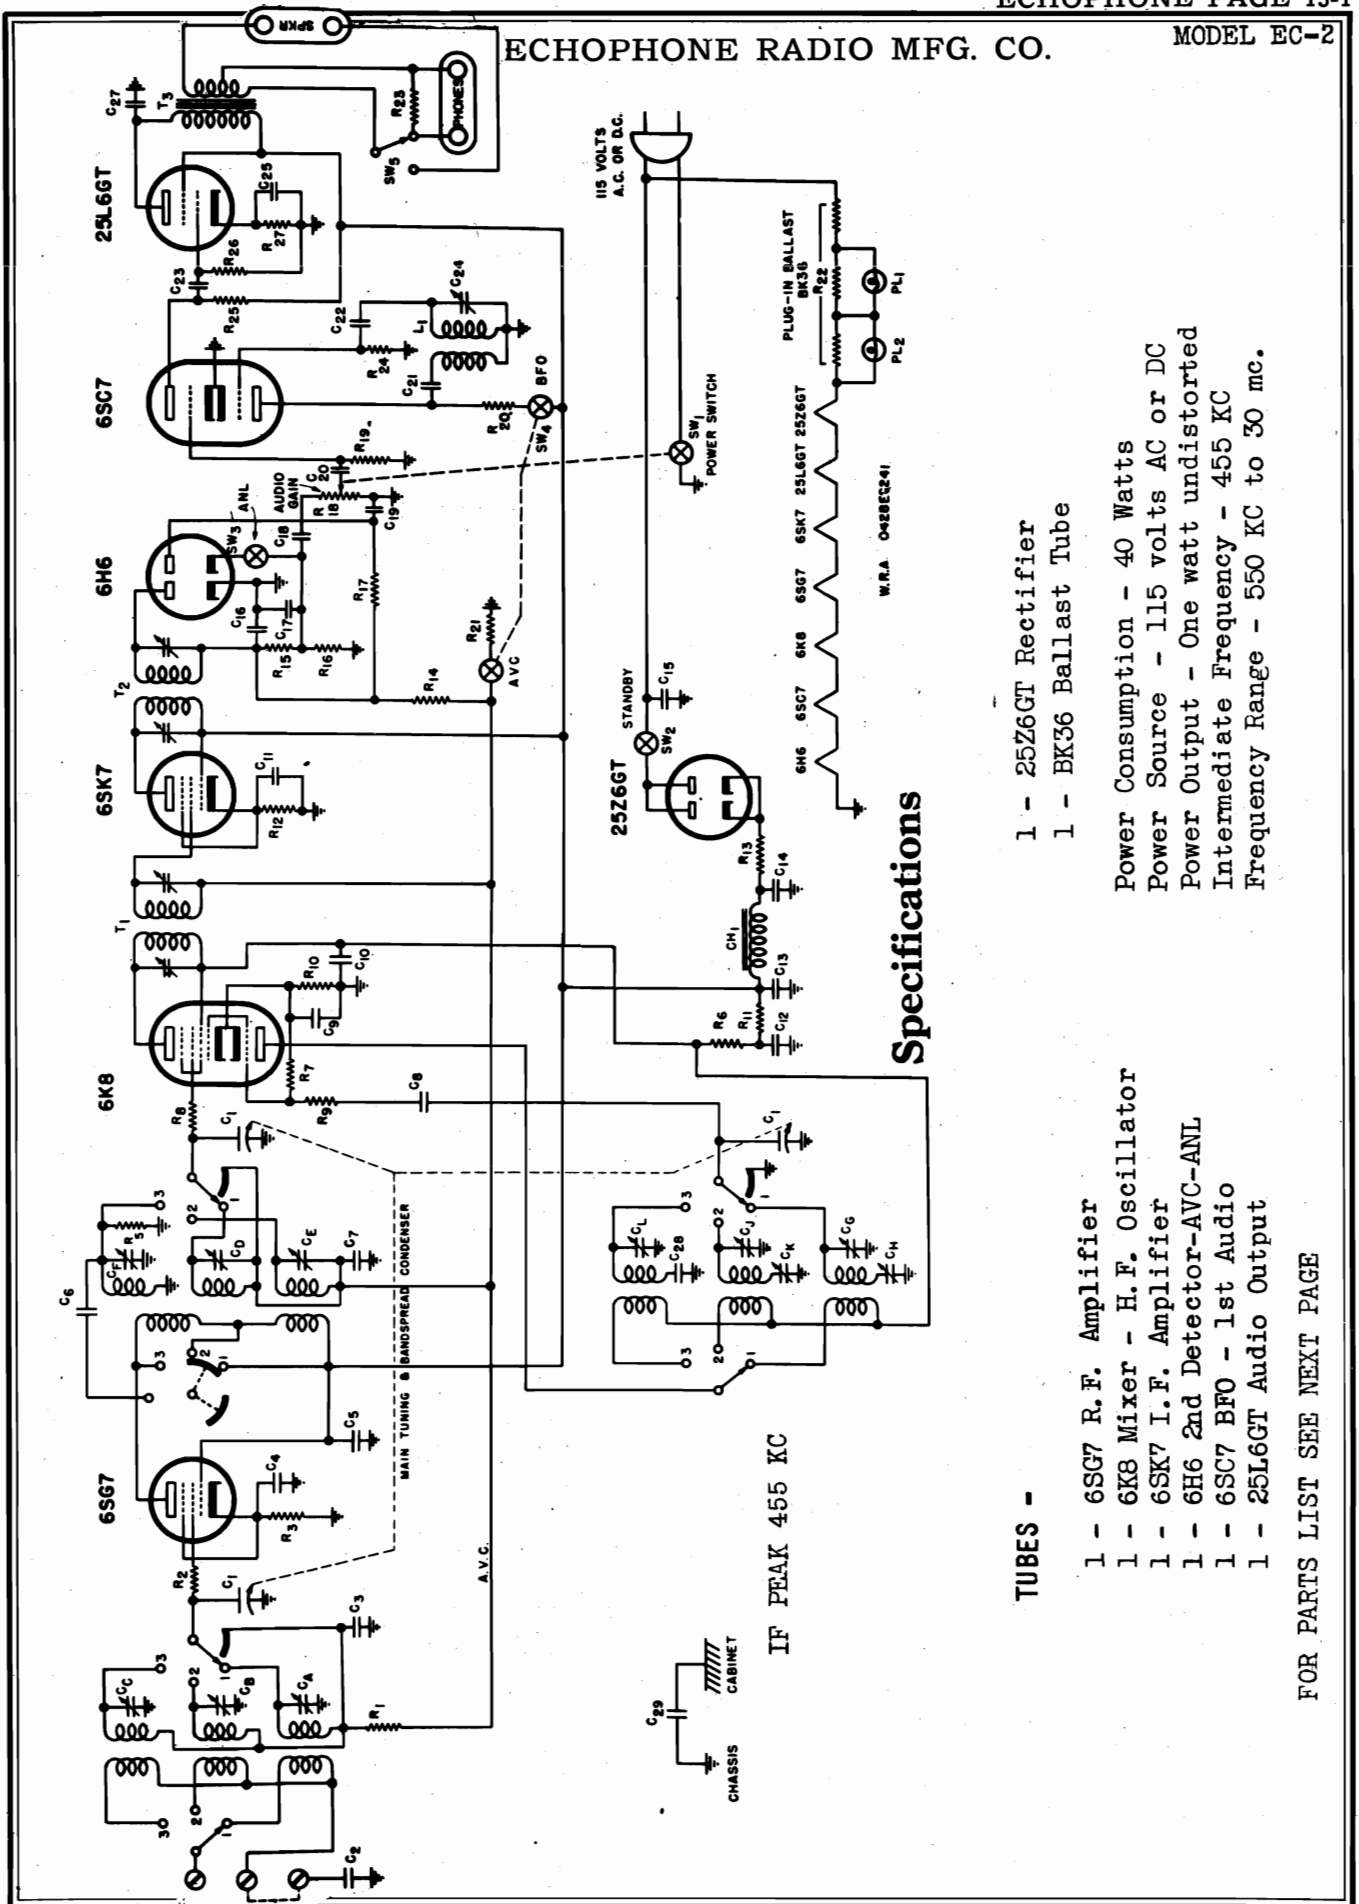

1. Receiver dead
2. Sound but no picture
3. Picture but no sound
4. Poor sound
5. Poor sync. picture tears out
6. Bright spot on screen of CRT Sound OK

MODELS 180X
to 183X

ALLEN B. DUMONT LABS., INC.

7. No control of focus or intensity
 - (a) Fibre tongue is usually broken on controls. The fibre tongue insulates the intensity and focus control pots from ground as they are 4000 volts above ground. If no fibre tongues are available, turn controls with an insulated screwdriver to the proper intensity and focus.
 - (b) The 750K and a meg.bleeder resistors mounted on the front panel between the focus and intensity pots may be open.
8. Breakdown in raster or test pattern
 - (a) Check for leakage at CRT socket and base.
 - (b) If breakdown is due to leakage at CRT socket, you will hear a sizzling noise at base of CRT socket. If socket hasn't arced across causing complete breakdown, you can put a 25 watt lamp in tube socket to dry out moisture. If that doesn't do it, replace CRT socket and if CRT base is badly burned from arcing send CRT to plant to be rebased.
 - (c) Breakdown is noticed on the raster by the separation of the line structure.
9. Microphonics
 - (a) Check the 6J5 oscillator, 1852 mixer and the 1851 first audio tubes for microphonic conditions.
10. Sound in picture
 - (a) Check 1851 first video amplifier tube.
 - (b) Check 6V6 video amplifier tube.
 - (c) R.F. and detector circuits being off, frequency due to drift or misalignment. Realignment will be necessary.
11. Vertical or horizontal lines on screen
 - (a) Caused by no plate voltage on 6AD5 horizontal or vertical sweep oscillator, due to open plate supply resistors. On the vertical side there are four 100K 1 watt resistors. Always turn down the intensity control if there is a bright horizontal or vertical line on screen or it will become burned.
12. Intermittent sound or picture
 - (a) Due to shorted antenna line.
13. Poor linearity
 - (a) Due to defective 6R6G horizontal or vertical amplifier tube. On the right side of the sweep deck, you will find the horizontal linearity control. On the left side you will find the vertical linearity control. By adjusting controls, poor linearity can be corrected.
1. Receiver dead
 - (a) If receiver is dead check a.c. plug and check back of cabinet 8. Breakdown in raster or test pattern to make sure safety switch is closed.
 - (b) If 3 amp. fuse is blown, look for a shorted or arcing 2X2, 4000 volt, high voltage rectifier tube.
 - (c) Check for shorted or arcing 5X3, 1500 volt, high voltage rectifier tube.
 - (d) Check for shorted or arcing 2X2, 4500 volt intensifier-rectifier tube mounted in a horizontal position.
 - (e) Check for a shorted high voltage filter condenser in the 1500 or 4000 volt supply.
 - (f) Check for a shorted .05-4500 volt coupling condenser mounted in a horizontal position under sweep deck.
2. Sound but no picture
 - (a) Check video amplifier by touching grid of 1851 first video amplifier tube. You should see broad white bars on CRT indicating that that circuit is OK. If no response is noted, check that portion of the circuit the 1851, or 6V6G video amplifier tubes may be defective.
 - (b) Drift in oscillator - realign oscillator trimmer.
 - (c) Check 1852 video I.F. amplifier tubes for open filament or shorts.
3. Picture but no sound
 - (a) Check oscillator for drift realign oscillator trimmer.
 - (b) Check 6V6G audio amplifier tube. Check 6Q7G, 6J7G, also 1851 first audio I.F. amplifier tube. These tubes will also cause the sound to be distorted, weak and intermittent.
4. Poor sound
 - (a) Defective 6V6G audio amplifier tube.
 - (b) Shorted or gassy 1st audio 1851 tube.
 - (c) 6Q7G audio amplifier tubes not all the way in sockets - press tubes all the way in socket.
5. Poor synchronism. Picture tears out
 - (a) A weak signal due to a broken or shorted antenna lead-in or a defective synchronism separator tube, will cause the picture to lose synchronism. Also check frequency controls for correct adjustment.
6. Bright spot on screen of CRT. Sound OK
 - (a) If this condition exists, turn intensity off at once as this will burn a spot on the screen of the CRT. Look for a defective 5X3, 1500 volt rectifier tube. If tube is OK look for a shorted 4 mfd. 1500 volt filter condenser.

ALLEN B. DUMONT LABORATORIES, INC.
PASSAIC,
NEW JERSEY

Specifications

TUBES -

Alignment Procedure

EQUIPMENT NEEDED FOR ALIGNING AND PRE-LIMINARY ADJUSTMENTS:

An all wave signal generator which will provide an accurately calibrated signal at the test frequencies listed.

Output indicating meter

Non-metallic screw driver

Dummy antenna 400 ohm, 200 mmf. and 0.1 mfd.

Connect signal generator ground to ground terminal (G) of receiver.

Set bandspread at 100.

Connect output meter across primary of output transformer.

Gain controls - Maximum all adjustments.

I.F. ALIGNMENT

Connect 0.1 mfd. dummy antenna between high side of generator and 6K8 grid.

Set signal generator to 455 kc. Adjust all trimmers on T₁, T₂ and T₃ for maximum output.

Adjust the BFO control to give the desired beat note with the 455 kc I.F. signal. This adjustment, C₂₄, is located under chassis.

R. F. ALIGNMENT

The following table indicates R. F. alignment procedure.

Alignment Procedure

EQUIPMENT NEEDED FOR ALIGNING AND PRE-LIMINARY ADJUSTMENTS:

An all wave signal generator which will provide an accurately calibrated signal at the test frequencies listed.
 Output indicating meter
 Non-metallic screw driver
 Dummy antenna 400 ohm, 200 mmf. and 0.1 mfd.
 Connect signal generator ground to ground terminal (G) of receiver.
 Set bandsread at 100.
 Connect output meter across primary of output transformer.
 Gain controls - Maximum all adjustments.

I. F. ALIGNMENT

Connect 0.1 mfd. dummy antenna between high side of generator and 6K3 grid.
 Set signal generator to 455 kc.
 Set receiver selectivity in "I.F. SHARP" position.
 Adjust all trimmers on T₁, T₂ and T₃ for maximum output.

R. F. ALIGNMENT

Remove knob from PITCH CONTROL (L₁) and loosen the set screw holding the shaft extension. This is located on the underside of the chassis.
 Adjust the BFO control to give a beat note with the 455 kc. I.F. signal.
 If necessary, change the setting by adjusting the screw located under the PITCH CONTROL knob.
 Tighten the set screw holding the extension shaft and replace the knob.
 Place the SELECTIVITY switch in the CRYSTAL BROAD POSITION.

Detune the signal generator so that a high pitched note is heard (BFO "ON").
 Adjust the crystal phasing control for maximum rejection or until minimum volume is obtained.
 Adjust #2 trimmer on T₁ noting that the output reaches a maximum, goes through a dip and then back to maximum. Wobulate the signal generator tuning adjustment and align to the dip between the two peaks. A distinct change in the crystal note to a wishy sound will be noted when the correct adjustment has been reached.
 Now readjust the other trimmers for maximum gain without changing any other adjustments.
 Set the selectivity switch to the I.F. Sharp position and adjust the trimmer (C₁₅) under T₁ for maximum output.

ECHOPHONE RADIO MFG. CO.

MODEL EC-2
MODEL EC-3

IMPORTANT:- This receiver, unless otherwise marked, must be operated from 115-125 volts - Alternating OR Direct Current power. If the set does not operate in one minute when connected to Direct Current, reverse the power plug in the receptacle.

Make sure the antenna is not grounded at some point, and is securely connected to the antenna terminal.

The speaker wires may not be plugged into the speaker terminal strip. Be sure the PHONES-SPKR switch is in the SPKR position and the STANDBY switch is in the RECEIVE position.

ANTENNA:- A wire approximately 50 to 75 feet long, including the lead-in, will provide very satisfactory reception throughout the tuning range of the receiver. It should be connected to the A1 terminal of the antenna terminal strip located on the rear apron of the chassis; the jumper between A2 and G should remain in place. A good antenna of this type should be erected as high as possible; insulated from ground, and at right angles to interference producing power lines. A ground connected to the G terminal may be used if it is found to materially improve the operation of the receiver. DO NOT GROUND CHASSIS DIRECT.

A doublet antenna should be connected to terminals A1 and A2. The jumper may remain connected between A2 and G or removed depending upon its favorable effect on reception.

NOTE:- If a ground is used it should always be connected to the G terminal, NEVER to the chassis itself.

CONTROLS & THEIR FUNCTIONS:

A.F. GAIN:- The ON-OFF switch is part of the A.F. Gain Control. Turning this knob to the right turns the receiver ON and increases the volume. Turning it all the way to the left decreases the volume until the switch clicks and the receiver goes off. The pilot lights indirectly illuminate the dial scale when the power is on.

MAIN TUNING:- The main tuning control, when rotated, will tune the receiver to any frequency throughout its range.

BAND SWITCH:- Turning this knob connects the proper coils in the circuit to tune the desired frequency range.
Band 1 - 550 to 2100 K.C.
Band 2 - 2.1 to 8.1 M.C.
Band 3 - 8 to 30 M.C.

BAND SPREAD TUNING:- The band spread control acts as an electrical vernier on the main tuning condenser. The 80, 40, 20 and 10 meter amateur bands are calibrated on the band spread scale together with a logging scale. To use these amateur band calibrations it is necessary that careful adjustment of the main tuning pointer be made; the most convenient way being to set the transmitter frequency or some known receiver frequency, then adjust the MAIN TUNING pointer until the signal is heard. If this is not possible, it will be necessary to locate the bands by setting the main tuning pointer at the high frequency end of the desired amateur band; then adjust the band spread pointer until amateur signals are heard. The band may then be scanned by the BAND SPREAD TUNING to check the calibration. Slight readjustment of the main tuning may be necessary for best accuracy of the BAND SPREAD scale.

"STDBY-RECEIVE" This switch must be in the RECEIVE position for normal operation of the receiver. The STANDBY position renders the EC-3 inoperative for standby purposes.

BFO-ON-OFF:- This switch removes the CILLATOR in operation for the reception of CW signals, and for locating weak DX signals.

AML-ON-OFF:- The AUTOMATIC NOISE LIMITER switch will effectively minimize ignition and similar types of interference which would be objectionable to short wave reception. Best results are obtained with the R.F. Gain full on and the A.F. Gain set near minimum.

Amateurs who operate on C.W. will find the MONITOR circuit in the EC-3 an aid to easier and more efficient operating

A short wire must be connected to the single MONITOR PICKUP TERMINAL at the rear of the receiver to allow a small amount of R.F. energy to be picked up from the transmitter by the monitor circuit. The length of this wire and its proximity to the transmitter can only be determined experimentally, because it depends entirely on the power of your transmitter. Too much coupling is indicated by a raspy note when the monitor circuit is in operation.

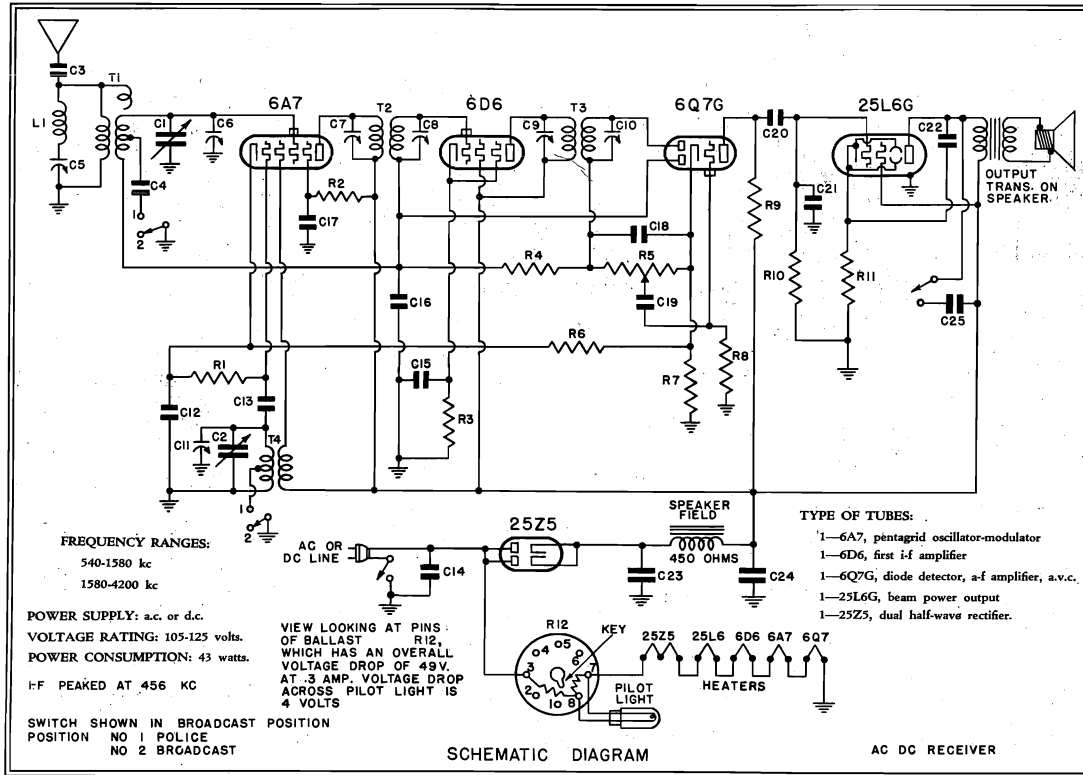

The value of the "CRYSTAL SHARP" SELECTIVITY position will be apparent when it is desired to receive CW signals on any of the amateur bands. The tremendous sideband interference encountered will be reduced to a minimum when the SELECTIVITY knob is in the "CRYSTAL SHARP" position and the CRYSTAL PHASING control is adjusted for maximum reduction of unwanted signals. Since tuning becomes easier with decreasing selectivity the receiver should not be set at a SELECTIVITY greater than is necessary. Thus, for best fidelity on the Broadcast band the SELECTIVITY should be "IF BROAD". For amateur phone work the SELECTIVITY may be "IF SHARP" or "SELECTIVITY". This switch allows four step selectivity to meet all receiving requirements.

CRYSTAL PHASING:- This control is in the circuit only when the SELECTIVITY switch is in the "CRYSTAL SHARP" or "CRYSTAL BROAD" positions. The function of the PHASING control is to eliminate the unwanted interfering sideband signal.

STDBY-RECEIVE-MONITOR - This switch must be in the RECEIVE position for normal operation of the receiver. The STANDBY position renders the EC-3 inoperative for standby purposes. The MONITOR position places the CW MONITOR in operation to allow the C.W. operator to listen to his keying.

PHONES - SPKR - On the rear apron of the chassis will be found two phone tip jacks. Headphones may remain permanently connected to the receiver. The PHONES-SPKR switch makes it possible to select either.

	5EB-802	Celluloid station name tab caps (set of 6).
	5EB-58	Pilot light socket.

The color coding of the i-f transformer leads is as follows:
Grid—green Plate—blue
Grid return—black B plus—red

*Item number locates the article on the schematic diagram.
†These trimmers are part of coil assemblies and cannot be supplied separately.
‡These trimmers are part of variable condenser and cannot be supplied separately.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except cathodes and heaters were taken on 250 volt scale.

Tube	Plate	Screen	Cathode	Osc. Plate	Fil.
6A7	100	50	2.3	100	6.3
6D6	100	100	3.5	—	6.3
6Q7G	43	—	1.2	—	6.3
25L6G	92	100	6.5	—	25.0

Voltage at 25Z5 cathode—130 volts. Voltage across speaker field—30 volts. Voltage drop across ballast resistor (pins Nos. 3, 7)—49 volts. Voltage drop across pilot light section (pins Nos. 8 and 7)—4 volts.

ADJUSTMENTS

An oscillator with frequencies of 456 and 1400 kc is required.
An output meter should be used across the voice coil or output transformer for observing maximum response.
The set's oscillator is higher in frequency than the signal, so images should be observed on the low frequency side of the signals.
The last motion in adjusting trimmers should always be a tightening one, not a loosening one.
Never leave a trimmer with the outside plate so loose that there is no tension on the screw. Either bend the plate up or remove the screw entirely.
Always use as weak a test signal as possible during alignment.
Use a .0001 mf mica condenser as a dummy antenna during alignment.

Location of Coils and Trimmer Adjustments

The two i-f transformers are in oblong coil cans located on top of the chassis deck. The first i-f transformer is the one behind the variable condenser. The trimmers for these transformers are accessible through holes in the tops of the cans.
The 456 kc wave-trap is mounted on the top of the chassis to left of variable condenser. Its trimmer is mounted on the trap.
The antenna coils for the broadcast and police bands are wound on one form and are mounted underneath the chassis deck below the variable condenser.
The oscillator coils for the broadcast and police bands are wound on one form and are mounted on the rear wall of the chassis deck near the variable condenser.
The trimmers for the broadcast antenna and oscillator coils are located on the variable condenser. The trimmer on the section closest to dial is for the antenna coil.

I-f Transformer and Wave-Trap Alignment

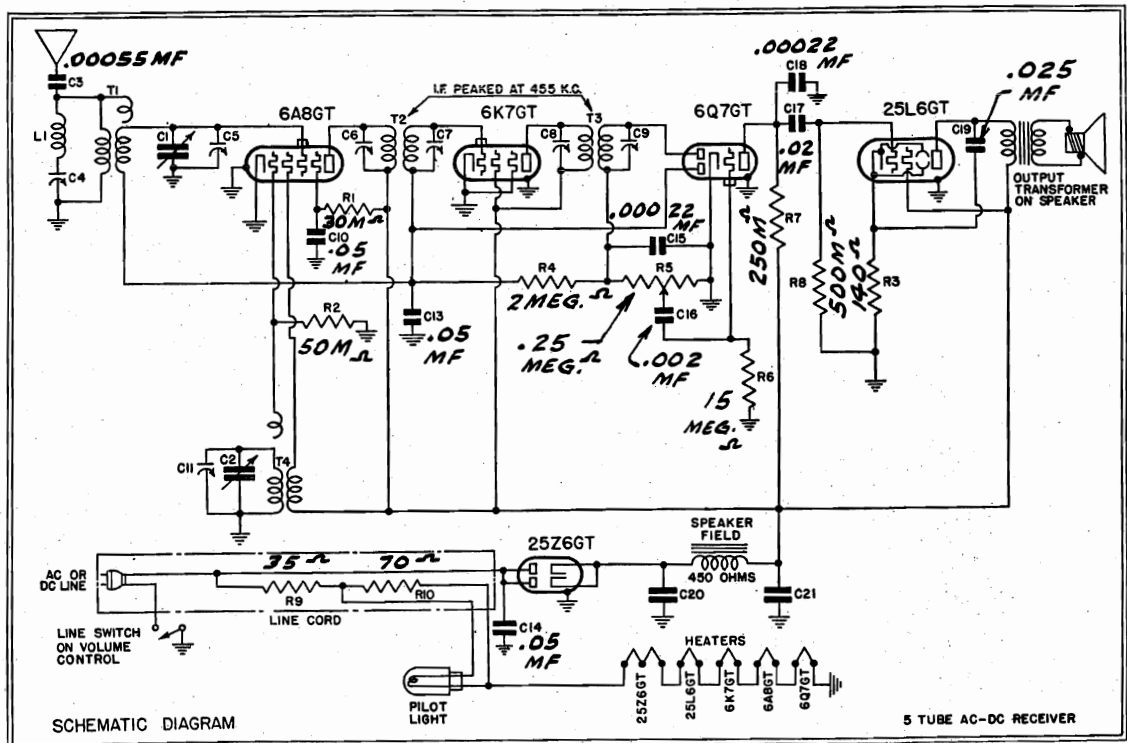

Turn the switch clockwise to the broadcast position and rotate the variable condenser to the minimum capacity position. Feed 456 kc to the grid cap of the 6A7 tube through a .02 mf condenser and adjust the four i-f trimmers for maximum response. Feed 456 kc to the antenna through a .0001 mf condenser and adjust the wave-trap trimmer for minimum response. (See General Notes, No. 7.)

R-f Alignment

With the wave-band switch (rear of chassis) in the broadcast position, clockwise, loosen indicator drive pulley set screw and set the dial indicator at 140. Feed 1400 kc through a .0001 mf condenser to the antenna lead and adjust first the oscillator trimmer (on left section of variable condenser) then the antenna trimmer (on right section of variable condenser) for maximum response. The police band is self-tracking and does not require any adjustment.

Chassis CL

EMERSON RADIO & PHONOGRAPH CORP.

SCHEMATIC DIAGRAM FOR CH CHASSIS BEARING SERIAL NUMBERS BELOW 2,395,000

PRODUCTION CHANGES

- Chassis bearing serial numbers below 2,395,000 differ from the above as follows:

T4	4XT-458	Oscillator coil. (See production change no. 2)
T2	4XT-434	Double-tuned 455 kc first i-f transformer
T3	4XT-435	Double-tuned 455 kc second i-f transformer
R4	KR-57	1 megohm 1/4 watt carbon resistor
R9, R10	4XW-112	Resistance line cord with pilot light section (R9—150 ohms; R10—40 ohms)
C13	AC-6	0.1 mf, 200 volt tubular condenser
C20, C21	4HC-348B	Dual 20 mf, 150 volt dry electrolytic condenser
	4BL-94	Pilot light, 6.3 volt, .25 amp., Mazda No. 44
	4XS-324	4" dynamic speaker
	4XZ-811C	Dial drive shaft
- Chassis which use oscillator coil 4XT-458 may use 6JT-467 or 6JT-467A as replacement. For correct lug connections for either of the three coils see illustration on next page.
- Condenser C12 is not used in CH chassis which have the negative connected to the chassis.
- Not used in CL above 2,656,950.

FOR ALL OTHER DATA SEE EMERSON PAGE 10-22, RIDER'S VOL.X
VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (line switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

FOR CH SERIAL NUMBERS BELOW 2,395,000:

Tube	Plate	Screen	Cathode	Osc. Plate	Fil.
6A8	100	55	0	100	6.3
6K7	100	100	0	—	6.3
6Q7	43	—	0	—	6.3
25L6	92	100	5.5	—	25.0

- Voltage at 25Z6 cathode—125 volts.
- Voltage across speaker field—28 volts.
- Voltage across pilot light—4 volts.

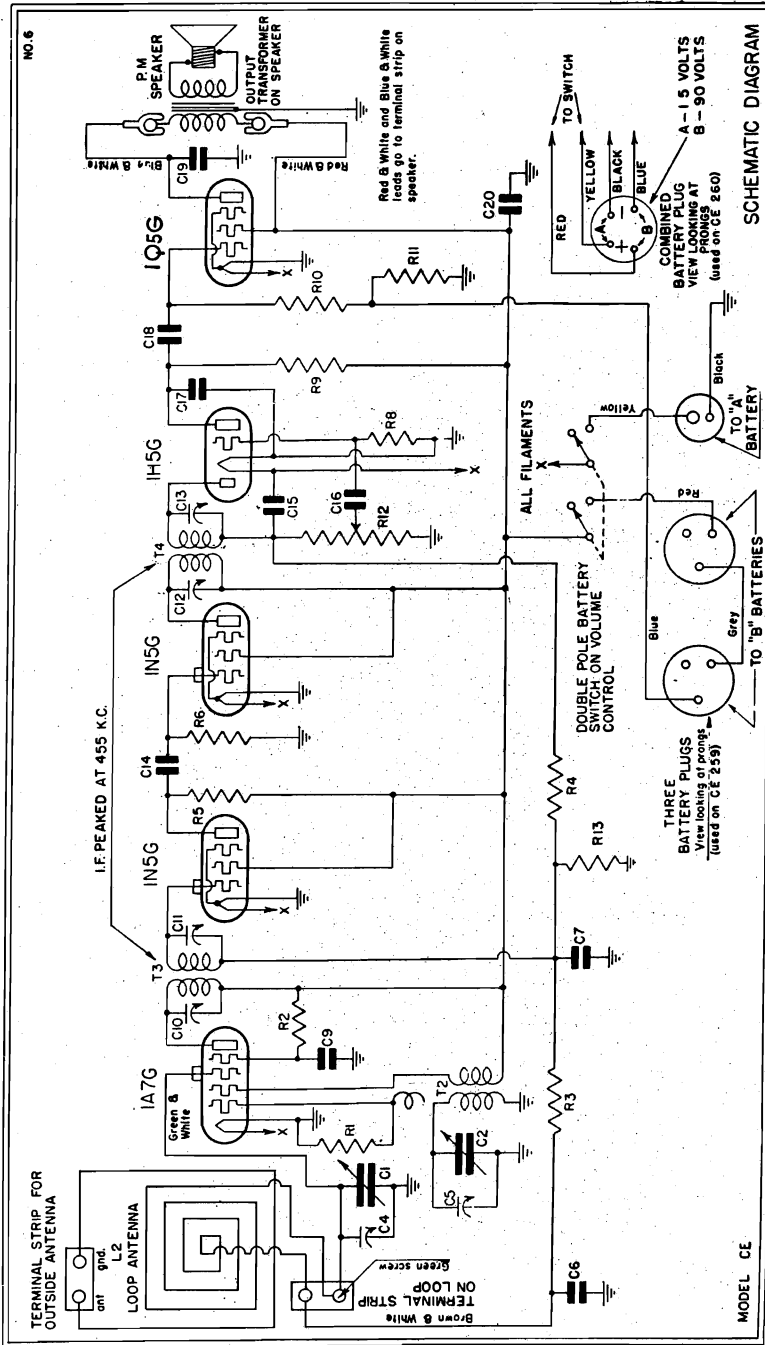

FOR CH SERIAL NUMBERS ABOVE 2,395,000 AND CL SERIAL NUMBERS BELOW 2,656,950:

Tube	Plate	Screen	Cathode	Osc. Plate	Fil.
12A8	94	50	0	94	12
12K7	94	94	0	—	12
12Q7	40	—	0	—	12
†35L6	87	94	5.2	—	35

- ‡Voltage at 35Z4 cathode—121 volts.
- Voltage across speaker field—27 volts.
- Voltage across pilot light section of ballast resistor (R9)—3.5.
- Voltage drop across entire ballast resistor (R9 and R10)—13.5.
- †Plate and screen voltages for 50L6 are 5% lower.
- Heater voltage—50 volts.
- ‡Voltage at 35Z5 cathode—115 volts.

	6EW-148	Battery cable (for CE-260).....

*Item number locates the article on the schematic diagram.

†Not supplied separately.

PRODUCTION CHANGES

Chassis bearing serial numbers below 2,319,650 use:

- (a) Double-tuned 455 kc first i-f transformer, part no. 4XT-434A
- (b) Double-tuned 455 kc diode i-f transformer, part no. 4XT-435B.....
- (c) Oscillator coil, part no. 4XT-433.....
- (d) The low side of the volume control (R12) is connected to A plus instead of A minus (chassis) as shown in the schematic.
- (e) Condenser C19 is connected from plate to B plus instead of from plate to ground as shown in the schematic.
- (f) Resistor R2 is 50,000 ohms, part no. KR-53, instead of 30,000 ohms.
- (g) Chassis using oscillator coil 4XT-433 have a 60 mmf condenser connected from oscillator grid to the grid terminal of the coil. Coil 6JT-467A has an extra capacity winding on the form which replaces this condenser.

Chassis bearing serial numbers below 2,408,049 use dial face, part no. 4XD-51

On Model CE-260 the antenna trimming condenser (C4) is mounted on the loop antenna frame instead of on the variable condenser.

In chassis bearing serial numbers above 2,319,650 condenser C15 is connected from the high side of the volume control to ground instead of to A plus as shown in the schematic.

Chassis bearing serial numbers below 2,439,541 use R1, 200,000 ohm 1/4 watt carbon resistor.....

Chassis bearing serial numbers below 2,440,834 use R5, 10,000 ohm 1/4 watt carbon resistor.....

Chassis bearing serial numbers below 2,593,855 use 1C5G output tube in same position on chassis as 1Q5G output tube and also have following changes:

- (a) Resistor R11 was 740 ohm 1/2 watt wire-wound resistor.....
- (b) Resistor R5 was 10,000 ohm 1/4 watt carbon resistor.....

Chassis bearing serial numbers above 2,593,855 use a resistor 50,000 ohms in series with the high side of the volume control. This resistor is not shown on the schematic diagram.

EMERSON RADIO & PHONOGRAPH CORP.

MODELS CE259,
CE260, CE263
Chassis CE, Late

DESCRIPTION

GENERAL NOTES

TYPE: Single-band superheterodyne.

FREQUENCY RANGE:

540-1730 on early CE-259
530-1600 on all Models CE-260, CE-263 and later CE-259.

NUMBER OF TUBES: Five.

TYPE OF TUBES:

- 1—1A7G, oscillator-modulator
- 1—1N5G, 1st i-f amplifier
- 1—1N5G, 2nd i-f amplifier
- 1—1H5G, 2nd detector, a.v.c., a-f amplifier
- †1—1C5G, pentode output, or, 1Q5G, beam power output
(see production change no. 7).

POWER SUPPLY: A and B batteries.

VOLTAGE RATING:

1.5 volts A
90 volts B

CURRENT DRAIN:

.3 amps A at 1.5 volts
.01 amps B at 90 volts.

1. Batteries. The Models CE-259, CE-260 and CE-263 are designed to house the complete set of batteries within the cabinet.
2. The color coding of the i-f transformer leads is as follows:
Grid—green Plate—blue
Grid return—black B plus—red
3. The color coding of the battery cable is as follows:
Red—B plus, 90 volts Yellow—A plus, 1.5 volts
Blue—B minus Black—A minus.
4. If replacements are made in the r-f section of the circuit, the receiver should be carefully re-aligned.
5. Models CE-259, CE-260 and CE-263 have self-contained antennas and do not require additional antenna or ground connections. For permanent home installations of either model, however, if it is desired to improve reception of weak stations, an additional outdoor antenna should be used. For this purpose a terminal strip is provided in the cabinet for antenna and ground connections. (See diagram on last page.)
6. The self-contained loop antenna operates at maximum efficiency when its position is at right angles to the broadcasting source. It is important, therefore, once the station is tuned in, to rotate the cabinet back and forth through a quarter of a circle (90 degrees), leaving it at the position where the station is received with maximum volume.

BATTERY COMPLEMENT

FOR MODEL CE-259 (Portable)

Type Battery	No. Req.	Eveready Par: No.	Ray-o-vac Part No.	Burgess Part No.
1½ volt "A"	1	742 (plug-in type)	P-94A (plug-in type)	4FA-PI (plug-in type)
45 volt "B"	2	762 (plug-in type)	P-5303 (plug-in type)	B30-PI (plug-in type)

FOR MODEL CE-260

Combined "A" and "B" Pack	1	748 (plug-in type)	AB82 (plug-in type)
---------------------------	---	--------------------	---------------------

FOR MODEL CE-263 (Portable)

1½ volt "A"	1	741 (plug-in type)	P-96A (plug-in type)	8F (plug-in type)
45 volt "B"	2	762 (plug-in type)	P-5303 (plug-in type)	B30-PI (plug-in type)

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed are from point indicated to chassis with volume control turned on full and no signal. The battery voltages for these readings were: "A" 1.5 volts, "B" 90 volts.

Tube	Plate	Screen	Osc. Plate	Fil.
1A7G	82	52	82	1.5
1N5G, 1st i-f	70	82	—	1.5
1N5G, 2nd i-f	82	82	—	1.5
1H5G	25	—	—	1.5
†1C5G or 1Q5G	77	82	—	1.5

Bias for the 1C5G or 1Q5G tube is obtained across the resistor R11. The voltage drop across this resistor should be 7.8 volts with 1C5G or 7volts with 1Q5G (see production change no. 7.)

MODELS CE259, EMERSON RADIO & PHONOGRAPH CORP.
 CE260, CE263
 Chassis CE, Late

ADJUSTMENTS

An oscillator with frequencies of 455 and 1400 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The oscillator coil is located beneath the chassis. The trimmer for the oscillator coil is on the rear section of the variable condenser.

The loop antenna acts as the antenna coil. The trimmer for the loop, when provided, is on the front section of the variable condenser or on the loop frame. (See Production Change No. 3.)

I-f Alignment

Model CE-259 (below serial number 2,319,650). Swing variable condenser to maximum capacity position.

Model CE-259 (above serial number 2,319,650), CE-260 and CE-263. Swing the variable condenser to minimum capacity position.

Feed 455 kc to the grid of the 1A7G tube through a 0.01 mf condenser. Adjust the four i-f trimmers for maximum response.

Battery Installation for Model CE-259

The diagram above illustrates the proper position of the batteries in the portable cabinet. To install and connect the batteries in this cabinet observe the following procedure:

1. Open the end side of the cabinet (side with speaker grille) by removing the two wood screws in the top corners of the panel. The panel is hinged at the bottom. Open the panel by pulling the small leather tab at the top edge.
2. A small wood cleat is fastened to the bottom of the cabinet directly below the two large wood rails. Remove this cleat by taking out the small wood screws.
3. The three-prong plugs on the battery cable from the receiver should be plugged into the two "B" batteries.
4. Slide the "B" batteries, one at a time, in an upright position between the two wood rails in the cabinet, as indicated in the diagram.
5. Replace the small wood cleat in front of the second battery and fasten it securely with the wood screws.
6. The small two-prong plug in the battery cable should be plugged into the "A" battery. Place the "A" battery in the front corner of the cabinet as shown in the diagram.
7. Be sure that all of the cable wires are free and clear of the chassis. Care should be taken also to keep the wires from jamming between the wood rails and the batteries.

R-f Alignment

Set the dial pointer at 140. Set the signal generator at 1400 kc and feed its output into a loop of wire about 12 inches in diameter. Hold this radiating loop about 12 inches from and parallel to the receiver loop antenna. Advance the output of the signal generator until deflection is obtained on the output meter. Adjust first the oscillator trimmer (on front section of variable condenser or on loop frame) then the antenna trimmer (on rear section of variable condenser) for maximum response.

If the loop antenna has been replaced it may be necessary to adjust the loop inductance as follows. Align at 140. Set the pointer at 60 and feed 600 kc to the antenna lead. A portion of the outside turn of the loop may be swung to either side of the center to give maximum response. Realign at 140.

Battery Installation for Model CE-260

The cabinet for this model is designed to house completely the combined "A" and "B" pack. Place the battery pack in the cabinet at the rear of the receiver and insert the four-prong plug of the battery cable into the socket on the top of the battery.

8. Close the end panel and replace the wood screws, fastening them securely.

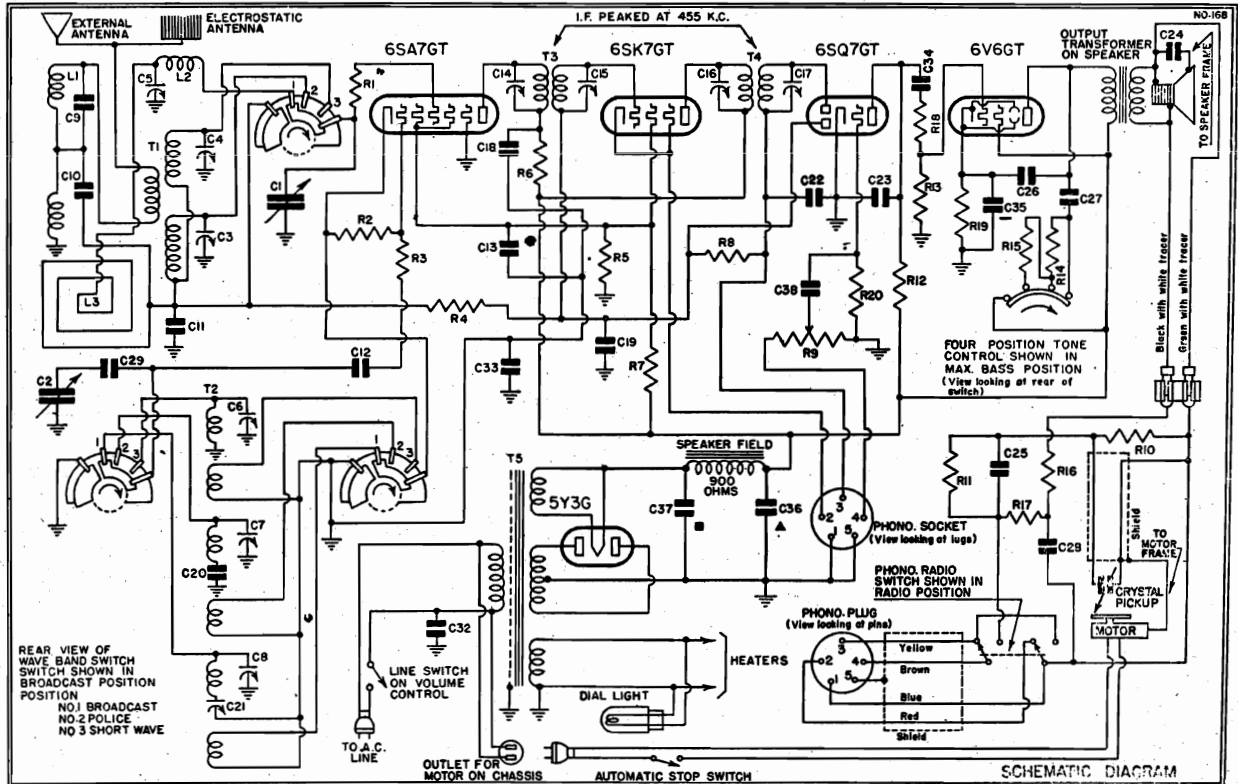

Battery Installation for Model CE-263

The cabinet for this model contains a shelf under the receiver for housing the batteries. The illustration above indicates the position of the batteries. To install and connect the batteries observe the following procedure:

1. Remove the back panel of the cabinet by taking out the wood screws.
2. Locate the battery cable on the bottom shelf of the cabinet.
3. With the batteries out of the cabinet insert the three-prong plugs on the battery cable into the two "B" batteries and the small two-prong plug into the "A" battery.
4. Place the batteries in the cabinet as indicated in the illustration. Note that the "A" battery is placed between the two "B" batteries. Also note that the plug end of the battery is up against the front panel of the cabinet.
5. Replace the back panel of the cabinet and fasten it in place with the wood screws.

EMERSON RADIO & PHONOGRAPH CORP.

I-f Alignment

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 455 kc through a 0.02 mf paper condenser, to the grid of the 6SA7 tube. The input may be fed to the stator lug of the front condenser section. Adjust the four i-f trimmers for maximum response.

Broadcast Alignment

Rotate the wave-band switch to the broadcast (clockwise) position. Set the dial pointer at 160 and feed 1600 kc from the signal generator into a loop of wire about 12 inches in diameter. Hold this radiating loop about 12 inches from and parallel to the receiver loop antenna and advance the output of the generator until a deflection is obtained on the output meter. Adjust first the oscillator coil trimmer then the antenna trimmer for maximum response. Reset the pointer at 60, feed 1600 kc and rock the variable condenser while adjusting the series padder for maximum response. Return to 1600 kc and check alignment. If readjustment is necessary return to 600 and repeat entire procedure.

Police Alignment

Set the wave-band switch at the police band (central) position and the pointer at 7.5. Feed 7500 kc to the antenna and adjust the oscillator trimmer for maximum response. Then adjust the antenna trimmer for maximum response. The police band padder is fixed and therefore requires no adjustment.

Short-Wave Alignment

Set the wave-band switch at the short-wave (counter-clockwise) position. Move the pointer to 20 and feed 20,000 kc to the antenna (using a 400 ohm dummy antenna) and adjust the short-wave oscillator trimmer for maximum response. If two peaks are obtained choose the minimum capacity peak. Then adjust the antenna coil trimmer for maximum response. If two peaks are obtained choose the maximum capacity peak.

GENERAL NOTES

- The receiver should never be turned on with either the speaker plug or the 6V6GT tube out of their respective sockets, since the rapid rise in rectifier voltage will damage the electrolytic condenser.
- When replacing the chassis in the cabinet take precautions to keep any part of the dial and condenser assembly from touching the cabinet, otherwise microphonism will result.
- The color coding of the i-f transformers is as follows:
Grid—green
Plate—blue
Grid return—black
B plus—red
- The color coding of the power transformer is as follows:
Primary—two black leads
High-voltage secondary—two red leads
High-voltage secondary center tap—red and yellow lead
6.3 volt secondary—two green leads
5 volt secondary—two yellow leads
- The adjustable padding condenser for the broadcast band is mounted on the top of the chassis, with the screw adjustment accessible in the top of the chassis. The police and short-wave bands have fixed padders, C20 and C29 on the schematic. When replacing these fixed padders be careful to use a condenser which has a capacity within 2% of the specified value, otherwise the short-wave coils may not track.
- The phonograph motor is equipped with an automatic stop switch. To set this stop, with receiver switched off, push the motor start lever arm toward the rear (arm crosses under pickup near rear of cabinet). Then, with record in place on turntable, swing the vertical arm (which is at the left rear of the pickup) about its pivot so that the pickup bears against the arm when the needle reaches the spiral groove at the center of the record. This adjustment may have to be changed with different records.

DESCRIPTION

TYPE: Three-band superheterodyne.

FREQUENCY RANGES:
540-1750 kc. (555-170 meters)
2300-7500 kc. (130-40 meters)
6.9-22 mc. (43.5-13.6 meters)

NUMBER OF TUBES: Five.

TYPE OF TUBES:
1—6SA7GT, pentagrid converter
1—6SK7GT, i-f amplifier
1—6SQ7GT, diode detector, audio amplifier and a.v.c.
1—6V6GT, power output
1—5Y3G, full-wave rectifier.

POWER SUPPLY: A.C. only.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION:
55 watts for the receiver.
75 watts for the combination.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned full and no signal. Line voltages for these readings was 117 volts, 60 cycles, a.c. All readings except B plus at rectifier, heaters, and cathode voltages were taken on 250 volt scale.

Tube	Plate	Screen	Cathode	FIL
6SA7GT	250	85	0	6.3 ac.
6K7GT	250	85	0	6.3 ac.
6SQ7GT	125	—	0	6.3 ac.
6V6GT	235	250	0	6.3 ac.

ADJUSTMENTS

- An oscillator with frequencies of 455, 600, 1600, 7500 and 20,000 kc should be used.
- An output meter should be used across the voice coil or speaker output transformer for observing maximum response.
- Use a dummy antenna for aligning the police and short-wave bands. A .0001 mf condenser in series with a 400 ohm carbon resistor may be used for the police band dummy antenna. For the short-wave band a 400 ohm carbon resistor may be used.
- Always use as weak a test signal as possible during alignment.
- The set's oscillator is higher in frequency than the signal on all three bands, so images should be observed on the low frequency side of the signal.
- Always choose the minimum capacity peak on oscillator trimmers and maximum capacity peaks on antenna trimmers. The last motion in adjusting trimmers should always be a tightening one, not a loosening one.
- Never leave the trimmer with the outside plate so loose that there is no tension on the screw. Either bend the plate up or remove the screw entirely. Loose screws are a sure source of noise, drifting, and microphonism.
- In aligning antenna trimmers on the high frequency signals there is always a tendency for the oscillator to drift, due to interlocking. To compensate for this always keep tuning the variable condenser as the trimmers are being adjusted.

EMERSON RADIO & PHONOGRAPH CORP.

Receivers using 55, 75, 85, 6Q7, 12Q7, 6F5 and similar type tubes used as first audio amplifiers (see Fig. A).

1. Remove the adapter plug from the phonograph connecting cable.
2. Remove the control grid lead from the grid cap on the tubes; connect the red wire emerging from the connecting cable to the grid cap of the tube; connect the black wire emerging from the connecting cable to the grid lead which originally connected to the grid cap.
3. The connecting cable shield must be connected to B— on the receiver chassis.

MODEL: E0-388
Phonograph Adapter
CHASSIS MODEL: E0

MOTOR:
Alternating current type
Rim-drive.

PICK-UP: Crystal.

POWER CONSUMPTION: 20 watts.

VOLTAGE RATING: 105-125 volts.

8CPM-64 Rim drive motor, 117 volt a.c.

8CC-486A Crystal pick-up

TT5-111R Phono-radio switch

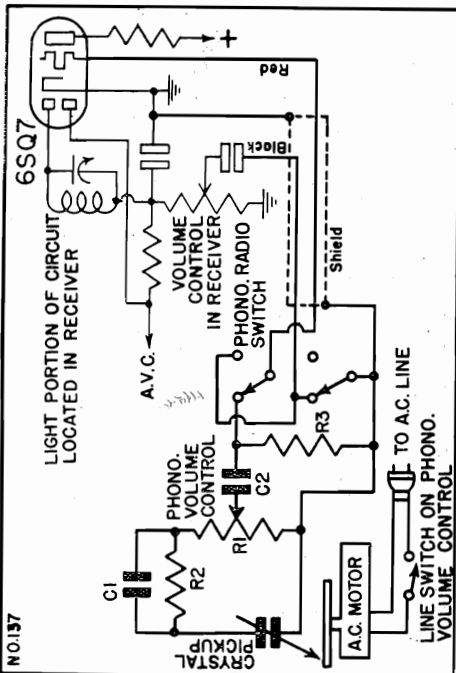

6VG-24 Rubber needle cup

7MW-305 Phonograph connecting cable and adapter plug.

—E0-388—S1 —E0-388—S2

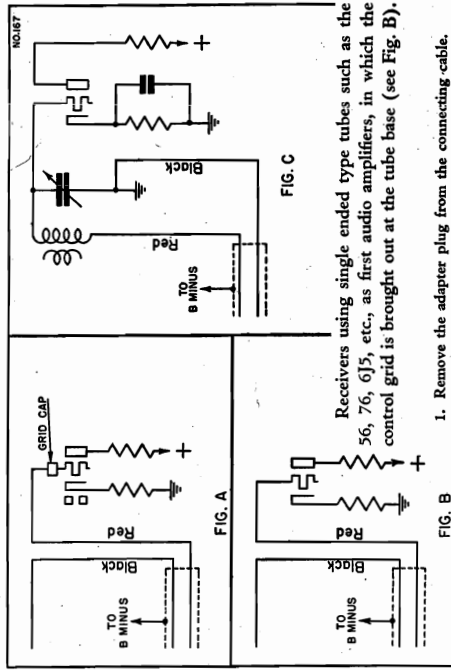

GENERAL NOTES

1. This adapter may be used with any receiver which employs a 6SQ7, 6SQ7GT, 12SQ7 or 12SQ7GT tube for its first second detector and first audio amplifier provided as follows:
 1. Remove the back from the cabinet (if cabinet is equipped with a back).
 2. Locate and remove the 6SQ7 or 12SQ7 tube from its socket, inserting the prong end of the adapter (which comes attached to the 388 cabinet by a length of cable) into the socket from which the 6SQ7 or 12SQ7 tube has been removed. See Figure 1.
 3. Insert the 6SQ7 or 12SQ7 tube into the top of the adapter, plug. See Figure 1.
 4. The back may then be replaced on the cabinet.
2. The motor used in the adapter is of the A.C. ONLY type and will be damaged if used on direct current.
3. The regular receiver volume control operates when the adapter switch is in the "radio" position.
4. The phonograph volume control and motor on-off switch are operated by the same knob.
5. The motor on-off switch does not switch the receiver on or off.
6. THIS RECORD PLAYER HAS BEEN DESIGNED TO OPERATE WITHOUT A GROUND. UNDER NO CIRCUMSTANCES SHOULD ANY GROUND (OR GROUND WIRE) BE PERMITTED TO COME IN CONTACT WITH ANY METAL PART OF THE COMBINATION.

FOR OTHER DATA SEE THAT PERTAINING TO MODEL EQ-10, EMERSON PAGE 12-22.

- R1 Volume control, 5 megohms, with line switch.
- R2 2 megohm 1/4 watt carbon resistor.
- R3 15 megohm 1/4 watt carbon resistor.
- C1 0.00011 mf mica condenser.
- C2 0.002 mf, 600 volt tubular condenser.

Receivers using single ended type tubes such as the 56, 76, 6J5, etc., as first audio amplifiers, in which the control grid is brought out at the tube base (see Fig. B).

1. Remove the adapter plug from the connecting cable.
2. Remove the grid lead from the control grid socket lug; connect the red wire emerging from the connecting cable to the grid socket lug; connect the black wire emerging from the connecting cable to the wire which originally connected to the control grid socket lug.
3. The connecting cable shield is connected to B— on the receiver chassis.

Receivers using a plate bend detector tube and having no first audio tube (see Fig. C).

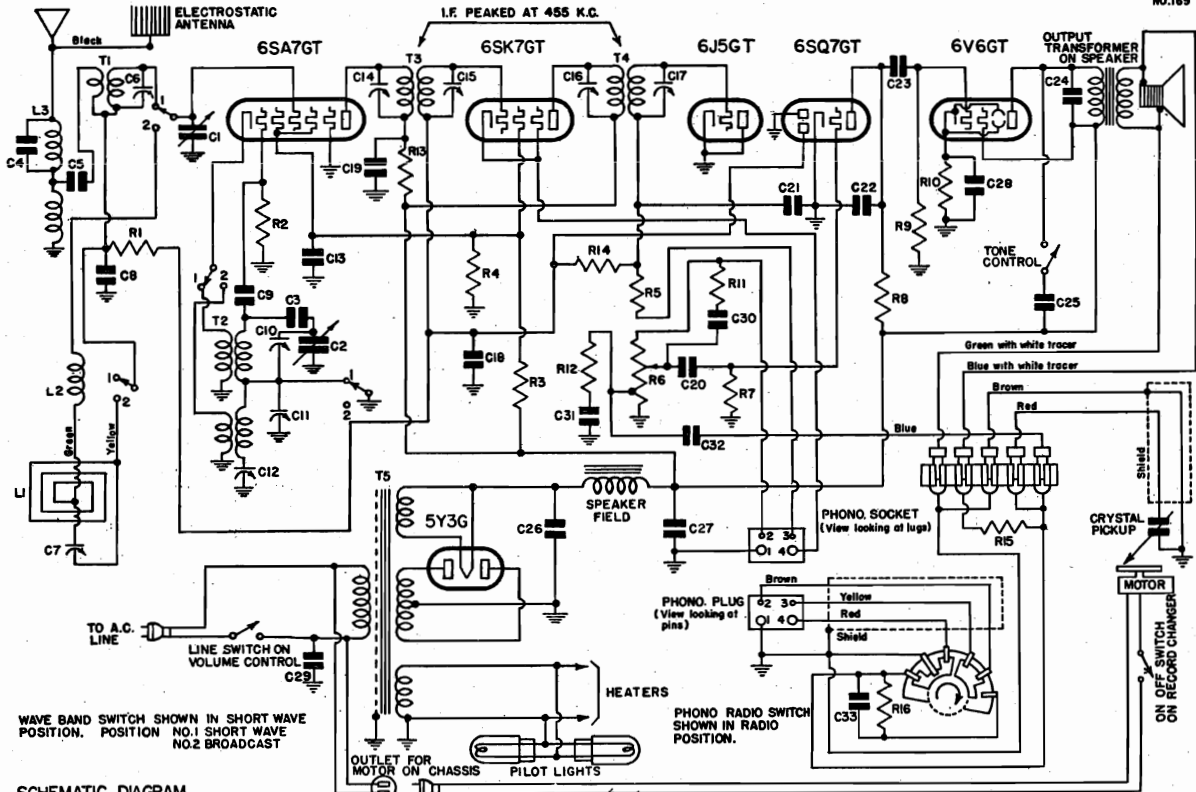

1. Remove the adapter plug from the connecting cable.
2. Remove lead to the low end of the secondary on the detector coil; connect the red wire emerging from the connecting cable to the low end of the detector secondary; connect the black wire emerging from the connecting cable to the lead which originally connected to the secondary of the coil.
3. The connecting cable shield is connected to B— on the receiver chassis.

Notes: This record player is not recommended for use with receivers using a grid leak detector and having only one audio stage.

GENERAL NOTES

- The color coding of the i-f transformer leads is as follows:
Grid—green Plate—blue
Grid return—black B plus—red
- The color coding of the battery cable is as follows:
Red—B plus, 90 volts Blue—B minus
- If replacements are made in the r-f section of the circuit, the receiver should be carefully re-aligned.
- The self-contained loop antenna operates at maximum efficiency when its position is at right angles to the broadcasting source. It is important, therefore, once the station is tuned in, to rotate the cabinet back and forth through a quarter of a circle (90 degrees), leaving it at the position where the station is received with maximum volume.

DESCRIPTION

TYPE: Single-band (battery operated) superheterodyne.

FREQUENCY RANGE: 540-1700 kc.

NUMBER OF TUBES: Four.

TYPE OF TUBES:

- 1—1R3, oscillator-modulator
- 1—1T4, i-f amplifier
- 1—1S5, 2nd detector, a.v.c., a-f amplifier
- 1—1S4, pentode output.

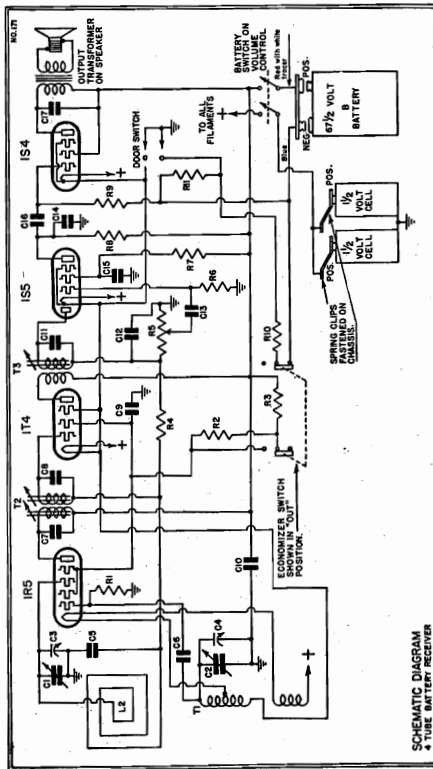

POWER SUPPLY: A and B batteries.

VOLTAGE RATING:

- "A" Battery—1.5 volts
- "B" Battery—67.5 volts.

CURRENT DRAIN:

- "A" Battery—0.25 amp.
- "B" Battery—0.0075 amp with Battery Saver "OUT"
- 0.0095 amp with Battery Saver "IN"

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohm-per-volt meter. Voltages listed are from points indicated to chassis with volume control turned on full and no signal. The battery voltages for these readings were: "A", 1.5 volts; "B", 67.5 volts. All readings except filament were taken on the 250 volt scale, with battery saver "on."

Tube	Plate	Screen	fil.
1R3	57	60	1.5
1T4	57	.60	1.5
1S5	93	*3	1.5
1S4	55	60	1.5

Bias for the 1S4 tube is obtained across the resistor R11. The voltage drop across this resistor should be 7.5 volts with battery saver "out" or 5.4 volts with battery saver "in."
*The operating voltage of this tube cannot be measured because of the high resistor in the circuit.

ADJUSTMENTS

i-f-Alignment

Swing variable condenser to minimum capacity position.
Feed 455 kc to the grid of the 1R3 tube through a 0.01 mfd condenser. Adjust the three i-f trimmer core screws for maximum response. (Clip the i-f input to the stator lug of the upper variable condenser section.)
R-f Alignment

Set the dial pointer at 150. Set the signal generator at 1500 kc and feed its output into a loop of wire about one foot in diameter. Hold this radiating loop about one foot away from and parallel to the receiver loop antenna. Advance the output of the generator until deflection is obtained on the output meter. Adjust first the oscillator trimmer (on lower section of variable condenser) then the antenna trimmer (on upper section of variable condenser) for maximum response.

BATTERY COMPLEMENT

The cabinet is designed to house the complete set of batteries. The battery complement should be as follows:
Type Battery Number Required
1 1/2 volt "A" 2
67 1/2 volt "B" 1
Standard "D" size (1 1/4" diameter) flashlight cell
Eveready "Mini-max" No. 467

Location of Coils and Trimmer Adjustments

The first i-f transformer is located in the bottom outer edge of the chassis behind the lower flashlight cell. The brass screws which protrude from either end of the can are the core adjustment for trimming the transformer. The second i-f transformer is located between the 1T4 and 1S5 tubes. The single trimming core screw extends from the end of the can.

The oscillator coil is located inside the chassis, beside the variable condenser. Trimmer for the oscillator is located on the lower section of the variable condenser.

The loop antenna acts as the antenna coil. Trimmer for the loop is located on the upper section of the variable condenser.

MODEL FJ412, Chassis FJ

EMERSON RADIO & PHONOGRAPH CORP.

ADJUSTMENTS

An oscillator with frequencies of 455 and 1400 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck next to the 12SA7 tube. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is mounted on top of the chassis next to the variable condenser. The trimmers are accessible through holes in the top of the can.

The trimmer for the oscillator coil is mounted on the front section of the variable condenser. The loop antenna trimmer is located on the loop assembly.

i-f Alignment

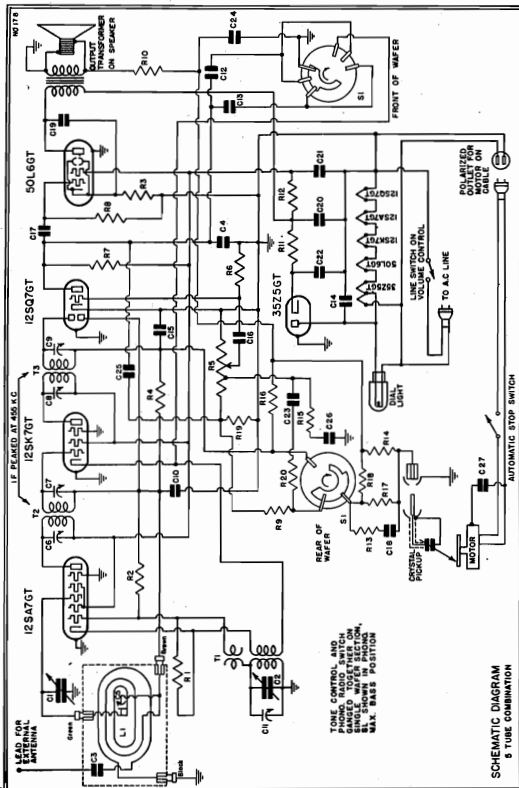

Swing the variable condenser to the minimum capacity position. Feed 455 kc to the grid of the 12SA7GT tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response. The grid of the 12SA7GT tube may be reached by clipping the input lead to the stator lug of the antenna section.

R-f Alignment

Set the dial pointer at 140. Feed 1400 kc from the signal generator into a loop of wire about one foot in diameter. Hold this radiating loop about 12 inches away from and parallel to the receiver loop antenna. Advance the input to the loop until a satisfactory deflection is obtained on the output meter. Adjust first the oscillator trimmer then the antenna trimmer for maximum response. If the loop antenna has been replaced it may be necessary to retrace the loop inductance. With the dial set at 60 feed 600 kc to the antenna lead. A portion of the outside may be swung to either side of the center to give maximum response. Repeat the trimmer alignment at 140.

SCHEMATIC DIAGRAM FOR MODEL FJ

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (line switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale.

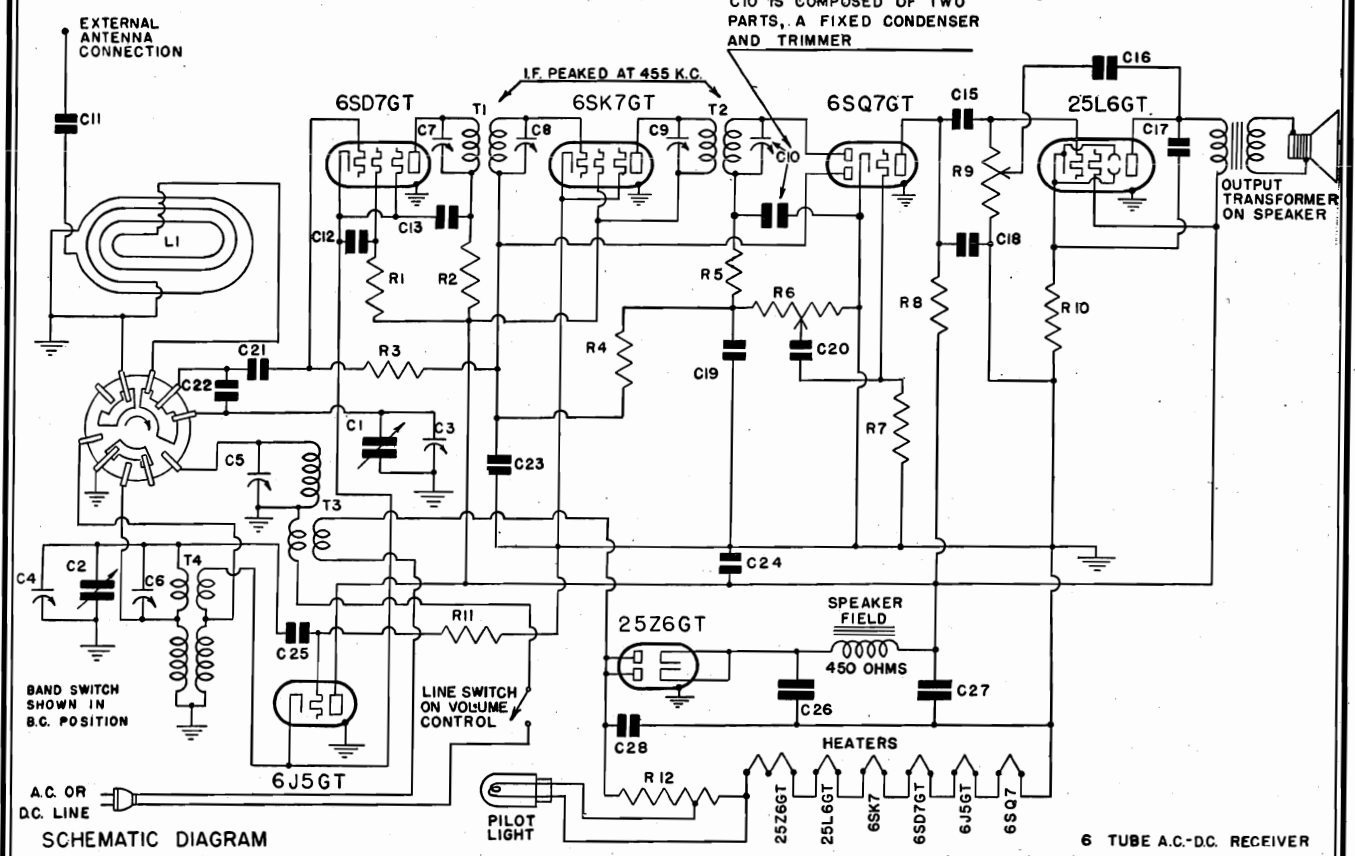

Tube	Plate	Screen	Cathode	FIL
12SA7GT	88	88	0	12
12SK7GT	88	88	0	12
12SQ7GT	30	—	0	12
50L6GT	100	88	5.3	50

GENERAL NOTES

Voltage at 35Z5 cathode—120 volts.
Voltage across pilot light—4.5 volts.

- If replacements are made or the wiring disturbed in the i-f section of the circuit, the receiver should be carefully re-aligned.
- The color coding of the i-f transformer leads is as follows:
Grid—green
Grid return—black
Plate—blue
B plus—red
- The receiver has a self-contained antenna and does not require additional antenna connections. For permanent home installations, however, if it is desired to improve reception of weak stations, an additional outdoor antenna should be used. For this purpose a lead has been brought out of the rear near the line cord.
- The self-contained loop antenna has directional properties. It is important, therefore, once the station is tuned in, that the cabinet be rotated on its base back and forth through a quarter of a circle (90 degrees), and left at the position where the station is received with maximum volume.

Voltage at 25Z6 cathode—150 volts.
 Voltage across speaker field—32 volts.
 Voltage across pilot light—4.5 volts.

MODELS FH413, FH440
Chassis FH

EMERSON RADIO & PHONOGRAPH CORP.

ADJUSTMENTS

An oscillator with frequencies of 455, 600, 1600 and 12,000 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

I-f Alignment

Swing the variable condenser to the minimum capacity position. Feed 455 kc to the grid of the 6SD7 tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response.

Note: The grid of the 6SD7 tube is the No. 4 pin.

R-f Alignment

Rotate the wave-band switch counter-clockwise to the short-wave position. Set the dial pointer at 12 megacycles and using a 300 ohm carbon resistor as a dummy antenna feed 12 megacycles from the generator to the external antenna lead emerging from the rear of the chassis. Adjust first the short-wave oscillator trimmer and then the short-wave antenna trimmer for maximum response.

Rotate the wave-band switch clockwise to the broadcast position. Set the dial pointer at 160 and feed 1600 kc from the signal generator into a loop of wire about 12 inches in diameter. Hold this radiating loop about 12 inches from the loop antenna and advance the signal generator until a deflection is obtained on the output meter. Adjust first the oscillator trimmer (rear section of the variable condenser) and then the antenna trimmer (front section of the variable condenser) for maximum response.

If the loop has been replaced it may be necessary to adjust the loop inductance as follows: Align at 1600. Set the pointer at 60 feed 1600 kc into the radiating loop. A portion of the inside of the loop may then be swung to either side of the center to give maximum response. Realign at 1600.

CUT-AWAY VIEW SHOWING METHOD OF STRINGING PULLEYS.

PRODUCTION CHANGES

- Chassis bearing serial numbers below 4,540,900 use:
 - (a) Volume control 7BR-363C..... .85
 - (b) Drive shaft 7BR-40D..... .10

VOLTAGE ANALYSIS

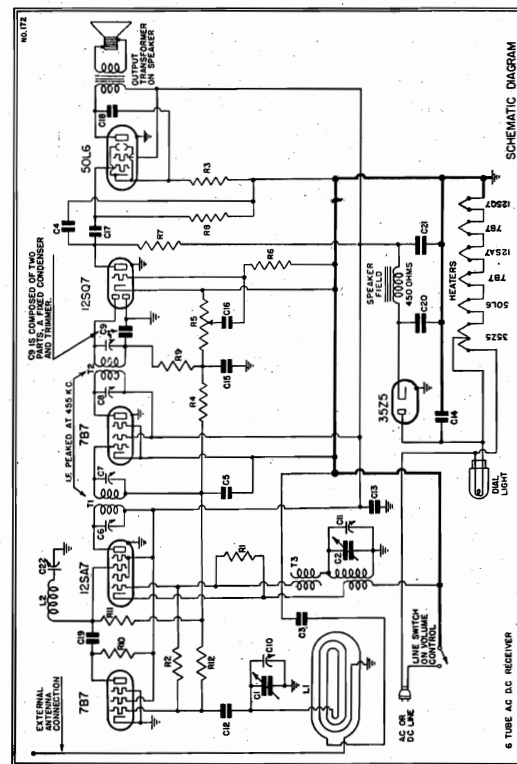

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (line switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	Plate	Screen	Cathode	FIL
7B7 (r-f)	18	88	0	5.5
12SA7	88	88	0	12.0
7B7	88	85	0	5.5
12SQ7	30	0	0	12.0
50L6	82	88	5.6	90.0

- The color coding of the i-f transformer leads is as follows:
 - Grid—green
 - Grid return—black
 - Plate—blue
 - B plus—red

DIAL CORD REPLACEMENT

Draw the cord snugly around the condenser pulley and knot it, with no slack, near the notch in the pulley, after which the spring may be hooked to the cord and pulley. The dial face should bear against the fibre washer when finally assembled.

SCHEMATIC DIAGRAM FOR MODEL FL

- TYPE: Single-band Superheterodyne.
- POWER SUPPLY: A.C. or D.C.
- VOLTAGE RATING: 105-125 volts.
- POWER CONSUMPTION: 30 watts.
- NUMBER OF TUBES: Six.
- TYPE OF TUBES:
- 1—7B7, r-f amplifier
 - 1—12SA7, pentagrid oscillator-modulator
 - 1—7B7, first i-f amplifier
 - 1—12SQ7, diode detector, r-f amplifier, a.v.c.
 - 1—50L6, beam power output
 - 1—3Z25, half-wave rectifier.

ADJUSTMENTS

An oscillator with frequencies of 455 and 1400 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

Swing the variable condenser to the minimum capacity position. Then adjust the four i-f trimmers for maximum response.

Feed 455 kc to the external antenna lead and adjust the wave-trap for minimum response.

Note: The grid of the 12SA7 tube is the No. 8 pin.

R-f Alignment

Set the dial pointer at 1400. Set the signal generator at 1400 kc and feed its output into a loop of wire about 12 inches in diameter. Hold this resonating loop about 12 inches from and parallel to the receiver loop antenna. Advance the output of the signal generator until the output meter indicates maximum response. Adjust first the oscillator trimmer (on front section variable condenser) then the antenna trimmer (on rear section of variable condenser) for maximum response.

If the loop antenna has been replaced it may be necessary to adjust the loop inductance as follows. Align at 1400. Set the pointer at 60 and feed 600 kc to the antenna lead. A portion of the outside turn of the loop may be swung to either side of the center to give minimum response. Realign at 1400.

The second i-f transformer is mounted on top of the chassis between the 7B7 tube and the speaker. The trimmers are accessible through holes in the top of the can.

The 455 kc wave-trap is located below the chassis deck.

The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the oscillator coil.

The oscillator coil is located underneath the chassis. The loop antenna acts as the antenna coil.

EMERSON RADIO & PHONOGRAPH CORP. **MODEL FO420, Chassis FO**

ADJUSTMENTS
I-f Alignment

Swing the variable condenser to the minimum capacity position. Feed 455 kc to the grid of the 12SA7 tube through the trimmer and adjust the four I-f trimmers for maximum response.

Note: The grid of the 12SA7 tube is connected to the lower anode leg of the rear variable condenser section. Connection between the trimmer and the condenser section is easily identified by the connection of the green lead to the loop.

R-f Alignment

Set the dial pointer at 150. Set the signal generator at 1500 kc and connect the lead from the antenna to the grid of the 12SQ7 tube. Hold this radiating loop about 12 inches from and parallel to the receiver loop antenna. Advance the output of the signal generator until deflection is obtained on the output meter. Then adjust the antenna trimmer (on the loop assembly) for maximum response.

If the loop antenna has been replaced it may be necessary to adjust the loop inductance as follows. Align at 150. Set the signal generator at 1500 kc. The position of the outside turn of the loop may be swung to either side of the center to give maximum response. Realign at 150.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (line switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale.

Tube	Plate	Screen	Cathode	FIL
12SA7GT	90	90	0	12
12SK7GT	90	90	0	12
12SQ7GT	30	—	0	12
50L6GT	100	87	5.5	50

DIAL CORD REPLACEMENT

Use a turn and a half of cord, part number 7BZ267A. Draw the cord snugly around the condenser pulley and knot it, with no slack, near the notch in the pulley, after which the cord should be drawn over the pulley. The dial cord face should bear against the fibre washer when finally assembled.

The color coding of the i-f transformer leads is as follows:
Grid—green Plate—blue
Grid return—black B plus—red

The receiver has a self-contained antenna and does not require additional antenna connections. For permanent home installations, however, if it is desired to improve reception of weak stations, an additional outdoor antenna should be connected to the antenna terminals. A lead has been brought out of the rear near the line cord.

The self-contained loop antenna has directional properties. It is recommended, therefore, once the station is tuned in, that the antenna be swung to the left or right and then swung forth, and left at the position where the desired station is received with maximum volume.

When replacing the chassis in the cabinet take precautions to keep any part of the dial and condenser assembly from touching the cabinet, otherwise microphonism will result.

An oscillator with frequencies of 455, 600 and 1500 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

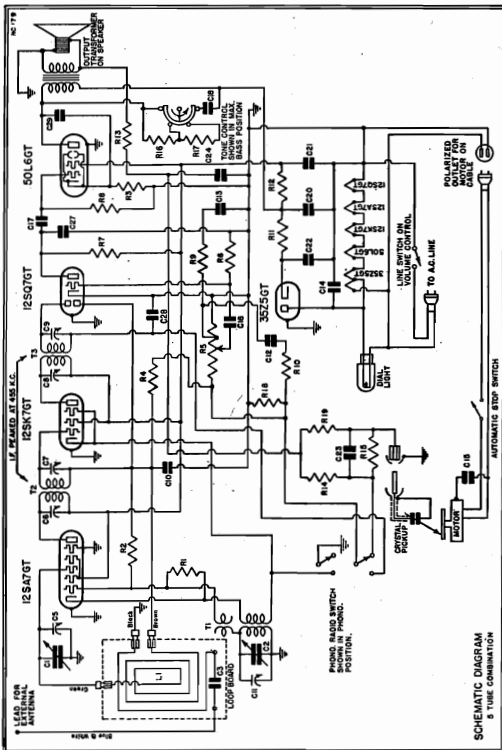

Location of Coils and Trimmer Adjustments

The first i-f transformer is located on top of the chassis deck. The trimmers are available through holes in top of the can.

The second i-f transformer is located on the rear wall underneath the chassis. The trimmers are available through holes in the rear chassis wall.

The loop antenna trimmer is mounted on the loop assembly. The oscillator trimmer is mounted on the front section of the variable condenser.

The oscillator coil is located underneath the chassis. The loop antenna acts as the antenna coil.

REPLACEMENT PARTS LIST

FOR GENERAL INSTRUMENT 101 RECORD CHANGER DATA. SEE RIDER'S "AUTOMATIC RECORD CHANGERS AND RECORDERS".

DESCRIPTION

Voltage at 35Z5 cathode—115 volts.
Voltage across pilot light—4.5 volts.

TYPE: Single-band superheterodyne and phonograph.

FREQUENCY RANGE: 540-1630 kc.

NUMBER OF TUBES: Five.

TYPE OF TUBES:
1—12SA7GT, pentagrid oscillator-modulator
1—12SK7GT, first i-f amplifier
1—12SQ7GT, diode detector, a-f amplifier, a.v.c.
1—50L6GT, beam power output
1—35Z5GT, half-wave rectifier.

POWER SUPPLY: A.C. only.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION:
30 watts for receiver.
20 watts for phono motor.

EMERSON RADIO & PHONOGRAPH CORP. MODELS FP421, FP422

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (line switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	Plate	Screen	Cathode	File
12SA7GT	88	88	0	12
12SK7GT	88	88	0	12
12SQ7GT	30	—	0	12
50L6GT	82	88	5.6	50

Voltage at 35Z5 cathode—120 volts.
Voltage across speaker field—32 volts.
Voltage across pilot light—4.5 volts.

ADJUSTMENTS

I-f Alignment

Swing the variable condenser to the minimum capacity position. Feed 455 kc to the grid of the 12SA7GT tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response. The grid of the 12SA7GT tube may be reached by clipping the input lead to the stator lug of the antenna section.

An oscillator with frequencies of 455 and 1400 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

R-f Alignment

Set the dial pointer at 140. Feed 1400 kc from the signal generator into a loop of wire about one foot in diameter. Hold this radiating loop about 12 inches away from and parallel to the receiver loop antenna. Advance the input to the loop until a satisfactory deflection is obtained on the output meter. Adjust first the oscillator trimmer then the antenna trimmer for maximum response. If the loop antenna has been replaced, it may be necessary to retrack the loop inductance. With the dial set at 60 feed 600 kc to the antenna lead. A portion of the outside may be swung to either side of the center to give maximum response. Repeat the trimmer alignment at 140.

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck next to the loop antenna. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is mounted on top of the chassis next to the 50L6 tube. The trimmers are accessible through holes in the top of the can.

The trimmers for the antenna loop and the oscillator coil are located on the variable condenser. The front section is for the oscillator. The rear section is for the antenna loop. The oscillator coil is located beneath the chassis deck.

TYPE: Single-band superheterodyne.

FREQUENCY RANGE: 540-1630 kc.

NUMBER OF TUBES: Five.

TYPE OF TUBES:

- 1—12SA7, pentagrid oscillator-modulator
- 1—12SK7, first i-f amplifier
- 1—12SQ7, diode detector, a-f amplifier, i.v.v.m.
- 1—50L6GT, beam power output
- 1—35Z5GT, half-wave rectifier.

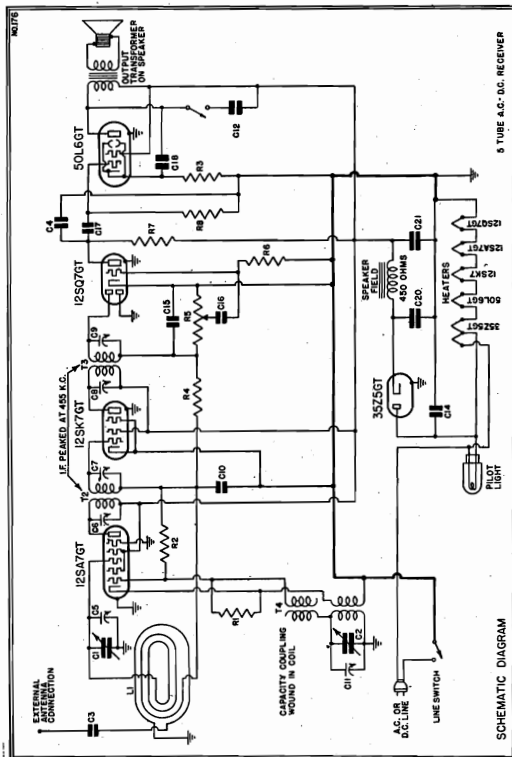

POWER SUPPLY: A.C. or D.C.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 30 watts.

GENERAL NOTES

- If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
- In operating the receiver on d.c. it may be necessary to reverse the line plug for correct polarity.
- The color coding of the i-f transformer leads is as follows:
Grid—green
Grid return—black
Plate—blue
B plus—red
- The receiver has a self-contained antenna and does not require additional antenna connections. For permanent home installations, however, if it is desired to improve reception of weak stations, an additional outdoor antenna should be used. For this purpose a lead has been brought out of the rear near the line cord.
- The self-contained loop antenna has directional properties. It is important, therefore, once the station is tuned in, that the cabinet be rotated on its base back and forth through a quarter of a circle (90 degrees), and left at the position where the station is received with maximum volume.

SCHEMATIC FOR MODEL FW

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck next to the 12SA7 tube. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is mounted on top of the chassis next to the 12SQ7 tube. The trimmers are accessible through holes in the top of the can.

The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the oscillator coil.

The oscillator coil is located underneath the chassis. The loop antenna acts as the antenna coil.

- In operating the receiver on d.c. it may be necessary to reverse the line plug for correct polarity.
- The color coding of the i-f transformer leads is as follows:
Grid—green Plate—blue
Grid return—black B plus—red
- The receiver has a self-contained antenna and does not require additional antenna connections. For permanent home installations, however, if it is desired to improve reception of weak stations, an additional outdoor antenna should be used. For this purpose a lead has been brought out of the rear near the line cord.
- The self-contained loop antenna operates at maximum efficiency when its position is at right angles to the broadcasting source. It is important, therefore, once the station is tuned in, to rotate the cabinet back and forth through a quarter of a circle (90 degrees), leaving it at the position where the station is received with maximum volume.
- Before turning the phono motor on check the a.c.-d.c. switch underneath the turntable on the motor board, making sure that it is in a position corresponding to the power supply.

VOLTAGE ANALYSIS

Readings should be taken with a 1,000 ohm-per-volt meter. Voltages listed below are from point indicated to B minus (line switch) with the filament turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	Plate	Screen	Cathode	Fil.
12SA7	88	88	0	12
12SQ7	88	88	0	12
12SQ7	30	—	0	12
50L6	82	88	5.6	50

An oscillator with frequencies of 455 and 1400 kc is required. An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

ADJUSTMENTS

i-f Alignment

Swing the variable condenser to the minimum capacity position. Feed 455 kc to the grid of the 12SA7 tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response.

Notes: The grid of the 12SA7 tube is connected to the lower stator lug of the rear variable condenser section. Connection may be made with a test clip to the upper stator lug.

R-f Alignment

Set the dial pointer at 1400. Set the signal generator at 1400 kc and feed its output into a loop of wire about 12 inches in diameter. Hold this radiating loop about 12 inches from and parallel to the receiver loop antenna. Advance the output of the signal generator until the antenna trimmer (on front section of variable condenser) is at maximum response. Then adjust the antenna trimmer (on rear section of variable condenser) for maximum response.

If the loop antenna has been replaced it may be necessary to adjust the loop inductance as follows: Align as above. A position of the outside turn of the loop may be swung to either side of the center to give maximum response. Realign at 1400.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohm-per-volt meter. Voltages listed are from point indicated to chassis with volume control turned on full and no signal. The battery voltages for these readings are: A= 30 volts, B= 30 volts, Fil= 1.5

Point	Screen	Osc. Plate	Fil.
1A7GT	50	84	1.5
1NS5GT	88	88	1.5
1H5GT	27	88	1.5
3Q5GT	85	88	3.0
117N7 (line operation only)	86	95	1.17
117N7 (line operation only)	86	95	1.17

117N7 may be substituted for the 117P7.

DIAL PARTS

DESCRIPTION

TYPE: Universal (battery, a.c.-d.c.) superheterodyne.
 FREQUENCY RANGE: 540-1630 kc.
 NUMBER OF TUBES: Six.
 TYPE OF TUBES:
 1—1A7GT, oscillator-modulator
 1—1NS5GT, i-f amplifier
 1—1H5GT, 2nd detector, a.v.c., a.f. amplifier
 1—3Q5GT, beam power output and half-wave rectifier
 1—117N7, (line operation).

POWER SUPPLY: Battery, a.c. or d.c.
VOLTAGE RATING: (Line operation) 105-125 volts, a.c.-d.c.
POWER CONSUMPTION: (Line operation) 20 watts.
CURRENT DRAIN: "A" battery 0.05 amp.
 "B" battery 0.01 amp.

GENERAL NOTES

- The color coding of the i-f transformer leads is as follows:
 Grid return—black
 B plus—red
 Plate—blue
- The color coding of the battery cable is as follows:
 Red—B plus, 90 volts
 Blue—B minus
 Black—A minus
- If replacements are made in the r-f section of the circuit, the receiver should be carefully realigned.

BATTERY COMPLEMENT

The cabinet is designed to house the complete set of batteries. The battery complement should be as follows:

Type	Number	Part No.
Battery	Required	746
4 1/2 volt "A"	2	(plug-in type)
45 volt "B"	2	482 Minimax (plug-in type)

ADJUSTMENTS

An oscillator with frequencies of 262, 1400 and 600 kc is required.
 An output meter should be used across the voice coil or output transformer for observing maximum response.
 Always use as weak a test signal as possible when aligning the receiver.

i-f Alignment
 Note: This receiver has an i-f frequency of 262 kc.
 Swing variable condenser to minimum capacity position.
 Feed 262 kc to the grid of the 1A7 tube through a 0.01 mf condenser. Adjust the three i-f trimmers for maximum response.

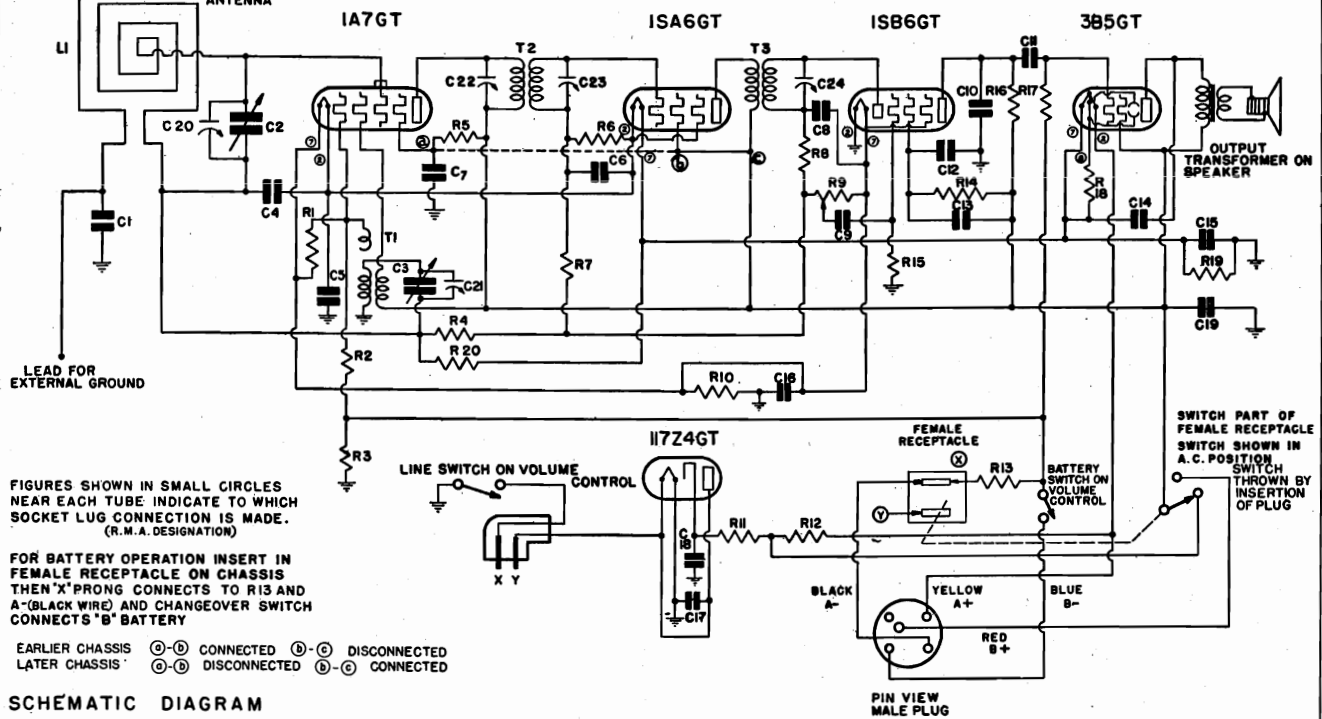

Location of Coils and Trimmer Adjustments

The oscillator coil is located beneath the chassis. The trimmer for the oscillator is on the middle section of the variable condenser.
 The interstage coil is the shielded coil located beneath the chassis. Its trimmer is on the front section of the variable condenser.
 The trimmer for the loop antenna is on the last section of the variable condenser (the section nearest the loop).

The i-f transformers are mounted on top of the chassis. The first i-f transformer is mounted next to the loop. The second i-f transformer is mounted next to the dial.
 The series pecker is located between the variable condenser and the shielded i-f tube.

R-f Alignment
 Set the dial pointer at 140. Feed 1400 kc from the signal generator into a loop of wire about one foot in diameter. Feed this radiating loop approximately one foot away from and parallel to the receiver loop and advance the output of the signal generator until a suitable deflection is obtained on the output meter. Move the dial pointer to 60 and feed 600 kc into the radiating loop and adjust the series peaking condenser (while rocking the variable condenser back and forth) for maximum response. Realign at 1400 kc.
 If the loop antenna has been replaced it may be necessary to adjust the dial pointer to 600 kc to the radiating loop. A portion of the outside turn of the loop may then be swung to either side of the center to give maximum response. Realign at 140.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (line switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	Plate	Screen	Osc. Plate	Fil.
1A7GT	69	46	69	1.4
1SA6GT	69	70	—	1.4
1SB6GT	9	5	—	1.4
3B5GT	67	69	—	2.5

Voltage at 117Z4GT cathode—125 volts.
Voltage drop across R11, R12—117 volts.

DESCRIPTION

TYPE: Universal (battery, a.c.-d.c.) superheterodyne.
FREQUENCY RANGE: 540-1600 kc.
NUMBER OF TUBES: Five.
TYPE OF TUBES:
 1—1A7GT, oscillator-modulator
 1—1SA6GT, i-f amplifier
 1—1SB6GT, 2nd detector, a.v.c., a-f amplifier
 1—3B5GT, beam power output (battery operation)
 1—117Z4, half-wave rectifier (line operation).
POWER SUPPLY: Battery, a.c. or d.c.
VOLTAGE RATING: (Line operation) 105-125 volts, a.c.-d.c.
POWER CONSUMPTION: (Line operation) 13 watts.
CURRENT DRAIN:
 (Battery operation) "A" battery .02 amp.
 "B" battery 0.007 amp.

- The color coding of the battery cable is as follows:
 Red—B plus, 67.5 volts Yellow—A plus, 7.5 volts
 Blue—B minus Black—A minus
- If replacements are made in the r-f section of the circuit, the receiver should be carefully re-aligned.
- Battery Operation: Important:** Remove the line plug from the electrical outlet. Insert the plug into the receptacle at the bottom of the receiver. This is important since the receiver will not operate from batteries with the plug out of the receptacle. The loose portion of the cord can then be coiled and placed in the cabinet.
- The receiver has a self-contained antenna and normally does not require additional antenna or ground connection. For permanent home installations, however, in a location far removed from broadcasting stations, an additional outside antenna should be used. The outside antenna and ground connections should be made to the two leads at the rear of the cabinet.

GENERAL NOTES

- The color coding of the i-f transformer leads is as follows:
 Grid—green Plate—blue
 Grid return—black B plus—red

- The self-contained loop antenna has directional properties. It is important, therefore, once the station is tuned in, that the cabinet be rotated on its base back and forth through a quarter of a circle (90 degrees), and left at the position where the station is received with maximum volume.

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck next to the variable condenser. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is mounted on top of the chassis between the volume control and the speaker. The trimmer is accessible through a hole in the top of the can.

The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the lower section is for the oscillator coil.

The oscillator coil is located underneath the chassis. The loop antenna acts as the antenna coil.

I-f Alignment

Swing the variable condenser to the minimum capacity position. Feed 455 kc to the grid of the 1A7GT tube through a .01 mf condenser and adjust the three i-f trimmers for maximum response.

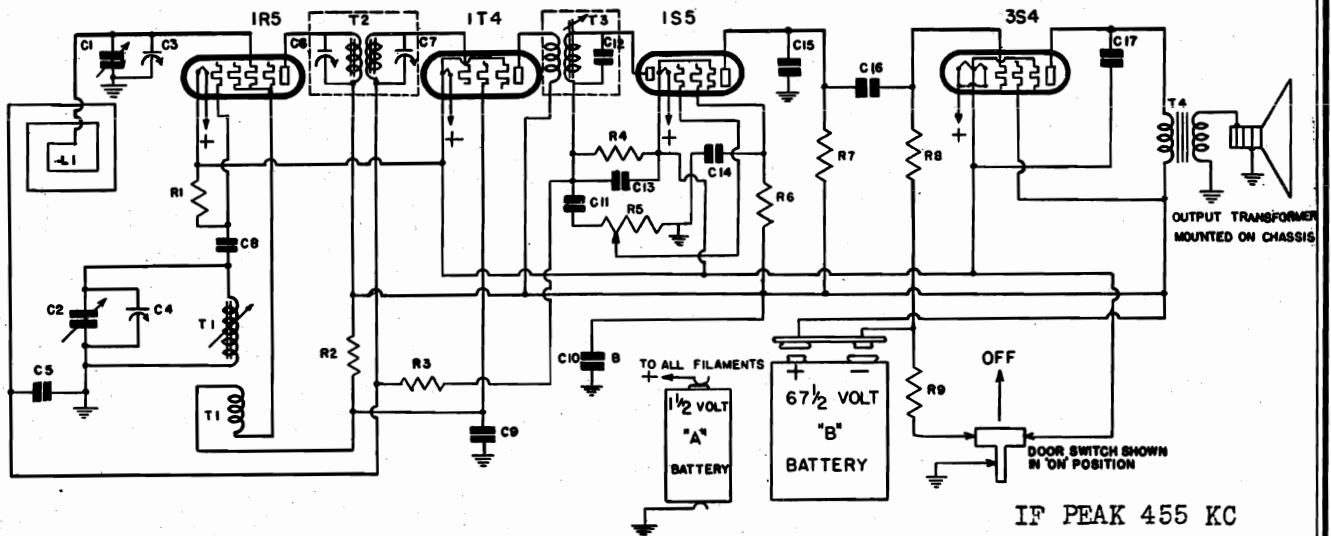

R-f Alignment

Set the dial pointer at 140. Set the signal generator at 1400 kc and feed its output into a loop of wire about 12 inches in diameter. Hold this radiating loop about 12 inches from and parallel to the receiver loop antenna. Advance the output of the signal generator until deflection is obtained on the output meter. Adjust first the oscillator trimmer (on front section of variable condenser) then the antenna trimmer (on rear section of variable condenser) for maximum response.

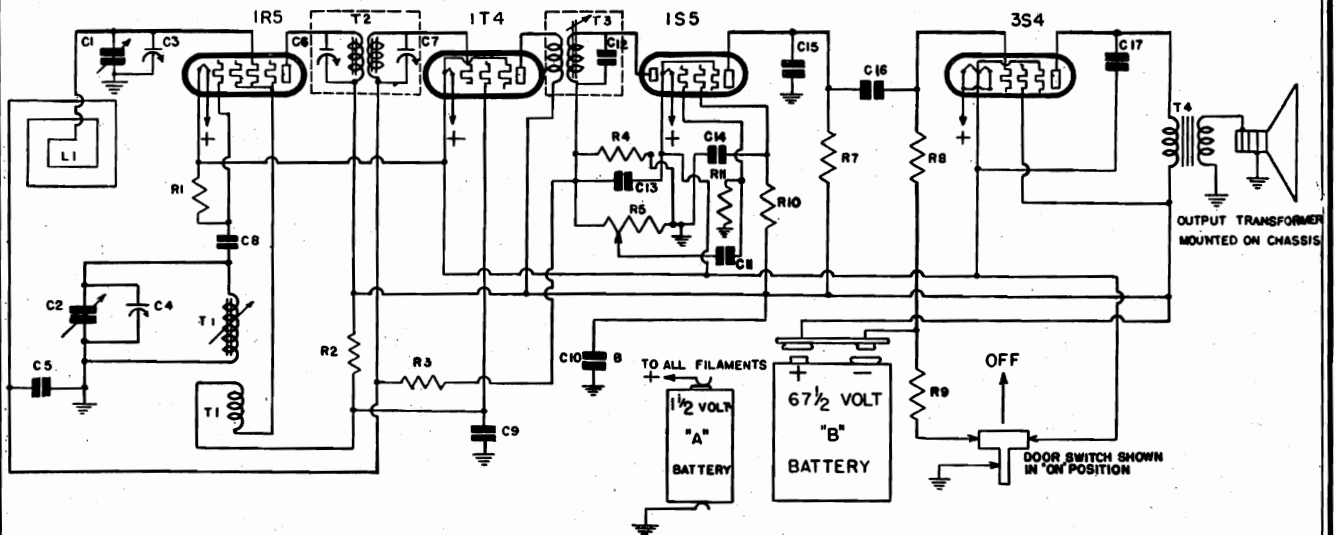

If the loop antenna has been replaced it may be necessary to adjust the loop inductance as follows: Align at 140. Set the pointer at 60 and feed 600 kc to the antenna lead. A portion of the outside turn of the loop may be swung to either side of the center to give maximum response. Realign at 140.

ADJUSTMENTS

An oscillator with frequencies of 455 and 1600 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The first i-f transformer is located next to the output transformer.

The trimmers are accessible through holes in top of the can.

The second i-f transformer is located between the 1T4 and 1S5 tubes. The single trimming core screw extends from the end of the can.

The oscillator coil is located next to the first i-f transformer. The trimmer for the oscillator is located on the smaller variable condenser section.

The 600 kc oscillator core adjustment is the brass screw protruding from the end of the oscillator coil.

The loop antenna acts as the antenna coil. Trimmer for the loop is located on the larger section of the variable condenser.

I-f Alignment

Swing variable condenser to minimum capacity position.

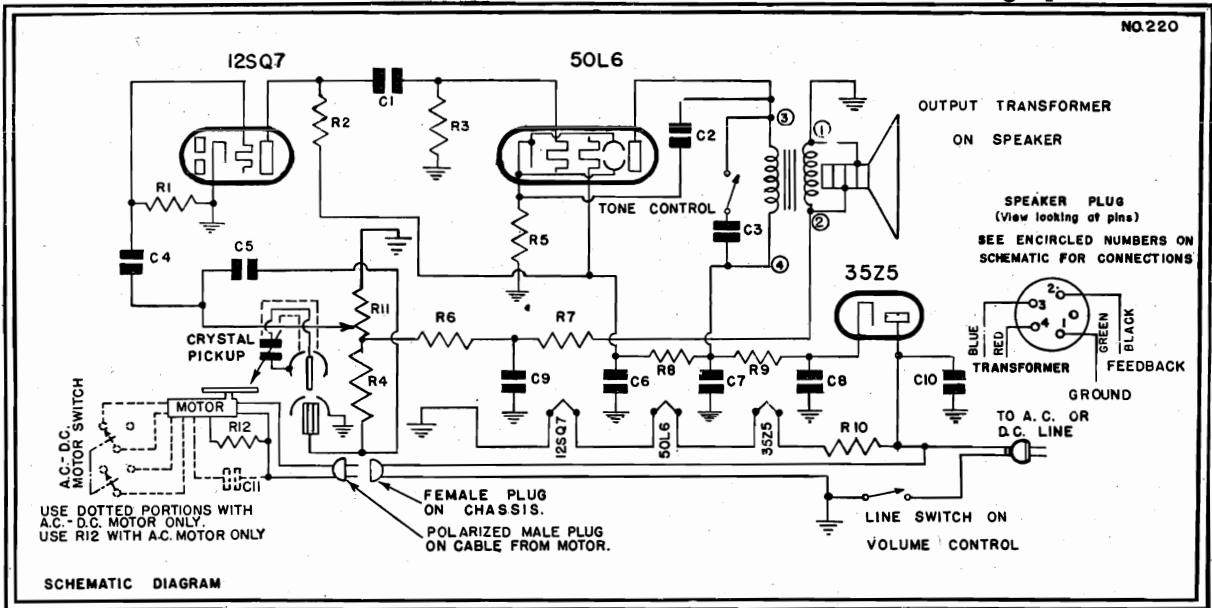

Feed 455 kc to the grid of the 1R5 tube through a 0.01 mf condenser. Adjust the three i-f trimmer screws for maximum response. (Clip the i-f input to the stator lug of the larger variable condenser section.)

R-f Alignment

Set the dial pointer at 160. Set the signal generator at 1600 kc and feed its output into a loop of wire about one foot in diameter. Hold this radiating loop about one foot away from and parallel to the receiver loop antenna. Advance the output of the generator until deflection is obtained on the output meter. Adjust first the oscillator trimmer (smaller section of variable condenser) then the antenna trimmer (larger section of variable condenser) for maximum response. Set the dial pointer at 60. Feed 600 kc and rock the variable condenser while adjusting the oscillator core adjustment for maximum response. Return to 1600 and check alignment. If re-adjustment is necessary return to 600 and repeat entire procedure.

Readings should be taken with a 1000 ohms-per-volt meter

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (line switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, A.C. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 D.C. will be given, lower than those given below.

VOLTAGE ANALYSIS

Tube	Plate	Screen	Cathode	fil.
12SA7	88	88	0	12 a.c.

ADJUSTMENTS

R-f Alignment

An oscillator with frequencies of 455 and 1600 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The first i-f transformer is located next to the output transformer.

The trimmers are accessible through holes in top of the can.

The second i-f transformer is located between the 1T4 and 1S5 tubes. The single trimming core screw extends from the end of the can.

The oscillator coil is located next to the first i-f transformer. The trimmer for the oscillator is located on the smaller variable condenser section.

The 600 kc oscillator core adjustment is the brass screw protruding from the end of the oscillator coil.

The loop antenna acts as the antenna coil. Trimmer for the loop is located on the larger section of the variable condenser.

I-f Alignment

Rotate variable condenser to minimum capacity position.

Feed 455 kc to the grid of the 1R5 tube through a 0.01 mf condenser. Adjust the three i-f trimmer screws for maximum response. (Clip the i-f input to the stator lug of the larger variable condenser section.)

Set the dial pointer at 160. Set the signal generator at 1600 kc and feed its output into a loop of wire about one foot in diameter. Hold this radiating loop about one foot away from and parallel to the receiver loop antenna. Advance the output of the generator until deflection is obtained on the output meter. Adjust first the oscillator trimmer (smaller section of variable condenser) then the antenna trimmer (larger section of variable condenser) for maximum response. Set the dial pointer at 60. Feed 600 kc and rock the variable condenser while adjusting the oscillator core adjustment for maximum response. Return to 1600 and check alignment. If re-adjustment is necessary return to 600 and repeat entire procedure.

SERVICE NOTES

MODEL: GC-448
CHASSIS MODEL: GC

GC-448

DESCRIPTION

1. The color coding of the i-f transformer leads is as follows:
Grid—green
Grid return—black
Plate—blue
B plus—red
2. The color coding of the battery cable is as follows:
Red—B plus, 67 1/2 volts
White—B minus
3. If replacements are made in the r-f section of the circuit, the receiver should be carefully realigned.
4. The receiver has a self-contained antenna and does not require additional antenna or ground connection.
5. The self-contained loop antenna operates at maximum efficiency when its position is at right angles to the broadcasting source. It is important, therefore, once the station is tuned in, rotate the cabinet back and forth through a quarter of a circle (90 degrees), leaving it at the position where the station is received with maximum volume.

BATTERY COMPLEMENT

The cabinet is designed to house the complete set of batteries. The battery complement should be as follows:
Type Battery
Number Required
1 1 1/2 volt "A"
67 1/2 volt "B"
Manufacturer's Part Number
Standard "D" size (1 1/8" diameter) flashlight cell
Eveready "Mini-max" No. 467

VOLTAGE ANALYSIS (Battery Operation)

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed are from point indicated to chassis with volume control turned on: full and no signal. The battery voltages for these readings were: "A" 1.5 volts, "B" 67.5 volts. All readings except filament were taken on the 250 volt scale.

Tube	Plate	Screen	Fil.
1R5	54	29	1.4
1T4	54	29	1.4
1S5	*4	—	1.4
3S4	51	54	1.4

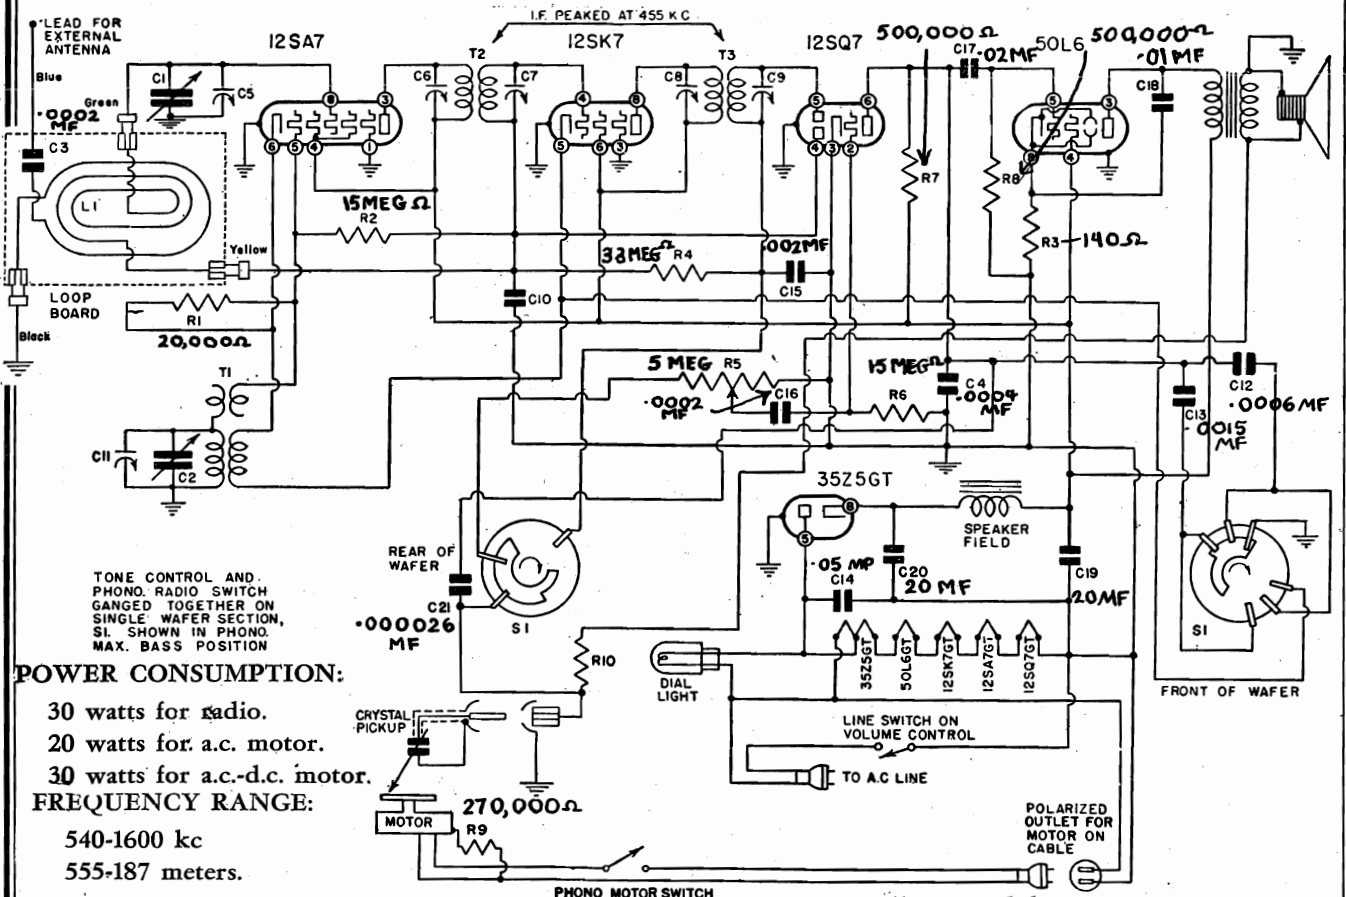

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (line switch) with filament and no signal. The battery voltages for these readings were 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	Plate	Screen	Fil.
1R5	72	39	1.4
1T4	72	39	1.4
1S5	*6	—	1.4
3S4	69	72	2.8

*The operating voltage of this tube cannot be measured because of the high resistor in the circuit. Voltage at 117Z4 cathode—125.

EMERSON RADIO & PHONOGRAPH CORP. MODELS GK450, Ch. GK; GK2-450, Chassis GK2

POWER CONSUMPTION:
 30 watts for radio.
 20 watts for a.c. motor.
 30 watts for a.c.-d.c. motor.
FREQUENCY RANGE:
 540-1600 kc
 555-187 meters.

R-f Alignment ADJUSTMENTS

Set the dial pointer at 140. Set the signal generator at 1400 kc and feed its output into a loop of wire about 12 inches in diameter. Hold this radiating loop about 12 inches from and parallel to the receiver loop antenna. Advance the output of the signal generator until deflection is obtained on the output meter. Adjust first the oscillator trimmer (on front section of variable condenser) then the antenna trimmer (on rear section of variable condenser) for maximum response.

If the loop antenna has been replaced it may be necessary to adjust the loop inductance as follows: Align at 140. Set the pointer at 60 and feed 600 kc to the antenna lead. A portion of the outside turn of the loop may be swung to either side of the center to give maximum response. Realign at 140.

- 1-12SA7, oscillator-modulator TYPE OF TUBES:
- 1-12SK7, i-f amplifier
- 1-12SQ7, diode detector, a-f amplifier and a.v.c.
- 1-50L6GT, beam power output
- 1-35Z5GT, half-wave rectifier

I-f Alignment
 Swing the variable condenser to the minimum capacity position. Feed 455 kc to the grid of the 12SA7 tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response.

Note: The grid of the 12SA7 tube is connected to the lower stator lug of the rear variable condenser section. Connection may be made with a test clip to the upper stator lug.

POWER SUPPLY: a.c. only. 60 cycle. (GK)
 a.c.-d.c. (GK2)

VOLTAGE RATING: 105-125 volts.

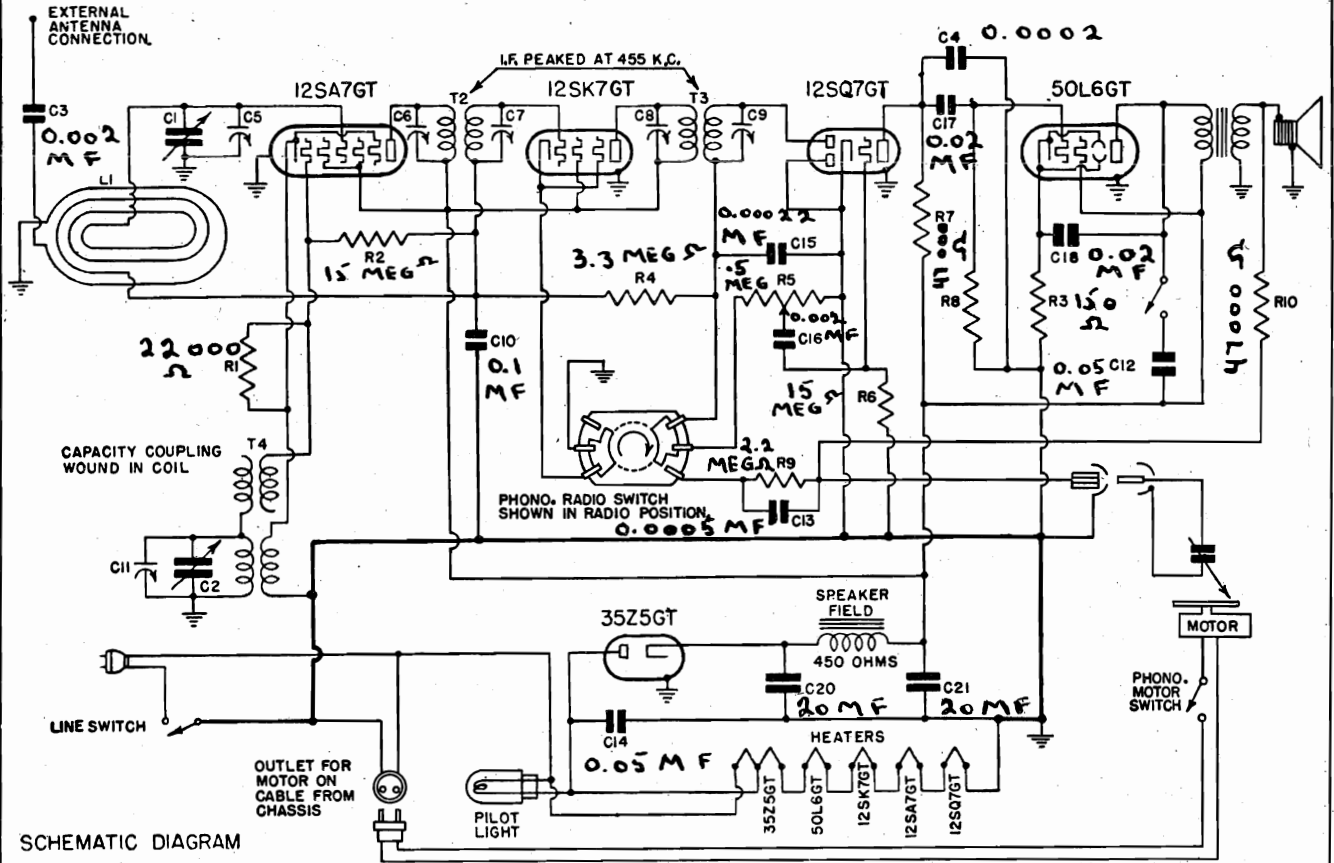

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (line switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

Voltage at 35Z5GT cathode—118 volts.

Tube	Plate	Screen	Cathode	Fil.
12SA7	75	85	0	12 a.c.
12SK7	85	85	0	12 a.c.
12SQ7	25	—	0	12 a.c.
50L6GT	75	85	6.6	50 a.c.

MODEL FZ452, Chassis EMERSON RADIO & PHONOGRAPH CORP.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (line switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale.

Tube	Plate	Screen	Cathode	Fil.
12SA7	88	88	0	12
12SK7	88	88	0	12
12SQ7	30	—	0	12
50L6	82	88	5.6	50

Voltage at 35Z5 cathode—120 volts.
 Voltage across speaker field—32 volts.
 Voltage across pilot light—4.5 volts.

I-f Alignment

Swing the variable condenser to the minimum capacity position. Feed 455 kc to the grid of the 12SA7 tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response.

Note: The grid of the 12SA7 tube is connected to the stator lug of the rear variable condenser section. Connection may be made with a test clip.

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck to the right of the variable condenser. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is mounted on top of the chassis between the variable condenser and the speaker. The trimmers are accessible through holes in the top of the can.

The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the oscillator coil.

The oscillator coil is located underneath the chassis. The loop antenna acts as the antenna coil.

R-f Alignment

Set the dial pointer at 140. Set the signal generator at 1400 kc and feed its output into a loop of wire about 12 inches in diameter. Hold this radiating loop about 12 inches from and parallel to the receiver loop antenna. Advance the output of the signal generator until deflection is obtained on the output meter. Adjust first the oscillator trimmer (on front section of variable condenser) then the antenna trimmer (on rear section of variable condenser) for maximum response.

If the loop antenna has been replaced it may be necessary to adjust the loop inductance as follows. Align at 140. Set the pointer at 60 and feed 600 kc to the radiating loop. A portion of the outside turn of the loop may be swung to either side of the center to give maximum response. Realign at 140.

TYPE OF TUBES:

- 1—12SA7, pentagrid oscillator-modulator
- 1—12SK7, first i-f amplifier
- 1—12SQ7, diode detector, a-f amplifier, a.v.c.
- 1—50L6, beam power output
- 1—35Z5, half-wave rectifier.

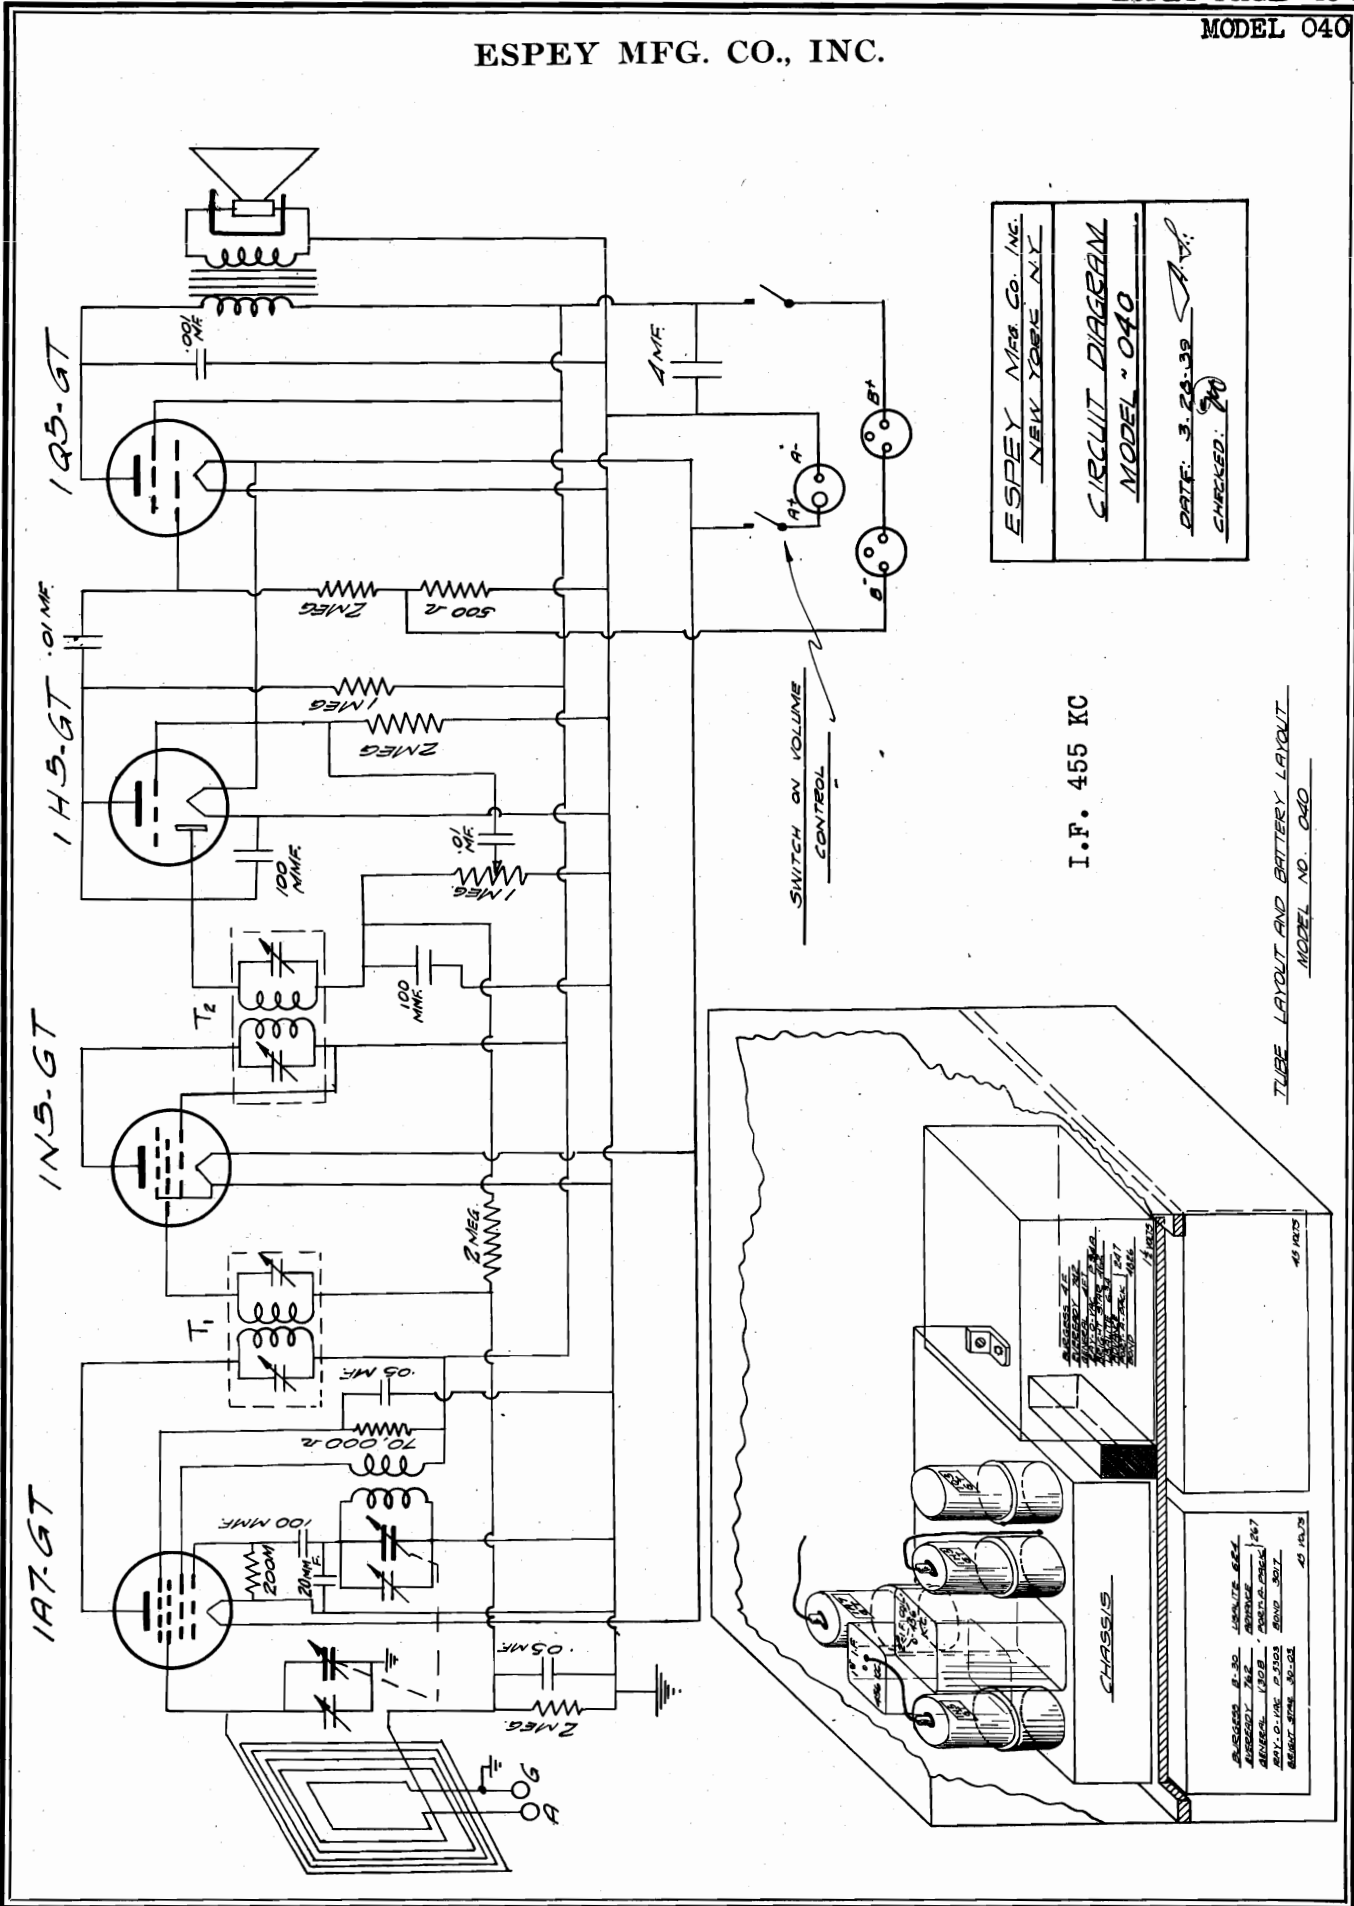

POWER SUPPLY: A.C. only.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION:

- 30 watts for receiver
- 15 watts for phono motor.

DIAL STRINGING

WHEN ALIGNING THE SHORT WAVE OSCILLATOR TIGHTEN THE ADJUSTING SCREW FOR MAXIMUM CAPACITY AND THEN LOOSEN IT UNTIL THE FIRST PEAK IS REACHED. DO NOT USE THE SIGNAL HEARD AT THE LOWER CAPACITY SETTING AS IN THIS RECEIVER THE OSCILLATOR WORKS AT A FREQUENCY LOWER THAN THE ONE THE R.F. IS TUNED TO. IF THE LOOP IS TUNED TO 9.0 Mc THE OSCILLATOR IS TUNED TO 8,545 Kc THAT IS SIGNAL FREQUENCY MINUS I.F. FREQUENCY, INSTEAD OF SIGNAL FREQUENCY PLUS I.F. FREQUENCY, OR 9,455 Kc AS IS CUSTOMARY.

BOTTOM VIEW OF SOCKETS

NOTES: ON D.C. VOLTAGE READINGS METER SHOULD HAVE AT LEAST 10 MEGOHMS INTERNAL RESISTANCE. D.C. VOLTAGE READINGS TAKEN WITH NO SIGNAL. REFER TO COMMON GROUND FOR D.C. VOLTAGES. LINE VOLTAGE - 117 A.C.

SCHEMATIC FOR MODEL BT-58

THIS SIX TUBE AC-DC OR FIVE TUBE BATTERY OPERATED PORTABLE RECEIVER HAS A BUILT IN LOOP ANTENNA. AN OUTSIDE ANTENNA MAY BE CONNECTED BY LOOSENING THE SCREW IN THE LOWER RIGHT HAND CORNER OF THE BACK COVER. A GROUND SHOULD BE CONNECTED TO THE SCREW IN THE LOWER LEFT HAND CORNER WHEN AN OUTSIDE ANTENNA IS USED.

ALIGNMENT

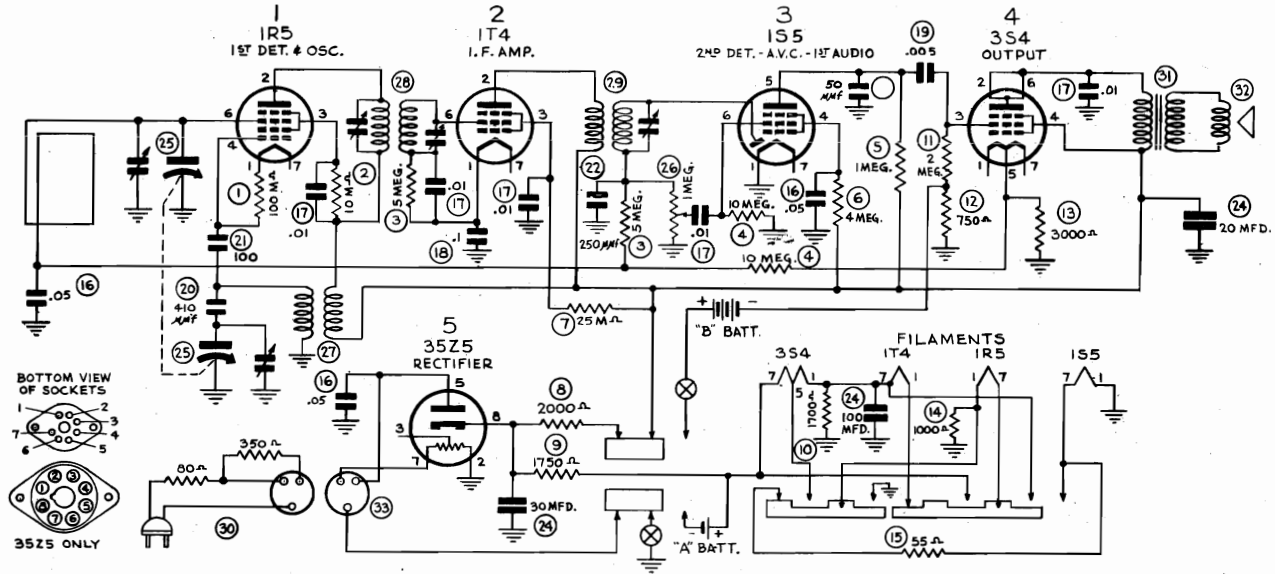

A SIGNAL GENERATOR CALIBRATED AT 455 Kc., 1400 Kc., AND 1730 Kc., IS NECESSARY TO PROPERLY ALIGN THIS RECEIVER. AFTER ALIGNING THE I.F. STAGES, REPLACE RECEIVER IN CABINET AND FASTEN LOOP IN NORMAL POSITION BEFORE ALIGNING THE R.F. END THROUGH THE OPENINGS IN THE END OF THE CABINET. THESE OPENINGS ARE CLOSED BY SNAP FASTENERS. THE OSCILLATOR TRIMMER IS NEAREST THE FRONT PANEL AND THE LOOP TRIMMER IS DIRECTLY BEHIND IT

STEPS	USE IN SERIES WITH GENERATOR	SET GENERATOR AT	SET GANG AT	ADJUST	LOCATED	TO OBTAIN

 This five tube AC-DC or four tube battery operated portable receiver has a built in loop antenna.

ALIGNMENT

A signal generator calibrated at 455 Kc., 1400 Kc., and 1600 Kc., is necessary to properly align this receiver. After aligning the I.F. stages, replace receiver in cabinet and fasten loop in normal position before aligning the R.F. The oscillator trimmer is nearest the front panel on the gang and the loop trimmer is directly behind it on the gang. When aligning this receiver it should be operated on the self contained batteries.

TUBE LAYOUT

WHEN ALIGNING THE SHORT WAVE OSCILLATOR TIGHTEN THE ADJUSTING SCREW FOR MAXIMUM CAPACITY AND THEN LOOSEN IT UNTIL THE FIRST PEAK IS REACHED. DO NOT USE THE SIGNAL HEARD AT THE LOWER CAPACITY SETTING AS IN THIS RECEIVER THE OSCILLATOR WORKS AT A FREQUENCY LOWER THAN THE ONE THE R.F. IS TUNED TO. IF THE LOOP IS TUNED TO 9.0 Mc THE OSCILLATOR IS TUNED TO 8,545 Kc THAT IS SIGNAL FREQUENCY MINUS I.F. FREQUENCY, INSTEAD OF SIGNAL FREQUENCY PLUS I.F. FREQUENCY, OR 9,455 Kc AS IS CUSTOMARY.

PUSH BUTTON SET UP

TO PREVENT THE BUTTONS FROM BEING SET UP ON THE WRONG STATION A SIGNAL GENERATOR SHOULD BE USED.

ADJUST THE LOWER SCREW FIRST AS THIS IS THE OSCILLATOR, UNTIL THE SIGNAL IS HEARD MOST CLEARLY (SEE FIG.). THEN ADJUST THE TRIMMER SCREW DIRECTLY ABOVE THE OSCILLATOR FOR MAXIMUM VOLUME.

EQUIPMENT AND PROCEDURE FOR ALIGNMENT

WHEN ALIGNING THIS RECEIVER A SIGNAL GENERATOR CALLIBRATED AT 455 Kc, 600 Kc, 1500 Kc, 1720 Kc, 9.5 Mc, 12 Mc, AND 12.1 Mc, ALSO AN OUTPUT INDICATOR ARE REQUIRED. ALL ADJUSTMENTS SHOULD BE MADE WITH THE VOLUME CONTROL SET FOR MAXIMUM VOLUME, KEEPING THE GENERATOR OUTPUT AS LOW AS POSSIBLE TO PREVENT A.V.C. ACTION AND FALSE READINGS. BEFORE RE-ALIGNING THE SET BE SURE ALL ADJUSTING SCREWS FOR THE IRON CORE OSCILLATOR COILS ARE FLUSH WITH OR INSIDE THE CHASSIS BASE.

CONNECT THE LOW SIDE OF THE SIGNAL GENERATOR TO THE TERMINAL MARKED G. (GROUND), AND THE HIGH SIDE OF THE GENERATOR TO THE TERMINAL MARKED A. (ANTENNA). (SEE FIG.A).

CAUTION--OFTEN TWO PEAKS ARE FOUND AT 12.1 Mc. USE THE ONE FOUND AT THE MAXIMUM SETTING OF THE OSCILLATOR TRIMMER.

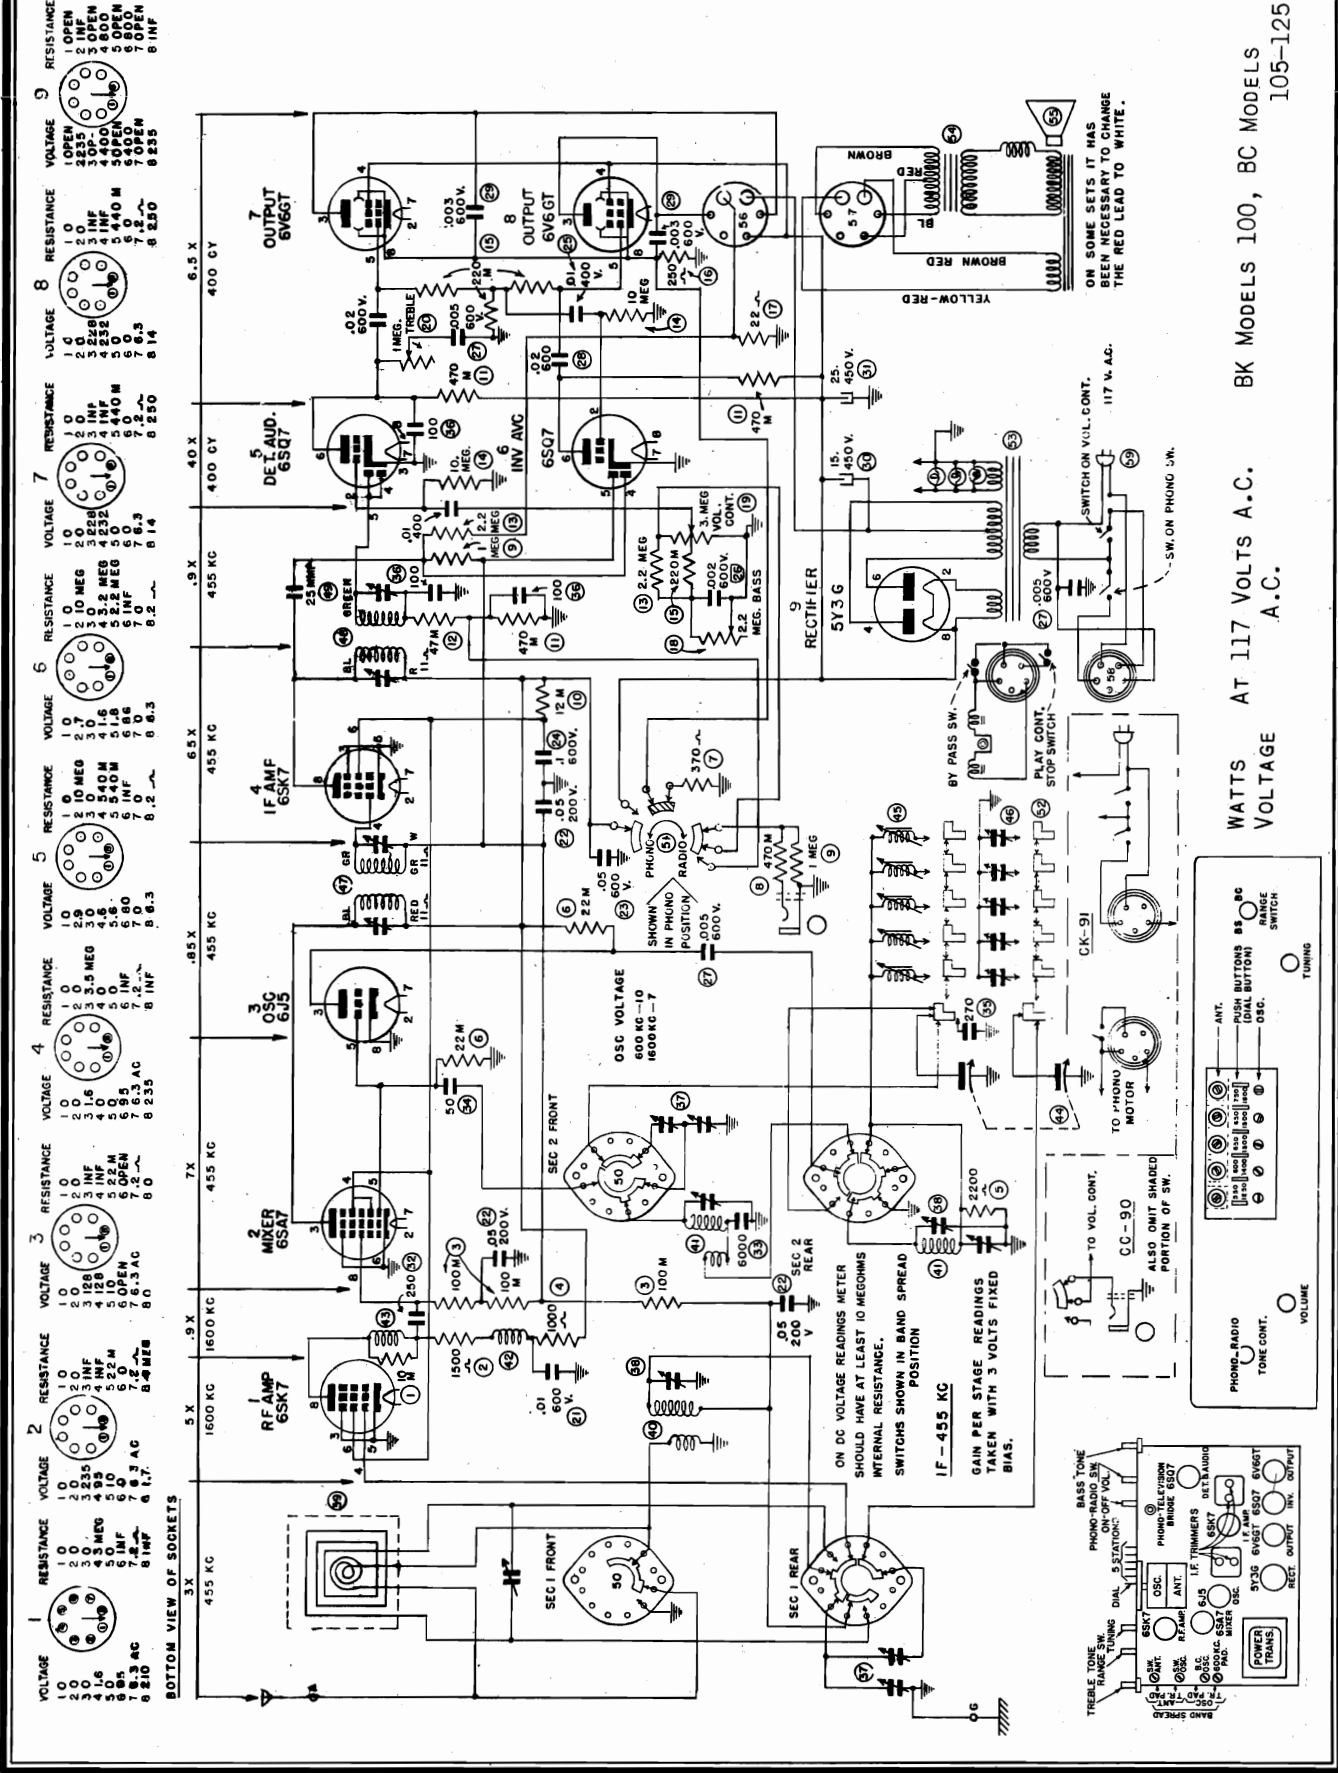

CAUTION--BE SURE AND REMOVE THE DIAL POINTER BEFORE REMOVING THE SET FROM THE CABINET.

After pointer has been set on BC and calibrations checked, with range switch on Band Spread (Full CCW) set condenser so pointer is on 12 MC on "Foreign Spread Band." Set "Spread Band" Osc. trimmer for maximum output. Check for image on 11.1 Mc. (A weakened signal should be heard). Align antenna Band Spread trimmer for maximum signal. Turn condenser so pointer is on 9.5 Mc. adjust Spread Band Osc. padder for maximum signal. Check for image. (NO signal should be heard on 10.4 Mc). Align Antenna Band Spread padder for maximum signal. Go back to 12 Mc and repeat above. If much readjustment has to be made on trimmers, the padders must be checked again. Great care must be taken in adjusting Band Spread trimmers. Image must be checked. A fibre screwdriver must be used to adjust band spread.

*Tighten oscillator trimmer screw for maximum capacity, then unscrew until second peak is secured.

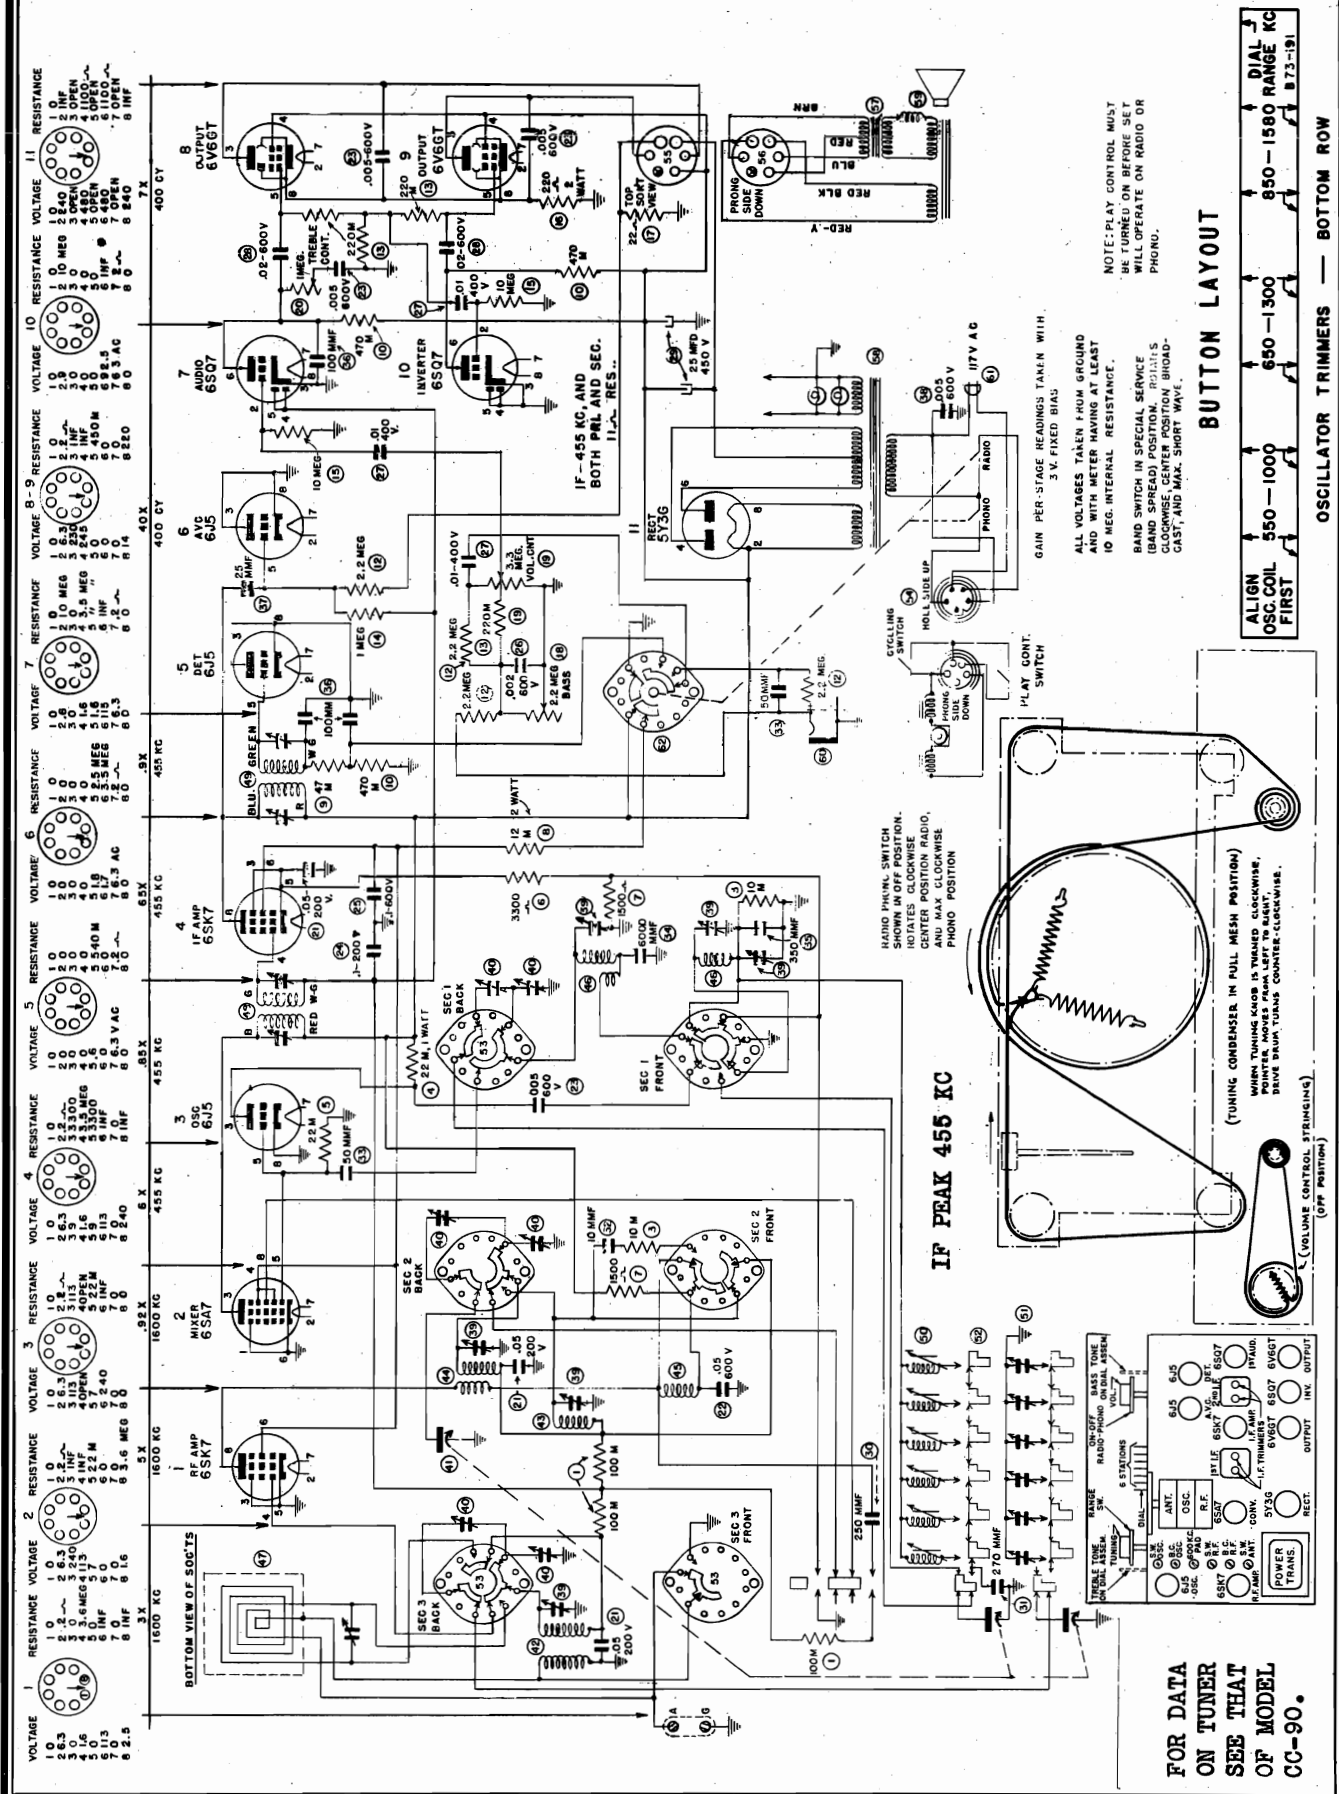

**Tighten R.F. trimmer screw for maximum capacity, then unscrew until first peak is secured.

NOTE A. Set gang at minimum.

NOTE B. Strongest signal and rock gang.

ALIGNMENT INSTRUCTIONS

AN OUTPUT METER AND A SIGNAL GENERATOR ARE REQUIRED FOR PROPER ALIGNMENT OF THESE SETS. THE OSCILLATOR SHOULD BE CALIBRATED AT THE FOLLOWING POINTS, 455 Kc, 600 Kc, 900 Kc, 1500 Kc, 1720 Kc, 9.5 Mc, 12 Mc, 16 Mc AND 18.1 Mc. ALWAYS KEEP THE OUTPUT OF THE SIGNAL GENERATOR AS LOW AS POSSIBLE TO PREVENT A.V.C. ACTION AND FALSE SETTINGS. CONNECT THE HIGH SIDE OF THE GENERATOR TO THE ANTENNA TERMINAL AND THE LOW SIDE OF IT TO THE GROUND TERMINAL MAKING CERTAIN JUMBER ON TERMINAL STRIP IS DISCONNECTED. BEFORE ALIGNING TIGHTEN WAVE TRAP TRIMMER SCREW.

TABULATION FOR ALIGNMENT

WATTS AT 117 VOLTS A.C. 25
 VOLTAGE A.C. 105-125

This six tube AC-DC or five tube battery operated portable receiver has a built in loop antenna. To connect an external antenna and ground remove the screws in the back of the cabinet then remove the back. The external antenna and ground may now be connected to the two wires at the top side of the cabinet. Try reversing the connections of the two wires to obtain best results.

ALIGNMENT

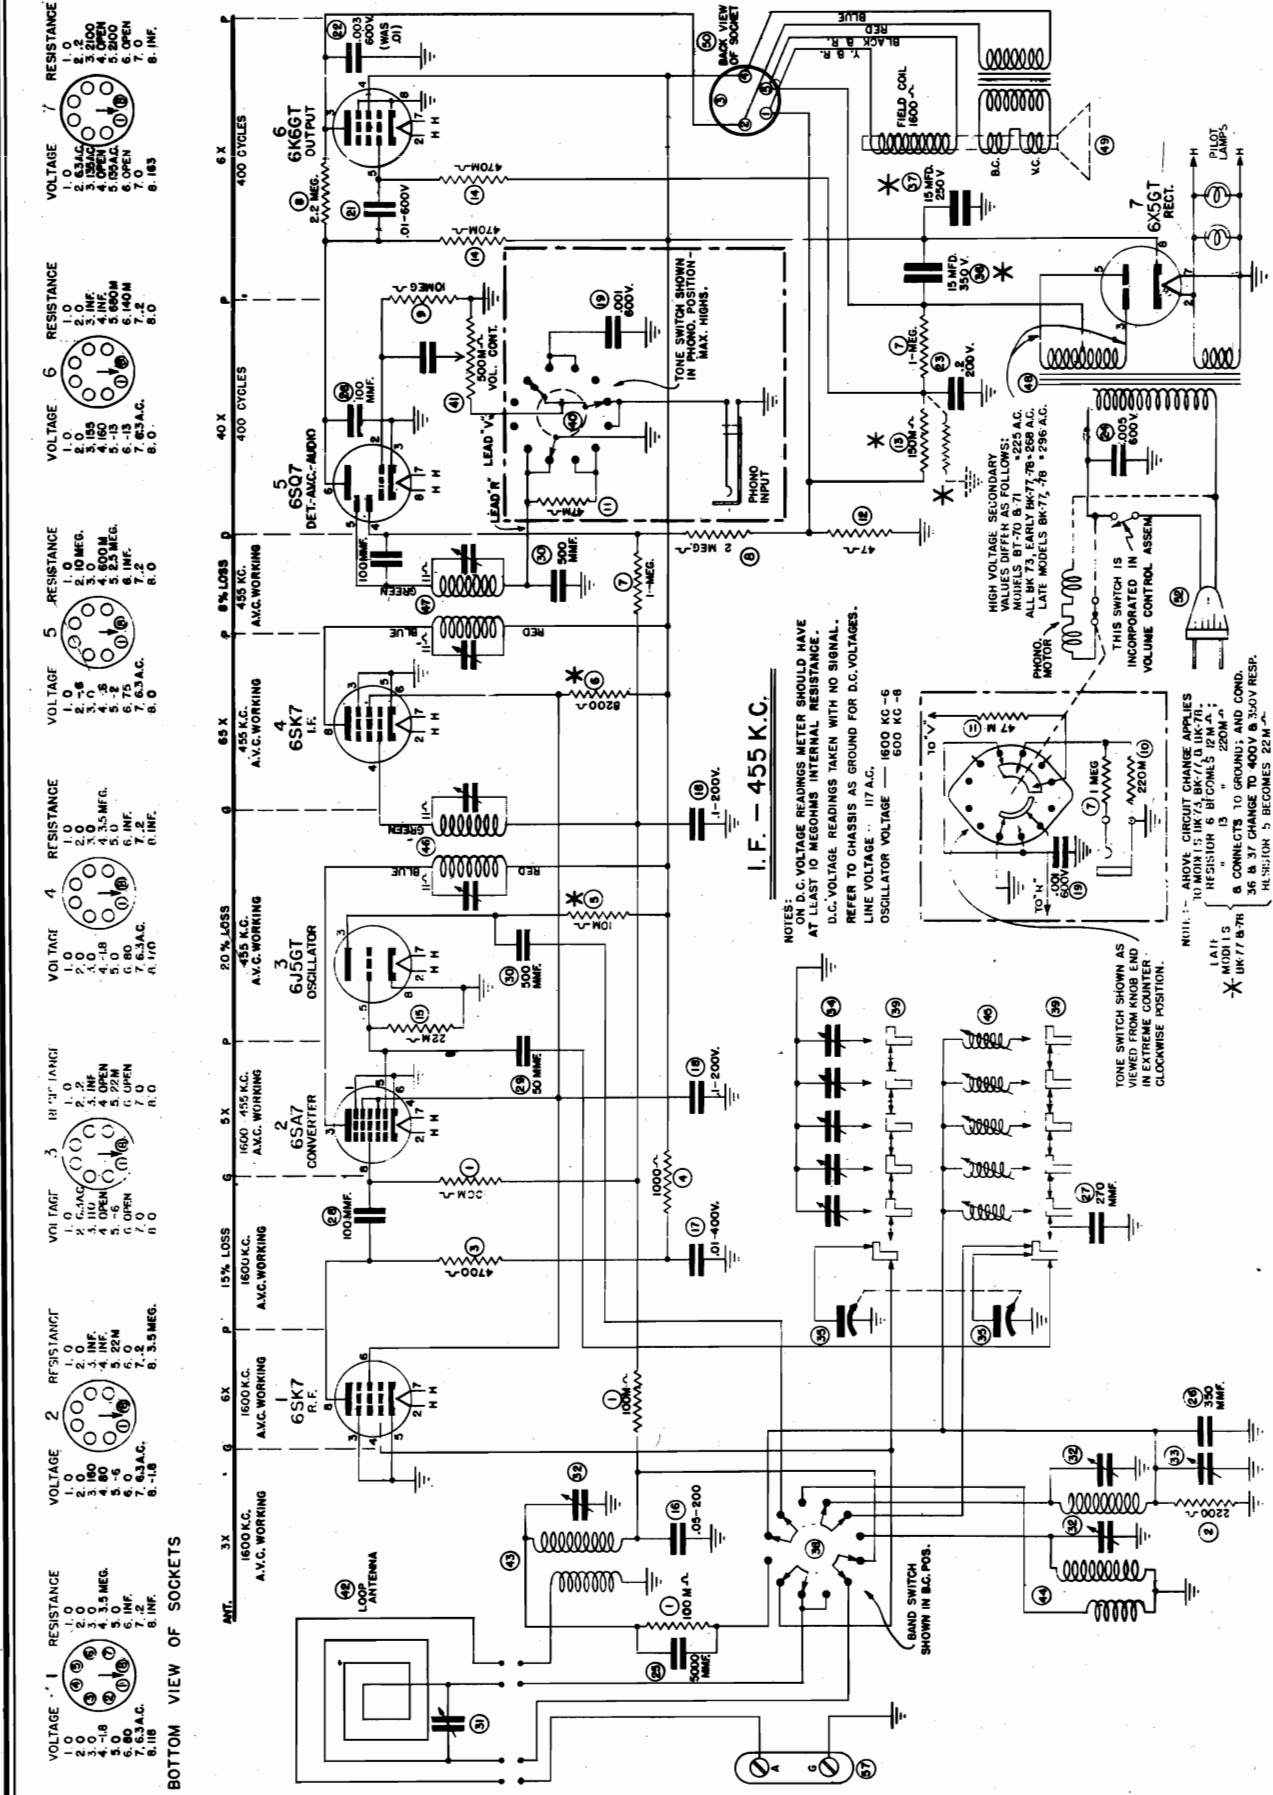

The alignment of this receiver requires the use of a signal generator that will cover the frequencies of 455, 1400 and 1600 Kc., and an output meter connected across the secondary of the output transformer. All alignments should be made with the set operating on the self-contained batteries.

PUSH BUTTON SET UP

TO PREVENT THE BUTTONS FROM BEING SET UP ON THE WRONG STATION A SIGNAL GENERATOR SHOULD BE USED. ADJUST THE LOWER SCREW FIRST AS THIS IS THE OSCILLATOR, UNTIL THE SIGNAL IS HEARD MOST CLEARLY (SEE FIG.). THEN ADJUST THE TRIMMER SCREW DIRECTLY ABOVE THE OSCILLATOR FOR MAXIMUM VOLUME.

ALIGNMENT PROCEDURE

SET DIAL TO	GENERATOR FREQUENCY	DUMMY ANTENNA	ADJUSTMENTS (IN ORDER SHOWN)	TRIMMER FUNCTION
540 kc	455 kc	.1 mfd.	T2, T1	IF
600 kc	455 kc	.1 mfd.	C14*	IF Wave Trap
Highest Frequency	1600 kc	.0001 mfd.	VC-2	Osc.
600 kc	600 kc	.0001 mfd.	C4	Shunt Coil
1400 kc	1400 kc	.0001 mfd.	VC-1	Transl. & Ant.

IMPORTANT ALIGNMENT NOTES

*The signal generator should be adjusted for high output and the trimmer should be adjusted for minimum response.

The alignment procedure should be repeated in the original order, step by step, to insure greater accuracy.

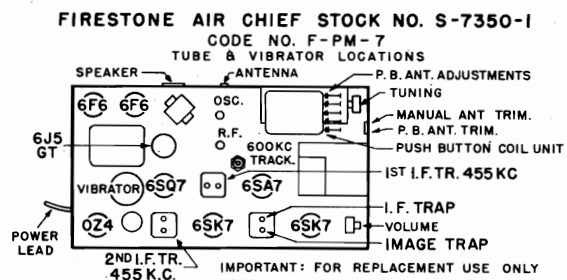

Always keep the output power from the generator at its lowest possible value to prevent AVC of the receiver from interfering with accurate alignment, except as noted by (*) above.

To adjust image rejector, return set to button #5. Set generator to 1500 kc and adjust #5 button for maximum signal at 1500 kc.

THE GENERATOR CHARGING RATE

Unless the car has an automatic voltage regulator, it is usually necessary to advance the generator charging rate to compensate for

the additional drain of the radio. Under no conditions should the rate be increased beyond that specified by the manufacturer as the safe limit.

the additional drain of the radio. Under no conditions should the rate be increased beyond that specified by the manufacturer as the safe limit.

MODEL S7350-1

FIRESTONE TIRE & RUBBER CO.

MODEL S7350-1
MODEL S7398-2

SETTING UP THE MONOMATIC TUNING MECHANISM:

Make a list of the five stations for which you desire Monomatic tuning. The stations chosen must be such that each will come within a different frequency range, as indicated by the following list. For example, it would not be possible to choose both a 550 kc station and a 600 kc station, since 600 kc does not come within the range of position #2. Arrange the stations, in order of their frequency; that is, the station of lowest frequency will be #1; of next higher frequency, #2, etc.

STATION	FREQUENCY RANGE
#1	540 to 920 kc
#2	630 to 1070 kc
#3	690 to 1170 kc
#4	850 to 1450 kc
#5	920 to 1570 kc

Operate the Monomatic button (marked "Push") until the dial becomes illuminated, indicating that the receiver is adjusted for Dial Tuning. Then tune your #1 station, using the Station Selector knob.

Operate the Monomatic button until the #1 station indicator (furtherest left of the station indicators) becomes illuminated.

Turn the knob, located on the side of the set, see Figure 2, which has the range 540-920 kc indicated below it, until the desired station is heard at maximum volume.

TO SET UP THE BUTTONS FOR AUTOMATIC TUNING:

1. Turn the set on and allow it to operate at least fifteen minutes before attempting to set up the buttons.
2. Make a list of the frequencies of five nearby stations to which you wish to set up the buttons. Be sure to select the most powerful nearby stations, since weak signals will not give as satisfactory results.
3. Turn the set around so that the back of the set is facing you and remove the cabinet back.
4. Just behind the dial plate, when viewed from the rear, will be seen ten push button adjusting screws (see Fig. 1). These screws are used to tune in the stations that the buttons are to be set to.

5. Each of the push buttons can be made to tune in stations in a definite frequency range as shown in Fig. 1.
Buttons No. 1 and 2 may be set up to any station which operates between 540 and 1000 KC. in frequency. Buttons No. 3 and 4 may be set up to stations operating between 750 and 1375 KC., while button No. 5 may be set up to stations operating between 980 and 1600 KC. **ALWAYS TRY TO SELECT THE BUTTON WHICH CAN BE SET UP TO A STATION WHOSE FREQUENCY IS WELL WITHIN THE BUTTON'S OPERATING RANGE.**

6. Turn the band switch to the "AM" position, push in the button labeled "MANUAL," then using the tuning knob (see Fig. 1) tune in the station you wish to set to button No. 1.
7. Push in button No. 1 and using a screwdriver, turn adjusting screw No. 1a (the extreme right hand screw) until the station you had previously tuned in is again heard. If it is not heard, advance the volume control and adjust the screw again. Be sure to adjust screw No. 1a to the point where the program is heard with the deepest tone.
8. Insert the screwdriver in screw No. 1b (just to the left of, and behind, 1a) and turn it until the program is heard with the maximum volume. Check the setting of screw No. 1a, making sure it still is adjusted to give deepest tone.
9. The set-up for button No. 1 is now complete.
10. To set up the remaining buttons use the same procedure; push in the "MANUAL" button; tune in the station, using the tuning knob; push in the button to be set up; adjust its associated "a" adjusting screw until the station is tuned in (screw 2a for button No. 2, etc., see Fig. 1); the associated "b" screw is then adjusted for maximum volume.
11. Call letter tabs which may be used to label the buttons are provided with your radio. They fit in the small space above each push button.
12. To use push buttons at any time, turn the band switch to the "AM" position and push the proper button.

Return to Manual then tune in your #2 station on the dial, then operate the Monomatic button until the #2 indicator becomes illuminated. Then proceed to adjust the knob for this station in the same manner as just done for the #1 station.

Proceed in the same manner for the remaining stations on your list. Insert the proper call letter, cut from the sheets supplied, in the indicator button slots.

After setting button #5 the antenna should be matched by adjusting the screw marked P.B. Antenna Trimmer in Fig. 2, as #7. This screw is covered by a 'snap button. Slowly turn this screw until maximum volume is secured.

After this adjustment is made, it is recommended that all the buttons be re-checked for maximum response.

After this re-check is completed, it is necessary to adjust the manual antenna trimmer, see Fig. 2, #6. The adjusting screw for this is accessible after removing the snap button. Return the set to dial tuning, turn the manual tuning control until a station near 1400 kc is heard then adjust this screw for maximum volume.

Be sure to replace snap buttons after completing these adjustments.

SOCKET VOLTAGES

NOTE A: The bias for the control grid of the 1A5GT tube is -5 volts measured across resistors 13 & 20.
NOTE B: Due to the high resistance of plate resistor NO. 10 only a slight deflection will be obtained when using a meter having a resistance of 1000 ohms per volt.

VOLTAGE TABLE
(BOTTOM VIEW OF SOCKETS)

SYM.	DESCRIPTION
F	FILAMENT
H	HEATER
RP	RESISTOR
P	PLATE
DP	DIODE PLATE
SG	SCREEN GRID
SA	SCREEN GRID
S	SCREEN
K	CATHODE
NC	NO CONNECTION

NOTE - ALL VOLTAGES EXCEPT FILAMENTS ARE MEASURED FROM SOCKET CONTACTS
FILAMENT VOLTAGES ARE MEASURED FROM SOCKET CONTACTS
FILAMENT VOLTAGES ARE MEASURED DIRECTLY ACROSS SOCKET CONTACTS.
VOLTAGES SHOWN IN CIRCLES PERTAIN ONLY TO 117 V. AC OR DC OPERATION.
* AC EXCEPT WHEN SET IS USED ON DC.

Set receiver dial to:	Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:
Any point where no interfering signal is received.	Exactly 455 K. C.	0.2 Mid. condenser	High side to lug on stator of gang condenser to which loop lead is connected.
1 Exactly 1550 K.C.	Exactly 1550 K.C.	None	Use Small Loop to couple test oscillator to receiver loop.
2 Approx. 1400 K.C.	Approx. 1400 K.C.	None	Use Small Loop to couple test oscillator to receiver loop.

ALIGNMENT PROCEDURE

Refer to parts layout diagram for location of trimmers mentioned below:

Adjust each of the second I.F. transformer trimmers for maximum output, then adjust each of the first I.F. transformer trimmers for maximum output.

Adjust 1550 K. C. oscillator trimmer for maximum output.

While rocking gang condenser adjust 1400 K. C. loop trimmer for maximum output.

MODEL S7397-1
MODEL S7397-2(443)

Model S-7391-1

FIRESTONE TIRE & RUBBER CO.

IMPORTANT: BEFORE ALIGNING, PLACE LOOP ANTENNA AND BATTERIES IN THE SAME POSITION THEY WILL BE IN WHEN THE SET IS IN THE CABINET. -- When adjusting 1550 kc. oscillator trimmer and 1400 kc. antenna trimmer, do not connect test oscillator to loop. Couple test oscillator to receiver loop by:
(a) Make a loop consisting of five to ten turns of No. 20 to 30 size wire wound on a three inch form and attach a cross output of test oscillator, (b) Place test oscillator loop near set loop -- **BE SURE THAT NEITHER MOVES WHILE ALIGNING.**

ALIGNMENT PROCEDURE

Model S-7397-2

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, (3) third.

Before starting alignment, check tuning dial adjustment by: turn gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial indicator must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move needle to correct position.

Use an accurately calibrated test oscillator with some type of output measuring device.

BEFORE ALIGNING, PLACE LOOP ANTENNA AND THE BATTERY IN THE SAME APPROXIMATE POSITION IN THE BACK OF CHASSIS THAT THEY WILL BE IN WHEN THE SET IS IN THE CABINET AND THE CABINET BACK CLOSED.

AS THE DIAL SCALE PARTIALLY COVERS THE I.F. TRIMMER, IT IS NECESSARY TO REMOVE DIAL SCALE FROM FRAME ON WHICH IT IS MOUNTED BY REMOVING THE STUDS THAT HOLD SCALE IN PLACE WHEN ALIGNING I.F. TRANSFORMERS.

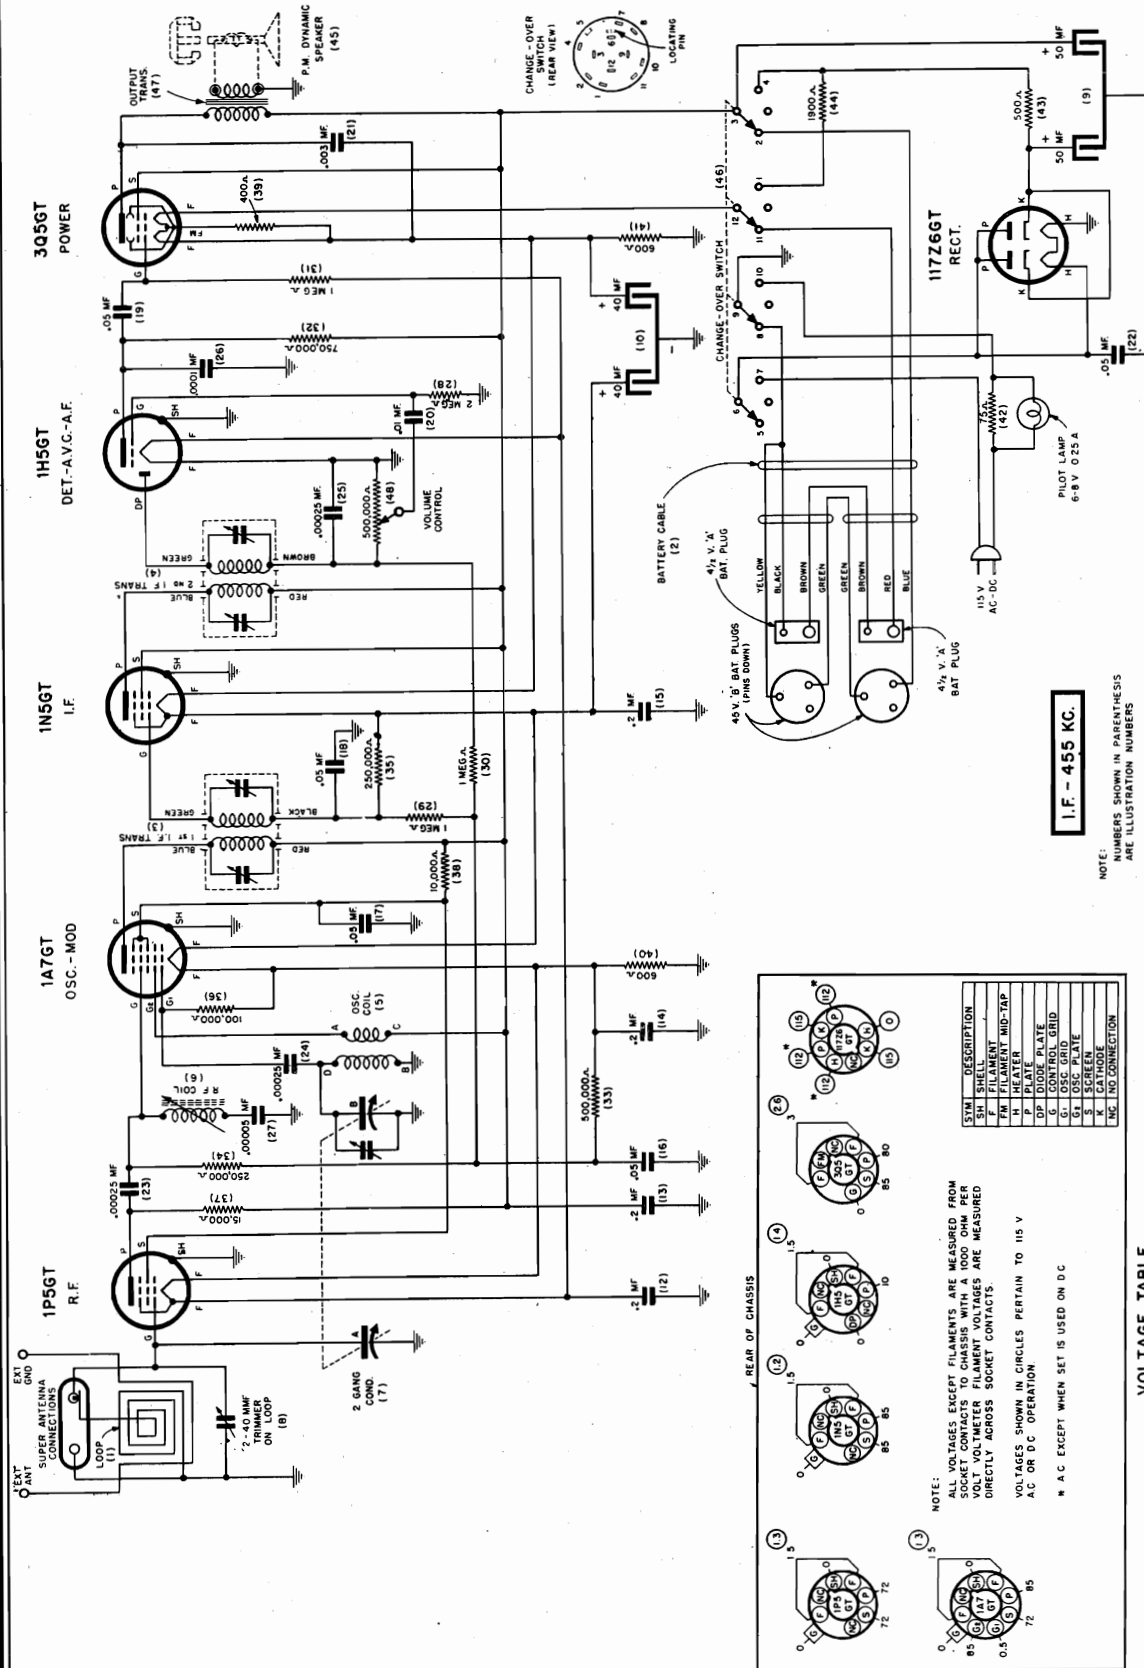

When adjusting 1600 kilocycle oscillator trimmer 600 K.C. padder, 455 K.C. R.F. trimmer and 1400 kilocycle antenna trimmer, do not connect test oscillator to loop. Couple test oscillator to receiver loop by: (a) Make a loop consisting of five to ten turns of No. 20 to 30 size wire wound on a three inch form and attach across output of test oscillator. (b) Place test oscillator loop near set loop—**BE SURE THAT NEITHER MOVES WHILE ALIGNING.**

Set receiver dial to:	TEST OSCILLATOR			Refer to parts layout diagram for location of trimmers mentioned below:
	Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	
Any point where no interfering signal is received.	Exactly 455 K.C.	0.2 Mfd. condenser	High side to grid cap of 1A7GT tube. Low side to frame of gang condenser.	Adjust each of the second I.F. transformer trimmers for maximum output, then adjust each of the first I.F. transformer trimmers for maximum output.
1 Rotate gang condenser to Maximum Capacity	Exactly 455 K.C.	None	Use Small Loop to couple test oscillator to receiver loop.	Adjust R.F. coil for minimum 455 K. C. signal.
2 Exactly 1730 K.C.	Exactly 1730 K.C.	None	Use Small Loop to couple test Oscillator to receiver loop.	Adjust 1730 K.C. oscillator trimmer for maximum output.
3 Approx. 1400 K.C.	Approx. 1400 K.C.	None	Use Small Loop to couple test Oscillator to receiver loop.	While rocking gang condenser adjust 1400 K.C. loop trimmer for maximum output.

MODEL S7397-2(443)

NOTE: ALL VOLTAGES EXCEPT FILAMENTS ARE MEASURED FROM SOCKET CONTACTS TO CHASSIS WITH A 1000 OHM PER VOLT METER. FILAMENT VOLTAGES ARE MEASURED DIRECTLY ACROSS SOCKET CONTACTS.

VOLTAGES SHOWN IN CIRCLES PERTAIN TO 115 V AC OR DC OPERATION

* A.C. EXCEPT WHEN SET IS USED ON D.C.

VOLTAGE TABLE (BOTTOM VIEW OF CHASSIS)

THIS RECEIVER CAN BE OPERATED EITHER WITH DRY BATTERIES OR FROM 110-120 VOLT DIRECT CURRENT OR 50-60 CYCLE ALTERNATING CURRENT. Thus the set may be operated on farms, in summer camps, hunting lodges, auto trailers, boats, or in any isolated districts where electric service is not available by using batteries. Where 110-120 volt direct current or 50-60 cycle alternating current is available, the radio may be operated direct from the electric lines without using the battery or making any change in the receiver.

When the Power Switch is in the AC-DC position the batteries are entirely disconnected and the set receives all its power from the AC or DC electric line.

FIRESTONE TIRE & RUBBER CO.

MODEL S7397-2
Code A-377

FOR PARTS LIST SEE NEXT PAGE

WARNING: THE ADJUSTMENTS DESCRIBED ON THIS PAGE ARE TO BE MADE BY A QUALIFIED SERVICE MAN ONLY. IF THESE ADJUSTMENTS ARE TAMPERED WITH BY ANYONE ELSE THE WARRANTY IS VOID.

ALIGNMENT PROCEDURE

FOR ALIGNMENT an output meter and an accurately calibrated signal generator are required.

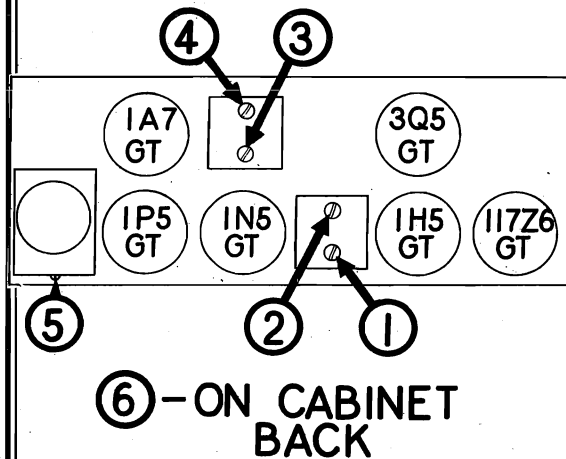

1. Connect the output meter across the voice coil or between the plate of the 3Q5GT output tube and ground through a 0.1 Mfd. condenser, depending on the type of meter. (The more sensitive type should be connected across the voice coil.)
2. Connect the ground lead of the signal generator through a .1 Mfd. condenser to the chassis.
3. Turn the volume control to the maximum volume position and keep it in this position while aligning.
4. With the gang condenser in full mesh, set the dial pointer to the low frequency end of the dial scale.

Dummy Ant. in Series with Sig. Gen.	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment

MODEL S7397-2

Code A-377

FIRESTONE TIRE & RUBBER CO.

INSTALLATION OF BATTERIES

BATTERIES USED

Quantity	Rating	Firestone Stock Number
2	4½ Volt "A"	E-1526-7
2	45 Volt "B"	E-1526-8

These batteries are placed on their sides in the bottom compartment of the cabinet as shown on page two of this booklet and on the label at the rear of the chassis. After plugging the four-pronged plug on the battery cable into the socket on the rear of the chassis, plug the two three-prong plugs on the battery cable into the sockets on the ends of the "B" batteries and the two two-prong plugs into the sockets on the ends of the "A" batteries. The four prong plug on the opposite end of the battery cable must be plugged into the socket on the rear of the chassis before connecting the batteries.

1I7Z6GT	Rectifier	111 A.C.	121	VOLTAGE ON P ₁ & P ₂ = 111 VOLTS A.C.					

NOTE A: Voltage on these elements is 1.4 volts measured across filament of 1H5GT.

NOTE B: Voltage on the grid of the 1N5GT I.F. cannot be measured with a standard voltmeter. Use a voltmeter of 1,000 ohms per volt.

FIRESTONE TIRE & RUBBER CO.

Voltages shown on the circuit diagram are from socket terminals to ground buss. In measuring voltages use a voltmeter having a resistance of at least 1000 ohms per volt. Allowances should be made for variations in line voltage.

ALIGNMENT DATA AND SERVICING

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT, THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400 and 1720 KC and an output meter to be connected across the primary and secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I. F. ALIGNMENT. With the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. con-

denser. The ground on the test oscillator should be connected to the ground buss, indicated in circuit diagram. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Remove the chassis from the cabinet and set on a bench, taking care that no metal is near the loop. Do not make this setup on a metal bench.

Connect the test oscillator to the antenna of the set through a 200 mmfd. (.0002) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1720 KC, and adjust the oscillator (or 1720 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

MODEL S7398-3

FIRESTONE TIRE & RUBBER CO.

ALIGNMENT EQUIPMENT & PROCEDURE

FOR ALIGNMENT: An output meter and an accurately calibrated signal generator are required.

1. Connect the output meter across the voice coil or between the plate of the 35L6GT output tube and the cathode of the 12SQ7 through a .1 mfd. condenser. (The more sensitive type of meter should be connected across the voice coil.)
2. Connect the ground lead of the signal generator to B— through a .25 mfd. condenser. If oscillation is encountered try dressing leads and changing point of connection to B—.
3. Volume control in maximum position. Weak signal input.

Dummy Ant. in Series with Sig. Gen.	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Band Switch Position	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
.1 MFD. Condenser	Lug on Rear Section of Gang Cond.	455 KC	American	Any Point Where It Does Not Affect the Signal	1-2	3rd I.F.	Adjust for Maximum Output. Then repeat Adjustment.
					3-4	2nd I.F.	
					5-6	1st I.F.	
400 OHM Carbon Resistor	Antenna Terminal (Blue Wire)	16 MC	Foreign	16 MC	7	Foreign Oscillator	Adjust for Maximum Output. Check to see if Proper Peak was Obtained by Tuning in Image at Approx. 15.1 MC. If Image does not appear, Realign at 16 MC, with Trimmer Screw farther out. Recheck Image.
400 OHM Carbon Resistor	Antenna Terminal (Blue Wire)	16 MC	Foreign	Tune to 16 MC Generator Signal	8	Foreign Antenna	Adjust for Maximum Output. Try to Increase Output by Detuning Trimmer and Retuning Receiver Dial until Maximum Output is Obtained.
200 MMFD. Mica Condenser	Antenna Terminal (Blue Wire)	1500 KC	American	1500 KC	9	Broadcast Oscillator (Shunt)	Adjust for Maximum Output.

Now replace the chassis and loop antenna in the cabinet before proceeding further.

200 MMFD. Mica Condenser	Antenna Terminal (Blue Wire)	1500 KC	American	Tune to 1500 KC Generator Signal	10	Broadcast Antenna	Adjust for Maximum Output.
200 MMFD. Mica Condenser	Antenna Terminal (Blue Wire)	600 KC	American	Tune to 600 KC Generator Signal	11	Broadcast Oscillator (Series)	Adjust for Maximum Output. Try to Increase Output by Detuning Trimmer and Retuning Receiver Dial until Maximum Output is Obtained.

Voltages shown on the circuit diagram are from socket terminals to ground buss. In measuring voltages use a voltmeter having a resistance of at least 1000 ohms per volt. Allowances should be made for variations in line voltage.

ALIGNMENT PROCEDURE

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400 and 1720 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I. F. ALIGNMENT. With the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. con-

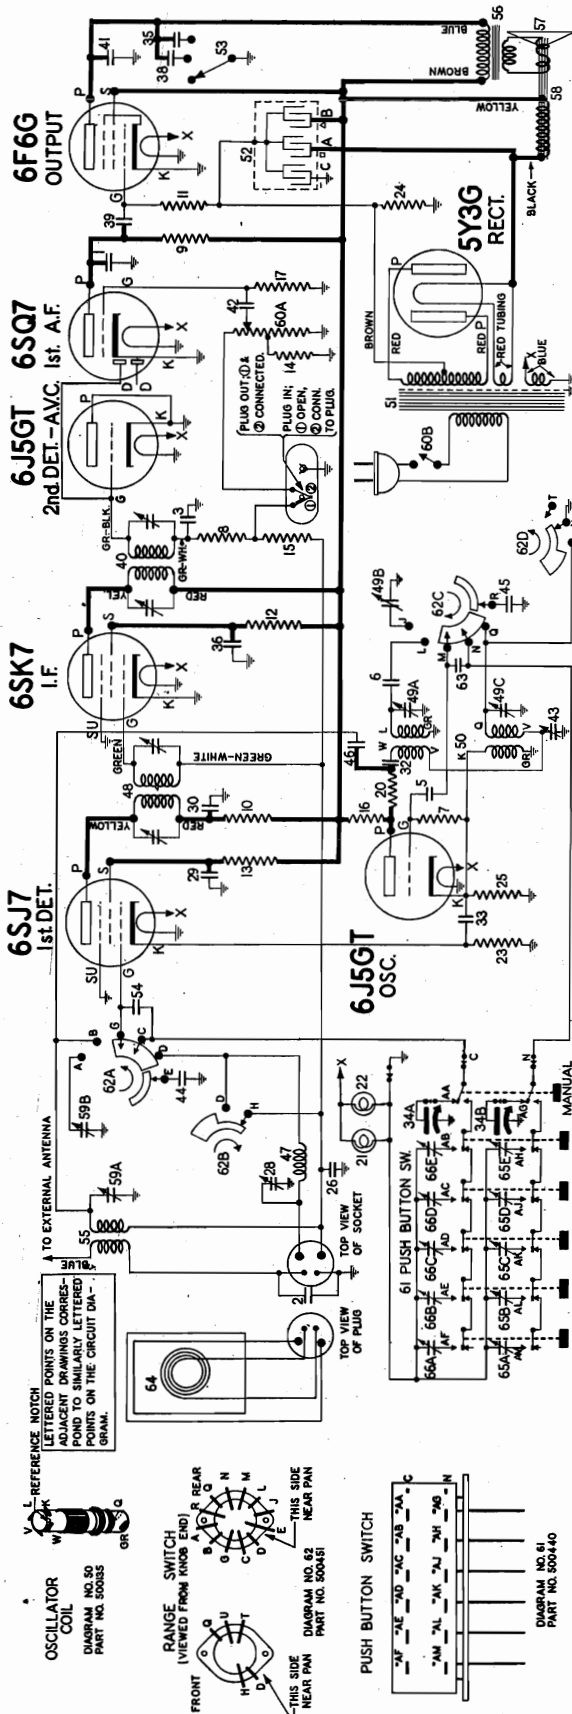

denser. The ground on the test oscillator should be connected to the ground buss, indicated in circuit diagram. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Remove the chassis from the cabinet and set on a bench, taking care that no metal is near the loop. Do not make this setup on a metal bench.

Connect the test oscillator to the antenna of the set through a 200 mmfd. (.0002) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1720 KC, and adjust the oscillator (or 1720 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

TUNING RANGE

This receiver is designed to operate over the standard broadcast band which extends from 535 to 1720 Kilocycles (KC) (174 to 560 Meters) and includes the popular 1712 KC police channel.

SOCKET VOLTAGES

Volume on Full with no Signal

NOTE A: Grid voltage on the 6F6G output tube is —17 volts measured across resistor No. 24. Use a high resistance voltmeter of 1000 ohms per volt.

INTERMEDIATE FREQUENCY 455 KC

FIRESTONE TIRE & RUBBER CO.

ALIGNMENT EQUIPMENT & PROCEDURE

THIS RECEIVER MAY BE ALIGNED IN THE CABINET WITH LOOP CONNECTED

1. Connect the output meter across the voice coil or from the plate of the 6F6G output tube to chassis through a .1 mfd. condenser.
2. Connect the ground lead of the signal generator to the receiver chassis.
3. Make sure that the wires coming from the chassis and push button switch are connected as shown in the figure below.
4. Push in the "manual" button and keep it pushed in. Check the pointer to see that it is correctly set to 540 KC. with gang in full mesh.
5. Turn the volume control to the maximum volume position, and the tone control to the "speech" position.
6. FOLLOW THE ORDER OF ALIGNMENT INDICATED BELOW

Dummy Ant. in Series with Sig. Gen.	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Band Switch Position	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment

FIRESTONE TIRE & RUBBER CO.

TO SET UP THE BUTTONS FOR AUTOMATIC TUNING: FOR ALL MODELS

1. Turn the set on and allow it to operate at least fifteen minutes before attempting to set up the buttons.
2. Make a list of the frequencies of five nearby stations to which you wish to set up the buttons. Be sure to select the most powerful nearby stations, since weak signals will not give as satisfactory results.
3. Turn the set around so that the back of the set is facing you. Through the ten holes in the back of the chassis will be seen ten adjusting screws. (See Fig. 1). These screws are used to tune in the stations that the buttons are to be set to.
4. Each of the push buttons can be made to tune in stations in a definite frequency range as shown in Fig. 1. It is imperative that in setting up the buttons you select stations whose frequency is in the indicated range of that button. ALWAYS TRY TO SELECT THE BUTTON WHICH CAN BE SET UP TO A STATION WHOSE FREQUENCY IS WELL WITHIN THE BUTTON'S OPERATING RANGE.
5. Turn the band switch to the "AM" position, push in the button labeled "MANUAL," then using the tuning knob (see Fig. 1) tune in the station you wish to set to button No. 1.
6. Push in button No. 1 and using a screwdriver turn adjusting screw No. 1a (the top one) until the station you had previously tuned in is again heard. If it is not heard, advance the volume control and adjust the screw again. Be sure to adjust screw No. 1a to the point where the program is heard with the deepest tone.
7. Insert the screwdriver in adjusting screw No. 1b (the one below 1a) and turn it until the program is heard with the deepest tone. Now again check the setting of screw No. 1a, making sure it is adjusted to give the deepest tone.
8. The set-up for button No. 1 is now complete.
9. To set up the remaining buttons use the same procedure; push in the "MANUAL" button; tune in the station, using the tuning knob; push in the button to be set up; adjust its associated "a" adjusting screw until the station is tuned in (screw 2a for button No. 2, etc., see Fig. 1); the associated "b" screw is then adjusted for deepest tone as before.
10. Call letter tabs which may be used to label the buttons are provided with your radio. They fit in the small space above each push button.
11. To use push button at any time, turn the band switch to the "AM" position and push the proper button.

ALIGNMENT EQUIPMENT & PROCEDURE

NOTE: THIS SET MAY BE COMPLETELY ALIGNED WITHOUT REMOVING FROM THE CABINET.
 FOR ALIGNMENT: An output meter and an accurately calibrated signal generator are required.

1. Connect the loop as indicated in the circuit diagram and keep it in the circuit at all times.
2. Connect the output meter across the voice coil or from the plate of the 6F6G output tube to chassis through a .1 mfd. condenser. Connect the ground lead of the signal generator to the receiver chassis.
3. Turn volume control to the maximum position and keep it in this position throughout alignment procedure.
4. Push the MANUAL button in and keep it pushed in.

Dummy Ant. in Series with Sig. Gen.	Connection of Sig. Generator Output To Receiver	Signal Generator Frequency	Band Switch Position	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
.1 MFD. Condenser	Rear Lug of Gang Condenser	455 KC	Broadcast	Any Point Where It Does Not Affect The Signal	1-2	2nd I. F.	Adjust for maximum output. Then repeat adjustment.

ALIGNMENT EQUIPMENT & PROCEDURE

THIS RECEIVER MAY BE ALIGNED IN THE CABINET WITH LOOP CONNECTED

1. Connect the output meter across the voice coil or from plate to plate of the 6F6G output tubes.
2. Connect the ground lead of the signal generator to the receiver chassis.
3. Push in the "manual" button and keep it pushed in. Check the pointer to see that it is correctly set to 540 KC. with gang in full mesh.
4. Turn the volume control to the maximum volume position, and the tone control to the "speech" position.
5. FOLLOW THE ORDER OF ALIGNMENT INDICATED BELOW.

Dummy Ant. in Series with Sig. Gen.	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Band Switch Position	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
.1 MFD Condenser	Lug on Middle Section of Gang Cond.	455 KC	American	Any Point Where It Does Not Affect the Signal	1-2	2nd I.F.	Adjust for Maximum Output. Then repeat Adjustment.
					3-4	1st I.F.	
400 OHM Carbon Resistor	Blue Lead from Chassis	16 MC	Foreign	16 MC	5	Foreign Oscillator	Adjust for Maximum Output. Check to see if Proper Peak was Obtained by Tuning in Image at Approx. 15.1 MC. If Image does not appear, Realign at 16 MC, with Trimmer Screw farther out. Recheck Image.
400 OHM Carbon Resistor	Blue Lead from Chassis	16 MC	Foreign	Tune to 16 MC Generator Signal	6	Foreign Antenna	Adjust for Maximum Output. Try to Increase Output by Detuning Trimmer and Retuning Receiver Dial until Maximum Output is Obtained.
400 OHM Carbon Resistor	Blue Lead from Chassis	11.5 MC	25-31 M.	11.5 MC	7	Spread Band Oscillator	Adjust for Maximum Output. Check to see if Proper Peak was Obtained by Tuning in Image at Approx. 10.6 MC. If Image does not appear, Realign at 11.5 MC, with Trimmer Screw farther out. Recheck Image.
400 OHM Carbon Resistor	Blue Lead from Chassis	11.5 MC	25-31 M.	Tune to 11.5 MC Generator Signal	8	Spread Band Antenna	Adjust for Maximum Output.
No Connection	Place Lead from Signal Gen. Near Loop	1500 KC	American	1500 KC	9	Broadcast Oscillator (Shunt)	Adjust for Maximum Output.
No Connection	Place Lead from Signal Gen. Near Loop	1500 KC	American	Tune to 1500 KC Generator Signal	10	Broadcast Detector	Adjust for Maximum Output.
No Connection	Place Lead from Signal Gen. Near Loop	600 KC	American	Tune to 600 KC Generator Signal	11	Broadcast Oscillator (Series)	Adjust for Maximum Output. Try to Increase Output by Detuning Trimmer and Retuning Receiver Dial until Maximum Output is Obtained.
No Connection	Place Lead from Signal Gen. Near Loop	1500 KC	American	Tune to 1500 KC Generator Signal	12	Broadcast Antenna	Adjust for Maximum Output.

Air Chief

FIRESTONE TIRE & RUBBER CO.

1. Connect the output meter across the voice coil or from plate to plate of the 6F6G output tubes.
2. Connect the ground lead of the signal generator to the receiver chassis.
3. Turn the volume control to the maximum volume position, and the tone control to the high position.
4. FOLLOW THE ORDER OF ALIGNMENT INDICATED BELOW.

Dummy Ant. in Series with Sig. Gen.	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Band Switch Position	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
.1 MFD Condenser	Lug on Middle Section of Gang Cond.	455 KC	Broadcast	Any Point Where It Does Not Affect the Signal	1-2	2nd I.F.	Adjust for Maximum Output. Then repeat Adjustment.
					3-4	1st I.F.	
400 OHM Carbon Resistor	Blue Lead from Chassis	16 MC	Foreign	16 MC	5	Foreign Oscillator	Adjust for Maximum Output. Check to see if Proper Peak was Obtained by Tuning in Image at Approx. 15.1 MC. If Image does not appear, Realign at 16 MC, with Trimmer Screw farther out. Recheck Image.
400 OHM Carbon Resistor	Blue Lead from Chassis	16 MC	Foreign	Tune to 16 MC Generator Signal	6	Foreign Antenna	Adjust for Maximum Output. Try to Increase Output by Detuning Trimmer and Retuning Receiver Dial until Maximum Output is Obtained.
400 OHM Carbon Resistor	Blue Lead from Chassis	11.5 MC	25-31M	11.5 MC	7	Spread Band Oscillator	Adjust for Maximum Output. Check to see if Proper Peak was Obtained by Tuning in Image at Approx. 10.6 MC. If Image does not appear, Realign at 11.5 MC, with Trimmer Screw farther out. Recheck Image.
400 OHM Carbon Resistor	Blue Lead from Chassis	11.5 MC	25-31M	Tune to 11.5 MC Generator Signal	8	Spread Band Antenna	Adjust for Maximum Output.
No Connection	Place Lead from Signal Gen. Near Loop	1500 KC	Broadcast	1500 KC	9	Broadcast Oscillator (Shunt)	Adjust for Maximum Output.

NOW PLACE THE CHASSIS AND LOOP ANTENNA INTO THE SAME RELATIVE POSITION AS WHEN IN THE CABINET.

No Connection	Place Lead from Signal Gen. Near Loop	1500 KC	Broadcast	Tune to 1500 KC Generator Signal	10	Broadcast Detector	Adjust for Maximum Output.
No Connection	Place Lead from Signal Gen. Near Loop	1500 KC	Broadcast	Tune to 1500 KC Generator Signal	11	Broadcast Antenna	Adjust for Maximum Output.
No Connection	Place Lead from Signal Gen. Near Loop	600 KC	Broadcast	Tune to 600 KC Generator Signal	12	Broadcast Oscillator (Series)	Adjust for Maximum Output. Try to Increase Output by Detuning Trimmer and Retuning Receiver Dial until Maximum Output is Obtained.

PUSH BUTTON TUNER

TUBE LOCATIONS

REAR OF CHASSIS

Fig. 1 SET VIEWED FROM REAR

Turn the BAND SWITCH to the "AM" position, then using the tuning knob (see Fig. 1) tune in the station you wish to set to button No. 1.

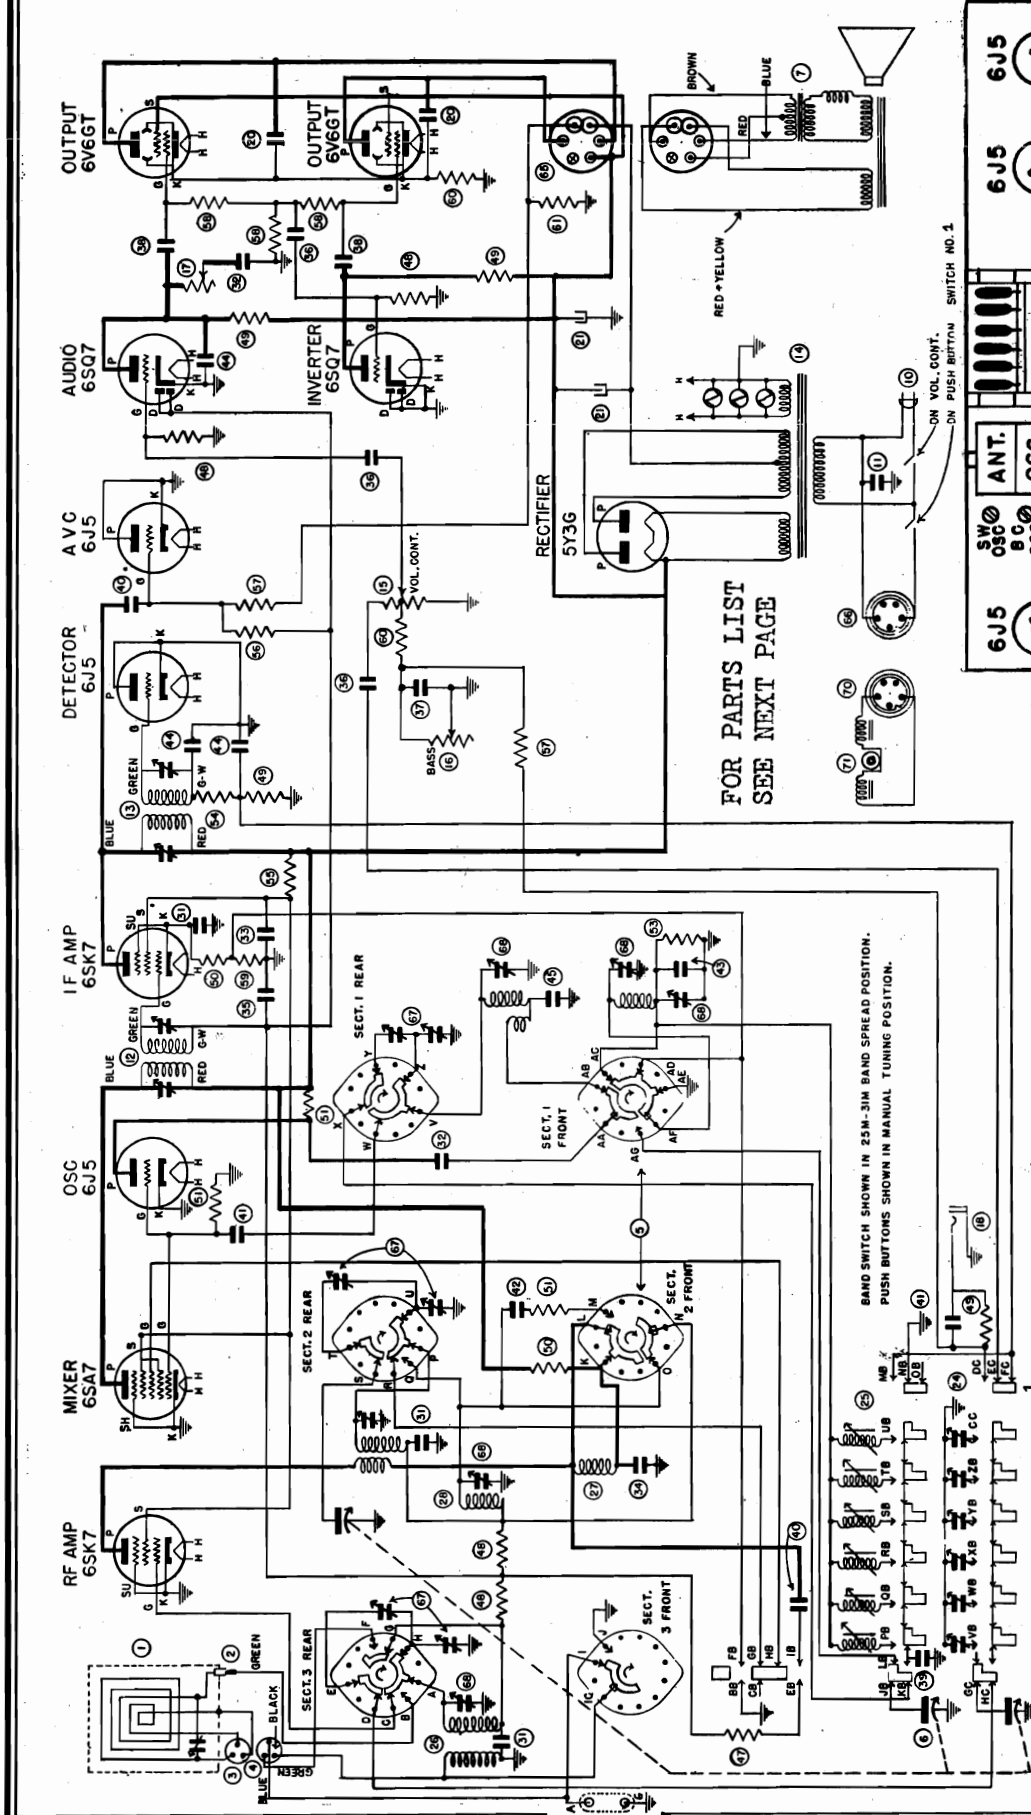

Turn the Band Switch to the "AUT" position and push in button No. 1. Using a screwdriver turn adjusting screw No. 1a until the station you had previously tuned in is again heard. If it is not heard, advance the volume control and adjust the screw again. Be sure to adjust screw No. 1a to the point where the program is heard with the deepest tone.

Insert the screwdriver in adjusting screw No. 1b and turn it until the program is heard with maximum volume. Now again check the setting of screw No. 1a making sure it is adjusted to give the deepest tone.

The set-up for button No. 1 is now complete.

To set up the remaining buttons use the same procedure; turn the Band Switch to the "AM" position, tune in the station using the tuning knob; turn the Band Switch to the "AUT" position; push the button to be set up; adjust its associated "a" adjusting screw until the station is tuned in (screw "2a" for button No. 2, etc., see Fig. 1); the associated "b" screw is then adjusted for maximum volume as before.

A Firestone "Powerscope" is built into this receiver and under normal conditions will give satisfactory reception. In locations remote from broadcasting stations, or where poor receiving conditions exist, it may be necessary to use an outside antenna. This antenna may be a single wire from 35 feet to 75 feet long, including the lead-in wire, erected as high as possible and as far from electric light wires (or other sources of noise) as possible. When an antenna is used a good ground should also be used. The antenna wire is connected to the screw marked "Ant." and the ground to the terminal, marked "Gnd." located at the rear of the chassis.

Fig. 1

The "Powerscope" in these instruments is rotatable and may be turned by means of the right hand knob on the panel. A stop is provided to prevent the "Powerscope" from turning too far. This knob should be used to adjust the "Powerscope" towards the station, or that direction which gives the best reception, i. e., loudest signals with least interference. In some locations it may be found that stations can only be received with the "Powerscope" in one position. This is a local condition and may be due to local shielding.

FIRESTONE TIRE & RUBBER CO.

FOR TUNER DATA SEE MODEL S7400-4

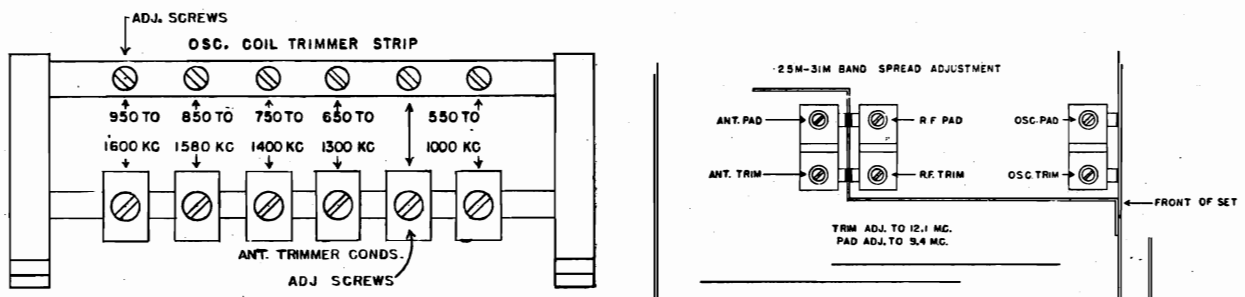

ALIGNMENT PROCEDURE

FOR ALIGNMENT: An output meter and an accurately calibrated signal generator are required.

1. Connect the output meter across the voice coil or across the plates of the 6F6G output tubes depending on the type of meter. (The more sensitive type should be connected across the voice coil.)
2. Connect the ground lead of the signal generator to the receiver chassis or to the "G" terminal at the back of the chassis.
3. Turn the volume control to within 15° of the maximum volume position and keep it in this position throughout the alignment procedure.
4. Push in the "Manual" button and keep it pushed in. Check the pointer to see that it is correctly set.

MODEL S7400-6

FIRESTONE TIRE & RUBBER CO.

ALIGNMENT EQUIPMENT & PROCEDURE

1. Connect the output meter across the voice coil or from plate of the 6V6GT output tube to chassis through a .1 mfd. condenser. (The more sensitive type should be connected across the voice coil.)
2. Connect the ground lead of the signal generator to the receiver chassis.
3. Turn the RADIO-PHONO TONE SWITCH to the extreme clockwise position.
4. Turn the volume control to the maximum position and keep it in this position throughout the alignment procedure.
5. Push in the "Manual" button and keep it pushed in. Check the pointer to see that it is correctly set to 540 KC. with gang in full mesh.
6. The loop must be connected as indicated in circuit diagram at all times.

Dummy Ant. in Series with Sig. Gen.	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Band Switch Position	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment

MODEL S7401-1
Lumitone

ALIGNMENT PROCEDURE

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400 and 1720 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

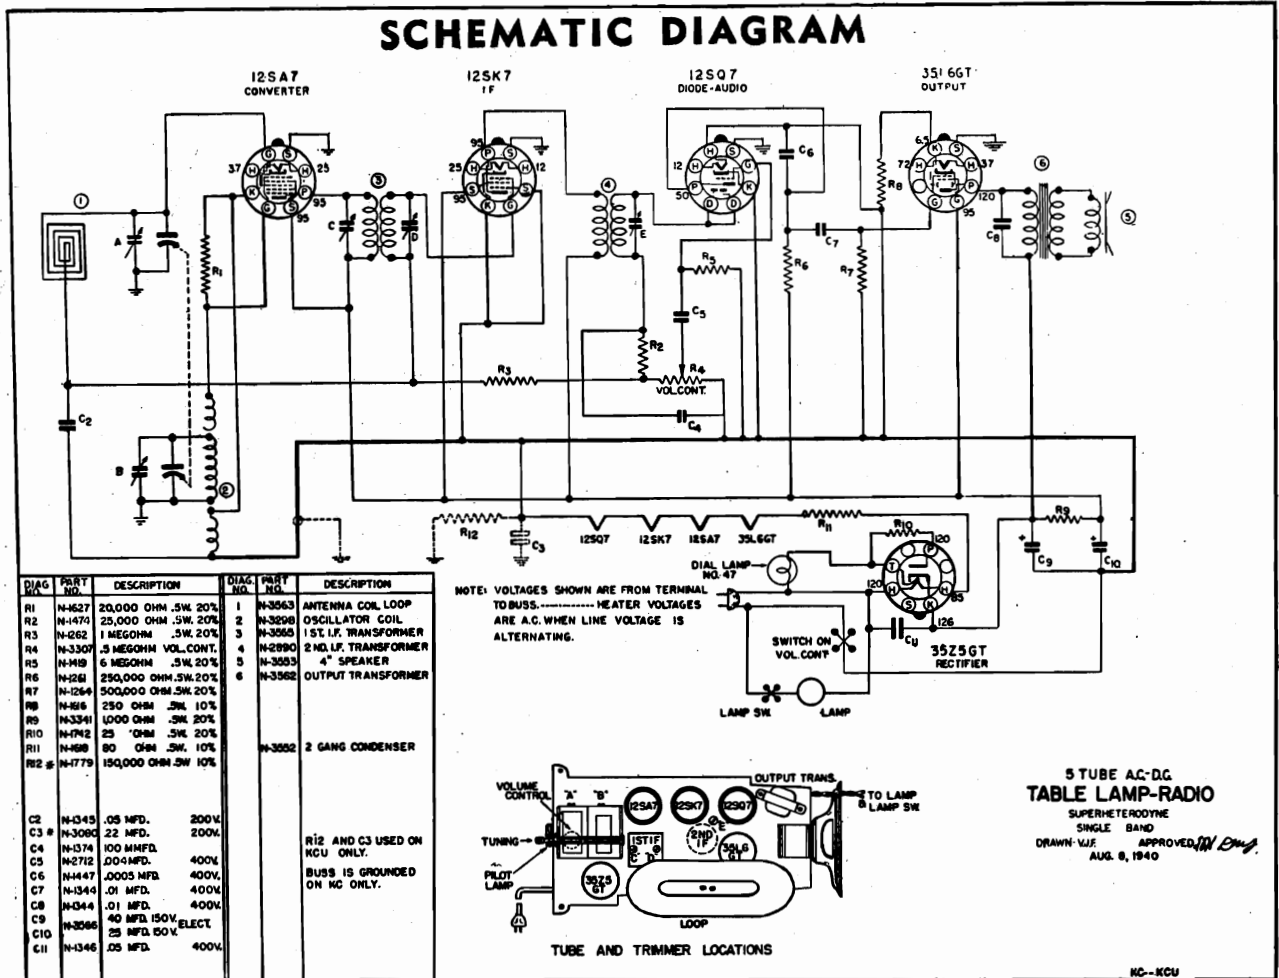

CORRECT ALIGNMENT PROCEDURE. Remove the chassis from the cabinet and set on a bench taking care that no iron or other metal is near the loop. (See section on replacement of tubes). Do not make this setup on a metal bench. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I. F. ALIGNMENT. With the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the chassis ground. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to a loop transmitter and couple to the loop antenna on the receiver. With the gang condenser set at minimum capacity, set the test oscillator at 1720 K.C. and adjust the oscillator (or 1720 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

Voltages shown on the circuit diagram are from socket terminals to chassis base. In measuring voltages use a voltmeter having a resistance of at least 1000 ohms per volt. Allowances should be made for variations in line voltage.

SCHMATIC DIAGRAM

MODEL S7401-1
Lumitone

FIRESTONE TIRE & RUBBER CO.

70 and 100 watt size with a medium base. For better illumination use the 50, 100 and 150 watt size with a medium base. Standard 60 or 100 watt bulbs can be used successfully in the lamp, but only one intensity of light will be obtained.

TUBES USED. Five tubes are used. Their type numbers and locations are shown on the tube location diagram inside the base of the lamp. Before attempting to replace tubes see the section on **replacement of tubes.**

ANTENNA AND GROUND. This radio lamp has a self contained loop antenna and requires no external antenna or ground. On weak stations the signal can be improved by rotating the lamp slightly.

TUNING DIAL. (Station Selector)—Rotate the dial in the base of the lamp slowly over a narrow range of the dial at a point where the desired station is located, until the station is received with maximum volume; then readjust the volume control to the proper level. **Never** use the station selector to adjust volume as this practice results in distorted tone quality and deficient bass response. The Volume Control only is to be used for this purpose. For maximum clarity the indicator knob should be adjusted to the center of the area covered by the station being tuned.

three light bulb is used. If a standard single light bulb is used only one intensity of light will be obtained.

REPLACEMENT OF TUBES

(See Figure 1)

If tubes are removed from their sockets for test or replacement purposes, make certain that each tube is placed in its proper socket. (See tube layout diagram in the base of the lamp). Failure to replace the tubes in their proper sockets may result in damage to the tube, or the receiver, or both.

TUNING RANGE

This receiver is designed to operate over the standard broadcast band which extends from 535 to 1720 Kilocycles (KC) (174 to 560 Meters) and includes the popular 1712 KC police channel.

This new Radio-Lamp of yours incorporates the latest developments and refinements that radio engineers have devised. In order to realize the advantages to the fullest extent you must thoroughly understand its operation and use. Therefore it is important that you read the following pages carefully. PLEASE READ THESE INSTRUCTIONS ALL THE WAY THROUGH BEFORE ATTEMPTING TO USE THE RECEIVER.

ASSEMBLY OF LAMP. Screw the small shade on the lamp socket and screw the lamp bulb in the socket. Then place the large shade on the small shade and the assembly is complete.

TYPE OF LAMP BULB REQUIRED. The lamp is designed to use a three light bulb. This type of bulb will give three intensities of light and comes in two sizes. For normal illumination use the 30,

POWER SUPPLY. This receiver is designed to operate on any alternating current supply (AC) ranging from 110 to 120 volts, 50 to 60 cycles; or on any direct current supply (DC) ranging from 110 to 120 volts.

SPECIAL INSTRUCTIONS FOR DC OPERATION. When operating from a DC (direct current) power supply, it may be necessary to reverse the power cord plug in the wall socket before the receiver will function, due to the polarity condition of a direct current supply. If the receiver fails to perform after being turned on one minute, simply reverse the power plug.

CONTROLS AND OPERATION

LAMP SWITCH. The switch located in lamp socket must be turned in a clockwise direction to secure the three intensities of light if a

Remove the shades and lamp bulb to prevent damage. Next loosen screw H and slip off washer G and the dial F. Next unscrew E and the screw next to it. (These screws have red heads). At the top of lamp just below the lamp socket, will be found nut A which must be loosened sufficiently to allow collar B to be moved high enough to allow the two halves of the lamp base to be separated.

ADJUSTMENTS

Set the receiver that is to be used with this record player to some frequency between 540 and 750 KC. Choose a frequency that is clear and free from interfering stations. Keep in mind the fact that strong signals may be present at night where there are no signals in the daytime. Remove the plug near the volume control on top of the record player. Using an insulated screwdriver turn the screw, located beneath this plug, until the signal from the record player is heard in the receiver. This will be heard as a reduction in noise as the signal comes in tune with the receiver. If a record is being played, the music or sound from it may be tuned in. If it is desired to change the frequency, set the receiver to the new frequency and turn the screw until the signal is heard. Turning the adjusting screw clockwise increases the frequency and turning it counter-clockwise lowers the frequency.

When the record player is located at some distance from the receiver, or under conditions when the signal from it is too weak, the coil of wire from the record player should be uncoiled enough to give a satisfactory signal. Under no conditions should more wire be uncoiled than is necessary for a reasonably strong signal in the receiver.

HOWLS OR SQUEALS

Howls or squeals from this unit may be caused by the following:

1. Interference caused by choosing a frequency which is not clear. To remedy, change the record player frequency to one where there is no interference.
2. Too weak a signal permitting interference from a weak station. To remedy, uncoil some of the wire from the coil under the record player, or move the record player nearer the set.
3. Too strong a signal permitting vibration from the speaker to cause microphonics. (The record player and receiver are in this case usually very close together.) To remedy, place the record player on another support or mount it on sponge rubber. Coiling up the wire coming from the chassis may help if the signal is too strong.

Commentator

FIRESTONE TIRE & RUBBER CO.

TUNING RANGE

This receiver is designed to operate over the standard broadcast band which extends from 535 to 1720 Kilocycles (KC) (174 to 560 Meters) and includes the popular 1712 KC police channel.

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400 and 1720 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

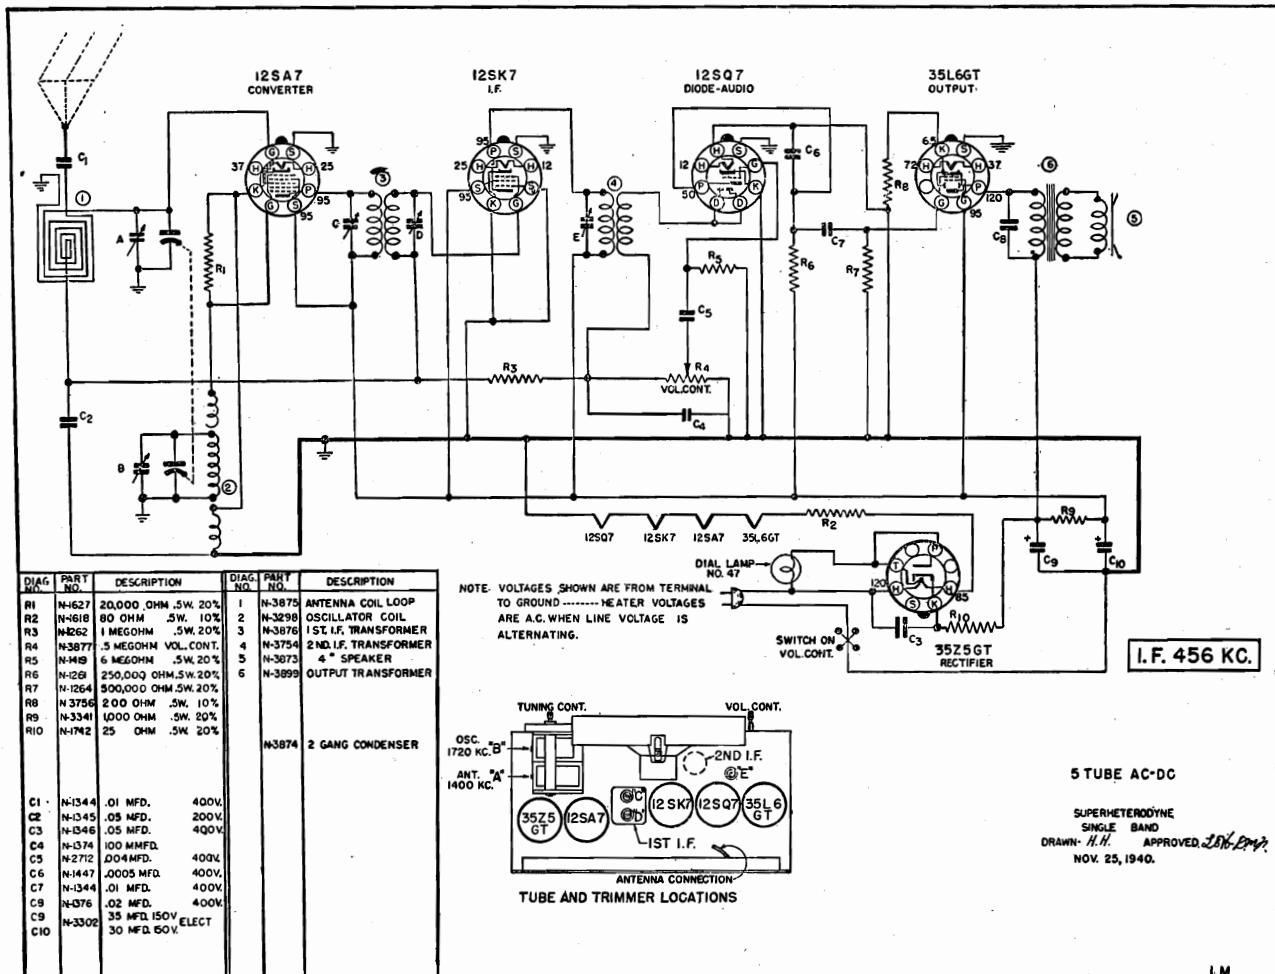

I. F. ALIGNMENT. With the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to

the chassis ground. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Remove chassis, and loop antenna from cabinet and set them up on the bench so that they occupy exactly the same respective positions on the bench as they did in the cabinet. Care should be taken to have no iron or other metal near the loop. Do not make this set-up on a metal bench.

Connect the test oscillator to the antenna of the set through a 100 mmfd. (.0001) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1720 KC, and adjust the oscillator (or 1720 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

Voltages shown on the circuit diagram are from socket terminals to chassis base. In measuring voltages use a voltmeter having a resistance of at least 1000 ohms per volt. Allowances should be made for variations in line voltage.

NOTE A: Only a small voltage will be measured at the plate of the 1N5GT when using a voltmeter having a resistance of 1000 ohms per volt.
NOTE B: The bias on the 1A5GT grid is -5 volts measured across resistor No. 23.

MISCELLANEOUS PARTS LIST IS ON OTHER SIDE

FIRESTONE TIRE & RUBBER CO.

ALIGNMENT PROCEDURE

FOR ALIGNMENT an output meter and an accurately calibrated signal generator are required.

1. Connect the output meter across the voice coil or between the plate of the 1A5GT output tube and ground through a 0.1 Mfd. condenser, depending on the type of meter. (The more sensitive type should be connected across the voice coil.)
2. Connect the ground lead of the signal generator to the black ground wire or the chassis.
3. Turn the volume control to the maximum volume position and keep it in this position while aligning.
4. With the gang condenser in full mesh, set the dial pointer to the low frequency edge of the dial scale.

MODEL S7405-8 (445)

FIRESTONE TIRE & RUBBER CO.

I.F. - 455 KC.
 NOTE: NUMBERS SHOWN IN PARENTHESIS ARE ILLUSTRATION NUMBERS

The diagram illustrates connection of battery designed for use with your Model S-7405-8 Firestone Radio. Before attempting to install battery TURN ON-OFF SWITCH TO "OFF" POSITION.

Firestone battery stock No. E-1527-7 is built of the finest material and is especially designed for best operation of your radio. When used on an average of two to three hours per day it will provide approximately 750-1000 hours' service.

SHOWING PLUG INSERTED IN RECEPTACLE ON TOP OF "AB" BATTERY PACK

FIRESTONE TIRE & RUBBER CO.

AERIAL

USE A GOOD AERIAL—RECEPTION WILL BE POOR IF THE RADIO IS OPERATED WITHOUT AN AERIAL OR WITH A POOR ONE—WITH A GOOD AERIAL GOOD RESULTS CAN BE EXPECTED. AS THE BEST AERIAL TO USE DEPENDS ON THE LOCATION, SURROUNDING OBJECTS, ETC., BE SURE TO:

1. Always use the best possible aerial. Remember an outdoor aerial erected as high as possible is the best one to use. If it is impractical to use an outdoor aerial, erect one in the attic or around the picture moulding.
2. A 35 to 100 foot aerial should be ample for most locations. While in shielded locations and in remote districts a longer aerial may have to be used, always keep the aerial as short as possible consistent with satisfactory reception.
3. Insulate aerial from its supports by glass or porcelain insulators, and keep lead-in wire away from buildings, etc., with stand-off insulators.
4. Use insulated window lead-in strip to bring aerial lead-in into house.
5. Use an approved lightning arrester.
6. Connect aerial lead-in to blue lead coming out rear of chassis.
7. Attach a good ground to the black lead coming out at rear of chassis. A cold water pipe, steam radiator, or an iron rod driven two to four feet in moist ground will provide a good ground.

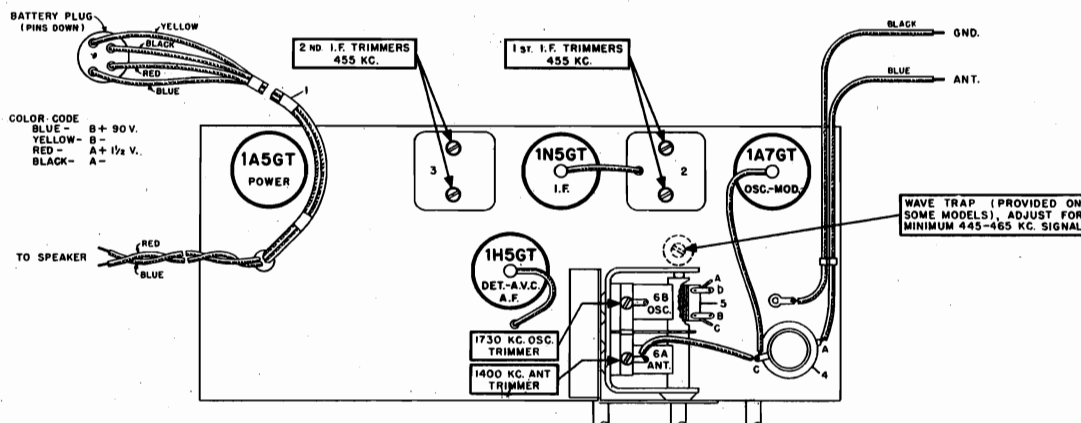

ALIGNMENT PROCEDURE

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, (3) third.

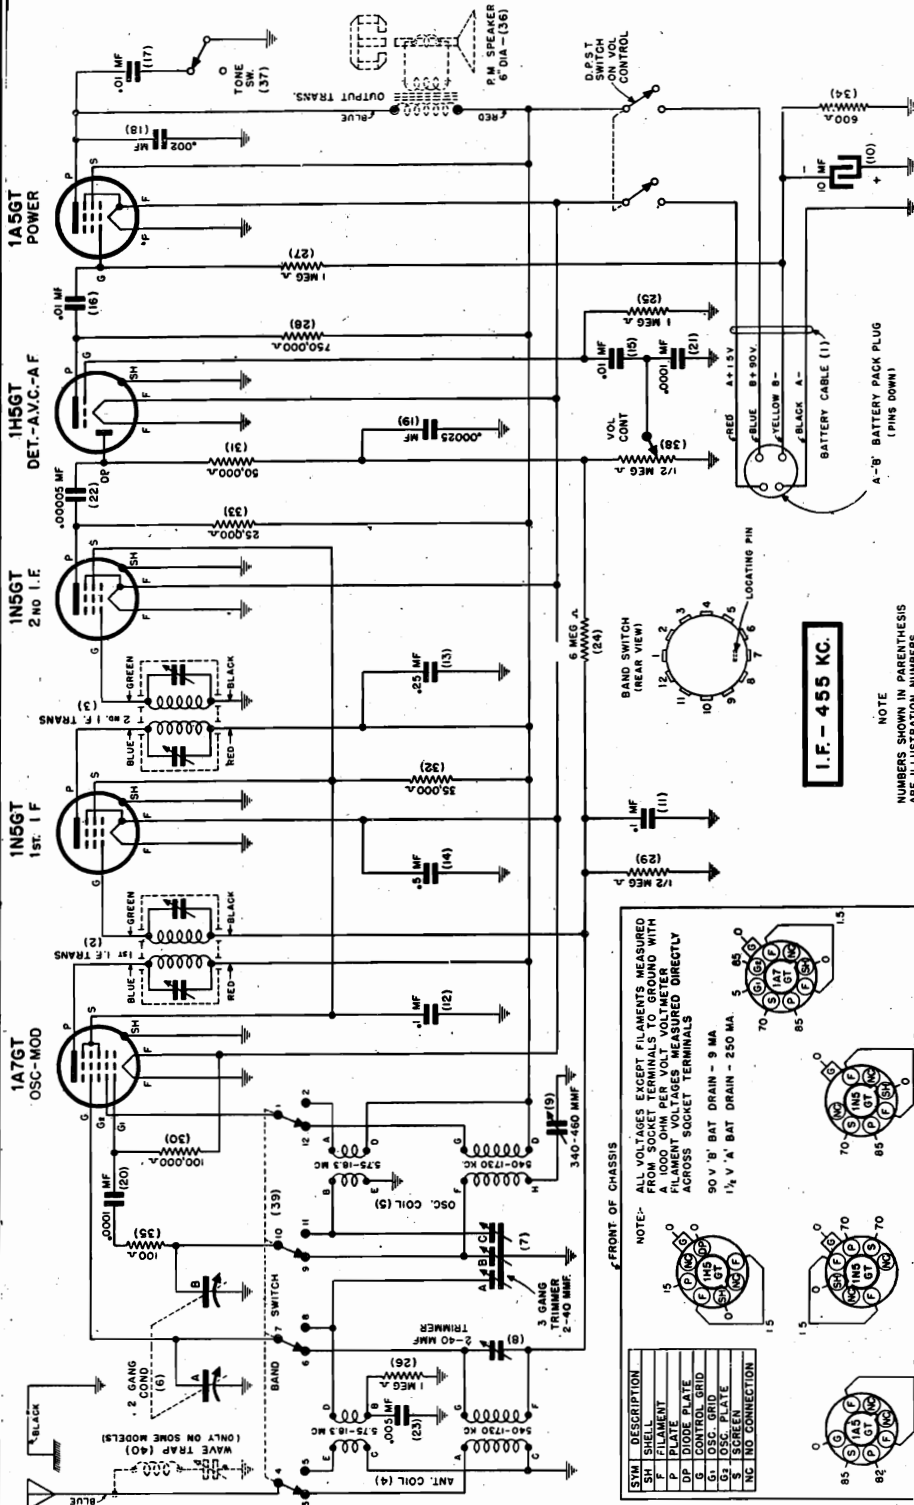

Before starting alignment:

- (a) Check tuning dial adjustment by turning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to the last line move to correct position.
- (b) Use an accurately calibrated test oscillator with some type of output measuring device.
- (c) Have ground lead of test oscillator attached to chassis.

Set receiver dial to:	TEST OSCILLATOR			Refer to parts layout diagram for location of trimmers mentioned below.
	Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	
I.F. Any point where no interfering signal is received	455 K. C.	.02 MFD condenser	High side to grid terminal of 1A7GT tube DO NOT REMOVE CAP.	Adjust each of the second I. F. transformer trimmers for maximum output—then adjust each of the first I. F. trimmers for maximum output.

FIRESTONE TIRE & RUBBER CO.

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400 and 1720 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

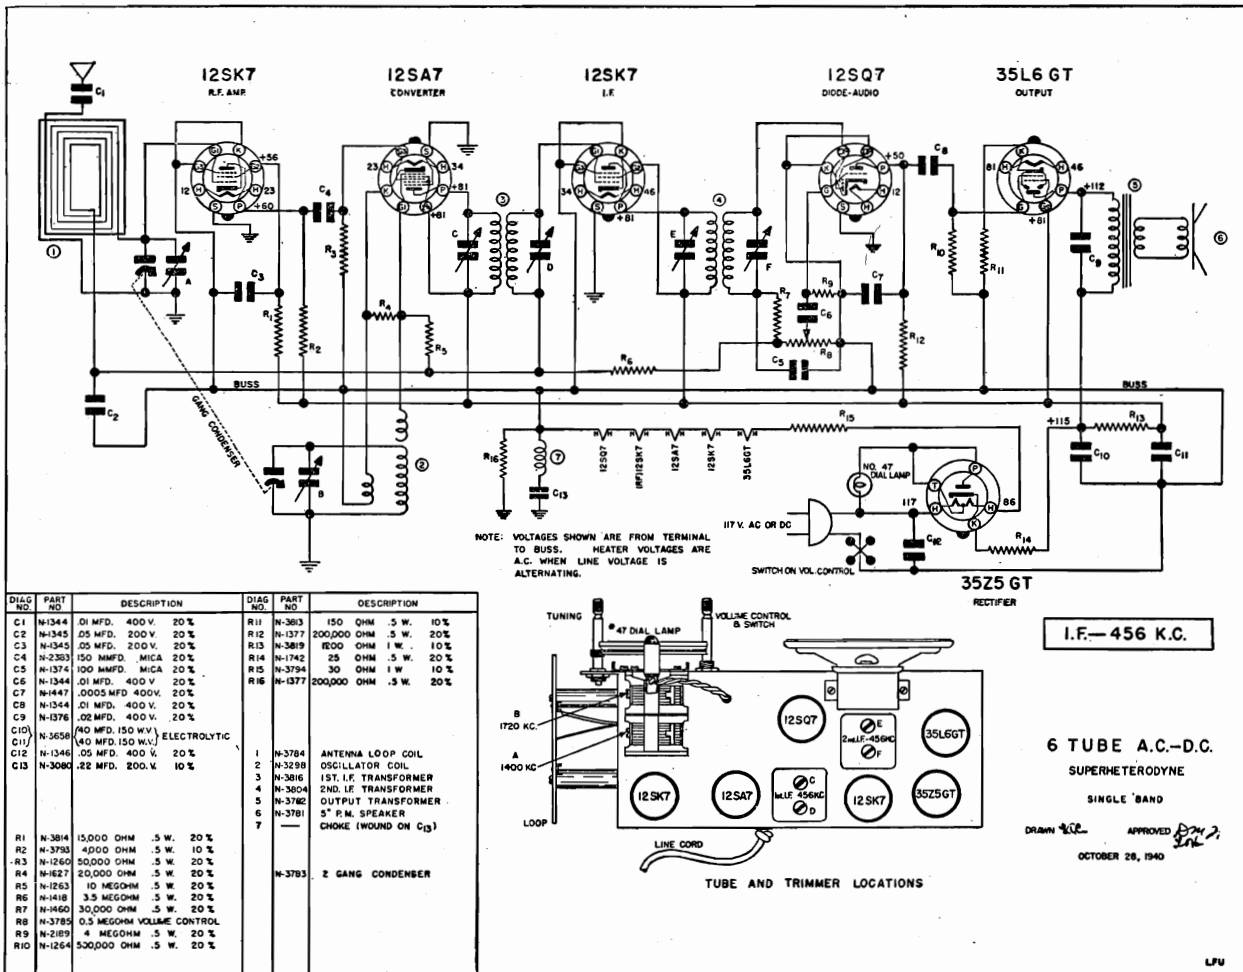

I. F. ALIGNMENT. With the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. con-

denser. The ground on the test oscillator should be connected to the ground buss, indicated in circuit diagram. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Remove the chassis from the cabinet and set on a bench, taking care that no metal is near the loop. Do not make this setup on a metal bench.

Connect the test oscillator to the antenna of the set through a 200 mmfd. (.0002) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1720 KC, and adjust the oscillator (or 1720 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

Voltages shown on the circuit diagram are from socket terminals to chassis base. In measuring voltages use a voltmeter having a resistance of at least 1000 ohms per volt. Allowances should be made for variations in line voltage.

FIRESTONE TIRE & RUBBER CO.

ALIGNMENT PROCEDURE

FOR OTHER DATA
SEE FIRESTONE
PAGE 11-24 IN
RIDER'S VOL. XI

ALIGNMENT: An output meter and an accurately calibrated signal generator are required.
Connect the output meter across the voice coil or, using a .1 mfd. condenser in series, connect as follows:
MODEL S-7425-9: Between the 35L6GT plate and B— terminal shown on voltage chart.
MODEL S-7425-6: Between the 35L6GT plate and chassis.

Connect the ground lead of the signal generator to the chassis of the receiver through a .25 mfd. condenser and keep it connected in this manner throughout the entire alignment procedure. Failure to do this may have serious results as one side of the power line may be grounded in the signal generator. If oscillation or hum occurs in the model S-7425-9, connect the ground lead of the signal generator through a .25 condenser to B— as shown on the Voltage Chart.

TO CALIBRATE THE DIAL:—Remove the chassis from the cabinet and set it on a flat surface (insulated from ground). With the gang in full mesh, the last dial division (just below 55) on the low frequency end, should be exactly $4\frac{3}{8}$ inches above the table surface. If this is not the case, release the set screw in the collar which connects the gang condenser shaft with the tuning unit, and holding the gang in full mesh, turn the dial until the last division is exactly $4\frac{3}{8}$ inches above the table surface. Now re-tighten the set screw in the collar. The $4\frac{3}{8}$ inch division on the ruler (when measured vertically from table surface), is to be used as the dial indicator for all calibrations and alignment.

Dummy Ant. in Series with Signal Generator	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
.1 MFD. Condenser	Green wire of Loop (Loop must be connected)	455 KC	Any point where it does not affect the signal	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3-4	1st I.F.	
200 MMFD. Mica Condenser	"Ant." Terminal	1500 KC	1500 KC	5	Broadcast Oscillator (Shunt)	Adjust trimmer to bring in signal.
200 MMFD. Mica Condenser	"Ant." Terminal	1500 KC	Tune to 1500 KC Generator Signal	6	Broadcast Antenna (Shunt)	Adjust for maximum output.

Now remove the output meter and signal generator connections and replace the set in the cabinet. Replace the cabinet back and MAKE SURE THAT THE GREEN WIRE GOES TO THE UPPER RECEPTACLE OF THE LOOP AND THE GREEN-WHITE WIRE TO THE LOWER RECEPTACLE. Place the antenna lead from the signal generator near the back of the cabinet and turn the output up until the 1500 KC signal is weakly heard. Adjust trimmer No. 6 for maximum output by ear.

ALIGNMENT EQUIPMENT & PROCEDURE

FOR ALIGNMENT: An output meter and an accurately calibrated signal generator with a tuning range from 455 KC to 1500 KC are required.

1. Connect the output meter across the voice coil or between the plate of the 6F6-G output tube and ground, depending on the type of meter. (The more sensitive type should be connected across the voice coil).
2. Connect the ground lead of the signal generator to the "G" terminal or the chassis.
3. Turn the volume control to the maximum volume position and keep it in this position throughout the entire alignment procedure.
4. Remove the connector from between the "A" and "X" terminals on the antenna strip.

HOW TO SET UP AND USE THE PUSH BUTTON TUNER

To set up the push buttons, proceed as follows:

1. Turn on the set and allow it to operate for at least one-quarter hour before attempting to set up the push buttons. Be sure that the set is connected to an antenna system before starting.
2. Select the five stations to which the buttons are to be set. Be sure to select nearby, powerful stations, since weak signals will generally give better results when tuned in manually. Any button may be set to any desired station.
3. Grasp the tuning knob and push it in (the movement is slight, about 1/8 inch) so that the drive pinion engages the condenser drive gear and the set may be tuned manually.
4. Tune in the station to which you wish to set the particular button. Be sure to tune in the station correctly by TUNING TO THE POINT WHERE THE PROGRAM IS HEARD WITH THE LEAST HISS OR DISTORTION.
5. Grasp the push button being set up, and turn it to the left (counter-clockwise) about one whole turn.
6. Push this button all the way in, and then release it. Now turn it to the right (clockwise) until reasonably tight. This completes the set-up operation.
7. Set up the remaining four buttons in a similar manner.
8. Label each button with the call letters of the stations you have selected, using the call letter tabs packed with your receiver. Paste the call letter tab in the recess above the push button.
9. To use your push button tuner, push in the button labelled with the call letters of the desired station. Be sure to push the button all the way in.

FIG. 2

GANG DRIVE CORD

1. Remove the chassis from cabinet.
2. Remove broken string.
3. Turn gang to fully meshed position.
4. Cut a 35" length of 30 lb. silk fish cord.
5. Tie one end of cord to tension spring (Part No. 41A14111).
6. Hook other end of spring to gang drive pulley as shown in Fig. 2.
7. Pass cord through slot in gang drive pulley and wind, in a counter-clockwise direction, around and down to tuning shaft.

8. Wind cord 3-1/2 turns counter-clockwise around tuning shaft exactly as shown in Fig. 2.
9. Route cord up and wind one full turn around gang drive pulley, in a counter clockwise direction, to slot.
10. Pass cord through slot and tie cord to spring.
NOTE: Before tying cord, adjust length so that spring will exert a light pull on cord.
11. Place a drop of shellac on cord knot.

POINTER DRIVE CORD

1. Remove the chassis from cabinet.
2. Remove broken string.
3. Turn gang to fully meshed position.
4. Cut a 40" length of 30 lb. silk fish cord.
5. Tie one end of cord to tension spring (Part No. 41A14111).
6. Hook other end of spring to gang drive pulley as shown in Fig. 2.
7. Pass cord through slot in gang drive pulley and route cord upward to idler pulley No. 1 (Back pulley).
8. Route cord in a counter-clockwise direction around idler pulley No. 1 and across chassis to idler pulley No. 2.
9. Continue in a counter-clockwise direction around idler pulley

10. Continue in a clockwise direction around idler pulley No. 3 and in a counter-clockwise direction around gang drive pulley to slot.
11. Pass cord through slot and tie to spring.
NOTE: Before tying cord, adjust length so that spring will exert a light pull on cord.
12. Replace pointer on cord. To calibrate, tune in a station of known frequency and adjust pointer on cord to indicate station frequency. Fasten to cord with a drop of shellac.
13. Place a drop of shellac on cord knot.

SENSITIVITY AND STAGE GAIN MEASUREMENTS

2	Minimum *	.1 Mfd.	RF Grid	5	1600 K.C.
3	1400 K.C.	.1 Mfd.	RF Grid	6	1400 K.C.
4	600 K.C.	.1 Mfd.	RF Grid	7 **	600 K.C.
5	1400 K.C.	None	***	8	1400 K.C.
6	Repeat above steps for maximum accuracy.				

** Adjust pointer to zero.

** Rock condenser until greatest output is obtained.

*** Connect output of signal generator to a 5' diameter 3 turn loop. With volume on full and output meter connected across voice coil bring loop close enough to receiver loop (receiver loop should be in front up position) until an output of 50 Milliwatts is obtained. 50 Milliwatts = .38 Volts on output meter.

Vary distance between generator and receiver loop to maintain this output during alignment.

NOTE: Trimmer No. 8 is adjusted with chassis in cabinet.

MODELS C4B15, C4B16
MODEL C640

GAMBLE-SKOGMO, INC.

ALIGNMENT PROCEDURE

MODELS C4B15, C4B16

The following equipment is required for aligning.

- Dummy antenna, 1 mfd. and 200 mmf.

- Volume control—Maximum all adjustments.
- Connect ground lead of radio chassis to ground post of signal generator.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Iron Cores (Dial Setting)	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
455 Kc. I. F.	455 Kc.	.1 MFD.	Connect to Grid of 1A7	Iron Cores All the way out	Two trimmers on top of output I. F. can	Output I. F.	maximum output
	455 Kc.	.1 MFD.	Connect to Grid of 1A7	Iron Cores All the way out	Two trimmers on top of input I. F. can	Input I. F.	maximum output
BROAD-CAST BAND	1700 Kc.	.1 MFD.	Connect to Grid of 1A7	Iron Cores All the way out	Trimmer (C7) (See chassis view)	Oscillator	maximum output
	1700 Kc.	200 MMF.	Connect to Antenna Clip	Iron Cores All the way out	Trimmer (C4) (See chassis view)	Antenna	maximum output
	1400 Kc.	200 MMF.	Connect to Antenna Clip	Turn Dial to 1400 Kc.	Adjust position of antenna coil (See coil assembly view)	Antenna Coil Adjustment	maximum output (See Note "A")
	1700 Kc.	200 MMF.	Connect to Antenna Clip	Turn Dial to 1700 Kc.	Adjust trimmer (C4) (See chassis view)	Antenna	Check for tracking (See Note "B")

NOTE "A"—The antenna coil assembly is made so that it is movable. When making the adjustment as given in the alignment procedure move the coil assembly very slowly. It can be moved by hand or by pivoting one edge of the blade of a screwdriver in the hole and engaging the blade in the gear teeth of the coil form.

NOTE "B"—After the antenna coil has been tracked at 1400 Kc. it is necessary to check the antenna trimmer (C4) adjustment again at 1700 Kc. If no appreciable change in trimmer adjustment is made the coil is in track, if the trimmer requires considerable change it will be necessary to again adjust the position of the antenna coil at 1400 Kc. These two adjustments should be tried several times until no change of trimmer adjustment is required at 1700 Kc.

ALIGNMENT PROCEDURE

MODEL C640

IMPORTANT!—See alignment instructions

- Volume control—Maximum all adjustments.
- Connect B - of radio chassis to ground post of signal generator through .1 Mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—1 Mfd.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	455 Kc.	.1 MFD.	Grid of 12SA7	Rotor full open (Plates out of mesh)	Four Trimmers on Top (See Fig. 1)	Output and Input I. F.	Adjust to maximum output
	1600 Kc.	.1 MFD.	Grid of 12SA7	Rotor full open (Plates out of mesh)	Trimmer bottom of rear section of gang (See Bottom of radio)	Broadcast Oscillator	Adjust to maximum output
BROAD-CAST BAND	1400 Kc.	See Note "A"		Set dial at 1400 Kc.	Trimmer bottom of front section of gang. (See bottom of radio)	Broadcast Antenna	Adjust to maximum output

NOTE "A"—Lay the output lead from the generator in back of the loop antenna. Turn up the output of the generator, picking up the energy in the loop antenna without any electrical connection from the generator.

FREQUENCY RANGE
540 to 1600 K.C.

Power Consumption.....35 Watts
Power Output.....1 Watt Undistorted, 1.5 Watts Maximum
Intermediate Frequency.....455 K.C.

MODEL 534

GAMBLE-SKOGMO, INC.

MODEL 534

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
 - Connect — B of radio chassis to ground post of signal generator through .1 Mfd. condenser.
 - Connect dummy antenna value in series with generator output lead.
 - Connect output meter across primary of output transformer.
 - Allow chassis and signal generator to "heat up" for several minutes.
- The following equipment is required for aligning:
- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
 - Output indicating meter.
 - Non-metallic screwdriver.
 - Dummy antennas—1 Mfd., and 20 Mmi.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	455 Kc.	.1 MFD.	Grid of 12SK7 I. F. Tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Top View)	Output I. F.	Adjust to maximum output
	455 Kc.	.1 MFD.	Grid of 12SA7	Rotor full open (Plates out of mesh)	Two trimmers on top (See Top View)	Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1650 Kc.	.1 MFD.	Grid of 12SA7	Rotor full open (Plates out of mesh)	Trimmer—Bottom of gang (See Top View)	Oscillator	Adjust to maximum output
	1400 Kc.		(See Note "A" and "B")	Set dial at 1400 Kc.	Trimmer—Bottom of gang (See Top View)	Antenna	Adjust to maximum output (See Note "A")

Loop aerial should be connected when aligning receiver.

NOTE "A"—Mount the chassis and the loop antenna in the cabinet, connect the loop antenna to the chassis. Adjust the antenna trimmer through hole in bottom of cabinet.

NOTE "B"—Lay the output lead from the signal generator in back of the loop antenna. Turn up the output of the generator, picking up the energy in the loop antenna without any electrical connection from the signal generator.

MODEL C5D15

VOLTAGE CHART

MODEL C5D16

GAMBLE-SKOGMO, INC.

POWER SUPPLY— Unless your radio is marked otherwise, it must be operated from 105 to 125 volts, 60 cycle A.C. If in doubt, phone your electric light company. Receivers of this same model which are for use on special voltages are marked accordingly. Reversing the plug may reduce station hum.

NOTE: THE ANTENNA COIL ASSEMBLY IS MADE SO THAT IT IS MOVABLE LEFT OR RIGHT. WHEN MAKING THE ADJUSTMENT AS GIVEN IN THE ALIGNMENT PROCEDURE MOVE COIL ASSEMBLY VERY SLOWLY

COIL ASSEMBLY VIEW

CHASSIS VIEW—Showing tube location and type. Note External Antenna Lead at back of chassis.

Antenna

This radio is designed to pick up strong local stations without requiring an outside antenna. For best results, however, an outside antenna approximately 50 to 75 feet long including lead-in is recommended. It should be erected as high as possible and as far from surrounding objects as practical. For minimum interference it should be

at right angles to street car lines, incoming power lines and other electrical apparatus which may be in the vicinity. A ground is not required.

Periodic inspection of the antenna system is recommended to be sure that all connections are clean and tight, and that the antenna is well insulated from the ground at all points.

ALIGNMENT PROCEDURE

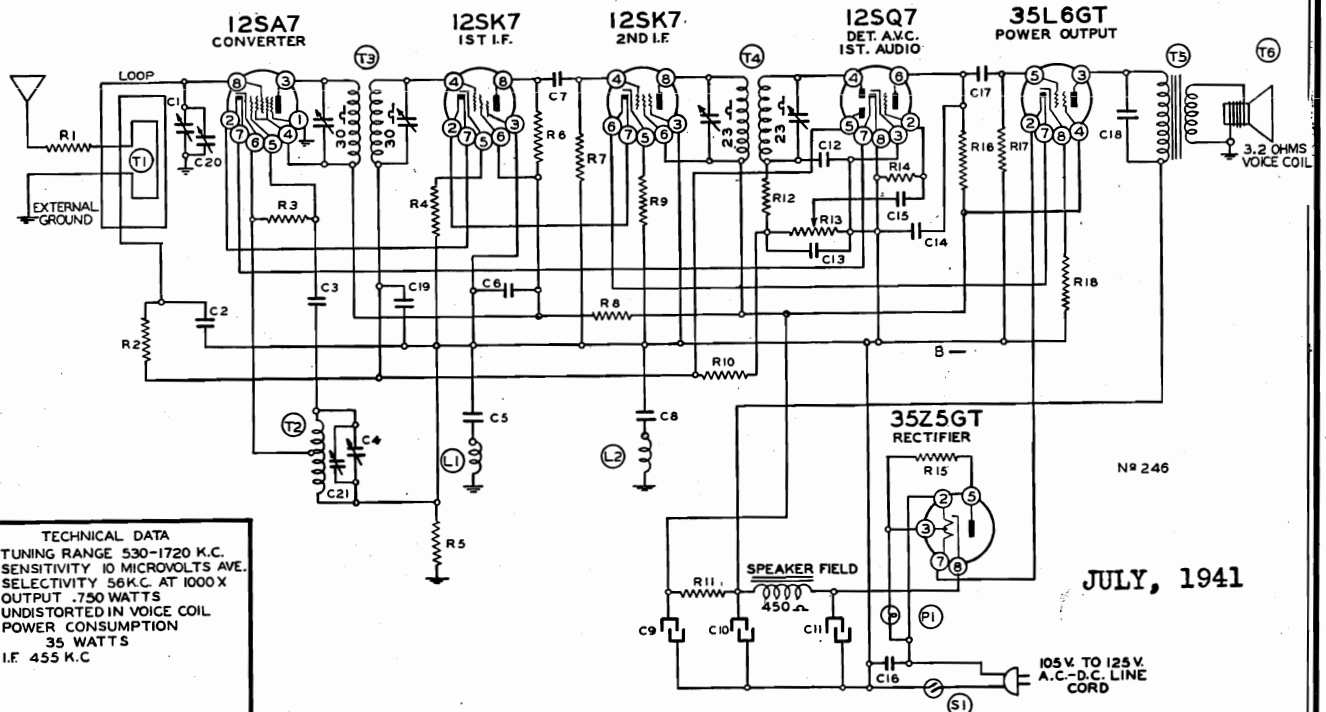

- Connect B— of radio chassis to ground post of signal generator through .1 Mfd. condenser.
- Volume control—Maximum all adjustments.

BAND	SIGNAL GENERATOR		Connection to Radio	Position of Iron Cores (Dial Setting)	Trimmers Adjusted to Maximum (in Order Shown)
	Frequency Setting	Dummy Antenna			
I. F.	455 Kc.	.1 MFD.	Connect to Antenna Plate	Iron Cores All the way out	Two trimmers on top of output I.F. (See Chassis View)
	455 Kc.	.1 MFD.	Connect to Antenna Plate	Iron Cores All the way out	Two trimmers on top of input I.F. (See Chassis View)
BROAD-CAST BAND	1690 Kc.	.1 MFD.	Connect to Antenna Plate	Iron Cores All the way out	Oscillator trimmer (C5) (See Chassis View)
	1690 Kc.	200 MMF.	Connect to Antenna Plate	Iron Cores All the way out	Antenna trimmer (C3) (See Chassis View)
	1400 Kc.	200 MMF.	Connect to Antenna Plate	Turn Dial to 1400 Kc.	Adjust position of antenna coil right or left. (See Note "A")
	1690 Kc.	200 MMF.	Connect to Antenna Plate	Turn Dial to 1690 Kc.	Adjust antenna trimmer (C3) (See Chassis View) (See Note "B")

NOTE "A"—The antenna coil assembly is made so that it is movable right or left. When making the adjustment as given in the alignment procedure move the coil assembly very slowly. It can be moved by hand or by pivoting one edge of the blade of a screwdriver in the hole and engaging the blade in the gear teeth of the coil form.

NOTE "B"—After the antenna coil has been tracked at 1400 Kc. it is necessary to check the antenna trimmer (C3) adjustment again at 1690 Kc. If no appreciable change in trimmer adjustment is made the coil is in track, if the trimmer requires considerable change it will be necessary to again adjust the position of the antenna coil at 1400 Kc. These two adjustments should be tried several times until no change of trimmer adjustment is required at 1690 Kc.

SPEAKER									
114263	T6	4 x 6 Inch Oval Electrodynamic Speaker (Less Output Transformer)	1	3.50	WE CANNOT SUPPLY SPEAKER CONES OR FIELDS SEPARATELY, WE CAN REPLACE OR REPAIR A DAMAGED SPEAKER FOR \$2.75 IF IT IS RETURNED TO OUR FACTORY, TRANSPORTATION CHARGES PREPAID.				
105106B	T5	Output Transformer for Speaker	1	1.00					

GAMBLE-SKOGMO, INC.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect B— of radio chassis to ground post of signal generator through .1 Mfd. condenser.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted to Maximum
I. F.	455 Kc.	.1 MFD.	Grid of 12SK7 2nd I. F.	Rotor full open (Plates out of mesh)	Two trimmers on top of Output I. F.
	455 Kc.	.1 MFD.	Grid of 12SA7 Converter	Rotor full open (Plates out of mesh)	Two trimmers on top of Input I. F.
BROAD- CAST BAND	1720 Kc.	.1 mmf.	Grid of 12SA7	Rotor full open (Plates out of mesh)	Osc. trimmer C21 See voltage chart view
	1400 Kc.	200 mmf.	External Antenna and B—	Set Dial at 1400 K. C.	Ant. trimmer C20 See voltage chart view

The loop antenna should be connected to the radio and in its proper position when making all adjustments.

Chassis View, Showing Tube Location and the External Antenna and Ground Leads

Setting the Pushbuttons

Make a list of your 6 favorite stations—push out the call letters of these stations from the call letter sheets supplied. Next insert a long slim screw driver into the hole in front of one of the pushbuttons and unscrew the pushbutton locking screw (to the left) several turns. Now with the screw driver still engaged in the locking screw slot push it all the way in. Hold it in this position and tune in the station you want with the tuning knob. Now tighten up the pushbutton locking screw by turning it to the right. Tighten firmly. Continue setting each button in the same way. When you have set your stations insert the call letter of each station in the front of the proper button and put one of the celluloid tabs over the station call letter.

To change stations simply repeat the above procedure.

If you are unable to set a station on any particular button it is probably because the pushbutton locking screw has not been unloosened (turned to the left).

Antenna

This radio is designed to pick up strong local stations without requiring an outside antenna. The built-in aerial may be somewhat directional therefore try the radio in several positions.

For best results, however, an outside antenna approximately 50 to 75 feet long including lead-in is recommended. It should be erected as high as possible and as far from surrounding objects as practical. For minimum interference it should be at right angles to street car lines, incoming power lines and other electrical apparatus which may be in the vicinity. A ground is advisable. A good ground will often reduce noise. The ground wire should be connected with a clamp to a well cleaned water pipe or to a piece of pipe driven several feet into damp earth.

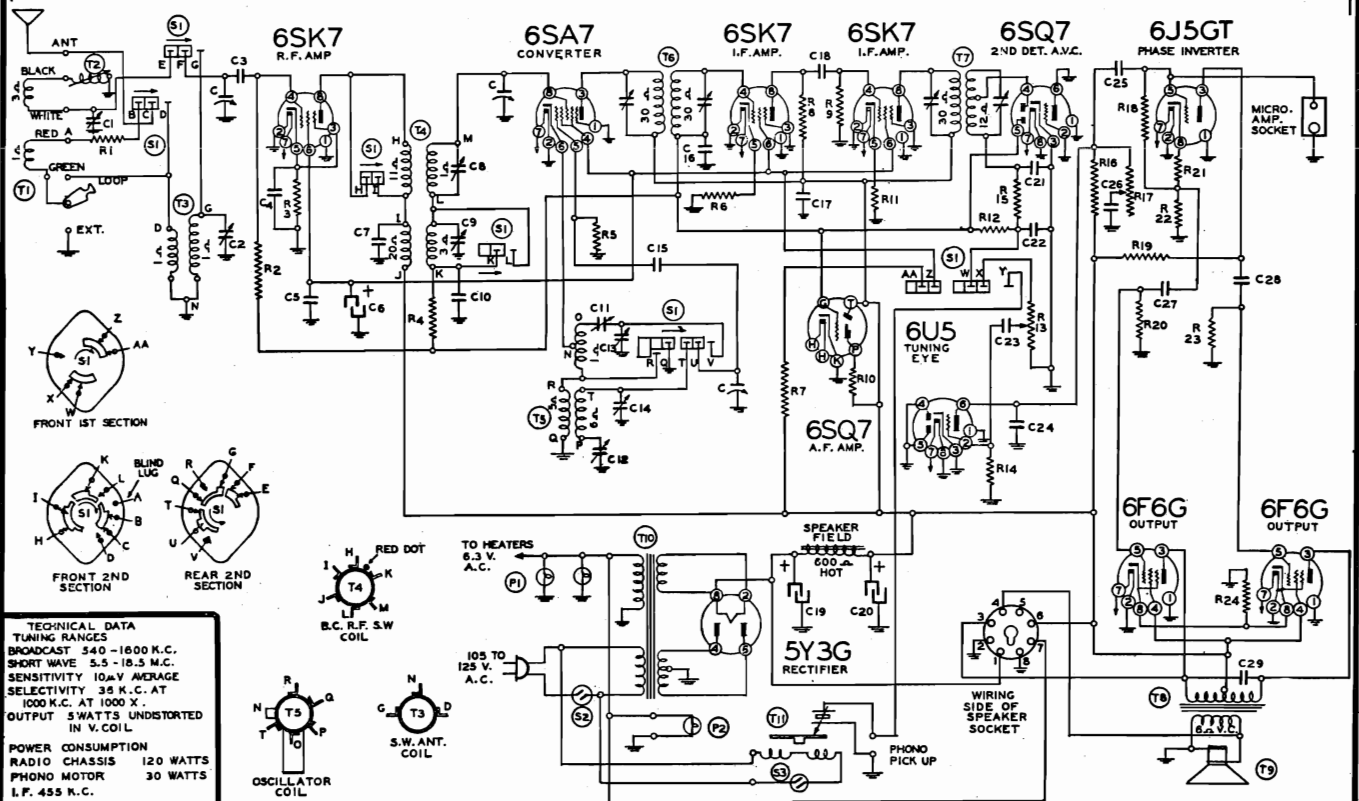

Periodic inspection of the antenna and ground system is recommended to be sure that all connections are clean and tight, and that the antenna is well insulated from the ground at all points.

VOLTAGE CHART

Unless your radio is marked otherwise, it must be operated from 105 to 125 volts, 50 to 60 cycle, or the same D. C. Voltage. If in doubt, phone your electric light company. Receivers of this same model which are for use on special voltages are marked accordingly. When using your radio on A. C., reversing the plug may reduce station hum. If set does not operate in one minute on direct current reverse the plug.

Setting the Automatic
Pushbuttons

Make a list of your 5 favorite stations. Push out the call letters of these stations from the call letter sheets supplied. Insert a call letter in the front of each pushbutton.

Press one of the buttons all the way down and hold it FIRMLY. Now tune in the station you want with the tuning knob. Tune back and forth until the station is clear, then release the button. NOTE: If the tuning knob turns quite hard when the button is held down firmly (loosen the reset lock screw several turns with a screwdriver or coin (quarter).

Continue, setting each of the remaining pushbuttons in the same way. Now turn the tuning knob all the way to the right and tighten the reset lock screw. This screw prevents the pushbuttons from slipping off the stations you have set. To change stations loosen lock screw and proceed as above.

MODEL C590
MODEL 642

GAMBLE-SKOGMO, INC.

ALIGNMENT PROCEDURE MODEL C590

The following equipment is required for aligning.

- Dummy antenna .1 mfd. and 200 mmf.

- Volume control—Maximum all adjustments.
- Connect ground lead of radio chassis to ground post of signal generator.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Iron Cores (Dial Setting)	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
455 Kc. I. F.	.1 MFD.	.1 MFD.	Connect to Grid of 1A7	Rotor full open (Plates out of mesh)	Trimmers on top of I. F. cans	Output and input I. F.	maximum output (See Note "A")
BROAD-CAST BAND	1600 Kc.	.1 MFD.	Connect to Grid of 1A7	Rotor full open (Plates out of mesh)	Trimmer on gang (See chassis view)	Oscillator	maximum output (See Note "A")
	1400 Kc.	200 MMF.	Connect to Antenna Clip	Set dial at 1400 Kc.	Trimmer on gang (See chassis view)	Antenna	maximum output (See Note "B")

NOTE "A"—The loop antenna need not be connected to the radio when making these adjustments, but a 1. Meg. Resistor must be substituted across the loop clips. The ground of the signal generator is connected to the chassis and the other lead from the signal generator in series with .1 MFD. dummy to the grid of the 1A7GT tube.

NOTE "B"—This adjustment should be made with the ground lead of the signal generator connected to the external ground terminal. The other lead of the signal generator is connected in series with a 200 Mmf. dummy to the external antenna terminal.

ALIGNMENT PROCEDURE MODEL 642

IMPORTANT!—See alignment instructions

- Volume control—Maximum all adjustments.
- Connect B - of radio chassis to ground post of signal generator through .1 Mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—1 Mfd.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	455 Kc.	.1 MFD.	Grid of 12SA7	Rotor full open (Plates out of mesh)	Four Trimmers on Top (See Fig. 1)	Output and Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1600 Kc.	.1 MFD.	Grid of 12SA7	Rotor full open (Plates out of mesh)	Trimmer rear section of gang.	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	See Note "A"		Set dial at 1400 Kc.	Trimmer front section of gang	Broadcast Antenna	Adjust to maximum output

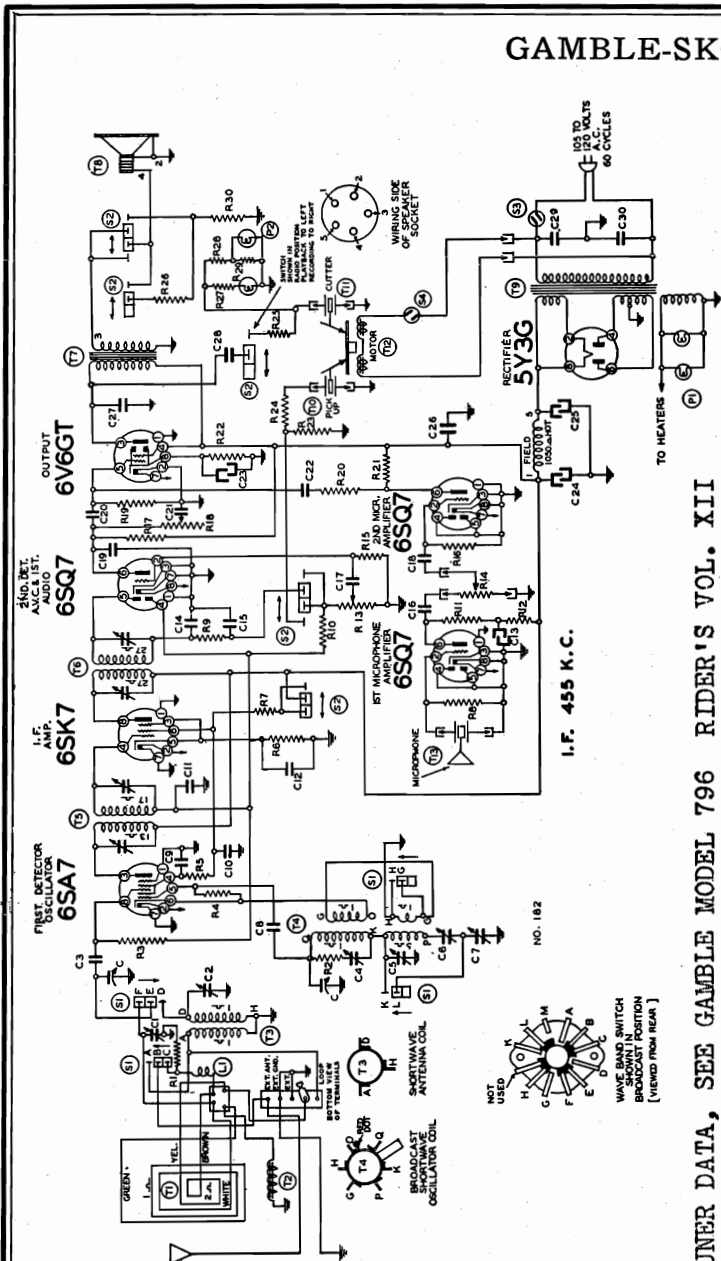

NOTE "A" Lay the output lead from the generator in back of the loop antenna. Turn up the output of the generator, picking up the energy in the loop antenna without any electrical connection from the generator.

POWER SUPPLY:

Power Consumption..... 35 Watts
Power Output..... 1 Watt Undistorted, 1.5 Watts Maximum
Intermediate Frequency..... 455 K. C.

Caution:—This radio, unless otherwise marked, must be operated from 105-115 volts, A. C. (50/60 cycles) or D. C. supply only. If you are in doubt as to the voltage rating of the power supply, consult your local power company before inserting plug. Do not insert plug unless all tubes are in their proper sockets.

Receivers of this model which are to be used on voltages other than 105-115 volts A. C. (50/60 cycle), or 105-115 volts D. C. are so marked. The power consumption of this receiver is 35 watts.

FOR DATA ON GENERAL INDUSTRIES R70 RECORD CHANGER, SEE RIDER'S "AUTOMATIC RECORD CHANGERS AND RECORDERS".

GAMBLE-SKOGMO, INC.

ALIGNMENT PROCEDURE

IMPORTANT: See Aligning Instructions.

- Volume control—Maximum all adjustments.
- Connect radio ground to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

- The following equipment is required for aligning:
- An all wave signal generator, which will provide an accurately calibrated signal at the test frequencies as listed.
 - Output indicating meter.
 - Non-metallic screwdriver.
 - Dummy antennas—1 mf., 200 mmf 400 ohms.

SIGNAL GENERATOR

BAND	Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	455 Kc.	.1 MFD.	Grid of 6SK7 I. F.	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 3)	Output I. F.	Adjust to maximum output
	455 Kc.	.1 MFD.	Grid of 6SA7 Mixer	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 3)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND (See Note A)	17 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 17 Mc.	Trimmer C4 (See Fig. 4)	Short Wave oscillator	Adjust to maximum output

	6 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 6 Mc.	Trimmer C7 (See Fig. 4)	Short Wave oscillator series pad	Adjust to maximum rock dial. (See note "C")
BROADCAST BAND (See Note A)	1570 Kc.	200 mmf.	Grid of 6SA7	Broadcast	Rotor full open (Plates out of mesh)	Trimmer C5 (See Fig. 4)	Broadcast oscillator	Adjust to maximum output
	532 Kc.	200 mmf.	Grid of 6SA7	Broadcast	Set Dial at 532 K. C.	Trimmer C6 (See Fig. 4)	Broadcast oscillator series pad	Adjust to maximum output
LOOP ALIGNMENT (See Note B)	1400 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 1400 Kc.	Trimmer C1 (See Fig. 5)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 600 Kc.	Trimmer T2 (See Fig. 5)	Iron Core Tracking Coil	Adjust to maximum output

POWER SUPPLY:

NOTE "A"—The signal generator is connected to the "ANT." and "GND." terminals on the rear of the chassis when aligning the Short Wave Band and to the grid of the 6SA7 tube and ground terminal when setting the Broadcast Band oscillator and frequencies, (1570 and 532 K. C.).

The loop antenna need not be connected to the radio when making these adjustments. **NOTE "B"**—Loop alignment is made with the chassis mounted in the cabinet and the setting plug. Do not insert plug unless all tubes and speaker terminals and the jumper on the terminal board connected to "EXT." terminal. (See Fig. 3).

NOTE "C"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained. Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each band is completed, repeat the procedure as a final check.

BAND SWITCH BAND
 Extreme Right Rotation Short Wave
 Center Position Broadcast
 Power Consumption (Radio Chassis only, less Phono Motor).....50 Watts
 Power Output.....3.6 Watts Undistorted, 5.4 Watts Maximum

MODEL 1010B
MODEL 1070A

The following equipment is needed for aligning this receiver:
 Model Signal generator covering Broadcast and short-wave bands, output meter, screw
 driver, dummy antennas of 200 MMF - 400 Ohms and .1MFD
 The receiver and generator should be allowed to warm up for a few minutes. The volume control
 should be set at maximum and the sensitivities given are for .5 watt output.
 The following chart gives connections and operations in their order for proper alignment of
 this receiver. The trimmer locations will be found on the circuit diagram.

Issue A
August, 1940
Serial No.
100001 up

Generator Frequency	Connection at Radio	Dummy Antenna	Range Switch	Dial Setting	Trimmers to Tune	Approx. Sensitivity
I.F. 456 K.C.	6SA7 Grid Center Stator of Var. Cond.	.1 MFD.	B.C.	H.F. End	I.F. Trimmers to Max.	65-75 M.V.
B.C. 1725 K.C.	Antenna	200 MMF.	"	H.F. End Limit of Travel	B. C. Oscillator	
1400 K. C.	"	"	"	1400 K.C. See Note "A"	B.C. Ant. & Loop Tune to Max.	5-6 M.V.
600 K. C.	"	"	"	Rock Rotor	Padder	5-6 M.V.
S.W. 15.2 M.C.	"	400 Ohm	S.W.	15.2 M.C.	S.W. Osc. & Ant. to Max.	40 M.V.
6.0 M.C.	"	"	"	6.0 M.C.	Check	20 M.V.

Note "A" - If the pointer is not at 1400 kc with a 1400 kc signal it may be loosened from the dial cord and moved to correct the calibration. This should be checked across the band to arrive at the optimum condition.

Note "B" - Care should be taken not to align on the image frequency. This may be checked by rotating the dial of the signal generator. Another signal should be heard at dial frequency plus 912 kc. This signal should be checked carefully on the short wave band, making sure the lowest frequency signal agrees with the dial setting in frequency and that it is the strongest of the two.

SPECIFICATIONS 1070-A

GAMBLE-SKOGMO, INC.

Code Part No. Description

IF PEAK 455 KC

FEBRUARY, 1941

RESISTORS

R1	13024	400 ohms— $\frac{1}{2}$ w.
R2	13019	1 megohm— $\frac{1}{2}$ w.
R3	13099	300 ohms— $\frac{1}{2}$ w.
R4	1305	300M ohm— $\frac{1}{2}$ w.
R5	130208	40M ohm— $\frac{1}{2}$ w.
R6	13054	500 ohm— $\frac{1}{2}$ w.
R7	130304	12M ohm—2 w.
R8	130263	12M ohm— $\frac{1}{2}$ w.
R9	13020	100M ohm— $\frac{1}{2}$ w.
R10		1 megohm—in eye socket
R11	13054	500 ohm— $\frac{1}{2}$ w.
R12	130170	3 megohm— $\frac{1}{2}$ w.
R13	101214	Volume control (500M ohm)
R14	130225	15 megohm— $\frac{1}{2}$ w.
R15	13012	50M ohm— $\frac{1}{2}$ w.
R16	13011	250M ohm— $\frac{1}{2}$ w.
R17	101213	Tone control (1 megohm)
R18	13019	1 megohm— $\frac{1}{2}$ w.
R19	13020	100M ohm— $\frac{1}{2}$ w.
R20	1303	500M ohm— $\frac{1}{2}$ w.
R21	13043	2500 ohm— $\frac{1}{2}$ w.
R22	13020	100M ohm— $\frac{1}{2}$ w.
R23	1303	500M ohm— $\frac{1}{2}$ w.
R24	130311	300 ohm—1 w.

CONDENSERS

C	102129	Three gang variable condenser
C1	124132	B.C. antenna trimmer

CHASSIS VIEW

GAMBLE-SKOGMO, INC.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio ground to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- The following equipment is required for aligning.
 - An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
 - Dummy antennas—1 mf., 200 mmf., 400 ohms.

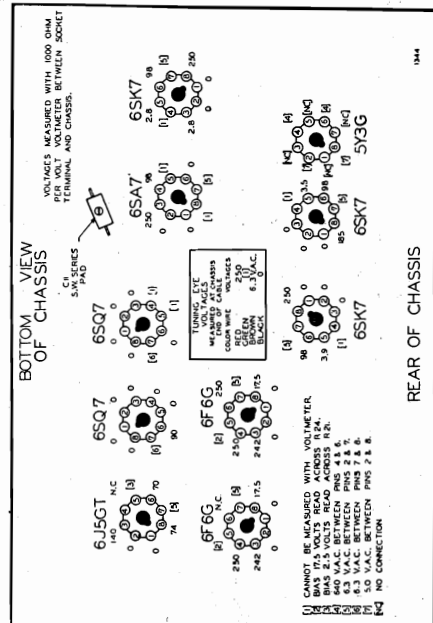

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	455 Kc.	.1 MFD.	Grid of 6SK7 I. F.	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top	Output I. F.	Adjust to maximum output
	455 Kc.	.1 MFD.	Grid of 6SA7 Mixer	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top	Input I. F.	Adjust to maximum output
SHORT WAVE BAND	17 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 17 Mc.	Trimmer C13	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 17 Mc.	Trimmers C8, C2	Short Wave R. F. and S. W. Antenna	Adjust to maximum output
(See Note A)	6 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 6 Mc.	Trimmer C11 (See voltage chart)	Short Wave oscillator series pad	Adjust to maximum rock dial. (See note "C")
BROAD-CAST BAND	1580 Kc.	200 mmf.	Grid of 6SK7 R. F. Tube	Broadcast	Rotor full open (Plates out of mesh)	Trimmer C14	Broadcast oscillator	Adjust to maximum output
	540 Kc.	200 mmf.	Grid of 6SK7 R. F. Tube	Broadcast	Set Dial at 540 Kc. (Plates in Mesh)	Trimmer C12	Broadcast oscillator series pad	Adjust to maximum output
(See Note A)	1400 Kc.	200 mmf.	Grid of 6SK7 R. F. Tube	Broadcast	Set Dial at 1400 Kc.	Trimmer C9	Broadcast R. F.	Adjust to maximum output
LOOP ALIGN-MENT	1400 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 1400 Kc.	Trimmer C1	Broadcast antenna	Adjust to maximum output
(See Note B)	600 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 600 Kc.	Trimmer T2	Iron Core Tracking Coil	Adjust to maximum output

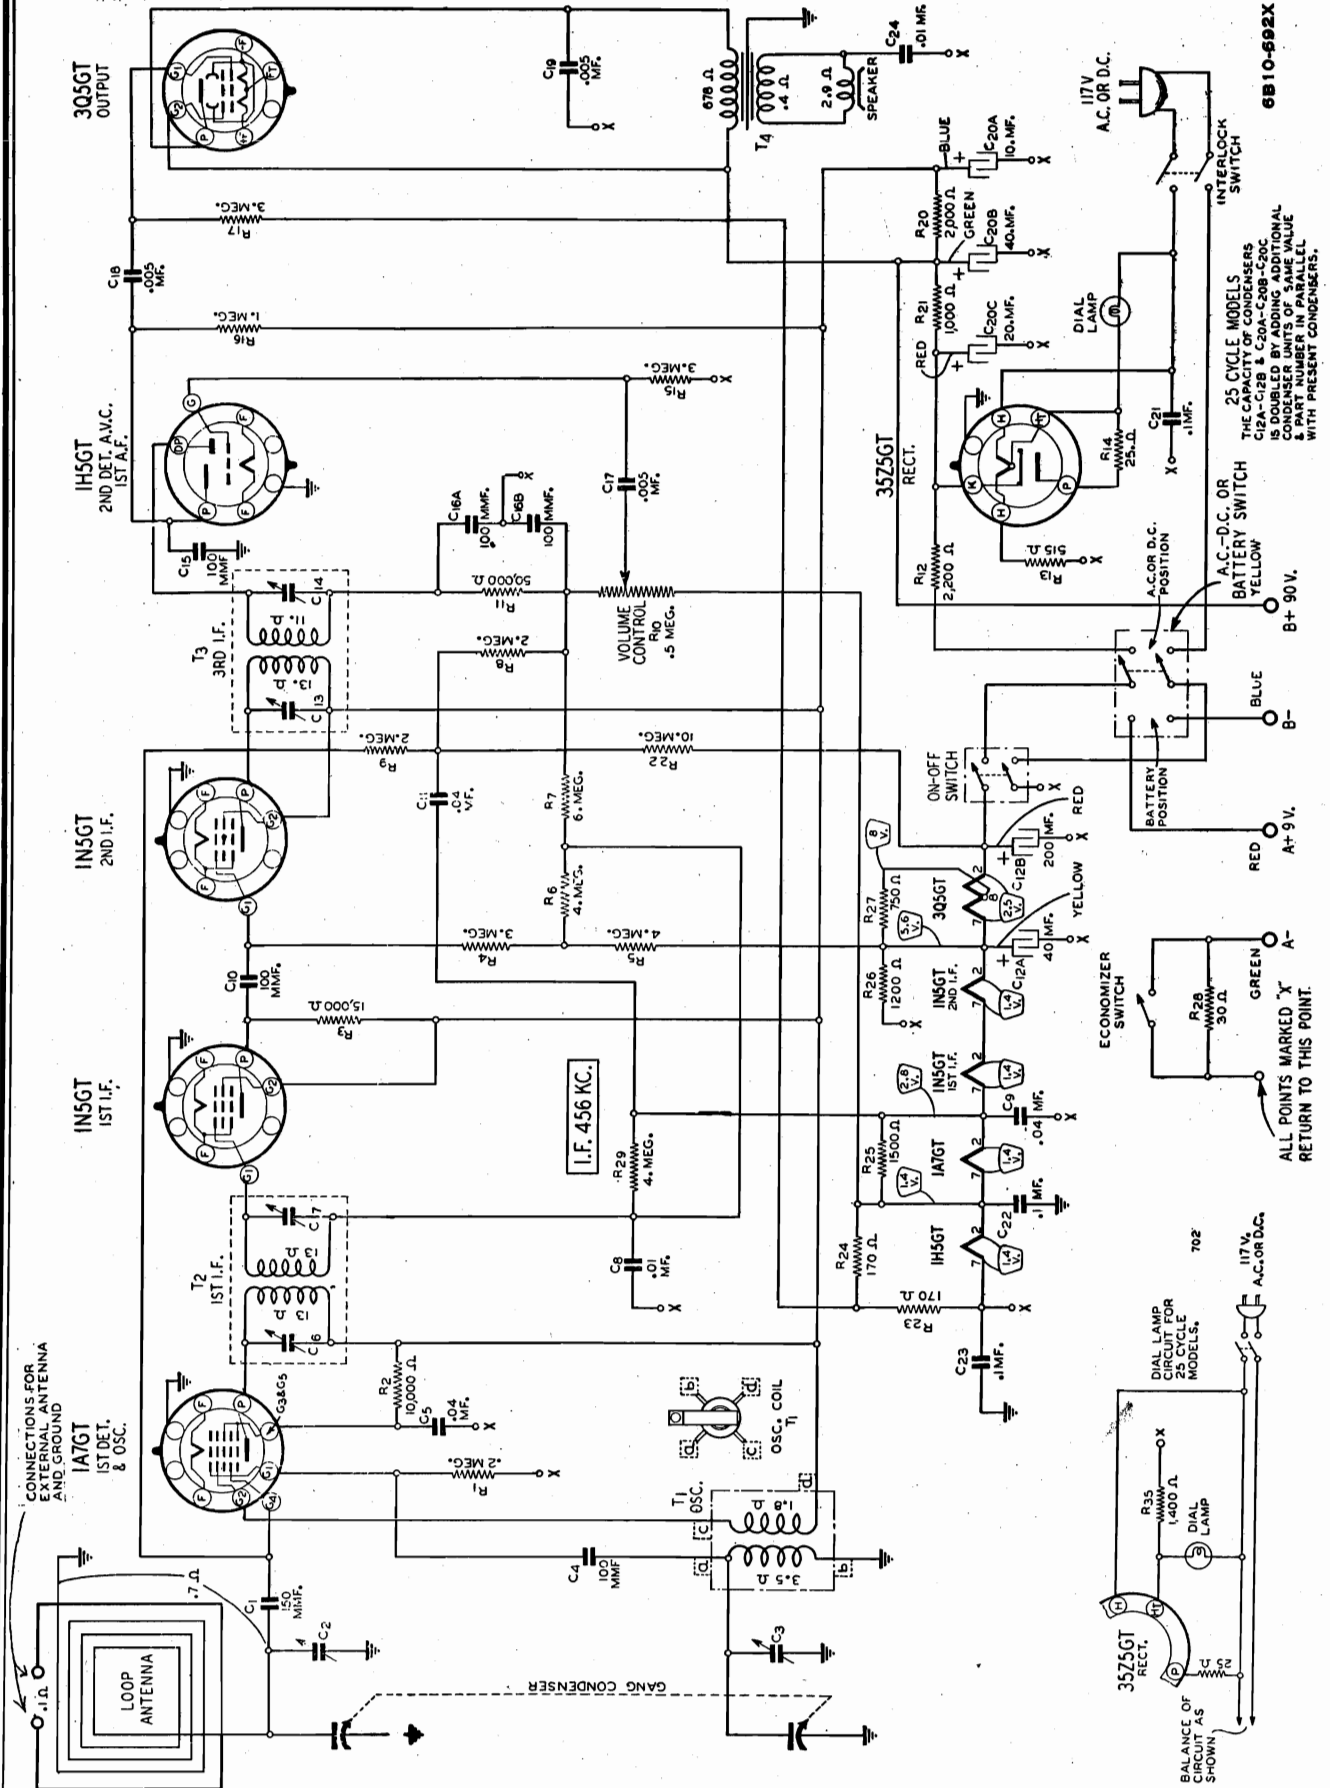

ANT. & GROUND TERMINALS—When using an external antenna and ground, move the metal strap shown above and fasten it under the screw marked "Ext."

The antenna and ground wires should then be connected to the terminals marked "Ant." — "Grnd."

IMPORTANT—Loosen the screws which hold the chassis to the cabinet and pull out the shipping strips under the chassis—The chassis will then rest on its rubber cushions. **POWER SUPPLY**—Unless your radio is marked otherwise, it must be operated from 105 to 125 volts, 50 to 60 cycle A.C. current. If in doubt, phone your electric light company. Receivers of this same model which are for use on special voltages are marked accordingly. When using your radio on A.C. current, reversing the plug may reduce station hum.

GAMBLE-SKOGMO, INC.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:

- A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output Indicating Meter—Non-Metallic Screwdriver.
- Dummy Antennas—.1 mf., 200 mmf.

SIGNAL GENERATOR			DUMMY ANTENNA	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration below)
FREQUENCY SETTING	ANTENNA CONNECTION	GROUND CONNECTION			
456 KC	External Antenna Clip on Loop	External Ground Clip on Loop	.1 mf.	Turn Rotor to full open	1st I.F. (C6) & (C7) 3rd I.F. (C13) & (C14)
1600 KC	External Antenna Clip	External Ground Clip	.1 mf.	Turn Rotor to full open	Oscillator (C3)
1400 KC	External Antenna Clip See Note A	External Ground Clip	200 mmf.	Turn Rotor to max. output	Antenna (C2)

SPECIFICATIONS

Input Voltages and Currents—Battery Operation

- "A" Batteries..... 9 Volts—50 Ma.
- "B" Batteries..... 90 Volts—11.5 Ma.

Power Consumption (At 117 volts AC Supply) 28 Watts
Power Output

- Battery Operation - - - - 150 Mw Undistorted
350 Mw Maximum
- AC Operation - - - - 200 Mw Undistorted
400 Mw Maximum

- Selectivity - 50 KC Broad at 1000 Times Signal
- Intermediate Frequency - - - - 456 KC
- Speaker - - - - 6" P.M. Dynamic
- Tuning Frequency Range - - 540 to 1600 KC
- Sensitivity (For 05 Watt Output)
External Antenna - - - 10 Microvolts Average

NOTE A—Re-assemble chassis in cabinet.
Close back on cabinet.

CALIBRATION—To obtain dial scale calibration, tune in an 800 KC signal. The pointer should be at the 800 KC mark on the dial. If it is not, loosen pointer set screw and set the pointer at the 800 KC mark. Retighten set screw.

MODEL 3058

GAMBLE-SKOGMO, INC.

Sensitivity—External Antenna—(For 0.5 Watt output)
 B Range..... 7 Microvolts Average
 D Range..... 15 Microvolts Average

SPECIFICATIONS

- Power Consumption 57 Watts (At 117 volts 60 cycles)
- Power Output..... 1.7 Watts Undistorted
 2.5 Watts Maximum
- Selectivity..... 40 KC Broad at 1000 times Signal
- Intermediate Frequency..... 456 KC
- Speaker 8" Electro-Dynamic

GAMBLE-SKOGMO, INC.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

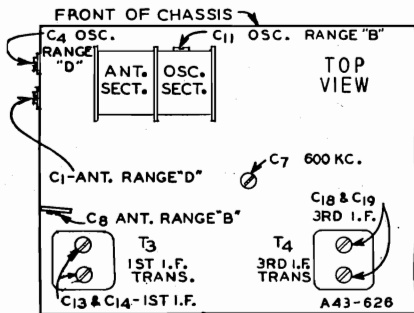

The following equipment is required for aligning:

An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

SIGNAL GENERATOR		BAND SWITCH SETTING		ADJUST TRIMMERS TO MAXIMUM	
FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA		CONDENSER SETTING	
Console Model—It is not necessary to remove chassis from cabinet. Merely remove chassis mounting screws so that chassis may be turned to reach oscillator trimmer on gang condenser.					
I.F.					
456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C13) & (C14) 3rd I.F. (C18) & (C19)
RANGE B					
1600 KC	External Antenna Clip or Lead	100 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C11)
1400 KC	External Antenna Clip or Lead	100 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1400 KC— See Note A	Ant. Range B (C8)
600 KC	External Antenna Clip or Lead See Note B	100 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C7) Rock Rotor—See Note C
RANGE D					
18,300 KC	External Antenna Clip or Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C4)
17,000 KC	External Antenna Clip or Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Ant. Range D (C1) Rock Rotor—See Note C
LOOP RANGE B					
1400 KC	External Antenna Clip or Lead See Note D	100 mmf.	B Range	Turn Rotor to Max. Output	Ant. Range B (C8)

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC. After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1400 KC on the dial, remove pointer from drive cord. Tune in a 1400 KC signal. Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—(Table Model) By means of wooden blocks, stand the loop aerial assembly upright exactly 4 inches from the back of the chassis.

NOTE C—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

NOTE D—(Table Model) Re-assemble chassis in cabinet. Replace back on cabinet. Connect ground post of signal generator to

external ground clip on loop antenna (Table Model) or ground screw on chassis (Console Model).

CAUTION—When aligning the short wave band, be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

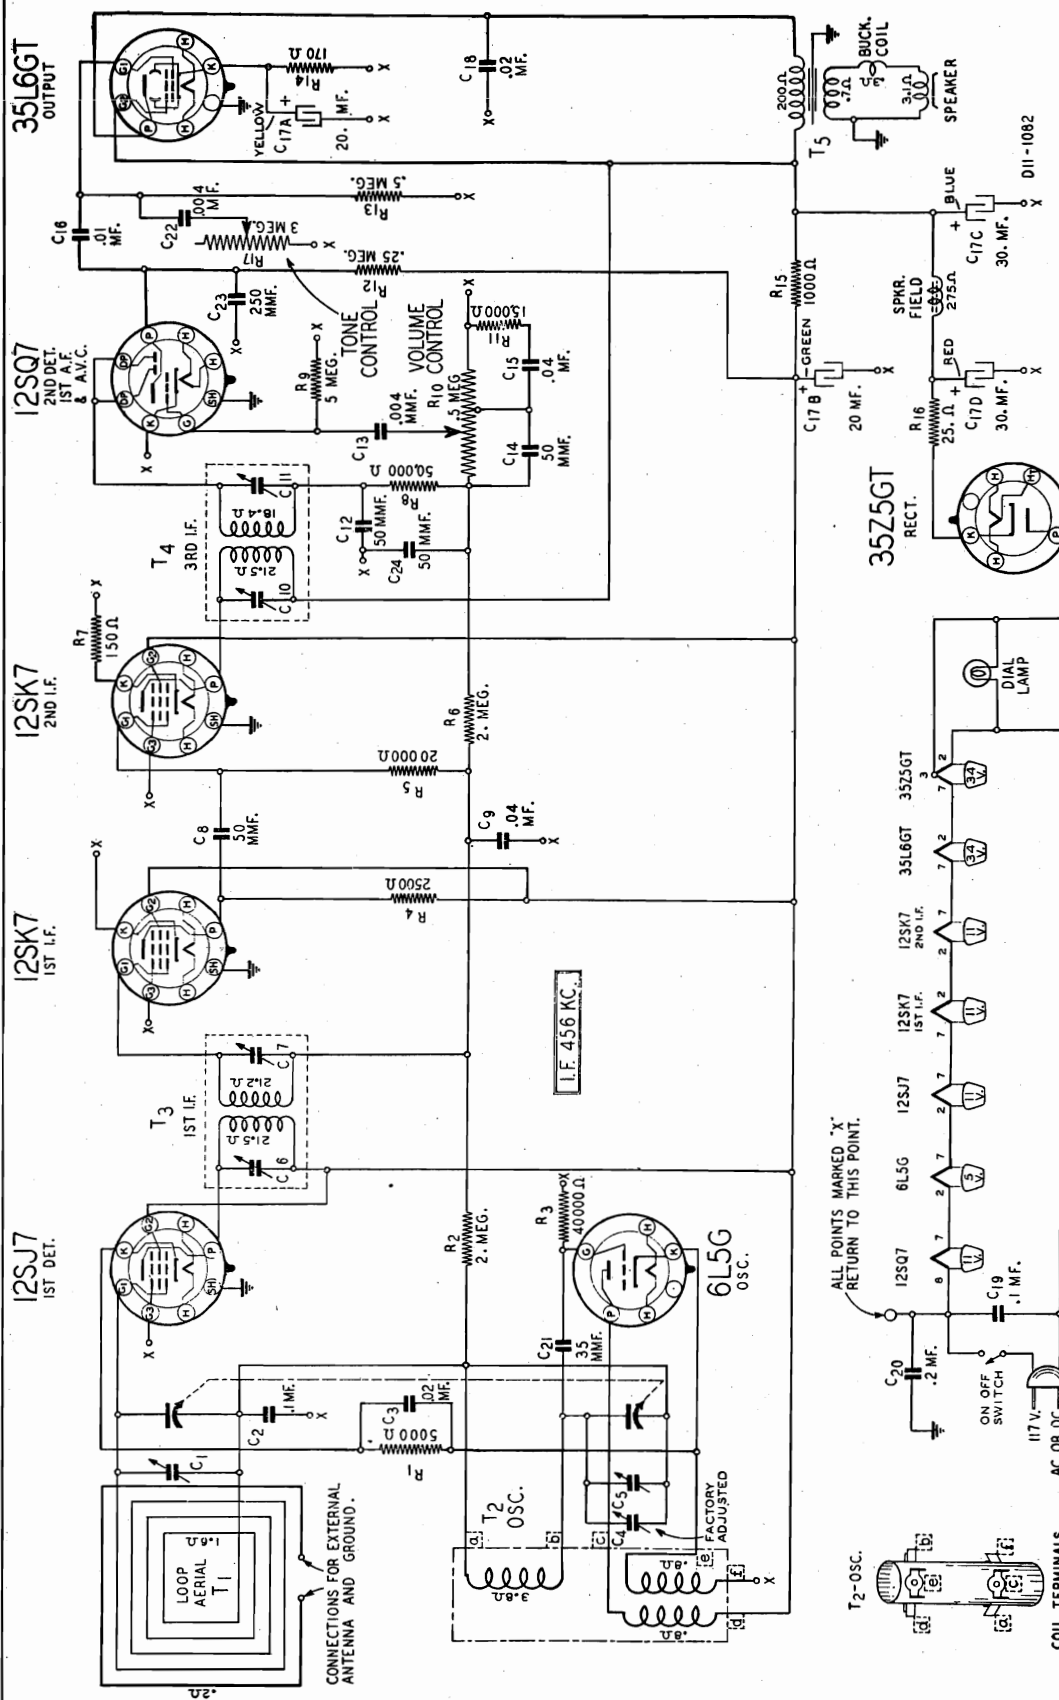

SPEAKER PLUG (Rear View)

In a few cases in the first shipments of this model, some of the speakers had reversed green lead and brown lead connections at the speaker plug. If hum is encountered, check these connections.

The illustrations below show the correct connections for the green (B+) and brown (plate) speaker leads.

BOTTOM VIEW OF CHASSIS

VOLUME CONTROL—MAXIMUM. READINGS TAKEN WITH 1000 OHMS-COLL METER. DIMENSIONS IN INCHES. DIMENSIONS IN PARENTHESES ARE READ ON 500 VOLT SCALE.

VOLTAGES AT SOCKETS FOR IIT V.A.C. LINE. ALL VOLTAGES EXCEPT HEATERS & DIAL LAMP ARE FOR HEATER & DIAL LAMP VOLTAGES. SEE SCHEMATIC.

ALL POINTS MARKED "X" RETURN TO THIS POINT.

GAMBLE-SKOGMO, INC.

MODEL 3128, Late
MODEL 4132

MODEL 4132 ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter—Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 200 mmf., and 400 ohms.

SIGNAL GENERATOR		DUMMY ANTENNA		CONDENSER SETTING		ADJUST TRIMMERS TO MAXIMUM	
FREQUENCY SETTING	CONNECTION AT RADIO	CONNECTION	BAND	SETTING			
I. F.	456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C13) & (C14) 2nd I.F. (C15) & (C16) 3rd I.F. (C22)	
RANGE B	1610 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C8)	
	1500 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1500 KC— See Note A	1st Ant. Range B (C11) 2nd Ant. Range B (C10)	
	600 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C5) Rock Rotor—See Note B	
RANGE D	18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C7)	
	16,000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Ant. Range D (C9) Rock Rotor—See Note B	
	6000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	6000 KC (C4) Rock Rotor—See Note B	

After each range is completed, repeat the procedure as a final check.
NOTE A—If the pointer is not at 1500 KC on the dial, remove pointer from drive cord. Set pointer at the 1500 KC mark on the dial scale. Attach pointer to drive cord.
NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

DRIVE CORD REPLACEMENT

Turn gang condenser to full open position. Using a new drive cord 50" in length, attach one end to tension spring. Fasten other end of tension spring to hook on drive pulley. Pass cord through slot in pulley rim and around idler pulleys A, B and C as shown. Pass cord through string guide.

MODEL 3128 ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
Allow Chassis and Signal Generator to "Heat-Up" for several minutes.
The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 200 mmf.

SIGNAL GENERATOR		DUMMY ANTENNA		CONDENSER SETTING		ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)	
FREQUENCY SETTING	ANTENNA CONNECTION	GROUND CONNECTION		SETTING			
I.F.	456 KC	Signal Grid of 1st Det.	Point "X" { 12SQ7— Connect at Stator of Large Gang Section. } 1st A.F.	.1 n.f.	Turn Rotor to Full Open	1st I.F. (C6) & (C7) 3rd I.F. (C10) & (C11)	
	1610 KC	Signal Grid of 1st Det.	Point "X"	.1 mf.	Turn Rotor to Full Open	Oscillator (C5) See Note A	
	1400 KC	External Antenna Clip	Point "X"	200 mmf.	Turn Rotor to Max. Output Set Indicator to 1400 KC— See Note B	Antenna (C1)	

SPECIFICATIONS

Power Consumption 28 Watts (At 117 volts AC Supply)
Power Output75 Watt Undistorted
..... 1.3 Watts Maximum
Selectivity... 49 KC Broad at 1000 times Signal.
Intermediate Frequency..... 456 KC
Speaker 5" Electro-Dynamic
Tuning Frequency Range 528 to 1610 KC
Sensitivity (For .05 watt output)—External Ant. 9 Microvolts Average

MODEL 3128

After each range is completed, repeat the procedure as a final check.
NOTE A—Adjust Oscillator (C5) trimmer on gang condenser. Oscillator (C4) auxiliary trimmer on other

side of gang is adjusted at factory and ordinarily need not be readjusted in the field.
NOTE B—If the pointer is not at 1400 KC on the dial, set pointer at this mark on the dial scale.

SPECIFICATIONS

Power Consumption	1.60 Amperes at 36 Volts DC
Power Output	.17 Watt Undistorted .40 Watt Maximum
Selectivity	30 KC Broad at 1000 times Signal
Sensitivity (For .05 watt output)	6.0 Microvolts Average 8.0 Microvolts Average
Intermediate Frequency	456 KC
Speaker	6" or 8" Electro-Dynamic
Tuning Frequency Range	535 to 1610 KC (Kilocycles)
B Range	5750 to 18300 KC (Kilocycles)
D Range

IMPORTANT - METAL BASE TUBES MUST BE USED IN THOSE SOCKETS AT WHICH SHIELDS ARE SHOWN.

ALL POINTS MARKED X RETURN TO THIS POINT.

NOTE: CHASSIS GROUND ONLY. (NOT EXTERNAL)

VOLTAGE AS READ WITH 117 VOLT A.C. LINE. ALL VOLTAGE EXCEPT HEATERS AND DIAL LAMP ARE BETWEEN SOCKET TERMINAL & -B (INDICATED BY "X")

A.C.-D.C. OR THE FOLLOWING NEW PART IS USED ON ISSUE "D" MODELS:
 BATTERY SWITCH
 A.C. OR D.C. POSITION
 117 V. A.C. OR D.C.

Part No.	Code	Description	List Price
B+ 90 V.	C23	.10 mf., 360 volt, tubular cond.	\$.015
B-			
A-			
A			

Removing Chassis from Cabinet

Take out the 2 screws, one at each side on the outside of the cabinet. Grasp the chassis shelf at each rear corner and edge it away from the cabinet front until the chassis shelf and chassis slide easily out of the cabinet.

To remove the shelf from the chassis, take out the bolt and the 2 screws at the bottom of the shelf.

Using Radio Without Batteries—The radio may be used without batteries when it is operated on AC-DC. If this is done, tape the prongs of the battery plugs to prevent them from accidentally touching each other, and place the plugs and cables in the battery compartment.

Two 4 1/2 Volt "A" Batteries—Portable Size
4" x 1 3/4" x 4 1/4" High

Two 45 Volt "B" Batteries—Portable Size
4 1/2" x 2 1/2" x 5 1/4" High

Caution

The metal chassis is connected to one side of the line through a .10 mfd. condenser. Both AC and DC power lines are generally grounded on one side. If the side of the line not connected to the metal chassis through this condenser is grounded and the metal chassis comes in contact with an external ground, this condenser will be connected across the line and there will be an increase in hum.

Therefore, in any service work on the chassis, keep it on a wood or other insulated surface to avoid contact with ground. The person working on the set should avoid getting in contact with any ground.

CHANGES MADE FOR ISSUE "D" March 11, 1940

To satisfy additional Underwriters requirements, the chassis has been isolated from the AC-DC line except for a connection through a .1 mf. condenser - See schematic. On these models the battery wires are held by a clamp located under the chassis shelf. On previous issues this clamp was above the shelf. The battery compartment cardboard fillers have been made smaller to clear the above mentioned clamp.

On chassis with the above changes incorporated, the issue letter becomes "D."

All voltages on this issue chassis except the heaters and dial lamp are measured between socket terminal and B- (indicated by "x") - See schematic

NOTE A—Chassis must be in cabinet. Connect a loop approximately one foot in diameter across the antenna and ground posts of the signal generator. The back of the cabinet must be in place. Place radio approximately 3 feet from loop so as to pick up signal. Radio should not be in proximity to any metal (metal bench, etc.).

CALIBRATION (For models with pointer in front of dial scale)—To obtain dial scale calibration, tune in an 800 KC signal. The pointer should be at the 800 KC mark on the dial. If it is not, hold the pulley at the back of the dial and loosen the pointer screw. Set the pointer at the 800 KC mark. Hold the pointer and retighten the pointer screw.

ALIGNMENT PROCEDURE

The following equipment is required for aligning:
A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter—Non-Metallic Screwdriver.
Dummy Antenna—.1 mf.

Series 6B7

CHANGES MADE FOR ISSUE "B"
To satisfy Underwriter's requirements, the chassis issue will become "B" when several changes in the routing of wires and the arrangement of parts in the chassis have been made.

Chassis with these changes have had the 6 lug terminal strip 4A98 removed.

PROLONGING TUBE LIFE - CHANGES FOR ISSUE "C"

To compensate for variations in tube characteristics as well as high line voltages, the following changes have been made in the filament series circuit to reduce the voltages across the tube filaments and to prolong tube life.

Resistor R12, which is in series with the filament series, has been changed from 1950 ohms to 2200 ohms.

There was unequal emission from the 2 sections of the filament of the 3Q5GT output tube. This caused unequal voltages across the 2 sections of the filament and shortened the tube life. There is now a 750 ohm resistor (R27) across one section which equalizes the currents through both portions.

The four 1 1/2 volt tube filaments were shunted with 1200 ohms - Resistors R19 - 800 ohms and R18 400 ohms (See old schematic). The connecting point between these 2 resistors established the grid (bias) voltage for the output tube. These 4 tubes are now shunted by one 1200 ohm Resistor R26.

The 1A7GT 1st Detector Filament is now shunted with a 1500 ohm resistor - R25.

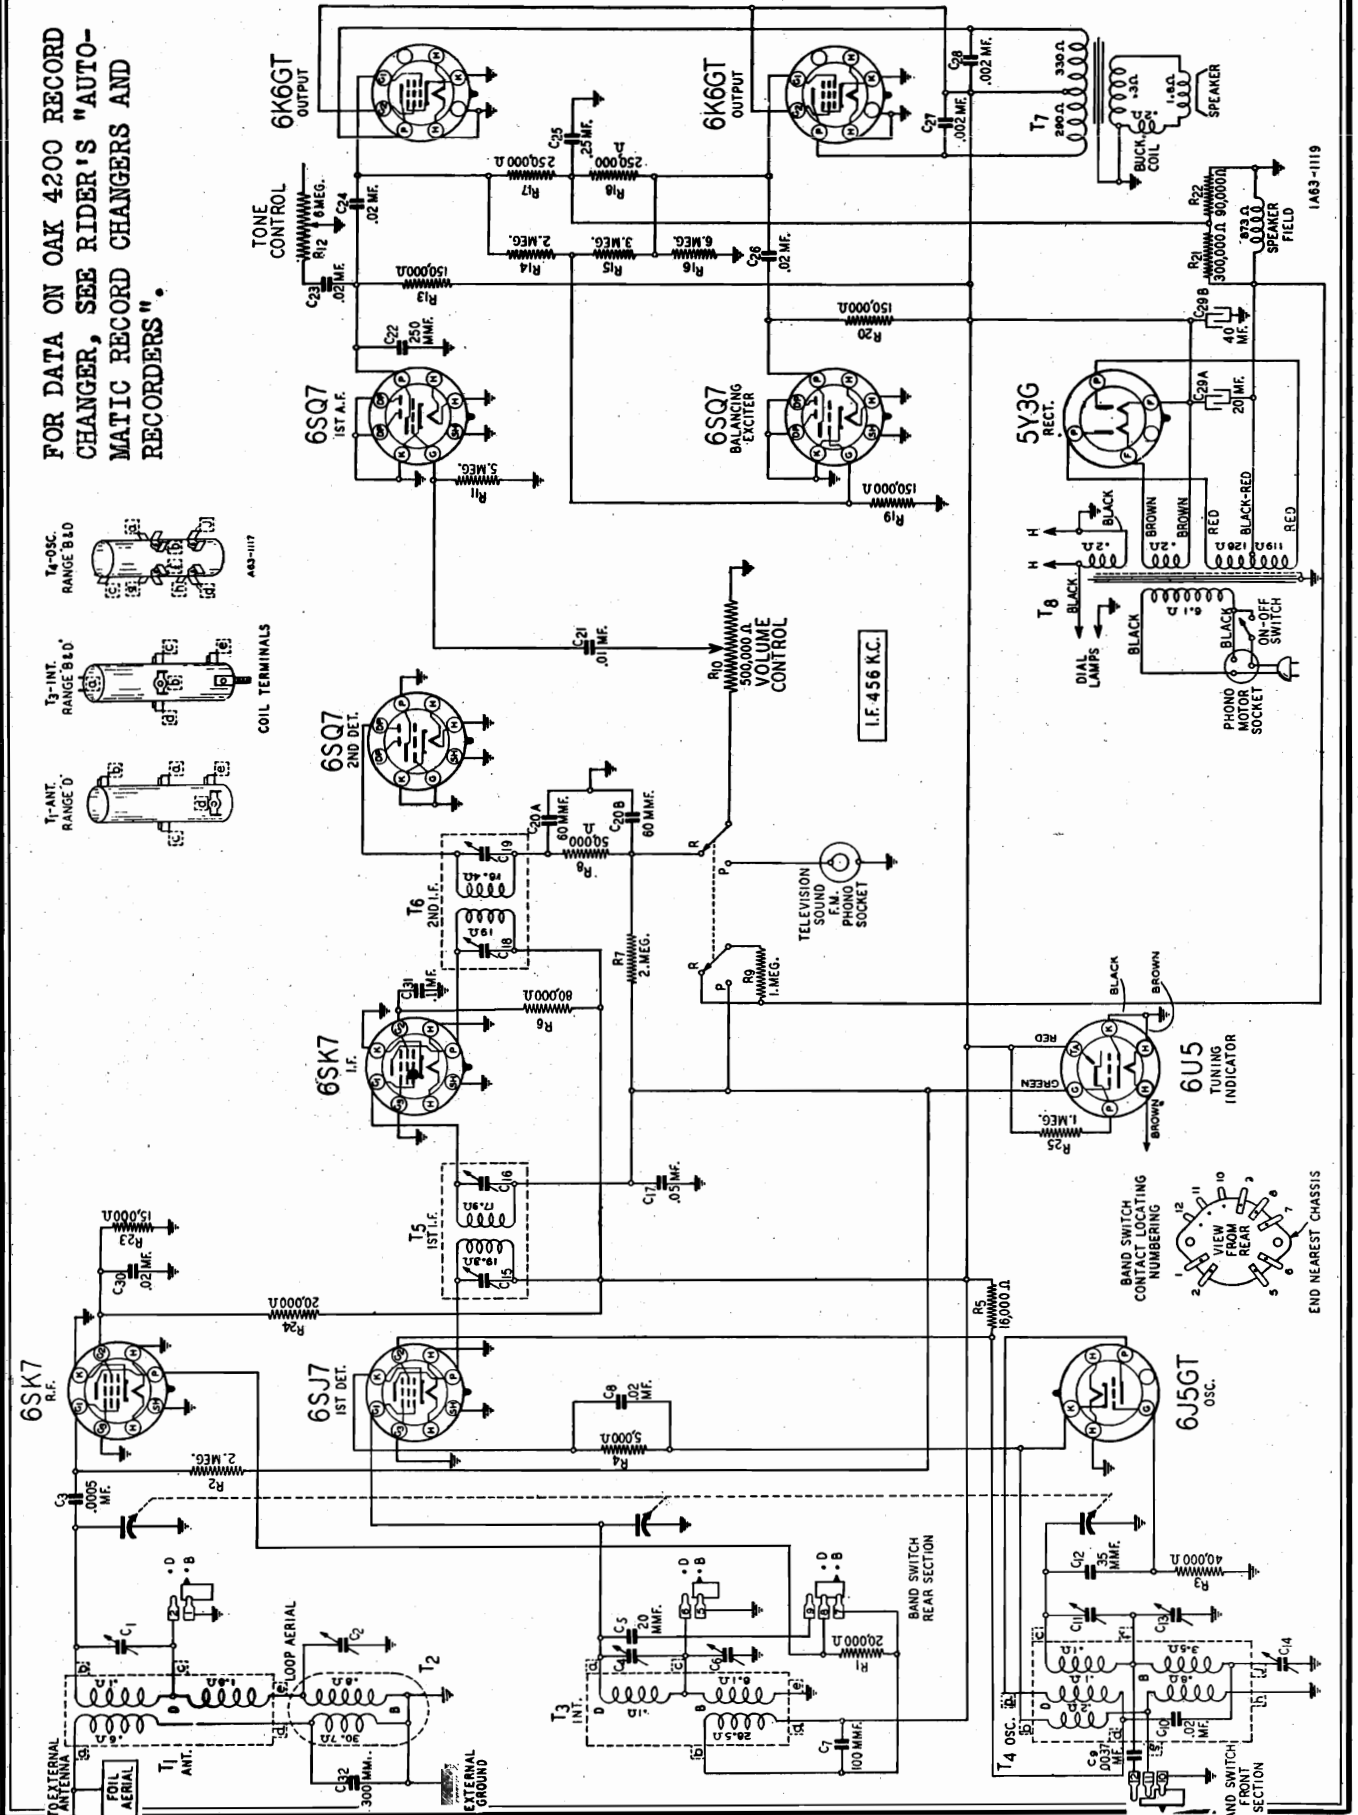

The 1H5GT 2nd Detector Filament is now shunted with 340 ohms - Resistors R24 and R23 in series. The connecting point between these 2 resistors establishes the grid (bias) voltage for the output tube.

VOLTAGES AT SOCKETS
UNLESS OTHERWISE INDICATED, THE VOLTAGE SHOWN IS BETWEEN SOCKET TERMINAL & GROUND. THESE VOLTAGES ARE READ UNDER THE FOLLOWING CONDITIONS:
LINE VOLTAGE 117 A.C.
VOLUME CONTROL MAXIMUM.
READINGS TAKEN WITH 1000 OHM-PER-VOLT METER. PLATE & SCREEN VOLTAGES ARE READ ON 500 VOLT SCALE. ANT. LEAD GROUNDED. BAND SWITCH IN "BROADCAST" POSITION.

DRIVE CORD REPLACEMENT

Turn gang condenser to open position. Use new drive cord 55" in length. Secure one end of tension spring to hook on drive pulley. Bend spring around drive pulley shaft—see illustration. Pass cord through slot in

pulley rim. Wind cord 1/4 turn clockwise (from drive pulley end of chassis) around drive pulley. Pass cord around idler pulleys A, B, C and D as in illustration. Then wind cord 2 1/2 turns clockwise (from front of chassis) around tuning shaft spool. These turns should progress away from chassis. Pass cord over top of drive pulley for 3/4 turn clockwise (from drive pulley end of chassis) and through slot in pulley rim. Fasten cord to tension spring—see illustration.

NOTE A—If the pointer is not at 1400 KC on the dial, remove pointer from drive cord. Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

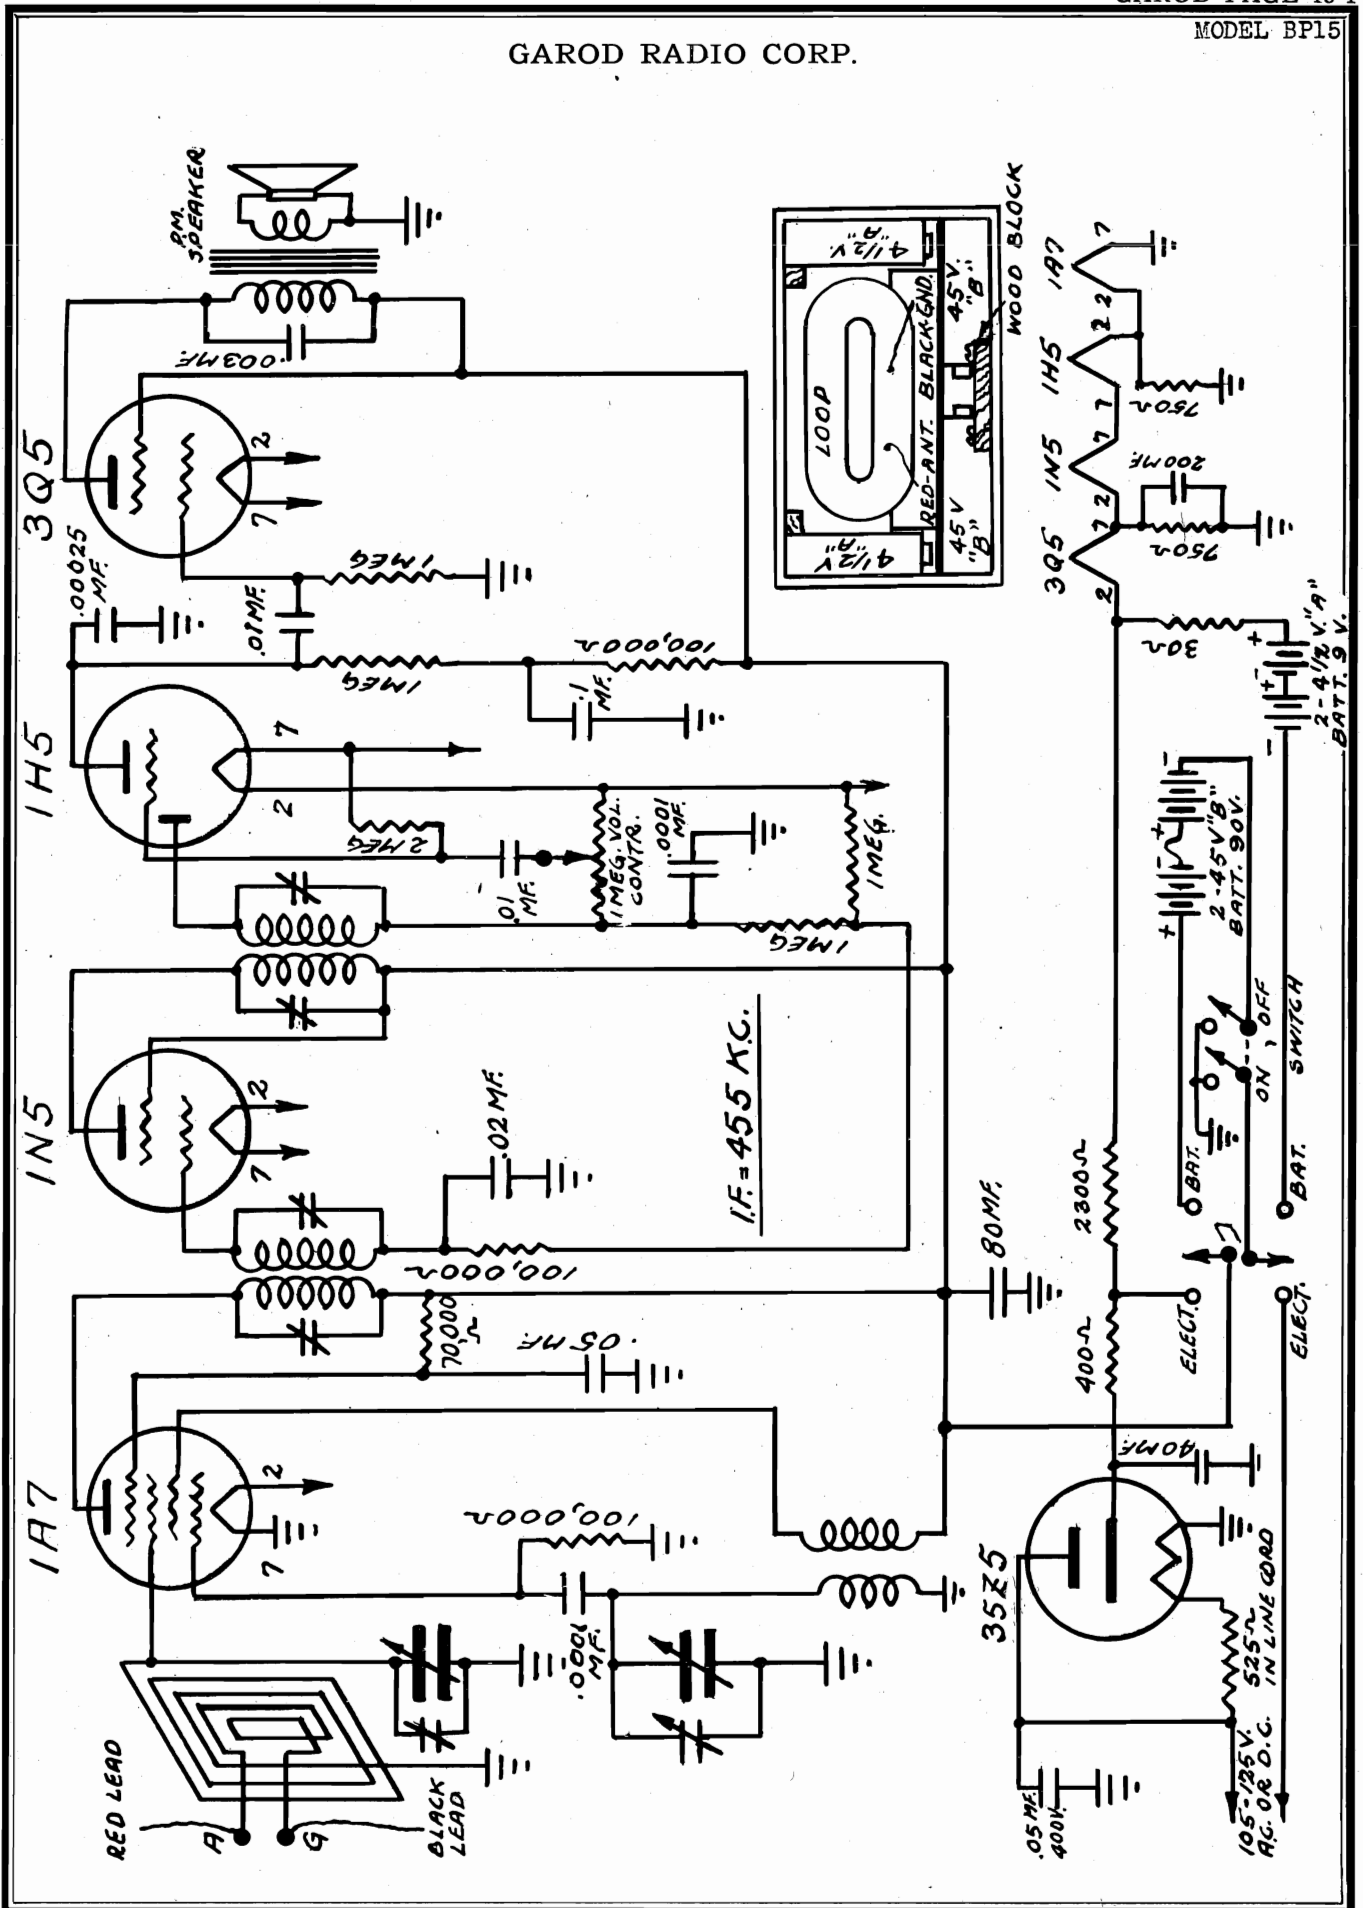

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning: An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed. Output Indicating Meter—Non-Metallic Screw-driver. Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

MODELS C124, 1444, 1454,
1464, 1474, 4014

Realignment of this receiver should not be attempted unless all other possible causes of faulty operation have been thoroughly investigated. An accurately calibrated signal generator which will cover the necessary wave-bands and an output meter for indicating the effect of adjustments are required.

It is important to remember that, in receivers of this kind which are equipped with automatic volume control, it is necessary to use the minimum possible signal from the signal generator; otherwise the A.V.C. action will tend to nullify the control at its maximum position, the I.F. trimmers are adjusted for maximum output. These trimmers may be found on top of the I.F. transformer shield cans.

The controls on this receiver are as follows: (from left to right)

- (1) Band Switch
- (2) Band Expansion (High Fidelity)
- (3) Volume & Phono Switch
- (4) Tone Control & Line Switch
- (5) Tuning.

All packing should be removed before attempting to set up the receiver. The tubes should be examined to make sure that they are mounted firmly in their sockets, as they may be jarred loose in shipment.

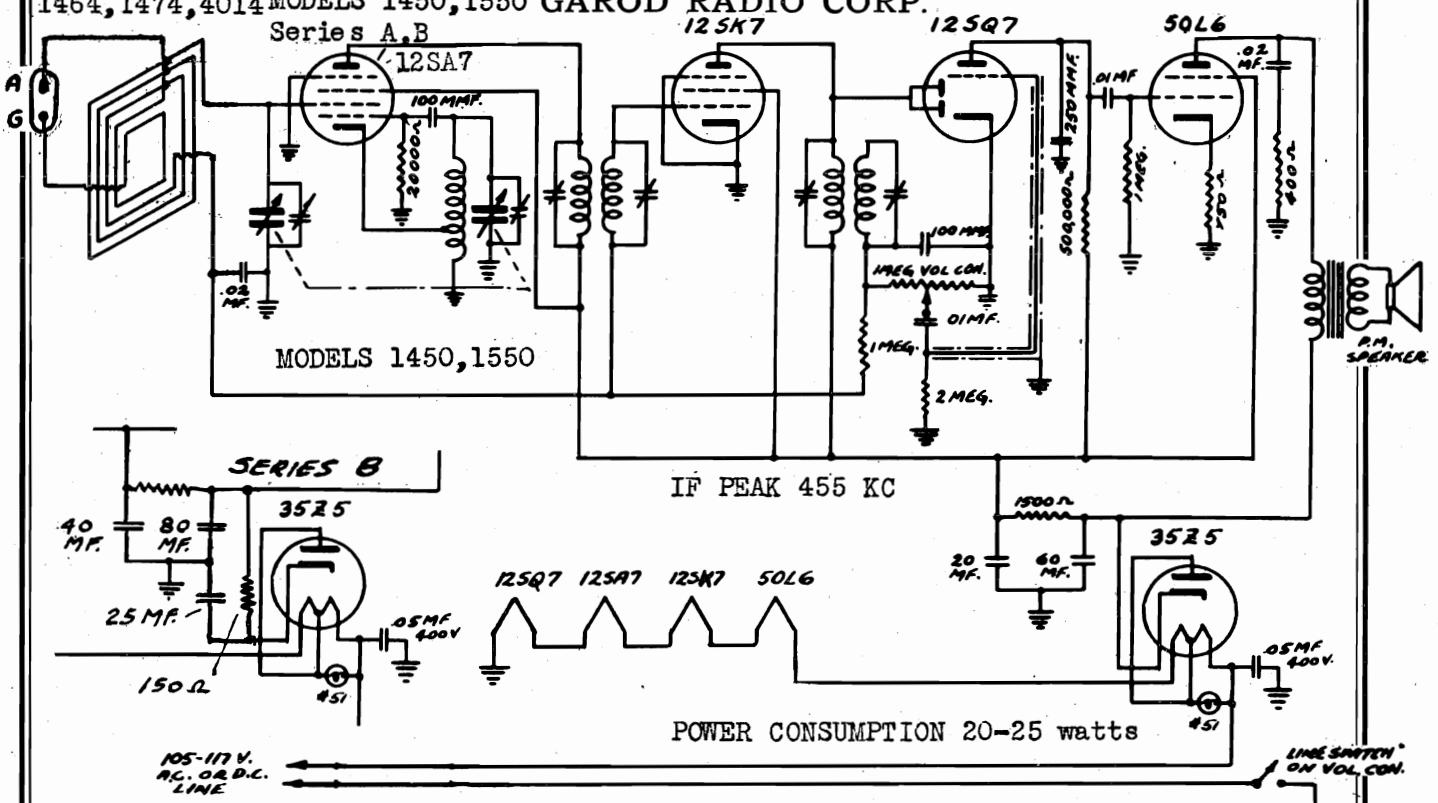

ANTENNA - A highly selective loop antenna is included in the cabinet of this receiver. By turning the cabinet slightly, maximum volume with a minimum of noise may be had. Where conditions do not permit placement of the receiver in a position for best reception, it may be desirable to connect a short antenna to the binding post marked "A" which is located on the Loop Antenna. Where reception from greater distances is desired, it is necessary to install a well-insulated outdoor antenna about 50 feet long.

BROADCAST BAND: The dummy antenna for this band should consist of a 250 mmfd condenser only. The signal generator is set at 1620 kc, the band switch set at broadcast position. The variable condenser should be opened so that the maximum response on that frequency (1620kc) is indicated. The dial pointer should coincide with the 1400 kc mark on the dial. Now adjust the interstage trimmer for maximum output. The signal generator is then set at 600 kc and the receiver is tuned until a response is indicated. The padder condenser is then adjusted for maximum gain while the tuning gang condenser is rocked slightly to the left and right. The antenna loading coil is now set for a maximum. This is located on top of the chassis behind the gang condenser. The 1400 kc adjustment should then be rechecked.

LONG WAVE BAND: The band selector switch is set in position for operation on the long wave band. The receiver and generator are both tuned to 300 kc and the oscillator trimmer is adjusted for maximum response. The antenna and first detector trimmers are adjusted in the order named for maximum output. The signal generator is then set at 150 kc and the signal is tuned in. The wave padder condenser is adjusted for maximum response while the tuning gang condenser is rocked slightly to the left and right. The 300 kc adjustment should then be rechecked.

FIRST SHORT WAVE BAND: The band selector switch is set in position for operation on the first short wave (second from left). The variable condenser is opened so that the plates are completely unmeshed and the oscillator trimmer is opened to its maximum capacity. The signal generator is set to 7.6 mc and the oscillator trimmer is increased in capacity until a response is heard. Two responses are possible and it is important that the higher frequency response (oscillator trimmer low capacity) be used. Set the signal generator at 7 mc and turn the tuning control until a response is indicated on the output meter. The pointer should coincide with the 7 mc marker on the dial. The antenna preselector trimmer is then adjusted to maximum output. After high frequency adjustments have been made, set the signal generator at 2.5 mc and turn the variable gang condenser until a response is observed. The load just the padding condenser for this band for maximum gain while rocking the tuning control slightly to the right and the left. The higher frequency adjustment should then be rechecked.

MODELS C124, 1444, 1454,
1464, 1474, 4014 MODELS 1450, 1550 GAROD RADIO CORP.

ALIGNMENT

Should it become necessary to realign the receiver at any time, proceed in the usual manner by first adjusting the I.F. transformers, for maximum output as indicated by an output meter connected across the voice coil. Then turn the dial to 1500 KC. Set the signal generator (or 1500KC local station) to this frequency and tune in the signal by means of the oscillator trimmer on the variable condenser, (Front section). Then adjust the antenna trimmer for maximum output. No other adjustments are necessary.

INFORMATION

When connecting this record player to an a-c/d-c receiver insert a .25 mfd. 400 V. paper capacitor between the black lead of the record player and the chassis ground, and a .005 or .01 mfd., 400 V. paper capacitor between the green lead of the record player and the circuit tapped in the radio.

Radio Receiver Connections

There are several different methods which may be used to connect the record player to the radio receiver depending upon the provisions incorporated in the radio for handling phonograph connections and upon the type of installation desired. Several methods are outlined below for super-heterodyne receivers.

The process of changing from radio reception to record-player operation and vice versa requires either the manual insertion of the record-player leads in the radio circuit each time the process is performed or the use of a switch to automatically perform the operation. The convenience of a switching arrangement will so far outweigh the labor involved in manual operation that the slight additional cost of a switch will pass unnoticed.

There follow several general methods of installation which should not be assumed to be comprehensive or all-conclusive.

Method No. 1.—(For radios equipped with phono pin-jack terminals.) The Model HM-3 is equipped with a plug for connecting to radios equipped with a phono pin jack. The green lead of the record player is connected to the pin terminal and the black lead to the shield of the plug. Some radio models automatically switch to record-player operation when the plug is inserted in the terminal; other models require pushing or rotating a switch incorporated on the radio control panel.

Method No. 2.—(For radios equipped with phono terminals.) Consult the instruction pamphlet which was supplied with your radio to determine which phono terminals are for connections to the record player. There may be three or four terminals, depending upon the type of radio. Determine which terminal is connected to the high side of the volume control. For radio operation, there will be a link connection between this volume-control terminal and the radio diode load terminal. On a three-terminal board, the remaining terminal will be chassis ground. On a four-terminal board, one of the remaining terminals will be chassis ground and the other a diode return.

Using manual insertion of the record player into the radio circuits, it is only necessary to remove the link from between the diode load and volume-control terminals and reinsert it between the diode load and chassis ground terminals (on a three-terminal board), or between diode load and diode return (on a four-terminal board). The green lead on the record player is then connected to the volume control terminal and the black lead to the chassis ground terminal. To return to radio operation, merely remove the link and reinsert between the diode load and volume-control terminals.

It may not be necessary to disconnect the record-player leads when returning to radio operation depending upon the circuit design in your radio receiver. If the tone quality and volume are impaired when the record player remains connected, then it will be necessary to remove the record-player leads from the radio terminals each time you turn from record-player performance to radio reception.

Using switch operation requires the use of a double-pole, double-throw toggle or rotary switch. The general method of connection is as shown in Fig. 1.

The record player can remain permanently connected when using this method of switch connection.

Some late radio models have the switch already incorporated in the push-button assembly.

Method No. 3.—(For radios not equipped with phono or pin-jack terminals but on which phono terminals are to be located.) First, pull the radio power-cord plug out of the power-supply socket; then remove the radio receiver chassis from the cabinet to allow access to the high side of the volume control. Unsolder the lead from the high side of the volume control and solder it on to one lead of a two-conductor shielded pair. Solder the other conductor of the shielded pair to the high side of the volume control. This shielded pair should be long enough to extend to the outside rear of the radio chassis. Solder the shields to the chassis. Procure a three-terminal board and mount it on the shelf of the cabinet at the rear of the chassis. Connect the shield to one outside terminal and the new volume-control conductor to the other outside terminal, leaving the center terminal for the remain-

ing conductor. Connect the record player to the two outside terminals. When record-player operation is desired, interconnect the center terminal and the shield terminal. When radio operation is desired, interconnect the center terminal and the volume-control terminal. It may be necessary, depending upon the circuit in your radio receiver, to remove the record-player leads from the terminals each time radio reception is to be enjoyed. Tone and volume performance will indicate connection requirements. A switch may be inserted to perform the change-over operations by connecting as shown in Fig. 1. (Read descriptive material pertaining to Fig. 1.)

Method No. 4.—Some radio models will permit satisfactory record-player operation with the green lead of the record player connected to grid of the first audio tube and the black lead connected to the chassis ground. This method, however, requires tuning the radio to a dead spot on the band and may, in addition, require shorting the antenna to ground. NOTE.—Do not remove radio grid lead from the first audio tube.

**The above instructions apply to the
Models JM-3 and JM-4 as well as to
Model HM-3.**

Alignment Frequency 1500 kc.

ALIGNMENT

Connect the high side of the signal generator through a 250 mmf. condenser to the antenna lead. The low side of the signal generator output should be connected to the receiver chassis through a .05 mfd. condenser. Connect a suitable output meter across the voice coil leads; then proceed as follows:

1. With gang condenser plates completely closed, the dial pointer should coincide with the horizontal dial line.
2. Tune receiver to the 1500 kc. point on the dial; then align trimmers (C-3 and C-5) on the gang condenser at 1500 kc. for a maximum output meter reading.

Precaution—One side of the power supply is connected to the chassis—Do not connect chassis to any external ground.

MODEL HE-74
MODEL J-629

GENERAL ELECTRIC CO.

ALIGNMENT PROCEDURE

Alignment Frequencies

I.F. 455 KC R.F. 1500 and 580 KC
The location of all trimmers is shown in Fig. 1.

I.F. Alignment

Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 KC and keep the oscillator output as low as a readable meter reading will permit.
Apply signal to the grid of the 6SK7GT through a .05 mfd. capacitor and align the 2nd I.F. transformer. Repeat the procedure, applying the 455 KC signal to the control grid of the 6SA7GT and aligning the 1st I.F. transformer. Finish by over-all adjustments.

R.F. Alignment

With gang condenser plates completely closed, set dial pointer to the first mark at the left end of the scale. Apply a 1500-KC signal either through a standard I.R.E. dummy to the antenna terminal or through an additional loop connected to the generator output which can be magnetically coupled

to the receiver Beam-a-Scope. Align (C-2) at 1500 KC and peak (C-1) for maximum output. Peak (C-3) on 580 KC while rocking the gang condenser. Retrim at 1500 KC.

Special Service Information

The following data will be very useful to servicemen equipped with vacuum-tube voltmeters or similar voltage-measuring instruments.

- (1) Stage Gains
Antenna Post to Converter Grid—6 at 1000 KC†
Converter Grid to 6SK7GT Grid—30 at 455 KC†
6SK7GT Grid to 6Q7GT Det. Plate—100 at 455 KC†
- (2) Audio Gains
.06 volts, 400 cycles signal across volume control with control set to maximum will give approximately 1/2-watt speaker output.
- (3) DC voltage developed across oscillator grid resistor (R-1) averages 12 volts.

† Variations of +10, -20% permissible.

BAND CHANGE AND TONE CONTROL SWITCHING

The following charts show the switch points connected for any one position of either the wave change or tone control switches. The numbers shown in each box indicate the switch points connected together in the section of the switch for each position of the switch. As for example: the numbers 5-9-10 indicate these switch points are all connected together for this particular position of the switch.

Variations of ±20% permissible. All measurements taken with R-26 shorted across.

VOLTAGES INDICATED BY ASTERISK (*) ARE AC VOLTAGES. VOLTAGES READ WITH 1000 OHMS/VOLT METER ON 250-VOLT SCALE

CONVERSION FOR SPECIAL LINE VOLTAGES

The Models X-108 and X-118 can be converted for operation on the following line voltages. In all cases where the power transformer is replaced with a ballast resistor, the power transformer must be removed from the chassis as the radiant heat from the ballast resistor is likely to injure the transformer insulation. When operated with these special resistors and lower power supplies than 220 volts, the audio power output and socket voltages will be reduced.

220 Volts AC/DC—(Range 200-240 Volts)

Remove transformer from chassis of X-108, insert ballast tube resistor RR-7003, and change label to read X-118.

180 Volts DC—(Range 160-200 volts)

Remove transformer from chassis of X-108 or ballast RR-7003 from X-118; insert the ballast tube resistor RR-7004 and change the label on the receiver so that it reads Model X-118Y?

NOTE—The 8200 ohm, 1 watt resistor (R-35) shown in dotted lines for the RR-7004 ballast tube schematic is not a part of the ballast tube. In order to increase the sensitivity and power output of this receiver when operating in this voltage range, this resistor may be installed externally across the terminals 1 and 8 of the ballast tube socket.

117 Volts DC—(Range 105-129 Volts)

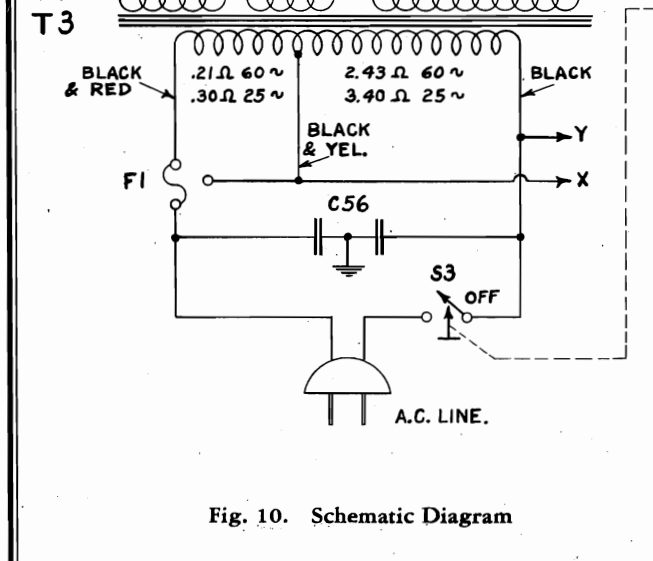

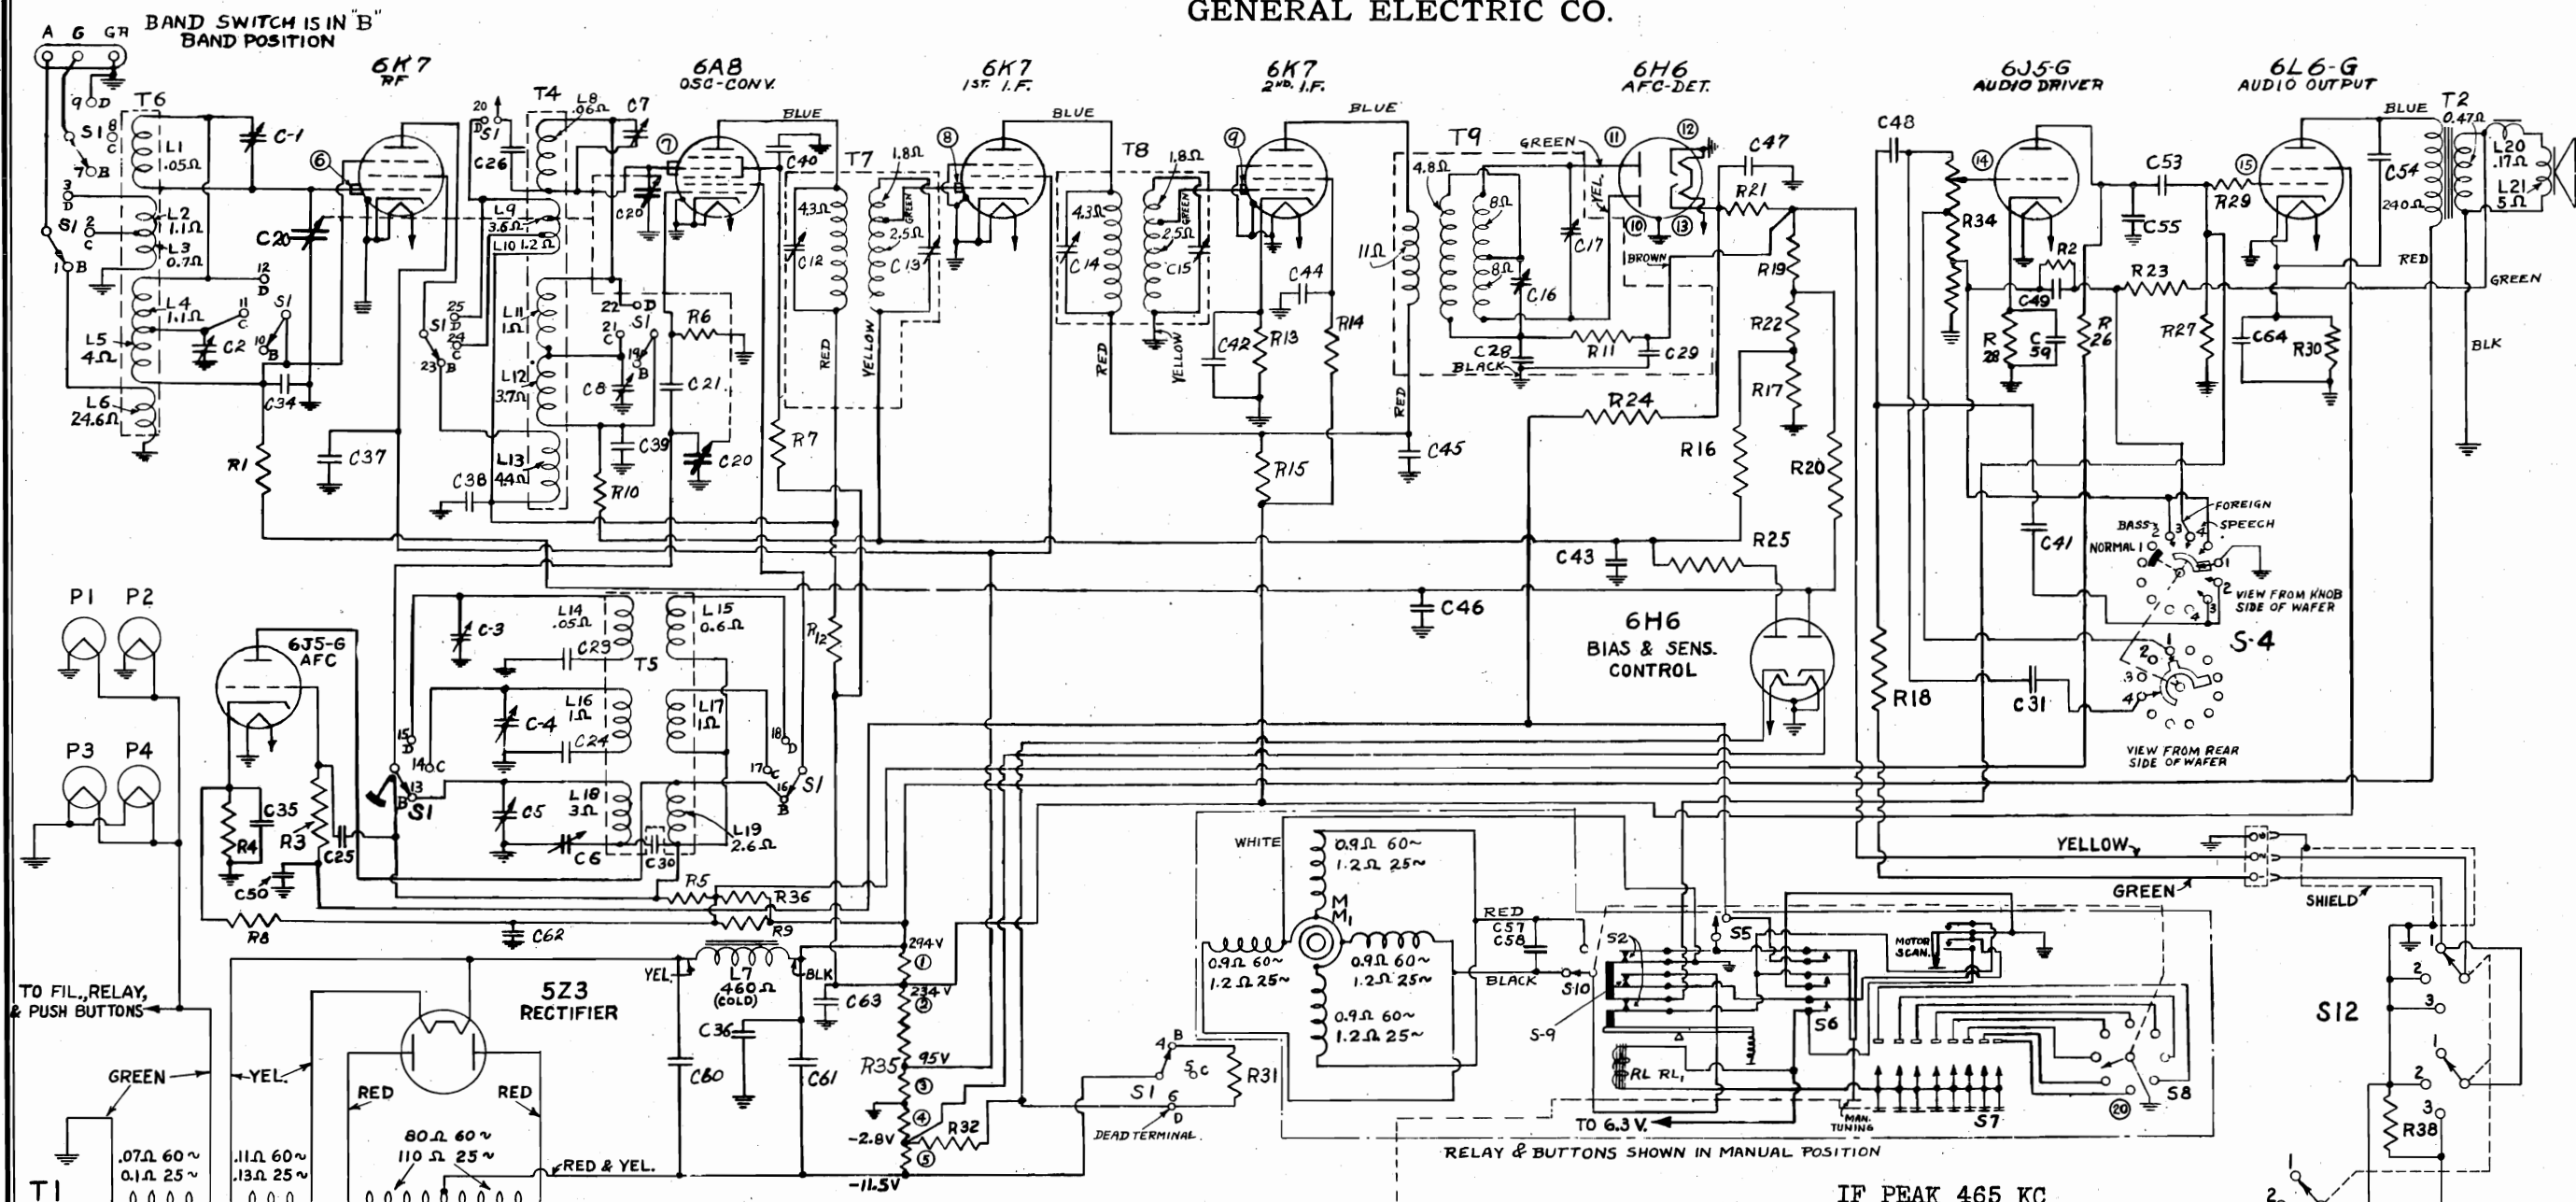

Remove transformer from chassis of X-108 or ballast RR-7003 from X-118; insert the ballast tube resistor RR-7005 and change the label on the receiver so that it reads Model X-118Z.

NOTE—The power output on this receiver can be raised if the resistors R-18, R-24 and R-25 are shorted across.

Two other transformers are available for AC operation. The transformer T5 can be substituted in the Model X-108 receiver for operation on 25-cycle circuits. Remark the label so that it reads Model X-108C. The special duty transformer T6 can be used in the Model X-108 receiver for operation on 50/60 cycle circuits where a 145-volt tap is required. Remark the label on the receiver so that it reads Model X-108X.

The cold resistance of all ballast tubes is shown directly on the schematic diagram, Fig. 2.

ALIGNMENT PROCEDURE
I.F. Alignment with Oscilloscope

Band Switch Setting	Input Frequency	Point of Input	Dummy Ant.	Trimmer (See Fig. 9)	Remarks
1. Band "B"	465 kc. Sweep	2nd I.F. Grid	.05 Mfd.	3rd I.F. Pri. (C-16)	A.F.C. switch "off"—Condenser gang at minimum capacity—vertical input ground and the junction of R-18, C-16 and R-19 connected across the 3rd I.F. trimmer. Adjust trimmer for maximum amplitude. The resulting curve with input at converter grid is shown in Fig. 3.
2. Band "B"	465 kc. Sweep	1st I.F. Grid	.05 Mfd.	2nd I.F. Sec. (C-15) Pri. (C-14)	
3. Band "B"	465 kc. Sweep	Converter Grid	.05 Mfd.	1st I.F. Sec. (C-13) Pri. (C-12)	
4. Band "B"	465 kc. Sweep	Converter Grid	.05 Mfd.	3rd I.F. Sec. (C-17)	Disconnect one end of C-17—Turn A.F.C. switch "on"—Vertical input of oscilloscope to ground and discriminator input to ground. Note position of A.F.C. control on horizontal axis, Fig. 4.

I.F. Alignment with Output Meter

1. Band "B"	465 kc. Modulated	2nd I.F. Grid	.05 Mfd.	3rd I.F. Pri. (C-16)	A.F.C. switch "off"—Condenser gang at minimum capacity—output meter connected across the voice coil—volume control at maximum—input as low as possible—Adjust trimmer for maximum output. Do not attempt an over-all re-alignment once a stage alignment has been completed.
2. Band "B"	465 kc. Modulated	1st I.F. Grid	.05 Mfd.	2nd I.F. Sec. (C-15) Pri. (C-14)	
3. Band "B"	465 kc. Modulated	Converter Grid	.05 Mfd.	1st I.F. Sec. (C-13) Pri. (C-12)	
4. Band "B"	3rd I.F. Sec. (C-17)	See paragraph on A.F.C. adjustment.

R.F. Alignment

1. Band "B"	18 mc. Modulated	Antenna post	250 Mmf. 400 ohms	Osc. (C-3) R.F. (C-7) Ant. (C-1)	Turn A.F.C. switch "off"—Set dial pointer to first line at left-hand end of dial scale with condenser gang fully meshed.
2. Band "D"	5220 kc. Modulated	Antenna post	250 Mmf. 400 ohms	Osc. (C-3) R.F. (C-7) Ant. (C-1)	Connect output meter across voice coil—Turn tone control to maximum—input signal when oscillator trimmer (C-3) is peaked properly. Example: 15 mc.—image 14.07 mc. Peak C-7 and C-1 while rocking gang condenser.
3. Band "C"	1800 kc. Modulated	Antenna post	250 Mmf. 400 ohms	Osc. (C-4)	Adjust trimmer for greatest output with dial pointer at 5,220 kc.
4. Band "B"	590 kc. Modulated	Antenna post	250 Mmf. 400 ohms	Osc. (C-6) R.F. (C-8) Ant. (C-2)	Adjust trimmers, in order listed, for greatest output at 5,900 kc.
5. Band "B"	Osc. paddler	Adjust paddler for maximum output in vicinity of 580 kc. while rocking gang condenser.
6. Band "B"	Repeat operation No. 4

Electrical Specifications

Rating Label	Power Supply (Volts)	Frequency (Cycles)	Power Consumption (Watts)
A6	120-130*	60	175
A5	110-120	50	175
C2	120-130*	25	180

* The receivers, as shipped from the factory, have the fuse on the fuse board (if the optional transformer marked 125 on the fuse board is used) at the 125-watt power supply is always below 115 volts, the fuse should be removed from this tap and placed in the lower voltage clip marked 115.

ALIGNMENT PROCEDURE

In order to align these receivers properly, it is necessary to have the following test equipment:
 1. A modulated test oscillator.
 2. An output indicator such as an A.C. voltmeter with a scale, or a cathode ray oscilloscope is preferred for I.F. alignment.
 3. A screw-driver type alignment tool.

The alignment procedure is given in table form along with the alignment points for each stage. The capacitor or resistor and resistor used in series with the signal generator. The grid lead should not be removed from the tube to this would remove the grid bias from the tube.

Automatic Frequency Control Adjustments
 After I.F. alignment is completed with output meter and without disturbing the generator setting, remove the signal

generator lead from the grid of the 6A8 converter. Apply the modulation to the 6A8 grid capacitively through the antenna lead in a weak broadcast station at about 1000 kc. and with the A.F.C. switch "off", tune the receiver carefully for the signal. Then throw the A.F.C. switch on and adjust the 3rd I.F. secondary trimmer (C-17) to zero beat. This adjustment is very critical and must be made with great care. When the difference in the beat note with the A.F.C. switch "on" or "off" is about 100 cycles, the A.F.C. adjustment is correct.
 Another method of A.F.C. adjustment after I.F. alignment is to connect the 6A8 grid to the 6H6 discriminator. Leave the signal generator connected to the 6A8 grid and without the A.F.C. switch on, tune the receiver for the signal. The meter reads plus when C-17 is tuned of resonance on one side and negative adjustment on the opposite side of resonance. The correct adjustment of C-17 is between these positions, when the voltmeter reads zero.

GENERAL INFORMATION

The Model F-109 is a three-band a-c operated receiver employing ten General Electric Pretested Tubes in a super-heterodyne circuit. This receiver incorporates automatic "Touch Tuning" with thirteen station buttons, electric finger-tip dial drive control, R.F. amplifier, two stages of I.F. amplification, four-point tone control and other features of design as described in the following paragraphs. The phonograph equipment is designed to play records on one side automatically.

Receiver Operation

The antenna transformer T-6 used in conjunction with a 6K7 tube and the R.F. transformer T-4 are the essential elements of the R.F. amplifier. After the conversion to 465 kc. by means of the combination oscillator converter tube 6A8, the signal is amplified by the I.F. amplifier which consists of three tuned transformers and two 6K7 tubes. The primary and secondary coils of these transformers are carefully adjusted midway between the points of critical and over-coupling so as to give the I.F. amplifier a broadened band width with a subsequent better fidelity of the received program.

The output of the I.F. amplifier is applied to a 6H6 diode rectifier, which is a combination detector, automatic volume control, and bias source for the automatic frequency control tube. A detailed explanation of the A.F.C. will be found in a following paragraph. A second 6H6 diode is used to supply minimum bias to all tubes controlled by the avc. One of the plates (16) of this diode supplies initial bias to the R.F. stage, while the other plate (17) supplies the 6A8 converter and 1st I.F. amplifier with the proper bias. Since the cathodes of the 6H6 are connected to a 2.8-volt point on the bleeder resistance R-35, this allows the avc controlled tubes to have a constant -2.8-volt bias with no signal input. This bias will remain constant until the point at which the avc voltage developed, becomes greater than this -2.8 volts, at which time the bias on these tubes will then be dependent upon the avc developed by the strength of the carrier. When operating in the "B" band, the minimum bias is automatically raised on the 6A8 converter and 6K7 1st I.F. tubes by means of a section of the wave change switch (S-1, terminal 4). This places R-31 in parallel with R-32 and the lower section of the bleeder resistance (R-5), which increases the fixed bias source applied to this avc controlled circuit through a section of the 6H6 diode. This reduces between station noise considerably on the "B" band but does not effect a reduction of sensitivity when a station carrier is tuned in.

Volume is controlled by the variable potentiometer (R-34) in the grid circuit of the 6J5-G audio amplifier tube. The output of the 6J5-G is resistance coupled to the 6L6-G Beam Power Output tube which gives ample undistorted power output to a 12-inch dynamic speaker.

TONE CONTROL

Negative feed back is used to control the quality and tone of reproduction. The frequency response of the audio circuit is varied by the tone control switch and its associated network as follows:

In the "normal" position, voltage from the voice coil is fed back through R-23, R-2, and C-49 to a tap on the volume control. C-31 serves to inject high frequencies into a tap higher up on the volume control. This arrangement gives an extended high frequency response, holds down the "boom" caused by pentode output and speaker resonance, and at the same time improves the quality and response to an extended range of both high and low frequencies.

In the "bass" position, the high frequency input to the audio system is limited by the addition of C-41 across the

volume control and its coupling condenser; and, also, by the omission of the high frequency injector capacitor C-31. This permits the true reproduction of a wide range of low frequencies without the "boom" at speaker resonance.

In the "foreign" position R-2 and C-49 are shorted out of the network used for "bass." This permits more degeneration of the lower frequencies, and provides a tone range most suited for foreign reception. This position may be used to reduce noise and also to reduce bass on programs which predominate in low frequency tones.

C-41 is removed from the circuit in the "speech" position, R-2 and C-49 are shorted out leaving only R-23 in the circuit thus allowing flat degeneration of all frequencies. This arrangement has been found to give the best response for programs predominating in speech.

COIL SYSTEM

The coils for the three bands are wound a single form. The antenna transformer is designated as T-6, the R.F. transformer as T-4 and the oscillator transformer is marked T-3. All contacts on the band switch are numbered in Fig. 10 and Fig. 11 to facilitate tracing the coil circuits.

The band switch connects the coils to operate as follows:

Ant.	Primary	Secondary	Remarks
"B"	L-6	L-4 & L-5	
"C"	L-3	L-4	L-5 shorted
"D"	L-2 & L-3	L-1	L-4 & L-5 shorted
RF			
"B"	L-13	L-11 & L-12	
"C"	L-10	L-11	L-12 shorted
"D"	L-9 & L-10	L-8	L-11 & L-12 shorted
Osc.			
"B"	L-19	L-18	
"C"	L-17	L-16	Connects C-30 across L-18
"D"	L-15	L-14	Connects C-30 across L-16

On "D" band contact No. 9 is used to provide a ground for the General Electric noise reducing antenna systems, KV-300 and FT-40. **RESISTANCE MEASUREMENTS**

AUTOMATIC FREQUENCY CONTROL

The Automatic Frequency Control used in this receiver shifts the oscillator frequency so that the correct intermediate frequency is very closely produced even when the receiver is mistuned several kilocycles.

The essential elements are the discriminator transformer T-9, the twin diode 6H6 with its balanced discriminator network, and the 6J5-G control tube connected across the broadcast oscillator plate coil.

The discriminator transformer is designed to deliver (when properly tuned to 465 kc.) equal voltages to each section of the 6H6 when the receiver is correctly tuned to give an I.F. frequency of 465 kc. Under this condition the voltage drop across R-21 is equal and opposite to the voltage across the total resistance of R-19, R-22 and R-17; thus no discriminator voltage is produced to control the 6J5-G tube.

However, if the signal frequency is increased above 465 kc., unequal voltages are applied to the diodes and the voltage over R-21 is greater than the voltage over the combined resistance of R-19, R-22 and R-17. The difference of these two voltages is positive and is applied to the 6J5-G control tube.

When the signal frequency is decreased below 465 kc., the result is less voltage over R-21 and a greater voltage over the combined resistances R-19, R-22 and R-17. The difference of these two voltages, as applied to the 6J5-G control tube, is negative.

Thus three conditions arise:

- On resonance: no discriminator voltage developed
- Above 465 kc.: a positive control voltage
- Below 465 kc.: a negative control voltage

The 6J5-G A.F.C. control tube has a combination of self and fixed bias, the latter being the result of the current supplied through R-8 to the cathode resistor R-4. The R.F. voltage applied to the control grid of the 6J5-G is obtained from the drop across the C-6 series padder and C-30. The vector sum of these two voltages is applied to the phase shifting network C-25 and R-3 and, in turn, to the control grid. This phase shifting network causes the control tube to appear as a reactance in parallel with the oscillator coil. The value of the apparent reactance depends upon the control voltage produced by the discriminator.

When the set is mistuned above the incoming signal, the converter output is above the 465 kc. required. A positive discriminator voltage is produced as explained above. This causes the 6J5-G tube to act as more capacitive reactance and thus lower the oscillator frequency; this gives a lower converter output frequency, approximately 465 kc.

When the set is mistuned below the incoming signal, the converter output is below the 465 kc. required. A negative discriminator voltage is produced as explained above. This

causes the 6J5-G to act as less capacitive reactance thus increasing the oscillator frequency. This in turn gives a higher converter output frequency, approximately 465 kc.

A decided A.F.C. action is apparent on short waves. The discriminator voltage is produced in the same manner as above. However, the action of the 6J5-G tube is different. The 6A8 oscillator plate voltage and 6J5-G plate voltage are supplied through the same resistor (R-5). A positive discriminator voltage allows the 6J5-G plate current to increase, thus reducing the 6A8 oscillator plate voltage. This causes a lower oscillator frequency with the resultant lower converter output frequency, approximately 465 kc.

With a negative discriminator voltage the 6J5-G plate current is less, thus increasing the 6A8 oscillator plate voltage. This causes a higher oscillator frequency with the resultant higher converter output frequency, approximately 465 kc.

DIAL MECHANISM

- (A) Manual drive leather-faced bevel gear
- (B) Beveled idler gear

- (10) Tone control pointer
- (11) Tone control cord pulley stud
- (12) Band switch indicator
- (13) Band switch indicator cord pulley stud
- (14) Long dial drive cord
- (15) Dial scale pointer
- (16) Volume control pointer
- (17) Short dial drive cord
- (18) Stationary spring support
- (19) Relay armature extension
- (20) Armature back stop

Fig. 7

Tuning mechanism diagram (Fig. 1) is self-explanatory. The tuning condenser drive cord can be easily replaced without removing *any* part of the chassis while all dial indicating control cords are made readily accessible for servicing by merely removing the seven small screws holding the dial reflector assembly.

Fig. 1. Dial Mechanism

GENERAL ELECTRIC CO.

RELAY ADJUSTMENTS

The following adjustments should be made with relay assembled on the motor bracket, Fig. 7.

(1) Make sure contacts are adjusted to open in correct sequence: center contacts (motor) first, contacts farthest from armature (AFC) second, contacts nearest armature (silent tuning) last. *It is very important that the silent tuning switch open last.*

(2) Adjust backstop (24), so that the armature snaps closed when the relay coil is energized with 4.5 volts A.C. The backstop must make a positive contact with the back of the armature in the open position; otherwise sluggish operation of the relay will result which will cause the motor drive to skip buttons. If the relay will not close at 4.5 volts and still maintain proper travel and sequence, weaken the spring on the rear of the armature plate by bending the stationary spring support (20).

(3) Loosen the setscrew on the motor shaft collar nearest motor (9) and adjust collar so that the pulley dog (8) misses the relay armature extension by .001 in. (relay not energized). All contacts must be closed when the relay armature touches the end of the motor dog; if the motor contacts open in this position the armature will chatter.

(4) Spring adjustment (7) on slip clutch should be just tight enough so as not to allow slippage of motor when driving the dial mechanism. Loosen setscrew on outside shaft collar (6) and screw the collar on the shaft to tighten slip clutch.

(5) The pole piece of the relay coil is divided in two semi-circles. The relay armature should only touch the pole segments toward the motor shaft. There should be a .001 in. clearance between the back segment (21) and the armature when closed; otherwise a buzzing will be heard. Sometimes a front pole segment that is not perfectly flat will cause the same trouble. File off the offending bump.

(6) Backstop setting should be such that the distance (22) is $26/32$ in. with the relay closed and $29/32$ in. with the relay open.

(7) Spacing between relay contact points when open should be .015 to .018 inches for contact No. 1 and .008 to .010 inches for contact No. 2 and No. 3.

Fig. 7. Relay

INCORRECT OPERATION AND SUGGESTED REMEDIES

Skipping of Stations

(a) "Touch Tuning" button leads not making good contact to adjustable contact pins. Clean contacts and re-insert.

(b) Sliding contactor blade either covered by thin piece of bakelite or dirty. Carefully run fine file over top of sliding contactor, making sure not to leave any sharp corners. Sliding contactor should have a small amount of vaseline on beveled surface to prevent chattering.

(c) Nipple too sharp on adjustable contacts will cause sliding contactor blade to jump across. Smooth off with fine sandpaper.

(d) Relay armature out of adjustment causing sluggish operation of relay switch. See paragraph 2 under Relay Adjustments.

(e) Excessive side play in sliding contactor. Loosen the setscrew on the back of the sliding contactor and slide holder together. Final adjustment should allow sliding contactor to rock freely.

(f) Not enough tension on sliding contactor arm. Loosen collar on shaft in rear of contact segment and move sliding contactor arm towards the contact segment; then tighten collar on shaft.

(g) If the contacts at the rear of the "Touch Tuning" button assembly shafts do not close or make good contact, the motor will continue to scan the dial without stopping at the desired station.

(h) Contact segment may be bent out of shape. This should be perpendicular to chassis deck and parallel to rear chassis apron in order to allow the contactor arm to wipe the adjustable contacts evenly.

No Action When Station Button Is Pressed

(a) Relay remains energized and audio continues to function—push button escutcheon grounded. Be sure dial and push button escutcheons are insulated from each other or from the control shafts.

(b) "Off" switch contacts do not close.

(c) If set does not tune automatically unless scan button is also depressed, contacts No. 6, Fig. 5, require closer spacing.

(d) Open or shorted motor capacitor—Characterized by motor armature humming but no torque. Replace 1000 mfd. capacitor C58.

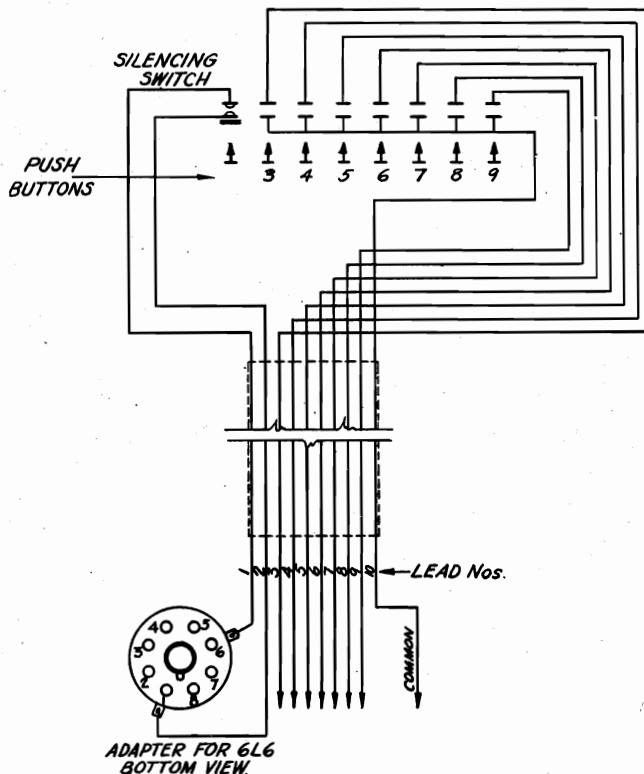

Fig. 6. Schematic of Remote Control

MODEL F-109

GENERAL ELECTRIC CO.

Fig. 8. Wiring Diagram of "Off," "Manual" and "Scan"

- (e) Open or shorted coil in motor—Characterized by no torque or low torque in one direction. Replace motor or repair coil.
- (f) Drive mechanism bound, or too tight for motor to drive.
- (g) Not enough friction in slip pulley—The friction of the slip pulley is adjusted by tightening the collar on the end of the motor shaft. Care should be exercised that the setscrew does not hit the relay armature.
- (h) Belt slippage—The tension of the belt may be increased by raising the motor on the relay bracket. If the belt still slips, reverse belt and use other surface or use belt dressing.

Noise in Audio Output While "Touch Tuning"

(a) Improper sequence—If the relay switch contacts open in improper sequence, audio output will be available too soon, and the break in the motor switch will be heard in the speaker. Correct as described in (1) under Relay Adjustments.

(b) Dressing of silent tuning lead—Early production receivers had silencing lead from 6L6 grid run to connector socket on rear apron, up to "Push Button" switch, and return through socket connector to the relay switch where the ground wires of AFC, motor and silent tuning contacts were connected together and grounded to chassis. Reconnect as follows: Ground A.F.C. and motor contacts to a point of the chassis directly underneath the motor. The green grid lead from the 6L6 should be rewired over the top of the chassis deck to the silencing contact, Fig. 9, of the relay switch; the lead from the other relay silencing contact should be connected to a prong of the connector plug, Fig. 8, from this point, connection is made to the silencing portion of the "Touch Tuning" switch, and a return to ground from this point is made through the connector plug to the chassis near the connector plug socket.

(c) Noise through filter circuit—The "blurr" in the speaker on early production due to the sudden application of audio may be reduced by placing a .05 mfd., 600-volt capacitor (RC-092) across the output filter capacitor (C-61).

Fig. 9. Motor Relay Wiring Diagram

Miscellaneous Adjustments

(a) When a "Touch Tuning" button will not remain in a locked position, it usually indicates that the springs at each end of the latch bar are not in proper adjustment. They should exert an equal pull on each end.

(b) The fork on the tuning condenser should be adjusted so that the motor reversing switch clicks over when the pointer approximately reaches the 540 and 1620 kc. markings on the dial scale. With the pointer at the extreme end of calibrations when tuning manually, the reversing switch lever should be set so there is not more than 1/16 in. nor less than 1/32 in. clearance between the lever and the switch trigger after the switch has snapped.

(c) The motor and relay mounting plate should rest parallel to the chassis deck. Do not adjust the spring tension foot; raise or lower motor on bracket, as required. Make sure that there is no electrical connection between the motor frame and the chassis.

(d) The "Off" switch on the "Touch Tuning" assembly should stay closed for at least one-half the movement of the key, opening only on the final click. If firm contact does not exist between the points, vibration of the set may cause an intermittent noise.

(e) The silent tuning contacts of the "Manual" and "Scan" switches should open last to permit quiet operation.

GENERAL ELECTRIC CO.

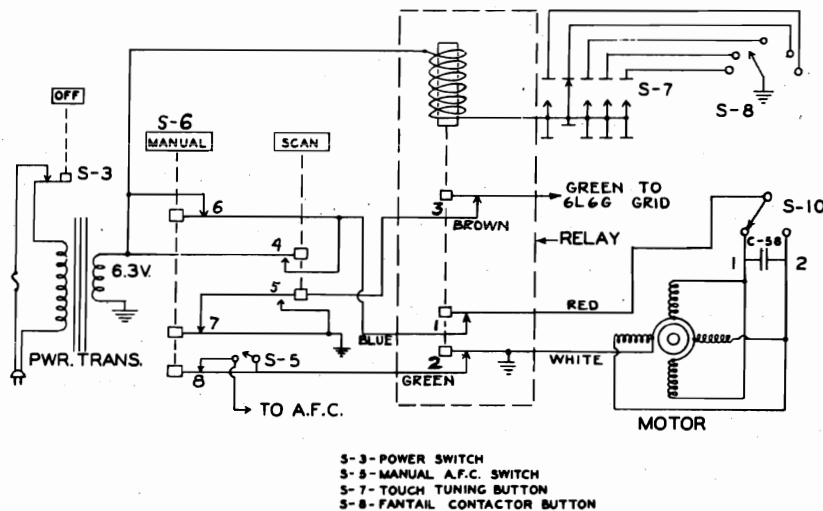

Fig. 5. Schematic of "Touch Tuning" System

TOUCH TUNING

General Electric "Touch Tuning" consists of three essential units; the push-button assembly of sixteen buttons, used by the operator for control; the motor and relay assembly, operating in conjunction with the buttons to provide fast and accurate tuning; and the contact segment with its sliding contactor and adjustable contacts enabling selection of thirteen different stations to be tuned automatically.

Of the sixteen push-buttons, thirteen are used for station selection. The other buttons are used for "Manual" control (No. 8), "Scanning" (No. 15) and "Off" (No. 16). Depression of any button except No. 15 will lock the depressed button and release any other that may be in the circuit. Thus the selection of any station button or of "Manual" will release the "Off" switch turning the set on.

The tuning motor is operated as a capacitor type squirrel-cage induction motor, with capacitor C-58 as the phase-shifting device. By tracing the motor circuit it will be seen that C-58 is in series with one set of poles when the motor reversing the switch is in position shown in Fig. 5. When the switch S-10 is reversed the capacitor C-58 is in series with the opposite set of poles. This causes the motor field to rotate in the opposite direction with the resultant change in motor rotation.

The motor power is supplied from the tube heater circuit through "Manual" switch (contact No. 6), Fig. 5, the relay (contact No. 1) and the motor reversing switch (S-10) with the chassis as common return. It will continue to run until the sliding contactor (S-8) contacts the stud on the contact segment which is connected to the button in the circuit. When this contact is made, the relay field coil is energized, causing the relay to open the motor circuit (contact No. 1). At the same time the relay arm also engages the motor clutch, causing instantaneous stopping of tuning mechanism travel. Depression of another station button causes another similar cycle.

Pressing the "Manual" button (S-6) releases any depressed button. Thus S-7 is opened and the relay field coil can not be energized. Contact No. 6 opens the motor circuit. Contacts No. 7 and No. 8 remove the ground from the grid of the 6L6-G and from the A.F.C. circuit respectively.

With the receiver set for "Manual" operation, depression of the "Scan" button closes the motor circuit by the shunting of contact No. 6 on the "Manual" switch allowing continuous motor operation and dial travel. As the motor drives to the dial limits on either end, S-10 is automatically thrown, causing reversal of motor rotation.

During periods of motor operation, either for automatic station selection or for scanning, the grid of the 6L6-G is shorted to ground. This "silent tuning," accomplished by relay contact No. 3, in the former case or scan button contact (No. 5) in the latter, avoids reception of unwanted stations or inter-station noise when tuning automatically or by means of the "Scan" button.

The use of automatic frequency control on "Manual" is made optional by the A.F.C. switch (S-5). When any one of the thirteen "Touch Tuning" buttons is depressed, circuit is made through contact No. 8 on S-6 and is completed through relay contact No. 2, thus removing A.F.C. while the motor is in operation. When the station is reached the relay opens contact No. 2, thus removing the ground on the A.F.C. circuit. The A.F.C. is automatically turned on when "Touch Tuning" is being used.

REMOTE CONTROL

There are ten leads in the "Remote Touch Tuning Control" cable. These leads serve the following functions:

The No. 1 and No. 2 leads are connected to the octal base adapter and serve to connect the silencing button to the output tube.

The No. 3 to No. 9 leads correspond to the button numbers and with the No. 10 lead, provide the selection of stations from the remote control unit. These leads are to be connected to pins on the contact segment on the rear of the chassis.

Remove the least desirable station's letters from one of the "Touch Tuning" buttons of the receiver and insert the "Remote" tab. Note the number of this button as marked on the escutcheon.

Remove from a pin on the contact segment on the receiver, the lead which bears this number, and connect it to the No. 10 lead from the remote control cable, Fig. 6.

(The pin on the contact segment from which this lead was removed is left vacant.)

Now note the number of a receiver push button which bears the same call letters as a remote unit button. Remove the lead with this number from the pin on the contact segment. Connect to this pin the lead from the remote cable which corresponds to the above-mentioned remote unit button. Fasten the lead with a hex nut and tighten lightly with a pair of pliers or small wrench. Now re-connect the original lead to the pin. Proceed in the same manner until the seven remote button leads are connected.

Remove the 6L6G tube and place in the 6L6G tube socket the adapter which is connected to leads No. 1 and No. 2. Insert the 6L6G tube in this adapter.

When the "Remote Touch Tuning Control" unit is connected, as explained above, the action is identical with that of the regular station selection circuit. The remote button unit is in series with the "Remote" button lead on the receiver through lead No. 10 of the remote unit cable. The relay field coil circuit is completed through the set "Remote" button (S-7); the common (No. 10) lead; the depressed control button; its lead to a pin on the contact segment, and to ground through the sliding contactor. The "Silent" button must be in the released position when operating the receiver from either the remote control unit or from the receiver controls otherwise no audio output will be obtained.

 MODEL LFC-1118 HAS THE RCA RP-162 RECORD CHANGER
 MODEL LFC-1128 " " " RP-158 " "
 MODEL LFC-1228 " " " RP-160 " "

GENERAL INFORMATION

Models LF-115 and LF-116 are combination AM and FM superheterodyne receivers using eleven tubes. The LF-116 differs from the LF-115 by the use of a special 10-inch speaker and an enclosed and lined tone chamber which provide superior acoustic qualities.

The Model LFC-1118 uses the Model LF-115 AM and FM chassis in conjunction with an automatic record changer.

The Model LFC-1228 is a deluxe phonograph and A-FM receiver using the LF-115 chassis and the 10-inch speaker and padded sound chamber as used in Model LF-116 receiver. The

The Model LFC-1128 is very similar to the Model LFC-1118 phono combination except for the automatic record player.

A detailed description of the FM portion of these receivers is given in the following paragraphs.

Oscillator-converter Circuit

The first 6SG7 tube acts as a conventional RF amplifier when operating in the Short-wave or Broadcast bands. However, in order to obtain optimum gain, the above tube becomes the first converter of a double or cascade converter system when operating in the FM band.

This cascade converter system consists of the two 6SG7 converter tubes and an oscillator tube 7Q7 with their associated circuits. The tuning condensers for the two converters and oscillator are low capacity sections and ganged together as usual. The antenna tuning circuit consisting of T5 and C3 tunes the FM band from 42 to 50 megacycles; the second converter tuned circuit consisting of a portion of T6 and C29 tunes from 23.15 to 27.15 megacycles; while the oscillator tuned circuit consisting of C5 and a portion of T7 tunes from 18.85 to 22.85 megacycles. The oscillator voltage is capacity coupled to the grid of the first converter tube through C-7. This produces, by heterodyne action, a signal to which the plate circuit of this first converter is tuned. The first converter tube also provides a gain of unity for the oscillator frequency. Accordingly, oscillator voltage is also applied to the grid of the second 6SG7 converter tube which produces in its plate circuit the IF frequency of 4.3 megacycles.

To illustrate the action consider an FM signal of 42 MC to which the receiver is tuned. The oscillator frequency for this setting of the tuning control is 18.85 MC and it heterodynes in the 1st converter tube with the 42 MC signal to

Fig. 2. Trimmer Location

NOTE: THIS UNIT USED WITH LFC 1228 ONLY

MODELS LF-115, LF-116, LFC-1118, LFC-1128, LFC-1228 GENERAL ELECTRIC CO.

form 23.15 MC (42-18.85). The 23.15 MC signal, in turn, beats with oscillator signal in the 2nd converter to produce the 4.3 MC intermediate frequency.

IF Amplifier

The IF amplifier operates as a dual amplifier in that it will operate either at the 455 KC required for the Broadcast and SW bands or at 4.3 MC required for the FM band, without the need of switching transformers except at the primary of the 1st IF. When the IF is operating at 455 KC, the primary and secondary coils of the 4.3 MC section of T1 and T2 are such a low impedance that they can be considered as shorted across; while when operating at 4.3 MC, the primary and secondary trimmers of the 455 KC section of T1 and T2 are such a low impedance that they effectively short out this portion of the transformer. Thus the frequency at which the IF is operating is applied across the proper section of the dual transformers and is amplified by the IF tubes.

Cascade Limiter Circuit

The limiter circuit consists of two resistance coupled 6SH7 tubes in series. Each limiter operates at zero initial bias and low screen voltage. Both grid circuits are designed for self-biasing and the use of capacity-resistance networks provides enough time delay to retain the grid bias between signal peaks. The action of the limiter is such that as soon as a signal is applied to the grid of the tube the grid draws current. This grid current charges up the capacitor across the grid resistor and at the same time establishes a bias through current drain in the resistor. The circuit is so designed that negative signal swings are all beyond plate current cutoff and positive signal peaks are cut off by plate current saturation. The value of the 1st limiter capacity-resistance network is so chosen as to limit noise amplitudes. This arrangement leaves the 2nd limiter with the very much simplified task of reducing the remaining noise to the desired level.

FM Station Silencer

This circuit operates on amplitude modulated signals to produce squelch or quieting of the audio amplifier. Since the noise limiter circuits only operate when an FM carrier is present, noise between stations will ride through with undiminished amplitude. This amplitude modulation appears in the last noise limiter plate circuit and develops a voltage across R35. This voltage is rectified by one diode of the 6SQ7 tube and then applied to the 1st audio grid circuit of this tube provided the switch S6 is open. This rectified DC voltage is sufficient to completely bias off this audio tube so that no signal is passed. When a sufficiently strong FM signal is received so that the noise limiters operate with satisfactory signal strength, the noise or amplitude signal is reduced so low that the proper bias is restored to the 6SQ7 audio amplifier and the audio signal is then passed through to the output and phase inverter circuits. This squelch voltage can be manually removed by closing switch S6 so that weak FM stations that have considerable noise present can be received if desired.

FM CHANNEL ALIGNMENT

Due to good stability of components and the wide band characteristics of the IF amplifier circuits, alignment should

Fig. 9. Phono Compensation Circuit (Models LFC-1118 and LFC-1128)

be unnecessary under normal conditions. However, if alignment is necessary, the procedure is given in table form on page 3 with the location of all trimmers shown in Fig. 2.

IF Alignment

It is preferable to align the IF amplifier by means of a cathode ray oscilloscope and a 4.3 megacycle signal generator with a superimposed 200 KC sweep frequency. Many signal generators and mechanical frequency wobblers are available wherein the above requirements are fulfilled. As for example: G-E Model TMV-97-C Test Oscillator used in conjunction with the G-E Frequency Modulator TMV-128A will give a sufficient sweep of 200 KC when operated in the "Hi" position in conjunction with the 3100-6800 KC band of the Test Oscillator. When the Frequency Modulator is added to the Test Oscillator, the Test Oscillator calibration no longer is accurate, thus making necessary a recalibration. The following procedure may be followed. With a factory aligned receiver where the IF alignment can be assumed to be accurate, connect the above equipment to show the IF selectivity curve as described in Table I. When the two curves are brought together (by tuning Test Oscillator rather than receiver IF trimmers) so that they coincide, take the reading of the signal generator as being the proper point for 4.3 MC with 200 KC sweep alignment. As a further check on the accuracy, another signal generator where the 4.3 MC calibration is accurately known can be coupled to the same point of input as the Test Oscillator and Modulator are coupled and then when the 2nd single frequency generator (4.3 MC) is turned ON, a beat note should be observed at the peak of the resonance curve on the oscilloscope. If this beat note is not at the peak retune the Test Oscillator-Modulator until it does appear at this point.

Where the above equipment is not available, satisfactory alignment can be accomplished by using the equipment and procedure given in Table II. This makes use of an unmodulated RF signal of 4.3 MC and a high resistance (20,000 ohm per volt) voltmeter. The calibration of the signal generator must be accurately known.

A dummy antenna of 50 mmf. or less should be used in series with the signal generator input to the receiver when all IF alignments are made.

RF Alignment

Make all Frequency Modulation RF alignments with the chassis in the cabinet. The alignment procedure is given in Table III on page 3. The image signal should be below 46 MC when the oscillator is properly set.

AM CHANNEL ALIGNMENT

The Amplitude Modulation Channel of the receiver is aligned by following the procedure as outlined in Table IV. All IF alignment may be made with the chassis either installed in or removed from the cabinet. The RF alignment, however, must be made with the chassis and loop antennas securely fastened into their respective places in the cabinet as their relative position in respect to each other affects the alignment. The RF signal should be capacity coupled to the loop antennas by placing a two-foot wire for an antenna on the test-oscillator output post (high side). Keeping this antenna two feet or more from the receiver loops will generally insure freedom from too much coupling.

SERVICE HINTS

Replacement of Components

When servicing the FM portion of this receiver and especially when replacing parts, care should be exercised to return all components including wiring to the original position occupied in the chassis. The positioning of parts and wiring is very critical. When replacing coils or IF transformers, maintain the lead lengths provided and use the same terminals to which the original coil or transformer was connected.

Pointer Focusing

The focusing of the pointer on the dial scale is accomplished by increasing or decreasing the pointer distance from the dial scale. This is a rather critical adjustment and can be varied enough by loosening the mounting bolts and moving the chassis either back or forward in the cabinet until properly focused and then tightening mounting bolts.

Rotor Balance Spring

On the right-hand side of the tuning condenser assembly is a wire bracket from which a spring is suspended that connects to the drive drum of the tuning condenser. The proper adjustment of this spring counterbalances the weight of the condenser drive assembly and prevents backlash. For chassis mounted horizontally, as in Models LFC-1118, LFC-1128 and LFC-1228, the spring must be in the rear notch of wire bracket. For the Model LF-115 which has a 20° slope mounting, the spring is fastened in the center notch of the bracket while on LF-116 mounting (30° slope) the spring is in the bracket notch nearest front of chassis.

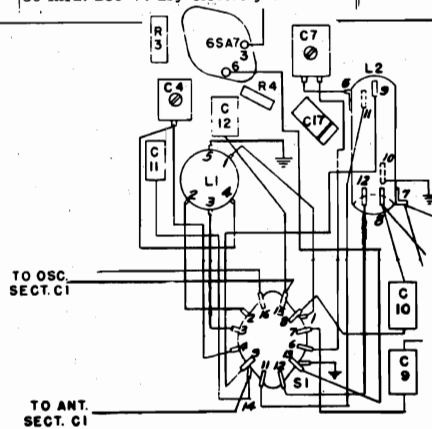

Fig. 5. Switch Wiring

MAGNETIC PICKUP (MODEL X-145)

To Replace Pickup Coil

Service operations which may be necessary on the pickup unit can be carried out by carefully observing the following disassembly procedure:

1. The cover is removed from the pickup head by removing the wax from the hole immediately to the rear of the needle holder. This will expose the slotted end of the cover screw which can be backed out with a small screwdriver. *Extreme care should be exercised so as not to burr or break the slot.*

2. Remove the magnet by placing an iron bar (keeper) of approximately the same cross-section area, above the armature block assembly so that the magnet can be slid upon the keeper without breaking the magnetic circuit. The magnet is held in place by a spring at the elbow of the magnet. If the magnetic circuit is broken the magnetism may be permanently impaired.

3. The rubber damping blocks are held in a frame which fastens to the two armature blocks by means of setscrews. Remove the screws, rubber blocks and holder.

4. Unsolder the two leads from the pickup coil which fasten to the terminal board at the top of the magnet.

5. Remove the armature blocks from the back plate of the pickup by removing the two large head screws which hold them in place. The coil, armature and blocks can now be removed and a new coil substituted. Before removing this assembly, it is advisable to measure the distance across the face of the assembled armature and blocks and when you replace this assembly the same dimension should be maintained.

To assemble the unit, the reverse procedure should be followed. To maintain the correct assembled dimension of the coil, armature, and blocks; loosely fasten the assembly to the back plate by the screws, then clamp the assembly in a vise to the desired dimension, and tighten screws. Next assemble the rubber damping block and frame to the armature blocks. When tightening the assembly the armature vane is centered between the armature block pole pieces by the damping block; then tighten the two screws. The coil leads are soldered to the terminal strip being careful not to break or burn off the leads with too hot an iron. Replace the magnet (without breaking magnetic circuit), cover, and cover screw. Seal the cover screw with a bit of wax.

GENERAL ELECTRIC CO.

PHONOGRAPH OR TELEVISION SOUND CONNECTION

Fig. 1 shows a simple method for connecting a crystal or high impedance magnetic pick-up into the receiver circuit of the Models X-115 and X-125. The phono switch is a double-pole, double-throw type with a phono motor power switch attached such as General Electric Stock No. RS-366. This should be mounted in close proximity to the rear chassis terminal board. It is important that the pick-up leads be shielded with copper braid to prevent hum interference. Connect the shield braid to the chassis ground.

When making the connections in Fig. 1, remove the jumper between terminals 1 and 2.

A television sound channel or FM converter may be connected in place of the pick-up.

When the connections are made as shown the regular radio volume and tone controls control the external unit the same as when operating the radio.

Fig. 1. Pick-up Connections
SPECIAL SERVICE INFORMATION

The following information will be very useful in servicing receivers if a vacuum tube voltmeter or similar voltage measuring instrument is available.

- (1) Stage gains.
 - (a) Antenna Post to Converter Grid at
 - 1000 KC 4.0
 - 4000 KC 3.2
 - 18,000 KC 2.4
 - (b) R.F. on Converter Grid to I.F. on 6SK7 Grid at
 - 1000 KC 36
 - 4000 KC 30
 - 18,000 KC 28
 - (c) I.F. on Converter Grid to I.F. on 6SK7 Grid at
 - 455 KC 55
- (2) Voltage across the diode load to give 1/2-watt speaker output at 400 cycles07 volts.
- (3) DC voltage developed across oscillator grid resistor (R4) at
 - 1000 KC 8.6
 - 4000 KC 9.7
 - 18,000 KC 7.7

Variations of +10, -20% are permissible.

ALIGNMENT PROCEDURE

The alignment procedure, shown in table form, is made with the chassis removed from the cabinet.

Since the dial scale and pointer are not a part of the main chassis, it is necessary to use the special alignment scale glued to the back side of the pulley frame adjacent to the pointer cord and make a temporary pointer. To make the pointer, close the gang condenser plates, then with paper clip or drop of paint mark point on cord which is in line with last thin line on right side of scale (viewed from rear of chassis). The selected edge of the paper clip or the drop of paint then will serve as a pointer for performing the R.F. alignment.

Output meter alignment is preferable and the meter may be connected across the voice coil leads, then turn volume control partially up. Keep the signal input as low as possible to avoid AVC action.

I.F. transformers are double, permeability-tuned with adjusting shafts at top and bottom of shield cans.

PHONO MOTOR FREQUENCY CONVERSION (MODEL X-145)

The Model X-145 can be operated from either a 50- or 60-cycle source of power by a slight alteration in the phono motor.

The phono motor leaves the factory for operation on 50 cycles. To convert to 60-cycle operation, it is merely necessary to remove the conversion spring from the rotor drive pulley, shown in Fig. 3. This can be easily accomplished by grasping the end of the spring with a pair of pointed pliers and pulling, using an unwinding motion to aid in loosening.

If at any time the motor is desired to be reconverted for 50-cycle operation, a new conversion spring, Stock No. RS-4037, may be put on the motor drive pulley by hand in the following manner. Hold the conversion spring in the right hand with the extension on the top side, then hook spring over the edge of drive pulley pressing down over same with a twisting effort in the direction to unwind or enlarge the inside diameter of the spring. The rotor should be held stationary during this procedure with fingers of left hand. After completely seating the spring over the pulley, the extension which is provided to facilitate assembly should be sprung out away from pulley sufficiently so that it may be clipped off, allowing no protrusion to remain.

CONVERSION FOR SPECIAL LINE VOLTAGES MODELS X-115, X-125, X-145

The Models X-115 and X-125 can be converted for operation on the following line voltages. In all cases where the power transformer is replaced with a ballast resistor, the power transformer must be removed from the chassis as the radiant heat from the ballast resistor is likely to injure the transformer insulation. When operated with these special resistors and lower power supplies than 220 volts the audio power output and socket voltages will be reduced.

220 Volts AC/DC—(Range 200-240 volts)

Remove transformer from chassis of X-115 and substitute ballast resistor RR-783 in socket previously occupied by transformer plug. Change label so that it reads Model X-125.

115 Volts DC—(range 105-129 volts)

Remove transformer from chassis of X-115 or ballast RR-783 from X-125; insert the ballast tube resistor RR-785 and change label so that it reads Model X-125Z.

180 Volts DC (range 145-215 volts)

Remove transformer from chassis of X-115 or ballast RR-783 from X-125; insert the ballast tube resistor RR-784 and change the label on the receiver so that it reads Model X-125Y.

Loud-speaker

The voice coil is accurately and permanently centered at the factory and should seldom give trouble. In case a voice coil needs recentering, it will be necessary to replace the entire cone and voice coil assembly. Assembly instructions accompany each replacement cone.

NOTE: In no case should the magnet be removed from the assembly position as it will lose magnetism.

ALIGNMENT PROCEDURE

There are two 17.8 reference points on the paper scale on the rear of the dial reflector plate. The one towards the lower frequency end of the dial is the proper one to use for the 16-meter spread-band alignment; while the other is used for a reference point on the SW2 band.

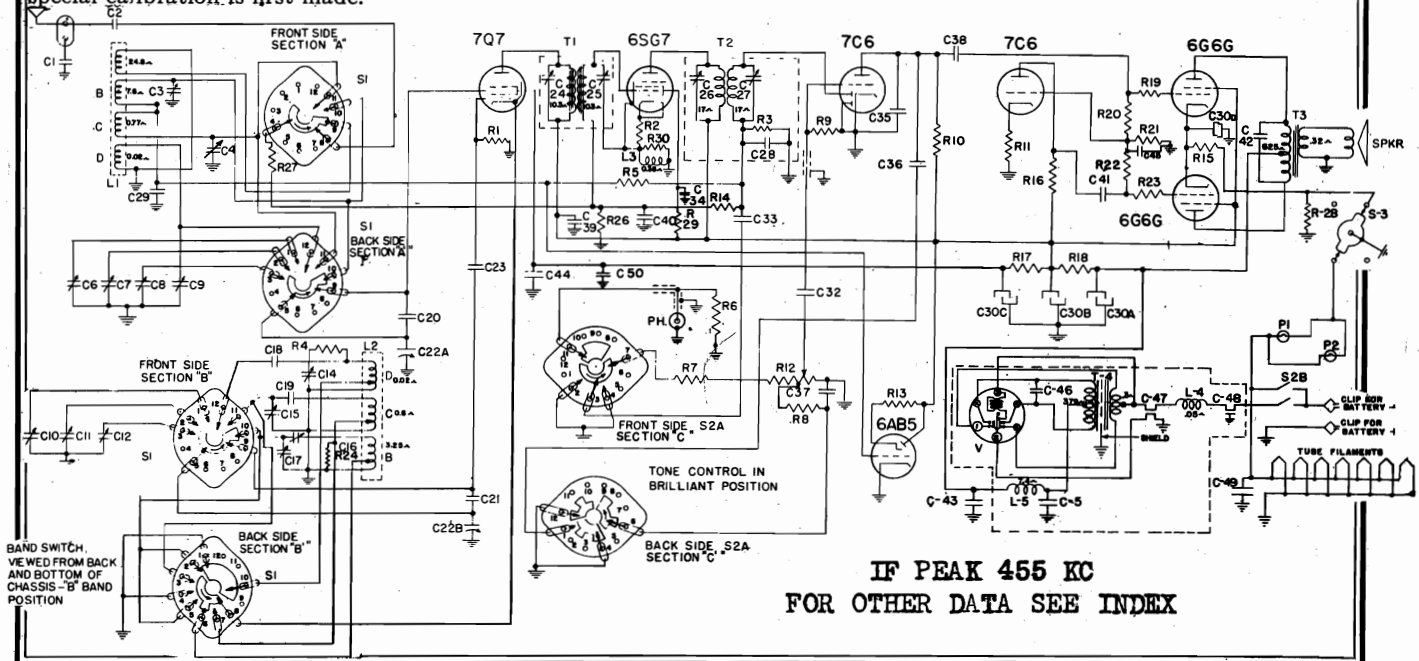

The SW2 band does not require alignment. This band is taken care of when the 16-meter spread band is aligned.

Spread-band Alignment

Since accuracy in frequency calibration is very essential for proper alignment of the spread bands, it is impractical to use the standard test oscillator for this purpose unless a special calibration is first made.

The actual reception of short-wave stations of known frequency in the band to be checked is probably the most satisfactory method for determining the proper setting of the oscillator trimmers in these bands. The oscillator trimmer should be adjusted so that the station appears at the correct position on the dial. RF alignment can be made with the test oscillator.

The calibration of the test oscillator may be checked by zero beating the test oscillator with a short-wave station of known frequency. By taking several of these calibration points, it will afford a calibration of a high degree of accuracy in case you wish to use the test oscillator for alignment in these bands.

Power Output	GE-25L6GT
Rectifier	GE-25Z6GT
Tuning Indicator	GE-6U5
Pilot Lamps	(2) MAZDA No. 44

Power Supply

The Model X-156 is equipped with a plug-in type power supply which permits practically instantaneous conversion to DC operation. Simply remove the power transformer and replace with a plug-in type ballast resistor. Refer to the data given under "Conversion for Special Line Voltages."

The power transformer in the Model X-156 is provided with four voltage taps. Instant tap switching is made by a simple pin plug and jack device. For correct operation, measure the power supply voltage. Note which voltage range covers this voltage (see Electrical Specifications) and using the corresponding tap, insert the plug in the jack.

CONVERSION FOR SPECIAL LINE VOLTAGES

The Models X-156 and X-166 can be converted for operation on the following line voltages. In all cases where the power transformer is replaced with a ballast resistor, the power transformer must be removed from the chassis as the radiant heat from the ballast resistor is likely to injure the transformer insulation. When operated with these special resistors and lower power supplies than 220 volts, the audio power output and socket voltages will be reduced.

220 Volts AC/DC—(Range 200-240 Volts)

Remove transformer from chassis of X-156; insert ballast tube resistor RR-7007, and change label to read X-166.

180 Volts DC—(Range 160-200 Volts)

Remove transformer from chassis of X-156 or ballast RR-7007 from X-166; insert the ballast tube resistor RR-7008 and change the label on the receiver so that it reads Model X-166Y.

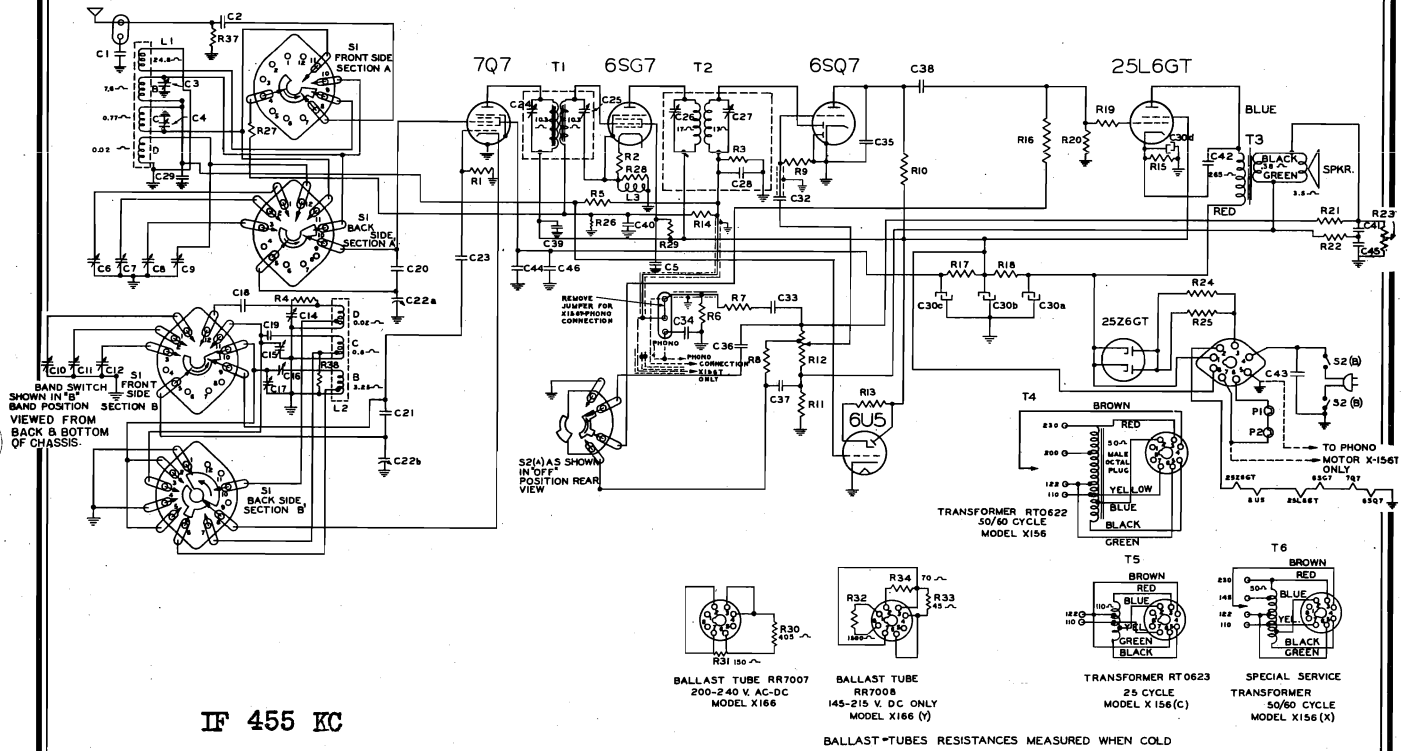

Miscellaneous

The transformer T5 can be substituted in the Model X-156 receiver for operation on 25-cycle circuits. Remark the label so that it reads Model X-156C.

The cold resistance of all ballast tubes is shown directly on the schematic diagram, Fig. 2.

MODELS X-156, X-166

GENERAL ELECTRIC CO.

PRODUCTION CHANGE

During the production of these receivers, the Type 6SG7 tube was altered so that its suppressor grid element which formerly was connected directly to the shield, now connects to the cathode element of the tube instead.

Due to circuit usage, this new type will cause oscillation if used in a chassis that was designed for the early style tube, and vice versa, without first changing the neutralizing coil, L-3. The early type 6SG7 tube must be used with neutralizing coil RL-371; while the late production tube must be used in conjunction with neutralizing coil RL-380.

For identification, the early production 6SG7 has either a X marked on the tube or tube carton while the late production tube is unmarked except for the tube symbol. All chassis with the new neutralizing coils (RL-380) and new production 6SG7 tubes are serial numbered 8750 and over and are stamped as REV. 1.

The schematic diagram, Fig. 2, illustrates the connections to the earlier type 6SG7 tube.

PHONOGRAPH INSTALLATION

This receiver is provided with a phonograph terminal board on the rear of the back cover of the receiver for the connection of a record player. The following connection procedure should be observed.

1. Remove the link from terminals 1 and 2, and replace it between terminals 2 and 3.
2. Connect the record player to terminals 1 and 3. If the record player does not have a high-impedance pick-up a matching transformer may have to be used. It is very important that the high side pick-up lead has a shield to prevent hum interference. This shield should be connected to terminal No. 3 and the high side pick-up lead to terminal No. 1.

If, on operating the record player, external radio signals leak through, turn the tuning control to a position where no radio signals would be received. Complete silencing of the external radio signals can be obtained by grounding the antenna terminal while operating the record player.

If, in operating the record player, there is appreciable hum interference, reverse the record player phono motor power cord plug in the power supply outlet.

Alignment Procedure

The alignment procedure shown in table form is made either with the chassis in or removed from the cabinet.

If the chassis is removed from the cabinet to make the RF alignment, the dial which is fastened to the cabinet cannot be used for calibration reference. Use must be made, therefore, of the paper scale fastened on the rear of the dial reflector plate. With the gang condenser completely closed, one of the edges of the pointer rider should be lined up with the first marking to the right of the scale on the rear of the dial reflector plate. This can be accomplished by sliding the pointer on the cord until it does. The selected edge of the pointer rider may now serve as a pointer for the RF alignment. There are two 17.8 reference points on the paper scale on the rear of the dial reflector plate. The one towards the lower frequency end of the dial is the proper one to use for the 16-meter spread-band alignment; while the other is used for a reference point on the SW2 band.

The SW2 band does not require alignment. This band is taken care of when the 16 meter spread-band is aligned.

Spread-band Alignment

Since accuracy in frequency calibration is very essential for proper alignment of the spread-bands, it is impractical to use the standard test oscillator for this purpose unless a special calibration is first made.

The actual reception of short-wave stations of known frequency in the band to be checked is probably the most satisfactory method of determining the proper setting of the oscillator trimmers in these bands. The oscillator trimmer should be adjusted so that the station appears at the correct position on the dial. R.F. alignment can be made with the test oscillator.

The calibration of the test oscillator may be checked by zero beating the test oscillator with a short-wave station of known frequency. By taking several of these calibration points, it will afford a calibration of a high degree of accuracy in case you wish to use the test oscillator for alignment in these bands.

*Use minimum capacity peak if two are obtainable.
 **Rock gang condenser for optimum peak.
 ***Use maximum capacity peak if two are obtainable.

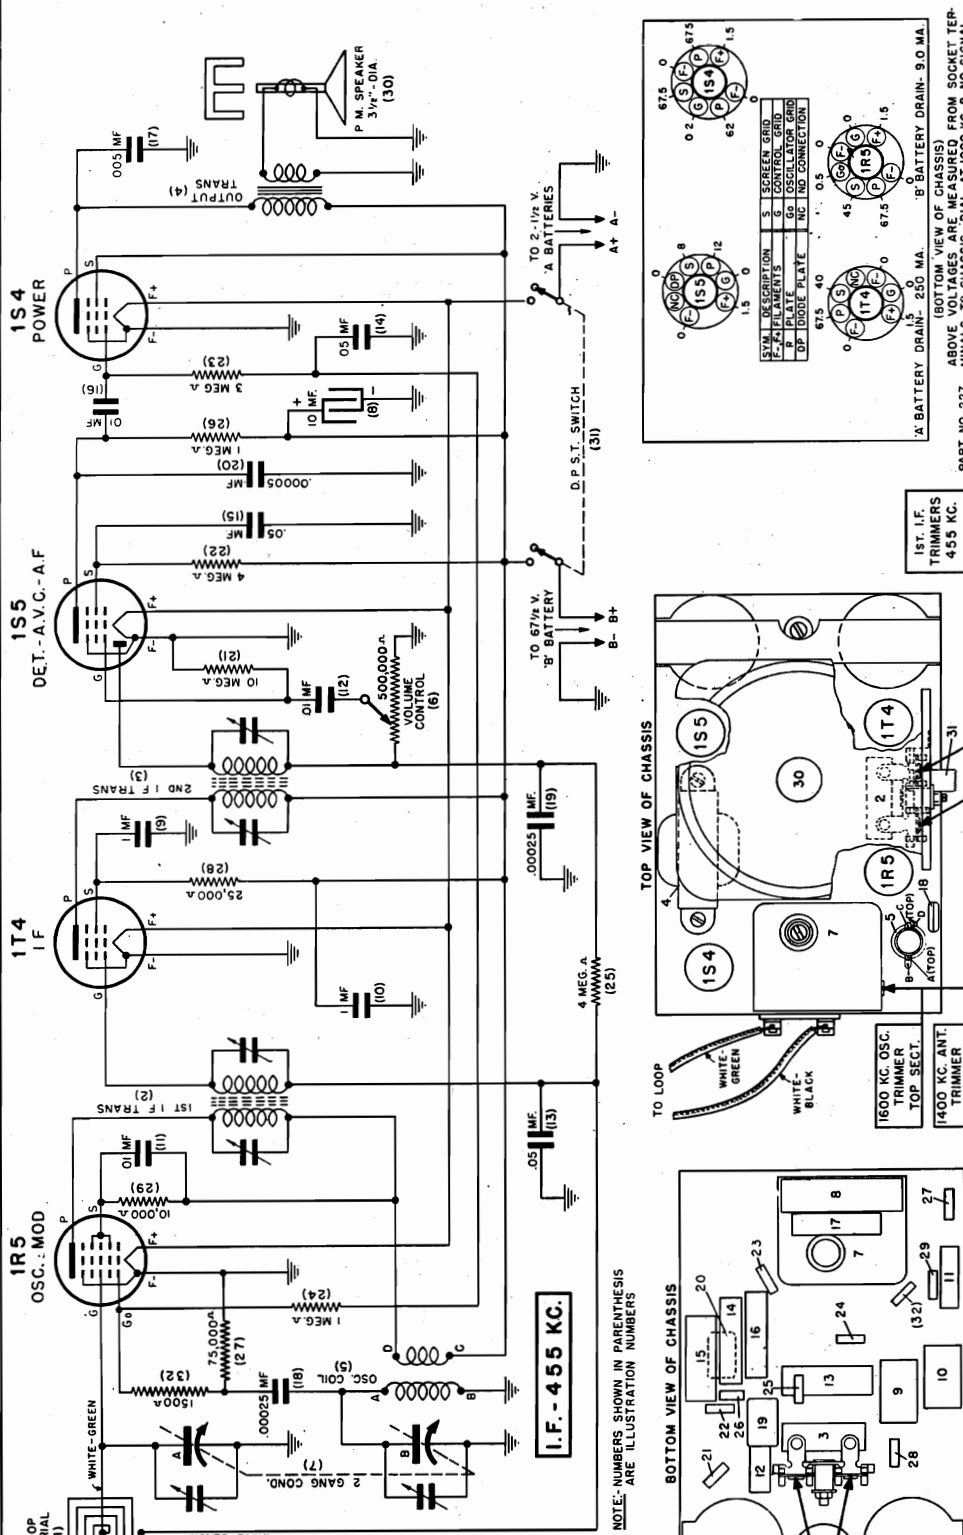

BAND CHANGE SWITCHING

The following charts show the switch points connected for any one position of the wave change switch. The numbers shown in each box indicate the switch points connected together in the section of the switch for each position of the switch. As for example: the numbers 5-9-10 indicate these switch points are all connected together for this particular position of the switch.

BAND SWITCH CONNECTIONS

ALIGNMENT PROCEDURE

Alignment Frequencies I.F. 455 K.C.
R.F. 1700 & 1400 K.C.

I.F. Alignment

Connect an output meter across the voice coil. Rotate the volume control to maximum. Set test oscillator to 455

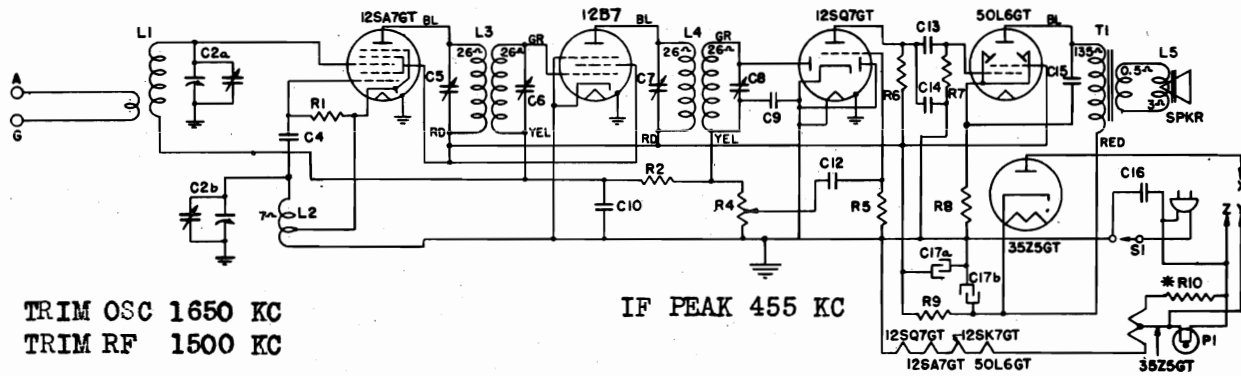

kilocycles and apply signal to control grid of 12SA7 tube through a .05 mfd. capacitor. Align the second I.F. transformer trimmers, next adjust the first I.F. transformer trimmers. Keep the test oscillator output to a level that will give a good meter reading.

R.F. Alignment

Attach high side of test oscillator to flexible lead extending from rear of chassis through a .00025 mfd. condenser. Connect the low side to the receiver chassis. Adjust the test oscillator and receiver to 1700 kilocycles. Peak 1700 kilocycles oscillator trimmer for maximum output. Change test oscillator signal and receiver dial to approximately 1400 kilocycles. Then while rocking gang condenser, trim 1400 kilocycles antenna trimmer for maximum output.

MODEL J-512

Alignment Frequencies

I.F. 455 KC
R.F. 1500 KC
The location of all trimmers is shown in Fig. 1.

I.F. Alignment

Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 KC and keep the oscillator output as low as a readable meter reading will permit.

Apply signal to the converter grid through a .05 mfd. capacitor and align progressively the trimmers in the 2nd and 1st I.F. transformer cans.

R.F. Alignment

Close the gang condenser by rotating the tuning control. Slide the pointer along the cord until it lines up with the first dial marking on the left. Now rotate the tuning control until the pointer is over the 1500 KC dial mark. Apply a 1500 KC signal to the receiver by means of a standard loop antenna. Align the oscillator trimmer (C-7) to bring in the signal and peak the signal by adjusting the antenna trimmer (C-5). (See Fig. 1 for trimmer locations.)

Precaution

If the signal generator is AC operated, use an isolating transformer between the power supply and the radio receiver power input. The use of an isolating capacitor is not recommended as AC current through the capacitor will introduce hum modulation and/or create the possibility of a burned-out signal generator attenuator.

Special Service Information

The following information will be very useful in servicing receivers if a vacuum tube voltmeter or similar voltage measuring instrument is available.

- Stage Gains*
Antenna Post to Converter Grid... 3.0 at 1000 KC
I.F. on Converter Grid to I.F. on I.F. Amplifier Grid... 60 at 455 KC
I.F. Amplifier Grid to Diode Plate... 45 at 455 KC
- 0.20-volt, 400-cycle signal across the volume control will give 1/2-watt speaker output.* (Volume control turned to maximum.)
- Average DC voltage developed across oscillator grid leak... 6 volts

* Variations of ±20% permissible. All readings obtained with enough signal input to give 1/2-watt speaker output.

GENERAL ELECTRIC CO.

To Charge Battery

The battery is charged by merely plugging the receiver power cord in the rated AC power outlet and turning the selector switch to "charge." Frequent check should be taken of the charge indicator and when all indicator balls are visible, the battery is fully charged. Charging the battery after all indicator balls are visible will not harm the battery except that it will evaporate the water faster. A completely discharged battery will be restored usually within 20 to 30 hours.

When operating the receiver from the AC house current, the battery is being charged at a slow rate. Thus if you wish to operate the receiver at the same time that you are charging even a fully discharged battery, plug the power cord in the AC receptacle and turn the power selector switch to the AC position. Prolonged and repeated operation on this position will assure that the battery is always maintained in a nearly fully charged condition.

Battery Operating Instructions

1. Add distilled or tap water in the filter cap at sufficiently frequent intervals to keep liquid level at indicator mark as viewed through opening in a battery case. DO NOT OVERFILL. The battery is available by removing the thumb screw on the left side of the battery case and removing the cover of the case. If any water is spilled in receiver when filling battery, remove with absorbent tissue.

Tap or drinking water is satisfactory as long as it does not contain large quantities of iron or chlorine dissolved in it.

2. If battery is discharged (only one or two indicators showing), water should be added to the level line before starting the recharge.

3. A fully charged battery will operate the radio in "Battery" position about 15 hours before recharging is required. Whenever possible, it is best not to allow the battery to become discharged to the extent that all three indicators disappear.

However, if all three indicators have sunk, the battery should be recharged immediately or within 24 hours.

4. A battery will continually discharge at a slow rate even when not in use. For this reason, monthly checks should be made of the charge condition and the battery placed on charge when necessary. This will prevent damage to the battery such as freezing during cold weather.

BATTERY INSTALLATION

The following instructions should be carefully followed in installing battery:

1. Remove battery from packing carton.
2. If needed, add water to bring liquid level to indicator mark on battery container. Do not overfill.
3. Remove back cover from radio, also battery case cover. The latter is removed by taking out the thumb screw and pulling the left side of the cover away from the battery case.
4. Turn battery with ball indicators faced to left, and then connect the two black leads with spade terminals onto the extreme right or negative (-) terminal of the battery. Note that the leads when connected to the terminal come away from the terminal on the side of battery toward you.
5. Turn battery so that the indicators face the front, then slide the battery part way into the case. Connect the two yellow leads with the spade terminals to the front or positive (+) terminal of the battery. The leads when connected will come away from the terminal on the right-hand side of the battery.
6. Connect the rubber vent tube over the vent located in middle of battery.
7. Slide battery as far as it will go into battery case.
8. Replace battery case cover.
9. Place battery on charge, if necessary, as described in a previous paragraph, until all three indicators are showing in the opening in the case cover.

Charger Characteristics

A ¼-ampere fuse is used in series with the primary of the charger transformer. If the battery, after being placed on charge, does not show any signs of becoming charged after a reasonable length of time, the fuse should be checked. Replace only with a ¼-amp GE Cat. No. 2548 fuse or its equivalent.

If one or more of the copper oxide discs of the rectifier unit are defective, the charger will not operate properly. To test the rectifier unit operation, proceed as follows: Remove the two black leads from the negative terminal of the battery and connect a DC ammeter which will read two amperes, in series with these leads to the negative terminal of the battery. Plug the power cord into an AC supply and turn the power selector switch to the "Charge" position. With the AC line voltage at 117 volts, the average charging current should read about 1.35 amperes at 2.1 volts battery. If line voltage is greater or battery voltage is lower than 2.1 volts the charging current will be greater. If the current is much less than this value at the rated line of 117 volts, one or more of the copper oxide discs may be defective.

To check individual discs, the following tests are suggested. In the conducting direction, the rectifier disc should pass 0.5 ampere or more when ½ volt is impressed across the disc. Note: The copper oxide rectifier disc conducts when the positive potential is applied to the copper oxide surface. The copper oxide is a dark blue coating and is plated with nickel to afford a good surface contact to the oxide. If a DC ammeter is not available for measuring currents as high as 0.5 ampere, the circuit shown in Fig. 2 can be used for this check. This method requires that the resistance of 2.75 ohms be made fairly accurate and is placed in series with the rectifier disc and placed across the two volt storage battery. The voltage should always read 0.5 volt or less; if the voltage exceeds 0.5 volt across the disc in this circuit, it indicates a defective disc.

The reverse current flow is as important as the above test and is made as follows: Reverse the battery polarity in the above test circuit and place a milliammeter that will read 10 milliamps in series with a lead to one of the battery terminals. This reverse current should not exceed 2½ milliampers at the applied voltage of 2.0 volts. If the current is considerably above this value the disc should be discarded. Precaution—A suitable meter fuse should be used in series with the milliammeter to prevent damage to the meter in case the disc under test is shorted. A rough check, if a milliammeter is not available, is to measure the resistance of the disc in the non-conducting direction on the low-resistance tap (1½ volt) of the ohmmeter. The resistance should measure at least 750 ohms.

BATTERY INFORMATION

The receiver uses a 2-volt Willard Radio Battery No. 20-2 or equivalent. It has a twenty ampere-hour capacity and should be cared for in the same manner as any other storage battery.

Charge Indicator

The degree of charge of the battery can be determined by removing the back cover of the radio and referring to the charge ball indicator visible through the hole in the metal battery case.

If the battery is fully charged, three indicator balls will be visible at the surface of the liquid in the battery. When the battery discharges, these ball indicators will sink and disappear in the following order:

1. Green indicator sinks when approximately 10 per cent of battery capacity has been discharged.
2. White ball sinks when 50 per cent capacity has been discharged.
3. The red ball sinks when battery is 90 per cent discharged.

On charge, the balls rise or float in the reverse order and the charge is complete and may be stopped when all three balls appear in the opening.

GENERAL ELECTRIC CO.

ALIGNMENT PROCEDURE

Alignment Frequencies

- I.F. 455 KC
- R.F. 1500 KC

The location of all trimmers is shown in Fig. 4.

I.F. Alignment

Connect an output meter across the voice coil. Turn volume control to maximum. Set test oscillator to 455 KC and keep the oscillator output as low as a readable meter reading will permit.

Apply signal to 1A7GT converter grid through .05 Mfd. capacitor and align progressively the trimmers in the 2nd and 1st I.F. transformer cans.

R.F. Alignment

Adjust the signal generator to 1750 KC and loosely couple a wire from the output terminal of the signal generator so that the receiver loop will pick up the signal. Set the gang condenser to minimum capacity and adjust the oscillator trimmer (C2A) to receive the signal. After this has been done set the signal generator to 1500 KC and tune the receiver until this signal is tuned in. Adjust the R.F. trimmer (1A) for maximum output. In case of bent plates in the condenser, set the signal generator and the receiver to 600 KC and bend plates into the position for maximum output.

Tubes

- Converter-Oscillator..... GE-1A7GT
- 1st I.F. Amplifier..... GE-1N5GT

- Power Output..... GE-1Q5GT

SPECIFICATIONS

Physical Dimensions

- Height 13 inches
- Width 13 inches
- Depth 4 3/4 inches
- Weight (with Battery) 16 pounds

Special Service Information

The following service information will be very useful in servicing receivers if a vacuum tube voltmeter or similar voltage measuring instrument is available.

- (1) Stage Gains
 - 1A7GT grid to 1st IF grid..... 40 at 1,000 KC
 - 1A7GT grid to 1st IF grid..... 57 at 455 KC
 - 1st IF grid to 2nd IF grid..... 95 at 455 KC
 - 2nd IF grid to 1H5GT diode plate..... 8.5 at 455 KC

- (2) Audio Gain

0.08 volts, 400 cycle signal across volume control with control set at maximum, will give approximately 50 milliwatts speaker output.

- (3) DC voltage developed across oscillator grid resistor (R2) averages 6.5 volts at 1,000 KC.

Variations of 20 per cent permissible. All readings obtained are with AVC shorted to chassis ground.

Electrical Rating

Charging from AC line:

- 110-125 volts AC..... 50-60 cycles..... 6 watts
- 110-125 volts AC..... 25-60 cycles..... 10 watts

Charging from storage battery (using LM-1 Charging Cable):

- 6.3 volts DC..... 1.4 amperes

Receiver power consumption:

- 2.1 volts DC..... 1.3 amperes..... 2.7 watts

Receiver battery requirement:

- Willard 2.0 volts No. 20-2 or equivalent rechargeable battery.

Fuse: G-E No. 2548 1/4-ampere rating.

Tuning Frequency Range

- Broadcast Band..... 550-1750 KC

Electrical Power Output

- Maximum..... 225 milliwatts

Loudspeaker—PM Dynamic

- Cone Diameter..... 5 inches
- Voice Coil Impedance..... 3.5 ohms (400 cycles)

GENERAL INFORMATION

Power Supply

All power necessary for the operation of the receiver is supplied by the 2-volt built-in rechargeable battery. The tube filaments are heated directly by the two volts from the battery while the necessary high voltage for the screen and plates of the tubes is furnished by a synchronous vibrator used in conjunction with a step-up power transformer and its associated filter circuit. The synchronous vibrator operates on the two volts from the battery.

Provision has been made to charge the battery directly from the house current without removing the battery from the receiver circuit. Two charging positions are provided on the four-position power selector switch. The "Charge" position of this switch allows the battery to be charged at the rate of approximately 1.35 amperes from the house current during the period that the receiver is not being operated. The "AC" position of the switch allows the receiver to be operated at the same time that the battery is being charged. Under this condition, however, it takes a considerably longer period for a partially discharged battery to be fully restored due to the fact that current is taken from the battery to operate the receiver.

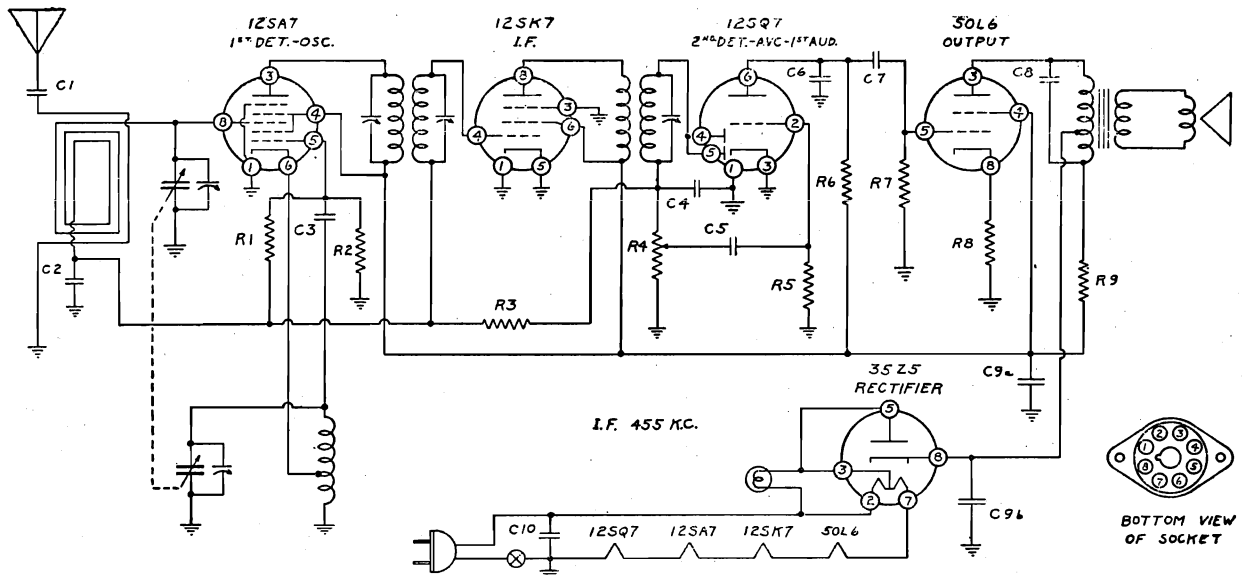

The battery charging unit consists of a step-down transformer which converts the house current to approximately 5.5 volts on 50-60 cycle models; on 25-60 cycle models the voltage is 6.6 volts. This low voltage is then applied to a copper oxide rectifier in a full wave rectifier circuit which supplies the battery with a DC charging current.

A charging cable, Stock LM-1, is available, which provides a convenient means of charging the radio battery from an automobile or 6-volt storage battery. The cable plug is inserted over the two prongs on the left side of the metal battery case and the plug and socket on the other end of the cable is provided with terminals for connection to a 6-volt supply. Full installation instructions are provided with each cable.

Before the receiver chassis can be removed from the cabinet, it is necessary to first remove the battery-vibrator case. The battery case is held in place by four screws available from the bottom of the cabinet. The radio chassis is held by two Phillips head screws located on the control panel. Fig. 3 shows the various connectors used to interconnect the units.

General Data

The alignment of this receiver requires the use of a signal generator that will cover the frequencies of 455, 600, 1400 and 1730 K.C., and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the signal generator output as low as possible, to prevent the AVC from operating and giving false readings.

I.F. Alignment

Adjust the signal generator to 455 K.C. and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. condenser. Connect ground of signal generator to chassis ground through a .1 mfd. condenser. Align all I.F. trimmers to peak or maximum reading on the output meter.

Broadcast Band Alignment

Adjust the signal generator to 1730 K.C. and connect the output to the antenna lead, through a .0002 mfd. mica condenser. Set the gang condenser to minimum capacity and adjust the oscillator trimmer to receive this signal. After this has been carefully done, the next step is to set the signal generator to 1400 K.C. and after tuning in the signal adjust the B.C. antenna trimmer to peak. In case of bent plates, set the signal generator and the receiver to 600 K.C. and bend the plates into the position for maximum output.

Electrical Power Output (117 line volts)
 Undistorted.....1.0 watts
 Maximum.....1.5 watts

ALIGNMENT PROCEDURE

Alignment Frequencies

RF.....1500 KC
 IF.....455 KC

The chassis must be removed from the cabinet to make the following alignment. The location of all trimmers is shown in Fig. 2.

IF Alignment

Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 KC and keep the oscillator output as low as a readable meter reading will permit.
 Apply signal to the 12SA7 converter grid through a .05 mfd. capacitor and align progressively the trimmers in the 2nd and 1st IF transformers.

RF Alignment

When making the following alignment the loop antenna must be bolted to the chassis by the screw and spacer mounting. The RF signal should be capacity coupled to the receiver loop by placing a two-foot piece of wire for an antenna on the test oscillator output post (high side). Keeping this antenna two feet or more from the receiver loop will generally insure freedom from too much coupling. Metal objects such as meters, tools, etc., should not be placed in close proximity to the loop when making this alignment.

With the gang condenser plates completely closed, the pointer should line up with the first mark on the left of the scale. Set the signal generator to 1500 KC. Align (C-1b) to the signal while the pointer is on the 1500 KC mark. Peak (C-1a) for maximum output.

Special Service Information

The following information will be very useful to servicemen equipped with vacuum tube voltmeters or similar voltage measuring instruments.

- (1) Stage Gains
 Antenna post to RF grid—3.8 at 1000 KC
 RF grid to converter grid—6.0 at 1000 KC
 Converter grid to IF grid—46 at 455 KC
 IF grid to 12SQ7 diode plate—75 at 455 KC
- (2) Audio Gain
 .14 volts, 400 cycles signal across volume control with control set at maximum, will give approximately 1/2-watt speaker output.
- (3) DC voltage developed across oscillator grid resistor (R4) averages 10.0 volts at 1000 KC.
 Variations of ±20% permissible. All readings obtained with enough signal input to give 1/2-watt speaker output.

(PRICES SUBJECT TO CHANGE WITHOUT NOTICE)

SERVICE NOTES
 Battery Specifications..... Three Eveready No. 950, Burgess No. 2 or equivalent. One Eveready No. 467 Burgess No. XX45 or equivalent.
 Intermediate Frequency 455 K.C.
 Tuning Frequency range 540-1700 K.C.
 Maximum Power Output 150 Milliwatts
 Loud Speaker Cone Diameter-4 inches
 Voice Coil Impedance (400 cycles) 3 1/2 ohms
 Tubes: R. F. 1T4, Converter-Oscillator 1R5, I. F. 1T4, Detector, A. V. C. 1S5, Power Output 3S4, Rectifier 35Z5GT

2. The batteries are easily installed or replaced. When the back of the cabinet is opened, the battery compartment is accessible. Place the dry cell batteries on the right side with brass terminal toward the outside. Snap the red lead terminal to the positive (+) terminal of the "B" battery. The blue lead should be snapped to the negative (-) terminal. Place the "B" battery on the left side of the compartment with the terminals toward the center. The sketch inside the cabinet will be found an aid in connecting the batteries properly.

ALIGNMENT PROCEDURE

Alignment Frequencies R. F. 600-1500-1700 K. C.
 I. F. 455 K. C.

I. F. Alignment

Connect an output meter across the voice coil. Rotate the volume control to maximum. Set test oscillator to 455 kilocycles and apply signal to control grid of 1T4 R. F. tube through a .05 mfd. capacitor. Align the second I. F. transformer trimmers, next adjust the first I. F. trimmers. Keep the test output to a level that will give a good meter reading.

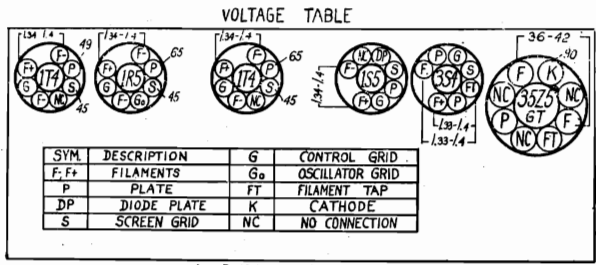

R. F. Alignment

Place a one turn loop not closer than six inches from the receiver Beam-a-Scope which is located in the front cover. Apply a 1700 kilocycles signal to the coupling loop. Adjust the receiver to 1700 kilocycles by turning

the variable condenser until it is in the extreme clockwise position. Align the oscillator trimmer (C-1A). Set the signal generator to 1500 kilocycles. Turn the receiver tuning condenser until the generator signal is picked up. Peak (C-1B) for maximum output. Change the test signal

to 600 kilocycles and turn the condenser until signal is heard. Peak (C-2) while rocking the gang variable.

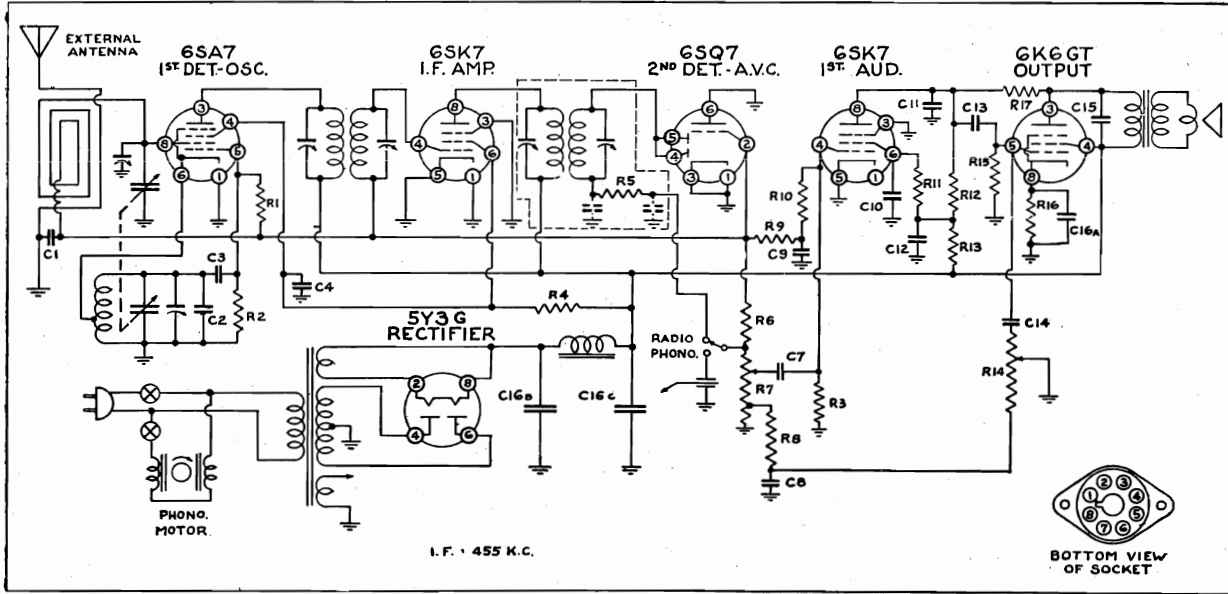

The Beam-a-Scope leads should be dressed the same after the components are mounted in the cabinet as during alignment.

ALIGNMENT DATA

Fig. 2—Top View of Chassis

The alignment of this receiver requires the use of a signal generator that will cover the frequencies of 455, 600, 1400 and 1630 kc., and an output meter to be connected across the primary or secondary of the output transformer. All alignments should be made with the volume control in the maximum position, to prevent the AVC from operating and giving false readings.

LF. ALIGNMENT

Adjust the signal generator to 455KC and connect the output to the grid of the first detector tube (6SA7) through a .05 or .1 mfd. condenser. Align all I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT

Adjust the signal generator to 1630 KC. and connect the output to a shielded loop radiator and place this loop about two feet from the loop antenna. If no loop radiator is available the output of the signal generator should be connected to the blue lead extending from the loop antenna through a .0002 mfd. mica condenser. Set the gang condenser to minimum capacity and adjust the oscillator trimmer (See Fig. 2) to receive this signal. After this has been carefully done, the next step is to set the signal generator to 1400 K.C. and after tuning in the signal adjust the antenna trimmer to peak. This is all that is necessary for the alignment unless the plates of the gang condenser have been bent out of shape. In case of bent plates, set the signal generator and the receiver to 600 K.C. and bend the plates into the position for maximum sensitivity over the tuning range.

For Radio Products RC-50 Record Changer see Riders "Automatic Record Changers and Recorders."

ALIGNMENT PROCEDURE

Alignment Frequencies:
 I. F.....455 K.C.
 R. F.....1500 K.C.

I. F. Alignment

Connect an output meter across the voice coil. Rotate the volume to maximum. Set test oscillator to 455 K.C. and apply signal to lug on stator of gang condenser to which loop is connected through a .05 Mfd. capacitor. Align the second I. F. transformer trimmers, next adjust the first I. F. transformer trimmers. Keep test oscillator output as low as a readable-meter reading will permit.

R. F. Alignment

Set the dial pointer and generator at 1500 K.C. Run a wire from the output terminal of the generator, having it come near the receiver. However, no metallic connection is made between the signal generator and the receiver.

Peak the oscillator trimmer for maximum output and then the antenna trimmer.

If the variable condenser plates have become bent or damaged, it may be necessary to adjust them for tracking, at 600 K.C. The oscillator plates are adjusted first, then the antenna plates are adjusted for maximum output at 600 K.C.

MODELS L-613, L-621, L-624, L-632, L-633 GENERAL ELECTRIC CO.

On 40-60 cycle receivers, omit R12 and connect A-B & X-Z.
 On 25-cycle receivers, add R12 and connect X-Y.
 R16 used only when No. 47 pilot lamp is used.

MODEL LC-619

GENERAL ELECTRIC CO. MODELS L-613, L-621, L-624, L-632, L-633

FRONT OF CHASSIS
BOTTOM VIEW OF CHASSIS

G.E. Models L-613, L-621, L-624, L-632, L-633.

GENERAL INFORMATION

Two different types of record changers were used during the production of the Model LC-619 phonograph combination.

The Model LRP-170 record changer is identified by the single record post and the eccentric turntable spindle, whereas the LRP-162 changers make use of a two-post record holder. Different pickup compensation is used for the two changers as noted at the bottom of the schematic diagram and the change in value of resistors, R12 and R16, as given in the replacement parts list.

Special Service Information

The following data are taken with a vacuum tube voltmeter or similar voltage measuring device.

- (1) Stage Gains
 - Antenna Post to RF Grid 5 at 1000 KC
 - RF Grid to Converter Grid 5 at 1000 KC
- (2) Audio Gains
 - .14 volts, 400 cycles signal across volume control with control set to maximum will give approximately 1/2-watt speaker output.
- (3) DC voltage developed across oscillator grid resistor R4 averages 10 volts at 1000 KC or 8.0 volts at 10,000 KC.

Variations of ±20% permissible. All readings taken with AVC shorted out.

ALIGNMENT PROCEDURE

The location of trimmers is shown in Fig. 4. All oscillator and RF trimmers are accessible through a slot through the back cover of the cabinet.

The alignment procedure is given in table form. All IF alignments may be made with the chassis removed from the cabinet. However, the RF alignments are made with the chassis and loop antennas securely fastened in the cabinet, as the relative position of the loop antenna with respect to the chassis materially affects it. The RF signal should be capacity coupled by placing a two-foot wire for an antenna on the test-oscillator output post (high side). Keeping this antenna two feet or more from the receiver loop will generally insure freedom from too much coupling. Metal objects such as meters, tools, etc., should not be placed on top of the receiver cabinet.

* Use minimum capacity peak.
 ** Rock gang condenser when making alignment.

BOTTOM VIEW OF CHASSIS

Fig. 2. Socket Voltages

ALIGNMENT PROCEDURE

The location of trimmers is shown in Fig. 1. All oscillator and RF trimmers are accessible through a slot through the back cover of the cabinet.

The alignment procedure is given in table form. All IF alignments may be made with the chassis removed from the cabinet. However, the RF alignments are made with the chassis and loop antennas securely fastened in the cabinet

as the relative position of the loop antenna with respect to the chassis materially affects it. The RF signal should be capacity coupled by placing a two-foot wire for an antenna on the test-oscillator output post (high side). Keeping this antenna two feet or more from the receiver loop will generally insure freedom from too much coupling. Metal objects such as meters, tools, etc., should not be placed on top of the receiver cabinet.

Special Service Information

The following data are taken with a vacuum tube voltmeter similar voltage measuring device.

- Stage Gains
 Antenna Post to RF Grid 5 at 1000 KC
 RF Grid to Converter Grid 5 at 1000 KC
 Converter Grid to IF Grid 40 at 1000 KC
 Converter Grid to IF Grid 60 at 455 KC
 IF Grid to 6SQ7 diode plates 90 at 455 KC
- Audio Gains
 .14 volts, 400 cycles signal across volume control with control set to maximum will give approximately 1/2-watt speaker output.
- DC voltage developed across oscillator grid resistor R4 averages 10 volts at 1000 KC or 8.0 volts at 10,000 KC.

Variations of ±20% permissible. All readings taken with AVC shorted out.

Some production receivers have C-30 connected from the 6V6GT plate to chassis ground. Late production receivers have C-30 connected as shown in the schematic diagram.

ALIGNMENT PROCEDURE

The location of trimmers is shown in Fig. 1. All oscillator and RF trimmers are accessible through a slot through the back cover of the cabinet.

The alignment procedure is given in table form. All IF alignments may be made with the chassis removed from the cabinet. However, the RF alignments are made with the chassis and loop antennas securely fastened in the cabinet, as the relative position of the loop antenna with respect to

the chassis materially affects it. The RF signal should be capacity coupled by placing a two-foot wire for an antenna on the test-oscillator output post (high side). Keeping this antenna two feet or more from the receiver loop will generally insure freedom from too much coupling. Metal objects such as meters, tools, etc., should not be placed on top of the receiver cabinet.

*Use minimum capacity peak.

**Rock gang condenser when making alignment.

Special Service Information

The following data are taken with a vacuum tube voltmeter or similar voltage measuring device.

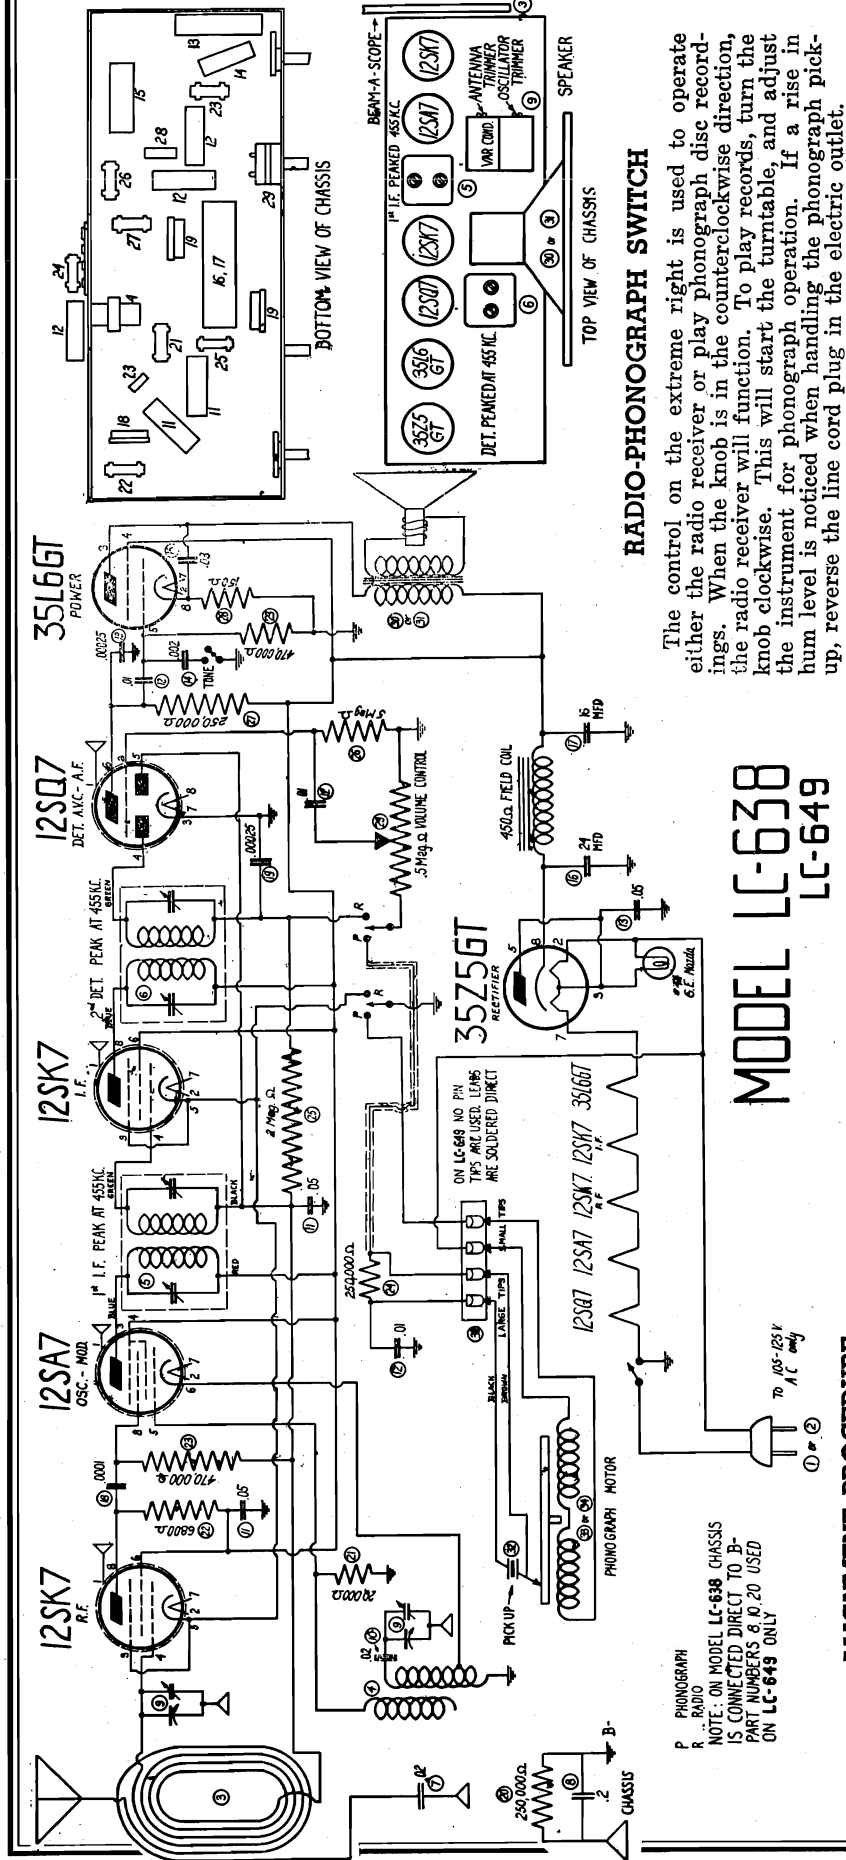

- Stage Gains
 - Antenna Post to RF Grid 6.5 at 1000 KC
 - RF Grid to Converter Grid 7.0 at 1000 KC
 - Converter Grid to IF Grid 45 at 1000 KC
 - Converter Grid to IF Grid 63 at 455 KC
 - IF Grid to 6SQ7 diode plates 70 at 455 KC

- Audio Gains
 - .14 volts, 400 cycles signal across volume control with control set to maximum will give approximately 1/2-watt speaker output.

- DC voltage developed across oscillator grid resistor R7 averages 10 volts at 1000 KC or 8.0 volts, at 10,000 KC.

Variations of ±20% permissible. All readings taken with AVC shorted out.

GENERAL ELECTRIC CO. MODELS LC-638, LC-649

RADIO-PHONOGRAPH SWITCH

The control on the extreme right is used to operate either the radio receiver or play phonograph disc recordings. When the knob is in the counterclockwise direction, the radio receiver will function. To play records, turn the knob clockwise. This will start the turntable, and adjust the instrument for phonograph operation. If a rise in hum level is noticed when handling the phonograph pickup, reverse the line cord plug in the electric outlet.

ALIGNMENT PROCEDURE

Alignment Frequencies I. F.455 K. C.
R. F. 1700 & 1400 K. C.

I. F. Alignment

Connect an output meter across the voice coil. Rotate the volume control to maximum. Set test oscillator to 455 kilocycles and apply signal to control grid of 12SK7 R. F. through a .05 mfd. capacitor. Align the second I. F. transformer trimmers, next adjust the first I. F. transformer trimmers. Keep the test oscillator output to a level that will give a good meter reading.

R. F. Alignment

Attach high side of test oscillator to flexible lead extending from rear of chassis through a .00025 mfd. condenser. Connect the low side to the receiver chassis. Adjust the test oscillator and receiver to 1700 kilocycles. Peak 1700 kilocycles oscillator trimmer for maximum output. Change test oscillator signal and receiver dial to approximately 1400 kilocycles. Then while rocking gang condenser, trim 1400 kilocycles antenna trimmer for maximum output.

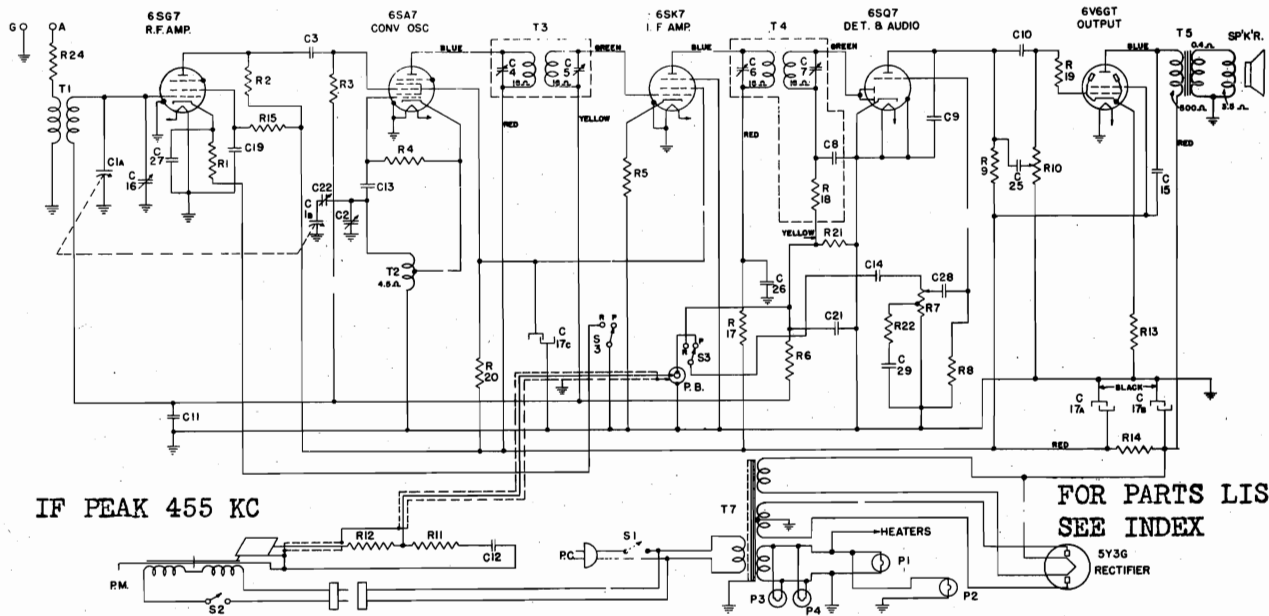

BOTTOM VIEW OF CHASSIS

All above voltages measured from socket terminal to chassis with a 1000Ω per volt voltmeter.

GENERAL ELECTRIC CO.

MODELS L-650, L-652

Alignment Frequencies

RF.....1500 KC
IF.....455 KC

The chassis must be removed from the cabinet as described above to make the following alignments. The locations of all trimmers are shown in Fig. 1.

IF Alignment

Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 KC and keep the oscillator output as low as a readable meter reading will permit.

Apply signal to the 12SA7 converter grid through a .05 mfd. capacitor and align progressively the trimmers in the 2nd and 1st IF transformers.

RF Alignment

When making the following alignment the loop antenna must be bolted to the chassis by the two mounting screws. Since the glass dial scale is fastened to the cabinet, it cannot be used for reference during the alignment of the chassis outside the cabinet. Use must be made therefore of the four calibration marks at the bottom flange of the dial scale reflector plate (immediately below end of dial scale pointer). These marks referring from left to right are as follows: Reference point, 580 KC, 1000 KC, and 1500 KC.

The RF signal should be capacity coupled to the receiver loop by placing a two foot piece of wire for an antenna on the test oscillator output post (high side). Keeping this antenna two feet or more from the receiver loop will generally insure freedom from too much coupling. Metal objects such as meters, tools, etc. should not be placed in close proximity to the loop when making the alignment.

With the gang condenser plates completely closed, the end of the pointer should line up with the first mark to the left of the dial reflector plate. If it doesn't the pointer can be moved on the dial cord until it does. Set the signal generator to 1500 KC. Set pointer to the 1500 KC mark (extreme right flange mark) and align (C2B) to the signal. Peak (C2A) for maximum output.

Special Service Information

The following information will be useful to servicemen equipped with vacuum tube voltmeters or similar voltage measuring instruments. When making the Stage Gain measurements in (1), the AVC bus should be shorted to B—.

- (1) Stage Gains
Antenna post to converter grid.....26 at 1000 KC
RF grid to converter grid.....5.6 at 1000 KC
Converter grid to IF grid.....25 at 455 KC
IF grid to 12SQ7 diode plate.....53 at 455 KC

- (2) Audio Gain
0.14 volts, 400 cycle signal across volume control with control set at maximum, will give approximately 1/2-watt speaker output.

- (3) DC voltage developed across oscillator grid resistor (R4) averages 5.0 volts at 1000 KC.
Variations of 20 per cent permissible. All readings obtained with enough signal input to give 1/2-watt speaker output.

Alignment Procedure MODELS X-108, X-118

The alignment procedure shown in table form is made either with the chassis in or removed from the cabinet.

If the chassis is removed from the cabinet to make the RF alignment, the dial which is fastened to the cabinet cannot be used for calibration reference. Use must be made, therefore, of the paper scale fastened on the rear of the dial reflector plate. With the gang condenser completely closed, one of the edges of the pointer rider should be lined up with the first marking to the right of the scale on the rear of the dial reflector plate. This can be accomplished by sliding the pointer on the cord until it does. The selected edge of the pointer rider may now serve as a pointer for the RF alignment. There are two 17.8 reference points on the paper scale on the rear of the dial reflector plate. The one towards the lower frequency end of the dial is the proper one to use for the 16-meter spread-band alignment; while the other is used for a reference point on the SW2 band.

The SW2 band does not require alignment. This band is taken care of when the 16 meter spread-band is aligned.

Since accuracy in frequency calibration is very essential for proper alignment of the spread-bands, it is impractical to use the standard test oscillator for this purpose unless a special calibration is first made.

The actual reception of short-wave stations of known frequency in the band to be checked is probably the most

satisfactory method or determining the proper setting of the oscillator trimmers in these bands. The oscillator trimmer should be adjusted so that the station appears at the correct position on the dial. R.F. alignment can be made with the test oscillator.

The calibration of the test oscillator may be checked by zero beating the test oscillator with a short-wave station of known frequency. By taking several of these calibration points, it will afford a calibration of a high degree of accuracy in case you wish to use the test oscillator for alignment in these bands.

TO SET-UP PUSH BUTTONS

1. Make a list of stations desired on push buttons and arrange in order, from low to highest frequency; insert tabs of the call letters of the stations in the keys in the order listed.
2. Allow the receiver to run five minutes before making the following adjustments. Manually tune in first station, lift key upward and loosen adjusting bolt. Hold the tuning control to the exact tune position and with a screwdriver push in the adjusting bolt as far as it will go, then tighten the adjusting bolt.
3. Adjust for each of the five remaining stations in a similar manner.

MODEL L-678

ALIGNMENT PROCEDURE

Alignment Frequencies

I.F. 455 KC. R.F. 1500 and 580 KC
The location of all trimmers is shown in Fig. 1.

I.F. Alignment

Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 KC and keep the oscillator output as low as a readable meter reading will permit.
Apply signal to the grid of the 6SK7GT through a .05-mfd. capacitor and align the 2nd IF transformer. Repeat the procedure, applying the 455-Kc signal to the control grid of the 6SA7GT and aligning the 1st I.F. transformer. Finish by over-all adjustments.

R.F. Alignment

With gang condenser plates completely closed, set dial pointer to the first mark at the left end of the scale. Apply a 1500-Kc signal either through a standard I.R.E. dummy to the antenna terminal or through an additional loop connected to the generator output which can be magnetically coupled to the receiver Beam-a-Scope. Align (C-2) at 1500 KC and peak (C-1) for maximum output. Peak (C-3) on 580 KC while rocking the gang condenser. Retrim at 1500 KC.

Precaution

If the signal generator is AC operated, use an isolating transformer between the power supply and the radio receiver power input. The use of an isolating capacitor is not recommended as AC current through the capacitor will introduce hum modulation and/or create the possibility of a burned out signal generator attenuator.

Special Service Information

The following data will be very useful to servicemen equipped with vacuum tube voltmeters or similar voltage measuring instruments.

- (1) Stage Gains*
Antenna post to 6SA7GT grid..... 4 at 1000 KC
6SA7GT grid to 6SK7GT grid..... 30 at 455 KC
6SK7GT grid to 6Q7GT det. plate..... 100 at 455 KC
- (2) Audio Gains
.06 volts, 400 cycles signal across volume control with control set to maximum will give approximately 3/4 watt speaker output.
- (3) DC voltage developed across oscillator grid resistor (R-1) averages 12 volts.

* Variations of +10%, -20% permissible.

Loud-speaker

The voice coil is accurately and permanently centered at the factory and should seldom give trouble. In case a voice coil needs recentering it will be necessary to replace the entire cone and voice-coil assembly.

NOTE.—In no case should the magnet be removed from the assembled position without remagnetizing after replacing it.

MODEL LC-658

ALIGNMENT PROCEDURE

Alignment Frequencies I. F. 455 K.C.
R. F. 1700 & 1400 K.C.

I. F. Alignment

Connect an output meter across the voice coil. Rotate the volume control to maximum. Set test oscillator to 455 kilocycles and apply signal to control grid of 12SK7 R. F. through a .05 mfd. capacitor. Align the second I. F. transformer trimmers, next adjust the first I. F. transformer trimmers. Keep the test oscillator output to a level that will give a good meter reading.

R. F. Alignment

Attach high side of test oscillator to flexible lead extending from rear of chassis through a .00025 mfd. condenser. Connect the low side to the receiver chassis. Adjust the test oscillator and receiver to 1700 kilocycles. Peak 1700 kilocycles oscillator trimmer for maximum output. Change test oscillator signal and receiver dial to approximately 1400 kilocycles. Then adjust 1400 kilocycles antenna trimmer for maximum output.

MODEL 660

ALIGNMENT PROCEDURE

Alignment Frequencies

RF	1500 KC
IF	455 KC

The chassis must be removed from the cabinet as described above to make the following alignments. The locations of all trimmers is shown in Fig. 1.

IF Alignment

Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 KC and keep the oscillator output as low as a readable meter reading will permit.

Apply signal to the 12SA7 converter grid through a .05 mfd. capacitor and align progressively the trimmers in the 2nd and 1st IF transformers.

RF Alignment

When making the following alignment the loop antenna must be bolted to the chassis by the two mounting screws. Since the glass dial scale is fastened to the cabinet, it cannot be used for reference during the alignment of the chassis outside the cabinet. Use must be made therefore of the four calibration marks at the bottom flange of the dial scale reflector plate (immediately below end of dial scale pointer). These marks referring from left to right are as follows: Reference point, 580 KC, 1000 KC, and 1500 KC.

The RF signal should be capacity coupled to the receiver loop by placing a two foot piece of wire for an antenna on the test oscillator output post (high side). Keeping this antenna two feet or more from the receiver loop will generally insure freedom from too much coupling. Metal objects such as meters, tools, etc. should not be placed in close proximity to the loop when making the alignment.

With the gang condenser plates completely closed, the end of the pointer should line up with the first mark to the left of the dial reflector plate. If it doesn't the pointer can be moved on the dial cord until it does. Set the signal generator to 1500 KC. Set pointer to the 1500 KC mark (extreme right flange mark) and align (C2B) to the signal. Peak (C2A) for maximum output.

Loudspeaker—PM DYNAMIC

Outside cone diameter	5 inches
Voice coil impedance (400 cycles)	3.5 ohms

SPECIFICATIONS

Over-all Dimensions:

Height	8 5/8 inches
Width	13 inches
Depth	8 inches

J644, J644W, J654, J654W

These receivers incorporate the following features: Single-ended tubes, automatic volume control, built-in antenna, dynapower speaker and beam power output.

ALIGNMENT PROCEDURE

Alignment Frequencies

I.F.	455 KC
R.F.	1650 and 1500 KC

The location of all trimmers is shown in Fig. 1.

I.F. Alignment

Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 KC and keep the oscillator output as low as a readable meter reading will permit.

Apply signal to the converter grid through a .05 mfd. capacitor and align progressively the trimmers in the 2nd and 1st I.F. transformer cans.

R.F. Alignment

To insert the R.F. signal use either a standard I.R.E. dummy antenna between the signal generator and the receiver antenna post, or loop-couple the generator signal to the receiver Beam-a-Scope. A distance of two feet between generator loop and receiver Beam-a-Scope will insure freedom from over-coupling. When using an I.R.E. dummy antenna for R.F. alignment, do not connect the signal generator ground to the receiver chassis

Electrical Rating

105-125 volts AC/DC, 50-60 cycles AC.

Tuning Frequency Range 550-1720 KC

Intermediate Frequency 455 KC

Electrical Power Output (117 volts)

Undistorted	1.1 watts
Maximum	1.6 watts

GENERAL INFORMATION

Station Key Adjustments

The station key adjustments are located on the bottom of the cabinet through the slots designated as "Osc." and "RF." The extreme left trimmer in rows "Osc." and "RF" are corresponding adjustments for the first or extreme left station key. The second set of adjustment trimmers are for the No. 2 or second key from left; correspondingly the remaining sets of trimmers are for the station keys No. 3 and No. 4. All receivers to run for 15 minutes before making the following adjustments.

1. List desired station on key, then manually tune in station desired for this key.
2. Push in station key to be set-up, to its depressed position.
3. Adjust its corresponding "Osc." adjustment for the station signal which you tuned manually above and which is listed for the key. Peak adjustment for clearest reception.
4. Adjust corresponding "RF" adjustment for maximum signal strength.
5. Proceed in like manner for adjustment of remaining keys.

NOTE.—Clockwise rotation of adjustment screws lowers the frequency.

Special Service Information

The following information will be useful to servicemen equipped with vacuum tube voltmeters or similar voltage measuring instruments. When making the Stage Gain measurements in (1), the AVC bus should be shorted to B—.

- (1) Stage Gains

Antenna post to converter grid	3.8 at 1000 KC
Converter grid to IF grid	30 at 455 KC
IF grid to 12SQ7 diode plate	53 at 455 KC
- (2) Audio Gain
0.14 volts, 400 cycle signal across volume control with control set at maximum, will give approximately 1/2-watt speaker output.
- (3) DC voltage developed across oscillator grid resistor (R4) averages 5.0 volts at 1000 KC.
Variations of 20 per cent permissible. All readings obtained with enough signal input to give 1/2-watt speaker output.

With the gang condenser wide open, align oscillator trimmer (C-3b) to 1650 KC. Change generator signal to 1500 KC, tune receiver to the signal and peak antenna trimmer (C-3a) for maximum output.

Precaution

If the signal generator is AC operated use an isolating transformer between the power supply and the radio receiver power input. The use of an isolating capacitor is not recommended as AC current through the capacitor will introduce hum modulation and/or create the possibility of a burned-out signal generator attenuator.

Special Service Information

The following information will be very useful in servicing receivers if a vacuum tube voltmeter or similar voltage measuring instrument is available.

- (1) Stage Gains

Antenna Post to Converter Grid	4.0 at 1000 KC	Gain*
I.F. on Converter Grid to I.F. on I.F. Amplifier Grid	35 at 455 KC	
I.F. Amplifier Grid to Diode Plate	60 at 455 KC	
- (2) 0.05-volt, 400-cycle signal across the volume control will give 1/2-watt speaker output.* (Volume control turned to maximum.)
- (3) Average RF voltage developed from oscillator cathode to B — 1.5 volts

* Variations of ± 20% permissible. All readings obtained with enough signal input to give 1/2-watt speaker output.

105-125 volts, 25-60 cycles on AC, 25 watts
- Battery Power Supply
9 volt "A" Supply
90 volt "B" Supply

Loudspeaker—"Alnico" Magnet Dynamic

Outside Cone Diameter..... 5 inches
Voice Coil Impedance (400 cycles)..... 3.5 ohms

Maximum Power Output..... 440 milliwatts

Special Service Information

The following information will be very useful in servicing receivers if a vacuum tube voltmeter or similar voltage measuring instrument is available:

- Stage Gains
RF Grid to Converter Grid 5.0 to 1000 KC
Converter Grid to 1F Grid 40 at 1000 KC
Converter Grid to 1F Grid 50 at 455 KC
1F Grid to 1H5GT diode plate 90 at 455 KC
- 0.07 volts, 400 cycle signal across the volume control will give 50 milliwatts speaker output. With volume control set at maximum.
- Average DC voltage developed across the oscillator grid resistor (R9)—10 volts

Variations of ±20 o/o permissible. All readings are obtained with the AVC shorted out.

Line-Battery Switch Wiring

Figures 4 and 5 show the line-battery switch for the Models LB700-LB702 and LB701-LB703 respectively. The switch terminals are numbered from 1-6 and 1-12 to facilitate the tracing of the circuit when referring to the schematic diagram in changing or servicing a switch.

ALIGNMENT PROCEDURE

Alignment Frequencies

IF-455 KC..... RF-1750 and 1500 KC

General Alignment Notes

The chassis must be removed from the carrying case in order to perform the alignment of the IF, wavetrap and oscillator trimmers. For alignment of the RF trimmer, the chassis should be assembled in the cabinet. Special care must be exercised in making alignments outside the cabinet so as to place the batteries, Beam-a-Scope and chassis in the same relative positions with respect to one another as these components occupy in the cabinet; otherwise alignment will not be satisfactory.

IF Alignment

Connect an output meter across the voice coil of speaker and rotate volume control to maximum. Tighten wave trap trimmer (C24), then loosen this trimmer screw about two turns. Set test oscillator to 455 KC and capacity couple this test oscillator signal to the loop antenna. This can be done by using a three foot piece of wire connected to the high side of the signal generator and bring this wire to within a foot or two of the receiver loop antenna. Keep oscillator signal as low as a readable meter reading will permit and align all IF trimmers (C14, 13, 12, 11) for maximum output.

Wave Trap Alignment

With test oscillator set at 455 KC and with same input as described under "IF Alignment," adjust wave trap trimmer (C24) for a minimum output-meter reading.

RF Alignment

Adjust test oscillator to 1750 KC and loosely couple a wire from the output terminal of the signal generator so that the receiver loop will pick up the signal. Set the gang condenser to minimum capacity and adjust the oscillator trimmer (C2A) to receive the signal. After this has been done return the chassis to the cabinet, replace the back cover and set test oscillator to 1500 KC. Tune the receiver until this signal is heard, then with a thin insulated screw driver, peak the RF trimmer C1A for maximum output. This trimmer is available through the hole in the side of the cabinet.

SPECIFICATIONS

Over-all Dimensions

Height..... 11 3/8 inches
 Width..... 17 inches
 Depth..... 11 inches

Electrical Rating

"A" rating, 110-125 volts, 50-60 cycles, 70 watts.
 "C" rating, 110-125 volts, 25 cycles, 70 watts.

Tuning Frequency Range

"BC" Band..... 550-1720 KC
 "SW1" Band..... 1.7-5.2 MC
 "SW2" Band..... 5.2-18.1 MC

Intermediate Frequency..... 455 KC

Electrical Power Output

Undistorted..... 3.5 watts
 Maximum..... 5.5 watts

Loud-speaker—PM Dynamic

Outside Cone Diameter..... 6 1/2 inch
 Voice Coil Impedance..... 3.5 ohms

Tubes

RF Amplifier..... GE-6SG7
 Converter, Oscillator..... GE-6SA7
 IF Amplifier, Detector, AVC..... GE-6SF7
 Audio Amplifier, Phase Inverter..... GE-6SC7
 Power Output..... (2) GE-6K6GT
 Rectifier..... GE-5W4GT
 Dial Lamps..... (2) MAZDA No. 44

ALIGNMENT CHART

Step	Connect Test-Osc. to	Test-Osc. Setting	Pointer Setting	Adjust Trimmers for Maximum Output
1	6SF7 IF Grid in series with .05 mfd.	455 KC	"BC" Band 550 KC	C17 & C16
2	6SA7 Conv. grid in series with .05 mfd.	455 KC	"BC" Band 550 KC	C14 & C13
3	Capacity Coupled	580 KC	"BC" Band 580 KC	C11**
4	Capacity Coupled	1500 KC	"BC" Band 1500 KC	C8** (Osc.)
5	Repeat Step 3			
6	Capacity Coupled	5 MC	"SW1" Band	C7** (Osc.)
7	Capacity Coupled	18 MC	"SW2" Band 18 MC	C6* (Osc.)
8	Capacity Coupled	18 MC	"SW2" Band 18 MC	C1** (Ant.)

*Use minimum capacity peak.
 **Rock gang condenser when making alignment.

Special Service Information

The following data are taken with a vacuum tube voltmeter or similar voltage measuring device.

- Stage Gains
 Antenna Post to RF Grid 6.5 at 1000 KC
 RF Grid to Converter Grid 10 at 1000 KC
 Converter Grid to IF Grid 45 at 1000 KC
 IF Grid to 6SF7 diode plates 60 at 455 KC
 110 at 455 KC
- Audio Gains
 .16 volts, 400 cycles signal across volume control with control set to maximum will give approximately 1/2-watt speaker output.
- DC voltage developed across oscillator grid resistor R4 averages 10 volts at 1000 KC or 8.0 volts at 10,000 KC.

Variations of ±20% permissible. All readings taken with -1 1/2-volt fixed bias on AVC bus.

Fig. 1. Trimmer Location

ALIGNMENT PROCEDURE

The location of trimmers is shown in Fig. 1. All oscillator and RF trimmers are accessible through a slot through the back cover of the cabinet.

The alignment procedure is given in table form. All IF alignments may be made with the chassis removed from the cabinet. However, the RF alignments are made with the chassis and loop antennas securely fastened in the cabinet, as the relative position of the loop antenna with respect to the chassis materially affects it. The RF signal should be capacity coupled by placing a two-foot wire for an antenna on the test-oscillator output post (high side). Keeping this antenna two feet or more from the receiver loop will generally insure freedom from too much coupling. Metal objects such as meters, tools, etc., should not be placed on top of the receiver cabinet.

GENERAL ELECTRIC CO.

SPECIFICATIONS

Over-all Dimensions

Height.....	36 inches
Width.....	34 7/8 inches
Depth.....	16 1/8 inches

Electrical Rating

Rating "A6"—110-125 volts, 60 cycles, 85 watts
 Rating "A5"—110-125 volts, 50 cycles, 85 watts

Tuning Frequency Range

"BC" Band.....	550-1720 KC
"SW1" Band.....	1.7-5.2 MC
"SW2" Band.....	5.2-18.1 MC

Intermediate Frequency.....455 KC

For RCA RP 158 Record Changer,
 see Rider's "Automatic Record
 Changers and Recorders".

Special Service Information

The following data are taken with a vacuum tube voltmeter or similar voltage measuring device.

- (1) Stage Gains
 - Antenna Post to RF Grid 6.5 at 1000 KC
 - RF Grid to Converter Grid 10 at 1000 KC
 - Converter Grid to IF Grid 45 at 1000 KC
 - Converter Grid to IF Grid 60 at 455 KC
 - IF Grid to 6SF7 diode plates 110 at 455 KC
- (2) Audio Gains
 - .16 volts, 400 cycles signal across volume control with control set to maximum will give approximately 1/2-watt speaker output.
- (3) DC voltage developed across oscillator grid resistor R4 averages 10 volts at 1000 KC or 8.0 volts at 10,000 KC.

Variations of $\pm 20\%$ permissible. All readings taken with minus 1 1/2-volt fixed bias on AVC bus.

ALIGNMENT PROCEDURE

The location of trimmers is shown in Fig. 4. All oscillator and RF trimmers are accessible through a slot through the back cover of the cabinet.

The alignment procedure is given in table form. All IF alignments may be made with the chassis removed from the cabinet. However, the RF alignments are made with the

ALIGNMENT CHART

Step	Connect Test-Osc. to	Test-Osc. Setting	Pointer Setting	Adjust Trimmers for Maximum Output
1	6SF7 IF Grid in series with .05 mfd.	455 KC	"BC" Band 550 KC	C17 & C16
2	6SA7 Conv. grid in series with .05 mfd.	455 KC	"BC" Band 550 KC	C14 & C13
3	Capacity Coupled	580 KC	"BC" Band 580 KC	C11**
4	Capacity Coupled	1500 KC	"BC" Band 1500 KC	C8** (Osc.)
5	Repeat Step 3			
6	Capacity Coupled	5 MC	"SW1" Band	C7** (Osc.)
7	Capacity Coupled	17.8 MC	"SW2" Band 18 MC	C6* (Osc.)
8	Capacity Coupled	17.8 MC	"SW2" Band 18 MC	C1** (Ant.)

* Use minimum capacity peak.
 ** Rock gang condenser when making alignment.

GENERAL INFORMATION

Models L915W and L916 are electrically identical and only vary in cabinet and dial scale treatment.

In Model L915W, electrodynamic speaker RS1092 (marked K33J371) was substituted for a portion of the production in place of the speaker listed in the parts list (marked K-33J365). Since this substitute speaker has a field coil resistance of 400 ohms instead of 500 ohms as shown on the schematic diagram, a 100 ohm resistor, RQ621, is added in series with the speaker field coil to maintain proper socket

Fig. 3. Socket Voltages

voltages whenever this substitute speaker is used. When replacing the cone for either speaker, use Stock No. RC9045.

ALIGNMENT PROCEDURE

The location of all trimmers is shown in Fig. 4. All oscillator and RF trimmers are accessible from the back of the receiver. The alignment procedure is given in table form. All IF alignment may be made with the chassis removed from the cabinet. However, the RF alignments are made with the chassis and loop antennas securely bolted in the cabinet, as the relative position of the loop antennas with respect to the chassis materially affects the alignment. The RF signal should be capacity coupled by placing a two-foot wire for an antenna on the test oscillator output post (high side). Keeping this antenna two feet or more from the receiver loop will generally assure freedom from too much coupling.

MODEL X-1708

GENERAL ELECTRIC CO.

FOR OAK RECORD CHANGER DATA
SEE RIDER'S "AUTOMATIC RECORD
CHANGERS AND RECORDERS".

Power Requirements

POWER SUPPLY		Frequency Cycles AC	Power Consumption (Watts)
Tap	Voltage Range		
110	103-117	50-60	90
125	117-133		
200	185-215		
230	215-240		
250	240-260		

The power transformer is provided with five voltage taps. Instant tap switching is made by a simple pin plug and jack device. For correct operation, measure the power supply voltage, note which voltage range covers this voltage and using the corresponding tap, insert the plug in the jack.

SPECIAL SERVICE INFORMATION

The following information will be very useful in servicing receivers if a vacuum tube voltmeter or similar voltage measuring instrument is available.

NOTE—Connection to converter grid must be made directly to tube grid and not to gang condenser on spread bands.

(1) Stage gains

(a) Antenna Post to Converter Grid, through 400 ohms and 200 mmfd. in series, at

Stand.	1000 KC.....5.4	31 M... 9.6 MC...1.8
SW1	4000 KC.....3.7	25 M... 11.8 MC...1.6
SW2	18000 KC.....1.1	19 M... 15.22 MC...1.4
		16-13 M... 17.8 MC...1.0

(b) RF on Converter Grid to IF on 6SG7 grid at

Stand.	1000 KC... 61	31 M... 9.6 MC...65
SW1	4000 KC... 63	25 M... 11.8 MC...68
SW2	18000 KC... 71	19 M... 15.22 MC...71
		16-13 M... 17.8 MC...71

(c) IF on Converter Grid to IF on 6SG7 grid at 455 KC—85

(d) IF Grid to diode plate at 455 KC—160

(2) Voltage across the diode load to give 1/2-watt speaker output at 400 cycles—.046 V.

(3) DC voltage developed across oscillator grid resistor (R1) at

Stand.	1000 KC...8.3 V.	31 M... 4.4 V.
SW1	4000 KC...7.7 V.	25 M... 4.8 V.
SW2	18000 KC...5.0 V.	19 M... 4.4 V.
		16-13 M... 3.7 V.

Variations of ±20% permissible. All measurements taken with R-26 shorted across.

Electrical Power Output

Undistorted with proper voltage at tap on power transformer—6 watts.

Maximum with proper voltage at tap on power transformer—6.5 watts.

Loud-speaker

The voice coil is accurately and permanently centered at the factory and should seldom give trouble. In case a voice coil needs recentering, it will be necessary to replace the entire cone and voice coil assembly. In no case should you attempt to move the magnet in the assembly.

SOCKET VOLTAGES

Voltages indicated by asterisk (*) are AC voltages
DC voltages measured between socket terminals and chassis
Voltages measured on 1000 ohms/volt meter on 500 volt scale
Gang closed, no signal input
Band switch turned to standard broadcast band

GENERAL INFORMATION

The Model X-1708 is a seven-band receiver employing eight tubes in a superheterodyne circuit. Four of these bands are spread bands which allow taking the most important portions of the "SW2" band and expanding them for ease in tuning the short-wave stations.

It is designed for operation on 50 or 60 cycle AC sources ranging from 103 to 260 volts. See **Power Requirements**.

Automatic Record Changer

The record changer will automatically play seven 12-inch or eight 10-inch records at one loading. It is shipped for operation on a 110-volt 50-cycle power supply but can be converted for use on a 110-volt 60-cycle power supply by changing the motor spindle bushing. The 60-cycle bushing is slightly smaller in diameter than the 50-cycle bushing, and is tied to the underside of the record changer frame. To replace, unscrew the setscrew on the motor spindle bushing (which drives the turntable drive wheel), and replace with the bushing for 60-cycle operation. Be sure the setscrew matches with the depression on the motor shaft, and is securely tightened. When properly installed, the top of the bushing should be just a fraction below the top of the motor shaft.

NOTE: Regardless of choice of tap on the power transformer, the phonograph motor is fed 110 volts.

GENERAL ELECTRIC CO.

MODEL X-1708

Alignment Procedure

The alignment procedure shown in table form is made either with the chassis in or removed from the cabinet.

If the chassis is removed from the cabinet to make the RF alignment, the dial which is fastened to the cabinet cannot be used for calibration reference. Use must be made, therefore, of the paper scale fastened on the rear of the dial reflector plate. With the gang condenser completely closed, one of the edges of the pointer rider should be lined up with the first marking to the right of the scale on the rear of the dial reflector plate. This can be accomplished by sliding the pointer on the cord until it does. The selected edge of the pointer rider may now serve as a pointer for the RF alignment. There are two 17.8 reference points on the paper scale on the rear of the dial reflector plate. The one towards the lower frequency end of the dial is the proper one to use for the 16-meter spread-band alignment; while the other is used for a reference point on the SW2 band.

The SW2 band does not require alignment. This band is taken care of when the 16-meter spread-band is aligned.

Spread-band Alignment

Since accuracy in frequency calibration is very essential for proper alignment of the spread bands, it is impractical to use the standard test oscillator for this purpose unless a special calibration is first made.

The actual reception of short-wave stations of known frequency in the band to be checked is probably the most satisfactory method for determining the proper setting of the oscillator trimmers in these bands. The oscillator trimmer should be adjusted so that the station appears at the correct position on the dial. RF alignment can be made with the test oscillator.

The calibration of the test oscillator may be checked by zero beating the test oscillator with a short-wave station of known frequency. By taking several of these calibration points, it will afford a calibration of a high degree of accuracy in case you wish to use the test oscillator for alignment in these bands.

BAND CHANGE AND TONE CONTROL SWITCHING

The following charts show the switch points connected for any one position of either the wave change or tone control switches. The numbers shown in each box indicate the switch points connected together in the section of the switch for each position of the switch. As for example: the numbers 5-9-10 indicate these switch points are all connected together for this particular position of the switch.

GENERAL ELECTRIC CO.

Amplitude modulation, as the name implies, is a method of superimposing the audio frequencies on a constant amplitude radio frequency carrier so as to vary the carrier amplitude at the audio frequency rate. To illustrate: Suppose we amplitude-modulate a radio frequency carrier with a 400 cycle audio tone. When the audio tone is going through the positive portion of its cycle, its voltage will add to the carrier voltage. When the audio tone goes through the negative portion of its cycle, its voltage will subtract from the carrier voltage. The resultant voltage will be equal to the carrier voltage plus or minus the varying audio voltage and will swing from a maximum to a minimum and back to a maximum every 1/400 of a second. The frequency of the carrier remains fixed.

With frequency modulated signals the carrier amplitude remains fixed and the carrier frequency is varied—just the reverse of amplitude modulation. To illustrate: Suppose we frequency-modulate a 50 megacycle radio frequency carrier with a 400 cycle audio tone of one volt. The one volt audio tone, we shall assume, will vary the 50 megacycle carrier by 25 kilocycles. When the audio tone is going through the positive portion of its cycle, the carrier frequency will increase from 50 megacycles to 50 megacycles plus 25 kilocycles or 50.025 megacycles when the cycle is at a maximum. When the audio tone is going through the negative portion of its cycle, the carrier frequency will decrease from 50 megacycles to 50 megacycles minus 25 kilocycles or 49.975 megacycles when the cycle is at a minimum. The resultant carrier frequency will thus be varying back and forth between 49.975 and 50.025 megacycles at the rate of 400 times per second. Now if the voltage (volume) of the audio tone increases to two volts, the frequency swing will increase to 50 kilocycles above and below 50 megacycles. Thus, the audio tone is transmitted as the rate of the carrier frequency variations and audio volume is transmitted as the magnitude of the carrier frequency variations. It should be noted that the amplitude of the carrier remains constant during the modulation with audio.

Oscillator-Converter Circuit

If the full noise reducing properties of frequency modulation are to be realized the sensitivity of the Translator must be good enough to insure proper limiter operation. The gain through the intermediate frequency circuits is limited to that point beyond which lies instability. Hence, a considerable amount of gain must be realized through the R.F. amplifier and converter circuits in order to insure adequate receiver sensitivity.

To secure this required gain the double superheterodyne or cascade converter circuit is employed. It consists of two converter tubes, 6AB7's, and an oscillator tube, 7A4, with their associated circuits. The antenna circuit tunes the band from 42 to 50 MC. The circuit between the two converters tunes from 23.15 to 27.15 MC. The oscillator voltage is inductively coupled to the grid of the first converter tube. This produces by heterodyne action a signal to which the interconverter circuit is tuned. The first converter also conducts the oscillator signal through to the interconverter circuit. Accordingly, the oscillator signal heterodynes with the tuned signal in the interconverter circuit to produce an I.F. frequency of 4.3 MC at the output of the second converter.

To illustrate the action consider an FM signal of 42 MC to which the Translator is tuned. The oscillator frequency for this setting of the tuning control is 18.85 MC and it heterodynes in the 1st converter tube with the 42 MC signal to form 23.15 MC (42-18.85). This 23.15 MC signal, in turn, beats with oscillator signal in the 2nd converter to produce the 4.3 MC intermediate frequency.

Cascade Limiter Circuit

The limiter circuit consists of two resistance coupled 6SJ7 tubes in series. Each limiter operates at zero initial bias and low plate voltage. Both grid circuits are designed for self-biasing and the use of capacity-resistance networks provides enough time delay to retain the grid bias between signal peaks. The action of the limiter is such that as soon as a signal is applied to the grid of the tube the grid draws current. This grid current charges up the capacitor across the grid resistor and at the same time establishes a bias through current drain in the resistor. Between positive signal peaks the capacitor discharges through the resistor maintaining the grid bias. The circuit is so designed that negative signal swings are all beyond plate current cutoff and positive signal peaks are cut off by plate current saturation. The value of the 1st limiter capacity-resistance network is so chosen as to limit noise amplitudes. This arrangement leaves the 2nd limiter with the very much simplified task of reducing the remaining noise to the desired level.

Servicing

When servicing this Translator and especially when replacing parts care should be exercised to return all components including wiring to the original positions occupied. The positioning of parts and wiring is very critical. When replacing coils and I.F. transformers, maintain the lead lengths provided and use the same terminals to which the original coil or transformer was connected.

ALIGNMENT PROCEDURE

Equipment

In order to perform the necessary alignment operations on this Translator the following equipment is recommended:

- (1) A good signal generator capable of giving a 46 MC signal with adjustable output voltage.
- (2) A wide band signal generator covering 4.3 MC with a sweep circuit of plus or minus 200 KC.
- (3) A cathode ray oscilloscope.
- (4) A 0-100 microammeter.

I.F. Alignment

Alignment of the I.F. transformers must be performed stage by stage and no over-all adjustments should be made after completing the stage by stage adjustments.

Connect the high side of the oscilloscope input through a 470,000 ohm carbon resistor to point "A" on the 1st limiter 6SJ7 load circuit. The ground side of the oscilloscope input connects to the chassis. Progressively apply a wide band signal generator output of 4.3 MC to points "B," "C" and "D" of the 2nd I.F., 1st I.F. and 2nd converter grids. Use a .05 mfd. capacitor between the generator output and points "B" and "C." Use a 22 mmf. capacitor between the generator output and point "D." Connect the ground lead of the wide band signal generator output to the chassis at the same point to which the oscilloscope ground is connected. Align the primary and secondary I.F. transformer trimmers for maximum vertical deflection of the oscilloscope curve. The third circuit trimmers (C14 and C17) of the 1st and 2nd I.F. transformers should be adjusted to give maximum broadness to the peak of the oscilloscope curve consistent with maximum vertical deflection. The I.F. curve should not be broadened beyond that point where the vertical deflection of the oscilloscope curve is reduced.

Discriminator Alignment

Remove the oscilloscope input connections from the limiter load and connect the high lead directly to the audio output. Connect the ground lead to the chassis using the same point to which the generator ground is connected. Apply the wide band generator signal of 4.3 MC through a 22 mmf. capacitor to point "D" on the 2nd converter grid. Adjust the discriminator transformer (T4) primary trimmer (C21) for maximum vertical deflection on the oscilloscope. Align the secondary trimmer (C22) for center crossover of the two curves. Retrim the primary trimmer (C21) for straight crossover lines if necessary.

R.F. Alignment

Connect a 0-100 microammeter in series with a 470,000 ohm resistor between chassis and point "A" on the load circuit of the 1st limiter tube, 6SJ7. The resistor should be between the meter and point "A." Apply a 46 MC generator signal to the antenna input terminals of the Translator. Set dial pointer to 46 MC and align oscillator trimmer (C2). The image signal should be below 46 MC when the oscillator is properly set. Peak the converter trimmers (C3 and C4) for maximum output.

NOTE: If oscillations develop in the I.F. circuits during alignment it is probably due to the generator and oscilloscope ground connections. Be sure these ground connections are made to the same point on the chassis. Changing ground points will generally assist in eliminating instability.

GENERAL INFORMATION

Two different types of record changers were used during the production of the Model LC648W phonograph combination.

The Model LRP-170 record changer is identified by the single record post and the eccentric turntable spindle; whereas the LRP-162 changers make use of a two-post record holder. Different pickup compensation is used for the two changers as noted at the bottom of the schematic diagram and the change in value of resistors R-11 and R-12 as given in the parts list.

ALIGNMENT PROCEDURE

The location of trimmers is shown in Fig. 1. All oscillator and RF trimmers are accessible through a slot through the back cover of the cabinet.

The alignment procedure is given in table form. All IF alignments may be made with the chassis removed from the cabinet. However, the RF alignments are made with the chassis and loop antennas securely fastened in the cabinet, as the relative position of the loop antenna with respect to the chassis materially affects it. The RF signal should be capacity-coupled by placing a two-foot wire for an antenna on the test-oscillator output post (high side). Keeping this antenna two feet or more from the receiver loop will generally insure freedom from too much coupling. Metal objects such as meters, tools, etc., should not be placed near the receiver loop.

ALIGNMENT CHART

Step	Connect Test-Osc. to	Test-Osc. Setting	Pointer Setting	Adjust Trimmers for Maximum Output
1	6SK7 IF Grid in series with .05 mfd.	455 KC	"BC" Band 550 KC	C6 & C7
2	6SA7 Conv. grid in series with .05 mfd.	455 KC	"BC" Band 550 KC	C4 & C5
3	With input on 6SA7 conv., repeat step 1.			
4	Capacity Coupled	580 KC	"BC" Band 580 KC	C22*
5	Capacity Coupled	1500 KC	"BC" Band 1500 KC	C2 (Osc.)
6	Capacity Coupled	1500 KC	"B" Band 1500 KC	C16 (RF)
7	Repeat step 4.			

* Rock gang condenser when making alignment.

Special Service Information

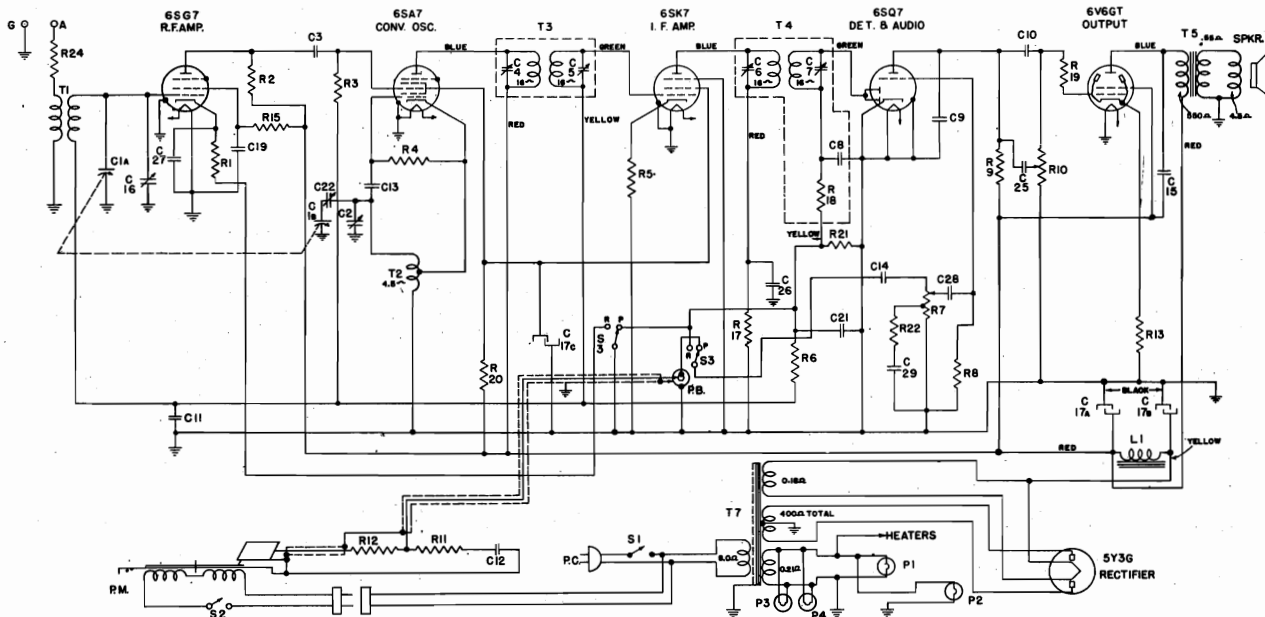

The following data are taken with a vacuum tube voltmeter or similar voltage measuring device.

- (1) Stage Gains
 - Antenna Post to RF Grid 5 at 1000 KC
 - RF Grid to Converter Grid 5 at 1000 KC
 - Converter Grid to IF Grid 40 at 1000 KC
 - Converter Grid to IF Grid 60 at 455 KC
 - IF Grid to 6SQ7 diode plates 90 at 455 KC
- (2) Audio Gains
 - .14 volts, 400 cycles signal across volume control with control set to maximum will give approximately 1/2-watt speaker output.
- (3) DC voltage developed across oscillator grid resistor R4 averages 10 volts at 1000 KC.

Variations of $\pm 20\%$ permissible. All readings taken with AVC shorted out.

SPECIFICATIONS

Height.....36 inches
 Width.....32 1/4 inches
 Depth.....16 1/4 inches

Electrical Rating

Rating "A6"—110-125 volts, 60 cycles, 80 watts.
 Rating "A5"—110-125 volts, 50 cycles, 80 watts.

Tuning Frequency Range

"BC" Band.....540-1720 KC
 "SW" Band.....5.3-18.0 MC

Intermediate Frequency.....455 KC

Electrical Power Output

Undistorted.....2.5 watts
 Maximum.....4.5 watts

Loud-speaker—EM Dynamic

Outside Cone-diameter.....12 inches
 Voice Coil Impedance (400 cycles).....5.0 ohms

Phonograph Mechanism

Type changer.....Models LRP-162 or LRP-170
 Type pickup.....Crystal
 Turntable speed.....78 Rpm

Tubes

RF Amplifier.....GE-6SG7
 Converter-Oscillator.....GE-6SA7
 IF Amplifier.....GE-6SK7
 Detector, 1st Audio, AVC.....GE-6SQ7
 Power Output.....GE-6V6GT
 Rectifier.....GE-5Y3G
 Dial Lamps.....(2) MAZDA No. 44

GENERAL INFORMATION

Two different types of record changers were used during the production of the Model LC-619W phonograph combination.

The Model LRP-170 record changer is identified by the single record post and the eccentric turntable spindle, whereas the LRP-162 changers make use of a two-post record holder. Different pickup compensation is used for the two changers as noted at the bottom of the schematic diagram and the change in value of resistors, R12 and R16, as given in the replacement parts list.

Special Service Information

The following data are taken with a vacuum tube voltmeter or similar voltage measuring device.

- (1) Stage Gains
 Antenna Post to RF Grid 5 at 1000 KC
 RF Grid to Converter Grid 5 at 1000 KC

Fig. 3. Socket Voltages

Converter Grid to IF Grid 40 at 1000 KC
 Converter Grid to IF Grid 60 at 455 KC
 IF Grid to 6SQ7 diode plates 90 at 455 KC

(2) Audio Gains

.14 volts, 400 cycles signal across volume control with control set to maximum will give approximately 1/2-watt speaker output.

(3) DC voltage developed across oscillator grid resistor R4 averages 10 volts at 1000 KC or 8.0 volts at 10,000 KC.

Variations of ±20% permissible. All readings taken with AVC shorted out.

ALIGNMENT PROCEDURE

The location of trimmers is shown in Fig. 4. All oscillator and RF trimmers are accessible through a slot through the back cover of the cabinet.

The alignment procedure is given in table form. All IF alignments may be made with the chassis removed from the cabinet. However, the RF alignments are made with the chassis and loop antennas securely fastened in the cabinet, as the relative position of the loop antenna with respect to the chassis materially affects it. The RF signal should be capacity coupled by placing a two-foot wire for an antenna on the test-oscillator output post (high side). Keeping this antenna two feet or more from the receiver loop will generally insure freedom from too much coupling. Metal objects such as meters, tools, etc., should not be placed on top of the receiver cabinet.

ALIGNMENT CHART

Step	Connect Test-Osc. to	Test-Osc. Setting	Pointer Setting	Adjust Trimmers for Maximum Output
1	6SK7 IF Grid in series with .05 mfd.	455 KC	"BC" Band 550 KC	C6 & C7
2	6SA7 Conv. grid in series with .05 mfd.	455 KC	"BC" Band 550 KC	C4 & C5
3	With input on 6SA7 Conv., repeat step 1			
4	Capacity Coupled	580 KC	"BC" Band 580 KC	C22**
5	Capacity Coupled	1500 KC	"BC" Band 1500 KC	C2** (Osc.)
6	Repeat Step 4			
7	Capacity Coupled	18 MC	"SW" Band 18 MC	C23* (Osc.)
8	Capacity Coupled	18 MC	"SW" Band 18 MC	C24** (Ant.)

* Use minimum capacity peak.

** Rock gang condenser when making alignment.

R51	150,000 ohms, carbon	C90	.002 mfd., paper

Fig. 4. Phonograph Schematic

ALIGNMENT PROCEDURE

The location of trimmers is shown in Fig. 3 and alignment procedure is given in table form below.

Before making the R.F. alignment make sure the pointer is set to the line at the extreme low frequency end of the dial scale when the gang condenser plates are closed. Output meter alignment is preferable and the meter may be connected across the voice coil leads, then turn volume control partially up. Keep the signal input as low as possible to avoid AVC action. NOTE—the wave trap trimmer C-12 is aligned to give minimum output.

Alignment Chart

Step	Connect Test—Osc. to	Test—Osc. Setting	Pointer Setting	Adjust Trimmers for Max. Output
1	IF grid in series with .05 mfd.	455 KC	Band "B" 550 KC	2nd IF primary and secondary

IMPORTANT

Although the schematic diagram indicates that this model is adaptable to line-voltages up to 250 volts, do not attempt to operate it from any power source other than 105-125 volts, 60 cycles as so doing will result in damage to the record changer.

VOLTAGE CHART

Table with 5 columns: Tubes, Plate to Gnd. Volts, Screen to Gnd. Volts, Cathode to Gnd. Volts, Filament Volts. Rows include 6SK7 (R.F.), 6K8, 6SK7 (I.F.), 6J5G (Det.), 6SF5, 6J5G (Inverter), 6V6G, 5U4G, 6U5.

FOR DATA COVERING RECORD CHANGER SIMILAR TO G.E. LRP-158, SEE RIDER'S "AUTOMATIC RECORD CHANGERS AND RECORDERS"

All antenna, R.F. and oscillator transformer switch terminals are numbered in the chassis parts layout drawing to facilitate the location of these common points on the schematic diagram.

Loud-speaker

The voice coil on the speaker is accurately and permanently centered at the factory and should seldom give trouble. In case a voice coil needs recentering it will be necessary to replace the entire cone and voice coil assembly. Assembly instructions accompany each replacement cone.

NOTE: In no case should the magnet be removed from the assembled position as it will lose magnetism.

SPECIAL SERVICE INFORMATION

The following information will be found very useful in servicing receivers if a vacuum tube voltmeter or similar voltage measuring instrument is available.

MODEL 45-01005

Series A, B

GOODYEAR TIRE & RUBBER CO., INC.

NOTE: IN SERIES B THE TYPE 75 WAS REPLACED BY TYPE 6B7, DUPLEX DIODE PENTODE AS A SECOND DETECTOR, A.V.C. AND AUDIO.

Series A and B chassis are serially numbered on the back flange of the chassis, series A beginning with number "5B104021A" and up, series B chassis beginning with number "5D114175B" and up. Series A and B may be identified by the letter "A" and "B" at the end of the serial numbers.

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 40 and 60 cycles and with primary taps for 108, 125, 150, 220 and 250 volts (see instructions) and also sometimes equipped with 25 cycle transformers with 105-115 volt or 220 volt primaries, not universals.

ALIGNING INSTRUCTIONS

Dummy Antennas

The following dummy antennas are used in aligning both series A and B and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Intermediate and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNMENT PROCEDURE SERIES A ONLY

The following adjustments to be made after the I.F.'s have been aligned as explained above.

BROADCAST BAND ALIGNMENT:

1. With wave changing switch in the broadcast position, extreme left of its rotation, and with external oscillator set at 550 kilocycles and connected in series with "Dummy 2" to the tan antenna and black ground lead, make the following adjustments:

- Adjust broadcast series pad to resonance with oscillator. Keep set in tune with oscillator by slowly rocking to and fro the variable condenser until maximum output is obtained. Note: This adjustment is accessible from the top of the chassis and is located between the variable condenser and the electrolytic condenser. See top view.
- Re-set external oscillator to 1500 K.C., move dial pointer to 1500 K.C. and adjust oscillator (adjustment number 3), R.F. (adjustment number 2) and antenna (adjustment number 1) to resonance. See bottom view for location of these adjustments.
- Repeat adjustments "a" and "b" until sensitivity is at its maximum.

NOTE: IT IS EXTREMELY NECESSARY IN MAKING ALL OF THESE ADJUSTMENTS THAT THE FUNDAMENTAL OSCILLATOR SIGNAL BE TUNED IN AND NOT THE IMAGE FREQUENCY WHICH WILL FALL BELOW THE FUNDAMENTAL.

SHORT WAVE BAND ALIGNMENT:

1. With wave changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:

- Move dial pointer to 17 megacycles and adjust short wave oscillator (adjustment number 8), short wave R.F. (adjustment number 7) and short wave antenna (adjustment number 6) to resonance.
- Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check for sensitivity.

INTERMEDIATE BAND ALIGNMENT:

1. With wave changing switch in the intermediate position, center of its rotation, and with external oscillator set at 5 megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:

- Move dial pointer to 5 megacycles and adjust intermediate wave oscillator (adjustment number 9), intermediate wave R.F. (adjustment number 5) and intermediate antenna (adjustment number 4) to resonance.
- Re-set external oscillator to 1800 K.C. and pick up signal by rotating variable condenser and check for sensitivity.
- Re-check broadcast sensitivity as outlined under "Broadcast Band Alignment".

Series "A" chassis have no intermediate band series oscillator pad adjustment.

ALIGNMENT PROCEDURE SERIES B ONLY

The following adjustments to be made after the I.F.'s have been aligned as explained above.

BROADCAST BAND ALIGNMENT:

1. With wave changing switch in the broadcast position, extreme left of its rotation, and with external oscillator set at 600 kilocycles and connected in series with "Dummy 2" to the tan antenna and black ground lead, make the following adjustments:

- Adjust broadcast series pad to resonance with oscillator. Keep set in tune with oscillator by slowly rocking to and fro the variable condenser until maximum output is obtained. Note: This adjustment is accessible from the top of the chassis and is located between the variable condenser and the electrolytic condenser. See top view.
- Re-set external oscillator to 1400 K.C., move dial pointer to 1400 K.C. and adjust oscillator (adjustment number 3), R.F. (adjustment number 2) and antenna (adjustment number 1) to resonance. See bottom view for location of these adjustments.
- Repeat adjustments "a" and "b" until sensitivity is at its maximum.

NOTE: IT IS EXTREMELY NECESSARY IN MAKING ALL OF THESE ADJUSTMENTS THAT THE FUNDAMENTAL OSCILLATOR SIGNAL BE TUNED IN AND NOT THE IMAGE FREQUENCY WHICH WILL FALL BELOW THE FUNDAMENTAL.

SHORT WAVE BAND ALIGNMENT:

1. With wave changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:

- Move dial pointer to 17 megacycles and adjust short wave oscillator (adjustment number 8), short wave R.F. (adjustment number 7) and short wave antenna (adjustment number 6) to resonance.
- Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check for sensitivity.

INTERMEDIATE BAND ALIGNMENT:

1. With wave changing switch in the intermediate wave position, center of its rotation, and with external oscillator set at 1800 K.C. and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:

- Rotate variable condenser to approximately 1800 K.C., tune in oscillator signal and adjust M.W. series pad (see top view) to resonance. Slowly rock condenser to and fro while making this adjustment to be sure maximum output is obtained.
- Set external oscillator at 5 M.C., rotate condenser, pick up signal and adjust intermediate wave R.F. (adjustment number 5), intermediate wave antenna (adjustment number 4) and intermediate wave oscillator (adjustment number 9) to resonance.
- Re-check broadcast alignment and if it is found necessary to re-adjust either R.F. or antenna trimmers, repeat the 17 M.C. short wave and 5 M.C. intermediate wave adjustments.

ALIGNING I.F. TRANSFORMERS (465 K.C.)

Series A and B.

Series A—Part No. 108-35 Output I.F. Transformer
Series A—Part No. 108-36 Input I.F. Transformer
Series B—Part No. 108-35 Output I.F. Transformer
Series B—Part No. 108-36 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the underside of chassis (see bottom view).

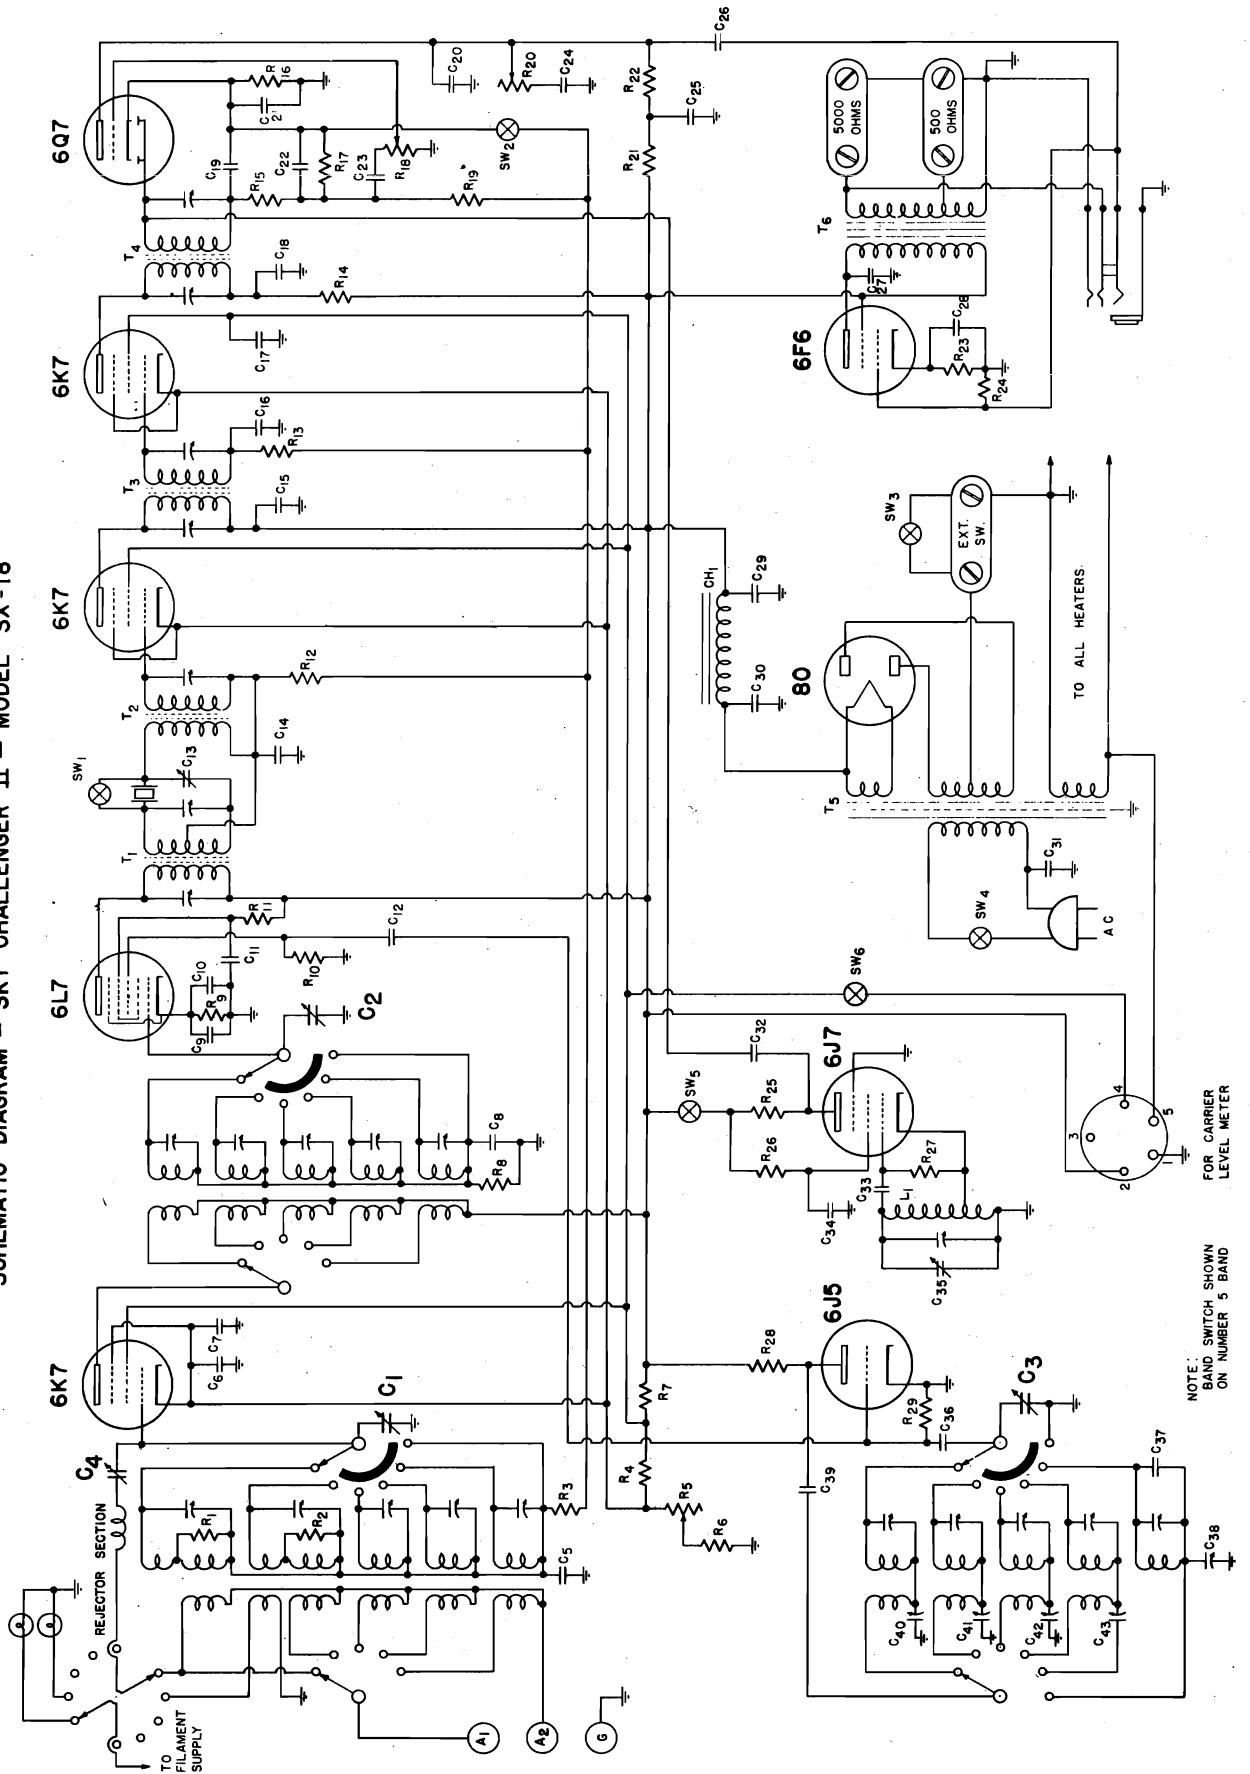

1. With volume control full on, the extreme right of its rotation, and with wave changing switch in the broadcast position, extreme left of its rotation, and with variable condenser set to approximately 1400 kilocycles, make the following adjustments:

- Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6D6 tube, located between the two I.F. transformers, and adjust the output I.F. transformer to resonance.
- With "Dummy 1" still connected, move oscillator output clip from grid of 6D6 to grid cap to 6C6 and adjust input I.F. transformer to resonance.
- With oscillator still connected to 6C6, re-adjust output I.F. transformer.

CONNECT THE SIGNAL GENERATOR TO GRID OF THE 6L7 TUBE THROUGH A .1 MFD CONDENSER. TUNE THE SIGNAL GENERATOR TO 465 KC AND THEN ADJUST THE CONDENSERS ON THE INTERMEDIATE FREQUENCY TRANSFORMERS T1, T2, T3, T4, RESPECTIVELY. NOW THROW THE CRYSTAL SWITCH TO THE "OUT" POSITION AND READJUST T1 FOR MAXIMUM OUTPUT. AS AN OUTPUT INDICATOR IT IS SUGGESTED THAT A RECTIFIER TYPE METER BE USED.

ALIGNMENT USING A 465 KC CRYSTAL

SHOULD THE RECEIVER BE A CRYSTAL MODEL IT IS NECESSARY THAT THE CRYSTAL BE USED IN AN EXTERNAL OSCILLATOR IN PLACE OF A SIGNAL GENERATOR SUCH AS THE ABOVE. THE OUTPUT OF THIS CRYSTAL CONTROLLED OSCILLATOR IS THEN FED TO THE GRID OF THE 6L7 TUBE AND THE ABOVE PROCEDURE FOLLOWED. WHEN THE IF AMPLIFIER HAS BEEN ALIGNED, FROM THE CRYSTAL OSCILLATOR'S OUTPUT, RE-INVERTING THE CRYSTAL IN ITS SOCKET IN THE RECEIVER WILL SHOW LITTLE DIFFERENCE IN OUTPUT WHETHER THE CRYSTAL IS "IN" OR "OUT" OF THE CIRCUIT AS INDICATED BY THE CRYSTAL SWITCH.

R. F. ALIGNMENT PROCEDURE

ON BAND #1, OR BROADCAST, USE A .0002 MFD CONDENSER IN SERIES WITH THE OUTPUT LEAD FROM THE GENERATOR TO A1 ON THE RECEIVER. ON THE OTHER BANDS A 400 OHM RESISTOR SHOULD BE USED. BE SURE THE JUMPER FROM THE DOUBLET, OR A2 POST, TO GROUND REMAINS CONNECTED WHEN ALIGNING THE RECEIVER.

ALL PAD ADJUSTMENTS (LOCATED ON THE TOP OF THE CHASSIS) ARE FOR THE LOW FREQUENCY ENDS OF THE BANDS. ALL TRIMMER ADJUSTMENTS (LOCATED ON THE BOTTOM OF THE CHASSIS) ARE FOR THE HIGH FREQUENCY ENDS OF THE BANDS. REDUCE R.F. GAIN CONTROL BELOW THE POINT OF BLOCKING OR OVERLOADING; ALSO BE SURE THAT THE CRYSTAL SWITCH IS IN THE "OUT" POSITION AND THE AVC SWITCH IS IN THE "OFF" POSITION.

BE SURE TO CHECK IMAGES - IMAGES WILL FALL A LITTLE LESS THAN 1 MC LOWER IN FREQUENCY ON BANDS 1 TO 4 INCLUSIVE. ON BAND 5 THE IMAGE WILL FALL ABOUT 1 MC HIGHER IN FREQUENCY THAN THE FUNDAMENTAL. REJECTOR ADJUSTMENT - ON BANDS 1, 2 AND 3 THE REJECTOR CIRCUIT SHOULD BE LEFT AT 34 MC. ON BANDS 4 AND 5 THE REJECTOR IS IN THE CIRCUIT. CARE SHOULD BE EXERCISED TO SEE THAT THE REJECTOR CIRCUIT IS NOT ADJUSTED SO THAT IT WILL REJECT THE SIGNAL FREQUENCY. IF THIS OCCURS VERY LOW SENSITIVITY WILL RESULT WHICH CAN BE CURED BY DETUNING THE REJECTOR ABOUT 1 MC.

WHEN ALIGNING THE R.F. END OF THE RECEIVER THE TUNING GANG SHOULD BE ROCKED BACK AND FORTH ACROSS THE SIGNAL SO THAT YOU ARE SURE YOUR ADJUSTMENTS ARE SUCH THAT YOU HAVE OBTAINED MAXIMUM GAIN AND ACCURATE TRACKING.

NOTE #1 HARMONICS OF SUITABLE FREQUENCIES MAY BE USED IF THE FOLLOWING FREQUENCIES SUGGESTED ARE NOT AVAILABLE.

NOTE #2 IT IS NECESSARY TO REPEAT EACH PAIR OF OPERATIONS SEVERAL TIMES UNTIL NO CHANGE IS NOTED.

THE FOLLOWING MEASUREMENTS MADE WITH 1000 OHMS PER VOLT METER AND TAKEN FROM THE POINT INDICATED TO GROUND WITH THE AVC SWITCH IN THE "ON" POSITION. ANTENNA AND GROUND DISCONNECTED AND R. F. AND A. F. GAIN CONTROLS SET AT MAXIMUM. LINE VOLTAGE OF 115 AT THE TIME THESE MEASUREMENTS WERE TAKEN. NORMAL TOLERANCE ALLOWS VARIATIONS OF PLUS OR MINUS 10% FROM THE VALUES INDICATED. "DL" INDICATES A DEAD LUG BUT WILL INDICATE VOLTAGE WHEN USED AS A TIE.

BOTTOM VIEW OF SOCKET

INTERMEDIATE FREQUENCY ALIGNMENT (465 KC)

HAVE THE CONTROLS SET IN THE FOLLOWING POSITIONS:

- B.F.O. SWITCH "OFF"
- A. F. AND R. F. GAIN CONTROLS ON FULL.
- CRYSTAL PHASING CONDENSER MIDWAY (POINTER STRAIGHT UP).
- A.V.C. SWITCH "OFF"
- CRYSTAL SWITCH "IN"
- BAND SWITCH ON #1 BAND - TUNING GANG OPEN (MINIMUM CAPACITY).
- REMOVE 6J5G OSCILLATOR TUBE FROM ITS SOCKET.
- REMOVE THE 6L7 GRID CAP.

MODELS S-18, SX-18
Sky Challenger II

THE HALLICRAFTERS INC.

OPR.	BAND	RECEIVER DIAL SETTING	SIGNAL GENERATOR FREQUENCY	ADJUST Osc. WITH	TRIMMERS R. F. & MIXER WITH	ADJUST Osc. PAD WITH	SET REJECTOR DIAL AT
1 2	1	600kc 1100kc	600kc 1100kc	----- CA	----- Cc - Cb	C38 -----	----- -----
3 4	2	1300kc 2600kc	1300kc 2600kc	----- Cd	----- Cf - Ce	C43 -----	----- -----
5 6	3	3000kc 6000kc	3000kc 6000kc	----- Ce	----- Ci - Ch	C42 -----	----- -----
7 8	4	7000kc 14000kc	7000kc 14000kc	----- Cj	----- Cl - Ck	C41 -----	9 mc 14mc
9 10	5	17000kc 34000kc	17000kc 34000kc	----- Cm	----- Co - Cn	C40 -----	24mc 34mc

IT IS HELPFUL TO REMEMBER THAT THE CARTRIDGE TYPE AIR TRIMMING CONDENSERS WILL SHOW AN INCREASE OF CAPACITY WHEN THE SCREW IS ROTATED COUNTER-CLOCKWISE.

WHEN MAKING ADJUSTMENTS ON THIS RECEIVER IT IS SUGGESTED THAT GAIN BE CONTROLLED BY USING THE R.F. GAIN CONTROL ONLY. LEAVE THE A.F. GAIN CONTROL ON FULL AT ALL TIMES.

TO MAKE A RAPID CHECK OF THE RECEIVER REMOVE THE GRID CAP OF THE 6Q7 TUBE AND TOUCH THE GRID OF THE TUBE WITH YOUR FINGER. IF A LOUD HUM IS HEARD THE AUDIO END OF THE RECEIVER IS OK.

DEAD SET. CHECK BIAS ON THE R. F. TUBES. IF THIS BIAS IS TOO HIGH CHECK THE R.F. GAIN CONTROL FOR AN OPEN CIRCUIT. ADDITIONALLY, CHECK THE PLATE AND SCREEN VOLTAGE OF THE R.F. TUBES - (SEE CHART). CHECK B PLUS FOR A SHORT TO GROUND - IF SO CHECK ALL TUBES.

IF THE TUNING GANG IS NOISY WHEN THE SET IS JARRED, INCREASE THE TENSION ON THE GANG WIPERS.

NOISY COIL ASSEMBLY - CHECK SWITCH CONTACTS. ALSO CHECK THE TRIMMERS ON THE PARTICULAR BAND IN WHICH NOISE OCCURS. IT IS POSSIBLE THAT THE TRIMMER HAS DEVELOPED A PARTIAL SHORT.

IF LOW SIGNAL AND HIGH NOISE LEVEL DEVELOPS, REPLACE THE 6L7 TUBE.

DEAD BEAT OSCILLATOR - IF THE 6J7 SHOULD SHORT TO GROUND THE BEAT OSCILLATOR WILL BE DEFECTIVE. CHECK B PLUS TO B0 COIL FOR A GROUND. IN MOST CASES A NEW 6J7 WILL CORRECT A DEAD B0.

THE HALLICRAFTERS INC.

MODELS S-18, SX-18
Sky Challenger II

THE IMAGE REJECTOR

THE REJECTOR CIRCUIT INCORPORATED IN THE SKY CHALLENGER II REPRESENTS A NOTEWORTHY CONTRIBUTION BY THE HALLICRAFTERS TO IMAGE-FREE HIGH-FREQUENCY RECEPTION. IT HAS LONG BEEN APPRECIATED THAT ADDITIONAL STAGES OF RADIO FREQUENCY AMPLIFICATION WAS NOT THE CORRECT ANSWER TO IMAGE SUPPRESSION. THROUGH THE USE OF THE "INFINITE IMAGE REJECTOR" IN THE SKY CHALLENGER II ALL PREVIOUS IMAGE RATIOS ARE OUT-MODED. IMAGE REJECTION OF INFINITY IS NOW POSSIBLE.

THE REJECTOR IS UNIQUE. BECAUSE OF THAT YOUR ATTENTION IS CLOSELY DRAWN TO THE PROPER OPERATION OF THE CONTROL AS WELL AS WHAT TO EXPECT FROM ITS USE.

THE REJECTOR IS SWITCHED INTO THE CIRCUIT ONLY WHEN THE RECEIVER IS OPERATED ON BANDS #4 AND #5. YOU WILL NOTICE A LIGHT APPEAR BEHIND THE PARTICULAR CALIBRATED SCALE THAT SHOULD BE USED.

LET US OPERATE THE RECEIVER ON THE 14 MC. OR 20 METER AMATEUR BAND. IN TUNING ACROSS THE BAND YOU RUN ACROSS THE IMAGE OF SOME COMMERCIAL STATION, THE FUNDAMENTAL OF THIS STATION AS WE ALL KNOW IS REMOVED FROM THE 20 METER BAND BY DOUBLE THE FREQUENCY TO WHICH THE I. F. AMPLIFIER OF THE RECEIVER IS TUNED. NOW ADJUST THE REJECTOR CONTROL CAREFULLY IN THE VICINITY OF 14 MC ON THE CALIBRATED REJECTOR DIAL. WHEN PROPERLY ADJUSTED THE IMAGE WILL BE COMPLETELY ELIMINATED WITHOUT SERIOUSLY AFFECTING THE SENSITIVITY OF THE RECEIVER ON THE FREQUENCY TO WHICH IT HAD BEEN TUNED.

SHOULD YOU BE LISTENING AT A FREQUENCY NOT BEING BOTHERED WITH IMAGES, AND YOU DO NOT WISH TO USE THE REJECTOR LEAVE THE CONTROL AS FOLLOWS FOR THE TWO AMATEUR BANDS COVERED BY THE REJECTOR CIRCUIT.

20 METERS - LEAVE THE REJECTOR AT APPROXIMATELY 15 MC. (ON THIS BAND THE HIGH FREQUENCY OSCILLATOR IS ON THE HIGH-FREQUENCY SIDE).

14 MC - LEAVE THE REJECTOR AT APPROXIMATELY 15 MC. (ON THIS BAND THE HIGH FREQUENCY OSCILLATOR IS ON THE HIGH-FREQUENCY SIDE).
NOTE: THE 7 MC OR 40 METER BAND IS ALSO ON BAND #4 OF THE RECEIVER. WHEN RECEIVING ON 40 METERS THE REJECTOR CONTROL SHOULD BE LEFT 9 MC. USE OF THE REJECTOR CIRCUIT ON THIS BAND IS NOT NECESSARY.

10 METERS - LEAVE THE REJECTOR AT APPROXIMATELY 27 MC. (THE OSCILLATOR IS ON THE LOW FREQUENCY SIDE ON THIS BAND).

CAUTION: SHOULD YOU NOT BE ABLE TO GET SIGNALS THROUGH AT ALL CHECK THE SETTING OF THE REJECTOR CONTROL. IT IS POSSIBLE THAT YOU HAVE THE REJECTOR CONTROL AT A POINT WHERE THE FREQUENCY TO WHICH YOU WISH TO LISTEN IS BEING REJECTED, OR "BEING DROPPED IN THE SLOT".

ALWAYS REMEMBER TO KEEP THE REJECTOR CONTROL SET AT APPROXIMATELY THE SAME FREQUENCY AS THAT TO WHICH YOU ARE LISTENING. WHEN YOU MOVE THE MAIN TUNING CONTROL FOLLOW UP WITH THE REJECTOR OR OTHERWISE YOU WILL RUN INTO THE POSSIBILITY OF LEAVING YOUR MAIN TUNING DIAL AT A GROUP OF FREQUENCIES BEING REJECTED.

THE TOTAL POWER CONSUMPTION OF THE SKY CHALLENGER II IS 75 WATTS AT 115 VOLTS 60 CYCLE ALTERNATING CURRENT.

SPEAKER - HEADPHONES ETC.

ON THE LOWER RIGHT HAND CORNER OF THE BACK OF THE CHASSIS YOU WILL FIND A TERMINAL STRIP MARKED 5000 OHMS. TO THIS STRIP SHOULD BE CONNECTED THE HALLICRAFTERS PERMANENT MAGNET DYNAMIC SPEAKER. THE TERMINAL STRIP DIRECTLY ABOVE THE 5000 OHM STRIP AND MARKED 500 OHMS CAN BE CONNECTED TO A LOAD OF THAT IMPEDANCE VALUE. THE OTHER TERMINAL STRIP TO THE RIGHT OF THESE TWO, AND MARKED "EXT SW", IS USED TO MAKE THE RECEIVER TEMPORARILY INOPERATIVE FOR STAND-BY DURING TRANSMISSION PERIODS. THESE TWO TERMINALS SHOULD BE CONNECTED TO AN EXTERNAL SWITCH WITHIN IN CONJUNCTION WITH THE POWER SWITCH ON YOUR TRANSMITTER OR A MANUALLY OPERATED SWITCH AT YOUR OPERATING POSITION. WHEN USING AN EXTERNAL SWITCH THE SEND RECEIVE SWITCH ON THE RECEIVER SHOULD BE IN THE SEND POSITION.

IN THIS RECEIVER THE SPEAKER IS NOT A PORTION OF THE FILTER SYSTEM. THIS ALLOWS THE RECEIVER TO BE OPERATED INDEPENDENTLY OF THE SPEAKER. FOR MOST SATISFACTORY RESULTS AN 8 INCH HALLICRAFTERS SPEAKER SHOULD BE USED WITH THE SKY CHALLENGER II.

THE HEADPHONE JACK IS CONNECTED TO THE PLATE OF THE 6Q7 TUBE THROUGH A CONDENSER. THE POSSIBILITY OF SHOCK TO THE OPERATOR IS ELIMINATED BY HAVING NO DIRECT CURRENT FLOWING THROUGH THE HEADPHONES. CRYSTAL TYPE HEADPHONES CAN BE USED WITH THIS RECEIVER WITHOUT USING A SPECIAL COUPLING TRANSFORMER.

CRYSTAL OPERATION

TO PROPERLY ADJUST THE CRYSTAL CIRCUIT FOR BEST PERFORMANCE THE FOLLOWING PROCEDURE SHOULD BE CAREFULLY FOLLOWED:

TUNE IN SOME STATION TRANSMITTING CONTINUOUSLY. BE VERY CAREFUL TO GET THE SIGNAL RIGHT ON THE NOSE. AFTER YOU ARE SURE THAT YOU HAVE THE SIGNAL RESONATED PERFECTLY, SNAP THE "BFO" SWITCH TO THE "ON" POSITION. YOU SHOULD HEAR A WHISTLE, OR BEAT NOTE. AFTER THE BFO IS ON ROTATION OF THE "PITCH CONTROL" WILL CHANGE THE TONE OF THE BEAT NOTE. PROPER OPERATION OF THIS CONTROL WILL BE INDICATED BY HEARING THE SIGNAL TWICE IN ONE COMPLETE ROTATION OF THE KNOB; THERE BEING TWO POSITIONS AT WHICH NO SIGNAL, OR WHISTLE, WILL BE HEARD. THESE TWO POSITIONS ARE KNOWN AS THE "ZERO BEAT" POSITIONS.

NOW SNAP THE "CRYSTAL SWITCH" TO THE "ON" POSITION. YOU WILL NOTICE A GREAT REDUCTION IN NOISE. CAREFULLY RETUNE THE SIGNAL ON THE BAND SPREAD DIAL. NOTICE HOW SHARPLY THE SIGNAL PEAKS. NOW TUNE THROUGH THE SIGNAL AND FIND WHICH SIDE OF THE SIGNAL IS THE WEAKER. TUNE IN THE WEAKER SIDE AND THEN CAREFULLY ADJUST THE "CRYSTAL PHASING" CONTROL UNTIL THE SIGNAL IS INAUDIBLE. GOING BACK TO THE OTHER SIDE OF THE SIGNAL SHOULD FIND NO CHANGE IN ITS VOLUME, AND KNIFE-LIKE SELECTIVITY RESULTING. USE WHICHEVER SIDE OF ZERO-BEAT ADJUSTMENT OF THE PITCH CONTROL, IN CONJUNCTION WITH CRITICAL ADJUSTMENT OF THE PHASING CONTROL GIVES THE GREATER REJECTION OF THE INTERFERING SIGNAL.

THE PHASING CONTROL AFFECTS THE SENSITIVITY AND SELECTIVITY OF THE RECEIVER WHETHER THE CRYSTAL IS IN THE CIRCUIT OR NOT. THE CRYSTAL MAY BE USED WHEN RECEIVING TELEPHONE SIGNALS WITH SOME SACRIFICE IN THEIR QUALITY DUE TO THE EXTREME SELECTIVITY DEVELOPED.

MODELS S-18, SX-18
Sky Challenger II

THE HALLICRAFTERS INC.

ADJUST THE "BANDS" SWITCH UNTIL THE POINTER ON THE KNOB INDICATES THAT YOU HAVE THE BAND YOU WISH TO TUNE IN THE CIRCUIT. WHEN LISTENING FOR DISTANT OR POSSIBLY WEAK STATIONS, IT IS RECOMMENDED THAT THE CONTROL MARKED "BFO" BE USED BY SNAPPING THE SWITCH TO THE "ON" POSITION. ONCE THE TELEPHONE SIGNALS HAVE BEEN LOCATED THE BFO SHOULD BE TURNED OFF OR A CONTINUOUS WHISTLE WILL RESULT. WHEN LISTENING FOR OR TO CW CODE TRANSMISSIONS THE BFO MUST BE LEFT ON. THE "PITCH CONTROL" WILL PROVE MOST HELPFUL IN CHANGING THE BEAT NOTE TO ONE MOST PLEASING TO THE OPERATOR. IT IS ADVISABLE TO HAVE THE "AVC" SWITCH IN THE OFF POSITION WHENEVER THE BFO SWITCH IS ON.

THE TUBE LINE-UP

- 6K7 PRE-SELECTOR, R.F. AMPLIFIER
- 6L7 1ST DETECTOR-MIXER
- 6J5 SIGNAL FREQUENCY OSCILLATOR
- 6K7 1ST I. F. AMPLIFIER
- 6K7 2ND I. F. AMPLIFIER
- 6Q7 2ND DETECTOR, AVC, 1ST STAGE OF AUDIO
- 6F6 2ND AUDIO STAGE
- 6J7 BEAT FREQUENCY OSCILLATOR
- 80 FULL WAVE RECTIFIER

THE 6K7 R. F. STAGE GIVES MAXIMUM GAIN IN INVERSE RELATION TO FREQUENCY AND PROVIDES INCREASED SELECTIVITY.

THE FIRST DETECTOR-MIXER IS A 6L7. THE OUTPUT OF THE 6J5 SIGNAL FREQUENCY OSCILLATOR IS ELECTRON COUPLED TO THE INJECTOR, OR # 3 GRID, OF THE 6L7. BECAUSE NO OSCILLATOR PLATE CURRENT FLOWS IN THE 1ST DETECTOR THE RATIO OF SIGNAL TO NOISE IS MORE FAVORABLE THAN THAT OBTAINED IN A COMPOSITE TUBE, OR IN CIRCUITS WHERE THE CATHODES OF TWO TUBES ARE TIED TOGETHER.

THE 6J5 OSCILLATOR HAS SEPARATE COILS FOR EACH BAND. SUPERIOR OVER-ALL PERFORMANCE OF THE SKY CHALLENGER II IS IN PART DUE TO THE DESIGN OF THE SIGNAL FREQUENCY OSCILLATOR. NO HARMONICS OF THE OSCILLATOR ARE USED ON ANY OF THE BANDS COVERED BY THIS RECEIVER.

THE TWO 6K7 I. F. AMPLIFIER STAGES USE IRON-CORE TRANSFORMERS WHICH RESONATE AT 465 KC. THIS TYPE OF TRANSFORMER HAS SO DEFINITELY SHOWN ITS SUPERIORITY OVER THE AIR CORE TYPE AS TO WARRANT ITS USE IN THE SKY CHALLENGER II. TREMENDOUS GAIN, AND A BETTER SIGNAL TO NOISE RATIO ARE BUT TWO OF THE MANY ADVANTAGES OF THE IRON-CORE SYSTEM.

THE 6J7 BEAT OSCILLATOR OUTPUT IS COUPLED TO THE DIODE PLATES OF THE 6Q7 SECOND DETECTOR. THE 6J7 OSCILLATOR IS ELECTRON COUPLED.

THE 6F6 AUDIO OUTPUT STAGE IS CAPABLE OF DELIVERING 3.5 WATTS OF AUDIO.

OPERATING INSTRUCTIONS - SKY CHALLENGER II MODELS S-18, SX-18

THE SKY CHALLENGER II IS A 5 BAND 9 TUBE SUPERHETERODYNE RECEIVER COVERING THE FOLLOWING FREQUENCIES:

BANDS	COVERAGE
1	545 TO 1230 KC (550 TO 243 METERS)
2	1.18 TO 2.85 MC (254 TO 105 METERS)
3	2.75 TO 6.82 MC (109 TO 44 METERS)
4	6.75 TO 16.40 MC (45 TO 18.3 METERS)
5	15.40 TO 38.10 MC (19.5 TO 7.85 METERS)

SEPARATE COILS ARE USED TO COVER EACH BAND. INDUCTIVE COUPLING TO THE ANTENNA PERMITS THE MAXIMUM TRANSFER OF SIGNAL ENERGY FROM EACH SEPARATE PRIMARY TO THE PARTICULAR SECONDARY SOIL IN THE CIRCUIT. THE UNUSED SOILS ARE SHORTEd.

THE MAIN DIAL IS CALIBRATED IN KILOCYCLES ON BAND #1 AND IN MEGACYCLES ON THE REMAINING FOUR BANDS. THE CALIBRATION OF THE MAIN DIAL WILL HOLD ACCURACY ONLY WHEN THE BAND-SPREAD DIAL IS SET AT "0", WHICH IS THE POSITION OF MINIMUM CAPACITY OF THE BAND-SPREAD SECTION.

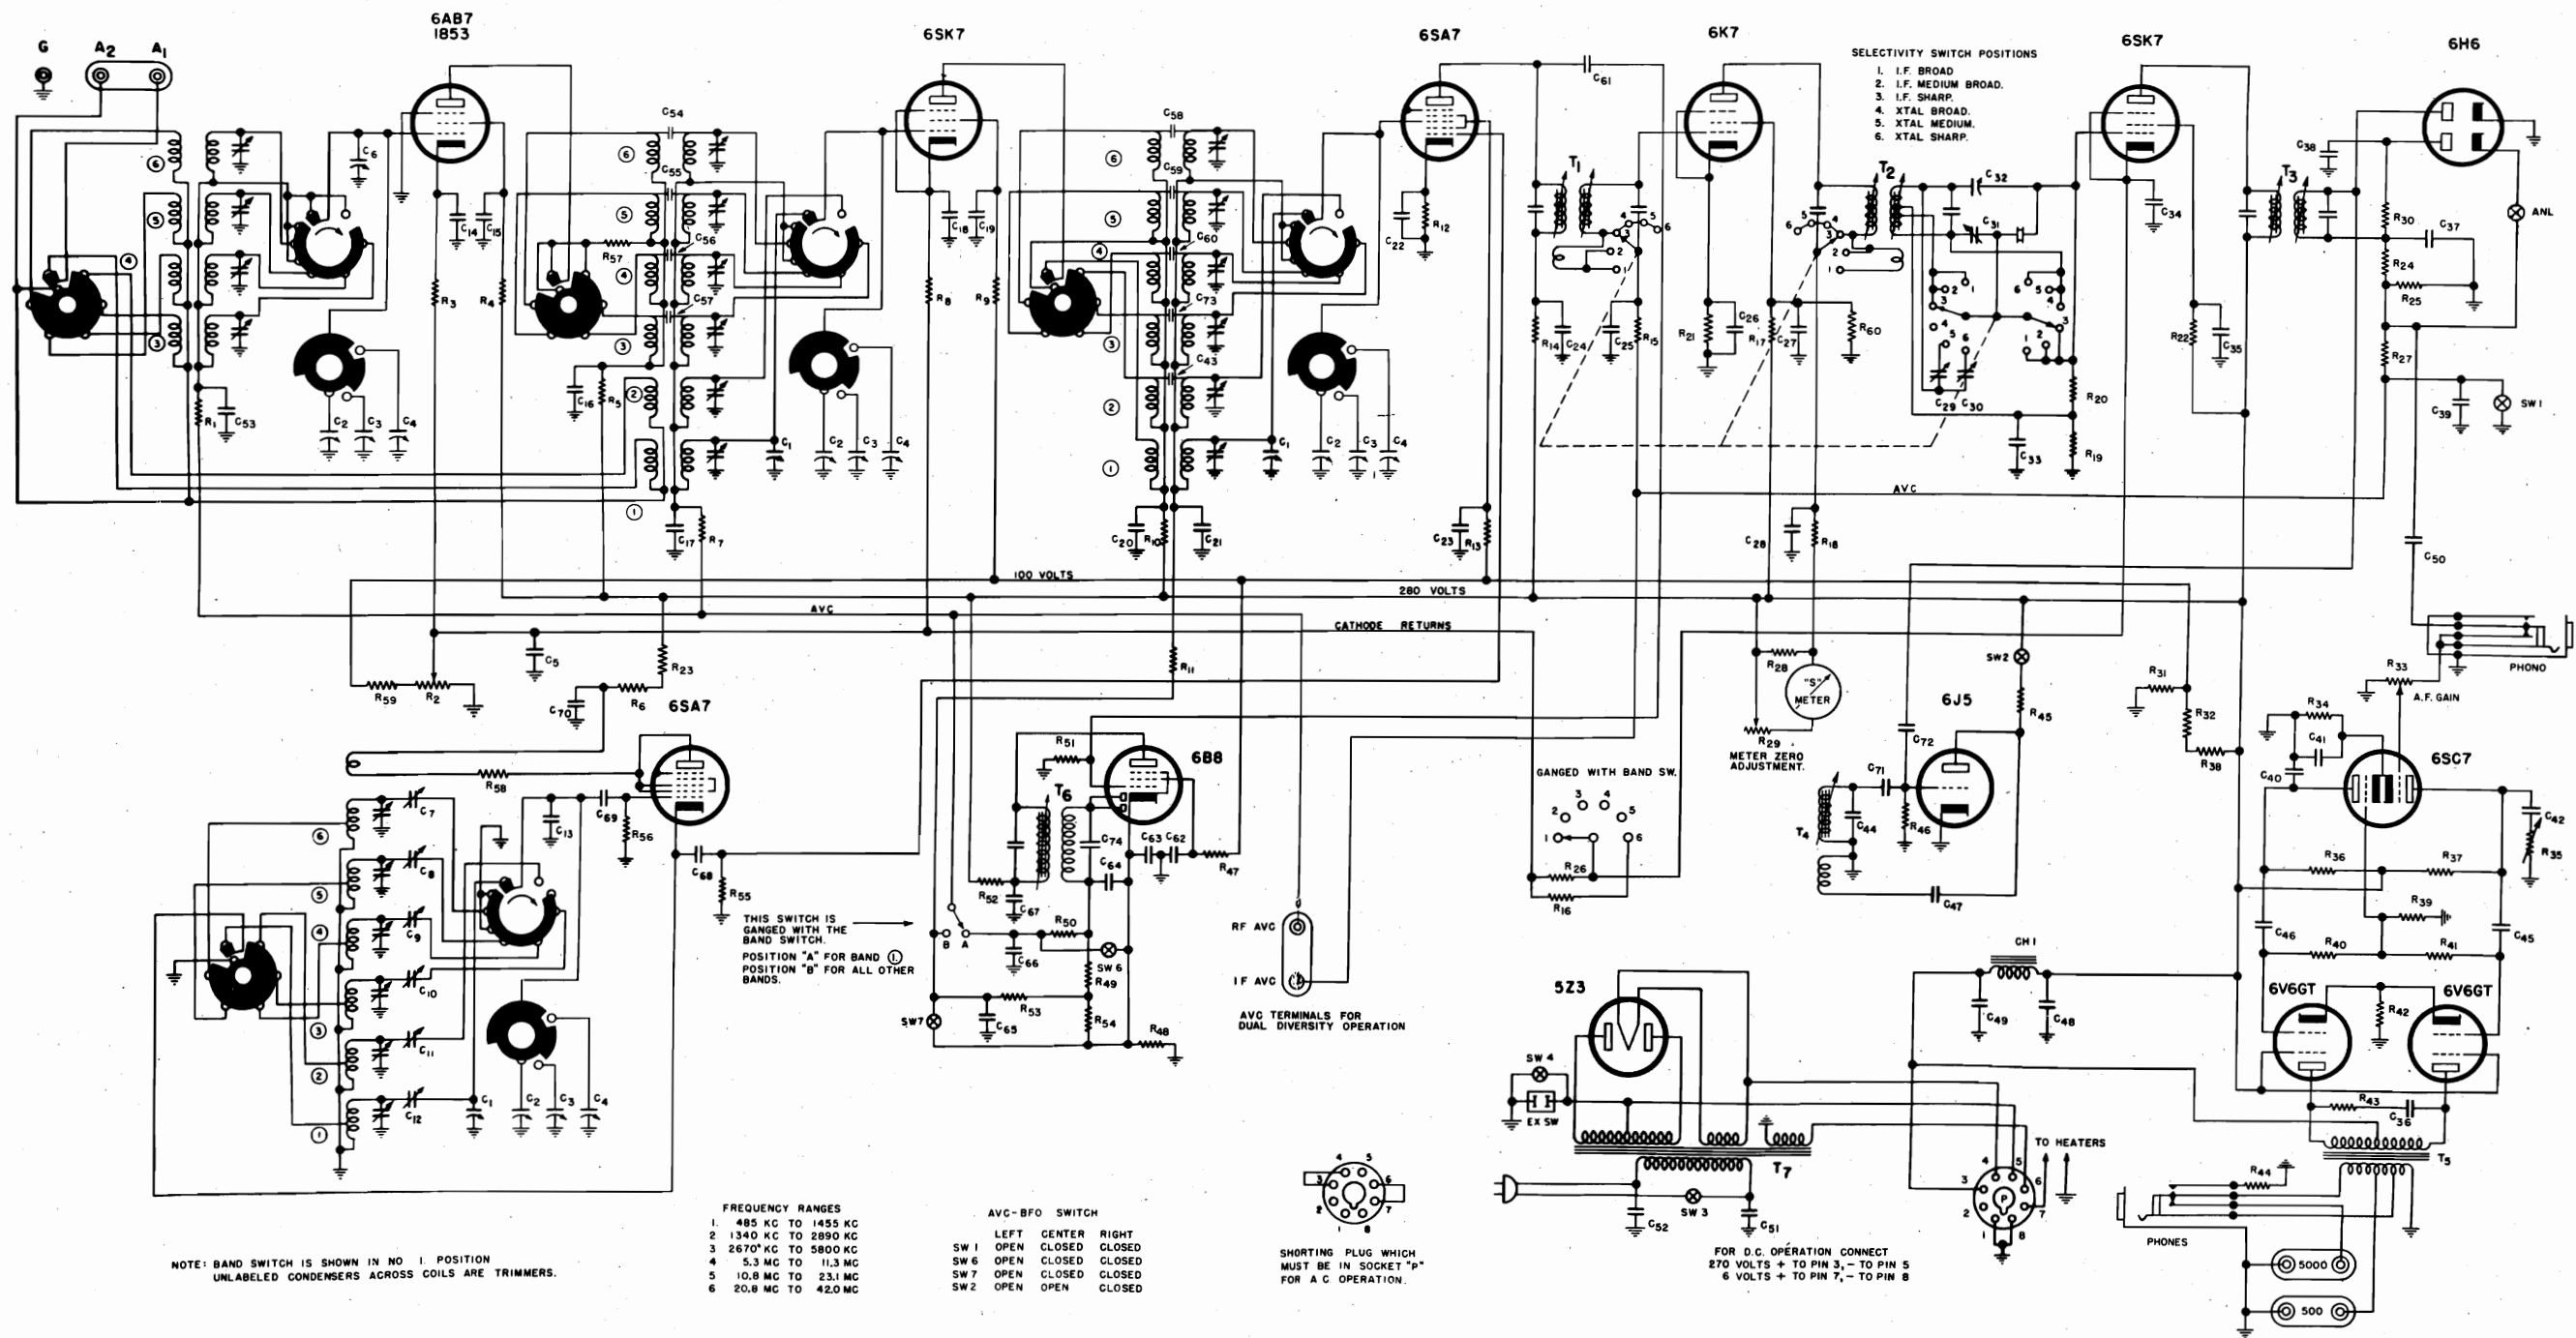

ANTENNA

IN THE BACK OF THE CHASSIS WILL BE FOUND THE ANTENNA, DOUBLET AND GROUND TERMINAL STRIP. WHEN A CONVENTIONAL ANTENNA IS USED IT SHOULD BE CONNECTED TO A1. WHEN USING THIS TYPE OF ANTENNA BE SURE THE JUMPER REMAINS CONNECTED TO A2 AND G. IF A DOUBLET ANTENNA IS USED THE JUMPER SHOULD BE REMOVED AND THE TWO WIRES OF THE DOUBLET LEAD-IN CONNECTED TO A1 AND A2 RESPECTIVELY. PLEASE REMEMBER THAT THE NORMAL SHORT WAVE DOUBLET ANTENNA IS DESIGNED TO WORK BEST ON THE SHORT WAVE BROADCAST FREQUENCIES. IT WILL NOT PERFORM EQUALLY WELL ON THE AMATEUR BANDS, OR FREQUENCIES IN BETWEEN THE SHORT WAVE BROADCAST CHANNELS. ANTENNA LOCATION, LENGTH AND TYPE PLAY A MOST IMPORTANT PART IN THE SUCCESSFUL OPERATION OF THE RECEIVER. ON THE HIGHER FREQUENCIES COVERED BY THIS UNIT IT IS PARTICULARLY IMPORTANT TO USE THE PROPER TYPE OF ANTENNA. FOR MOST EFFICIENT ANTENNA SYSTEMS YOU ARE REFERRED TO THE ANTENNA DESIGN SECTION OF THE A.R.R.L. HANDBOOK, AS WELL AS CURRENT RADIO PERIODICALS. IT IS SUGGESTED THAT A LITTLE EXPERIMENTING BE DONE WITH ANTENNAE SO THAT YOU WILL EXPERIENCE THE MAXIMUM IN PERFORMANCE FROM YOUR RECEIVER.

OPERATION

PLUG THE CORD ON THE RECEIVER INTO THE POWER SOCKET. (UNLESS OTHERWISE SPECIFIED THE RECEIVER OPERATES ON 60 CYCLE 110-120 VOLT ALTERNATING CURRENT.) TURN THE CONTROL MARKED "TONE" TO THE RIGHT. THIS WILL TURN THE RECEIVER ON. DURING THE TIME THE RECEIVER IS WARMING UP ALSO TURN THE "R.F. GAIN" AND "A.F. GAIN" KNOBS TO THE RIGHT. THE RECEIVER IS SHIPPED WITH THE BAND CHANGE SWITCH IN THE HIGHEST FREQUENCY POSITION.

THE HALLICRAFTERS INC.

NOTE: BAND SWITCH IS SHOWN IN NO. 1 POSITION
UNLABELED CONDENSERS ACROSS COILS ARE TRIMMERS.

THE HALLICRAFTERS INC.
AUDIO FIDELITY CURVE

The following measurements made with a 20,000 ohms per volt meter and taken from the socket terminal indicated to ground or receiver chassis. Antenna and ground were disconnected from the receiver when these measurements were taken and the RF and AF gain controls set at maximum. "DL" means Dead Lug but will indicate voltage when used as a tie. Normal tolerance allows a variation of $\pm 10\%$ from the indicated values.

MODEL SX-32, Sky Rider

THE HALLICRAFTERS INC.

THE 1942 MODEL SX-32 SKYRIDER RECEIVER INSTRUCTIONS FOR INSTALLATION, OPERATION AND SERVICE

INSTALLATION

It is recommended that, upon receipt, the carton and then the receiver be carefully examined for any damage which might have occurred in transit. Should any sign of damage be apparent immediately file claim with the carrier stating the extent of the damage.

Important: Unless otherwise marked, this receiver is to be operated from 110-125 volts of 50/60 cycle alternating current. A universal 110-220 volt model is obtainable on order. This model can be operated at either of those two voltages with 25/60 cycle current. If the voltages are higher than indicated an external stepdown transformer must be used. A switch, mounted on the top of the universal transformer case, will allow convenient 110-220 volt change.

The standard model SX-32 receiver comes equipped with a cabinet for table mounting. The standard 8 1/2" x 19" panel dimension with holes suitably spaced make it possible for the chassis to be mounted in a standard relay rack. Maximum overall chassis length is 17 1/2" and depth 13 1/2". When the model SX-32 is so mounted the table cabinet is replaced with a dust cover. The maximum over-all length of the receiver will then allow it to be mounted in a rack with upright channel clearance of 17 1/2".

TERMINALS AND CONNECTIONS ON REAR OF RECEIVER

SPEAKER

On the rear apron of the receiver's chassis appear two terminal strips for connecting either a 500 or 5000 ohm speaker to the receiver. Should a matching HALLICRAFTERS Bass-Reflex speaker be used with the receiver, it should be connected to the 5000 ohm terminals. The 500 ohm terminals can be connected to a speaker or other load of that impedance value.

ANTENNA

To the terminals marked A1-A2 and G should be connected the antenna you have chosen to use with the model SX-32 receiver.

Very satisfactory results throughout the tuning range of the SX-32 will be obtained with a conventional inverted "L" Marconi type of antenna 75 to 100 feet long including lead-in. This antenna should be erected as high as possible and removed from surrounding objects. Be sure that the antenna is insulated from the ground at all points. When this type of antenna is used it is connected to terminal A-1. The Jumper between A-2 and G should remain connected.

In the event a doublet antenna is used with the model SX-32 SKYRIDER receiver, the two wires of the doublet lead-in should be connected to terminals A1 and A2. The Jumper between A2 and G can remain connected or removed, depending upon its effect on favorable reception.

A ground can be used if desired and should be connected to the G terminal. Connecting the receiver to a good ground (cold water pipe or 6 foot rod driven in moist soil) might improve reception and reduce noise. Under normal conditions no noticeable difference will exist so a ground is suggested only if it aids reception.

A similar plug to the shorting plug should be wired as shown on the Schematic diagram and connected to the external source of DC power. The DC operation plug is then inserted in the socket and operation from batteries or a vibratorpack is secured.

270 volts of plate voltage, or B supply, at 150 milliamperes current are necessary for successful operation of the receiver, should it be operated in this manner.

"S" METER ZERO SET

"S" METER CONTROL is obtained by varying the knurled knob appearing on the left hand chassis apron edge. This control enables you to properly set the "S" Meter to zero. In order to make the adjustment correctly, the RF GAIN CONTROL must be advanced clockwise as far as it will go. In addition, the switch directly below the bandspread hand-wheel must be in the AVC-ON position.

ALIGNMENT PROCEDURE MODEL SX-32 SKYRIDER

Equipment Needed for Aligning:

- 1—An all wave signal generator which will provide an accurately calibrated signal at the test frequencies indicated.
- 2—Output indicating meter connected to 5000 ohm output terminals.
- 3—Non-metallic screw driver.
- 4—Dummy antenna of 200 mmf and also 400 ohm carbon resistor.

Setting of controls prior to alignment—IF and RF. Tone control at maximum high frequency position (#5)—BFO at 0—AF Gain at #9—RF Gain at #9—Band switch—IF alignment position .5 to 1.4 band.—RF alignment depending on band aligned.

Selectivity control sharp IF, Send-Receive switch in Receive, Crystal phasing at #3 on left side, ANL—OFF, AVC OFF. **Important:** Have bandspread control so logging scale reads 100.

Antenna trimmer adjusted for Maximum gain at each RF alignment point on Bands 3-4-5-6.

Notes: Antenna trimmer not in circuit on bands 1 and 2. 455 KC—IF Alignment: Tune main dial to 1400 kc on .5 to 1.4 m.c. band. Connect the hot lead from the signal generator to 6SA7 mixer terminal #8—Ground to chassis. Roughly adjust the aligning screws of T1, the lower screw of which is accessible through hole in right mounting bracket, for maximum gain. Now adjust lower screw on T2 (do not adjust upper screw). Also adjust C31 and the trimmer screws at the top of T3 for maximum gain.

Switch to Crystal Broad Position—Turn on BFO and adjust to a tone of about 1000 cycles. Vary the frequency of the signal generator while adjusting the top screw on T2 until the output goes through a maximum, dips down and starts going up again. Adjust the phasing control for maximum selectivity and then back off the top screw

Position. When these conditions have been complied with, remove the antenna from the Receiver and then adjust the S meter control until the S meter reads zero. Reconnecting the antenna to the receiver will then make the meter indicate the relative carrier strength of each incoming signal as various signals are tuned in.

The large calibrated main dial shows the frequencies covered throughout the 6 band, 500 K.C. to 42 m.c. frequency range of the receiver. They are as follows:

- Band 1—500 to 1400 kilocycles
- Band 2—1.4 to 2.7 megacycles
- Band 3—2.7 to 5.3 megacycles
- Band 4—5.3 to 11 megacycles
- Band 6—11 to 21 megacycles
- Band 6—21 to 42 megacycles

on T2 until the output reaches a minimum value between the two maximum values first noted. The frequency of the signal generator should be varied over a small range while adjusting the top screw of T2. A swishing note, in contrast to the usual sharp crystal tone will be apparent when the correct adjustment has been reached.

Switch to "Xtal Sharp" and adjust C-70 for maximum output while varying signal generator frequency. Two points of maximum output will be noted corresponding to two adjustments of C-70. Either one of these points may be used at which to leave C-70. A sharply peaked tone will result at the correct adjustment.

Switch to "Xtal Medium" and adjust C-70 till the output is midway between the outputs reached while aligning the "Xtal Sharp" and "Xtal Broad" positions. The apparent sharpness of tone should be midway between the "Sharp" and "Broad" positions.

Switch again to "Xtal Sharp" and set the signal generator to exact crystal frequency. Set BFO front panel control to a tone of approximately 1000 cycles. Switch again to "Sharp IF" and carefully realign the IF transformers as earlier described in the first paragraph of these instructions.

Beat Frequency Oscillator Adjustment:—In the center of the "Pitch Control" shaft, after the knob has been removed, you will find a recessed screw for the adjustment of the Beat Frequency Oscillator. Before rotating this screw with a suitable screw driver, loosen the set screw on this shaft. This set screw can be reached with a spirit wrench from the top. With the signal generator connected to the 6SA7 mixer terminal #8 as above, the generator set to the frequency of the crystal, and the BFO switch on, adjust the screw in the center of the pitch control till zero beat is heard. Tighten the set screw and assemble the knob so that this zero beat position will occur in the center of the total angular rotation of the pitch control knob.

AVC Amplifier Adjustment:—Connect a high resistance voltmeter across resistors R-49 and R-54. With the signal generator tuned to the crystal frequency as above, adjust the trimming screw on top of T-6 till the voltmeter reads maximum.

THE HALLICRAFTERS INC.

MODEL SX-32, Sky Rider

RF ALIGNMENT

Connect hot lead of signal generator to A₁—through dummy antenna shown in table. Leave jumper connected between A₂ and G. Ground of Generator to Chassis.

MODEL SX-32, Sky Rider

THE HALLICRAFTERS INC.

triode is fed to the grid of the other 6SK7 triode Section, thereby giving two output voltages in opposite phase suitable for exciting the push-pull 6V6GT output amplifier.

THE POWER SUPPLY

The power supply in the Model SX-32 is quite normal except that it supplies voltage for the 6V6GT output tubes directly from the rectifier or before the filter stage. Voltage fluctuations in the receiver are greatly reduced—increasing the audio output of the receiver and stabilizing the operation of all circuits.

The filter circuit consisting of a total of 60 mfd of capacity and a 12 henry choke keep the hum level of the receiver in excess of 60 DB below maximum output. The power transformer is built to withstand continuous operation at 250 degrees F but has been designed to run at approximately 160 degrees F under normal conditions.

SPECIFICATIONS

- Tubes: 1-6AB7 1st RF Amplifier, 1-6SK7 2nd RF Amplifier, 1-6SA7 Mixer, 1-6SA7 HF Oscillator, 1-6K7 1st IF Amplifier, 1-6K7 2nd IF Amplifier, 1-6B8 AVC Amplifier, 1-6H6 2nd Detector and A.N.L. Tube, 1-8J5 Beat Oscillator, 1-6SC7 1st Audio Amplifier, 2-6V6GT Push-Pull Output Amplifiers, 1-SZ3 Rectifier

Power Consumption—at 117 volts—60 cycles—138 watts on 108 watts or 108 watts DC operation—18 amp. at 6 volts Power Output—8 watts undistorted Sensitivity (for .05 mv r.m.s. output) Bands 1 to 5—2 MV and under; 6th band 4 MV 2 x 1000 x 12 kc, 36 kc, 41 kc, 22 kc IF Sharp RF—Notes: These are the actual frequencies covered corresponding to nominal figures indicated on the front panel.

500 to 1450 kilocycles 1.4 to 2.8 megacycles 2.7 to 5.4 megacycles 5.2 to 11 megacycles 10.5 to 22 megacycles 21 to 42 megacycles Frequency response AF broad IF—tone control high-70 to 3000 cycles = 2 1/2 DB Speaker Output Impedance—5000 and 500 ohms Intermediate Frequency—455 kc Table cabinet dimensions—20 1/2" long x 10" high x 14 3/4" deep Relay Rack dust cover dimensions—14 3/4" deep x 17 3/4" long x 8 3/4" high Panel dimensions—19" x 8 3/4" Chassis dimensions—17 3/4" x 13 1/4" Weight—(unpacked)—75 lbs.—(packed) 87 lbs.

A double AVC system is used. The RF and mixer tubes are operated by the broadly tuned carrier coming through only three tuned IF circuits. The final signal however passes through six-tuned IF circuits. As a result, when the signal is slightly detuned, the receiver output has dropped considerably while the AVC action has dropped but very little. This results in a reduction of between-station noise and a more sharply defined aural tuning action.

"S" OR SIGNAL INTENSITY METER

The approximate dB per S unit equivalent is 6 DB's. As is known, a DB, or decibel, is a unit of change in signal level and is defined as being the least detectible change the average ear can appreciate when listening to a single pitched tone. 3DB is the least change the ear detects when listening to sounds varying in both amplitude and pitch. By comparison, a variation of one S unit on the meter will indicate a change of two detectable steps in signal level. Quantitatively, a DB gain or loss is equal to 20 log (E1/E2) where E1 = input voltage and E2 = output voltage.

THE SECOND DETECTOR

As will be noted, a diode type of second detector is used in the Model SX-32. Its choice was prompted by the fact that such a detector is capable of handling large percentages of modulation with very little distortion. This is due to the output of the diode being easily filtered (C.F. removed). In addition, the rectified output contains a DC component which can be used for AVC purposes.

THE BEAT FREQUENCY OSCILLATOR

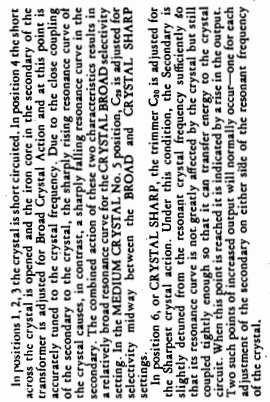

The BFO is turned on with the switch below the broad spread handwheel and adjusted by the skirted knob directly below the tone control. The BFO circuit as will be seen by referring to the schematic, is that well known Hartley oscillator. It will be noticed that a plate dropping resistor is used to compensate for plate voltage variations. An increase in receiver voltage causes an increase in turn causes the voltage drop across the resistor to increase, thus maintaining a more constant voltage at the plate of the beat oscillator tube. A favorable ratio of capacity to inductance is used. The fixed tank capacity has been artificially aged by alternately exposing it to very high and then low temperatures. In this manner any residual strains of the component parts are removed and the capacity of the condenser remains constant. The BFO coil is permeability tuned which further removes the possibility of drift which would occur should a compression variable be used to resonate the circuit. Proper location of the Beat Oscillator tube and its associated components plus excellent shielding and mechanical rigidity do much to keep stray fields from being established. Little BFO leakage is to be expected in the Model SX-32 so "twentys" or BFO harmonics will not prove to be bothersome.

THE AUDIO AMPLIFIER

The second or output stage of the audio amplifier in the Model SX-32 receiver uses two 6V6GT tubes connected in push-pull. These tubes are driven by the 6SC7 double triode. One of the triode sections of the 6SC7 tube is used as the inverter to the 6V6GT tubes. A portion of the signal from the plate circuit of the first 6SC7

In positions 1, 2, 3 the crystal is short-circuited. In position 4 the short circuiting crystal is bypassed and the secondary is directly connected to the crystal. In position 5 the secondary is connected to the crystal through the secondary winding of the secondary. In position 6, in contrast, a sharply falling resonance curve in the secondary is obtained. In position 7, the secondary is connected to the crystal through the secondary winding of the secondary. In position 8, in contrast, a sharply falling resonance curve in the secondary is obtained. In position 9, the secondary is connected to the crystal through the secondary winding of the secondary. In position 10, in contrast, a sharply falling resonance curve in the secondary is obtained.

CRYSTAL FILTER CIRCUIT

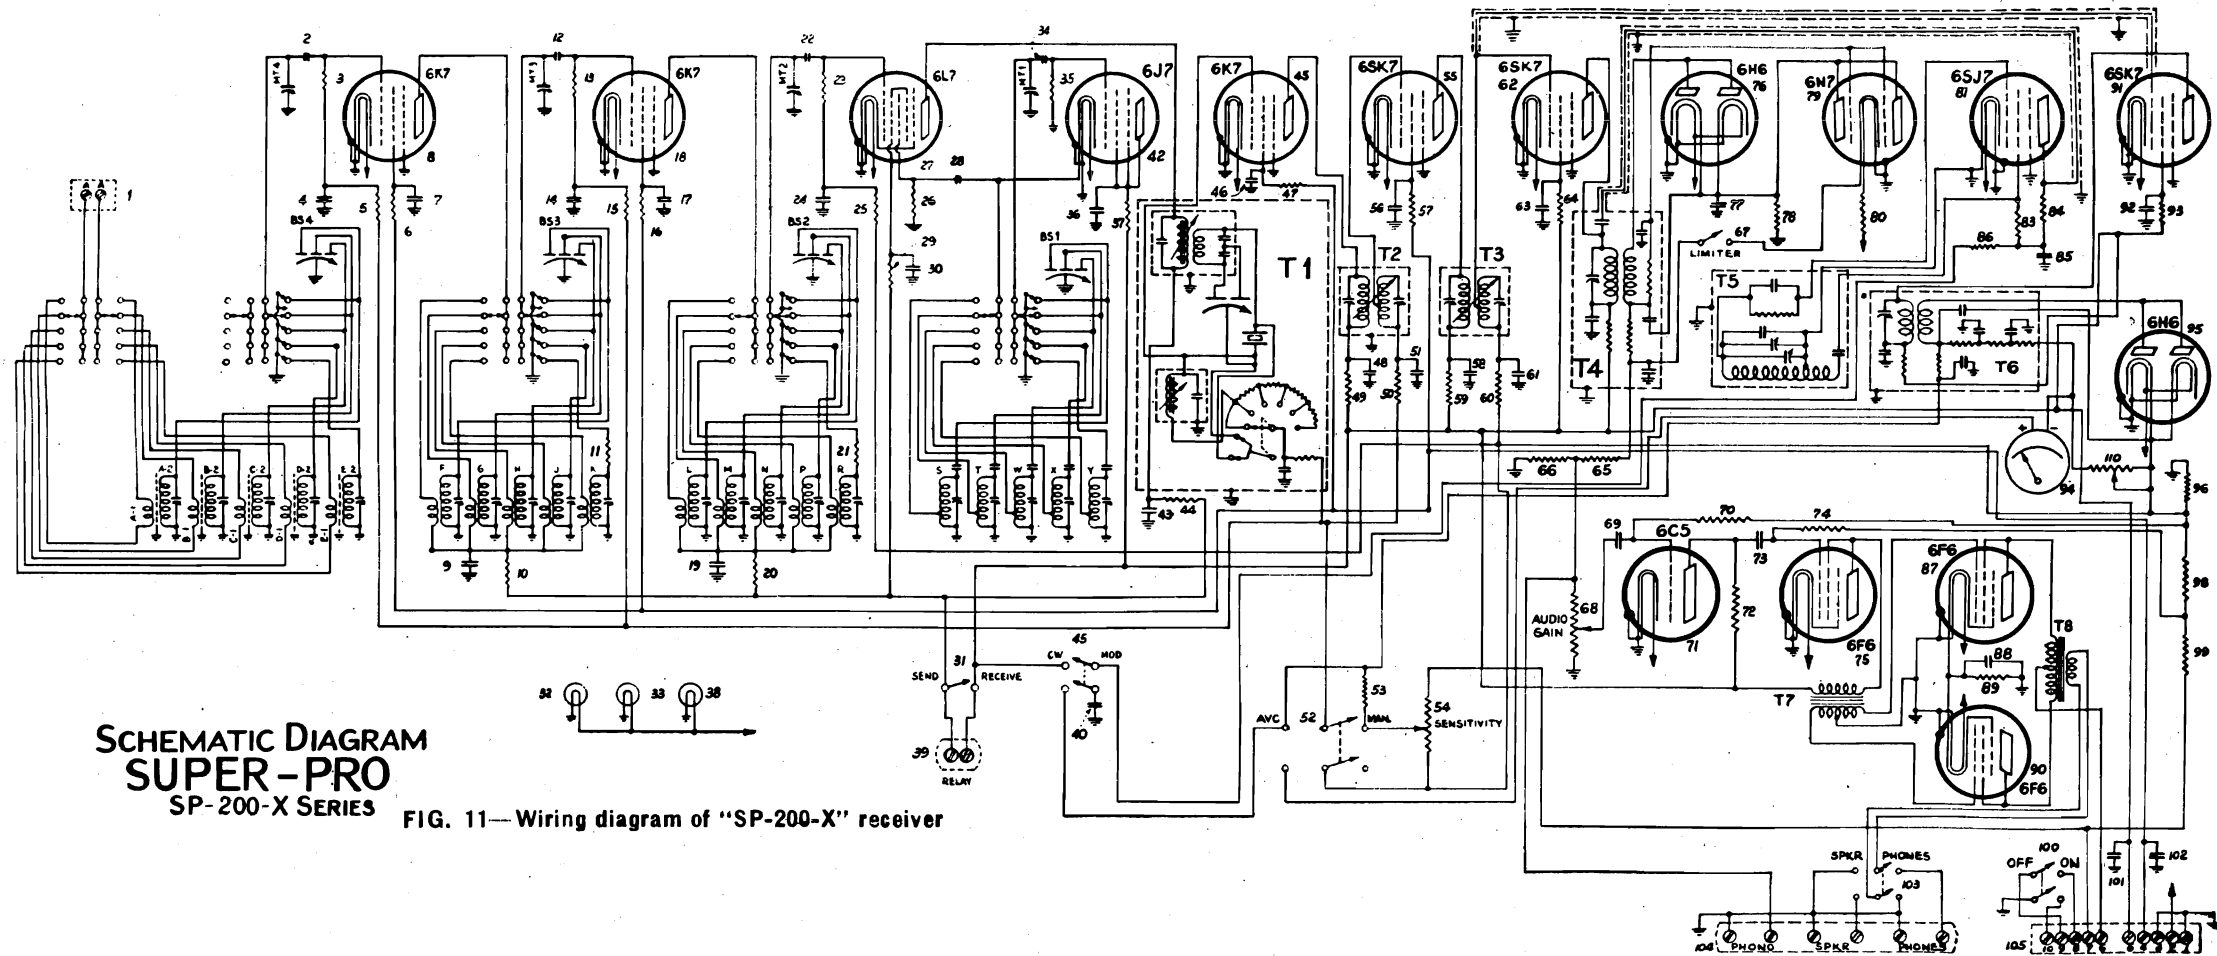

With selective switch in XTAL SHARP position identify the weaker amplitude and then adjust phasing control carefully until this weaker amplitude is reduced to a minimum. Adjust phasing control carefully until this weaker amplitude is reduced to a minimum. Adjust phasing control carefully until this weaker amplitude is reduced to a minimum.

NOTE: The CRYSTAL FILTER and holder are wired directly into the receiver and do not plug in as heretofore. In this manner exceptional crystal filter action is obtained because of the elimination of the capacity and losses of a socket. So mounting the crystal prevents possible change in polarity which would occur if the crystal were improperly inserted in the circuit. The size of the crystal has been carefully determined to allow the BROAD CRYSTAL position to tune as broadly as possible. The capacity of the crystal holder has been reduced to a minimum through the use of a specially designed polystyrene holder.

ANTENNA REQUIREMENTS

The input of the Series 200 "Super-Pro" is approximately 112 ohms. This means that for best results, the antenna should be coupled to the receiver by means of a low impedance transmission line. The doublet type antenna produces best results. Any well-known low impedance lead-in cable can be used with satisfaction. The use of low impedance lead-ins provides less chance for the lead-in itself to pick up extraneous noises. The low impedance lead-in, together with the electrostatic shield built into the antenna coil of the receiver, reduces noise to a minimum. It must be remembered that every antenna has a period of resonance and works best at that frequency. When erecting a doublet antenna, it is advisable to arrange its physical dimensions so that it will resonate in the band of frequencies where most sensitivity is desired. Care taken in designing and erecting an antenna will pay for itself many times in superior results.

SP-200-X SERVICE DATA

CONNECTING COMPLETE EQUIPMENT FOR SUPER-PRO RECEIVER
HAMMARLUND MFG. CO., INC. NEW YORK, N.Y.

The two drawings on this page show the proper method of connecting the receiver, power supply, and speaker together. The drawing above shows a standard installation, while the diagram below indicates receiver connections when batteries furnish the power. Protective covers are furnished for all important terminal strips and they should always be in place.

CONNECTING COMPLETE EQUIPMENT FOR EMERGENCY BATTERY OPERATION SUPER-PRO RECEIVER
HAMMARLUND MFG. CO., INC. NEW YORK, N.Y.

The "Super-Pro" is available to cover several frequency ranges. Such information will pertain to all models. The two standard models have the following tuning ranges:

SP-200	SP-200-S
540 - 1160 kc.	1250 - 2500 kc.
1160 - 2500 kc.	2.5 - 5 mc.
2.5 - 5 mc.	5 - 10 mc.
5 - 10 mc.	10 - 20 mc.
10 - 20 mc.	20 - 40 mc.

The sensitivity of the new "Super-Pro" is truly remarkable. By careful circuit design, the overall set noise has been held down to a minimum, thus making it possible to receive extremely weak signals with favorable signal-to-noise ratio. The variable selectivity feature of the "Super-Pro" permits the operator to make full use of the extreme sensitivity even under most severe conditions of interference. Selectivity can be adjusted to cut down interference within very close limits. The advantages of variable selectivity are tremendous when one considers that conditions of interference are not always the same. Under certain conditions, it may be possible to use quite a wide band width and thus enjoy improved tone, as well as easier tuning. Under other conditions, where interference is quite bad, the band width can be narrowed just enough to eliminate interference and in that case, the best possible fidelity that can be obtained without too much interference, is available. In a case where there is practically no interference from other stations, the band width can be adjusted to its widest point and high fidelity reception can be enjoyed.

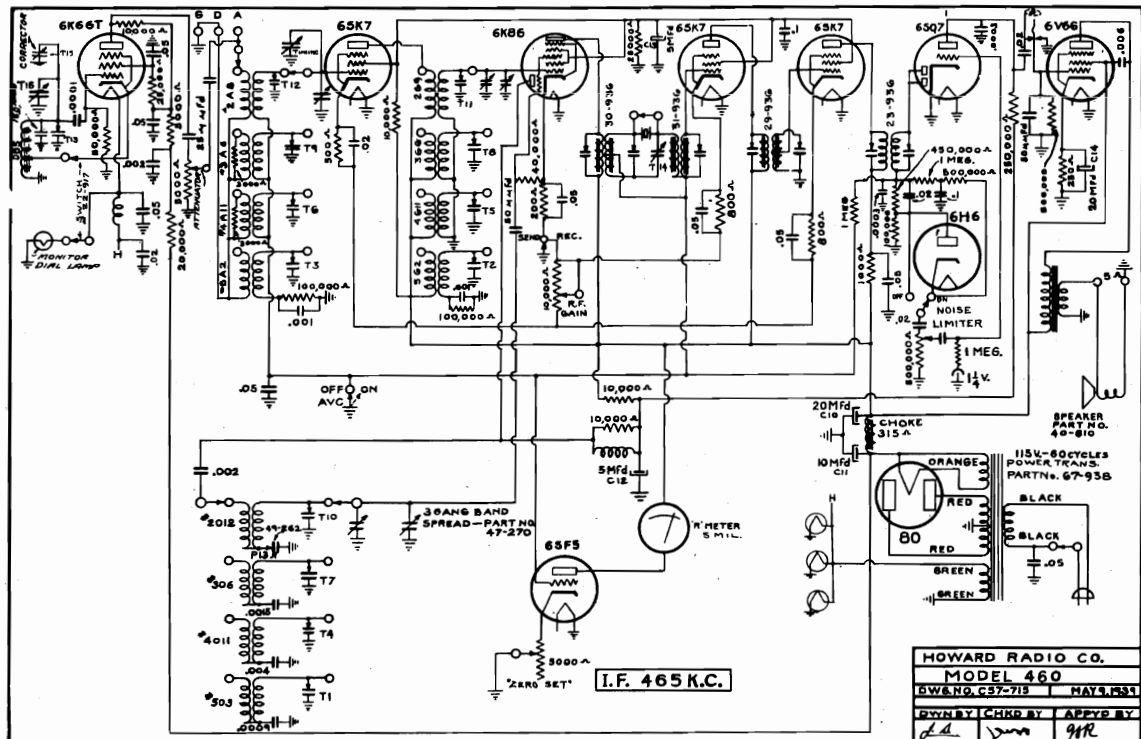

FIG. 1—Band width control which varies selectivity and permits the operator to adjust the receiver for best quality obtainable with minimum interference.

ALIGNMENT INSTRUCTIONS - FOR RECEIVERS EQUIPPED WITH CRYSTALS

- (1) REMOVE CRYSTAL, set crystal phasing condenser to almost minimum capacity and throw "XTAL" switch to "IN" position.
- (2) With the 465 KC signal, re-adjust the I.F. Trimmer C-6 by turning the screw counterclockwise. The signal now may be slightly weaker than before and sound "off-side". This, however, is a normal condition.
- (3) REPLACE THE CRYSTAL - A very noticeable drop in signal strength may be noted due to the filtering action of the crystal and the frequency control of the signal generator must be "rocked" slowly back and forth until the increase in signal strength indicates the exact frequency of the crystal being used. Now re-align the entire I.F. system to this frequency.
- (4) Adjust "XTAL" phasing condenser for the lowest pitched note possible and re-adjust signal generator frequency. Repeat and continue to repeat this alignment procedure until no further improvement in the alignment can be accomplished.

NOTE: If the "XTAL" switch should now be thrown to another position, an apparent rise in gain will be noticed, which is caused by the addition of higher frequencies and background noise, so it does not mean that the sensitivity of this set is impaired in any way by use of the crystal.

BAND SPREADING THE RELAY BANDS

The following table shows the amount of spread obtained by the Band Spread Needle after the exact setting and re-setting of the main tuning hand is made of the LOG SCALE in even divisions. Make the first settings at the left end of the band, further settings are towards the right since the Band Spread Needle is tuning to lower frequencies as it approaches zero.

The Band Spread of the regular amateur bands has been covered in the regular instructions in conjunction with the Frequency Monitor.

RELAY BANDS

MAIN TUNING HAND SET TO LOG SCALE AT	FREQ. MC	BAND SPREAD NEEDLE TRAVEL FROM	ACTUAL SPREAD TO
2	17.90	100 to 41	17.22
15	15.79	100 to 30	14.80
32	12.29	100 to 8	11.59
36	11.59	100 to 32	11.20
45	9.9	100 to 21	9.60
47	9.60	100 to 16	9.30
49	9.30	100 to 19	9.00
82	6.25	100 to 33	6.17
83	6.17	100 to 34	6.10
84	6.10	100 to 33	6.04
85	6.04	100 to 33	5.98
86	5.98	100 to 36	5.95
87	5.95	100 to 2	5.88
75	18.10	100 to 2	17.81
77	17.81	100 to 31	17.68
78	17.68	100 to 30	17.55
79	17.55	100 to 30	17.40
80	17.40	100 to 36	17.30
54	22.25	100 to 11	21.80
56	21.80	100 to 11	21.33
58	21.33	100 to 10	20.80

NOTE 5: Check for an image signal about .9 mc. lower in frequency. For example:- If a peak has been made at 6 mc. an image should be heard at about 5.1 mc. Otherwise the original setting was not correct.

NOTE 1: When aligning the I.F. channel, a condenser of .05 MFD may be used in series with the generator lead.

NOTE 2: When aligning the broadcast band, a 250 MMFD condenser may be used in series with the signal generator.

NOTE 3: When aligning the short wave bands, a 400 ohm resistor may be used in series with the signal generator.

NOTE 4: When using a CRYSTAL, set PHASING CONTROL to almost minimum capacity. See special alignment instructions below for Crystal.

HOWARD RADIO CO.

FOR USE WITH ALTERNATING CURRENT ONLY
 105-120 V. 60 Cycles, Power consumption 80 W.
 (Unless otherwise specified on set)

The Model 460 is designed as an efficient communications type receiver. Although it will cover the regular broadcast band, it is built primarily for Amateur short wave work and for those interested in short wave reception at its best.

The frequency coverage from .55 to 43 megacycles is divided into four bands. The left-hand pointer indicates the band in operation. For correct tuning calibration, the band spread pointer must be set at 100. The lower scale 0 to 100 is for additional help in logging. SEE INSTALLATION INSTRUCTIONS ON FOLLOWING PAGES, SEC. VII.

I - THE FREQUENCY MONITOR

For successful results with the HOWARD FREQUENCY MONITOR SYSTEM the following rules must be followed:

(1) Turn on the set but wait at least fifteen minutes until the circuits reach their normal operating conditions before using the Frequency Monitor. This will maintain uniformity in dial settings.

(2) Turn Monitor Switch to "ON" position, set the fundamental frequency calibration (the scale at the right side of the Monitor Dial), to the known frequency of a nearby broadcast station. (Between 850 & 1030 KC).

(3) With the BAND SWITCH in the broadcast band position and the BAND SPREAD HAND SET TO 100, tune in the same station as selected on the Monitor Dial to exact resonance.

(4) Adjust the "CORRECTOR" to "Zero Beat" with the broadcast station, keeping the "ATTENUATOR" to as low an output as possible (with knob toward the left); otherwise spurious oscillations will be present, with the possibility of zero-beating to a wrong signal near the fundamental with confusing results.

"Zero Beat" refers to the position of the "Corrector" knob, causing the contained oscillator to beat against the incoming signal exactly. A movement of the knob in either direction from this point causes a frequency difference that falls in the Audio range.

(5) The adjacent calibrated scales to the left of the fundamental scale just used are harmonics that fall in the amateur bands and therefore can be depended upon as an accurate means of pre-tuning, checking and logging the stations. Read Section II showing how these harmonics are derived and how other harmonics are possible which can be ignored. The accuracy of this system is without question.

(6) To determine the exact frequency of an incoming signal, merely set the monitor to zero beat with the station and read the frequency direct on the monitor scale. Take note of course the scale position of the band switch and read the correct harmonic scale.

CAUTION: TAKE SPECIAL CARE NOT TO MOVE THE "CORRECTOR" KNOB ACCIDENTALLY OR OTHERWISE AFTER IT HAS ONCE BEEN SET FOR A CERTAIN FREQUENCY.

FOLLOW DIAGRAM BELOW FOR REPLACEMENT OF DRIVE CORDS

MODEL 460

HOWARD RADIO CO.

II THEORY OF OPERATION

The Frequency Monitor in the Howard Model 460 receiver consists of a highly stabilized oscillator covering the fundamental frequency range of 850 to 1030 kilocycles. The RF output of this oscillator is loosely coupled to the antenna circuit of the receiver and the voltage applied to the receiver is controlled by a variable resistance attenuator.

The Oscillator is tuned by a precision ceramic insulated variable condenser carrying an extremely accurate frequency scale covering the 10, 20, 40, 80, and 160 meter amateur bands as well as the fundamental range. The range is so selected that harmonics cover the entire length of all amateur bands and these are calibrated so that frequency can be read within one kilocycle on the lower frequency bands and several kilocycles on the highest band.

The accuracy of the oscillator is established by setting its dial so that the fundamental frequency shown exactly corresponds to that of some known broadcast station within range. This station is then tuned in on the receiver and the frequency monitor corrector set to zero beat with this station. This establishes the oscillator frequency as exactly the same as that of the broadcast station. The Federal Communications Commission requires all broadcast stations to operate within 50 cycles of their assigned frequency and most of them are within a very few cycles. With the accuracy of the frequency monitor dial established at any one point, it may be depended on to be accurate throughout its range.

Harmonics of the oscillator may be tuned directly on the receiver and exact receiver frequency established in this way or the monitor can be set to zero beat with any station heard and that station's frequency read directly on the monitor dial. The 160 meter band is covered by the second harmonic of the oscillator fundamental; the 80 meter band the fourth harmonic; the 40 meter band the ninth harmonic; the 20 meter band the fourteenth harmonic; the 10 meter band the thirtieth harmonic. These harmonics bear a mathematical relationship of exactly 2, 4, 9, 14, and 30 times the fundamental frequency covered. There are of course other harmonic frequencies present in the oscillator output but the one desired is easily found by tuning the receiver to the approximate frequency as indicated by the receiver dial as this will always be approximately correct. The exactly correct frequency will be found near this point. Harmonics heard at frequencies not corresponding to monitor dial are ignored. Harmonics that fall outside the amateur bands may be used if there is any reason to use them.

THE ATTENUATOR

The Attenuator will be found of invaluable aid in controlling the Frequency Monitor Output. The circuits leading from the monitor

have been completely filtered and the shielding is complete, in order that the greatest percentage of output from monitor is controlled by attenuator.

Advancing attenuator to right increases the R.F. Output from monitor.

No fixed rules can be set down as to the proper use of the attenuator. The operator will find after practice just what positions give best results for the various applications of Frequency Monitor.

IN GENERAL THE ATTENUATOR SHOULD BE ADVANCED, MAKING MONITOR SIGNAL EASY TO LOCATE. AFTER SIGNAL HAS BEEN LOCATED THE ATTENUATOR SHOULD BE TURNED BACK TO LEFT AS FAR AS POSSIBLE, WITH THE SIGNAL JUST AUDIBLE. The practice of using as weak a monitor signal as possible will avoid making mistakes on "spurious" beats.

The attenuator will also be found very convenient in controlling voltage in BFO code reception. The perfect control afforded by the attenuator enables the injection voltage to be held very close to the threshold level, which makes for better CW reception.

III BAND SPREAD - USING FREQUENCY MONITOR FOR ESTABLISHING BAND SPREAD STARTING POSITIONS

The following procedure should be followed for band spreading, using frequency reference:

- (1) ESTABLISH FREQUENCY CORRECTION OF MONITOR AS OUTLINED IN SECTION I.
- (2) SET BAND SPREAD POINTER AT 100.
- (3) SET MONITOR DIAL TO POINT WHERE SPREAD IS TO START, CORRESPONDING TO THE POSITION OF THE MAIN DIAL HAND THAT HAS BEEN SET TO THE HIGH FREQUENCY END OF THE PARTICULAR ALLOTTED BAND. TUNE THIS SIGNAL FOR EXACT RESONANCE WITH MAIN TUNING CONTROL, WATCHING "R" METER. USE THE ATTENUATOR TO INCREASE MONITOR SIGNAL IF NECESSARY, DECREASE OUTPUT OF ATTENUATOR IF RESONANCE PEAK IS BEYOND "R" METER SCALE READING.

NOTE 2: The frequency monitor signal can be identified from other signals in that it is slightly modulated at 120 cycles per second. Only enough modulation is used (approximately five per cent) to make the signal easily identified, while the carrier is sufficiently clean to give good beat note performance.

Turn Monitor off and band spread over the limits of band spread for the particular step chosen.

Any one of the reset positions may be chosen at will. However, if band spreading the entire band is desired the steps should be chosen consecutively, as 1, 2, etc.

HOWARD RADIO CO.

It is good practice to get in the habit of following the operations as outlined above. By so doing, all records or logs of stations heard can be accurately logged BY FREQUENCY and CAN ALWAYS BE FOUND IN THE SAME POSITION.

STATION FREQUENCY MEASUREMENT

It is quite simple to measure the frequency of any signal being heard while covering the range with band spread. Turn Monitor on and zero beat signal by tuning monitor dial, using attenuator if necessary to get correct monitor signal strength for proper zero beating. READ STATION FREQUENCY DIRECTLY ON MONITOR SCALE. Special care must be taken in checking frequencies in 10 meter band in that the image frequency can be mistaken for the true signal frequency. In other words, it is possible to hear the monitor in two spots on signals in this band -- rotate monitor dial until the LOWEST frequency is heard. This is the true signal frequency.

FREQUENCY CHECK OF OWN TRANSMITTER as required by the FCC is possible by the method explained above providing a reasonable amount of isolation is maintained between the transmitter and the receiver.

The following explanation of band spread starting positions may be of help in a better understanding of BAND SPREADING BY FREQUENCY REFERENCE:

It has always been known that if the starting positions of band spread can be established to be exactly the same in FREQUENCY, each time band spreading is started the signal positions and logging can be repeated accurately.

In establishing these starting positions in the past it has been customary to set the main tuning indicator as close as possible to the original or logging position. This naturally leaves much to be desired in accuracy because a slight error, even smaller than the eye can detect, would make a tremendous difference in repeating the band spread dial reading. Also, the oscillator in any receiver drifts somewhat over a period of time. The visual mechanical methods of setting band spread of course never corrected for these things.

The frequency reference method as used in the Howard 460 does correct for these discrepancies and enables an accurate log to be kept either by frequency or by actual band spread indicator position.

It will be noticed that on the Frequency Monitor dial there are positions indicated by an arrow and in some cases these arrows are numbered as 1, 2, etc; these arrows indicate the limits of frequency span of band spread and should be used as the starting positions.

It is customary not to band spread the 160 meter band. However, it can be done quite accurately by using the starting positions as shown on monitor scale.

The positions for each of the amateur bands are as follows:

The 20 meter band starts at 14,000 KC. Band spread covers the entire band. Band spread scale will read from 100 to 50 for this band.

The 10 meter band starts at 30,000 KC and goes to 28,400 KC in first step; therefore, the second reset position is at 28,400 KC. The balance of the band is covered in the second setting of band spread.

The 40 meter band starts at 7,300 KC and goes to 7,150 KC in first step. 7,150 KC is start of second position. The balance of this band to 7,000 KC is covered in second setting.

The 80 meter band is covered in three steps, starting at 4,000 KC, going to 3,750 KC, then to 3,540 KC, and finish band to 3,500 in a short step.

The 160 meter band is covered in thirteen steps, starting at 2,050 and going to 2020, 1990, 1960, 1930, 1900, 1870, 1840, 1820, 1800, 1780, 1760, 1740, and finishes at 1716 KC.

IV C.W. RECEPTION

Use the Frequency Monitor to zero beat the received signal on its fundamental frequency. The customary intermediate frequency beat system is not used, thus eliminating certain unnecessary harmonics that would fall in the amateur band. Throw AVC Switch to "OFF" position.

V THE NOISE LIMITER

The Noise Limiter (with switch in the "ON" position) is so designed to help receive signals that might not come through certain types of interference such as automobile ignition noise, and a high percentage of static impulses from various sources. The noise limiter must not be considered as a "noise eliminator"; such an arrangement would impair the sensitivity of the receiver.

VI THE USE OF THE CRYSTAL

NOTE THAT THE "XTAL PHASE" CONTROL AFFECTS THE SELECTIVITY AND SENSITIVITY OF THE RECEIVER EVEN THOUGH THE CRYSTAL IS NOT BEING USED.

- (1) Set the BAND SPREAD to about 50 on its dial, tune in a station on the main dial to exact resonance, watching the meter deflection.
- (2) Turn Frequency Monitor "ON" and set to same frequency as incoming signal, beat to null point with "Corrector".
- (3) Snap XTAL Switch "IN" and rock Band Spread hand back and fourth, which will show two "sides" of the signal,

MODEL 460

HOWARD RADIO CO.

one of which is weaker than the other. Set Band Spread hand to the weaker position.

- (4) Now "Phase Out" the weaker side with the XTAL phase control.
- (5) Retune back to the strong side, which will be found to be free from noise and very selective.

THE SUCCESS OF THE CRYSTAL OPERATION WILL DEPEND UPON TUNING THE SIGNAL TO EXACT RESONANCE.

VII EXTERNAL CONNECTIONS

From the SPEAKER UNIT extends a two lug cable which must be connected to the "5 Ohm" terminal strip on the back of the chassis. No other connections are necessary to the speaker.

The terminals A, D, and G are for antenna and ground connections. Connect the conventional antenna lead-in to terminal "A" and the ground lead to "G"; leave shorting jumper between "G" and "D" unless a Doublet system is used.

For a Doublet system, remove jumper between "G" and "D" and connect doublet wires to "D" and "A". The ground connection can remain.

Due to varied conditions in different localities, it is not possible to give definite recommendations regarding the antenna structure. It is suggested that a little experimenting be done and to follow information given by current radio periodicals, also the A.R.R.L. Handbook.

Special consideration must be taken for reception on the higher frequency bands. There will be periods within a short space of time when no reception is possible. Since the set is designed to meet the conditions for satisfactory short wave reception, there should be no question as to the sensitivity of the set itself, and the receiver should be given a fair chance to produce the required results.

THE MODEL 460 IS DESIGNED TO BE USED EITHER WITH OR WITHOUT THE CRYSTAL. IF THE SET IS NOT EQUIPPED WITH THE CRYSTAL BE SURE TO LEAVE XTAL SWITCH IN THE "OUT" POSITION.

TO LOCATE OR INSERT THE 465 KC CRYSTAL, TURN SET BOTTOM SIDE UP AND REMOVE THE TWO SCREWS HOLDING THE SMALL FLAT COVER.

METER ZERO SET With the Antenna terminal grounded (or the AVC switch in the "OFF" position) turn this control until the "R" Meter hand rests at the 0 point. This will establish accurate readings on this meter.

THE RF GAIN varies the sensitivity of the receiver and under certain conditions is used in conjunction with THE AF GAIN Control to obtain a suitable "signal to noise" ratio.

THE HEADPHONE JACK at the back of the chassis cuts out the regular speaker from the circuit when the plug is inserted.

THE SEND-RECEIVE SWITCH opens the cathode circuits of the RF and IF stages for "standing by".

THE AVC SWITCH should be in the OFF position for reception of C.W.

THE POWER OUTPUT will be about 4.2 watts, undistorted.

GENERAL INFORMATION

For each band there is a Radio Frequency stage with individual coils for the RF Oscillator and Mixer stages for each band.

Ceramic coil forms are used on the high frequency band. Ceramic trimmers are used throughout. The unused coil secondaries of the lower frequency bands are shorted as the band switch is shifted to the higher bands.

The tubes are accessible by removing two screws holding screen to back of cabinet.

The Intermediate Frequency is 465 KC. The Crystal input, Crystal output, and the 2nd IF consist of windings wound on iron cores.

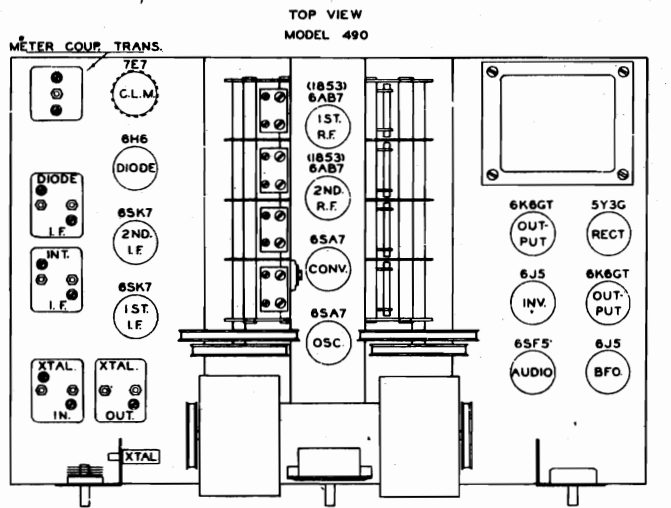

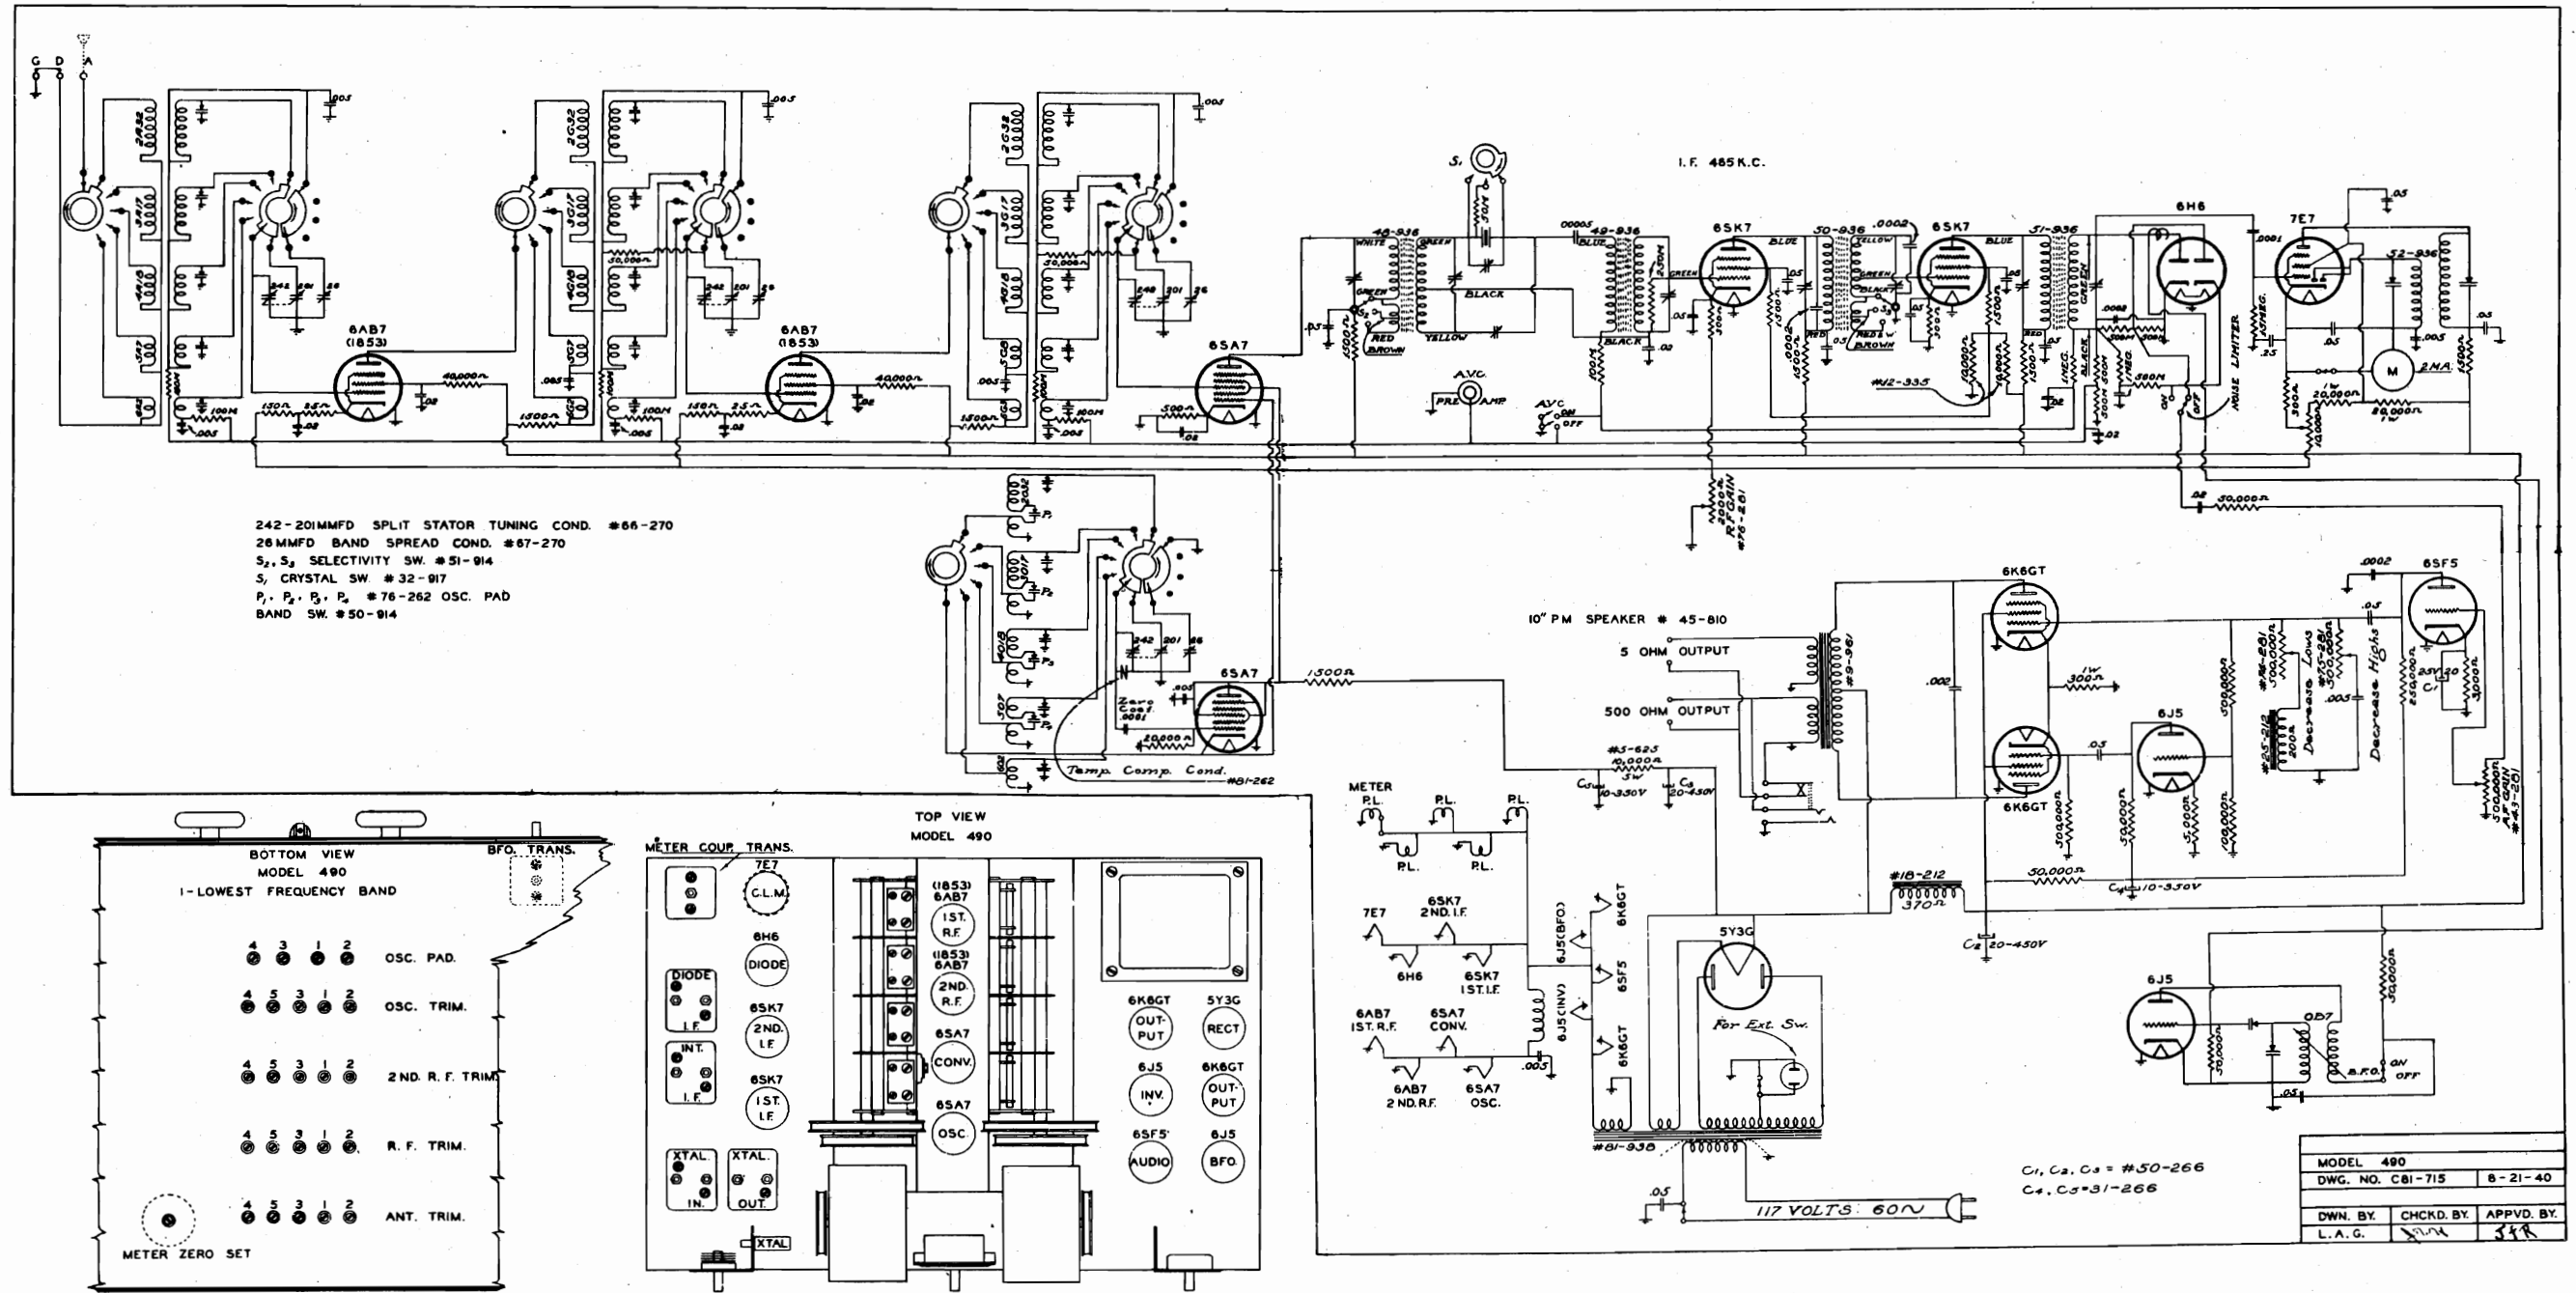

The chassis dimensions are such that the model is adaptable to a standard panel rack.

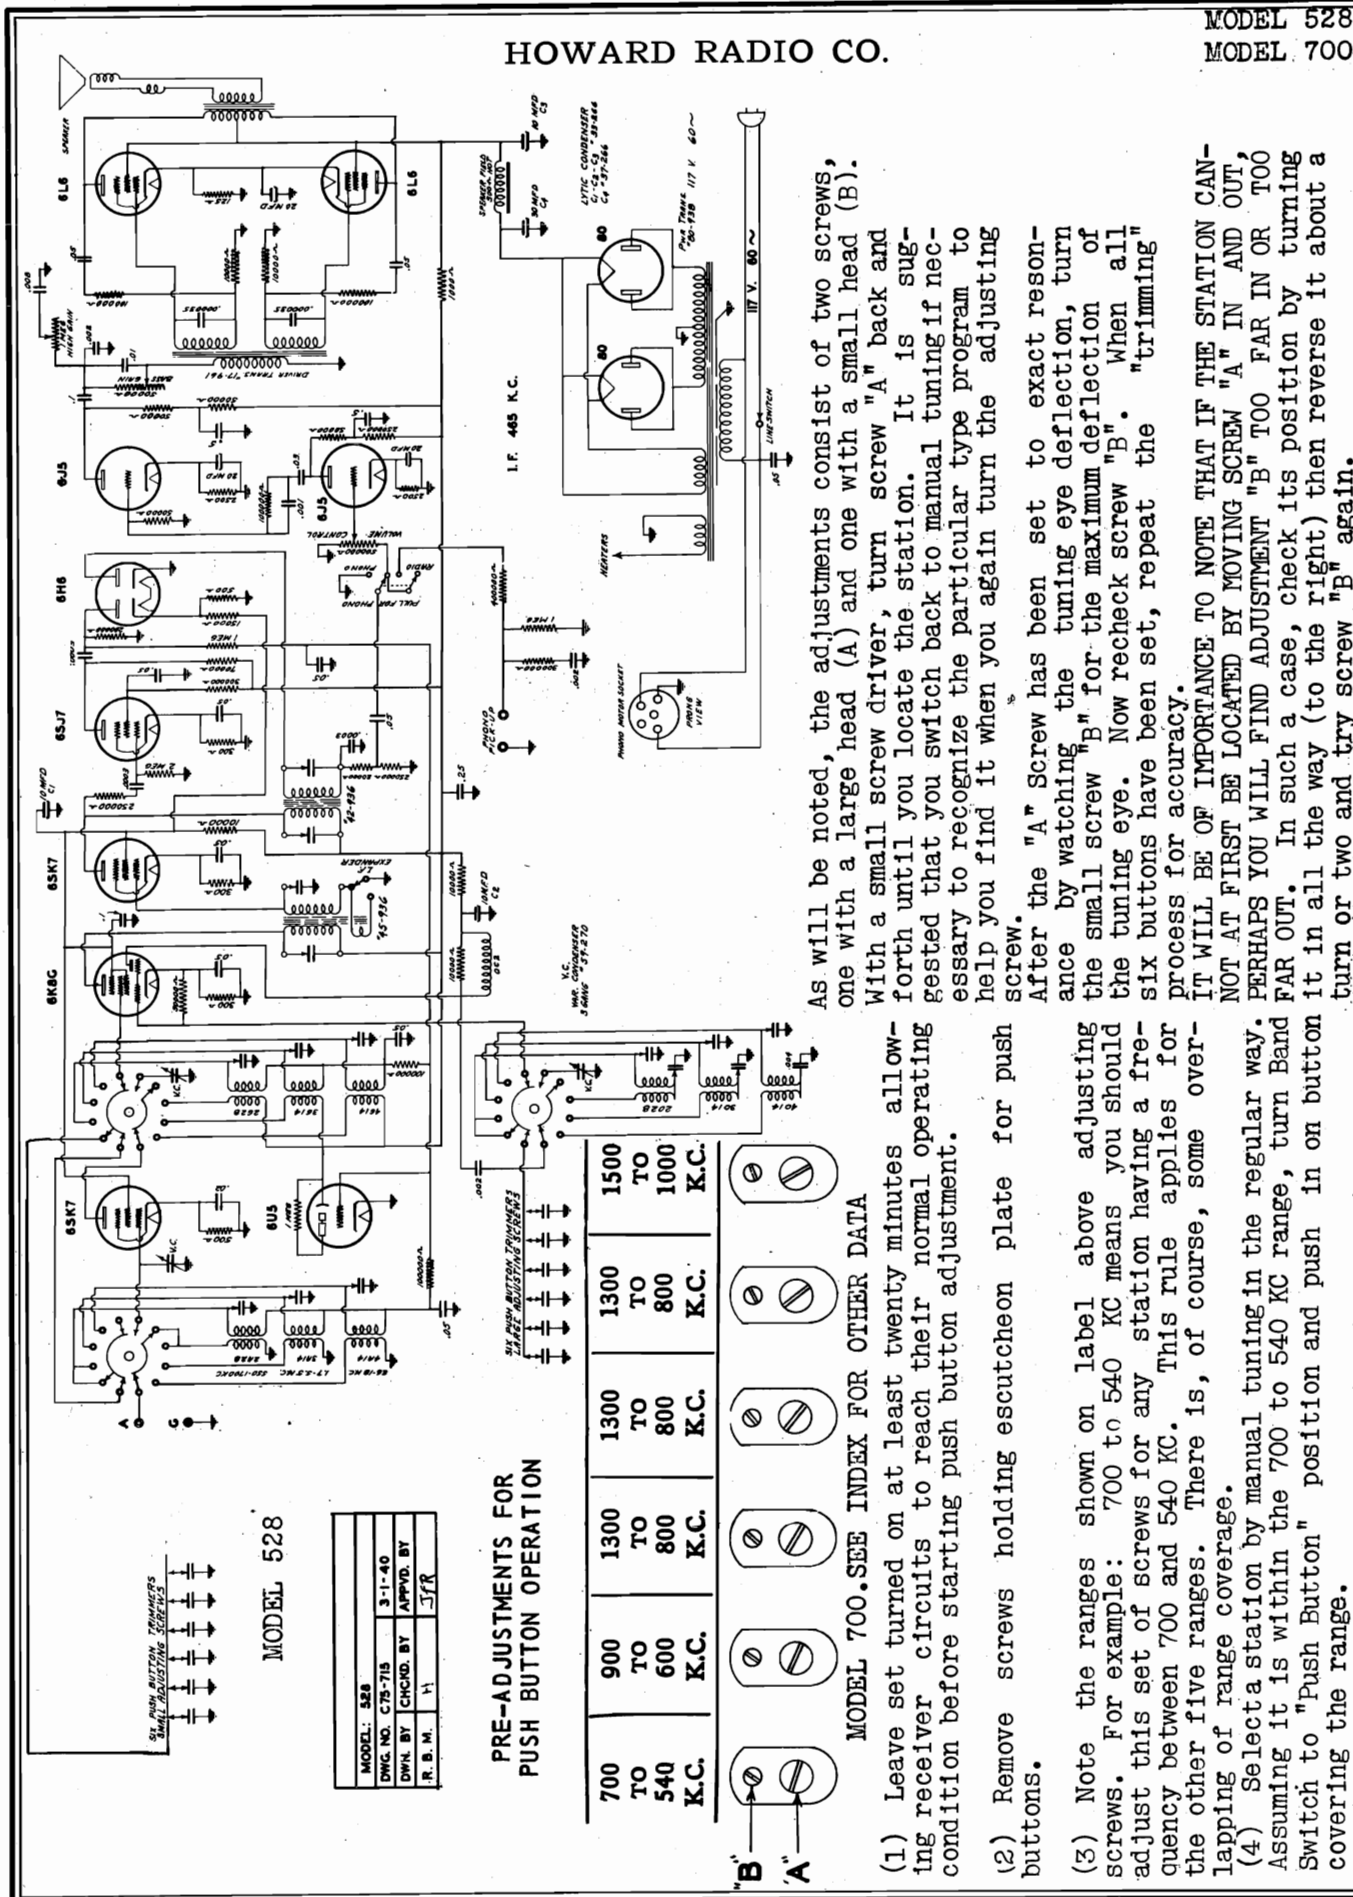

THE FREQUENCY MONITOR ADJUSTMENTS

The electrical alignment of this circuit has been set at the factory and under no circumstances should any changes be attempted since there will be no necessity for any change.

For correct calibration see that the Frequency Monitor Dial, when rotated to the lower frequency, stops at the last line above 850 with the condenser at full capacity. If necessary, adjust scale by shifting drum on condenser shaft by loosening hub set screws.

HOWARD RADIO CO.

MODEL 528
MODEL 700

HOWARD RADIO CO.

AS will be noted, the adjustments consist of two screws, one with a large head (A) and one with a small head (B). With a small screw driver, turn screw "A" back and forth until you locate the station. It is suggested that you switch back to manual tuning if necessary to recognize the particular type program to help you find it when you again turn the adjusting screw. After the "A" screw has been set to exact resonance by watching the tuning eye deflection, turn the small screw "B" for the maximum deflection of the tuning eye. Now recheck screw "B". When all six buttons have been set, repeat the "trimming" process for accuracy. IT WILL BE OF IMPORTANCE TO NOTE THAT IF THE STATION CAN NOT AT FIRST BE LOCATED BY MOVING SCREW "A" IN AND OUT, PERHAPS YOU WILL FIND ADJUSTMENT "B" TOO FAR IN OR TOO FAR OUT. In such a case, check its position by turning it in all the way (to the right) then reverse it about a turn or two and try screw "B" again.

(1) Leave set turned on at least twenty minutes allowing receiver circuits to reach their normal operating condition before starting push button adjustment.
(2) Remove screws holding escutcheon plate for push buttons.
(3) Note the ranges shown on label above adjusting screws. For example: 700 to 540 KC means you should adjust this set of screws for any station having a frequency between 700 and 540 KC. This rule applies for the other five ranges. There is, of course, some overlapping of range coverage.
(4) Select a station by manual tuning in the regular way. Assuming it is within the 700 to 540 KC range, turn Band Switch to "Push Button" position and push in on button covering the range.

PRE-ADJUSTMENTS FOR PUSH BUTTON OPERATION

700 TO 540 K.C.	1300 TO 800 K.C.	1300 TO 800 K.C.	1300 TO 800 K.C.	1500 TO 1000 K.C.

HOWARD RADIO CO.

MODEL 700

Align the Intermediate frequency stages at 465 KC. Reach trimmer through top of shield cans. Set dial at 1400 KC and adjust oscillator trimmer which is located on front section of variable condenser inside chassis, then peak antenna stage trimmer on back section of variable condenser to 1400 KC. No adjustment is required at the low frequency end of the dial other than the conventional bending of the split condenser plates. The tubes are connected in series in the order as shown by the schematic diagram. The dual section filter condenser has a common negative, but note that it does not return to ground as the can is insulated from the chassis.

SOCKET BOLTAGE READINGS:

GENERAL SPECIFICATIONS

14 Tube, 4 Band, Frequency Modulation, R.F. Stage and Loop for Broadcast band only, Mechanical Push-Button Tuning with declutching system, Built-in Phono Switch, Bass Boost, Treble Control, Beam Power Output, Inverse Feed-Back, 6 Ohm Voice Coil, Power Consumption 115 Watts, Alternating Current only.

THIS SHEET INCLUDES:

- Socket voltage chart (also indicates tube function).
- Alignment chart with pictorials showing trimmer and tube locations.
- Replacement parts list with list prices.
- Schematic diagram.
- SEE FORM 31-480 for dial mechanism.

SOCKET VOLTAGE READINGS FOR MODEL 718-FM
* Socket Terminal Number

Voltage taken from ground with voltage at 117 Volts AC. Drop across speaker field 65 V. Use at least a 1000 Ohm per Volt Meter. High voltage reading off rectifier 315 V. DC.

ALIGNMENT PROCEDURE FOR 718 FM

EQUIPMENT REQUIRED:

1. SIGNAL GENERATOR to accurately cover the alignment frequencies as shown below.
2. GALVANOMETER 75 microamperes center "0" (Such as Simpson Type 25) USE SERIES RESISTOR of 100,000 Ohms in positive lead. Leads from meter to set to be as short as possible.
3. OUTPUT METER (0 to 3 V. AC if used in voice coil circuit).
4. DUMMY ANTENNA. Although the values as shown in below table for antenna load may be satisfactory, we urgently recommend the circuit as shown at the right to properly take care of the various frequencies to accomplish the correct alignment.

START ALIGNMENT WITH:

Treble and Bass controls turned toward left, Volume Control full ON to right and Band Switch in Broadcast position. After checking for pointer travel to last line above 550, set dial to point where there is no interference with generator signal and proceed with AM-IF alignment.

NOTE A: When a re-alignment is made of either the AM I.F. or FM I.F. it should not be necessary to turn the adjustments very far in either direction. The AM I.F. adjustments are reached through holes in the base from underside of chassis. Should the screws be turned too far in, they might fall out of position which would require that the coil be re-assembled. At the other extreme, if the screws are forced too far out, there is danger of breaking the iron cores.

NOTE B: Connect Galvanometer from tap of limiter grid load circuit to ground. See Fig. 1. Adjust for max. current. Normal gain should give deflection (with meter as specified) of 22 with 2,000 to 3,000 microvolt input. Now shift generator frequency each side of 4.3; that is, to 4.2 and 4.4. The drop-in meter deflection should be approximately proportional to change in frequency. If not, recheck alignment.

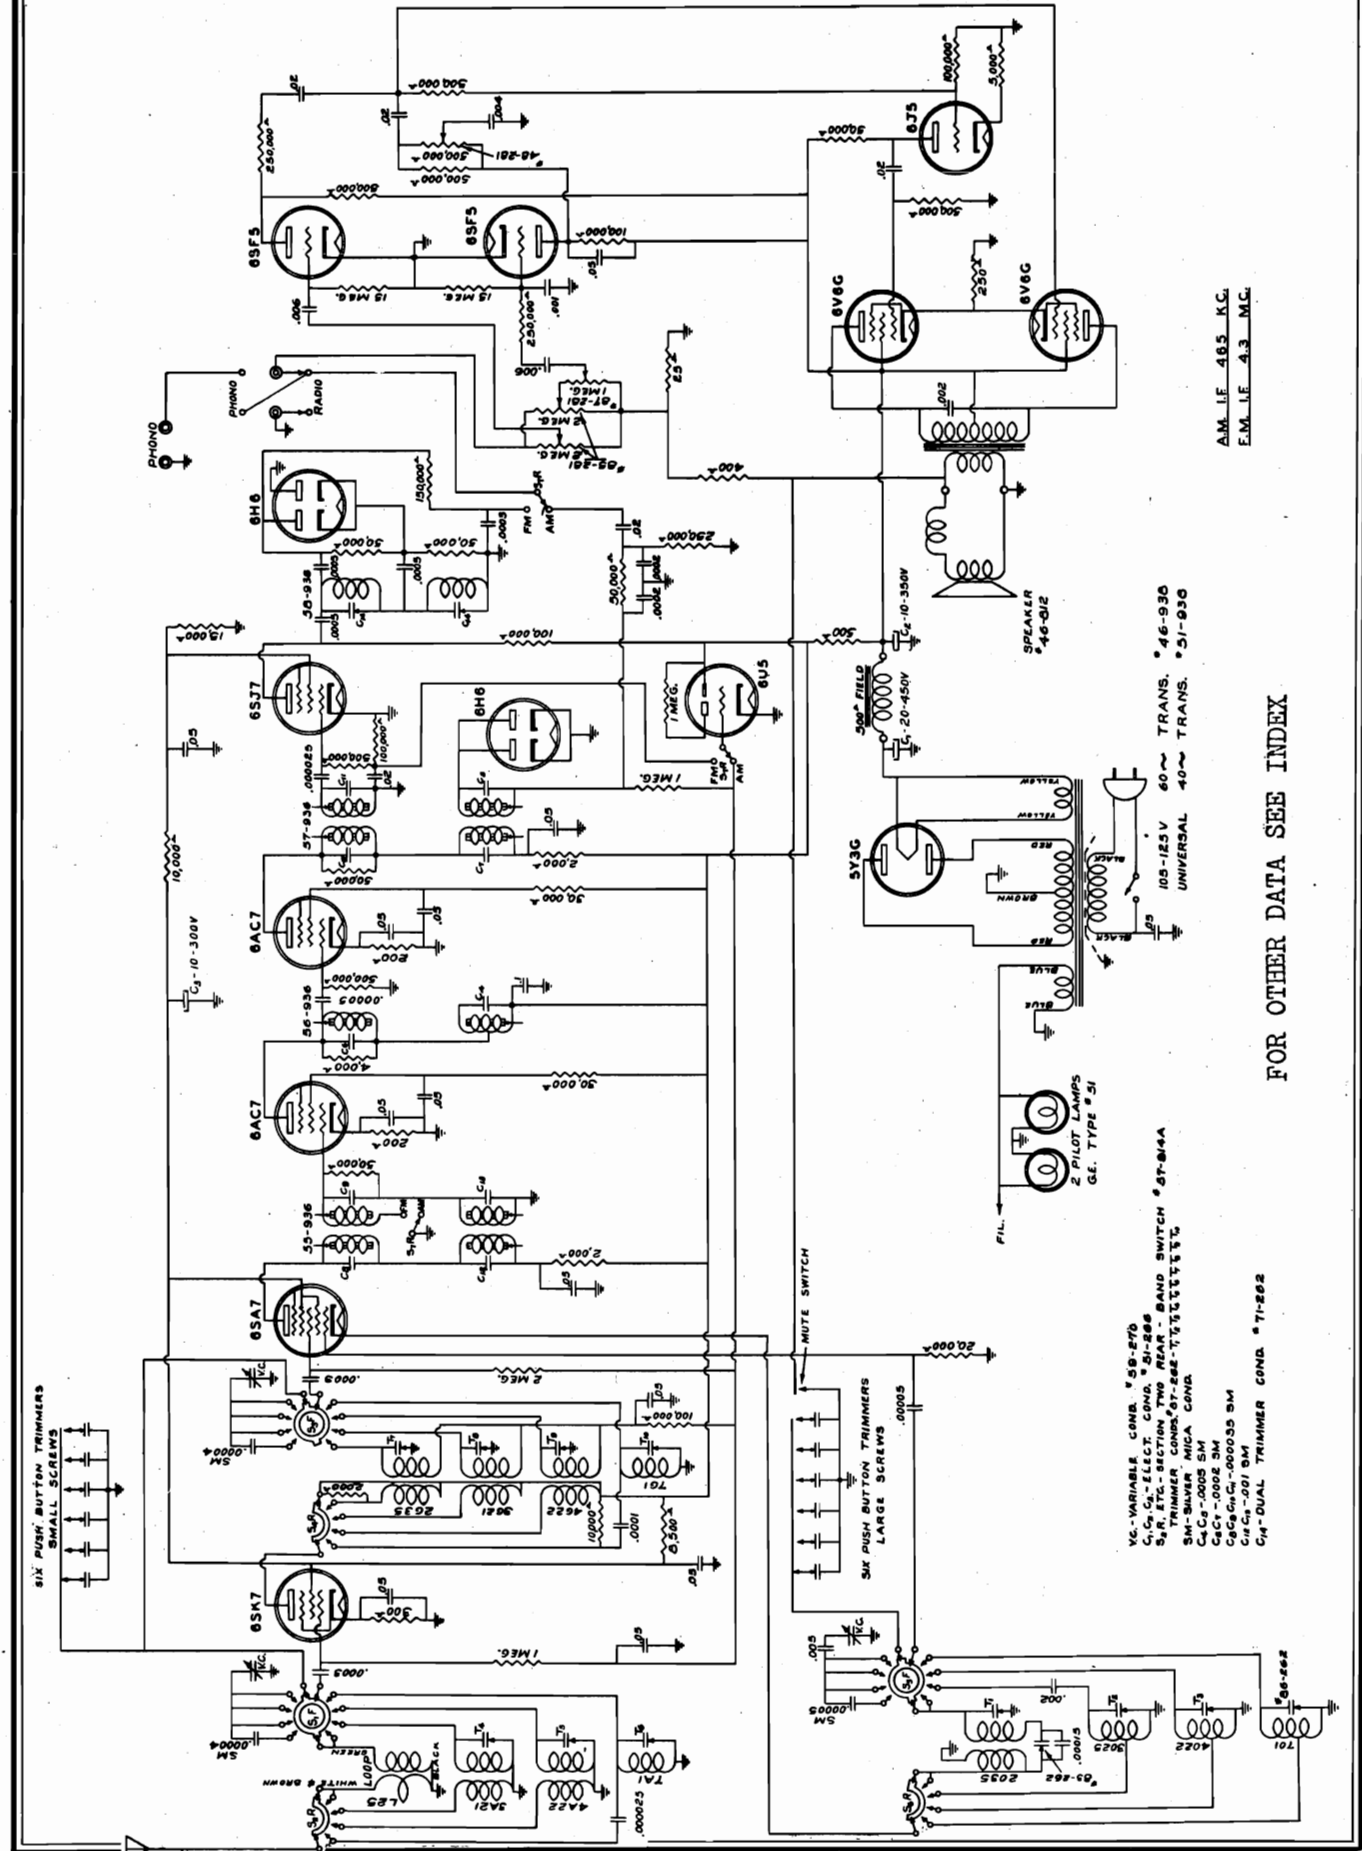

NOTE C: With Galvanometer connected to FM Detector output (See Fig.1) and Trimmer 11 turned all the way in temporarily, adjust Trimmer 12 for max. deflection at 4.4 M.C. Normal gain should give deflection of 9 with 2,000 to 3,000 microvolts input.

NOTE D: After Trimmer 12 is adjusted to 4.4, adjust Trimmer 11 to zero deflection at 4.3. Then shift generator to 4.2 MC. Meter should then show deflection approximately same as at 4.4 at reverse polarity. If the I.F. circuits are ever readjusted, always recheck detector afterwards.

NOTE E: Peak for greatest deflection of output meter.

MODEL 806

SOCKET VOLTAGE READINGS FOR MODEL 806
 * Socket Terminal Number

Voltage taken from ground with voltage at 117 Volts AC. Drop across speaker field 44 V. Use at least a 1000 ohm per Volt Meter. High Voltage reading off rectifier 314 V. DC.

MODEL 806
MODEL 808

HOWARD RADIO CO.

START ALIGNMENT WITH:

Volume control full ON to right and Band Switch in "A" Band position. After checking for pointer travel to last line above 550, set dial to point where there is no interference with generator signal and proceed with I.F. alignment.

NOTE THAT THIS IS A SPREAD BAND RECEIVER, AND THE ALIGNMENT PROCEDURE IS NOT CONVENTIONAL. ONE SET OF COILS COVERS TWO SHORT WAVE BANDS WHICH ARE SPREAD BY MEANS OF PADDING CIRCUITS.

NOTE ALSO THAT A SETTING POINT FOR THE DIAL HAND POSITION IS GIVEN ON A DIFFERENT BAND OTHER THAN THE BAND BEING ALIGNED AND THE FREQUENCY SETTING OF THE GENERATOR. THIS IS NECESSARY TO OBTAIN THE PROPER BAND-SPREAD.

EQUIPMENT REQUIRED:

1. Signal Generator to accurately cover the alignment frequencies as shown below.
2. Output Meter (0 to 3 V. AC, if used in voice coil circuit).
3. Dummy Antenna. Although the values as shown in table below for antenna load may be satisfactory, we urgently recommend the circuit as shown at right to properly take care of the various frequencies for correct alignment.

FOR OTHER DATA SEE INDEX

High Voltage off Rect. - 114 V.
Drop across choke - 16 V.
Voltages taken from ground with line voltage of 177 V. AC.

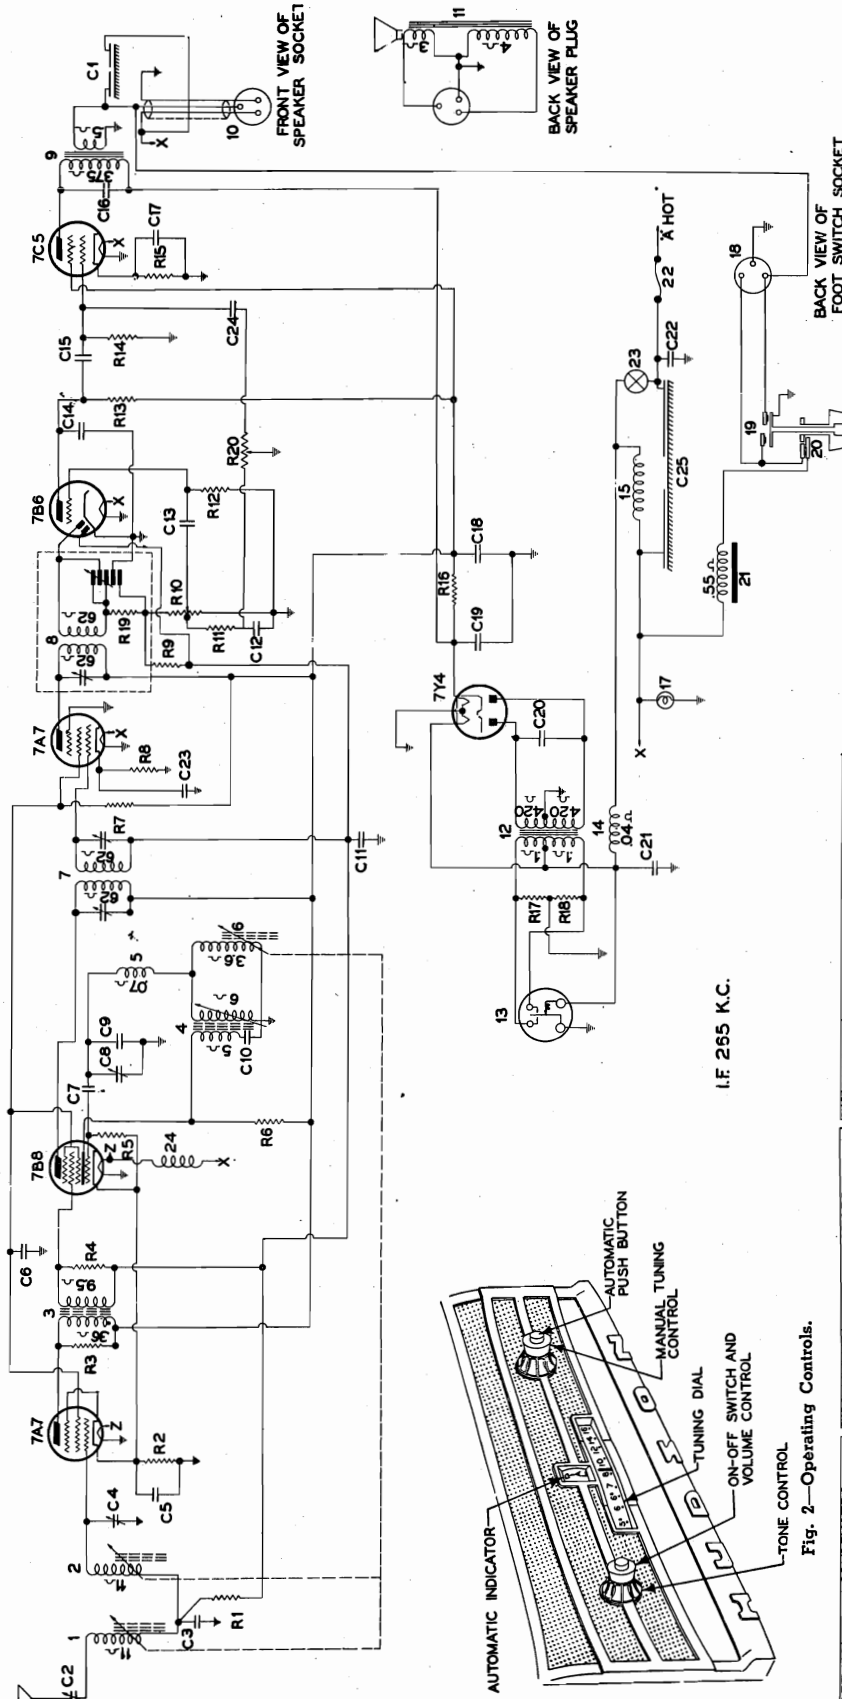

"B" drain at 90 Volts - .0125 A.
"A" drain at 9 Volts - .050 A.

All of the tube filaments are connected in series with the exception of the rectifier which has a 117 Volt filament.

A filament current equalizing system is employed using a 2,000 Ohm resistor from the power tube filament to ground and a 600 Ohm in the mixer tube filament circuit. See diagram.

The alignment of this receiver is conventional, the Intermediate Frequency being 465 KC. The Loop and Oscillator circuits are aligned at 1400 KC. If necessary, the condenser cut plates can be varied at the lower frequencies.

HUDSON MOTOR CAR CO.

Fig. 4—Trimmer Positions.

ALIGNMENT

CAUTION—Care should be taken while making all adjustments on the receiver to have the volume control turned full on. The signal fed to the receiver through a 30 mmfd. series and 30 mmfd. shunt dummy to the antenna socket of the receiver. The intensity of the signal should be reduced only at the signal generator. Let receiver warm up a while before making adjustments.

I. F.

1. Set signal generator to 265 K.C.
2. Place set in manual tuning position and set dial pointer at 600 K.C.
3. Adjust screws D, C, B and A in sequence for maximum response on the output meter.

R. F.

1. Set signal generator to 540 K.C.
2. Place set in manual tuning position and tune set to the extremity of the dial scale at 540 K.C.
3. Adjust trimmer F, Fig. 4, for maximum response.
4. Set signal generator to 1200 K.C.
5. Tune set to 1200 K.C.
6. Adjust E, Fig. 4, for maximum response.

WARNING: The following adjustments are to be made only if a core or coil is replaced.

OSCILLATOR CORE OR COIL REPLACEMENT ONLY

On all adjustments give set sufficient time to warm up.

1. Replace coil or core.
2. Set signal generator to 540 K.C.
3. Tune the set to the 540 K.C. end of the dial scale.
4. Adjust core for maximum peak.
5. Back off trimmer F, Fig. 4, to 1/3 of output reading.

6. Repeat operations 4 and 5 until no further gain can be reached by adjusting core.
7. Re-cement core screw with speaker cement.
8. Follow instructions given under general R.F. alignment.

R. F. CORE OR COIL REPLACEMENT ONLY

On all adjustments give set sufficient time to warm up.

1. Replace coil or core.
2. Set the signal generator to 540 K.C.
3. Tune set all the way to low end of 540 K.C. dial scale.
4. Adjust core for maximum response.
5. Back off trimmer (E if R.F. or trimmer G if antenna stage) until output is reduced by approximately one third.
6. Repeat 4 and 5 until no further gain is obtained from core adjustment.
7. Set signal generator to 600 K.C.
8. Tune set to 600 K.C.
9. Adjust trimmer (E if R.F.—G if antenna stage) Fig. 5 for maximum response.
10. Set signal generator to 1400 K.C.
11. Tune set to 1400 K.C.
12. Adjust core for maximum output.
13. Re-cement core screw with speaker cement.
14. Peak set following general instruction given under R.F., alignment.

SOCKET VOLTAGES AS MEASURED WITH 1000 OHM PER VOLT METER TO CHASSIS, VOLUME CONTROL AT MAXIMUM WITH NO SIGNAL. BATTERY 6.3 VOLTS.

Fig. 5—Socket Voltages.

HUDSON MOTOR CAR CO.

CIRCUIT: 6 Tube Superheterodyne.

TUBE COMPLEMENT: 7A7 R.F., 7B8 Converter, 7A7 I.F., 7B6 Detector, A.V.C., 1st Audio, 7C5 Beam Power Output, 7Y4 Rectifier. Fig. 1.

TUNING RANGE: 540 to 1600 Kilocycles.

AUTOMATIC POSITIONS: 5 plus "Dial."

SPEAKER: 6" Dynamic externally mounted behind instrument panel. Voice coil impedance 3.2 ohms at 400 cycles. Field resistance 4 ohms cold.

tone CONTROL: Variable with bass, high fidelity and voice positions.

POWER OUTPUT: Maximum 4.5 watts. Undistorted 1.5 watts.

VIBRATOR: Non-synchronous.

POWER RATING: Current drain 7.5 amperes. Fuse—20 amperes.

TUNING RATIO: 15 to 1.

SENSITIVITY: 5 microvolts overall.

I. F. FREQUENCY: 265 K.C.

TUBE LAYOUT

Fig. 1—Tube Position.

Turn receiver on and tune to a weak station near 1200 K.C. (see instruction card.) Adjust antenna trimmer on top of receiver through ash tray opening for maximum volume. Place ash tray back into instrument panel.

SUPPRESSION

Attach condenser, part No. 22-1262 to rear of generator with machine screw and lockwasher provided. Connect condenser lead to generator "A" terminal, Fig. 3-D.

Install suppressor in center hole of distributor cap being sure to make good contact. Place distributor lead in top of suppressor Fig. 3-E.

Mount ignition lock condenser part No. 22-1263 under rear left nut holding ventilator handle guide assembly. Connect the other lead to the "AM" terminal of the ignition lock Fig. 3.

Attach condenser part No. 22-1260 to the upper rear cap screw on the engine water manifold plate and attach the condenser lead to the heat indicator terminal, Fig. 3-F.

Install bonnet grounding spring under hood lacing 23½" to left of center line of car as shown, using no. 8 sheet metal screw Fig. 3-G.

Remove tape from special hole in dash and install flat ground strap from rear cylinder head stud to dash. Fasten it to dash with sheet metal screw and shake proof washer. The ground strap is mounted under the regular stud nut on the eight cylinder cars. The ground strap is placed on top of the regular stud nut on the six cylinder cars and held in place by special nut furnished in kit. Fig. 3-F.

1942 OPERATING INSTRUCTIONS

This radio incorporates the new Hudson Automatic Touch Tuning with Foot Control.

1. TO TURN RADIO ON—Rotate left control knob in a clockwise direction and allow receiver to reach operating temperature. (Approximately 60 seconds.)
2. Press the Automatic Push Button several times or until the word DIAL appears on the Automatic Indicator.
3. MANUAL TUNING — Turn right hand control knob to tune in stations on the tuning dial. Be sure to tune to point where tone is deepest.
4. TONE CONTROL — The tone control knob is located behind the volume control knob. Turn in either direction to most pleasing tone position.
5. VOLUME — Adjust volume control knob to desired level.

AUTOMATIC TUNING

If not previously set up for Automatic operation by the dealer, proceed as follows:

1. Press the Automatic button in the center of the right hand knob, until Number 1 position appears on the Automatic Indicator.
2. Pull the tuning knob OUT to engage the Automatic mechanism.
3. Select the station desired and tune to its corresponding frequency by rotating the tuning knob. Tune very carefully for deepest and clearest reception.
4. Push the tuning knob IN to its original position. Automatic push button and Foot Control will not operate if tuning knob is left in the OUT position.
5. Follow above procedure in setting automatic positions (i.e. 2, 3, 4 and 5.)

HUDSON MOTOR CAR CO.

When the five automatic positions have been adjusted to the five desired stations as instructed, it is only necessary to press the Automatic button to return to Dial tuning, or any one of the stations selected on the Automatic.

board, thus avoiding the necessity of removing the hands from the wheel, or the eyes from the road. Its function is identical to that of the automatic push button in the center of the right hand knob, and therefore requires no set-up or other adjustment.

FOOT CONTROL

The foot control button provides a convenient means of automatically tuning the receiver from the floor

Press the foot control button all the way down to change stations.

Press lightly to silence radio during conversation.

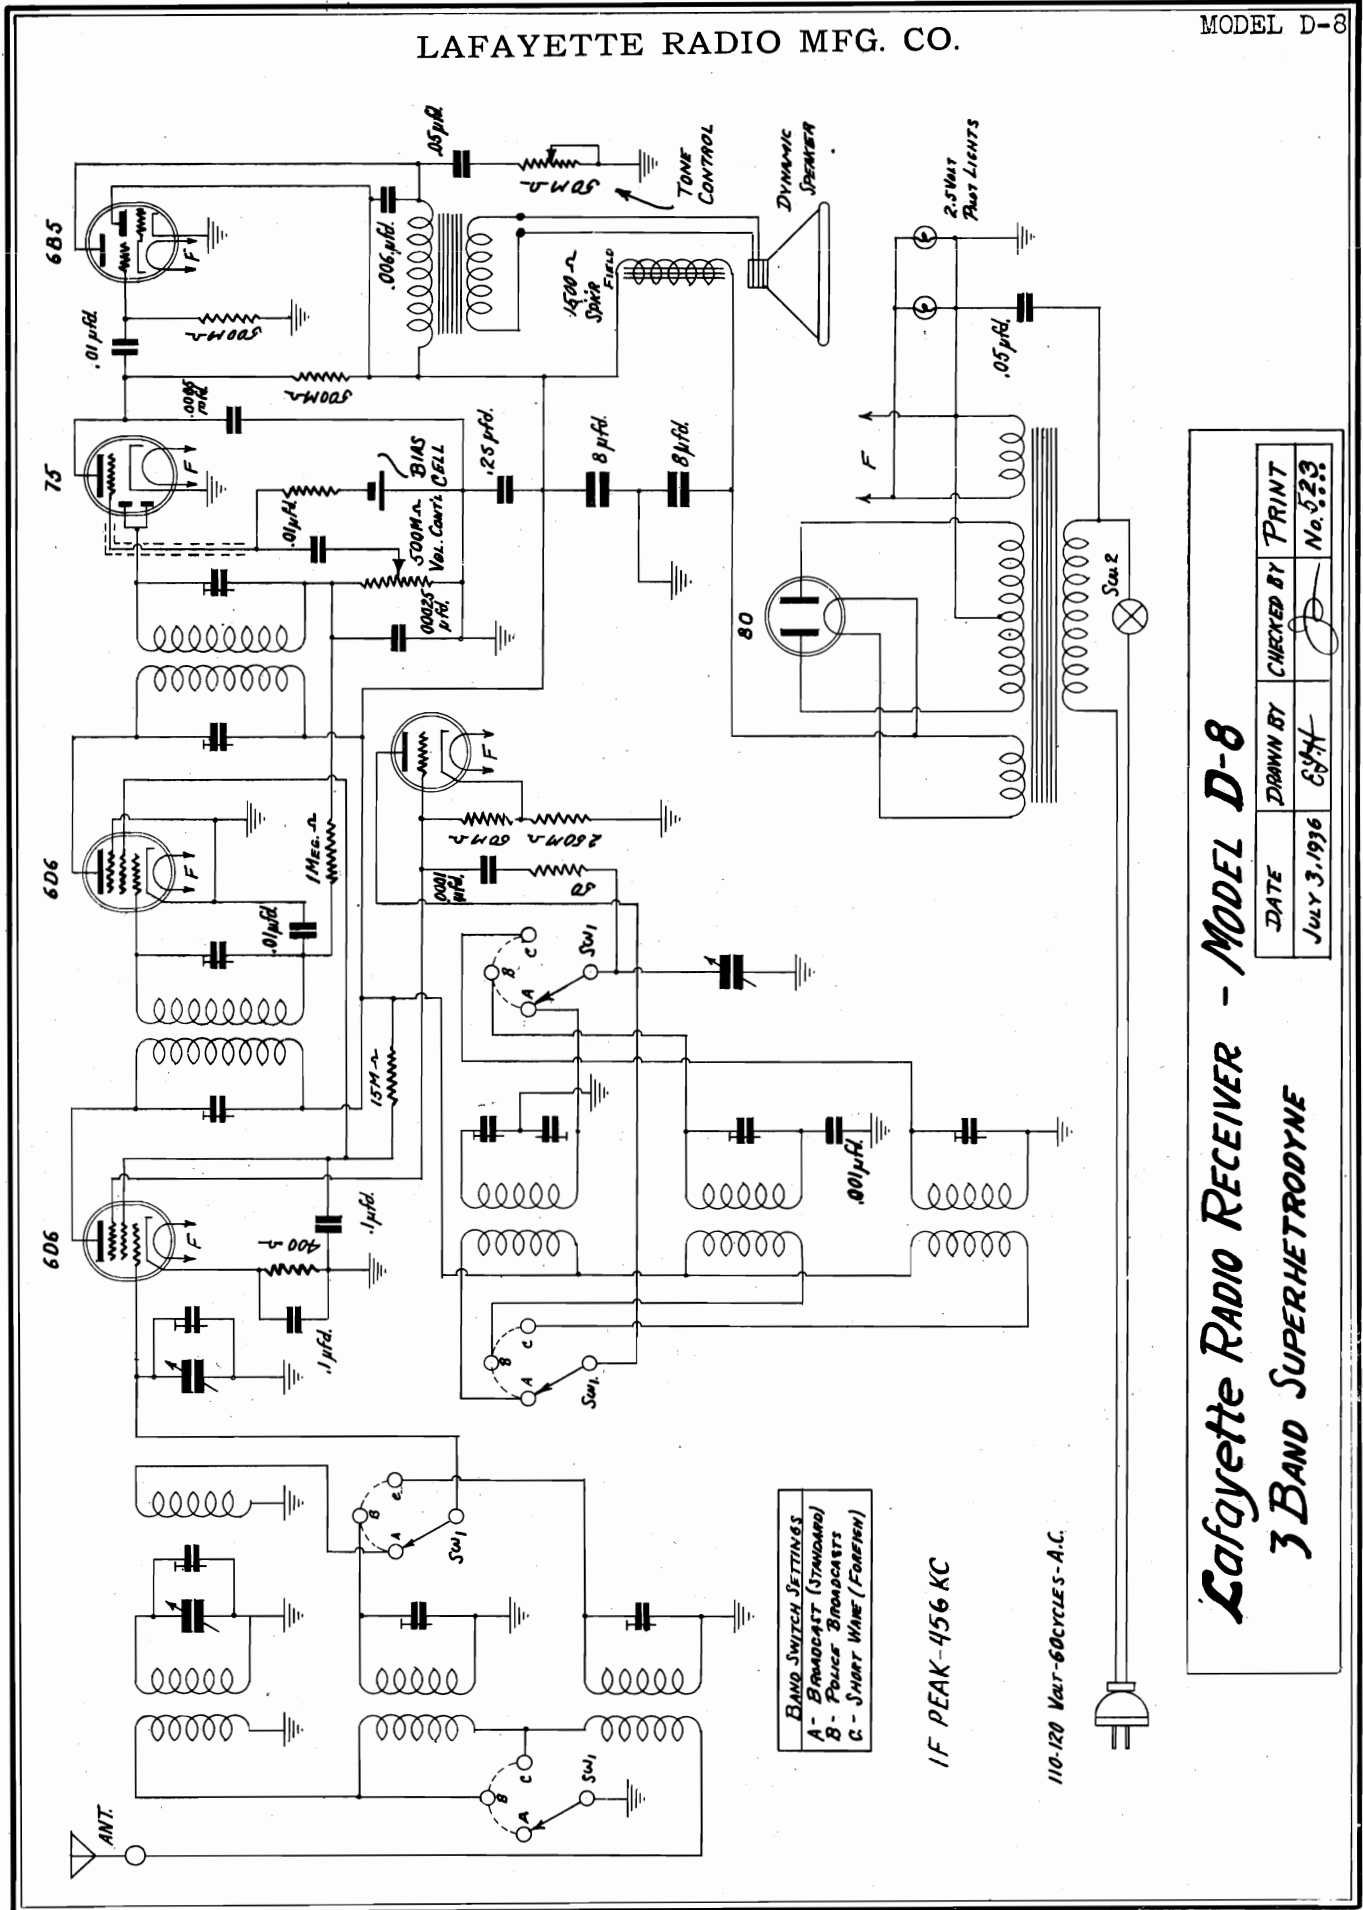

Fig. 3—Mounting Details and Connections.

LAFAYETTE RADIO MFG. CO.

This receiver is a 5 tube Alternating Current operated superheterodyne. The tubes used are a 6A7 as oscillator modulator, a 6D6 as I.F. Amplifier, a 75 as AVC and Audio voltage amplifier and audio as power audio amplifier and an 80 as a power rectifier. The receiver is made to cover two tuning bands, the standard broadcast band which ranges from 1730 KC to 535 KC and the middle or police band which has a frequency range of from 6.4 MC to 21 MC.

			WAVE BAND S.W.
			10-107
			50-60 CYCLES

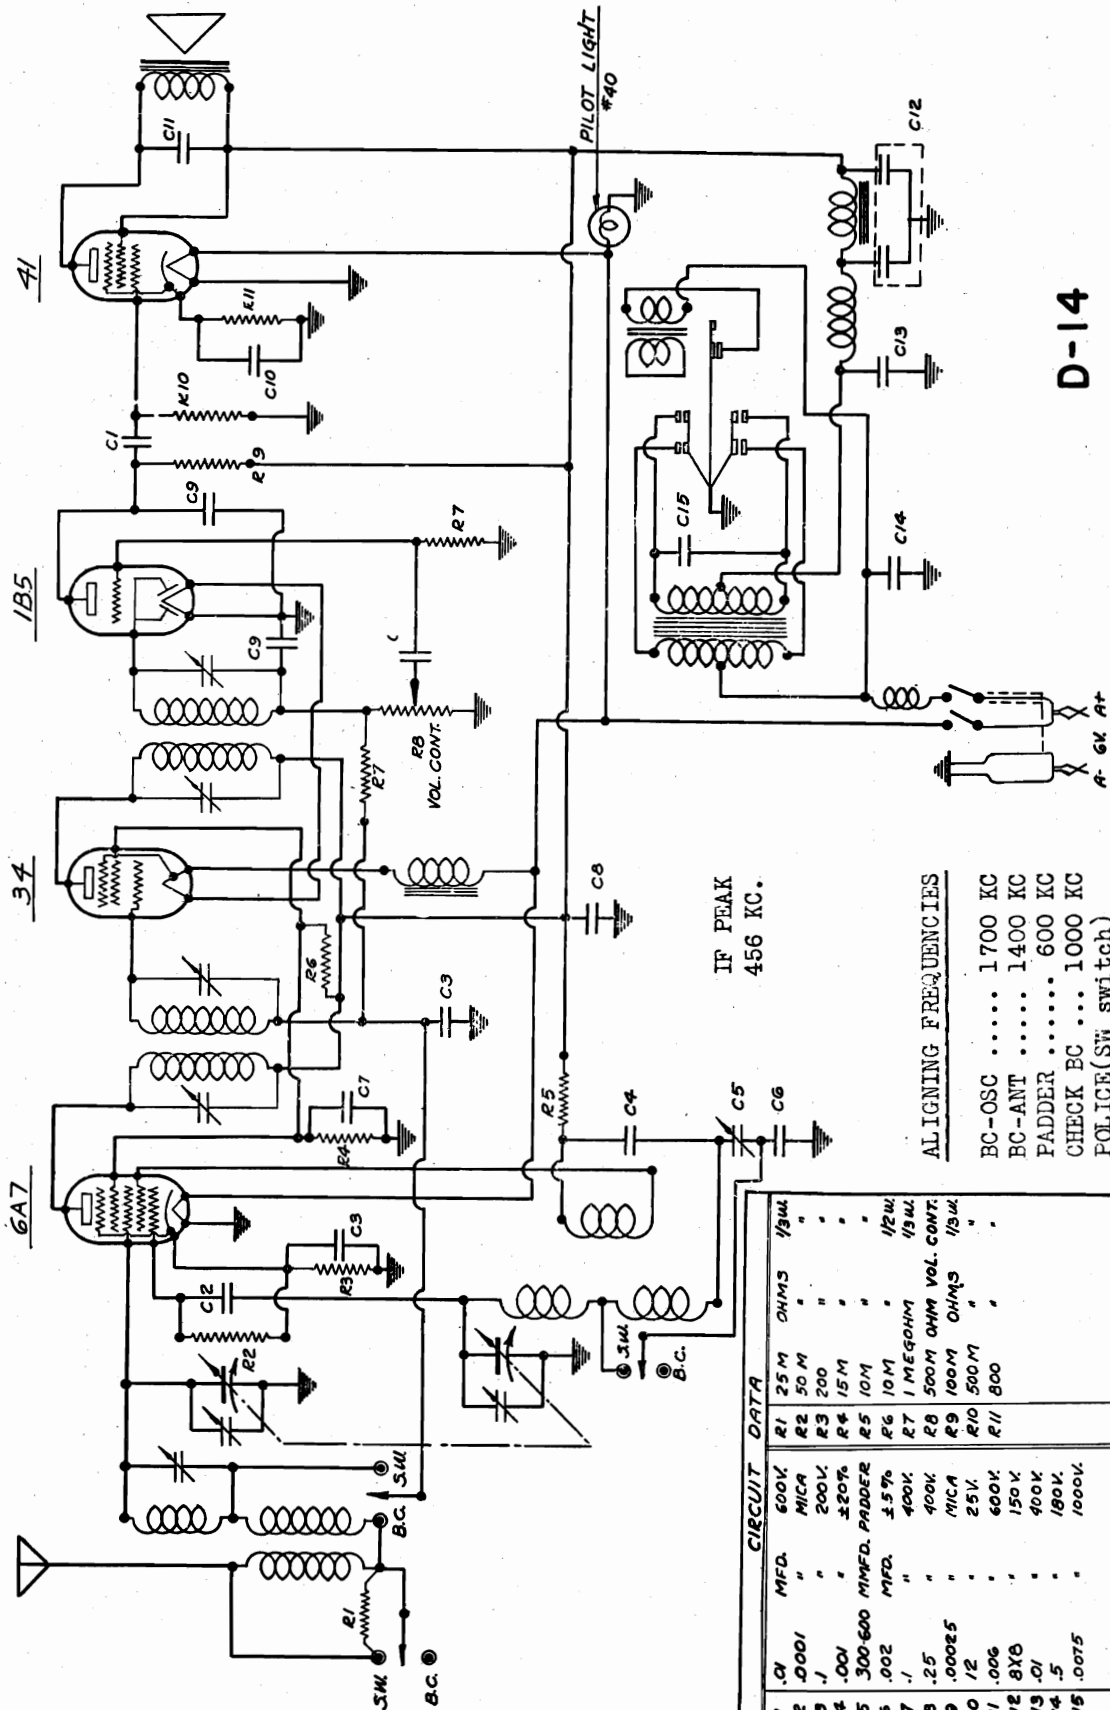

Connect the signal generator to the grid cap of the 6A7 tube through a .1 M.F. condenser. Connect the ground of the generator to the ground lead of the receiver. With the wave switch on broadcast position and the dial set to about 1000 K.C., feed in a 456 K.C. signal. Adjust the trimmers on top of the first and second I.F. transformers until the maximum output is obtained. Connect output meter thru a .5 mfd. dummy, total resistance 7000 ohms to speaker plug. This aligns the I.F. Leaving the wave switch on broadcast position turn the dial to the extreme high frequency end. Feed a 1730 K.C. signal to the receiver antenna lead through a .00025 M.F. mica condenser. Adjust the 1730 K.C. broadcast oscillator trimmer until maximum output is shown. Set the generator to 1400 K.C. and tune in this signal on the receiver. Then adjust the 1400 K.C. broadcast antenna trimmer to maximum output. Set the generator to 600 K.C. and adjust the 600 K.C. broadcast oscillator pad to maximum output while tuning the receiver back and forth across the signal from the generator. This completes the alignment of the broadcast band.

The short wave band is aligned while feeding a 6.0 M.C. signal to the receiver antenna lead through a .00025 M.F. mica condenser. Turn the wave switch to short wave position and tune in the 6.0 M.C. signal. Adjust the 6.0 M.C. short wave trimmer to maximum output.

LAFAYETTE RADIO MFG. CO.

MODEL D-14
MODEL C-17

For aligning the police band, set test oscillator to 4.2 megacycles and switch to the police band position on the set. With the condenser rotated to this frequency setting as indicated on the dial, adjust oscillator trimmer located on the right side of the chassis, second position from the front. Set test oscillator to 4.0 megacycles and rotate condenser to the corresponding dial reading. Now adjust antenna trimmer located on the front of the chassis, center position to resonance. Then set oscillator to 2.0 megacycles and rotate the condenser to the 2 megacycle reading. Adjust padder located on top of chassis, first position from the front.

The short wave band is aligned by setting the condenser to 15 megacycles and adjust the oscillator trimmer located on the right side of the chassis, third position from the front to resonance with a 15 megacycle signal from the test oscillator. At the same time adjust the antenna trimmer located in front of the chassis, third position from the left.

INSTRUCTIONS AND SERVICE NOTES FOR THE MODEL C-17
2 AND 3 VOLT BATTERY SUPERHETERODYNE

Frequency Range - 540 - 1500 Kilocycles, 1.5-4.2 Megacycles and 5.6-15 Megacycles.

- 1 TYPE 1C6 Det.-Osc.
- 2 TYPE 34 I.F. Amplifier
- 1 TYPE 1B5 Diode Detector and Amp.
- 1 TYPE 30 Audio Amplifier
- 1 TYPE 19 Class B Twin Amplifier
- 1 TYPE 6-1 Ballast Tube

ANTENNA AND GROUND

For best reception, an antenna 75 to 100 feet long and erected high and clear of surrounding objects should be used.

A good ground connection is essential with this receiver, preferably to a water pipe with the ground wire as short as possible.

BATTERY CONNECTIONS

- Red Lead A+2 or 3 Volts
- Blue Lead B+135 Volts
- Black Lead B- (connected to A-)
- Black Lead A-

"C" BATTERY CONNECTIONS

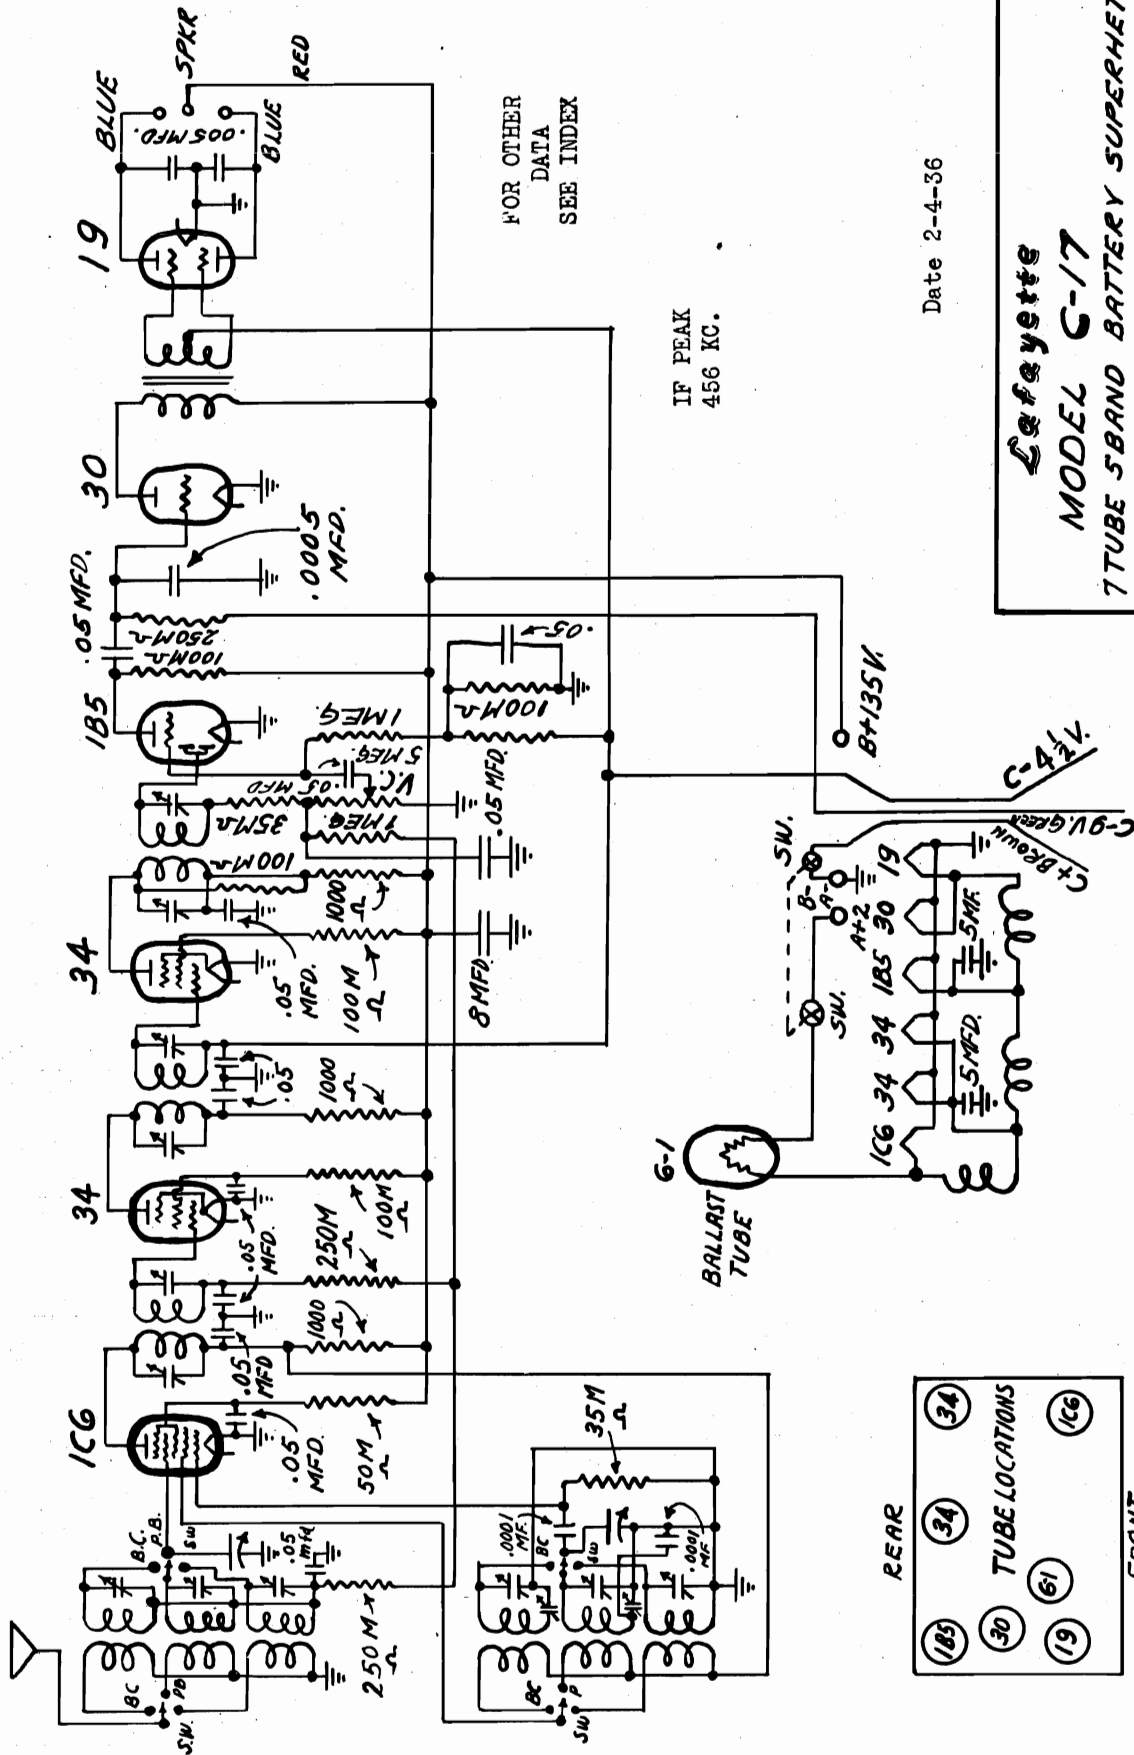

A "C" battery should be connected to leads extending from the top of the chassis. Provision is made for mounting "C" battery within the cabinet.

On models using a tapped "9" volt "C" battery, three leads are connected as follows: Brown wire to C+, yellow wire -3 volts and the green wire to -9 volts. On models using a tapped 22½ volt battery, four leads from the chassis are connected as follows: Black wire to C+, green wire to -3 volts, orange wire to -4½ volts and red wire to -9 volts.

Use a test oscillator and connect an output meter from plate to plate of the 19 output tube.

I.F. ALIGNMENT - Connect the oscillator through a .00025 condenser to the grid of the 1C6 tube and set the oscillator to 456 kilocycles. Peak each I.F. stage to resonance as indicated by maximum output or the output meter.

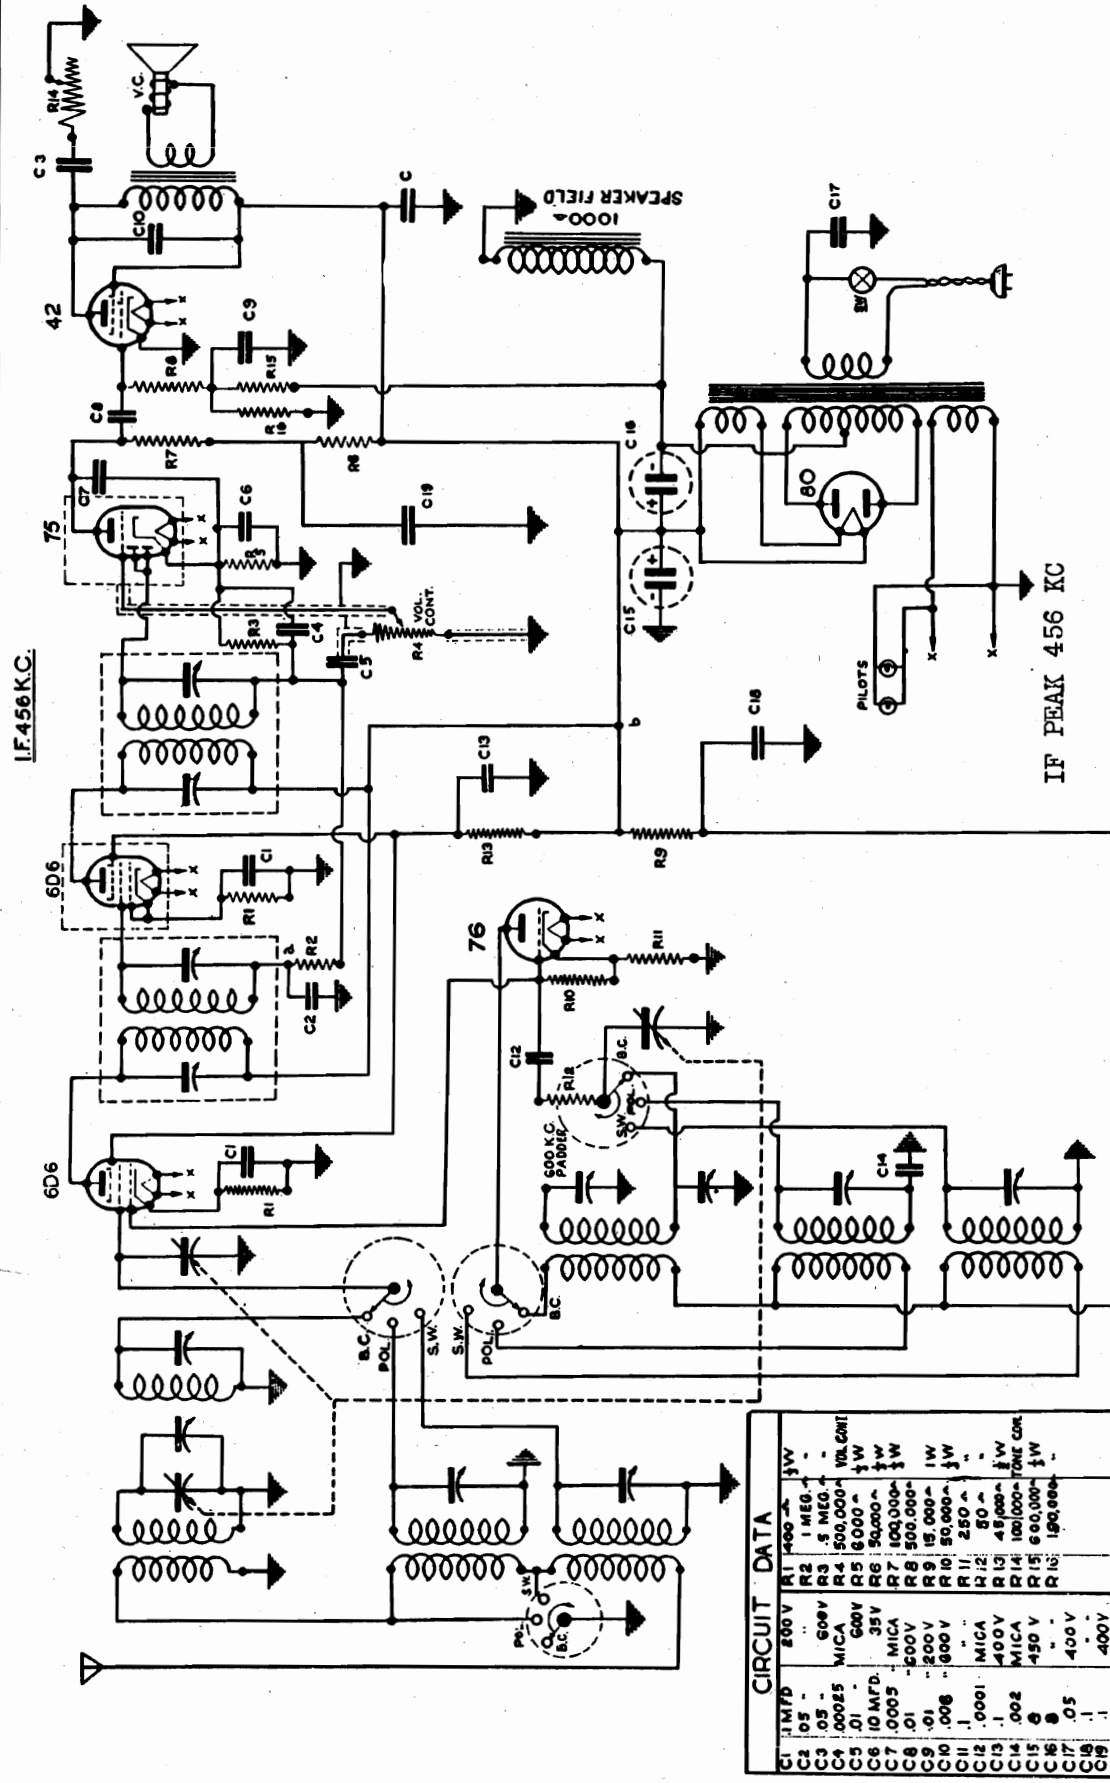

R.F. ALIGNMENT - With the wave change switch in the broadcast position, set oscillator to 1500 kilocycles and connect in series with a .00025 condenser to the antenna of the receiver. Rotate the variable condenser to the 1500 setting of the dial and adjust the trimmer condenser of the broadcast oscillator to resonance. This trimmer is located on the right side of the chassis, third position from the front. Reset the test oscillator to 1400 kilocycles and adjust antenna trimmer located in front of the chassis, first position from the left. Now set oscillator to 600 kilocycles and adjust padder located on top of the chassis, second from the front. Check alignment at 1000 kilo.

LAFAYETTE RADIO MFG. CO.

I. F. ALIGNMENT:

With volume control turned on full and variable gang condenser at maximum capacity, attach test oscillator lead in series with a .1 mfd. condenser to grid of 6A7 tube. Set test oscillator 456 KC and adjust I.F. trimmers for maximum output as indicated on an output meter connected across voice coil of speaker or from plate and screen of 41 tube.

R. F. ALIGNMENT:

Set test oscillator at 1500 KC and connect to antenna of receiver through a 150 mmf. condenser. Rotate variable gang condenser to minimum capacity and back off slightly. Adjust trimmer on oscillator section of gang condenser (first section from shaft end) to resonance indicated by maximum output. Re-set test oscillator at 1400 KC and rotate variable condenser until oscillator signal is picked up. Adjust antenna (rear section) to resonance. Check alignment at 1400, 1000, 600 and 550 kilocycles by setting test oscillator to these frequencies and rotate condenser until signal is picked up. Off tracking at 1000 and 600 kilocycles may be compensated for by slightly bending the slotted plates of the antenna section of gang condenser. **DO NOT BEND PLATES OF OSCILLATOR SECTION.**

LAFAYETTE RADIO MFG. CO

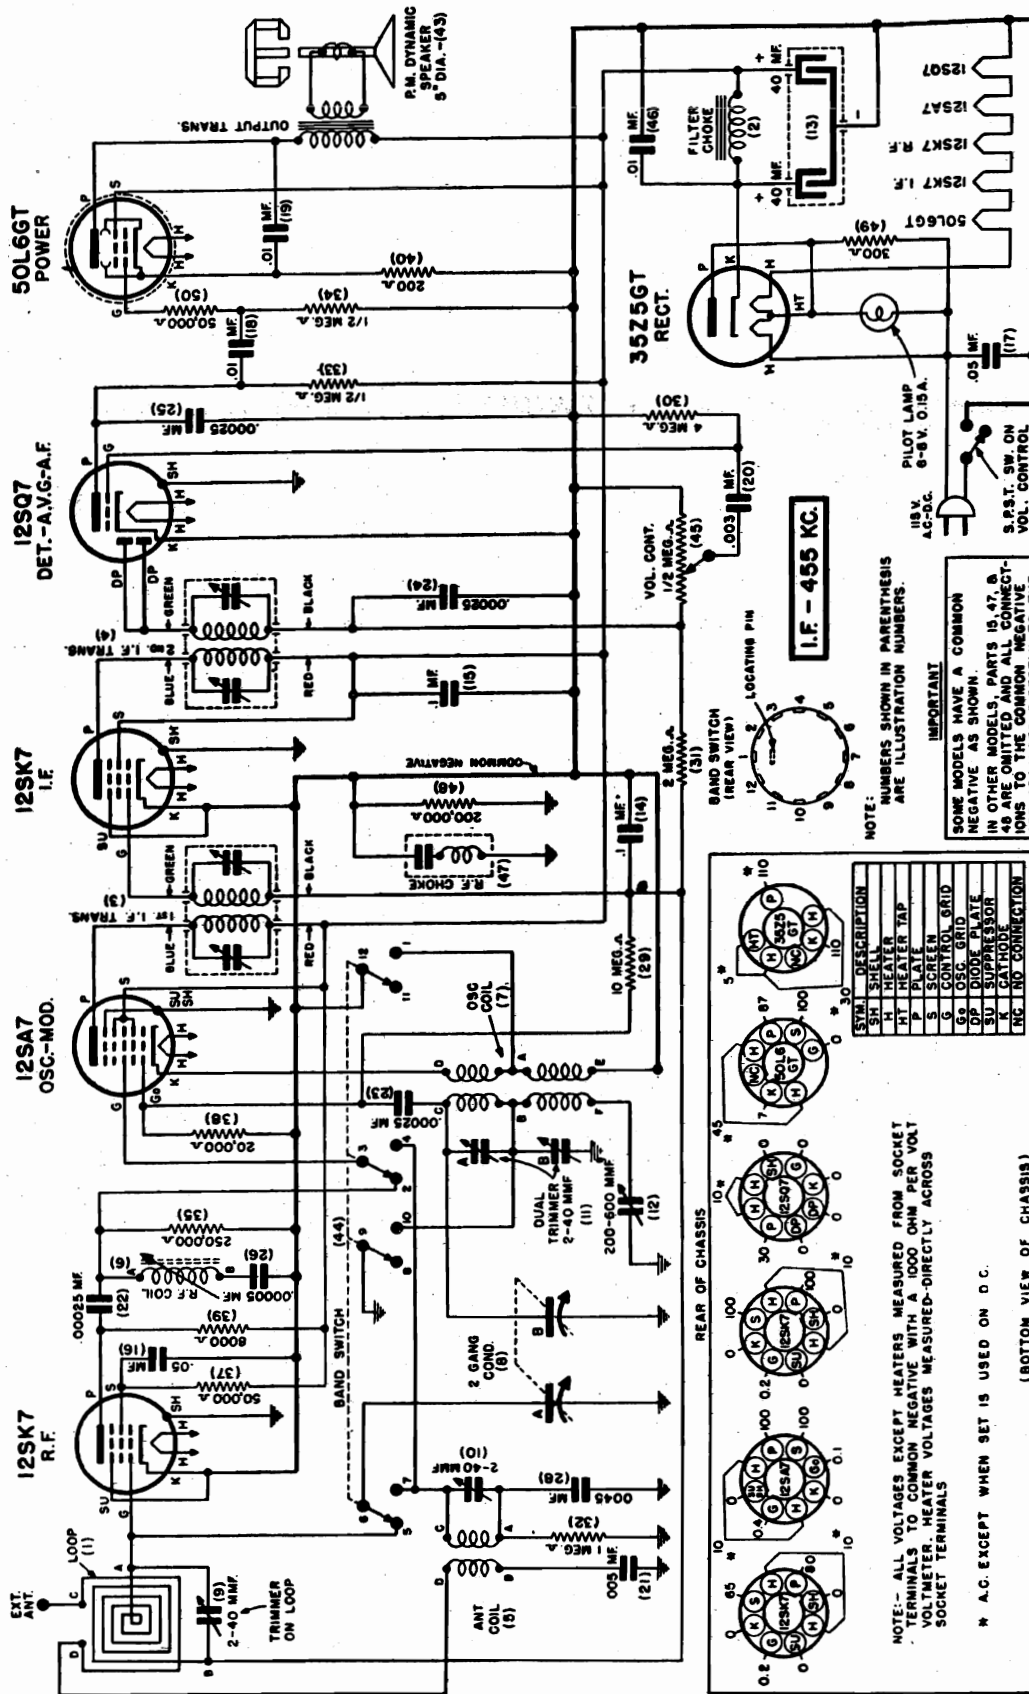

9 TUBE A.C. RECEIVER	
USED ON:-	
BAND 399-C31	4990
BY	D.L.

NOTE:-
 BAND SWITCH SHORT CIRCUITS COILS OF LOWER FREQUENCY THAN THE ONE IN USE.

BAND 1 - 234 KC. TO 7.2 MC. OR 13 METERS TO 41.75 METERS
 BAND 2 - 2.4 MC. TO 2.94 MC. OR 40.5 METERS TO 128.25 METERS
 BAND 3 - 1720 KC. TO 2475 KC. OR 175 METERS TO 550 METERS
 BAND 4 - 375 KC. TO 137.5 KC. OR 800 METERS TO 2200 METERS - USE ON MODEL #4990 ONLY

LAFAYETTE RADIO MFG. CO.

MODEL E-186

I.F. - 455 KC.

NOTE: NUMBERS SHOWN IN PARENTHESIS ARE ILLUSTRATION NUMBERS.

IMPORTANT
SOME MODELS HAVE A COMMON NEGATIVE AS SHOWN. IN OTHER MODELS, PARTS 15, 47, & 49 ARE OMITTED AND ALL CONNECTIONS TO THE COMMON NEGATIVE ARE GROUNDED DIRECTLY TO THE CHASSIS.

NOTE: ALL VOLTAGES EXCEPT HEATERS MEASURED FROM SOCKET TERMINALS TO COMMON NEGATIVE WITH A 1000 OHM PER VOLT VOLTMETER. HEATER VOLTAGES MEASURED DIRECTLY ACROSS SOCKET TERMINALS

* A.C. EXCEPT WHEN SET IS USED ON D.C.

LAFAYETTE RADIO MFG. CO.

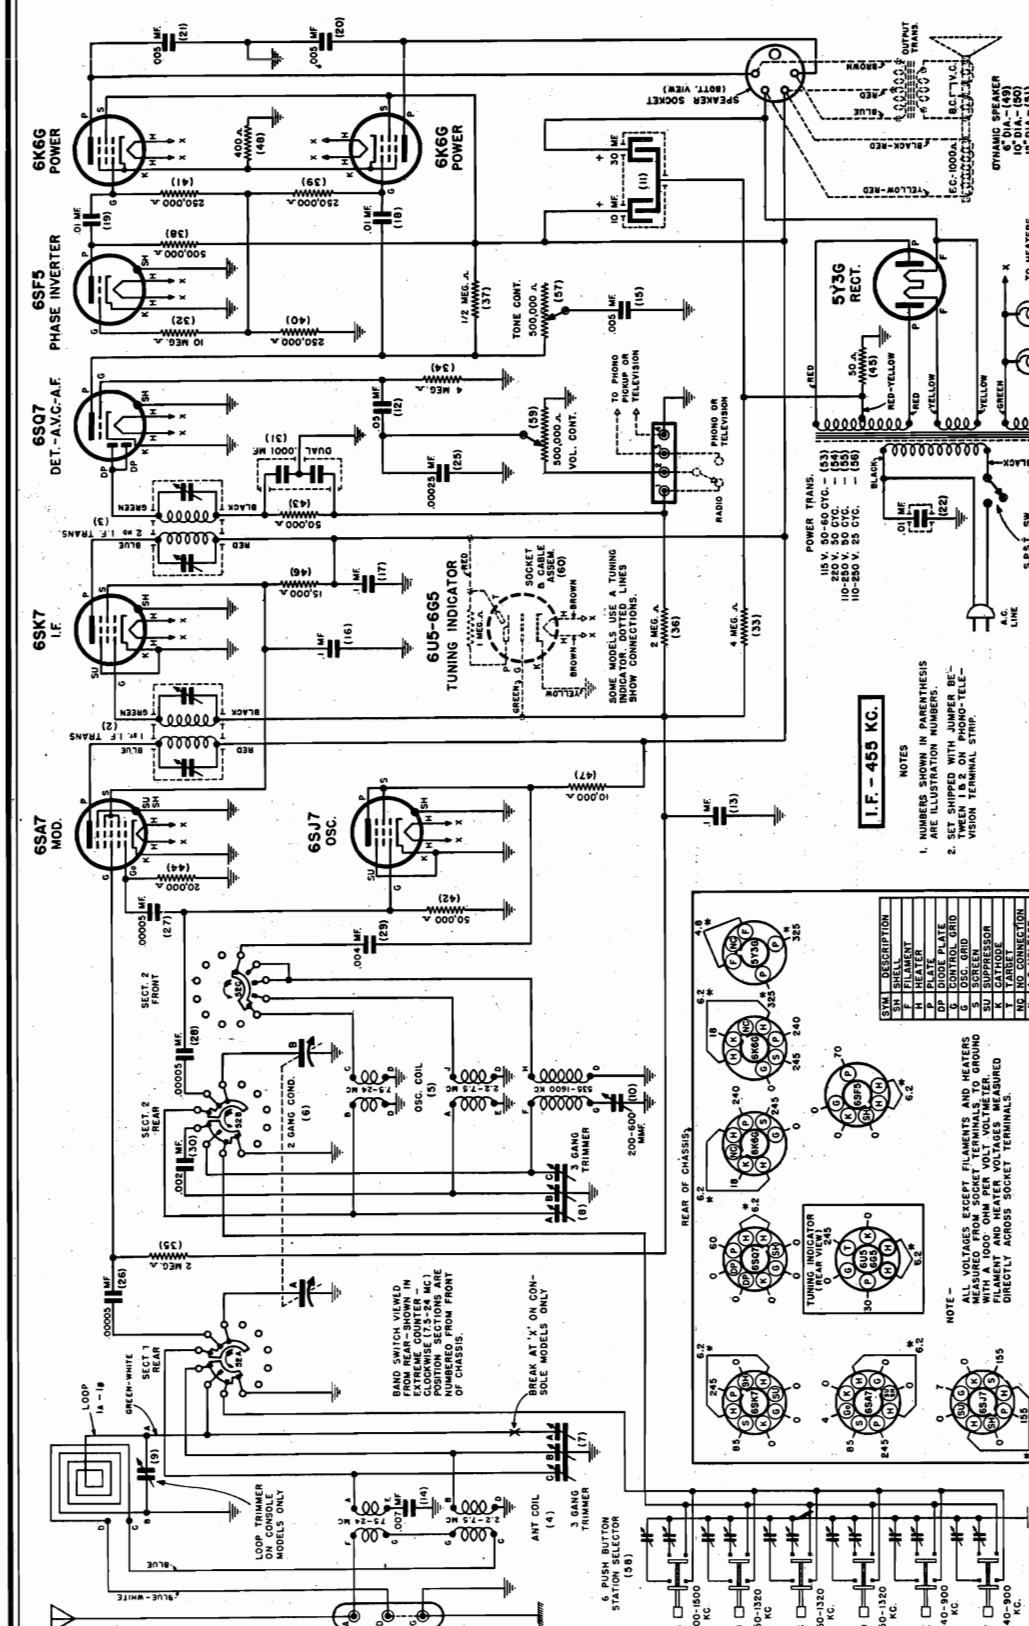

ALIGNMENT PROCEDURE

For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, (3) third. IMPORTANT: BEFORE ALIGNING, PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET.

When adjusting 1600 kilocycle oscillator trimmer 600 K.C. padder, 455 K.C. R.F. trimmer and 1400 kilocycle antenna trimmer, do not connect test oscillator to loop. Couple test oscillator to receiver loop by: (a) Make a loop consisting of five to ten turns of No. 20 to 30 size wire wound on a three inch form and attach across output of test oscillator. (b) Place test oscillator loop near set loop—BE SURE THAT NEITHER MOVES WHILE ALIGNING.

Place band switch for operation on:	Set receiver dial to:	Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
I. F. alignment use any band position.	Any point where no interfering signal is received	Exactly 455 K.C.	0.2 Mfd. condenser	High side to grid cap of 12SA7 tube. Low side to frame of condenser through .01 Mfd. condenser.	Adjust each of the second I.F. transformer trimmer for maximum output, then adjust each of the first I.F. transformer trimmers for maximum output.
1800 to 540 K.C. Band	1 Rotate gang condenser to Maximum Capacity	Exactly 455 K.C.	None	Use Small Loop to couple test oscillator to receiver loop. Low side to frame of condenser through .01 Mfd. condenser.	Adjust R.F. coil for minimum 455 K.C. signal.
	2 Exactly 1600 K.C.	Exactly 1600 K.C.	None	Use Small Loop to couple test oscillator to receiver loop. Low side to frame of condenser through .01 Mfd. condenser.	Adjust 1600 K. C. oscillator trimmer for maximum output
	3 Approx. 1400 K.C.	Approx. 1400 K.C.	None	Use Small Loop to couple test oscillator to receiver loop. Low side to frame of condenser through .01 Mfd. condenser.	While rocking gang condenser adjust 1400 K. C. loop trimmer for maximum output.
	4 Approx. 600 K.C.	Approx. 600 K.C.	None	Use Small Loop to couple test oscillator to receiver loop. Low side to frame of condenser through .01 Mfd. condenser.	While rocking gang condenser adjust 600 K. C. oscillator padder for maximum output.
5.7 to 18.3 M.C. Band	1 Exactly 18.3 M.C.	Exactly 18.3 M.C.	400 Ohm carbon resistor	High side to Blue Ant. Lead, Low side to frame of Mfd. condenser.	Adjust 18.3 M.C. oscillator trimmer for maximum output—be sure to use proper peak. If more than one peak is noticed, back off trimmer to minimum capacity, then screw down trimmer (add capacity) until the second peak—which is the proper one to use is tuned in.
	2 Approx. 15 M.C.	Approx. 15 M.C.	400 Ohm	High side to Blue Ant. Lead, Low side to frame of gang condenser.	While rocking gang condenser adjust 15 M. C. antenna trimmer for maximum output.

FRONT VIEW CHASSIS TRIMMER VIEW

Aligning Instructions

First refer to the "Iron Core Adjustment View" now turn the tuning knob until the drive bar comes within 1/64 to 1/32 from the stops. (A piece of blotting paper is about the right thickness and will serve as a gauge). The clearance of the bar must be the same at both stops. If far off you can raise one drive screw gently and equalize them. Minor adjustments may be made with the drive bar adjustments.

Next rotate each iron core until the fine score marks are even with the edge of the coil forms.

You are now ready to continue with the trimmer adjustments as shown on the alignment chart.

Should it ever be necessary to replace a broken or lost pushbutton you will notice they are made in two parts, a clear front and a brown body. To separate the two portions first take off the escutcheon. Push the button in—

IF PEAK 4.3 MC

ALIGNMENT PROCEDURE

Although it is most convenient to align this receiver with a frequency-modulated oscillator, a satisfactory job can also be done with an accurately-calibrated signal generator or oscillator covering a range in the vicinity of 4.3 megacycles. The object of alignment is to adjust the I.F. trimmers so that the I.F. system has a pass band from 4.2 to 4.4 megacycles, and then to adjust the discriminator transformer to cover exactly the same band. Proceed as follows:

1. Connect the "high" side of the generator output to the grid (G3) of the 6SA7 converter, and the "low" side of the generator to the ground of the chassis. The connection to the grid is most easily made by connecting to the stator or middle condenser in the tuning gang. If it is found that the generator does not furnish enough signal, it will be necessary to make this connection directly to the control grid of the 6SA7 tube and to disconnect the R.F. coil from this grid. This point is indicated at "D" on the schematic diagram.
2. Connect a 0-50 or 0-200 microammeter in series with the "ground" end of the 100,000 ohm resistor (44). This is point "M" on the diagram. Connect the positive terminal of the meter to ground. This will measure the grid current of the 6AC7 tube. A reading of 30 to 100 microamperes is all that should be expected at this point. If an Analyst or a D.C. electronic voltmeter is available, it can be connected directly across this 100,000 ohm resistor (62) without disconnecting the resistor. This measures the limiter grid bias voltage. A reading of 3 to 10 volts should be considered normal.
3. Set the generator at 4300 kc. and align the I.F. Trimmers for maximum grid current in the 6AC7 tube as indicated by the microammeter or voltmeter.
4. The I.F. stages are now aligned. Remove the microammeter and re-connect the 100,000 ohm resistor (44) as it was before.

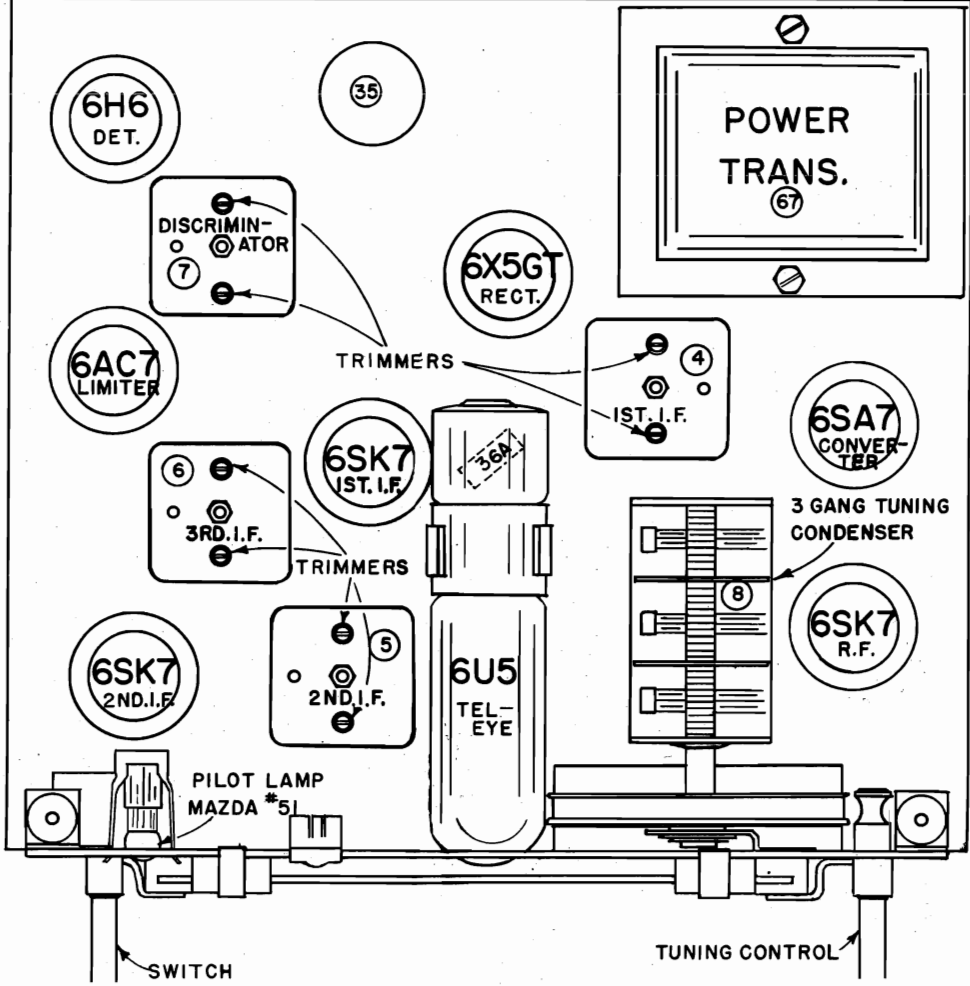

THE MAGNAVOX CO., INC.

5. The discriminator will be adjusted next. Connect the microammeter in parallel with the 40,000 ohm resistor (49). This is indicated as point "X" on the diagram. The positive side of the meter is connected to ground. Instead of this, a high impedance electronic voltmeter, such as an Analyst or similar device, can be connected across this resistor. This measures the detector output current or voltage.
6. Adjust the test generator to 4375 kc. Adjust both trimmers on the discriminator transformer (7) for a peak. Adjust the output of the generator so that the meter reads at least 60 microamperes or 2.4 volts. Readjust the oscillator to 4300 kc. Adjust the trimmer nearest the 6H6 tube until the current or voltage is zero. A non-metallic screwdriver is essential; this is an extremely important operation. Re-set the oscillator to 4375 kc. and note the meter reading.

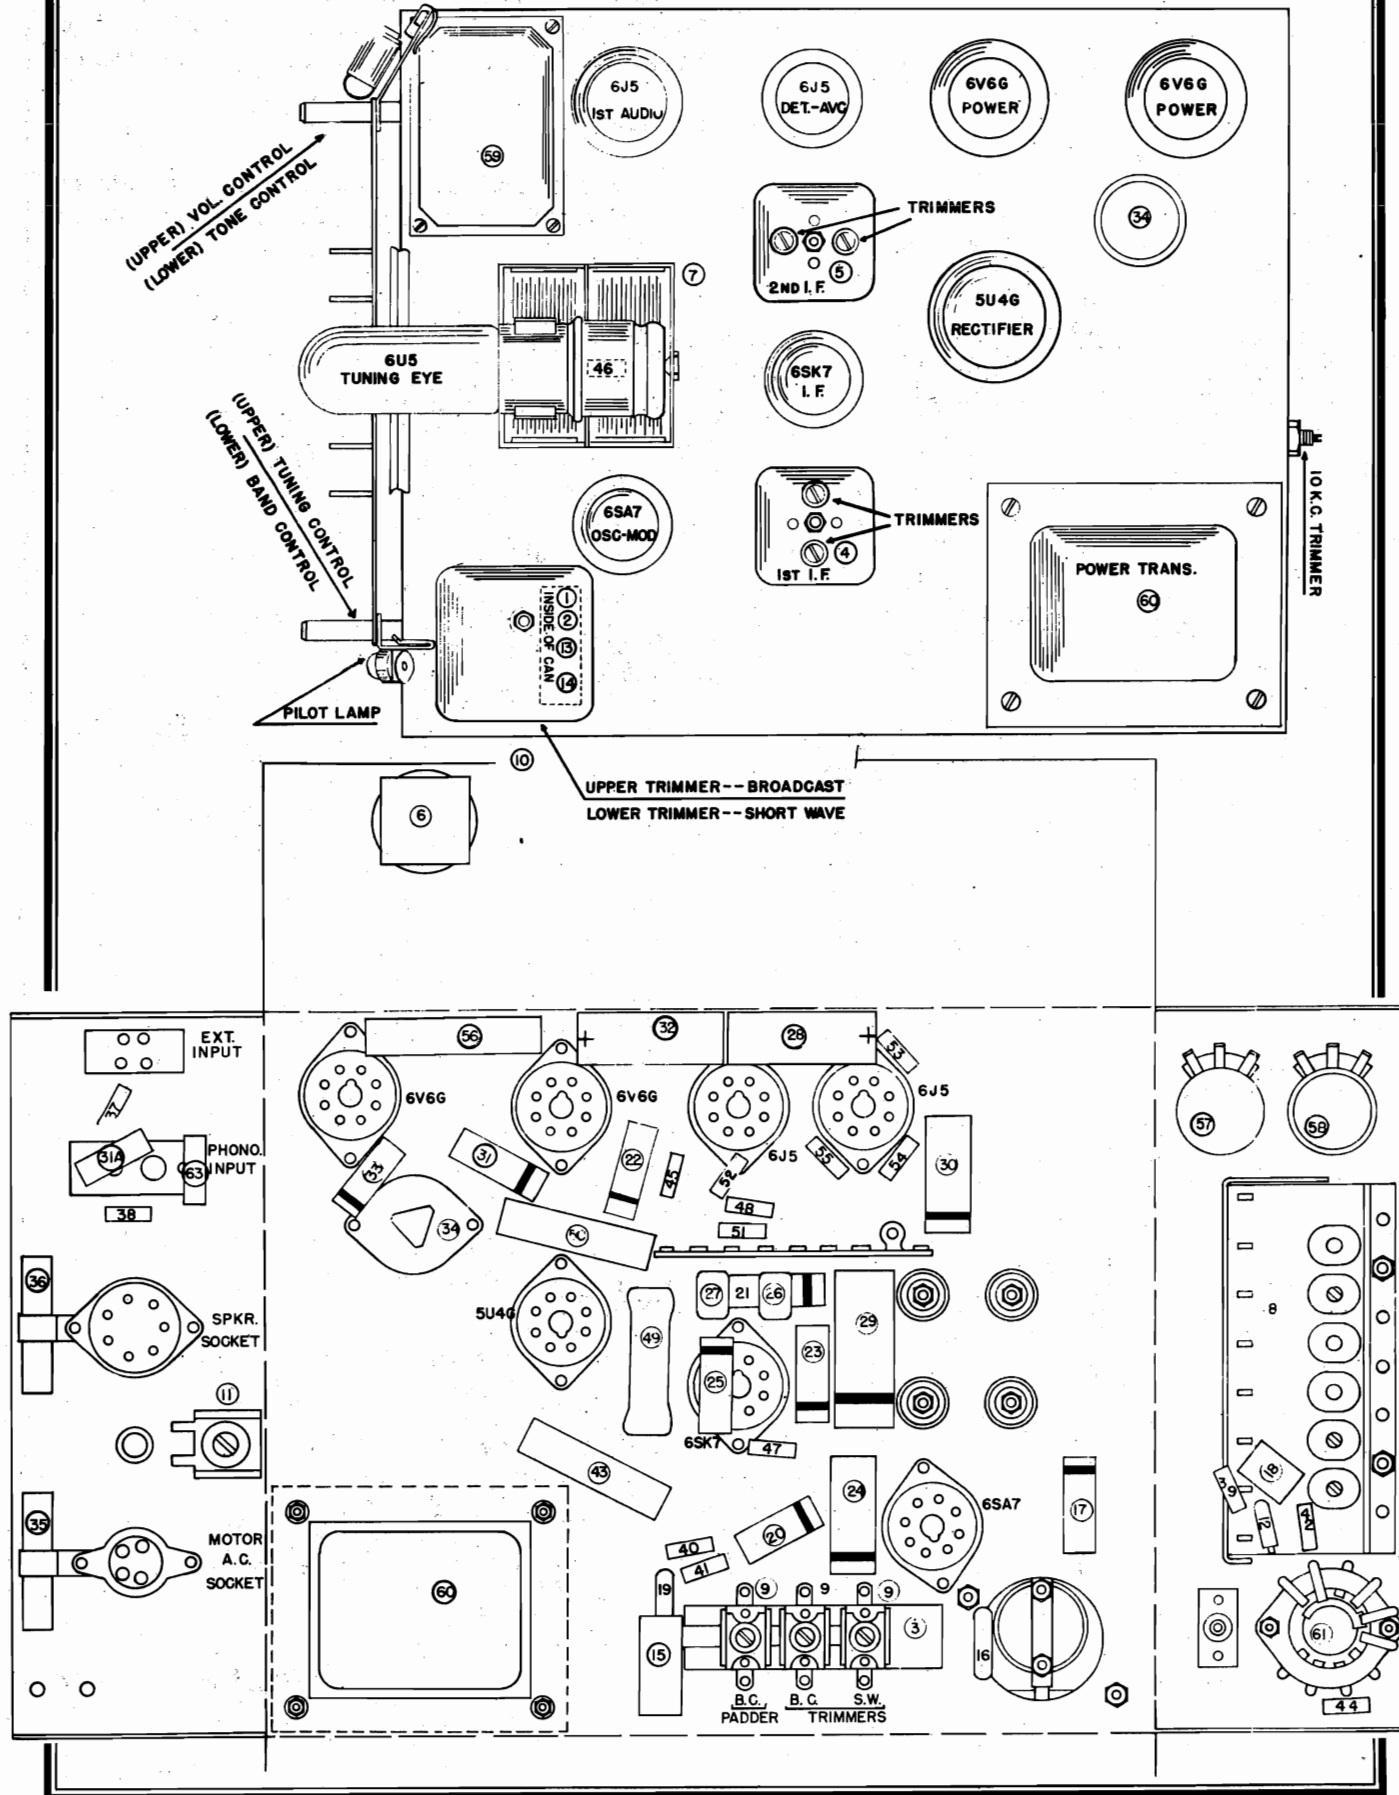

Now reverse the meter connections so that the negative terminal is connected to ground. Set the generator to 4225 kc. and the meter reading should be within 10% of being the same. If not, the tuning of the discriminator transformer was not done carefully enough and must be repeated. This completes the adjustment of the discriminator. Remove the meter from the circuit.
7. Re-connect the control grid of the 6SA7 to the mixer coil if this connection had been removed and disconnect the generator from this point.

THE MAGNAVOX CO., INC.

8. The antenna, mixer, and oscillator coils are now ready to be aligned. Check to see that the dial pointer is at the end of the dial calibration (41.7 mc.) when the tuning gang is fully meshed.
9. Prepare to measure the limiter grid current by again connecting the microammeter as described in paragraph 2.
10. If an extremely accurate signal generator is available, it may be used for setting the oscillator to the dial calibration. The generator is connected to the antenna post through a 70 ohm resistor. Otherwise it will be necessary to connect an antenna to the receiver and use a F.M. transmitter for the frequency standard, preferably one between 47 mc. and 50 mc.
11. Set the dial to the known frequency of the transmitter and adjust the oscillator air trimmer "r" until the signal produces a maximum reading on the microammeter. Then adjust the trimmers "u" and "v" on the antenna and R.F. coils for maximum reading. If too much signal is fed to the receiver, it will appear at several settings of the dial and confuse the adjusting. These trimmers should align rather loosely. If they are tightened so that the frequency of the R.F. circuit equals the oscillator frequency, spurious oscillations and responses are produced. The oscillator frequency is normally 4300 kc. lower than the signal frequency. When the above adjustments are completed and the 100,000 ohm resistor (44) is again grounded, the receiver has been aligned.

THE MAGNAVOX CO., INC.

THE MAGNAVOX CO., INC.

CR-172, 178 ALIGNING THE I.F. AT 455 KILOCYCLES

1. Connect the ground lead of the test oscillator to the chassis or radio ground lead. Connect the other lead of the test oscillator to the oscillator grid of the 6SA7 tube through a .00025 mfd. series condenser.
 2. Set the test oscillator to EXACTLY 455 kilocycles and turn the receiver volume to its maximum setting.
 3. Peak each of the second I.F. transformer trimmer condensers.
 4. Peak each of the first I.F. transformer trimmer condensers.
- To insure most accurate trimmer setting, repeat the above adjustment several times, always using the lowest possible test oscillator output consistent with readable output meter scale deflection.

CR-171 ALIGNING THE I.F. AT 455 KILOCYCLES

1. Connect the ground lead of the test oscillator to the chassis or radio ground lead. Connect the other lead of the test oscillator to the oscillator grid of the 6SA7 tube through a .00025 mfd series condenser.
 2. Set the test oscillator to EXACTLY 455 kilocycles and turn the receiver volume to its maximum setting.
 3. Peak each of the second I.F. transformer trimmer condensers.
 4. Peak each of the first I.F. transformer trimmer condensers.
- To insure most accurate trimmer setting, repeat the above adjustment several times, always using the lowest possible test oscillator output consistent with readable output meter scale deflection.

ALIGNING THE 541-1630 K.C. BAND

1. Remove the test oscillator lead from the grid of the 6SA7 tube and connect it to the receiver antenna lead (blue) through a .00025 mfd. series condenser.
 - Set the ANT-LOOP switch to the ANT position.
 - Check the tuning dial adjustment by turning the gang condenser until the plates are completely meshed, at which point the dial pointer must be exactly even with the last line at the low frequency end of the dial calibration.
 - Set the test oscillator frequency and receiver dial to EXACTLY 1400 kilocycles. Adjust the oscillator trimmer (on condenser gang) and the antenna trimmer (accessible through opening in top of chassis -- see layout diagram) to bring in the 1400 kilocycles test oscillator signal to maximum output.
 - Set the test oscillator frequency and receiver dial to EXACTLY 600 kilocycles. While rocking the gang condenser slightly to the right and to the left, adjust the 600 kc. oscillator padder (accessible through opening in top of chassis back of condenser gang) for maximum output.
- The loop trimmer adjustment must now be made to provide for maximum possible signal pickup with the loop. This adjustment must be made while the chassis and loop are in the cabinet, or with the chassis and loop in the same relative positions as when they are mounted in the cabinet.
- Connect the output of a signal generator that has been adjusted to 1400 kilocycles, to a loop of about five turns of wire, eight inches in diameter. Set the ANT-LOOP switch to the LOOP position.
- Tune the receiver to 1400 kilocycles and adjust the loop trimmer (accessible through an opening in the top of chassis -- see layout diagram) for maximum output as indicated on an output meter connected across the voice coil while holding the smaller loop approximately 18 inches from the set loop and in the same plane.

ALIGNING THE 539-1677 K.C. BAND

1. Remove the test oscillator lead from the grid lead of the 6SA7 tube and connect it to the receiver antenna lead (blue) through a .00025 mfd. series condenser.
 - Check the tuning dial adjustment by turning the gang condenser until the plates are completely meshed, at which point the dial pointer must be exactly even with the last line at the low frequency end of the dial calibration.
 - Adjust the band selector switch for operation of the 539-1677 kilocycle BROADCAST band.
 - Set the test oscillator frequency and receiver dial to EXACTLY 1400 kilocycles. Adjust the BROADCAST oscillator trimmer and the antenna trimmer to bring in the 1400 kilocycle test oscillator signal to maximum output.
 - Set the test oscillator and receiver frequency to 600 kilocycles. While rocking the gang condenser slightly to the right and to the left, adjust the 600 kilocycle oscillator padder for maximum output.
- Substitute a 400 ohm resistor for the .00025 mfd. condenser in series with the test oscillator output feeding the antenna lead.
2. Adjust the band selector switch to the 5.7-18.1 megacycle SHORT-WAVE band. Tune the receiver and test oscillator frequency to EXACTLY 15 megacycles, and adjust the SHORT WAVE oscillator trimmer and antenna trimmer for maximum output consistent with readable output meter scale deflection.
- While adjusting the oscillator trimmer, two peaks may be noticed, in which case, care must be taken so that the proper peak is used for aligning the receiver at 15 megacycles. Always screw in the trimmer to maximum capacity, then back off the trimmer until the second peak (if more than one is noticed) which is the correct one, is tuned in.

ALIGNING THE 5.7-18.1 M.C. BAND

1. Substitute a 400 ohm resistor for the .00025 mfd. condenser in series with the test oscillator output feeding the antenna lead.
2. Adjust the band selector switch to the 5.7-18.1 megacycle SHORT-WAVE band. Tune the receiver and test oscillator frequency to EXACTLY 15 megacycles, and adjust the SHORT WAVE oscillator trimmer and antenna trimmer for maximum output consistent with readable output meter scale deflection.

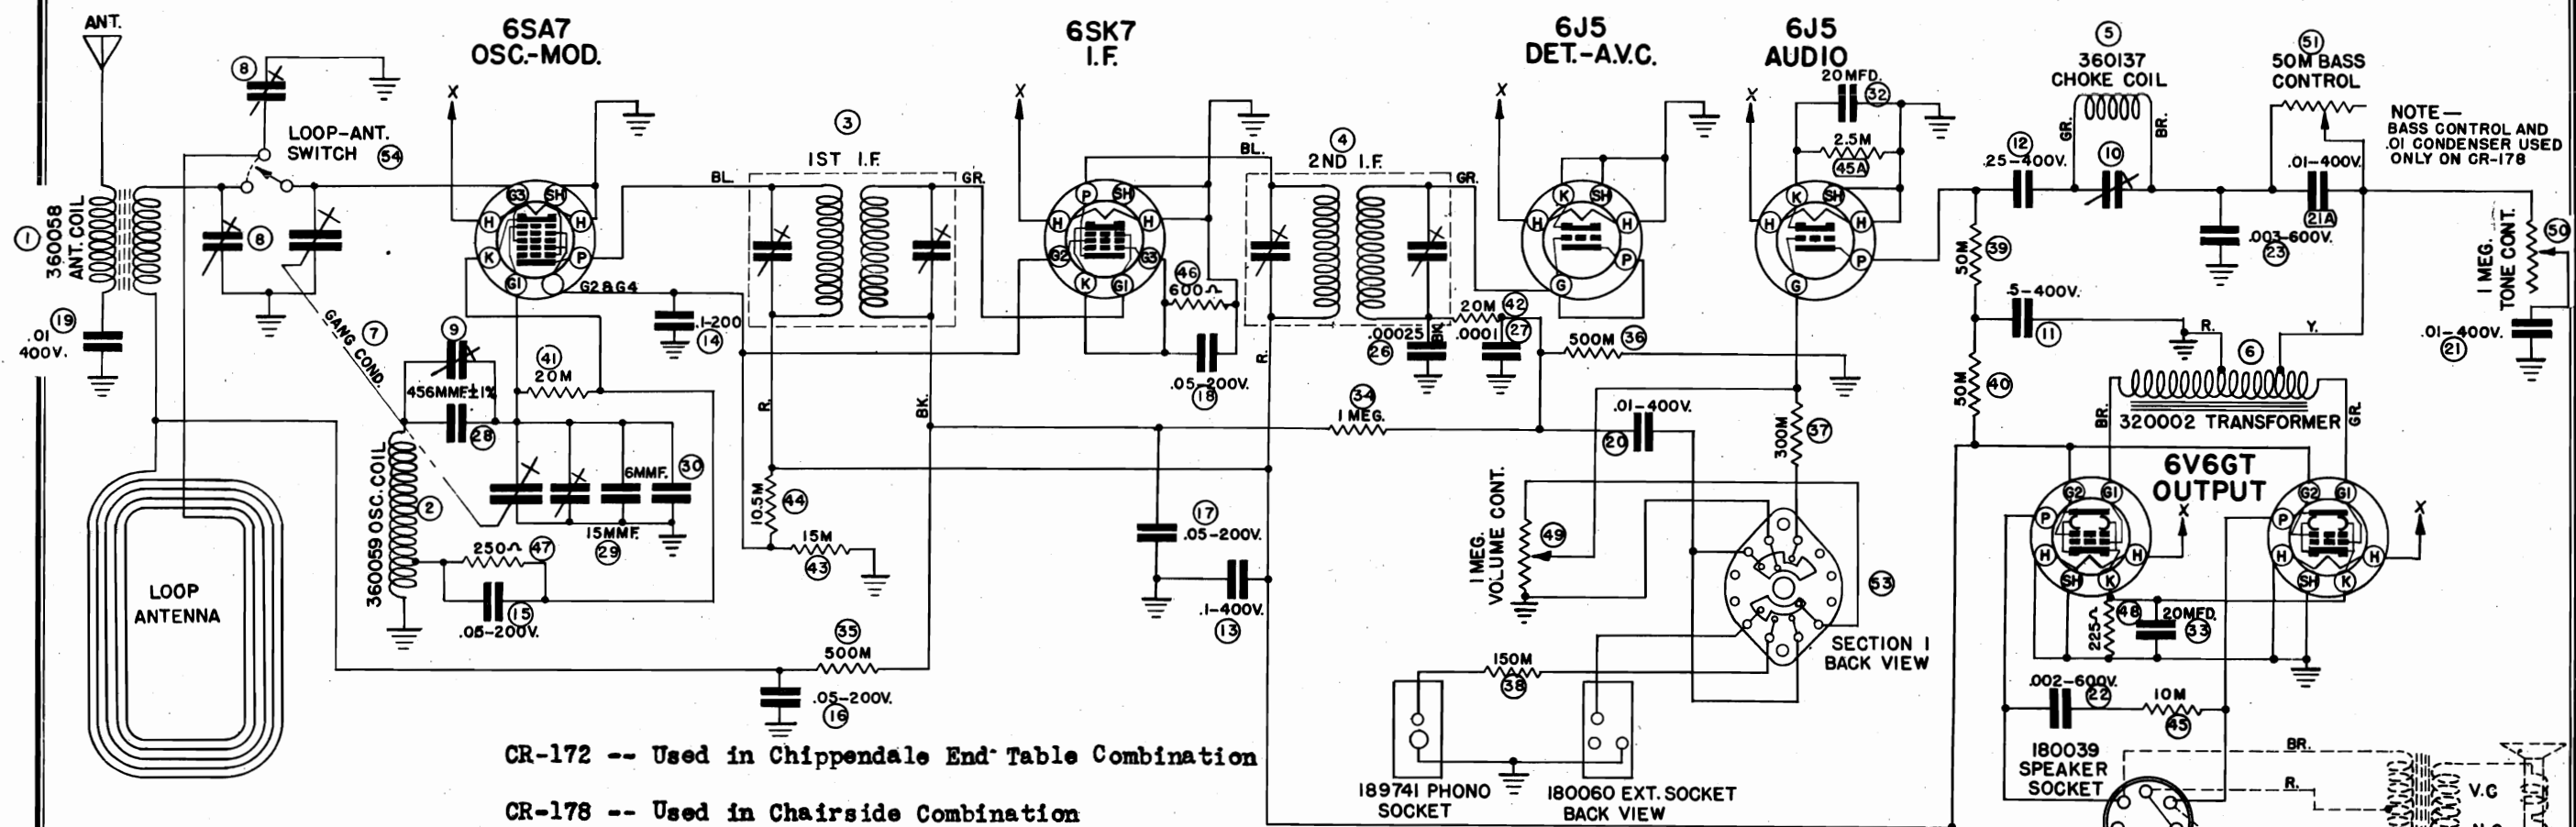

10 K.C. FILTER ADJUSTMENT

With the treble control set for maximum treble response, tune the receiver to a point between two stations of about the same signal strength on adjacent channels. If a 10,000 cycle heterodyne is heard as the beat note between the two carriers, it may be eliminated by returning the 10 KC output filter by means of the 10 KC trimmer condenser at the top center of the chassis.

10 K.C. FILTER ADJUSTMENT

With the tone control set for maximum treble response, tune the receiver to a point between two stations of about the same signal strength on adjacent channels. If a 10,000 cycle heterodyne is heard as the beat note between the two carriers, it may be eliminated by returning the 10 KC output filter by means of the 10 KC trimmer condenser at the rear center of the chassis.

Models 152, 154, 155, 161, 174, 174C.

10 KC. FILTER ADJUSTMENT

With the tone control set for maximum treble response and the Band Expander set in the High-Fidelity position (accomplished by rotating the treble control to the right as far as possible), tune the receiver to a point between two stations of about the same signal strength on adjacent channels. If a 10,000 cycle heterodyne is heard as the best note between the two carriers, it may be eliminated by returning the 10 KC output filter by means of the 10 KC trimmer condenser located on the top of the chassis between the two 6J5 tubes. In the absence of such a signal source in the daytime, an ACCURATE audio oscillator may be used to feed 10 KC into the phonograph input socket.

ALIGNING THE 540-1710 KC. BAND

1. Remove the test oscillator lead from the grid of the 6SA7 tube and connect it to the receiver antenna lead (blue) through a .00025 mfd. series condenser.
2. Check the tuning dial adjustment by turning the gang condenser until the plates are completely meshed, at which point the dial pointer must be exactly even with the last line at the low frequency end of the dial calibration.
3. Adjust the band selector switch for radio operation on the 540-1710 K. C. (broadcast) band.
4. Set the test oscillator and receiver frequency to 600 kilocycles. While rocking the gang condenser slightly to the right and to the left, adjust the 600 kilocycle oscillator padder for maximum output.
5. Loosen the adjustment screw on the preselector trimmer (indicated on the layout diagram) as far as possible.
6. Set the test oscillator frequency and receiver dial to EXACTLY 1400 kilocycles. Adjust the BROADCAST oscillator trimmer and the antenna trimmer to bring in the 1400 kilocycle test oscillator signal to maximum output.
7. Now adjust the preselector trimmer for maximum deflection on the output meter, after which the broadcast antenna trimmer should be returned for maximum output.

ALIGNING THE 57-18.3 MC. BAND

1. Substitute a 400 ohm resistor for the .00025 mfd. condenser in series with the test oscillator output feeding the antenna lead.
2. Adjust the band selector switch to the 5.7 - 18.3 megacycle (short-wave) band, tune the receiver and test oscillator frequency to EXACTLY 15 megacycles, and adjust the SHORT WAVE oscillator trimmer and antenna trimmer for maximum output as indicated on the output meter.

NOTE A

While adjusting the oscillator trimmer, two peaks may be noticed, in which case, care must be taken so that the proper peak is used for aligning the receiver at 15 megacycles. Always screw in the trimmer to maximum capacity, then back off the trimmer until the second peak (if more than one is noticed) which is the correct one, is tuned in.

NOTE: To assure most accurate trimmer setting, repeat all of the above adjustments several times, always using the lowest possible test oscillator output consistent with readable output meter scale deflection.

10 KC. FILTER ADJUSTMENT

Models 156, 165, 176, 177.
With the tone control set for maximum treble response, tune the receiver to a point between two stations of about the same signal strength on adjacent channels. If a 10,000 cycle heterodyne is heard as the best note between the two carriers, it may be eliminated by returning the 10 KC output filter by means of the 10 KC trimmer condenser at the top of the chassis, adjacent the spare fuse.

ALIGNING THE I.F. AT 455 KC.

1. Connect the ground lead of the test oscillator to the chassis or set ground lead (black). Connect the other lead of the test oscillator to the #5 grid terminal on the 6SA7 tube socket, through a .00025 mfd. series condenser.

2. Set the test oscillator to EXACTLY 455 kilocycles and turn the receiver volume to its maximum setting.
3. Peak both of the second I.F. transformer trimmers.
4. Peak both of the first I.F. transformer trimmers.

To assure most accurate trimmer setting, repeat the above adjustment several times, always using the lowest possible test oscillator output consistent with readable output meter scale deflection.

ALIGNING THE 535-1720 KILOCYCLE BAND

1. Check the tuning dial adjustment by turning the gang condenser until the condenser plates are completely meshed, at which point the dial pointer must coincide with the last line at the low-frequency end of the dial scale. If the pointer does not have this setting, move it to the correct position, holding the condensers in complete mesh. This is accomplished by loosening the two set-screws in the hub of the large pulley on the condenser shaft.

2. Remove the test oscillator lead from the grid on the 6SA7 tube and connect it to the receiver antenna lead (blue) through a .00025 mfd. series condenser.

3. Set the band selector switch for operation on the broadcast band.

4. Set the test oscillator frequency and receiver dial to EXACTLY 1400 kilocycles. Adjust the 1400 kilocycle oscillator trimmer, the R.F. trimmer and the antenna trimmer to bring in the test oscillator signal at maximum output as indicated on the output meter.

5. Set the test oscillator and receiver frequency to 600 kilocycles. While rocking the gang condenser slightly to the right and to the left, adjust the 600 kilocycle oscillator padder for maximum output. If this padder needs much adjusting, then finish up by repeating operation (4) above.

ALIGNING THE 1667-5680 KILOCYCLE BAND

1. Replace the .00025 mfd. test oscillator antenna lead series condenser with a 400 ohm resistor.

2. Adjust the band selector switch for operation on the Police band.

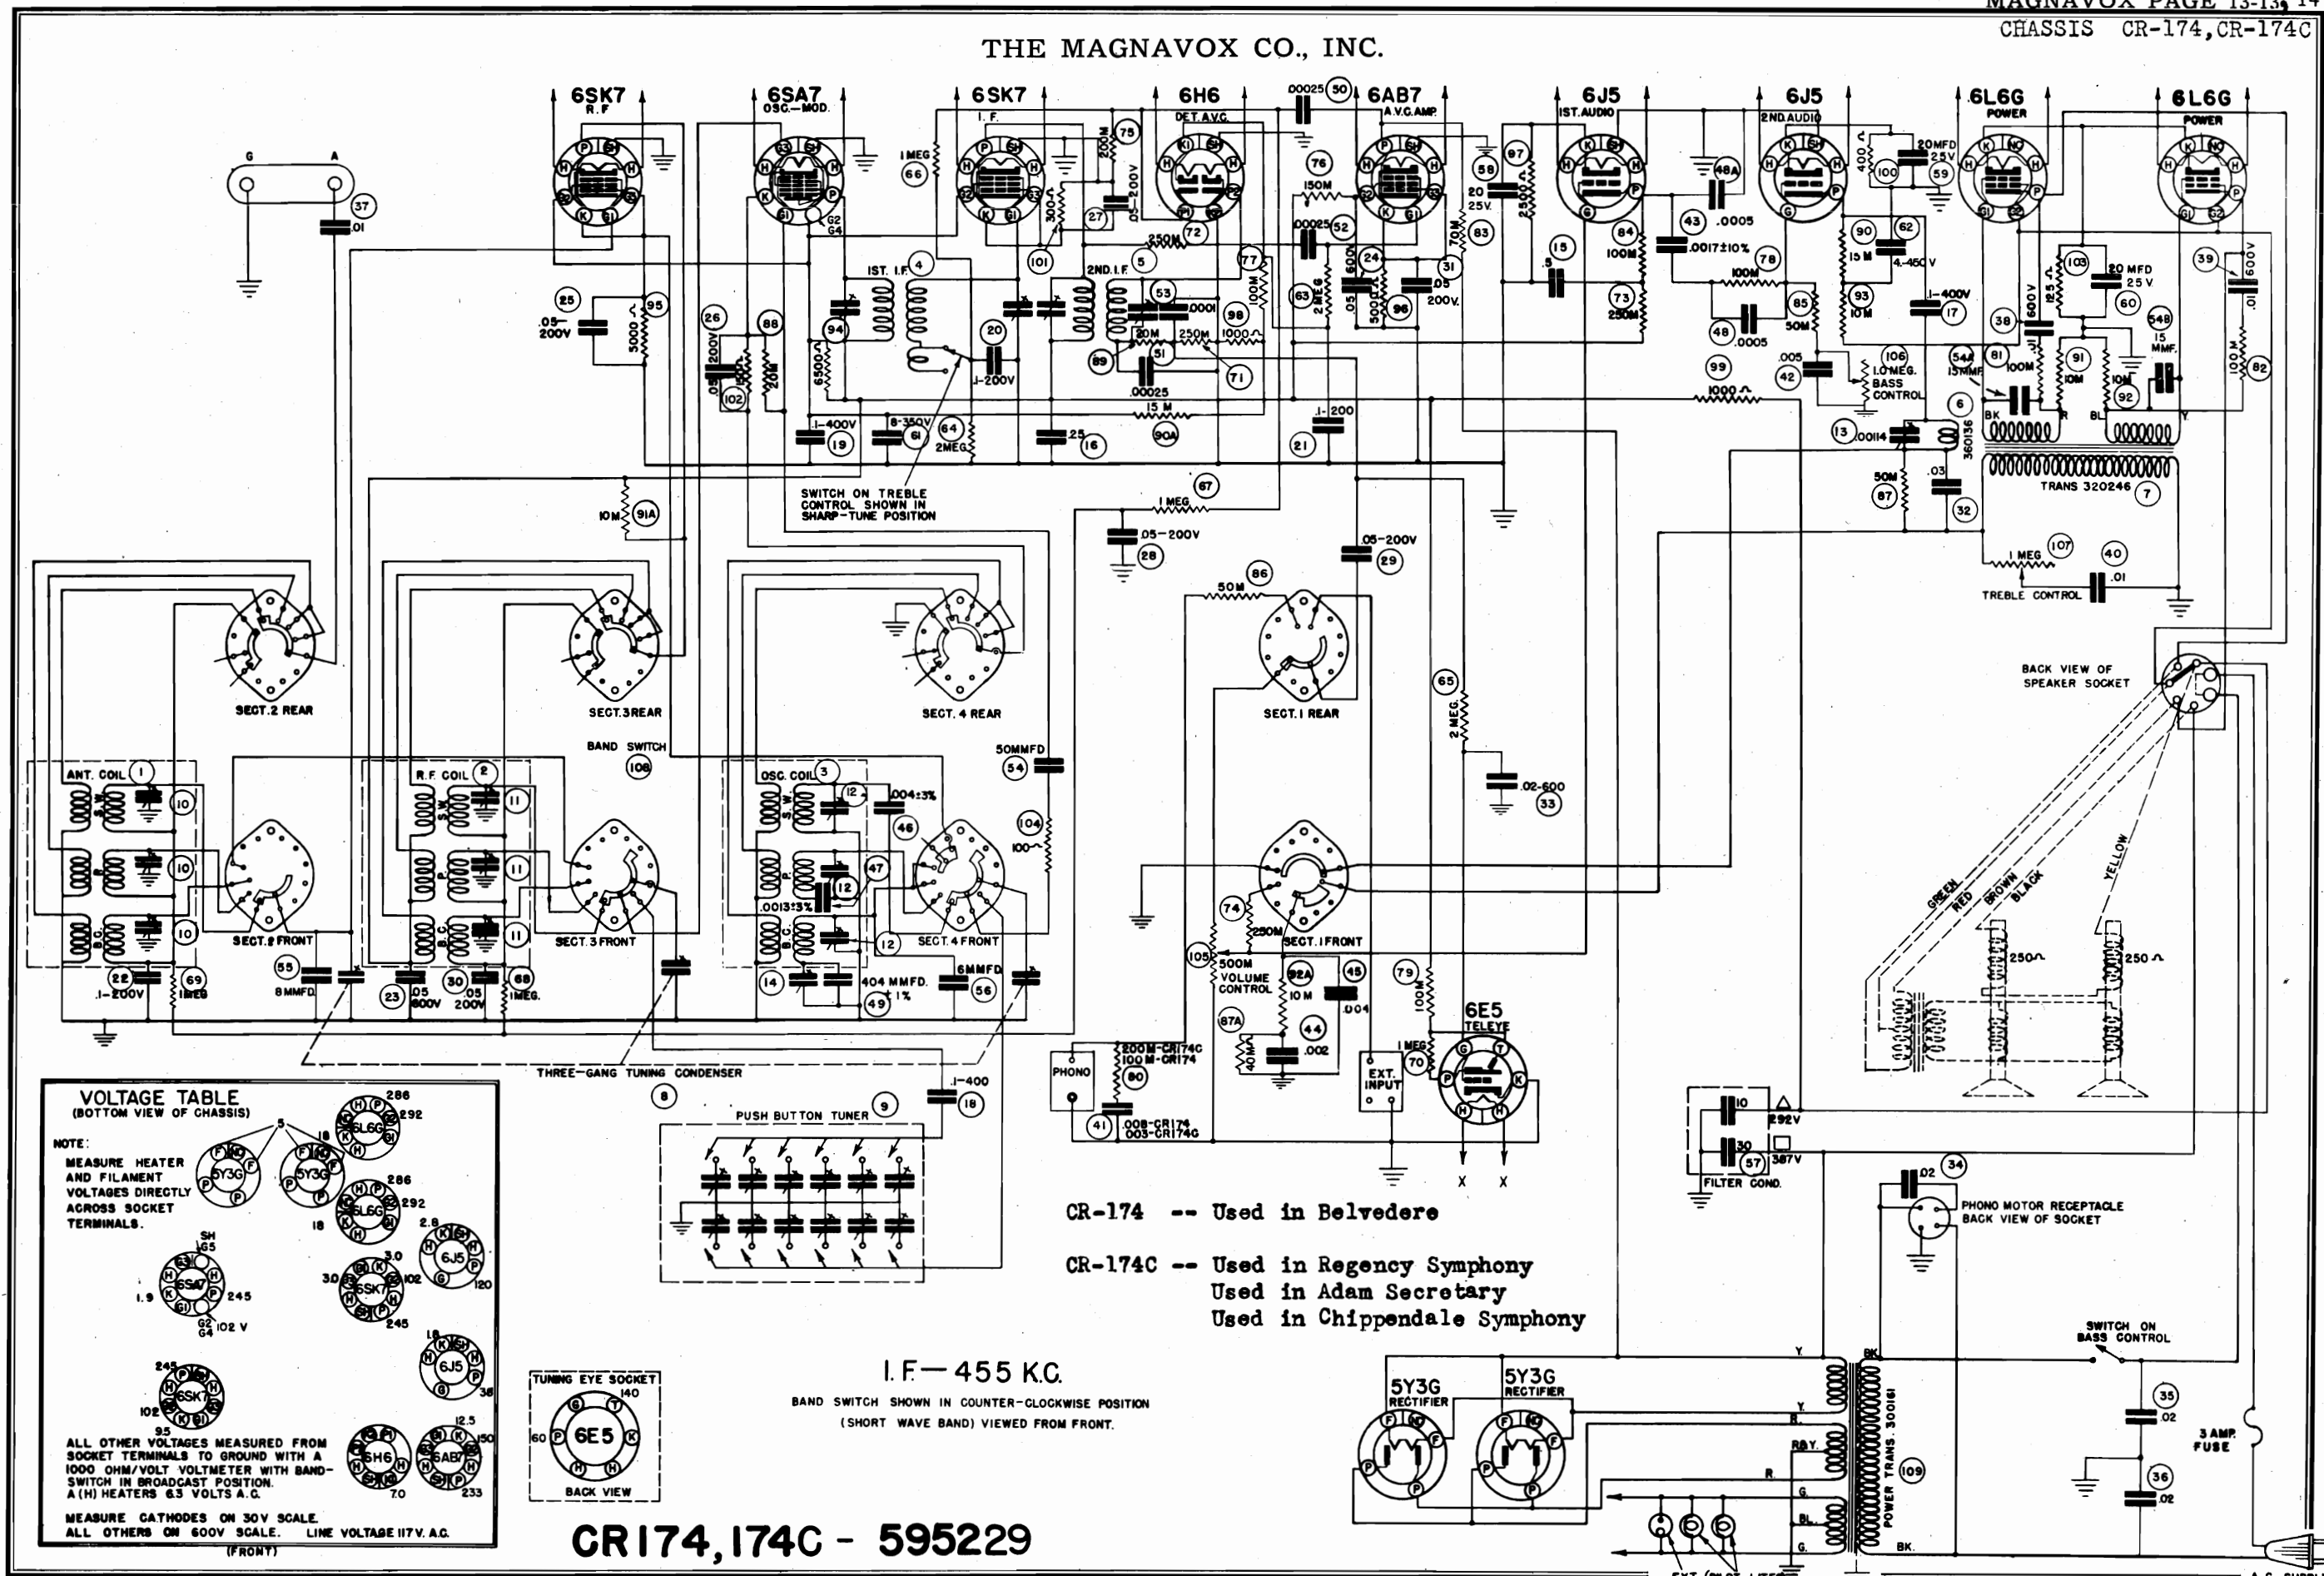

3. Set the radio and test oscillator frequency to EXACTLY 5000 kilocycles. Now adjust the 5000 kilocycle oscillator trimmer, the R.F. trimmer and the antenna trimmer to bring in the test oscillator signal to maximum output as indicated on the output meter.

ALIGNING THE 5.6-18.4 MEGACYCLE BAND

1. With the 400 ohm resistor in series with the test oscillator lead to the antenna lead of the radio receiver, set the band selector switch to the Short Wave band.

2. Set the radio and test oscillator frequency to EXACTLY 15 megacycles and adjust the 15 megacycle oscillator trimmer, the R.F. trimmer and the antenna trimmer to bring the test oscillator signal in to maximum output as indicated on the output meter. SEE NOTE A (FOR ALL MODELS)

TUBE LAYOUT MODEL TR321-A TR331-A

This receiver is equipped with a built-in loop antenna and, under normal conditions, should not require an external antenna. Since reception of loops is directional, reception can be improved by orienting the set for best reception of preferred stations. In very difficult locations, an external antenna should be used. This should be connected to the clip on the back of the receiver. No ground should be used on this set.

Model TR321-A operates on 105-125 volts 60 cycles AC only.

Model TR331-A operates on 105-125 volts 50 cycles AC only.

This is a seven tube combination superheterodyne radio receiver, home recorder, phonograph, and public address amplifier.

The tuning range is from 540 to 1720 kilocycles. This includes the standard broadcast band and police calls in 1600 to 1720 kilocycles range.

MIDWEST RADIO CORP.

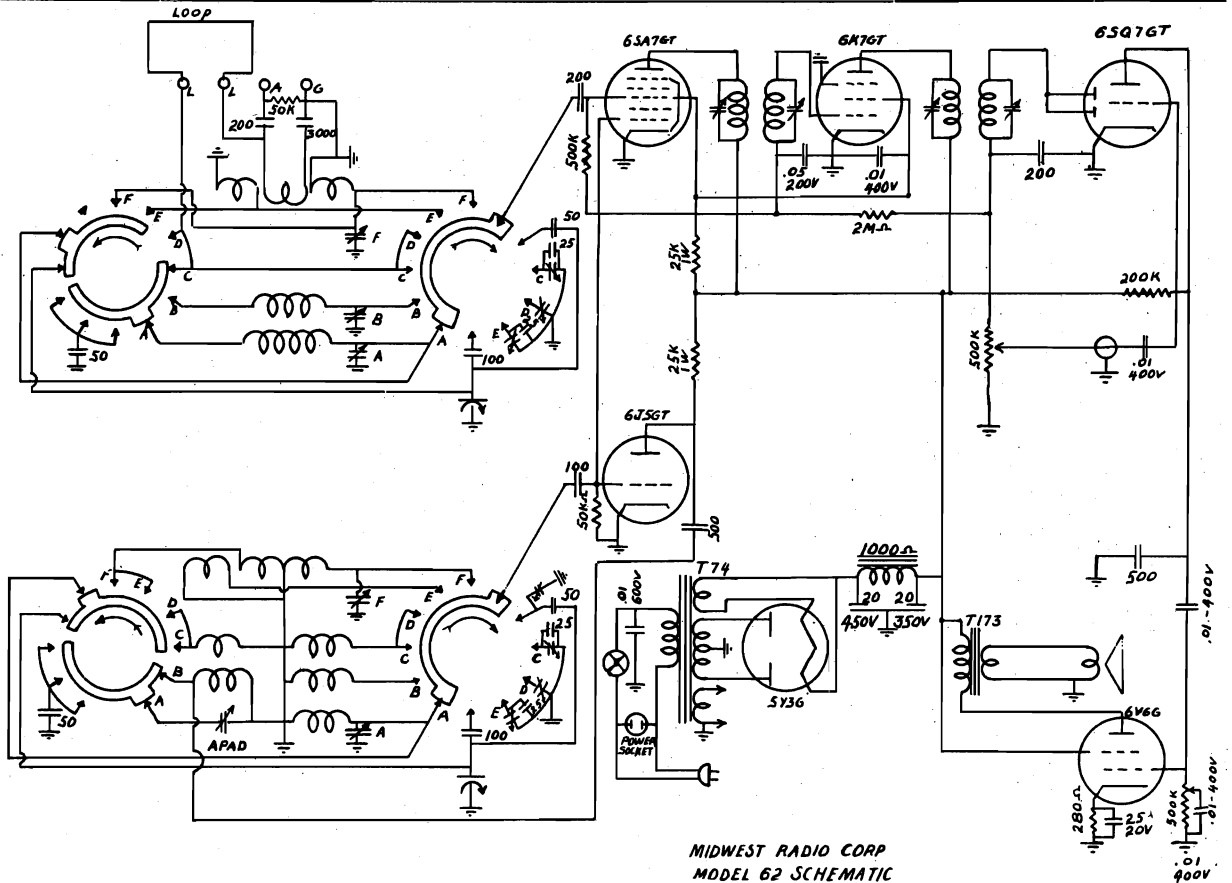

SETTING PUSH BUTTONS

1. Expose locking screw by removing push button.
 2. Loosen locking screw about one full turn.
 3. With locking screw loose, and button depressed, tune in desired station accurately.
 4. Tighten screw and replace moulded cap.
- DO NOT LOOSEN screw more than 4 turns. Screw may come out and may be hard to replace.

TUBE AND TRIMMER CHART. 'A' BAND PAD AVAILABLE THRU HOLE IN REAR OF CHASSIS NEAR ANT. STRIP IF FREQUENCY 455 KC

BANDS

This receiver has six separate and distinct wave bands. It is designed so that you may easily receive all of the foreign and domestic stations now operating in the radio spectrum. Bands are lettered "A B C D E and F." The "A" band is the usual broadcast band and on it you will receive your favorite U.S. broadcast stations. The tuning range of the other five bands is so designed that you may tune in your favorite short wave stations during the day or night time. For example: In the early morning hours you will find most of the short wave stations on the "E" or "F" bands. As daylight increases you will find that these stations will disappear and reappear again on the "C" and "D" bands. At night you will find that these stations have again changed and will appear on the "B" and "C" bands.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
 - Connect radio chassis to ground post of signal generator with a short heavy lead.
 - Connect dummy antenna in series with generator output lead.
 - Connect output meter across primary of output transformer.
 - Allow chassis and signal generator to "heat up" for several minutes.
- The following equipment is required for aligning:
- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
 - Output indicating meter.
 - Non-metallic screwdriver.
 - Dummy antennas—1 Mf., 200 Mmf., 400 Ohms.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	455 Kc.	.1 MFD.	Grid of 12SK7 I. F. Tube	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Chassis View)	Output I. F.	Adjust to maximum output
	455 Kc.	.1 MFD.	Grid of 12SA7	Broadcast (Extreme Left Rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Chassis View)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND	21 Mc.	400 ohms	Antenna lead	Short Wave (Extreme Right Rotation)	Set Dial at 21 MC	Trimmer (C6) (See Trimmer View)	Short wave oscillator	See Note "A" Adjust to maximum output
	21 Mc.	400 ohms	Antenna lead	Short Wave (Extreme Right Rotation)	Set Dial at 21 MC	Trimmer (C3) (See Trimmer View)	Short wave antenna	Adjust to maximum output
MEDIUM WAVE BAND	6 Mc.	400 ohms	Antenna lead	Medium Wave	Set Dial at 6 MC	Trimmers (C7 C4) (See Trimmer View)	Medium wave oscillator and antenna	Adjust to maximum output
	2.3 Mc.	400 ohms	Antenna lead	Medium Wave	Set Dial at 2.3 MC	Trimmer (C8) (See Chassis View)	Medium wave osc. series pad	Adjust to maximum rock dial. (See note "B")
BROADCAST BAND	1730 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme Left Rotation)	Rotor full open (Plates out of mesh)	Trimmer (C25) (See Trimmer View)	Broadcast oscillator	Adjust to maximum output
	1500 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 1500 Kc.	Trimmer (C5) (See Trimmer View)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 600 Kc.	Trimmer (C9) (See Chassis View)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "B")

NOTE "A"—It is extremely necessary when making this adjustment that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental.

NOTE "B"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

MONTGOMERY-WARD & CO.

MODEL O4BR-615A

INTERMEDIATE FREQUENCY 455 K.C.

JUNE 1941

OPERATING THE PHONOGRAPH

Turn radio on. Turn recording switch to Playback position.

Put your record on turntable and start motor. Place playback arm on record and control tone and volume with the radio volume and tone control knobs.

RECORDING RADIO PROGRAMS

Turn the radio on and tune in the program you wish to record. Put recording switch in "Record-Radio" position. The volume will drop. Start motor and then gently lower cutting needle onto blank record, about 1/4" from outer edge.

RECORDING VOICE

Turn the radio volume control nearly full on. Recording switch should be in Record "Mike" position. Start motor, and set cutting needle gently on start of record. Turn mike switch on and talk.

NOTE: The cutting arm must be raised about three inches to move it freely across the record.

- The following equipment is required for aligning:
- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
 - Output indicating meter.
 - Non-metallic screwdriver.
 - Dummy antennas—1 mf., 200 mmf., 400 ohms.

- Volume control—Maximum all adjustments.
- Connect radio to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	455 Kc.	.1 MFD.	Grid of 6S7	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Top View)	Output	Adjust to maximum output
	455 Kc.	.1 MFD.	Grid of 6SA7 Mixer	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Top View)	Input	Adjust to maximum output
SHORT WAVE BAND (See Note A)	17 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 17 Mc.	Trimmer C5	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 17 Mc.	Trimmer C2	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 6 Mc.	Trimmer C8	Short Wave oscillator series pad	Adjust to maximum output (See note "C")
BROAD-CAST BAND (See Note A)	1600 Kc.	200 mmf.	Grid of 6SA7	Broadcast	Rotor full open (Plates out of mesh)	Trimmer C6	Broadcast oscillator	Adjust to maximum output
	535 Kc.	200 mmf.	Grid of 6SA7	Broadcast	Rotor full closed	Trimmer C7	Broadcast oscillator series pad	Adjust to maximum output
LOOP ALIGN-MENT (See Note B)	1400 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 1400 Kc.	Trimmer C1	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 600 Kc.	Trimmer C7 (See Top View)	Broadcast osc. Series Pad	Adjust to maximum output

NOTE "A"—The signal generator is connected to the "ANT." and "GND." leads when aligning the Short Wave Band and to the grid of the 6SA7 tube and ground terminal when setting the Broadcast Band oscillator end frequencies, (1600 and 535 K. C.).

The loop antenna should be connected to the radio when making these adjustments.

NOTE "B"—Loop alignment is made with the chassis mounted in the cabinet and the loop antenna connected. The signal generator is connected to the "ANT." and "GND."

- Power Consumption
- Radio Only - - - - - 70 Watts
 - Motor Only - - - - - 40 Watts
 - Power Output - - - - - 2.1 Watts Undistorted
 - Sensitivity for 500 Milliwatt Output: 15 Microvolts Average
 - Selectivity - 51 KC Broad at 1000 Times Signal at 1000 KC
 - Tuning Frequency Range Broadcast Band - 535 to 1600 KC
 - Shortwave Band - 5.46 to 18.3 MC
 - Intermediate Frequency - - - - - 455 KC
 - Speaker - - - - - 6 in. Electro Dynamic

NOTE "A"—The signal generator is connected to the "ANT." and "GND." leads when aligning the Short Wave Band and to the grid of the 6SA7 tube and ground terminal when setting the Broadcast Band oscillator end frequencies, (1600 and 535 K. C.).

The loop antenna should be connected to the radio when making these adjustments.

NOTE "B"—Loop alignment is made with the chassis mounted in the cabinet and the loop antenna connected. The signal generator is connected to the "ANT." and "GND."

Drive Cord Replacement

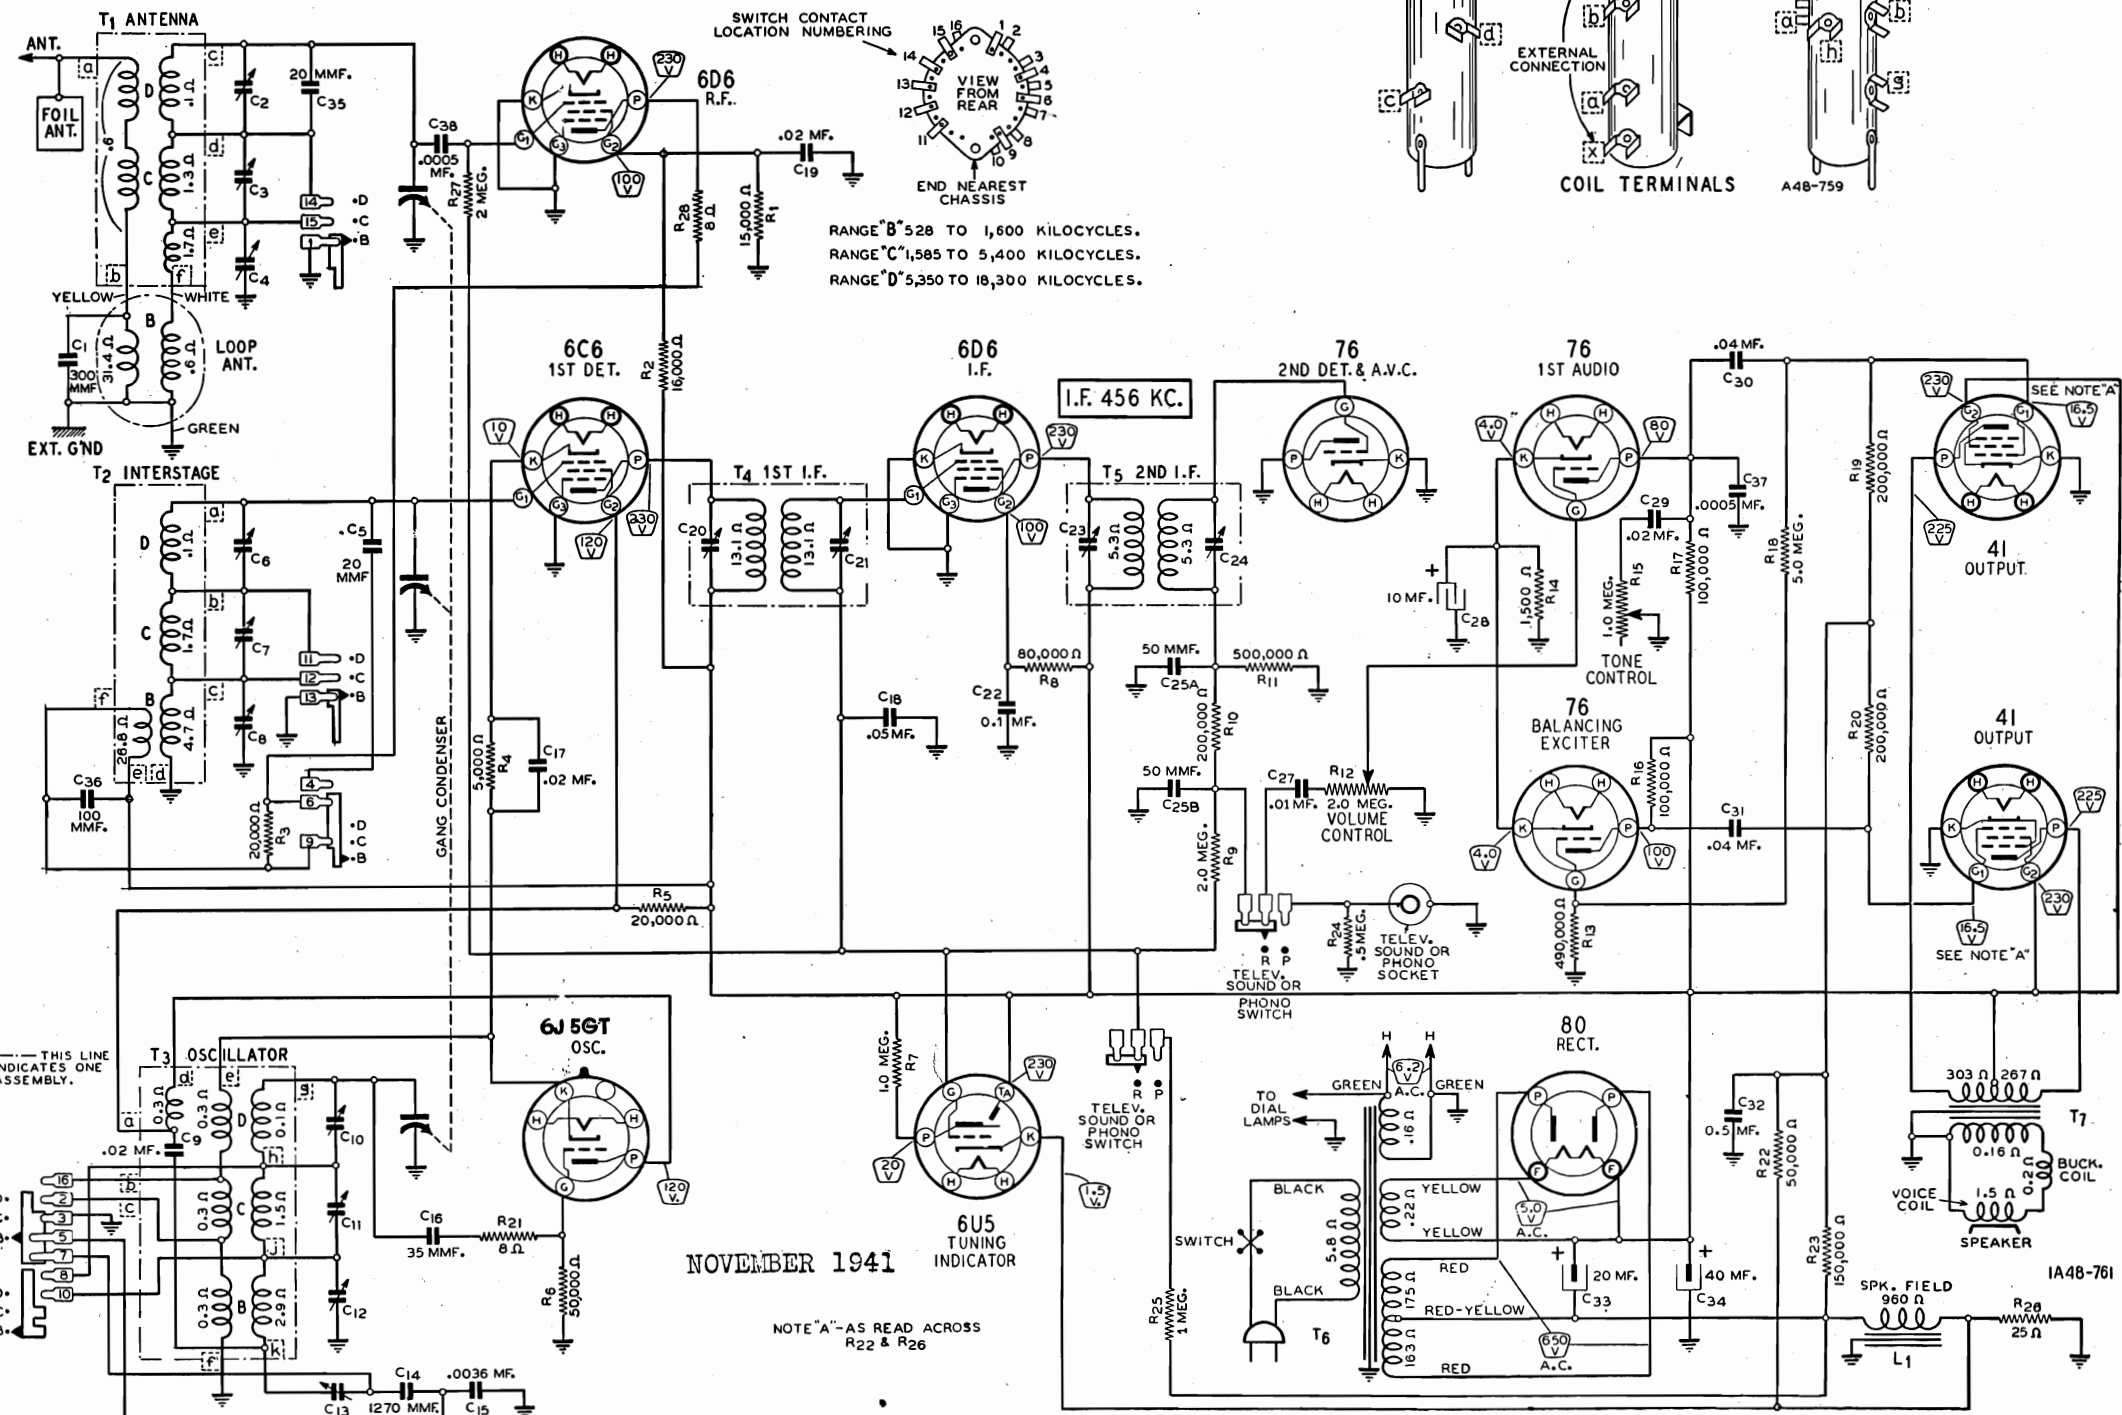

Tie a knot with a small loop at one end of the new drive cord. Slide a 1 3/4 inch length of fabric tubing on the cord. The free end of the drive cord should be tied to the tension spring in such a manner that there is a distance of 56 3/8 inches between the knots.

Turn the gang condenser to full open position.

Place the looped end of the drive cord over the hook on condenser drive drum A—See illustration. Bring the cord up through the slot in the drum rim and pass to the right (from back of chassis) and around pulley B. Then bring the cord to the left and over pulley C. See that the fabric tubing is now between pulleys B and C. Continue cord down to control shaft D and wind 3 1/2 turns counter-clockwise (from back of chassis) on shaft D. Bring cord up to and over pulley E. Bring cord down to top of drive drum A and wind one turn clockwise around the drum rim.

Pass the remaining drive cord and tension spring through the slot in the drum. Place free end of spring over the hook on the condenser drive drum.

ATTACHING DIAL POINTER—Tune in a 1500 KC signal. Move the pointer to the 1500 KC mark on the dial and clamp it tightly over the fabric tubing on the cord.

NOVEMBER 1941

NOTE "A"—AS READ ACROSS R22 & R26

MONTGOMERY WARD & CO.

MODEL 04WG-1108A

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
 Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
 Allow Chassis and Signal Generator to "Heat Up" for several minutes.
IMPORTANT—Follow procedure in the order shown.

The following equipment is required for aligning:
 An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
 Output Indicating Meter—Non-Metallic Screwdriver.
 Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I. F.					
456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	2nd I.F. (C23) & (C24) 1st I.F. (C20) & (C21)
RANGE D 18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
15,000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Ant. Range D (C2) Int. Range D (C6) Rock Rotor—See Note A
RANGE C 5400 KC	Antenna Lead	400 Ohm	C Range	Turn Rotor to Full Open	Oscillator Range C (C11)
5000 KC	Antenna Lead	400 Ohm	C Range	Turn Rotor to Max. Output	Antenna Range C (C3) Int. Range C (C7)
RANGE B 1600 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C12)
1400 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1400 KC— See Note B	Ant. Range B (C4) Int. Range B (C8)
600 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C13) Rock Rotor—See Note A

LOOP RANGE B—If chassis has been aligned in the cabinet, no loop trimmer re-adjustment is required. If, however, chassis has been removed, re-assemble in cabinet and re-adjust Antenna Range B (C4) trimmer as covered in 1400 KC adjustment.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

NOTE B—If the pointer is not at 1400 KC on the dial, loosen the 2 clamps which hold the pointer assembly on the cord, move the

pointer to the 1400 KC mark, and tighten the clamps.

CAUTION—When aligning the short wave bands, be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 5000 KC. The signal will then be heard at 5000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 5000 less 912 KC, or 4088 KC on the dial. It may be necessary to increase the input signal to hear the image.

Voltages at Sockets

These voltages are read under the following conditions:

- Line Voltage—117.
- Band Switch—Broadcast.
- Volume Control—Maximum.
- Antenna Shorted to Ground.

Readings taken with 1000 ohm-per-volt meter. Plate and screen voltages are read on 500 volt scale.

- Power Consumption - 80 Watts (At 117 volts 60 cycles)
- Power Output - 5.0 Watts Undistorted, 5.5 Watts Maximum
- Selectivity - 32 KC Broad at 1000 times Signal
- Intermediate Frequency - 456 KC.
- Speaker - 10" Electro-Dynamic

- Tuning Frequency Range
 - B Range - 528 to 1600 KC.
 - C Range - 1585 to 5400 KC.
 - D Range - 5350 to 18300 KC.
- Sensitivity—External Antenna—(For 0.5 Watt Output)
 - B Range - 5.0 Microvolts Average
 - C Range - 3.0 Microvolts Average
 - D Range - 8.0 Microvolts Average

MONTGOMERY-WARD & CO.

VOLTAGE CHART
incoming power lines and other electrical apparatus which may be in the vicinity. A ground is advisable. A good ground will often reduce noise. The ground wire should be connected with a clamp to a well cleaned water pipe or to a piece of pipe driven several feet into damp earth.

ANTENNA For best results, an outside antenna approximately 50 to 75 feet long including lead-in is recommended. It should be erected as high as possible and as far from surrounding objects as practical. For minimum interference it should be at right angles to street car lines.

POWER SUPPLY—This radio is equipped with a universal transformer, 40 to 60 cycles which has the following taps: 95-110-130-150-230 volts. A rotary switch mounted on top of the transformer selects the proper voltage tap.

Set the switch for various line voltages to conform with the following table: 95 mark for current of 85 to 105 volts; 110 mark for current of 105 to 125 volts; 130 mark for current of 125 to 145 volts; 150 mark for current of 145 to 165 volts; 230 mark for current of 210 to 250 volts.

To set the switch, unloosen the set screw on the side of the switch and rotate the knob so that the mark desired shows up in the small framed window on the top of the switch. Tighten the set screw.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator.

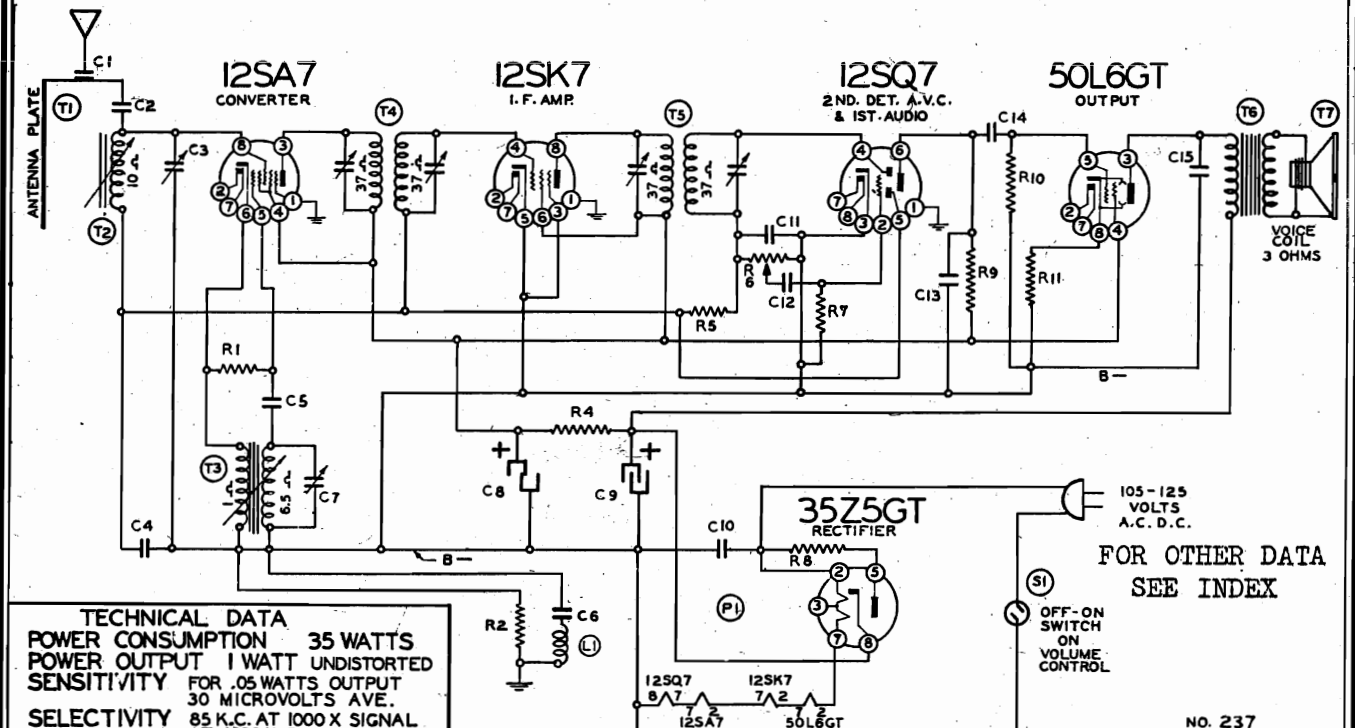

BAND	Frequency Setting	SIGNAL GENERATOR Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted to Maximum (in Order Shown)
I. F.	455 Kc.	.1 MFD.	Grid of 6SK7 I. F. Tube	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top of Output I. F. (See Chassis View)
	455 Kc.	.1 MFD.	Grid of 6SA7	Broadcast (Extreme Left Rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top of Input I. F. (See Chassis View)
SHORT WAVE BAND	21 Mc.	400 ohms	Antenna lead	Short Wave (Extreme Right Rotation)	Set Dial at 21 MC	Trimmer (C7) Short wave oscillator (See Trimmer View) See Note "A"
	21 Mc.	400 ohms	Antenna lead	Short Wave (Extreme Right Rotation)	Set Dial at 21 MC	Trimmer (C1) Short wave antenna (See Trimmer View)
MEDIUM WAVE BAND	6 Mc.	400 ohms	Antenna lead	Medium Wave	Set Dial at 6 MC	Trimmers (C8, C2) Medium-wave oscillator and antenna (See Trimmer View)
	2.3 Mc.	400 ohms	Antenna lead	Medium Wave	Set Dial at 2.3 MC	Trimmer (C9) Medium wave osc series pad (See Chassis View) See Note "B"
BROADCAST BAND	1730 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme Left Rotation)	Rotor full open (Plates out of mesh)	Trimmer (C10) Broadcast osc. (See Trimmer View)
	1500 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 1500 Kc.	Trimmer (C3) Broadcast antenna (See Trimmer View)
	600 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 600 Kc.	Trimmer (C11) Broadcast osc. series pad (See Chassis View) See Note "B"

NOTE "A"—It is extremely necessary that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental.

NOTE "B"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained. After each range is completed, repeat the procedure as a final check.

TUNER DATA

NO. 255

Make a list of your 5 favorite stations—push out the call letters of these stations from the call letter sheets supplied. Next insert a long slim screw driver into the hole in front of one of the pushbuttons and unscrew the pushbutton locking screw (to the left) several turns. Now with the screw driver still engaged in the locking screw slot push it all the way in. Hold it in this position and tune in the station you want with the tuning knob. Now tighten up the pushbutton locking screw by turning it to the right. Tighten firmly. Continue setting each button in the same way. When you have set your stations insert the call letter of each station in the front of the proper button and put one of the celluloid tabs over the station call letter.

To change stations simply repeat the above procedure.

ALIGNMENT PROCEDURE

The following equipment is required for aligning.
 • Dummy antenna .1 mfd. and 200 mmf.

BAND	Frequency Setting	Dummy Antenna	Connection to Radio	Dial Setting	Trimmers Adjusted (in Order Shown)	Adjustment
455 Kc. I. F.	455 Kc.	.1 MFD.	Connect to Grid of 1A7	Rotor full open (Plates out of mesh)	Input and Output Trimmers on Top of I. F. cans	Maximum output (See Note "A")
BROADCAST BAND	1600 Kc.	.1 MFD.	Connect to Grid of 1A7	Rotor full open (Plates out of mesh)	Osc. Trimmer on gang (See chassis view)	Maximum output (See Note "A")
	1400 Kc.	200 MMF.	Connect to Antenna Clip	Set dial at 1400 Kc.	Ant. Trimmer on gang (See chassis view)	Maximum output (See Note "B")

NOTE "A"—The loop antenna need not be connected to the radio when making these adjustments, but a 1. Meg. Resistor must be substituted across the loop clips. The ground of the signal generator is connected to the B— and the other lead from the signal generator in series with .1 MFD. dummy to the grid of the 1A7GT tube.

NOTE "B"—This adjustment should be made with the ground lead of the signal generator connected to the external ground terminal. The other lead of the signal generator is connected in series with a 200 Mmf. dummy to the external antenna terminal.

BATTERY CONNECTIONS—When replacing battery, plug cable into battery socket as shown above. Note: Clips for connecting an external antenna and ground are shown on the side of cabinet.

- Volume control—Maximum all adjustments.
- Connect B— of radio chassis to ground post of signal generator.

BATTERIES REQUIRED

The battery pack must contain a 1 1/2 volt "A" battery and 90 volts of "B" battery. Plug the Battery Cable from the radio into the socket on the battery pack. The pack will fit nicely into the back of the cabinet as shown in the battery view.

Replacement batteries may be obtained from Wards Stores or Mail Order Houses. Order battery pack No. 62-5033.

ECONOMIZER SWITCH—When the A battery is fresh the economizer switch on the back of the chassis should be pushed down.

After the radio has been in use several weeks and reception becomes weaker push the switch up, (the white dot will show). Leave in this position until new batteries are installed.

TECHNICAL DATA
 TUNING RANGE 530 TO 1720 KC. & 5.8-8.1 M.C.
 A - CURRENT 300 MILLIAMPERES.
 B - CURRENT 10 MICROVOLTS AVERAGE.
 SENSITIVITY 36 K.C. X
 1000 TIMES TO MILLIWATTS.
 UNDISTORTED IN VOICE COIL
 I.F. 455 K.C.

BATTERY VIEW—When replacing battery, plug cable into battery socket as shown above. Note: Battery can be placed in back of cabinet as shown.

MODEL 14BR-574A

MONTGOMERY WARD & CO.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator.

BAND	SIGNAL GENERATOR		Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted to Max.
	Frequency Setting	Dummy Antenna				
I. F.	455 Kc.	.1 MFD.	Grid of 1N5G 2nd I. F.	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top of Output I. F.
	455 Kc.	.1 MFD.	Grid of 1N5G 1st I. F.	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top of Interstage I. F.
	455 Kc.	.1 MFD.	Grid of 1A7G Mixer	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top of Input I. F.
SHORT WAVE BAND	16 Mc.	400 ohms	Antenna lead	Short Wave	Set Dial at 16 Mc.	Trimmer C6— S. W. osc. Top of front section of gang
	16 Mc.	400 ohms	Antenna lead	Short Wave	Set Dial at 16 Mc.	Trimmer C2 S. W. antenna
	6 Mc.	400 ohms	Antenna lead	Short Wave	Set Dial at 6 Mc.	Trimmer C7 S. W. osc. series pad (See note "A")
BROAD-CAST BAND	1720 Kc.	200 mmf.	Antenna lead	Broadcast	Rotor full open (Plates out of mesh)	Trimmer C8 B. C. osc.
	1500 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 1500 Kc.	Trimmer C3 B. C. antenna
	600 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 600 Kc.	Trimmer C9 B. C. osc. series pad (See note "A")

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

ANTENNA

For best results, an outside antenna approximately 50 to 75 feet long including lead-in is recommended. It should be erected as high as possible and as far from surrounding objects as practical. For minimum interference it should be at right angles to street car lines,

incoming power lines and other electrical apparatus which may be in the vicinity. A ground is advisable. A good ground will often reduce noise. The ground wire should be connected with a clamp to a well cleaned water pipe or to a piece of pipe driven several feet into damp earth.

SETTING THE PUSHBUTTONS

Make a list of your 6 favorite stations. Push out the call letters of these stations from the call letter sheets supplied. Insert a call letter in the slot on top of each pushbutton.

Next pull one of the pushbuttons all the way out as far as it will come (pull, with fingers on top and bottom of button). Now tune in the station you want with the tuning knob—Tune back and forth until the station is clear and distinct. Now push the button hard all the way in to lock the station in place. Continue setting each pushbutton in the same way. Pressing the proper button will now tune the station you want. If it does not do so you did not push the button hard enough to lock it in place when setting up the station.

To change stations simply repeat the procedure above.

CHASSIS VIEW showing tube location and battery cable. NOTE: Antenna and ground leads at back of chassis.

The following equipment is required for aligning.
 • Dummy antenna .1 mfd. and 200 mmf.

- Volume control—Maximum all adjustments.
- Connect B— of radio chassis to ground post of signal generator.

ALIGNMENT PROCEDURE

BAND	Frequency Setting	Dummy Antenna	Connection to Radio	Dial Setting	Trimmers Adjusted (in Order Shown)	Adjustment
455 Kc. I. F.	455 Kc.	.1 MFD.	Connect to Grid of 1A7	Rotor full open (Plates out of mesh)	Input and Output Trimmers on Top of I. F. cans	Maximum output (See Note "A")
BROAD-CAST BAND	1600 Kc.	.1 MFD.	Connect to Grid of 1A7	Rotor full open (Plates out of mesh)	Osc. Trimmer on gang (See chassis view)	Maximum output (See Note "A")
	1400 Kc.	200 MMF.	Connect to Antenna Clip	Set dial at 1400 Kc.	Ant. Trimmer on gang (See chassis view)	Maximum output (See Note "B")

NOTE "A"—The loop antenna need not be connected to the radio when making these adjustments, but a 1. Meg. Resistor must be substituted across the loop clips. The ground of the signal generator is connected to the B— and the other lead from the signal generator in series with .1 MFD. dummy to the grid of the 1A7GT tube.

NOTE "B"—This adjustment should be made with the ground lead of the signal generator connected to the external ground terminal. The other lead of the signal generator is connected in series with a 200 Mmf. dummy to the external antenna terminal.

JANUARY 1941

ALIGNMENT PROCEDURE

- The following equipment is required for aligning:
- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
 - Output indicating meter.
 - Non-metallic screwdriver.
 - Dummy antennas—1 mt., 35 mmf.

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Remote Tuner Dial Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	455 Kc.	.1 MFD.	Grid of 6SK7 I. F. Tube	Set dial at 1400 Kc.	See Chassis View	Output I. F.	Adjust to maximum output
	455 Kc.	.1 MFD.	Grid of 6SA7 I. F. Tube	Set dial at 1400 Kc.	See Chassis View	Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1600 Kc.	35 mmf.	Antenna lead	Set dial at 1600 Kc.	Trimmer C9, C6, C1 See Chassis View	Oscillator R. F. antenna	Adjust to maximum output
	1400 Kc.	35 mmf.	Antenna lead	Set dial at 1400 Kc.	Rotate cores of antenna and R. F. coils	Antenna and R. F.	Adjust to maximum output

SHOWING TRIMMER POSITIONS

- Battery Drain - - - - - 7 Amps.
- Power Output - - - - - 1.8 Watts Undistorted
- Sensitivity for 1 Watt Output - - 6 Microvolt Average
- Selectivity - 38 KC Broad at 1000 Times Signal at 1000 KC
- Tuning Frequency Range - - - - - 540 to 1600 KC
- Intermediate Frequency - - - - - 455 KC
- Speaker - - - - - 6 in. Electro Dynamic

GENERATOR CONDENSER

A Generator Condenser must be connected in all cases from the battery terminal of the generator to the Generator frame.

This condenser must not be connected across the field winding terminal on late cars which use Automatic Cutouts.

It is advisable that you find out from your local car dealers where the manufacturer recommends the condenser be connected for each make of car.

CALIBRATING THE DIAL

Tune set to some station of a known frequency (between 800 and 1200 K.C.), hold selector knob, then remove pilot light assembly from back of remote head and with a screw driver adjust the slotted screw through this opening and in this way adjust the dial pointer to the correct frequency setting.

ADJUSTING THE ANTENNA TRIMMER

The input circuit has been especially designed to be used with a low capacity antenna of the fish pole or whip type.

The antenna lead supplied with the radio should not be shortened or otherwise altered.

It is important that the grounding lead on the end of the antenna cable be carefully grounded to the car body,

otherwise it may prove difficult to eliminate ignition noise.

Tune in a station on the high frequency end of the dial and adjust the antenna trimmer for maximum volume. A weak station which does not fade is best for this adjustment.

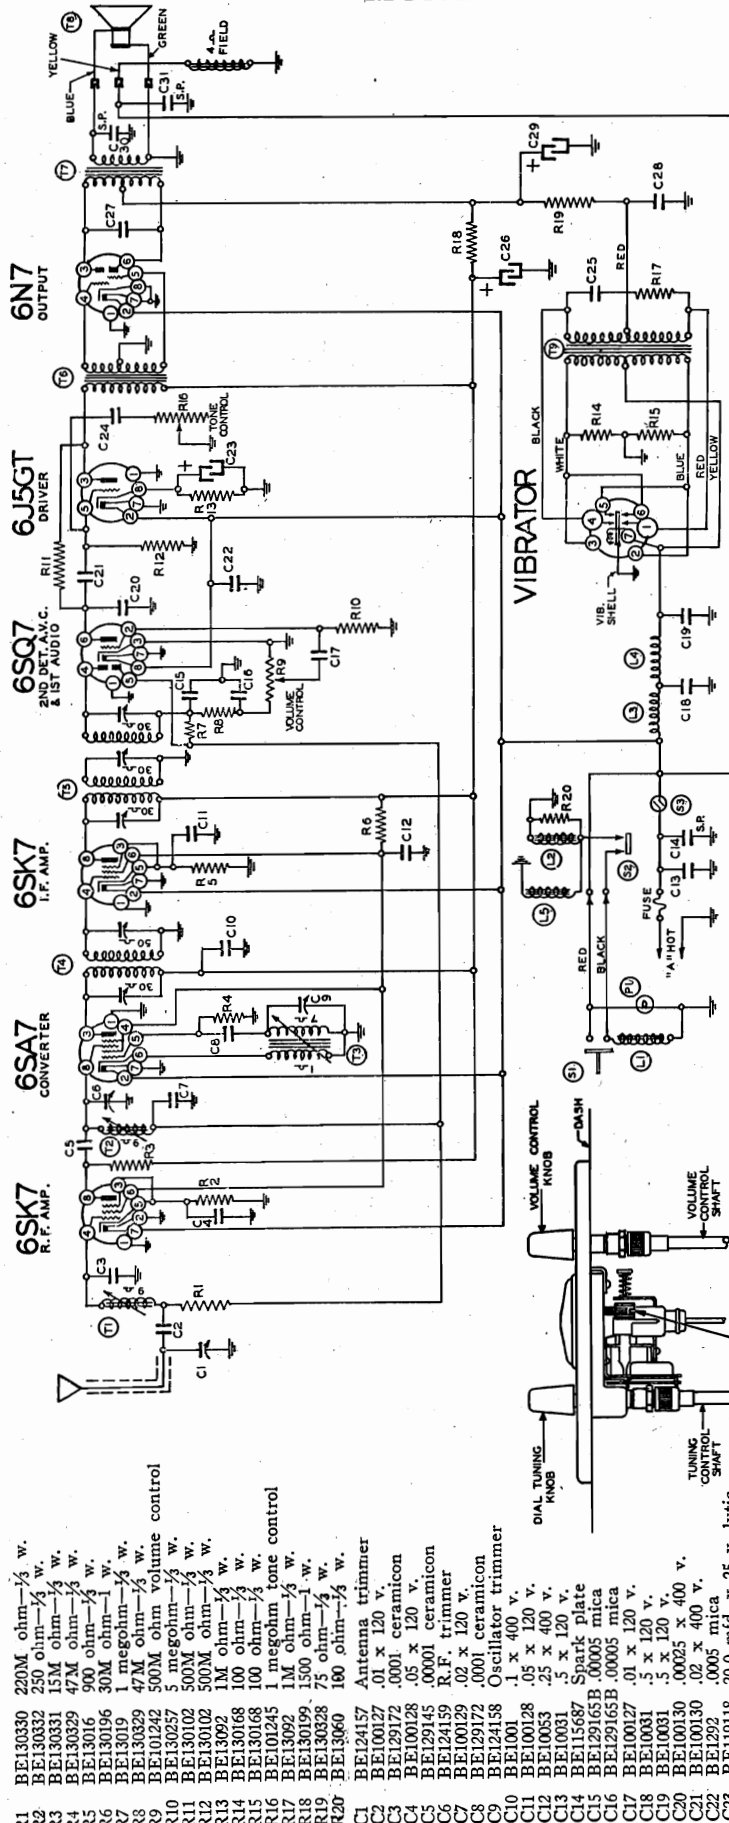

HIGH AND LOW TENSION LEADS

In many cars the low tension battery leads, etc., are grouped together with the high tension wires. These leads will very often pick up motor noise and feed it into the receiver through the battery circuit. In cases such as these it will be necessary to separate the low tension from the high tension wires and run them through another hole if they are from the engine compartment up to the instrument panel. This condition is particularly true on the V-8 Ford as the battery and primary leads run through a special tube which also houses the high tension leads. Shield and ground these leads.

AMMETER CONDENSER

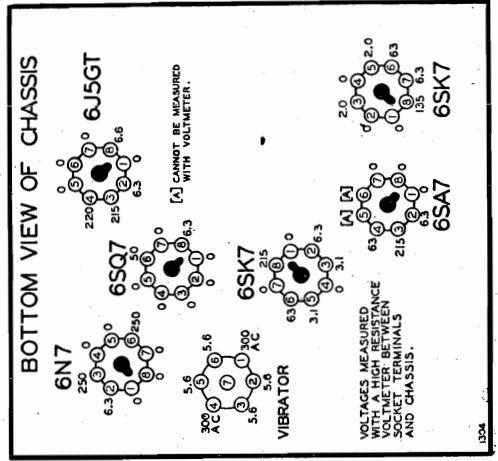

A .5 Mfd. by pass condenser should be connected from one ammeter terminal to a good ground on the instrument panel. Usually this condenser plus the generator condenser and distributor suppressor will remove all objectionable ignition noise.

MONTGOMERY-WARD & CO.

INTERMEDIATE FREQUENCY 455 K.C.

JANUARY 1941

CALIBRATING THE DIAL

Turn the manual tuning knob and set the dial at 540 KC or 1600 KC whichever end the dial scale will reach. Now tighten the pointer adjustment screw (see Dash Control Rear View) this will lock the dial scale in place.

Turn the manual tuning knob to the right until it stops if you have the dial scale set at 540 Kc. Turn it to the left if it is set at 1600 Kc. Next loosen the adjustment screw to unlock the dial scale.

- Battery Drain - - - - - 7.8 Amps.
- Power Output - - - - - 5 1/2 Watts Undistorted
- Sensitivity for 1 Watt Output - - - 1 Microvolt Average

SETTING UP THE AUTOMATIC TUNING

NOTE: Stations may be set up on the bench, before installing radio.

There are three major steps in setting up the automatic. Take these steps in order. After you become familiar with them, you may vary the routine, but you will then know the operations needed.

1st—To Synchronize the word "Dial" on the dial scale with the "Dial" position in the Chassis Tuner.

Note—The word "dial" is short for manual tuning.

2nd—To select one station and put it on the first automatic position.

3rd—To put the call letter on the dial.

The synchronizing must be done only once, but items two and three are repeated until 5 Automatic Positions are set up.

ADJUSTING THE ANTENNA TRIMMER

The input circuit has been especially designed to be used with a low capacity antenna of the fish pole or whip type.

The antenna lead supplied with the radio should not be shortened or otherwise altered.

It is important that the grounding lead on the end of the antenna cable be carefully grounded to the car body, otherwise it may prove difficult to eliminate ignition noise.

Tune in a station on the high frequency end of the dial and adjust the antenna trimmer for maximum volume. A weak station which does not fade is best for this adjustment.

two—Tune the station on the manual first—Note the program and then move to the first Automatic Position and locate the program on the screw.

times or until the word "Dial" shows up on the dial scale. Close the synchronizer switch (white dot showing) and the dial and tuner are now in synchronism.

SYNCHRONIZING (Step 1) SELECT ONE STATION (Step 2) CALL LETTER ON THE DIAL (Step 3)

See that the Synchronizing Switch on the chassis case is closed (white dot showing). Press the tuning knob once. Let it come back—and then see if the knob will tune in stations (Don't forget to turn up the volume control). Repeat this until the radio can be tuned with the tuning knob. It is now in the Manual Tuning (Dial) Position.

Now open the "Synchronizer" Switch the station quickly. One—tune it in on (No white dot showing). This will disconnect the tuner and keep it from shifting the station in the car) and then adjust that you will press the tuning knob into ing. Next, press the tuner knob several times for the same program; or the 2nd Automatic Position.

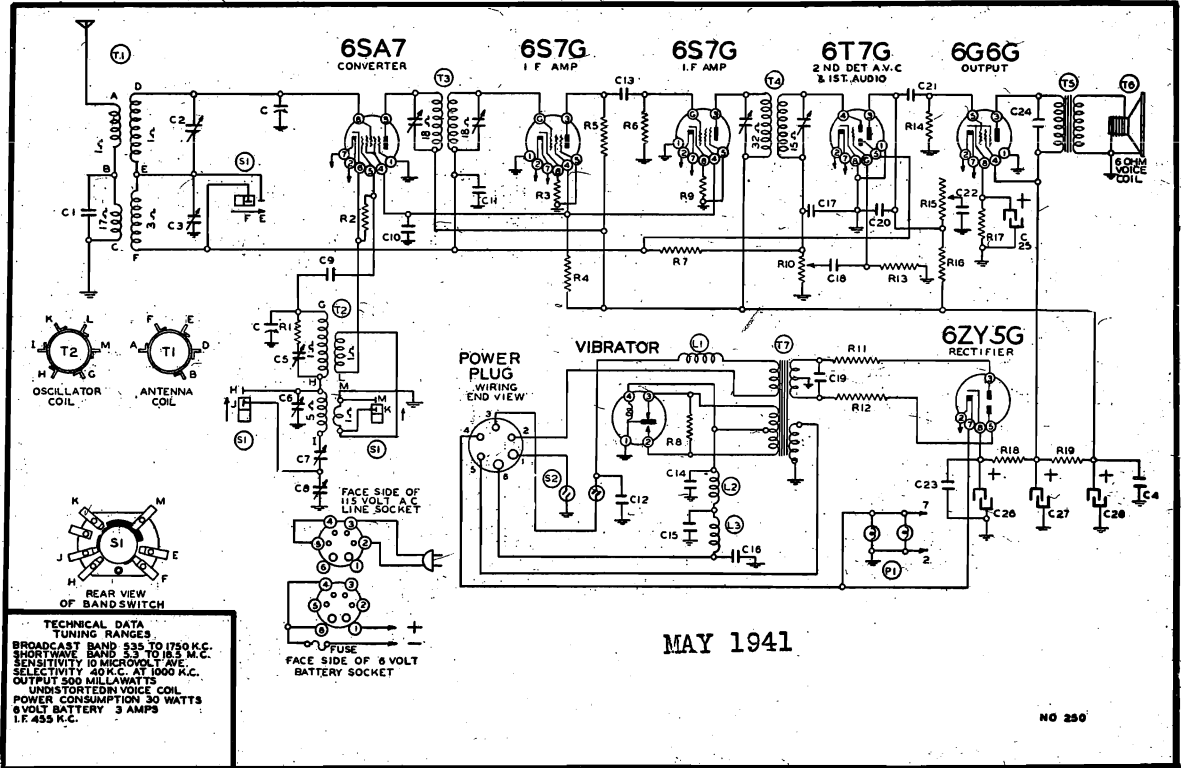

Continue the same operation thru the 3rd, 4th and 5th automatic positions.

POWER SUPPLY—Unless marked otherwise, this radio will operate on either a 6 volt storage battery or on 105 to 125 volts A.C. 50 to 60 cycle line. Two power cords are supplied one for battery and one for electric operation. Whichever cord is required should be plugged into the back of the chassis. When using a battery be sure A+ lead is connected to + battery terminal. Do not lengthen battery cable. Keep antenna lead away from battery cable.

MODELS 14BR-688A,
14BR-689A

MONTGOMERY-WARD & CO.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator.

	600 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 600 Kc.	Trimmer C7 B. C. osc. series pad (See note "A")

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

CHASSIS VIEW showing tube location and power cables.

NOTE: Antenna and ground leads at side of chassis.

ANTENNA

For best results, an outside antenna approximately 50 to 75 feet long including lead-in is recommended. It should be erected as high as possible and as far from surrounding objects as practical. For minimum interference it should be at right angles to street car lines, incoming power lines and other electrical apparatus which may be in the vicinity. A ground is necessary. The ground wire should be connected with a clamp to a well cleaned water pipe or to a piece of pipe driven several feet into damp earth.

SETTING THE PUSHBUTTONS

Make a list of your 6 favorite stations. Push out the call letters of these stations from the call letter sheets supplied. Insert a call letter in the slot on top of each pushbutton.

Next pull one of the pushbuttons all the way out as far as it will come. Now tune in the station you want with the tuning knob—Tune back and forth until the station is clear and distinct. Now push the button hard all the way in to lock the station in place. Continue setting each pushbutton in the same way. Pressing the proper button will now tune the station you want. If it does not do so you did not push the button hard enough to lock it in place when setting up the station.

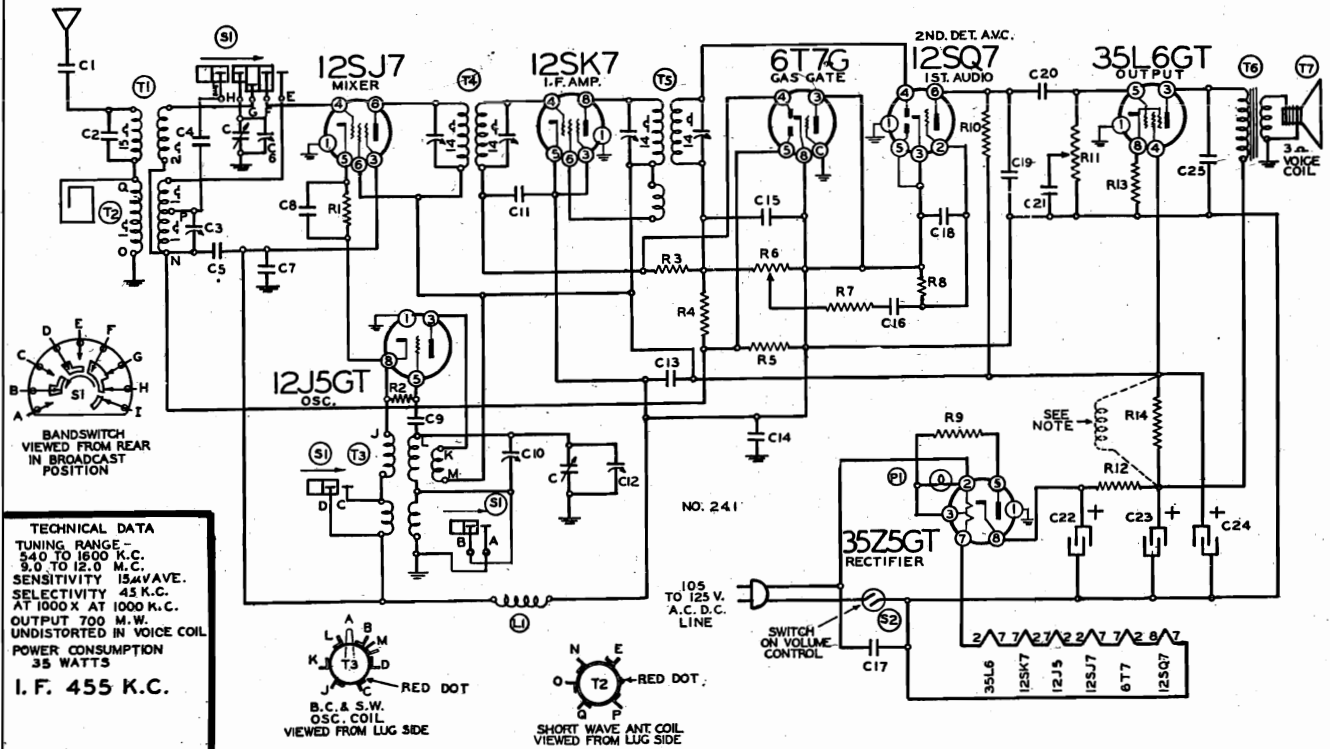

To change stations simply repeat the procedure above.

VOLTAGE CHART

MODELS 14BR-734A,
14BR-735A

TECHNICAL DATA
 TUNING RANGE - 540 TO 1600 K.C.
 9.0 TO 12.0 M.C.
 SENSITIVITY 15μVAVE.
 SELECTIVITY 45 K.C.
 AT 1000 X AT 1000 K.C.
 OUTPUT 700 M.W.
 UNDISTORTED IN VOICE COIL
 POWER CONSUMPTION
 35 WATTS
I. F. 455 K.C.

On sets which have an electrodynamic speaker, R12 is eliminated and the hot side of C22 is connected in parallel with C23. R14 is replaced by the speaker field.

IS YOUR LINE VOLTAGE CORRECT?

MAY 1941

Unless your radio is marked otherwise, it must be operated from 10. to 125 volts, 50 to 60 cycle current or the same D. C. Voltage. If in doubt, phone your electric light company. Receivers of this same model which are for use on special voltages are marked accordingly. When using your radio on A. C. current, reversing the plug may reduce station hum. If set does not operate in one minute on direct current reverse the plug.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect B—of radio chassis to ground post of signal generator through .1 Mfd. condenser.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted to Maximum
I. F.	455 Kc.	.1 MFD.	Grid of 12SK7 I. F.	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top of Output I. F.

MODEL 14BR-742A

MONTGOMERY-WARD & CO.

VOLTAGE CHART

POWER SUPPLY

Unless your radio is marked otherwise it is designed to operate on the following power supplies:

- 6 volt storage battery
- 105 to 125 volts 40 to 60 cycles (A.C.)
- 200 to 250 volts 40 to 60 cycles (A.C.)

For 6 Volt Battery Operation—The Batt-A.C. switch (see chassis view) must be in battery position and battery cables connected to battery.

For 105 to 125 Volt Operation—The red dot on "Adapter Plug" (see chassis view) must point to 110 V.

For 200 to 250 Volt Operation—The red dot on "Adapter Plug" must point to 230 V.

To Change "Adapter Plug" loosen the bracket, pull the plug out and replace it in the desired position.

Caution: The Batt-A.C. switch must be in the proper position before connecting receiver to the electrical supply.

ALIGNMENT PROCEDURE

• Volume control—Maximum all adjustments.

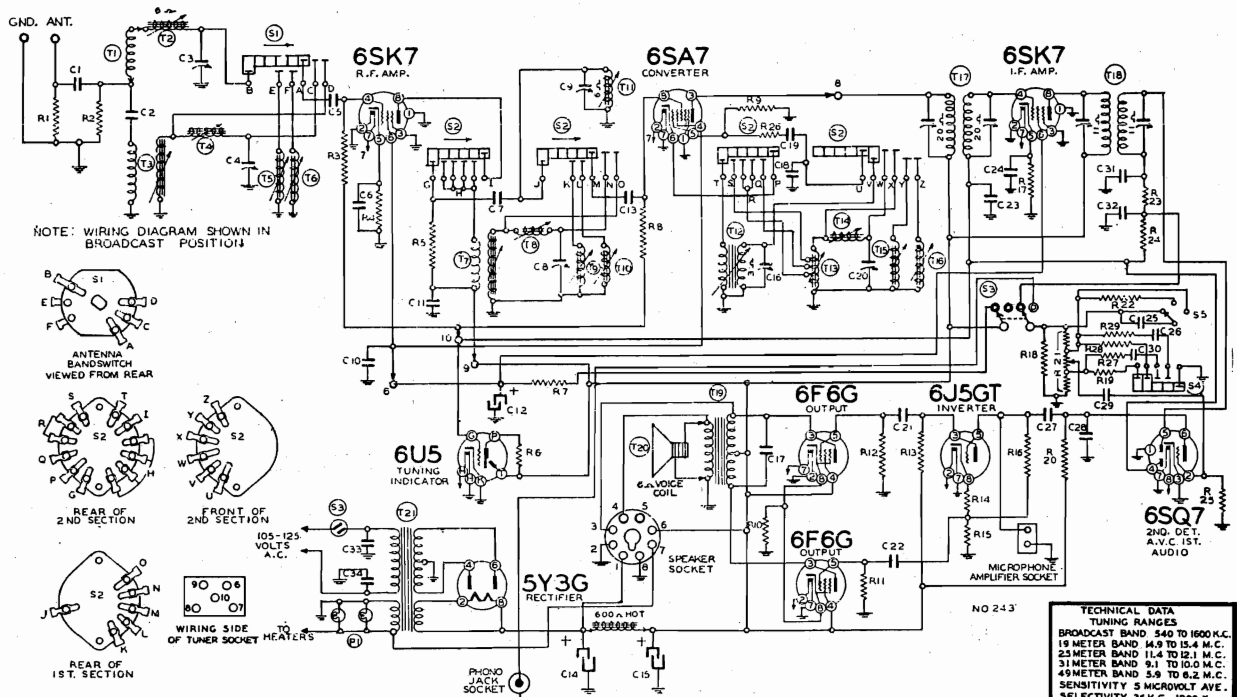

• Connect radio chassis to ground post of signal generator.

BAND	SIGNAL GENERATOR		Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted to Max.
	Frequency Setting	Dummy Antenna				
I. F.	455 Kc.	.1 MFD.	Grid of 6S7 I. F.	Broadcast	Tuning & Bandsread Plates out of mesh	Two trimmers on top of Output I. F.
	455 Kc.	.1 MFD.	Grid of 6SA7 I. F.	Broadcast	Tuning & Bandsread Plates out of mesh	Two trimmers on top of Input I. F.
SHORT WAVE BAND	17 Mc.	400 ohms	Antenna lead	Short Wave	Set Dial at 17 Mc.	Trimmer C16—S. W. osc. (See Note A)
	17 Mc.	400 ohms	Antenna lead	Short Wave	Set Dial at 17 Mc.	Trimmer C1-C9 S. W. ant. and R. F.
	8 Mc.	400 ohms	Antenna lead	Short Wave	Set Dial at 8 Mc.	Trimmer C15 S. W. osc. series pad (See note "B")
MEDIUM WAVE BAND	6 Mc.	400 ohms	Antenna lead	Medium Wave	Set Dial at 6 Mc.	Trimmer C18 M. W. osc.
	6 Mc.	400 ohms	Antenna lead	Medium Wave	Set Dial at 6 Mc.	Trimmer C2-C10 ant. and R. F.
	2.5 Mc.	400 ohms	Antenna lead	Medium Wave	Set Dial at 2.5 Mc.	Trimmer C17 osc. series pad (See note "B")
BROADCAST BAND	1720 Kc.	200 mmf.	Antenna lead	Broadcast	Tuning & Bandsread Plates out of mesh	Trimmer C20 B. C. osc.
	1400 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 1400 Kc.	Trimmer C3-C11 B. C. ant. R. F.
	600 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 600 Kc.	Trimmer C19 B. C. osc. series pad (See note "B")

NOTE "A"—It is extremely necessary that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental.

NOTE "B"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained. After each range is completed, repeat the procedure as a final check.

JUNE 1941

MODEL 14BR-911A
 MODELS 14WG-808M, 14WG-808W
MONTGOMERY-WARD & CO.

ALIGNMENT FOR MODELS 14WG-808M, 14WG-808W IS THE SAME AS THAT FOR MODEL 14WG-807

FOR SEEBURG C RECORD CHANGER SEE RIDER'S "AUTOMATIC RECORD CHANGERS AND RECORDERS".

SPECIFICATIONS

Power	Tuning Frequency Range	Sensitivity External Antenna (For 0.5 Watt Output)
Consumption - 57 Watts (at 117 volts 60 cycles)	B Range... 535 to 1610 KC...	15 Microvolts Aver.
77 Watts (Phonograph Operating)	19 Meter... 14.6 to 15.8 MC...	26 Microvolts Aver.
Power Output - 3.0 Watts Undistorted	25 Meter... 11.1 to 12.0 MC...	25 Microvolts Aver.
4.5 Watts Maximum	31 Meter... 9.3 to 10.05 MC...	22 Microvolts Aver.
Selectivity - 38 KC Broad at 1000 times Signal		
Intermediate Frequency - 456 KC		
Speaker - 10" Electro-Dynamic		

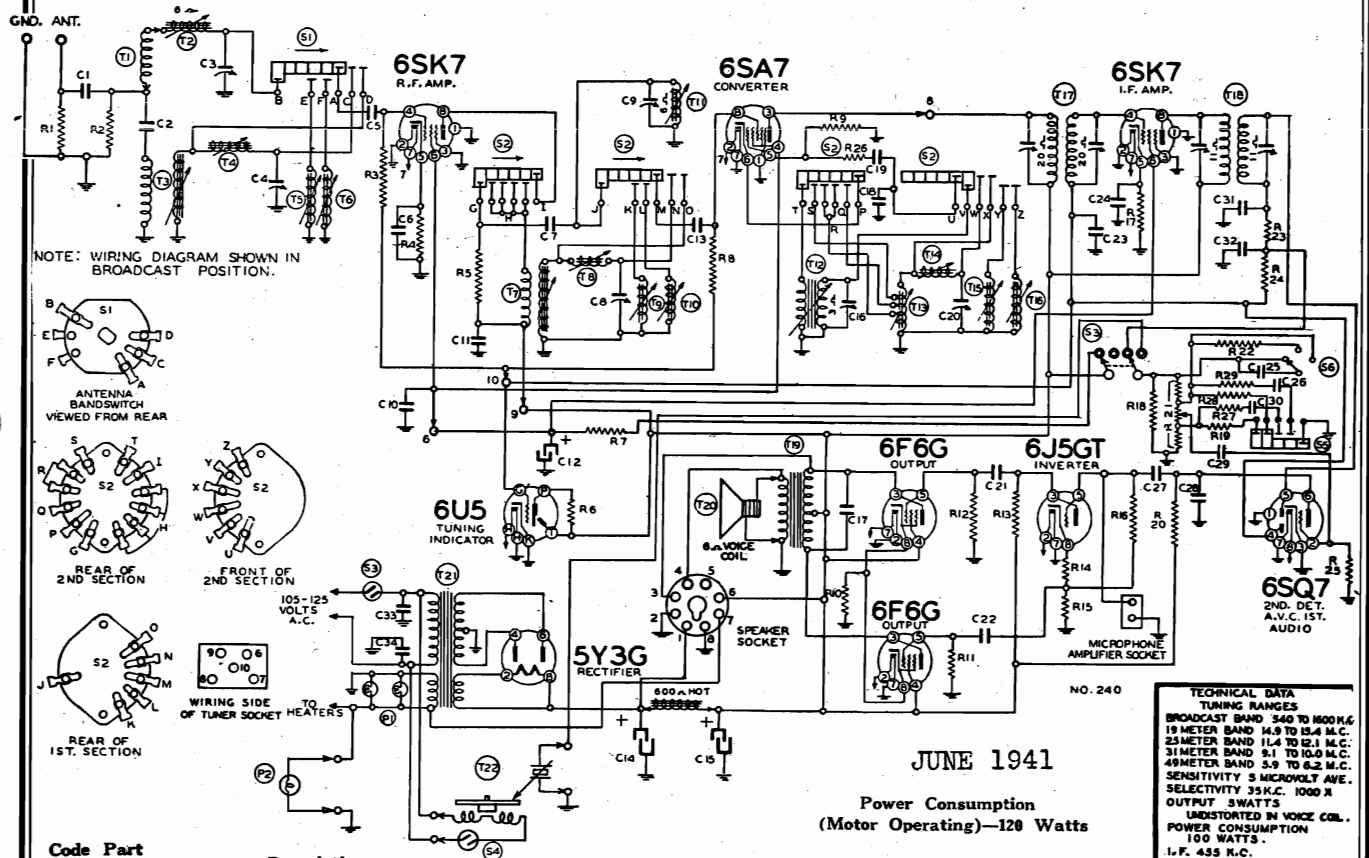

- Tone control—Treble
- Volume control—Maximum all adjustments.
- Use an all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.

IRON CORE ADJUSTMENT VIEW

ALIGNING INSTRUCTIONS

CAUTION:—No Aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltage, defective tubes, condensers and resistors. In order to properly align this radio, the chassis should be removed from the cabinet. Although the short wave bands on this radio are of the band spread type the Alignment Procedure is not difficult. However because each short wave scale covers only a small portion of the short wave spectrum you must do the work carefully and your oscillator must be accurate.

Do not realign the band spread scales unless you are positive they are out of adjustment. When adjustment is necessary proceed as follows.

Tune set to high frequency end of dial scale on any band.

Rotate each iron core until the fine score marks are even with the edge of the coil forms.

You are now ready to continue with the trimmer adjustments as shown on the alignment chart.

VOLTAGE CHART

TRIMMER VIEW

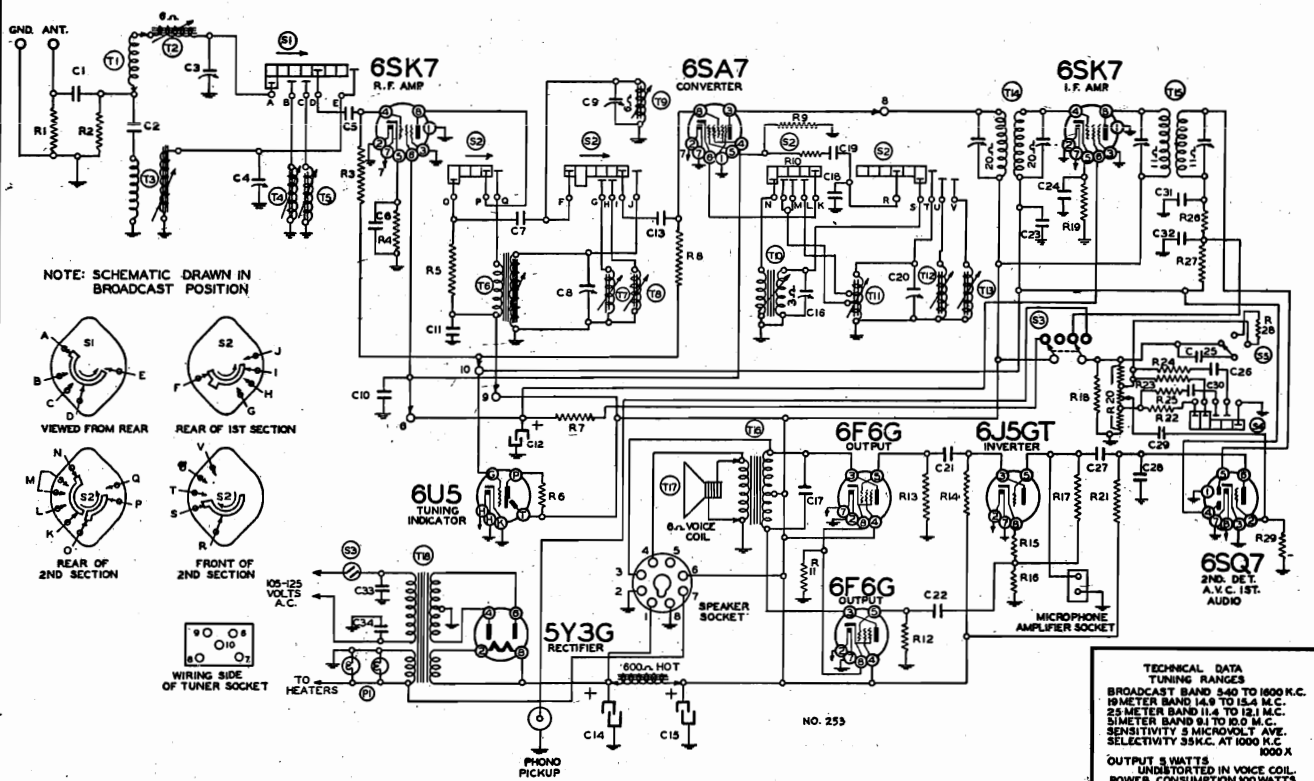

ALIGNMENT PROCEDURE

- Tone control—Treble.
- Volume control—Maximum all adjustments.
- Connect dummy antenna value in series with generator output lead.

- Use an all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.

BROAD-CAST BAND	1600 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 1600 Kc.	(See Trimmer View) C16—Osc. (See Trimmer View) C9—R.F. (See Chassis View) C3—Ant.
	1400 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 1400 Kc.	Rotate Core T9—R.F. Rotate Core T2—Ant. (See Iron Core Adjustment View)

FRONT VIEW CHASSIS

TRIMMER VIEW ANTENNA

This radio is designed to pick up strong local stations without requiring an outside antenna. The built-in aerial may be slightly directional therefore try the radio in several positions. For best results, however, an outside antenna approximately 50 to 75 feet long including lead-in is recommended. It should be erected as high as possible and as far from surrounding objects as practical. For minimum interference it should be at right angles to street car lines, incoming power lines and other electrical apparatus which may be in the vicinity. A ground is advisable. A good ground will often reduce noise. The ground wire should be connected with a clamp to a well cleaned water pipe or to a piece of pipe driven several feet into damp earth.

Periodic inspection of the antenna system is recommended to be sure that all connections are clean and tight, and that the antenna is well insulated from the ground at all points.

VIEW LOOKING AT BOTTOM OF CHASSIS

IRON CORE ADJUSTMENT VIEW

PHONOGRAPH-TELEVISION AND FM. JACK

Should you wish to use an external phonograph it should be plugged into the phono jack shown in the chassis view. The radio-phono-on-off knob on the front panel will then switch from radio to phono operation.

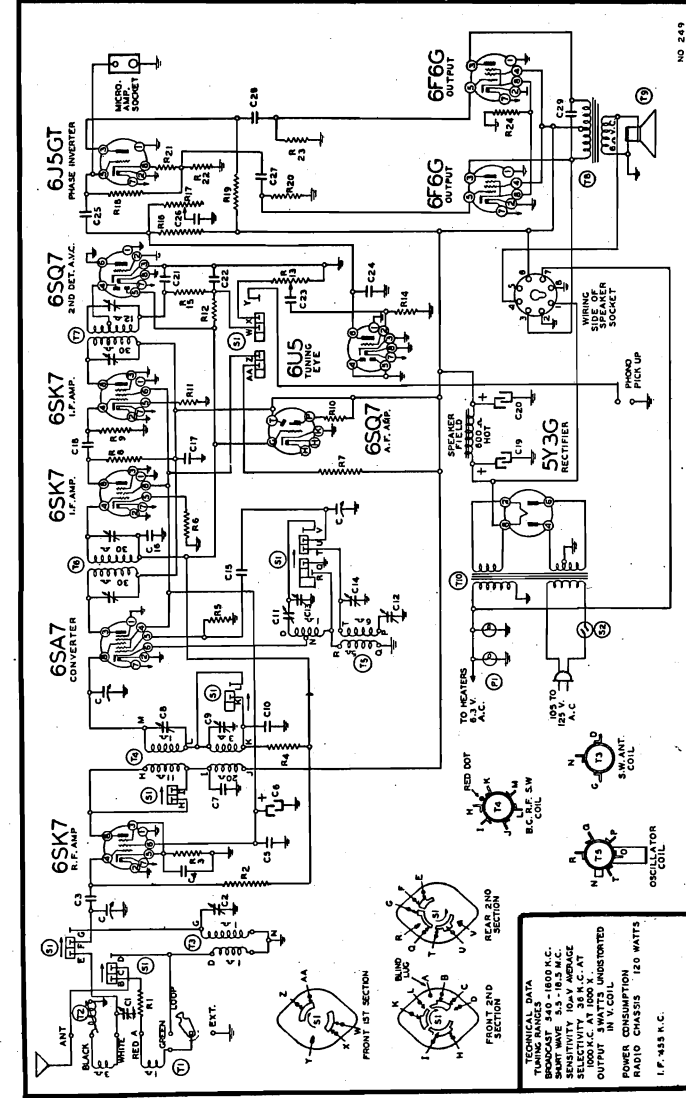

If television or frequency modulation (FM) programs ever become available in your community this radio may still be used in conjunction with the necessary converters.

The jack marked phono-jack plug in the chassis view will accommodate either the Phono or a television or FM converter.

	600 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 600 Kc.	T2 Iron Core Tracking Coil

NOTE "A"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.
After each band is completed, repeat the procedure as a final check.

JUNE 1941

CHASSIS VIEW

ANTENNA AND GROUND TERMINALS

When using an external antenna and ground, move the metal strap (connector bar) from terminal marked LOOP and connect it to terminal marked EXT.

The antenna and ground wires should then be connected to the terminals marked "Ant."—"Gnd."

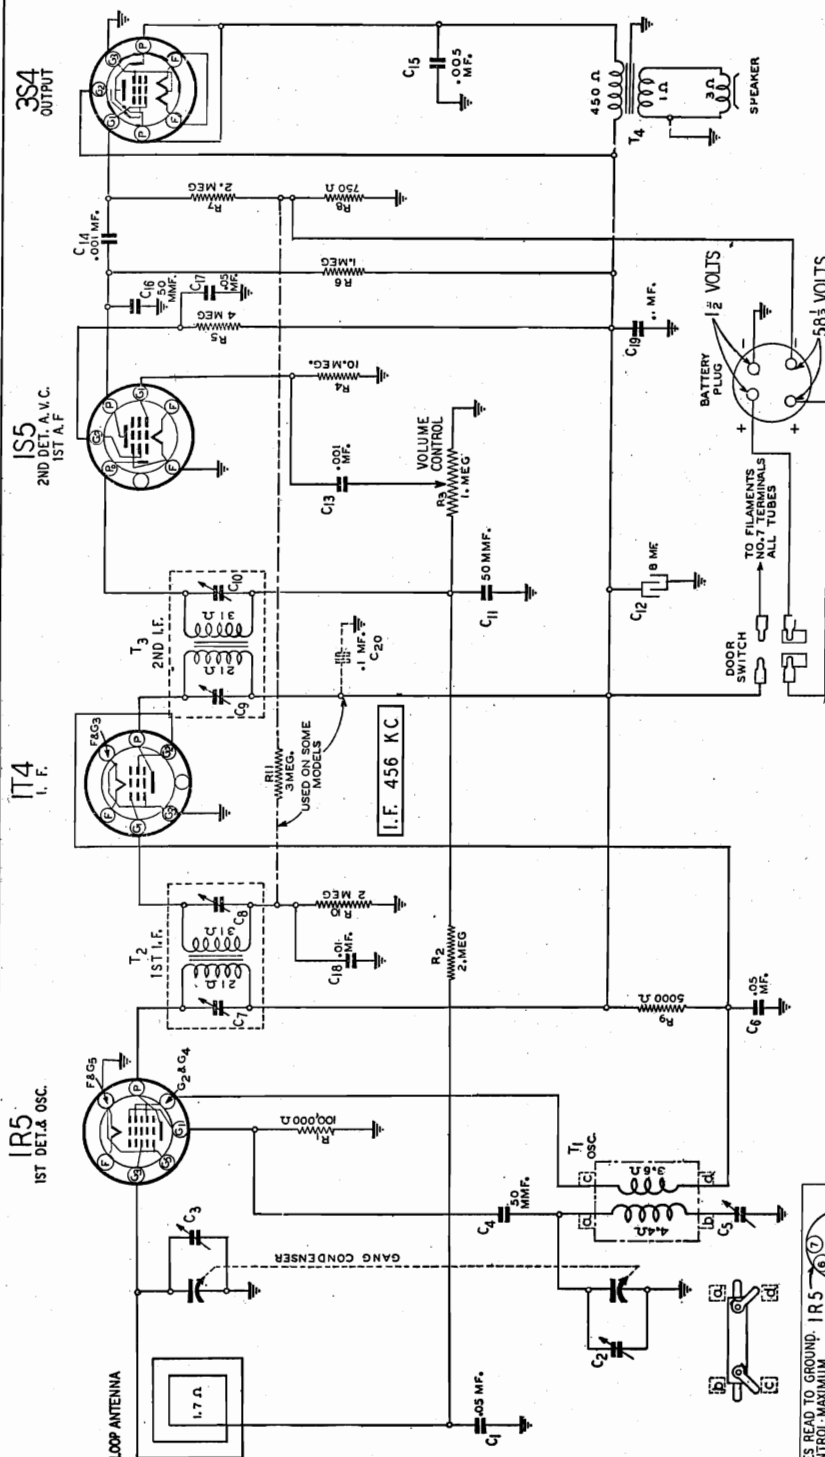

POWER SUPPLY—Unless your radio is marked otherwise, it must be operated from 105 to 125 volts, 50 to 60 cycle A.C. If in doubt, phone your electric light company. Receivers of this same model which are for use on special voltages are marked accordingly.

ANTENNA

This radio is designed to pick up strong local stations without requiring an outside antenna. The built-in aerial may be slightly directional therefore try the radio in several positions. For best results, however, an outside antenna approximately 50 to 75 feet long including lead-in is recommended. It should be erected as high as possible and as far from surrounding objects as practical. For minimum interference it should be at right angles to street car lines, incoming power lines and other electrical apparatus which may be in the vicinity. A ground is advisable. A good ground will often reduce noise. The ground wire should be connected with a clamp to a well cleaned water pipe or to a piece of pipe driven several feet into damp earth.

Periodic inspection of the antenna system is recommended to be sure that all connections are clean and tight, and that the antenna is well insulated from the ground at all points.

MODEL 14WG-438

TUBES

The tube types and position of the tubes and tube shields are shown in the illustration below.

APRIL 1941

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
 Allow Chassis and Signal Generator to "Heat Up" for several minutes.
 A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
 Output Indicating Meter—Non-Metallic Screwdriver.

Signal Gen. FREQUENCY SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
456 KC	Turn Rotor to Full Open	1st I.F. (C7) & (C8)
1610 KC	Turn Rotor to Full Open	2nd I.F. (C9) & (C10)
1500 KC	Turn Rotor to Full Open	Oscillator (C2)
600 KC	Turn Rotor to Max. Output	Antenna (C3)
1500 KC	Turn Rotor to Max. Output	600 KC (C5)
		Rock Rotor—See Note B
		Antenna (C3)

SPECIFICATIONS

Input Voltages and Currents
 "A" Battery - - - 1.5 Volts—25 Amperes
 "B" Battery - - - 50% Volts—8 Ma.
 Power Output - - - 55 Milliwatts Undistorted
 Selectivity - 40 KC Broad at 1000 Times Signal
 Intermediate Frequency - - - 456 KC
 Speaker - - - - - 4" P.M. Dynamic
 Tuning Frequency Range - 528 to 1610 KC
 Sensitivity - 400 Microvolts per Meter Average
 (For .05 Watt Output)

NOTE A—Connect a loop approximately one foot in diameter across the antenna and ground posts of the signal generator. Place radio approximately 2 feet (6" for I.F. adjustment) from loop.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

MONTGOMERY-WARD & CO.

MONTGOMERY-WARD & CO.

MODELS 14BR-521A, 14BR-522A

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect B—of radio chassis to ground post of signal generator through .1 Mfd. condenser.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Iron Cores (Dial Setting)	Adjust Trimmers to Maximum (in Order Shown)
I. F.	455 Kc.	.1 MFD	Connect to Metal Antenna Backplate	Iron Cores All the way out	Two trimmers on top of output I. F. can
	455 Kc.	.1 MFD	Connect to Metal Antenna Backplate	Iron Cores All the way out	Two trimmers on top of input I. F. can
BROAD-CAST BAND	1720 Kc.	.1 MFD	Connect to Metal Antenna Backplate	Iron Cores All the way out	Osc. Trimmer (C7) (See voltage chart)
	1720 Kc.	200 MMF.	Connect to Outside Antenna Clip	Iron Cores All the way out	Ant. Trimmer (C3) (See voltage chart)
	1400 Kc.	200 MMF.	Connect to Outside Antenna Clip	Turn Dial to 1400 Kc.	Adjust position of antenna coil (See coil assembly view)
	1720 Kc.	200 MMF.	Connect to Outside Antenna Clip	Turn Dial to 1720 Kc.	Adjust trimmer (C3) (See voltage chart)

NOTE "A"—The antenna coil assembly is made so that it is movable. When making the adjustment as given in the alignment procedure, move the coil assembly by the blade of a screwdriver in the hole and by the edge of the blade of a screwdriver in the hole and engaging the blade in the gear teeth of the coil form.

NOTE "B"—After the antenna coil has been tracked at 1400 Kc. it is necessary to check the chassis trimmer (C3) adjustment again at 1720 Kc. If the chassis trimmer adjustment is made the coil is in track if the trimmer requires considerable change. It will be necessary to again adjust the position of the antenna coil at 1400 Kc. These two adjustments should be tried several times until no change of trimmer adjustment is required at 1720 Kc.

SPECIFICATIONS

- Input Voltages and Currents
- "A" Battery - - 1.5 Volts—2 Amperes
- "B" Battery - - - 90 Volts—0.5 Ma.
- Power Output - - 70 Milliwatts Undistorted
- - - 160 Milliwatts Maximum
- Selectivity - 40 KC Broad at 1000 Times Signal
- Intermediate Frequency - - - - 456 KC
- Speaker - - - - 5" P.M., Dynamic
- Tuning Frequency Range - 528 to 1730 KC
- Sensitivity - - - - 50 Microvolts Average (For .05 Watt Output)

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
 Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
 Allow Chassis and Signal Generator to "Heat Up" for several minutes.
 The following equipment is required for aligning:
 A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
 Output Indicating Meter—Non-Metallic Screwdriver.
 Dummy Antennas—.1 mf. & 200 mmf.

SIGNAL GENERATOR FREQUENCY SETTING	DUMMY ANTENNA	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
456 KC	.1 mf.	Turn rotor to full open	1st I.F. (C7) & (C9) 2nd I.F. (C10) & (C11)
1730 KC	.1 mf.	Turn rotor to full open	Oscillator (C2)
1400 KC	200 mmf.	Turn Rotor to Max. Output Set Indicator to 1400 KC—See Note A	Antenna (C1)

NOTE A—If the pointer is not at 1400 KC on the dial, remove pointer from drive cord. Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

DRIVE CORD REPLACEMENT

Use a new drive cord approximately 38 inches in length. Tie one end to tension spring. Secure other end of spring to hook on gang condenser drive pulley. Thread free end of cord through hole in pulley rim. Turn gang condenser to full open position—See illustration.

Wind cord 3/4 turn counter-clockwise (from gang condenser end of chassis) around drive pulley. Wind cord 3/4 turns counter-clockwise (from rear of chassis) around tuning control shaft. Turns should progress toward front of chassis. Pass cord over idler studs A and B as shown in illustration. Wind cord 3/4 turn counter-clockwise (from gang condenser side of chassis) around drive pulley. Turn should be on right side (from rear of chassis) of pulley groove.

Pass cord through hole in pulley rim. Stretch tension spring and tie cord to tension spring.

DIAL POINTER ATTACHMENT—Tune in a signal of known frequency. Set the pointer at this frequency on the dial scale. Attach pointer to cord. —See illustration.

MODEL 14WG-469

MONTGOMERY-WARD & CO. MODELS 14WG-518, 14WG-519

SPECIFICATIONS

- Power Consumption - 28 Watts (At 117 volts AC Supply)
- Power Output -8 Watt Undistorted
- Selectivity - 55 KC Broad at 1000 times Signal
- Intermediate Frequency - 456 KC
- Speaker - 4" P.M. Dynamic
- Tuning Frequency Range - 528 to 1600 KC
- Sensitivity (For .05 Watt Output) - 20 Microvolts Average
- External Antenna -

NOTE A—Re-assemble chassis in cabinet. Replace back on cabinet.

NOTE B—Tune in a 1400 KC signal. If pointer is not at the 1400 KC mark on the dial scale, remove chassis and pull pointer off shaft. Set pointer at the 1400 KC mark and push back on shaft.

ISSUE "C" June 12, 1941
 When the 4" Electro-Dynamic Speaker replaces the 4" P.M. Speaker on the above chassis, the issue letter advances to "C". The speaker field replaces the 1500 ohm B+ filter resistor with additional changes in the B+ circuit connections to the 35L6GT Output tube. A 20 mf. 25 volt electrolytic condenser is placed across the 170 ohm 35L6GT cathode resistor. A 60 ohm 1.5 watt resistor is inserted in the heater circuit between the 12SK7 and 12SA7 tube heaters.

Part No.	Description
12A408	4" Electro-Dynamic Speaker..... \$ 1.76
45X317	20 mf. 25 Volt Dry Electrolytic..... .24
D95600	R13 60 ohm 1.5 Watt Carbon Resistor.... .12

The following parts are used on issues "A" and "B" chassis only:

- 12A380 4" P.M. Speaker..... 1.46
 - C95152 R11 1500 Ohm 1.0 Watt Carbon Resistor.. .06
- Issues "A," "B" and "C" chassis of the above models used an antenna trimmer (C3) mounted on the loop aerial assembly. On issue "D" chassis, the antenna trimmer (C3) has been replaced by a "Gimmick" fixed capacitance, consisting of 2 wires, one wrapped around the other. The 1400 KC adjustment is made at the factory and need not be made in the field.
- The following part is used on issues "A," "B" and "C" chassis only:
- 17A116 C3 2.5-23 mmf. antenna trimmer \$0.06

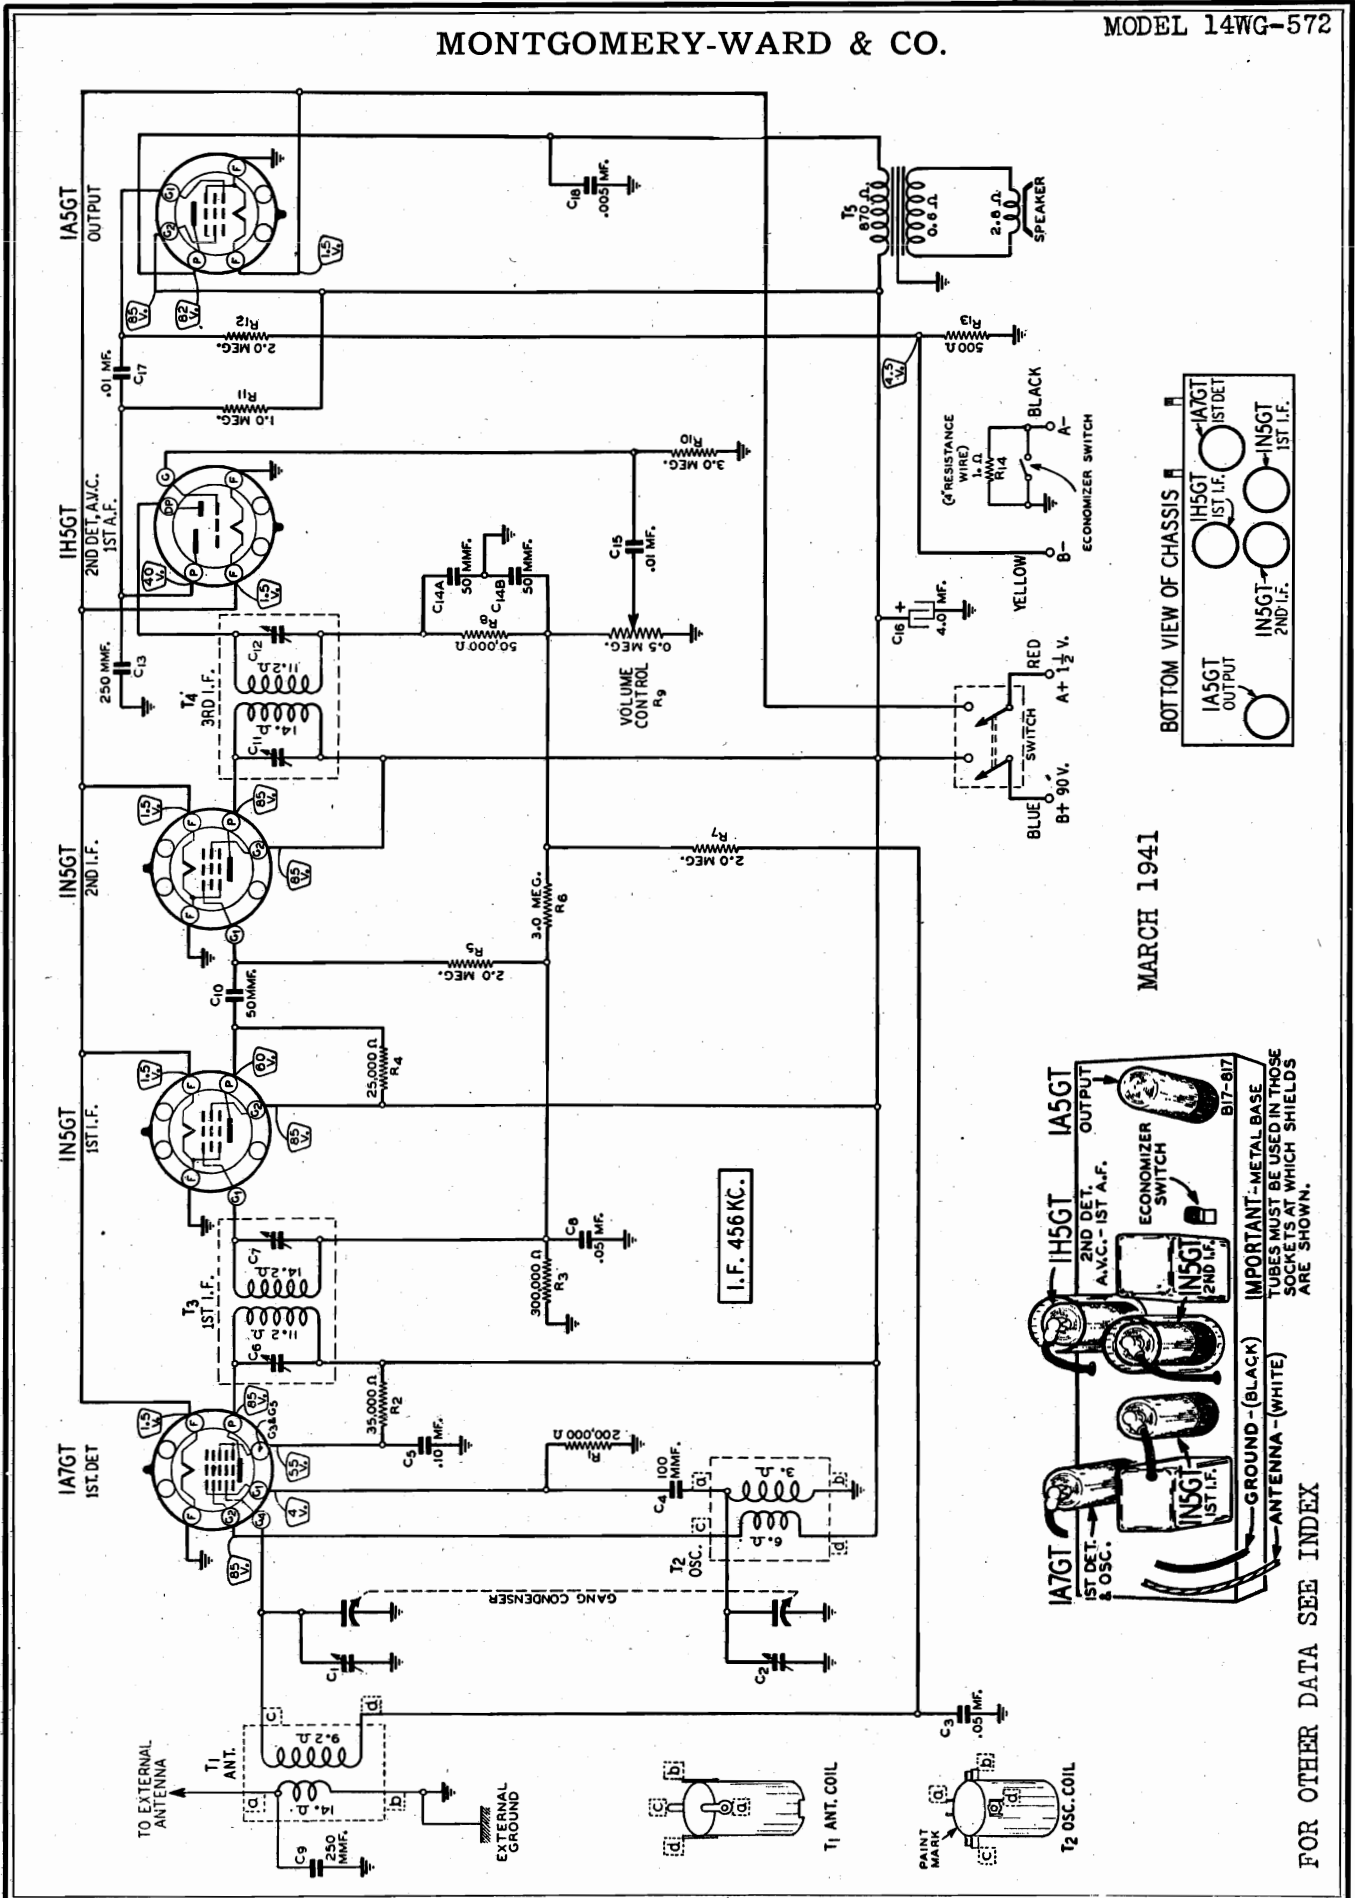

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
 Allow Chassis and Signal Generator to "Heat Up" for several Minutes.
 The equipment in column at right is required for aligning:

FREQUENCY SETTING	SIGNAL GENERATOR ANTENNA CONNECTION	GROUND CONNECTION	DUMMY ANTENNA	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
456 KC	Control Grid 12SK7—I.F.	Point "X" (12SK7—I.F. Prong No. 3)	.1 mf.	Turn Rotor to full open	2nd I.F. (C9) & (C10)
456 KC	Control Grid 12SA7—Ist Det.	Same As Above	.1 mf.	Turn Rotor to full open	1st I.F. (C7) & (C8)
1600 KC	Control Grid 12SA7—Ist Det.	Same As Above	.1 mf.	Turn Rotor to full open	Oscillator (C2)
1400 KC	External Antenna Clip On Loop —See Note A	External Ground Clip On Loop	50 mmf.	Turn Rotor to Max. Output Set Indicator to 1400 KC—See Note B	Antenna (C3)

NOTE A—Re-assemble chassis in cabinet, pointer is not at the 1400 KC mark on the Fasten loop assembly to back of cabinet. dial scale, pull pointer off shaft. Set pointer
NOTE B—Tune in a 1400 KC signal. If at the 1400 KC mark and push back on shaft.

ANTENNA

An Air Wave Loop Aerial is built on the inside of the back cover of the cabinet of this radio. For reception of local or powerful nearby stations no other antenna or ground is usually required.

However, more stations will be heard and noise will often be reduced by using an outside antenna and a good ground. For locations in the city or close to the broadcasting stations, the antenna should be 20 to 35 feet in length while for locations in the country or at a distance from the broadcasting stations, use a 35 to 60 foot antenna.

When using the radio on AC, if there appears to be excessive hum, reverse the plug. Leave the plug inserted the way which gives the least hum.

Radios for 25 cycle AC operation are so marked.

110 Volt D.C. Operation—Insert plug so that prong on same side as ribbed side of cord is on the positive side of the line. **CAUTION**—If polarity of line is not known, insert plug. If set does not operate after one minute, reverse plug.

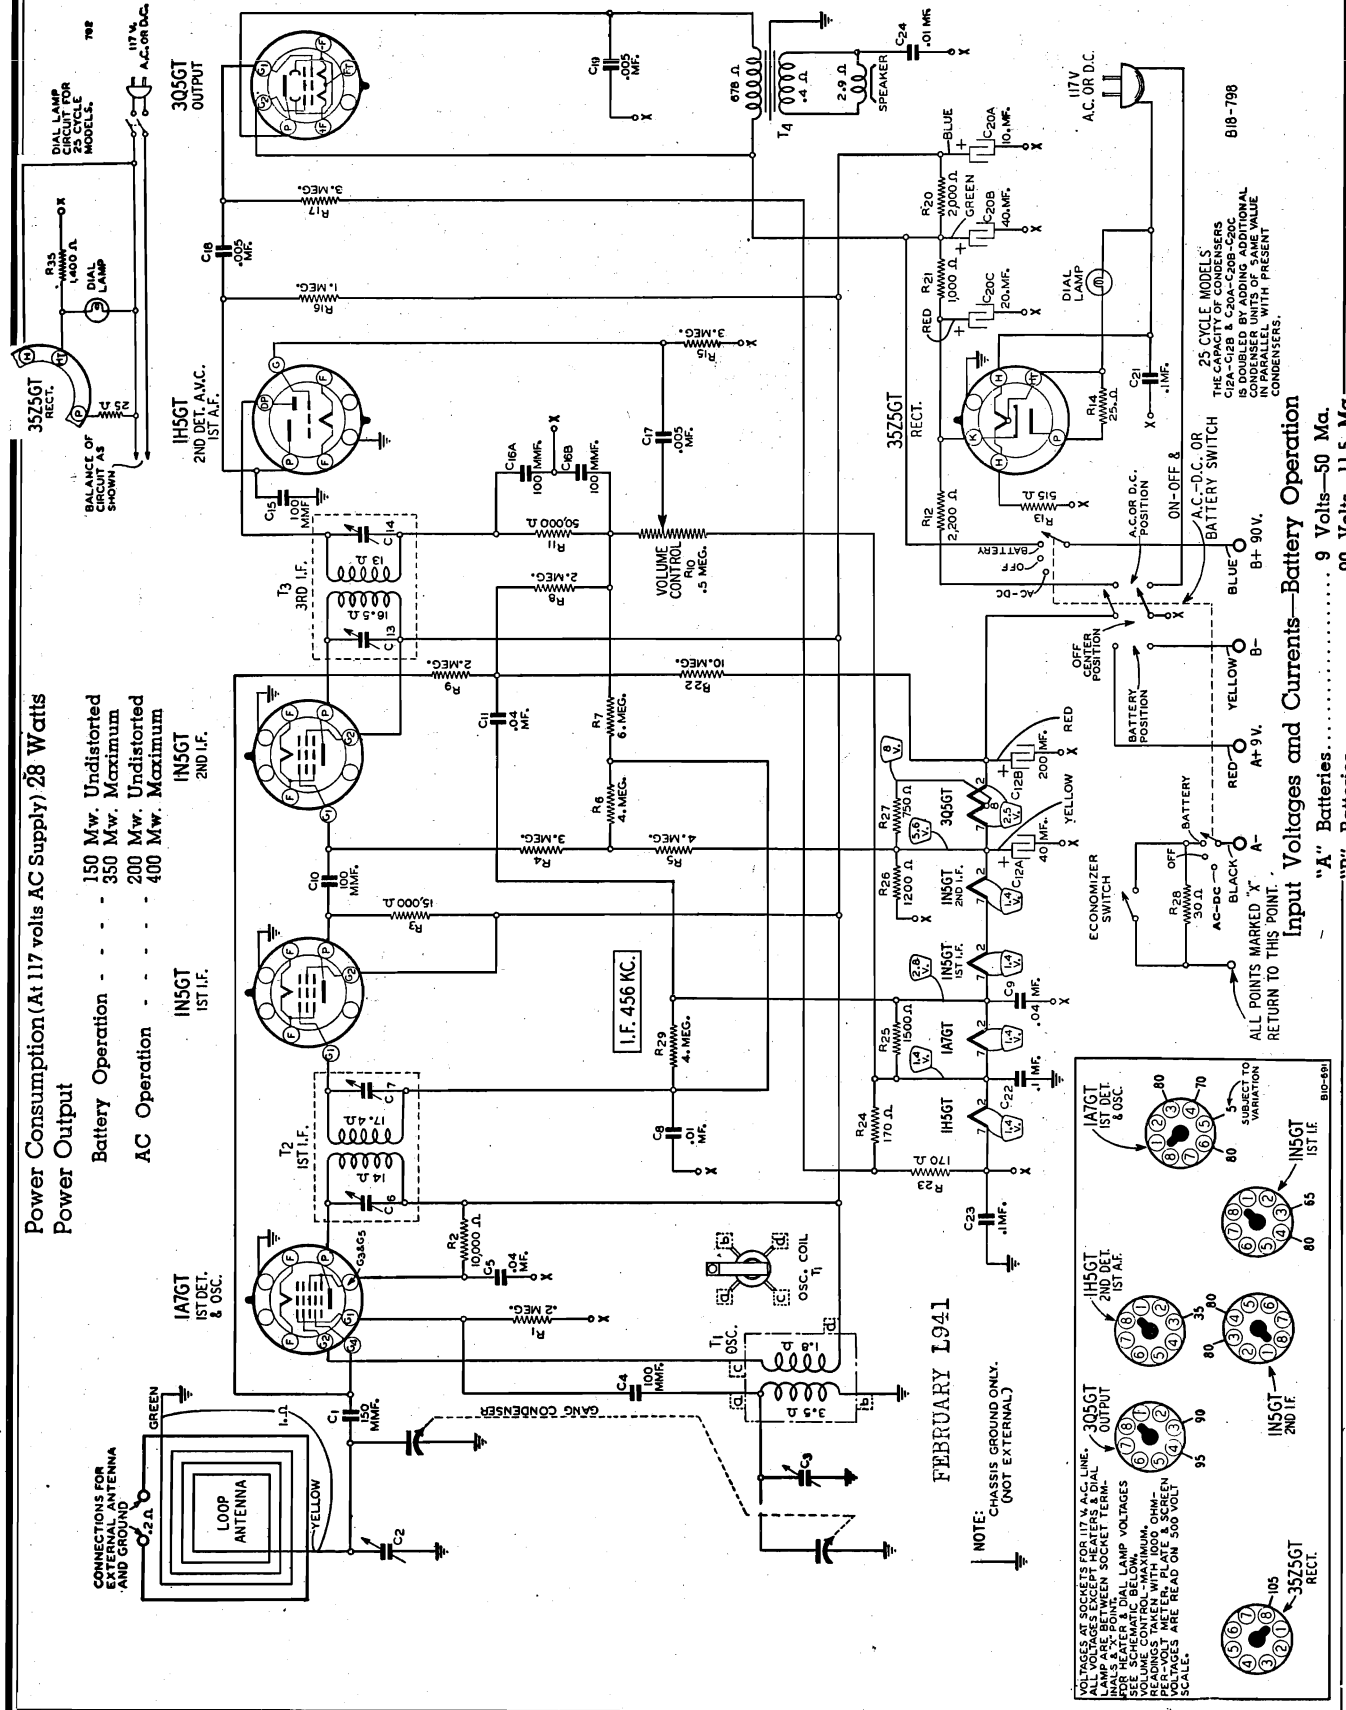

CHECK YOUR LINE VOLTAGE
Unless otherwise marked, this radio must be operated on a power supply of 105-125 Volts AC, 50 to 60 cycles only, or 105-125 Volts DC.

A GROUND CONNECTION IS REQUIRED if an external antenna is used. A ground connection may be obtained by connecting to a water pipe, radiator, or a pipe driven into the ground.

The antenna and ground connections are made at the clips marked "External Antenna" and "External Ground" on the cabinet back.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
 The following equipment is required for aligning:
 A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
 Output Indicating Meter—Non-Metallic Screwdriver.
 Dummy Antennas—.1 mf., 50 mmf.

SIGNAL GENERATOR FREQUENCY SETTING	ANTENNA CONNECTION	GROUND CONNECTION	DUMMY ANTENNA	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
456 KC	External Antenna Clip on Loop	External Ground Clip on Loop	.1 mf.	Turn Rotor to full open	1st I.F. (C6) & (C7) 3rd I.F. (C13) & (C14)
1600 KC	External Antenna Clip on Loop	External Ground Clip on Loop	.1 mf.	Turn Rotor to full open	Oscillator (C3)
1400 KC	External Antenna Clip on Loop	External Ground Clip on Loop	See Note A	Turn Rotor to max. output	Antenna (C2)

Car Antenna Adjustment—Tune in weak signal near 1400 KC—Adjust Car Antenna Trimmer C25 for maximum output. This trimmer is in special antenna coil can at left side of chassis (See illustration in Auto Installation Sheet).

Dial Pointer Attachment—Tune in a signal of known frequency. Set pointer to this frequency mark on dial scale. Attach pointer to drive cord—See illustration.

NOTE A—Re-assemble chassis in cabinet. Close back on cabinet.
 CALIBRATION—To obtain dial scale calibration, tune in an 800 KC signal. The pointer should be at the 800 KC mark on the dial. If it is not, set the pointer at the 800 KC mark.

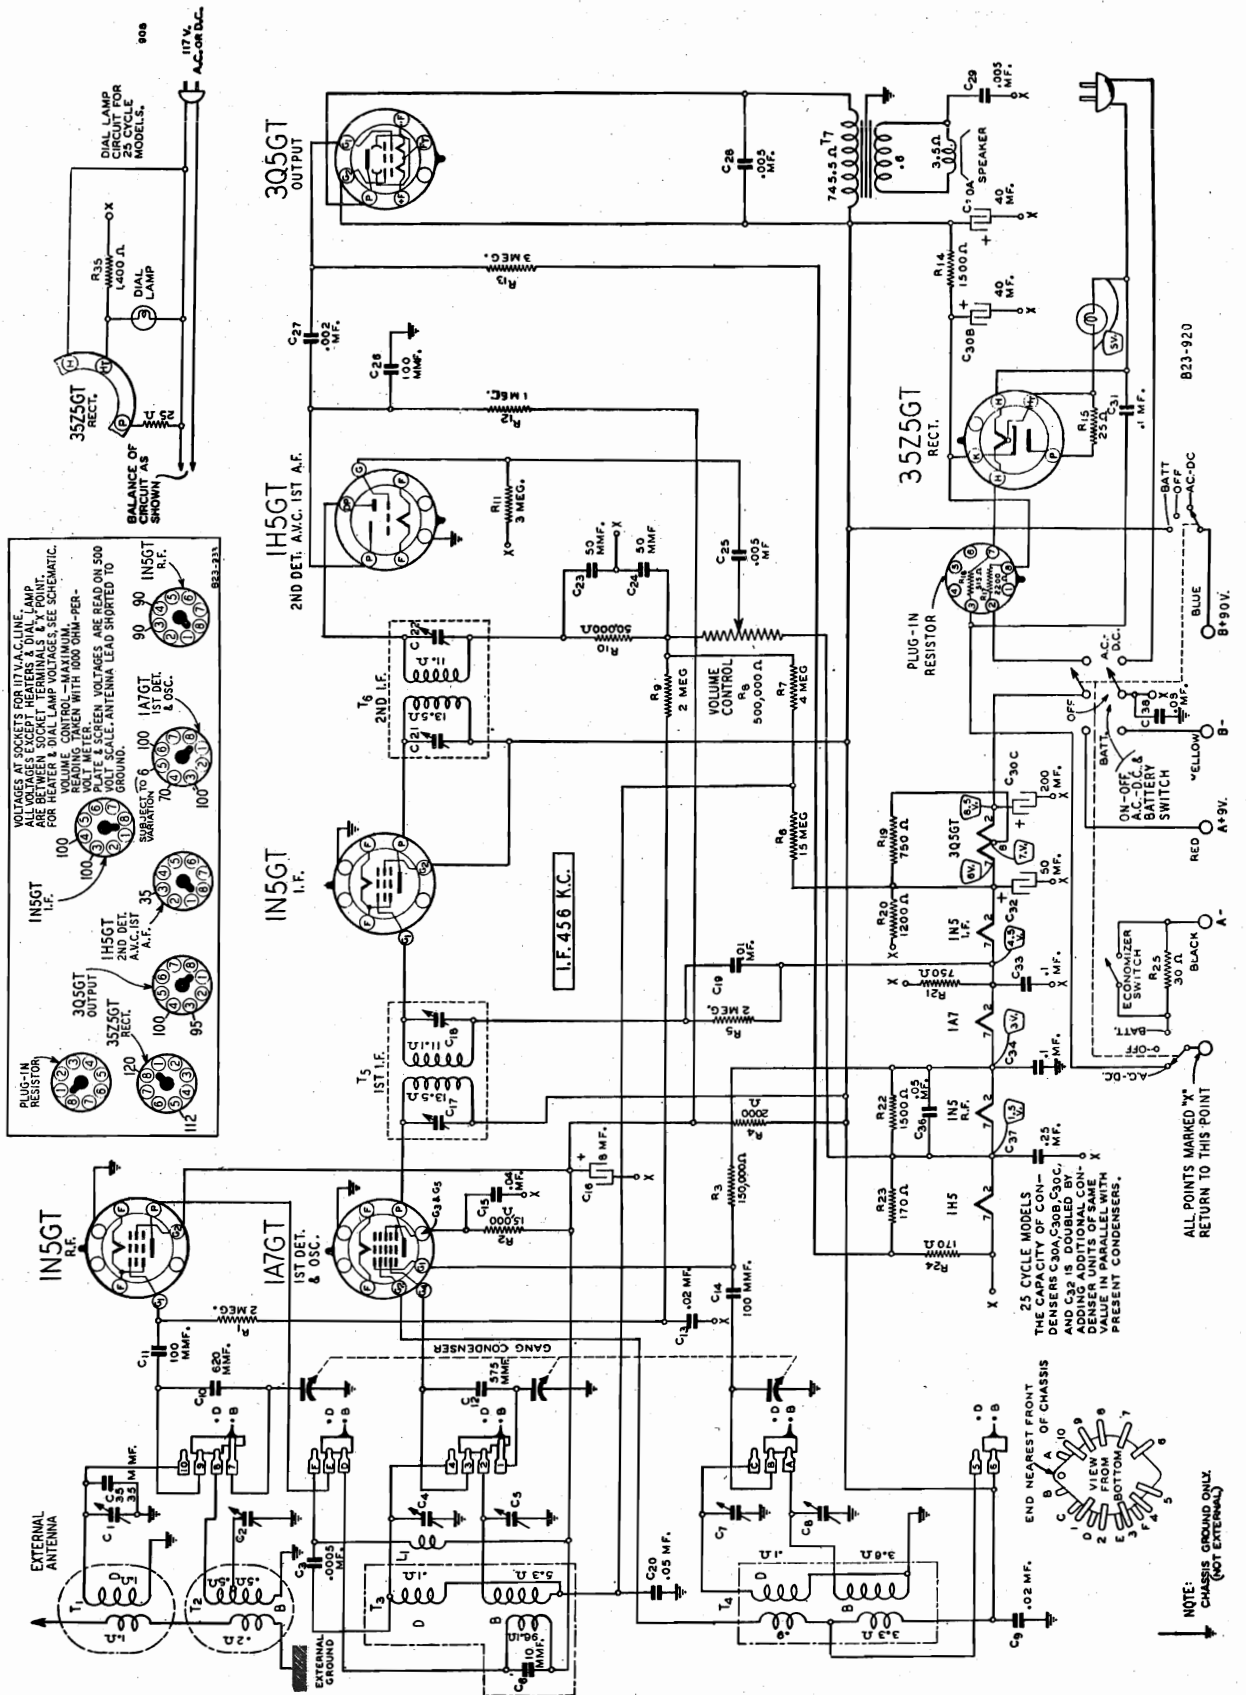

If radio is equipped with special antenna coil for use in car, make the following additional adjustment after the radio is installed in the car and the car antenna is connected.

VOLTAGES AT SOCKETS FOR TUBES A-DIAL LAMP ARE BETWEEN SOCKET TERMINALS IN HEATER DIAL LAMP VOLTAGES SEE SCHEMATIC BELOW. READINGS TAKEN WITH 1000 OHM PER-VOLT METER, PLATE & SCREEN SCALES ARE READ ON 500 VOLT SCALE.

DRIVE CORD REPLACEMENT

Turn gang condenser to completely closed position—See illustration. Use a new drive cord 35 inches in length. Tie a knot with small loop at one end of drive cord. Secure loop to hook on drive pulley. Thread cord through hole in rim of drive pulley. Pass cord clockwise (from pulley side of chassis) around drive pulley and around pulleys A, B, C, and D as shown.

Wind cord 3 1/2 turns clockwise (from rear of chassis) around tuning control shaft. Turns should progress toward back of chassis. Continue cord around pulley E and around gang condenser drive pulley as shown. Thread cord through hole in pulley rim and tie to tension spring. Fasten other end of spring to hook on pulley.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments. Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
 A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
 Output Indicating Meter—Non-Metallic Screwdriver.
 Dummy Antennas—1 mf., 50 mmf.

FREQUENCY SETTING	SIGNAL GEN. ANTENNA CONNECTION	GROUND CONNECTION	DUMMY ANTENNA	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
485 KC	External on Loop	External on Loop	.1 mf.	Turn Rotor to full open	1st I.F. (C7) & (C8) 3rd I.F. (C12) & (C13)
1600 KC	External on Loop	External on Loop	.1 mf.	Turn Rotor to full open	Oscillator (C4)

If radio is equipped with special antenna coil for use in car, make the following additional adjustment after the radio is installed in the car and the car antenna is connected.
 Car Antenna Adjustment—Tune in weak signal near 1400 KC—Adjust Car Antenna Trimmer C3 for maximum output. This trimmer is in special antenna coil can at left side of chassis (See illustration in Auto Installation Sheet).

NOTE A—Reassemble chassis in Cabinet. Close back on cabinet.
 CALIBRATION—To obtain dial scale calibration, tune in an 800 KC signal. The pointer should be at the 800 KC mark on the dial. If it is not, set the pointer at the 800 KC mark.

ANTENNA

This radio is equipped with a built-in Airwave Loop Aerial. For reception of local or powerful near-by stations, no other antenna or ground is usually required. Directional effects are obtained when using the loop aerial. Rotate the radio until signal pickup is at a maximum and there is least interference from nearby stations.

More stations will be heard and noise will often be reduced by using an outside antenna and a good ground.

For locations in the city or close to broadcasting stations, the antenna should be 20 to 35 feet in length while for locations in the country or at a distance from the broadcasting stations, use a 35 to 60 foot antenna.

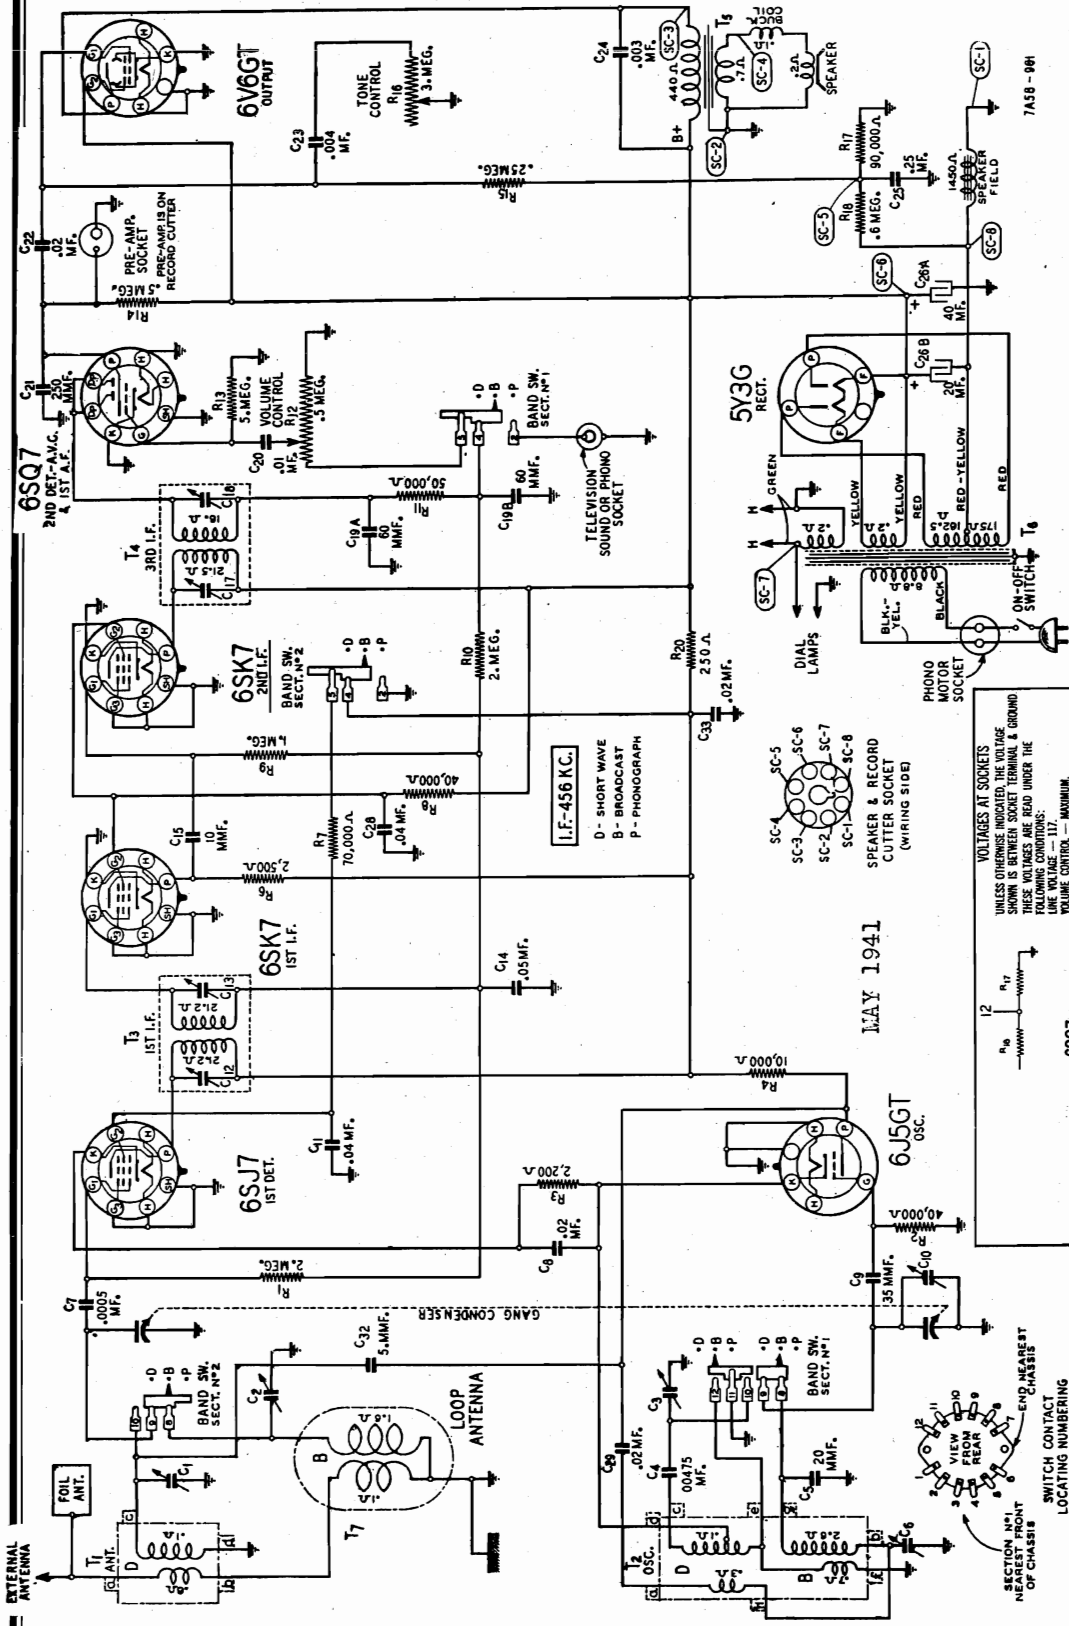

A GROUND CONNECTION IS REQUIRED if an external antenna is used. A ground connection may be obtained by connecting to a water pipe, radiator, or pipe driven into the ground.

The antenna and ground connections are made at the clips on the loop aerial. Open the cabinet back and pass the antenna and ground leads through the holes in the cabinet back—See illustration. Connect the antenna lead to either clip and the ground lead to the other clip.

MONTGOMERY-WARD & CO.

MODEL 14WG-737

PHONOGRAM CONNECTIONS

Phonograph records may be played through this radio. On the back of the chassis base is a socket for a single shielded pin tip at which connections are made—See illustration. The connector on the cable from any standard phono pickup can be inserted in the socket.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
 Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
 Allow Chassis and Signal Generator to "Heat Up" for several minutes.

I.F.	SIGNAL GENERATOR		CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM

TELEVISION SOUND AND FREQUENCY MODULATION CONNECTIONS

If Television or Frequency Modulation programs become available in your community, this radio may be used in conjunction with a Television Picture Receiver and Sound Converter, or a Frequency Modulation Converter to reproduce these programs.

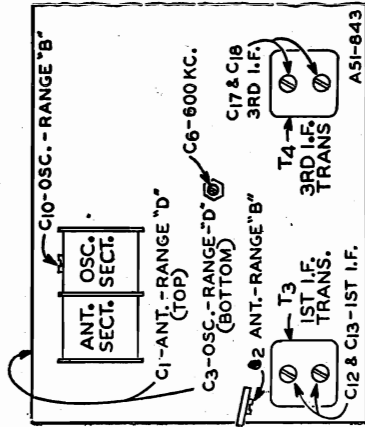

On the back of the chassis base is a single pin tip socket. The connector on the cable from a television receiver or a frequency modulation converter can be inserted in this socket.

SPECIFICATIONS

Power Consumption	60 Watts (At 117 volts 60 cycles)
80 Watts (Phonograph Operating)	
Power Output	2.5 Watts Undistorted 3.5 Watts Maximum
Intermediate Frequency	40 KC Broad at 1000 times Signal - - - - - 456 KC
Speaker	8" Electro-Dynamic
Tuning Frequency Range	
B Range	528 to 1600 KC
D Range	5750 to 18300 KC
Sensitivity—External Antenna (For 0.5 Watt output)	
B Range	3 Microvolts Average
D Range	5 Microvolts Average

A50-965

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1400 KC on the dial remove pointer from drive cord. Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

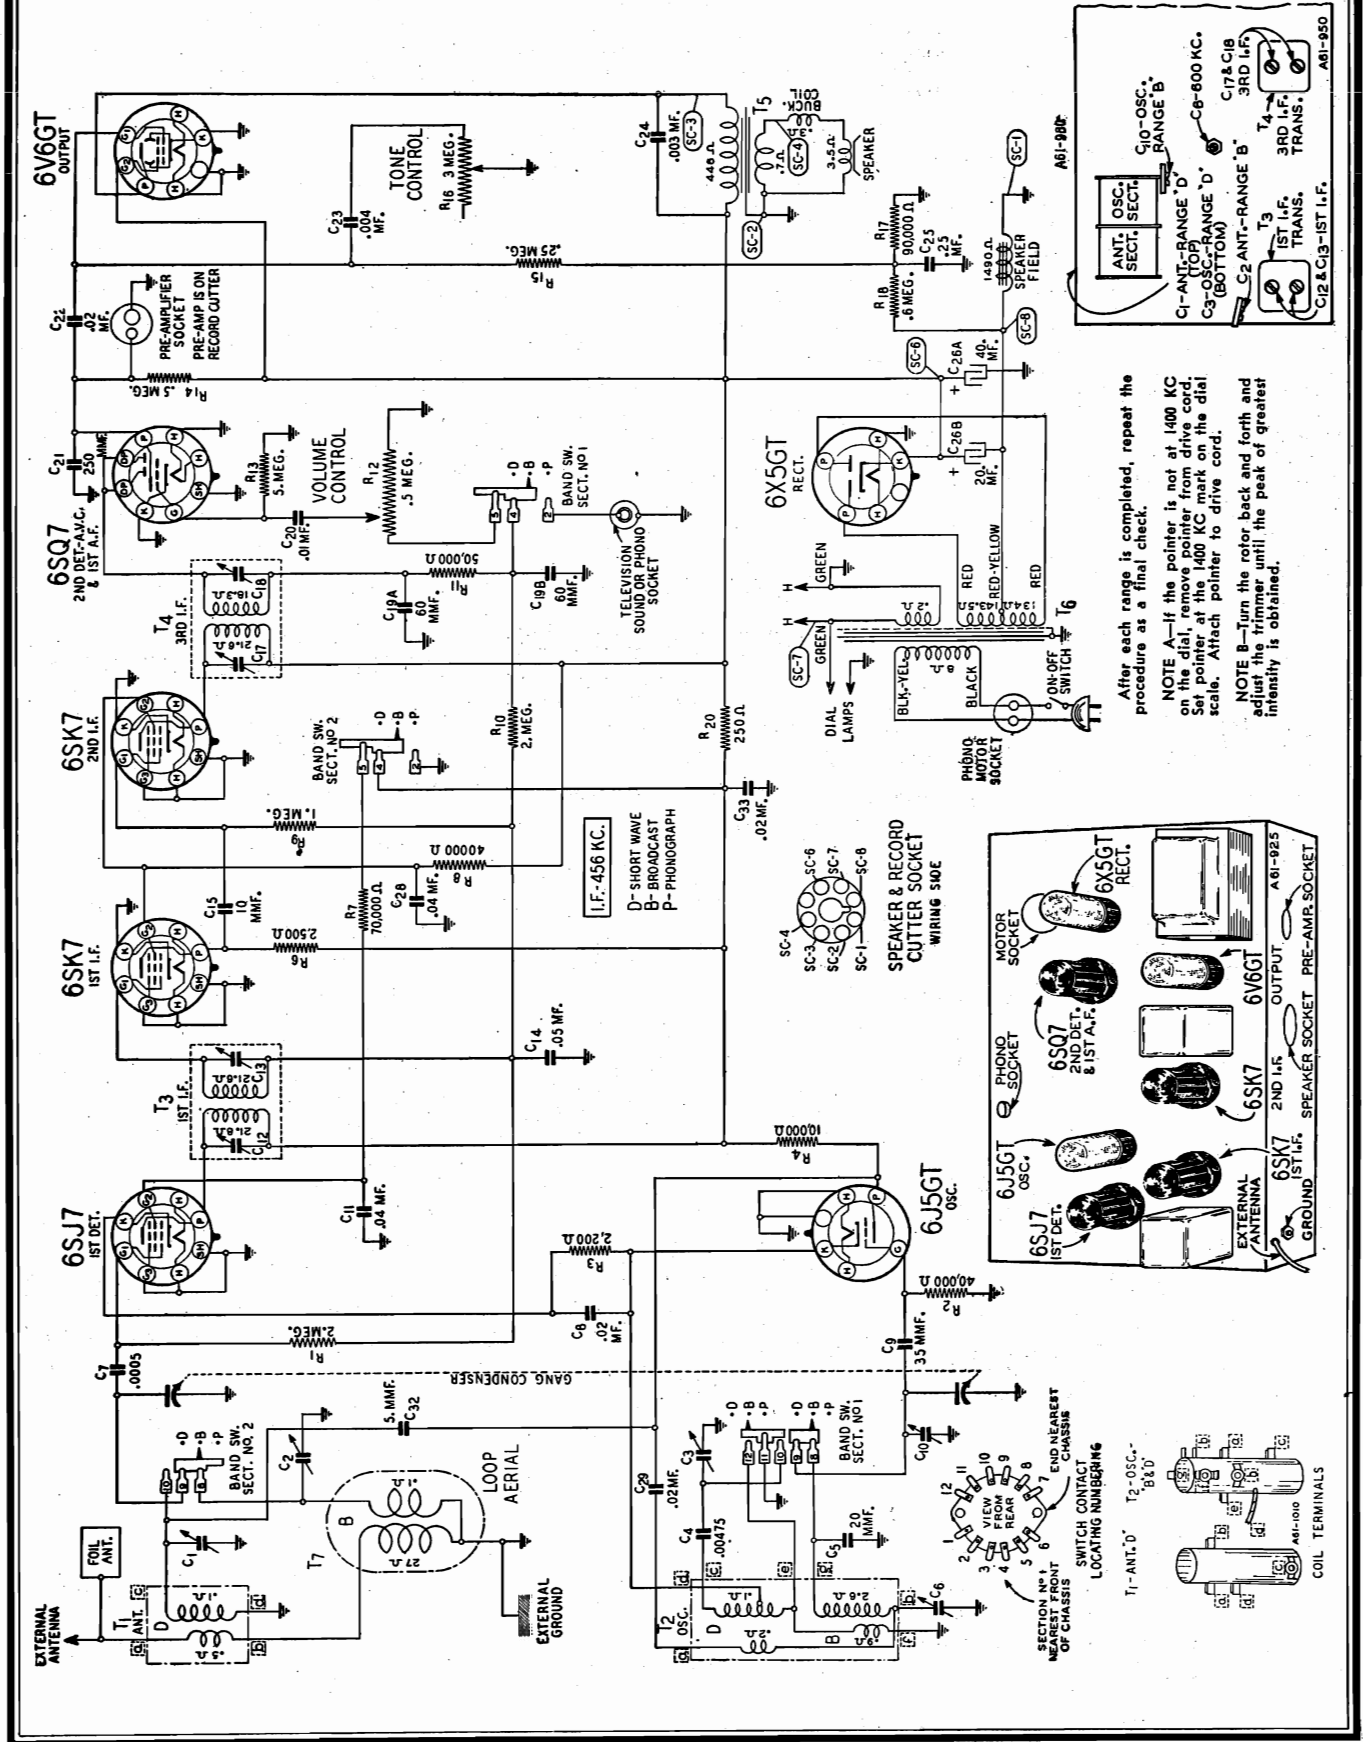

DRIVE CORD REPLACEMENT

Turn gang condenser to full open position. Using a new drive cord 43" in length, tie one end to tension spring. Fasten other end of tension spring to hook on drive pulley. Pass cord through slot in drive pulley rim and continue 3/4 turn around drive pulley forward front of chassis. Continue cord around idler stud "A." Wind 3/4 turns clockwise (from front of chassis) around tuning shaft. Turns should progress toward rear of chassis.

Pass cord through string guide, around idler pulleys "B" and "C" and idler stud "D"—See illustration. Continue cord 3/4 turn counter-clockwise (from gang end of chassis) around drive pulley. Cord should be on left side of pulley groove (from front of chassis). Pass cord through slot in pulley rim. Stretch tension spring and tie free end of cord to spring.

MONTGOMERY-WARD & CO.

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1400 KC on the dial, remove pointer from drive cord. Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

MODEL 14WG-739

MONTGOMERY-WARD & CO.

DRIVE CORD REPLACEMENT

Turn gang condenser to full open position—See illustration. Use a new drive cord 37 inches in length.

Tie one end of cord to tension spring. Pass other end of cord up through hole in groove of drive pulley. Pull cord through hole until spring is flush against inside of pulley rim.

Wind cord 3/4 turn counter-clockwise (from gang end of chassis) around drive pulley. Then wind 3 1/2 turns clockwise (from front of chassis) around tuning control shaft. These turns should progress away from chassis. Pass cord through wire string guide and over idler studs A and B as shown, then wind cord 3/4 turn counter-clockwise (from gang end of chassis) around drive pulley. This turn should be on right side (from front of chassis) of pulley groove.

Pass cord through hole in groove of drive pulley. Tie cord to tension spring. Fasten other end of spring to hook on drive pulley.

JUNE 1941

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning: An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver. Dummy Antennas—1 mf., 100 mmf., and 400 ohms.

	SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM

D Range - - - - - 5 Microvolts Average

ANTENNA AND GROUND

Two built-in Air Wave Aerials are incorporated in the cabinet.

One of these, the loop aerial, is used for broadcast band reception. The other, a counterpoise foil aerial, is used for reception on the short wave band. For the reception of local or nearby stations, an outside antenna and ground are usually not required.

In general, however, more stations will be heard by using an outside antenna and ground. To receive distant short wave stations, an outside antenna is essential.

If an outside antenna is used, it should be 50 to 60 feet long, including the lead-in.

A good ground connection is recommended if an outside antenna is used. A ground connection may be obtained by connecting to a water pipe, radiator, or a pipe driven into the ground.

Avoid using gas pipes or electrical conduits for grounds.

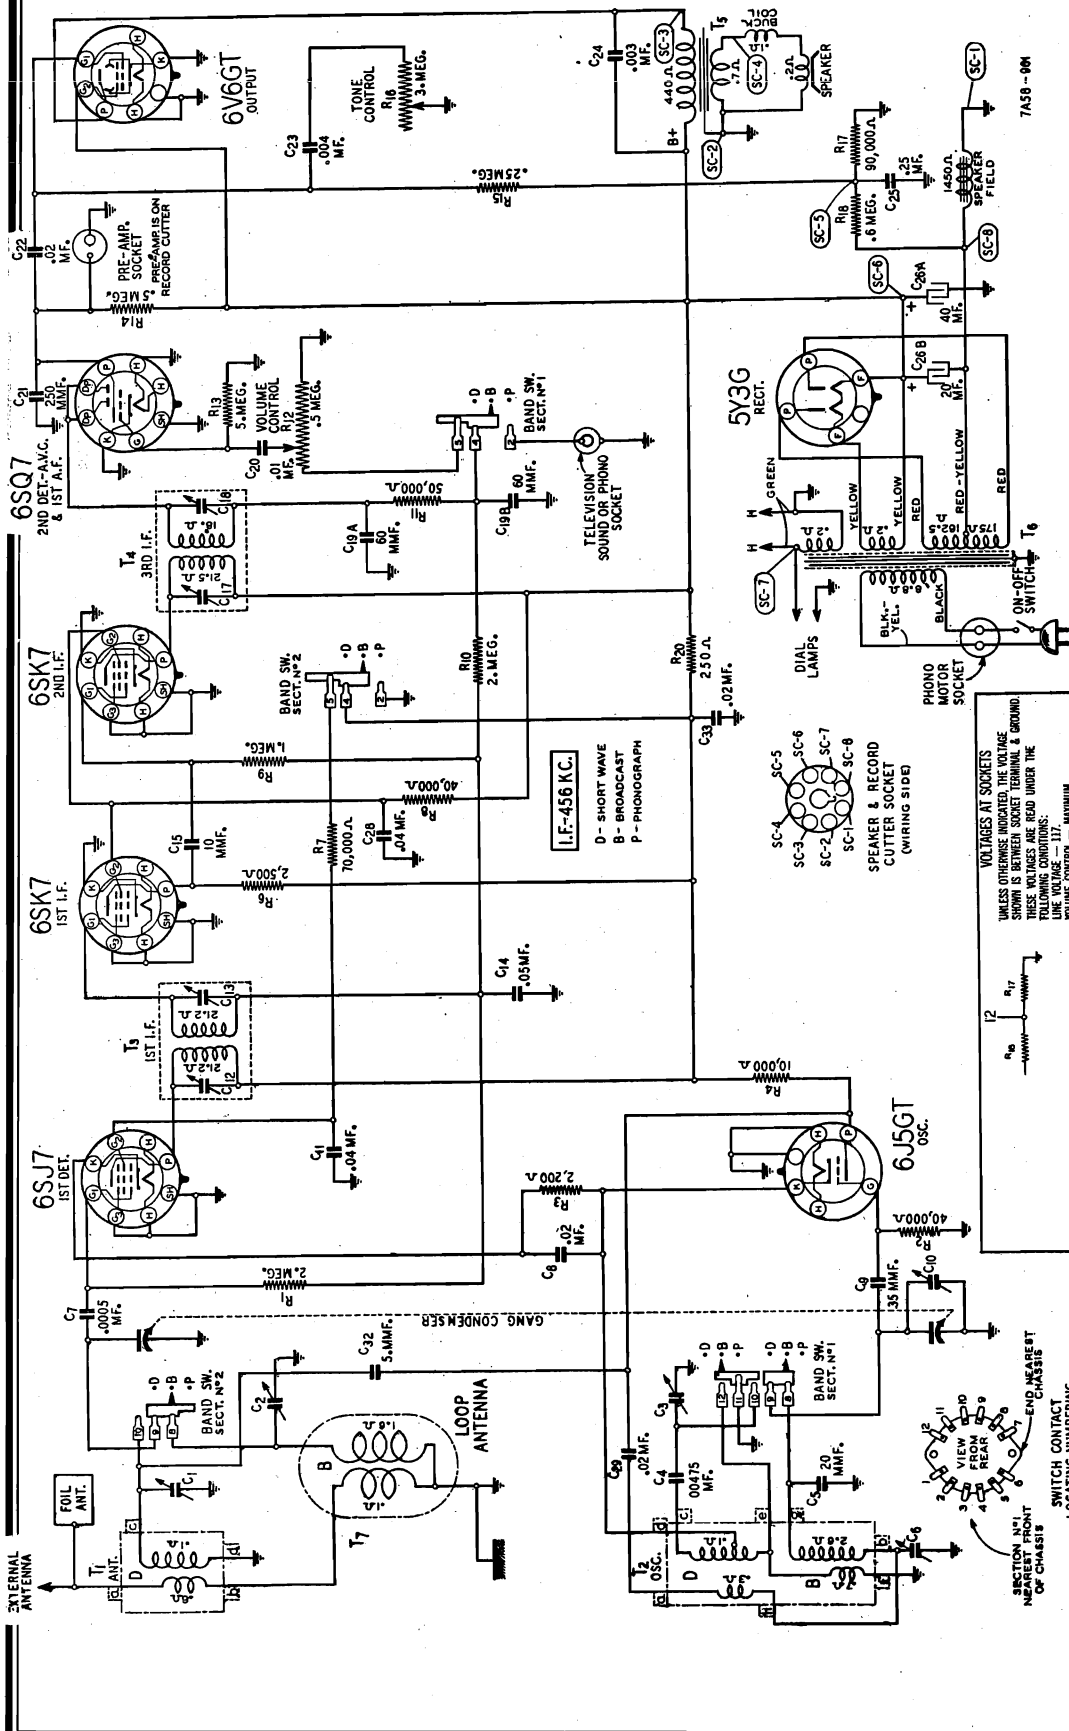

The ground connection is made under the screw (marked GND) on the back panel of the chassis base.

Unless otherwise marked, this radio must be operated on 105 to 125 volt, 60 cycle AC supply only. If there is any doubt, consult the local power company before inserting the plug. Radios of this model which are to be used on 25 cycle, 230 volt, or other service are so marked.

Sensitivity—External Antenna—	
(For 0.5 Watt output)	
B Range	3 Microvolts Average
D Range	5 Microvolts Average

ANTENNA AND GROUND

Two built-in Air Wave Aerials are incorporated in the cabinet. A white wire with black tracer and an antenna marker will be found coming out of the chassis. If it is desired to operate the radio using the loop and counterpoise foil antennas, do not connect this wire to anything. If it is desired to operate the radio using an outside antenna, connect this wire to the lead from the outside antenna.

The wire which is connected to the counterpoise foil antenna should never be disconnected.

If an outside antenna is used, it should be 50 to 60 feet long, including the lead-in.

A good ground connection is recommended if an outside antenna is used. A ground connection may be obtained by connecting to a water pipe, radiator, or a pipe driven in to the ground.

Avoid using gas pipes or electrical conduits for grounds. The ground connection is made under the screw (marked GND) on the back panel of the chassis base.

One of these, the loop aerial, is used for broadcast band reception. The other, a counterpoise foil aerial, is used for reception on the short wave band. For the reception of local or nearby stations, an outside antenna and ground are usually not required.

DRIVE CORD REPLACEMENT

Turn gang condenser to full open position. Using a new drive cord 43" in length, tie one end to tension spring. Fasten other end of tension spring to hook on drive pulley. Pass cord through slot in drive pulley rim and continue 3/4 turn around drive pulley toward front of chassis. Continue cord around idler stud "A." Wind 3/4 turns clockwise (from front of chassis) around tuning shaft. Turns should progress toward rear of chassis.

Pass cord through string guide, around idler pulleys "B" and "C" and idler stud "D"—See illustration. Continue cord 3/4 turn counter-clockwise (from gang end of chassis) around drive pulley. Cord should be on left side of pulley groove (from front of chassis). Pass cord through slot in pulley rim. Stretch tension spring and tie free end of cord to spring.

On the back of the chassis base is a socket to which is connected the phono cable shielded pin tip. Upon removal of this pin tip, the connector on the cable from a television receiver or a frequency modulation converter can be inserted in the socket.

TELEVISION SOUND AND FREQUENCY MODULATION CONNECTIONS

After each range is completed, repeat the procedure as a final check. NOTE A—If the pointer is not at 1400 KC on the dial, remove pointer from drive cord. Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord. NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

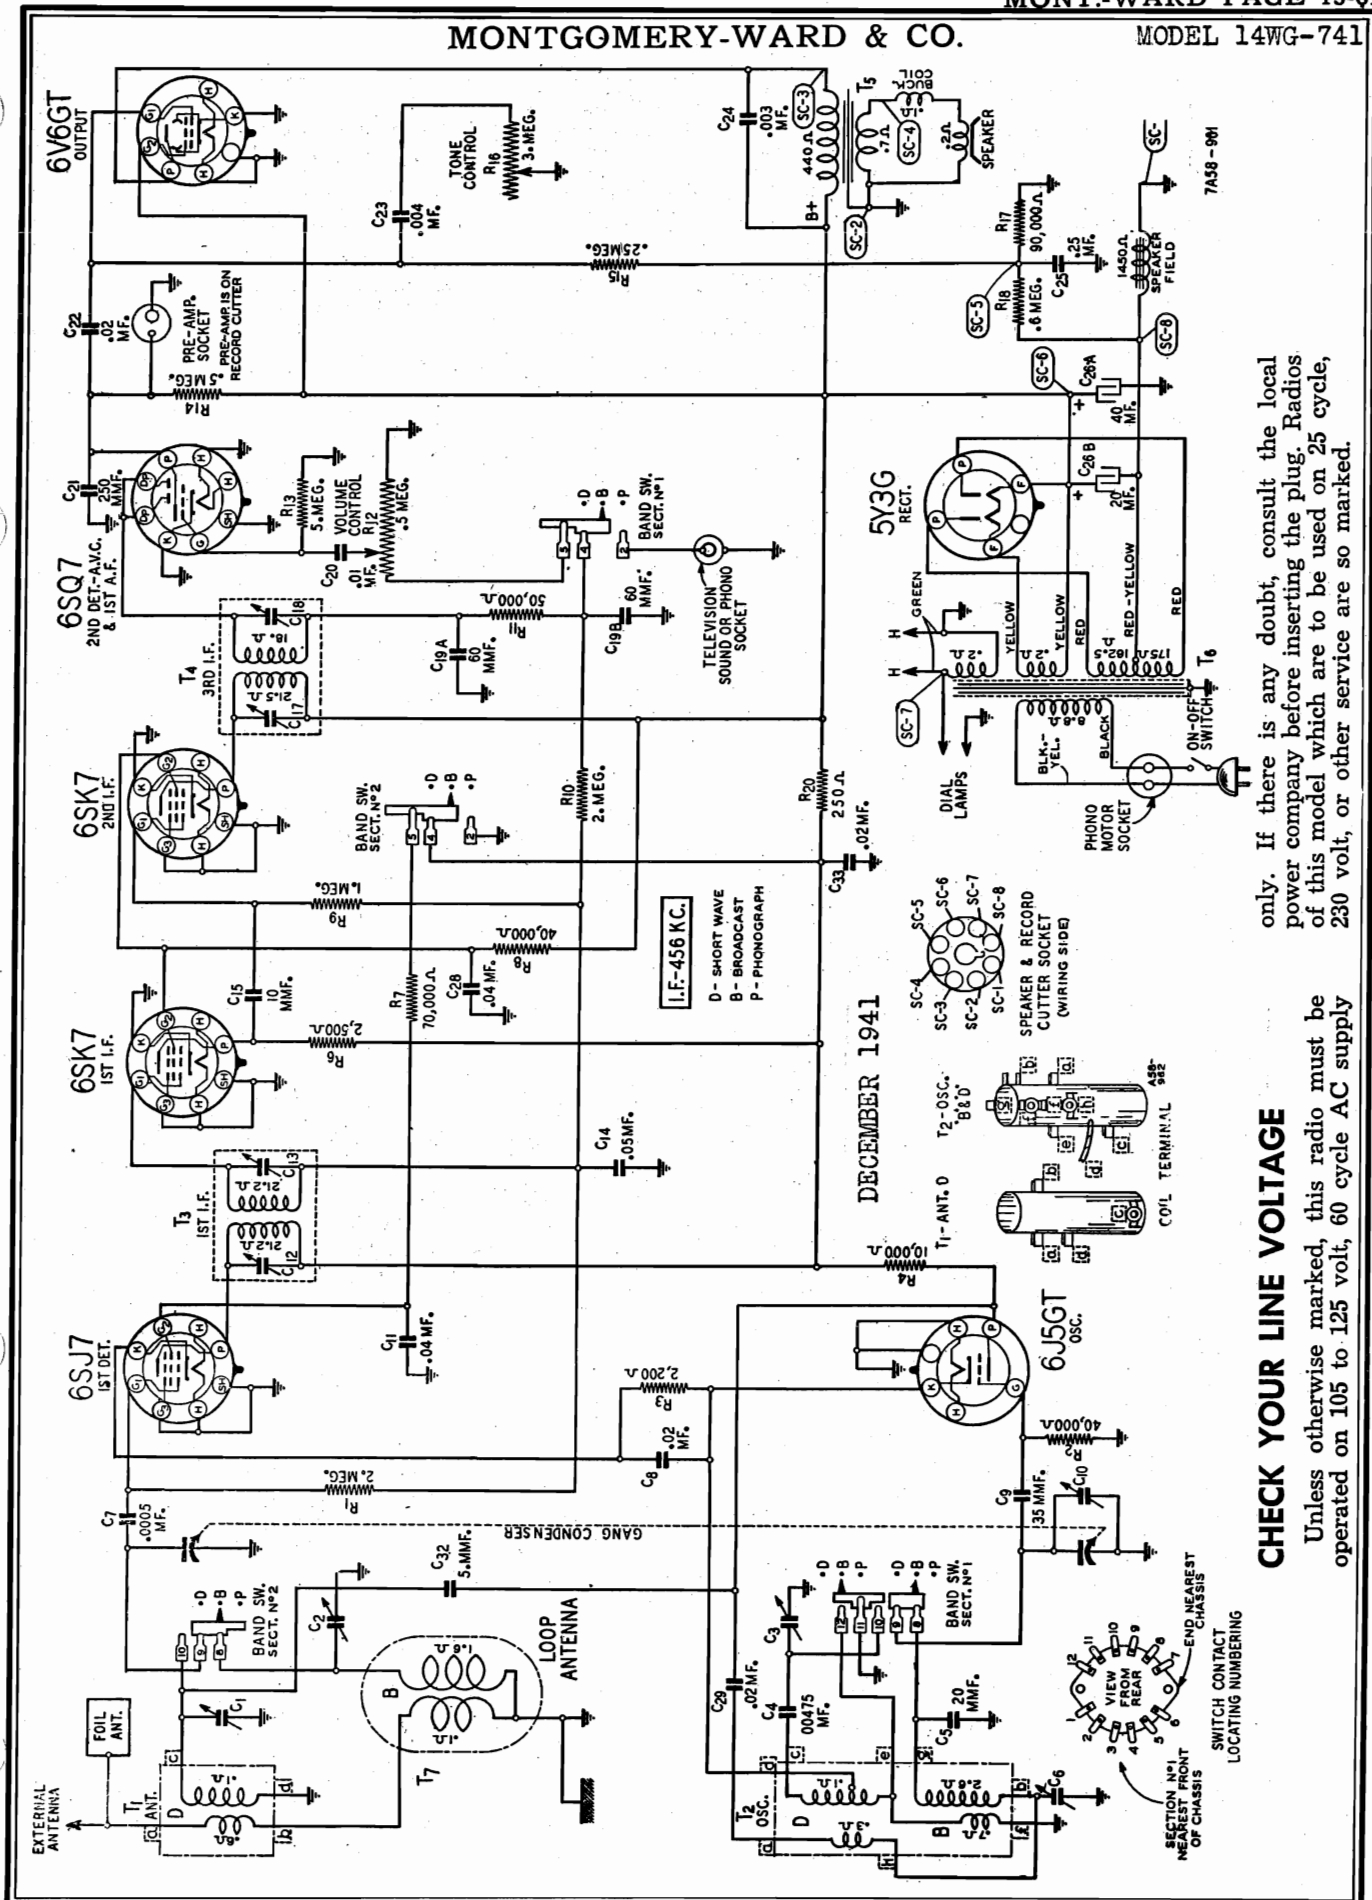

ALIGNMENT PROCEDURE

The following equipment is required for aligning: An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed. Output Indicating Meter—Non-Metallic Screwdriver. Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

SIGNAL GENERATOR FREQUENCY CONNECTION AT RADIO	BAND DUMMY SWITCH ANTENNA SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I.F. 455 KC	Grid of 1st Det. .1 mf.	B Range	Turn Rotor to Full Open
RANGE B 1600 KC	Antenna Lead 100 mmf.	B Range	Turn Rotor to Full Open

LOOP RANGE 1400 KC	Antenna Lead 100 mmf.	B Range	Turn Rotor to Max. Output Ant. Range B (C2)

MONTGOMERY-WARD & CO.

MODEL 14WG-741

only. If there is any doubt, consult the local power company before inserting the plug. Radios of this model which are to be used on 25 cycle, 230 volt, or other service are so marked.

CHECK YOUR LINE VOLTAGE

Unless otherwise marked, this radio must be operated on 105 to 125 volt, 60 cycle AC supply

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.
Dummy Antennas—1 mf., 100 mmf., and 400 ohms.

	SIGNAL GENERATOR		BAND SWITCH		CONDENSER	ADJUST TRIMMERS TO
	FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	SETTING	SETTING	MAXIMUM
I.F.	456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C12) & (C13) 3rd I.F. (C17) & (C18)
RANGE B	1600 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C10)
	1400 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1400 KC See Note A	Ant. Range B (C2)
	600 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C6) Rock Rotor—See Note B
RANGE D	18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C3) Ant. Range D (C1)
	17,000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Rock Rotor—See Note B
LOOP RANGE B	1400 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output	Ant. Range B (C2)

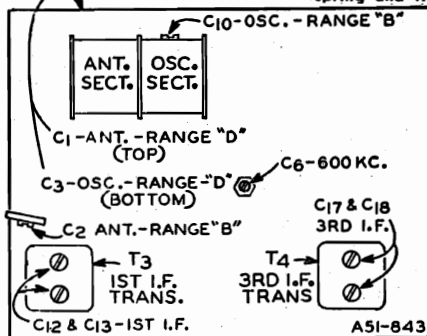

DRIVE CORD REPLACEMENT

Turn gang condenser to full open position. Using a new drive cord 43" in length, tie one end to tension spring. Fasten other end of tension spring to hook on drive pulley. Pass cord through slot in drive pulley rim and continue ¼ turn around drive pulley toward front of chassis. Continue cord around idler stud "A." Wind 3½ turns clockwise (from front of chassis) around tuning shaft. Turns should progress toward rear of chassis.

Pass cord through string guide, around idler pulleys "B" and "C" and idler stud "D"—See illustration. Continue cord ¼ turn counter-clockwise (from gang end of chassis) around drive pulley. Cord should be on left side of pulley groove (from front of chassis). Pass cord through slot in pulley rim. Stretch tension spring and tie free end of cord to spring.

A white wire with black tracer and an antenna marker will be found coming out of the chassis. If it is desired to operate the radio using the loop and counterpoise foil antennas, do not connect this wire to anything. If it is desired to operate the radio using an outside antenna, connect this wire to the lead from the outside antenna.

The wire which is connected to the counterpoise foil antenna should never be disconnected.

FOR SEEBURG
MODEL J RE-
CORD CHANGER
SEE RIDER'S
"AUTOMATIC
RECORD CHANGERS
AND RECORDERS"

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1400 KC on the dial, remove pointer from drive cord. Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

SPECIFICATIONS

Power Consumption 60 Watts (At 117 volts 60 cycles)
80 Watts (Phonograph Operating)

Power Output 2.5 Watts Undistorted
3.5 Watts Maximum

						Rock Rotor—See Note B

LINE VOLTAGE RANGE
The radio will operate satisfactorily within a line voltage range of 25 to 42 volts. If the line voltage is higher than 42, it will be necessary to use a series resistor to cut it down. If the voltage varies, a variable resistor may be required.

ANTENNA AND GROUND

For best results, an outside antenna 50 to 60 feet long, including the lead-in, should be used. An inside antenna is not satisfactory for this radio. The antenna should be as high and as far from surrounding objects as possible.

Run the antenna at right angles to any 32 volt lines and keep it as far away from these lines as possible in order to avoid line noise being carried into the radio via the antenna.

A good ground connection is required. A ground connection may be obtained by connecting to a water pipe, a pipe driven into the ground, or to the metal jacket of a water pump. Do not ground the radio to the 32 volt system conduit or fittings at any point.

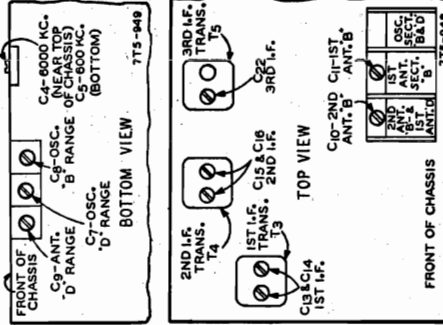

Two wires will be found coming out of the chassis. Connect the wire with the antenna marker to the antenna lead and the wire with the ground marker to the ground lead.

32 VOLT POWER SUPPLY

This radio is designed for use on farms and in those places where the power supply consists of a 32 volt direct current generating plant. The radio may not be satisfactory on plants which do not use storage batteries.

Polarity of 32 Volt Power Supply—Insert plug so that prong on same side as ribbed side of cord is on the positive side of the line.

If the polarity of the line is not known, insert plug. If the tubes light but no sounds are heard from the speaker after the plug has been in one minute, reverse the plug.

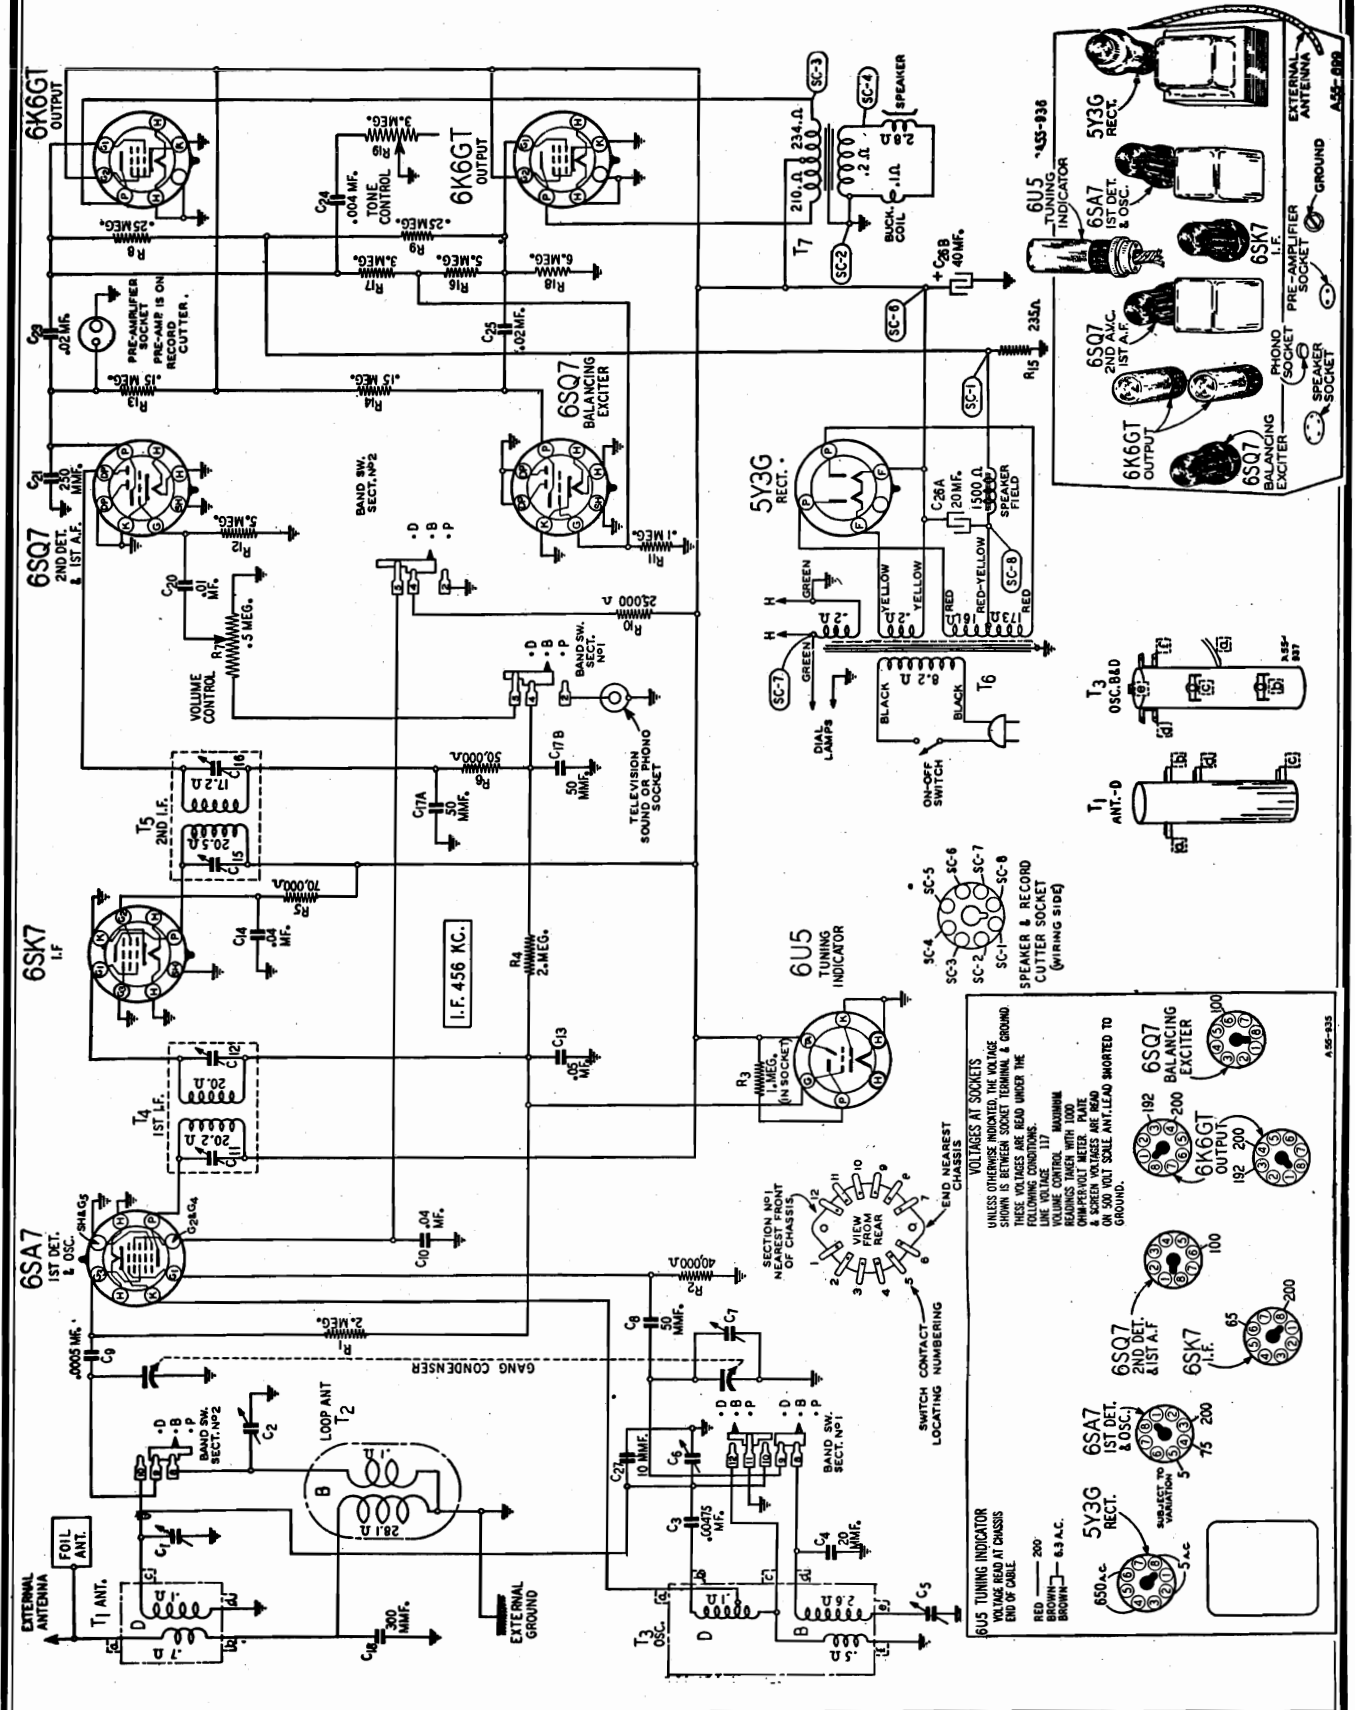

SPECIFICATIONS

Power Consumption	1.60 Amperes at 36 Volts DC	456 KC
Power Output	.17 Watt Undistorted .40 Watt Maximum	6" or 8" Electro-Dynamic

REPLACING BAND SPREAD COILS

It is not practicable to make field replacements of the individual Antenna, R.F. Interstage or Oscillator coils in the Band Spread Assembly Unit.

Should one of these coils be damaged in any way, remove the Band Spread Assembly Unit (consisting of the Antenna, R.F. Interstage and Oscillator Coils, the right-angle mounting plate, and the band switch) from the chassis and return to the factory for replacement.

DRIVE CORD REPLACEMENT

Tie 57" drive cord to spring. Thread other end thru hole in drive pulley, pull flush with inside pulley rim. Gang cord in open pos.—pass cord around idler pulley A, B, C, and D, and thru string guide. Wind 2 1/2 turns counterclockwise around tuning shaft spool, around E. Wind 1 turn clockwise around drive pulley.

PROCEDURE FOR SETTING THE STATION BUTTONS

Make a list of your six favorite stations, those which you tune in regularly. It is better to list the station with the highest kilocycle number first, the station with the next lower kilocycle number next, and so on.

The selectivity control should be in the Sharp Position.

Grasp the left-hand button at the sides (depress the adjacent button) and pull it out as far as it will go. A click will be heard. If it is impossible to depress the button which is adjacent to the button you are

setting, rotate the tuning knob a few turns.

Select the first station from the list you have prepared. Carefully tune in this station by means of the manual tuning knob until the dark sector in the tuning eye is narrowest.

Now lock the mechanism by pushing the button all the way in until it is felt to lock into place.

Proceed in the same manner to set stations on any of the remaining buttons. Any button may be used for any station you can receive, although it will be more convenient

to set the stations so that the kilocycle numbers decrease from left to right.

EACH MODEL EXCEPT 14WG-1202B, HAS A SEEBURG B-3A RECORD CHANGER INCORPORATED. FOR DATA ON THIS SEE RIDER'S "AUTOMATIC RECORD CHANGERS AND RECORDERS".

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for several minutes.
Selectivity Control—In Sharp Position.

The following equipment is required for aligning: An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter—Non-Metallic Screw-driver.
Dummy Antennas—1 mf., 100 mmf., and 400 ohms.

SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
------------------------------------	---------------------	---------------	---------------------	-------------------	----------------------------

Remove chassis from cabinet but do not disconnect leads to loop aerial.

Removing Chassis from Cabinet

Take out the 2 screws, one at each rear corner of the chassis shelf. Grasp the chassis shelf at each rear corner and edge it away from the 2 screws at the bottom of the shelf.

cabinet front until the chassis shelf and chassis slide easily out of the cabinet.

To remove the shelf from the chassis, take out the bolt and the 2 screws at the bottom of the shelf.

CAUTION—When Operated on AC or DC Power. As the chassis is connected to one side of the line, in any service work, keep the chassis on a wood or other insulated surface to avoid contacts with ground.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:

A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

Dummy Antenna—.1 mf.

The chassis may be aligned on either AC-DC or Battery power. If AC-DC power is used, see precaution above about avoiding external grounds. Also do not connect the signal generator to any outside ground as the ground terminal of the generator will be connected to the chassis.

SIGNAL GENERATOR			ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration below and Illustration of Back—Page 1)	
FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	CONDENSER SETTING	
456 KC	Signal Grid of 1st Det. (Top Cap)	.1 mf.	Turn Rotor to full open	1st I.F. (C6) & (C7) 2nd I.F. (C13) & (C14)
1600 KC	Signal Grid of 1st Det.	.1 mf.	Turn Rotor to full open	Oscillator (C3)
1500 KC	None—See Note A		Turn Rotor to max. output	Antenna (C2)

NOTE A—Chassis must be in cabinet. Connect a loop approximately one foot in diameter across the antenna and ground posts of the signal generator. The back of the cabinet must be in place. Place radio approximately 3 feet from loop so as to pick up signal. Radio should not be in proximity to any metal (metal bench, etc.).

CALIBRATION (For models with pointer in front of dial scale)—To obtain dial scale calibration, tune in an 800 KC signal. The pointer should be at the 800 KC mark on the dial. If it is not, hold the pulley at the back of the dial and loosen the pointer screw. Set the pointer at the 800 KC mark. Hold the pointer and retighten the pointer screw.

50L6GT

ANTENNA:

The receiver is supplied with 30 ft. of aerial wire fixed to the chassis. This wire is in the form of a tightly wrapped bundle and should be stretched out full length under a rug or around the edge of the room for best operation of the receiver. When practical, although not necessary, even better results will be obtained if a small outside aerial is used.

In rural areas, or in areas where signal strengths are low, use of a small outside antenna will result in better reception.

GENERAL: 35Z4GT OR 35Z5GT

This carton contains one superheterodyne radio receiver.

It is designed for operation on 115 volts AC or DC. Power consumption is 30 watts.

This receiver is complete and ready to operate when installed as described in the following paragraphs.

SCHEMATIC CIRCUIT DIAGRAM
ARVIN CAR RADIO CHASSIS RE-85

DESCRIPTION:

The Arvin Model 620 is a five tube combination dial and push button single unit Car Radio Receiver. This receiver is designed to mount under the lower edge of the instrument panel on most models of cars.

The radio may be tuned either by rotating the calibrated thumb wheel on the lower front of the radio, or by pressing any one of the four push buttons which are disposed vertically along the left front of the radio.

BALANCING INSTRUCTIONS:

PUSH BUTTON ADJUSTMENT:

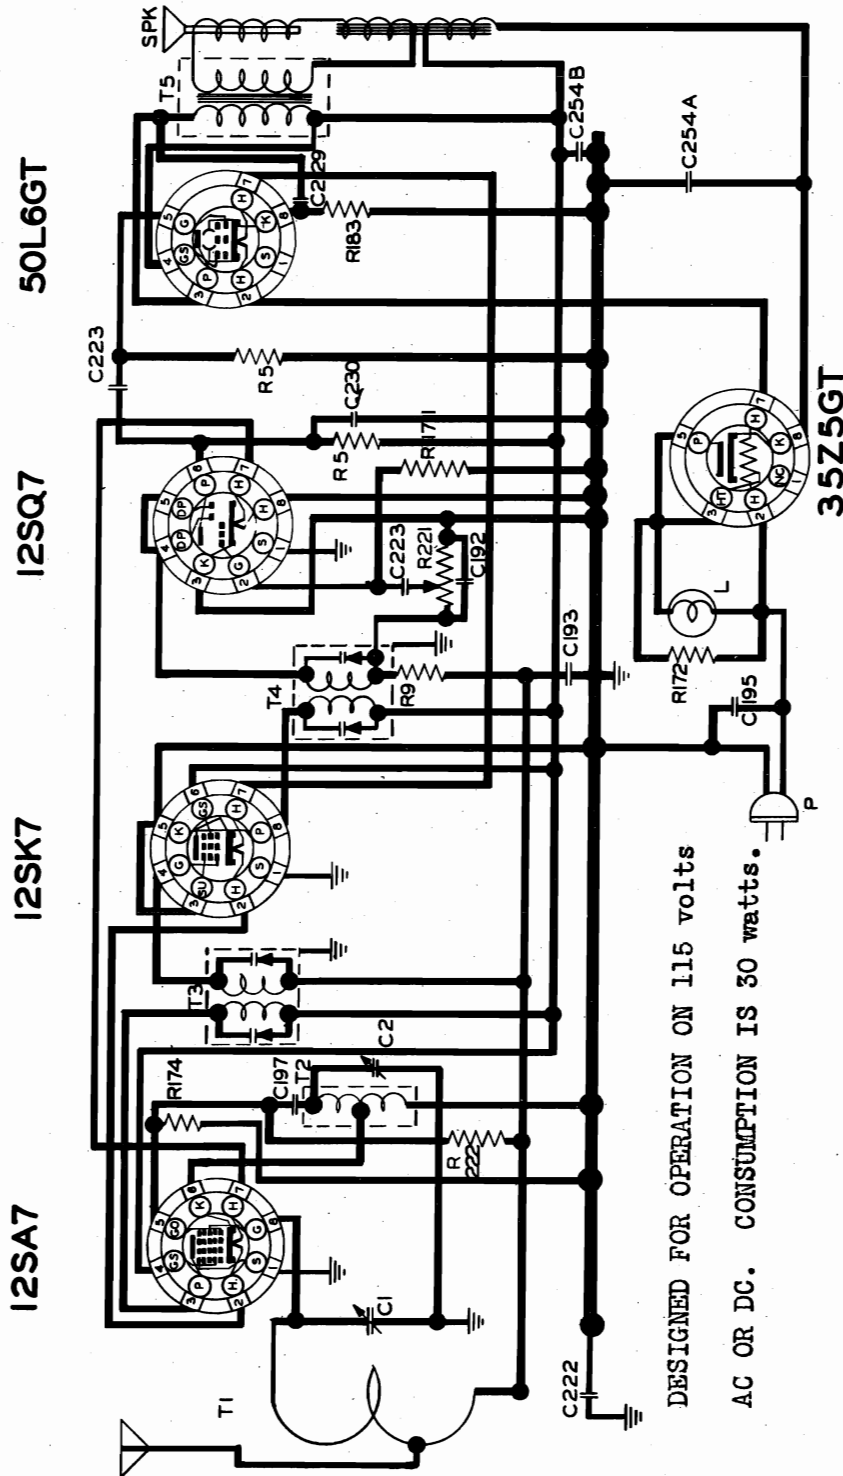

Any button may be set to any station desired. First, tune in the desired station by means of the thumb wheel. Second, turn the push button counter-clockwise two full turns. Then depress this button the full length of its stroke, and while depressed, tighten the button again by turning it clockwise.

The button may now be released. To check the correct setting for this button, turn the thumb wheel to some other point and depress the push button. This will return the tuning mechanism to the station just set up. If it does not, repeat the foregoing sequence of operations more carefully. Each of the remaining buttons may be set to other stations in a like manner.

1937 DELUXE MODEL 525

ALIGNMENT PROCEDURE

1937 Masterpiece Model 733

WARNING: The following information is to be used only by an experienced serviceman with the proper equipment. In most cases it is necessary only when set has been tampered with or damaged by accident.

I.F. ALIGNMENT: Connect signal generator, through .00025 cond., to grid cap of 1C6 tube. Set signal generator at 456 K.C. (this must be accurate), dial pointer at 1700 K.C. Short out oscillator section (center section) of variable cond. gang. Connect suitable output meter across voice coil of loud speaker. (If output meter is not available it will be necessary to adjust by ear, using the loudest note from signal generator.) Increase attenuator until output meter shows deflection or a note is heard from signal generator. Carefully adjust I.F. transformer trimmers for greatest deflection of meter or loudest note from generator. Reduce generator output as intensity of signal increases as I.F.s are tuned nearer their original 456 K.C. setting. Signal should be just audible by ear. Go back over the adjustments to be sure they are correct. Remove short from oscillator section of variable cond. and adjustment is complete.

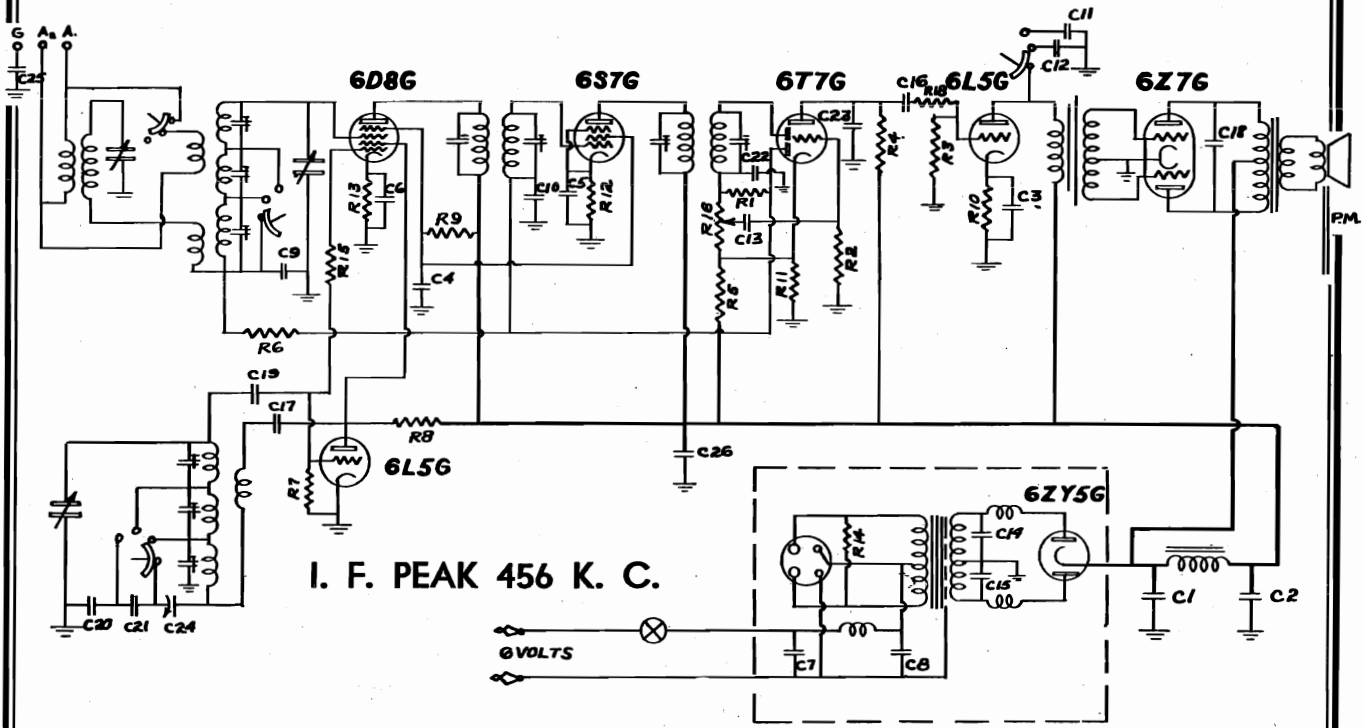

B.C.—R.F. ALIGNMENT: (1) Connect signal generator, through .00025 cond., to antenna post A1. Short wave switch in broadcast position. (2) Set signal generator and dial pointer to 1400 K.C. (3) Adjust osc. B.C. trimmer "A" (see diagram) for greatest deflection of meter or loudest note. (4) Set generator and dial pointer to 1400 K.C. Adjust antenna B.C. trimmer and trimmer "E" for greatest deflection of meter or loudest note. (5) Set generator and dial pointer to 600 K.C. Adjust trimmer "D" for greatest deflection or loudest note. (This adjustment is critical and must be accurate.) Rock cond. gang across 600 K.C. note while adjusting trimmer "D." Repeat adjustment at least twice to be sure it is correct.

POLICE AND AMATEUR BAND ADJUSTMENT: (1) Set switch in Police-Amateur position. Connect signal gen. to ant. post A1 through 400 ohm resistor. (2) Set gen. and dial pointer to 6 meg. (6000 K.C.). Carefully adjust trimmer "B" for greatest deflection or loudest note. Check adjustment with gen. and dial pointer at 2 meg. (2000 K.C.).

FOREIGN BAND ADJUSTMENT: (1) Set switch in Foreign position. Connect gen. to ant. post A1 through 400 ohm resistor. (2) Set generator and dial pointer to 18 meg. (18000 K.C.). This must be accurate. (3) Carefully adjust trimmer "C" and ant. S.W. trimmer for greatest deflection or loudest note. Check adjustment with gen. and dial pointer at 7 meg. (7000 K.C.). This completes all R.F. adjustments.

ALIGNMENT PROCEDURE

WARNING: The following information is to be used only by an experienced serviceman with the proper equipment. In most cases it is necessary only when set has been tampered with or damaged by accident.

I.F. ALIGNMENT: Connect signal generator, through .00025 cond., to grid cap of 6D8 tube. Set signal generator at 456 K.C. (this must be accurate), dial pointer at 1700 K.C. Short out oscillator section (center section) of variable cond. gang. Connect suitable output meter across voice coil of loud speaker. (If output meter is not available it will be necessary to adjust by ear, using the loudest note from signal generator.) Increase attenuator until output meter shows deflection or a note is heard from signal generator. Carefully adjust I.F. transformer trimmers for greatest deflection of meter or loudest note from generator. Reduce generator output as intensity of signal increases as I.F.s are tuned nearer their original 456 K.C. setting. Signal should be just audible by ear. Go back over the adjustments to be sure they are correct. Remove short from oscillator section of variable cond. and adjustment is complete.

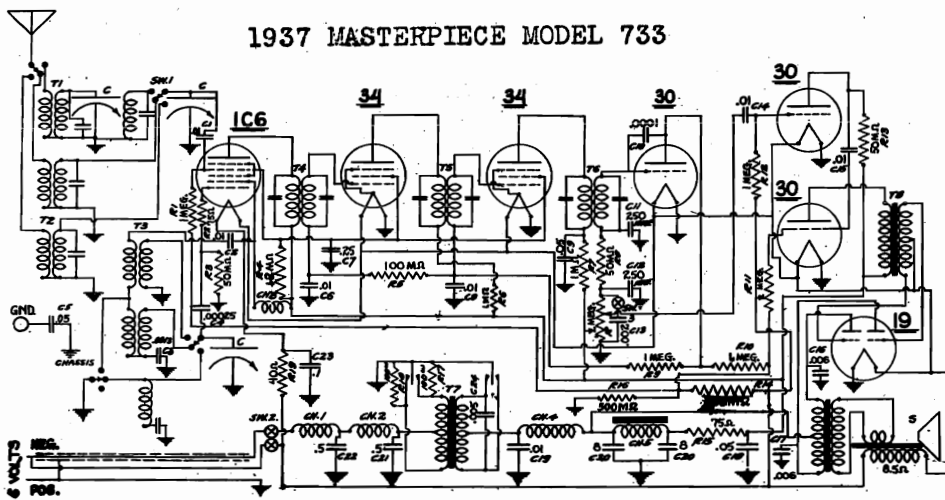

B.C.—R.F. ALIGNMENT: (1) Connect signal generator, through .00025 cond., to antenna post A1. Short wave switch in broadcast position. (2) Set signal generator and dial pointer to 1700 K.C. (3) Adjust osc. B.C. trimmer "A" (see diagram) for greatest deflection of meter or loudest note. (4) Set generator and dial pointer to 1400 K.C. Adjust antenna B.C. trimmer and trimmer "E" for greatest deflection of meter or loudest note. (5) Set generator and dial pointer to 600 K.C. Adjust trimmer "D" for greatest deflection or loudest note. (This adjustment is critical and must be accurate.) Rock cond. gang across 600 K.C. note while adjusting trimmer "D." Repeat adjustment at least twice to be sure it is correct.

POLICE AND AMATEUR BAND ADJUSTMENT: (1) Set switch in Police-Amateur position. Connect signal gen. to ant. post A1 through 400 ohm resistor. (2) Set gen. and dial pointer to 6 meg. (6000 K.C.). Carefully adjust trimmer "B" for greatest deflection or loudest note. Check adjustment with gen. and dial pointer at 2 meg. (2000 K.C.).

FOREIGN BAND ADJUSTMENT: (1) Set switch in Foreign position. Connect gen. to ant. post A1 through 400 ohm resistor. (2) Set generator and dial pointer to 18 meg. (18000 K.C.). This must be accurate. (3) Carefully adjust trimmer "C" and ant. S.W. trimmer for greatest deflection or loudest note. Check adjustment with gen. and dial pointer at 7 meg. (7000 K.C.). This completes all R.F. adjustments.

Note 1.—Adjust antenna compensator (5) two turns from tight position.
 Note 2.—Turn condenser rotor plates completely out of mesh as far as they will go.
 Note 3.—Connect antenna lead, Part No. 95-0185, to antenna receptacle in the radio. Connect a 30 mmf condenser in series between signal generator and antenna lead.
 Note 4.—When antenna stage adjustment is made with radio installed in car, the radio antenna lead must be connected to car antenna in usual manner. Connect signal generator output lead to a wire placed near car antenna but not connected to it.
 Note 5.—After installing radio in car, tune in a weak broadcast signal between 1200 and 1400 kc. Remove plug button on side of radio and adjust antenna compensator (5) for maximum signal.

Note 1.—Adjust aerial compensator (6) two turns from tight position.
 Note 2.—Turn condenser rotor plates completely out of mesh as far as they will go.
 Note 3.—Connect antenna lead, Part No. 95-0185, to antenna receptacle in radio. Connect a 10 mmf condenser in series between signal generator and antenna lead.
 Note 4.—When antenna stage adjustment is made with radio installed in car, the radio antenna lead must be connected to car antenna in usual manner. Connect signal generator output lead to a wire placed near car antenna but not connected to it.
 Note 5.—After installing radio in the car, tune in a weak broadcast signal between 1200 and 1400 kc and adjust aerial compensator (6) for maximum signal.
 * While rocking.

Note 1.—When adjusting i-f trimmers, the high side of signal-generator is connected through 0.1 mf condenser to loop-section stator lug of tuning-condenser.

Note 2.—DIAL CALIBRATION: With tuning-condenser fully closed (maximum capacity), set dial pointer on small dot below 860 kc.

Note 3.—When aligning r-f trimmers, a loop antenna is made from a few turns of wire and connected to signal-generator output terminals; this loop being placed a few feet from receiver loop.

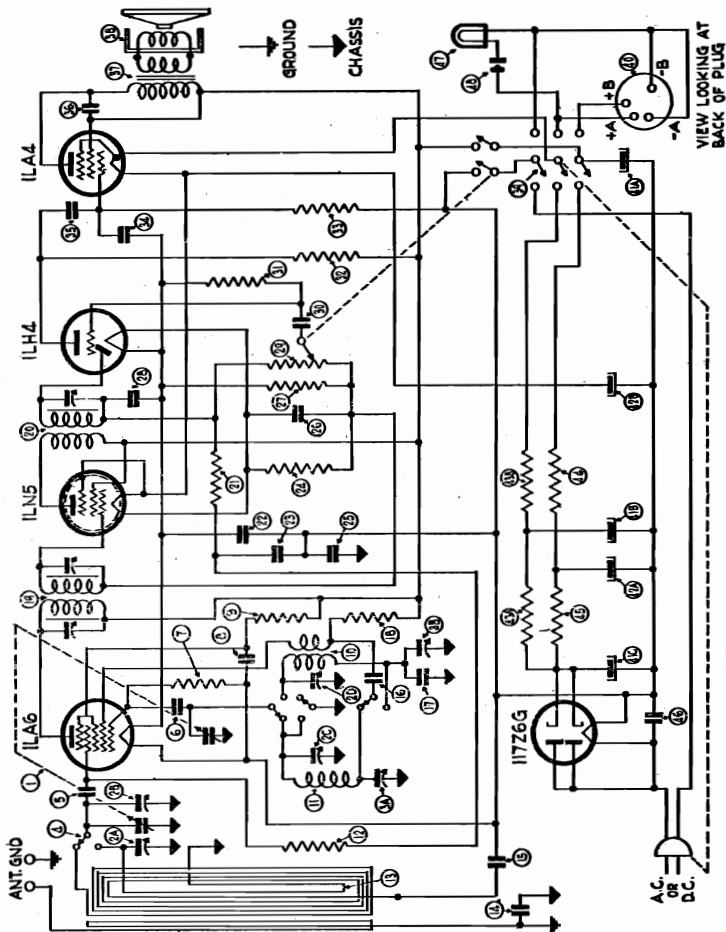

Note 4.—Trimmer (4) on Model 41-85 or (5) on Model 41-861.

Note 5.—Trimmer (6) is nut adjustment.

Note 6.—Trimmer (7) is screw adjustment.

Note 7.—Adjust to maximum on fundamental-signal peak.

* While rocking.

* Condenser changed to .01 mfd., part No. 30-4572 in run 2nd types.
 † Two types of speakers are used on these models. These speakers are interchangeable and will have the same part numbers with the exception of a suffix number -4, -9 added to the part number. These assemblies, however, of these speakers are not interchangeable.

PHILCO RADIO & TELEVISION CORP.

MODELS 42-1008, 42-1009M,
42-1009W

ALIGNING R. F. AND I. F. COMPENSATORS
MODEL 42-1008, CODE 121; 42-1009W, AND 42-1009M, CODE 121

The following procedure is the same for both models.

EQUIPMENT REQUIRED

- SIGNAL GENERATOR:** Covering the frequency range of the receiver, such as Philco Model 070.
- ALIGNING INDICATOR:** Either a vacuum tube voltmeter or an audio output meter may be used as an aligning indicator. Philco Models 027 and 028. Circuit testers contain both these meters.
- TOOLS:** Philco Fiber Screw Driver, Part No. 45-2610.

CONNECTING ALIGNING INSTRUMENTS

VACUUM TUBE VOLTMETER: To use the vacuum tube voltmeter as an aligning indicator, make the following connections: Attach the negative (-) terminal of the voltmeter to any point in the circuit where the A.V.C. voltage can be obtained. Connect the positive (+) terminal of the vacuum tube voltmeter to the chassis.

AUDIO OUTPUT METER: Terminal No. 1 is provided on the loop aerial panel for connecting one lead of the audio output meter to the voice coil of the speaker. The other lead of the meter is connected to the chassis. When using these connections, the lowest A.C. scale of the meter must be used. (0 to 10 volts).

The audio output meter can also be connected between the plate of the output tube and the ground of the chassis.

SIGNAL GENERATOR: When adjusting the "I. F." padders, the high side of the signal generator is connected through a .1 mfd. condenser to the antenna

section of the tuning condenser. Connect the ground or low side of the generator to the chassis.

When aligning the R. F. padders a loop is made from a few turns of wire and connected to the signal generator output terminals; the signal generator is then placed close to the loop of the radio.

When adjusting the radio outside the cabinet the loop aerial should be placed in approximately the same position around or near the chassis as when assembled.

After connecting the aligning instruments, adjust the compensators as shown in the tabulation below. Locations of the compensators are shown in the figure 3. If the indicating meter pointer goes off scale when adjusting the compensator, reduce the strength of the signal from the generator. Keep volume control of radio at maximum position.

Operations in Order	SIGNAL GENERATOR		RECEIVER			Special Instructions
	Output Connections to Receiver	Dial Setting	Dial Setting	Control Settings	Adjust Compensators in Order	
1	Amt. Section of Tuning Cond. with .1 mfd. Cond.	455 K.C.	Tuning Cond. Closed	Vol. Max. Bands Switch S. W.	35, 35B, 43A, 47A	
2	Loop Signal Generator	1720 K.C.	1720 K.C.	Bands Switch "Brdcst"	14	Note A
3	Loop Signal Generator	1500 K.C.	1500 K.C.	Bands Switch "Brdcst"	7A	
4	Loop Signal Generator	580 K.C.	580 K.C.	Bands Switch "Brdcst"	8A	Roll comp. (8A) to "max." Recheck Operation No. 2
5	Loop Signal Generator	1720 K.C.	1720 K.C.	Bands Switch "Brdcst"	14	
6	Loop Signal Generator	15 M.C.	15 M.C.	Bands Switch S. W.	14A, 8	Note B

AERIAL CONNECTIONS: The built-in loop aerial system is designed to operate without an outside aerial or ground and to give exceptionally sensitive receiving performance of stations on the standard and short wave frequencies. When operating the radio, however, in steel reinforced buildings and other shielded locations, the PHILCO Outdoor Aerial Part No. 45-2817 is recommended for maximum receiving performance. The outdoor aerial can be easily connected to the radio by inserting the plug attached to the transformer unit into the socket provided at the rear of the chassis. This aerial can be obtained from your local PHILCO distributors. A ground connection is not required with either type of installation.

NOTE A.—Dial calibration: In order to adjust the receiver correctly, the dial must be aligned to track properly with the tuning condenser. To do this, proceed as follows: Turn the tuning condenser to the maximum capacity position (plates fully meshed). With the condenser in this position, set the tuning pointer on the extreme left index line at the low frequency end of the broadcast scale.

NOTE B.—Adjust padder (14A) to the second signal peak from the tight position. Roll padder (8) slowly to maximum on the first peak from tight position.

FIG. 3. LOCATIONS OF COMPENSATORS—TOP OF CHASSIS
MODELS 42-1008, 42-1009

INTERMEDIATE FREQUENCY: 455 K.C.

TUNING BAND FREQUENCIES: 540 to 1720 K.C.; 9 to 15.5 M.C.

POWER SUPPLY: 115 volts, 50 or 60 cycle A.C., Consumption Watts. These models are shipped for operation on a 115-volt, 60-cycle, A.C.

ADJUSTING ELECTRIC PUSH-BUTTON TUNING

Select five of the most popular stations received in the locality. Insert the station call letters into the spaces on the buttons. The station with the lowest frequency is placed in the second button from the left and the highest frequency is placed in the sixth push button on the right. Each push button is adjusted by two adjusting screws located on the rear of the chassis. Each set of screws is numbered and labeled "Ant.", "Osc." and covers a frequency range as follows:

Looking at the front of the cabinet, the second button on the left is adjusted by adjusting screws No. 1 and 2. The next push button by adjusting screws No. 3 and 4, and the remaining push buttons in order.

1. Press in "Off-On" push button, turn "Bands" knob to "Broadcast."
2. Set up a Model 070 Signal Generator near the receiver and connect a loop aerial (made from a few turns of wire 12 inches in

diameter) to the high and ground output jacks of the signal generator. Turn the output controls to maximum and set the modulation control to "MOD. ON."

3. Manually tune in the station to be set up on the first push button. After doing this set the indicator of the 070 Signal Generator to the frequency of the station being received. As the indicator approaches the frequency of the station a whistle will be heard; leave the indicator at this point.

4. Turn "Bands" knob to "Push button" position. Using the insulated screw driver, turn the No. 2 "Osc." screw until the broadcast station identified by the signal generator is heard; at this point, turn the indicator of the signal generator away from the frequency of the station. Readjust No. 2 "Osc." and No. 1 "Ant." screws until the station is clearly and distinctly heard. The push button should then be adjusted properly to the station.

After setting up the first station the same procedure as outlined above is used for the remaining stations. When these models are set up to receive the sound of a television program tuned in by the special type Philco Television Sets or if it is to be used in conjunction with a Philco Record Player, the lowest frequency push button should be used. To tune in these programs, the same procedure as given for broadcast stations above is used.

Further details for setting up these Radios for operation with Philco Television Sets or Record Players are supplied with the instruments.

ADJUSTING ELECTRIC PUSH BUTTON TUNING

The Electric push button tuning mechanism consists of ten push buttons. Five push buttons control and select power supply, Broadcast, Police and Shortwave Bands and Phonograph Operation. The remaining five push buttons are used for automatically selecting five standard broadcast stations.

Select five of the most popular stations received in the locality. Insert the station call letters into the spaces above the buttons. The station with the lowest frequency is placed in the second button from the left and the highest frequency is placed in the sixth push button from the left. Each push button is adjusted by two adjusting screws located on the rear of the chassis. Each set of screws is numbered and labeled "Ant.", "Osc." and covers a frequency range as shown in Fig. 1.

Looking at the front of the cabinet, the second button from the left is adjusted by adjusting screws No. 1. The next push button by adjusting screws No. 2, and the remaining push buttons in order.

1. Press in "Broadcast" push button.
2. Set up a Model 070 Signal Generator near the receiver and connect a loop aerial (made from a few turns of wire 12 inches in diameter) to the high and ground output jacks of the signal generator. Turn the output controls to maximum and set the modulation control to "MOD. ON."
3. Manually tune in the station to be set up on the first station push button. After doing this set the indicator of the 070 Signal Generator to the frequency of the station being received. As the indicator approaches the frequency of the station a whistle will be heard; leave the indicator at this point.

4. Press "in" the second push button from the left of cabinet. Using the insulated screw driver, turn the No. 1 "Osc." screw until the broadcast station identified by the signal generator is heard; at this point, turn the indicator of the signal generator away from the frequency of the station. Readjust No. 1 "Osc." and "Ant." screws until the station is clearly and distinctly heard. The push button should then be adjusted properly to the station.

After setting up the first station the same procedure as outlined above is used for the remaining stations. When these models are set up to receive the sound of a television program tuned in by the special type Philco Television Sets or if it is to be used in conjunction with a Philco Record Player, the lowest frequency push button should be used. To tune in these programs, the same procedure as given for broadcast stations above is used.

Further details for setting up these Radios for operation with Philco Television Sets or Record Players are supplied with the instruments.
 MODELS 42-1010, 42-1011M

FIG. 1.—PUSH BUTTON COMPENSATOR LOCATIONS

LIGHT-BEAM REPRODUCER ADJUSTMENTS

To reproduce the sound from a record, the light beam of the reproducer must be carefully positioned on the light sensitive cell. If the light beam is not carefully set, the sound reproduction will be distorted, weak or, if the light beam is completely on or off the cell, the phonograph will be silent.

If any of these conditions exist, the following adjustment procedure should be made:

NOTE—These adjustments should be made with the power line voltage at 117 volts A.C.

A. ADJUSTING WIDTH OF LIGHT BEAM

To make this adjustment push the lamp socket assembly into its holder until a clear image of the lamp filament appears on the light cell. The socket should then be slightly pushed in beyond this point until the rectangular spot of light is 5/32" in width. The socket assembly is now rotated so that the spotlight is vertical.

B. POSITIONING THE LIGHT BEAM

To position the light beam on the light cell, turn the adjusting screw at the lower left side of the reproducer until the spot is half on the cell and half on the metal frame surrounding the cell.

C. ADJUSTING INTENSITY OF LAMP

When shipped from the factory, the lamp of the reproducer is adjusted for best operating efficiency. The intensity of the light from the lamp is adjusted by Compensator No. 17 located on the radio chassis. Under ordinary circumstances, an adjustment will not be necessary. When replacing the reproducer or lamp, however, it may be necessary to readjust the light intensity. In this case the compensator is adjusted as follows:

1. Turn volume control on full and play a record.
2. While the record is playing, turn compensator 17 in the direction necessary to obtain the best operating point without distortion. By turning the compensator the strength of the pick-up output is increased or decreased.

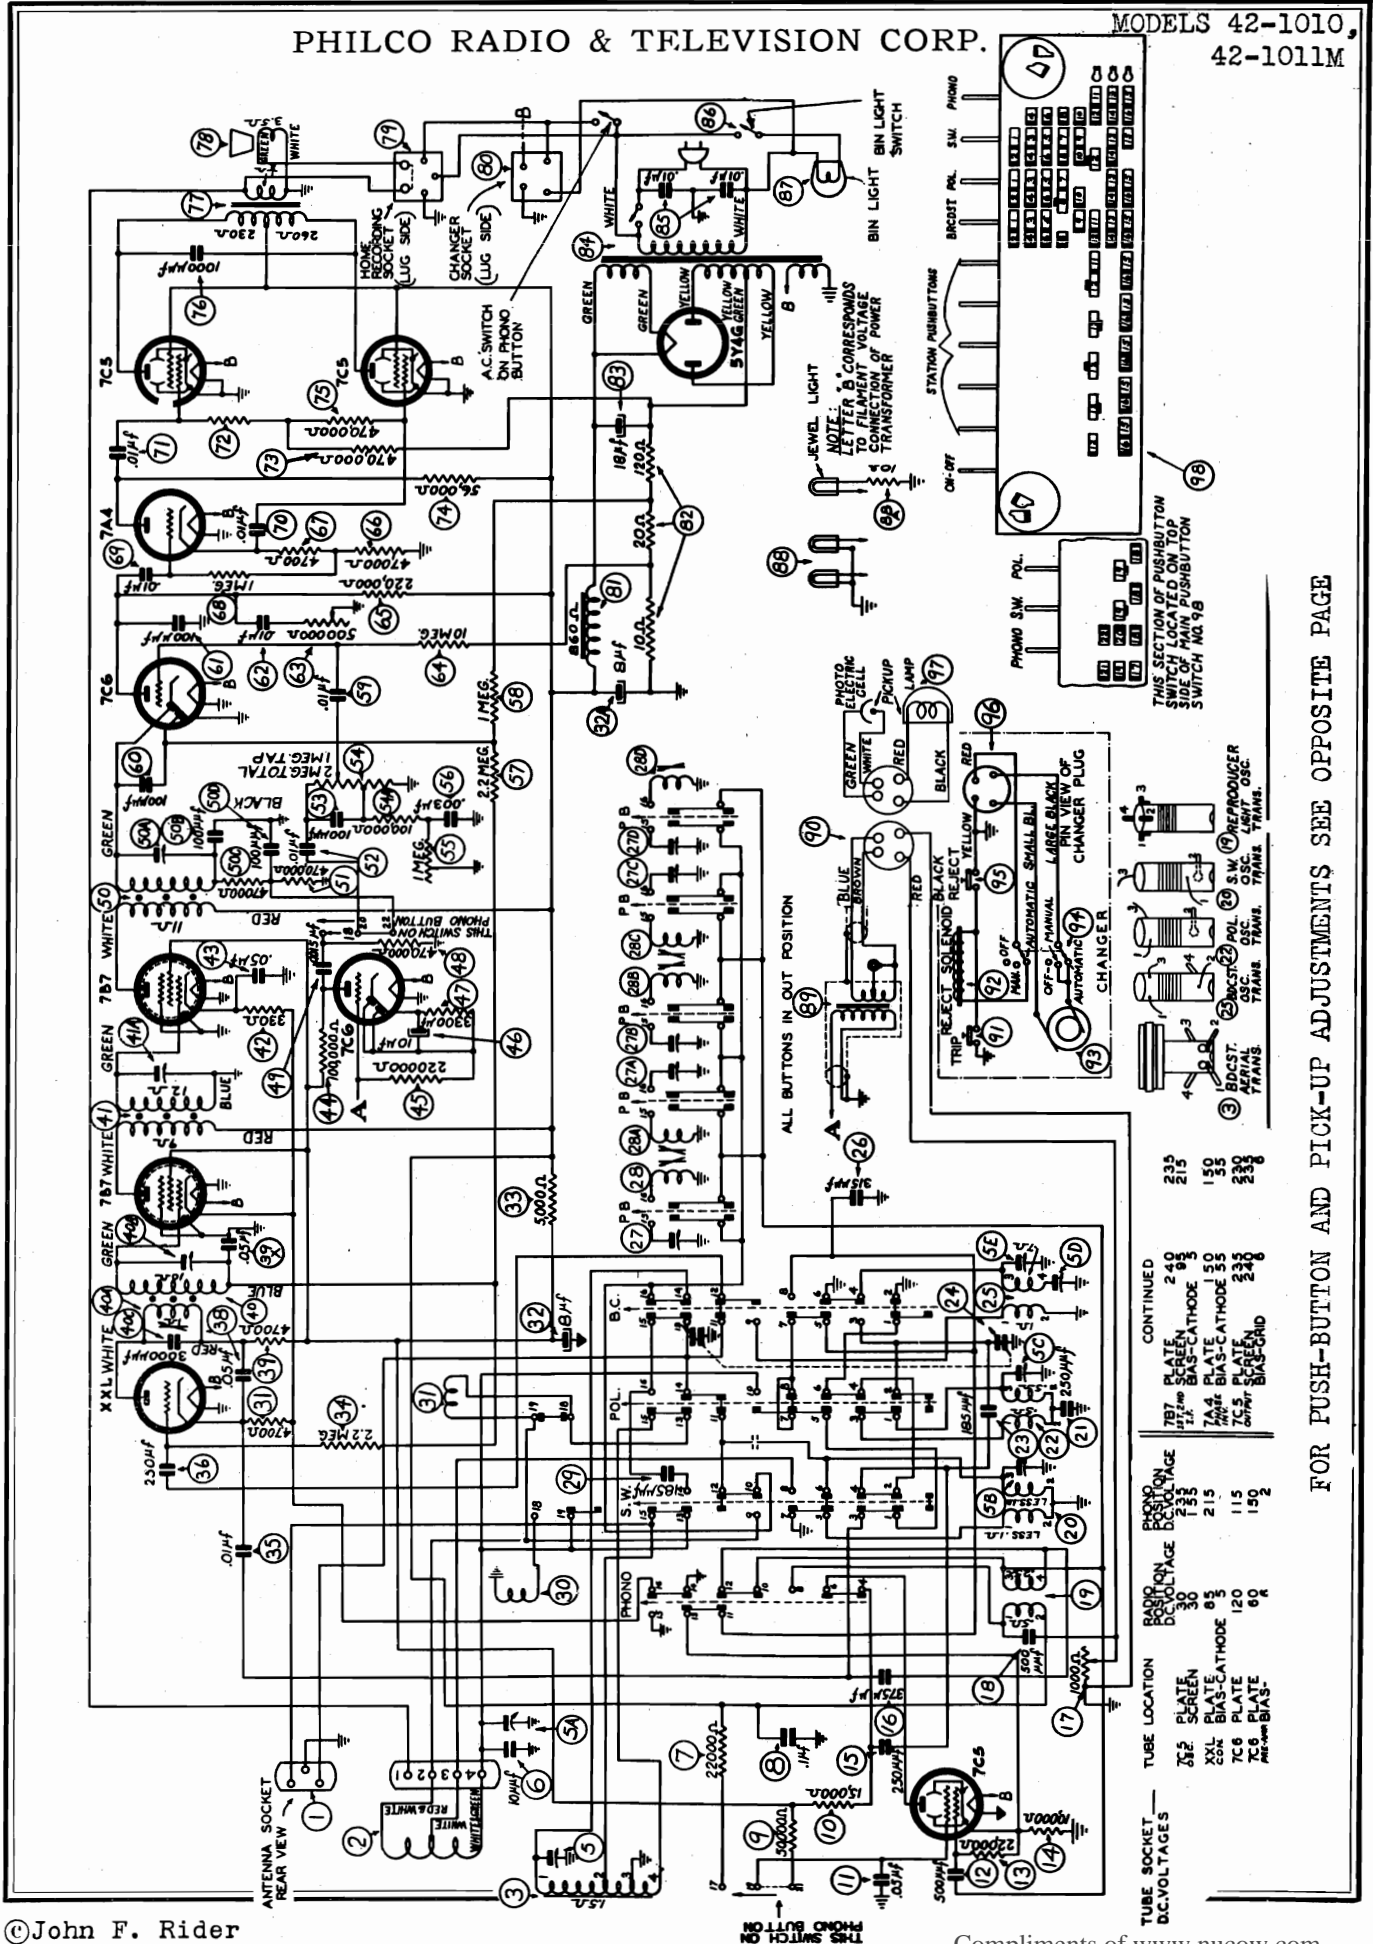

D. INSTALLING NEW LAMP

When installing a new lamp in the socket, there are two positions in which the lamp can be inserted. Ordinarily, either of these positions can be used. In some cases, however, due to the lamp filament being off center, the lamp must be inserted in the position that gives the best centering of the spot of light on the vibrating mirror.

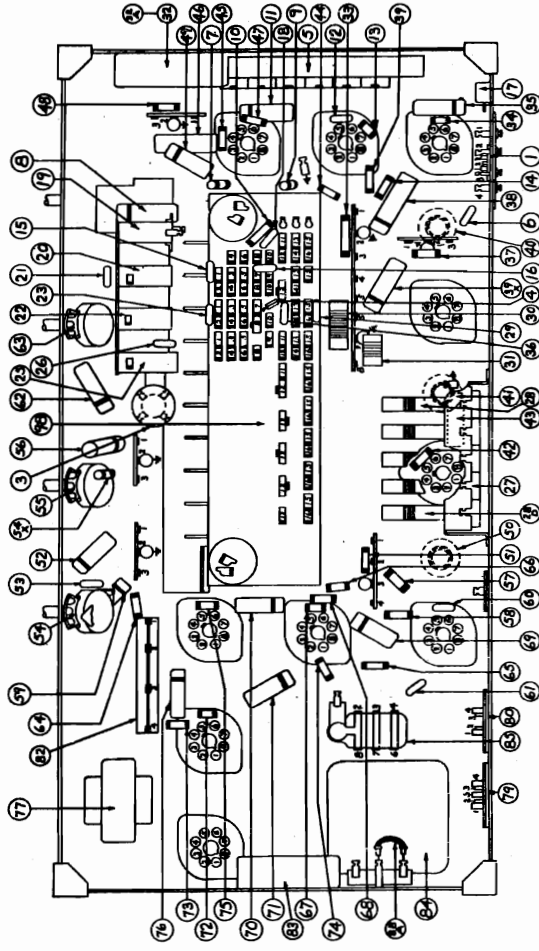

FIG. 3.—LOCATIONS OF PARTS—UNDER CHASSIS.

PHILCO RADIO & TELEVISION CORP.

ALIGNING R. F. AND I. F. COMPENSATORS

The following procedure is the same for both models:

EQUIPMENT REQUIRED

- SIGNAL GENERATOR:** Covering the frequency range of the receiver, such as Philco Model 070.
- ALIGNING INDICATOR:** Either a vacuum tube voltmeter or an audio output meter may be used as an aligning indicator. Philco Models 027 and 028 circuit testers contain both these meters.
- TOOLS:** Philco Fiber Screw Driver, Part No. 45-2610.

CONNECTING ALIGNING INSTRUMENTS

Either a vacuum tube voltmeter or an audio output meter may be used as a signal indicator when adjusting the receiver.

Vacuum Tube Voltmeter: To use the vacuum tube voltmeter as an aligning indicator, make the following connections: Attach the negative (-) terminal of the voltmeter to any point in the circuit where the A.V.C. voltage can be obtained. Connect the positive (+) terminal of the vacuum tube voltmeter to the chassis.

Audio Output Meter: Terminal No. 1 is provided on the loop aerial panel for connecting one lead of the audio output meter to the voice coil of the speaker. The other lead of the meter is connected to the chassis. When using these connections, the lowest A. C. scale of the meter must be used. (0 to 10 volts).

The audio output meter can also be connected between the plate of the output tube and the ground of the chassis.

Signal Generator: The radio can be aligned in the cabinet or removed from the cabinet. When adjusting the "I.F." padders, the high side

of the signal generator is connected through a .1 mfd. condenser to the lug on the aerial section of the tuning condenser. The ground or low side of the signal generator is connected to the ground of the receiver.

When aligning the R.F. padders with the radio in the cabinet, a loop is made from a few turns of wire and connected to the signal generator output terminals; the loop is then placed two or three feet from the loop in the cabinet. If the radio is aligned outside of the cabinet without the loop connected an aerial input transformer, Part No. 76-1134, will be required. Insert the transformer into the external aerial socket on the rear of the chassis. Connect the high output terminal of the signal generator to the terminal on the transformer. Connect the ground terminal to the chassis.

After connecting the aligning indicator, adjust the compensators in the order shown in the tabulation below. Locations of the compensators are shown below. If the output meter pointer goes off scale when adjusting the compensators, reduce the strength of the signal from the generator.

Operations in Order	SIGNAL GENERATOR		RECEIVER			SPECIAL INSTRUCTIONS
	Output Connections to Receiver	Dial Setting	Dial Setting	Control Setting	Adjust Compensators in Order	
1	Lug Aerial Section of Tuning Condenser	455 KC	580 KC	Vol. Max. "Brdcst" Push-button IN	50A, 41A 40B, 40A	
2	Use Loop on Generator or Aerial Trans.	1500 KC	1500 KC	Vol. Max. "Brdcst" Push-button IN	5E, 5	Note A
3	Use Loop on Generator or Aerial Trans.	580 KC	580 KC	Vol. Max. "Brdcst" Push-button IN	5D	Roll Tuning Condenser Note B
4	Use Loop on Generator	Repeat Operation No. 2				
5	Use Loop on Generator	6 MC	6 MC	Vol. Max. "Police" Push-button IN	5C	
6	Use Loop on Generator	15 MC	15 MC	Vol. Max. "S.W." Push-button IN	5B, 5A	Note C

NOTE A—DIAL CALIBRATION: In order to adjust the receiver correctly, the dial must be aligned to track properly with the tuning condenser. To adjust the dial, proceed as follows: With the tuning condenser closed (maximum capacity), set the dial pointer on the extreme left index line at the low frequency end of the broadcast scale. The arrangement of the drive cable in this position is shown in the schematic.

NOTE B—When adjusting the low frequency compensator of Range One (Broadcast) or the aerial padders of the high frequency tuning range; the receiver Tuning Condenser must be adjusted (rolled) as follows: First, tune the compensator for maximum output, then vary the tuning condenser of the receiver for maximum output. Now turn the compensator slightly to the right or left and again vary the receiver tuning condenser for maximum output. This procedure of first setting the compensator and then varying the tuning condenser is continued until maximum output reading is obtained.

NOTE C—To accurately adjust the high frequency oscillator compensator to the fundamental instead of the image signal, turn the oscillator compensator (5B) to the maximum capacity position (clockwise). From this position slowly turn the compensator counter-clockwise until a second peak is obtained on the output meter. Adjust the compensator for maximum output at this second peak.

If the above procedure is correctly performed, the image signal will be found (much weaker) by turning the signal generator dial 910 KC above the frequency being used on any high frequency range.

The aerial padder (5A) must be adjusted to maximum by rolling the tuning condenser. If two signal peaks occur when turning the padder, adjust the

maximum output on the first signal peak from the tight position (screw all the way down) of the padder.

PHILCO RADIO & TELEVISION CORP

PHILCO MODEL AR-55
I.F. = 455 KC

FOR OTHER DATA
SEE INDEX

No.	Description	Part No.
1	Antenna Choke	65-0102
2	Condenser (.01 Mfd.)	61-0114
3	Aerial Compensator	Part of 10
4	Antenna Transformer	65-0323
5	Resistor (820 ohms)	33-182336
6	Condenser (.05 Mfd.)	61-0101
7	Condenser (.05 Mfd.)	61-0101
8	Tuning Condenser	63-0047
9	Antenna Padder (on Tun. Cond.)	
10	Antenna Padder Assembly (For Push Buttons)	77-0512
11	Wafer Switch	77-0506
12	Resistor (10,000 ohms)	33-310334
13	Wave Trap Padder	Part of 10
14	R. F. Transformer	65-0321
15	Resistor (1,000,000 ohms)	33-510154
16	Condenser (25 Mmfd.)	30-1087
17	Resistor (100,000 ohms)	33-410154
18	Condenser (280 Mmfd.)	61-0043
19	High Frequency Padder (on Tun. Cond.)	
20	Condenser (250 Mmfd.)	60-125157
21	Condenser (.05 Mfd.)	61-0101
22	Resistor (68,000 ohms)	33-368334
23	Padder (Pri. 1st I. F. Trans.)	
24	Condenser (485 Mmfd.)	61-0144
25	Resistor (22,000 ohms)	33-322434
26	Condenser (15 Mmfd.)	60-015327
27	Resistor (1,000,000 ohms)	33-510154
28	Condenser (.05 Mfd.)	61-0101
29	First I. F. Transformer	65-0319
30	Padder (Sec. 1st I. F. Trans.)	
31	Resistor (180 ohms)	33-118336
32	Oscillator Transformer (550-1065 KC)	65-0173
33	Oscillator Transformer (600-1165 KC)	65-0172
34	Oscillator Transformer (660-1240 KC)	65-0171
35	Oscillator Transformer (750-1410 KC)	65-0170
36	Oscillator Transformer (855-1580 KC)	65-0169
37	Low Frequency Padder	63-0048
38	Manual Oscillator Trans.	65-0420
39	Resistor (15,000 ohms)	33-315154
40	Condenser (.01 Mfd.)	61-0114
41	Volume Control (350,000 ohms)	67-0032
42	Resistor (4,700 ohms)	33-247334
43	Condenser (6,000 Mmfd.)	61-0155
44	Resistor (27,000 ohms)	33-327154
45	Padder (Pri. 2nd I. F. Trans.)	

No.	Description	Part No.
46	Second I. F. Transformer	65-0320
47	Padder (Sec. 2nd I. F. Trans.)	
48	Resistor (15,000,000 ohms)	33-615154
49	Condenser (6,000 Mmfd.)	61-0155
50	Resistor (220,000 ohms)	33-422334
51	Condenser (.01 Mfd.)	61-0120
52	Tone Control Switch Wafer	77-0733
53	Resistor (470,000 ohms)	33-447154
54	Filter Condenser (10-15-20 Mfd.)	61-0089
55	Resistor (220 ohms)	33-122436
56	Condenser (.01 Mfd.)	61-0124
57	Output Transformer	65-0408
58	Replacement Cone (For 73-0047-2 Speaker)	91-0086
59	Resistor (220 ohms)	33-122436
60	Condenser (.01 Mfd.)	61-0124
61	Field Coil Assembly Not Replaceable	
62	Filament Choke	32-2729
63	Condenser (.5 Mfd.)	61-0106
64	Condenser (250 Mmfd.)	60-125157
65	Condenser (250 Mmfd.)	60-125157
66	Resistor (150 ohms)	33-115334
67	Vibrator Choke	65-0075
68	Vibrator	83-0025
69	Condenser (.5 Mfd.)	61-0137
70	Resistor (220 ohms)	33-122334
71	Power Transformer	65-0318
72	Condenser (3,000 Mmfd.)	61-0115
73	Resistor (1,000 ohms)	33-210434
74	Condenser (250 Mmfd.)	60-125157
75	Condenser (250 Mmfd.)	60-125157
76	Condenser (250 Mmfd.)	60-125157
77	"On-Off" Switch	85-0112
78	Pilot Lamp	34-2039
79	Condenser (.25 Mfd.)	61-0125
80	Condenser (.05 Mfd.)	61-0101
81	Resistor (180 ohms)	33-118336
82	Test Socket	55-1118
83	Test Link	57-1121
84	Resistor (47,000 ohms)	33-347334
85	Condenser (6,000 Mmfd.)	61-0155
86	Receiver Housing Control Assembly	77-0694FC59
87	Control Assembly	85-0133
88	Dial	55-1194
89	Drive Cord	55-0935
90	Drive Cord Spring	57-1425FA3
91	Tuning Shaft	57-1385
92	Volume Shaft	57-1384
93	Push Button Shaft	57-1386
94	Pointer	57-1889FCP
95	Station Indicator Drum	77-0755
96	Tone Control Lead	95-0135

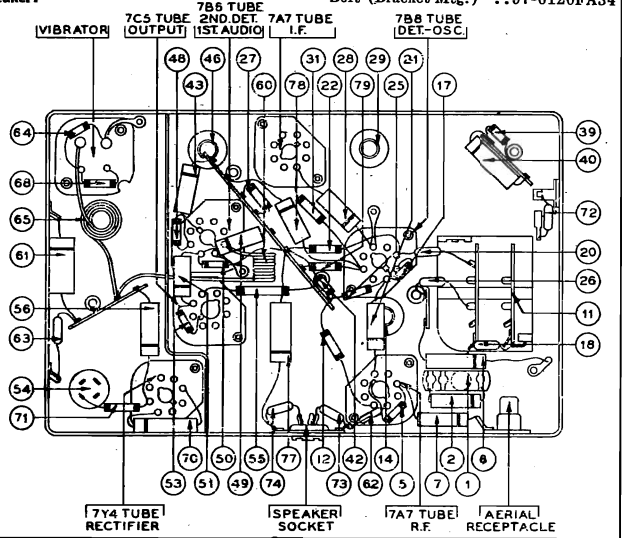

No.	Description	Part No.
97	Hook Bolt (Receiver Mtg.)	57-1340FA3
98	Lockwasher (Receiver Mtg.)	W166SFE7
99	Nut (Receiver Mtg.)	W98FA3
100	Cable Clamps	57-1429FA38
101	Interference Condenser	30-4007
102	Distributor Resistor	33-1196
103	Tube Side Cover	318-2382
104	Wiring Side Cover	57-1345FC59
105	Padder Cover	57-1348FC59
106	Speaker Socket	55-0443
107	Loktal Socket	55-1075
108	Vibrator Socket	27-6153
109	Screw & Core Assembly	57-1363
110	Coil Cups (Brass)	W-2032
111	Volume Control Nut	W684FA3
112	Tone Control Switch Shaft	57-1839FA3

No.	Description	Part No.
113	Speaker & Housing Complete	73-2393
114	Speaker Unit	73-0058
115	Stud (Speaker Mtg.)	57-0892
116	Washer (Speaker Mtg.)	2703FA3
117	Lockwasher (Speaker Mtg.)	W388
118	Nut (Speaker Mtg.)	W55FA3
119	Wood Spacer (Speaker Mtg.)	55-0642

The following parts are for the Instrument Board Speaker:

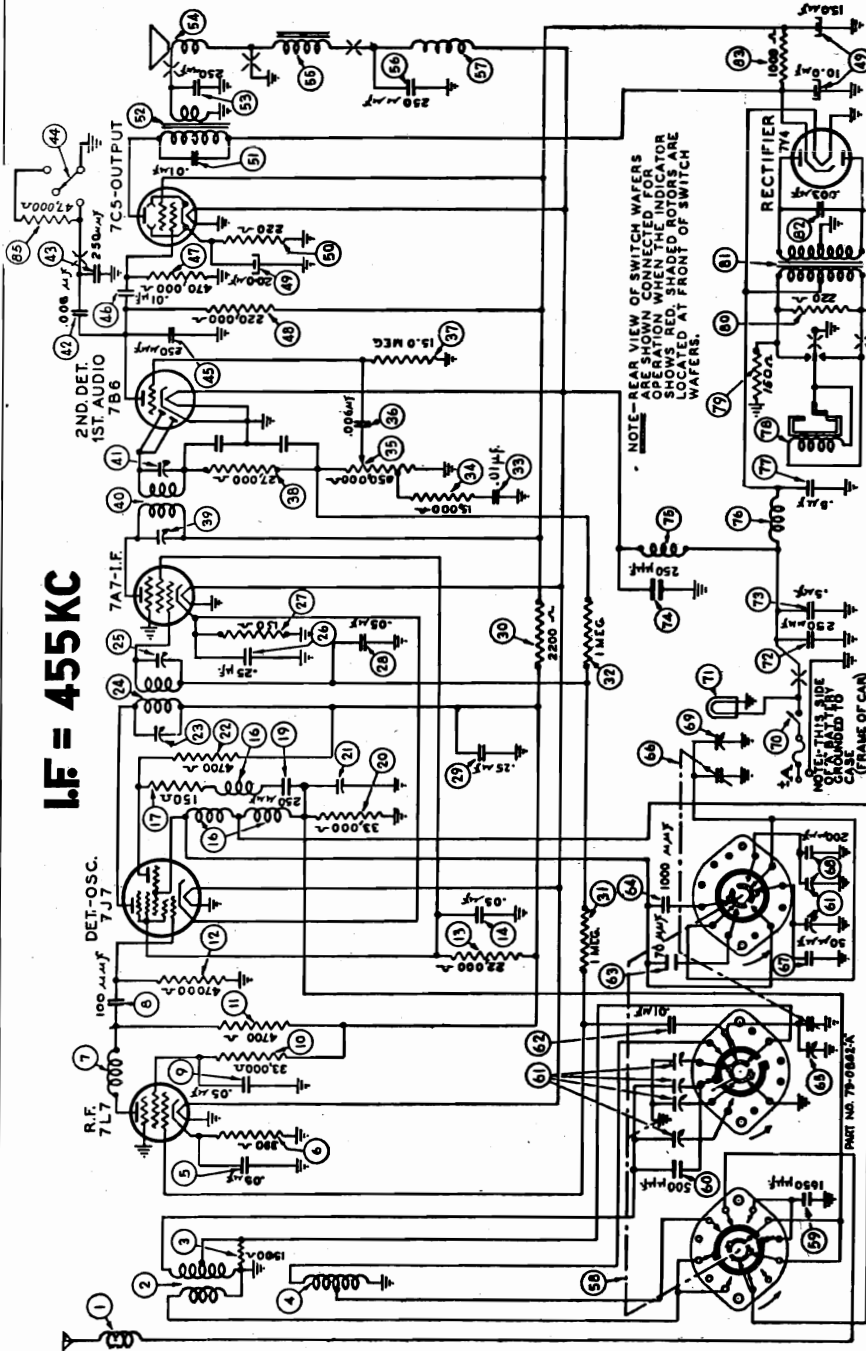

120	Speaker	73-0047
121	"U" Bracket	57-0720FA3
122	Rubber Gasket & Screen	55-0958
123	Side Brackets	57-1461
124	Cardboard Baffle	55-0957
125	Cardboard Spacers	55-0449
126	Nuts (Speaker Mtg.)	W124FA3
127	Screw (Speaker Mtg.)	W152FA4
128	Lockwasher (Speaker Mtg.)	W291
129	Lockwasher (Speaker Mtg.)	W286
130	Carriage Bolt	97-0061FA3
131	Carriage Bolt Nut	W98FA3
132	Bolt (Bracket Mtg.)	97-0120FA34

The following parts are for the Dash Speaker:

PHILCO RADIO & TELEVISION CORP.

f = 455 KC

No.	Description	Part No.
1	Antenna Choke	65-0834
2	Short Wave Antenna	65-0834
3	Transformer (1500 ohms)	33-21534
4	Breakfast Antenna	65-0885
5	Condenser (.05 Mfd.)	61-0101
6	Resistor (350 ohms)	33-119136
7	Choke	65-0837
8	Condenser (.05 Mfd.)	61-0117
9	Condenser (.05 Mfd.)	61-0117
10	Resistor (33,000 ohms)	33-22334

75	'A' Choke	60-125157
76	Vibrator (50 Mmfd.)	61-0106
77	Vibrator (150 ohms)	33-115334
78	Resistor (200 ohms)	33-122334
79	Power Transformer	65-0318
80	Resistor (3000 Mmfd.)	61-0115
81	Resistor (1000 ohms)	33-210434
82	Resistor (250 Mmfd.)	60-125157
83	Receiver Housing	33-317334
84	Speaker Socket	77-0191FC35
85	Loktal Socket	65-0443
86	Antenna Connector	67-0891
87	Tube Side Cover	57-1358FC55
88	Wiring Side Cover	57-1343FC55
89	Indicator Plate	57-1343FC55
90	Hook Bolt	65-0075
91	Nut (Radio Mtg.)	57-1340FA3
92	Lockwasher (Radio Mtg.)	W08FA3
93	Cable Clamps	57-1429FA38
94	Interference Condenser	30-4007
95	(Generator)	30-4490
96	Spark Plug Suppressor	33-1015
97	Distributor Resistor	33-1196
98	Hood Grounding Screws	97-0125FA3
99	Control Assembly	85-0132
100	Slide & Pawl Assembly	77-0721
101	Station Indicator Drum	65-1198
102	Dial	65-1198
103	Tone Switch Spring	57-1840
104	Tone Switch Shaft	57-1889FA3
105	Pointer	57-1888
106	Station Indicator Flexible Shaft	57-1385
107	Tuning Flexible Shaft	57-1384
108	Volume Flexible Shaft	57-1887FCP
109	Dial Background Plate	57-1425FA3
110	Drive Cord Spring	55-0885
111	Drive Card	65-0145

8	580 K.C.	To Aerial Receptacle on Radio	See Note 1	Set Tuning Condenser at 580 K.C.	Ⓢ

Make all adjustments for maximum reading on the output meter.
NOTE 1—Connect the aerial lead, Part No. 95-0185, to the aerial receptacle in the radio. Connect a 10 mmfd. Condenser in series between the signal generator and the aerial lead.
NOTE 2—Turn the condenser rotor plates completely out of mesh as far as they will go.
NOTE 3—Rock the tuning condenser while adjusting the low frequency padder. Tune the condenser to the signal and adjust

the padder for maximum output. Rotate the tuning condenser back and forth slightly for maximum output. Then readjust the padder for maximum output. Repeat this procedure until no further improvement is noticed.
NOTE 4—When the aerial stage adjustment is made with the Radio installed in the car, the Radio aerial lead must be connected to the car aerial in the usual manner. Connect the signal generator output lead to a wire placed near the car aerial but not connected to it.

MODEL Studebaker Tuner

Part 77-0588

MODEL Packard Tuner

Part 77-0636

PHILCO RADIO & TELEVISION CORP.

- (b) Set up the signal generator to 1600 K.C. and adjust padder (1) (see Fig. 1) for maximum signal. **(3) FOR PACKARD**
- (c) Adjust the signal generator to 1400 K.C. and set the tuning control at 1400 K.C. Adjust the coil form by turning the mounting nut (B) until maximum signal is obtained. In case a peak cannot be obtained, it may be necessary to unsolder the piano wire and move the core slightly, either in or out.

4—ALIGNMENT WHEN ONLY THE OSCILLATOR TRACKING COIL OR CORE IS REPLACED

- (a) Set the signal generator to 600 K.C. and the tuning control at 600 K.C. Adjust screw (4) (see Fig. 1) for maximum signal. Rock the tuning control while making this adjustment. Tune the control to the signal and adjust the screw for maximum output. Rotate the tuning control back and forth slightly until maximum output is obtained. Then readjust the screw until no further improvement is noticed.

- (b) Check and readjust the aerial compensator (2) in the radio, and padders (1), (2), and (4) as described in 1.

5—ALIGNMENT WHEN ONLY THE OSCILLATOR COIL OR CORE IS REPLACED

- (a) Set the piano wire end of the core 1/4" from the end of the coil form when the core draw bar is in the extreme "out" position, and solder the wire to the lug.

- (b) Set up the signal generator to 1600 K.C. and adjust padder (3) (see Fig. 1) for maximum signal. **(1) FOR PACKARD**

- (c) Follow the same procedure as outlined under "1—Complete Alignment Procedure".

- (g) In case a great adjustment was necessary in (f) the adjustments (c) and (d) should be repeated.

- (h) In case the dial calibration is off frequency, it can be corrected by changing the starting position of the oscillator core. This is done by unsoldering the piano wire from the lug and moving the core slightly. A change of 1/64" in the position of the core is equivalent to approximately 20 K.C. on the dial. If the dial reads low, it can be corrected by starting the oscillator core further in the coil form. If it reads high, the core should be pulled out. If this position is changed, it will be necessary to realign the radio as described above.

2—ALIGNMENT WHEN ONLY THE ANTENNA COIL OR CORE IS REPLACED

- (a) Set the piano wire end of the core 1/4" from the end of the coil form when the core draw bar is in the extreme "out" position, and solder the wire to the lug.

- (b) Set up the signal generator to 1600 K.C., and adjust the aerial compensator (2) in the radio for maximum signal.

- (c) Adjust the signal generator to 1400 K.C. and set the tuning control at 1400 K.C. Adjust the coil for maximum signal by turning the mounting nut (A) until maximum signal is obtained. In case a peak cannot be obtained, it may be necessary to unsolder the piano wire and move the core slightly, either in or out.

- (d) Repeat (b) and (c).

3—ALIGNMENT WHEN ONLY THE R.F. TRANSFORMER OR CORE IS REPLACED

- (a) Set the piano wire end of core 1/4" from the end of the coil form when the core draw bar is in the extreme "out" position and solder the wire to the lug.

FIG. 1
USE THIS DRAWING FOR STUDEBAKER ONLY

- (d) Set the signal generator at 1400 K.C. and tune the manual control to 1400 K.C. Adjust the R.F. and antenna coil for maximum signal by turning the mounting nuts (A) and (B).

- (e) Repeat (c) and (d) until no further improvement is noticed.

- (f) Set the signal generator at 600 K.C. and the tuning control at 600 K.C. Adjust the screw (4) (see Fig. 1) for maximum signal. Rock the tuning control when making this adjustment. Tune the control to the signal and adjust the screw for maximum output. Rotate the tuning control back and forth slightly until maximum output is obtained. Then readjust the screw until no further improvement is noticed.

1—COMPLETE ALIGNMENT PROCEDURE

- (a) Push in the tuning control knob so that stations can be tuned in by manual tuning.
- (b) Turn the tuning control knob clockwise as far as it will go so that the cores will be in the extreme "out" position. Set the signal generator to 1600 K.C. and adjust padder (3) (Fig. 1) for maximum signal. **(1) FOR PACKARD**
- (c) Adjust padder (2) aerial compensator in radio and padder (1) (see Fig. 1) for maximum signal. **(3) FOR PACKARD**

PHILCO RADIO & TELEVISION CORP.

MODEL S-1616

INSTALLING CALL LETTERS IN AUTOMATIC TUNING DIAL

One of the "A" leads on the back of the control head must be connected so that the current is supplied to operate the automatic control dial. Insert the fuse in the fuse housing in the separate "A" lead (supplied in the radio package), and connect to the "A" lead on the control. The eyelet end of this lead should be connected to the terminal of the Gas Gauge nearest the center of the car.

1—Select and remove from the Call Letter Sheets, the Call Letters of five popular stations in the area in which the radio is to be operated and that comes within the frequency range of the positions on the dial as shown in Illustration for Model S-1616.

2—If the section of the dial in which the tab marked "DIAL" is not at the indicator window, push the Automatic Station Selector until it is in position in the indicator window. The control must be held against the edge of the instrument panel in order to complete the electrical circuit.

3—Push the Automatic Station Selector once more and No. 1 section of the dial will rotate to the front. Insert in this position the call letter tab of the station having the highest kilocycle frequency.

EXAMPLE: The No. 1 position may have the call letters of a station operating on 1400 kilocycles; the No. 2 position, a station operating on 1050 kilocycles, etc.

4—Repeat this procedure until all five call letter tabs selected are inserted in the dial in the order of their frequency. Be sure and record the call letters with respect to their position on the dial for use in setting up the adjusting screws.

5—The control unit should now be completely installed. Remove the trim panel covering the control openings and place the control unit in position in the back of the instrument panel. Insert the bezel windows in the bezel plate, and apply the bezel plate to the front of the panel. The control and bezel are assembled to the instrument with gland nuts. Using the special gland nut wrench provided, tighten the nuts and then apply the two knobs.

SETTING UP THE RECEIVER FOR AUTOMATIC TUNING

Before setting up the Receiver for automatic tuning, it is necessary to synchronize the automatic dial to the Receiver as follows:

Try to tune in a station with the tuning control knob. If no station can be picked up, push the automatic station selector button until the position is found where stations can be tuned in. This is the "DIAL" position. Remove the automatic control cable from the Receiver and again push the automatic station selector button until the word "DIAL" appears in the dial window. The automatic control cable should then be replaced in its socket on the Receiver and secured with the two self threading screws supplied.

1—Turn the Receiver on and allow it to operate for TWENTY minutes. Remove the cover plate over the automatic tuning adjusting screws. This plate is on the control end of the Receiver and can easily be pried off.

2—Push the automatic station selector button until the word "DIAL" is at the indicator window. Tune in the station whose call letters are in the No. 5 position on the dial (the lowest frequency station) and note the program. Push the automatic selector button five times and this station's call letters will appear at the indicator window.

IMPORTANT—Start adjustments with low frequency screws.

3—With a small screwdriver, turn the No. 5 adjusting screw (See Illustration for Model S-1616) in the left column to the right or left until the station is tuned in. Now adjust the corresponding screw in the right column until maximum volume is obtained. Make these adjustments carefully, as it may be easy to pass by the loudest point on some stations.

4—Press the automatic station selector button until "DIAL" again is at the indicator window and tune in the station whose call letters are in the No. 4 position on the automatic dial (the next higher frequency). Press the automatic button four times and adjust the number 4 set of adjusting screws to this station.

Repeat this procedure until each of the five pairs of adjusting screws has been tuned to its respective station.

It is NECESSARY that the setting of the adjusting screws be repeated to be sure they are properly set so that maximum performance may be had.

TURN ADJUSTING SCREWS COUNTER CLOCKWISE TO INCREASE AND CLOCKWISE TO DECREASE FREQUENCY.

VIEW OF AUTOMATIC ADJUSTING SCREWS

Be sure and save the unused call letters giving them to the owner as they may be needed at some future time if the radio is to be operated in a different area where the local stations are not the same.

If the Stations set up on the Automatic Tuning Dial should at some time tune in at the wrong position, the dial can be easily synchronized to the radio as follows:

PHANTOM VIEW OF THE AUTOMATIC-DIAL SHOWING POSITIONS ON DIAL AND FREQUENCY RANGE OF EACH

- 1—Find "DIAL" position as explained in the second Paragraph under "Setting up the Receiver for Automatic Tuning."
- 2—Remove the automatic cable from the socket on the end of the Receiver.
- 3—Press the automatic station selector button until "DIAL" appears in the Automatic Window.
- 4—Replace automatic cable.

FOR OTHER DATA SEE INDEX

MODEL P-1617
MODEL C-1708

PHILCO RADIO & TELEVISION CORP.

MODEL P-1617

PREPARING FOR AUTOMATIC TUNING ADJUSTMENTS
Turn on the Receiver and allow it to operate for TWENTY minutes before starting this procedure.

- 1—Try to tune in a station with the manual tuning control knob. If no station is received, press the Automatic Station Selector button and again try to tune in a station. Repeat if necessary until the Automatic Station Dial has rotated to a point where stations may be tuned in with the manual tuning knob. This point will be the "DIAL" position of the Automatic Station Selector and call letters may now be inserted in the dial.
- 2—Remove the "right knob, gland nut cover, gland nut and bezel.

Remove the two screws in the front right side of the automatic dial housing. (These screws can be seen thru the opening in the instrument panel when the bezel is removed.)

- 3—Remove the Automatic Control Dial and assembly from the control units and drop it down below the edge of the instrument panel so that the dial is accessible.
- 4—Select and remove from the call letter sheets, the call letters of five popular stations received in the area in which the radio is to be operated, and that come within the frequency range of the adjusting screws as shown in Illustration for Model P-1617. Also remove the tab marked "DIAL."

5—Insert the "DIAL" tab in the slot in the dial which is now at the front. (The position just located by being able to tune in a station).

ADJUSTING SCREWS

FOR OTHER DATA ON THESE MODELS SEE INDEX

1. With the antenna installed and connected, turn on the radio and allow it to operate for TWENTY minutes before making adjustments.

The Receiver must be adjusted with the Skyway antenna fully extended and it is recommended that adjustments be made with the car in a shielded area such as under a viaduct or in a steel constructed building. However best results may be obtained using the new signal Antennator. This permits setting up nearby local stations on the buttons without having the car in a shielded area.

2. Push in the dial button and tune with manual control a weak station between 1350 and 1500 kilocycles. Pull push buttons off. Adjust the antenna compensator with a screw driver by turning the adjusting screw either to the left or right until maximum volume is reached. See illustration.

3. If numbers on buttons are not desired, select and remove from the call letter sheet, five call letter tabs of popular stations received in the area in which the receiver is to be operated, selecting stations within the range of each button as shown in illustration, Model C-1708. Reference to programs published in your local newspaper aids in quick selection of stations. Remove metal caps to install the tabs in push buttons.

4. Push dial button and tune in the station you have selected for the No. 1 button, identify the program and push in the No. 1 push button shaft. Using a small screw driver, turn the No. 1 adjusting screw (inner screw) and tune in the station selected for this position by turning the screw driver counter-clockwise to increase frequency and clockwise to decrease frequency.

After the station has been tuned in accurately, (see illustration) a finer adjustment can be made by adjusting the vernier screw, which is the outside shell of the adjusting screw. Use a larger screw driver for this operation. Careful adjustment of this screw will insure maximum performance in areas where broadcasting reception is poor.

MODEL C-1708

Proceed in like manner with the adjustment of No. 2, 3, 4 and 5 screws in the order of frequency until all five stations have been tuned in. It is recommended that the above procedure of setting up stations should be repeated in order that accurate adjustments may be insured, for satisfactory reception at some distance from stations.

5. The push buttons may now be replaced on their respective shafts.

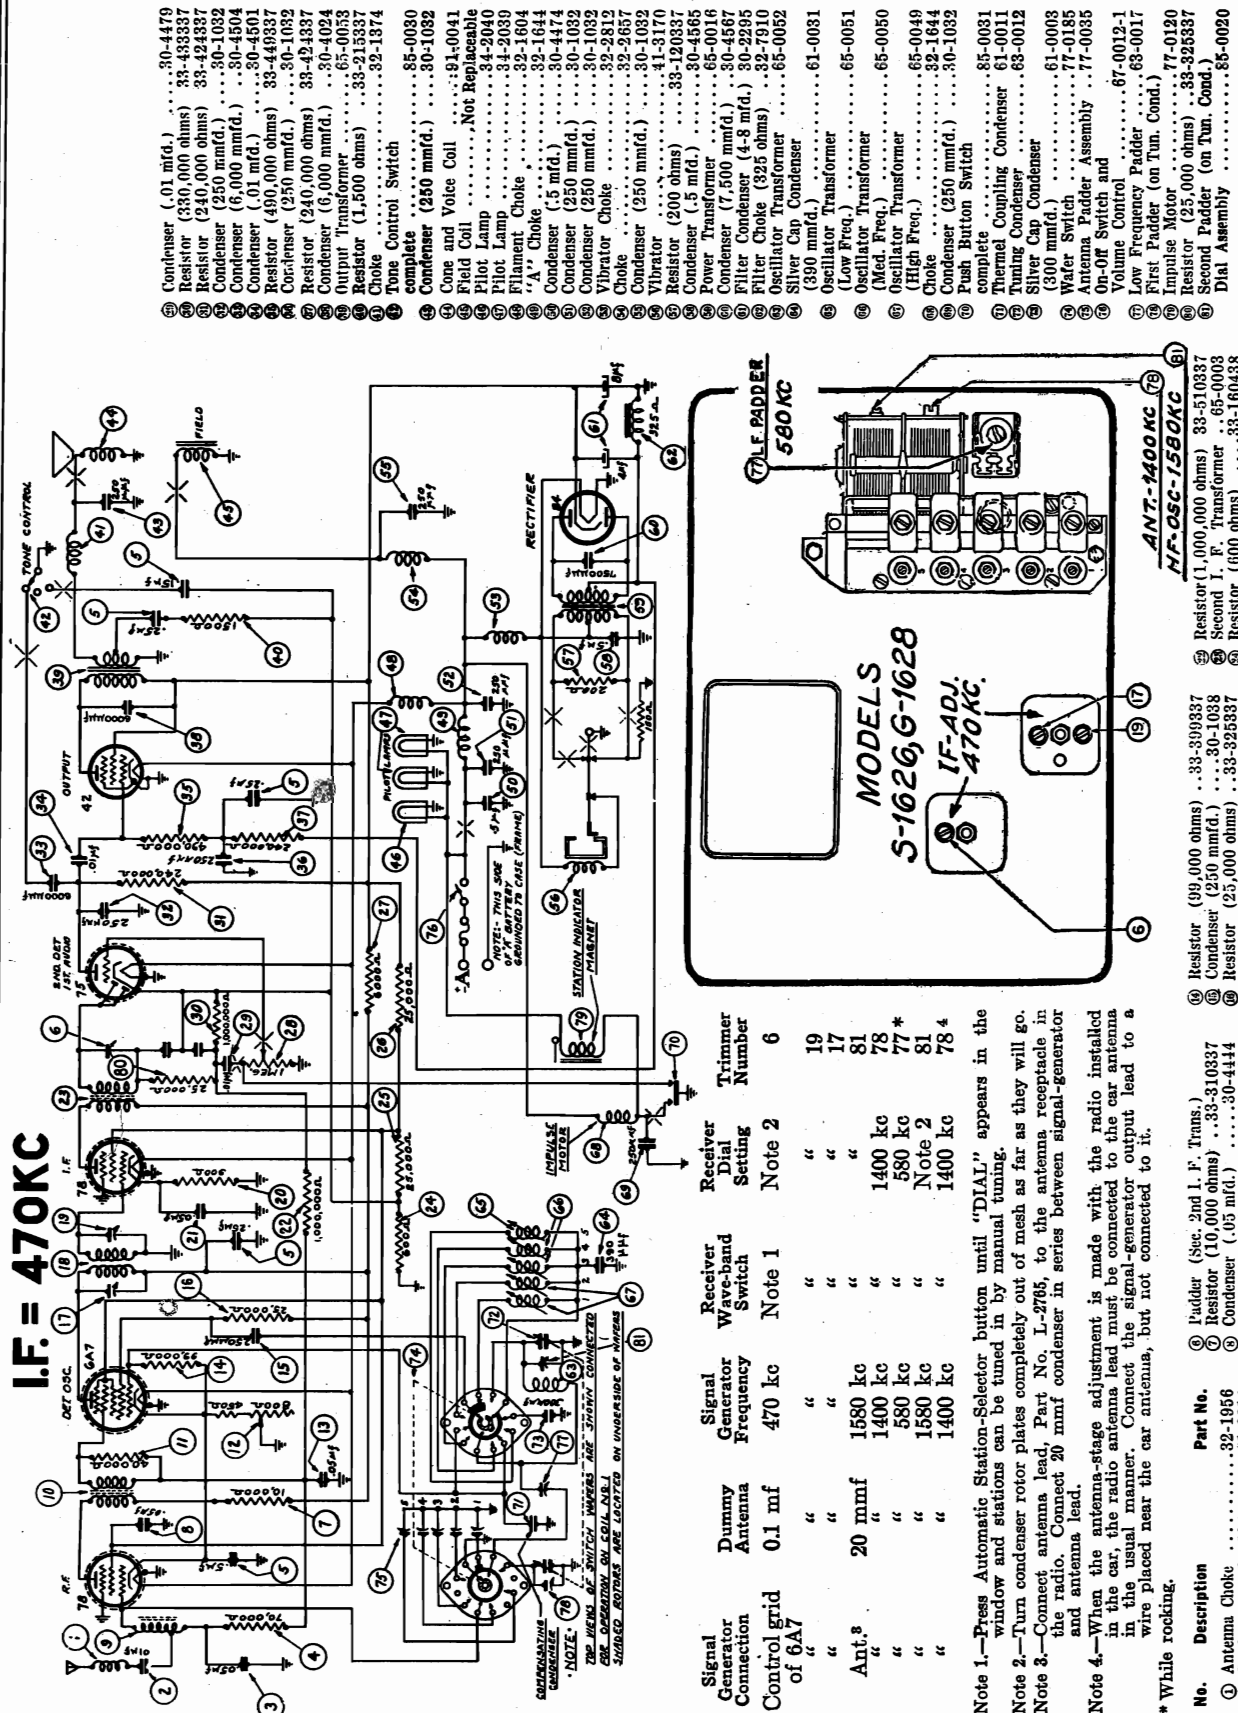

The Receiver may be set up before installing in the car, but FINAL adjustments must be made with the radio operating on the antenna in the car. Eight hundred call letter tabs in sheet form are furnished so that at least five popular radio broadcasting stations can be selected.

BE SURE AND SAVE THE UNUSED CALL LETTERS, GIVING THEM TO THE OWNER AS THEY MAY BE NEEDED AT SOME FUTURE TIME IF THE RADIO IS TO BE OPERATED IN A DIFFERENT AREA WHERE THE LOCAL STATIONS ARE NOT THE SAME.

AUTOMATIC ADJUSTING SCREWS

MODELS S-1626
G-1628

PHILCO RADIO & TELEVISION CORP.

MODELS S-1626 and G-1628**SETTING UP THE RECEIVER
FOR AUTOMATIC TUNING**

Select and remove from the Call Letter Sheets, the Call Letters of five popular stations received in the area in which the radio is to be operated and that come within the frequency range of the adjusting screws as shown in Illustration for Models S-1626, G-1628. Also remove the tab marked "DIAL."

Insert the "DIAL" tab in the slot in the dial which is at the front.

Hold the control against the edge of the instrument panel in order to complete the electrical circuit and push the automatic selector button. The dial will rotate one position. Insert in the dial, the call letter tab of the station having the highest frequency in kilocycles. Press the selector button once more and insert the call letters of the station with the next highest frequency in kilocycles.

EXAMPLE—The first position may have the call letters of a station operating on 1400 kilocycles; the second position, a station operating on 1050 kilocycles, etc. Repeat this procedure until all five call letter tabs selected are inserted in the dial in the order of their frequency. Be sure and record the call letters with respect to their position on the dial for use in setting up the adjusting screws.

Before setting up the Receiver for automatic tuning, it is necessary to synchronize the automatic dial to the Receiver as follows:

Try to tune in a station with the tuning control knob. If no station can be picked up, push the automatic station selector button until the position is found where stations can be tuned in. This is the "DIAL" position. Remove the automatic control cable from the Receiver and again push the automatic station selector button until the word "DIAL" appears in the dial window. The automatic control cable should then be replaced in its socket on the Receiver and secured with the two self threading screws supplied.

1—Turn the Receiver on and allow it to operate for TWENTY minutes. Remove the cover plate over the automatic tuning adjusting screws. This plate is on the front of the Receiver and can easily be pried off.

2—Push the automatic station selector button until the word "DIAL" is at the indicator window. Tune in the station whose call letters are in No. 5 position on the dial (the lowest frequency station) and note the program. Push the automatic selector button five times and this station's call letters will appear at the indicator window.

3—With a small screwdriver, turn the No. 5 adjusting screw (See Illustration for Models S-1626, S-1628) in the left column to the right or left until the station is tuned in. Now adjust the corresponding screw in the right column until maximum volume is obtained. Make these adjustments carefully, as it may be easy to pass by the loudest point on some stations.

4—Press the automatic station selector button until "DIAL" again is at the indicator window and tune in the station whose call letters are in the No. 4 position on the automatic dial (the next higher frequency). Press the automatic button four times and adjust the number 4 set of adjusting screws.

Repeat this procedure until each of the five pairs of adjusting screws has been tuned to its respective station.

It is **NECESSARY** that the setting of the adjusting screws be repeated to be sure they are properly set so that maximum performance may be had.

Be sure and save the unused call letters, giving them to the owner as they may be needed at some future time if the radio is to be operated in a different area where the local stations are not the same.

If the Stations set up on the Automatic Tuning Dial should at some time tune in at the wrong position, the dial can be easily synchronized to the radio as follows:

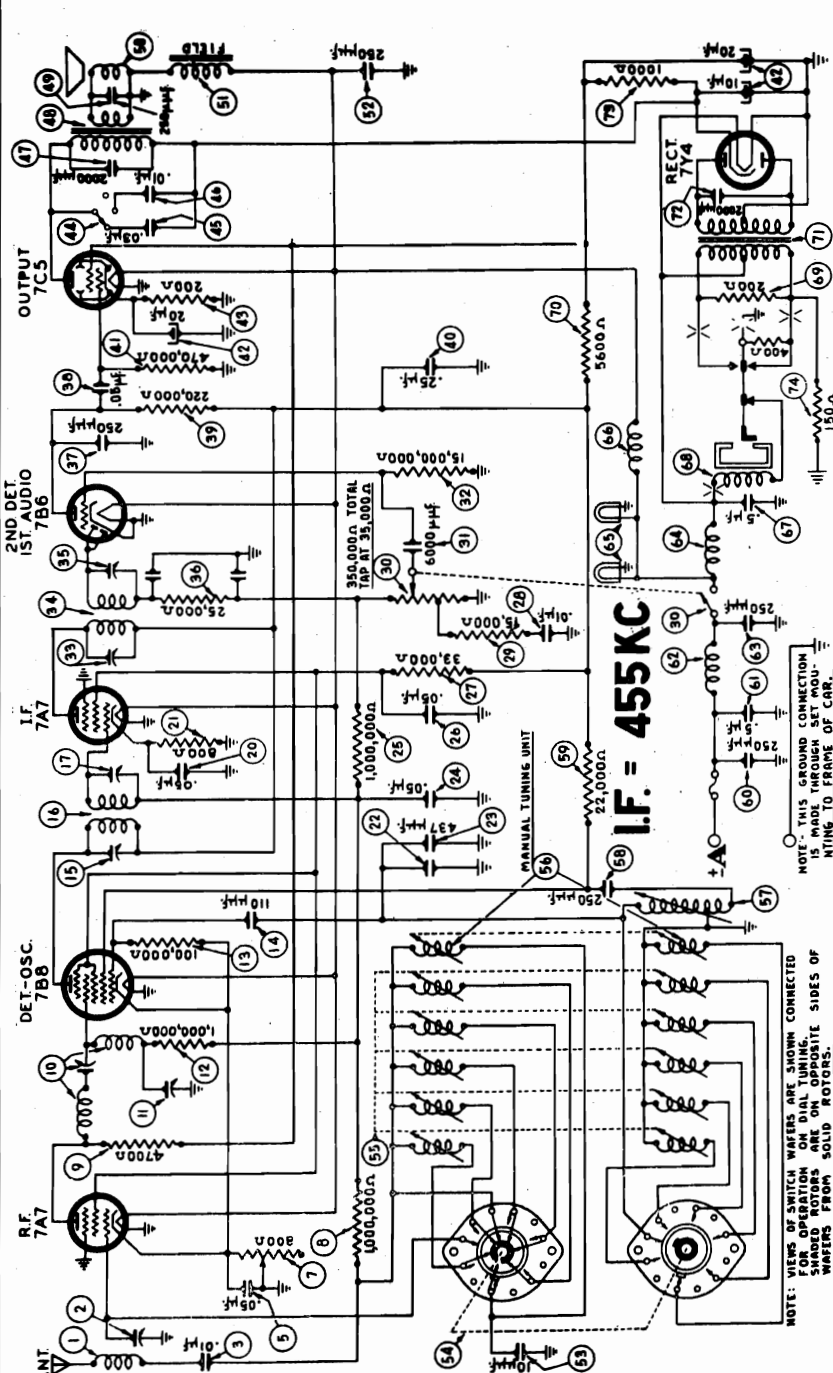

- 1—Find "DIAL" position as explained in the second Paragraph under "Setting up the Receiver for Automatic Tuning."
- 2—Remove the automatic cable from the socket on the end of the Receiver.
- 3—Press the automatic station selector button until "DIAL" appears in the Automatic Window.
- 4—Replace automatic cable.

Note 1.—Press automatic push button until "DIAL" appears in the window and stations can be tuned in by manual tuning.

Note 2.—Turn tuning-control knob clockwise as far as it will go.

Note 3.—Adjust (11) to obtain minimum output.

Note 4.—Connect antenna lead, Part No. 95-0120, to the antenna receptacle on the radio. Connect 30 mmf condenser in series between signal-generator and antenna lead. Ground the shield pigtail to the signal-generator.

Note 5.—When the antenna-stage adjustment is made with the radio installed in the car, the radio antenna lead must be connected to the cowl antenna in the usual manner. Connect the signal-generator output lead to a wire placed near the car antenna lead, but not connected to it; and adjust trimmer (2) for maximum signal at 1400 kc.

* While rooking.

PHILCO RADIO & TELEVISION CORP.

MODEL S-1726

The antenna and touch tuning station adjustments are accessible from the front of the receiver when the two screws holding the cover plate are removed. On cars equipped with the "Climatizer", it will be necessary to remove the screws holding the "Climatizer" control assembly to the lower edge of the instrument panel and drop it down out of the way while making the adjustments.

1—Turn on the radio set and allow it to heat for at least twenty minutes before starting any adjustments.

2—Press the touch control button until the word "DIAL" appears in the "DIAL" window. Tune in a weak station on the manual dial between 1350 and 1500 kilocycles. Now adjust the antenna high frequency compensating screw (See Illustration) until maximum volume is obtained.

3—Select five stations within the frequency range shown over each set of adjusting screws (See Illustration). Remove the call letters for these stations from the call letter tab sheet. Remove the top cover of the set; this exposes the plastic drum into which the tabs should be inserted. It is important to insert these tabs in a definite relationship with respect to frequency in order that tuning adjustments can be made properly. Arrange the tabs in the order of frequency from high to low, placing the highest frequency on the drum immediately next to the dial tab in a counter clockwise direction. Insert the remaining tabs in the order of frequency in this same counter clockwise direction. If the tabs have been inserted correctly, it will be found that when the word "DIAL" shows in the window, the next push of the button will place the call letter for the highest frequency station in the window. Each successive push of the control button will place a next lower frequency station in the window until the series is repeated.

4—With "DIAL" showing in the dial window, manually tune in the station to be set up on push button number 1 and identify the program.

5—Press the touch control button once and adjust the left hand screw using the small end of the special screw driver, until the station identified has been tuned in as accurately as possible. A final adjustment can be made by inserting the large end of the screw driver into the vernier adjusting screw. Careful adjustment of this screw will insure maximum performance in areas where reception is poor. **NOTE:** Stations of the higher frequencies are tuned in by turning the screws to the left or counter clockwise. Lower frequency stations are tuned by turning to the right or clockwise. Proceed in like manner with the adjustment of each of the remaining stations in the order of frequency until all five stations selected have been tuned in. Because there is some detuning of the coils due to the movements of the cores in adjacent coils, it is necessary to re-check the adjustments again going back from right to left and again re-checking from left to right. This is important for accurate reception while driving at a distance from the broadcasting stations.

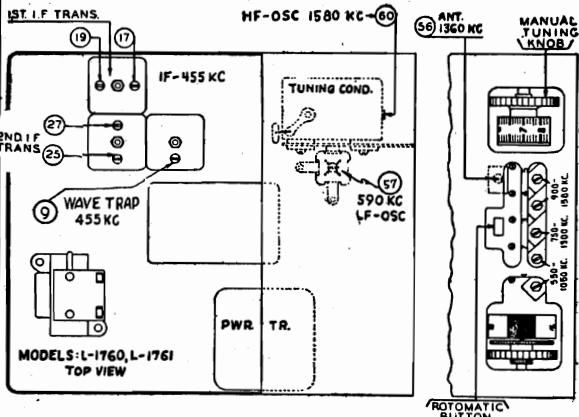

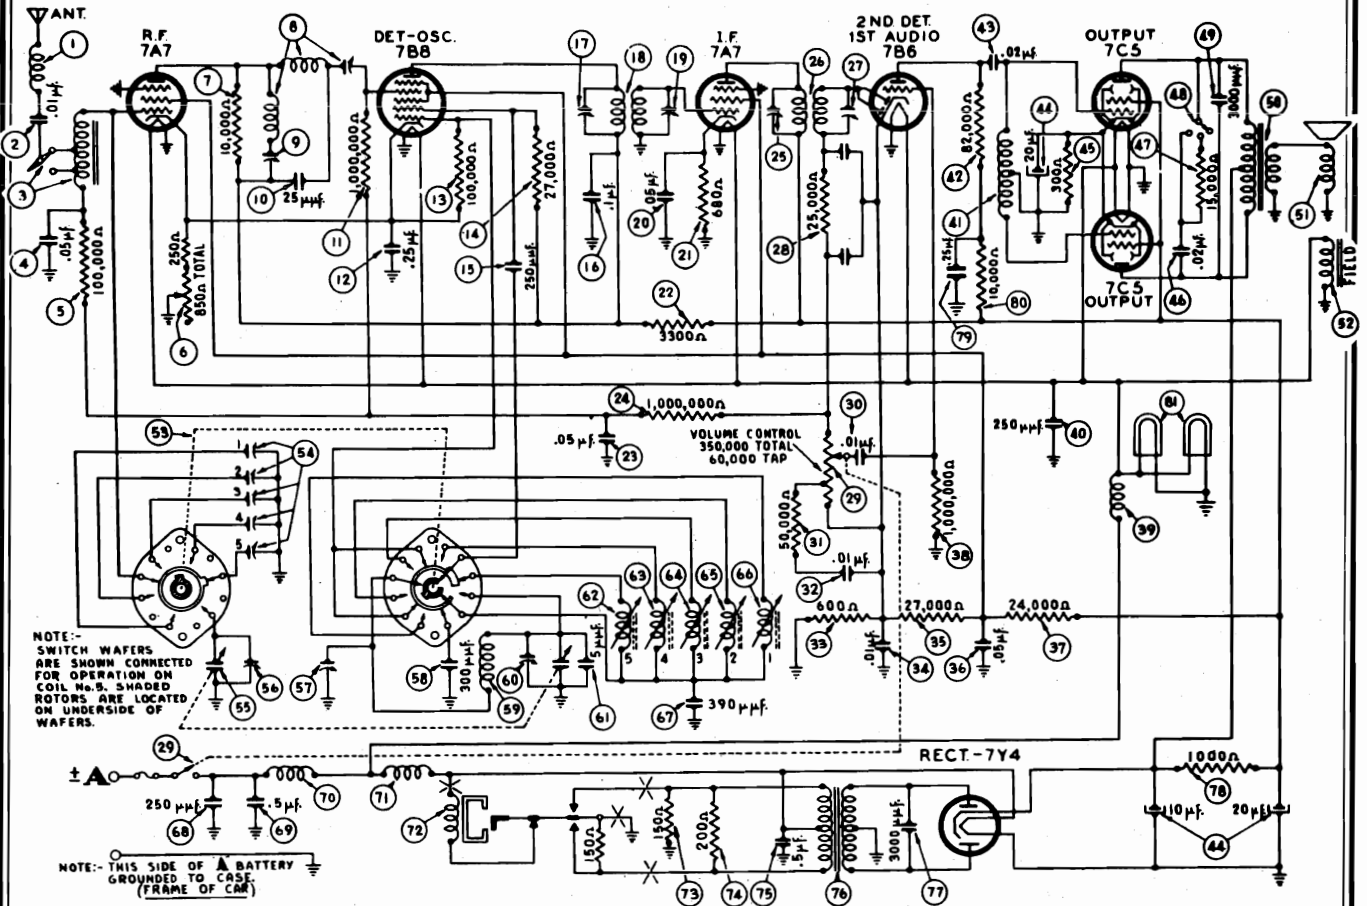

6—This final re-checking of adjustments should be made in an area of low signal strength in your service station or in some known "dead" spot where signals can just barely be heard.

7—Replace the cover plate over the adjusting screws and replace the "Climatizer" controls.

BE SURE AND SAVE THE UNUSED CALL LETTERS, GIVING THEM TO THE OWNER AS THEY MAY BE NEEDED AT SOME FUTURE TIME IF THE RADIO IS TO BE OPERATED IN A DIFFERENT AREA WHERE THE LOCAL STATIONS ARE NOT THE SAME.

Note 1.—Press "Rotomatic" Station-Selector button until "DIAL" appears in the window and stations can be tuned in by manual tuning.

Note 2.—Turn condenser rotor plates completely out of mesh as far as they will go.

Note 3.—Adjust (9) for minimum output.

Note 4.—When TIRE-COMPARTMENT DOOR antenna is used; connect antenna lead, part number 95-0120, to the antenna receptacle on the radio. Connect an 830 mmf condenser in series between antenna lead and signal-generator. Ground the shield pigtail on the antenna lead to the signal-generator. Be sure antenna switch (3) is turned clockwise.

When COWL antenna is used; connect the antenna lead, part number 95-0120, to the antenna receptacle in the radio. Connect a 45 mmf condenser in series between antenna lead and signal-generator. Ground the shield pigtail on the antenna lead to the signal-generator. Be sure antenna switch (3) is turned counter-clockwise.

Note 5.—When the antenna-stage adjustment is made with the radio installed in the car, the radio antenna lead must be connected to the car antenna in the usual manner. Connect the signal-generator output lead to a wire placed near the car antenna, but not connected to it.

* While rocking.

MODELS L-1760,
L-1761

PHILCO RADIO & TELEVISION CORP.

MODELS L-1760 and L-1761

The Aerial and Rotomatic adjustments are easily accessible through the openings in the instrument panel. (See Illustration).

1—Turn the radio set on and allow it to heat for at least TWENTY minutes before starting any adjustments.

2—Press the Rotomatic button until the word "DIAL" appears in the Rotomatic indicator. Tune in a weak station on the manual dial between 1400 and 1500 kilocycles. Now adjust the aerial screw until maximum volume is obtained. (When the special concealed cowl aerial is used, adjustment should be made with the aerial fully extended.)

3—Select five stations within the frequency range shown under each set of adjustment screws shown in Illustration.

4—With "DIAL" showing on the Rotomatic indicator, manually tune in the station to be set up on position No. 1 and identify the program.

5—Press the Rotomatic button until No. 1 appears on the Rotomatic indicator. Now adjust the top screw at position No. 1 until the station selected is brought in with loudest volume. Then adjust the slotted hex screw at the bottom until maximum volume is obtained. NOTE: Stations of the higher frequencies are tuned in by turning the screws to the left or counter clockwise. Lower frequency stations are tuned by turning to the right or clockwise.

6—Proceed with setting up the remaining four stations in the same manner as described under Paragraphs 4 and 5.

7—Because there is some detuning of the coils due to the movements of the cores in adjacent coils, it is necessary to recheck the adjustments again going back from Position No. 5 to No. 1 and again rechecking from No. 1 to No. 5. This is important for accurate reception while driving at a distance from the broadcasting stations.

8—This final rechecking of adjustments should be made in an area of low signal strength in your service station or in some known "dead" spot where signals can just barely be heard.

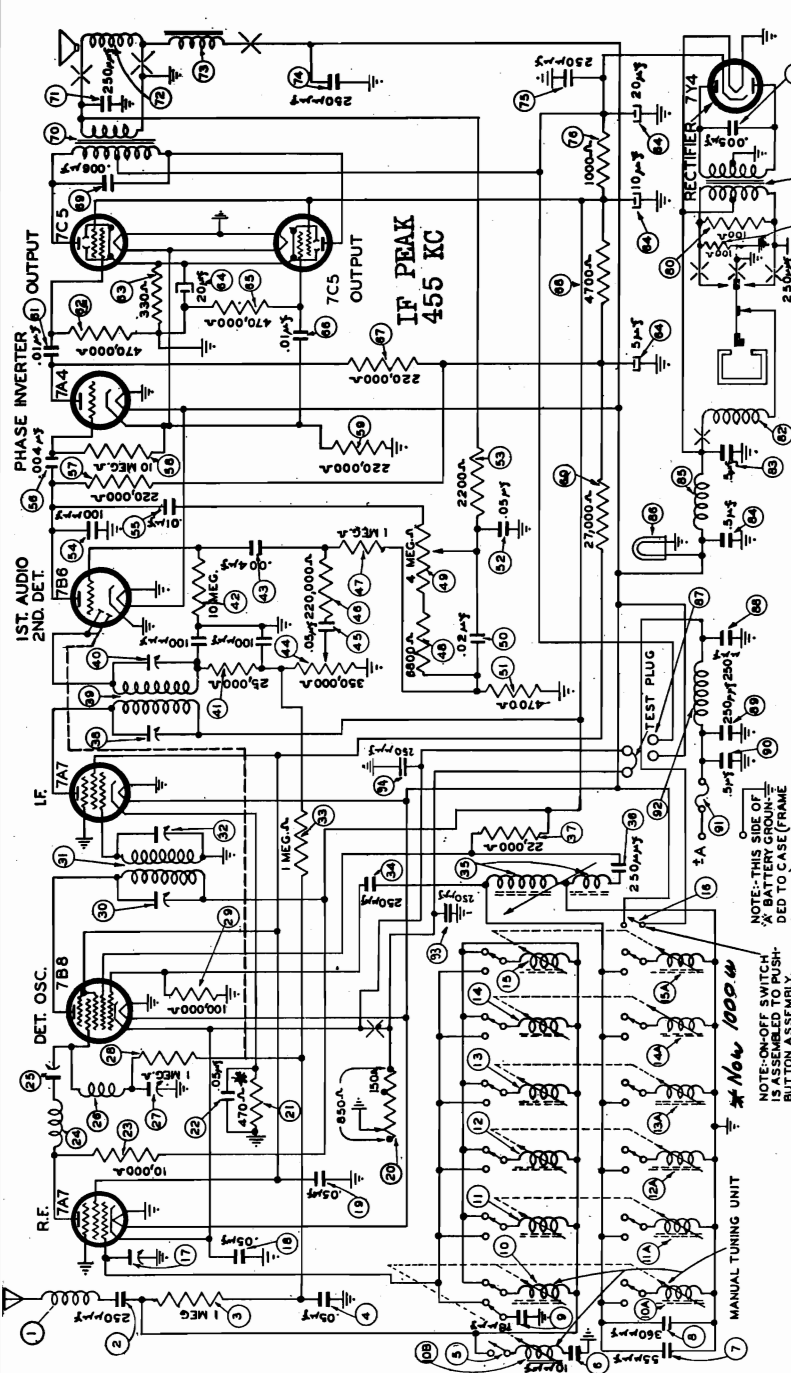

9—Should the Special Concealed Cowl Aerial be installed after the original installation, it is absolutely essential that the aerial change-over switch be shifted counter-clockwise and also that all automatic adjustments be made again as described in Paragraphs Nos. 1 to 8 inclusive.

MODEL C-1808

PHILCO RADIO & TELEVISION CORP.

MODEL C-1808 — ADJUSTMENTS

All padding adjustments are carefully made at the factory and ordinarily no readjustments are necessary. However, when readjustments are required, the procedure given below must be followed in detail.

EQUIPMENT — Fully charged heavy duty storage battery or 6 volt power pack, 077 or 177 Philco Signal generator, 027 Philco Vacuum tube voltmeter and set tester or audio output meter, 45-2610 Padding screw driver.

GENERAL — VACUUM TUBE VOLTMETER. The model 027 Vacuum tube voltmeter is an extremely sensitive and accurate test instrument and is recommended for use when aligning and adjusting auto radios. Connect the negative (—) terminal of the Vacuum Tube Voltmeter to the high side (ungrounded side) of the volume control. Connect the positive (+) terminal to the radio housing. Connect the "AC" cord to a 110 volt AC socket. Press the VTVM button and the 10 volt button. Turn the "Set Zero Ohms — VTVM" control clockwise until a click is heard. Allow the tubes to heat up for a few minutes. Short the 150 meg. VTVM terminals and adjust the "Set Zero 150 meg." control until the meter reads zero on the 0-10 range scale (bottom scale). The needle will deflect from left to right.

AUDIO OUTPUT METER. If an audio output meter is used, connect the leads across the voice coil of the speaker. Use the 0-30 volt scale.

the prescribed frequency, turn the Radio volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the meter. The signal in the speaker should be audible but not loud.

The shielding on the generator output lead must be connected to the Radio housing.

OPERATION	SIGNAL GENERATOR		DUMMY CAPACITY	SPECIAL INSTRUCTIONS	ADJUST PADDER
	FREQUENCY	CONNECTION			
1	PRESS THE "DIAL" BUTTON AND STATIONS CAN BE TUNED IN BY "DIAL" TUNING				
2	455 K.C.	To Aerial Receptacle on Radio	.1 Mfd.	Note 2	38 40 30 32 38 40 30 32
3	455 K.C.	To Aerial Receptacle on Radio	.1 Mfd.	Note 2	27 Min.
4	1400 K.C.	To Aerial Receptacle on Radio	See Note 1	Set Tuning Control at 1400* K.C.	17 4
5	580 K.C.	To Aerial Receptacle on Radio	See Note 1	Set Tuning Control at 580 K.C.	35 Note 3
6	1400 K.C.	To Aerial Receptacle on Radio	See Note 1	Set Tuning Control at 1400 K.C.	17 4 Note 4
7	580 K.C.	To Aerial Receptacle on Radio	See Note 1	Set Tuning Control at 580 K.C.	35 Note 3

Make all adjustments for maximum reading on the meter.

NOTE 1 — Connect the aerial lead, Part No. 95-0111, to the aerial receptacle in the radio. Connect a 25 Mmfd. Condenser in series between the signal generator and the aerial lead.

NOTE 2 — Turn the tuning control clockwise as far as it will go.

NOTE 3 — Rock the tuning control while adjusting the low frequency screw. Tune the control to the signal and adjust the

screw for maximum output. Rotate the tuning control back and forth slightly for maximum output. Then readjust the screw for maximum output. Repeat this procedure until no further improvement is noticed.

NOTE 4 — When the aerial stage adjustment is made with the Radio installed in the car, the Radio aerial lead must be connected to the car aerial in the usual manner. Connect the signal generator output lead to a wire placed near the car aerial but not connected to it.

INSTRUCTIONS FOR SETTING UP ELECTRIC PUSH BUTTONS

1. Turn on the radio and allow it to operate for twenty minutes or longer if possible. All adjustments MUST be made with the aerial fully extended. Turn the volume control on full and set the tone control on voice. In metropolitan areas it is best to adjust the push buttons in a shielded building or under a viaduct.

2. Push in the DIAL button so that stations can be tuned in by manual tuning and tune in a weak station around 1400 K.C. on the dial. Then adjust the aerial padder (17) for maximum signal.

3. Select the five stations which you desire to use on push button tuning. Tune in a station between 535 and 1000 Kilocycles.

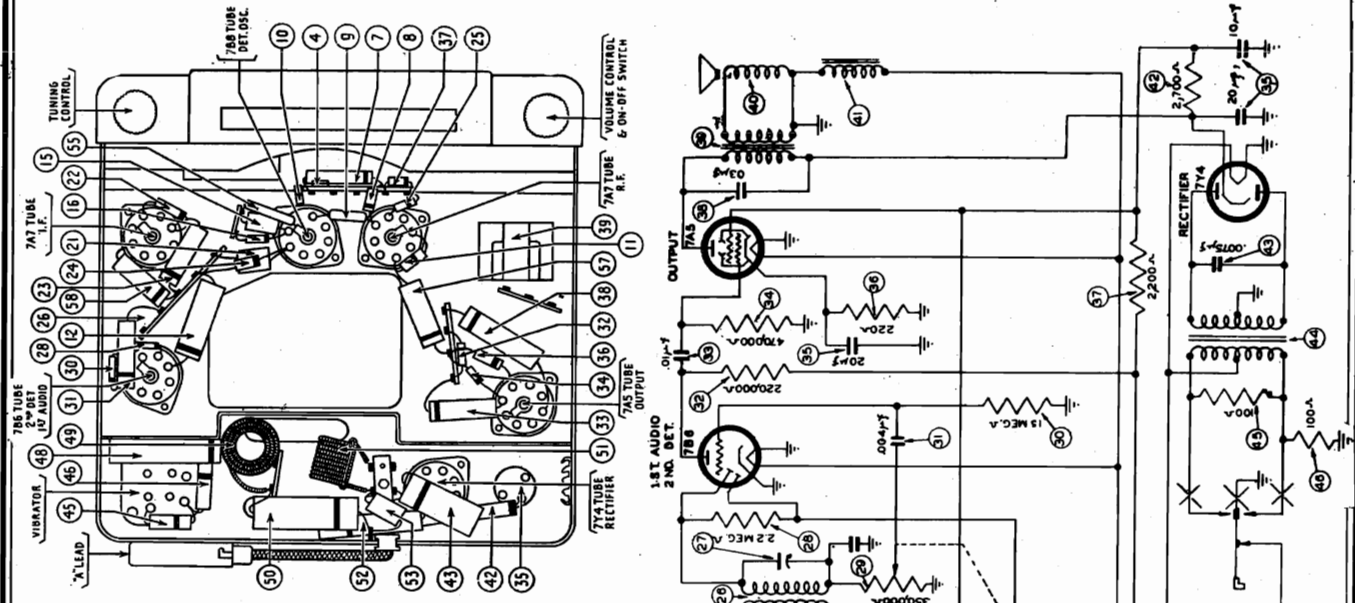

Remove the No. 1 push button cover and push in the No. 1 button. Using a coin or a small screw driver, adjust the button until the station selected is tuned in with the loudest volume. Turning the button counter-clockwise will increase the frequency, and clockwise will decrease the frequency. Check the station by pushing in the DIAL button again to identify the program.

4. Proceed in the same manner for adjusting No. 2, No. 3, No. 4 and No. 5 buttons.

The stations may be set up before installing the radio in the car, but the final adjustments must be made after installation of the radio and connected to the aerial in the car.

MODEL S-1824

Studebaker "Custom"

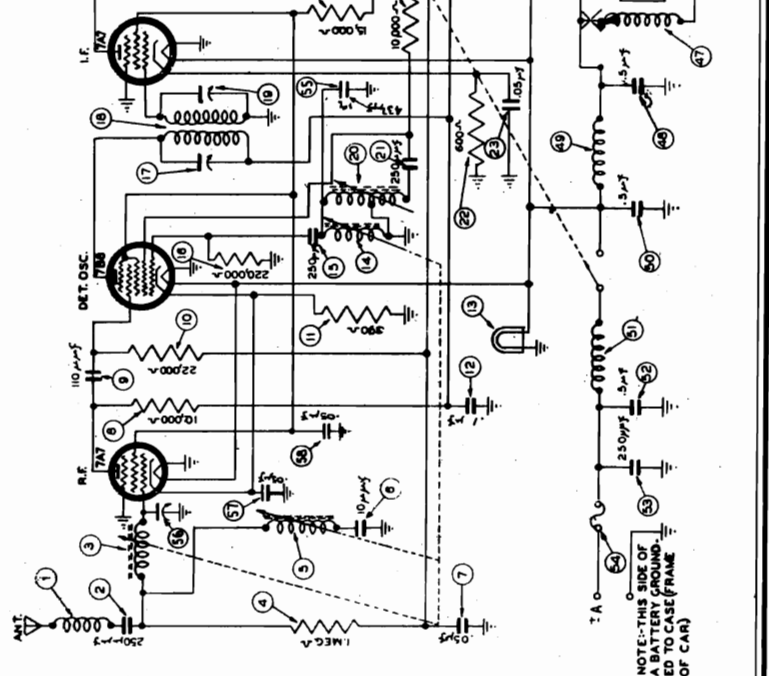

PHILCO RADIO & TELEVISION CORP.

MODEL S-1824 — ADJUSTMENTS

All padding adjustments are carefully made at the factory and ordinarily no readjustments are necessary. However, when readjustments are required, the procedure given below must be followed in detail.

EQUIPMENT— Fully charged heavy duty storage battery or 6 volt power pack, 077 or 177 Philco Signal generator, 027 Philco Vacuum tube voltmeter and set tester or audio output meter, 45-2610 Padding screw driver.

GENERAL — VACUUM TUBE VOLTMETER. The model 027 Vacuum tube voltmeter is an extremely sensitive and accurate test instrument and is recommended for use when aligning and adjusting auto radios. Connect the negative (—) terminal of the Vacuum Tube Voltmeter to the high side (ungrounded side) of the volume control. Connect the positive (+) terminal to the radio housing. Connect the "AC" cord to a 110 volt AC socket. Press the VTVM button and the 10 volt button. Turn the "Set Zero Ohms — VTVM" control clockwise until a click is heard. Allow the tubes to heat up for a few minutes. Short the 150 meg. VTVM terminals and adjust the "Set Zero 150 meg." control until the meter reads zero on the 0-10 range scale (bottom scale). The needle will deflect from left to right.

AUDIO OUTPUT METER. If an audio output meter is used, connect the leads across the voice coil of the speaker. Use the 0-30 volt scale.

With the Radio and signal generator set up for operation at the prescribed frequency, turn the Radio volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the meter. The signal in the speaker should be audible but not loud.

The shielding on the generator output lead must be connected to the Radio housing.

OPERATION	SIGNAL GENERATOR		DUMMY CAPACITY	SPECIAL INSTRUCTIONS	ADJUST PADDER
	FREQUENCY	CONNECTION			
1	455 K.C.	To Aerial Receptacle on Radio.	See Note 1	Note 2	27 19 17 27 19 17
2	1360 K.C.	To Aerial Receptacle on Radio	See Note 1	Set Tuning Control at 1360 K.C.	56
3	590 K.C.	To Aerial Receptacle on Radio	See Note 1	Set Tuning Control at 590 K.C.	20 Note 3
4	1360 K.C.	To Aerial Receptacle on Radio	See Note 1	Set Tuning Control at 1360 K.C.	56
5	1200 to 1400 K.C.	Note 5	Note 5	Note 5	56 Note 4

Make all adjustments for maximum reading on the meter.

NOTE 1— Connect the aerial lead, Part No. 95-0111, to the aerial receptacle in the radio. Connect a 35 Mmfd. Condenser in series between the signal generator and the aerial lead.

NOTE 2— Turn the tuning control clockwise as far as it will go.

NOTE 3— Rock the tuning control while adjusting the low frequency screw. Tune the control to the signal and adjust the screw for maximum output. Rotate the tuning control back and forth slightly for maximum output. Then readjust the screw for

maximum output. Repeat this procedure until no further improvement is noticed.

NOTE 4— When the aerial stage adjustment is made with the Radio installed in the car, the Radio aerial lead must be connected to the car aerial in the usual manner. Connect the signal generator output lead to a wire placed near the car aerial but not connected to it.

NOTE 5— When installing the radio in the car, follow the installation instructions carefully. Tune in a weak broadcast signal between 1200 and 1400 Kilocycles on the control scale. Remove the plug button on the end of the radio and adjust the aerial compensator 56 (see Figure 3) for maximum signal.

PHILCO RADIO & TELEVISION CORP.

S-1722

INSTALLING CALL LETTERS

Before installing the Receiver, the Call Letters of the stations which are to be tuned in automatically must be inserted in the Automatic Dial. See Illustration, Models S-1622, S-1722. Select and remove from the Call Letter Sheets, the Call Letters of five popular stations received in the area in which the radio is to be operated and that come within the frequency range of the adjusting screws as shown in Illustration Models S-1622, S-1722. Each of the adjusting screws cover the portion of the broadcast band as indicated in Illustration, Models S-1622, S-1722. It is important, therefore, that only such stations be selected as can be tuned in in the range as covered by each screw.

Push the Automatic Station Selector until the word "DIAL" is at the front. This is the starting point. Push the Automatic Station Selector once more and the first position of the dial will be at the front. Insert in this position the call letter tab of the station having the highest frequency in kilocycles. Insert in back of each tab one of the clear celluloid tabs. Press the Automatic Station Selector button once more and insert the call letters of the station with the next highest frequency in kilocycles in the second position.

Installing Call Letter Tabs

EXAMPLE—The first position may have the call letters of a station operating on 1400 kilocycles; the second position, a station operating on 1050 kilocycles, etc. Repeat this procedure until all five call letter tabs selected are inserted in the dial in the order of their frequency. Be sure and record the call letters with respect to their position on the dial for use in setting up the adjusting screws.

1—Turn the Receiver on and allow it to operate for TWENTY minutes. Remove the cover plate over the automatic tuning adjusting screws. This plate is on the front of the Receiver and is removed by removing two screws.

2—Push the Automatic Station Selector button until the word "DIAL" is at the indicator window. Tune in the station whose call letters are in the first position on the dial (the highest frequency station) and note the program. Push the Automatic Selector button once and this station's call letters will appear at the indicator window.

3—With a small screwdriver, turn the No. 1 adjusting screw (See Illustration, Models S-1622, S-1722) in the lower column, to the right or left until this station is tuned in. Now adjust the corresponding screw in the upper column until maximum volume is obtained. Make these adjustments carefully, as it may be easy to pass by the loudest point on some stations.

When adjusting for Automatic Tuning on strong local stations the antenna rod should be all the way down and the adjustments made with the car in a shielded area, such as in a steel constructed building or under a viaduct. This is necessary in order to obtain a weak signal so the adjustments can be accurately made.

4—Press the Automatic Station Selector button until "DIAL" again is at the indicator window and tune in the station whose call letters are in the second position on the automatic dial (the next lowest frequency). Press the automatic button two times and adjust the number 2 set of adjusting screws.

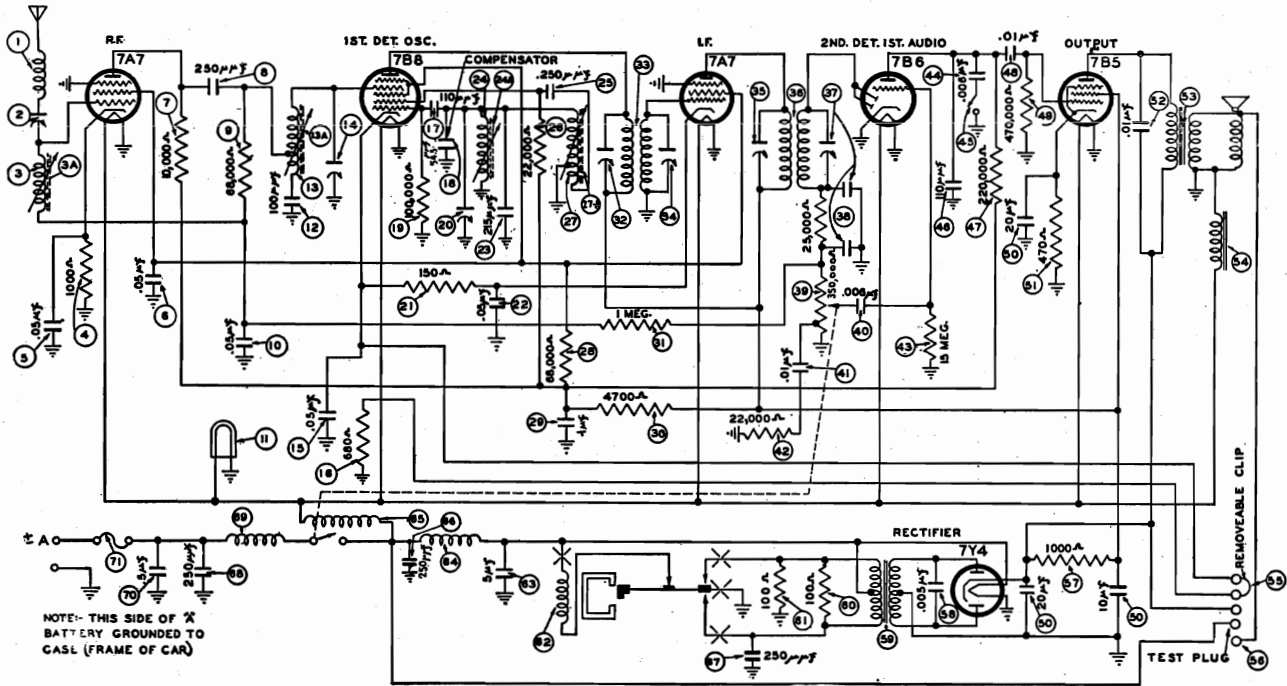

Repeat this procedure until each pair of the five pairs of adjusting screws has been tuned to its respective station.

IT IS NECESSARY THAT THE SETTING OF THE ADJUSTING SCREWS BE REPEATED TO BE SURE THEY ARE PROPERLY SET SO THAT MAXIMUM PERFORMANCE MAY BE HAD.

Be sure and save the unused call letters giving them to the owner as they may be needed at some future time if the radio is to be operated in a different area where the local stations are not the same.

MODEL S-1825 PHILCO RADIO & TELEVISION CORP.
MODEL S-1826 MODEL P-1835

EQUIPMENT — Fully charged heavy duty storage battery or 6 volt power pack, 077 or 177 Philco Signal generator, 027 Philco Vacuum tube voltmeter and set tester or audio output meter, 45-2610 Padding screw driver.

GENERAL — VACUUM TUBE VOLTMETER. The model 027 Vacuum tube voltmeter is an extremely sensitive and accurate test instrument and is recommended for use when aligning and adjusting auto radios. Connect the negative (—) terminal of the Vacuum Tube Voltmeter to the high side (ungrounded side) of the volume control. Connect the positive (+) terminal to the radio housing. Connect the "AC" cord to a 110 volt AC socket. Press the VTVM button and the 10 volt button. Turn the "Set Zero Ohms — VTVM" control clockwise until a click is heard. Allow the tubes to heat up for a few minutes. Short the 150 meg. VTVM terminals and adjust the "Set Zero 150 meg." control until the meter reads zero on the 0-10 range scale (bottom scale). The needle will deflect from left to right.

AUDIO OUTPUT METER. If an audio output meter is used, connect the leads across the voice coil of the speaker. Use the 0-30 volt scale.

With the Radio and signal generator set up for operation at the prescribed frequency, turn the Radio volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the meter. The signal in the speaker should be audible but not loud.

The shielding on the generator output lead must be connected to the Radio housing.

8	1200 to 1400 K.C.	Note 5	Note 5	Note 5	⓪㉔ Note 4

Make all adjustments for maximum reading on the meter.

NOTE 1 — Connect the aerial lead. Part No. 95-0111, to the aerial receptacle in the radio. Connect a 35 Mmfd. Condenser in series between the signal generator and the aerial lead.

NOTE 2 — Turn the tuning control clockwise as far as it will go.

NOTE 3 — Rock the tuning control while adjusting the low frequency screw. Tune the control to the signal and adjust the screw for maximum output. Rotate the tuning control back and forth slightly for maximum output. Then readjust the screw for

maximum output. Repeat this procedure until no further improvement is noticed.

NOTE 4 — When the aerial stage adjustment is made with the Radio installed in the car, the Radio aerial lead must be connected to the car aerial in the usual manner. Connect the signal generator output lead to a wire placed near the car aerial but not connected to it.

NOTE 5 — When installing the radio in the car, follow the installation instructions carefully. Tune in a weak broadcast signal between 1200 and 1400 Kilocycles on the control scale. Remove the plug button on the end of the radio and adjust the aerial compensator ⓪ (see Figure 3) for maximum signal.

INSTRUCTIONS FOR SETTING UP THE AUTOMATIC TUNING BUTTONS

Turn on the radio and allow it to operate for twenty minutes or longer if possible.

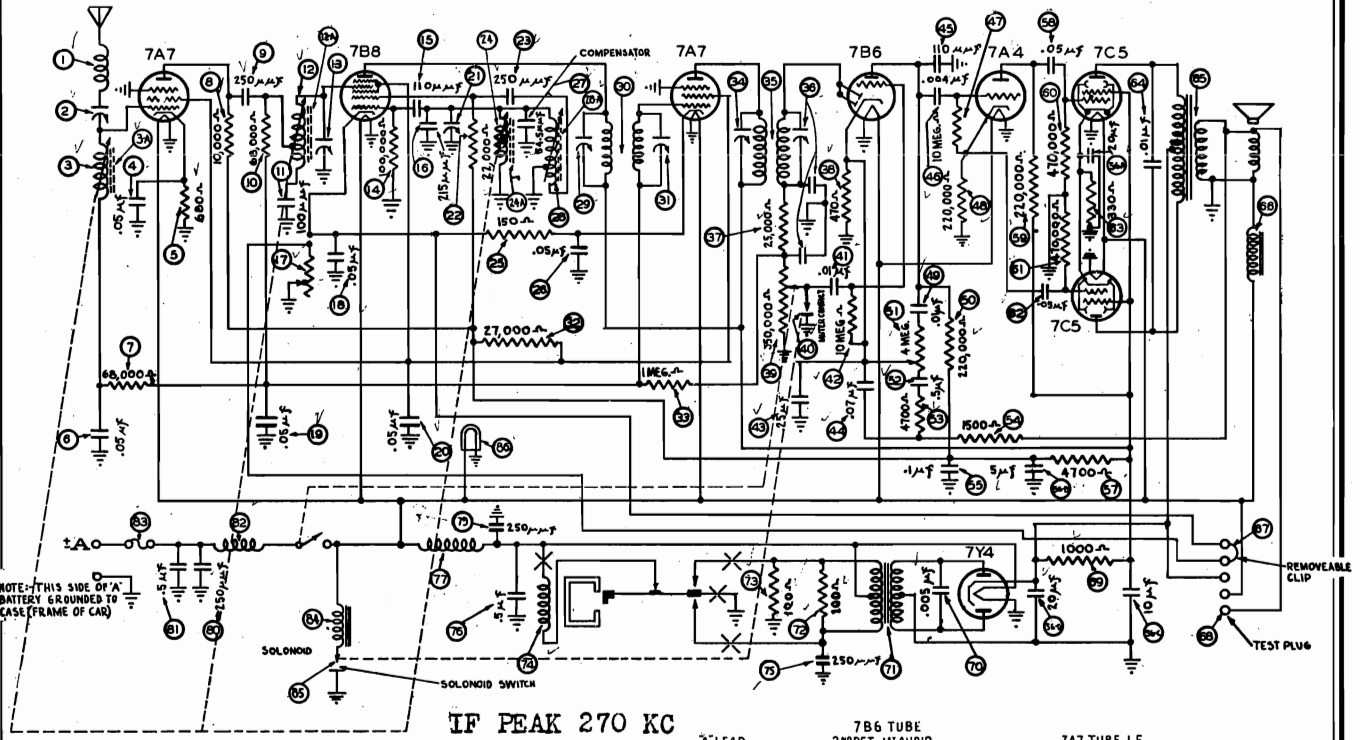

Press in any automatic button so that it remains engaged. Then tune in the station desired by turning the small wheel in the button. The station can be identified by the pointer, which indicates the frequency of the station in Kilocycles. The automatic buttons may be readjusted to any station within the range of the broadcast band. The automatic buttons may be readjusted to

stations in any sequence desired. However, for convenience in remembering stations, it is recommended that the buttons be set up in the same order that the stations appear across the dial.

CAUTION — All adjustments must be carefully made so that reception can be received best when remote from the broadcasting station. Careless tuning off to one side, even though the signal is heard, will result in distorted reception.

EQUIPMENT—Fully charged heavy duty storage battery or 6 volt power pack, .077 or 177 Philco Signal generator, 027 Philco Vacuum tube voltmeter and set tester or audio output meter, 45-2610 Padding screw driver.

GENERAL—**VACUUM TUBE VOLTMETER.** The model 027 Vacuum tube voltmeter is an extremely sensitive and accurate test instrument and is recommended for use when aligning and adjusting auto radios. Connect the negative (—) terminal of the Vacuum Tube Voltmeter to the high side (ungrounded side) of the volume control. Connect the positive (+) terminal to the radio housing. Connect the "AC" cord to a 110 volt AC socket. Press the VTVM button and the 10 volt button. Turn the "Set Zero Ohms—VTVM" control clockwise until a click is heard. Allow the tubes to heat up for a few minutes. Short the 150 meg. VTVM terminals and adjust the "Set Zero 150 meg." control until the meter reads zero on the 0-10 range scale (bottom scale). The needle will deflect from left to right.

AUDIO OUTPUT METER. If an audio output meter is used, connect the leads across the voice coil of the speaker. Use the 0-30 volt scale.

With the Radio and signal generator set up for operation at the prescribed frequency, turn the Radio volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the meter. The signal in the speaker should be audible but not loud.

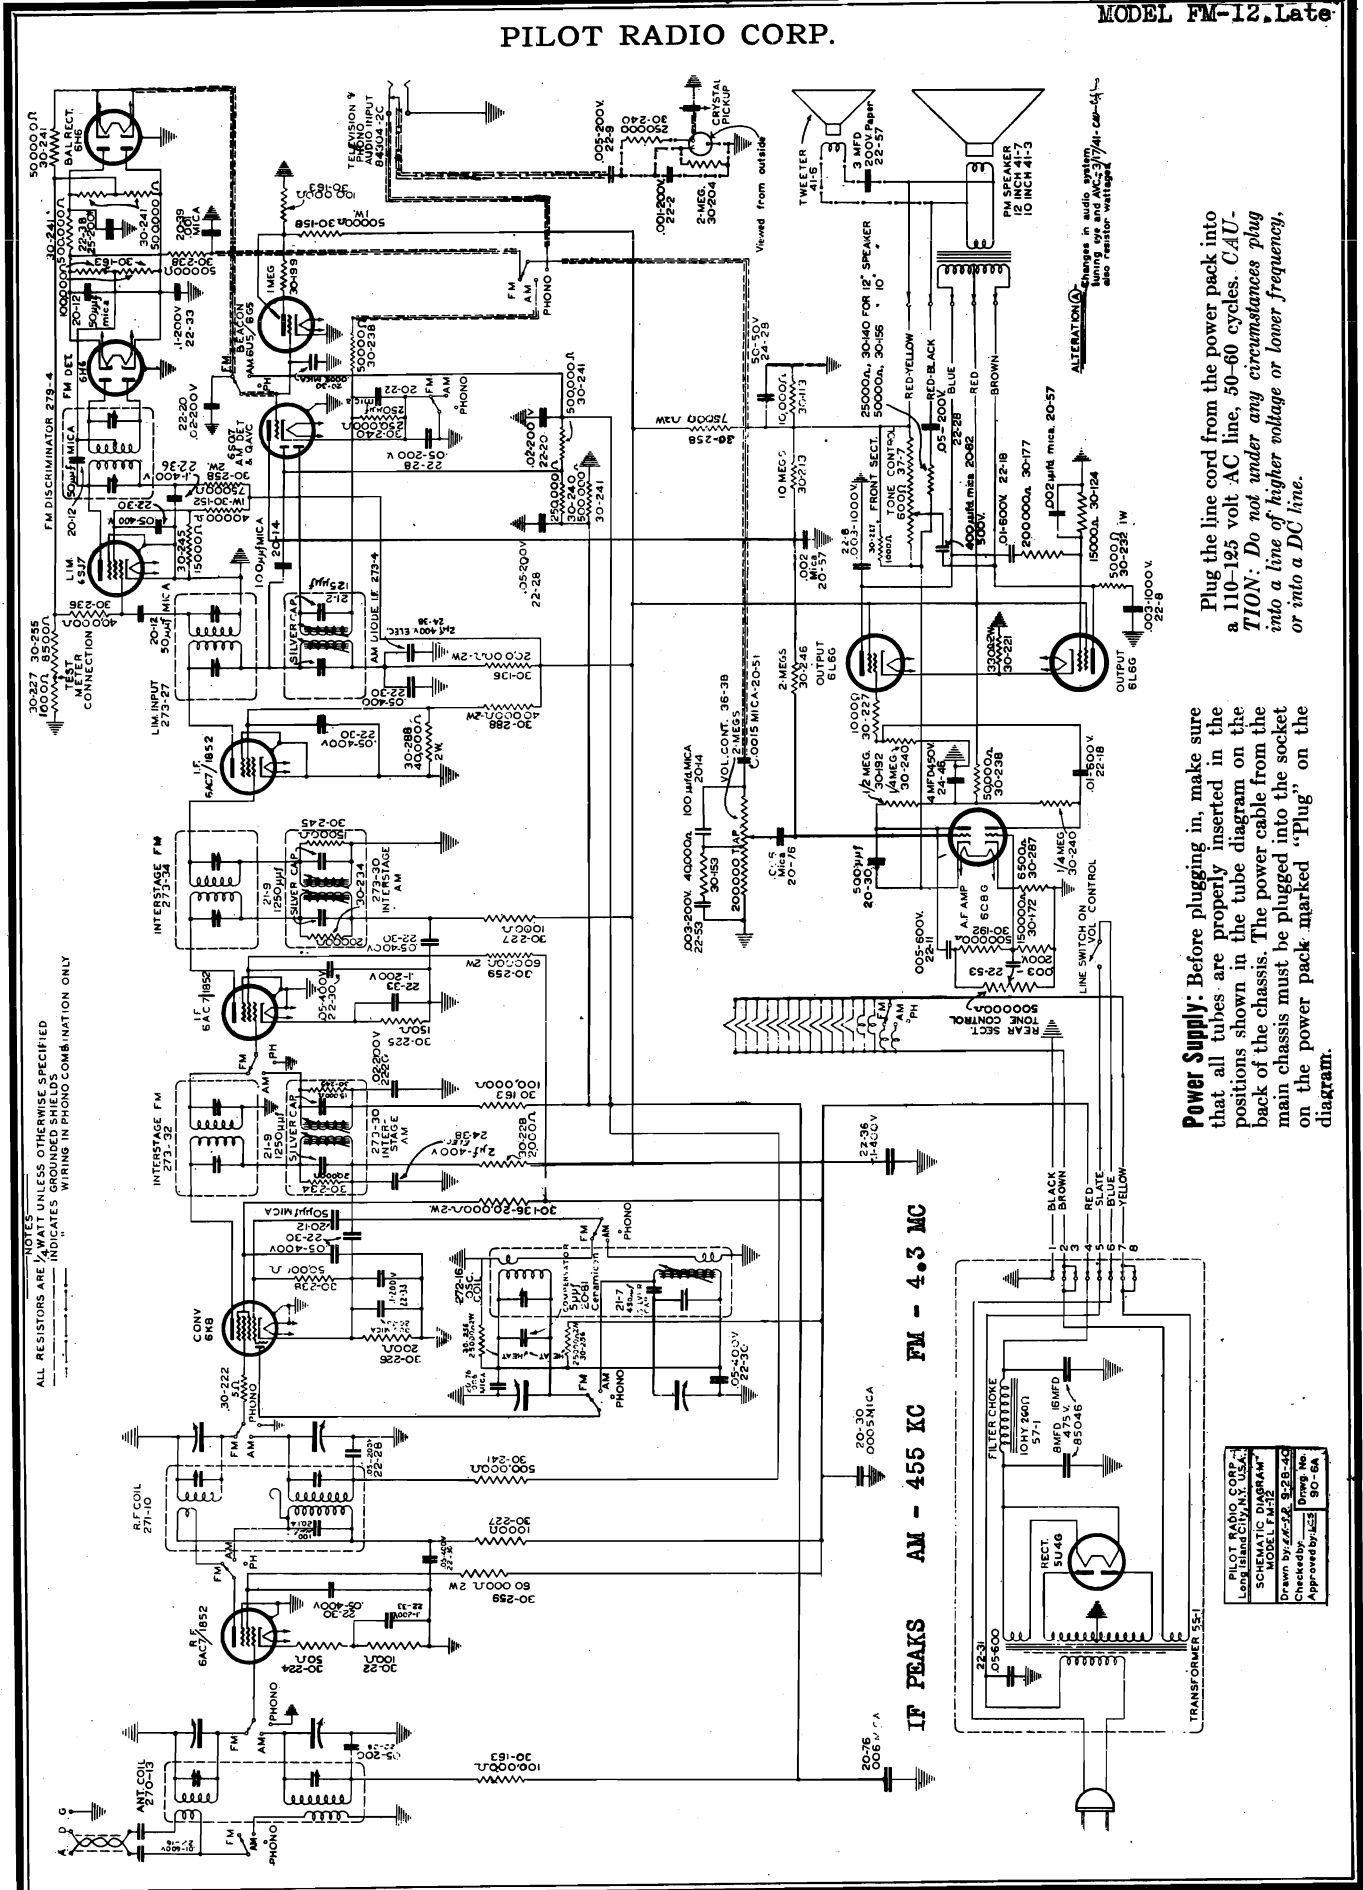

The shielding on the generator output lead must be connected to the Radio housing.

FORD CUSTOM
AUTO RADIO

PILOT RADIO CORP.

MODEL FM-12, Late

NOTES:
 ALL RESISTORS ARE 1/2 WATT UNLESS OTHERWISE SPECIFIED
 WATT UNLESS OTHERWISE SPECIFIED
 INDICATES WIRING IN PHONO COMBINATION ONLY

Plug the line cord from the power pack into a 110-125 volt AC line, 50-60 cycles. CAUTION: Do not under any circumstances plug into a line of higher voltage or lower frequency, or into a DC line.

Power Supply: Before plugging in, make sure that all tubes are properly inserted in the positions shown in the tube diagram on the back of the chassis. The power cable from the main chassis must be plugged into the socket on the power pack marked "Plug" on the diagram.

MODEL FM-12, Early

PILOT RADIO CORP.

MODEL FM-12, Early

FEATURES

This Pilot Radio receiver provides static-free full-fidelity reception by the Armstrong Wide-Band Frequency Modulation System, with switch-controlled changeover to the standard broadcast band. The following special features are incorporated in the design of this receiver:

1. Interstation silencer (QAVC) for f-m tuning
2. Balance detector for accurate cathode ray beacon tuning indicator on f-m reception
3. Push-pull audio output with inverse feedback for superior tone quality
4. Inverse feed-back tone control, providing sharper cut-off than conventional types.

Antenna: For noise-free reception it is essential to use a good di-pole antenna, properly installed with down-leads arranged to avoid noise pickup. Under present-day conditions (prior to January 1, 1941), some localities are served by two f-m stations whose frequencies are on adjacent channels (300 kilocycles separation). When this is the case interference from the stronger station may be experienced in reception from the weaker. Such interference may be reduced by loosening the mast clamps and rotating the di-pole until the most favorable position is found.

After January 1, 1941, the new frequencies assigned to f-m stations by the Federal Communications Commission will be in effect, and stations serving the same area will be separated by at least 400 kilocycles. Under these conditions interference between stations will not occur.

SPECIFICATIONS

Voltage Rating: 110-125 volts, 50-60 cycles

Type of Circuit: Frequency modulation, super-heterodyne

Tuning Range:

F-M tuning, 42 to 50 mc. — 7.14 to 6 m.

A-M tuning, 540 to 1750 kc. — 555 to 171 m.

Number and types of tubes: 12 plus tuning beacon

- RF Converter — 6AC7/1852
- IF — 6AC7/1852
- IF Limiter — 6AC7/1852
- F-M Det. — 6H6
- A-M Det. and QAVC — 6H6
- AF Amp. and Phase Inv. — 6SQ7
- AF Output — 6L6G
- Rectifier — 6L6G
- Tuning Beacon — 5U4G
- A-M IF Frequency: 455 kc.
- F-M IF Frequency: 430 kc.

Antenna: Pilot F-M, A-M di-pole, No. 110-7

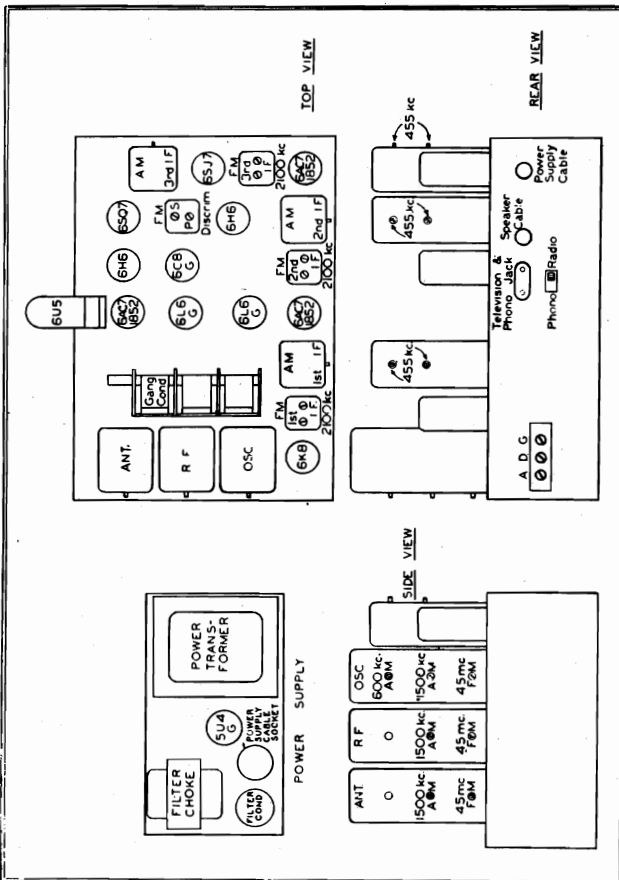

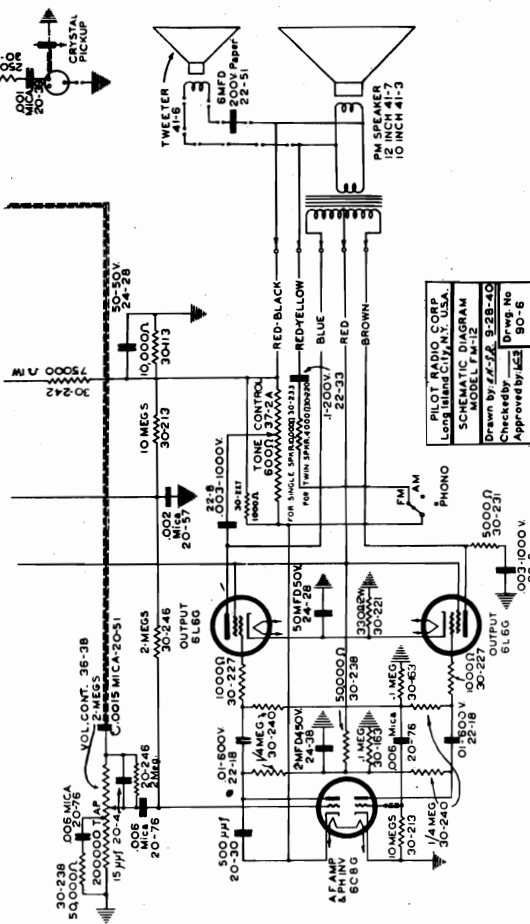

(5) TUBE AND VOLTAGE CHART

All voltages taken with 117-volt 60-cycle line. Band switch on FM no signal
Voltmeter resistance = 300,000 ohms for readings above 30 volts; 30,000 ohms for lower readings

PILOT RADIO CORP.

MODEL FM-12

CONTROLS

The function of each control knob is indicated by lettering on the panel. From left to right the controls are as follows:

(1) **Volume Control** and **POWER SWITCH**
To put the set in operation, turn this knob to the right. After the tubes have warmed up, turn the knob further towards the right to increase the volume.

(2) **Tone Control**: When turned to the right this control increases the treble or high-pitched notes, producing "brilliant" quality. When turned to the left it reduces the treble and thereby emphasizes the bass register, producing "mellow" quality. This control may be adjusted in accordance with individual taste, but in general the best fidelity of reproduction is obtained with maximum brilliancy. This is particularly important on f-m, and it should be noted that a small rotation on the knob away from the extreme right produces a marked reduction in highs on a good f-m broadcast.

Attention is directed to certain differences in tone range among present-day f-m broadcasts. In general the best fidelity may be expected from an f-m broadcast utilizing live studio program material. When the f-m transmitter takes its program material from a distant studio over a wire-line network, or from ordinary phonograph records, there is usually a perceptible loss in reproduction of the extreme highs, such as the overtones of high violin notes, the "S" sounds in speech.

As the commercial use of f-m transmitters expands, in accordance with the plans of the Federal Communications Commission, special broadcasting methods and equipment, now in restricted use, will be more widely introduced. This progress will lead to fuller utilization of the potentialities of f-m, affording at all times the degree of realism and the quality of enjoyment obtainable with these special broadcasting methods and equipment.

(3) **Band Switch**: Turn to the left for f-m (Frequency Modulation) center for a-m (Amplitude Modulation), right for phonograph.
(4) **Tuning**: This control combines fast and slow tuning in a special Pilot drive mechanism, permitting quick transfer from one part of the dial to another, yet providing for fine tuning with great facility.

TUNING BEACON

Accurate tuning is extremely important on both FM and AM; careless adjustment will introduce noise and distortion. The cathode ray tuning beacon in the top center of the dial provides visual means to facilitate tuning. As the tuning point is approached the V-shaped shadow of the beacon becomes smaller. On very strong signals the two sides of the V-shaped sector may overlap. For correct tuning adjust to the smallest shadow or the largest overlap.

PHONO-TELEVISION SOUND

Audio Input Jacks: All three models have pin-jack terminals at the rear of the receiver chassis for connection to an external phonograph pickup, a microphone, or the audio channel of a television receiver.

SERVICE INFORMATION

The following sections include:
(1) a brief outline of the principles of frequency modulation, so far as they will assist in servicing this receiver;
(2) a description of the special features of this receiver;

- (3) alignment procedure;
- (4) trimmer diagram;
- (5) tube and voltage chart;
- (6) schematic wiring diagram.

(1) FREQUENCY-MODULATION

The Armstrong Wide-Band Frequency-Modulation system has a twofold purpose: (a) to eliminate interference from static, electrical induction, and tube noise; (b) to increase the fidelity of reproduction. To achieve these aims a new kind of signal is used, which is totally different in character from the disturbances, so that the receiver can discriminate between the two.

Under this new system the program material is impressed upon the carrier wave by changing the frequency of the carrier in accordance with the sound impulses instead of changing its strength or amplitude. The departure from carrier frequency, known as the "deviation," depends upon the sound intensity, and the number of times the deviation is applied and removed depends upon the pitch of the sound. The maximum deviation permitted by the Federal Communications Commission is 75 kilocycles, and this deviation corresponds to 100 per cent modulation at the transmitter.

To illustrate: suppose that the carrier frequency is 43,000 kilocycles, and that a 1,000-cycle note of maximum loudness occurs in the musical program; then the frequency of the transmitted wave will vary from 42,925 to 43,075 kilocycles and back again, and will repeat this process 1,000 times per second. Now suppose that the 1,000-cycle note becomes weaker, say 33 per cent modulation; then the transmitted wave will vary from 42,975 to 43,025 kilocycles and back again, and will repeat this process 1,000 times per second.

At the receiver, the frequency-modulated wave is converted, by the standard super-heterodyne process, to a lower intermediate frequency with the same frequency modulation. (In the FM-12 receiver the intermediate frequency is 43,000 kilocycles, and a swing from 42,25 to 43,75 kilocycles would represent 100 per cent modulation.) After amplification, this IF signal is then applied to a "limiter" tube, in a circuit which is arranged to deliver constant output regardless of changes in the amplitude of the input. Since the static and other disturbances are primarily amplitude changes, the smoothing out of amplitude changes by the "limiter" removes the disturbing effects, but leaves the frequency modulation unaltered.

The output of the limiter is applied to a "frequency discriminator" (or second detector) which converts the frequency deviations into audio-frequency currents. These in turn are amplified and delivered to a loudspeaker.

This system makes possible the reproduction of audio frequencies up to 15,000 cycles per second. Such high-fidelity reproduction has been impracticable hitherto, for two reasons: first, a receiver designed to provide adequate selectivity between 10-kilocycle a-m broadcast channels generally cuts the sidebands representing modulation beyond about 5,000 cycles; and secondly, the noise interference lies mainly in the higher audio-frequency register.

(2) SPECIAL FEATURES OF FM-12 RECEIVER

The FM-12 chassis embodies virtually two complete receivers, utilizing the same audio system and the same RF, converter, and IF tubes for both. The IF transformers for both systems are connected in series and work with the common IF tubes, but separate second detectors are used. A band switch selects the proper antenna, RF, and oscillator tuning components, and transfers the input terminal of the audio system from one second detector to the other. Reference to the schematic diagram will show additional details of the switching arrangements.

Audio System: The audio system comprises a 6C8G twin triode, used as first audio amplifier and self-regulating phase inverter, followed by a pair of 6L6G tubes operating in push-pull, Class A-B1.

Inverse Feedback: Inverse feedback is employed to improve tone quality. For this purpose a resistor network is connected across the loudspeaker voice-coil and a suitable proportion of the voice-coil voltage is fed back into the cathode of the first audio triode. This cathode feedback voltage reduces the grid-cathode voltage which is effective in producing output. The action is equivalent to a large reduction of amplifier gain at those frequencies at which the gain is high, and a small reduction where the gain is low. The gain is also reduced more on the peaks of harmonics generated in the output stage. The result is the establishment of virtually uniform gain over a wide frequency range and the reduction of harmonics.

Inverse Feedback Tone Control: Continuous tone control is provided by a novel circuit arrangement. A network consisting of a condenser and a variable resistor is connected between the plate of one of the output tubes and ground. The variable resistor forms part of the inverse feedback network described above, so that the voltage across the variable portion is fed back to the cathode of the first audio triode. This reduces the input for all frequencies above a certain value, without affecting lower frequencies. The cutoff frequency is controlled by adjustment of the variable resistor. A moderately sharp cutoff of the high audio frequencies is produced, and the action is much more satisfactory than the gradual cutoff provided by conventional tone controls.

Balance Detector: In tuning an f-m receiver it is most essential to adjust the IF precisely to the "balance frequency" of the discriminator. In order to secure freedom from noise and distortion. It is not sufficient to provide means for tuning to resonance peak, because the resonance is too broad and the peak may be considerably off the balance frequency.

The locations of all trimmers are shown in the trimmer chart. The a-m intermediate frequency is 455 kilocycles.

The voice coil terminals are accessible on the speaker frame for output meter connection. The voice coil impedance is approximately 6 ohms at 400 cycles. Should it be desired temporarily to remove the squelch feature so as to permit a-m alignment on weak inputs, this may be done by grounding the plate supply of the 6SQ7 tube (junction between 75,000-ohm and 10,000-ohm resistors on terminal strip on front apron). Since the diodes of this tube are used for a-m second detector and AVC, the tube cannot be removed as it can on f-m.

Should it be desired temporarily to remove the inverse feedback, this may be done either by shorting the 600-ohm tone control or by opening the resistor-condenser network connected in series with it across the voice coil. The former method will also remove tone control, while the latter will not.

The resistor in the inverse-feedback network above referred to is 10,000 ohms in the table model (with single speaker) and 4,000 ohms in the console and phono combination (for dual speakers). In the phono combination a 10,000-ohm resistor is switched in series with the 4,000-ohm resistor when the front phonoradio switch is thrown to phono position.

Removal of inverse feedback will increase the audio sensitivity about 2.0 times in the 10,000-ohm case, or about 2.5 times in the 4,000-ohm case.

F-M Alignment: The correct alignment of an f-m receiver, while not difficult, is an exact procedure requiring suitable equipment, an understanding of the fundamental principles involved, and some experience. *Alignment operations should not be attempted under any circumstances without these three essentials, and with them only if clearly necessary.*

Equipment for F-M Alignment: The following are the minimum requirements:

- (a) Signal generator having the following frequency and output ranges: For IF alignment: Accurate calibration between 2,000 and 2,200 kilocycles; output adjustable at least between 100 and 10,000 microvolts. For RF alignment: Accurate calibration between 40 and 50 megacycles; output adjustable at least between 5 and 1,000 microvolts.

These requirements may be met either by one or by two separate signal generators. Amplitude modulation at 400-1,000 cycles is desirable to facilitate finding, but is not indispensable.

The signal generator output should be brought out through a short concentric transmission line. A .1 mfd. blocking condenser should be at all times inserted at one end of the central or high-potential conductor.

- (b) Dummy antenna resistor, approximately 70 ohms, for connection between high-potential output conductor of signal generator and A terminal of receiver.
- (c) D. C. milliammeter, 0-0.5 or 0-1.0 milliamperes, for measuring limiter-grid current. A shunting resistor capable of increasing the range to about 0-2,000 microamperes is desirable but not essential. This meter should be connected to a pair of leads about two feet long, terminating in spring clips.
- (d) D. C. microammeter having zero center with range of 100 microamperes to both right and left of center. As a substitute a single-sided meter with reversing switch may be used, but this will be much less convenient. This meter should be connected to a pair of leads about two feet long, each lead connected to a 250,000-ohm resistor, the free ends of the resistors terminating in spring clips.

- (e) Resistor, 500,000 ohms, with clips for insertion between converter grid lead and grid cap.

F-M Meter Connections:

- (a) Connect the limiter grid milliammeter across the 1,000-ohm resistor which is connected in series with 40,000-ohm and 16,000-ohm resistors from the grid of the 6SJ7 limiter to chassis. The positive terminal of the meter should be connected to the grounded end of the 1,000-ohm resistor, and the negative terminal to the other end.
- (b) Connect the zero-center meter (through its two 250,000-ohm resistors) across the two 100,000-ohm resistors which are connected between the cathodes of the 6H6 discriminator tube. These resistors are readily identified because they are mounted end-to-end on a lug strip between the discriminator tube and the discriminator transformer.

F-M Intermediate-Frequency Alignment:

- (a) Remove the converter grid cap and insert 500,000-ohm resistor between grid cap and grid lead. Connect signal generator between grid cap and chassis. Adjust signal generator to exactly 4,300 kilocycles, with IF input (signal generator output) at about 1,000 microvolts.

- (b) Now tune each of the six 2,100 kc. IF trimmers (see trimmer diagram) for maximum response in limiter grid meter. Check sensitivity by adjusting IF input until milliammeter reads 0.20 milliamperes. This should take between 150 and 250 microvolts.
- (c) Next increase signal generator output to about 10,000 microvolts and adjust secondary trimmer of discriminator transformer carefully until zero-center meter reads zero.
- (d) Next detune signal generator by exactly 100 kilocycles upward and note reading of zero-center meter. Detune by 100 kilocycles downward and note reading. Adjust primary trimmer of discriminator transformer and repeat this test until readings on both sides of zero are equal (approximately 48 microamperes).

F-M Radio-Frequency Alignment:

- (a) Restore normal grid lead connection to grid cap of converter tube. Connect low-potential output terminal of signal generator to terminal D of receiver. Connect high-potential terminal to terminal A through a 70-ohm dummy antenna resistor.
- (b) Adjust signal generator to about 1,000 microvolts output at exactly 45 megacycles. Tune receiver dial to exactly 45 megacycles. Tune f-m oscillator trimmer until limiter grid meter responds, then adjust this trimmer very carefully to give zero reading on zero-center meter. Switch signal generator off and on and watch limiter grid meter to make sure that observed signal is coming from signal generator.

Adjust signal generator to vicinity of 40.8 megacycles, and find image frequency, which produces a somewhat weaker response in limiter grid meter. If image cannot be found near 40.8 megacycles, but appears instead near 49.2 megacycles on signal generator, then oscillator trimmer capacity is too low. In this case reset to 45 megacycles and increase oscillator trimmer capacity by turning screw counter-clockwise until a second response is found. Now adjust accurately to zero-center reading and repeat test for image response at 40.8 megacycles.

- (c) Reduce signal generator output to about 50 microvolts. Tune f-m RF and antenna trimmers to maximum response on limiter grid meter. This completes the alignment of the receiver.

This completes the alignment of the receiver.

The FM-12 receiver provides means for tuning easily and precisely to the balance frequency. At this frequency there is no DC potential difference between the two cathodes of the discriminator tube, and a slight mistuning in either direction gives rise to a potential difference whose polarity corresponds to the direction of mistuning. In the FM-12 receiver this effect is utilized by a separate 6H6 tube, called the "balance detector," whose cathode becomes positive when there is a potential difference in either direction between the discriminator cathodes. This positive potential is used to neutralize a negative potential developed by the signal at the limiter tube, and prevents the negative potential from closing the tuning beacon. At exact tuning, the positive potential disappears, leaving the negative potential to close the beacon. The result is a sharp tuning indication, governed by discriminator balance and not by mere resonance.

Inter-Station Silencer: When signal input is detuned or otherwise removed from an f-m receiver, the limiter ceases to function so that the entire amplifying system up to the second detector operates at full gain. Under these conditions, unless steps are taken to prevent it, the tube noise becomes objectionably loud. In the FM-12 this inter-station noise is completely suppressed by a 6SQ7 squelch tube whose plate current flows in a biasing resistor in circuit with the grid of the first audio triode. The grid of the squelch tube is in turn controlled by the same balance detector system which operates the tuning beacon, so that the squelch tube is biased to cutoff when a signal is correctly tuned in. Under these conditions the 6SQ7 plate current ceases to flow in the grid circuit of the first audio triode, permitting the latter to function normally.

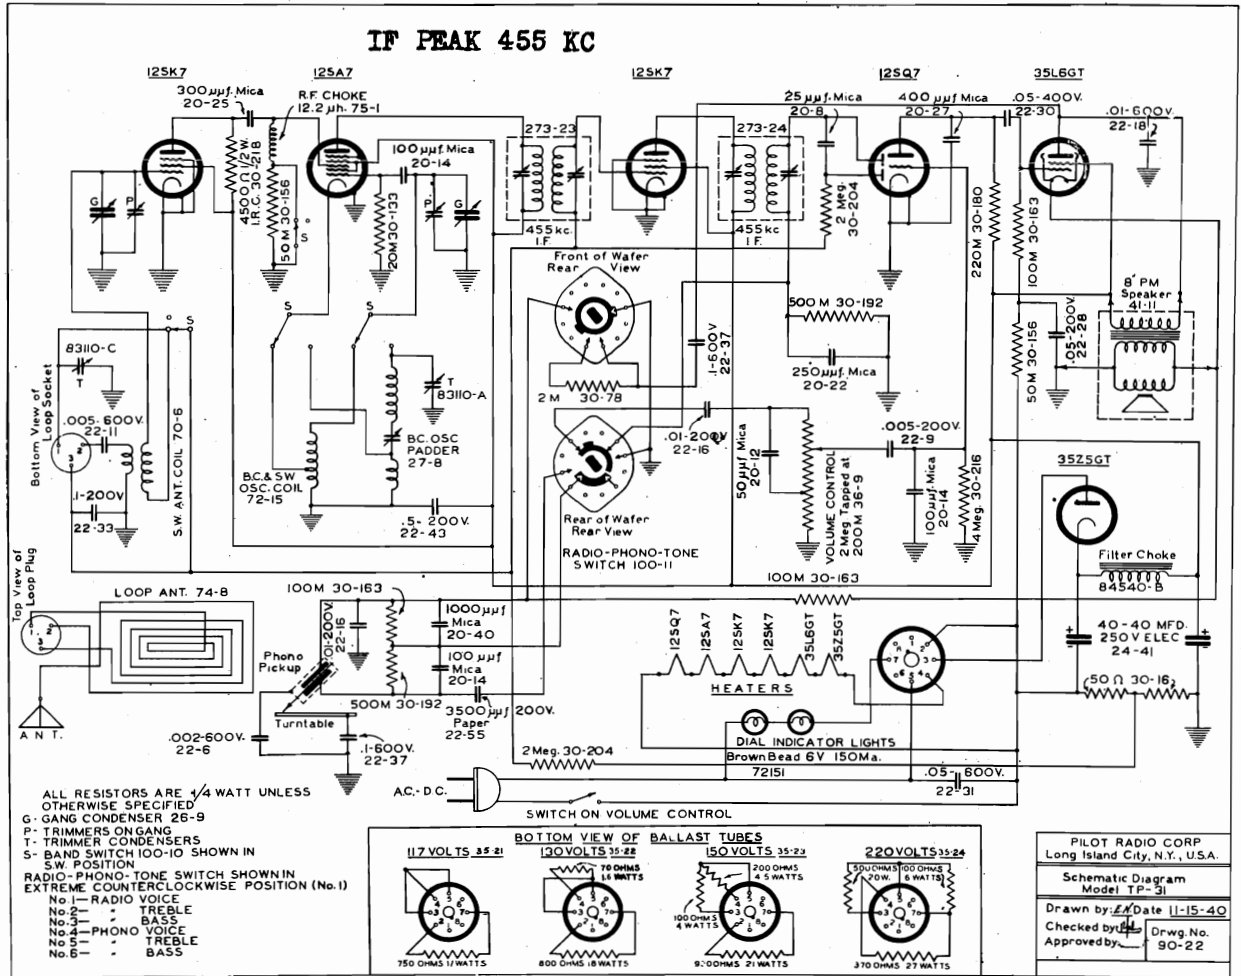

The value of the inter-station silencer is readily and forcefully demonstrated by removing the 6SQ7 tube when the receiver is off tune on f-m reception.

While the squelch feature is intended primarily for f-m, it also functions on a-m when a very small aerial is used.

(3) ALIGNMENT PROCEDURE

A-M Alignment: The A-M alignment of this receiver is conventional in every respect. Most skilled radio servicemen have the equipment and experience needed to perform this alignment successfully. A detailed description of the a-m alignment will not, therefore, be given here, but the following information is included:

PILOT RADIO CORP.

PHONOGRAPH OPERATION

IT IS IMPORTANT THAT THE SWITCH AT THE REAR OF THE CABINET IS IN THE POSITION CORRESPONDING TO THE TYPE OF LINE CURRENT BEING USED.

The motor is controlled by the automatic stop lever which is at the rear right side of the turntable. The lever protruding from under the turntable on the front side is the speed control. For true reproduction the speed should be adjusted to 78 revolutions per minute. Volume for both, "Phono" and "Radio" is regulated by the same control on the front of the receiver.

The tone control and phono radio switch must be in either of the three clockwise positions for phono operation.

SERVICE NOTES

The screws for adjusting both the R.F. and I.F. amplifiers of this receiver, together with the frequencies at which they should be adjusted, are all pictured on the above diagram. When aligning the I.F. amplifier, the generator must be connected to the grid of the 12SK7 R.F. tube through a .1 mfd condenser. When aligning the receiver, first align the shortwave band connecting the generator to the antenna post with a 400 ohm resistor. Then align the broadcast band using a .0002 mfd. condenser.

When aligning the loop, the receiver should be in the cabinet with the back in place. The adjusting condenser can be reached through the slot in the lower left hand side of the back.

SERVICE NOTES

The location of all adjustments used in re-aligning this receiver, and the frequencies at which these adjustments should be made, are shown in the accompanying diagram.

When aligning the I. F. amplifier, the generator must be connected to the grid of the 6SA7 tube through a .1 mfd condenser. When aligning the receiver on the Broadcast Band, connect the generator to the Antenna wire through a .0002 mfd condenser, and on the two short wave bands use a 400 ohm carbon resistor.

ANTENNA

This receiver contains the latest type of self-contained loop aerial and will give excellent results even in distant localities where the signal from the broadcasting stations are faint. However, it may be necessary to turn the cabinet toward the direction of the incoming signal (since most broadcasting stations use the directional antennas), for the best reception from that particular station. For short wave or distant broadcast band reception, the use of an external antenna is required.

When using a doublet antenna, connect one lead-in wire to terminal "A" at the rear of the chassis, and the other lead-in wire to terminal "D". Remove the connecting link from terminals "D" and "G" and connect terminal "G" to a ground such as a cold water pipe or radiator. If an ordinary single wire antenna is used, connect the lead-in wire to Terminal "A" on the rear of the chassis. Leave the link between "D" and "G" terminals and connect a ground wire under terminal "G". A doublet antenna kit complete with all accessories, can be purchased from your dealer. Ask to see the "Pilot Antenna Kit".

TUNING RANGE

Broadcast Band: 561 to 187 meters; or 535 to 1605 kc.

SERVICE NOTES

The location of the screws for adjusting the oscillator, loop and I.F. circuits is indicated above.

When aligning this receiver, the "A" and "B" batteries must be in place, and the set correctly mounted in the cabinet.

The signal generator should be connected to the grid of the 1A7GT through a .1 mfd condenser when aligning the I.F. at 455 kc and when setting the oscillator trimmer at 1400 kc. The loop antenna trimmer and the 600 kc padder should be adjusted, using either a weak station or a radiated signal from a signal generator. This receiver may be aligned on either battery or house current.

Model T-71

BATTERY INSTALLATION

Remove the screws from the back and carefully lift off the back.

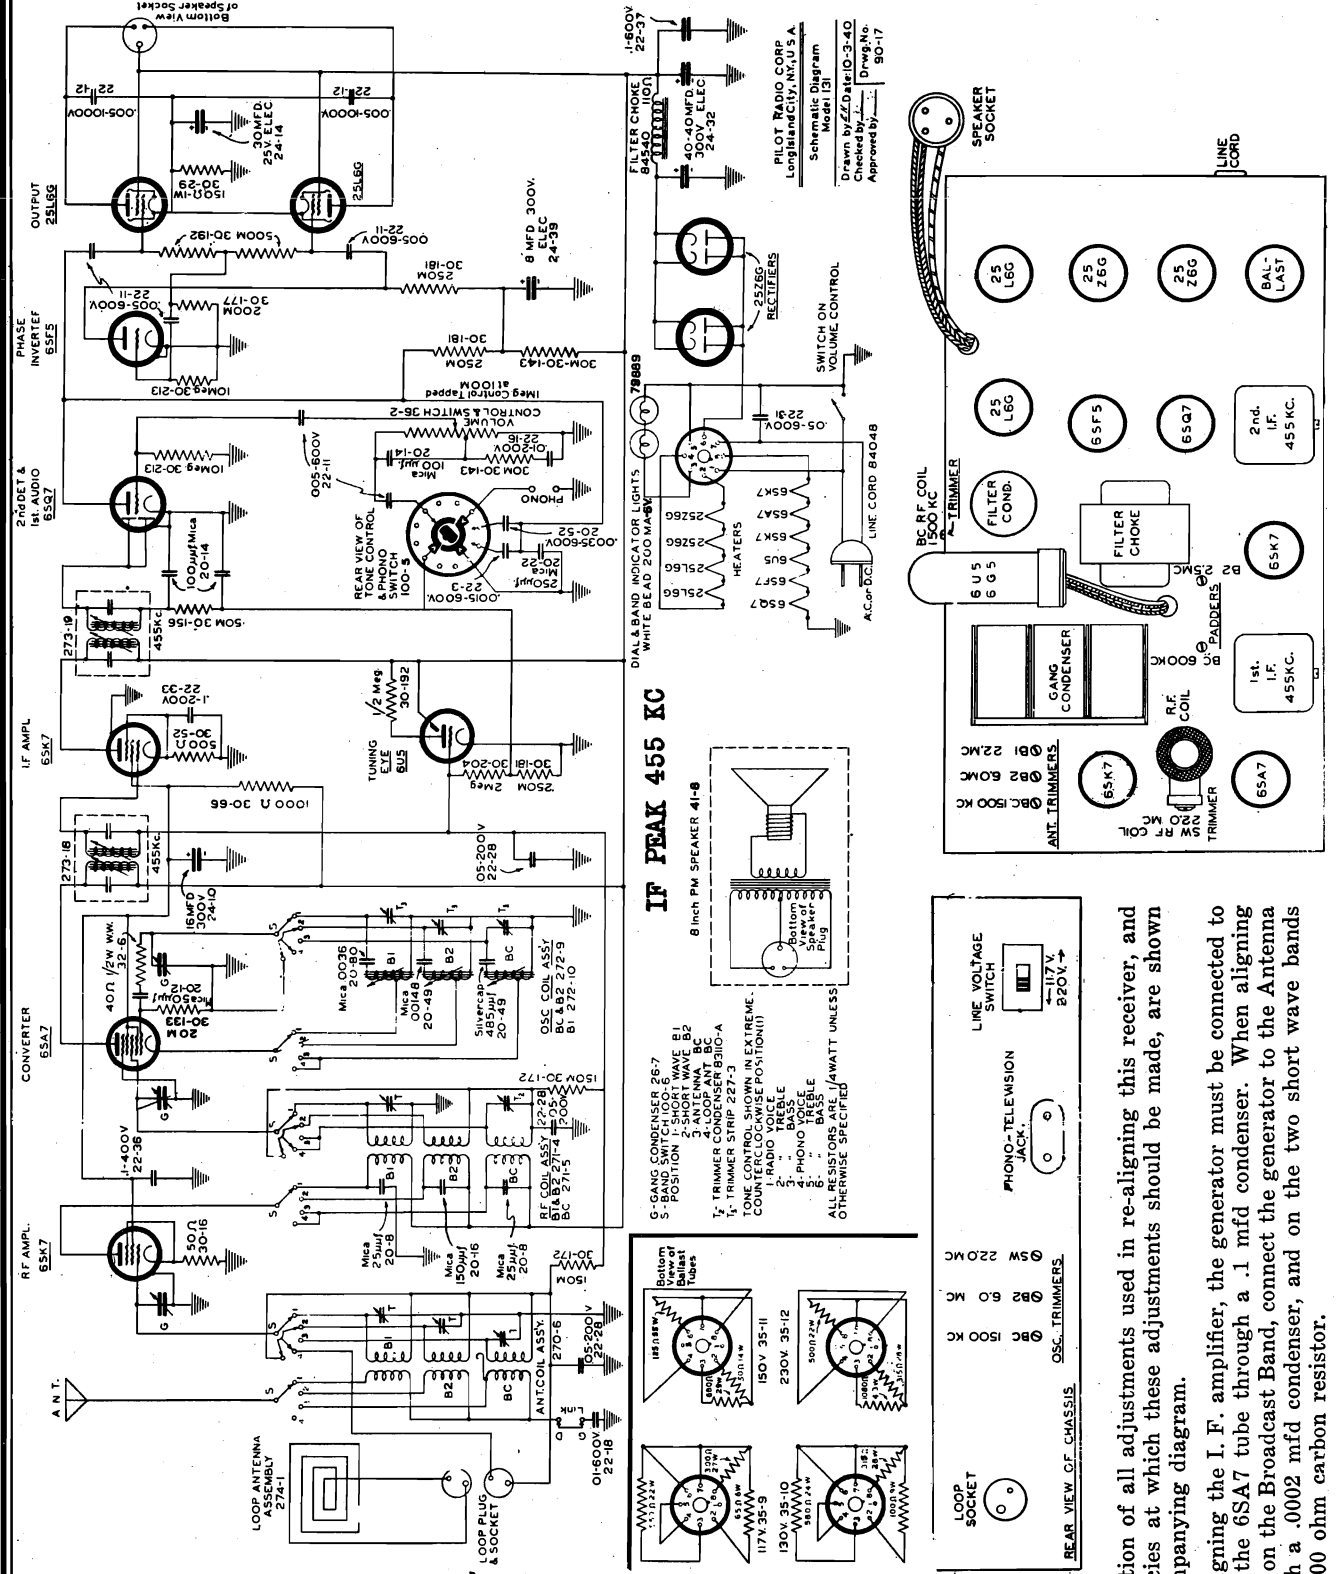

When removing the batteries, first unscrew clamps, and then remove battery plugs. Be sure not to pull on the cables, but on the plugs themselves.

Place the new "A" and "B" batteries in position shown on diagram below and replace clamps in position shown below.

The black and white cable, coming from the chassis, has a 2-prong plug which is then plugged into the double "A" battery. The red and black cable has two 3-prong plugs, both of which are plugged into the "B" batteries. It is optional which plug goes into either "B" battery.

ANTENNA

This receiver contains the latest type of self-contained loop aerial and will give excellent results even in distant localities where the signal from the broadcasting stations are faint. However, it may be necessary to turn the cabinet toward the direction of the incoming signal (since most broadcasting stations use the directional antennas), for the best reception from that particular station. For short wave or distant broadcast band reception, the use of an external antenna is required.

When using a doublet antenna, connect one lead-in wire to terminal "A" at the rear of the chassis, and the other lead-in wire to terminal "D". Remove the connecting link from terminals "D" and "G" and connect terminal "G" to a ground such as a cold water pipe or radiator. If an ordinary single wire antenna is used, connect the lead-in wire to Terminal "A" on the rear of the chassis. Leave the link between "D" and "G" terminals and connect a ground wire under terminal "G".

MODEL FM-200

SPECIFICATIONS

Voltage Rating - 110-125 volts, 50-60 cycles AC

Combination Frequency Modulated and Broadcast and shortwave amplitude modulated receiver - provision for microphone and phono pickup or television converter provided.

NUMBER OF TUBES AND TYPES

- FM - RF #1 - 6AC7/1852
- FM - RF #2 - 6AC7/1852
- FM - detector - 6SA7
- FM - oscillator - 6J5
- AM - RF - 6SK7
- AM - converter - 6SA7
- FM-AM 1st I.F. 4.3 mc - 455 kc - 6AC7/1852
- FM-AM 2nd I.F. 4.3 mc - 455 kc - 6AC7/1852
- FM - detector - 6SJ7
- FM - tuning rectifier - 6H6
- AM - detector & FM QAVC - 6SQ7
- FM-AM Voltage Amplifier - 6SJ7
- FM-AM Cathode Loaded driver - 6J5
- FM-AM Push Pull AB2 amp. - 6L6
- FM-AM " " " " - 6L6
- Rectifier - 5Y4G
- Tuning Beacon - 6U5/605

FEATURES

This Pilot dual superheterodyne using two tuned R.F. stages for FM and one tuned R.F. for AM, provides static-free full-fidelity reception by the Armstrong wide-band Frequency Modulated system as well as superior reception of the AM broadcast and shortwave bands. One dial and one set of controls are used for all services. Five controls are provided from left to right; they are:

1. The volume control with low-level bass and treble compensation.
2. Tone Color control which provides adjustable bass and treble compensation at higher audio levels. The knob for the tone color control operates a pointer which indicates on the dial scale the tone color positions, which are:
 - a. Bass - This position provides a high bass & lowered treble tone
 - b. Music - high bass & high treble tone
 - c. Voice - lowered bass & lowered treble tone
 - d. Treble - lowered bass & high treble tone

A television adapter connected to the pin-jacks provided at the rear of the chassis will permit the user to use the same high quality audio system and dual loudspeakers for Television Sound, and this can be controlled with the Service Selector.

5. Tuning Control; This control operates the FM-AM, broadcast and shortwave, and should be rotated very carefully to provide maximum reception. Careless tuning will not permit the automatic volume control to function properly and distortion and poor tone will result.

OPERATION OF PUSHBUTTONS

This set is provided with eight push buttons which mechanically operate the dual 3-gang tuning condenser. These may be set on AM and FM in any combination, that is, 5 for AM, 3 for FM, etc.

To set up these buttons pull off the bakelite caps and loosen the locking screw. Tune in the stations with the tuning knob and push the flat piece of the control all the way in. Then tighten the locking screw. A careful check with the tuning eye should immediately ascertain the exactness of the setting. An identifying station tab should then be inserted above the button in the space provided. It is easily possible to set up the buttons on AM or FM in this manner and extra care used in their set-up will amply reward the listener.

On very weak signals it may be necessary to return the station very slightly with the tuning knob - It is recommended, however, that the left buttons be set on AM locals and the right buttons be set on FM locals.

Slight misadjustments due to continuous use will cause little effect on the tone as this FM-AM I.F. system is expressly designed for push-button use.

ANTENNA

A good antenna system cannot be overemphasized and should the receiver be used in the locality of any vertically polarized FM transmitter, best reception from that station at a slight sacrifice of the reception of the usual horizontally polarized transmitters can be secured by tilting the dipole to about a 45-degree angle. The whole array should then be rotated for best average reception of all the local stations.

Maximum pickup from a given transmitter is usually secured when the broadside of the dipole antenna faces the transmitter and is in line of sight of said transmitter.

The Pilot FM-AM antenna, #110-7, is recommended for use with this receiver. This antenna is shipped in Kit form and consists of a dipole with supporting mast, shielded transmission line, and special couplers at both ends of the transmission line, which provide automatic operation on either the FM or AM bands. Detailed instructions are furnished with the antenna.

The amount of bass and treble compensation increases as the volume is lowered in order to retain the balance of tones so often lost at lower volumes. This is done to compensate for the audio discrimination effect of the average human hearing system which varies with sound intensity and tone.

Individual tastes and programs as well as the location of the receiver will require different settings of the Tone Color Control for maximum pleasantness of reception. This should be used in conjunction with

3. The Harmonic Control & QAVC switch: This control provides a very sharp cut-off of the higher audio frequencies and operates in an inverse feed-back circuit.

It will usually be desirable to keep this control at less than maximum setting when listening to recorded and live programs on AM and phono. It's effect can readily be realized on an FM studio program where maximum setting permits music instruments to be easily recognized. For such service, it will be found that reducing the harmonics will tend to cause, violins and saxophones, for example, to sound similar - both being capable of making the same fundamental tones. The harmonics which distinguish the various instruments can be regulated by this control.

It must be remembered that unwanted hiss, etc., due to records should be removed with this control, the setting depending upon the quality of the record, the better quality records permitting a wider range of audio frequencies.

Rotating the harmonic control to the extreme left until a click is heard cuts out the QAVC on F.M. and this position is meant to be used on very weak F.M. signals. These must be tuned very carefully as the tuning beacon cannot function properly on very small signals. The higher harmonics are automatically removed in order to reduce external noises introduced with extremely low signals. The tuning buttons should not be set on any station which can only be received without the QAVC.

4. Band Selector: This control selects the type of service desired. The knob for the Band Selector operates a pointer which indicates on the dial scale the Band Selector positions which are:

- a. Short Wave - A.M.
- b. Broadcast A.M. external Antenna
- c. Broadcast A.M. internal loop antenna
- d. F.M. external antenna
- e. Phono-Television accessories

In the phono-models the phono pickup is built in and connected in this position.

MODEL FM-200

PILOT RADIO CORP.

SERVICE NOTES

This receiver has been correctly aligned at the factory and no further adjustments to either the trimmers or iron cores is recommended.

The minimum requirements for satisfactory adjustment of the trimmers, etc. are:

1. 0 to 1 milliamperes meter, preferably with an extra .5 milliamperes shunt resistor.
2. Zero center. 0 to 200 microamperes galvanometer and two 100,000 ohm resistors.
3. Rectifier type output meter of approximately 0 to 2 volts R.M.S.
4. 65 ohm FM dummy antenna
400 ohm shortwave dummy antenna
200 mmfd. AM dummy antenna
.1 mfd. I.F. dummy

5. Accurately calibrated signal generator capable of supplying 0.5 to 100,000 microvolts at the following frequencies, which constitute the order for adjusting and balancing the receiver:

- a. 455 kc I.F.'s and wave trap
- b. 4.3 mc I.F.'s and discriminator
- c. 600 kc oscillator
- d. 1500 kc antenna, R.F. and osc. and loop
- e. 600 kc osc. rock-in
- f. 1500 kc osc.
- g. 6 mc osc.
- h. 18 mc osc.
- i. 15 mc ant. R.F.
- j. 43 mc osc. 2nd R.F. & 1st R.F.
- k. 48 mc osc. 2nd R.F. & 1st R.F.
- l. repeat 43 & 48 mc adjustments and slightly rock-in variable

The antenna circuit has no adjustments for FM and is expressly designed for the Pilot FM-AM dipole antenna #110-7.

The zero center galvanometer is used to set the discriminator secondary trimmer and the FM oscillator trimmer and padder.

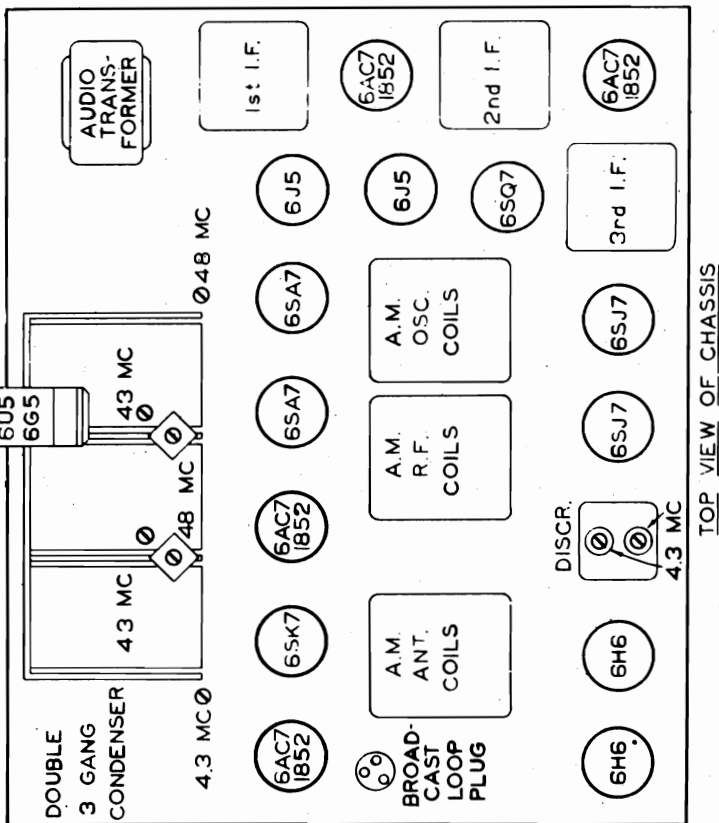

The 0 to 1 milliamperes meter for 4.3 mc I.F. & FM R.F. trimmers and padders.

The AC output meter across the voice coil and only for A.M. adjustments.

The volume control should be on full for all final AM adjustments.

- T₄ Trimmer Condenser 25-13 4-70 MAF

MODEL 340

PILOT RADIO CORP.

When aligning the I.F. amplifier, the generator must be connected to the grid of the 6SA7 tube through a .1 mfd condenser. When aligning the receiver on the Broadcast Band, connect the generator to the Antenna wire through a .0002 mfd condenser, and on the seven short wave bands through a 400 ohm carbon resistor.

In general it is not recommended to re-align the bandspread coils unless it is definitely necessary. If re-aligning is found to be necessary, take off the dial pan by removing the five screws, as indicated on the diagram.

First adjust the oscillator iron core to make the pointer correspond with the calibration mark. Then adjust the antenna iron core for maximum output. The signal generator must be accurate within 5 kc on each band, and the use of a calibrating crystal oscillator is recommended. Otherwise a broadcast signal of known frequency may be used.

In this receiver the oscillator frequency is higher than the signal frequency on the broadcast band and lower on the seven other bands.

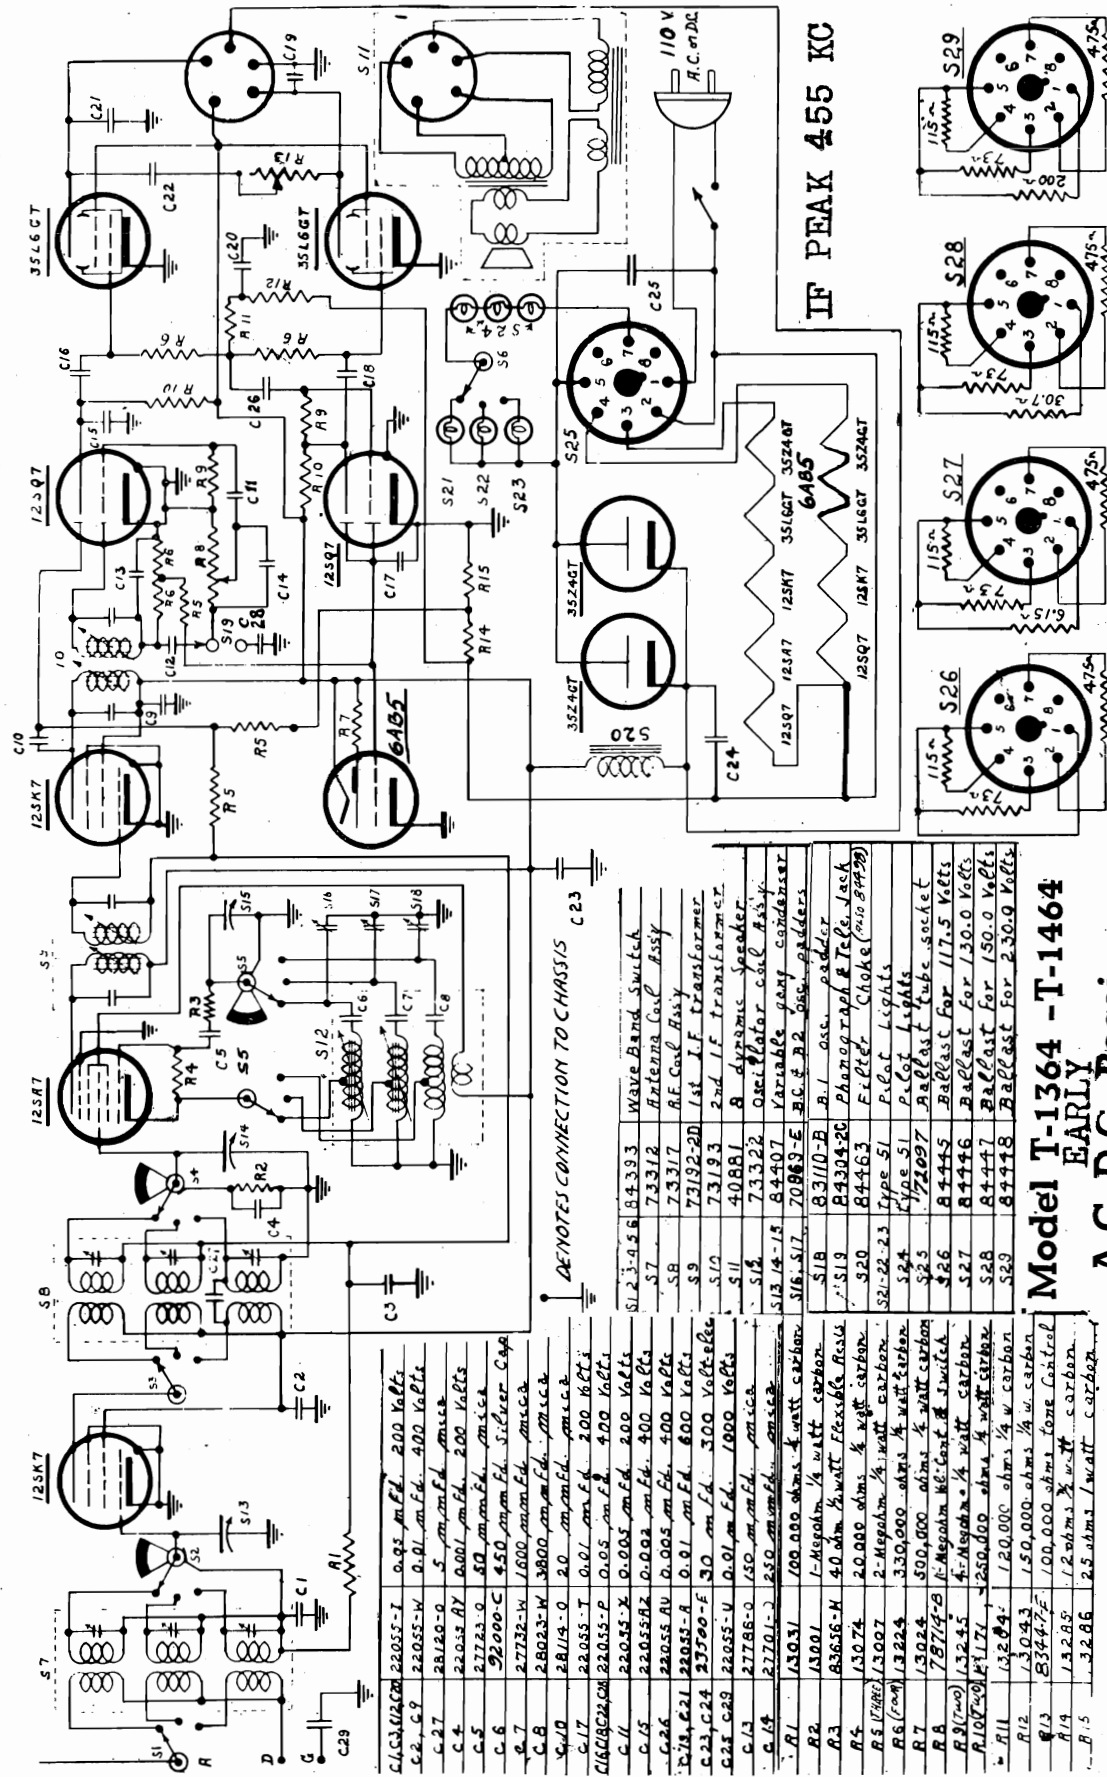

This Pilot Superheterodyne Receiver has 10 tubes and a Cathode Ray Tuning Beacon, and operates on either an Alternating or Direct Current power supply.

THIS PRINT SUPERSEDES ALL OTHERS

SCALE: 1\"/>

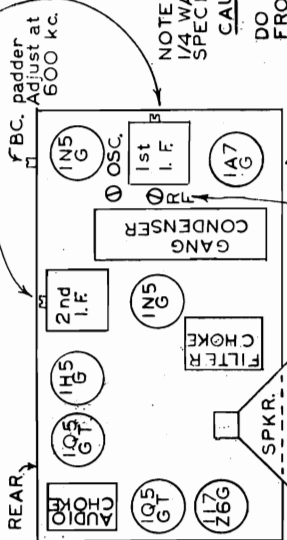

The location of the screws for adjusting the ANT., R.F., and I.F. circuits are illustrated above. The I.F. amplifier may be aligned with the chassis out of the cabinet, but with the loop antenna plugged in. For the I.F. alignment the signal generator must be connected to the grid of the 1A7G tube through a .1 mfd. condenser. The R.F. trimmers should also be peaked for maximum with the chassis out of the cabinet. When aligning the ANT. trimmers the "A" and "B" batteries must be in place, the loop antenna and receiver correctly mounted in the cabinet. The receiver may be aligned on either battery or house current. When the receiver is aligned on the Broadcast Band connect the generator to the Antenna just on the back through a .0002 mfd. condenser.

SERVICE NOTES

The location of all adjustments used in re-aligning this receiver, and the frequencies at which these adjustments should be made, are shown in the accompanying diagram.

When aligning the I. F. amplifier, the generator must be connected to the grid of the 6SA7 tube through a .1 mfd capacitor. When aligning the receiver on the Broadcast Band, connect the generator to the Antenna wire through a .0002 mfd capacitor, and on the two short wave bands use a 400 ohm carbon resistor.

MODEL "MAGIC WAVE"
ANTENNA

RCA MFG. CO., INC.

FIG. 2 MODIFIED MAGIC WAVE ANTENNA AS USED WITH 2 TO 5 DISTRIBUTION TRANSFORMERS

THIS MODIFIED ANTENNA IS RECOMMENDED FOR INSTALLATIONS FEEDING A LARGE NUMBER OF RECEIVERS

THE ABOVE DIAGRAM SHOWS THE INSTALLATION OF FIVE DISTRIBUTION TRANSFORMERS PROVIDING FOR THE OPERATION OF UP TO SIXTEEN RECEIVERS. TRANSMISSION LINES MAY BE RUN IN METAL CONDUIT IF DESIRED ALTHOUGH THIS IS NOT NECESSARY. TWO OR MORE LINES MAY BE RUN IN THE SAME CONDUIT BUT NOT WITH OTHER ELECTRICAL WIRING.

MASTER ANTENNA KIT STOCK NO. 9845

NOISE REDUCING ADJUSTMENT 540 TO 1600KC RANGE

SCHEMATIC DIAGRAM OF RECEIVER TRANSFORMER STOCK 9846

COUNTERPOISE SHOULD BE ONE HALF THE LENGTH OF THE TRANSMISSION LINE PLUS 10 FEET EXAMPLE:- IF THE TRANSMISSION LINE IS 40 FEET LONG, THE COUNTERPOISE WILL BE 20+10 OR 30 FEET LONG.

RCA MFG. CO., INC.

MODEL "Magic Tone"
Cell Pickup Kit

Installation of the new Magic Tone Cell contained in this kit offers an opportunity for improving record reproduction from radio-phonographs or other record playing devices. Its design provides reduced "needle" chatter and surface noise, plus the additional feature of converting the pickup to a permanent sapphire point type completely eliminating the changing and use of needles, and crystal breakage at the time of needle change. It is particularly designed for installation in

RCA Victrolas and Record Players manufactured during 1938 and later, with practically no exceptions and slight changes. See Table page 3.

Electrical Characteristics.—

Output 1½ volts at 400 cycles approximately.
Impedance 200,000 ohms at 400 cycles approximately.
Frequency characteristics. See Figure 1.

OUTPUT-FREQUENCY RESPONSE CURVE

CIRCUIT DIAGRAM

Figure 1—Typical Circuit and Curve

The kit consists of:

- 1 RCA Victor Magic Tone Cell with Flexible Tone Bridge and Jewel-Lite Scanner assembled complete in cartridge form.
- 4 Mounting Screws.
- 2 Spacers.
- 1 Mounting Plate.
- 4 Washers.
- 1 Plug Button.

INSTALLATION

The following illustrations show different types of pickup arms with the new Magic Tone Cell installed.

Figure 2—Pickup Arms—Underneath View with Supports

**MODEL "Magic Tone"
Cell Pickup Kit**
RCA MFG. CO., INC.
To make the installation:

1. See that the power control on the phonograph is turned off.
2. Loosen the pickup arm at its base mounting so that it can be lifted complete and turned over. The pickup arm may be removed from its location in the cabinet to the extent permitted by the connecting wires. The support remains attached to the motorboard.

The arms A, D and E, Figure 2, may be disengaged from their supporting pivots by compressing the two hinge springs at the rear of the arms.

Remove the pickup arms B and C by pushing out the pin at the rear of the arm. Then pull the pickup forward off the pickup arm support.

3. With pickup arm turned over in a convenient position, unsolder the two leads and loosen the two screws holding the present pickup cartridge in the pickup arm head. Then remove the cartridge complete leaving the loose leads clamped in the arm.

The arm A, Figure 2 may contain a lead weight which will obstruct ready installation of the new pickup cartridge. The weight may be removed by (a) scoring the bracket at its bend with diagonal cutters and bending until it breaks or (b) drilling several small holes in the bracket at the bend and bending until it breaks. **It is preferable and recommended to use a new arm, Stock No. 9951, List Price \$0.90.**

4. Place the plate, supplied in the kit, in the pickup arm head with the two irregularly shaped holes in the plate matching with the screw holes in the arm. Attach the plate loosely in position with the two short binder head screws supplied in the kit, placing a washer above and below the plate on each screw.
5. Solder the two leads to the strip terminals on the Magic Tone Cell, being sure that the shield lead is attached to the ground terminal—the one on the right when viewed facing the front end, sapphire downwards—See Figures 2 and 3.

Figure 4—Pickup Axis

The soldering operation must be performed as quickly as possible so as not to heat the crystal.

6. Place the Magic Tone Cell in position, sapphire outward, with screw holes matched with the correct pair of threaded holes in the plate. Before fastening the Magic Tone Cell to the mounting plate, hold it in position and adjust the plate so as to permit mounting with playing point position, pickup axis and tracking the same as for the cartridge removed.

Tighten up the plate screws and then assemble the Magic Tone Cell in place using the two long fillister head screws supplied, placing the spacers on the screws between the cartridge and the mounting plate.

Note: Be careful not to bend the sapphire support wire, and be sure that the lead connections do not short to the arm, spacers or plate.

7. On pickup with a comparatively large hole on top for needle insertion, insert the plug button, supplied in the kit, securely in the hole.
8. Carefully reassemble the pickup arm and check its movement, making any necessary adjustments for correct operation as indicated in later paragraphs.

In case adjustment for "set down" and "height" is necessary it may be advisable to refer to service notes for the particular record player.

It may be necessary to weaken the tension on the feed-in spring on some mechanisms, in order to prevent the pickup from kicking-in too hard at the beginning of each record. Reduce tension by lengthening the spring or in most cases cut and remove the spring.

On certain phonographs it may be desirable to adjust the compensation in the audio circuit for best record reproduction.

Figure 3—Magic Tone Cell (Sapphire Downwards)

RCA MFG. CO., INC.

COMPENSATION

Table of typical RCA Models with suggested changes for greatest volume and best fidelity

Model	Electrical Adjustments	Mechanical Adjustments
U-9	Change R14 to 220,000 ohms Change C17 to .005 mfd.	<p>On all models the sapphire height above the motorboard should be checked. The sapphire point must enter the record groove and bear properly on the record. It must not strike or scrape on the motorboard as it may be damaged.</p> <p>Swing out the pickup over the motorboard and adjust the sapphire height by carefully bending the pickup arm support bracket so that the sapphire point is 1/8 inch above the motorboard. The pickup should then operate properly throughout the playing cycle for both automatic and manual playing.</p> <p>Any other necessary mechanical adjustments should be made in accordance with the Service Notes for the particular model.</p>
U-25	Remove R9. Short out R10. Connect C13 from high side of phono input to tap on volume control.	
U-40	Change R18 to 120,000 ohms Change R16 to 22,000 ohms Change C9 to .005 mfd.	
U-42	Change R18 to 68,000 ohms Change R16 to 18,000 ohms Change C9 to .007 mfd.	
U-43	Change R18 to 220,000 ohms Change C9 to .005 mfd.	
U-44	Change R24 to 15,000 ohms Change R25 to 150,000 ohms Change C49 to .005 mfd.	
U-123	No changes required.	
U-125	Remove R9. Short out R10. Connect C12 from high side of phono input to tap on volume control.	
U-130	Remove R46	
R-98	Change R2 to 27,000 ohms Change C1 to .025 mfd.	
V-100	Change R14 to 180,000 ohms Change C17 to .005 mfd.	
V-170	Change R21 to 220,000 ohms Change C48 to .005 mfd.	
V-200	Change R4 to 82,000 ohms Change R5 to 180,000 ohms Change R6 to 270,000 ohms Change C25 to .005 mfd.	
V-205	Change R7 to 120,000 ohms Change R8 to 270,000 ohms Change R9 to 220,000 ohms Change R31 to 15,000 ohms Change C34 to .005 mfd.	
V-405		<p>The information on the above key models will serve as a guide to cover the installation on other RCA Models of 1938 and later manufacture.</p>

General Information on Compensation for Pickup Circuits

1. The pickup should be terminated or loaded in accordance with the information given in the preceding table.
2. Decreasing shunt resistance across pickup circuit decreases bass response and increasing shunt resistance across pickup circuit increases bass response.
3. Examples of compensation adjustments.

Figure 5—Pickup Circuit

Circuit I—Increasing R1 increases low frequency response. Increasing C1 increases high frequency response. Increasing value of R3 with respect to total value of R2 plus R3 increases the output.

MODEL "Magic Tone
Cell Pickup Kit

RCA MFG. CO., INC.

CIRCUIT II

CIRCUIT III

R-874

Figure 6—Pickup Circuits

Circuit II—Increasing R1 increases low frequency response.*
Increasing R2 increases high frequency response.
Decreasing C1 increases output.

Circuit III—Increasing R1 increases low frequency response.
Increasing R2 increases high frequency response.
Increasing value of C1 with respect to total value of C1 plus C2 increases the output.

Operating Tests

1. **Mechanical**—The pickup should be tested for its complete operating performance. On record changing instruments both a full stack of records and a single record should be used in the test.

Checks should be made for:—

- a. Correct landing on 10 inch and 12 inch records.
- b. Correct tripping on 10 inch and 12 inch records.
- c. Correct elevation of pickup arm.
- d. See that neither sapphire guard nor rear end of pickup tends to "drag" on the record when a full stack of records is being used. Seat pickup deeper into arm if necessary.

Refer to the service notes for the particular model in all cases requiring readjustment.

2. **Electrical**—It should be remembered that the output of the Magic Tone Cell is inherently lower than that of former crystal pickups, thus involving a lower reserve volume. The volume control on the instrument must therefore be further advanced than before, and the full volume position may occasionally be necessary. The best operating position should be checked on several records.
 - a. **Hum**—In cases of excessive hum, examine to see that shielding is intact and receiver circuits are normal. Make any necessary corrections.
 - b. **Rumble or Howl**—Excessive rumble or howl may be remedied by examining motor and motorboard mountings for flexibility and making any necessary corrections or improvements.

Replacement of Sapphire Stock No. 38449

Figure 7—Magic Tone Cell Showing Sapphire

Caution—Never bend the sapphire support wire.

The nut on the sapphire holder assembly is locked by a light cement (such as Glyptal). Extreme care should be used when loosening the nut so that the twisting motion does not break the crystal.

Remove the two screws holding the sapphire guard in place and take the guard off. Remove the small nut and washer on the threaded shaft of the sapphire holder and push the shaft through the hole in the viscoloid until the sapphire holder assembly comes free.

Insert threaded shaft of replacement sapphire holder through viscoloid and replace the washer and nut. Make

sure that the flat sides of the shaft are firmly in place in the clamp and then tighten the nut very carefully so as not to strip the threads nor break the crystal. Replace the sapphire guard, positioning it by means of the oversize screw slots. Make certain that the sapphire and its supporting wire are centered in the guard. Tighten the guard screws.

Before using, check to see that the sapphire projects far enough beyond the guard so that the guard will not strike the record. If necessary, bend the guard a little. Apply a drop of light cement (such as Glyptal) to the sapphire nut holder.

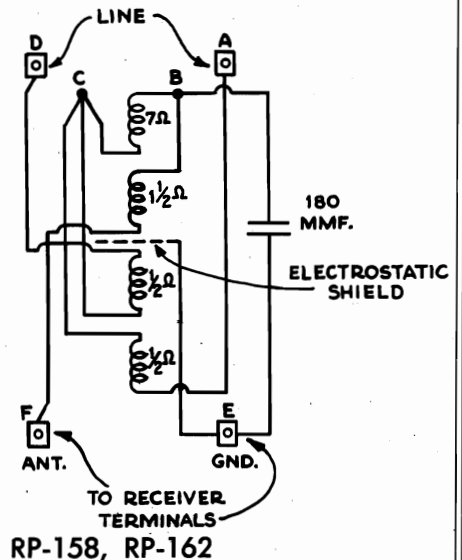

RCA MFG. CO., INC.

MODEL "Spider-Web"
Antenna
NOTES, CHANGES

SPIDER-WEB ANTENNA STOCK NO. 9689

THE EFFECTIVE RANGE OF ANTENNA IS FROM 140 TO 23,000 KC (4 BANDS) THE ULTRA HIGH FREQUENCY BAND (23 TO 70 MC) MAY BE COVERED BY THE ADDITION OF AUXILIARY KIT STOCK NO. 9689

RP-158, RP-160

Tone Arm Stop Bracket:

On 2nd production RP-158 and RP-160, a stop bracket has been added to the top of the motorboard to restrain the tone arm. It is mounted by means of the same screw, lock-washer, and nut used to mount the pickup shorting switch. Where difficulty is experienced with excessive movement of the tone arm on 1st production mechanisms, this bracket may be added as shown. The bracket is Stock No. 39832.

RP-158, -160

To Repeat One Record:

When checking RP-158 and -160 record changers for landing and tripping action, it is possible to play one record repeatedly by simply placing a weight on the rear record post. A small pipe nipple that fits over the top of the post is satisfactory.

Tone-arm stop bracket (No. 39832) position on RP-158, -160.

RP-151 RECORD CHANGER

To Play One Record Continuously:

It is possible to play one record continuously on the RP-151 by stretching a 3 1/2-in. or 4-in. rubber band across the mechanism, as shown, to prevent the record dropping through the motorboard.

The continuous playing of a record in this manner is handy when the record changer is being serviced, especially after the separator knives have been checked and tested, and it is desired to allow the changer to run on the shop bench without attention.

Revised reject button and lever in RP-158, -162.

Change in Reject Lever and Button:

2nd production of RP-158 and RP-162 automatic record changers have a reject lever arrangement as shown in accompanying sketch.

Stock No.	Description	List Price
39755	Button—Reject button15
39756	Lever—Reject lever and stud25
39757	Lever—Reject button right angle lever10

RP-160

Tone Arm Return Lever Spring:

The tone arm return lever spring is listed as Stock No. 39599. The correct number is 39088.

V-215, V-221

Speaker RL-70N-6:

On 2nd Production of V-215 and V-221, the speaker is changed from RL-70M-2 to RL-70N-6. The replacement parts are identical. A rubber band stretched across the motorboard as shown permits continuous playing of one record on RP-151 record changer during service checking of the mechanism.

CHANGES

NOTES, DATA

"KNOCKED-DOWN" VOICE COIL AND CONE

Installation Instructions:

To simplify cone replacement in certain speakers, the cone and voice coil are supplied as two separate units: (1) The voice coil and support, (2) The cone diaphragm.

General Procedure

- (a) Cement voice-coil support to the speaker, using centering gauge or speaker shims.
- (b) Solder voice-coil leads.
- (c) Put cone in place, cementing around rim of speaker frame.
- (d) Cement junction of cone and voice coil.

Detailed Instructions

- (a) Remove old cone and voice coil. Protect air gap with scotch tape. Clean off all paper and cement.
- (b) Apply a ring of cement (Duco Household) on top plate.
- (c) Insert centering gauge in new voice coil, handle first, from the winding end.
- (d) Remove scotch tape from gap. Insert voice coil and gauge in gap with leads in correct position for soldering. Press rim of voice coil support into the cement.

RCA MFG. CO., INC.

- (e) Solder the voice coil leads to terminals, allowing sufficient slack to permit free motion of the cone. Dress leads in plane of motion, clear of cone and housing.
- (f) Apply a ring of cement around the rim of speaker frame. Place cone down over voice coil and press cone rim tight to speaker frame.

- (g) Allow cement to dry on cone rim and voice-coil support. Then run a ring of cement around the junction of the cone and voice coil, being careful the cement does not run inside voice coil.
- (h) After cement at junction has dried, remove gauge, using a rotary motion.
- (i) Cement large cardboard gasket in place. Set the speaker in inverted position on a flat surface until gasket is dry. Cement dust cap on cone center.

Certain replacement cones are supplied "knocked-down" in two pieces—(1) The voice coil and centering support. (2) The cone diaphragm.

When installing "knocked-down" speaker cone, the junction of the cone and the voice coil is cemented last.

ABSORPTION WAVE TRAP

For Loop Receivers:

Interference and cross modulation due to the presence of a strong local broadcast station is seldom experienced on loop-type receivers because the signal pickup is much less on a loop than on an antenna.

However in rare cases where such interference is encountered, it can generally be eliminated by using an absorption-type wave trap, loosely coupled to the loop on the receiver, as shown in accompanying sketch, and tuned to the frequency of the interfering station.

A good absorption trap can be made with a small loop like that used in Model BP-10 "Personal" radio. Fasten a two-section mica trimmer (salvaged from a discarded IF transformer) on the small loop. Connect the trimmer across the terminals of the small loop. Use one trimmer, or both in parallel, depending on whether the interfering station is at the high or low end of the broadcast band.

Tune the receiver to the frequency of the interfering station, place the trap near the receiver loop, and adjust the trap trimmer(s) to resonance, indicated by a sharp dip in signal strength. Use smaller or larger capacity trimmers if required to reach resonance.

Check to see if the particular interference effects have been eliminated. Adjust the position of the trap to secure closer coupling if necessary to further increase signal absorption. Avoid over coupling. Fasten the trap in the desired position on the receiver loop.

VOICE COIL IMPEDANCE

And DC Resistance:

In servicing RCA radio loudspeakers, it is helpful to know that the DC resistance of the voice coil is approximately 10 percent less than the impedance at 400 cycles.

For example, a speaker with a rated voice-coil impedance of 2.2 ohms at 400 cycles will measure about 2 ohms DC resistance.

RECHARGING 6V BATTERY

On 12V or 32V DC Supply:

A 12-volt or 32-volt DC farm-lighting supply can be used to recharge a 6-volt radio storage battery. The recommended circuit is shown herewith. The charging rate may be increased or decreased by using a higher or lower wattage lamp.

Radio storage battery can be charged on a DC farm-lighting outfit.

BATTERY COMPLEMENT

For RCA Portable Models.

* Or equivalent.

On a loop receiver, interference from a strong local broadcast station can be reduced by using an absorption loop, tuned to the interfering station, and loosely coupled to the receiver loop.

RCA MFG. CO., INC.

CHANGES
NOTES, DATA

RCA SCHEMATICS

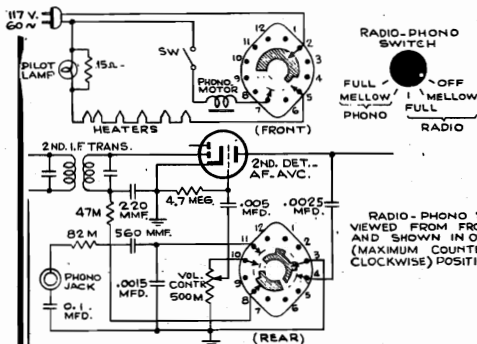

Switch Positions:

Practically all of the larger RCA receivers have decals on the cabinet (or other means) to indicate the function of each position on the more complicated switches. In cases where only the chassis is brought in for service, the corresponding information about controls is given in a knob drawing printed in the Service Note.

For example, the accompanying schematic shows the radio-phono-tone control switch circuit in Model V-135, drawn as usual in the extreme counter-clockwise position. The knob view shows the function of each position:

- (1) "Off" (counter-clockwise).
- (2) Radio—mellow tone.
- (3) Radio—full tone.
- (4) Phono—mellow tone.
- (5) Phono—full tone (clockwise).

As a general rule, on RCA receivers clockwise rotation of a control produces an increase. Thus on a range switch, the lowest-frequency band is counter-clockwise, and the highest-frequency band is clockwise. On tone controls, the narrowest audio range or deepest tone is counter-clockwise. The widest audio range or highest tone is clockwise.

In RCA Service Note schematics, wafer switches are shown in extreme counter-clockwise position, and the drawing of control knobs gives sequence and function of switch positions.

Installing No. 38204 Antenna Loop in BP-10 Where Loop is Held with Snap Fasteners:

- A. Remove the defective loop and its flat molded cover by prying out the two snap fasteners.
- B. Spread white paint or ink on the surface of the two bosses in lid.
- C. Place the new loop and cover in correct position inside the lid and press down so the paint will transfer on to the loop cover.
- D. Drill holes (.242-inch, No. C drill) in the flat loop cover at the exact center of each paint mark. Countersink each hole (approximately 3/64-inch) on loop side, so that the flat cover will set flush with the top of the bosses.
- E. Fasten the loop and cover to the lid with the two snap fasteners supplied.

Installing No. 38204 Antenna Loop in BP-10 Where Loop is Riveted in Lid:

- A. Drill the riveted ends of the rivets, and knock the rivets out, being careful not to damage the molded lid. Remove the defective loop and its flat molded cover.
- B. Place the new loop and cover in correct position inside the lid. Use the two rivet holes in the lid as a guide to drill corresponding holes in the loop cover.
- C. Fasten the loop assembly to the lid with the two rivets supplied.

BEST LOOP PICKUP

In Corner of Window:

In a metal-framed structure, such as a car, train, plane, or steel building, best signal pickup is usually obtained by placing the loop in one corner of the window instead of in the center. The center of the glass space is usually a null for signal. This fact should be kept in mind when using the extension loop on a portable radio, as there is a natural tendency to fasten the loop in the center of the window.

For best signal pickup, the extension loop on a portable set should be placed in corner of window.

DUMMY TERMINAL

On Replacement Volume Controls:

On certain replacement volume controls, the location of the "dummy" terminal is changed as shown in accompanying sketch.

ORIGINAL LOCATION OF DUMMY TERM.

NEW LOCATION OF DUMMY TERMINAL. (HAS COPPER RIVET)

Change in location of dummy terminal on certain replacement volume controls.

ELECTROLYTIC CAPACITORS

Terminal Identification:

On certain types of multiple-section electrolytics, the terminals are identified by small markings (triangle, half-round, or square). The marks are either cut-outs or mouldings in the base. Corresponding marks are shown adjacent to the electrolytic symbols in the schematic diagrams.

In some electrolytic capacitors, the terminals are identified by half-round, triangular, and square markings. Corresponding marks are shown adjacent to the symbols in the schematic.

QU7, QU-51, -52, -55, -56

Tone Arm Pressure Spring:

When replacing the tone arm, or the magnetic pickup head, check the needle pressure which should be approximately 3 1/2 ounces. Alter the counter-balance spring in arm to obtain the correct pressure, or install a new spring. Two springs (65 turns and 75 turns) are supplied under Stock No. 38213. Use the spring that most nearly gives the correct pressure and then remove turns, or stretch the spring, as required, for final adjustment.

BP-10

Loop and Moulded Lid:

Stock No. 38204 antenna loop with undrilled flat molded cover, and/or Stock No. 38211 molded lid with bosses for snap fasteners, can be used in any Model BP-10 where the antenna loop is secured in place with rivets, or with snap fasteners.

Installing Stk. No. 38211 Molded Lid in BP-10 Where Loop is Riveted in Lid:

- A. Snip the two hinge pins and pull the pins out of the hinges, to permit removal of the defective lid.
- B. Drill the riveted end of the rivets and knock them out, being careful not to damage the flat loop cover. Remove the loop and its cover from the lid.
- C. Spread white paint or ink on the surface of the two bosses in the Stock No. 38211 lid.
- D. Place the original loop with its flat cover in correct position inside the Stock No. 38211 lid and press down so the paint will transfer to the loop cover.
- E. Drill holes (.242 inch, No. C drill) in the flat loop cover at the exact center of each paint mark. Countersink each hole (approximately 3/64-inch) on loop side, so that the flat loop cover will set flush with the top-of the bosses.
- F. Fasten the loop and cover to the No. 38211 lid with the two snap fasteners supplied.
- G. Assemble the lid and loop to the chrome panel, using the hinge pins and springs furnished with No. 38211 lid.

6X2, 24BT-1, -2

Loose Dial Pointer:

Expansion and contraction due to temperature changes may cause the metal dial pointer to become loose on the moulded button shaft. This condition has been corrected in production by fastening the pointer with "Du Pont Household Cement" as shown.

Loose dial pointer can be repaired with Du Pont Household Cement.

**CHANGES
NOTES, DATA**

RCA MFG. CO., INC.

Q16E (RC-561-C)

Service Data:

Model Q16E is similar to Model Q16, except that it has an EM speaker, as shown in accompanying sketch, and the following parts are different:

Stock No.	Description	Unit List Price
12896	Capacitor—15 mmfd., moulded mica	\$.35
33806	Capacitor—.0015 mfd.	.25
32342	Capacitor—Electrolytic, comprising 2 sections of 10 mfd., 450 volts each	1.20
38409	Control—Tone control	1.00
34761	Resistor—10 ohms, 1/2 watt.	.20
30492	Resistor—22,000 ohms, 1/2 watt	.20
30652	Resistor—1 meg., 1/2 watt.	.20
30649	Resistor—2.2 meg., 1/2 watt.	.20
32911	Transformer—Power transformer—105-120 volts, 50-60 cycle	4.10
32852	Transformer—Power transformer—110-220 volts, 50-60 cycle	4.50
2917	Washer—"C" washer to hold tuning shaft	.03

**SPEAKER ASSEMBLIES
(RL-79C-1)**

31825	Cap—Dust cap	.02
32903	Coil—Field coil—1,800 ohms	1.25
38392	Cone—Cone complete with voice coil	1.25
5118	Plug—3-prong male plug for speaker	.25
32905	Transformer—Output transformer	1.35

Note.—If the stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker, and full description of part required.

Speaker connections in Model Q16E (RC-561-C).

26BP

Alignment:

The RF, detector, and oscillator adjustments in Model 26BP are easily accessible when the chassis is mounted in the cabinet. Consequently the regular dial may be used for reference during alignment. In the event that only the chassis is brought in for service, the accompanying full-size dial reproduction can be used as a substitute for the regular dial.

Q12

Correction in Service Data:

The RL-86A-3 speaker is incorrectly listed as a PM type. This should be listed as an EM speaker with 450-ohm field coil.

16X4

RF Plate Load Resistor:

In some production, the load resistor in the plate circuit of the RF tube is changed from 3,900 to 2,200 ohms.

QU56C, QU56M

Instability:

Development of appreciable RF impedance in the electrolytic filter capacitor creates common coupling and may cause IF oscillation. To eliminate this possibility, an RC filter is connected in the +B lead of the 1st-detector plate circuit, as shown in accompanying sketch.

In Q56-C, -M, an RC filter is added in the 1st-detector plate circuit.

When Model Q17 is used on 110-volt DC supply, the 1st-audio grid circuit should be changed as shown above to prevent distortion due to incorrect bias.

Q17

Distortion on 110-V DC Operation:

Distortion at all volume levels when Model Q17 is operated on 110-volt DC supply is caused by incorrect bias on the 12SQ7 control grid. This condition can be eliminated by changing to the circuit shown in accompanying sketch.

28X5

Insufficient Push-Button Range:

In Model 28X5 if the push-buttons have insufficient range, realign IF at exactly 455 kc. If this does not correct the trouble, replace the main oscillator coil Stock No. 38685 and realign the set. The correct coil has no number stamping; do not use coil stamped 95106-501.

Q44

.05 Mfd. Capacitor:

Change Stock No. 32787 to No. 4886.

QU51C, QU51M, QU55

Voice-Coil Impedance:

The voice-coil impedance of the RL-70N-1, RL-70N-3, and RL-71A-4 is incorrectly listed as 15 ohms in the Service Data. The correct impedance is 2.2 ohms at 400 cycles.

STOCK No. 160 CRO

Vertical "Bounce":

The 160 oscillograph has extremely good low-frequency response, passing a 4-cycle square wave with good fidelity. It is possible to encounter instances in which a line-voltage meter, due to its inertia will indicate little or no variation of voltage, whereas the oscillograph will exhibit noticeable vertical "bounce" due to line-voltage fluctuations.

If a customer desires to retain the normal low-frequency response of the 160 and has a power line which varies in voltage appreciably, it is necessary to provide voltage regulation, such as TMV-173 voltage regulator. However, if the extreme response of the 160 is superfluous for the particular application in mind it can readily be reduced, affording a reduction of the "bounce" to an unobjectionable value. This is accomplished by removing the present coupling condenser, C-20, and substituting a 0.05 mfd. 400-volt condenser. The response is then down a few percent with a 15-cycle sine wave input.

(The 160B incorporates filtering circuits to eliminate vertical "bounce.")

For applications in which it is desired to connect directly to the cathode ray tube deflecting plates, such as the observation of a modulated RF envelope from a transmitter, it is possible to completely eliminate the vertical "bounce" by merely disconnecting either side of the coupling capacitor, C-23.

Connections for RL-86A-3 EM speaker in Model V-105.

V-105

Using EM Speaker Replacement:

RL-86A-3 "EM" speaker can be used as a replacement for RL-81B-4 PM speaker in Model V-105 by wiring in the field coil and output transformer as shown in accompanying diagram. The original output transformer can be used by taping up the black (tap) lead.

In this particular model, it is necessary to solder a jumper across contacts 8 and 9 on the front section of the radio-phonograph switch. This keeps the 1st-detector and IF tubes in operation when the switch is in "phono" position, and thus maintains sufficient current through the field coil for adequate excitation.

The customer should be instructed to tune the set to a quiet point on the dial to prevent radio break-through on phono.

RCA MFG. CO., INC.

CHANGES
NOTES, DATA

55 60 70 80 100 120 140 160

Model 26BP full-size dial reproduction.
This can be used for reference during alignment.

CV-112, CV-112X

Electrolytic Capacitor:

These AC power units are described in "Supplementary Information No. 4 and No. 5." The Stock Number of the electrolytic capacitor should be changed from No. 30873 to No. 39846.

STOCK No. 154 BFO

Alignment:

The instruction book for Stock No. 154 beat-frequency oscillator specifies 850 kc for the fixed oscillator frequency. In some production, a frequency of approximately 343 kc is used in order to secure correct dial calibration.

Also, in figure 11 of this instruction book, the trimmer numbers C10 and C3 are reversed. They are shown correctly in figure 9.

158 AND 160-B CRO

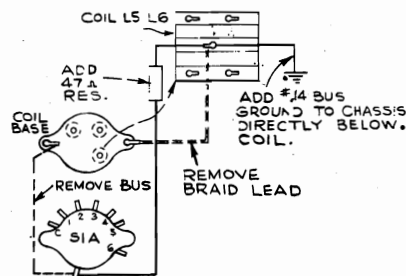

Filter Circuit Change:

In some 1st Production of Stock No. 158 and 160-B cathode ray oscillographs, numbered in the 2,000 series, the .1 mfd 1st-filter capacitor may short due to starting-voltage surge. To prevent recurrence, replace the 27,000 ohm input filter resistor (R38 in 158, R33 in 160) with a 120,000 ohm 1 watt resistor, Stock No. 13483. This change should be made when the shorted .1 mfd capacitor is replaced.

167, 167A TEST OSCILLATOR

Dead Spots on HF Band:

Dead spots or failure to oscillate on the high-frequency band in the Stock No. 167 or 167A test oscillator may be corrected by inserting a 47-ohm 1/4-watt resistor, and making slight changes as shown in accompanying sketch.

Change in Stock No. 167, 167A test oscillator to eliminate dead spots, or failure to oscillate, on HF band.

MODEL vs "RP" NUMBERS

The automatic record changer mechanism in certain models is designated by an "RP" number, as follows:

RCA Model Number	"RP" Number
QU5	RP-145E
VA-15	RP-152
U-40	RP-139A, 145
U-42	RP-139A, 145
U-43	RP-139A, 145
U-44	RP-139A, 145
U-45	RP-139A, 145
QU51-C	RP-145E
QU51-M	RP-152R
QU52-C	RP-152S
QU52-M	RP-152R
V-135	RP-162

CONVERSION KIT No. 9889

For Television Alignment Oscillator:

This kit is used to convert No. 159 oscillator to include 59-67 mc in place of 43-51 mc.

Parts supplied in this kit consist of: 1 escutcheon; 1 coil complete with core and bracket; 1 switch contact; and necessary screws, nuts, and washers for mounting.

Revision procedure is as follows:

- Cut lead from C1 to S1A.
- Cut lead from L1 to S1B.
- Cut lead between old 44-50 mc and 50-56 mc taps on S1A.
- Mount extra contact on S1A preceding old 44-50 mc position.
- Connect extra contact lead to L1.
- Drill and tap 6-32 hole in center of sweep condenser stator bar nearest front panel.
- Mount new 59-67 mc coil L9.
- Connect lower L9 lead (nearest bracket end) to common coil bus near L5.
- Connect tap L9 lead to former L1 switch contact on S1B.
- Connect C1 to former 44-50 mc contact on S1A.
- Mount escutcheon.

Make the following changes to the instruction book IB-32011:

Page 8—Delete adjustment No. 5.

Add adjustment 6A, symbol L9, description 60-66 mc band tuning; set the center of the sweep range to 63 mc.

Page 14—Change schematic as shown in accompanying sketch.

To accommodate deletion of the original No. 1 channel (44-50 mc), and addition of the new No. 2 channel (60-66 mc), kit No. 9889 is available to convert Stock No. 159 television alignment oscillator.

RCA VICTROLA MECHANISM DATA

"RP" vs STOCK NUMBERS

In service data for radio-phonograph combinations, the automatic record changer mechanism is usually described in a separate service note. In such cases, the mechanism is identified by an "RP" number. Certain of these mechanisms are also marketed under RCA "Stock Numbers." Corresponding "RP" and Stock Numbers are listed below. For service data on any given Stock Number of mechanism, refer to the corresponding "RP" service note.

RP No.	Stock No.
RP-139B	9865
RP-139C	9865
RP-145A	9865A
RP-151	9933
RP-152C	9909
RP-152M	9909D
RP-155A	9910
RP-158	9930
RP-160	9931
RP-162	9932

CABINET MUST BE LEVEL

For Correct Landing and Feed-in:

V-215 and V-221 "roll-out" record changers are designed to operate WHEN THE CABINET IS LEVEL. The changer is automatically tilted forward 3 degrees when in the cabinet. Always make landing and feed-in adjustments under these conditions.

In V-215 and -221, an adjustment is located on each of the rear legs to permit fore-and-aft leveling. If the changer does not roll out correctly when the cabinet is level, inspect the rubber-tired rollers and the guides.

V-219, -225, and all other models in which the changer is fastened in cabinet, are designed to operate WHEN THE CHANGER AND CABINET ARE LEVEL. Always make landing and feed-in adjustments under these conditions.

Legs can be used to support a record changer in level position at a convenient height above work table. The legs can be made from threaded rod, or from pipe fittings, as shown above.

Original and new motor switch for automatic shut-off in manual operation on RP-152D and RP-153.

**CHANGES
NOTES, DATA**

RCA MFG. CO., INC.

**HOLDER FOR RECORD
CHANGER**

Essential in Servicing:

In servicing an automatic record changer, it is essential to have some kind of a holder or stand to support the mechanism in a level position at a convenient height above the work table to permit easy access to all parts under the motorboard.

Adjustable stands can be purchased, or assembled from pipe fittings as shown in the accompanying sketch.

The simplest and cheapest type of holder is made by using legs that screw into the motorboard-mounting-screw sockets. Such legs can be made from pipe fittings or from threaded rods as shown in the sketches. One end of each leg has a 1/20 thread to accommodate most RCA changers, and the other end has a 5/16-18 thread to accommodate the RP-151 mechanism.

An adjustable holder for automatic record changer mechanisms can be made from pipe fittings as shown above.

RP-152D, -153, QU7

Automatic Motor Switch:

Some models of RCA automatic record changers incorporate a switch that acts to shut off the motor when the pickup needle is 1 1/2 inches from the spindle, and also when the pickup is moved out to its rest position.

The original switch, Stock No. 36529, is superseded by an improved switch, Stock No. 38995. When installing the new switch, remove the angle bracket that is used between the motor board and the original switch.

VHR-202, -207, -307, -407

Crystal Pickup is No. 37158

In the Service Data for these home-recording models, the pickup cartridge is incorrectly listed as No. 33905. The correct Stock Number is 37158. This correction should also be noted in the tabulation on page 5 of "Supplementary Information No. 5."

DO NOT TOUCH THIS TONE ARM

when playing either one or more records automatically, to avoid possibility of disturbing Automatic Adjustment. Just Push a Button—There's Your Record Program.

The label reproduced above is fastened to the record changer in Models V-215, -219, -221, and -225.

These mechanisms are designed for completely automatic operation on a stack of records or on a single record.

Customers should be instructed to use the START-REJECT button and not to handle the tone arm.

The following parts are required for the record-changer holder shown above. These parts can be obtained in hardware or plumbing shops.

Drawing Number	Description	Quantity
1	3/8-in. ell.	2
2	3/8-in. all-thread nipple	2
3	3/8-in. gas-pipe locknut	2
4	3/8-in. x 15-in. pipe	2
5	3/8-in. 4-way ell on side outlet tee	2
6	3/8-in. x 1/4-in. pipe	1
7 (optional)	3/8-in. x 3/8-in. reducer	1
8	3/8-in. x 15-in. pipe	1
9-10	3/8-in. to 1/2-in. bushing	1
11 (optional)	3/8-in. std. nut and 5/16-in. std. nut	2 each
12	3/8-in. x 1 1/4-in. std. and 5/16-in. x 1/2-in. std. bolt	2 each
13	3/8-in. awning eyelet	2
14	3/8-in. pipe cap	4

Note: If item 13 is not obtainable, change item 2 to 2 1/2-in. nipples, and drill 5/16-in. holes close to one end to accommodate the motorboard mounting bolts.

RP-151, -158, -160, -162

Trip Lever and Trip Pawl Spring:

The original bronze trip-pawl spring, Stock No. 38562, is no longer available. When this spring requires replacement, due to loss or irreparable damage, it is necessary to install either a new steel spring, Stock No. 39961, in accordance with instructions given below, or else install a complete new trip lever assembly which employs the steel spring.

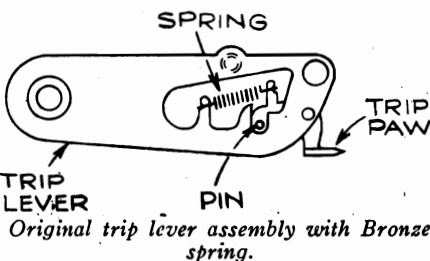

In RP-151, the new trip lever, trip pawl, and steel spring assembly is Stock No. 38561

In RP-158, -160, and -162, the new trip lever, trip pawl, and steel spring assembly is Stock No. 38632.

The new lever and spring assemblies will be supplied on orders for the original assemblies.

Installing Steel Spring No. 39961 on Trip Lever:

1. Drill a 3/32-inch hole in lever as shown.
2. Cut off the tab that was used to anchor the original bronze spring.
3. Install steel spring as shown.

Original trip lever with corner cut off to prevent lever striking the ratchet.

Trip lever with new steel spring. This steel spring can be installed on original lever in place of bronze spring by drilling a 3/32 inch hole and cutting off the tab on original lever.

Spring sleeve installed on 60-cycle motor spindle for operation on 50-cycle supply.

REVISED RATCHET LEVER

In RP-158, -160, and -162, continuous tripping can be caused by failure of the ratchet lever to block the drive cam pawl at completion of a change cycle.

This has been corrected by doubling the thickness of the end of the ratchet lever so that it presents a broader face to the edge of the drive cam pawl. The lever with double thickness is carried under the same Stock Number (38656) as the original lever, which it supersedes.

Continuous tripping in RP-158, -160, and -162 can be caused by failure of the ratchet lever to block the drive cam pawl. The replacement lever has double thickness at end to present a broader face to the drive cam pawl.

**CHANGES
NOTES, DATA**

RCA MFG. CO., INC.

RP-151, -158, -160, -162

Crystals and Sapphires:

The following Stock Numbers for crystal-and-sapphire assemblies supersede all previous listings:

RP	Used in Models	Stock No. of Sapphire and Holder, less nut—	Stock No. of Crystal and Sapphire Assembly—
151	V-225	38449	Top, 39919 (Alum. case) Bottom, 38598 (Alum. case)
158	V-175, V-209, V-210	39564	38610
160	V-215, V-219, V-221	38449	39550 (Zinc case)
162	V-135	39564	38610

Zinc-cased crystals have letters "ZN" east in the metal.

Use only zinc-cased crystal No. 39550 for RP-160. This can not be used in RP-151.

Do not replace complete pickup where sapphire only requires replacement.

IMPROVED TONE ARM RETURN LEVER

Stock No. 39751

The tone arm return lever in RP-158, -160, -162, has been revised to incorporate two important improvements:

- (1) A cam to adjust landing position on 12-inch records.
- (2) A positive-acting feed-in lever and spring. (This pushes the tone arm in toward the music grooves after the sapphire has landed on the record.)

This revised lever, Stock No. 39751, supersedes the original lever, Stock No. 38618.

RP-160

Sapphire Pressure:

The correct sapphire pressure in RP-160 is approximately 1½ ounces. The pressure is governed by a spring inside the end of the pickup arm. Owing to the fact that both aluminum and zinc castings (with difference in weight) have been used for the arm and the crystal, and also that only the zinc crystal (Stock No. 39550) is supplied for replacement,

it is necessary to check the sapphire pressure whenever either the crystal or the arm is replaced.

The zinc arm is identified by the letters "ZN" after the drawing number inside the arm.

The zinc crystal is identified by the letters "ZN" moulded at the rear end of the cartridge.

The various combinations are tabulated below, along with the Stock Numbers of pivot arms and springs involved.

60 TO 50 CYCLE CONVERSION

For Rim-Drive Phono Motors:

(These instructions supersede all past issues, covering the use of shrunk sleeves.)

A spring sleeve is used to increase the diameter of the motor drive spindle, to compensate for the slower speed of the motor when used on a 50 cycle line.

Spring sleeves are available for the following

models which comprise most of the motors using spindle drive manufactured to date.

To apply the spring-sleeve to the motor spindle, lock the rotor manually and press spring gently over end of spindle, twisting the free end of spring counter-clockwise (to unwind coil) until following end of spring is flush with end of spindle.

The ends of spring should not protrude, and all coils should be close together, allowing a flat even surface on the motor spindle to contact the rubber drive.

12-inch Landing Adjustment:

When adjusting a mechanism that has this revised lever, make the 10-inch landing adjustment in the usual manner as specified in the service notes. Then check landing on a 12-inch record and adjust the cam if necessary. The correct landing position for 12-inch records is 5½ inches from the sapphire to the nearest side of the spindle.

Feed-in Spring Adjustment:

The feed-in spring (Stock No. 39752) is hooked in one hole on a bracket that has three spaced holes to permit coarse adjustment of feed-in tension. Fine adjustment can be obtained by bending the bracket.

Stock No. 39751 tone arm return lever has a cam to adjust 12-inch landing position, and a positive acting feed-in mechanism. The feed-in tension can be adjusted by hooking the spring in a different hole on the bracket, and by bending the bracket.

RP-158, RP-162

Tone-Arm Resonance:

Chatter at frequencies near 2,500 cycles on some 1st production RP-158 or RP-162 mechanisms is caused by tone-arm resonance which can be eliminated by inserting a block of viscoloid (½ in. x ½ in. x 3/16 in.) in the arm as shown. The viscoloid block is No. 39949.

Viscoloid damper (No. 39949) minimizes tone arm resonance in RP-158, -162.

RCA MFG. CO., INC.

MODEL 6X2
Chassis RC-1013

Output Meter Alignment—Connect the meter across the voice coil and turn the receiver volume control to maximum.

Electronic Voltmeter—The electronic voltmeter in the Chanalyist or VoltOhmyst provides an unexcelled output indicator. It should be connected to the AVC bus.

Test-Oscillator—For I.F. alignment, connect the low side of the test-oscillator to the receiver chassis through a .01 mfd. capacitor, and keep the output as low as possible.

Pre-Setting Dial—With gang condenser in full mesh, the printer should be adjusted so that it is vertical.

Power-Supply Polarity—For operation on d.c., the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a.c., reversal of the plug may reduce hum.

FREQUENCY RANGE..... 540-1,720 kc
Intermediate Frequency..... 455 kc

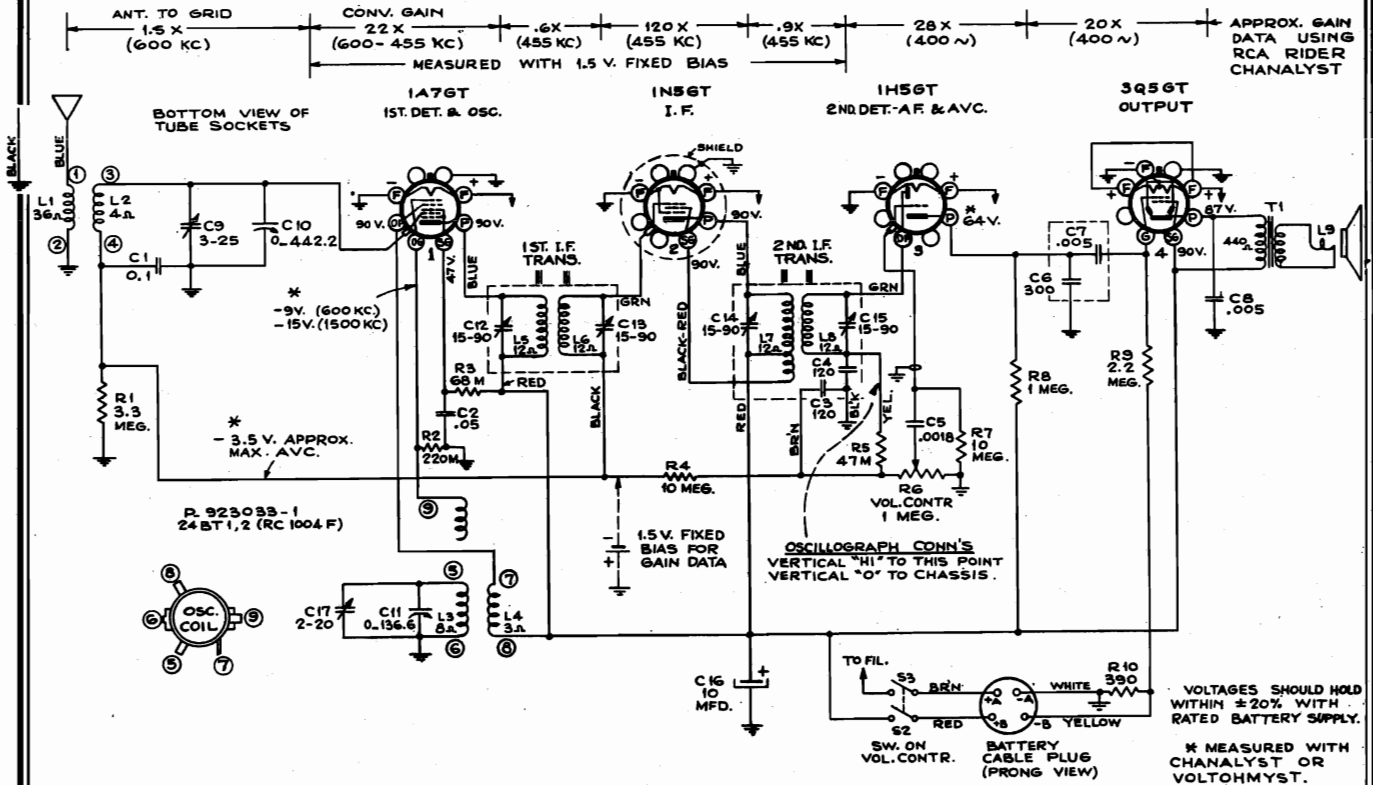

POWER SUPPLY RATINGS
 105-125 volts, direct current, or 50-60 cycles..... 30 watts
 Power Output (125 volts .60 cycle supply)
 Undistorted..... 0.8 watts
 Maximum..... 1.2 watts

LOUDSPEAKER RL-81-B2..... 5 inch permanent magnet
 or RL-80-A3..... 5 inch electro magnet

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	I.F. grid, in series with .01 mfd.	455 kc.	Quiet point 1,800 kc. end of dial	C8, C9 2nd I-F Transformer
2	1st Det. grid in series with .01 mfd.		Gang at minimum	C6, C7 1st I-F Transformer
3	Ant. terminal in series with 100 mmfd.	1,720 kc	Signal Frequency	C3 (osc.)
4	Radiated signal 1300 kc			C1 (ant.)
5	Repeat steps 3 and 4.			

MODELS 24BT-1, 24BT-2
Chassis RC-1004F

RCA MFG. CO., INC.

FREQUENCY RANGE..... 540-1,720 kc
INTERMEDIATE FREQUENCY..... 455 kc

BATTERY DRAIN

"A"..... .25 amperes
"B"..... 14 m.a.

MAX. POWER OUTPUT..... .3 wat.

LOUDSPEAKER (5-inch PM)

Identification number..... RL-85-6..... 92322-1
Voice coil impedance at 400 cycles..... 3 ohms..... 3 ohms

Cathode Ray Alignment is the preferable method. Connections for the oscillograph are shown in the diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test oscillator to the receiver chassis, and keep the output as low as possible to avoid AVC action.

Electronic Voltmeter.—The electronic voltmeter in the Chanalyst or VoltOhmyst provides an unexcelled output indicator. It should be connected to the AVC bus.

Pre-Setting Dial.—With gang condenser in full mesh, the pointer should be adjusted so that it is horizontal.

Step	Connect high side of test osc. to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	I-F grid in series with .01 mfd.	455 kc	Quiet point between 550 and 750 kc	C14, C15 (2nd I-F Trans.)
2	1st Det. grid in series with .01 mfd.			C12, C13 (1st I-F Trans.)
3	Antenna terminal in series with 220 mmfd.	1,720 kc	Tuning condenser rotor plates all out	C17 (osc.)
4		1,300 kc	1,300 kc signal	C9 (ant.)

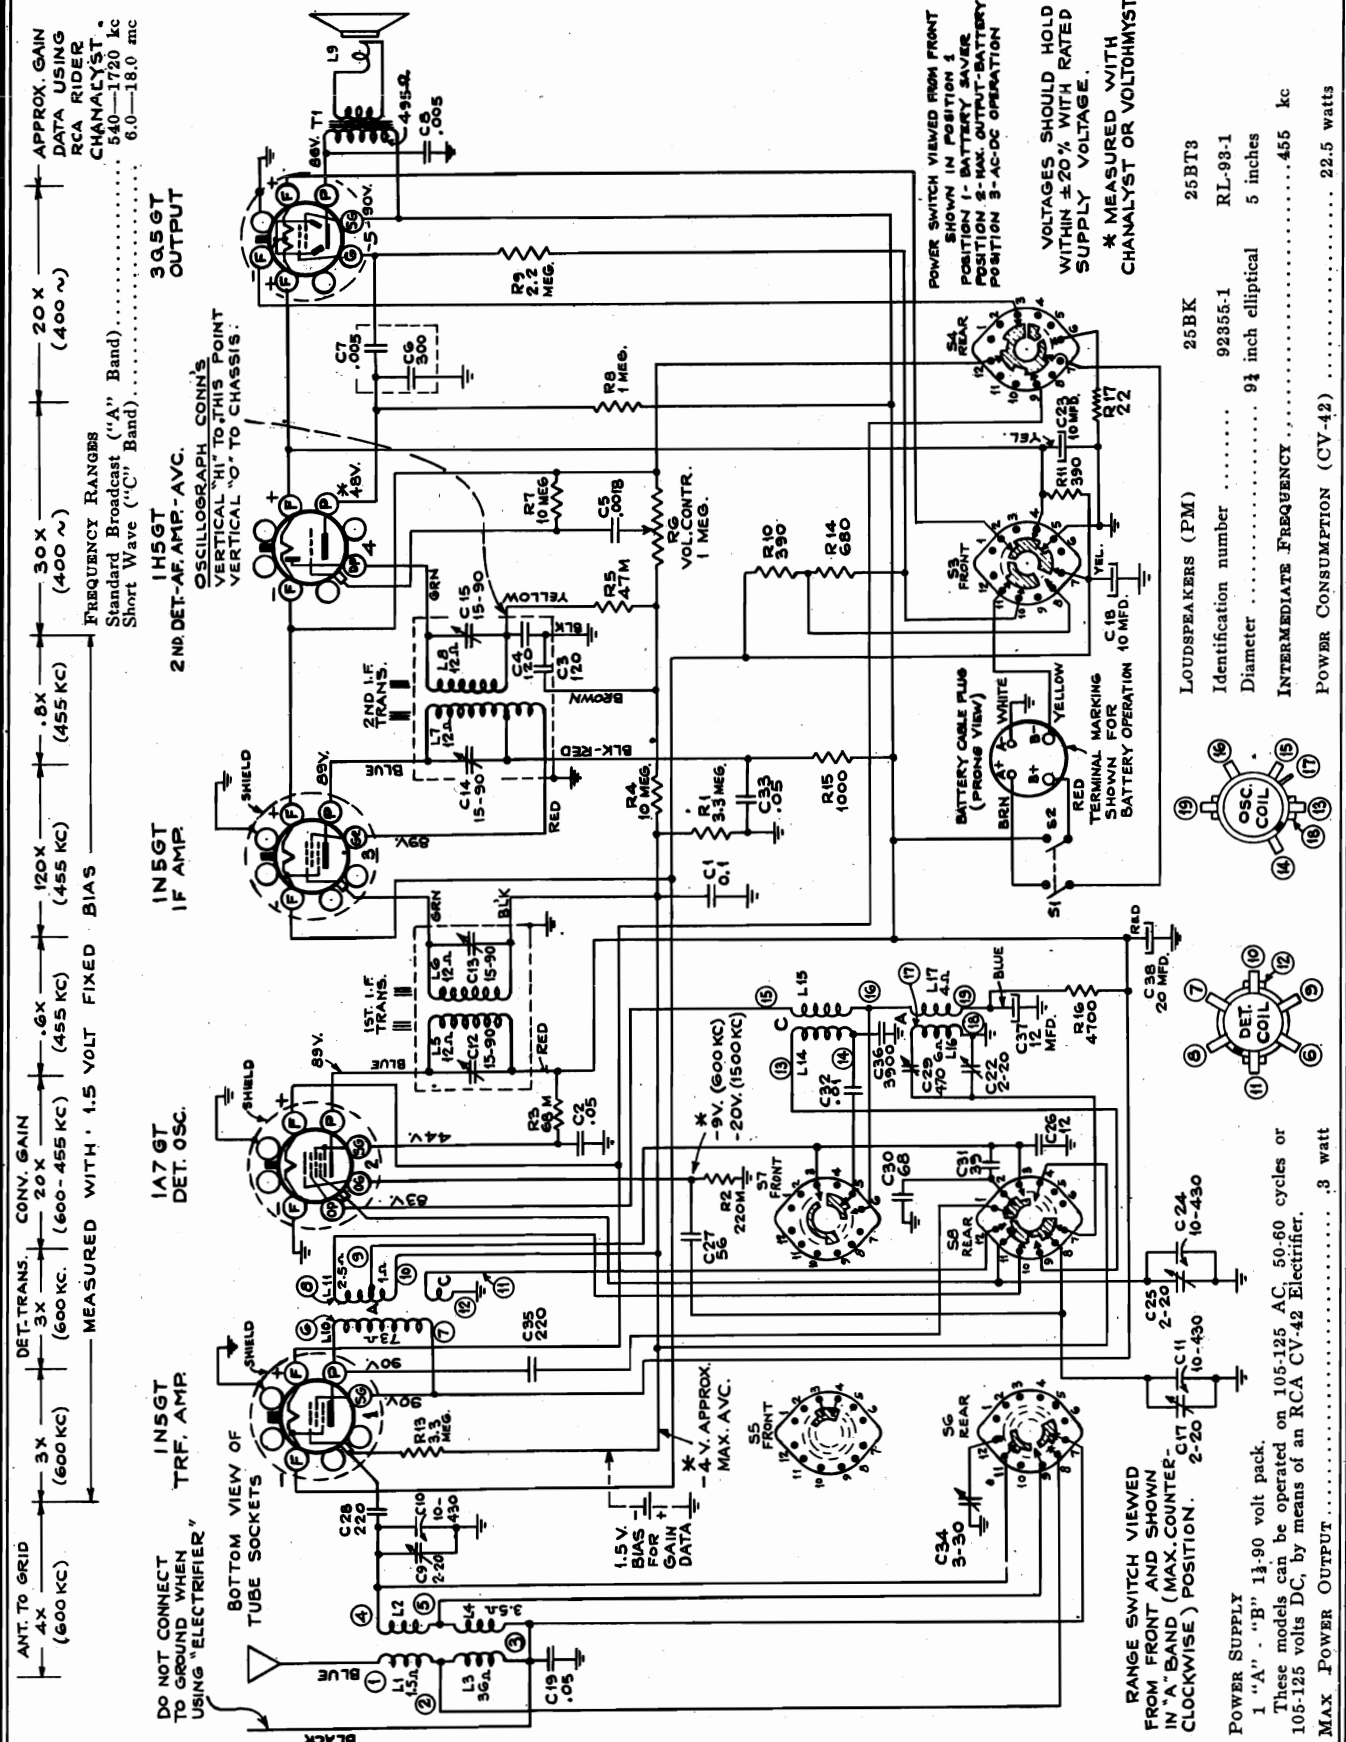

Precautionary Lead Dress.—

- The lead from the 3Q5 plate to output transformer should be dressed under clip and away from audio input leads.
- Keep AVC lead connecting C1 away from the 1A7GT plate.
- Keep blue plate leads coming from IF transformers short and close to the chassis.
- All filament wires should be dressed close to chassis.

ALTERNATIVES
THREE SEPARATE PLUG-IN BATTERIES THREE SEPARATE TERMINAL BATTERIES

Precautionary Lead Dress:—

1. All filament wires should be dressed close to chassis.
2. Keep AVC lead connecting .1 Mfd. Filter to Ant. Coil away from 1A7GT plate.
3. Keep grid lead coming from first IF transformer short.
4. Keep Blue leads coming from IF transformer short and close to chassis.
5. Keep grid leads of 1N5GT and 1A7GT tubes away from each other.

Circuit of CV-42 Electrifier

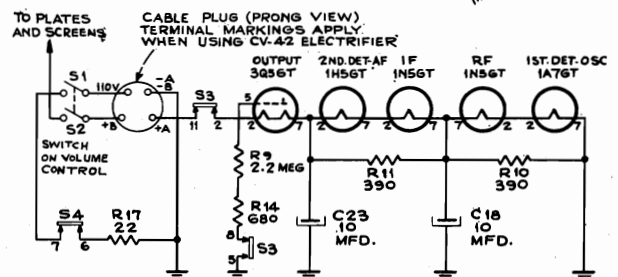

Remove any external ground connections when using the Electrifier.

CAUTION: Turn power switch off (counter-clockwise) when installing or replacing tubes or batteries.

DO NOT TURN THE "BATTERY-ELECTRIC" SWITCH TO ELECTRIC POSITION WHILE THE RECEIVER IS CONNECTED TO BATTERIES.

On a DC power supply, if no reception is obtained, reverse the plug in the outlet and retune. On an AC supply, reversal of the plug may reduce hum. CAUTION! Do not touch Radio Chassis unless power plug is removed from socket.

Step	Connect high side of test osc. to—	Tune test-osc. to—	Turn radio-dial to—	Adjust the following for maximum peak output
1	I-F grid, in series with .01 mfd.	455 kc	"A" Band, Quiet point between 550 and 750 kc	C14 and C15 (2nd I-F trans.)

Simplified Diagram of Filament Circuit when using CV-42

Hum Modulation on Model 25BT3 When Using CV-42 "Electrifier."

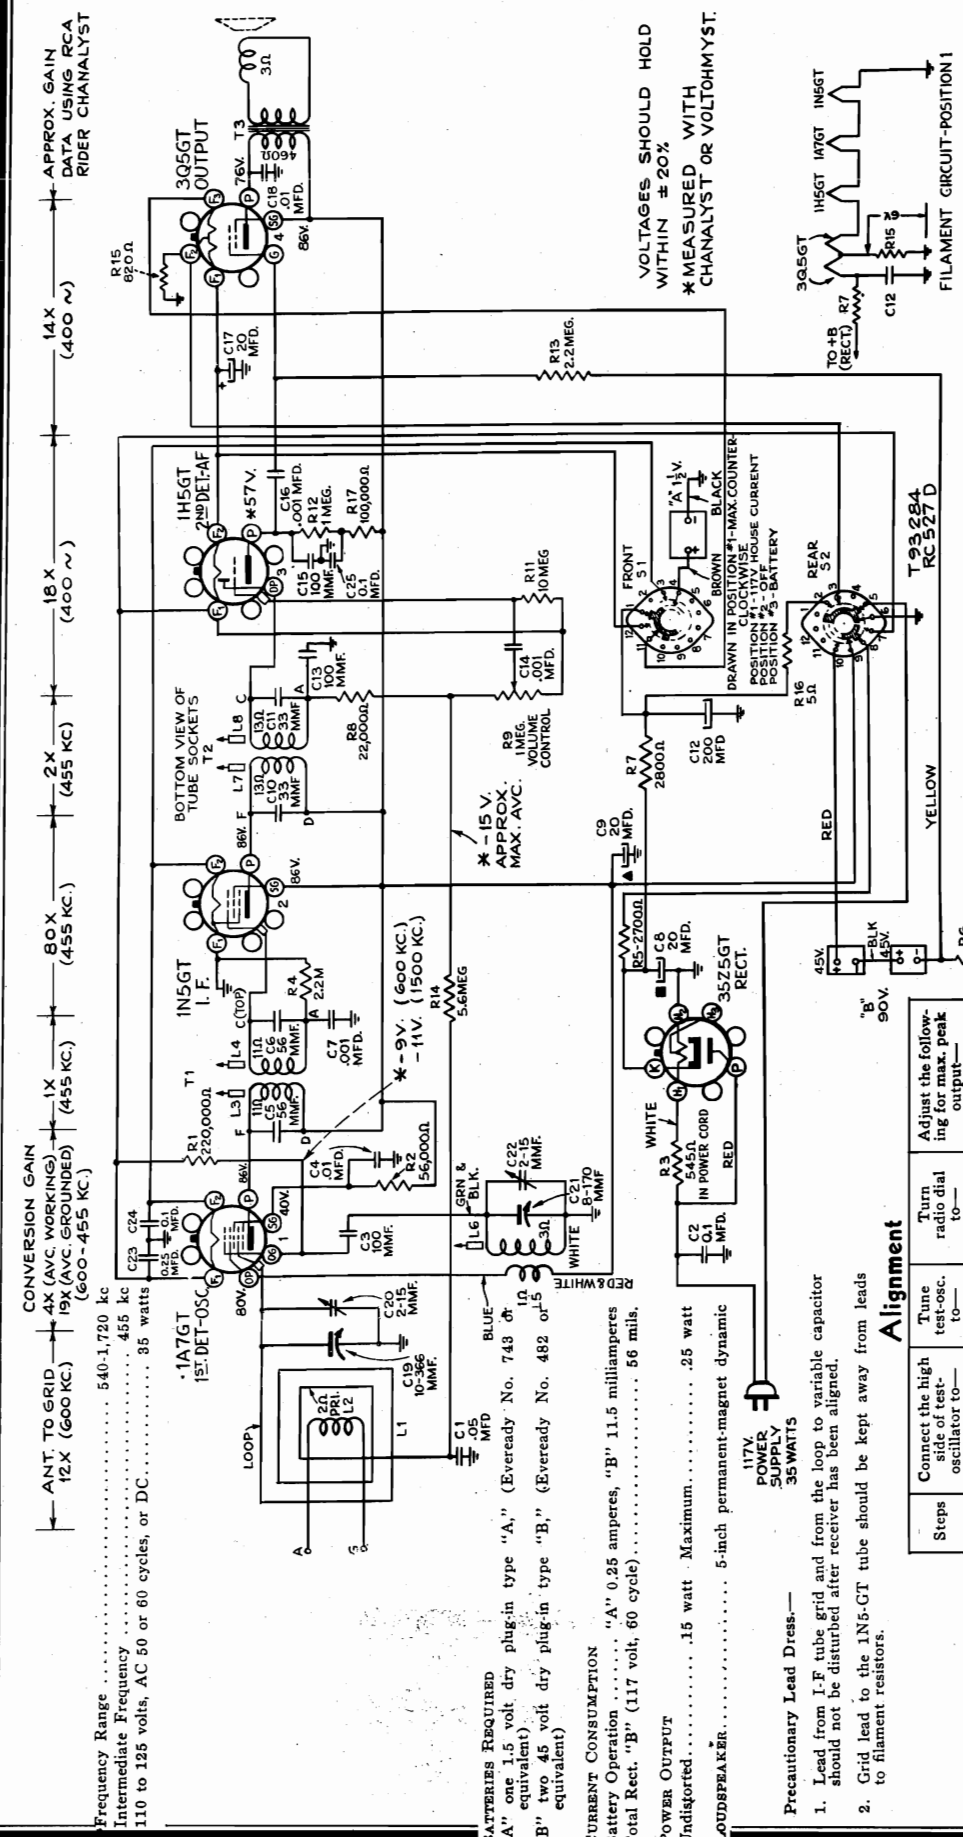

The following changes should be made in cases where hum modulation is experienced when operating Model 25BT3 from a CV-42 electrifier power unit. It is not necessary to remove the chassis from the cabinet to make these changes.

- (1) Connect a 220 mmfd. molded mica capacitor in series with the blue antenna lead as shown.
- (2) Disconnect the black ground lead and C19 from the bottom lug on the antenna coil. Connect a jumper from this lug to chassis. Connect the black ground lead to C19 and tape the joint.

The original and revised connections are shown at left.

INDICATES COMMON WIRING INSULATED FROM CHASSIS.

VOLTAGES SHOULD HOLD WITHIN 20% WITH 177V. AC. SUPPLY.

* MEASURED WITH CHANNELYST OR VOLTOHMYST.

MODEL 26X-4
Chassis RC-1014B

RCA MFG. CO., INC.

FREQUENCY RANGE
Broadcast..... 535-1,600 kc
Short Wave..... 8.7-15.6 mc
Intermediate Frequency..... 455 kc

PILOT LAMP..... Mazda No. 51, 6-8 volts, 0.2 amp.

POWER OUTPUT
Undistorted..... 0.9 watts
Maximum..... 1.4 watts

LOUDSPEAKER RL-81B2 "PM," or RL-86-B1 "EM."
Size..... 5-inch
V.C. Impedance..... 4 ohms at 400 cycles

POWER SUPPLY RATING
105-125 volts, AC, 50 or 60 cycles, or DC..... 30 watts

PUSH-BUTTON RANGES
One station between approximately..... 540-1,100 kc
One station between approximately..... 610-1,250 kc
Two stations between approximately..... 750-1,420 kc
One station between approximately..... 950-1,560 kc

Push Button Adjustment

The station push buttons connect to separate magnetite-core oscillator coils and separate antenna trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as RCA Stock No. 31031. Allow at least five minutes warm-up period before making adjustments.

In the event that the receiver is to be used with an external antenna use one or two feet of wire (as an antenna) to ensure sharp

peaking during the final adjustment procedure. For loop operation, the link should be strapped across terminals on back of set. In either case the procedure is as follows:

1. Make a list of the desired stations, arranged in order from low to high frequencies.
2. Turn the range selector to "A" band, and manually tune in the first station on the list.
3. Turn range selector to "PB" position, push in station button No. 1 (extreme left). Then adjust the No. 1 oscillator core to receive the station.
4. After oscillator core is set correctly, adjust No. 1 antenna trimmer for maximum output.
Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.
5. Adjust for each of the remaining stations in the same manner.
6. Make a final careful adjustment of the oscillator cores and antenna trimmers.

On the 950 to 1,560 kc push-button, the higher frequency stations may be received with L24 either in or out (oscillator frequency either 455 kc below or 455 kc above the station frequency). The adjustment with this core in its out position (oscillator frequency 455 kc above the station frequency) is the correct one.

Alignment Procedure

Test Oscillator.—For all alignment operations, keep the output as low as possible to avoid a.v.c. action.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the dial backing plate for quick reference during alignment.

Power Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

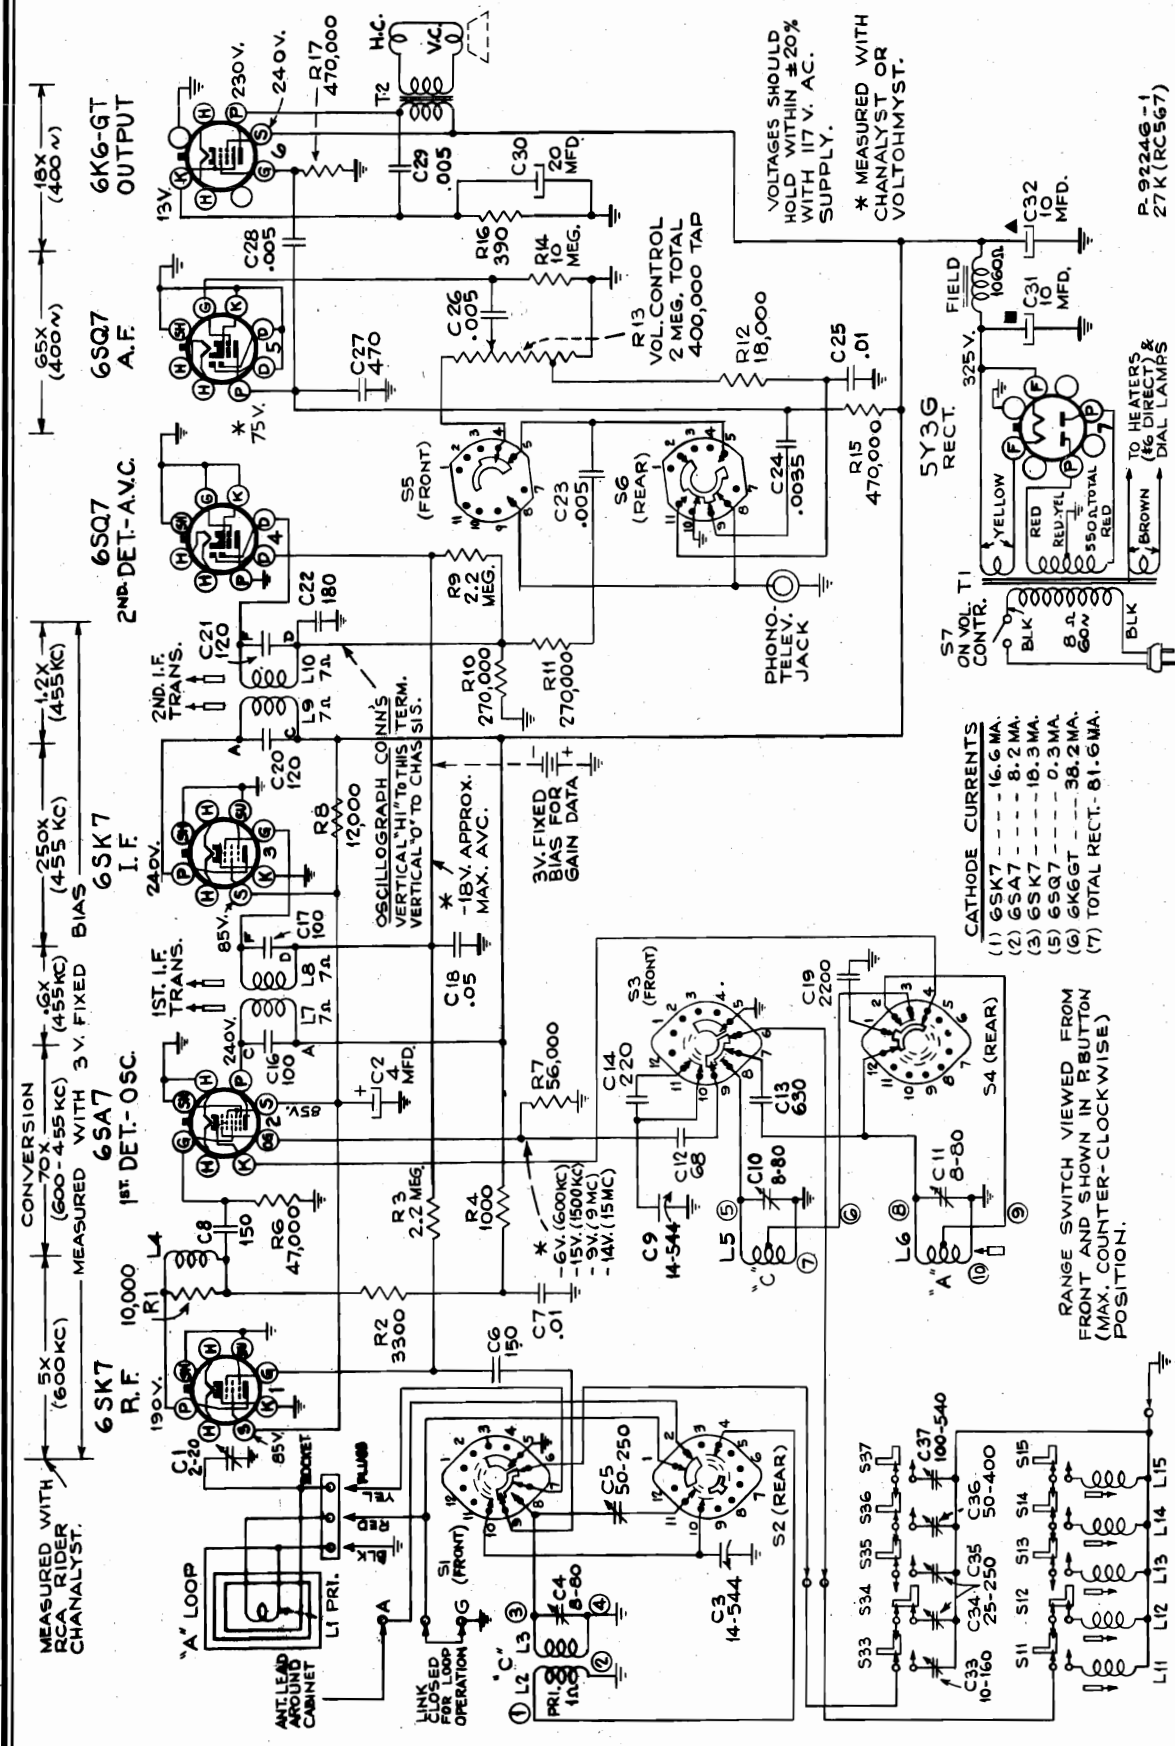

Steps	Connect high side of the test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	I.F. grid in series with 0.1 mfd.	455 kc	Quiet Point at 1,700 kc end of dial	C30, C31 2nd I-F trans.
2	1st det. grid in series with 0.1 mfd.			C-28, C-29 1st I-F trans.
3	R.F. grid in series with 0.1 mfd.			C-27** Wave trap
4	Ant. terminal in series with 47 mmf. (link open)	15 mc	15 mc "C" Band	C-24 (osc.)* C-22 (ant.)
5		9.5 mc	9.5 mc "C" Band	L-10 (osc.) L-5 (ant.)
6	Repeat steps 4 and 5.			
7	Ant. terminal in series with 220 mmf. (link open)	1,300 kc	1,300 kc "A" Band	C-25 (osc.) C-23 (ant.)
8		600 kc	600 kc "A" Band	C-26 (osc.)
9	Repeat steps 7 and 8.			

*Use minimum capacity peak if two peaks can be obtained.
**Adjust C-27 for minimum signal with 455 kc applied to R.F. grid.

Note.—Oscillator tracks 455 kc above signal on all bands.

FREQUENCY RANGES

Standard Broadcast..... 540-1,600 kc

Short Wave..... 9.4-15.4 mc

INTERMEDIATE FREQUENCY..... 455 kc

POWER OUTPUT RATING

Undistorted..... 2.5 watts

Maximum..... 4.5 watts

LOUDSPEAKER (RL-70-L6)

Type..... 12-inch Electrodynamic

V.C. Impedance..... 2.2 ohms at 400 cycles

POWER SUPPLY RATINGS

105-125 volts, 50-60 cycles, 90 watts

105-125 volts, 25-60 cycles, 90 watts

Universal, 40-60 cycles, 90 watts

Steps	Connect high side of test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output—
1	6SK7 I-F grid in series with 0.01 mfd.	455 kc	"A" Band Quiet Point between 650 and 750 kc	L-9 and L-10 (2nd I-F Trans.)
2	6SA7 grid in series with 0.01 mfd.			L-7 and L-8 (1st I-F Trans.)
3	Yellow loop lead in series with 200 mfd.	1,500 kc	"A" Band 1,500 kc (20°)	C-11 (osc.)
4		800 kc	"A" Band 800 kc (149.5°)	L-8 (osc.)
5	Antenna terminal in series with 47 mfd. (link open)	15.2 mc	"C" Band 15.2 mc (13.5°)	C-10 (osc.)* C-4 (ant.)
6		9.5 mc	"C" Band 9.5 mc (14.8°)	C-5 (ant.) (Rock gang)
7	Radiation loop consisting of two turns of wire 18 inches in diameter located 4 to 6 feet from receiver	1,500 kc	"A" Band 1,500 kc	C-1 (on loop)
8		800 kc	800 kc	L-6 (osc.) (Rock gang)
9		Repeat steps 7 and 8.		

*Use minimum capacity peak if two can be obtained.
 Note.—Oscillator tracks 455 kc above signal on all bands.

External Antenna.—For best reception on "C" band with an external antenna, peak the trimmer on "C" antenna coil for maximum output on a station in the 81-meter band.

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the schematic drawing.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment, therefore a calibration scale is attached to the indicator-drive-cord drum which is mounted on the shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The "90°" mark on the drum scale must be vertical, and directly under the center of the gang-condenser shaft when the plates are fully meshed. The drum is held to the shaft by plastic cement which must be tight when the drum is in the correct position.

To determine the corresponding frequency for any setting of the calibration scales, refer to the accompanying drawing which shows the dial with 0-180° calibration scales drawn at top and bottom.

Pointer for Calibration Scale.—Improve a pointer for the calibration scale by fastening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "180°" mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator at the 540 kc mark, and gang condenser fully meshed. The indicator has a spring clip for attachment to the cable.

Push Button Adjustment

The station push buttons connect to separate magnetic-core oscillator coils and separate antenna trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as RCA Stock No. 31031. Allow at least five minutes warm-up period before making adjustments.

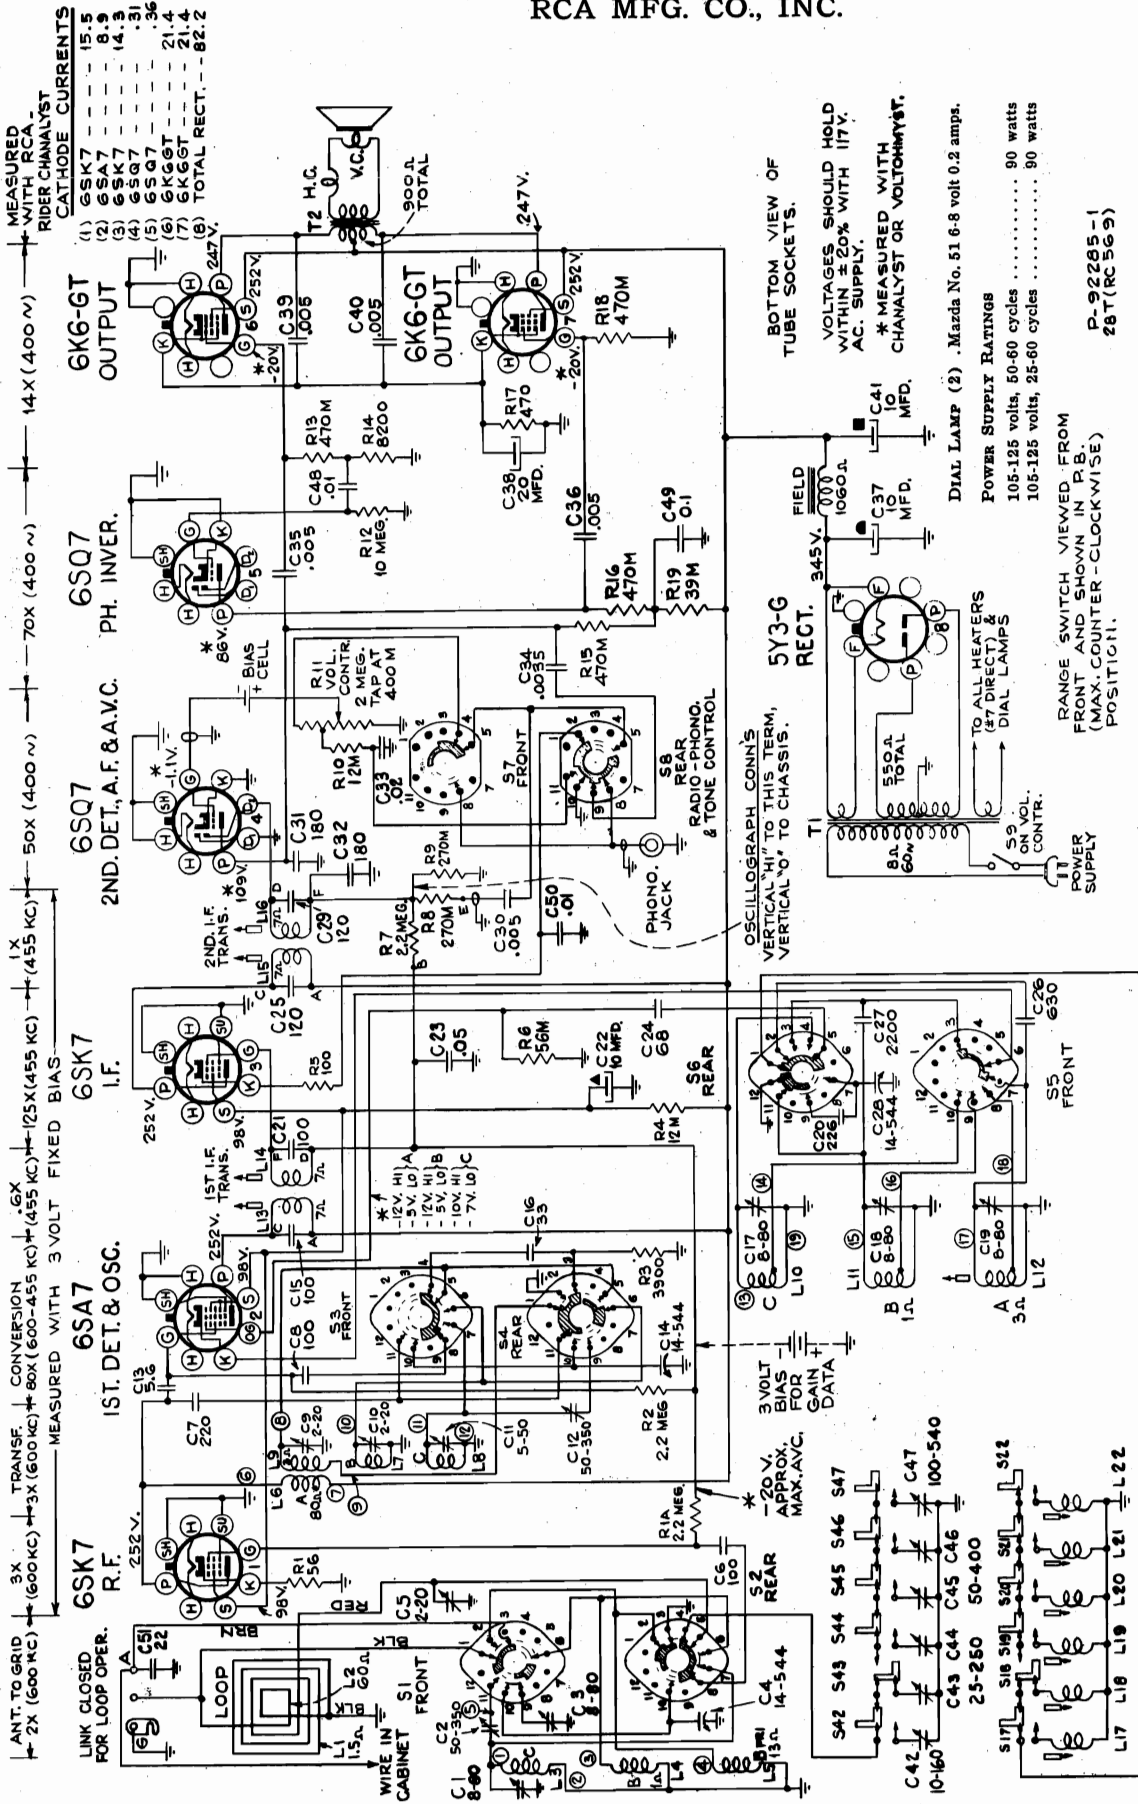

In the event that the receiver is to be used with an external antenna use one or two feet of wire (as an antenna) to ensure sharp peaking during the final adjustment procedure. For loop operation the link should be strapped across terminals on back of set. In either case the procedure is as follows:

1. Make a list of the desired stations, arranged in order from low to high frequencies.
2. Turn the range selector to "A" band, and manually tune in the first station on the list.
3. After turning range selector to "PB" position, push in station button No. 1 (extreme left). Then adjust the No. 1 oscillator core (L-1B) to receive the station.
4. After oscillator core is set correctly, adjust C-37 for maximum output.
 Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.
5. Adjust for each of the remaining stations in the same manner.
6. Make a final careful adjustment of the oscillator cores and antenna trimmers.

On the 880 to 1,600 kc push-button, the higher frequency stations may be received with L-11 either in or out (oscillator frequency either 455 kc above or 455 kc below the station frequency). The adjustment with this C-37 in "PB" position (oscillator frequency 455 kc above the station frequency) is the correct one.

PRECAUTIONARY LEAD DRESSING

1. Dress shielded lead from diode filter to tone control switch away from grid of the 6S07 a-f amplifier.
2. Dress shielded lead from grid of 6S07 a-f amplifier away from diode output system.
3. Power leads to rear of volume control should be dressed towards side apron.
4. Plate leads on output tubes should be dressed towards chassis.

MODEL 28T, Chas. RC-569

RCA MFG. CO., INC.

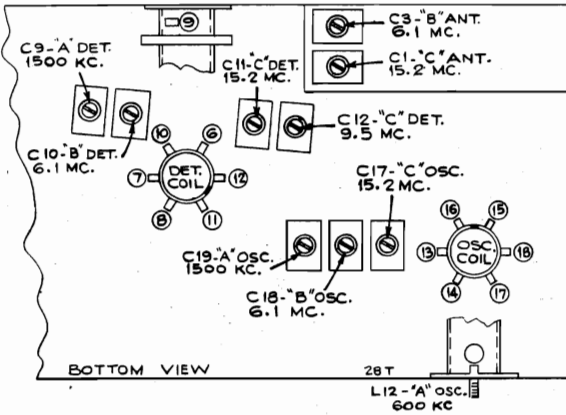

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Electronic Voltmeter.—The electronic voltmeter in the Chanalyst or VoltOhmyst provides an unexcelled output indicator. It should be connected to the AVC bus, and the test-oscillator output adjusted to produce several volts of AVC.

Calibration for Alignment.—The dial calibration for alignment purposes can be set up in two ways:

1. The dial may be very easily removed from the cabinet. The condenser plates should then be turned into full mesh, the pointer adjusted to the scratch at the left end of the dial backing plate, and the dial placed on the frame so that its extreme left calibration mark coincides with the pointer. The dial may be held in place with scotch tape. In this manner the actual receiver dial is used for alignment. When alignment is finished, the scale should be replaced.
2. A calibration scale is attached to the tuning drum. The correct setting of the gang, in degrees, for each alignment frequency is given in the alignment table. Check the position of the drum, making sure that the 0 degree scale mark is horizontal with the gang in full mesh.

Pointer for Calibration Scale.—If method (2) is used, improvise a pointer for the calibration scale by fastening a piece of wire to the chassis, and bend the wire so that it points to the 0 degree mark on the calibration scale when the plates are fully meshed.

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

External Antenna.—For best reception on "C" band with an outside antenna, adjust C2 for peak output on a station in the 31-meter band.

Steps	Connect the high side of the test-osc. to—	Tune test osc. to—	Turn radio dial to—	Adj. the following for max. peak output
1	I-F Grid in series with .01 mfd.	455 kc	"A" Band Quiet Point between 550-750 kc	L-15 and L-16 2nd I-F Trans.
2	Det. Grid in series with .01 mfd.			L-13 and L-14 1st I-F Trans.
3	Ant. terminal in series with 200 mmfd. (link open)	1,500 kc	1500 kc (160°) "A" Band	C-19 (osc.) C-9 (Det.) C-5 (on loop)

FREQUENCY RANGES

Standard Broadcast..... 535-1,720 kc
 Short Wave..... 8.7-15.6 mc
 Intermediate Frequency..... 455 kc

Thermal relay cuts in the dial lamps after the set warms up.— This set incorporates a thermal relay to control the dial lamps. When the set is "off," the relay contacts are closed. This shorts out the two lamps. When the set is turned "on," the heater current flows through the relay element R24. This heats up and causes the relay contacts to open, permitting the heater current to flow through the two dial lamps and light them. In normal operation, the lamps light about a half-minute after the set is turned on.

Overall Chassis Height.....			9 1/2

Alignment Procedure

Output Meter Alignment.—Connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—Connect the low side of the test-oscillator to the receiver chassis, through a .01 mfd. capacitor, and keep the output as low as possible.

Antenna.—The set is equipped with a built-in loop antenna. If an outdoor antenna is used, it may be connected to the "ANT." terminal on rear of cabinet. It should not be longer than 100 feet, including lead-in. If it is longer, connect a 100 to 200 mmf. capacitor in series with the lead-in.

Power-Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Phono Attachment.—A jack is provided on the rear of cabinet for connecting a Phono Attachment into the audio-amplifying circuit. The cable from the Phono Attachment should be terminated in a Stock No. 31048 plug to fit the jack.

Dial Pointer Adjustment.—The dial pointer should be set at the left hand end dial marks, with the gang in full mesh.

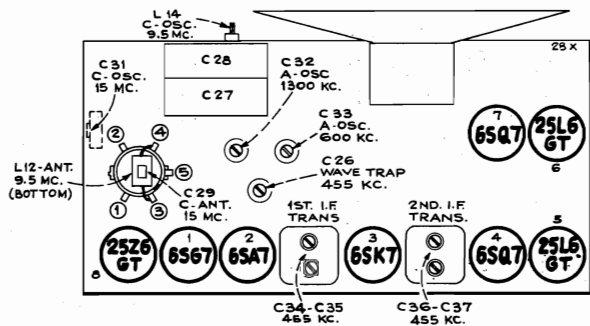

Steps	Connect the high side of test osc. to—	Tune test osc. to—	Range Switch to—	Turn radio dial to—	Adjust the following for max. peak output
1	I-F grid in series with .01 mfd.	455 kc	A	Quiet Point near middle of dial	C36, C37 2nd I.F. Trans.
2	Det. grid in series with .01 mfd.				C34, C35 1st I.F. Trans.
3	Ant. lead in series with 50 mmfd.	15 mc	C	15 mc	C-31 (osc.)* C-29 (ant.)
4		9.5 mc	C	9.5 mc	L14 (osc.) L12 (ant.)
Repeat steps 3 and 4.					
5	Antenna terminal in series with 200 mmfd.	1,300 kc	A	1,300 kc	C-32 (osc.) C-30 (ant.)
6		600 kc	A	600 kc	C-33 Rock in
7		Repeat steps 5 and 6.			
8	R-F grid in series with .01 mfd.	455 kc	A	low end of dial	C-26**

*Oscillator should track on high frequency side of signal. If two peaks are obtained use high frequency (minimum capacity peak).

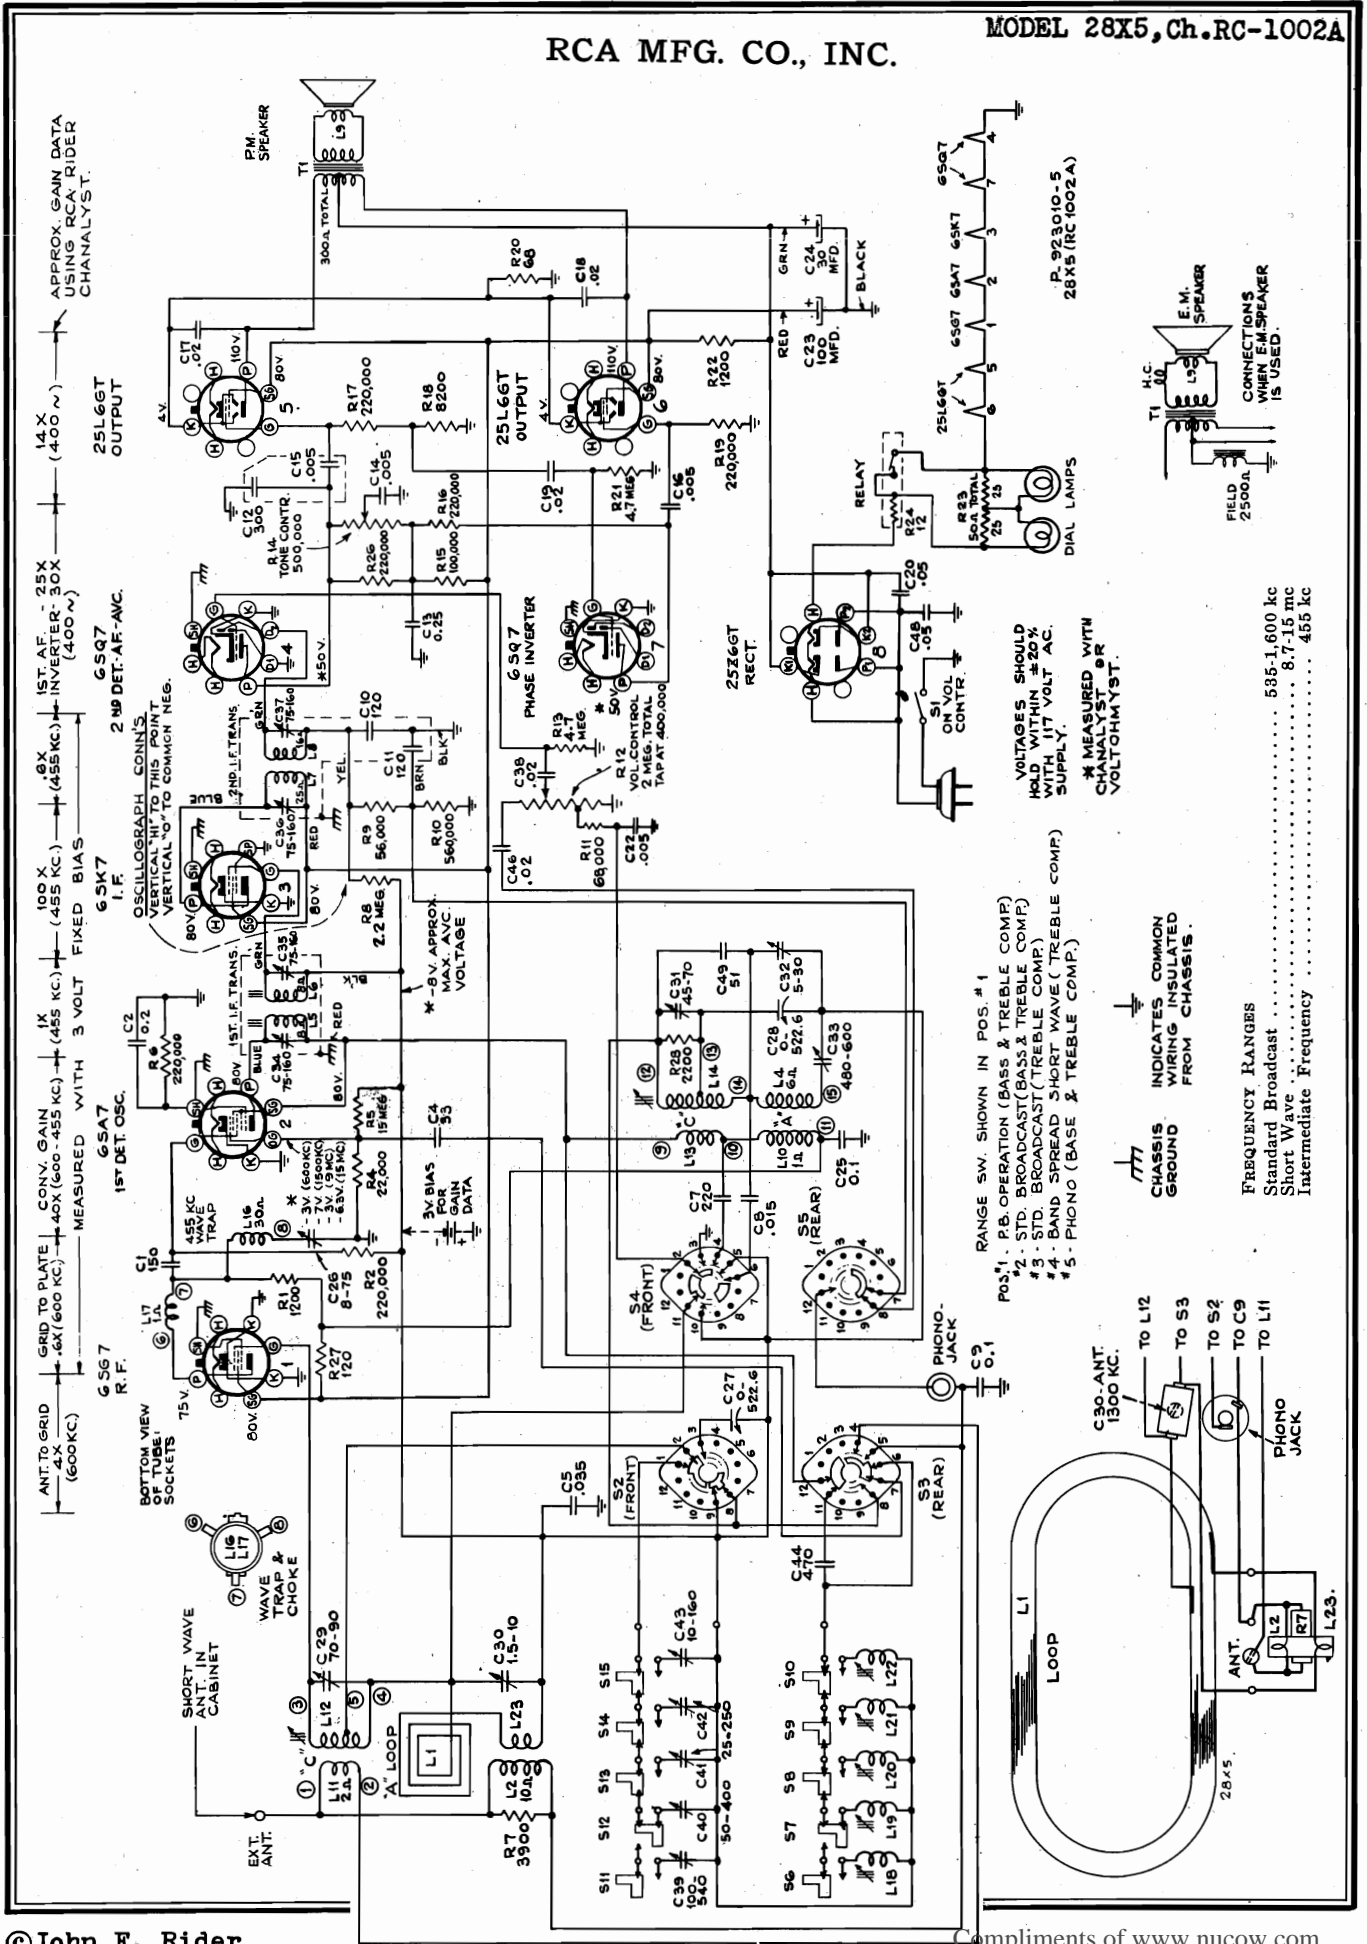

**Feed a high signal level of 455 kc into R.F. grid and adjust C-26 for minimum signal.

Critical Lead Dress

1. Dress all AC filament and power wiring down close to chassis and as far as possible from all audio grid or plate wiring.
2. Dress all leads or parts as far as possible away from oscillator coil.
3. Dress audio coupling capacitor C38 from volume control to grid of 6SQ7 away from filament wire connecting No. 8 pin socket 5 and No. 8 pin socket 7.
4. Dress lead from trimmer condenser on loop to S.W. ant. coil between rectifier and R.F. tube and away from other coil leads.
5. Dress I-F plate and grid leads back into shield can to keep exposed length as short as possible.

Thermal relay cuts in the dial lamps after the set warms up.— This set incorporates a thermal relay to control the dial lamps. When the set is "off," the relay contacts are closed. This shorts out the two lamps. When the set is turned "on," the heater current flows through the relay element R24. This heats up and causes the relay contacts to open, permitting the heater current to flow through the two dial lamps and light them. In normal operation, the lamps light about a half-minute after the set is turned on.

Push Button Adjustment

The station push buttons connect to separate magnetite-core oscillator coils and separate antenna trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as RCA Stock No. 31031. Allow at least five minutes warm-up period before making adjustments.

In the event that the receiver is to be used with an external antenna use one or two feet of wire (as an antenna) to ensure sharp peaking during the final adjustment procedure.

1. Make a list of the desired stations, arranged in order from low to high frequencies.

2. Turn the range selector to "A" band, and manually tune in the first station on the list.
3. After turning range selector to "PB" position, push in station button No. 1 (extreme left). Then adjust the No. 1 oscillator core to receive the station. It may be necessary to maintain approximate tracking between antenna and oscillator to receive weak stations.
4. After oscillator core is adjusted properly, adjust antenna trimmer No. 1 for maximum output.
 Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.
5. Adjust for each of the five remaining stations in the same manner.
6. Make a final careful adjustment of the oscillator cores and antenna trimmers.

On push-button No. 5, the higher frequency stations may be obtained with the oscillator core No. 5 either in or out. (Oscillator frequency either 455 kc below or above the signal.) The out position should be used so the oscillator is 455 kc above the signal.

Alignment Procedure

Output Meter Alignment.—Connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—Connect the low side of the test-oscillator to the receiver chassis, through a .01 mfd., capacitor, and keep the output as low as possible.

Antenna.—The set is equipped with a built-in loop antenna. If an outdoor antenna is used, it may be connected to the "ANT" terminal on rear of cabinet. It should not be longer than 100 feet, including lead-in. If it is longer, connect a 100 to 200 mmf. capacitor in series with the lead-in.

Power-Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Phono Attachment.—A jack is provided on the rear of cabinet for connecting a Phono Attachment into the audio-amplifying circuit. The cable from the Phono Attachment should be terminated in a Stock No. 31048 plug to fit the jack.

Dial Pointer Adjustment.—The dial pointer should be set at the left-hand end dial marks, with the gang in full mesh.

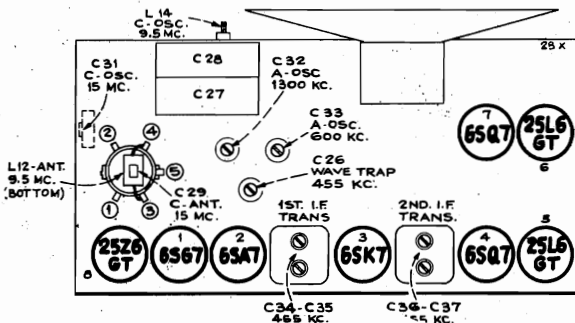

Steps	Connect the high side of test osc. to—	Tune test. osc. to—	Range Switch to—	Turn radio dial to—	Adjust the following for max. peak output
1	I-F grid in series with .01 mfd.	455 kc	A	Quiet Point near middle of dial	C36, C37 2nd I-F trans.
2	Det. grid in series with .01 mfd.				C34, C35 1st I-F trans.
3	Ant. lead in series with 50 mmfd.	15 mc	C	15 mc	C31 (osc.)* C-29 (ant.)
4		9.5 mc	C	9.5 mc	L-14 (osc.) L-12 (ant.)
Repeat steps 3 and 4.					
5	Antenna terminal in series with 200 mmfd.	1,300 kc	A	1,300 kc	C-32 (osc.) C-30 (ant.)
6		600 kc	A	600 kc	C-33 Rock in
7		Repeat steps 5 and 6.			
8	R-F grid in series with .01 mfd.	455 kc	A	low end of dial	C-26**

*Oscillator should track on high frequency side of signal. If two peaks are obtained use high frequency (minimum capacity peak).

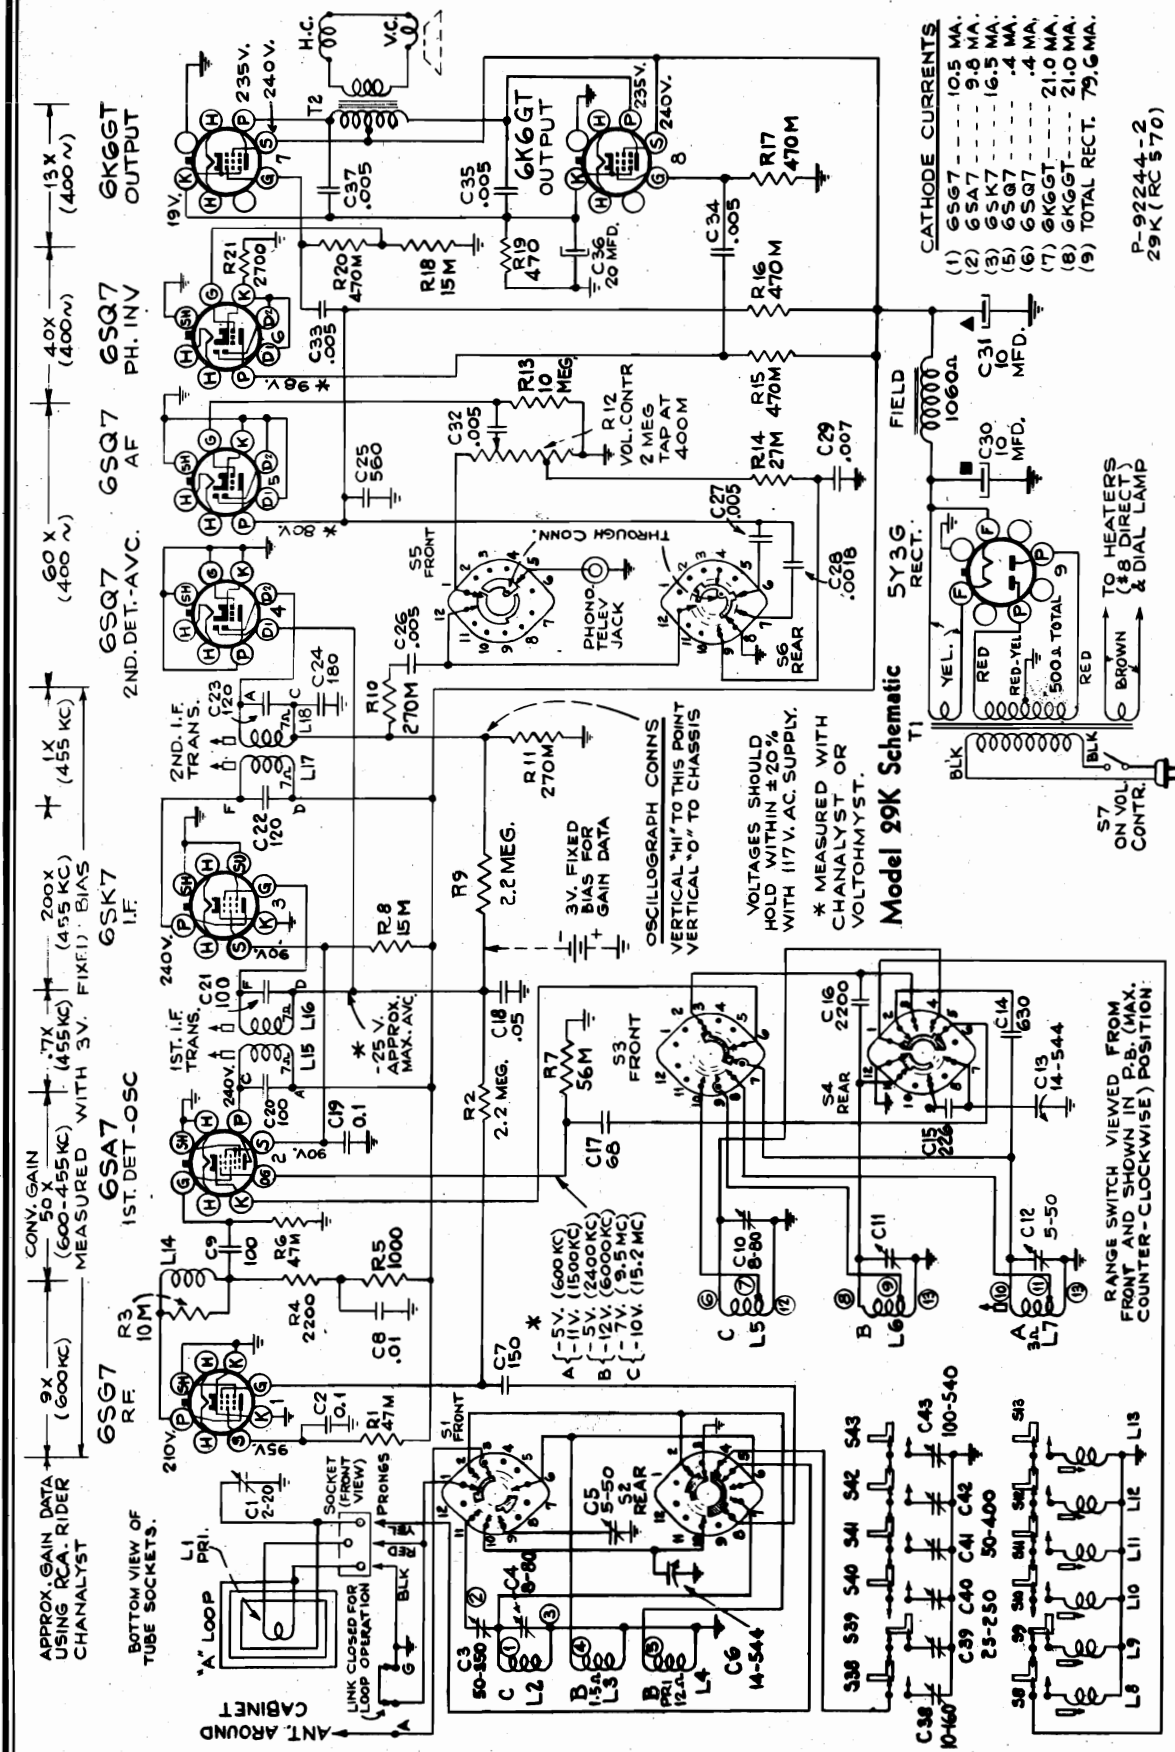

**Feed a high signal level of 455 kc into R.F. grid and adjust C-26 for minimum signal.

Critical Lead Dress

1. Dress all AC filament and power wiring down close to chassis and as far as possible from all audio grid or plate wiring.
2. Dress all leads or parts as far as possible away from oscillator coil.
3. Dress audio coupling capacitor C38 from volume control to grid of 6SQ7 away from filament wire connecting No. 8 pin socket 5 and No. 8 pin socket 7.
4. Dress lead from trimmer condenser on loop to S.W. ant. coil between rectifier and R.F. tube and away from other coil leads.
5. Dress I-F plate and grid leads back into the shield can to keep exposed length as short as possible.

POWER SUPPLY RATINGS

Rating A..... 105-125 volts, 50-60 cycles, 100 watts
Rating B..... 105-125 volts, 25-60 cycles, 100 watts

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment, therefore a calibration scale is attached to the indicator-drive-cord drum which is mounted on the shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in R.F. alignment, check the position of the drum. The 135° mark on the drum scale must be vertical, and directly over the center of the gang-condenser shaft when the plates are in minimum capacity position. The drum is held to the shaft by means of plastic cement which must be securely fastened when the drum is in the correct position.

To determine the corresponding frequency for any setting of the calibration scales, refer to the accompanying drawing which shows the dial with 0-180° calibration scales drawn at top and bottom.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "0" mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator at the 540 kc mark, and gang condenser fully meshed. The indicator has a spring clip for attachment to the cable.

LOUDSPEAKERS

(RL 70J-1)

(RL 81B-6)

Models..... 29K and 29K2 29K2
Type..... 12-inch electrodynamic .. 5-inch Perm. Magnet

7		9,500 kc					32°
8	Repeat steps 6 and 7.						
9	Fasten chassis in cabinet, see that link is closed on antenna terminal board, indicator at left end of dial scales with gang at maximum capacity.						
10	A radiation loop consisting of two turns of wire 18 inches in diameter located 4 to 6 feet from receiver	1,500 kc	"A"	1,500 kc signal	C-1 (ant.) on loop		
11		600 kc		600 kc	L-7 (osc.) (Rock Gang)		
12	Repeat steps 10 and 11.						

*Use minimum capacity peak if two peaks can be obtained.
Note: Oscillator tracks above signal on all bands.

External Antenna.—When using an External Antenna, Peak C3 for max. output on a station in the 31-meter band.

Model 29K2 Speaker Connections

Phasing Speakers in 29K2

For correct tone, it is ESSENTIAL that the two speakers operate "in phase," so that the two cones move in and out together.

It is necessary to check the phasing whenever a new speaker, cone, field coil, or output transformer is installed, or whenever the speaker connections are altered in any way.

The recommended procedure is as follows:

1. Hook up a "phase checker," using headphones or PM speaker units as shown. Connect the checker to an audio amplifier that has an output meter. (The audio channel in the Chanalyst is excellent for this purpose.)
2. Feed a 400-cycle modulated signal into the receiver. Turn volume up to medium. Hold both units of the checker in front of the large speaker in set. Throw the toggle switch to each position and note which position gives maximum output on meter. Mark this position of the switch "in phase." Mark the other position "out of phase."
3. Place one unit of the phase checker in front of each speaker in the set. Throw the toggle switch to each position and leave it at the position that gives greatest output on the meter. Note the switch marking for this position. If it says "in phase," the set speakers are correctly phased. If it says "out of phase," reverse the leads to the voice-coil terminals of the small speaker in the receiver.

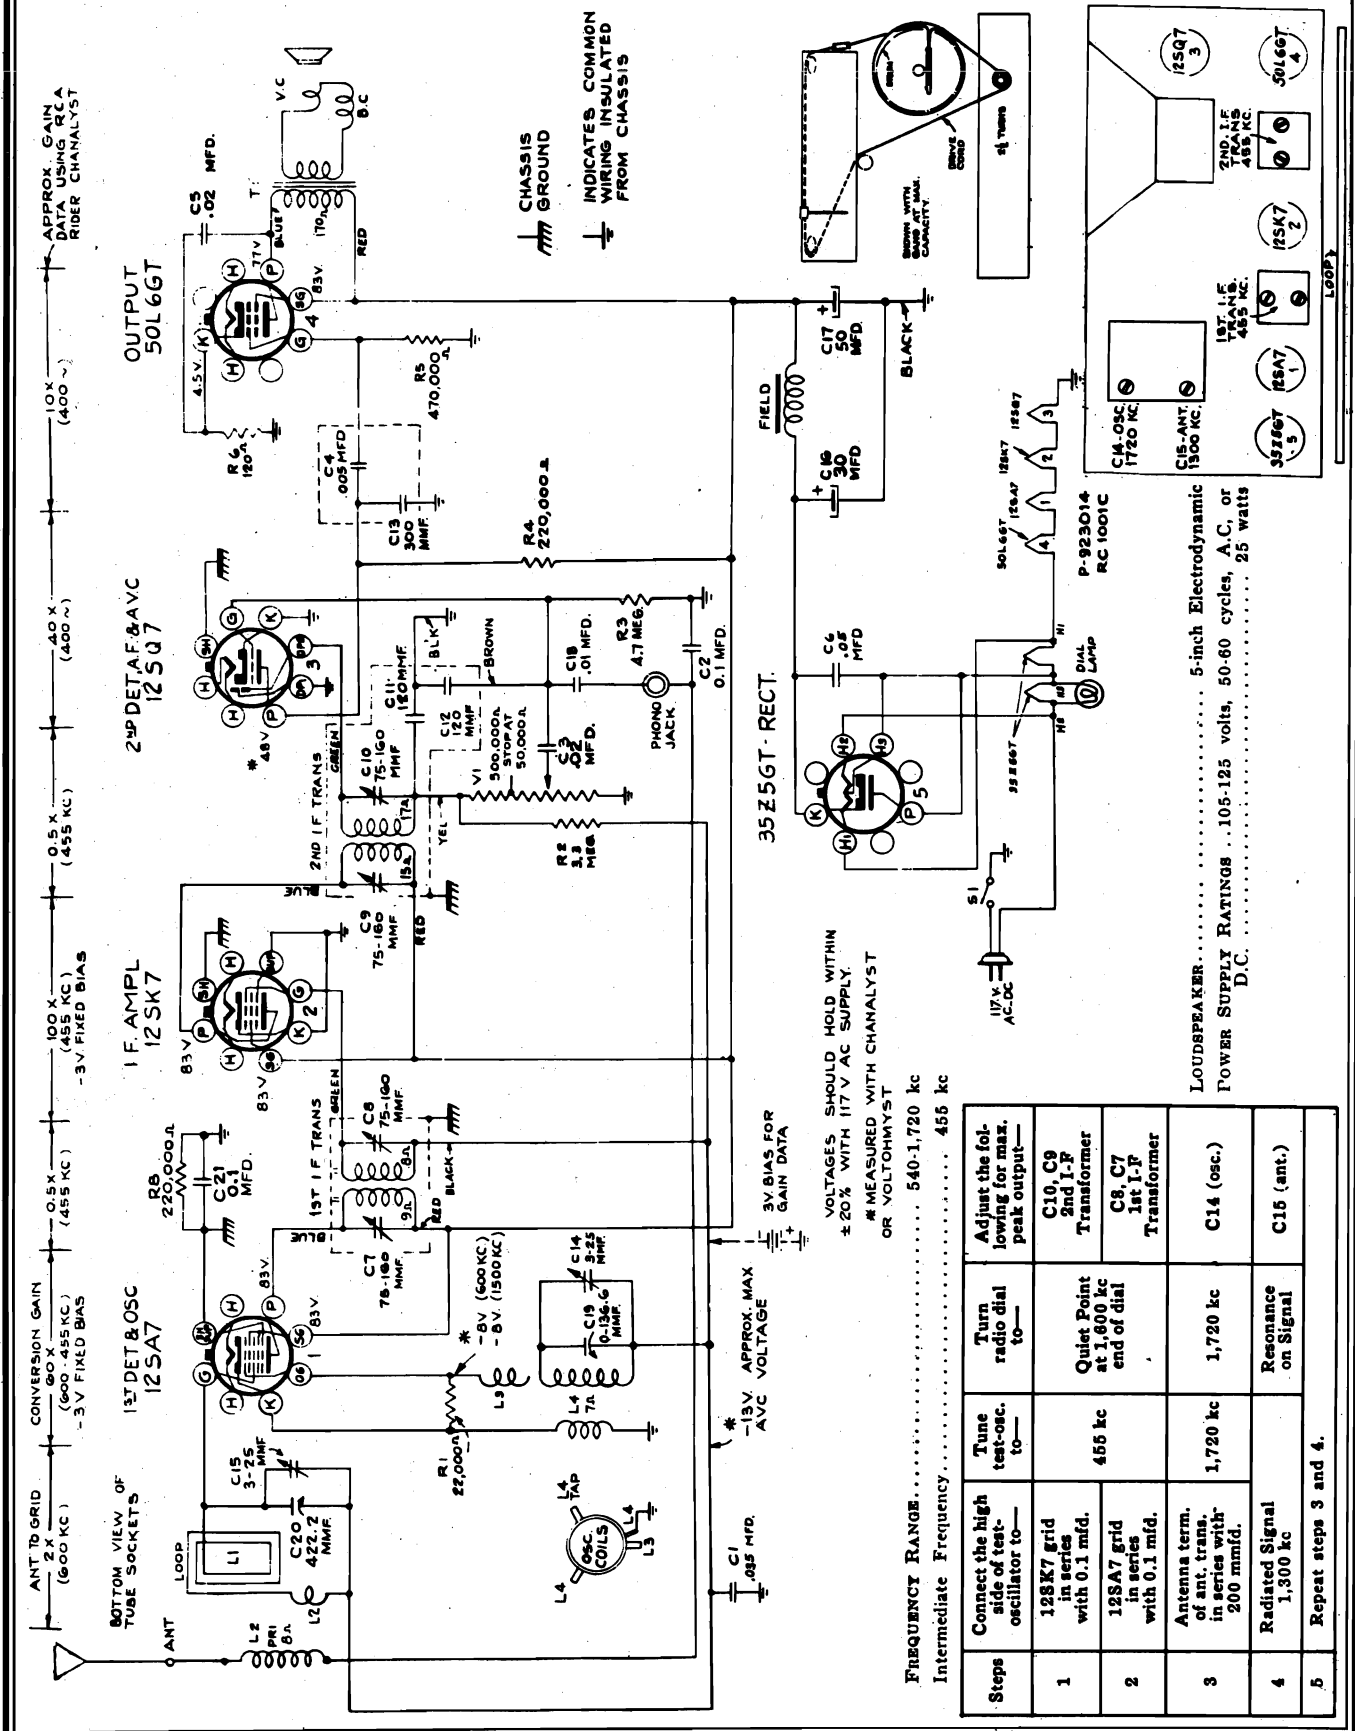

"Phase Checker," using Headphones.

"Phase Checker," using small PM speakers.

RCA MFG. CO., INC.

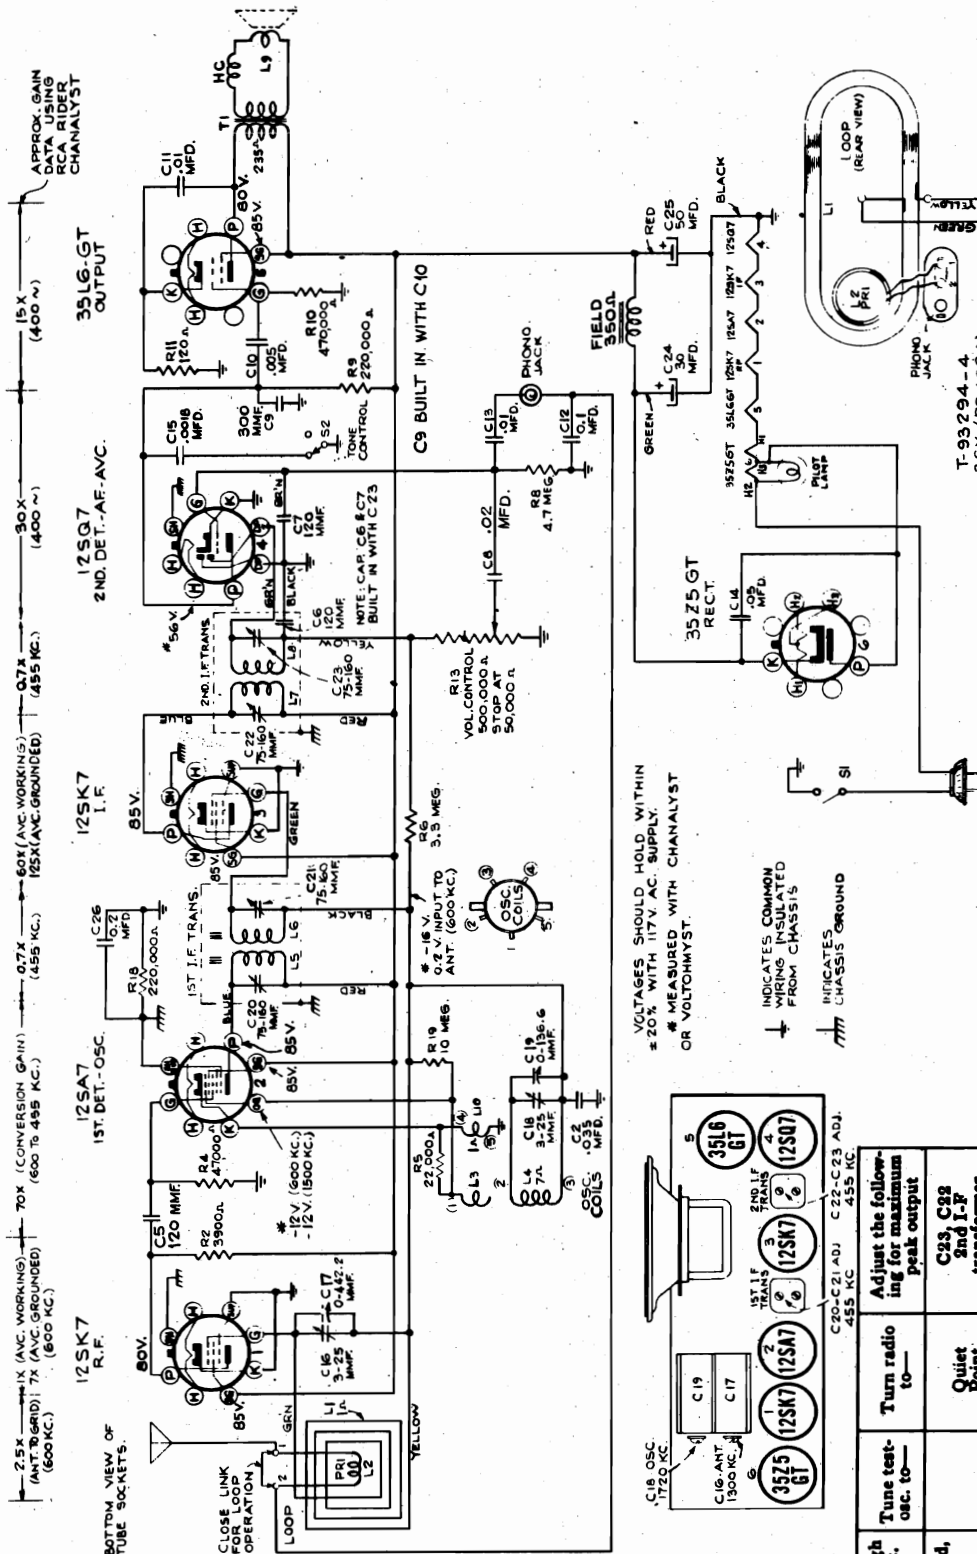

FREQUENCY RANGE..... 540-1,720 kc
Intermediate Frequency..... 455 kc

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output—
1	12SK7 grid in series with 0.1 mfd.	455 kc	Quiet Point at 1,600 kc end of dial	C10, C9 2nd I-F Transformer
2	12SA7 grid in series with 0.1 mfd.	1,720 kc	1,720 kc	C8, C7 1st I-F Transformer
3	Antenna term. of ant. trans. in series with 200 mmfd.	1,720 kc	1,720 kc	C14 (osc.)
4	Radiated Signal 1,300 kc	Resonance on Signal		C15 (ant.)
5	Repeat steps 3 and 4.			

LOUDSPEAKER..... 5-inch Electrodynamic
POWER SUPPLY RATINGS... 105-125 volts, 50-60 cycles, A.C. or D.C. 25 watts

MODEL 36X, Ch. RC-462A

RCA MFG. CO., INC.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, keep the output as low as possible to avoid a-v-o action.

Precautionary Lead Dress:

- .01 mfd. capacitor from output plate to cathode to be dressed as far as possible away from .015 mfd. 1st audio grid condenser and volume control terminals to eliminate audio howl.
- Filament lead to pin No. 7 on 35L6-GT socket to be dressed away from 1st audio grid.
- Dress B+ lead on 12SK7 I.F. socket across bottom of socket between grid and plate contacts to aid reduction of grid plate capacitance.
- Dress excess lead lengths of I.F. transformer, grid and plate leads into cans to aid shielding.
- Dress filament leads of 35L6-GT around 12SQ7 socket and into chassis corner to reduce hum.

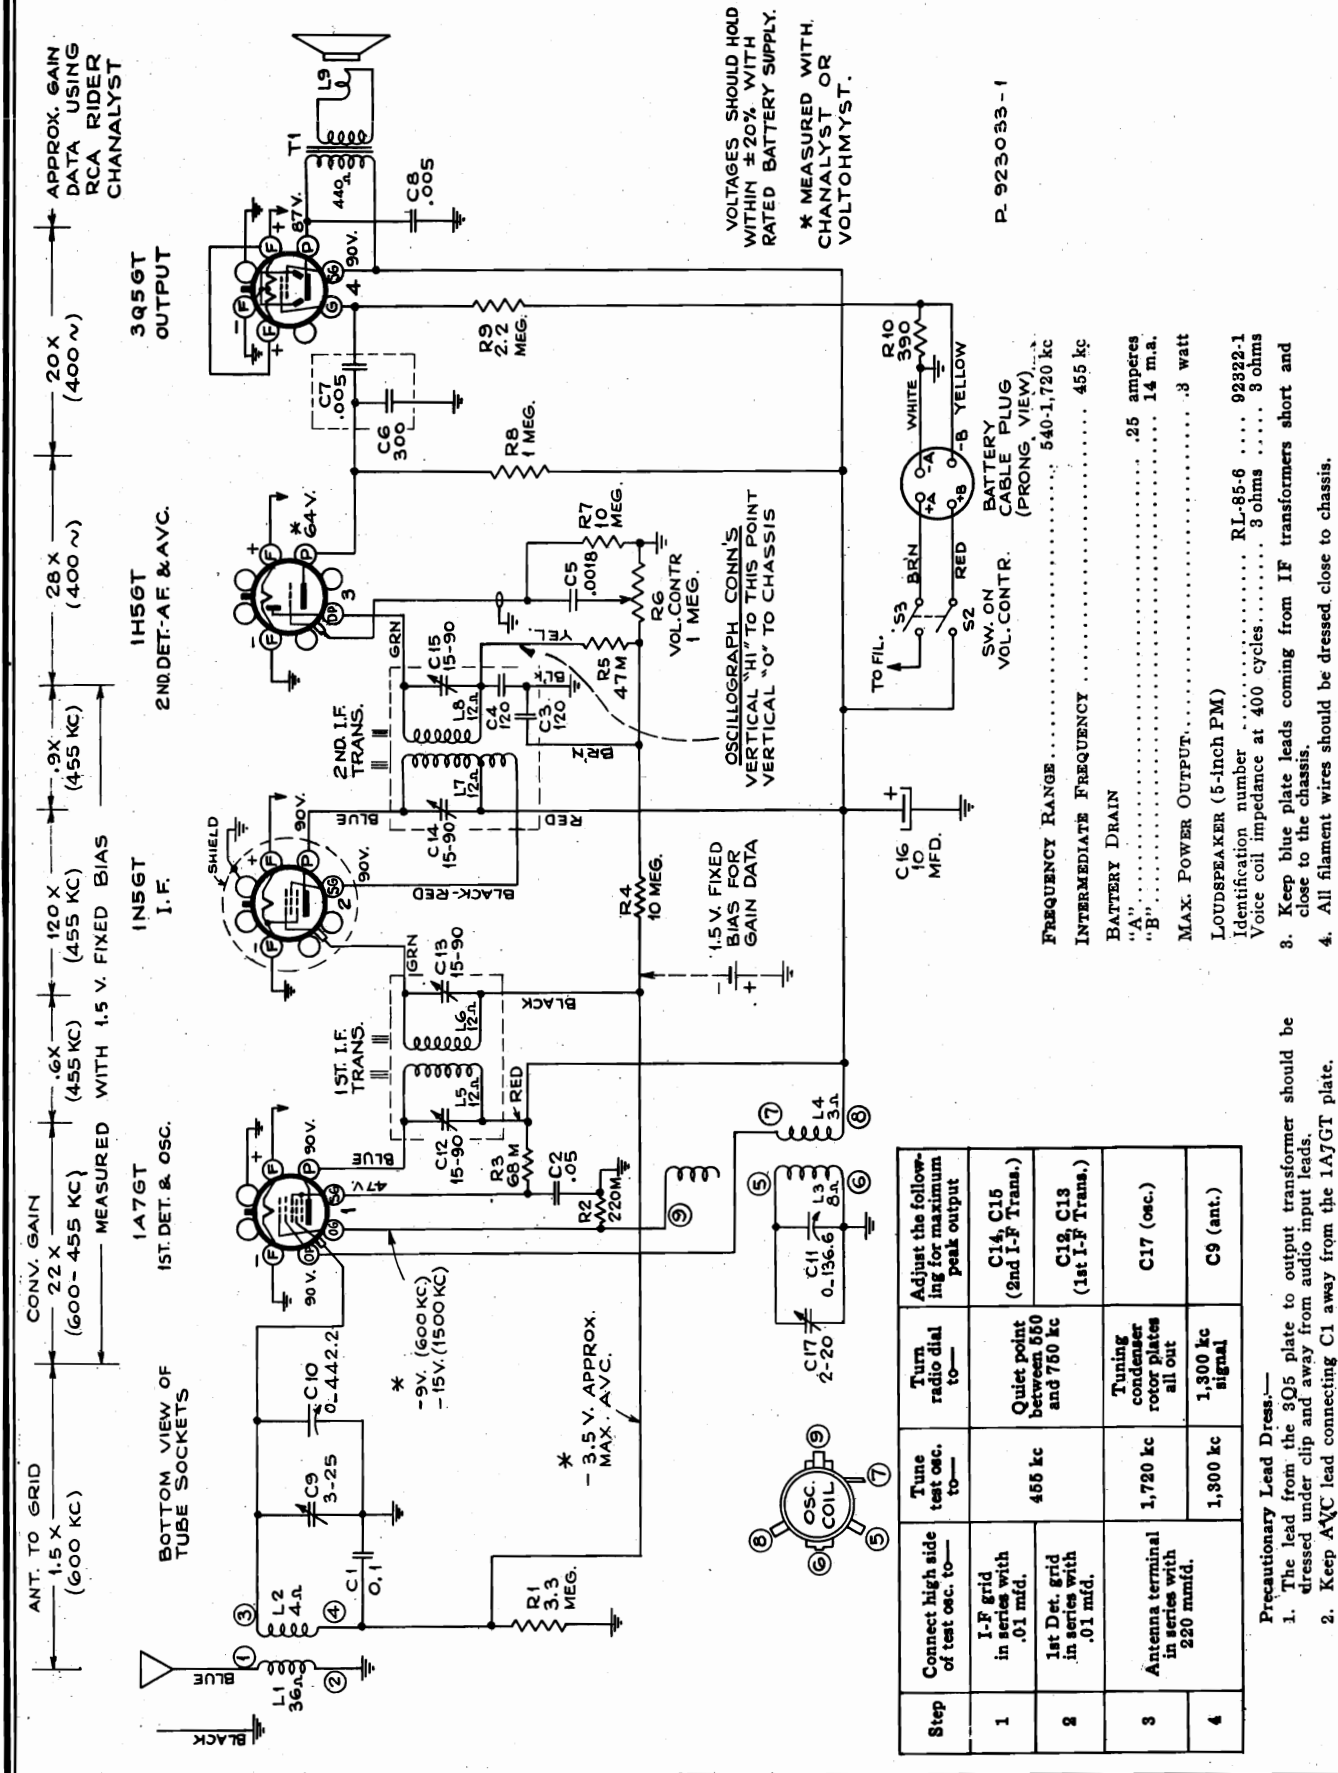

POWER SUPPLY TESTING
 105-125 volts, AC, 50 or 60 cycles, or DC..... 30 watts

PILOT LAMP Mazda No. 51, 6-8 volts, 0.2 amp.

Steps	Connect the high side of test-osc. to—	Tune test-osc. to—	Turn radio to—	Adjust the following for maximum peak output
1	12SK7 I-F grid, in series with 0.1 mfd.	455 kc	Quiet Point at 1,700 kc end of dial	C23, C23 2nd I-F transformer
2	12SA7 1st det. grid, in series with 0.1 mfd.	1,720 kc	Signal frequency	C21, C20 1st I-F transformer
3	12SK7 R-F grid, in series with 0.1 mfd.	1,720 kc		C18 (osc.)
4	Radiated signal	1,300 kc		C16 (ant.)
5	Repeat steps 3 and 4			

RCA MFG. CO., INC.

MODEL B-50, Ch. RC-1004H

VOLTAGES SHOULD HOLD WITHIN ±20% WITH RATED BATTERY SUPPLY.
* MEASURED WITH CHANALYST OR VOLTOHMYST.

P. 923033-1

Step	Connect high side of test osc. to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	I-F grid in series with .01 mfd.	455 kc	Quiet point between 550 and 750 kc	C14, C15 (2nd I-F Trans.)
2	1st Det. grid in series with .01 mfd.	1,720 kc	Tuning condenser rotor plates all out	C19, C18 (1st I-F Trans.)
3	Antenna terminal in series with 220 mmfd.	1,300 kc	1,300 kc signal	C17 (osc.)
4				C9 (ant.)

- Precautionary Lead Dress—
- The lead from the 3Q5 plate to output transformer should be dressed under clip and away from audio input leads.
 - Keep AVC lead connecting C1 away from the 1A7GT plate.

MODEL B-52, Ch. RC-1004D

RCA MFG. CO., INC.

BATTERY DRAIN

- "A" 3 amperes
- "B" 10 m.a. (Switch at "Battery Saver" position)
- "B" 14 m.a. (Switch at "Maximum Output" position)

POWER CONSUMPTION

With CV-42 Conversion Unit 22.5 watts

LOUDSPEAKER (5-inch PM) RL-85-6 92322-1
 Voice coil impedance at 400 cycles 3 ohms 3 ohms

CAUTION: Turn power switch off (counter-clockwise) when installing or replacing tubes or batteries.

DO NOT TURN THE "BATTERY-ELECTRIC" SWITCH TO ELECTRIC POSITION WHILE THE RECEIVER IS CONNECTED TO BATTERIES.

Step	Connect high side of test osc. to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	I-F grid in series with .01 mfd.	455 kc	Quiet point between 550 and 750 kc	C14, C15 (2nd I-F Trans.)
2	1st Det. grid in series with .01 mfd.			C12, C13 (1st I-F Trans.)
3		1,720 kc	Tuning condenser rotor plates all out	C17 (osc.)
4	Antenna terminal in series with 200 mmfd.	1,300 kc	1,300 kc signal	C9 (ant.)
5		455 kc	Quiet point between 550 and 750 kc	Adjust C22 for minimum output on strong 455 kc signal

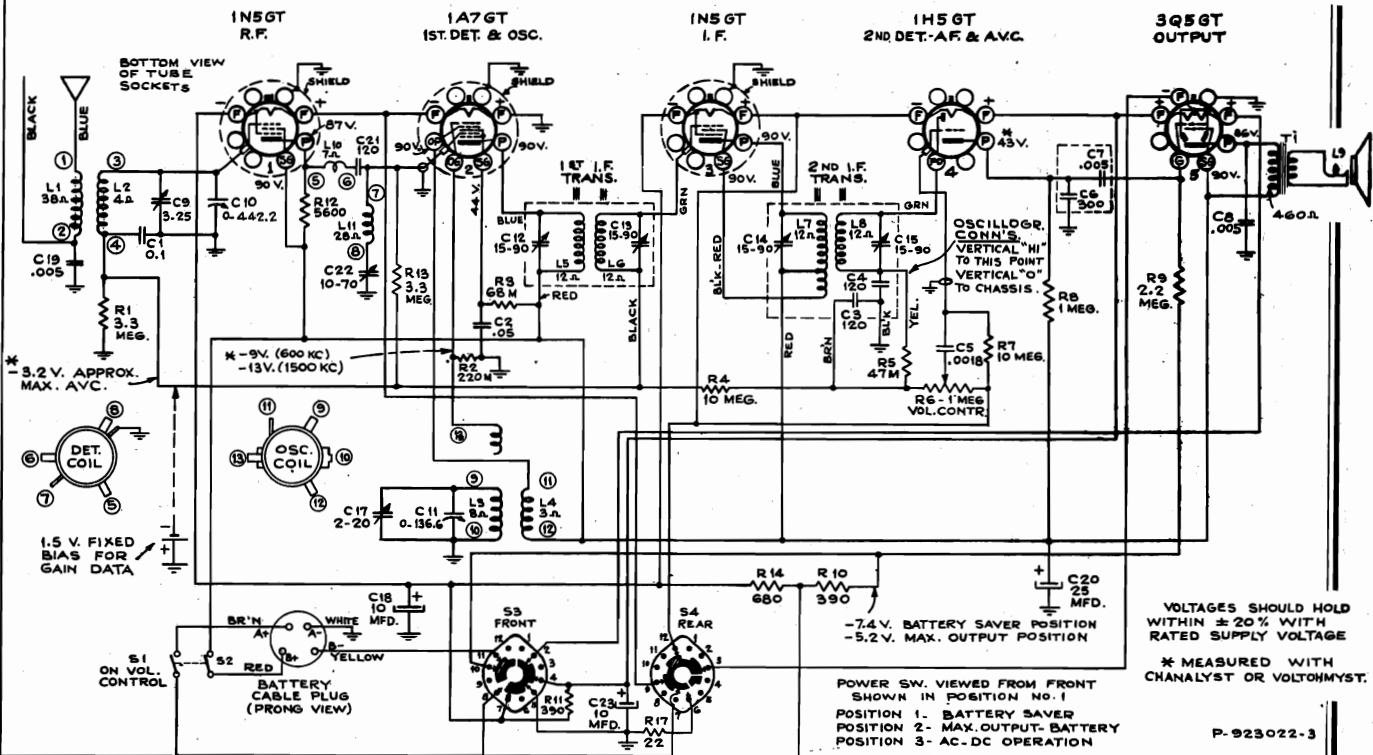

Precautionary Lead Dress.—

1. The lead from the 3Q5 plate to output transformer should be dressed under clip and away from audio input leads.
2. All filament wires should be dressed close to chassis.
3. Keep AVC lead connecting C1 to antenna coil away from the 1A7GT plate.
4. Keep blue plate leads coming from I.F. transformers short and close to chassis.
5. Keep yellow leads connecting to oscillator coil away from trap coil.
6. Keep grid lead of 1N5GT RF tube away from 1A7GT grid.

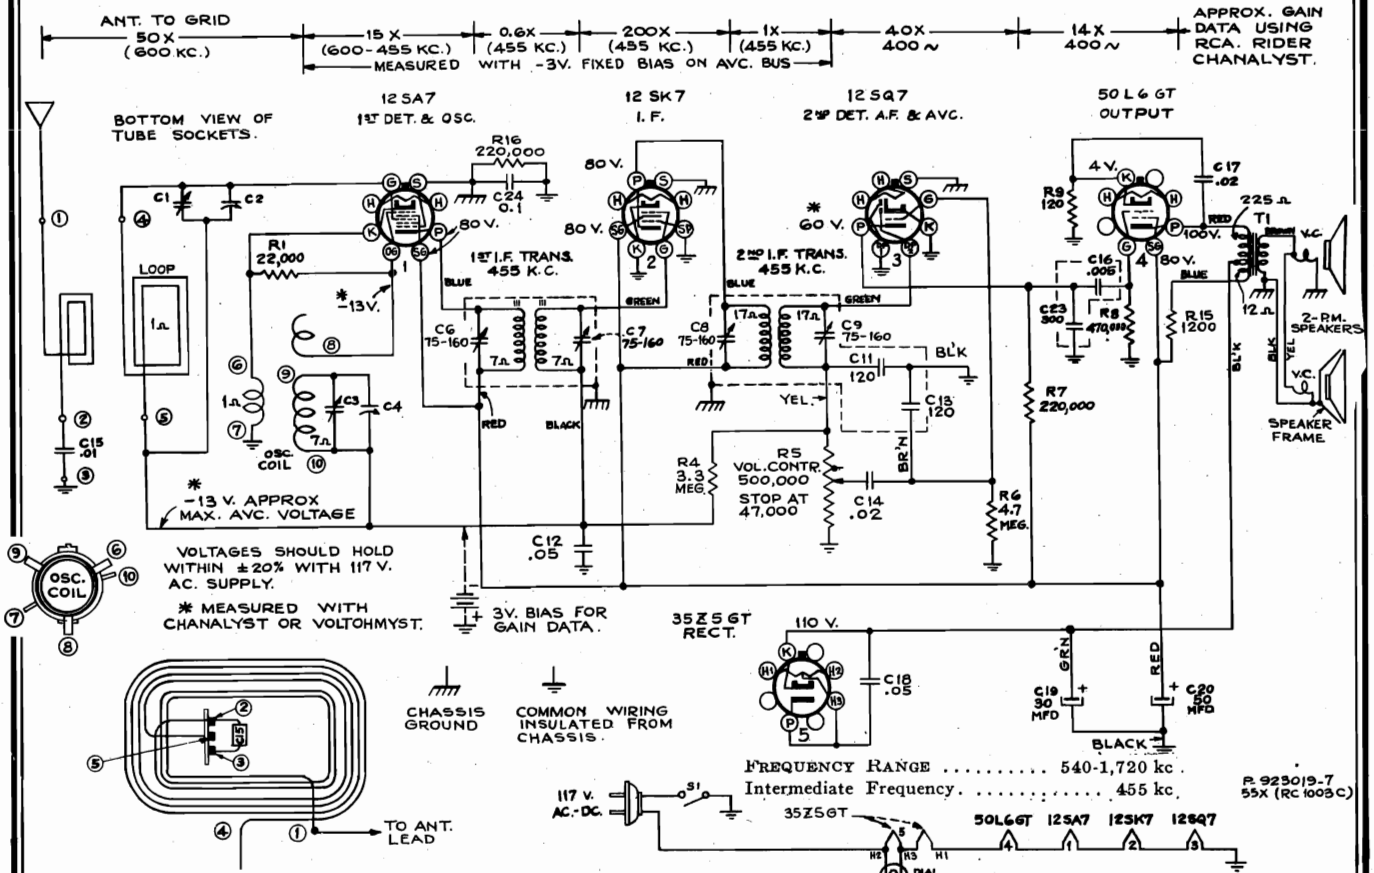

POWER SUPPLY

1 "A" - "B" 1 1/2-90 volt pack.

Model B-52 can be operated on 105-125 volts AC, 50-60 cycles, or 105-125 volts DC, by means of CV-42 Conversion Unit.

RCA MFG. CO., INC.

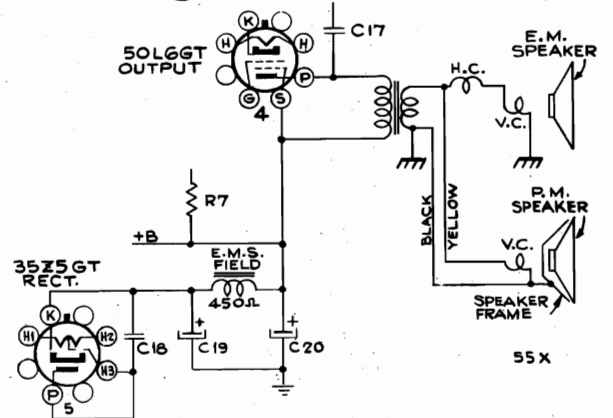

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	I-F grid, in series with .01 mfd.	455 kc	Quiet point 1,600 kc end of dial	C8, C9 2nd I-F Transformer
2	1st Det. grid in series with .01 mfd.			C6, C7 1st I-F Transformer
3	Ant. terminal in series with 100 mmfd.	1,720 kc	Gang at minimum	C3 (osc.)
4	Radiated signal 1300 kc		Signal Frequency	C1 (ant.)
5	Repeat steps 3 and 4.			

Phasing Speakers in Model 55X.—

For correct sound quality, it is ESSENTIAL that the cones of the two loudspeakers move in and out together.

To check the phasing, connect a 1½-volt dry cell across the secondary of the output transformer and observe, by sight or feel, whether the two cones move in the same direction. If one moves in while the other moves out, reverse the external connections to the voice coil of the permanent-magnet speaker.

Above—Circuit of Model 55X Using one "PM" and one "EM" Speaker.

POWER SUPPLY RATINGS

105-125 volts, direct current, or 50-60 cycles..... 80 watts
POWER OUTPUT (125 volts, 60 cycle supply)
Undistorted..... 0.8 watts Maximum..... 1.2 watts

LOUDSPEAKERS

RL-86-A3 5-inch "EM," 4-ohm voice coil
RL-81-B2 5-inch "PM," 4-ohm voice coil

Test-Oscillator.—For I-F alignment, connect the low side of the test-oscillator to the common negative through a .01 mfd. capacitor, and keep the output as low as possible.

Pre-Setting Dial.—With gang condenser in full mesh, the pointer should be adjusted so that it is vertical.

Power-Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

RCA MFG. CO., INC. MODELS TRK-90, Chassis KC-4H, KK-7H; TRK-120, Chassis KC-4F, KK-7F

General Description

The TRK-120 consists of a console-type, high-picture-definition, mirror-viewing, five channel, Television Receiver and an eleven-tube, three-band broadcast radio receiver enclosed in a handsomely styled modern cabinet. Features of the Television receiver include: Twelve-inch Kinescope; Styrol (humidity-resisting) r-f and i-f transformer forms; black and white pictures; single station selector switch; temperature compensated condensers; iron core i-f and r-f tuning; double safety switch protection; safety-glass viewing

shield; extra large viewing mirror for wide angle viewing; automatic brightness control; and automatic volume control.

The TRK-90 is a direct viewing, high-picture-definition console-type, five channel, Television Receiver and an eleven tube, three-band broadcast radio receiver in a deluxe upright modern cabinet. Television features of this receiver are the same as for the TRK-120, except that a nine-inch Kinescope is used.

Precautions in Handling Kinescopes

The Kinescope bulb encloses a high vacuum and, due to its large surface area, is subjected to considerable air pressure. For these reasons, Kinescopes must be handled with more care than ordinary receiving tubes.

The large end of the Kinescope bulb — particularly that part at the rim of the viewing surface—must not be struck, scratched or subjected to more than moderate pressure at any time. If the tube sticks, or fails to slip into its socket or deflecting yoke smoothly, investigate and remove the cause of trouble. Do not force the tube.

All RCA Kinescopes are shipped in special cartons and should always be left in the cartons until ready for installation in the receiver. Keep the carton for future use.

The RCA-1803-P4 (12-inch) Kinescope is equipped with a protective lid and shield. Do not at any time remove the close-fitting cone-shaped section of the protective shield from the Kinescope. This section should be installed with the tube in the cabinet and is designed to protect the user while handling the glass bulb.

CAUTION: Do not open the shipping carton, install, remove, or handle the Kinescope in any manner, unless shatter-proof goggles and heavy gloves are worn. People not so equipped should be kept away while handling Kinescopes. Keep Kinescope away from the body while handling.

Socket Power Units KK-7F, KK-7H

The following precautions should be observed when any work is being done on the SPU:

1. Remove power supply cord from the power supply socket.
2. No attempt should ever be made to measure the high (7,500 volts) voltage because of the difficulties and dangers involved. Servicing should be done with an ohm meter.

3. If, at any time it becomes necessary to service the SPU, the suspected parts should be replaced by parts known to be in good operating condition.
4. Use only one hand at a time. It is advisable to keep the other hand in one's pocket.
5. Connect a shorting lead between ground (first) and the high voltage side of C-113 and C-114.

6. Whenever working with the oil-filled capacitors, keep a constant short across the capacitor, as these capacitors do not completely lose their charge after being discharged a single or several subsequent times.
7. Only one person at a time should work on the unit to prevent any misunderstanding which may result in an accident.

BOTTOM VIEW EARLY PRODUCTION MODELS.

RCA MFG. CO., INC.

MODELS TRK-90, TRK-120

The finest television receiver built may be said to be only as good as the antenna design and installation. It is therefore important to use a correctly designed antenna, and use care in its installation.

The RCA Double Dipole Antenna, Stock No. 9871, is recommended for use with these receivers. Both this antenna and the "V" antenna described below are especially designed for a sufficient broad frequency response to cover the contemplated television spectrum with good efficiency and are therefore superior to a single Dipole type antenna.

When greater signal pickup, or where a shielding effect from noise sources or image reflections are desired, a reflector assembly, Stock No. 9872, may be added to the Stock No. 9871 Antenna to obtain an improved signal-to-noise ratio.

The RCA Double "V" Wire Type Television Antenna is an alternative type of antenna designed for television sight and sound reception. Two points of support are necessary. It serves adequately in suburban areas, but may not be sufficiently flexible in congested city areas where bad reflections and interference are encountered.

Antenna Installation.

In most cases, the antenna should not be installed permanently on the apartment or residence roof until the quality of the picture reception has been observed on a Television receiver. A temporary transmission line can be run between receiver and the antenna allowing sufficient slack to permit moving the antenna. Then, with a telephone system connecting an observer at the receiver and an assistant on the roof to find an antenna location, the antenna can be positioned to give the most satisfactory results on the received signal. A shift of only a few feet in antenna position or direction may effect a tremendous difference in picture reception.

Whenever possible, the antenna location should be chosen or erected so the antenna is not only broadside to the transmitter but removed as far as possible from highways, hospitals and doctors' offices and similar sources of interference. Auto ignition and diathermy apparatus may cause noise interference spoiling the picture.

In mounting any antenna, care must be taken to keep the antenna rods or pickup wires proper at least $\frac{1}{4}$ wave length (at least 6 feet) away from other antennas, metal roofs and gutters or metal objects. Under certain extremely unusual conditions, it may be possible to rotate or position the antenna so it receives the cleanest picture over a reflected path. If such is the case, the antenna should be so positioned. However, such a position may give variable results as the nature of reflecting surfaces may vary with weather conditions, as a wet surface has been known to have different reflecting characteristics than a dry surface.

In short, a television receiving antenna and its installation must conform to much higher standards than an antenna for reception of International Short Wave and Standard Broadcast signals because:

(1) Intervening obstacles have a pronounced shielding effect on the ultra-high frequency waves producing low intensity signals. Severe trouble with multi-path transmissions may be experienced, especially in congested city areas.

(2) The picture signal is comprised of a very wide band or range of frequencies, all of which must be received with good efficiency.

(3) It must be continually remembered that the discernment for the eye is much more critical than that of the ear.

Transmission Line

RCA Victor has made available two types of exterior transmission lines. One is a special low loss weather-proofed line having the correct surge impedance to match the RCA Victor Television antennas and the RCA Victor Television receivers. It is carried as Stock No. 9882 in 1,000-foot rolls. The second type is a standard weather-proofed line, also having the correct surge impedance for proper antenna and receiver matching. It is carried as Stock No. 12430 in 90-foot rolls, Stock No. 12429 in 45-foot rolls and is available in 1,000-foot spools as Stock No. 9881. Use of improper lines may result in excessive loss or may lead to line reflections, resulting in multiple images or "ghosts," thus marring the reception.

For transmission line runs up to 200 feet, and where the signal strength on the antenna is relatively high, the Stock No. 12430, or Stock No. 12429 transmission line may be used. For all other applications the Stock No. 9882 transmission line is recommended.

In some areas of very high signal intensity, a lead covered transmission line may be advantageous.

Five-Television-Channel, Receiver

Kinescope Installation (TRK-90).

1. Remove back cover of cabinet.
2. Remove the two screws which secure the wooden block, on which the yoke is mounted, to the upper shelf, and drop this block and yoke away from the shelf.
3. Loosen the thumb screw in the center of the slotted block of wood on the top shelf, pull this block of wood towards the rear of the cabinet and turn it so that the "V" slot on the front end of the block is to your right.
4. Wearing gloves and goggles, carefully slide the Kinescope on the "V" in the block, and turn both the block and the Kinescope so that the Kinescope faces the viewing window. Slide the Kinescope up to the mask in the window and fasten loosely in place by sliding the "V" block up to the bottom of the Kinescope face, and fastening it with the thumb screw.
5. Place the yoke and the wooden block on which it is mounted, on the Kinescope neck, rotate the block 90° from its original mounting position in order to have it clear the top of the cabinet and slide it into position on the Kinescope neck. **DO NOT FORCE YOKE.** In some cases where the yoke lead is too short it may be necessary to loosen the "V" block and swing the Kinescope neck to the left in order to be able to place the yoke on the Kinescope neck without forcing.
6. Fit the upper part of the wooden yoke mounting block into the slot on the underside of the cabinet top and fasten the lower end of the block securely by means of the two screws. The Kinescope should be mounted loosely in place, so that the yoke is not forced on the Kinescope neck at any time.
7. Loosen the wing nuts on the yoke mounting bracket, and move the yoke forward on the neck of the Kinescope so that it pushes the Kinescope against the mask. Tighten the wing nuts to hold the Kinescope and yoke securely in this position.
8. It may be necessary to rotate the Kinescope, within the limits allowed by the high voltage second anode lead, with respect to the mask in order to obtain proper masking of the edges on the Kinescope screen. Before rotating the Kinescope, the screws holding the yoke mounting block should be loosened, so that the Kinescope neck will not be forced.
9. Move the "V" block forward so that it holds the bottom of the Kinescope in place. Tighten the thumb screw.
10. Place the second anode lead on the second anode cap at the side of the Kinescope.
11. After the receiver is operating, and if the picture is not squared with the mask, using a screw driver loosen the clamping screws on the band around the yoke and rotate the yoke until the picture is squared with the mask, then tighten these clamping screws securely.

CAUTION: When removing the back cover of the cabinet, after the screws have been removed do not allow the cover to slide down on the neck of the Kinescope, or the neck of the Kinescope may be snapped off.

Kinescope Installation (TRK-120).—Refer to figure 4.

1. Remove back cabinet cover.
2. Remove the top safety glass cover by removing the three wing nuts "E" at the two front corners and right rear corner of the cover and loosening the wing nut "E" at the left rear corner of the cover.
3. Lift the cover straight upwards, taking care not to scratch the cabinet finish with the protruding screws or the cover itself.
4. Loosen the two wing nuts "F" on the yoke holding frame, and allow the yoke to drop down as far as possible.
5. Using gloves and goggles, open the Kinescope shipping carton and remove the top cover on the Kinescope.

MODELS TRK-90, TRK-120

RCA MFG. CO., INC.

6. Remove the Kinescope from the shipping carton (do not remove the close fitting cardboard shield from the Kinescope), and insert the Kinescope into the cabinet, guiding the neck of the Kinescope into the yoke. Do not force the neck of the Kinescope into the yoke, or the tube may break. Let the Kinescope down slowly so that it finally rests on the yoke.

7. Rotate the Kinescope and cardboard container (but not the yoke), so that the second anode cap at the side of the tube is towards the front of the cabinet.

8. Place the white rubber mask on the face of the Kinescope, with the ribs on the mask facing upwards toward the mirror. Line up the mask so that it masks the edges on the Kinescope face. Then, if necessary, lift the Kinescope and rotate it so the mask is approximately squared up with the cover opening. The second anode cap should be kept towards the front of the cabinet.

9. Replace the safety glass cover and wing nuts. Tighten wing nuts to hold the cover securely.

10. Loosen the wing nuts "F" on the yoke mounting bracket and push the two metal brackets, on which the bottom of the yoke rests, upward, until the rubber mask rests against the top cover. If the mask and the cover opening do not line up, rotate the cone-shaped Kinescope shield until they do. Tighten the wing nuts to hold the yoke and tube in this position. In some cases it may be necessary to loosen the four screws holding the yoke support to the wooden frame and shift the yoke support to make the mask and Kinescope line up symmetrically with the cover opening.

11. Place the second anode lead on the second anode cap at the side of the Kinescope.

12. After the receiver is operating, and if the picture is not squared up with the cover opening, the two screws "H" on the band around the yoke should be loosened, and the yoke rotated to square up the picture, then these screws should be tightened with a screw driver.

Focusing Control.—This is a screw driver adjustment located on the right side of the cabinet near the base.

Adjustments.—There are a series of screw driver slot adjustments at the rear of the TRK-120 (at the side of the TRK-90), used to obtain the proper picture size, centering, and vertical distribution. These adjustments are explained fully in the receiver operating instructions

Eleven-Tube, Three-Band, Electric Tuning, AC, Superheterodyne Broadcast Receiver

Video Chassis KC-4F, KC-4H

When it is desired to measure any voltages on this chassis, the primary leads of the high voltage transformer T6 should be disconnected and taped together.

When any changes have to be made in the Video chassis, the lead and part locations should be replaced as closely as possible to the original positions.

Because of the special equipment and procedure necessary for the proper alignment of these receivers, the alignment will be covered in a supplementary booklet.

Refer to the booklet: **Practical Television by RCA**, for detailed explanations of circuit operation in a Television receiver.

Service Hints:

1. Poor Horizontal Distribution of the picture elements may be due to a 6L6 tube. RCA-6L6 tubes of known recent manufacture are the only tubes recommended for the Horizontal sweep output circuit. By careful scrutiny, these tubes can be identified by the three "rings" or sections welded together at the base ring of the tube, as shown in Figure 6. If any other 6L6 tube is used in this position it will break down in a very short time.

2. If the picture "tears out" when the receiver is jarred it may be due to microphonic 6AB7, 6AC7 or 6J5 tubes.

3. The 6J5 oscillator tube should be removed without rocking it in its socket to loosen it, as the rocking motion may cause the 80.5 mmf capacitor to break off.

4. The coils in oscillator circuit should not be touched or moved or the alignment of the receiver will be disturbed.

5. The insulator on the filter capacitors may become dirty and break down to short out the high voltage.

6. The Video coupling capacitors C50, 53, 59 should be kept clear of chassis.

7. A gassy 2V3-G tube may cause resistor R-137 to burn. Replace 2V3-G tube, and resistor, if necessary.

8. Changing the position of the oscillator shield plate will disturb the alignment.

Calibration Scale

27687

Tuning Dial, and Corresponding 0-180° Calibration Scale

The corresponding dial setting for any reading of the calibration scale can be determined by drawing a line straight up from this point; for example, 151° on the calibration scale corresponds to a dial reading of 1,500 kc on "A" band. Read instructions under "Alignment Procedure."

MODELS TRK-90, TRK-120
Ch. RC-427 (Receiver)

General Description

Radio receiver chassis No. RC-427 is used in RCA Victor Television Console Models TRK-90 and TRK-120.

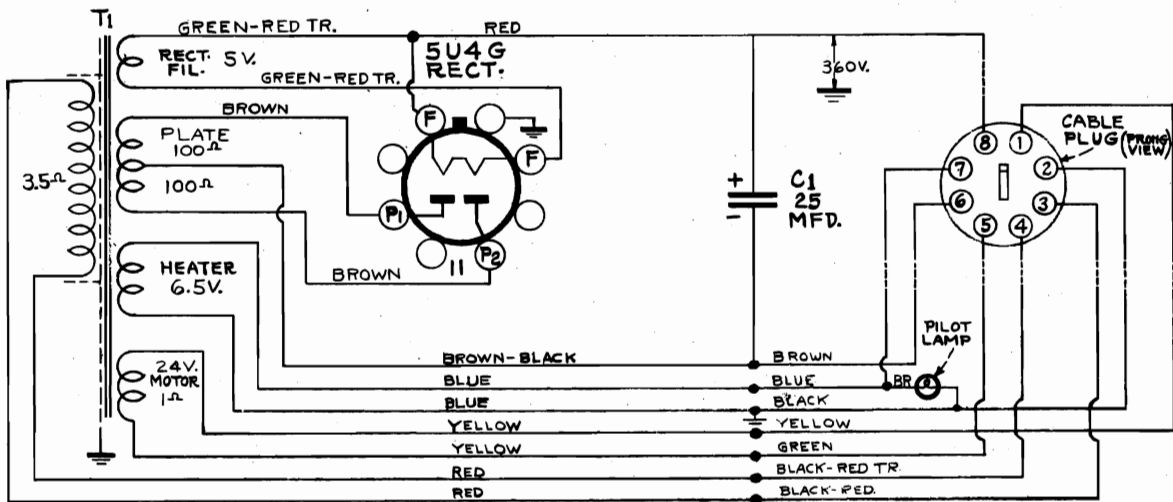

The audio output of the television chassis is connected to the audio input of the radio chassis by means of jack X-17 and section S7 of the fidelity switch. The functions of this switch are tabulated on the following page.

A separate plug-in power unit, RS-83E, is used to supply heater and plate voltages to the radio chassis. Service data and diagram for this power unit are shown below.

Miscellaneous Data for Radio Chassis

Connections and Colors of Loudspeaker and Cable

TRK-120 for 105-125 Volts—50-60 Cycle Power Supply

General differences are as follows:

Chassis KC-4J

1. Tube No. 21 formerly RCA-5V4G changed to RCA-25Z6 and socket wiring revised.
2. Circuit changes are indicated on the schematic diagram (Fig. 9).

Chassis KK-7J

1. Capacitors C-118 (80 mfd.) and C-119 (10 mfd.) added in parallel with C-110.
2. Capacitor C-128 (0.25 mfd.) added in parallel with resistor R-166.
3. Capacitors C-113 (0.03 mfd.) and C-114 (0.03 mfd.) changed to C-121 (0.1 mfd.) and C-122 (0.1 mfd.)
4. Power transformer (T-5) changed to (T-8) having a 25v. heater winding to supply the RCA-25Z6 horizontal damping tube.
5. High voltage power transformer (T-6) changed to (T-9).
6. Resistor R-165 is added.
7. Inductance L-50 is 100 ohms in this model.
8. An RCA-5T4 replaces the RCA-5U4G.

In addition Kinescope shielding is provided as follows:

1. A metallic conical section is installed in the cabinet to shield the Kinescope bulb.
2. A double metallic cylindrical section is installed with the deflecting yoke mounting assembly to shield the deflecting yoke proper. The accompanying illustration shows its assembly.

CAUTION: The conical shield is of the proper size to permit installing the 1803P4 Kinescope with its protective cardboard sleeve. The latter should **never** be removed.

To prevent Kinescope breakage, when installing a Kinescope, the deflecting yoke and shield assembly must be in place. To prevent breakage of Kinescope when removing the deflecting yoke and shield assembly the Kinescope must be removed first.

Replacing or orienting deflecting yoke:

1. Remove Kinescope.
2. Loosen yoke support bracket wing nuts and remove complete yoke and shield assembly.
3. Remove outer shield. Loosen yoke clamp screws to permit removal or orientation of yoke. If it is necessary to orient yoke, pull yoke out so it extends about one inch. Tighten screws just enough to hold yoke but not too tight as it may be necessary to turn it in this extended position. Replace the inner shield and yoke in the yoke mounting brackets.
4. Replace Kinescope and protective glass cover.
5. Move the inner shield and yoke assembly vertically until yoke is gently touching Kinescope bulb. Tighten yoke bracket wing nuts.

Precautionary Lead Dress

- (1) All A-C leads should be twisted together and dressed away from parts in chassis to prevent hum pickup.
- (2) Keep pilot light leads away from 6R7 grid.
- (3) Yellow, green, and black leads from fidelity switch to 1st i-f transformer must be twisted together and dressed away from chassis. The same applies to the 2nd i-f transformer leads.

Victrola Attachment

A jack (X-16) is located near the antenna terminal board for convenience in plugging in a Victrola Attachment. The cable from the Victrola Attachment should be terminated in a Stock No. 31048 plug to fit the jack.

6. Rotate yoke carefully with one hand to orient raster or picture.
7. Remove Kinescope.
8. Remove carefully (so as not to disturb yoke adjustment) the inner shield and yoke assembly. Place the latter on a flat surface with the extended yoke end flush to surface. Press inner shield gently down until yoke edge is flush with inner shield edge. Tighten yoke clamp screws evenly by first pulling one up and then the other.
9. Assemble outer shield to inner shield and yoke assembly so bottoms of shields are flush.
10. Replace complete shield and yoke assembly in the yoke support bracket.
11. Replace Kinescope and tighten protective glass cover.
12. Push gently complete assembly up flush against the Kinescope bulb. Tighten wing nuts.

IMPORTANT: 1. The hole in the conical metallic shield must line up with the hole in the protective sleeve to permit connection of the second anode cable.

2. Do not jar or drop the shields and keep away from the loudspeaker field coil to prevent magnetization.

Assembly Details, Showing Kinescope and Deflecting Yoke Shielding

RCA MFG. CO., INC.

MODELS TRK-90, TRK-120

IMPORTANT PRECAUTIONS

A good ground should be connected to the receiver at all times.

Always wear gloves and shatter-proof goggles when handling Kinescope tubes.

Do not eliminate the protection afforded by the interlock switches.

ALWAYS replace the shield can over the 2V3-G high voltage rectifier. The most dangerous portion of the H.V. supply is the plate lead of the 2V3-G tube.

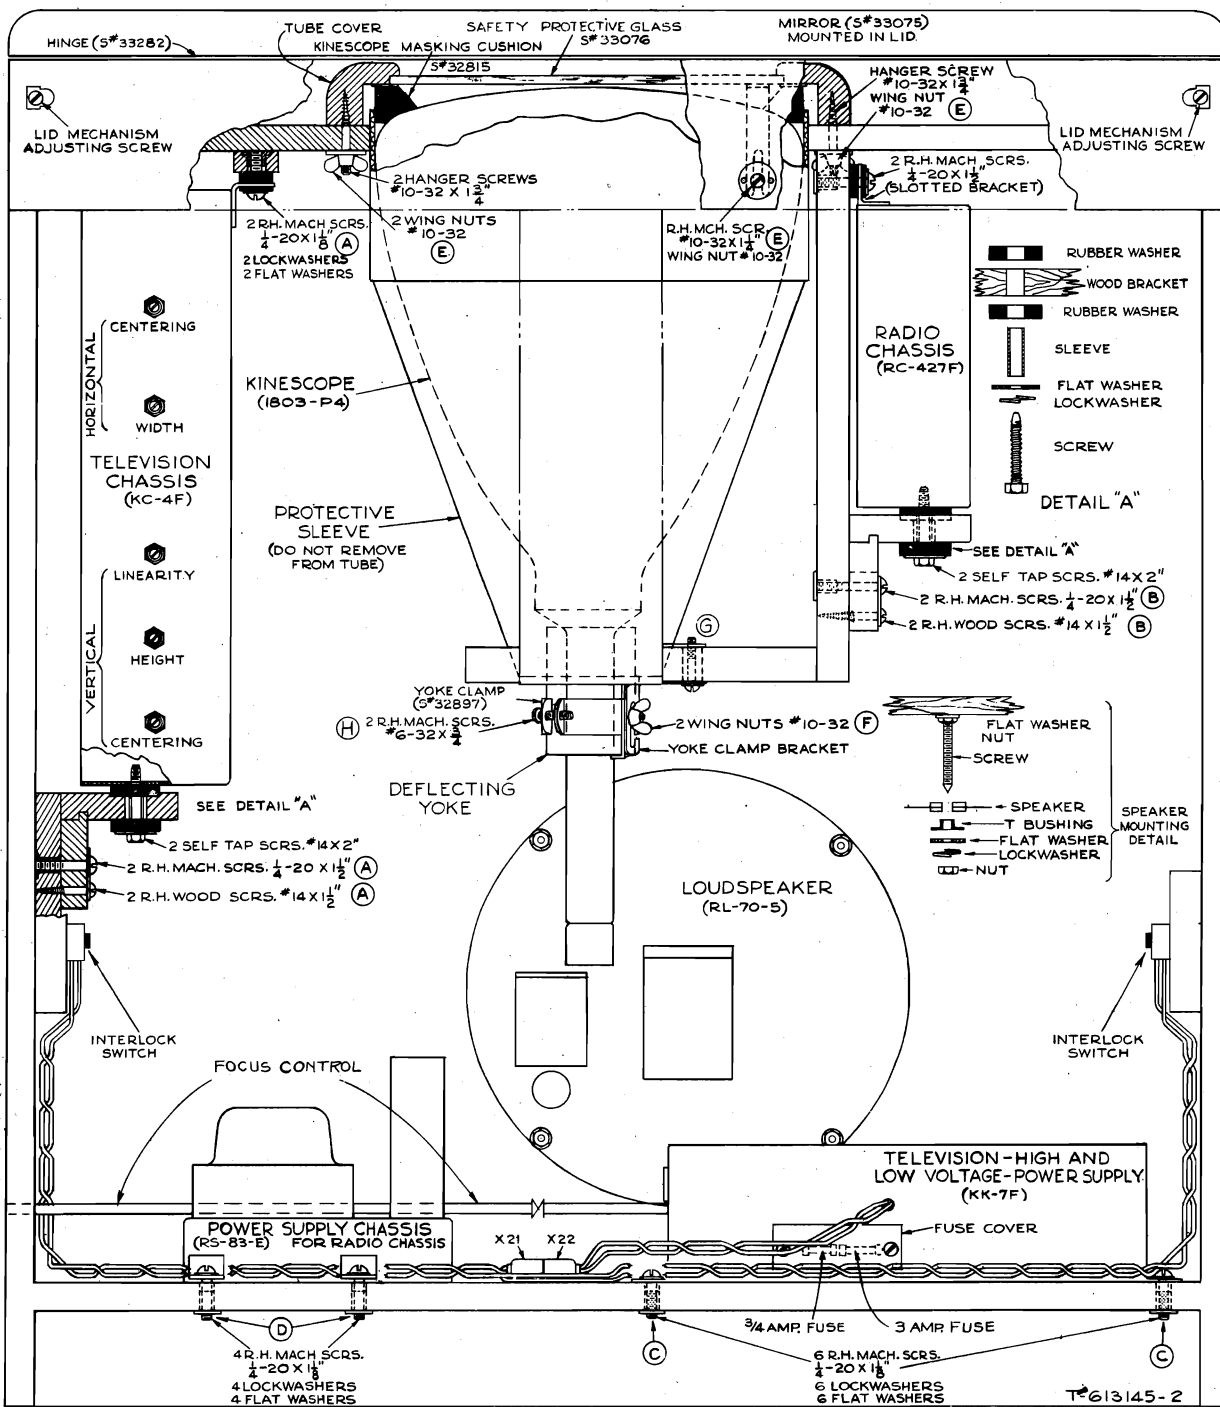

Do not measure any voltages on the video chassis unless the primary leads of the high voltage trans-

former have been unsoldered from the supply line, and taped.

Use only one hand when working on the video or high voltage SPU chassis, and always connect a shorting lead to ground (first), then to the high side of both high voltage filter capacitors.

Make no voltage measurements on the high voltage (7,300 volts) SPU chassis.

Work on a television receiver should not be attempted by anyone who is not thoroughly familiar with the precautions necessary when working on high voltage equipment.

Operation

The "Power Volume" control on the radio receiver turns on the power for the complete receiver. The "Victrola, Radio, Television" control selects the type of operation desired. There are three Victrola fidelity positions, four radio fidelity positions and three Television sound fidelity positions on this switch. The furthestmost clockwise position being the highest fidelity position for Television sound.

Television Operation:

Station Selector and Fine Tuning.—The outer ring "O" section of the central dual control knob on the Television panel selects the station from which it is desired to receive television transmissions.

Five television channels are covered as follows:

- (1) 44 to 50 mc.
- (2) 50 to 56 mc.
- (3) 66 to 72 mc.
- (4) 78 to 84 mc.
- (5) 84 to 90 mc.

Set the station selector to the number corresponding to the frequency of the station from which it is desired to receive Television broadcasts.

The inner section "I" of this knob is used for fine tuning and may eliminate moving ripples or distortion if due to interfering radio signals. A slight downward pressure must be exerted while turning the knob on the TRK-120, and an inward pressure on the TRK-90.

Before the Television portion of the receiver is turned "ON" it is advisable to turn the Brightness and Contrast controls completely counter-clockwise to reduce the illumination of the spot which appears on the Kinescope before the sweep circuits have started functioning.

Contrast and Brightness Controls.—The inner "I" section of the "Contrast", "Brightness" controls is the "Contrast" control and varies the black and white tones of the picture being received. Too much contrast gives blurred details and a lack of half-tones, while too little contrast makes it all half-

tones or grays. Turning clockwise increases contrast from grays, to black and white. See Operating Instructions for this receiver.

The outer ring "O" is the Brightness Control and affects the average illumination of the picture. Turning clockwise increases the brightness. See Operating Instructions for this receiver.

An approximate adjustment for proper contrast is to turn the "Contrast" control fully counter-clockwise, then turn the "Brightness" control until the screen is slightly illuminated. Then reduce the Brightness control just sufficient to make the screen dark, then bring up the Contrast Control until the picture appears. A slight further adjustment of the Brightness or Contrast control may be necessary in some cases. A slight readjustment of the contrast control may aid synchronization of the picture.

Hold Controls.—The dual knobs on the Television panel marked "Horizontal" and "Vertical" Hold, control the picture stability. The inner section designated by a "I" is the Horizontal Hold Control and when being set should be turned slowly to the point at which the picture "locks in" horizontally. See Operating Instructions for this receiver.

The outer ring section designated by "O" is the vertical Hold Control and when being set should be turned to the point where the picture "locks in" vertically.

These two controls on this dual knob should not ordinarily require readjustment after good picture reception has once been obtained. An occasional resetting may be necessary due to changing to a different station, and to the gradual aging of the tubes.

Alignment Procedure (RADIO CHASSIS)

At Right—Tube and Trimmer Locations

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the chassis drawing.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment, therefore a calibration scale is attached to the rear of the indicator-drive-cord drum which is mounted on the front shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The "O" mark on the drum scale must be vertical, and directly over the center of the gang-condenser shaft when the plates are fully meshed. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

To determine the corresponding frequency for any setting of the calibration scales, refer to the accompanying drawing which shows the dial with 0-180° calibration scales drawn at top and bottom.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "O" mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator approximately 1/16-inch above end dots at low frequency ends of bands with gang condenser fully meshed. See that pointer does not rub background screen or dial face. The indicator has a spring clip for attachment to the cable.

Steps	Connect the high side of test-osc. to—	Tune test-osc. to—	Set tuning gang to—	Adjust the following—	To obtain—
1	Turn fidelity switch to No. 3 radio (sharp).				
2	6K7 2nd I-F grid cap, in series with .01 mfd.	455 kc	Quiet point on "B" band	L15, L16 (3rd I-F Trans.)	Coincidental images on cathode-ray oscillograph, or max. output on output meter.
3	6K7 1st I-F grid cap, in series with .01 mfd.			L13, L14 (2nd I-F Trans.)	
4	6A8 1st Det. grid cap, in series with .01 mfd.			L11, L12 (1st I-F Trans.)	
5	Turn fidelity switch to No. 4 radio (broad). The curve on CRO should broaden out to a double peak and reduce gain nearly 50%.				
6	Turn fidelity switch to No. 3 radio for the following adjustments. Back out the "B" and "C" oscillator trimmers, C5 and C4. Preset "A" band oscillator trimmer, C9, approximately an inch out.				
7	Antenna terminal, in series with 100 mmf.	600 kc	600 kc (31°) "A" band	L10 (osc.)	Max. Output
8		1,500 kc	1,500 kc (151°) "A" band	C9 (osc.) C2 (ant.) C15 (det.)	Max. Output
9		600 kc	600 kc "A" band	L10 (osc.)	Rock in for Max. Output
10	Repeat step No. 8.				
11	Antenna terminal, in series with 300 ohms	6,100 kc	6,100 kc (140°) "B" band	C5 (osc.)	Max. Output *
12		20 mc	20 mc (146°) "C" band	C4 (osc.)	Rock in for Max. Output *
Follow "Adjustments for Electric Tuning."					

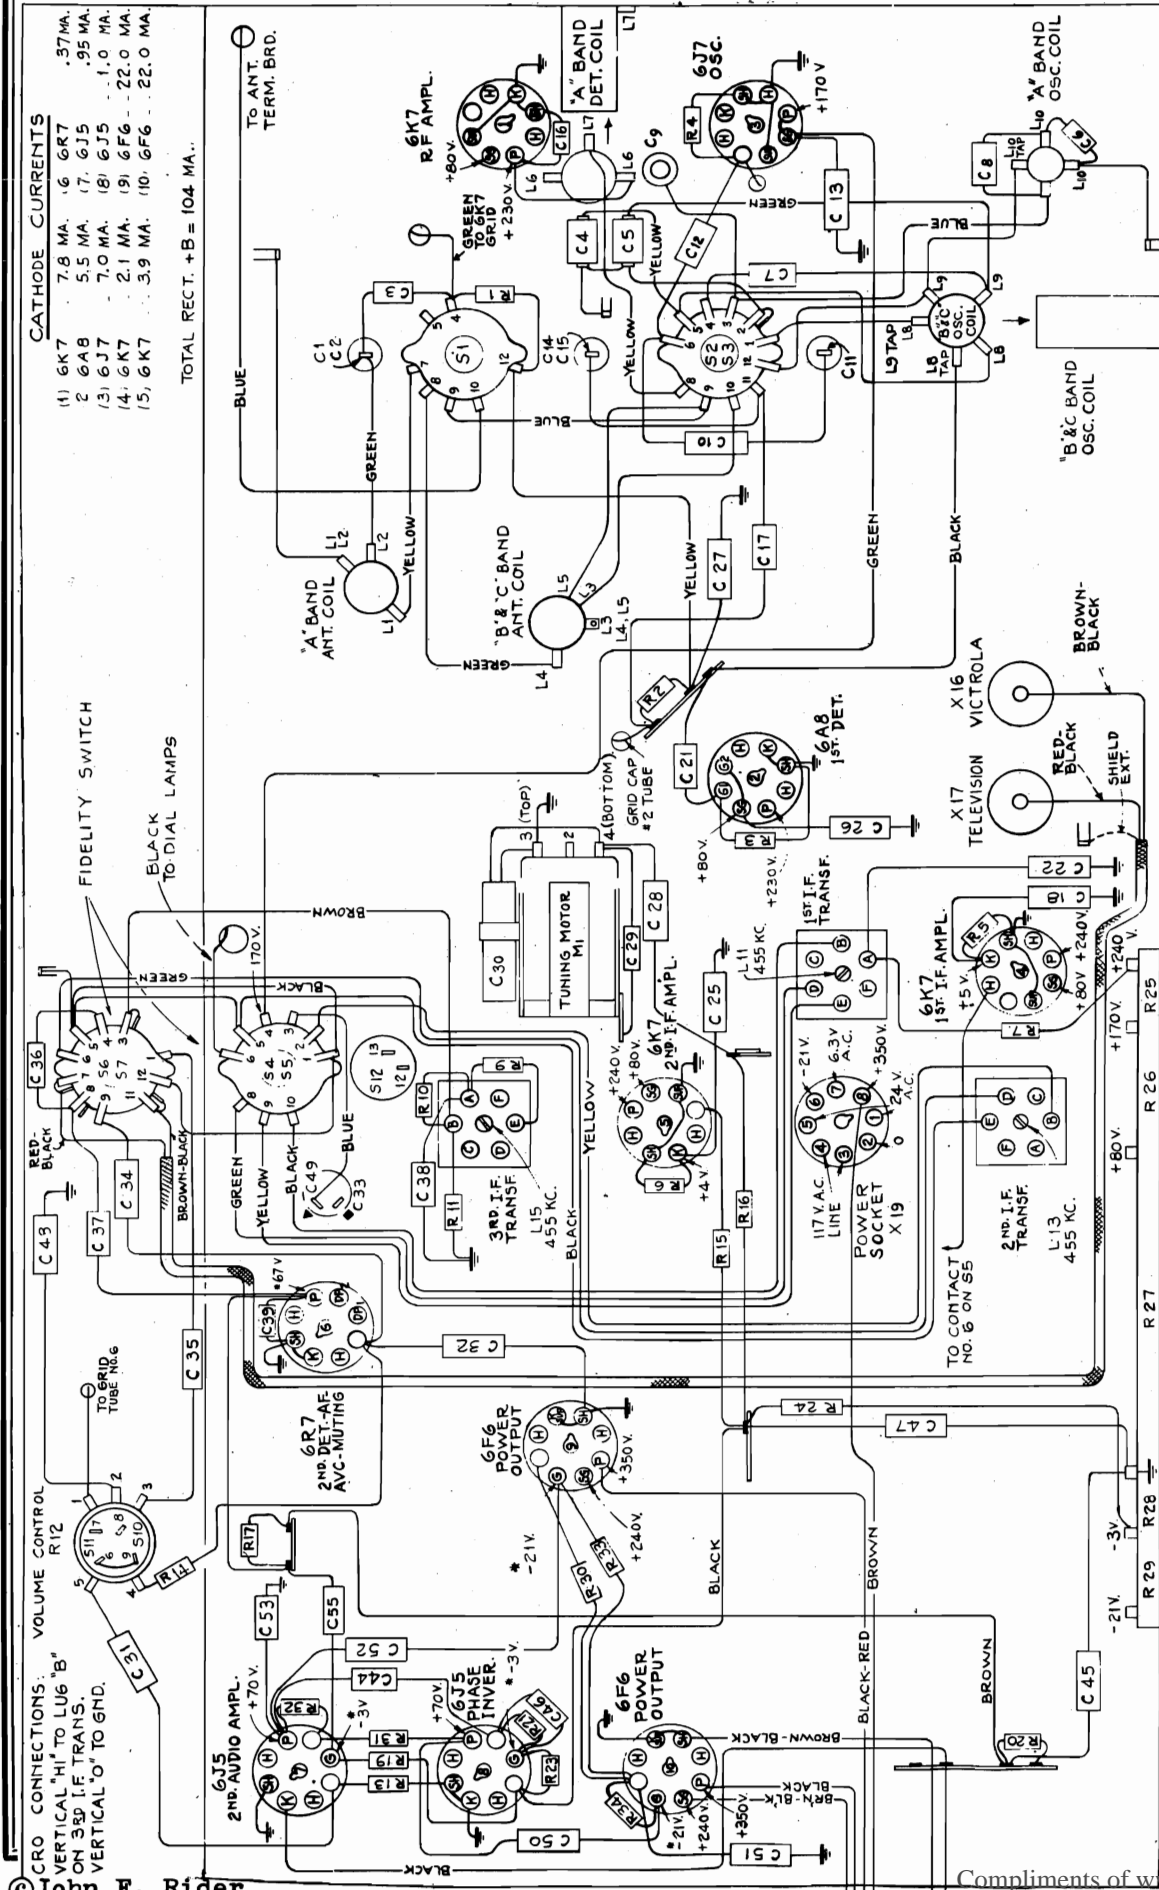

* Use minimum capacitance peak if two peaks can be obtained.

Note: The oscillator tracks 455 kc above the signal on all bands.

BOTTOM VIEW - REAR OF CHASSIS

ALL HEATER VOLTAGES 6.3 V. A.C.

R-F Wiring Diagram and Socket Voltages (Radio Chassis)

Measurements made to chassis unless otherwise indicated, with set tuned to quiet point, volume control at minimum. Values should hold within approximately $\pm 20\%$ with 117 volt a.c. supply.

NOTE: Values with star () are operating voltages in circuits with high series-resistance, and when measured will read lower depending on the voltmeter loading.

Electric Tuning Mechanism

When a station button is pushed in, it completes the 24-volt circuit through the corresponding station-setting contact and one-half of the brass selector disc, which is connected to one side of the motor field coil. This energizes the motor, and the rotor is pulled forward, engaging with the gear train that drives the tuning condenser and selector disc. The condenser and disc rotate until the insulation line comes under the particular station-setting contact, and the motor circuit is broken.

When the electric tuning mechanism is in action, the motor-supply voltage is fed into a diode rectifier circuit which applies a high bias to the first-audio amplifier. This prevents audio amplification and makes the set quiet or "mute" while the mechanism is operating.

The brass selector disc is fastened to the rear shaft of the tuning condenser by means of two set-screws. When the condenser is at maximum (plates fully meshed) the insulation line should be horizontal, with the operating-end at the left (viewed from rear). The brass is beveled at this end.

The selector disc should be set so that the contact-tip plungers in the station-setting contacts project not more than 1/16-in. from the body of the contacts.

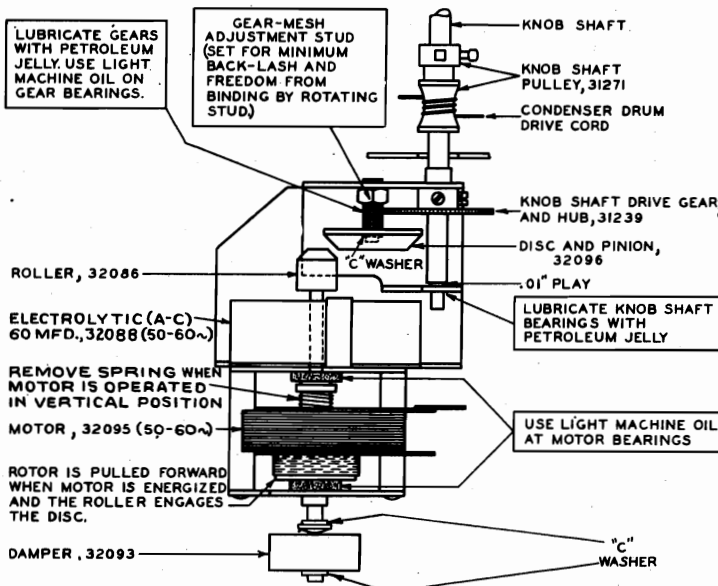

LUBRICATION

Motor bearings and gear bearings; use light machine oil.

Gear faces; use "Pure Oil No. 611" or petroleum jelly.

Dial-indicator pulleys and rails; use "Castodag" or petroleum jelly.

Selector disc; apply thin film of petroleum jelly.

Station Button	Color of Lead To Station-Setting Contact	Station Button	Color of Lead To Station-Setting Contact
No. 1	Yellow-green	No. 6	Red
No. 2	Black	No. 7	Red-black
No. 3	Brown	No. 8	Brown-black
No. 4	Blue	No. 9	Red-yellow
No. 5	Green		

Adjustments for Electric Tuning

With power turned off, disconnect the antenna transmission line and ground connection, turn fidelity control to radio (3rd radio position—6th position from full counter-clockwise). Remove the back from the cabinet and reconnect the antenna transmission line and ground connection. The two interlock switches on the side panels should not be touched and care should be taken not to press on them when making the push-button set-up. Then turn on power, set range selector to "A," allow a few moments warm-up period and proceed as follows:

1. Make a list of the desired nine stations, arranged in order from low to high frequencies.
2. Turn on power-volume control, turn range selector to "A" band, and allow a few minutes for warming up.
3. Press down the "dial-tuning" (right-hand) button.

4. Manually tune in the first station on the list.
5. Hold down the "dial-tuning" button and press down station button No. 1 (left-hand). Both buttons will stay down. Move station adjuster contact pin No. 1 to the insulating line on the disc at rear of gang. When the pin is correctly centered on the insulating line, the central dial lamp will go out completely.
6. Press down any other button in order to release the dial tuning button and station button No. 1. Tune to some other section on the dial, and then press down station button No. 1 again; the electric tuning mechanism will function to tune in the first station, and the central dial lamp will stay on.
7. Repeat this process for the remaining stations.

Components of Station Setting Contact

At Right—Dial Mechanism

RCA MFG. CO., INC.

Replacement Parts

Insist on genuine factory-tested parts, which are readily identified and may be purchased from authorized dealers.

STOCK No.	DESCRIPTION	Unit List Price	STOCK No.	DESCRIPTION	Unit List Price
	TELEVISION CHASSIS ASSEMBLIES				
	KC-4F in TRK 120 (60 cycle)		33208	Control—2.7 meg. "Height" control (R108)	1.00
	KC-4J in TRK 120 (60 cycle)		4574	Plug—6-prong male plug for Television chassis power supply cable (X14)	.48
	KC-4H in TRK 90 (60 cycle)		16836	Plug—8-prong male plug for Television chassis power supply cable (X12)	.25
33387	Adjuster—Magnetite core and stud in tube for high frequency oscillator circuit adjustment (Used with L11, L12, L14, L15)	.55	14671	Resistor—33 ohms, 1/2 watt (R152)	.20
33835	Adjuster—Magnetite core and stud in tube, for high frequency oscillator circuit adjustment (Used with L13)	.55	35568	Resistor—Voltage divider comprising a 70, 7.4 and 5 ohm section (R162, R163, R164)	.60
31253	Board—4 terminal antenna-ground terminal board	.25	14074	Resistor—82 ohms, 1/2 watt (R64, R67, R14, R21, R28, R34)	.20
12884	Capacitor—Adjustable plunger type air trimmer (C6)	.60	13428	Resistor—150 ohms, 1/2 watt (R39)	.20
33097	Capacitor—4.7 mmfd. (neg. temp. coeff.) (C69)	.35	13454	Resistor—270 ohms, 1/2 watt (R141)	.20

XX—Price upon application to your RCA Parts Distributor.

ALL PRICES ARE SUBJECT TO CHANGE OR WITHDRAWAL WITHOUT NOTICE.

General Description and Service Data

The model R-91 Electric Victrola consists of a crystal pickup, a four tube audio amplifier, a five-inch dust-proof dynamic speaker, and a motor turntable mechanism all combined in a hinged-top, table type walnut veneer cabinet. Any record, up to and including the 12-inch size, may be played on this instrument.

The crystal pickup unit is securely sealed in a metal casing, against extreme changes of climate. If failure occurs due to a defective crystal unit, no attempt should be made to repair it, but a new replacement crystal unit should be installed.

Phonograph Motor

The synchronous motor used in this instrument is designed to be simple and foolproof. The parts that may require attention are plainly shown in figure 2. The motor is started by turning "on" the power switch and giving the turntable a clockwise spin with the hand. Smooth starting and running will be insured by keeping the bearings well cleaned and oiled.

Hum and Vibration.—A small amount of hum when starting, decreasing to a negligible amount when running, is normal. If excessive vibration occurs it may be due to:

1. Insufficient lubrication, or any failure that will cause binding.
2. Leather washer not oiled. (Check to make certain that the leather washer is above the steel washer.)
3. Motor not properly supported from motor board.
4. Burrs on poles of rotor or stator. Remove with fine emery cloth.
5. Stator should be free to rotate between limits of damping assembly.

Removing Rotor.—The rotor and turntable assembly simply rests on the ball bearing at bottom of vertical bearing. Remove by lifting upward.

Rotor Adjustment.—Remove motor from cabinet. Loosen the three screws that hold the rotor to the turntable, insert three 16-mil shims at equal distances around the gap between the rotor and stator, and then carefully tighten the three screws. The top of rotor must be flush with top of stator; add additional steel washers beneath the stator if necessary.

Pilot Lamp.—To replace pilot lamp, remove the screws from the small raised block at the front of the motor board, and remove the wooden block. The pilot lamp compartment is then accessible.

POWER SUPPLY RATING

- A-5..... 105-125 volts, 50 cycles, 65 watts
- A-6..... 105-125 volts, 60 cycles, 65 watts

POWER OUTPUT

- Undistorted..... 1.5 watts
- Maximum..... 2.0 watts

LOUDSPEAKER

- Type..... Electrodynamic
- Voice Coil Impedance..... 4.9 ohms at 400 cycles

MOTOR BOARD

- Motor..... Manual Starting Synchronous
- Turntable Speed..... 78 r.p.m.

PICKUP

- Type..... Crystal
- Impedance..... 80,000 ohms at 1,000 cycles

Figure 2—Motor Details

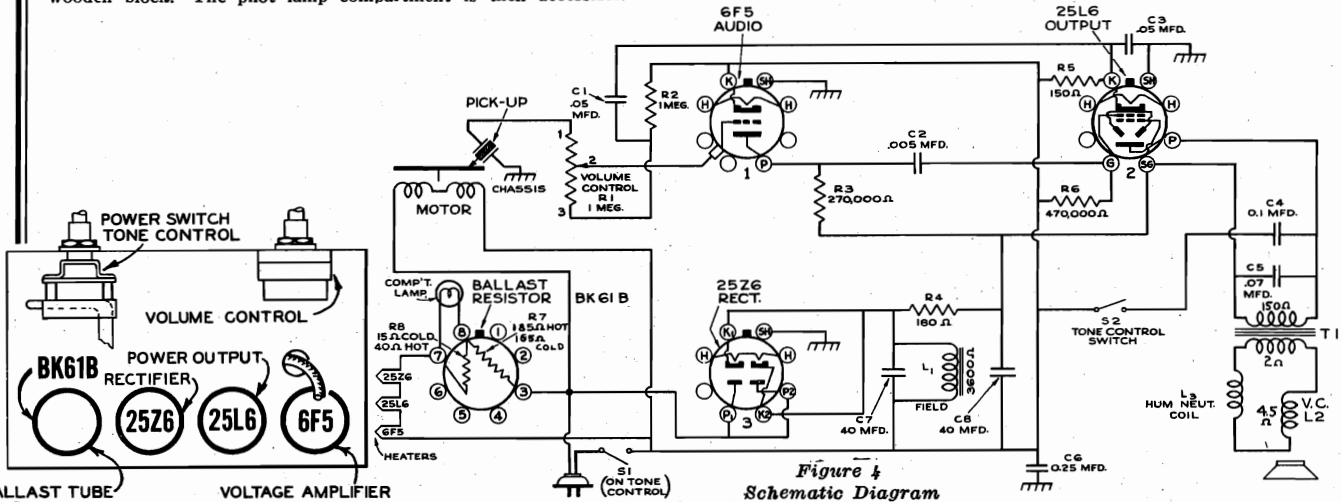

Figure 4 Schematic Diagram

Figure 3—Tube Layout

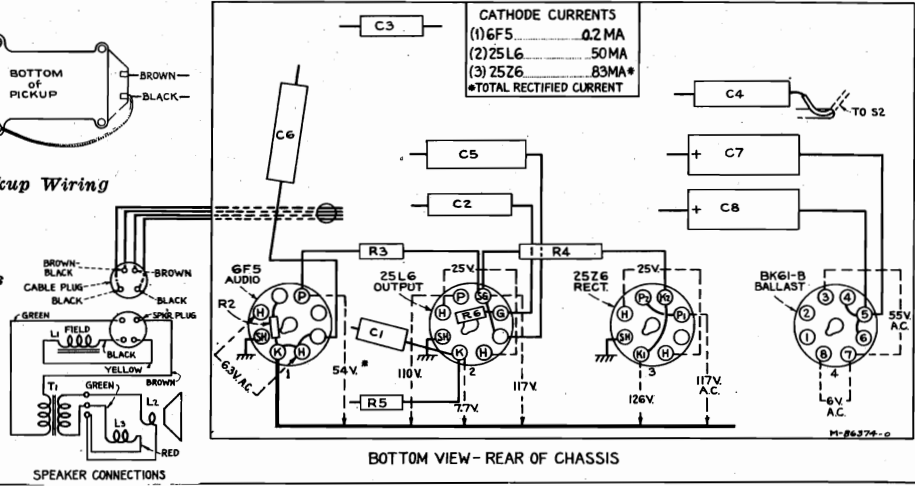

Figure 1—Motor Coil and Pickup Wiring

Figure 5 Wiring and Socket Voltages

*** NOTE:** Values with star (*) are operating voltages in circuits with high series-resistance, and when measured will read lower depending on the voltmeter loading. Measurements made to chassis unless otherwise indicated, volume control at minimum. Values should hold within approximately ± 20% with 117-volt a-c supply.

BOTTOM VIEW—REAR OF CHASSIS

RCA MFG. CO., INC.

General Description

These instruments employ a crystal pickup unit which depends upon torsional vibration to provide the necessary output voltage. The crystal unit is contained in a metal case, securely sealed against extremes of climate. An offset mounting for the pickup head gives an ideal tracking angle between the needle and record grooves.

The motor is a manual starting, synchronous type, designed to operate with good regularity of speed at the standard 78.26 r.p.m. Mechanically, the motor consists of a laminated stator having a large number of salient poles; a laminated rotor with a corresponding number of poles, which is affixed to the turntable; and two field coils, installed on the stator to furnish the energizing magnetic flux. The rotor, stator, and their bearing assembly are mechanically isolated from the turntable, motor mounting, and cabinet by adequate flexible couplings and supports.

A volume control unit is associated with the record player, and its output is terminated in a twisted-pair cord with a pin-plug connector.

The two models are electrically and mechanically similar; they differ in that Model R-93B has a molded plastic cabinet, whereas Model R-93C has a veneer wood cabinet.

VOLTAGE RATINGS

- A-6..... 105-125 volts, 60 cycles, 9 watts
- A-5..... 105-125 volts, 50 cycles, 9 watts
- B-2..... 105-125 volts, 25 cycles, 9 watts
- C-5..... 200-250 volts, 50 cycles, 9 watts

MOTOR AND PICKUP

- Type of Motor..... Synchronous (Manual Starting)
- Turntable Speed..... 78 r.p.m.
- Type Pickup..... Crystal
- Pickup Impedance..... 80,000 ohms at 1,000 cycles
- Average Output Voltage..... 1½ volts at 1,000 cycles with 250,000 ohm load
- Volume Control Resistance..... 250,000 ohms

† Add Jumpers J1 and J2 to Phono-Radio Switch if not present.
 †† Remove Jumpers J1 and J2 to Phono-Radio Switch if present.
 § Open circuit between R5 and other resistors named, and wire-in cable as instructed. See Figure 4.
 * Use a second adapter. * R5 is the volume control.

CONNECTING RECORD PLAYER TO RADIO RECEIVER—In connecting this player to the radio, care must be exercised to connect it at a point where sufficient gain is between it and the speaker to give normal output. Usually two or more stages of audio amplification are required. The radio part must be thoroughly disconnected or "killed" when playing records, else the radio signals will be heard with the record's music. Attention should be given to the possibility of introducing hum and feedback voltage into the

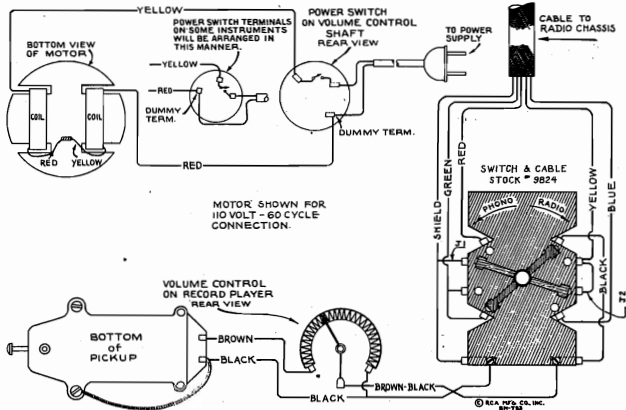

Figure 1—Wiring Diagram

radio when connecting the player. A radio-phonograph switch, Stock No. 9824 is recommended for a switching system. Its connections are shown in Figure 1. With it, radio or phonograph may be selected by simply turning the switch.

Figure 3—Motor Coil Assembly and Connections

When the radio is equipped with a phonograph terminal board, the player is easily connected. One should follow the instructions pertaining to that particular radio. In general, the player's output should be applied to the grid circuit of the first audio tube in the same manner as the second detector is connected. Use a switching arrangement that grounds the radio as it connects the phonograph.

When using the radio phonograph switch Stock No. 9824 on radios using a 6B7 or some similar tube for second detector, the yellow and green leads are connected in series with the grid cap connections of this tube. The green lead is connected to the grid cap.

RECORD PLAYER SWITCH JUMPERS—Some record player switches do not have jumpers J1 and J2 attached. When the switch is so connected and turned to phonograph position, the voltage developed by the pickup is fed into the radio receiver through the green wire and shield, and at the same time the yellow wire is connected to shield. The jumpers J1 and J2 permit the yellow lead to kill radio by connection to shield. The jumpers should be removed where the yellow lead connects in such a position as to short bias batteries, etc. Check the switch to be used for the method chosen and use the jumpers accordingly.

ROTOR CENTERING CALIPERS

A special calipers (Stock No. 36950) is now available for quickly and accurately centering the rotor in these motors.
Exact centering is essential for minimum hum and "wow." The precision of manufacture of these calipers provides checking and centering with an accuracy of .0005 inch.

Rotor Centering Calipers

To use the calipers, lift out the turntable and rotor, slide the caliper onto the rotor shaft, and adjust the calipers to fit the internal radius of the rotor. Rotate the calipers and check for run out, or widening of the radius. Tap the edge of the rotor to move it in the desired direction. Recheck and tap as necessary until rotation of the calipers indicates accurate centering.

Motor Data

Smooth starting and running will be insured by keeping the bearings well cleaned and oiled.
Hum and Vibration—A small amount of hum when starting, decreasing to a negligible amount when running, is normal. If excessive vibration occurs, it may be due to:
1. Insufficient lubrication, or any failure that will cause binding.
2. Leather washer not oiled. (Check to make sure that the leather and steel washers are arranged in proper sequence, as shown in the drawings.)
3. Motor not properly fastened in cabinet.
4. Burrs on poles of motor or stator.
5. Slight eccentricity of rotor or spindle.
6. Loose laminations of the stator.
7. Improper horizontal alignment of the rotor and stator (pertaining only to the type motor shown in Figure 1). Correct

horizontal alignment is as shown in the motor assembly drawing. The position of the stator is raised or lowered by adding or removing washers below the leather washer. In the type motor shown in Figure 2, no adjustment is necessary because correct horizontal alignment is provided by the design of the motor.
The damper spring must fit without binding or chattering, in the slot in the stator. The stator must be free to deflect in either direction between the limits of the damper spring. Any binding in the washers or stator bearing which prevents the movement of the stator may cause speed variations in the motor. The damper spring must exert equal force in restoring the stator to its mid-position when the stator is deflected manually in either direction.

Tone Compensation

Because of the widely varying frequency characteristics of various types of audio amplifiers with which the Player may be used, it may be desirable in some cases to make refinements in the pickup circuit of the Player to compensate for the characteristics of the amplifier. The following circuits show means of making such refinements.
In Figure 3, R1 controls the low-frequency response; larger values of R1 give increased lows; For maximum low-frequency response, remove R1. R2 controls pickup output, smaller values of R2 giving increased output. C1 controls high-frequency response; to increase highs, increase C1.

Where a decrease in high-frequency response may be desired (for example, as an aid in reducing "needle scratch" on worn records), the circuit in Figure 4 is applicable. In this circuit, C2 acts as loading on the pickup and is also a controlling factor on the high-frequency response. Smaller values of C2 give more pickup output and also more highs. R3 gives a sharper high-frequency reduction; increasing R3 decreases highs.
The suggested values shown in Figures 3 and 4 should serve as a basis from which slight alterations may be made to suit individual cases.

MODEL R-93FPhono
2nd Edition

RCA MFG. CO., INC.

Connecting Record Player to Radio Receivers

This Record Player consists of a motor-turntable mechanism, a crystal pickup unit and a volume control with motor switch. The player may be connected to the audio amplifier system of practically any type of radio receiver for the reproduction of records.

For convenience in connecting the player to receivers without the conventional phono-jack, a new type switch (Stock No. 9824-A) is recommended.

This switch may be used for quickly connecting Record-Players, Television Attachments, Frequency-Modulation Attachments, Microphones, and similar devices into the audio amplifier of the receiver.

The great majority of receivers in use have a grid-cap type

1st-audio tube, and the new switch is designed for rapid connection to the grid cap, without removing the chassis from the cabinet. On other receivers, the switch can be readily installed by means of socket adapters or connection into the audio circuit.

The new switch is designed to provide:

1. Changeover from radio to record player, with retention of the original tone quality, and without introducing hum.
2. Suppression of radio on the "phono" position.
3. Maintenance of all original bias conditions in the radio circuit.

Complete instructions are furnished with the switch.

Stock No. 9824-A
Record-Player Switch

A typical hook-up as used on receivers with a grid-cap 1st-audio tube. (On a.c.-d.c. sets, a .25 mfd. condenser should be connected in the cable shield lead.) Methods of connecting receivers (without the grid-cap 1st-audio tube) thru the use of adapters, etc. are explained in detail in the instructions packed with each switch.

Replacement Parts

Insist on genuine factory-tested parts, which are readily identified and may be purchased from authorized dealers.

Net Weight..... 12½ pounds
Shipping Weight..... 18 pounds

General Description

The RCA Victor Record Player Model R-94B consists of a self-starting motor turntable mechanism, a crystal pickup, an aurally compensated volume control, and a motor switch. This record player can be adapted to play records through the audio amplifier—loudspeaker system of practically every type of radio receiver. The cabinet is of walnut veneer, and has a hinged lid, which locks in the "open" position—but should be closed while records are being played. Any record up to and including the 12-inch diameter size may be played on this instrument. An automatic switch turns the motor "off" when the end of a record has been reached.

Service Data

The crystal pickup unit is thoroughly sealed in a metal casing, against extreme changes of climate. The offset mounting of the crystal unit in the pickup arm insures ideal tracking between needle and record grooves. If failure occurs due to a defective crystal unit, no attempt should be made to repair the unit, but a new replacement crystal unit should be installed.

The turntable drive, is a self-starting, variable-speed, governor-type, induction motor. The motor speed adjusting screw is located under

the turntable, which must be removed for speed adjustment. The motor speed should be 78 r.p.m., and may be checked by placing a piece of paper between a record and the turntable, with the paper protruding beyond the edge of the record, and then counting the number of revolutions of the turntable per minute. The motor is designed to be simple and foolproof in operation. Occasionally, however, lubrication and certain adjustments may be required. These are illustrated and explained in figure 1. In addition, an application of oil to the felt pad, which rubs against the governor disc, will insure smooth operation.

The turntable is started by pushing to the rear the motor starting lever, which appears to the right of the turntable. The adjustment on the automatic motor stopping switch should be made so that the switch will snap to the "off" position when the needle in the pickup head is 1½ inches away from the center of the turntable. The locking screw and details of the switch mechanism are shown in figure 2.

The volume control is of the potentiometer type, tapped to give aural compensation at low volume settings. The output lead from the volume control is a single shielded wire, terminating in a small, male, pin plug. See figure 3. This pin plug fits into the female jack receptacle on most of the RCA Victor 1939 "90" series of radio receivers.

Connecting Record Player to Radio Receivers

A table giving methods of connecting the Record Player to various types of audio systems is shown in the following text. Also included are the model numbers of the various RCA Victor Receivers to which the particular method shown applies. The data given in the table requires that an RCA Stock No. 9824 "Radio"-Phono switch be used for switching from radio to phono, as desired. For ease in connecting the "phono" lead to the Stock No. 9824 switch, the male plug on the end of the shielded lead should be removed by unsoldering, or cutting it off.

In general, the Record Player must be used with radio receivers having at least two stages of high-gain audio amplification. The Record Player output should be connected to the grid of the first audio tube, and at the same time the output of the radio receiver portion of the chassis should be shorted or opened, to prevent radio signals being heard while the Record Player is in operation.

CONNECTING RECORD PLAYER TO:

1939 RCA RADIO RECEIVERS OF "90" SERIES:

Plug male jack on end of Record Player into female receptacle on receiver chassis. Push or turn "Phono" switch to "Phono" position, and operate Record Player according to instructions.

RADIO RECEIVERS HAVING "PHONO" TERMINAL BOARDS.

RCA Radio Receivers to which the above illustration applies: 5T1, 5T4, 5T5, 5T6, 5T7, 5T8, 6T5, 8T2, 8T11, 8K11, 85T5, 86E, 86K, 86T, 86T1, 86T4, 86K7, 86T44, 87K, 87T, 87K1, 87K2, 87T2, 88K, 810K, 810K1, 810T, 810T4, 811K, 812K, 813K, 816K, 811T.

For following Receivers, Yellow lead should go on Terminal No. 1, Green lead on Terminal No. 2: 6K2, 6T2, 6K3, 6T10, 7T1, 7K1, 85T8, 86T3, 87T1, 86T2, 86T6, 6K10.

Insulate shield of switch wires from chassis, on following RCA Receivers: 5T, 6T, 6K, 6K1, 7T, 7K, 7X, 8T, 8K, 86X4, 87EY, 87X, 87Y, 8T10, 7X1, 8K1.

Receivers having a Four Terminal Board: 9K, 9T, 9K1, 9K2, 9K3, 9K10, 10T, 10K, 10K1, 13K, 15K. Reverse Red and Blue leads to Terminal Board of C9-6, T9-9, T8-16, C8-17.

RADIO RECEIVERS USING 6C5 OR 6J5, 6C5G OR 6J5G. TUBE FOR FIRST AUDIO AMPLIFIER.

Stock No. 14179 Adaptor opens grid circuit, and inserts 2,700 ohm resistor in cathode of 6C5 or 6J5 tubes, for bias on Phono reproduction.

Stock No. 14180 Adaptor opens grid circuit of 6C5 or 6J5 tube.

Stock No. 14180 Adaptor necessary for RCA: C11-1, C13-2, T10-1, C11-3, C13-3.

Stock No. 14179 Adaptor necessary for RCA: C15-3, C15-4.

RADIO RECEIVERS WHOSE FIRST AUDIO AMPLIFIER TUBE IS OF THE GRID CAP TYPE.

RCA Receivers for which above method applies: 125, 128, 128E, 224E, 225, 226, T6-1, C6-2, T6-9, T7-5, C7-6, T7-12, C7-14, T8-14, C8-15, T8-18, C8-19, C8-20, C9-4, T9-10.

RADIO RECEIVERS WHERE RECEIVER VOLUME CONTROL IS TO BE USED TO ALSO CONTROL "PHONO" VOLUME.

RADIO RECEIVERS WHOSE FIRST AUDIO TUBE IS OF THE GRID CAP TYPE, AND FIXED BIAS FOR TUBE IS OBTAINED THROUGH GRID LEAD.

INTERMEDIATE FREQUENCY..... 455 kc

PILOT LAMP 1—Mazda No. 51, 6-8 volts, 0.2 amps.

POWER SUPPLY RATING
 105-125 volts, 50 cycles..... 55 watts
 105-125 volts, 60 cycles..... 55 watts

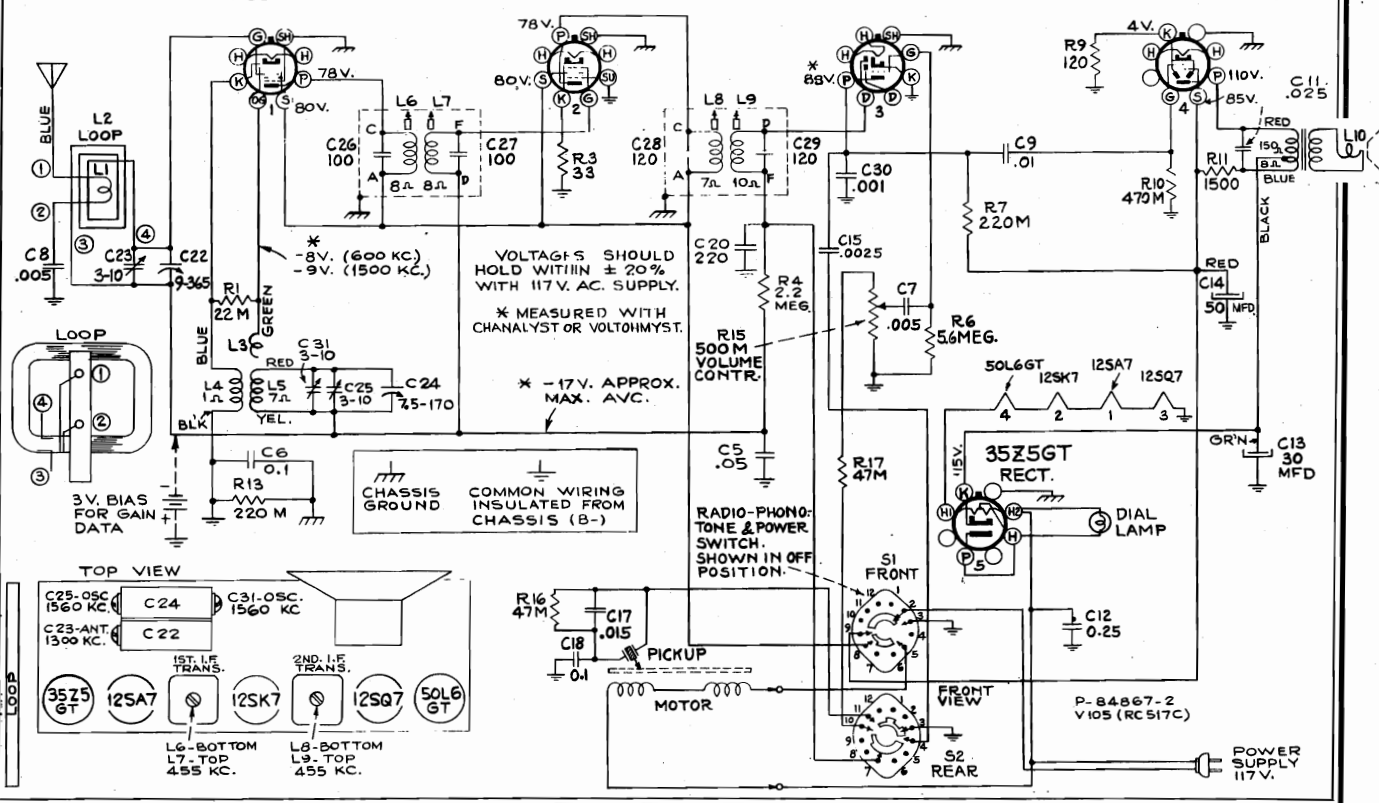

LOUDSPEAKER (RL-81B-4)
 Type..... 5-inch electrodynamic
 V.C. Impedance..... 4 ohms at 400 cycles

Phonograph Motor Service Data:—

The phonograph motor is of the self starting synchronous type and operates the turntable through friction drive between the motor drive spindle and the rubber tired idler on the rim of the turntable.

The motor should be lubricated once or twice a year by placing a few drops of S. A. E. 20 (or equivalent) on the turntable spindle and saturating the oil retaining felt pads on the motor shaft with S. A. E. 10 oil. **Caution**—The motor drive spindle and the rubber tire on the idler must be kept clean and entirely free from oil and grease at all times.

Power Supply.—Although this model employs an ac-dc chassis, it is not suitable for use on d.c., as this would damage the motor.

POWER OUTPUT

Undistorted..... 1.6 watts
 Maximum..... 3 watts

 - (6) TOTAL RECT. - - - 80.3 MA.

VOLTAGES SHOULD HOLD WITHIN ±20% WITH 117V. AC. SUPPLY.
* MEASURED WITH CHANNELYST OR VOLTOHMYST.

Alignment Procedure

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

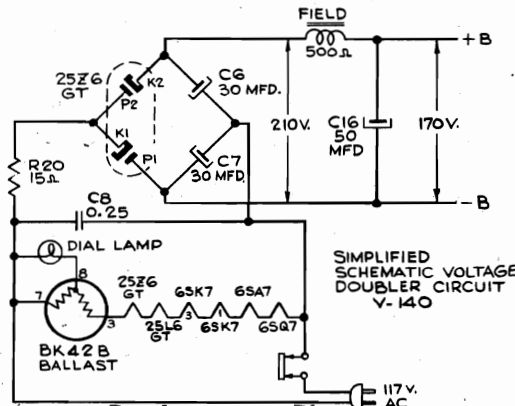

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the common negative, and keep the output as low as possible to avoid a-v-c action.

Electronic Voltmeter.—The electronic voltmeter in the Chanalyst or VoltOhmyst provides an unexcelled output indicator. It should be connected to the AVC bus, and the test-oscillator output adjusted to produce several volts of AVC.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the chassis for quick reference during alignment. In the event that only the chassis is returned for service, and the cabinet with its tuning dial is left in the customer's home, the scale printed in this service note can be used as an accurate and convenient substitute for the regular dial. With gang in full mesh, move the dial pointer to a point 1/16 inch to left of reference mark at left hand end of the dial backing plate. Place the dial under the pointer so that the extreme left scale graduation coincides with the pointer. Use scotch tape to hold the dial in place.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	I-F grid, in series with .01 mfd.	455 kc	Quiet point 1,600 kc end of dial	L9 and L10 2nd I-F transformer
2	1st Det. grid in series with .01 mfd.			L6 and L7 1st I-F transformer
3	Ant. terminal in series with 200 mmfd.	1,720 kc	Gang at minimum	C10 (osc.)
4	Radiated signal 1,500 kc		Signal Frequency	C1 (ant.)
5	Radiated signal near 600 kc		Signal Frequency	L5 (osc.) (Rock gang)
6	Repeat steps 3, 4 and 5.			

- 22,000 ohm R-10 i-f to audio isolating resistor to have end connecting to last i-f transformer as short as possible. Prevents i-f beats.
- First audio grid coupling capacitor C-23 and C-24 to be dressed close to chassis and away from heater wiring. Prevents hum.
- Dress phono power leads away from phono socket.

Replacement Parts

Critical Lead Dress:

- Lead from 6SK7 i-f plate to last i-f transformer to be dressed close to chassis and under all other leads. Prevents i-f beats.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the common negative wiring, and keep the output as low as possible to avoid a-v-c action.

Electronic Voltmeter.—The electronic voltmeter in the Chanalyst or VoltOhmyst provides an unexcelled output indicator. It should be connected to the AVC bus, and the test-oscillator output adjusted to produce several volts of AVC.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the chassis for quick reference during alignment. In the event that only the chassis is returned for service, and the cabinet with its tuning dial is left in the customer's home, the calibration scale printed full size in this service note can be used as an accurate and convenient substitute for the regular dial.

Each method is described below.

Using Tuning Dial.

1. Remove the glass dial from the cabinet.
2. With gang in full mesh, move the dial pointer to the reference mark at the left-hand end of the dial backing plate.
3. Place the glass dial under the pointer so that the extreme left scale graduations coincide with the pointer. Use scotch tape to hold the glass dial in this position.
4. After completion of alignment, replace the glass dial in cabinet.

Using Calibration Scale.

1. With gang in full mesh, move the dial pointer to the reference mark at the left-hand end of the dial backing plate.
2. Temporarily fasten the dial scale drawing in this service note, to the dial backing plate with scotch tape, so that the extreme left scale graduation coincides with the pointer.

Dial Pointer Adjustment.—After the chassis is replaced in cabinet move the dial pointer (if necessary) so that it is at the left-hand graduation on the dial with the gang in full mesh.

55 60 70 80 100 130 160

The dial scale drawing shown is a full size reproduction. It can be used as a direct substitute for regular dial scale in alignment procedure.

Critical Lead Dress

- (1) Dress bias cell up from chassis and away from A.C. switch.
- (2) Dress R13 (volume control compensation circuit) close to front apron.
- (3) Dress C9 between osc. coil and side apron.
- (4) Black lead from AC switch should be kept away from tone control leads and switch.
- (5) Dress R22, C32 (pickup compensation circuit) close to front apron.
- (6) Keep R4 and C5 bus (1st det. grid circuit) (socket end) as short as possible.
- (7) Blue lead to antenna terminal board should be dressed in back of I-F'S.
- (8) Dress brown lead from volume control to tone switch close to front apron.
- (9) Dress R18 (output grid circuit) away from A.C. switch and A.C. leads.
- (10) Dress lead to phono. socket up from chassis.

Steps	Connect the high side of test-osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for maximum peak output—
1	I-F Grid in series with .01 mfd.	455 kc	"A" Band 540 kc	L11, L12 (2nd I-F Trans.)
2	1st-Det. Grid in series with .01 mfd.			L9, L10 (1st I-F Trans.)
3	"A" terminal on ant. terminal board	15.2 mc	"C" Band 15.2 mc	C37 (osc.)* C34 (ant.)
4	in series with 47 mmf. (link open)	9.5 mc	"C" Band 9.5 mc	C1 (ant.) (Rock Gang)
5		Repeat steps 3 and 4.		
6	Middle terminal on ant. terminal board	1,500 kc	"A" Band 1,500 kc	C10 (osc.) C33 (ant.) (on loop)
7	in series with 200 mmf. (link open)	600 kc	"A" Band 600 kc	L7 (Rock Gang)
8		Repeat steps 6 and 7.		

* Use minimum capacity peak. Oscillator tracks 455 kc above signal on both bands.

Push Button Adjustments

The push buttons connect to separate magnetite-core oscillator coils and separate ant. circuit trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as RCA Stock No. 81081. Allow about five minutes warm-up period before making adjustments.

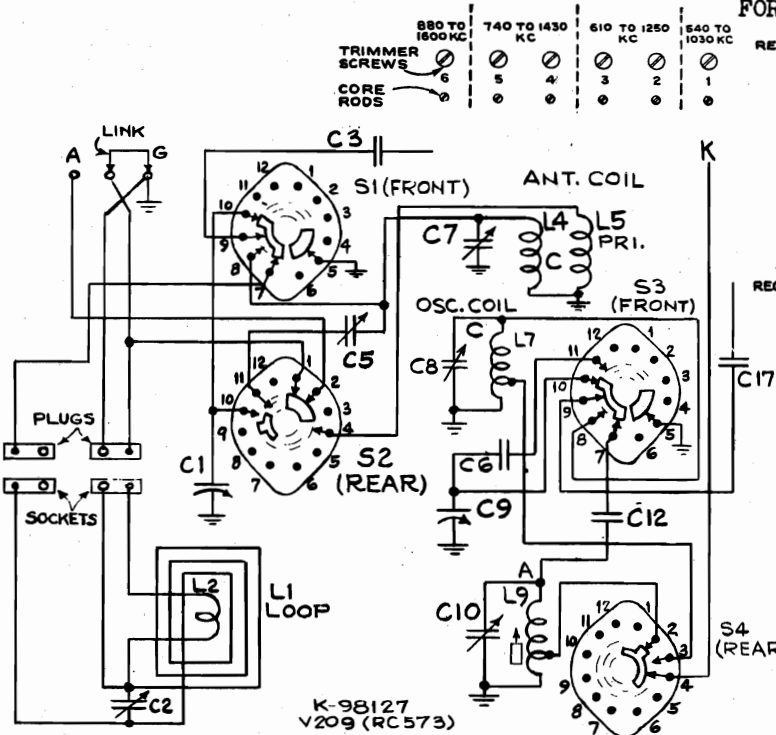

The procedure is as follows:

1. Make a list of the desired stations, arranged in order from low to high frequencies.
2. Turn the range switch to the broadcast position and manually tune in the first station on the list.
3. Turn range switch to push-button position and press in the left-hand button.

4. Adjust No. 1 oscillator core to receive the first station. To secure the best adjustment, rotate the set for least pickup, and adjust core for peak output.
 5. Adjust No. 1 antenna trimmer capacitor for peak output on the first station.
 6. Proceed in the same manner to adjust for the remaining stations.
- On the 880 to 1,600 kc push-button, the higher frequency stations may be received with osc. core either in or out (oscillator frequency either 455 kc below or 455 kc above the station frequency). The adjustment with this core in its out position (oscillator frequency 455 kc above the station frequency) is the correct one.

NOTE: Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.

FOR CHANGE IN MODEL V-209 SEE NEXT PAGE

The dial scale drawing shown is a full size reproduction. It can be used as a direct substitute for regular dial scale in alignment procedure.

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Electronic Voltmeter.—The electronic voltmeter in the Chanalyst or VoltOhmyst provides an unexcelled output indicator. It should be connected to the AVC bus, and the test-oscillator output adjusted to produce several volts of AVC.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the chassis for quick reference during alignment. In the event that only the chassis is returned for service, and the cabinet with its tuning dial is left in the customer's home, the scale printed in this service note can be used as an accurate and convenient substitute for the regular dial.

Using Tuning Dial.—

1. Remove glass dial from the cabinet.
2. With gang in full mesh, move the dial pointer to a point 1/16 inch to left of reference mark at left hand end of the dial backing plate.
3. Place the glass dial under the pointer so that the extreme left scale graduation coincides with the pointer. Use scotch tape to hold the glass dial in place.

"C" Band Reception.—For best reception on "C" band with an outside antenna, adjust the trimmer screw on the RF coil on the chassis. Turn screw carefully with a special screwdriver (RCA Stock No. 31031) while the receiver is tuned to a station in the 31-meter band, and make setting for best reception. If returning to internal antenna at any time, close the link on the center terminal and adjust "C" band antenna trimmer for best reception on 31-meter band.

Steps	Connect test-osc. output to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output—
1	I-F grid in series with .01 mfd.	455 kc	"A" band 540 kc	L12 and L13 (2nd I-F trans.)
2	1st Det. grid in series with .01 mfd.			L10 and L11 (1st I-F trans.)
3	A-Terminal in series with 47 mmfd. (link closed)	15.2 mc	"C" band 15.2 mc	C8 (osc.)* C7 (ant.)
4		9.5 mc	"C" band 9.5 mc	C5 (ant.) (Rock gang)
5	Repeat steps 3 and 4			
6	Yellow loop lead in series with 200 mmfd. (link closed)	1,500 kc	"A" band 1,500 kc	C10 (osc.)
7		600 kc	"A" band 600 kc	L9 (osc.)
8	Repeat steps 6 and 7			
9	Install and connect chassis in cabinet with antenna link closed. Tune in a radiated oscillator signal at 1,500 kc. and peak the "A" band trimmer C2 (on loop). Rock in L9 for peak output at 600 kc.			

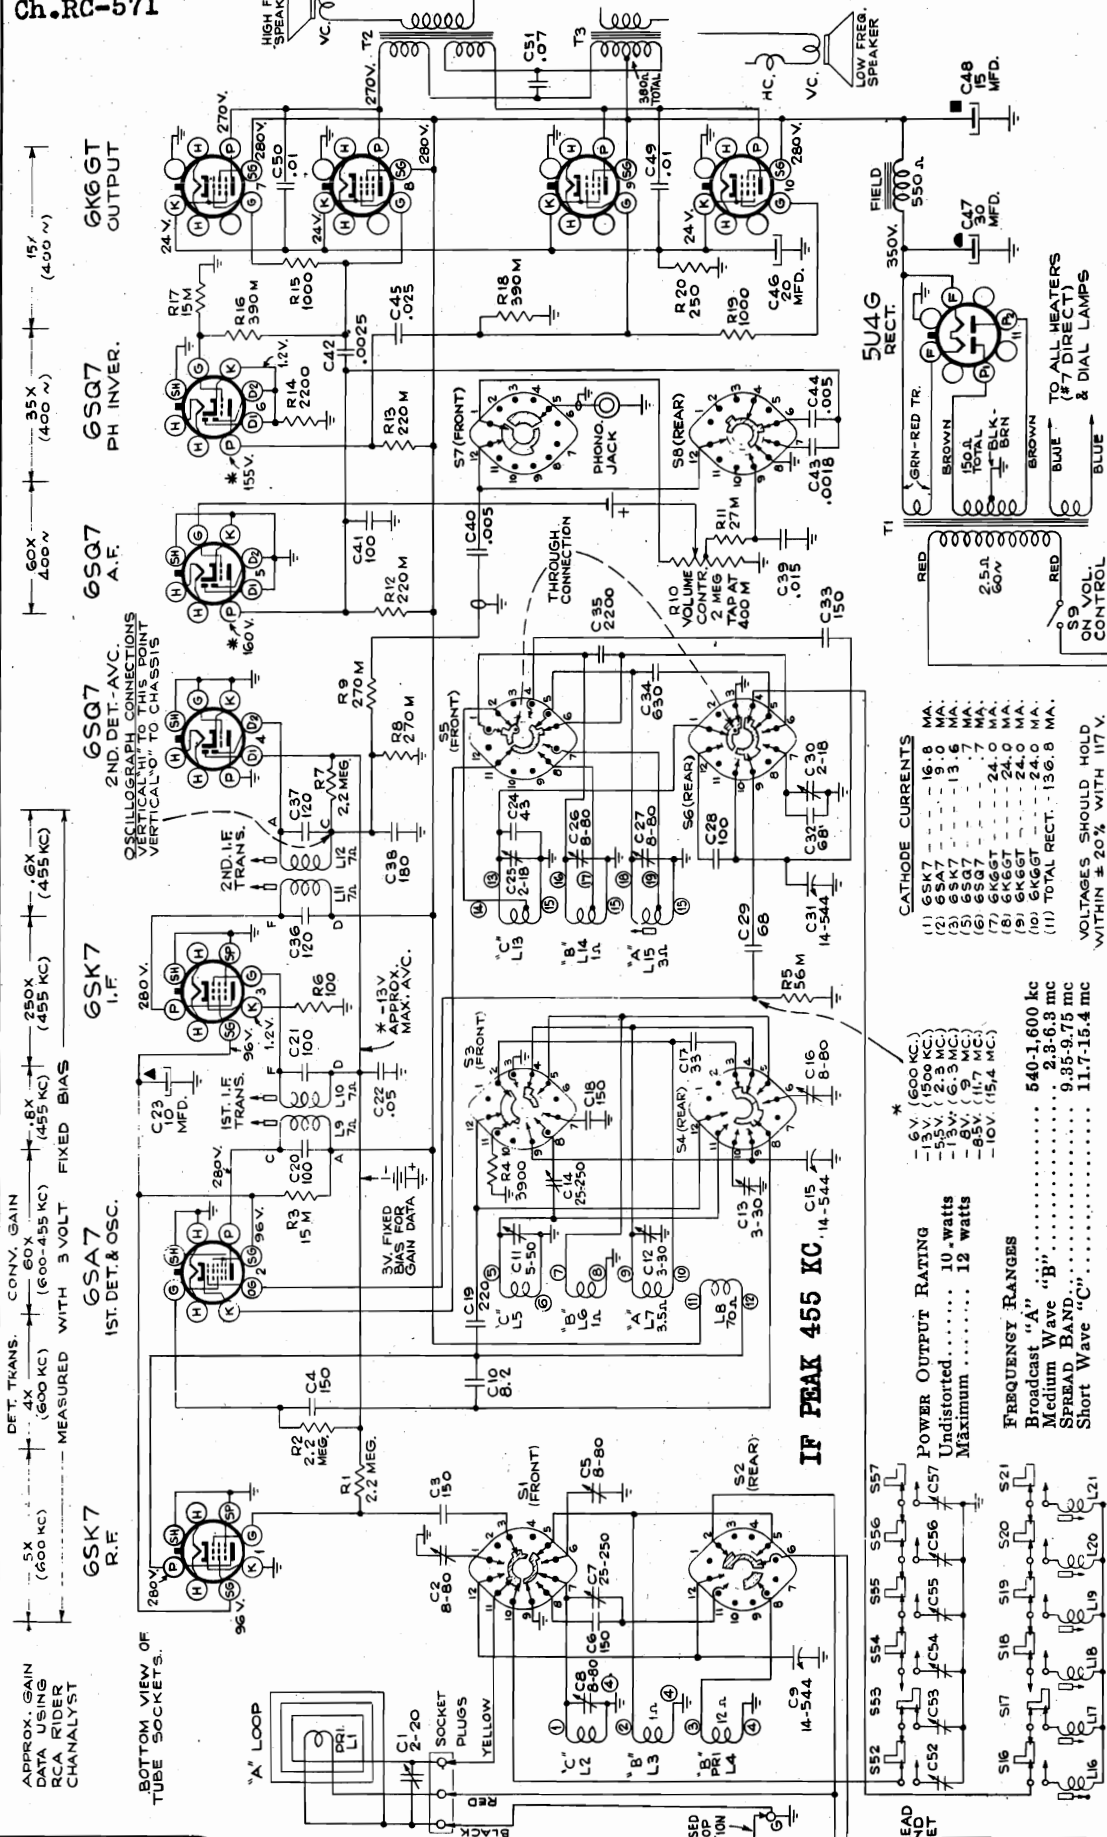

*Use minimum capacity peak if two peaks can be obtained. Oscillator tracks 455 kc. above signal on all bands.

Critical Lead Dress:

1. Bus from "C" oscillator coil to range switch must be held to length and dressed close to coil.
2. C30 (audio coupling capacitor to volume control) should be dressed close to front apron.
3. A.C. cord and motor leads must be dressed away from phono and F.M. jack.
4. Excess trans. leads to be dressed between trans. and rectifier socket.
5. Keep R5, C16 bus (in grid circuit of 6SA7 tube) as short as possible.
6. Dress C28 (in plate circuit of 1st A.F.) close to socket.
7. Keep R15 (grid resistor) C34 (coupling capacitor of output tube) close to socket.
8. Keep C23 (tone compensating capacitor) close to back apron.
9. Keep R15, C48 (in tone compensating circuit) close to front apron.
10. Dress green lead from osc. coil to trimmer close to oscillator coil.
11. Dress cable from phono. socket to phono. switch up away from base.
12. Dress red A.C. leads away from I.F. trans. and 6SQ7 socket.
13. RF choke in plate of 6SG7 must be dressed toward back apron.

POWER OUTPUT RATING

Undistorted 10 watts
Maximum 12 watts

FREQUENCY RANGES

Broadcast "A" 540-1,600 kc
Medium Wave "B" 2.3-6.3 mc
SPREAD BAND 9.35-9.75 mc
Short Wave "C" 11.7-15.4 mc

INTERMEDIATE FREQUENCY LOUDSPEAKER (RL-70L-4)

Type 12-inch Electrodynamic
V.C. Impedance 2.2 ohms at 400 cycles

PRECAUTIONARY LEAD DRESS

1. Dress all filament wiring away from output grids.
2. Leads from electrolytic to rectifier should be dressed so that all excess wire is at the socket side.
3. Speaker leads should be dressed down close to the chassis base and away from the phono plug.

FOR SPEAKER PHASING DATA, SEE MODEL 29K2

4. Dress all excess power transformer leads between chassis and transformer down close to the chassis.
5. Dress pilot light leads under A.C. cord.
6. Dress audio grid lead from tone switch to No. 2 pin of 6SQ7 and bias cell away from diode lead.

LOUDSPEAKER (RL-81B-6)
Type 5-inch Permanent Magnet
V.C. Impedance 3 ohms at 400 cycles

MEASURED WITH CHANNELYST OR VOLTOHMVST.

PRECAUTIONARY LEAD DRESS

1. Dress all filament wiring away from output grids.
2. Leads from electrolytic to rectifier should be dressed so that all excess wire is at the socket side.
3. Speaker leads should be dressed down close to the chassis base and away from the phono plug.

RANGE SW. VIEWED FROM FRONT AND SHOWN IN P.B. (MAX. COUNTER-CLOCKWISE) POSITION.

ANT LEAD AROUND CABINET

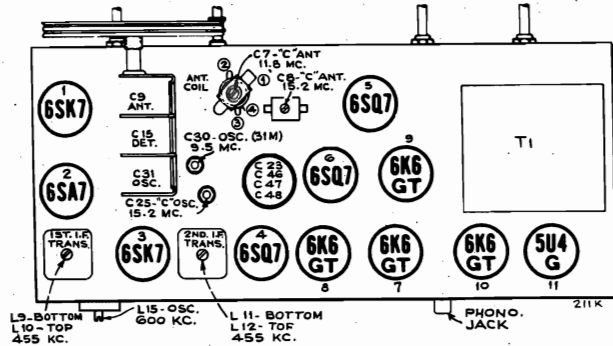

RCA MFG. CO., INC.

Calibration for Alignment.—

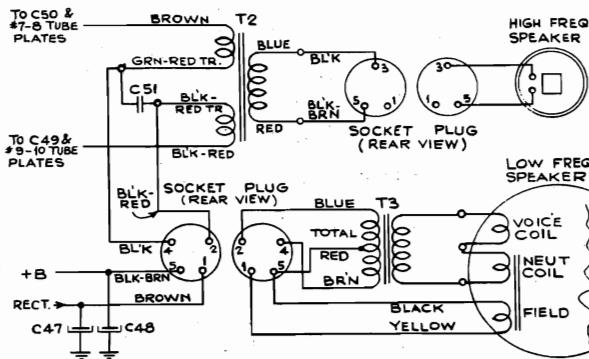

A calibration scale is attached to the tuning drum. The correct setting of the gang, in degrees, for each alignment frequency is given in the alignment table. Check the position of the drum, making sure that the 140 degree scale mark is directly above condenser shaft when the gang is at minimum setting.

Pointer for Calibration Scale.—

Improvise a pointer for the calibration scale by fastening a piece of wire to the chassis, and bend the wire so that it points to 0 degree mark on the calibration scale when the plates are fully meshed.

Below.—Speaker Wiring Diagram.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Electronic Voltmeter.—The electronic voltmeter in the Chanalyst or VoltOhmyst provides an unexcelled output indicator. It should be connected to the AVC bus, and the test-oscillator output adjusted to produce several volts of AVC.

Push Button Adjustment.

The station push buttons connect to separate magnetite-core oscillator coils and separate antenna trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as RCA Stock No. 31031. Allow at least five minutes warm-up period before making adjustments.

In the event that the receiver is to be used with an external antenna use one or two feet of wire (as an antenna) to ensure sharp peaking during the final adjustment procedure. For loop operation, the link should be strapped across terminals on back of set. In either case the procedure is as follows:

1. Make a list of the desired stations, arranged in order from low to high frequencies.
2. Turn the range selector to "A" band, and manually tune in the first station on the list.
3. Turn range selector to "PB" position, push in station button No. 1 (extreme left). Then adjust the No. 1 oscillator core to receive the station.
4. After oscillator core is set correctly, adjust No. 1 antenna trimmer for maximum output.

POWER SUPPLY RATINGS

105-125 volts, 50-60 cycles	140 watts
105-125 volts, 25-60 cycles	140 watts

External Antenna.—When using an External Antenna, Peak C7 for max. output on a station in the 31-meter band.

Steps	Connect the high side of the test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output—
1	I-F grid in series with .01 mfd.	455 kc	Quiet Point on "A" Band	L-11 and L-12 (2nd I-F Trans.)
2	1st Det. grid in series with .01 mfd.			L-9 and L-10 (1st I-F Trans.)
3	Yellow loop lead in series with 200 mmf.	1,500 kc	1,500 kc (160°) "A" Band	C-27 (osc.) C-12 (det.)
4		600 kc	600 kc (30.5°)	L-15 (osc.) Rock
5	Repeat steps 3 and 4.			
6	Antenna terminal (A) in series with 47 mmfd. (link open)	6,100 kc	6,100 kc (161°) "B" Band	C-26 (osc.)* C-13 (det.) Rock C-2 (ant.) Gang
7		15.2 mc	15.2 mc (165°) "C" Band	C-25 (osc.)* C-11 (det.) Rock C-8 (ant.) Gang
8		11.8 mc	11.8 mc (52°) "C" Band	C-7 (ant.) C-14 (det.) Rock Gang
9	Repeat steps 7 and 8.			
10		9.5 mc	9.5 mc (87.5°) 31M-Band	C-30 (osc.)* C-5 (ant.) Rock C-16 (det.) Gang
11	Fasten chassis in cabinet, close ant. link, adjust indicator to left-hand end of dial scales with gang closed.			
12	Radiation loop consisting of two turns of wire 18 inches in diameter located 4 to 6 feet from receiver	1,500 kc	1,500 kc signal "A" Band	C-1 (ant.) on loop
13		600 kc	600 kc signal "A" Band	L-15 (osc.) Rock Gang
14	Repeat steps 12 and 13.			

* Use minimum capacity peak if two peaks can be obtained. Note: Oscillator tracks 455 kc above signal on all bands.

Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.

5. Adjust for each of the remaining stations in the same manner.
6. Make a final careful adjustment of the oscillator cores and antenna trimmers.

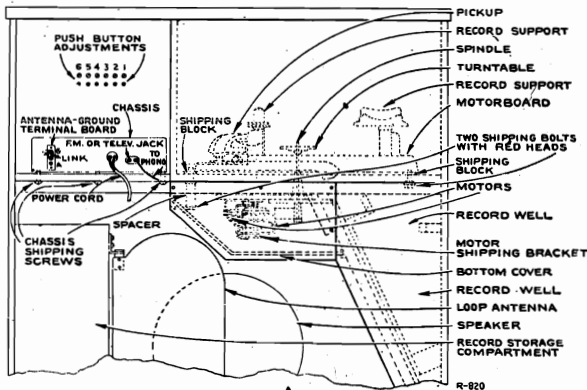

On the 880 to 1,600 kc push-button, the higher frequency stations may be received with No. 1 oscillator core either in or out (oscillator frequency either 455 kc below or 455 kc above the station frequency). The adjustment with this core in its out position (oscillator frequency 455 kc above the station frequency) is the correct one.

RECORD CHANGER SLIDE MECHANISM (Models V-215, V-221)

An adjustment is located on each of the rear legs so that the angle of the cabinet may be adjusted to allow the record changer to slide out easily. Adjust so that the changer rolls out of the cabinet to a gradual stop at the front edge of the opened door.

AUTOMATIC PHONOGRAPH RP-151 for V-225
 Type Pickups..... (2) Crystal
 Record Capacity..... Fifteen 10-in or Twelve 12-in.
 Power consumption turntable drive motor... (14) watts
 Power consumption cycle motor..... (38) watts

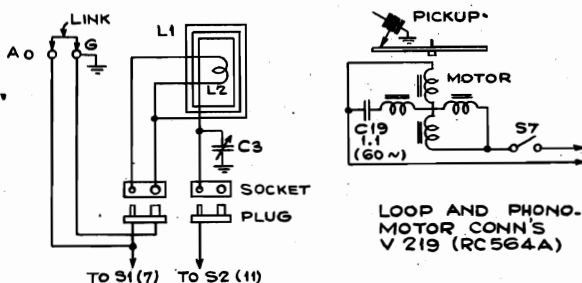

ELECTRIC TUNING

No. of Stations	Frequency Range (kc)
1	540-1,080 kc
2	610-1,250 kc
2	740-1,430 kc
1	880-1,600 kc

For all Models

External Antenna.—For best reception on “C” band with an external antenna, peak the trimmer on “C” antenna coil for maximum output on a station in the 31-meter band.

Removing Mechanism

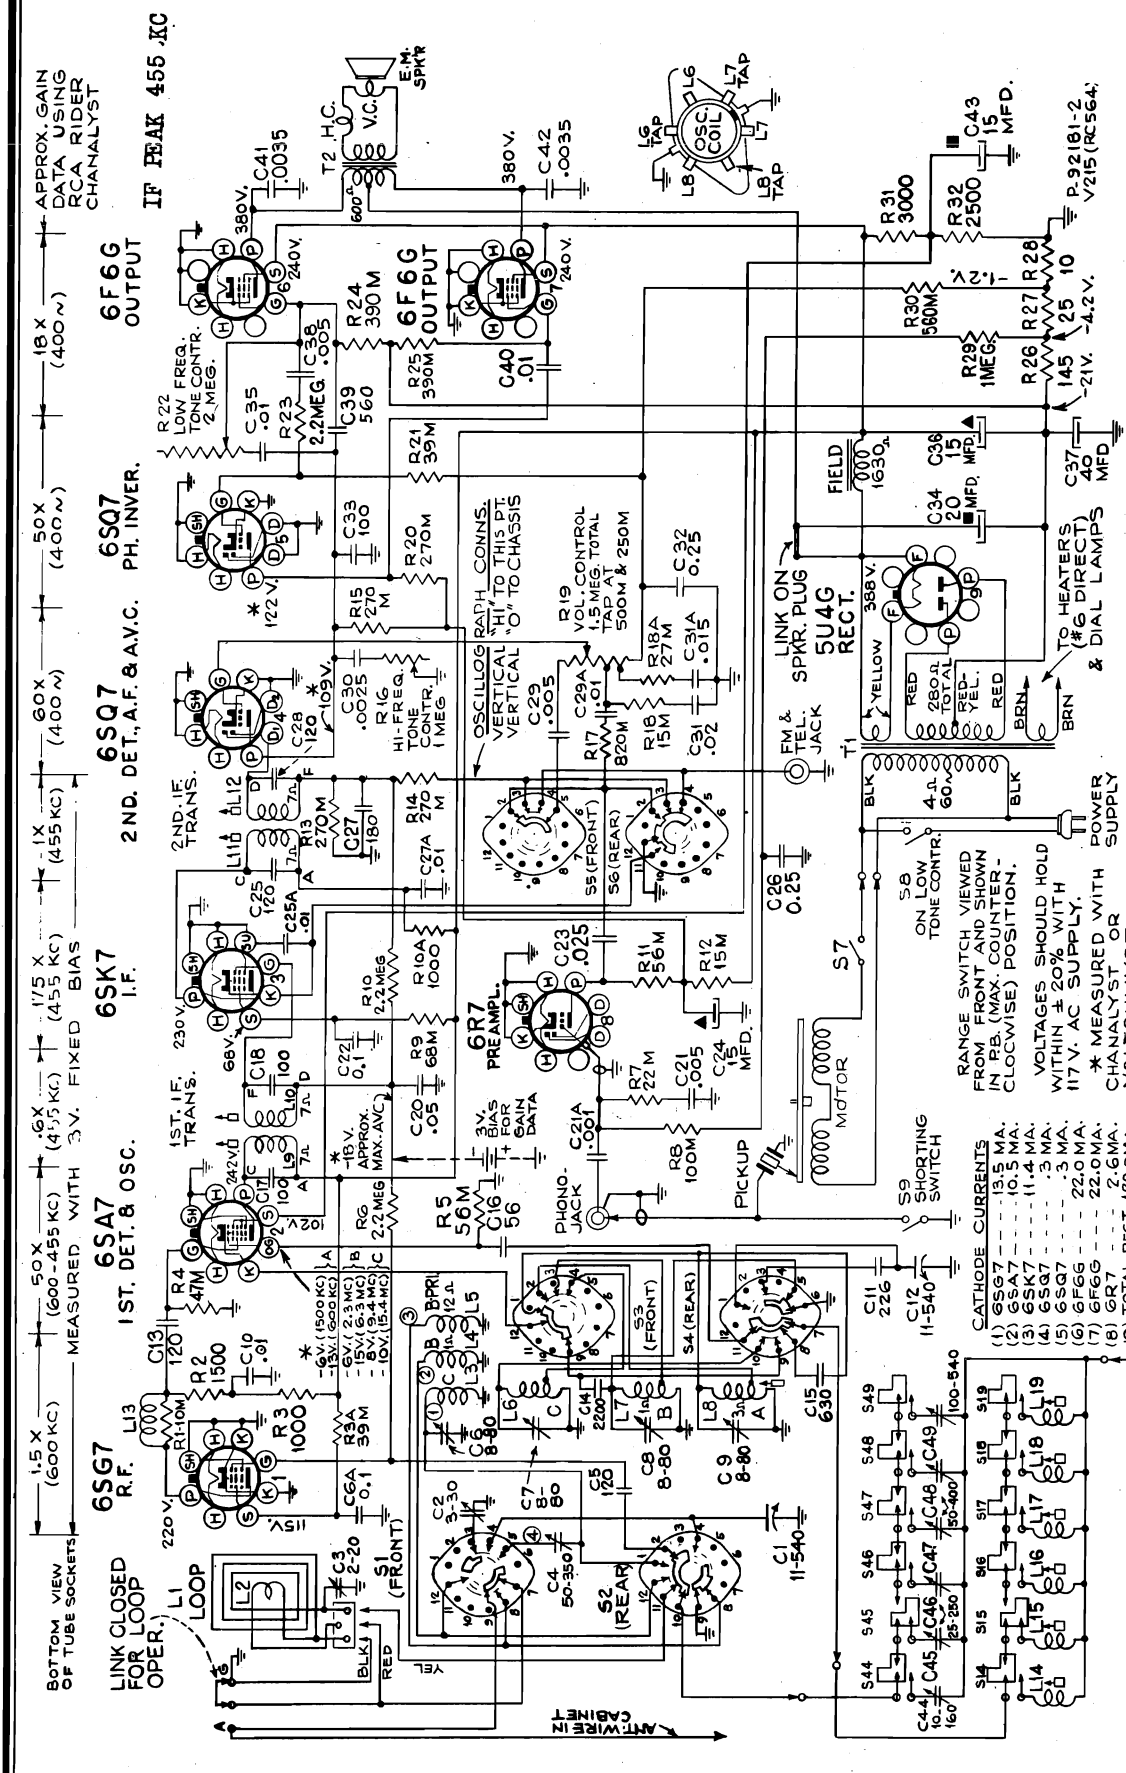

- Unplug the power cord and pickup cord.
- Reach in behind the motor board and lift up the two metal tabs which act as stops and prevent the record changer from sliding out.
- Loosen the cable clamp holding the two cables in place.
- Pull the record changer out of the instrument.

RCA MFG. CO., INC.

The dial scale drawing shown is a full size reproduction. It can be used as a direct substitute for regular dial scale in alignment procedure.

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Electronic Voltmeter.—The electronic voltmeter in the Chanalyst or VoltOhmyst provides an unexcelled output indicator. It should be connected to the AVC bus, and the test-oscillator output adjusted to produce several volts of AVC.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the chassis for quick reference during alignment. In the event that only the chassis is returned for service, and the cabinet with its tuning dial is left in the customer's home, the full size calibration scale printed in this service note can be used as an accurate and convenient substitute for the regular dial.

Using Tuning Dial.—

1. Remove the dial glass from the cabinet.
2. With gang at full mesh move the pointer to a point (1/16) inch to the left of the reference mark at the left hand end of the dial backing plate.
3. Place the glass dial under the pointer so that the extreme left scale graduations coincide with the pointer. Use scotch tape to hold the glass dial in place.

Using Dial Scale Printed In This Service Note.—

Follow the procedure above, substituting the dial scale printed in this service note for the glass dial in the cabinet.

Steps	Connect high side of test osc. to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output—
1	I-F grid in series with .01 mfd.	455 kc	"A" Band 540 kc	L12, L11 (2nd I-F Trans.)
2	1st Det. grid in series with .01 mfd.			L10, L9 (1st I-F Trans.)
3	Yellow loop lead in series with 200 mmf. (link closed)	1,500 kc	"A" Band 1,500 kc	C9 (osc.)
4		600 kc	"A" Band 600 kc	L8 (osc.)
5	Repeat steps 3 and 4			
6	Ant. terminal in series with 47 mmf. (link closed)	6.1 mc	"B" Band 6.1 mc	C8 (osc.)* C2 (ant.)
7		15.2 mc	"C" Band 15.2 mc	C7 (osc.)* C6 (ant.)
8		9.5 mc	"C" Band 9.5 mc	C4 (ant.)
9	Repeat steps 7 and 8			
10	Install and connect chassis in cabinet, with link closed. Tune in a radiated oscillator signal at 1,500 kc and peak the "A" band ant. trimmer C3 (on loop). Rock in L8 for peak output at 600 kc.			

* Use minimum capacity peak if two peaks can be obtained. Oscillator tracks 455 kc above signal on all bands.

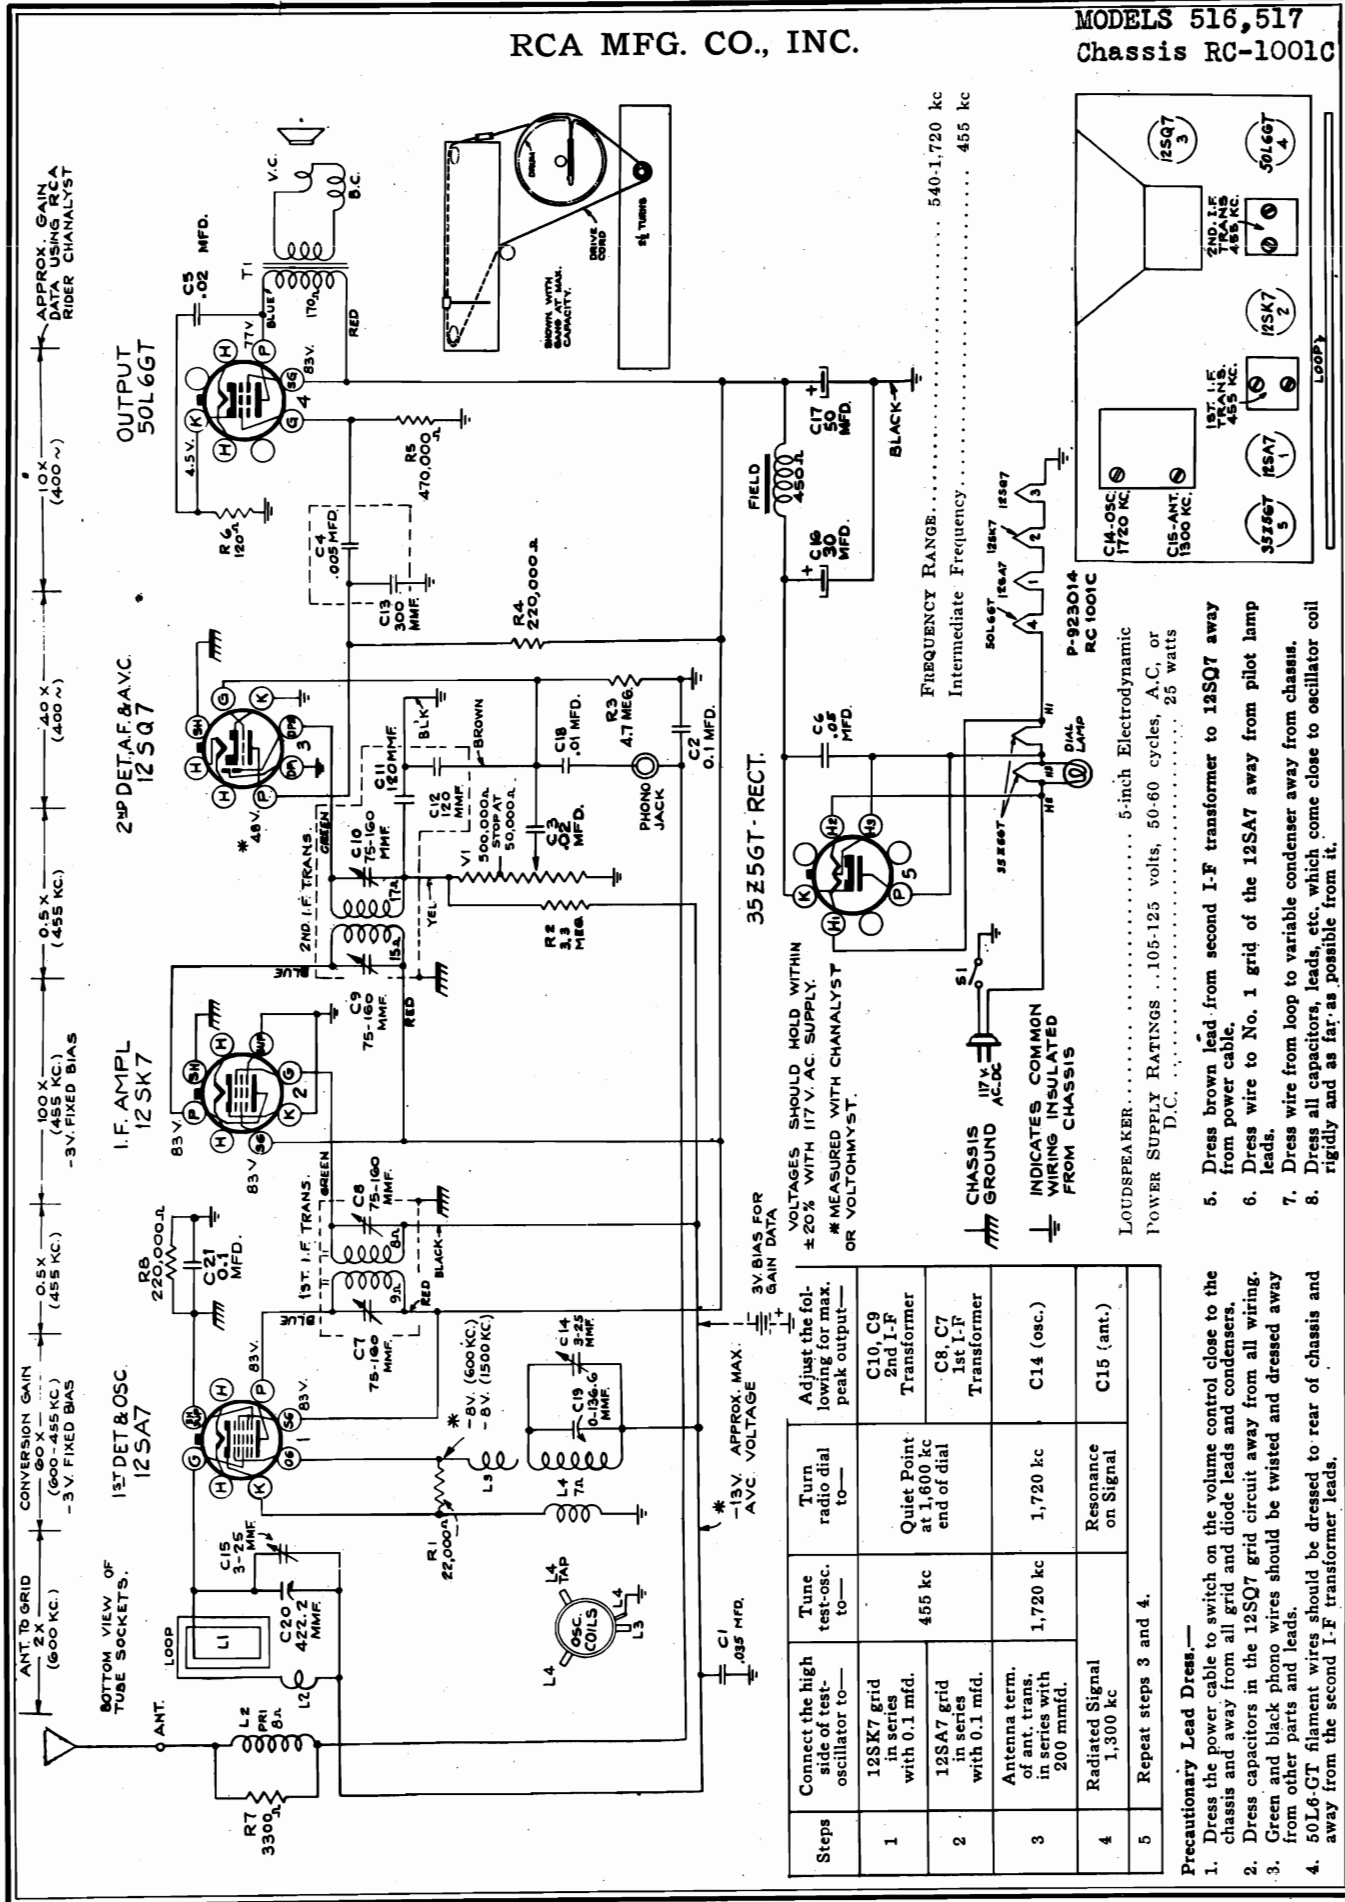

Critical Lead Dress

1. Push button, R.F. and oscillator leads should be separated as much as possible to reduce degeneration on push button reception.
2. R.F. choke in plate circuit of 6SG7 should be dressed towards the back apron.
3. Dress green push button lead under clamp and away from "C" band series capacitor.
4. Dress heater leads away from grids and diodes.
5. Dress phono. cables up and away from all wiring.
6. Dress all excess leads from transformer towards back towards transformer.
7. Keep output plate leads short and dressed close to chassis.
8. Dress green lead from 6SA7 screen to electrolytic down close to chassis.
9. Dress "C" band coil lead from oscillator coil to range switch down towards green lead.
10. Keep yellow loop lead clear of all wiring.
11. Dress ground bus of large electrolytic away from mounting lug.
12. Remove all excess slack from pilot light assembly and dress it close to chassis base away from volume control.
13. Dress oscillator grid capacitor (56 mmfd.) up and away from the screen and plate of 6SA7 socket.
14. A-C leads to "off-on" switch should be kept away from tone control cable to reduce hum.
15. Peaking coil should be dressed away from R-F grid resistor to reduce degeneration in R-F stage.
16. Dress oscillator push button lead in weld clamp on front apron away from 220 mmf. series condenser.
17. Keep all leads away from Phono-FM jack to prevent audio oscillation and hum. Dress underneath the shield provided.

PRECAUTIONARY LEAD DRESS.—

1. Dress the power cable to switch on the volume control close to the chassis and away from all grid and diode leads and condensers.
2. Dress capacitors in the 12SQ7 grid circuit away from all wiring.
3. Green and black phono wires should be twisted and dressed away from other parts and leads.
4. 50L6-GT filament wires should be dressed to rear of chassis and away from the second I-F transformer leads.
5. Dress brown lead from second I-F transformer to 12SQ7 away from power cable.
6. Dress wire to No. 1 grid of the 12SA7 away from pilot lamp leads.
7. Dress wire from loop to variable condenser away from chassis.
8. Dress all capacitors, leads, etc. which come close to oscillator coil rigidly and as far as possible from it.

FREQUENCY RANGE

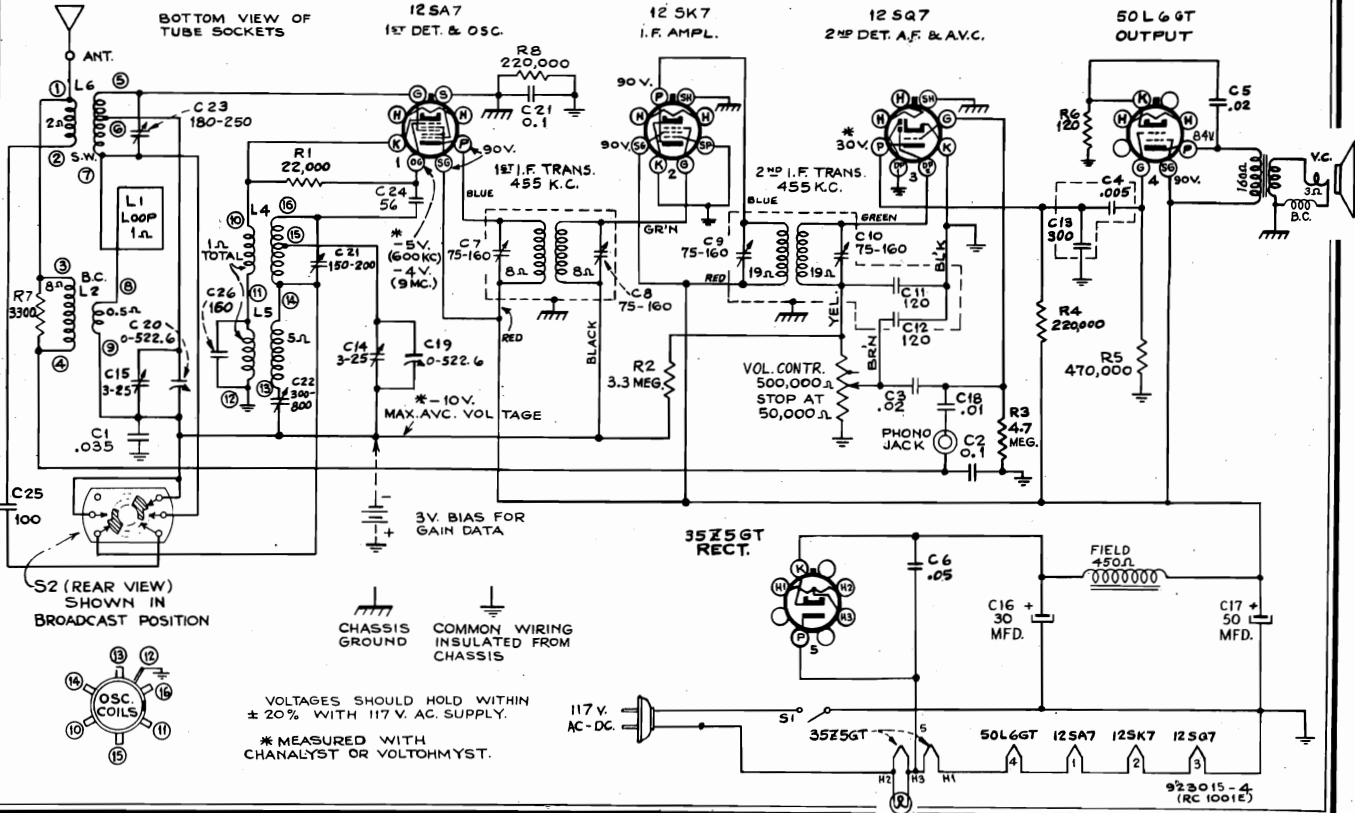

Broadcast Band 535-1,720 kc
Short Wave Band 8.9 mc to 12 mc.

INTERMEDIATE FREQUENCY 455 kc

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output—
1	12SK7 grid in series with 0.1 mfd.	455 kc	Quiet Point at 1,600 kc end of dial	C10, C9 2nd I-F Transformer

POWER OUTPUT

Undistorted..... 0.9 watts
Maximum..... 1.2 watts

Output Meter Alignment.—Connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—Connect the low side of the test-oscillator to the receiver chassis, through a .01 mfd. capacitor, and keep the output as low as possible.

Phonograph Motor Service Data:—

The phonograph motor is of the self starting synchronous type and operates the turntable through friction drive between the motor drive spindle and the rubber tired idler on the rim of the turntable.

The motor should be lubricated once or twice a year by placing a few drops of S. A. E. 20 (or equivalent) on the turntable spindle and saturating the oil retaining felt pads on the motor shaft with S. A. E. 10 oil. **Caution**—The motor drive spindle and the rubber tire on the idler must be kept clean and entirely free from oil and grease at all times.

Power Supply.—Although this model employs an ac-dc chassis, it is not suitable for use on d.c., as this would damage the motor.

Model MI-4803 Type Pt-16
Pickup - Low Impedance
Voltage Rating of Motor - 105-125 volts AC

Frequency - 60 cycles
Power Consumption - 30 watts

PHONOGRAPH MOTOR

Synchronous motor is adjusted for either 33 1/3 or 78 rpm

AUTOMATIC SWITCH

MODEL MI-4810

This is the same as Model MI-4803 with these exceptions: MI-4810 has no reactor, L1; the frequency rating of the motor is 50/60 cycles.

TELEPHONE PLUG
A.C. POWER PLUG

- Dimensions: - 18" x 15" x 9" high
- Weight - 22 pounds
- Shipping Weight - 37 pounds
- Finish - Black Leatherette

MAGNETIC PICKUP

SWITCH

Pickup designed to match impedances from 60 to 500 ohms.

AUTOMATIC SWITCH

MODEL MI-4804
MODEL MI-4811

RCA MFG. CO., INC.

MODEL MI-4804

MODEL MI-4811

Type- PT-17

These two Double Turntable Phonographs are the same except that Model MI-4804 is for 60-cycle operation only and Model MI-4811 is for 50 or 60-cycle operation.

Pickups are designed to match impedances from 60 to 500 ohms

RCA MFG. CO., INC.

MODELS MI-4816, MI-4817,
MI-4818

The MI-4816, 4818 equipments are designed for regular Public Address use, while the MI-4817 is designed for Sound Truck (6 volt) operation. Standard, 78 rpm, records may be played on the MI-4816 and MI-4818. The MI-4817 has provision for changing the speed of the turntable to enable both 78 rpm and 33-1/3 rpm records to be played. A low-impedance (125 ohm) magnetic pickup is used, designed primarily to use chromium (RCA orange or green shank) needles. The output of the pickup is fed through a volume control into a standard phone plug, or, for permanent connection, the plug may be removed, and the wires soldered directly to the amplifier input. **CAUTION:** Connect only to the type power supply specified on name plate.

POWER RATINGS

MI-4816 105-125 volts, 60 cycles 30 watts
 MI-4817 6 volts, d.c. 35 watts
 MI-4818 105-125 volts, 50 cycles 30 watts
 Pickup Impedance 125 ohms
 Turntable Speeds ... MI-4816, 4818 78 rpm
 ... MI-4817...78 rpm and 33-1/3 rpm
 Dimensions (lid closed) 20" x 15" x 9" high
 Weight (Net)....22 lbs.; Weight (Shipping)....37 lbs.
 Finish Gray Wrinkle

Operation

To operate turntable - connect to proper power supply, place phono. plug into amplifier input, place record on turntable, set the speed selecting mechanism to the proper position to correspond to the type record used (MI-4817 only), then pull starting lever toward the front of the case, place pickup on record, and regulate volume as desired. To stop turntable, lift pickup arm, place it on the pickup rest, and the automatic switch turns the motor off. When transporting equipment, be sure the pickup arm is on the pickup arm rest.

For adjustments of magnetic pickup, see data on Model MI-12700.

MODELS MI-4829, MI-4829A

RCA MFG. CO., INC.

Operation

Figure 1—MI-4829

Height (with cover) 8½ inches
 Length 21⅓ inches
 Depth 18 inches
 Weight—net 32 pounds

General Description

The MI-4829 and MI-4829A are portable turntables for playing of laterally cut records up to 16 inches in diameter, at either 78 or 33⅓ r.p.m. They use a governor type motor which is adjustable over a wide range of speed, and operate on 105/125 volts 50 to 60 cycles. An output jack and shielded cable is provided for connection to an external amplifier. The MI-4829 is equipped with a high impedance crystal pickup. The MI-4829A uses a low impedance magnetic pickup for connection to 250-ohm amplifier inputs. Both have an integral volume control for controlling the input level to an external amplifier.

MI PICKUP	R-1	R-2	C-1
4829 Crystal	500,000	100,000	0.0025
4829A Magnetic	600	---	---

Average Overall Gain.....	Microphone Input, 116 db
	Phonograph Input, 77 db

General Description

The MI-12754 Sound Truck Equipment consists of a combined 25 watt amplifier-turntable assembly, two permanent magnet speakers and an MI-6228A microphone. This equipment may be used on a 6-volt D-C supply, or 110-volt A-C supply by merely changing the power supply cord and associated plugs. The A-C and D-C cords are supplied with the equipment. This equipment may be used for permanent or mobile installations.

Input.—There are two input channels with separate volume controls. Each channel has provision for high impedance phonograph or microphone input, and both channels may be used simultaneously.

Channel No. 1 has provision for either microphone or phonograph input. Microphone input to this channel is through the receptacle at the rear of cabinet marked "MIC. 1." Phono. input is either through the jack at the rear of the cabinet marked "PHONO." or through the receptacle marked "MIC. 1." Proper connections to the input plug can be determined from the schematic diagram. Both microphone and phono. pickup may be used simultaneously on this channel if provision is made for controlling the volume of the pickup separately.

The phono. pickup located on the cabinet is permanently connected to channel No. 2. If it is desired to use channel No. 2 for a microphone, then the microphone should be connected to the receptacle marked "MIC. 2," located at the rear of the cabinet. Both microphone and phono. cannot be used simultaneously, due to a possible difference in sound level, because no provision is made for controlling the volume of either one separately.

If additional phono. pickup is desired, for a-c operation the RCA R-93 or MI-4816 portable turntable phono. pickup may be used. For 6-volt d-c operation, the MI-4817 portable turntable may be used. For additional microphones, an RCA MI-4036 or an additional MI-6228A microphone may be used.

Due to the fact that the signal level of each channel is controlled electrically and not in the signal circuit, remote control is possible at any point removed from the amplifier at a distance not exceeding 2,000 ft. The remote control unit is available as a separate unit and is connected to the amplifier by a cable and plug which fits into a socket provided on the rear of the main amplifier case. The remote mixing controls available are: **MI-4123** which comes without cord or plug for use where the amplifier and wiring are permanently installed. **MI-4123A** which is identical to the MI-4123 except that a 30 ft. five conductor cable with plug attached, is included in this assembly. A 50 ft. extension cable with male and female plugs is stocked as **MI-4685**. **MI-45**, five conductor cable, is recommended for connecting the remote control to the amplifier. No. 18 R.C. wire may be used.

Two output receptacles are provided at the rear of the amplifier case. Output impedances of 4, 7½, 15, 60 and 250 ohms are available.

Remote Control Wiring

Microphones

Two recommended types of microphones are available for use with the MI-12754 amplifier. For orchestrations, and where close talking is not necessary, the RCA type **MI-4036** junior velocity microphone will give excellent results. The MI-4036 will operate into inputs of either 50, 250 or 15,000 ohms impedance, and therefore, by making the proper connections to the microphone transformer, the microphone can be used for the High Impedance input. For average announcing purposes the **MI-6228A Aerodynamic Microphone** is excellent. The output impedance of this microphone is 40,000

ohms. Thus it may be directly plugged into the microphone input jack on the amplifier.

Stands for the MI-4036 microphone are available as follows:

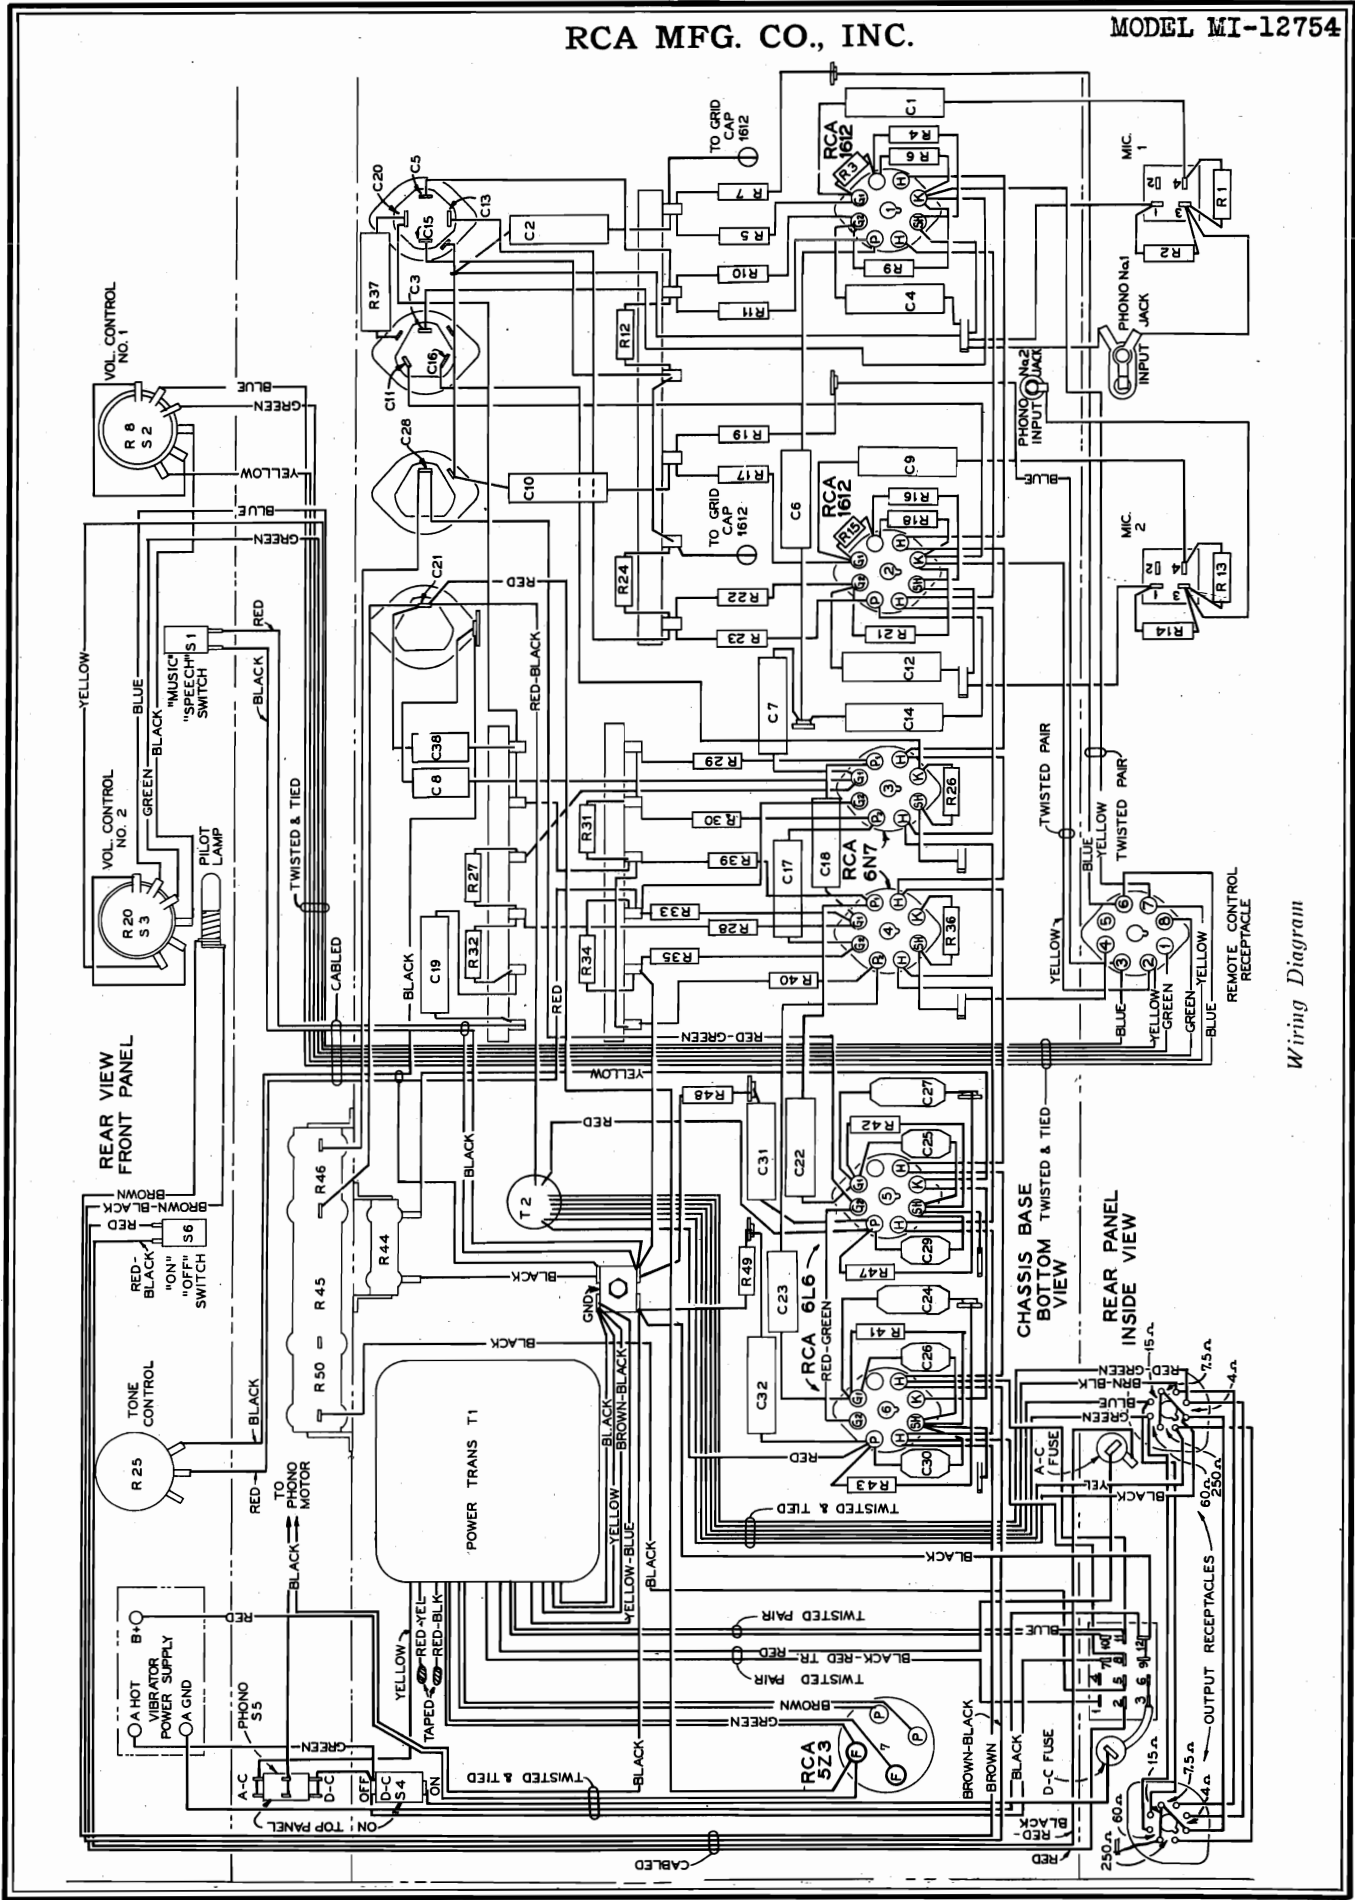

- Floor Stand..... **MI-4068-A**
- Table Stand..... **MI-4065-A**

Stands for the MI-6228-A are available as follows:

- Table Stand..... **MI-6227**

Schematic Diagram of Vibrator Supply

Wiring Diagram

RCA MFG. CO., INC.

The phono. motor should be oiled occasionally with a light grade of high quality oil, a few drops each month being sufficient. The oil wick is located near the turntable spindle, and is accessible through an opening in the top of the cabinet located under the turntable.

Operating Instructions

No. 1.—Set up amplifier assembly and speakers in location desired.

No. 2.—Plug a-c or d-c female plug into receptacle on rear of cabinet. If power supply is to be d-c, the switch at front left of cabinet should be thrown to the d-c position.

No. 3.—If remote control is to be used, plug in remote control at the rear center of the cabinet. If no remote control is to be used, plug in dummy plug supplied with equipment.

No. 4.—Plug in microphone No. 1 or microphone No. 2 as desired.

No. 5.—Turn "ON-OFF" switch to the "ON" position. A pilot light on the control panel shows when the amplifier is "ON".

No. 6.—Turn both volume controls to the complete counter-clockwise position, but do not snap to the remote position, unless remote control is to be used.

No. 7.—Turn tone control completely clockwise.

No. 8.—Bring volume up on the channel desired by turning the volume control slowly clockwise until the desired volume level is obtained. If microphone is to be used on "SPEECH," snap "MUSIC-SPEECH" switch to the "SPEECH" position. If phonograph is to be used, snap "MUSIC-SPEECH" switch to the "MUSIC" position.

No. 9.—Turn tone control slowly counter-clockwise until the desired tonal quality is obtained. For phonograph reproduction, the tone control should be turned until needle scratch is not objectionable.

No. 10.—To use turntable, when equipment is connected to d-c supply, snap phono. switch to "DC" position. To

The motor speed should be 78 r.p.m. and may be checked by placing a piece of paper between a record and the turntable, with the paper protruding slightly beyond the edge of the record, then counting the number of revolutions of the record per minute. The correct speed may be obtained by adjusting the speed regulating lever.

stop turntable, snap switch to "AC" position. A-C operation is the opposite.

The input receptacle marked "Microphone No. 1" may be used for either microphone or additional phonograph input if the input plug is connected as shown in the schematic diagram.

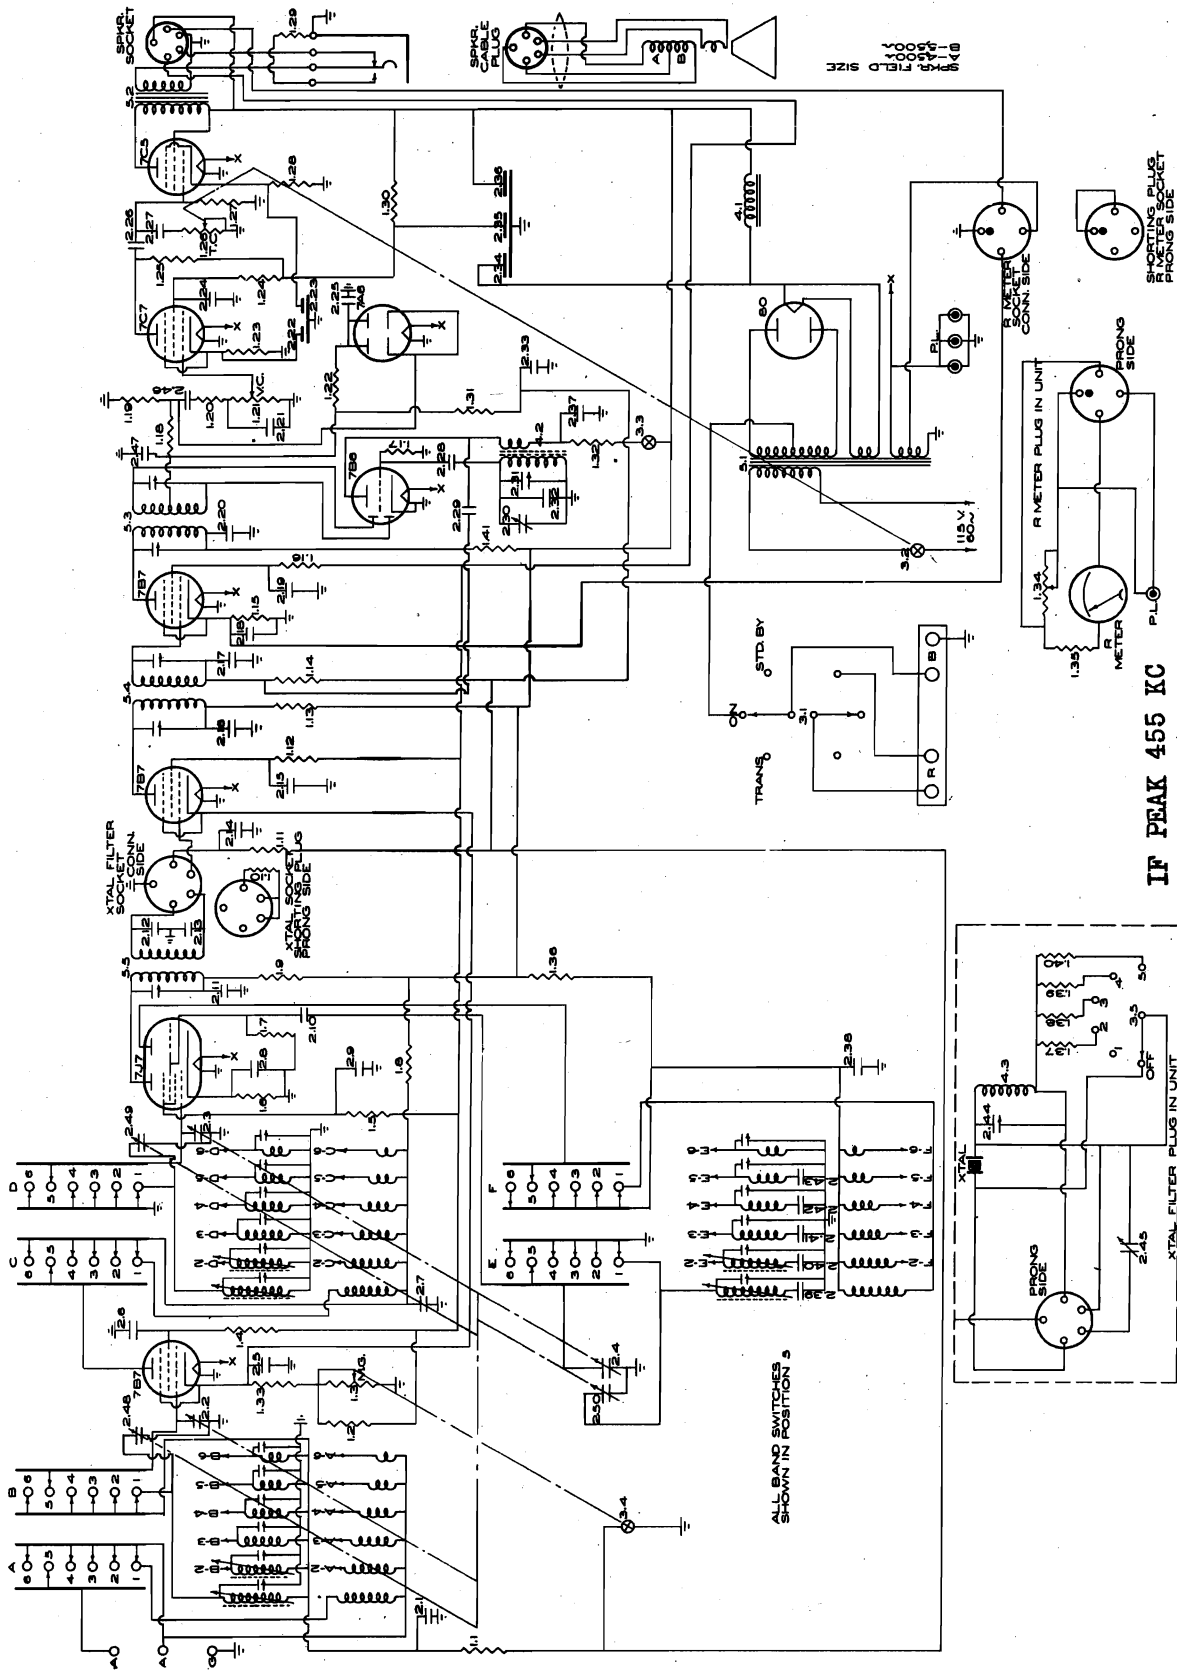

Care must be taken when plugging the speakers in, to match the correct speaker impedance to the correct output impedance. Each speaker supplied with this unit has 15 ohms impedance, and should be plugged into the 7.5 ohm terminals of the receptacles marked on the rear of the amplifier case when both speakers are used. The assembly screw on the speaker plug shows the proper indexing point for speaker impedance.

Other speakers than those supplied may be used with this equipment. However, care must be taken that the proper impedance match is kept between the speaker and the amplifier output. If only one speaker is desired to take the full output of the amplifier, an RCA MI-6260 speaker may be used. This speaker provides large coverage with high efficiency, and is ideally suited for outdoor mobile or permanent installations.

IMPORTANT: The clip of the d-c black power lead must always be connected to the GROUND side of the battery, irregardless of whether (+) or (-) side of battery is grounded. The vibrator should be inserted in its socket so that the (+) sign marked on the vibrator is toward the arrow on the metal cover if the (-) side of the battery is grounded to chassis. The (-) sign on vibrator should be toward the arrow on the cover if the (-) side of the battery is grounded to the chassis.

STOCK No.	DESCRIPTION	STOCK No.	DESCRIPTION
AMPLIFIER ASSEMBLIES			
30314	Cap—Grid cap for Radiotron	7900	Switch—"On-Off" power or "Music-Speech" switch (S-1, S-6)
12725	Capacitor—150 mmfd. (C-25, C-26)	30452	Tone Control—1 megohm (R-25)
12894	Capacitor—220 mmfd. (C-29, C-30)	30164	Volume Control and Switch—250,000 ohms (R-8, R-20, S-2, S-3)
12835	Capacitor—.001 mfd. (C-24, C-27)	MICROPHONE ASSEMBLY	
30303	Capacitor—.0035 mfd. (C-19)	MI-6228A	Microphone
4838	Capacitor—.005 mfd. (C-8)	MI-6227	Stand—Microphone stand
30852	Capacitor—.005 mfd. (C-31, C-32)	12035	Cable—30 ft. 2-conductor shielded cable
4858	Capacitor—.01 mfd. (C-7)	30052	Transformer—Microphone transformer
4870	Capacitor—.025 mfd. (C-17, C-18, C-22, C-23)	MOTOR ASSEMBLIES	
4886	Capacitor—.05 mfd. (C-1, C-4, C-6, C-9, C-12, C-14)	32036	Motor—A.C.-D.C. phonograph motor
12484	Capacitor—.25 mfd. (C-2, C-10)	32041	Plate—Metal support plate
32019	Capacitor Pack—10-10-10-10 mfd., 450 volts each (C-5, C-13, C-15, C-20)	32042	Plate—Rubber support plate
32021	Capacitor—20 mfd. (C-28)	32038	Pointer—Speed indicator pointer
32018	Capacitor Pack—20-20-20 mfd., 25 volts each (C-3, C-11, C-16)	32040	Tip—Turntable shaft tip
32020	Capacitor—30 mfd. (C-21)	32037	Turntable—10-inch turntable
4358	Clamp—Remote control plug locking clamp	MOTOR BOARD ASSEMBLIES	
10907	Fuse—3 amp. (F-1)	11762	Box—Needle box and lid
3646	Fuse—20 amp. (F-2)	32039	Dial—Speed indicator dial
30187	Jack—Phonograph input jack	32084	Rest—Pickup arm rest position bracket and spring
32058	Plug—8-contact male remote control plug	17507	Switch—D.P.D.T. Phonograph switch (S-5)
32057	Plug—12-contact male power plug	32070	Switch—D.P.S.T. Power switch (S-4)
32059	Post—Extraction fuse post	PICKUP AND ARM ASSEMBLIES	
30189	Resistor—120 ohms, $\frac{1}{2}$ watt (R-48, R-49)	14291	Armature—Pickup armature assembly
30197	Resistor—176 ohms, 25 watt (R-44)	11732	Coil—Pickup coil
30731	Resistor—1,200 ohms, $\frac{1}{2}$ watt (R-6, R-18)	14292	Damper—Pickup damper block with clamp and screw
30654	Resistor—1,500 ohms, $\frac{1}{2}$ watt (R-26, R-36)	32044	Pickup and Arm
30196	Resistor—6,200 ohms, tapped at 1,670, 3,590, 940 ohms (R-45, R-46, R-50)	31100	Pickup Unit only
13204	Resistor—8,200 ohms, 2 watt (R-38)	3811	Screw—Needle holding screw
3078	Resistor—10,000 ohms, $\frac{1}{2}$ watt (R-31)	SPEAKER ASSEMBLY	
30436	Resistor—12,000 ohms, $\frac{1}{2}$ watt (R-32)	32201	Cone—Speaker cone and voice coil, complete with dust cap
12759	Resistor—15,000 ohms, $\frac{1}{2}$ watt (R-2, R-14, R-34)	32202	Dust Cap—Dust cap for speaker cone
30685	Resistor—33,000 ohms, $\frac{1}{2}$ watt (R-4, R-9, R-16, R-21)	32200	Speaker—Complete
30787	Resistor—47,000 ohms, $\frac{1}{2}$ watt (R-12, R-24)	VIBRATOR POWER SUPPLY	
30650	Resistor—56,000 ohms, $\frac{1}{2}$ watt (R-3, R-15)	18075	Capacitor—.005 mfd., 1,600 volts
30225	Resistor—68,000 ohms, 2 watt (R-37)	18077	Capacitor—.05 mfd., 600 volts
5064	Resistor—82,000 ohms, $\frac{1}{2}$ watt (R-39, R-40)	18080	Capacitor—.5 mfd., 50 volts
3253	Resistor—100,000 ohms, $\frac{1}{2}$ watt (R-29, R-30)	18078	Choke—"A" choke coil
30493	Resistor—150,000 ohms, $\frac{1}{2}$ watt (R-10, R-22)	18079	Choke—R.F. choke coil
30651	Resistor—270,000 ohms, $\frac{1}{2}$ watt (R-41, R-42)	4436	Resistor—5,000 ohms, $\frac{1}{2}$ watt
30784	Resistor—330,000 ohms, $\frac{1}{2}$ watt (R-11, R-23, R-33, R-35)	18076	Transformer—Power transformer
30648	Resistor—470,000 ohms, $\frac{1}{2}$ watt (R-27, R-28, R-43, R-47)	18010	Vibrator—Plug-in unit
30161	Resistor—820,000 ohms, $\frac{1}{2}$ watt (R-7, R-19)	MISCELLANEOUS, CABLES & PLUGS, ETC.	
30162	Resistor—1.2 megohm, $\frac{1}{2}$ watt (R-1, R-5, R-13, R-17)	32098	Cable—A.C. power cable and plug
32055	Socket—4-contact socket for microphone plug	32101	Cable—D.C. power cable—less battery clips and socket
13318	Socket—4-contact insulated rectifier tube socket	32100	Cable—Speaker cable, less plug
31251	Socket—Octal base tube, output, or remote control socket	14289	Clip—1-set battery clips
14274	Socket—Pickup cable socket and ground plate	32054	Plug—Microphone plug
30195	Transformer—Output transformer (T-2)	25341	Plug—Power cord plug, 12 contact
32024	Transformer—Power transformer (T-1)	30188	Plug—Speaker cable plug, 8 contact
CONTROL PANEL ASSEMBLIES			
	Jewel—Pilot lamp jewel bracket and socket. Yaxley Mfg. Co. Cat. No. 310-R or equivalent; with red jewel.	30278	Screw—Cabinet thumb screw
30247	Knob—Volume control or tone control knob	32056	Socket—Power cable or battery cable socket
5226	Lamp—6.3 volt pilot lamp		
30198	Panel—Control panel only, less mounting

RADIO MFG. ENGINEERS, INC.

ALIGNING ADJUSTMENTS

RME-41/43

Low Frequency (Bands 1 and 2)

General Marconi connection.
Optimum condition exists when
 $A + B = \frac{\lambda}{4}, \frac{3\lambda}{4}, \frac{5\lambda}{4}, \dots$, etc.

Optimum signal input to receiver when $A = \frac{\lambda}{2}$, and feeder is tapered at proper distance from center. This antenna works quite well usually on even harmonics also.

Optimum condition when $A = \frac{\lambda}{2}$.
Not satisfactory for wide range frequency. Excellent for any amateur band if $A = \frac{\lambda}{2}$ is in the middle of the band. For example: For 20 meter band antenna should be designed for 14,200 KC. $A =$ Approximately 33 feet, direction at right angle from line of wire. Jumper "Y" can usually be omitted.

Dimensions same as those of C. Antenna good for one narrow band. (For example amateur band) is not directional.

NOTE: Large holes are padders, small holes are core adjustments.

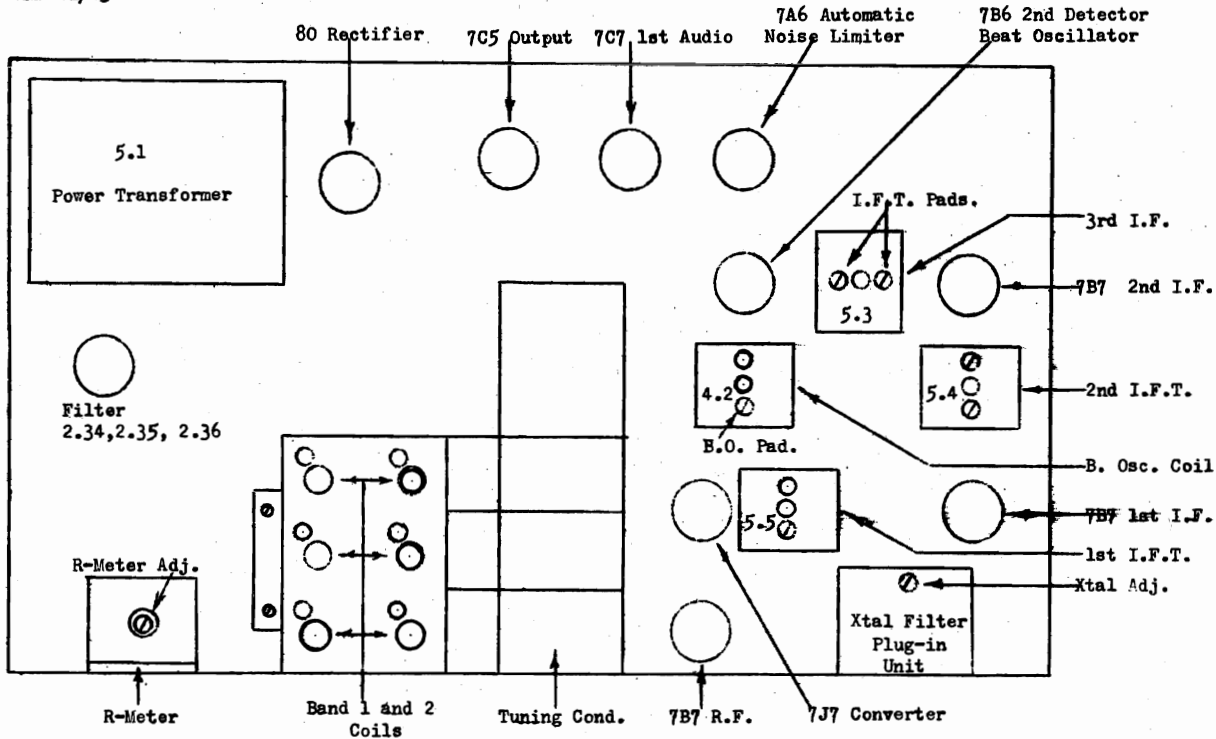

High Frequency (Bands 3,4,5 and 6)

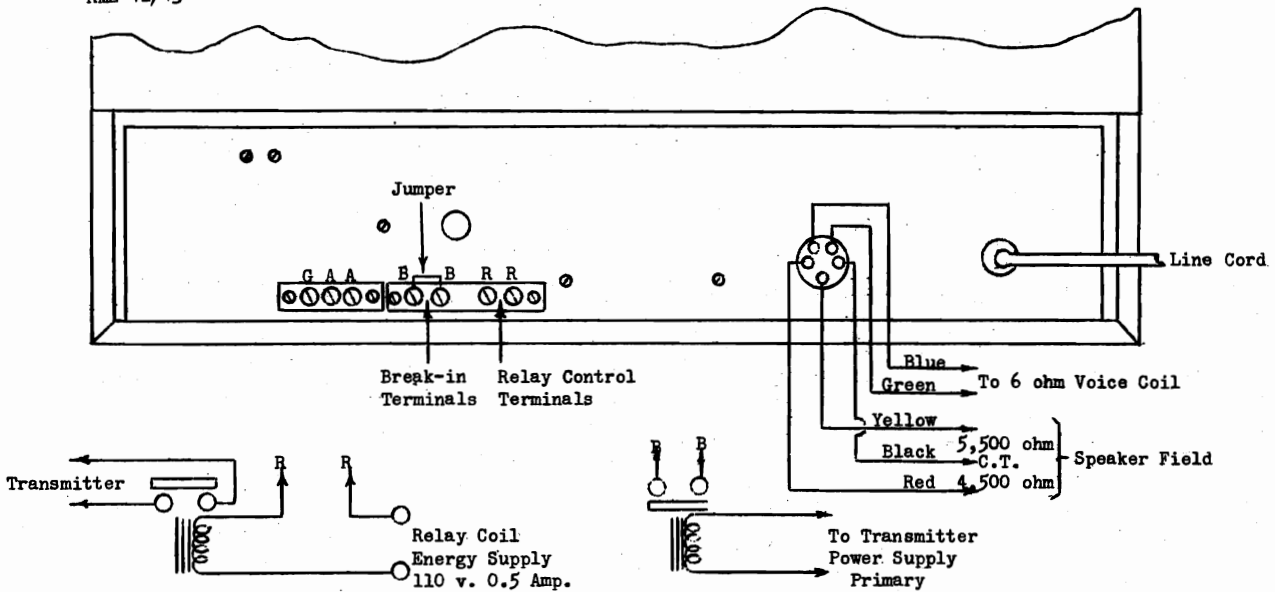

RADIO MFG. ENGINEERS, INC.

RME-41/43

RME-41/43

Relay to Control transmitter typical circuit diagram for connecting of relay control. Connect to terminal pair marked "R" on receiver. Relay closes when Stand-by Switch is turned to "Trans".

Typical circuit for remote break-in control of receiver. Terminal pair marked "B" on receiver connect to "B - B". Circuit between "B" pair is closed when relay or remote switch is closed during transmitter stand-by periods. Break-in terminals must be shorted if above circuit is not used.

RADIO MFG. ENGINEERS, INC.

High frequency beat is used on all bands. That is to say, that the oscillator is 455 KC higher in frequency than the signal received.

If sufficient input is used each signal can be received at two points, differing by 910 kilocycles. The other signal is the image or "low beat" signal. The higher frequency signal received, according to the receiver dial, is the proper one and the circuits should be aligned to it.

When using a signal generator or test oscillator to align the set a resistor of about 150 or 200 ohms should be inserted between the signal generator and the antenna connection. This will prevent misaligning of the RF stage caused by the connection of the low impedance of the signal generators output circuit across the receiver input.

CRYSTAL FILTER ADJUSTMENT

In order that the full capabilities of the crystal filter in the model 43 be realized the following procedure in tuning it is recommended:

On the top of the crystal filter box is a trimmer (Figure 1). The easiest way to adjust this trimmer is to tune in a station in the broadcast band that is broadcasting music, preferably an orchestra. The XTAL SELECTIVITY switch should be turned to Position 5 and the signal tuned in accurately on the crystal. The XTAL PHASING control should be adjusted to give minimum background noise. The SELECTIVITY control is then turned to Position 1. The trimmer should then be carefully adjusted. As the trimmer is turned it will be found that the character of the music changes. The trimmer should be set to a point that sounds the most natural. If the adjustment is made carefully there will be a regular sharpening of the receiver as the SELECTIVITY switch is turned from "OFF" to Position 5.

TEST VOLTAGES OBTAINED AT VARIOUS POINTS IN RECEIVER CIRCUIT

Measurements made with a voltmeter having internal resistance of 1000 ohms per volt. Instruments with lower internal resistance may give entirely different readings.
NOTE: Line voltage should be 115 volts. Stand-by Switch on.

PLACE TEST PRODS BETWEEN	CORRECT VOLTAGE
Radio frequency amplifier plate and ground.....	290 volts
Radio frequency amplifier cathode and ground.....	107.5 volts
Converter plate (pentode section) and ground.....	3 volts
Converter screen (pentode section) and ground.....	310 volts
Oscillator supply and ground.....	107.5 volts
First I.F. amplifier plate and ground.....	168 volts
First I.F. amplifier screen and ground.....	290 volts
First I.F. amplifier cathode and ground.....	107.5 volts
(The same voltages apply to the 2nd I.F. stage)	3 volts
7C7 plate and ground.....	43 volts
7C7 screen and ground.....	112.5 volts
7C7 cathode and ground.....	3.1 volts
7C5 plate and ground.....	290 volts
7C5 screen and ground.....	305 volts
7C5 cathode and ground.....	13.5 volts

RME-41/43-----6

CORRECT VOLTAGE

80 Rectifier filament and ground.....325 volts
B.O. plate supply and ground.....125 volts
(B.O. turned on)

These voltages are subject to a fluctuation of ±15% without indication of material difficulties.

CONTINUITY CHECKS

Receiver turned off. No jumper between "A" and "G" on antenna terminal strip.

RESISTANCE

A-1 and ground..... Infinite
A-2 and ground..... Infinite
"G" and ground..... Short
RF amp. Grid and ground..... 1.1 Megohms ±20%
Converter grid and ground..... Band 1 3-5 ohms
Band 2 1-5 ohms
Band 3 .3 ohm
Band 4 .2 ohm
Band 5 .1 ohm
Band 6 .1 ohm
First I.F. grid and ground..... 1-5 Megohms ±20%
Second I.F. grid and ground..... 1.5 Megohms ±20%
Oscillator grid and ground..... 50,000 ohms ±20%
B.O. grid and ground..... 100,000 ohms ±20%
7C7 grid and ground..... 250,000 ohms to 0 ohm as audio gain control is rotated.
7C5 grid and ground..... 250,000 ohms ±20%
Oscillator section of tuning condenser and ground. Bands 1,2,3,4,5 Infinite
Band 6 .1 ohm

SPECIFICATIONS

TUBES:	Type	Use
1.	7B7	R.F. Amplifier
2.	7J7	Converter
3.	7B7	1st I.F. Amplifier
4.	7B7	2nd I.F. Amplifier
5.	7B6	Detector and Beat Oscillator
6.	7C7	1st A.F. Amplifier
7.	7C5	Output Amplifier
8.	7A6	Automatic Noise Limiter
9.	80	Rectifier

I. F. Frequency: 455 Kilocycles
Power Consumption: At 115 volts, 90 watts
Audio Output: 3 Watts
Audio Frequency Response: 100 to 5,000 cycles per second ±2.5 db.
Cabinet Dimensions: Length 19 inches. Depth 10-1/2 inches. Height 10-1/4 inches.
Weight (Unpacked): 36 pounds
Voice Coil Impedance: 6 ohms
Speaker Field Coil Resistance: 10,000 ohms
Tapped at: 4,500 ohms

RME-41/43-----7

MODEL 41-43

RADIO MFG. ENGINEERS, INC.

SERVICE NOTES FOR THE RME-41/43 RECEIVERS

If the owner has available an accurate signal generator he may, by following the steps outlined in succeeding paragraphs, realign and recalibrate his receiver. If a signal generator is not available he may take the receiver to a reputable service man to have the work done. In addition to the signal generator an insulated screw driver will be required and if the receiver is a Model 41 an output meter will be needed.

NOTE: If the receiver is a Model 43 the "R" meter makes an excellent resonance indicating device. All adjustments are made with the AVC ON.

If the receiver is a Model 41 the output meter is used and is connected across the voice coil leads of the speaker. It may also be connected to a plug and inserted into the phone jack. When an output meter is used the AVC should be turned off by turning the RF GAIN control slightly to the left. The signal generator must be modulated.

I.F. ALIGNMENT

The I.F. frequency of the RME-41/43 is 455 Kc. The band switch should be turned to Band 1. The tuning dial should be turned to the low frequency end (.55 Mc.). The hot lead from the signal generator is clipped to the lug on the detector section (middle) of the tuning condenser. With the signal generator set to 455 Kc., each pad-der on the 1st, 2nd and 3rd I.F. transformers (see Fig. 1) are carefully adjusted for maximum response as indicated on the meter.

NOTE: If the receiver is a Model 43 the frequency of the signal generator must be set accurately to that of the crystal. This is done in the following manner:

Turn the crystal selectivity switch to Position 5. Carefully adjust the signal generator frequency until the carrier meter rises sharply. The signal generator is now accurately on the crystal frequency. The crystal selectivity switch is turned to "OFF" and the three I.F. transformers are aligned as before.

BEAT OSCILLATOR ADJUSTMENT

With the signal generator connected as for aligning I.F. circuits, turn "B.O. SWITCH" on and set "B.O. PITCH" control pointer vertical. With an insulated screw driver adjust B.O. padder (See Fig. 1) until zero beat is obtained.

ALIGNMENT OF THE RADIO FREQUENCY SECTION

Alignment of the radio frequency section of the receiver will affect, principally, the calibration of the receiver. Within certain limits this, of course, will also affect the sensitivity. Small variations in frequency (up to 2%) will not materially reduce the sensitivity of the receiver, although they will, of course, show up as variations in the calibration as indicated by the setting of the MAIN TUNING DIAL. Correction of any variation of calibration can be made by following the suggestions outlined in the following paragraphs.

OPERATION

Each control on the RME-41/43 receiver has a definite function and the operator should familiarize himself with their purpose and operation in order to obtain the best results.

The MAIN TUNING DIAL is somewhat novel in design. Continuous mechanical band spread is utilized. Mechanical band spread has been somewhat frowned upon in the past due to the difficulty of obtaining a mechanical arrangement free of backlash. This is accomplished in the 41/43 by using a preloaded gear train instead of the more conventional belt system. Illumination of the bandspread condenser lowers the loss in the RF circuits resulting in greater gain and greater stability.

The band spread scale makes 5 complete revolutions for 180° of main tuning pointer travel. As the main pointer reaches an amateur band these frequencies may be read off the band spread dial with greater accuracy. In addition to the amateur band calibrations an arbitrary calibration is also included. This scale is the outermost one on the bandspread dial. It is divided into 100 divisions. For any position of the main pointer this calibration may be read off by placing in front of the figure read, the figure indicated by the main tuning pointer. Thus when the main pointer is at the extreme left the arbitrary calibration will be read from 0 to 99. For the next revolution of the band spread scale the calibration will be read from 100 to 199, etc. Thus the arbitrary calibration will consist of 500 divisions for each range. As an example: 2 megacycles may also be read as 190 (or more accurately 199.8) on the arbitrary scale.

The BAND SELECTOR SWITCH selects the frequency range desired. The range of the receiver is divided into 6 bands. The range covered by each band is as follows:

Band I	.540 to 1.6 MC.	American Broadcast
Band II	1.6 to 2.9 MC.	Includes 160 M. Amateur Band
Band III	2.9 to 5.4 MC.	Includes 80 M. Amateur Band
Band IV	5.4 to 9.8 MC.	Includes 40 M. Amateur Band
Band V	9.8 to 18.0 MC.	Includes 20 M. Amateur Band
Band VI	18.0 to 33.0 MC.	Includes 10 M. Amateur Band

Actually these figures do not represent the full range of each band since there is considerable overlap between the end of one band and the start of the next.

The LINE TONE control turns the receiver on and off. As the control is turned clockwise the line switch will close. Continued turning of the knob controls the audio response.

The STAND-BY SWITCH on the extreme right end of the control panel is used to make the receiver inoperative without turning off the line switch. When the control is in the center at "on" the receiver will operate, when it turned to the right to "Stand-by" it will be dead. The third position labeled "Trans" also makes the receiver inoperative and, in addition, closes the relay circuit as mentioned previously.

The AUDIO GAIN control to the left of the stand-by switch is used to adjust the audio volume to the desired level.

Below the control panel is a toggle switch labeled B. O. SWITCH turning on the beat oscillator. The beat oscillator is indispensable in the reception of CW signals and is an aid in locating weak phone carriers.

The pitch of the beat frequency may be varied by means of the control labeled B. O. PITCH.

RADIO MFG. ENGINEERS, INC.

The beat oscillator may be used either with or without the automatic volume control (AVC). It is usually more satisfactory to receive CW signals with the AVC off. This may be accomplished by turning the control labeled "R.F. GAIN" slightly to the left. Continued rotation of this control varies the gain of the receiver manually.

Below the control panel on the left is a jack marked "PHONES". Any pair of good headphones may be plugged into this jack for headphone reception. When the phones are plugged in the speaker is automatically cut out.

The CARRIER LEVEL METER is supplied only with the model 43. It may also be purchased separately for installation in the Model 41. This meter indicates the average value of the carrier being received. The meter is calibrated in db as well as in conventional numbers. As in previous RME models a signal difference of 1-R is equivalent to 6 db., and R-9 is equivalent to 200 microvolts input to the receiver. A signal is always tuned so as to give a maximum reading on the meter. The meter should be adjusted to zero with the antenna disconnected by means of the screw on the bracket behind the meter.

The CRYSTAL FILTER, also supplied with the 43 only, has two controls. The top control, marked "XVAL SELECTIVITY", makes it possible to select the desired amount of selectivity for best results. Turning the control to "OFF" removes the crystal from the circuit. Rotating the control to the right changes the selectivity from a broad crystal characteristic at "1" suitable for phone reception to a razor-sharp characteristic at "5" for CW reception.

The CRYSTAL PHASING control should be adjusted to give minimum background noise. This setting will depend somewhat on particular conditions. This control may also be used to wipe out an interfering signal. Expert manipulation of the crystal filter usually comes only after a certain amount of practice.

The AUTOMATIC NOISE LIMITER is always in the circuit on the 41 and 43. No adjustment is required. The circuit is of a type that automatically adjusts itself to maximum effectiveness.

INSTRUCTIONS FOR INSTALLATION AND OPERATION OF THE RME-41/43 RECEIVERS

The RME-43 is a 9 tube superheterodyne communication type receiver. This receiver incorporates several revolutionary features, notably the tuning arrangement which provides accurate calibration on all amateur bands and a continuous arbitrary calibration of 500 divisions on each range. The 43 is supplied complete with a variable selectivity type crystal filter and a calibrated carrier level meter. The crystal filter and meter are both plugged in so that the receiver may be purchased without them and added later. The two units may be installed in a few minutes. The only tool required is a screw driver. No soldering is necessary and the receiver need not be removed from the cabinet. A receiver purchased without these two features is designated as a model RME-41.

ANTENNA

The terminals on the rear apron (Figure 2) marked "A-A-C" are for the antenna connection. When the receiver leaves the factory there is a jumper between one of the "A" posts and the "g" post. Good results may be obtained by connecting a wire 50 to 75 feet long to the other "A" post. If a 2 wire feeder system is used the jumper is removed and the two feeders are connected to "A" and "A". A sketch (Figure 4) of several suggested antennas is included in this booklet. A ground may be connected to the "g" post if it improves reception.

RELAY AND BREAK-IN TERMINALS

On the rear apron are 2 sets of contacts marked "R" and "B" (See Fig. 2). The pair marked "B" are in series with the plate supply. This pair must always be shorted when the receiver is being used, either by a relay, as suggested in Fig. 3, or by a jumper if the remote control feature is not used. This jumper is in place when the set leaves the factory.

The pair marked "R" are relay control terminals. This pair is shorted when the receiver stand-by switch is turned to "Trans". It may be used to control an external relay in conjunction with a suitable external voltage.

Band 1 includes frequencies between 540 and 1600 Kc. For Band 1 there are two frequency adjustments for adjusting the dial to the proper calibration. The adjustments are made on the top of the chassis through the dust cover over the Band 1 and 2 coils. The proper holes for making the adjustments are indicated on the top sketch on Figure 3. There are 6 sets of large and small holes each. The two sets toward the rear of the chassis are the oscillator adjustments. The set toward the front are the RF stage adjustments; and the center set are for the detector. Under the large hole is a padder for adjusting the high frequency end of the scale. Under the small hole is a screw which moves the core in the coil and adjusts the low frequency end.

The next step is to choose a station or a signal of accurately known frequency on the low frequency end of the range (for example 600 Kc.) and set the main tuning scale to read this frequency. If the station is not tuned in which the scale indicates its frequency it may be brought in by adjusting the oscillator coil core. This may be done with a small screw driver through the small hole marked "BAND 1 OSC" on Figure 3. Another station or signal is now selected near the high frequency end of the range (for example 1400 Kc.). If this signal is not heard when the dial is accurately set to its frequency it may be brought in by adjusting the padder under the large hole marked "BAND 1 OSC" by means of an insulated trimmer tool. When this signal is accurately brought in as indicated by a maximum reading on the carrier meter one should go back to the low frequency test point and readjust it if it has changed. It may be necessary to go back and forth several times until both frequencies are accurately calibrated.

The accuracy of most service signal generators is not very great, especially on the higher frequencies. The owner of an RME-41/43 should hesitate in using one to calibrate his receiver unless he is sure that it is accurately calibrated.

The procedure in calibrating and aligning Band 2 is the same for Band 1. On this band two frequencies, such as 1800 and 2800 KC, may be used. For the low frequency point the band spread dial should be set accurately to 1800 KC for calibration.

The four high frequency bands are calibrated and aligned by removing the bottom plate from the receiver. The screws holding the four rubber feet and the four small screws between them are removed. This allows the bottom plate to be removed. It will be found that an aluminum plate covers the coils. This plate has holes over the 12 padders and all adjustments should be made with this plate in position.

Since the inductance of the coils are accurately adjusted and set at the factory it is necessary only to calibrate one frequency on each band. The same applies to the alignment of the RF and detector padders. This calibration and alignment should preferably be made at a point which is on the calibrated band spread scale. Suggested calibration points for each band are as follows:

Band 3	4 MC.
Band 4	7 MC.
Band 5	14 MC.
Band 6	30 MC.

From the bottom sketch on Figure 3 the location of each of the 3 padders for each band may be readily located. Note in particular the location of Band 5 and 6 padders. Adjustments should be made with insulated screw driver type trimmer tool.

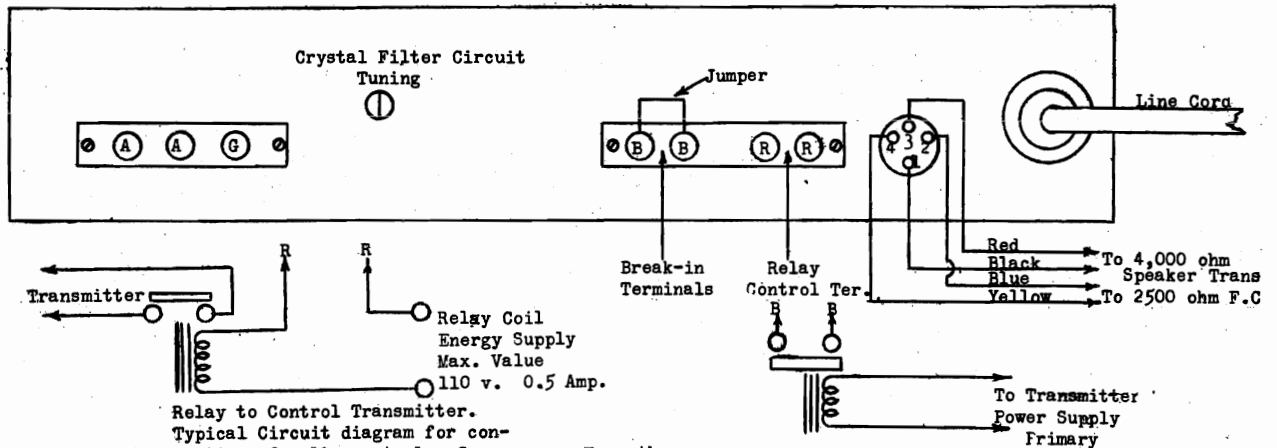

Fig. 1 — Front View

Late Model 99 same as Early Model 99 in Vol. XII except that 7A7 tubes were replaced by 7B7 tubes. For Early Schematic, see RME pgs. 12-13.

RADIO MFG. ENGINEERS, INC.

Relay to Control Transmitter. Typical circuit diagram for connecting of relay control. Connect to terminal pair marked "R" on receiver. Relay closes when receiver is on stand-by.

For other data see Volumes XII

Typical circuit for remote break-in control of receiver. Terminal pair marked "B" on receiver connect to "B - B". Circuit between "B" pair closed when relay or remote switch is closed during transmitter stand-by periods. Break-in terminal must be shorted if above circuit is not used.

Not satisfactory for wide range frequency. Excellent for any amateur band if $A = \frac{A}{2}$ is in the middle of the band. For example: For 20 meter band antenna should be designed for 14,200 KC. A = Approximately 33 feet, directional at right angle from line of wire. Jumper "Y" can usually be omitted

Dimensions same as those of C. Antenna good for one narrow band. (For example amateur band) Is not directional.

Late Model RME99 is the same as the Early model (see Rider's Vol. XII) except that 7A7 tubes were replaced by 7B7 tubes.

TEST VOLTAGES OBTAINED AT VARIOUS POINTS IN RECEIVER CIRCUIT

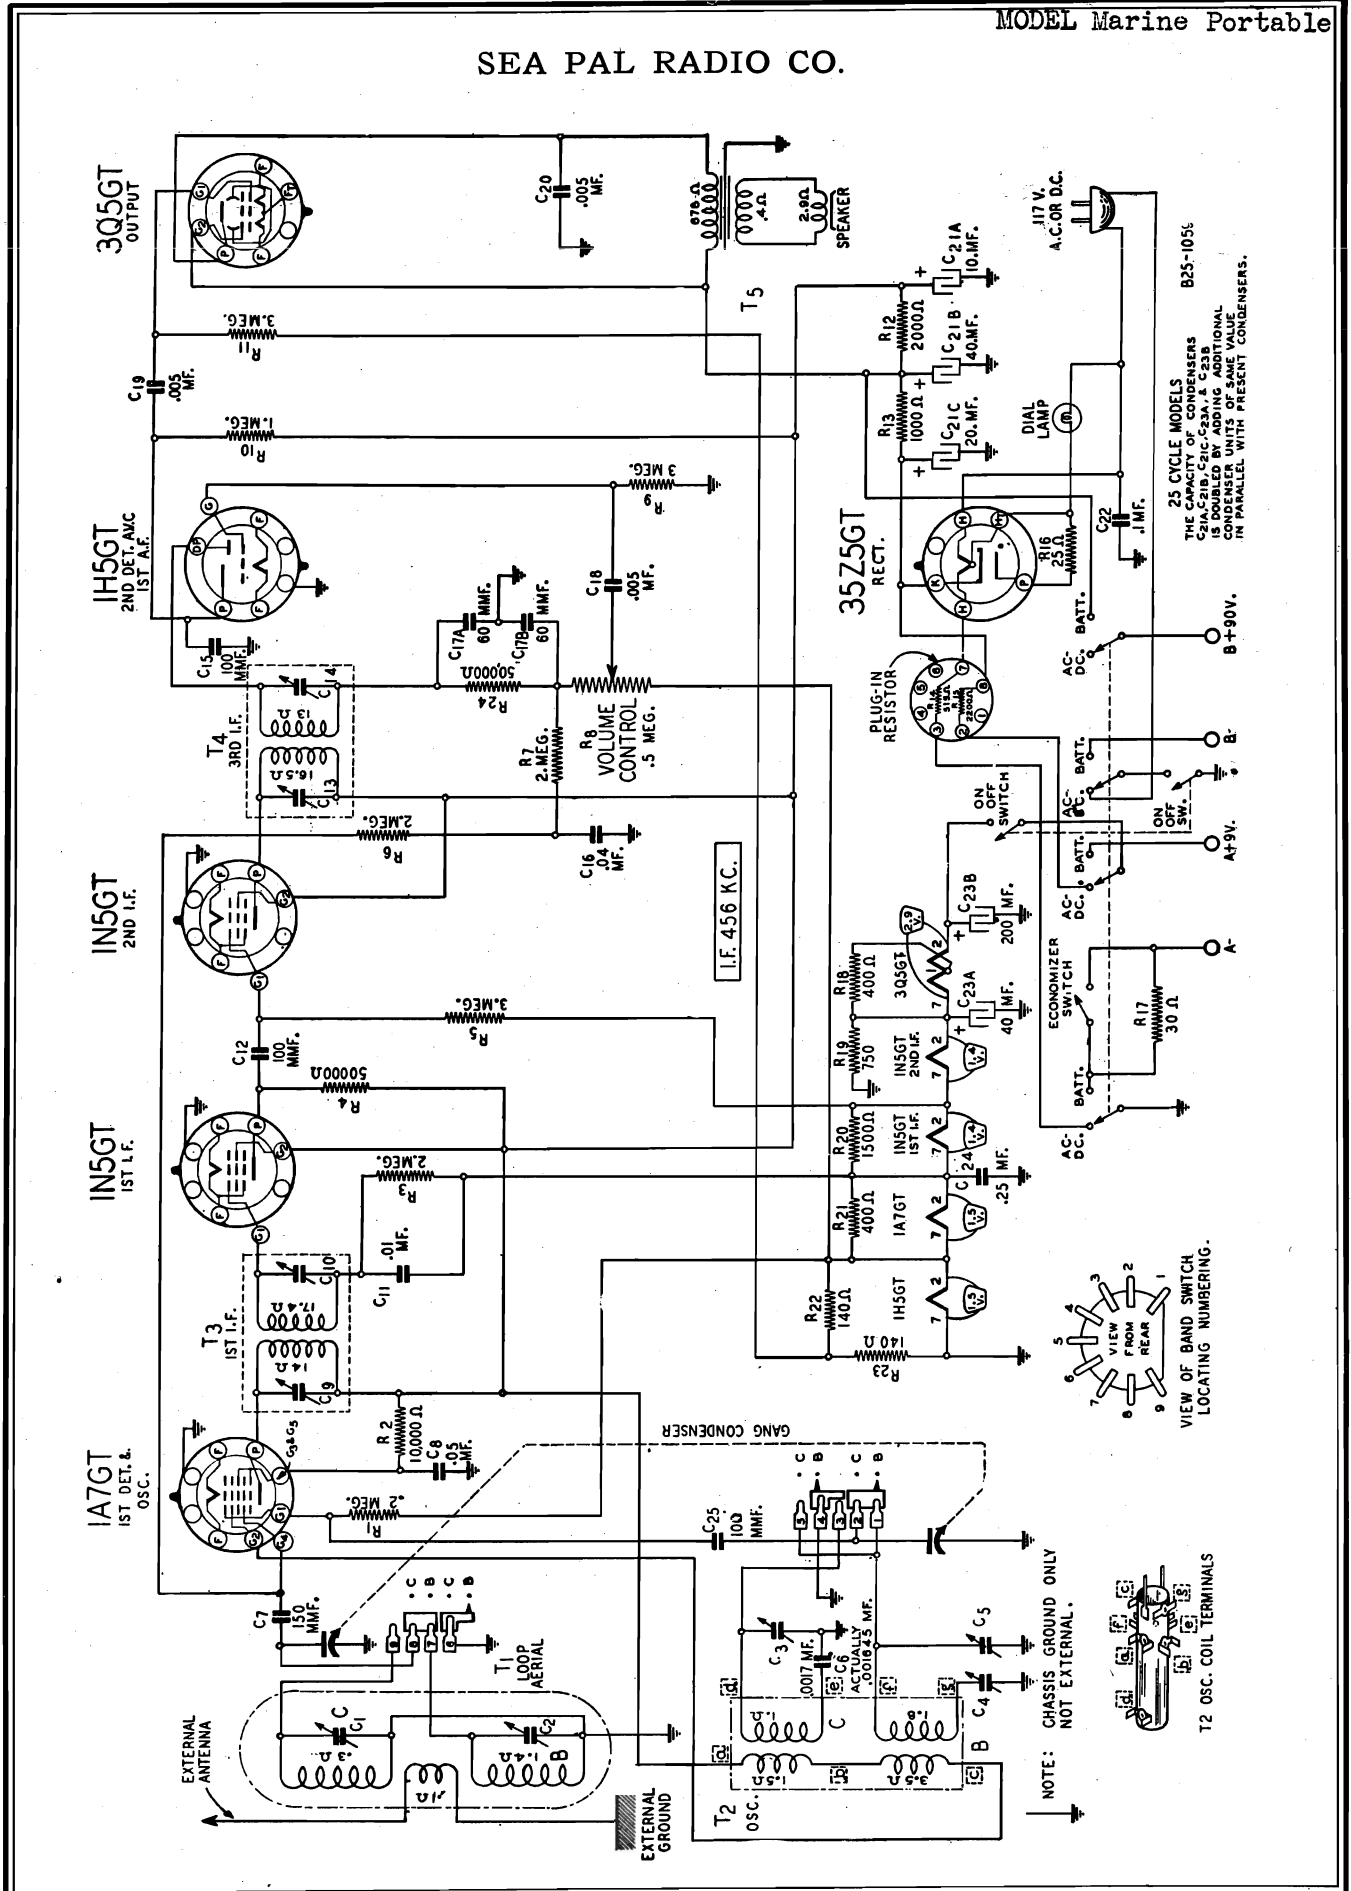

Measurements made with voltmeter having internal resistance of 1000 ohms per volt. Instruments with other internal resistances give entirely different readings. NOTE: Line voltage should be 115 volts, Stand-by Switch on.

DESCRIPTION:

TUBES—

The tube complement of this chassis consists of the following tubes.

The type and function of each tube is as follows:

- 1—Type 1A7GT Mixer, First Detector-oscillator.
- 2—Type 1N5GT Remote Cut-Off Pentode, 1st and 2nd I. F. Amplifiers.
- 1—Type 1H5GT Second Detector, A.V.C. 1st Audio.
- 1—Type 1T5GT Output Amplifier.
- 1—Type 117Z6GT Rectifier.

MODEL 6P21
Series A

SEA PAL RADIO CO.

ALIGNMENT PROCEDURE

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—1 Mfd., 50 Mmfd.

- Volume control—Maximum all adjustments.
- Connect generator ground to B—.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	455 Kc.	.1 MFD.	Grid of 1A7GT	Rotor full open (Plates out of mesh)	Four trimmers on top	Output and input I. F.	(See Note "A") Adjust to maximum output
BROADCAST BAND	1560 Kc.	.1 MFD.	Grid of 1A7GT	Rotor full open (Plates out of mesh)	Trimmer C9	Broadcast Oscillator	(See Note "A") Adjust to maximum output
(Band Switch in Broadcast Position)	1400 Kc.	50 MMFD.	Antenna and Ground Terminals	Set dial at 1400	Trimmer C3—Front section of gang	Broadcast Antenna	Adjust to maximum output
LONG WAVE BAND	410 Kc.	See Note B	Grid of 1A7GT	Set dial at 410 (Rotor plates full open)	Trimmer C6	Long Wave Oscillator	Adjust to maximum output
(Band Switch in Long Wave Position)	375 Kc.	See Note B	Std. Loop	Set dial at 375 Kc.	Trimmer C2—Rear Section of gang	Long Wave Antenna	(See Note "B") Adjust to maximum output
	225 Kc.	See Note B	Std. Loop	Set dial at 225 Kc.	Padder C4	Long Wave Oscillator Series Padder	(See Note "B") Adjust to maximum output

NOTE "A"—The loop may be connected to the radio when making these adjustments. The ground of the signal generator is connected to the B— and the other lead from the signal generator in series with the proper dummy to the grid of the 1A7GT tube.

NOTE "B"—For aligning long wave band, connect a radiating loop consisting of 4 turns of wire 10" Dia. in series with .1 MFD. of condenser to terminals of signal generator. Place radiating loop 2 feet away from loop on receiver. The plane of both loop must be parallel.

FREQUENCY RANGES
535 to 1560 KC.
190 to 410 KC.
Power Consumption.....(On A.C. or D.C.) 35 Watts
Power Output.....140 Milliwatts Undistorted, 280 Milliwatts Maximum
Intermediate Frequency.....455 K.C.

In any radio compass there may be a deviation from a true reading due to the motor or other metal parts around the boat just as there is with a magnetic compass. The simplest method to determine the amount of deviation is to select a broadcast or beacon station which you can see from the ship—Point your ship directly at the station and then tune the loop to the "Null" point. If there is no error the loop pointer should point to the station straight ahead, parallel with a line from bow to stern. If there is a deviation the pointer will not point exactly straight ahead. You can either note how many degrees the variation is and allow for it in future readings or you can turn the radio case so the loop pointer points straight ahead. This will correct for the error and you won't need to make any future allowance.

Check for deviation on several stations and also with the boat turned 180 Degrees from the stations.

View Showing Tube Layout

View showing method of connecting batteries and the external antenna jack—An external antenna will give maximum reception on distant stations but should be disconnected for direction finding operation.

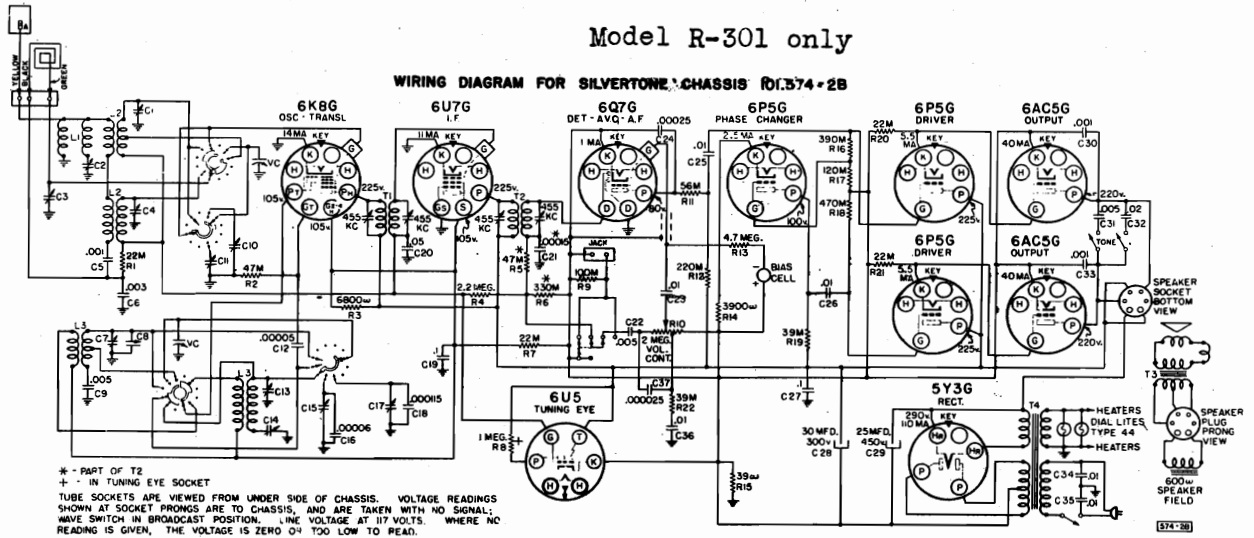

SEARS, ROEBUCK & CO.

MODEL R301, Ch. 101.574-2B
MODEL 701, Ch. 101.574-1A

SUBJECT: ADDITION OF SUFFIX -1A AND -2B TO 101.574:

Chassis identified by 101.574-1A have been revised to include a built-in loop antenna. There are also differences in knobs, dial, escutcheon and other appearance items because of the difference in cabinets.

Chassis identified by 101.574-2B are similar to 101.574-1A except for changes in the circuit, affecting tone, and for appearance items changes.

ALIGNMENT PROCEDURE

Models R-301, 701

PRELIMINARY:

Output meter connection Across loudspeaker voice coil
Output meter reading to indicate 500 milliwatts 1.6 volts
Approximate microvolts input for 500 milliwatts output See chart below
Generator ground lead connection Receiver chassis
Dummy antenna value to be in series with generator output See chart below
Connection of generator output lead See chart below
Generator modulation 30%, 400 cycles
Position of Volume Control Fully clockwise
Position of Tone Control Both buttons out
Position of Dial Pointer with variable fully closed On first mark to left of 550 kc calibration mark

E	11.71 mc	11.71 mc	400 ohms	Ant. Term.	C15**	Oscillator	--
E	11.71 mc(rock)	11.71 mc	400 ohms	Ant. Term.	C10	Translator	55

IMPORTANT ALIGNMENT NOTES

* The generator should be adjusted for high output. The trimmer should be adjusted for minimum output meter reading instead of the usual maximum reading. If the frequency of an interfering station around 455 kc is known, the generator should be adjusted to the frequency of that station instead of to 455 kc.

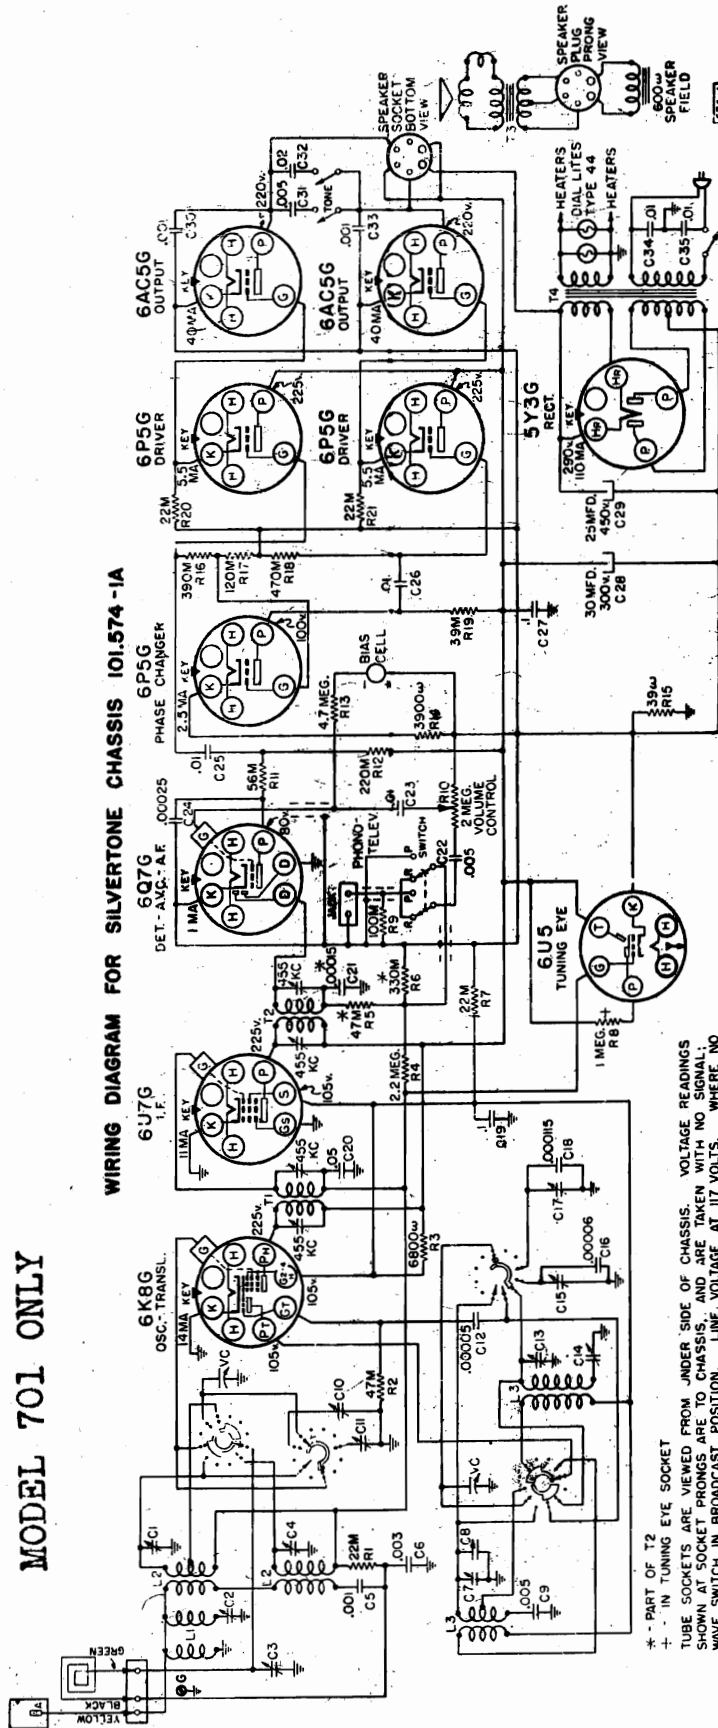

** If two peaks can be had, the correct one is with the trimmer screw further out; the other peak is the image.

Where indicated by the word, "Rock", the variable should be rocked back and forth a degree or two while making the adjustment.

The alignment procedure should be repeated stage by stage, in the original order, for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

MECHANICAL & ELECTRICAL CHANGES SINCE START OF FIRST PRODUCTION:

Soon after the start of the first production of these models, certain minor mechanical and electrical changes were made to make these receivers more uniform in their characteristics.

The coupling turns used to couple the oscillator tank to the 12SA7GT tube were dropped in favor of a .00005 mfd. mica condenser (C-12). The plate bypass on the 12SQ7GT tube was reduced from .0005 mfd. to .00025 mfd. and redesignated (C-11) on the Circuit Diagram. This was done to make the tone somewhat more brilliant and increase the apparent power output.

The mechanical changes consisted in reversing the positions of the two I.F. coils-- practically all production having the I.F. Output in the shield can with the I.F. Input unshielded. The I.F. Input was also moved to mount on the front chassis flange instead of on the top of the chassis base.

ADAPTER FOR OPERATING 6 VOLT, 1.5 AMPERE RECEIVERS FROM 32 VOLT DC SUPPLY

CONSULE MODELS - MOUNT AND CONNECT 32 VOLT ADAPTER AS SHOWN. PLUS INTO 32 VOLT D.C. LIGHT SOCKET. IF RADIO DOES NOT PLAY, REVERSE PLUG IN SOCKET.

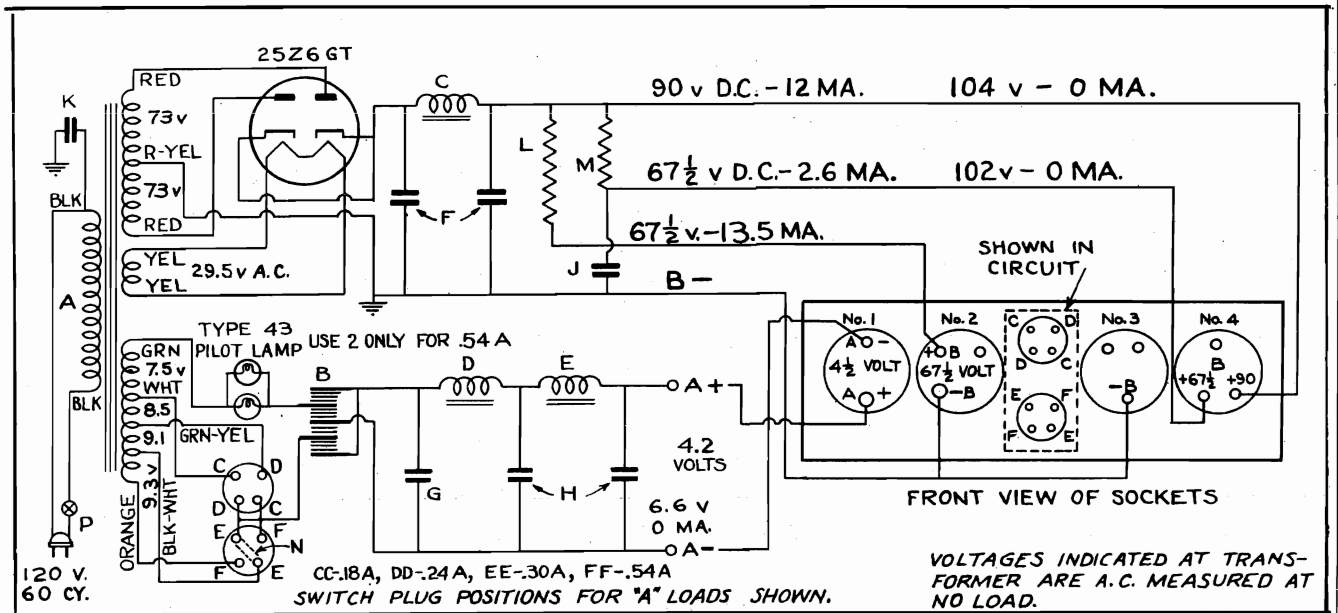

TABLE MODELS - MOUNT AND CONNECT 32 VOLT ADAPTER AS SHOWN. PLUS INTO 32 VOLT D.C. LIGHT SOCKET. IF RADIO DOES NOT PLAY, REVERSE PLUG IN SOCKET.

ELIMINATING INTERFERENCE FROM THE 32 VOLT BATTERY CHARGER:

- In single cylinder plants connect a spark plug suppressor to the spark plug. In four cylinder plants connect a distributor suppressor in the center socket of the distributor cap.
- Connect a .5 mfd., 200 volt generator condenser from the negative brush of the generator to the frame. If this is not sufficiently effective, connect an additional condenser from the positive brush to the frame.
- Connect a .5 mfd., 200 volt generator condenser from the generator frame to the positive or negative line terminal, whichever is more effective, on the plant switchboard. Keep all condenser leads as short as possible.

PRICES SUBJECT TO CHANGE WITHOUT NOTICE

SEARS, ROEBUCK & CO. MODEL 4701 Power Shifter
Chas. 139.450

WIRING DIAGRAM FOR SILVERTONE MODEL 4701 POWR SHIFTR

"A" SUPPLY

The "A" Supply is obtained from a full wave copper sulfide rectifier filtered by a condenser input filter consisting of three high capacity condensers and two low resistance chokes. Four taps on the power transformer rectifier winding in connection with two pilot lamp ballasts as regulators allow a fairly constant output voltage to be obtained with various "A" loads and line voltages. Terminal voltages for various loads are indicated on the wiring diagram.

POWER DRAIN

The primary input is 22 watts when the "A" circuit is loaded to 540 MA. with switch plug in proper position, and both pilot lamps in the circuit, and the "B" circuit is loaded to 12 MA. The input watts under no-load should be approximately 12 watts and the primary current without load, not more than 160 MA. at 120 volts, 60 cycles.

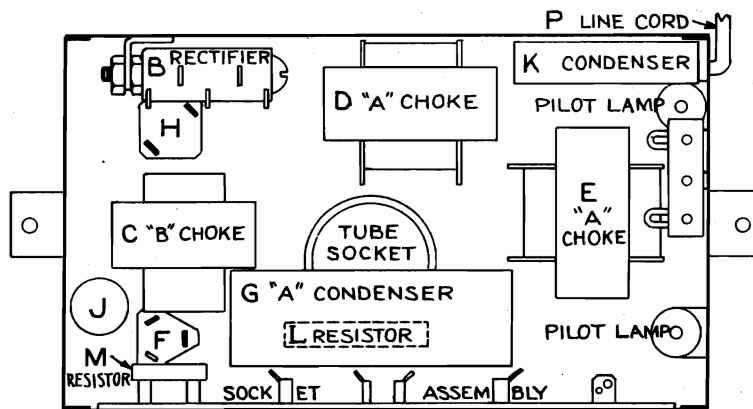

"B" SUPPLY

The "B" supply employs a 25Z6GT rectifier tube operated as a full wave rectifier feeding into a condenser input filter followed by a choke and another condenser. Voltage dropping resistors supply 67 1/2 volts at two load ratings and a 90 volts D. C. tap. The "A" and "B" circuits are not common to each other or to the chassis.

SWITCH PLUG POSITION FOR "A" CURRENTS IN MA.

* Use two pilot lamps (#43)

TO OPEN CHASSIS

The chassis bottom cover is held firmly to the chassis by four snap-on indentations in the sides. To remove this bottom cover, insert a thin screw driver between cover and chassis and pry open. With a little pressure the cover will snap back in place easily.

The top cover is fixed to the chassis by two screws on each end. To remove this cover it is only necessary to loosen the screws one turn.

"A" SUPPLY FAILS

When the "A" voltage is excessively low the rectifier, condensers or transformer may be defective. Check the switch plug position carefully for correct location for load connected to "A", and also make sure one pilot lamp only is used when in the CC, DD, or EE position and two pilot lamps when in the FF position. These must be Type 43 pilot lamps.

To check the transformer remove one transformer lead from the rectifier and measure for A.C. voltage indicated on the wiring diagram. To check the rectifier remove wires from choke "D" and condenser "G", -- also disconnect one side of jumper wire and measure D.C. voltage across each side of rectifier. This should be 1.9 to 2.1 volts, D.C. with the switch plug in position CC and only one pilot lamp in the circuit.

IMPORTANT: The copper sulfide rectifier is designed to give the voltages indicated on the wiring diagram when the unit is warmed up to normal operating temperatures. This heating up period is usually about 20 minutes with the Power Shiftr "A" circuit loaded. The rectifier's characteristics are peculiar and for an accurate check the unit must be tested when hot.

When the Power Shiftr has been out of service for a long time (4 months or more) the "A" voltage may test low due to the inactive life of the rectifier. This is an inherent characteristic of the copper sulfide rectifier. The unit may be reactivated by placing a direct short for 3 to 4 minutes across the rectifier from the center lug to either outside lug of the rectifier. **WARNING!** Two pilot lamps must be in the circuit and the switch plug should be in position CC, otherwise the pilot lamps will be burnt out.

Low "A" voltage may also be caused by a dropping in capacity of the input condenser "G". To check this another condenser of 500 to 1000 MFD. can be connected across this condenser and -if an appreciable rise is observed in the output voltage it is obvious that the input condenser is low in capacity.

"B" SUPPLY FAILS

The 25Z6GT tube should be tested with a standard tube tester. The transformer may be tested by measuring the A.C. voltage across each half of the plate winding with the red leads disconnected. The carbon resistors should be checked for their resistance values.

Ch. 139,200

OUTPUT RATINGS:

- "B" 135 V tap - 14MA. (28 MA. max.) - (148V no load)
 - 90 V tap - 14MA. (118V no load)
 - 67.5V tap - 2MA. load and 21 MA. on 135V tap - (93V no load)
 - 22.5V tap - with 19 MA. load on 22.5 to 135V tap - (16V no load)
- "A" 2 or 3 volts at 365 MA. to 670 MA.
Adjust voltage by turning slotted shaft.

FOR 2 TO 3 VOLT BATTERY RADIOS

WIRING DIAGRAM FOR SILVERTONE MODEL 4708 POWR SHIFTR

"A" SUPPLY

The "A" supply is obtained from a full wave copper sulfide rectifier filtered by a condenser input filter consisting of three high capacity chokes and two low resistance chokes. A rheostat after the rectifier allows the voltage to be controlled over a wide range which is indicated by a voltmeter across the output.

"B" SUPPLY

The "B" supply employs a 25Z6GT rectifier tube operated as a full wave rectifier feeding into a condenser input filter followed by a choke and another condenser. A lead with spade lug from the second condenser is brought thru the chassis for proper filtering by connecting this to the highest B plus voltage tap used. Voltage dropping resistors supply 22½, 67½, 90 and 135 volts.

"A" SUPPLY FAILS

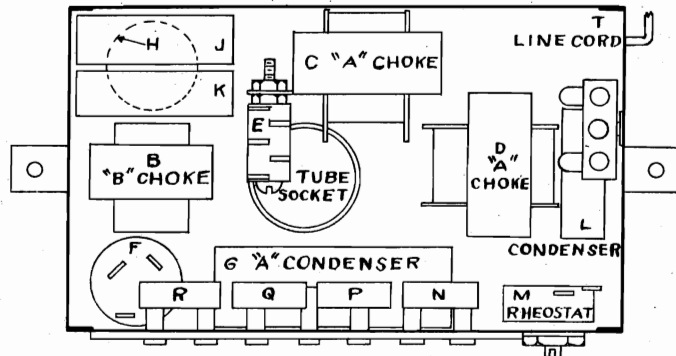

When the "A" voltage is excessively low the transformer, condensers or rectifier may be defective.

To check the transformer remove one green lead from the rectifier and measure for AC voltage indicated on the wiring diagram.

Low "A" voltage may be caused by a dropping in capacity of the input condenser "G". To test for this condition, another condenser of 500 to 1000 MFD. may be connected across this condenser, and if an appreciable rise in the output voltage is observed it is obvious that the input condenser is low in capacity.

IMPORTANT: The copper sulfide rectifier is designed to give the voltages indicated on the wiring diagram when the unit is warmed up to normal operating temperatures. This heating up period is usually about 20 minutes with the Power Shifter "A" circuit loaded. The rectifier's characteristics are peculiar and for an accurate check the unit must be tested when hot.

When the Power Shifter has been out of service for some length of time (4 months or more) the "A" voltage may test low due to the inactive life of the rectifier. This is an inherent characteristic of the copper sulfide rectifier. To reactivate the rectifier it is only necessary to short the "A" plus and "A" minus terminals for a period of 4 to 5 minutes. The high temperature developed in the rectifier

LOCATION OF PARTS IN CHASSIS

SEPTEMBER 16, 1940

LOCATION OF PARTS ON CHASSIS

during this period has the tendency to restore the discs to their normal rectifying capacity. The unit will not be harmed by this process.

POWER DRAIN

The primary input at 120 volts 60 cycles is 26 watts when the "A" and "B" supplies have maximum rated loads. The input watts under no-load should be 12.5 watts and the primary current without load not more than 215 MA.

FILAMENT SUPPLY

The filament supply, marked "F" on the terminal strip, is obtained from a full wave copper sulfide rectifier feeding into a high capacity condenser input filter followed by a low resistance choke and another high capacity condenser.

VIBRATOR SUPPLY

The vibrator supply, marked "v" on the terminal strip, is obtained from a full wave copper sulfide rectifier filtered by a single high capacity condenser. Terminal voltages for various loads are indicated on the load charts.

POWER DRAIN

The primary input with a single "v" or "F" supply loaded to 0.75 amperes is 17 watts, and with the two supplies in parallel and a 2.00 amp load the input watts are 30. At rated load of 3.0 amperes the primary drain is 43 watts.

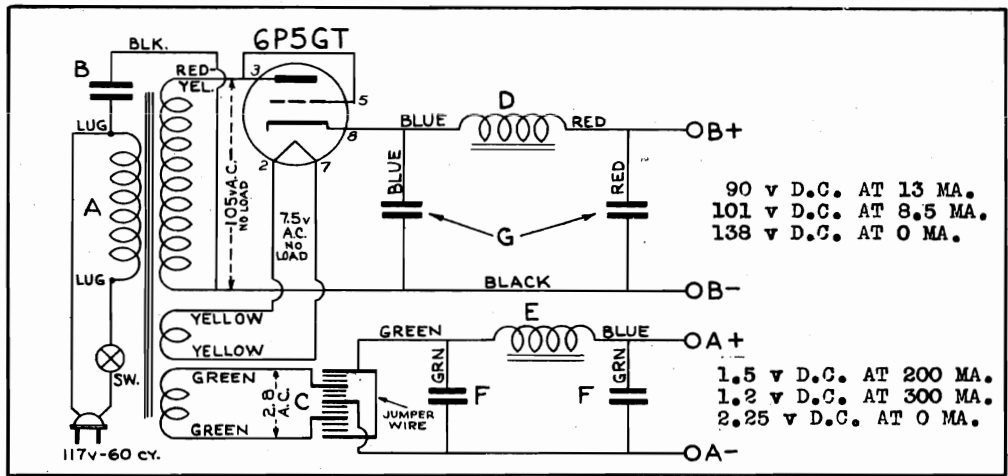

TWO SEPARATE SUPPLIES

Several different basic designs in six volt single battery radios have made it necessary to provide separate supplies for the vibrator and for the filaments. This special design provides hum-free operation with proper installation of the Powr Shiftr. The two separate sources of D.C. power labeled "F" and "V" may be considered the equivalent of two separate six volt batteries.

SEPTEMBER 16, 1940

MODEL 5302 Power Shifter
Chas. 139.210

SEARS, ROEBUCK & CO.

WIRING DIAGRAM FOR SILVERTONE MODEL 5302 POWER SHIFTER
FOR 1 1/2 VOLT BATTERY RADIOS OF 4 OR 5 TUBES

"A" SUPPLY

The "A" supply is obtained from a full wave copper sulfide rectifier filtered by a condenser input filter consisting of two condensers and a low resistance choke. Terminal voltages with and without loads are indicated on wiring diagram.

"B" SUPPLY

The "B" supply employs a 6P5GT tube operated as a half wave rectifier operating into a condenser input filter of one choke followed by another condenser.

The "A" and "B" circuits are not common to each other or to the chassis. Different tube biasing methods make this necessary.

POWER DRAIN

The primary input is 7 watts when the "A" and "B" circuits are loaded as indicated on wiring diagram. The input watts under no-load should not be more than 4.5 watts and the primary current without load not more than 110 MA at 117 volts, 60 cycles.

"A" SUPPLY FAILS

When the "A" voltage is excessively low the rectifier, condensers or transformer may be defective. To check the transformer remove one green lead of transformer winding from the rectifier and measure for A.C. voltage indicated on wiring diagram. To check the rectifier remove green lead from choke "E" and condenser "F", -- also

disconnect one side of jumper wire and measure D.C. voltage across rectifier. This should be 1.4 to 1.5 volts.

LOCATION OF PARTS IN CHASSIS

WIRING DIAGRAM OF SOCKET ASSEMBLY (Back)

"B" SUPPLY FAILS

The 6P5GT tube should be checked with a standard tube tester. Care should be exercised in removing this tube as all parts fit closely in chassis. A small screw driver may be used as a light pry behind the base of the tube to assist in removal. Be sure the tube is inserted with proper key alignment to tube socket. Also if a metal base tube, make certain the insulating sleeve of fibre is replaced on the tube base to prevent it from touching or contacting other parts in the chassis.

The transformer may be tested by measuring the secondary plate winding with the red-yellow lead disconnected.

NOVEMBER 15, 1939

SEARS, ROEBUCK & CO. MODEL 5215, Ch. 127.6150
 MODEL 5252, Ch. 127.630
THIS CHARGER AND WHAT IT WILL DO MODEL 5253, Ch. 127.620, -1, -2
 Gas-O-Power Battery Charger

This engine generator has been principally designed as a battery charger and is rated, electrically, at 240 watts, 6 volts.

The engine of this charger is a single cylinder, four cycle "L" head, internal combustion engine air cooled. A ventilating fan, rotating on the crankshaft, drives off engine heat and circulates fresh air to engine and generator.

Engine lubrication is by the splash system from the crankcase, with a splash arm on the connecting rod.

Crankcase capacity is $\frac{3}{4}$ pint. Gasoline tank capacity is two (2) quarts.

The generator of this charger is of four pole design with four brushes, and supplies Direct Current.

The generator of the charger is directly coupled to the engine (no belts). The armature is keyed to the engine crankshaft which extends through the generator and serves as the generator shaft.

Because the engine of this charger operates constantly at one speed, the charging rate is permanent at approximately 25 amperes. The actual voltage development of this charger is approximately 8 volts, with the battery fully charged, and $6\frac{1}{2}$ volts, when the battery is low in charge.

THE GENERATOR REQUIRES NO LUBRICANT.

The generator will charge from one to three 6 volt batteries of standard automotive and radio size at one time. The time required to charge the batteries depends upon the number of batteries being charged.

The generator is air cooled.

THIS CHARGER CANNOT BE OPERATED WITHOUT A BATTERY AND NO ATTEMPT SHOULD BE MADE TO DRAW ELECTRIC ENERGY DIRECTLY FROM THE GENERATOR.

A maximum of 240 watts of lamp load may be used at one time to incorporate a light line with the charger. Any combination of wattage bulbs may be used as long as the total wattage is not in excess of 240 watts.

The generator will charge the battery at the same time a lamp load is used, if the load does not exceed the rating of the charger.

THE ENGINE OF THIS CHARGER IS NOT INTENDED OR CLAIMED TO BE LARGE ENOUGH TO OPERATE POWER APPLIANCES, EITHER DIRECTLY OR INDIRECTLY, AS THE HORSEPOWER RATING OF THE ENGINE IS APPROXIMATELY 4/10 OR ONE HORSEPOWER.

INSTALLATION AND LOCATION OF CHARGER

The proper location of this charger is of vital importance to insure proper operation and long life.

The motor of the engine and generator of the unit incorporate air cooling. The unit should be operated in a location which permits the proper circulation of cool air. The unit should not be operated in a small closed room, nor should any cover be placed over the unit while operating. A cover may be placed over the unit when not operating to protect it from dirt and dust. The charger must also receive protection from climatic conditions.

Care should also be taken to make sure that the unit is not operating in a location where the circulation of dust and dirt would clog the cooling system, and the charger should not be installed in a hen house or barn.

The unit may be located in a garage, basement (if dry), tool shed, or similar shelter with good ventilation. Do not locate the charger near gasoline or oil storage tanks.

The charger must be in a level and secure position at all times while in operation.

For permanent installation, a concrete mounting base may be formed to fit the base measurements.

DO NOT INSTALL THE UNIT IN LIVING QUARTERS. EXHAUST GASES ARE DEADLY. UNLESS THERE IS AMPLE VENTILATION, OR FACILITIES TO PIPE THE EXHAUST OUTSIDE, THE CHARGER MUST BE LOCATED ELSEWHERE.

If the exhaust extension runs upward from the engine, a water condensation trap should be inserted in the pipe near the engine to prevent condensed moisture in the exhaust line from seeping down into the engine. Water in the engine would cause considerable damage. Empty the water trap frequently.

MODEL 5215, Ch. 127.6150
MODEL 5252, Ch. 127.630

SEARS, ROEBUCK & CO.

MODEL 5253, Ch. 127.620, -1, -2

Gas-O-Power Battery Charger

The exhaust line may be piped into a galvanized can, or barrel, buried in the ground for a more quiet muffler. The can or barrel must have holes drilled in its bottom to allow an outlet for condensation. The barrel should rest on a bed of stones or loose gravel. There must also be an extension pipe opening at top of barrel to relieve pressure. It is desirable to fill this underground muffler with coarse stones.

When piping the exhaust outside through the wall, a sheet metal guard should be placed in opening to prevent direct contact of the pipe to the wall.

One inch diameter flexible tubing is recommended as an exhaust extension, and the exhaust line should be installed as short as possible. Joints and elbows should be eliminated, and the exhaust line should not leak.

Check exhaust back-pressure upon installation. If the engine's operation improves when the exhaust line is disconnected, then the exhaust extension is too long.

Keep the exhaust line clean. Tapping it with a wooden mallet will loosen carbon formation so that it may be cleaned out.

BATTERY CHARGING AND ELECTRICAL INFORMATION

A battery, or batteries of correct voltage must be chosen for operation with this plant (6 volt)

Standard automotive batteries may be used and charged with this plant (6 volt) as well as radio batteries (6 volt), and if a permanent installation hook-up is used, a battery of not less than 145 ampere hour capacity is advisable.

The glass jar farm light batteries are very efficient and dependable, if the proper size is chosen. High capacity batteries will allow a load to be carried at greater length without the necessity of frequent recharging. If a heavy load is used, it is advisable to operate the plant while the load is connected.

If batteries of smaller capacities are attached to the charger for recharging, it is advisable to attach one or two lights on a line taken from the battery to eliminate too rapid a voltage rise. Battery connection must be made parallel to the lamp or line load.

An automobile battery may be charged without removing it from the vehicle. However, be certain to disconnect the automotive terminals from the battery before connecting the charger leads.

DO NOT ATTEMPT TO OPERATE THIS PLANT AT ANY TIME WITHOUT A BATTERY.

No. 4 cable, or heavier, should be used as leads from the plant to the battery to insure proper voltage relay. These leads should be as short as possible.

For better radio reception, this charger should be operated as far away as possible from the set and antenna, as most radios are susceptible to a certain amount of engine noise.

The radio should be operated with a separate battery and removed to the charger when recharging becomes necessary.

It is not advisable to operate the radio if the charger is operating on the radio battery and at the same time.

The radio battery should be at least within three feet of the radio to minimize electrical annoyances. Noise suppressors may be used on the engine of the charger if necessary.

If a connected load is installed to utilize the 240 watt capacity of the charger, the line leads of the charger must be connected to the battery terminals. A fuse block is recommended to be installed between the line lead and battery.

A 30 ampere main line fuse should be used if all the load is carried on one line. If the two circuit distribution system is incorporated, use fuses with a rating proportioned to the number of connected lamps; 5 ampere fuse capacity for each 25 watt lamp.

MODEL 5253, Ch. 127.620, -1, -2
Gas-O-Power Battery Charger SEARS, ROEBUCK & CO.

MODEL 5215, Ch. 127.6150
MODEL 5252, Ch. 127.630

NOT LESS THAN NO. 10 WIRE SHOULD BE USED FOR AN EFFECTIVE LIGHT LINE, IF THE LINE IS VERY SHORT, AND NO. 8 IS THE AVERAGE DESIRABLE SIZE.

Line connections should be very securely fastened, and it is advisable to study the individual lighting problem to obtain the greatest efficiency from 240 watts. The use of a group of low wattage lamps is more effective than two or three of greater wattage. The line should not be carried over one hundred and twenty-five feet so as to eliminate voltage drop and dim lights.

DO NOT ATTEMPT TO HANDLE WATTAGE GREATER THAN THE CHARGER'S CAPACITY.

All electrical wiring should be done in a dry location, and it should be made certain that all materials used in the construction of a light line are of good quality.

HOW TO CONNECT GAS-O-POWER FOR BATTERY CHARGING ONLY

The battery should be located as close as possible to the charger. Long leads cause voltage drop and loss of power.

Terminal leads must be of the proper size. Standard automotive cables are very desirable.

Use No. 4 wire or larger.

Use heavy screw clamp battery terminals on connections. X-clips are not recommended.

The charger terminals are wing nut connections.

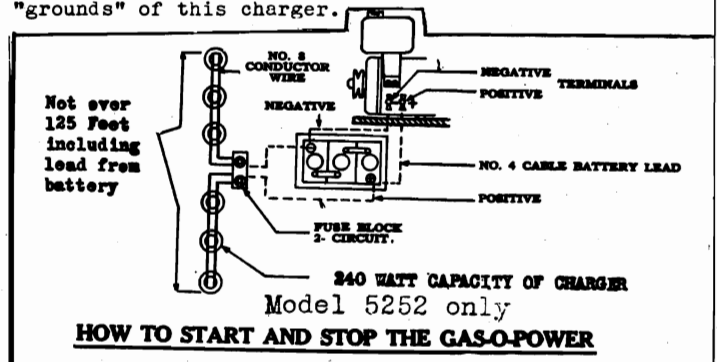

Connect the charger positive (+) post, and the charger negative terminal (-) to the battery negative (-) post.

THE NEGATIVE TERMINAL OF THIS CHARGER IS GROUNDED.

Do not attempt at any time, to reverse the "grounds" of this charger.

FOR USE WITH A LIGHTING SYSTEM HOW TO CONNECT GAS-O-POWER

1. Fill the crankcase with $\frac{3}{4}$ pint of the correct grade of good oil.

Use S.A.E. No. 20 oil all year around, if average climatic conditions prevail.

Use S.A.E. No. 30 oil under extreme heat conditions.

Use S.A.E. No. 10 oil under extreme cold conditions.

THE CRANKCASE SHOULD BE DRAINED EVERY 50-75 HOURS OF OPERATION.

2. Fill the gasoline tank within $\frac{1}{4}$ inch of top. Use a good grade of white gasoline. It is not necessary to use high-test or colored fluids.

DO NOT MIX OIL WITH GASOLINE

Tighten gas tank cap and oil filler plug securely. Make certain that oil drain plug is tight. This unit will not operate satisfactorily with the gas tank cap off.

3. Connect battery.
4. Place choke shutter in a nearly-closed position.
5. Press starting button.
6. Proceed to open choke shutter gradually after engine is operating. (Usual choking can be accomplished by merely holding the thumb and forefinger over choke opening).
7. Adjust the carburetor needle valve after the warm-up period, if engine is not operating smoothly. This adjustment very slightly governs the engine speed until the best operating point is reached for maximum economy.

MODEL 5215, Ch. 127.6150

MODEL 5253, Ch. 127.620, -1, -2

MODEL 5252, Ch. 127.630

SEARS, ROEBUCK & CO. Gas-O-Power Battery Charger

Turn the needle valve to the right (clockwise) to make the mixture leaner, and left (counter-clockwise) to render the mixture richer.

ALWAYS OPEN CHOKE FULLY AFTER WARM-UP PERIOD.

A check valve in the tube, extending into the gasoline tank, prevents engine stalling by not allowing gasoline to flow back into the tank after the piston intake stroke.

MANUAL STARTING may become necessary when the battery does not retain sufficient charge to crank the engine. Wind a rope counter-clockwise (outboard motor principle) around pulley, catching the end in pulley slot. Adjust choke then press starting button and pull the rope at the same time. Then release starting button until the engine fires and operates.

Four (4) dry cell batteries will supply electric energy for ignition only, if the regular battery does not retain sufficient electric energy.

TO STOP THIS CHARGER.

Press and hold down the "Stop" button, located on the top of the ignition breaker assembly. Hold the button down until the charger comes to a complete rest.

SYMPTON CHART TO LOCATE DIFFICULTIES**WHEN PLANT WILL NOT CRANK**

1. Loose or improper battery connection.
2. Discharged battery.
3. Generator brushes worn or dirty - poor contact.
4. Battery lead cables too small or too long.
5. Starter button - dirty contact.

WHEN PLANT WILL NOT START

1. Empty gasoline tank.
2. Check spark plug for break, dirt or loose connection.
3. Compression leak. Blown gasket, loose spark plug, improper valve seating.
4. Clogged fuel system. Check strainer valve in gas tank.
5. Poor ignition contacts. Dirty or gap too wide.
6. Flooded spark plug.
7. Defective condenser.
8. Poor grade of gasoline.

WHEN PLANT DOES NOT GENERATE OR CARRY FULL LOAD

1. Generator brushes worn - poor contact.
2. Low engine compression.
3. Shorted armature.
4. Dirty or rough commutator.
5. Reduced engine speed - check ignition and piston assembly, also valves.
6. Adjust carburetor for maximum power.

WHEN ENGINE RUNS HOT

1. Exhaust back-up. Improper discharge.
2. Check ventilation. Is plant installed in surroundings with good air circulation?
3. Check crankcase breather for dirt.
4. Poor grade of gasoline - do not use Naphtha, or natural gasoline, or colored fluids.
5. Low oil level or improper grade for climatic temperature.

WHEN PLANT USES EXCESSIVE AMOUNTS OF OIL

1. Oil should be changed every 50 to 75 hours of operation to prevent stale oil. (depends on hours of continuous operation).
2. Too rich mixture.
3. Piston rings stuck in piston grooves because of improper lubrication, overheating or defective rings.

WHEN ENGINE OPERATES PLANT GENERATOR BUT CURRENT IS NOT AVAILABLE ON A LIGHT LINE

1. Blown fuses.
2. Open line wire.
3. Open line switch.
4. Burned out bulbs.
5. Improper wire size.
6. Carrying lights too great a distance.

IMPROPER LIGHT EFFECTS OR FLICKERING LIGHTS

1. Low battery voltage.
2. Break in line.
3. Loose connection.
4. Shorted battery cell.
5. Battery old or in poor condition.

CARE OF GAS-O-POWER AND BATTERIES

Check oil and fuel before each period of operation.

Clean the charger periodically. Do not allow the fuel lines gas tank, or crankcase to become congested with dirt or sediment. Wipe the charger free of any oil and gasoline if same is spilled when the operating liquids are being replenished.

MODEL 5253, Ch. 127.620, -1, -2

MODEL 5215, Ch. 127.6150

Gas-O-Power Battery Charger SEARS, ROEBUCK & CO. MODEL 5252, Ch. 127.630

All plant and battery connections should be maintained tight. Do not cause an electrical short by allowing the lead wires to make contact with any other wire or metal part. Considerable damage to the generator can be caused if a short occurs.

Use good grades of fuel and lubricant. Change crankcase oil every 50 to 75 hours (depending upon periods of continuous operation).

Keep your batteries filled with Electrolyte (liquid) $\frac{1}{2}$ inch above top of battery plates. Keep the battery terminals clean and tight. Grease them (vaseline) to prevent corrosion.

Keep the batteries clean and dry.

Keep the batteries charged to a certain point. Do not allow them to remain discharged for long periods of time. By keeping the batteries in good condition, their life increases. Old batteries are not efficient and will not take a full charge. Do not overcharge the batteries. However, if the battery has not been used for several weeks, it may be necessary to over charge the battery for a few hours in order to restore the battery to proper condition.

Keep the batteries fully charged in cold weather.

AUTOMATIC VOLTAGE RELAY CUTOUT

The Gas-O-Power Charger Model #127.630 is equipped with the Automatic Voltage Relay Cutout. This cutout is located on the generator housing on the starter button side of the charger. (See Photograph.) The mechanism of the cutout is covered by a metal box-like top which occasionally should be removed to inspect the parts underneath for dirt and dust which will retard operation.

The batteries must be disconnected from the charger while inspecting or adjusting the cutout.

If it has been determined that the charger is stopping before the batteries are receiving a full charge, it may be necessary to make a minor adjustment of the cutout. Remove the cutout cover and study the mechanism carefully. (Identify the correct adjusting position of the cutout as appearing in diagram.) Note the tension spring hooked between the two lugs or spring holder arms which are located directly in front of the paper covered voltage cutout coil. Its position will be further noted in that it is behind the lead post for the connection of the lead wire from the ignition coil to the cutout. (The heavy wire coil at the left-hand side is the current cutout and no attempt at any time should be made to make adjustments for any purposes whatever.)

PROPER VIEW OF CUTOUT FOR ADJUSTMENT

The tension of the spring must be very slightly increased if the charger is stopping before a full battery charge is reached. Place a blunt instrument on the edge of the lower lug or spring holder arm and exert downward pressure bending the lug slightly. Extreme Caution should be exercised when attempting this adjustment and it may be necessary that the adjustment be made several times until the correct cutout point is reached. The correct cutting out point may be determined by testing the batteries with a hydrometer. The correct gravity reading should be between 1275 and 1300.

If it is determined that the charger continues to operate after a full battery charge has been reached, then the same blunt instruments should be placed under the bottom lug or spring arm exerting pressure slightly upward to decrease the spring tension.

Study the charger's reaction carefully if the cutout adjustment is made. Do not attempt any further adjustment of the cutout than described and if necessary request further information from the Sears store from which you purchased the charger.

SERVICE

NOTE: Because of the compact design and close fitted parts, the operator of this charger should carefully and thoroughly study the construction of both the engine and the generator before service or disassembly is undertaken.

THE CARBURETOR may be unscrewed from position on the gas tank. The needle valve, as well as the check valve in the tank, should be inspected. The gas tank can be removed by unscrewing it from its position on top of generator.

THE IGNITION may be tested by disconnecting and holding the terminal lead to spark plug $\frac{1}{8}$ inch from engine frame. Note a hot thick spark when starter button is pressed. Check coil condenser and ignition breaker plunger (spring and point). The spark plug clearance should be between .020 and .030. Breaker point contact should be .022.

MODEL 5215

MODEL 5252

MODEL 5253

SEARS, ROEBUCK & CO.

TIMING of the plant is correct when the line mark (/) on the crankshaft counterweight is directly in line between the camshaft gear teeth marked (0). Timing can be set and checked through the front of engine with the crankcase breather removed, and the charger at eye level.

THE VALVES may be ground by removing from the engine the exhaust line, carburetor, cylinder head and breaker box (interrupter assembly). Force valve spring up, remove stem key and retainers, then remove valves. Place a good valve grinding compound on the bevel edge of the valve and insert back into cylinder. Use a screw driver for grinding and **DO NOT USE A VALVE GRINDING TOOL**. A valve tool is too heavy, for a great amount of pressure should not be exerted when grinding. The valves do not require frequent grinding. The valve seats should be cleaned before reassembly (wash in gasoline or kerosene.)

VALVE TIMING is correct when the gap between valve stem and tappet is between .010 and .012. After a valve grinding operation, the operator may find it necessary to grind off the valve stem to adjust and obtain the proper clearance.

COMPRESSION may be checked by inspecting the piston rings, gaskets and valve and tappet clearance. Compression loss at the valve seat may be adjusted by grinding the valves and correctly setting the valve and tappet clearance by grinding off the stem to proper clearance.

THE STARTER SWITCH should be periodically inspected and disassembled for cleaning, to insure good contact.

THE PISTONS AND PISTON RINGS may be removed from the engine for inspection after the cylinder has first been removed. If the piston rings are worn excessively or broken, they should be replaced. Clean the ring grooves of any foreign deposits. Piston clearance is .004 to .005 with a clearance feeler 3/8 inches wide, and ring openings should be spaced thirty degrees (30°) apart.

CARBON DEPOSITS in the engine should be removed periodically by cleaning with a carbon solvent to prevent valve pitting, overheating, loss of oil and mechanical failure.

THE CRANKCASE BREATHER AND EXHAUST MUFFLER should be periodically inspected and cleaned. A clean muffler eliminates exhaust back-pressure. The crankcase breather can be washed in gasoline. A clogged breather retards cooling which will result in harm to the engine.

THE GENERATOR may be inspected by removing the end housing plate, held by two screws. Note brush condition. They should not stick in the brushholders, but run free on commutator with smooth contact. The brush faces should fit the commutator in a curved arc, as they are designed in this manner. Check the brushholder spring tension for weakness. Replace worn brushes. Brush faces may be smoothed with a piece of "00" sandpaper to improve contact, if roughened. Charging rate of the generator is dependent upon good brush condition. **DO NOT OIL ANY PART OF THE GENERATOR**. When servicing the generator, extreme care should be exercised to insure against shorting injury to, or dislocation of, any part or wire. The correct position of all parts and connections in the generator should be carefully noted before reassembly. Do not allow any wire or metal part to touch, causing an electrical short.

SEARS, ROEBUCK & CO.

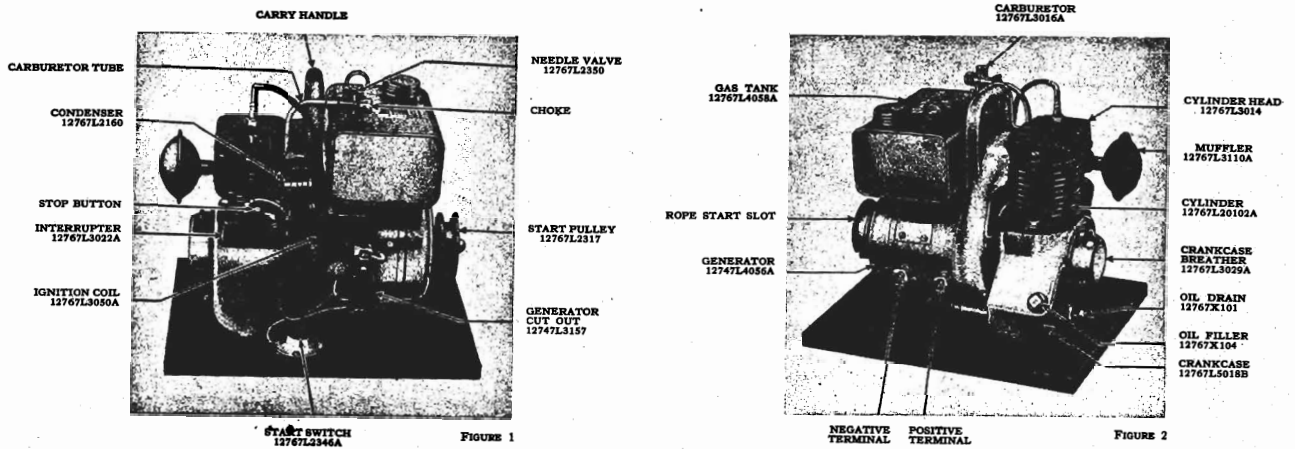

Fig. 1. ILLUSTRATION OF TYPICAL RECOMMENDED INSTALLATION

The above diagram shows connections for charging the radio battery and for six 6 volt 25 watt electric lights. Unless you wish to charge a 2 volt storage battery the extra 6 volt storage battery will not be needed if it is not intended to wire for lights. If a 2 volt storage battery is used a 6 volt battery will be necessary at this point in the circuit for furnishing ignition current to start the engine. It will also be necessary to use the Resistor shown (part No. 5223) for charging a 2 volt storage battery or a 4 volt storage battery.

GENERAL INFORMATION AND SERVICE HINTS

1. Handle the charger with care. Do not drop the charger, and keep it in an upright position when filled with fuel and lubricant.

2. WHERE TO INSTALL THE PLANT:

A. LENGTH OF WIRE: The plant should be installed in such a manner that the wires to the lights, batteries and radio will be as short as possible. As the wire offers a resistance to the flow of electricity, the more wire used the lower the voltage will be at the point of use. Similarly, the smaller the wire size the lower the voltage will be at the point of use. This is particularly important in the connection between the plant and the batteries, for the larger the wire size the higher the voltage at the batteries, and the result is a higher charging rate. SEE THE WIRE EXTENSION TABLE BELOW:

WIRE EXTENSION TABLE

IF THE DISTANCE BETWEEN PLANT AND RADIO BATTERY IS:

20 feet use	No. 12 wire
40 feet use	No. 10 wire
60 feet use	No. 8 wire
100 feet use	No. 6 wire
140 feet use	No. 4 wire

OCT. 13, 1938

HOW TO START AND STOP THE GAS-O-POWER

SUBJECT: REVISION OF 127.620 GAS-O-POWER BATTERY CHARGER

The following changes are now in production and will be effective on all GAS-O-POWER plants numbered A-15000, upward. There has been a change in the design of the unit. The generator housing has been slotted to allow the free passage of air, and the installation of the larger fan, L3416, greatly improves the cooling of the plant.

The cylinder is interchangeable as an assembly and is to be supplied for all service replacements, but the valves, springs, retainers, and locks are not interchangeable with the old parts which must be supplied for service on all 127.620 plants, the engine number of which is not prefixed with the letter (A). The cylinder head is not interchangeable unless the spark plug is also changed. The 14 m.m. spark plug cannot be supplied for service, its use being restricted to production. The new piston is interchangeable with the old and will be furnished for all service replacements. The piston rings are also interchangeable. The new crankcase is interchangeable with the old.

The difference between 127.620-1 and 127.620-2 is the change of the fan, #L3416 superseding L3124. These parts are not interchangeable and L3124 must be supplied for service on all 127.620 and 127.620-1 plants.

GAS-O-POWER BATTERY CHARGER

SEARS, ROEBUCK & CO.

MODEL 5303, Ch. 139.700
Power Shifter

WIRING DIAGRAM FOR SILVERTONE MODEL 5303 POWER SHIFTER

"A" SUPPLY

The "A" Supply is obtained from a full wave copper sulfide rectifier filtered by a condenser input filter consisting of three condensers and two low resistance chokes. A tap on the power transformer allows the voltage on the rectifier to be changed giving two "A" load voltages. Terminal voltages for various loads are indicated on the wiring diagram.

"B" SUPPLY

The "B" supply employs a 6P5GT tube operated as a half wave rectifier operating into a condenser input filter of one choke followed by another condenser.

The "A" and "B" circuits are not common to each other or to the chassis. Different tube biasing methods make this necessary.

POWER DRAIN

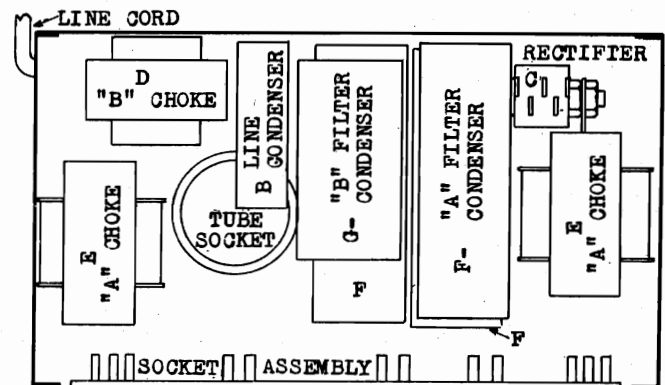

The primary input is 8 watts when the "A" and "B" circuits are loaded. The input watts under no-load should not be more than 4.5 watts and the primary current without load not more than 115 MA at 117 volts, 60 cycles.

"A" SUPPLY FAILS

When the "A" voltage is excessively low the rectifier, condensers or transformer may be defective. To check the transformer remove one green lead of transformer winding from the rectifier and measure for A.C. voltage indicated on wiring diagram. To check the rectifier remove green lead from choke "E" and condenser "F", -- also disconnect one side of jumper wire and measure D.C. voltage across rectifier. This should be 1.4 to 1.5 volts with the tap changer tie block in the 4-5 tube position.

"B" SUPPLY FAILS

The 6P5GT tube should be tested with a standard tube tester. The transformer may be tested by measuring the A.C. voltage across the secondary plate winding with the red-yellow lead disconnected.

PLACING MAIN-FRAME ON TOWER

Before you proceed to mount main frame on tower mast head, place the turntable ball bearing (No. 144) on mast head with the name and figures on bearing, up. Now, place small weather cap (No. 114) over the top of bearing with flange down. Before you climb tower to install head let us caution you to use some kind of a safety belt device, just in case you should slip or become overbalanced. It is advisable to tie a rope around generator and main-frame assembly and pull them up in that manner. Slide main-frame pipe (103B) down over mast head (118) being sure that you do not allow machine to drop as to do so might injure the ball thrust bearing.

PROPELLER MOUNTING

Insert two 5/16x1 1/2" machine bolts through propeller front plate (No. 107) and through holes in propeller. Place propeller hub spinner cap (102) in position over generator hub with flange toward generator. See Fig. 9 below. This part of the propeller assembly can be done before propeller is taken up on tower for mounting on the generator. In attaching the propeller to the propeller hub (No. 105), screw bolts into the threaded holes of the hub. BE SURE THE FLAT SURFACE OF THE PROPELLER FACES WIND, as stated on small sticker. Make sure to tighten down propeller bolts evenly.

FIGURE 9

ASSEMBLING MAIN-FRAME

Note from Fig. A, that the main frame head assembly consists of three integral parts. (No. 103A) the pressed steel main frame proper, (103B), the Turntable pipe, and (103C) the trunnion pin clamp. These are all electrically welded together and listed as part No. 103. In this, is mounted the collector ring assembly, which consists of the positive brush assembly (133) and the negative brush assembly (132). To assemble the charger, bolt tail arms 129R and 129L to main frame as illustrated in Fig. A, using 1/2" x 5/16" square head bolts, nuts and lockwashers having the nuts on the outside. Leave these bolts loose until trunnion pin clamp bolts are in place and tightened around trunnion pin. Then tighten the other bolts. Place cable clamps (113) over the front bolt on right hand side as you face the charger. Place distributor box cover (135) in position as shown in Fig. A, page 8. Set generator in place and slide trunnion pin (108) through the generator hinge lugs, distributor box cover ears, and trunnion pin clamp (103C). Insert 5/16x3/4" square head bolts through holes in tail arms (129R and 129L) and up through holes in trunnion pin clamp (103C) and tighten down nuts over lockwashers. Then tighten other bolts. Slide throwout collar (112) and throwout bale (111) up on turntable pipe (103B) and connect throwout bale (111) to fin on rear of generator using throwout bale pin, (No. 110), washer and cotter key, which also attaches clevis to fin. Place governor spring tail arm clip and spacer (128) in position between tail arms and bolt loosely. Hook one end of governor spring in hole in tail arm clip and spacer (128) and attach other end to clevis on generator tail fin. The tail vane comes in two sections and is bolted between the tail arms using three 1/4x1 1/2" bolts, nuts and lockwashers. Now tighten all bolts carefully.

ATTACHING CABLE

After main frame assembly is completed refer to illustration and note carefully position of generator cable No. 109. Connect the red positive wire to positive generator post, No. 138 between the two hexagon nuts. Connect the black negative wire to the negative screw No. 137 which is just above the positive post. Fasten cable in position under cable clamp No. 113 as shown.

PROPELLER TRACK

After propeller has been placed on charger, take a ruler and measure the distance from the propeller tip to the tower as shown in Figure 10. Now turn the propeller half over and measure the distance between the

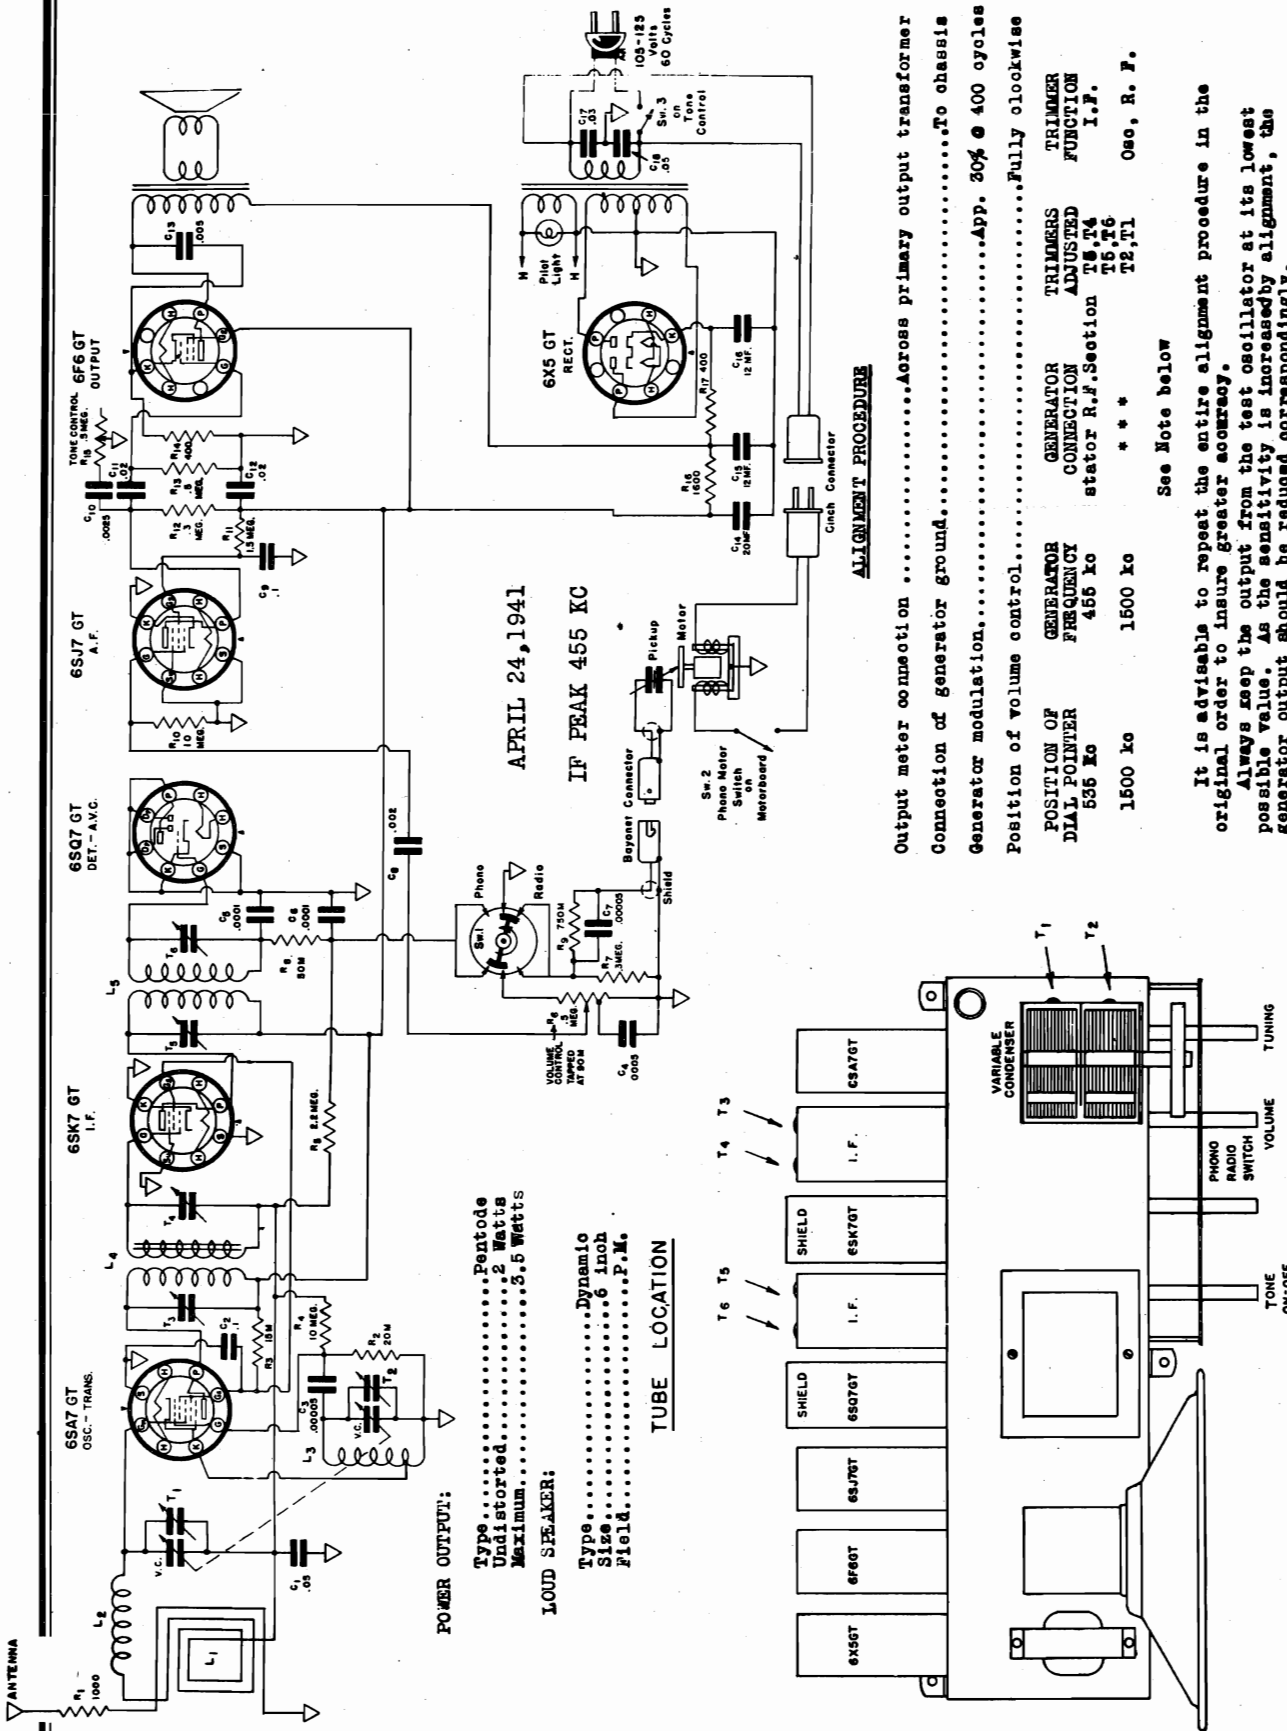

FIGURE 10

tower and other measurements should be the same. Should there be a difference the bolt on the side which the tip is closest to the tower should be loosened and the other bolt should be tightened more. Should you still be unable to make propeller track, you will have to loosen both bolts and place a broad tin shim between propeller and hub.

See Note below

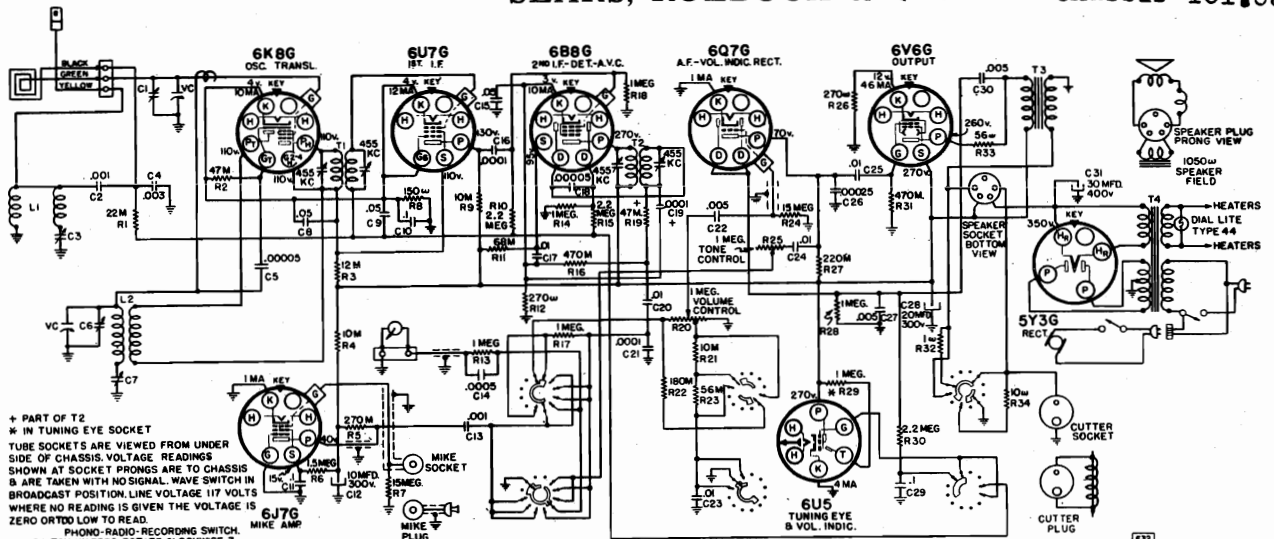

It is advisable to repeat the entire alignment procedure in the original order to insure greater accuracy. Always keep the output from the test oscillator at its lowest possible value. As the sensitivity is increased by alignment, the generator output should be reduced correspondingly.

***Run a wire from the output terminal of the generator, having it come near the receiver. However, no metallic connection is made between the signal generator and the receiver.

1400 kc	1400 kc	.00005 mfd.	Ant. Clip	C1	Translator	125
600 kc (rock)	600 kc	.00005 mfd.	Ant. Clip	C7	Padder	55

IMPORTANT ALIGNMENT NOTES

* The generator should be adjusted for high output. The trimmer should be adjusted for minimum output meter reading instead of the usual maximum reading. If the frequency of an interfering station around 455 kc is known, the generator should be adjusted to the frequency of that station instead of to 455 kc.

Where indicated by the word, "Rock", the variable should be rocked back and forth a degree or two while making the adjustment.

The alignment procedure should be repeated stage by stage, in the original order, for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

IMPORTANT ALIGNMENT NOTES

* If two peaks can be had, the correct one is with the trimmer screw further out; the other peak is the image.

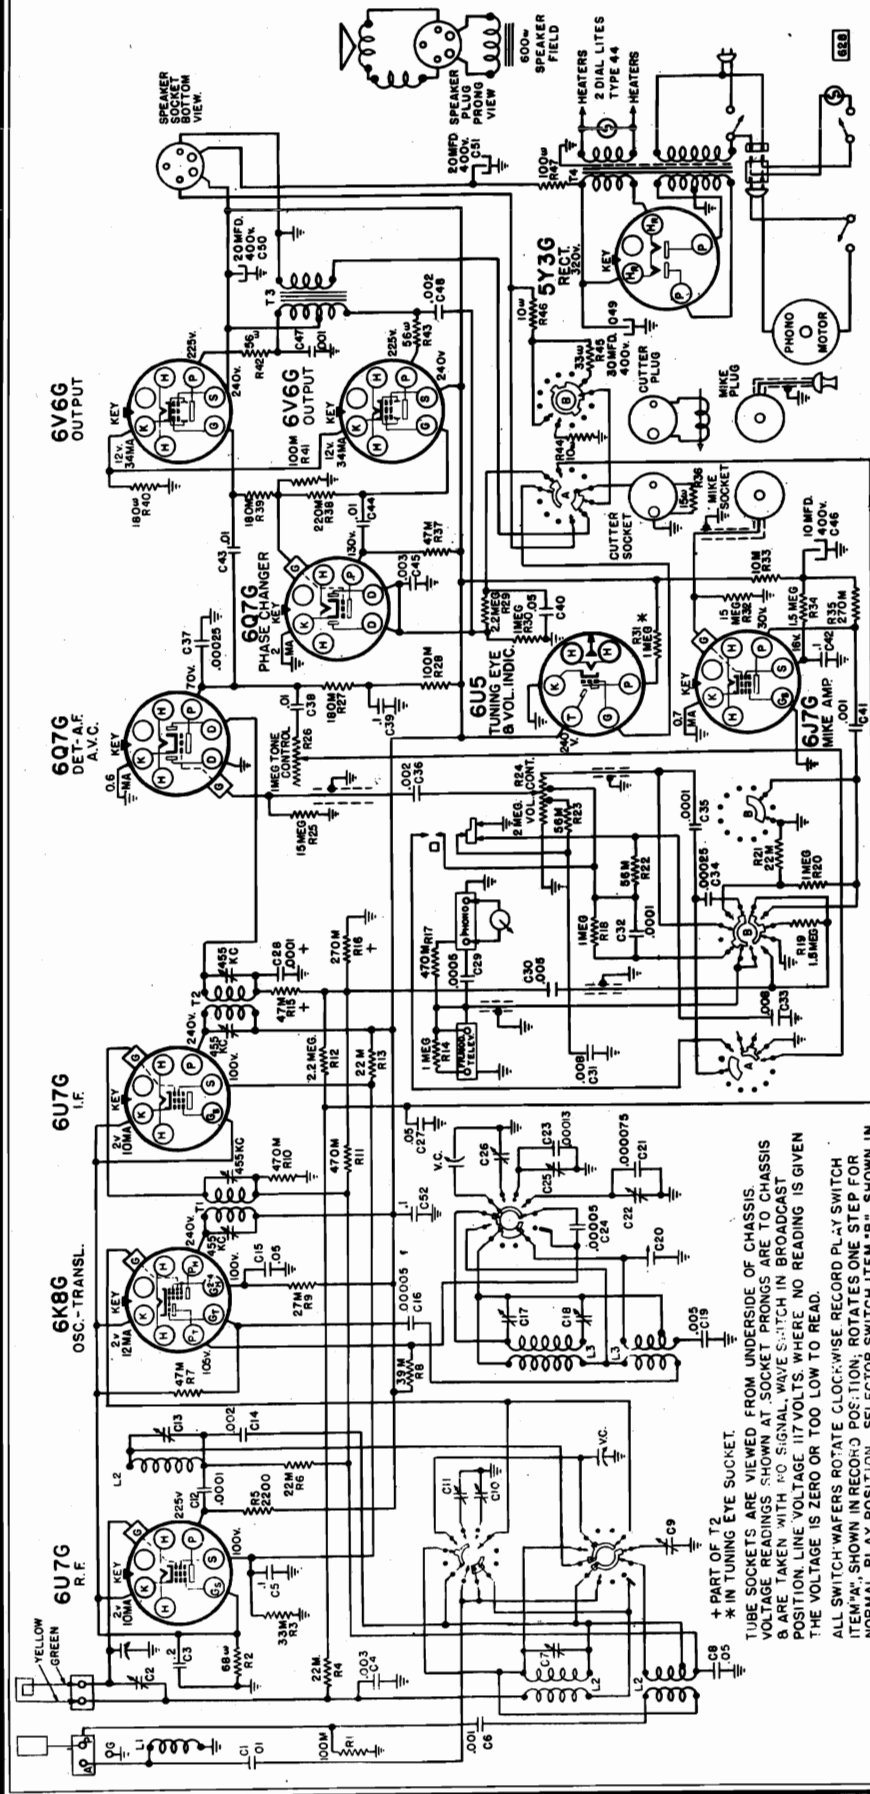

Where indicated by the word, "Rock", the variable should be rocked back and forth a degree or two while making the adjustment.

The alignment procedure should be repeated stage by stage, in the original order, for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

Calibration Scale on Variable Condenser Drive Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment when chassis is out of cabinet; therefore, a calibration scale is attached to the rear of the drum which is mounted on the shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The 45° mark on the drum scale (see "Dial Drive Drawing") must be in a horizontal position when the plates are fully meshed. The distance from the edge of the chassis to the drum must not exceed 1/8-inch. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "0°" mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial pointer to the drive cable with variable condenser fully closed and pointer on last calibration mark at 550 kc end of Broadcast "A" band. The dial pointer has a spring clip for attachment to the cable.

SERVICE INFORMATION

The Model Number 5812, carrying identification number 138.905 is an alternating current electrical phonograph designed for the transcription of all laterally modulated records.

In first placing the equipment into operation, it should be carefully unpacked and all packing removed from the various parts associated with the operation of the equipment.

To place the equipment in operation, the attachment cord which is seen to come out of the base of the equipment, should be attached to an electrical cord power outlet giving power of the correct voltage and frequency as shown above. This information can be ascertained by looking at the specification on the light meter or by calling the local power company and asking for the information.

A record should be placed on the turntable. The pickup arm should be equipped with a new needle and placed in the outside groove of the record. The motor switch should be turned on causing the turntable to rotate.

When it is desired to replace the tubes in this equipment, remove the base plate by unscrewing the four screws that hold the rubber feet on the bottom. This will expose not only the tubes but the turntable motor as well.

The cartridge used in the pickup of this equipment is a crystal cartridge and will yield some distortion if used when extremely cold. The equipment should be at a temperature of approximately 70 degrees for good operation.

Unless long playing needles are used, the needle should be replaced regularly, at least every two records and preferably each time a record is played.

When it is desired to replace the tubes in this equipment, remove the base plate by unscrewing the four screws that hold the rubber feet on the bottom. This will expose not only the tubes but the turntable motor as well.

The cartridge used in the pickup of this equipment is a crystal cartridge and will yield some distortion if used when extremely cold. The equipment should be at a temperature of approximately 70 degrees for good operation.

Unless long playing needles are used, the needle should be replaced regularly, at least every two records and preferably each time a record is played.

HOW TO ORDER PARTS FOR THIS PORTABLE ELECTRIC PHONOGRAPH-IDENTIFICATION NO. 145.815

On the Purchase Order always give the following information:

- (1) PART NUMBER and DESCRIPTION for each part ordered. When no part number is assigned order by description and rating. Also give PRICE of part number.
- (2) The IDENTIFICATION NUMBER is 145.815. This number will be found on a plate immediately underneath the turntable.

MODEL 5831 Phono.
Ch. 137.394

DECEMBER 17, 1941

RETAIL SELLING PRICES PREPAID
PRICES SUBJECT TO CHANGE WITHOUT NOTICEELECTRICAL SPECIFICATIONS

POWER SUPPLY 115 volts, 60 cycle AC, 17 watts

TURNABLE SPEED - Constant 78 r.p.m.

GENERAL INFORMATION AND SERVICE HINTS

Before starting the motor, see that the rubber edged driving pulley is completely under the turntable as this motor is a rim drive type, and this pulley must be in place for proper operation. This is a constant speed motor and no adjustment is necessary to obtain the proper number of revolutions per minute for correct reproductions. Be sure the electric supply is of the same voltage and frequency as that of the phonograph motor shown on a tag attached to the cord.

To play a record, insert the cord in an electrical receptor and turn on the post type switch on the side of the case near the cord. Be sure the reproducer is started on the record on the right hand side of the turntable at the very edge of the record. Needles should be changed often to preserve the life of the record. Ten selections of a 10" record may be played with each of the needles accompanying this machine.

Service Instructions - All parts of this phonograph have been completely serviced previous to shipment. It is recommended when servicing is necessary on the motor itself, that the entire motor be returned to the factory for the most satisfactory adjustment or replacement. However, parts can be purchased as listed for self servicing or servicing by a competent service man.

To remove the motor from the case, first be sure that the connections of the phonograph to any electrical supply is disconnected. Remove the bottom of the case and break the wiring connections from motor to switch and motor to cord. Remove the turntable and remove the three rivets that hold the motor to the case.

Caution - 1. Do not use extreme force in removing the turntable from the shaft. 2. Be sure the voltage and frequency of the power supply is the same as that of the motor. 3. Avoid hitting the reproducer or the arm on the reproducer against the side of the case, turntable or other rigid parts as this is a delicate instrument and undue movement or pressure against the small arm near the needle may damage it or subtract considerably from good reproduction.

WIRING DIAGRAM

SEARS-ROEBUCK & CO.

MODEL 5832 Phono.
Ch. 137,542

ELECTRICAL SPECIFICATIONS

POWER SUPPLY:115 volts, 60 cycle AC, 17 watts

TURNTABLE SPEED - Constant: 78 r.p.m.

Service Instructions - All parts of this phonograph have been completely serviced previous to shipment. It is recommended when servicing is necessary on the motor itself, that the entire motor be returned to the factory for the most satisfactory adjustment or replacement. However parts can be purchased as listed for self servicing or servicing by a competent service man.

To remove the motor from the case, first be sure that the connections of the phonograph to any electrical supply is disconnected. Remove the bottom of the case and break the wiring connections from motor to switch and motor to cord. Remove the turntable and take out the three machine screws that hold the motor to the metal mounting plate. Be careful not to lose the metal washers and rubber grommets used in holding the motor in place.

Caution - 1. Do not use extreme force in removing the turntable from the shaft. 2. Be sure the voltage and frequency of the power supply is the same as that of the motor. 3. Never attempt to close the lid while a record is playing. 4. Avoid hitting the reproducer or the arm on the reproducer against the side of the case, turntable or other rigid parts as this is a delicate instrument and undue movement or pressure against the small arm may damage it or subtract considerably from good reproduction.

Wireless Record Player

SEARS-ROEBUCK & CO.

POWER SUPPLY

105-125 V. 60 cycle AC.....35 watts
105-125 V. 50 cycle AC.....35 watts

OPERATING CONTROLS

Switch for Turntable.....Automatic
Knob....."OFF-ON" Volume

105-125 V. 25 cycle AC.....35 watts

CONTROL OPERATION

"OFF" when pickup arm is on rest.
"ON" when pickup arm is moved to playing position
Turning clockwise.....turns power on
Continuing to turn increases volume.

ADJUSTMENT OF MODEL 5848 WIRELESS RECORD PLAYER

- Carefully tune your radio receiver from 540 to 700 KC. to find a dial setting where no station is heard during either the day or night. If there is no dial position where no station is heard, pick a spot where stations come in the weakest.
- Place the record player in operation.
- Remove the plug button on front of the record player and by means of a small screwdriver adjust the screw located beneath the plug button until the record player is heard on the radio receiver. It is suggested that you turn the screw all of the way out (counter-clockwise) very slowly, then if the record player still is not heard, turn the screw inward (clockwise) as far as necessary. After you hear the player, turn the screw back and forth slowly until the record is heard with deepest tone and minimum noise. If you find that there is a howl or whistle while records are being played, it may be necessary for you to set the receiver dial to a different position and readjust the record player for this new setting.

If the radio receiver has push button tuning, you can tune a push button to the signal of the record player in the same manner as you would adjust a button for a radio station.

ALIGNMENT PROCEDURE

Output meter connections.....Across primary of output transformer
 Connection of output generator lead.....See Chart below
 Generator modulation.....30%, 400 cycles
 Position of volume control.....Fully on

POSITION OF VARIABLE	GENERATOR FREQUENCY	GENERATOR CONNECTION	TRIMMER ADJUSTMENTS	TRIMMER FUNCTION
Closed	455 KC	1A7GT Grid	T3, T4 T5, T6	I.F.
1500 KC	1500 KC	*See note below	T2, T1	Osc., R.F.

The complete assembly of loop mounting and chassis shelf should be removed as a unit in order to align the receiver

The batteries should be in the proper position when aligning the receiver.

Always keep the output power from the generator at its lowest possible value to prevent the AVC of the receiver from interfering with accurate alignment.

*Run a wire from the output terminal of the generator, having it come near the receiver. However, no electrical connection is made between the signal generator and the receiver.

 Right knob..... Tuning

CONTROL OPERATION

Turn right: Power on, volume increase

GENERAL INFORMATION AND SERVICE HINTS

THE 417 IS ALMOST IDENTICAL TO THE 411 WITH BUT A FEW MINOR CHANGES AS FOLLOWS:

- 1 - A TRIPLE POLE DOUBLE THROW SWITCH IS USED TO ISOLATE "A" AND "B" BATTERY PLUGS WHEN THE RECEIVER IS OPERATED FROM 110-125 VOLT SOURCE.
- 2 - THE PAPER CONDENSER (C20-.05MF) IS REPLACED BY A MICA MOULDED CONDENSER OF THE SAME VALUE.
- 3 - A NEGATIVE BUS IS USED AND IS CONNECTED TO THE CHASSIS THROUGH A .2MF CONDENSER C21

THE ANTENNA

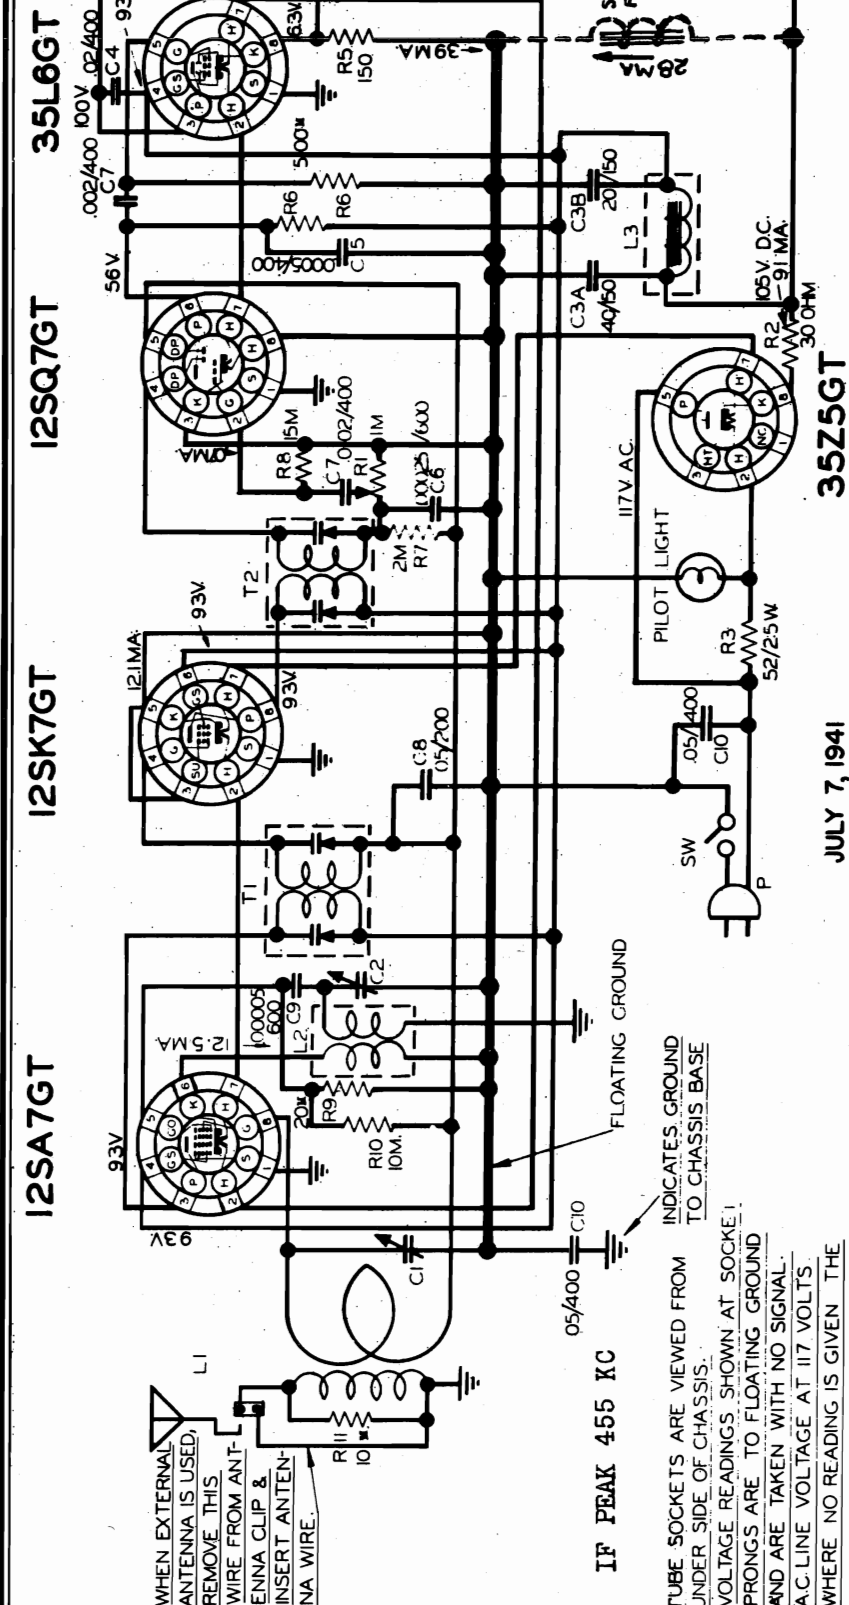

The receiver contains a built-in "loop" antenna which will give entirely satisfactory reception from local and moderately distant stations. Additional range can be had by connecting to a conventional outdoor antenna. If such an external antenna is used, connection should also be made to a ground. A ground should never be used, however, in 110-125 volt (AC)(DC) operation.

AC-DC OPERATION

For (AC) alternating current (DC) direct current operation, the male plug is withdrawn from its receptacle at the rear of the chassis and inserted into the 110-125 volt source. The receiver may then be operated normally. This is illustrated by diagram on the following page.

SUBJECT: ADDITION OF SUFFIX NUMBER -2 TO CHASSIS IDENTIFICATION NUMBER
 The Pilot Lamp Shield and Snubber Assembly has been improved and simplified. This assembly which was identified by Part Number N17225 is superseded by Part Numbers N17308-Pilot Lamp Snubber and N17307-Pilot Lamp Shield.
 When ordering parts for Chassis marked 132.812-2, -2A, -2B, use the parts list included in this Supplement.
SUBJECT: ADDITION OF SUFFIX NUMBER "-3" TO CHASSIS IDENTIFICATION NUMBER 132.812 AND PARTS LIST AND CIRCUIT DIAGRAM CHANGES FOR ALL MODELS.
 The Oscillator Coil Pt. No. N17233 was supplanted by Pt. No. N17320. The new coil Pt. No. N17320 may be identified by the fact that lug no. 1 is blank whereas the start of the white winding of coil no. N17233 was connected to lug no. 1. (See fig. 1)
 The hookup of the coil in the circuit remains unchanged and is as follows:
 Lug no. 1 - To chassis
 Lug no. 2 - To Variable Condenser
 Lug no. 3 - To Ft. ground
 Lug no. 4 - To cathode 12SA7GT

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection Across loud speaker voice coil
 Output meter reading to indicate 50 milliwatts 0.38 volts
 Dummy antenna value to be in series with generator output See chart below
 Connection of generator output lead See chart below
 Connection of generator ground lead See chart below
 Generator modulation 30%, 400 cycles
 Position of Volume Control Fully clockwise
 Position of Dial Pointer with Variable fully closed See note below

POSITION OF VARIABLE	FREQUENCY GENERATOR	DUMMY ANTENNA	GENERATOR CONNECTION (High)	GENERATOR CONNECTION (Low)	TRIMMERS ADJUSTED (In order shown)	TRIMMER FUNCTION	UV IN-PUT TO STD. LOOP TO GIVE 1/2 W. OUTPUT
Open	455 kc	.1 mfd.	12SA7GT Grid	Var. cond. frame	T2, T1	IF	-----
1400 kc	1400 kc.	.00005 mfd.	Ant. clip	Ch. base	C2, C1	Translator	1600 uv.
600 kc	600 kc	.00005 mfd.	Ant. clip	Ch. Base	Check point	---	1000 uv.

IMPORTANT ALIGNMENT NOTES

With the variable condenser closed the pointer should point vertically upward. When properly set with the variable condenser closed the pointer will point just to the right of the "54" calibration mark.
 The alignment procedure should be repeated stage by stage, in the original order for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

ELECTRICAL CHANGES IN 100.363 CHASSIS

The first group of 100.363 chassis produced were equipped with a Permanent Magnet speaker and a six volt pilot lamp. Later chassis were produced with electro-magnetic speakers and 110 volt pilot lights. These later chassis are identified by 100.363-1 stamped on the identification plate.

WHEN ORDERING PARTS OR REFERRING TO A CIRCUIT DIAGRAM, BE SURE TO SPECIFY OR REFER TO THE PROPER AND COMPLETE CHASSIS NUMBER AS SHOWN ON THE IDENTIFICATION PLATE.

ELECTRICAL & MECHANICAL SPECIFICATIONS

The 100.380 & 100.380-1 chassis are the Underwriters' listed versions of the 100.363 & 100.363-1 chassis respectively. The electrical and mechanical specifications are the same as those for the 100.363 & 100.363-1 chassis and may be obtained from the RL issued for these chassis. The 100.363 & 100.363-1 chassis use the metal chassis pan as the B-return. The Underwriters' listed chassis (100.380 & 100.380-1) use a separate B-return which is by-passed to the metal chassis pan through condenser C19.

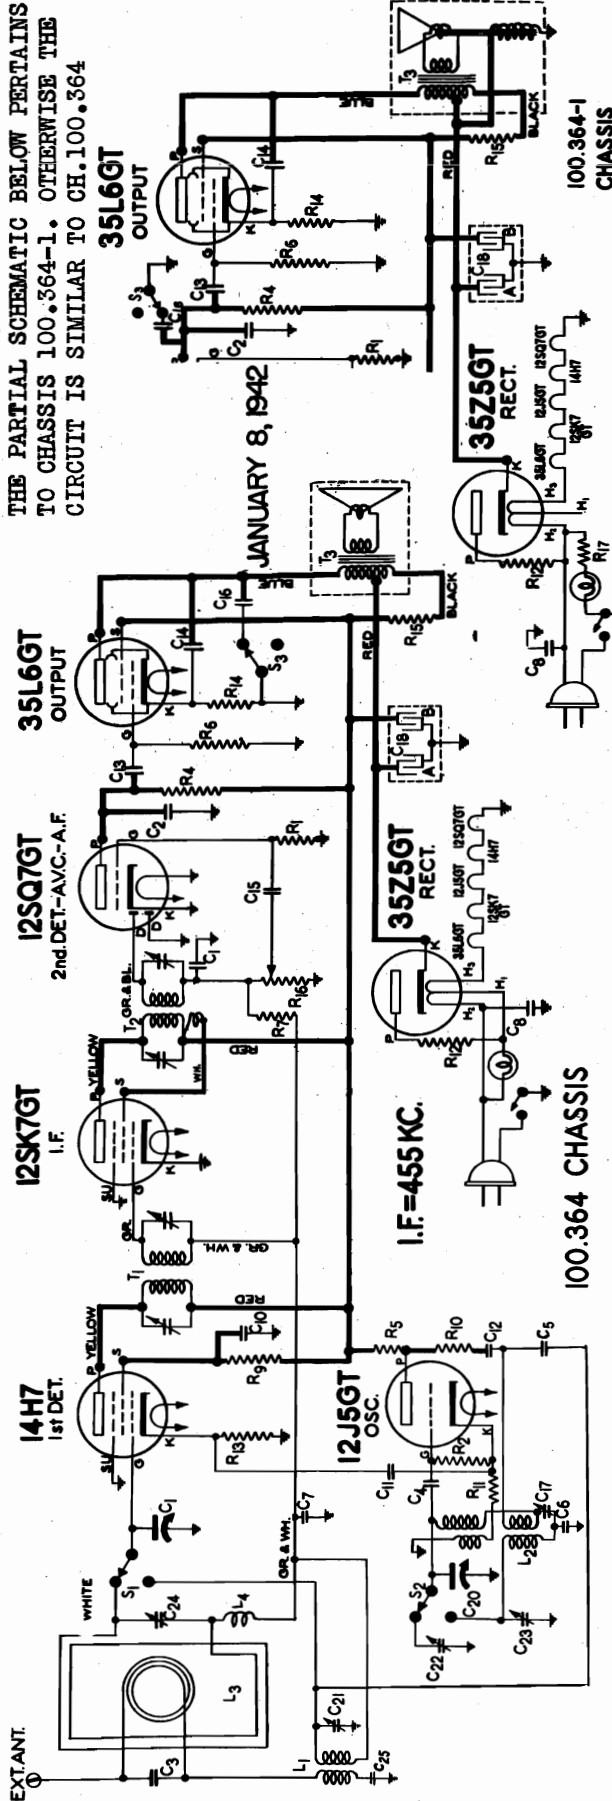

The parts listed for 100.363 & 100.363-1 diagrams applies to the 100.380 & 100.380-1 diagrams

WITH THE DIFFERENCES SHOWN IN THE ABOVE PARTIAL SCHEMATIC, CHASSIS 100.380-1 IS IDENTICAL TO CHASSIS 100.380

SEE SEARS PAGE 13-53 FOR PARTS

SEARS, ROEBUCK & CO.

THE PARTIAL SCHEMATIC BELOW PERTAINS TO CHASSIS 100.364-1. OTHERWISE THE CIRCUIT IS SIMILAR TO CH.100.364

The 100.364 chassis as first produced used a P.M. dynamic speaker and a 6 volt pilot light. Later versions use an electro-dynamic speaker whose field is connected across the B supply in order to obtain the required excitation. These later models, which are identified by 100.364-1, also use a 110 volt pilot light. The later models have the tone control connected in the 12SQ7 plate instead of the 35L6GT plate as in the earlier models.

Position of Volume Control	-----	Fully clockwise
Position of Tone Control	-----	"Hi" position
Position of Dial Pointer with gang fully closed	-----	On mark to left of 550 KC. calibration mark
Approximate input to standard loop giving 500 MW @ 400 cycles, 30% mod.	-----	1200 μ v.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECTION SIGNAL GENERATOR OUTPUT TO RECEIVER	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. CONDENSER	STATOR ON REAR SECTION OF GANG	455 KC	"AM" POSITION	600 KC	1 - 2 3 - 4	2ND I. F. 1ST I. F.	ADJUST FOR MAXIMUM OUTPUT THEN REPEAT ADJUSTMENT.
400 OHM CARBON RESISTOR	ANTENNA TERMINAL	14 MC	"FOR" POSITION	14 MC.	5	SHORT WAVE OSCILLATOR	ADJUST FOR MAXIMUM OUTPUT. CHECK TO SEE IF PROPER PEAK WAS OBTAINED BY TUNING IN IMAGE AT APPROX. 15.1 MC. IF IMAGE DOES NOT APPEAR, REALIGN AT 14 MC. WITH TRIMMER SCREW FARTHER OUT.
400 OHM CARBON RESISTOR	ANTENNA TERMINAL	14 MC	"FOR" POSITION	14 MC	6	SHORT WAVE ANTENNA	ADJUST FOR MAXIMUM OUTPUT. TRY TO INCREASE OUTPUT BY DETUNING TRIMMER AND RETUNING RECEIVER DIAL UNTIL MAXIMUM OUTPUT IS OBTAINED
STANDARD ALIGNING LOOP	*STANDARD LOOP PLACED 24" FROM RECEIVER LOOP	1400 KC	"AM" POSITION	1400 KC	7	BROADCAST OSCILLATOR (SHUNT)	ADJUST FOR MAXIMUM OUTPUT.
STANDARD ALIGNING LOOP	*STANDARD LOOP PLACED 24" FROM RECEIVER LOOP	1400 KC	"AM" POSITION	1400 KC	8	BROADCAST DETECTOR	ADJUST FOR MAXIMUM OUTPUT.
STANDARD ALIGNING LOOP	*STANDARD LOOP PLACED 24" FROM RECEIVER LOOP	600 KC	"AM" POSITION	600 KC	9	BROADCAST OSCILLATOR (SERIES)	ADJUST FOR MAXIMUM OUTPUT. TRY TO INCREASE OUTPUT BY DETUNING TRIMMER AND RETUNING RECEIVER DIAL UNTIL MAXIMUM OUTPUT IS OBTAINED

* A 50 mfd. mica condenser connected to the Antenna Terminal may be used in place of the standard loop.

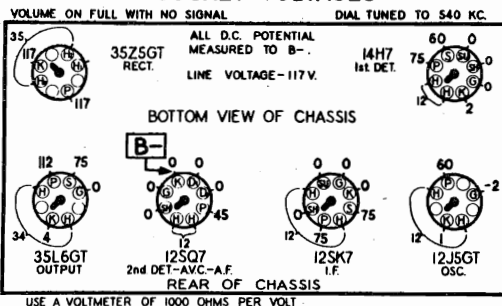

NOTE: After alignment is completed, place chassis and cabinet in their final position and repeat adjustments #8 & 9.

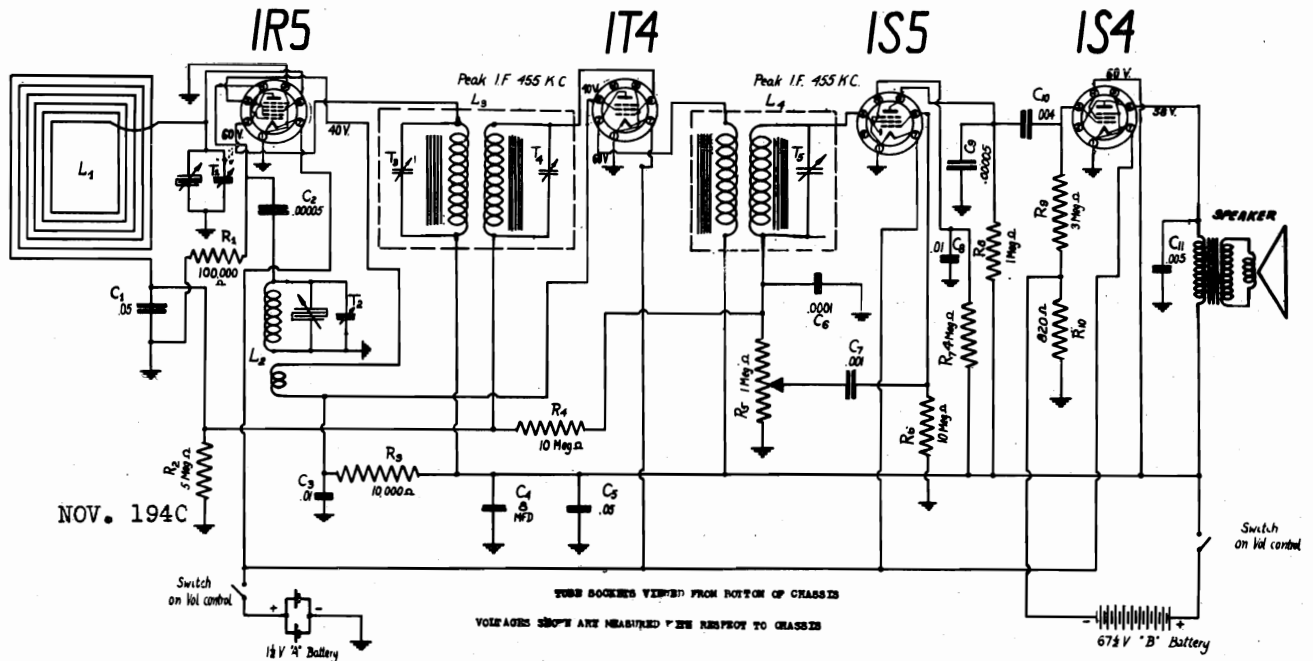

100.364 SOCKET VOLTAGES

100.364-1 SOCKET VOLTAGES

SEARS, ROEBUCK & CO.

ALIGNMENT PROCEDURE

- Output meter connections.....Across primary of output transformer
- Connection of generator output lead.....See Chart below
- Generator modulation.....30%, 400 cycles
- Position of Volume Control.....Fully on

POSITION OF VARIABLE	GENERATOR FREQUENCY	GENERATOR CONNECTION	TRIMMER ADJUSTMENTS	TRIMMER FUNCTION
Closed	455 KC	1R5 Grid (var.cond.section)	T3, T4 T5	I.F.
1500 KC	1500 KC	*	T2, T1	Osc. R.F.

* Run a wire from the output terminal of the generator, having it come near the receiver. However, no electrical connection is made between the signal generator and the receiver.

Always keep the output power from the generator at its lowest possible value to prevent the avc of the receiver from interfering with accurate alignment.

ELECTRICAL & MECHANICAL SPECIFICATIONS

The 100.381-1 chassis is the Underwriter's Listed version of the 100.364-1 chassis for which an R.L. has been issued. The electrical & mechanical specifications are the same as those for the 100.364-1 and can be obtained from the R.L. for that chassis. The 100.364-1 chassis uses the metal chassis pan as the B-return. The 100.381-1 chassis has a separate B-return but this return is by-passed to the chassis thru C26 & C29. On the 100.381-1 chassis the A.V.C. is shunt-fed to the grid of the 14H7 thru R18 instead of thru the loop as on the 100.364-1. This means that the loop now connects to the chassis instead of the A.V.C. line. L4 has been moved to the other side of the loop. 100.381-1 has seven parts not used on the 100.364-1; they are; C26, C27, C28, C29, C30, R18, & R19. REFER TO 57 RL 383 FOR 100.364-1 CHASSIS FOR SOCKET VOLTAGES AND ALIGNMENT DATA.

600 kc.	600 kc.	.00005 mfd.	Ant. clip	Chassis	Check point	----	1000 uv.

IMPORTANT ALIGNMENT NOTES

With the variable condenser closed the pointer should point vertically upward. When properly set with the variable condenser closed the pointer will point just to the right of the "54" calibration mark. This alignment procedure should be repeated stage by stage, in the original order for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

SUBJECT: ADDITION OF SUFFIX NUMBER "-1" TO CHASSIS IDENTIFICATION NUMBER 132.806 AND PARTS LIST AND CIRCUIT CHANGES FOR ALL MODELS.

THIS SUPPLEMENT COVERS THE FOLLOWING CHANGES:

- Soon after start of production on 132,806 the Oscillator coil Pt. No. N17233 was supplanted by Pt. No. N17320. The new coil Pt. No. N17320 may be identified by the fact that lug No. 1 is blank whereas the start of the white winding of coil No. N17233 was connected to lug No. 1. (See fig. 1) The hookup of the coil in the circuit remains unchanged and is as follows:
 Lug No. 1 - To chassis
 Lug No. 2 - To Var. condenser
 Lug No. 3 - To Flt. Ground
 Lug No. 4 - To cathode 12SA7GT
- The Pilot Lamp Shield and Snubber Assembly has been improved and simplified. This assembly which was identified by Pt. No. N17225 is superseded by Pt. No. N17308- Pilot Lamp Snubber and N17307- Pilot Lamp Shield.

"SW"	17 mc(rock)	17 mc	400 ohms	Ant. Term.	C5	Antenna	40

IMPORTANT ALIGNMENT NOTES

* C2 should be adjusted after the receiver is in the cabinet, through a hole in the receiver back, with the loop in position.

** Two peaks can be had; the correct one is with the trimmer screw further in. This band is aligned so that the oscillator is at a lower frequency than the signal. The Broadcast and Intermediate bands are aligned with the oscillator at a higher frequency than the signal, in the normal manner.

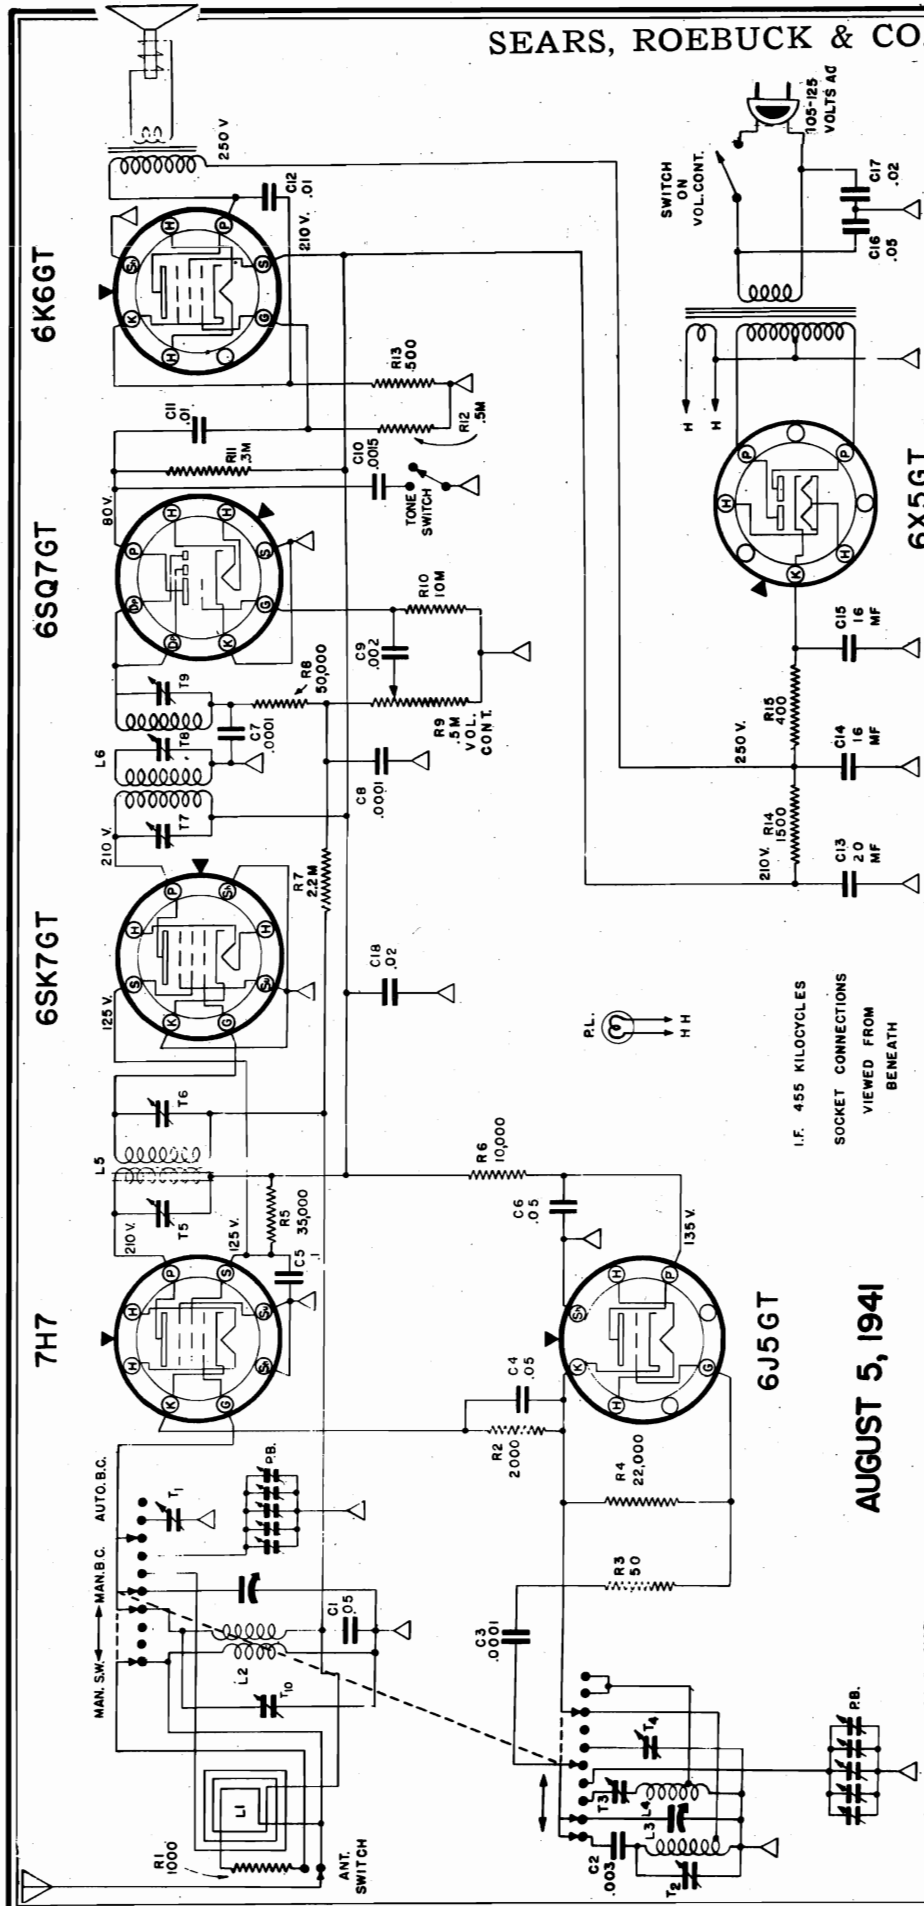

*** 120 microvolts per meter using standard Hazeltine alignment loop 24 inches from receiver loop.

Where indicated by the word, "rock", the variable should be rocked back and forth a degree or two while making the adjustment.

The alignment procedure should be repeated stage by stage, in the original order, for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

SEARS, ROEBUCK & CO.

ALIGNMENT PROCEDURE

OUTPUT METER CONNECTION.....Across voice coil.
 Output meter reading to indicate 1/2 watt output 1.25 volts for 3.1 ohm voice coil.
 Connection of generator ground.....Receiver chassis.
 Generator modulation.....Approximately 30% @ 400 cycles.
 Position of volume control.....Fully clockwise
 Position of tone control switch (at rear of chassis).....High position.

SELECTOR POSITION	POSITION OF DIAL POINTER	GENERATOR FREQUENCY	GENERATOR CONNECTION	DUMMY ANTENNA	TRIMMERS ADJUSTED IN ORDER SHOWN.	TRIMMER FUNCTION.
"A"	540 KC	455 KC	7H7 Grid	.1 mfd	T5, T6, T8, T7, T9	I.F.

"A"	1400 KC	1400 KC	Loop		Readjust T4	Osc.
"B"	18 mc	18mc	Antenna post	400 ohms	T2***	Osc.
"B"	16 mc	16 mc	**ant.post	400 ohms	T10	Ant.

IMPORTANT ALIGNMENT NOTES

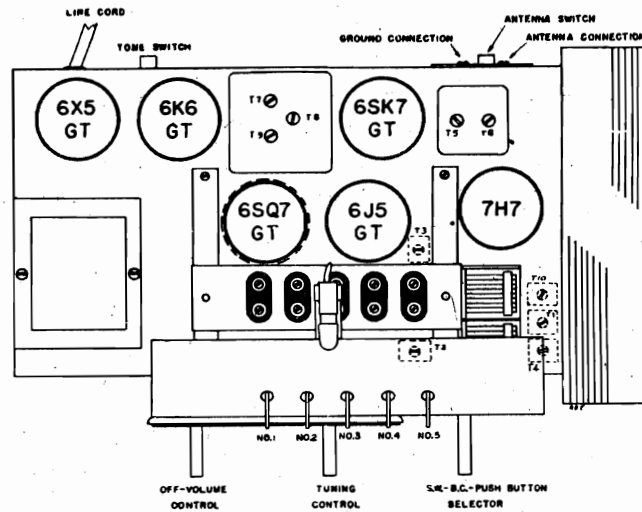

*Approx. 125 mv. per meter when using a standard Hazeltine loop at 24 inches from set loop for 1/2 watt output.

**60 microvolts approximately for 1/2 watt.

***If two peaks can be had, the correct one is with trimmer screws further out; the other peak is the image.

The alignment procedure should be repeated stage by stage in the original order for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the A.V.C. action of the receiver ineffective.

IMPORTANT ALIGNMENT NOTES

* If two peaks can be had, the correct one is with the trimmer screw further out; the other peak is the image.

Where indicated by the word, "Rock", the variable should be rocked back and forth a degree or two while making the adjustment.

The alignment procedure should be repeated stage by stage, in the original order, for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

1500 KC	1500 KC	Standard Radiating Loop	T5, T6	Osc., R.F.
			T2, T1	

It is advisable to repeat the entire alignment procedure in the original order to insure greater accuracy.

Always keep the output from the test oscillator at its lowest possible value. As the sensitivity is increased by alignment, the generator output should be reduced correspondingly.

Approx. 250 microvolts per meter input using standard Hazeltilne alignment loop 24" from set loop for 1/2 watt output.

Drive Ratio 8:1

GENERAL INFORMATION AND SERVICE HINTS

ANTENNA AND GROUND:
This model has a self-contained antenna loop for the reception of local broadcasting stations. If it is desired to improve the reception of weak or distant stations, an additional outdoor antenna must be used. For this purpose, a wire lead extending from the rear of the Radionet is provided.

POWER SUPPLY:
This unit uses 105-125 volts A.C. 50 watts. The frequency (cycles) is specified on the bottom of the cabinet.

TUBES AND FUNCTIONS:
12SA7GT.....Transl. Oscill.
12SK7GT.....I.F.
35Z5GT.....Rectifier

CONTROL OPERATION:
The automatic phono-switch of this receiver starts the turntable and switches from radio to phono when the pickup is placed on the record to be played. The pickup arm must be replaced on its rest in order to operate the radio portion of this receiver.

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection Across loudspeaker voice coil
 Output meter reading to indicate 500 milliwatts 1.25 volts
 Generator ground lead connection Receiver chassis
 Dummy antenna value to be in series with generator output See chart below
 Connection of generator output lead See chart below
 Generator modulation 30%, 400 cycles
 Position of Volume Control Fully clockwise
 Position of Tone ControlHI
 Position of Dial Pointer with variable fully closed On first mark to left of 540 kc calibration mark.

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	TRIMMERS ADJUSTED (IN ORDER SHOWN)	TRIMMER FUNCTION	ANT. COUPLED APPROXIMATE MICROVOLTS
Open	455 kc	.1 mfd.	7H7 Grid	T2, T1	IF	--
Fully open	1720 kc	.00005 mfd.	Ant. Lead	C19B*	Oscillator	--
1400 kc	1400 kc	.00005 mfd.	Ant. Lead	C19A*	Antenna	80**

IMPORTANT ALIGNMENT NOTES

* C19 A and B are best adjusted when the receiver is in the cabinet, through holes provided in the back cover.

** 120 microvolts per meter using standard Hazeltine alignment loop 24 inches from receiver loop.

For operation of the chassis outside the cabinet with the phonograph plug disconnected, connect a jumper wire across the two top terminals of the phono socket.

The alignment procedure should be repeated stage by stage, in the original order, for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

GENERAL INFORMATION & SERVICE HINTS

RADIO-PHONO AUTOMATIC SWITCH:

With the power switch on, the receiver is automatically switched for record playing and the phonograph motor will start when the pick-up arm is moved in toward the turntable. Return of the pick-up arm to its rest automatically switches the receiver to resume radio reception and stops the motor.

NOTE: To obtain full switching leverage when returning the pick-up arm to its rest for radio reception, move the arm slightly to the right of the rest before lowering it.

TO SERVICE THE CHASSIS:

For operation of the chassis outside the cabinet with the phonograph plug disconnected, connect a jumper wire across the two top terminals of the phono socket.

OPERATING FEATURES:

- Automatic Volume Control
- Automatic Radio/Phono Switch, operated by Phono Pickup Arm.
- Three Position Switch Tone Control
- Lo-Noise Converter Circuit

CHASSIS FEATURES:

- Number IF stages One
- Number of condensers in gang . . . Two
- Underwriters Approved
- Built-in Loop (RADIONET Antenna System)
- Provision for external Ant. Connection

POWER OUTPUT:

TUBE LOCATION

Output meter connection. Across voice coil (3.1 ohms)
 Output meter reading for 1/2 watt output 1.25 volts
 Connection of generator ground To chassis
 Generator Modulation Approx. 30% at 400 cycles
 Position of Volume Control Fully clockwise
 Position of Tone Control Fully clockwise

POSITION OF DIAL POINTER	GENERATOR FREQUENCY	GENERATOR CONNECTION	DUMMY ANTENNA	TRIMMERS ADJUSTED IN ORDER SHOWN	TRIMMER FUNCTION
540 K. C. 1720 *1400	455 K. C. 1720 1400	7H7 Grid. Standard Radiating Loop	.1 mfd.	T5, T6, T3, T4 To Ta**	I.F. Osc. Ant.

* Approximately 100 microvolts per meter using a standard Hazeltine loop at 24 inches distance from the receiver loop for 1/2 watt output.

** On Loop Board.

The alignment procedure should be repeated stage by stage to obtain greatest accuracy. Always keep the output from the test oscillator at its lowest possible value. As the sensitivity is increased by alignment, the generator output should be reduced correspondingly so as to minimize the effect of the Automatic Volume Control.

Check alignment at 600 K. C. Tracking may be corrected by adjusting the spacing of the two pies of the loading coil found on the loop board assembly.

SEARS, ROEBUCK & CO.

MODEL 7063
Chassis 110.450
Wireless Record Player

DECEMBER 5, 1941

TUBES AND FUNCTIONS:

12SA7GT Modulated Oscillator
3524GT or 3525GT Rectifier

POWER SUPPLY:

This unit uses 105-125 volts A. C. 75 watts.
The frequency (cycles) is specified on the
bottom of the cabinet.

FREQUENCY RANGE:

The carrier frequency may be adjusted between
the limits of 540 and 1100 kilocycles.

OPERATING CONTROL:

A single knob operates the power switch and
controls the modulation level.

GENERAL INFORMATION AND SERVICE HINTS.

This wireless record player uses a 12SA7GT tube in which the screen, cathode and oscillator grid are used in a Hartley oscillator circuit which may be tuned from 540 to 1100 K. C. by means of a trimmer. The output of this oscillator is electronically coupled to the plate circuit of the 12SA7GT which is loaded with a two millihenry choke. Amplitude modulation is effected by means of an audio signal impressed on the control grid. This signal serves to control the space current and the oscillator strength is not dependant upon modulation. Thus it may be seen that any energy radiated from the oscillator coil is not modulated. The modulated signal is radiated from an antenna capacitatively coupled to the plate of the 12SA7GT.

The signal from this wireless record player may be received by any broadcast receiver. The tone and volume should be controlled at the receiver as would be done when listening to a regular broadcast station.

For normal use the control on the wireless record player is advanced to the maximum clockwise position. If exceptionally loud recordings are used, the volume control may be retarded slightly to prevent distortion in the transmitter unit.

ADJUSTMENT PROCEDURE.

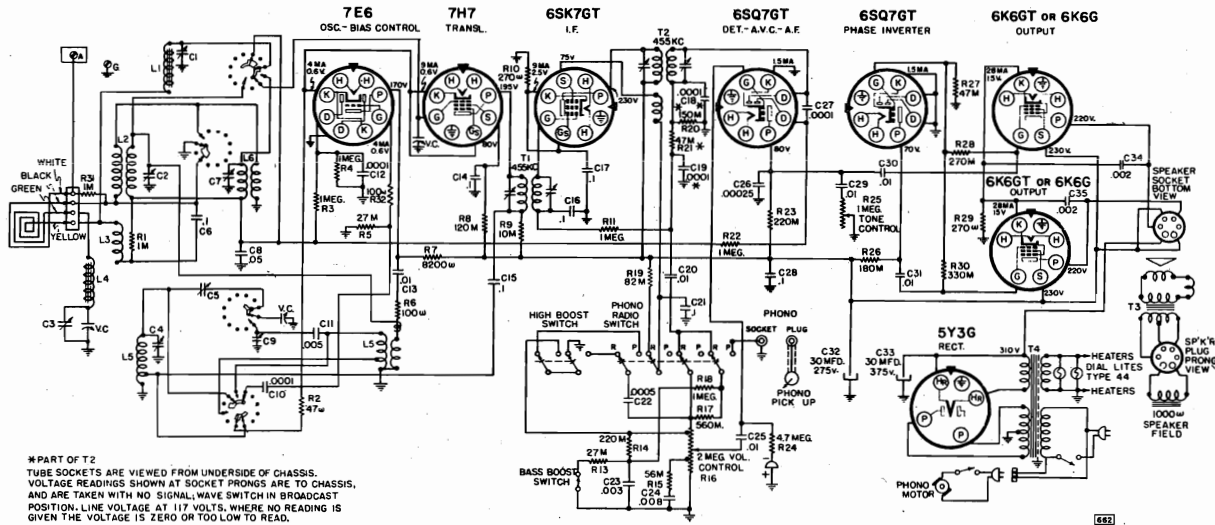

The radio receiver is tuned to a frequency between 540 and 1100 K. C. where there is as little interference as possible. With the record changer in operation, the adjusting screw found on the back of the chassis is turned until the wireless record player is heard through the receiver.

SPURIOUS RESPONSES.

Spurious responses may be obtained in some localities where broadcast signals are quite strong, if the wireless record player is placed too close to the receiver (e.g. on top of the cabinet). This manifests itself in the form of numerous signals in the receiver for a given setting of the wireless record player tuning adjustment, or numerous settings of the wireless record player tuning adjustment for a given receiver setting. This difficulty may be remedied by moving the wireless record player a little farther away from the radio during the set-up procedure.

NOTE A: Voltage on the grids of the 7H7 1st. Det. and 6SK7GT I. F. Amp. is variable and cannot be measured with a standard voltmeter.
 NOTE B: Voltage on the grid of the 6SQ7GT A. F. Amp. is -1.2 volts measured across R21.
 NOTE C: Voltage on the grid of the 6K6GT output tube is -16 volts measured across resistors R21 and R14.

USE A VOLTMETER OF 1000 OHMS PER VOLT.

VOLUME CONTROL

OFF-ON AND TONE CONTROL

RADIO-PHONO

TUNING CONTROL

BAND SWITCH

PUSH BUTTON TRIMMERS

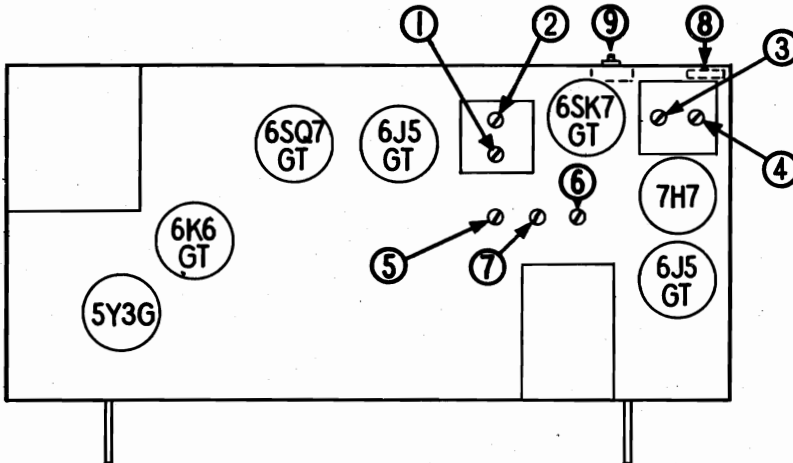

REAR OF CHASSIS

980 TO 1600 KC. 750 TO 1375 KC. 540 TO 1000 KC.

SETTING UP THE PUSH BUTTONS

1. Turn the Band Switch to the "A" position and tune in the desired station by means of the Tuning Control.
2. Push in a button of the proper frequency range and turn the Band Switch to the "PB" position.
3. Adjust the "a" screw with the same number as that of the button you have pushed in, until you again hear the desired station.
4. Adjust the "b" screw (below the "a" screw) for deepest tone.
5. Readjust both "a" and "b" screws for deepest tone.

POWER SUPPLY

Model 7071 is supplied for either 25 or 60 cycle power supplies.

FREQUENCY RANGES

- (A) Broadcast 540 to 1700 KC
- (B) Short Wave 5.6 to 18 MC

INTERMEDIATE FREQUENCY

POWER OUTPUT

Type Pentode
 Undistorted 2.8 Watts
 Maximum 5 Watts

105-125 Volts A.C. . . (RADIO-65 Watts)
 (PHONO-85 Watts)

ALIGNMENT FREQUENCIES

1400 KC, 600 KC
 16 MC

. 455 KC

LOUD SPEAKER

Type Electro Dynamic
 Size 10"
 Field resistance (cold) . . . 900 Ohms

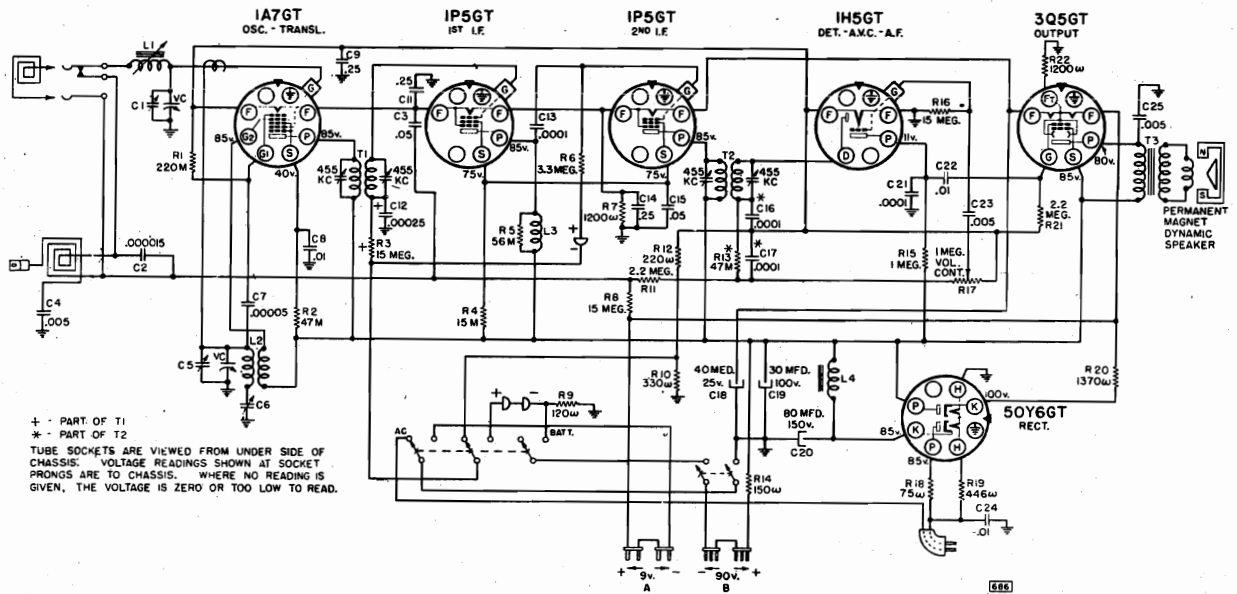

ALIGNMENT PROCEDURE

Dummy Ant. in Series with Sig. Gen.	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Band Switch Position	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
.1 MFD. Mica Condenser	Lug on Rear Section of Gang Cond.	455 KC	Broadcast	Any Point Where it Does Not Affect the Signal	1-2 3-4	2nd I.F. 1st. I.F.	Adjust for Maximum Output. Then repeat adjustment.
400 Ohm Carbon Resistor	Terminal Marked "Antenna"	16 MC	Short Wave	16 MC	5	Short Wave Oscillator	Adjust for Maximum Output. Check to see if Proper Peak was Obtained by Tuning in Image at Approx. 15.1 MC. If Image does not appear, Re-align at 16 MC, with Trimmer Screw farther out. Recheck Image.
400 Ohm Carbon Resistor	Terminal Marked "Antenna"	16 MC	Short Wave	Tune to 16 MC Gen. Sig.	6	Short Wave Antenna	Adjust for Maximum Output. Try to Increase Output by Detuning Trimmer and Retuning Receiver Dial until Maximum Output is Obtained.
Standard Loop placed 24" from Rec. Loop	Aligning Loop	1400 KC	Broadcast	1400 KC	7	Broadcast Oscillator	Adjust for maximum output.
Standard Loop placed 24" from Rec. Loop	Aligning Loop	1400 KC	Broadcast	Tune to 1400 KC Gen. Sig.	8*	Broadcast Antenna	Adjust for maximum output.
Standard Loop placed 24" from Rec. Loop	Aligning Loop	600 KC	Broadcast	Tune to 600 KC Gen. Sig.	9*	Broadcast Oscillator (Series)	Adjust for Maximum Output. Try to Increase Output by Detuning Trimmer and Retuning Receiver Dial until Maximum Output is Obtained.

*NOTE: ADJUSTMENTS NO. 8 AND NO. 9 SHOULD BE MADE WITH THE SET IN THE CABINET AND WITH LOOP LEADS AND LOOP IN FINAL POSITION. A 50 mmfd. mica condenser in series to the antenna terminal may be used in place of the aligning loop.

2. Right knob Station Selector

CONTROL OPERATION:

Turning right: On; Volume increase
Tuning ratio: Direct

GENERAL INFORMATION & SERVICE HINTS

The receiver contains a built-in "loop" antenna which will give entirely satisfactory reception from local and moderately distant stations. Because this antenna is directional, it will often be found that turning the receiver case to a particular position will considerably improve reception. An external loop is provided for attachment to window of an automobile, train, or other shielded location.

Additional range can be had by connecting to a conventional outdoor antenna or even to a 20 or 30 foot length of wire, run along the floor. The connection is made to the clip on the right side of the cabinet, accessible when the backcover is opened.

If the receiver is used inside a shielded building (a building having a large amount of steel in its structure), reception may be poor even with the external loop. Under such conditions, connection to an external antenna or even to a piece of wire hung outside the window will improve reception.

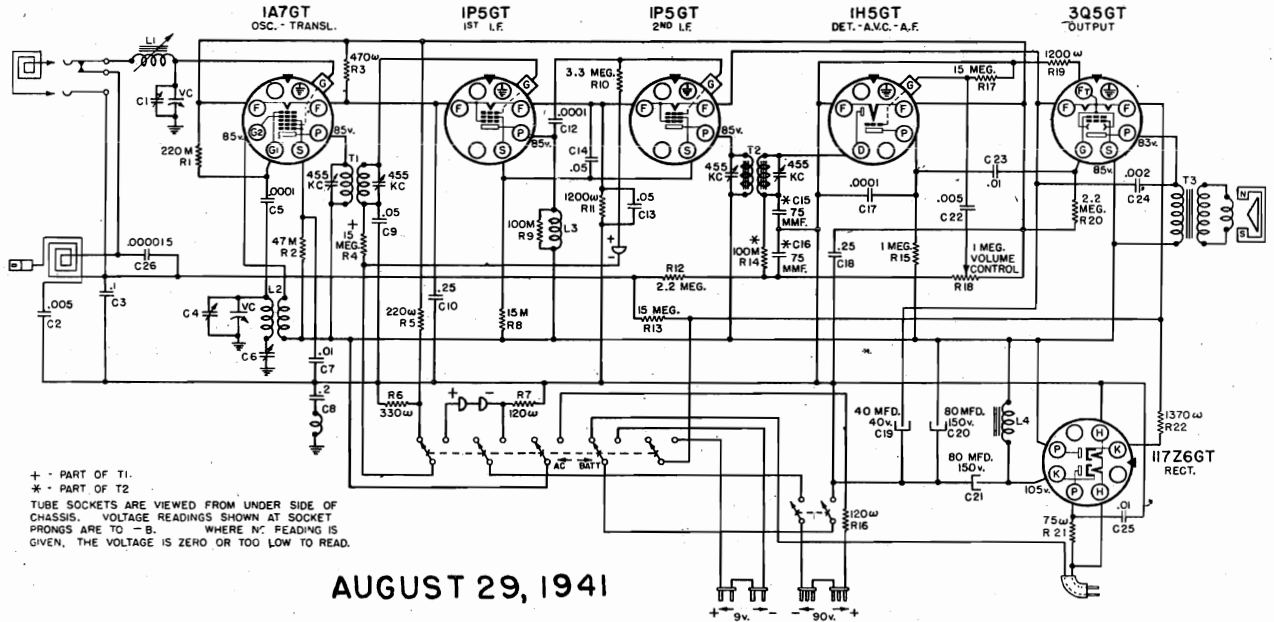

When electric power supply is used, the battery cable plugs must either be in place in the batteries, or else must be inserted in the holder provided if "B" batteries are not installed in the cabinet. They must not be allowed loose in the cabinet with possibility of touching each other. Failure to observe this instruction may result in shorting of the plugs and burning out of the tubes.

DIFFERENCE BETWEEN 101.636, 101.636-A AND 101.636-B

101.636-A (Catalog 7039) is the same as 101.636 (Catalog 7033) except the case is covered in blue and tan. 101.636-B (Catalog 7037) is the same except that the case is covered in maroon and tan.

IMPORTANT ALIGNMENT NOTES

*Use minimum capacity peak if two peaks can be obtained.
 Where indicated by the word "Rock," the variable tuning condenser should be rocked back and forth a degree or two while making this adjustment.
 Each step of the alignment should be repeated in its original order for greater accuracy. Always keep the output from the generator at its lowest possible value to prevent the a-v-c action of the set interfering with accurate alignment.
 Adjustment locations are shown on the top and bottom parts location views of chassis.
 Only the dummy antenna indicated in the chart for any particular band should be used. Remove the dummy used for alignment in any other band. Grid cap leads should remain in place during alignment.
 Note.—Oscillator tracks 455 kc above signal on all bands.
 Values shown under, "Microvolts," are only approximate.

Calibration Scale on Variable Condenser Drive Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment when chassis is out of cabinet; therefore, a calibration scale is attached to the rear of the drum which is mounted on the shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The 45° mark on the drum scale (see "Dial Drive Drawing") must be in a horizontal position when the plates are fully meshed. The distance from the edge of the chassis to the drum must not exceed 3/8-inch. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "0" mark on the calibration scale when the plates are fully meshed.

Power Output:

Type..... **Beam Power**
Undistorted (210-250 volt operation)..... **3.0 watts**
Maximum..... **4.5 watts**

Tuning Drive Ratio..... **17 to 1**

Power Supply Ratings:

105-125 volts..... **30 watts**
160-180 volts..... **45 watts**
210-250 volts..... **60 watts**

Frequency Ranges:

Standard Broadcast..... **540-1,720 kc (555-174 m)**
Medium Wave..... **2.3-7.0 mc (130-42.8 m)**
Short Wave..... **7.0-22 mc (42.8-13.6 m)**

Loudspeaker:

Type..... **6-inch permanent-magnet dynamic**
Voice Coil Impedance..... **3.4 ohms at 400 cycles**

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial pointer to the drive cable with variable condenser fully closed and pointer on last calibration mark at 550 kc end of Broadcast "A" band. The dial pointer has a spring clip for attachment to the cable.

Calibration Scale

Reduced Reproduction of Receiver Dial, and Corresponding 0-180° Calibration Scales

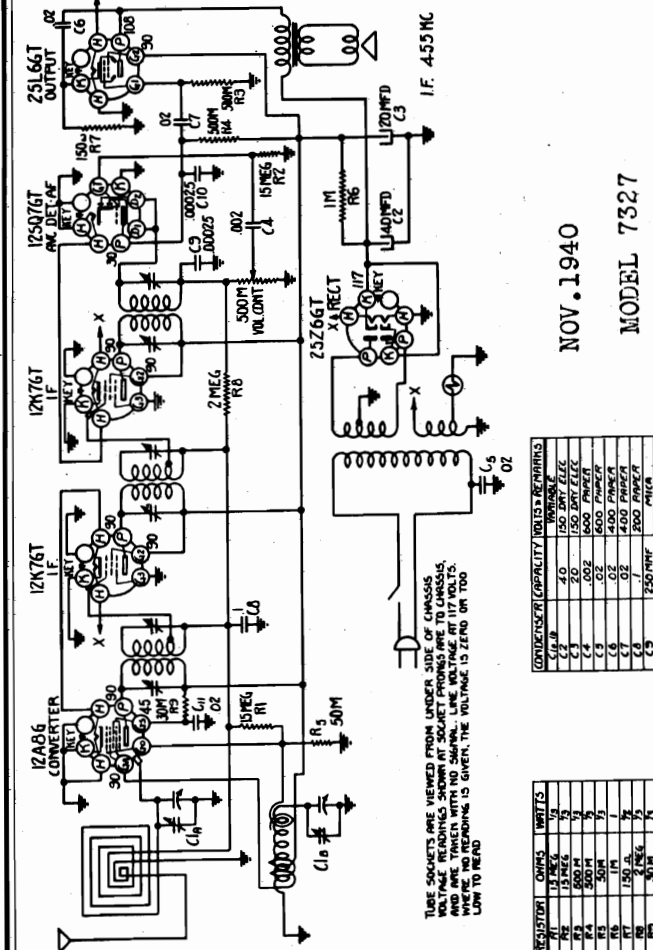

The corresponding position of the dial indicator for any setting of the calibration scale can be determined by drawing a line from this point on the bottom calibration scale to the same point on the top calibration scale. For example: 33° on the calibration scale corresponds to approximately 7.9 mc on "C" band, and 600 kc on "A" band, etc. Read instructions under "Alignment Procedure."

600 kc	.00005 mfd.	Ant. clip	600 kc	Check point	---

IMPORTANT ALIGNMENT NOTES

With the variable condenser closed the pointer should be in a horizontal position matching the horizontal line across the face of the dial. The alignment procedure should be repeated stage by stage, in the original order for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

LOCATION OF PARTS ON TOP OF CHASSIS
MODELS 3611, 3711, 3811

MODEL 7327

SEARS, ROEBUCK & CO.

ALIGNMENT PROCEDURE

This receiver covers the broadcast band 540-1600 KC. A "tracking section" oscillator condenser is used to accomplish tracking without a padding condenser. The only adjustments provided on the RF portion of the set are loop and oscillator trimmers. The circuit is quite conventional.

The normal alignment frequencies are shown below. It is to be noted that after aligning according to instructions, the top frequency of the set may not agree with the calibration. If an important station that should be received at the top end of the dial cannot be turned in, the condenser should be opened and the oscillator trimmer adjusted to permit the reception of the desired signal, then the antenna circuit aligned at the specified aligning frequency.

PRELIMINARY:

Output meter connection Across loud speaker voice coil
 Output meter to indicate 50 milliwatts 0.4 volts
 Dummy to be used between high side of generator and receiver See Note 1
 Position of volume control Fully on
 Aligning Frequency 1400 KC

It should be noted that on this set the dial is not fastened to the gang condenser or any of its supporting members, and since the condenser is flexibly mounted there can be motion of the condenser shaft with respect to the dial scale. This construction has been adopted to make the set as nearly free from microphonic howling as possible on a set with its unusual selectivity. The first step in aligning the set is to remove the pointer, by pulling it off of the condenser shaft and inspecting the shaft to see that it is approximately in the center of the hole in the dial scale. If this is not the case, the screws holding the dial should be loosened and the scale moved until the gang condenser shaft is centered in the hole. Replace the pointer, close the gang condenser and slide the pointer until it coincides with the horizontal line dividing the two scales, kilocycles and meters.

Note 1. This receiver has been designed primarily for operation on the loop without any outside antenna, therefore, it is best to align the set under the conditions under which it will be used most often. It is therefore recommended that the aligning signal be induced from another loop on the set rather than to follow the conventional practice of introducing the signal through a dummy antenna into the antenna lead. A loop 5 or 6 inches in diameter made of ordinary hook-up wire, and placed 3 or 4 inches behind the loop of the set and fed through a carbon resistor of 400 to 2000 ohms is the recommended device for inducing the aligning signal into the receiver loop.

Note 2. Due to production variations in wiring and in condenser construction, a few loop trimmer condensers may peak wide open. Retrimming the oscillator to a 1400 KC signal when the pointer is set at a frequency slightly above 1400 KC may permit the loop trimmer to pass through a "peak".

Calibration Scale

Reduced Reproduction of Receiver Dial, and Corresponding 180-0° Calibration Scales

The corresponding position of the dial indicator for any setting of the calibration scale can be determined by drawing a line from this point on the bottom calibration scale to the same point on the top calibration scale. For example: 30° on the calibration scale corresponds to approximately 600 kc on "A" band, etc. Read instructions under "Alignment Procedure."

RECORD-PLAYER CONNECTIONS
(220 V—110 V)

TUBE, TRIMMER AND PARTS LOCATION—BOTTOM VIEW

Tuning Dial:

The tuning shaft is connected through a cord drive to a drum on the condenser shaft. This same cord drives the dial indicator by passing over a pulley on the chassis.

Calibration Scale on Variable Condenser Drive Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment when chassis is out of cabinet; therefore, a calibration scale is attached to the rear of the drum which is mounted on the shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

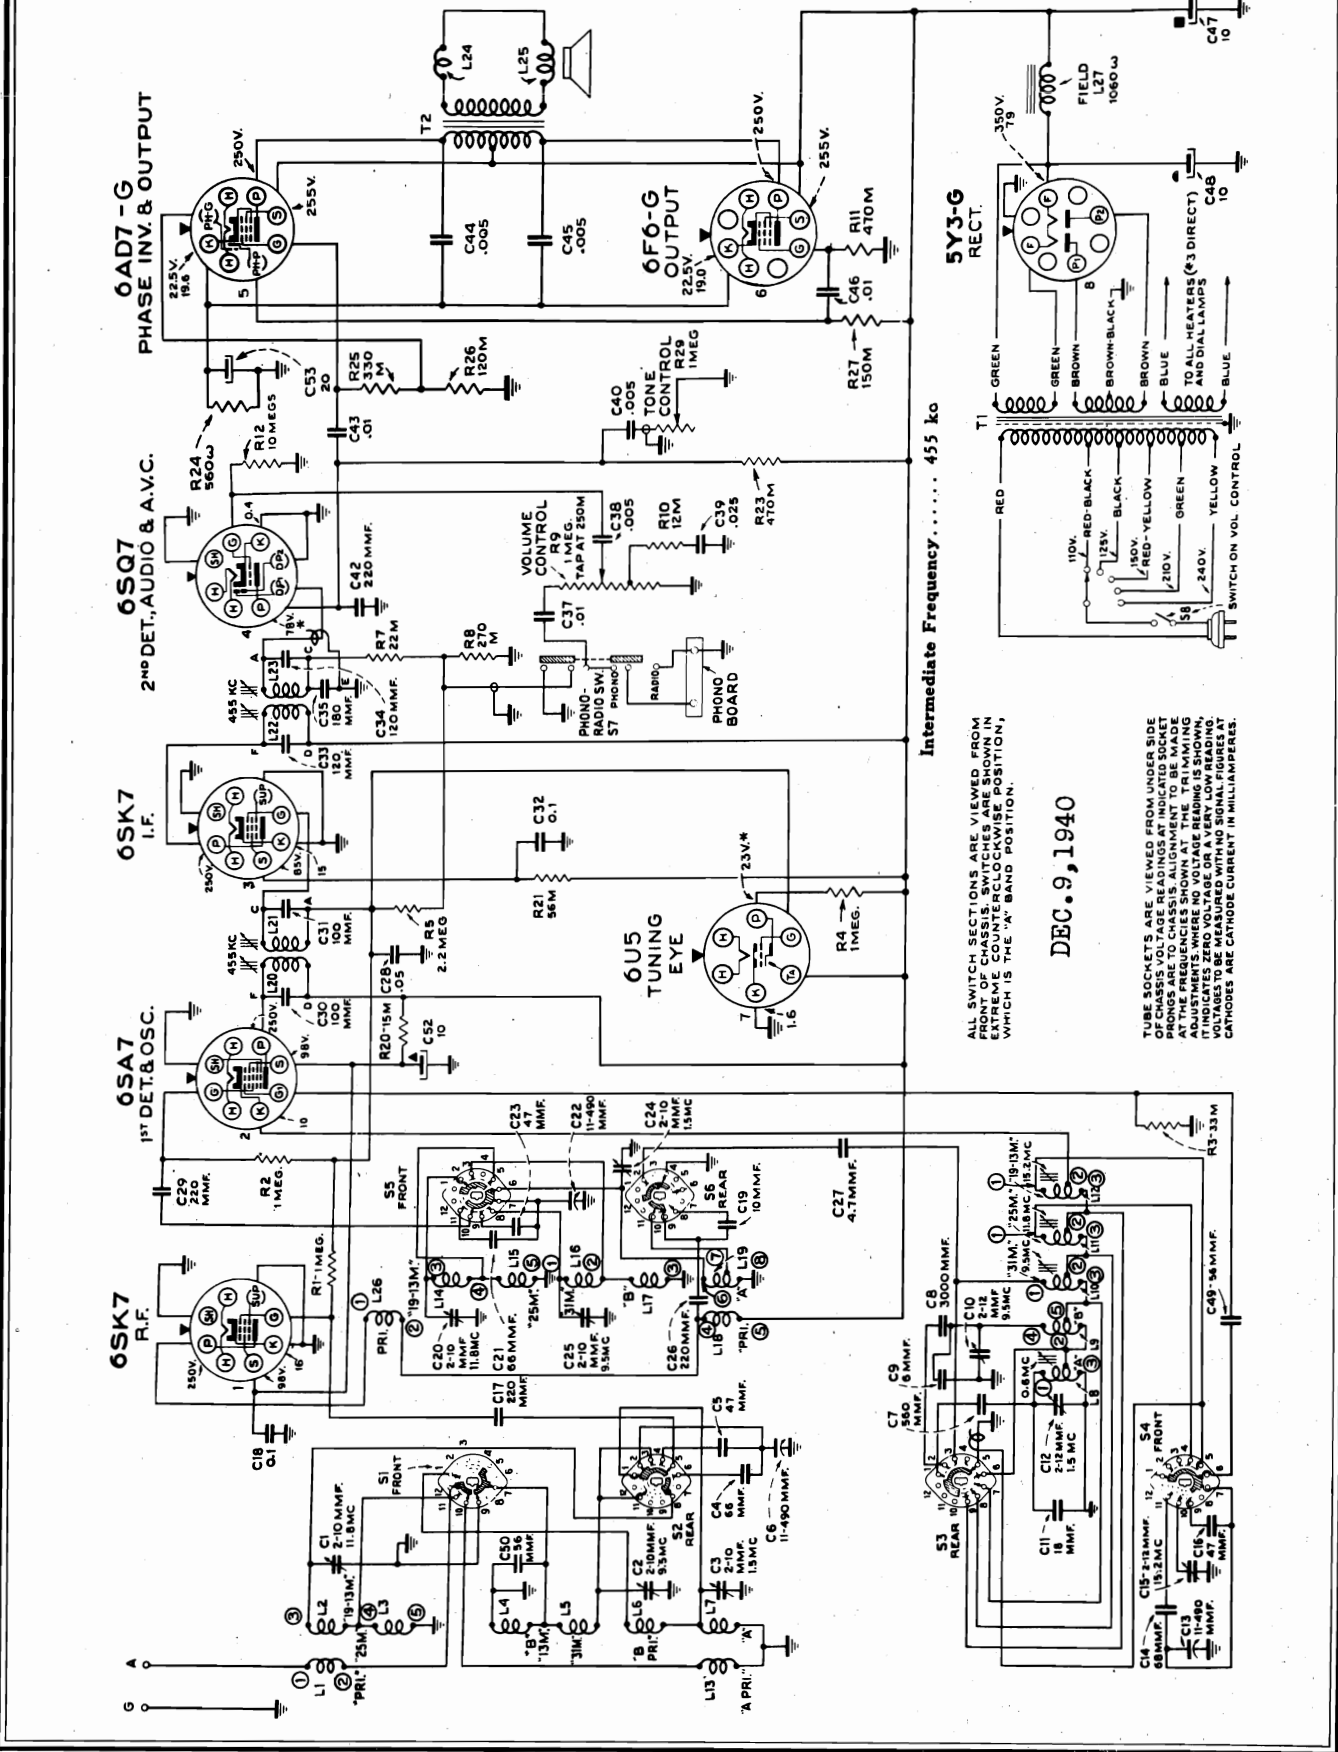

As the first step in r-f alignment, check the position of the drum. The 0° mark on the drum scale must be in a vertical position when the plates are fully meshed. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "0°" mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet attach the dial pointer to the drive cable with variable condenser fully closed and pointer on last calibration mark at 550 kc end of Broadcast "A" band. The dial pointer has a spring clip for attachment to the cable.

CONDENSER AND INDICATOR DRIVE CORDS

ALL SWITCH SECTIONS ARE VIEWED FROM FRONT OF CHASSIS. SWITCHES ARE SHOWN IN POSITION, WHICH IS THE 'A' BAND POSITION.

DEC. 9, 1940

TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS AT INDICATED SOCKET ARE FOR THE 'A' BAND POSITION. ADJUSTMENTS WHERE NO VOLTAGE READING IS SHOWN, ARE TO BE MADE ON A VERY LOW READING. VOLTAGES TO BE CATHODE CURRENT IN MILLIAMPERES.

MODEL 7330
Ch. 126.227

SEARS, ROEBUCK & CO.

Spread-Band Alignment.—The most satisfactory method of aligning or checking the spread-band ranges is on actual reception of short-wave stations of known frequency, by adjusting the magnetite-core oscillator coil for each band so that these stations come in at the correct points on the dial.

In exceptional cases, when the set is being serviced in a location where the noise level is high enough to prevent reception of short-wave stations, a test-oscillator may be used for alignment, but an extremely high degree of accuracy is required in the frequency settings of the test-oscillator, as a slight error will produce considerable inaccuracy on the spread-band dials. The frequency settings of the test-oscillator may be checked by one or both of the following methods:

1. Determine the exact dial settings of the test-oscillator (for frequencies at or close to the specified alignment frequencies) by zero-beating the test-oscillator against short-wave stations of known frequency.
2. Use harmonics of the standard-broadcast range of a test-oscillator, or by zero-beating against standard broadcast stations.

When a test oscillator is employed for spread-band alignment, a final check should be made on actual reception of short-wave stations of known frequency, and the magnetite-core oscillator coil for each band should be re-adjusted so that the stations come in at the correct points on the dial.

ALIGNMENT PROCEDURE

GENERAL INFORMATION AND SERVICE HINTS

This unit is a combination 6 volt-110 volt mobile system. For AC operation use the AC cord. For DC operation, use the heavy cord that is provided with battery clips. The phonograph motor which is 110 volt-60 cycle type operates from a 110 volt winding on the transformer when the system is used on 6 volts, the vibrator functioning as a converter. The vibrator has ample capacity to carry the entire load of the amplifier.

GENERAL INFORMATION AND SERVICE DATA

The amplifier uses 5 tubes and has 3 stages. Each input tube has an individual volume control which is located in the upper left hand corner of the portable case.

The voice microphone used with this system should be of the high impedance crystal, velocity or dynamic types. Contact or instrument microphones should be similar to the Imperite Contact type. It will be noted that input for four contact microphones is provided. All are connected in parallel so that all must be of the same type.

TUBES:

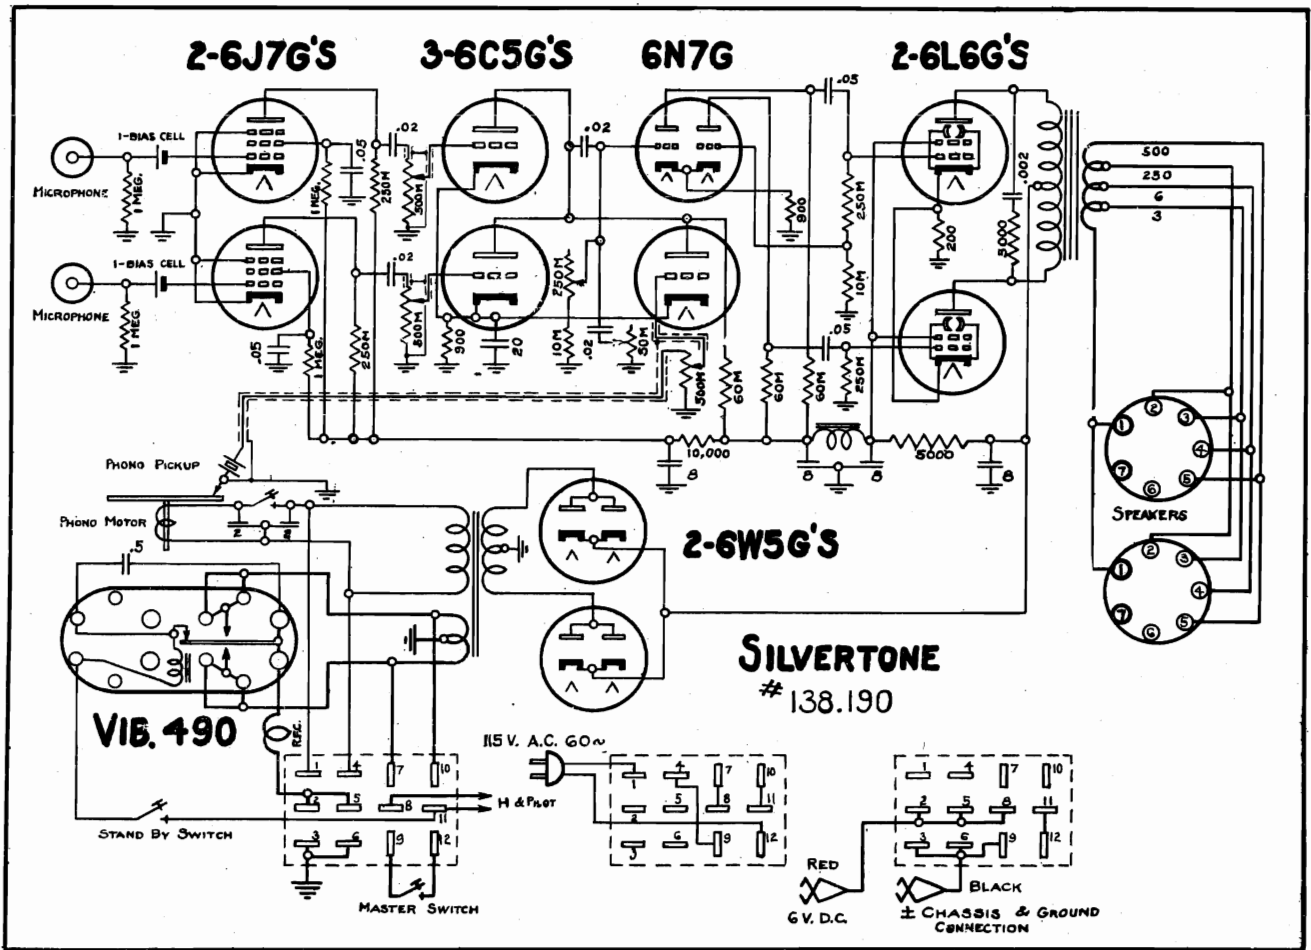

When it is necessary to replace tubes be sure to have them checked as a shorted tube will damage the amplifier. The two 6J7 input tubes must be tested for low hum and noise level.

HUM:

If unit hums, it may be due to any one of several causes. Check your tubes. Check your microphone cable for breaks in shielding or for inferior microphone cable if you have made replacement.

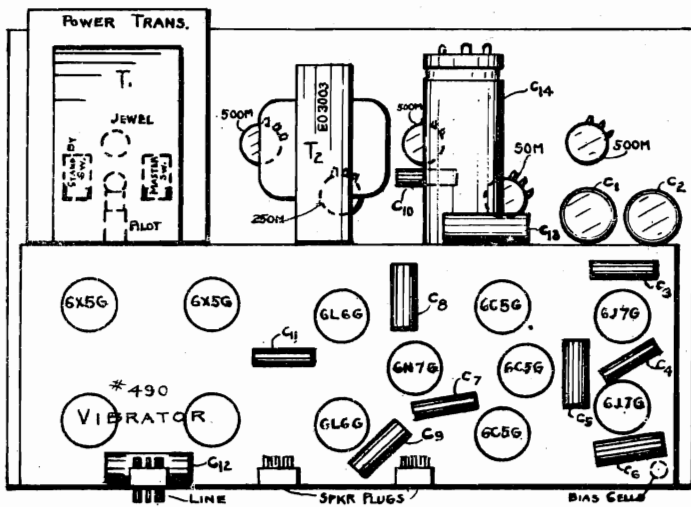

Microphone wiring should be kept well separated from the heavy power wiring, separate lights, or other electrical equipment. In order to minimize line disturbances, the chassis of the amplifier should be connected to a water pipe ground.

The chassis 138.190-3 incorporates a (Erwood) New Products 320 Record Changer. See Riders "Automatic Record Changers and Recorders".

138.190-2 or 3
with automatic changer

This unit contains a four stage amplifier consisting of two high impedance microphone input positions feeding two 6J7 tubes, which in turn feed into a 6C5 tube (second stage). Signal is then fed to the 6N7 driver and thru the two 6L6 output tubes. The phonograph feeds thru a 6C5 into the driver. Two 6W5 rectifiers are used in power supply.

The phonograph motor operates on 110-115 volts, 60 cycle AC current. When unit is used on 6 volt operation, the vibrator is used to transform the current from straight DC to 60 cycles pulsating current. Current is then fed thru a transformer with a secondary which produces 110 volts 60 cycles.

FREQUENCY CHARACTERISTICS

Curve - substantially flat from 50 to 10,000 cycles per second.

INPUTS

2 input positions each to accommodate high impedance crystal, velocity or no-voltage veletron microphones.

| 2 - 6J7 Input | 3 - 6C5 Voltage amps. |
| 1 - 6N7 Phase Inverter | 2 - 6W5 Rectifiers |
| 2 - 6L6 Output | |

TUBES:

When it is necessary to replace tubes, be sure to check tubes as a shorted tube will damage the amplifier.

6J7 input tubes must be audio tested for low hum and noise level. This will also apply on the 6N7's, as these tubes are very critical from this standpoint, and a great deal of trouble due to noise and distortion may arise from this point. It is important that the 6J7 tubes be balanced or matched.

SEARS, ROEBUCK & CO.

	1 Switch		Filament Supply

GENERAL INFORMATION AND SERVICE HINTS

This amplifier is designed for high power installations, and care must be exercised in its installation. It consists of a 17 tube circuit having inputs for four microphones or three microphones and a phonograph attachment. The circuit incorporates a selector switch that permits the use of volume expansion for phonograph record reproduction or automatic volume control when using microphones. The use of this latter feature is limited by the acoustic characteristics of the enclosure.

This amplifier has been checked and inspected under laboratory test conditions for gain hum and power output.

TUBES:

When it is necessary to replace tubes, be sure to check them carefully as a shorted tube will damage the amplifier. The 6J7G tubes must be tested for hum and in order to obtain the full output of the amplifier it is necessary that the 6L6 output tubes all be of the same characteristics. Failure to obtain proper action on the part of the volume expander or volume control circuit can generally be traced to a faulty 6L7 tube.

HUM:

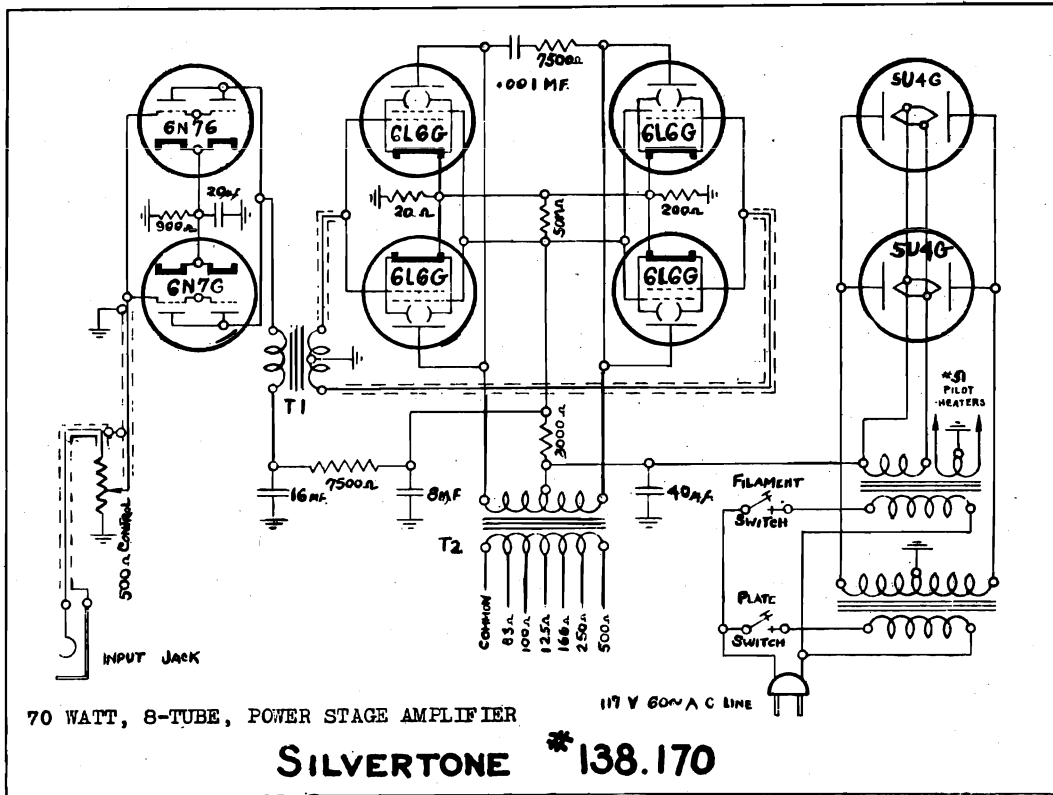

If this amplifier hums recheck the tubes. Be sure that the amplifier is grounded and that all input wiring is carefully shielded. Microphone wiring with a broken or incomplete shield will cause hum. Also be sure that microphone wiring is well separated from the A.C. wiring in the building or enclosure.

INSTALLATION:

In the installation of this unit be sure that the microphone is well separated from the loud speaker, otherwise sound waves from the loud speaker will be picked up by the microphone and the result will be a continuous howl that can only be eliminated by reducing the gain of the amplifier.

MODEL 8980 Amplifier
Chassis 138.170

SEARS, ROEBUCK & CO.

TUBES:

Before placing this amplifier in operation, be sure that the tubes are normal in characteristic. A shorted tube will damage the amplifier. Unbalanced 6L6G's will cause power reduction and increase hum. The rectifier tubes must have proper emission, otherwise the amplifier will not develop full power.

This amplifier has been laboratory checked for power output and hum and will give fine service when it is used correctly.

HUM:

If hum is experienced in using this amplifier, be sure that the amplifier used ahead of it is not the cause of the trouble. It is also necessary that the proper side of the input be connected to the ground of the input amplifier. Be sure to use shielded cable for inter-connection. This cable should not be more than 6 feet long. Be sure before putting this amplifier into operation that the proper speaker connections are made. Operating the amplifier without the proper speaker load will damage the power stage tubes.

Where To Install Charger

The most important part of a successful operating charger is to see that it is installed in the proper location. It must be clear of all obstructions. The general rule to follow is "THE CHARGER SHOULD BE INSTALLED 15 FEET HIGHER THAN ANY OBSTRUCTIONS WITHIN 400 FEET DISTANCE."

Any extra effort spent in selecting and making an installation meeting this requirement will be many times repaid by increased charging current.

It has often been found that an additional 10 or 15 feet height will almost double generator out-put.

Fig. 1 A good installation in the full sweep of the wind. Note how it is clear of obstructions in all directions. This is a typical installation on a farm home.

Fig. 2. Installations on a flat-roofed building. Note that wind strikes side of building and builds up a back pressure or cushion which deflects the air stream upward and over the charger, making installation "A" useless.

However, with pipe added to the regular tower, as illustrated at "B," the charger is raised from 10 to 15 feet up into the main wind stream and gives 100% performance.

Wind velocities increase with the height above ground, and still better performance is obtained by mounting charger higher up on a sectional tower as illustrated at "C."

Fig 3 Shows a typical farm home surrounded by trees. Note how the trees to the right of the house deflect the air stream high above the roof top. The installation (A) is too low receiving very little power from the wind.

The installation (B) however, is satisfactory because the charger was mounted higher by adding a section of 1 1/4" inch pipe to the tower increasing the height 10 to 15 feet.

The same satisfactory results can be obtained by using a sectional tower illustrated in installation (C).

In making your installation **keep this in mind:** If charger location is in the clear, height of installation is not as important. But, if charger is not located in the clear, extra height must be obtained, either by using our pipe adapter, higher tower, or sectional tower.

Remember, the charger should be 15 feet higher than wind obstructions within 400 feet distance.

In selecting your location, bear in mind that it is advisable not to have the charger more than 200 feet away from the batteries. Further distances mean poor charging results as well as greater expense due to more and costlier wire.

In view of this, it is sometimes better to select a location near the house and extend the tower height by the various suggestions mentioned in this book, rather than selecting a location in the clear but a considerable distance from the batteries.

**REMEMBER THE SUCCESS OR FAILURE OF YOUR CHARGER DEPENDS ON ITS LOCATION.
FOLLOW THE ABOVE INSTRUCTIONS CAREFULLY**

How to Fasten Tower to Roof; Increasing Height of Charger

FIGURE 1. Illustrates how you securely bolt the tower to the roof. A board is placed under the rafters and 5/16" machine bolts securely bolt the tower feet to the board. Rubber cushions made of old inner tubes or rubber heels can be inserted under the tower feet to eliminate vibration.

FIGURE 2. For any mounting without a tower—a 1 1/4" pipe can be used to hold charger. Several 3/8" "U" bolts are recommended for securely holding the pipe in place. A straight 3/8" bolt, through pipe and studding of house as shown should be used to prevent pipe from slipping should the "U" bolts loosen.

Guy wires should be used as shown to brace the pipe. These should be fastened at least 3 to 3 1/2 feet below the upper end of the pipe for propeller clearance. A 1/4" bolt through the pipe will prevent the guy wires from slipping down the pipe. Turnbuckles should be used with guy wire to tighten them.

The charger collector ring assembly is fastened to the pipe by threading the ends of the pipe and using a standard 1 1/4" coupling. A pipe adapter can be obtained from the same place where you purchased the charger enabling you to clamp two 1 1/4" pipes together without threading the ends and using a coupling.

FIGURE 3. Illustrates another method of securely fastening the tower to the roof. A board, a foot or two in length is placed under the boards of roof (sheeting). Two 5/16" bolts or lag screws through roof and into this board will securely hold the tower.

FIGURE 4. A very effective means of increasing the height of the charger is the use of an extension 1 1/4" pipe. To do this, cut the 1 1/4" mounting pipe between the two support plates on top of the tower (cut about 3 1/4" from lower support plate). Thread the ends of the pipe.

The 1 1/4" extension pipe used, can be 10 to 15 feet tall—both ends being threaded. It is connected to the tower and charger through 1 1/4" standard pipe couplings. (Note illustration.)

Pipe adapters can be used to connect the ends of the pipe as illustrated in Figure 2. This eliminates the necessity of threading pipe ends and use of pipe coupling.

This additional length of pipe should have guy wires to brace it as illustrated.

FIGURE 5 AND FIGURE 6: To mount charger on a sloping roof, two tower legs must have leveling blocks, Fig. 5. The bottom block should be bolted to roof, or fastened with lag screws, as shown in Fig. 1. Round head bolts are used to bolt the feet and all other blocks to the bottom block (Fig 6).

SEARS ROEBUCK & CO.

Assembling The Charger

1. TOWER ASSEMBLY

The tower comes in two sections—the 5-foot standard tower and a 5-foot extension to make a 10-foot tower.

a. Five-Foot Standard Tower—

Unpack all parts and with them laid out, study the illustration on the preceding page. You will note that the top of the tower, consisting of the upper and lower support plates, mounting pipe with collector ring assembly, comes assembled in one piece. To this part bolt the four legs and cross braces using short $\frac{1}{4}$ "x $\frac{1}{2}$ " bolts. Remember to use lock washers.

b. Five-Foot Extension to Make Ten-Foot Tower—

To the above 5-foot tower bolt the extension legs (T-4). (Note—extension legs are on OUTSIDE of upper legs.) At the same time bolt the top horizontal braces (T-3) and the long cross braces (T-6) to the LOWER hole at top end of extension leg. Keep the cross brace on the outside of horizontal brace.

Then bolt lower horizontal braces (T-5) to legs, bolting cross braces to them at the same time. Be sure to place bolt at point where cross braces cross.

Next attach the tower feet. In the lower hole use a large $\frac{5}{16}$ " diameter bolt. A smaller bolt is used in upper slotted hole—being sure to use a large washer provided so bolt head will not pull through the large slot. The cross braces are bolted BEHIND the tower legs.

2. GENERATOR

The generator is installed on a 1" shaft which extends from collector ring cover.

Place the generator on this mounting shaft, being sure that the generator brackets rest between the two small knobs on top of the collector ring cover.

Generator is securely held about this shaft by two $\frac{5}{16}$ " x 2" bolts (O).

There is a wire pin in the $\frac{1}{4}$ " mounting pipe (R) that should be removed as it is used to hold the parts together only during shipment.

3. TAIL VANE

Then fasten the one vane brace (K) to the vane as illustrated. Remember, there is only one vane brace and it is placed on the side of the vane that does not rest against the vane angle.

Next bolt the vane angle assembly to the end plate of the generator (H) using $\frac{3}{8}$ " diameter bolts.

4. PROPELLER, GOVERNOR AND BRAKE DRUM

These parts can now be bolted to the propeller hub. Note that the governor is shipped to you with the carriage bolts in place. The governor is placed in front of the propeller (and on the **FLAT** side of the propeller). Then the brake drum is placed in back of the propeller and the entire assembly bolted to the hub.

BE CERTAIN THAT THE FLAT SIDE OF THE PROPELLER FACES THE WIND. It will not operate otherwise..

At this point check the propeller track as stated in the following paragraph.

MODELS 533.661,
533.692

SEARS ROEBUCK & CO.

5. PROPELLER TRACK

To avoid vibration, it is important that the propeller "track" properly. This means that both propeller tips must travel in the same path. This can be checked by measuring between the propeller tip and the tower leg as each tip passes a tower leg. Note accompanying illustration that shows how this is done. If both tips do not pass at the same distance, it can be corrected by adjusting the propeller bolts. (It may sometimes be necessary to place a small piece of cardboard between the propeller and brake drum.

**6. BRAKE (Shut-Off) ASSEMBLY**

Pass the brake rod (G) down through the end of the brake lever (D) and through the pipe. The loop end of wire should be kept on top of lever as illustrated, being sure washer (L) is in position. At the bottom end of brake rod attach the short spring provided (its purpose is to take up the slack of extension rope or wire, keeping the brake tightly set at all times when shut off.)

Connect an extension wire or rope to end of spring. This should be long enough to almost reach the ground so that charger may be shut off when desired.

7. CONNECTING GENERATOR WIRES TO COLLECTOR RING COVER

The generator has two terminals—one marked "P" which is positive, the other marked "N" which is negative. Connect this positive wire to the UPPER terminal (+) on collector ring cover. Connect the negative wire to the LOWER collector ring cover terminal (-).

8. CONNECTING LEAD-IN WIRES

The lead-in wires are the long wires connecting the generator assembly to the instrument panel in the house.

The upper tower support plate has two terminals, one marked + (positive) and one - (negative). The positive terminal has a YELLOW sleeving underneath the support plate. The negative terminal has black sleeving.

After selecting the proper size lead-in wire, connect one wire to the + terminal and one to the - terminal on upper support plate. Identify the positive wire so that there will be no mistake on the instrument panel connections. (This can be done by putting a twist or kink in the loose end.)

These wires should be fastened to the tower legs with tape or strain insulators so that they will not be struck by the propeller or have their connections loosened by swinging in the wind.

9. NOTE

The generator is constructed with double grease sealed ball bearings on each end of the armature shaft, making it unnecessary to ever oil the generator.

The 1-inch pipe shaft is greased before leaving the factory, making it unnecessary to lubricate this part for at least three months.

CAUTION: Never allow the charger to operate without a battery connected to the circuit. It will result in serious damage to the generator.

SEARS-ROEBUCK & CO.

Wiring

NO. 8 WIRE
 B & S Gauge
 For use when
 distance from
 charger to
 battery is
 under 50 feet.

NO. 6 WIRE
 B & S Gauge
 For use when
 distance from
 charger to
 battery is
 50 to 90 feet.

NO. 4 WIRE
 B & S Gauge
 For use when
 distance from
 charger to
 battery is
 90 to 130 feet.

NO. 2 WIRE
 B & S Gauge
 For use when
 distance from
 charger to
 battery is
 130 to 200 feet.

1. Remember the size of wire is of extreme importance. The above wire size must be used for the various distances. The guarantee is void unless the size wire recommended is used.

CAUTION: Do not under any circumstances use lamp cord or other small wire as it will seriously affect the operation and life of the charger. Use only insulated weather-proof copper wire in the sizes shown above.

2. LOCATION OF BATTERY AND INSTRUMENT PANEL

The battery should be located as closely as possible to the radio. If it cannot be placed next to the radio, place it in the cellar or basement directly below. The instrument panel should then be placed near the battery.

3. CONNECTING LEAD-IN WIRES TO INSTRUMENT PANEL

MODEL 533,661

The two lead-in wires from generator should be connected to the instrument panel as shown in the diagram on right. The wire connected to the positive terminal on the upper support plate, should be connected to the right hand instrument panel terminal marked "A" Gen. The negative wire should be connected to the left hand terminal marked "F" GEN. - BAT.

In connecting the wires to the terminals, clean the insulation thoroughly from the end of the wire and make a loop of the end.

CAUTION: Do not attempt to bend the wire about the instrument panel terminal as you may crack the insulating washers.

To make good electrical contact, it is necessary to scrape the bare copper wire with a knife or file at the loop where contact is made.

4. CONNECTING BATTERY WIRES TO INSTRUMENT PANEL

Using No. 6 wire, connect the battery to the instrument panel. The positive battery terminal is connected to the middle instrument panel terminal marked "+ BAT." The negative battery post is connected to the left-hand instrument panel terminal marked "F" GEN. - BAT.

Battery clips are provided for connecting wire to the battery.

NOTE: If battery terminals are not plainly marked as to which is positive or negative they can be determined by the following test:

Connect a short wire to the one battery terminal. Connect another short wire to the other battery terminal. Hold the free end of both of these wires about 1/2 inch apart in a glass of salt water. A violent bubbling will be noticed about the **NEGATIVE** wire.

SEARS ROEBUCK & CO.

5. CONNECTING RADIO WIRES TO BATTERIES

If it is necessary to use additional wire to connect the radio to the batteries, use large size wire (No. 4 or No. 6). Be sure however, that the radio wires are connected directly to the battery posts.

Do not clip the radio wires on top of the charger battery clips, for this may prove harmful to the radio. Instead, be sure that the radio clips are connected directly to the battery post.

6. CONNECTING LIGHT WIRES

To connect wires for lights, connect them directly to the battery terminals or else to the two terminals on instrument panel marked ("F GEN. — BAT.") and (+ BAT.). The main light wire should be No. 8 size.

CAUTION: Be sure to use 30 ampere fuses in main light wire.

Installation Recheck

To determine if the charger is properly wired, and also to properly polarize the generator in case the wires have been reversed, it is advisable to perform the installation re-check. To perform this re-check, first stop the propeller. Then being sure that the brake has been released, take a short piece of copper wire or a pair of pliers and touch to top and bottom terminals of the relay as shown in the illustration on the right.

This "shorts" the relay, making the generator act as a motor forcing it to revolve the propeller. When doing this, carefully observe the ammeter, for it should show a discharge of approximately 4 to 6 amperes. If this occurs, it is a positive check of the correctness of the hook-up.

If on shorting the relay, the ammeter needle should show a full deflection of the ammeter scale, it definitely indicates a short circuit somewhere in the wiring.

If when the re-check is performed the propeller does not revolve, and the ammeter stays at "0," then there is an open circuit, and somewhere there is a break in the wiring.

Whenever any change in wiring has been done, it is always advisable to perform this installation re-check, for should the wires be reversed the generator will be in opposite polarity with the battery. This can be corrected by the re-check and the generator will be properly polarized. This should be done particularly when there is a furious chattering of the relay, and rapid vibration of the ammeter needle.

Batteries

A great deal of the success of a wind-electric installation depends upon the size and type of battery used to store the electric energy developed by the generator. For this heavy duty 6-volt charger we recommend a radio type battery of at least 200 ampere hour capacity. If this is not available, use two smaller radio type batteries connected in parallel. (This increases capacity but allows the voltage to remain the same.) Note illustration.

A large size battery is very important for two reasons:

1. A large capacity battery is necessary to absorb the high charging current.
2. This same large capacity provides a large store of energy to carry the electrical load during periods of low wind velocity.

The ideal type of battery is three glass jar 2-volt cells known as "Farm Lighting Type Battery," each cell to be of 200 ampere hour capacity. These three 2-volt cells should be connected in series for a 6-volt battery supply.

It is not desirable to use automotive batteries as their plate construction is entirely different from that of the radio type battery. The type battery needed for wind electric use is one with a large storage capacity and capable of delivering a comparatively small current (10 to 15 amperes) over a long period of time. You will realize the best results from your charger by utilizing a radio or lighting type of battery.

Three 6-Volt Batteries—Parallel Connection

Three 2-Volt Cells—Series Connection

SEARS, ROEBUCK & CO.

SERVICE**1. PROPER LOCATION**

It is absolutely necessary that the charger be located in such a position that it will obtain the full sweep of the wind from all directions. Unless your charger is so located it will be impossible for it to operate properly. The majority of cases of faulty operation are due to this cause. The first step, however, is to see that the charger is properly located, and we suggest that you check the installation against the instructions on Page 2.

REMEMBER, THE CHARGER SHOULD BE 15 FEET HIGHER THAN WIND OBSTRUCTIONS WITHIN 400 FEET DISTANCE.

Should your installation be too low, an easy method of increasing the height is shown on Page 4, Figure 4, through the use of an extension 1 $\frac{1}{4}$ " pipe.

2. NO CHARGING CURRENT

If the generator refuses to charge at all and the relay does not close, it is probable that there is an open or short circuit present. Immediately perform the installation recheck as described on Page 9. If the ammeter shows a full deflection on discharge, it indicates that there is a short circuit. If the ammeter stays at zero and the propeller does not move, it is an open circuit. (If you are certain there is no open or short circuit, the difficulty may be due to a damaged armature.)

3. LOW CHARGING RATE

Low charging rate may be the result of worn generator brushes. To determine the condition of the brushes, remove the generator cover band found on the front of the generator. After the cover band is removed the brushes can be easily seen and the extent of wear can be determined.

If the ammeter indicates a small charge of never more than 8 or 10 amperes, first observe the charging rate when the wind velocity is high enough to force the governor blades into governing position. If at that time the charging rate is still much less than 15 amperes, there is something wrong with the generator. If the generator is suspected, it can be removed and tested at a reliable repair shop.

However, if the governing blades are forced into governing position, and the charging rate reaches 15 amperes or more, the generator and other parts are functioning properly. If the battery is not being fully charged, it is probably due to the charger being installed too low. We would suggest that you refer to Page 4, Figure 4, where you will find described an easy method of increasing the height of the charger.

4. WHAT CURRENT THE GENERATOR SHOULD PRODUCE

Revolutions per minute	Amperes
270	0.1 FOR 533.661 only
350	5
440	10
570	15
700	20
900	25

Wind Velocity (Mi. Per Hr.)	Amperes
6	0.1
8	4
10	7
12	11
14	14
16	18
18	22
20	25

5. GENERATOR BRUSHES

This is a two-brush generator—both stationary. This eliminates any brush adjustment.

CAUTION:

Never allow the generator to operate without a battery connected. The generator will become badly over-heated and will require rewinding of the armature.

MODELS 533.661,
533.692

SEARS, ROEBUCK & CO.

6. RADIO INTERFERENCE

Be sure that the tower and radio are properly grounded. We recommend as an ideal ground a pipe or rod driven 6 or 7 feet into the ground and connected to a bolt on tower with a No. 4 copper wire. It is advisable that the wire connected to the grounding pipe be soldered as a loose connection will oftentimes cause radio interference.

The commutator on the generator should be clean, as a dirty commutator will cause arcing which results in radio interference. Clean the commutator with a cloth soaked in gasoline and then brighten the segments with No. 00 sandpaper.

A .5 MFD condenser connected to the third brush and to the ground will also eliminate radio interference.

In the rear end plate of the generator there is installed a noise eliminator. First check to see if this is in the proper position. The center of the noise eliminator should ride against the end of the armature shaft. Its purpose is to ground the armature to the frame of the generator.

Radio interference sometimes cannot be completely eliminated on the short wave bands by the regular condenser. However, by using a single pole, single throw switch (Shown in the accompanying diagram) the generator can be short circuited and current will not be generated. This will eliminate radio interference.

This switch may also be used to eliminate excessive radio interference on standard broadcast bands. (It is not advisable to use this switch for long periods of time in high wind velocities; instead stop propeller).

**7. OILING AND GREASING CHARGER****Generator—**

The generator is equipped with double grease sealed ball bearings. It will be unnecessary to oil the generator bearings for the entire life of the generator.

Collector Ring Bearing and Turntable Shaft—

You may find it necessary to grease the turntable shaft and collector ring bearing. This can be done by opening the collector ring cup (The accompanying illustration will show how this is done). The shaft can then be lifted two to three inches above the cup and a light cup grease applied to the shaft. This will allow the charger to swing freely in any change of wind direction.

COLLECTOR RING ASSEMBLY

Governor—

It is advisable to place a few drops of light oil on the pin joints of the governor flaps. This will allow the flaps to operate freely.

8. VIBRATION

If the charger vibrates badly, first check the propeller track as described. This is most important as vibration will invariably result when the propeller is out of track.

Excessive vibration may be caused by an out-of-balance propeller. This can be determined and corrected by placing it at its exact center on a knife's edge. If out of balance, it can be corrected by placing a small wood screw on the flat side of the propeller at the point where balance is restored.

An out-of-balance governor will also cause considerable vibration. To determine whether or not the governor is at fault, remove it and allow the charger to operate without it. If the governor is found to be the cause of vibration, its balance can be restored by inserting or removing small flat washers on the bolts on the governor frame.

9. BATTERIES

The storage batteries will require only the usual attention given an automobile battery. Check the water level regularly and add sufficient distilled water or rain water to keep the battery plates covered ½ inch. Keep the batteries clean and the terminals well greased with a light cup grease or vaseline to prevent corrosion. See that the battery connections are tight.

SEARS, ROEBUCK & CO.

4. WHAT CURRENT THE GENERATOR SHOULD PRODUCE

The following Performance Chart is to be used in checking the generator:

Revolutions Per Minute	Amperes
330.....	1
370.....	2
440.....	4
600.....	8
700.....	10
860.....	12
1000.....	14
1100.....	17

Wind Velocity, Miles Per Hr.	Amperes
7½.....	1
10.....	4
12.....	7
16.....	12
20.....	17

FRONT END VIEW**5. GENERATOR BRUSH ADJUSTMENT**

The generator has a third brush which controls the charging rate. It also protects the generator from overheating during high speeds.

(The proper position of the third brush is one commutator segment away from the left-hand stationary brush when looking at the front of the generator.) NOTE THE ILLUSTRATION AT THE RIGHT.

The third brush is stationary and cannot be moved.

The chief reason for a damaged armature is allowing the generator to operate without a battery connected. The armature will become badly burned and will show only a few amperes charge or even none at all.

**7. CONNECTING GENERATOR WIRES TO COLLECTOR RING COVER**

The generator has two terminals--one marked "A" which is positive, the other marked "F" which is negative. To the POSITIVE terminal is connected a LIGHT wire. Connect this LIGHT wire to the UPPER terminal (+) on collector ring cover. To the NEGATIVE generator terminal is connected a DARK wire. Connect this to the LOWER collector ring cover terminal (-).

SENTINEL RADIO CORP.

I.F. - 455 KC.

NOTE:--
 I. NUMBERS SHOWN IN PARENTHESIS ARE ILLUSTRATION NUMBERS.

SOME MODELS HAVE A COMMON NEGATIVE AS SHOWN.
 IN OTHER MODELS ALL CONNECTIONS TO THE COMMON NEGATIVE ARE GROUNDED DIRECTLY TO THE CHASSIS AND PARTS (6B), (10), (13), (21) AND (26) ARE OMITTED (N.-X.) AS SHOWN BY DOTTED LINES

FRONT OF CHASSIS

SYM.	DESCRIPTION
SH	SHELL
H	HEATER
HT	HEATER TAP
P	PLATE
S	SCREEN GRID
G	CONTROL GRID
0	LOOSE PLATE
SU	SUPPRESSOR
K	CATHODE
NC	NO CONNECTION

NOTE:-- ALL VOLTAGES EXCEPT HEATERS MEASURED FROM SOCKET TERMINALS DC VOLT VOLTMETER WITH A 1000 OHM PER VOLT VOLTAGE MEASURED DIRECTLY ACROSS SOCKET TERMINALS. * AC EXCEPT WHEN USED ON DC

VOLTAGE TABLE (BOTTOM VIEW OF CHASSIS)

GROUND

When a regular aerial is used, best results will be obtained with a ground attached to the black lead.

WARNING—Do not attach a ground direct to the radio chassis—ANY EXTERNAL GROUND CONNECTION TO ANY METAL PART OF THE CHASSIS WILL CAUSE A SHORT AND POSSIBLE DAMAGE.

VOLTAGE RATING.

THIS RADIO IS DESIGNED FOR USE ON EITHER 110-120 VOLTS 50-60 CYCLES ALTERNATING CURRENT (AC) OR 110-120 VOLTS DIRECT CURRENT (DC)—unless the marking on the white paper license notice which will be found attached either to bottom or inside the cabinet is marked differently, in which case the radio must only be used on the type of current shown on this notice.

PART NO. 1U-226-226

SENTINEL RADIO CORP.

ALIGNMENT PROCEDURE

For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, (3) third. **IMPORTANT: BEFORE ALIGNING, PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET.**

When adjusting 1730 kilocycle oscillator trimmer, and 1400 kilocycle antenna trimmer, do not connect test oscillator to loop. Couple test oscillator to receiver loop by: (a) Make a loop consisting of five to ten turns of No. 20 to 30 size wire wound on a three inch form and attach across output of test oscillator. (b) Place test oscillator loop near set loop—BE SURE THAT NEITHER MOVES WHILE ALIGNING.

Place band switch for operation on:	Set receiver dial to:	Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
I. F. alignment use any band position	Exactly 455 K.C.	Exactly 455 K.C.	0.5 Mfd. condenser	High side to grid of 12SA7 tube. Low side to frame of gang condenser through .01 Mfd. condenser.	Adjust each of the second I.F. transformer trimmers for maximum output. Then adjust each of the first I.F. transformer trimmers for maximum output.
1730 to 540 K.C. Band	Exactly 1730 K.C. Approx. 1400 K.C.	Exactly 1730 K.C. Approx. 1400 K.C.	None	Use Small Loop to couple test oscillator to receiver loop. Low side to frame of gang condenser through .01 Mfd. condenser.	Adjust 1730 K.C. oscillator trimmer for maximum output. While rocking gang condenser adjust 1400 K.C. loop trimmer for maximum output.

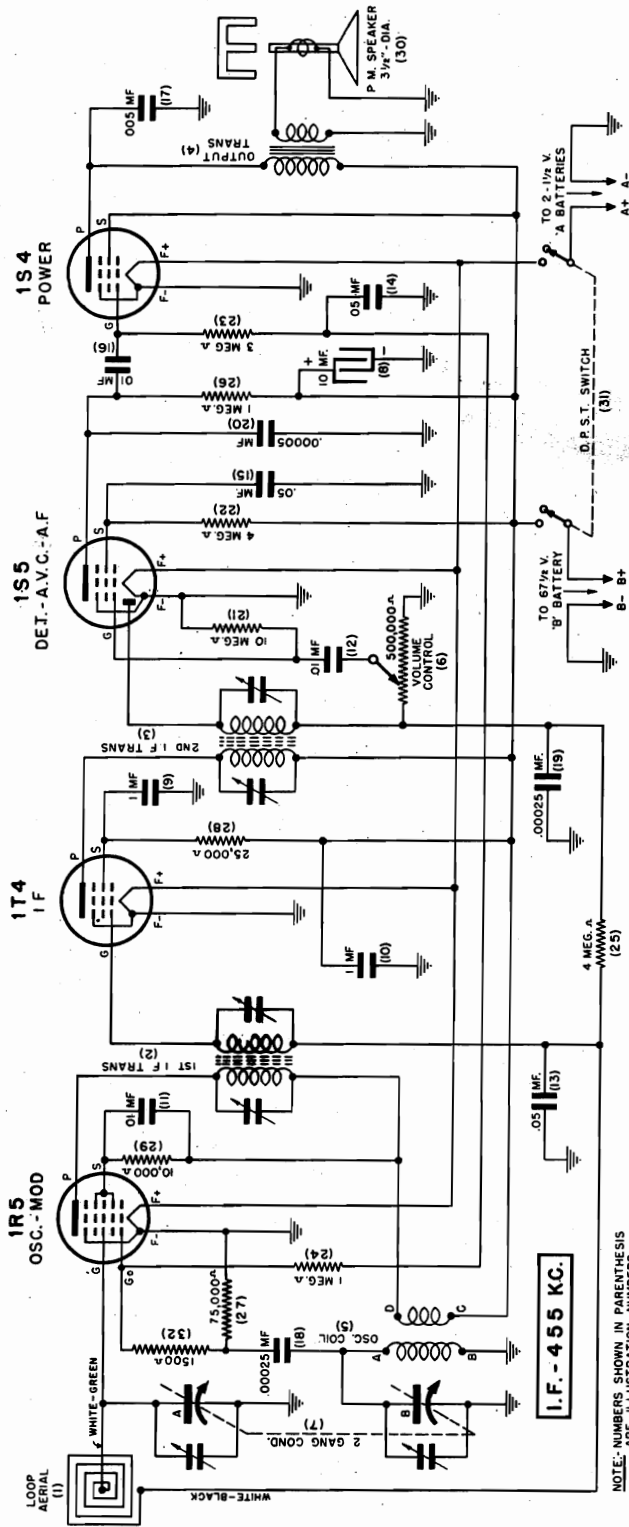

NOTE: IN SOME MODELS, PARTS 45, 50, 13, 22 AND 26 ARE OMITTED. SEE WIRING DIAGRAM.

SENTINEL RADIO CORP.

MODEL 227
MODEL 233

NOTE: NUMBERS SHOWN IN PARENTHESIS ARE ILLUSTRATION NUMBERS.

ABOVE VOLTAGES ARE MEASURED FROM SOCKET TERMINALS TO CHASSIS, DIAL AT 1000 KC. & NO SIGNAL.

BATTERY EQUIPMENT MODELS 227 and 233

The receiver is designed to use:
Two—1 1/2 volt "A" batteries, such as Eveready No. 950 or equivalent flashlight size cylindrical battery.
One—67 1/2 volt "B" battery, such as Eveready No. 467 or equivalent.
IMPORTANT: THE BATTERIES USED MUST BE OF THE CORRECT VOLTAGE AND SIZE.

DIAGRAM SHOWS CORRECT LOCATION OF BATTERIES

MODEL 227
MODEL 233

SENTINEL RADIO CORP.

ALIGNMENT PROCEDURE

For alignment procedure read tabulations from left to right. If more than one adjustment is required, make the adjustment marked (1) first, (2) next. **IMPORTANT: BEFORE ALIGNING, PLACE LOOP ANTENNA AND BATTERIES IN THE SAME POSITION THEY WILL BE IN WHEN THE SET IS IN THE CABINET.**

When adjusting 1600 kilocycle oscillator trimmer and 1400 kilocycle antenna trimmer, do not connect test oscillator to loop. Couple test oscillator to receiver loop by: (a) Make a loop consisting of five to ten turns of No. 20 to 30 size wire wound on a three inch form and attach across output of test oscillator. (b) Place test oscillator loop near set loop—BE SURE THAT NEITHER MOVES WHILE ALIGNING.

Set receiver dial to:	TEST OSCILLATOR		Refer to parts layout diagram for location of trimmers mentioned below:
	Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	
ANY point where no interfering signal is received.	Exactly 485 K.C.	0.3 MFD. condenser	High side to lug on stator of gang condenser to which loop lead is connected.
1 Exactly 1600 K.C.	Exactly 1600 K.C.	None	Use Small Loop to couple test oscillator to receiver loop.
2 Approx 1400 K.C.	Approx 1400 K.C.	None	Use Small Loop to couple test oscillator to receiver loop.
			Adjust 1600 K. C. oscillator trimmer for maximum output.
			While rocking gang condenser adjust 1400 K. C. loop trimmer for maximum output.

CIRCUIT CHANGES IN MODEL 227 CHASSIS

I. F. TRANSFORMER CHANGE:

First production runs of Model 227 used part #12598 first and second I. F. transformer --- these were replaced in later production by part #12902 first and second I. F. transformer. These I. F. transformers are interchangeable, and as performance is somewhat improved with the new type, we are filling all orders for part #12598 I. F. transformers with the new type part #12902.

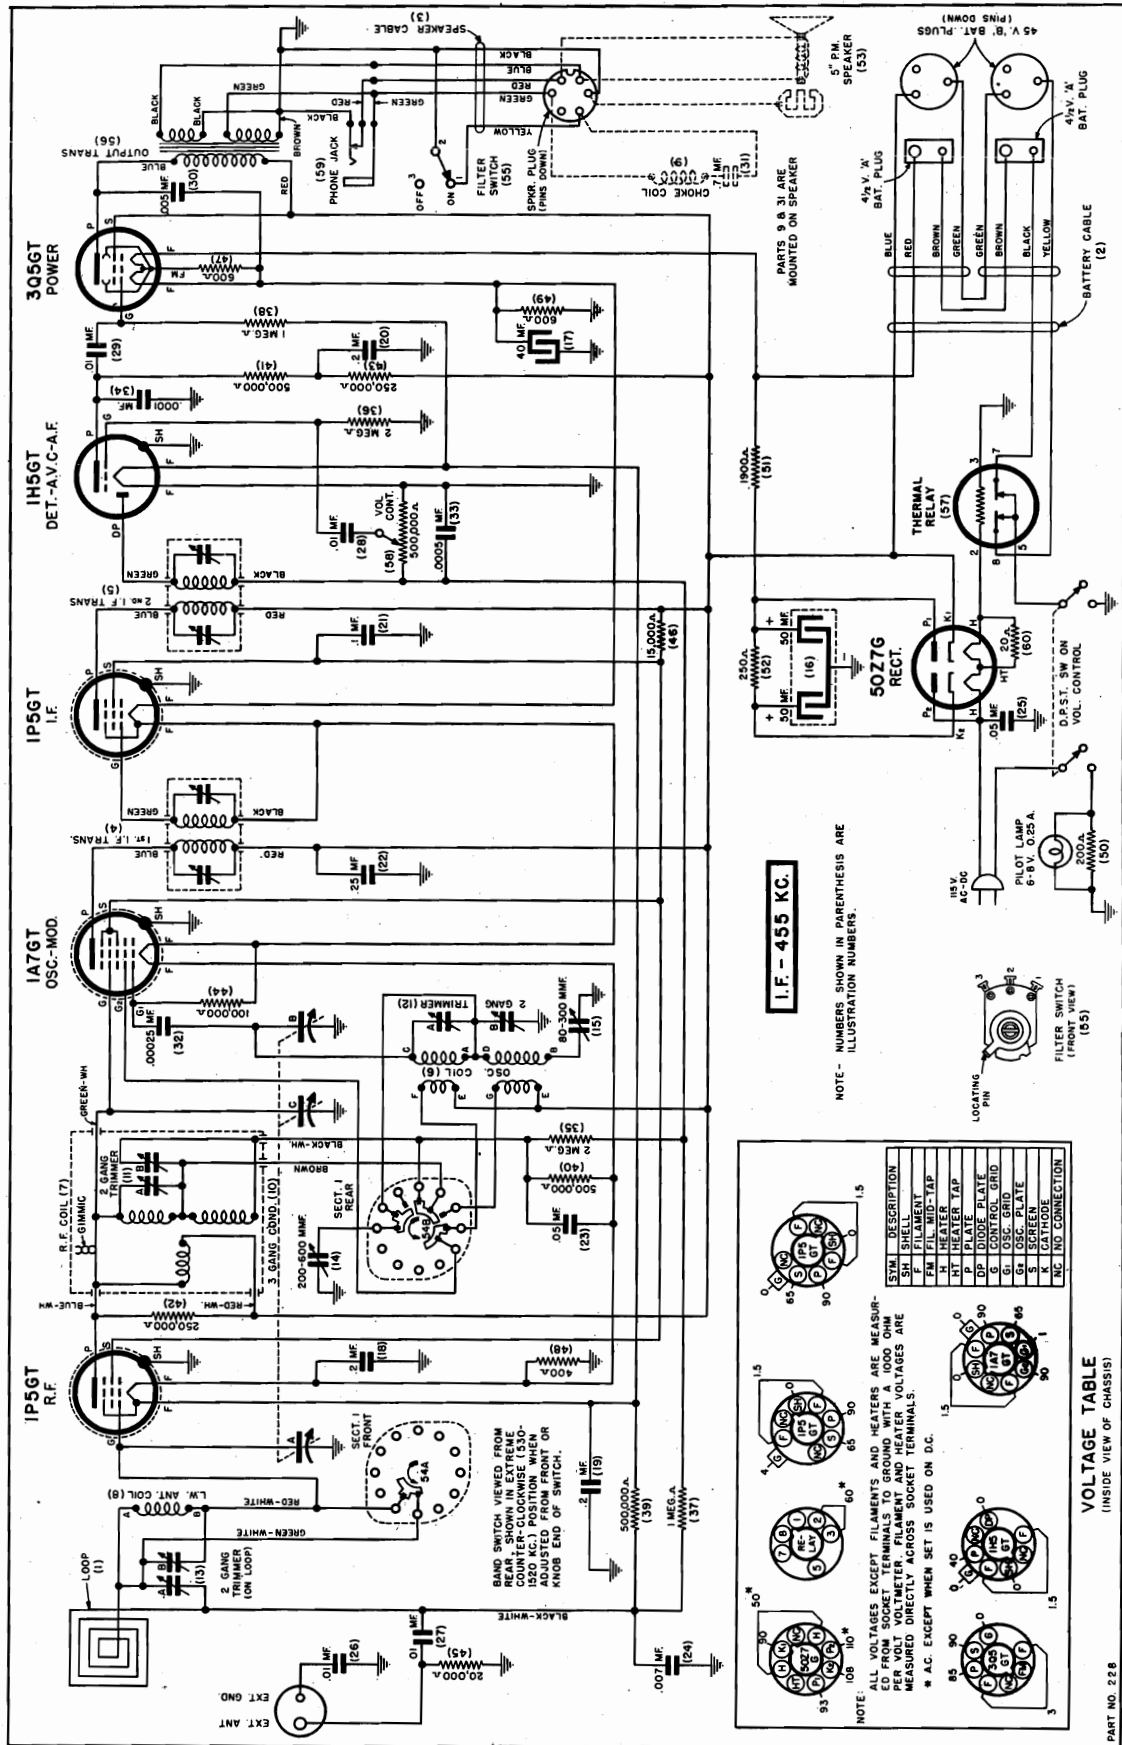

OSCILLATOR COIL CHANGE:

Early production runs used a #12601 oscillator coil. To increase "B" battery life and eliminate self-modulation, this oscillator coil was replaced by part #12906. IN ADDITION A 1500 OHM 1/3 WATT RESISTOR WAS USED IN SERIES WITH THE OSCILLATOR GRID OF THE 1R5 TUBE. As the old and new type oscillator coils are not interchangeable, be sure to use proper coil. ALL CHASSIS HAVING NEW TYPE 12906 OSCILLATOR COIL AND THE 1500 OHM RESISTOR HAVE A LETTER "A" STAMPED ON BACK OF CHASSIS ADJACENT TO THE SERIAL NUMBER.

VOLUME CONTROL CHANGE:

A 500,000 ohm volume control part #12604 was used in early production Model 227 Receivers. This was replaced by part #13014; a two megohm control. As the two megohm control improves sensitivity, we recommend that whenever a 500,000 ohm control part #12604 is replaced that a #13014 two megohm control be used.

SENTINEL RADIO CORP.

VOLTAGE RATING

THIS RADIO IS DESIGNED FOR USE WITH BATTERIES OR ON EITHER 110-120 VOLTS 50-60 CYCLES ALTERNATING CURRENT (AC) OR 110-120 VOLTS DIRECT CURRENT (DC).
IMPORTANT—If hum is high when set is operated on A.C. current, reverse position of set power cord plug in house current socket.

PART NO. 12896-228

ALIGNMENT PROCEDURE

Printed in U.S.A.—S.P.—11-40-2M

For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, (3) third. **IMPORTANT: BEFORE ALIGNING, PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET.**

When adjusting oscillator R.F. and loop trimmers, do not connect test oscillator to loop. Couple test oscillator to receiver loop by: (a) Make a loop consisting of five to ten turns of No. 20 to 30 size wire wound on a three inch form and attach across output of test oscillator. (b) Place test oscillator near set loop—**BE SURE THAT NEITHER MOVES WHILE ALIGNING.**

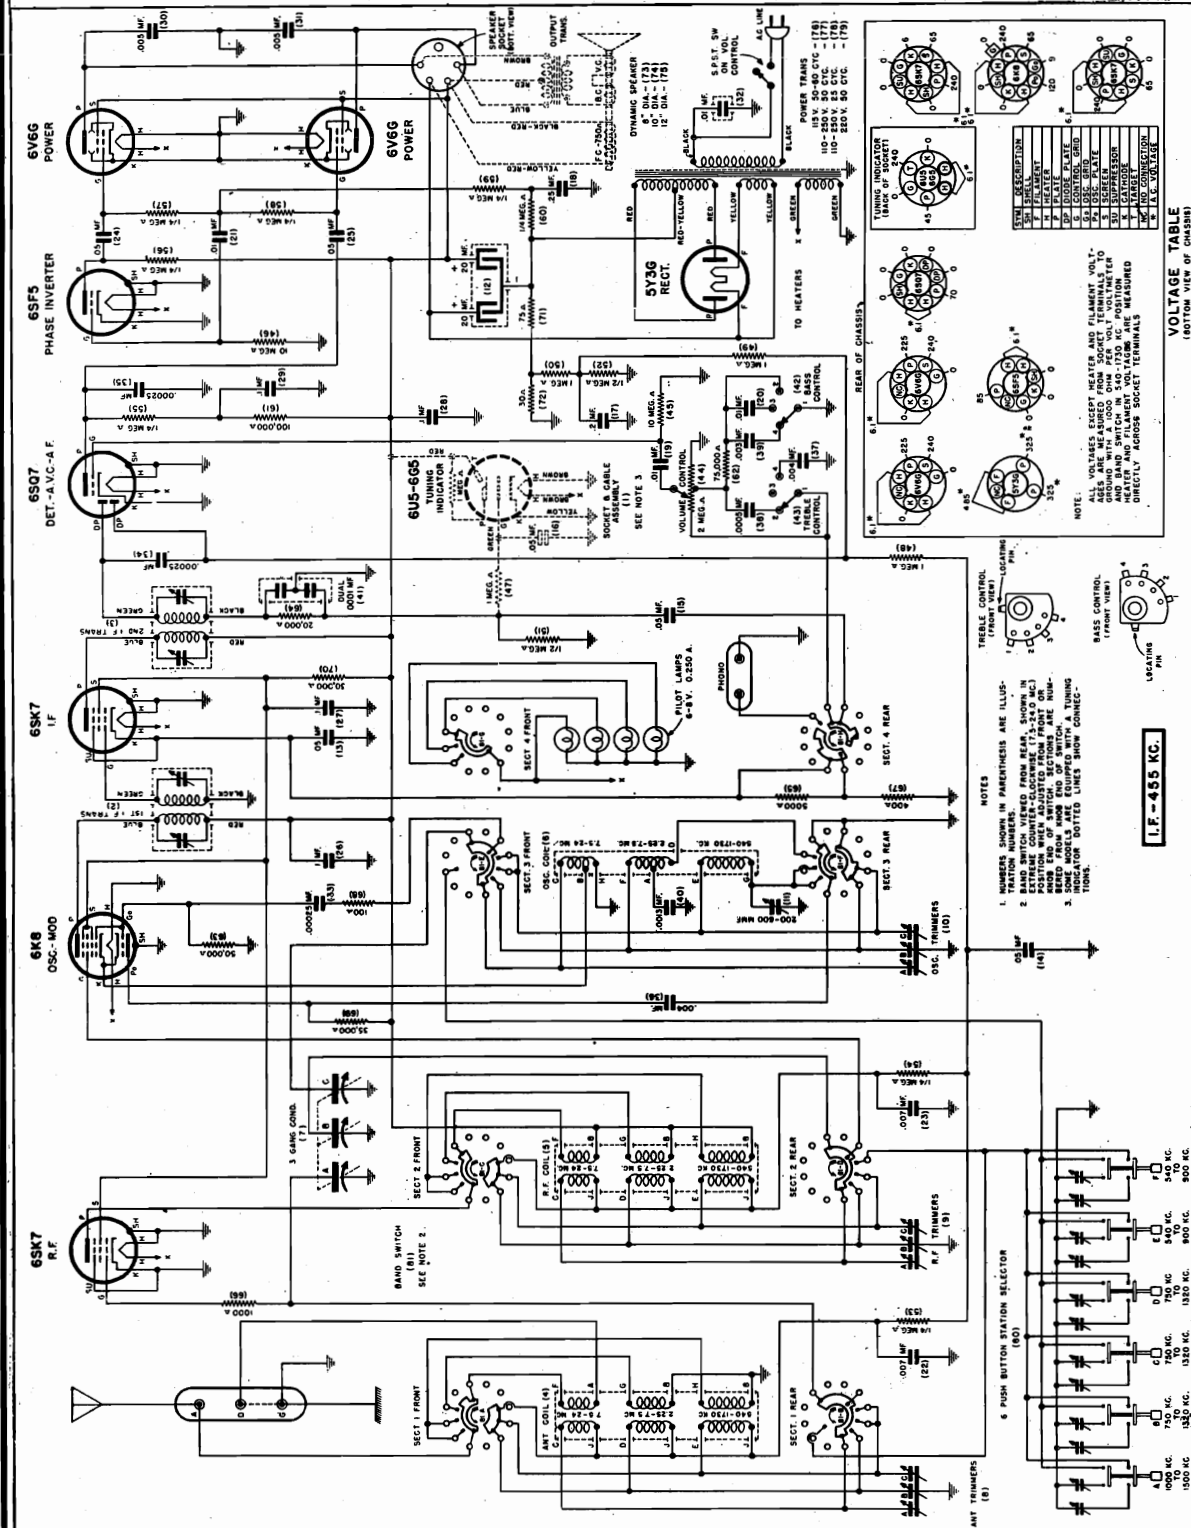

Place band switch for operation on:	Set receiver dial to:	TEST OSCILLATOR	
		Adjust test oscillator frequency to	Attach output of test oscillator to:
L. F. alignment use any band position	Any point where no interfering signal is received	02 Mfd condenser	High side of grid of 1A7G Tube. Do not remove cap.
1520 to 580 K.C. Band	1 Exactly 1520 K.C.	None	Use Small Loop to couple test oscillator to receiver loop
	2 Approx. 1400 K.C.	None	Use Small Loop to couple test oscillator to receiver loop
	3 Approx. 600 K.C.	None	Use Small Loop to couple test oscillator to receiver loop
150 to 410 K.C. Band	1 Exactly 410 K.C.	None	Use Small Loop to couple test oscillator to receiver loop
	2 Approx. 350 K.C.	None	Use Small Loop to couple test oscillator to receiver loop
	3 Approx. 150 K.C.	None	Use Small Loop to couple test oscillator to receiver loop

Refer to parts layout diagram for location of trimmers mentioned below:

- Adjust each of the second I.F. transformer trimmers for maximum output—then adjust each of the first I.F. transformer trimmers for maximum output.
- Adjust 1520 K.C. oscillator trimmer for maximum output.
- While rocking gang condenser adjust 1400 K.C. loop & R.F. trimmers for maximum output.
- While rocking gang condenser adjust 600 K.C. oscillator padder for maximum output.
- Adjust 410 K.C. oscillator trimmer for maximum output.
- Adjust 350 K.C. loop & R.F. trimmers for maximum output.
- While rocking gang condenser adjust 150 K.C. oscillator padder for maximum response.

SENTINEL RADIO CORP.

VOLTAGE TABLE (BOTTOM VIEW OF CHASSIS)

LF-455 KC.

VOLTAGE RATING

THIS RADIO IS DESIGNED FOR USE ON 110-120 VOLTS 50-60 CYCLES ALTERNATING CURRENT—unless the marking on the white paper license notice which will be found attached either to bottom or inside the cabinet is marked differently, in which case the radio must only be used on the type of current shown on this notice.

BE SURE THAT THE CURRENT RATING GIVEN ON THE LICENSE TAG IS THE SAME AS THE HOUSE CURRENT SUPPLY.

MODEL 230

SENTINEL RADIO CORP.

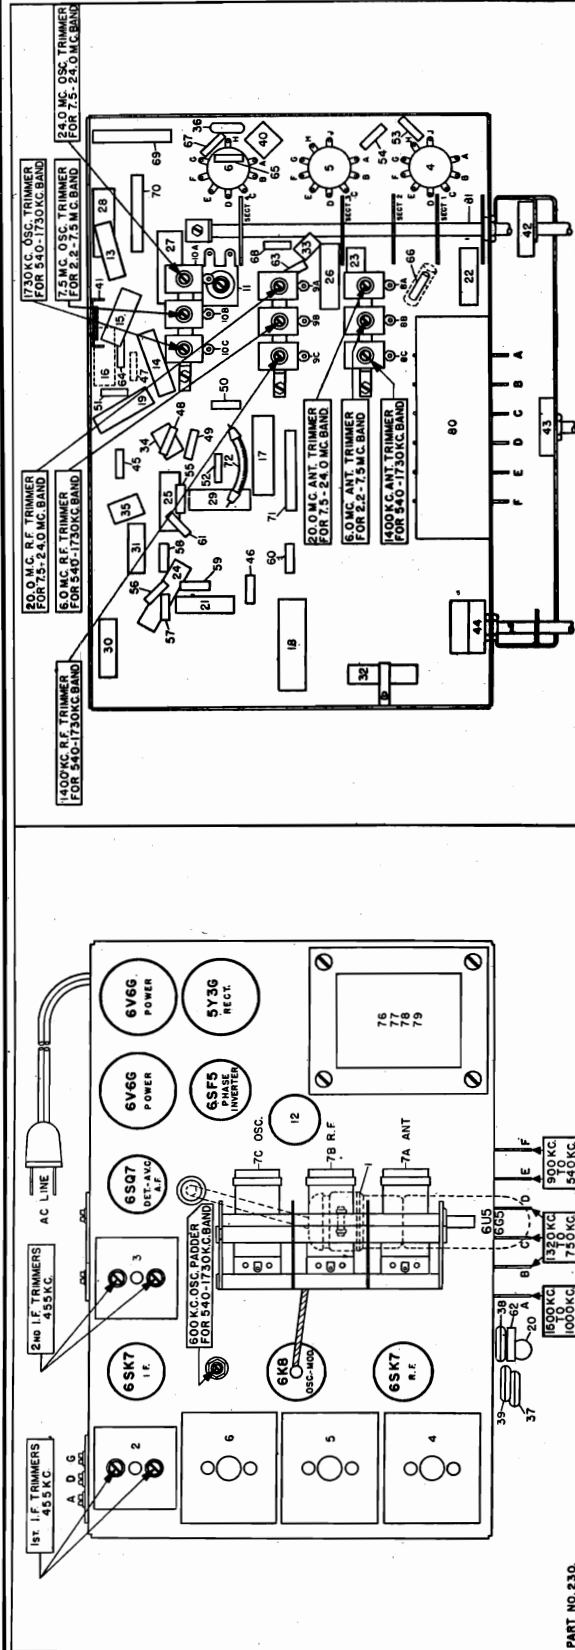

ALIGNMENT PROCEDURE

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, (3) third.

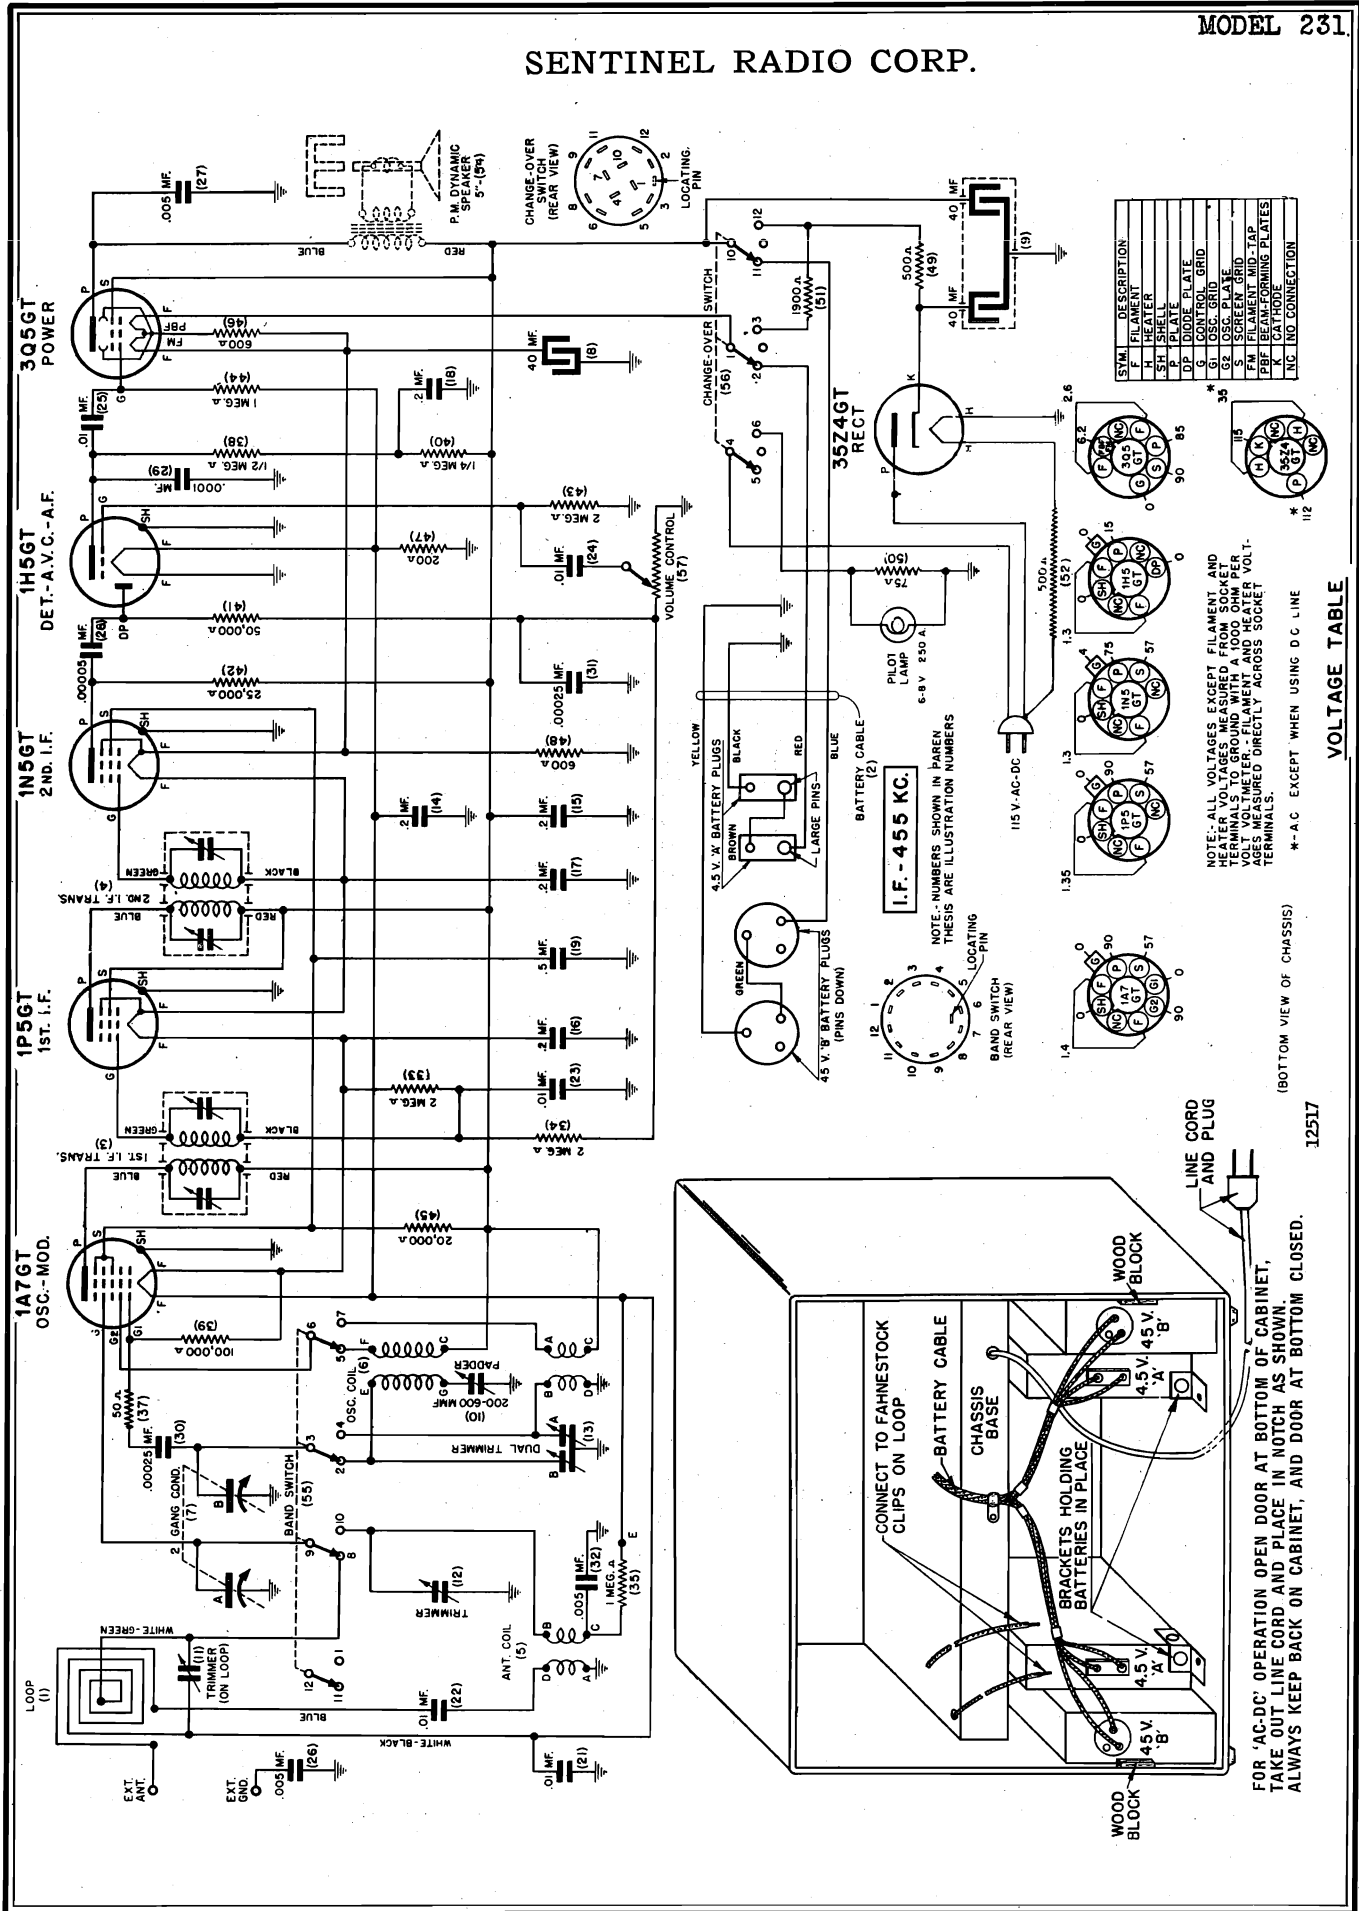

Before starting alignment:

- (a) Check tuning dial adjustment by turning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move needle to correct position.
- (b) Use an accurately calibrated test oscillator with some type of output measuring device.
- (c) Have ground lead of test oscillator attached to chassis.

Place band switch for operation on:	Set receiver dial to:	Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator, consisting of:	Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
I. F. alignment use any band position.	Any point where no interfering signal is received.	Exactly 455 K.C.	.02 Mfd. condenser	High side to grid cap of 6X8 tube. Do not remove cap.	Adjust each of the second I.F. transformer trimmers for maximum output—then adjust each of the first I.F. transformer trimmers for maximum output.

Refer to parts layout diagram for location of trimmers mentioned below:			
Adjust each of the second I.F. transformer trimmers for maximum output—then adjust each of the first I. F. transformer trimmers for maximum output.	Attach output of test oscillator to:	Use dummy antenna in series with output of test oscillator consisting of:	Adjust test oscillator frequency to:
Adjust 1650 K.C. oscillator trimmer for maximum output.	Receiver antenna "A" post	.02 Mfd. condenser	Exactly 455 K.C.
While rocking gang condenser adjust 1400 K.C. antenna trimmer for maximum output.	Receiver antenna "A" post	.00025 Mfd. condenser	Exactly 1650 K.C.
While rocking gang condenser adjust 600 K.C. oscillator padder for maximum output.	Receiver antenna "A" post	.00025 Mfd. condenser	Approx. 1400 K.C.
Adjust 9.5 M.C. oscillator trimmer for maximum output.	Receiver antenna "A" post	400 Ohm carbon resistor	Approx. 600 K.C.
While rocking gang condenser adjust 8 M.C. antenna trimmer for maximum output.	Receiver antenna "A" post	400 Ohm carbon resistor	Exactly 9.5 M.C.
Adjust 11 M.C. oscillator trimmer for maximum output.	Receiver antenna "A" post	400 Ohm carbon resistor	Exactly 8 M.C.
While rocking gang condenser adjust 10.8 M.C. antenna trimmer for maximum output.	Receiver antenna "A" post	400 Ohm carbon resistor	Exactly 11 M.C.
Adjust 14.1 M.C. oscillator trimmer for maximum output.	Receiver antenna "A" post	400 Ohm carbon resistor	Approx. 10.8 M.C.
While rocking gang condenser adjust 10.8 M.C. antenna trimmer for maximum output.	Receiver antenna "A" post	400 Ohm carbon resistor	Exactly 14.1 M.C.
Adjust 14.1 M.C. oscillator trimmer for maximum output.	Receiver antenna "A" post	400 Ohm carbon resistor	Approx. 13.8 M.C.
While rocking gang condenser adjust 10.8 M.C. antenna trimmer for maximum output.	Receiver antenna "A" post	400 Ohm carbon resistor	Exactly 23.5 M.C.
Adjust 23.5 M.C. oscillator trimmer for maximum output.	Receiver antenna "A" post	400 Ohm carbon resistor	Approx. 22 M.C.
While rocking gang condenser adjust 23 M.C. antenna trimmer for maximum output.	Receiver antenna "A" post	400 Ohm carbon resistor	Exactly 23.5 M.C.
Adjust 23.5 M.C. oscillator trimmer for maximum output.	Receiver antenna "A" post	400 Ohm carbon resistor	Approx. 22 M.C.

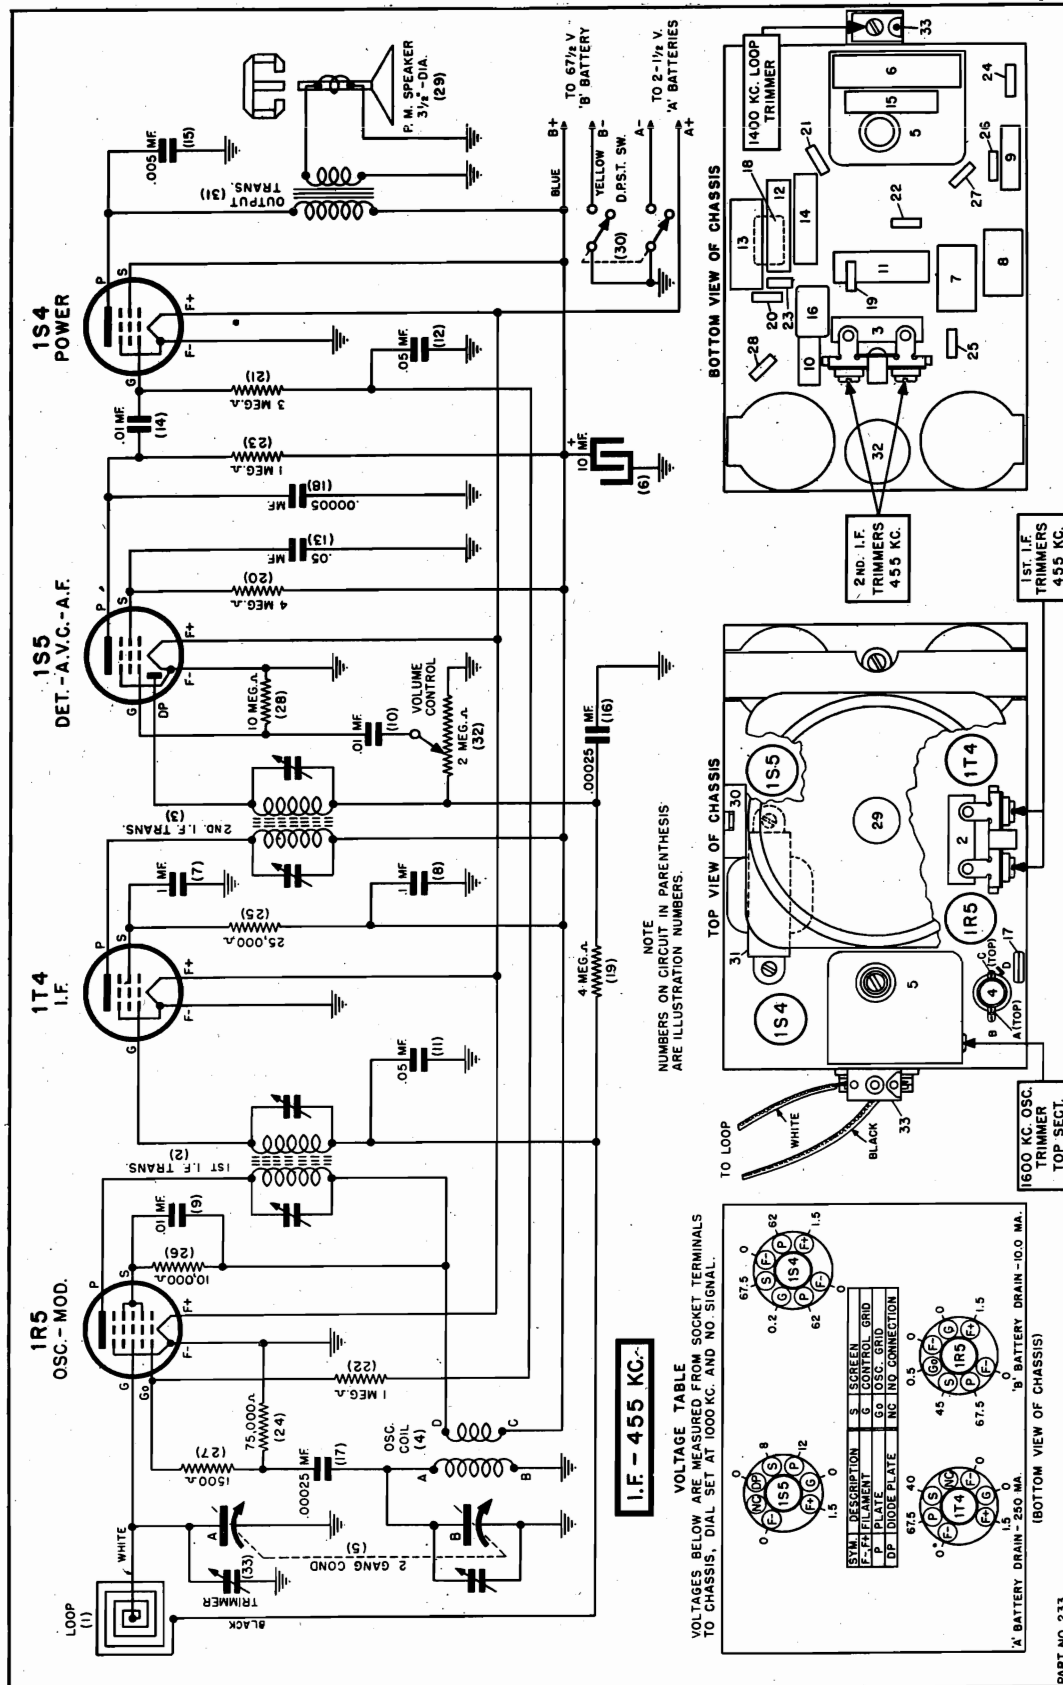

VOLTAGE RATING
 BE SURE THAT THE CURRENT RATING GIVEN ON THE LICENSE TAG IS THE SAME AS THE HOUSE CURRENT SUPPLY.

THIS RADIO IS DESIGNED FOR USE ON 110-120 VOLTS 50-60 CYCLES ALTERNATING CURRENT—unless the marking on the white paper license notice which will be found attached either to bottom or inside the cabinet is marked differently, in which case the radio must only be used on the type of current shown on this notice

SENTINEL RADIO CORP.

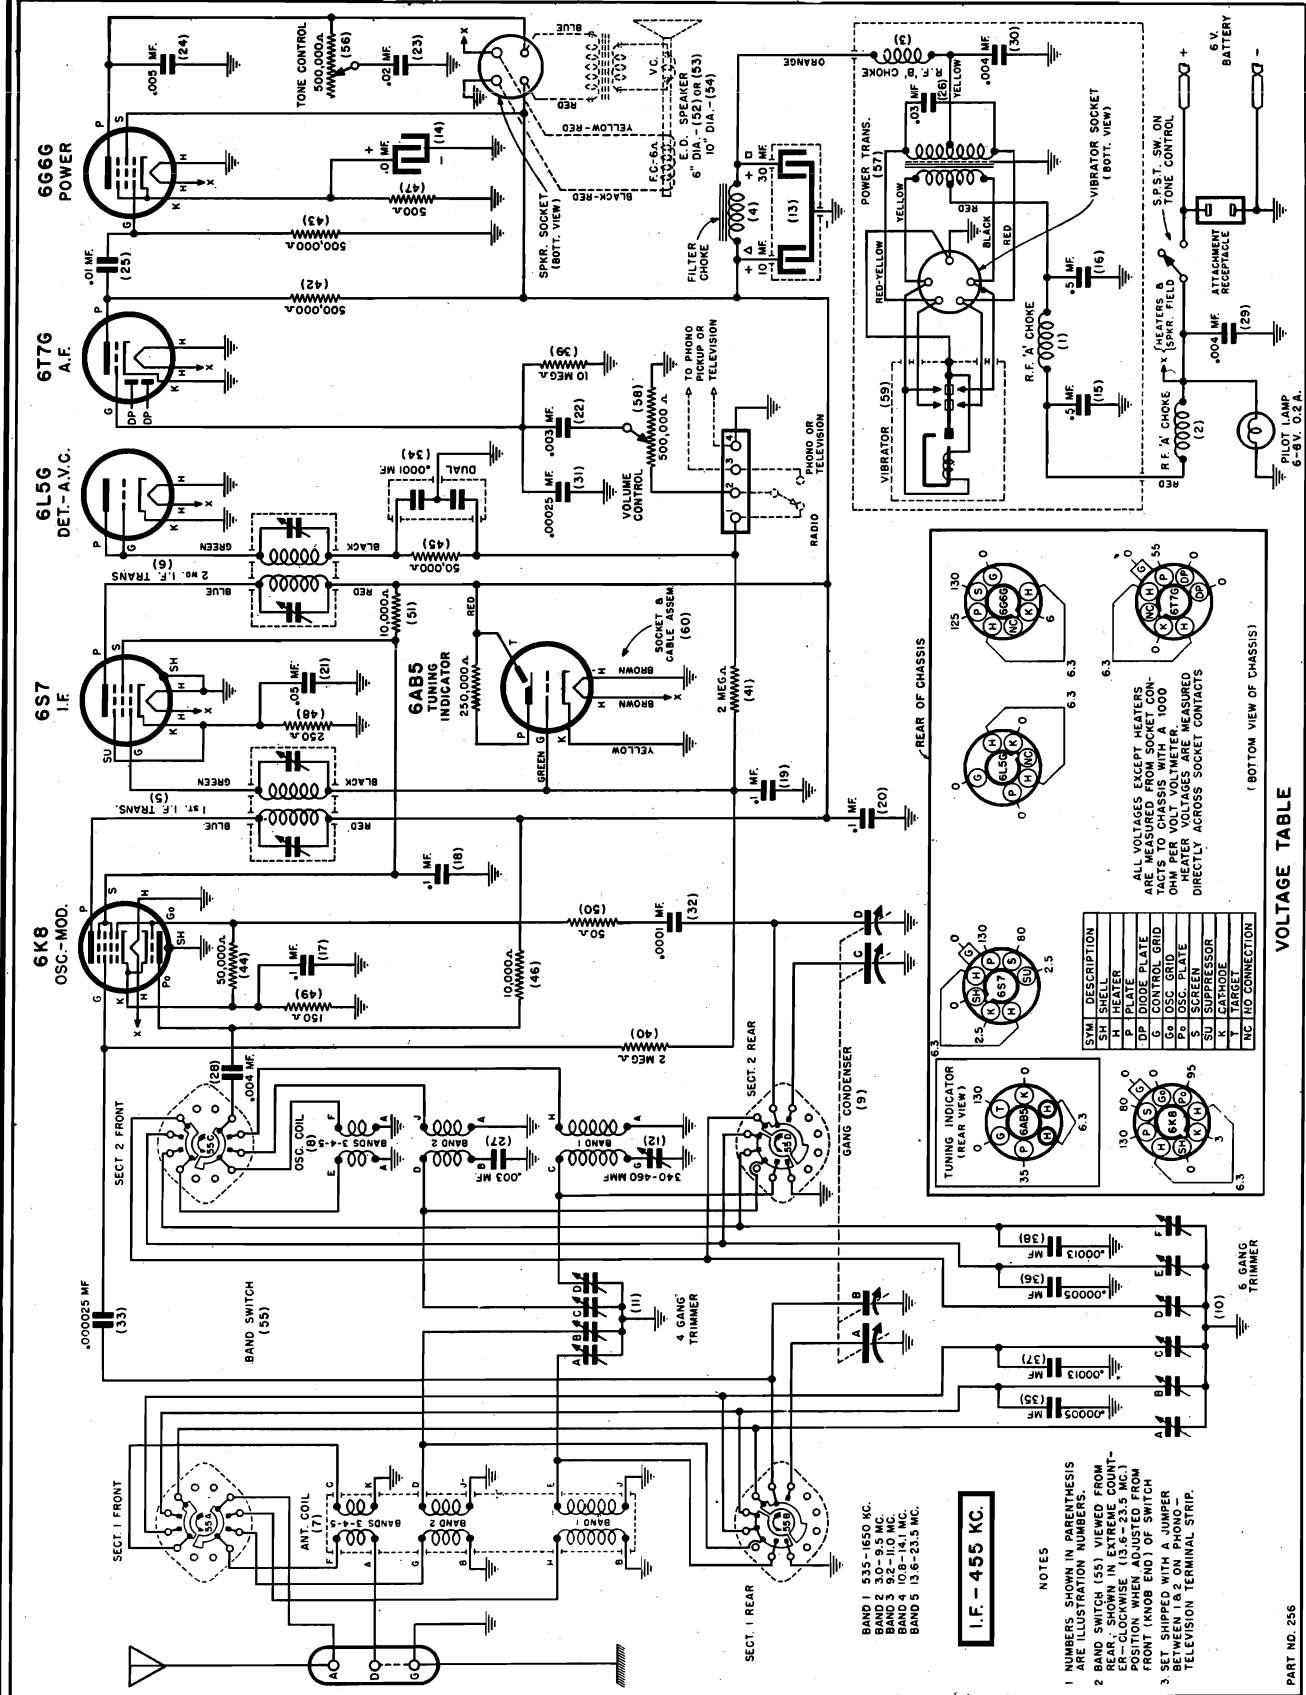

Based on average usage, the flashlight 1 1/2 volt "A" batteries will supply approximately ten hours' service—the "B" battery approximately forty hours' service.

Because the "A" batteries become exhausted much faster than the "B" battery, six to eight "A" batteries may be used during the life of a single "B" battery.

FOR ALIGNMENT AND BATTERY CONNECTIONS SEE INDEX

SENTINEL RADIO CORP.

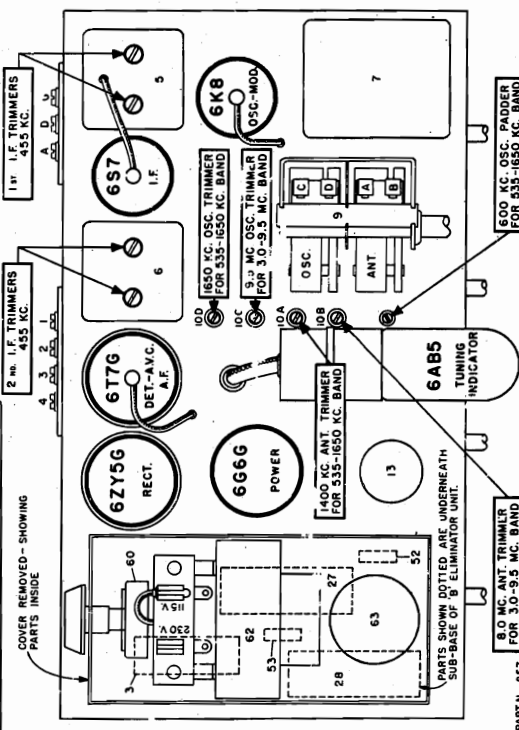

SENTINEL RADIO CORP.

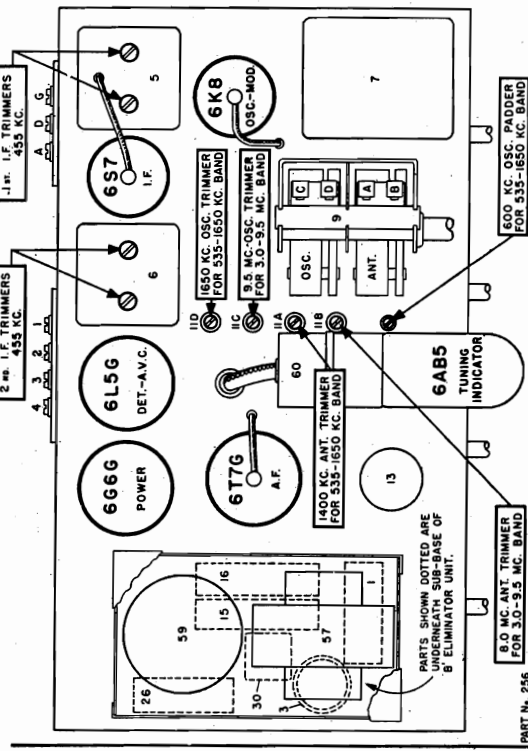

THIS RECEIVER CAN BE OPERATED WITH A SIX VOLT STORAGE BATTERY OR FROM 117 OR 230 VOLT 50 TO 60 CYCLE CURRENT.
NEVER ATTEMPT TO OPERATE THE RECEIVER WITH A 12 VOLT STORAGE BATTERY OR ON 25 CYCLE CURRENT OR ON DIRECT CURRENT (D.C.) OR WITH THE METAL TIPPED LEAD IN THE WRONG TERMINAL SOCKET BECAUSE THE SET WILL BE DAMAGED.

THE RECEPTACLE ON BACK of chassis is connected to the storage battery operating the radio. A single six volt 15 or 25 watt light may be run on the battery by inserting male plug on end of light cord into receptacle. Light cord wire must not be smaller than No. 18 nor longer than six feet, and only one six volt light should be used, otherwise the light will be dim.

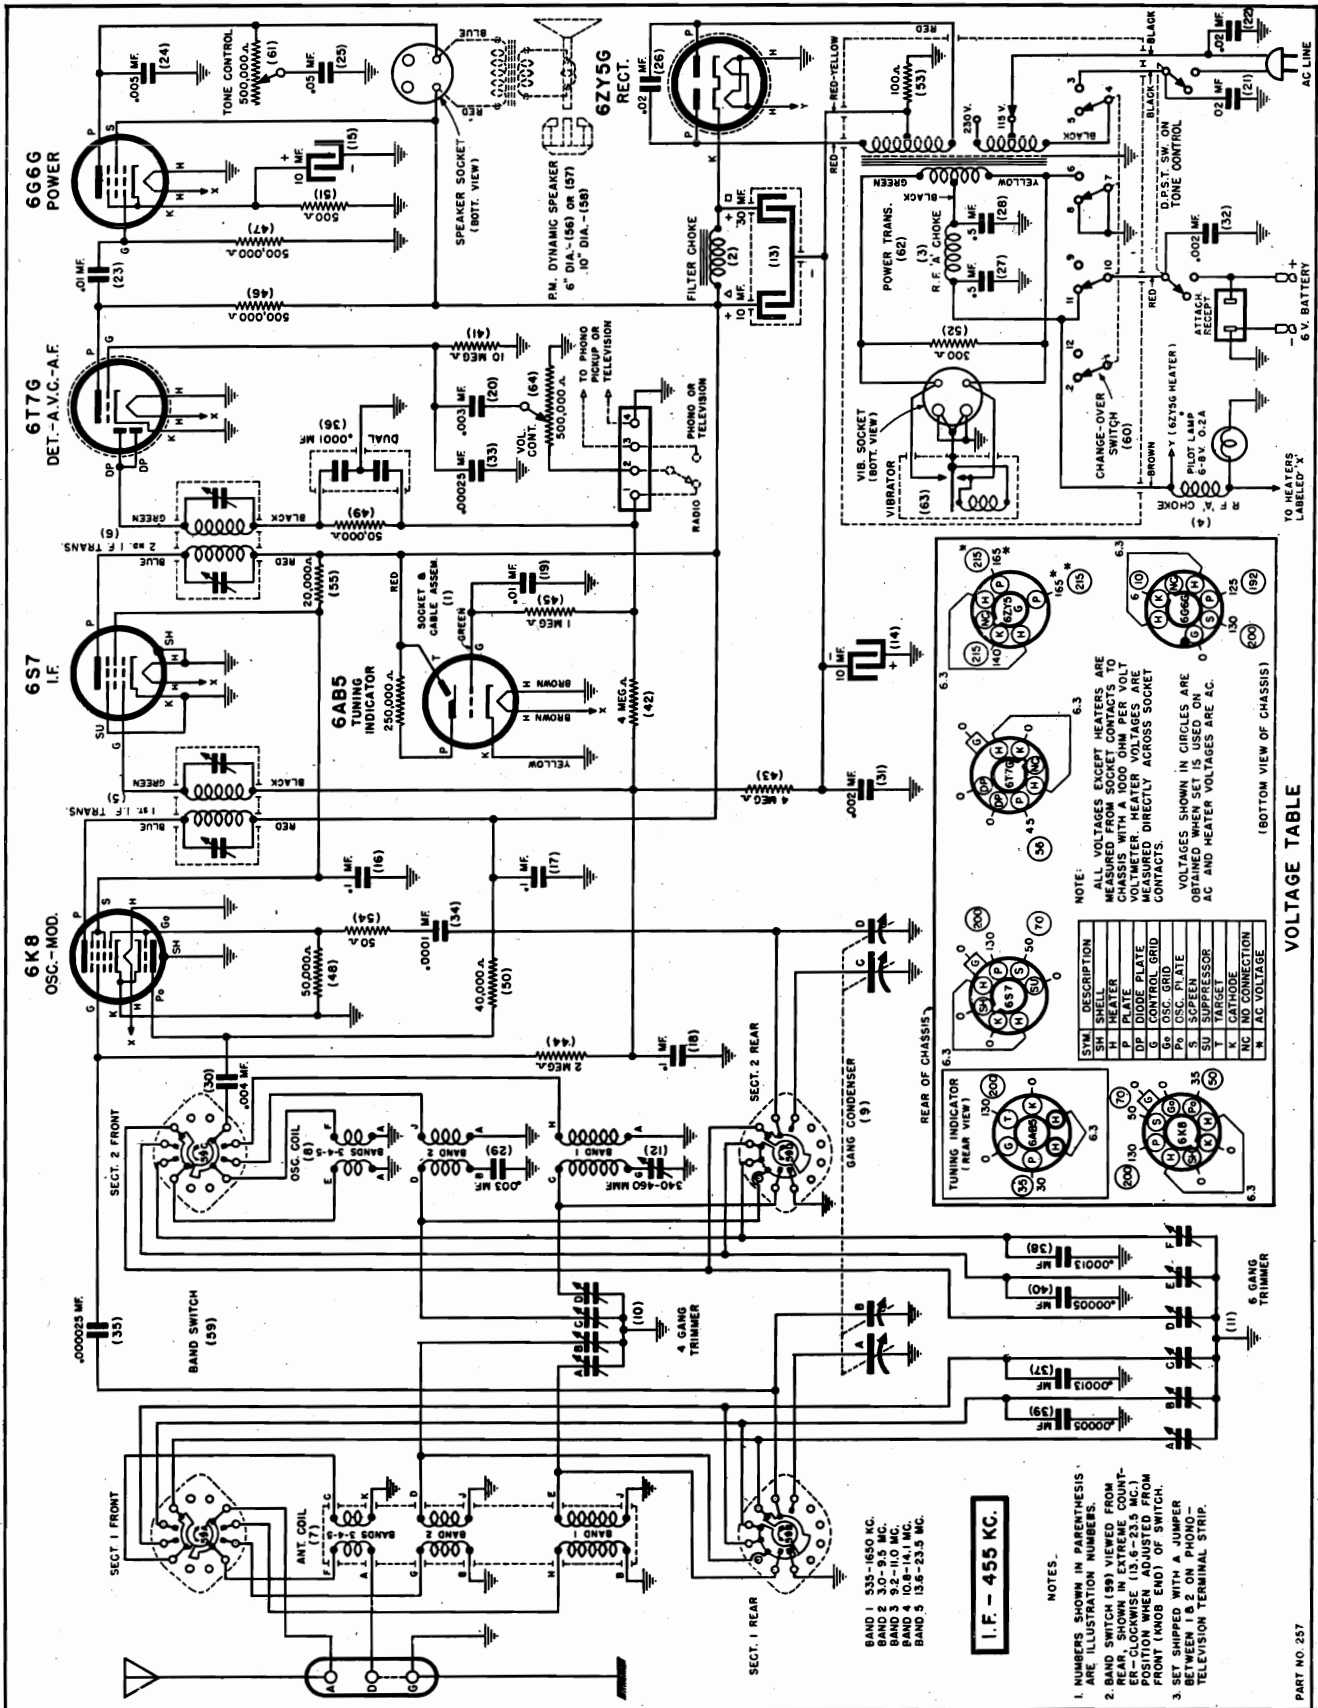

IF ELECTRIC SERVICE IS 110-125 VOLT, INSERT INTO TERMINAL MARKED 115V—if Service is 210-230 Volt insert into terminal marked 230V.

GROUND
A. GOOD GROUND such as a cold water pipe, steam radiator, or an iron rod driven into the ground three or four feet in a place where it is moist should be attached to the post marked "G", regardless of the type of antenna used.

SENTINEL RADIO CORP.

VOLTAGE TABLE

PART NO. 257

SENTINEL RADIO CORP.

SENTINEL RADIO CORP.

For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, (3) third. **IMPORTANT: BEFORE ALIGNING, PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET.**

When adjusting 1730 kilocycle oscillator trimmer and 1400 kilocycle antenna and R.F. trimmers, do not connect test oscillator to loop. Couple test oscillator to receiver loop by: (a) Make a loop consisting of five to ten turns of No. 20 to 30 size wire wound on a three inch form and attach across output of test oscillator. (b) Place test oscillator near set loop—**BE SURE THAT NEITHER MOVES WHILE ALIGNING.**

Set receiver dial to:	Adjust test oscillator frequency to:	Uses dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:
Any point where no interfering signal is received.	Exactly 455 K.C.	0.2 Mfd. condenser	High side to grid cap of 1A7GT tube. Do not remove cap.
1 Exactly 1730 K.C.	Exactly 1730 K.C.	None	Use Small Loop to couple test oscillator to receiver loop.
2 Approx. 1400 K.C.	Approx. 1400 K.C.	None	Use Small Loop to couple test oscillator to receiver loop.

Refer to parts layout diagram for location of trimmers mentioned below:

Adjust each of the second I.F. transformer trimmers for maximum output, then adjust each of the first I.F. transformer trimmers for maximum output.

Adjust 1730 K. C. oscillator trimmer for maximum output.

Adjust 1400 K.C. loop and R.F. trimmers for maximum output.

TO INSTALL BATTERIES REMOVE BACK FROM CABINET, AND PLACE BATTERIES AS SHOWN. FOR AC/DC OPERATION BRING LINE CORD THROUGH OPENING IN BOTTOM OF CABINET. ALWAYS KEEP BACK ON CABINET.

VOLTAGE RATING

THIS RADIO IS DESIGNED FOR USE WITH BATTERIES OR ON EITHER 110-120 VOLTS 50-60 CYCLES ALTERNATING CURRENT (AC) OR 110-120 VOLTS DIRECT CURRENT (DC). **IMPORTANT**—If hum is high when set is operated on A.C. current, reverse position of set power cord plug in house current socket.

TEST OSCILLATOR

NOTE - PARTS 15, 21, AND 34 ARE OMITTED ON SOME MODELS, SEE WIRING DIAGRAM.

If the radio does not operate on DC current after approximately one minute, remove the plug on the end of radio line cord from the house current receptacle, turn it half way around (180°) and reinsert it into the power receptacle.

WARNING—Do not attach a ground to the radio chassis — ANY EXTERNAL GROUND CONNECTION TO ANY METAL PART OF THE CHASSIS WILL CAUSE A SHORT AND POSSIBLE DAMAGE.

THIS RADIO IS DESIGNED FOR USE ON EITHER 110-120 VOLTS 50-60 CYCLES ALTERNATING CURRENT (AC) OR 110-120 VOLTS DIRECT CURRENT (DC)—unless the marking on the white paper license notice which will be found attached either to the bottom or inside the cabinet is marked differently in which case the radio must only be used on the type of current shown on this notice.

PART NO. 264, 1U-264

SENTINEL RADIO CORP.

ALIGNMENT PROCEDURE

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next.

Before starting alignment:

- (a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move to correct position.
- (b) Use an accurately calibrated test oscillator with some type of output measuring device.
- (c) Have ground lead of test oscillator attached to chassis.

TEST OSCILLATOR		
Set receiver dial to:	Adjust test oscillator frequency to:	Attach output of test oscillator to:
I.F. Any point where no interfering signal is received	.02 MFD. condenser	High side to grid terminal of 1A7GT tube DO NOT REMOVE CAP
1 Exactly 1620 K. C.	.00025 MFD. condenser	Receiver blue antenna lead
2 Approx. 1400 K. C.	.00025 MFD. condenser	Receiver blue antenna lead

Refer to parts layout diagram for location of trimmers mentioned below:

Adjust each of the second I. F. transformer trimmers for maximum output—then adjust each of the first I. F. trimmers for maximum output.

Adjust 1620 K. C. oscillator trimmer for maximum output.

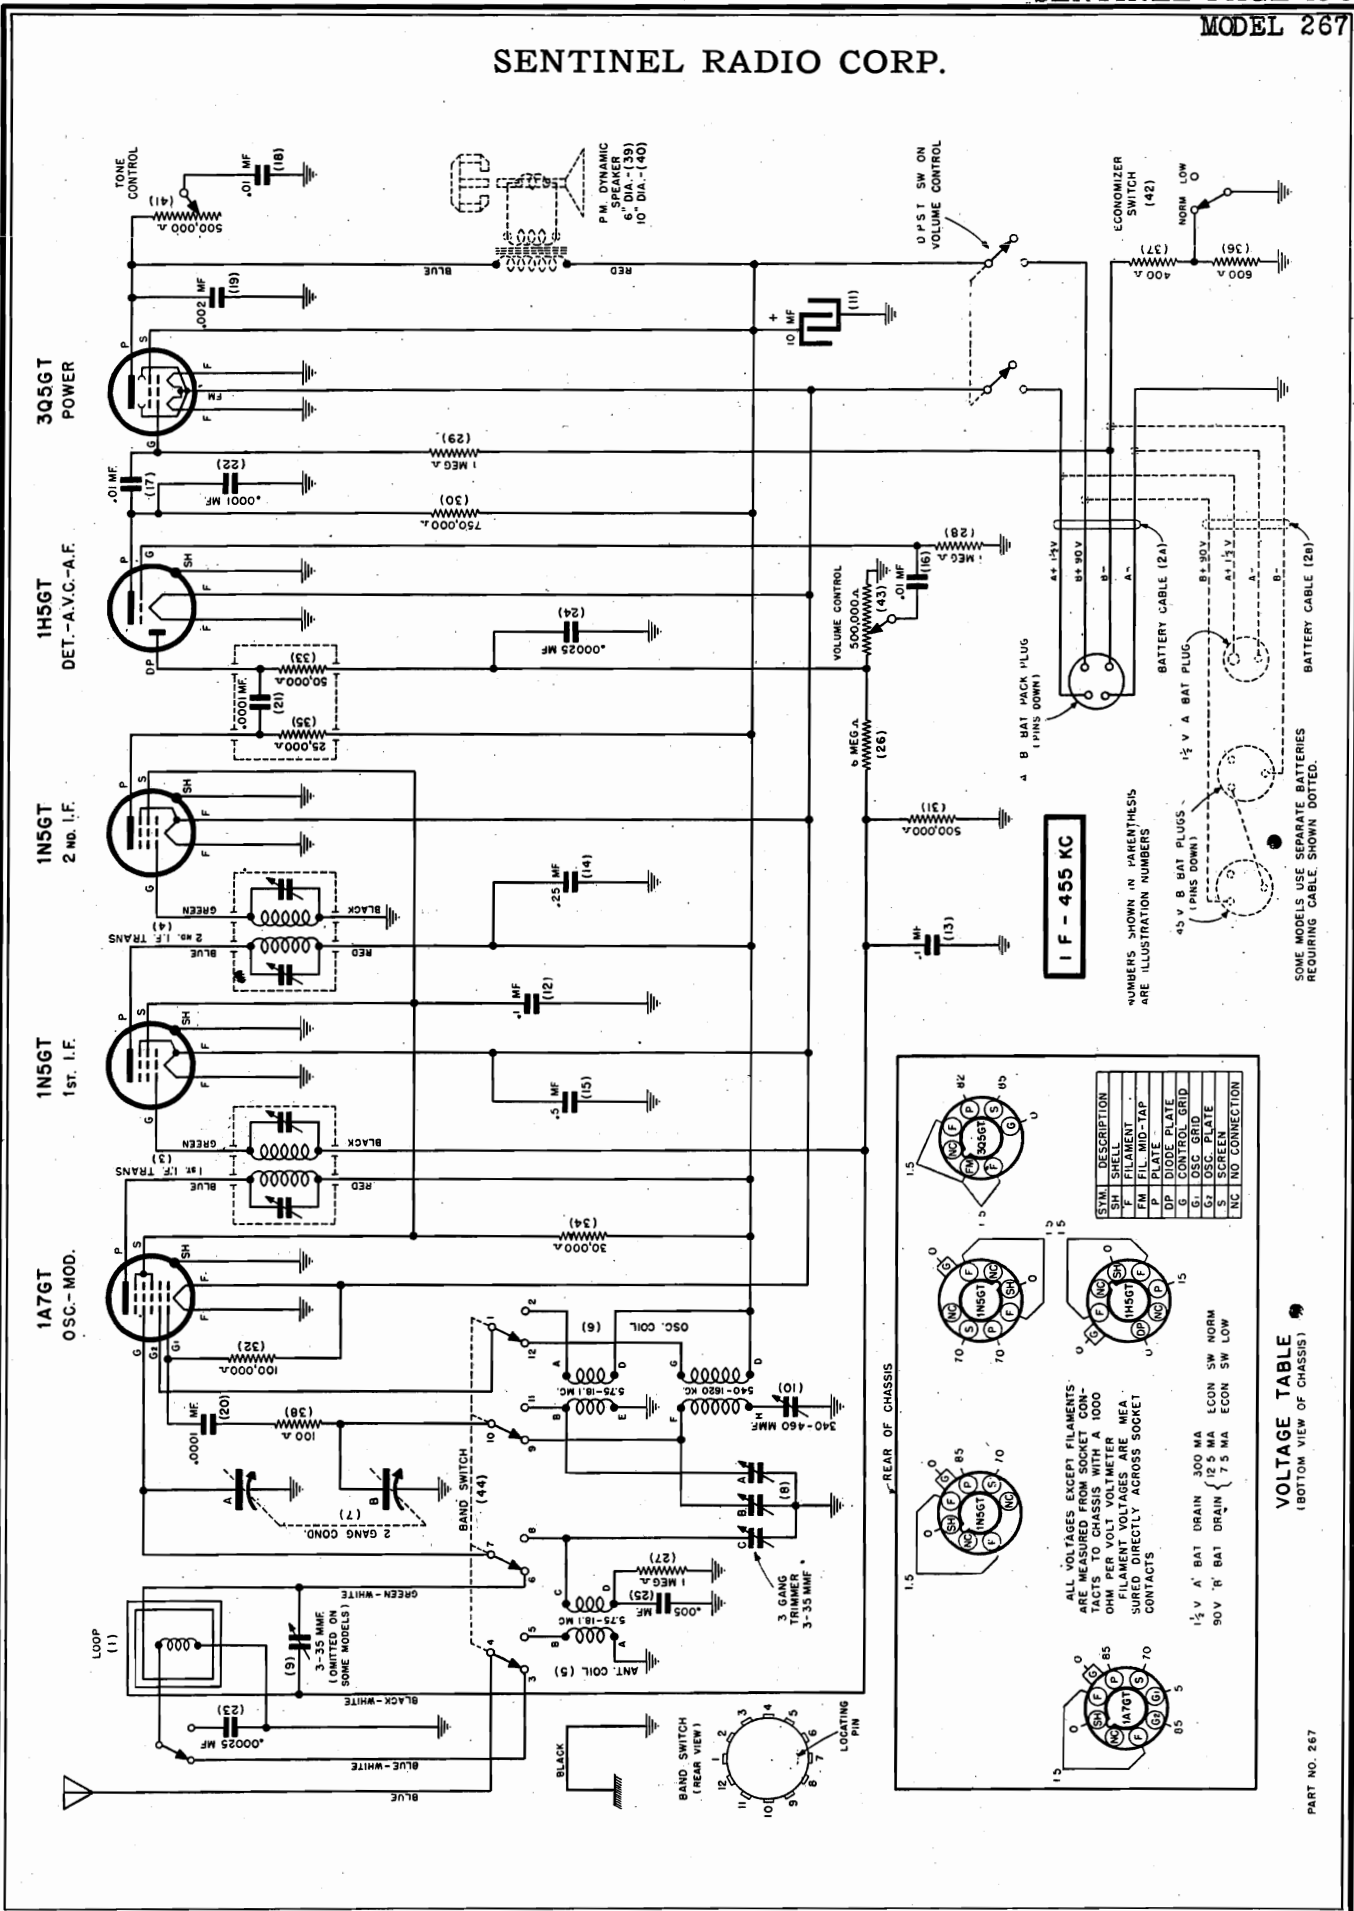

While rocking gang condenser adjust 1400 K. C. antenna trimmer for maximum output.

The life of the battery depends entirely on the number of hours the set is operated daily and the quality and size of the battery.

The special large size "AB" Battery Pack, designed specifically for use with this radio, will provide approximately 750 to 1,000 hours of service under normal, average operating conditions.

JUNE, 1941

ALIGNMENT FOR MODELS: LC, LCU, LKS, LKSU, LMS, LMSU, LQS, LQSU, LR, LZ, MTF-164

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400 and 1720 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. Remove the chassis from the cabinet and set on a bench taking care that no iron or other metal is near the loop. Do not make this setup on a metal bench. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I. F. ALIGNMENT. With the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (12A8GT) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the chassis ground. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to the antenna of the set through a 200 mmfd. (.0002) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1720 K.C. and adjust the oscillator (or 1720 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

OPERATION

Controls and Moving Mechanism

(1) OFF-ON PHONOGRAPH VOLUME CONTROL —

This is the only knob on the Phonograph Attachment. A twist to the right switches on the current to the turntable motor; turning the knob further increases volume. On models equipped with automatic stop switch, no off-on switch is used in conjunction with the volume control. To start the turntable motor on these models, it is only necessary to move the automatic switch lever slightly forward.

The automatic stop switch is adjustable and should be adjusted to stop the motor when the pick-up needle travels the last record groove (nearest the center). This can be done by moving the release arm to a position where it just touches the side of the pick-up arm when the needle is in the last groove and with the motor running.

(2) TURNTABLE —In placing the turntable plate on the motor spindle be sure that the small rubber tire of the motor drive wheel makes contact with the inner edge of the turntable plate. Be certain that the phonograph attachment cabinet rests squarely on a flat surface so that the turntable is level and rotates in a true horizontal plane.

(3) PICKUP —The pickup is the new crystal type. To insert a needle, raise the pickup arm to a vertical position, loosen the needle holder screw on the front, insert a needle to its full depth, tighten up the needle holder screw and lower pickup arm to its non-playing position outside the record and slip into the pickup rest holder. When commencing to play, remove pickup from holder, lift and place gently the point of needle in outside starting groove of record.

(4) RADIO RECEIVER CONTROLS —The power control or "ON-OFF" switch on your radio receiver must be in its "ON" position as for radio reception. Other radio controls will, in many cases, affect record reproduction. Adjustment of the radio set's volume and tone controls may add considerably to the enjoyment of your record selections.

MOTOR SWITCH—(a) Models with combined motor and amplifier "on-off" switch. The combined switch is located on the volume control. When the volume is turned to the right the switch will click and the turntable will revolve as the amplifier heats. After the amplifier is heated, the switch should be turned off momentarily for record changing as the amplifier will cool off.

(b) Models with separate motor switch. The amplifier switch on the volume control turns on the amplifier. The operation of the motor switch does not turn the amplifier on or off. A separate push button switch is used to turn the motor "on" and "off." The button is pushed to start the motor. Another push of the button stops the motor.

(5) PLAYING RECORDS

(a) Turn on the power switch on your radio receiver. The radio dial should light up.

(b) If your radio is the type that has phono-connections applied at the factory and a switch or push-button for phono-radio switching, turn the switch to the phono position or if it has a phono-push button, this button should be depressed.

(c) Place the selected record upon the turntable and turn the knob on the Phonograph Attachment to the right (clockwise) or in the case of automatic stop models, move the switch lever forward. This should place the record in motion.

(d) Lift pickup and lower the needle point gently to the outside record groove.

(e) Adjust volume to suit, by further rotation of the phonograph attachment volume control knob. With some radios the radio volume control will be found effective. In such cases either the Phonograph Attachment volume control, or the radio volume control may be used. Two procedures are possible. The phonograph attachment control knob may be turned fully on and the radio volume control used for regulation, or, if more convenient or desirable, turn the radio volume control about two-thirds ($\frac{2}{3}$) on, and regulate volume with the phonograph attachment control. If your radio has a tone control it can also be set for best reproduction. If record and needle scratch noise is objectionable the tone control may be used to subdue or eliminate by adjustment of the tone control in the direction that favors "Bass" response. After the selection is completed, lift the pickup, swing the arm to the right beyond the edge of the record and lower and affix to the arm rest bracket.

(f) When you have finished playing, turn knob on the Phonograph Attachment fully to the left. This is unnecessary on models EQUIPPED WITH AUTOMATIC STOP. Lift pickup and place in its rest position and remove record from turntable. Never leave pickup with needle resting on record or on turntable. If you have had to connect the cable to the Grid terminal of your radio's 1st audio amplifier tube, it will have to be removed in order to play the radio only.

(c) Models with automatic stop. These models have the motor switch incorporated in the automatic stop. To start the motor move the lever at the right side of the turntable. The automatic stop can be adjusted so that the pickup arm will strike it at the conclusion of a record and thus turn off the motor. The automatic stop operates a separate switch and does not turn the amplifier on or off.

A little oil applied to the motor, idler and turntable bearings about once every three months will suffice.

SONORA RADIO & TELEV., CORP.

INSERT INSULATED LEAD PIN PLUG IN HOLE INDICATING GRID.

SKETCH NO. 1

The Phonograph Attachment is designed for use on alternating current (AC) only, and may be badly damaged if subjected to use on direct current (DC). The improper application of power source will burn out the motor that drives the rotating turntable.

The Phonograph Attachment can be operated only on 110 to 125 volt AC (alternating current) 60 cycles.

Note: To obtain proper musical rendition of phonograph records the records must revolve at a speed of 78 R.P.M. (revolutions per minute). To insure the proper turning speed to your records the power supply must be 60 cycles. A 50 cycle supply will rotate the phonograph record at reduced speed and consequently change the tempo and true tone of the musical recorded program.

SKETCH NO. 2

SKETCH NO. 3

SKETCH NO. 4

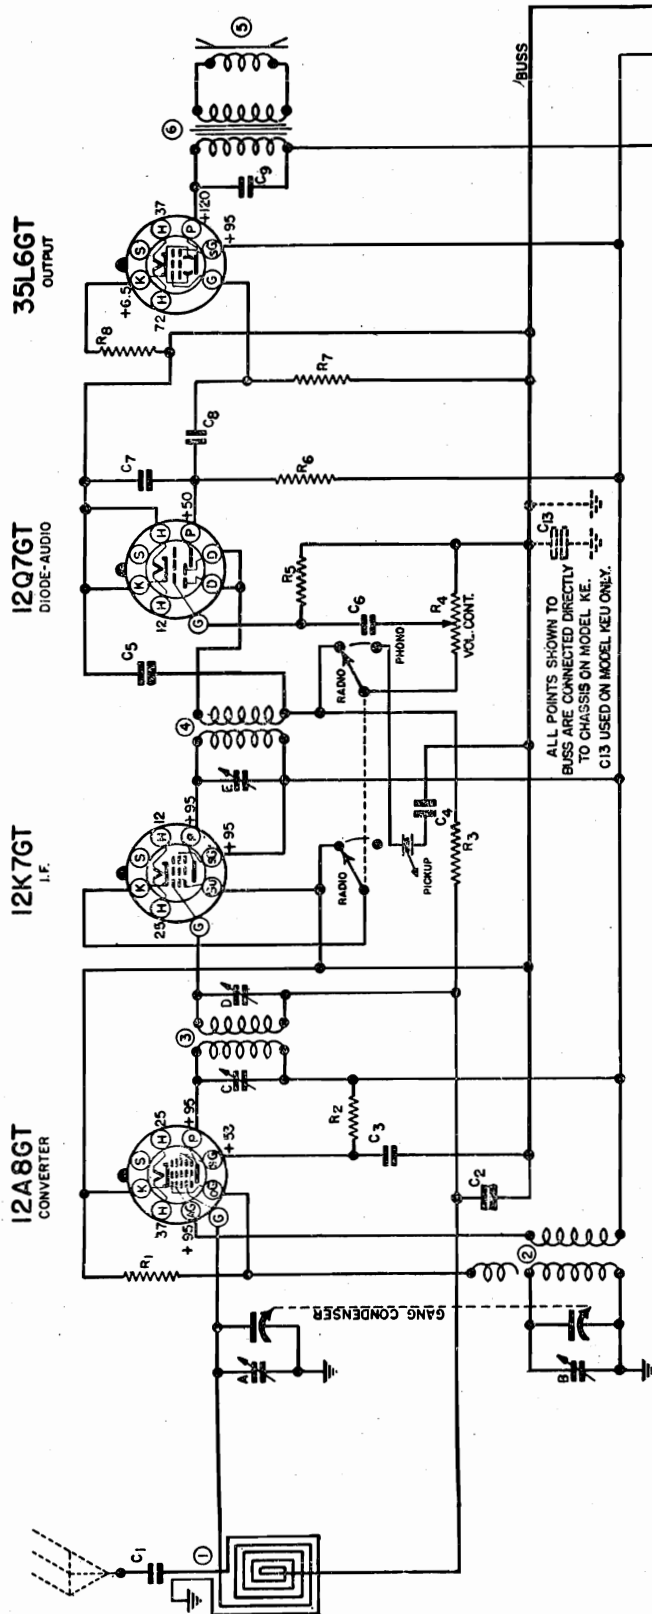

SKETCH NO. 5

Before making any connections from the phonograph attachment to the radio receiver, be certain that the power to the radio set is turned off; a mild electric shock may be experienced if the chassis is touched by the hand on some radios. To prevent any possibility of such an unpleasant occurrence many radios are equipped with means for connecting a phonograph attachment. On such radios a small strip of insulated material (see sketch 1) with two terminals or phono-tip jacks will be marked phono. It is only necessary to connect the pin plug connectors to this strip if your radio has this provision and follow **operating** instructions of your Phonograph Attachment and your radio. If no provision for phonograph adaption exists on your radio set, the following procedure becomes necessary:

Locate the first audio tube in the radio chassis by refer-

ence to radio set manufacturers' instructions or the tube location chart that usually is attached to the interior or bottom of the radio cabinet. There are three (3) distinctive types of tubes that may be found in use in this position and the three accompanying sketches 2, 3, and 4 show their differences and the proper treatment of connection to each type. The insulated pin-plug should be connected to the "Grid" terminal of the first audio tube and the bare braided wire lead to the chassis, as indicated in the sketches. In connecting the insulated lead to grid terminal of tube types as shown in sketch 2 and 3 it will be necessary to attach the adaptor lug furnished separately to the insulated lead pin-plug and fasten to the grid terminal by removing the tube and then replacing the tube with the connection made. This is clearly illustrated in sketches 3, 4 and 5.

DRAWN W.J.F. APPROVED *[Signature]*
 JULY 11, 1940.

ALIGNMENT FOR MODELS: LV-181, KL-185, LV-186

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400, 1720, 6000, 15000 and 18300 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast and Short Wave bands in the order given, should be aligned.

I.F. ALIGNMENT. With the wave switch in the Broadcast Band and the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (6SG7 or 6SD7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the chassis base. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. With the switch turned to the broadcast position, connect the antenna to the generator through a 100 MMF dummy and the ground of the set (Black wire) to

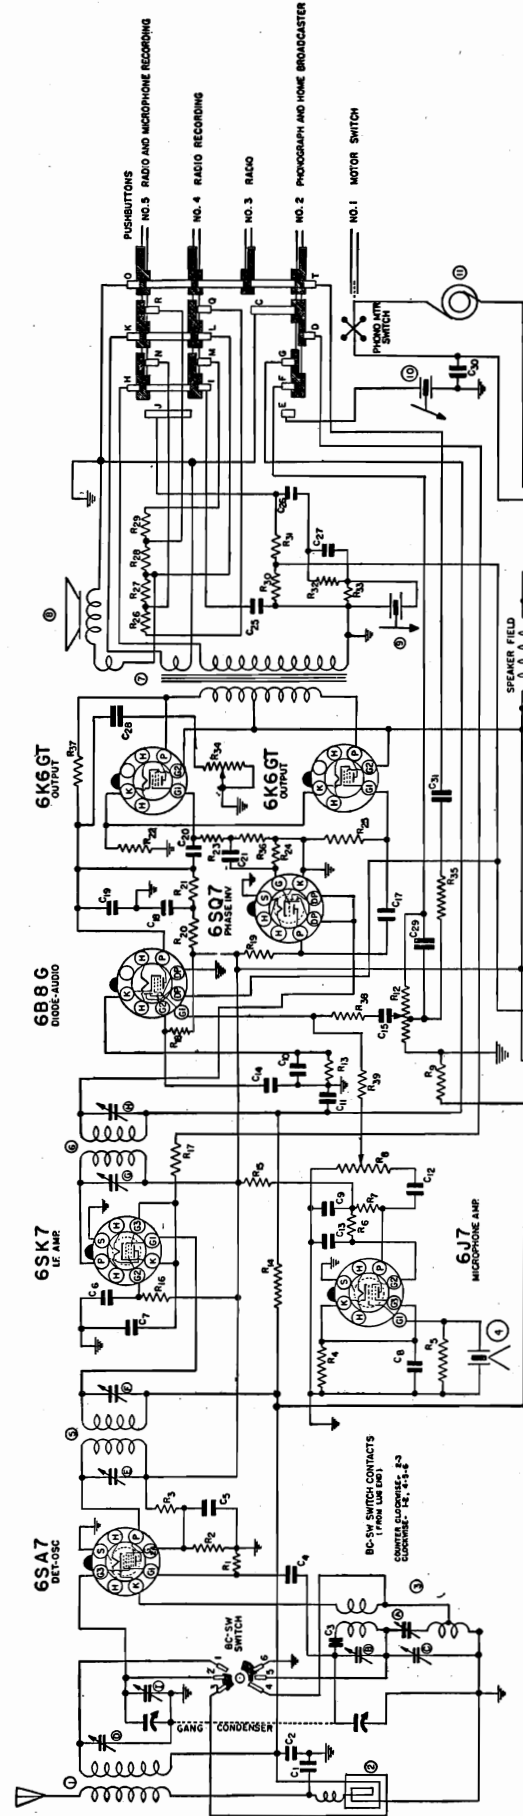

the generator ground. Set the dial and generator at 1720 KC. Align the BC oscillator trimmer for maximum output. Set the generator at 1400 KC and tune-in signal with the dial. Adjust antenna trimmer for maximum output. Next set the generator at 600 KC and tune in the signal with the dial. Adjust the BC pad by rocking the gang back and forth while adjusting the pad until maximum output is attained. Recheck the adjustment at 1400 KC as the pad adjustment may have caused misalignment.

SHORT WAVE BAND ALIGNMENT. With the band switch turned to the S. W. position, connect the generator to the antenna with a 400 ohm dummy and the ground of the set (Black wire) to the generator ground. Adjust the S. W. oscillator to give a maximum output with the dial at 18300 KC (extreme end). Set the generator at 15000 KC and tune-in the signal with the dial. Adjust the antenna trimmer for maximum output. With a strong signal input turn the dial to approximately 1 M. C. lower in frequency and pick up the image frequency. If the image is not received, it will be necessary to return the dial to 18300 KC to reduce the capacity in the oscillator trimmer until a second signal is received. Proceed as before with the alignment of the antenna and recheck for image frequency. Check the sensitivity at 6000 KC to determine if the coils and mica pad are not defective.

* Generator connected to #6 Pin on 1R5 tube.
** Use dummy antenna as described below.
*** Rock dial while adjusting for maximum output.

DUMMY ANTENNA

SPECIFICATIONS

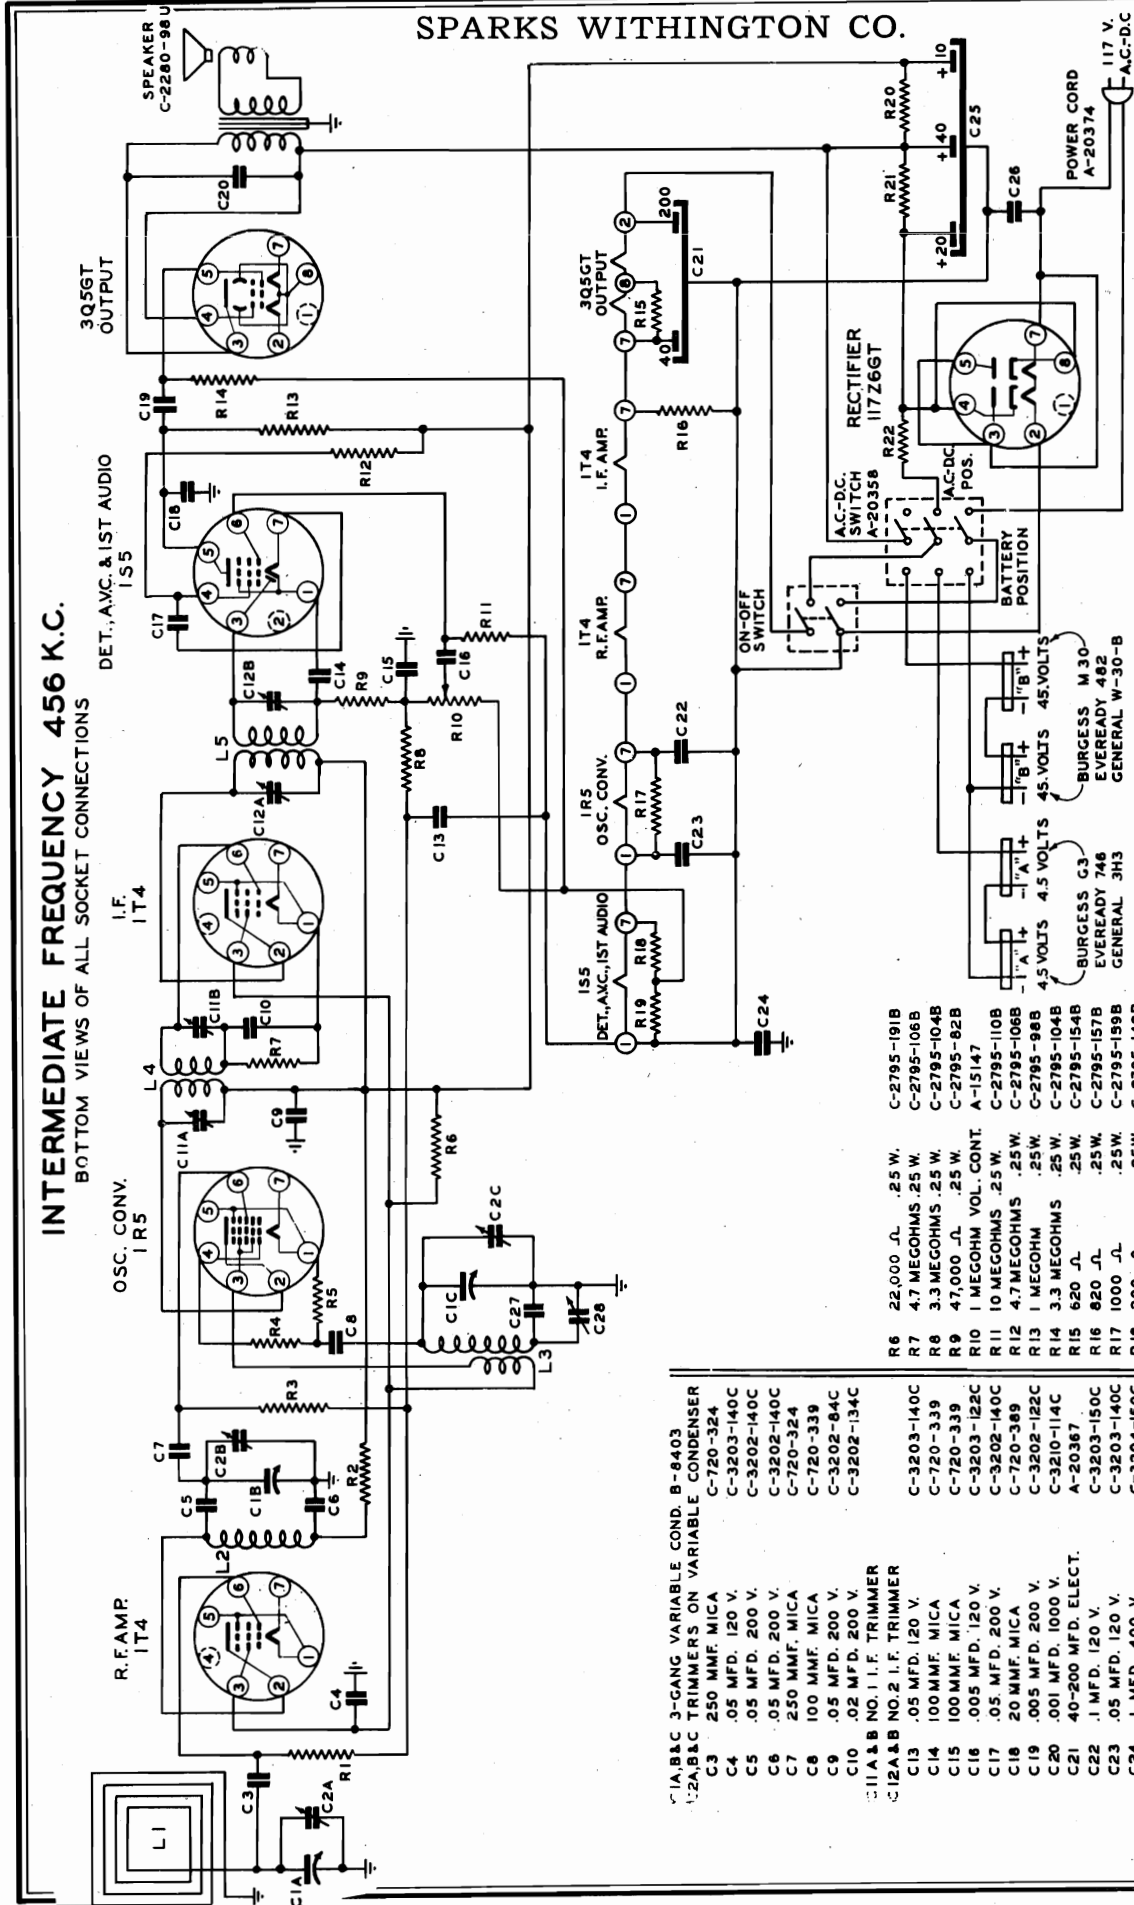

Two loops of 1/4" copper tubing 8" in diameter spaced 1/4" apart with 400 ohms resistor in series. Connecting cable and resistor must be shielded. The loop should be spaced twice the diameter of the loop from the receiver being aligned to prevent an over modulated signal and poor alignment of the receiver.

	B1	"B" Battery

To properly align receiver, it should be removed from the cabinet.

A signal generator is required, having the following frequencies: 456KC, 1400KC, 1720KC. An output meter of some kind is also necessary.

First Step: Connect generator lead to grid cap of 1A7GT tube through a .1MFD condenser. Generator ground lead should be connected to any available spot on the metal chassis of the receiver. Turn tuning condenser so that its plates are completely unmeshed. This puts circuit at 1720KC. Adjust manual volume control to maximum clockwise rotation. This will prevent the automatic volume control from working and giving false readings. All alignment adjustments should be made with manual volume control at maximum. Now adjust the signal generator to 456KC. Align the intermediate frequency amplifier (IF) to this frequency by adjusting the screws in the small metal cans underneath the chassis. There are four screws in all, two for the input IF which is at the rear of the chassis and two for the output IF which is located closer to the front of the chassis. Adjust each screw until a maximum reading is obtained on an output meter which has been connected across the speaker leads. After the IF coils have been aligned, with tuning coils completely unmeshed, turn signal generator to 1720KC and adjust oscillator trimmer which is on top of the tuning condenser (see figure 2 layout) until a maximum reading is noted on the output device. This is the proper oscillator setting for 1720KC. Remove signal generator leads from receiver and connect both to a transmitting loop antenna. This can be made with two turns of wire about 6 inches in diameter, and placed about one foot from the loop antenna of the receiver. It will be necessary to increase the output of the signal generator. Next adjust the generator to 1400KC. Turn tuning condenser so that the plates mesh and the 1400KC signal is tuned in. Adjust trimmer condenser which is located on loop antenna of receiver for maximum output. Unless set has been damaged, no further adjustments are necessary, as the coils and condensers in this receiver have been specially handled at the factory so as to insure proper alignment at the lower frequency end of the dial. As a final step of alignment after the set has been reinstalled in the cabinet, tune in a weak station between 1400KC and 1500KC and readjust loop antenna trimmer for maximum signal strength. This should be done only after receiver has been mounted in place along with the batteries.

IF PEAK 456 KC

SPIEGEL, INC.

I.F. 456 K.C.

IMPORTANT NOTE: The battery must never be charged while set is in operation. If a windcharger is used, it should always be disconnected from the battery when the receiver is being used. An inexpensive single pole switch can be used for disconnecting the windcharger from the battery. This will increase the life of the tubes and give additional economy to the use of the receiver.

AUTOMATIC TUNING

For Chassis

ADJUSTMENT. All adjustments are simply made from the top of the cabinet without the use of tools since the push-button knobs serve this purpose.

To make adjustments, turn each knob to the left about 1 complete turn. The knob is knurled to provide a positive grip for this purpose. With the knob turned free, tune to any desired station with the manual tuning control. Depress the push button knob as far as possible and turn to the right to tighten adjustment. Meanwhile, hold the manual tuning control in position to the station tuned. Be sure the push button knob is held down in position while being tightened.

After the stations are adjusted it is advisable to check each button to assure sufficient tightening.

To assure accurate adjustment, the volume tuned should be set at a moderate level and the station tuned in slowly to a point of maximum volume and clarity.

It is not necessary to follow any particular sequence of stations since each button is adjustable to any station.

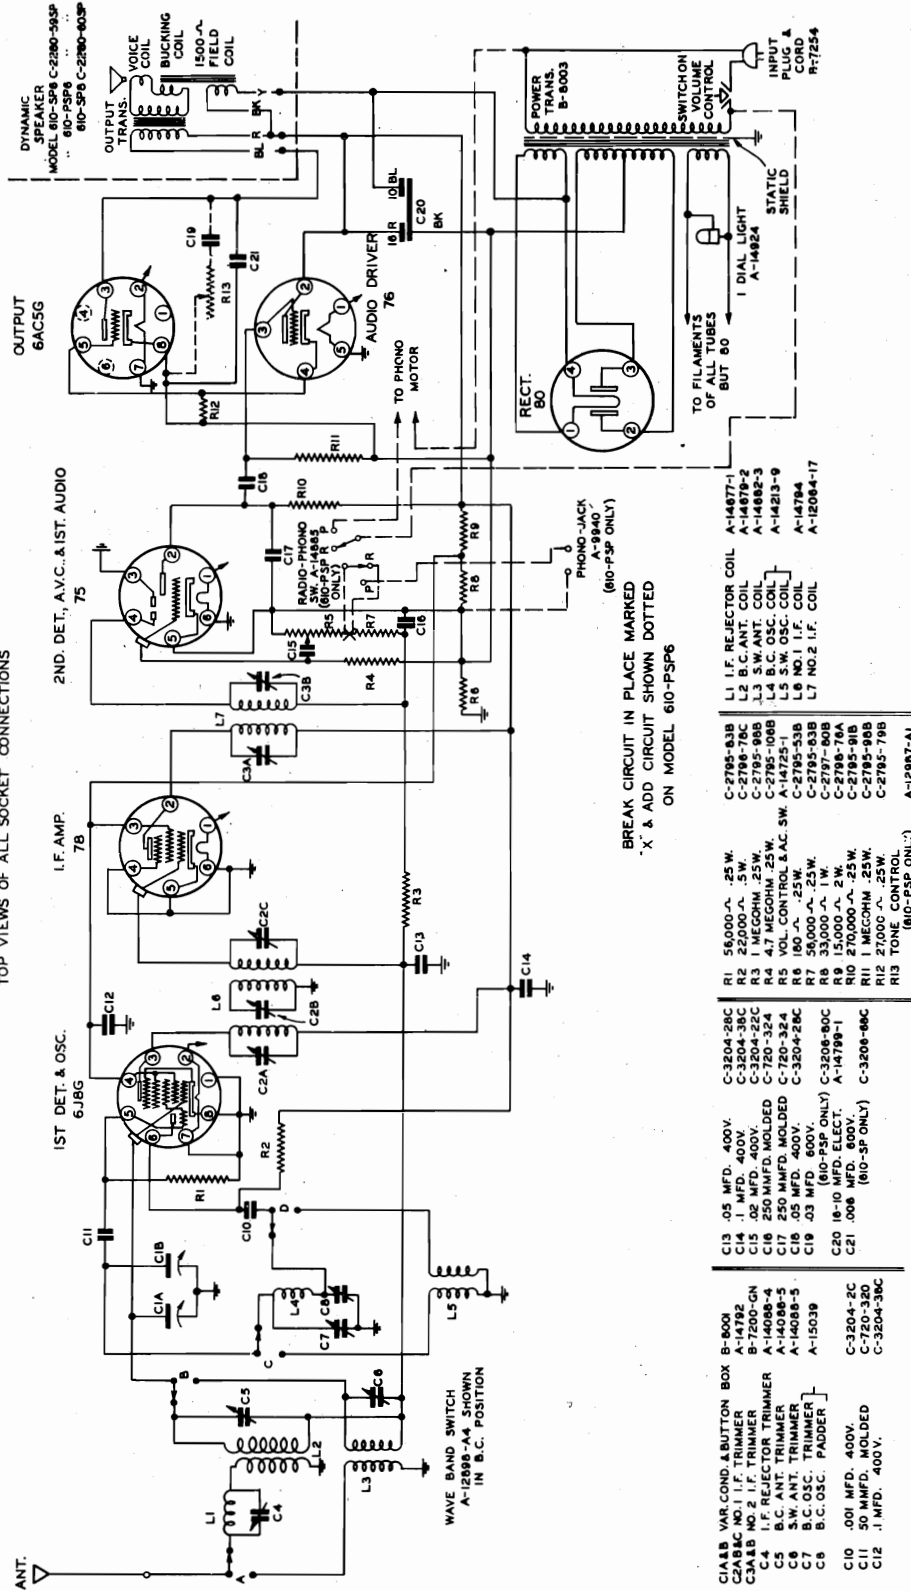

With each button definitely set and securely tightened to the selected stations, the tuner is ready for operation.

MODEL W116 IS THE SAME AS MODEL W104 WITH THE ADDITION OF A 6U5 CONNECTED AS SHOWN ON PAGE 13-57

- The tube equipment is:
- 1—Type 6J8G —Converter Heptode
 - 1—Type 78 —Intermediate-Frequency Pentode
 - 1—Type 75 —Duplex-Diode-Triode Second Detector—A. V. C. and Audio Amplifier
 - 1—Type 76 —Driver
 - 1—Type 6AC5G—Power Amplifier Triode
 - 1—Type 80 —Full-Wave Vacuum Rectifier
2. POWER SUPPLY: On models designed for operation on 60-cycle current the receptacle plug may be attached to any outlet from 110 to 120 volts, 50 to 60 cycle alternating current (a. c.) power supply system.
 This model is available in either 25 cycle or 60 cycle alternating current (a. c.).
 This model receiving set, designed for operation on 25 cycle current, will operate satisfactorily on 60 cycle current; however, a radio set designed for operation on 60 cycle current WILL NOT operate on 25 cycle current.

*100 ohm non-inductive resistor and 200 mmf. condenser in series.

**Rock dial while making this adjustment. Make certain that adjustment is made on fundamental signal and not on image. Peak accurately.

CHASSIS DIAGRAM

ADJUSTING THE PUSH-BUTTON TUNER

1. Select four favorite nearby broadcast stations and detach the corresponding call letter tabs from the station call letter tab sheets.

2. Insert the station call letter tabs. Any tab may be used for any button, but it is usually more convenient for the operator if the tabs are arranged in sequence so that the tab for the lowest frequency station (station having lowest number of kilocycles [K. C.]) will be at the extreme left. This, however, is not vital, since the tuner will operate with any arrangement of the tabs.

3. **TO ADJUST BUTTONS**, loosen selected button by turning one-half turn to the left (counter-clockwise). Push this loosened button in as far as it will go, and while in this position, tune in manually the station desired or indicated by tab under button.

Then, with the button still pushed in as far as it will go, tighten by turning button to the right (clockwise) until it can be tightened no more.

Be sure the station is tuned in accurately when pushed in button is tightened.

4. Repeat the procedure in paragraph 3 for each of the remaining three buttons and stations.

5. Be sure the buttons have been tightened firmly.

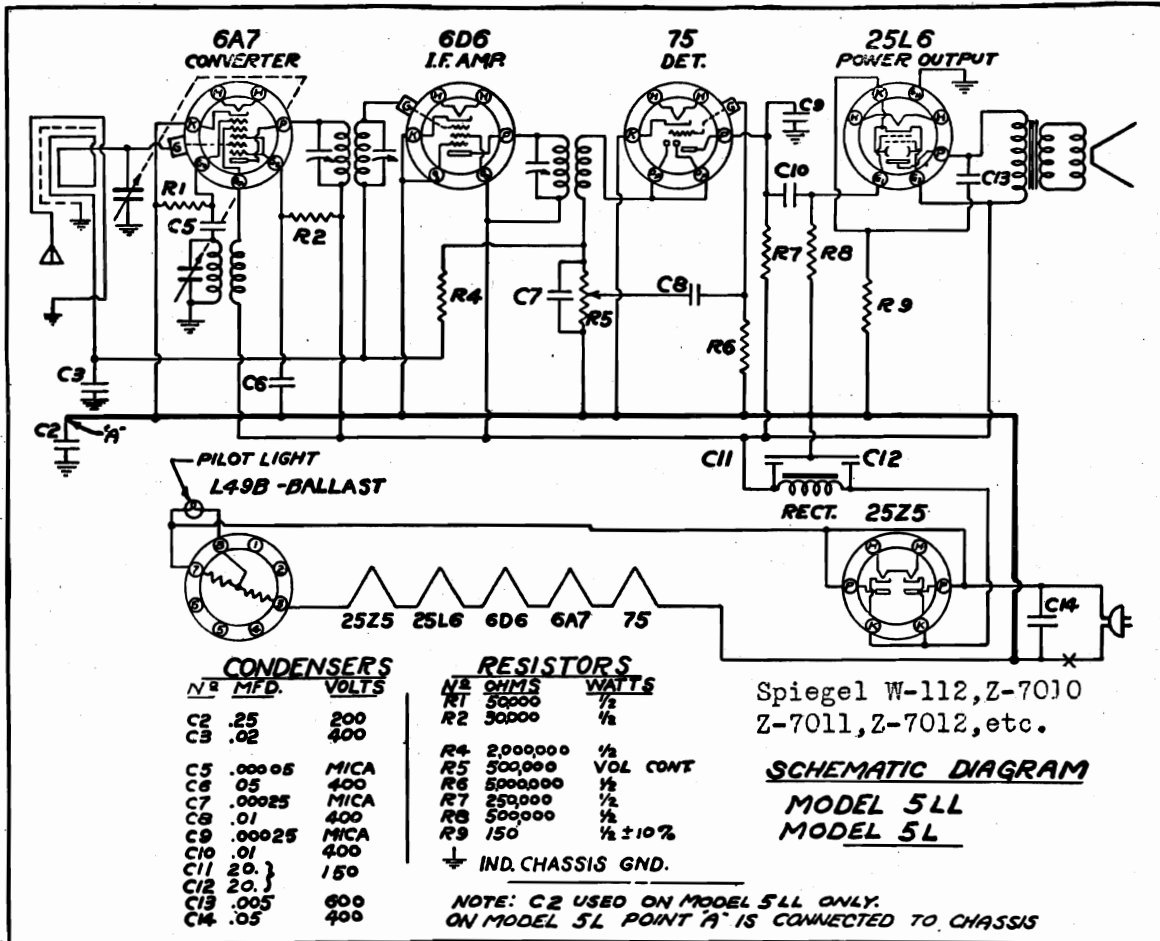

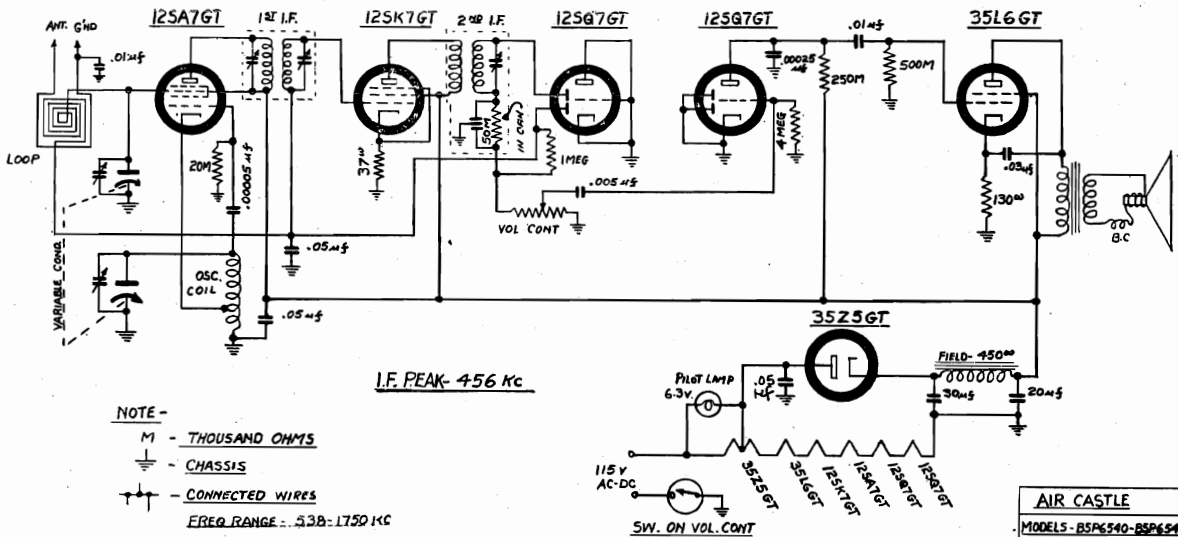

6. Check all buttons by pushing them in, one at a time, to determine whether desired stations are tuned in properly.

6. Any of the four stations to which the push button tuner has been adjusted may now be instantly received simply by pushing the button for the desired station.

Z7012, Chassis 5L
MODELS 540, 541

Models 540-541

SERVICE INFORMATION

Voltages—Line 115 Volts A.C. Power Consumption 44 Watts.
 Volume Control minimum. Antenna shorted to ground. Meter 1,000 ohms per volt.
 Cathode of 25Z5 tube to Ground.....124 volts
 Screen of 25L6 tube to Ground..... 95 volts
 Screen of 6A7 tube to Ground..... 44 volts
 Cathode of 25L6 tube to Ground..... 5.7 volts
Specker (Part No. P2218)
 Field resistance.....450 ohms
 D.C. voice coil resistance..... 4.6 ohms
 Voice coil impedance at 400 cycles..... 5 ohms
First I.F. Transformer (Part No. P2998)
 Primary—Blue white, plate; red white B+—Resistance 26.9 ohms.
 Secondary—White, grid; black white, AVC—Resistance 26.5 ohms.

Second I.F. Transformer (Part No. 2999)

Starting at the mounting strip in a clockwise direction the terminals are—No. 1, plate; No. 2, diode; No. 3, AVC; No. 4, B+.

Primary—No. 1 and No. 4—Resistance 33.2 ohms.

Secondary—No. 2 and No. 3—Resistance 34.3 ohms.

Oscillator Coil (Part No. P3003) (Blue Dot)

Looking at the connection end (with dot) in a clockwise direction starting at the chassis the terminals are—No. 1, grid; No. 2, plate; No. 3, B+; No. 4, ground.

Primary—No. 2 and No. 3—Resistance 3.5 ohms.

Secondary—No. 4 and No. 1—Resistance 6.5 ohms.

Electrolytic Condenser (Part No. P2936)

Red, 20 mfd., 150 volt; green, 20 mfd., 150 volt; black, negative for both sections.

Loop Antenna

Since the loop antenna acts also as the antenna coil the set will not operate properly with the loop antenna disconnected.

ALIGNMENT DATA

The alignment of this receiver requires the use of a signal generator that will cover the frequencies of 455, 600, 1400, and 1730, and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the signal generator output as low as possible, to prevent the AVC from operating and giving false readings.

I.F. ALIGNMENT

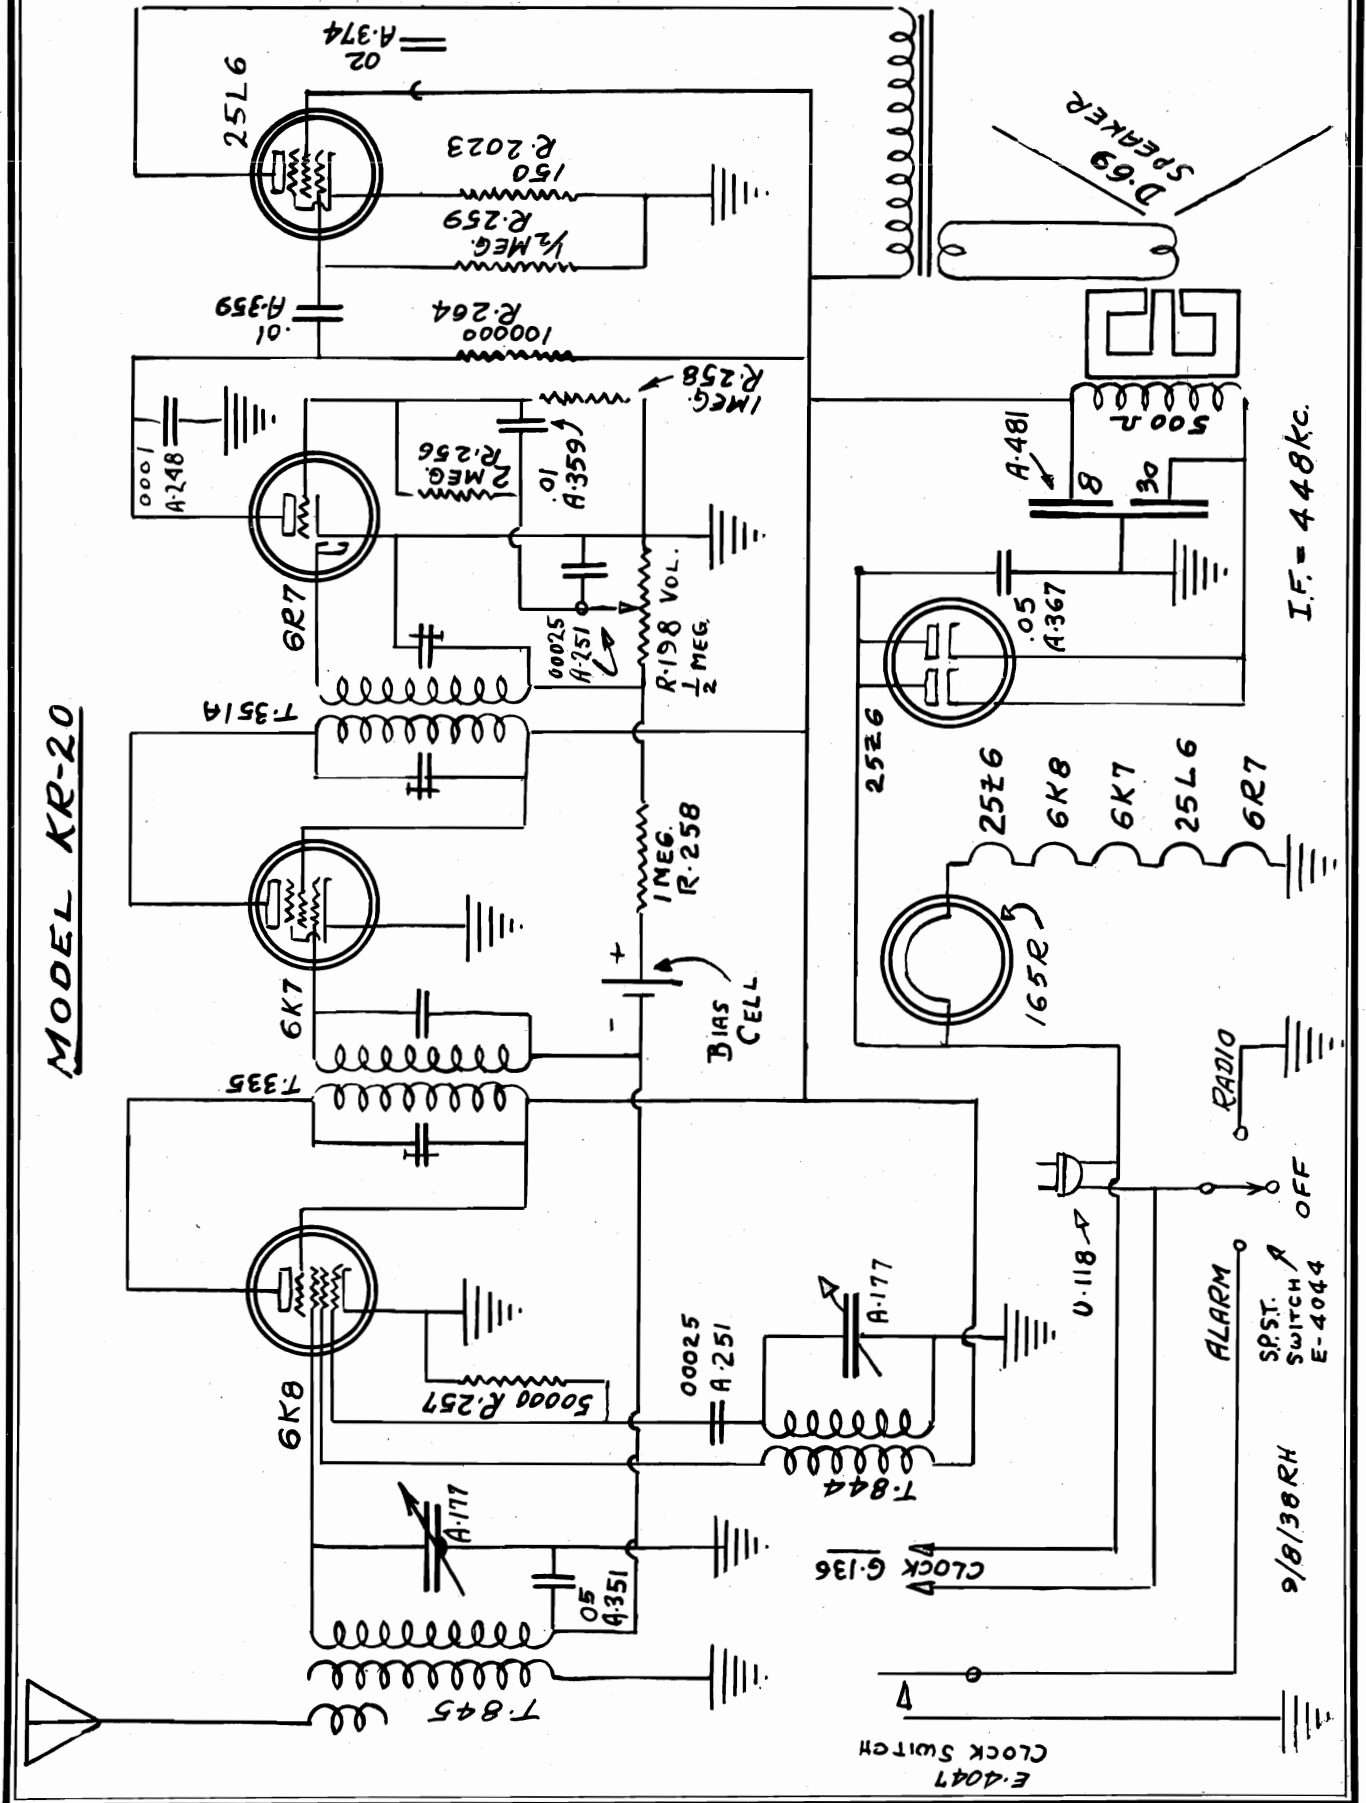

Adjust the signal generator to 455 KC and connect the output to the grid of the first detector tube (6A7) through a .05 or .1 mfd. condenser. Connect ground of signal generator to chassis ground through a .1 mfd. condenser. Align all I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT

Adjust the signal generator to 1730 KC and connect the output to the antenna lead, through a .0002 mfd. mica condenser. Set the gang condenser to minimum capacity and adjust the oscillator trimmer to receive this signal. After this has been carefully done, the next step is to set the signal generator to 1400 KC and after tuning in the signal adjust the antenna trimmer to peak. Set the signal generator to 600 KC, tune the signal and check the sensitivity; if it is low bend the plates into the positior for maximum output.

SPIEGEL, INC.

MODEL KR-20

NOTE : SUPPLEMENT TO KR-20 CIRCUIT DIAGRAM
THESE PARTS ARE INTERCHANGEABLE
ON MODEL KR-20, BUT MUST BE
CONNECTED AS SHOWN.

H-461

H-468

H-469

This chassis is designed to operate from 110-125 volt power lines alternating current.
 ESSENTIAL DATA: The intermediate frequency employed is 448 Kc.

The standard type of output meter should be used to indicate signal strength. It should be connected from the plate of the 25L6 tube to ground.

Aligning of broadcast band should be done on 1500, 1000 and 600 kilocycles.

I.F. TRIMMERS: To align the I.F. circuits, set the signal generator to 448 Kc. and feed its modulated signal direct to the antenna. Adjust the first I.F. transformer trimmers for maximum meter reading. Go over both adjustments at least three or four times for accuracy. Repeat this process on the second I.F. transformer. If adjustments are not made accurately, selectivity will be poor and I.F. oscillation may result.

R.F. TRIMMERS: Turn the dial to 1500 Kc. and feed a very weak 1500 Kc. modulated signal from your signal generator to the antenna. Adjust the oscillator trimmer for maximum reading. Then peak the antenna trimmer to this setting.

There is no adjustment padder condenser on this model so resonance on lower frequencies is accomplished by onding plates on tuning condensers.

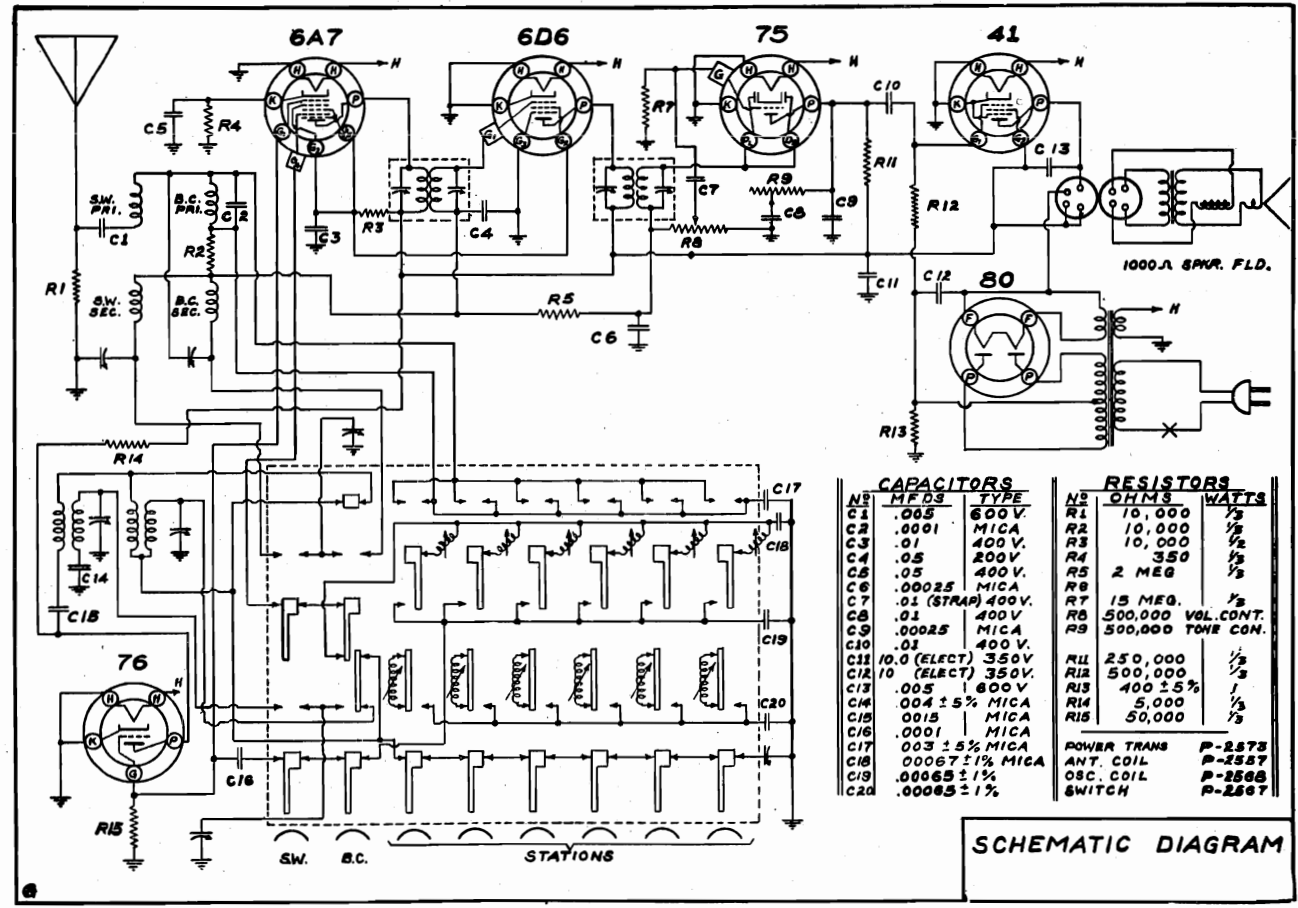

AVERAGE SOCKET VOLTAGES:

TUBE	POSITION	Ek	Ea	Es	Ep
6K8	Det. Osc.	-	100	100	100
6K7	I.F.	-	-	100	100
6R7	2nd. Det.	-	-	-	25
25L6	Output	6	-	100	90
25Z6	Rect.	100	-	-	-

Line 118 volts. Volume control full on. 10% variation allowable.

Measurements made from tube prongs to circuit ground with 1000 ohms per volt meter.

**PROCEDURE FOR SETTING UP
AUTOMATIC PUSH BUTTONS**

MODEL 2460

The remaining two (2) push buttons, located at the extreme left hand end of the push button plate are for short wave and manual tuning. Short wave tuning is accomplished by pressing "short wave" button and tuning with the selector knob. By pressing "manual tuning" button, the automatic disconnects and the selector knob becomes active for the broadcast band.

1. Choose a station having a frequency within the range of button No. 1 (540 to 980 kc).
2. Press "Manual Tuning" button and tune this station conventionally by using the selector knob.
3. Now press button No. 1 and turn adjusting screw in either direction until the previously selected station is heard. Adjust the screw until the station is received with maximum volume.
4. Remove the call letters of the station from the call letter sheet furnished and insert in the window of the adjusting screw.
5. Repeat the above procedure for the remaining five (5) stations.

A glance at Fig. 1 will show that there are eight (8) push buttons, six (6) of which are for automatic use; the adjusting screws are located directly below these push buttons. Fig. 1 also shows the tuning range or frequencies covered by each button.

NOTE: It is advisable to retain the call letter sheet in case of station change later on.

49 METER BAND

The popular 49 meter band is the area adjacent to the 6 megacycle calibration and offers the most consistent reception from Italy, Germany, Africa and Java. This area also affords the most popular reception of North and South American Short Wave Broadcasts and many other Foreign Countries. (Best evening reception all year round.)

31 METER BAND

The 31 meter band is the area extending from the 10 megacycles and lists Spain, Italy, Portugal and Australia as the most favorable of the Foreign Countries in this range. (Late afternoon and early evening.)

25 METER BAND

The 25 meter band is the area adjacent to the 12 megacycle calibration and associates itself with the listing of Russia, France, England and Holland. (Late afternoon and early evening. This band is unusually free from static during the summer months when maximum static is prevalent on the Standard Broadcast Band.)

19 METER BAND

The 19 meter band is the area adjacent to 15 megacycle calibration and lists France, Holland England and Amateur phones.

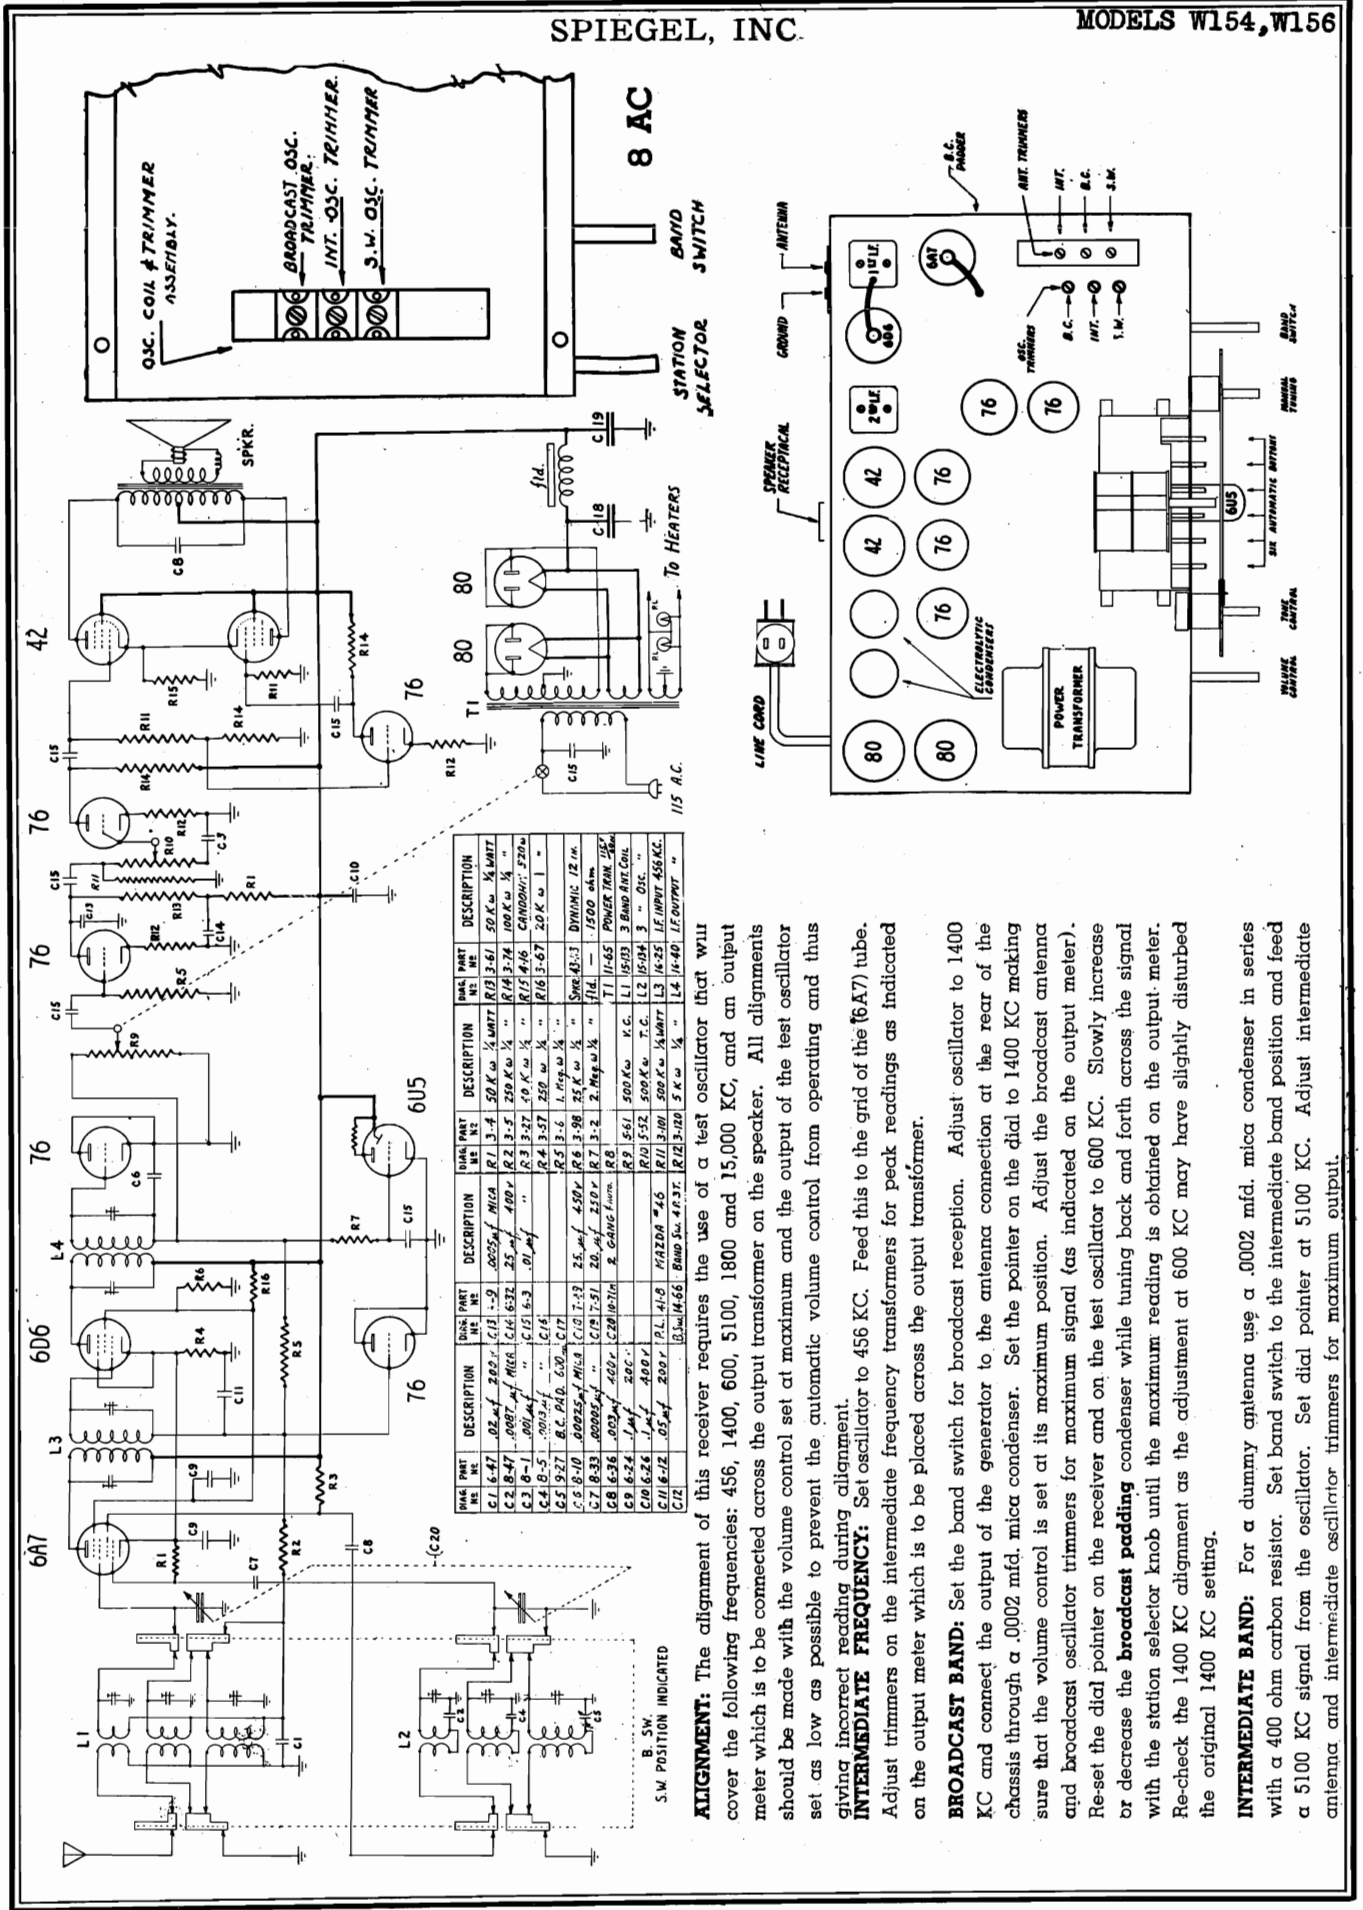

16 METER BAND

The 16 meter band is the area between 17 and 18 megacycles and lists Germany and England.

LOCATION OF PARTS ON TOP OF CHASSIS FIG. 6

MODEL W180

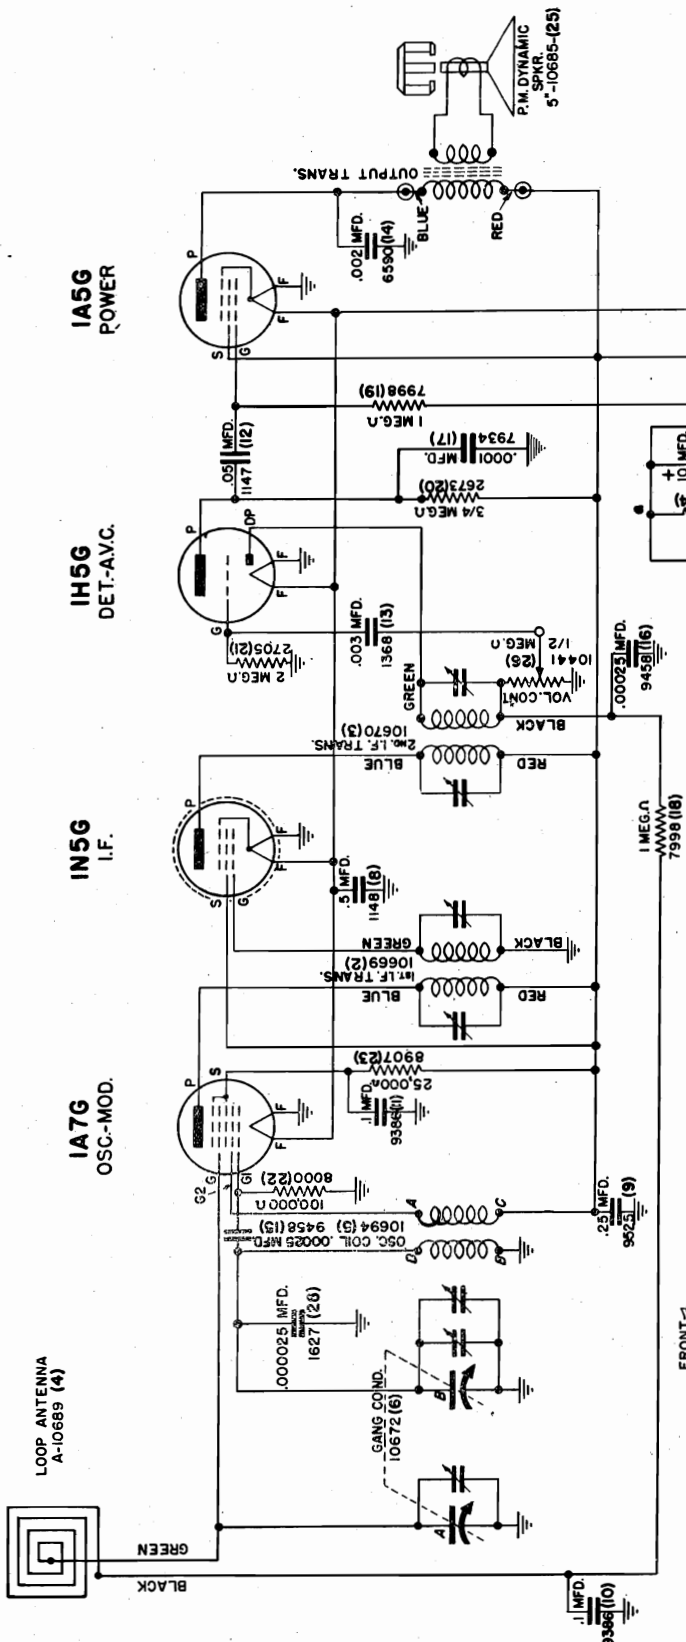

ALIGNMENT: The alignment of this receiver requires the use of a test oscillator that will cover the following frequencies: 456, 1400, 600, 5100, 1800 and 15,000 KC, and an output meter which is to be connected across the output transformer on the speaker. All alignments should be made with the volume control set at maximum and the output of the test oscillator set as low as possible to prevent the automatic volume control from operating and thus giving incorrect reading during alignment.

INTERMEDIATE FREQUENCY: Set oscillator to 456 KC. Feed this to the grid of the 6A7 tube. Adjust trimmers on the intermediate frequency transformers for peak readings as indicated on the output meter which is to be placed across the output transformer.

BROADCAST BAND: Set the band switch for broadcast reception. Adjust oscillator to 1400 KC and connect the output of the generator to the antenna connection at the rear of the chassis through a .0002 mfd. mica condenser. Set the pointer on the dial to 1400 KC making sure that the volume control is set at its maximum position. Adjust the broadcast antenna and broadcast oscillator trimmers for maximum signal (as indicated on the output meter). Re-set the dial pointer on the receiver and on the test oscillator to 600 KC. Slowly increase or decrease the broadcast padding condenser while tuning back and forth across the signal with the station selector knob until the maximum reading is obtained on the output meter. Re-check the 1400 KC alignment as the adjustment at 600 KC may have slightly disturbed the original 1400 KC setting.

INTERMEDIATE BAND: For a dummy antenna use a .0002 mfd. mica condenser in series with a 400 ohm carbon resistor. Set band switch to the intermediate band position and feed a 5100 KC signal from the oscillator. Set dial pointer at 5100 KC. Adjust intermediate antenna and intermediate oscillator trimmers for maximum output.

NOTE:
 ALL MEASUREMENTS MADE FROM SOCKET CONTACTS TO GROUND WITH A 1000 OHM PER VOLT VOLTMETER AND 90 VOLTS 'B' SUPPLY. FILAMENT VOLTAGES MEASURED DIRECTLY ACROSS SOCKET TERMINALS WITH A 1 1/2 VOLT 'A' SUPPLY.

ALIGNMENT PROCEDURE IN TABULATED FORM

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, (3) third.

Before starting alignment, check tuning dial adjustment by: turn gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial indicator must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move needle to correct position.

Use an accurately calibrated test oscillator with some type of output measuring device.

BEFORE ALIGNING, PLACE LOOP ANTENNA AND THE "A" AND "B" BATTERIES IN THE SAME APPROXIMATE POSITION IN THE BACK OF CHASSIS THAT THEY WILL BE IN WHEN THE SET IS IN THE CABINET AND THE CABINET BACK CLOSED.

When adjusting 1650 kilocycle oscillator trimmer and 1400 kilocycle antenna trimmer, place test oscillator in series with set loop by:

1. Remove the black with white tracer wire used to connect loop antenna to Fohenstock clip on chassis.
2. Attach test oscillator to terminals marked "A" and "B" on parts layout diagram.

IMPORTANT—No condenser should be in series with generator leads.

TEST OSCILLATOR				
Set receiver dial to:	Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below—and:
I. F. Any point where no interfering signal is received	455 K. C.	.02 MFD condenser	High side to grid terminal of 1A7G tube Low side to chassis DO NOT REMOVE CAP.	Adjust each of the second I. F. transformer trimmers for maximum output—then adjust each of the first I. F. trimmers for maximum output.
(1) Exactly 1650 K. C.	Exactly 1650 K. C.	None	Attach in series with "A" and "B" Loop Terminals	Adjust 1650 K. C. oscillator trimmer for maximum output.
(2) Approx. 1400 K. C.	Exactly 1400 K. C.	None	Attach in series with "A" and "B" Loop Terminals	Adjust 1400 K. C. antenna trimmer for maximum output.

FIG. 6 LOCATION OF PARTS ON TOP OF CHASSIS

MODELS W406, Z7450
Chassis 620

SPIEGEL, INC.

I. F. ALIGNMENT Set the variable condenser at minimum capacity, (dial pointer at 1560 K.C.). Connect the two leads from a good, modulated signal generator, the ground lead to the radio chassis and the other lead through a .1 mfd. condenser, to the grid cap of the 6A7, with the tube's grid lead still in place.

Connect the leads from a fully charged 6 volt storage battery to the receiver chassis and battery lead, the polarity being reversible.

With the set in operation and the volume control full on, set the signal generator to 456 K.C. and increase its output until the signal is heard in the set's speaker. Starting with the second I. F., adjust the I. F. trimmers for maximum output, decreasing the signal generator output as the receiver output increases.

The generator output in all the alignment adjustments should be adjusted so the meter will read approximately .4 volts continually.

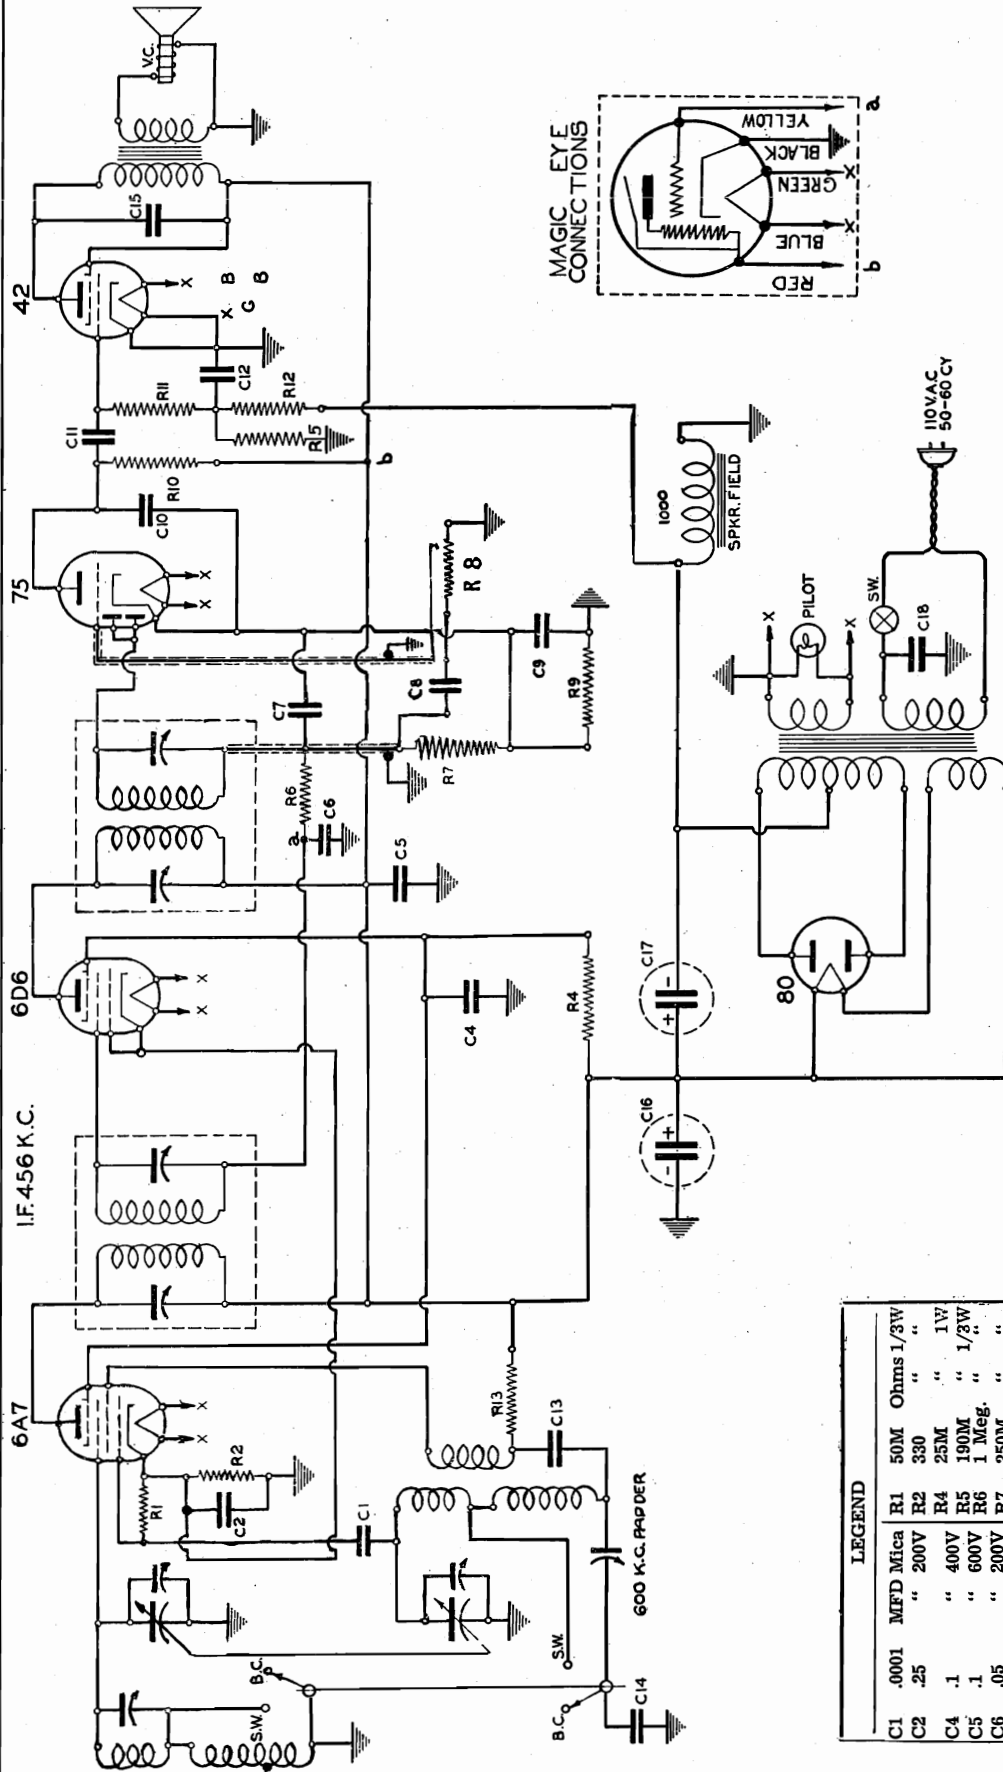

R. F. ALIGNMENT With the variable condenser still full open, set the generator to 1560 K.C. Connect the generator lead to the antenna lead through a .0001 mfd. condenser as dummy antenna. Adjust the oscillator trimmer for maximum output. Set the receiver dial and the generator to 1400 K.C. so the signal comes through, and adjust the antenna trimmer for maximum output.

Set the receiver dial and generator to 600 K.C. and adjust the oscillator padder for maximum output by rocking the variable condenser (with the tuning knob) as the padder is adjusted.

Return the dial and generator setting to 1400 K.C. and check for alignment.

ALIGNMENT PROCEDURE

PRELIMINARY

Output Meter Connections	Across Loud Speaker Voice Coil
Output Meter Reading to Indicate 1 Watt	1.85 Volts
Generator Ground Lead Connection	Receiver Chassis
Dummy Antenna Value to Be in Series with Generator Output	See Chart Below
Connection of Generator Output Lead	See Chart Below
Generator Modulation	30%, 400 Cycles
Position of Volume Control	Fully On

Position of Variable	Generator Frequency	Dummy Antenna	Generator Connection	Trimmer Adjustments (In Order Shown)	Trimmer Function
Closed	456 KC	.1 mfd.	6A7 Grid	T2, T1	I. F.
Fully Open	1580 KC	.0002 mfd.	Antenna Conn.	C16	Oscillator Trimmer
1400 KC	1400 KC	.0002 mfd.	Antenna Conn.	C15	Antenna Trimmer
600 KC	600 KC	.0002 mfd.	Antenna Conn.	C3	Antenna Padder

The variable condenser should be at 600 k.c. for antenna adjustment.

The alignment procedure should be repeated in the original order, step by step, to insure greater accuracy. A final adjustment of antenna padder condenser C3 is always made after the receiver is installed in the car, in order to match the car antenna.

Always keep the output power from the generator at its lowest possible value to prevent the A.V.C. of the receiver from interfering with accurate alignment.

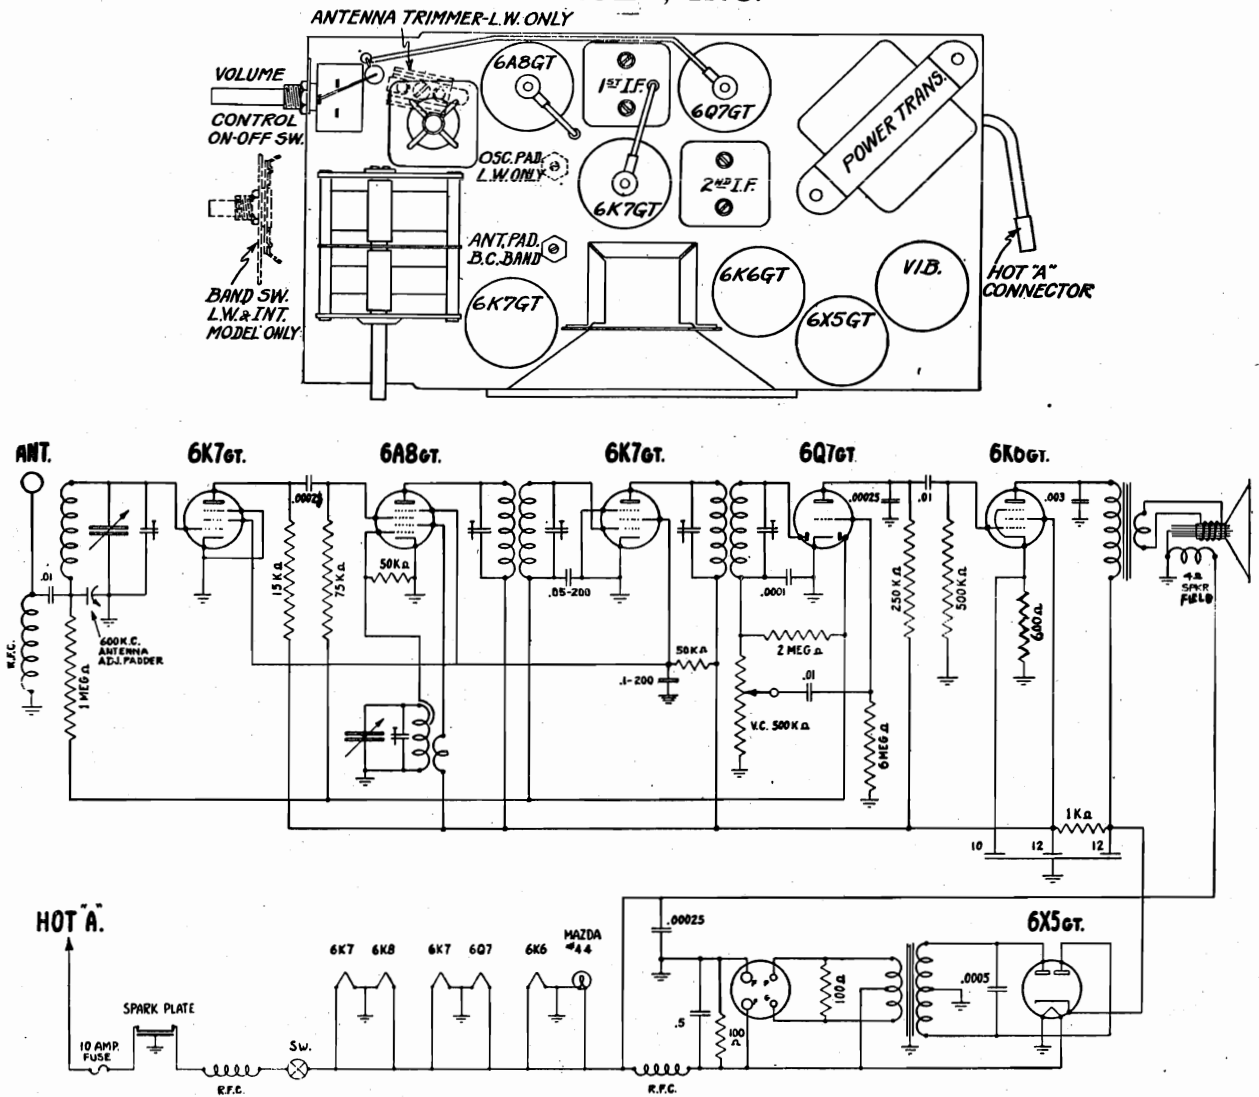

LOCATIONS OF PARTS UNDER CHASSIS

LOCATIONS OF PARTS ON TOP OF CHASSIS

SPIEGEL, INC.

I. F. ALIGNMENT Set the variable condenser at minimum capacity, (dial pointer at 1550 K.C.). Connect the two leads from a good, modulated signal generator, the ground lead to the radio chassis and the other lead through a .1 mfd. condenser, to the grid cap of the 6A8GT with the tube's grid lead still in place.

Connect the leads from a fully charged 6 volt storage battery to the receiver chassis and battery lead, the polarity being reversible.

With the set in operation and the volume control full on, set the signal generator to 456 K.C. and increase its output until the signal is heard in the set's speaker. Starting with the second I. F., adjust the I. F. trimmers for maximum output, decreasing the signal generator output as the receiver output increases.

The generator output in all the alignment adjustments should be adjusted so the meter will read approximately .4 volts continually.

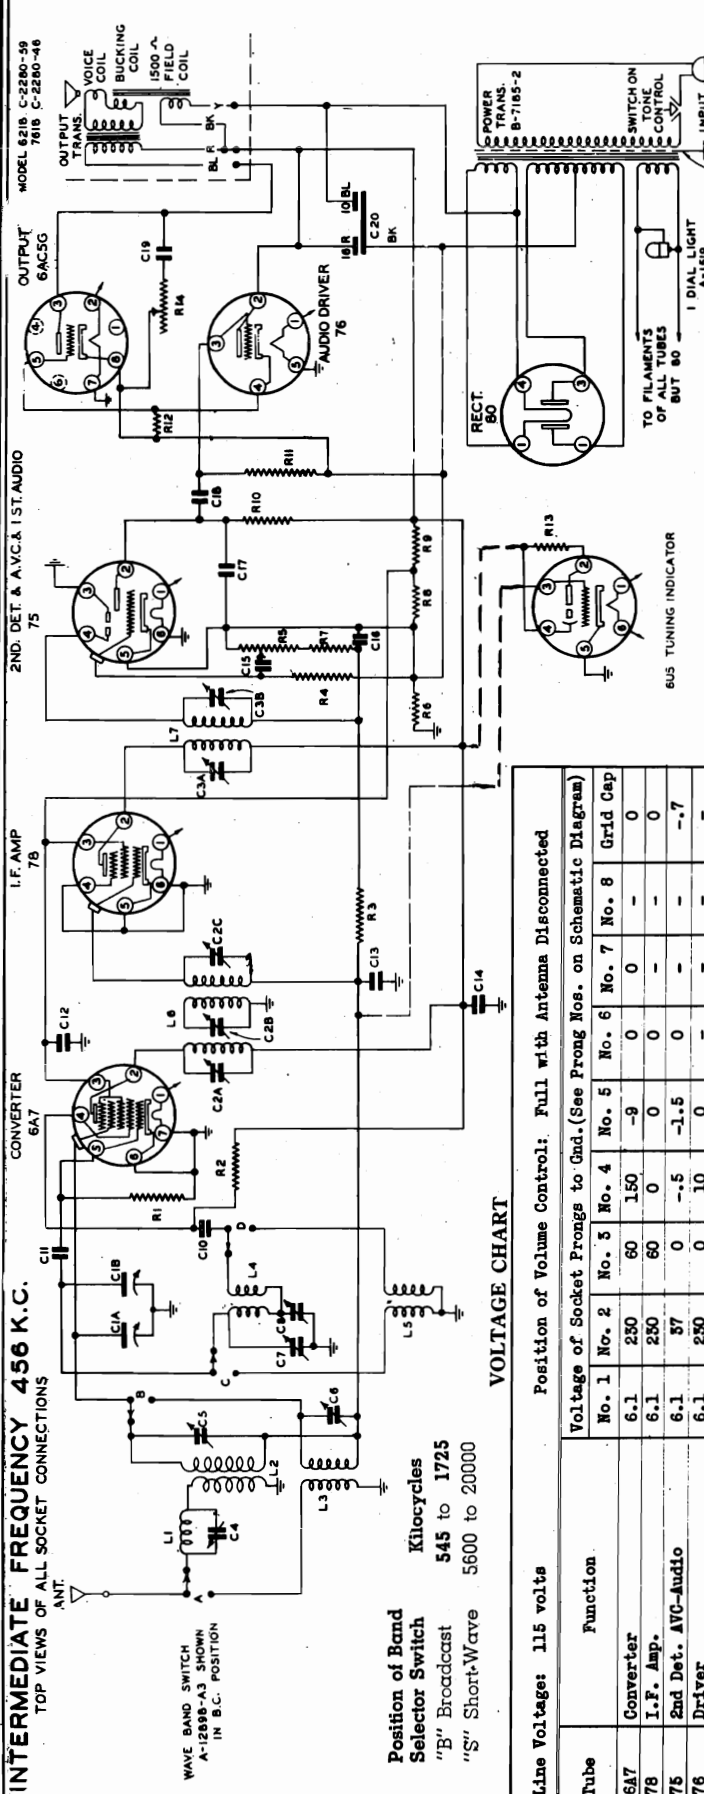

R. F. ALIGNMENT With the variable condenser still full open, set the generator to 1550 K.C. Connect the generator lead to the antenna lead through a .0001 mfd. condenser as dummy antenna. Adjust the oscillator trimmer for maximum output. Set the receiver dial and the generator to 1400 K.C. so the signal comes through, and adjust the antenna trimmer for maximum output.

Set the receiver dial and generator to 600 K.C. and adjust the oscillator padder for maximum output by rocking the variable condenser (with the tuning knob) as the padder is adjusted.

Return the dial and generator setting to 1400 K.C. and check for alignment.

**Rock dial while making this adjustment. Make certain that adjustment is made on fundamental signal and not on image. Peak accurately.

ADJUSTING THE PUSH-BUTTON TUNER

- Select six favorite nearby broadcast stations and detach the corresponding call letter tabs from the station call letter tab sheets.
- Remove the escutcheon plate from the front of the cabinet by means of the two screws and insert the station call letter tabs. Any tab may be used for any button, but it is usually more convenient for the operator if the tabs are arranged in sequence so that the tab for the lowest frequency station (station having lowest number of kilocycles [K. C.]) will be at the extreme left.
- Using a small screwdriver or other tool that will fit the slot in the end of the button, push the button in as far as it will go and turn to the right or left until the dial pointer has moved to the desired station frequency. Be sure the button is pushed all the way in and the station is tuned in accurately.
- Repeat the procedure in paragraph 3 for each of the remaining five buttons.
- Check all buttons by pushing them in, one at a time, to determine whether desired stations are tuned properly.
- Replace escutcheon.
- Any of the six stations to which the automatic push-button mechanism has been adjusted may now be received simply by pushing the button for the desired station.

1. **DESCRIPTION:** Equipped with six-button automatic push button tuner; Dial having tuning scale for Broadcast Band and Short-Wave Band; Automatic Volume Control; Interference Rejector Circuit; Band Selector Switch; Full Dynamic Speaker and six Tubes, with equivalent performance of nine single-purpose tubes.

The tube equipment is:

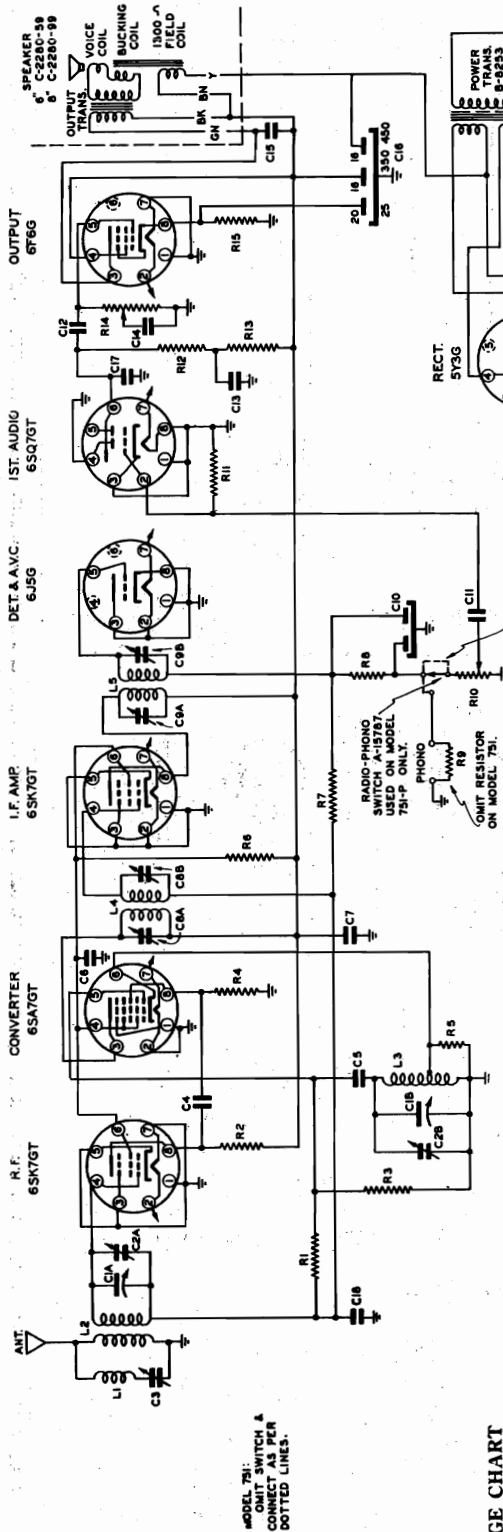

- 1—Type 6A7 —Converter Heptode
- 1—Type 78 —Intermediate-Frequency Pentode
- 1—Type 75 —Duplex-Diode-Triode Second Detector—A. V. C. and Audio Amplifier
- 1—Type 76 —Driver
- 1—Type 6AC5G —Power Amplifier Triode
- 1—Type 80 —Full-Wave Vacuum Rectifier

2. **POWER SUPPLY:** On models designed for operation on 60-cycle current the receptacle plug may be attached to any outlet from 110 to 120 volts, 50 to 60 cycle alternating current (a. c.) power supply system.

This model is available in either 25 cycle or 60 cycle alternating current (a. c.).

This model receiving set, designed for operation on 25 cycle current, will operate satisfactorily on 60 cycle current; however, a radio set designed for operation on 60 cycle current WILL NOT operate on 25 cycle current.

TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS.
 VOLTAGE READINGS AT INDICATED SOCKET PRONGS ARE TO CHASSIS.
 VOLTAGES MUST BE MEASURED WITH NO SIGNAL. ALIGNMENT IS TO BE MADE AT THE FREQUENCIES SHOWN AT THE TRIMMER CONDENSERS.
 WHERE NO VOLTAGE READING IS SHOWN AT SOCKET PRONG, IT INDICATES ZERO VOLTAGE OR A VERY LOW READING.
 FIGURES AT CATHODES ARE CATHODE CURRENT IN MILLIAMPERES.
 CAPACITY VALUES ARE IN MICROFARADS.

PUSH BUTTON DATA:

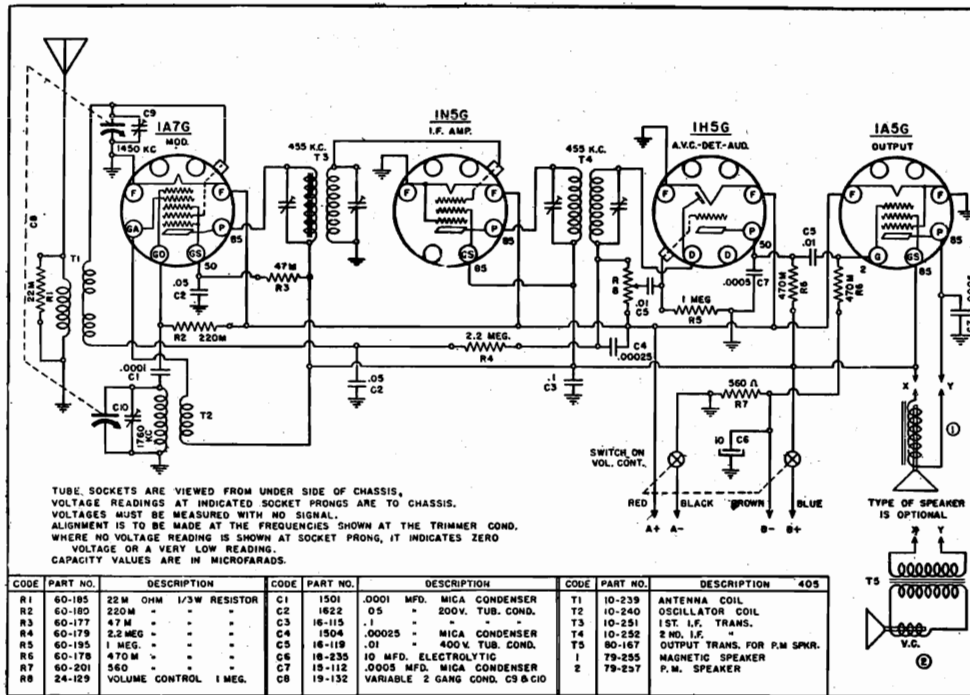

1. By means of Selector Knob tune in WITH RIGHT HAND AS ACCURATELY AS POSSIBLE station with lowest frequency.
2. After station has been tuned in continue to hold in its position with left hand loosen Push-Button to be set up for station by unscrewing Push-Button one turn to left (counter-clockwise).
3. After Push-Button has been depressed, tighten it gently (clockwise). Release Push-Button slowly when in normal position grip button and tighten. Push-Button is now set up for first selected station of lowest frequency and Call Letter Tab for station should be at extreme right of Call Letter Holders. Second station set up will be second lowest in frequency.

LOCATION OF PARTS ON TOP OF CHASSIS

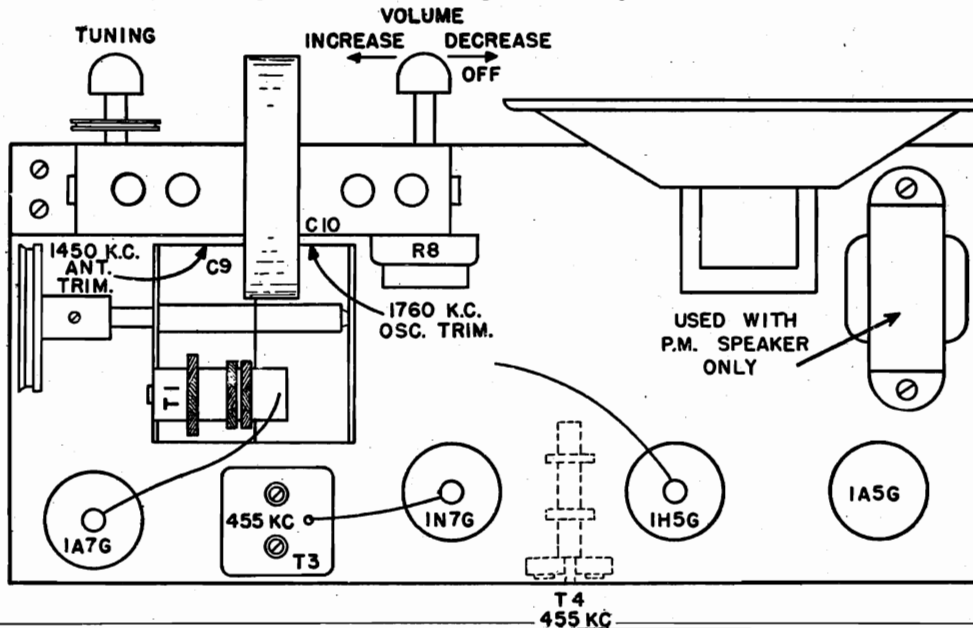

MODEL V1216
Chassis 405

SPIEGEL, INC.

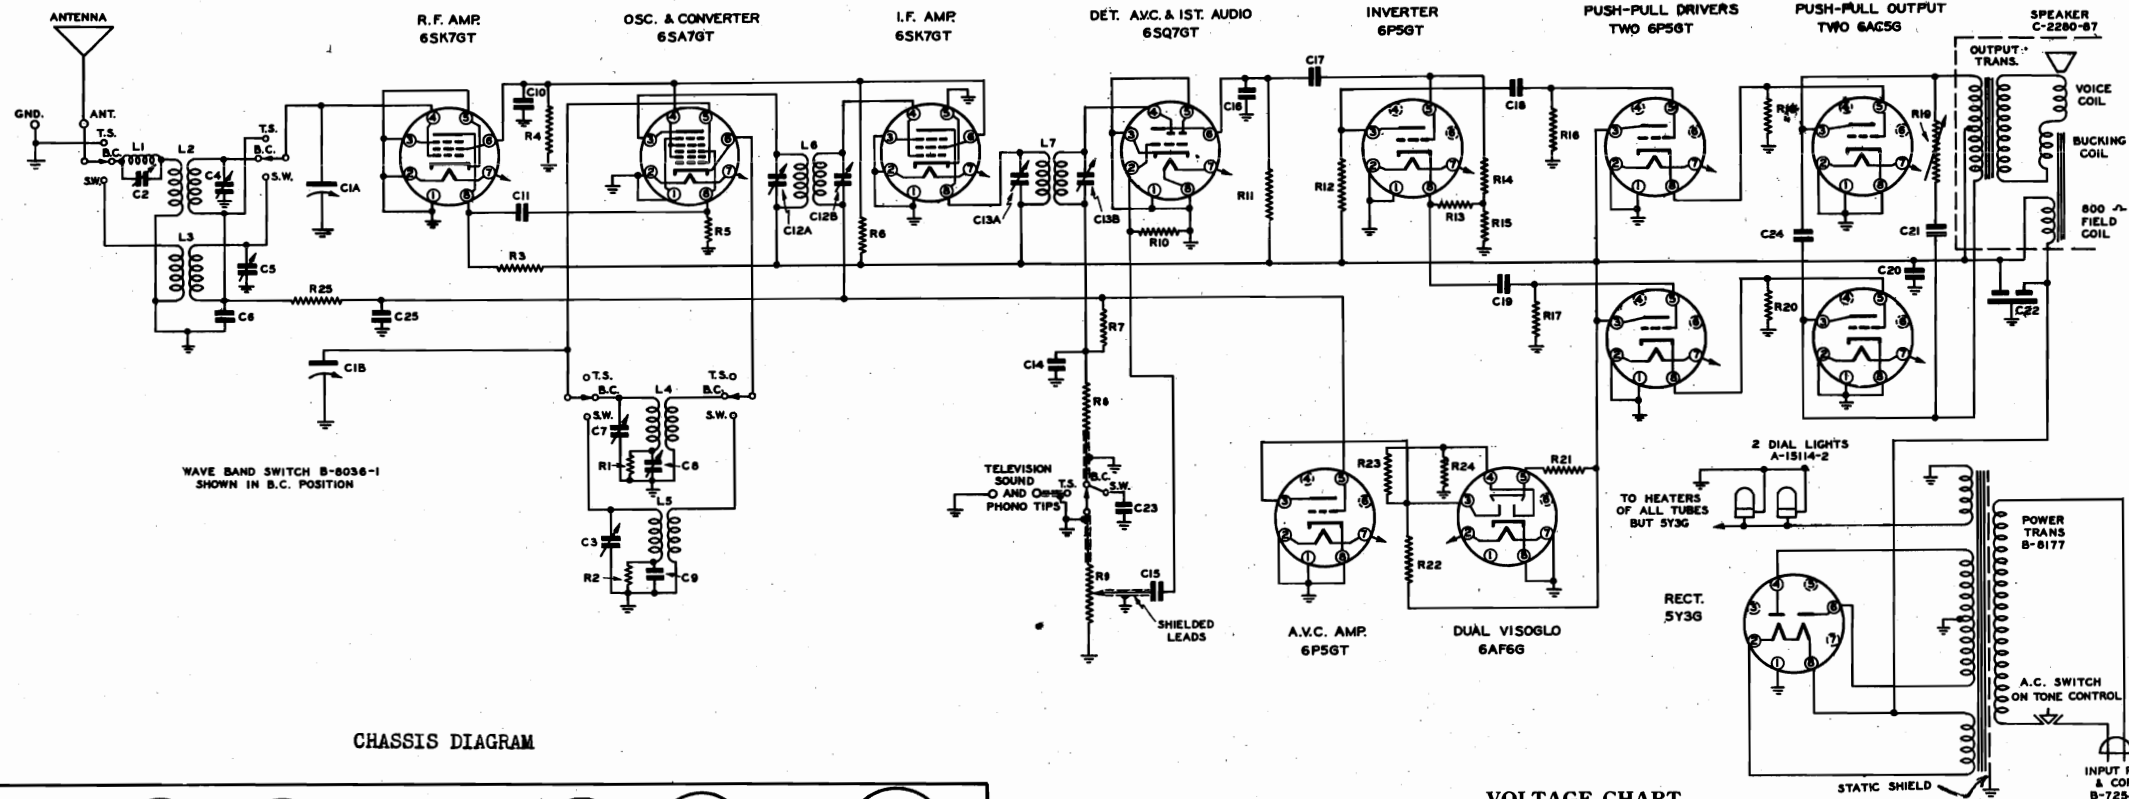

Follow the procedure outlined below, in order to adjust the push-buttons properly:

1. By means of the Station Selector Knob tune in WITH THE RIGHT HAND AS ACCURATELY AS POSSIBLE the station having the lowest frequency.
2. After the station has been tuned in accurately with the right hand, continue to hold it in its exact position firmly, and with the left hand loosen the Push-Button to be set up for that station by unscrewing the Push-Button about one turn to the left (counter-clockwise).
3. Continuing to hold the Station Selector Knob in its exact position, PUSH THE PUSH-BUTTON IN ALL THE WAY with the left hand.
4. After the Push-Button has been depressed all the way, tighten it gently toward the right (clockwise). Release Push-Button slowly and when in normal position grip button and tighten firmly.

SPIEGEL, INC.

I. F. Alignment
 Set the pointer to 1500 K. C. Connect the generator leads to the 1A7G grid and to the chassis thru a .1 Mfd. condenser. Adjust the I. F. trimmers for maximum output indication.

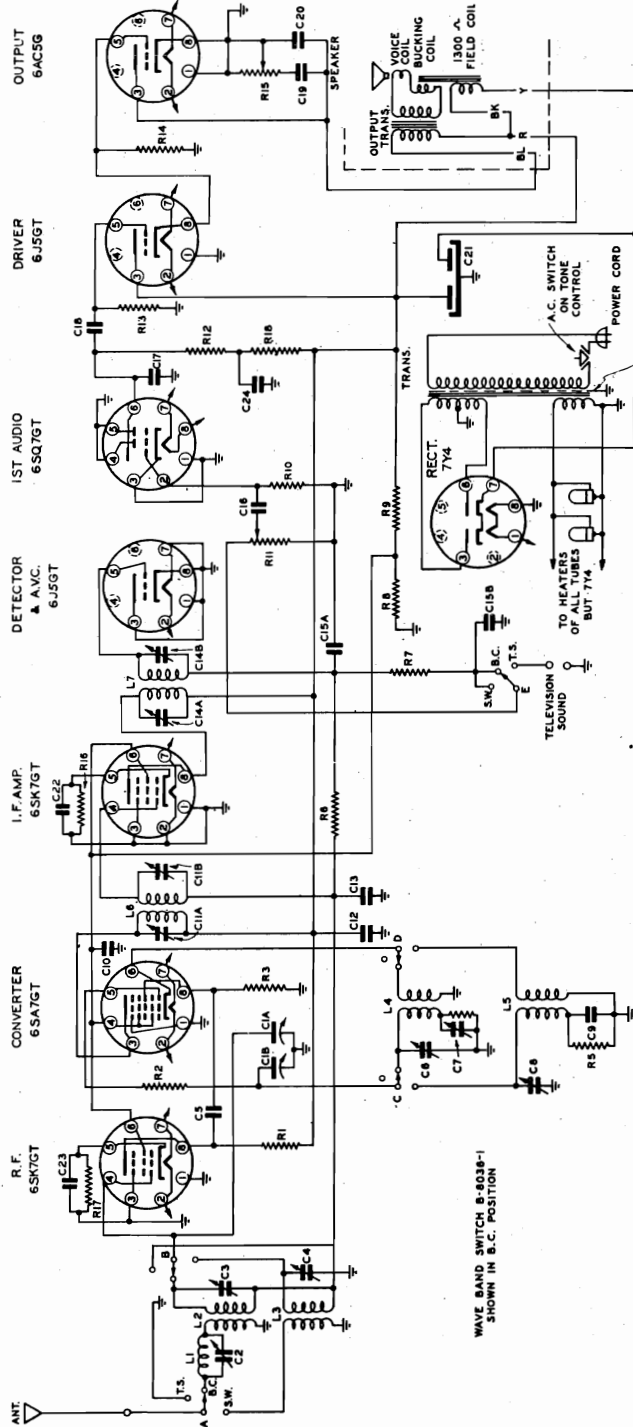

R. F. Alignment
 Connect the generator leads to the 1A7G grid and to the chassis through a .1 Mfd. condenser. Set the signal generator at 1400 KC., and set the receiver pointer at 1400 KC. Adjust the oscillator shunt trimmer for resonance. Fasten the back cover. Connect the generator to the antenna and ground terminal, and adjust the loop antenna trimmer at 1400 KC. for maximum output.

INTERMEDIATE FREQUENCY 456 K.C.
BOTTOM VIEWS OF ALL SOCKET CONNECTIONS

ADJUSTING THE PUSH-BUTTON TUNER

1. Select six favorite nearby broadcast stations and detach the corresponding coil letter tabs from the station coil letter tab sheets.
2. Any tab may be used for any button, but it is usually more convenient for the operator if the tabs are arranged in sequence so that the tab for the lowest frequency station (station having lowest number of kilocycles [K. C.]) will be at the low frequency end of the dial.
3. Using a small screwdriver or other tool that will fit the screw in the end of the button, push the button in as far as it will go and turn to the right or left until the dial pointer has moved to the desired station frequency. Be sure the button is pushed all the way in and the station is tuned in accurately.
4. Repeat the procedure in Paragraph 3 for each of the remaining five buttons.
5. Check all buttons by pushing them in, one at a time, to determine whether desired stations are tuned properly.
6. Insert the proper tab in each button by pressing it in position.
7. Any of the six stations to which the push-button tuner has been adjusted may now be received simply by pushing the button for the desired station.

7Y4	Rectifier ***	0	0	300*	0	0	300*	0	0

Notes: Voltage readings are for schematic diagram on back of sheet. Allow 15% + or - on all measurements. Always use meter scale which will give greatest deflection within scale limits. All DC measurements made with 1000 ohms per volt voltmeter. All AC voltages made with rectifier type voltmeter. Unless designated otherwise, voltages in table are + DC voltages.

* AC volts

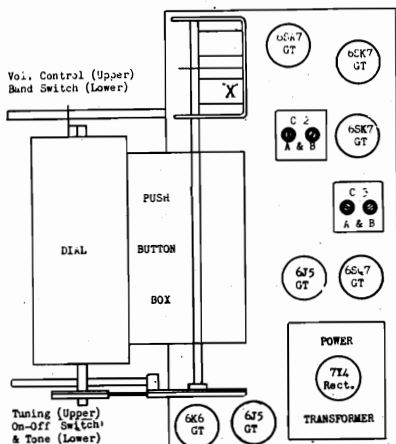

** Cannot be measured with 1000 ohms/volt voltmeter.

*** Tube removed from socket to enable test prods to reach socket prongs.

ALIGNMENT CHART

8	Shortwave Band	Ant.	*	18 MC	SW	18 MC	C9 Osc: C8 Ant.	Rock dial while adjusting for maximum output
9	(Check calibration and sensitivity at 6 MC and 18 MC)							
10	(Check operations 1 to 9 inclusive)							

Notes: *Connect to point "X" on Variable Condenser. See drawing below.
**100 ohm and 200 mf. in series

2. **POWER SUPPLY:** On models designed for operation on 60-cycle current the receptacle plug may be attached to any outlet from 110 to 120 volts, 50 to 60 cycle alternating current (A. C.) power supply system.

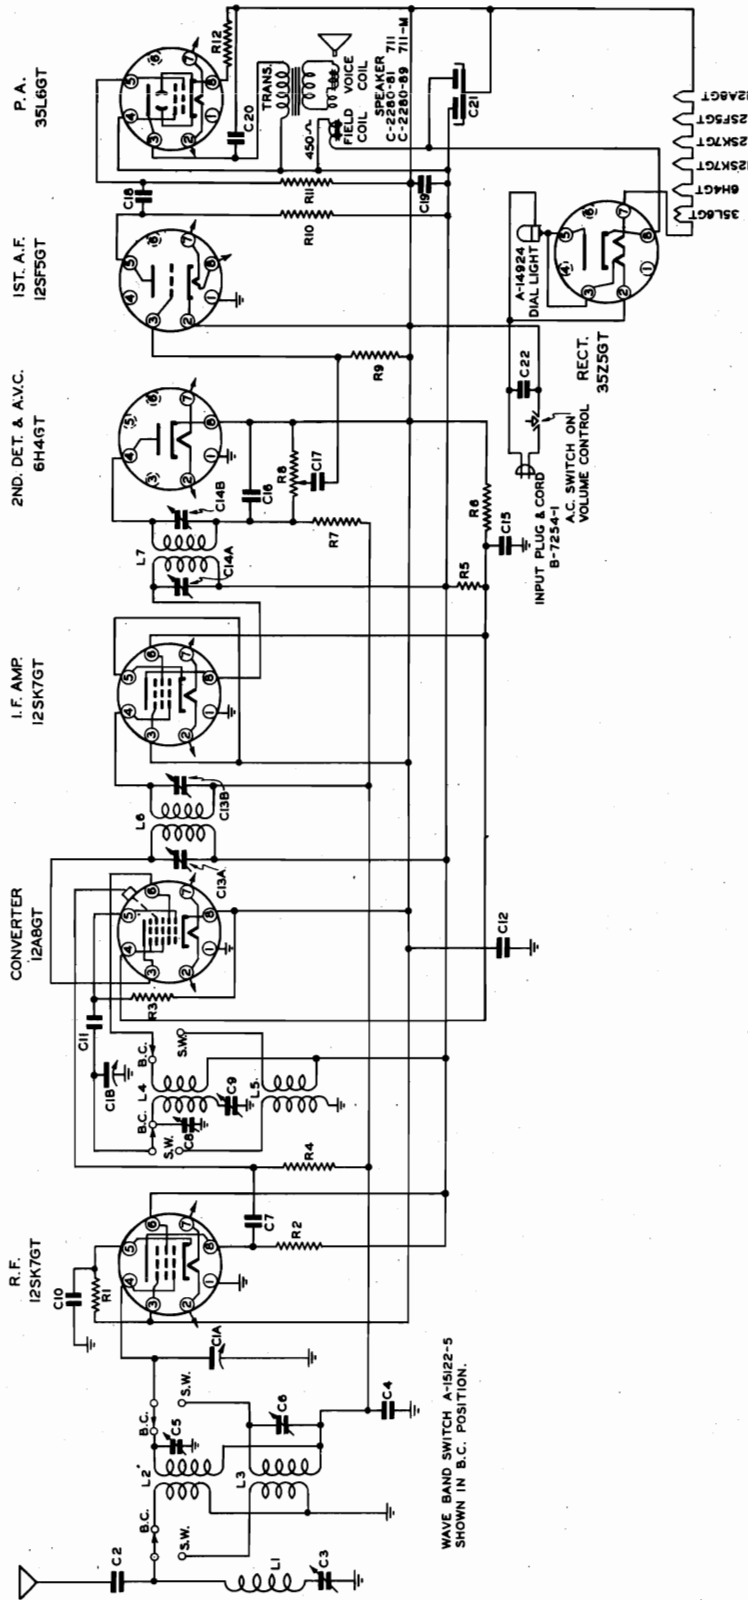

Any receiving set designed for operation on 25-cycle current will operate satisfactorily on 60-cycle current; however, a radio set designed for operation on 60 cycle current **WILL NOT** operate on 25 cycle current.

1. **DESCRIPTION:** Equipped with six-button automatic push button tuner; new Rocket-Roto Dial with scales for Broadcast Band and Short-Wave Band; Automatic Volume Control; Continuously variable Tone Control; Interference Rejector Circuit; Band Selector Switch with positions for "Broadcast," "Short-wave" and "Television Sound," which is also used for reproducing phonograph records by means of an electrical pick-up; Full dynamic speaker and eight tubes.

This receiver is designed to operate from a power supply main of 110-120 volt, 60 cycle alternating current (AC). **Never plug into a DC outlet.**

GROUND Where ever possible, a good ground should be employed. Water pipes and steam or hot water radiators make a very desirable ground connection. The ground wire should be connected to the "Black" lead.

P.B. ADJUSTMENT
Six button auto. tuner on receiver can be adj. to any station on reg. B.C. Band. To adj. use screw driver furnished with receiver. To turn, insert screw driver, keep turning while holding button in. Notice dial turn until desired station is tuned in perfectly. Insert call letter tab to cover a.i. screw head.

INTERMEDIATE FREQUENCY: 456 KC.

BROADCAST BAND: Set the band switch for broadcast reception. With test oscillator at 456 KC and maximum signal, adjust wave trap for a minimum (or dip) in output. Care in this adjustment will insure best rejection of interfering signals at I. F. frequency. Adjust oscillator to 1400 KC and connect the output of the generator to the antenna connection at the rear of the chassis through a .0002 mfd. mica condenser. Set the pointer on the dial to 1400 KC, making sure that the volume control is set at its maximum position. Adjust the broadcast antenna and broadcast oscillator trimmers for maximum signal (as indicated on the output meter). Re-set the dial pointer on the receiver and on the test oscillator to 600 KC. Slowly increase or decrease the **broadcast padding** condenser while tuning back and forth across the signal with the station selector knob until the maximum reading is obtained on the output meter. Re-check the 1400 KC alignment as the adjustment at 600 KC may have slightly disturbed the original 1400 KC setting.

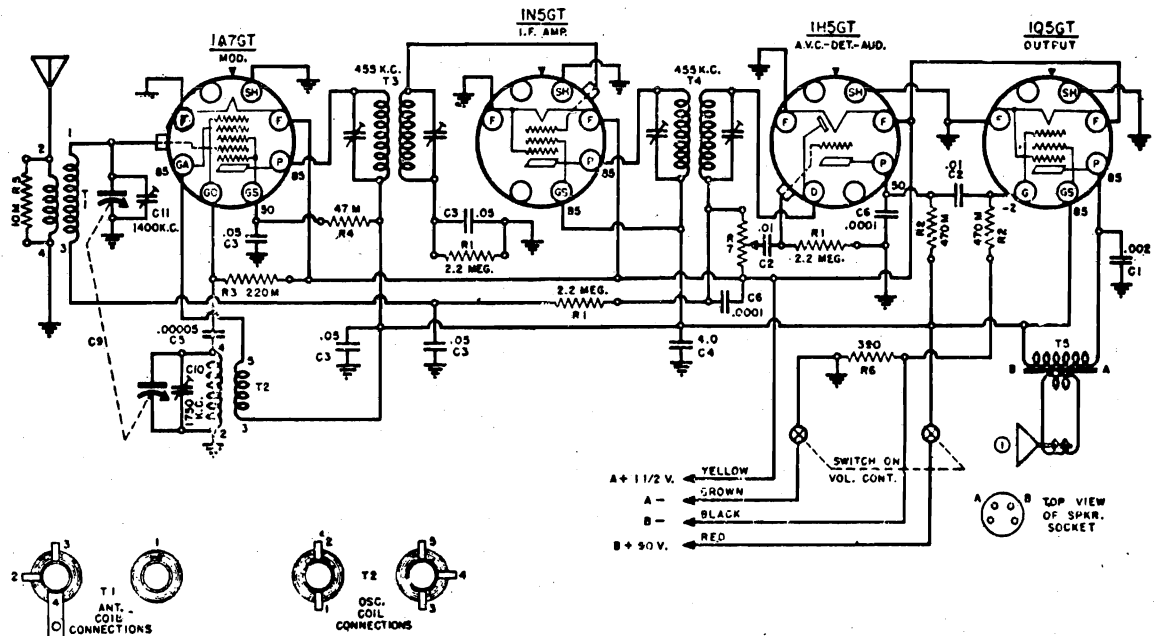

INTERMEDIATE BAND: For a dummy antenna use a .0002 mfd. mica condenser in series with a 400 ohm carbon resistor. Set band switch to the intermediate band position and feed a 5100 KC signal from the oscillator. Set dial pointer at 5100 KC. Adjust intermediate antenna and intermediate oscillator trimmers for maximum output.

SHORT WAVE: Set band switch on short wave position. Connect the antenna of the radio receiver to the output of the test oscillator through a 400 ohm carbon resistor. Set oscillator and receiver dial at 15 megacycles. Adjust the short wave antenna and short wave oscillator trimming condensers for maximum output as indicated by readings on the output meter. No other adjustments are necessary for aligning this band. It is advisable to check the sensitivity at 6000 KC to determine whether the circuits are properly aligned.

SPEIGEL, INC.

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400, 1550 and an output meter to be connected across the primary or secondary of the output transformers. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible, to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stage should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast Band alignment should be the next procedure.

I.F. ALIGNMENT. Adjust the test oscillator to 456 KC and connect the output to the grid of the first detector

tubes (6A8) through a .05 or .1 mfd. condenser. The ground on the test oscillator can be connected to the chassis ground. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the output of the oscillator to the antenna lead of the receiver through a 50 mmfd. condenser. This antenna lead should be a two foot length of standard low capacity shielded loom fitted with the proper bayonet type plug to accommodate the antenna input receptacle on the receiver. Set the oscillator to 1550 KC and with the gang condenser at minimum, adjust the oscillator trimmer to receive this signal. Then set the oscillator to 1400 KC and adjust the antenna trimmer to give maximum output.

MODEL A2450
Chassis 620N

PUSH BUTTON ADJUSTMENT

Six push button station selectors are incorporated in this receiver, and each may be set to select any frequency or station within the range of the set. To adjust each button, follow these instructions.

1. With the set in operation, tune in any station the push button is to be set for, with the right hand tuning knob.
2. Keep a firm grip on the tuning knob so the station will not be detuned, and turn the push button about one turn to the left to loosen the mechanism. Press the button all the way in and turn it to the right until it is tight.

Repeat these operations with the other five buttons, setting each for a different station. Insert the correct call letter tab into the space provided in the panel just above the push buttons.

R. F. ALIGNMENT

With the variable condenser still full open, set the generator to 1550 K.C. Connect the generator lead to the antenna lead through a .0001 mfd. condenser as dummy antenna. Adjust the oscillator trimmer for maximum output. Set the receiver dial and the generator to 1400 K.C. so the signal comes through, and adjust the antenna trimmer for maximum output.

Set the receiver dial and generator to 600 K.C. and adjust the oscillator padder for maximum output by rocking the variable condenser (with the tuning knob) as the padder is adjusted.

Return the dial and generator setting to 1400 K.C. and check for alignment.

ground lead to the radio chassis and the other lead through a .1 mfd. condenser, to the grid cap of the 6A8GT with the tube's grid lead still in place.

Connect the leads from a fully charged 6 volt storage battery to the receiver chassis and battery lead, the polarity being reversible.

With the set in operation and the volume control full on, set the signal generator to 456 K.C. and increase its output until the signal is heard in the set's speaker. Starting with the second I. F., adjust the I. F. trimmers for maximum output, decreasing the signal generator output as the receiver output increases.

The generator output in all the alignment adjustments should be adjusted so the meter will read approximately .4 volts continually.

As the sizes and types of antennas vary considerably, it is necessary to adjust the radio to "match" the antenna used. To do this, tune in a station, accurately, at roughly 600 kilocycles, reduce the volume of the set, pry out the plug on the underside of the set, insert a screw driver, and turn for maximum output. Replace the plug when this has been accomplished, and the radio is ready to operate efficiently on any station.

6-TUBE PUSH BUTTON SUPERHETERODYNE AUTO RADIO

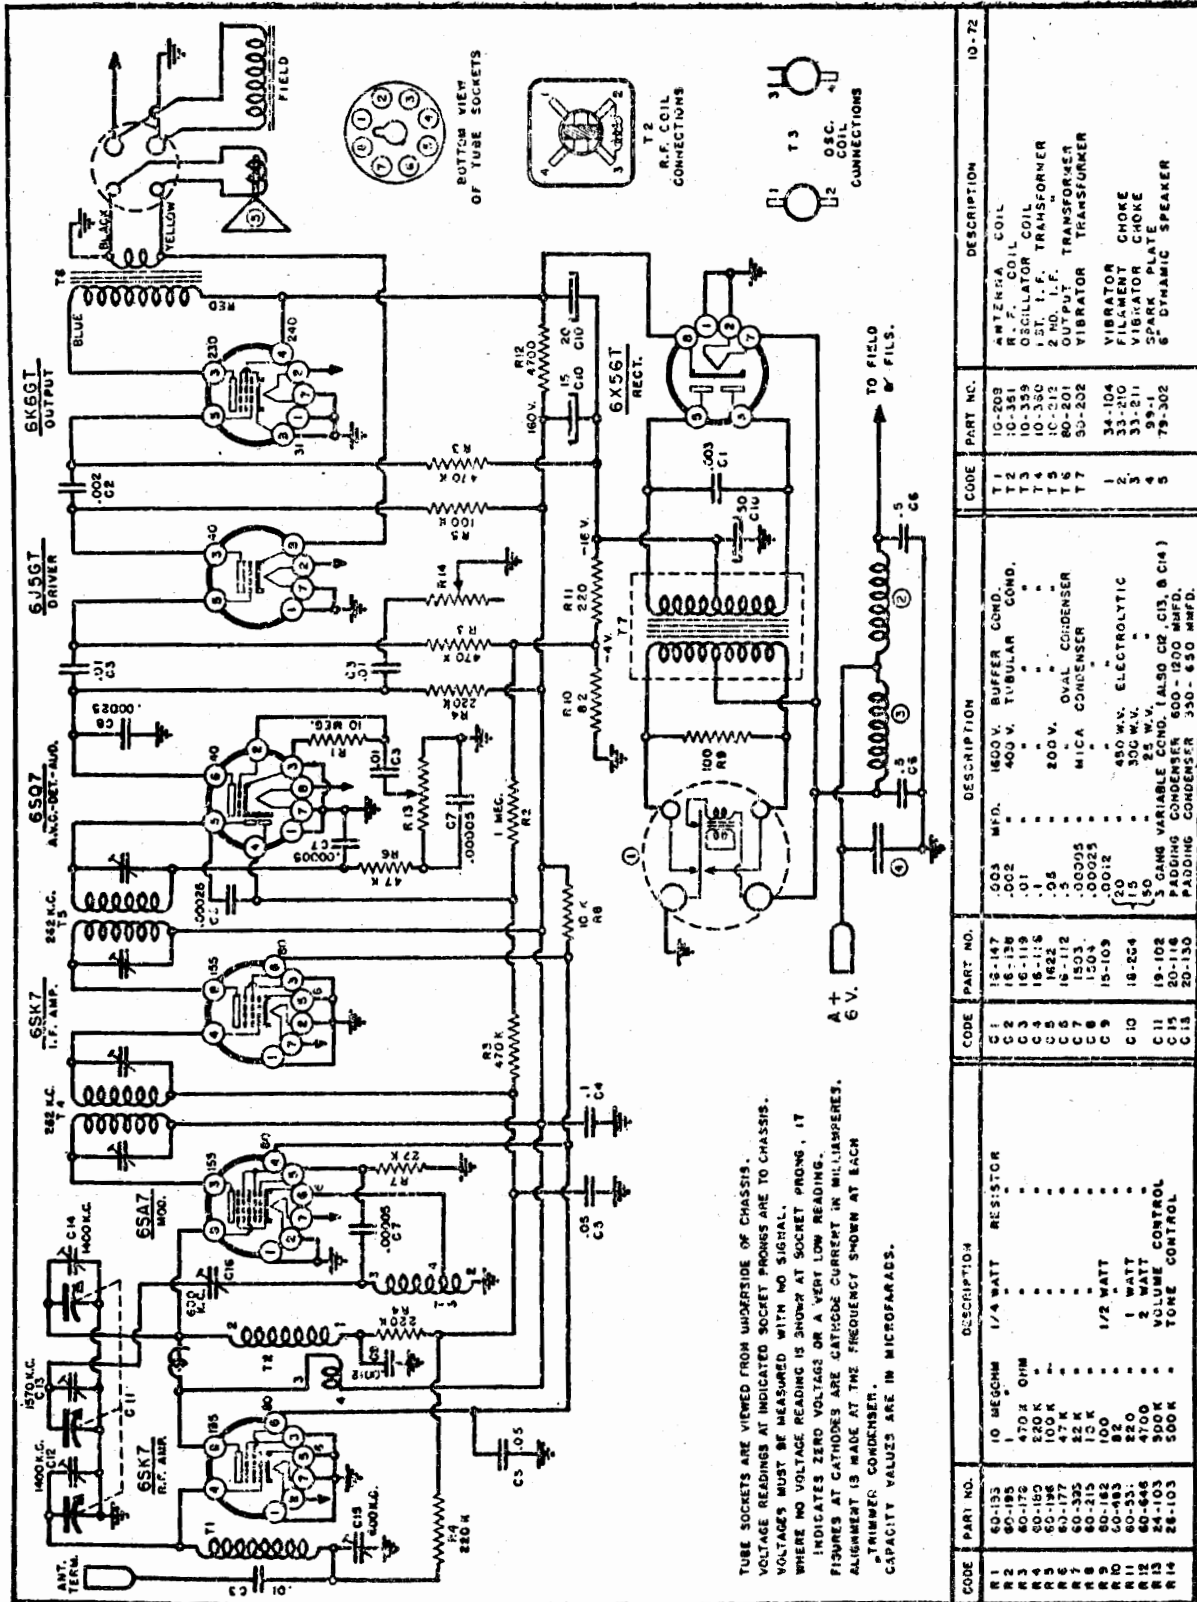

I. F. ALIGNMENT

Set the variable condenser at minimum capacity, (dial pointer at 1550 for maximum output, decreasing the signal generator, the output increases.)

ANTENNA MATCHING ADJUSTMENT

As the sizes and types of antennas vary considerably, it is necessary to adjust the radio to "match" the antenna used. To do this, tune in a station, accurately, at roughly 600 kilocycles, reduce the volume of the set, pry out the plug on the underside of the set, insert a screw driver, and turn for maximum output. Replace the plug when this has been accomplished, and the radio is ready to operate efficiently on any station.

When set is initially equipped with batteries, the antenna trimmer is properly adjusted at the factory and no further adjustment is necessary. However, in changing batteries, or installing outside antenna, it may be necessary to adjust this antenna trimmer. If so, proceed as follows:

- (1) Tune the receiver to a radio station somewhere near 1400 kilocycles, which is about 140 on the dial.
- (2) Remove the plug button from the right hand side of the cabinet (when looking at the front of the set).
- (3) Adjust antenna trimmer with a screw driver very slowly until this station is heard the loudest.

No other adjustments are necessary in this set.

DRWN. LTC. BY APP'D. DND AUG. 6, 1940.

LB-LBU

Alignment Data and Servicing

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as a weak or defective tube or speaker, open or grounded bias resistor, bypass cond. Never attempt to realign set until all other possible sources of trouble have been thoroughly investigated and proved not to be the cause. NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

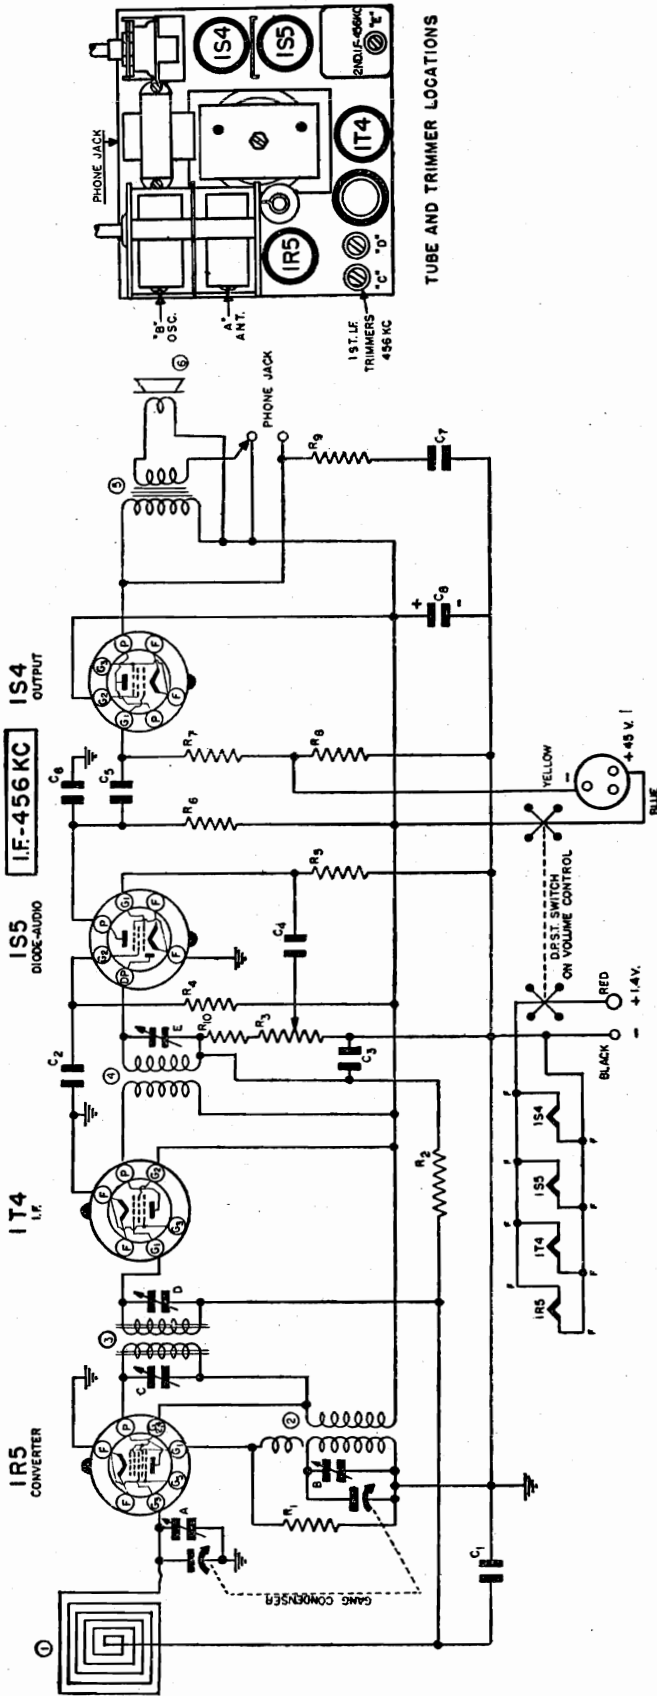

I. F. ALIGNMENT. With the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (12A8GT) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the chassis ground. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to the antenna of the set through a 200 mmfd. (.0002) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1720 K.C. and adjust the oscillator (or 1720 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400 and 1720 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. Remove the chassis from the cabinet and set on a bench taking care that no iron or other metal is near the loop. Do not make this setup on a metal bench. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

Voltages shown on the circuit diagram are from socket terminals to chassis base. In measuring voltages use a voltmeter having a resistance of at least 1000 ohms per volt. Allowances should be made for variations in line voltage.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400 and 1720 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

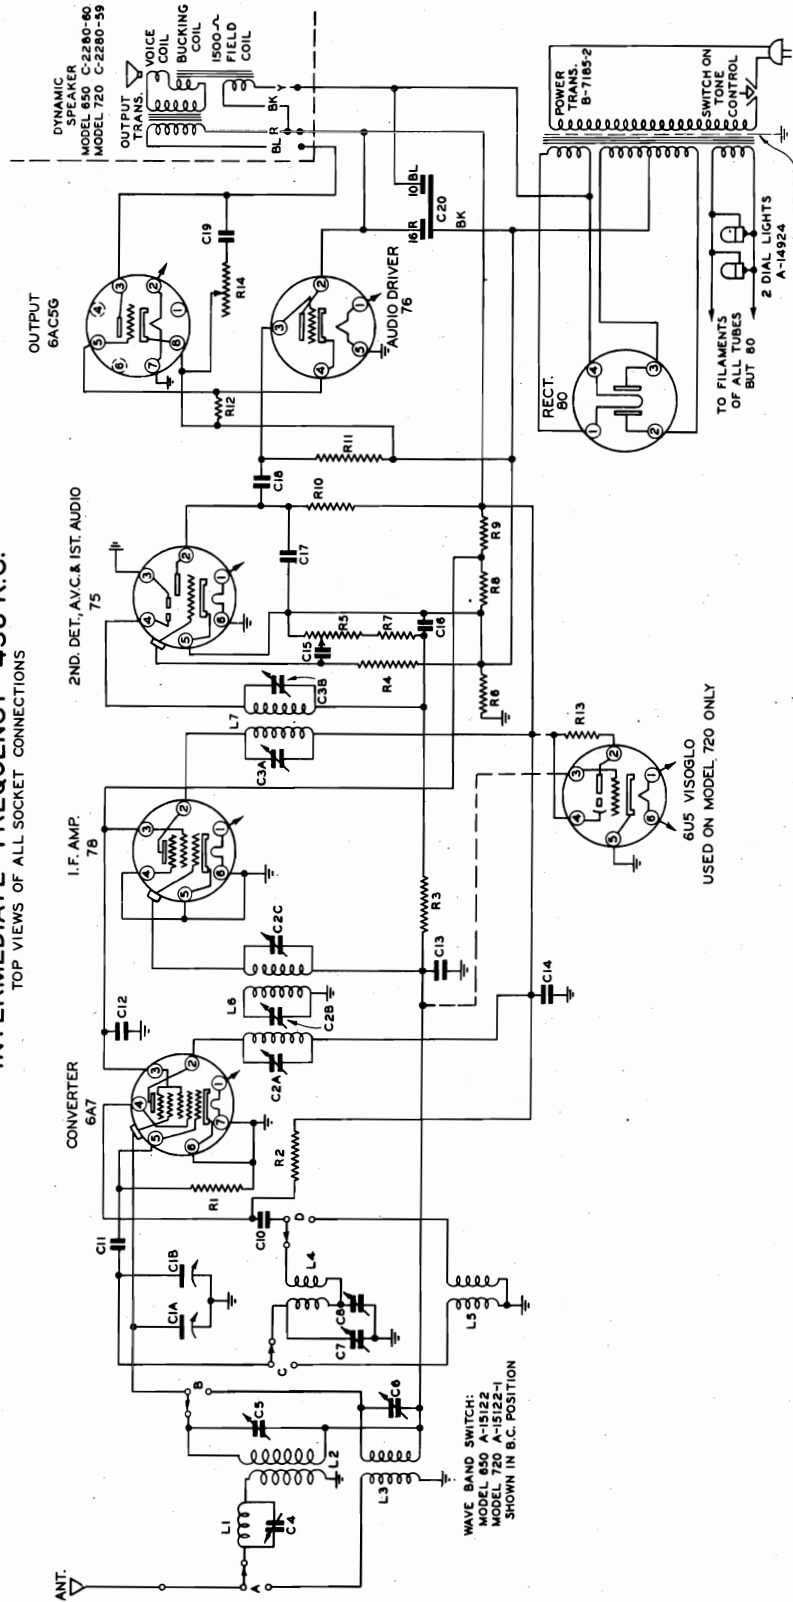

BROADCAST BAND ALIGNMENT. Remove chassis, battery pack, and loop antenna from cabinet and set them up on the bench so that they occupy exactly the same respective positions on the bench as they did in the cabinet. Care should be taken to have no iron or other metal near the loop. Do not make this set-up on a metal bench. Make a loop consisting of two turns of wire approximately one foot in diameter and connect across the generator terminals. Place this loop parallel to the loop antenna and about six inches away from it.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I.F. ALIGNMENT. With the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (IR5) through a .05 or .1 mid. condenser. The ground on the test oscillator should be connected to the chassis the gang and generator at 1720 KC (gang at minimum capacity). Adjust the oscillator trimmer for maximum output. Set the generator at 1400 KC and tune in the signal. Adjust the antenna trimmer for maximum output. Check the sensitivity at 800 KC to determine if the coils have been damaged.

TUBE SOCKETS ARE VIEWED FROM UNDERSIDE OF CHASSIS. VOLTAGE READINGS AT INDICATED SOCKET PROMTS ARE TO CHASSIS. VOLTAGES MUST BE MEASURED WITH NO SIGNAL. FIGURES AT CATHODES ARE CATHODE CURRENT IN MILLIAMPERES. WHEN NO VOLTAGE READING IS SHOWN AT SOCKET, IT INDICATES ZERO VOLTAGE OR A VERY LOW READING. ALIGNMENT IS TO BE MADE AT THE FREQUENCY SHOWN AT EACH TRIMMER CONDENSER. CAPACITY VALUES ARE IN MICROFARADS.

ALIGNMENT DATA

I.F. ALIGNMENT

Adjust the signal generator to 455 KC and connect the output to the grid of the first detector tube (6A7) through a .05 or .1 mfd. condenser. Align all I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT

Adjust the signal generator to 1730 KC and connect the output to the antenna lead (blue) through a .0002 mfd. mica condenser. Set the gang condenser to minimum capacity and adjust the oscillator trimmer to receive this signal. The oscillator and antenna trimmers may be reached by removing the dial escutcheon. (See Fig. 2 for trimmer locations.)

The next step is to set the signal generator to 1400 KC and after tuning in the signal adjust the antenna trimmer to peak. Next, re-set the dial pointer on the receiver and the signal generator to 600 KC. Slowly increase or decrease the oscillator padding condenser and at the same time continuously tune back and forth across the signal with the receiver until the maximum reading is obtained on the output meter.

Return to 1400 KC and again go over the adjustments of this frequency to be certain that they were not put slightly out of alignment when adjustment was made at 600 KC.

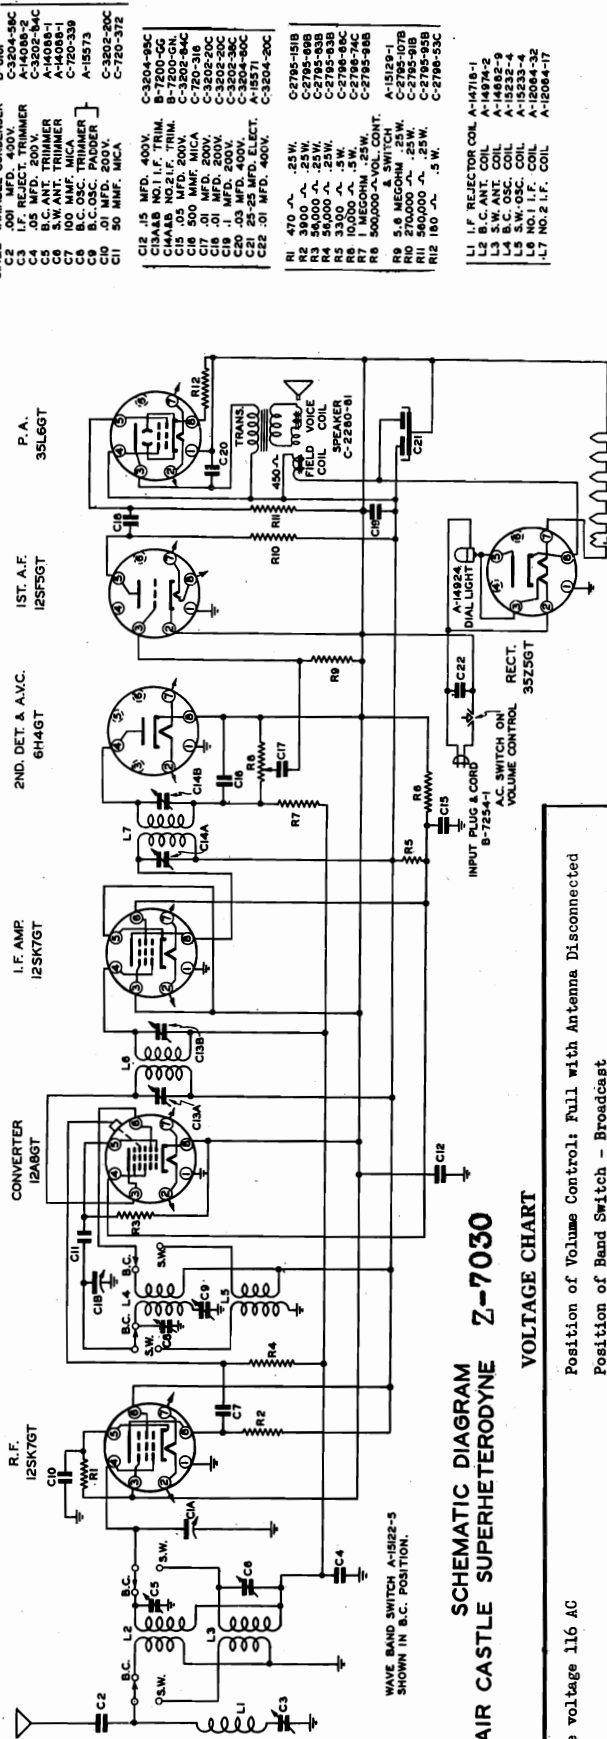

SHORT WAVE BAND ALIGNMENT

The short wave band is adjusted by setting the signal generator to 18100 KC and connecting the output to the antenna lead through a 400 ohm resistor. Set the gang at minimum and adjust the "short wave oscillator trimmer" to receive the signal. Set the generator at 16,000 KC, tune in the signal and adjust the "short wave antenna" trimmer to give maximum output. As there is no variable low frequency padding condenser on this band, the sensitivity of the receiver should be checked at 6000 KC to determine whether the circuits are in line at this frequency. Should the receiver lack sensitivity at 6000 KC, the antenna and oscillator coils, as well as the mica padding condenser, should be tested.

AUTOMATIC TUNING ADJUSTMENT AND OPERATION

Automatic tuning is a standard feature on this Model. It provides instantaneous selection of any six favorite stations by simply depressing a button. The automatic unit is wholly mechanical in operation and of rugged construction to assure greater accuracy over a longer period of time.

ADJUSTMENT. All adjustments are simply made from the front of the cabinet without the use of tools since the push-button knobs serve this purpose.

To make adjustments, turn each knob to the left about 1 complete turn. The knob is knurled to provide a positive grip for this purpose. A groove is also provided across the knob for use of a small coin to lock each setting with ease and surety.

With the knob turned free, depress as far as possible and hold down, meanwhile tune to any desired station with the manual tuning control. At this point, the automatic push button knob should be turned to the right until securely tightened. Be sure the knob is being held down in position while it is being tightened. To assure accurate adjustment, the volume control should be set at a moderate level and the station tuned in slowly to a point of maximum volume and clarity.

It is not necessary to follow any particular sequence of stations since each button is adjustable to any station.

With each button definitely set and securely tightened to the selected stations, the tuner is ready for operation.

OPERATION. With the set tuned on to a moderate level of volume, the automatic tuner is operated by merely pressing a button set to the desired station.

Station selection may be made automatically or manually at will since the manual tuning control operates free and independent of the automatic unit.

The station call letter tabs furnished should be inserted in the escutcheon above the push-buttons using designations corresponding to the station selected for each button.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1720, 6000, and 18100 KC and an output meter to be connected across the primary or secondary of the output transformers. If possible, all alignments should be made with the volume control at maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Short Wave and Broadcast bands in the order given, should be aligned.

I.F. ALIGNMENT. With the wave switch in the Broadcast Band and the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (6D8G) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the chassis ground. Align all four I.F. trimmers to peak or maximum reading on the output meter.

SHORT WAVE BAND ALIGNMENT. With the band switch turned to the S. W. position, connect the generator to the antenna with a 400 ohm dummy. Adjust the S. W. oscillator to give a maximum output with the dial at 18100 KC (extreme end). Set the generator at 15000 KC and tune-in the signal with the dial. Adjust the antenna trimmer for maximum output. With a strong signal input turn the dial to approximately 1 M. C. lower in frequency and pick up the image frequency. If the image is not received, it will be necessary to return the dial to 18100 KC to reduce the capacity in the oscillator trimmer until a second signal is received. Proceed as before with the alignment of the antenna and recheck for image frequency. Check the sensitivity at 6000-KC to determine if the coils and mica pad are not defective.

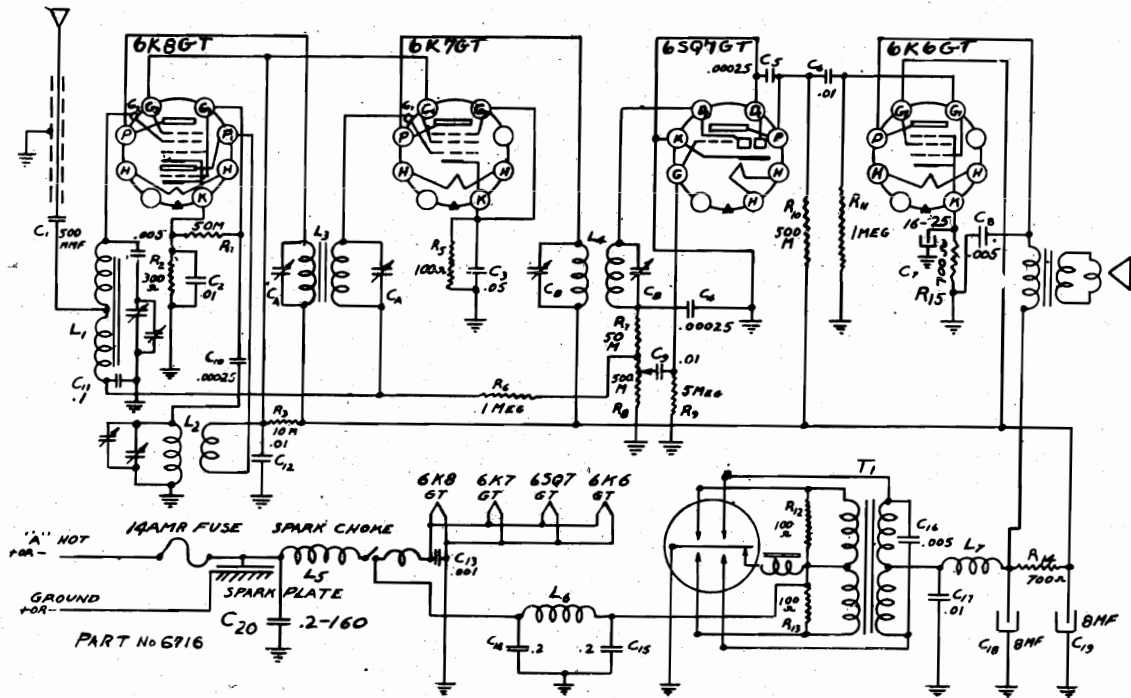

BROADCAST BAND ALIGNMENT. With the switch turned to the broadcast position, connect the antenna to the generator through a 200 MMF dummy and set the dial and generator at 1720 KC. Align the BC oscillator trimmer for maximum output. Set the generator at 1400 KC and tune-in signal with the dial. Adjust antenna trimmer for maximum output. Next set the generator at 600 KC and tune in the signal with the dial. Adjust the BC pad by rocking the gang back and forth while adjusting the pad until maximum output is attained. Recheck the adjustment at 1400 KC as the pad adjustment may have caused misalignment.

ALIGNMENT DATA AND SERVICING

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as a weak or defective tubes or speaker. Open or grounded bias resistor, bypass condenser, inadequate or excessively long antenna etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proven not to be the cause. NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMER AND PADDING CONDENSERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

PART NO. 6753

ALIGNMENT

- I.F. Frequency 455 KC.
- Frequency Range 1550—540 KC.
- Dummy Antenna 30 MMF.
- Input to I.F. 1/10 MF.

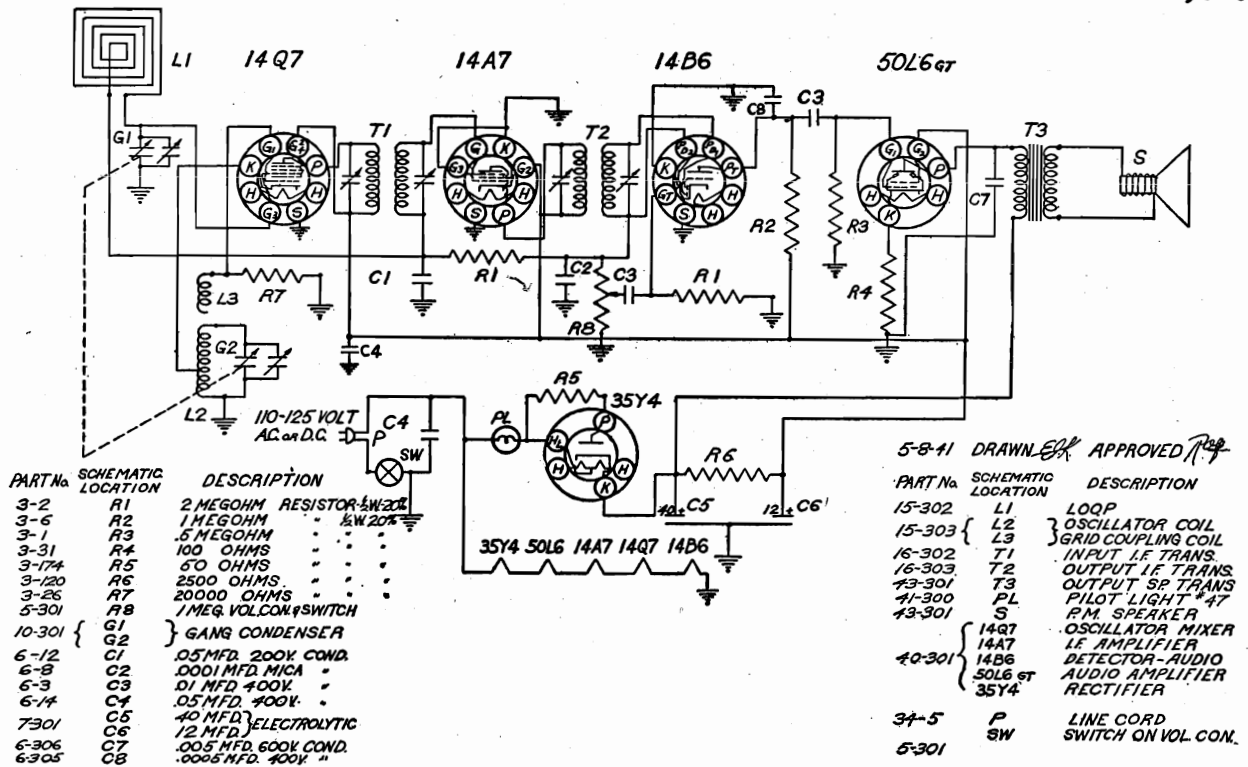

To align the I.F., feed the signal generator or test oscillator through a 1/10 MF condenser to the grid of the 6K8 tube, ground the ground side of signal generator to the case. With volume control full on and a weak signal, adjust screws of 1st and 2nd I.F. transformers using a suitable output meter to indicate resonance.

The oscillator should be set at 1550 K.C. Turn variable condenser to minimum capacity and with a 30 MMF dummy antenna condenser connected to the antenna cable and a low signal input, set the oscillator to its top frequency. The antenna trimmer should be adjusted at 1400 KC. The antenna trimmer should be readjusted at this frequency when the set is installed in the car.

MODELS EP2000-1,
DP7001-2, Ch. T530

110-125 VOLTS 60 CYCLES A.C. OR D.C.

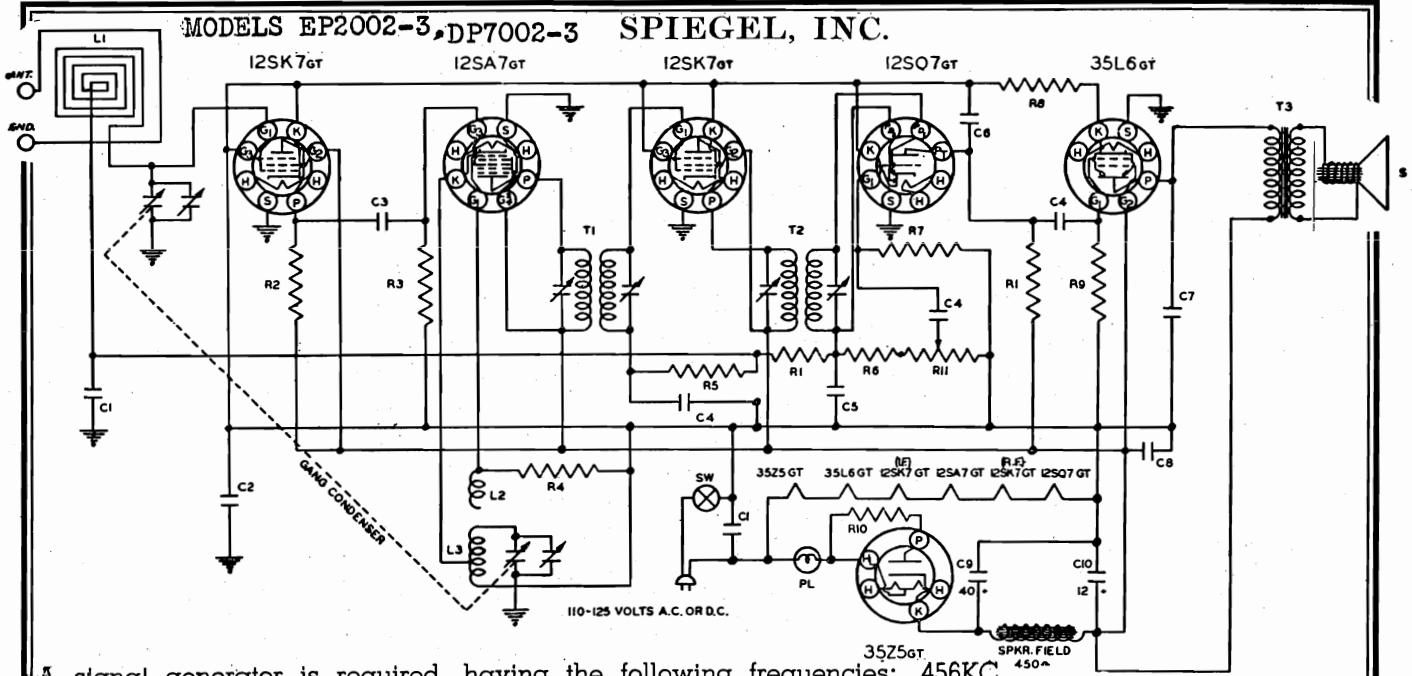

Remove chassis from cabinet for alignment.

A signal generator is required having the following frequencies: 456KC, 1400KC, 1720KC.

First Step: Connect the generator lead through a .1 mfd. condenser to the terminal lug next to the Antenna trimmer on top of the tuning condenser. The ground lead from the generator may be connected to any convenient spot on the metal chassis. Adjust generator to 456KC and adjust IF trimmer screws until a maximum reading is noted on the output meter which has been connected across the speaker. The tuning condenser should be turned out to complete minimum capacity when aligning the IF. With generator lead still connected to antenna trimmer terminal, adjust generator frequency to 1720KC, and with tuning condenser still at minimum, adjust oscillator trimmer till the 1720KC signal is tuned in. Next, remove generator leads from set and connect both to a transmitting loop. This loop can be made with 2 turns of wire about 6 inches in diameter. Adjust generator frequency to 1400KC. Turn tuning condenser until the signal is tuned in and adjust antenna trimmer until a maximum reading is noted. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory so as to insure proper alignment at the lower frequency end of the dial.

MODELS EP2002-3, DP7002-3 SPIEGEL, INC.

A signal generator is required, having the following frequencies: 456KC, 1400KC, 1720KC. An output meter of some kind is also necessary. (See figure No. 1 for trimmer locations).

All adjustments in aligning this receiver should be made with the volume control fully turned on, so as to prevent the A. V. C. from working and giving false readings. It is also advisable to keep the gang condenser turned all the way out to complete minimum capacity and keep the signal from the generator down as low as possible so as to prevent false peaks when aligning the I. F. transformers.

FIRST STEP: Connect the generator lead through a .1 condenser to the No. 8 pin at the 12SA7GT socket base (this is the control grid) and connect the generator ground lead to some point on the floating ground, above the .25 MFD floating ground condenser. Adjust the signal generator to 456KC and adjust the I. F. trimmer screws till a maximum reading is noted on the output meter which has been connected across the speaker leads. With the generator leads still connected to the 12SA7GT grid, adjust the generator frequency to 1720KC and adjust the oscillator trimmer till the signal is tuned in, with the gang condenser still at complete minimum.

SECOND STEP: Disconnect the generator leads from the receiver and connect both to a transmitting loop which may be made with two turns of wire about six inches in diameter and placed about one foot from the receiver loop. Adjust the generator frequency to 1400KC and turn the tuning condenser till this signal is tuned in. Adjust the antenna trimmer on the gang till a maximum reading is noted on the output meter.

THIRD STEP: Adjust the generator frequency to 600KC and turn tuning condenser till signal is tuned in. The alignment may be checked at this point, but no adjustment should be necessary at this point as the coils and gang condenser have been thoroughly checked at the factory to insure proper alignment at this frequency.

PROCEDURE FOR SETTING THE AUTOMATIC PUSH-BUTTONS

IMPORTANT: Read carefully before setting the automatic push buttons.

1. Select four favorite nearby broadcast stations and detach the corresponding call letter tabs from the station call letter tab sheets.
2. Any tab may be used for any button, but it is usually more convenient for the operator if the tabs are arranged in sequence so that the tab for the lowest frequency station (station having lowest number of kilocycles [K. C.]) will be at the extreme left.
3. Pull off push-button knobs so that slots in end of shafts are accessible.
4. Using the small screwdriver furnished with the radio or other tool that will fit the slot in the end of the shaft, push the shaft in as far as it will go and turn to the right or left until the dial pointer has moved to the desired station frequency. Be sure the shaft is pushed all the way in and the station is tuned in accurately.

5. Repeat the procedure in paragraph 4 for each of the remaining three buttons.
6. Check all buttons by pushing them in, one at a time, to determine whether desired stations are tuned properly.
7. Insert proper tab in end of each button knob, and replace knob.
8. Any of the four stations to which the push-button tuner has been adjusted may now be received simply by pushing the button for the desired station.

SCHMATIC DIAGRAM

DRAWN BY E.J.K. APPROVED BY F.P.

TO CHANGE FROM BATTERY TO AC OR DC

When the set is to be used as a strictly portable set using the batteries for power, it is only necessary to turn on the volume control knob as described above and the set is operating on batteries.

When it is desired to operate this set on house current, merely remove the cord from the back of the set, plug it into the outlet making sure that the outlet is alive and the set will be operating on either AC or DC, whichever is available. It is not necessary to use any switches whatsoever to make this change. Just plugging into a live outlet automatically changes from battery to AC or DC.

This set is designed to operate on 110 volts, either AC or DC. If you are in doubt as to the voltage at the outlet to be used, check with your service man or local power company.

When operating this set on DC, plug the cord into the outlet and turn the set on. After about three minutes have elapsed, give the rectifier tube a chance to warm up, reverse the plug in the outlet, watching the pilot light to see which position gives the greatest brilliance. That is the position in which the set should be operated.

When changing from AC or DC operation to battery operation merely remove the plug from the outlet and the set will be running on batteries.

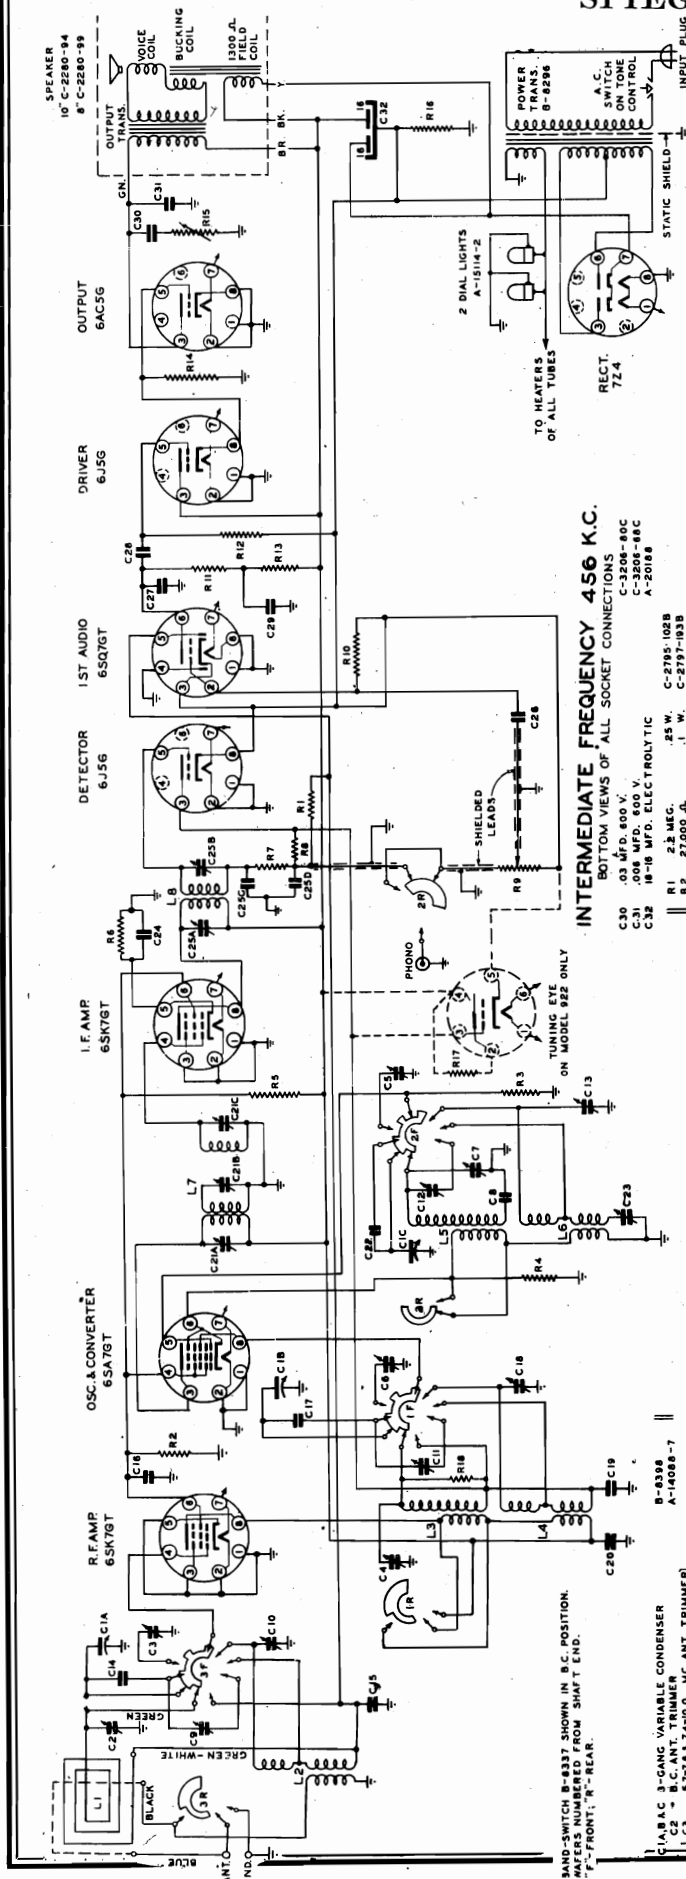

BATTERY LIFE

In normal use (three to four hours daily) the batteries your set is originally equipped with, will give approximately 250 or more working hours' service. Replacement should be made with one of the following kits of batteries, or their equivalent in another make:

- 2—"Ray-O-Vac" 45 V. "B" No. 5303.
- 2—"Ray-O-Vac" stand. 4½ V. "A" P83A.
- 2—"General" 45 V. "B" Bat. No. V-30-B.
- 2—"General" 4½ V. "A" Bat. 3H3.

If batteries inferior to the ones initially installed are used, service may be shortened considerably.

PROCEDURE FOR SETTING AUTOMATIC PUSH-BUTTONS

- IMPORTANT:** Read carefully before setting the automatic push buttons.
1. Select six favorite nearby broadcast stations and detach the corresponding call letter tabs from the station call letter tab sheets supplied.
 2. Any tab may be used for any button.
 3. Using a small screw driver furnished with radio, or other tool that will fit the screw in the end of the button, push the first button in as far as it will go, and turn to the right or left until the dial pointer has moved to the correct point on the dial for receiving that same station. Be sure the button is

- pushed all the way in and the station is tuned in accurately.
4. Repeat the procedure in Paragraph 3 for each of the remaining five buttons.
 5. Check all six buttons by pushing them in, one at a time, to determine whether the desired stations are all tuned in properly.

6. Insert the proper station call letter tab in each button by pressing it in position.
7. Any of the six stations to which the automatic push button tuner has been adjusted may now be received simply by pushing the button all the way in for the desired station.

Note: Use Dummy Antenna as described on page 2.

Eight-tube Superheterodyne with Push-Button Tuning
(Five Bands—Broadcast and Four Short-wave Band Spread)

POWER SUPPLY:

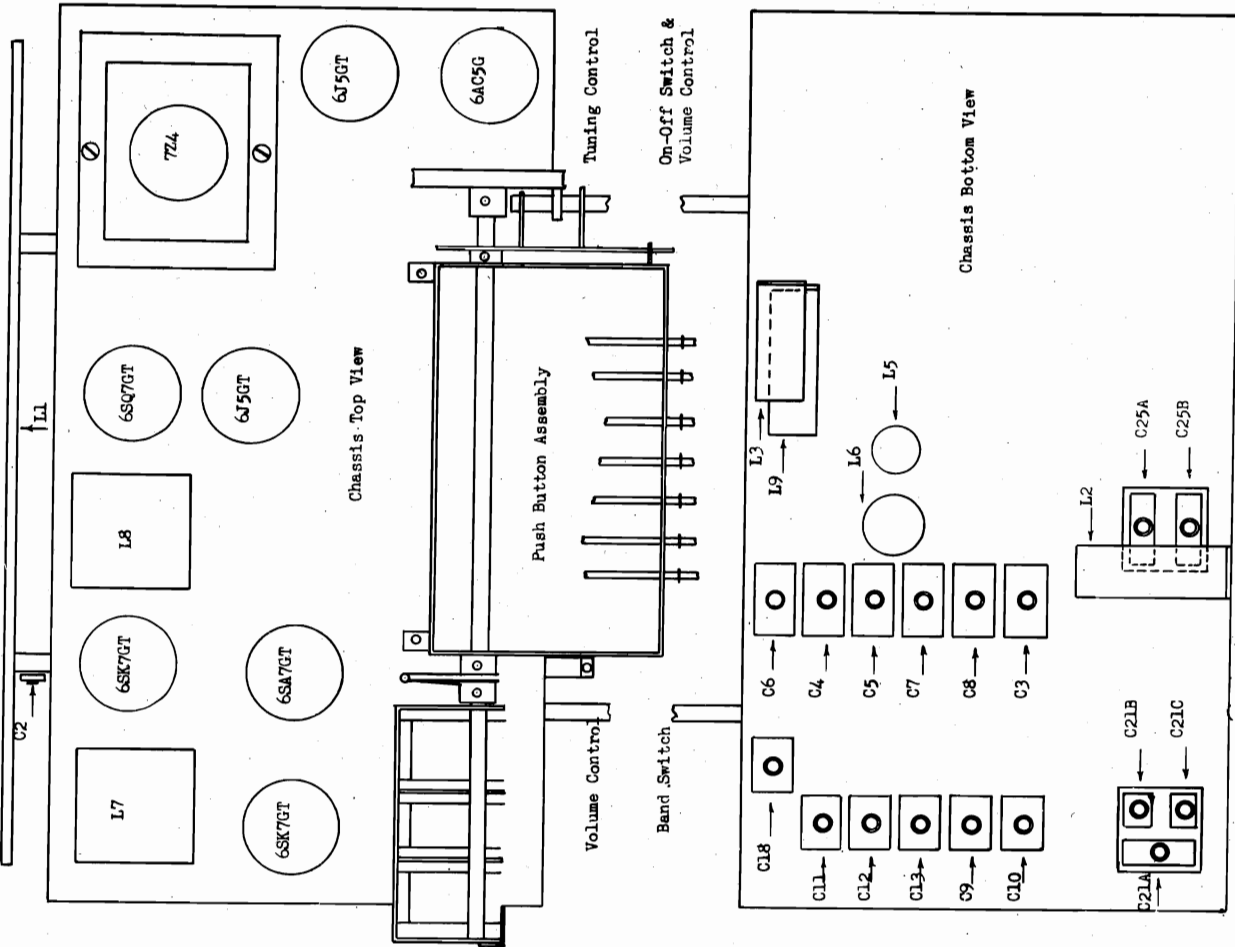

CAUTION: This radio, unless otherwise marked, must be connected to 110 to 120 volts, 50 to 60 cycle alternating current (AC) supply only. If you are in doubt about the voltage or "cycle" of your electric outlets, consult your local power company before connecting the radio. Do not connect radio unless all tubes and speaker plug are in their proper sockets.

Receivers of this model which are to be used on power supplies other than 110-120 volts, 50-60 cycle, are marked accordingly.

The tuning range of each band is as follows:

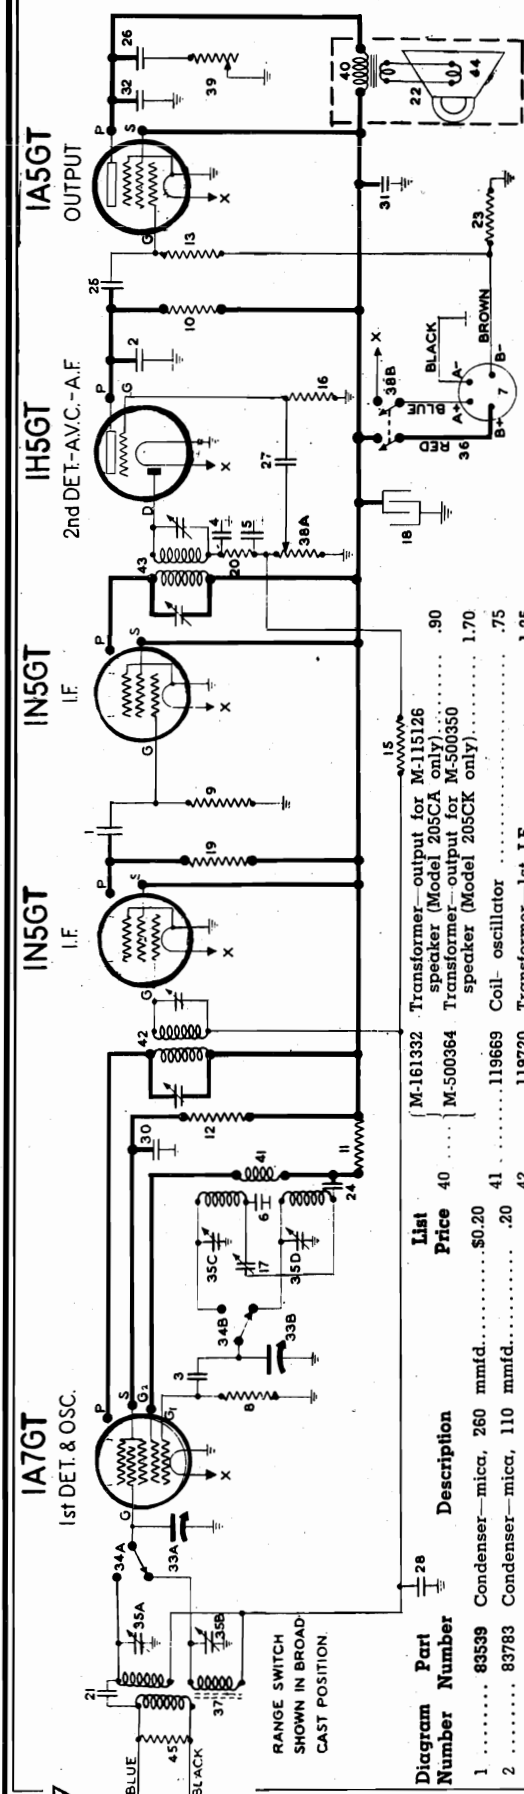

Position of Switch	Meters	Kilocycles	Megacycles
1 Broadcast	548 to 186	547 to 1,610	.54 to 1.61
2 Short-wave	18 to 24	16,800 to 12,600	16.8 to 12.6
3 Short-wave	22.5 to 80	13,400 to 9,900	13.4 to 9.9
4 Short-wave	20 to 40	10,000 to 7,400	10.0 to 7.4
5 Short-wave	40 to 53	7,600 to 5,700	7.6 to 5.7
6 Phono—Use Tip Jack at Back of Chassis.

STEWART-WARNER CORP.

ALIGNMENT PROCEDURE

FOR ALIGNMENT an output meter and an accurately calibrated signal generator are required.

Connect the output meter across the voice coil or between the plate of the 1A5GT output tube and ground through a 0.1 Mfd. condenser, depending on the type of meter. (The more sensitive type should be connected across the voice coil.)

Connect the ground lead of the signal generator to the black ground wire or the chassis.

Turn the volume control to the maximum volume position and keep it in this position while aligning.

With the gang condenser in full mesh, set the dial pointer to the low frequency edge of the dial scale.

Dummy Ant. in Series with Sig. Gen.	Connection of Sig. Generator Output To Receiver	Signal Generator Frequency	Band Switch Position	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
.1 MFD. Condenser	Control Grid of 1A7GT	455 KC	Broadcast	Any Point Where It Does Not Affect The Signal	1-2	2nd I. F.	Adjust for maximum output. Then repeat adjustment.

SOCKET VOLTAGES
Volume on full with no signal. Dial tuned to 540 KC.

BOTTOM VIEW OF CHASSIS

Use a Voltmeter of 1000 ohms per volt.

MODEL 205FA
Chassis 205F

STEWART-WARNER CORP.

SERVICE DATA FOR 205F CHASSIS (RECEIVER MODEL 205FA) ALIGNMENT PROCEDURE

FOR ALIGNMENT: An output meter and an accurately calibrated signal generator are required.

1. Connect the output meter across the voice coil; or, using a condenser in series, connect between the plate of the 50L6GT output tube and B— as shown on the voltage chart. The more sensitive type should be connected across the voice coil.
2. Connect the ground lead of the signal generator to the B— lug (shown on the voltage chart) through a .25 mfd. condenser and keep it connected in this manner throughout the entire alignment procedure. Failure to use the series condenser may have serious results, as one side of the power line may be grounded in the signal generator, or hum may be encountered.
3. Turn the volume control to the maximum volume position and leave it in this position throughout the entire alignment procedure.
4. Set the Dial Pointer to last mark after 55 on the dial with the gang condenser in full mesh.
5. The loop must be connected at all times.

Dummy Ant. in Series with Signal Generator	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
200 MMFD. Mica Condenser	White wire of Loop (loop must be connected)	455 KC	Any point where it does not affect the signal	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3-4	1st I.F.	
No Connection	Place Lead from Signal Generator near Loop	1500 KC	1500 KC	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
No Connection	Place Lead from Signal Generator near Loop	1500 KC	Tune to 1500 KC Generator Signal	6*	Broadcast Antenna (Shunt)	Adjust for maximum output.

*Make adjustment of trimmer No. 6 with the chassis in the cabinet, and with the loop mounted to the cabinet by the top-center mounting screw. The loop and cabinet back may be tilted on this screw to permit reaching the trimmer.

LOOP CONNECTIONS

REDUCING HUM

If excessive hum is encountered on connecting an external antenna to this receiver, try reversing the power cord plug in the power outlet.

ELECTRICAL PARTS

NOTE: The possession of this price list by any person is not to be construed as an offer to sell to him, nor anyone else, the goods listed herein at prices stated.

MODELS 205GA to 205GZ
Chassis 205G

STEWART-WARNER CORP.

1. Connect output meter across voice coil or from 50L6GT plate through a .1 mfd. condenser to chassis.
2. Set Volume Control in maximum position.
3. Connect signal generator ground through a .1 mfd. condenser to chassis.
4. Set dial pointer to 160 with slugs all the way out.

Dummy Ant. in Series with Sig. Gen.	Connection Sig. Gen. Output to Receiver	Sig. Gen. Freq.	Receiver Dial Setting	Trimmer No.	Trimmer Description	Type of Adjustment
200 Mmfd. Mica Condenser	Grid of 12SA7 Tube	455 KC	Any place where it does not affect signal	1-2 3-4	2nd I.F. 1st I.F.	Adjust screws on top of I.F. cans for maximum output
200 Mmfd. Mica Condenser	Antenna Terminal	1600 KC	1600 KC	5	B.C. Osc.	Adjust for maximum output
200 Mmfd. Mica Condenser	Antenna Terminal	1600 KC	Tune to 1600 KC Gen. Sig.	6	B.C. Ant.	Adjust for maximum output
200 Mmfd. Mica Condenser	Antenna Terminal	1400 KC	Tune to 1400 KC Gen. Signal	7	B.C. Ant. Coil	Adjust moveable Antenna Coil for maximum output

NOTE: After completing adjustment No. 7 return slugs to maximum out position and check trimmer No. 6. If no appreciable change in trimmer adjustment is necessary for maximum output, the antenna circuit is tracking. If the trimmer No. 6 requires considerable change it will be necessary to repeat adjustment No. 7 again. These two adjustments (Nos. 6 & 7) should be made several times until no change in trimmer adjustment for maximum output is necessary at either point.

TO RESTRING TUNING MECHANISM

1. Form a loop in one end of the cord and attach it to the hook nearest to the dot on the slug marked with a yellow dot. Form another loop through the hook farthest from the dot on the slug with the white dot and adjust the length so that the distance from the iron end of one slug to the iron end of the other is 2 15/16 inches.
2. Attach another length of cord to the other end of the yellow dot slug and drop the assembly through the hole in the top of the antenna coil leaving the newly added length of cord on the top end.
3. Pass the lower slug through the hole in the chassis, around the lower pulley and through the oscillator coil.
4. Now pass the cord from the top end over the two pulleys at the top of the mounting bracket, around the rear side of the small irregularly shaped pulley (see Fig. 1) threading it through the slots as shown in the "Detail" drawing and across the front down through the second hole in the chassis. Pass the cord under the upper pulley and around the top of the left hand pulley.
5. Form a loop and attach to spring (part no. 501145). Attach spring to slug in oscillator coil and adjust loop in cord to give normal tension.
6. The iron slug in the oscillator coil should project 1/16" from the end of the coil when the drive pulley is in its maximum counter-clockwise position. This may be adjusted by sliding the cord in the slots shown in the "Detail" drawing.
7. If the procedure outlined in the steps above has been carefully followed, the colored dot ends of the slugs will enter the coil last when the slugs are fully entered in the coils.
8. After restringing tuning mechanism, perform the alignment indicated under "Alignment Procedure" above.

TO RESTRING DIAL CORD

1. Set drum to position shown in Figure 2 with slugs in full out position (shown in Fig. 1).
2. Attach one end of the dial cord to point A on the drum.
3. Pass the cord through the opening at the bottom of the drum around the rear of the left side over the top and make two and one half turns around the rubber bushing on the tuning shaft as shown in Fig. 2.
4. Pass the cord around the guides as shown and over the front edge of the drum around and up through the opening at the bottom of the drum.
5. Attach spring to point A and bring it over hub of drum.
6. Form a loop in the cord and adjust for normal tension on the spring. (See Fig. 2).
7. Set the pointer to 1600 KC on the dial scale with the drum in the maximum counter-clockwise position.

SOCKET VOLTAGES

VOLUME ON FULL WITH NO SIGNAL DIAL TUNED TO 540 KC

ALIGNMENT PROCEDURE

1. Connect output meter across the voice coil; or from 50L6GT plate to B— as shown on voltage chart.
2. Connect the ground lead of the signal generator to the chassis through a .25 mfd. condenser.
3. Set the volume control to the maximum volume position.
4. Set dial pointer to lowest frequency point on dial scale with gang in full mesh.
5. Connect the antenna lead of the signal generator to the lug on the top of the rear section of the gang, using a 200 mmfd. mica condenser in series.
6. Set the signal generator to 455 KC. Set receiver dial to a point where it does not affect signal. Adjust the trimmer screws on the top of each I.F. Transformer for maximum output.
7. Connect the output of the signal generator in series with a 200 mmfd. mica condenser to the antenna terminal on the cabinet back. Set the receiver dial to 1500 KC.
8. Set the signal generator to 1500 KC and adjust the trimmer on the front section of the gang condenser for maximum output of the oscillator signal.
9. Place the loop antenna in its correct position at the rear of the cabinet and adjust the trimmer screw on the back of the chassis for maximum output at 1500 KC.

500497	Stud—dial scale retaining	.02
500289	Tuning Shaft	.22
111456	Washer—spring washer for tuning shaft	Per C .50

ALIGNMENT PROCEDURE

1. Connect the output meter across the voice coil or from the plate of the 35L6GT output tube to B— through a .25 mfd. condenser.
2. Connect the ground lead from signal generator to B— through a .25 mfd. condenser for all alignment steps.
3. Set volume control in maximum position.
4. Set dial pointer to last marking on dial with gang in full mesh.
5. Connect hot lead from signal generator to stator on rear section of gang using 200 mmfd. in series as dummy.
6. Set generator to 455 KC. and adjust trimmer screws on top of I.F. transformer cans for maximum output.
7. Connect hot lead to antenna terminal on loop through a 200 mmfd. condenser as a dummy. Set dial to 1500 KC. and adjust trimmer on front section of gang for maximum output on a 1500 KC. generator signal.
8. Place chassis in cabinet and using connections in "7" place loop in position and adjust loop trimmer at rear of chassis for maximum output while tuning dial to maximum signal.

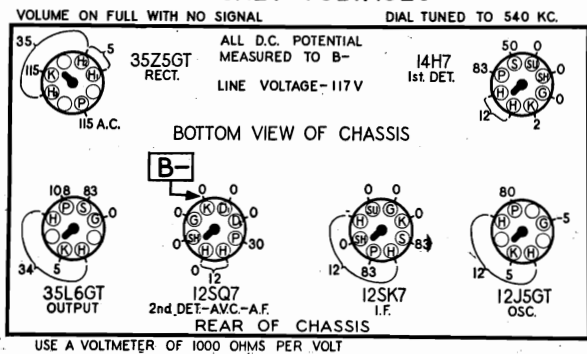

NOTE: Place the chassis in the cabinet to find dial settings.

SOCKET VOLTAGES

- ALIGNMENT PROCEDURE**
1. Connect the output meter across the voice coil or from the plate of the 35L6GT output tube to B— through a .25 mfd. condenser.
 2. Connect the ground lead from signal generator to B— through a .25 mfd. condenser for all alignment steps.
 3. Set volume control in maximum position.
 4. Set dial pointer to last marking on dial with gang in full mesh.
 5. Connect hot lead from signal generator to stator on rear section of gang using 200 mmfd. in series as dummy.
 6. Set generator to 455 KC. and adjust trimmer screws on top of I.F. transformer cans for maximum output.
 7. Connect hot lead to antenna terminal on loop through a 200 mmfd. condenser as a dummy. Set dial to 1500 KC. and adjust trimmer on front section of gang for maximum output on a 1500 KC. generator signal.
 8. Place chassis in cabinet and using connections in "7," place loop in position and adjust loop trimmer at rear of chassis for maximum output while tuning dial to maximum signal.
- NOTE: Place the chassis in the cabinet to find dial settings.

1. Connect the output meter across the voice coil or from plate of the 35L6GT output tube to B— through a .1 mfd condenser.
2. Connect ground lead from signal generator to B— (cathode on 12SQ7) through a .25 mfd. condenser.
3. Turn volume control to maximum position throughout alignment.
4. Use a weak signal from the signal generator.

Dummy Ant. in Series with Sig. Gen.	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Band Switch Position	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
200 MFD. Mica Condenser	Lug on Rear Section of Gang Cond.	455 KC	Broadcast	Any Point Where It Does Not Affect the Signal	1-2	2nd I.F.	Adjust for Maximum Output. Then repeat Adjustment.
					3-4	1st I.F.	
400 Ohm Carbon Resistor	Terminal Marked "Antenna"	14 MC	Short Wave	14 MC	5	Short Wave Oscillator	Adjust for Maximum Output. Check to see if Proper Peak was Obtained by Tuning in Image at Approx. 13.1 MC. If Image does not appear, Realign at 14 MC, with Trimmer, Screw farther out. Recheck Image.
400 Ohm Carbon Resistor	Terminal Marked "Antenna"	14 MC	Short Wave	Tune to 14 MC Generator Signal	6	Short Wave Antenna	Adjust for Maximum Output. Try to Increase Output by Detuning Trimmer and Retuning Receiver Dial until Maximum Output is Obtained.
200 MMFD. Mica Condenser	Terminal Marked "Antenna"	1500 KC	Broadcast	1500 KC	7	Broadcast Oscillator	Adjust for maximum output.
200 MMFD. Mica Condenser	Terminal Marked "Antenna"	1500 KC	Broadcast	Tune to 1500 KC Generator Signal	8*	Broadcast Antenna	Adjust for maximum output.
200 MMFD. Mica Condenser	Terminal Marked "Antenna"	600 KC	Broadcast	Tune to 600 KC Generator Signal	9*	Broadcast Oscillator (Series)	Adjust for Maximum Output. Try to Increase Output by Detuning Trimmer and Retuning Receiver Dial until Maximum Output is Obtained.

*NOTE: ADJUSTMENTS No. 8 AND No. 9 SHOULD BE MADE WITH THE SET IN THE CABINET AND WITH LOOP LEADS AND LOOP IN FINAL POSITION.

INDICATOR LAMP

This receiver is equipped with a neon lamp on the dial scale which indicates the condition of the batteries. The neon lamp is included in an oscillating (R-C) circuit which has been designed to oscillate at approximately 3 pulses per second when the batteries are in a fully charged condition. As the battery voltage decreases with use the number of pulses per second decreases.

When the battery voltage is low (approximately 72 volts) the light flickers more slowly (approximately 1 a second). The set should not be operated from battery power after this point is reached. The batteries should be charged for at least twice the time they were used—as soon as possible after they have been run down. (See "Charging Batteries" on other side).

The indicator lamp shows the condition of the batteries only when the Selector Switch is in the "Battery" position, as the voltage is much higher during charging or AC-DC operation.

PRICES SUBJECT TO CHANGE WITHOUT NOTICE.

SOCKET VOLTAGES

NOTE A: Voltage on the grid of the 1N5GT intermediate amplifier tube cannot be measured with a standard voltmeter because of the high resistance of resistor No. 15.

Use A Voltmeter of 1000 Ohms Per Volt.

MODELS 206GA to 206GZ STEWART-WARNER CORP.
Chassis 206G

1. Connect the output meter across the voice coil of the speaker or between the plate of the 3Q5GT output tube and chassis through a .1 mfd. condenser.
2. Connect the ground lead of the signal generator to chassis through a .25 mfd. condenser.
3. Set the volume control in the maximum position and use a weak signal from the generator.
4. Set Selector Switch in AC-DC position.

Dummy Ant. in Series with Sig. Gen.	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
200 MMFD. Condenser	Lug on Rear Section of Gang Condenser	455 KC.	Any Point Where It Does Not Affect Signal	1	2nd I.F.	Adjust the screws on the top of each I.F. can for maximum output. Then repeat adjustment.
				2-3	1st I.F.	
200 MMFD. Condenser	"A" Terminal	1500 KC.	1500 KC	4 (On front section of variable condenser)	Broadcast Oscillator (Shunt)	Adjust trimmer for maximum output.
200 MMFD. Condenser	"A" Terminal	1500 KC.	Tune To 1500 KC Generator Signal	5 (Located on cabinet back)	Broadcast Antenna	Adjust for maximum output.

Now disconnect the output meter and signal generator leads and replace the chassis and batteries in the cabinet being sure to connect the loop. Bring the antenna lead of the signal generator near the loop until the 1500 KC. signal is heard weakly and re-adjust trimmer No. 5 for maximum output by ear.

CHARGING BATTERIES

A separate charging system consisting of a 35Z5GT rectifier and a suitable resistor voltage dividing network and filter is incorporated in this receiver. The circuit is arranged to provide a very light charging current when the receiver is operated from either AC or DC. This is just enough to maintain the batteries but will not charge up used batteries. A separate charging position is provided for rapid recharging of the batteries. The resistance voltage divider is designed to give a charging rate of approximately one third the discharge rate, this having been found to give best results. It is recommended that the batteries be left on charge at least twice the time they were used. As the batteries age it is necessary to charge for a longer period. For longest battery life the batteries should be placed on charge immediately after they have been used. Batteries deteriorate from standing idle so if the set is not used on AC or DC occasionally, the batteries should be charged for a short time every few weeks even though they have not been used. The batteries are automatically maintained if the set is used on house current at regular intervals.

FIG. 1

FIG. 2

IMPORTANT:

1. Completely dead batteries cannot be recharged.
2. Check polarity by operating set from power line before attempting to charge batteries from D.C.
3. The batteries will be discharged if the ON-OFF switch is left on when the power cord is not connected.

4½ Volt "A" Battery	45 Volt "B" Battery
Eveready No. 746	Eveready No. 482
Burgess No. G3	Burgess No. M30
Ray-O-Vac No. P83A	Ray-O-Vac No. P7830

REPLACING THE BATTERIES

When the Selector Switch is turned to the Battery position, the flickering red neon light indicates the condition of the batteries. (See section INDICATOR LAMP on front page). As the batteries age the dropping off in voltage after charging becomes more rapid. The batteries should be replaced when the operating period is reduced to two hours, after the batteries have been fully charged. For satisfactory results all the batteries MUST be replaced at one time.

INSTALLING THE BATTERIES

Plug the two prong plugs on the battery cable into the sockets on the tops of the "A" batteries and the three prong plugs into the sockets on the tops of the "B" batteries.

Model 206GA: Place the two "B" batteries on the bottom and the two "A" batteries on the top, in the battery compartment at the bottom of the cabinet with the battery plug sockets facing each other at the center. Insert the long corrugated board piece (1) between the "A" batteries, and the corrugated board roll (2) between the "B" bat-

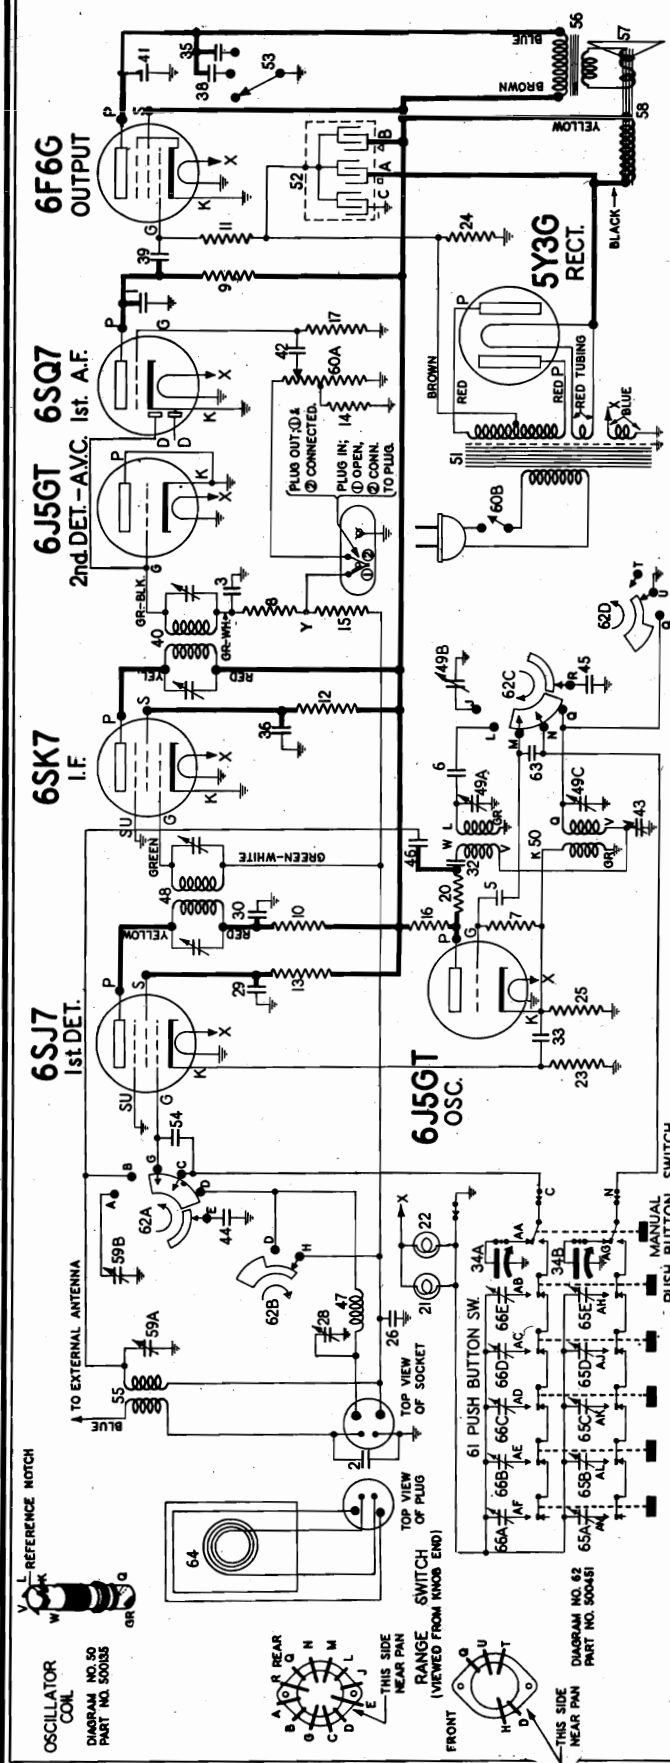

teries. Insert pieces (3) and (4) at each end as shown in Figure 1. Plug the four prong plug on the battery cable into the socket at the rear of the chassis.

Model 206GB: Place the two "B" batteries in the bottom of the battery compartment. Insert the long rectangular corrugated board piece (5) alongside the batteries and force the small corrugated board roll (6) in between the ends of the "B" batteries. Place the "A" batteries on top of the "B" batteries and force the long roll of corrugated board (7) lengthwise between them. The sockets of both "A" and "B" batteries face each other at the center. The offset pieces (8) and (9) are placed on top of each "A" battery as shown in Figure 2. Plug the four prong plug on the battery cable in the socket on the bottom of the cabinet. The extension from this socket must be plugged into the socket on the rear of the chassis.

CAUTION: DO NOT LEAVE BATTERIES IN CABINET AFTER THEY ARE DISCHARGED AS THEIR SWELLING MAY CAUSE DAMAGE.

STEWART-WARNER CORP.

MODELS 207BA to 207BZ
Chassis 207B

NOTE: A 110 MMFD. MICA CONDENSER IS CONNECTED FROM POINT "Y" TO CHASSIS.

IF PEAK 455 KC NOTE: RESISTOR No. 7 RETURNS TO CHASSIS INSTEAD OF CATHODE AS SHOWN.

ALIGNMENT EQUIPMENT & PROCEDURE

THIS RECEIVER MAY BE ALIGNED IN THE CABINET WITH LOOP CONNECTED

1. Connect the output meter across the voice coil or from the plate of the 6F6G output tube to chassis through a .1 mfd. condenser.
2. Connect the ground lead of the signal generator to the receiver chassis.
3. Make sure that the wires coming from the chassis and push button switch are connected as shown in the figure below.
4. Push in the "manual" button and keep it pushed in. Check the pointer to see that it is correctly set to 540 KC. with gang in full mesh.
5. Turn the volume control to the maximum volume position, and the tone control to the "speech" position.
6. FOLLOW THE ORDER OF ALIGNMENT INDICATED BELOW.

Dummy Ant. In Series with Sig. Gen.	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Band Switch Position	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
.1 MFD Condenser	Lug on Outer Section of Gang Cond.	455 KC	Broadcast	Any Point Where It Does Not Affect the Signal	1-2	2nd I.F.	Adjust for Maximum Output. Then repeat Adjustment.

5Y3G RECT. 30 A.C. 230
60 A.C. 245 230

NOTE A: Voltage on the grid of the 6S07 1st. A.F. is -1 volt measured across resistor No. 25.
NOTE B: Voltage on the grid of the 6F6G Output Tube is -6 volts measured across resistor No. 25 and 6.
USE A VOLTMETER OF 1000 OHMS PER VOLT.

MODEL 207DK,
Chassis 207D

STEWART-WARNER CORP.

ALIGNMENT EQUIPMENT & PROCEDURE

1. Connect the output meter across the voice coil or from plate of the 6F6G output tube to chassis through a .1 mfd. condenser. (The more sensitive type should be connected across the voice coil.)
2. Connect the ground lead of the signal generator to the receiver chassis.
3. Turn the RADIO-PHONO TONE SWITCH to the "Radio-Speech" position.
4. Turn the volume control to the maximum position and keep it in this position throughout the alignment procedure.
5. Check the pointer to see that it is correctly set to low freq. end of dial scale with gang in full mesh.
6. The loop must be connected as indicated in circuit diagram at all times.

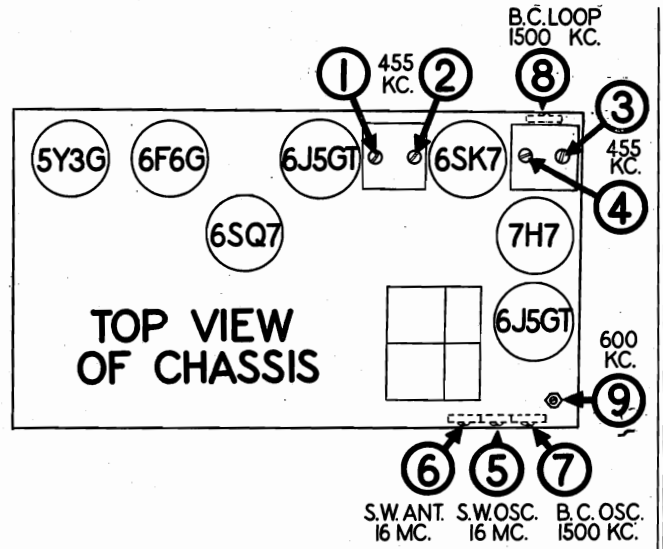

Dummy Ant. in Series with Sig. Gen.	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Band Switch Position	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
.1 MFD. Condenser	Lug on front Section of Gang Cond.	455 KC	American	Any Point Where It Does Not Affect the Signal	1-2	2nd I.F.	Adjust for Maximum Output. Then repeat Adjustment.
					3-4	1st I.F.

STEWART-WARNER CORP.

ALIGNMENT EQUIPMENT & PROCEDURE

1. Connect the output meter across the voice coil or from the plate of one 6F6G output tube to chassis through a .1 mfd. condenser.
2. Connect the ground lead of the signal generator to the receiver chassis.
3. Check the pointer to see that it is correctly set to the low freq. end of the dial scale with gang in full mesh.
4. Push in the "manual" button and keep it pushed in.
5. Turn the volume control to the maximum volume position, and the tone control to the "Radio-Speech" position.
6. FOLLOW THE ORDER OF ALIGNMENT INDICATED BELOW.

Dummy Ant. in Series with Sig. Gen.	Connection of Sig. Generator Output to Receiver	Signal Generator Frequency	Band Switch Position	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
.1 MFD Condenser	Lug on Rear Section of Gang Cond.	455 KC	Broadcast	Any Point Where It Does Not Affect the Signal	1-2	2nd I.F.	Adjust for Maximum Output. Then repeat Adjustment.
					3-4	1st I.F.	
400 OHM Carbon Resistor	Blue Lead from Chassis	16 MC	Foreign	16 MC	5	Foreign Oscillator	Adjust for Maximum Output. Check to see if Proper Peak was Obtained by Tuning in Image at Approx. 15.1 MC. If Image does not appear, Realign at 16 MC, with Trimmer Screw farther out. Recheck Image.
400 OHM Carbon Resistor	Blue Lead from Chassis	16 MC	Foreign	Tune to 16 MC Generator Signal	6	Foreign Antenna	Adjust for Maximum Output. Try to Increase Output by Detuning Trimmer and Returning Receiver Dial until Maximum Output is Obtained.
No Connection	Place Lead from Signal Gen. Near Loop	1500 KC	Broadcast	1500 KC	7	Broadcast Oscillator (Shunt)	Adjust for Maximum Output.

NOW PLACE THE CHASSIS AND LOOP ANTENNA INTO POSITION IN THE CABINET.

No Connection	Place Lead from Signal Gen. Near Loop	1500 KC	Broadcast	Tune to 1500 KC Generator Signal	8	Broadcast Antenna	Adjust for Maximum Output.
No Connection	Place Lead from Signal Gen. Near Loop	600 KC	Broadcast	Tune to 600 KC Generator Signal	9	Broadcast Oscillator (Series)	Adjust for Maximum Output. Try to Increase Output by Detuning Trimmer and Returning Receiver Dial until Maximum Output is Obtained.

ADJUSTING DIAL LAMP

To adjust the dial lamp simply push the pilot lamp and socket forward until maximum illumination of the dial is obtained.

Location Chart

ALIGNING INFORMATION

Never realign unless absolutely necessary.

Use a good modulated signal generator (test oscillator) with variable output voltage and a sensitive output meter across the voice coil of the speaker.

Always align using the smallest possible input from the signal generator. A strong signal makes adjustments inaccurate.

Always have the volume control "full on".

Important: Be sure the metal plate is fastened in place on the bottom of the chassis before alignment is attempted.

ALIGNING PROCEDURE (follow this order exactly).

I. Dial Pointer Adjustment.

With the plates of the gang tuning capacitor fully engaged set the dial pointer in a vertical position directly on the calibration marks located at the top and bottom of the dial scale.

II. Intermediate Frequency Adjustments.

1. Tune the set to the extreme low frequency position. (Variable capacitor plates all the way in).
2. Connect the ground terminal of the signal generator to the chassis base.
3. Introduce a modulated signal of 455 kilocycles using a .01 M. F. capacitor in series with the lead from the signal generator to

the oscillator aligning capacitor located on the front section of the variable capacitor.

4. Adjust the I. F. aligners for maximum output in the following order:

- A. Secondary of second I. F. Transformer.
- B. Primary of second I. F. Transformer.
- C. Secondary of first I. F. Transformer.
- D. Primary of first I. F. Transformer.

III. Radio Frequency Adjustments.

1. Replace the .01 M. F. capacitor in series with the output lead of the signal generator with a 200 mmf. capacitor and connect them to the antenna terminal located on the back of the loop assembly.
2. Set the signal generator's frequency and the receiver's tuning dial to 1.4 megacycles.
3. Adjust the oscillator and antenna aligning capacitors for maximum signal.
4. Set both the signal generator's frequency and the receiver's tuning dial to 0.6 megacycles and check calibration.

NOTE: If the calibration is too far off at 0.6 megacycles, operations 2 and 3 may be repeated until the best results are obtained.

ALIGNING INFORMATION

Never realign unless absolutely necessary.

Use a good modulated signal generator (test oscillator) with variable output voltage and a sensitive output meter across the voice coil of the speaker.

Always align using the smallest possible input from the signal generator. A strong signal makes adjustments inaccurate.

Always have the volume control "full on".

Important: Be sure the metal plate is fastened in place on the bottom of the chassis before alignment is attempted.

ALIGNING PROCEDURE (follow this order exactly).

I. Dial Pointer Adjustment.

With the plates of the gang tuning capacitor fully engaged set the dial pointer in a horizontal position directly on the top of the calibration mark located at 550 Kc. on the dial scale.

II. Intermediate Frequency Adjustments.

1. Tune the set to the extreme low frequency position. (Variable capacitor plates all the way in.)
2. Connect the ground terminal of the signal generator to the chassis base.
3. Introduce a modulated signal of 455 kilocycles using a .01 M. F. capacitor in series with the lead from the signal generator to the oscillator aligning capacitor located on the front section of the variable capacitor.
4. Adjust the I. F. aligners for maximum output in the following order:

- A. Secondary of second I. F. Transformer.
- B. Primary of second I. F. Transformer.
- C. Secondary of first I. F. Transformer.
- D. Primary of first I. F. Transformer.

III. Radio Frequency Adjustments.

1. Replace the .01 M. F. capacitor in series with the output lead of the signal generator with a 200 mmf. capacitor and connect them to the antenna terminal located on the back of the loop assembly.
2. Set the signal generator's frequency and the receiver's tuning dial to 1.4 megacycles.
3. Adjust the oscillator and antenna aligning capacitors for maximum signal.
4. Set both the signal generator's frequency and the receiver's tuning dial to 0.6 megacycles and check calibration.

NOTE: If the calibration is too far off at 0.6 megacycles, operations 2 and 3 may be repeated until the best results are obtained.

Wave Trap Adjustment.

(Leave the receiver connected in the same manner as when making the Radio Frequency Adjustments.)

1. Tune set to 1000 K. C.
2. Set the signal generator frequency to 455 K. C. and introduce a fairly strong Modulated signal to the receiver.
3. Adjust the wave trap aligner for minimum signal.

TERMINALS OF SOCKETS

DATA SEE INDEX

STROMBERG-CARLSON TEL. MFG. CO.

Use a good modulated signal generator (test oscillator with variable output voltage and a sensitive output meter across the voice coil of the speaker.)

Always align using the smallest possible input from the signal generator. A strong signal makes adjustments inaccurate.

Always have the volume control "full on".

ALIGNING PROCEDURE. (Follow this order exactly.)

I. Dial pointer adjustment.

With the plates of the gang tuning capacitor fully engaged, check to be sure that the dial pointer is in a vertical position directly on the calibration marks located at the low frequency end of the dial scale. Adjust the dial pointer if necessary.

II. Intermediate frequency adjustments.

1. Set range switch to Standard Broadcast position.
2. Tune set to extreme low frequency end of dial.
3. Connect the ground terminal of the signal generator to the ground terminal of the chassis.
4. Introduce a modulated signal of 455 kilocycles to the grid of the 6SA7 Modulator and Oscillator tube (terminal No. 8) using a 0.1 microfarad capacitor in series with the output lead of the signal generator.
5. Adjust the I. F. aligners for maximum output in the following order:
 - A. Secondary of second I. F. Transformer.
 - B. Primary of second I. F. Transformer.
 - C. Secondary of first I. F. Transformer.
 - D. Primary of first I. F. Transformer.

III. Radio frequency adjustments.

Short Wave Range

1. Remove the output lead of the signal generator and the 0.1 microfarad capacitor from the grid of the 6SA7 tube.

2. Disconnect the output lead from the signal generator and replace with a few turns of wire connected to the signal generator output terminals.
3. Place the signal generator two or three feet from the receiver's loop.
4. Set the range switch to the short-wave range position.
5. Set the signal generator frequency and the receiver tuning dial to 9 megacycles.
6. Adjust the 9 megacycle oscillator and loop aligners (iron cores) for maximum signal.
7. Set the signal generator frequency and the receiver tuning dial to 12 megacycles.
8. Adjust the 12 megacycle oscillator aligning capacitors for maximum signal. Then rock the tuning gang capacitor slowly through resonance and adjust the 12 megacycle loop aligning capacitor for maximum signal.
9. Repeat operations 5 and 6.
10. Repeat operations 7 and 8.

Standard Broadcast Range

1. Set the range switch to the "Loop" position.
2. Set the signal generator frequency and the receiver tuning dial to 600 kilocycles.
3. Adjust the 600 K. C. oscillator and loop aligner (iron cores) for maximum signal.
4. Set the signal generator frequency and the receiver tuning dial to 1500 kilocycles.
5. Adjust the 1500 K. C. oscillator and loop aligning capacitors for maximum signal.
7. Repeat operations 2 and 3.
8. Repeat operations 4 and 5.

IV. Wave trap adjustment

1. Tune the receiver to 1000 kc.
2. Set the signal generator frequency to 455 kc., and introduce a fairly strong modulated signal to the receiver.
3. Adjust the wave trap aligning capacitor for minimum signal.

TERMINALS OF SOCKETS

ADJUSTING THE DIAL LAMP. To obtain the proper illumination of the dial, slide the two dial lamp sockets on their mounting brackets to the position where maximum illumination of the dial is obtained.

Showing Typical Wiring of Push Button Set-up Terminal Strip

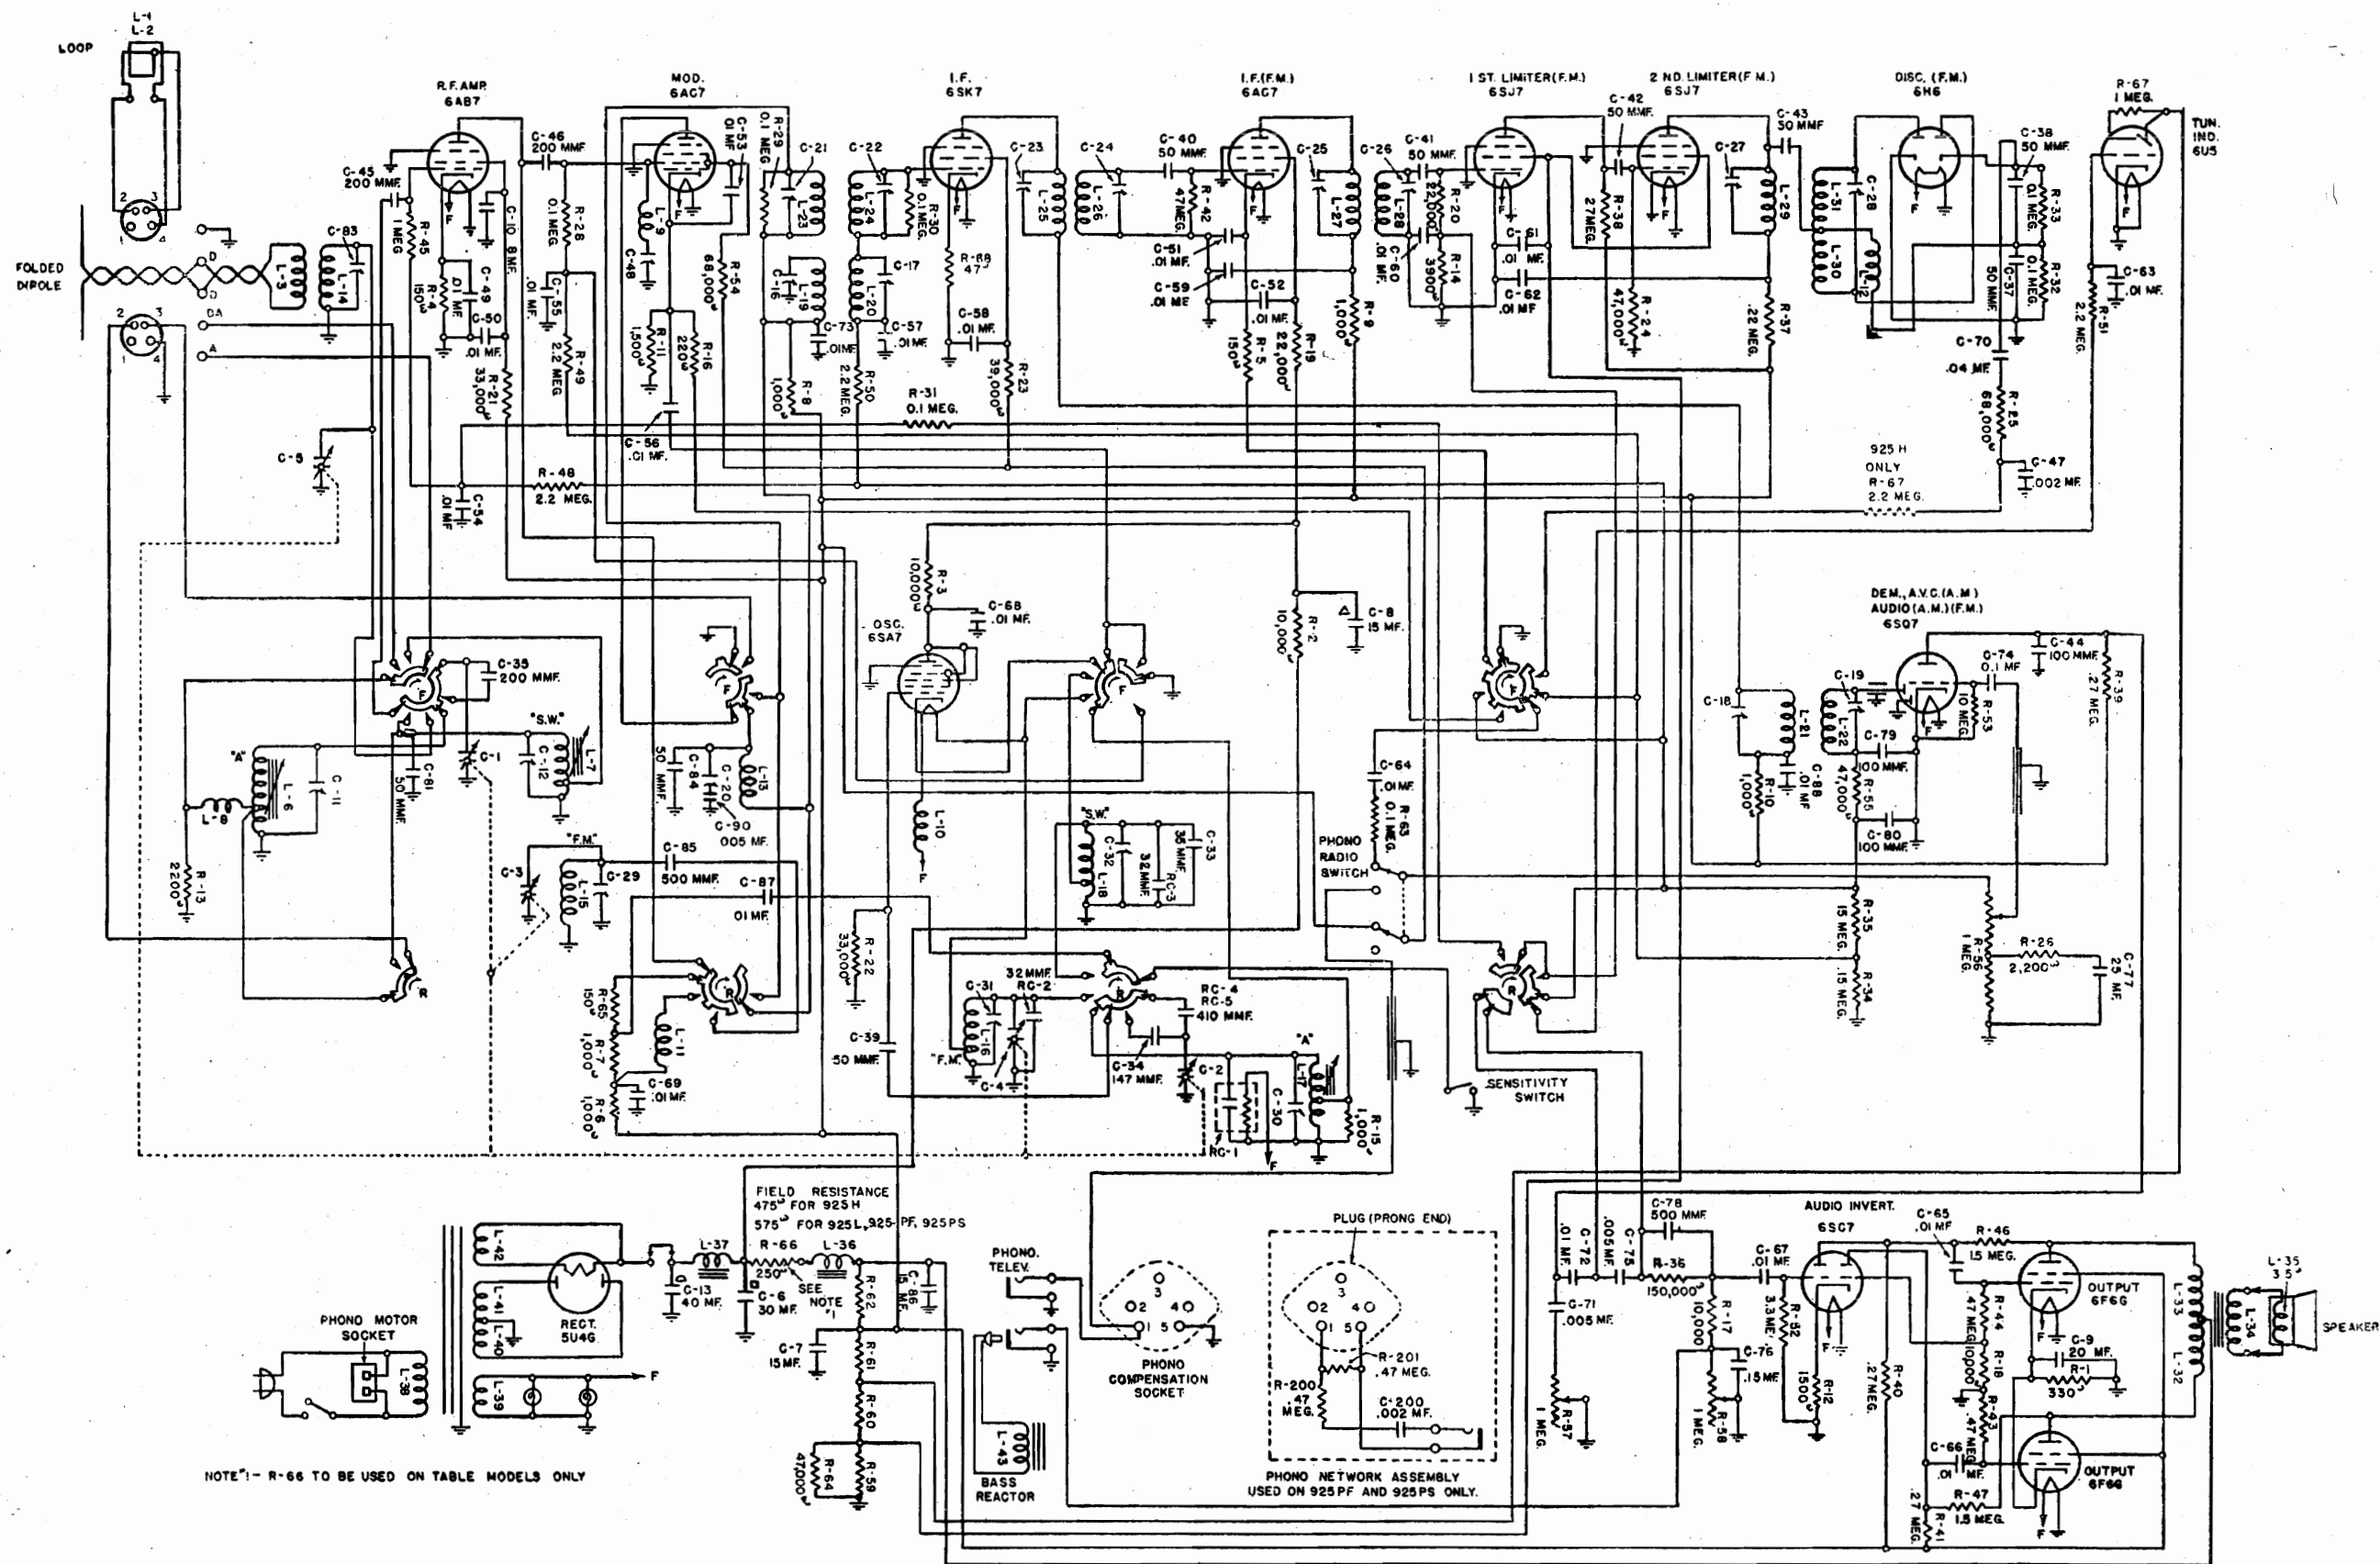

PHONOGRAPH OPERATION. The 935-PL, PF and PR Phonograph Models are equipped with an automatic record changer using a one ounce sapphire pick-up in conjunction with specially equalized circuits. This type of pick-up eliminates the frequent changing of needles and reduces record wear to a minimum. This record player shifts and plays the standard 10 or 12 inch records. The 935-M Receivers are provided with a phonograph jack on the back of the chassis into which a record player may be plugged.

Speaker Voice Coil Impedance	3.5 ohms
Power Output	10 watts 10% distortion, 16 watts maximum

INSTRUCTIONS FOR SETTING UP PUSH BUTTONS

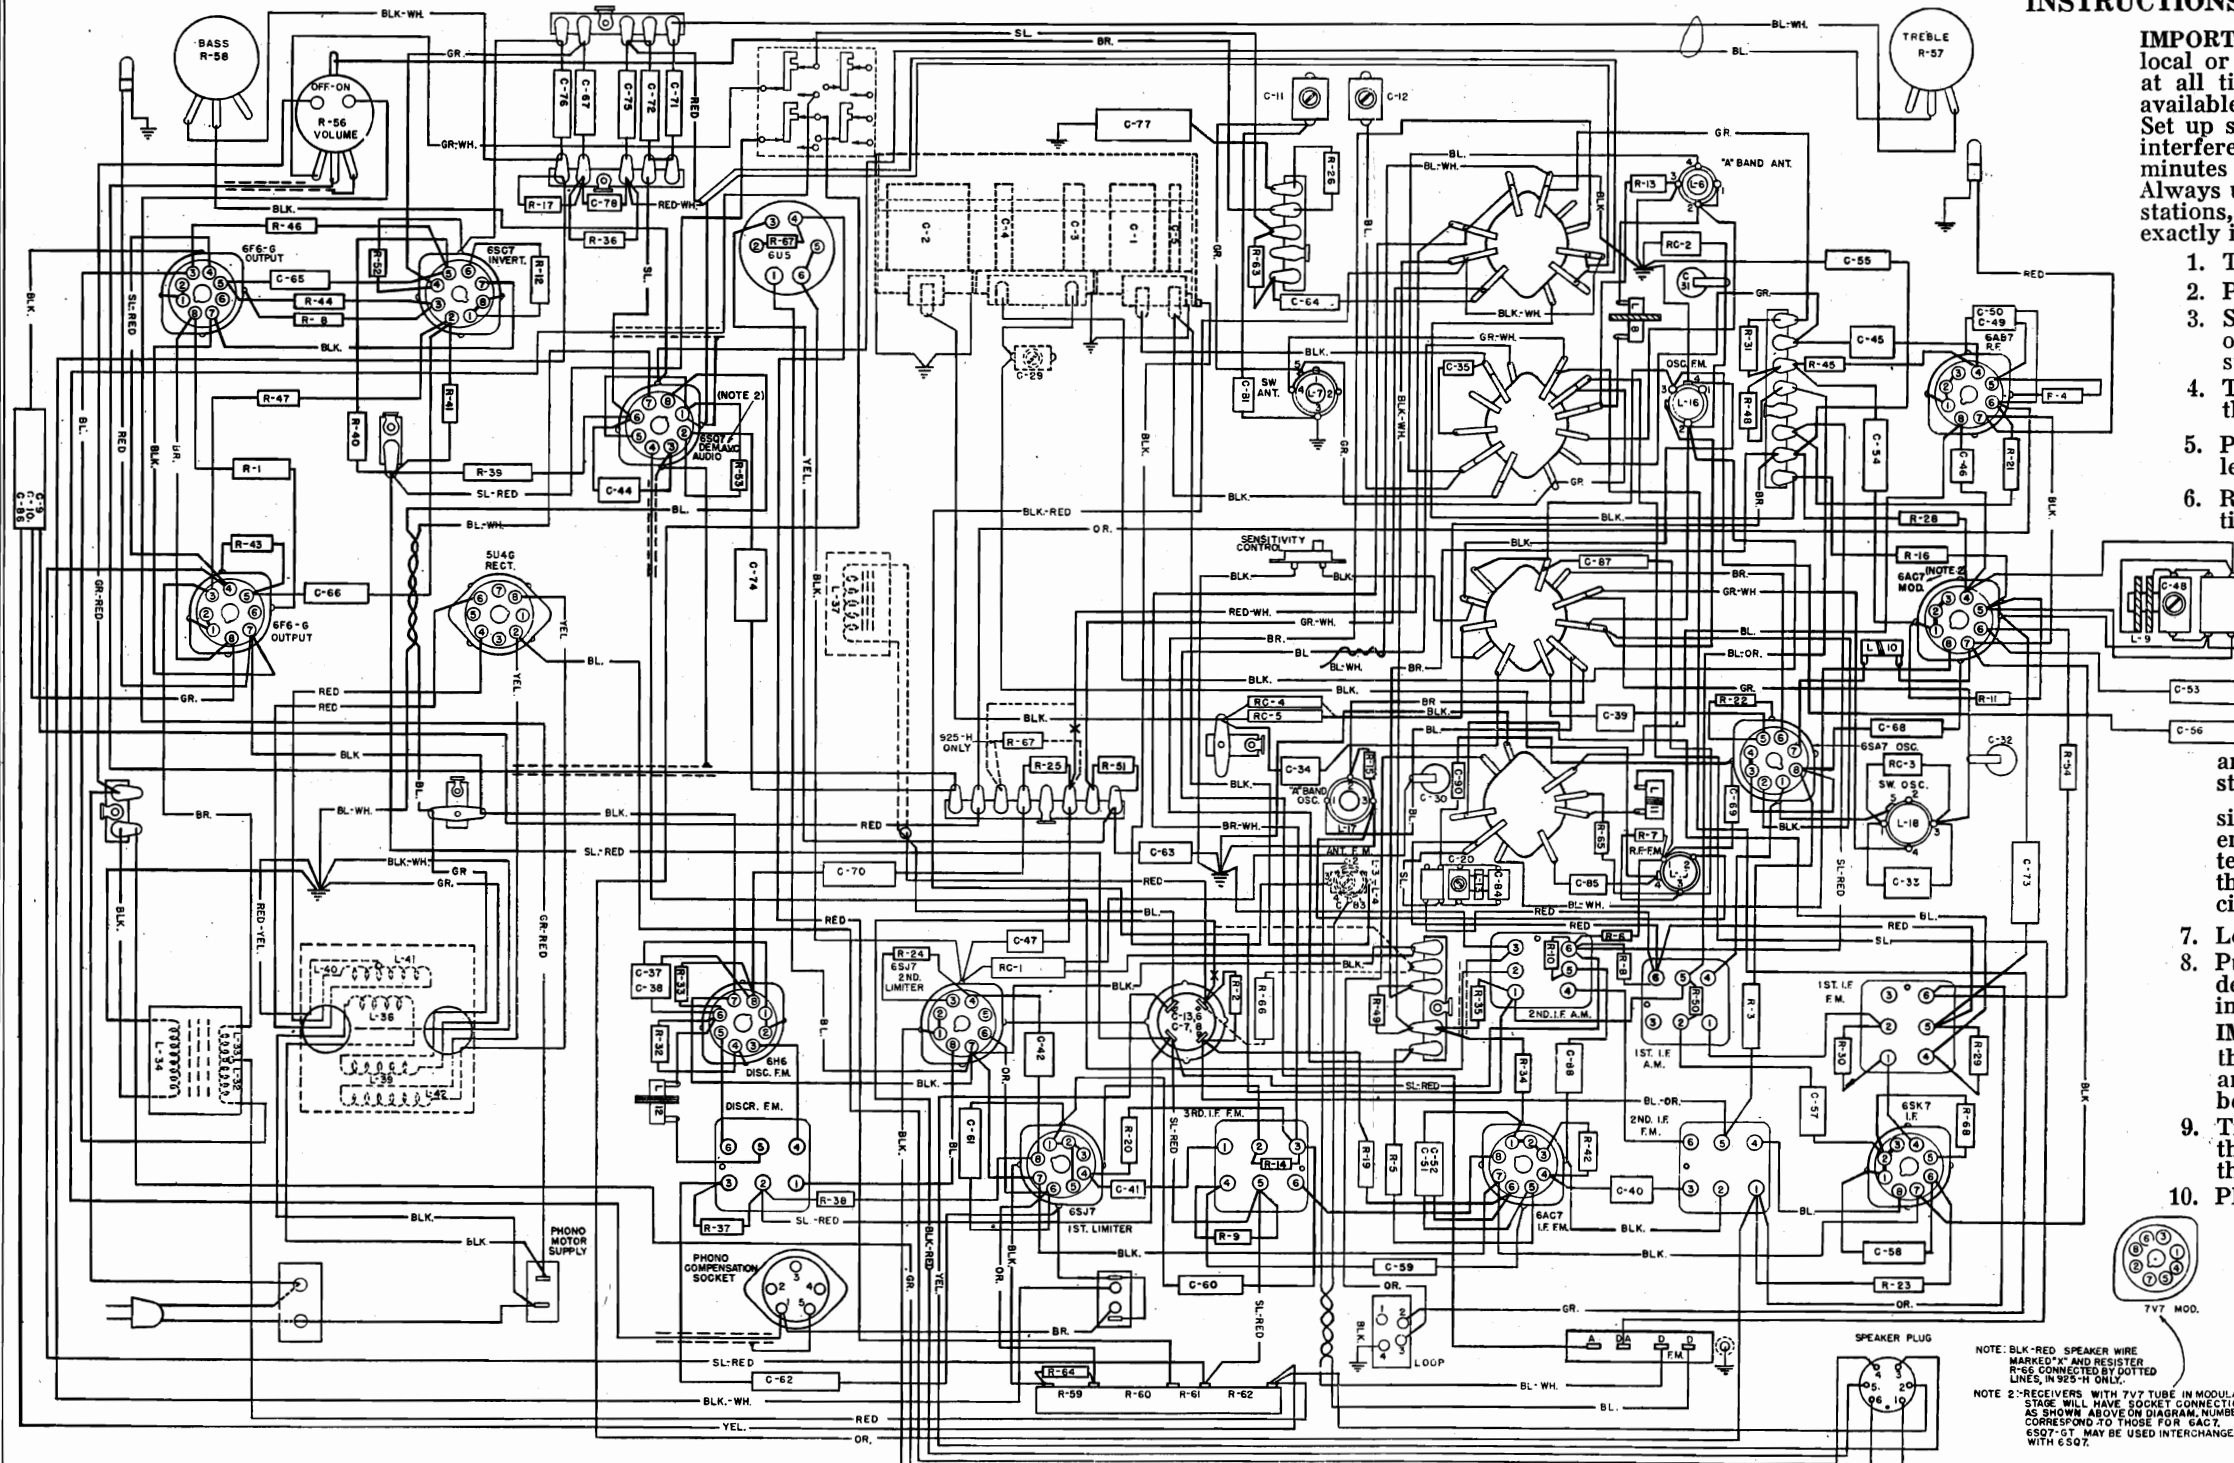

IMPORTANT: The stations selected should be the local or favorite stations which give good reception at all times. If a Frequency Modulation station is available, it may be set up on one of the push buttons. Set up stations in the daytime to avoid unnecessary interference. Allow the set to run for about twenty minutes before setting up stations. Always use the tuning indicator unit when setting up stations, in order to determine when the station is exactly in tune.

1. Turn the receiver "On".
2. Push in the button designated "Radio".
3. Set the range switch to the Standard Broadcast or F. M. position depending on the particular stations which are to be set up.
4. Turn volume control about three-quarters of the way on (in a clockwise direction).
5. Pull the six station push buttons off their levers.
6. Remove the call letters of the six selected stations from the call letter sheets, which are in

an envelope stapled to the cabinet. Insert the station call letters part way in the slots at the sides of the buttons. Next, insert a transparent tab in each slot in front of the station letters. Then push both the transparent tabs and the call letters all the way into the slot. (A pencil eraser may be helpful.)

7. Loosen the set screw of the lever to be set up.
8. Push in the lever and manually tune in the desired station, observing the tuning indicator in order to obtain exact resonance.
9. Tighten the set screw. Be sure not to disturb the adjustment in any way while tightening the screw.
10. Place the proper button on the lever.

IN MODEL 925PF, WEBSTER 22 or 24 RECORD CHANGER IS USED.
IN MODEL 925PS, FARNSWORTH CAPEHART P44 RECORD CHANGER IS USED.
FOR DATA ON THESE, SEE RIDER'S "AUTOMATIC RECORD CHANGERS AND RECORDERS".

NOTE: BLK-RED SPEAKER WIRE MARKED "M" AND RESISTOR R-66 CONNECTED BY DOTTED LINES, IN 925-H ONLY.
NOTE 2: RECEIVERS WITH 7U7 TUBE IN MODULATOR STAGE WILL HAVE SOCKET CONNECTIONS AS SHOWN ABOVE ON DIAGRAM, NUMBERS CORRESPOND TO THOSE FOR 6AV6. 6S07-GT MAY BE USED INTERCHANGEABLY WITH 6S07.

STROMBERG-CARLSON TEL. MFG. CO.

ALIGNING INFORMATION

NEVER REALIGN UNLESS ABSOLUTELY NECESSARY.

GENERAL. All aligning adjustments are carefully made at the factory with special equipment which is designed for aligning Frequency Modulation receivers. The limitations of commercial oscillographs and other ordinary test equipment are such that alignment should not be attempted in the field unless absolutely necessary.

If alignment is attempted, it will not be successful unless the instructions which follow are adhered to exactly.

The following equipment will be required:

1. Standard signal generator with sweep circuit.
2. Wide band sweep signal generator.
3. Oscillograph.
4. Microammeter—0 to 200 microamps.
5. Center "0" microammeter with 100 divisions either side of "0".

See location chart for location of all aligners.

ALIGNING PROCEDURE (AMP. MOD.)

I. Dial Pointer Adjustment. (A. M.)

With the plates of the gang tuning capacitor fully engaged, check to be sure that the dial pointer is in a vertical position directly on the calibration marks located at the low frequency end of the dial scale. Adjust if necessary.

II. Intermediate Frequency Adjustments. (A. M.)

1. Set the range switch to standard broadcast position.
2. Tune set to extreme low frequency end of dial.
3. Connect the ground terminal of the signal generator to the ground terminal of the chassis.
4. Introduce a modulated signal of 455 kilocycles to the grid of the 6AC7 or 7V7 Modulator, using a 0.1 mmf. capacitor in series with the output lead of the signal generator.
5. Adjust the I. F. aligners for maximum output in the following order:
 - a. Secondary of second I. F. transformer.
 - b. Primary of second I. F. transformer.
 - c. Secondary of first I. F. transformer.
 - d. Primary of first I. F. transformer.

III. Wave Trap Adjustment.

(Leave the signal generator connected in the same manner as when making the A. M. I. F. Frequency adjustments.)

1. Tune the set to 1000 kc.
2. Introduce a fairly strong modulated signal to the grid of the modulator tube and adjust the wave trap aligner for minimum signal.

IV. Radio Frequency Adjustments. (A. M.)

Standard Broadcast Range (A Band)

1. Remove the output lead from the signal generator and the grid of the modulator tube.
2. Connect a few turns of wire to the output terminals of the signal generator.
3. Place the signal generator two or three feet away from the receiver's loop.
4. Set the range switch to the Standard Broadcast range (A Band).
5. Set the signal generator frequency and the receiver tuning dial to 600 kc.

6. Adjust the 600 kc. oscillator and antenna aligners (iron cores) for maximum signal.
7. Set the signal generator frequency and the receiver tuning dial to 1500 kc.
8. Adjust the 1500 kc. oscillator and antenna aligning capacitors for maximum signal.
9. Repeat operations three and four.
10. Repeat operations five and six.

Short Wave Range (C Band)

1. Set the range switch to the Short Wave Range (C Band).
2. Set the signal generator frequency and the receiver tuning dial to 9 megacycles.
3. Adjust the 9 megacycle oscillator and antenna aligners (iron cores) for maximum signal.
4. Set the signal generator frequency and the receiver tuning dial to 12 megacycles.
5. Adjust the 12 megacycle oscillator and antenna aligning capacitors for maximum signal.
6. Repeat operations three and four.
7. Repeat operations five and six.

Note: After the receiver has been placed in the cabinet, plug the loops into their respective sockets and readjust the Standard Broadcast and Short Wave antenna high frequency shunt aligners for maximum signal.

ALIGNING PROCEDURE (FREQ. MOD.)

V. Intermediate Frequency Adjustments. (F. M.)

Note: All I. F. adjustments are made using a wide band sweep signal generator with a sweep circuit of plus or minus 300 kilocycles.

1. Set the range switch to the F. M. position.
2. Tune the set to the extreme high frequency end of the dial (50 megacycles).
3. Connect the 0-200 microammeter between the R-14, 3900-ohm resistor and ground.
4. Connect the oscillograph between ground and the tap of the limiter grid resistors R-14 and R-20.
5. Connect the ground terminal of the wide band sweep signal generator to the ground terminal of the 6AC7 second I. F. tube socket.
6. Introduce a signal of 4.3 megacycles to the grid of the 6AC7 second I. F. tube socket (terminal No. 4), using a 0.1 capacitor in series with the output lead of the signal generator. Keep the 0 to 200 microammeter at approximately 100 microamps.
7. Adjust the secondary and primary of the third I. F. transformer for maximum reading on the 0 to 200 microammeter. Check pattern on oscilloscope for symmetrical curve.
8. Connect the output lead of the wide band sweep signal generator and the 0.1 microfarad capacitor in series with it to the grid of the 6SK7 first I. F. tube socket (terminal No. 4).
9. Connect the ground lead of the signal generator to the ground terminal of the 6SK7 first I. F. tube socket.
10. Adjust the second I. F. transformer for maximum reading of microammeter.
11. Connect the output lead of the wide band sweep signal generator with the 0.1 microfarad capacitor in series with it to the grid of the 6AB7 R. F. tube.

12. Connect the ground terminal of the signal generator to the ground terminal of the 6AB7 tube socket.
13. Adjust the first I. F. transformer for maximum reading on microammeter. Adjust slightly for symmetrical curve on oscilloscope.

VI. Discriminator Adjustment. (F. M.)

1. Connect the ground terminal of the standard unmodulated signal generator to the ground terminal of the 6SK7 first I. F. tube socket.
2. Connect the output lead of the unmodulated standard signal generator to the grid of the 6SK7 first I. F. tube (terminal No. 4), using a 0.1 microfarad capacitor in series with the output lead of the standard signal generator, leaving the wide band sweep signal generator connected to the grid of the 6AB7 R. F. tube socket.
3. Adjust the attenuator of the wide band sweep signal generator for a curve on the oscilloscope.
4. Set the frequency of the unmodulated standard signal generator to approximately 4.3 megacycles and adjust the attenuator for interference patterns on the oscilloscope. Adjust the unmodulated standard signal generator frequency until interference patterns on each trace come together. (This is done in order to assure that the frequency of the standard signal generator which is used to align the discriminator coincides with the mean frequency of the wide band sweep signal generator.)
5. Remove the wide band sweep signal generator.
6. Connect the center "0" microammeter with a .5 megohm resistor in series across one-half of the discriminator load. (From ground to the junction of the two .1 megohm resistors R-32 and R-33.)
7. Set the attenuator of the standard signal generator for maximum output.

8. Adjust the primary of the discriminator transformer for maximum reading on the center "0" microammeter.
9. Connect the center "0" microammeter and the .5 megohm resistor in series with it across the whole discriminator load. (From ground to the junction of R-33 .1 megohm resistor and C-70 .04 mf. capacitor.)
10. Adjust the secondary of the discriminator transformer for center "0" reading of the microammeter.
11. Vary the frequency of the standard signal generator, making sure that the voltage peaks, which should be of the same magnitude, are the same number of kilocycles off on either side of resonance. Any departure from these conditions may be corrected by a slight re-adjustment of the primary.

Note: Leave the wide band sweep signal generator connected to the grid of the 6SB7 R. F. tube socket and make slight readjustments of the I. F. transformers for proper curve, since there is some interaction between these stages and the discriminator.

VII. Radio Frequency Adjustments (F. M.)

1. Set the signal generator frequency and the receiver tuning dial to 48.5 megacycles.
2. Replace the 0.1 microfarad capacitor in series with the output lead from the signal generator with a 100 ohm resistor and connect it to one of the F. M. terminals on the back of the chassis.
3. Connect the ground lead of the signal generator to the other F. M. terminal.
4. Adjust the oscillator aligner (air trimmer) for maximum signal.
5. Adjust the R. F. and antenna aligners for maximum signal on the 0 to 200 microammeter, maintaining the center "0" microammeter at "0" at all times by rotating the receiver dial slightly back and forth.

NORMAL VOLTAGE READINGS

NOTE: These receivers use either a 6AC7 or 7V7 tube in the modulator stage. (See wiring diagram)

Take all readings with chassis operating and tuned manually to 1000 kc. or 47 megacycles—no signal. Use a line voltage of 120 volts or make allowance for the variation.

Use a good high resistance voltmeter having a resistance of at least 1000 ohms per volt.

Take all D. C. readings on the 500 volt scale, except when an asterisk appears.

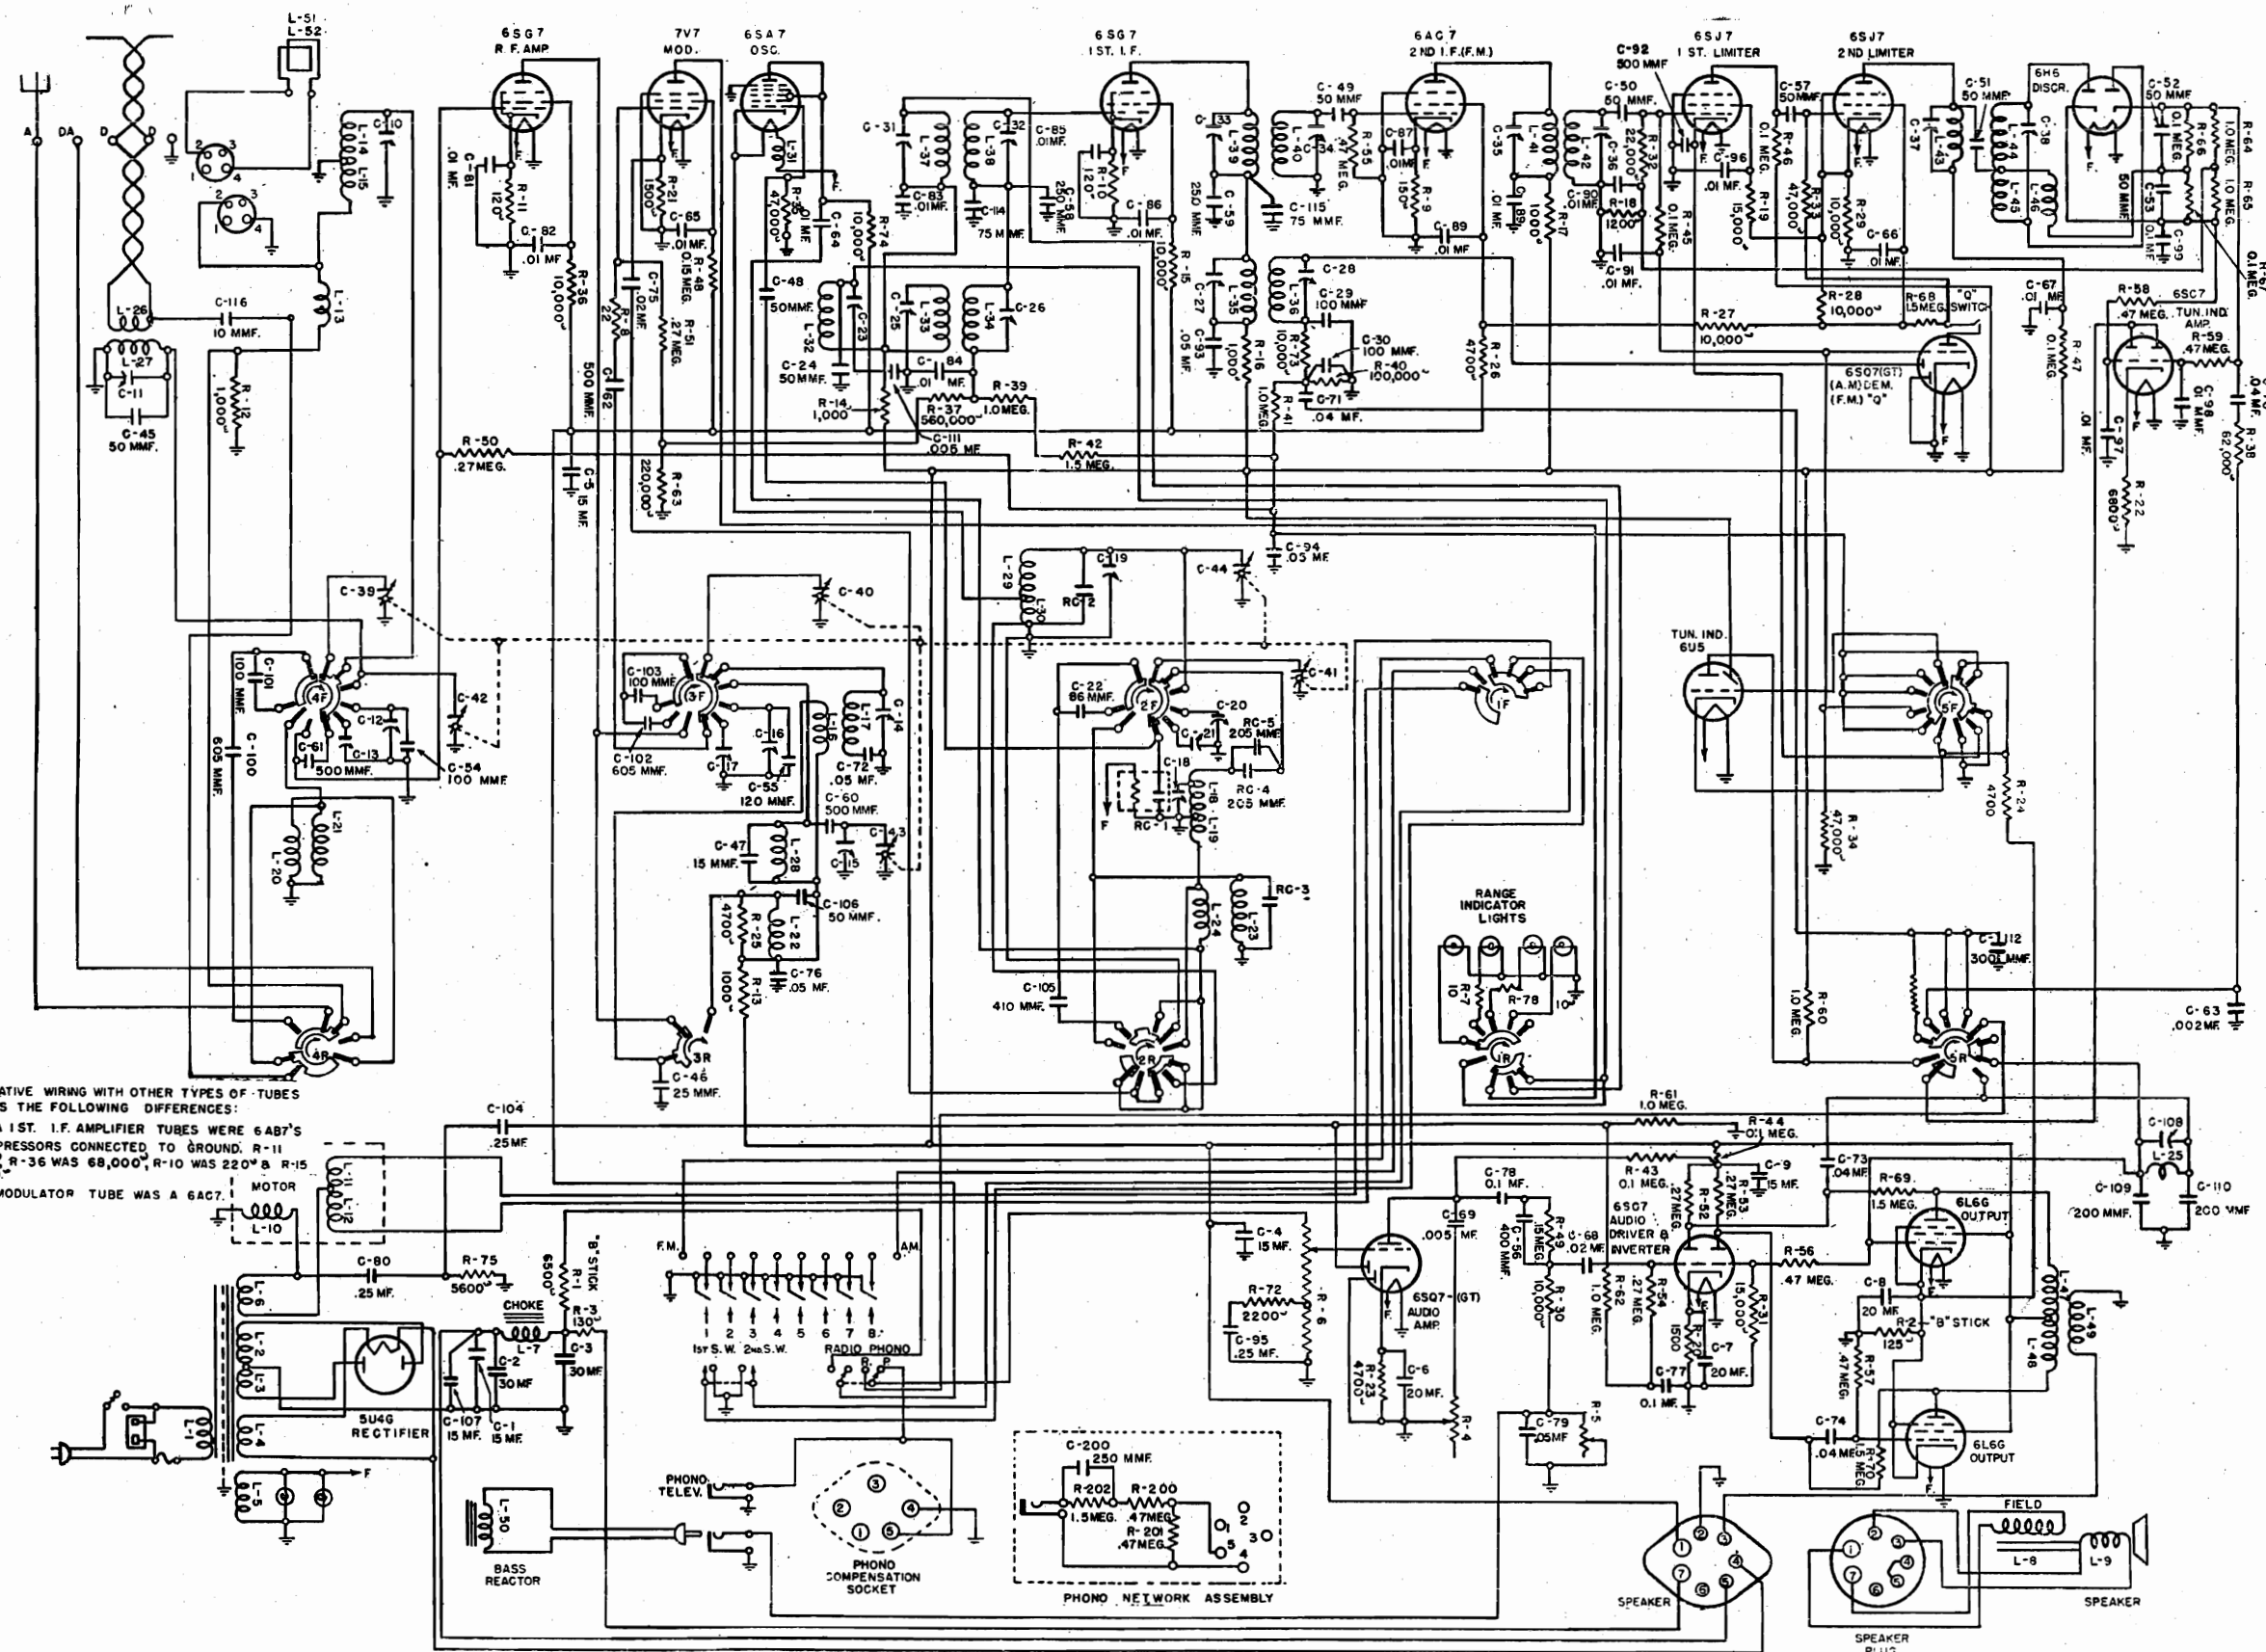

Read from indicated terminals to chassis base. See location chart for position of terminals. A. C. voltages are indicated by italics.

Intermediate Frequency { 455 Kilocycles (Amplitude Modulation)	
4.3 Megacycles (Frequency Modulation)	
Speaker Field Coil Resistance	345 Ohms
Speaker Voice Coil Impedance	10 Ohms
Power Output	19 Watts at 10% Distortion

STROMBERG-CARLSON TEL. MFG. CO.

9. Connect the ground lead of the signal generator to the ground terminal of the first I. F. tube socket.
10. Adjust the second I. F. transformer in the same manner.
11. Connect the output lead of the wide band sweep signal generator in series with the output lead of the Modulator tube.
12. Adjust the first I. F. transformer in the same manner.

II. Discriminator Adjustment (F. M.)

1. Connect the ground terminal of the standard unmodulated signal generator to the ground terminal of the first I. F. tube socket.
2. Connect the output lead of the unmodulated standard signal generator to the grid of the first I. F. tube (terminal No. 4) using a 0.1 microfarad capacitor in series with the output lead of the standard signal generator.
3. Place "Q" switch in position where white dot does not show.
4. Ground terminal 8 of 6H6 socket.
5. Connect the Volt Ohmyst across one half of the discriminator load (from ground to the junction of the two .1 megohm resistors R-66 and R-67).
6. Set the attenuator of the standard signal generator for maximum output.
7. Adjust the primary of the discriminator transformer for maximum reading.
8. Connect the volt ohmyst across the whole discriminator load (from ground to the junction of the .1 megohm resistor and C-70 .04 mf. capacitor).
9. Adjust the secondary of the discriminator transformer for center "O" reading.
10. Vary the frequency of the standard signal generator making sure that the voltage peaks, which should be of the same magnitude, are the same number of kilocycles off on either side of the center "O" reading. Under these conditions may be corrected by a slight readjustment of the primary.
11. Remove ground from terminal 8 of 6H6 tube socket.

Radio Frequency Adjustments (F. M.)

1. Set the signal generator frequency and the receiver tuning dial to 48.5 megacycles.
2. Connect a wire between the ground binding post and the nearest F. M. dipole connection.
3. Replace the 0.1 microfarad capacitor in series with the output lead from the signal generator with a 100 ohm resistor and connect it to the other F. M. terminal on the back of the chassis.
4. Connect Volt Ohmyst between ground and terminal No. 6 of the 6S07, "Q" tube socket.
5. Adjust the oscillator aligner (Afr trimmer) for maximum signal.
6. Adjust the R. F. and antenna aligners for maximum signal.

2. Set the signal generator frequency and the receiver tuning dial to 600 kc.
3. Set the range switch to the standard broadcast range (A Band).
4. Adjust the 600 kc. oscillator and R. F. aligners (iron cores) for maximum signal.
5. Set the signal generator frequency and the receiver tuning dial to 1500 kc.
6. Adjust the 1500 kc. oscillator, R. F. and antenna aligning capacitors for maximum signal.
7. Repeat operations five and six.

1st Short Wave Spread Band (Red)

1. Replace the 0.1 mf. capacitor in series with the output lead from the signal generator with a 100 ohm resistor and connect it to the antenna terminal of the chassis.
2. Ground the F. M. dipole terminal which is nearest the ground binding post.
3. Switch to Red Band.
4. Set the signal generator frequency and the receiver tuning dial to 12 megacycles.
5. Adjust the oscillator R. F. and antenna aligning capacitors for maximum signal.
6. Set pointer to 9.0 megacycles on dial and adjust oscillator, R. F. and antenna iron cores for a maximum.
7. Repeat operations 3, 4 and 5.

2nd Short Wave Spread Band (Green)

1. Leave the signal generator connected in the same manner.
2. Switch to Green Band.
3. Set the signal generator frequency and the receiver tuning dial to 17 megacycles.
4. Adjust the oscillator, R. F. and antenna trimmers for maximum signal.

ALIGNING PROCEDURE (FREQ. MOD.)

I. Intermediate Frequency Adjustments (F. M.)

- Note: All I. F. adjustments are made using a wide band sweep signal generator with a sweep circuit of plus or minus 300 Kilocycles.
1. Switch to F. M. band.
 2. Tune the set to the extreme high frequency end of the dial (50 megacycles).
 3. Connect a volt ohmyst or equivalent between sweep signal generator and terminal 6 of the 6S07 "Q" tube socket.
 4. Connect the oscillograph between same points as Volt Ohmyst.
 5. Connect the ground terminal of the wide band sweep signal generator to the ground terminal of the 6A27 second I. F. tube socket.
 6. Introduce a signal of 4.3 megacycles to the grid of the 6A27 second I. F. tube socket (terminal No. 4), using a 0.1 mf. capacitor in series with the output lead of the signal generator. Maintain a reading of about two volts on the Volt Ohmyst.
 7. Adjust the secondary and primary of the third I. F. transformer for maximum reading.
 8. Connect the output lead of the wide band sweep signal generator and the 0.1 microfarad capacitor in series with it to the grid of the first I. F. tube socket terminal No. 4.

Upper values are for Broadcast Band.

Lower values are for F. M. Band.

* Use 10 volt scale. All others except AC on 500 volt scale, 1000 ohm per voltmeter used on DC.

† Value is for white dot showing on "Q" switch, with white dot not showing these values change to 100 volts.

‡ Value shown is for white dot showing; white dot not showing, value is zero. Rectifier filament voltage is 4.6 volts.

ALIGNING INFORMATION

Never Realign Unless Absolutely Necessary

4. Introduce a modulated signal of 455 Kilocycles to the antenna terminal of the chassis. Use 0.1 mf. capacitor in series with the output lead of the signal generator.
5. Adjust the following I. F. aligners for maximum output.
 - A. Secondary of second I. F. transformer.
 - B. Primary of second I. F. transformer.
 - C. Secondary of first I. F. transformer.
 - D. Volt Ohmyst or equivalent.
 - E. Tertiary of first I. F. circuit.

The following equipment will be required:

1. Standard signal generator.
2. F. M. signal generator with wide band sweep circuit.
3. Oscillograph.
4. Volt ohmyst or equivalent.

ALIGNING PROCEDURE (AMP. MOD.)

I. Intermediate Frequency Adjustments (A. M.)

1. Set the range switch to standard broadcast position.
2. Tune set to 1000 kc.
3. Connect the ground terminal of the signal generator to the ground terminal of the chassis. Be sure loop antenna is plugged in.

II. Radio Frequency Adjustments (A. M.)

1. Replace the 0.1 mf. capacitor in series with the output lead of the signal generator with a 200 ohm resistor and connect it to the antenna terminal of the chassis. Be sure loop antenna is plugged in.

MODEL 920

MODELS 935 and 955

STROMBERG-CARLSON TEL. MFG. CO.

INSTRUCTIONS FOR SETTING UP PUSH BUTTONS

MODEL 920

IMPORTANT: The stations selected should be the local or favorite stations which give good reception at all times.

Set up stations in the daytime to avoid unnecessary interference.

Allow the set to run for about twenty minutes before setting up stations.

1. Turn the receiver "On".
2. Push in the "Radio" button.
3. Set the Range Switch as follows:
 - a. If an external antenna is used, set knob so arrow points to designation "ANT."
 - b. If the built-in loop antenna is used, set knob so arrow points to designation "Loop".
4. Turn volume control about three-quarters of the way on (in a clockwise direction).
5. Pull the six station push buttons off their levers.
6. Remove the call letters of the six selected stations from the call letter sheets, which are in an envelope stapled to the cabinet. Insert the station call letters part way in the slots at the sides of

IMPORTANT. The eight selected broadcast stations should be local or favorite stations which give good reception at all times. Set up stations in the daytime to avoid unnecessary interference. Allow the set to run for about twenty minutes before setting up stations. Always use the tuning indicator unit when setting up stations in order to determine when the station is correctly tuned in.

1. Turn the receiver "on" by rotating the "Off-On-Volume" control.
2. Push in the button designated, "Radio".
3. Decide which buttons are to be used for F. M. stations and which for standard broadcast stations. (Button No. 1 is the extreme right-hand button.)

On the push-button set-up terminal strip (see Figure 3), connect the F. M. button terminal to the end terminal labelled F. M., and the standard broadcast button terminals to the other end terminal labelled A. M.

NOTE: All station buttons may be used for either the F. M. or standard broadcast range, but if it is desired to tune in both F. M. stations and standard broadcast stations either manually or with push buttons, at least one station button must be set up for each range.

4. Turn the Volume control to about three-quarters of its maximum rotation (in clockwise directions).
5. Pull the eight station push buttons off their levers.
6. Remove the station identification tabs from the sheets which will be found in the envelope stapled to the cabinet. For stations located in the standard broadcast range, call letters are provided; for identification of F. M. stations, assigned channel numbers from 21 to 99 are provided for the push buttons. Push buttons set up for F. M. stations should be designated by inserting the appropriate channel number tabs.

For example, assume that a local F. M. station's call is W51R. This indicates that its assigned frequency is 45.1 megacycles. Therefore, the channel number tab, 51, which corresponds to the last two numbers of the assigned frequency would be inserted in the push but-

ton. Next, insert a transparent tab in each slot in front of the station letters. Then push both the transparent tabs and the call letters all the way into the slot. A pencil eraser may be helpful.

7. Loosen the set screw of the lever to be set up.
 8. Push in the lever and manually tune in the desired station, observing the tuning indicator in order to obtain exact resonance.
- IMPORTANT:** For accurate set-up, be sure that the lever is pushed in, in the same manner and with the same amount of pressure as will be used when operating the push buttons.
9. Tighten the set screw. Be sure not to disturb the adjustment in any way while tightening the screw.
 10. Place the proper button on the lever.
 11. Check the accuracy of the adjustment by detuning the station and retuning with the button several times, pushing the button with an even pressure. Readjust if necessary.
 12. Set up the other five stations in the same manner.

MODEL 935

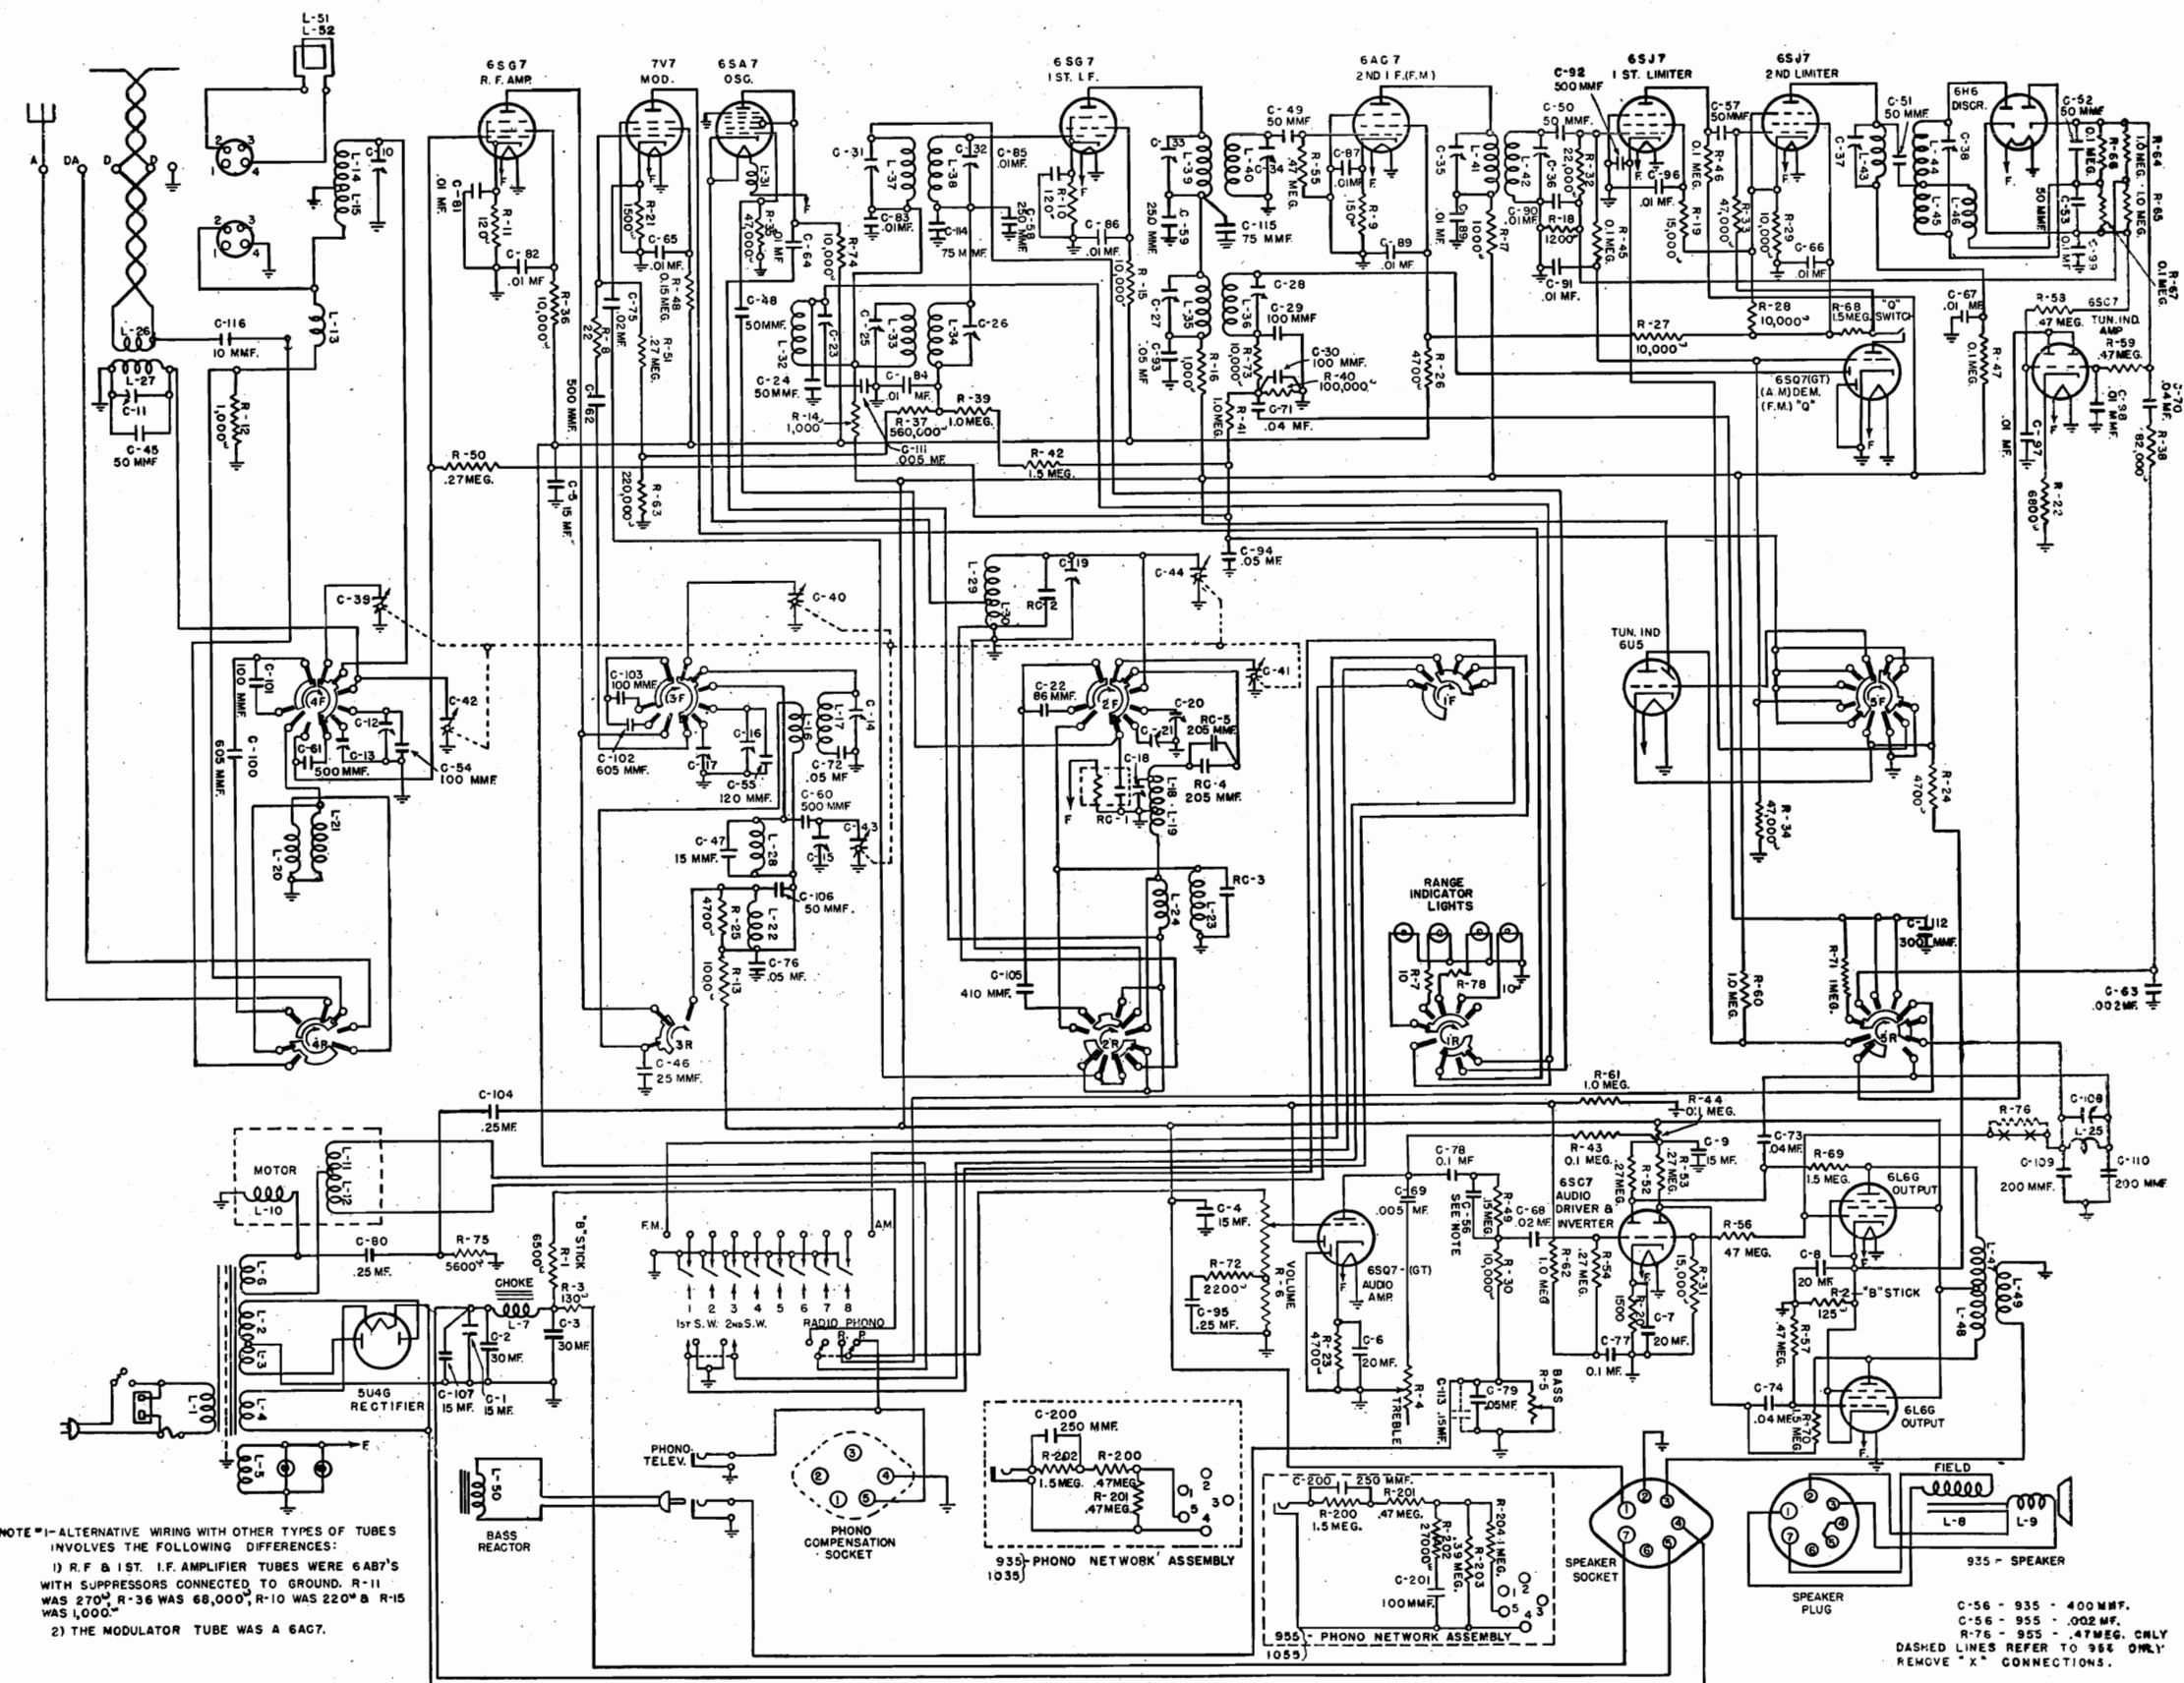

MODEL 955

ton. Channel numbers for F. M. stations will not be repeated in the same or nearby localities; thus the tabs provided will always be suitable for these stations. Insert the station identification tabs part way in the slots at the sides of the buttons. Next insert a transparent tab in each slot in front of the station identification tabs. Then push both the transparent tab and the station identification tabs all the way into the slot.

7. Loosen the set screw of the lever to be set up.
 8. Push in the lever and manually tune in the desired station, observing the tuning indicator in order to obtain exact resonance.
- IMPORTANT.** For accurate set up, it is essential that the lever be pushed in, in the same manner and with the same amount of pressure as will be used in the normal operation of the push buttons.
9. Tighten the set screw. Be sure not to disturb the adjustment in any way while tightening the screw.
 10. Place the proper button on the lever.
 11. Check the accuracy of the adjustment by detuning the station and returning with this button several times, pushing the button with an even pressure. Readjust if necessary.
 12. Set up the other seven stations in the same manner.

In order that the push buttons may be set up for either A. M. or F. M. stations we have provided a terminal strip in the rear of the chassis which has ten screw type terminals. The F. M. connection is on the left end (facing the rear of the chassis), the A. M. connection on the right. It is possible, therefore, to connect any one of the eight push button terminals for either A. M. or F. M. operation by merely connecting the push button terminals required for F. M. operation to the terminal marked F. M. and the buttons to be used on the A. M. band to terminal marked A. M. When the sets leave our factory terminals one and two are connected for F. M., the other six for A. M. See cut below.

- with the output lead of the signal generator. Maintain a reading of about two volts on the Volt Ohmyst.
- 7. Adjust the secondary and primary of the third I. F. transformer for maximum reading.
- 8. Connect the output lead of the wide band sweep signal generator and the 0.1 microfarad capacitor in series with it to the grid of the first I. F. tube socket terminal No. 4.
- 9. Connect the ground lead of the signal generator to the ground terminal of the first I. F. tube socket.
- 10. Adjust the second I. F. transformer in the same manner.
- 11. Connect the output lead of the wide band sweep signal generator with the 0.1 microfarad capacitor in series with it to the grid of the Modulator tube.
- 12. Adjust the first I. F. transformer in the same manner.

- II. Discriminator Adjustments (F. M.)
1. Connect the ground terminal of the standard unmodulated signal generator to the ground terminal of the first I. F. tube socket.
 2. Connect the output lead of the unmodulated standard signal generator to the grid of the first I. F. tube (terminal No. 4) using a 0.1 microfarad capacitor in series with the output lead of the standard signal generator.
 3. Place "Q" switch in position where white dot does not show.
 4. Ground terminal 8 of 6H6 socket.
 5. Connect the Volt Ohmyst across one half of the discriminator load (from ground to the junction of the two .1 megohm resistors R-66 and R-67).
 6. Set the attenuator of the standard signal generator for maximum output.
 7. Adjust the primary of the discriminator transformer for maximum reading.
 8. Connect the volt ohmyst across the whole discriminator load (from ground to the junction of R-66, 0.1 megohm resistor and C-70 .04 mf. capacitor).
 9. Adjust the secondary of the discriminator transformer for center "Q" reading.
 10. Vary the frequency of the standard signal generator making sure that the voltage peaks, which should be of the same magnitude, are the same number of kilocycles off on either side of the center. If necessary, these conditions may be corrected by a slight re-adjustment of the primary.
 11. Remove ground from terminal 8 of 6H6 tube socket.

- Radio Frequency Adjustments (F. M.)
1. Set the signal generator frequency and the receiver tuning dial to 48.5 megacycles.
 2. Connect a wire between the ground binding post and the nearest F. M. dipole connection.
 3. Replace the 0.1 microfarad capacitor in series with the output lead from the signal generator with a .100 ohm resistor and connect it to the other F. M. terminal on the back of the chassis.
 4. Connect Volt Ohmyst between ground and terminal No. 6 of the 6SQ7 "Q" tube socket.
 5. Adjust the maximum signal.
 6. Adjust the R. F. and antenna aligners for maximum signal.

- A. Secondary of second I. F. transformer.
 B. Primary of second I. F. transformer.
 C. Primary of first I. F. transformer.
 D. Primary of first I. F. transformer.
 E. Tertiary of first I. F. circuit.
- Radio Frequency Adjustments (A. M.)
 Standard Broadcast Range (A Band)
1. Replace the 0.1 mf. capacitor in series with the output lead of the signal generator with a 200 mmf. capacitor and connect it to the antenna terminal of the chassis. Be sure loop antenna is plugged in.
 2. Set the signal generator frequency and the receiver tuning dial to 600 kc.
 3. Set the range switch to the standard broadcast range (A Band).
 4. Adjust the 600 kc. oscillator and R. F. aligners (iron cores) for maximum signal.
 5. Set the signal generator frequency and the receiver tuning dial to 1500 kc.
 6. Adjust the 1500 kc. oscillator, R. F. and antenna aligning capacitors for maximum signal.
 7. Repeat operations five and six.

- 1st Short Wave Spread Band (Red)
1. Replace the 0.1 mf. capacitor in series with the output lead from the signal generator with a 400 ohm carbon type resistor and connect it to the antenna terminal of the chassis.
 2. Ground the F. M. dipole terminal, which is nearest the ground binding post.
 3. Switch to Red Band.
 4. Set the signal generator frequency and the receiver tuning dial to 12 megacycles.
 5. Adjust the oscillator R. F. and antenna aligning capacitors for maximum signal.
 6. Set pointer to 9.0 megacycles on dial and adjust oscillator, R. F. and antenna iron cores for a maximum.
 7. Repeat operations 3, 4 and 5.
- 2nd Short Wave Spread Band (Green)
1. Leave the signal generator connected in the same manner.
 2. Switch to Green Band.
 3. Set the signal generator frequency and the receiver tuning dial to 17 megacycles.
 4. Adjust the oscillator, R. F. and antenna trimmers for maximum signal.

- ALIGNING PROCEDURE (FREQ. MOD.)
- I. Intermediate Frequency Adjustments (F. M.)
- Note: All I. F. adjustments are made using a wide band sweep signal generator with a sweep circuit of plus or minus 300 kilocycles.
1. Switch to F. M. band.
 2. Tune the set to the extreme high frequency end of the dial (50 megacycles).
 3. Connect a volt ohmyst or equivalent between ground and terminal 6 of the 6SQ7 "Q" tube socket.
 4. Connect the oscillograph between same points as Volt Ohmyst.
 5. Connect the ground terminal of the wide band sweep signal generator to the ground terminal of the 6AC7 second I. F. tube socket.
 6. Introduce a signal of 4.3 megacycles to the grid of the 6AC7 second I. F. tube socket (terminal No. 4), using a 0.1 mf. capacitor in series

MODEL R-701

MODEL R-699

1. Superheterodyne Theory and Alignment

Most Auto Radios employ the superheterodyne circuit which uses an intermediate frequency (I-F) amplifier, the characteristics of which largely govern the selectivity of the receiver. The I-F amplifier characteristics are determined principally by the adjustment and design of the I-F transformers. It is, therefore, important that the I-F amplifier be correctly adjusted to provide the best selectivity. These adjustments may be in the form of adjustable trimmers connected across the coils or movable iron cores placed within the coils. During alignment, it is necessary only to adjust these trimmers or iron cores as specified in the tabular Alignment Procedure, to obtain the best operation.

Incorporated in every superheterodyne is a local oscillator, the output of which mixes with the incoming signal from the antenna. The local oscillator does not operate at the same frequency as the incoming signal which is to be received. The resonant (acceptance) frequency of the I-F amplifier establishes the difference in frequency required; 262 KC is commonly used. In most auto radios the local oscillator operates at a frequency higher than the incoming signal frequency. When the local oscillator output mixes with the incoming signal, the two predominating resultant frequencies produced are the sum and difference of the two frequencies. The design of most superheterodyne receivers is such that the difference in frequency is the same as the I-F amplifier resonant frequency. Modulation of the incoming signal will be present as modulation of input to the I-F amplifier.

2. Effects of R-F or I-F Misalignment

The effects of misaligned R-F or I-F stages are most commonly observed as a loss of sensitivity either over a portion or over the entire band; loss of selectivity, often characterized by the selectivity being noticeably unequal on the two sides of the point of best reception; change in fidelity; and inaccurate dial readings. Loss of Fidelity will be apparent as a loss of high or low audio frequencies. If the I-F amplifier is not tuned to the specified frequency, the oscillator and other tuned circuits will not track. The dial readings will then be incorrect and a portion of the band will have low sensitivity.

3. Alignment Preliminaries

The radio receiver should be functioning normally before the various aligning adjustments are made. The trouble shooting, if necessary, should precede the final alignment.

Receiving signals at the correct dial setting depends upon having the proper relation between tuning condenser or iron cores and the dial scale. Pointer or dial setting is necessary because the scales are not linear with frequency and all scales are pre-calibrated for maximum accuracy.

4. Test Oscillator Connection -- Dummy Antenna Use

The chassis or frame of the radio receiver is considered as being at ground potential and the "O" or "GND" terminal of the Test Oscillator should be connected to the chassis wherever good contact can be established.

The "Ant" or "High" terminal of the Test Oscillator output must be connected to the Antenna connector or other points in the radio receiver as specified in the Alignment Procedure. The use of a fixed condenser in series with the Test Oscillator lead, is specified in some instances. A .1 mfd. condenser is usually used in aligning the I-F stages and a smaller condenser is used in series with the antenna connector. This condenser, sometimes called a "Dummy Antenna", provides the proper input loading to the receiver. It is important that this condenser be connected at the point where the Test Oscillator lead joins the radio set, and should not be connected at the

MODEL R-698
MODEL R-699
MODEL R-701

UNITED MOTORS SERVICE

test oscillator. In order to provide d-c bias to the tubes, the grid caps should be left connected if test oscillator connection is made also. Shielded leads should be used.

5. Output Meter Connections

Any standard type of output meter can be employed during alignment. The meter should be connected across either the primary or secondary of the output transformer. It is best to leave the voice coil connected while using the output meter. It is essential that an Output Meter with sufficient sensitivity be used to avoid the possibility of using too much Test Oscillator Output to get a readable indication on the Output Meter. Sometimes it is desirable to connect the output meter from the output tube plate to ground; when this connection is employed be sure that a .1 mfd. condenser is connected in series with the meter to afford protection from the d-c potential.

6. Alignment of the Tuned Circuits

Tuning adjustments with trimmers or adjustable iron cores is accomplished while applying a modulated signal, of the specified frequency, to the input of the stage being adjusted. Maximum Output Meter indication, of the amplitude of Audio-Frequency output, of the radio receiver, shows when tuning is correct.

The various, tuned circuits are aligned by adjusting each in this manner. During all alignment adjustments, the output of the Test Oscillator must be kept as low as possible, consistent with a reasonable output meter indication, to prevent A-V-C action from taking place and making all adjustments seem very broad.

The tuning tool used must have a minimum of metal so it will cause little or no tuning reaction. If removing the tool, after making an adjustment, reduces the output appreciably, a slight compensating mis-tuning will correct the error and produce maximum output when the tool is removed.

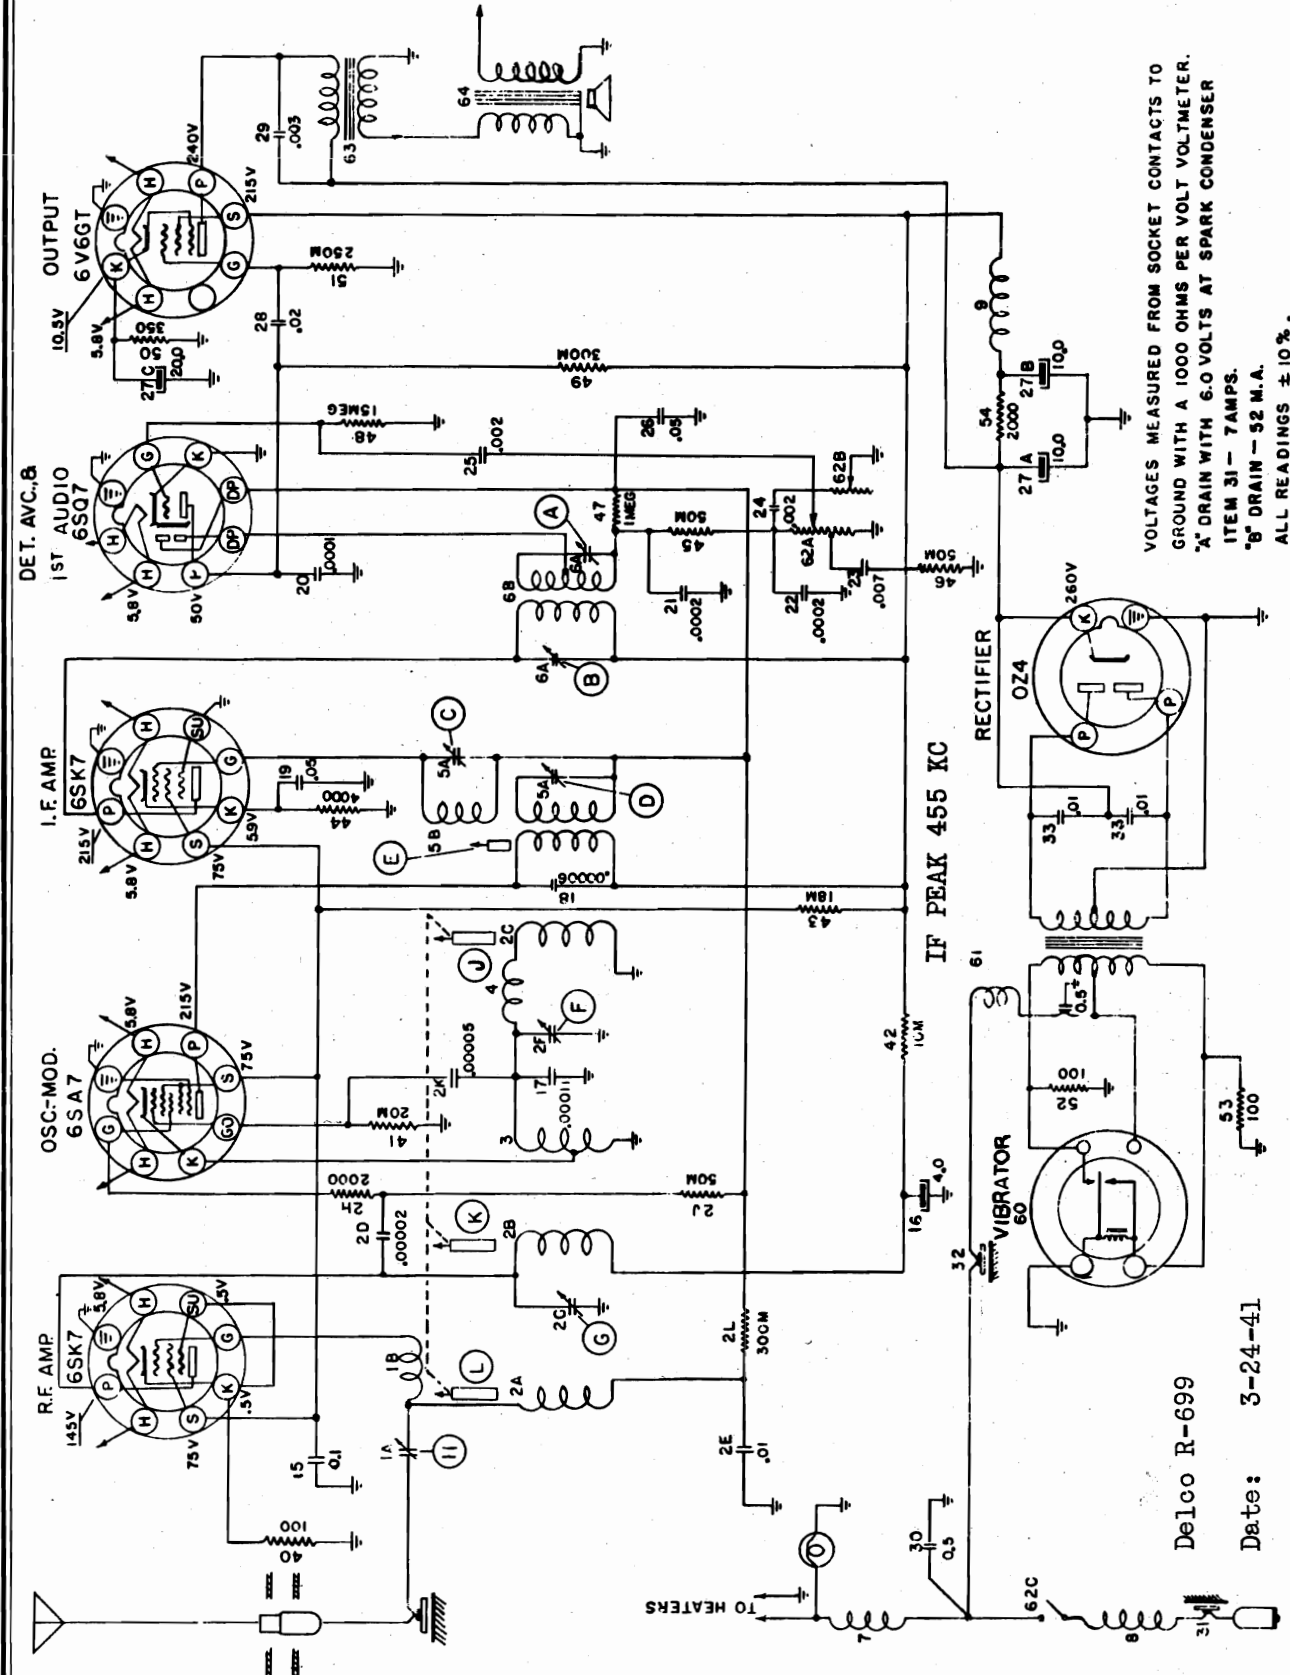

7. Rocking-In Adjustments

Provisions are incorporated in the Oscillator circuit of some Superheterodyne receivers for a tracking adjustment at the low frequency end of the band. This consists of a variable oscillator tracking condenser or magnetic core. Tuning frequencies specified in Alignment Procedure Table for making these adjustments should be carefully followed because the tuned circuits design is such that only this procedure will produce correct dial calibration.

For maximum sensitivity at low frequency end of the band, this should be a rocking adjustment. To make a rocking adjustment, change the setting of the specified oscillator tracking condenser or magnetic core slightly, then tune the gang condenser for maximum output regardless of dial setting, and note the exact reading of the output meter. Now repeat this procedure and note if the Output Meter reading so obtained is greater, or less than the first one. If the Second Reading is greater than the first, continue this process while changing the Oscillator tracking adjustment in the same direction until the highest possible output meter reading is obtained. If the second reading is less than the first, continue this process while changing the Oscillator tracking adjustment in the opposite direction until the highest possible output reading is obtained. The maximum amplitude setting which produces the most accurate dial calibration should be used.

This procedure increases the receiver sensitivity by effectively tuning the local Oscillator circuit simultaneously with the R-F and 1st Detector stages at the low frequency end of the band. Simultaneous adjustment is necessary to maintain correct tracking. An adjustment at the low-frequency end of a band should be followed by readjustments at the high frequency end because each tuning adjustment affects the other.

ALIGNMENT PROCEDURE

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Steps	Connect high side of the test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	I.F. grid in series with 0.1 mfd.	455 kc	Quiet Point at 1,700 kc end of dial	C-30, C-31
2	1st det. grid in series with 0.1 mfd.			C-28, C-29
3	R.F. grid in series with 0.1 mfd.			C-27**
4	Ant. terminal in series with 47 mmf. (link open)	15 mc	15 mc "C" Band	C-24 (osc.)* C-22 (ant.)
5		9.5 mc	9.5 mc "C" Band	L-10 (osc.) L-5 (ant.)
6	Repeat steps 4 and 5.			
7	Ant. terminal in series with 220 mmf. (link open)	1,300 kc	1,300 kc "A" band	C-25 (osc.) C-23 (ant.)
8		600 kc	600 kc "A" Band	C-26 (osc.)
9	Repeat steps 7 and 8.			

* Use minimum capacity peak if two peaks can be obtained.
** Adjust C-27 for minimum signal with 455 kc applied to R.F. grid.
Note.—Oscillator tracks 455 kc above signal on all bands.

Speaker 5-inch Electrodynamic
Antenna Built-in Loop or External
Tuning Manual and 5 electric push-buttons
Tuning Range 540-1,600 kc, 9-15.5 mc
Power Supply 105-125 A. C., 50-60 cy. or D. C.

MODELS R-1212 and R-1214

ADJUSTMENT FOR ELECTRIC TUNING

The station push buttons connect to separate magnetite-core oscillator coils and separate antenna trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool and allow at least five minutes warm-up period before making adjustments.

In the event that the receiver is to be used with an external antenna use one or two feet of wire (as an antenna) to ensure sharp peaking during the final adjustment procedure.

1. Make a list of the desired stations, arranged in order from low to high frequencies.
2. Turn the range selector to Broadcast band, and manually tune in the first station on the list.
3. After turning range selector to "PB" position, push in station button No. 1 (extreme left). Then adjust the No. 1 oscillator core to receive the station. It may be necessary to maintain approximate tracking between antenna and oscillator to receive weak stations.
4. After oscillator core is adjusted properly, adjust antenna trimmer No. 1 for maximum output.
Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.
5. Adjust each of the remaining stations in the same manner.

Antenna.—The set is equipped with a built-in loop antenna. If an outdoor antenna is used, it may be connected to the "ANT" terminal on rear of cabinet. It should not be longer than 100 feet, including lead-in. If it is longer, connect a 100 to 200 mmf. capacitor in series with the lead-in.

Power-Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Phono Attachment.—A jack is provided on the rear of cabinet for connecting a Phono Attachment into the audio-amplifying circuit.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the dial backing plate for quick reference during alignment.

With gang in full mesh, move the dial pointer to the last mark at the left-hand end of the dial scale.

Loop Antenna Connections

6. Make a final careful adjustment of the oscillator cores and antenna trimmers.

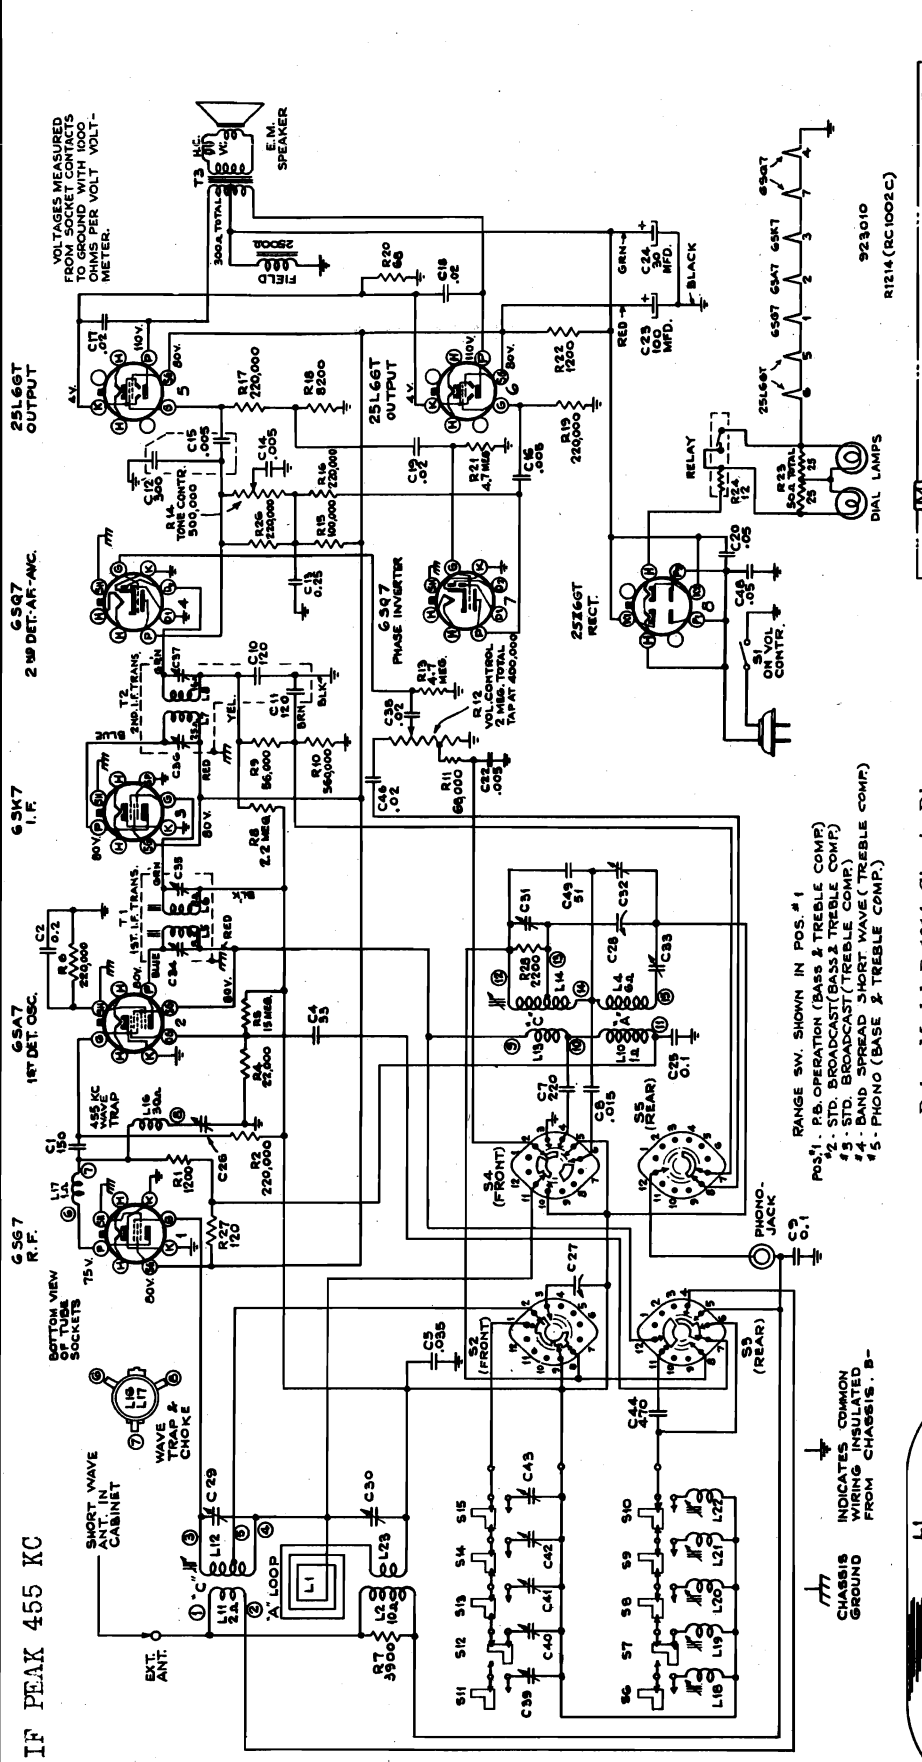

On push-button No. 5, the higher frequency stations may be obtained with the oscillator core No. 5 either in or out. (Oscillator frequency either 455 kc below or above the signal.) The out position should be used so the oscillator is 455 kc above the signal.

UNITED MOTORS SERVICE

MODEL R-1214

Delco Model R-1214 Circuit Diagram

Thermal relay cuts in the dial lamps after the set warms up.—This set incorporates a thermal relay to control the dial lamps. When the set is "off," the relay contacts are closed. This shorts out the two lamps. When the set is turned "on," the heater current flows through the relay contacts to open, permitting the heater current to flow through the two dial lamps and light them. In normal operation, the lamps light about a half-minute after the set is turned on.

Power-Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a.c., reversal of the plug may reduce hum.

Phono Attachment.—A jack is provided on the rear of cabinet for connecting a Phono Attachment into the audio-amplifying circuit.

Dial Pointer Adjustment.—The dial pointer should be set at the left-hand end dial marks, with the gang in full mesh.

Steps	Connect the high side of test-osc. to—	Tune test-osc. to—	Range Switch	Turn radio dial to—	Adjust the following for max. peak output
1	6SK7 I-F grid in series with .01 mfd.	455 kc	"A"	Quiet Point near 180°	L17 and L18 (2nd I-F Trans.)
2	6SA7 Det. grid in series with .01 mfd.				L-15 and L-16 (1st I-F Trans.)
3	Ant. section of Gang Condenser	1,500 kc	"A"	160°	C-12 (osc.)
4		600 kc		30.5°	L-7 (osc.)
5	Ant. terminal "A" in series with 47 mmf. link open	6,100 kc	"B"	161°	C-11 (osc.)* C-5 (ant.)
6		15,200 kc	"C"	167°	C-10 (osc.)* C-4 (ant.)
7		9,500 kc		32°	C-3 (ant.) (Rock Gang)
8	Repeat steps 6 and 7.				
9	Fasten chassis in cabinet, see that link is closed on antenna terminal board, indicator at left end of dial scales with gang at maximum capacity.				
10	A radiation loop consisting of two turns of wire 18 inches in diameter located 4 to 6 feet from receiver	1,500 kc	"A"	1,500 kc signal	C-1 (ant.) on loop
11		600 kc		600 kc	L-7 (osc.) (Rock Gang)
12	Repeat steps 10 and 11.				

*Use minimum capacity peak if two peaks can be obtained.
Note: Oscillator tracks above signal on all bands.
External Antenna.—When using an External Antenna, peak C3 for max. output on a station in the 31-meter band.

ADJUSTMENT FOR ELECTRIC TUNING

This model has six push buttons for electric tuning. The buttons connect to separate magnetite-core oscillator coils and separate antenna trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool, and allow at least five minutes warm-up period before making adjustments.

The procedure is as follows:

1. Make a list of the six desired stations, arranged in order from low to high frequencies.
2. Turn Range Control knob to "A" position, and manually tune in the first station on the list.

Turn the Loop Antenna to give **minimum** pickup of signal, no outside antenna should be used and link on antenna board should be closed.

3. Turn Range Control knob to "PB" and press push button No. 1 and adjust No. 1 oscillator core to receive this station. Screw the core all the way in, to lowest frequency, and then unscrew slowly until station is received.
4. Adjust No. 1 antenna trimmer for maximum output on this station.

Owing to the relatively high R-F gain, it may be found that there are several settings of each push-button magnetite core that will bring in any particular station. In such cases it is advisable to unscrew the push button

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for referencing during alignment, therefore a calibration scale is attached to the indicator-drive-cord drum which is mounted on the shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in R.F. alignment, check the position of the drum. The 135° mark on the drum scale must be vertical, and directly over the center of the gang-condenser shaft when the plates are in minimum capacity position. The drum is held to the shaft by means of plastic cement which must be securely fastened when the drum is in the correct position.

To determine the corresponding frequency for any setting of the calibration scales, refer to the accompanying drawing

Dial Calibration

Parts Layout—Top View

antenna trimmers to minimum capacity before adjusting the oscillator cores.

Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.

5. Adjust for each of the remaining five stations in the same manner.
6. After all six stations are tuned-in on the buttons, turn the Loop Antenna to a position giving the best signal pickup and make a final careful adjustment of all core rods until best reception is obtained for each. Outdoor antenna should now be reconnected if used.

PUSH-BUTTON DATA ON THE LEFT FOR MODELS R-1216 and R-1217

Dial Calibration

Parts Layout—Top View

External Antenna.—When using an External Antenna, Peak C7 for max. output on a station in the 31-meter band.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang condenser frame, and bend the wire so that it points to the "0" mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator at the 540 kc mark, and gang condenser fully meshed. The indicator has a spring clip for attachment to the cable.

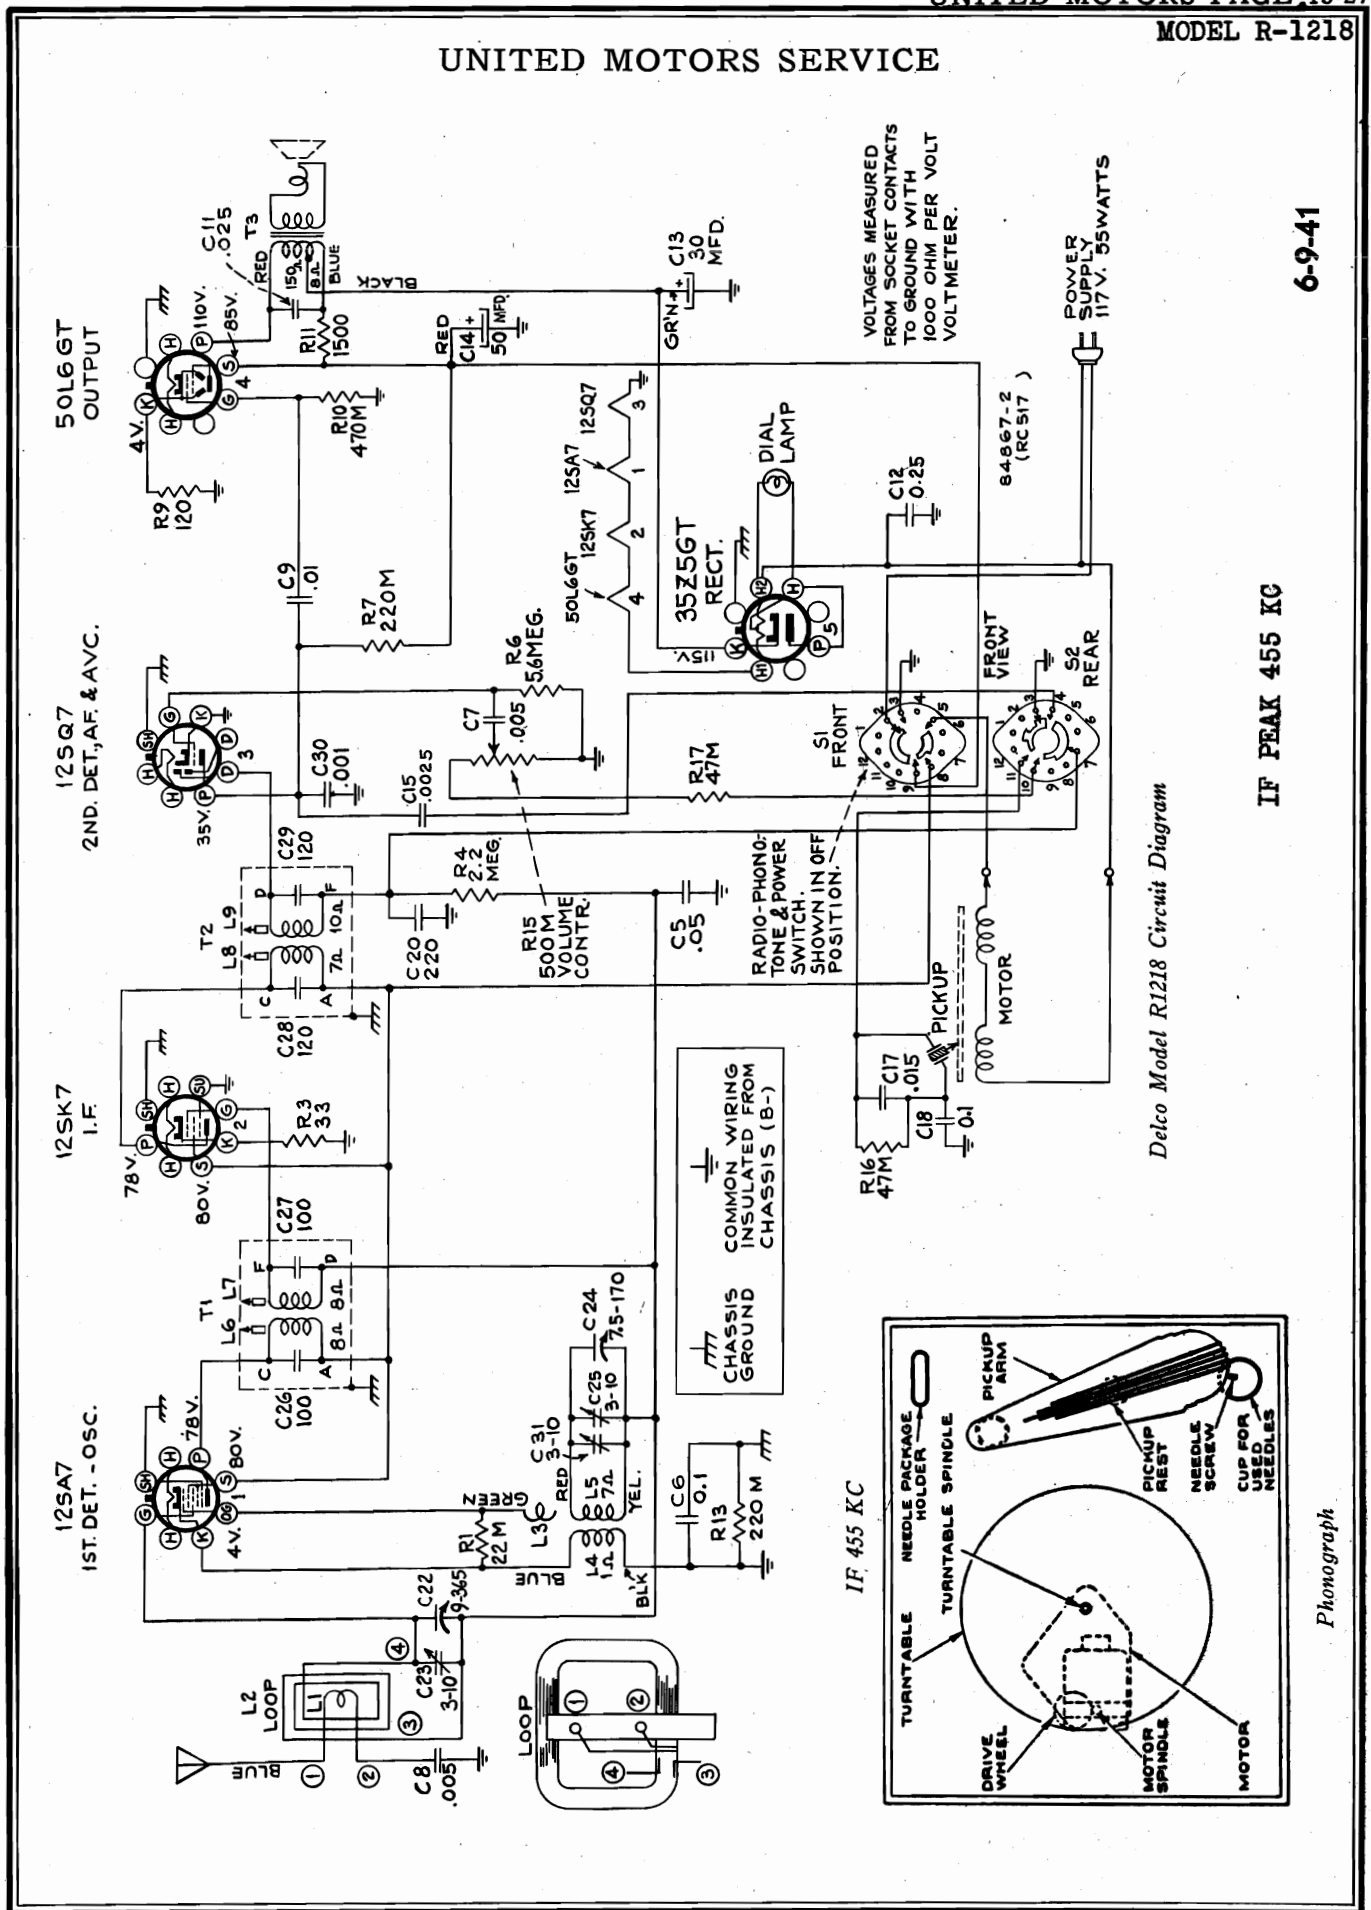

Steps	Connect the high side of the test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output—
1	I-F grid in series with .01 mfd.	455 kc	Quiet Point on "A" Band	L-11 and L-12 (2nd I-F Trans.)

Photograph

MODEL R-1218

UNITED MOTORS SERVICE

GENERAL

The Delco Model R-1218 is a five-tube, single-band, AC, superheterodyne radio and phonograph with 5-inch permanent magnet dynamic speaker and built-in loop antenna.

ANTENNA

A loop antenna is attached to the chassis. This type of antenna is somewhat directional, therefore, the radio should be tried in different positions to determine the position which will produce the best reception. An antenna lead is provided for coupling an outside antenna to the receiver.

ALIGNMENT PROCEDURE

Volume Control maximum, Signal Generator output minimum for satisfactory output indication.

PHONOGRAPH MOTOR

The phonograph motor is of the self starting synchronous type and operates the turntable through friction drive between the motor drive spindle and the rubber tired idler on the rim of the turntable.

The motor should be lubricated once or twice a year by placing a few drops of S.A.E. 20 oil on the turntable spindle and saturating the felt oil retaining pads on the motor shaft.

CAUTION

The motor drive spindle and the rubber tire on the idler must be kept clean and entirely free from oil and grease at all times.

POWER SUPPLY

Although this model employs an AC-DC chassis, it is not suitable for use on DC, as this would damage the motor.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	I-F grid, in series with .01 mfd.	455 kc	Quiet point 1,600 kc end of dial	L8 and L9 2nd I-F Transformer
2	1st Det. grid in series with .01 mfd.			L6 and L7 1st I-F Transformer
3	Ant. terminal in series with 200 mmfd.	1,650 kc	Gang at minimum	C25 (osc.) C31 (osc.)
4	Radiation loop consisting of two turns of wire 18 inches in diameter located 4 to 6 feet from receiver	1300 kc	Signal Frequency	C23 (ant.)
5	Repeat steps 3 and 4.

MODEL R-1220

FOR RCA RP-158 record changer, see Rider's "Automatic Record Changers and Recorders"

Tuning Range—

Broadcast "A"	540-1,600 kc
Short Wave "C"	9.4-15.4 mc
Intermediate Frequency	455 kc
Power Supply	105-120 V. 60 cycle AC

PHONOGRAPH

Type	Automatic
Record Capacity	Twelve 10-in., Ten 12-in.
Turntable Speed	78 r.p.m.
Type Pickup	Crystal
Motor Power Consumption	17 watts

- Critical Lead Dress:**
- C30 (audio coupling capacitor to volume control) should be dressed close to front apron.
 - A.C. cord and motor leads must be dressed away from phono. and F.M. jack.
 - Dress cable from phono. socket to phono. switch up away from base.
 - Dress red A.C. leads away from I.F. trans. and 6SQ7 socket.
 - RF choke in plate of 6SK7 must be dressed toward back apron.

MODEL R-1220
MODEL R-1221

UNITED MOTORS SERVICE

GENERAL

- Tubes Eight
- Speaker 12-inch Electrodynamic
- Antenna Built-in Loop or external
- Tuning Manual and 6 electric push-buttons

The procedure is as follows:

1. Make a list of the six desired stations, arranged in order from low to high frequencies.
2. Turn Range Control knob to standard broadcast position, and manually tune in the first station on the list. No outside antenna should be used and link on antenna board should be closed.
3. Turn Range Control knob to electric tuning and press push button No. 1 and adjust No. 1 oscillator core to receive this station. Screw the core all the way in, to lowest frequency, and then unscrew slowly until station is received.
4. Adjust No. 1 antenna trimmer for maximum output on this station.

Owing to the relatively high R-F gain, it may be found that there are several settings of each push-button magnetite core that will bring in any particular station. In such cases it is advisable to unscrew the push button antenna trimmers to minimum capacity before adjusting the oscillator cores.

Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.

5. Adjust for each of the remaining five stations in the same manner.

On the 880 to 1,600 kc push-button, the higher frequency stations may be received with osc. core either in or out (oscillator frequency either 455 kc below or 455 kc above the station frequency). The adjustment with this core in its out position (oscillator frequency 455 kc above the station frequency) is the correct one.

Push Button Adjustments

Using Tuning Dial.—

1. Remove glass dial from the cabinet.
2. With gang in full mesh, move the dial pointer to a point 1/16 inch to left of reference mark at left hand end of the dial backing plate.
3. Place the glass dial under the pointer so that the extreme left scale graduation coincides with the pointer. Use scotch tape to hold the glass dial in place.

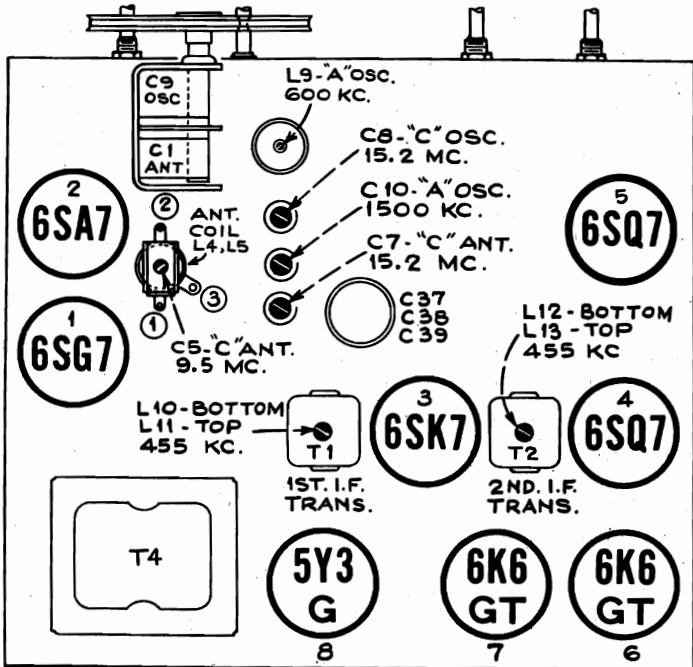

"C" Band Reception—For best reception on "C" band with an outside antenna, adjust the trimmer screw on the RF coil on the chassis. Turn screw carefully with an insulated screwdriver while the receiver is tuned to a station in the 31-meter band, and make setting for best reception. If returning to internal antenna at any time, close the link on the center terminal and adjust "C" band antenna trimmer for best reception on 31-meter band.

Steps	Connect test-osc. output to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output—
1	I-F grid in series with .01 mfd.	455 kc	"A" band 540 kc	L12 and L13 (2nd I-F trans.)
2	1st Det. grid in series with .01 mfd.			L10 and L11 (1st I-F trans.)
3	A-Terminal in series with 47 mfd. (link closed)	15.2 mc	"C" band 15.2 mc	C8 (osc.)* C7 (ant.)
4		9.5 mc	"C" band 9.5 mc	C5 (ant.) (Rock gang)
5		Repeat steps 3 and 4		
6	Yellow loop lead in series with 200 mfd. (link closed)	1,500 kc	"A" band 1,500 kc	C10 (osc.)
7		600 kc	"A" band 600 kc	L9 (osc.)
8		Repeat steps 6 and 7		
9	Install and connect chassis in cabinet with antenna link closed. Tune in a radiated oscillator signal at 1,500 kc. and peak the "A" band trimmer C2 (on loop). Rock in L9 for peak output at 600 kc.			

* Use minimum capacity peak if two peaks can be obtained. Oscillator tracks 455 kc. above signal on all bands.

FM - TELEV. JACK PHONO-JACK

Critical Lead Dress

1. Push button, R.F. and oscillator leads should be separated as much as possible to reduce degeneration on push button reception.
2. R.F. choke in plate circuit of 6SG7 should be dressed towards the back apron.
3. Dress green push button lead under clamp and away from "C" band series capacitor.
4. Dress heater leads away from grids and diodes.
5. Dress green lead from 6SA7 screen to electrolytic down close to chassis.
6. Keep yellow loop lead clear of all wiring.
7. Dress oscillator grid capacitor (56 mmfd.) up and away from the screen and plate of 6SA7 socket.
8. Keep all leads away from Phono-FM jack to prevent audio oscillation and hum. Dress underneath the shield provided.
9. Remove all excess slack from pilot light assembly and dress it close to chassis base away from volume control.
10. A-C leads to "off-on" switch should be kept away from tone control cable to reduce hum.

CIRCUIT ALIGNMENT

If realignment is found necessary the circuits can be properly adjusted only with the use of a calibrated test oscillator or signal generator and an output meter.

All adjustments on back of the tuner unit are accessible by removing the back cover. During I.F. alignment, the speaker cover must be removed from the tuner unit to permit access to the two I.F. adjustments located in front of the chassis. Turn the volume control full on, to maximum volume position.

1. Aligning I.F. Stages at 260 kilocycles
 - (a) Connect the signal lead of the signal generator to the control grid of the 6SA7 tube (Pin #8) through a .1 mfd. condenser.
 - (b) Connect the ground lead of the signal generator to the chassis frame.
 - (c) Connect the output meter from the plate prong of one 6V6d to the plate prong of the other 6V6d.
 - (d) Set the signal generator to exactly 260 k. c.

(e) Adjust the core screws on the I.F. coils carefully (Ill. 5 & 6 Figs. 5 & 6, one on bottom and one on top of each I.F. coil) for maximum output. These adjustments should be repeated several times and during alignment, the signal generator output should be kept to as low a value as is consistent with obtaining a readable indication on the output meter.

2. Aligning at 1560 kilocycles

- (a) Leave the signal generator leads connected the same as for aligning the I.F. circuits.
- (b) Turn the rotor plates of the gang condenser all the way out of mesh and against the high frequency stop.
- (c) Set the signal generator to 1560 kilocycles.

(d) Adjust the parallel trimmer for the oscillator section of the condenser gang (Ill. 9 Fig. 5) for a maximum output. It is very important that this frequency be set accurately, as a slight missetting will cause the receiver to be out of track over the entire high frequency end of the dial.

3. Aligning at 545 kilocycles

- (a) Leave the signal generator leads connected the same as before.
- (b) Turn the rotor plates of the gang condenser all the way into mesh so that they rest against the low frequency stop.
- (c) Set the signal generator to 545 k. c.
- (d) Adjust the magnetite core of the oscillator coil (Ill. 4 Fig. 5) to maximum output.

(This adjustment sets the low frequency tuning range of this receiver to 545 k. c.)

4. Realigning at 1560 kilocycles

Recheck alignment of oscillator parallel trimmer as given in paragraph #2. Aligning at 1400 kilocycles

- (a) Remove the signal lead of the signal generator from the control grid of the 6SA7 tube and connect to the antenna connector of the receiver through a .00006 mfd. mica condenser connected in place of the .1 mfd. condenser previously used.

- (b) Set the signal generator to 1400 k. c.
- (c) Turn the condenser rotor plates until this frequency is tuned in with maximum output.
- (d) Adjust the R.F. parallel trimmer on the condenser gang (Ill. 7C, Fig. 6 & 10) and the antenna parallel trimmer on the gang condenser (Ill. 7A, Fig. 6 & 10) for maximum output.

POWER UNIT

MODEL 983705

UNITED MOTORS SERVICE

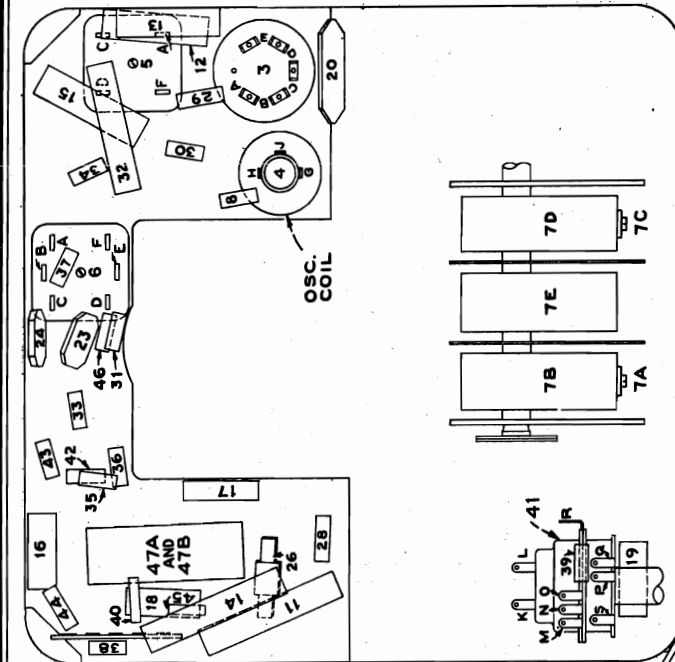

FIG. 6--PARTS LAYOUT--I-P UNIT--BOTTOM VIEW

Tuning is by conv. manual tuning or by six P.B. which control the circuits of solenoids which rotate tuning cond. to any setting. 1. slight touch and movement of less than 1/8" is required to tune receiver with P.B. after button is adj.

2. Heavier pressure and movement of about 1/4" is required when button is set to station selected. To adj. button, P.B. in and hold in that pos. while tuning desired station accurately as possible with manual tuning knob. Release button and station is set.

FIG. 6--DIAL POINTER CORD LAYOUT

POSITION OF DRUM ASSEMBLY WITH COIL CORES FULLY IN

FIG. 7--POSITION OF DRUM ASSY. WITH COIL CORES FULLY IN

ANTENNA SYSTEM: The antenna system used with the receiver consists of a rod type antenna with a specially designed low capacity lead-in.

TUNING CONTROLS: Tuning is accomplished by means of the conventional manual control or by means of 5 push-buttons which mechanically drive the permeability cores to pre-selected settings.

CIRCUIT ALIGNMENT

If realignment is found necessary the circuits can be properly adjusted only with the use of a calibrated test oscillator or signal generator and an output meter. It is not necessary to remove the chassis from the case for alignment.

1. Aligning I-F stages at 260 kilocycles

- (a) Connect the ground lead of the test oscillator to the chassis.
- (b) Connect the signal lead of the test oscillator to terminal (Illus. X, Fig. 4) through a .1 mfd. condenser.
- (c) Connect the output meter across the speaker voice coil at the terminal board mounted on the speaker.
- (d) Set the test oscillator to 260 K.C.
- (e) Adjust the trimmers (Illus. A-B, Fig. 4) on the I-F coil for maximum output. These adjustments should be repeated several times and during alignment the test oscillator output should be kept to as low a value as is consistent with obtaining a readable indication on the output meter.

2. Aligning at 1610 kilocycles

- (a) Leave the test oscillator leads connected as for aligning the I-F circuits.
- (b) Loosen lock screw (Illus. C, Fig. 4) and turn the receiver by means of the manual control to the extreme high frequency position, against the stop, and tighten screw (Illus. C, Fig. 4).
- (c) Set the test oscillator to 1610 K.C.
- (d) Adjust the condenser (Illus. D, Fig. 4) for maximum output.

3. Aligning at 1400 kilocycles

- (a) Connect the signal lead of the test oscillator to the antenna connections of the receiver, through a 50 mmfd. mica condenser.
- (b) Set the test oscillator to 1400 K.C.
- (c) Tune the receiver until this frequency is tuned in with maximum output.
- (d) Adjust the R.F. trimmer (Illus. F, Fig. 4) for maximum output.

*IMPORTANT NOTE: Lock Screw (Illus. C, Fig. 4) maintains the location of the mechanical stop at the high frequency end of the band. New frequency assignments to 1600 K.C. make it desirable for the receiver to cover this range, but due to local ordinances it is not permissible in all locations. The stop is set at 1560 K.C. at the factory and to increase the frequency range, where permissible, loosen lock screw (Illus. C, Fig. 4) and tune manually to the frequency to be covered and tighten the screw.

UNITED MOTORS SERVICE

MODEL 983775

GENERAL: The Pontiac Model 983775 is a five tube, single unit receiver with automatic push-button tuning and a 6" dynamic speaker. This set is designed specifically for mounting behind the dash of the 1941 Pontiac car.

BOTTOM VIEW OF TUBE SOCKETS

READINGS TAKEN FROM TUBE SOCKET CONTACTS TO GROUND WITH A D.C. VOLTMETER HAVING A RESISTANCE OF 1000 OHMS PER VOLT; "A" BATTERY 6.0 VOLTS. CURRENT DRAIN 6.5 AMPERES. "B" SUPPLY DRAIN APPROXIMATELY 50 M.A.

MODEL 983776

UNITED MOTORS SERVICE

GENERAL: The Pontiac Model 983776 is a seven tube, single unit super-heterodyne receiver with an 8" P.M. speaker. The unit is custom built for 1941 Pontiac and mounts behind the instrument panel.

ANTENNA: The receiver is designed to operate at maximum efficiency with a cowl type antenna and a specially designed low capacity lead-in.

TUNING CONTROLS: Tuning is accomplished by means of a conventional manual tuning knob, or by five push-buttons which mechanically rotate the tuning condenser to pre-selected frequencies.

CIRCUIT ALIGNMENT

If alignment is found necessary, the circuits can be properly aligned only with the use of a calibrated test oscillator or signal generator and an output meter. The back and front covers must be removed for alignment.

1. Aligning I-F Stages at 260 Kilocycles
 - (a) Connect the ground lead of the signal generator to the chassis frame.
 - (b) Connect the signal lead of the signal generator to the R.F. trimmer condenser, (illus. F, Fig. 3) through a .1 mfd. condenser.
 - (c) Connect the output meter from the speaker lead connector to the chassis. Leave the speaker connected in the circuit and ground the speaker to the case.
 - (d) Set the signal generator to exactly 260 kilocycles.
 - (e) With volume control on full, adjust the trimmers (illus. A, B, C, D, Fig. 4) for maximum output. These adjustments should be repeated several times and during alignment, the signal generator output should be kept to as low a value as is consistent with obtaining a readable indication on the output meter.
2. Aligning at 1560 Kilocycles
 - (a) Connect the signal lead of the signal condenser to the antenna connection of the receiver through a .000075 mfd. mica condenser.
 - (b) Turn the rotor plates of the gang condenser all the way out against the high frequency stop.
 - (c) Set the signal generator to exactly 1560 kilocycles.
 - (d) Adjust the oscillator trimmer (illus. E, Fig. 3) for maximum output.
3. Aligning at 1400 Kilocycles
 - (a) Leave the signal generator leads connected the same as before.
 - (b) Set the signal generator to 1400 kilocycles.
 - (c) Tune the receiver until this signal is tuned in with maximum output.
 - (d) Adjust the trimmers (illus. F1, G, Fig. 3) for maximum output.

NOTE: (illus. F2, Fig. 3) is sealed at the factory and SHOULD NOT be adjusted.
4. Aligning at 600 Kilocycles
 - (a) Leave the signal generator leads connected the same as before.
 - (b) Set the signal generator to 600 kilocycles.
 - (c) Tune the receiver until this signal is tuned in with maximum output.
 - (d) Adjust the oscillator coil core screw (illus. H, Fig. 4) while rocking the rotor plates back and forth through the signal until maximum output is obtained.
5. Realignment at 1560 and 1400 Kilocycles

Repeat alignment of R.F. and antenna sections of the gang condenser as outlined under paragraphs 2 and 3.

When the set is reinstalled in the car, the antenna trimmer (illus. G, Fig. 3) should be readjusted on a weak signal at approximately 1400 K.C. for maximum output.

CIRCUIT ALIGNMENT

If realignment is found necessary the circuits can be properly adjusted only with the use of a calibrated test oscillator or signal generator and an output meter.

All R.F. and I.F. adjustments are accessible by removing the front and rear covers. Turn the volume control full on, to maximum volume position.

1. Aligning I.F. Stages at 260 Kilocycles

- (a) Connect the ground lead of the signal generator to the chassis frame of the receiver.
- (b) Connect the signal lead of the signal generator to the control grid of the 6SA7 tube (PIN #9, Fig. 2) through a .01 mfd. condenser.
- (c) Connect the output meter across the speaker voice coil.
- (d) Set the signal generator to 260 kilocycles.
- (e) Adjust the core screws on the I.F. coils (illus. A,B,C,D, Figs. 3 & 4) for maximum output.

These adjustments should be repeated several times and during alignment, the signal generator output should be kept to as low a value as is consistent with obtaining a readable indication on the output meter.

2. Aligning at 1645 Kilocycles

- (a) Connect the signal lead of the signal generator to the antenna connector through a .000075 mfd. mica condenser.
- (b) Tune the receiver to the extreme high frequency end against the stop.
- (c) Turn each of the four iron core screws (illus. E,F,G,H, Fig. 4) in a counter-clockwise direction, four turns.
- (d) Set the signal generator to 1645 Kilocycles.
- (e) Adjust the oscillator trimmer (illus. J, Fig. 3) for maximum output.
- (f) Adjust the antenna and R.F. trimmers (illus. K,L,M, Fig. 3) for maximum output.

3. Aligning at 1620 Kilocycles

- (a) Leave the signal generator connected the same as before.
- (b) Set the signal generator to 1620 kilocycles.
- (c) Turn the oscillator iron core adjustment (illus. H, Fig. 4) clockwise until maximum output is obtained.
- (d) Adjust antenna and R.F. iron core (illus. E,F,G, Fig. 4) for maximum output by turning them clockwise and reduce signal generator output to a satisfactory level.

4. Aligning at 1200 Kilocycles

- (a) Leave signal generator connected same as before.
- (b) Set signal generator to 1200 kilocycles.
- (c) Tune receiver for maximum signal at 1200 kilocycles.
- (d) Adjust antenna and R.F. cores (illus. E,F,G, Fig. 4) for maximum output.

5. Aligning at 600 Kilocycles.

- (a) Leave the signal generator connected the same as before.
- (b) Set the signal generator to 600 kilocycles.
- (c) Tune receiver for maximum signal at 600 kilocycles.
- (d) Adjust antenna and R.F. trimmers (illus. K,L,M, Fig. 3) for maximum output.

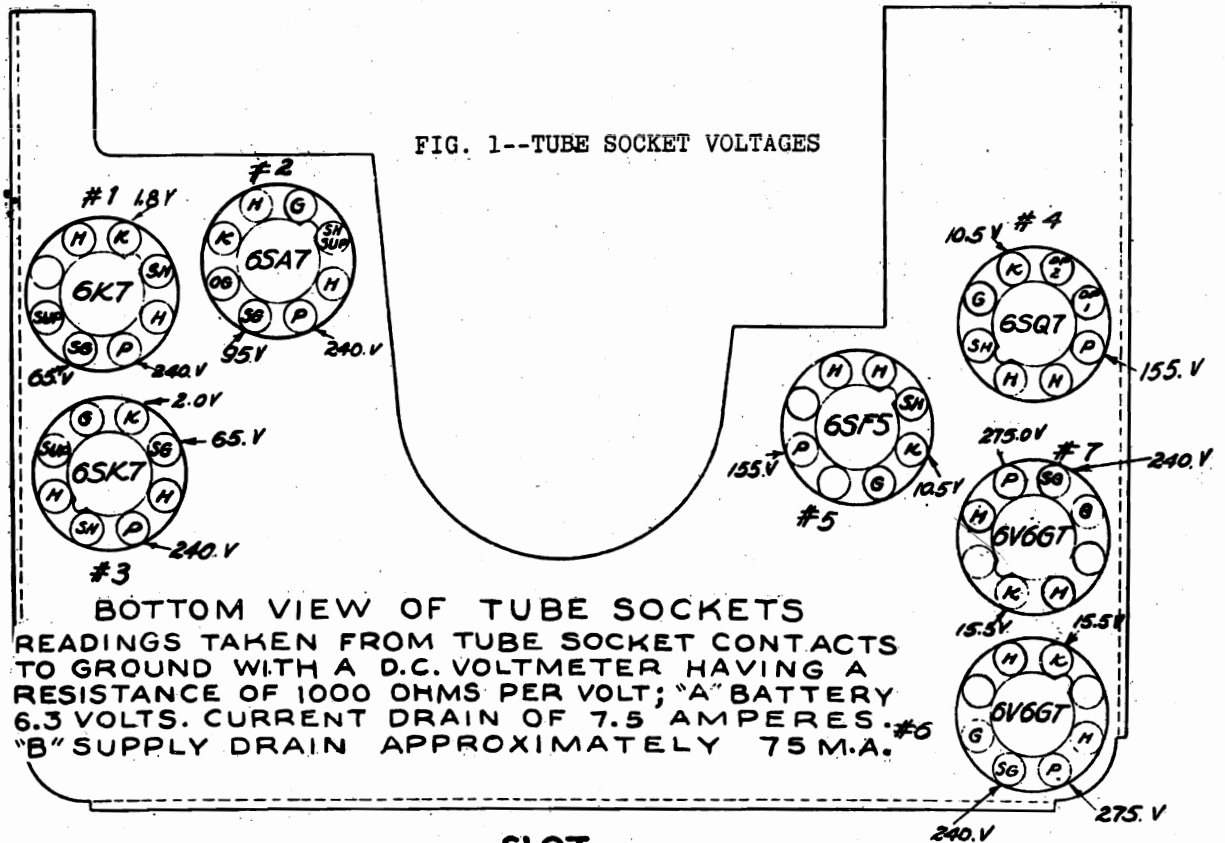

(e) Repeat adjustments under alignment number 4.

MODEL 522

SCHEMATIC DIAGRAM

ALIGNMENT AND SERVICE DATA

A signal generator is required having the following frequencies: 456KC, 1400KC, 1720KC.

First Step: Connect the generator lead through a .1 mfd. condenser to the terminal lug next to the Antenna trimmer on top of the tuning condenser. The ground lead from the generator may be connected to any convenient spot on the metal chassis. Adjust generator to 456KC and adjust IF trimmer screws until a maximum reading is noted on the output meter which has been connected across the speaker. The tuning condenser should be turned out to complete minimum capacity when aligning the IF. With generator lead still connected to antenna trimmer terminal, adjust generator frequency to 1720KC, and with tuning condenser still at minimum, adjust oscillator trimmer till the 1720KC signal is tuned in. Next, remove generator leads from set and connect both to a transmitting loop. This loop can be made with 2 turns of wire about 6 inches in diameter. Adjust generator frequency to 1400KC. Turn tuning condenser until the signal is tuned in and adjust antenna trimmer until a maximum reading is noted. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory so as to insure proper alignment at the lower frequency end of the dial.

two blue---.1 MFD each, one to RF cathodes and one to RF screen grids.
one red ---.1 MFD to B plus terminal on back of variable condenser.

Electrolytic filter condenser-
Long leads -----Yellow to speaker socket and C.T. of power transformer's secondary.
Short leads -----Black to resistor strip and speaker socket
Red to B plus in 80 socket.
Red to B plus in 80 socket.

COUPLING CONDENSERS: capacities printed directly on covers.

Voltages other than those shown, within the limits specified, will indicate the probable source of trouble. After the necessary repairs or replacements have been made we want to caution the serviceman not to realign the condenser trimmers as this has been carefully performed at the factory with calibrated precision equipment. However, in rare cases where the radio frequency coils have been replaced, realignment will be found necessary. This can best be done with a calibrated oscillator and an output meter, preferably not on a broadcast signal, however, where an oscillator is not available a weak broadcast signal around 1400 KC on the dial should be used to check by.

Taken with volume control on full -- Dial set at 100.

MODELS 2-400 TO 2-409

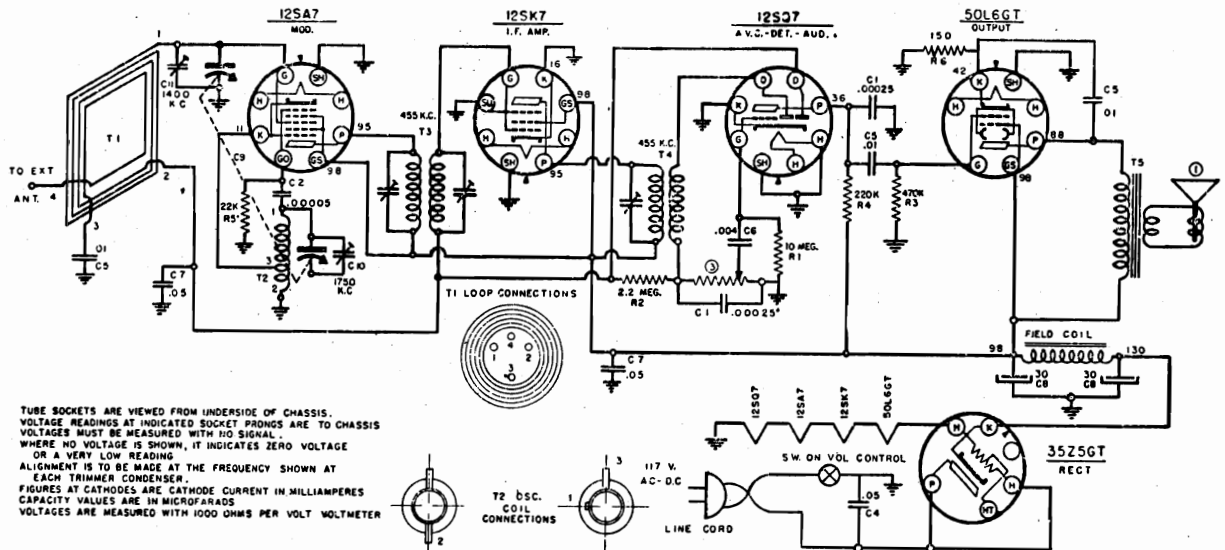

TUBE SOCKETS ARE VIEWED FROM UNDERSIDE OF CHASSIS.
VOLTAGE READINGS AT INDICATED SOCKET PRONGS ARE TO CHASSIS.
VOLTAGES MUST BE MEASURED WITH NO SIGNAL.
VOLTAGES ARE MEASURED WITH 1000 OHM PER VOLT VOLTMETER.
WHERE NO VOLTAGE IS SHOWN AT SOCKET PRONGS, IT INDICATES
ZERO VOLTAGE OR A VERY LOW READING.
ALIGNMENT IS MADE AT THE FREQUENCIES SHOWN AT THE TRIMMER CONDS.
CAPACITY VALUES ARE IN MICROFARADS.

A+ 1 1/2 V. ← YELLOW
A- ← BROWN
B- ← BLACK

MP-420			
DATE 4-23-36	DR'N BY GS	CHKD	APP'D
THE WEBSTER CO.			DRWG No.
3825 W. LAKE ST., CHICAGO, ILL.			

Two plug-in power packs are available for the Model MP-420 adaptable for either 6 volts dc or 110 volts ac, requiring 66 watts for the former and 98 watts for the latter.

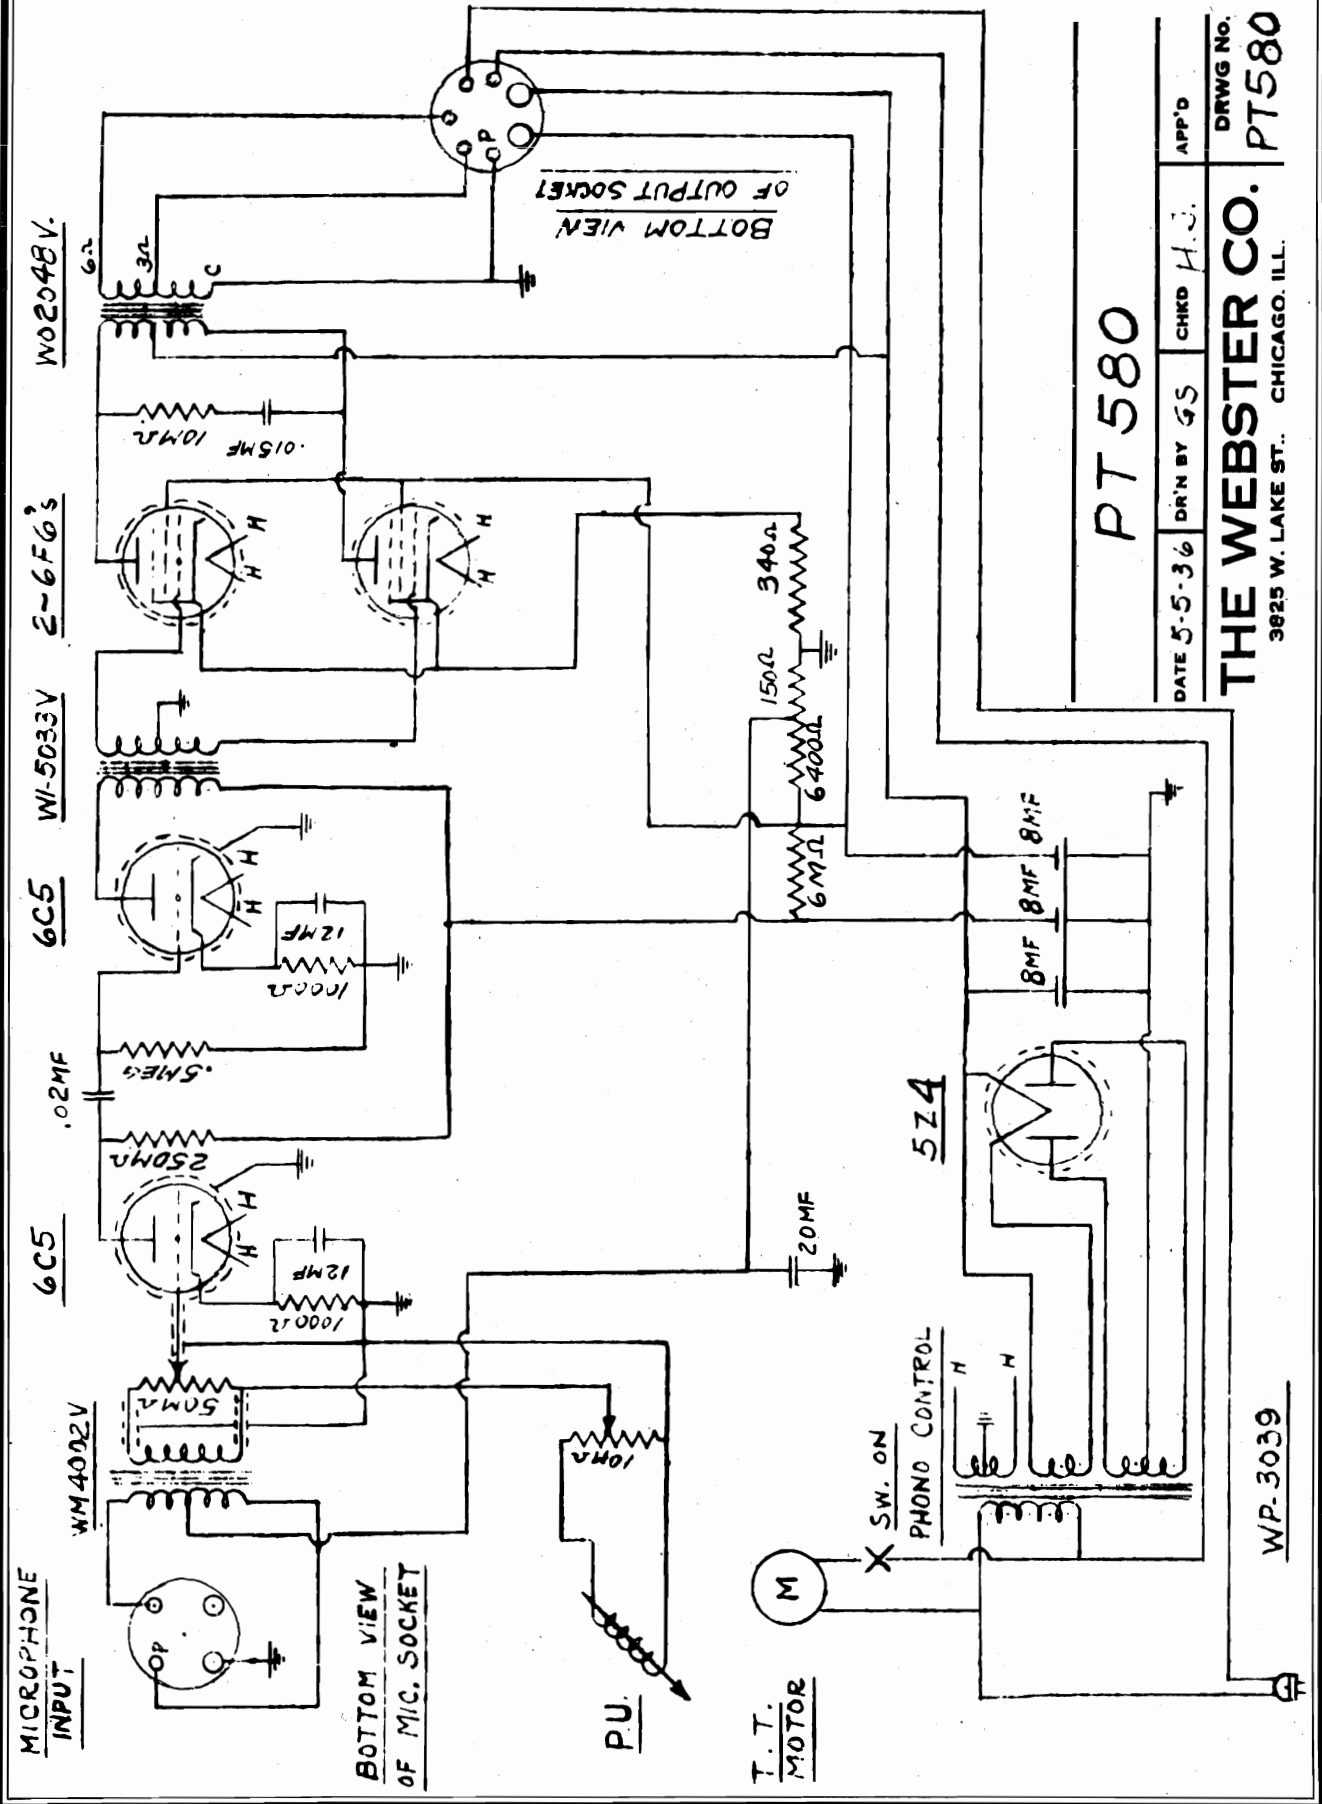

6-volt power pack: Two switches are mounted on this pack, one marked "Gen On" and the other "Fil". The former controls the genemotor, which should be on only when equipment is in operation. The other switch controls the filaments and acts also as master switch. With all other switches "off" this switch may be left "on" keeping the filaments heated for intermittent work where instant response is required. This arrangement effects a saving of battery current.

110-volt a-c power pack: One a-c switch controls the entire amplifier and acts also as a master switch. The change from one pack to another is accomplished as follows: remove phonograph turntable, remove 4 screws holding pack in place, lift out and remove plug. Plug-in other pack, slide back into place and replace the 4 mounting screws.

When used on ac the steel case of the amplifier should be grounded to assure stable operation; likewise when it is used in an automobile it is sometimes necessary to connect the steel case of the amplifier to the frame of the car. Note from the schematic that the output transformer has 3,6, and 500-ohm taps. This system is normally supplied with two 6-ohm speakers, which connect to the 3-ohm tap. If only one 6-ohm speaker is used, it should be connected to the 6-ohm tap. The 500-ohm tap is provided for use when the speakers are located more than 50 feet from the amplifier, in which case a matching transformer should be used at the speaker location.

Turn gang condenser to open position. Use new drive cord 55" in length.

Secure one end of tension spring to hook on drive pulley. Bend spring around drive pulley shaft—see illustration. Pass cord through slot in pulley rim. Wind cord 1/4 turn clockwise (from drive pulley end of chassis) around drive pulley. Pass cord around idler pulleys A, B, C and D as in illustration. Then wind cord 2 1/2 turns clockwise (from front of chassis) around tuning shaft spool. These turns should progress away from chassis. Pass cord over top of drive pulley for 1/4 turn clockwise (from drive pulley end of chassis) and through slot in pulley rim. Fasten cord to tension spring—see illustration.

PROCEDURE FOR SETTING THE STATION BUTTONS

Grasp left-handed nutton at sides (depress adjacent button) and pull it out as far as it will go. A click will be heard. If it is impossible to depress button which is adjacent to button you are setting, rotate tuning knob a few turns. Now lock mechanism by pushing button all the way in until felt to lock into place. Proceed in same manner to set stations on any of remaining buttons. Any button may be used for any station you can receive, although it will be more convenient to set station so that the Kc. numbers will increase from left to right. Changing setting of one button will not affect setting of any others.

Car Antenna Readjustment—Tune in weak signal near 1400 KC—Readjust Antenna Trimmer C4 for maximum output.

SERIES B CHANGES

To secure improved performance, the following changes are made in issue "B" chassis:
The oscillator grid resistor is increased from 20,00 ohms to 40,000 ohms. The R.F. plate resistor is decreased from 20,000 ohms to 15,000 ohms. The R.F. screen is disconnected from the modulator screen and connected to the R.F. plate. In the Series 6C18 only, the modulator screen resistor is increased from 10,000 ohms to 12,000 ohms. To permit easier installation, the issue "B" chassis use a socket and plug arrangement for the speaker connection. Issue "A" chassis used pin tips and clips to connect cable to speaker.

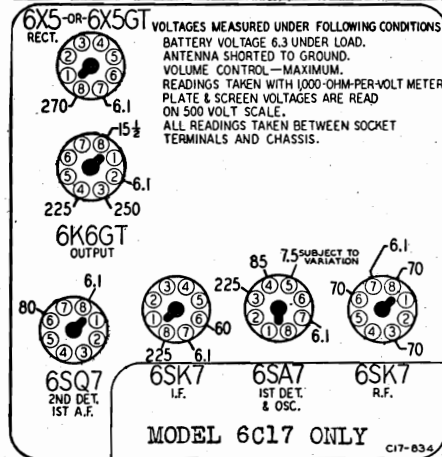

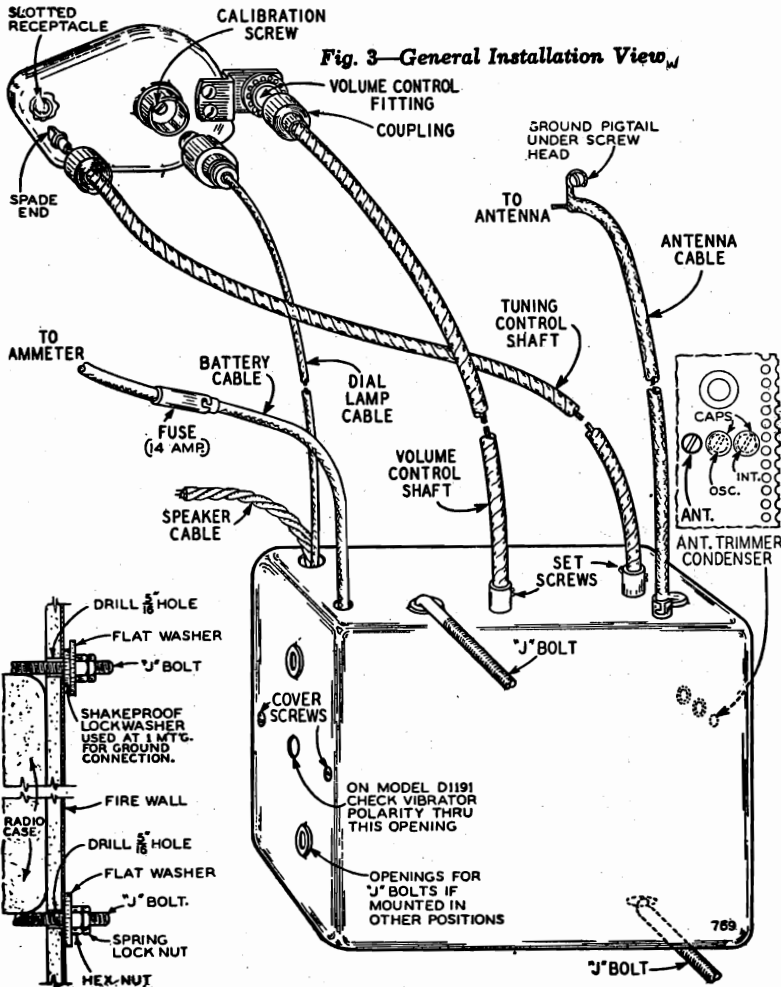

Fig. 3—General Installation View

CALIBRATION—To calibrate the radio, tune in a station of known frequency. At the back of the control unit is the calibration screw. Remove the dial lamp assembly. Insert a fine bladed screwdriver and turn this screw until the pointer on the dial scale is at the frequency of the station being received.

capacity of the antenna cable and dummy antenna should be 60 mmf. If the cable, for example, has a capacity of 30 mmf., use a 30 mmf. condenser for a dummy antenna. Connect the other end of the antenna cable through the dummy antenna capacity to the output of the signal generator.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—Insert the antenna cable plug in the antenna socket on the chassis. The total

Alignment Procedure: Vol. Cont. Max. all adj. Connect Radio Chassis to ground post of Sig. Gen. with short heavy lead. Allow chassis and Sig. Gen. to "Heat Up" for few minutes. ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter—Non-Metallic Screw-driver.
Dummy Antennas—1 mf., 100 mmf., and 400 ohms.

	SIGNAL GENERATOR		DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
	FREQUENCY SETTING	CONNECTION AT RADIO				
I.F.	456 KC	Signal Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C9) & (C10) 3rd I.F. (C14) & (C15)
RANGE B	1600 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C3)
	1400 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1400 KC— See Note A	Ant. Range B (C5)
	600 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C4) Rock Rotor—See Note B
RANGE D	18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C2)
	17,000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Ant. Range D (C1) Rock Rotor—See Note B
LOOP RANGE B	1400 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output	Ant. Range B (C5)

NOTE A—If the pointer is not at 1400 KC on the dial, remove pointer from drive cord. Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

DRIVE CORD REPLACEMENT

Turn gang condenser to full open position—See illustration. Use a new drive cord 37 inches in length.

Tie one end of cord to tension spring. Pass other end of cord up through hole in groove of drive pulley. Pull cord through hole until spring is flush against inside of pulley rim.

Wind cord 1/4 turn counter-clockwise (from gang end of chassis) around drive pulley. Then wind 3 1/2 turns clockwise (from front of chassis) around tuning control shaft. These turns should progress away from chassis. Pass cord through wire string guide and over idler studs A and B as shown, then wind cord 3/4 turn counter-clockwise (from gang end of chassis) around drive pulley. This turn should be on right side (from front of chassis) of pulley groove.

Pass cord through hole in groove of drive pulley. Tie cord to tension spring. Fasten other end of spring to hook on drive pulley.

ANTENNA AND GROUND

Two built-in aerials are incorporated in the cabinet.

One of these, the loop aerial, is used for broadcast band reception. The other, a counterpoise foil aerial, is used for reception on the short wave band. For the reception of local or nearby stations, an outside antenna and ground are usually not required.

In general, however, more stations will be heard by using an outside antenna and ground. To receive distant short wave stations, an outside antenna is essential.

If an outside antenna is used, it should be 50 to 60 feet long, including the lead-in.

A good ground connection is recommended if an outside antenna is

used. A ground connection may be obtained by connecting to a water pipe, radiator, or a pipe driven into the ground.

Avoid using gas pipes or electrical conduits for grounds.

The ground connection is made under the screw (marked GND) on the back panel of the chassis base.

A wire with an antenna marker will be found coming out of the chassis. If it is desired to operate the radio using the loop and counterpoise foil antennas, do not connect this wire to anything. If it is desired to operate the radio using an outside antenna, connect this wire to the lead from the outside antenna.

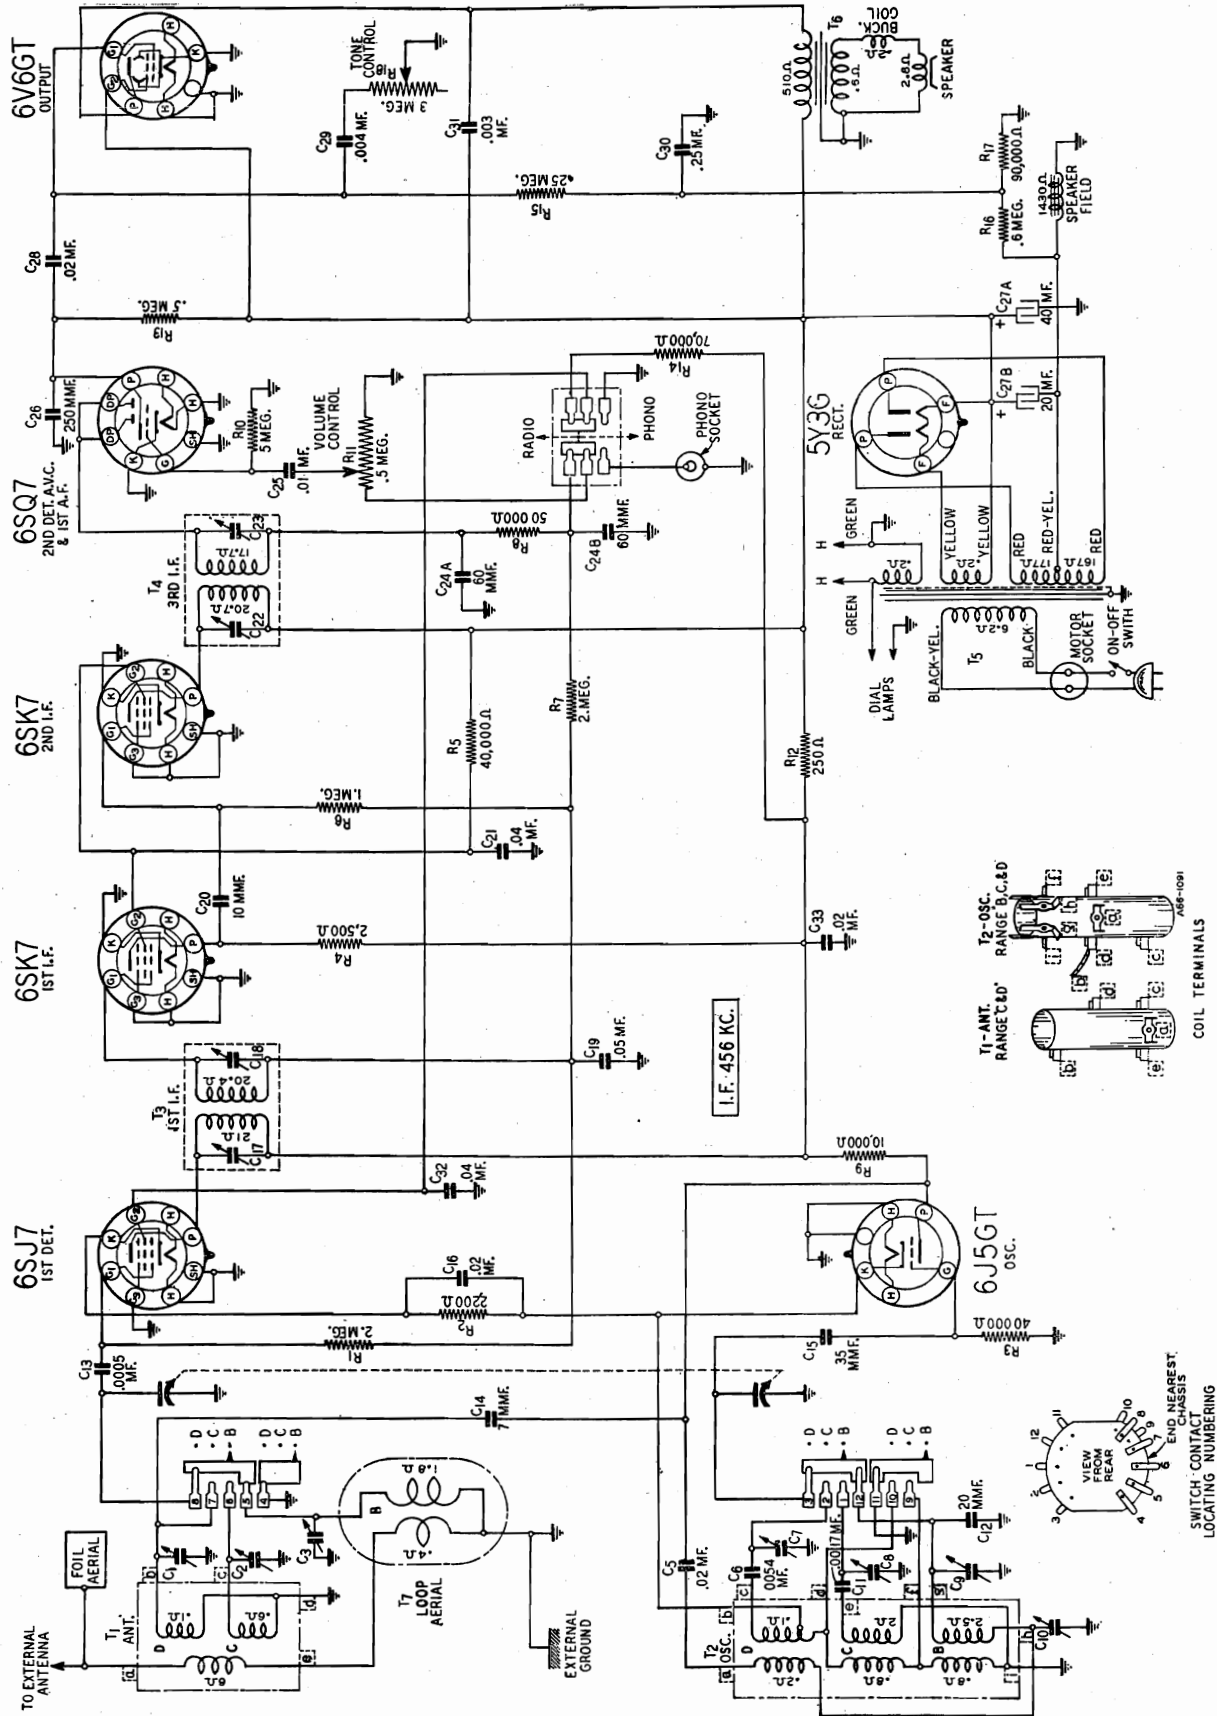

The wire which is connected to the counterpoise foil antenna should never be disconnected.

SPECIFICATIONS

Power Consumption	1.60 Amperes at 36 Volts DC	Intermediate Frequency	456 KC
Power Output	.17 Watt Undistorted .40 Watt Maximum	Speaker	6" or 8" Electro-Dynamic
Selectivity	30 KC Broad at 1000 times Signal	Tuning Frequency Range	B Range 535 to 1610 KC (Kilocycles) D Range 5750 to 18300 KC (Kilocycles)
Sensitivity (For .05 watt output)	B Range 6.0 Microvolts Average D Range 8.0 Microvolts Average		

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments. The following equipment is required for aligning: Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead. An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed. Allow Chassis and Signal Generator to "Heat Up" for several minutes. Output Indicating Meter—Non-Metallic Screwdriver. Dummy Antennas—.1 mf., 200 mmf., and 400 ohms.

SIGNAL GENERATOR		DUMMY ANTENNA		CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
FREQUENCY SETTING	CONNECTION AT RADIO	CONNECTION AT ANTENNA SWITCH	BAND		
I. F.	456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open 1st I.F. (C13) & (C14) 2nd I.F. (C15) & (C16) 3rd I.F. (C22)
RANGE B	1610 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Full Open Oscillator Range B (C8)
	1500 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1500 KC— See Note A 1st Ant. Range B (C11) 2nd Ant. Range B (C10)
	600 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output 600 KC (C5) Rock Rotor—See Note B
RANGE D	18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open Oscillator Range D (C7)
	16,000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output Ant. Range D (C9) Rock Rotor—See Note B
	6000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output 6000 KC (C4) Rock Rotor—See Note B

LINE VOLTAGE RANGE

After each range is completed, repeat the procedure as a final check. NOTE A—If the pointer is not at 1500 KC on the dial, remove pointer from drive cord. Set pointer at the 1500 KC mark on the dial scale. Attach pointer to drive cord. NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

The radio will operate satisfactorily within a line voltage range of 25 to 42 volts. If the line voltage is

higher than 42, it will be necessary to use a series resistor to cut it down. If the voltage varies, a variable resistor may be required.

7T5-4

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments. Signal Generator which will provide an accurately calibrated signal at test frequencies as listed. Allow Chassis and Signal Generator to "Heat-Up" for several minutes. Output Indicating Meter; Non-Metallic Screwdriver. The equipment in column at right is required for aligning: Dummy Antennas—.1 mf., 200 mmf.

7D11, 7D11-3

Polarity of 32 Volt Power Supply—Insert plug so that prong on same side as ribbed side of cord is on the positive side of the line.
 If the polarity of the line is not known, insert plug. If the tubes light but no sounds are heard from the speaker after the plug has been in one minute, reverse the plug.

32 VOLT POWER SUPPLY
 This radio is designed for use on farms and in those places where the power supply consists of a 32 volt direct current generating plant. The radio may not be satisfactory on plants which do not use storage batteries.

WESTERN AIR PATROL

ALIGNMENT AND CALIBRATION

This radio was properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment.

A signal generator that will provide an accurately calibrated signal at 460, 1715, 1300, 600, 5400, 9000, 14400, 16200, 17400 and 18000 K.C. and an output indicating meter or V.T. volt meter are required. It will be practically impossible to align the receiver if unsatisfactory apparatus is used.

Use a non-metallic screwdriver for the adjustments. The complete procedure is as follows:

I.F. AMPLIFIER ADJUSTMENT

Adjust signal generator to give proper output at 460 K.C. Connect the output of the signal generator to the antenna of the receiver.

Connect the ground lead of the receiver to the ground post of the signal generator.

Turn the band switch to Range A. position (Standard wave band). Connect the vacuum tube volt meter to the A.V.C. buss of the receiver and adjust trimmers in the I.F. stage to resonance.

RANGE A ALIGNMENT

525 to 1750 K.C.

Turn the rotor of the tuning condenser to full maximum position. Set both ends of pointer to true horizontal line.

1.

Turn pointer to 1712 K.C. and set signal generator output to 1712 K.C. and adjust oscillator high frequency trimmer "A1" for maximum output.

2.

Turn pointer to 600 K.C. and adjust signal generator to 600 K.C. output.

Then use low frequency trimmer "E" and adjust for maximum output.

3.

Turn pointer to 1300 K.C. and set signal generator output to 1300 K.C. and adjust modulator high frequency trimmer "A2" and "D" pre-selector stage for maximum output.

Then turn pointer to 600 K.C. and readjust trimmer E but do not adjust A2 and D at this point.

RANGE B ALIGNMENT

1700 to 5800 K.C.

1. Turn pointer to 5400 and set signal generator at 5400 K.C. and adjust high frequency trimmer "B1" to resonance of 5400 K.C. on the dial.

RANGE C ALIGNMENT

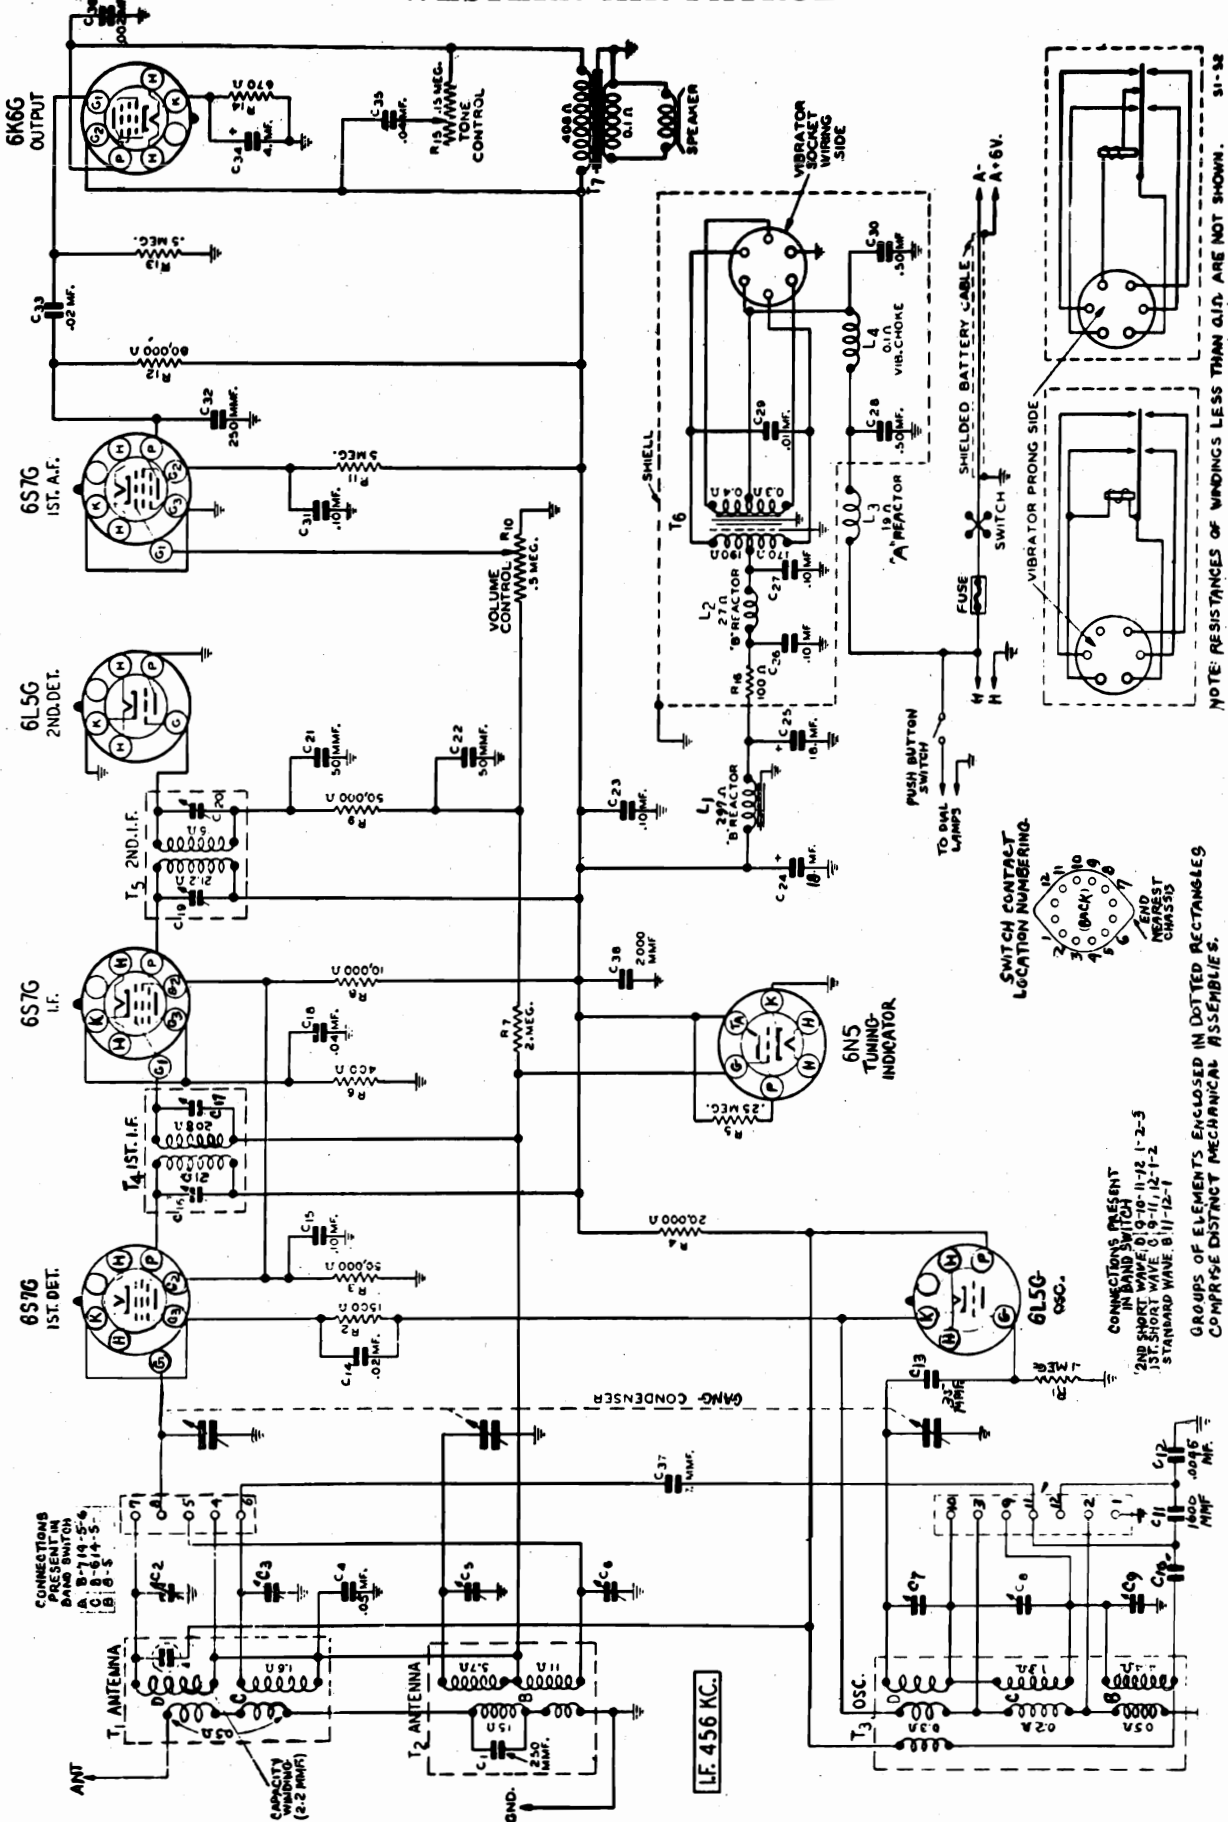

18000 to 5400 K.C.

1. Turn pointer to 18 Meg. and set signal generator at 18 Meg. and adjust high frequency trimmer "C1" to resonance at 18 Meg. on dial. Then adjust trimmer C for maximum output.

CAUTION

During this procedure it is very easy to set the oscillator high-frequency trimmer on the image side of signal which will give incorrect alignment. The oscillator trimmers are always turned to a frequency that is higher than that of the true signal that the receiver is receiving.

OPERATION INSTRUCTIONS

This receiver is designed to operate on 106 to 185 volts, direct or alternating current. Do not connect to any other source, unless designated on instruction card. Connect attachment plug to light socket. See that all tubes are properly inserted in sockets as per chart showing top view of chassis. The aerial furnished with the receiver should be strung around a picture molding or under the edge of a rug. Turn operating switch on by turning the volume knob to the right. Continue to turn volume control in clockwise direction as far as it will go and allow an interval of time for tubes to become heated. Turn the station selector knob slowly until station is heard clearly and reduce volume to desired intensity by turning volume control knob to the left.

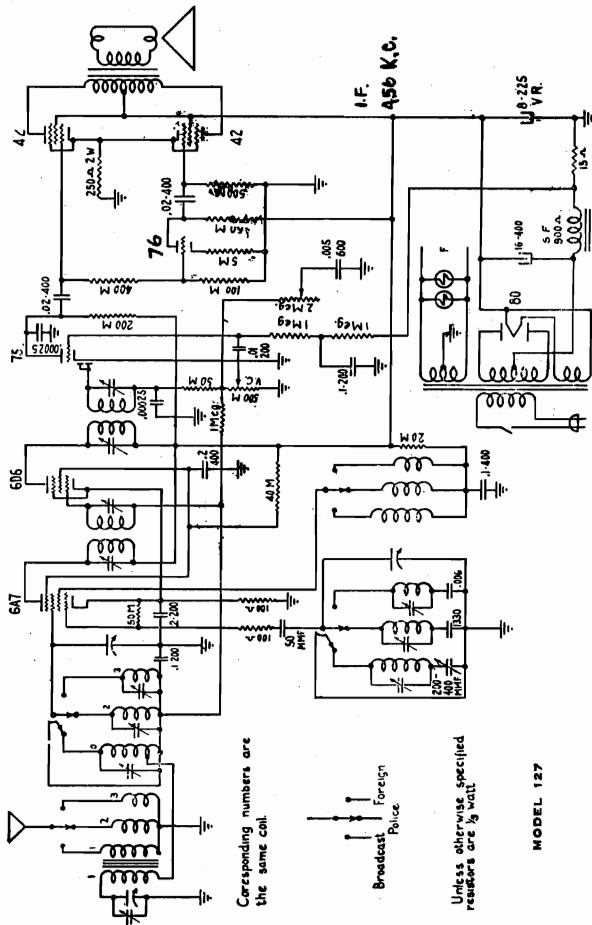

This receiver covers a continuous range from 540 to 1785 KC. Standard and experimental broadcast stations will be received between 540 and 1600 KC. Many police stations can be received near 1700 KC.

The following tubes are used in this receiver:

- 1—No. 6D6 R. F. Amplifier
- 1—No. 6C6 Detector
- 2—No. 43 Power Output
- 1—No. 25Z5 Rectifier
- 1—BK 55B Regulator

If this receiver should fail to operate when connected to direct current, reverse the attachment plug in the light socket.

CIRCUIT DIAGRAM MODELS D700, D723

MODEL 127

TUBE LAYOUT

TUBE LAYOUT and CONNECTION DIAGRAM

Tubes must be in proper position and connected as shown.

How to set up the Automatic Tuner: On the tube location chart, observe the relative positions of the push buttons and the MASTER CONTROL; button No. 1 controls selector pin No. 1, etc. The selector pins on the Master Control may be moved around the drum by sliding them along the slot—no tools are necessary. Note that there is a paint dot on the rim of the bakelite drum directly opposite the break between the contact ribbons.

List four favorite local stations, calling the highest frequency station (the one nearest the 1700 kc. end of the dial) the No. 1 station, the next lowest No. 2, etc.

Using the manual station selector, tune in the No. 1 station, then move the No. 1 selector pin opposite the paint dot so that the contact rests between the two ribbons. As a means of checking the accuracy of this setting, a spring clip is provided on one of the pilot light leads so that the lead may be disconnected from the chassis and attached to the selector pin. With the clip fastened to the pin, the lamp will glow until the contact is properly set. **DO NOT LEAVE THE PILOT LIGHT LEAD CONNECTED TO THE PIN.** As soon as the station has been set up, **RECONNECT THE PILOT LIGHT LEAD TO THE CHASSIS** so that the lamp glows normally.

Using similar procedure, set up the other three stations. When all four stations are set up, locate their call letters on the sheets furnished, punch out the tabs and insert in proper buttons. Thereafter any of the four stations may be tuned in by merely pressing the button bearing the call letters of the desired station.

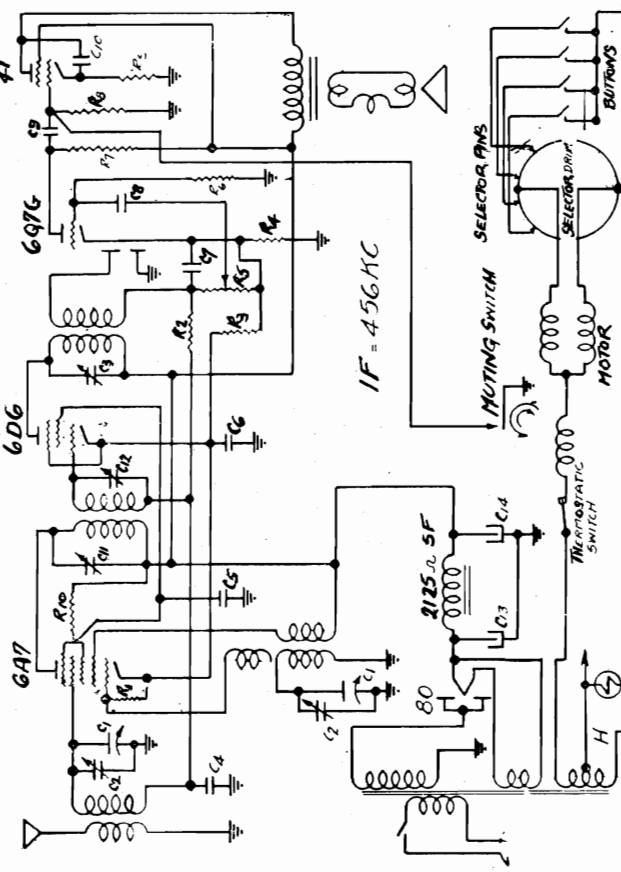

Be sure that your stations are listed in the proper order according to frequency or position on the dial. Do not confuse frequency (kilocycles) with wave length (meters).

Be sure that your stations are tuned in exactly before setting the contact pins. Do not set up weak stations, or distant stations too weak to afford clear reception at all times.

Connect a high impedance AC voltmeter across loud-speaker terminals. Volume control should be set a few degrees back of maximum volume position. Use a weak signal from generator, strong signals tend to cause improper adjustments.

I.F.: Connect the generator ground to receiver chassis. Using .1 mfd. condenser in series with high side of generator, apply 456 kc. signal to grid of 6D6 I.F. amplifier tube, and a line transformer No. 2. Connect generator to grid of 6A7 tube and a line transformer No. 1.

R.F.: Using a 200 MMF. condenser in series with the high side of the generator, adjust trimmers at frequencies shown.

MODEL D719
 MODELS D900, 901

WESTERN AUTO SUPPLY CO.

For models D-719, D-900, D-901

Connect a high impedance AC voltmeter across loud-speaker terminals. Volume control should be set a few degrees back of maximum volume position. Use a weak signal from generator, strong signals tend to cause improper adjustments.

IF: Connect generator ground to receiver ground. Using 1 mfd condenser in series with "high" side of generator, apply 456 kc signal to grid of 6S7G and adjust second IF transformer: same for first IF, applying signal to grid of 6D8G. (See diagram for location of tubes and transformers.)

RF: Using 200 mmf condenser in series with generator, feed 1725 kc signal to antenna lead and adjust oscillator top frequency. Set generator at 1400 kc, tune receiver to signal and adjust antenna trimmer.

* 6D6 for models D-900, D-901

TRUETONE MODEL D 722

MODEL D730

WESTERN AUTO SUPPLY CO.

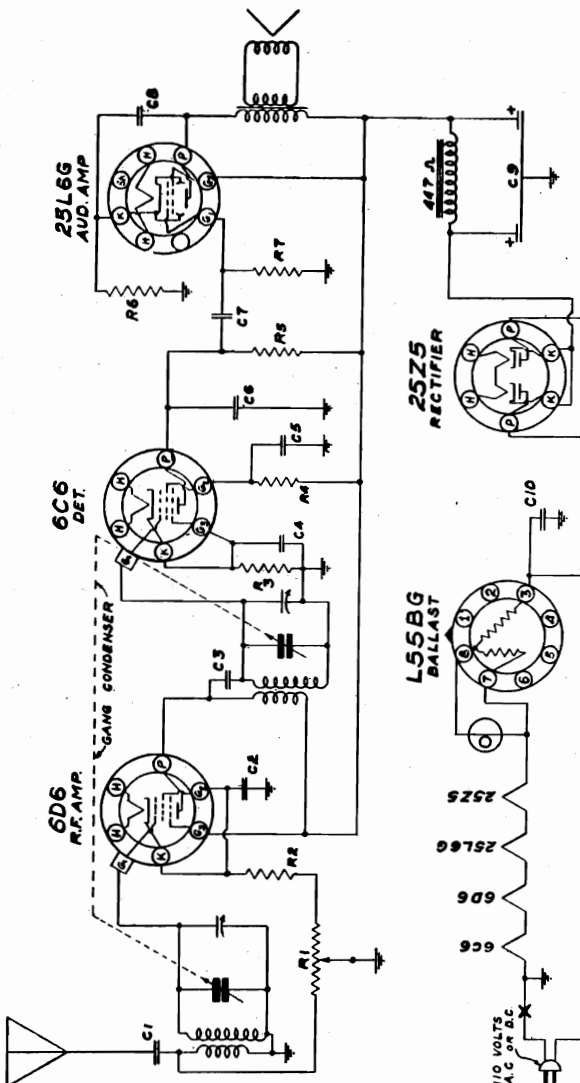

POWER SUPPLY: This receiver is designed to operate from any AC (alternating current) or D.C. (Direct current) power supply main of 105-125 volts, 60 cycle. If the receiver fails to operate on D.C. reverse the power line plug.

FOR CONVENTIONAL ALIGNMENT SEE SPECIAL SECTION RIDER'S VOL. VIII

ALIGNMENT DATA AND SERVICING

Connect a signal generator to the antenna lead of the receiver through a 100 Mmf. condenser. Set the dial pointer at 1400 KC. Set the generator at 1400 KC. Now adjust the antenna and RF trimmers of the gang condenser to maximum output.

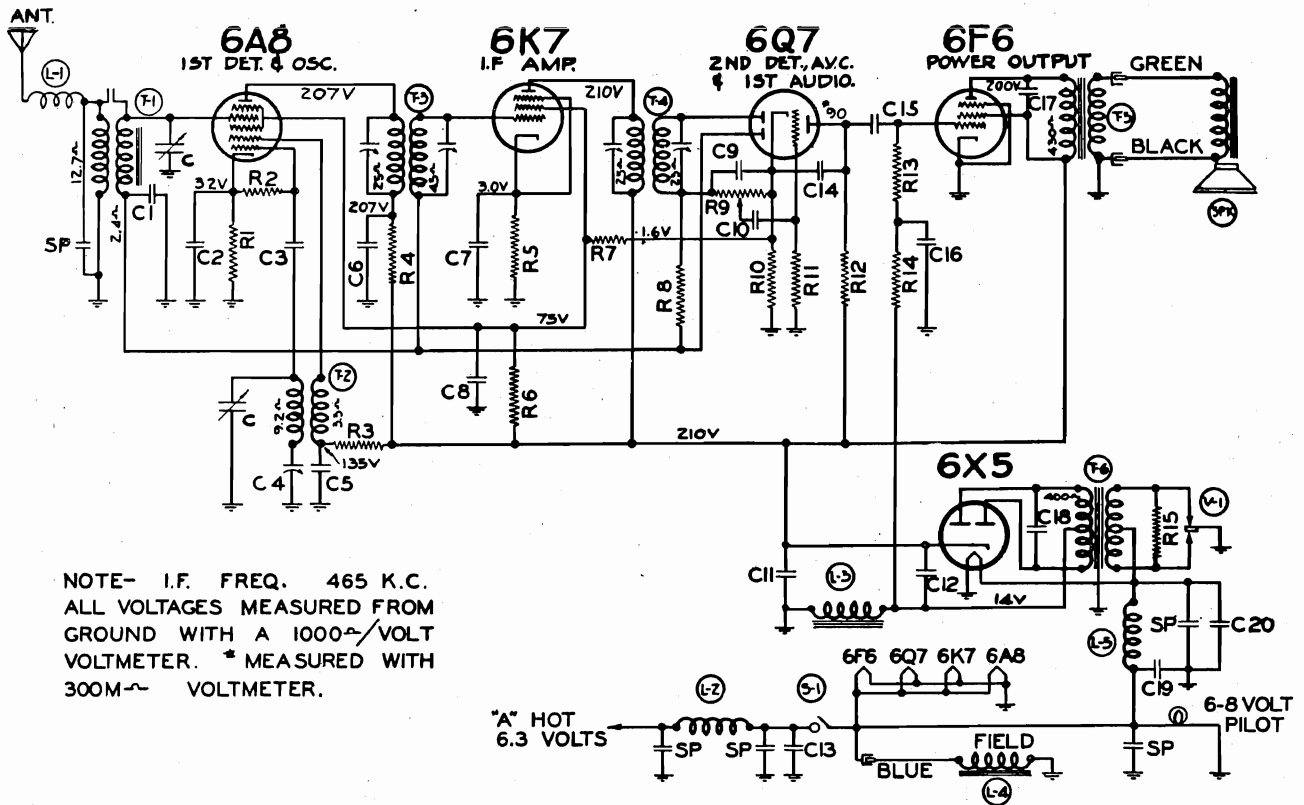

This receiver is designed to operate over three tuning ranges. The broadcast range which extends from 540 to 1700 Kc. (175 to 550 meters), Police and Aviation Band which extends from 1700 to 5000 Kc. (52 to 175 meters) and the international short wave band which extends from 5800 to 15,200 Kc. (18.5 to 52 meters). This short wave range is the one which includes the four internationally assigned bands—the 19, 25, 31 and 49 meter bands.

I.F. 456 KC	Control Grid (prong No. 8) 6SA7 1st Det. Tube	.05 mf.		1st I.F. (C11) & (C12) 2nd I.F. (C15) & (C16)
OSCILLATOR				
1560 KC	Antenna Cable See Note A	See Note A	Extreme Position out of Coil	Oscillator (C6)
1000 KC ADJUSTMENT				
1000 KC	Antenna Cable	See Note A	Tune to Max. Output with Tuning Knob	Int. (C5) Ant. (C4)

Reassemble Radio—Install in Car—Connect Car Antenna to Radio.

Car Antenna Readjustment—Tune in weak signal near 1000 KC—Readjust Antenna Trimmer C4 for maximum output.

Remove Grille, Speaker, Trimmer Caps and Rear Cover From Chassis Case—

Volume Control—Maximum All Adjustments.

Local-Distance Switch—"Distance" Position.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:

A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

Dummy Antenna—.05 mf., See Note A.

NOTE A—Insert the antenna cable plug in the antenna socket on the chassis. The total capacity of the antenna cable and dummy antenna should be 60 mmf. If the cable, for example, has a capacity of 30 mmf., use a 30 mmf. condenser for a dummy antenna. Con-

nect the other end of the antenna cable through the dummy antenna capacity to the output of the signal generator.

CALIBRATION—To calibrate the radio, tune in a station of known frequency. At the

back of the control unit is the calibration screw. Remove the dial lamp assembly. Hold the tuning knob. Insert a fine bladed screwdriver and turn this screw until the pointer on the dial scale is at the frequency of the station being received.

Alignment Procedure

D-748

BOTTOM VIEW OF CHASSIS

Fig. 7—600 KC Padder

Set the signal generator for 456 KC and connect the output of the signal generator through a .05 mf. condenser to the stator of the interstage section (middle) of the tuning condenser. Connect the ground lead of the signal generator to the chassis. Set the volume control at maximum and the L-D switch in the distance position. Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC. Then adjust the 4 I.F. trimmers until maximum output is obtained—See Fig. 4.

Insert the antenna cable plug in the antenna socket on the chassis. The total capacity of the antenna cable and dummy antenna should be 60 mmf. If the cable, for example, has a capacity of 30 mmf., use a 30

mmf. condenser for a dummy antenna. Connect the other end of the antenna cable through the dummy antenna capacity to the output of the signal generator.

Set the signal generator for 1560 KC. Turn the rotor of the tuning condenser to the full open position. Adjust the trimmer of the oscillator section of the gang condenser until maximum output is obtained. See Fig. 4 for location of this trimmer.

Set the signal generator for 1400 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained. Adjust the interstage and antenna 1400 KC trimmers for maximum output. Do not change the setting of the oscillator trimmer.

Set the signal generator for 600 KC.

Turn the tuning condenser rotor until maximum output is obtained. Then turn the tuning condenser rotor back and forth, at the same time adjusting the 600 KC padder (see Fig. 7) until the peak of greatest intensity is obtained.

Readjusting Antenna 1400 KC Trimmer—After the radio is installed

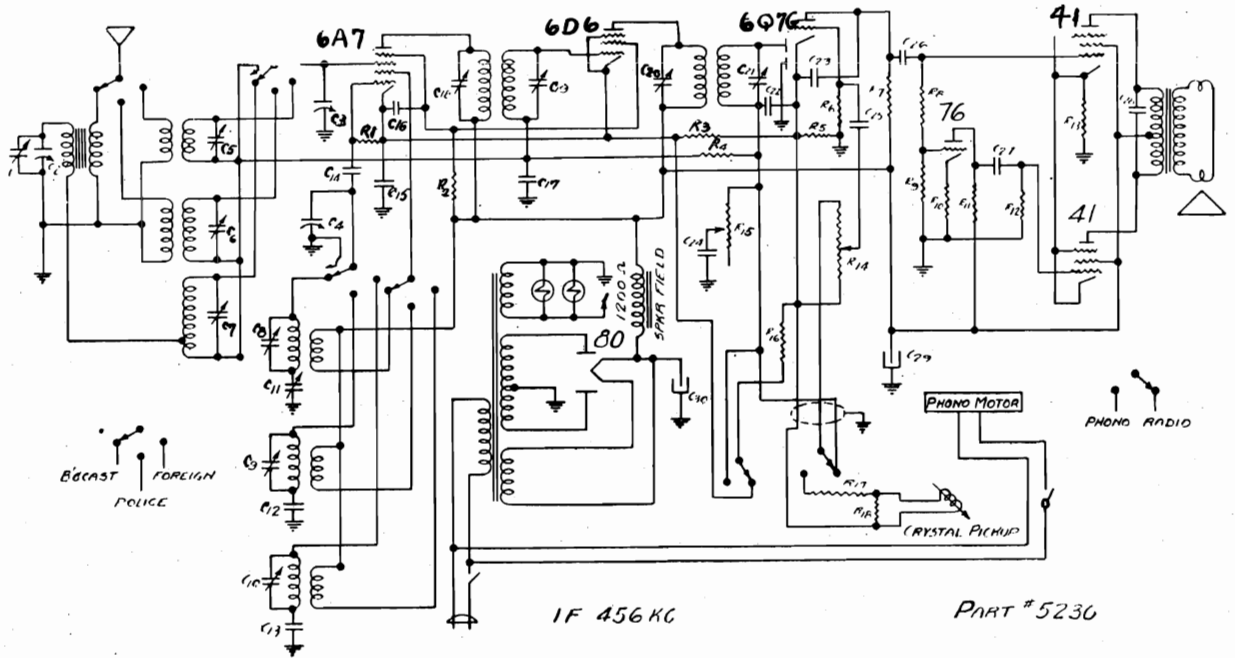

and the car antenna is connected, it will be necessary to readjust the antenna 1400 KC (Fig. 3) trimmer. This trimmer can be reached through an opening in the chassis case. Tune in a weak signal at approximately 1400 KC with the volume control about three-fourths on. Turn the adjusting screw of the antenna 1400 KC trimmer up or down until maximum output is obtained.

If a distinct peak cannot be reached, it may be due to the fact that the antenna capacity is not properly matched to the antenna input circuit of the radio. An extension adapter cable may be required or if one is being used it may not be required—see article on antenna in this instruction manual.

Calibration—To calibrate the radio, first turn the tuning knob 9 complete turns in either direction. Then tune in a station of known frequency. Remove the dial lamp assembly from the back of the dial unit. The calibration screw is at the bottom of the dial lamp tube. Hold the tuning knob. Insert a fine blade screwdriver and turn this screw until the pointer is at the frequency of the station being received.

FIG. 4

TRIMMER ADJUSTMENTS

ALIGNMENT PROCEDURE

The diagrams below should be studied carefully as they show the location of all trimming and padding condensers. The following equipment is necessary to properly align this chassis:

1. An all Wave Signal Generator which will provide an accurately calibrated signal at the frequencies listed.
2. An Output Meter.
3. A non-metallic screwdriver.
4. Dummy Antenna—.1mfd., 200 mmf., 400 ohms.

Set the volume control near the maximum volume position, Connect the signal generator ground to the receiver chassis, Connect the proper value of dummy antenna in series with the generator output. Connect the output meter either across the primary of the output transformer or across the speaker voice coil. Allow the signal generator and the chassis to heat up for several minutes.

TUBES:

- 1—6A8G Converter (Oscillator and First Detector).
- 1—6K7G I. F. Amplifier.
- 1—6Q7G Detector-First Audio Amplifier.
- 1—6C5G Phase Inverter.
- 2—6F6G Push Pull Power Output.
- 1—80 Rectifier.

WESTERN AUTO SUPPLY CO.
ALIGNMENT PROCEDURE

MODEL D906
MODEL D924
MODEL D924C

The following equipment is necessary to properly align this chassis:

1. An all Wave Signal Generator which will provide an accurately calibrated signal at the frequencies listed.
2. An Output Meter.
3. A non-metallic screwdriver.
4. Dummy Antenna—.1 mfd., 200 mmf., 400 ohms.

Set the volume control near the maximum volume position, connect the signal generator ground to the receiver chassis, connect the proper value of dummy antenna between the high side of the generator output and the point in the receiver indicated in the table below. Connect the output meter either across the primary of the output transformer or across the speaker voice coil. Allow the signal generator and the the chassis to heat for several minutes.

BAND	SIGNAL FREQUENCY SETTING	GENERATOR CONNECTED TO	DUMMY ANTENNA	BAND SWITCH POSITION	VARIABLE CONDENSER SETTING	TRIMMER LOCATION	TRIMMER FUNCTION	ADJUSTMENT

SHORT WAVE BAND	16,000 kc. exact	Ant. Terminal	400 ohms	Short wave	Set pointer to indicate 16,000 kc.	Underneath chassis on osc. coil See Fig. 6	Short wave oscillator	Adjust to maximum output. *See note 1
	16,000 kc. exact	Ant. Terminal	400 ohms	Short wave	As above	Underneath chassis on RF. coil See Fig. 6	Short wave RF. amplifier	Adjust to maximum output while rocking the tuning-condenser slightly.
	16,000 kc. exact	Ant. Terminal	400 ohms	Short wave	As above	Underneath chassis on Ant. coil See Fig. 6	Short wave Antenna	Adjust to maximum output while rocking the tuning-condenser slightly.

REPEAT ABOVE PROCEDURE AS FINAL CHECK

NOTE 1.—Exercise care to see that the oscillator is tuned to a frequency higher than the signal since it is very easy to mistakenly set the oscillator on the wrong side of the signal at this high frequency.

BAND SWITCH:

The Band Switch, lower right hand knob, serves to make the necessary changes in connections so that reception may be obtained on the short wave band instead of the broadcast band or vice versa as desired.

In the left hand, or counterclockwise position, connections are made for receiving stations in the range 540 to 1800 KC., which range includes the American broadcast band (540 to 1670 KC.) a large number of municipal police stations (1600 to 1712 KC.) and a number of amateur stations (above 1712 KC.).

In the right hand, or clockwise position, connections are made for reception of short wave stations in the range 5500 to 18,000 KC. (5.5 to 18 megacycles). An extra scale has been provided for the short wave range, calibrated in meters (54.5 to 17) for the convenience of the user.

There are 6 buttons on the automatic tuning dial by means of which 6 stations may be set for quick tuning.

Make a list of your favorite stations, those which you tune in regularly

It is better to list the station with the lowest kilocycle number first, the station with the next higher kilocycle number next, and so on.

Any button may be used for any station you can receive, although it will be better to set the stations so that the kilocycle numbers increase from left to right.

SETTING A STATION BUTTON:

Pull the button at the extreme left off the shaft. When this is done, the locking screw under the shaft will be exposed.

Loosen this screw with a small screwdriver by turning several turns in a counterclockwise direction. Continue to press in firmly on the screwdriver, thus holding the station button shaft depressed. Select the first station from the list you have prepared and carefully tune in this station by means of the manual tuning knob.

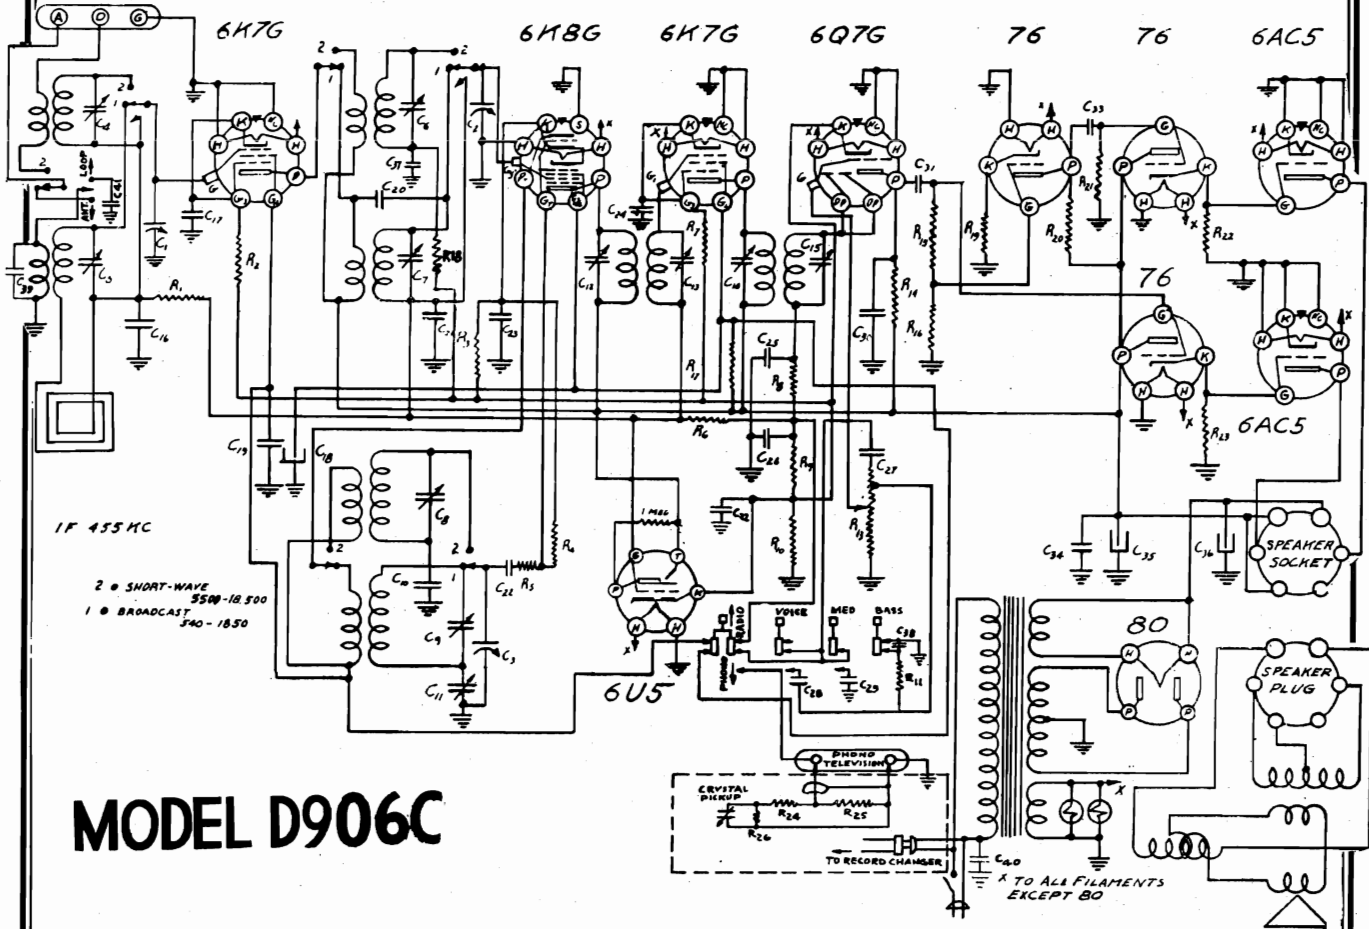

Continue to press in firmly on the screwdriver and lock the mechanism by turning the locking screw in a clockwise direction until it is tight. The station is now set on this button.

Proceed in the same manner to set any additional stations on your list on the remaining station buttons.

MODEL 910
Issues A, B

WESTERN AUTO SUPPLY CO.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
 - Connect radio chassis to ground post of signal generator with a short heavy lead.
 - Connect dummy antenna value in series with generator output lead.
 - Connect output meter across primary of output transformer.
 - Allow chassis and signal generator to "heat up" for several minutes.
- The following equipment is required for aligning:
- An all wave signal generator which will provide an accurately calibrated signal at the test frequency as listed.
 - Output indicating meter.
 - Non-metallic screwdriver.
 - Dummy antennas—1 mf., 200 mmf. and 400 ohms.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6SK7	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6K8	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1750 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Trimmer (C12) (See Fig. 4)	Broadcast oscillator	Adjust to maximum output
	1400 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 1400 Kc.	Trimmer (C5) (See Fig. 4)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 600 Kc.	Trimmer (C7) (See Fig. 4)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")
SHORT WAVE BAND	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 17 MC.	Trimmer (C11) (See Fig. 4)	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Dial Set at 17 MC.	Trimmer (C6) (See Fig. 4)	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 6 MC.	Trimmer (C8) (See Fig. 4)	Short Wave oscillator series pad	Adjust to maximum rock dial. (See note "A")

NOTE "A." Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each band is completed, repeat the procedure as a final check.

BAND SWITCH
Extreme right rotation
Extreme left rotation

BAND
Short Wave
Broadcast

FREQUENCY RANGE
5.2 to 18.3 MC.
540 to 1750 KC.

Power Consumption.....60 Watts (At 115 volts 50-60 cycles)
Power Output.....3 Watts Undistorted, 5 Watts Maximum

INTERMEDIATE FREQUENCY.....465 KC.

TUBES:

- The tube complement of this chassis consists of the following octal base glass and metal tubes:
- The type and function of each tube is as follows:
- 1—Type 6K8 Converter (Oscillator and First Detector).
 - 1—Type 6SK7 Remote Cut-Off Pentode, I. F. Amplifier (465 K. C.).
 - 1—Type 6Q7G Duplex Diode Triode Second Detector, A.V.C. and First Audio.

- 1—Type 6P5G Driver Amplifier.
 - 1—Type 6AC5G Positive Grid Triode Output Amplifier.
 - 1—Type 5Y3G High Vacuum Rectifier.
- Transformers are available and chassis are sometimes equipped with universal transformers for operation on 25, 40 and 60 cycles and with primary taps for 110, 130, and 230 volts, (see parts list.)

PROCEDURE FOR SETTING THE AUTOMATIC STATION PUSHBUTTONS:

Press any one of the automatic pushbuttons all the way in. Hold the push button in firmly and with a screw driver inserted through the opening in the escutcheon loosen the locking screw directly above the pushbutton which is being held in (See "C" Fig. 3). Three or four complete turns will be sufficient.

Now, while still holding the pushbutton in firmly, tune in very carefully by means of the dial tuning knob the station you wish this pushbutton to represent. You will note that in order to tune the station, the dial tuning knob will have to be pressed in. The knob is equipped with a spring which partially disengages the control from the drive mechanism when dial tuning knob is not being used.

Turn the dial tuning knob back and forth very slowly until the station is heard clearly and with maximum volume.

Now, while still holding the pushbutton in firmly, tighten the locking screw above this pushbutton. Turn the screw until it is just tight. Do not use force. Release the pushbutton. This pushbutton is now set up and locked.

Press in another pushbutton and holding it in firmly, loosen the locking screw above this pushbutton. Carefully tune in another station while still holding the pushbutton in firmly. After the station has been tuned in, tighten the locking screw above the pushbutton which is being held in.

Follow this procedure until you have selected all of your favorite stations.

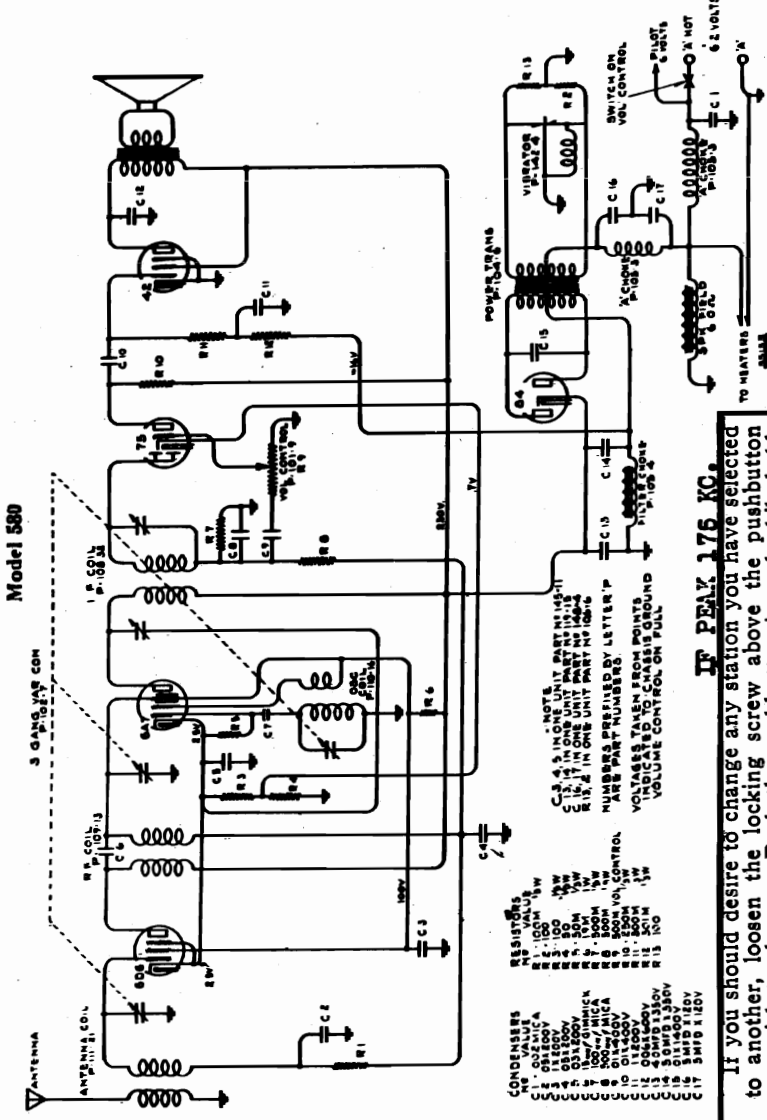

It is very important that the locking screw for each pushbutton is tightened, otherwise the stations will not remain set up accurately for pushbutton tuning.

If you find you have made an error in setting a station or a station is not accurately tuned due to the pushbutton not being held in firmly while tightening the locking screw for this particular pushbutton, repeat the setting procedure for this pushbutton again.

Each pushbutton has its own locking screw and the pushbuttons are entirely independent of one another.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have set up for pushbutton tuning.

Insert the call letter tabs in the rectangular openings above each of the pushbuttons over the pushbutton locking screws. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs, (See "B", Fig. 2).

IF PEAK 175 KC.

If you should desire to change any station you have selected to another, loosen the locking screw above the pushbutton you wish to change. Push the pushbutton in and while holding it in firmly tune in the new station by means of the dial tuning knob. After the station is carefully tuned in, tighten the locking screw while still holding the pushbutton in. Insert the new station call letter tab and the celluloid protective cover. The radio is now set up for automatic tuning.

ALIGNING INSTRUCTIONS:

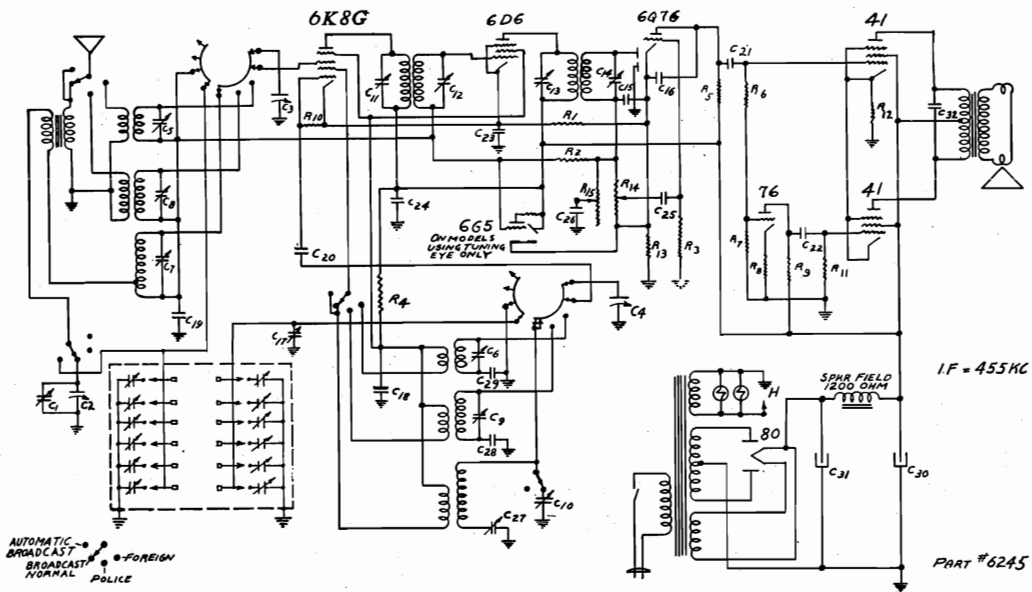

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet.

To remove the chassis from the cabinet, remove the four chassis mounting bolts which are used to hold the chassis to the cabinet bottom; take the knobs off their shafts, the tuning knob is held on by means of a set screw; the volume control, tone control and band switch knobs are of the push-on type.

Model 277
ANTENNA

For best results, it is recommended that a good outdoor antenna be installed. Do not use an old antenna as most of the older installations were not intended for reception of short waves, and many are not suitable for good broadcast reception.

The average length of a single wire antenna, including lead-in, should be not less than fifty feet. In locations near powerful broadcast stations, this length may be shortened to thirty-five feet. In more favorable locations, seventy-five feet should be used.

Regardless of its length, the antenna and lead-in should be spaced well away from the roof, sides of the building, trees, and power lines. Stand-off insulators should be used to hold the lead-in wire at least six inches from the building, and the lead should be brought into the building through a porcelain tube insulator. The receiver should be located as near to the point where the lead-in is brought through the wall as is conveniently possible.

Indoor antennae will give good broadcast reception except in steel frame buildings. However, foreign reception will not be satisfactory unless an outdoor antenna is provided.

When a lightning arrestor is used, it must be of a special low-capacity type so that foreign reception will not be impaired.

TUBES

- Tubes required are:
- 1—6K8G Oscillator-translator
 - 1—6D6 Intermediate Frequency Amplifier
 - 1—6Q7G Detector AVC—First Audio Amplifier
 - 1—76 Driver—Phase Inverter
 - 2—41 Power Output
 - 1—80 Rectifier
 - 1—6G5 Cathode Ray Tuning Tube (on models equipped with "eye" tuning indicator)

WESTERN AUTO SUPPLY CO.

MODEL D911

Connect a high impedance AC voltmeter across the loudspeaker terminals. Volume control should be set a few degrees back of maximum volume position. Use a weak signal from the generator, strong signals tend to cause improper adjustments.

IF. Connect the generator ground to receiver chassis. Using .1 mfd. condenser in series with high side of the generator, apply 455 kc. signal to the grid of the 6D6 IF amplifier tube and align second IF transformer trimmers. Repeat for first IF transformer, applying signal to grid of the 6K8G tube. (See above diagram for location of tubes and transformers.)

RF. (See above diagram for location of trimmers.) Using a 200 mmf. condenser in series with the high side of the generator, turn band selector switch to position "B," tuning condenser to minimum capacity, feed 1680 kc. signal to antenna terminal and adjust broadcast oscillator trimmer for top frequency. Set generator frequency at some point around 1400-1500 kc., and adjust broadcast antenna and RF trimmers. Set generator for 600 kc., tune receiver to signal and adjust the padder. The tuning condenser should be rocked back and forth through the signal while varying the padder in order to assure perfect alinement.

A 400 ohm resistor must be used in series with the generator as a "dummy" antenna for proper alinement of the two short wave bands. Set the band selector switch in the "P" position, adjust the oscillator top frequency for 5400 kc., then aline the antenna trimmer at about 5000 kc. With the band selector in the extreme right position, adjust the top frequency of the high frequency band to 16,000 kc., and aline the antenna trimmer at about 15,000 kc. In order to make sure that the top end of the last band is set properly, it is best to screw the oscillator trimmer down tight, then unscrew to the second peak. The antenna trimmer should be screwed down tight, then unscrewed to the first peak. This procedure must be followed in order that the oscillator and RF circuits will be set in the correct relation to each other, otherwise a "dead" spot at a lower frequency will result, and the dial calibration will not be correct. Usually, it is best to rock the tuning condenser back and forth slightly while making these adjustments at high frequencies.

Turn the wave switch to the extreme left or automatic tuning position and depress the extreme left push button. Apply a signal at 1620 kc. to the receiver antenna lead through a 200 mmfd. condenser and unscrew the adjustment screw of the depressed push button to within about one turn of its limit in this direction. Then adjust the isolantite trimmer on the wave switch bracket, shown in the above drawing, until the signal is heard. This is the only service alinement necessary for the automatic tuner and stations may now be set up according to the instructions given elsewhere in this book.

Setting Up the Push Button Station Selector

First select six favorite local or strong nearby stations, listing them according to frequency or position on the dial. Setting up weak or distant stations is not recommended. Call the station nearest the left hand end of the dial (nearest 1600 kc.) the No. 1 station and number the other five stations consecutively as they are tuned in on the dial, tuning from left to right. For example assume your selected stations operate on frequencies of 1500 kc., 1300 kc., 1100 kc., 900 kc., 700 kc., and 600 kc. The 1500 kc. station should be listed as No. 1, the 1300 kc. station would be No. 2, and so on through the list with the 600 kc. station becoming No. 6. In setting up the buttons, the 1500 kc. station should be set up on No. 1 button, or the first button from the left, the 1300 kc. station on the second button from the left, and so on until the 600 kc. station is finally set up on the button farthest to the right.

With the band selector set at "B", or the second position from the left, tune in station No. 1. Observe the program in progress, then turn the band selector knob to the extreme left position (A). Push the No. 1 button in as far as it will go; when the proper operating position is reached the button will lock in. Then insert the screw driver through the opening directly above the No. 1 button and turn the larger headed screw until the same program is heard. *Do not force this screw. It should turn very easily and if the station is not heard when the screw is turned all the way in one direction, reverse the direction of rotation until the station is found.* When the station is located, turn the screw back and forth through the station slowly and observe when the station is accurately tuned in, indicated by a minimum of noise or hiss, or by watching the tuning eye on the models so equipped. Inserted in one side of the larger screw head is a smaller screw. This screw is for fine adjustment, and should be turned in and out until position of least hiss is found, or until the tuning eye, on models so equipped, shows the least shadow. It will not be necessary to turn this small screw more than one full turn from the factory adjusted position.

MODEL D920

WESTERN AUTO SUPPLY CO.

ALIGNMENT PROCEDURE

- The following equipment is required for aligning:
- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
 - Output indicating meter.
 - Non-metallic screwdriver.
 - Dummy antennas—1 mf., 200 mmf., and 400 ohms.

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Pushbutton Indicated Below Pushed "In"	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6K7 1.F Tube	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6K8G	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND	17 Mc.	400 ohms	Antenna lead	Short Wave	Set dial at 17 MC	Trimmer (C22) (See Fig. 1)	Short wave oscillator	Adjust to maximum output
	17 Mc.	400 ohms	Antenna lead	Short Wave	Set dial at 17 MC	Trimmer (C10) (See Fig. 1)	Short wave antenna	Adjust to maximum output
MEDIUM WAVE BAND	5 Mc.	400 ohms	Antenna lead	Med. Wave	Set dial at 5 MC	Trimmer (C23) (See Fig. 1)	Medium wave oscillator	Adjust to maximum output
	5 Mc.	400 ohms	Antenna lead	Med. Wave	Dial set at 5 MC	Trimmer (C11) (See Fig. 1)	Medium wave antenna	Adjust to maximum output
BAND BROAD-CAST	1600 Kc.	200 mmf.	Antenna lead	Broadcast	Rotor full open (Plates out of mesh)	Trimmer (C24) (See Fig. 1)	Broadcast oscillator	Adjust to maximum output
	1400 Kc.	200 mmf.	Antenna lead	Broadcast	Set dial at 1400 Kc.	Trimmer (C12) (See Fig. 1)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast	Set dial at 600 Kc.	Trimmer (C18) (See Fig. 4)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")

IMAGE REJECTION ADJUSTMENTS

1930 Kc. 200 mmf. Antenna lead Broadcast Pick up signal at 1000 Kc. on dial Trimmer (C9) (See Fig. 1) Image rejection Adjust for minimum output (See note "B")

NOTE "A". Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

NOTE "B". 1930 Kc. is the image frequency of 1000 Kc. Adjust Trimmer (C9) until a minimum output is obtained.

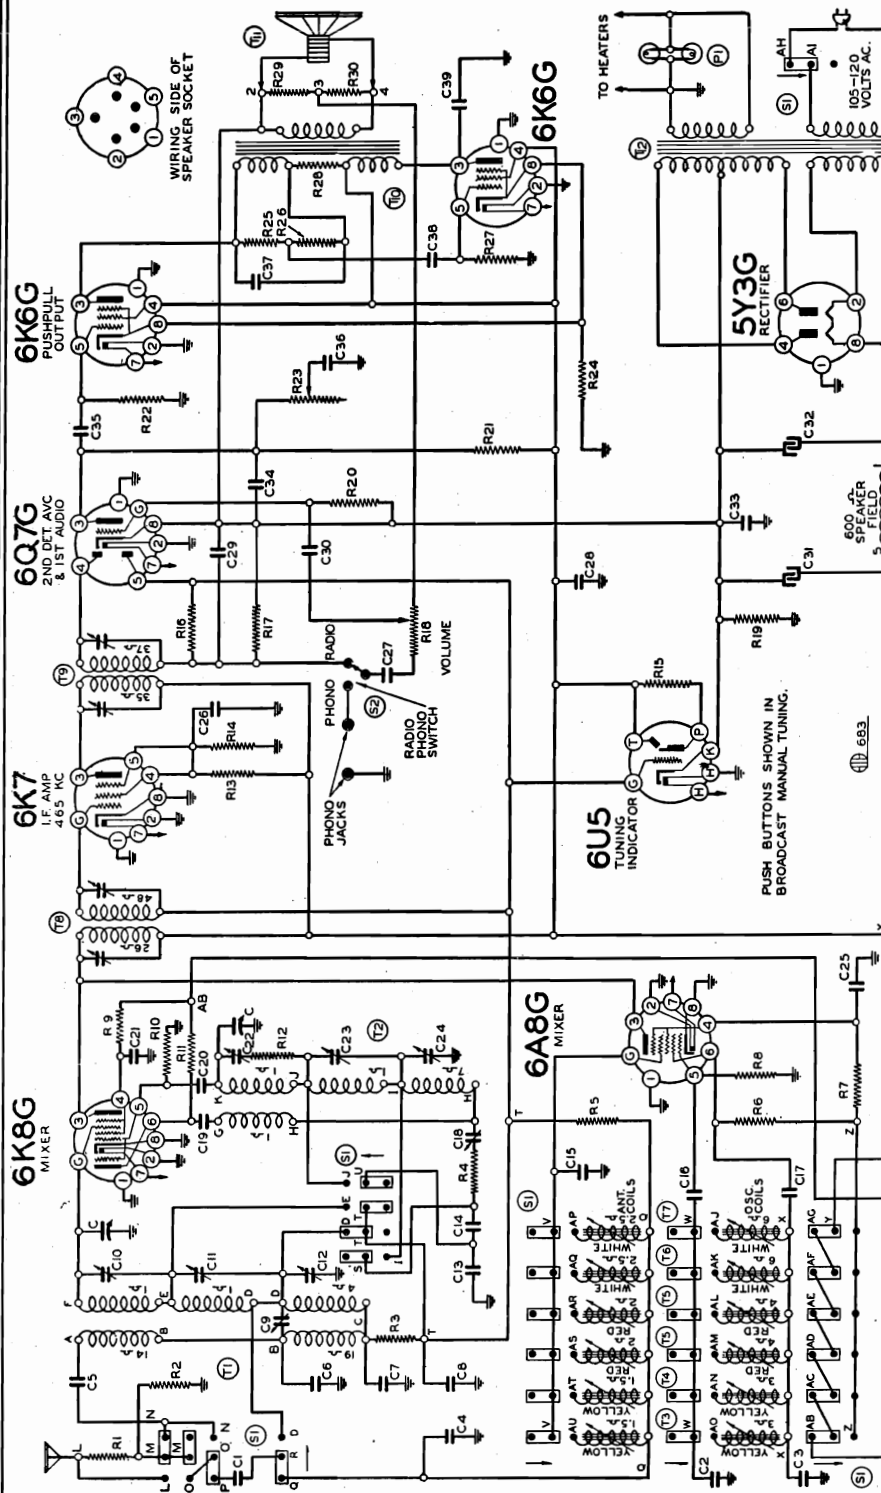

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each band is completed, repeat the procedure as a final check.

BAND	FREQUENCY RANGE
Broadcast	535 to 1600 Kc.
Medium Wave	1.58 to 5.5 MC.
Short Wave	5.0 to 18.3 MC.
Power Consumption	75 Watts (At 115 volts 50-60 cycles)
Power Output	4.5 Watts Undistorted, 6.5 Watts Maximum Intermediate Frequency

BAND	DIAL SCALE	FREQUENCY RANGE
Broadcast	Lower Scale "BC"	535 to 1600 KC. (Kilocycles)
Medium Wave	Center Scale "MW"	1.58 to 5.5 MC. (Megacycles)
Short Wave	Upper Scale "SW"	5.0 to 18.3 MC. (Megacycles)

MODEL D920

WESTERN AUTO SUPPLY CO.

Press pushbutton marked "Broadcast" and tune in next station selected. Press button covering frequency range in which station is located. Adjust screw through station tab opening above button pressed until the same station is heard clearly and with maximum volume.

Follow this procedure for each button until you have selected all of your stations. The automatic buttons are now set up for quick tuning and no further adjustment is necessary.

FIG. 1—TOP VIEW

FIG. 4

PROCEDURE FOR SETTING THE AUTOMATIC STATION PUSHBUTTONS:

Important: Allow the radio to "warm up" for about 15 minutes before setting the station adjustment screws for the pushbuttons.

Only a single adjustment for each station is required in setting up your favorite stations for automatic pushbutton operation. These adjustments are located at the front of the chassis shown in Fig. 3 and are accessible through the station call letter tab holes. The only equipment needed is a small screw driver to make the adjustments.

Make a list of your favorite local stations, those which you tune in regularly. Put down the frequency (kilocycle number) of these stations. There may be 2, 3, 5 or any number up to and including six in this list.

If you do not know the broadcasting frequencies, consult your local newspaper or a radio log book. They can also be obtained by pressing the button marked "Broadcast" on the right hand side of the pushbutton assembly and tuning in the stations manually, noting the numbers on the dial at which they are received.

The automatic station pushbuttons are grouped to cover specific frequency ranges.

The range of the frequencies covered by each button are given below and are also shown in Fig. 3. Only stations within the frequency ranges given can be obtained on a particular button. Counting the station buttons from left to right, looking at the front of the set, the frequency ranges are as follows:

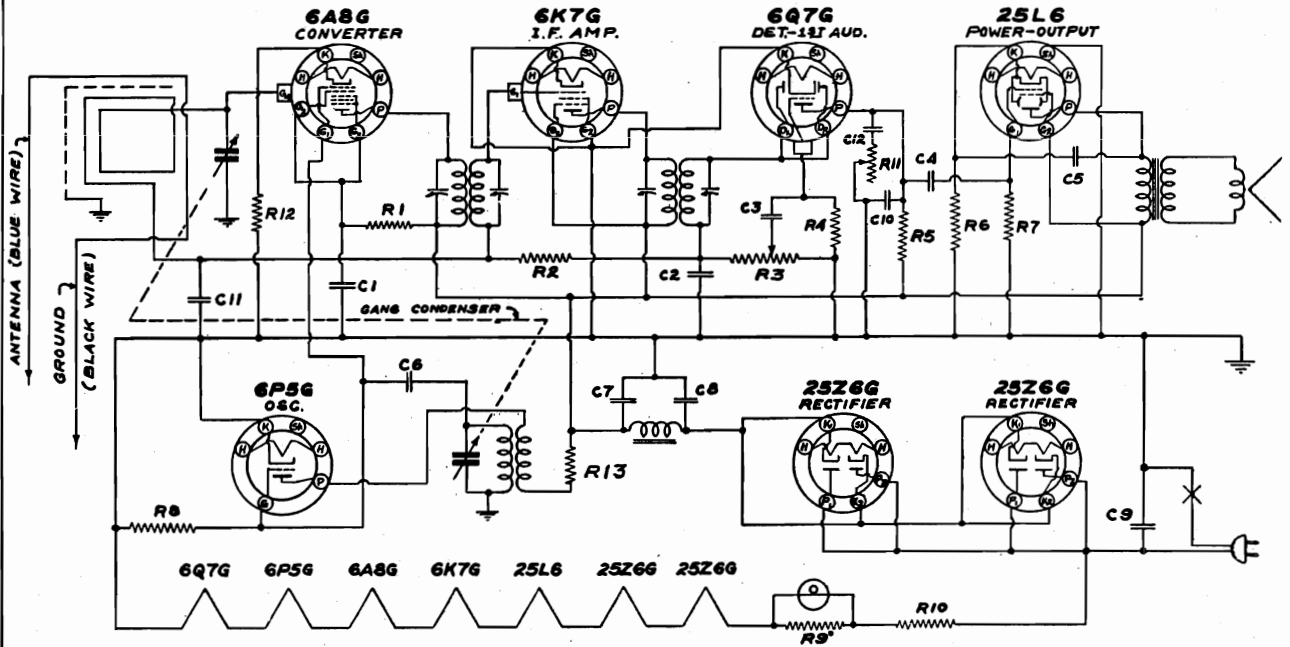

1. 1600 to 1050 Kilocycles.
2. 1600 to 1050 Kilocycles.
3. 1100 to 750 Kilocycles.
4. 1100 to 750 Kilocycles.
5. 800 to 530 Kilocycles.
6. 800 to 530 Kilocycles.

This means that any station which has a kilocycle number lying between 1600 and 1050 K.C. can be set on either Button 1 or Button 2. Any station which has a kilocycle number lying between 1100 and 750 K.C. can be set on either Button 3 or Button 4. Any station which has a kilocycle number lying between 800 and 530 K.C. can be set on either Button 5 or Button 6.

After you have made up your list of stations, press button marked "Broadcast" and tune set manually until station selected having the highest frequency is tuned in and the program noted. Press button covering frequency range in which station is located (See Fig. 3). Adjust screw through station tab opening above button pressed until the same station is heard clearly and tuning indicator indicates that it is correctly tuned.

WESTERN AUTO SUPPLY CO.

VOLTAGE FOR
MODEL D-913
D-914

VOLTAGES AT SOCKETS

Bottom View of Chassis

POWER SUPPLY

This receiver is designed to operate from any AC (Alternating Current) or DC (Direct Current) power supply main of 105-125 volts, 60 cycle. If the receiver fails to operate on DC (Direct Current), reverse the power line plug.

SERVICE DATA

SERVICE NOTES

MODEL D-913, D-914

Voltages taken from the different points of the circuit to chassis are measured with volume control in maximum position, all tubes in their sockets and with a volt meter having a resistance of 1000 ohms per volt, on the 150 volt scale. These voltages are clearly indicated on the voltage chart.

In order to prevent signal from acting upon A.V.C. and affecting accuracy of voltage measurements, aerial and ground leads should be short circuited while making measurements.

SERVICE NOTES

MODEL D-915

Voltages taken from the different points of the circuit to chassis are measured with volume control in maximum position, all tubes in their sockets and with a volt meter having a resistance of 20,000 ohms per volt. These voltages are clearly indicated on the voltage chart.

All voltages should be measured with 117.5 volts A.C. input to receiver. Resistance and actual connections of coils and transformers, electrolytic condenser information and speaker data are given under Service Information.

To check for open by pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good until the defective unit is located.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good.

ALIGNING INSTRUCTIONS

All of the adjustments have been very carefully set with signal generators at the factory and require no further adjustment, unless it becomes necessary to replace a coil or transformer, or if the adjustments have been tampered with in the field. Under no circumstances attempt any adjustments without first making certain that adjustment is necessary and only after voltages, tubes and condensers have been checked and found to be normal. To properly re-align this receiver, a signal generator as well as an output meter, must be used.

Fig. 1—Front View

PROCEDURE FOR SETTING UP PUSH BUTTONS

There are four push buttons by means of which four stations may be selected. Make a list of four stations tuned in regularly. Loosen one of the push buttons by turning the push button knob counter clockwise a half turn or less and push it in; while holding the button in, tune in a desired station by means of the station selector wheel. Turn the selector very slowly back and forth until the signal is clearest. Now while holding the push button in, tighten it by turning clockwise. Release the push button and turn the station selector to one end of the dial; then check the button by pushing it in and if the station is tuned to the center of the area on the dial covered by the station the adjustment is correct.

Release the push button and loosen another push button and repeat the above procedure, doing this for the remaining buttons.

If it is desired to change a button to a different station simply loosen the push button and re-set.

Punch the correct station call letter tabs from the set of sheets supplied and insert them into the recesses above the push buttons.

The dial is now set up for quick tuning and all that is necessary is to push the button under the desired station all the way in and then release.

WESTERN AUTO SUPPLY CO.

MODELS D913, D913
Issue C

Oscillator Coil (Part No. P3205) (Red Dot) MODEL D913

Looking at the connection end (with dot) in a clockwise direction starting at the chassis the terminals are No. 1, grid; No. 2, plate; No. 3, B+; No. 4, ground.

Speaker (Part No. P3284)

Field resistance 450 ohms
D.C. voice coil resistance 4.6 ohms
Voice coil impedance at 400 cycles 5 ohms

SERVICE INFORMATION

Electrolytic Condenser (Part No. P3531)

Red, 20 mfd., 150 volt; green, 20 mfd., 150 volt; yellow, 20 mfd., 25 volt; black, negative for all three sections.

Loop Antenna

Since the loop antenna acts also as the antenna coil the set will not operate with the loop antenna disconnected.

Oscillator Coil (Part No. P3682) MODEL D913, Issue C

Looking at the connection end (with dot) in a clockwise direction starting at the chassis the terminals are No. 1, grid;

Primary—No. 2 and No. 3—Resistance 1.5 ohms.
Secondary—No. 4 and No. 1—Resistance 4.5 ohms.

First I.F. Transformer (Part No. P3282)

Primary—Blue white, plate; red white B+—Resistance 24.2 ohms.
Secondary—White, grid; black white, AVC—Resistance 23.6 ohms.

Second I.F. Transformer (Part No. P3283)

Primary—Blue white, plate; red white, B+—Resistance 11.9 ohms.
Secondary—White, grid; black white, AVC—Resistance 16.9 ohms.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mfd., 200 mmf.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	455 KC.	.1 MFD.	Grid of 6K7G I.F. tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 2)	Output I.F.	Adjust to maximum output
	455 KC.	.1 MFD.	Grid of 6A8G tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 2)	Input I.F.	Adjust to maximum output
BROAD-CAST	1730 KC.	200 mmf.	Antenna lead	Rotor full open (Plates out of mesh)	Trimmer—Top of Left section of gang (See Fig. 2)	Oscillator	Adjust to maximum output
	1400 KC.	200 mmf.	Antenna lead	Set dial at 1400 KC.	Trimmer—Top of Right section of gang (See Fig. 2)	Antenna	Adjust to maximum output

This is all that is necessary for the alignment unless the plates of the gang have been bent out of shape. In case of bent plates, set the signal generator and receiver to 600 KC and bend the plates into the position for maximum output. Attenuate the signal from the signal generator to prevent the leveling off-action of the AVC. After each band is completed, repeat the procedure as a final check.

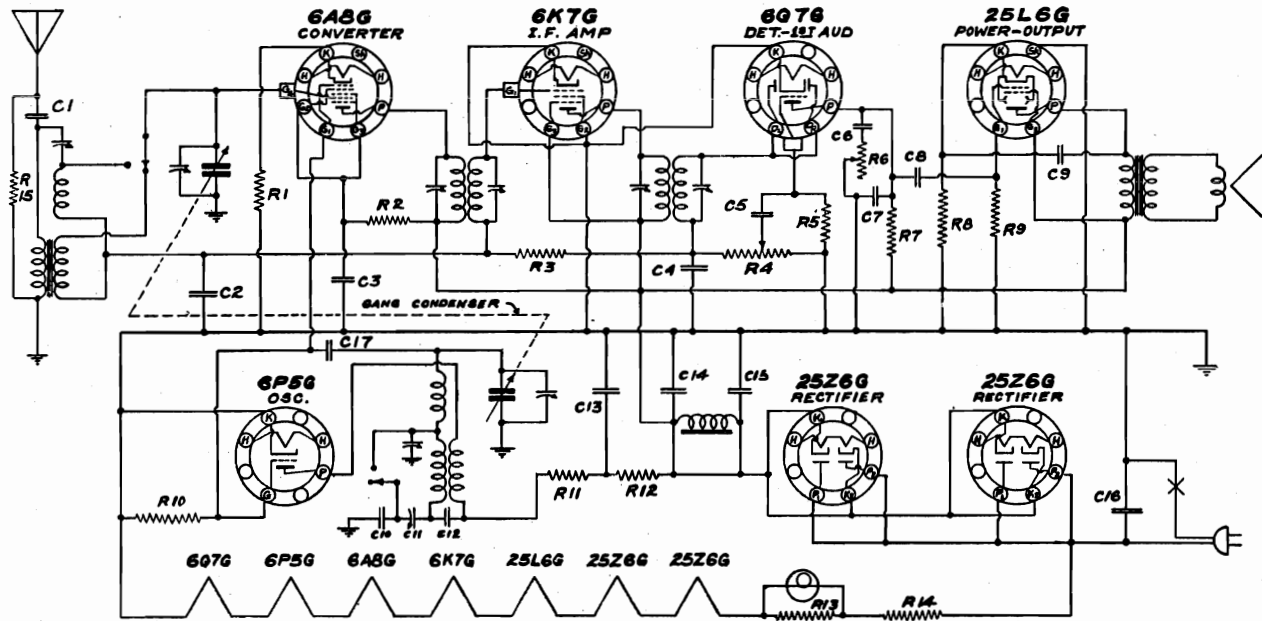

FREQUENCY RANGE

540 to 1630 KC

Power output 1 watt undistorted—1.7 watts maximum.
Intermediate Frequency 455 KC.
Power Consumption—50 watts.

SERVICE INFORMATION

Speaker (Part No. P3284) Model D-914
D.C. voice coil resistance 450 ohms
Voice coil impedance at 400 cycles 4.6 ohms
Antenna Coil (Part No. G5960).
Resistance—1 ohm.

Looking at the connection end starting at the mounting strip in a clockwise direction the terminals are: No. 1, (not used); No. 2, AVC; No. 3, grid; No. 4, antenna; No. 5, ground (grounded directly to mounting strip).

Primary—No. 4 and No. 5—Resistance 26 ohms.
Secondary—No. 2 and No. 3—Resistance 2 ohms.
Short Wave Antenna Coil (Part No. 3294).
Resistance—1 ohm.

Oscillator Coil (Part No. P3293).

Looking at the end with mounting strip, starting at the mounting strip in a clockwise direction the terminals are: No. 1, padder; No. 2, B+; No. 3, (not used); No. 4, switch; No. 5, plate; No. 6, grid.

Primary—No. 2 and No. 5—Resistance .85 ohm
Short Wave Secondary—No. 4 and No. 6—Resistance .07 ohm
Broadcast Secondary—No. 1 and No. 4—Resistance 5.1 ohms.
First I.F. Transformer (Part No. P3282)

Primary—Blue, white, plate; red white B+—Resistance 24.2 ohms.
Secondary—White, grid; black white, AVC—Resistance 23.6 ohms.

Second I.F. Transformer (Part No. P3283)

Primary—Blue white, plate; red white, B+—Resistance 11.9 ohms.
Secondary—White, grid; black white, AVC—Resistance 16.9 ohms.

Electrolytic Condenser (Part No. P3169)

Red, 25 mfd, 150 volt; red and white, 25 mfd, 150 volt; blue, 5 mfd, 150 volt; black, negative for all three sections.

SERVICE INFORMATION

Short Wave Antenna Coil (Part No. P3702)

Looking at the connection end starting at the mounting strip in a clockwise direction the terminals are: No. 1, grid; No. 2, D.C. voice coil resistance 300 ohms
ant.; No. 3, ground; No. 4 (on other end), AVC.
Primary—No. 2 and No. 3—Resistance .03 ohm
Secondary—No. 1 and No. 4—Resistance 1 ohm

Oscillator Coil (Part No. P3700)

Looking at the end with mounting strip, starting at the mounting strip in a clockwise direction the terminals are: No. 1, padder; No. 2, B+; No. 3, (not used); No. 4, switch; No. 5, plate; No. 6, grid.

Primary—No. 2 and No. 5—Resistance .85 ohm

Short Wave Secondary—No. 4 and No. 6—Resistance .07 ohm

Broadcast Secondary—No. 1 and No. 4—Resistance 5.1 ohms.

Electrolytic Condenser (Part No. P3531)

Red, 20 mfd, 150 volt; green, 20 mfd, 150 volt; yellow, 20 mfd, 25 volt; black, negative for all three sections.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	455 KC.	.1 Mfd.	Grid of 6K7G I.F. tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 2)	Output I. F.	Adjust to maximum output
	455 KC.	.1 Mfd.	Grid of 6A8G tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 2)	Input I. F.	Adjust to maximum output
SHORT WAVE	18,100 KC.	400 ohms	Antenna lead	Rotor full open (Plates out of mesh)	Trimmer—Top of left section of gang (See Fig. 2)	Short Wave Oscillator	Adjust to receive signal
	16,000 KC.	400 ohms	Antenna lead	Tune signal	Trimmer—On right side of chassis, 3rd from front	Short Wave Antenna	Adjust to maximum output
BROAD-CAST	1730 KC.	200 Mmf.	Antenna lead	Rotor full open (Plates out of mesh)	Trimmer—On right side of chassis, 2nd from front	Broadcast Oscillator	Adjust to maximum output
	1400 KC.	200 Mmf.	Antenna lead	Set dial at 1400 KC.	Trimmer—Top of right section of gang (See Fig. 2)	Broadcast Antenna	Adjust to maximum output
	600 KC.	200 Mmf.	Antenna lead	Set dial at 600 KC.	Trimmer—On right side of chassis, 1st from front	Oscillator Series Pad.	Adjust to maximum rock dial

Note "A"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of intensity is obtained. Attenuate the signal from the signal generator to prevent the leveling-off action of the A.V.C.
Do not bend variable condenser to correct tracking.

(Spkr. Part no. P 3553) only on Model D-915
Speaker (Part No. P3356) 5" PM Type (issue C)
 D.C. voice coil resistance.....3.4 ohms
 Voice coil impedance at 400 cycles.....3.8 ohms

Oscillator Coil (Part No. P3347)

Looking at the connection end in a clockwise direction starting at the chassis the terminals are No. 1, end of winding; No. 2, start of winding; No. 3 tap.

- No. 2 and No. 1—Resistance 4.8 ohms.
- No. 3 and No. 1—Resistance 4.2 ohms.

First I.F. Transformer (Part No. P3345)

Primary—Blue, plate; red, B+—Resistance 32.1 ohms.
 Secondary—White, grid; black, AVC—Resistance 33.2 ohms.

Second I.F. Transformer (Part No. P3364)

Primary—Blue, plate; red B+—Resistance 24.2 ohms.
 Secondary—White, grid; black, AVC—Resistance 24.1 ohms.

Electrolytic Condenser (Part No. P3355)

Red, 30 mfd., 150 volt; green, 20 mfd., 150 volt; black, negative for both sections.

Loop Antenna

Since the loop antenna acts also as the antenna coil the set will not operate with the loop antenna disconnected.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—1 mf., 100 mmf.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	455 KC.	.1 MFD.	Grid of 12K7 I.F. tube	Rotor full open (Plates out of mesh)	One trimmer on top (See Fig. 1)	Output I.F.	Adjust to maximum output
	455 KC.	.1 MFD.	Grid of 12SA7 tube	Rotor full open (Plates out of mesh)	Two trimmers on side (See Fig. 1)	Input I.F.	Adjust to maximum output
BROAD-	1730 KC.	100 mmf.	Antenna lead	Rotor full open (Plates out of mesh)	Trimmer—Side of rear section of gang (See Fig. 1)	Oscillator	Adjust to maximum output
CAST	1400 KC.	100 mmf.	Antenna lead	Set dial at 1400 KC.	Trimmer—Side of front section of gang (See Fig. 1)	Antenna	Adjust to maximum output

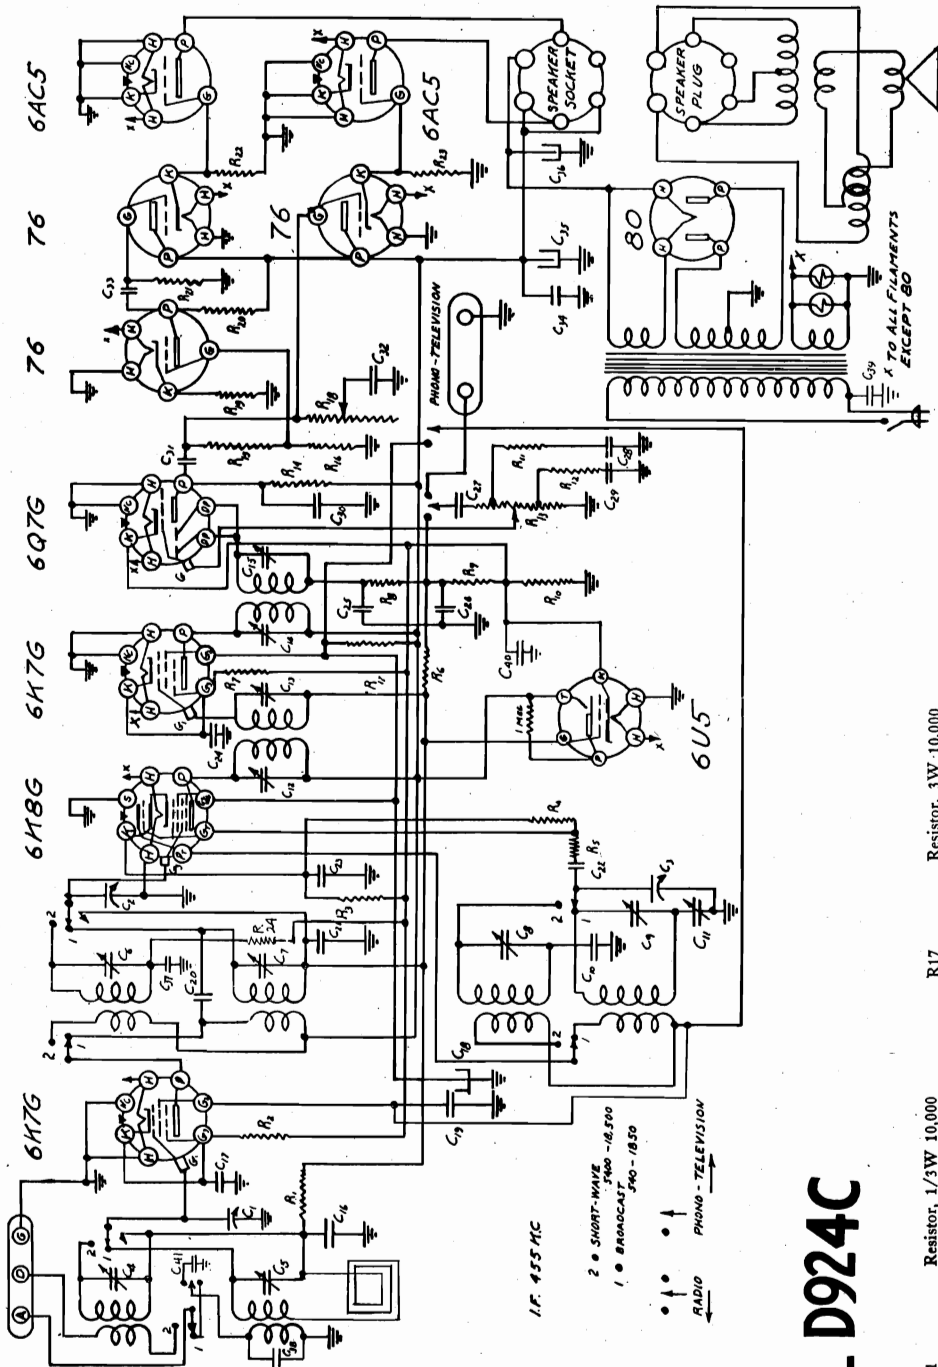

This is all that is necessary for the alignment unless the plates of the gang have been bent out of shape. In case of bent plates, set the signal generator and receiver to 600 KC and bend the plates into the position for maximum output.

Attenuate the signal from the signal generator to prevent the leveling off-action of the AVC. After each band is completed, repeat the procedure as a final check.

Frequency Range

540 to 1730 K.C.

Power output 1.2 watts undistorted—2 watts maximum.
 Intermediate Frequency 455 K.C.—Power Consumption 30 watts.

WESTERN AUTO SUPPLY CO.
ALIGNMENT PROCEDURE

MODELS D925
Issues A,B

The diagrams below should be studied carefully as they show the location of all trimming and padding condensers. The following equipment is necessary to properly align this chassis:

1. An all Wave Signal Generator which will provide an accurately calibrated signal at the frequencies listed.
2. An Output Meter.
3. A non-metallic screwdriver.
4. Dummy Antennae—.1 mfd., 200 mmf., 400 ohms.

Set the volume control near the maximum volume position, connect the signal generator ground to the receiver chassis, connect the proper value of dummy antennae in series with the generator output. Connect the output meter either across the primary of the output transformer or across the speaker voice coil. Allow the signal generator and the chassis to heat up for several minutes.

	SIGNAL BAND/FREQUENCY SETTING	GENERATOR CONNECTED TO	DUMMY ANTENNA	BAND SWITCH POSITION	VARIABLE CONDENSER SETTING	TRIMMER LOCATION	TRIMMER FUNCTION	ADJUSTMENT
I. F.	455 kc.	Grid of 6K7G	.1 mfd.	Short wave	Minimum capacity	On top.	2nd I. F.	Adjust to maximum output
I. F.	455 kc.	Grid of 6K8G	.1 mfd.	Short wave	Minimum capacity	On top.	1st I. F.	Adjust to maximum output
BROADCAST BAND	1400 kc. exact	Antenna lead	200 mmf.	Broadcast	Set pointer to indicate 1400 kc.	Underneath chassis on oscillator coil	Broadcast oscillator	Adjust to maximum output
BROADCAST BAND	1400 kc. exact	Antenna lead	200 mmf.	Broadcast	As above	Underneath chassis on ant. coil	Broadcast Translator	Adjust to maximum output
BROADCAST BAND	1400 kc.	Antenna lead	200 mmf.	Broadcast	As above	On gang condenser	Preselector coil	Adjust to maximum output
BROADCAST BAND	600 ks. approx.	Antenna lead	200 mmf.	Broadcast	Tune in signal	Under chassis	Broadcast padder	Adjust to maximum output while rocking gang condenser

REPEAT ABOVE BROADCAST ALIGNING PROCEDURE AT LEAST ONCE MORE

MIDDLE WAVE BAND	5,000 kc. exact	Ant. Lead	400 ohms	Middle wave	Set pointer to indicate 5000 kc.	Under chassis on osc. coil	Middle wave oscillator	Adjust to maximum output
	5,000 kc. exact	Ant. Lead	400 ohms	Middle wave	As above	Underneath chassis on Ant. coil	Middle wave Antenna	Adjust to maximum output while rocking the tuning condenser slightly
SHORT WAVE BAND	16,000 kc. exact	Ant. Lead	400 ohms	Short wave	Set pointer to indicate 16,000 kc.	Underneath chassis on osc. coil	Short wave oscillator	Adjust to maximum output.
	16,000 kc. exact	Ant. Lead	400 ohms	Short wave	As above	Underneath chassis on ant. coil.	Short wave Antenna	Adjust to maximum output while rocking the tuning condenser slightly.

TRUETONE MODEL D925

TUBES: 1—6K8G converter (Oscillator and First Detector).

- 1—6K7G IF amplifier.
- 1—6Q7G Detector—First Audio Amplifier.
- 1—76 Phase inverter.
- 2—6N6 Push Pull Power Output.
- 1—80 Rectifier.

POWER TRANSFORMERS:

Power transformers are available and receivers are sometimes equipped with them for operation on 25 or 40 cycles.

Power Supply

CAUTION—Unless otherwise marked, this radio must be operated on a 105-125 volt, 50 to 60-cycle AC supply only. Do not insert the plug of the power cord in the receptacle unless all tubes and the speaker plug are in their proper sockets. The power rating of this radio is shown on the tube arrangement label. Receivers of this model which are to be used on 25 cycle, 230 volt, or other service are so marked on this label. If there is any doubt regarding the voltage and frequency of the power supply, consult the local power company before inserting the plug.

ALIGNMENT PROCEDURE

- Volume Control—Maximum All Adjustments.
- Button No. 2 (Voice)—pulled out all adjustments.
- Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
- Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:

- An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output Indicating Meter—Non-Metallic Screwdriver.
- Dummy Antennas—.1 mf., 200 mmf., and 400 ohms.

**ISSUE A
JULY 1939**

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

CALIBRATION—Chassis must be in cabinet. If it is necessary to re-calibrate the radio, remove pointer from drive cord—See drive cord illustration. Tune in a 1500 KC signal. Set pointer at the 1500 KC mark on the dial scale. Attach pointer to drive cord.

NOTE A—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

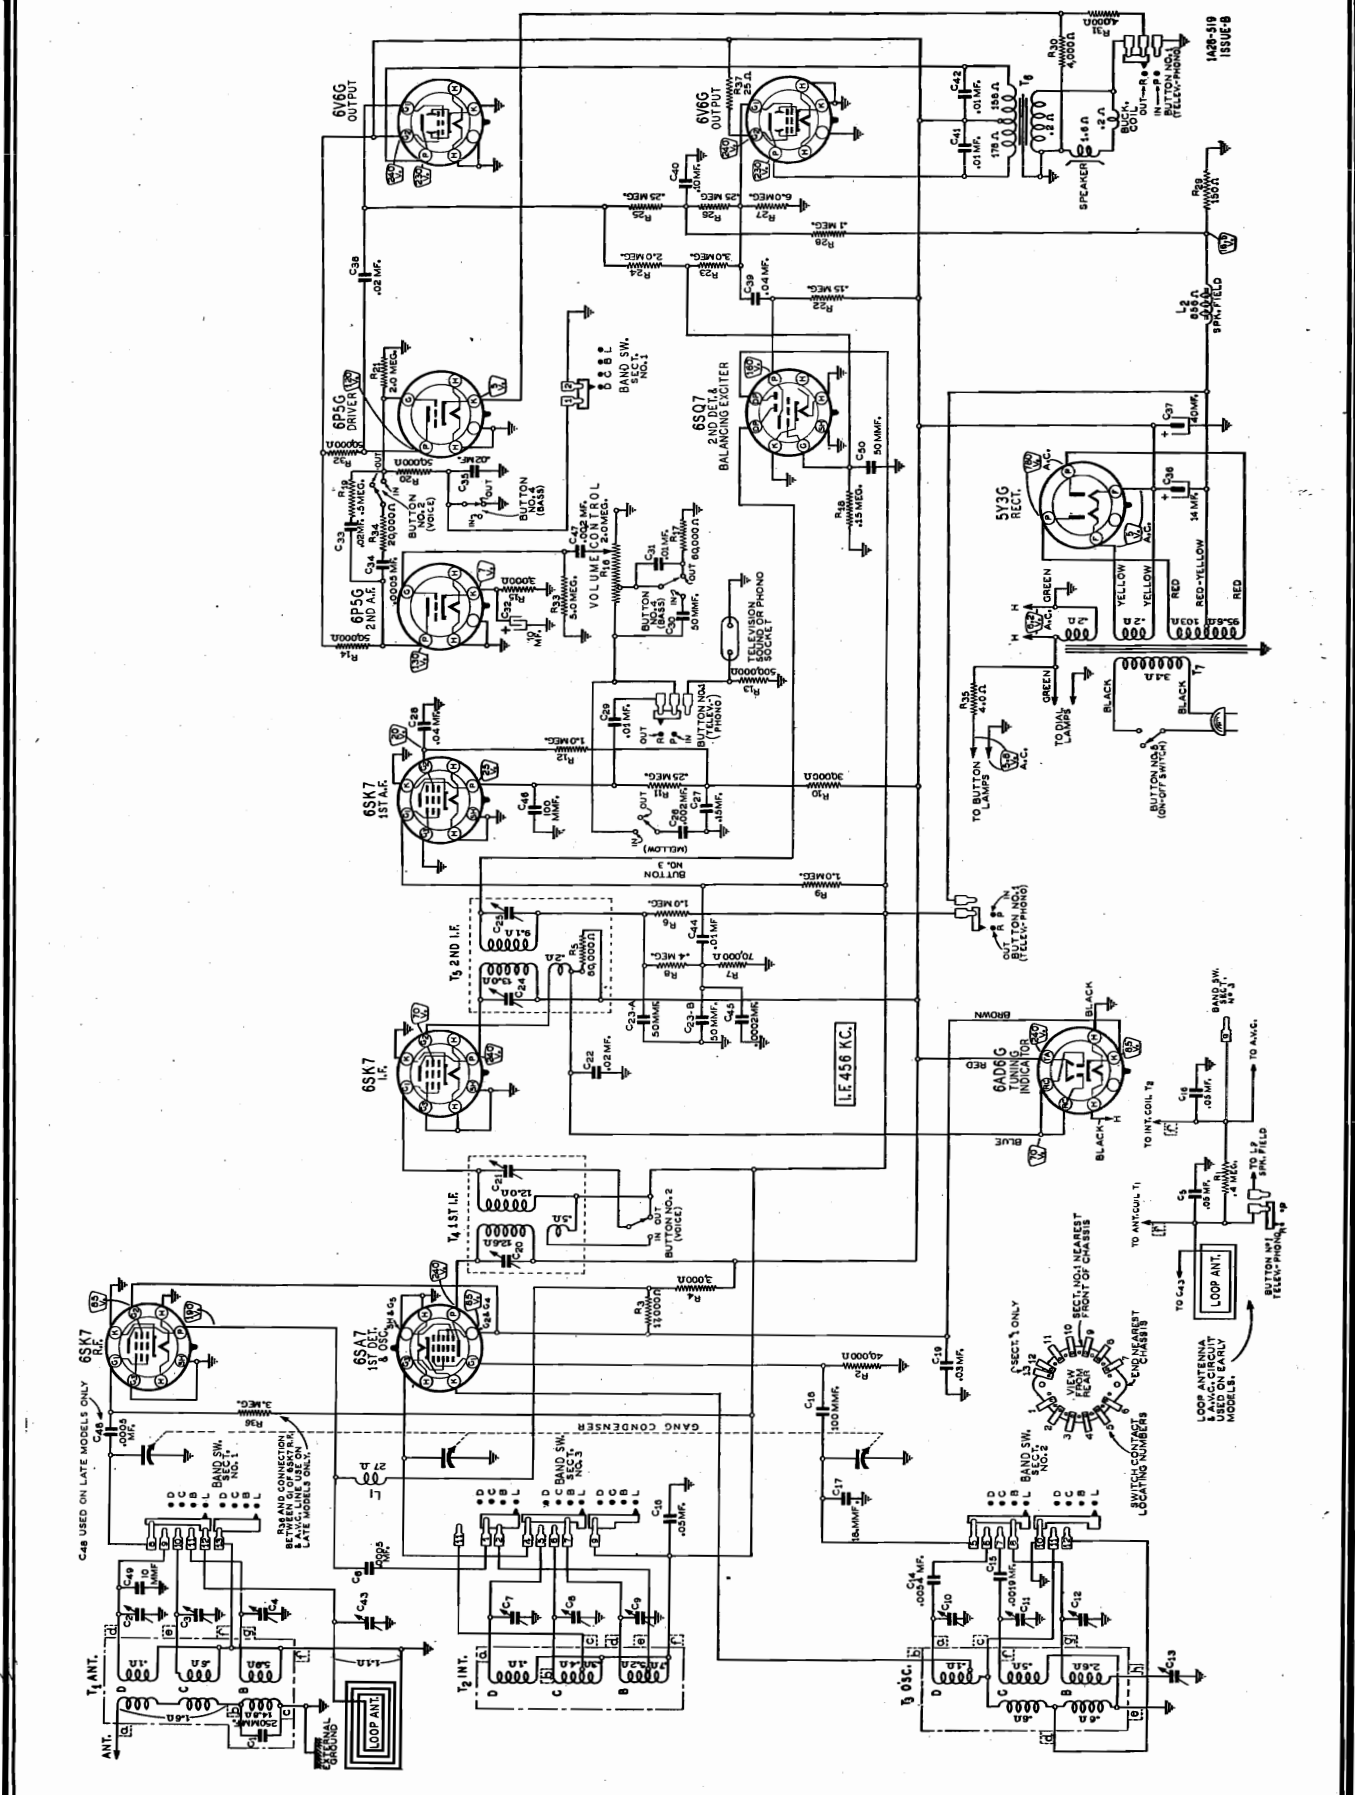

NOTE B—Re-install set in cabinet. Connect a loop approximately one foot in diameter across the antenna and ground posts of the signal generator. Place signal generator so that this loop is between 3 and 10 feet from Stratoscope loop in cabinet.

NOTE C—Turn knob of Stratoscope loop until output is maximum.

**ISSUE B
NOVEMBER 1939**

CAUTION—When aligning the short wave bands, be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 5000 KC. The signal will then be heard at 5000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 5000 less 912 KC, or 4088 KC on the dial. It may be necessary to increase the input signal to hear the image.

WESTERN AUTO SUPPLY CO.

MODELS D926, D1926

Issue B

WESTERN AUTO SUPPLY CO.

CHANGES FOR "B" ISSUE

The following Electrical Changes are made in the "B" issue of this series:

The AVC line is now connected through a 3 megohm resistor directly to the control grid of the 6SK7 R.F. tube.

The loop antenna and the common lead of the antenna secondary coils are now grounded.

Condenser C5 (.05 mf.), Resistor R1 (.40 megohm), and the connecting wire between them have been removed.

The radio-phono switch remains connected to the AVC line.

A .0005 mf. condenser has been added between the control grid of the 6SK7 R.F. tube and the band switch.

The following mechanical change is made in the "B" issue of this series:

A new type of retainer spring is employed to hold the lower row of push buttons on the plunger shafts. In order to replace the tone scale lamps or to remove the chassis from the cabinet, it is necessary to remove the lower row of push buttons in the manner described in the instruction manual for this series and issue.

The 50 mmf. condenser (C46), from the plate of the 6SK7 1st A.F. tube to ground, was changed to 100 mmf.

A 50 mmf. condenser (C50) was added between the grid of the 6SQ7 Balancing Exciter tube and ground.

A 25 ohm resistor was connected in series with the screen grid of the 6V6G Output tube. This is the output tube which is driven by the 6SQ7 Balancing Exciter tube.

The following additional NEW PARTS are used in issue "B" chassis:

NO.	CODE	DESCRIPTION	PRICE

ALIGNMENT PROCEDURE

SIGNAL GENERATOR		DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER OR DIAL SETTING	ADJUST TRIMMERS TO MAXIMUM
FREQUENCY SETTING	CONNECTION AT RADIO				
L.F.					
456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	2nd I.F. (C13) & (C14) 1st I.F. (C11) & (C12)
RANGE B					
1730 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C5)
1500 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1500 KC— See Note A	Ant. Range B (C7)
600 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C6) Rock Rotor—See Note B
RANGE D					
18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C4)
17,000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Ant. Range D (C3) Rock Rotor—See Note B
6000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	6000 KC (C2) Rock Rotor—See Note B

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1500 KC on the dial, slip the drive cord out from under one of the end clamps on the pointer lead. Move pointer to 1500 KC on the dial and replace drive cord under end clamp.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

CAUTION—When signing the short wave bands, be sure NOT to adjust at the image

frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

SCHMATIC DIAGRAM

Bottom view of chassis

VOLTAGE CHART

All voltages measured with a 1,000 ohm per volt meter on 150 volt scale. Line voltage 117.5 volts AC.

-Top View

Second I.F. Transformer (Part No. P2606)

- Primary—Blue white, plate; red white, B+—Resistance 15.1 ohms.
- Secondary—White, grid; black white, AVC—Resistance 11.8 ohms.

Loop Antenna Since the loop antenna acts also as the antenna coil the set will not operate with the loop antenna disconnected.

POWER SUPPLY

This receiver is designed to operate from the self contained batteries or from any AC (Alternating Current) or DC (Direct Current) power supply main of 105 to 125 volts, 60 cycle. To operate this receiver from a power line of 115 volts 60 cycle AC or 115 volts DC, open the door in the back of the cabinet, extend the power line cord and plug it into the nearest outlet. Then turn the center knob on the front of the cabinet to the left (counter-clockwise). The radio will then operate from the power line after warming up for about one minute. If the radio fails to operate after a few minutes on DC, reverse the power line plug.

ALIGNMENT PROCEDURE

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—1 mf., 200 mmf.

SERVICE INFORMATION

Speaker (Part No. P3564) 5" PM Type

- D.C. voice coil resistance.....2.3 ohms
- Voice coil impedance at 400 cycles.....2.7 ohms

Oscillator Coil (Part No. P3318) (Brown Dot)

Looking at the connection end (with dot) starting at the chassis in a clockwise direction the terminals are:
 No. 1, grid; No. 2, plate; No. 3, B+; No. 4, ground.
 Primary—No. 2 and No. 3—Resistance 1.7 ohms.
 Secondary—No. 4 and No. 1—Resistance 4.9 ohms.

First I.F. Transformer (Part No. P3559)

- Primary—Red white, B+; blue white, plate—Resistance 12.1 ohms.
- Secondary—White, grid; black white, AVC—Resistance 24.9 ohms.

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna valve in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Condenser Setting	Variable Rotor full open / Plates out of mesh	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	455 KC.	.1 MFD.	Grid of 1N5GT tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I.F.	Output I.F.	Adjust to maximum output
BROAD. CAST	1550 KC.	200 mmf.	Grid of 1A7GT tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I.F.	Input I.F.	Adjust to maximum output
See Note "A"	1400 KC.	200 mmf.	Antenna Connection	Rotor full open (Plates out of mesh)	Trimmer—Left rear of chassis	Oscillator	Oscillator	Adjust to maximum output
See Note "B"	1400 KC.	200 mmf.	Antenna Connection	Set dial at 1400 KC.	Trimmer—Next to AVC clip	Antenna	Antenna	Adjust to maximum output

This is all that is necessary for the alignment unless the plates of the gang have been bent out of shape. In case of bent plates, set the signal generator and receiver to 800 KC and bend the plates into the position for maximum output.

Attenuate the signal from the signal generator to prevent the leveling off-action of the AVC. After each band is completed, repeat the procedure as a final check.

NOTE "A"—Use battery operation for all adjustments.

NOTE "B"—Align broadcast band with chassis in cabinet and loop antenna connected.

Frequency Range 540 to 1550 K.C.

Power output (on batteries) .27 watt undistorted—.35 watt maximum.

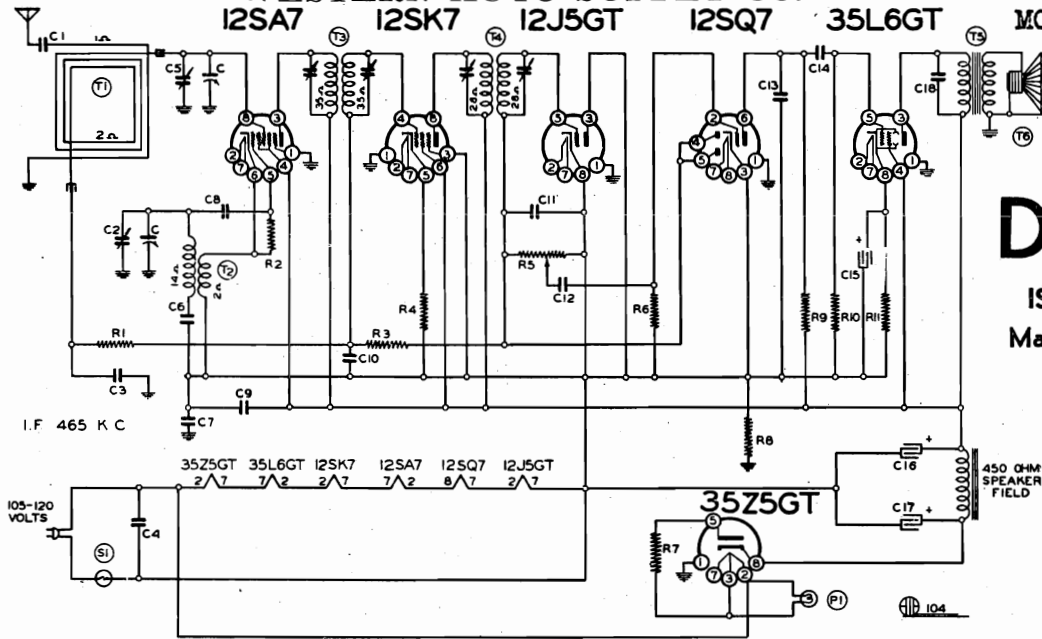

Power output (AC-DC) 1 watt undistorted—1.7 watts maximum.

Intermediate Frequency 455 K.C. Power consumption 26 watts.

SERVICE NOTES:

Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D. C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

TUBES:

WESTERN AUTO SUPPLY CO.

MODELS D976
Issues A,B

DESCRIPTION:

The tube complement of this chassis consists of the following octal base glass and metal tubes.
The type and function of each tube is as follows:

- 1—Type 12SA7 Mixer, First Detector-oscillator.
- 1—Type 12SK7 I. F. Amplifier.
- 1—Type 12J5GT Second Detector, A.V.C.
- 1—Type 35L6GT Beam Output Amplifier.
- 1—Type 35Z5GT High Vacuum Rectifier.

ALIGNMENT PROCEDURE

IMPORTANT:—See alignment instructions on page 3.

- Volume control—Maximum all adjustments.
- Connect B - of radio chassis to ground post of signal generator through .1 Mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—1 Mfd.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 12SA7	Rotor full open (Plates out of mesh)	Four Trimmers on Top (See Fig. 1)	Output and Input I.F.	Adjust to maximum output
BROADCAST BAND	1650 Kc.	.1 MFD.	Grid of 12SA7	Rotor full open (Plates out of mesh)	Trimmer bottom of front section of gang. (See bottom of radio)	Broadcast Oscillator	maximum output Adjust to
	1400 Kc.	See Note "A"		Set dial at 1400 Kc.	Trimmer bottom of rear section of gang. (See bottom of radio)	Broadcast Antenna	Adjust to maximum output

NOTE "A" Lay the output lead from the generator in back of the loop antenna. Turn up the output of the generator, picking up the energy in the loop antenna without any electrical connection from the generator.

Power Consumption	530 to 1650 K.C.
Power Output	40 Watts
Intermediate Frequency	850 Milliwatts Undistorted, 1.4 Watts Maximum
	465 K.C.

For general P.B. Data see

FIG. 3-BOTTOM VIEW

WESTERN AUTO SUPPLY CO.

MODEL D1001

ALIGNMENT PROCEDURE

IMPORTANT: See Aligning Instructions on Page 4.

- Volume control—Maximum all adjustments.
- Connect -B of radio chassis to ground post of signal generator through .1 Mfd. Condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mfd. and 200 mmf.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Iron Cores (Dial Setting)	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Connect to Terminal "B" (See Fig. 4)	Iron Cores All the way out	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Connect to Terminal "A" (See Fig. 4)	Iron Cores All the way out	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROADCAST BAND	1720 Kc.	.1 MFD.	Connect to Terminal "B" (See Fig. 4)	Iron Cores All the way out	Trimmer (C5) (See bottom of Radio, Fig. 3)	Oscillator	Adjust to maximum output
	1720 Kc.	200 MMF.	Connect to Terminal "A" (See Fig. 4)	Iron Cores All the way out	Trimmer (C2) (See bottom of Radio, Fig. 3)	Antenna	Adjust to maximum output
	1400 Kc.	200 MMF.	Connect to Terminal "A" (See Fig. 4)	Turn Dial to 1400 Kc.	Adjust position of antenna coil up or down (see Fig. 4)	Antenna Coil Adjustment	Adjust to maximum output (See Note "A")
	1720 Kc.	200 MMF.	Connect to Terminal "A" (See Fig. 4)	Turn Dial to 1720 Kc.	Adjust trimmer (C2) (See Fig. 3)	Antenna	Check for tracking (See Note "B")

NOTE "A"—The antenna coil assembly is made so that it is movable up or down. When making the adjustment as given in the alignment procedure move the coil assembly very slowly. It can be moved by hand or by pivoting one edge of the blade of a screwdriver in the hole and engaging the blade in the gear teeth of the coil form.

NOTE "B"—After the antenna coil has been tracked at 1400 Kc. it is necessary to check the antenna trimmer (C2) adjustment again at 1720 Kc. If no appreciable change in trimmer adjustment is made the coil is in track; if the trimmer requires considerable change, it will be necessary to again adjust the position of the antenna coil at 1400 Kc. These two adjustments should be made several times until no change of trimmer adjustment is required at 1720 Kc.

FIG. 1—TOP VIEW

FREQUENCY RANGE
540 to 1720 K.C.

Power Consumption.....35 Watts
Power Output.....800 Milliwatts Undistorted, 1.2 Watts Maximum
Intermediate Frequency.....465 K.C.

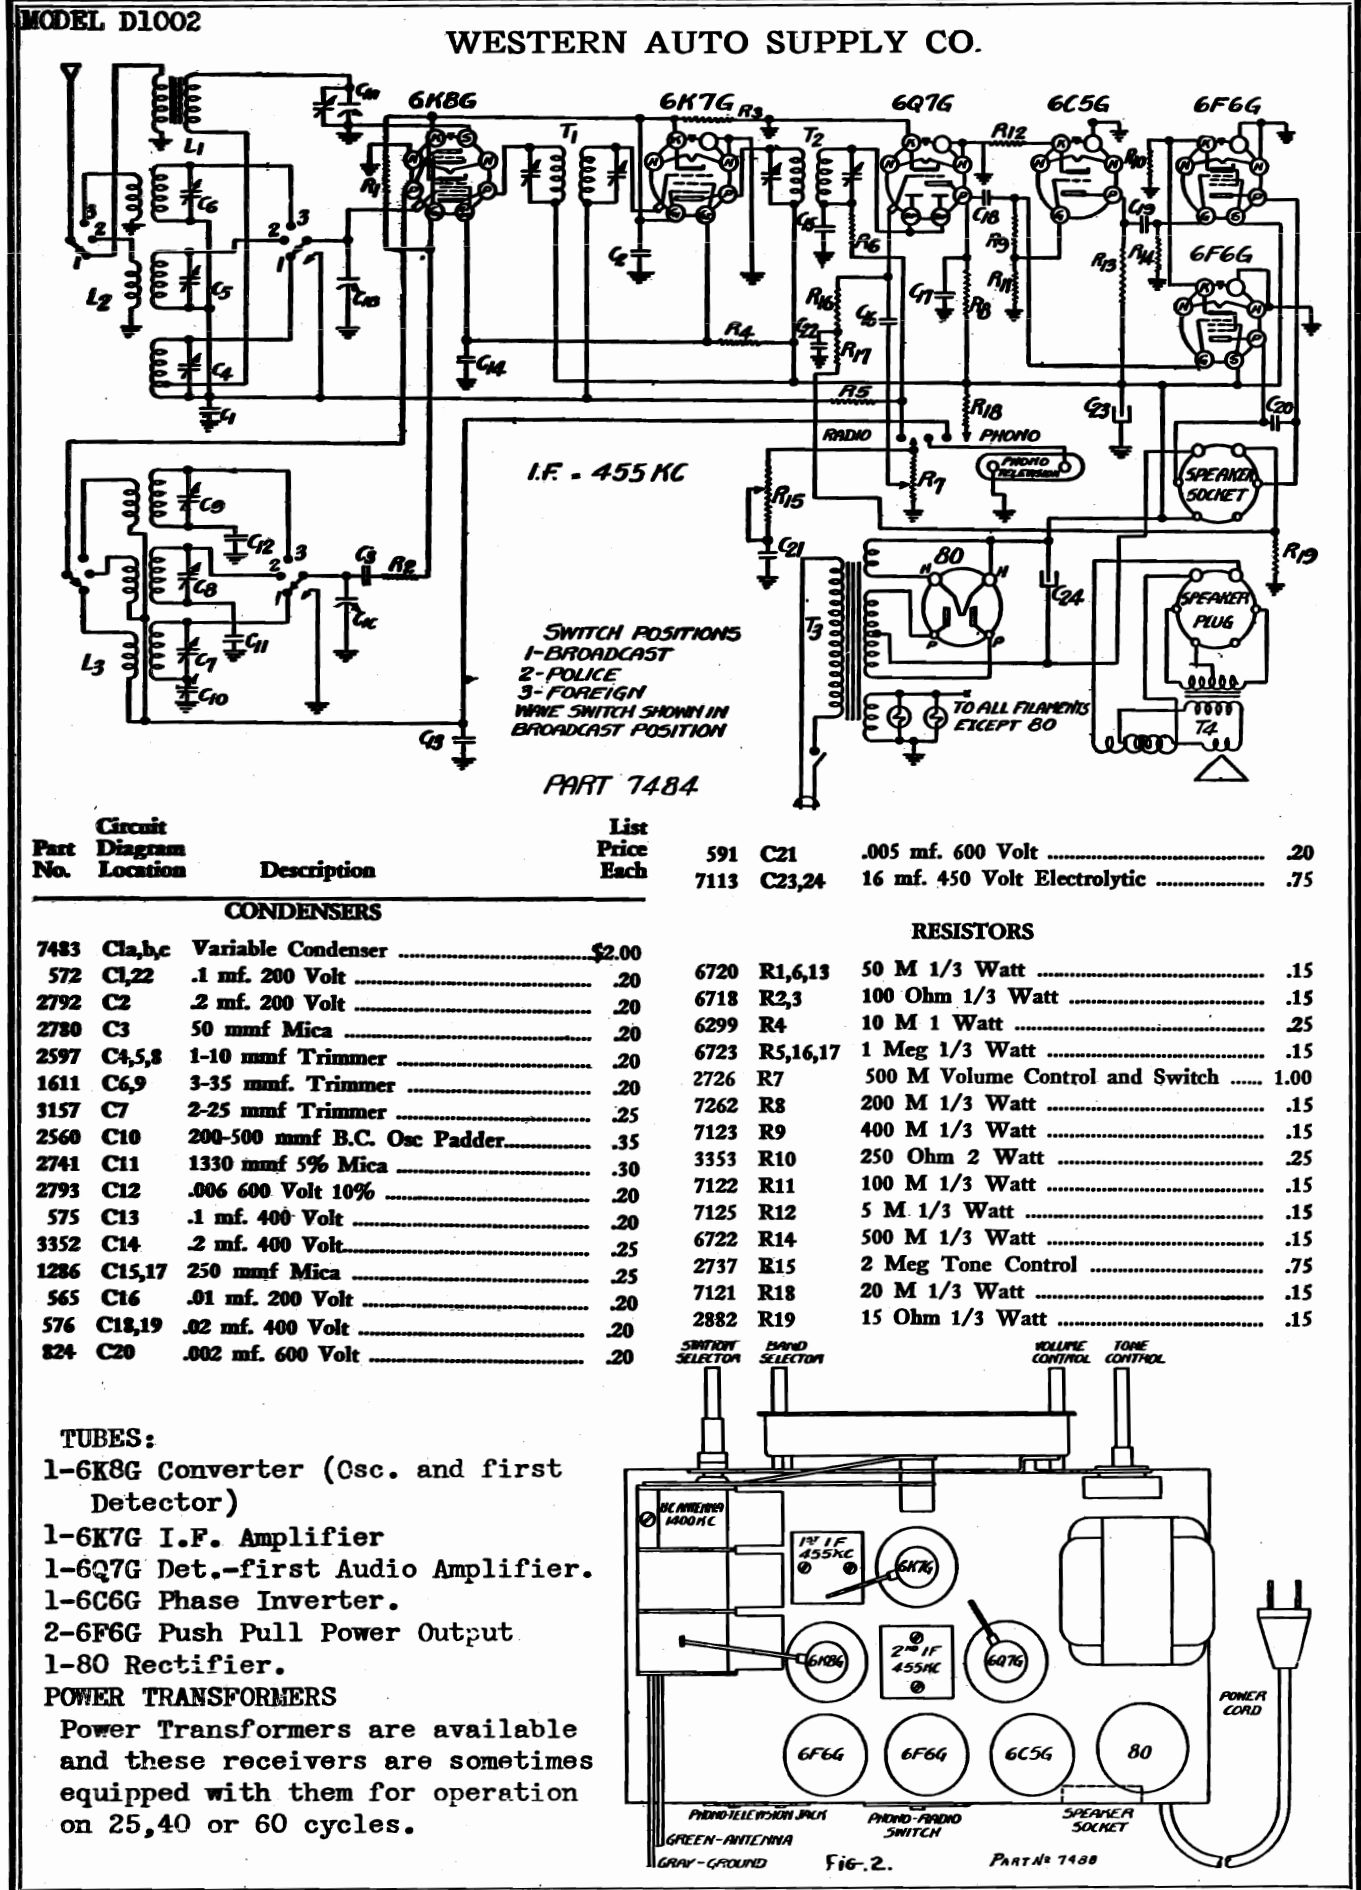

TUBES:

The tube complement of this chassis consists of the following octal base glass and metal tubes.

The type and function of each tube is as follows:

- 1—Type 12SA7 Mixer, First Detector-oscillator.
- 1—Type 12SK7 I. F. Amplifier.
- 1—Type 12SQ7 Second Detector, A.V.C. and First Audio.
- 1—Type 35L6GT Beam-Output Amplifier.
- 1—Type 35Z4GT Rectifier.

Voltages from points of Ckt. to -B are measured with tubes in sockets and Spk.conn. with volt meter having res.of 1000 ohms per volt. Voltages on chart measured with 117V.A.C. line. To check open by-pass cond. shunt each cond.with another cond.of same cap.and good volt. rating,till defective unit is found.Excessive hum, stutterin low vol.and reduction in D.C. volt.is caused by shorted el-ectl.cond;open by-pass cond. cause osc.and distorted tone.

VOLTAGES MARKED AT SOCKET TERMINALS ARE MEASURED WITH 1000 OHM PER VOLT METER, ON 117 VOLT LINE WITH NO SIGNAL (ANTENNA LEAD SHORTED TO CHASSIS)

NOTE - X - CANNOT BE MEASURED WITH VOLTMETER POINTS MARKED "O" ARE CONNECTED TO CHASSIS

POWER SUPPLY:

Unless specifically stated otherwise these receivers are designed to operate on 117 volts 60 cycle alternating current and will operate properly on 105 to 125 volts. Do not connect the power cord to any receptacle until it has been made certain that the voltage and frequency of the power available is the same as that called for on the license plate on the rear of the chassis. A telephone call to the local power company will eliminate all doubt as to the nature of the power supply.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mfd., 200 mmf., 400 ohms.

BAND	SIGNAL Frequency Setting	GENERATOR Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	455 KC.	.1 Mfd.	Grid of 6SK7 I.F. tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	455 KC.	.1 Mfd.	Grid of 6SA7 tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROAD-CAST	1,630 KC.	200 Mmf.	Antenna lead	Rotor full open (Plates out of mesh)	Trimmer—Top of left section of gang (See Fig. 1)	Oscillator	Adjust to maximum output
	1,400 KC.	200 Mmf.	Antenna lead	Set dial at 1400 KC.	Trimmer—Top of right section of gang (See Fig. 1)	Broadcast Antenna	Adjust to maximum output
	600 KC.	200 Mmf.	Antenna lead	Set dial at 600 KC.	Trimmer—Right top chassis nearest gang (See Fig. 1)	Oscillator Series Pad.	Adjust to maximum rock dial See Note 'A'
SHORT WAVE	16,000 KC.	400 ohms	Antenna lead	Tune signal	Trimmer—Top of chassis nearest right side (See Fig. 1)	Short Wave Antenna	Adjust to maximum output

Note "A"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of intensity is obtained. Attenuate the signal from the signal generator to prevent the leveling-off action of the A.V.C. Do not bend variable condenser to correct tracking.

Frequency Range — 535 to 1630 and 5,450 to 17,100 K.C.
 Power output 1 watt undistorted — 1.7 watts maximum.
 Intermediate Frequency 455 KC.
 Power Consumption—55 watts.

POWER SUPPLY

This receiver is designed to operate from any AC (Alternating Current) power supply main of 105 to 125 volts, 60 cycles or DC (Direct Current) power supply main of 105-125 volts. If the receiver fails to operate on DC (Direct Current), reverse the power line plug.

On AC only the line plug should be tried both ways and left in the position that gives minimum hum.

SERVICE INFORMATION

Speaker (Part No. P4107) 5 inch Dynamic

Field resistance	300 ohms
D. C. voice coil resistance	4.6 ohms
Voice coil impedance at 400 cycles	5 ohms

Short Wave Antenna Coil (Part No. P3786)

Starting with the mounting end (nearest chassis) the connections are: No. 1, ground; other end in a clockwise direction starting at the mounting lug side, No. 2, grid; No. 3, ant. Primary—No. 3 and No. 1—Resistance .26 ohm
Secondary—No. 2 and No. 1—Resistance .07 ohm

Oscillator Coil (Part No. P3789)

Starting at the mounting bracket in a clockwise direction the connections are: No. 1, sec. tap; No. 2, open; No. 3, B+; No. 4, pad; on other end No. 5, grid; No. 6, plate.

Primary—No. 3 and No. 6—Resistance	.92 ohm
S.W. Secondary—No. 1 and No. 5—Resistance	.07 ohm
B.C. Secondary—No. 1 and No. 4—Resistance	5.1 ohms

First I.F. Transformer (Part No. P4108)

Primary—Blue, plate; red, B+—Resistance	18.2 ohms
Secondary—White, grid; black, AVC—Resistance	15.1 ohms

Second I.F. Transformer (Part No. P4109)

Primary—Blue, plate; red B+—Resistance	20.8 ohms
Secondary—White, diode; black, AVC—Resistance	17.4 ohms

Electrolytic Condenser (Part No. P4106)

Red, 30 mfd., 150 volt; green, 30 mfd., 150 volt; yellow, 20 mfd., 25 volt; black, negative for all three sections.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect B—of radio chassis to ground post of signal generator through .1 Mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning.

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antenna—1 Mfd., and 200 Mfd.

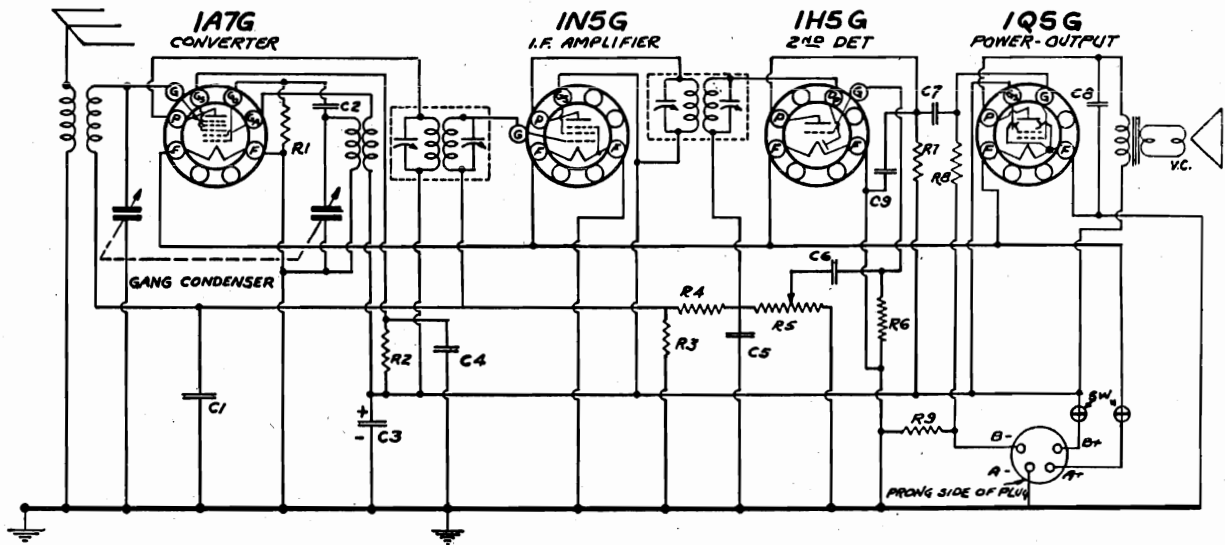

BAND	Frequency Setting	Dummy Antenna	Connection to Radio	Position of Iron Cores (Dial Settings)	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	455 Kc.	.1 MFD.	Connect to Grid of 12SA7	All the way out	Two trimmers on top of output I. F. can	Output I. F.	Adjust to maximum output
	455 Kc.	.1 MFD.	Connect to Grid of 12SA7	All the way out	Two trimmers on top of input I. F. can	Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1720 Kc.	.1 MFD.	Connect to Grid of 12SA7	Iron Cores All the way out	Trimmer (C6) (See chassis view)	Oscillator	Adjust to maximum output
	1720 Kc.	200 MMF.	Connect to Outside Antenna Clip	Iron Cores All the way out	Trimmer (C3) (See chassis view)	Antenna	Adjust to maximum output
	1400 Kc.	200 MMF.	Connect to Outside Antenna Clip	Turn Dial to 1400 Kc.	Adjust position of antenna coil (See coil assembly view)	Antenna Coil Adjustment	Adjust to maximum output (See Note "A")
	1720 Kc.	200 MMF.	Connect to Outside Antenna Clip	Turn Dial to 1720 Kc.	Adjust trimmer (C3) (See chassis view)	Antenna	Adjust to maximum output (Check for trimming) (See Note "B")

NOTE "A"—The antenna coil assembly is made so that it is movable. When making the adjustment as given in the alignment procedure move the coil assembly very slowly. It can be moved by hand or by pivoting one edge of the blade of a screwdriver in the hole and engaging the blade in the gear teeth of the coil form.

NOTE "B"—After the antenna coil has been tracked at 1400 Kc. it is necessary to check the antenna trimmer (C3) adjustment again at 1720 Kc. If no appreciable change in trimmer adjustment is made the coil is in track, if the trimmer requires considerable change it will be necessary to again adjust the position of the antenna coil at 1400 Kc. These two adjustments should be repeated times until no change of trimmer adjustment is required at 1720 Kc.

I.F. 455 K.C.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mf., 200 mmf.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	455 K.C.	.1 MFD.	Grid of 1N5G tube	Rotor full open (Plates out of mesh)	Two Trimmers on top (See Fig. 1)	Output I.F.	Adjust to maximum output
	455 K.C.	.1 MFD.	Grid of 1A7G tube	Rotor full open (Plates out of mesh)	Two Trimmers on top (See Fig. 1)	Input I.F.	Adjust to maximum output
BROAD-CAST	1610 KC.	200 mmf.	Antenna Lead	Rotor full open (Plates out of mesh)	Trimmer—Left rear of chassis	Oscillator	Adjust to maximum output
	1400 KC.	200 mmf.	Antenna Lead	Set dial at 1400 KC.	Trimmer—Next to Osc. trimmer	Antenna	Adjust to maximum output

This is all that is necessary for the alignment unless the plates of the gang have been bent out of shape. In case of bent plates, set the signal generator and receiver to 600KC and bend the plates into the position for maximum output.

Attenuate the signal from the signal generator to prevent the leveling off-action of the AVC. After each band is completed, repeat the procedure as a final check.

Frequency Range

535 to 1720 K.C.

Power output .27 watt undistorted—.35 watt maximum.

Intermediate Frequency 455 K.C.

WESTERN AUTO SUPPLY CO.

FOR SEEBURG J RECORD CHANGER, SEE RIDER'S "AUTOMATIC RECORD CHANGERS AND RECORDERS"

Note "A"-If the pointer is not at 1400 KC with a 1400 KC sig. it may be loosened from the dial cord and moved to correct the calibration. This should be checked across the band to arrive at the optimum condition.

Note "B"- Care should be taken not to align on the image frequency. This may be checked by rotating the dial of the signal generator. Another signal should be heard at dial frequency plus 912 KC. This signal should be checked carefully on all short wave bands, making sure the lowest frequency signal agrees with the dial setting in frequency and that it is strongest of two.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	455 KC.	.1 MFD.	INSGT I.F. tube	Rotor full open (Plates out of mesh)	Two trimmers on top	Output	Adjust to maximum output
See Note "A"	455 KC.	.1 MFD.	Grid of 1A7GT tube	Rotor full open (Plates out of mesh)	Two trimmers on top	Input	Adjust to maximum output
BROAD-CAST	1550 KC.	200 mmf.	Antenna Connection	Rotor full open (Plates out of mesh)	Trimmer—Top of gang-rear	Oscillator	Adjust to maximum output
See Note "B"	1400 KC.	200 mmf.	Antenna Connection	Set dial at 1400 KC.	Trimmer—Top of gang-front	Antenna	Adjust to maximum output

NOTE "A"—Use battery operation for all adjustments.

This is all that is necessary for the alignment unless the plates of the gang have been bent out of shape. In case of bent plates, set the signal generator and receiver to 800 KC and bend the plates into the position for maximum output.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC. After each band is completed, repeat the procedure as a final check.

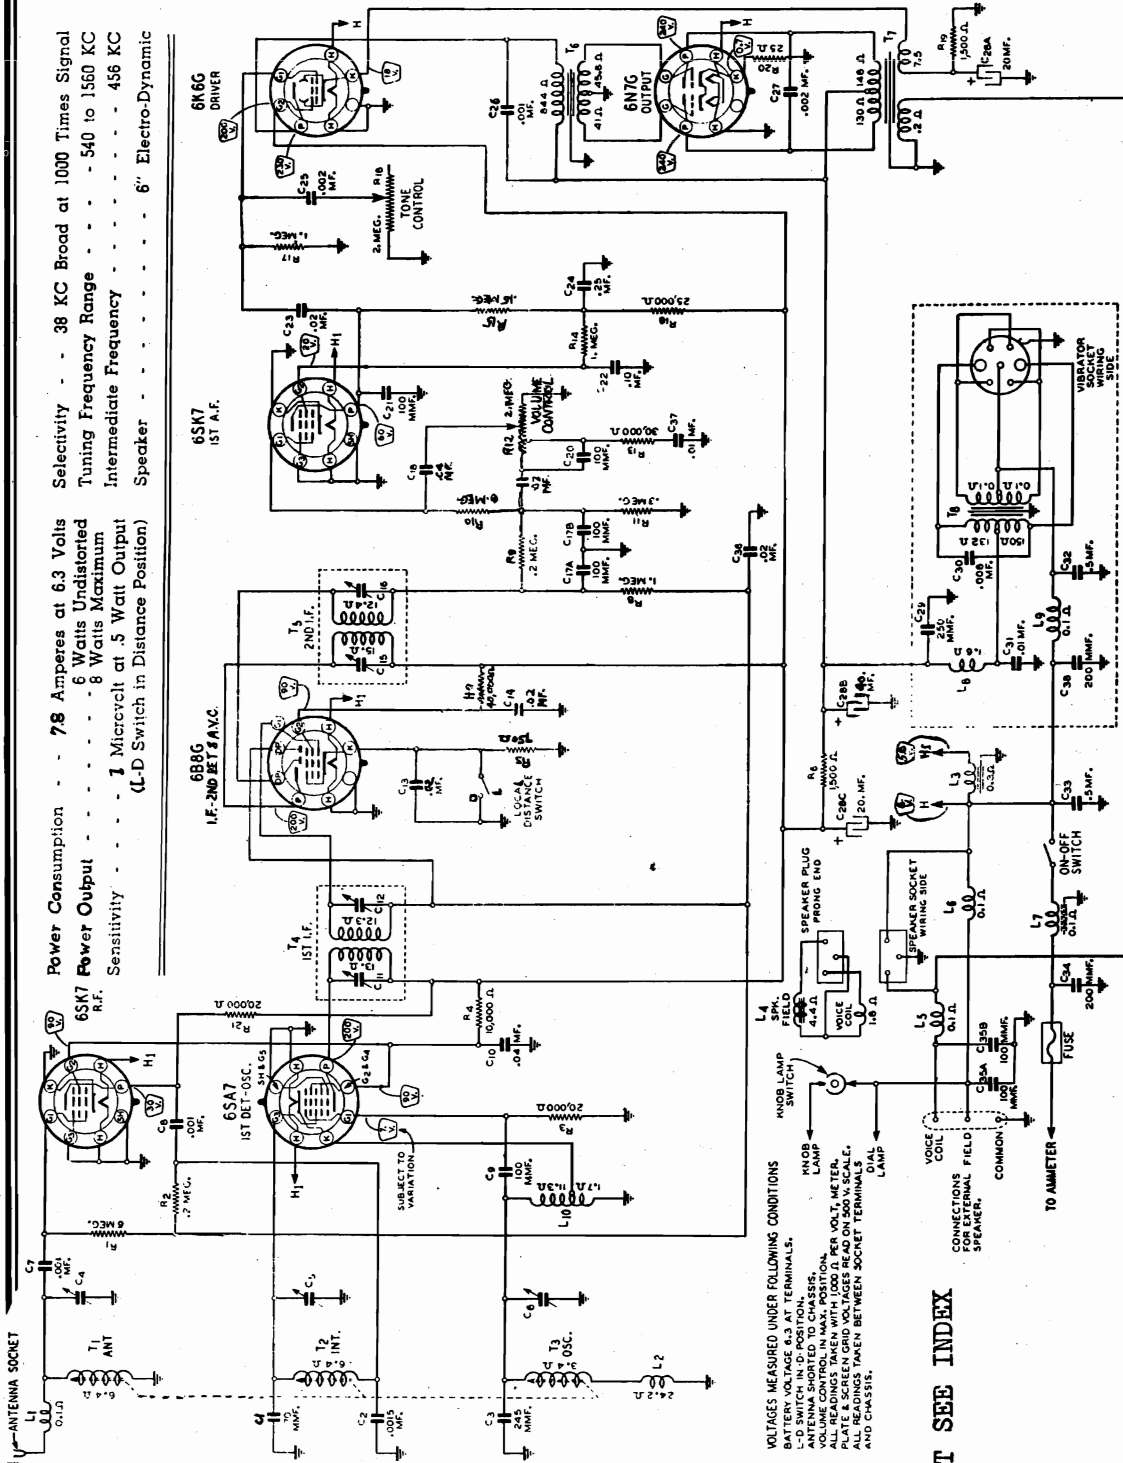

NOTE "B"—Use battery operation for all adjustments.

Procedure for Setting the Stations

MODELS D1091, D4040

There are 6 positions of the Automatic Station Mechanism. Five of these are Automatic Station positions and one is the Manual Tuning position. A sixth station may be tuned in with the Manual Tuning Knob. If the position of this knob is not disturbed, the sixth station will be automatically tuned in when the Automatic Station Mechanism is in the Manual Tuning position.

The different positions are reached by pushing the Automatic Station Knob firmly and gently all the way in and releasing this knob so that it snaps all the way back. Pushing in the knob once in this manner will advance the mechanism to the next position, twice will move it to the second position, etc.

When the radio is in the Manual Tuning position, the Automatic Station Knob is dark. When it is in any of the 5 station setting positions, the Automatic Station Knob is illuminated.

Five stations may be set for Automatic Tuning. A sixth station may also be automatically tuned in at the Manual Tuning position as explained above.

Make a list of your favorite stations, those which you tune in regularly. There may be any number up to and including 6 in this list.

It is better to list the stations in frequency order.

Any station setting position may be used for any station you can receive although it is better to put the stations on your list in frequency order.

First get the mechanism in the Manual Tuning position. If the Automatic Station Knob is dark, it is already in this position. If the Automatic Station Knob is illuminated, depress this knob one or more times until it is dark.

Select the first station from the list you have made and carefully tune in this station by rotating the Manual Tuning Knob. Determine what program is being broadcast.

Then advance the mechanism to position No. 1 by depressing the Automatic Station Knob once. As shown in Fig. 3, there are 5 small holes in the chassis case through which the station setting screws are reached.

Insert a small bladed screwdriver in the opening for setting screw No. 1 and turn this screw in or out until the desired station (the one previously tuned in) is heard. Turning the screw in (clockwise) will tune in stations with lower kilocycle numbers while turning the screw out (counter-clockwise) will tune in stations with higher kilocycle numbers.

There is a card supplied with the radio on which is a frequency scale. Using the screwdriver as a guide, this scale will show the approximate frequency (kilocycle number) at which the setting screw is set.

Be sure not to tune in some other station broadcasting the same program. Turn the screw slowly back and forth until this station is carefully tuned in to the clearest and loudest point. The final motion of the setting screw should be to the right (clockwise). The station is now set for position No. 1.

Next advance the mechanism to position No. 2 by depressing the Automatic Station Knob once more. Tune in the second station on your list by adjusting setting screw No. 2 as explained above.

If you have difficulty in knowing when this station is tuned in, push the Automatic Tuning Knob 4 times to reach the Manual Tuning position. Then tune in this station with the Manual Tuning Knob, noting the program that is being broadcast. Push in the Automatic Station Knob twice to get the mechanism back into position No. 2 and again tune in this station by carefully adjusting setting screw No. 2 until the station is clearest and loudest.

Proceed in like manner to set any remaining stations on your list.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments. Allow Chassis and Signal Generator to "Heat Up" for several minutes. The equipment in column at right is required for aligning:

A Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screw-driver.

Dummy Antennas—.1 mf., 100 mmf.

SIGNAL GENERATOR

FREQUENCY SETTING	SIGNAL GENERATOR	ANTENNA CONNECTION	GROUND CONNECTION	DUMMY ANTENNA	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
456 KC	Remove chassis from cabinet	Signal Grid of 1st Det. (Top Cap)	Chassis base thru .1 mf. Condenser	.1 mf.	Turn Rotor to full open	1st I.F. (C9) & (C10) 2nd I.F. (C13) & (C14)
1600 KC	Reassemble chassis in cabinet.	Signal Grid of 1st Det.	Same as Above	.1 mf.	Turn Rotor to full open	Oscillator (C1)
1400 KC		External Antenna Clip	External Ground Clip	100 mmf.	Turn Rotor to max. output	Antenna (C2)

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments. Allow Chassis and Signal Generator to "Heat Up" for several minutes. The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at test frequencies as listed.

Output Indicating Meter; Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 200 mmf., and 400 ohm.

FREQUENCY SETTING	SIGNAL GENERATOR	ANTENNA CONNECTION	GROUND CONNECTION	DUMMY ANTENNA	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
I.F. 456 KC	Point "X" 12SQ7—1st A.F.—Prong No.3	Signal Grid of 1st Det.	Connect at Stator of Large Gang Section.	.1 mf.	Turn Rotor to Full Open	1st I.F. (C10) & (C11) 3rd I.F. (C17) & (C18)
RANGE B 1600 KC	Point "X"	Signal Grid of 1st Det.		.1 mf.	Turn Rotor to Full Open	Oscillator Range B (C3) See Note A
400 KC	Point "X"	External Antenna Clip		200 mmf.	Turn Rotor to Max. Output	400 KC (C5) See Note C
RANGE D 18,300 KC	Point "X"	External Antenna Clip		400 Ohm	Turn Rotor to Full Open	Oscillator Range D (C4)
17,000 KC	Point "X"	External Antenna Clip		400 Ohm	Turn Rotor to Max. Output	Ant. Range D (C1)

DRIVE CORD REPLACEMENT

Turn gang condenser to full open position. Using a new drive cord 50" in length, attach one end to tension spring. Fasten other end of tension spring to hook on drive pulley. Pass cord through slot in pulley rim and around idler pulleys A, B and C as shown. Wind 2 turns counter-clockwise (from front of chassis) around tuning shaft spool. Turns should progress away from chassis—See Illustration.

Pass cord through string guide. Wind 1/4 turns counter-clockwise (from front of chassis) around drive pulley. This turn should be on the left side of the pulley rim (from gang end of chassis). Continue cord through slot in pulley rim. Stretch tension spring and tie free end of cord to spring.

NOTE A—Adjust Oscillator Range B (C3) trimmer on gang condenser. Oscillator Range B (C7) auxiliary trimmer on side of chassis is adjusted at factory and ordinarily need not be readjusted in the field.

NOTE B—If the pointer is not at 1400 KC on the dial, set pointer at this mark on the dial scale.

NOTE C—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

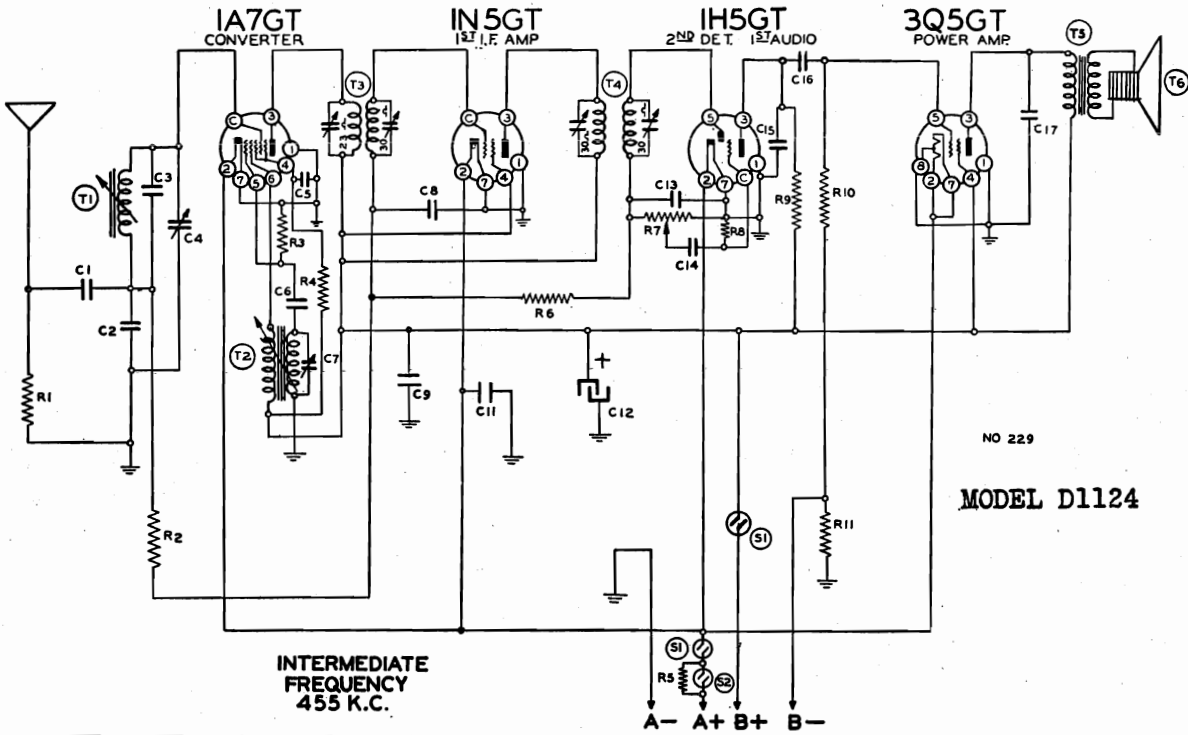

After each range is completed, repeat the procedure as a final check.

TECHNICAL DATA

Sensitivity for 50 Milliwatt Output:
45 Microvolts Average
Tuning Frequency Range - - - 540 to 1700 KC

Power Consumption - A—.250 Amp. B .014 Amps.
Power Output - - - 160 Milliwatts Undistorted
Selectivity - 48 KC at 1000 Times Signal at 1000 KC

NOTE: THE ANTENNA COIL ASSEMBLY IS MADE SO THAT IT IS MOVABLE LEFT OR RIGHT. WHEN MAKING THE ADJUSTMENT AS GIVEN IN THE ALIGNMENT PROCEDURE MOVE COIL ASSEMBLY VERY SLOWLY

COIL ASSEMBLY VIEW

ALIGNMENT PROCEDURE

The following equipment is required for aligning.

- Dummy antenna .1 mfd. and 200 mmf.

- Volume control—Maximum all adjustments.
- Connect ground lead of radio chassis to ground post of signal generator.

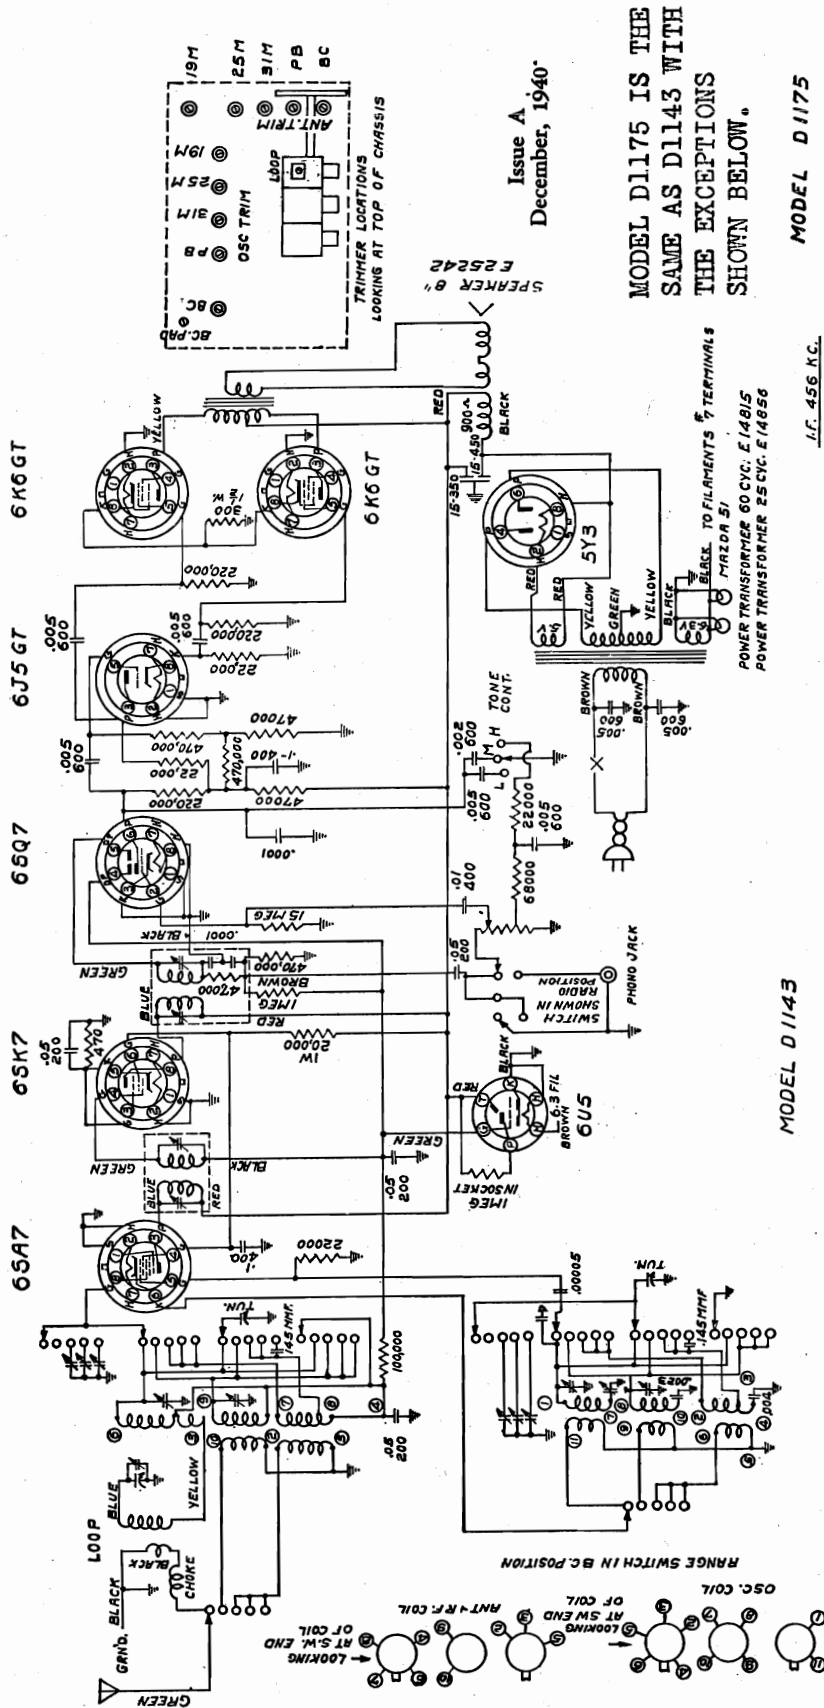

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Iron Cores (Dial Setting)	Trimmers Adjusted (in Order Shown)	Trimmer Function	Ajustment
455 Kc. I. F.	455 Kc.	.1 MFD.	Connect to Grid of 1A7	Iron Cores All the way out	Two trimmers on top of output I. F. can	Output I. F.	maximum output
	455 Kc.	.1 MFD.	Connect to Grid of 1A7	Iron Cores All the way out	Two trimmers on top of input I. F. can	Input I. F.	maximum output
BROAD-CAST BAND	1700 Kc.	.1 MFD.	Connect to Grid of 1A7	Iron Cores All the way out	Trimmer (C7) (See chassis view)	Oscillator	maximum output
	1700 Kc.	200 MMF.	Connect to Antenna Clip	Iron Cores All the way out	Trimmer (C4) (See chassis view)	Antenna	maximum output
	1400 Kc.	200 MMF.	Connect to Antenna Clip	Turn Dial to 1400 Kc.	Adjust position of antenna coil (See coil assembly view)	Antenna Coil Adjustment	maximum output (See Note "A")
	1700 Kc.	200 MMF.	Connect to Antenna Clip	Turn Dial to 1700 Kc.	Adjust Trimmer (C4) (See chassis view)	Antenna	Check for tracking (See Note "B")

NOTE "A"—The antenna coil assembly is made so that it is movable. When making the adjustment as given in the alignment procedure move the coil assembly very slowly. It can be moved by hand or by pivoting one edge of the blade of a screwdriver in the hole and engaging the blade in the gear teeth of the coil form.

NOTE "B"—After the antenna coil has been tracked at 1400 Kc. it is necessary to check the antenna trimmer (C4) adjustment again at 1700 Kc. If no appreciable change in trimmer adjustment is made the coil is in track, if the trimmer requires considerable change it will be necessary to again adjust the position of the antenna coil at 1400 Kc. These two adjustments should be tried several times until no change of trimmer adjustment is required at 1700 Kc.

MODEL D1143, Issue A
MODEL D1175

WESTERN AUTO SUPPLY CO.

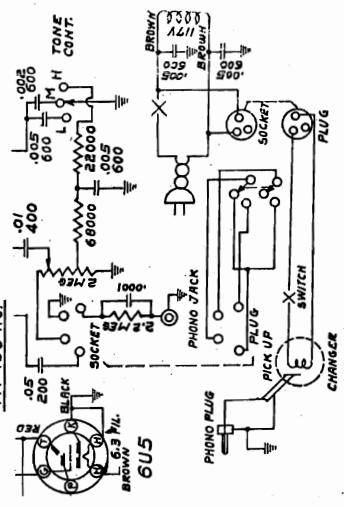

Issue A
December, 1940

MODEL D1175 IS THE SAME AS D1143 WITH THE EXCEPTIONS SHOWN BELOW.

MODEL D1175

J.F. 456 K.C.

MODEL D1143

PARTIAL SCHEMATIC

SERVICE DATA

The tube complement of this chassis consists of the following octal base glass and metal tubes:
The type and function of each tube is as follows:

- 1-6SA7 First Detector and Oscillator
 - 1-6SK7 I. F. Amplifier
 - 1-6SQ7 Diode Detector and A. F. Amplifier
 - 1-6J5GT Phase Inverter
 - 2-6K6GT Power Output
 - 1-6U5 Tuning Eye
 - 1-5Y3G Rectifier
- Power input at 115 V. line—85 Watts—with phono—100
Power output—5 Watts.
Selectivity at 1000 times signal—40 KC Band width.
Sensitivity as shown in alignment chart.
Intermediate frequency—456 KC.

The following chart will give ample data for aligning this receiver. The generator and receiver should be allowed to warm up for several minutes. An accurately calibrated generator should be used and dummy antennas of 200 MMF, 400 Ohms and .1 MFD should be available as well as an output indicating device. The volume control setting is maximum and sensitivities given are for .5 Watt output.

WESTERN AUTO SUPPLY CO.

MODEL D1143
 MODEL D1175
 MODEL DE3000, Issue A

MODELS D1143 and D1175

Note "A"-If the pointer is not at 1400 KC with a 1400KC sig. it may be loosened from the dial cord and moved to correct the calibration. This should be checked across the band to arrive at the optimum condition.

Note "B"-Care should be taken not to align on image frequency. This may be checked by rotating the dial of sig. Gen. Another sig. should be heard at dial frequency plus 912 KC. This sig. should be checked carefully on all short wave bands, making sure the lowest frequency sig. agrees with dial setting in frequency and that it is the strongest of the two.

ALIGNMENT PROCEDURE

- The following equipment is required for aligning:
- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
 - Output indicating meter.
 - Non-metallic screwdriver.
 - Dummy antennas—1 mt., 175 mmf.

MODEL DE3000

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6K7G I.F. Tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 2)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6A8G	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 2)	Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1550 1225 Kc.	175 200 mmf.	Antenna lead	Rotor full open (Plates out of mesh)	Trimmer—Top of Middle section of gang (See Fig. 2)	Oscillator Antenna and R. F.	Adjust to maximum output
	1400 Kc.	175 200 mmf.	Antenna lead	Set dial at 1400 Kc.	Trimmers—Top of front and rear section of gang (See Fig. 2)	Oscillator series pad	Adjust to maximum rock dial. (See note "A")
	600 Kc.	175 200 mmf.	Antenna lead	Set dial at 600 Kc.	B. C. Series Pad (See Fig. 2)		

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained. Trimmer is located on top of chassis along side of gang. Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC. After each band is completed, repeat the procedure as a final check. Do not bend plates of variable condenser to correct tracking.

Power Output 2 Watts Undistorted, 3.5 Watts Maximum
 Intermediate Frequency 465 KC.
 Power Consumption 6 Amperes at 6.3 Volts

FREQUENCY RANGE
 530 to 1550 Kc.

WESTERN AUTO SUPPLY CO.

VOLTAGE CHART

All voltages measured with a 1,000 ohm per volt meter on the 150 volt scale. Line voltage 117 volts A.C. Volume control maximum and no signal tuned in. Power consumption 30 watts, radio only, with changer 48 watts.

In model M5-PH only, connect points w, x, and y together. R10 and C13 are not used. Also C12 is not used, and point C connects to D. Disconnect points A and E.

MODEL D1171, Issue B

WESTERN AUTO SUPPLY CO.

SERVICE INFORMATION

Speaker (Part No. P4792) 5" PM Type.

D.C. voice coil resistance.....3.5 ohms
 Voice coil impedance at 400 cycles.....3.8 ohms

Oscillator Coil (Part No. P4780) Used in M5-PH only.

Looking at the connection end in a clockwise direction starting at the chassis the terminals are No. 1, end of winding; No. 2, start of winding; No. 3, tap.

No. 2 and No. 1—Resistance 4.9 ohms.
 No. 3 and No. 1—Resistance 4.3 ohms.

Oscillator Coil (Part No. P4941) XM5-PH only

Looking at the connection end in a clockwise direction, starting at the chassis, the terminals are No. 1, tap; No. 2, dummy; No. 3, end; No. 4, start.

No. 4 and No. 3—Resistance.....4.8 ohms
 No. 1 and No. 3—Resistance.....4.3 ohms

First I.F. Transformer (Part No. P3923)

Primary—Blue, plate; red, B+ Resistance.....20.4 ohms
 Secondary—White, grid; Black, AVC Resistance.....20.3 ohms

Second I.F. Transformer (Part No. P3924)

Primary—Blue, plate; red B+ Resistance.....22.2 ohms
 Secondary—White, diode; black, AVC Resistance.....22.1 ohms

POWER SUPPLY

This receiver is designed to operate from a power supply main of 110-120 volts, 60 cycle alternating current (A.C.). **Never plug in a D.C. outlet.**

ISSUE B

APRIL, 1941

FOR RADIO PRODUCTS RC-50 RECORD CHANGER, SEE RIDER'S "AUTOMATIC RECORD CHANGERS AND RECORDERS".

—Top View

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mfd., 200 mmf.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	455 KC.	.1 Mfd.	Grid of 12SK7 I.F. tube	Rotor full open (Plates out of mesh)	One trimmer on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	455 KC.	.1 Mfd.	Grid of 12SA7 tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROAD-CAST	1,630 KC.	200 Mmf.	Antenna lead	Rotor full open (Plates out of mesh)	Trimmer—Top of gang	Oscillator	Adjust to maximum output
	1,400 KC.	200 Mmf.	Antenna lead	Set dial at 1400 KC.	Trimmer—Top of gang	Broadcast Antenna	Adjust to maximum output

Frequency Range—535 to 1630 K.C.

Attenuate the signal from the signal generator to prevent the leveling-off action of the A.V.C.

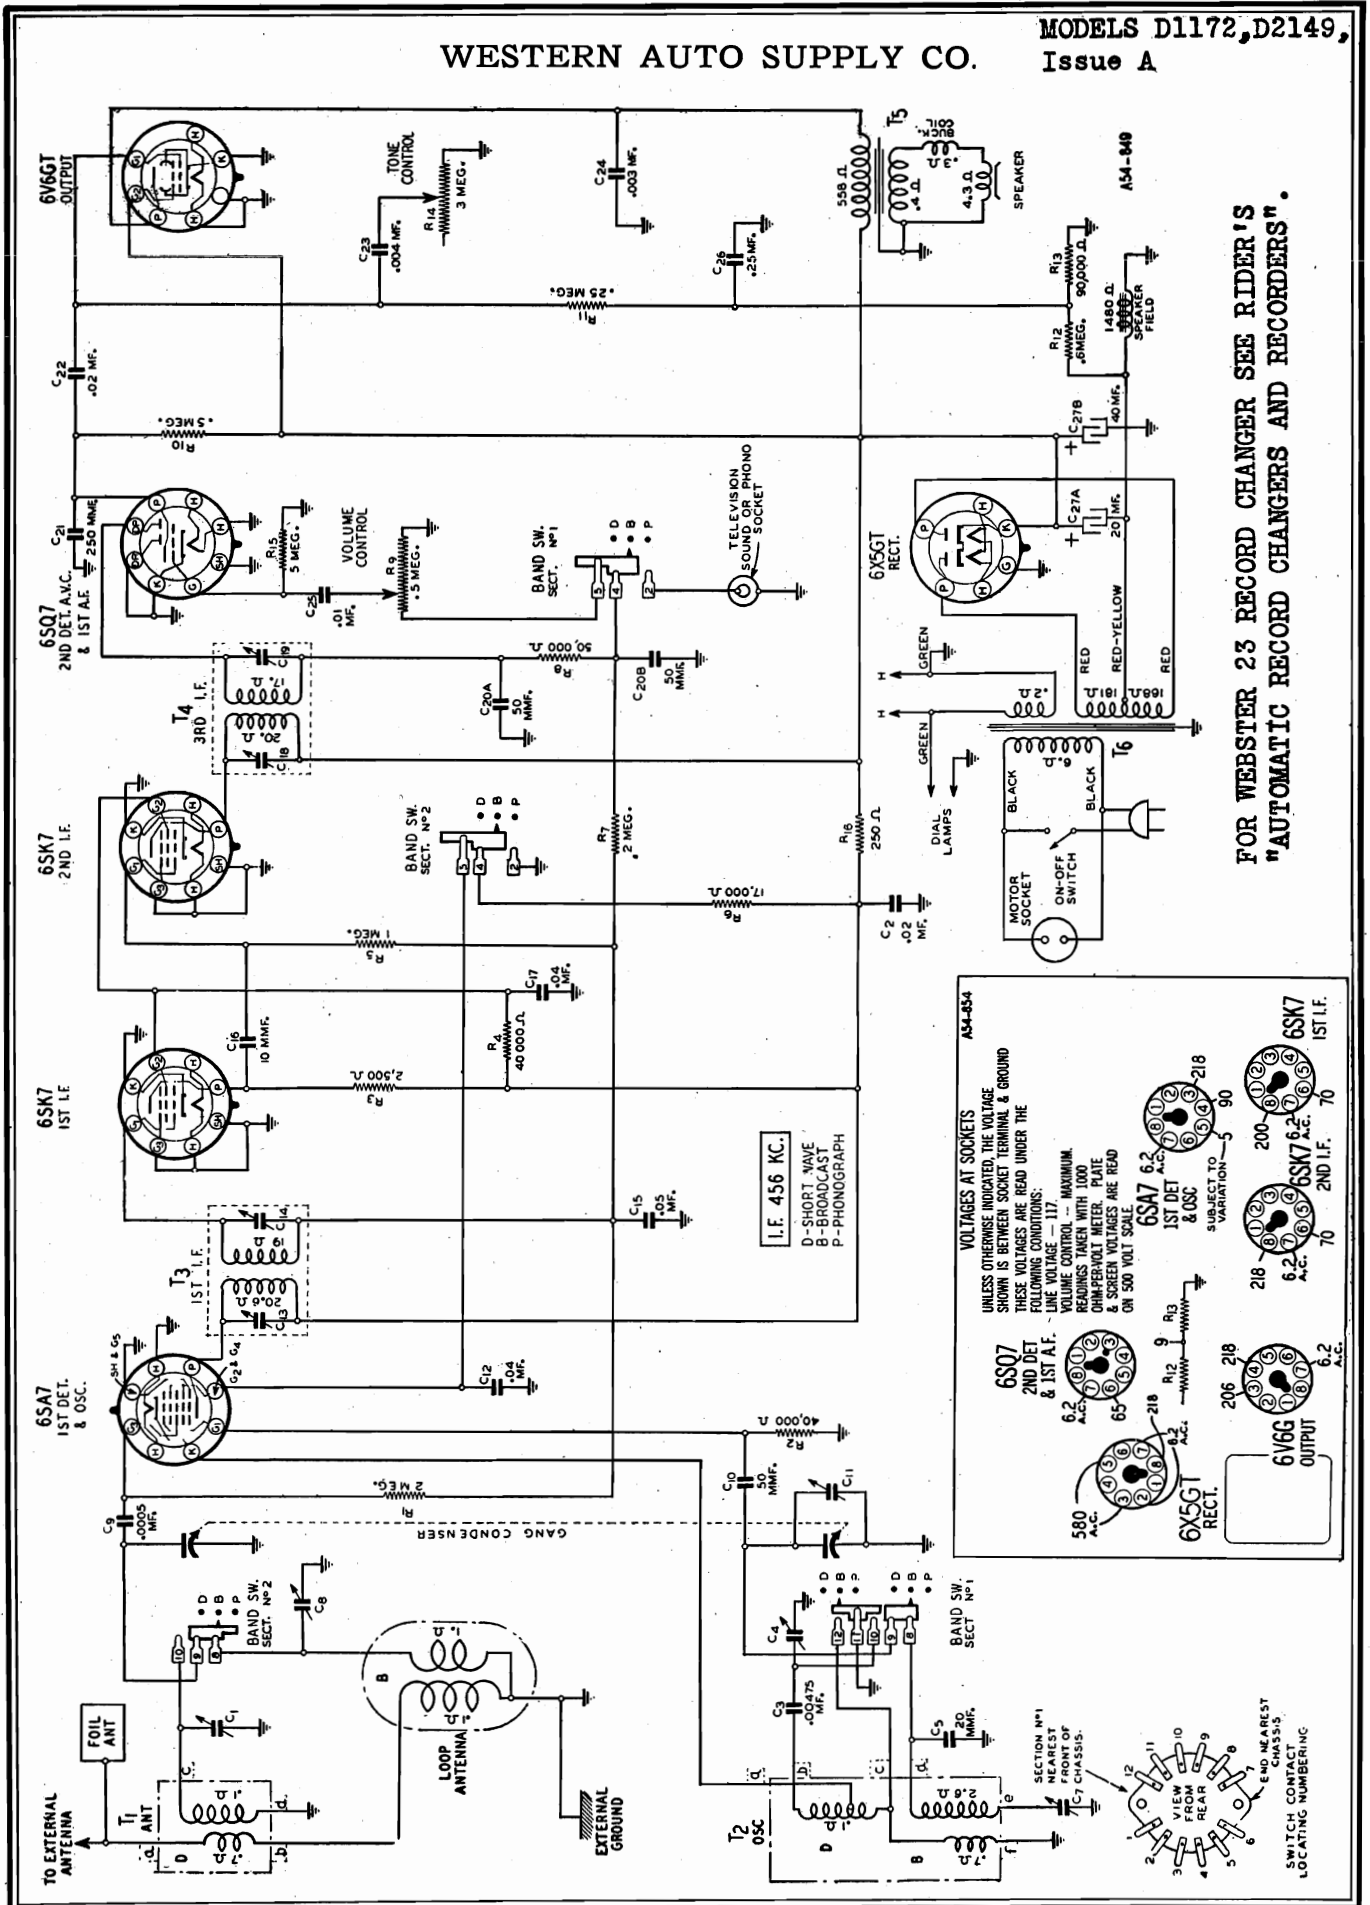

Power output 1.3 watts undistorted—2.0 watts maximum.

Intermediate Frequency 455 K.C.

Total Power Consumption—48 watts.

Issue A

MODELS D1145, D1176

ALIGNMENT PROCEDURE FOR MODELS D1172, D2149, D1145, D1176

Volume Control—Maximum All Adjustments.

The following equipment is required for aligning:

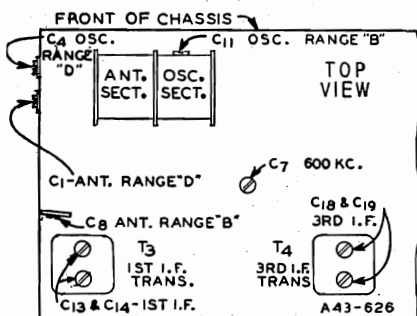

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

Output Indicating Meter—Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I.F.					
456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C13) & (C14) 3rd I.F. (C18) & (C19)
RANGE B					
1600 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C11)
1400 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1400 KC— See Note A	Ant. Range B (C8)
600 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C7) Rock Rotor—See Note B
RANGE D					
18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C4)
17,000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Ant. Range D (C1) Rock Rotor—See Note B
LOOP RANGE B					
1400 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output	Ant. Range B (C8)

15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

DRIVE CORD REPLACEMENT

Turn gang condenser to full open position—See illustration. Use a new drive cord 42 inches in length.

Tie one end of cord to tension spring. Pass other end of cord up through hole in groove of drive pulley. Pull cord through hole until spring is flush against inside of pulley rim.

Wind cord 1/4 turn counter-clockwise (from pulley side of chassis) around drive pulley. Then wind 4 1/2 turns clockwise (from front of chassis) around tuning control shaft. These turns should progress toward chassis. Pass cord over idler studs A and B as shown, then wind cord 3/4 turn counter-clockwise (from pulley side of chassis) around drive pulley. This turn should be on left side (from front of chassis) of pulley groove.

Pass cord through hole in groove of drive pulley. Tie cord to tension spring. Fasten other end of spring to hook on drive pulley.

DIAL POINTER ATTACHMENT—Tune in a signal of known frequency. Set pointer at this frequency mark on dial scale. Fasten pointer to drive cord—See illustration.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1400 KC on the dial, remove pointer from drive cord. Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

CAUTION—When aligning the short wave bands, be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for

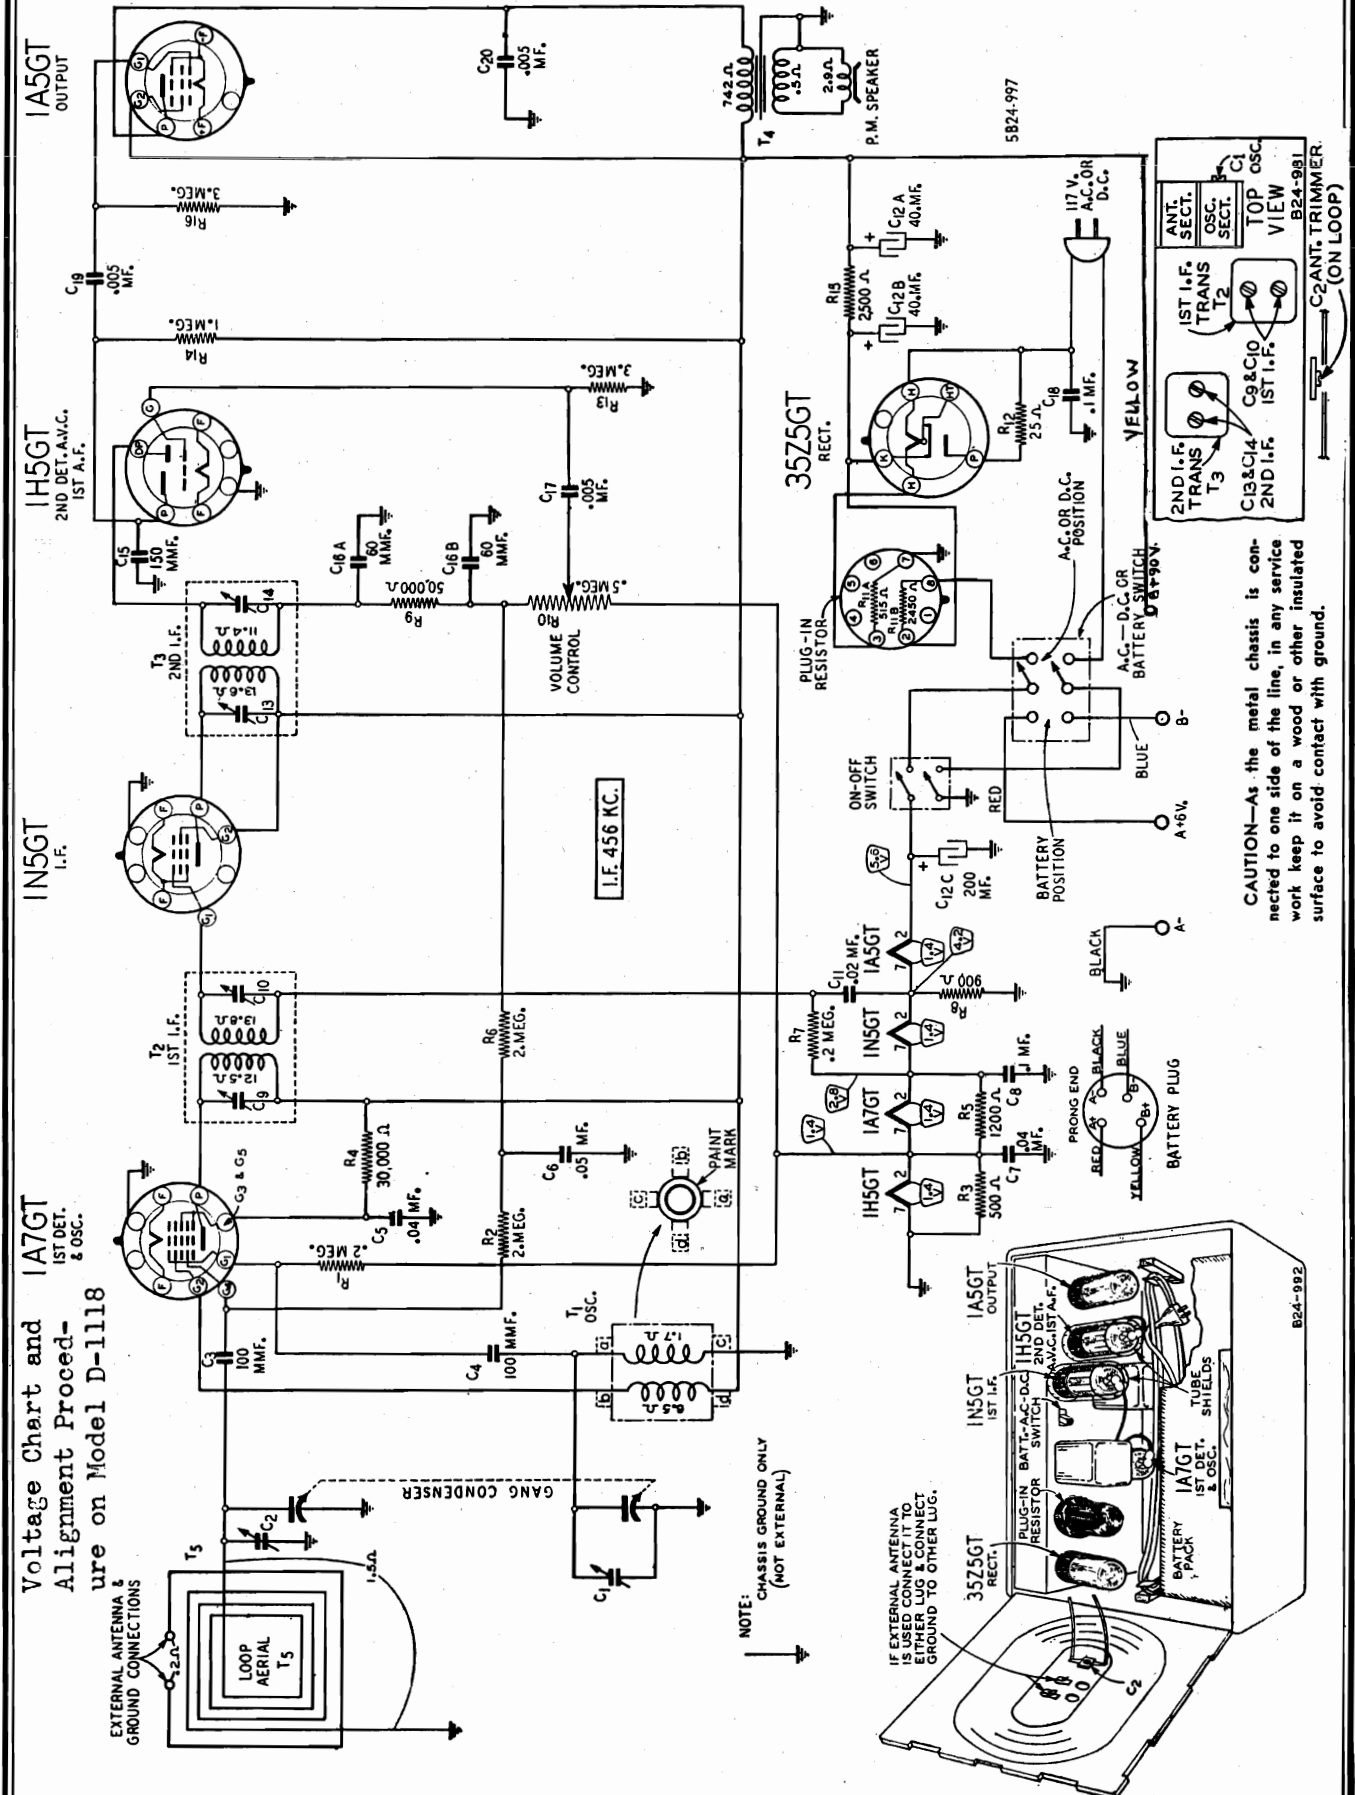

- Power Consumption 60 Watts (At 117 volts 60 cycles)
80 Watts (Phonograph Operating)
- Power Output - - - - - 2.5 Watts Undistorted
3.5 Watts Maximum
- Selectivity - - 40 KC Broad at 1000 times Signal
- Intermediate Frequency - - - - - 456 KC
- Speaker - - - - - 6" and 8" Electro-Dynamic
- Tuning Frequency Range
B Range - - - - - 528 to 1600 KC
D Range - - - - - 5750 to 18300 KC
- Sensitivity—External Antenna—(For 0.5 Watt output)
B Range - - - - - 4.0 Microvolts Average
D Range - - - - - 10 Microvolts Average

ALIGNMENT PROCEDURE

sections.

The following equipment is required for aligning.
 • Dummy antenna .1 mfd. and 200 mmf.
 • Volume control—Maximum all adjustments.
 • Connect ground lead of radio chassis to ground post of signal generator.

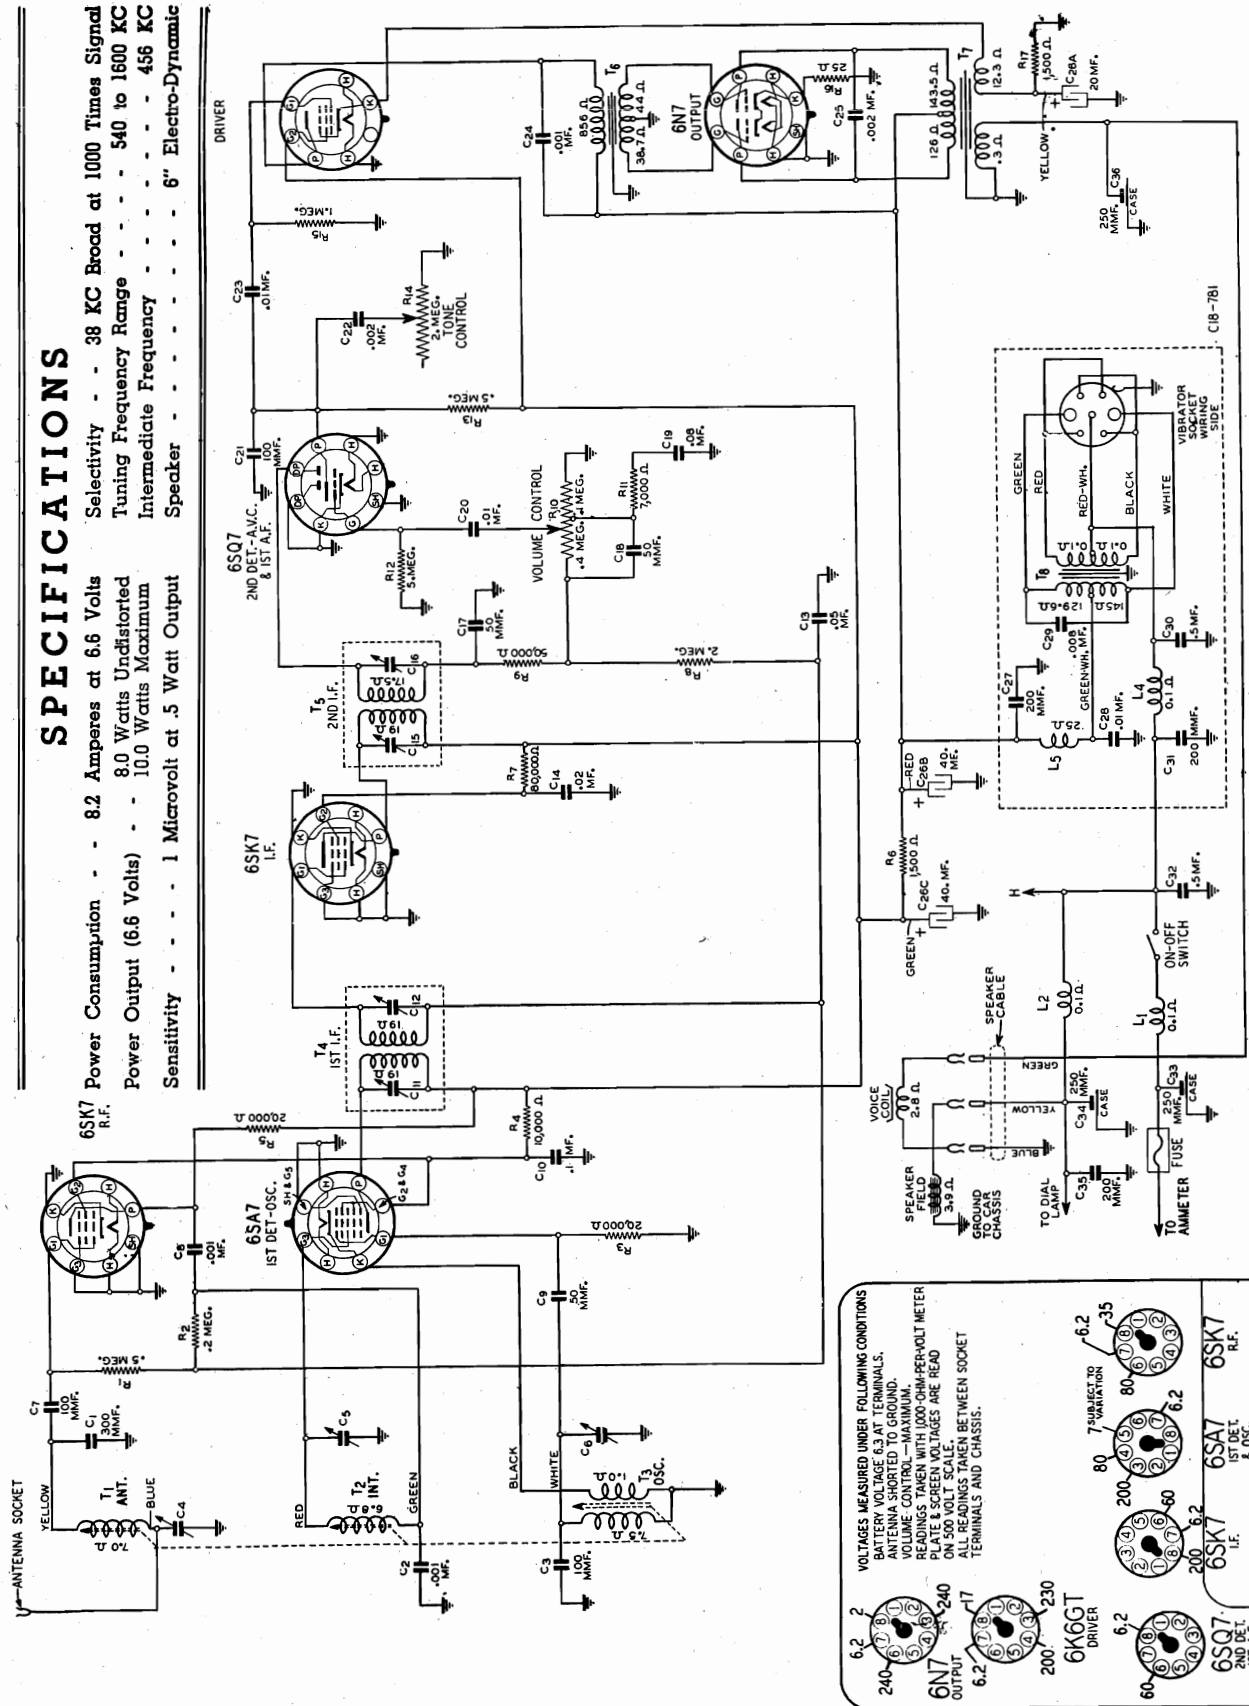

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Iron Cores (Dial Setting)	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
455 Kc. I. F.	.1 MFD.	455 Kc.	Connect to Grid of 1A7	Rotor full open (Plates out of mesh)	Trimmers on top of I. F. cans	Output and input I. F.	maximum output (See Note "A")
BROAD-CAST BAND	.1 MFD.	1600 Kc.	Connect to Grid of 1A7	Rotor full open (Plates out of mesh)	Trimmer on gang (See chassis view)	Oscillator	maximum output (See Note "A")
	200 MMF.	1400 Kc.	Connect to Antenna Clip	Set dial at 1400 Kc.	Trimmer on gang (See chassis view)	Antenna	maximum output (See Note "B")

NOTE "A"—The loop antenna need not be connected to the radio when making these adjustments, but a .1 Meg. Resistor must be substituted across the loop clips. The ground of the signal generator is connected to the chassis and the other lead from the signal generator in series with .1 MFD. dummy to the grid of the 1A7GT tube.

NOTE "B"—This adjustment should be made with the ground lead of the signal generator connected to the external ground terminal. The other lead of the signal generator is connected in series with a 20 Mmf. dummy to the external antenna terminal.

Voltage Chart

The voltage readings are taken with a voltmeter having a resistance of 1000 ohms per volt.

The standard metal tube socket terminal numbering system (bottom of socket) is shown in Fig. 5. On the schematic circuit diagram, Fig. 2 is a list giving the complete names of the tube elements and the corresponding symbols as used on the sockets on the schematic.

Alignment and Calibration

Correct alignment is extremely important in connection with all wave radios. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment.

A signal generator that will provide an accurately calibrated signal at 456, 1730, 1500, 600, 5800, 5000, 1800, 18,300, 15,000 and 6000 KC and an output indicating meter are required. It will be practically impossible to align the receiver if unsatisfactory apparatus is used.

Use a non-metallic screwdriver for the adjustments. The complete procedure is as follows:

I. F. Adjustment

Set the signal generator for a signal of 456 KC.
Connect the output of the signal generator through a .1 mf. condenser to the grid of the 1st detector.
Connect the ground lead of the receiver to the ground post of the signal generator.

Turn the band selector to the Range B position (standard wave band).

Turn the selectivity control to the sharp position and keep it in this position for all adjustments.

Turn the volume control to the maximum position.

Attenuate the signal from the signal generator to prevent the levelling-off action of the AVC.

Then adjust the four I.F. trimmers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis, and the location is shown in Fig. 3.

Range B Alignment

After the procedure for the alignment of each range, as explained below, is completed, it is advisable to repeat the procedure as a final check.

1730 KC Adjustment

Set the signal generator for 1730 KC.

Turn the rotor of the tuning condenser to the full open position.

Keep the band selector in the standard wave position.

MODEL D701

WESTERN AUTO SUPPLY CO.

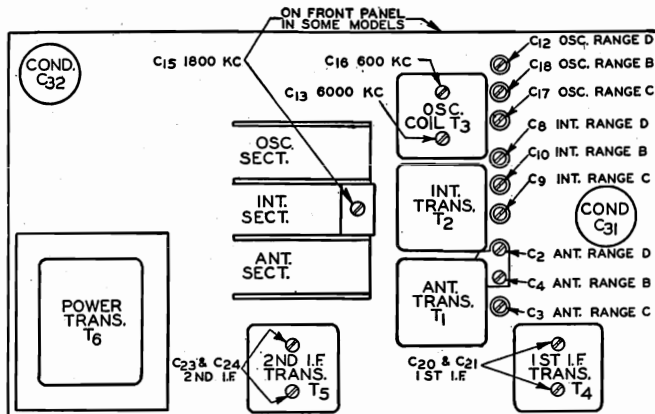

Fig. 3—Location of Trimmers

Connect the antenna lead of the receiver through a 200 mmf. condenser to the output of the signal generator.

For this and *all* subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent AVC action.

Adjust the oscillator Range B trimmer (C18) until maximum output is obtained. The location of this trimmer is shown in Fig. 3.

1500 KC Adjustment

Set the signal generator for 1500 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Loosen the pointer set screw and set the large pointer at the 1500 KC mark on the standard wave band scale. Retighten the set screw.

Adjust the interstage Range B trimmer (C10) and antenna Range B trimmer (C4) to maximum.

Do not change the setting of the oscillator Range B trimmer.

600 KC Adjustment

Set the signal generator for 600 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth, at the same time adjusting the 600 KC trimmer, until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range C Alignment

CAUTION—When aligning the short wave bands be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 5000 KC. The signal will then be heard at 5000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 5000 less 912 KC, or 4088 KC. It may be necessary to increase the input signal to hear the image.

5800 KC Adjustment

Set the signal generator for 5800 KC.

Connect the antenna lead of the receiver through a 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band selector to the Range C position (1st short wave band).

Adjust the oscillator Range C trimmer (C17) until maximum output is obtained. See Fig. 3 for location of this trimmer.

5000 KC Adjustment

Set the signal generator for 5000 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the interstage Range C trimmer (C9) and antenna Range C trimmer (C3) to maximum.

Do not change the setting of the oscillator Range C trimmer.

1800 KC Adjustment

Set the signal generator for 1800 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth, at the same time adjusting the 1800 KC trimmer, until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range D Alignment

18,300 KC Adjustment

Set the signal generator for 18,300 KC.

Keep the antenna lead of the receiver connected through the 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band selector to the Range D position (2nd short wave band).

Adjust the oscillator Range D trimmer (C12) until maximum output is obtained. See Fig. 3 for location of this trimmer.

15,000 KC Adjustment

Set the signal generator for 15,000 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the interstage Range D trimmer (C8) and antenna Range D trimmer (C2) to maximum.

When adjusting the interstage Range D trimmer, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.

Do not change the setting of the oscillator Range D trimmer.

6000 KC Adjustment

Set the signal generator for 6000 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 6000 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

WESTERN AUTO SUPPLY CO.

MODEL D701

Fig. 4—R. F. and Oscillator Coil Base Terminal Arrangement and D. C. Resistance of Windings

Trimmer Replacement

If one trimmer of the gang trimmer strip should become defective, it is not necessary to replace the entire strip. A single trimmer P-17A36, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (side not grounded) of the defective trimmer in the strip. This connection is then made to the single trimmer. Connect it to the side of the

trimmer not in contact with the adjusting screw. The other side of the single trimmer is then connected to a good ground, using a piece of heavy wire in order to support the trimmer adequately. In replacing a trimmer, be sure to keep both leads as short as possible and keep the ungrounded lead as far from ground as possible.

Phonograph Connections

Phonograph connections can be made as shown in Fig. 7. The parts required are shown in the parts list. Knockouts are provided in the back panel of the chassis for mounting the phono jack and phono switch—See Fig 8.

ected to the switch terminals nearest the chassis base. Before connecting the cable leads to the phono switch, it will be necessary to slip a piece of varnished tubing over the portion of the cable that passes near the 6K7 1st I.F. tube socket.

The phono switch must be mounted with one set of terminals nearest the bottom of the chassis base.

Now ground the shielding by soldering it to the lugs on the chassis base. One of these lugs is located just below the planetary drive; the other is near the rear mounting foot of the gang condenser.

The connections are made by opening the diode return circuit at the volume control. Unsolder the .01 mf. condenser C27 from the volume control.

Complete the other connections as illustrated in Fig. 7. The lead between the tone control and the .05 mf. tubular condenser C36 mounted on the back of the chassis base, should be covered with a piece of varnished tubing.

Strip about 2¾ inches of the shielding from each end of the cable furnished with the phono attachment parts. Connect one lead of the cable to the terminal on the volume control from which condenser C27 was removed. The other end of this lead is connected to the phono switch as shown in Fig. 7. The second cable lead is connected to the open end of condenser C27. Then connect the other end of this lead to the phono switch as shown in Fig. 7. Both of the shielded cable leads connected to the phono switch are con-

The tin plate shield is soldered to the tone control mounting bracket in such a way that when it is bent down toward the bottom and back of the chassis it will shield the lower leads of the phono switch and the lead between the tone control and tubular condenser C36.

After making the phono connections, the I.F. stages should be realigned.

WESTERN AUTO SUPPLY CO.

Alignment and Calibration

Correct alignment is extremely important in connection with all wave receivers. The receivers are all properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment.

A signal generator that will provide an accurately calibrated signal at 456, 1730, 1500, 600, 5800, 5000, 18,300, 15,000 and 6000 KC and an output indicating meter are required. It will be practically impossible to align the receiver if unsatisfactory apparatus is used. If a station is tuned in with the selectivity control in the broad position and this control is then turned to the sharp position, the station may disappear. This is not an indication that the receiver is out of alignment.

Use a non-metallic screwdriver for the adjustments. The complete procedure is as follows:

I. F. Adjustment

Set the signal generator for a signal of 456 KC. Connect the output of the signal generator to the grid of the 1st detector through a 0.1 MF condenser. Connect the ground lead of the receiver to the ground post of the signal generator. Turn the band selector to the Range B position (standard wave band—purple dial color). Turn the selectivity control to the sharp position and keep it in this position for all adjustments. Turn the volume control to the maximum position.

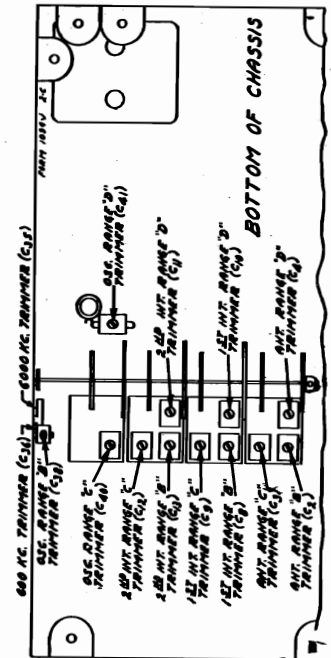

Fig. 3—Location of Trimmers

Attenuate the signal from the signal generator to prevent the levelling-off action of the A.V.C.

Then adjust the five I.F. trimmers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis, and the location is shown in Fig. 5.

Range B Alignment

1730 KC Adjustment

Set the signal generator for 1730 KC. Turn the rotor of the tuning condenser to the full open position. Keep the band selector in the standard wave position. Connect the antenna lead of the receiver through a 200 mmf. condenser to the output of the signal generator.

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent A.V.C. action.

Adjust the oscillator Range B trimmer (C38) until maximum output is obtained. The location of this trimmer is shown in Fig. 3.

1500 KC Adjustment

Set the signal generator for 1500 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained. Loosen the pointer set screw and set the large pointer at the 1500 KC mark on the standard wave band scale. Retighten the set screw.

Adjust the 1st and 2nd interstage Range B trimmers (C8 and C13) and antenna Range B trimmer (C2) to maximum.

Do not change the setting of the oscillator Range B trimmer.

600 KC Adjustment

Set the signal generator for 600 KC. Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 6000 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Use a non-metallic screwdriver for this adjustment

Twenty-five Cycle Receivers

The twenty-five cycle receiver differs from the sixty cycle receiver only in the fact that a different power transformer is used. The correct power transformer is shown in the parts list.

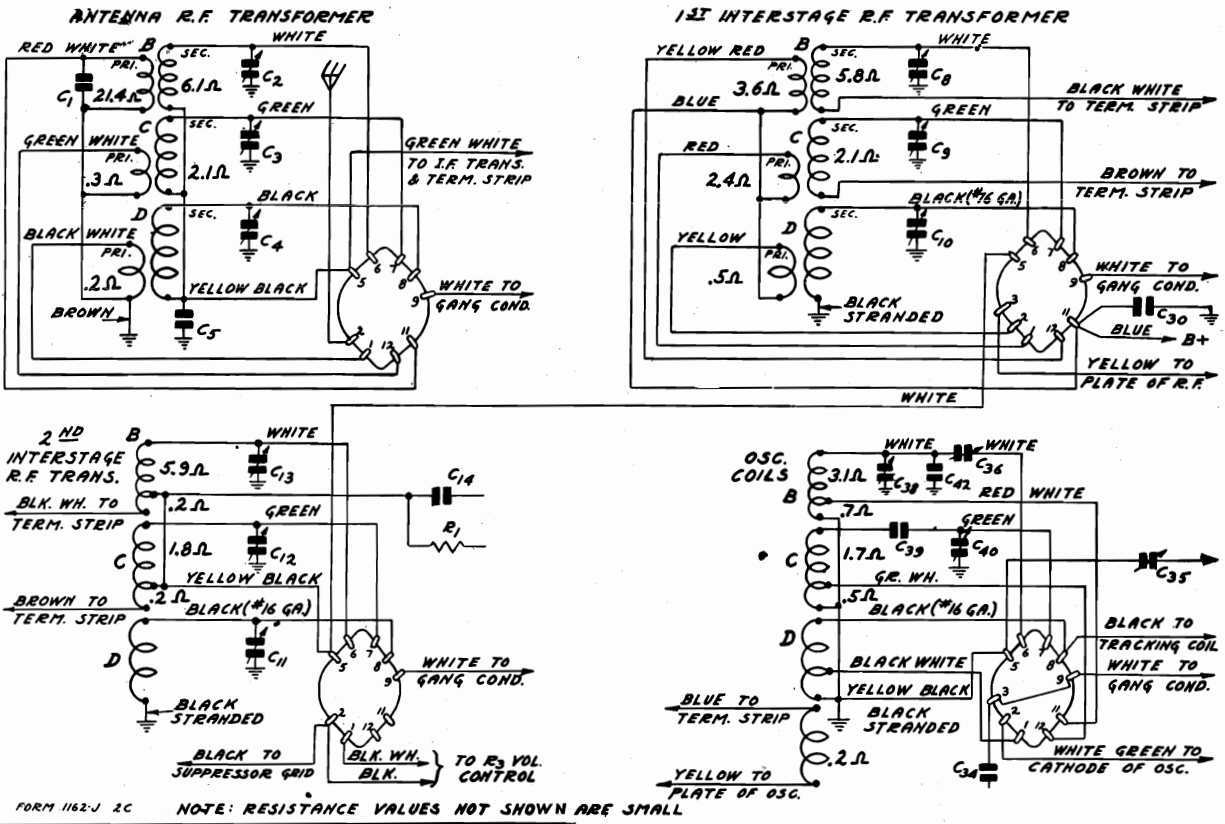

The twenty-five cycle receiver can be operated satisfactorily from a sixty cycle power supply. However, the reverse is not true, the sixty cycle receiver cannot be operated from a twenty-five cycle power supply.

A. 115-230 Volt, 40 to 60 cycle as well as other power transformers with special power ratings are also available for this model.

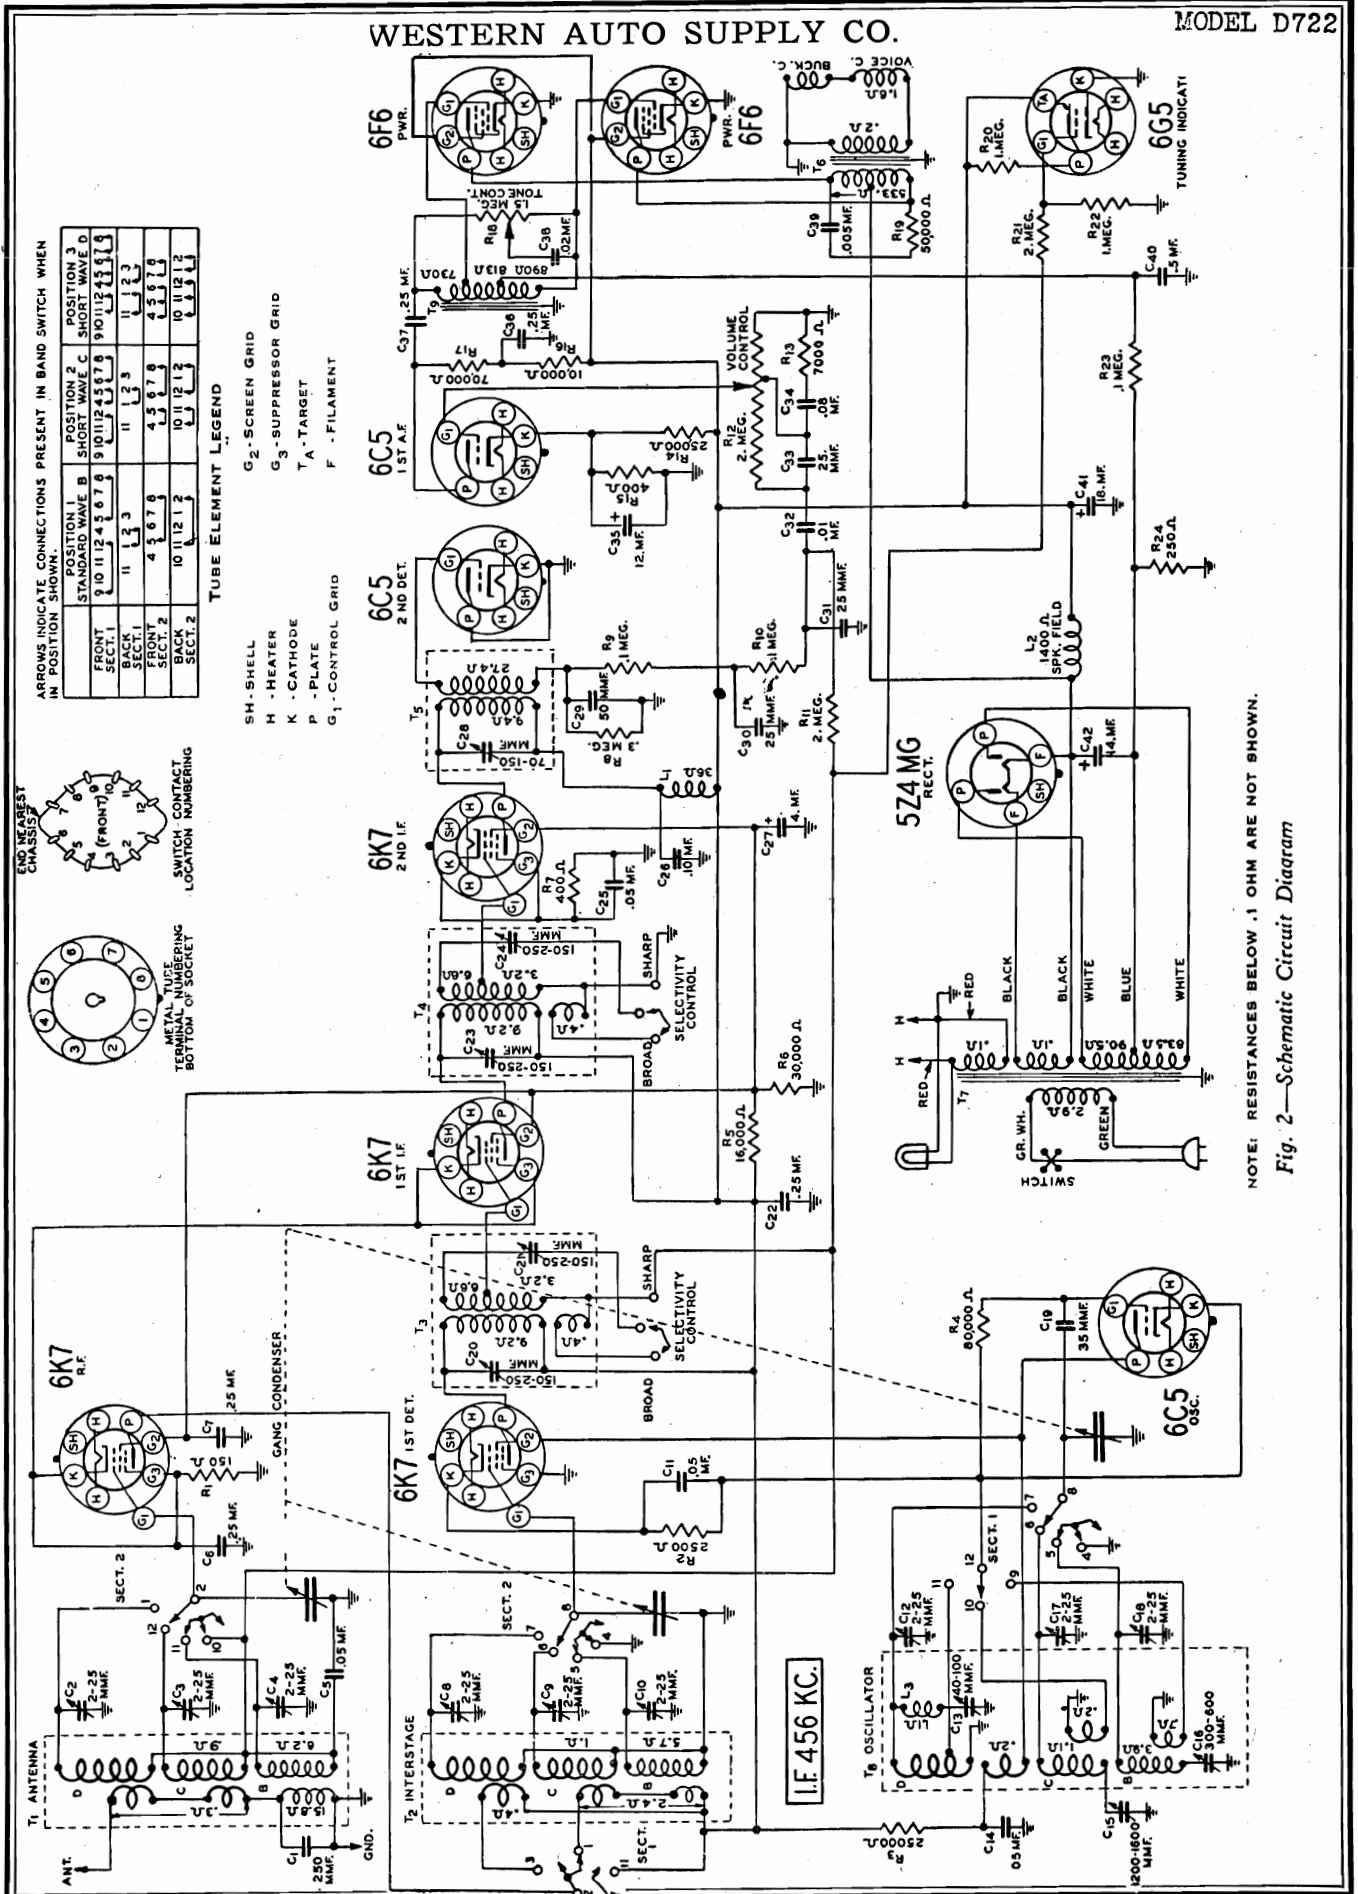

Fig. 2—Schematic Circuit Diagram

I. F. Adjustment

Set the signal generator for a signal of 456 KC. Connect the output of the signal generator through a .1 mf. condenser to the grid of the 1st detector. Connect the ground lead of the receiver to the ground post of the signal generator. Turn the band switch to the Range B position (standard wave band). Turn the selectivity control to the sharp position and keep it in this position for all adjustments. Turn the volume control to the maximum position. Attenuate the signal from the signal generator to prevent the levelling-off action of the AVC. Then adjust the five I.F. trimmers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis and the location is shown in Fig. 3.

Range B Alignment

After the procedure for the alignment of each range, as explained below, is completed, it is advisable to repeat the procedure as a final check.

1730 KC Adjustment

Set the signal generator for 1730 KC. Turn the rotor of the tuning condenser to the full open position. Keep the band switch in the standard wave position.

Connect the antenna lead of the receiver through a 200 mf. condenser to the output of the signal generator.

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent AVC action.

Adjust the oscillator Range B trimmer (C18) until maximum output is obtained. The location of this trimmer is shown in Fig. 3.

1500 KC Adjustment

Set the signal generator for 1500 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

In sets using pointers, loosen the screw of the large pointer and set the pointer at the 1500 KC mark on the standard wave-band scale. Re-tighten the screw.

In sets using the moving beam of light, there is a moving light assembly held to the front of the drive drum by means of a screw. Loosen this screw and move the light assembly until it is at the 1500 KC mark on the dial. Re-tighten the screw.

Adjust the interstage Range B trimmer (C10) and antenna Range B trimmer (C4) to maximum.

Do not change the setting of the oscillator Range B trimmer.

600 KC Adjustment

Set the signal generator for 600 KC. Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 600 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range C Alignment

CAUTION—When aligning the short wave bands be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 7000 KC. The signal will then be heard at 7000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 7000 less 912 KC, or 4088 KC. It may be necessary to increase the input signal to hear the image.

5000 KC Adjustment

Set the signal generator for 5000 KC. Connect the antenna lead of the receiver through a 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band switch to the Range C position (first short wave band).

Adjust the oscillator Range C trimmer (C17) until maximum output is obtained. See Fig. 3 for location of this trimmer.

5000 KC Adjustment

Set the signal generator for 5000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the interstage Range C trimmer (C9) and antenna Range C trimmer (C3) to maximum.

Do not change the setting of the oscillator Range C trimmer.

1800 KC Adjustment

Set the signal generator for 1800 KC. Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 1800 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range D Alignment

18,300 KC Adjustment

Set the signal generator for 18,300 KC. Keep the antenna lead of the receiver connected through the 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band switch to the Range D position (second short wave band).

Adjust the oscillator Range D trimmer (C12) until maximum output is obtained. See Fig. 3 for location of this trimmer.

15,000 KC Adjustment

Set the signal generator for 15,000 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the interstage Range D trimmer (C8) and antenna Range D trimmer (C2) to maximum.

When adjusting the interstage and antenna Range D trimmers, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.

Do not change the setting of the oscillator Range D trimmer.

6000 KC Adjustment

Set the signal generator for 6000 KC. Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth at the same time adjusting the 6000 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Trimmer Replacement

If one trimmer of the gang trimmer strip should become defective, it is not necessary to replace the entire strip. A single trimmer P-17A36, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (side not grounded) of the defective trimmer in the strip. This connection is then made to the single trimmer. Connect it to the side of the trimmer not in contact with the adjusting screw. The other side of the single trimmer is then connected to a good ground, using a piece of heavy wire in order to support the trimmer adequately. In replacing a trimmer, be sure to keep both leads as short as possible and keep the ungrounded lead as far from ground as possible.

Planetary Drive Assembly

The planetary assembly is the unit that is integral with the tuning shaft.

If the nut on the back end of this assembly is too tight, the drive will be jerky and will turn hard in high speed. If this condition exists, back off this nut one or two turns and note the effect.

If this nut is too loose, the drive will slip in slow speed. The remedy in this case, of course, is to tighten the nut.

Should the condenser drive cord slip when the planetary pulley is turning, inspect the tuning condenser, drive drum and gears to see if they are turning properly or if they are being obstructed in some way.

If the drive turns unevenly (rough in spots), this may mean that the planetary assembly is defective or damaged internally and a new unit will be required.

Phonograph Connections

Phonograph connections can be made as shown in Fig. 7. The parts required are shown in the parts list. Knockouts are provided in the back panel of the chassis for mounting the phono jack and phono switch—See Fig. 8.

The phono switch must be mounted with one set of terminals nearest the bottom of the chassis base.

The connections are made by opening the diode return circuit at the volume control. This is done by removing the white wire connected to the insulated lug of the terminal strip on which one end of con-

denser C32 is also connected. The terminal strip is located at the back of the volume control. This wire is then connected to the phono switch, as shown in Fig. 7. A wire is then connected from the lug on the above mentioned terminal strip to the phono switch, as shown in Fig. 7. Both of the above wires are connected to the switch terminals nearest the chassis base and should be twisted together as far

Fig. 7.—Phonograph Connections

as possible and run as close to the back of the chassis base as possible.

The lead to condenser C32, after turning away from the back of the chassis base, should be run close to the 6C7 tube sockets.

Complete the other connections as illustrated in Fig. 7, using the lugs in the chassis base, located near the phono switch and jack, for grounding purposes.

The control grid lead of the 6F6 power tube near the back of the chassis should be removed and a longer lead substituted. This lead is run, from the tone control to the back of the chassis, along the lower edge and is then brought to the grid terminal by being routed between the speaker socket and the tubular condenser next to it.

If a hum is heard when the phono pickup is touched, reverse the two pickup leads.

Switch Contact Location Numbering

A standard arrangement for switch contact location numbering has been adopted. This numbering is illustrated in Fig. 2. In contact locations not used, the number applying to that particular location is not employed.

Voltage Chart

The voltage readings are taken with a voltmeter having a resistance of 1000 ohms per volt.

The standard metal tube socket terminal numbering system (bottom of socket) is shown in Fig. 3. On the schematic circuit diagram, Fig. 2, is a list giving the complete names of the tube elements and the corresponding symbols as used on the sockets on the schematic.

MODEL D725

WESTERN AUTO SUPPLY CO.

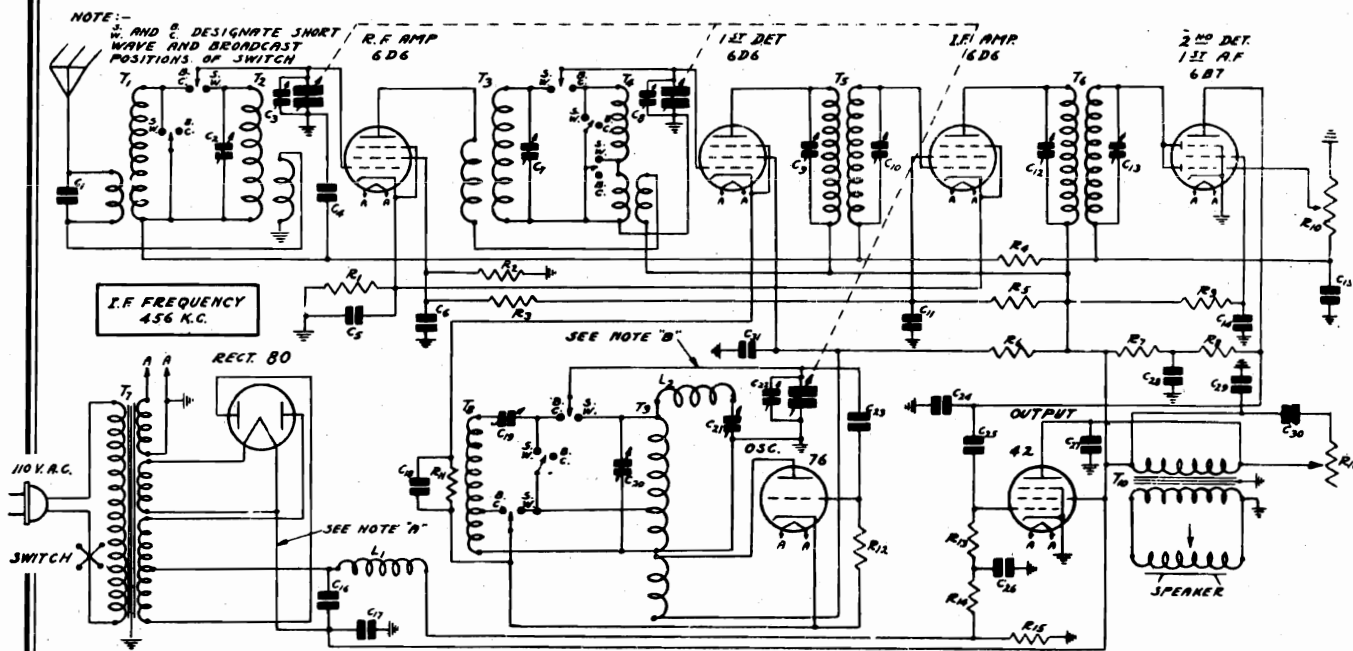

Fig. 1—Schematic Circuit Diagram

Condenser Alignment

Correct alignment is extremely important in connection with all wave receivers. The receivers are all properly aligned at the factory with precision instruments and re-alignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment. A signal generator that will provide an accurately calibrated signal of 456 K. C. and accurately calibrated signals over the broadcast and short wave bands, 530-1740 K. C. and 5.8-18.3 M. C., is required. An output indicating meter is also necessary. It will be practically impossible to align the receiver if unsatisfactory apparatus is used.

Use a non-metallic screw driver for the adjustments. The complete procedure is as follows:

Intermediate Frequency Adjustment

Set the signal generator for 456 K. C. Connect the antenna lead of the signal generator to the grid of the 1st detector through a .05 mfd. condenser. Turn the tuning condenser rotor, until the plates are completely out. The ground lead from the signal generator goes to the ground lead of the receiver. The volume control should be at the maximum position. Attenuate the signal so that A. V. C. action is not obtained.

Then adjust the four I. F. trimmer condensers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis and are in the round I. F. cans—See Fig. 2. The openings to the trimmer condensers are covered over by a small cover plate which is held in position by a screw. Loosen these screws until the cover plates can be swung around.

Broadcast Band Adjustment

The broadcast short wave switch should be in the broadcast position. Set the signal generator for 1740 K. C. Turn the rotor to the full open position. The antenna lead from the signal generator is in this instance connected to the antenna lead of the receiver. Attenuate the signal so that A. V. C. action is not obtained. Adjust the oscillator broadcast trimmer until maximum output is obtained. This trimmer is on the tuning condenser and its location is shown in Fig. 2.

Then set the signal generator for 1500 K. C. Turn the rotor until maximum output is obtained. Loosen the pointer

Fig. 2—Tube Arrangement and Location of Trimmers

screw and set the pointer at the 1500 K. C. mark on broadcast band scale. Retighten pointer screw. Then adjust the antenna and 1st detector broadcast trimmers until maximum output is obtained.

Next set the signal generator for 600 K. C. and adjust the 600 K. C. trimmer. The adjusting screw is reached through a hole in the front panel of the chassis as shown in Fig. 2. Turn the tuning condenser rotor until maximum output is obtained. Then turn the rotor slowly back and forth over

WESTERN AUTO SUPPLY CO.

This setting at the same time adjusting the 600 K. C. trimmer screw until the highest output is obtained.

Short Wave Band Adjustment

CAUTION—After the broadcast band alignment as described above has been made, do not change the adjustment of any of the broadcast band trimmers. Turn the broadcast short wave switch to the short wave position. Turn the rotor to the full open position. As explained above, the volume control should be at the maximum position and the signal should be attenuated to prevent A. V. C. action. Set the signal generator for 18,300 K. C. Then adjust the oscillator short wave trimmer for maximum output. This trimmer is reached from under the chassis and its position is shown in Fig. 2.

Next set the signal generator for 15,000 K. C. Turn the rotor until the dial pointer is at the 15,000 K. C. mark on the short wave portion of the dial scale. Then adjust the antenna and 1st detector short wave trimmers until maximum output is obtained. In aligning the short wave band of the receiver, it will be noted that the signal will be heard with the signal generator set at two points 912 K. C. apart. That is, if the receiver is tuned to 15,000 K. C. a signal will be heard when the signal generator is set at 15,000 K. C. and again at approximately 15,912 K. C. This is due to image reception or the fact that a 456 K. C. beat is obtained when the signal is 450 K. C. lower than the receiver oscillator and also when the signal is 456 K. C. higher than the receiver oscillator. Care should be taken to see that the receiver is tracked with the signal generator adjusted to the lower of the two frequencies at which a signal is heard, in order that the receiver oscillator will be 456 K. C. higher in frequency than the signal.

Next set the signal generator for 6000 K. C. and adjust the 6000 K. C. trimmer. In the first models of this receiver, this condenser was located at the point shown in Fig. 2 in dashed lines. In the later models it is reached through a hole in the front panel of the chassis as shown in the same illustration. Turn the rotor slowly back and forth to cover this setting, at the same time adjusting the 6000 K. C. trimmer screw until the highest output is obtained. In the later models this adjustment is broad while in the later models it is more critical.

Caution

The can of electrolytic condenser C16 is not at ground potential. Therefore in any work on the chassis, other than should be taken not to touch it with any grounded point such as the other electrolytic condenser can.

Replacing Drive Cord

Remove chassis from cabinet.

Take off the pilot light assembly by lifting off the two sockets and spring clips.

Detach the large element by removing the screw at the center of the dial.

Loosen the dial assembly by taking out the two screws which secure the bottom of this assembly to the chassis. Then lay the complete dial assembly face downward in front of the chassis. It is not necessary to remove the volume control and tone control collars which hold the indicator cords of these two controls in position.

Turn the drive drum until the opening in this drum is approximately vertical and with the hole at the top as shown in Fig. 3.

Remove the tension spring and the old drive cord. See that the eyelet in the hole in the drive drum as shown in Fig. 3. Insert one end of the drive cord at the outside through the hole in the eyelet in the drive drum.

Voltagess at Sockets LINE VOLTAGE — 115 ANTENNA SHORTED TO GROUND

Table with columns: Type Tube, Function, Across Filia. or Heater, Plate Cath. Cath., Screen Cath., Control Grid Cath., Normal M.A. Values for 6D6, 6D6, 6D6, 6B7, 42, 80, and Rectifier.

- (1) Cathode to ground (2) Subject to variation (3) Read with 1,000,000 ohm meter (4) As read across R15

Tie the end of the cord which has been inserted in the hole to one end of the tension spring.

Fig. 3—Drive Cord Replacement

Wrap the cord in a clockwise direction (facing front of chassis) around the drive drum approximately one-half turn. Then tilt the chassis up on its back panel and bring the cord mentioned in the previous paragraph down to the drive shaft as shown in Fig. 3.

Then bring this cord up from the drive shaft and wrap it around the drive drum approximately one and one fifth turns in a clockwise direction until it is up to the hole in this drum as illustrated.

Insert the free end of the cord through the hole in the eyelet and tie it to the end of the tension spring. The end of the spring, when hanging free, should be approximately 3/4" from the flange of the drum as shown in Fig. 3. Cut off the surplus length of cord after it is knotted.

Then secure the other end of the tension spring over the spur on the drive drum.

Replace the dial assembly and pointer. Replace the pilot light assembly after which the chassis may be reinstalled in the cabinet.

Changes in Early Models

There are two points at which the early models of this receiver differ from the present models. These points are indicated in Fig. 1 and described below.

Power Unit

In the early models a separate filter choke was used in series with the power transformer. The filter choke values of the two filter condensers C16 and C17 are less than those used at present. The values of the old and new condensers are shown in the parts list. A different power transformer was also used with the early filter system and this likewise shown in the parts list.

The two power transformers are not interchangeable and care must be taken in ordering for replacement purposes to order the correct one. The original chassis can be identified by the separate filter choke.

Short Wave Oscillator

Referring to Fig. 1 it will be noted that there is a tracking coil L2 and a trimmer condenser C21 connected in series between the short wave oscillator coil and ground. In the first models of this receiver these two units, which are required for tracking the short wave oscillator, are not used. Instead a series padding condenser was used at the point in the circuit indicated by note B in Fig. 1.

At the time this change was made a change was also made in the oscillator assembly and care must be taken in ordering models with the original oscillator assembly have no spot of paint or a green spot of paint on the 80 socket rivet. Later models with the new oscillator assembly and new tracking system have a red spot of paint on the 80 socket rivet.

Twenty-five Cycle Receivers

The twenty-five cycle receiver differs from the sixty-cycle receiver only in the fact that a different power transformer is used. The correct power transformer is shown in the parts list.

The twenty-five cycle chassis can be operated satisfactorily from a sixty-cycle power supply. However, the reverse is not true; the sixty-cycle receiver cannot be operated from a twenty-five cycle power supply.

A 110-220 Volt 40-60 cycle Power Transformer is also available for this model.

REPAIR PARTS LIST FOR 7 TUBE BROADCAST AND SHORT WAVE RECEIVER

When ordering parts be sure and give the part number. Also give the series number which will be found in the License Notice label. If there is a spot of paint on the chassis, give this color.

In the first models of this receiver a bypass condenser block (P-82600) containing condensers C2, C4, C10, C14, the later models and added as a separate tubular condenser (P-81132) while the other condensers remained in the block (P-82600-D). A second condenser change from the earlier models was in the electrolytic filter block (P-82002). In this block section C24 was changed from an 8 mfd., 250 volt to a 2 mfd., 250 volt condenser.

WESTERN AUTO SUPPLY CO.

front) around the drive shaft, three and one-quarter turns between the two fibre washers, progressing towards the front of the chassis. Be sure that the condenser plates are kept in a closed position and that the cord is held tight.

Set the dial indicator drum so that the offset is at the top or a little to the right of the center — see Fig. 4.

Wrap the cord from the drive shaft once around the offset in the dial indicator drum and then approximately one and one-half turns around the drum itself in a clockwise direction, progressing toward the back.

From the dial indicator drum draw the cord over the lower right hand quarter of drive drum as shown in Fig. 4.

Fig. 5—Drive "Take-up" Spring

Then bring the cord inside of the drum by way of the turned-in portion of the flange at top.

The drive tension spring "D" to the loose end of the cord at the point "C" in the illustration. The top edge of the lip "B" as shown in the illustration is to be held "C" so that the lower hook of spring "D" is about 1/4" from the portion of the flange "B" in the flange of the drive drum. After the spring is hooked and the drive turned over several times the tension in the cord will cause this distance to become about 1/4".

Now, by applying a tension on the drive spring "D" hook the other end of the spring into the small hole "A" near the top of the drive drum. Hook spring from the inside out.

After the cord has been put on it may be necessary to calibrate the receiver as explained in the article on condenser alignment.

All of the earlier models did not have drive shaft "take-up" springs. This spring will prevent any tendency toward change of setting should the receiver be subjected to vibration. To insert these springs and fibre washers on the drive shaft proceed as follows:

Remove the stator selector knob by pulling it off of the shaft.

Slip the small fibre washer over the shaft and clip the "take-up" spring to the drive bracket as shown in Fig. 5.

The chassis may now be replaced into the case in the reverse order of the manner in which it was removed.

Replacing Drive Cord

The drive cord in this receiver may be replaced as follows:

Fig. 3—Cord Drive—Top View

First remove the chassis from the case as explained on page 4.

Some of the first models did not have two fibre washers on the drive shaft to protect the drive cord — see Fig. 3. In this case, these washers should be put on.

Separate and take off the fibre-washer lock washer which holds the drive shaft in position. This may be done with a fine sawed, long nose pliers.

Now pull the drive shaft out just far enough to permit the two fibre washers to be slipped over the end of the shaft.

Then slip the shaft back into place and replace the fibre-washer lock washer.

Remove one end of the new drive cord and with the condenser alignment in the position, slip the drive cord through the small hole "A" in the inside of the drum.

Now wrap the cord around the lower half of the drive drum as indicated and bring it up to the drive shaft. Proceed by wrapping it in a clockwise direction (from

Fig. 4—Cord Drive Replacement

When servicing this receiver, a new vibrator unit should be tried out in the same manner as a new set of tubes would be tried out.

One or more vibrator units should be kept on hand for replacement purposes.

Replacing Volume Control

To remove the volume control and the switch, first pull the knob from the volume control shaft. Next loosen the hexagonal nut on the inside of the case with a flat end wrench. Then unscrew and remove the round knurled nut from the front.

The old volume control and switch connections may now be unhooked and the new unit put in its place and the leads resoldered.

Fasten the volume control to the case in the reverse order in which it was removed.

D. C. Resistance of Windings

Following are the D. C. resistances of the various windings in the chassis. The values given below will vary slightly in different sets.

Table with columns: Part No., Item, D.C. Resistance, Code. Lists various components like Antenna Tuning, Volume Control, and Speaker Field with their respective resistances.

When ordering parts be sure and give the part number. Also give the complete serial number which includes the Series No.

Table with columns: Part No., Item. Lists various parts like tubes, capacitors, and coils with their corresponding part numbers.

Condenser Alignment Misalignment or mistuning of condensers generally manifests itself as broad tuning and lack of volume at portions or all of the standard wave band. The receivers are all properly aligned at the factory with the precision instruments and the alignment of the antenna and antenna lead of the receiver. Adjust the trimmer of the antenna section of the 3 gang condenser until maximum output is obtained. The oscillator section is the one with the cut plate rotor.

Now set the signal generator for 1400 K. C. and turn the rotor until maximum output is obtained. Adjust the other two trimmers on the gang condenser for maximum output.

To calibrate the receiver, tune in a station of known frequency at about the center of the dial. Remove the escutchion plate and glass. The pointer is held in position by friction. Grasp the pointer at the center and turn it until it points to the frequency of the station being received.

The use of the cut plate type of condenser eliminates the necessity of a 600 K. C. padder and, therefore, no adjustment at this frequency is required.

Adjusting Antenna Trimmer After the receiver is installed and the car antenna is connected it will be necessary to adjust the antenna trimmer. Tune in a weak signal between 1200 and 1400 K. C. with the volume control about three-fourths on. Drop the trimmer is shown in Fig. 2. Turn the adjusting screw of this condenser up or down until maximum output is obtained. CAUTION—Do not turn any of the other trimmer adjusting screws for this adjustment.

Removing Chassis From Case First unsolder the black, brown, yellow, and green speaker leads which connect to the terminal strip at the rear of the chassis. Then remove the solder from the shield which is soldered to the solder lug and the shield to the chassis case between the dial scale and the speaker control shaft. Unsolder this shielding at the lug.

Remove the 4 screws which hold the chassis in the case — 2 are in the side and 2 on the speaker panel of the chassis case. (Do not remove the four speaker mounting screws.)

Remove the two control knobs by pulling them off of the shaft.

Next remove the volume control. To do this first loosen the hexagonal nut on the inside of the case with a flat end wrench. Then unscrew and remove the round knurled nut from the front.

The chassis may then be taken out.

Replacing Vibrator Unit The vibrator unit is plugged in in the same manner as a tube. This unit may, in case of failure, be readily replaced. (CAUTION—Polarity, as explained in the label on the vibrator unit, must be observed when plugging in vibrator unit.)

In replacing the vibrator unit be sure to replace the corrugated cardboard pad, which prevents the unit from working its way out of the socket.

Following are the D. C. resistances of the various windings in the chassis. The values given below will vary slightly in different sets.

Part No.	Winding	Code	D. C. Resistance in Ohms
P-9A443	Antenna Transformer	T1	
	Primary Winding		8.7
	Secondary Winding—Either Portion		1.0
P-9A439	Interstage Transformer	T2	
	Primary Winding		44.4
	Secondary Winding—Either Portion		1.4
P-9A441	1st I. F. Transformer	T3	
	Primary Winding		93.5
	Secondary Winding		97.6
P-9A442	2nd I. F. Transformer	T4	
	Primary Winding		44.1
	Secondary Winding		49.6

Part No.	Winding	Code	D. C. Resistance in Ohms
P-12A227	Dynamic Speaker		
	Output Transformer Primary	T5	416.6
	Output Transformer Secondary	T5	Small
	Speaker Field	L3	5.3
	Speaker Voice Coil		Small
P-9A440	Oscillator Coils	T6	
	Grid Coil		
	Long Portion		3.0
	Short Portion		0.9
	Plate Coil		5.8
P-53X108	Power Transformer	T7	
	Primary Winding		
	Center Tap to Inside		Small
	Center Tap to Outside		Small
	Secondary Winding		
	Center Tap to Inside		200.
	Center Tap to Outside		200.
P-9A444	Motor Noise Reactor	L1	Small
P-9A448	Pilot Light Line Reactor	L2	Small
P-9A446	Filament Reactor	L4	Small
P-52X42	Filter Choke	L5	312.5
P-9A447	R. F. "B" Plate Reactor	L6	4.1
P-9A445	Vibrator Filter Reactor	L7	Small

Replacement Parts

There is a large letter on the chassis which identifies the set as to major part changes. When ordering parts please be sure to mention the series number and this large letter

600 KC Adjustment

Set the signal generator for 600 KC. Connect the output of the signal generator through a .05 mf. condenser to the control grid of the 6K7 R.F. tube. Turn the tuning condenser rotor until maximum output is obtained. Then turn the tuning condenser rotor back and forth, at the same time adjusting the 600 KC padder (see Fig. 2) until the peak of greatest intensity is obtained. Re-connect the output of the signal generator to the shielded antenna lead through a 150 mmf. condenser (1500 mmf. if antenna is high capacity). Adjust the 600 KC antenna trimmer to maximum. This trimmer is reached from the outside of the case

Adjusting Antenna 600 KC Trimmer

After the receiver is installed and the car antenna is connected, it will be necessary to adjust the antenna trimmer. Tune in a weak signal at approximately 600 KC with the volume control about three-fourths on. Turn the adjusting screw of the antenna 600 KC trimmer up or down until maximum output is obtained. See Fig. 3 for location of this trimmer.

As shown in this illustration, the antenna plug is inserted in one of two ways, depending on whether the car has a high or low capacity antenna. Full instructions are in the installation manual, packed with each radio.

Calibrating the Radio

To calibrate the radio, tune in a station of known frequency. At the back of the control head is the calibration screw. Remove the pilot lamp assembly. Insert a fine blade screwdriver and turn this screw until the pointer on the dial scale is at the frequency of the station being received. The knob must be held during this adjustment.

If the control head is inaccessible it may be calibrated by setting the pointer from the front. Remove the crystal by inserting a knife blade under the lower edge. Loosen the pointer screw, set the pointer and retighten.

6 Tube Synchronous Vibrator Automobile Radio

Antenna Plug Wires	Plate Across Heater	Screen to Ground	Control Grid to Ground	Antenna to Ground
6K7 R.F.	5.6	260	110	3
6I7 1st Det.	5.6	260	110	3
6K7 I.F.	5.6	260	110	3
6B7 2nd Det.	5.6	55	50	30
4I 2nd A.F.	5.7	255	55	30
6A6 P.W.T.	5.7	275		

I. F. Adjustment

Set the signal generator for a signal of 175 KC. Connect the output of the signal generator through a .05 mf. condenser to the stator of the R.F. intermediate section of the tuning condenser. (See Fig. 2 for location of this section.) Connect the ground lead of the signal generator to the chassis ground. Turn the Local Distance switch to the Distance position and keep it in this position for all adjustments.

Set the volume control at the maximum position. Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC. Then adjust the three I.F. trimmers until maximum output is obtained. The location of these trimmers is shown in Fig. 2.

1575 KC Adjustment

Set the signal generator for 1575 KC. Turn the rotor of the tuning condenser to the full open position. If a low capacity antenna is used, connect the shielded antenna lead from the chassis through a 150 mmf. condenser to the antenna post of the signal generator. (If high capacity, use 1500 mmf.) The antenna plug must be correctly inserted, dependent on the capacity of the antenna used.

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent AVC action. Adjust the trimmer of the oscillator section of the three gang condenser until maximum output is obtained—see Fig. 2 for location of this trimmer.

1400 KC Adjustment

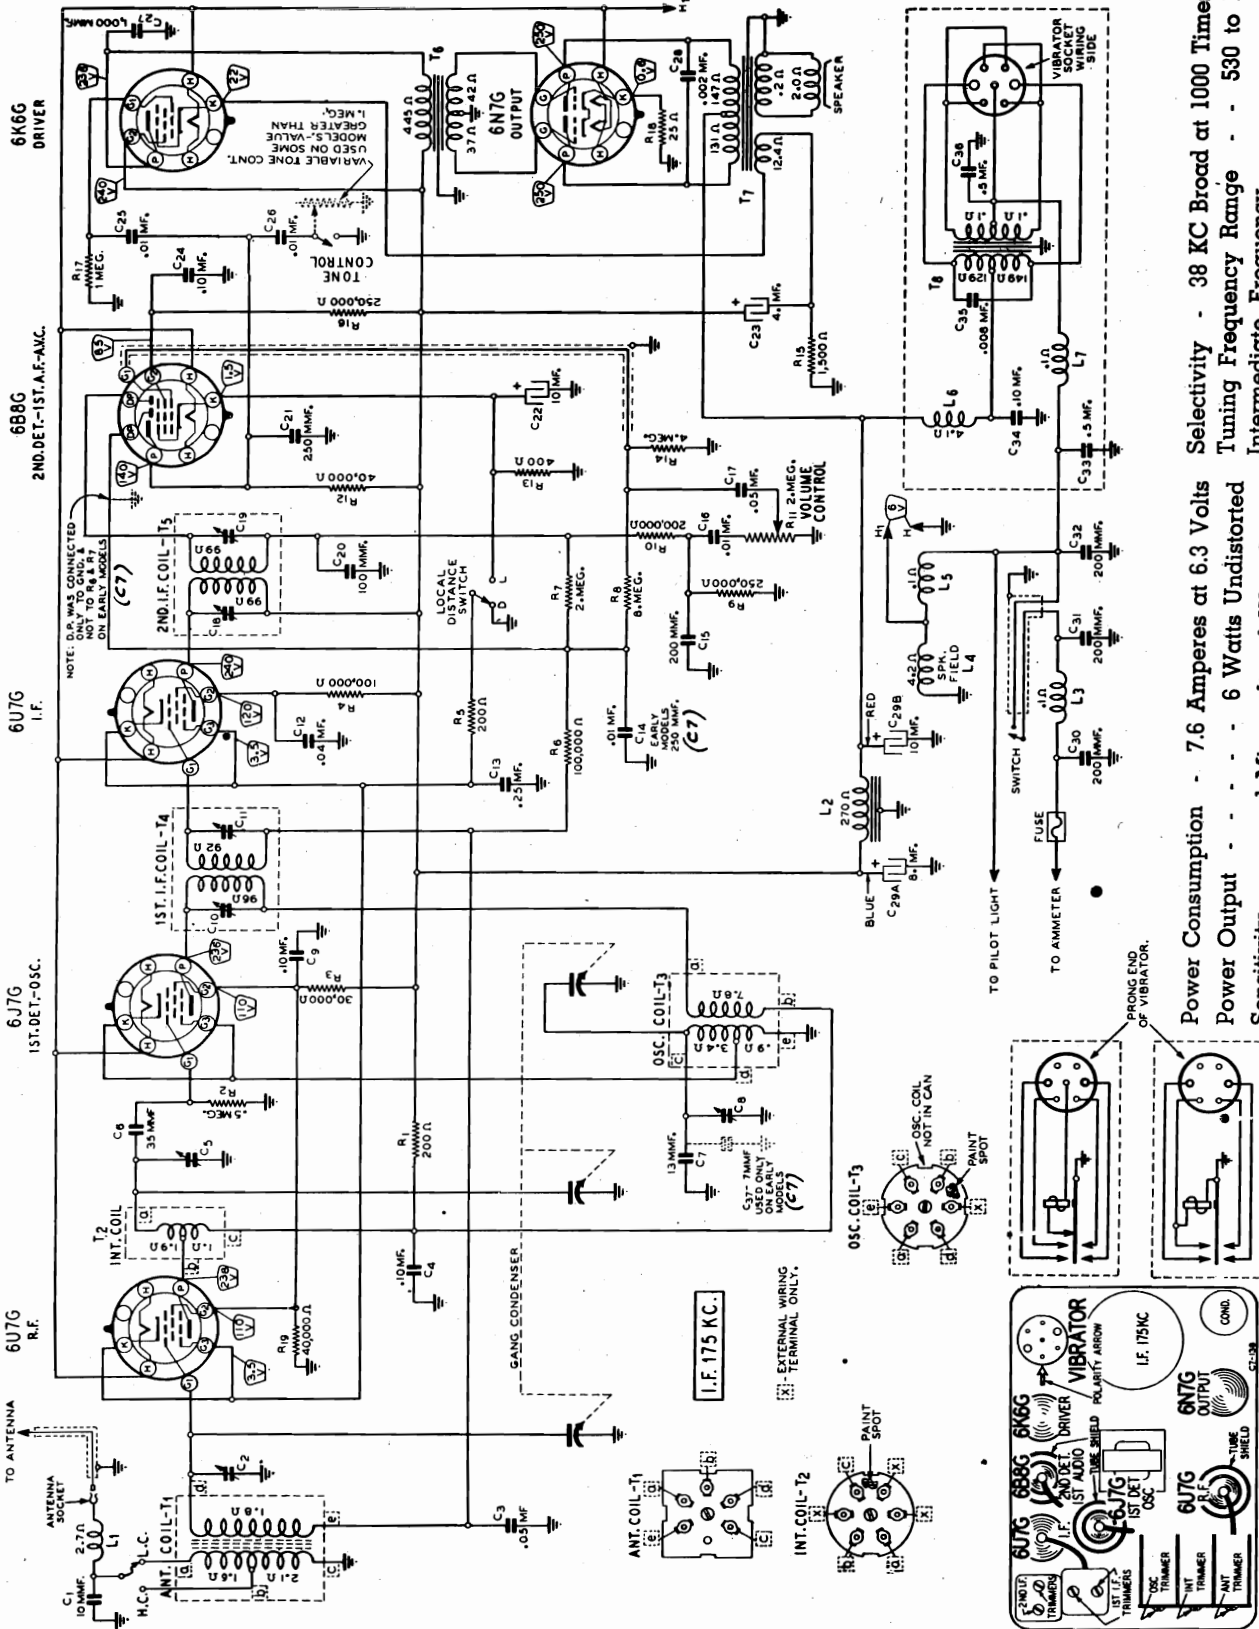

Set the signal generator for 1400 KC. Turn the rotor of the tuning condenser carefully until maximum output is obtained. Adjust the R.F. interstage and antenna 1400 KC trimmers for maximum output.

Do not change the setting of the oscillator trimmer.

MODEL D748

WESTERN AUTO SUPPLY CO.

ALIGNMENT Adjust IF trimmers at 175 KC thru .05 mf dummy. Adjust Osc. trimmer at 1581 KC thru 120 mmf dummy if 60 inch cable 70 mmf is used - or thru 25 mmf dummy if 30 inch cable 35 mmf dummy is used. Adjust Interstage and Antenna trimmers at 1400 KC. Readjust Antenna trimmer C2 at 1400 KC.

Power Consumption	7.6 Amperes at 6.3 Volts
Power Output	6 Watts Undistorted
Sensitivity	1 Microvolt at 1 Watt Output (L-D Switch in Distance Position)
Selectivity	38 KC Broad at 1000 Times Signal
Tuning Frequency Range	530 to 1581 KC
Intermediate Frequency	175 KC
Speaker	6" Dynamic

—FRONT OF CHASSIS

It is important during loop alignment that the loop antenna and the chassis be installed in the cabinet.
 To remove the chassis from the cabinet, remove the two chassis mounting bolts which are used to hold the chassis to the cabinet shelf; take the knobs off their shafts and disconnect the loop antenna.

After each band is completed, repeat the procedure as a final check.

NOTE "A"—The signal generator is connected to the "ANT." and "GND." terminals on the rear of the chassis when aligning the Short Wave Band and to the grid of the 6SK7 R.F. Tube and ground terminal when setting the Broadcast Band oscillator end frequencies, (1580 and 540 K. C.).

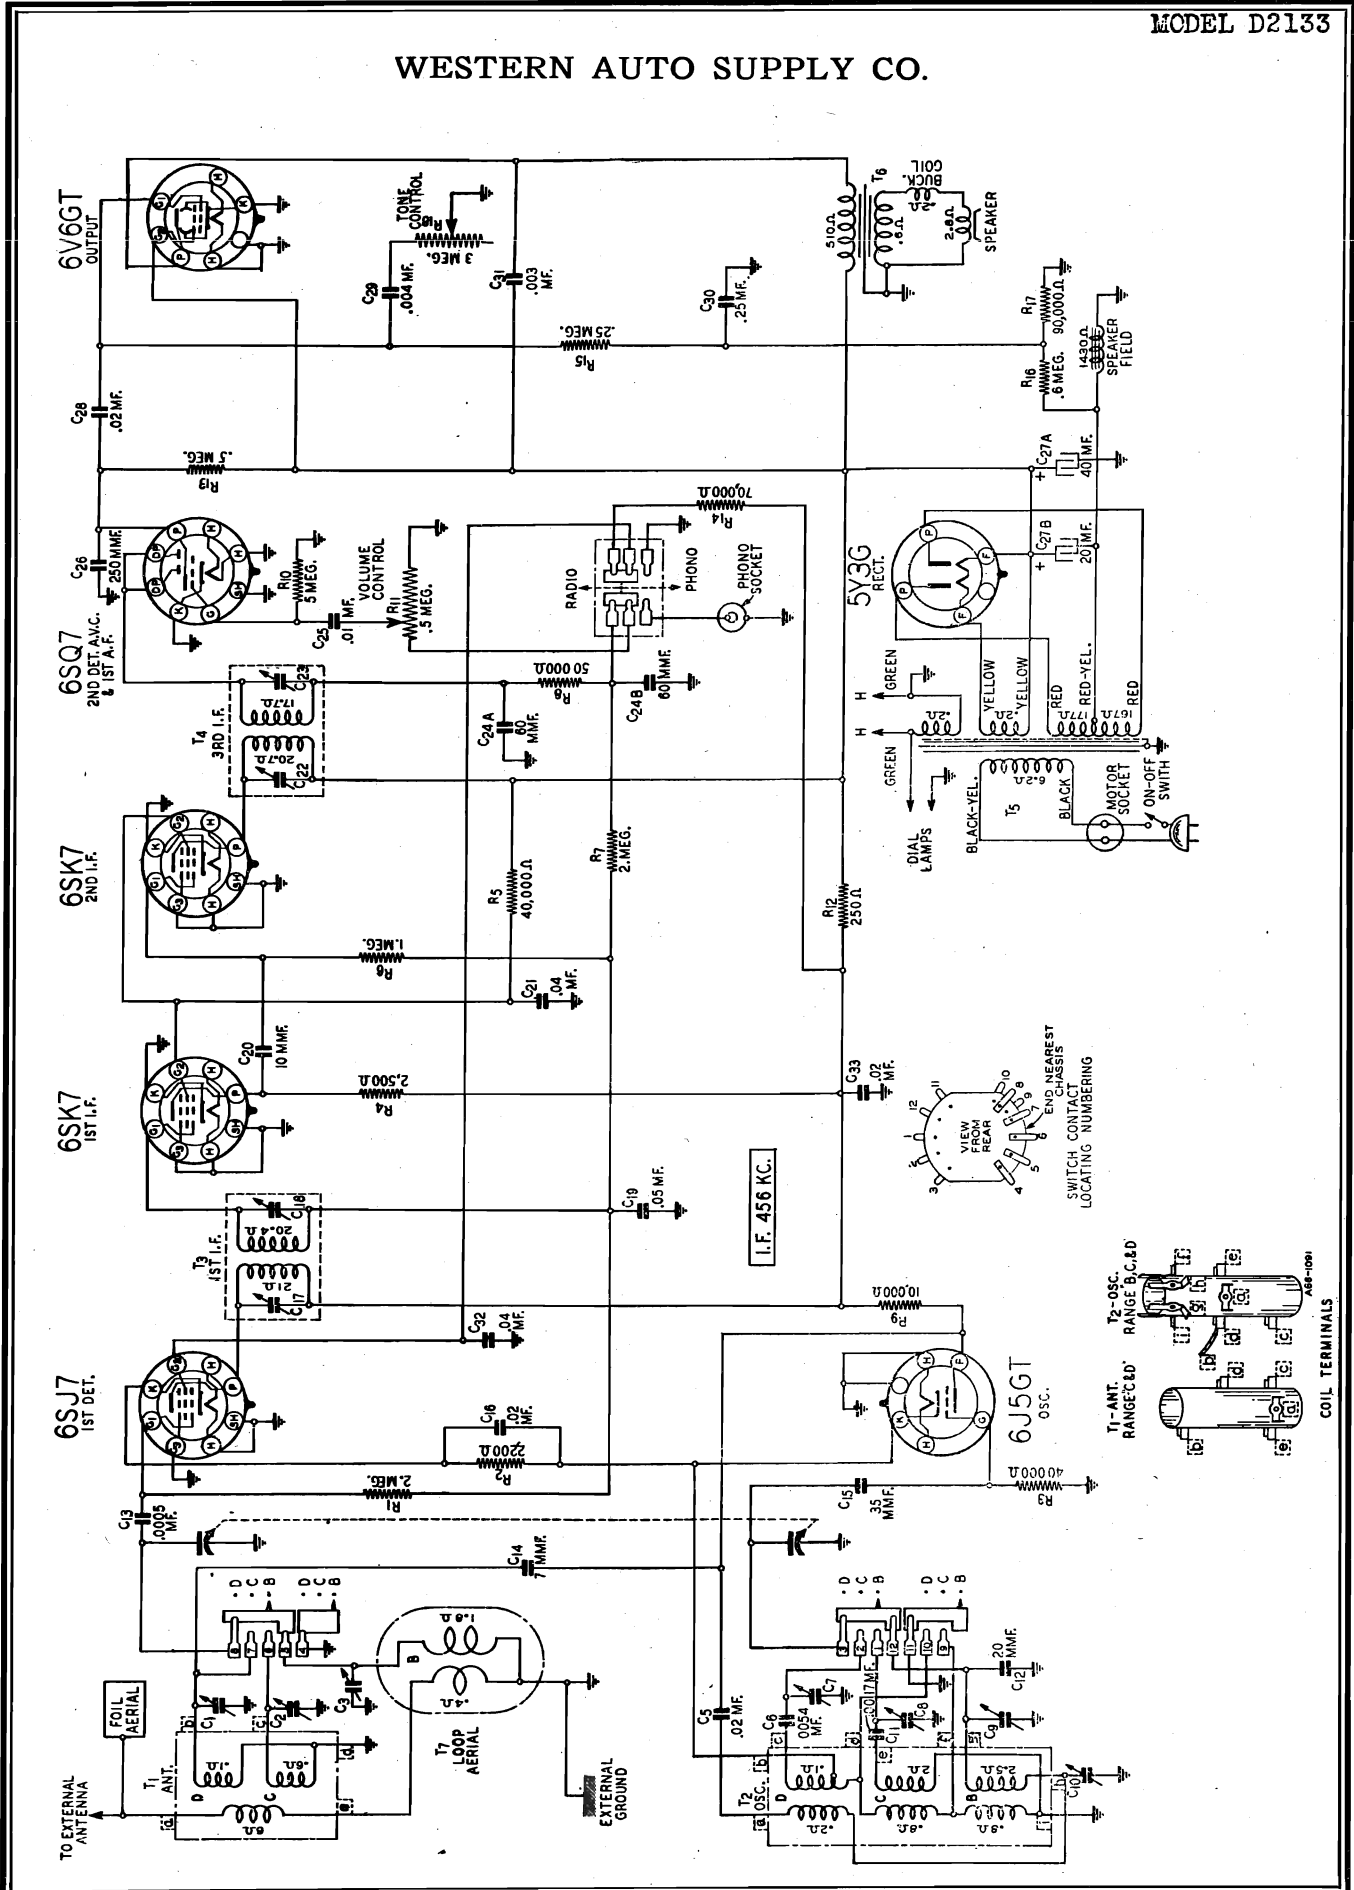

The loop antenna need not be connected to the radio when making these adjustments.

NOTE "B"—Loop alignment is made with the chassis mounted in the cabinet and the loop antenna connected to the terminal board. The signal generator is connected to the "ANT." and "GND." terminals and the jumper on the terminal board connected to "EXT." terminal. (See Fig. 1).

NOTE "C"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained. Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

WHEN OUTSIDE ANTENNA IS USED MOVE CONNECTOR BAR FROM TERMINAL MARKED "LOOP" & CONNECT IT TO TERMINAL MARKED "EXT."

WESTERN AUTO SUPPLY CO.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
 Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
 Allow Chassis and Signal Generator to "Heat Up" for several minutes.
 Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

SIGNAL GENERATOR FREQUENCY CONNECTION AT RADIO	DUMMY ANTENNA SETTING	BAND SWITCH AT RADIO	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I.F.	456 KC Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open
RANGE B	1600 KC Antenna Lead	100 mmf.	B Range	Turn Rotor to Full Open
	1400 KC Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1400 KC—See Note A
RANGE C	600 KC Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output Rock Rotor—See Note B
	7000 KC Antenna Lead	400 Ohm	C Range	Turn Rotor to Full Open
	6000 KC Antenna Lead	400 Ohm	C Range	Turn Rotor to Max. Output Rock Rotor—See Note B
RANGE D	22,000 KC Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open
	18,000 KC Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output Rock Rotor—See Note B
LOOP RANGE B	1400 KC Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output Ant. Range B (C3)

NOTE A—If the pointer is not at 1400 KC on the dial, remove pointer from drive cord. Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

A66-1092

A66-1077

A66-1076

DRIVE CORD REPLACEMENT

Turn gang condenser to full closed position. Using a new drive cord 57" in length, tie one end to tension spring. Fasten other end of tension spring to hook on drive pulley. Pass cord through slot in pulley rim. Wind cord 1/3 turn clockwise (from gang end of chassis) around drive pulley; confining around idler pulleys A, B, and C as shown. Pass cord through wire string guide and wind 3 turns counter-clockwise (from front of chassis) around tuning shaft. These turns should progress away from shaft. Continue cord around idler pulley D and wind 1/4 turn clockwise (from gang end of chassis) around drive pulley. Turn should be on left side of pulley groove (from front of chassis). Pass cord through slot in pulley rim. Stretch tension spring and attach free end of cord.

SPECIFICATIONS

- Power Consumption 60 Watts (At 117 volts 60 cycles)
- Power Output 2.5 Watts Undistorted
3.5 Watts Maximum
- Selectivity 40 KC Broad at 1000 Times Signal

1400 KC	Antenna Cable	See Note A	Tune to Max. Output with Tuning Knob	Int. (C5) Ant. (C4)

Reassemble Radio—Install in Car—Connect Car Antenna to Radio.
 Car Antenna Readjustment—Tune in weak signal near 1400 KC—Readjust Antenna Trimmer C4 for maximum output.

CALIBRATION—To calibrate the radio, see article "Calibrating the Radio" on page 4.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—Insert the antenna cable plug in the antenna socket on the chassis. The total capacity of the antenna cable and dummy antenna should be 60 mmf. If the cable, for example, has a capacity of 30 mmf., use a 30 mmf. condenser for a dummy antenna. Connect the other end of the antenna cable through the dummy antenna capacity to the output of the signal generator.

capacity of the antenna cable and dummy antenna should be 60 mmf. If the cable, for example, has a capacity of 30 mmf., use a 30 mmf. condenser for a dummy antenna. Connect the other end of the antenna cable through the dummy antenna capacity to the output of the signal generator.

SPECIFICATIONS

Power Consumption	- 8.2 Amperes at 6.6 Volts	Selectivity	- 38 KC Broad at 1000 Times Signal
Power Output (6.6 volts)	- 3.0 Watts Undistorted	Tuning Frequency Range	- 540 to 1600 KC
Sensitivity	- 1 Microvolt at .5 Watt Output	Intermediate Frequency	- 456 KC
		Speaker	- 6" Electro-Dynamic

Setting the Pushbuttons

Make a list of your 6 favorite stations. Push out the call letters of these stations from the call letter sheets supplied. Insert a call letter in the front of each pushbutton.

Next push one of the pushbuttons all the way in as far as it will go and hold it there. Now tune in the station you want with the tuning knob—Tune back and forth until the station is clear and distinct, then release the button. Continue setting each pushbutton in the same way. Now rotate the tuning knob to the right (clockwise) as far as it will turn.

Looking at the back of the cabinet note the reset lock screw on the left hand side of the chassis, (see chassis view).

Rotate the reset lock screw to the right (clockwise) by means of the pin thru the shaft.

It is very important that this locking screw is turned until it is absolutely tight.

This screw will lock in place all the stations you have selected on the automatic tuner pushbuttons. Pressing the proper button will now tune the station you want. (NOTE: Locking screw is loose when radio is shipped from factory).

To change stations simply loosen the reset lock screw and repeat the procedure above.

MODEL W261, Series A

WESTERN ROYAL

ALIGNMENT PROCEDURE

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1—mf., 200 mmf., 400 ohms.

- Volume control—Maximum all adjustments.
- Connect radio ground to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	455 Kc.	.1 MFD	Grid of 6SA7	Broadcast	Rotor full open (Plates out of mesh)	Trimmers on top (See Chassis View)	Input and Output I. F.	Adjust to maximum output
SHORT WAVE BAND	17 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 17 Mc.	Trimmer C4	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 17 Mc.	Trimmer C1	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 6 Mc.	Trimmer C7	Short Wave oscillator series pad	Adjust to maximum output dial. (See note "A")
BROADCAST BAND	1600 Kc.	200 mmf.	Grid of 6SA7	Broadcast	Rotor full open (Plates out of mesh)	Trimmer C5	Broadcast oscillator	Adjust to maximum output
	1400 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 1400 Kc.	Trimmer C2 (See Chassis View)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 600 Kc.	Trimmer C6 (See Chassis View)	Broadcast oscillator series pad	Adjust to maximum output and rock dial. (See note "A")

CHASSIS VIEW

The loop antenna should be connected to the radio when making all R. F. adjustments.

NOTE "A"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC. After each band is completed, repeat the procedure as a final check.

Setting the Pushbuttons

Make a list of your 6 favorite stations. Push out the call letters of these stations from the call letter sheets supplied. Insert a call letter in the slot on top of each pushbutton.

Next pull one of the pushbuttons all the way out as far as it will come (pull, with fingers on top and bottom of button). Now tune in the station you want with the tuning knob—Tune back and forth until the station is clear and distinct. Now push the button hard all the way in to lock the station in place, (push directly on front of button). Continue setting each pushbutton in the same way. Pressing the proper button will now tune the station you want. If it does not do so you did not push the button hard enough to lock it in place when setting up the station.

To change stations simply repeat the procedure above.

Power Consumption.....80 Watts
Power Output...2 1/2 watts Un-Distorted.

Sensitivity for 500 Milliwatt O.P. 10 Microvolts Average.
Selectivity-35KC Broad at 1000 Times Sig. at 1000 KC.

ALIGNMENT PROCEDURE

IMPORTANT:—See alignment instructions

- Volume control—Maximum all adjustments.
- Connect B - of radio chassis to ground post of signal generator through .1 Mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—1 Mfd.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	455 Kc.	.1 MFD.	Grid of 12SA7	Rotor full open (Plates out of mesh)	Four Trimmers on Top (See Fig. 1)	Output and Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1600 Kc.	.1 MFD.	Grid of 12SA7	Rotor full open (Plates out of mesh)	Trimmer rear section of gang.	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	See Note "A"		Set dial at 1400 Kc.	Trimmer front section of gang	Broadcast Antenna	Adjust to maximum output

NOTE "A" Lay the output lead from the generator in back of the loop antenna. Turn up the output of the generator. Turn up the energy in the loop antenna without any electrical connection from the generator.

Power Consumption _____
 Power Output _____
 Intermediate Frequency _____

FREQUENCY RANGE
 535 to 1600 K.C.

_____ 35 Watts
 _____ 1 Watt Undistorted, 1.5 Watts Maximum
 _____ 455 K.C.

TUBES:

The tube complement of this chassis consists of the following octal base glass and metal tubes.

The type and function of each tube is as follows:

- 1—Type 12SK7 R. F. Amplifier.
- 1—Type 12SA7 Mixer, First Detector-Oscillator.
- 1—Type 12SK7 I. F. Amplifier.
- 1—Type 12SQ7 Second Detector, A.V.C. and First Audio.
- 1—Type 35L6GT Beam Output Amplifier.
- 1—Type 35Z5GT High Vacuum Rectifier.

ALIGNING INSTRUCTIONS:

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltage, defective tubes, condensers and resistors. In order to properly align this radio, the chassis should be removed from the cabinet.

It is important during alignment that the same distance between the loop antenna and the chassis be maintained as when the chassis is installed in the cabinet. Slight adjustments to the oscillator and antenna circuits can be made without removing the chassis from the cabinet through two holes which are provided on the bottom of the cabinet.

The two adjustments on the variable gang condenser can be reached with a long insulated type screw driver through these two holes.

PROCEDURE FOR SETTING THE AUTOMATIC TUNER PUSH BUTTONS

1. Make a list of six stations you tune in regularly. There are six push buttons on the front of the radio by means of which six stations may be tuned automatically. (See "B," Fig. 2.)
2. Punch out the call letters of the stations you have selected from the set of station call letter tabs supplied. On the front of each automatic tuner button an opening is provided for inserting the call letter tabs, (See "A" Fig. 2). Insert the call letter tabs in the rectangular openings in each of the automatic tuner push buttons.
3. Stations may be set up in any sequence desired. Press any one of the automatic tuner push buttons down-all the way.
4. Hold the push button down firmly, and tune set very carefully to station desired, until station is heard clearly and with maximum volume. Release the push button.
5. Press down another automatic tuner push button. Hold it down FIRMLY and carefully tune in next station desired. Release this push button.

Follow this procedure until you have selected all of your favorite stations.

It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the automatic tuner push buttons. (Note: Locking screw "C" is loose when radio is shipped from factory.)

CHANGING STATIONS:

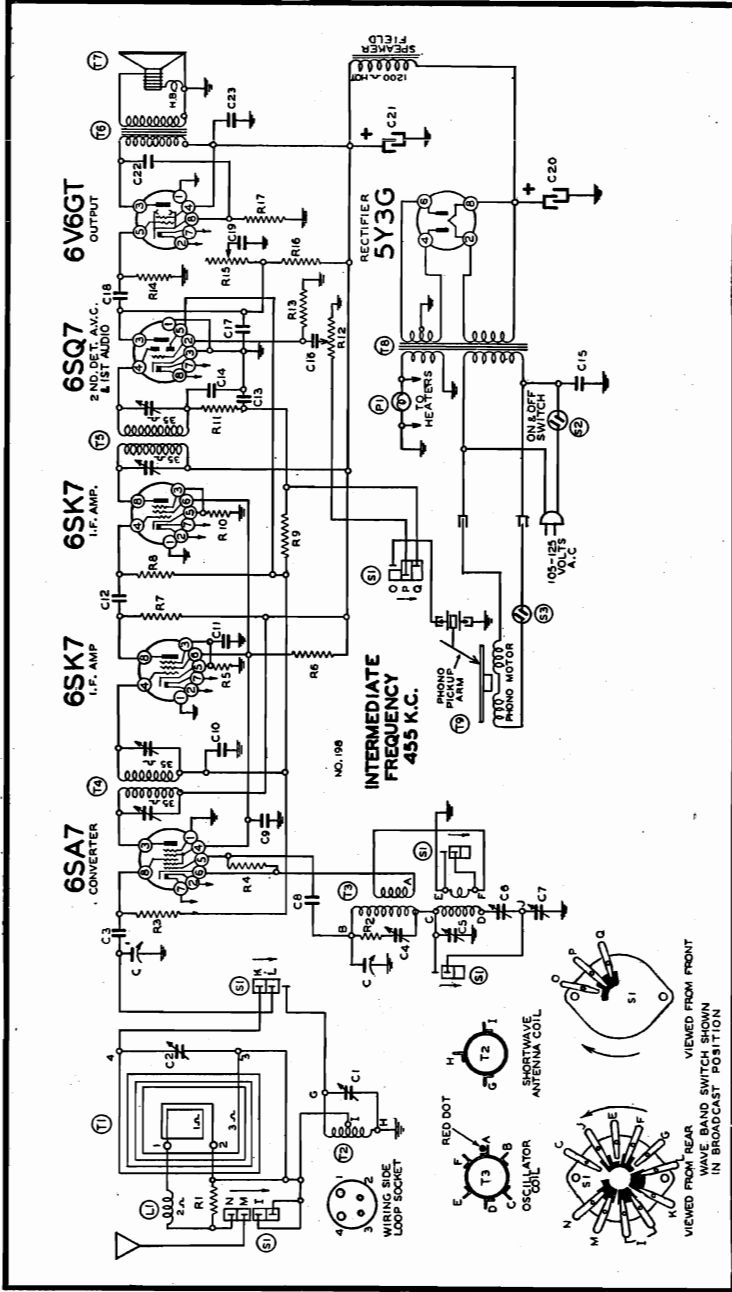

If you should desire to change any station you have selected to another, hold the tuning knob securely and with a coin loosen the locking screw "C" one or two turns. Hold down push button on which the station is to be changed and tune in new station desired. Release the push button.

Be sure to retighten the locking screw, otherwise the stations you have previously selected will not stay adjusted to the push buttons.

The set is now set up for automatic tuning.

	17 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 17 Mc.	Trimmer C1	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 6 Mc.	Trimmer C7	Short Wave oscillator series pad	Adjust to maximum output (See note "C")
BROADCAST BAND (See Note A)	1600 Kc.	200 mmf.	Grid of 6SA7	Broadcast	Rotor full open (Plates out of mesh)	Trimmer C5	Broadcast oscillator	Adjust to maximum output
	530 Kc.	200 mmf.	Grid of 6SA7	Broadcast	Rotor full closed	Trimmer C6	Broadcast oscillator series pad	Adjust to maximum output
LOOP ALIGNMENT (See Note B)	1400 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 1400 Kc.	Trimmer C3 (See Top View)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 600 Kc.	Trimmer C6 (See Top View)	Broadcast oscillator series pad	Adjust to maximum output

NOTE "A"—The signal generator is connected to the "ANT." and "GND" leads when aligning the Short Wave Band and to the grid of the 6SA7 tube and ground terminal when setting the Broadcast Band oscillator end frequencies, (1600 and 530 K. C.).

The loop antenna should be connected to the radio when making these adjustments.

NOTE "B"—Loop alignment is made with the chassis mounted in the cabinet and the loop antenna connected. The signal generator is connected to the "ANT." and "GND." leads.

NOTE "C"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each band is completed, repeat the procedure as a final check.

TECHNICAL DATA—Model No. W-671

- Power Consumption Radio Only 70 Watts
- Power Consumption Motor Only 20 Watts
- Power Output 2.1 Watts Undistorted
- Sensitivity for 500 Milliwatt Output: 15 Microvolts Average
- Selectivity - 51 KC Broad at 1000 Times Signal at 1000 KC
- Tuning Frequency Range Broadcast Band - 530 to 1600 KC
- Shortwave Band - 5.46 to 18.3 MC
- Intermediate Frequency 455 KC
- Speaker 8 in. Electro Dynamic

Service Notes

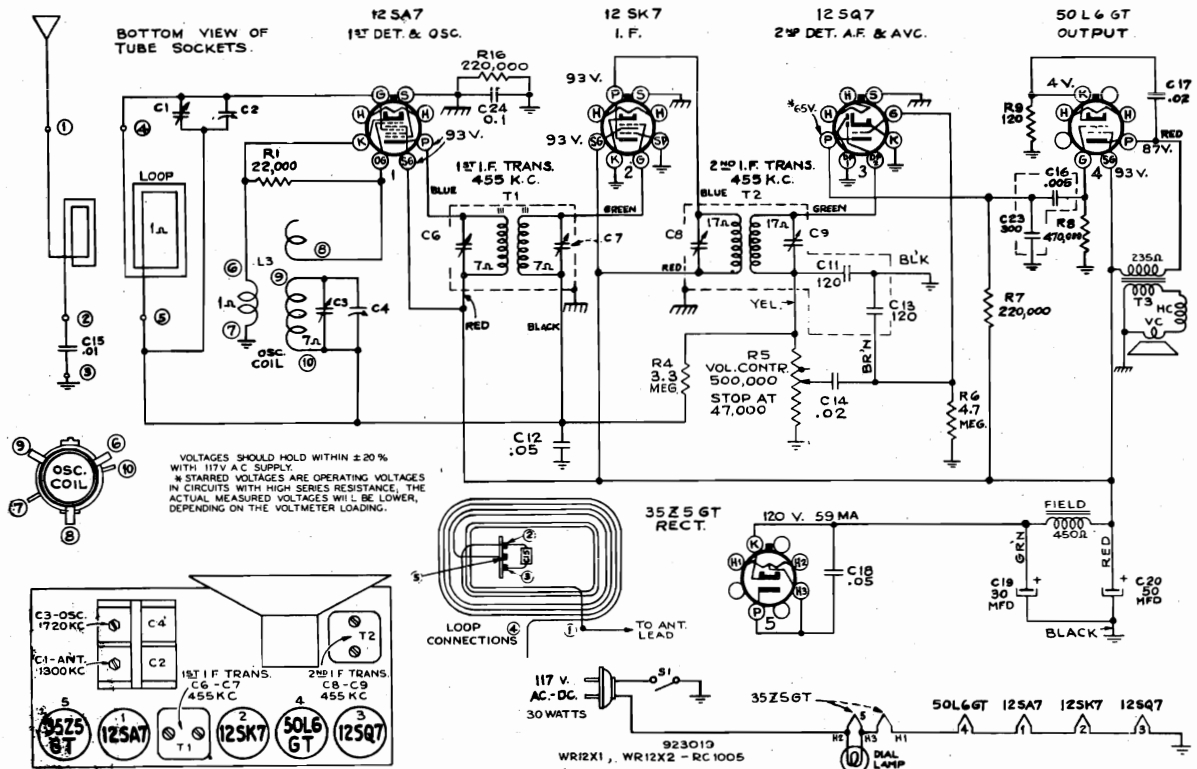

Voltagess taken from different points of circuit to chassis are measured with volume control at minimum, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

Alignment Procedure

Output Meter Alignment.—If this method is used connect the meter across the voice coil and turn the receiver volume control to maximum.

Test Oscillator.—Connect the low side of the test oscillator to the receiver chassis through a .01 mfd. capacitor. With the output meter alignment method the test oscillator output should be kept as low as possible.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the dial backing plate for quick reference during alignment.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output—
1	I-F grid, in series with .01 mfd.	455 kc	Quiet point 1,600 kc end of dial	C10, C9 2nd I-F Transformer
2	1st Det. grid in series with .01 mfd.			C8, C7 1st I-F Transformer
3	Ant. terminal in series with 100 mmfd.	1,720 kc	Gang at minimum	C14 (osc.)
4	Radiated signal 1,300 kc		Signal frequency	C15 (ant.)
5	Repeat steps 3 and 4.			

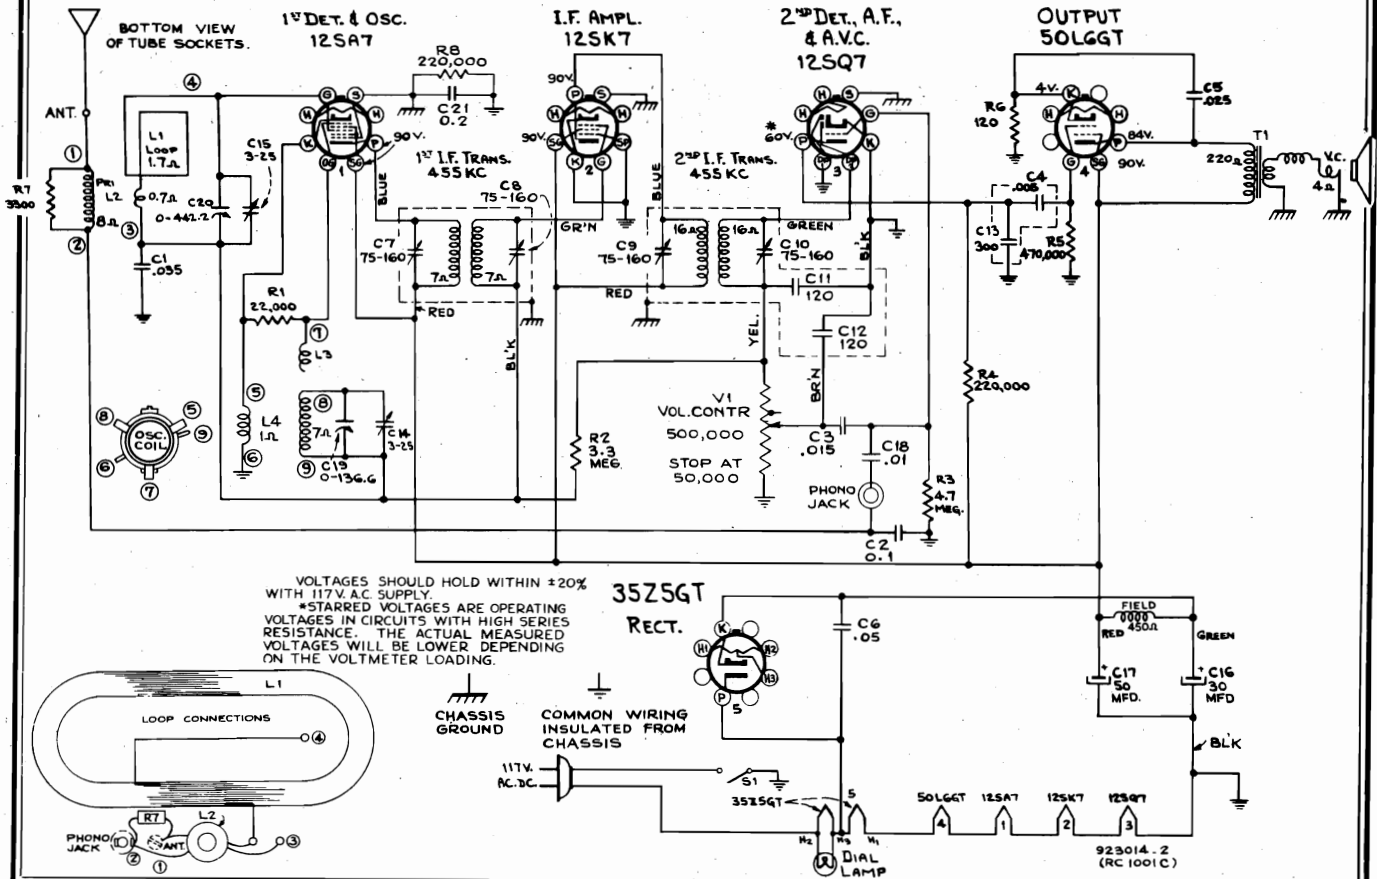

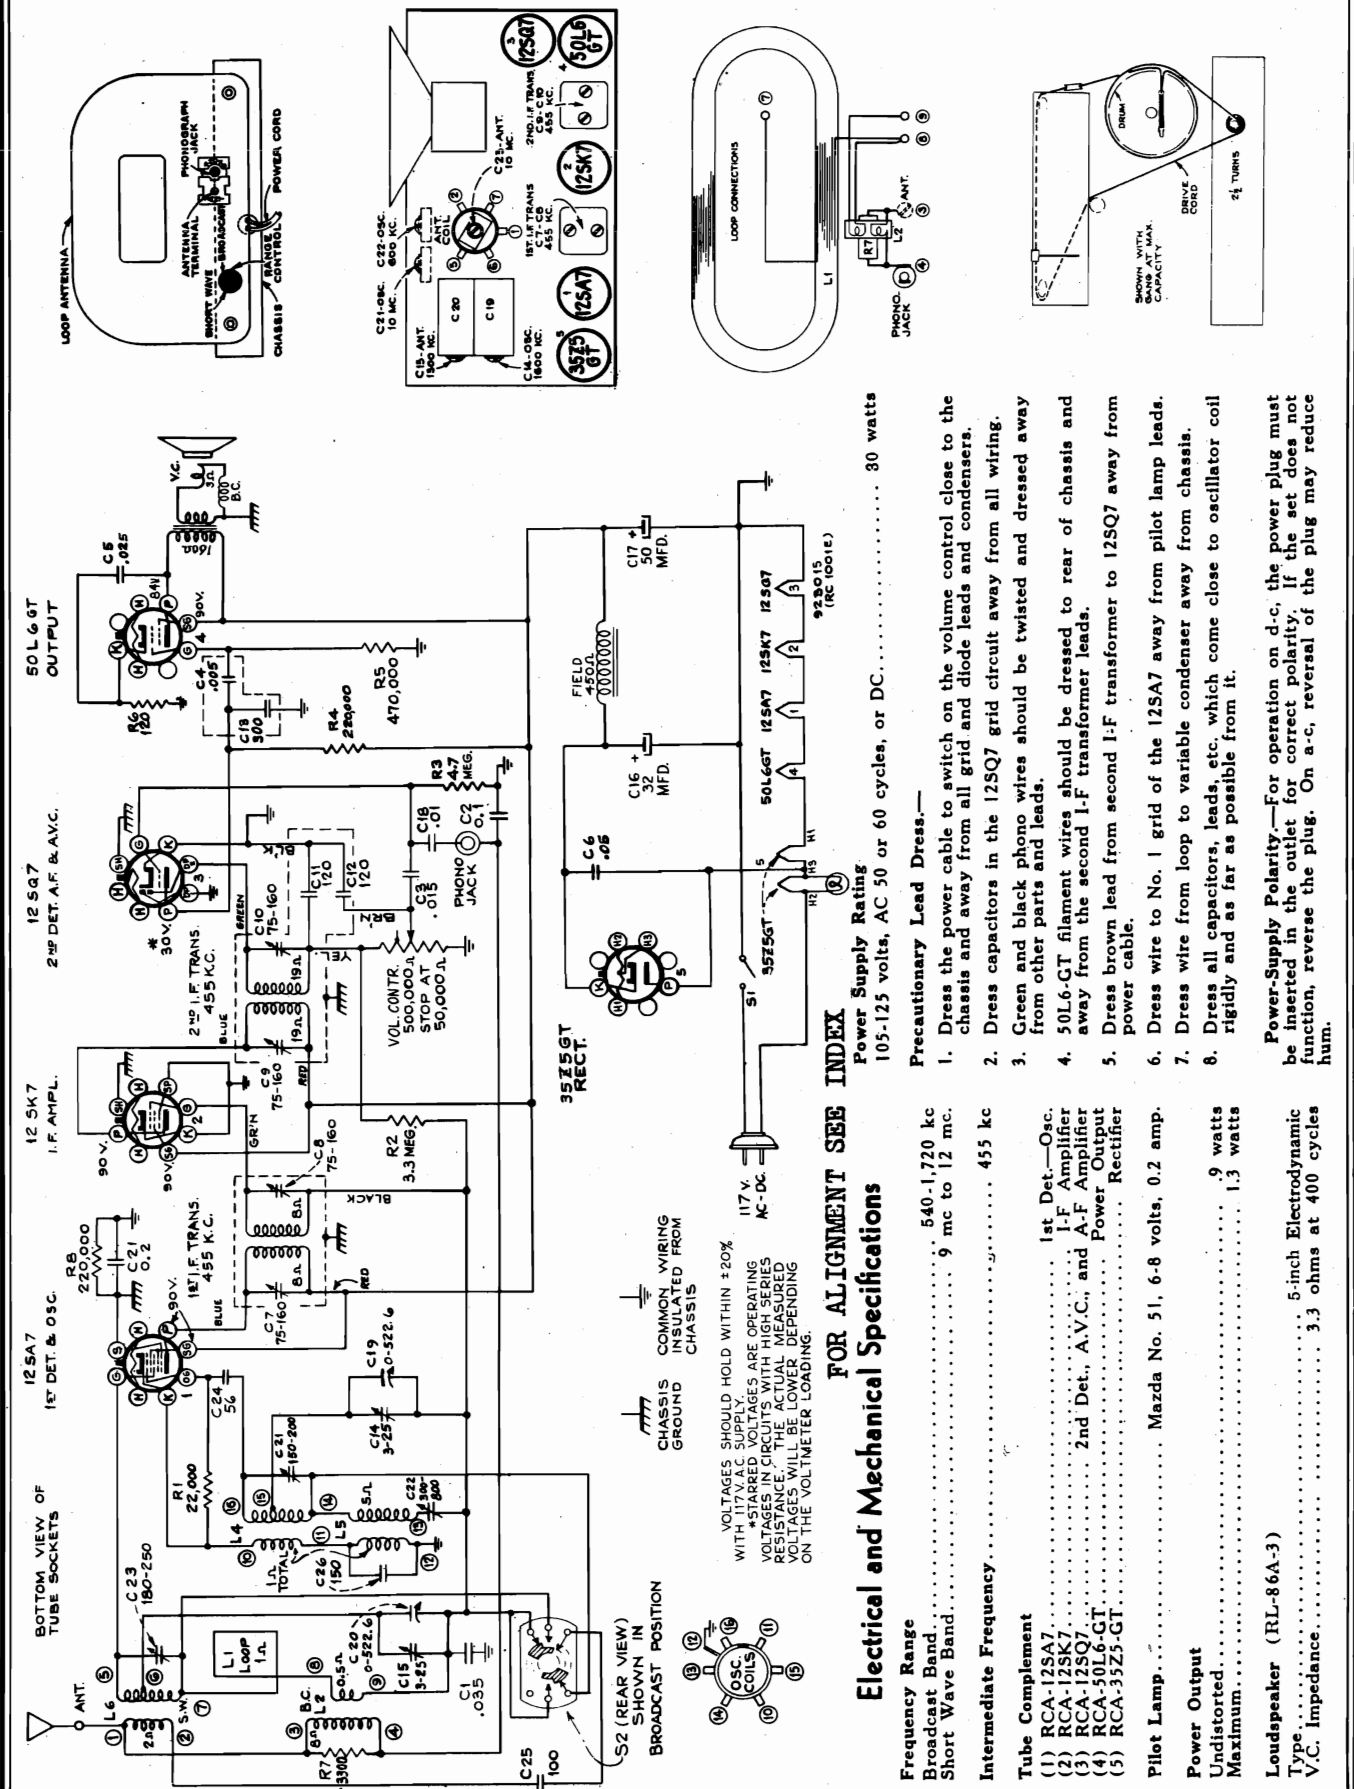

Tube and Trimmer Locations

Record Player.—A jack is provided on the rear of the set for attaching a Record Player. The cable from the Record Player should be terminated in a Stock No. 31048 plug to fit the jack.

For phono operation, tune the receiver to a quiet point on the dial, turn the radio volume control to minimum, and use the control on the Record Player to regulate volume.

For radio operation, always remove the record-player plug from the jack.

Alignment Procedure FOR MODELS WR12X10, 12X11, WR12X14

Output Meter Alignment.—Connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—Connect the low side of the test-oscillator to the receiver chassis, through a .01 mfd. capacitor, and keep the output as low as possible.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the dial backing plate for quick reference during alignment.

Antenna.—The set is equipped with a built-in loop antenna. If an outdoor antenna is used, it should be connected to the blue antenna lead on the rear of the chassis.

Precautionary Lead Dress:

- .01 mfd. capacitor from output plate to cathode to be dressed as far as possible away from .015 mfd. 1st audio grid condenser and volume control terminals to eliminate audio howl.
- Filament lead to pin No. 7 on 35L6-GT socket to be dressed away from 1st audio grid.
- Dress B+ lead on 12SK7 I.F. socket across bottom of socket between grid and plate contacts to aid reduction of grid plate capacitance.
- Dress excess lead lengths of I.F. transformer, grid and plate leads into cans to aid shielding.
- Dress filament leads of 35L6-GT around 12SQ7 socket and into chassis corner to reduce hum.

Steps	Connect the high side of test-osc. to—	Tune test-osc. to—	Turn radio to—	Adjust the following for maximum peak output
1	12SK7 I-F grid, in series with 0.1 mfd.	455 kc	Quiet Point at 1,700 kc end of dial	C23, C22 2nd I-F transformer
2	12SA7 1st det. grid, in series with 0.1 mfd.			C21, C20 1st I-F transformer
3	12SK7 R-F grid, in series with 0.1 mfd.	1,720 kc	1,720 kc	C18 (osc.)
4	Radiated signal 1,300 kc		Signal frequency	C16 (ant.)
5	Repeat steps 3 and 4.			

MODELS WR12X10, WR12X11

MODEL WR12X14 ONLY

Push Button Adjustment:

- Make a list of the five desired stations, arranged in order from low to high frequencies, push in Dial Tuning button, allow at least a five minute warm-up period, and manually tune-in the first station on this list.
- Push in station button No. 1 (extreme left) and adjust No. 1 oscillator core to receive the station.
- Adjust antenna trimmer for maximum output. Clockwise core and trimmer adjustment tunes circuits to lower frequencies.
- Adjust for each of the four remaining stations in a similar manner.
- Make a final careful re-adjustment of oscillator cores and antenna trimmers.

MODEL WR12X15

Precautionary Lead Dress

- Dress output tube plate lead to speaker and output bypass condenser away from terminal board and yellow lead in cable.
- Dress brown and yellow leads from 2nd I.F. transformer away from output plate and bypass condenser.
- Dress .02 capacitor C12 away from output capacitor C16.
- Dress all leads or parts as far as possible away from oscillator coil.
- Dress lead from C13 to band switch down along front apron of chassis.
- Dress lead from trimmer condenser on loop to S.W. Ant. coil around outside of rectifier tube. Other leads between rectifier and R.F. tube.

Loop Connections

Power Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Drive Cord Arrangement

Record Player.—A jack is provided on the rear of the set for attaching a Record Player. The cable from the Record Player should be terminated in a Part No. 31048 plug to fit the jack.

Alignment Procedure

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, keep the output as low as possible to avoid a.v.c. action.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the dial backing plate for quick reference during alignment.

With gang in full mesh, move the dial pointer to the last mark at the left-hand end of the dial scale.

Tube and Trimmer Locations

Steps	Connect high side of the test oscillator to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	I.F. grid in series with 0.1 mfd.	455 kc	Quiet Point at 1,700 kc end of dial	C-30, C-31
2	1st det. grid in series with 0.1 mfd.			C-28, C-29
3	R.F. grid in series with 0.1 mfd.			C27**
4	Ant. terminal in series with 47 mmf. (link open)	15 mc	15 mc "C" Band	C-24 (osc.)* C-22 (ant.)
5		9.5 mc	9.5 mc "C" Band	L-10 (osc.) L-5 (ant.)
6	Repeat steps 4 and 5.			
7	Ant. terminal in series with 220 mmf. (link open)	1,300 kc	1,300 kc "A" Band	C-25 (osc.) C-23 (ant.)
8		600 kc	600 kc "A" Band	C-26 (osc.)
9	Repeat steps 7 and 8.			

*Use minimum capacity peak if two peaks can be obtained.
**Adjust C-27 for minimum signal with 455 kc applied to R.F. grid.

Note.—Oscillator tracks 455 kc above signal on all bands.

MODEL WR12X15

Push Button Adjustment

The station push buttons connect to separate magnetite-core oscillator coils and separate antenna trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as Part No. 31031. Allow at least five minutes warm-up period before making adjustments.

In the event that the receiver is to be used with an external antenna use one or two feet of wire (as an antenna) to ensure sharp peaking during the final adjustment procedure. For loop operation, the link should be strapped across terminals on back of set. In either case the procedure is as follows:

1. Make a list of the desired stations, arranged in order from low to high frequencies.
2. Turn the range selector to dial position, and manually tune in the first station on the list.
3. Turn range selector to "PB" position, push in station button No. 1 (extreme left). Then adjust the No. 1 oscillator core to receive the station.
4. After oscillator core is set correctly, adjust No. 1 antenna trimmer for maximum output.
Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.
5. Adjust for each of the remaining stations in the same manner.
6. Make a final careful adjustment of the oscillator cores and antenna trimmers.

On the 950 to 1,560 kc push-button, the higher frequency stations may be received with L24 either in or out (oscillator frequency either 455 kc below or 455 kc above the station frequency). The adjustment with this core in its out position (oscillator frequency 455 kc above the station frequency) is the correct one.

PUSH-BUTTON RANGES

One station between approximately..... 540-1,100 kc

One station between approximately..... 610-1,250 kc
Two stations between approximately..... 750-1,420 kc
One station between approximately..... 950-1,560 kc

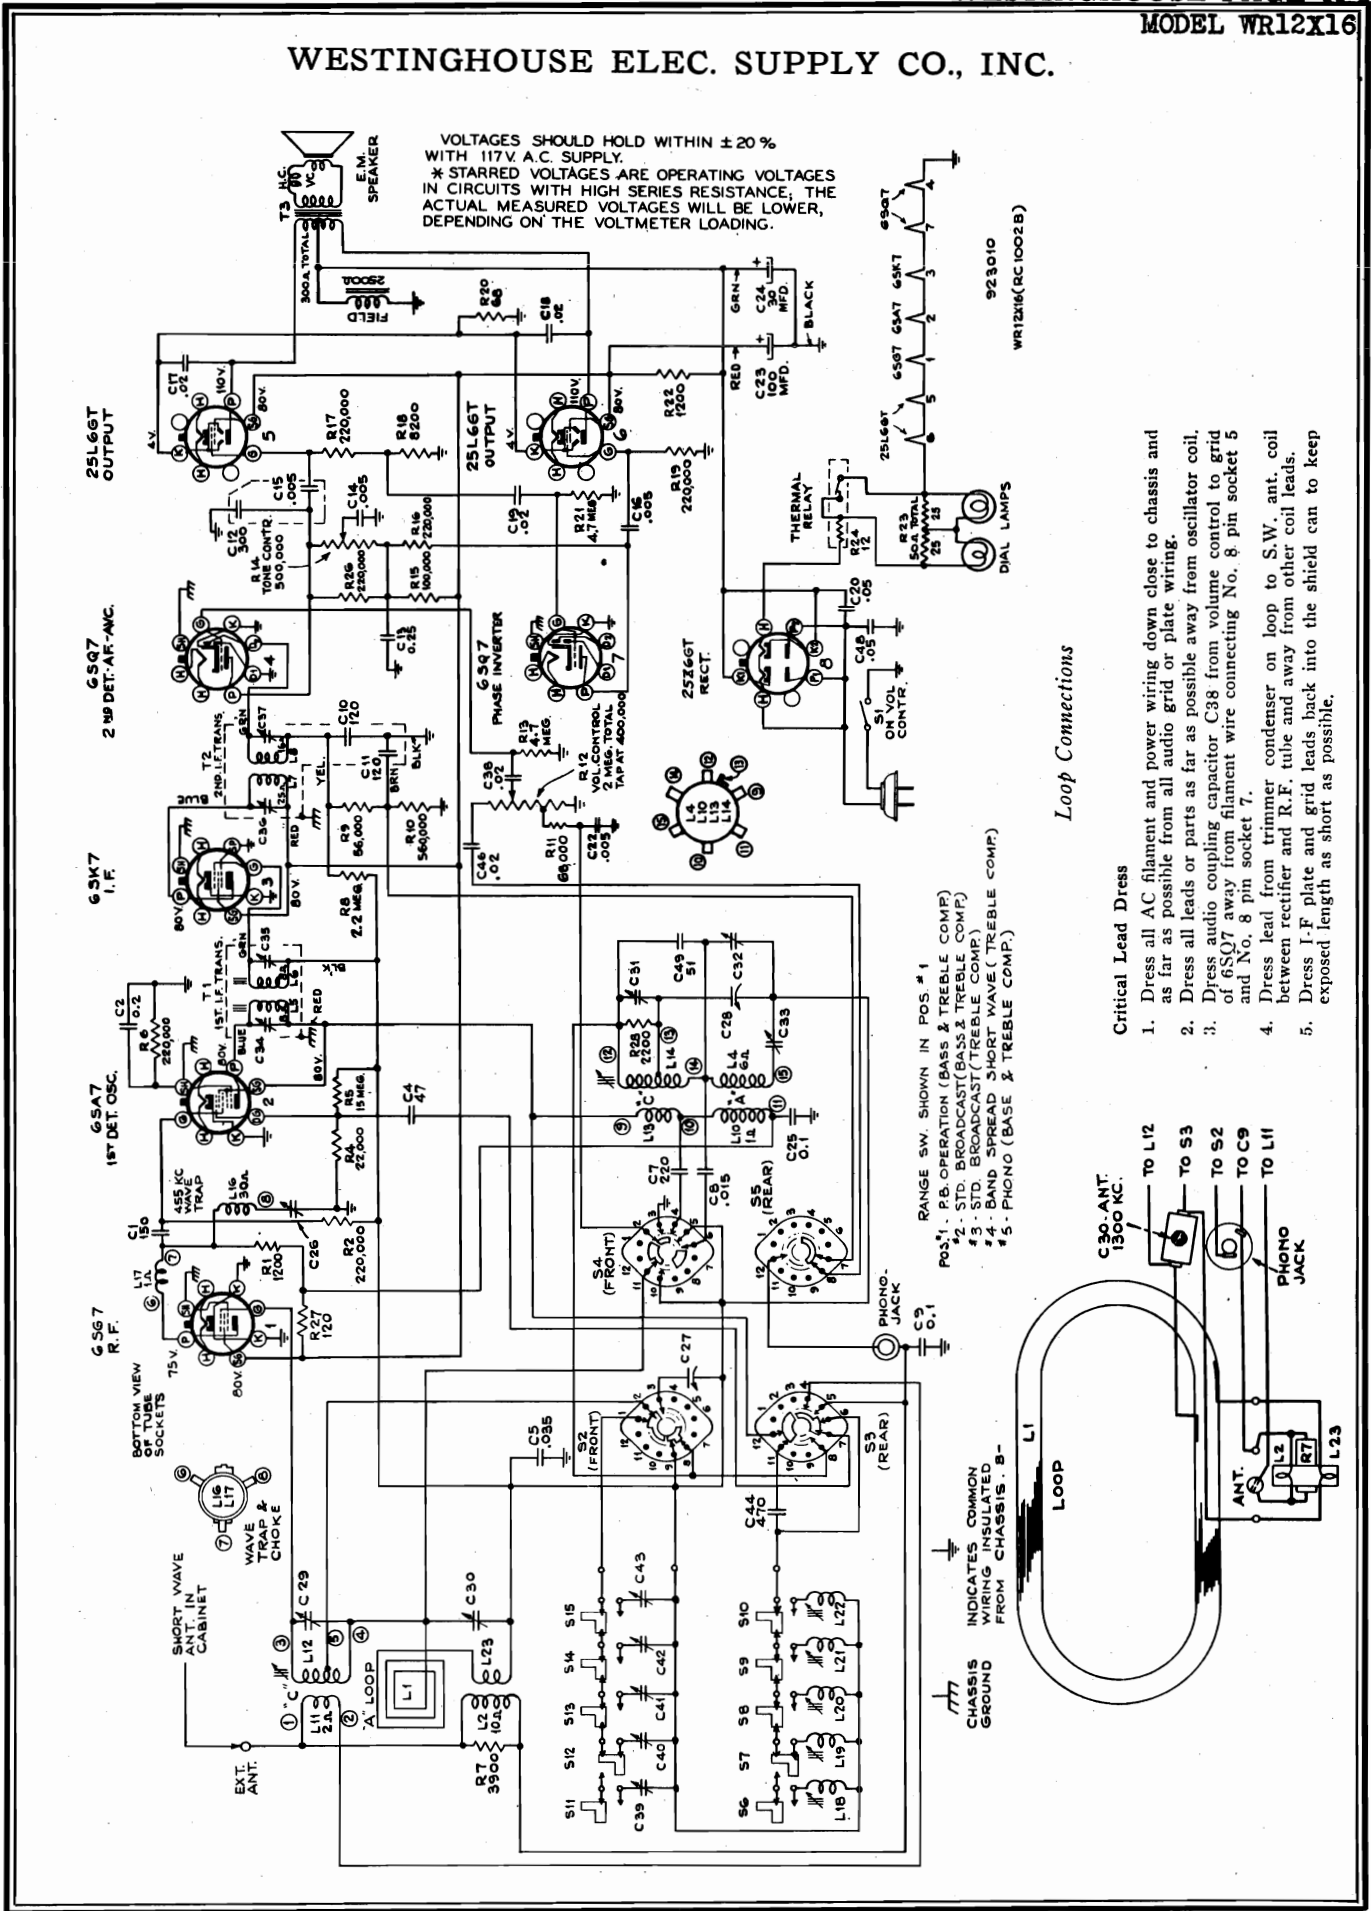

Model WR-12X16

Drive and Indicator Cord Arrangement

Phono Attachment.—A jack is provided on the rear of cabinet for connecting a Phono Attachment into the audio-amplifying circuit. The cable from the Phono Attachment should be terminated in a Part No. 31048 plug to fit the jack.

Power-Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

WESTINGHOUSE ELEC. SUPPLY CO., INC.

MODEL WR12X16

Alignment Procedure

Output Meter Alignment.—Connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—Connect the low side of the test-oscillator to the receiver chassis through a .01 mfd. capacitor, and keep the output as low as possible.

Antenna.—The set is equipped with a built-in loop antenna. If an outdoor antenna is used, it may be connected to the "ANT" terminal on rear of cabinet. It should not be longer than 100 feet, including lead-in. If it is longer, connect a 100 to 200 mmf. capacitor in series with the lead-in.

Dial Pointer Adjustment.—The dial pointer should be set at the left-hand end dial marks, with the gang in full mesh.

Steps	Connect the high side of test osc. to—	Tune test. osc. to—	Range Switch to—	Turn radio dial to—	Adjust the following for max. peak output
1	I-F grid in series with .01 mfd.	455 kc	A	Quiet Point near middle of dial	C-36, C-37 2nd I-F trans.
2	Det. grid in series with .01 mfd.				C-34, C-35 1st I-F trans.
3	Ant. lead in series with 50' mmfd.	15 mc	C	15 mc	C-31 (osc.)* C-29 (ant.)
4		9.5 mc	C	9.5 mc	L-14 (osc.) L-12 (ant.)
5	Repeat steps 3 and 4.				
6	Antenna terminal in series with 200 mmfd.	1,300 kc	A	1,300 kc	C-32 (osc.) C-30 (ant.)
7		600 kc	A	600 kc	C-33 Rock in
8	Repeat steps 6 and 7.				
9	R-F grid in series with .01 mfd.	455 kc	A	low end of dial	C-26**

* Oscillator should track on high frequency side of signal.

If two peaks are obtained use high frequency (minimum capacity peak).

** Feed a high signal level of 455 kc into R.F. grid and adjust C-26 for minimum signal.

Push Button Adjustment

The station push buttons connect to separate magnetite-core oscillator coils and separate antenna trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool

such as Part No. 31031. Allow at least five minutes warm-up period before making adjustments.

In the event that the receiver is to be used with an external antenna use one or two feet of wire (as an antenna) to ensure sharp peaking during the final adjustment procedure.

1. Make a list of the desired stations, arranged in order from low to high frequencies.
2. Turn the range selector to "A" band, and manually tune in the first station on the list.
3. After turning range selector to "PB" position, push in station button No. 1 (extreme left). Then adjust the No. 1 oscillator core to receive the station. It may be necessary to maintain approximate tracking between antenna and oscillator to receive weak stations.
4. After oscillator core is adjusted properly, adjust antenna trimmer No. 1 for maximum output.
Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.
5. Adjust for each of the five remaining stations in the same manner.
6. Make a final careful adjustment of the oscillator cores and antenna trimmers.

On push-button No. 5, the higher frequency stations may be obtained with the oscillator core No. 5 either in or out. (Oscillator frequency either 455 kc below or above the signal.) The out position should be used so the oscillator is 455 kc above the signal.

MODEL WR42X1

WESTINGHOUSE ELEC. SUPPLY CO., INC.

Alignment Procedure

Power Supply.—Although this model employs an ac-dc chassis, it is not suitable for use on d.c., as this would damage the motor.

Output Meter Alignment.—Connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—Connect the low side of the test-oscillator to the receiver chassis, through a .01 mfd. capacitor, and keep the output as low as possible.

Antenna.—The set is equipped with a built-in loop antenna. If an outdoor antenna is used, it should be connected to the blue antenna lead on the rear of the chassis.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	I-F grid, in series with .01 mfd.	455 kc	Quiet point 1,600 kc end of dial	L8 and L9 2nd I-F Transformer
2	1st Det. grid in series with .01 mfd.			L6 and L7 1st I-F Transformer
3	Ant. terminal in series with 200 mmfd.	1,650 kc	Gang at minimum	C25 (osc.) C31 (osc.)
4	Radiated signal 1300 kc		Signal Frequency	C23 (ant.)
5	Repeat steps 3 and 4.			

The phonograph motor is a self-starting, constant-speed induction type. It should be lubricated every six months by applying a few drops of light machine oil to the top and bottom motor spindle bearings, to the turntable spindle and to the turntable drive wheel bearing.

CAUTION: Keep oil away from drive bushing on top of motor spindle and from rubber driving tire on turntable drive wheel.

Phonograph

Alignment Procedure

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the common negative wiring, and keep the output as low as possible to avoid a-v-c action.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the chassis for quick reference during alignment. In the event that only the chassis is returned for service, and the cabinet with its tuning dial is left in the customer's home, the calibration scale printed full size in this service note can be used as an accurate and convenient substitute for the regular dial.

Each method is described below.

Using Tuning Dial.—

1. Remove the glass dial from the cabinet.
2. With gang in full mesh, move the dial pointer to the reference mark at the left-hand end of the dial backing plate.
3. Place the glass dial under the pointer so that the extreme left scale graduations coincide with the pointer. Use scotch tape to hold the glass dial in this position.
4. After completion of alignment, replace the glass dial in cabinet.

Using Calibration Scale.—

1. With gang in full mesh, move the dial pointer to the reference mark at the left-hand end of the dial backing plate.
2. Temporarily fasten the dial scale drawing in this service note, to the dial backing plate with scotch tape, so that the extreme left scale graduation coincides with the pointer.

Steps	Connect the high side of test-osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for maximum peak output—
1	I-F Grid in series with .01 mfd.	455 kc	"A" Band 540 kc	L11, L12 (2nd I-F Trans.)
2	1st-Det. Grid in series with .01 mfd.			L9, L10 (1st I-F Trans.)
3	"A" terminal on ant. terminal board in series with 47 mmf. (link open)	15.2 mc	"C" Band 15.2 mc	C37 (osc.)* C34 (ant.)
4		9.5 mc	"C" Band 9.5 mc	C1 (ant.) (Rock Gang)
5	Repeat steps 3 and 4.			
6	Middle terminal on ant. terminal board in series with 200 mmf. (link open)	1,500 kc	"A" Band 1,500 kc	C10 (osc.) C33 (ant.) (on loop)
7		600 kc	"A" Band 600 kc	L7 (Rock Gang)
8	Repeat steps 6 and 7.			

*Use minimum capacity peak.
Oscillator tracks 455 kc above signal on both bands.

Dial Pointer Adjustment.—After the chassis is replaced in cabinet move the dial pointer (if necessary) so that it is at the left-hand graduation on the dial with the gang in full mesh.

Critical Lead Dress

- (1) Dress bias cell up from chassis and away from A.C. switch.
- (2) Dress R13 (volume control compensation circuit) close to front apron.
- (3) Dress C9 between osc. coil and side apron.
- (4) Black lead from AC switch should be kept away from tone control leads and switch.
- (5) Dress R22, C32 (pickup compensation circuit) close to front apron.
- (6) Blue lead to antenna terminal board should be dressed in back of I-F's.
- (7) Dress brown lead from volume control to tone switch close to front apron.
- (8) Dress R18 (output grid circuit) away from A.C. switch and A.C. leads.
- (9) Dress lead to phono socket up from chassis.

The dial scale drawing shown is a full size reproduction. It can be used as a direct substitute for regular dial scale in alignment procedure.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the chassis for quick reference during alignment. In the event that only the chassis is returned for service, and the cabinet with its tuning dial is left in the customer's home, the scale printed in this service note can be used as an accurate and convenient substitute for the regular dial.

Critical Lead Dress:

1. Bus from "C" oscillator coil to range switch must be held to length and dressed close to coil.
2. C30 (audio coupling capacitor to volume control) should be dressed close to front apron.
3. A.C. cord and motor leads must be dressed away from phono and F.M. jack.
4. Excess trans. leads to be dressed between trans. and rectifier socket.
5. Keep R5, C16 bus (in grid circuit of 6SA7 tube) as short as possible.
6. Dress C28 (in plate circuit of 1st A.F.) close to socket.
7. Keep R15 (grid resistor) C34 (coupling capacitor of output tube) close to socket.
8. Keep C23 (tone compensating capacitor) close to back apron.
9. Keep R15, C48 (in tone compensating circuit) close to front apron.
10. Dress green lead from osc. coil to trimmer close to oscillator coil.
11. Dress cable from phono. socket to phono. switch up away from base.
12. Dress red A.C. leads away from I.F. trans. and 6SQ7 socket.
13. RF choke in plate of 6SG7 must be dressed toward back apron.

Using Tuning Dial.—

1. Remove glass dial from the cabinet.
2. With gang in full mesh, move the dial pointer to a point 1/16 inch to left of reference mark at left hand end of the dial backing plate.
3. Place the glass dial under the pointer so that the extreme left scale graduation coincides with the pointer. Use scotch tape to hold the glass dial in place.

"C" Band Reception.—For best reception on "C" band with an outside antenna, adjust the trimmer screw on the RF coil on the chassis. Turn screw carefully with a special screwdriver (Part No. 31031) while the receiver is tuned to a station in the 31-meter band, and make setting for best reception. If returning to internal antenna at any time, close the link on the center terminal and adjust "C" band antenna trimmer for best reception on 31-meter band.

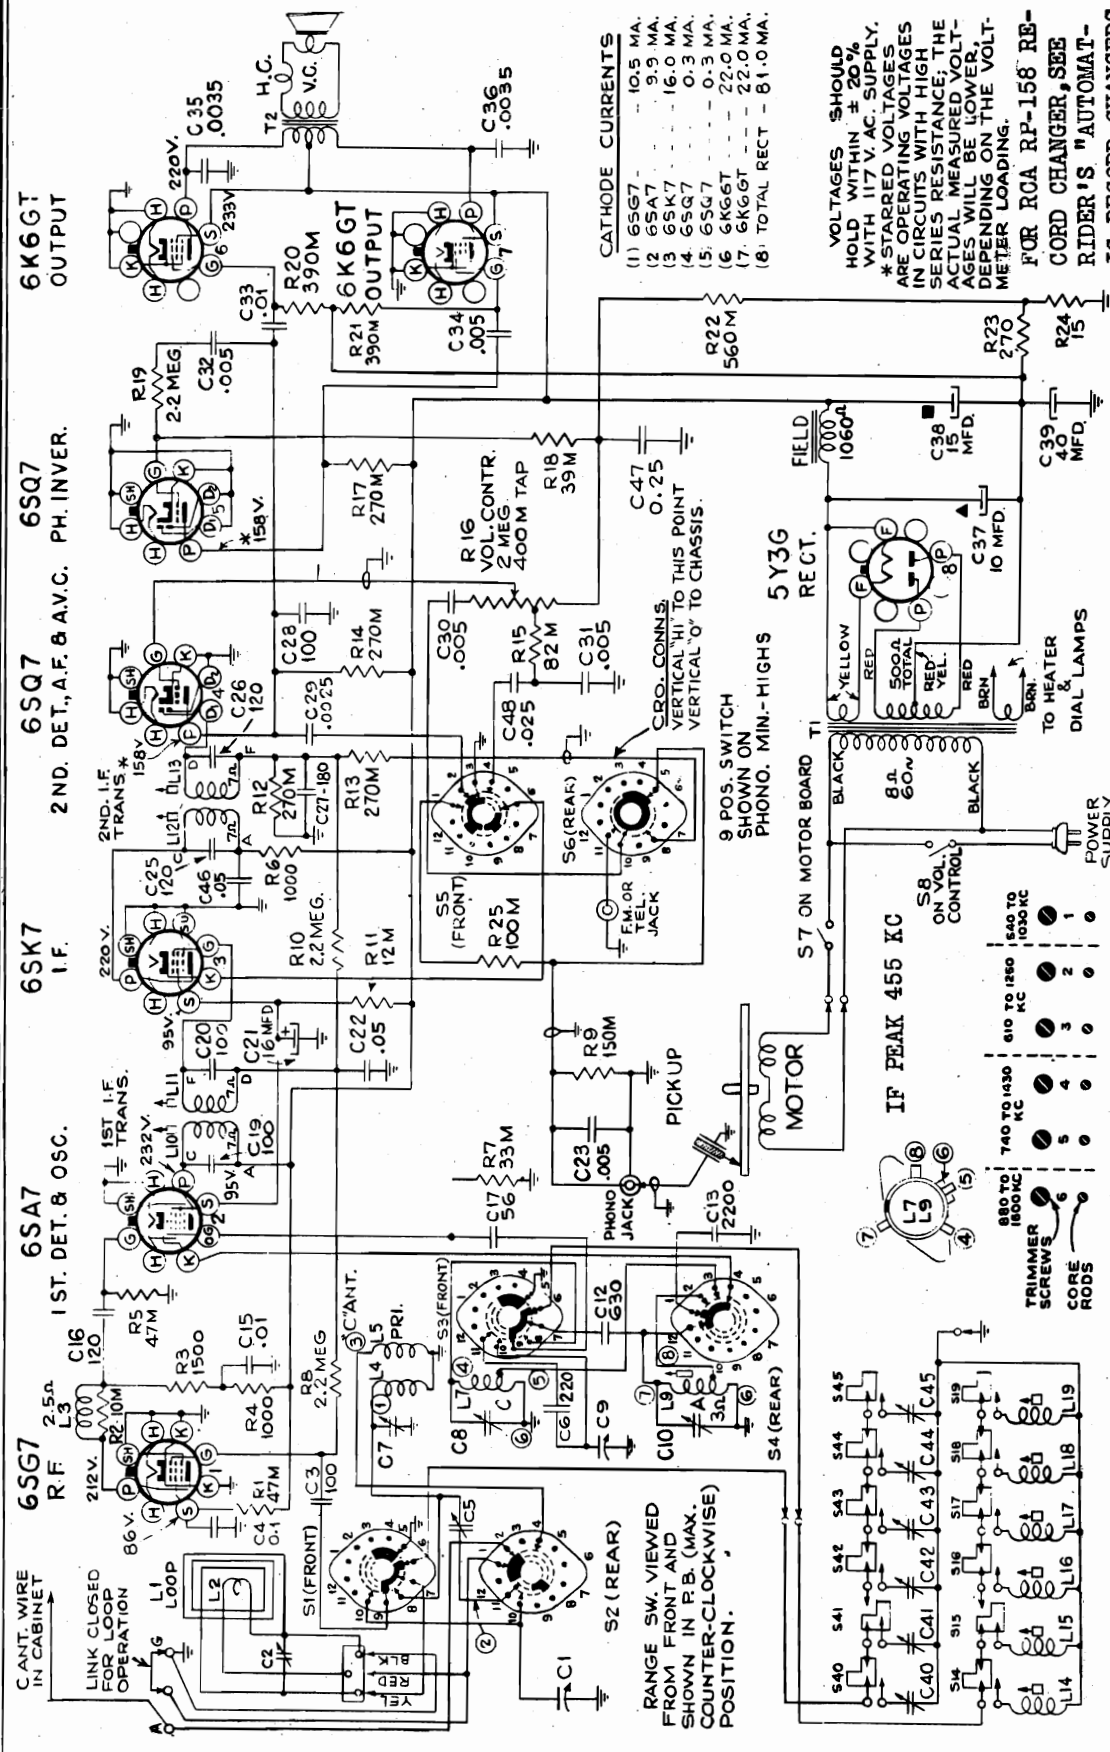

Steps	Connect test-osc. output to—	Tune test osc. to—	Turn radio dial to—	Adjust the following for maximum peak output—
1	I-F grid in series with .01 mfd.	455 kc	"A" band 540 kc	L12 and L13 (2nd I-F trans.)
2	1st Det. grid in series with .01 mfd.			L10 and L11 (1st I-F trans.)
3	A-Terminal in series with 47 mmfd. (link closed)	15.2 mc	"C" band 15.2 mc	C8 (osc.)* C7 (ant.)
4		9.5 mc	"C" band 9.5 mc	C5 (ant.) (Rock gang)
5	Repeat steps 3 and 4			
6	Yellow loop lead in series with 200 mmfd. (link closed)	1,500 kc	"A" band 1,500 kc	C10 (osc.)
7		600 kc	"A" band 600 kc	L9 (osc.)
8	Repeat steps 6 and 7			
9	Install and connect chassis in cabinet with antenna link closed. Tune in a radiated oscillator signal at 1,500 kc. and peak the "A" band trimmer C2 (on loop). Rock in L9 for peak output at 600 kc.			

* Use minimum capacity peak if two peaks can be obtained. Oscillator tracks 455 kc. above signal on all bands.

VOLTAGES SHOULD HOLD WITHIN ± 20% WITH 117 V. AC. SUPPLY. * STARRED VOLTAGES ARE OPERATING VOLTAGES IN CIRCUITS WITH HIGH SERIES RESISTANCE; THE ACTUAL MEASURED VOLTAGES WILL BE LOWER, DEPENDING ON THE VOLT-METER LOADING.

FOR RCA RP-158 RECORD CHANGER, SEE RIDER'S "AUTOMATIC RECORD CHANGERS AND RECORDERS".

On the 880 to 1,600 kc push-button, the higher frequency stations may be received with osc. core either in or out (oscillator frequency either 455 kc below or 455 kc above the station frequency). The adjustment with this core in its out position (oscillator frequency 455 kc above the station frequency) is the correct one.

NOTE: Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.

Push Button Adjustments

- Turn range switch to push-button position and press in the left-hand button.
- Adjust No. 1 oscillator core to receive the first station. To secure the best adjustment, rotate the set for least pickup, and adjust core for peak output.
- Adjust No. 1 antenna trimmer capacitor for peak output on the first station.
- Proceed in the same manner to adjust for the remaining stations.

The push buttons (Models WR-42X5 and WR-42X15) connect to separate magnetic-core oscillator coils and separate ant. circuit trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as Part No. 31031. Allow about five minutes warm-up period before making adjustments.

- The procedure is as follows:
- Make a list of the desired stations, arranged in order from 1. low to high frequencies.
 - Turn the range switch to the broadcast position and manually tune in the first station on the list.

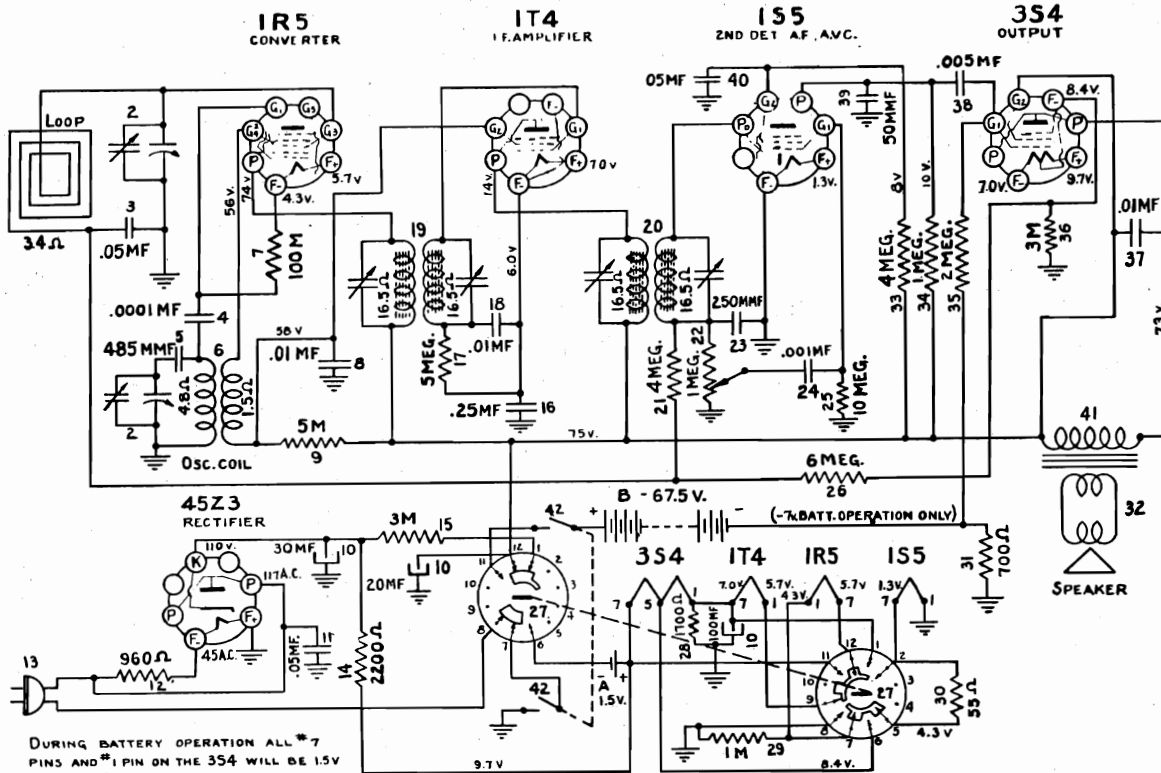

RANGE SW. VIEWED FROM FRONT AND SHOWN IN P.B. (MAX. COUNTER-CLOCKWISE) POSITION.

MODEL WR62K3 WESTINGHOUSE ELEC. SUPPLY CO., INC.

Output Meter: Connect across voice coil and turn receiver volume control to maximum.

Test Oscillator: For all alignment operation, keep the output as low as possible to avoid A.V.C. action.

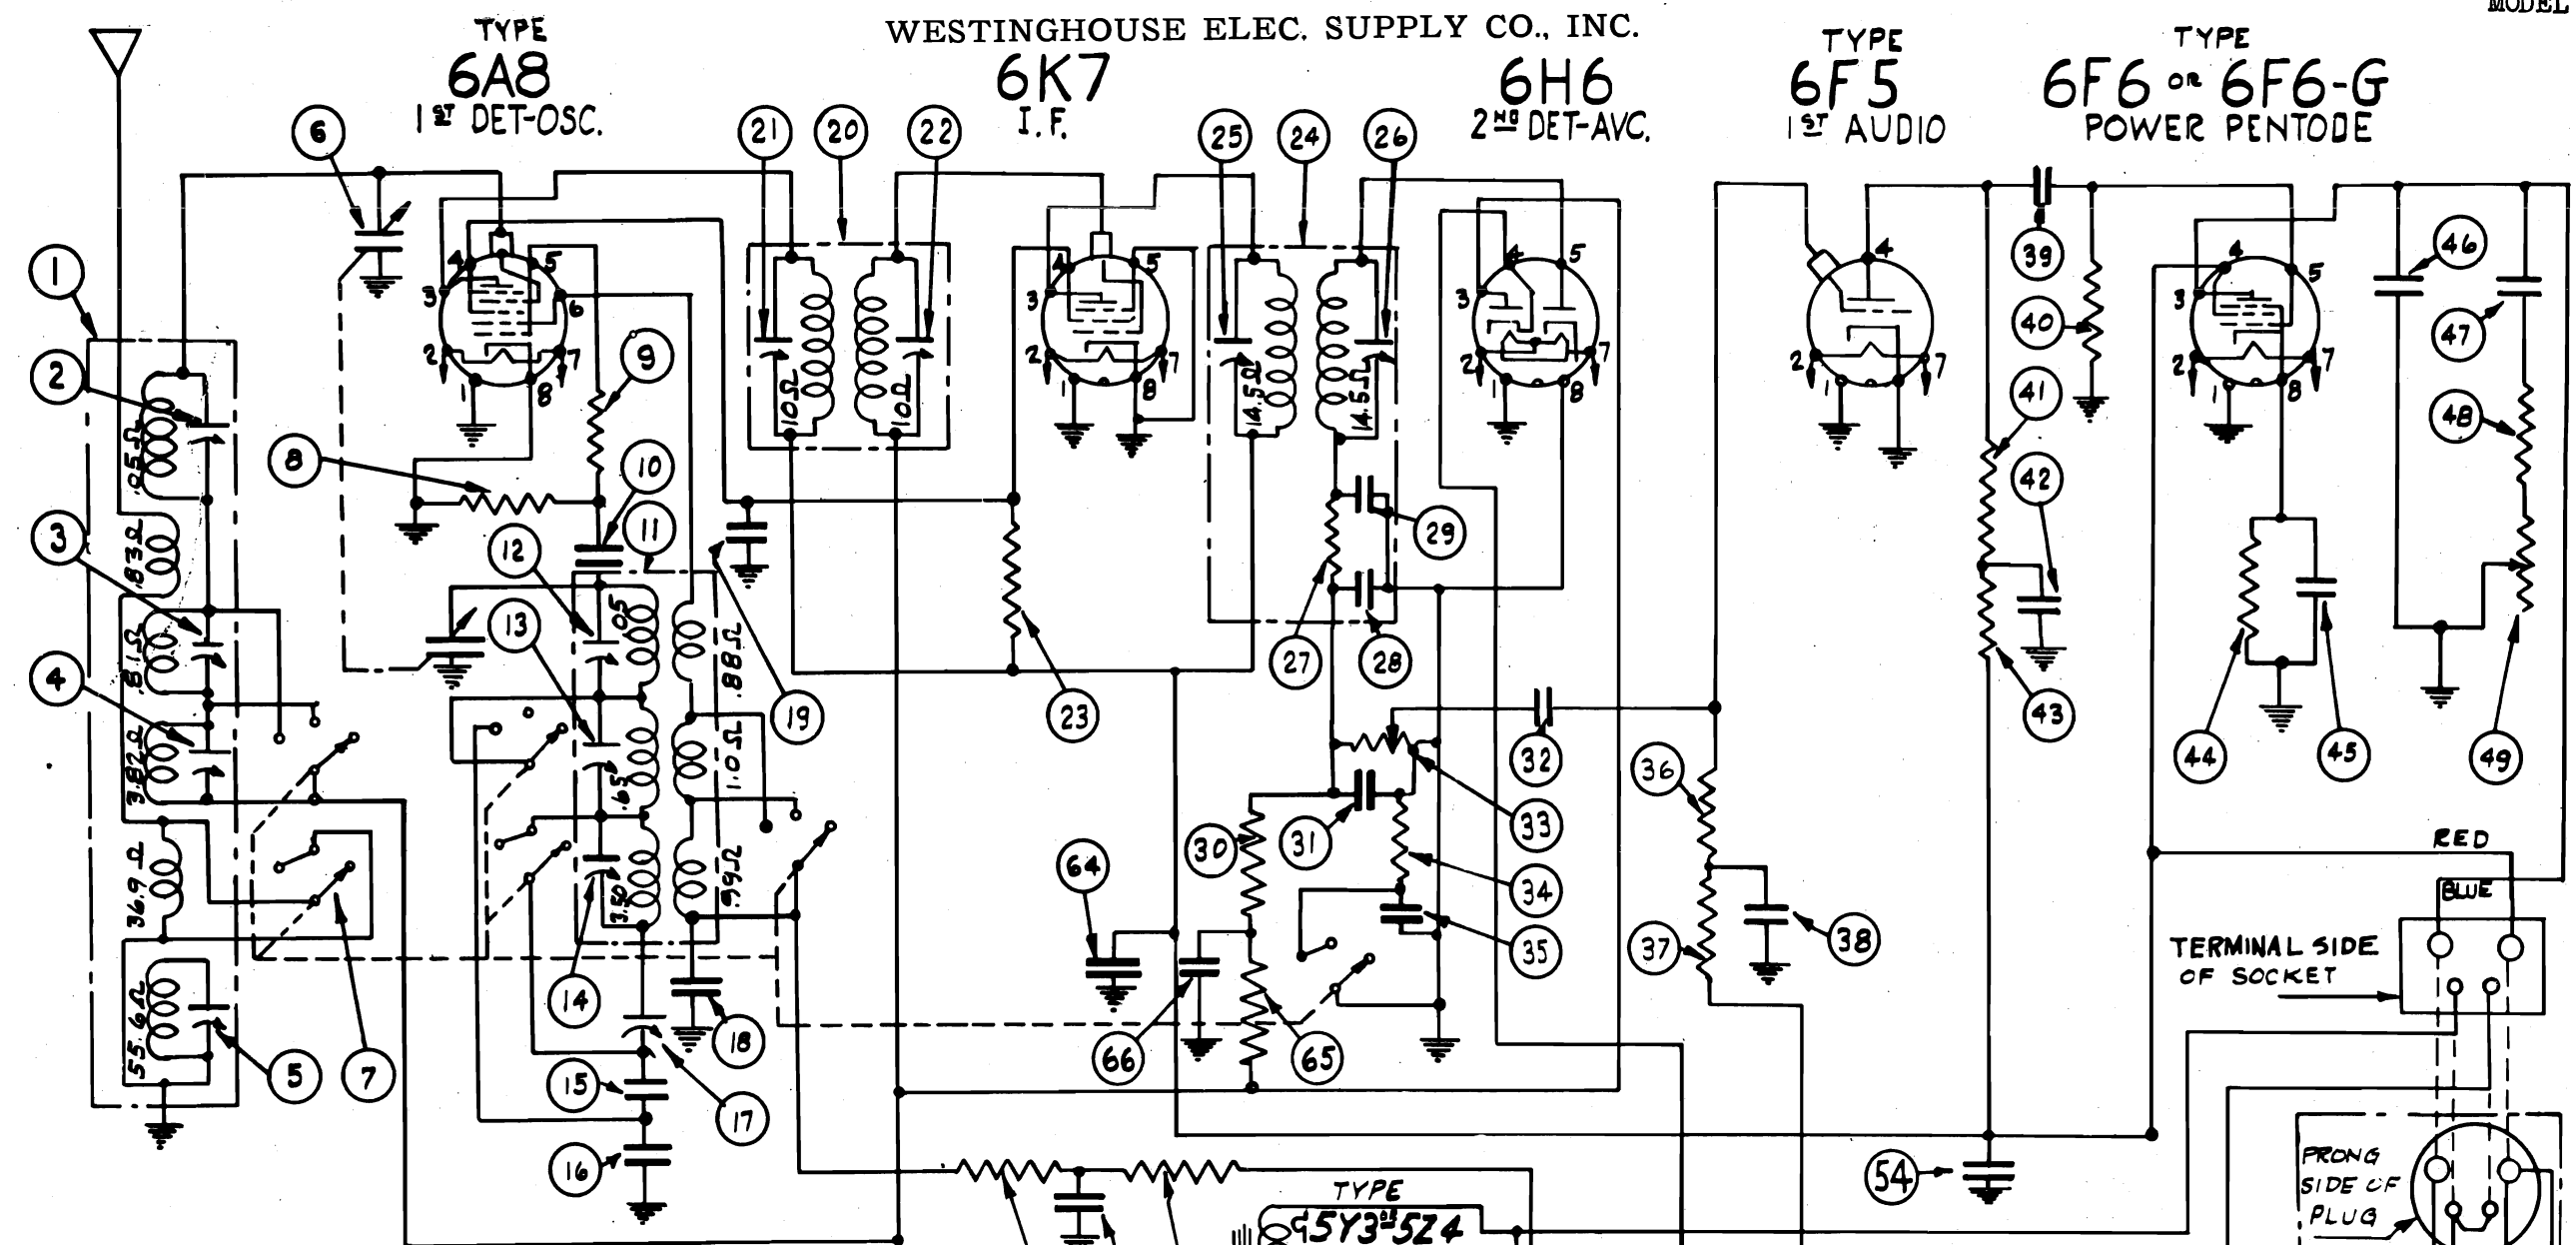

Steps	Test Oscillator	Tune Test Osc. to	Turn Radio Dial to	Adjust the following for max. output
1	To antenna section of tuning condenser stator through 0.1 mfd	455 kc	Quiet point at 1600 kc end of dial	Transformers 19 and 20 Four Trimmers
2	Radiate signal	1610 kc	Full counter-clockwise (gang open)	Oscillator Trimmer On Gang
3	Radiate signal	1400 kc	Tune to signal	Antenna Trimmer On Gang
4	Repeat steps 1, 2, and 3			

DURING BATTERY OPERATION ALL #7 PINS AND #1 PIN ON THE 354 WILL BE 1.5V POSITIVE. ALL OTHER FILAMENT PINS WILL BE GROUND. DURING A.C. OR D.C. IIT VOLT OPERATION THE VOLTAGES WILL BE AS INDICATED ±20%. VOLTAGES MEASURED WITH 1000 OHM PER VOLT METER.

Calibration: To make dial calibrate, close tuning condenser, then install knob so that it points to 54. The tuning shaft is knurled so that the knob will slide on in any position.

MODEL WR-311

WESTINGHOUSE ELEC. SUPPLY CO., INC.

ADJUSTMENT OF BROADCAST BAND (540 to 1580 KC.)

Set wave change switch to standard broadcast band position. Set test oscillator and dial indicator to 1400 KC. Apply the test signal to the antenna of the receiver through a .0002 mfd. condenser and adjust the oscillator trimmer condenser #14 until the signal is received. Adjust the preselector trimmer #4 to maximum output. Set the test oscillator and dial indicator to 800 KC. and adjust the oscillator series condenser #17 until the signal is received. Tune the variable condenser to a slightly lower frequency and repeat the above steps until maximum output. If the sensitivity increases, continue this trial and error procedure in the same direction until no further improvement in sensitivity can be made. If the sensitivity decreases, try this adjustment at slightly higher frequencies.

ADJUSTMENT OF GREEN BAND

Set the wave change switch to the green band position. Set the test oscillator and dial indicator to 1000 KC. and adjust the oscillator trimmer condenser #13 until the signal is received. Adjust the preselector trimmer condenser #3 to maximum output. Check the sensitivity and calibration over scale.

ADJUSTMENT OF RED BAND

Set the wave change switch to the red band position. Set the test oscillator and dial indicator to 1500 KC. and adjust the oscillator trimmer condenser #12 until the signal is received. Two positions may be found at which the signal may be received. The position with the lower capacity screw turned further or with the alignment screw turned further #2 to the alignment screw turned further #2 to maximum output. Check the receiver over scale for calibration and sensitivity.

GENERAL DESCRIPTION

This model is a six-tube, three-band, superheterodyne receiver whose circuits employ a type 6A8 tube as a combined oscillator-tuner, a type 6K7 tube as an intermediate frequency amplifier, a type 6BE6 tube as a second detector and automatic volume control, a type 6F5 tube as a first audio frequency amplifier, a type 6F6 as an output amplifier, and a type 5Y3 tube as a rectifier.

LINE-UP CAPACITOR ADJUSTMENTS

To align the circuits of this receiver it is essential to use a high grade modulated test oscillator, the output of which can be continuously varied, with absence from overlap between the broadcast circuits of the receiver and broadcast circuits of a conventional output meter should be connected across the terminals of the speaker voice coil to indicate when the circuits are aligned. The sensitivity of the output meter must be sufficient to give satisfactory reading with a low input signal.

- 1. Before attempting to align the receiver, the service man should familiarize himself with the general layout of the chassis, the location of the tubes and various adjustment condensers. Top and bottom views are shown in Figures #1 and #2 and should be carefully studied before the actual work is started.
2. Set volume control to maximum position, to traplo, waves change 1. switch on Broadcast and indicator at approximately 800 KC.
3. Connect output meter across voice coil of speaker.
4. Set test oscillator to 465 KC., and apply signal to grid of 6K7 I.F. tube through trimmer #25.
5. Adjust trimmer #25 until maximum output, reducing output of test oscillator as required.
6. Apply test signal to grid of 6A8 first detector-oscillator tube and adjust trimmer #21 and #22 to maximum output.
7. Adjust trap coil trimmer #5 to minimum output.

Type and Number of Tubes: 1 #6A8, 1 #6BE6, 1 #6K7, 1 #6F5, 1 #6F6, 1 #5Y3 - Total 6 Power Supply Characteristics: 105-125 volts, 50-60 cycle A.C. Power Consumption: 3.5 Watts Maximum Output: 3.5 Watts Maximum Undistorted Output: 2.5 Watts Tuning Ranges: (White Band - 540 to 1650 KC. (Green Band - 1500 to 4500 KC. (Red Band - 500 to 16500 KC. I.F. 465 KC., 1400 KC., 800 KC., 4000 KC.)

MODEL WR336

GENERAL DESCRIPTION OF ELECTRIC TUNER

The electric tuning mechanism consists essentially of a group of adjustable levers attached to their respective push buttons. Mounted adjacent to these levers is a rotating disc driven by a reversible electric motor through a belt and gear mechanism. Attached to this disc is the tuning condenser (through a reducing gear), reversing stops and a mechanical stop.

The levers may be turned or adjusted to allow a specific band of frequency as outlined in the instruction book, to be tuned. The gate contacts any depressed button and stops the disc, thus stopping the tuning condenser at the desired station. Associated with the gate are three pairs of contacts arranged to perform the following functions: 1. Remove power from the motor when the button drops into the gate, not close. With some dial contact button and short out a resistor which mutes or silences the set during tuning. On the twelve-tube set, a third pair of contacts on the gate removes a short-circuit from the A.F.C.

For manual tuning, a switch (red button) is provided, which cuts out the repositioning of the set, allowing normal operation of the set. The reversing stops are used to engage a lever attached to the field winding, thus changing the direction of rotation of the motor.

A lever attached to the manual-electric check controls the belt tension through an idler pulley which makes manual tuning easier.

ELECTRIC DRIVE SERVICE SUGGESTIONS

MOTOR DRIVE DOES NOT OPERATE: 1. With receiver turned "on", turn manual dial indicator lamp at right side of scale. 2. Dial button contact comes to brass switch is making contact, and there is slot. Motor speed too slow. Increase voltage to the field of the motor (see diagram).

RECEIVER DOES NOT TUNE (NOT SILENT WHILE MOTOR IS IN OPERATION) WHILE TUNING CAUSING MOTOR NOISE AND OTHER INTERFERENCE: 1. Check bottom contacts on mute switch terminal #2 of the motor. Disconnect one terminal #2 and check from the same field terminal #2 to both armature terminals #1 and #4, at the same time operating the making sure that it is tight and in the motor reversing switch "p" by hand. If correct position, on the rim of the gate no reading is obtained on continuity meter, plate there is a bolt in a slot. This has either the reversing switch or the field been set at the factory to give the proper amount of rotation of the dial, and should be readjusted. Check each individual amount of rotation of the dial, and should be readjusted. If reading is obtained when not be changed unless it has become visually.

MANIPULATING THE REVERSING SWITCH, CHECK 2. CHECK REVERSING SWITCH "P" IN BOTH POSITIONS FOR BAD BRUSH CONTACTS OR OPEN CIRCUIT POSITIONS FOR CONTINUITY.

4. Check between #1 and #2 (top) terminal of mute switch "O". Open circuit indicates bad contacts on switch.

5. Check between #2 terminal of mute switch "O" and ground for open circuit. This will indicate the condition of the gate switch "G", section #1.

MECHANISM DOES NOT TUNE IN STATION: 1. Motor speed set too slow. Increase the speed of the motor slightly by turning the motor speed adjustment on the rear of the chassis in a clockwise direction (when facing the chassis from the rear).

2. Mute section of gate switch "G" does not close. With some dial contact button engaged in the gate in a normal manner, check the pair of contacts, section #1, of the gate plate for continuity. (Normal on the twelve-tube set, a third pair of contacts on the gate removes a short-circuit from the A.F.C.)

3. Bar attached to the red button is off position on long leaf of mute switch "O". Re-set position.

4. Check sections #1 and #2 of gate switch (should read open).

On the ten-tube chassis, both pairs of contacts are associated with the motor circuit, while on the twelve-tube set, one pair of contacts are associated with the motor circuit and the remaining pair cuts out the A.F.C. while the motor is performing the tuning function.

1. Turn receiver "off" and remove right-hand dial indicator lamp, and with the button other than the red button depressed without touching the upper check for 1. Check bottom contacts on mute switch terminal #2 of the motor. Disconnect one terminal #2 and check from the same field terminal #2 to both armature terminals #1 and #4, at the same time operating the making sure that it is tight and in the motor reversing switch "p" by hand. If correct position, on the rim of the gate no reading is obtained on continuity meter, plate there is a bolt in a slot. This has either the reversing switch or the field been set at the factory to give the proper amount of rotation of the dial, and should be readjusted. Check each individual amount of rotation of the dial, and should be readjusted. If reading is obtained when not be changed unless it has become visually.

PUSHING A BUTTON AFFECTS THE ADJACENT BUTTON:

1. The levers connected to the odd-numbered buttons (counting the button at the left of the red button as #1) point to the hub of the assembly, while the levers connected to the even-numbered buttons point to the armature of the assembly. By having loosened the small screw, the lever may become turned in the wrong sequence. This condition is overcome as follows:

a. Turn the dial pointer as far away from the button being re-set as possible.

b. Remove the button cap and loosen the button sleeve about one turn.

c. Insert a small screw driver into the button and push and turn the small screw at the same time, until the position of the lever is corrected.

d. Set the button to the desired station, as described in the operating instructions.

If a button has been loosened too many turns, it may be found that it cannot be re-tightened. Place a long screw driver in back of the lever button assembly and press forward, at the same time turning the button sleeve until the thread catches.

LIST OF PARTS

Table with 3 columns: Part #, Description, Price. Includes items like CU 9527 Control head assembly, PU 9554 Station button cap, PL 9514 Wiper cover, etc.

DEPRESSING RED BUTTON CAUSES MOTOR TO START:

1. Check lever on end of red button (grounding top contact of mute switch "O").

Referring to the diagram, it will be seen that the various switches associated with the motor make a complete circuit to the ground. Thus, if the motor continues to operate, check for grounds in the circuit.

If the electric drive appears to operate too fast, check the position of the idler pulley which may be touching the large pulley. The correct position of this large pulley is approximately 1/4" away from the large pulley when the manual-electric switch is in the electrical position.

WESTINGHOUSE ELEC. SUPPLY CO., INC.

WESTINGHOUSE ELEC. SUPPLY CO., INC.

2. Set the test oscillator and dial pointer to 1500 KC.
 3. Adjust the oscillator trimmer #14.
 4. Connect the test oscillator to the antenna terminal of the receiver through a .0002 mfd. condenser.
 5. Adjust the R.F. and antenna trimmers #13 and #4 for maximum output.
 6. Set the test oscillator and dial pointer to 600 KC.
 7. Adjust the oscillator series (lag) condenser #15 at the same time turning the gang condenser slightly back and forth until a maximum is reached.
 8. Return the test oscillator and dial pointer to the 1500 KC. setting and re-check trimmers #14, #13 and #4.
 9. Check sensitivity and calibration over the scale.
- NOTE: In adjusting the two remaining bands, a .0002 mfd. condenser and a 400 ohm resistor connected in series should be inserted between the test oscillator and the antenna terminal of the receiver. This combination is the approximate equivalent of a short wave antenna.
- ADJUSTMENT OF THE GREEN BAND
1. Turn the wave change switch to the Green band position.
 2. Set the test oscillator and dial pointer at 5000 KC.
 3. Adjust the oscillator trimmer #22.
 4. Check sensitivity and calibration over the scale.
- ADJUSTMENT OF THE RED BAND
1. Turn the wave change switch to the red band position.
 2. Set the test oscillator and dial pointer at 16,000 KC.
 3. Adjust the oscillator trimmer #18. Two positions may be found at which the signal can be heard. Use the one with the least capacity or with the trimmer farther out.
 4. Adjust the R.F. and antenna trimmers #17 and #2 for maximum output.
 5. Check calibration and sensitivity over the scale.

1. With test signal still applied to the I.F. tube increase the signal output of the oscillator.
 2. Adjust the bottom screw on the discriminator coil #75 for maximum deflection of the micro-ammeter (either direction).
 3. Adjust the top screw on the discriminator coil until a zero reading on the micro-ammeter is reached. To check this alignment, vary the I.F. signal slightly to each side of the 465 setting and the micro-ammeter should show a deflection first on one side then the other of the zero point.
- ADJUSTMENT OF 1ST I.F. COIL 465 KC.
1. Apply the test signal to the grid of the 6A8 detector-oscillator tube through a .5 mfd. blocking condenser.
 2. Adjust first the bottom, second the middle and third the top alignment screws on I.F. coil #54 for maximum output.
- ADJUSTMENT OF THE BROADCAST BAND
1. With the gang condenser completely in mesh, check the position of the dial pointer which should be at the end horizontal line of the scale.

WR-336

GENERAL DESCRIPTION

This model is a twelve tube, three band superheterodyne receiver. Among the many desirable features are, controlled bass and treble compensation, high fidelity and automatic frequency control of the broadcast band.

The tubes, in the order mentioned under the heading "type and number of tubes" function as follows: RF amplifier, 1st detector-oscillator, I.F. amplifier, 2nd detector A.V.C. 1st audio, phase inverter, output, rectifier, limiter, discriminator, rectifier, A.F.C. control and tuning indication.

The R.F. amplifier and detector oscillator with the associated parts including the gang condenser, coils, trimmer and lag condensers and wave change switch, is mounted on the chassis as a unit.

LINE-UP CAPACITOR ADJUSTMENT

To properly align the circuits of the receiver, it is essential to use a high grade modulated test oscillator, the output of which can be continuously varied when the individual circuits are brought into alignment. A conventional output meter should be connected across the speaker voice coil terminals to indicate proper alignment. The sensitivity of the output meter must be sufficient to give a satisfactory reading with a low input signal.

A zero center micro-ammeter with an approximate 0-50 scale is absolutely essential for the proper alignment of the discriminator circuit.

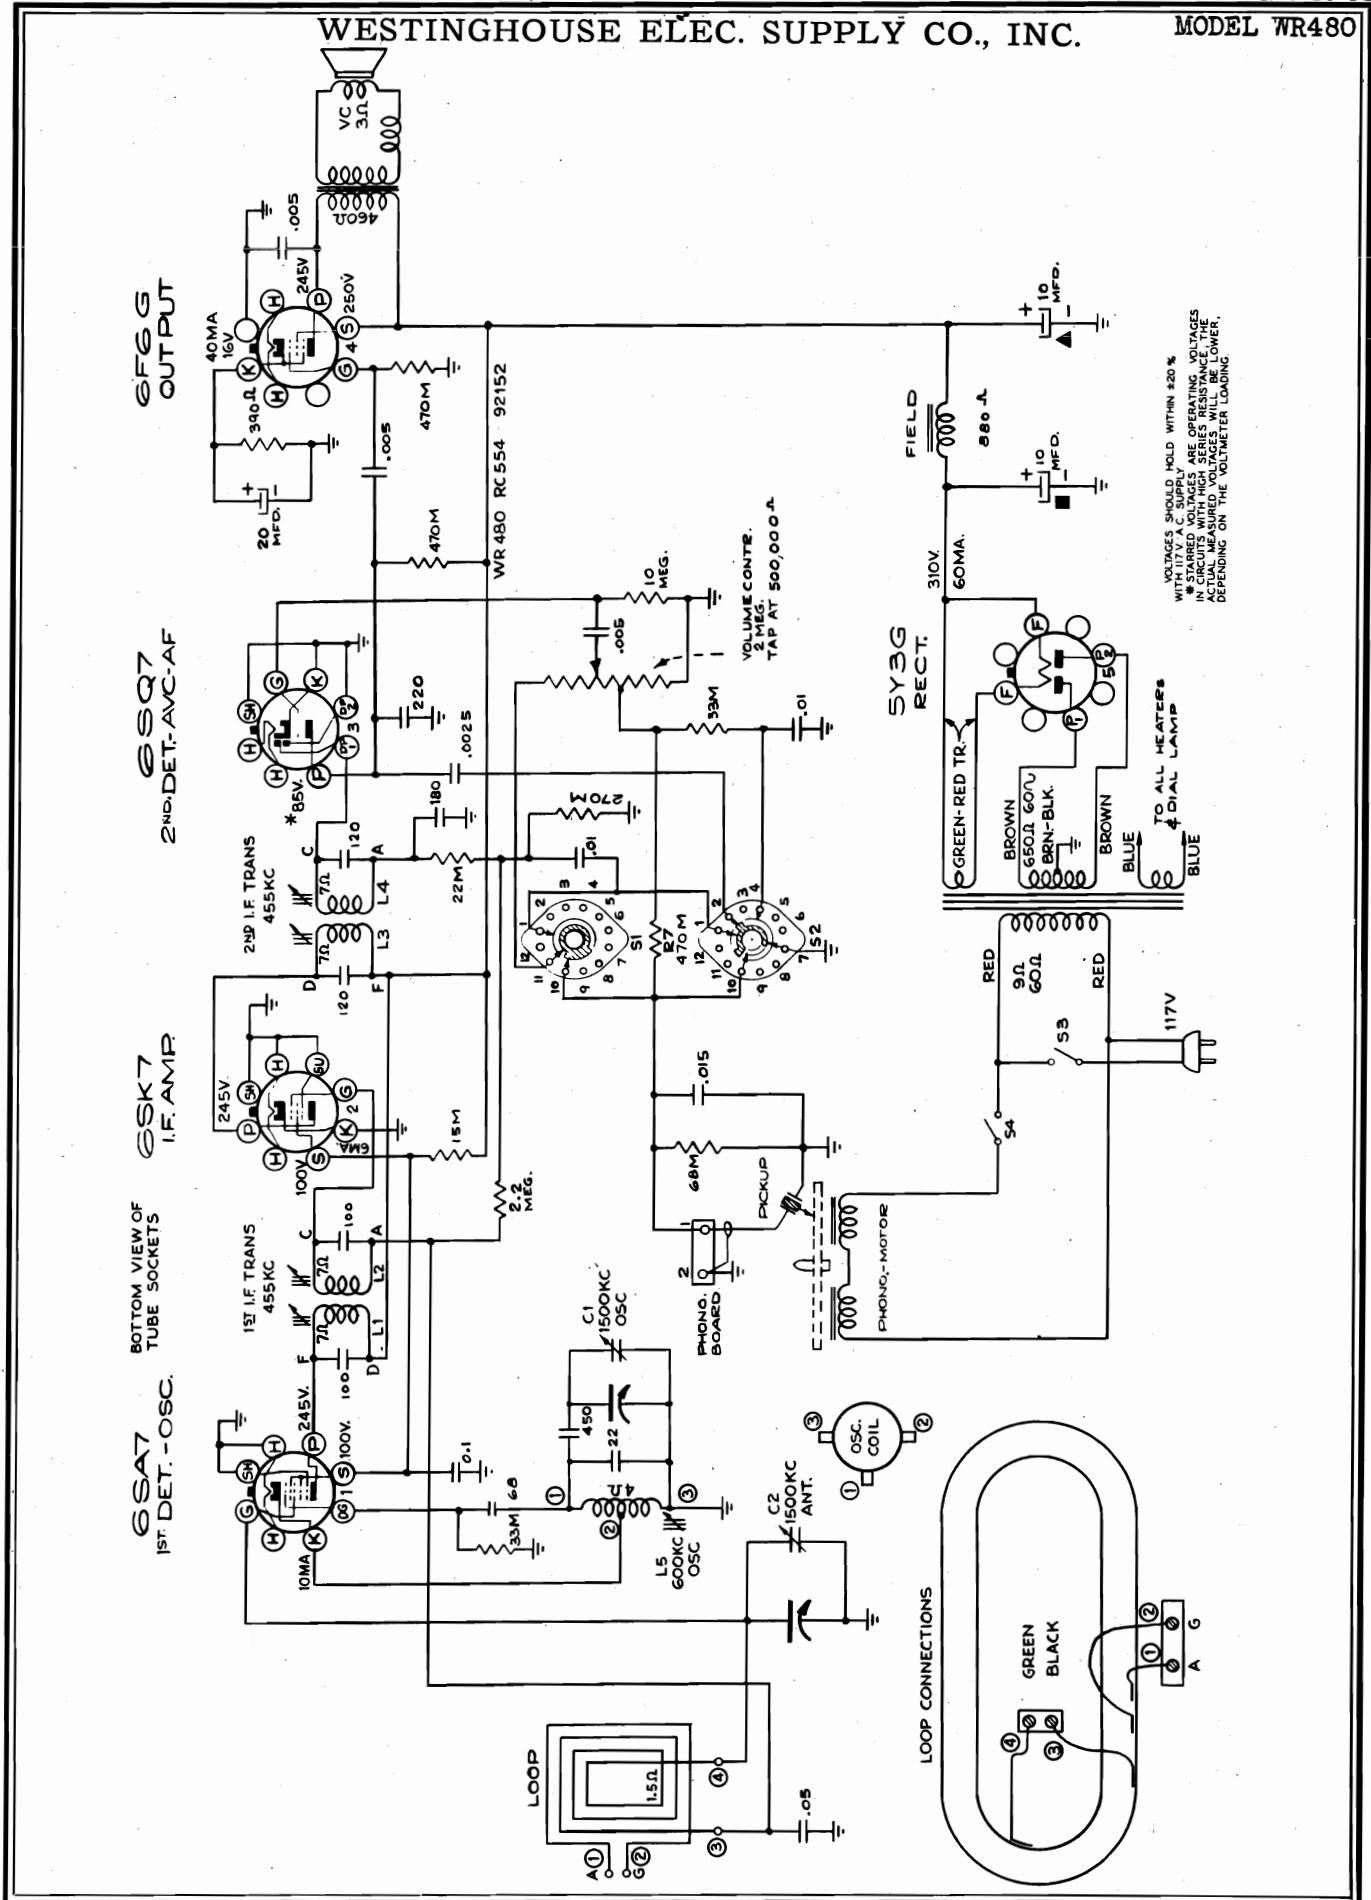

Before attempting to align the receiver, the circuit, position of alignment adjustments and chassis layout should be familiarized. The top and bottom views of the chassis are shown in figures #1 and #2.

ADJUSTMENT OF THE I.F. DIODE COIL 465 KC.

1. Refer to bottom view of chassis and connect a 20,000 ohm resistor between points "C" and "D" under 2nd I.F. coil #4.
2. Turn the receiver "ON" and to the position immediately after set is turned on. Set volume control on full. Set A.F.C.

Alignment Procedure

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max peak output—
1	I-F grid, in series with .01 mfd.	455 kc	Quiet Point at H-F end of dial	L3 and L4 (2nd I.F. Trans.)
2	1st det. grid, in series with .01 mfd.			L1 and L2 (1st I.F. Trans.)
3	Antenna term. of ant. loop in series with 100 mmfd.	1,500 kc	1,500 kc	C1 (oscillator) C2 (antenna)
4		600 kc	600 kc	L5 (oscillator)
5	Repeat steps 3 and 4.			

Output Meter Alignment.—Connect the meter across the voice coil, and turn the receiver volume control to maximum.
Test-Oscillator.—Connect the low side of the test-oscillator to the receiver ground, and keep the output as low as possible.

Precautionary Lead Dress

1. Dress 1st I-F plate and grid leads against chassis and away from each other. Dress plate lead from 6SK7 close to chassis.
2. Dress leads from terminal board on loop support away from loop.

Electrical and Mechanical Specifications

Frequency Range..... 540-1,720 kc
Intermediate Frequency..... 455 kc
Tube Complement
 (1) RCA-6SA7..... First Detector-Oscillator
 (2) RCA-6SK7..... I-F Amplifier
 (3) RCA-6SQ7..... Second Detector A-F Amplifier and A.V.C.
 (4) RCA-6F6G..... Power Output
 (5) RCA-5Y3G..... Rectifier.
Power Output
 Undistorted..... 2.0 watts
 Maximum..... 4.0 watts
Power Supply Rating
 105-125 volts, 50-60 cycles..... 55 watts
Loudspeaker (RL 79 B3)
 Type..... 6-inch Electrodynamic
 Voice Coil Impedance..... 3.4 ohms at 400 cycles

Calibration Scale.—The glass tuning dial may be easily removed from the cabinet and temporarily attached to the chassis for quick reference during alignment. Or, if necessary, the calibration scale printed in this service note can be used in conjunction with an ordinary 6-inch ruler as an accurate and convenient substitute for the regular dial.

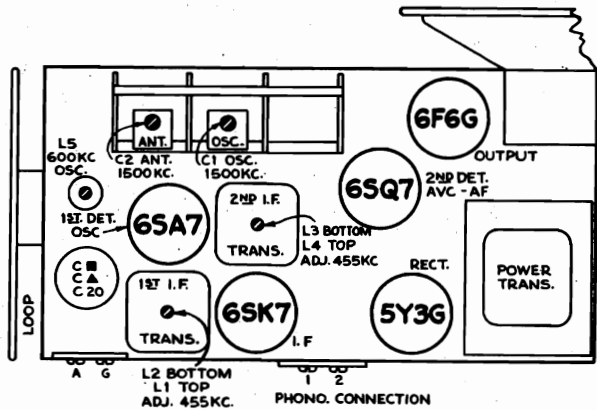

Receiver Dial Scale and Corresponding Calibration Scale

Using Calibration Scale.—

1. With gang in full mesh, move the dial pointer to the reference mark at the left-hand end of the dial backing plate.
2. Place a flat 6-inch ruler on the dial backing plate so the left-end of ruler is at the reference mark at left-end of backing plate. Temporarily fasten the ruler with scotch tape to the backing plate.
3. Refer to calibration scale printed in this service note. This is a reduced reproduction of the dial with an inch-scale drawn at the bottom. To find the correct pointer position in inches for any desired frequency, draw a vertical line through this frequency on the calibration scale. For example 1,500 kc is approximately 3 1/4 inches from the reference mark.

Dial-Pointer Adjustment.—After the chassis is replaced in cabinet, move the dial pointer (if necessary) so that it is at the left-hand graduation on the dial with the gang in full mesh.

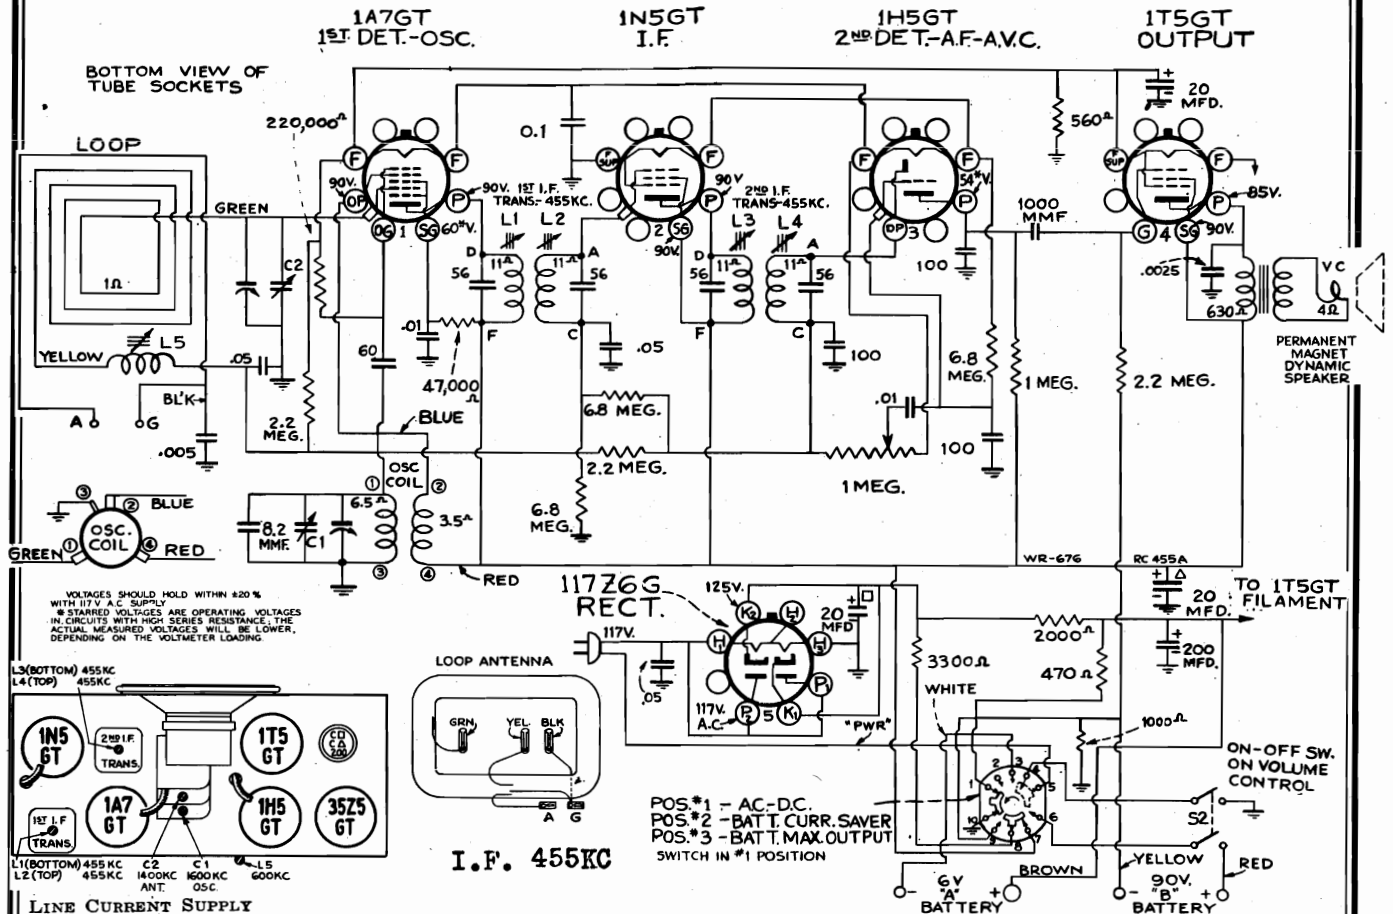

• Tube and Trimmer Locations

Alignment Procedure

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, keep the output as low as possible to avoid a-v-c action.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output—
1	1A7GT 1st-Det. grid cap, in series with .01 mfd.	455 kc	Quiet point at 1,600 kc end of dial	L1, L2, L3, L4 (1st and 2nd I-F transformers)
2		1,600 kc	1,600 kc	C1 osc.
3	radiated signal near 600 kc		signal frequency	L5
4	radiated signal near 1,400 kc		signal frequency	C2
5	radiated signal near 600 kc		signal frequency	L5

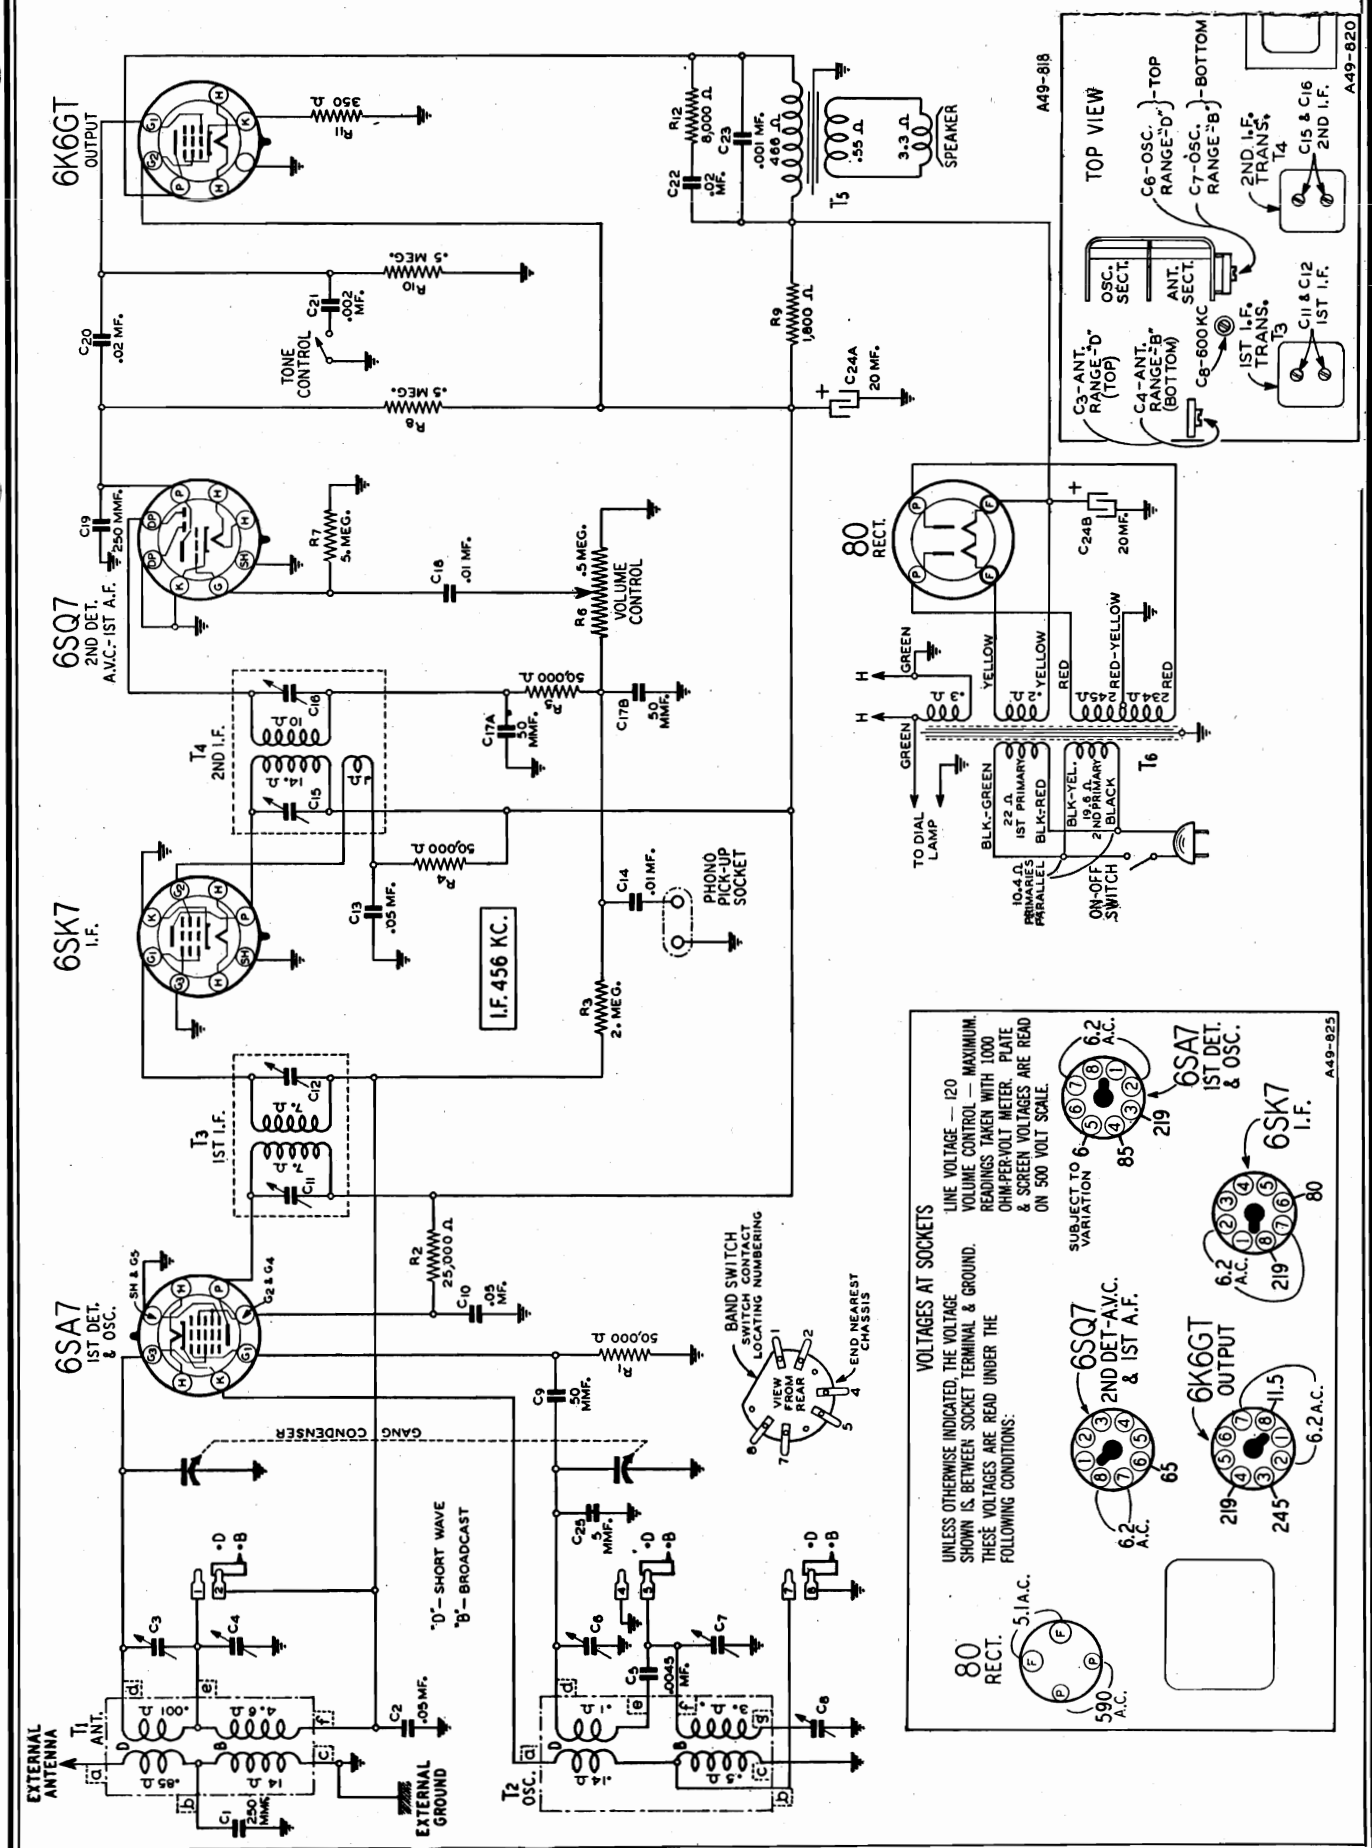

For steps 3, 4, and 5 the chassis must be in the cabinet and the batteries in place and connected. L-5 is then reached through the small hole in the cabinet which is normally covered with a small plug located farthest away from C-2 and C-2 is reached through an eyelet in the speaker grille. If a broadcast signal is used it should be weak to avoid a-v-c action. Turning loop in minimum pickup position will sometimes be helpful. If no broadcast signal is available connect test oscillator output to a suitable radiation loop located several feet away from receiver.

WESTINGHOUSE ELEC. INTERNATIONAL CO.

MODEL M101

MODEL M101

WESTINGHOUSE ELEC. INTERNATIONAL CO.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:

An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Small Screwdriver.

Dummy Antennas—.1 mf., 200 mmf., and 400 ohm carbon resistor.

SIGNAL GENERATOR	RANGE SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
FREQUENCY CONNECTION DUMMY ANTENNA			

It is not necessary to remove chassis from cabinet if a short screwdriver is used for the I.F. adjustments.

CAUTION—Align S.W. (Range D) before aligning Broadcast (Range B).

I.F.						
456 KC	Antenna Lead	.1 mf.	Broadcast (to left)	Turn Rotor to Full Open	1st I.F. (C11) & (C12) 2nd I.F. (C15) & (C16)	
S.W. (RANGE D)						
18,000 KC	Antenna Lead	400 Ohm	Shortwave (to right)	Turn Rotor to Full Open	Oscillator Shortwave (C6)	
17,000 KC	Antenna Lead	400 Ohm	Shortwave (to right)	Turn Rotor to Max. Output	Ant. Shortwave (C3) Rock Rotor—See Note B	
BROADCAST (RANGE B)						
1600 KC	Antenna Lead	200 mmf.	Broadcast (to left)	Turn Rotor to Full Open	Oscillator Broadcast (C7)	
1400 KC	Antenna Lead	200 mmf.	Broadcast (to left)	Turn Rotor to Max. Output Set Pointer to 1400 KC— See Note A	Ant. Broadcast (C4)	
600 KC	Antenna Lead	200 mmf.	Broadcast (to left)	Turn Rotor to Max. Output	600 KC (C8) Rock Rotor—See Note B	

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1400 KC on the dial when maximum output is obtained, move the pointer to the 1400 KC mark on the dial scale.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

CAUTION—When aligning the short wave bands, be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

Tuning Frequency Range
Broadcast Range—540 to 1600KC; Short Wave Range—4700 to 18000KC
Sensitivity—(for 0.5 W. output) Broadcast Range—20 Microvolts Average; Short Wave Range—60 Microvolts Average; Power Consumption—45 W. (at 120 v. 60 cycles) Power Output—1.5 W. Undistorted; 3.0 W. Max.
Selectivity—37 KC Broad at 1000 times Sig.
Intermediate Frequency—456 KC; Speaker Voice Coil Impedance at 400 cycles..3 1/2 Ohms.

DRIVE CORD REPLACEMENT

To replace drive cord, first remove dial scale mounting plate from chassis as follows: Pull dial scale pointer off its shaft. Remove dial lamp socket assembly from mounting plate. Take out the 2 screws in the bottom mounting brackets and the screw in the top brace bracket.

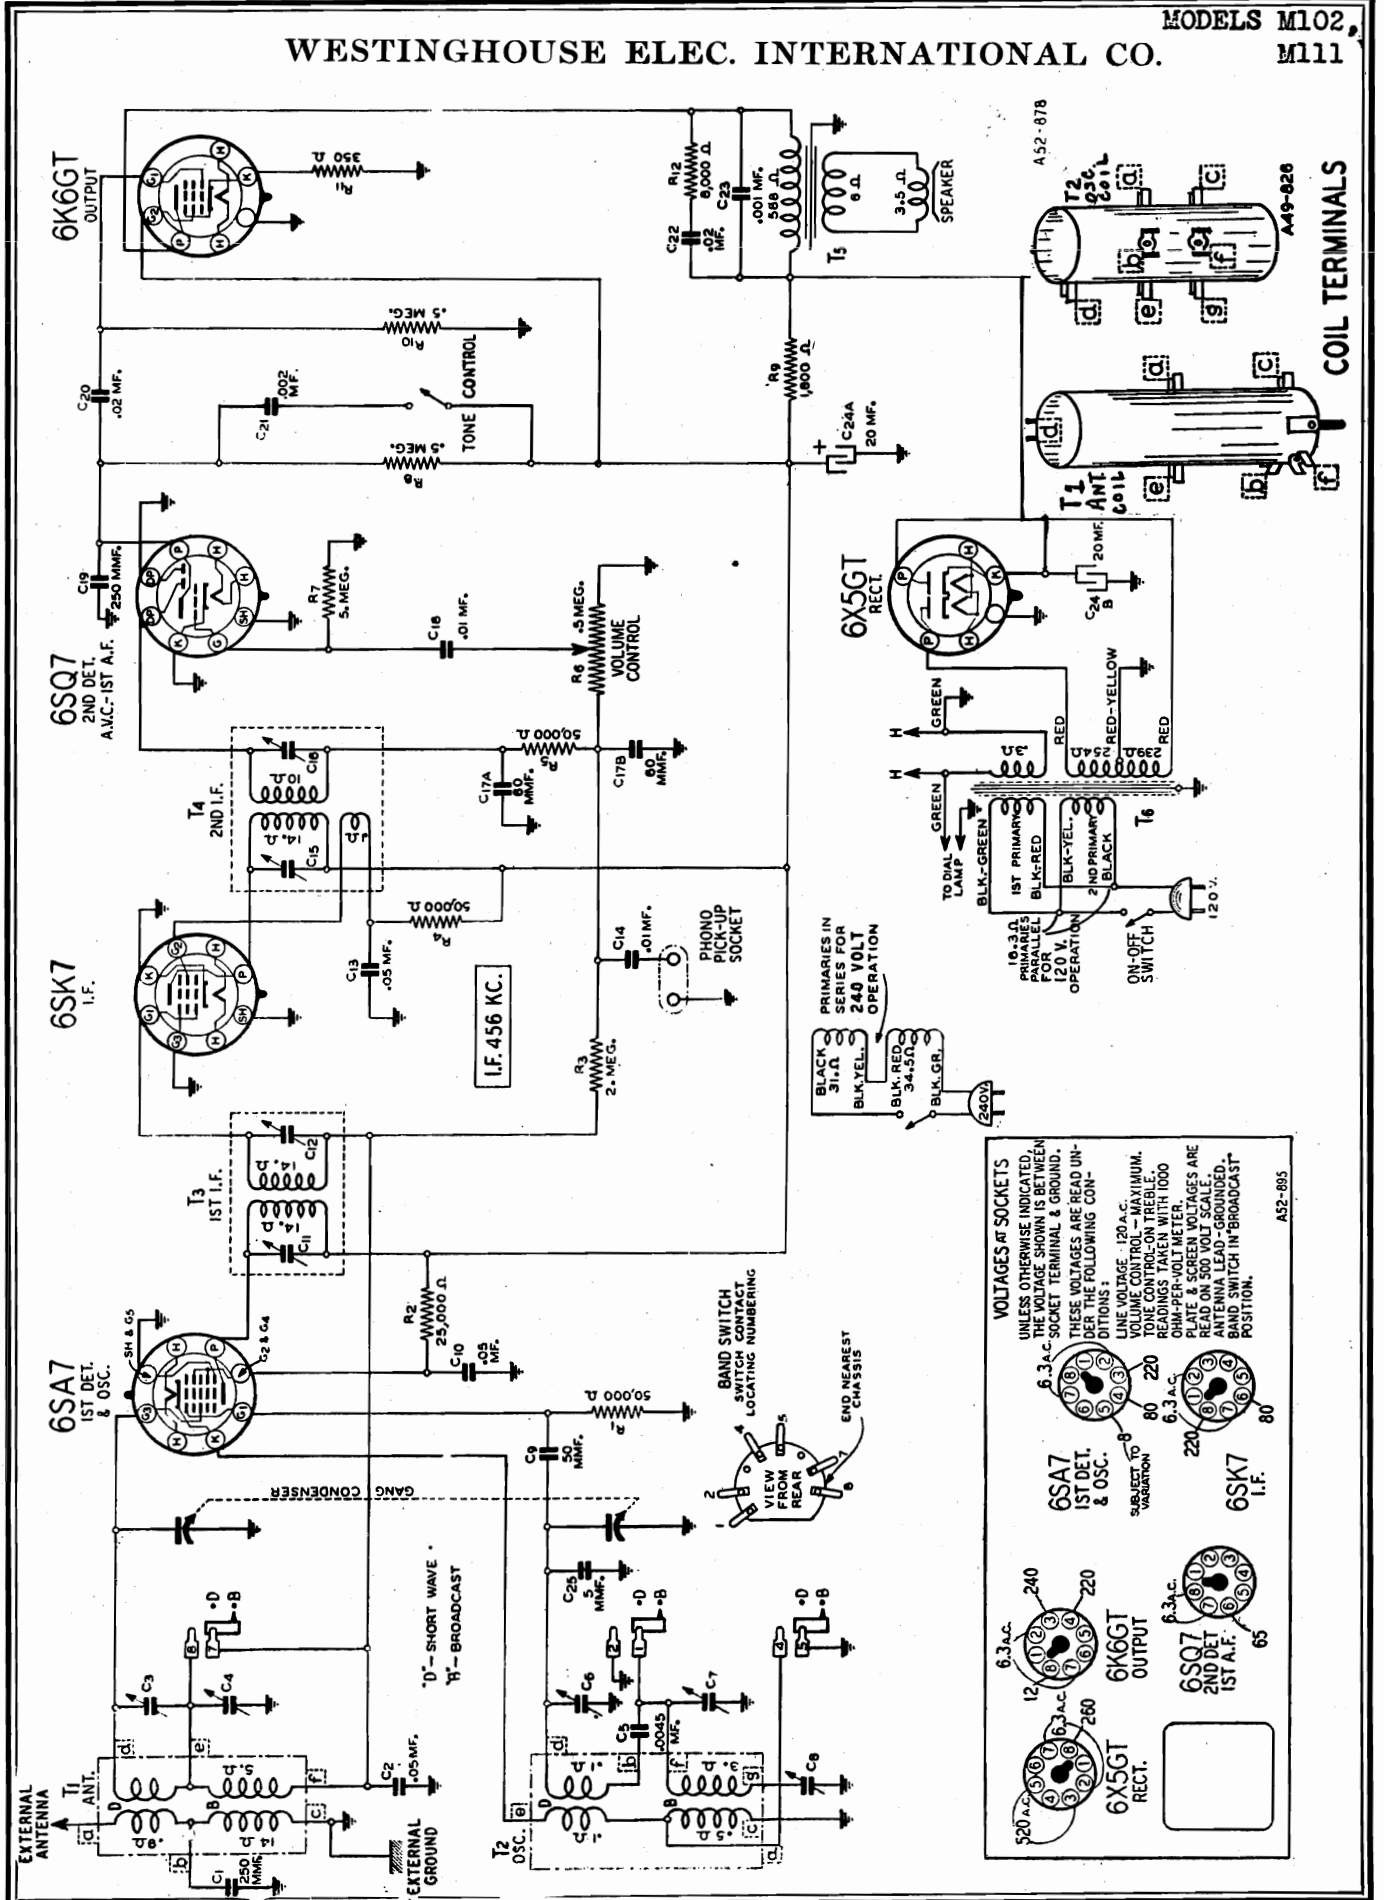

Tie both ends of new drive cord to same end of tension spring, so that doubled

drive cord measures 10 3/4" from knots to looped end of cord. Secure spring to hook on pulley—see illustration. Turn gang condenser to full open position. Thread doubled cord through hole in pulley groove. Wind one section of cord approximately 2 1/2 turns counter-clockwise (from front of chassis) around tuning control shaft. Turns should progress away from chassis. Stretch tension spring and wind remaining section of cord around drive pulley.

 Shortwave Range.....60 Microvolts Average

120 OR 240 VOLT POWER TRANSFORMER CONNECTIONS

All radios except those for use on 25 cycles are equipped with a dual voltage power transformer which may be connected for 120 volts or 240 volts operation on 50-60 cycles. See diagram on page 3.

DRIVE CORD REPLACEMENT

Turn gang condenser to completely closed position. Using a new drive cord 45" in length, tie one end to tension spring. Pass other end through hole in rim of drive pulley. Pull spring flush against inside of pulley rim. Wind cord around drive pulley and pass over idler pulleys "A," "B," and "C"—See illustration.

Continue cord around drive pulley to tuning control shaft. Cord should be on right side of pulley groove (from gang condenser end of chassis). Wind drive cord 2 turns around section of tuning control shaft directly below drive pulley—See illustration.

Continue cord around drive pulley. Pass cord through hole in pulley rim. Tie cord to tension spring. Stretch tension spring and secure free end to hook on pulley.

Turn tuning knob counterclockwise until extreme high frequency position is reached (gang condenser to full open) Slip pointer on the dial cord and move to the high frequency end of scale. Carefully align pointer with the 18 MC dial mark and clamp securely into position.

ALIGNMENT PROCEDURE

Before aligning make certain that the dial pointer is adjusted properly as instructed under "Drive Cord Replacement."
 Volume Control—Maximum All Adjustments.
 Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
 Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
 An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
 Output Indicating Meter—Small Screwdriver.
 Dummy Antennas—.1 mf., 200 mmf., and 400 ohm carbon resistor.

SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	RANGE SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
------------------------------------	---------------------	---------------	----------------------	-------------------	----------------------------

It is not necessary to remove chassis from cabinet if a short screwdriver is used for the I.F. adjustments.

CAUTION—Align S.W. (Range D) before aligning Broadcast (Range B).

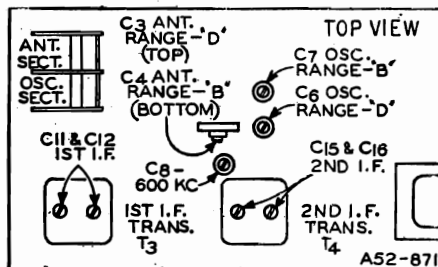

I.F.					
.456 KC	Antenna Lead	.1 mf.	Broadcast (to left)	Turn Rotor to Full Open	1st I.F. (C11) & (C12) 2nd I.F. (C15) & (C16)
S.W. (RANGE D)					
18,000 KC	Antenna Lead	400 Ohm	Shortwave (to right)	Turn Rotor to Full Open	Oscillator Shortwave (C6) Ant. Shortwave (C3)
17,000 KC	Antenna Lead	400 Ohm	Shortwave (to right)	Turn Rotor to Max. Output	Rock Rotor—See Note B
BROADCAST (RANGE B)					
1600 KC	Antenna Lead	200 mmf.	Broadcast (to left)	Turn Rotor to Full Open	Oscillator Broadcast (C7)
1400 KC	Antenna Lead	200 mmf.	Broadcast (to left)	Turn Rotor to Max. Output Set Pointer to 1400 KC—	Ant. Broadcast (C4)
600 KC	Antenna Lead	200 mmf.	Broadcast (to left)	Turn Rotor to Max. Output	600 KC (C8) Rock Rotor—See Note B

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

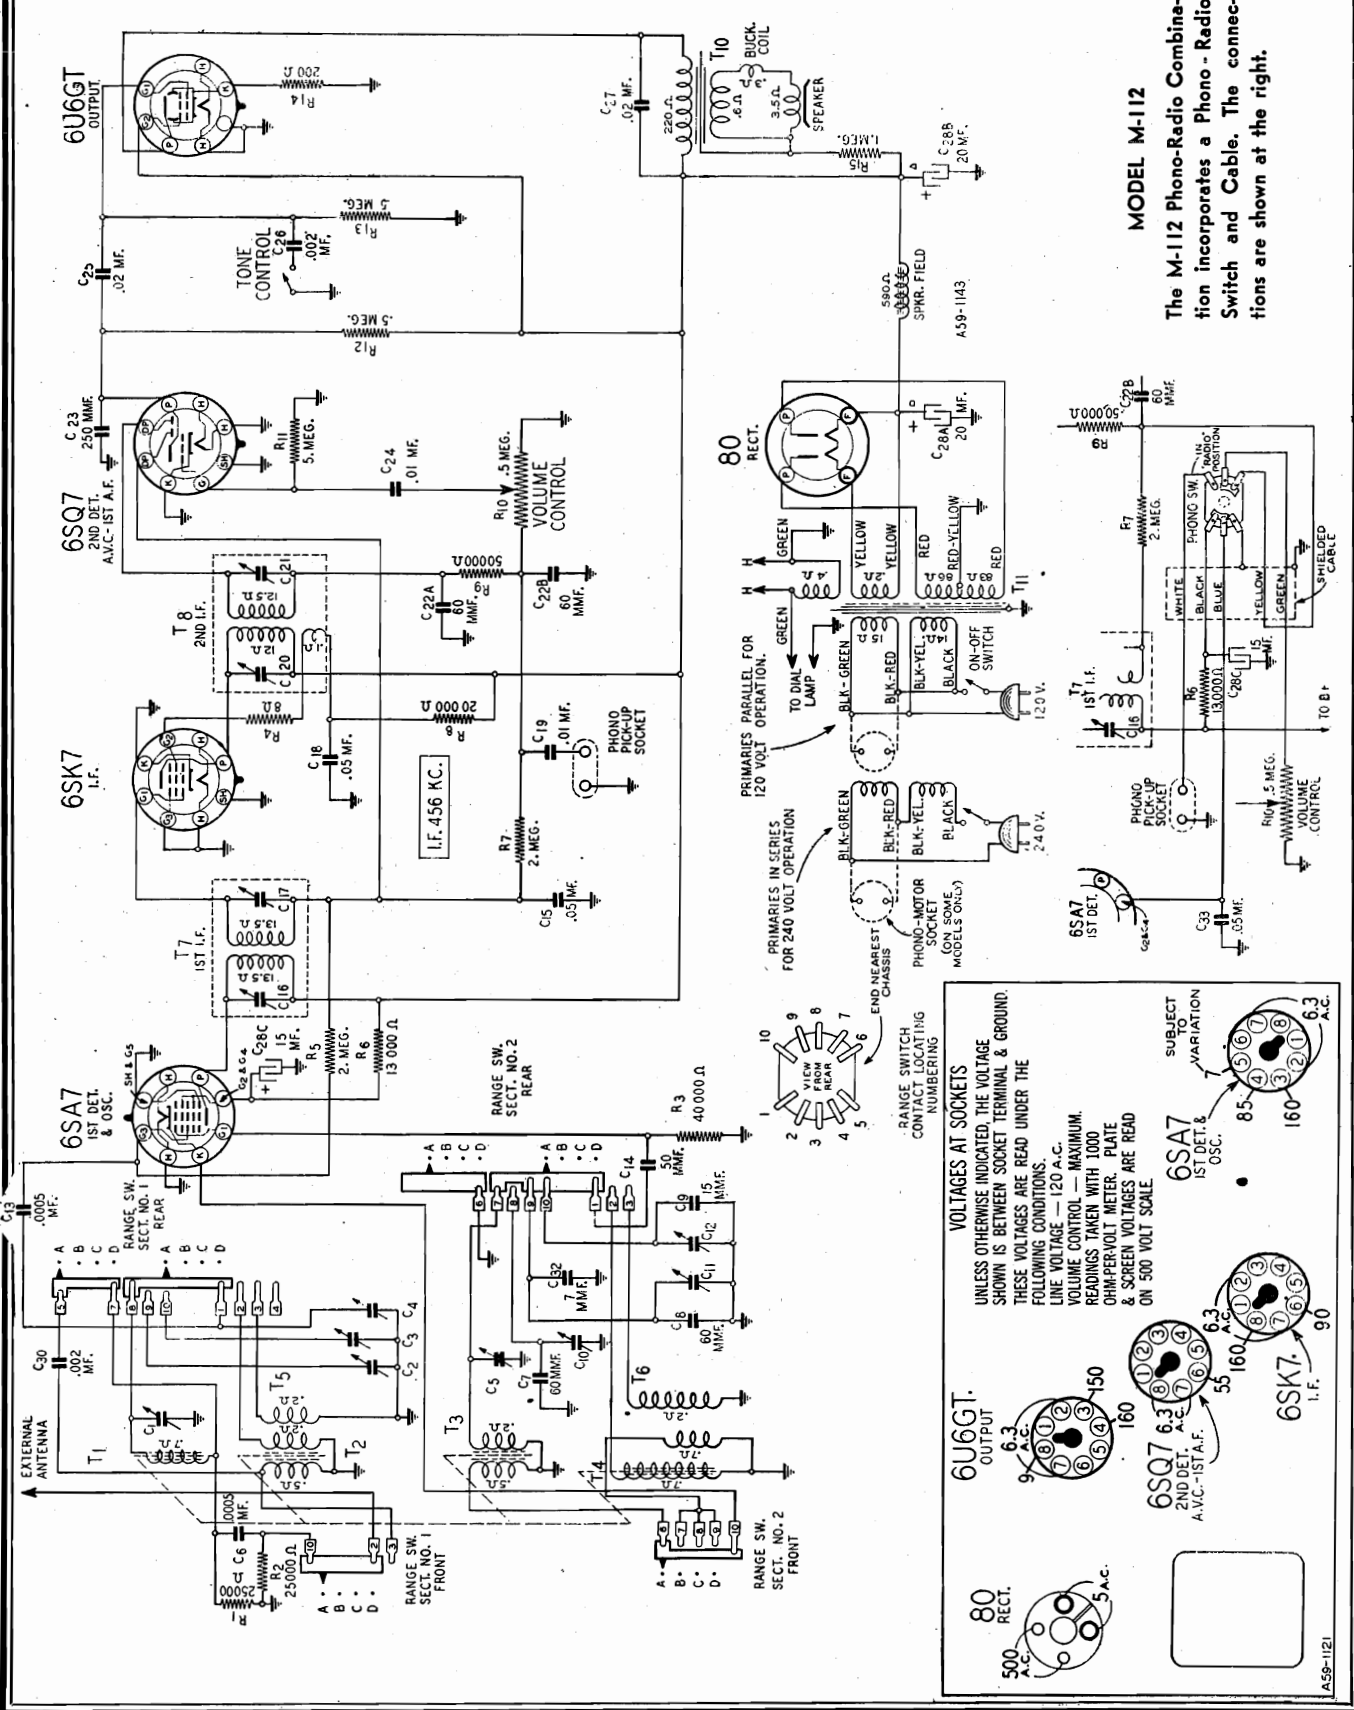

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

CAUTION—When aligning the short wave bands, be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal should be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

	Reset to 11.5 MC	Antenna Lead	400 Ohm	C Range	Turn Tuner to Max. Output Antenna Range C (C3) Rock Tuner—See Note A
RANGE B	7.4 MC	Antenna Lead	400 Ohm	B Range	Extreme High Frequency Position Oscillator Range B (C10)
	Reset to 7.0 MC	Antenna Lead	400 Ohm	B Range	Turn Tuner to Max. Output Antenna Range B (C2) Rock Tuner—See Note A
RANGE A	1610 KC	Antenna Lead	200 mmf.	A Range	Extreme High Frequency Position Oscillator Range A (C5) Antenna Range A (C1)

WAVE RANGES BROADCAST RANGE

A Range 535 to 1610 Kilocycles

This range is calibrated in kilocycles and meters. Standard Broadcast stations are tuned in on this range.

SHORT WAVE RANGES

B Range 3.2 to 7.4 Megacycles

C Range 8.3 to 12.05 Megacycles

D Range 15.1 to 21.8 Megacycles

The Short Wave ranges are calibrated in megacycles and meters. Short Wave broadcasts will be heard best on the D range during the day and on the B and C ranges at night.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

CAUTION—When aligning the short wave ranges, be sure NOT to adjust at the image frequency. This can be checked as follows: let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It will be necessary to increase the input signal to hear the image. The image frequency must always be 912 KC LESS than the frequency at which the set is aligned. This is true of all the short wave ranges.

It is very important that the bandspread ranges (B, C and D) be aligned at the precise frequencies given. If the accuracy of the signal generator is not known, it is always best to first calibrate the signal generator by using a receiver that is in good condition. First tune in a station of known frequency close to 12.05 MC. Then tune the signal generator until it "beats" with the station, carefully marking the setting of the generator. Proceed in the same manner for all the other alignment frequencies.

NOTE A—Turn tuner back and forth and adjust trimmer until peak of greatest intensity is reached.

DRIVE CORD REPLACEMENT

Turn drive shaft until cores are entirely within coil form. Pass cord through hole in tuning shaft and bring two ends together evenly. **CAUTION**—Cord must remain centered on shaft. Wind one part of cord two turns on tuning shaft in a counterclockwise direction (from front of chassis). These turns should progress away from chassis. Hold both parts of cord and withdraw cores from within coils slowly by turning the tuning shaft. One part of cord should progress towards chassis and the other away from the chassis. Unwind the inside cord from shaft. Then wind this cord two turns in a clockwise direction (from front of chassis). These turns should progress towards rear of chassis.

Pass this cord over idler pulley A—see illustration. Pass outer cord on tuning shaft over idler pulleys B, C, D and E, attaching it to tension spring. Secure other end of cord to opposite end of tension spring. This spring should be slightly stretched for tension.

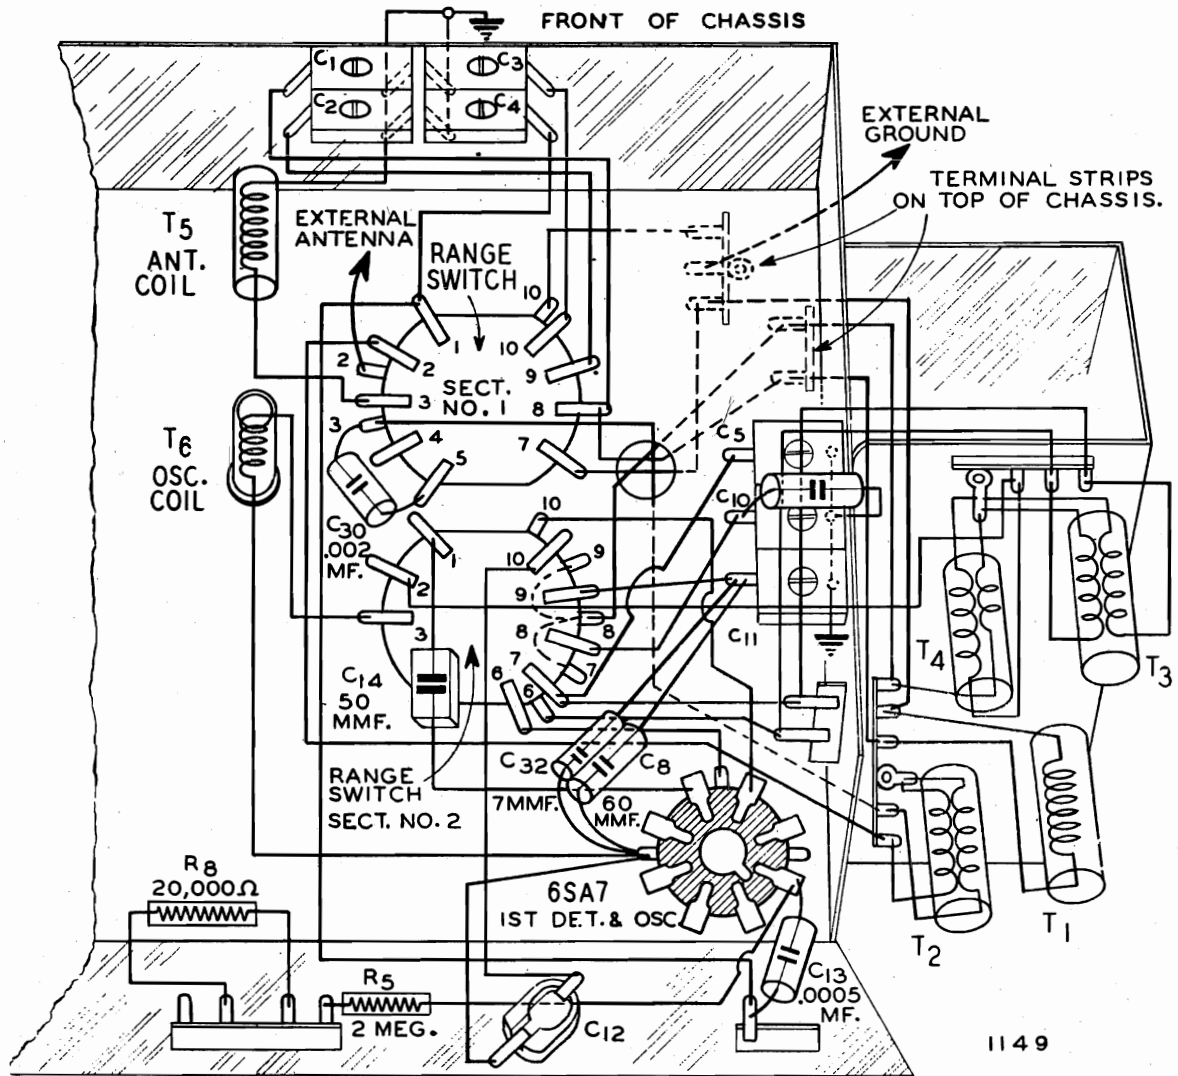

ATTACHING DIAL POINTER

Turn tuning knob clockwise until extreme high frequency position is reached. (Cores completely out of coils.) Slip the pointer on the dial cord and move to high frequency end of dial scale. Carefully align pointer with end of printed scales and clamp securely into position.

ELECTRICAL SPECIFICATIONS

Type and Number of Tubes 1 #6A7, 1 #6D6, 1 #75 1 #43, 1 #25Z5, 1 #K49C - Total 6
 Power Supply 105 to 125 volt, D.C., or 105 to 125 volt, 50 to 60 cycle A.C.
 Power Consumption 500 to 520 Watts
 Tuning Ranges 540 to 1550 and 1500 to 520 KC.
 Maximum Output 1.75 Watt
 Maximum Undistorted Output 1.5 Watt
 Line-Up Frequencies I.F. 465 KC., 1400 KC.

LINE-UP CAPACITOR ADJUSTMENTS

ADJUSTMENT OF I.F. (465 KC.)

1. Set volume control on full, the wave-change switch on the Broadcast (treble position) and the dial indicator at approximately 800 KC.
2. Connect output meter across voice coil of speaker.
3. Set test oscillator to 465 KC., and adjust its output to produce a measurable reading on output meter when test signal is applied to the grid of the 6D6 I.F. tube through a .5 mfd. blocking condenser.
4. Adjust #24 (see Fig. #2) to maximum output, reducing output of test oscillator as required.
5. Apply test signal to grid of 6A7 first detector-oscillator tube and adjust #15 and #15 (Fig. #1) to maximum output.
6. With test signal still on the grid of 6A7 tube, repeat the above adjustments for greatest sensitivity.
7. Apply strong 465 KC. signal to the antenna and adjust trap coil trimmer #3 to a minimum output.

ADJUSTMENT OF POLICE BAND

When adjustments as outlined under the Broadcast Band are completed, the Police Band requires no adjustment unless the coil oscillator and station indicator, set 1700 KC., and apply test signal to antenna lead. The Police Band winding is indicated by "A" in Fig. #2. Adjust the position of this winding by sliding it back and forth on the coil until maximum output is indicated on the output meter. This winding should then be secured in place by applying a thin coat of coil cement.

6 TUBE AC
4 RANGES

B Range 3.2 to 7.4 Megacycles
C Range 8.32 to 12.05 Megacycles
D Range 15.0 to 22.0 Megacycles

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC. After each range is completed, repeat the procedure as a final check.

CAUTION—When aligning the short wave ranges, be sure NOT to adjust at the image frequency. This can be checked as follows: let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It will be necessary to increase the input signal to hear the image. The image frequency must always be 912 KC LESS than the frequency at which the set is aligned. This is true of all the short wave ranges.

It is very important that the bandsread ranges (B, C and D) be aligned at the precise frequencies given. If the accuracy of the signal generator is not known, it is always best to first calibrate the signal generator by using a receiver that is in good condition. First tune in a station of known frequency close to 12.05 MC. Then tune the signal generator until it "beats" with the station, carefully marking the setting of the generator. Proceed in the same manner for all the other alignment frequencies.

NOTE A—Turn tuner back and forth and adjust trimmer until peak of greatest intensity is reached.

ALIGNMENT PROCEDURE

Before aligning make certain that dial pointer is adjusted properly as instructed under "Drive Cord Replacement" on page 5. Volume Control—Maximum All Adjustments. Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead. Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning: An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed. Output Indicating Meter—Non-Metallic Screw-driver. Dummy Antennas—.1 mf., 200 mmf., and 400 ohms. (Connect in series with Antenna lead.)

SIGNAL GENERATOR		CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	POINTER SETTING	ADJUST TRIMMERS TO MAXIMUM
FREQUENCY SETTING						
I. F.	456 KC	Antenna Lead	.1 mf.	A Range	Turn Tuning Knob until Extreme High Frequency Position is Reached	2nd I.F. (C20) & (C21) 1st I.F. (C16) & (C17)
RANGE D	21.8 MC	Antenna Lead	400 Ohm	D Range	Same as Above	Oscillator Range D (C12)

RANGE B	7.4 MC	Antenna Lead	400 Ohm	B Range	Extreme High Frequency Position	Oscillator Range B (C10)
	Reset to 7.0 MC	Antenna Lead	400 Ohm	B Range	Turn Tuner to Max. Output	Antenna Range B (C2) Rock Tuner—See Note A
RANGE A	1610 KC	Antenna Lead	200 mmf.	A Range	Extreme High Frequency Position	Oscillator Range A (C5) Antenna Range A (C1)

ADJUSTMENT TO VARIOUS LINE VOLTAGES

An accurate AC voltmeter should be used to measure the line voltage before installing the radio.

CAUTION—Never make any of the following power transformer adjustments without first withdrawing the plug on the end of the power cord from the receptacle.

OPERATION ON LINE VOLTAGE OF 200 TO 250 VOLTS, 50-60 CYCLES

When shipped from the factory, these radios are adjusted for a line voltage of 200 to 250 volts.

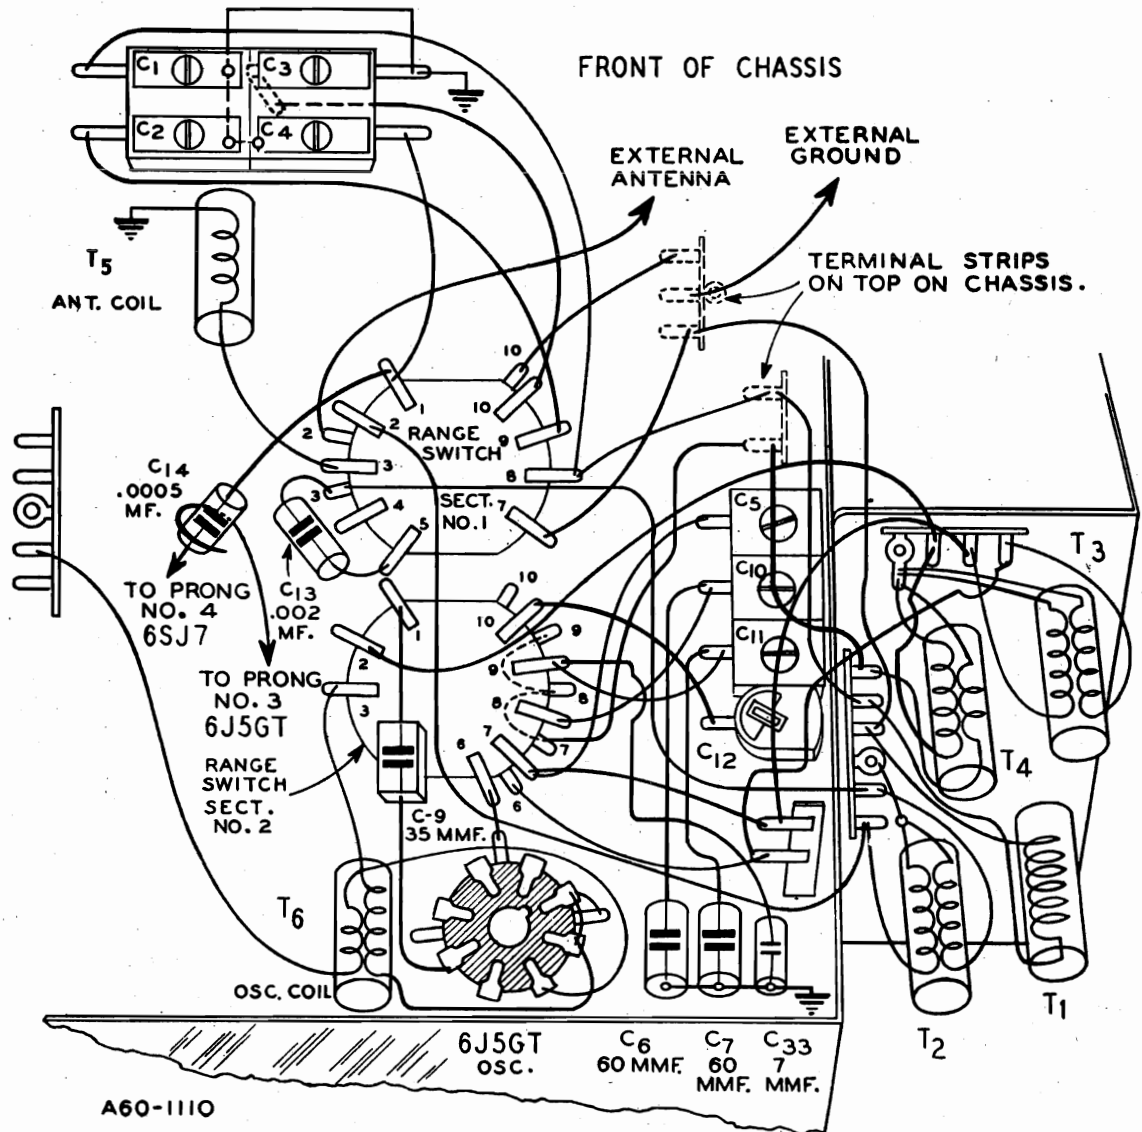

Care should be taken to see that the voltage changer plug (see tube arrangement illustration) is so inserted in the voltage changer socket

that the white dot is adjacent to the "220 Volt" marking on the chassis.

TO ADJUST THE RECEIVER FOR A LINE VOLTAGE OF 100 TO 125 VOLTS, 50-60 CYCLES

Remove the voltage changer plug and reinsert it so that the white dot is adjacent to the "110 Volt" marking on the chassis.

WESTINGHOUSE ELEC. INTERNATIONAL CO.

A60-1110

Wiring Diagram for Coil System

DRIVE CORD REPLACEMENT

Turn drive shaft until cores are entirely within coil forms. Pass cord through hole in tuning shaft and bring two ends together evenly. **CAUTION**—Cord must remain centered on shaft. Wind one part of cord two turns on tuning shaft in a counter-clockwise direction (from front of chassis). These turns should progress away from chassis. Hold both parts of cord and withdraw cores from within coils slowly by turning the tuning shaft. One part of cord should progress towards chassis and the other away from the chassis. Unwind the inside cord from shaft. Then wind this cord two turns in a clockwise direction (from front of chassis). These turns should progress towards rear of chassis.

Pass cord, progressing away from chassis, over inside idler pulley A and outside idler pulley B—See illustration. Wind cord around dial brace bracket. Pass the outside cord from tuning shaft to outside idler pulley A to inside idler pulley B and over idler pulley C. Attach tension spring to end of cord.

Unwind cord from dial brace bracket and attach to other end of spring. The spring should be slightly stretched for tension.

ATTACHING DIAL POINTER

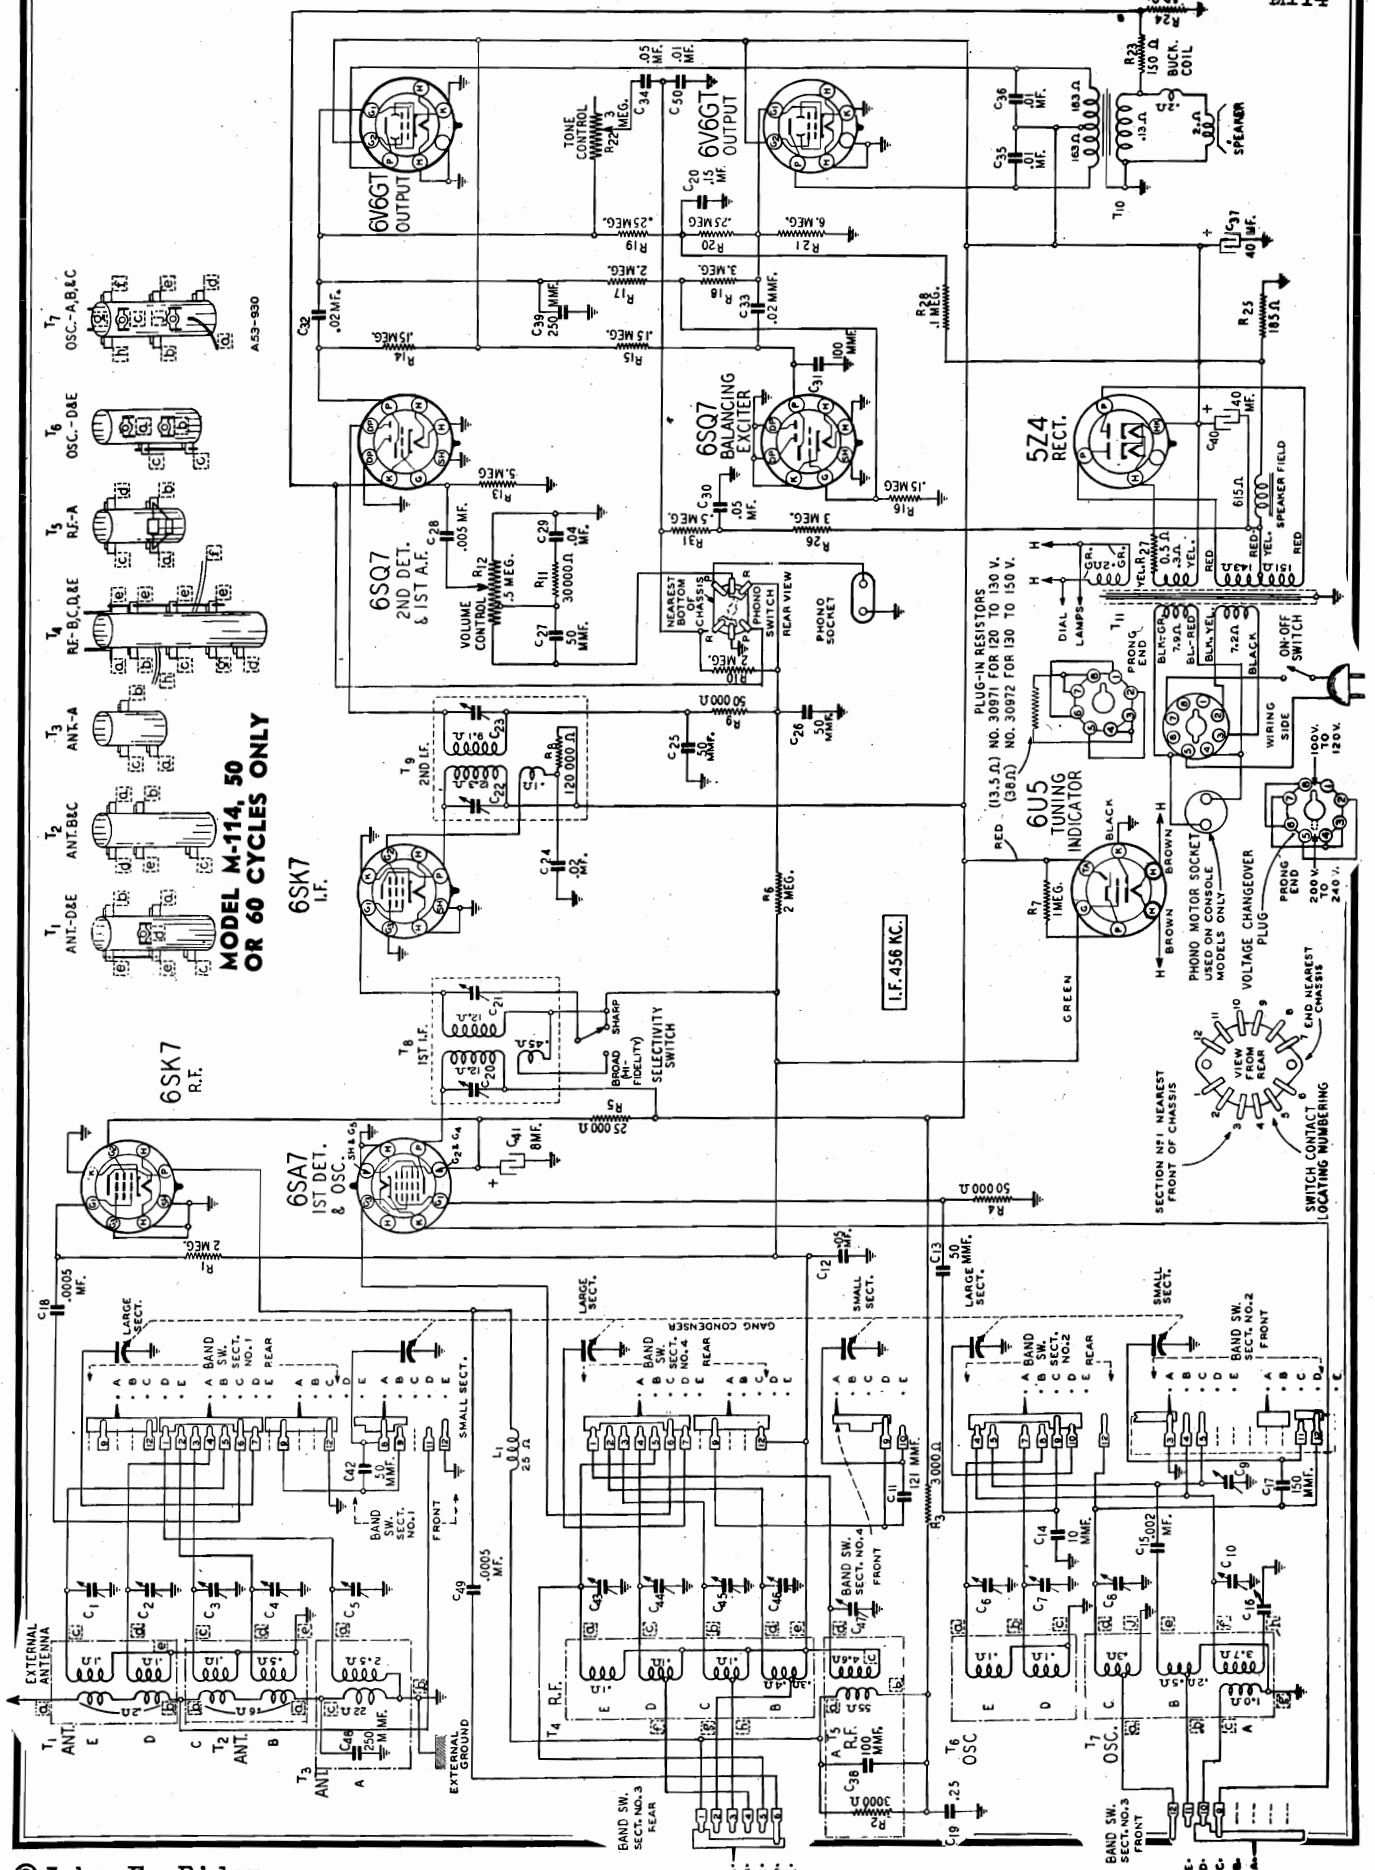

Turn tuning knob clockwise until high frequency position is reached. (Cores completely out of coils.) Slip pointer on the dial cord and move to high frequency end of dial scale. Carefully align pointer with the round dots at the end of each scale and clamp it securely into position.

DRIVE CORD REPLACEMENT

MODEL M-110

TO REPLACE DRIVE CORD AT BACK OF DIAL MOUNTING PLATE

—Tie one end of new drive cord to each end of tension spring (length of doubled cord should be 29½ inches). Place cord over pulleys A and B so that tension spring is between these pulleys—See illustration. Continue left-hand section of cord around pulleys C and D. Loop remainder of cord over pulley E.

TO REPLACE DRIVE CORD AT FRONT OF CHASSIS

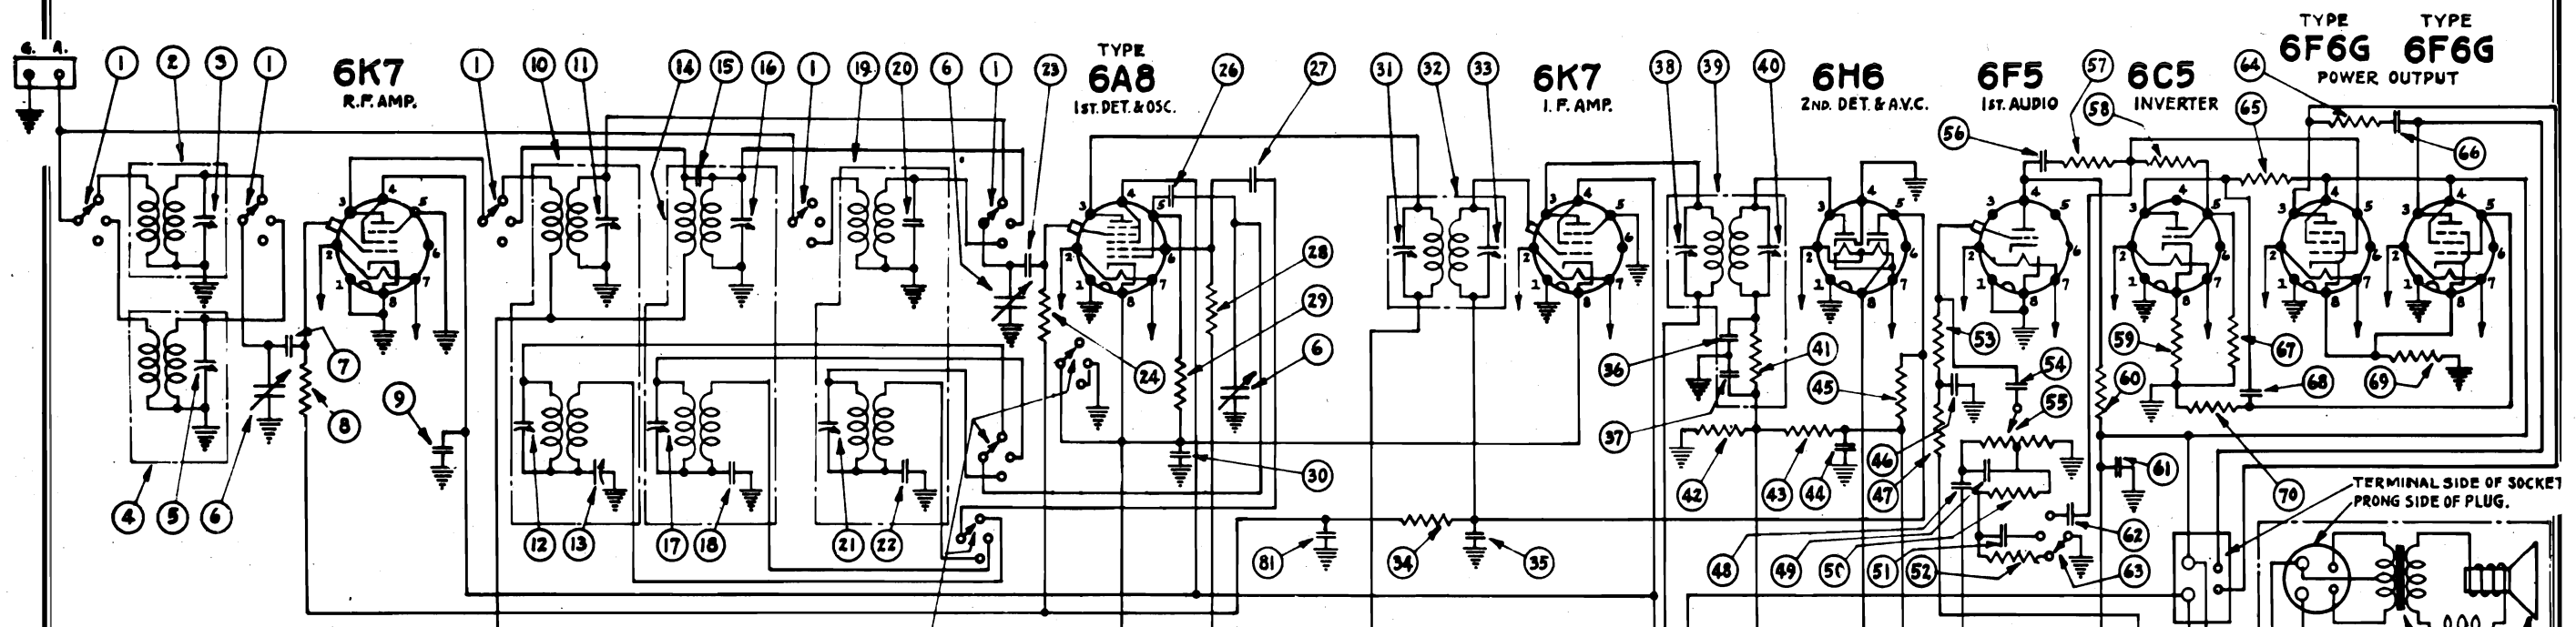

—Turn gang condenser to closed position. Tie both ends of new drive cord to one end of tension spring (length of doubled drive cord should be 38½ inches). Hook free end of spring in hole just below and to left of hub on gang condenser drive pulley. Pass cord through slot in pulley rim. Wind one section of cord around drive pulley toward front of chassis and continue under pulley F. Wind 3 turns counter-clockwise (from front of chassis) around tuning shaft. Turns should progress away from chassis. Continue cord over pulleys G, H and J. Stretch tension spring. Wind remainder of cord around the gang condenser drive pulley.

Calibration—Tightly fasten top of pointer to drive cord at left of tension spring on dial mounting plate. Tune in a station of known frequency. Move pointer to correct frequency by moving dial plate cord. Tightly fasten bottom of pointer to dial plate cord only. Assemble cord clamp on both cords as shown in illustration.

MODEL WR330 WESTINGHOUSE ELEC. INTERNATIONAL CO.

WESTINGHOUSE ELEC. INTERNATIONAL CO. MODEL WR330

GENERAL DESCRIPTION

This model is a ten-tube, A.C. three-band superheterodyne receiver, designed for complete coverage from 535 to 18,500 KC.

The circuits of the receiver comprise an R.F. amplifier, a combined detector-oscillator, an I.F. amplifier, a combined 2nd detector and automatic volume control, an audio amplifier, an inverter, power output, a rectifier and a tuning tube.

The R.F. amplifier and detector-oscillator with the associated parts, including the gang condenser, coils, trimmer and lag condensers and wave-change switch, is mounted on the chassis as a unit.

The radio circuit proper is the same for the manual and electric drive models.

LINE-UP CAPACITOR ADJUSTMENTS

To align the circuits of this receiver, it is essential to use a high grade modulated test oscillator, the output of which can be continuously varied with absence from overload, when the individual circuits of the receiver are brought into alignment. A conventional output meter should be connected across the terminals of the speaker voice coil to indicate when the circuits are aligned. The sensitivity of the output meter must be sufficient to give satisfactory reading with a low input signal.

Before attempting to align the receiver, the service man should familiarize himself with the general layout of the chassis, the location of the tubes and various alignment condensers. Top and bottom views of the chassis are shown in Figures #1 and #2 and should be carefully studied before the actual work is started.

ADJUSTMENT OF I.F. (455 KC.)

1. Set the volume control on full, the wave-change switch to the broadcast position and the dial indicator to approximately 600 KC.

2. Set test oscillator to 455 KC., and adjust its output to produce a measurable reading on output meter when test signal is applied to grid of detector-oscillator tube through a .5 mfd. blocking condenser.

3. Set test oscillator to 455 KC., and adjust its output to produce a measurable reading on output meter when test signal is applied to grid of detector-oscillator tube through a .5 mfd. blocking condenser.

4. Adjust I.F. trimmers #31, #33, #38, and #40 to maximum output, reducing output of test oscillator as required.

ADJUSTMENT OF BROADCAST BAND

1. With the gang condenser fully in mesh, check the dial pointer, which should be at the horizontal line on the end of the scale.

2. Set test oscillator and dial indicator to 1500 KC.

3. With signal still applied to grid of detector-oscillator tube, adjust oscillator trimmer #12.

4. Apply test signal to antenna terminal of chassis through a .0002 mfd. series condenser and adjust R.F. and antenna trimmers #11 and #3.

5. Set test oscillator and dial indicator to 600 KC., and adjust oscillator series (lag) condenser #13, at the same time tuning the gang back and forth slightly, until a maximum is reached.

6. Set the test oscillator and dial indicator at 1500 KC., and recheck the oscillator, R.F. and antenna trimmers #12, #11 and #3.

7. Check sensitivity and calibration over the scale.

NOTE: In adjusting the two short-wave bands, a .0002 mfd. condenser and a 400 ohm resistor in series should be inserted between the antenna terminal and the high side of the test oscillator. This combination is the approximate equivalent of a short-wave antenna.

ADJUSTMENT OF 1st SHORT-WAVE BAND

1. Set wave-change switch to 1st short-wave position.

2. Set test oscillator and dial indicator to 5000 KC.

3. With the condenser-resistor combination connected to the chassis antenna terminal, adjust oscillator trimmer #21.

ADJUSTMENT OF 2nd SHORT-WAVE BAND

1. Set wave-change switch to the 2nd short-wave position.

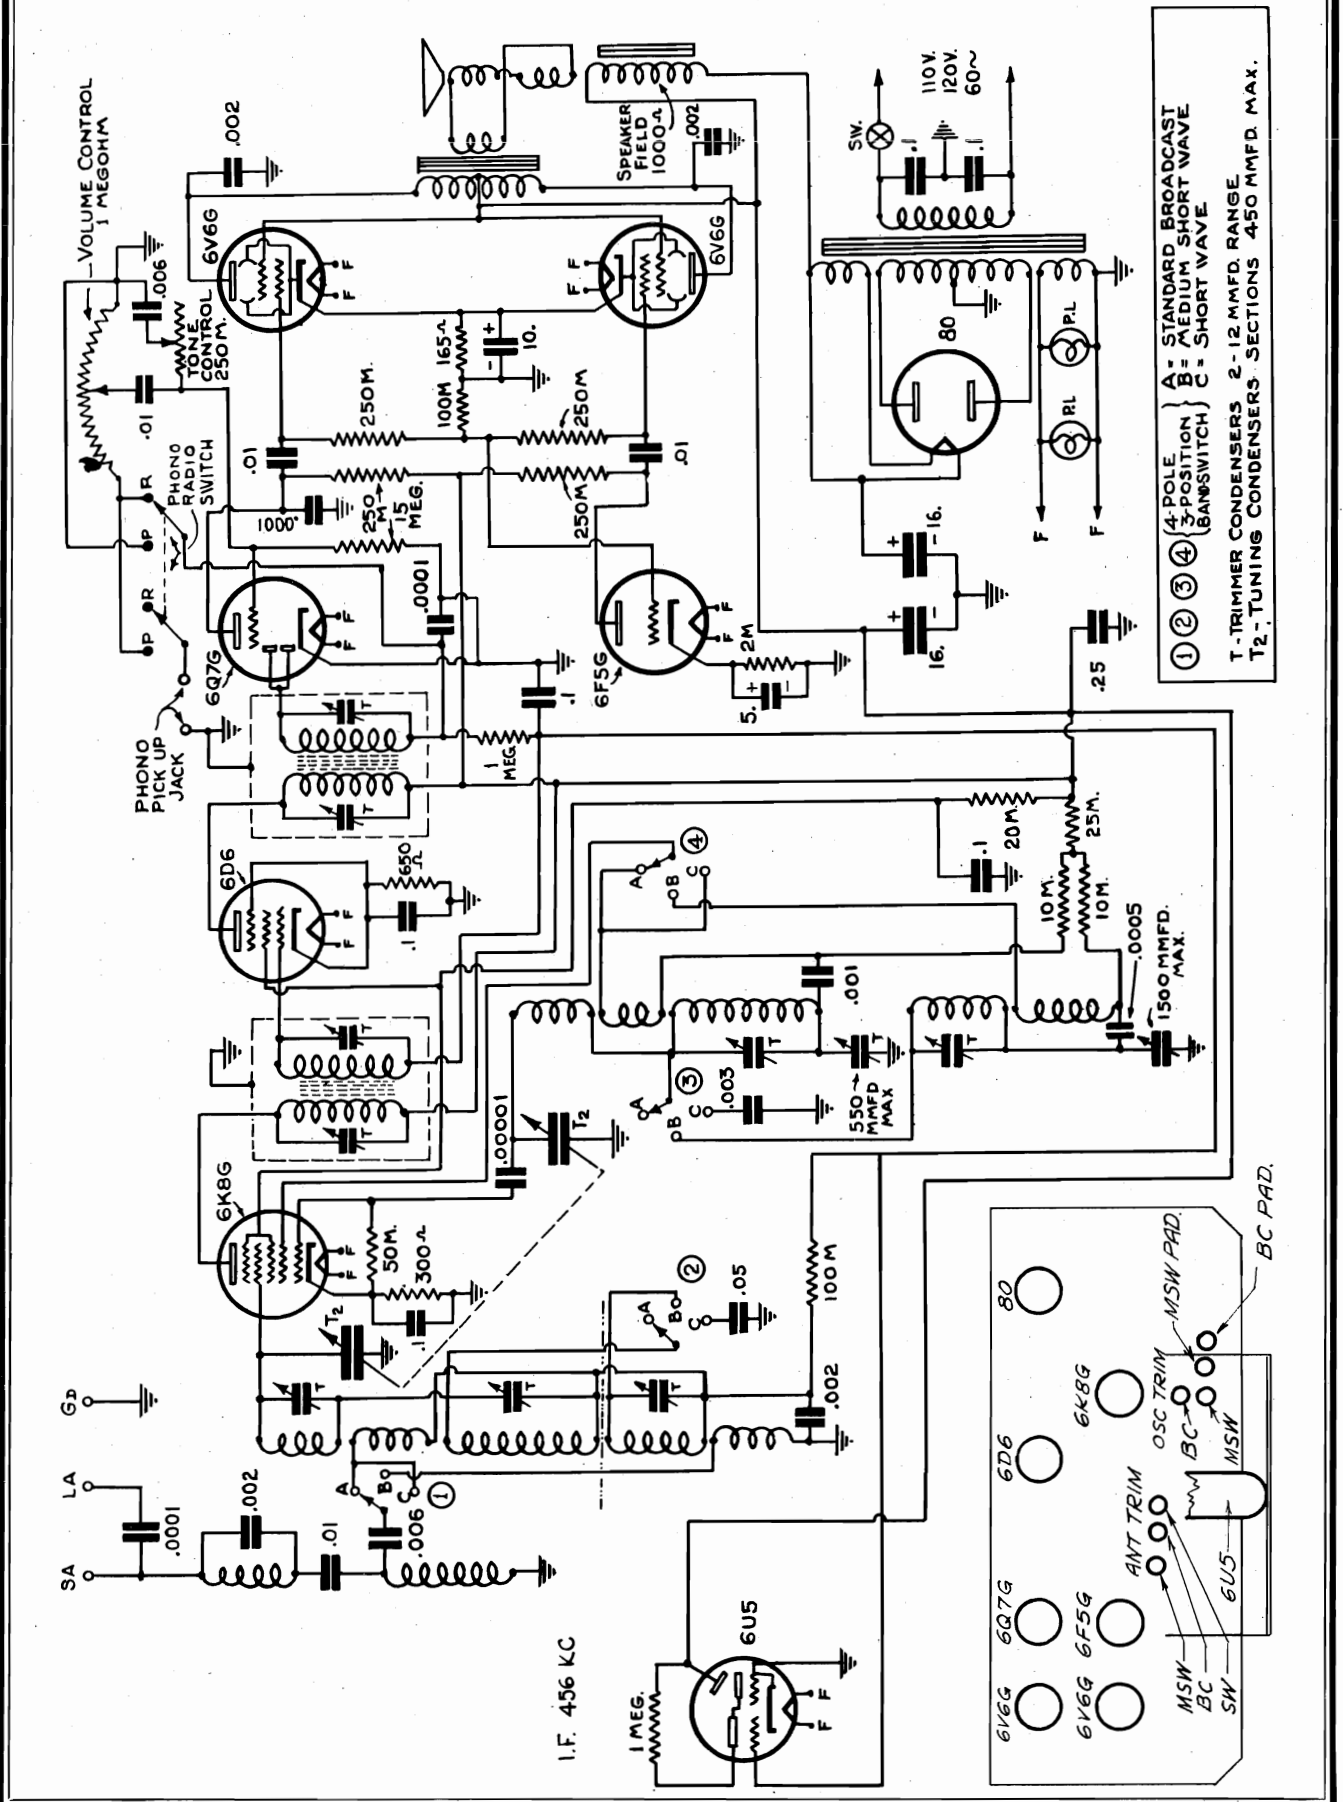

2. Set test oscillator and dial indicator to 16,500 KC., and adjust oscillator trimmer #17. Two positions on the trimmer condenser may be found where the signal is heard. Use the one with the least capacity or with the trimmer screw farther out.

3. Adjust the R.F. and antenna trimmers #16 and #5.

4. Check sensitivity and calibration over the scale.

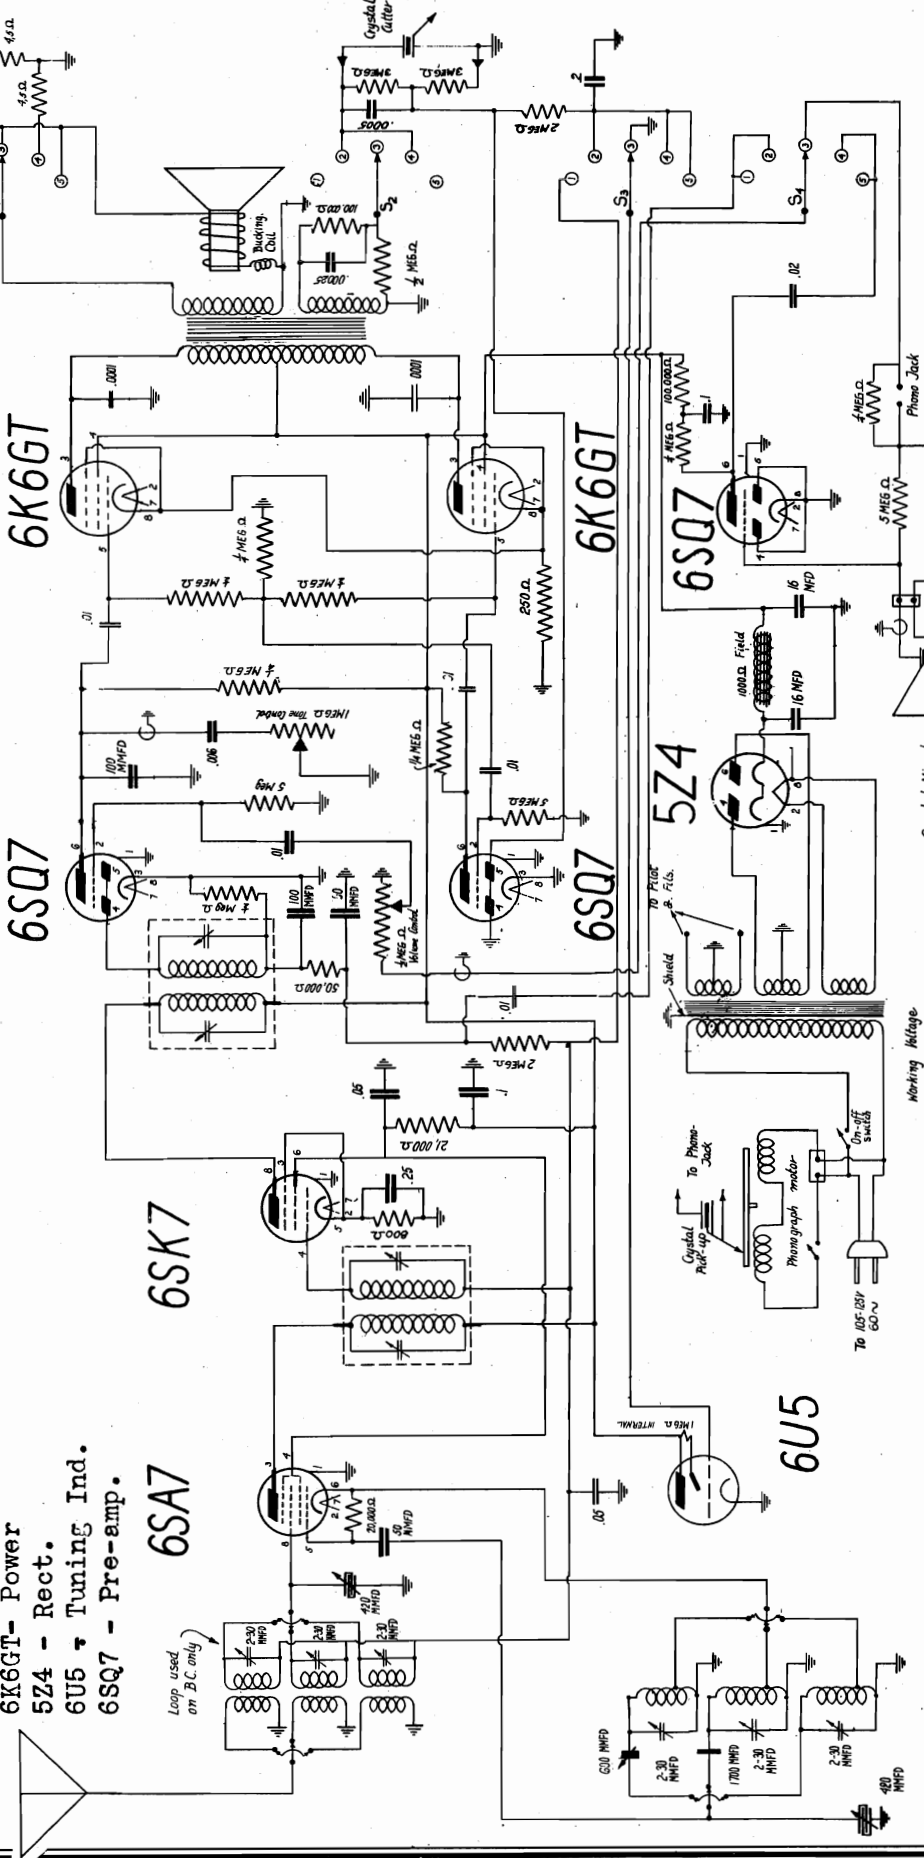

WHOLESALE RADIO SERVICE CO., INC.

I.F. Alignment -455 KC for Maximum.
 B.C. Alignment -1500 MC osc. Trim. for Maximum.
 Padder at 600 KC Maximum.
 S.W. Alignment S.W. osc. at 8 MC. for max. at 2.7-9.0 MC. Band.
 Low frequency is automatically adjusted by a fixed padder.

Foreword

The Wilcox-Gay INSTA-MATIC Record Changer is truly an innovation because its operation does not depend upon an assembly of gears and levers, and no power is taken from the motor in actuating the automatic changing mechanism.

Since the power to operate the changer is derived from a separate source other than the turntable rotating mechanism, it has been possible to design the unit to operate rapidly without putting demand for power on one source. This feature eliminates the necessity for a series of reduction gears which are both costly and complicated, and has permitted unique design with respect to changing from 10" to 12" records, using but one cam and set of adjustments for both record sizes.

Description of Trip Mechanism

1. The eccentric groove on the record causes the pickup arm to oscillate in a forward and backward motion. The trip switch "J" contact is then closed by friction of the leather contact on the knurled rocker plate "A". Closing of the trip switch energizes solenoid "B" and plunger is drawn into solenoid "B" through magnetic action of the coil. This action closes the lock-in switch "C" which still maintains closed circuit for the solenoid "B" even though trip switch "J" is now open. The main cam assembly "D" is then drawn forward

by draw spring "E" against the snubbing action of the dashpot "F". At the time main cam rubber bumper "G" strikes the solenoid plunger, the lock-in switch "C" is opened by arm "X" releasing current from solenoid "B". During this inward action, pickup arm is raised by push rod and returned to replay position by the rounded section of cam on pin "Y" on rocker plate. At the same time, cam action rotates record holding knob and record selector arm finger releases bottom record to turntable. Reset pin is engaged in rocker arm return slot. Internal spring against dashpot action forces main cam "D" outward and reset pin follows rocker arm slot carrying the pickup arm to edge of record. The tone arm is automatically positioned on the record just inside the record periphery and the feed-in spring "H" acting upon the rocker plate attached to the tone arm pivot post, urges the phonograph needle, gently but positively, into the first record groove. Reset pin drops away from the rocker plate due to hold down spring.

5. (2) Raise the switch vertically (toward the rocker plate) until the end of the phosphor bronze spring nearly touches the rocker plate.
- (3) The correct switch position will be found to be approximately half way between these two extreme positions.

Mechanism Trips But Pickup Arm Does Not Return To Record

6. This is usually caused by failure of the lock-in switch to open when the cam assembly is at the end of its forward motion. The lock-in switch should have a clearance of approximately .025 and can be adjusted by bending forward or backward arm "X". Bending the arm so that more pressure is exerted on the fiber stub of the long contact arm increases the gap and bending the arm so that less pressure is exerted decreases the gap contact. Failure of the arm to return to the record is sometimes caused by binding action of the reset pin and rocker plate or failure of the reset pin to engage the rocker plate. This will be covered in another paragraph entitled "Adjustment of Reset Plate Hold-down Spring".

ADJUSTMENT OF RESET PLATE HOLD-DOWN SPRING

7. Illustrations (A) (B) (C) (D) show four phases of the operation of the resetting device located between the main cam and inside surface of the cam box. The resetting action can be observed by viewing the cam box assembly from the end nearest the arm pivot post. At the beginning of the change cycle the cam moves

Removing Changer From Cabinet

- (1) Before removing record changer unit from cabinet, remove cutting stylus and position the recording arm near the center of the turntable to prevent damage to the follower arm in lifting the unit from the cabinet. (The arm should be returned to this position before replacing unit in cabinet.)
- (2) Remove playback needle if unit is type 11-D or 11-E. If unit is type 11-F place metal guard on pickup cartridge to protect sapphire needle against injury.
- (3) Remove mounting screws (one at each corner of unit base plate) and remove all plug-in connections between record changer unit and amplifier chassis.
- (4) Remove record changer unit from cabinet. DO NOT TAKE HOLD OF RECORD SUPPORT POSTS. Instead, grasp the base plate of the unit, at opposite sides.
- (5) Place unit on the service bench, tilted to a position that provides access to the under side of the unit. DO NOT PLACE UNIT IN UPSIDE-DOWN POSITION, as the record spindle may be sprung or bent.

Failure To Trip At End of Record

2. All commercial records manufactured in recent years have the eccentric (oscillating) type of trip groove. Make sure first that the record that does not trip the mechanism has the eccentric groove. Failure to trip is caused by lack of proper contact or friction of the leather finger on the trip switch with the knurled surface on the rocker plate. Too great an opening of the contact points will not allow the switch to close during an oscillating action. Check and set points for .020" gap when trip switch is at rest (leather finger not in contact with rocker plate). The switch can be removed by taking out the two lockwasher screws in the slotted section immediately below the clamp holding the one red and two black wires. After the contact point clearance has been set and checked, the switch should be replaced and set to the point where the leather finger just makes contact with the rocker plate. A forward and back motion of the rocker plate should move the phosphor bronze spring slightly. The phosphor bronze support spring eliminates the fatiguing of the leather finger to a semi-circular position and gives constant upward pressure on the leather finger. The trip switch should not be set too high whereby the leather and phosphor bronze spring both engage the rocker plate.

Positioning of Trip Switch

3. When the switch is correctly positioned, the switch contacts will remain normally open at all times excepting after the playback arm reaches a position near the center of the turntable. A slight reversal in the lateral movement of the arm will cause the contacts to close.
4. The contact spacing should be approximately .020" and the leather piece should just touch the stop bracket when the switch is "idle" or "at rest".
- (1) Position the switch so that the leather finger just touches the rocker plate surface, and note the point of contact between the leather and the phosphor bronze spring.

WILCOX-GAY CORP.

Pick-up Feed-in Adjustment

in a direction shown by the arrow in illustration (A). The reset pin, moving with the cam, should travel beneath the rocker plate, illustration (B). Near the end of the initial cam stroke, the reset pin should snap into the enlarged opening in the rocker plate, illustration (C). With the return stroke of the cam, the reset pin should travel in the narrow slot of the rocker plate, illustration (D) and at the very end of the stroke drop out of the slot and resume position as shown in illustration (A).

8. The function of the hold down spring is to hold the reset plate down while bearing on one side of the fulcrum point, and to hold it up when bearing on the opposite side of the fulcrum point, illustration (A) and (C).

9. It will now be obvious that insufficient pressure of the hold down spring will cause (1) the reset pin to approach the rocker plate in too high a position causing a possibility of jamming; (2) also at the end of the initial cam stroke, illustration (c), the reset pin will not protrude through the rocker plate far enough to allow proper retraction of the cam, illustration (D).

10. Pressure of the hold down spring in excess of that required to produce correct operation as described above, will not result in any better operation of the resetting device, but will only introduce a source of undesired friction.

11. Greater hold down spring pressure may be obtained by use of a long slender screwdriver as shown in (E). With the screwdriver bit held into the "w" at the junction of the hold down spring and the plate to which it is attached, rotate the screwdriver in alternately opposite directions as shown by the arrows, thus increasing the downward pressure of the spring.

12. Less hold down spring pressure may be obtained by use of the screwdriver as shown in (F).

Adjustment of Pickup Arm To Set Properly On Record

13. The pickup arm when returning to the record should drop at a point half-way between the first playing groove and the edge of the record. The kick-in spring moves the pickup arm gently to the first playing groove. If the needle is dropping into the first playing groove, then loosen the screw in front of the pickup arm bracket and immediately under the pickup arm channel. Move the pickup arm bracket slightly outward and tighten the screw. If the arm is dropping at the edge of the record, loosen the screw and move the pickup arm bracket slightly inward and retighten screw.

14. The feed-in adjustment can best be made by use of a record having no spiral feed-in groove. With record on turntable and changer set for size record used, the changer is caused to cycle by either depressing the reject button or allowing the arm to trip. When operating correctly, the arm should set down on the record and move gently into the first groove. If the feed-in is too violent, resulting in groove jumping, bend the feed-in spring toward the dotted line (A). If the feed-in action is insufficient, resulting in the arm not reaching the first groove consistently, bend the spring toward dotted line (B).

Setting Mechanism To Release Records Properly

15. Remove screw and finishing washer in top of record selector shaft. Replace so that the flat sections of the shaft engage the flat sections of the record selector finger. Install and tighten screw. Place the mechanism in the 10" operating position by rotating the Uni-point control knob so that it points directly to the turntable shaft. Place a 10" record on turntable shaft so that the edges rest on the retaining arms. The selector finger and the record should have approximately 1/16" clearance. If this clearance is not correct, loosen the two screws on the tie rod assembly (formed rod underneath turntable connecting cam box and Uni-point control post) and move selector post inward or outward so that the clearance of selector finger and record is correct. Then tighten screws in tie rod securely. Adjustment for 10" or 12" dropping of records is exactly the same and if adjustment is made for 10" record, the 12" adjustment is automatically taken care of and vice versa.

16. It is very important that the Uni-point control post be positioned in the proper manner. Sometimes this post becomes bent inward slightly which "hangs on" to a 12" record too long and causes the record to flutter down instead of dropping down with a positive action. Breakage or cracking of records sometimes results. The Uni-point control post is stationary but can be bent inward or outward by hand. The control post should be at a point where a 12" record is very near the edge of the record holding bracket.

MODEL Insta-Matic

WILCOX-GAY CORP.

Dash Pot

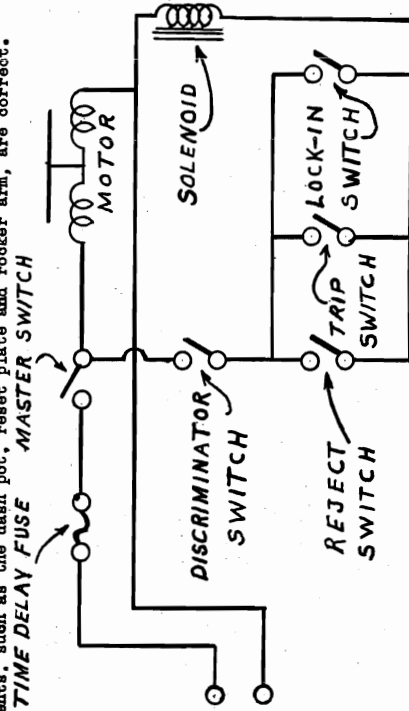

19. The dash pot, which is an air chamber with an internal spring return piston and an air release serves to govern the speed at which the main cam or changing process operates. At the start of the solenoid stroke, the contacts on the lock-in switch, which is connected in parallel with the trip switch, are closed maintaining energy in the solenoid. The draw spring then functions to pull the main cam assembly forward against the snubbing action of the dash pot. At the end of the stroke, when the lock-in switch points are opened, energy is released from the solenoid and the internal spring of the dash pot returns the main cam assembly to its original position.

20. It can readily be seen from the above that if the dash pot through some manner has lost its snubbing action, the changing process of the unit will be very erratic and in most cases damage will result through the fast action. Always replace a defective dash pot and never attempt to repair or oil the plunger. This plunger is treated by a special process and further oiling will eventually ruin the leather.

Buzzing or Weak Solenoids

21. Incorrect spacing of the lock-in switch will oftentimes cause the solenoid to buzz or chatter during the change period. If the contacts are set so that they are just touching on the solenoid stroke, vibration will cause them to open and close resulting in the solenoid being energized and de-energized at a very rapid rate. If the lock-in switch contacts are correctly set and buzzing still continues, it is usually found to be in the laminations of the solenoid and the only cure is replacement of the complete solenoid including core. The solenoid plus the core are matched at the factory and the complete assembly should be installed.

22. The solenoid on the Insta-Matic changer is designed to operate satisfactorily on line voltages 105 Volts or above. Lower line voltages will cause the mechanism to either chatter or buzz and in some cases will not operate. If the line voltage is above 105 Volts and the mechanism changes very slowly or the solenoid plunger is drawn only partway in, this is an indication of a weak solenoid and the only solution is to install a new assembly. This naturally is assuming that all other adjustments, such as the dash pot, reset plate and rocker arm, are correct.

Pickup Arm Remains Stationary At About The Center of Home Recorded Discs

17. Make sure first that the home recorded disc has a good clean groove and the proper depth of cut. Pivot posts of the pickup arm should be set to the point where very little play is evidenced but not to the binding point. The lower part of the pickup arm channel should just come flush with or a little bit lower than the top of the turntable. If the arm is above the turntable, the flat bracket immediately above the push rod in the center of the pickup arm shaft should be bent upward slightly. Positioning of the trip switch to the point where the leather finger engages the rocker arm too high sometimes causes friction which will hold the pickup arm in place when home recorded records are played. Be sure that the pickup arm cord is hanging free and is not under pickup arm bracket and arm channel.

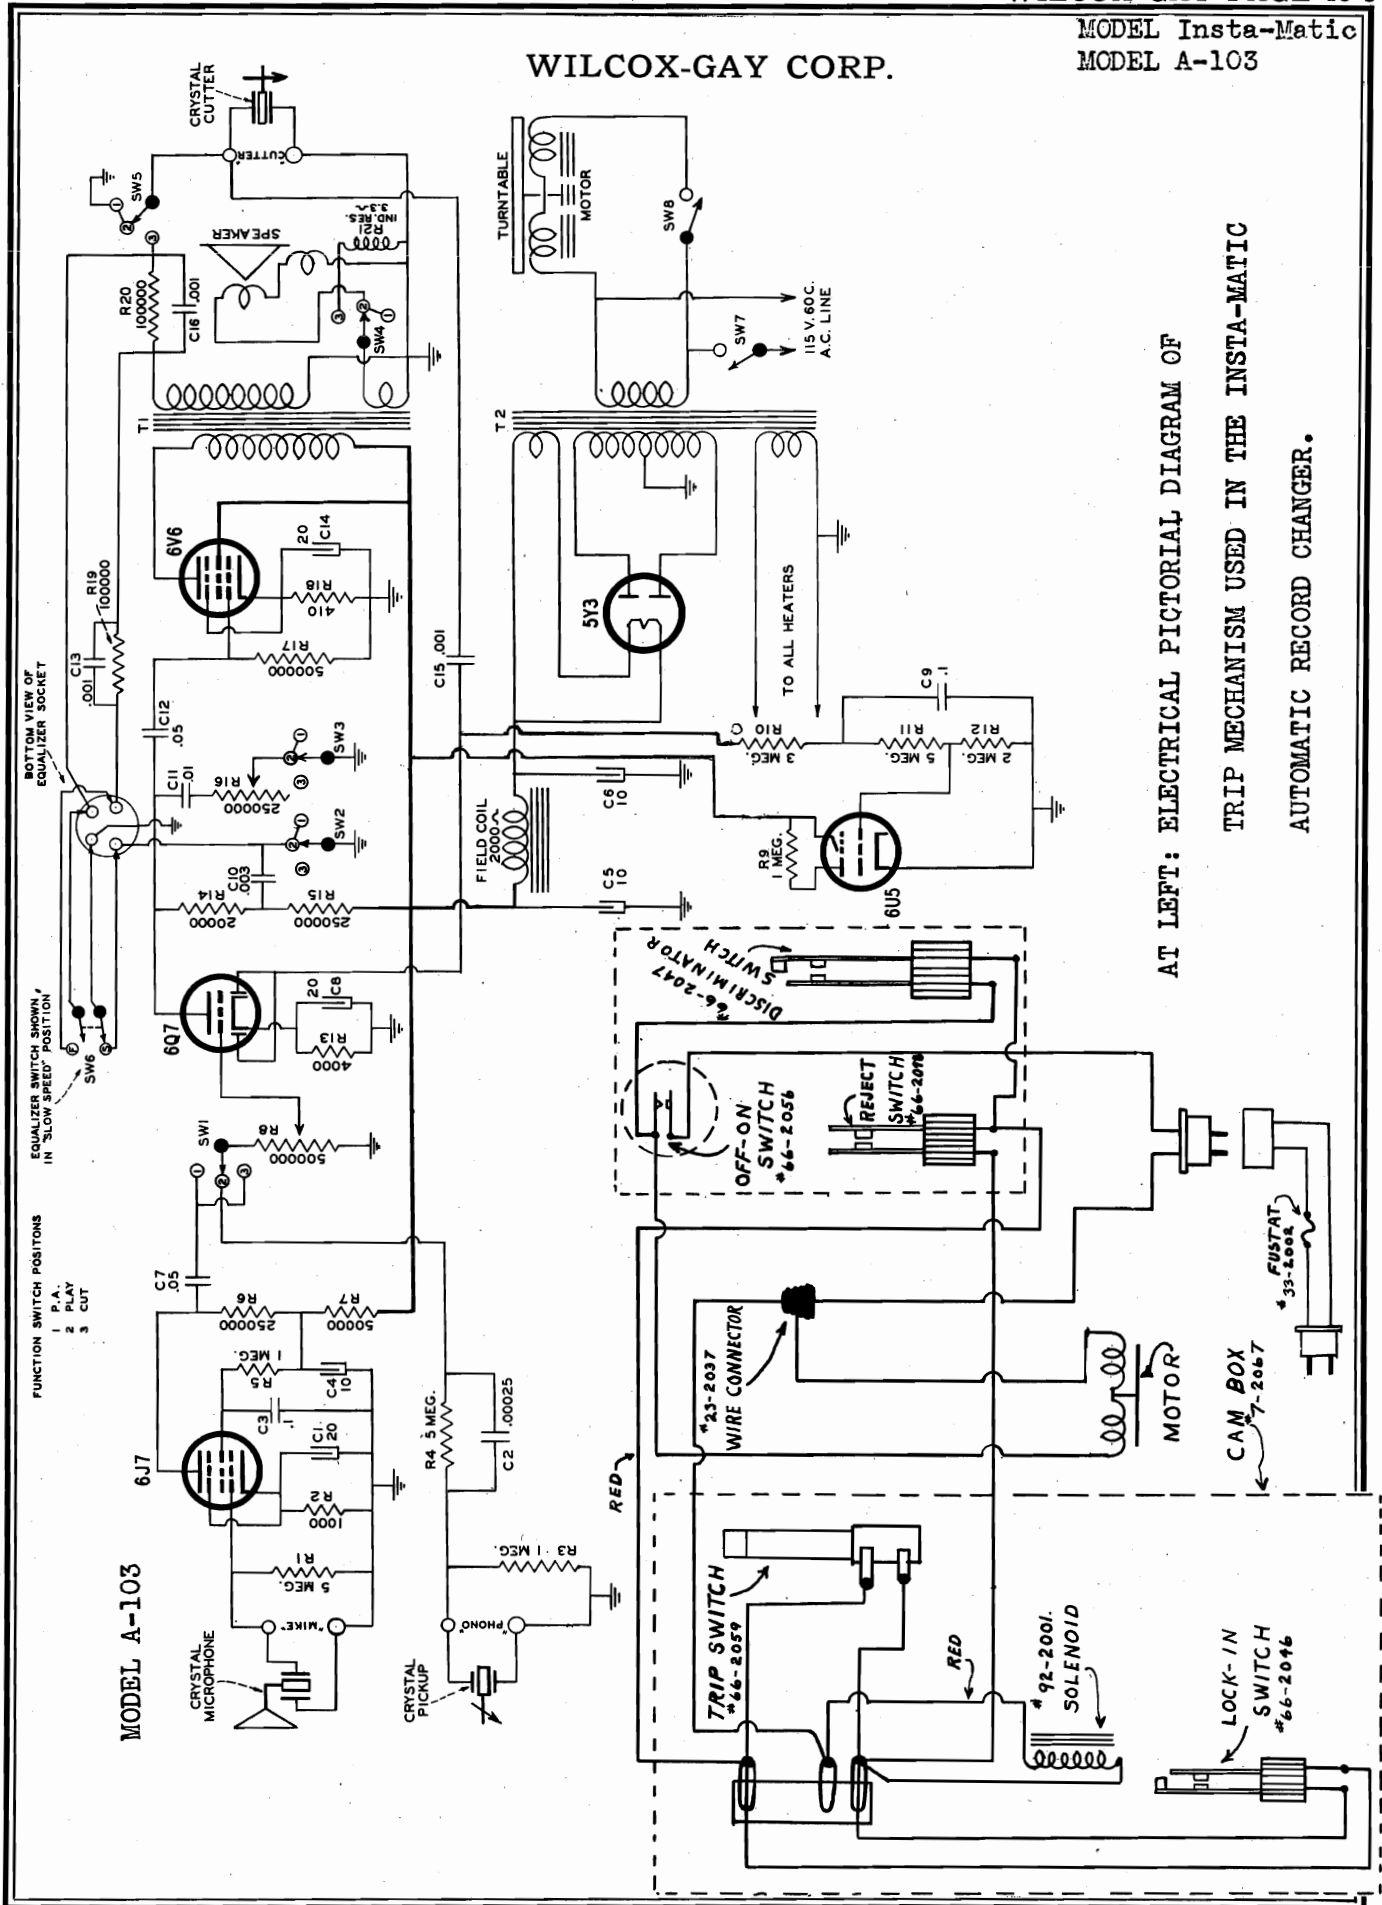

Variation in Lowering of Pick-Up Arm

18. It will be observed that it is the retraction of the reset pin through the slot in the rocker plate, during the return stroke of the cam, that causes the arm to move from its outward position and reset onto the record. It can be seen that lost motion or "shake" in the lateral movement of the pickup arm must be at a minimum in order for the pickup lowering position to remain unchanged when records are changed automatically. To determine the cause for any variation in the position of the pickup lowering point:

- (1st.) Move the main cam be the method illustrated (Page 4) and allow the cam to return to the position shown in Figure (D) page 7. The relative positions of the rocker plate and reset plate, with the reset pin engaged in the slot in the rocker plate. Holding the cam in this position, take hold of the pickup arm and by lightly applying force in alternately opposite directions (laterally) observe the resulting effect on the position of the reset pin. If the reset pin can be moved excessively in making this test, this gives indication of a broken hinge plate, which condition necessitates removal of the main cam with the reset plate assembly attached, and replacement with a new one.
- (2nd.) Observe that the cone point pivot screws at the heel of the pickup arm are properly adjusted so that no lost motion in the lateral movement of the arm exists. CAUTION: Do not make this adjustment too tight as abnormal friction in the vertical movement of the arm may result.
- (3rd.) Note that the screw provided for adjusting the pickup lowering position (Figure E) is tightened securely.

NOTE: An extension of the antenna contained within the line cord, and placed near the antenna lead of the radio receiver will provide sufficient signal intensity to overcome unusual static and interference conditions.

Test for oscillation: Connect low range voltmeter across R1. Use short meter leads, as long leads or high capacity to ground may cause oscillations to stop. Meter reading...non-oscillating condition....zero. Meter reading...oscillating condition....on the order of 0.5 volt. Meter reading will depend upon tube characteristics, resistance of meter used, length of meter leads, and frequency to which the record player oscillator is tuned.

WILCOX-GAY CORP.

Alignment Data

An OUTPUT METER or other indicating device should be used for accuracy in making ganging adjustments.

If an output meter is not available, the magic eye (6U5) may be used as an output indicator as follows:

- (a) Depress push-button No. 4 "To Record Radio"
- (b) Disconnect cutting-head from chassis.
- (c) Adjust volume control to near maximum.

Connect signal generator to control grid of the 6A8 tube.

SIGNAL GENERATOR FREQUENCY	DIAL POSITION	WAVE BAND SWITCH POSITION	TRIMMER NUMBER
456 K.C.	1500 K.C.	Broadcast	2nd. I.F.--S
" "	" "	"	" " P
" "	" "	"	1st. I.F.--S
" "	" "	"	" " P
" "	550 K.C.	"	C-33 °

Connect signal generator to ANT. and GND. leads.

Turn condenser gang to full maximum capacity and check position of dial pointer with reference line on the scale, which is the last graduation below the 550 K.C. calibration.

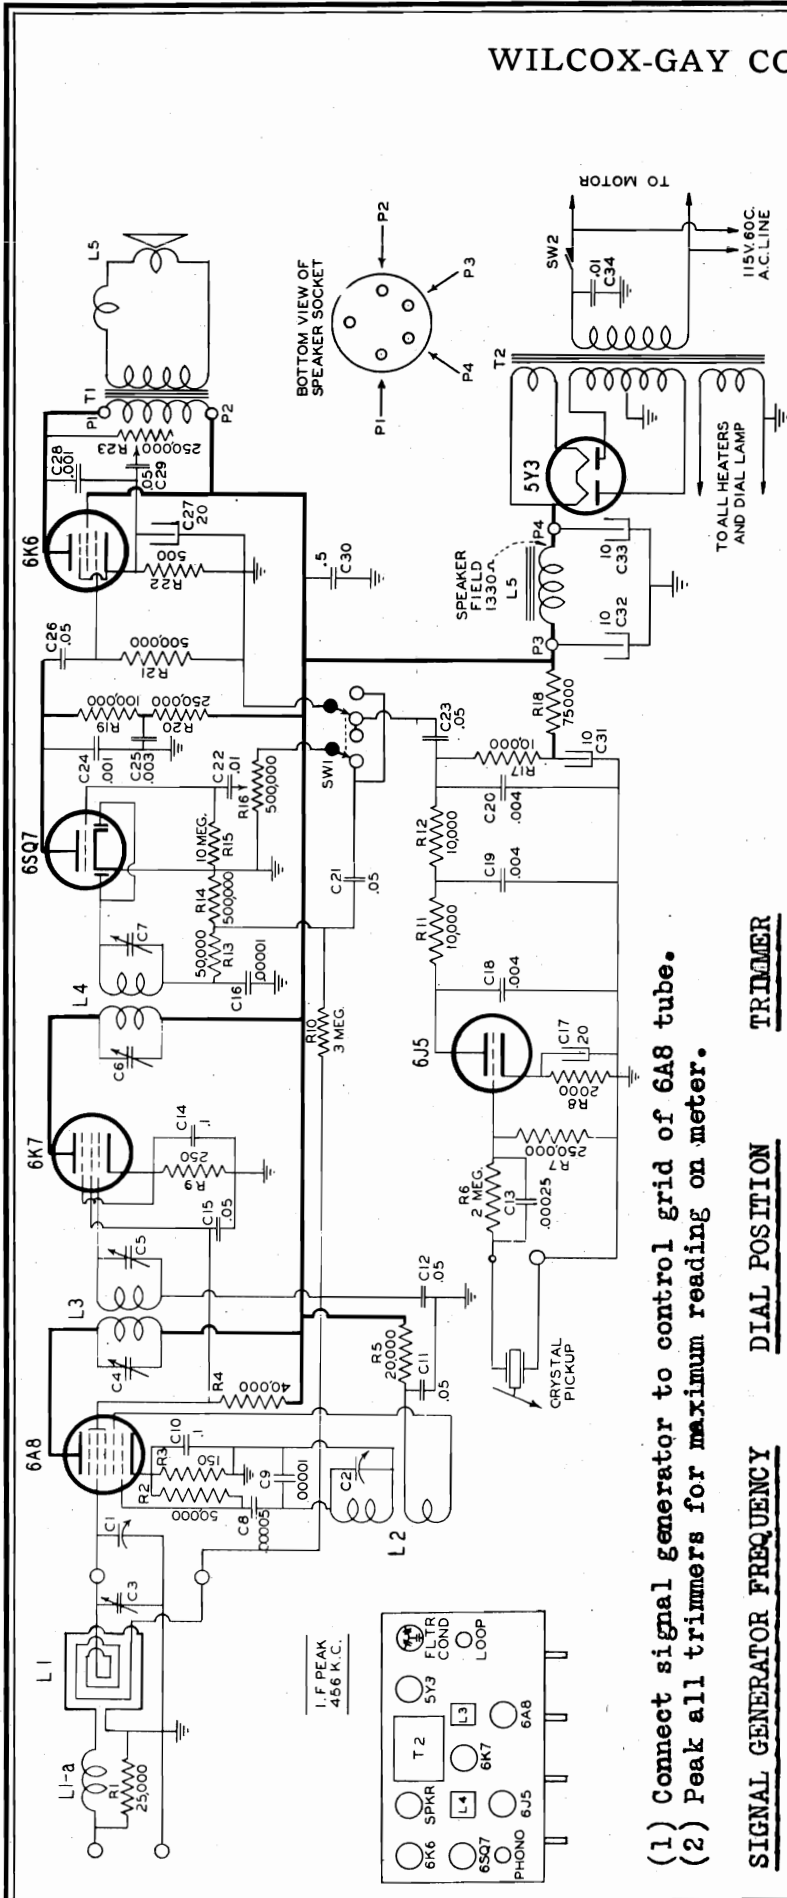

600 K.C.	600 K.C.	Broadcast	L.F.Pad (C-3)
1400 K.C.	1400 K.C.	"	Osc.(C-2)
" "	" "	"	Det.(C-1)
Not used °°	15-16 M.C.	Short Wave	Ant.(C-5)

The entire alignment procedure should be repeated to obtain greatest accuracy in the adjustment of the trimming condensers.

° Adjust C-33 trimmer for MINIMUM signal.

°° Connect antenna to receiver, and adjust dial so that no station is received. Advance volume control until a fair volume of noise is received. Adjust trimmer for greatest noise.

WILCOX-GAY CORP.

- (1) Connect signal generator to control grid of 6A8 tube.
- (2) Peak all trimmers for maximum reading on meter.

SIGNAL GENERATOR FREQUENCY	DIAL POSITION	TRIMMER
456 K.C.	1700 K.C.	I.F. - C4
" "	" "	I.F. - C5
" "	" "	I.F. - C6
" "	" "	I.F. - C7

Connect signal generator to ANT. and GND. terminals.

1400 K.C.	1400 K.C.	C2-Osc.
" "	" "	Trimmer on Loop - R.F.

NOTE: In the event of loop antenna replacement, the R.F. alignment should be checked at 600 K.C., and if necessary, inductance of the loop may be adjusted to bring about correct alignment of the dial at 600 K.C., by dressing the end of the inside loop turn to provide more or less inductance as required.

Ad adjustment of loop inductance should be followed by re-alignment of the R.F. trimmers at 1400 K.C.

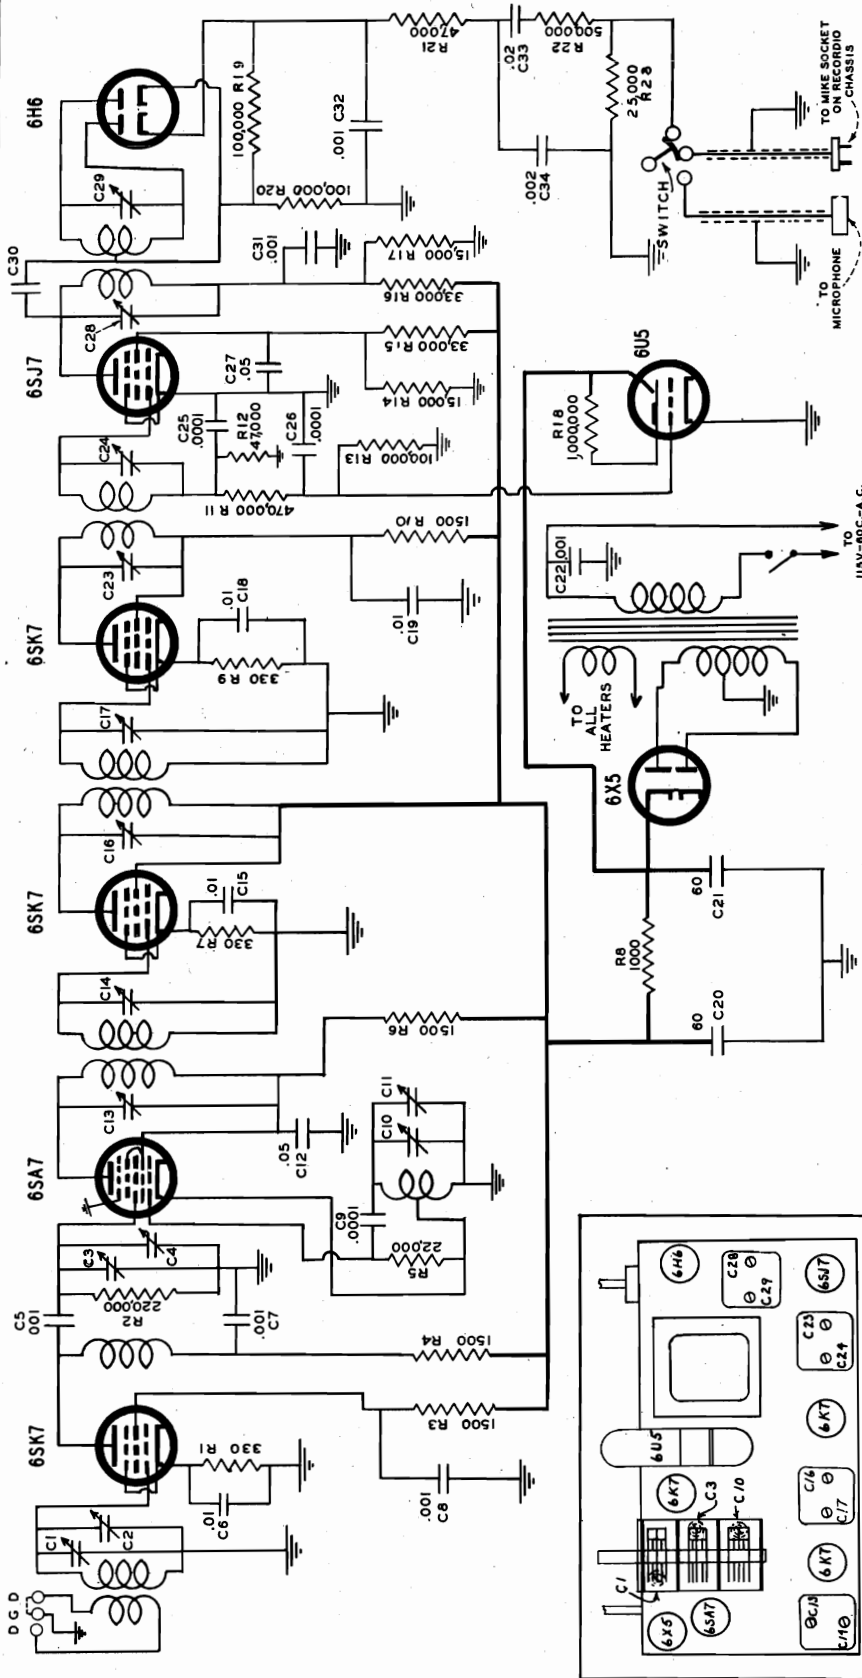

Check the alignment of the pointer with reference line below the 550-kc mark on the scale.

The Oscillator trimmer C2 is on the front section of the gang condenser.

DISCRIMINATOR ALIGNMENT

Connect the audio output leads of the F. M. unit to any convenient audio amplifier or "Phono" plug of any receiver, and connect an output meter (having a low range of 1 to 5 Volts) across the voice coil of the speaker. Temporarily increase the gain of the 6SJ7 limiter tube by shunting a 2,000 ohm resistor across the transformer, No. 01860. Apply a 4.3 mc. signal to the grid of the limiter tube through an .05 mfd. coupling condenser.

When a Frequency Modulated signal is used for aligning the Discriminator, the adjustment is made for maximum output in much the same manner as the conventional alignment of a 456 KC (AM) I. F. transformer on an AM signal, but if only an AM generator is available for aligning the Discriminator, the primary is aligned for maximum output and the secondary for balance or zero output, since one of the functions of the Discriminator is to eliminate amplitude modulated signals.

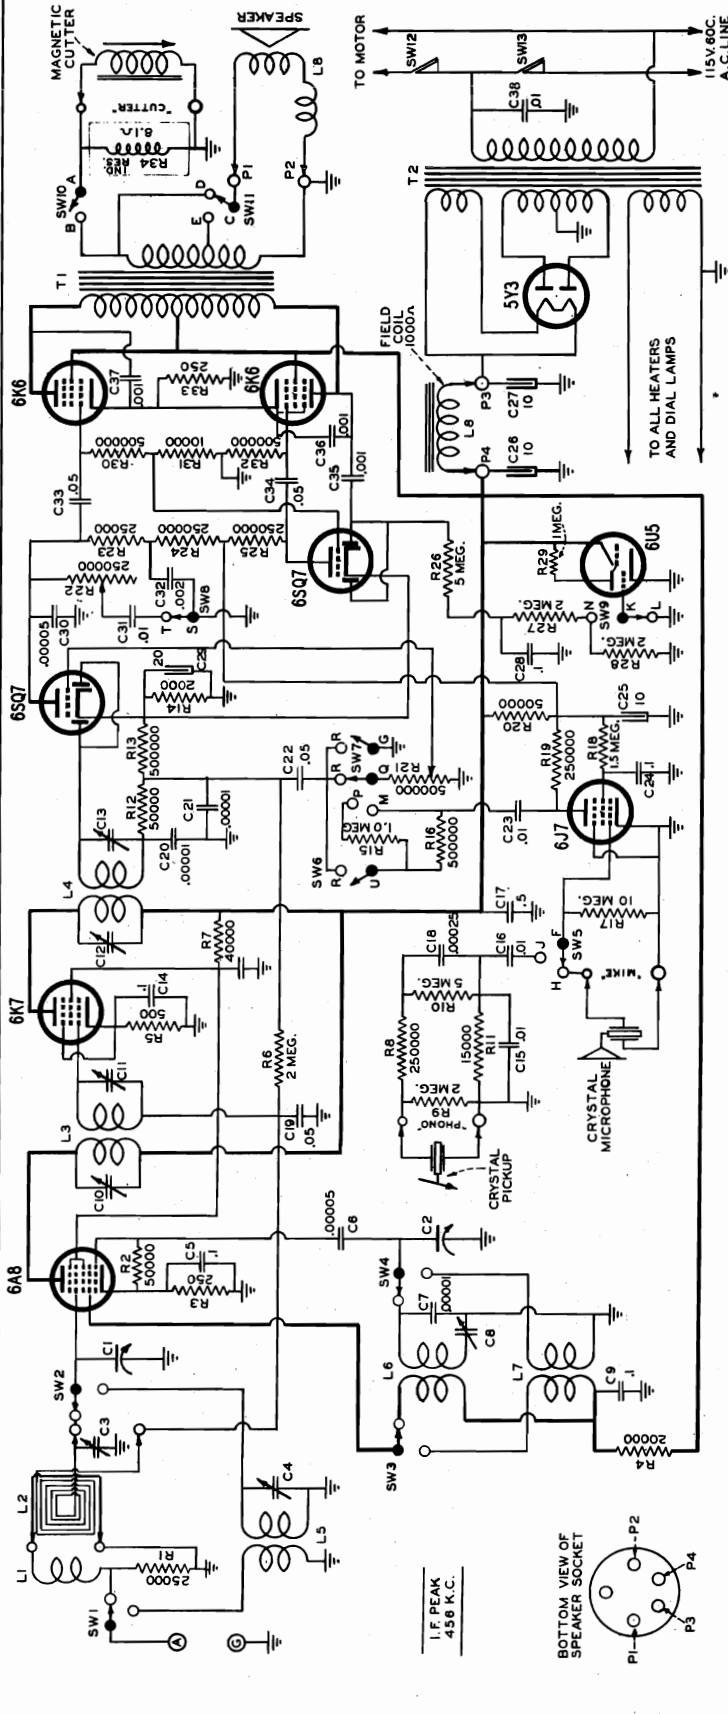

In tuning the secondary of the discriminator there are three places of minimum response; (1) out of resonance with the condenser too tight, (2) CORRECT, and (3) out of resonance, with the condenser too loose. The proper minimum has the characteristic that the signal rises very rapidly as the trimmer is turned IN EITHER DIRECTION. The other two minima mentioned above DO NOT have this characteristic and are incorrect. The trimmer farthest from the 6SJ7 tube tunes the secondary of the discriminator and by slowly rotating this trimmer the point of minimum audio response will be found and will indicate correct alignment of this trimmer. Now MISTUNE this trimmer as little as possible but enough to hear a signal and to obtain an output meter indication with which to align the primary trimmer for MAXIMUM response. Leaving the secondary trimmer mistuned, to assist in the I. F. alignment, move the signal input to the grid of the second 6SK7 I.F. amplifier tube, and align this stage, always reducing input as sensitivity increases so as to remain below the level at which the "Limiter" works. Unless this precaution is observed, the resonance indication is broadened. In the same way align the remaining I.F. transformers finishing with the signal applied to the 6SA7 grid. The SECONDARY of the discriminator may now be retuned to minimum response and the 2000 ohm shunt resistor removed, completing the I.F. alignment.

R. F. ALIGNMENT

For reasons of stability, the oscillator in the F.M. unit operates on the low side of R.F. signal. Because of the high intermediate frequency (4.3 mc) there is no possibility of aligning the oscillator on the image. If there is reason to believe that the trimmers are badly out of alignment, a very practical initial adjustment would be to adjust ALL THREE TRIMMERS to a position about one-fourth turn from maximum capacity. Then apply a 48 mc. signal (or equivalent harmonic of some lower frequency) to the antenna terminals of the Receptor through a dummy antenna of 200 to 400 ohms, set the pointer to 48 mc. and adjust the trimmer on the center (oscillator) section of the gang condenser to give the maximum response OF THE TUNING EYE. Align the antenna (front) and R.F. (rear) trimmers for maximum response and check the sensitivity at various points within the band. When properly aligned the antenna and oscillator trimmers are about one-fourth turn from maximum capacity with the R. F. trimmer about two turns from minimum.

WILCOX-GAY CORP.

An OUTPUT METER or other indicating device should be used for accuracy in making ganging adjustments.

If an output meter is not available, the magic eye (6U5) may be used as an output indicator as follows:

FIG. 2

- (a) Depress push button "To Record Radio".
- (b) Disconnect cutting head from chassis.
- (c) Adjust volume control to near maximum.

- (1) Connect signal generator to control grid of 6A8 tube and chassis.

SIGNAL GENERATOR FREQUENCY	DIAL POSITION	WAVE BAND SWITCH POSITION	TRIMMER NUMBER
456 K.C.	1500 K.C.	Broadcast	2nd. I.F. - Sec.* C13
" "	" "	"	" " - Pri. C12
" "	" "	"	1st. I.F. - Sec. C11
" "	" "	"	" " - Pri. C10

- (2) Connect signal generator to ANT. and GND. terminals.

Turn condenser gang to full maximum capacity and check position of dial pointer with reference line on the scale, 530 K.C. calibration.

600 K.C.	600 K.C.	Broadcast	L.F. Pad. (C-3)
1400 K.C.	1400 K.C.	"	Osc. (C-2)
1400 K.C.	1400 K.C.	"	Det. Trimmer on Loop
Not Used**	15-16 M.C.	Short Wave	Trimmer (C-4)

It is advisable to repeat the entire alignment procedure to correct the slight effect one adjustment may have upon the other.

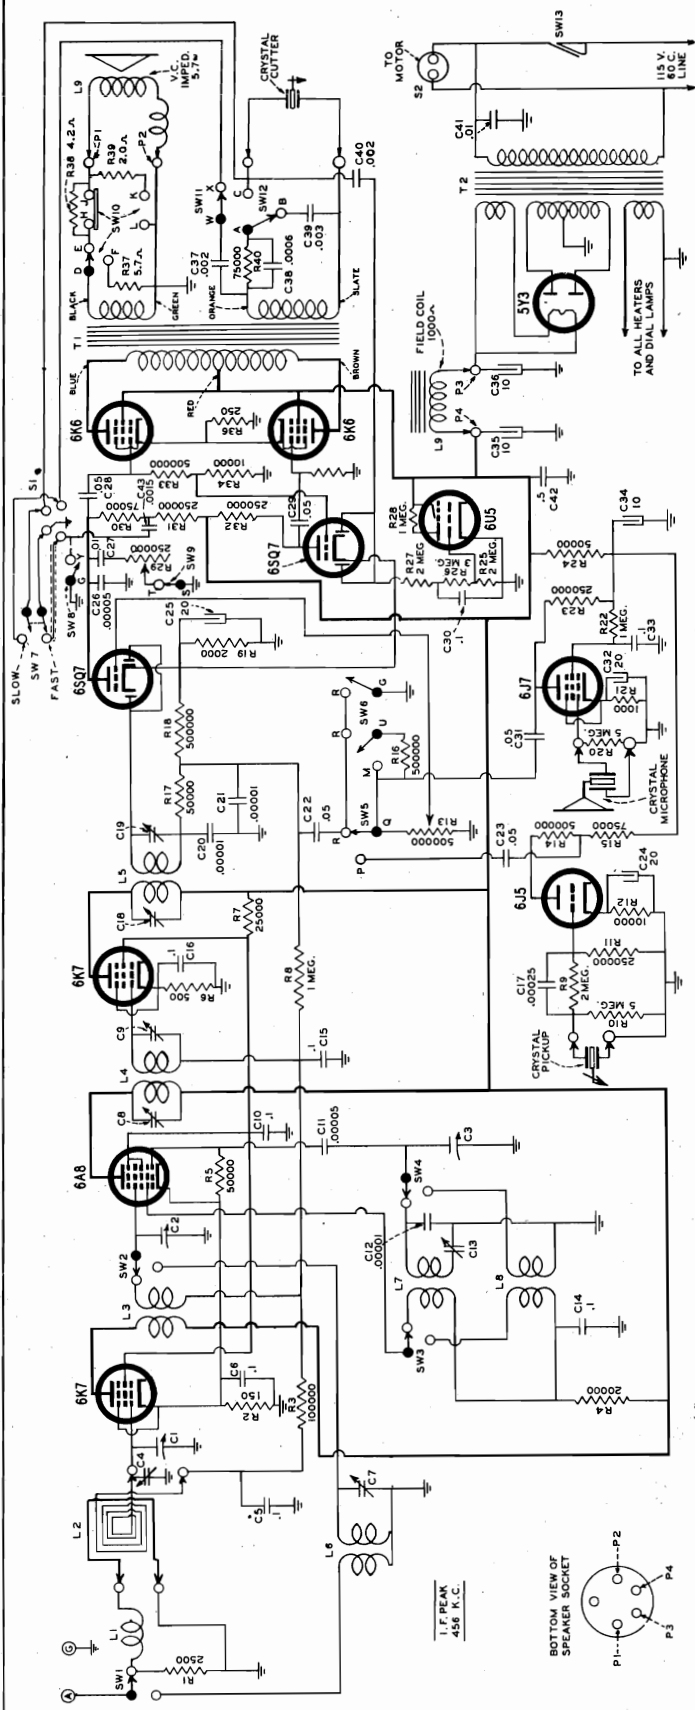

As resonance is approached by adjustment of the trimmers, the signal generator attenuator should be adjusted for a minimum signal that will provide a low reading on the output indicator.

* If the trimming condenser on the secondary of the second I.F. transformer is adjusted throughout its full range, two "peaks" will be observed. The correct peak is the one of lowest capacity in the adjustment of the trimmer. The I.F. trimming condensers when properly adjusted will rest at approximately one and one half turns from the fully closed position.

** Connect antenna to receiver, and adjust dial so that no station is received. Advance volume control until a fair volume of noise is received. Adjust trimmer for greatest noise.

Volume Control - Minimum
All Voltage Measurements
made from noted point
to ground (chassis) except
as noted.

WILCOX-GAY CORP.

An OUTPUT METER or other indicating device should be used for accuracy in making ganging adjustments.

If an output meter is not available, the magic eye (6U5) may be used as an output indicator as follows:

- (a) Depress push button "To Record Radio".
- (b) Disconnect cutting head from chassis.
- (c) Adjust volume control to near maximum.

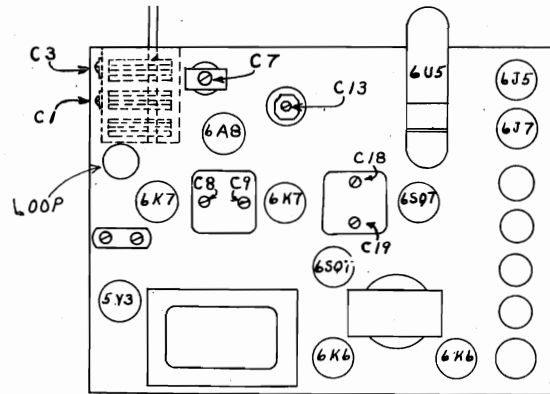

FIG. 3

Connect signal generator to control grid of 6A8 tube. Make connection to side of middle section (C3) of condenser gang. (Fig. 11)

SIGNAL GENERATOR FREQUENCY	DIAL POSITION	WAVE BAND SWITCH POSITION	TRIMMER NUMBER
456 K.C.	1500 K.C.	Broadcast	2nd I.F. - C19
" "	" "	"	" " - C18
" "	" "	"	1st I.F. - C 9
" "	" "	"	" " - C 8

Connect signal generator to ANT. and GND. terminals.

600 K.C.	600 K.C.	Broadcast	L.F. Pad (C-13)*
1400 K.C.	1400 K.C.	"	Osc. (C- 3)
1400 K.C.	1400 K.C.	"	Det. (C- 1)
1400 K.C.	1400 K.C.	"	Trimmer on Loop (P-2)
Not Used**	15-16 M.C.	Short Wave	R.F. (C- 7)

As resonance is approached by adjustment of the trimmers, the signal generator attenuator should be adjusted for a minimum signal that will provide a low reading on the output indicator.

It is advisable to repeat the entire alignment procedure to correct the slight effect one adjustment may have upon the other.

* First note the position of the dial pointer with the condenser gang turned to full maximum capacity. The left edge of the pointer should be slightly to the right of the last dial graduation.

In adjusting the L.F. Pad.(C-13) rock the condenser gang back and forth across the 600 K.C. signal and note that maximum output meter reading coincides with the 600 K.C. dial graduation. If the dial reading is other than 600 K.C., reset the dial pointer on the dial cord, to read 600 K.C. at maximum output meter indication.

** Connect antenna to receiver, and adjust dial so that no station is received. Advance volume control until a fair volume of noise is received. Adjust trimmer (C-7) for greatest noise.

ALIGNMENT INSTRUCTIONS

Chassis No. 4B01

FOR ALIGNMENT FREQUENCIES AND OTHER DATA SEE ZENITH PAGE 12-30 IN RIDER'S VOLUME XII.

The following ALIGNMENT PROCEDURE on Model 4K600 POKETRADIO must be carefully followed using a #MS-652 Zenith Alignment Jig to maintain actual shielding capacities during the balancing operations.

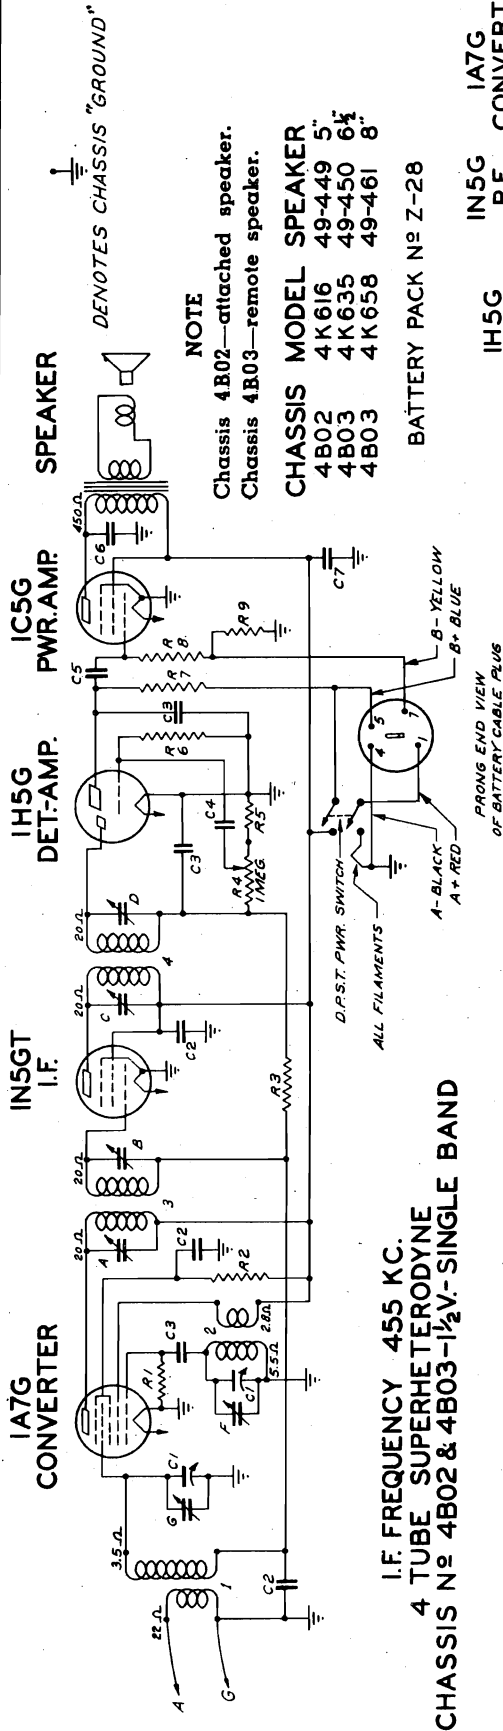

- Remove back of receiver.
- Remove "B" batteries.
- Remove case of receiver.

To remove case; first place receiver on bench with lid down, then place screw driver under spring clips and pry up, at the same time pulling case away from chassis. After spring clips have been released the case can be lifted off chassis. Next remove clips by turning and pulling away from chassis. Do not remove "A" Batteries. Place chassis in Alignment Jig as shown in Figure 1.

Connect one lead from the output meter to the bare jumper connecting the plates of the output tube (1S4) and the other output meter lead to B+ at the battery (blue wire). CAUTION — Keep signal from generator at minimum so A.V.C. action will not give a false peak.

I.F. Alignment Procedure

- 1—Remove the top and bottom covers from the receiver.
- 2—Place the receiver in the Manual tuning position and set the pointer at the low frequency end of the dial (540 Kc.).
- 3—Set the signal generator at 265 Kc.
- 4—Apply the signal from the generator through a .1 mfd. dummy to the 7B8 converter grid.
- 5—Adjust trimmers A-B-C and D (Fig. 8) for maximum output. Repeat the operation to assure accurate alignment.

R.F. and Oscillator

- 1—Set the signal generator at 1640 Kc.
- 2—Connect the signal generator leads, through the dummy as illustrated in Figure 10, to the antenna receptacle on the receiver.
- 3—Set the receiver dial at 1640 Kc. (Maximum high frequency end of dial).
- 4—Screw the cores completely out of the antenna, R.F. and oscillator coils.
- 5—Set the oscillator trimmer (F—Fig. 9) at 1640 Kc.
- 6—Peak the R.F. and antenna trimmers (G and H—Fig. 8-9) for maximum output reading.

- 7—Replace the cores to their approximate original positions in the antenna, R.F. and oscillator coils.
- 8—Set the generator and the receiver dial at 1200 Kc.
- 9—Adjust the oscillator core (6—Fig. 9) to scale at 1200 Kc.
- 10—Adjust the antenna and R.F. cores (1 and 2—Fig. 8) for maximum output reading.
- 11—Set the signal generator at 600 Kc.
- 12—"Rock in" the Shunt oscillator core (4—Fig. 9) for maximum output reading. (Same as rocking in the padder condenser on a ganged condenser receiver.)
- 13—Check receiver at 1200 Kc. for calibration and gain. If the receiver is off scale or weak, repeat operations 9 and 10.

IMPORTANT: When reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature before checking the antenna trimmer alignment on a weak station at approximately 1200 Kc.

Figure 9 shows the approximate voltages as measured with a 1000 ohm per volt meter measured between the socket terminals and the chassis. Volume control set at maximum with no signal.

Battery Voltage — 6.3.

Power consumption 80 watts.
Maximum audio power output 6 watts.

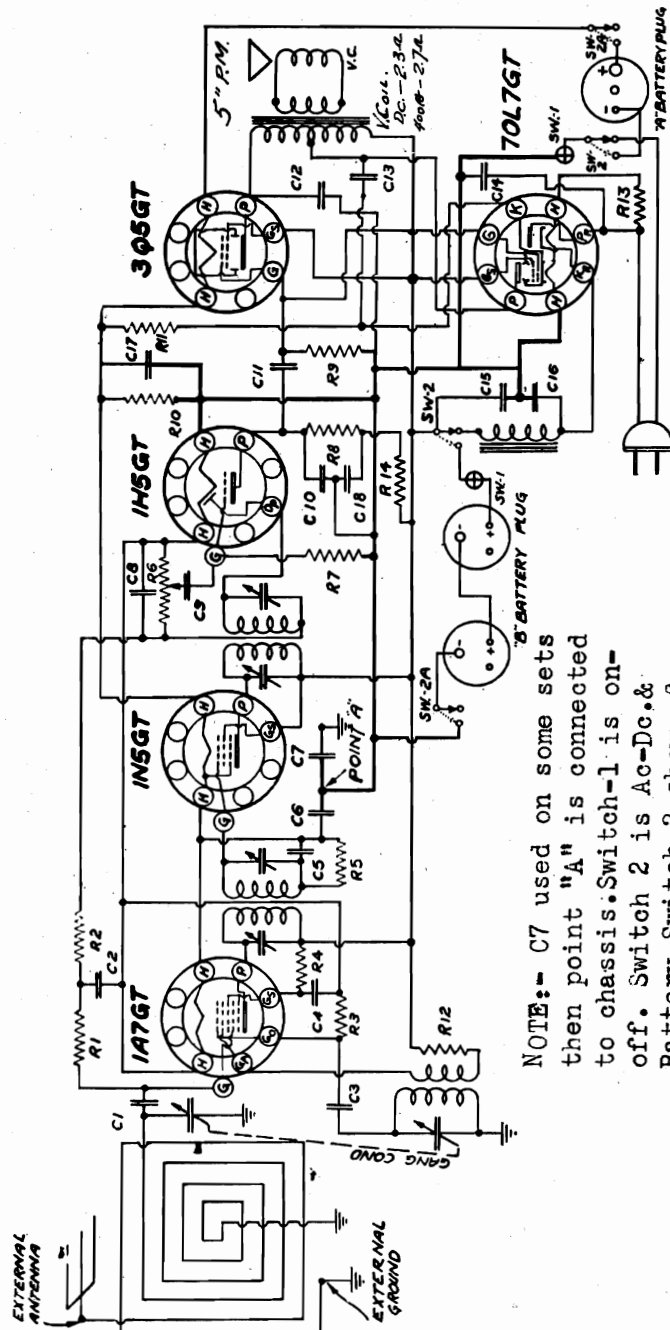

Operation	Connect oscillator to	Dummy Antenna	Input Sig. Frequency	Trimmers	Purpose
1	Coil side of Cl. See Schematic	.5 mfd.	250 Kc.	C	Align for max. deflec. across 1/2 discrim. load
2	"	"	"	D	Align for zero deflec. across full discrim. load
3	"	"	"	A	Align for max. deflec. across 1/2 discrim. load
4	"	"	"	G	Align for max. deflec. across 1/2 discrim. load
5	Repeat step No. 2 and then remove oscillator leads.				
6	If the tone quality of the remote speaker is impaired, the frequency of the 6AD7C transmitter will have to be reset in the following manner: Align F. (see 22B1 trimmer locations) for zero deflection across the full discriminator load of the remote receiver and then align F. for maximum deflection across 1/2 of the discriminator load. If F. tunes broad it is an indication that the remote speaker is located too close to the transmitter and the action of the limiter is making the correct peak adjustment.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400 just the test oscillator to 456 KC and connect the output to the grid and 1720 KC and an output meter to be connected across the of the first detector tube (12A8GT) through a .05 or .1 mfd. primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum the chassis ground. Align all three I.F. trimmers to peak or maximum and the test oscillator output as low as possible to prevent the hum reading on the output meter. AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. Remove the chassis from the cabinet and set on a bench taking care that no iron or other metal is near the loop. Do not make this setup on a metal bench. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to the antenna of the set through a 200 mmfd. (.0002) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1720 K.C. and adjust the oscillator (or 1720 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

Voltages shown on the circuit diagram are from socket terminals to chassis base. In measuring voltages use a voltmeter having a resistance of at least 1000 ohms per volt. Allowances should be made for variations in line voltage.

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

DESCRIPTION

These are six tube superheterodyne receivers designed for use on 110-120 volts, 50 or 60 cycles, alternating current. The basic circuit of these models is the same and the following general instructions apply to all above listed models.

INSTALLATION

This receiver may be used with the Built-In antenna where receiving conditions are favorable. Where greater distance is required, or where receiving conditions are not satisfactory with the Built-In antenna, an outside antenna may be used. This outside antenna should be from 50 to 100 feet in length and should be connected to the blue wire accessible at the back of the cabinet. This antenna should be run in as straight a line as possible and be kept clear of wires or other metal objects. A good ground connection to a water pipe is essential for clearest reception. The ground lead should be connected to the black wire extending from the rear of the chassis.

CONTROLS

The control on the left side of the cabinet is the volume control and ON and OFF switch when in the extreme left position. Next to the volume control is the tone control which controls the high frequency response. When turned to the left the full tone range of the program is reproduced. Turning the control to the right diminishes the higher frequency response. A position approximately one quarter turn from the left is satisfactory for most programs. On the right of the receiver is located the station selector, or tuning control. On receiver models 465, 468, and 471 a small switch knob below the middle of the dial controls the bass and treble response. When turned to the left the lower frequency response is reduced. In this position reproduction of the voice frequencies is generally improved. When the switch is turned to the right the bass response is emphasized. This condition is usually more acceptable for musical programs. An operation switch is provided on models 465 and 471 for changing the functions of the receiver as noted on the control escutcheon. On the back of the chassis an antenna switch is provided for changing the connections of the receiver to the Built-In antenna or to the Outside Antenna when one is connected.

OPERATION

With the line cord connected turn the volume control about one half turn to the right and allow about one half minute for the tubes to properly heat. Select the desired station with the tuning control, varying the control until the tuning indicator produces the narrowest shadow. Adjust the volume control to the desired level and the tone control for the most pleasing response. For best quality be certain the station is properly tuned in as indicated by the tuning indicator.

AUTOMATIC PUSH BUTTON TUNING - MODELS 464, 469 and 470

The push buttons are adjusted for selecting five stations as indicated by the call letters over the buttons. To receive any one of these stations, turn on the receiver as described above and depress the button corresponding to the desired station. Adjust the volume to the intensity required. To use the tuning control for selecting the stations, depress the DIAL button. Directions for changing the push button station set up are attached to the bottom of the cabinet.

PHONOGRAPH COMBINATION MODEL 465

This model is provided with a record player which reproduces up to 12 inch recordings with the cabinet top closed. To change to phonograph operation turn the operation switch to the Phono position and after turning up the volume - ON and OFF switch, start the motor with the motor switch located in the top of the cabinet. Volume and tone may be adjusted as with the radio operation.

SERVICE DATA

The antenna switch on the back of the receiver changes the input circuit to either the enclosed loop antenna or to an outside aerial. The trimmer for this circuit is on the rear section of the variable condenser, while the oscillator trimmer is on the front section of the variable condenser. Trimmers for the I.F. circuits are adjustable through holes on the tops of the I.F. transformer shields. The intermediate frequency is 455 K.C.

Trimmers for the push button circuits are accessible through an opening in the bottom of the cabinet. The lowest frequency range sections are on the left.

The following tubes are used in this receiver:

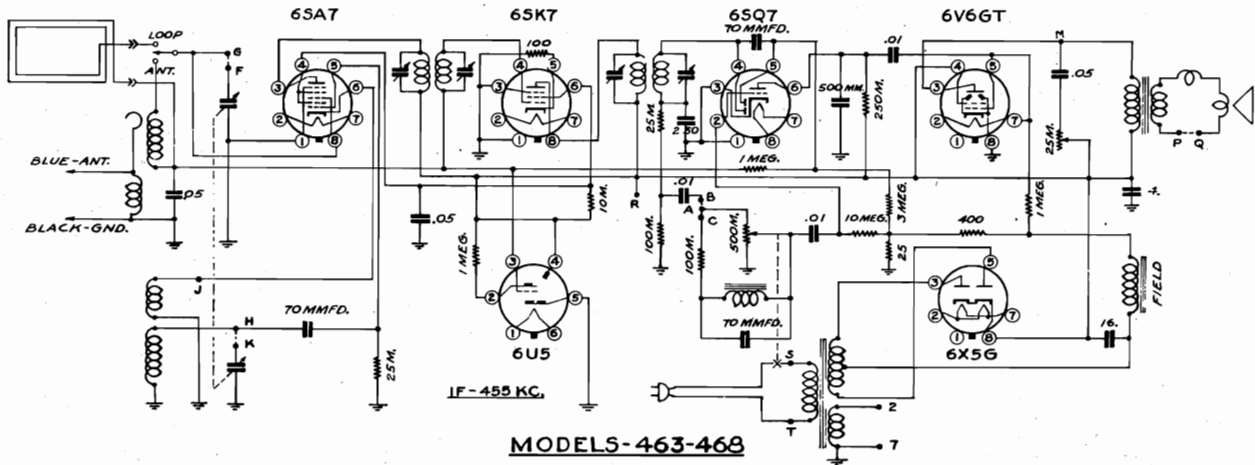

- 6SA7 - Mixer Oscillator
 - 6SK7 - I.F. Amplifier
 - 6SQ7 - Detector - A.F. Amplifier
 - 6V6GT - Power Amplifier
 - 6X5G - Rectifier
 - 6SU5 - Tuning Indicator
 - 6J7 - Microphone Amplifier (Model 471)
- Type 46 dial lamps

Voltage Readings

ALIGNMENT PROCEDURE:

Set the pointer to 1500 K. C. Connect the generator leads to the 1A7G grid and to the chassis thru a .1 Mfd. condenser. Adjust the I.F. trimmers for maximum output indication.

Connect the generator leads to the 1A7G grid and to the chassis thru a .1 Mfd. condenser. Set the signal generator at 1400 KC., and set the receiver pointer at 1400 KC. Adjust the BC. oscillator shunt trimmer for resonance.

Couple the generator loosely to the set and adjust the BC. loop antenna trimmer at 1400 KC. for maximum output.

NOTE: POWER AUTOMATICALLY TURNED "OFF" WHEN CABINET BACK PANEL IS REMOVED. (INTERLOCK SWITCH).

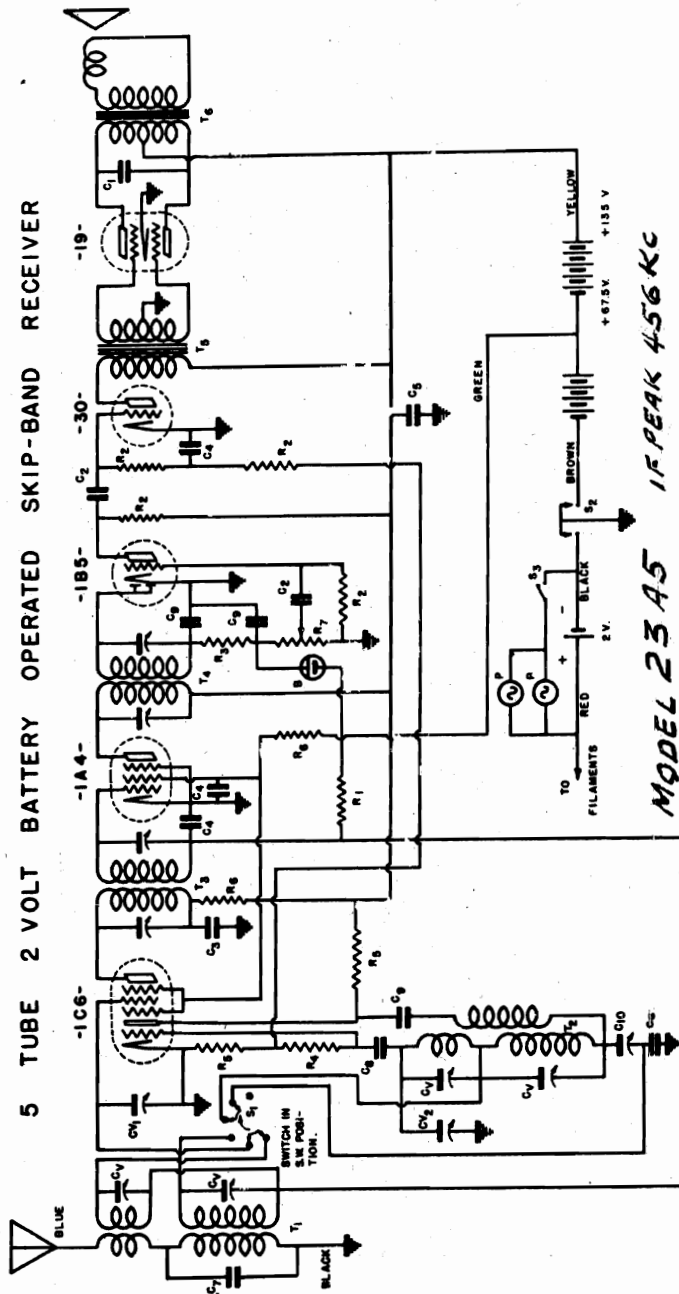

TECHNICAL INSTRUCTIONS:

A good output meter should be used in all alignment adjustments. This meter should be of the high resistance A. C. type, and is connected across the voice coil of the speaker, using the low voltage range of the meter. (0 to 1.5 or 2 volts). Use the lowest possible readings in order to minimize the A. V. C. effect.
