8	F.M.		103 MC.	RESONANCE (APPROX. 103 ON DIAL).	C 2 (ANTENNA TRIMMER) ROCK VARIABLE FOR MAXIMUM SIGNAL

SERVICE AND ALIGNMENT INSTRUCTIONS

This receiver has been carefully aligned in the factory and the circuit is unusually stable. Realigning should only be attempted when necessary and only with a proper signal generator and in accordance with the service instructions. The receiver cannot be aligned on modulated signals. To insure proper broadcast alignment it is recommended to use a radiated signal. To radiate the signal connect a loop of about 6" to 8" diameter 1 turn of #14 or #12 wire across the output of the signal generator and place this loop parallel to the loop of the receiver to be aligned at a distance of 8" or 10". For complete alignment instructions on AM and FM Bands see alignment chart.

ALIGNMENT

Equipment required: Modulated r-f signal generator, output meter, insulated screw driver, two .1 mfd. 400 volt condensers, one 300 ohm resistor. An FM signal generator is not required for the alignment of this receiver.

With the receiver removed from the cabinet connect output meter across voice coil. Connect ground side of the signal generator in series with a .1/400 volt condenser to the common B—; turn volume control fully on, and keeping the output of the signal generator as low as possible, proceed in the sequence as shown on the alignment chart.

Before aligning, close the variable condenser fully counter clockwise (plates fully closed) and check that pointer coincides with the reference line. (horizontal line running through center of dial).

SERVICE AND ALIGNMENT INSTRUCTIONS

For tube replacement it is not necessary to remove the chassis from its cabinet. Tilt cabinet forward and the tubes will be accessible through the opening in the cabinet bottom. To service this receiver it is necessary to remove the motorboard first and then remove the chassis through the top opening of the cabinet. To do this unfasten the screws holding the motorboard in place, lift the entire motorboard with the record changer, disconnect motor and pick-up plugs from chassis and remove motorboard. Now unsolder the leads from the chassis on the loop, or remove the screw holding the loop to the cabinet side to permit removal of the loop with the chassis. The chassis can now be removed by unfastening the two (2) screws holding it to the base plate. WHEN REMOVING THE CHANGER BE SURE TO PLACE IT IN A POSITION WHEREBY THE CHANGER MECHANISM WILL NOT BE DAMAGED.

To insure proper alignment it is suggested to use a radiated signal. To radiate a signal connect a loop of about 6" to 8" diameter, (one turn of #14 or #12 wire) across the output of the signal generator and place this loop parallel to the loop of the receiver to be aligned, at a distance of about 8" or 10". While aligning keep the distance between the receiver loop and the chassis approximately equal to their distance when assembled in their cabinet.

ALIGNMENT:

Equipment Required: Modulated r-f signal generator; output meter; insulated screw driver; one .1 mfd 400 volts and one 50 mmfd 400 volts condenser; one radiation loop.

With the receiver removed from the cabinet, connect output meter across voice coil. Turn volume control fully on, and keeping the output of the signal generator as low as possible, proceed in the sequence as shown on the alignment chart.

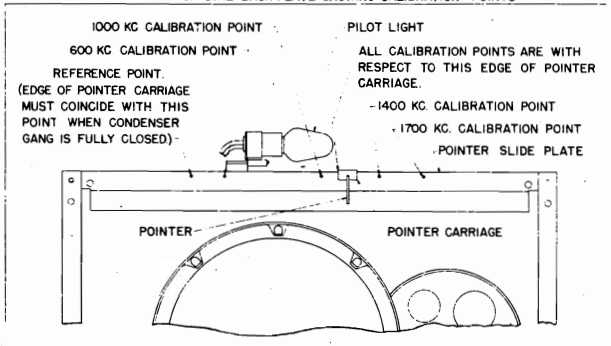
To facilitate alignment of the receiver when removed from cabinet, calibration points are provided on the pointer slide bar (see drawing).

Before aligning, close the variable condenser fully counterclockwise (plates fully closed) and check that edge of pointer carriage coincides with the "reference line" on the pointer slidebar.

ALIGNMENT PROCEDURE CHART

STEP	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO-	SET SIGNAL GENERATOR TO-	SET EDGE OF POINTER CARRIAGE TO-	ADJUST THE FOLLOWING FOR MAXIMUM OUTPUT. (KEEP SIGNAL FROM SIGNAL GENERATOR AS LOW AS POSSIBLE)
1	R.F. SECTION OF VARIABLE CONDENSER IN SERIES WITH A .1 MFD, 400 VOLT CONDENSER.	455 KC.	EXTREME RIGHTHAND POSITION. (CONDENSER PLATES FULLY OPEN.)	C6, C5, C4, C3 AND REPEAT IN SAME ORDER. (1ST. AND 2ND. I.F. TRANSFORMERS)
2	USE RADIATED SIGNAL (CONNECT BOTH SIDES OF SIGNAL GENERATOR TO RADIATION LOOP.)	1400 KC.	1400 KC. CALIBRATION POINT.	C2 AND C1 OSCILLATOR AND R.F. TRIMMERS
3		600 KC.	RESONANCE (APPROXIMATELY 600KC. CALIBRATION POINT.)	CHECK THAT EDGE OF POINTER CARRIAGE (AT RESONANCE) COINCIDES WITH 600 KC. CALIBRATION POINT.

FRONT VIEW OF DIAL BACK-PLATE SHOWING CALIBRATION POINTS



The pick-up is of the low pressure crystal type and is equipped with a permanent type needle which will give about 4,000 playings before requiring replacement. When first used a pronounced needle scratch will be heard which will be greatly reduced after about twenty playings. This "breaking-in-period" is essential on all needles of the permanent type in order to permit the point to become polished.

17	F.M.		102 MC.	102 MC. ON DIAL.	OUTPUT METER ACROSS SPEAKER VOICE COIL.	L3 (R.F. COIL) FOR MAXIMUM OUTPUT.
						L2 (ANTENNA COIL) FOR MAXIMUM OUTPUT.

The pick-up is of the low-pressure crystal type and is equipped with a permanent needle which will give about 4,000 playings before requiring replacement. When first used a pronounced needle scratch will be heard which will be greatly reduced after about twenty playings. This "breaking in" period is essential on all needles of the permanent type in order to permit the point to become polished.

This instrument is equipped with a sensitive 9 tube plus rectifier superheterodyne receiver. The rotatable built-in loop antenna will provide satisfactory reception under all normal operating conditions. The loop is mounted between springs, so that it can be freely rotated to the best position for reception. Once this position is established it is no longer necessary to make any further loop adjustments. The directional characteristic of the loop is particularly useful for the elimination of elevator noises or other local electrical disturbances.

SERVICE AND ALIGNMENT INSTRUCTIONS

To remove the chassis from the console, it is first necessary to disconnect the loop connector plug, the female connector plug on the speaker, the phono input plug, the motor plug and the two F.M. lugs on the F.M. antenna terminal post. Then remove the four knobs and the four screws holding the chassis to its mounting panel.

CAUTION: WHEN REMOVING THE CHANGER BE SURE TO PLACE IT IN A POSITION IN WHICH THE CHANGER MECHANISM WILL NOT BE DAMAGED.

ALIGNMENT

Equipment Required: Modulated a-m, r-f signal generator; modulated f-m signal generator covering the range from 88 to 108 megacycles; vacuum tube voltmeter; output meter; insulated screw driver; radiation loop (1 turn of about 6" to 8" diameter of #12 or #14 wire connected across output of signal generator and placed parallel to receiver loop about 8" or 10" away); one .1 mfd 400 volt condenser; two 150 ohm resistors.

With the receiver removed from the cabinet, connect output meter, or vacuum tube voltmeter and signal generator as indicated in the alignment procedure chart and keeping the output of the generator as low as possible, proceed exactly in the sequence as shown on the chart.

Before aligning, close the variable condenser fully counter clockwise (plates fully closed) and check that pointer coincides with the reference line on the dial.

ALIGNMENT PROCEDURE CHART

Power Requirement: 105-125 Volts a-c 60 cycles

Power Consumption: Receiver on a-m: 103 watts
Receiver with Record Changer: 120 watts

To remove the chassis from the console, it is first necessary to disconnect the loop connector plug, the female connector plug on the speaker, the phono input plug, the motor plug and the two F.M. lugs on the F.M. antenna terminal post. Then remove the four knobs and the four screws holding the chassis to its mounting panel.

CAUTION: WHEN REMOVING THE CHANGER BE SURE TO PLACE IT IN A POSITION IN WHICH THE CHANGER MECHANISM WILL NOT BE DAMAGED.

ALIGNMENT

Equipment Required: Modulated a-m, r-f signal generator; modulated f-m signal generator covering the range from 88 to 108 megacycles; vacuum tube voltmeter; output meter; insulated screw driver; radiation loop (1 turn of about 6" to 8" diameter of #12 or #14 wire connected across output of signal generator and placed parallel to receiver loop about 8" or 10" away); one .1 mfd 400 volt condenser; two 150 ohm resistors.

With the receiver removed from the cabinet, connect output meter, or vacuum tube voltmeter and signal generator as indicated in the alignment procedure chart and keeping the output of the generator as low as possible, proceed exactly in the sequence as shown on the chart.

Before aligning, close the variable condenser fully counter clockwise (plates fully closed) and check that pointer coincides with the reference line on the dial.

OLYMPIC RADIO & TELEV. INC.

MODELS 8-925, 8-934, 8-936

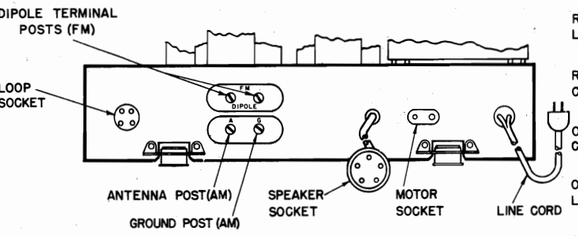
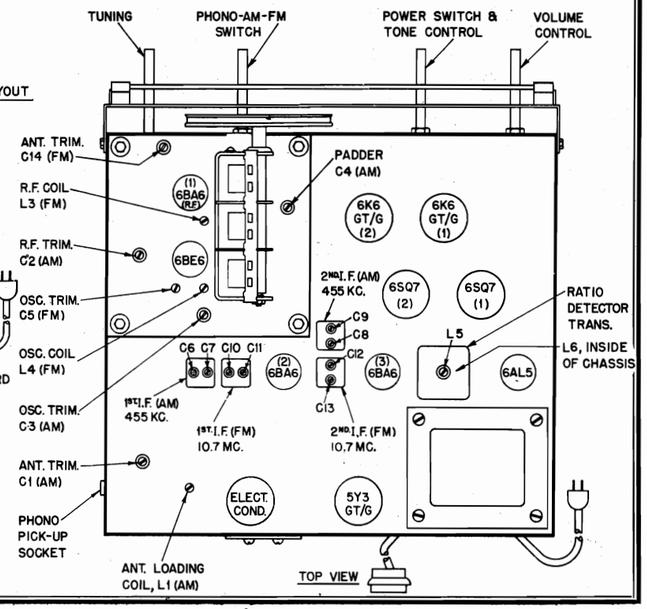
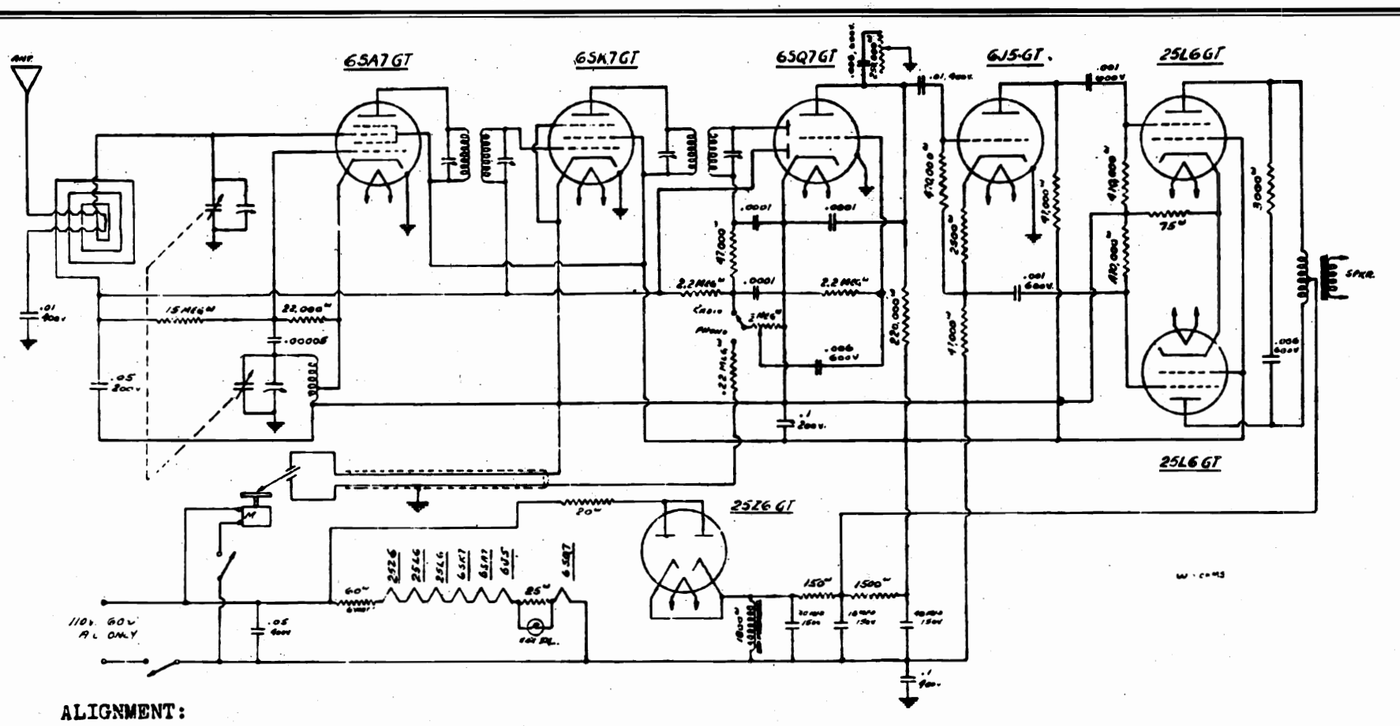
TUBE & TRIMMER LAYOUT





RECORD CHANGERS: For 8-925, Webster Model 156, RCD.CH. 19-1; For 8-934, 8-936, Seeburg Model K, RCD.CH. 15-2



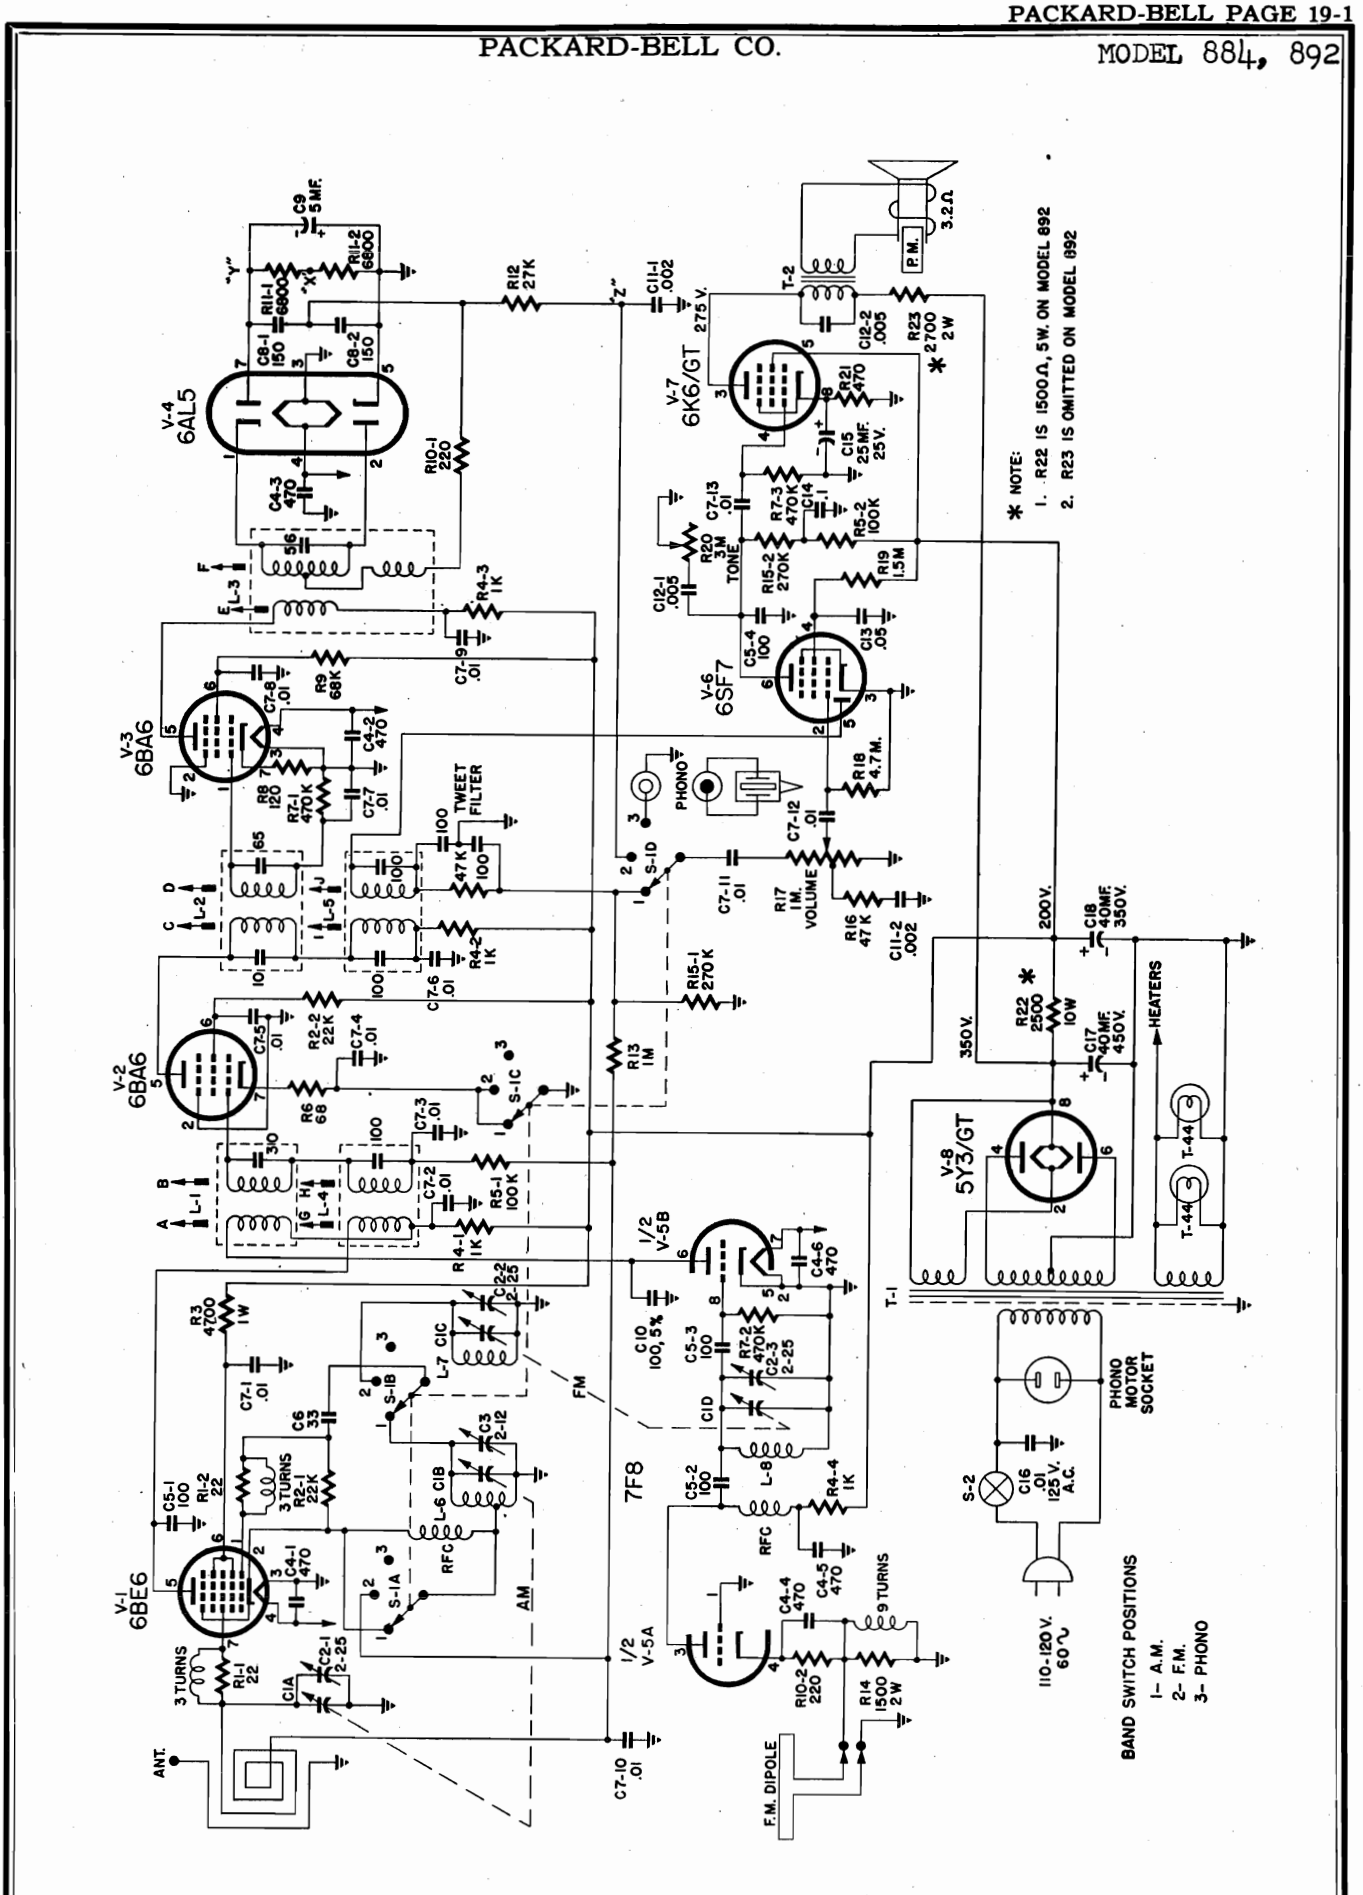
ALIGNMENT:

Should it be necessary to re-align the receiver, proceed in the usual manner by first adjusting the I.F. transformers for maximum output as indicated by an output meter connected across the plate and B-bus through a series condenser.

NOTE:---This chassis is wired with a common negative bus instead of grounding directly to the chassis and therefore all negative connections are to be made to the B-bus instead of the chassis. In connecting the signal generator connect the high side to the antenna section of the tuning condenser and the low side to the B-bus. Now rotate the dial to 1500 K.C. and with a 1500 K.C. signal radiating from a dummy loop of the signal generator first adjust the oscillator trimmer for maximum output and follow with an adjustment of the antenna trimmer for maximum output. No further adjustments are required.

PACKARD-BELL CO.

MODEL 884, 892



MODEL 884, 892 PACKARD-BELL CO.

SPECIFICATIONS

Overall Dimensions:

	884	892		884	892
Height	12⅛"	34¼"	Depth	16¼"	21½"
Width	18¼"	21¼"	Weight	35 Lbs.	85 Lbs.

Electrical Rating:

Line Voltage . . . . 110-120 volts, 50-60 cycle, A.C.
Power Consumption . . 75 watts

Tuning Frequency Range:

AM . . . . . 540 to 1620 KC
FM . . . . . 87.5 to 108.5 MC

Intermediate Frequency:

AM . . . . . 455 KC
FM . . . . . 10.7 MC

Electrical Output:

Maximum . . . . . 2 watts

Loudspeaker:

	884	892
Type	Permanent Magnet	
Outside Cone Dia.	6½"	10"
Voice Coil Impedance	3.2 ohms at 400 cycles	
Magnet Rating	2.15 Oz. Alnico V	3.16 Oz. Alnico V

Tubes:

Tube	No.	Function
6BE6	V-1	Oscillator & AM Converter
6BA6	V-2	I-F Amplifier
6BA6	V-3	FM Driver
6AL5	V-4	FM Detector
7F8	V-5A, B	FM R-F Amplifier & Converter
6SF7	V-6	AM Detector & Audio
6K6/GT	V-7	Power Amplifier
5Y3/GT	V-8	Rectifier

GENERAL INFORMATION

Models 884 and 892 are combination AM-FM radio phonograph receivers. Model 884 is housed in a wooden table model cabinet, and model 892 in a wooden consolette cabinet. The chassis wiring in each model is the same except as noted in the schematic diagram. Both models employ a specially designed "Hi-Q" loop antenna and a permanent magnet dynamic speaker.

For information concerning the record changer, refer to Webster Model 148 Automatic Record Changer Service Manual.

SPECIAL SERVICE INFORMATION

Stage Gain Measurements — AM

Measurements taken with volume and tone controls maximum. Switch in Radio position.

Standard Output . . . . . 50 milliwatts
Dummy Antenna . . . . . 200 Mmf.
Antenna to Converter Grid . . . . 4X at 1000 KC
Converter Grid to 1st I-F Grid . . 40X at 455 KC
1st I-F Grid to 2nd Detector . . . 125X at 455 KC
Overall Audio Gain . . 18 MV into phono socket for 50 MW output at 1000 cycles

Stage Gain Measurements — FM

Dummy Antenna . . . 270 ohms
Dipole to Converter Grid . . . . 5X at 98 MC
Converter Grid to 1st I-F Grid . . 70X at 10.7 MC
I-F Grid to Driver Grid . . . . . 33X at 10.7 MC

Oscillator Cathode Voltages:

AM		FM	
1500 KC	3.5 volts AC	108 MC	1.4 volts AC
1000 KC	3.0 volts AC	98 MC	1.4 volts AC
600 KC	2.9 volts AC	88 MC	1.8 volts AC

D.C. Resistance Measurements:

AM 1st & 2nd I-F Coils
Primary . . . . . 20 ohms
Secondary . . . . . 20 ohms
FM I-F windings about 1.0 ohm.
Oscillator Coil
Ground to Tap . . . 1.0 ohm
Ground to Finish . . . 9.0 ohms

NOTE: Due to the variation in winding methods, the D.C. resistance on all coils is subject to a 20% tolerance.

ALIGNMENT PROCEDURE — AM

Alignment procedure consists of the 3 steps outlined in the Alignment Chart. Connect the test oscillator leads to the mixer grid and ground in series with an .01 Mfd. Capacitor for step No. 1, I-F Alignment.

Use the Hazeltine Standard Test Loop No. 1150 or a reasonable substitute for the balance of the alignment. Place the test loop about two feet from the receiver loop in a vertical position.

NOTE: Make certain that each alignment step is done with a minimum input signal.

ALIGNMENT CHART — AM

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAX. OUTPUT
1	6BE6 Grid & Gnd. .01 Mfd. Capac.	455 KC	540 KC	Trimmers G, H, I, J
2	Standard Test Loop	1620 KC	1620 KC	Trimmer L to 1620
3	Standard Test Loop	1500 KC	1500 KC	Trimmer K

ALIGNMENT PROCEDURE — FM

Connect a Vacuum Tube Voltmeter between points X and Y on schematic diagram, and a Center-Zero meter between points X and Z on schematic diagram.

ALIGNMENT CHART — FM

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST
1	Terminals 1 & 8 of 7F8	10.7 MC	88 MC	A, B, C, D, E for max. on V.T.V.M. & F for zero on Center-Zero meter
2	Repeat Step No. 1			
3	Dipole Terminals thru 300 ohms	108 MC	108 MC	N & M for max. on V.T.V.M.

NOTE: 1. Rock the variable condenser when adjusting M, step 3.
2. Reset F for zero if necessary, to coincide with max. on V.T.V.M. after step 3.

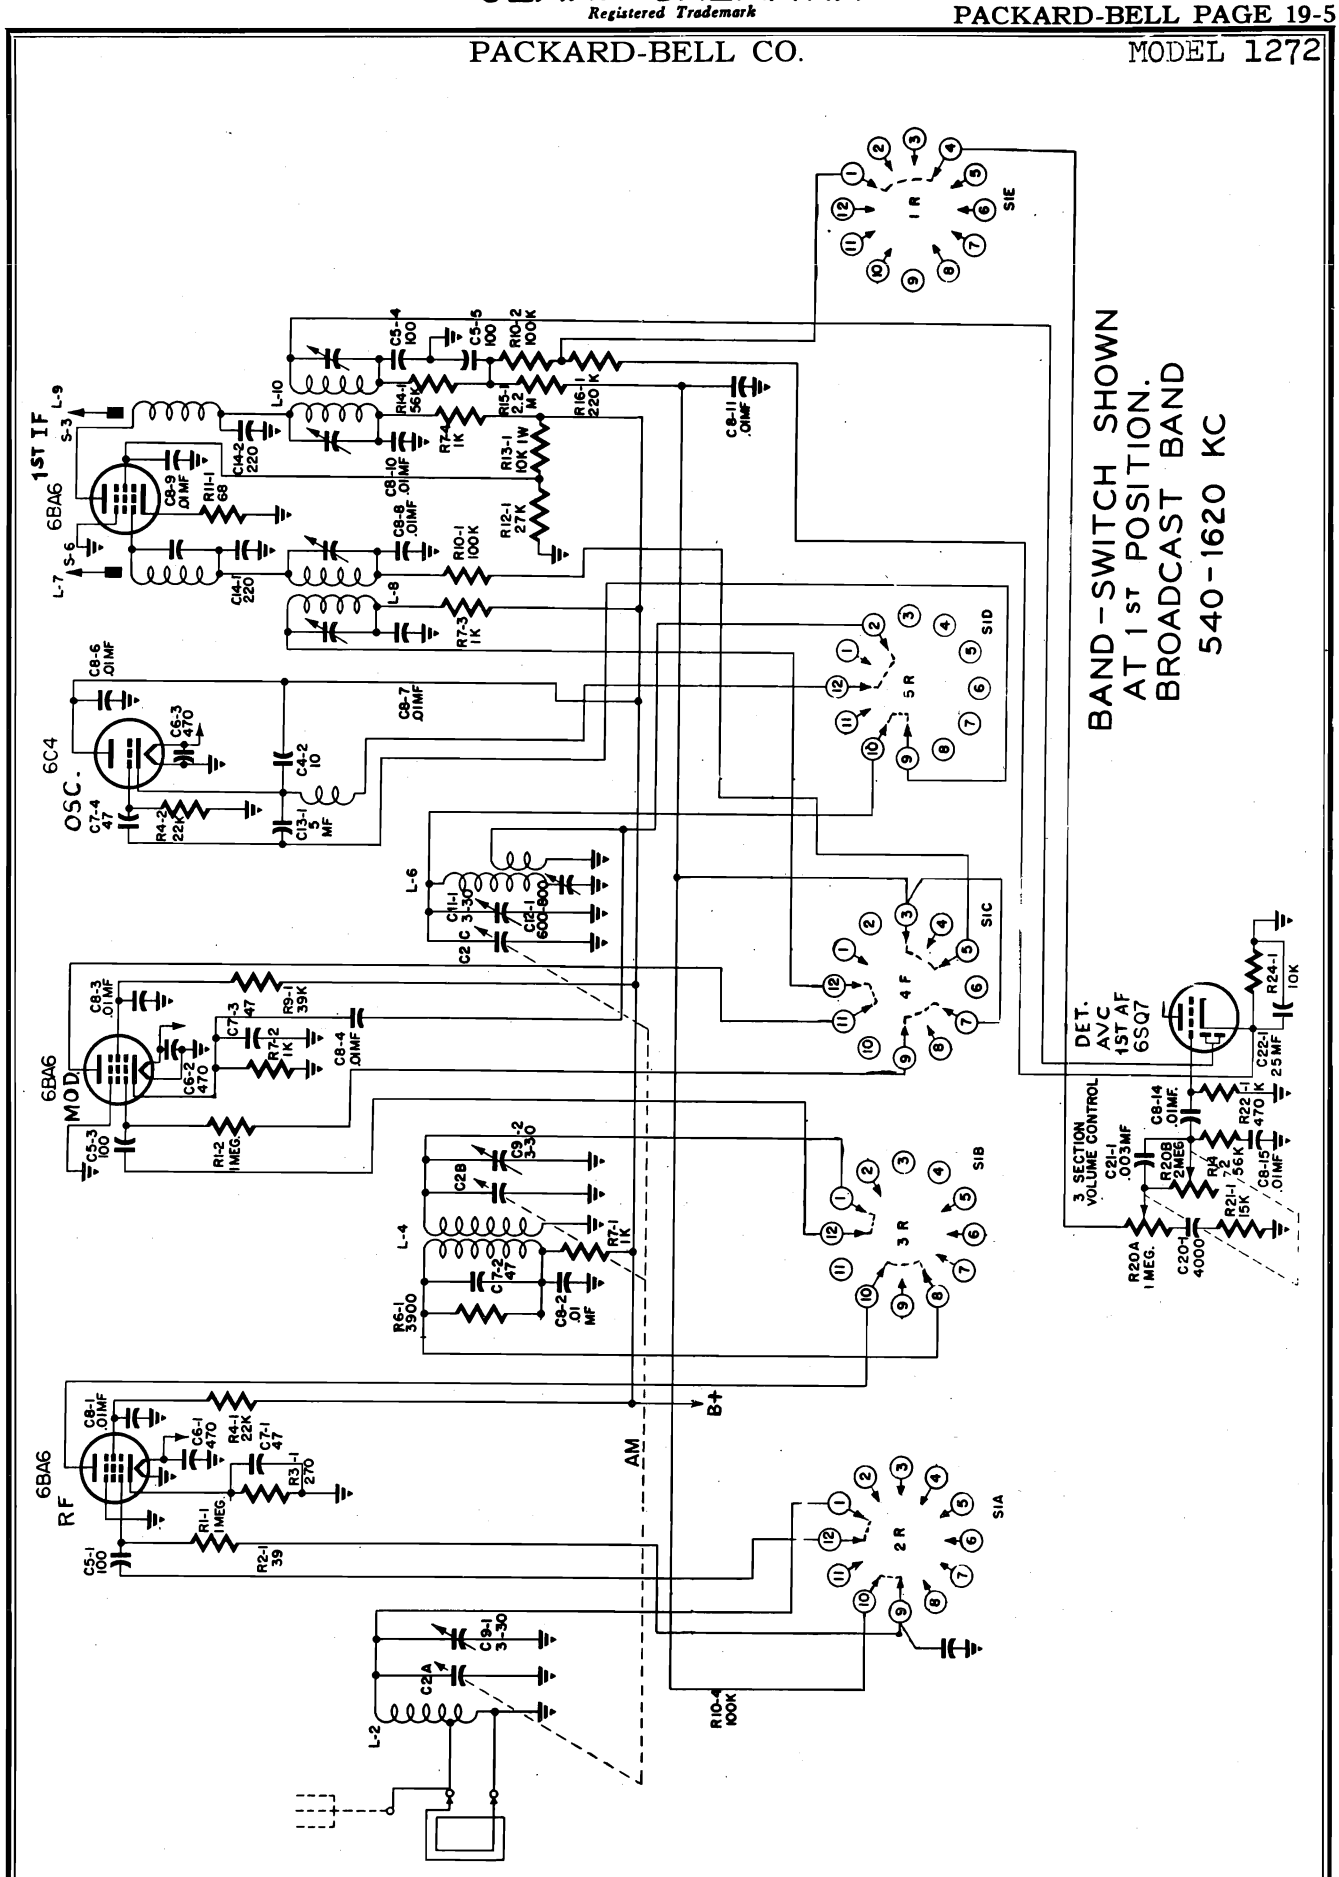
Intermediate Frequency:
AM.....455 Kc
FM.....10.7 Mc

Tuning Frequency Range:
Standard Broadcast.....540 to 1620 Kc
Frequency Modulation.....87.5 to 108.5 Mc

SCHEMATIC NOTES: 1. Switch is shown in broadcast position.
2. Switching from left to right is broadcast, frequency modulation and phono.

RECORD CHANGER: Webster Model 56, RCD.CH. 15-10

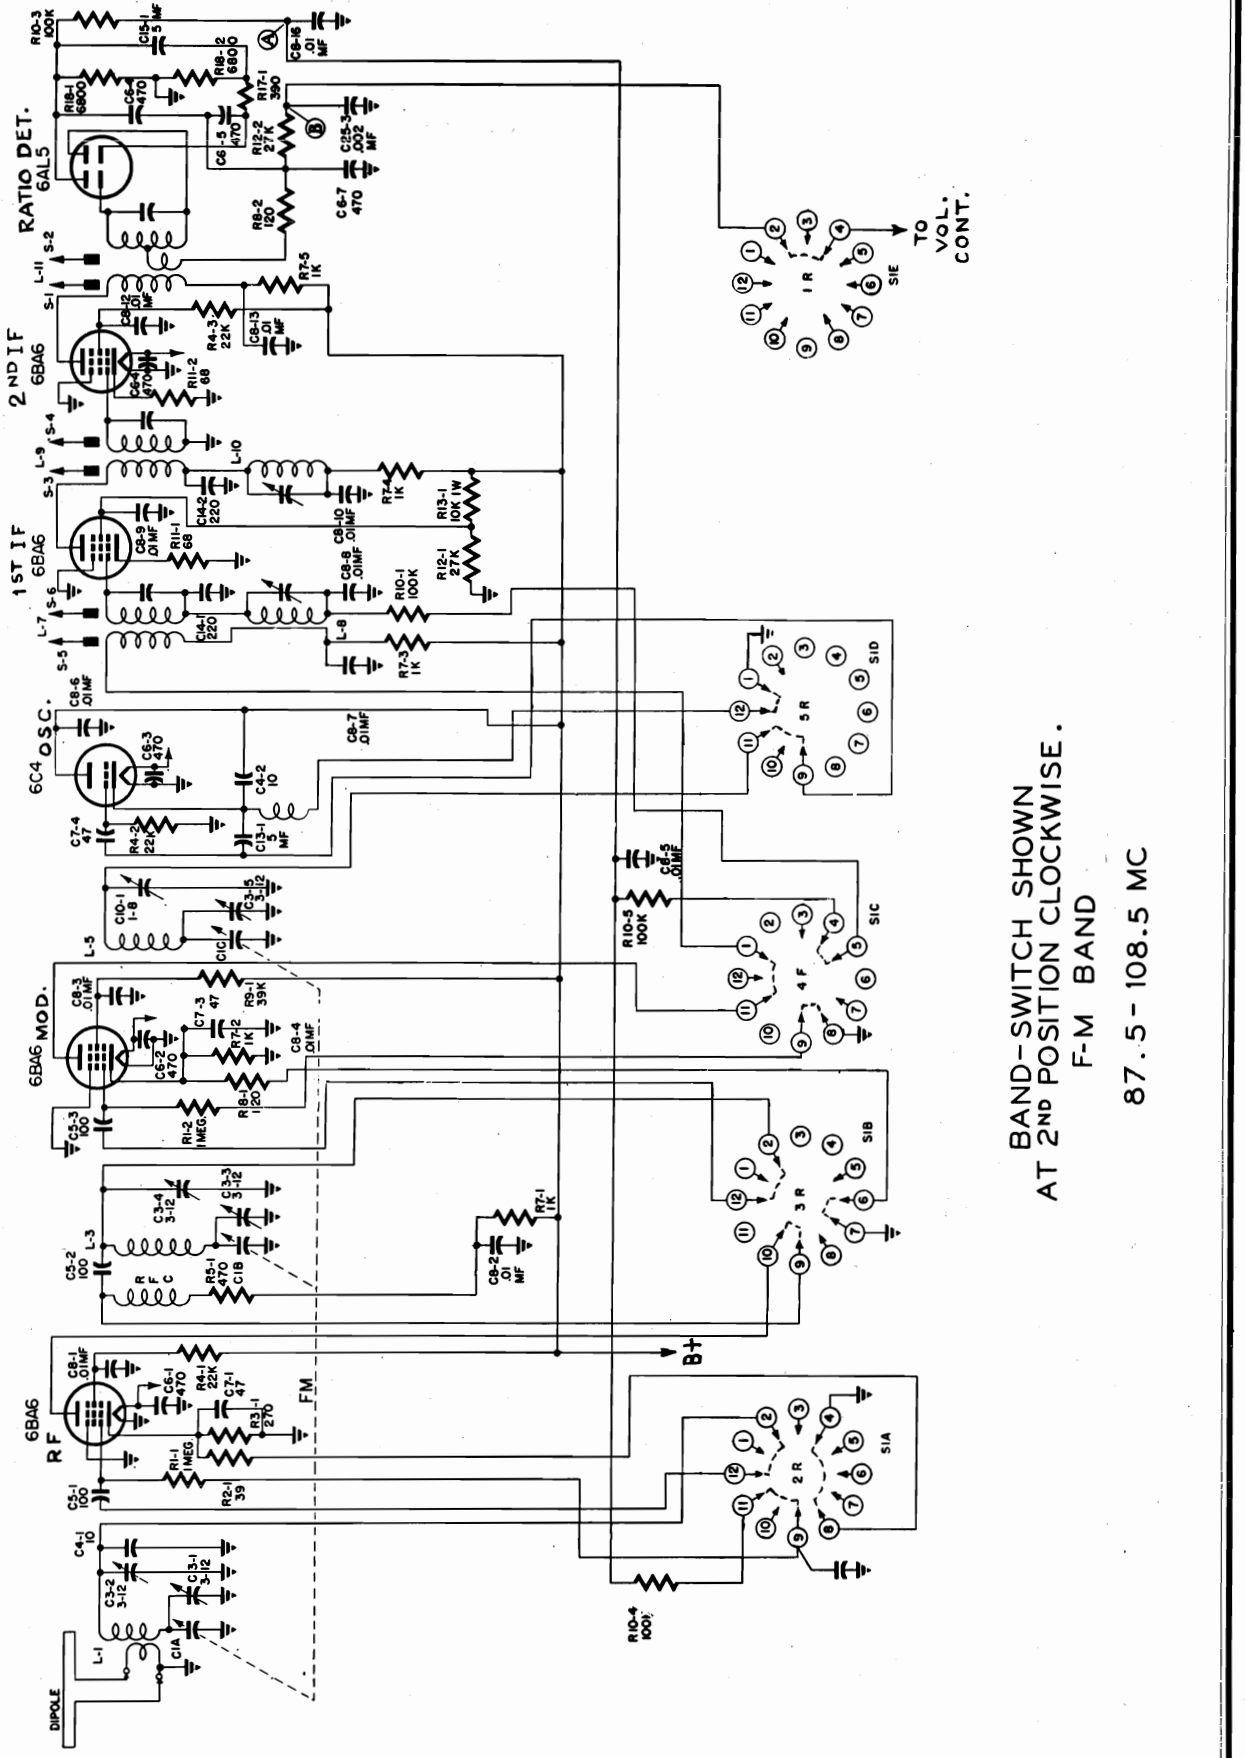
PACKARD-BELL CO. MODEL 1272



CLARI-SKEMATIX
Registered Trademark

MODEL 1272

PACKARD-BELL CO.



PACKARD-BELL CO. MODEL 1272

GENERAL INFORMATION

Model 1272 is a 2 band console radio phonograph combination with Standard Broadcast and Frequency Modulation. It has 12 tubes including the rectifier and tuning eye, and employs a 12 inch permanent magnet speaker.

Listed below are some of the features included in this model:

1. Standard Broadcast and Frequency modulation bands
2. Phonograph with automatic record changer.
3. Tuning eye for accurate tuning of stations.

NOTE: R-23 which is called out 330 ohms, 2 watts in the schematic may be two 680 ohm, 1 watt resistors in parallel. Either is satisfactory.

SPECIAL SERVICE INFORMATION

Stage Gain Measurements: A M

Measurements taken with volume and tone controls maximum. Band Switch in Standard Broadcast position.

AVC shorted out.

Standard Output	50 milliwatts
Dummy Antenna	200 Mmf.
Antenna Post to R.F. Grid	12X at 1000 Kc
R.F. Grid to Converter Grid	6X at 1000 Kc
Converter Grid to 1st I.F. Grid	30X at 455 Kc
1st I.F. Grid to 2nd Detector	100X at 455 Kc
Overall Audio Gain	5000X at 1 watt 400 cycles

Stage Gain Measurements: F M

Measurements taken with volume and tone controls maximum. Band Switch in Frequency Modulation position.

AVC shorted out.

Dummy Antenna	270 ohms
Dipole Terminal to R.F. Grid	9X at 98 Mc
R.F. Grid to Converter Grid	7X at 98 Mc
Converter Grid to 1st I.F. Grid	49X at 10.7 Mc
1st I.F. Grid to Driver Grid	35X at 10.7 Mc

OSCILLATOR CATHODE VOLTAGES:

Measured at 117 Volts AC line voltage with AC vacuum tube voltmeter input loading above 10 Megohms.

1620 KC	3.5 volts AC
1300 KC	3.3 volts AC
750 KC	2.5 volts AC
550 KC	2.2 volts AC

OSCILLATOR GRID CURRENT: FM

Measured at 117 volt line voltage with DC microammeter connected in series with ground end of the 22,000 ohm grid resistor.

108 MC	180 microamps
98 MC	300 microamps
88 MC	440 microamps

D.C. RESISTANCE MEASUREMENTS:

I.F. COILS

1st I.F.		2nd I.F.	
Primary	17 ohms	Primary	10 ohms
Secondary	10 ohms	Secondary	17 ohms*

*Note: To obtain the true reading of the secondary of the 2nd I.F. coil it must be removed from the can. This is so because of the 56,000 ohm resistor in series with the AVC lead inside the can.

OSCILLATOR COIL

Primary	1 ohm
Secondary	6 ohms

ANTENNA COIL

Start to Finish	12.2 ohms
Start to Tap	10.5 ohms

R.F. COIL

Primary	5.8 ohms
Secondary	4.2 ohms

NOTE: Due to the variation of winding methods, the D.C. resistance on all coils is subject to a 20% tolerance.

Loudspeaker:

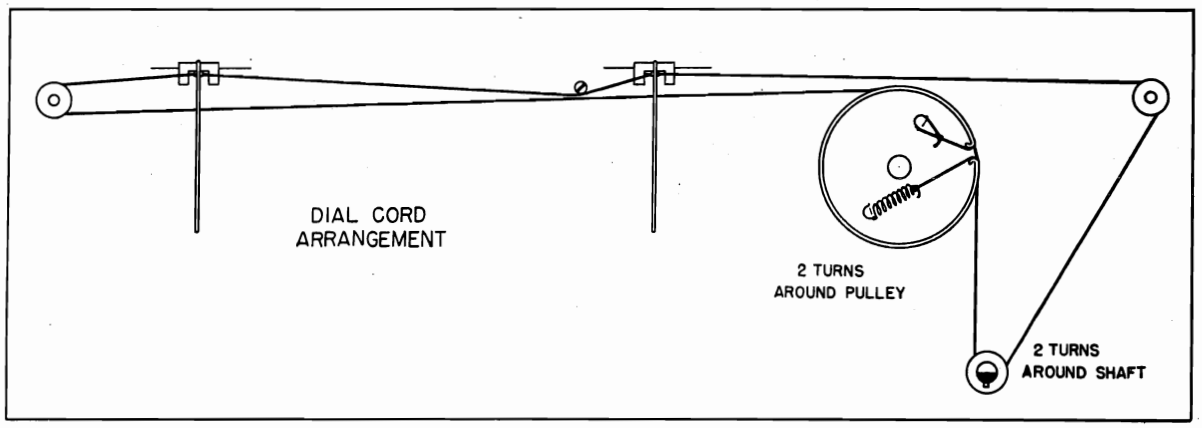
Type	Permanent magnet
Outside Cone Diameter	12"
Voice Coil Impedance	3.2 ohms at 400 cycles
Magnet Rating	6.8 oz. Alnico 5

Tubes:

TUBE	No.	FUNCTION
6BA6	V-1	R.F. Amplifier
6BA6	V-2	Modulator
6C4	V-3	Oscillator
6BA6	V-4	1st I.F. Amplifier
6BA6	V-5	2nd I.F. Amplifier
6AL5	V-6	Detector
6SQ7	V-7	Audio Amplifier
6SN7-GT	V-8	Inverter
6V6-GT	V-9	Power Amplifier
6V6-GT	V-10	Power Amplifier
5Y3-GT	V-11	Rectifier
6U5-6G5	V-12	Tuning Eye

Electrical Rating:

Line Voltage	110 - 120 volts 50-60 cycle AC
Power Consumption	120 watts



Dial Cord Arrangement

MODEL 1272 PACKARD-BELL CO.

ALIGNMENT PROCEDURE

Alignment procedure consists of the steps outlined in the Alignment Chart. Make certain that each allignment step is done with a minimum input signal.

ALIGNMENT CHART AM

Step	Connect Test Osc. to	Test Osc. Setting	Pointer Setting	Adjust for Max. Output
Step	Connect Test Osc. to	Test Osc. Setting	Pointer Setting	Adjust for Max. Output
1	Mixer grid & ground	455 Kc	540 Kc	Trimmers A,B,C,D
2	R.F. grid & ground	1500 Kc	1500 Kc	Trimmers F & G
3	R.F. grid & ground	600 Kc	600 Kc	Trimmer E
4	Repeat Step No. 2			
5	Standard Test loop	1500 Kc	1500 Kc	Trimmer H
6	Check stationizing. Slide pointer on string if stations are uniformily off in one direction.			

NOTE: 1. Rock variable condenser for step 3.
2. Standard Test Loop is Hazeltine #1150 or a reasonable substitue.

EQUIPMENT REQUIRED FOR FM ALIGNMENT

1. Signal generator capable of generating signals at 10.7 Mc, and from 88 to 108 Mc.
2. Vacuum tube voltmeter connected to point "A" (on schematic).
3. Center-zero D.C. voltmeter connected to point "B" (on schematic).

ALIGNMENT CHART FM

ALIGNMENT PROCEDURE

Step	Connect Test Osc. to	Test Osc. Setting	Pointer Setting	Adjust for Max. Output
1	R.F. grid & ground	10.7 Mc	88 Mc	S-1,S-3,S-4 S-5,S-6
2	Adjust S-2 for zero on zero-center meter.			
3	Repeat Steps 1 and 2.			
4	Doublet Terminals thru 270 ohms	88 Mc	88 Mc	Trimmers I, K, M
5	Doublet Terminals thru 270 ohms	108 Mc	108 Mc	Trimmers J, L, M
6	Repeat Step No. 4.			

NOTE: 1. Rock variable condenser for step 4.

Voltage Chart

No signal
117 volts A.C. line voltage.
Switch in Standard Broadcast position.

All voltages shown are positive D.C. except heater voltages which are all 5.8 V.A.C.

A.C. voltages measured with a 1000 ohm per volt A.C. meter. Volume and tone controls maximum.

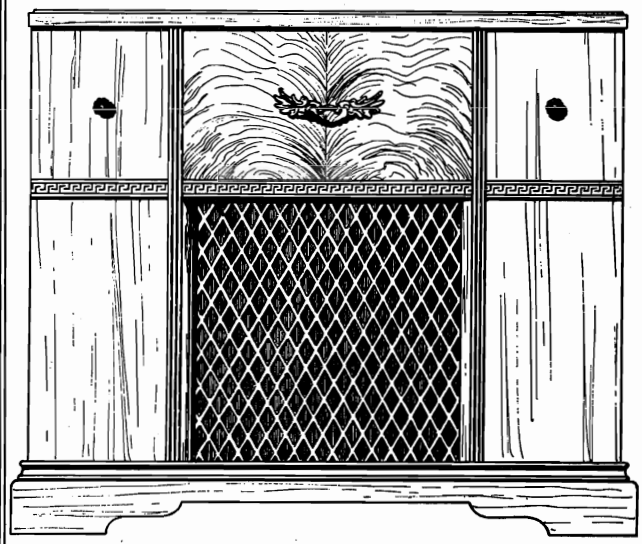
PACKARD-BELL CO. MODEL 1273



Electrical Rating:
Line Voltage . . . . . 110–120 volts 50–60 cycle AC
Power Consumption . . 110 watts including phonograph

Tuning Frequency Range:
Standard Broadcast . . 540 to 1620 Kc
Frequency Modulation . 87.5 to 108.5 Mc.

Intermediate Frequency:
AM . . . . . 455 Kc
FM . . . . . 10.7 Mc

Loudspeaker:
Type . . . . . Permanent Magnet
Outside Cone Diameter . 12″
Voice Coil Impedance . 3.2 ohms at 400 cycles
Magnet Rating . . . . 6.8 Oz. Alnico V

Tubes:

Tube:	No.:	Function:
6BA6	V-1	R.F. Amplifier
6BA6	V-2	Mixer
6BA6	V-3	I.F. Amplifier
6BA6	V-4	Driver
6AL5	V-5	F.M. Detector
6H6	V-6	A.M. Detector—AVC
6SF7	V-7	Audio Amplifier
6SN7-GT	V-8	Phase Inverter
6C4	V-9	Oscillator
6V6-GT	V-10	Output
6V6-GT	V-11	Output
5Y3-GT	V-12	Rectifier
6U5-6G5	V-13	Tuning Eye

GENERAL INFORMATION

Model 1273 is a 2 band console PhonOcord. It has 13 tubes including the rectifier and tuning eye, and employes a 12-inch speaker.

Listed below are some of the features included in this model:

1. Standard Broadcast from 540 to 1620 Kc.
2. Frequency Modulation from 87.5 to 108.5 Mc.
3. Tuning Eye for accurate tuning of stations.
4. Home recording combined with an automatic record changer.

In an early run of this model, R-4 connected to the Plate of the 6C4 instead of to R-5. Also you may find two 680 ohm resistors in place of the 330 ohm 2 watt resistor. Either is satisfactory.

RECORDING HEAD PRESSURE

The proper recording head pressure is 1¼ oz. Adjustment of this pressure is made by turning the small screw on the top of the recording arm. This adjustment is very critical and should be made in quarter turns. TURN THE SCREW CLOCKWISE TO INCREASE THE CUTTING DEPTH and COUNTERCLOCKWISE TO DECREASE THE CUTTING DEPTH.

This adjustment is made at the factory with an ordinary postal scale, consequently, field adjustments should be made in a like manner.

BRIEF DESCRIPTION OF COMPRESSION CIRCUIT

One diode section of the 6H6 serves as the compressor rectifier. The compression system is automatic, and is in the circuit on both record positions. A portion of the output voltage is rectified by the 6H6 and varies grid bias of the first audio, 6SF7.

HOW TO CHECK COMPRESSION VOLTAGE

Turn the Selector Switch to Radio Record position. Feed a 2 volt (RMS) 1000 cycle signal into the diode return of the 2nd I.F. (brown lead). Connect the leads of a vacuum tube voltmeter to the point indicated on Figure 4, Schematic Diagram, and ground. The voltage at this point should be approximately a minus 2.5 volts.

SPECIAL SERVICE INFORMATION

STAGE GAIN MEASUREMENTS, AM:

Measurements taken with volume and tone controls maximum. Band Switch in Standard Broadcast position.
AVC shorted out.
Standard Output . . . 50 milliwatts
Dummy Antenna . . . 200 Mmf.
Antenna Post to R.F. grid . . . . . 12X at 1000 KC
R.F. grid to Converter grid . . . . . 9X at 1000 Kc
Converter grid to 1st I.F. grid . . . . . 20X at 455 Kc
1st R.F. grid to 2nd Detector . . . . . 40X at 455 Kc
Overall Audio Gain . . . . 4600X at 1 watt 400 cycles

STAGE GAIN MEASUREMENTS, FM:

Measurements taken with volume and tone controls maximum. Band switch in Frequency Modulation position.
AVC shorted out.
Dummy Antenna . . . 270 ohms
Dipole Terminal to R.F. grid . . . . . 0.9X at 98 Mc
Converter grid to 1st I.F. grid . . . . . 12X at 10.7 Mc
1st I.F. grid to Driver grid . . . . . 45X at 10.7 Mc

OSCILLATOR CATHODE VOLTAGES:

Measured at 117 volts AC line voltage with AC vacuum tube voltmeter input loading above 10 Megohms.
1620 KC . . . . . 8.5 volts AC
1200 KC . . . . . 8.2 volts AC
800 KC . . . . . 5.5 volts AC
540 KC . . . . . 2.5 volts AC

OSCILLATOR GRID CURRENT, FM:

Measured at 117 volts line voltage with DC microammeter connected in series with ground end of the 22,000 ohm grid resistor.
108 MC . . . . . 190 Microamps
98 MC . . . . . 200 Microamps
88 MC . . . . . 220 Microamps

MODEL 1273 PACKARD-BELL CO.

ALIGNMENT PROCEDURE

Alignment procedure consists of the steps outlined in the Alignment Chart. Make certain that each alignment step is done with a minimum input signal.

ALIGNMENT CHART A M

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAX. OUTPUT
1	Mixer grid & ground	455 Kc	540 Kc	Trimmers A, B, C, D
2	R.F. grid & ground	1500 Kc	1500 Kc	Trimmers G & H
3	R.F. grid & ground	600 Kc	600 Kc	Trimmer E
4	Repeat Step No. 2			
5	Standard Test Loop	1500 Kc	1500 Kc	Trimmer F
6	Check stationizing. Slide pointer on string if stations are uniformly off in one direction.			

NOTE: 1. Rock variable condenser for Step No. 3.
2. Standard Test Loop is Hazeltine No. 1150 or a reasonable substitute.

EQUIPMENT REQUIRED FOR FM ALIGNMENT

1. Vacuum tube type voltmeter connected to point "A" (on schematic) for Step No. 1.
2. Center-zero D.C. voltmeter connected to point "B" (on schematic) for step No. 2.

ALIGNMENT CHART F M

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAX. OUTPUT
1	R.F. grid & ground	10.7 Mc	88 Mc	S-1, S-3, S-4, S-5, S-6
2	Adjust S-2 for zero on zero-center meter.			
3	Repeat steps 1 and 2.			
4	Doublet terminals thru 270 ohms	108 Mc	108 Mc	Trimmers J, I, K
5	Doublet terminals thru 270 ohms	88 Mc	88 Mc	S-7, S-8
6	Repeat step No. 4.			

NOTE: Rock variable condenser for step No. 4.

D.C. RESISTANCE MEASUREMENTS:

I.F. COILS:

1st I.F.		2nd I.F.:	
Primary	17 ohms	Primary	10 ohms
Secondary	10 ohms	Secondary	17 ohms*

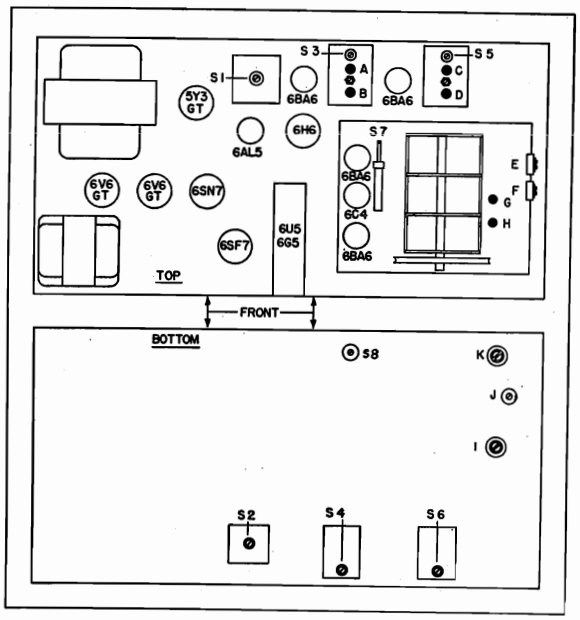
*NOTE: To obtain the true reading of the secondary of the 2nd I.F. coil, it must be removed from the can. This is true because of the 56,000 ohm resistor in series with the AVC lead inside the can.

Oscillator Coil:
Primary . . . . . 1 ohm
Secondary . . . . . 6 ohms

Antenna Coil:
Start to Finish . . . 12.2 ohms
Start to Tap . . . . 10.5 ohms

R.F. Coil:
Primary . . . . . 5.8 ohms
Secondary . . . . . 4.2 ohms

NOTE: Due to the variation of winding methods, the D.C. resistance on all coils is subject to a 20% tolerance.

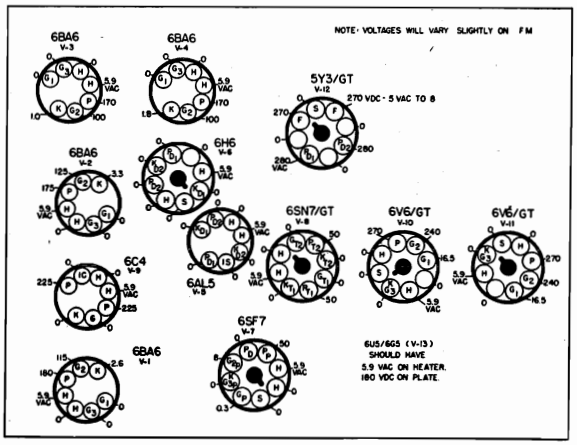


TRIMMER LOCATION

A—I.F. trimmer
B—I.F. trimmer
C—I.F. trimmer
D—I.F. trimmer
E—B.C. padder
F—Antenna trimmer
G—B.C. osc. trimmer
H—B.C. R.F. trimmer
I—F.M. R.F. trimmer
J—F.M. osc. trimmer
K—F.M. antenna trimmer

SOCKET VOLTAGES

All D.C. voltages measured with a vacuum tube voltmeter from socket contacts to chassis.—A.C. voltage measured with a 1000 ohms per volt A.C. meter from socket contacts to chassis. —Volume and tone controls maximum.—Switch in Radio Receive position. No signal. 117 volts A.C. line. All voltages shown are positive D.C. unless otherwise noted.



SOCKET VOLTAGE

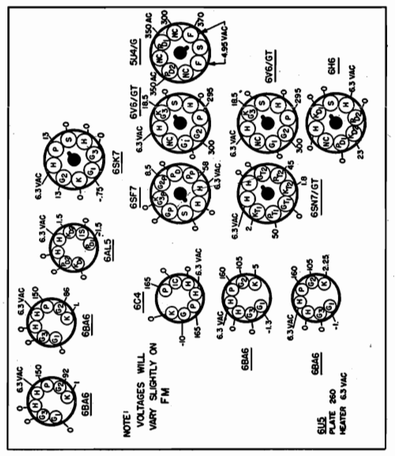
A.C. voltages measured with a 1000 ohms per volt A.C. meter from socket contacts to chassis. Volume and tone controls maximum.



SOCKET VOLTAGES

Stage Gain Measurements: AM

Measurements taken with volume and tone controls maximum. Band Switch in Standard Broadcast position. AVC shorted out.

Standard Output	50 milliwatts
Dummy Antenna	200 Mmf.
Antenna Post to R.F. Grid	12X at 1000 KC
R.F. Grid to Converter Grid	6X at 1000 KC
Converter Grid to 1st I.F. Grid	30X at 455 KC
1st I.F. Grid to 2nd Detector	100X at 455 KC
Overall Audio Gain	0.1 volt into phono socket for 1.0 watt output at 400 cycles

Stage Gain Measurements: FM

Measurements taken with volume and tone controls maximum. Band Switch in Frequency Modulation position. AVC shorted out.

Dummy Antenna	270 ohms
Dipole Terminal to R.F. Grid	1.0X at 98 MC
R.F. Grid to Converter Grid	7X at 98 MC
Converter Grid to 1st I.F. Grid	49X at 10.7 MC
1st I.F. Grid to Driver Grid	35X at 10.7 MC

Information for method of checking for
proper recording level.

SPECIAL SERVICE INFORMATION

Recording Head Pressure:

The proper recording head pressure is 1¼ ounces and is indicated by a small red dot on the indicator located on the cutter arm. In the event this has varied due to shipping vibrations it may be re-set with the aid of an ordinary pocket type postage scale. To increase pressure turn indicator wheel clock-wise. Turn counter-clockwise to decrease pressure.

Brief Description of Compression Circuit:

One diode section of the 6H6 serves as the compressor rectifier. Delay is accomplished by applying a positive potential to the cathode of the 6H6. A portion of the output voltage is rectified by the 6H6 and varies the grid bias of the 1st audio tube 6SF7.

How to Check Compression Voltage:

Turn the Selector Switch to BC position and press the push-button labeled Record Program. Feed a 2 volt (RMS) 1000 cycle signal into the 2nd detector diode return between the 56K and 220K ohm resistors. Connect a V.T.V.M. to the termination of the 4.7 megohm resistor and .1 mfd. condenser in the control grid circuit of the 6SF7. This should read between 2.5 to 3.5 volts negative.

How to Check Recording Level (Radio Record):

Substitute a 3 ohm resistor in place of the cutting head and with the same test setup as outlined in the preceding paragraph the voltage across this resistor should be between 1.1 and 1.5 volts A.C.

How to Check Recording Level (Record Phono):

Turn the Selector Switch to Phono position, press Record Program pushbutton and feed a 1000 cycle signal of 0.8 volts into the Phono input socket. Substitute a 3 ohm resistor in place of the cutting head. The voltage across the cutter should read between 1.1 and 1.5 volts A.C.

Socket Voltages:

All voltages shown are positive D.C. unless otherwise noted. Heater voltages are 6.3 volts A.C.

D.C. voltages measured with a vacuum tube voltmeter from socket contacts to chassis.

GENERAL INFORMATION

Model 1472 is a two band dual turntable, console PhonOcord. It has 12 tubes, plus a tuning eye and power rectifier, and employs a 12-inch electro dynamic speaker.

Listed below are some of the features included in this model:

1. Standard Broadcast—540 to 1620 KC.
2. Frequency Modulation—87.5 to 108.5 MC.
3. Cathode Ray tuning indicator.
4. Push-button home recording and automatic record changer.

Electrical Rating:	
Line Voltage	110–120 volts, 50–60 cycles A.C.
Power Consumption	188 watts
Tuning Frequency Range:	
Standard Broadcast	540 to 1620 KC.
Frequency Modulation	87.5 to 108.5 MC.
Intermediate Frequency:	
AM	455 KC
FM	10.7 MC
Loudspeaker:	
Type	Electro Dynamic
Outside Cone Diameter	12"
Voice Coil Impedance	3.2 ohms at 400 cycles
Field Coil	500 ohms D.C.
Electrical Power Output:	
Maximum	15 watts
Undistorted	10 watts

Tubes:

Tube	No.	Function
6BA6	V-1	R.F. Amplifier
6BA6	V-2	Mixer
6C4	V-3	Oscillator
6BA6	V-4	1st I.F. Amplifier
6BA6	V-5	Driver
6AL5	V-6	F.M. Detector
6SF7	V-7	Audio Amplifier, A.M. Detector
6SN7-GT	V-8	Phase Inverter
6V6-GT	V-9	Power Amplifier
6V6-GT	V-10	Power Amplifier
6SK7	V-11	Microphone Amplifier
6H6	V-12	Compressor Rectifier
5U4-G	V-13	Power Rectifier
6U5-6G5	V-14	Tuning Eye

NOTE: R26-2 shown as 1.5 M was replaced by 680 K in some instances to compensate for variations in recording level. See Special Service Information for method of checking for proper recording level.

Alignment Procedure:

Alignment procedure consists of the steps outlined in the two alignment charts. A.M. alignment is carried out with minimum signal input. F.M. alignment signal should be strong enough to produce 3 volts A.V.C. voltage.

ALIGNMENT CHART AM

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAX. OUTPUT
1	Mixer Grid & Ground	455 KC	540 KC	Trimmers R. L. P. K
2	R.F. Grid & Ground	1500 KC	1500 KC	Trimmers I & H
3	R.F. Grid & Ground	600 KC	600 KC	Trimmer J
4	Repeat Step No. 2			
5	Standard Test Loop	1500 KC	1500 KC	Trimmer G
6	Check stationizing. Slide pointer on string if stations are uniformly off in one direction.			

NOTE: 1. Rock variable condenser for step 3.

2. Standard Test Loop is Hazeltine No. 1150 or a reasonable substitute.

Equipment Required for F.M. Alignment

1. Signal generator capable of generating signals at 10.7 MC and from 88 to 108 MC.
2. Vacuum tube voltmeter connected to point "A" (on Schematic).
3. Center-zero D.C. voltmeter connected to point "B" (on Schematic).

ALIGNMENT CHART FM

STEP	CONNECT TEST OSC. TO	TEST OSC. SETTING	POINTER SETTING	ADJUST FOR MAX. A.V.C.
1	R.F. Grid & Ground	10.7 MC	88 MC	O, S, N, Q, M
2	Adjust T for zero on zero-center meter.			
3	Repeat Steps 1 and 2.			
4	Doublet Terminals thru 270 Ohms	88 MC	88 MC	Trimmers F, E, D
5	Doublet Terminals thru 270 Ohms	108 MC	108 MC	Trimmers C, B, A
6	Repeat Step No. 4.			

NOTE: 1. Rock variable condenser for step 4.

Oscillator Cathode Voltages:

Measured at 117 volts AC line voltage with an AC vacuum tube voltmeter input impedance above 10 megohms.

1620 KC	3.8 volts A.C.
1300 KC	3.6 volts A.C.
750 KC	2.8 volts A.C.
550 KC	2.5 volts A.C.

Oscillator Grid Current: FM

Measured at 117 volts A.C. line voltage with a D.C. microammeter connected in series with ground end of the 22,000 ohm grid resistor.

108 MC	200 Microamps
98 MC	330 Microamps
88 MC	480 Microamps

D.C. Resistance Measurements:

A.M. I.F. Coils

1st I.F.		2nd I.F.	
Primary	9.0 ohms	Primary	9.0 ohms
Secondary	9.0 ohms	Secondary	9.0 ohms

A.M. Oscillator Coil	
Primary	1.0 ohms
Secondary	6.0 ohms
A.M. Antenna Coil	
Start to Finish	12.2 ohms
Start to Tap	10.5 ohms
A.M. R.F. Coil	
Primary	5.8 ohms
Secondary	4.2 ohms

NOTE: Due to the variation in winding methods, the D.C. resistance on all coils is subject to a 20% tolerance.

CIRCUIT DESCRIPTION

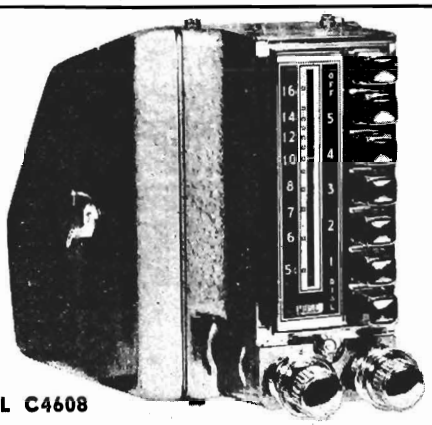
The circuit of the Model C4608 custom-built auto radio consists of a 7A7 r-f stage, a 7B8 converter, a 7A7 i-f stage, a 7B6 second detector and first audio, a 7A4 phase inverter, and two 7C5 tubes in push-pull in the output. The power supply is of the six-volt non-synchronous vibrator type, using a 7Y4 full-wave rectifier.

An unusually high signal-to-noise ratio is achieved in this set by the use of a permeability-tuned r-f stage, coupled to the converter by a band-pass r-f transformer. This transformer is designed to give maximum transfer of signals in the broadcast band, while greatly attenuating all other frequencies. Permeability tuning of both r-f and oscillator stages provides the best possible sensitivity, selectivity, and stability. Both push-button and manual tuning utilize this markedly superior method.

Automatic volume control is provided by filtering the rectified voltage from the diode section of the second detector-first audio tube, and applying it to the grids of the r-f and converter stages.

A feature of the audio system is the continuously variable tone control, which consists of an inverse feed-back circuit built around the first audio stage.

The phase-inverter stage provides push-pull drive for the output tubes, by means of equal load resistances in the plate and cathode circuits of the inverter tube. One signal is taken from the plate, and the other, equal in amplitude but opposite in phase, is taken from the cathode. The push-pull output stage delivers a full five watts of audio power through the output transformer to the electro-dynamic speaker.



MODEL C4608

SPECIFICATIONS

CIRCUIT ..... **Eight-tube, superheterodyne**
FREQUENCY RANGE ..... **540 to 1600 kc.**
INTERMEDIATE FREQUENCY ..... **455 kc.**
PHILCO TUBES **7A4, 7A7 (2), 7B6, 7B8, 7C5 (2) 7Y4**
POWER INPUT ..... **6.3 volts, 9.2 amps.**
ANTENNA ..... **Retractable-tip, Philco Part No. 91-0484**

All components in the receiver circuit are symbolized and located as follows:

C—condenser	LS—loud speaker	T—transformer
I—pilot lamp	R—resistor	VB—vibrator
L—choke or coil	S—switch	Z—electrical assembly

100-series components are in section 1—the power supply.
200-series components are in section 2—the audio system.
300-series components are in section 3—the i-f and second detector.
400-series components are in section 4—the r-f and first detector.

PHILCO TROUBLE-SHOOTING PROCEDURE

In this manual, the circuit is divided into four sections, with a schematic and chassis layout, showing test points, for each section. The trouble-shooting procedure for each section is outlined in a chart. Tests indicated by a large asterisk (*) provide sectional master checks, making it possible to eliminate each section as a source of trouble without going through its entire test chart. Wherever trouble is found (indicated by failure to get a "Normal Indication" on any test) it should be isolated by voltage and resistance checks of the parts associated with the point under test, and remedied before testing further.

Before starting the trouble-shooting procedure, the following steps are recommended:

1. Before connecting the receiver to a source of power, inspect both sides of the chassis. Make sure that all tubes are securely in their sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Connect the receiver to the power source (6.3 volts, d. c.), and ascertain that all the tube filaments are lighted. If the 7Y4 rectifier is observed to be defective, check the filter condensers (C100 A, B, and C) for short circuits before inserting a new tube.

3. Turn the volume control fully on and set the sensitivity control (shown in Figure 9, page 6) at maximum. Connect an antenna or a signal generator to the antenna receptacle, and ascertain that the receiver definitely does not operate properly.

MODEL C4608, Code 121; PHILCO CORP.
Mopar MODEL 802,
Chrysler

TESTS TO ISOLATE TROUBLE WITHIN SECTION 1

With the exception of the first, make all measurements for this section with a high-quality volt-ohmmeter, using the applicable d-c range. All voltages given in this manual are average, and were measured with the volume control set at minimum.

NOTE: If the vibrator (VB100) is found to be defective, check C101 and C100 for shorts before inserting a new vibrator.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
Ammeter (0-30 amps, d-c) in series with power souurce.	9.2 amps	Defective power-supply components (isolate by following tests)
A to B—	215 volts	Defective 7Y4, VB100, C100, C101, T100.
C to B—	195 volts	Open R101, leaky C100B, C100C.
D to B—	180 volts	Open R102, leaky C100C.

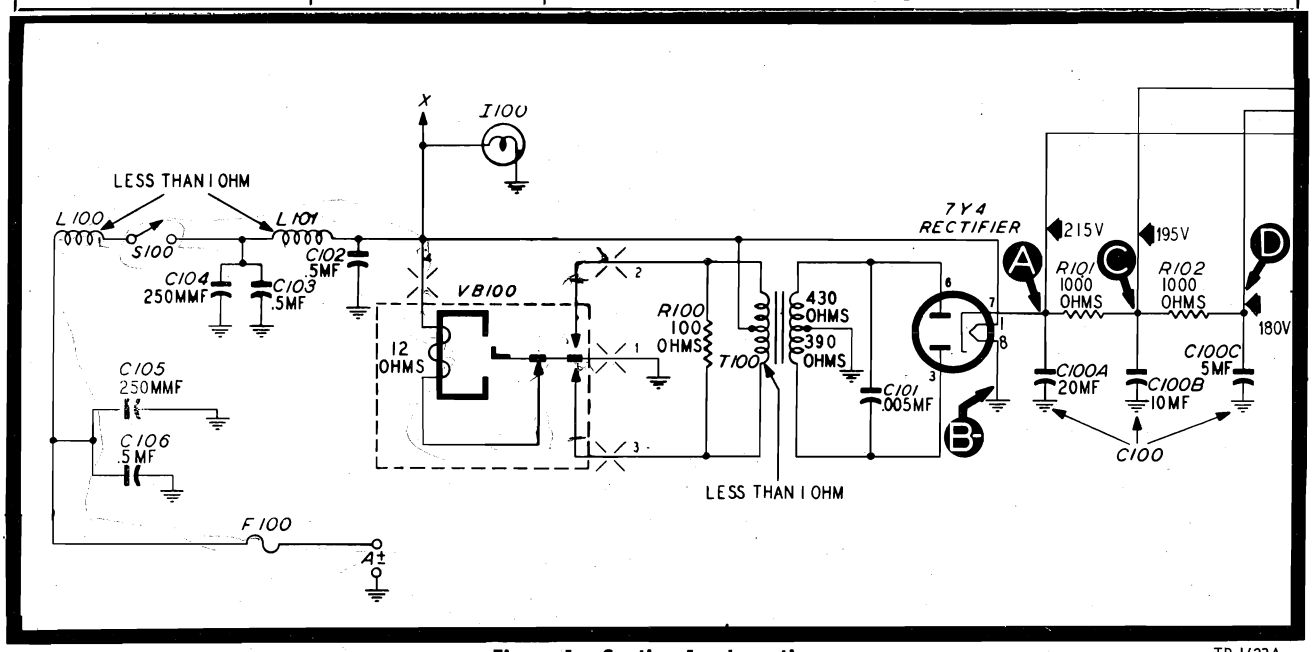


Figure 1. Section 1 schematic. TP-1623A

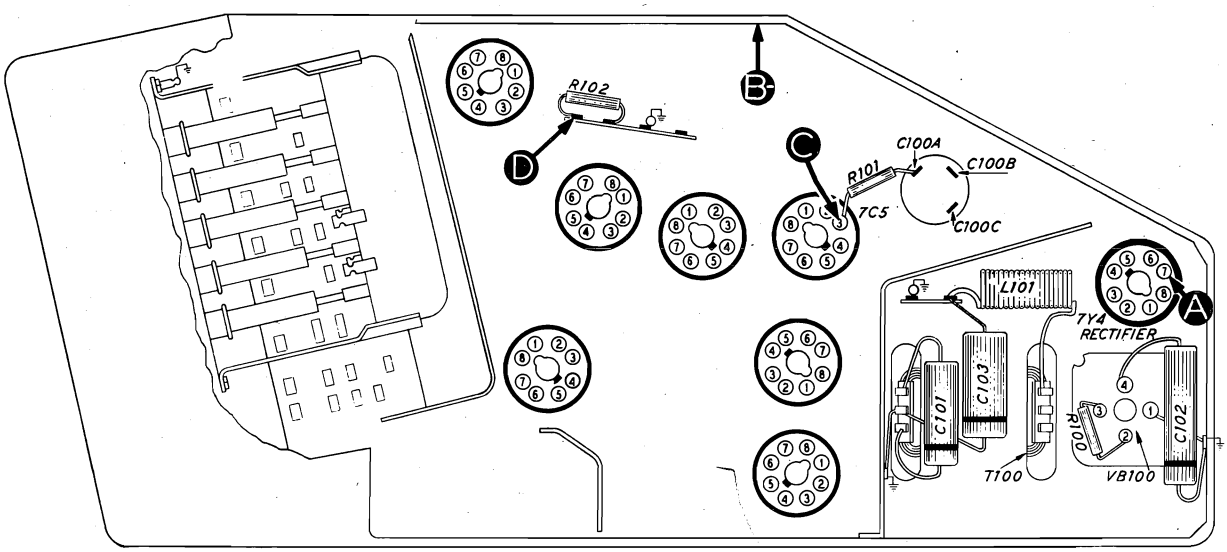

Figure 2. Bottom view, showing Section 1 test points. TP-1623E

TESTS TO ISOLATE TROUBLE WITHIN

SECTION 2

For all tests in this section, use an audio signal. Connect the generator output lead through a condenser (.01 to .25 mf.) to the test points indicated; connect the generator ground lead to the receiver chassis (B–). Set the receiver volume control at maximum, and adjust the signal-generator output for a loud, clear signal on the first test.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
E to B– (Remove 7A4)	Loud, clear signal from speaker.	Defective 7C5, T200, LS200; open R205; leaky C201.
F to B– (7A4 removed)	Loud, clear signal, same as previous test.	Defective 7C5, T200; leaky C202.
G to B– (7A4 removed)	Loud, clear signal.	Open C201.
H to B– (7A4 removed)	Loud, clear signal.	Open C202.
J to B– (Replace 7A4)	Clear signal, louder than previous tests.	Defective 7A4, C200; open R202, R201.

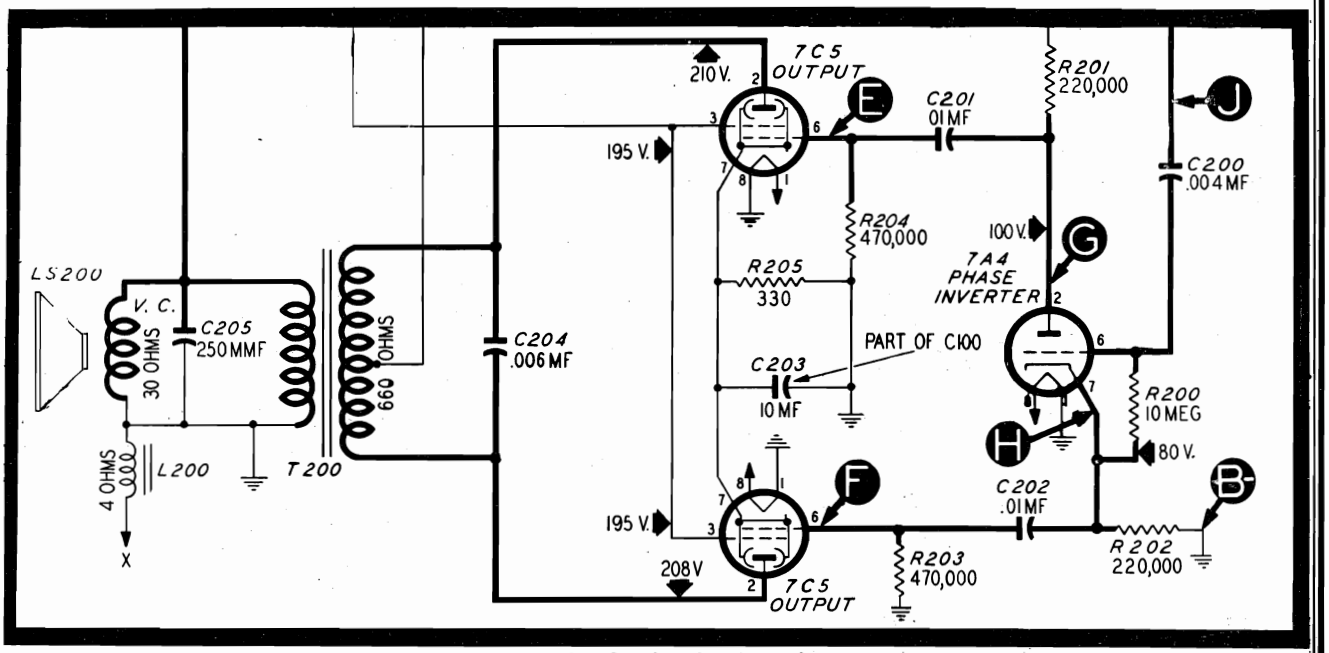

Figure 3. Section 2 schematic. TP-1623B

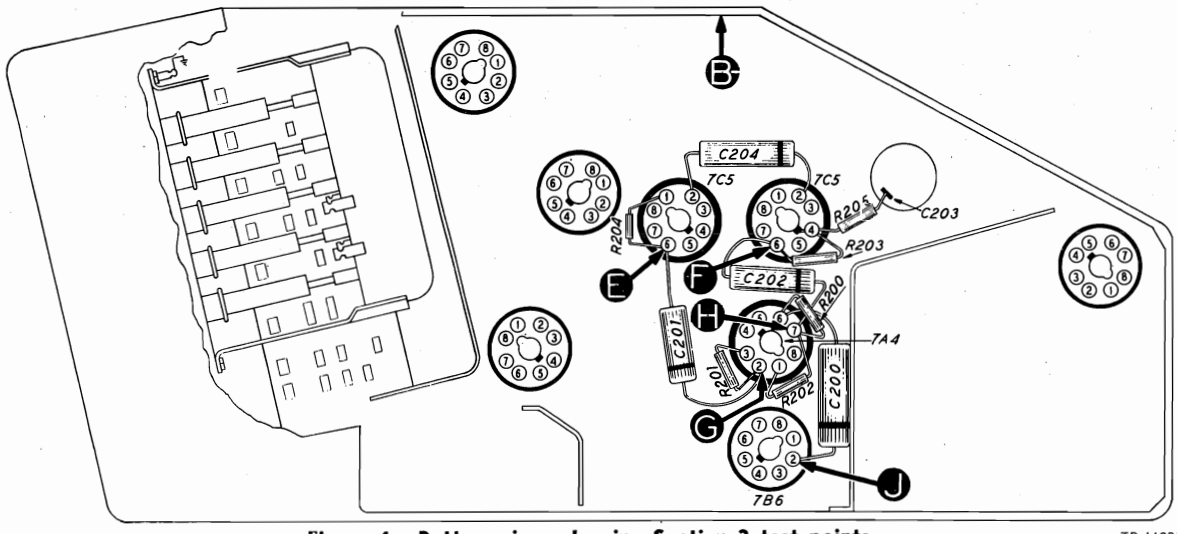

Figure 4. Bottom view, showing Section 3 test points. TP-1623F

Chrysler

SECTION 3

For the first two tests in this section, use an audio signal. For the last two, use a modulated 455-kc signal. Connect the signal-generator output lead through a condenser (.01 to .25 mf.) to the test points indicated; connect the generator ground lead to the receiver chassis (B–). Set the receiver volume control at maximum, and adjust the signal-generator output for a loud, clear signal on the first test.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
K to B– (audio sig.)	Loud, clear signal.	Defective 7B6; open R306, C304; shorted C305.
L to B– (audio sig.)	Loud, clear signal.	Open R307, C303; defective volume control (rotate through entire range for complete check.)
M to B– (455-kc. sig.)	Loud, clear signal.	Defective 7A7, Z301; open R302, R304; shorted C403 (see Section 4 for location.)
N to B– (455-kc. sig.)	Loud, clear signal.	Defective Z300.

PHILCO CORP.

MODEL C4608, Code 121;
Mopar MODEL 802,
Chrysler

SECTION 4

1. Attach the positive lead of a 20,000-ohms-per-volt meter to the receiver chassis, and the prod end of the negative lead through a 50,000-ohm resistor to point S. Set the meter on a 10-volt or similar range. Depress the "Dial" push-button, and rotate the tuning control through its entire range. Absence of voltage at any point indicates that the oscillator is not functioning. If so, check the components listed in the first test in the chart below.

2. Set the volume and sensitivity controls at maximum. Proceed through the chart tests below, connecting the signal-generator output lead through a condenser (.01 to .25 mf.) to the test points indicated. The "NORMAL INDICATION" in each test will be a loud, clear signal when the signal generator is tuned to the same frequency as the receiver.

TEST POINTS	PUSH-BUTTON SETTING	POSSIBLE CAUSE OF ABNORMAL INDICATION
P to B—	"DIAL"	Defective 7B8, L403, L404A, or push-button switch; open R404, C405, C407, C408, C409.
P to B—	pre-tuned, 1 to 5	Defective oscillator coils L401E to K, or push-button switches.
Q to B—	"DIAL"	Defective 7A7, Z400, L404A, L404C, or push-button switch; open R402, R401 (rotate R401 through its entire range for complete check.)
Q to B—	pre-tuned, 1 to 5	Defective r-f coils L401 A to E, or push-button switches.
R to B—	"DIAL"	Defective L402, C404, L404A, L404C, or push-button switch.
R to B—	pre-tuned, 1 to 5	Defective r-f coils L401A to E, or push-button switches.

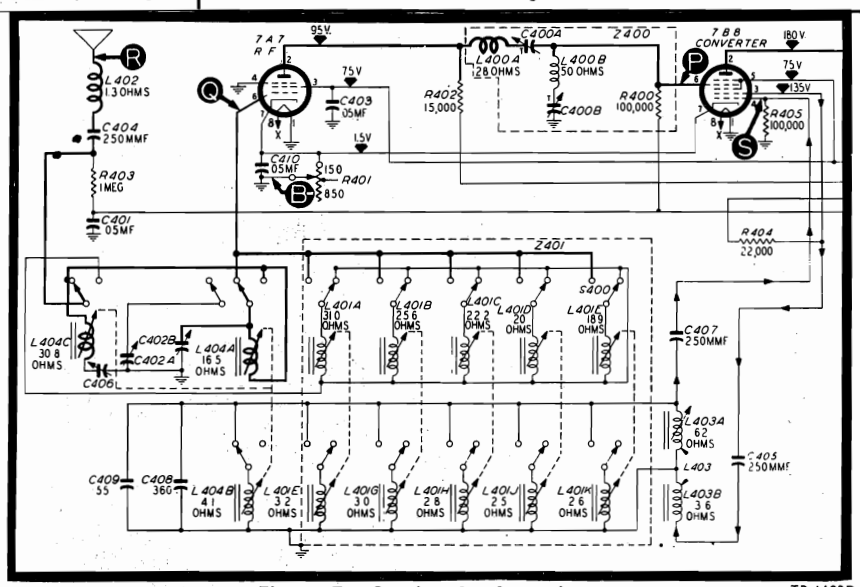

Figure 7. Section 4 schematic. TP-1623D

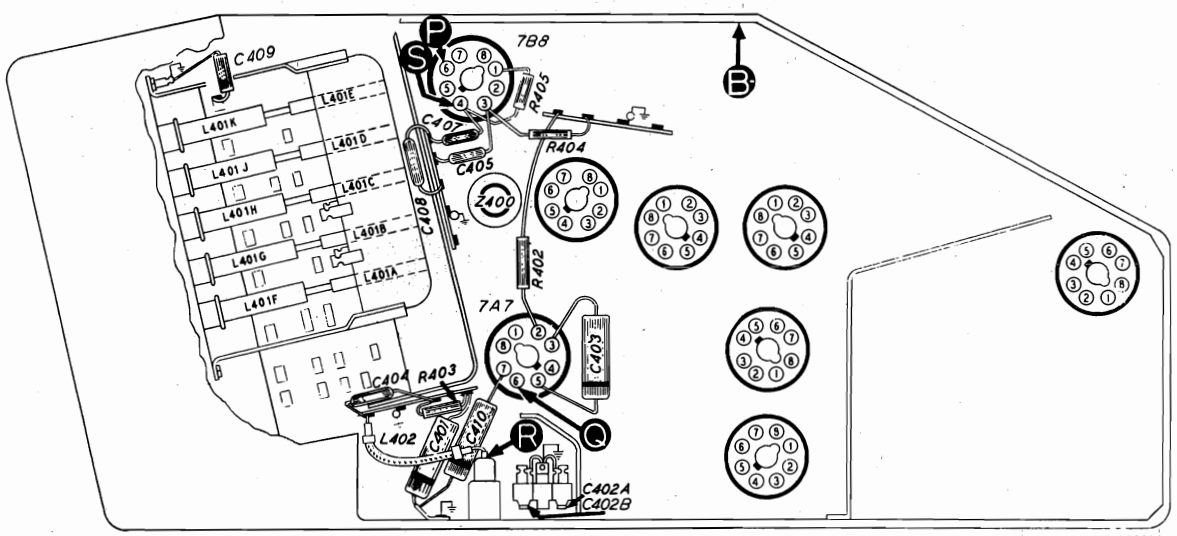

Figure 8. Bottom view, showing Section 4 test points. TP-1623H

ALIGNMENT PROCEDURE

CONNECT THE OUTPUT METER between the voice-coil lug on the speaker and ground.

CONNECT THE SIGNAL-GENERATOR output lead as follows: For the i-f alignment (the first step in the chart), connect through a 20-mmf. condenser to pin 6 of the 7B8 converter. For the r-f alignment (all steps after the first), connect through a 20-mmf. condenser in series with an antenna lead (Part No. 95-0181) to the antenna receptacle. If the antenna lead is not available, connect a 30-mmf. condenser from the antenna receptacle to ground.

CALIBRATE THE DIAL as follows: Turn the tuning control to its maximum clockwise position. The pointer should then be at 1600 kc. If not, insert a stiff rod 2¼" into the small hole on the left side of the control head, near the number 8 on the dial scale. Rotate the tuning control until the pointer mechanism is stopped by the rod, and continue rotating the control for a fraction of a turn, to slide the pointer mechanism a short distance along the drive cord. Repeat this operation until the pointer coincides with the 1600-kc. mark on the dial when the tuning control is fully clockwise.

SET THE RECEIVER CONTROLS as follows: Set the tone control at "VOICE" (maximum high position). Set the volume and sensitivity controls at maximum. Adjust the signal-generator output as alignment progresses to keep the meter needle near center scale.

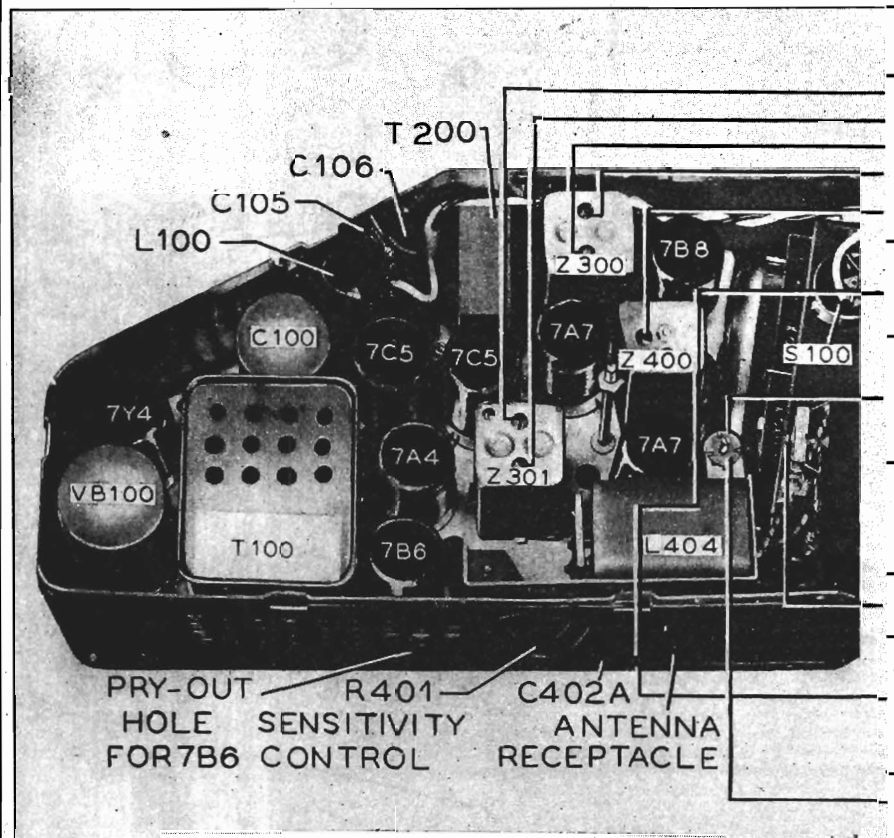

Figure 9. Chassis view, showing trimmer locations.

ADJUST IN ORDER	SPECIAL INSTRUCTIONS	DIAL SETTINGS SIG. GEN.	DIAL SETTINGS RECEIVER
C301B Max. C301A Max. C300B Max. C300A Max. C400B Min.	Ground pin 4 of the 7B8. Adjust the i-f trimmers for maximum in the order listed. Then adjust the i-f trap condenser (C400B) for minimum output.	455 kc.	1600 kc.
C402B Max.	Remove the ground from pin 4 of the 7B8. Adjust for maximum output.	1500 kc.	1500 kc.
L403A Max.	Adjust for overall maximum while rocking the tuning control.	580 kc.	580 kc.
	Tune the receiver for maximum output with the tuning control set at 550 kc.	550 kc.	550 kc. (approx.)
C406 Min.	Adjust for minimum output.	1460 kc.	550 kc.
C402B Max.	Adjust for maximum output. Final adjustment to be made after re-installing the set in the car.	1500 kc.	Tune in 1500 kc. signal
L403A Max.	Adjust for overall maximum while rocking the tuning control.	580 kc.	580 kc.

Mopar MODEL 802,
Chrysler

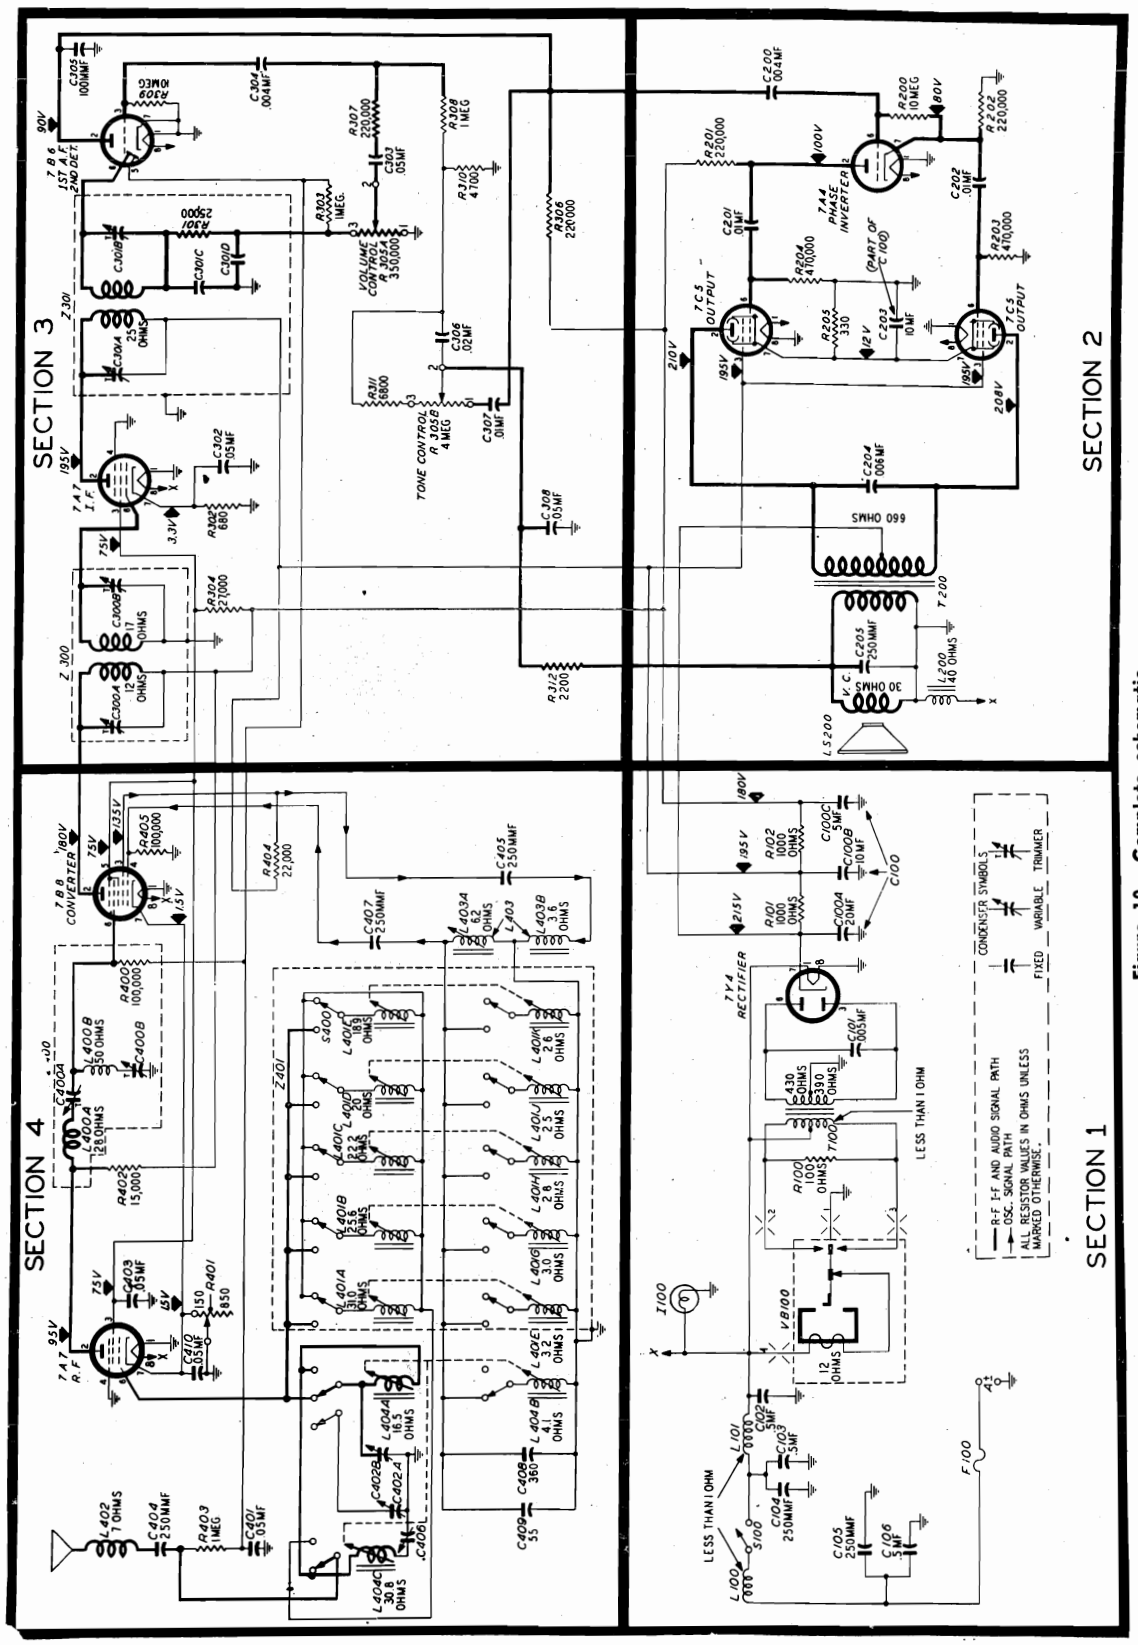

Figure 10. Complete schematic.

NOTE: All voltage, capacity, and resistance values shown are average. The voltages between B– (chassis) and other points indicated were measured with a 20,000 ohms-per-volt meter, with the volume control at minimum and the tuning control at 550 kc.

MODEL C4608, Code 121; PHILCO CORP. Mopar MODEL 802, Chrysler

REPLACEMENT PARTS LIST

NOTE: Parts marked with an asterisk (*) are general replacement items, and the numbers will not be identical with those used on factory assemblies. Use only the "Service Part No." shown in the parts list when ordering replacements.

SECTION 1

Reference	Description	Service Part No.
C100	Condenser, electrolytic	61-0150*
	C100A: condenser, 20 mf.	Part of C100
	C100B: condenser, 10 mf.	Part of C100
	C100C: condenser, 5 mf.	Part of C100
C101	Condenser, .005 mf.	61-0153*
C102	Condenser, .5 mf.	61-0134*
C103	Condenser, .5 mf.	61-0137*
C104	Condenser, 250 mmf.	60-10255007*
C105	Condenser, 250 mmf.	60-10255007*
C106	Condenser, .5 mf.	61-0137*
F100	Fuse	45-2559
I100	Lamp, pilot	34-2064*
L100	Choke, "A"	32-1644
L101	Choke, vibrator	65-0389
R100	Resistor, 100 ohms	66-1104340*
R101	Resistor, 1,000 ohms	66-2104340*
R102	Resistor, 1,000 ohms	66-2104340*
S100	Switch, on-off	67-0046*
T100	Transformer, power	65-0347*
VB100	Vibrator	83-0026*

SECTION 2

C200	Condenser, .004 mf.	61-0179*
C201	Condenser, .01 mf.	61-0120*
C202	Condenser, .01 mf.	61-0169*
C203	Condenser, 10 mf.	Part of C100
C204	Condenser, .006 mf.	61-0105*
C205	Condenser, 250 mmf.	60-10255007*
L200	Coil, field	Part of LS200
LS200	Speaker unit	73-0042*
	Replacement cone	91-0164
R200	Resistor, 10 megs.	66-6101540*
R201	Resistor, 220,000 ohms	66-4221540*
R202	Resistor, 220,000 ohms	66-4221540*
R203	Resistor, 470,000 ohms	66-4471540*
R204	Resistor, 470,000 ohms	66,4471540*
R205	Resistor, 330 ohms	66-1334340*
T200	Transformer, output	65-0363*

SECTION 3

C302	Condenser, .05 mf.	61-0101*
C303	Condenser, .05 mf.	61-0101*
C304	Condenser, .004 mf.	61-0179*
C305	Condenser, 100 mmf.	60-10145307*

R303	Resistor, 1 meg.	66-5101540*
R304	Resistor, 27,000 ohms	66-3274340*
R305	Control, volume	67-0040*
	R305A: control, volume, 350,000 ohms	Part of R305
	R305B: control, tone, 4 meg.	Part of R305
R306	Resistor, 220,000 ohms	66-4221540*
R307	Resistor, 220,000 ohms	66-4221540*
R308	Resistor, 1 meg.	66-5101540*
R309	Resistor, 10 megs.	66-6101540*
R310	Resistor, 4,700 ohms	66-2471340*
R311	Resistor, 6,800 ohms	66-2681540*
R312	Resistor, 2,200 ohms	66-2221540*
Z300	Transformer, 1st i-f	65-0365
	C300A: condenser, trimmer	Part of Z300
	C300B: condenser, trimmer	Part of Z300
Z301	Transformer, 2nd i-f	65-0366
	C301A: condenser, trimmer	Part of Z301
	C301B: condenser, trimmer	Part of Z301
	C301C: condenser	Part of Z301
	C301D: condenser	Part of Z301
	R301: resistor	Part of Z301

SECTION 4

C401	Condenser, .05 mf.	61-0101*
C402	Condenser, antenna assembly	77-0788
	C402A: condenser, trimmer	Part of C402
	C402B: condenser, trimmer	Part of C402
C403	Condenser, .05 mf.	61-0111*
C404	Condenser, 250 mmf.	60-10255007*
C405	Condenser, 250 mmf.	60-10255007*
C406	Condenser, trimmer	63-0069
C407	Condenser, 250 mmf.	60-10255007*
C408	Condenser, 360 mmf.	30-1220-13*
C409	Condenser, 55 mmf.	61-0149*
C410	Condenser, .05 mf.	61-0101*
L402	Choke, antenna	65-0437
L403	Coil, oscillator shunt	65-0440
	Iron core and screw assembly	57-2325
	Mounting nut	218-1341
L404	Manual tuning unit assembly	77-0962
	Coil assembly, antenna	65-0449
	Coil assembly, oscillator	65-0439
	Coil, assembly, image trap	65-0382

SECTION 4 (Continued)

Reference	Description	Service Part No.
	Control, sensitivity, 1,000 ohms (R401)	67-0025*
	Core assembly, iron, image trap	77-0677
	Core, iron, antenna	57-1702
	Core, iron, oscillator	57-1703

Condenser, generator	61-0156*
Condenser, ignition switch	61-0177*
Filter assembly, fuel guage	67-0050*
Suppressor, distributor	33-1196*

PHILCO CORP. MODEL C4608, Code 122; Chrysler

Functionally, both sets are identical, but there have been several parts changes in Code 122 which, because of their effect upon the characteristics and adjustment of the set, definitely require the correct substitution. These changes involve the parts listed below.

In Code 122, the sensitivity control is replaced by a fixed resistor; also, the i-f transformers and wave trap are replaced by units which use permeability tuning instead of trimmer-condenser tuning.

Physically, the alignment procedure remains the same, except that the transformers are of the K type; therefore, the primary must be adjusted from the bottom of the can, while the secondary is adjusted from the top.

We suggest that you examine the list below and order the new parts. We feel that these parts may be required in the course of warranty service.

SECTION 1

Reference Symbol	Description	Service Part No. (Code 122)	Service Part No. (Code 121)
L101	Choke, vibrator	32-4170	65-0389

SECTION 2

C200	Condenser, grid blocking, .005 mf.	45-3502	61-0179
C201	Condenser, grid blocking, .01 mf.	61-0120	61-0105
C202	Condenser, grid blocking, .01 mf.	61-0120	61-0105
C204	Condenser, plate by-pass, .007 mf.	61-0127	61-0105
T200	Transformer, output	32-8316-1	65-0363

SECTION 3

Reference Symbol	Description	Service Part No. (Code 122)	Service Part No. (Code 121)
C304	Condenser, grid blocking, .005 mf.	45-3502	61-0179
C307	Condenser, tone compensation, .01 mf.	61-0120	61-0105
R302	Resistor, cathode bias, 470 ohms	66-1473340	61-1683340
Z300	Transformer, 1st i-f	32-4160	65-0365
Z301	Transformer, 2nd i-f	32-4161	65-0366

SECTION 4

L404	Manual-tuning-unit assembly	77-0666-2	77-0962
R401	Resistor, cathode bias, 220 ohms (replaces sensitivity control in Code 121)	66-1223340	67-0025
Z400	Transformer, r-f and i-f wave trap	32-4162	65-0421
Z401	Tuning-unit assembly, push-button (complete)	77-0657-1	77-0943

NOTE: On a small percentage of the first sets made, some difficulty may be encountered in keeping the i-f transformers aligned. If the radio is weak or the i-f transformers are far out of alignment, adjust the cores. If they seem to turn very easily, it will be necessary to replace the entire i-f transformer. This condition may occur only on some sets made prior to run #4, for Model C-4608, Code 122 only.

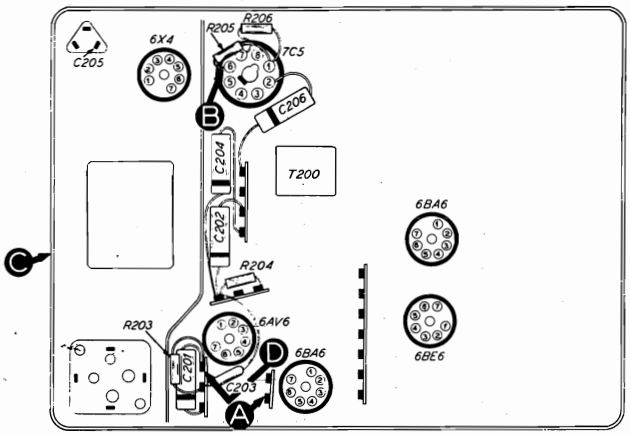
TROUBLE SHOOTING

Section 2

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Turn the volume control to maximum, and the tone control fully counterclockwise. Adjust the signal-generator output as required for each step.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3. If not, isolate and correct the trouble in this section.



TP-4049B

Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	B	Loud, clear signal with strong signal input.	Defective: 7C5. Open: R206, T200, LS200. Shorted: C203, C206, T200. Leaky: C206, C203.
3	D	Loud, clear signal with weak signal input.	Defective: 6AV6. Open: C204, R204. Shorted or leaky: C204, C202 (rotate R202).
4	A	Loud, clear signal with weak signal input.	Open: C201, R203. Shorted: C304*. Leaky: C304*.

Listening Test: Distortion may be caused by shorted or leaky C201, C204, or C205, or by open R203 or R205.

* This part, located in another section, may cause abnormal indication in this section.

TROUBLE SHOOTING

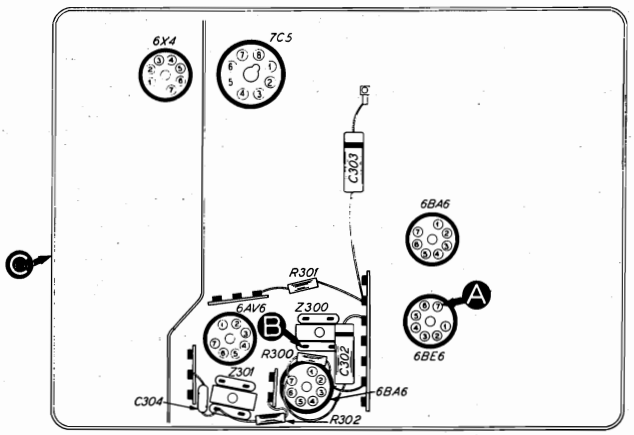
Section 3

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Depress manual-tuning push button.

Turn the volume control to maximum, and the tone control fully counterclockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4; if not, isolate and correct the trouble in this section.



TP-4049C

Bottom View, Showing Section 3 Test Points

Since the circuit location of test point A for this section is the same as that of test point B for Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	B	Loud, clear signal with moderate signal input.	Defective: 6BA6, Z301. Misaligned: Z301. Open: R300, R301, R302. Shorted: C302, C303, C304.
3	A	Loud, clear signal with weak signal input.	Defective: 6BE6*, Z300. Misaligned: Z300. Open: L403*.

* This part, located in another section, may cause abnormal indication in this section.

TROUBLE SHOOTING

Section 4

For the tests in this section, with the exception of the oscillator tests, use an r-f signal generator, with modulated output. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Turn the radio volume control to maximum, and the tone control fully counterclockwise.

If the "NORMAL INDICATION" is not obtained in step 1 (a), isolate and correct the trouble before making the test in step 1 (b).

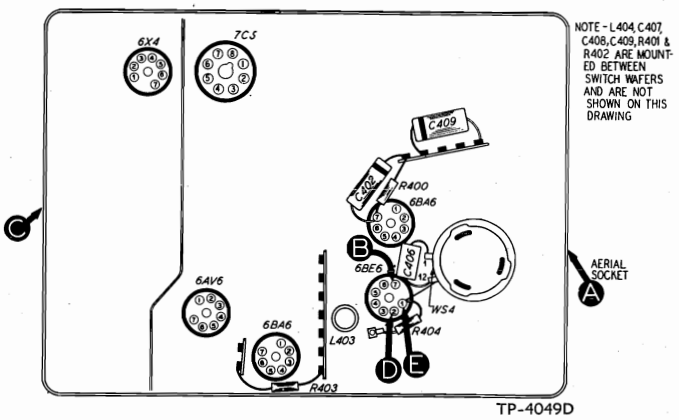


Figure 4. Bottom View, Showing Section 4 Test Points (locations of C404, WS1, 2, 3, 4, Z401, and Z402 are shown in figure 6)

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1 (a)	A	1000 kc.	Manual. Tune to signal.	Loud, clear signal with weak signal input.	Trouble in manual-tuning circuits; isolate by steps 2, 3, and 4, and correct trouble before proceeding.
1 (b)	A	Tune to freq. of each button.	Push button. Depress each button.	Loud, clear signal with weak signal input.	Trouble in push-button-tuning circuits; isolate by steps 5, 6, and 7.

MANUAL-TUNING TESTS

2	B	1000 kc.	Manual. Tune to signal.	Loud, clear signal with moderate signal input.	Defective: 6BE6. Open: R402. Trouble in oscillator circuit (step 3).
3	E to D Osc. Test (see note below).		Manual. Tune through range.	Negative 2 to 4 volts.	Defective: 6BE6, WS2(F). Open: L403, L402C, C406, C407, C408, R404. Shorted or leaky: C406, C407, C408.
4	A	1000 kc.	Manual. Tune to signal.	Loud, clear signal with weak signal input.	Defective: 6BA6, WS3(R), WS3(F), WS1(F), WS1(R), WS2(R). Open: L405, L402B, L402A, R400, R401, R402, R403, R405, C409, C404. Shorted or leaky: C409, C405, C404, C401.

PUSH-BUTTON-TUNING TESTS

5	B	Tune to freq. of each button.	Push button. Depress each button.	Loud, clear signal with moderate signal input.	Defective: WS1(F), WS1(R). Trouble in oscillator circuit (step 6).
6	E to D Osc. Test (see note below).		Push button. Depress each button.	Negative 2 to 4 volts.	Defective: WS2(F). Open or shorted: L401F, L401G, L401H, L401I, L401J.
7	A	Tune to freq. of each button.	Push button. Depress each button.	Loud, clear signal with weak signal input.	Defective: WS3(R), WS3(F), WS1(F), WS1(R), WS2(R), Z400. Open: L401A, L401B, L401C, L401D, L401E. Misaligned: Z400.

OSCILLATOR TESTS (steps 3 and 6)

Connect positive lead of high-resistance voltmeter to test point D (pin 2, cathode of 6BE6); connect prod end of negative lead through 100,000-ohm isolating resistor to test point E (pin 1, osc. grid of 6BE6). Use suitable meter range, such as 0—10 volts. Proper operation of oscillator is indicated by negative voltage, 2 to 4 volts (measured with 20,000-ohms-per-volt meter), throughout range of manual tuning, step 3, and of push-button tuning, step 6.

SETTING PUSH BUTTONS

Each adjusting rod controls ganged tuning cores for both aerial and oscillator circuits, so that only a single adjustment is required for a given frequency. The ganged tuning cores are adjusted by turning the small plastic knobs, numbered 1, 2, 3, 4, and 5, on the front of the radio.

1. Use an r-f signal generator to furnish test signals at the approximate frequencies of the desired stations. Connect the generator ground lead to the chassis. Connect the output lead through a 30-mmf. condenser to the aerial receptacle; connect another 30-mmf. condenser between the aerial receptacle and the chassis.

2. Turn on the power, set the volume control to maximum, and turn the tone control fully counter-clockwise.

3. Starting with the lowest frequency desired, set the signal generator, depress button No. 1 and adjust knob No. 1 for maximum output. Repeat the procedure for buttons 2, 3, 4, and 5.

4. After the radio is installed in the car, and the aerial connected, allow a fifteen-minute warm-up period, then readjust the tuning for each button while listening to the station for which the adjustment is being made.

REPLACEMENT PARTS LIST

NOTE: Part numbers marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

SPECIFICATIONS

CIRCUIT	Six-tube superheterodyne
FREQUENCY RANGE	535—1600 kc.
PUSH BUTTONS	Six: five for station selection; one for manual tuning
AUDIO OUTPUT	3 watts
POWER INPUT	8 amperes at 6.6 volts, d.c.
AERIAL	Any Philco auto-radio aerial
PHILCO TUBES (6)	6BA6 (2), 6BE6, 6AV6, 7C5, 6X4

Circuit Description

Philco Auto Radio Model CR-8 is a six-tube superheterodyne radio of the universal-mounting type. The speaker and control head are separately mounted.

The aerial input circuit is designed for maximum reduction of signal interference without loss of signal strength. Permeability tuning is used for all main circuits. Of the six push buttons, located on the control head, five are used for automatic station selection, and one selects manual tuning. A foot switch and cable assembly (Foot Control Kit, Philco Part No. 45-1545) is available, for automatic tuning of stations by foot control; the switch cable is connected by plugging it into the pin jack, J101. The pilot lamps are connected, through the switch wafers, in a series-parallel circuit; the wiring is so arranged that the lamp which glows above the push button in use is in series with the parallel combination of the other five lamps.

A tuned r-f amplifier stage, incorporating a 6BA6 pentode, provides good sensitivity and selectivity. The converter, a 6BE6, works into a 6BA6 i-f amplifier, which operates at 455 kc.

The 6AV6 duo-diode, triode tube provides detection and a-v-c voltage in the diode section; the triode section functions as the first audio amplifier. The first audio stage is resistance-coupled to the 7C5 beam-power output amplifier. Approximately three watts of audio power is supplied to the electrodynamic speaker.

The power supply includes a non-synchronous vibrator and a type 6X4 rectifier.

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance between B+ (pin 7 of 6X4 rectifier tube) and the radio chassis, test point C, with the ohmmeter polarity such that the highest resistance reading is obtained. If the reading is lower than 5,000 ohms, check condensers C105A, C105B, and C106 for leakage or shorts.

The resistance value above, which is much lower than normal, is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 are performed.

ALIGNMENT PROCEDURE

NOTE: THE CONTROL UNIT SHOULD BE PLUGGED INTO THE RADIO.

DIAL POINTER—With tuning cable disengaged, set tuning-core gang to full-mesh position; turn dial of tuning control to low-frequency end until pointer stops, then engage tuning cable.

OUTPUT METER—Connect across voice-coil terminals.

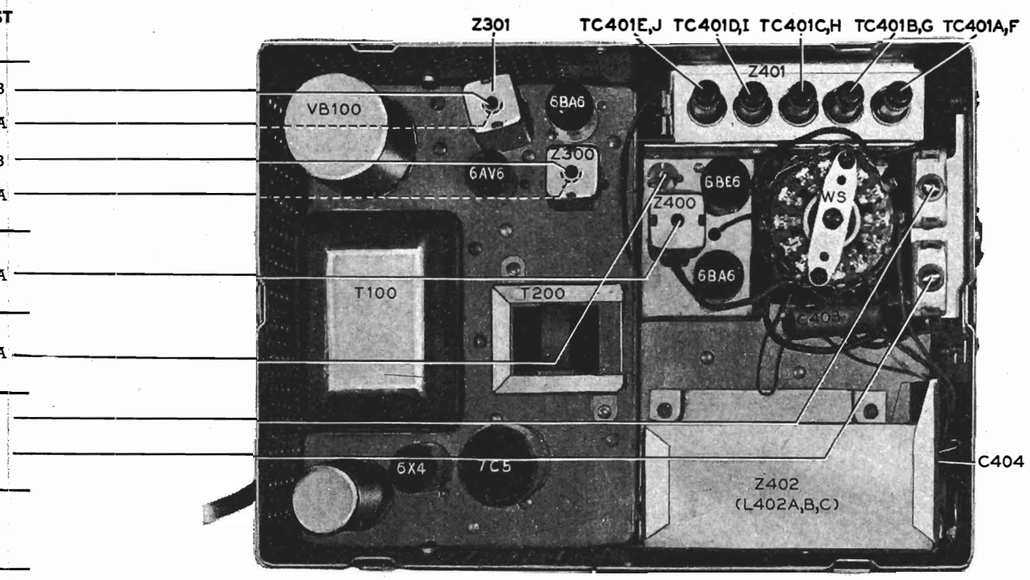
SIGNAL GENERATOR—Connect ground lead to chassis; connect output lead as indicated in chart. Use modulated output.

RADIO CONTROLS—Turn volume control to maximum, and tone control fully counterclockwise; use push buttons as directed in chart.

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below 1 volt.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTIONS TO RADIO	FREQUENCY	TUNING	SPECIAL INSTRUCTIONS	
1	Through .05-mf. condenser to aerial receptacle.	455 kc.	Manual. 1600 kc.	Adjust, in order given, for maximum output.	TC301B TC301A TC300B TC300A
2	Same as step 1.	455 kc.	Any push button except manual tuning.	Adjust for **minimum** output.	TC400A
3	Dummy aerial (see note below).	580 kc.	Manual. 580 kc.	Adjust for maximum output while rocking tuning control.	TC403A
4	Same as step 3.	1600 kc.	Manual. Tune to signal.	Adjust for maximum output.	C405 C401
5	Same as step 3.	1400 kc.	Manual. Tune to signal.	Re-engage tuning cable for correct calibration.	
6	Repeat steps 3, 4, and 5 until no further improvement is obtained.				
7	After reinstalling radio in car, adjust C401 for maximum output from weak station near 1400 kc. Re-engage tuning control for correct dial calibration.				

DUMMY AERIAL: Connect generator output lead through 30-mmf. condenser to aerial receptacle; connect another 30-mmf. condenser between aerial receptacle and chassis.



Top View, Showing Trimmer and Tuning-Core Locations (dotted lines indicate tuning screws located at bottom of chassis)

TROUBLE SHOOTING

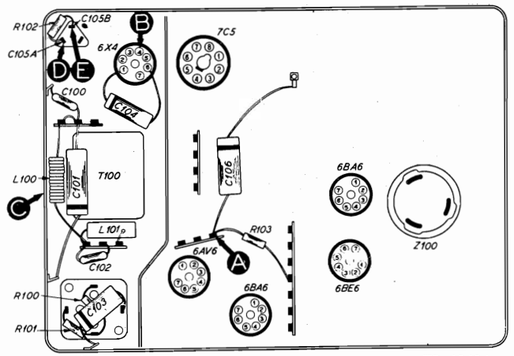
Section 1

NOTE: For all trouble-shooting tests given in this manual, the control unit should be plugged into the radio.

Make the tests for this section with a d-c voltmeter, connecting the leads between test point C (chassis) and the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, with an "A" supply voltage of 6.6 volts, d.c.

Turn on the power and depress the manual-tuning button. Turn the volume control to minimum, and the tone control fully counterclockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2; if not, isolate and correct the trouble in this section.



Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A B	212v 6.6v		Trouble in this section. Isolate by the following tests.
2	B	6.6v	No voltage Low voltage	Open: F100, S100, L100, L101. Weak battery. Leaky: C100, C101, C102. Defective: VB100.
3	D	270v	No voltage Low voltage	Open: T100. Shorted: C100, C101, C102, C103, T100, C105A, C104. Defective: VB100, 6X4. Leaky: C105A. Defective: 6X4.
4	E	257v	No voltage Low voltage	Open: R102. Shorted: C105B. Leaky: C105B. Changed resistance: R102.
5	A	212v	No voltage Low voltage	Open: R103. Shorted: C106. Leaky: C106. Changed resistance: R103.

AERIAL .....Any Philco Auto-Radio Aerial

PHILCO TUBES (6) ....6BA6(2), 6BE6, 6AV6, 6AQ5, 6X4

Circuit Description

Philco Model CR-9 is an auto radio of the custom-mounting type. The speaker is separately mounted. Permeability tuning is used in all r-f and i-f circuits. Of the six push buttons, five are used for instant automatic tuning of stations, and one for selecting manual tuning. In manual tuning, three tuned circuits are used. In push-button tuning, two tuned circuits are used, plus a broad-band r-f transformer (Z400) containing an i-f wave trap.

The circuit includes a 6BA6 r-f amplifier, a 6BE6 converter, a 6BA6 i-f amplifier, a 6AV6 detector, a.v.c., and first audio amplifier, and a 6AQ5 output amplifier. The power supply has a non-synchronous vibrator and a 6X4 rectifier. An iron-core choke (L101) is used for hash elimination.

The radio may come equipped with either an electro-dynamic or a permanent-magnet speaker. Replacement speakers of either type are available; the speaker socket connections for both types are shown in the schematic diagram.

ALIGNMENT PROCEDURE

DIAL POINTER — Set tuning-core gang to full-mesh position. Adjust dial pointer to coincide with index mark, to left of "55."

OUTPUT METER — Connect across voice-coil circuit.

SIGNAL GENERATOR — Connect ground lead to chassis; connect output lead as indicated in chart. Use modulated output.

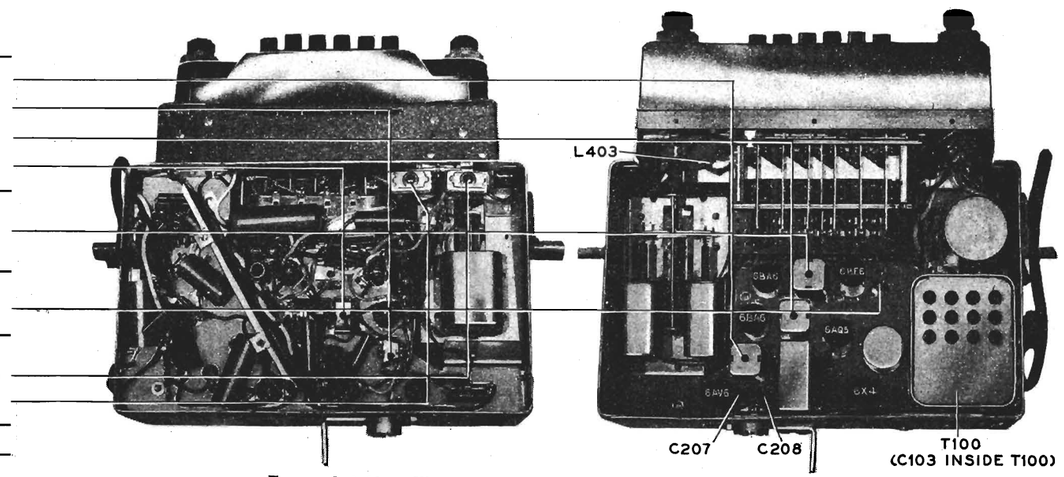
RADIO CONTROLS — Set volume control to maximum, and tone control fully clockwise. Set tuning control and push buttons as directed in chart.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTIONS TO RADIO	DIAL SETTING	PUSH BUTTON AND DIAL	SPECIAL INSTRUCTIONS	
1	Through .05 mf. condenser to mixer grid (pin 7) of 6BE6.	455 kc.	Manual. 1600 kc.	Adjust, in order given, for maximum output. (TC301A and TC300A are reached through holes in bottom of i-f transformers.)	TC301B — 2nd i-f sec. TC301A — 2nd i-f pri. TC300B — 1st i-f sec. TC300A — 1st i-f pri.
2	Through .05 mf. condenser to aerial receptacle.	455 kc.	Any push button except manual.	Adjust for minimum output.	TC400 — i-f trap
3	Through dummy aerial to aerial receptacle.	580 kc.	Manual. 580 kc.	Adjust for maximum, while rocking tuning control.	TC404 — osc. padding
4	Same as step 3.	1400 kc.	Manual. Tune to signal.	Adjust, in order given, for maximum output.	C407A — aerial (series) C407B — r-f (shunt)
5	Repeat steps 3 and 4 until no further improvement is obtained.				
6	After reinstalling radio in car, with aerial connected, depress manual push button, and tune in weak station near 1400 kc.; then adjust aerial series trimmer, C407A, for maximum output.				

OUTPUT LEVEL — During alignment, adjust signal-generator output to maintain output-meter indication below 1.5 volts.

DUMMY AERIAL — For steps 3, 4, and 5, connect signal-generator output lead through 30-mmf. condenser to aerial receptacle; connect another 30-mmf. condenser from receptacle to chassis.

IMPORTANT! These instructions for the use of a dummy aerial must be carefully followed if the radio is to perform at its best after being reinstalled in the car.



Top and Bottom Views, Showing Trimmer and Tuning-Core Locations

TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, as follows:

Section 1—the power supply
Section 2—the audio circuits
Section 3—the i-f, detector, and a-v-c circuits
Section 4—the r-f and converter circuits

Test points are specified for each section, and are indicated in the sectionalized schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis, showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire chart.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before connecting the radio to a source of power.

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, blown fuse, or other obvious indications of trouble.

2. Measure the resistance between B+ (pin 7 of 6X4 rectifier) and the chassis, test point C. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 2775 ohms, check condensers C105A and C105B for leakage or shorts.

NOTE: The resistance value above, which is much lower than normal, is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 are performed.

3. If the fuse is blown, check the vibrator before installing a new fuse; if the vibrator is defective, check the buffer condenser, C104, before installing a new vibrator.

SETTING PUSH BUTTONS

The adjustments are made by removing the push-button caps and turning each of the adjusting rods. Each rod controls ganged tuning cores for both aerial and oscillator circuits, so that only a single adjustment is required for a given frequency.

Use an r-f signal generator to furnish test signals at the approximate frequencies of the desired stations. Connect the dummy aerial described in the alignment procedure.

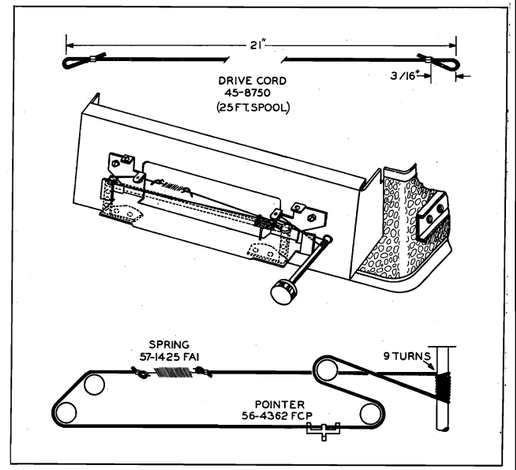
1. Turn on the power, and allow the radio to warm up for 15 minutes. Set the volume control for a moderate level, and the tone control fully clockwise.

2. Starting with the lowest frequency desired, set the signal generator, depress PB-5 (fifth from left), and adjust the rod for maximum output. Repeat the procedure for each remaining button, working from right to left.

The frequency ranges of the buttons are as follows:

PUSH BUTTON (Left to right, from front)	FREQUENCY RANGE
PB-1	850—1600 kc.
PB-2	750—1400 kc.
PB-3	700—1300 kc.
PB-4	650—1150 kc.
PB-5	540—1000 kc.

3. With the radio in the car, and the aerial connected, make a final adjustment of each rod while listening to the station for which the adjustment is being made.



Drive-Cord Installation Details

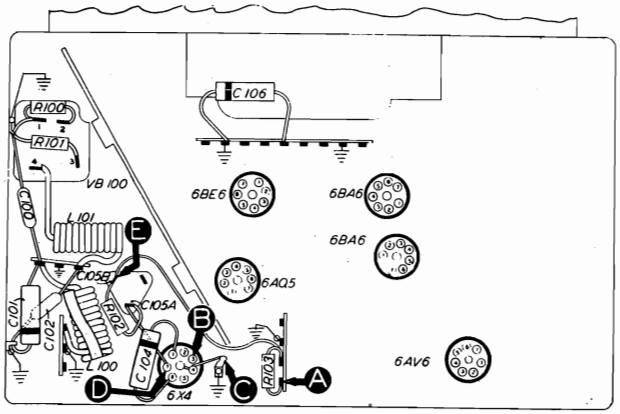
Section 1 — Power Supply

TROUBLE SHOOTING

Make the tests for this section with a d-c voltmeter, connecting the leads between the chassis and the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, with an input voltage of 6.6v, d.c. to the radio.

Depress the manual push button; set the volume control to minimum, and tone control fully clockwise.

Follow the steps in the order given. If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.



TP-4734A

Bottom View, Showing Section 1 Test Points (location of C103 shown in figure 6)

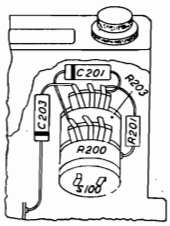
STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	205v		Trouble in this section. Isolate by the following tests.
2	B	6.4v	No voltage Low voltage	Open: F100, L100, S100, L101. Leaky: C100, C101, C102, C103. Weak battery.
3	D	260v	No voltage Low voltage High voltage	Defective: VB100†, 6X4. Open: T100. Shorted: T100, C104, C105A. Defective: 6X4, VB100†. Leaky: C105A, C104. Shorted: C105B, T100. Open: C105A, T100. Open: R102, T200*, R207*.
4	E	245v	No voltage Low voltage High voltage	Open: R102. Shorted: C105B. Leaky: C105B. Changed resistance: R102. Open: R103, R207*.
5	A	205v	No voltage Low voltage	Shorted: C106. Open: R103. Leaky: C106. Changed resistance: R103.
Listening Test: Abnormal hum may be caused by open C105A, C105B, or C104.				

*This part, located in another section, may cause abnormal indication in this section.
†If the vibrator is defective, check the buffer condenser, C104, before installing a new vibrator.

Section 2 — Audio Circuits

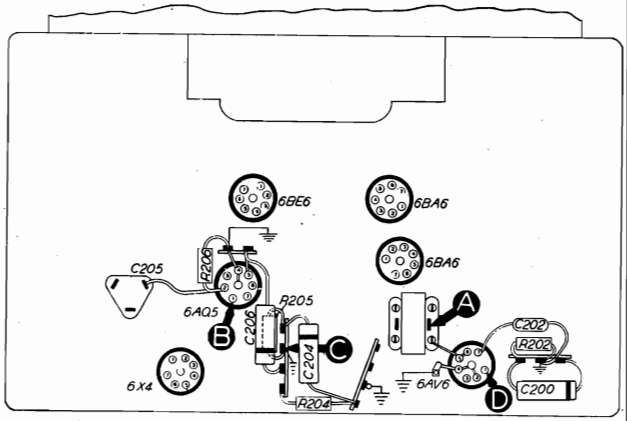
TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.



Depress the manual push button; set the volume control to maximum, and the tone control fully clockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.



TP-4734B

Bottom View, Showing Section 2 Test Points (locations of C207 and C208 shown in figure 6)

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	B	Clear signal with strong signal input.	Defective: 6AQ5. Open: T200, LS200, L200, R206. Shorted: T200, C206, C207, C204, C202.
3	D	Loud, clear signal with weak signal input.	Defective: 6AV6 (triode section). Open: C204, R204. Shorted or leaky: C203 (rotate R203 through range).
4	A	Loud, clear signal with weak signal input.	Open: R200 (rotate through range), C200.
Listening Test: Distortion may be caused by shorted or leaky C200, C204, C205, or open R202, R205.			

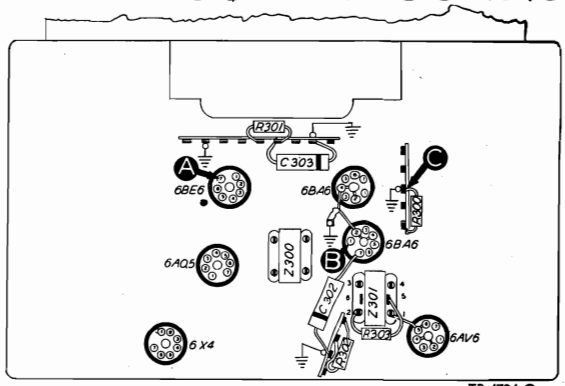
Section 3 — I-F, Detector, and A-V-C Circuits TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Depress the manual push button; set the volume control to maximum, and the tone control fully clockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

Since the circuit location of test point A for this section is in Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."



TP-4734-C

Bottom View, Showing Section 3 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	B	Clear signal with weak signal input.	Defective: 6AV6 (diode section), 6BA6. Misaligned: Z301. Open: L301A, L301B, R301, R300, C301A, C301B, R303. Shorted: C301C, C303, C301A, C301B, C301D, C300B.
3	A	Same as step 1.	Defective: 6BE6*. Misaligned: Z300. Open: L300A, L300B, L404*, C407B*. Shorted: C300A, C300B.

*This part, located in another section, may cause abnormal indication in this section.

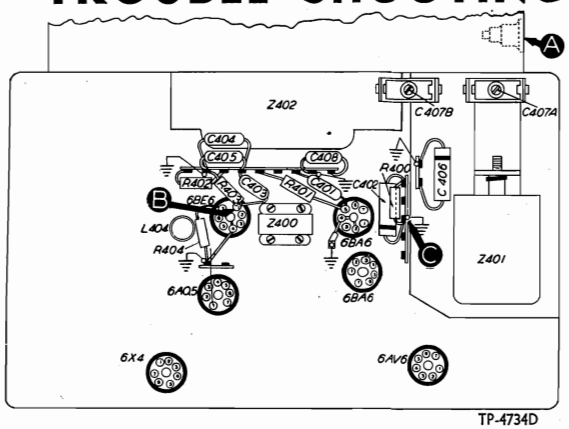
Section 4 — R-F and Converter Circuits TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator tests, use an r-f signal generator, with modulated output. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control fully clockwise.

Set the push buttons, tuning control, and signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1(a) and (b), isolate the trouble by following the remaining steps.



TP-4734D

Bottom View, Showing Section 4 Test Points (location of L403 shown in figure 6)

STEP	TEST POINT	SIGNAL GEN. FREQUENCY	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1 (a)	A	1000 kc.	Manual. Tune to signal.	Loud, clear signal with weak signal input.	Trouble in manual-tuning circuits. Isolate by steps 2 and 3, and correct trouble before proceeding.
1 (b)	A	Tune to freq. of each push button	Depress each station push button.	Same as step 1 (a).	Trouble in push-button-tuning circuits. Isolate by steps 4 and 5.
2	B (Osc. test; see note below.)		Manual. Tune through range.	Negative .8 to 1.4 volts.	Defective: 6BE6 (osc. section). Open: R403, C403, L404, L401C, C404, C405, PB-6. Shorted: L404, L401C, C404, C405.
3	A	1000 kc.	Manual. Tune to signal.	Same as step 1 (a).	Defective: 6BA6. Open: L403, L401A, L401B, R400, R401, C401, PB-6, C408. Shorted: C408, C401, L401A, L401B.
4	B (Osc. test; see note below.)		Depress each station push button.	Negative 1.1 to 1.4 volts.	Open: Osc. coil or switch associated with any push button. Shorted: Osc. coil associated with any push button.
5	A	Tune to freq. of each push button	Depress each station push button.	Loud, clear signal with weak signal input.	Open: L400B, C400B, C407B, ant. coil associated with any push button. Shorted: L400B, C407A, ant. coil associated with any push button.

OSCILLATOR TEST

Connect the positive lead of a high-resistance voltmeter to the chassis, test point C; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 1) of the 6BE6, test point B. Proper operation of the oscillator is indicated by negative voltages of approximately the values given in the chart (measured with 20,000-ohms-per-volt meter), throughout the tuning range.

PHILCO CORP.

TROUBLE SHOOTING

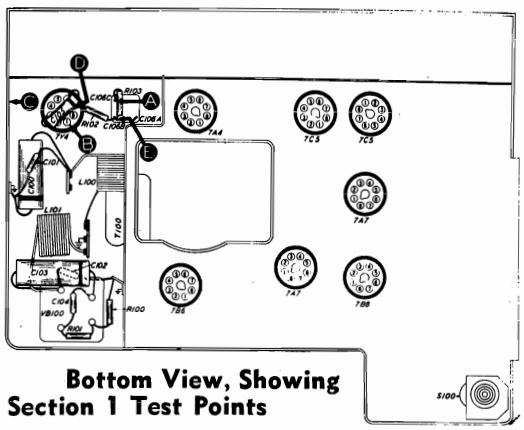
Section 1

Make the tests for this section with a d-c voltmeter, connecting the leads between test point B (B–) and the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, with an "A"-supply voltage of 6.6 volts, d.c.

Turn on the power, and set the sensitivity control to maximum (clockwise).

Turn the volume control to minimum, and the tone control fully counterclockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2; if not, isolate and correct the trouble in this section.



Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A B	165v 6.6v		Trouble in this section. Isolate by the following tests.
2	B	6.6v	No voltage	Open: F100, L100, L101, S100. Shorted: C100, C101, C102, C103, C104.
			Low voltage	Weak battery.
3	D	220v	No voltage	Defective: VB100, 7Y4. Shorted: C105, C106A, T100. Open: T100.
			Low voltage	Defective: 7Y4. Open: C106A. Leaky: C105, C106A.
			High voltage	Open: T200*, R102, R211*.
4	E	200v	No voltage	Shorted: C106B, R102.
			Low voltage	Changed value: R102. Leaky: C106B.
5	A	165v	No voltage	Open: R103. Shorted: C106C.
			Low voltage	Leaky: C106C. Changed value: R103.

* This part, located in another section, may cause abnormal indication in this section.

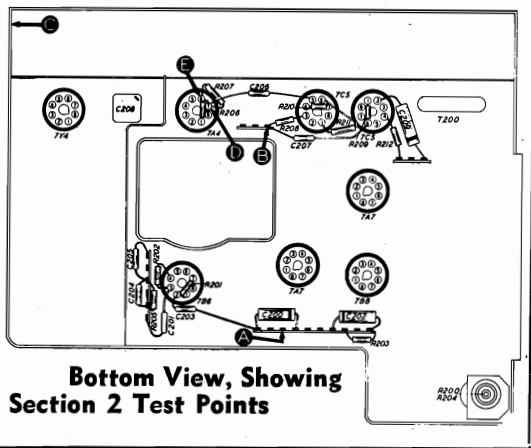
TROUBLE SHOOTING

Section 2

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Turn the volume control to maximum, and the tone control fully counterclockwise. Adjust the signal-generator output as required for each step.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3. If not, isolate and correct the trouble in this section.



Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	B (Remove 7A4)	Clear signal with strong signal input.	Defective: 7C5, LS200. Shorted or leaky: C209, T200. Open: R211, R209, T200, C207.
3	D	Same as step 2.	Defective: 7C5. Open: T200. Shorted: T200, C206.
4	E (Replace 7A4)	Loud, clear signal with moderate signal input.	Open: R207, R206, R208. Shorted or leaky: C204, C205, C203 (rotate R204). Defective: 7A4.
5	A	Same as step 1.	Defective: 7B6, R200 (rotate through range). Open: R200, R201, C201, R205.

Listening Test: Rotate tone control, R204, through range; lack of treble attenuation may be caused by open C203 or R204; lack of bass accentuation may be caused by open R212, R204, R203, or C202, or by shorted or leaky C202. Distortion may be caused by leaky C201, C205, C206, or C207.

PHILCO CORP.

MODEL P-4735, Packard

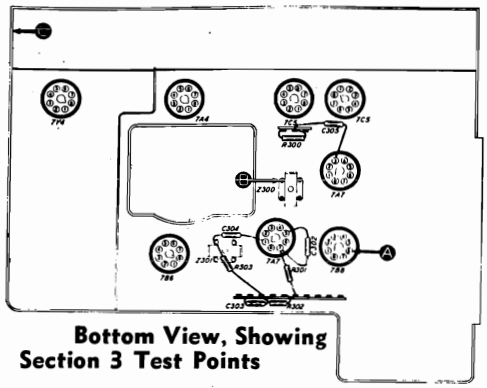
TROUBLE SHOOTING

Section 3

For the tests in this section, use an r-f signal generator, with modulated output, set at 265 kc. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Turn the volume control to maximum, and the tone control fully counterclockwise. Set the sensitivity control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4; if not, isolate and correct the trouble in this section.



Bottom View, Showing Section 3 Test Points

Since the circuit location of test point A for this section is the same as that of test point B for Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	B	Loud, clear signal with moderate signal input.	Defective: 7A7, 7B6 (diode section). Misaligned: Z301. Open: Z301 pri. or sec., C301A, C301B, R301, R300, R406* (rotate through range), R303. Shorted: Z301 pri. or sec., C301A, C301B, C300B, C303, C304, C305.
3	C	Loud, clear signal with weak signal input.	Defective: 7B8.* Misaligned: Z300. Open: Z300 pri. or sec., C300A, C300B. Shorted: C405,* Z300 pri., C300A, C300B.

* This part, located in another section, may cause abnormal indication in this section.

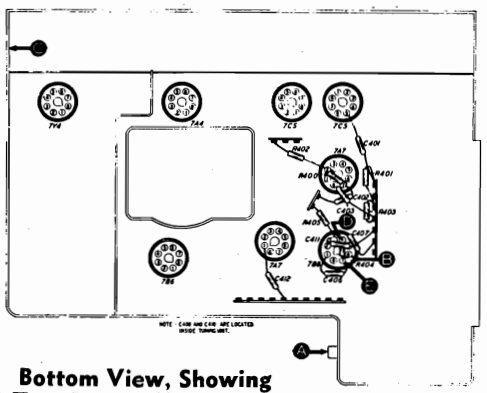
TROUBLE SHOOTING

Section 4

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator, with modulated output. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Turn the volume control to maximum, and the tone control fully counterclockwise. Set the sensitivity control to maximum.

If the "NORMAL INDICATION" is not obtained in step 1, isolate the trouble by following the remaining steps.



Bottom View, Showing Section 4 Test Points (locations of C404, L401, R406, and Z400 are shown in figure 6)

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal.	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	B	1000 kc.	Tune to signal.	Loud, clear signal with moderate signal input.	Defective: 7B8. Shorted: L400B, C404, C405. Trouble in oscillator circuit (step 3).
3	D to E Osc. Test (see note below)		Tune through range.	Negative 2 to 4 volts.	Shorted or leaky: C411, C410, C407, C408, C409. Open: C411, L400D, C407, R404, R405, R406, L400C, C408, C410. Shorted: L400C, L400D.
4	A	1000 kc.	Tune to signal.	Loud, clear signal with weak signal input.	Defective: 7A7. Open: L401, R400, R401, R402, C403, R403, L400B, L400A. Shorted or leaky: C403, C412, C404.

OSCILLATOR TEST

Connect positive lead of high-resistance voltmeter to test point E (pin 7, cathode of 7B8); connect prod end of negative lead through 100,000-ohm isolating resistor to test point D (pin 4, osc. grid of 7B8). Use suitable meter range, such as 0—10 volts. Proper operation of oscillator is indicated by negative voltage, 2 to 4 volts (measured with 20,000-ohms-per-volt meter), throughout tuning range.

MODEL P-4735,
Packard

PHILCO CORP.

REPLACEMENT PARTS LIST

NOTE

Part numbers marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

PUSH BUTTONS	Six: five for station selection; one for manual tuning
AUDIO OUTPUT	5.9 watts
POWER INPUT	8.8 amperes at 6.6 volts, d.c.
AERIAL	Retractable-tip, Philco Part No. 45-1468-1
PHILCO TUBES (8)	7A7 (2), 7B8, 7B6, 7A4, 7C5 (2), 7Y4

Circuit Description

The circuit is an eight-tube superheterodyne, using permeability tuning. Of the six push buttons, five are used for automatic station selection, and one selects manual tuning. The ganged tuning cores of the aerial, r-f, and oscillator circuits are mechanically actuated (by pantograph drive) for either push-button or manual operation.

The tuned-r-f amplifier stage employs a 7A7. The converter, a 7B8, works into a 7A7 i-f amplifier, which operates at 265 kc.

The 7B6 duo-diode, triode tube provides detection and a-v-c voltage in the diode section; the triode section functions as the first audio amplifier. A 7A4 plate-and-cathode-loaded phase inverter drives the two 7C5 push-pull output amplifiers, which, at full output, provide 5.9 watts of audio power to the electrodynamic speaker.

The power-supply circuit incorporates a non-synchronous vibrator and a 7Y4 full-wave rectifier.

A variable sensitivity control, R406, is connected in the common cathode circuit of the converter and i-f tubes. This control is mounted on the chassis as shown in figure 6, and may be adjusted with a screwdriver, inserted through a hole in the back of the radio; in areas where most reception is from local stations, the control should be set for lower sensitivity, to permit quieter operation of the radio.

The tone control is part of a feed-back circuit in which the feedback to the first audio stage is degenerative at high audio frequencies and regenerative at the lower frequencies.

SECTION 1

MODEL P-4735

PHILCO CORP.

ALIGNMENT PROCEDURE

DIAL POINTER—Turn manual tuning knob until pointer stops at high-frequency end of dial; if pointer does not coincide with index mark at 1600 kc., carefully bend it to the correct position.

OUTPUT METER—Connect across voice-coil terminals.

SIGNAL GENERATOR—Connect ground lead to chassis; connect output lead as indicated in chart. Use modulated output.

RADIO CONTROLS—Set volume and sensitivity controls to maximum. Set tone control for maximum signal (approximate center of range).

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTIONS TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Through .1-mf. condenser to aerial receptacle.	265 kc.	540 kc.	Adjust trimmers, in order given, for maximum output.	TC301B TC301A TC300B TC300A
2	Through dummy aerial.	1600 kc.	Tune to signal.	Adjust for maximum.	C405
3	Same as step 2.	1400 kc.	1400 kc.	Adjust for maximum.	C409
4	Same as step 2.	580 kc.	Tune to signal.	Adjust for maximum while rocking tuning control.	TC400D
5	Repeat steps 2, 3, and 4 until no further improvement is obtained.				
6	After reinstalling radio in car, with aerial connected, adjust C401 for maximum output from weak station near 1400 kc. If the radio is to be used in an area having local broadcasting stations, the sensitivity control may be adjusted for somewhat lower sensitivity, to permit quieter operation.				

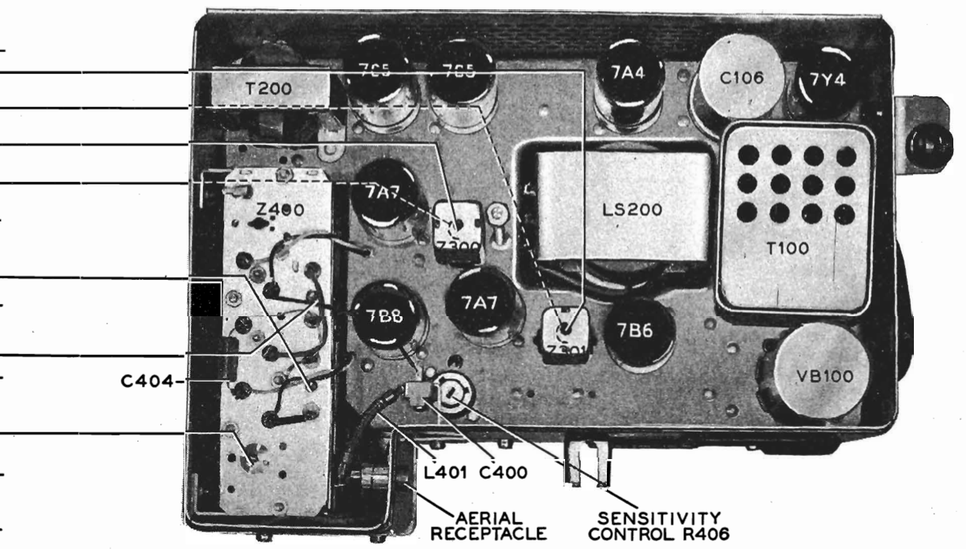
OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below 1 volt.

DUMMY AERIAL—For steps 2, 3, and 4, either of two dummy-aerial connections should be used: (1) connect generator output lead through 22-mmf. condenser to shielded aerial lead (Philco Part No. 45-1468-1) plugged into aerial receptacle; (2) connect output lead through 22-mmf. condenser to aerial receptacle, then connect 30-mmf. condenser from receptacle to chassis.

IMPORTANT: The above instructions for the dummy aerial must be carefully followed if the radio is to perform at its best after being reinstalled in the car.

Top View, Trimmer and Tuning-Core Locations

(dotted lines indicate tuning screws located at bottom of chassis)



SETTING PUSH BUTTONS

Any one of the five station push buttons may be set for any frequency within the broadcast band.

1. Turn on the power, and allow the radio to warm up for fifteen minutes.
2. Pull off the five uppermost push-button knobs (the lower knob selects manual tuning), thus exposing the shafts which operate the tuning mechanism.
3. Depress one of the shafts until it locks in, then rotate the shaft to tune in the desired station; turning the shaft causes the dial pointer to move, indicating the frequency to which the circuits are tuned.
4. Repeat the procedure for each button. Replace the knobs.

TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

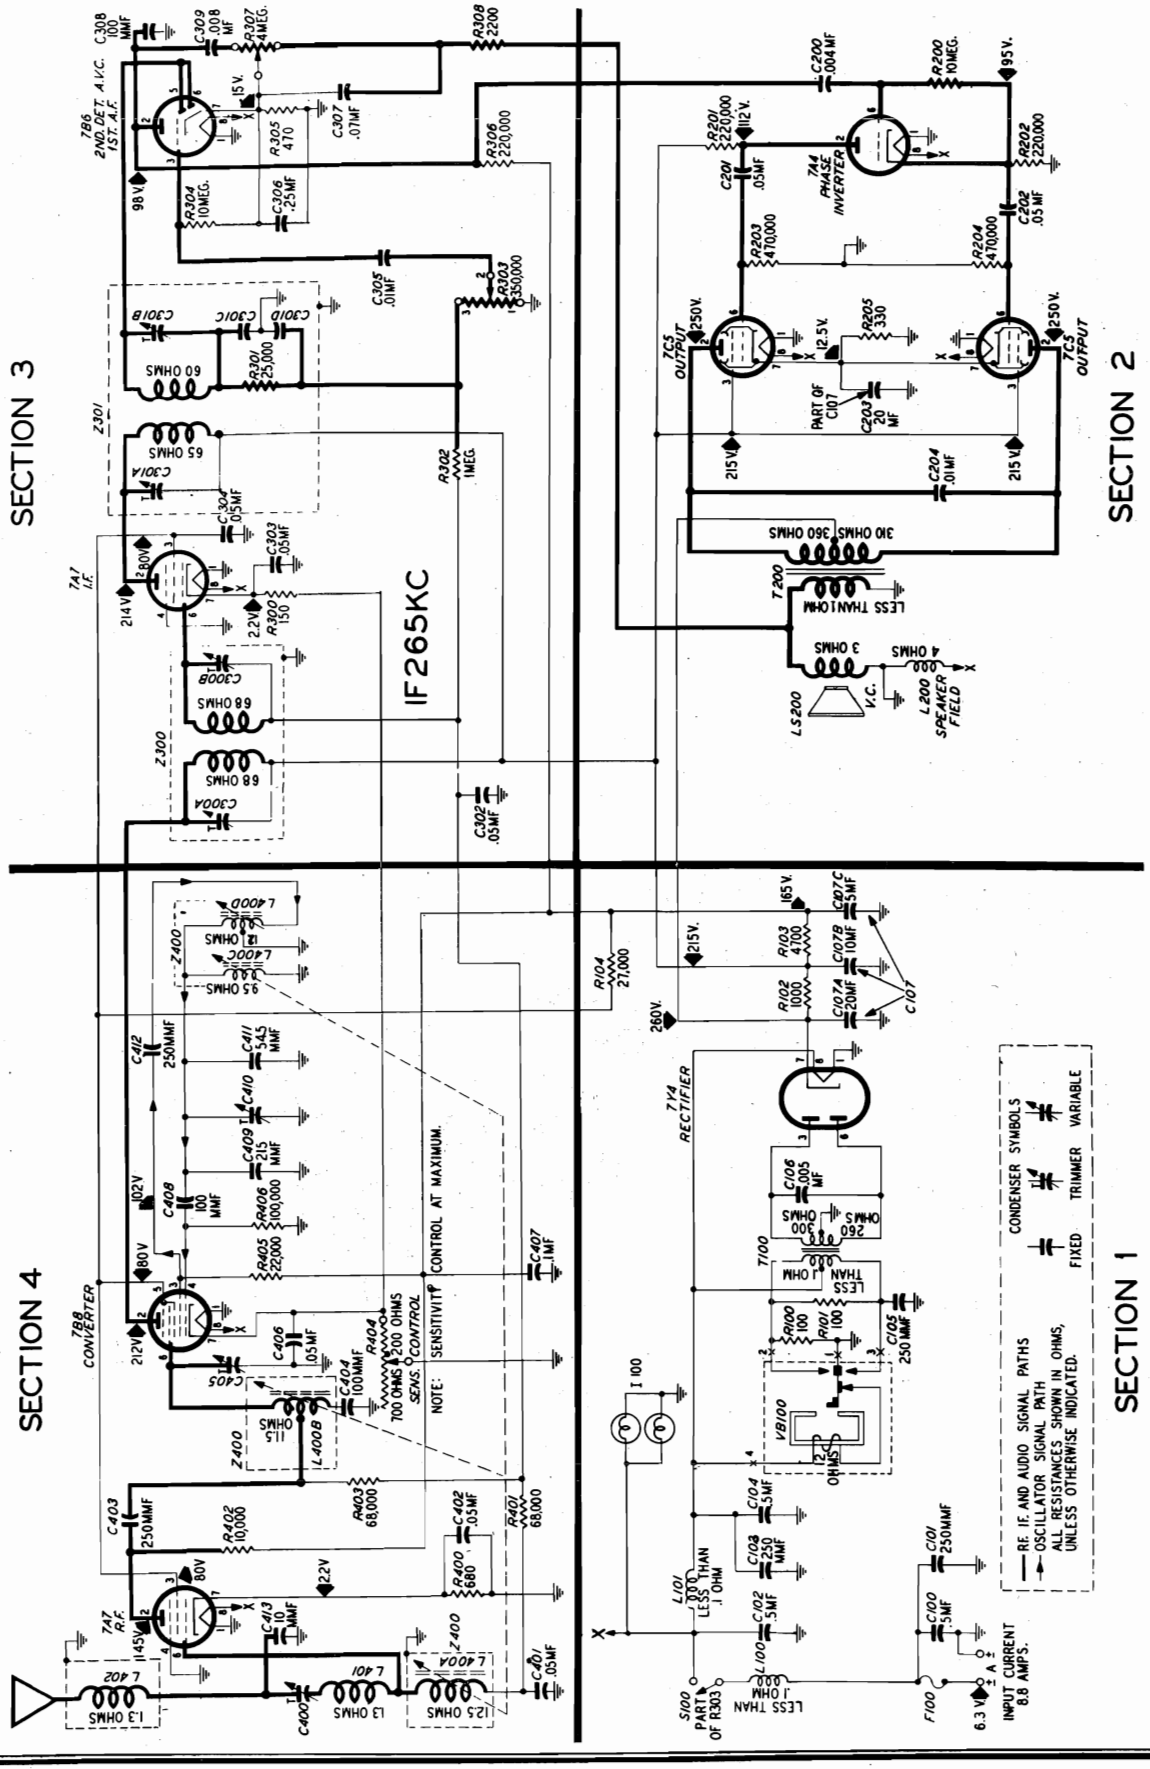
To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.
2. Measure the resistance between B+ (pin 7 of 7Y4 rectifier tube) and the radio chassis, test point C, with the ohmmeter polarity such that the highest resistance reading is obtained. If the reading is lower than 2700 ohms, check condensers C106A and C106B for leakage or shorts. The resistance value above, which is much lower than normal, is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 are performed.

If the fuse is open, check the vibrator before installing a new fuse; if the vibrator is defective, check the buffer condenser, C105, for leak or short.

PHILCO CORP.

MODELS S-4626, S-4627, Studebaker



NOTE: All voltage, capacity, and resistance values shown are average. The voltages were measured between the points indicated and the receiver chassis (B–), using a 20,000-ohms-per-volt meter, with 6.3 volts d-c input to the receiver power supply; the volume control was set at minimum, and the tuning control at 540 kc.

ALIGNMENT PROCEDURE

CONNECT THE SIGNAL-GENERATOR output lead as follows:

For the i-f alignment (the first step in the chart), connect through a .05-mf. condenser to the aerial connector.

For the r-f alignment (all steps after the first), inject the signal through a dummy aerial consisting of a 20-mmf. condenser in series with an aerial lead (Part No. 95-0181) plugged in to the aerial receptacle. If an aerial lead is not available, connect a 30-mmf. condenser from the aerial receptacle to ground, and inject the signal through the 20-mmf. condenser alone. **The foregoing instruction must be carefully followed if the receiver is to give its best performance after being reinstalled in the car.**

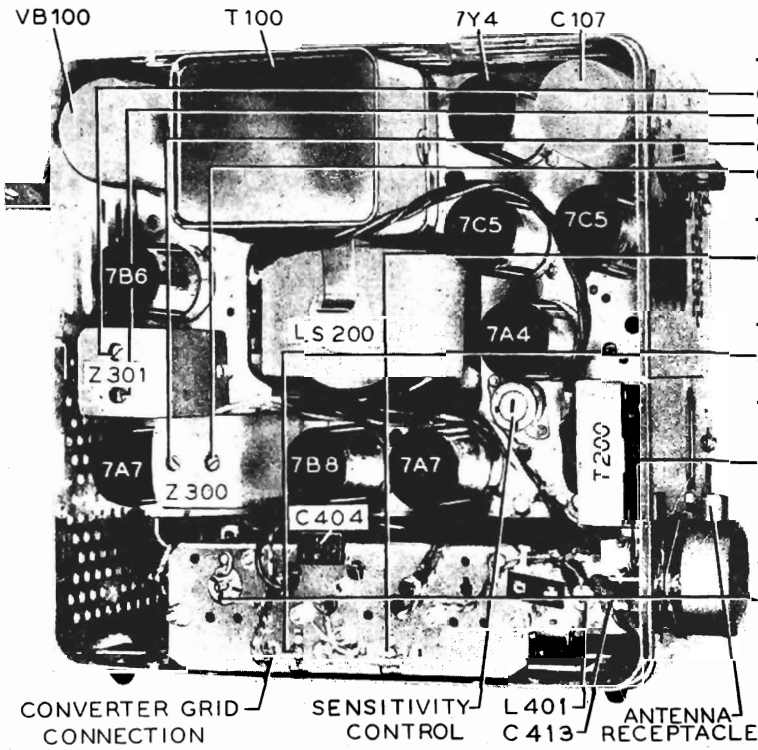
CONNECT THE OUTPUT METER between the voice-coil lug on the speaker and the receiver chassis.

ADJUST THE RECEIVER CONTROLS as follows:

Set the volume and sensitivity controls at maximum. Set the tone control for maximum signal output (approximately the center of its range).

ADJUST THE SIGNAL-GENERATOR OUTPUT as alignment progresses to keep the meter needle near center scale, using the lowest range on the output meter.

AFTER REINSTALLING THE RECEIVER in the car and connecting the aerial, make the following adjustments: Set the aerial trimmer for maximum signal strength on a weak station near 1400 kc. Set the sensitivity control for low sensitivity, if the receiver is to be used mainly for local-station reception, or higher sensitivity depending on the degree of distant-station reception desired. The lower the sensitivity can be set, the less will be the noise and interference pickup.



ADJUST IN ORDER	SPECIAL INSTRUCTIONS	DIAL SETTINGS SIG. GEN.	DIAL SETTINGS RECEIVER
C301B, C301A, C300B, C300A	Ground pin 4 of the 7B8. Adjust for maximum in order as numbered, and then repeat procedure.	265 kc.	540 kc.
C410	Remove the ground from pin 4 of the 7B8. Adjust for maximum.	1600 kc.	1600 kc.
C405	Adjust for maximum.	1400 kc.	1400 kc.
C400	Adjust for maximum. Final adjustment to be made after installation in car, with aerial connected.	1400 kc.	1400 kc.
L400D	Adjust for maximum while rocking tuning control back and forth across signal.	580 kc.	580 kc.
	Repeat all steps after the first.		

Chassis view, showing trimmer locations.

MAKE TEST NO. 1 FIRST !

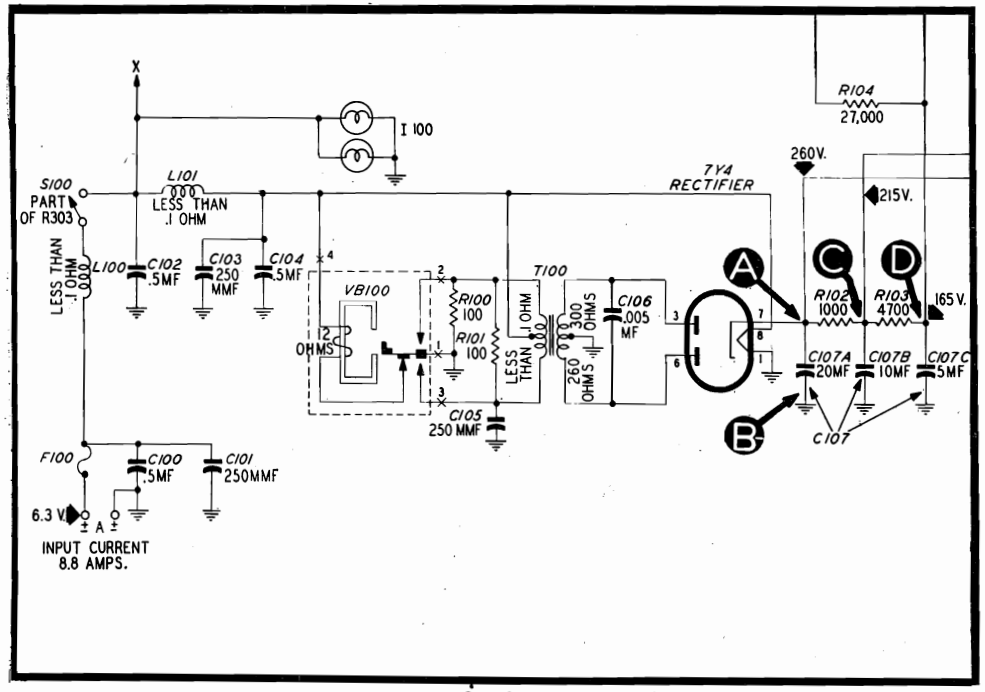
If the "NORMAL INDICATION" for this test is obtained, proceed to Test No. 1 in the next section. If not, continue through the chart to isolate and remedy the trouble in this section.

TESTS TO ISOLATE TROUBLE WITHIN SECTION 1

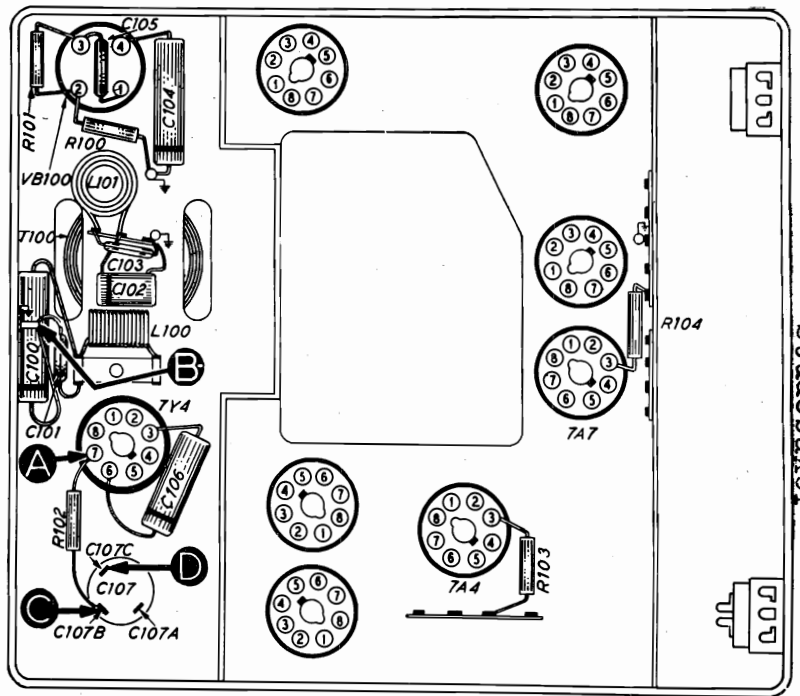
Make all measurements for this section with a volt-ohmmeter, using the applicable d-c range. All voltages given in this manual are average, and were taken with a 20,000 ohms-per-volt meter, with 6.3 volts d-c input; the volume control was set at minimum, and the tuning control at 540 kc.

WARNING: If the 7Y4 rectifier is found to be defective, check the main filter condenser, C107, for shorts before inserting a new tube. If the vibrator is found to be defective, check C106 for a short before inserting a new vibrator.

	TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1.	D to B—	165 volts	Trouble within Section 1. Isolate by following tests.
2.	A to B—	260 volts	Defective 7Y4, VB100, T100, C105, C106, C107A, or C107B.
3.	C to B—	215 volts	Defective R102, C107B or C107C.
4.	D to B—	165 volts	Defective R103, C107C or C407 (see Section 4 for location).



Section 1 schematic.



Bottom view, showing Section 1 test points.

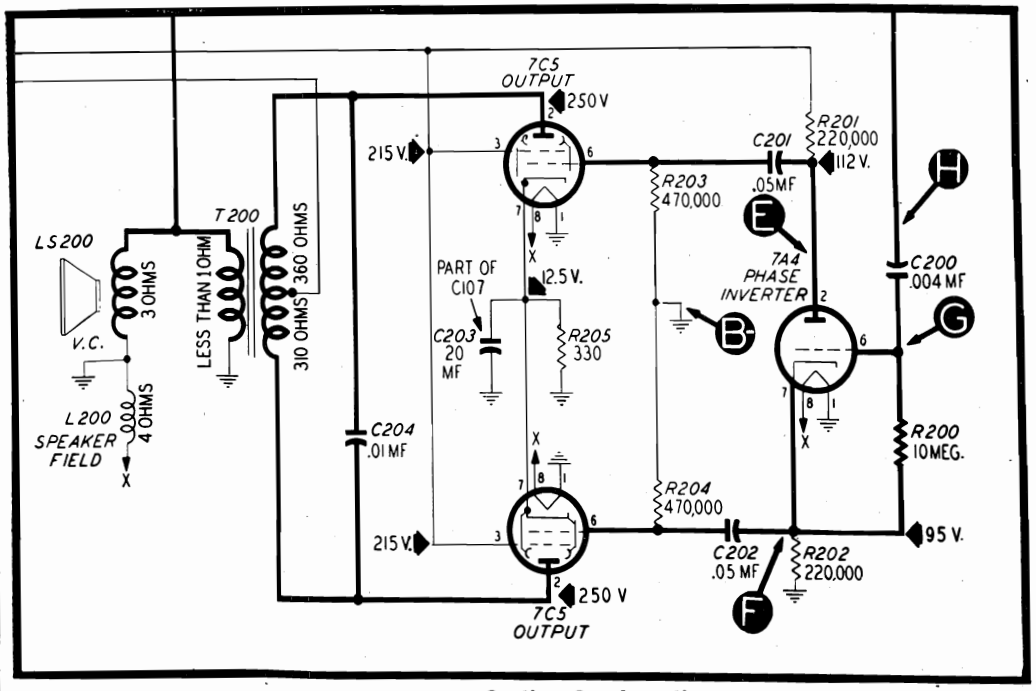
MAKE TEST NO. 1 FIRST !

If the "NORMAL INDICATION" for this test is obtained, proceed to Test No. 1 in the next section. If not, continue through the chart to isolate and remedy the trouble in this section.

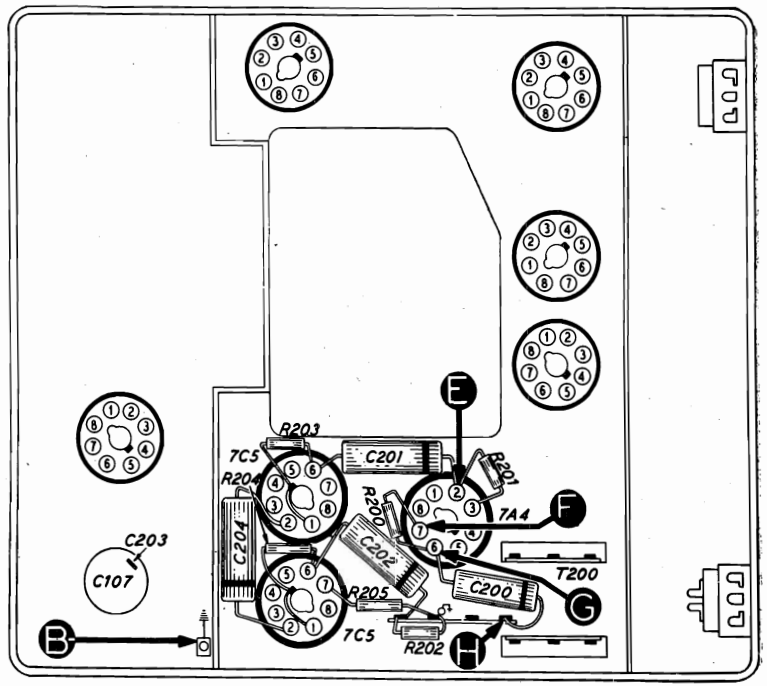
TESTS TO ISOLATE TROUBLE WITHIN SECTION 2

For all tests in this section, use an audio signal. Connect the generator output lead through a condenser (.01 to .25 mf.) to the test points indicated; connect the ground lead to the receiver chassis (B–). Set the receiver volume control at maximum, and adjust the signal-generator output for a loud, clear signal.

	TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1.	H to B–	Loud, clear signal.	Trouble within Section 2. Isolate by following tests.
2.	E to B– (Remove 7A4)	Loud, clear signal.	Defective 7C5, T200, LS200, R203, R205, C201, C203, or C204.
3.	F to B– (7A4 removed)	Loud, clear signal, same as preceding test.	Defective 7C5, T200, R204, or C202.
4.	G to B– (Replace 7A4)	Clear signal, louder than preceding test.	Defective 7A4, R202, R201, R200, or C200.
5.	H to B–	Loud, clear signal, same as preceding test.	Defective C200, R200, or C308 (see Section 3 for location).



Section 2 schematic.



Bottom view, showing Section 2 test points.

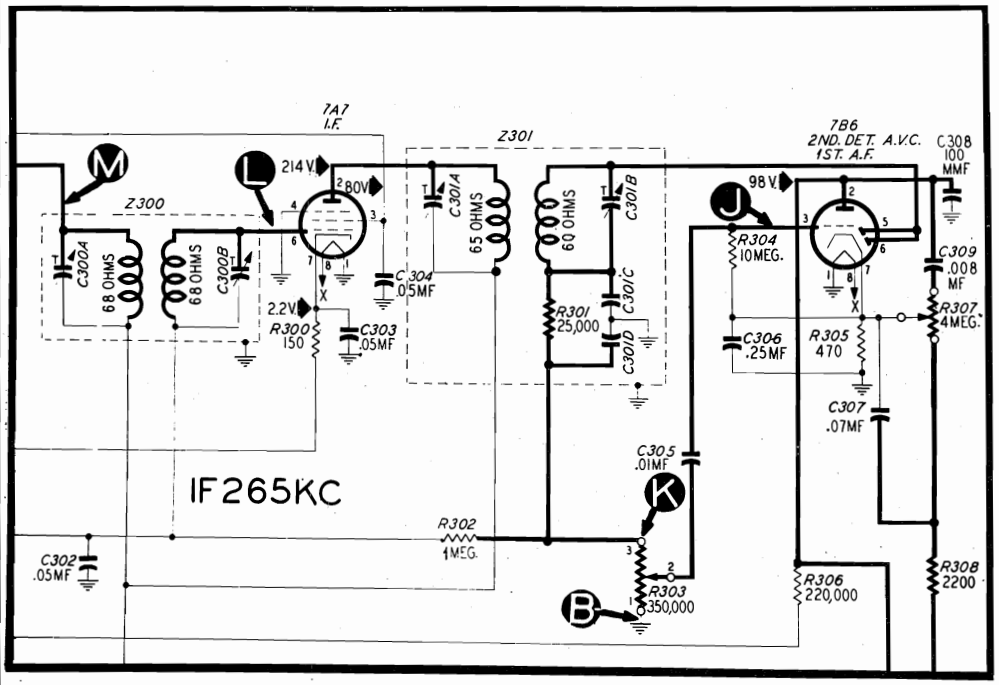
MAKE TEST NO. 1 FIRST !

If the "NORMAL INDICATION" for this test is obtained, proceed to Test No. 1 in the next section. If not, continue through the chart to isolate and remedy the trouble in this section.

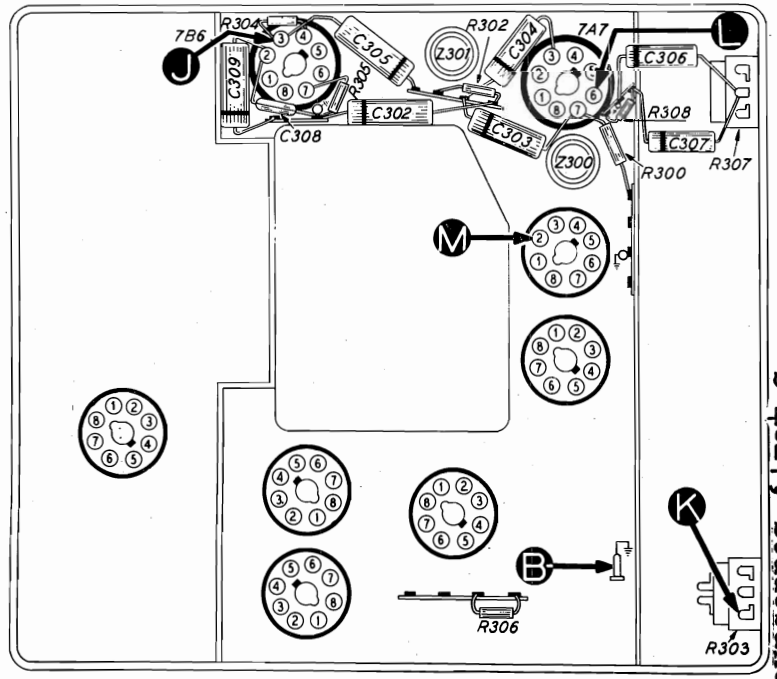
TESTS TO ISOLATE TROUBLE WITHIN SECTION 3

For the second and third tests in the chart for this section, use an audio signal. For the first, and the last two, use a modulated 265-kc. signal. Connect the signal-generator output lead through a condenser (.01 to .25 mf.) to the test points indicated; connect the ground lead to the receiver chassis (B–). Set the receiver volume control at maximum, and adjust the signal-generator output for a loud, clear signal.

	TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1.	M to B– (265-kc. signal)	Loud, clear signal.	Trouble within Section 3. Isolate by following tests.
2.	J to B– (audio signal)	Loud, clear signal.	Defective 7B6, R306, R305, R304, C306, or C308.
3.	K to B– (audio signal)	Loud, clear signal.	Defective C305 or R303 (rotate R303 through its entire range for complete check).
4.	L to B– (265-kc. signal)	Loud, clear signal.	Defective 7A7, C303, C304, R104 (shown in Section 1), R300, R404 (shown in Section 4), or Z301.
5.	M to B– (265-kc. signal)	Loud, clear signal.	Defective R302, C302, or Z300.



Section 3 schematic.



Bottom view, showing Section 3 test points.

TESTS TO ISOLATE TROUBLE WITHIN SECTION 4

MAKE TEST NO. 1 FIRST !

If the "NORMAL INDICATION" for this test is not obtained, continue through the chart to isolate and remedy the trouble in this section.

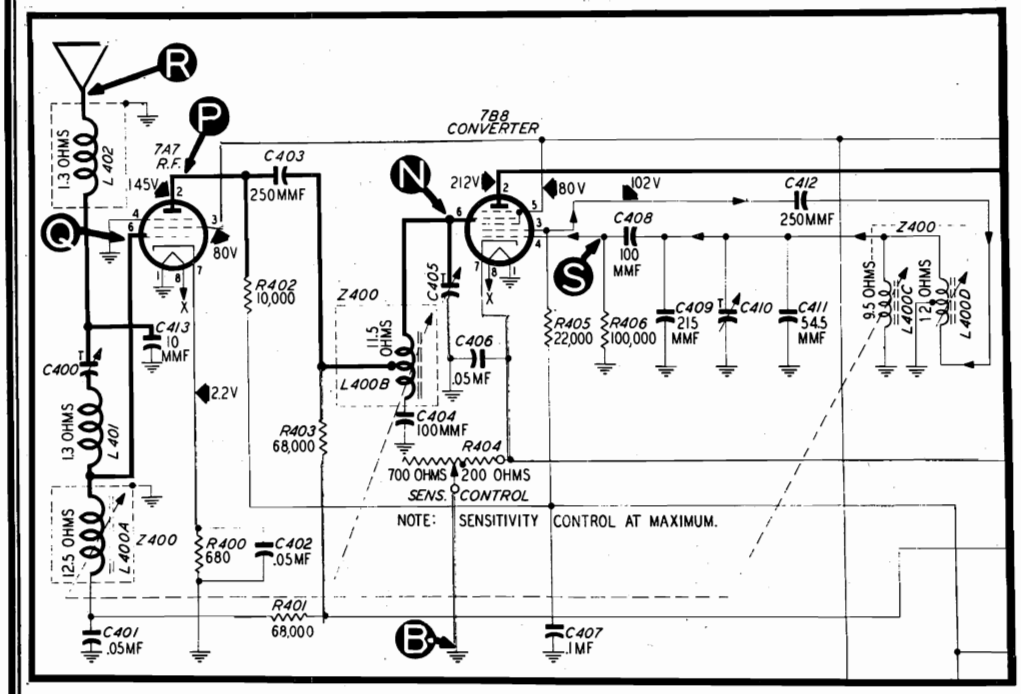
PRELIMINARY OSCILLATOR CHECK:

Attach the positive lead of a 20,000-ohms-per-volt meter (10-volt range) to the receiver chassis, and the prod end of the negative lead through 50,000 ohms to point S. Rotate the tuning control; absence of voltage indicates that the oscillator is not functioning. If this is the case, check the components listed in the second test below.

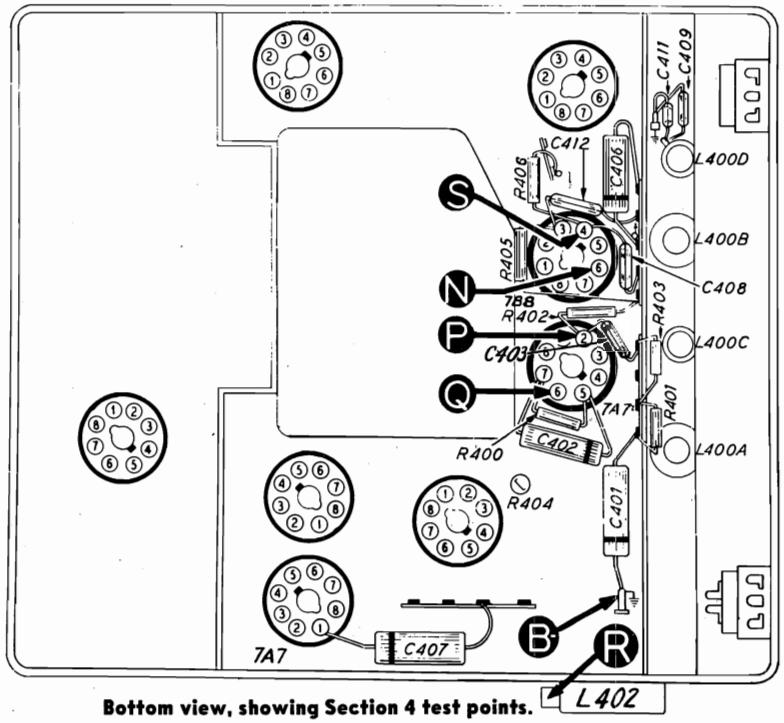
FOR CHART TESTS 1 - 5:

Connect the signal - generator output lead through a condenser (.01 to .25 mf.) to the test points indicated; connect the ground lead to the receiver chassis. Set the receiver volume control at maximum, tune the signal generator and receiver to 1000 kc., and adjust the generator output for a loud, clear signal.

	TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1.	R to B—	Loud, clear signal.	Trouble within Section 4. Isolate by following tests.
2.	N to B—	Loud, clear signal.	Defective 7B8, L400C, L400D, R403, R404, R405, R406, C403, C405, C408, C409, C410, C411, or C412.
3.	P to B—	Loud, clear signal.	Defective C403, C404, R403, or L400B.
4.	Q to B—	Clear signal, louder than preceding test.	Defective 7A7, L400A, R400, R402, or C402.
5.	R to B—	Loud, clear signal.	Defective L401, L402, C400, C401, C413, or R401.



Section 4 schematic.



Bottom view, showing Section 4 test points.

PHILCO CORP.

MODELS S-4626, S-4627, Studebaker

CIRCUIT DESCRIPTION

The circuit of the S4626 consists of a 7A7 r-f amplifier, a 7B8 converter, a 7A7 i-f amplifier, a 7B6 second detector–first audio, and an audio power amplifier using two 7C5's in push-pull, driven by a 7A4 phase inverter. The power supply is of the six-volt non-synchronous vibrator type, using a 7Y4 rectifier.

The aerial input circuit is designed for maximum interference elimination, without sacrifice of signal strength. Permeability tuning, controlled by a pantograph tuning unit, is used for both the r-f and oscillator stages. This method of tuning assures maximum sensitivity, selectivity, and stability for this type of receiver. A sensitivity control is provided (identified in figure 9, page 6), which consists of a variable resistor in the common cathode circuit of the converter and i-f stages. This should be adjusted for lower sensitivity in areas where most reception is from local stations, in order to minimize noise pickup.

The S4626 uses an intermediate frequency of 265 kc.

Two features of the audio system are the tone control, which is an inverse feed-back circuit built around the first audio amplifier, and the push-pull output stage, which delivers a full five watts of audio power to the dynamic speaker.

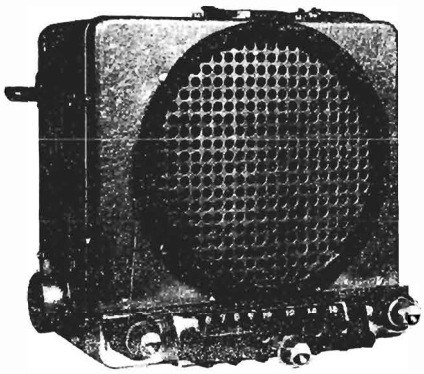
MODELS S-4626, S-4627, Studebaker

PHILCO CORP.



SPECIFICATIONS

CIRCUIT .....Eight-tube, superheterodyne
FREQUENCY RANGE .....540 to 1600 kc.
INTERMEDIATE FREQUENCY .....265 kc.
POWER INPUT .....6.3 volts, 8.8 amperes, d.c.
PHILCO TUBES.....7A7(2), 7B8, 7B6, 7A4, 7C5(2), 7Y4
AERIAL.....Retractable-tip, Philco Part No. 91-0230

The dial scale on the S-4627 is a fluorescent type to match the panel indicators of the 1947 cars. The dial pointer and cam assembly is different thus giving a new part number to the tuning assembly which otherwise is the same. The "A" lead is dressed to the left side of the radio case instead of the right side for convenience to the new position of the ignition switch. A clip is provided on the side of the case to hold the fuse holder and prevent it from rattling against the set. The receiver is mounted in the same position as in the 1946 car, but hook bolts of a new design are provided to fit the installation.

The suppression material is different and complete information on the suppression of ignition interference is given in the installation instructions with the radio.

IMPORTANT

The aerial and aerial lead-in form part of the r-f tuning circuit. When testing or aligning this receiver on the bench it is important that an aerial dummy load of equal capacity be used.

TROUBLE-SHOOTING PROCEDURE

This service manual provides a logical trouble-shooting procedure for the S4626, which will facilitate the isolation of most of the faults that may be encountered. The circuit is divided into four sections, with a schematic and chassis layout, showing test points, for each section. The trouble-shooting procedure is outlined in a chart for each section. The first test in each chart is a sectional master check, making it possible to eliminate the section under test as a source of trouble without going through its entire chart procedure.

Wherever trouble is indicated (by failure to get a "Normal Indication" on any one test) it should be isolated by voltage and resistance checks of the parts associated with the point under test, and remedied before testing further.

PRELIMINARY CHECKS

The following preliminary checks are recommended:

1. Carefully inspect both sides of the chassis. Make sure that all the tubes are secure, and look for bad connections, burned resistors, or other mechanical faults.

2. Check the fuse, and connect the receiver to a source of power (6.3 volts, d.c.). Look for unlighted tube filaments, overheated resistors (smoke, sweating, etc.), and listen for the hum of the vibrator.

3. Check the tubes and the vibrator. WARNING: If the 7Y4 is defective, check C107 for shorts before inserting a new tube. If the vibrator is defective, check C106 for a short before inserting a new vibrator.

New part numbers have been given to the following items and apply only to the S-4627 receivers.

SECTION 4

Reference Number	Description	Model S-4627 Service Part No.
C400	Condenser, trimmer	31-6472
Z400	Pantograph tuning assembly	77-0970-1

ANTENNA	Philco universal auto radio type

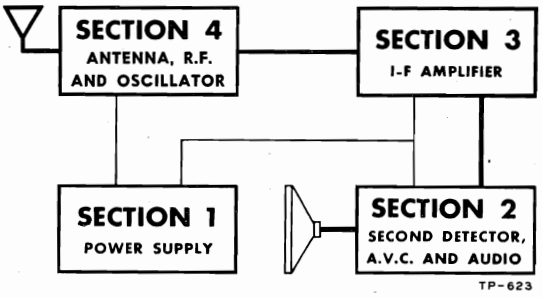

Figure 1. Block diagram (Heavy lines indicate signal path.)

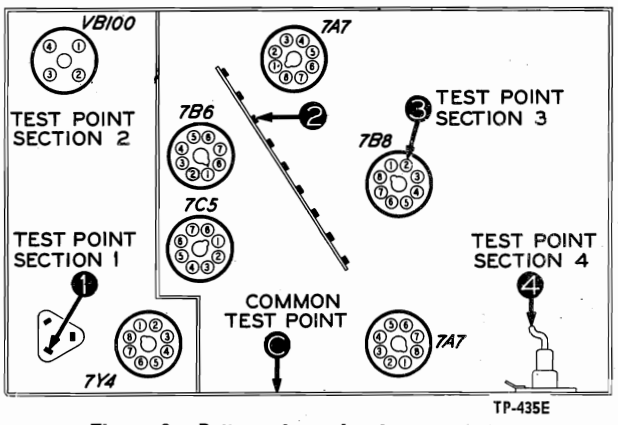

Figure 2. Bottom view, showing test points.

PHILCO TROUBLE-SHOOTING PROCEDURE

In this manual, the receiver circuit is divided into four sections, as shown in figure 1. One test point is designated for each section, as shown in figure 2. Normal indications, secured when checking these points, eliminate the section under test as a source of trouble. Isolation of the faulty part is accomplished by testing in the order shown in the sectional test charts. A high-quality signal generator and volt-ohmmeter, an ammeter (0-30 amperes, d.c.), and a 6.3-volt d-c power source are required. The voltage readings shown were taken with a 20,000-ohms-per-volt meter.

To localize trouble, connect the receiver to the 6.3-volt d-c power source, and turn the receiver volume control to maximum; see that all tube filaments are lighted; then proceed in the order given in the following chart. When abnormal indications appear, make voltage and resistance checks of the circuit under test. Remedy any defect encountered before proceeding with the next step.

TESTS TO LOCALIZE TROUBLE TO ONE SECTION

SECTION	TEST	NORMAL RESULTS
1	Place ammeter in series with power source and check current drain. Measure voltage between point 1 and chassis (C).	Approximately 8.3 amps. 235 volts.
2	Apply audio signal between point 2 and chassis, through a condenser (.01 to .25 mf.).	Loud, clear signal from speaker.
3	Apply a weak, modulated r-f signal (455 kc.) between point 3 and chassis, through a condenser (.01 to .25 mf.).	Loud, clear signal.
4	Turn tuning condenser to half-meshed position. Apply weak, modulated r-f signal between point 4 and chassis, through a condenser (.01 to .25 mf.). Tune signal generator until the signal is heard in the speaker.	Loud, clear signal.

MODEL UN6-400 PHILCO CORP.

TESTS TO ISOLATE TROUBLE WITHIN SECTION 1

With the exception of the first, make all measurements for this section with a volt-ohmmeter, using the applicable d-c range. The voltages given were taken with the set operating and the volume control set at minimum.

TEST POINTS	NORMAL READING	POSSIBLE CAUSE OF ABNORMAL READING
Connect ammeter (0-30) in series with power source.	8.3 amps.	Excessively high or low current indicates defective VB100, T100, C103, or 7Y4.
A to C	250 volts	Defective 7Y4 or C104.
B to C	235 volts	Defective C104, open R102, or shorted C202 (see Section 2 for location).

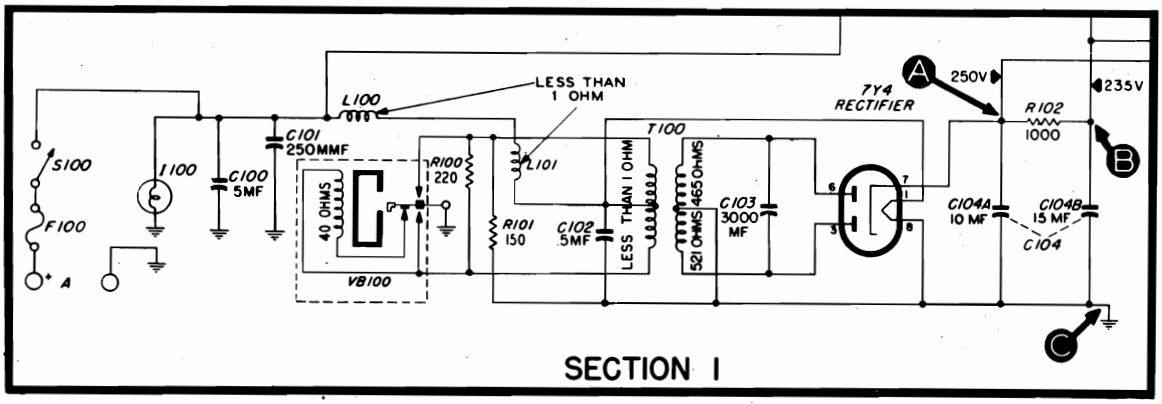

Figure 3. Section 1 schematic. TP-435A

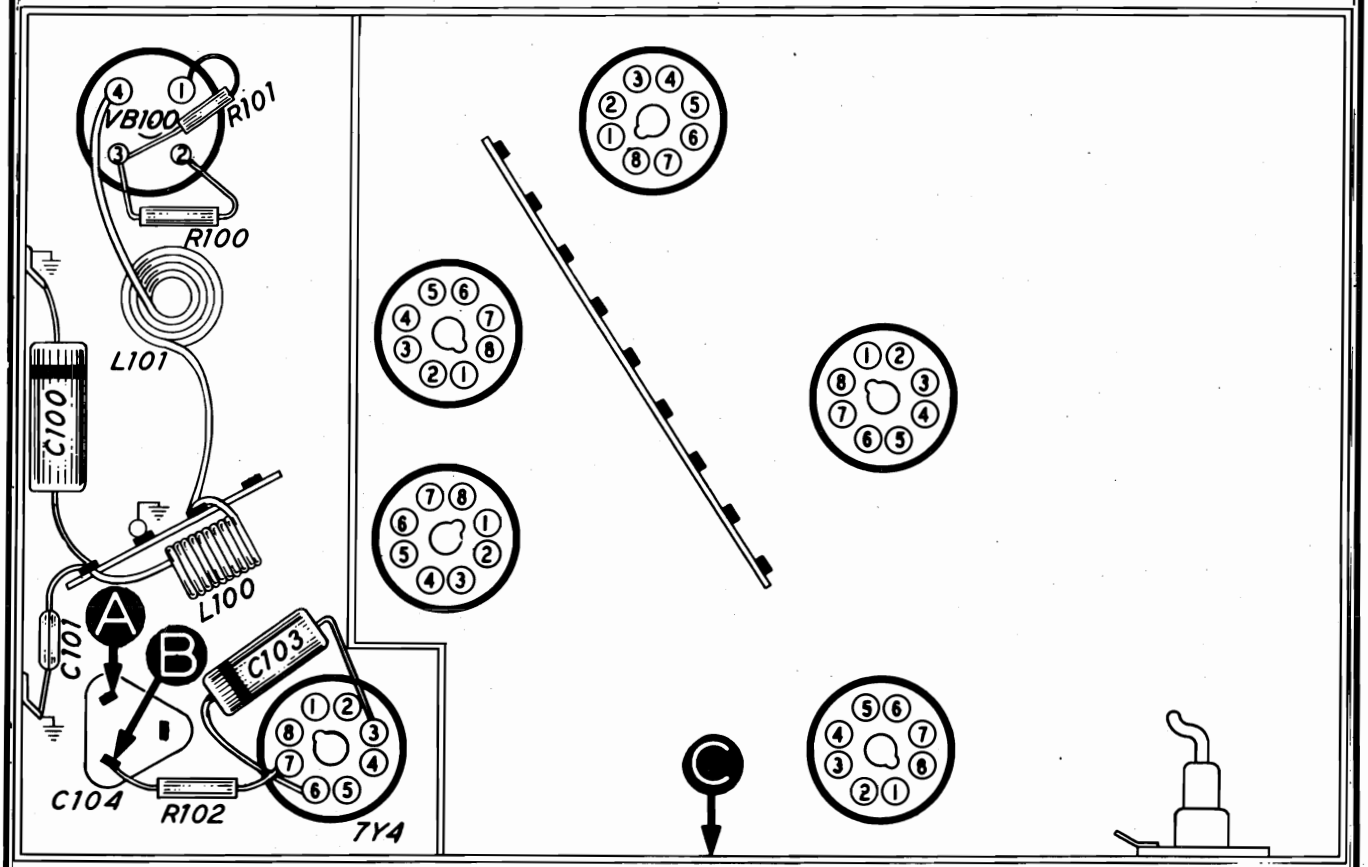

Figure 4. Bottom view, showing Section 1 test points. TP-435F

PHILCO CORP. MODEL UN6-400

TESTS TO ISOLATE TROUBLE WITHIN SECTION 2

For all tests in this section, use an audio signal. Connect the generator output lead through a condenser (.01 to .25 mf.) to the points indicated; connect the ground lead to the receiver chassis (C). Set the receiver volume control at maximum and adjust the signal-generator output for a loud, clear signal.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
D to C	Loud, clear signal from speaker.	Defective 7C5, T200, LS200, C205, or C206.
E to C	Loud, clear signal.	Open C205.
F to C	Clear signal, noticeably louder than preceding test.	Defective 7B6, or open R203, R202, or R406.
G to C	Loud, clear signal, same as preceding test.	Open C200, or defective R200 (rotate R200 through its entire range for complete check).

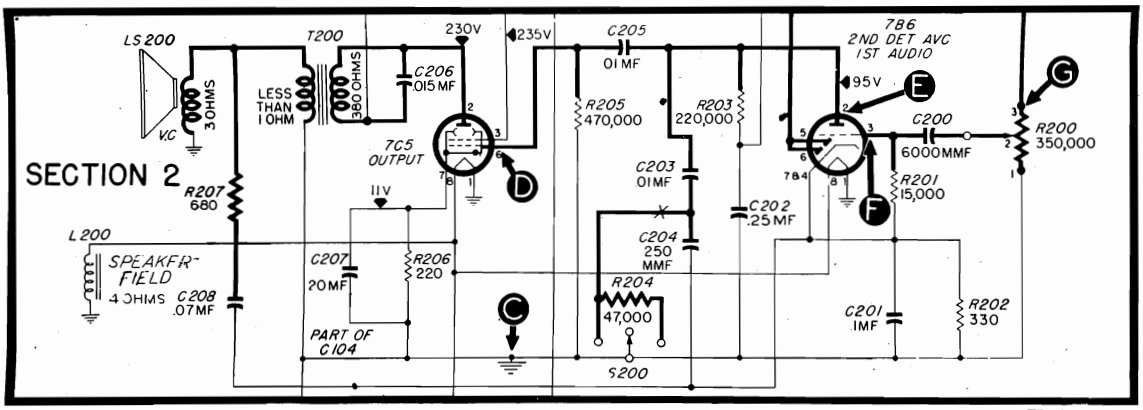

Figure 5. Section 2 schematic. TP-435B

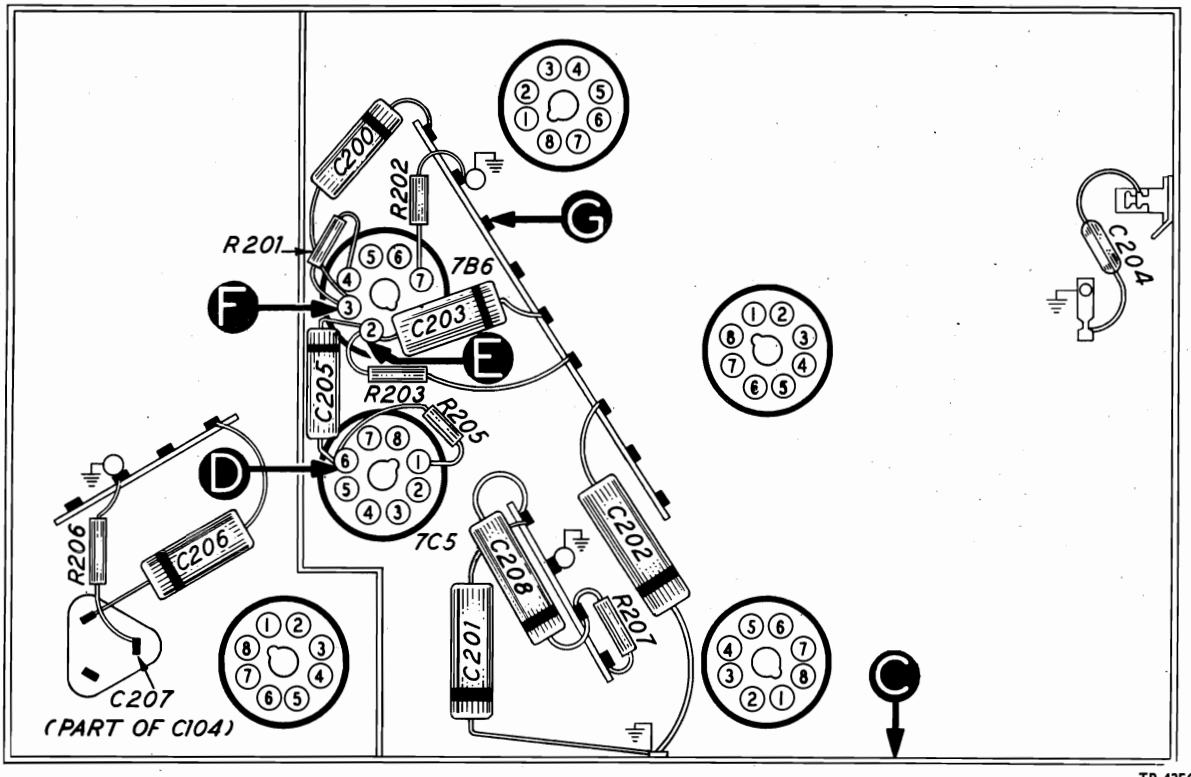

TP-435G

Figure 6. Bottom view, showing Section 2 test points.

MODEL UN6-400 PHILCO CORP.

TESTS TO ISOLATE TROUBLE WITHIN SECTION 3

For all tests in this section, set the signal generator at 455 kc., with modulation on. Connect the generator output lead through a condenser (.01 to .25 mf.) to the points indicated; connect the ground lead to the receiver chassis (C). Set the receiver volume control at maximum and adjust the signal-generator output for a loud, clear signal.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
H to C	Loud, clear signal from speaker.	Defective 7A7 or Z301, open R300, R302, or R404, or shorted C406.
J to C	Loud, clear signal.	Defective or misaligned Z300.

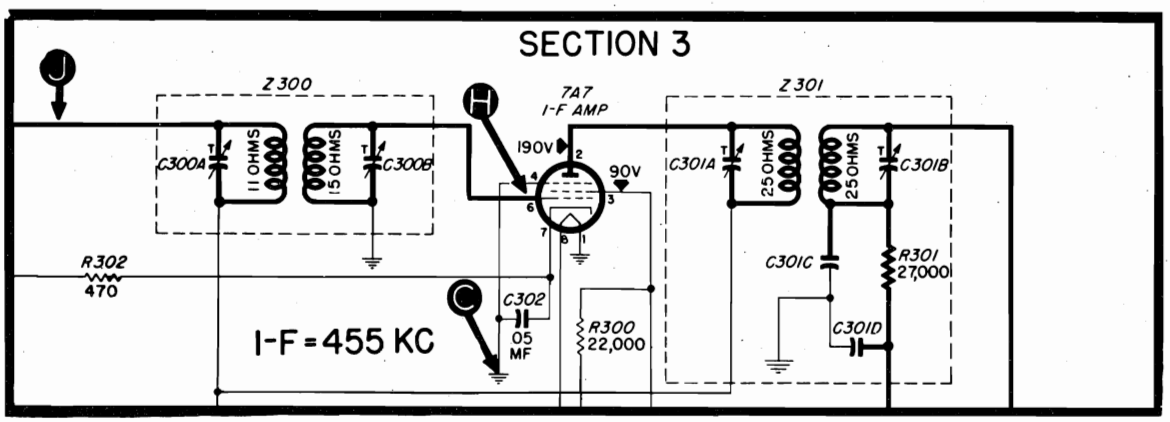

Figure 7. Section 3 schematic. TP-435C

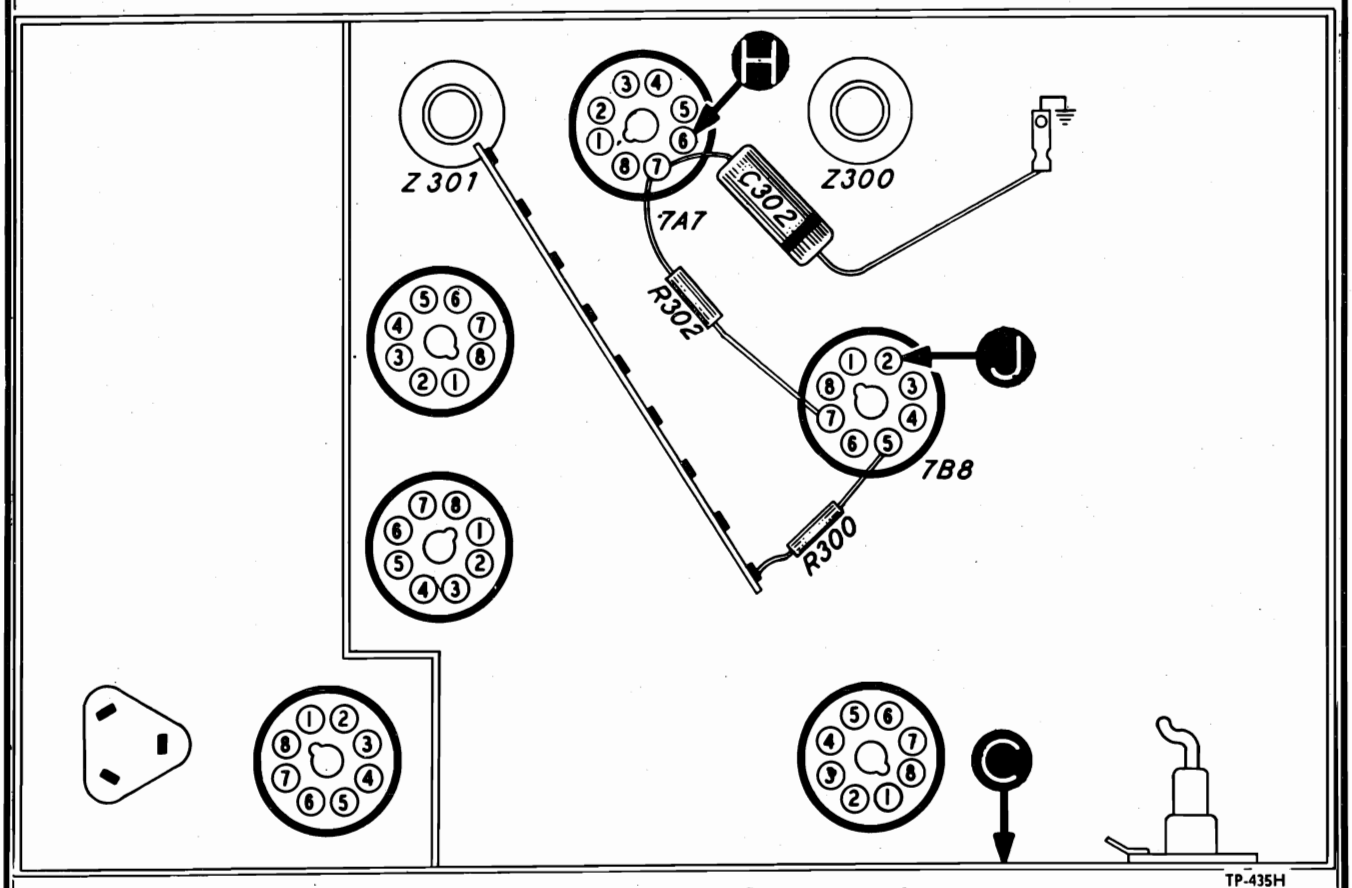

TP-435H

Figure 8. Bottom view, showing Section 3 test points.

PHILCO CORP.

MODEL UN6-400

TESTS TO ISOLATE TROUBLE WITHIN SECTION 4

1. Set the volume control at maximum. Rotate the tuning condenser through its entire range. Any scraping noise from the speaker indicates bent plates, or dirt between plates or on wiper contacts. Remedy such conditions before proceeding further.

2. Attach the positive lead of a 20,000-ohms-per-volt meter to chassis and the prod end of the negative lead through a 50,000-ohm resistor to point P. Set the meter on a 10-volt or similar range, and rotate the tuning condenser through its entire range. Absence of voltage at any point indicates that the oscillator is not functioning. If so, check the components listed in the first test below.

3. Connect the signal generator as for previous tests, tune the generator and receiver to 1000 kc., and proceed as below.

TEST POINTS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
K to C (chassis)	Loud, clear signal from speaker.	Defective 7B8, L402, C407, or open R407, R403 or C411.
L to C	Loud, clear signal.	Open C407.
M to C	Loud, clear signal.	Defective 7A7, or open R400 or R401.
N to C	Loud, clear signal.	Defective L400, C400, or L401.

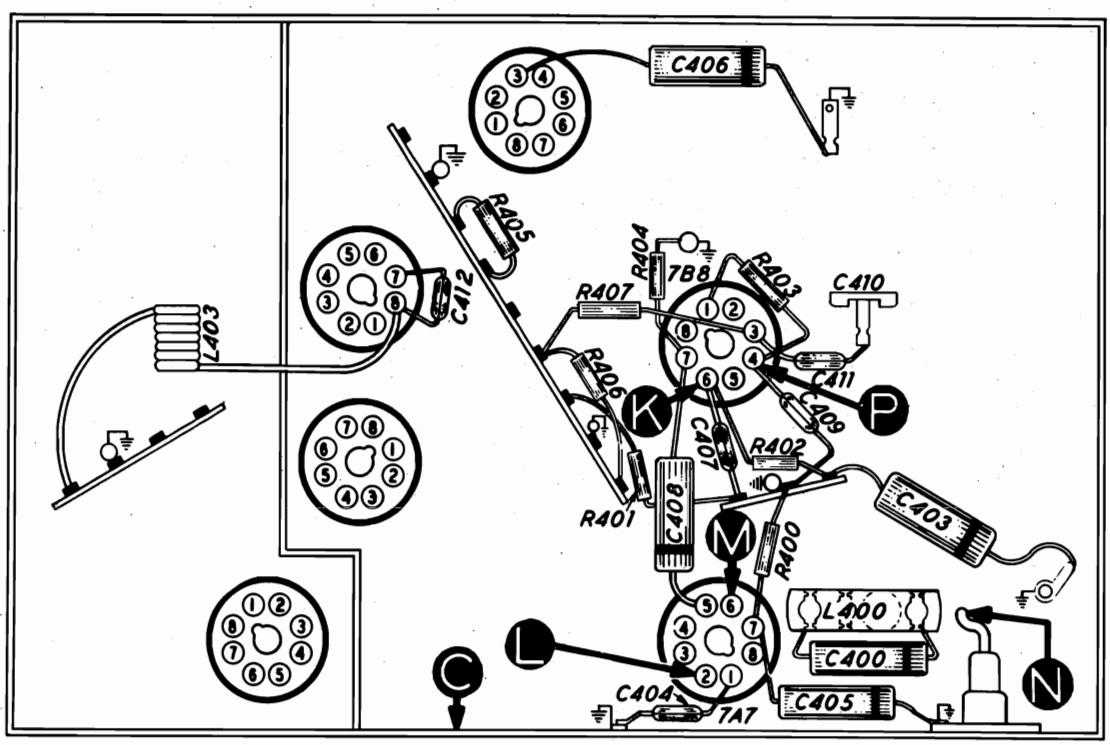

Figure 10. Bottom view, showing Section 4 test points. TP-435J

MODEL UN6-400 PHILCO CORP.

PRELIMINARY INSTRUCTIONS

Remove the top chassis cover to reach adjustments.

OUTPUT METER:

Connect to the voice-coil lugs on the speaker.

SIGNAL GENERATOR:

Set the receiver volume control at maximum. Adjust the signal-generator output to give a readable deflection on the output meter, using a meter range that best indicates small changes in output. Reduce the signal-generator output as alignment progresses, to prevent the meter needle from going off scale. Adjust all trimmers listed for maximum output.

DIAL CALIBRATION:

When the radio is re-installed in the car, the dial pointer must be set to coincide with the index dot at the low-frequency end of the dial, with the tuning condenser fully meshed.

ALIGNMENT CHART

	SIGNAL GENERATOR		RECEIVER		
	Connections to Receiver	Dial Setting	Tuning-Condenser Setting	Special Instructions	Adjust Trimmers
1	Through a .05 mf. condenser to stator of antenna section of tuning gang.	455 kc.	Fully meshed.	Ground stator of oscillator section of gang. Adjust in given order, and then repeat adjustment.	C301B C301A C300B C300A
2	Through a 10-mmf. condenser in series with antenna lead, Philco Part No. 95-0185, to antenna connector.	1580 kc.	Fully open.	Remove ground from oscillator section of gang. Adjust for maximum.	C402A
3	Same as 2.	1400 kc.	Tune in 1400 kc. signal.	Adjust for maximum. (Final adjustment should be made with receiver in car, connected to car antenna.)	C401
4	Same as 2.	580 kc.	Tune to maximum.	Adjust while rocking tuning condenser.	C410
5	Same as 2.			Repeat steps 2, 3, and 4.	

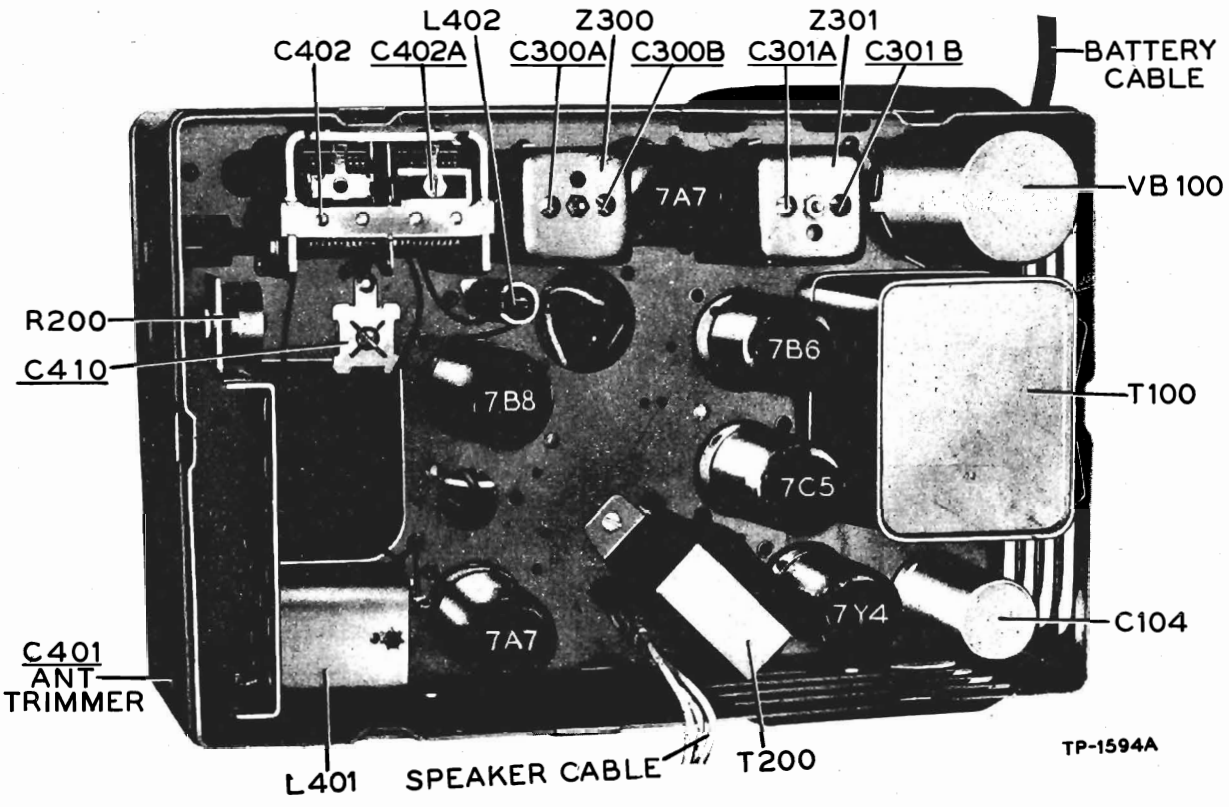

Figure 11. Top view, showing trimmer-condenser locations.

PHILCO CORP. MODEL UN6-400

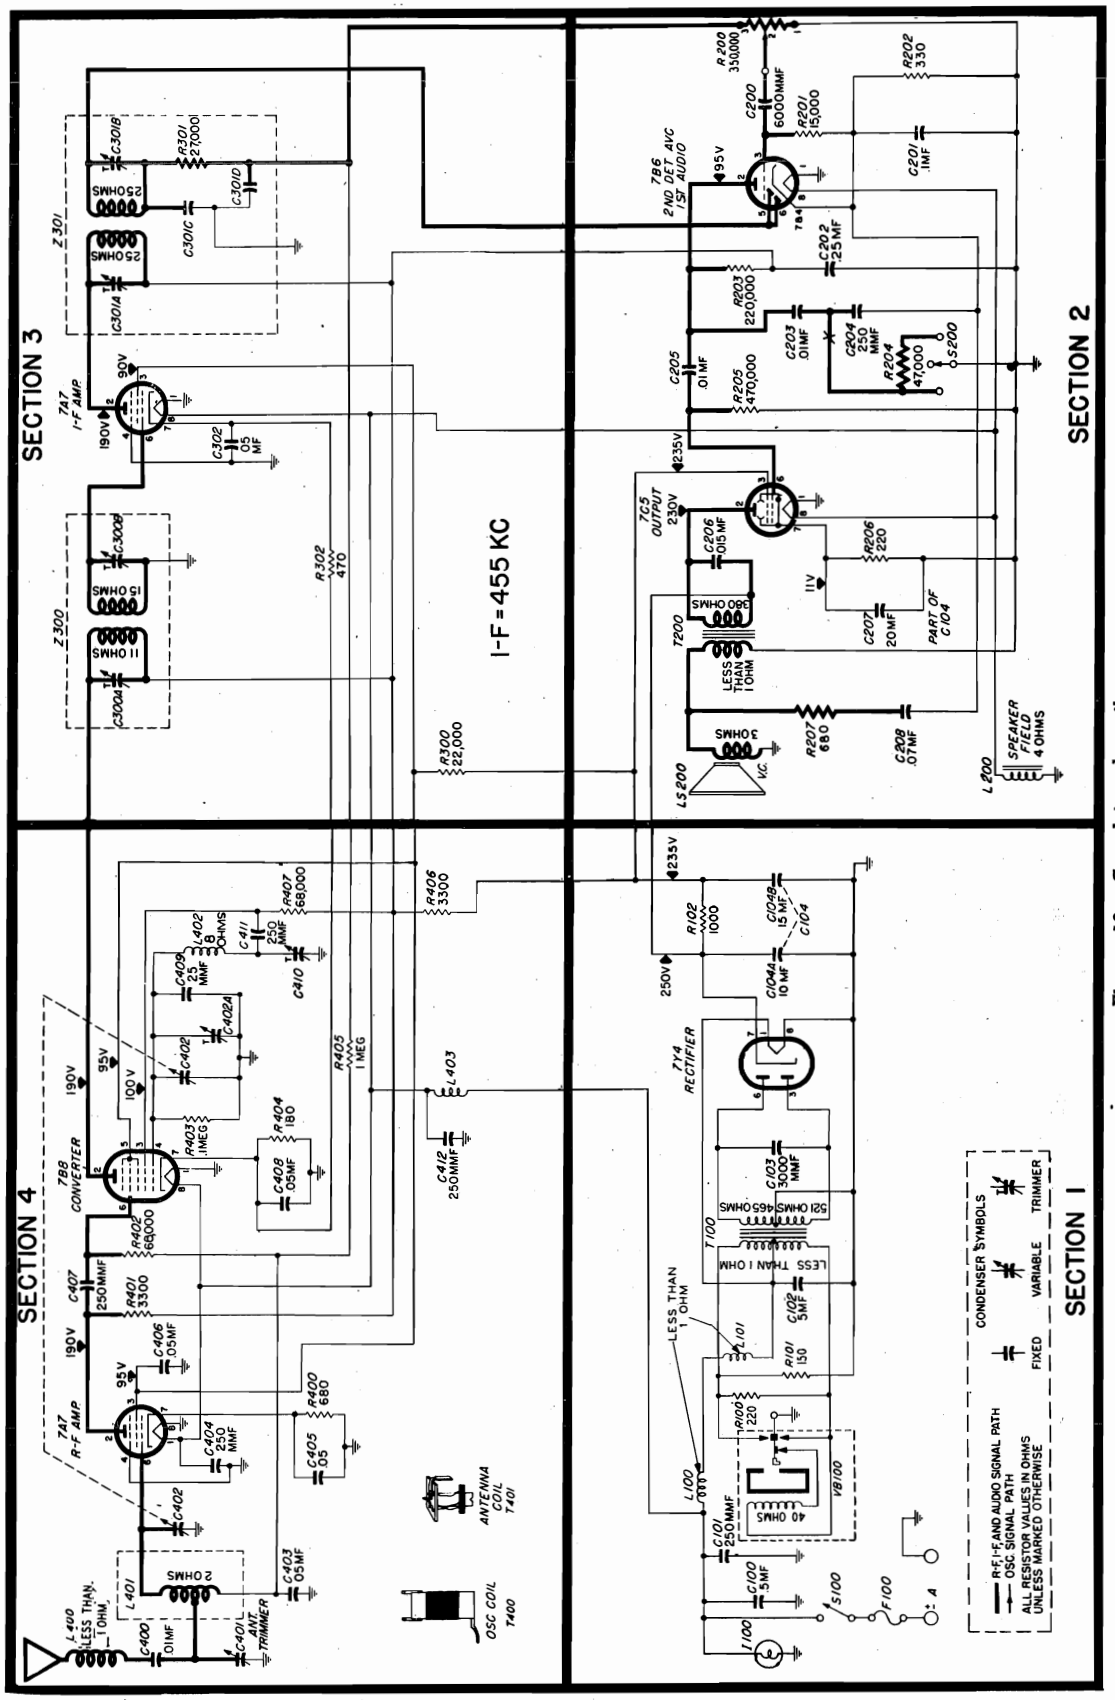

Figure 12. Complete schematic.

NOTE: All voltage, capacity, and resistance values shown are average. The voltages were measured with a 20,000-ohms-per-volt meter between the indicated test points and chassis (C).

MODEL UN6-400 PHILCO CORP.

REPLACEMENT PARTS LIST — Model UN6-400

Symbol designations used in the schematic and parts list are as follows:

LA—loop antenna
LS—loudspeaker
R—resistor
C—condenser
I—pilot lamp
L—choke or coil
S—switch
T—transformer
W—power cord and plug
Z—i-f transformer assembly

NOTE: Parts marked with an asterisk (*) are general replacement items, and the numbers will not be identical with those used on factory assemblies. Use only the "Service Part No." shown in the parts list when ordering replacements.

PHILCO TROUBLE-SHOOTING PROCEDURE

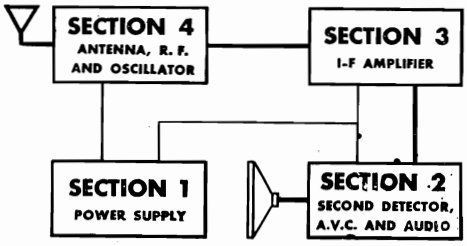

Figure 1. Block diagram (Heavy lines indicate signal path).

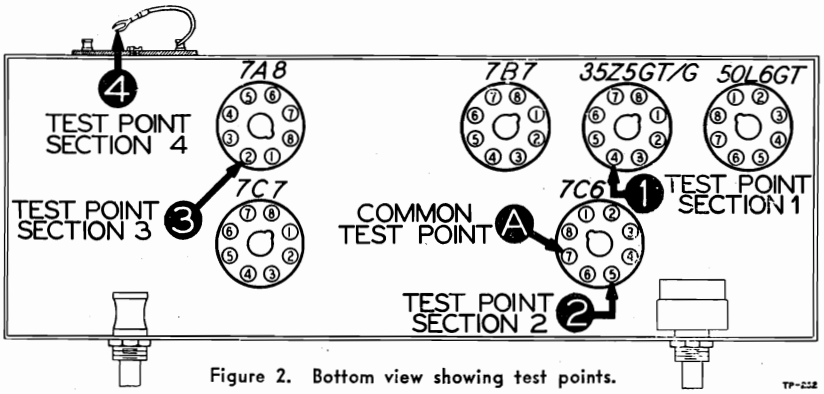

Figure 2. Bottom view showing test points.

In this bulletin, the receiver circuit is divided into four sections, as shown in figure 1. One test point is designated for each section, see figure 2, and tests made at these points localize the trouble to one section. After the trouble has been localized to one section by the tests given below, proceed with the tests outlined for that section. The equipment required for all tests outlined in this bulletin is a quality signal generator and a volt-ohm-meter. Voltage readings shown in this bulletin were measured with a 20,000-ohm-per-volt meter. Connect the receiver to the power line, turn the volume control full on, and see that all tube filaments are lighted. Proceed with the section tests given in the following chart. If a normal result is not obtained at any test point, the trouble is in the section under test.

TESTS TO LOCALIZE TROUBLE TO ONE SECTION

SECTION	TEST	NORMAL RESULTS
1	Measure voltage between points 1 (+) and A (B–).	90 volts*.
2**	Apply audio signal between points 2 and A.	Loud, clear signal.
3**	Apply a weak, modulated r-f signal (455 kc.) between points 3 and A.	Loud, clear signal.
4**	Apply a weak, modulated r-f signal (frequency to which set is tuned) between points 4 and A.	Loud, clear signal.

*For 117-volt a-c input. When operating from a d-c power line and no voltage is measured, reverse the power plug.
**Connect signal generator output lead through a condenser (.01 to .25 mf.).

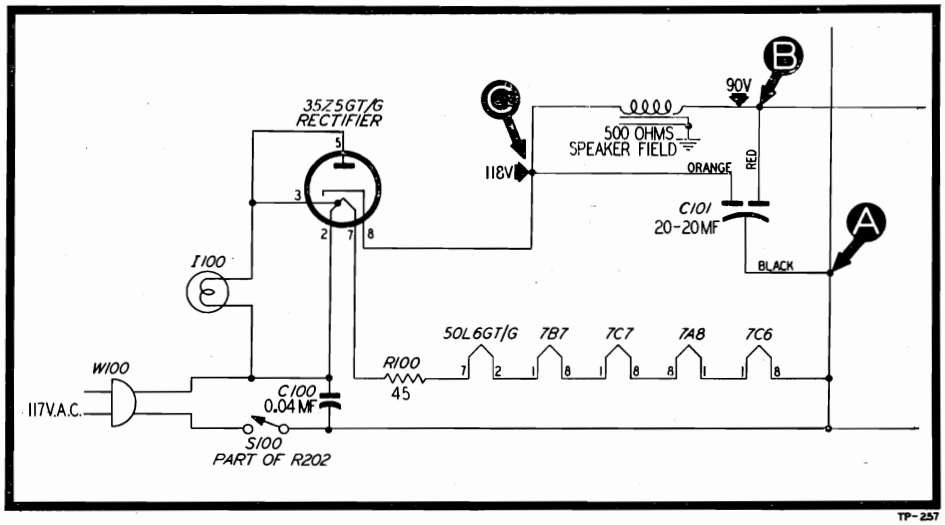
TESTS TO ISOLATE TROUBLE WITHIN SECTION 1

Test Points	Normal Reading	Possible Cause of Abnormal Reading
B to A	90 volts	No voltage indicates defective 35Z5GT/G tube, shorted condenser C101, or open speaker field. Low voltage indicates defective 35Z5GT/G tube, or leaky condenser C101, or shorted condenser C203.
C to A	118 volts	No voltage indicates defective 35Z5GT/G tube, or shorted condenser C101. Low voltage indicates defective 35Z5GT/G tube, or open condenser C101, or shorted condenser C203.



Make all tests for this section with a volt-ohmmeter, using the 0-250v d-c range. See figures 3 and 4 for location of test points.

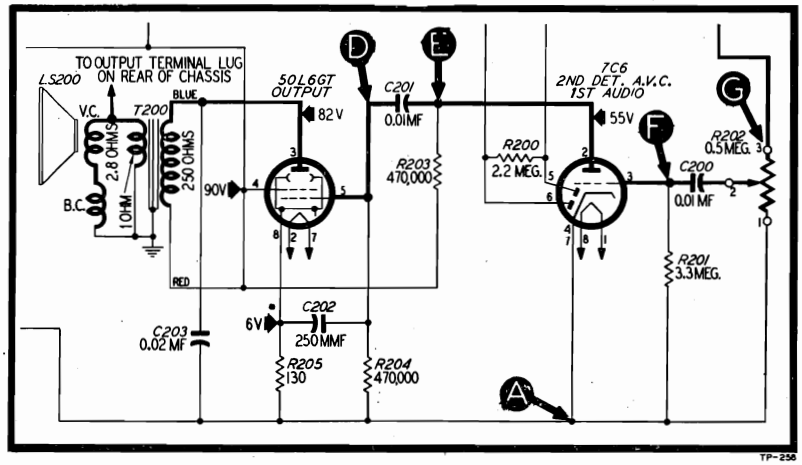
PHILCO CORP.

MODELS 46-421, 46-421-I

TESTS TO ISOLATE TROUBLE WITHIN SECTION 2

Test Points	Normal Indication	Possible Cause of Abnormal Indication
D to A	Audible signal from speaker.	No signal indicates defective 50L6GT tube, defective output transformer T200, defective speaker LS200, shorted condenser C202 or C203, or open resistor R205.
E to A	Audible signal, same as previous test.	No signal indicates open condenser C201.
F to A	Noticeable increase of audible signal.	No signal indicates defective 7C6 tube, or open resistor R203.
G to A	With volume control full on, audible signal, same as previous test.	No signal indicates open condenser C200, or open volume control R202.



For all tests in this section, use the audio range of a signal generator. Connect the output lead through a condenser (.01 to .25 mf.); ground lead to point A.

Figure 5. Section 2 schematic.

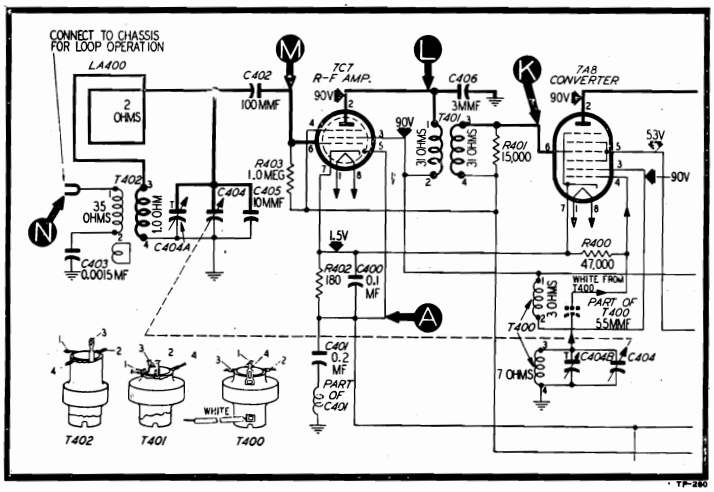
TESTS TO ISOLATE TROUBLE WITHIN SECTION 4

Test Points	Normal Indication	Possible Cause of Abnormal Indication
K to A	Audible signal from speaker.	No signal indicates defective 7A8 tube, defective oscillator transformer T400, defective resistors R400 or R402, defective condenser C400, or shorted plates of condenser C404.
L to A	Audible signal from speaker.	No signal indicates defective r-f transformer T401.
M to A	Increase in audible signal from speaker.	No signal indicates defective 7C7 tube.
N to A	Same signal output as previous step.	No signal indicates defective antenna transformer T402, loop LA400, coupling condenser C402, or shorted plates of condenser C404.



For all tests in this section, set the signal generator and the receiver to 540 kc. Connect the output lead of the signal generator through a condenser (.01 to .25 mf.); ground lead to point A.

CONNECTING ALIGNING EQUIPMENT

OUTPUT METER. Connect to output (left hand) and ground (center) lugs of terminal panel on rear of chassis as shown in figure 11.

SIGNAL GENERATOR. Use a 100-mmf. condenser to couple the signal-generator output lead to the receiver. Adjust the output of the signal generator to give a signal strength sufficient to cause a readable deflection of the output meter, using the range on the meter which best indicates small variations in output. Reduce the output of the signal generator if the pointer of the output meter goes off scale as alignment progresses.

Make all adjustments in the order listed.

CIRCUIT DESCRIPTION

The Philco Model 47-1227 is a nine-tube superheterodyne radio-phonograph combination providing reception on the standard broadcast band, 540—1720 kc and the FM band, 88—108 mc.

A low-impedance loop within the cabinet provides adequate signal pickup on the broadcast band. Satisfactory FM reception usually requires the use of an outdoor dipole aerial (Philco Part No. 45-1462). In areas of high signal strength, however, the dipole built into the cabinet is sufficient for FM operation.

A tuned r-f stage, using a type 6AG5 high-frequency pentode tube, functions on the FM band. The converter stage employs a 7F8 high-frequency double triode. The converter and r-f stages are built on a separate chassis, to insure reliable performance at high frequencies. These stages provide high signal-to-noise ratio, high conversion efficiency, and good image rejection.

Two transformer-coupled i-f stages are used. The i-f transformers have two sets of windings; one set is tuned to 455 kc for AM operation, the other to 9.1 mc for FM operation. Switching of the windings to attenuate undesired beat frequencies is necessary only in the first i-f transformer. The large difference between intermediate frequencies makes further switching unnecessary.

The first i-f stage employs a 6BA6 (miniature type) high-frequency pentode amplifier; the pen-

tode section of a 7R7 double-diode-pentode tube functions as the second i-f amplifier. One diode of the 7R7 tube is used for AM detection, while the other diode develops a-v-c voltage.

The ratio-detector circuit used for FM detection operates through the two diodes of the 7X7 tube; this circuit has good noise-reducing properties and a superior tuning characteristic. The triode section of the 7X7 tube is used as a first audio and phono amplifier stage. The output of the AM detector, FM detector, or phono pickup is switched into this circuit by the operation of the function switch.

A type 6J5GT triode tube operates as a phase inverter, driving the two 6K6GT output tubes in push-pull operation.

A more uniform frequency response is obtained by the use of inverse feedback. The inverse-feedback voltage is taken from the secondary of the output transformer, and applied through resistor R211 to the junction of R204 and the volume control.

The TONE control is continuously variable; with clockwise rotation, the bass is increased, and as rotation is continued, the high frequencies are attenuated.

The 12-inch electrodynamic speaker provides excellent bass reproduction.

PHILCO TROUBLE-SHOOTING PROCEDURE

In this manual, the circuit is divided into four sections, with individual chassis base layouts and a complete schematic showing test points for each section. The first step in each trouble-shooting chart is a master check, which makes it possible to determine whether trouble exists in that section without going through the entire test procedure. Failure to secure the "Normal Indication" in a given step indicates trouble, which should then be located by voltage, resistance, or capacitance checks of the parts associated with the point under test, and remedied before testing further.

For service information on the record changer, refer to the service manual PR-1156 for the Philco Automatic Record Changer, Models D-10 and D-10A.

SYMBOLIZATION AND TERMINOLOGY

All components in the radio circuit are symbolized and located as follows:

C—condenser LA—loop aerial S—switch
I—pilot lamp LS—loudspeaker T—transformer
L—choke or coil R—resistor Z—electrical ass'y

100-series components are in Section 1 — power supply

200-series components are in Section 2—audio amplifier

300-series components are in Section 3 — i-f amplifier, second detector and/or discriminator, and a.v.c.

400-series components are in Section 4 — the aerial, r-f and oscillator.

The main switch assembly, commonly referred to in the past as the "Band Switch", is used, in many instances, for various purposes in addition to band switching. Therefore, in this manual, the main wafer-switch assembly is designated as the "Function Switch".

PRELIMINARY CHECKS

The following preliminary checks are recommended, before turning on the radio.

1. Carefully inspect both top and bottom of the chassis. Make sure that all tubes are secure in the proper positions. Look for bad connections, burnt resistors, or other obvious faults.

2. Measure the resistance between B+ (pin no. 8 of the 5AZ4 rectifier tube) and the radio chassis, with the ohmmeter polarity such that it gives the highest resistance reading; if the reading is lower than 50,000 ohms, check condensers C102, and C103 (A and B) for leakage or shorts.

CALIBRATING DIAL BACKPLATE

When the radio chassis is removed from the cabinet, dial calibration and alignment points may be marked by small pencil dots made on the dial-backplate assembly below the pointer.

The method of measuring for these points is illustrated in figure 1, which shows the relationship between dial marking and scale backplate.

Hold a ruler against the scale backplate in the position shown. Make dots at the proper points for the desired frequency settings. When the ruler is correctly placed, the index point is 1-9/16 inches from the reference point, as shown in figure 1.

With the tuning gang fully meshed, the pointer should be adjusted on the dial drive cord to coincide with the index mark.

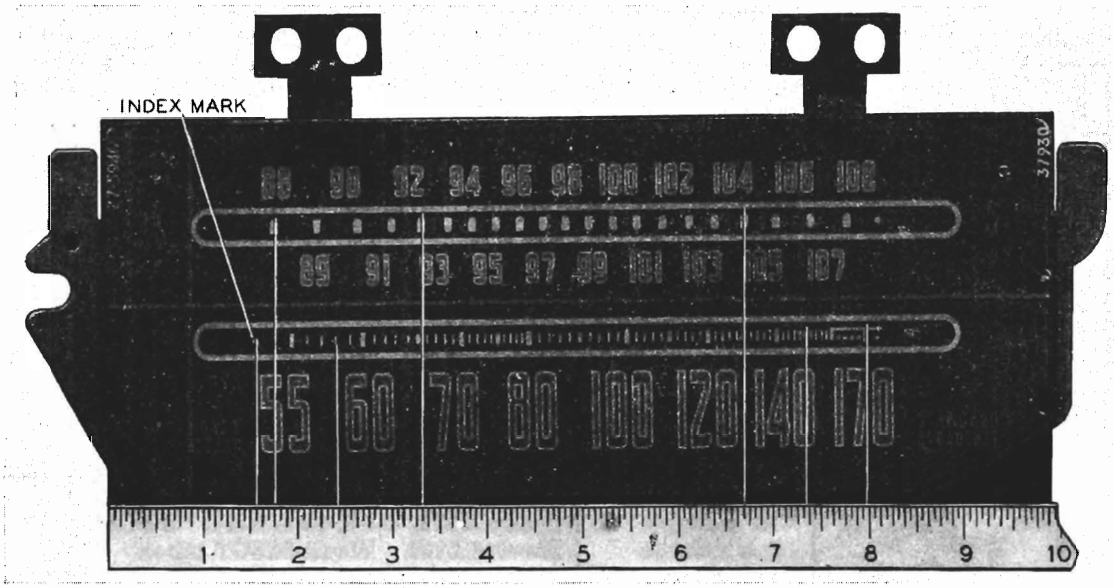

FIGURE 1. DIAL-BACKPLATE CALIBRATION MEASUREMENTS. TP-2827

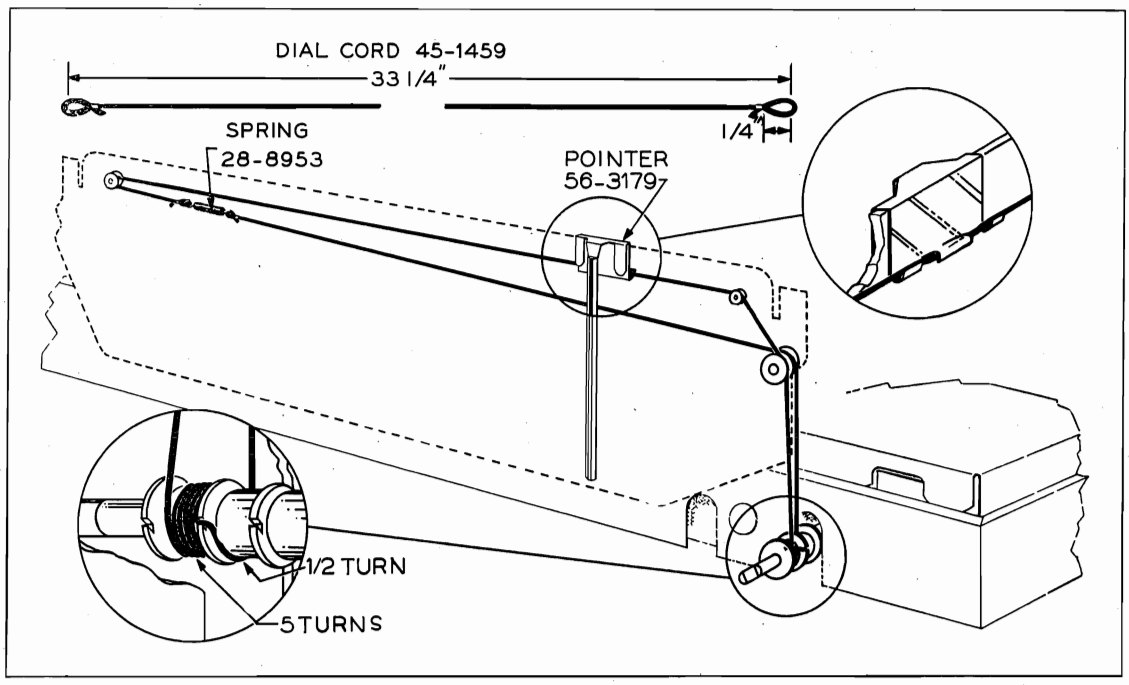

FIGURE 2. POINTER-DRIVE-CORD INSTALLATION DETAILS.

MODEL 47-1227 PHILCO CORP.

SECTION 1 – TROUBLE SHOOTING

CAUTION: Do not turn on power with speaker disconnected, as this may cause damage to the radio.

Make all tests for this section with a volt-ohmmeter, using the applicable d-c ranges. Voltages were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c. The VOLUME control was set at minimum and the TONE control fully counterclockwise; the function switch was set in BC (broadcast) position. See figure 3 for location of test points. Follow steps in proper sequence; if the "Normal Indication" is obtained in step 1, proceed with tests for Section 2; if not, isolate and remedy the trouble in this section. It will be noted that certain parts in other sections of the radio are listed under "Possible Cause of Abnormal Indication" because they may produce abnormal indication in Section 1.

STEP	TEST POINTS	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	D to C E to C	208 volts 290 volts	No voltage or incorrect voltage	Trouble in this section. Isolate by the following tests.
2	A to C	350 volts	No voltage	Defective 5AZ4 tube, T100, S100 or W100. Shorted C102. Open R100.
			Low voltage	Defective 5AZ4 tube. Shorted or leaky C102, C308, C311, C322, C309, C408 or C409. Shorted or leaky C103A or C103B.
			High voltage	Open L100, R101 or T200.
3	B to C	Negative 20 volts	High voltage Low or no voltage	Open R100. Shorted R100. Weak 6K6GT tubes.
4	D to C	208 volts	No voltage Low voltage High voltage	Shorted C103B. Open R101. Leaky C103B, C319, C307 or C310. Open R300 or R303.
5	E to C	290 volts	No voltage Low voltage High voltage	Shorted C103A. Open L100. Leaky C211, C212, or C103A. Grounded T200. Shorted L100. Weak 6K6GT tubes.
Listening Test			Abnormal hum may be caused by open C100, C101, C102 or C103A.	

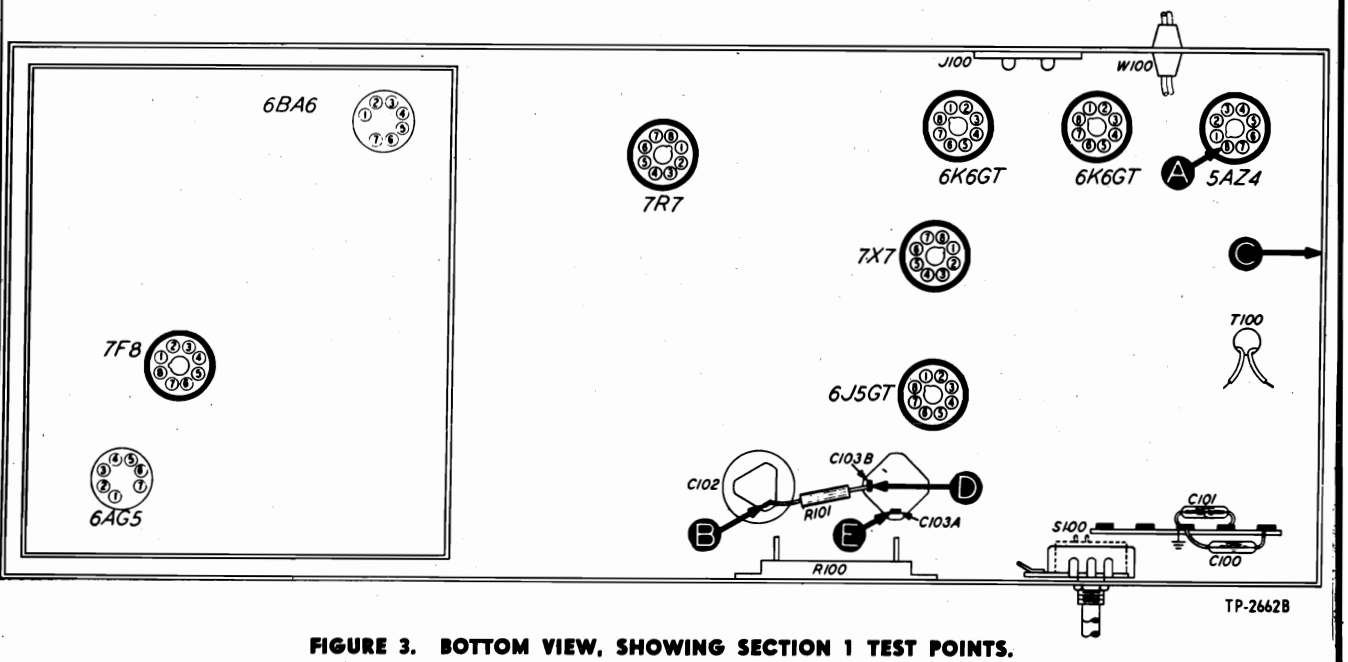

FIGURE 3. BOTTOM VIEW, SHOWING SECTION 1 TEST POINTS.

SECTION 2 – TROUBLE SHOOTING

Connect the audio-signal generator ground lead to test point "C" (chassis); connect the output lead through a .1-mf condenser to the test points indicated in the chart. Set the radio VOLUME control to maximum and adjust the signal-generator output as indicated in the chart. If the "Normal Indication" is obtained in step 1, proceed to Section 3; if not, isolate and remedy the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with low signal-generator output.	Trouble within this section. Isolate by the following tests.
2	B (Remove 6J5GT tube)	Loud, clear signal with high signal-generator output.	Defective 6K6GT tube, T200 or LS200. Open R214. Shorted or leaky C212 or C214.
3	D (Remove 6J5GT tube)	Same as step 2.	Defective 6K6GT tube. Shorted or leaky C211. Open R215.
4	E (Replace 6J5GT tube)	Loud, clear signal with moderate signal-generator output.	Defective 6J5GT tube. Open R212, R209 or R210. Leaky or shorted C210.
5	F	Loud, clear signal with low signal-generator output.	Defective 7X7 tube. Open R207 or C210. Shorted C206.
6	A	Same as step 5.	Shorted C202, C201 or C326. Open R201, C203, R203 or C208.
7	PL200 (Function switch on PHONO)	Same as step 5.	Defective PL200 or FS2 (R).
Listening Test		Distortion may be caused by leaky C210, C212, C211, C213 or C214. Hum will result if C213 is open.	

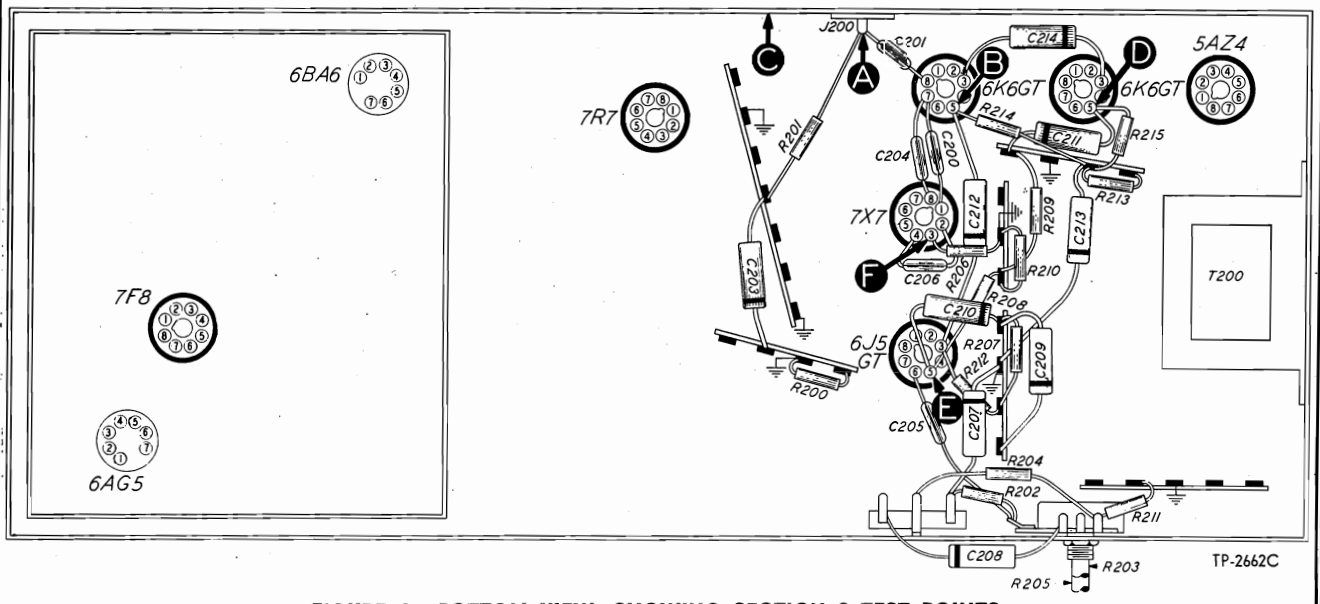

FIGURE 4. BOTTOM VIEW, SHOWING SECTION 2 TEST POINTS.

SECTION 3 – TROUBLE SHOOTING

AM TESTS

For the following tests, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the radio chassis, test point "C"; connect the output lead through a .1-mf condenser to the test points indicated.

Turn the radio VOLUME control to maximum, function switch to BC (broadcast) position, and TONE control fully counterclockwise.

If the "Normal Indication" is obtained in the first step, proceed to the FM tests, or to the tests in Section 4; if not, isolate and remedy the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with low signal-generator output.	Trouble within this section. Isolate by the following tests.
2	B	Loud, clear signal with high signal-generator output.	Defective 7R7 tube or Z302. Improperly aligned Z302. Open R313 or R314. Leaky or shorted C322, C321 or C326. Defective switch FS3 (R) or FS2 (R).
3	D	Loud, clear signal with moderate signal-generator output.	Defective or misaligned Z301. Defective 6BA6 tube. Open R306, R304, R305 or C307. Shorted or leaky C308, C309, C307, C311, or C310.
4	A	Loud, clear signal with low signal-generator output.	Defective or misaligned Z300. Shorted or leaky C303, C304, C305. Defective FS4 (R) or FS4 (F). Open R301,
Listening Test		Distorted signal with hum, may be caused by open C307, or C319.	

FM TESTS

Follow the instructions preliminary to the AM test chart, except set the signal-generator frequency to 9.1 mc, and detune to one side or the other until a satisfactory test signal is obtained; set function switch to FM position.

SECTION 3 — *Continued*

The most satisfactory check on the operation of the discriminator circuit is the ability to make proper alignment, as described on pages 14, 15 and 16.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	B	Loud, clear signal with high signal-generator output.	Defective 7X7 tube or C325. Open R318. Leaky or shorted C324, C328 or C323. Defective or misaligned Z302.
2	D	Same as step 1.	Same parts as listed in AM tests, step 3.
3	A	Loud, clear signal with low signal-generator output.	Same parts as listed in AM tests, step 4.

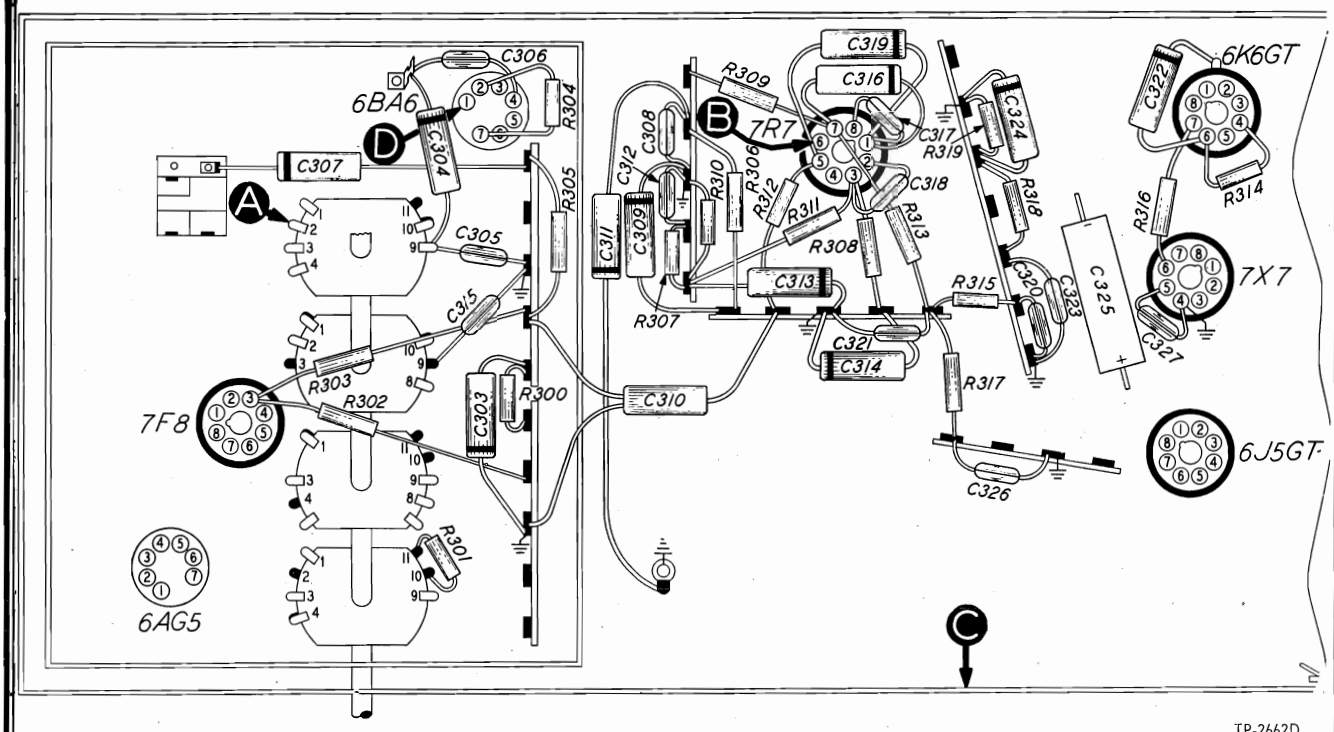

FIGURE 5. BOTTOM VIEW, SHOWING SECTION 3 TEST POINTS.

MODEL 47-1227 PHILCO CORP.

SECTION 4 – TROUBLE SHOOTING

For tests indicated in this section with the exception of oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to the radio chassis, test point "C"; connect the output lead through a .1-mf condenser to the test points indicated.

Turn the VOLUME control to maximum and the TONE control to nearly OFF position.

Set the function switch, TUNING control, and signal-generator frequency as indicated in chart.

Oscillator test: (AM tests, step 3, FM tests, step 3). Attach the positive lead of a high-resistance voltmeter to the 7F8 oscillator cathode (pin 4). Connect the negative lead through a 100,000-ohm isolating resistor to the 7F8 oscillator grid (pin 1) test point "D". Use a suitable meter range (0-10 to 0-50 volts).

Absence of negative grid voltage in either AM or FM position of function switch indicates that the oscillator is not functioning; check the parts listed in the chart for the oscillator tests.

AM TESTS

STEP	TEST POINT	SIG. GEN. FREQUENCY	FUNCTION SWITCH AND TUNING CONTROL	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc	BC. Tune to signal from generator.	Loud, clear signal with low generator input.	Trouble in this section. Isolate by the following tests.
2	B	1000 kc	Same as step 1.	Same as step 1.	Defective 7F8 tube, Z300, C400, L406 or R408. Open C303, C402B, R405, R406, R303 or R300. Misaligned Z300. Trouble in oscillator section (step 3).
3	D (Osc. test)	Not used	BC. Rotate 540-1720 kc	Negative 2 to 3 volts.	Defective 7F8 tube, FS3 (F), FS2 (F), C411, C412, C413, C402B, L404 or C400.
4	A	1000 kc	BC. Tune to signal from generator.	Loud, clear signal with low generator input.	Defective L400, C400, C401 or FS1 (R). Open R404 or C410.

FM TESTS

1	E	95 mc	FM. Tune to signal from generator.	Loud, clear signal with low generator input.	Trouble in this section. Isolate by the following tests.

PHILCO CORP. MODEL 47-1227

SECTION 4 — *Continued*

STEP	TEST POINT	SIG. GEN. FREQUENCY	FUNCTION SWITCH AND TUNING CONTROL	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
2	B	95 mc	Same as step 1.	Same as step 1.	Same troubles as in AM tests, step 2.
3	D (Osc. test)	Not used	FM. Rotate 88 to 108 mc.	Negative Voltage. Approx. 1 volt.	Defective 7F8 tube, FS3 (R), FS2 (R), C411, C412, C413, C400 or L405.
4	F	95 mc	FM. Tune to signal from generator.	Loud, clear signal with low generator input.	Defective C407, L403, C400, C400B, or FS1 (R).
5	E	95 mc	FM. Tune to signal from generator.	Loud, clear signal with low generator input.	Defective 6AG5 tube, C400, L401 or C400A. Open R400, R401, R402, R403, L402 or C403. Shorted or leaky C408 or C409.

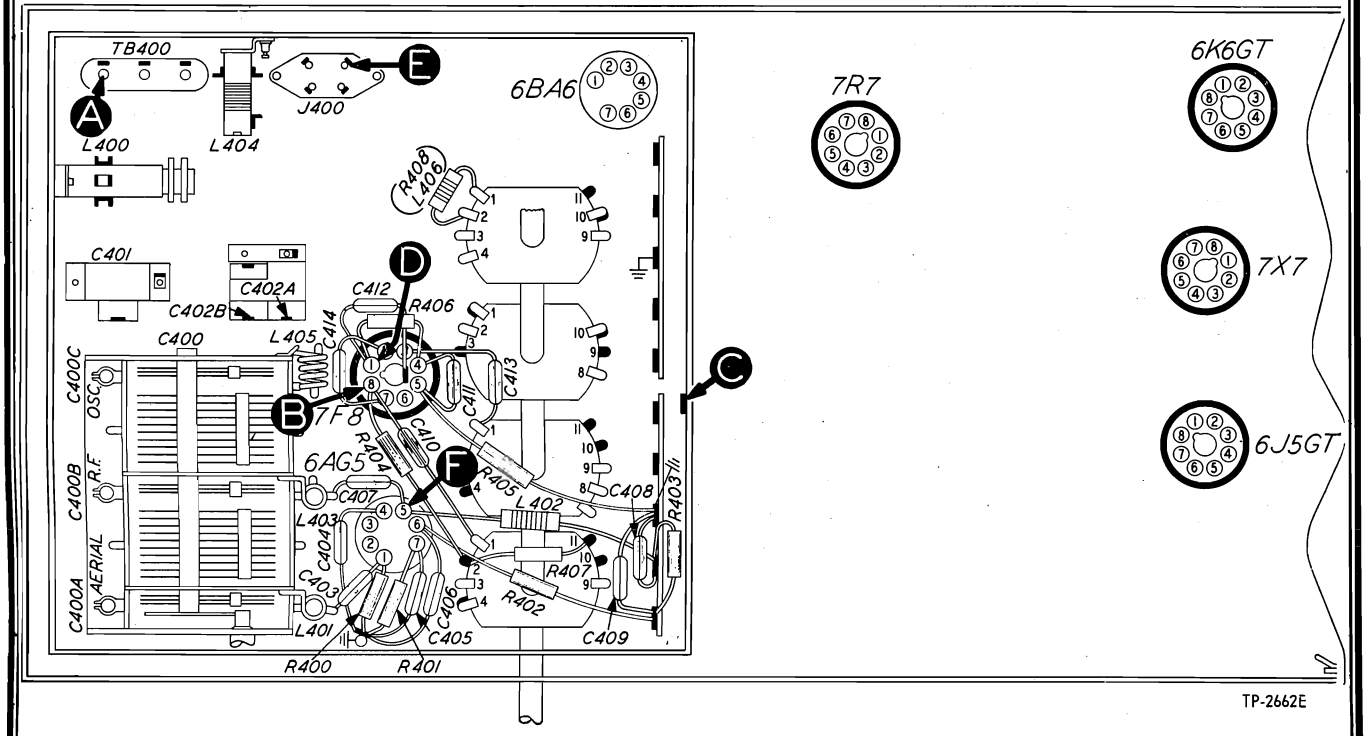

FIGURE 6. BOTTOM VIEW, SHOWING SECTION 4 TEST POINTS.

MODEL 47-1227 PHILCO CORP.

REPLACEMENT PARTS LIST

NOTE: Parts marked with an asterisk (*) are general replacement items, and the numbers may not be identical with those on factory assemblies: also, the electrical values of some replacement items furnished may differ from the values indicated in the schematic and parts list. The values substituted in any case are so chosen that the operation of the instrument will be either un changed or improved. When ordering replacements, use only the "Service Part No." in this parts list.

SECTION 1

Reference No.	Description	Service Part No.
C100	Condenser, .01 mf, line filter	61-0120*
C101	Condenser, .01 mf, line filter	61-0120*
C102	Condenser, electrolytic 20 mf, high-voltage filter	30-2555*
C103	Condenser, electrolytic	30-2556*
	C301A: condenser, 25 mf, high-voltage filter	Part of C103
	C103B: condenser, 10 mf, isolating filter	Part of C103
I100	Lamp, bin	34-2039*
I101	Lamp, panel	34-2040*
I102	Lamp, panel	34-2040*
J100	Socket, a-c phono power	27-6200
L100	Field, speaker	Part of LS200
R100	Resistor, 165 ohms, 6K6 bias	33-3435-1
R101	Resistor, 15,000 ohms, voltage-dropping	66-3155340*
S100	Switch, power ON-OFF	Part of R205
S101	Bin-light switch	42-1702
S102	Switch, phono a-c power	Part of 42-1803
T100	Transformer, power	32-8248
W100	Cord, line	L-3199

SECTION 2

C200	Condenser, 100 mmf, filament by-pass	60-10105407*
C201	Condenser, 100 mmf, r-f by-pass	60-10105407*
C202	Condenser, 100 mmf, r-f by-pass	60-10105407*
C203	Condenser, .006 mf, audio coupling	45-3500-7*
C204	Condenser, 100 mmf, filament by-pass	60-10105407*
C205	Condenser, 100 mmf, audio by-pass	60-10105407*
C206	Condenser, 100 mmf, plate by-pass	60-10105407*
C207	Condenser, .01 mf, bass compensation	61-0120*
C208	Condenser, .006 mf, audio coupling	45-3500-7*
C209	Condenser, .01 mf, audio by-pass	61-0120*
C210	Condenser, .006 mf, audio coupling	45-3500-7*
C211	Condenser, .006 mf, audio coupling	45-3500-7*
C212	Condenser, .006 mf, audio coupling	45-3500-7*
C213	Condenser, .1 mf, grid phasing	61-0113*
C214	Condenser, .003 mf, audio by-pass	61-0117*
J200	Socket—FM TEST	27-6180
LS200	Speaker	36-1595
PL200	Cable and plug assembly, phono-input	41-3735-2
R200	Resistor, 150,000 ohms, phono grid load	66-4153340*
R201	Resistor, 100,000 ohms, r-f decoupling	66-4103340*
R202	Resistor, 33,000 ohms, bass compensating	66-3333340
R203	Control, VOLUME, 2 meg. (tap at 1 meg.)	33-5535-1
R204	Resistor, 4.7 ohms, audio inverse feedback	66-9473340
R205	Control, TONE, 6 meg.	33-5538-1
R206	Resistor, 10 meg., grid leak, first audio	66-6103340*
R207	Resistor, 220,000 ohms, plate load 7X7	66-4223340*
R208	Resistor, 1 meg., grid load	66-5103340*
R209	Resistor, 4700 ohms, cathode bias	66-2473340*
R210	Resistor, 47,000 ohms, cathode bias	66-3473340*
R211	Resistor, 68 ohms, audio feedback	66-0683340*
R212	Resistor, 56,000 ohms, plate load 6J5	66-356340*
R213	Resistor, 150,000 ohms, grid phasing	66-4153340*
R214	Resistor, 330,000 ohms, grid load	66-4333340*
R215	Resistor, 330,000 ohms, grid load	66-4333340*
T200	Transformer, output	32-8274

SECTION 3

Reference No.	Description	Service Part No.
C303	Condenser, .01 mf, plate decoupling	61-0120*
C304	Condenser, .01 mf, a-v-c decoupling	61-0120*
C305	Condenser, 100 mmf, a-v-c decoupling	60-10105407*
C306	Condenser, 100 mmf, filament by-pass	60-10105407*
C307	Condenser, .01 mf, screen by-pass	61-0120*
C308	Condenser, 100 mmf,, plate decoupling	60-10105407*
C309	Condenser, .01 mf, plate decoupling	61-0120*
C310	Condenser, .01 mf, by-pass plate decoupling	30-4641
C311	Condenser, .01 mf, plate decoupling	61-0120*
C312	Condenser, 250 mmf, a-v-c decoupling	60-10255237*
C313	Condenser, .01 mf, a-v-c decoupling	61-0120*
C314	Condenser, .01 mf, a-v-c filter	61-0120*
C315	Condenser, 100 mmf, a-v-c decoupling	60-10105407*
C316	Condenser, .05 mf, cathode by-pass	61-0122*
C317	Condenser, 100 mmf, filament by-pass	60-10105407*
C318	Condenser, 100 mmf, a-v-c coupling	60-10105407*
C319	Condenser, .01 mf, screen by-pass	61-0120*
C320	Condenser, 100 mmf, r-f by-pass	60-10105407*
C321	Condenser, 100 mmf, r-f by-pass	60-10105407*
C322	Condenser, .05 mf, plate decoupling	61-0122*
C323	Condenser, 100 mmf, r-f by-pass	60-10105407*
C324	Condenser, .008 mf, r-f by-pass	61-0174*
C325	Condenser, 5 mf, noise limiter	30-2417*
C326	Condenser, 100 mmf, r-f by-pass	60-10105407*
C327	Condenser, 6 mmf, r-f by-pass	30-1224-9
C328	Condenser, 100 mmf, r-f by-pass	66-10105407*
R300	Resistor, 47,000 ohms, plate load, 7F8	66-3473340*
R301	Resistor, 2.2 meg., a-v-c decoupling	66-5223340*
R302	Resistor, 4700 ohms, plate load	66-2473340*
R303	Resistor, 33,000 ohms, plate load	66-3333340*
R304	Resistor, 68 ohms, cathode bias	66-0683340*
R305	Resistor, 10,000 ohms, screen dropping	66-3103340*
R306	Resistor, 1,000 ohms, plate load	66-2103340*
R307	Resistor, 2.2 meg., a-v-c decoupling	66-5223340*
R308	Resistor, 3.3 meg., a-v-c filter	66-5333340*
R309	Resistor, 150 ohms, cathode bias	66-1153340*
R310	Resistor, 220,000 ohms, a-v-c load	66-4223340*
R311	Resistor, 820,000 ohms, a-v-c load	66-4823340*
R312	Resistor, 33,000 ohms, screen dropping	66-3333340*
R313	Resistor, 330,000 ohms, r-f return	66-4333340*
R314	Resistor, 1000 ohms, plate load	66-2103340*
R315	Resistor, 47,000 ohms, diode decoupling	66-3473340*
R316	Resistor, 47,000 ohms, noise limiter	66-3473340*
R317	Resistor, 100,000 ohms, diode decoupling	66-4103340*
R318	Resistor, 100,000 ohms, FM decoupling	66-4103340*
R319	Resistor, 6.8 meg., discriminator load	66-5683340*
Z300	Transformer, 1st i-f	32-4146*
	C300A: condenser, FM trimmer	Part of Z300
	C300B: condenser, 3000 mmf, AM tuning	Part of Z300
	C300C: condenser, 6 mmf, i-f coupling	Part of Z300
	C300D: condenser, FM trimmer	Part of Z300
	C300E: condenser, AM trimmer	Part of Z300
	TC300, tuning core, AM	Part of Z300
Z301	Transformer, 2nd i-f	32-4156*
	C301A: condenser, FM trimmer	Part of Z301
	C301B: condenser, 300 mmf, AM tuning	Part of Z301
	C301C: condenser, FM trimmer	Part of Z301
	C301D: condenser, AM trimmer	Part of Z301

REPLACEMENT PARTS LIST — Continued

SECTION 3 — Continued

Reference No.	Description	Service Part No.
Z302	Transformer, 3rd i-f	32-4147*
	C302A: condenser, 470 mmf, AM tuning	Part of Z302
	C302B: condenser, AM trimmer	Part of Z302
	C302C: condenser, 27 mmf, FM coupling	Part of Z302
	C302D: condenser, FM trimmer	Part of Z302
	C302E: condenser, 25 mmf, FM tuning	Part of Z302
	C302F: condenser, 15 mmf, FM tuning	Part of Z302
	TC302: tuning core, FM tuning	Part of Z302

SECTION 4

C400	Condenser, tuning gang	31-2703-2
	C400A: condenser, FM aerial trimmer	Part of C400
	C400B: condenser, FM mixer trimmer	Part of C400
	C400C: condenser, FM oscillator trimmer	Part of C400
C401	Condenser, 1500-kc trimmer	31-6473
C402	Condenser trimmer assembly, two-section	31-6475-5
	C402A: condenser, shunt trimmer, BC osc.	Part of C402
	C402B: condenser, series trimmer, BC osc.	Part of C402
C403	Condenser, 51 mmf, FM coupling	60-00515307*
C404	Condenser, 100 mmf, filament by-pass	60-10105407*
C405	Condenser, 100 mmf, cathode by-pass	60-10105407*
C406	Condenser, 100 mmf, screen by-pass	60-10105407*
C407	Condenser, 33 mmf, FM coupling	60-00305307*
C408	Condenser, 1500 mmf, plate by-pass 6AG5	60-20155404*
C409	Condenser, 1500 mmf, screen by-pass 6AG5	60-20155404*
C410	Condenser, 220 mmf, converter coupling	60-10245307*
C411	Condenser, 750 mmf, cathode coupling	60-10755301*
C412	Condenser, 100 mmf, grid by-pass	60-10105407*
C413	Condenser, 220 mmf, osc. coupling	60-10245307*
C414	Condenser, 100 mmf, filament by-pass	60-10105407*
J400	Socket, 4-prong, external aerial	27-6214-1
L400	Coil, BC aerial	32-4033-2
L401	Coil, FM aerial	32-4158
L402	Choke, plate choke	32-4061
L403	Coil, FM r-f	32-4159
L404	Coil, BC oscillator	32-4019-4
L405	Coil, FM oscillator	32-4018-2
L406	Choke, parasitic oscillation suppressor	32-4157
LA400	Loop assembly, broadcast	76-1989
R400	Resistor, 2.2 meg., grid load	66-5223340*
R401	Resistor, 150 ohms, cathode bias	66-1151540
R402	Resistor, 47,000 ohms, screen dropping	66-3473340*
R403	Resistor, 1000 ohms, plate decoupling	66-2103340*
R404	Resistor, 2.2 meg., a-v-c decoupling	66-5223340*
R405	Resistor, 1500 ohms, cathode bias	66-2153340*
R406	Resistor, 15,000 ohms, grid leak	66-3153340*
R407	Resistor, 470,000 ohms, a-v-c decoupling	66-4473340*
R408	Resistor, 1500 ohms, a-v-c parasitic oscillation suppressor	Part of L406
FS	Function switch	42-1803
	FS1, section, function switch	Part of 42-1803
	FS2, section, function switch	Part of 42-1803
	FS3, section, function switch	Part of 42-1803
	FS4, section, function switch	Part of 42-1803
TB400	Terminal panel, aerial	38-9942

MISCELLANEOUS

Description	Service Part No.
Bin-Light Parts:	
Bin-light cable, socket and switch assembly	76-2728
Cord, pull (25-ft. spool)	45-1420*
Lamp, bin-light	34-2039*
Spring, pull-cord	28-8991
Cable assembly	41-3754-5
Cable, shielded	41-3754-11
Cabinet and Cabinet Hardware:	
Loop assembly, BC	76-1989
Spring washer (loop mtg.)	28-4186
Loop assembly, FM	76-2029-9
Washer (2 reqd.)	1W52540FA3
Bin mechanism, left hand	76-2176
Bin mechanism, right-hand	76-2174
Cabinet	10643C
Baffle, wood	219041
Baffle and cloth assembly	40-6770
Bezel, wood	16602
Bolt, speaker-mounting	W1587
Dial-scale plate assembly	76-2005
Frame, mounting assembly	76-2199
Hinge, baffle	45-6200
Lamp bracket	56-2332
Grommet (superstructure mounting)	27-4596
Capacitor mounting wafer	45-6409*
Chassis Mounting Hardware:	
Foot assembly, (4) mounting grommet	54-4122
Nut, "T"	W2502FA3
Washer	W2271FA3
Clip, aerial	28-5002FA1
Clip, BC oscillator	56-4303FA1
Dial-Scale Hardware:	
Cord, pointer-drive (25-ft. spool)	45-1459*
Pointer	56-3179
Scale and backplate assembly	76-2226-3
Mounting screws (4)	1W24894FE11
Spacer (2), scale backplate	56-3279FA3
Rubber band	54-4234
Spring, pointer-drive-cord	28-8953
Grommet (2), superstructure mtg. — sub. and plate assy.	27-4596
Spacer (2), superstructure mtg. — sub. and plate assy.	1W29184FA3
Washer (2)	1W52116FA3
Screw (2)	1W25349FA3
Function switch	42-1803
Function-Switch Hardware:	
Link assembly	76-2186
Phono OFF-ON switch	Part of 42-1803
Shaft	56-3298FA11
Washer, "C"	1W42535FA3
Grommet (3), r-f chassis mounting	54-4295
Knob (4)	54-4105
Lamp, panel (2)	34-2040*
Lamp-socket assembly, panel (2)	76-2109
Washer	1W52237FA3
Record Changer Mounting Parts:	
Bolt (4), changer-mounting	56-3295
Grommet (4), changer-mounting	54-4313
Nut, "T" (4), changer-mounting	1W56643FA3
Palnut (4), changer-mounting	1W29061FA3
Spring (8), changer-mounting	56-3043
Socket (3), Loktal	27-6138*
Socket (1), Loktal (7F8)	27-6213*
Socket (1), Miniature (6BA6)	27-6203-4
Socket (3), octal	27-6199*
Socket (1), Miniature (6AG5)	27-6203-3
Speaker Hardware:	
Bolt, mounting	W1587FA3
Cable and plug assembly	41-3701
Nut (4), speaker-mounting	1W19988FA3
Plug, speaker-cable	27-4419-2

MODEL 47-1227 PHILCO CORP.

AM ALIGNMENT PROCEDURE

When the complete AM and FM alignments are to be made, the AM alignment should be made first; if FM alignment is not required, the AM alignment alone may be made.

RADIO DIAL POINTER: With tuning-condenser plates fully meshed, adjust pointer to coincide with index mark at low-frequency end of scale.

VOLUME CONTROL: Maximum clockwise.

TONE CONTROL: Maximum counterclockwise.

AM SIGNAL GENERATOR: Connect ground lead to radio chassis and output lead as indicated in chart.

OUTPUT METER: Connect between terminal 3 (voice-coil connection) of aerial terminal strip (TB400) and chassis.

OUTPUT LEVEL: During alignment, the input signal must be attenuated to hold the output-meter reading below 1.5 volts.

RADIO FUNCTION SWITCH, RADIO DIAL and SIGNAL GENERATOR: Set as indicated in chart.

NOTE: Make up a coil of insulated wire consisting of 6 to 8 turns, about 6" in diameter. Connect coil ends to the signal generator leads and suspend coil near radio broadcast loop.

FM ALIGNMENT PROCEDURE

NOTE: Make AM alignment first.

D-C METER: Connect the negative lead of a 20,000-ohms-per-volt meter to pin 6 of the 7X7 tube and the positive lead to chassis (across the 5-mf condenser, C325, in the discriminator circuit). Use 10-volt meter range.

AM SIGNAL GENERATOR: Use modulated output for the entire alignment. The generator must have sufficient output to give a reading of approximately 9 volts on the d-c meter and the signal should be attenuated during the alignment to keep the meter at this value. Connect the generator ground lead to chassis and the output lead as indicated in the chart.

RADIO FUNCTION SWITCH, RADIO DIAL and SIGNAL GENERATOR: Set as indicated in chart. Allow the radio and generator to warm up for 15 minutes before starting the alignment.

NOTE 1: The resonance of the circuits using coils L401, L403, and L405 may be checked with a powdered-iron tuning core, such as Part No. 56-6100. If the signal strength (meter reading) increases when the iron end is inserted in the coil, compress the turns slightly. If the signal increases when the threaded brass end is inserted, spread the turns. Do not compress or spread the turns excessively; only a small change is required at these frequencies.

NOTE 2: Oscillator coil L405 — Adjust coil for maximum meter reading.

NOTE 3: R-F coil L403 — Adjust coil for maximum meter reading while rocking tuning control.

NOTE 4: Aerial coil L401 — Adjust coil for maximum meter reading.

FS FUNCTION SWITCH SECTIONS SHOWN IN BC POSITION AS VIEWED WHEN CHASSIS IS INVERTED
(F) INDICATES FRONT CONTACTS LOOKING FROM FRONT.
(R) INDICATES REAR CONTACTS LOOKING THROUGH FROM FRONT.
SWITCH SYMBOLS FS1, FS2, FS3, AND FS4 INDICATES PLACEMENT OF SECTIONS FROM FRONT OF CHASSIS TO REAR.

L400 BC AERIAL
L401 FM AERIAL
L402 BC OSC.
L403 FM MIXER
L405 FM OSC.

R.F. I.F. AND AUDIO SIGNAL PATH.
OSC. SIGNAL PATH.
INDICATES CONNECTION AT SPEAKER PLUG.
ALL RESISTOR VALUES IN OHMS UNLESS MARKED OTHERWISE.

CONDENSER SYMBOLS: FIXED, VARIABLE, TRIMMER, ELECTROLYTIC

ALL VOLTAGE, CAPACITY, AND RESISTANCE VALUES SHOWN ARE AVERAGE. THE VOLTAGES WERE MEASURED BETWEEN THE POINTS INDICATED AND THE RADIO CHASSIS (C), USING A 20,000-OHMS-PER-VOLT METER, WITH 117-VOLT, 60-CYCLE INPUT TO THE RADIO POWER SUPPLY, THE VOLUME CONTROL AND TONE CONTROL WERE SET TO COUNTERCLOCKWISE POSITION AND THE FUNCTION SWITCH WAS SET TO BROADCAST POSITION. THE OSCILLATOR GRID VOLTAGE WAS TAKEN BETWEEN PINS 1 AND 4 OF THE 7F8 TUBE USING A 100,000-OHM ISOLATING RESISTOR IN SERIES WITH THE NEGATIVE PROD OF THE VOLTMETER LEAD.

8	Same as step 4	92 mc	FM	92 mc	Adjust L403. See notes 1 and 3.	
9	Same as step 4	92 mc	FM	92 mc	Adjust L401. See notes 1 and 4.	
10	Repeat steps 4 through 10 until no further increase is obtained.					

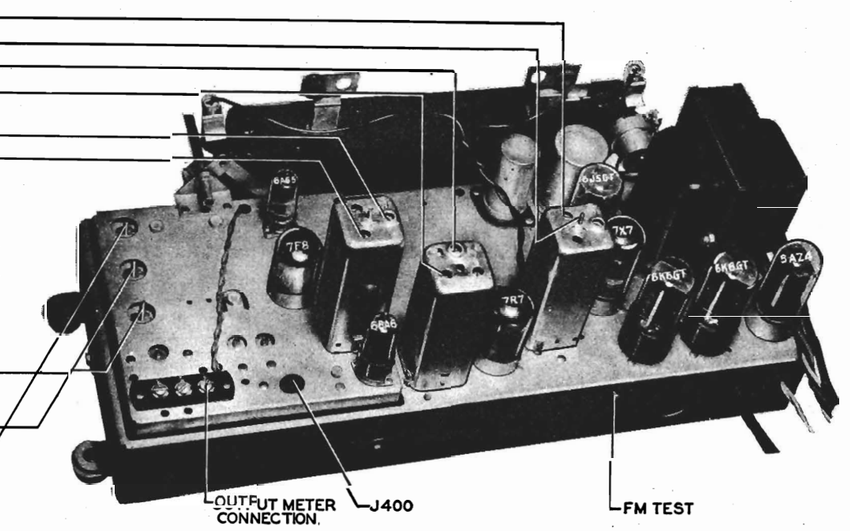

FIGURE 9. CHASSIS VIEW, SHOWING FM TRIMMER LOCATIONS.

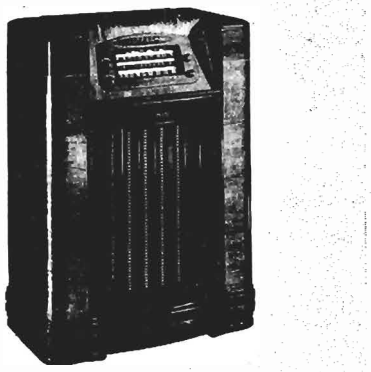


CIRCUIT	Nine-tube superheterodyne
FREQUENCY RANGES:	
BROADCAST	540 to 1720 kc.
SHORT WAVE	9.3 to 15.5 mc.
FM	88 to 108 mc.
AUDIO OUTPUT	10 watts
PUSH BUTTONS	Six: Five for broadcast-station selection, one for phono operation
OPERATING VOLTAGE	105—120 volts, 60 cycles, a.c.
POWER CONSUMPTION	110 watts
AERIALS	Built-in cabinet loop, dipole, or external aerial
INTERMEDIATE FREQUENCIES:	
AM	455 kc.
FM	9.1 mc.
PHILCO TUBES USED (9)	6AG5, 7F8, 6BA6, 7R7, 7X7, 7AF7, 6V6GT (2), 5Y3GT
RECORD PLAYER	Philco Automatic Record Changer, Model D-10A
PANEL LAMPS (2)	6—8-volt, Part No. 34-2040
BIN LAMP	6—8-volt, Part No. 34-2039

PRELIMINARY CHECKS

Before connecting the radio to a source of power, the following steps are recommended:

1. Inspect both top and bottom of the chassis. Make sure that all tubes are secure in their proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance between B+ (pin no. 8 of 5Y3GT rectifier tube) and the radio chassis. When the ohmmeter test leads are connected in proper polarity, the highest resistance reading will be obtained. If the reading is lower that 50,000 ohms, check condensers C102 and C103 for leakage or shorts.

SYMBOLIZATION AND TERMINOLOGY

All components in the radio circuit are symbolized and located as follows:

C—condenser LA—loop antenna S—switch
I—pilot lamp LS—loudspeaker T—transformer
L—choke or coil R—resistor Z—electrical ass'y

100-series components are in section 1 — the power supply

200-series components are in section 2 — the audio amplifier

300-series components are in section 3 — the i-f amplifier, second detector and/or discriminator, and a.v.c.

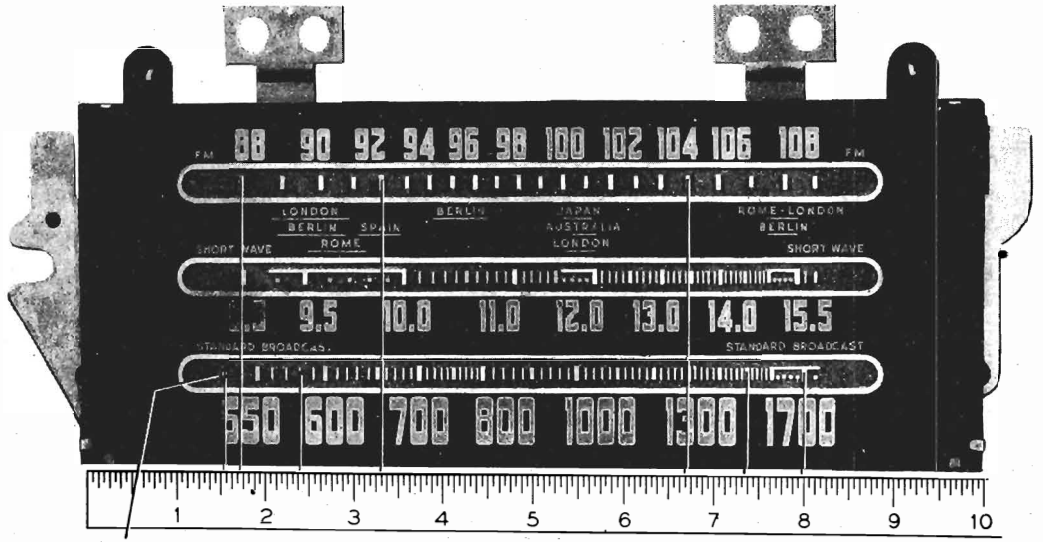
400-series components are in section 4 — the antenna, r-f and oscillator.

CALIBRATING DIAL BACKPLATE

When the radio chassis has been removed from the cabinet, dial calibration and alignment points may be marked on the dial backplate below the pointer.

The method of measuring for these points is illustrated in figure 1. Hold a ruler against the scale backplate, with the start of the ruler at the reference line shown, and mark pencil dots at the proper points for the required frequency settings. When the ruler is correctly placed, the index mark is 1½ inches from the reference point indicated in figure 1.

With the tuning gang fully meshed, the pointer should be adjusted on the dial drive cord to coincide with the index mark.



DIAL-BACKPLATE CALIBRATION MEASUREMENTS

MODEL 47-1230 PHILCO CORP.

CIRCUIT DESCRIPTION

The radio is designed with three tuning ranges, covering the standard broadcast, short-wave and FM bands by manual tuning. In addition, six push buttons are provided, one for phono-radio switching and five for automatic instant tuning of stations in the broadcast band. The function switch selects manual tuning on the broadcast, short-wave or FM bands, or push-button tuning. The ON-OFF switch is combined with the tone control.

A low-impedance loop within the cabinet provides adequate signal pickup for the broadcast and short-wave bands. In most locations, the built-in FM aerial provides satisfactory reception on the FM band. In areas where FM signals are weak, an outdoor dipole aerial (Philco Part No. 45-1462) will provide additional pickup.

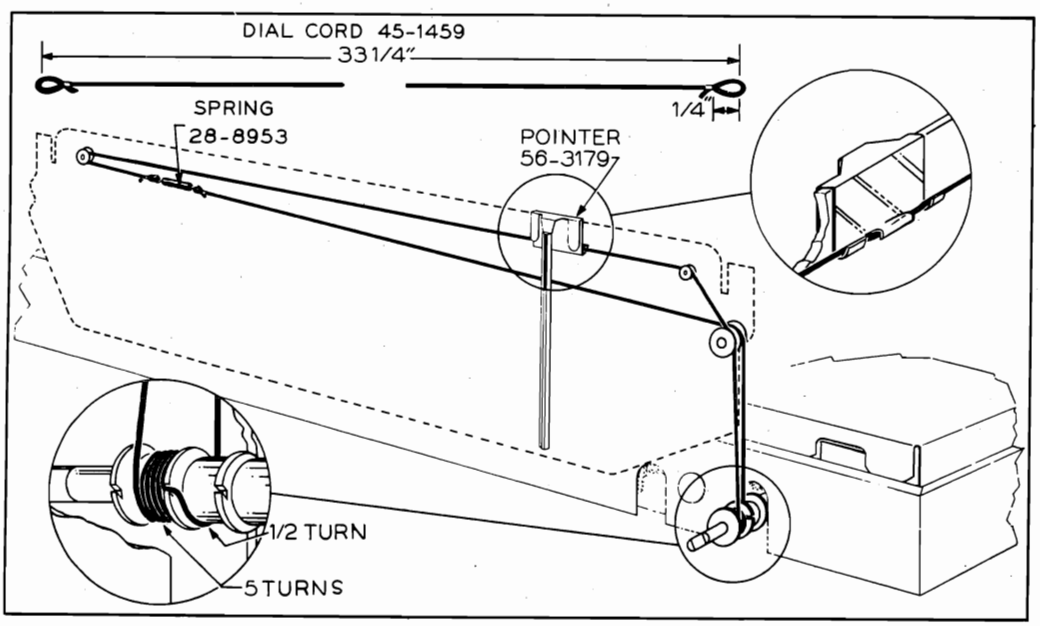
A high-frequency r-f pentode, type 6AG5, is used in the r-f stage (FM only) and a type 7F8 high-frequency dual-triode is employed as a converter. These stages provide high signal-to-noise ratio, high conversion efficiency and good image rejection.

Two transformer-coupled i-f stages are used. The transformers have two sets of windings; one set is tuned to 455 kc for AM reception, the other to 9.1 mc for FM operation. Both primary and secondary FM windings are tuned to provide additional gain at 9.1 mc. A 6BA6 high-frequency pentode is used in the first i-f amplifier stage and the pentode section of a 7R7 high-gain r-f amplifier is used in the second i-f stage. The diode section of the 7R7 is used for AM detection. The high gain achieved in the i-f amplifier at 9.1 mc gives improved FM reception by providing ample signal for proper operation of the FM detector.

A discriminator circuit having improved noise-reducing properties and a superior tuning characteristic is used for FM reception. Greater noise reduction on FM is achieved by preventing short-time amplitude variations across the secondary of the discriminator transformer. The two diodes of a 7X7 tube are connected in series with the secondary, with a large condenser (5 mf) connected across the output circuit of the diodes. As a result of the high current which flows to this condenser whenever the diodes conduct in series, amplitude variations across the secondary are dissipated.

The high-mu triode section of the 7X7 tube is used in the first audio stage. The output of this stage is applied to one section of a dual-triode 7AF7 tube which operates as a phase inverter to drive the two 6V6GT push-pull output tubes. When the PHONO push button is depressed, the cathode circuit of the second i-f amplifier is opened and the other section (phono preamplifier) of the 7AF7 tube is connected to the volume-control circuit in the input of the 7X7 tube.

The push-pull audio-output stage furnishes approximately 10 watts output to the 12-inch electrodynamic loudspeaker.



POINTER-DRIVE-CORD INSTALLATION DETAILS.

SECTION 1 – TROUBLE SHOOTING

CAUTION: Do not turn on power with speaker disconnected, as this may cause damage to the set.

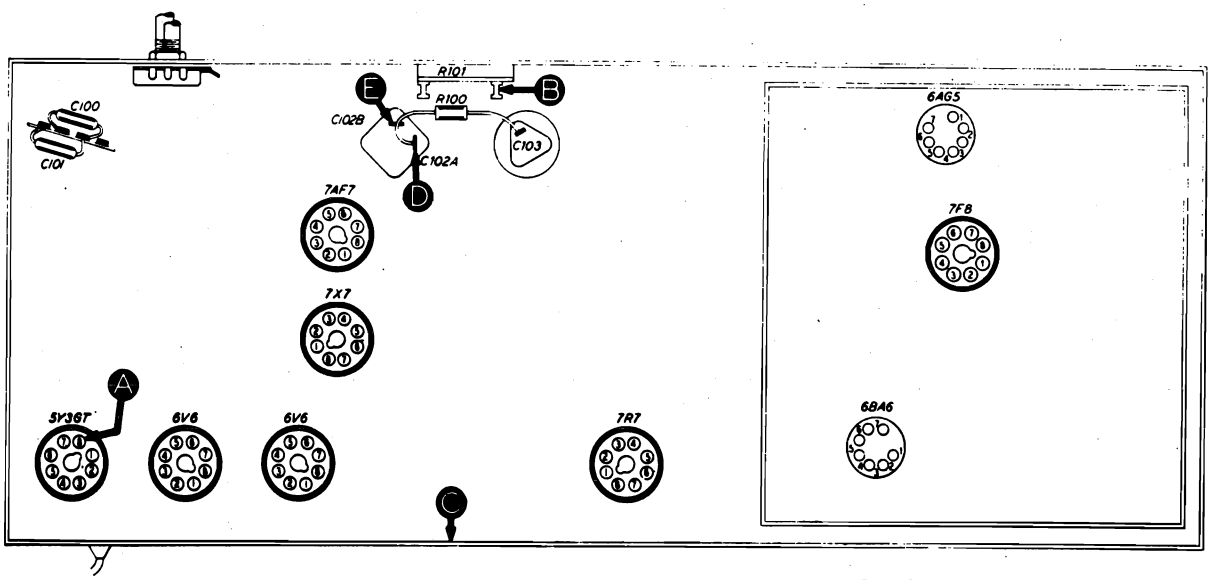
Make the tests for this section with a d-c voltmeter, connecting the leads to the test points indicated in the chart and in figure 3. The voltages given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts a.c.

With function switch set to push-button position, turn volume control to minimum and tone control to nearly off position.

Follow steps in proper sequence; if "NORMAL INDICATION" is obtained in step 1, proceed with tests for Section 2; if not, isolate and remedy the trouble in this section.

It will be noted that certain parts in other sections of the radio are listed under "POSSIBLE CAUSE OF ABNORMAL INDICATION", since they may produce abnormal voltage readings in Section 1.

STEP	TEST POINTS	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	E to C D to C	240 volts 190 volts	No voltage or incorrect voltage	Trouble in this section. Isolate by the following tests.
2	A to C	310 volts	No voltage Low voltage High voltage	Defective 5Y3GT; T100, S100, W100, L100. Shorted C103. Open R100. Defective 5Y3GT, C103, C102A, C419, C314. Open R100, L100, or T200.
3	B to C	Negative 16 volts	Low or no voltage High voltage	Shorted R101. Open R101.
4	D to C	190 volts	No voltage Low voltage High voltage	Open R100. Shorted C102A. Leaky C102A, C103. Defective C419. Open L100, T200.
5	E to C	240 volts	No voltage Low voltage High voltage	Open L100. Shorted C103. Shorted or leaky C102B, C216. Shorted L100. Open R100, T200.
Listening test			Abnormal hum may be caused by open C102A or C103.	



BOTTOM VIEW, SHOWING SECTION 1 TEST POINTS.

MODEL 47-1230 PHILCO CORP.

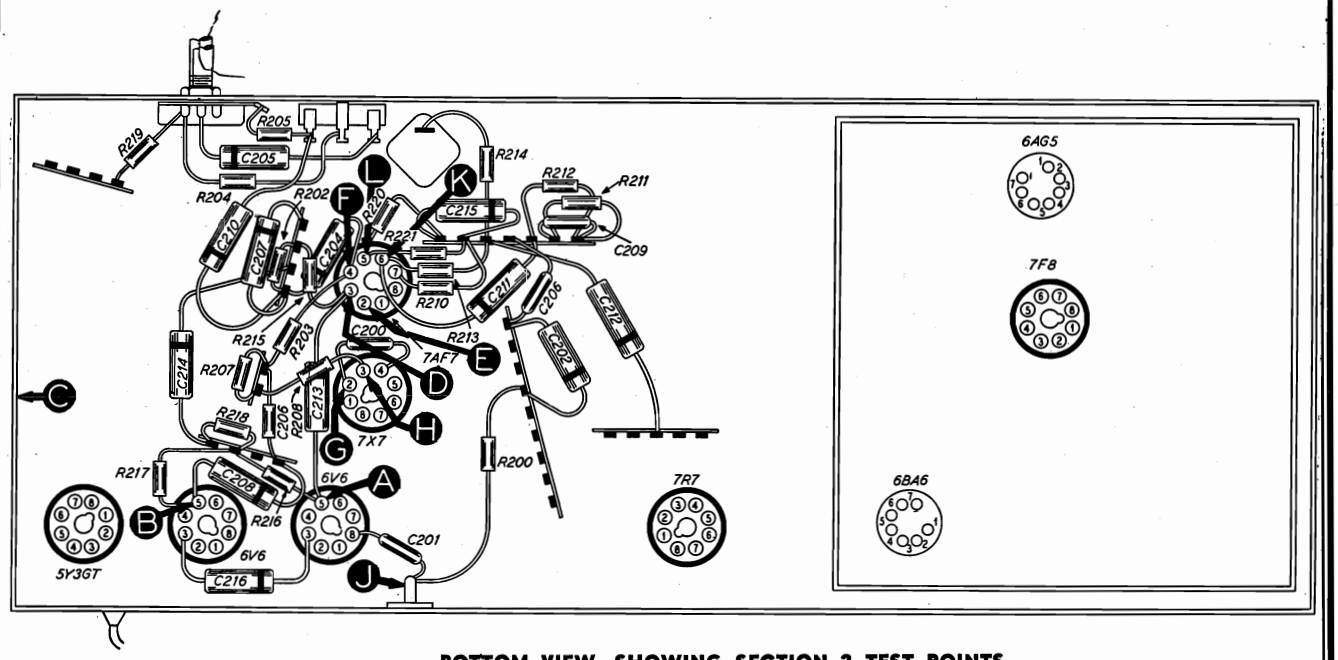
SECTION 2 – TROUBLE SHOOTING

For all tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to the radio chassis, test point "C"; connect the output lead through a .1-mf condenser to the test points indicated.

Set the radio volume control at maximum, tone control at nearly off position and depress the PHONO push button. Adjust the signal-generator output as required for each step.

If the "NORMAL INDICATION" is obtained in step 1, proceed to the tests in Section 3. If not, isolate and remedy the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	L J	Loud, clear signal with weak signal input	Trouble within this section. Isolate by the following tests.
2	A (7AF7 tube removed)	Loud, clear signal with strong signal input	Defective 6V6GT tube, T200 or LS200. Shorted or leaky C216 or C213.
3	B	Loud, clear signal with strong signal input	Defective 6V6GT tube. Shorted or leaky C208.
4	D	Loud, clear signal with strong signal input	Open C213, R215, R216.
5	E	Loud, clear signal with strong signal input	Open C208 or R217.
6	F (7AF7 tube replaced)	Clear signal, louder than preceding test	Defective 7AF7 tube, C204, R203, R206, R207.
7	G	Clear signal, same volume as step 6	Defective C200, R202. Open C204.
8	H	Loud, clear signal with moderate signal input	Defective 7X7 tube, C205, C308. Open R208.
9	J	Loud, clear signal with moderate signal input	Open R200, C202. Shorted C201, C203. Defective R201 (rotate through entire range).
10	K	Loud, clear signal with moderate signal input	Defective C211, C212.
11	L	Loud, clear signal with weak signal input	Defective 7AF7 tube, push button PB1. Shorted C215.



BOTTOM VIEW, SHOWING SECTION 2 TEST POINTS.

SECTION 3 – TROUBLE SHOOTING

AM TESTS

For the following tests us an r-f signal generator with modulated output set at 455 kc. Connect the generator ground lead to the radio chassis, test point "C", and connect the output lead through a .1-mf condenser to the test points indicated.

Turn the radio volume control to maximum, tone control to nearly off position and set function switch to push-button position.

If the "NORMAL INDICATION" is obtained in the first step, proceed to the FM tests, or to the tests in Section 4; if not, isolate and remedy the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	E	Loud, clear signal with low signal-generator input	Trouble within this section. Isolate by the following tests.
2	A	Normal signal with moderate input	Defective 7R7 tube, 7X7 tube, Z302. Improperly aligned Z302. Defective C314, C419, C317, C310, C311, C315, C312, C314, C328, FS4 (F).
3	B	Same as step 2.	Defective C308, C309. Defective or improperly aligned Z301.
4	D	Much stronger signal than in step 3; decrease input to obtain normal signal	Defective 6BA6 tube, C307. Open R303, R302, FS4 (R), C303, C305.
5	E	Approximately the same strength signal as in step 4	Defective C304, FS4 (R). Defective or improperly aligned Z300.
	Listening test with station tuned in	Normal, clear reception	Distorted signal with hum: defective R316 or FS4 (F). Intense hum or motorboating: open C419 or C328.

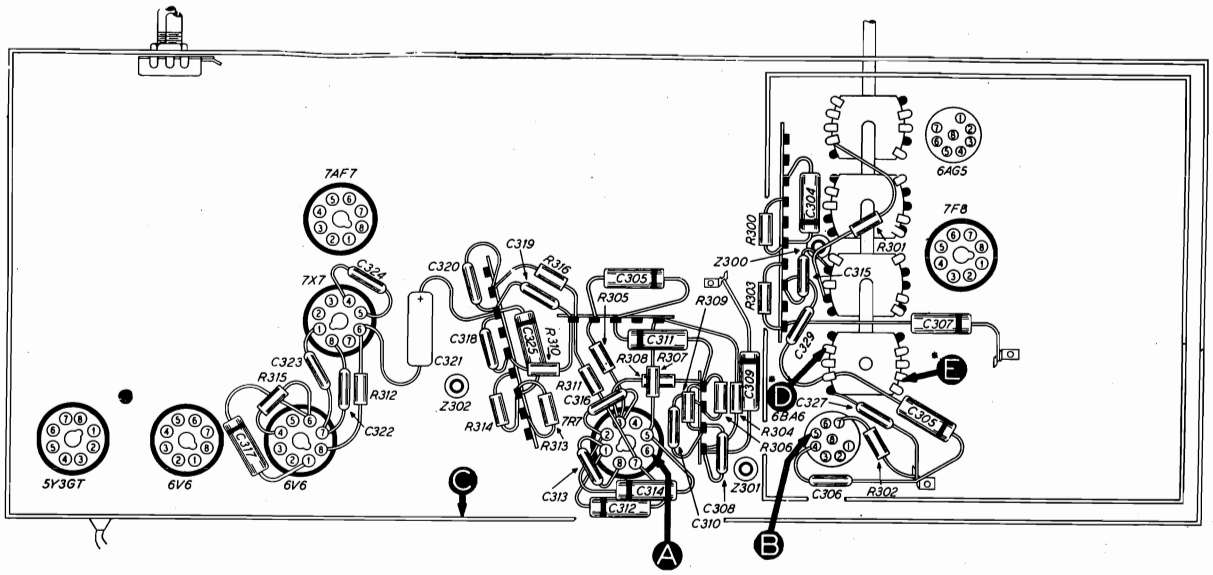
NOTE: Test points marked with an asterisk (*) on the base view are physically located in a different position from the same test points on the corresponding section of the main schematic. However, both test points are electrically identical, but the one shown on the base view has been chosen for greatest accessability during servicing procedure.

FM TESTS

Set the function switch to FM position and follow the instructions preliminary to the AM tests with these exceptions; set the signal-generator frequency to 9.1 mc and detune to one side or the other until a satisfactory test signal is obtained.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Normal signal with moderate input	Defective or improperly aligned Z302. Defective FS4 (F).
2	B	Same strength signal as in step 1	Defective Z301.
3	D	Much stronger signal than in step 2; decrease input to obtain normal signal	Same parts listed in AM section, step 4.
4	E	Approximately the same strength signal as in step 3	Defective Z300 or any other part listed in AM section, step 5.

MODEL 47-1230 PHILCO CORP.



BOTTOM VIEW, SHOWING SECTION 3 TEST POINTS.

SECTION 4 – TROUBLE SHOOTING

For tests indicated in this section, with the exception of oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to the radio chassis, test point "C", and connect the output lead through a .1-mf condenser to the test points indicated.

Turn the radio volume control to maximum and tone control to nearly off position.

Set the function switch, tuning control and signal-generator frequency as indicated in chart.

For oscillator tests (AM test chart, step 3; FM test chart, step 3) attach the positive lead of a high-resistance voltmeter to the 7F8 oscillator cathode, test point "E" (pin 4). Connect the negative lead through a 100,000-ohm isolating resistor to the 7F8 oscillator grid (pin 1), test point "F". Use a suitable meter range (0—10 volts).

Absence of negative grid voltage in either AM or FM position of function switch indicates that the oscillator is not working; check the parts listed in the chart for the oscillator tests.

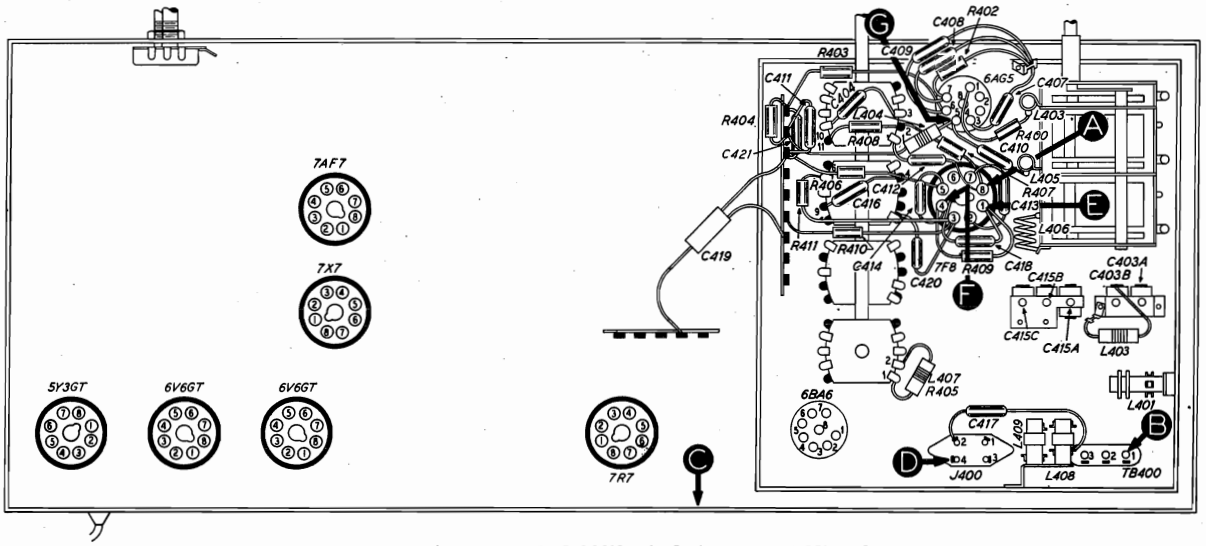
FM TESTS

STEP	TEST POINT	SIG. GEN. SETTING	FUNCTION SWITCH AND TUNING CONTROL	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	D	95 mc	FM. Tune to signal from generator	Loud, clear signal with low signal input.	Trouble in this section. Isolate by the following tests.
2	A	95 mc	Same as step 1	Same as step 1	Defective 7F8 tube, C412, C414, C413, FS4 (R), R406. Defective or misaligned Z300. Trouble in FM oscillator circuit (step 3).
3	E to F (osc. test)	Not used	FM. Tune through range	Negative approx. 3 volts	Defective 7F8 tube, FS2 (F), FS2 (R), FS3 (R), L406
4	G	95 mc	FM. Tune to signal from generator	Loud, clear signal with moderate signal input	Defective FS1 (R), C410, C411, C421, L404, L405.
5	D	95 mc	FM. Tune to signal from generator	Loud, clear signal with low signal input	Defective 6AG5 tube, C406, C408, C409, L403.

PHILCO CORP. MODEL 47-1230

AM TESTS

STEP	TEST POINT	SIG. GEN. SETTING	FUNCTION SWITCH AND TUNING CONTROL	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	B	1000 kc	BC (dial). Tune to signal from generator	Loud, clear signal with low generator input	Trouble in this section. Isolate by the following tests.
2	A	1000 kc	Same as step 1	Same as above	Defective 7F8 tube, C412, C414, C413, FS4 (R), R406. Open R300, R405. Shorted or leaky C304. Defective or misaligned Z300. Trouble in oscillator circuit (step 3).
3	E to F (osc. test)	Not used	BC. Tune through range	Negative approx. 3 volts	Defective 7F8 tube, C413, C414, C417, FS2 (F), FS2 (R), FS3 (R), R409. Shorted or leaky C419. Defective L408, C420.
4	B	1000 kc	BC (dial). Tune to signal from generator	Loud, clear signal with low generator input	Defective L401, FS3 (R), FS1 (R), C412.
5	B	Through range of each push button	PB. Operate each push button	Same as above	Defective FS3 (R), FS1 (R), PB 2, 3, 4, 5, 6. Trouble in push-button oscillator circuit (step 6).
6	E to F (osc. test)	Not used	PB. Operate each button		Defective 7F8 tube, FS2 (F), FS2 (R), L400 A, B, C, D, E or PB 2, 3, 4, 5, 6. C401, C402 or R400.
7	B	12 mc	SW. Tune to signal from generator		Defective FS1 (R), FS3 (R), L402, C404 or trouble in short-wave oscillator circuit (step 8).
8	E to F (osc. test)	Not used	SW. Tune through range	Negative approx. 3 volts	Defective 7F8 tube, FS2 (F), FS2 (R), FS3 (R), L408.



BOTTOM VIEW, SHOWING SECTION 4 TEST POINTS.

MODEL 47-1230 PHILCO CORP.

AM ALIGNMENT PROCEDURE

When the complete AM and FM alignment is to be made, the AM alignment should be made FIRST; however, if FM alignment is not required, the AM alignment alone may be made.

CONNECT OUTPUT METER between terminal 3 (voice-coil connection) of aerial terminal board and chassis.

ADJUST RADIO DIAL POINTER, with tuning-condenser plates fully meshed, to make pointer coincide with index mark at low-frequency end of scale.

CONNECT AM SIGNAL GENERATOR ground lead to radio chassis; connect output lead as indicated in chart.

SET VOLUME CONTROL at maximum and TONE CONTROL at nearly off position.

SET SIGNAL GENERATOR, RADIO FUNCTION SWITCH and RADIO DIAL as indicated in chart.

OUTPUT LEVEL: During alignment, the input signal must be attenuated to hold the output-meter reading below 1.5 volts.

NOTE: Make up a coil of wire, using 6 or 8 turns, about 6 inches in diameter; connect the signal-generator leads and suspend near the radio broadcast loop.

FM ALIGNMENT PROCEDURE

NOTE: Make AM alignment first.

Connect the negative lead of a 20,000-ohms-per-volt, d-c meter, to pin 6 of the 7X7 tube and the positive lead to ground (across the 5-mf condenser, C321, in the discriminator circuit). Use 10-volt range.

Use an r-f signal generator with MODULATED output for the entire alignment. The generator must have sufficient output to give a meter reading greater than 8.5 volts; the reading on the meter should be kept at approximately 9 volts throughout the alignment. Connect the generator ground lead to chassis and the output lead as indicated in the chart.

Set the function switch to FM position. Allow the radio and generator to warm up 15 minutes before starting the alignment.

NOTE: The resonance of the circuits using coils L403, L405 and L406 may be checked by the use of a powdered-iron tuning core, such as Philco Part No. 56-6100. If the signal strength (meter reading) increases when the iron end is inserted in the coil, compress the turns slightly. If the signal increases when the threaded brass end is inserted, spread the turns.

Do not spread or compress turns excessively, since only a small change is required at these frequencies.
Oscillator coil L406: Adjust coil for maximum meter reading.
R-F coil L405: Adjust coil for maximum meter reading while rocking tuning control.
Aerial coil L403: Adjust coil for maximum meter reading.

SETTING THE PUSH BUTTONS

1. Connect the output meter between terminal no. 3 on aerial terminal board and radio chassis.
2. Turn the radio volume control to maximum and the tone control counterclockwise to nearly OFF position.
3. Turn the radio function switch to PB position.
4. Couple the signal generator loosely through a coil of wire to the radio loop aerial, as described in AM alignment Procedure above.
5. Turn on the power and allow the radio to warm up for 15 minutes before starting the adjustments.
6. Starting with the lowest frequency desired, set the signal-generator frequency, push the button, and adjust the associated oscillator tuning core and aerial trimmer for maximum indication on the output meter. During alignment, the input signal must be attenuated to hold the output-meter reading below 1.5 volts.
7. Reset the signal-generator frequency and repeat the procedure for each remaining push button.
8. Turn off the signal generator and make a final adjustment of all tuning cores and trimmer condensers while listening to the stations for which the adjustments are being made.

PUSH-BUTTON (Left to right from front)	FREQUENCY RANGE	OSCILLATOR TUNING CORE	AERIAL TRIMMER
Phono	.....	.....	.....
PB1	540-1000 kc	L400A	C400A
PB2	600-1200 kc	L400B	C400B
PB3	650-1300 kc	L400C	C400C
PB4	850-1500 kc	L400D	C400D
PB5	900-1600 kc	L400E	C400E

PHILCO CORP. MODEL 47-1230

NOTE: Parts marked with an asterisk (*) are general replacement items, and the numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items furnished may differ from the values indicated in the schematic and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No." in this parts list.

SECTION 1

Reference No.	Description	Service Part No.
C100	Condenser, .01 mf, line filter	61-0120*

PHILCO CORP. MODEL 48-1253

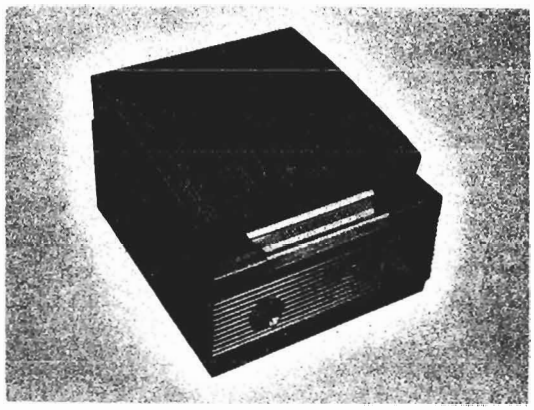
Philco TROUBLE SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.



MODEL 48-1253

SPECIFICATIONS

CABINET	Wood, walnut finish
CIRCUIT	Five-tube superheterodyne
FREQUENCY RANGE	540—1600 kc.
AUDIO OUTPUT	2.2 watts
OPERATING VOLTAGE	105—120 volts, 60 cycles, a.c.
POWER CONSUMPTION	
Radio	60 watts
Phonograph	30 watts
AERIAL	Built-in high-impedance loop; terminal provided for external aerial
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (5)	7A8, 7B7, 7C6, 50A5, 50X6
PHONOGRAPH	Philco Automatic Record Changer Model M-8 (for service information, see manual PR-1478)

TP-3632

Circuit Description

Philco Model 48-1253 is a table-model radio-phonograph combination consisting of a five-tube superheterodyne radio and a Philco Model M-8 Automatic Record Changer, operating on a.c. only. The tuning range is 540—1600 kc. The built-in high-impedance loop aerial is adequate in most areas; where greater pickup is required, an external aerial may be connected. When the external aerial is not in use, the aerial lead on the radio should be connected to the chassis.

The converter stage employs a 7A8 pentagrid converter. The i-f amplifier is a 7B7 high-transconductance tube, followed by a 7C6 duo-diode, triode, operating as detector, a.v.c., and first-audio amplifier. The 50A5 output tube works into a permanent-magnet dynamic speaker.

In the power supply, a 50X6 operates in a voltage-doubler circuit. A resistance-capacitance type of filter is used.

For service information on the record changer, refer to service manual PR-1478, Philco Automatic Record Changer Model M-8.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance between B+ (pin 2 of 50X6 rectifier tube) and the B– bus, test point B. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 3700 ohms, check condensers C101, C102, and C103A for leakage or shorts.

The resistance value above, which is much lower than normal, is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 are performed.

MODEL 48-1253 PHILCO CORP.

Section 1 TROUBLE SHOOTING

Make the tests for this section with a d-c voltmeter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Set the radio-phono switch to RADIO, and the volume control to minimum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2; if not, isolate and correct the trouble in this section.

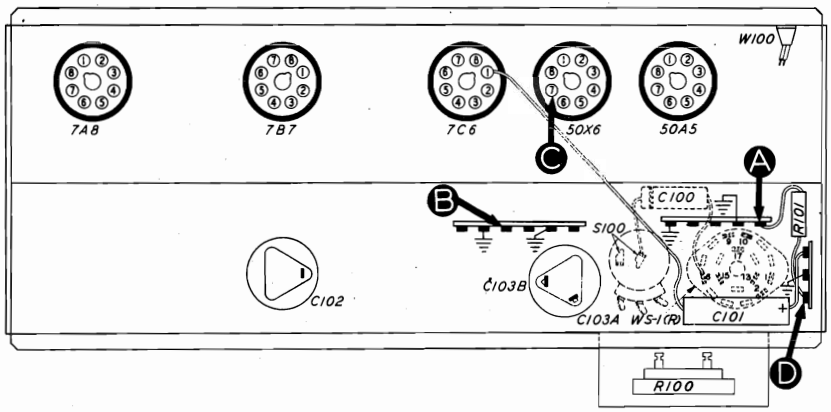


Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	96v	Trouble in this section. Isolate by the following tests.
2	C	220v	Defective: 50X6. Shorted or leaky: C101, C102. Open: R100, C101, C102, S100, WS-1(R).
3	D	207v	Shorted or leaky: C103A. Open: C103A, R101, T200*, R204*.
4	A	96v	Shorted or leaky: C103B. Open: R204*.
Listening test: Abnormal hum may be caused by open C101, C102, C103A, or C103B.			

* This part, located in another section, may cause abnormal indication in this section.

Section 2 TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum. For all the tests except step 5, set the radio-phono switch to RADIO.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3. If not, isolate and correct the trouble in this section.

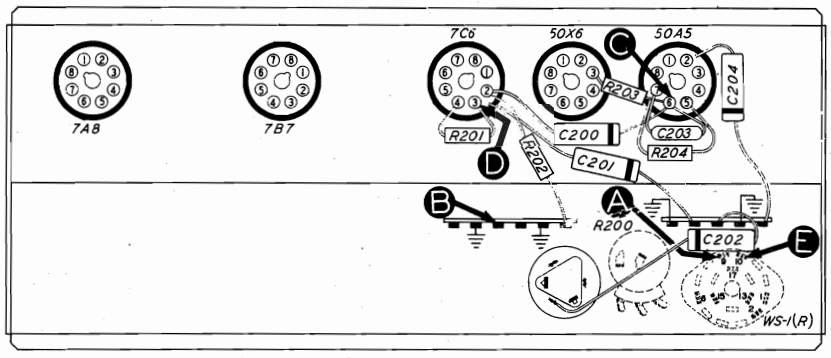

Figure 2. Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Clear signal with strong signal input.	Defective: 50A5. Open: LS200, T200, R204, R203. Shorted: LS200, T200, C200, C204, C203. Leaky: C200, C203, C204.
3	D	Same as step 1.	Defective: 7C6. Open: R202, R203, C200. Shorted: C200.
4	A	Same as step 1.	Open: WS-1(R), C201, R200 (rotate through range).
5*	E	Same as step 1.	Open: WS-1(R).
Listening Test: Distortion may be caused by open R201 or R203, or by shorted or leaky C201. Hum in phono operation may be caused by open C202.			

* Radio-phono switch in PHONO position.

Section 3 TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio-phono switch to RADIO, and the volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4; if not, isolate and correct the trouble in this section.

Since the circuit location of test point A for this section is the same as that of test point C for Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

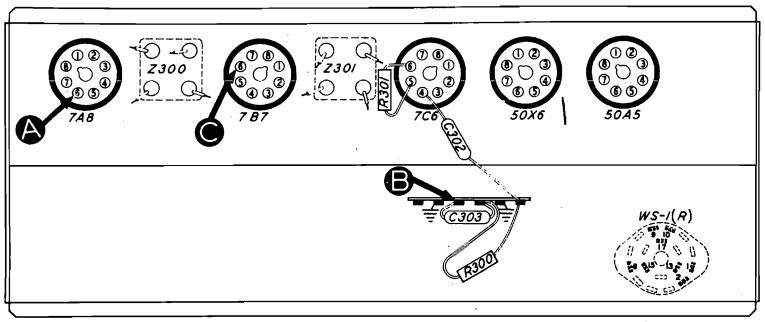

Figure 3. Bottom View, Showing Section 3 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Clear signal with strong signal input.	Defective: 7B7, 7C6 (diode section). Open or shorted: Z301 prl. or sec., C301A, C301B. Misaligned: Z301. Open: R404*, R300, WS-1(R). Shorted: C302, C303. Shorted or leaky: C405*.
3	A	Same as step 1.	Defective: 7A8*. Open or shorted: Z300 pri. or sec., C300A, C300B. Misaligned: Z300.

* This part, located in another section, may cause abnormal indication in this section.

Section 4 TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator, with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio-phono switch to RADIO, and the volume control to maximum.

If the "NORMAL INDICATION" is not obtained in step 1, isolate the trouble by following the remaining steps.

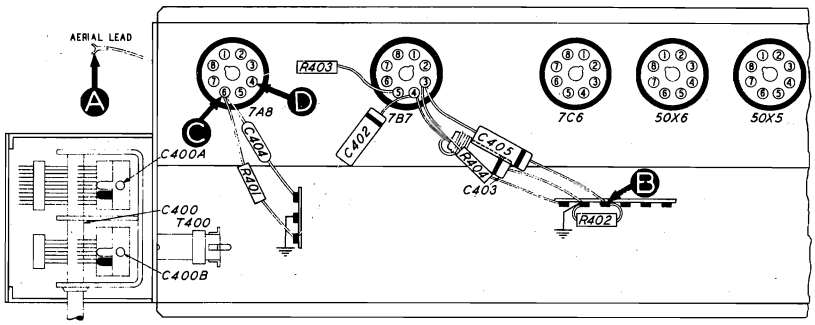

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal.	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	1000 kc.	Tune to signal.	Same as step 1.	Shorted: C400, C400A. Trouble in oscillator circuit (step 3).
3	D to B Osc. Test (see note below).		Tune through range.	Negative 2.4 to 3 volts.	Defective: 7A8. Open or shorted: T400 pri. or sec., C400B. Shorted: C400.
4	A	1000 kc.	Tune to signal.	Same as step 1.	Open: C401, C404, LA400, C400A. Shorted: C400A.

Listening Test: Hum may be caused by open R401 or C402.

OSCILLATOR TEST

Connect the positive lead of a high-resistance voltmeter to B–, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the 7A8 oscillator grid (pin 4), test point D. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by a negative voltage, 2.4 to 3 volts (measured with a 20,000 ohms-per-volt meter), throughout the tuning range.

MODEL 48-1253 PHILCO CORP.

REPLACEMENT PARTS LIST

NOTE

Part numbers marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

MODEL 48-1253

PHILCO CORP.

ALIGNMENT PROCEDURE

The radio may be aligned with the chassis in the cabinet. To connect the signal generator, it is necessary to remove the bottom plate from the chassis.

DIAL POINTER—Turn tuning condensers to full-mesh position. Adjust dial pointer to index dot, located to the left of "55."

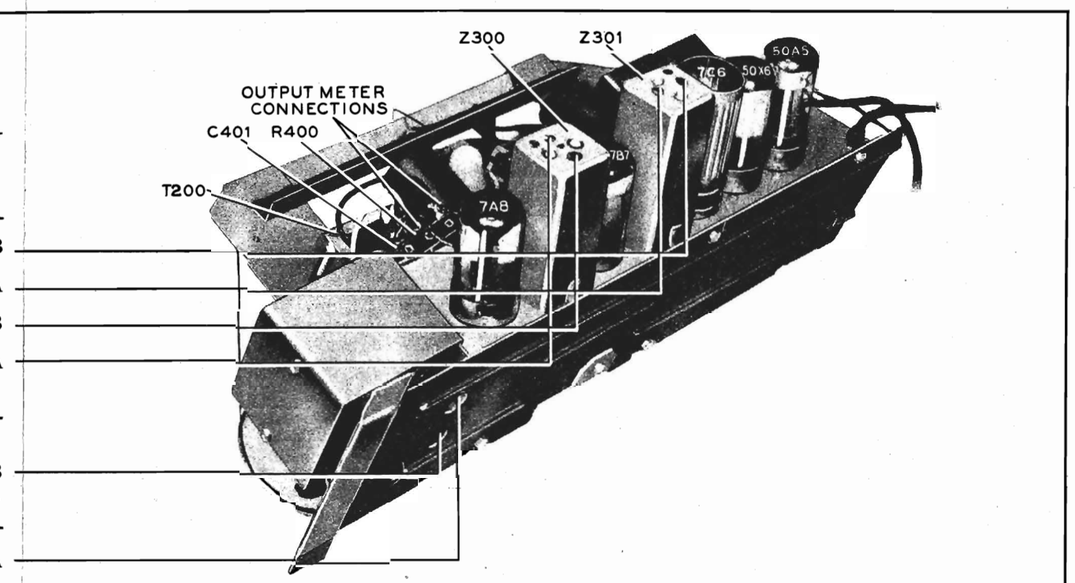
OUTPUT METER—Connect between right-hand (output) lug and center (chassis) lug of terminal panel shown in figure 6.

SIGNAL GENERATOR—Connect as indicated in chart.

OUTPUT LEVEL—During alignment, input signal must be attenuated to hold output-meter reading below .5 volt.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTIONS TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1				Turn C301B (copper screw) down tight.	
2	Ground lead to B–; output lead through .05-mf. condenser to pin 6 of 7A8 (test point C of Section 4).	455 kc.	540 kc.	Adjust trimmers, in order given, for maximum output.	C301B C301A C300B C300A
3	Radiating loop (see note below).	1600 kc.	1600 kc.	Adjust for maximum.	C400B
4	Same as step 3.	1500 kc.	1500 kc.	Adjust for maximum.	C400A

RADIATING LOOP: Make up a coil of insulated wire consisting of 6 to 8 turns, about 6 inches in diameter. Connect coil ends to signal-generator leads, and suspend coil near radio loop.



TP-3982

Figure 6. Chassis View, Showing Trimmer Locations

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C—condenser
I—pilot lamp
L—choke or coil
LA—loop aerial
LS—loud-speaker
R—resistor
S—switch
T—transformer
WS—wafer switch
Z—electrical assembly

The number of the symbol designates the section in which the part is located, as follows:

100-series components are in Section 1—the power supply.
200-series components are in Section 2—the audio circuits.
300-series components are in Section 3—the i-f amplifier, detector, and a-v-c circuits.
400-series components are in Section 4—the aerial and oscillator circuits.

A suffix letter identifies the part as a component of the assembly which bears an identical number without a suffix letter, and with perhaps a different prefix letter.

10	Repeat steps 4 through 9 until no further increase is obtained.					

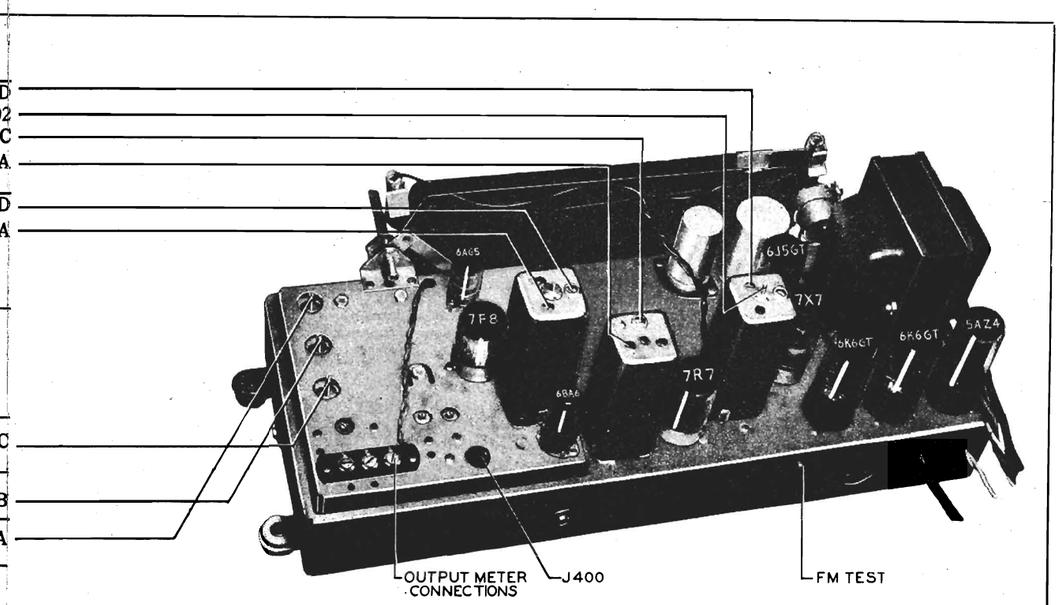

Figure 9. Top View, Showing FM Trimmer Locations

PHILCO CORP. MODEL 48-1264

AM ALIGNMENT PROCEDURE

When the complete AM and FM alignments are to be made, the AM alignment should be made first; if FM alignment is not required, the AM alignment alone may be made.

DIAL POINTER: With tuning-condenser plates fully meshed, adjust pointer to coincide with index mark at low-frequency end of scale. See "CALIBRATING DIAL BACKPLATE," page 2.

VOLUME CONTROL: Set to maximum.

TONE CONTROL: Set to maximum counterclockwise, near the "off" position.

AM R-F SIGNAL GENERATOR: Connect ground lead to radio chassis, and output lead as indicated in chart. Use modulated output.

OUTPUT METER: Connect between terminal 3 (voice-coil connection) of aerial terminal panel (TB400) and chassis.

OUTPUT LEVEL: During alignment input signal must be attenuated to hold output-meter reading below 1.5 volts.

RADIO WAFER SWITCH, RADIO DIAL, and SIGNAL-GENERATOR DIAL: Set as indicated in chart.

FM ALIGNMENT PROCEDURE

MAKE AM ALIGNMENT FIRST

OUTPUT METER: Connect as for AM alignment (this meter is used only in step 3).

D-C METER: Connect a 20,000-ohms-per-volt meter across the 5-mf. condenser, C325, in the FM detector circuit —the negative lead to pin 6 of the 7X7 tube and the positive lead to the chassis. Use the 10-volt meter range.

AM R-F SIGNAL GENERATOR: Use modulated output for the entire alignment. The generator must have sufficient output to give a reading of approximately 9 volts on the d-c meter, and the signal should be attenuated during the alignment to keep the meter at this value. Connect the generator ground lead to the chassis, and the output lead as indicated in the chart.

RADIO WAFER SWITCH, RADIO DIAL, and SIGNAL-GENERATOR DIAL: Set as indicated in chart. Allow the radio and generator to warm up for 15 minutes before starting the alignment.

NOTE 1: The resonance of the circuits using coils L401, L403, and L405 may be checked with a powdered-iron tuning core, such as Part No. 56-6100. If the signal strength (meter reading) increases when the iron end is inserted in the coil, compress the turns slightly. If the signal increases when the threaded brass end is inserted, spread the turns. Do not compress or spread the turns excessively; only a small change is required at these frequencies.

NOTE 2: Oscillator coil L405—Adjust coil for maximum meter reading.

NOTE 3: R-F coil L403—Adjust coil for maximum meter reading while rocking tuning control.

NOTE 4: Aerial coil L401—Adjust coil for maximum meter reading.

MODEL 48-1264 PHILCO CORP.

Model 48-1264, Code 122, is identical to Model 48-1264, Code 121, with the following exceptions:

1. The FM r-f amplifier tube, type 6AG5, was changed to a type 6AU6 tube. In making this change, the suppressor grid (pin 2) of the 6AU6 was connected to ground (pin 3).
2. Resistor R402, 47,000 ohms, was changed to 33,000 ohms, Part No. 66-3333340.
3. Condenser C325, 5 mf., 50v (noise suppressor), was changed to 2 mf., 50v, Part No. 30-2417-7.
4. Condenser C202, 100 mmf., was removed.

Circuit Description

Philco Model 48-1264 is a nine-tube superheterodyne radio-phonograph combination providing reception on the standard broadcast band, 540—1720 kc., and the FM band, 88—108 mc.

A low-impedance loop within the cabinet provides adequate signal pickup on the broadcast band. Satisfactory FM reception usually requires the use of an outdoor dipole aerial (Philco Part No. 45-1462). In areas of high signal strength, however, the dipole built into the cabinet is sufficient for FM operation.

A tuned r-f stage, using a type 6AG5 high-frequency pentode, functions on the FM band. The converter stage employs a 7F8 high-frequency double triode. The converter and r-f stages are built on a separate chassis, to insure reliable performance at high frequencies. These stages provide high signal-to-noise ratio, high conversion efficiency, and good image rejection.

Two transformer-coupled i-f stages are used. The i-f transformers have two sets of windings; one set is tuned to 455 kc. for AM operation, and the other to 9.1 mc. for FM operation.

The first i-f stage employs a 6BA6 (miniature type) high-frequency pentode amplifier; the pentode section of a 7R7 double-diode pentode functions as the second i-f amplifier. One diode of this tube is used for AM detection, while the other diode develops a-v-c voltage.

The ratio-detector circuit used for FM detection operates through the two diodes of the 7X7 tube; this circuit has good noise-reducing properties and a superior tuning characteristic. The triode section of the 7X7 is used as a first-audio and phono-amplifier stage. The output of the AM detector, FM detector, or phono pickup is switched into this circuit by the wafer switch.

A type 6J5GT triode operates as a phase inverter, driving the two 6K6GT output tubes in push-pull operation.

A more uniform frequency response is obtained by the use of inverse feedback. This feed-back voltage is taken from the secondary of the output transformer, and applied through resistor R211 to the junction of R204 and the volume control.

The 12-inch electrodynamic speaker provides excellent bass reproduction.

MODEL 48-1264

SPECIFICATIONS

CABINET	Wood, light mahogany or walnut finish
CIRCUIT	Nine-tube superheterodyne
FREQUENCY RANGES:	
Broadcast	540—1720 kc.
FM	88—108 mc.
AUDIO OUTPUT	6 watts
OPERATING VOLTAGE	105—120 volts, 60 cycles, a.c.
POWER CONSUMPTION	110 watts
AERIALS	Built-in low-impedance loop, and FM dipole; provision for external aerial
INTERMEDIATE FREQUENCIES:	
AM	455 kc.
FM	9.1 mc.
PHONOGRAPH	Philco Automatic Record Changer, Model D-10 (*for service information, see manual PR-1156*)
SPEAKER	12″ electrodynamic
PHILCO TUBES (9)	6AG5, 7F8, 6BA6, 7R7, 7X7, 6J5GT, 6K6GT (2), 5AZ4

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring the tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Carefully inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets. Look for any broken or shorted connections, burned resistors, or other obvious faults.

2. Measure the resistance between B+ (pin 8 of the 5AZ4 rectifier) and the radio chassis, with the ohmmeter polarity such that it gives the highest resistance reading; if the reading is lower than 3500 ohms, check condensers C102, C103A, and C103B for leakage or shorts.

The above resistance value, which is much lower than normal, is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 are performed.

CALIBRATING DIAL BACKPLATE

When the radio chassis has been removed from the cabinet, dial calibration and alignment points may be marked on the dial backplate below the pointer.

The measurements for these points are shown in figure 1. Hold a ruler against the scale backplate, with the start of the ruler at the reference line shown, and mark pencil dots at the proper points for the required frequency settings. When the ruler is correctly placed, the index mark is approximately 1-9/16" from the edge of the backplate.

With the tuning gang fully meshed, the pointer should be adjusted on the drive cord to coincide with the index mark.

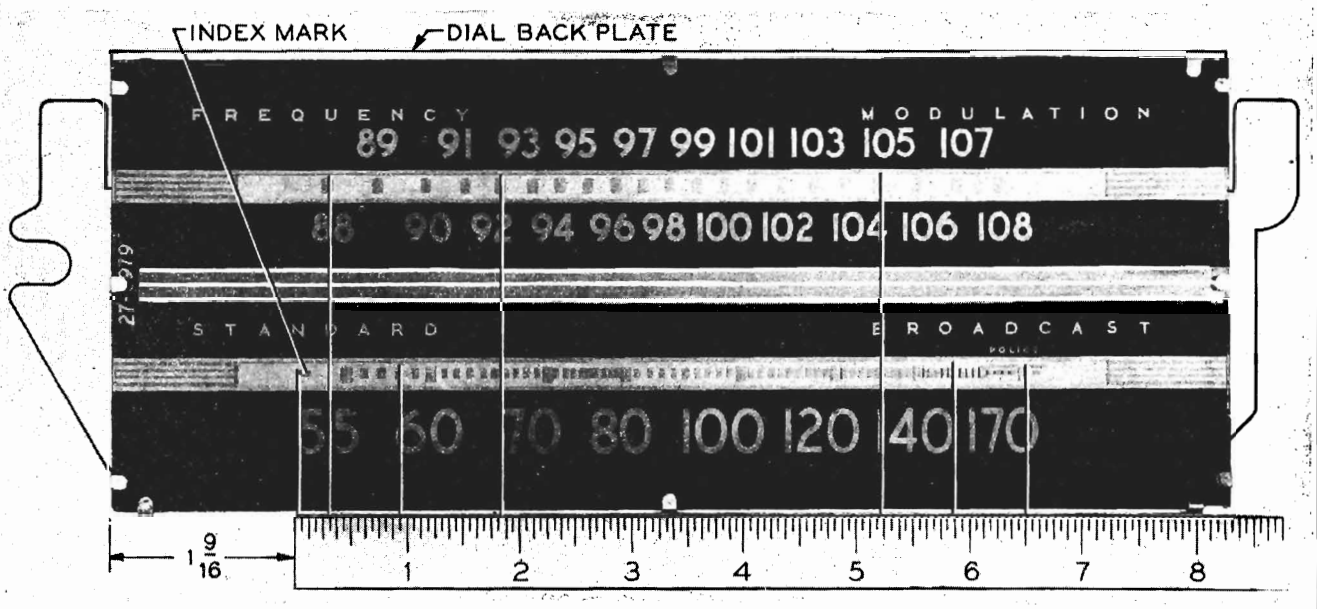

Figure 1. Dial-Backplate Calibration Measurements

MODEL 48-1264 PHILCO CORP.

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C—condenser
I—pilot lamp
L—choke or coil
LA—loop aerial
LS—loud speaker
R—resistor
S—switch
T—transformer
WS—wafer switch
Z—electrical assembly

The number of the symbol designates the section in which the part is located, as follows:

100-series components are in Section 1—the power supply.
200-series components are in Section 2—the audio circuits.
300-series components are in Section 3—the i-f amplifier, detector, and a-v-c circuits.
400-series components are in Section 4—the aerial, r-f, and oscillator circuits.

A suffix letter identifies the part as a component of the assembly which bears an identical number without a suffix letter, and with perhaps a different prefix letter.

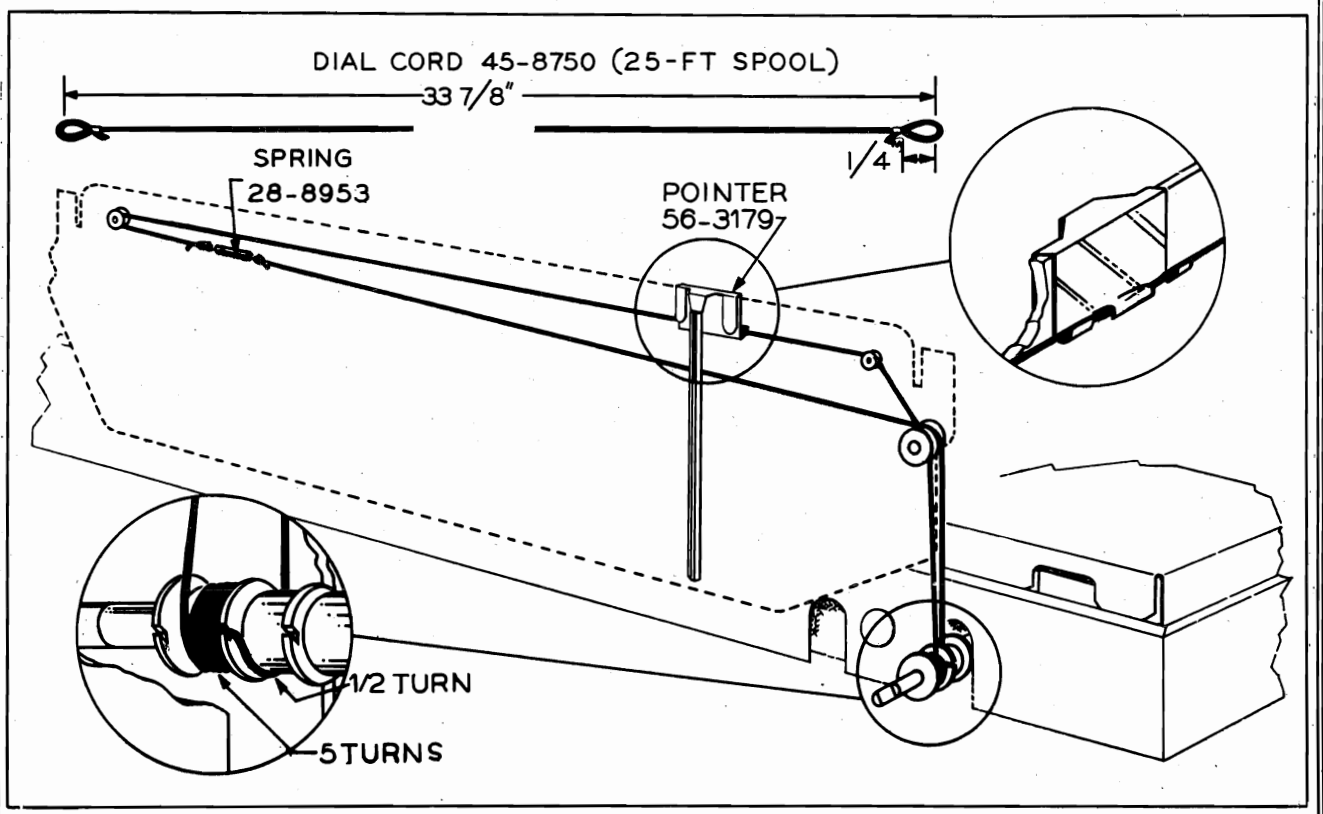

Figure 2. Pointer-Drive-Cord Installation Details

PHILCO CORP. MODEL 48-1264

Section 1 TROUBLE SHOOTING

CAUTION: Do not turn on the power with the speaker disconnected, as this may cause damage to the radio.

For the tests in this section, use a d-c voltmeter. Connect the voltmeter leads between the chassis, test point C, and the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

Set the volume control to minimum, and the tone control near the "off" position. Set the wafer switch to the broadcast (BC) position.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2; if not, isolate and correct the trouble in this section.

Step	Test Point	Normal Indication	Abnormal Indication	Possible Cause of Abnormal Indication
1	E A	200v 245v		Trouble within this section. Isolate by the following tests.
2	B	350v	No voltage Low voltage High voltage	Defective: 5AZ4, T100, S100, W100. Shorted: C102. Open: R100. Defective: 5AZ4. Shorted or leaky: C102, C308*, C311*, C322*, C309* C408*, C409*, C103A, C103B. Open: L100, R101, T200*.
3	D	Negative 18v	Low or no voltage High voltage	Shorted: R100. Weak 6K6GT tubes. Open: R100.
4	E	200v	No voltage Low voltage	Shorted: C103B. Open: R101. Leaky: C103B, C319*, C307*, C310*.
5	A	245v	No voltage Low voltage High voltage	Shorted: C103A. Open: L100. Leaky: C103A. Grounded T200*. Shorted: L100. Weak 6K6GT tubes.
Listening Test: Abnormal hum may be caused by open C100, C101, C102, or C103A.				

*This part, located in another section, may cause abnormal indication in this section.

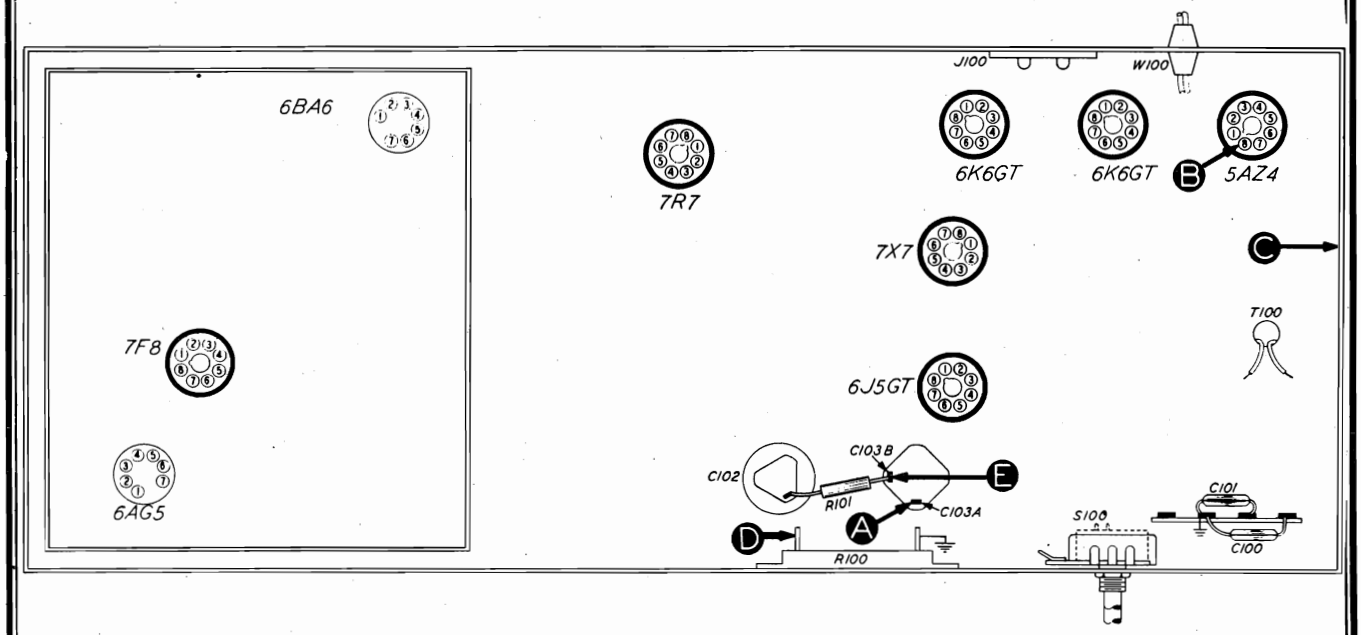

Figure 3. Bottom View, Showing Section 1 Test Points

MODEL 48-1264 PHILCO CORP.

Section 2 TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the tone control near the "off" position. Adjust the signal-generator output as required for each step.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3; if not, isolate and correct the trouble in this section.

Step	Test Point	Normal Indication	Possible Cause of Abnormal Indication
1	A	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	B (Remove 6J5GT tube)	Clear signal with strong signal input.	Defective: 6K6GT, T200, LS200. Open: C212, R214. Shorted or leaky: C212, C214.
3	D (6J5GT removed)	Same as step 2.	Defective: 6K6GT. Shorted or leaky: C211. Open: R215, C211, T200.
4	E (Replace 6J5GT tube)	Loud, clear signal with moderate signal input.	Defective: 6J5GT. Open: R212, R209, R210. Shorted or leaky: C210, C206.
5	F	Loud, clear signal with weak signal input.	Defective: 7X7. Open: R207, C210.
6	A	Same as step 5.	Shorted: C202, C201, C326*. Open: C208, C216, R201, R200 (rotate through range).
7	PL200 (Wafer switch on PHONO)	Same as step 5.	Defective: PL200, WS2(R).
Listening Test: Distortion may be caused by leaky C210, C211, C212, C213, or C214. Hum will result if C213 is open.			

*This part, located in another section, may cause abnormal indication in this section.

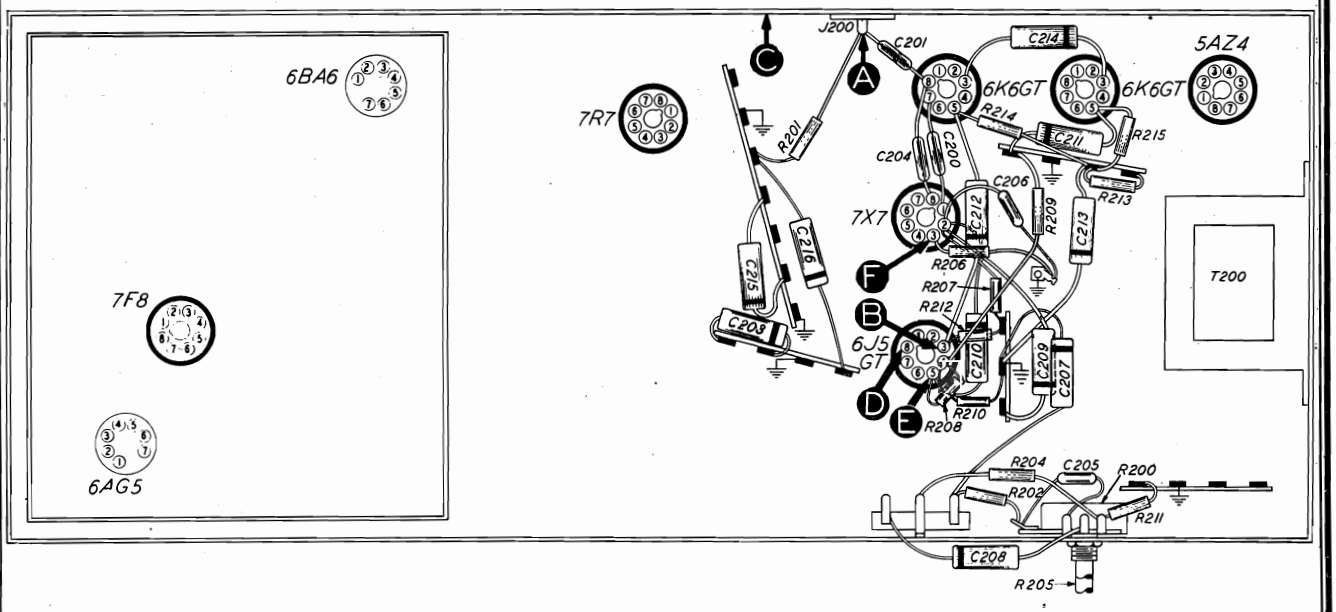

Figure 4. Bottom View, Showing Section 2 Test Points

Section 3

TROUBLE SHOOTING

AM CIRCUITS

For the following tests, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, the wafer switch to the broadcast (BC) position, and the tone control near the "off" position.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for the FM circuits, or to the tests in Section 4; if not, isolate and correct the trouble in the AM circuits.

Since the circuit location of test point A for this section is the same as that of test point B for Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

Step	Test Point	Normal Indication	Possible Cause of Abnormal Indication
1	A	Loud, clear signal with weak signal input.	Trouble in AM circuits. Isolate by the following tests.
2	B	Loud, clear signal with strong signal input.	Defective: 7R7, Z302, WS3(R), WS2(R). Shorted or leaky: C320, C321, C322. Open: R309, R312, R313, R314, R315, R317. Misaligned: Z302.
3	D	Loud, clear signal with moderate signal input.	Defective: 6BA6, Z301. Shorted or leaky: C307, C308, C309, C311. Open: R306, R304, R305, C307. Misaligned: Z301.
4	A	Loud, clear signal with weak signal input.	Defective: 7F8*, Z300, WS4(R), WS4(F). Shorted or leaky: C303, C304, C305. Open: R300, R301, R405*. Misaligned: Z300.
Listening Test: Distortion, with hum, may be caused by open C307 or C319.			

*This part, located in another section, may cause abnormal indication in this section.

FM CIRCUITS

These tests are also made with an AM r-f signal generator, using modulated output. Observe the instructions preliminary to the tests for the AM circuits, with the following exceptions: set the wafer switch to the FM position; set the signal-generator frequency to 9.1 mc., and detune to one side or the other until a satisfactory test signal is obtained.

The best indication of satisfactory FM-detector operation is the ability of this circuit to take the alignment properly (see page 14).

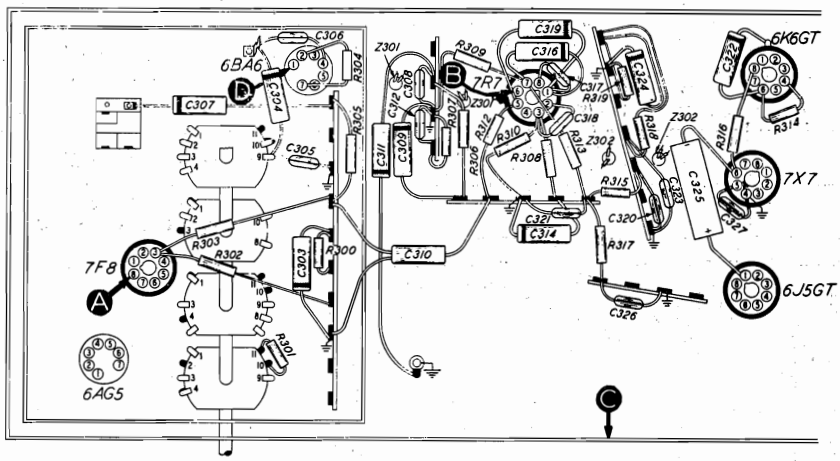

Figure 5. Bottom View, Showing Section 3 Test Points

Step	Test Point	Normal Indication	Possible Cause of Abnormal Indication
1	B	Loud, clear signal with strong signal input.	Defective: 7R7, 7X7 (diode section), C325, Z302. Shorted or leaky: C323, C324, C205*. Open: R318, R319. Misaligned: Z302.
2	D	Loud, clear signal with moderate signal input.	Same parts listed in AM test chart, step 3.
3	A	Loud, clear signal with weak signal input.	Same parts listed in AM test chart, step 4 and WS4(R), WS4(F).

MODEL 48-1264 PHILCO CORP.

Section 4 TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator tests, use an AM r-f signal generator, with modulated output. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the charts.

Set the volume control to maximum, and the tone control near the "off" position.

For the AM-circuit tests, set the wafer switch to the BC position, and set the signal-generator and radio dials to 1000 kc.

For the FM-circuit tests, set the wafer switch to the FM position, and set the signal-generator and radio dials to 95 mc. (detune the generator to one side or the other until a satisfactory test signal is obtained).

OSCILLATOR TESTS: For the oscillator tests (step 3 in each chart), connect the positive lead of a high-resistance voltmeter to the 7F8 oscillator cathode (pin 4); connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the 7F8 oscillator grid (pin 1), test point D. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator for either AM or FM is indicated by a negative voltage throughout the range of the tuning condensers (the normal oscillator voltages given in the charts were measured with a 20,000-ohms-per-volt meter).

AM CIRCUITS

Step	Test Point	Normal Indication	Possible Cause of Abnormal Indication
1	A	Loud, clear signal with weak signal input.	Trouble in AM circuits. Isolate by the following tests.
2	B	Same as step 1.	Defective: 7F8. Shorted: C400. Open: L406, R408, C411. Trouble in oscillator circuit (step 3).
3	D Osc. Test	Negative 2 to 3 volts (turn tuning control through range.)	Defective: 7F8, WS3(F), WS2(F). Shorted: C411, C412, C413, C402B, C402A, C400, L404. Open: R406, R303*, L404, C412, C413.
4	A	Same as step 1.	Defective: WS1(R). Shorted: L400, C401. Open: L400, R404, C410.

*This part, located in another section, may cause abnormal indication in this section.

FM CIRCUITS

Step	Test Point	Normal Indication	Possible Cause of Abnormal Indication
1	E	Loud, clear signal with weak signal input.	Trouble in FM circuits. Isolate by the following tests.
2	B	Loud, clear signal with moderately weak signal input.	Same parts listed in AM test chart, step 2.
3	D Osc. Test	Negative. 1 volt (approx.).	Defective: 7F8, WS3(R), WS2(R), C400, C400C. Open: L405.
4	F	Loud, clear signal with moderately weak signal input.	Defective: WS1(R). Open: C407.
5	E	Loud, clear signal with weak signal input.	Defective: 6AG5. Shorted: C400, C400A. Shorted or leaky: C408, C406, C407. Open: R400, R401, R402, R403, L402.

PHILCO CORP. MODEL 48-1264

REPLACEMENT PARTS LIST

NOTE

Part numbers marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the value indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

SECTION 1

Reference Symbol	Description	Service Part No.
C100	Condenser, line filter, .01 mf.	61-0120*
C101	Condenser, line filter, .01 mf.	61-0120*

SPECIFICATIONS

CABINET	
Model 48-1274	Wood, mahogany or walnut finish
Model 48-1276	Wood, mahogany finish
CIRCUIT	Sixteen-tube superheterodyne
FREQUENCY RANGES	
Broadcast	540—1720 kc.
Short Wave	9.25—15.5 mc.
Frequency Modulation	88—108 mc.
AUDIO OUTPUT	15 watts
PUSH BUTTONS	Ten: One for power OFF; one for phono operation; three for manual-tuning band selection (BC, SW, or FM); five for automatic (motor-driven) station and band selection (BC or FM)
OPERATING VOLTAGE	105—125 volts, 60 cycles, a.c.
POWER CONSUMPTION	
Radio	175 watts
Phonograph	20 watts
AERIALS	Built-in loop for broadcast and short wave; cabinet dipole for FM; provision for external aerial
INTERMEDIATE FREQUENCIES	
AM	455 kc.
FM	9.1 mc.
PHILCO TUBES (16)	6AU6, 7E5, 7H7(2), 7B7, 7F8, FM1000, 6J5GT(3), 7E6, 6L6GA(2), 7F7, 7E7, 5U4G
PHONOGRAPH	Philco Automatic Record Changer, Model M-4 (for service information, see manual PR-1157)
MOTOR-DRIVEN TUNING MECHANISM	Philco Electromechanical Push-Button Tuner (for service information, see manual PR-1481)

MODELS 48-1274, 48-1276

PHILCO CORP.

SETTING PUSH BUTTONS

NOTE: Before setting the push buttons, allow the radio to warm up for about 15 minutes.

1. Depress the BC push button, and rotate the tuning control until the Allen setscrew in the main camshaft is accessible from the rear of the chassis, as shown in figure 9.

2. Loosen the setscrew four turns.

CAUTION: Remove the wrench before proceeding with the next step.

3. Determine the dial positions of the desired stations (both FM and broadcast) in order, from left to right, and place the station tabs of these stations, in the same order, in the station-selector buttons.

4. Position the push-rod extension spring of the station-selector button so that it will engage the correct rocker bar (upper bar for broadcast, and lower bar for FM).

5. Depress the button for the band of the station to be set up on the left-hand station-selector button. Manually tune the radio to this station, and, while holding the manual-tuning control, depress the station-selector button.

6. After the tuning motor stops, operate the set-up switch (see figure 9); hold the set-up switch closed until the motor stalls, then release it.

7. Set the remaining four station-selector buttons, from left to right, in the same manner.

8. Depress the BC button, and again rotate the tuning control until the Allen setscrew is accessible; tighten the setscrew and remove the wrench.

PHILCO CORP.

MODELS 48-1274, 48-1276

AM ALIGNMENT PROCEDURE

CAUTION: Do not turn on the power with the speaker disconnected, or the radio may be damaged.

When the complete AM and FM alignments are to be made, the AM alignment should be made first; if AM alignment is not required, the FM alignment alone may be made. Before starting the alignment, allow the radio to warm up for about 15 minutes.

DIAL POINTER: With the tuning-condenser plates fully meshed, adjust the pointer to coincide with the index mark at the low-frequency end of the scale. See CALIBRATING DIAL BACKPLATE, page 12.

RADIO CONTROLS: Set the volume control to maximum. Turn the bass control fully counterclockwise, and the treble control fully clockwise.

AM R-F SIGNAL GENERATOR: Connect the ground lead to the radio chassis, and the output lead as indicated in the chart. Use modulated output.

OUTPUT METER: Connect between terminal 4 (voice-coil connection) of the aerial terminal panel and the chassis.

OUTPUT LEVEL: During the alignment, the input signal must be attenuated to hold the output-meter reading below 1.5 volts.

BAND PUSH BUTTONS, RADIO DIAL, AND SIGNAL-GENERATOR DIAL: Set as indicated in the chart.

FM ALIGNMENT PROCEDURE

MAKE AM ALIGNMENT FIRST

Follow the instructions preliminary to the AM alignment chart, except for the band selection; depress the FM push button. Use an AM r-f signal generator, with or without modulation, as indicated in the chart.

FM ALIGNMENT NOTES

1. When pin 2 of the FM1000 tube is shorted to the chassis, the detector oscillator is made inoperative, and the circuit is converted to an AM detector.
2. Make the loading network by connecting a 4700-ohm resistor and a .1-mf. condenser in series. Attach an alligator clip to each free end of the network. This network, when connected across the primary or secondary of an overcoupled i-f transformer, loads the circuit so that the transformer coupling is effectively below the critical value; the unloaded winding may then be correctly tuned to the center intermediate frequency.
3. The top of trimmer, C303B, can be reached only from the top of the shield can. Slide a length of flattened solder or wire down between the ceramic form and the edge of the trimmer plate. Attach the loading network between this connection and the chassis.
4. It is essential that the output of the generator be kept below the level at which the detector oscillator locks in, or an erroneous zero beat will be obtained. When a single very sharp zero-beat point in obtained, the adjustment is correct.
5. The use of a signal generator for steps 10 to 16, inclusive, is recommended only if the available generator is sufficiently accurate to insure correct frequency settings; otherwise, an alternate procedure employing FM broadcast-station signals instead of a signal generator is recommended. For adjustments at the high-frequency end of the band, use the station nearest 105 mc.; for the low-frequency adjustments, use the station nearest 92 mc. If the circuits are greatly misaligned, it may be necessary to adjust the trimmers and coils for maximum noise at each end of the band before station signals can be heard.
6. Check circuit resonance with a tuning wand. If the brass end, when placed in or near the coil, increases the output-meter reading, spread the coil turns; if the powdered-iron end increases the reading, compress the turns. If both ends cause a decrease in output, the coil is correctly tuned. Do not change the coils excessively, since only a small adjustment is required at these frequencies.
7. To feed signals from the signal generator into the aerial circuit of the radio, make two simple dipole aerials. Each aerial may consist of two 30-inch lengths of rubber-covered wire. Connect one dipole aerial to terminals 1 and 2 on the FM aerial socket. Connect the other to the signal-generator leads. Arrange the two aerials several feet apart.

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C—condenser	LA —loop aerial	PB—push-button switch	T —transformer
I —pilot lamp	LS —loud-speaker	R —resistor	WS—wafer switch
L—choke or coil	MO—motor	S —switch	Z —electrical assembly

The number of the symbol designates the section in which the part is located, as follows:
100-series components are in Section 1 — the power supply
200-series components are in Section 2 — the audio circuits
300-series components are in Section 3 — the i-f, detector, and a-v-c circuits
400-series components are in Section 4 — the r-f and converter circuits

A suffix letter identifies the part as a component of the assembly which bears an identical number without a suffix letter, and with perhaps a different prefix letter.

MODELS 48-1274, 48-1276

PHILCO CORP.

CIRCUIT DESCRIPTION

Philco Models 48-1274 and 48-1276 are 16-tube radio-phonograph combinations incorporating a sensitive superheterodyne radio and a Philco Automatic Record Changer, Model M-4. The two models are essentially identical except for the cabinets and cabinet hardware, as indicated in the Replacement Parts List.

Aerial System

A built-in, low-impedance loop provides signal pickup on the broadcast and short-wave bands. The cabinet dipole aerial gives satisfactory FM reception in areas of moderately high signal strength. For greater pickup on the FM band, the Philco Dipole Outdoor Aerial, Part No. 45-1462, should be used. To increase the pickup on all three bands, use the Philco Aerial Coupler, Part No. 76-2353, with the outdoor dipole. Information on aerial and coupler connections is given in external-aerial bulletin PR-1200.

Push Buttons

Nine of the ten push buttons are used for the selection of band, phono operation, or automatic station tuning; any one of these turns on the power. The OFF button turns off the power.

Push-Button Band Selectors

Any one of three push buttons (BC, SW, FM) selects the band for manual tuning by operating a motor-driven band switch. A muting switch, shorting out the speaker voice-coil circuit, operates simultaneously.

Push-Button Phono Switch

The PHONO push button operates the motor-driven band switch to select phono operation, and applies the power to the phonograph control on the record changer. The muting switch operates simultaneously.

Push-Button Station Selectors

Five push buttons are used for selecting any one of five standard-broadcast or FM stations. These buttons operate the motor-driven tuning mechanism, and, in addition, automatically actuate the motor-driven band switch whenever a band change is required. The muting switch operates simultaneously.

Radio Circuit

A 6AU6 r-f pentode is used as a tuned-r-f amplifier on all bands. See figure 8. Frequency conversion is accomplished by separate mixer and oscillator tubes. A 7E5, arranged for cathode injection, functions as the mixer on all bands. The oscillator system employs a 7F8 double triode. One section of this tube is employed as the oscillator for broadcast and short-wave reception. For FM reception, the second section of the tube, functioning as the oscillator, operates on frequencies of one-half those usually employed, while the first section of the tube functions as a frequency doubler, the tuning circuit being tracked with that of the oscillator. Another unique feature of the FM oscillator is the separate tuned circuit, which is inductively coupled to the untuned feed-back circuit. These oscillator design features achieve unusual stability.

The three stages of i-f amplification employ two 7H7's and one 7B7. In the i-f transformers the FM windings (9.1 mc.) are in series with the AM windings (455 kc.). The windings of the first i-f transformer are switched, to provide additional image rejection and conversion efficiency. No switching is required for the other i-f transformers.

The diode sections of the 7E6 provide AM detection and a.v.c.; the triode section of this tube functions as the first audio amplifier. For FM reception, the Philco Advanced FM Detector, using an FM1000, provides good sensitivity and noise rejection.

A positive voltage taken from a voltage divider (R104 and R105) is applied, through the center tap of the filament winding, to the first-audio and phono-preamplifier tubes; by making the filaments positive with respect to the cathodes and grids, emission from the filaments to these elements is prevented, and a-c hum is reduced in both radio and phono operation.

The first audio amplifier is resistance-coupled to a 6J5GT driver, which is resistance-coupled to one of the 6L6GA output tubes and, through a voltage divider (R223 and R224), to a 6J5GT phase inverter; the phase inverter drives the other 6L6GA output tube. Inverse feed-back voltage, taken from the secondary of the output transformer, is applied through a voltage divider (R221 and R227) to the 6J5GT driver, thus improving the fidelity of the audio system.

Both the tweeter and the large reproducer of the coaxial speaker system are used for FM reception. The tweeter is disconnected for broadcast and short-wave reception, and also for phono operation.

Phono Preamplifier

A 6J5GT is used in the phono-preamplifier stage. In phono operation, this stage is resistance-coupled to the first audio amplifier (triode section of the 7E6).

Scratch Eliminator

The Philco Electronic Scratch Eliminator, which is used in phono operation, reduces the high-frequency surface noise during the low-volume passages of a

record, and permits maximum treble response during the high-volume passages. The circuit employs a 7F7 double triode as a two-stage audio amplifier, and a 7E7 double diode, pentode as a half-wave rectifier and a reactance tube. The latter functions as a variable capacitance (at the output circuit of the phono preamplifier) which shunts a controlled portion of the higher audio frequencies to ground. The bias on the grid of the reactance tube controls the effective shunt capacitance, which becomes maximum with low bias, and minimum with high bias. The control bias is obtained from the audio signal, of which a definite amount is taken off, amplified by the 7F7, and rectified by the diode section of the 7E7.

High-Fidelity Switch

The high-fidelity switch, operating in conjunction with a band-switch section, WS-2(R), performs the following functions:

For broadcast and short-wave operation, the fidelity switch in the OFF position switches the treble control into the circuit, and in the ON position disconnects the treble control.

For FM operation, the fidelity switch in the ON position connects the tweeter speaker into the circuit, and also connects that section of the treble control which controls the output of the tweeter; in the OFF position the fidelity switch disconnects the tweeter, and connects the treble control into the circuit.

For phono operation, the fidelity switch in the OFF position turns on the scratch eliminator, and switches the treble control into the circuit; in the ON position the switch disconnects the treble control, and turns off the scratch eliminator.

Treble Control

The treble control has two variable-resistance sections; the .5-megohm potentiometer operates in conjunction with a .05-mf. condenser for treble-attenuation control, and is in the circuit whenever the high-fidelity switch is in the OFF position; the 50-ohm potentiometer controls the output of the tweeter speaker for FM high-fidelity operation, and is in the circuit when the high-fidelity switch is in the ON position (with the FM push button depressed).

Bass Control

The bass control is in the circuit for both radio and phono operation. This control, a 1-megohm potentiometer, is combined with C206 and R209 to furnish any desired degree of bass accentuation.

PHILCO AUTOMATIC BAND SELECTOR

The Philco Automatic Band Selector consists of a motor-driven band switch (figure 5), operated by the various push buttons. The position of the switch is selected manually, by the BC, SW, FM, or PHONO push-button, or automatically, by any of the five station-selector push buttons.

The motor is a reversible, shaded-pole, induction motor, operating on 24 volts a.c. The operation of the motor is controlled through the contacts on the "homing" wafer, WS-3(F) and WS-3(R), which is a section of the band switch; the contacts on both sides of this wafer are shown schematically in figure 8. The direction of motor rotation depends upon which section of the center-tapped field is energized; therefore, the direction in which the band switch is driven is determined by the position of the homing-wafer rotor when a given band-selector switch is closed. In manual band selection, motor power is applied to the homing wafer by the contacts of the BC, SW, FM, or PHONO push button. In automatic band selection, the power is applied by either S104 for the standard broadcast band, or by S105 for the FM band. Switches S104 and S105 are combined with the upper and lower rocker bars, respectively, located on the front of the Philco Electromechanical Push-Button Tuner. Either bar is mechanically actuated, when a given station-selector button is depressed, by the individual push-rod extension spring, which is positioned so as to strike the rocker bar for the band in which the station is located.

When any one of the push-button switches is closed, power is supplied to the motor until the moving rotor of the homing wafer breaks that circuit. Over-shooting is prevented by the use of a clutch, mounted on the motor shaft. When the motor is idle, a spring holds its rotor off-center with respect to the electromagnetic field, and keeps the motor disengaged from the gear train. When power is applied to the motor, the rotor attempts to center itself in the field, thus engaging the clutch in the gear train. When the power is removed, the clutch is immediately disengaged by the action of the spring.

As the clutch is disengaged, the muting switch (leaf type) is pushed open by the motor shaft. When the motor operates, the muting switch is allowed to close.

For an example of the band-changing operation, assume that the idle condition is as indicated in the schematic diagram, showing the BC push button, PB-3, depressed. Now, if PB-5 is depressed, the motor circuit is completed through contact 11 and the rotor of WS-3(R), thence through the upper section of the motor field winding. Power is supplied to the motor until the band switch is rotated sufficiently to break the circuit between contact 11 and the rotor of WS-3(R). At this instant, the rotor of the motor is thrown outward, disengaging the clutch from the gear train.

From the idle position shown, if PB-2, instead of PB-5, is depressed, the motor circuit is completed through contact 8 and the rotor of WS-3(F), thence through the lower section of the motor field winding, thus causing motor rotation in the direction opposite to that of the instance cited above.

MODELS 48-1274, 48-1276

PHILCO CORP.

PHILCO ELECTROMECHANICAL PUSH-BUTTON TUNER

As previously mentioned, the Philco Electromechanical Push-Button Tuner provides both automatic tuning and band selection, for five stations in the standard broadcast and FM bands, by the operation of push buttons. The five station-selector buttons operate the motor-driven tuning mechanism.

Band selection is determined by the position of the push-rod extension spring, one of these being attached to each of the five push rods; the push-rod extensions facing upward lock in the upper rocker bar (standard broadcast) when the buttons are depressed; the extensions facing downward lock in the lower rocker bar (FM).

The tuning-condenser gang is rotated to the correct position by the motor-driven tuning mechanism, which is operated by a 24-volt, a-c, series-wound motor. A 4-contact leaf switch (S102), located at the rear of the push rods, applies the motor power and closes the muting circuit when any of the five station-selector buttons is depressed; this switch is locked in the closed position by a small latch on the push rod, which hooks onto the actuator bar. When the tuning gang locks in the preset position, the intermediate gear of the gear train rides upward and trips the actuator bar, to release the small latch, thus removing the motor power and opening the muting switch.

The set-up switch (S101), which is used for setting the station-selector buttons, is connected in parallel with the motor power switch, and is operated by a small button located on the rear of the chassis.

Since the functioning of the tuning mechanism itself is somewhat complex, a detailed description of the tuner, with illustrations and complete service information, is presented in a separate manual, PHILCO ELECTROMECHANICAL PUSH-BUTTON TUNER, PR-1481.

PHILCO TROUBLE-SHOOTING PROCEDURE

For rapid trouble shooting, the radio circuit is divided into four sections, as follows:

Section 1—the power supply
Section 2—the audio circuits
Section 3—the i-f, detector, and a-v-c circuits
Section 4—the r-f and converter circuits

Test points are specified for each section, and are indicated in the sectionalized schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Important

To avoid the possibility of altering FM operation, special care should be used in replacing any part. Replacement parts should be placed in the same physical positions as the original parts; connections should be of the same length, and should be soldered to the same points. The placement or length of leads should not be changed.

PRELIMINARY CHECKS

To avoid possible damage to the radio, the following preliminary checks should be made before connecting the radio to a source of power:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance across condenser C100 (see figure 1). When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1500 ohms, check condensers C100, C101A, C104A, C436, C437, C410, and C411 for leakage or shorts.

The resistance value above, which is much lower than normal, is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 are performed.

PHILCO CORP.

MODELS 48-1274, 48-1276

Section 1 — Power Supply

TROUBLE SHOOTING

CAUTION: *Do not turn on the power with the speaker disconnected, or the radio may be damaged.*

Make the tests for this section with a d-c voltmeter; connect the leads between the chassis, test point C, and the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

Depress the BC push button, PB-3; set the volume control to minimum, and the bass and treble controls fully clockwise.

Follow the steps in the order given. If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	255v		Trouble in this section. Isolate by the following tests.
2	B	290v	Low voltage	Defective: 5U4G. Leaky: C100, C101A, C436*, C437*, C104A, C319*. Open: L100, T100, C100. Shorted: T100.
			No voltage	Defective: 5U4G. Open: PB-1, T100. Shorted: C101A, C104A, C319*.
			High voltage	Open: T200.
3	D	270v	Low voltage	Increased resistance: R412*. Leaky: C436*, C437*, C411*, C410*, C413*.
			No voltage	Open: R412*, WS-3(R). Shorted: C436*, C437*, C416*, C419*, C411*, C410*, C413*.
4	A	255v	Low voltage	Increased resistance: R106. Leaky: C104B, C315*, C344*, C329* (in FM operation only).
			No voltage	Open: R106. Shorted: C104B, C315*, C344*.
5	E	Negative 22v	Low voltage	Increased resistance: R101. Decreased resistance: R102.
			No voltage	Open: R101. Shorted: C102.
			High voltage	Open: R102, L100.
6	F	Negative 22v	No voltage	Open: R103. Shorted: C103.
Listening Test: Abnormal hum may be caused by open C101A, C104A, or C104B.				

* This part, located in another section, may cause abnormal indication in this section.

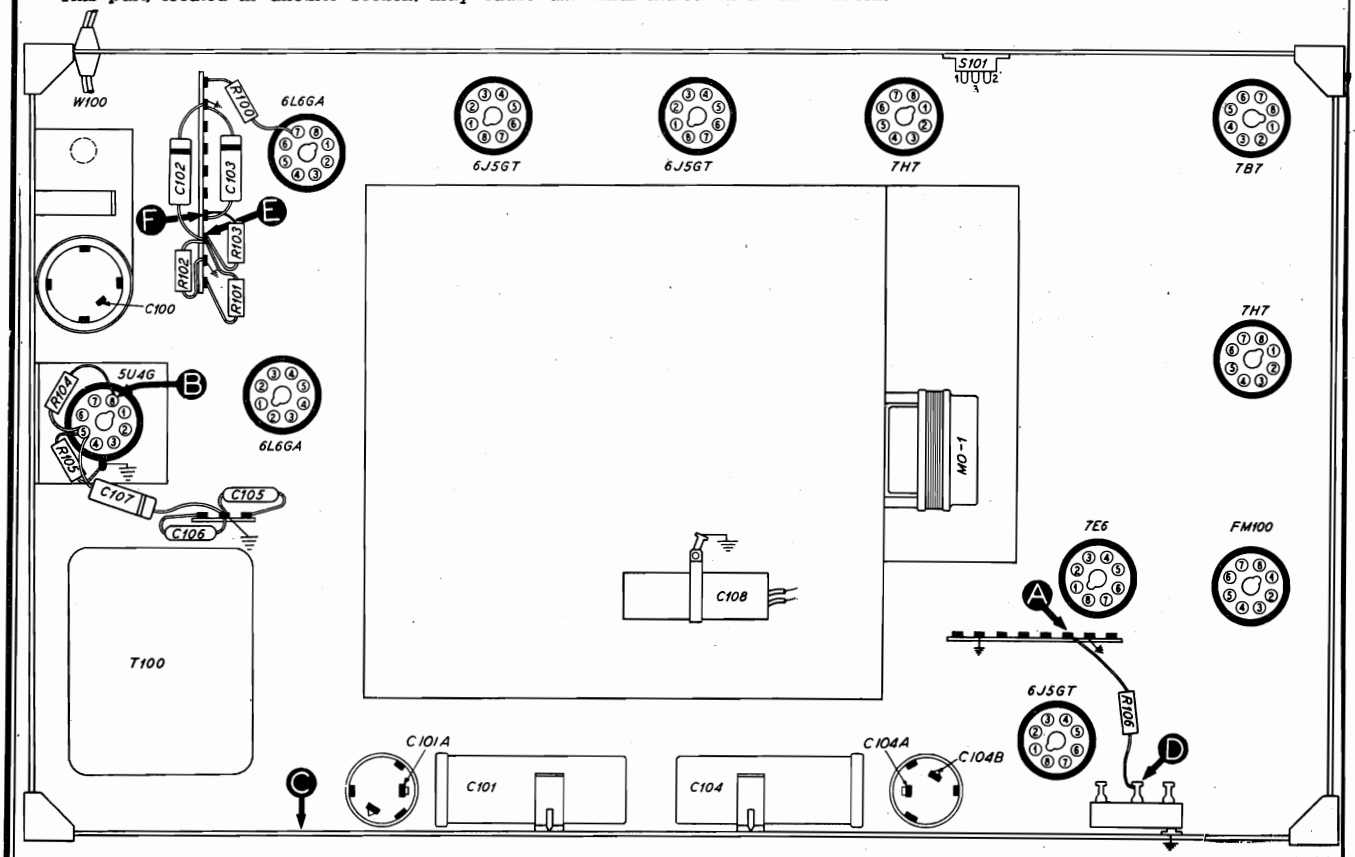

FIGURE 1. BOTTOM VIEW, SHOWING SECTION 1 TEST POINTS

TP-4723A

MODELS 48-1274, 48-1276

PHILCO CORP.

Section 2 — Audio Circuits

TROUBLE SHOOTING

AUDIO-AMPLIFIER AND PHONO-PREAMPLIFIER TESTS

Use an audio-frequency signal generator. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and the bass and treble controls fully clockwise. Depress the phono push button, PB-2.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the scratch-eliminator tests; if not, isolate and correct the trouble in the audio-amplifier or phono-preamplifier circuits.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	B (Remove 6J5GT phase inverter.)	Loud, clear signal with strong signal input.	Defective: 6L6GA. Open: LS200, T200, R230, C217, R228. Shorted or leaky: C217, C219.
3	D (Phase inverter removed.)	Loud, clear signal with strong signal input.	Defective: 6L6GA. Open: T200, R231, C218, R229. Shorted or leaky: C218, C220.
4	F (Phase inverter removed.)	Loud, clear signal with strong signal input.	Defective: 6J5GT driver. Open: R225, R221. Shorted or leaky: C215, C212.
5	E (Replace 6J5GT phase inverter.)	Loud, clear signal with strong signal input.	Defective: 6J5GT phase inverter. Open: R226, R222, R224. Shorted: C216.
6	G	Loud, clear signal with moderate signal input.	Defective: 7E6. Open: R200 (rotate through range), R214, R211, R212, C210, C215, R215. Shorted: C213. Leaky: C215, C213.
7	A	Loud, clear signal with weak signal input.	Defective: 6J5GT phono preamplifier. Open: R204, R205, C202, WS-2(F), R203, R202. Shorted or leaky: C204, C202.
Listening Test: Distortion may be caused by open R211 or R202, or by leaky C210 or C209.			

SCRATCH-ELIMINATOR TESTS

Except for the volume control, set the radio controls as directed for the audio-amplifier and phono-preamplifier tests; set the volume control to maximum for all steps except 1(b); for this step, adjust the volume control as indicated in the chart.

Turn the scratch eliminator on or off as indicated in the chart. (The scratch eliminator is on when the high-fidelity switch is in the OFF position.)

Connect an output meter between terminal 4 (voice-coil connection) of the aerial terminal panel and the chassis.

Connect the ground lead of an audio signal generator to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Set the generator for 5000 cycles. Adjust the generator output as indicated in the chart.

If normal operation is indicated by the tests in step 1, (a) and (b), proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in the scratch-eliminator circuits.

NOTE: For steps 2, 3, and 4, connect the positive lead of a 20,000-ohms-per-volt, d-c voltmeter to the chassis, test point C; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the "VOLTMETER" test points indicated in the chart.

STEP	TEST POINT	SIGNAL GENERATOR OUTPUT	VOLT-METER	SPECIAL INSTRUCTIONS	POSSIBLE CAUSE OF ABNORMAL INDICATION
1 (a)	A	Adjust for 6v output-meter reading, with scratch eliminator off.		Turn scratch eliminator on; output voltage should drop to 2.5v (approx.).

Section 3 — I-F, Detector, and A-V-C Circuits TROUBLE SHOOTING

AM CIRCUITS

Use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Depress the BC push button, PB-3. Set the volume control to maximum and turn the bass and treble controls fully clockwise.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for the FM circuits, or the tests for Section 4; if not, isolate and correct the trouble in the AM circuits.

Since the circuit location of test point A for this section is in Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in AM circuits. Isolate by the following tests.
2	B	Loud, clear signal with strong signal input.	Defective: 7H7. Misaligned: Z303. Open: R315, Z303 pri. or sec., R323, C325, WS-2(F), R321, R319, R324, C339. Shorted: C330, C331, C340, C336, C323, Z302 sec.
3	D	Loud, clear signal with moderate signal input.	Defective: 7B7. Misaligned: Z302. Open: R307, R310, R312, R313, Z302 pri. or sec., C322, C302C, C324, C321, C320. Shorted: Z302 pri. or sec., C322, C302C, C313, C324, C320.
4	E	Loud, clear signal with weak signal input.	Defective: 7H7. Misaligned: Z301. Open: R301, R302, R303, R304, R311, R305, Z301 pri. or sec., C312, C313, C314, C309, C311. Shorted: C309, C312, C301C, C314, Z301 pri. or sec.
5	A	Loud, clear signal with less signal input than in step 4.	Defective: 7E5. Misaligned: Z300. Open: Z300 pri. or sec. (AM), WS-5(F), WS-4(R), R411*, R410*, C307, C305. Shorted: Z300 pri. or sec. (AM), C305, C300C, C430*.

* This part, located in another section, may cause abnormal indication in this section.

FM CIRCUITS

The tests for the FM circuits are made with an AM r-f signal generator and a 20,000-ohms-per-volt, d-c voltmeter.

In steps 1(a), 4, 5, 6, 7, and 8, the oscillator section of the FM detector is made inoperative, thereby converting the circuit to an AM detector, and making it possible to use an AM signal for testing the i-f amplifiers and a section of the detector; the remaining section of the detector is tested by steps 1(b), 2, and 3.

In step 1(b), an unmodulated r-f signal is used to check the FM response of the detector; the test is made by observing the d-c voltage drops across the audio load resistor (R318) for different input frequencies within the i-f range of the detector. In steps 2 and 3, d-c voltage and r-f signal tests, respectively, are used to check the oscillator action in the FM detector.

Set the volume control to maximum, and turn the bass and treble controls fully clockwise. Depress the FM push button, PB-5, and turn the high-fidelity switch on. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

NOTE: The "TEST POINT" column refers to signal-generator connections in all cases except step 2, in which the test is made with the voltmeter only.

If the "NORMAL INDICATION" is obtained in step 1, (a) and (b), proceed with the tests for Section 4; if not, isolate and correct the trouble in the FM circuits.

Since the circuit location of test point A for this section is in Section 4, the effectiveness of step 1(a), as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

(CONTINUED)

STEP	TEST POINT	SPECIAL INSTRUCTIONS	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1 (a)	A (I-f Ampl. Check.)	Set generator to 9.1 mc. (mod. on). Short test point G (pin 2 of FM1000) to chassis.	Loud, clear signal with very weak signal input.	Trouble in FM circuits. Isolate by steps 4, 5, 6, 7, and 8.
1 (b)	B (FM Det. Check.)	Set generator to 9.1 mc (mod. off) with high output. Remove short from test point G. Connect positive lead of voltmeter to test point H, and negative lead to test point J. Use 50-volt range.	15 to 30 volts for 9.1-mc. signal or NO signal. 12 to 20 volts when generator is set at 80 kc. above or 80 kc. below 9.1 mc.	Trouble in FM detector circuit. Isolate by steps 2 and 3.
2	G (FM Det. Osc. Check.)	Connect positive lead of d-c voltmeter to chassis; connect prod end of negative lead through 100,000-ohm isolating resistor to test point G. Use 10-volt range.	Negative 2.5 volts (approx.).	Defective: FM1000. Open: C335, R322, Z304 sec., C333, C334. Shorted: C335, C333, C334, C301A, Z304 sec.
3	B	Using low to moderate output (mod. off), tune generator across 9.1 mc.	Beat signal, with zero beat at 9.1 mc.	Misaligned: Z304. Shorted: Z304 pri. or sec. Changed value: C333, C334. Open: C301A, C338.
4	F	Set generator to 9.1 mc. (mod. on). Short test point G to chassis. Short test point B (for this step only) to chassis.	Clear signal with strong signal input.	Defective: FM1000. Open: L300, Z304 pri., R318, R320, WS-2(F). Shorted or leaky: C337, C332, C329, C303B.
5	B	Set generator to 9.1 mc. (mod. on). Leave test point G shorted. Remove short from test point B.	Loud, clear signal with strong signal input.	Defective: 7H7 (3rd i.f.). Shorted or leaky: C303A. Open: Z303 sec. (FM), R325, R326. Misaligned: Z303.
6	D	Set generator to 9.1 mc. (mod. on). Leave test point G shorted.	Loud, clear signal with moderate signal input.	Defective: 7B7. Misaligned: Z302. Shorted: C302A, C302E.
7	E	Set generator to 9.1 mc. (mod. on). Leave test point G shorted.	Loud, clear signal with weak signal input.	Defective: 7H7 (1st i.f.). Misaligned: Z301. Shorted: C301A, C301B.
8	A	Set generator to 9.1 mc. (mod. on). Leave test point G shorted.	Loud, clear signal with very weak signal input.	Defective: 7E5*. Misaligned: Z300. Open: WS-4(R), Z300 pri. or sec., L401*. Shorted: C306, C300A, C300B.

* This part, located in another section, may cause abnormal indication in this section.

Section 4 — R-F and Converter Circuits

TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator and frequency-doubler tests, use an AM r-f signal generator, with modulated output. Connect the generator ground lead to the chassis, test point C; connect the output lead as indicated in the chart. Set the volume control to maximum, and turn the bass and treble controls fully clockwise. Depress the push buttons indicated in the chart.

OSCILLATOR AND FREQUENCY-DOUBLER TESTS: For the broadcast and short-wave oscillator tests (steps 2 and 5), and the FM frequency-doubler test (step 9), connect the positive lead of a 20,000-ohms-per-volt meter to test point D; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to test point B. For the FM oscillator test (step 8), transfer the negative lead and isolating resistor to test point G. The negative grid-voltage readings given in the chart are those obtained when operation is normal. Absence of negative grid voltage at any dial position indicates that the oscillator (or the frequency doubler) is not operating properly.

STEP	TEST POINT	SIGNAL GENERATOR	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1(a)	A	1000 kc. Through .1-mf. condenser.	BC (PB-3). Tune to signal.	Loud, clear signal with weak signal input.	Trouble in broadcast circuits. Isolate by steps 2, 3, and 4.
1(b)	A	11 mc. Through .1-mf. condenser.	SW (PB-4). Tune to signal.	Loud, clear signal with weak signal input.	Trouble in short-wave circuits. Isolate by steps 5, 6, and 7.
1(c)	F	98 mc. Through 100-mmf. condenser.	FM (PB-5). Short test point G, Section 3, to chassis. Tune to signal.	Loud, clear signal with weak signal input.	Trouble in FM circuits. Isolate by steps 8, 9, 10, and 11.
2	B to D Osc. Test.		BC (PB-3). Tune through range.	Negative 1.5 to 4 volts.	Defective: 7F8. Open: WS-5(F), WS-5(R), L411, C432, L408, R408, C423, C426, R407. Shorted or leaky: C423, C426, C434, C432, C433, L411. Shorted: C400F.
3	E	1000 kc. Through .1-mf. condenser.	BC (PB-3). Tune to signal.	Loud, clear signal with moderate signal input.	Defective: 6AU6. Open: R402, R403, L404, L403, C413, WS-6(F), WS-6(R), L407, C427, R409. Shorted or leaky: C410, C411. Shorted: L407, C400C.
4	A	1000 kc. Through .1-mf. condenser.	BC (PB-3). Tune to signal.	Loud, clear signal with weak signal input.	Open: WS-7(R), WS-7(F), L400, C405, R400, LA400. Shorted or leaky: C401A, C400B, C405.
5	B to D Osc. Test.		SW (PB-4). Tune through range.	Negative 1.5 to 2 volts.	Defective: 7F8. Open: WS-5(R), WS-5(F), L410, C431. Shorted or leaky: C420C, C431. Shorted: L410.
6	E	11 mc. Through .1-mf. condenser.	SW (PB-4). Tune to signal.	Loud, clear signal with moderate signal input.	Open: WS-6(F), WS-6(R), L406, C422, C417. Shorted or leaky: C422, C420A, C417. Shorted: L406.
7	A	11 mc. Through .1-mf. condenser.	SW (PB-4). Tune to signal.	Loud, clear signal with weak signal input.	Open: WS-7(R), WS-7(F), L402, C404. Shorted or leaky: C401B, C404.
8	G Osc. Test.		FM (PB-5). Tune through range.	Negative 3.5 to 4 volts.	Defective: 7F8. Open: WS-6(F), R404, C421, C424, R406, R405, T400. Shorted or leaky: C421, C424, C414, C415. Shorted: C400E.
9	B to D Frequency Doubler Test.		FM (PB-5). Tune through range.	Negative 2.5 to 3.5 volts.	Defective: 7F8. Open: WS-5(F), WS-5(R), L409. Shorted: C400G, C429.
10	E	98 mc. Through 100-mmf. condenser.	FM (PB-5). Short test point G, Section 3, to chassis. Tune to signal.	Loud, clear signal with moderate signal input.	Open: WS-6(F), WS-6(R), L405, C412, C418. Shorted or leaky: C412. Shorted: C400D.
11	F	98 mc. Through 100-mmf. condenser.	FM (PB-5). Test point G shorted. Tune to signal.	Loud, clear signal with slightly less input than in step 9.	Open: WS-7(F), L401, C403, C402. Shorted or leaky: C402, C403. Shorted: C400M.

Section 4 — R-F and Converter Circuits (CONTINUED)

TROUBLE SHOOTING

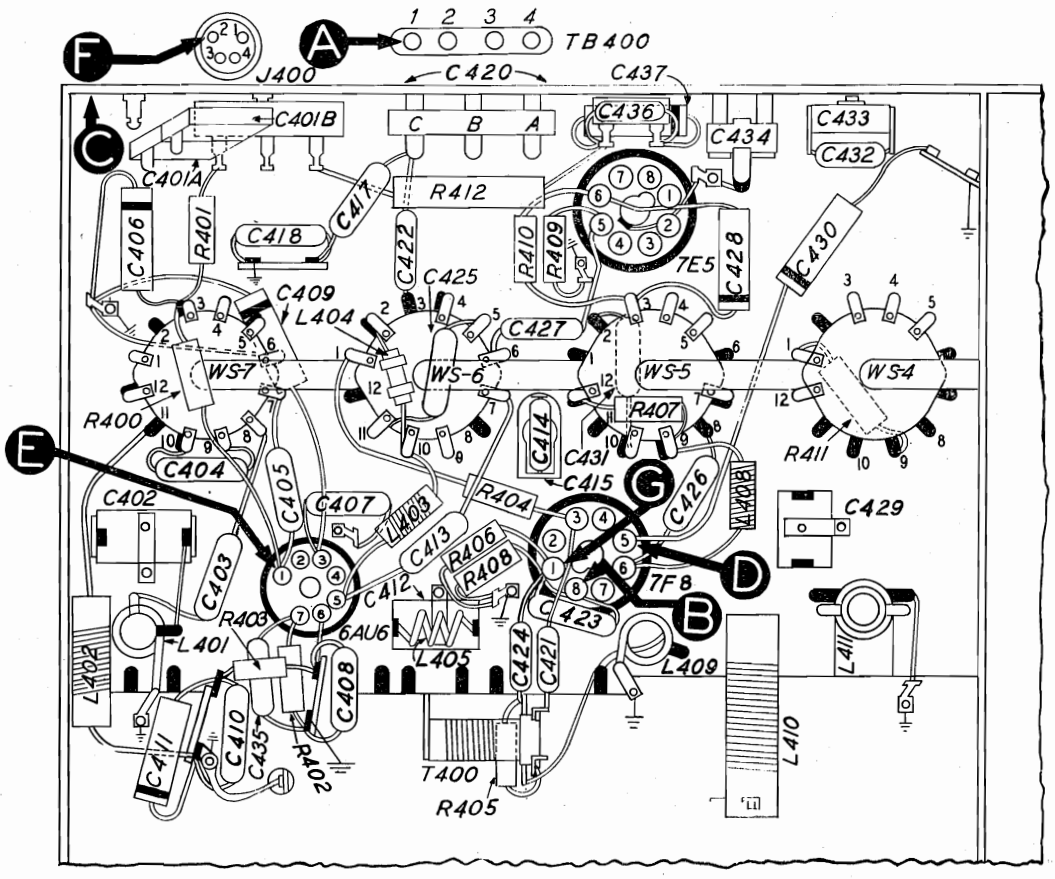

FIGURE 4. BOTTOM VIEW, SHOWING SECTION 4 TEST POINTS TP 4723D

SERVICING PHILCO AUTOMATIC BAND SELECTOR

To make the motor-driven band switch accessible for repairs, remove the four self-tapping screws holding the r-f chassis, and unsolder a sufficient number of connecting wires to allow the r-f chassis to drop away from the main chassis about six inches.

To obtain access to the band-switch components, unsolder the wires and parts connected to the rear plate on the r-f chassis, and remove the plate.

To replace individual switch wafers, loosen the two Allen setscrews locking the drive gear to the switch shaft, and remove the two nuts from the tie rods, at the motor end. See figure 5. Then slide the tie rods and switch shaft through the holes in the side of the r-f chassis.

CALIBRATING DIAL BACKPLATE

With the radio out of the cabinet, dial calibration points should be located by making pencil marks on the backplate, below the pointer. Figure 6 shows the measurements for these points with respect to the left-hand edge of the backplate.

NOTE: The dial scale shown in figure 6 is for Model 48-1274. Although this scale is shorter than that for Model 48-1276, the calibration of the two scales is identical, and the relationship between the backplate and the calibration points is the same for both models.

REPLACEMENT PARTS LIST

NOTE: Part numbers marked with an asterisk (*) are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

R221	Resistor, cathode bias, 1000 ohms	66-2103340*
R222	Resistor, cathode bias, 1000 ohms	66-2103340*
R223	Resistor, phase-inverter voltage divider, 1 megohm	66-5103340*
R224	Resistor, phase-inverter voltage divider, 68,000 ohms	66-3683340*
R225	Resistor, plate load, 56,000 ohms	66-3564340*
R226	Resistor, plate load, 56,000 ohms	66-3564340*
R227	Resistor, inverse-feedback voltage divider, 5600 ohms	66-2563340*
R228	Resistor, parasitic suppressor, 820 ohms	66-1823340*
R229	Resistor, parasitic suppressor, 820 ohms	66-1823340*
R230	Resistor, grid return, 330,000 ohms	66-4333340*
R231	Resistor, grid return, 330,000 ohms	66-4333340*
R232	Resistor, voltage divider, 680,000 ohms	66-4683340*
R233	Resistor, grid return, 330,000 ohms	66-4333340*
R234	Resistor, cathode bias, 2200 ohms	66-2223340*
R235	Resistor, plate load, 220,000 ohms	66-4223340*
R236	Resistor, plate load, 100,000 ohms	66-4103340*
R237	Resistor, grid return, 560,000 ohms	66-4563340*
R238	Resistor, bias filter, 220,000 ohms	66-4223340*
R239	Resistor, bias filter, 560,000 ohms	66-4563340*
R240	Resistor, bias volt. div., 220,000 ohms	66-4223340*
R241	Resistor, bias volt. div., 1.5 megohms	66-5153340*
R242	Resistor, bias decoupling, 3.3 megohms	66-5333340*
R243	Resistor, grid return, 1 megohm	66-5103340*
R244	Resistor, filter, 220,000 ohms	66-4223340*
R245	Resistor, plate load, 27,000 ohms	66-3273340*
R246	Resistor, filter, 220,000 ohms	66-4223340*
R247	Resistor, voltage divider, 33,000 ohms	66-3333340*
R248	Resistor, voltage divider, 33,000 ohms	66-3333340*
T200	Transformer, output	32-8287
T201	Transformer, phono input	32-8256
WS-2 (R)	Switch-wafer section (part of 76-2333-1)	54-7523
WS2-1	High-fidelity switch	42-1785

Parts list changes:

C108	Condenser, electrolytic, 45 mf., 30v, 60 cycles	30-2355-2
LA401	Loop, FM Aerial	76-2029-13 or 76-2381-3
MO2	Motor, Pushbutton tuning, part of 76-2150	35-1336
R412	Resistor, filter, 470 ohms	66-1474340
	Bin mechanism, left hand	76-3223-7
	Bin mechanism, right hand	76-3223-8

NOTE: Above listed bin mechanisms are not interchangeable with those listed in the Service Manual. When replacing mechanisms with these part numbers, replace both sides.

Cabinet top, 48-1274-M	45-6429
Two section lid, 48-1274-M	45-6426
Tilt front, 48-1274-M	45-6427
Instrument panel, 48-1274-M	45-6428
Cabinet, 48-1276	10657A
Two section lid, 48-1276	45-6430
Tilt front, 48-1276	45-6431
Instrument panel, 48-1276	45-6432
Cabinet top, 48-1276	45-6433
Escutcheon, High Fidelity, 48-1276	56-4403FA30

MODELS 48-1274, 48-1276

REPLACEMENT PARTS LIST

SECTION 3

I-F, DETECTOR, AND A-V-C CIRCUITS

Reference Symbol	Description	Service Part No.
C300A	Condenser, trimmer	Part of Z300
C300B	Condenser, trimmer	Part of Z300
C300C	Condenser, trimmer	Part of Z300
C301A	Condenser, trimmer	Part of Z301
C301B	Condenser, trimmer	Part of Z301
C301C	Condenser, trimmer	Part of Z301
C302A	Condenser, trimmer	Part of Z302
C302B	Condenser, trimmer	Part of Z302
C302C	Condenser, trimmer	Part of Z302
C303A	Condenser, trimmer	Part of Z303
C303B	Condenser, trimmer	Part of Z303
C303C	Condenser, trimmer	Part of Z303
C304A	Condenser, trimmer	Part of Z304
C305	Condenser, shunt (part of Z300), 2700 mmf.	60-20275404*
C306	Condenser, shunt (part of Z300), 51 mmf.	60-00515237*
C307	Condenser, d-c blocking, 240 mmf.	60-10245307*
C308	Condenser, a-v-c by-pass, .01 mf.	61-0120*
C309	Condenser, plate by-pass, .004 mf.	61-0179*
C310	Condenser, filament by-pass, .01 mf.	61-0120*
C311	Condenser, screen by-pass, .01 mf.	61-0120*
C312	Condenser, shunt (part of Z301), 330 mmf.	60-10335407*
C313	Condenser, d-c block. (part of Z301), 4.7 mmf.	30-1224-5*
C314	Condenser, shunt (part of Z301), 3900 mmf.	60-20395404*
C315	Condenser, r-f by-pass, .01 mf.	61-0120*
C316	Condenser, a-v-c filter, .01 mf.	61-0120*
C317	Condenser, tone compensation, .003 mf.	61-0109*
C318	Condenser, filament by-pass, .01 mf.	61-0120*
C319	Condenser, r-f by-pass, .01 mf.	61-0120*
C320	Condenser, plate by-pass, .004 mf.	61-0179*
C321	Condenser, screen by-pass, .01 mf.	61-0120*
C322	Condenser, shunt (part of Z302), 330 mmf.	60-10335407*
C323	Condenser, d-c blocking (part of Z302), 4.7 mmf.	30-1224-5*
C324	Condenser, shunt (part of Z302), 3900 mmf.	60-20395404*
C325	Condenser, d-c blocking, .006 mf.	61-0105*
C326	Condenser, r-f by-pass, .05 mf.	61-0122*
C327	Condenser, cathode by-pass, .01 mf.	61-0120*
C328	Condenser, shunt (part of Z304), 15 mmf.	30-1223-3*
C329	Condenser, r-f by-pass, .01 mf.	61-0120*
C330	Condenser, screen by-pass, .01 mf.	61-0120*
C331	Condenser, plate by-pass, .004 mf.	61-0179*
C332	Condenser, r-f by-pass, 1500 mmf.	60-20155404*
C333	Condenser, r-f voltage divider (part of Z304), 33 mmf.	30-1223-6*
C334	Condenser, r-f voltage divider (part of Z304), 68 mmf.	60-00685237*
C335	Condenser, d-c blocking, 33 mmf.	60-00365307*
C336	Condenser, r-f by-pass, 100 mmf.	60-10105407*
C337	Condenser, screen by-pass, .01 mf.	61-0120*
C338	Condenser, filament by-pass, .01 mf.	61-0120*
C339	Condenser, shunt (part of Z303), 270 mmf.	30-1220-5*
C340	Condenser, r-f by-pass, 240 mmf.	60-10245307*
C341	Condenser, d-c blocking, 100 mmf.	60-10105407*
C342	Condenser, filament by-pass, .01 mf.	61-0120*
C343	Condenser, r-f by-pass, .01 mf.	61-0120*
C344	Condenser, r-f by-pass, 100 mmf.	60-10105407*
L300	Choke, r-f	32-3352
R300	Resistor, parasitic suppressor, 10 ohms	66-0103340*
R301	Resistor, grid return, 2.2 megohms	66-5223340*
R302	Resistor, cathode bias, 180 ohms	66-1183340*
R303	Resistor, screen dropping, 100,000 ohms	66-4103340*
R304	Resistor, a-v-c decoupling, 470,000 ohms	66-4473340*
R305	Resistor, plate decoupling, 6800 ohms	66-2683340*
R306	Resistor, loading (part of Z301), 6800 ohms	66-2683340*
R307	Resistor, cathode bias, 180 ohms	66-1183340*
R308	Resistor, tone compensation, 220,000 ohms	66-4223340*
R309	Resistor, decoupling, 100,000 ohms	66-4103340*

SECTION 3 (Continued)

I-F, DETECTOR, AND A-V-C CIRCUITS

Reference Symbol	Description	Service Part No.
R310	Resistor, screen dropping, 100,000 ohms	66-4103340*
R311	Resistor, a-v-c filter, 330,000 ohms	66-4333340*
R312	Resistor, plate decoupling, 5600 ohms	66-2563340*
R313	Resistor, grid return, 1 megohm	66-5103340*
R314	Resistor, loading (part of Z302), 6800 ohms	66-2683340*
R315	Resistor, cathode bias, 180 ohms	66-1183340*
R316	Resistor, a-v-c diode load, 1 megohm	66-5103340*
R317	Resistor, loading (part of Z304), 5600 ohms	66-2563340*
R318	Resistor, audio load, FM detector, 47,000 ohms	66-3473340*
R319	Resistor, screen dropping, 82,000 ohms	66-3823340*
R320	Resistor, screen dropping, 56,000 ohms	66-3563340*
R321	Resistor, plate decoupling, 5600 ohms	66-2563340*
R322	Resistor, grid leak, 15,000 ohms	66-3153340*
R323	Resistor, filter, 47,000 ohms	66-3473340*
R324	Resistor, diode load, 100,000 ohms	66-4103340*
R325	Resistor, voltage divider, 560 ohms	66-1563340*
R326	Resistor, voltage divider, 47,000 ohms	66-3473340*
WS-4 (R)	Switch-wafer section (part of 76-2333-1)	54-7525
WS-2 (F)	Switch-wafer section (part of 76-2333-1)	54-7523
Z300	Transformer, 1st i-f	32-4072
Z301	Transformer, 2nd i-f	32-4060
Z302	Transformer, 3rd i-f	32-4060
Z303	Transformer, 4th i-f	32-4003-1
Z304	Transformer, FM detector	32-4004

SECTION 4

R-F AND CONVERTER CIRCUITS

C400	Condenser, tuning gang (See Note, Page 15)	Part of 76-2150
C400A	Condenser, tuning-gang section	Part of C400
C400B	Condenser, tuning-gang section	Part of C400
C400C	Condenser, tuning-gang section	Part of C400
C400D	Condenser, tuning-gang section	Part of C400
C400E	Condenser, tuning-gang section	Part of C400
C400F	Condenser, tuning-gang section	Part of C400
C400G	Condenser, tuning-gang section	Part of C400
C401	Condenser, trimmer, 2-section	31-6476-3
C401A	Condenser, trimmer, bc aerial	Part of C401
C401B	Condenser, trimmer, s-w aerial	Part of C401
C402	Condenser, trimmer, FM aerial	31-6473-4
C403	Condenser, blocking, FM, 22 mmf.	62-022009001
C404	Condenser, series tracking, s-w aerial, 255 mmf.	30-1220-24
C405	Condenser, d-c blocking, 100 mmf.	60-10105407*
C406	Condenser, a-v-c by-pass, .01 mf.	61-0120*
C407	Condenser, filament by-pass, 240 mmf.	60-10245307*
C408	Condenser, screen by-pass, 1500 mmf.	30-1225-1*
C409	Condenser, filament by-pass, .01 mf.	61-0120*
C410	Condenser, plate by-pass, 100 mmf.	60-10105407*
C411	Condenser, plate by-pass, .01 mf.	61-0120*
C412	Condenser, trimmer, FM r-f	31-6473-4
C413	Condenser, d-c blocking, 1000 mmf.	30-1225*
C414	Condenser, shunt, FM osc., 5 mmf.	60-90505007*
C415	Condenser, trimmer, FM osc.	31-6480
C416	Not used	
C417	Condenser, s-w r-f shunt, 36 mmf.	30-1224
C418	Condenser, r-f by-pass, 100 mmf.	60-10105407*
C419	Not used	
C420	Condenser, trimmer, 3-section	31-6477-1
C420A	Condenser, trimmer, s-w r-f	Part of C420
C420B	Condenser, trimmer, bc. r-f	Part of C420
C420C	Condenser, trimmer, s-w osc.	Part of C420
C421	Condenser, d-c blocking, 51 mmf.	30-1224-2
C422	Condenser, series tracking, s-w r-f, 255 mmf.	30-1220-24
C423	Condenser, d-c blocking, 24 mmf.	30-1224-4
C424	Condenser, d-c blocking, 51 mmf.	30-1224-2
C425	Condenser, neutralizing, s-w, 5 mmf.	60-90505007*
C426	Condenser, d-c blocking, 24 mmf.	30-1224-4
C427	Condenser, d-c blocking, 100 mmf.	60-10105407*
C428	Condenser, cathode by-pass, .01 mf.	61-0120*

PHILCO CORP.

REPLACEMENT PARTS LIST

SECTION 4 (Continued)
R-F AND CONVERTER CIRCUITS

Reference Symbol	Description	Service Part No.
C429	Condenser, trimmer, freq. doubler	31-6473-4
C430	Condenser, r-f by-pass, .05 mf.	61-0122*
C431	Condenser, series tracking, s-w osc., 215 mmf.	30-1220-4
C432	Condenser, series-padder shunt, bc. osc., 437 mmf.	30-1220-22
C433	Condenser, series padder, bc. osc.	31-6473-4
C434	Condenser, shunt trimmer, bc. osc.	31-6480-1
C435	Condenser, cathode by-pass, 100 mmf.	60-10105407*
C436	Condenser, by-pass, 510 mmf.	60-10515307*
C437	Condenser, by-pass, .01 mf.	61-0120*
L400	Coil, bc. aerial	32-4141
L401	Coil, FM aerial	32-4235
L402	Coil, shunt, s-w aerial	32-4050-5
L403	Coil, 6AU6 plate choke, FM	32-4061
L404	Coil. 6AU6 plate choke, AM	32-4189
L405	Coil, FM r-f	32-4067
L406	Coil, s-w r-f	Part of Z400
L407	Coil, bc. r-f	Part of Z400
L408	Coil, plate choke, osc.-doubler	32-4061
L409	Coil, frequency doubler	32-4071
L410	Coil, s-w osc.	32-4069
L411	Coil, bc. osc.	32-4188
LA400	Loop aerial	76-2344
LA401	FM aerial	76-2029-12
J400	Jack, FM aerial	27-6214-1
R400	Resistor, grid return, 2.2 megohms	66-5223340*
R401	Resistor, a-v-c volt. div., 2.2 megohms	66-5223340*
R402	Resistor, cathode bias, 82 ohms	66-0823340*
R403	Resistor, screen dropping, 39,000 ohms	66-3393340*
R404	Resistor, plate load, 6800 ohms	66-2683340*
R405	Resistor, parasitic suppressor, 10 ohms	66-0103340*
R406	Resistor, grid bias, 22,000 ohms	66-3223340*
R407	Resistor, plate load (AM), 27,000 ohms	66-3273340*
R408	Resistor, grid bias, 220,000 ohms	66-4223340*
R409	Resistor, grid return, 2.2 megohms	66-5223340*
R410	Resistor, cathode bias, 1000 ohms	66-2103340*
R411	Resistor, plate decoupling, 56,000 ohms	66-3563340*
R412	Resistor, filter, 470 ohms	66-3564340*
T400	Transformer, FM osc.	32-4070
TB400	Terminal panel, loop aerial	38-9870
WS-1	A-c switch, phono power off-on (part of 76-2333-1)	42-1840
WS-2 (F, R)	Switch-wafer (part of 76-2333-1)	54-7523
WS-3 (F, R)	Switch-wafer (part of 76-2333-1)	54-7524
WS-5 (F, R)	Switch-wafer (part of 76-2333-1)	54-7526
WS-6 (F, R)	Switch-wafer (part of 76-2333-1)	54-7527
WS-7 (F, R)	Switch-wafer (part of 76-2333-1)	54-7528
Z400	Transformer assembly, bc. and s-w r-f	32-4187

MISCELLANEOUS

Description	Model	Service Part No.
Bin lamp switch-and-cable assembly	48-1274, 76	76-2429-2
Bin lamp	48-1274, 76	34-2039
Cable and plug, speaker	48-1274, 76	41-3734-2
Cabinet Parts and Hardware		
Baffle, speaker	48-1274	219049
Baffle, speaker	48-1276	219048
Baffle and cloth	48-1274	40-6786
Baffle and cloth	48-1276	40-6820
Bin mechanism, l.h.	48-1274, 76	76-3223-2
Bin mechanism, r.h.	48-1274, 76	76-3223-3
Bracket, pilot lamp, l.h.	48-1274	56-3550-1FA3
Bracket, pilot lamp, r.h.	48-1274	56-3550-FA3
Bracket and cradle	48-1274	76-2188
Cabinet	48-1274 (mahogany)	10658B
Cabinet	48-1276	10657
Cabinet back	48-1274	40-6830
Cabinet back	48-1276	40-6831
Dome	48-1274, 76	45-6042
Hinge, continuous	48-1274	56-3627
Hinge, continuous	48-1276	56-3627-2
Hinge, lid separator	48-1274, 76	45-6301
Hinge, lid	48-1276	56-3837

MISCELLANEOUS (Continued)

Description	Model	Service Part No.
Hinge, pivot (2 req.)	48-1274, 76	45-6036
Lamp bracket	48-1274, 76	56-2332
Plate, high fidelity	48-1274, 76	56-4403FA30
Pull, door, brass	48-1274	56-3927
Pull, door, brass (2 req.)	48-1276	56-3928
Pull, door, brass (4 req.)	48-1276	56-3972
Chassis Mtg. Hardware		
Grounding spring	48-1274, 76	57-2140
Foot, rubber	48-1274, 76	54-4040
Dial Backplate and Hardware		
Backplate-and-pulley assembly	48-1274, 76	76-2326
Collar and pulley	48-1274, 76	76-2343
Dial backplate	48-1274, 76	56-3544
Drive cord, pointer (25-ft. spool)	48-1274, 76	45-8750*
Drive cord, tuning condenser (25-ft. spool)	48-1274, 76	45-8750*
Light conductor (plexiglass)	48-1274, 76	54-7279
Pointer	48-1274, 76	76-2327
Spring, pointer drive	48-1274, 76	28-8953
Spring, tuning-condenser drive	48-1274, 76	28-8751
Dial Scale and Hardware		
Dial-scale-and-rubber-shim assembly	48-1274 (mahogany)	76-3202
Dial-scale-and-rubber-shim assembly	48-1274 (walnut)	76-3202-1
Dial-scale-and-rubber-shim assembly	48-1276	76-3202-2
Scale bracket	48-1274, 76	56-3833
Scale bracket	48-1274, 76	56-3832
Knob	48-1274 (mahogany), 76	54-4329
Knob, high-fidelity	48-1274 (mahogany), 76	54-4338
Knob, push button	48-1274, 76	54-4292-1
Lamp brace (pilot)	48-1276	56-3628FA3
Lamp-socket assembly, pilot	48-1274, 76	76-2109-3
Lamp-socket assembly, telltale	48-1274, 76	41-3737-1
Mtg. frame	48-1276	76-2198

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Circuit Description

Philco Model 49-100 is a four-tube, battery-operated superheterodyne, providing reception on the standard broadcast band, 540→1720 kc. Manual tuning is employed. A 100-foot (overall), outdoor aerial, such as Philco Part No. 45-1469, is recommended.

The converter stage employs a type 1LA6 pentagrid converter tube; in this tube, the oscillator signal is fed to the mixer section through the electron stream within the tube.

A type 1LN5 pentode tube is used in the i-f amplifier stage. The diode section of the 1LH4 tube provides detection and a-v-c voltage, and the triode section functions as the first audio amplifier.

The first audio stage is resistance-coupled to the type 3LF4 output tube, which drives the permanent-magnet dynamic loud-speaker.

Preliminary Checks

The following preliminary checks should be made before turning on the radio:

1. Carefully inspect the top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Disconnect the battery, and measure the resistance between B+ (red lead of battery plug) and chassis, with the ohmmeter polarity such that the highest resistance reading is obtained. If this reading is lower than 10,000 ohms, check condensers C100, C203, and C404 for leakage or shorts.

PHILCO CORP. MODEL 49-100

TROUBLE SHOOTING

Section 1

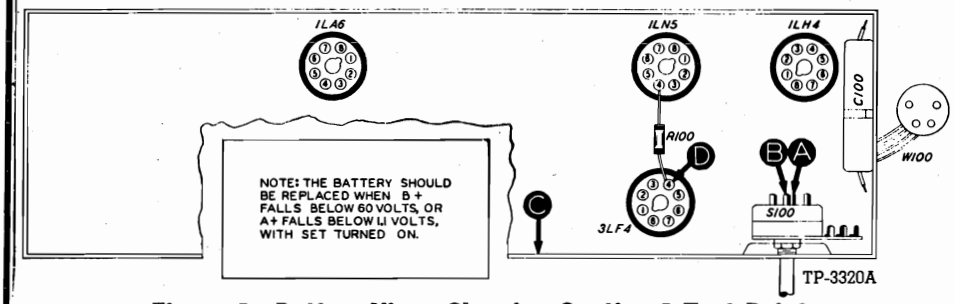

Figure 1. Bottom View, Showing Section 1 Test Points

For the tests in this section, use a d-c voltmeter, connecting the leads between the chassis, test point C, and the test points indicated in the chart. The voltages indicated were obtained from a fresh battery pack, and were measured with a 20,000-ohms-per-volt meter, with the radio turned on.

If the "NORMAL INDICATION" is obtained in the first step, proceed with the tests for Section 2; if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A B D	85 volts 1.5 volts Negative 5 volts		Trouble within this section. Isolate by the following tests.
2	A	85 volts	No voltage Low voltage	Open battery cable. Defective S100. Open R100. Shorted C100. Weak battery. Change in value of R100. Leaky C100. Excessive current drain in Sections 2, 3, or 4.
3	B	1.5 volts	No voltage Low voltage	Open battery cable. Defective S100. Weak battery.
4	D	Negative 5 volts		Change in value of R100. Open R100. Excessive current drain in Sections 2, 3, or 4.

TROUBLE SHOOTING

Section 2

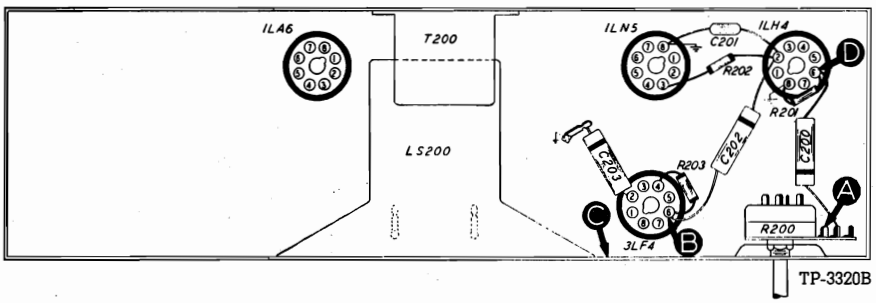

Figure 2. Bottom View, Showing Section 2 Test Points

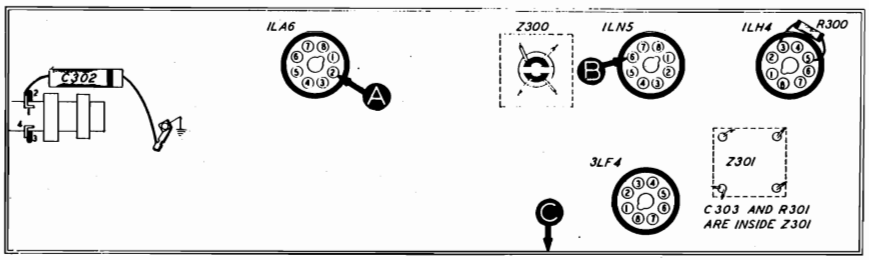
For the tests in this section, use an audio signal. Connect the signal-generator ground lead to the radio chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in the first step, proceed with the tests for Section 3; if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with moderate signal input.	Trouble within this section. Isolate by the following tests.
2	B	Normal, clear signal with strong signal input.	Defective 3LF4 tube, T200, or LS200. Shorted or leaky C203 or C201.
3	D	Loud, clear signal with moderate signal input.	Defective 1LH4 tube. Open R202 or C202.
4	A	Loud, clear signal with moderate signal input.	Defective R200. Shorted C301D. Open C200.
Listening Test: Distortion may be caused by leaky C201, C202, C203, or C200, or by open R203 or R201.			

TROUBLE SHOOTING

Section 3



TP-3320C

Figure 3. Bottom View, Showing Section 3 Test Points

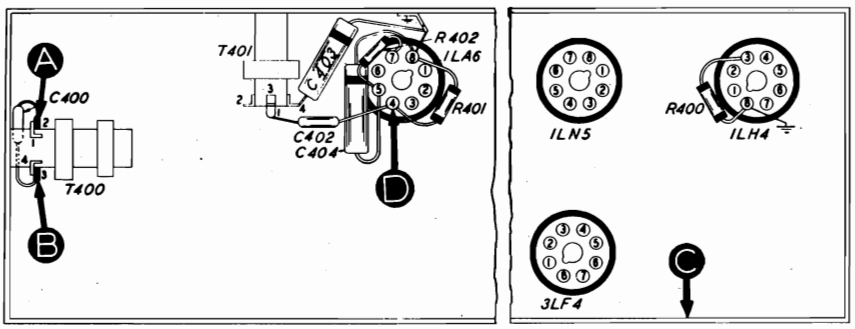
For the tests in this section, use an r-f signal generator with frequency set at 455 kc. (modulated output). Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in the first step, proceed with the tests for Section 4; if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with moderate signal input.	Trouble within this section. Isolate by the following tests.
2	B	Loud, clear signal with moderate signal input.	Defective 1LN5 or 1LH4 (diode section) tube. Defective or misaligned Z301. Open C302.
3	A	Loud, clear signal with moderate signal input.	Defective or misaligned Z300.

TROUBLE SHOOTING

Section 4



TP-3320D

Figure 4. Bottom View, Showing Section 4 Test Points

For the tests in this section, use an r-f signal generator with modulated output. Connect the generator ground lead to the chassis, test point C; connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Set the generator and radio dials as noted in the chart.

Inspect the tuning condensers for bent plates, dirt, or poor wiper contacts; any of these conditions will cause noise.

If the "NORMAL INDICATION" is not obtained in the first step, isolate the trouble by following the remaining steps.

STEP	TEST POINT	DIAL SETTINGS		NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
		SIG. GEN.	RADIO		
1	A	540 kc.	540 kc.	Loud, clear signal with low signal input.	Trouble within this section. Isolate by the following tests.
2	B	540 kc.	540 kc.	Loud, clear signal with moderate signal input.	Defective 1LA6 tube, C401, C401A, or oscillator circuit. Shorted C404. Misaligned Z300.
3	D Osc. test (See Note below.)		540 to 1720 kc.	Negative voltage (at least 1.5 volts) over complete range.	Defective 1LA6 tube, T401, C401, or C401B. Open R401, R402, C402, or C403. Shorted or leaky C402 or C403.
4	A	540 kc.	540 kc.	Loud, clear signal with low signal input.	Defective T400 or C401.

NOTE: Connect positive lead of 20,000-ohms-per-volt meter to the chassis, test point C; connect prod end of negative lead through 100,000-ohm isolating resistor to test point D (oscillator grid, pin 4 of 1LA6 tube).

PHILCO CORP.

ALIGNMENT PROCEDURE

TURN ON RADIO POWER, AND SET VOLUME CONTROL TO MAXIMUM

DIAL—Alignment points should be marked on the dial backplate. Measurements for these points are shown in the composite dial-and-backplate photo, figure 8. With tuning condensers fully meshed, set dial pointer to index mark.

OUTPUT METER—Connect across speaker voice coil.

SIGNAL GENERATOR—Connect ground lead to chassis; connect output lead as indicated in chart.

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below 1 volt.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTIONS TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Through .1-mf. condenser to stator of aerial tuning condenser.	455 kc.	Tuning condenser fully meshed.	Adjust trimmers, in order given, for maximum output.	C301A C300A C300B
2	Through 200-mmf. condenser to external aerial connector.	1700 kc.	1700 kc.	Adjust for maximum output.	C401B
3	Same as Step 2.	1500 kc.	1500 kc. (approx.)	Tune radio to generator signal, and adjust trimmer for maximum output.	C401A

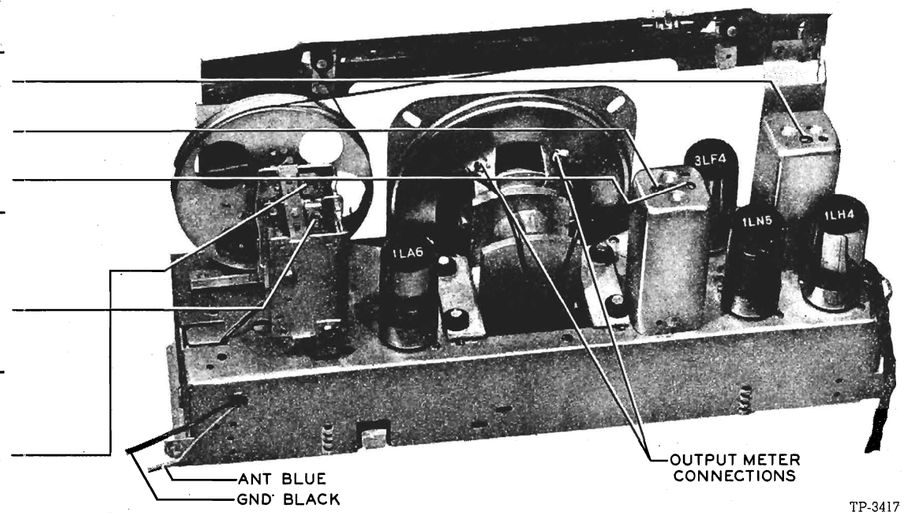

Figure 6. Top View, Showing Trimmer Locations

SYMBOLIZATION AND TERMINOLOGY

All components in the radio circuit are symbolized and located as follows:

C—condenser	LA—loop aerial	S—switch
I—pilot lamp	LS—loud-speaker	T—transformer
L—choke or coil	R—resistor	Z—electrical assembly

100-series components are in Section 1—the power supply.

200-series components are in Section 2—the audio circuits.

300-series components are in Section 3—the i-f, detector, and a-v-c circuits.

400-series components are in Section 4—the r-f and converter circuits.

REPLACEMENT PARTS LIST

NOTE: Part numbers marked with an asterisk (*) in the following parts list are general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

MODEL 49-101 PHILCO CORP.

Circuit Description

Philco Model 49-101 is a four-tube superheterodyne operating on a.c., d.c., or battery, and providing reception on the standard-broadcast band. A 100-foot (overall length), outdoor aerial, such as Philco Part No. 45-1469, is recommended.

The aerial is transformer-coupled to the 1R5 converter, where the incoming signal is converted to the 455-kc. intermediate frequency. A 1T4 is used in a single high-gain stage of i-f amplification, which employs neutralization to suppress oscillation. A 1.5-mmf. condenser, C304, feeds part of the i-f voltage, of the proper phase, back to the 1T4 grid through the tube-socket capacitance.

A 1U5 diode-pentode is used in the detector, a-v-c, and first audio circuits. The pentode section is resistance-coupled to a 3V4 pentode output amplifier, which works into a p-m speaker.

The d-c operating voltages are obtained from either a battery pack, Philco type P-326, or from a 105—120 volt, a-c or d-c power line. For power-line operation, the plate, screen, and filament voltages are provided by a power supply using a selenium rectifier (CR100).

MODEL 49-101

SPECIFICATIONS

CABINET	Molded Polystyrene (dark brown)
CIRCUIT	Four-tube superheterodyne
FREQUENCY RANGE	540—1600 kc.

BATTERY TYPE	Philco P-326

TP-6524

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire chart.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Check the total filament resistance, with the power switch turned on, the battery plug disconnected from the battery, and the change-over switch in the battery position (power-cord plug inserted in receptacle on rear of chassis). If the resistance between the A+ and A– pins on the battery plug is higher than 100 ohms, one of the tube filaments is probably open.

NOTE: If the 3V4 filament is open, check condenser C202 before replacing the tube.

3. Measure the resistance between B+ (output of selenium rectifier), test point D, and B–, test point B. See figure 1. When the ohmmeter leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 2000 ohms, check condensers C101A and C101B for leakage or shorts.

The resistance value above, which is much lower than normal, does not represent a quality check of these condensers; it is the lowest value which will permit the rectifier to operate safely while the voltage checks of Section 1 (power supply) are performed.

TROUBLE SHOOTING

Section 1—Power Supply

Make the tests for this section with a d-c voltmeter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Set the volume control to minimum.

The battery pack should be replaced when the "A" voltage drops below 5 volts, or the "B" voltage drops below 60 volts.

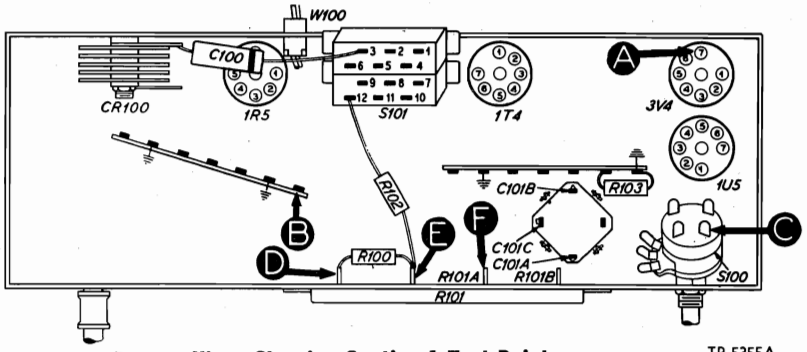

Figure 1. Bottom View, Showing Section 1 Test Points TP-5355A

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1(a) 1(b)	A C	7.5v 90v		Trouble in this section. Isolate by the following tests.
2	D	125v	Low voltage No voltage	Defective: CR100. Open: C101A. Defective: CR100. Open: S100, S101.
3	E	120v	Low voltage No voltage	Changed resistance: R100. Leaky: C101A. Open: R100. Shorted: C101A.
4	F	65v	Low voltage No voltage	Changed resistance: R101A. Leaky: C101B. Open: R101A. Shorted: C101B.
5	A	7.5v	Low voltage High voltage No voltage	Changed resistance: R101B. Open: One or more filaments, R205*. Open: R101B, S101.
6	C	90v	Low voltage High voltage No voltage	Changed resistance: R102. Leaky: C101C. Open: R205*, T200*, S100. Open: R102, S101. Shorted: C101C.
Listening Test: Abnormal hum may be caused by open C101B, C101C, or C202*.				

*This part, located in another section, may cause abnormal indication in this section.

TROUBLE SHOOTING

Section 2—Audio Circuits

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

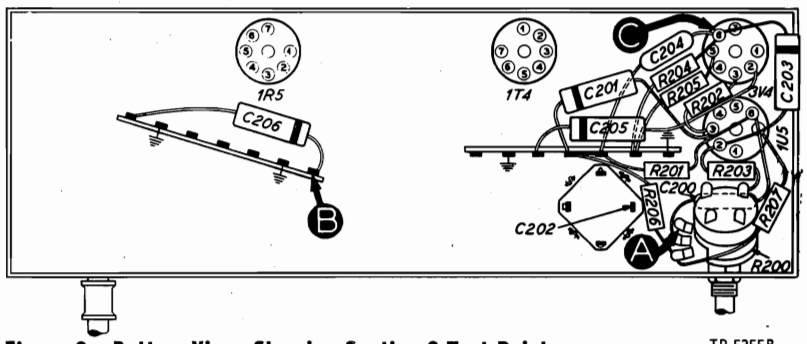

Figure 2. Bottom View, Showing Section 2 Test Points TP-5355B

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with moderate generator input.	Trouble in this section. Isolate by the following tests.
2	C	Clear speaker output with strong generator input.	Defective: 3V4, LS200. Open: R204, T200. Shorted: C203, C204, C205, T200.
3	A	Same as step 1.	Defective: 1U5, R200 (rotate). Open: C200, R201, R202, R203, C203. Shorted: C201, C301C*.
Listening Test: Distortion may be caused by leaky or shorted C203, or by changed resistance of R202. Distortion or strong signals may be caused by leaky or shorted C200.			

*This part, located in another section, may cause abnormal indication in this section.

MODEL 49-101 PHILCO CORP.

Section 3—I-F, Detector, And A-V-C Circuits

TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

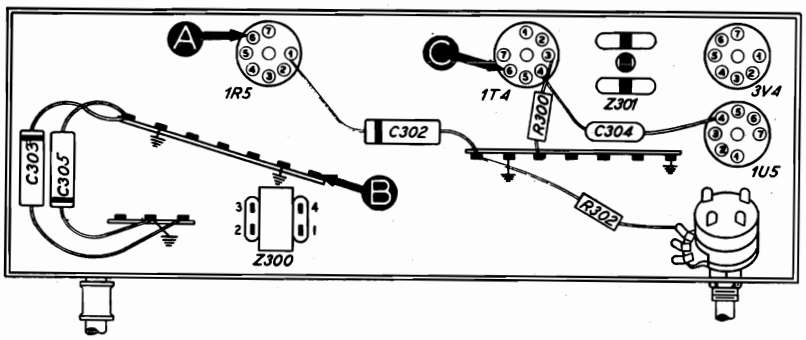

Figure 3. Bottom View, Showing Section 3 Test Points TP-6983B

To provide a complete i-f amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear output with moderate input.	Defective: 1T4, 1U5 (diode section). Misaligned: Z301. Open: R300, C303, L301A, R301, L301B, C301A. Shorted: C300B, C303, L301A, L301B, C301A, C301B.
3	A	Same as step 1.	Defective: 1R5*. Misaligned: Z300. Open: C300A, L300A, L300B, C300B, T400*. Shorted: C400A*, C400B*, C300A, L300A, L300B, C300B.

*This part, located in another section, may cause abnormal indication in this section.

Section 4—R-F And Converter Circuits

TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum. Set the tuning control and signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is obtained in step 1, further steps should be unnecessary; if not, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

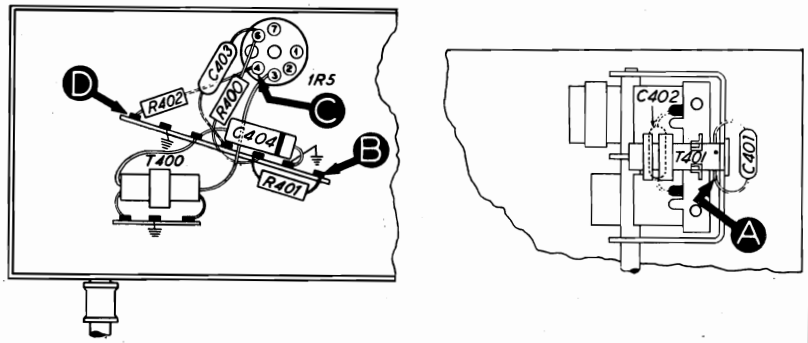

Figure 4. Bottom View, Showing Section 4 Test Points TP-6983A

STEP	TEST POINT	SIGNAL GEN. FREQUENCY	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal.	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C to D (Osc. test; see note below.)		Rotate through range.	Negative 5 to 10 volts.	Defective: 1R5. Open: R402, T400, C404. Shorted: C402, C400, C400A.

PHILCO CORP.

MODEL 49-101

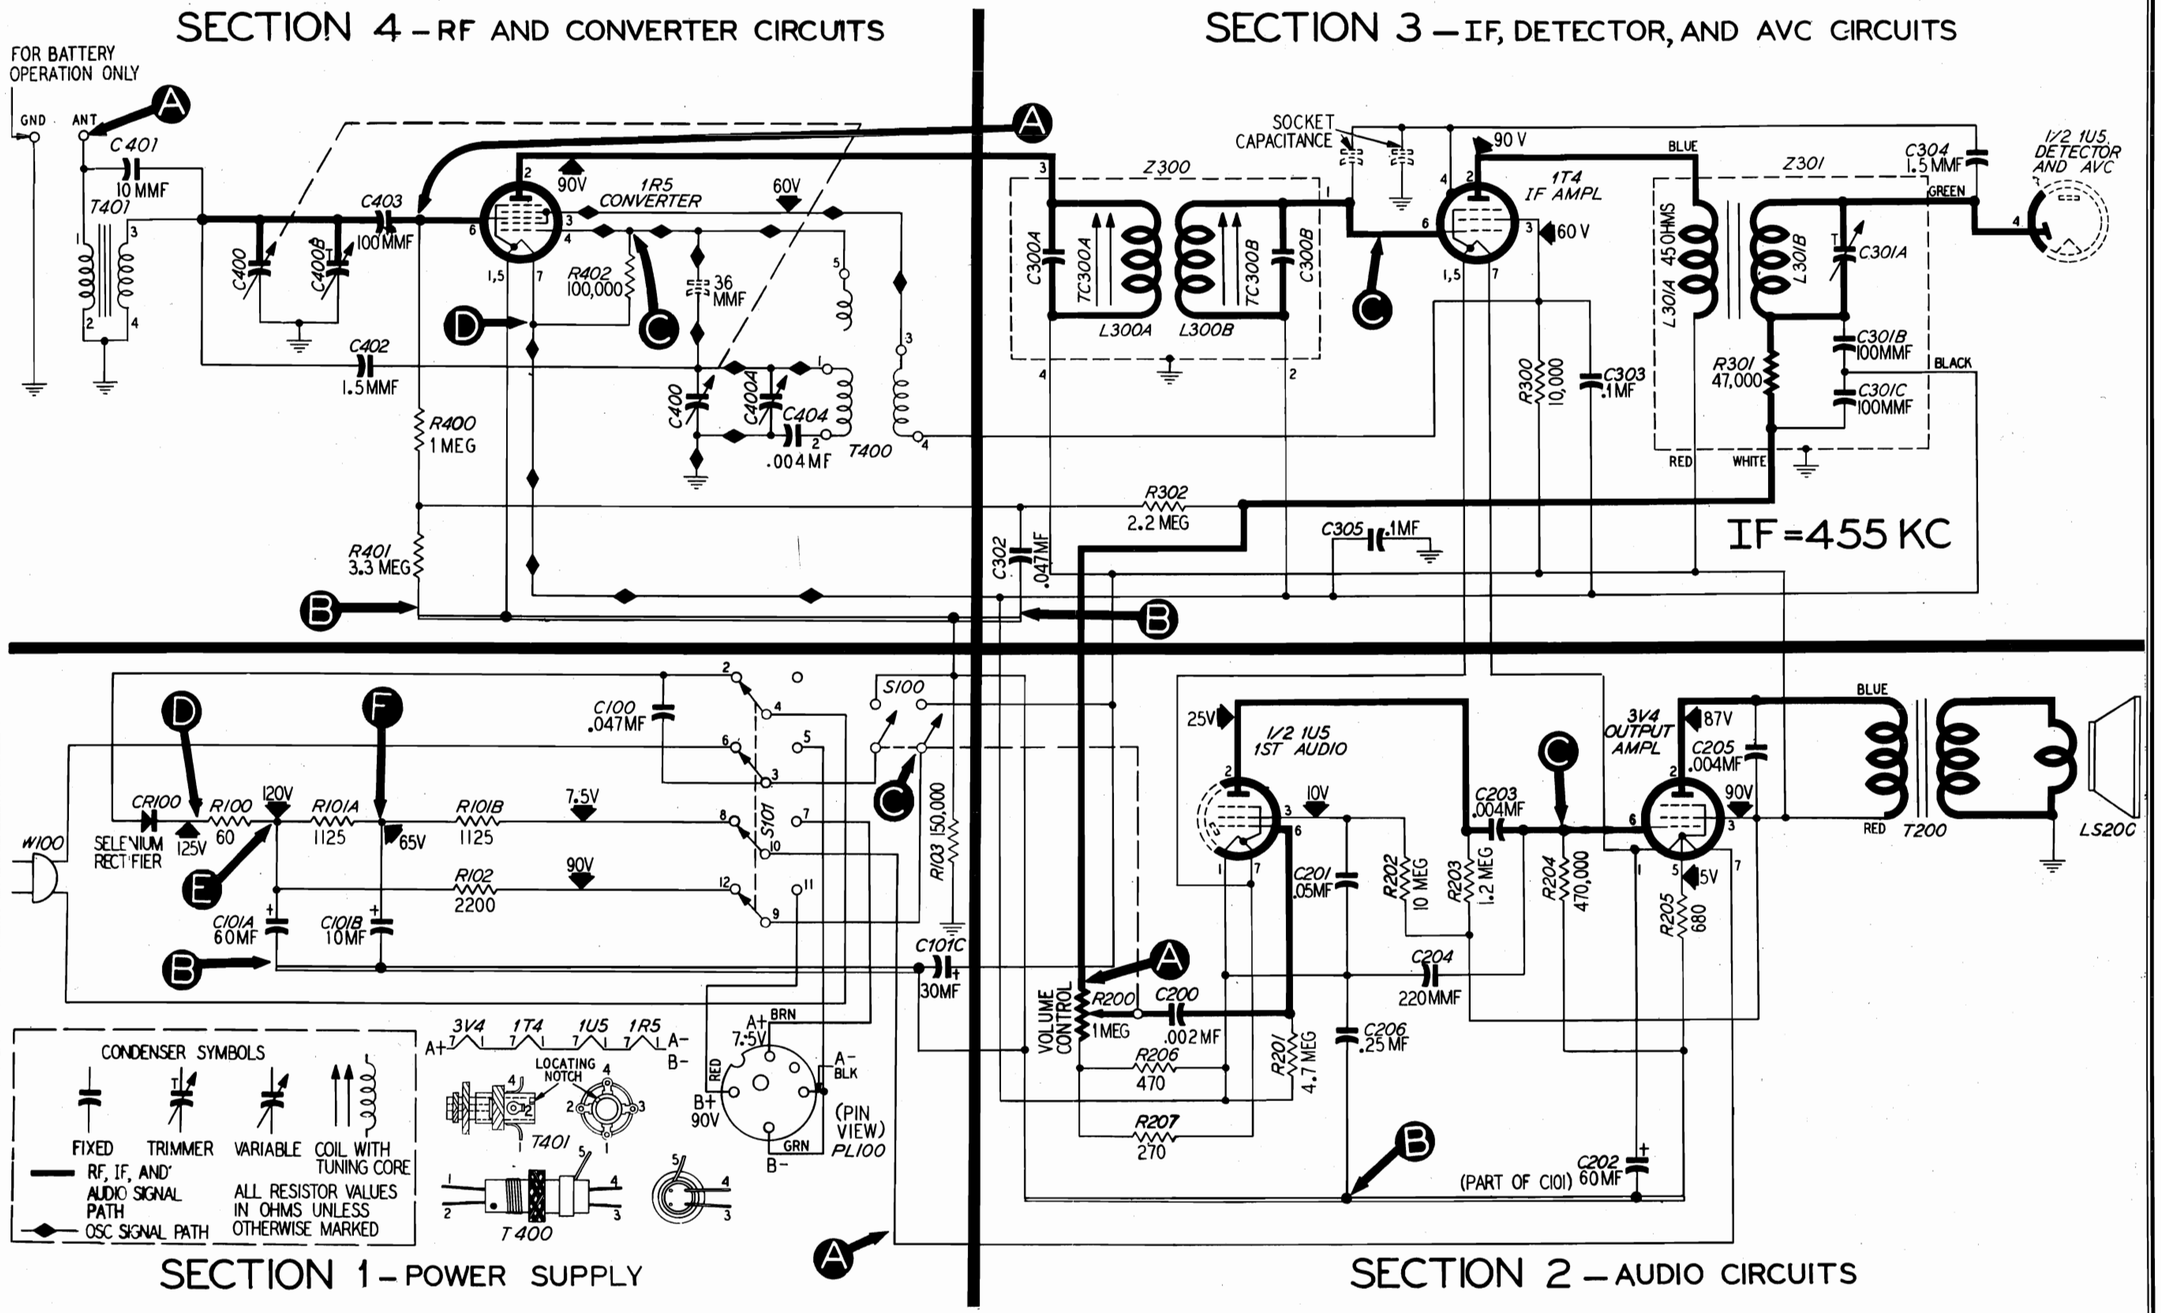

Figure 5. Philco Model 49-101, Sectionalized Schematic Diagram, Showing Test Points

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to test point D; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 4 of the 1R5), test point C. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage within the range given in the chart (measured with a 20,000-ohms-per-volt meter) throughout the tuning range.

ALIGNMENT PROCEDURE

DIAL—Calibration and pointer-index measurements are shown in figure 7. With tuning condenser fully meshed, set pointer to index mark.

RADIO CONTROLS—Set volume control to maximum.

OUTPUT METER—Connect across voice-coil terminals.

SIGNAL GENERATOR—Use modulated output.

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below .5 volt.

SPECIAL NOTE—The orientation of the loop with respect to the chassis is critical for correct tracking. During alignment, with the cabinet back (containing the loop) laid down on the bench, the chassis should be laid on its back, in approximately its normal relation to the loop.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Ground lead to B– (test point B in figure 4). Positive lead through .05-mf. condenser to external-aerial lead. Make sure that radio loop aerial is connected to radio.	455 kc.	Tuning condenser fully meshed.	Adjust, in order given, for maximum output.	C301A—2nd i-f sec. TC300B—1st i-f sec. TC300A—1st i-f pri.

3	Same as step 2.	1500 kc.	1500 kc.	Adjust for maximum output while rocking tuning condenser.	C400B—aerial

RADIATING LOOP: Make up a 6—8-turn, 6-inch-diameter loop, using insulated wire; connect to signal-generator leads and place near radio loop aerial. Make sure that radio loop aerial is connected to radio.

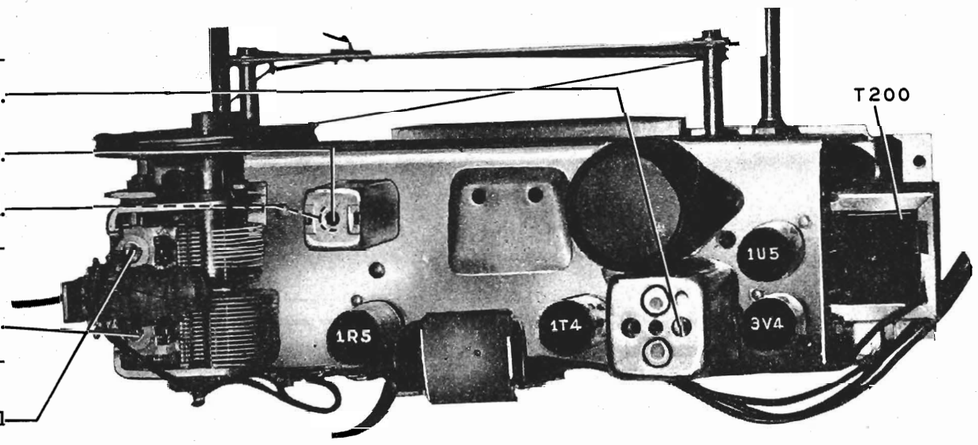

Figure 6. Top View, Showing Trimmer Locations

CALIBRATING DIAL BACKPLATE

When the radio chassis has been removed from the cabinet, dial-calibration and alignment points may be marked on the dial (chassis) backplate at the end of the pointer with a pencil. The method of measuring for these points is illustrated in figure 7.

With the tuning gang fully meshed, the pointer should be adjusted on the dial-drive cord to coincide with the index mark.

PHILCO CORP. MODEL 49-101

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C —condenser
I —pilot lamp
L —choke or coil
LA—loop aerial
LS—loud-speaker
R —resistor
S —switch
T —transformer
W—line cord
Z —electrical assembly

The number of the symbol designates the section in which the part is located, as follows:

100-series components are in Section 1—the power supply
200-series components are in Section 2—the audio circuits
300-series components are in Section 3—the i-f, detector, and a-v-c circuits
400-series components are in Section 4—the r-f and converter circuits

A suffix letter identifies the part as a component of the assembly which bears an identical number without a suffix letter, and with perhaps a different prefix letter.

REPLACEMENT PARTS LIST

NOTE: Part numbers identified by an asterisk (*) are general-replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

GENERAL INFORMATION

Philco Model 49-506 is a 5-tube superheterodyne. This set employs the same chassis as that used in Models 49-500 and 49-500-I, but is housed in a new-style cabinet which is supplied in either of two finishes, walnut or mahogany.

MODEL 49-506

SPECIFICATIONS

CABINET	Wood, with plastic grille; walnut or mahogany finish

MODEL 49-500 (Walnut)
MODEL 49-500-I (Ivory)

SPECIFICATIONS

CABINET	Bakelite
CIRCUIT	Five-tube superheterodyne
FREQUENCY RANGE	540 to 1620 kc.
OPERATING VOLTAGE	105 to 120 volts, a.c. or d.c.
POWER CONSUMPTION	30 watts
AERIAL	Loop fastened to cabinet; terminal also provided for outside aerial
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (5)	7A8, 14A7, 14B6, 50A5, 35Z5GT

TP-2667

Circuit Description

The Philco Models 49-500 and 49-500-I are 5-tube, table-model superheterodyne radios, providing reception in the standard broadcast band.

The high-impedance loop aerial normally provides adequate signal pickup. An external aerial may be connected, if desired, by detaching the aerial lead (shown in figure 6) from the chassis, and connecting the lead to an external aerial lead-in. Do not use a ground.

The loop is coupled to the 7A8 converter tube. Variable-condenser tuning is employed, the oscillator rotor-section plates being shaped to obtain tracking, thus eliminating the necessity for a series padding condenser.

The 7A8 is transformer coupled to the 14A7 i-f amplifier, which is also transformer coupled to the diodes of the 14B6 second detector — first audio-frequency amplifier. A-v-c voltage is applied to the control grids of both the i-f and converter tubes.

The triode section of the 14B6 is the first audio stage, and is resistance coupled to the 50A5 output tube. The output tube is transformer coupled to a permanent-magnet dynamic speaker.

D-c operating voltages are obtained from a 35Z5GT half-wave rectifier, the output of which is filtered by a two-section resistor-condenser filter.

Condenser C304 in Section 3 is a special condenser, inductively wound to form a series-tuned circuit, resonant at the intermediate frequency. This special condenser offers less impedance at this frequency than a conventional condenser, thus permitting higher i-f gain, with no tendency toward instability. Since the tuning gang is connected to the chassis, by-passing at broadcast and short-wave frequencies is adequate. The inductive effect is negligible at audio frequencies.

The 150,000-ohm resistor, R100, in Section 1, prevents hum which might otherwise occur under conditions of high humidity.

Philco TROUBLE-SHOOTING *Procedure*

In this manual, the schematic diagram is divided into four sections, with a chassis layout for each section, showing components and test points for each section. The test points are also indicated on the schematic diagram in the corresponding section. A simplified trouble-shooting procedure is given in a chart for each section. The first step in each chart is a master check, indicating whether trouble exists in that section. Failure to obtain the "NORMAL INDICATION" in a given step indicates trouble, which should be located by voltage, resistance, or capacitance checks of parts indicated in the step, and remedied before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Carefully inspect both top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets (see figure 6), and look for bad connections, burned resistors, or other obvious sources of trouble.
2. Measure the resistance between B+ and B– (test points C and B in figure 1), using the ohmmeter polarity giving the highest resistance reading; if the reading is lower than 50,000 ohms, check C101A, C101B, and C101C, for leakage or shorts. This resistance value, which is much lower than normal, does not represent a quality check of these condensers; it is the lowest value which will permit the rectifier to operate safely while the voltage tests of Section 1 (power supply) are performed.

PHILCO CORP.

MODELS 49-500, 49-500-I, 49-506

Section 1 — Power Supply

TROUBLE SHOOTING

For the tests in this section, use a d-c voltmeter; connect the leads to the test points indicated in the chart. The voltages shown were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, 60 cycles.

Turn the volume control to minimum, and set the dial pointer at 540 kc.

If the "NORMAL INDICATION" is obtained in step 1, proceed with tests for Section 2 (audio circuits); if not, isolate and correct the trouble within this section.

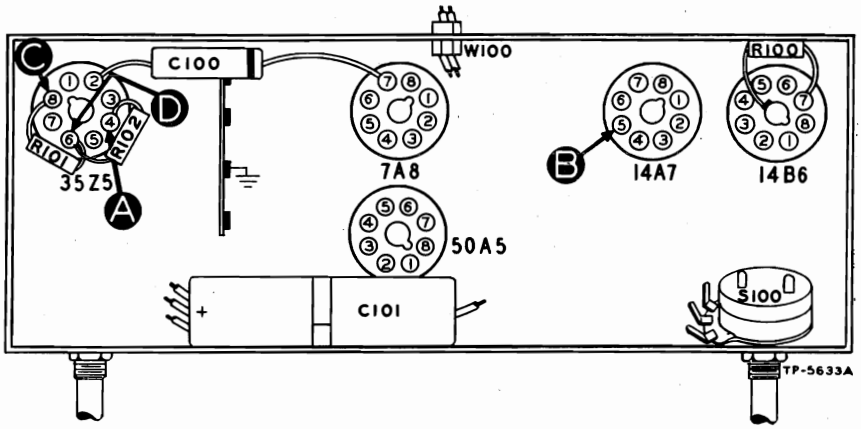

FIGURE 1. BOTTOM VIEW, SHOWING SECTION 1 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A to B	90v		Trouble within this section; isolate by the following tests.
2	C to B	115v	No voltage Low voltage High voltage	Defective 35Z5GT. Shorted: C101A. Defective: 35Z5GT. Open: C101A or I100. Leaky: C101A. Open: R101.
3	D to B	105v	No voltage Low voltage High voltage	Shorted: C101B. Open: C101B. Leaky: C101B or C203. Open: R102, T200, or R204.
4	A to B	90v	No voltage Low voltage High voltage	Shorted: C101C. Leaky: C101C. Open: R204.

Listening Test: Abnormal hum may be caused by open C101A, C101B, or C101C.

Section 2 — Audio Circuits

TROUBLE SHOOTING

For the tests in this section, use an audio-signal generator. Connect the ground lead of the generator to B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Set the volume control at maximum. If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble within this section.

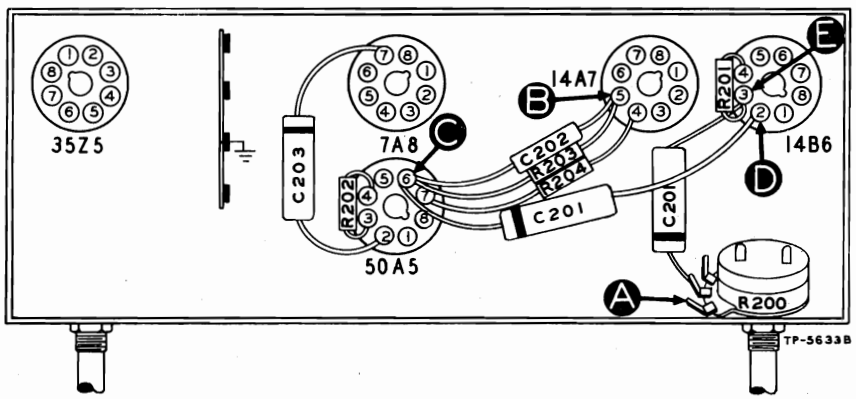

FIGURE 2. BOTTOM VIEW, SHOWING SECTION 2 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal-generator input.	Trouble within this section; isolate by the following tests.
2	C	Clear signal with weak signal-generator input.	No signal — Open or shorted: LS200 or T200. Shorted: C203. Open: R204. Defective: 50A5. Weak or distorted signal — Defective: 50A5 or LS200. Leaky: C202 or C201. Open: R203. Shorted: R204.
3	D	Same as step 2.	No signal — Open: C201. Weak or distorted signal — Leaky: C201.
4	E	Same as step 1.	No signal — Open: R202. Defective: 14B6. Weak or distorted signal — Shorted: C200. Open: R201. Defective: 14B6.
5	A	Same as step 1.	No signal — Open: C200. Shorted: C300D. Weak or distorted signal — Open: R200 (rotate through range).

MODELS 49-500, 49-500-I, 49-506

PHILCO CORP.

Section 3 — I-F, Detector, and A-V-C Circuits TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set to 455 kc. Connect the ground lead of the signal generator to B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart. Set the volume control at maximum. If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble within this section.

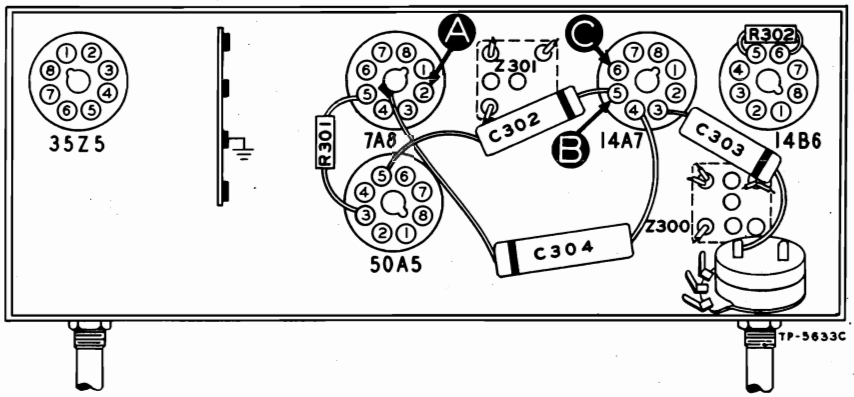

FIGURE 3. BOTTOM VIEW, SHOWING SECTION 3 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Clear signal with weak signal-generator input.	Trouble within this section; isolate by the following tests.
2	C	Same as step 1.	No signal — Open or shorted: Z300. Defective: 14B6 or 14A7. Open: R301. Shorted: C303. Weak or distorted signal — Leaky: C303. Open: C303 or C304. Defective: 14B6 or 14A7. Misaligned: Z300. Leaky or open: C302.
3	A	Same as step 1.	No signal — Open or shorted: Z301. Weak or distorted signal — Misaligned: Z301.

Section 4 — R-F and Converter Circuits TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output. Connect the generator ground lead to B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Inspect the tuning condensers for bent plates, dirt, or poor wiper contacts; any or all of these will cause noise. If the "NORMAL INDICATION" is not obtained in step 1, isolate the trouble by following the remaining steps.

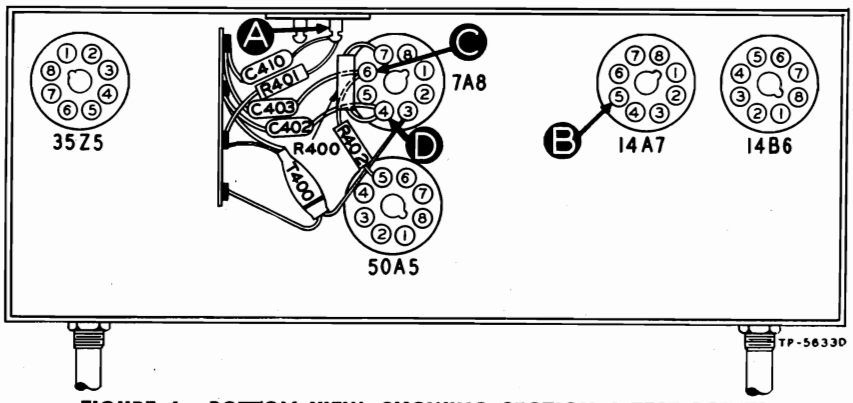

FIGURE 4. BOTTOM VIEW, SHOWING SECTION 4 TEST POINTS

STEP	TEST POINT	DIAL SETTINGS		NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
		SIG. GEN.	RADIO		
1	A	540 kc.	540 kc.	Clear signal with weak signal-generator input.	Trouble within this section; isolate by the following tests.
2	D (Osc. test; see note below.)		540 to 1620 kc.	Negative 9 to 12 volts.	Open or shorted: T400, C402, or R400. Shorted: C400 or C400B. Defective: 7A8.
3	C	540 kc.	540 kc.	Same as step 1.	No signal — Open or shorted: Z301. Shorted: C400 or C400A. Defective 7A8. Weak or distorted signal — Shorted or open: LA400. Defective: 7A8.
4	A	540 kc.	540 kc.	Same as step 1.	Weak signal — Open: C401.

OSCILLATOR-TEST NOTE: Connect positive lead of a 20,000-ohms-per-volt meter to B; connect prod end of negative lead through a 100,000-ohm isolating resistor to test point D. Proper operation of oscillator is indicated by a negative voltage of 9 to 12 volts throughout range of tuning condenser.

ALIGNMENT PROCEDURE

TURN ON THE RADIO, AND SET THE VOLUME CONTROL TO MAXIMUM.

DIAL POINTER — Turn tuning condensers to full-mesh position. Set dial pointer to index dot, located to the left of "55."

OUTPUT METER — Connect to left (output) lug and center (chassis) lug of terminal panel, shown in figure 6.

SIGNAL GENERATOR — Connect ground lead to B; connect output lead as indicated in the chart.

OUTPUT LEVEL — During alignment, adjust signal-generator output to maintain output-meter indication below 1.25 volts.

REPLACEMENT PARTS LIST

NOTE: Part numbers identified by an asterisk (*) indicate general replacement items. These numbers may not be identical with those on factory assemblies; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and replacement parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

TROUBLE SHOOTING

POWER SUPPLY

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn on the power and set the volume control to minimum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

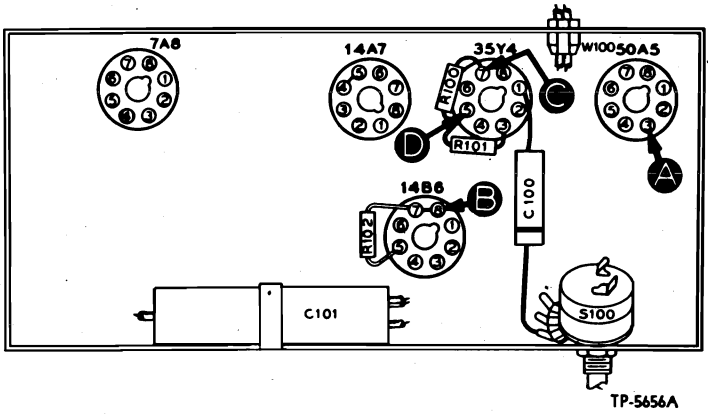

Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	92v		Trouble within this section. Isolate by the following tests.
2	C	105v	No voltage Low voltage High voltage	Defective: 35Y4. Open: S100, W100. Shorted: C101A. Open: C101A. Defective: 35Y4. Leaky: C101A. Open: R100.
3	D	116v	No voltage Low voltage High voltage	Shorted: C101B. Open: R100. Open: C101B. Leaky: C101B, C202*. Open: R101, T200*, R203*.
4	A	92v	No voltage Low voltage	Shorted: C101C. Open: R101. Leaky: C101C.
Listening Test: Abnormal hum may be caused by open C101A, C101B, or C101C.				

* This part, located in another section, may cause abnormal indication in this section.

TROUBLE SHOOTING

Section 2
AUDIO CIRCUITS

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

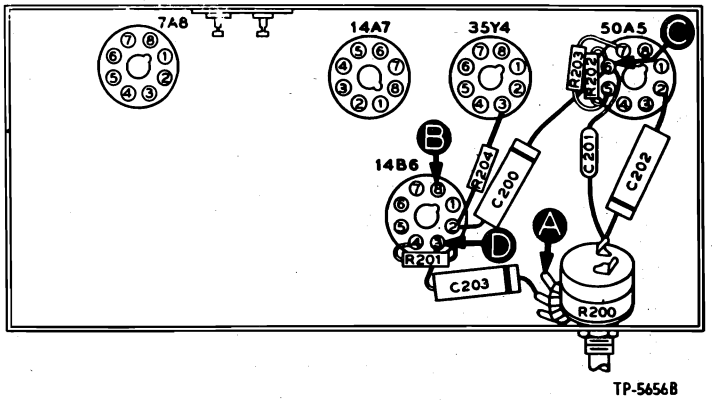

Figure 2. Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak signal-generator input.	Trouble within this section. Isolate by the following tests.
2	C	Clear output with strong input.	Defective: 50A5, LS200. Shorted: C201, C202. Open: R203, T200.
3	D	Same as step 2.	Defecive: 14B6. Shorted: C200. Open: R204, R202, C200.
4	A	Same as step 1.	Shorted: C301D*. Open: R200, R201, C203.
Listening Test: Distortion may be caused by shorted or leaky C200.			

* This part, located in another section, may cause abnormal indication in this section.

PHILCO CORP.

TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C CIRCUITS

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

To provide a complete i-f amplifier check, test point A for this section is placed at the grid of the converter in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the converter circuit. These parts are listed below under the "POSSIBLE CAUSE OF ABNORMAL INDICATION."

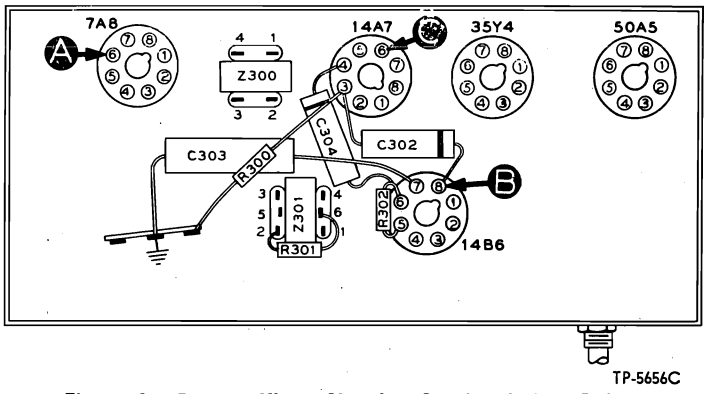

Figure 3. Bottom View, Showing Section 3 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak signal-generator input.	Trouble within this section. Isolate by the following tests.
2	C	Same as step 1.	Defective: 14A7, 14B6. Shorted: L300B, C300B, L301A, L301B, C301A, C301B, C301C, C301D. Open: L301A, L301B, C301A, C301B, C302, R300, R301. Misaligned: Z301.
3	A	Same as step 1.	Defective: 7A8*. Shorted: C400*, C400A*, L300A, C300A. Open: L300A, L300B, C300A, C300B. Misaligned: Z300.

* This part, located in another section, may cause abnormal indication in this section.

TROUBLE SHOOTING

Section 4
R-F AND CONVERTER CIRCUITS

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum. Set the tuning control and the signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

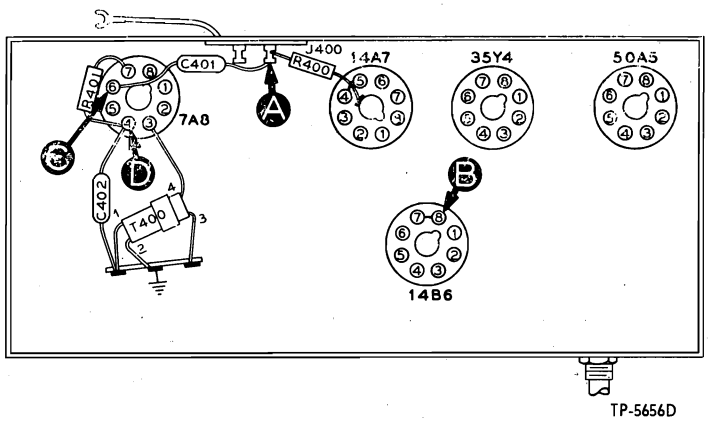

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	1000 kc.	Clear speaker output with weak signal-generator input.	Trouble within this section. Isolate by the following tests.
2	D (Osc. test; see note below.)		Rotate through range.	Negative 8 to 10 volts.	Shorted: T400, C400, C400B. Open: C402, R401, T400. Defective: 7A8.
3	C	1000 kc.	1000 kc.	Same as step 1.	Defective: 7A8. Shorted: C400, C400A, LA400. Open: LA400.
4	A	1000 kc.	1000 kc.	Same as step 1.	Open: C401.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to B–, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 4 of 7A8), test point D. Proper operation of the oscillator is indicated by a negative voltage of the value given in the chart (measured with a 20,000-ohms-per-volt meter) throughout the tuning range.

RADIATING LOOP: Make up a 6 to 8 turn, 6-inch-diameter loop from insulated wire; connect to signal-generator leads and place near radio loop aerial. The loop aerial must be connected.

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below 1.25 volts.

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part as follows:

C—condenser
I—pilot lamp
L—choke or coil
LA—loop aerial
LS—loud-speaker
R—resistor
S—switch
T—transformer
W—line-cord-and-plug assembly
Z—electrical assembly

The number of the symbol designates the section in which the part is located as follows:

100-series components are in Section 1—the power supply.

200-series components are in Section 2—the audio circuits.

300-series components are in Section 3—the i-f, detector, and a-v-c circuits.

400-series components are in Section 4—the r-f and converter circuits.

Circuit Description

Philco Radio Models 49-501 and 49-501-I are 5-tube, table-model superheterodynes, providing reception in the standard broadcast band.

A high-impedance loop aerial normally provides adequate signal pickup. An external aerial may be connected, if desired, by detaching the aerial lead from the chassis, and connecting it to the external aerial lead-in. Do not use a ground.

The loop aerial is coupled to the 7A8 converter. The aerial and oscillator circuits are tuned by ganged, variable condensers, and the oscillator rotor-section plates are properly shaped to obtain tracking, thus eliminating the necessity for a series padding condenser.

The 7A8 converter is transformer-coupled to the 14A7 i-f amplifier, which is also transformer-coupled to the diodes of the 14B6 second detector—first audio amplifier. A-v-c voltage is applied to the control grids of both the i-f amplifier and converter tubes. The triode section of the 14B6 is the first audio stage, and is resistance-coupled to the 50A5 output tube. The output tube is transformer-coupled to a permanent-magnet speaker.

D-c operating voltages are supplied from a 35Y4 half-wave rectifier, and filtered by a three-section resistor-condenser network.

Condenser C303 is a special condenser inductively wound to form a series-tuned circuit, resonant at the intermediate frequency. This condenser offers less impedance at this frequency than a conventional condenser, and thus permits higher i-f gain, with no tendency toward instability.

The 150,000-ohm resistor, R102, prevents hum which might otherwise occur under conditions of high humidity.

Circuit Description

Philco Radio Model 49-503 is a five-tube superheterodyne, providing reception in the standard broadcast band. A built-in high-impedance loop aerial normally provides adequate signal pickup; an external aerial may be connected, if desired, by detaching the aerial lead (shown in figure 6) from the chassis and connecting this lead to an external aerial lead-in. Do not use a ground.

The loop is coupled to a 7A8 converter. Variable-condenser tuning is employed; the oscillator rotor-section plates are shaped to obtain tracking, thus eliminating the need for a series-padding condenser.

The 7A8 is transformer-coupled to a 14A7 i-f amplifier, which is also transformer-coupled to a 14B6 second detector —first audio amplifier. A-v-c voltage is applied to the control grids of the i-f-amplifier and converter tubes.

The triode section of the 14B6 is the first audio stage, and is resistance-coupled to a 50A5 output tube. The output tube is transformer-coupled to a permanent-magnet speaker.

D-c operating voltages are obtained from a 35Z5GT half-wave rectifier, the output of which is filtered by a two-section, resistor-condenser filter.

Condenser C304 is a special condenser, inductively wound to form a series tuned circuit, resonant at the intermediate frequency. This special condenser offers less impedance at this frequency than a conventional condenser, thus permitting high i-f gain with no tendency toward instability.

The 150,000-ohm resistor, R100, prevents hum which might otherwise occur under conditions of high humidity.

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before it is turned on:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorter connections, burned resistors, or other obvious sources of trouble.

2. Measure the resistance between B+ (pin 7 of 35Z5GT) and B—, test point B. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1500 ohms, check condensers C101A, C101B, and C203 for leakage or shorts. The resistance value given is much lower than normal, and is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage checks of Section 1 (power supply) are performed.

PHILCO CORP. MODEL 49-503

Section 1—Power Supply

TROUBLE SHOOTING

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B—, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume control to minimum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

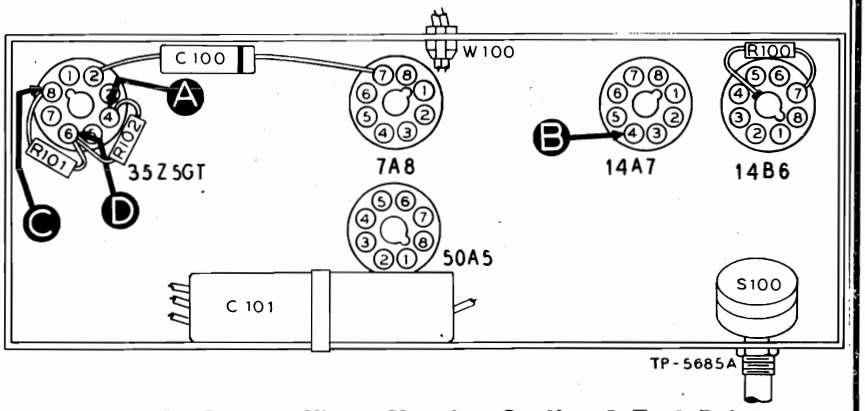

Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	90 v.		Trouble within this section. Isolate by the following tests.
2	C	115 v.	No voltage. Low voltage. High voltage.	Defective: 35Z5GT. Open: S100, W100. Shorted: C101A. Leaky: C101A. Open: R101.

4	A	90 v.	No voltage. Low voltage. High voltage.	Shorted: C101C. Open: R102. Leaky: C101B, C101C. Open: R204.*
Listening Test: Abnormal hum may be caused by open C101A, C101B, or C101C.				

* This part, located in another section, may cause abnormal indication in this section.

Section 2—Audio Circuits

TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

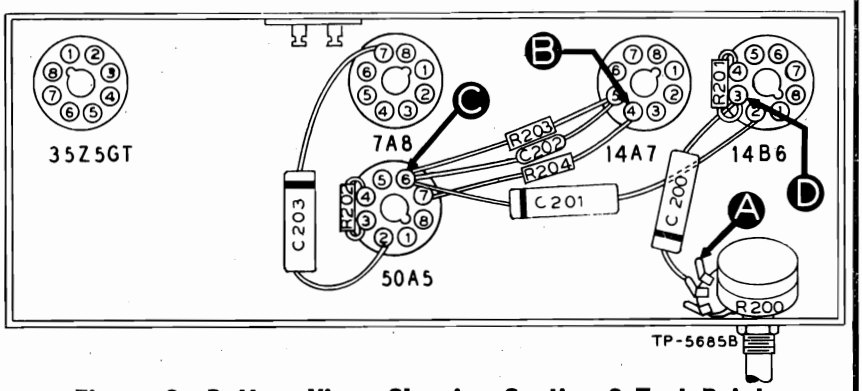

Figure 2. Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble within this section. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 50A5, LS200. Shorted: C202, C203. Open: R204, T200.
3	D	Same as step 1.	Defective: 14B6. Shorted: C201. Open: R201, R202, C201.
4	A	Same as step 1.	Shorted: C200, C301D.* Open: R200 (rotate through range).

* This part, located in another section, may cause abnormal indication in this section.

MODEL 49-503 PHILCO CORP.

Section 3—I-F, Detector, and A-V-C Circuits — TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and rotate the tuning control until the tuning condenser is fully meshed.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

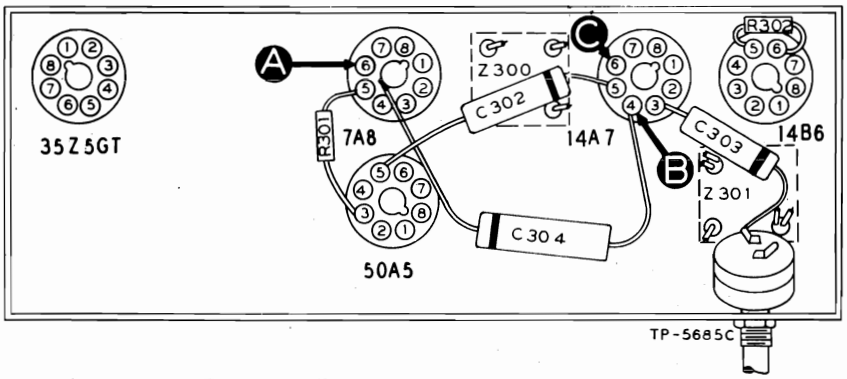

Figure 3. Bottom View, Showing Section 3 Test Points

To provide a complete i-f-amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under the "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble within this section. Isolate by the following tests.
2	C	Same as step 1.	Defective: 14A7, 14B6. Shorted: C303, Z300, Z301. Open: R301, Z300, Z301. Misaligned: Z301.
3	A	Same as step 1.	Defective: 7A8.* Open or shorted: Z300. Misaligned: Z300.

* This part, located in another section, may cause abnormal indication in this section.

Section 4—R-F and Converter Circuits — TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and set the tuning control and the signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

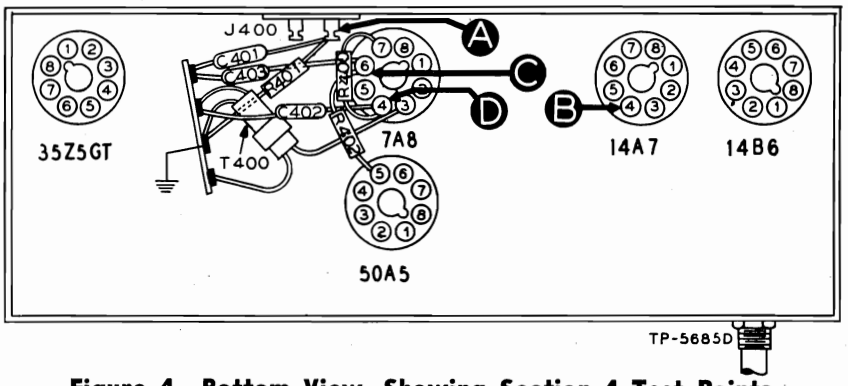

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	1000 kc.	Loud, clear speaker output with weak generator input.	Trouble within this section. Isolate by the following tests.
2	D (Osc. test; see note below.)		Rotate through range.	Negative 7 to 10 volts.	Defective: 7A8. Shorted: C400, C402, C400B. Open: T400, C402, R400.
3	C	1000 kc.	1000 kc.	Same as step 1.	Defective: 7A8. Shorted: C400, C400A, C403.
4	A	1000 kc.	1000 kc.	Same as step 1.	Open: C401, C403. Shorted: LA400.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to B—, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 4 of 7A8), test point D. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage of approximately the value given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part as follows:

C—condenser
I—pilot lamp
L—choke or coil
LA—loop aerial
LS—loud-speaker
R—resistor
S—switch
T—transformer
W—line cord
Z—electrical assembly

The number of the symbol designates the section in which the part is located, as follows:

100-series components are in Section 1—the power supply.
200-series components are in Section 2—the audio circuits.
300-series components are in Section 3—the i-f, detector, and a-v-c circuits.
400-series components are in Section 4—the r-f and converter circuits.

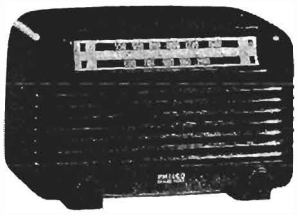
PHILCO CORP.



MODEL 49-504 (Walnut)
MODEL 49-504-I (Ivory)

Circuit Description

The Philco Radio Model 49-504 is a five-tube, table-model superheterodyne, providing reception in the standard-broadcast band.

The high-impedance loop aerial normally provides adequate signal pickup. Provisions are made for the connection of an external aerial.

The loop is coupled to the 7A8 converter. Variable condenser tuning is employed; the oscillator rotor-section plates are properly shaped to obtain tracking, thus eliminating the need for a series padding condenser.

The 7A8 is transformer-coupled to the 14A7 i-f amplifier, which is also transformer-coupled to the diodes of the 14B6 second detector — first audio-frequency amplifier. A-v-c voltage is applied to the control grids of both the i-f and converter tubes.

The triode section of the 14B6 is the first audio stage, and is resistance-coupled to the 50A5 output stage. The output tube is transformer-coupled to the permanent-magnet dynamic speaker.

D-c operating voltages are obtained from the 35Z5GT half-wave rectifier, the output of which is filtered by a two-section resistor-condenser filter.

Condenser C302 in Section 3 is a special condenser, inductively wound to form a series-tuned circuit, resonant at the intermediate frequency. This special condenser offers less impedance at this frequency than a conventional condenser, thus permitting higher i-f gain, with no tendency towards instability. The inductive effect at audio frequencies is negligible. Since the tuning gang is connected to the chassis, by-passing at broadcast frequencies is adequate.

Resistor R100, the 150,000-ohm resistor in Section 1, prevents hum which might otherwise occur under conditions of high humidity.

SPECIFICATIONS

CABINET	Plastic (ivory or walnut)
CIRCUIT	Five-tube superheterodyne
FREQUENCY RANGE	540—1620 kc.
OPERATING VOLTAGE	105—120 volts, a.c. or d.c.
POWER CONSUMPTION	30 watts
AERIAL	Loop fastened to cabinet; terminal also provided for outside aerial
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (5)	7A8, 14A7, 14B6, 50A5, 35Z5GT

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube-electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power.

1. Inspect the top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.
2. Measure the resistance between B+ (pin 8 of the 35Z5GT rectifier) and B- (test point B). When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1500 ohms, check condensers C101A, C101B, and C101C for leakage or shorts. The resistance value, which is much lower than normal, is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 (power supply) are performed.

PHILCO CORP.

MODELS 49-504, 49-504-I

Section 1 — Power Supply

TROUBLE SHOOTING

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a-c.

Turn on the power, and set the volume control to minimum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

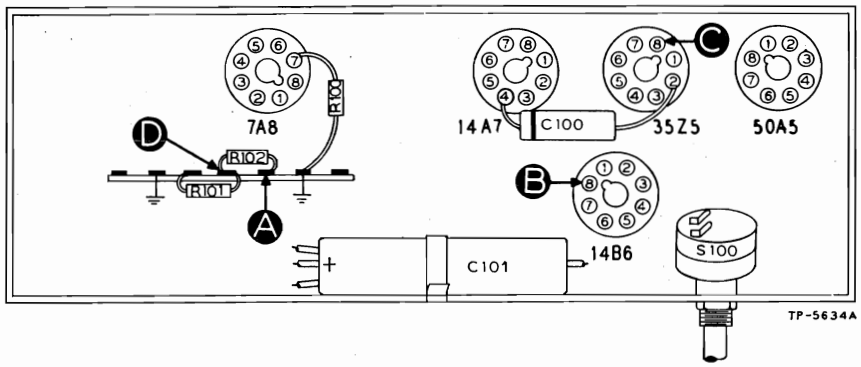


FIGURE 1. BOTTOM VIEW, SHOWING SECTION 1 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	107v		Trouble within this section. Isolate by the following tests.
2	C	130v	No voltage Low voltage High voltage	Defective: 35Z5GT, S100, W100. Shorted: C101A. Defective: 35Z5GT. Open: C101A, 1100. Leaky: C101A. Open: R101, R102, R203*, T200*.
3	D	120v	No voltage Low voltage High voltage	Shorted: C101B. Open: R101. Shorted: C203*. Leaky: C101B, C203*. Open: R102, R203*, T200*.
4	A	107v	No voltage Low voltage High voltage	Shorted: C101C. Leaky: C101C. Open: R203*.
Listening Test: Abnormal hum may be caused by open C101B, C101C, or R100.				

* This part, located in another section, may cause abnormal indication in this section.

Section 2 — Audio Circuits

TROUBLE SHOOTING

For the tests in this section, use an audio signal generator. Connect the ground lead of the generator to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

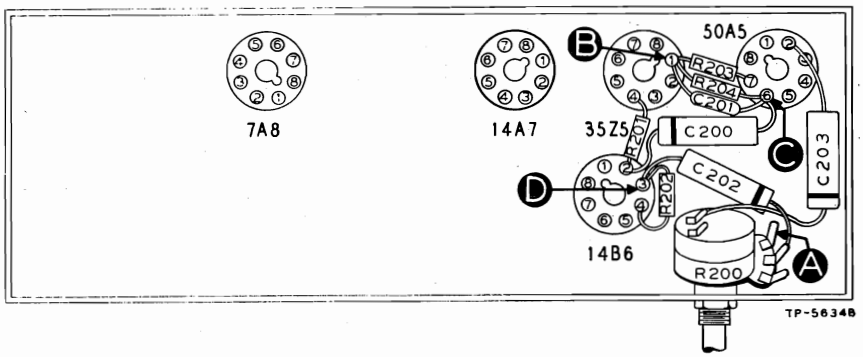

FIGURE 2. BOTTOM VIEW, SHOWING SECTION 2 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	Clear signal with strong signal input.	No signal—Open or shorted: LS200, T200. Shorted: C201, C203. Open: R203. Defective: 50A5.
3	D	Same as step 1.	Open: R201, R202, R204. Open, shorted, or leaky: C200. Defective: 14B6.
4	A	Same as step 1.	Open: R200 (rotate through entire range). Open, shorted, or leaky: C202. Shorted: C301D*.

* This part, located in another section, may cause trouble in this section.

MODELS 49-504, 49-504-I

PHILCO CORP.

Section 3 — I-F, Detector, and A-V-C Circuits TROUBLE SHOOTING

For the tests in this section use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

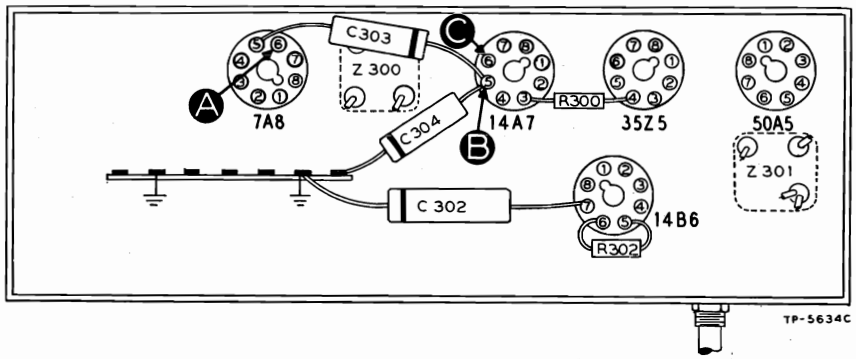

FIGURE 3. BOTTOM VIEW, SHOWING SECTION 3 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	Clear signal with moderate signal input.	Defective or misaligned: Z301. Defective: 14B6 (diode section), 14A7. Open: R300, C302. Shorted, leaky, or open: C303.
3	A	Same as step 1.	Defective or misaligned: Z300. Defective: 7A8*. Open: C302, LA400*.

* This part, located in another section, may cause trouble in this section.

Section 4 — R-F and Converter Circuits TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

Set the radio and signal-generator dials as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section.

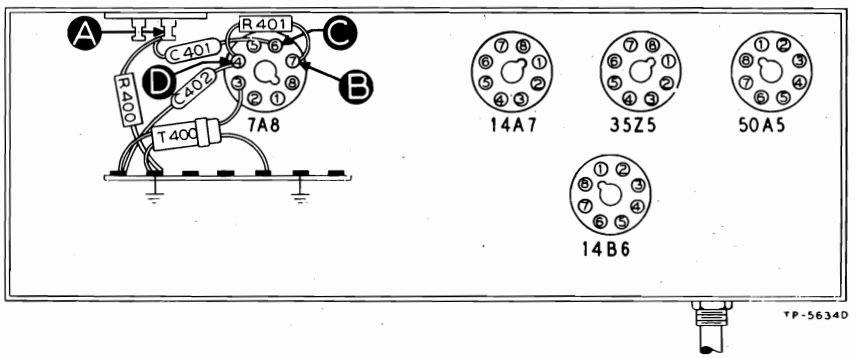

FIGURE 4. BOTTOM VIEW, SHOWING SECTION 4 TEST POINTS

STEP	TEST POINT	DIAL SETTINGS		NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
		SIG. GEN.	RADIO		
1	A	540 kc.	540 kc.	Clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	540 kc.	540 kc.	Same as step 1.	Shorted: C400, C400A. Defective: 7A8. Trouble in oscillator section.
3	D (Osc. test; see note below.)		540 to 1620 kc.	Negative 7 to 11 volts.	Defective: T400, 7A8. Open or shorted: C402. Shorted: C400, C400B.
4	A	540 kc.	540 kc.	Same as step 1.	Defective: LA400. Open C401.

OSCILLATOR-TEST NOTE: Connect positive lead of high-resistance voltmeter to B–, test point B; connect prod end of negative lead through a 100,000-ohm isolating resistor to the 7A8 oscillator grid, test point D. Use suitable meter range, such as 0—50 volts. Proper operation of oscillator is indicated by negative voltage of 7 to 11 volts (measured with a 20,000-ohms-per-volt meter) throughout range of tuning control.

PHILCO CORP.

MODEL 49-505

Circuit Description

The Philco Radio, Model 49-505, is a five-tube, table-model superheterodyne, providing reception in the standard-broadcast band.

The high-impedance loop aerial normally provides adequate signal pickup. Provisions are made for the connection of an external aerial.

The loop is coupled to the 7A8 converter. Variable-condenser tuning is employed; the oscillator rotor-section plates are properly shaped to obtain tracking, thus eliminating the necessity for a series padding condenser.

The 7A8 is transformer-coupled to the 14A7 i-f amplifier, which is also transformer-coupled to the diodes of the 14B6 second detector—first audio-frequency amplifier. A-v-c voltage is applied to the control grids of both the i-f and converter tubes.

The triode section of the 14B6 is the first audio stage, and is resistance-coupled to the 50A5 output stage. The output tube works into a permanent-magnet dynamic speaker.

D-c operating voltages are obtained from the 35Y4 half-wave rectifier, the output of which is filtered by a two-section resistor-condenser filter.

Condenser C302 in Section 3 is a special condenser, inductively wound to form a series-tuned circuit, resonant at the intermediate frequency. This special condenser offers less impedance at this frequency than a conventional condenser, thus permitting higher i-f gain, with no tendency toward instability. The inductive effect at audio frequencies is negligible. Since the tuning gang is connected to the chassis, by-passing at broadcast frequencies is adequate.

Resistor R100, the 150,000-ohm resistor in Section 1, prevents hum which might otherwise occur under conditions of high humidity.

SPECIFICATIONS

CABINET	Plastic (walnut)
CIRCUIT	Five-tube superheterodyne
FREQUENCY RANGE	540—1620 kc.
OPERATING VOLTAGE	105—120 volts, a.c. or d.c.
POWER CONSUMPTION	30 watts
AERIAL	Loop fastened to cabinet; connection also provided for outside aerial
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (5)	7A8, 14A7, 14B6, 50A5, 35Y4

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube-electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power.

1. Inspect the top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.
2. Measure the resistance between B+ (pin 7 of the 35Y4 rectifier) and B— (test point B). When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1500 ohms, check condensers C101A, C101B, and C101C for leakage or shorts.

The resistance value, which is much lower than normal, is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 (power supply) are performed.

PHILCO CORP. MODEL 49-505

Section 1—Power Supply

TROUBLE SHOOTING

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume control to minimum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

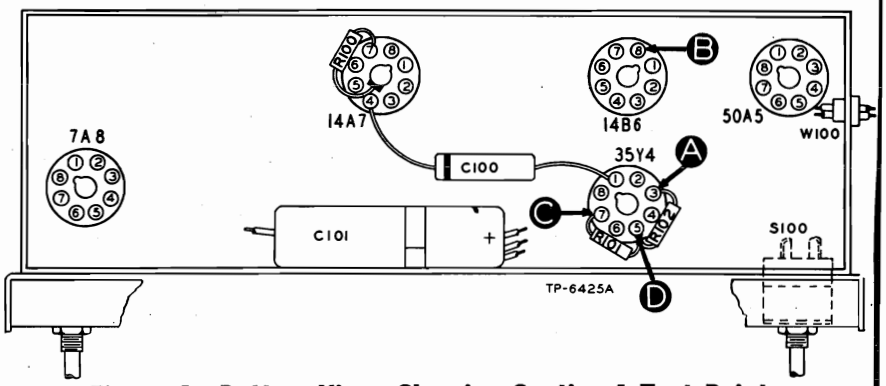

Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	107 volts		Trouble within this section. Isolate by the following tests.
2	C	130 volts	No voltage	Defective: 35Y4, S100, W100. Shorted: C101A.
			Low voltage	Defective: 35Y4. Open: C101A, I100. Leaky: C101A.
			High voltage	Open: R101, R102, R203*, T200*.
3	D	120 volts	No voltage	Shorted: C101B. Open: R101.
			Low voltage	Shorted: C203*. Leaky: C101B, C203*.
			High voltage	Open: R102, R203*, T200*.
4	A	107 volts	No voltage	Shorted: C101C.
			Low voltage	Leaky: C101C.
			High voltage	Open: R203*.
Listening Test: Abnormal hum may be caused by open C101B, C101C, or R100.				

* This part, located in another section, may cause abnormal indication in this section.

Section 2—Audio Circuits

TROUBLE SHOOTING

For the tests in this section, use an audio signal generator. Connect the ground lead of the generator to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits). If not, isolate and correct the trouble in this section.

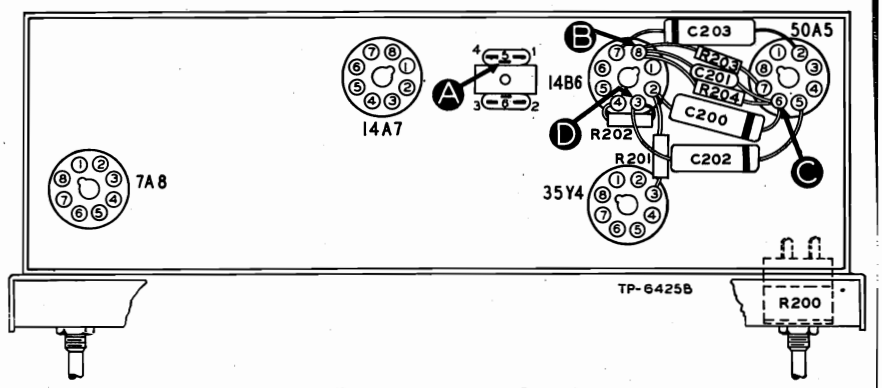

Figure 2. Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	Clear signal with strong signal input.	Open or shorted: LS200, T200. Shorted: C201, C203. Open: R203. Defective: 50A5.
3	D	Same as step 1.	Open: R201, R202, R204. Open, shorted, or leaky: C200. Defective: 14B6.
4	A	Same as step 1.	Defective: R200 (rotate through entire range). Open, shorted, or leaky: C202. Shorted: C301D*.

* This part, located in another section, may cause abnormal indication in this section.

MODEL 49-505 PHILCO CORP.

Section 3—I-F, Detector, and A-v-c Circuits — TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

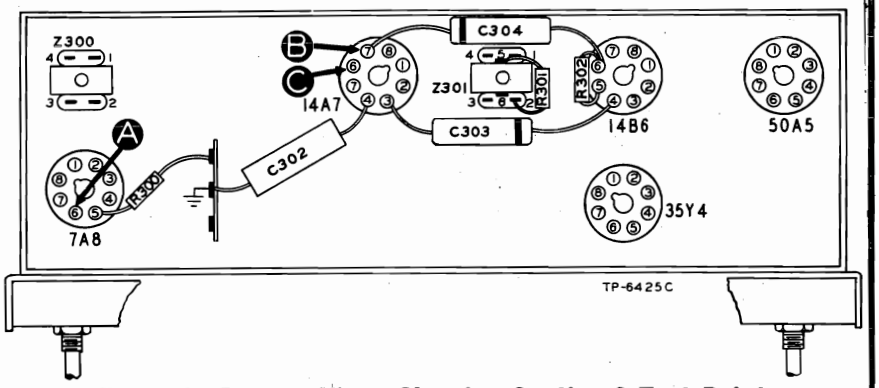

Figure 3. Bottom View, Showing Section 3 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	Clear signal with moderate signal input.	Misaligned: Z301. Defective: 14B6 (diode section), 14A7. Open: R300, C302. Shorted, leaky, or open: C303, Z301.
3	A	Same as step 1.	Defective or misaligned: Z300. Defective: 7A8*. Open: C302, LA400*, Z300. Shorted: Z300.

* This part, located in another section, may cause abnormal indication in this section.

Section 4—R-F and Converter Circuits — TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

Set the radio and signal-generator dials as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section.

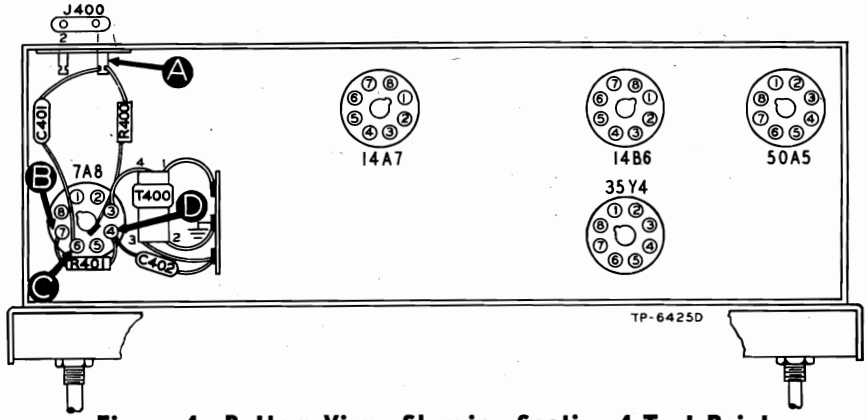

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	DIAL SETTINGS		NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
		SIG. GEN.	RADIO		
1	A	540 kc.	540 kc.	Clear signal with weak signal input.	Trouble within this section. Isolate by the following tests.
2	C	540 kc.	540 kc.	Same as step 1.	Shorted: C400, C400A. Defective: 7A8. Trouble in oscillator section.
3	Oscillator Test (see Note below)		540 to 1620 kc.	Negative 7 to 11 volts.	Defective: 7A8. Open or shorted: C402, T400. Shorted: C400, C400B.
4	A	540 kc.	540 kc.	Same as step 1.	Defective: LA400. Open: C401.

OSCILLATOR-TEST NOTE: Connect positive lead of high-resistance voltmeter to B–, test point B; connect prod end of negative lead through a 100,000-ohm isolating resistor to the 7A8 oscillator grid, test point D. Use suitable meter range, such as 0—50 volts. Proper operation of oscillator is indicated by negative voltage of 7 to 11 volts (measured with a 20,000-ohms-per-volt meter) throughout range of tuning control.

ALIGNMENT PROCEDURE

TURN ON THE RADIO, AND SET THE VOLUME CONTROL TO MAXIMUM

DIAL—Turn tuning condensers to full-mesh position. Set dial pointer to coincide with index mark; see figure 7.

OUTPUT METER—Connect to left (output) terminal of J400 and chassis.

SIGNAL GENERATOR—Connect as indicated in chart. Use modulated output.

OUTPUT LEVEL—During alignment, adjust signal-generator output to hold output-meter indication below 1.25 volts.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTIONS TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Ground lead to B–; output lead through .1-mf. condenser to test point C of Section 4.	455 kc.	540 kc.	Adjust tuning cores, in order given, for maximum output.	TC301B—2nd i-f sec. TC301A—2nd i-f pri. TC300B—1st i-f sec. TC300A—1st i-f pri.
2	Radiating loop (see note below).	1600 kc.	1600 kc.	Adjust for maximum.	C400B—osc.
3	Same as step 2.	1500 kc.	1500 kc.	Adjust for maximum.	C400A—aerial

RADIATING LOOP: Make up a six-to-eight-turn, 6-inch-diameter loop, using insulated wire; connect to signal-generator leads and place near radio loop.

NOTE: TC300A AND TC301A ARE ACCESSIBLE FROM UNDERSIDE OF CHASSIS.

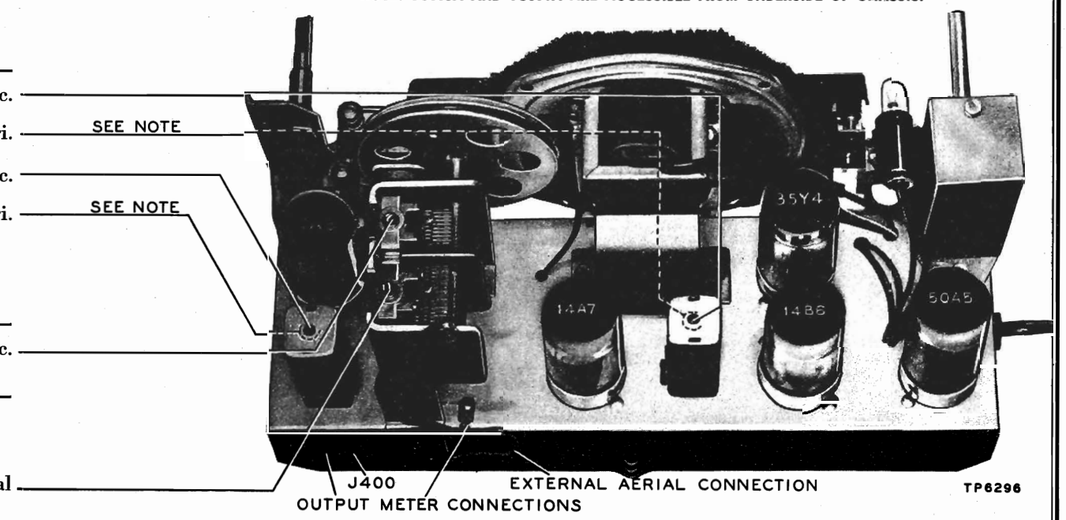

Figure 6. Top View, Showing Trimmer Locations

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C—condenser	LA—loop aerial	S—switch
I—pilot lamp	LS—loud-speaker	T—transformer
L—choke or coil	R—resistor	Z—electrical assembly

The number of the symbol designates the section in which the part is located, as follows:

100-series components are in Section 1—the power supply.
200-series components are in Section 2—the audio circuits.
300-series components are in Section 3—the i-f, detector, and a-v-c circuits.
400-series components are in Section 4—the r-f and converter circuits.

MODEL 49-602 PHILCO CORP.

Circuit Description

Philco Model 49-602 is a portable four-tube superheterodyne providing reception on the standard-broadcast band. A high-impedance loop within the cabinet normally provides adequate signal pickup. However, provisions have been made for connecting an external aerial, if required.

The aerial circuit works directly into a 1R5 converter, where the incoming signal is converted to the 455-kc. intermediate frequency. A 1T4 is used in a single high-gain stage of i-f amplification, which employs neutralization to suppress oscillation. A 1.5-mmf. condenser, C304, feeds part of the i-f voltage, of the proper phase, back to the 1T4 grid through the tube-socket capacitance.

A 1U5 diode-pentode is used in the detector, a-v-c, and first audio circuits. The pentode section is resistance-coupled to a 3V4 pentode output amplifier, which works into a p-m speaker.

The d-c operating voltages are obtained from either a battery pack, Philco type P-361, or from a 105—120 volt, a-c or d-c power line. For power-line operation, the plate, screen, and filament voltages are provided by a power supply using a selenium rectifier, CR100.

SPECIFICATIONS

CABINET	Molded Polystyrene (maroon, tan, ivory or green)
CIRCUIT	Four-tube superheterodyne
FREQUENCY RANGE	540—1600 kc.
AUDIO OUTPUT	160 milliwatts

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire chart.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious sources of trouble.

2. Check the total filament resistance, with the power switch turned on, the battery plug disconnected from the battery, and the change-over switch in the battery position (power-cord plug inserted in receptacle on rear of chassis). If the resistance between the A+ and A—pins on the battery plug is higher than 100 ohms, one of the tube filaments is probably open.

NOTE: If the 3V4 filament is open, check condenser C202 before replacing the tube.

3. Measure the resistance between B+ (output of selenium rectifier), test point D, and B—, test point B. See figure 1. When the ohmmeter leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 2000 ohms, check condensers C101A and C101B for leakage or shorts.

The resistance value above, which is much lower than normal, does not represent a quality check of these condensers; it is the lowest value which will permit the rectifier to operate safely while the voltage checks of Section 1 (power supply) are performed.

Section 1—Power Supply

TROUBLE SHOOTING

Make the tests for this section wi h a d-c voltmeter. Connect the negative lead to B—, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Set the volume control to minimum.

The battery pack should be replaced when the "A" voltage drops below 5 volts, or the "B" voltage drops below 60 volts.

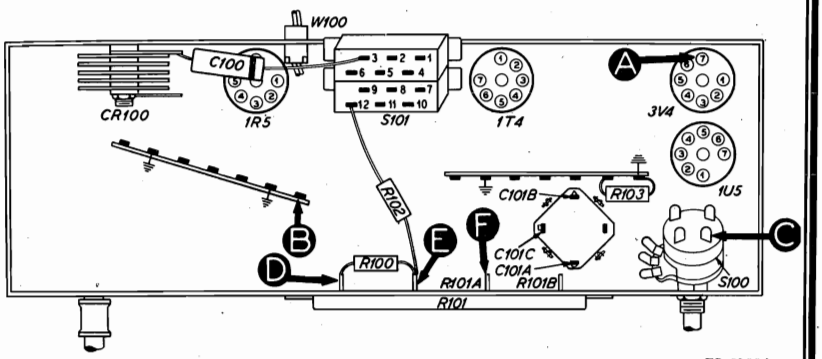

Figure 1. Bottom View, Showing Section 1 Test Points TP-5355A

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1(a) 1(b)	A C	7.5v 90v		Trouble in this section. Isolate by the following tests.
2	D	125v	Low voltage No voltage	Defective: CR100. Open C101A. Defective: CR100. Open: S100, S101.
3	E	120v	Low voltage No voltage	Changed resistance: R100. Leaky: C101A. Open: R100. Shorted: C101A.
4	F	65v	Low voltage No voltage	Changed resistance: R101A. Leaky: C101B. Open: R101A. Shorted: C101B.
5	A	7.5v	Low voltage High voltage No voltage	Changed resistance: R101B. Open: One or more filaments, R205*. Open: R101B, S101.
6	C	90v	Low voltage High voltage No voltage	Changed resistance: R102. Leaky: C101C. Open: R205*, T200*, S100. Open: R102, S101. Shorted: C101C.
Listening Test: Abnormal hum may be caused by open C101B, C101C, or C202*.				

*This part, located in another section, may cause abnormal indication in this section.

Section 2—Audio Circuits

TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

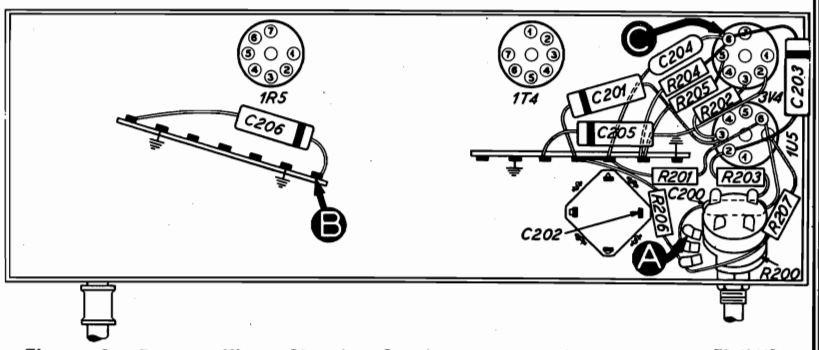

Figure 2. Bottom View, Showing Section 2 Test Points TP-5355B

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with moderate generator input.	Trouble in this section. Isolate by the following tests.
2	C	Clear speaker output with strong generator input.	Defective: 3V4, LS200. Open: R204, T200. Shorted: C203, C204, C205, T200.
3	A	Same as step 1.	Defective: 1U5, R200 (rotate). Open: C200, R201, R202, R203, C203. Shorted: C201, C301C*.
Listening Test: Distortion may be caused by leaky or shorted C203, or by changed resistance of R202. Distortion or strong signals may be caused by leaky or shorted C200.			

*This part, located in another section, may cause abnormal indication in this section.

MODEL 49-602 PHILCO CORP.

Section 3—I-F, Detector, And A-V-C Circuits

TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

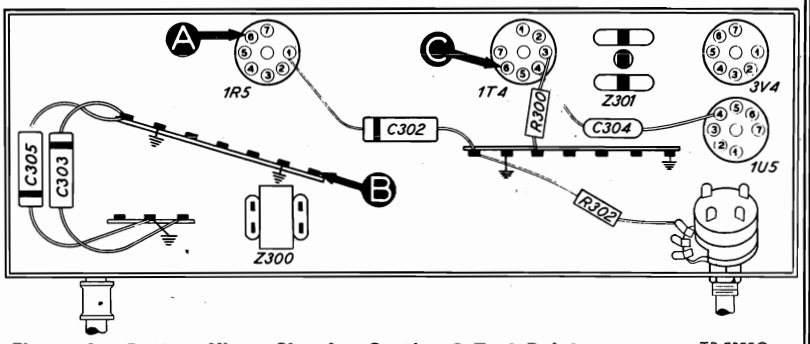

Figure 3. Bottom View, Showing Section 3 Test Points TP-5355C

To provide a complete i-f amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear output with moderate input.	Defective: 1T4, 1U5 (diode section). Misaligned: Z301. Open: R300, C303, L301A, R301, L301B, C301A. Shorted: C300B, C303, L301A, L301B, C301A, C301B.
3	A	Same as step 1.	Defective: 1R5*. Misaligned: Z300. Open: C300A, L300A, L300B, C300B, T400*. Shorted: C400A*, C400B*, C300A, L300A, L300B, C300B.

*This part, located in another section, may cause abnormal indication in this section.

Section 4—R-F And Converter Circuits

TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum. Set the tuning control and signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is obtained in step 1, further tests should be unnecessary; if not, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

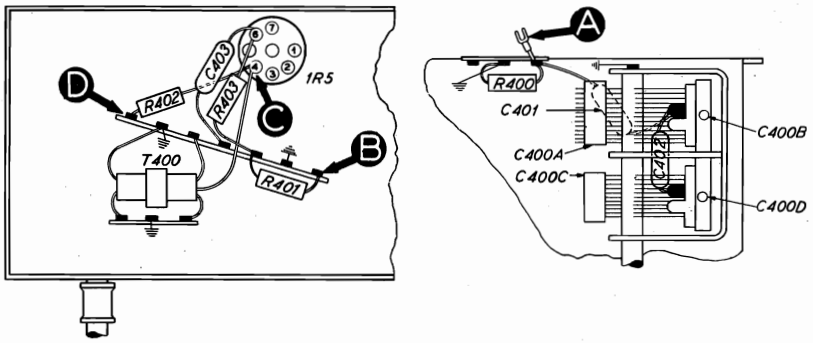

Figure 4. Bottom View, Showing Section 4 Test Points TP-5355D

STEP	TEST POINT	SIGNAL GEN. FREQUENCY	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal.	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C to D (Osc. test; see note below.)		Rotate through range.	Negative 5 to 10 volts.	Defective: 1R5. Open: R402, T400. Shorted: C402, C400C, C400D.
3	A	1000 kc.	Tune to signal.	Same as step 1.	Open: C401, C403, R401, R403, LA400.

PHILCO CORP.

MODEL 49-602

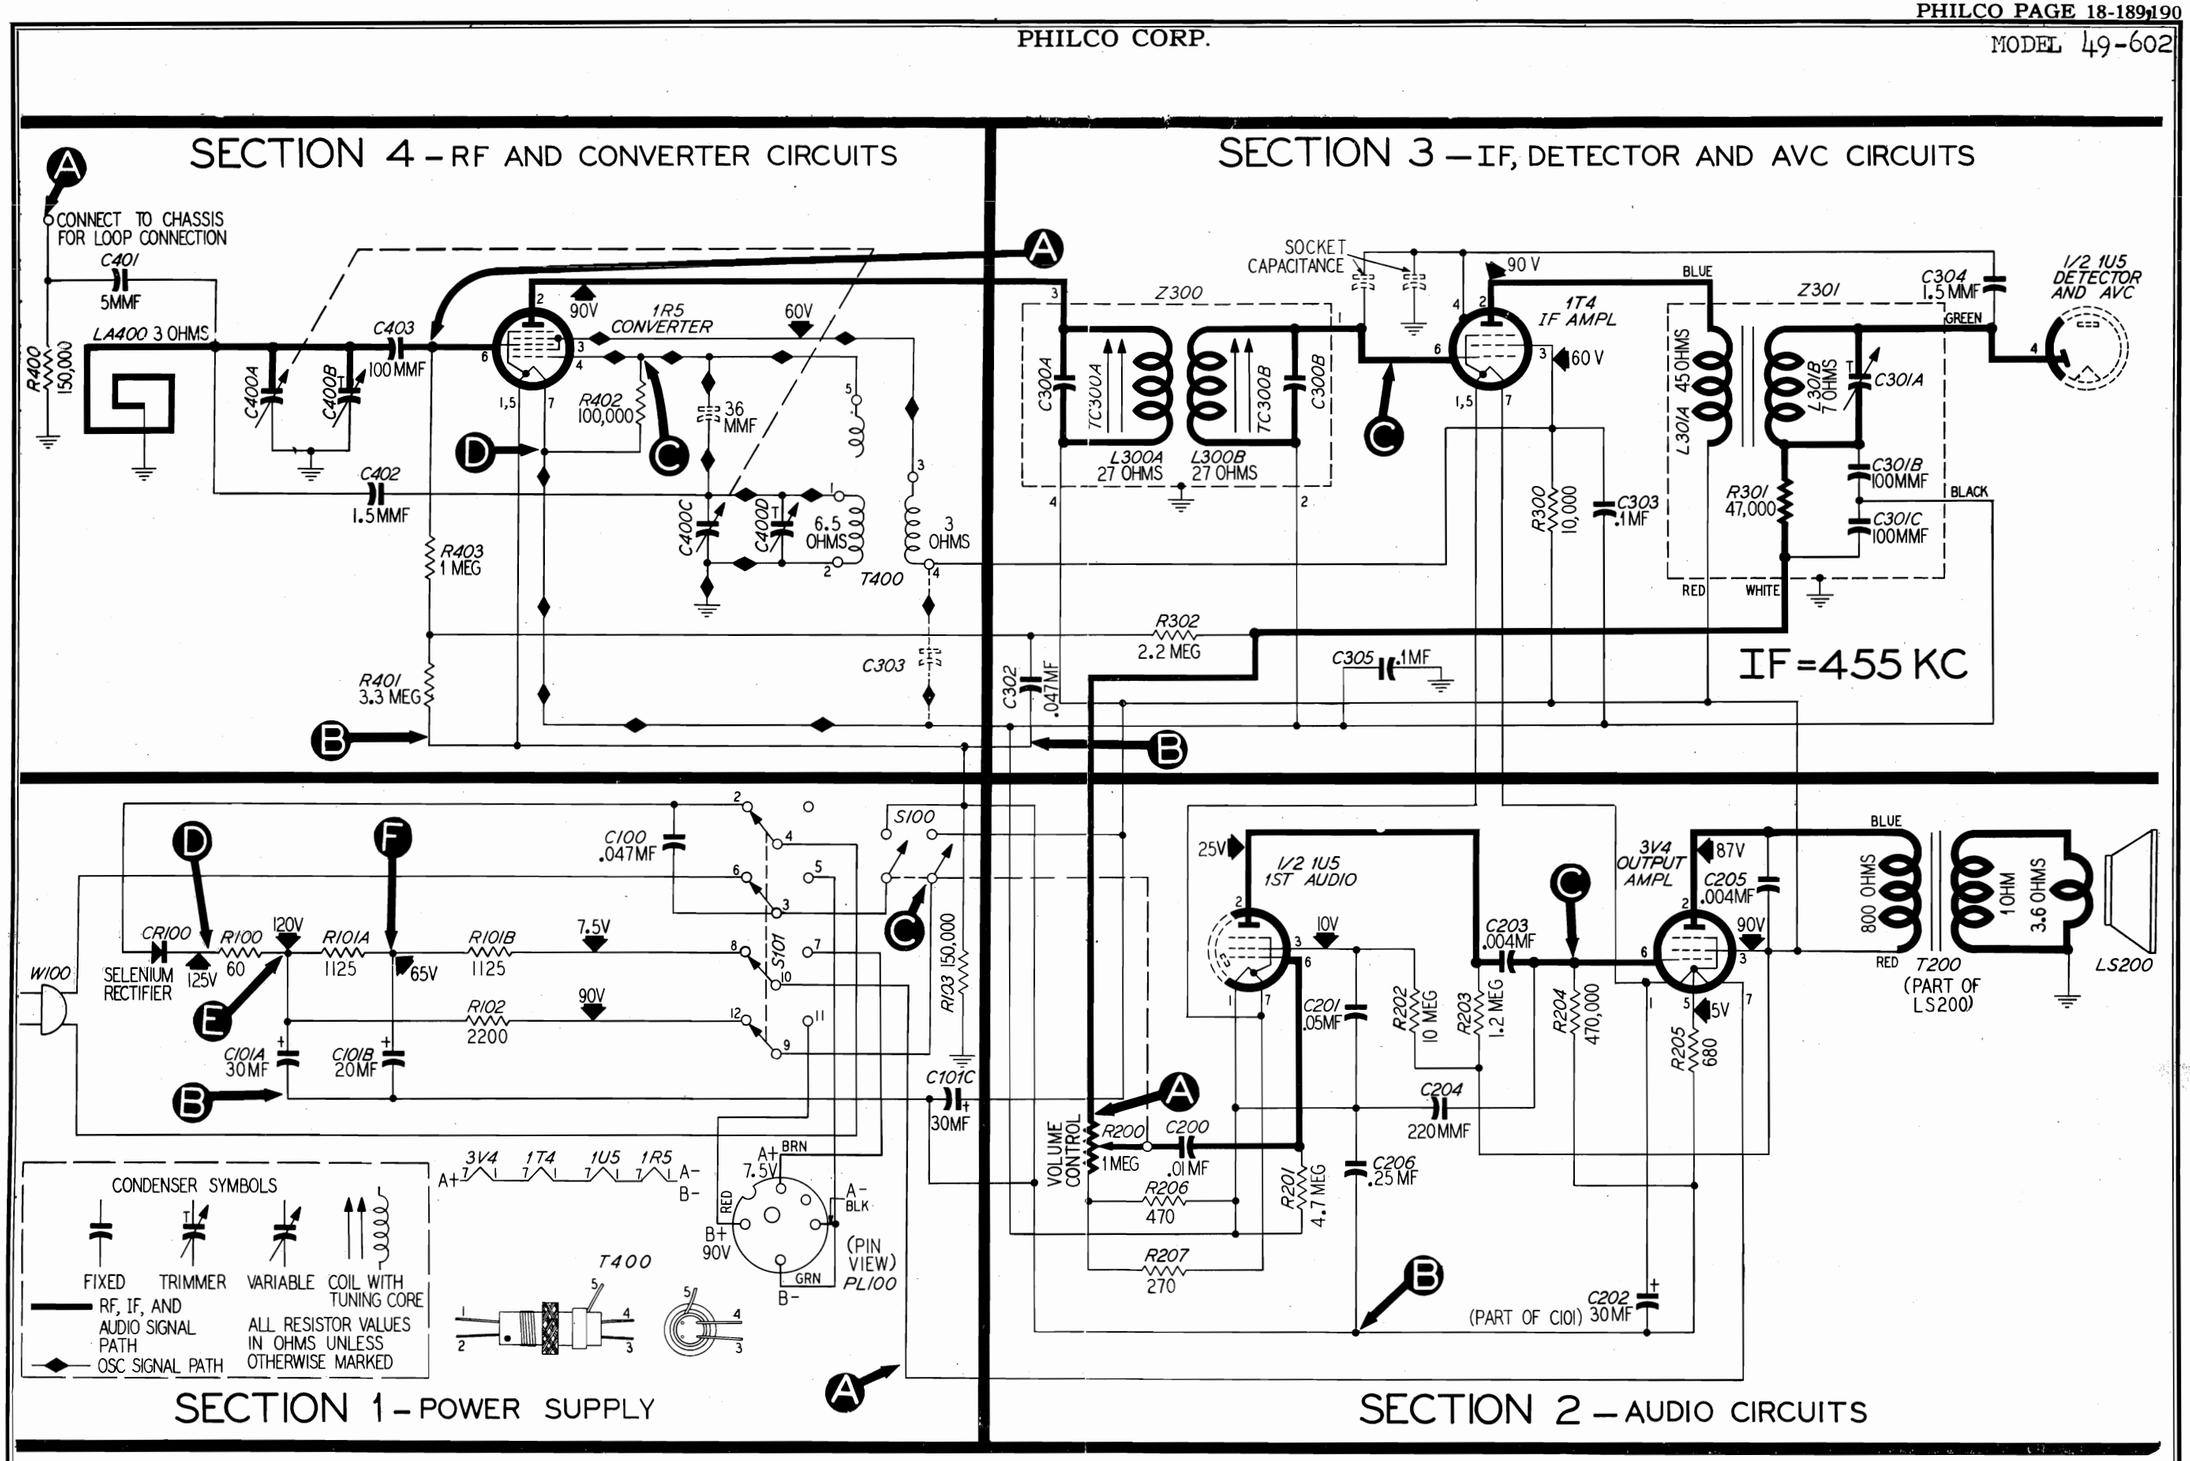

Figure 5. Philco Model 49-602, Sectionalized Schematic Diagram, Showing Test Points

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to test point D; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 4 of the 1R5), test point C. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage within the range given in the chart (measured with a 20,000-ohms-per-volt meter) throughout the tuning range.

ALIGNMENT PROCEDURE

DIAL—Calibration and pointer-index measurements are shown in figure 7. With tuning condenser fully meshed, set pointer to index mark.

RADIO CONTROLS—Set volume control to maximum.

OUTPUT METER—Connect across voice-coil terminals.

SIGNAL GENERATOR—Use modulated output.

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below .5 volt.

SPECIAL NOTE—The orientation of the loop with respect to the chassis is critical for correct tracking. During alignment, with the cabinet back (containing the loop) laid down on the bench, the chassis should be laid on its back, in approximately its normal relation to the loop.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Ground lead to B— (test point B in figure 4). Positive lead through .05-mf. condenser to external-aerial lead. Make sure that radio loop aerial is connected to radio.	455 kc.	Tuning condenser fully meshed.	Adjust, in order given, for maximum output.	C301A—2nd i-f sec. TC300B—1st i-f sec. TC300A—1st i-f pri.
2	Radiating loop (see note below).	1600 kc.	1600 kc.	Adjust for maximum output.	C400D—osc.
3	Same as step 2.	1500 kc.	1500 kc.	Adjust for maximum output while rocking tuning condenser.	C400B—aerial

RADIATING LOOP: Make up a 6—8-turn, 6-inch-diameter loop, using insulated wire; connect to signal-generator leads and place near radio loop aerial. Make sure that radio loop aerial is connected to radio.

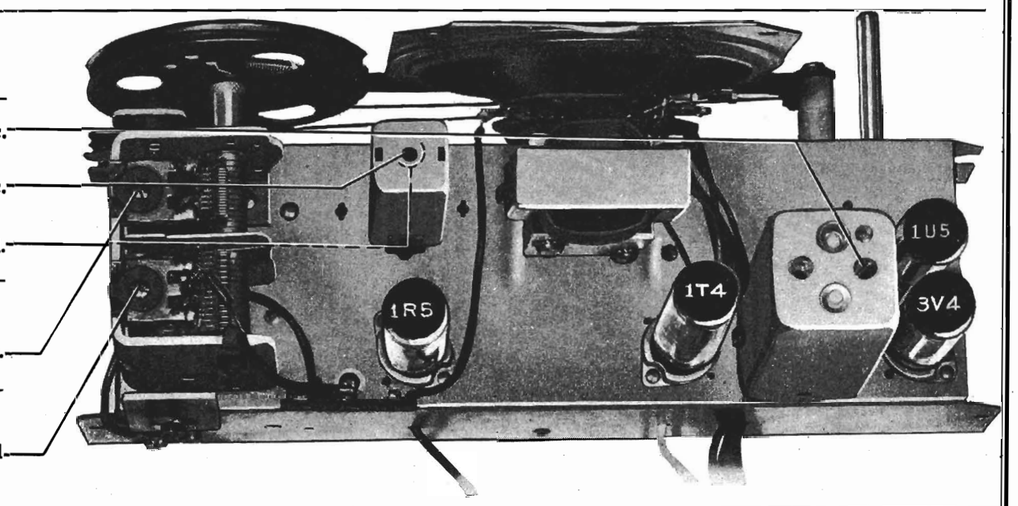

Figure 6. Top View, Showing Trimmer Locations

CALIBRATING DIAL BACKPLATE

When the radio chassis has been removed from the cabinet, dial calibration and alignment points may be marked on the dial (chassis) backplate at the end of the pointer with a pencil. The method of measuring for these points is illustrated in figure 7.

With the tuning gang fully meshed, the pointer should be adjusted on the dial-drive cord to coincide with the index mark.

MODEL 49-605 PHILCO CORP.

Circuit Description

Philco Model 49-605 is a six-tube, portable, superheterodyne radio, operating on a self-contained battery or a standard power source of a.c. or d.c. High sensitivity, selectivity, and power output are outstanding features. The frequency range is 540—1600 kc. The built-in loop aerial is adequate in most localities. Where signal strength is low, an external aerial may be used.

The tuned r-f stage, using a 1T4, provides a high signal-to-noise ratio. The converter employs a type 1R5 pentagrid converter.

The i-f stage, using another 1T4, has double-tuned transformers operating at 265 kc.; the voltage gain of this stage is increased considerably by positive screen feedback taken from the tertiary winding of the second i-f transformer.

The diode section of the 1U5 provides detection and a-v-c voltage. The pentode section functions as the first audio stage; this stage is resistance-coupled to the 3LF4 output amplifier. The speaker is a permanent-magnet dynamic type.

For a-c or d-c power-line operation, plate, screen, and filament power is supplied through the 117Z3 rectifier.

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

MODEL 49-605

SPECIFICATIONS

CABINET	2-piece plastic, metal frame
CIRCUIT	6-tube superheterodyne
FREQUENCY RANGE	540—1600 kc.
AUDIO OUTPUT	160 milliwatts
OPERATING VOLTAGES	Battery: "B", 90 volts; "A", 9 volts. A.c./d.c.: 105—120 volts
POWER CONSUMPTION	Battery: "B", 12 ma. at 90 volts; "A", 50 ma. at 9 volts. A.c./d.c.: 25 watts
AERIAL	Built-in loop; terminal also provided for external aerial
INTERMEDIATE FREQUENCY	265 kc.
PHILCO TUBES (6)	1T4 (2), 1R5, 1U5, 3LF4, 117Z3
BATTERY TYPE	Philco P-841A

TP-5854A

1. Inspect the top and bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.

2. Check the total filament resistance by measuring between the A+ and A– pins on the battery-cable plug (disconnected from battery) while holding down the change-over switch, S100. If the resistance is higher than 100 ohms, one of the tube filaments is probably open.

3. With the change-over switch in the a.c./d.c. position, measure the resistance between B+ (pin 6 of the 117Z3 rectifier) and B–, test point B. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1100 ohms, check condensers C100A, C100B, and C100C for leakage or shorts.

The resistance value above, which is much lower than normal, is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage tests of Section 1 (power supply) are performed.

PHILCO CORP. MODEL 49-605

Section 1

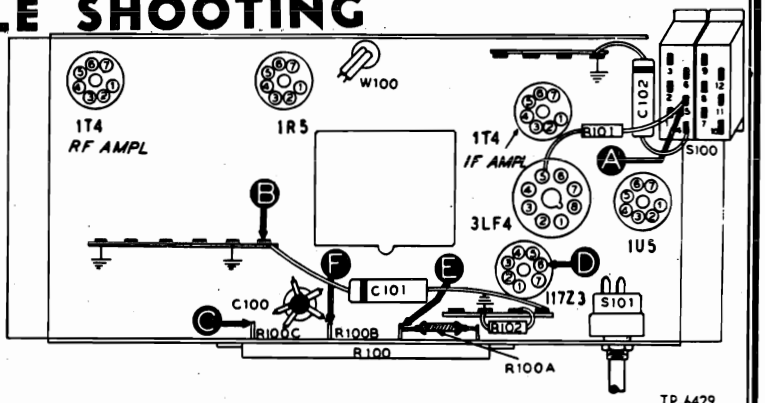
TROUBLE SHOOTING

POWER SUPPLY

For the tests in this section, use a d-c volt meter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume control to minimum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.



TP-6429

FIGURE 1. BOTTOM VIEW, SHOWING SECTION 1 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A C	80 volts 8.5 volts		Trouble in this section. Isolate by the following tests.
2	D	105 volts	High voltage. Low voltage. No voltage.	Open: R100A, R100B, R100C, R101, T200*. Defective: S100, S101. Defective: 117Z3. Leaky: C100A. Leaky or shorted: C100B, C100C, C100D. Defective: 117Z3, S100, S101, W100.
3	E	99 volts	Low voltage. No voltage.	Defective: R100A. Leaky: C100A. Shorted: C100B, C100C, C100D. Open: R100A. Shorted: C100A.
4	F	55 volts	Low voltage. No voltage.	Defective: R100B. Shorted: C100C, C100D. Leaky: C100B. Open: R100B. Shorted: C100B.
5	A	80 volts	Low voltage. No voltage.	Defective: R101. Leaky: C100C. Open: R101. Shorted: C100C.
6	C	8.5 volts	High voltage. Low voltage. No voltage.	Defective: Any tube, R207*, S100, S101. Leaky: C100D. Defective: R100C. Open: R100C. Shorted: C100D.

Listening Test: Distortion or abnormal hum may be caused by open C100B, C100C, or C100D.

* This part, located in another section, may cause abnormal indication in this section.

BATTERY VOLTAGE: Replace battery when (with radio turned on) "B" voltage falls below 60 volts, or "A" voltage falls below 7.2 volts.

Section 2

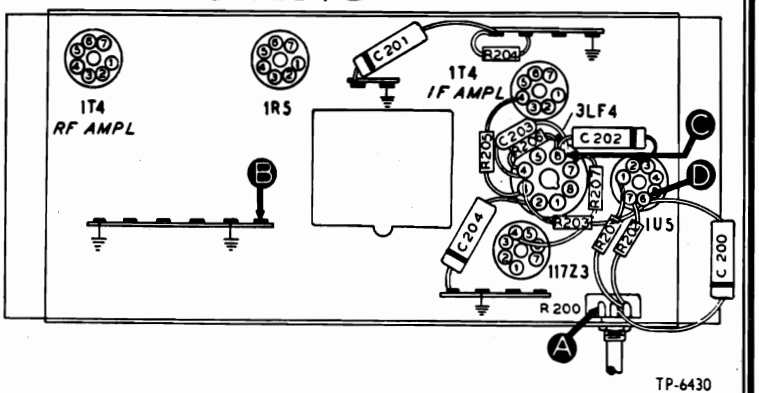
TROUBLE SHOOTING

AUDIO

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum. Adjust the signal-generator output as required for each step.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.



TP-6430

FIGURE 2. BOTTOM VIEW, SHOWING SECTION 2 TEST POINTS

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Clear, signal with strong signal input.	Defective: 3LF4, LS200. Open: T200, R207, R206. Shorted: C203, C204.
3	D	Loud, clear signal with weak signal input.	Defective: 1U5. Open: C202, C201, R205, R204, R203. Shorted or leaky: C202, C201.
4	A	Loud, clear signal with weak signal input.	Defective: R200. Open: C200, R201, R202.

Listening Test: Distortion on strong signals may be caused by shorted or leaky C200.

Section 3 TROUBLE SHOOTING

I-F, DETECTOR, AND A-V-C

For the tests in this section, use an r-f signal generator, with modulated output, set at 265 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

If the "NORMAL INDICATION" is obtained in the first step, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

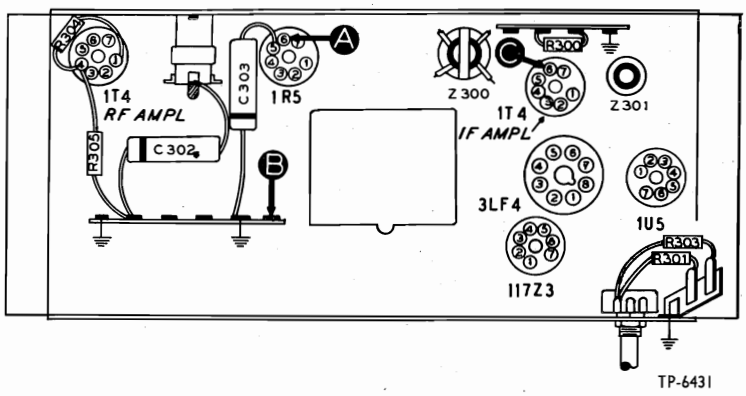


FIGURE 3. BOTTOM VIEW, SHOWING SECTION 3 TEST POINTS

Since the circuit location of test point A for this section is the same as that of test point C for Section 4, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in Section 4; these parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear signal with weak signal input.	Trouble in this section. Isolate by the following tests.
2	C	Clear signal with strong signal input.	Defective: 1T4. Misaligned: Z301. Open: R300, C302, Z301. Shorted or leaky: C302. Shorted: Z301.
3	A	Loud, clear signal with weak signal input.	Defective: 1R5*. Misaligned: Z300. Shorted: C406*, Z300. Open: Z300.

* This part, located in another section, may cause abnormal indication in this section.

Section 4 TROUBLE SHOOTING

R-F AND CONVERTER

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum.

Set the radio and signal-generator dials as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate the trouble by following the remaining steps.

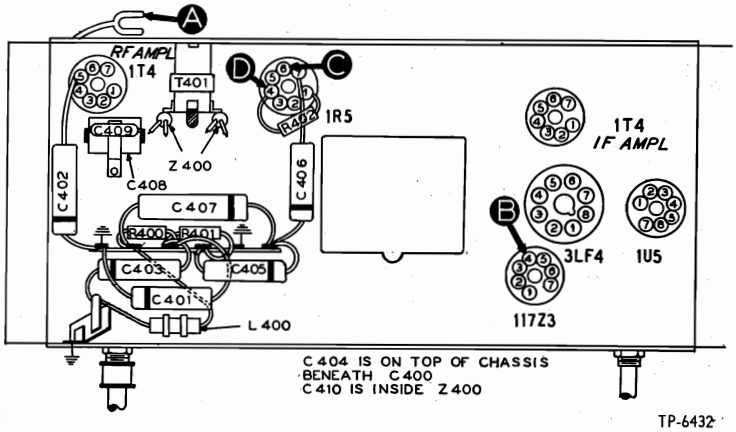

FIGURE 4. BOTTOM VIEW, SHOWING SECTION 4 TEST POINTS (Location of T400 shown in figure 6.)

STEP	TEST POINT	DIAL SETTINGS		NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION

MODEL 49-605

PHILCO CORP.

ALIGNMENT PROCEDURE

THE ALIGNMENT SHOULD BE MADE WITH THE RADIO INSTALLED IN THE CABINET AND THE LOOP CONNECTED

DIAL—Turn tuning condensers to full-mesh position. Set dial pointer to coincide with index mark at low-frequency end of dial (see figure 7).

OUTPUT METER—Connect between chassis and voice-coil terminal on output transformer, T200.

SIGNAL GENERATOR (modulated)—Connect as indicated in chart.

OUTPUT LEVEL—During alignment, adjust signal-generator output to maintain output-meter indication below .4 volt.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTIONS TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Ground lead to lug on T400 (see figure 6); output lead to ext. aerial lug.	265 kc.	Set at index mark.	Turn C300B fully tight, then adjust trimmers, in order given, for maximum output.	C301B C301A C300A C300B
2	Radiating loop (see note below).	1600 kc.	1600 kc.	Adjust for maximum.	C400C
3	Same as step 2.	580 kc.	580 kc.	Adjust for maximum while rocking tuning control.	C408
4	Same as step 2.	1600 kc.	1600 kc.	Adjust for maximum.	C400C
5	Same as step 2.	1500 kc.	1500 kc.	Adjust for maximum.	C400B
6	Same as step 2.	1500 kc.	1500 kc.	Adjust for maximum.	C400A
7	Repeat steps 3, 4, 5, and 6 until no further improvement is obtained.				

RADIATING LOOP: Make up a six-to-eight-turn, 6-inch diameter loop, using insulated wire; connect to signal-generator leads and place near radio loop.

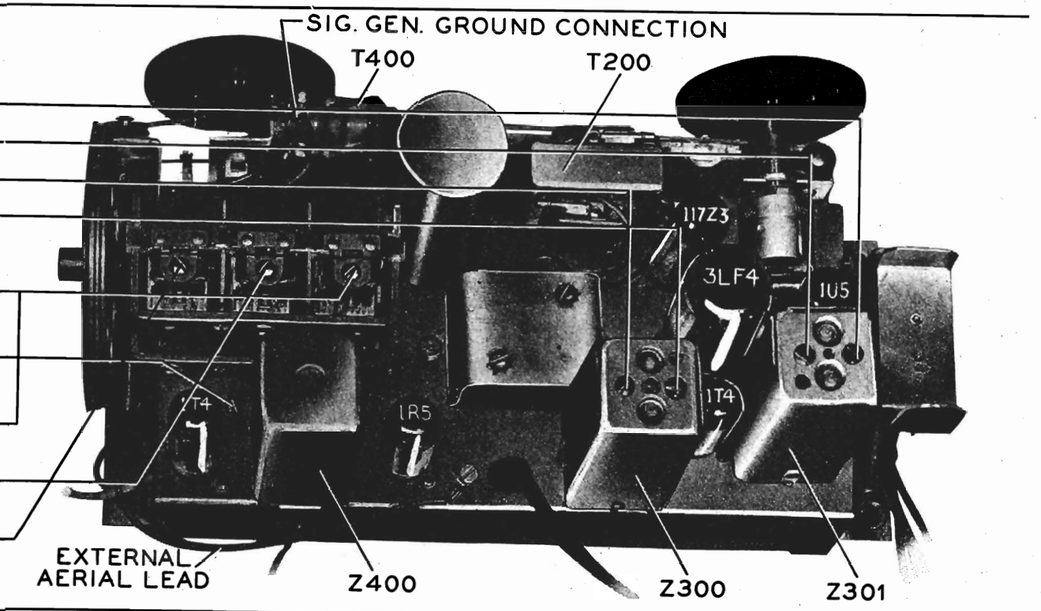

FIGURE 6. TOP VIEW, SHOWING TRIMMER LOCATIONS

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C—condenser
I—pilot lamp
L—choke or coil
LA—loop aerial
LS—loud-speaker
R—resistor
S—switch
T—transformer
Z—electrical assembly

The number of the symbol designates the section in which the part is located, as follows:
100-series components are in Section 1—the power supply
200-series components are in Section 2—the audio circuits
300-series components are in Section 3—the i-f amplifier, detector, and a-v-c circuits
400-series components are in Section 4—the r-f and converter circuits

REPLACEMENT PARTS LIST

NOTE: An asterisk (*) indicates a general replacement item. The part numbers of these items may not be identical with those on factory parts; also, the electrical values of some replacement items may differ from the values given in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

MODEL 49-902 PHILCO CORP.

Section 1—Power Supply

TROUBLE SHOOTING

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B—, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter, at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume control to minimum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

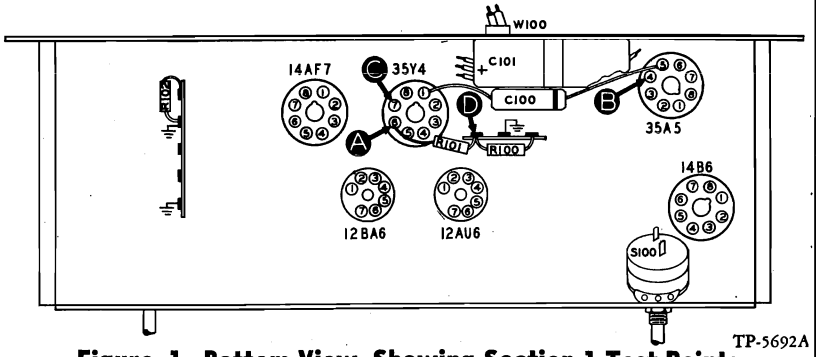

Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	90 volts		Trouble in this section. Isolate by the following tests.
2	C	105 volts	No voltage Low voltage High voltage	Defective: 35Y4. Shorted: C100, C101A. Open: S100, W100. Defective: 35Y4. Leaky: C101A. Shorted: C101B. Open: C101A. Open: R100.
3	D	115 volts	No voltage Low voltage High voltage	Shorted: C101B. Open: C101A. Leaky: C101B. Shorted: C101C, C203*. Open: R101.
4	A	90 volts	No voltage Low voltage	Shorted: C101C. Open: R101. Leaky: C101C. Shorted: C203*, C306*, C408*.
Listening Test: Abnormal hum may be caused by open C101A, C101B, or C101C.				

*This part, located in another section, may cause abnormal indication in this section.

Section 2—Audio Circuits

TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

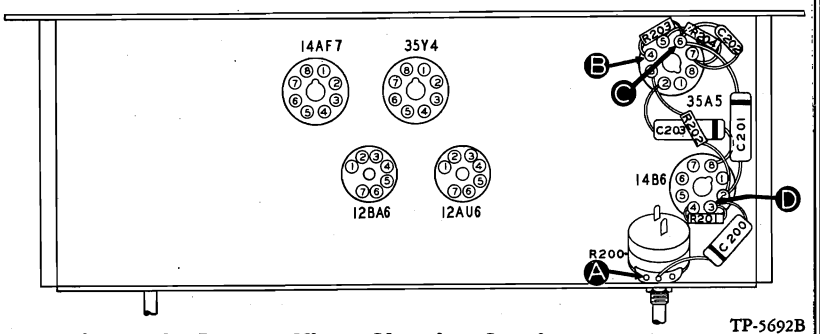

Figure 2. Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 35A5, LS200. Shorted: C202, C203. Open: T200, R204, R203.
3	D	Loud, clear output with weak input.	Defective: 14B6. Shorted: C201. Open: C201, R201, R202.
4	A	Loud, clear output with weak input.	Shorted: C200, C301D*. Open: C200, R200.
Listening Test: Distortion may be caused by shorted or leaky C200, C201.			

*This part, located in another section, may cause abnormal indication in this section.

Section 3—I-F, Detector, and A-V-C Circuits

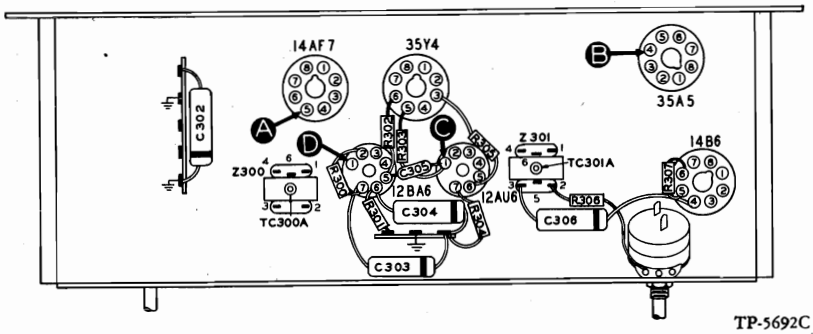
TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

To provide a complete i-f-amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."



TP-5692C

Figure 3. Bottom View, Showing Section 3 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION

3	D	Loud, clear output with moderate input.	Defective: 12BA6. Shorted: C304. Open: C305, R301, R302.
4	A	Loud, clear output with weak input.	Defective: 14AF7. Shorted: C408*, Z300. Open: R401*, R404*, Z300. Misaligned: Z300.

*This part, located in another section, may cause abnormal indication in this section.

Section 4—R-F and Converter Circuits

TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator, with modulated output. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum. Set the tuning control and the signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

REPLACEMENT PARTS LIST

Part numbers identified by an asterisk (*) are general replacement items. These numbers may not be identical with those on factory parts; also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation of the radio will be either unchanged or improved. When ordering replacements, use only the "Service Part No."

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before it is turned on:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.

2. Measure the resistance between B+ (pin 7 of 35Y4 rectifier tube) and the B— bus, test point B. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1500 ohms, check condensers C101A, C101B, C101C, and C203 for leakage or shorts. The resistance value given is much lower than normal, and is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage checks of Section 1 (power supply) are performed.

SPECIFICATIONS

CABINET	Plastic
CIRCUIT	6-tube superheterodyne
FREQUENCY RANGE	540—1620 kc.
AUDIO OUTPUT	1 watt
OPERATING VOLTAGE	105—125 volts, a.c. or d.c.
POWER CONSUMPTION	30 watts
AERIAL	Built-in loop; also connector for external aerial
INTERMEDIATE FREQUENCY	455 kc.

PHILCO CORP.

MODEL 49-902

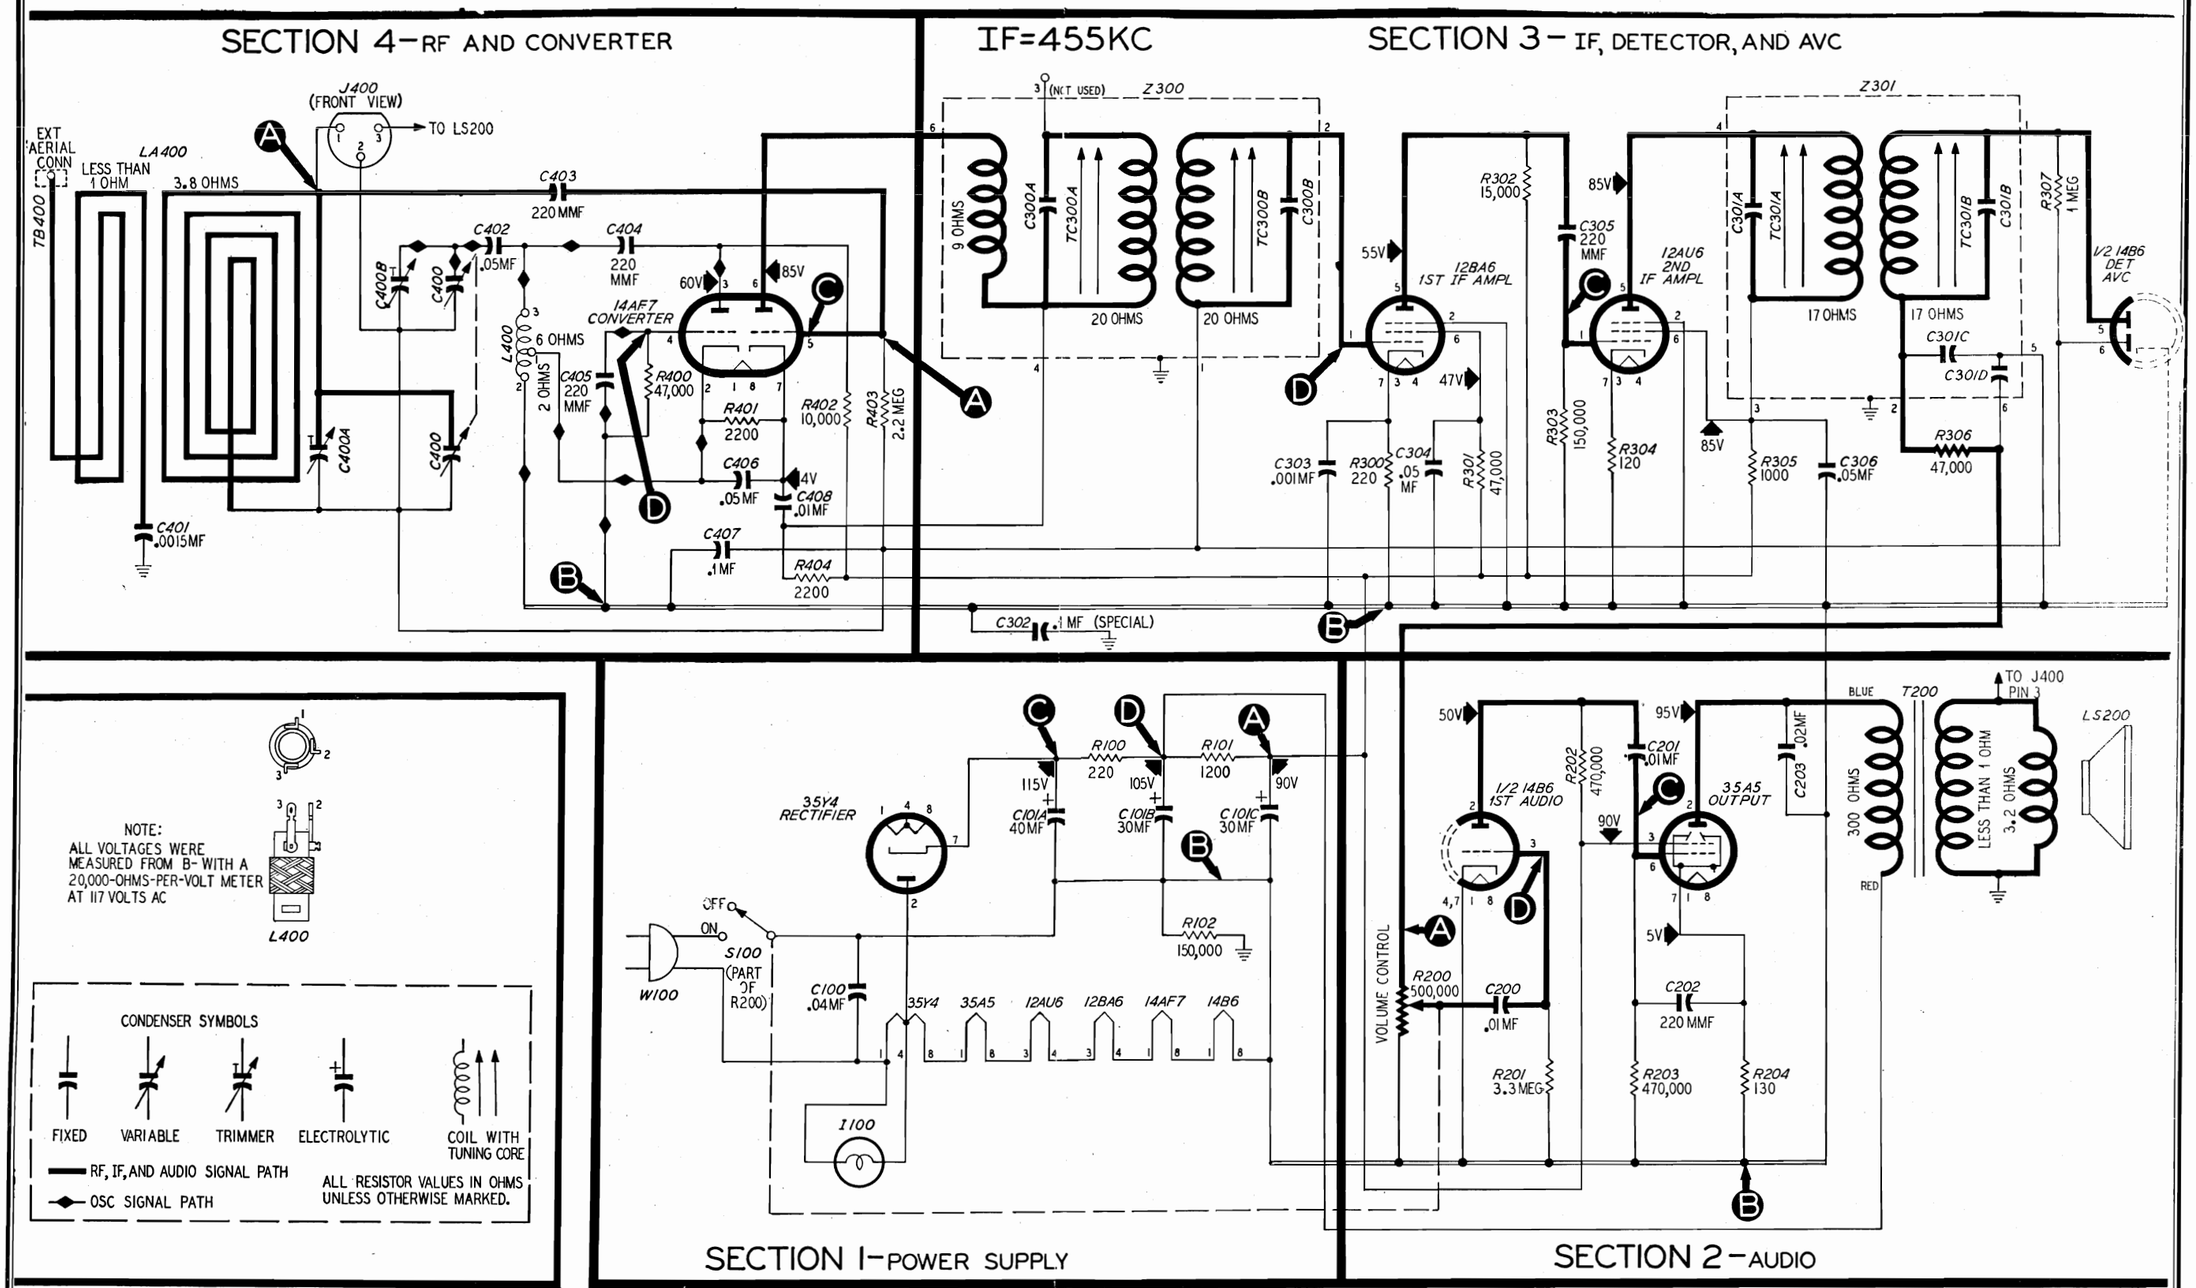

Figure 5. Philco Radio Model 49-902, Sectionalized Schematic Diagram, Showing Test Points

OSCILLATOR TEST

Connect the positive lead of a high-resistance voltmeter to B—, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 4 of 14AF7), test-point D. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage of approximately the value given in the chart (measured with 20,000-ohms-per-volt meter) throughout the tuning range.

MODEL 49-902

PHILCO CORP.

ALIGNMENT PROCEDURE

NOTE: The loop should be connected to the radio during alignment.

RADIO CONTROLS—Set volume control to maximum. Set tuning control as indicated in chart.

SIGNAL GENERATOR—Use modulated output. Connect leads and set frequency as indicated in chart.

OUTPUT METER—Connect across speaker voice-coil terminals (figure 6).

OUTPUT LEVEL—During alignment, adjust signal-generator output to hold output-meter reading below 1.25 volts.

STEP	CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	ADJUST TRIMMER

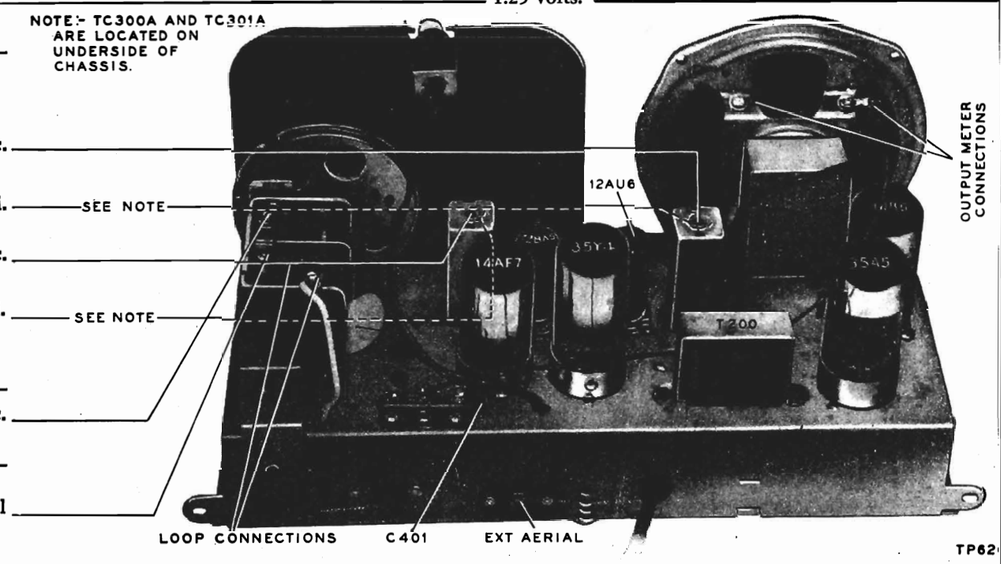

Figure 6. Top View of Chassis, Showing Trimmer Locations

RADIATING LOOP: Make up a 6-to-8 turn, 6-inch-diameter loop, using insulated wire; connect to signal generator leads and place near radio loop.

Circuit Description

Philco Model 49-902 is a 6-tube table-model superheterodyne radio, providing reception in the standard broadcast band.

The loop aerial normally provides adequate signal pickup. If greater pickup is required, an external aerial may be connected.

The loop works into a 14AF7 converter. Condenser tuning is used. The two i-f stages employ two pentode tubes, a 12BA6 and a 12AU6. To obtain stability, resistance coupling is employed between the first and second i-f tubes. One diode (pin 5) of the 14B6 provides detection and a-v-c- voltage. The triode section of this tube functions as the first audio amplifier, and is resistance-coupled to the 35A5 output tube. The speaker is a permanent-magnet dynamic. The power supply employs a 35Y4 rectfiier, working into a resistance-capacitance filter system.

The 150,000-ohm resistor, R102, connected between B- and chassis, prevents hum which might otherwise occur under conditions of high humidity.

The i-f by-pass condenser, C302, is a specially designed, inductively wound condenser, which is series-resonant at the intermediate frequency, 455 kc., thereby functioning as a by-pass of exceptionally low impedance at this frequency.

Philco TROUBLE-SHOOTING *Procedure*

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

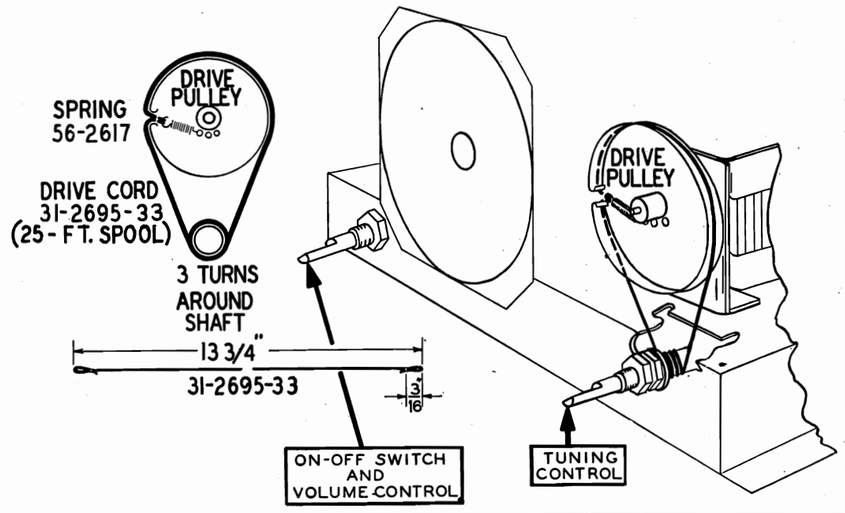

Figure 7. Drive-Cord-Installation Details

PHILCO CORP. MODEL 49-904

Circuit Description

Philco Model 49-904 is a six-tube, manually tuned superheterodyne radio, providing reception on the standard broadcast band, 540—1620 kc., and on the short-wave range between 5.8 mc. and 15.5 mc. A low-impedance loop within the cabinet normally provides adequate signal pickup. Where additional pickup is required, an external aerial may be used. Do not use a ground.

The converter, employing a type 14AF7 twin triode, provides high signal-to-noise ratio and high conversion efficiency. The oscillator section of the tuning-condenser gang is shaped for correct tracking on the short-wave band. An adjustable series tracking padder is used for tracking on the broadcast band.

The i-f circuit employs two tubes; a 12BA6 1st i-f amplifier is resistance-coupled to a 12AU6 2nd i-f amplifier. Both i-f transformers have permeability-tuned primary and secondary windings.

The diode section of the 14B6 provides detection and a-v-c voltage, the triode section functions as the first audio amplifier, which is resistance-coupled to the type 35A5 audio output tube. A tone control is connected across the plate circuit of the 14B6 triode section.

The d-c operating voltages are furnished by a 35Y4 half-wave rectifier, working into a resistance-capacitance filter system. A 150,000-ohm resistor is connected between the B– bus and the chassis, to prevent hum which might otherwise occur under conditions of high humidity.

C306 is a special condenser, inductively wound to act as a series-resonant circuit at the intermediate frequency (455 kc.). This condenser provides an exceptionally low-impedance i-f by-pass between B– and the chassis.

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, with test points specified for each section; these sections and test points are indicated in the schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire test procedure.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before it is turned on:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.

2. Measure the resistance between B+ (pin 7 of 35Y4 rectifier) and B–, test point B. When the ohmmeter test leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 1500 ohms, check condensers C102, C101A, C101B, and C204 for leakage or shorts. The resistance value given is much lower than normal, and is not intended as a quality check of these condensers; the value given is the lowest at which the rectifier will operate safely while the voltage checks of Section 1 (power supply) are performed.

SPECIFICATIONS

CABINET	Plastic, brown
CIRCUIT	6-tube superheterodyne
FREQUENCY RANGES	
Broadcast	540—1620 kc.
Short Wave	5.8—15.5 mc.
AUDIO OUTPUT	1 watt
OPERATING VOLTAGE	105—120 volts, a.c. or d.c.
POWER CONSUMPTION	30 watts
AERIAL	Built-in loop; terminal also provided for external aerial
INTERMEDIATE FREQUENCY	455 kc.
PHILCO TUBES (6)	14AF7, 12BA6, 12AU6, 14B6, 35A5, 35Y4

TP-6153A

MODEL 49-904 PHILCO CORP.

Section 1—Power Supply

TROUBLE SHOOTING

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B–, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20-000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

Turn on the power, and set the volume control to minimum. Set the tone control for minimum treble response (fully clockwise), and set the band switch to the broadcast position.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

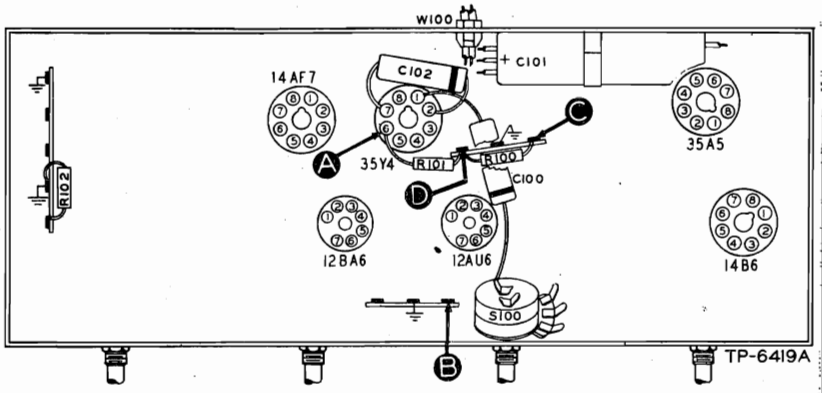

Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	85 volts		Trouble in this section. Isolate by the following tests.
2	C	115 volts	No voltage	Defective: 35Y4. Open: W100, S100. Shorted: C102, C101A.
			Low voltage	Defective: 35Y4. Leaky: C102, C101A. Shorted: C101B, C101C, C204*. Open: C101A.
			High voltage	Open: R100, R101.
3	D	105 volts	No voltage	Open: R100. Shorted: C101B.
			Low voltage	Leaky: C101B, C101C. Shorted: C204*, C101C.
			High voltage	Open: R101, T200*, R205*.
4	A	85 volts	No voltage	Open: R101. Shorted: C101C.
			Low voltage	Leaky: C101C. Shorted: C310*.
Listening Test: Abnormal hum may be caused by open or leaky C100, C101A, C101B, C101C.				

* This part, located in another section, may cause abnormal indication in this section.

Section 2—Audio Circuits

TROUBLE SHOOTING

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and set the tone control for maximum treble response (fully counterclockwise).

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

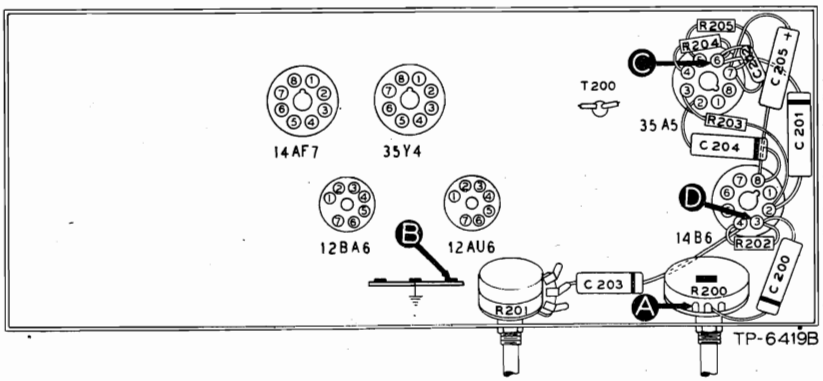

Figure 2. Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with moderate generator input.	Trouble in this section. Isolate by the following tests.
2	C	Clear output with strong input.	Defective: LS200, 35A5. Shorted: T200, C204, C201, C202, C205. Open: T200, R205, R204, C205. Leaky: C204, C201.
3	D	Same as step 1.	Defective: 14B6. Open: C201, R202, R203. Shorted: C203 (rotate tone control).
4	A	Same as step 1.	Defective: R200 (rotate). Open: C200. Shorted: C301D*.
Listening Test: Distortion may be caused by shorted or leaky C200 or C201.			

* This part, located in another section, may cause abnormal indication in this section.

PHILCO CORP. MODEL 49-904

Section 3—I-F, Detector, and A-v-c Circuits

TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and set the tone control for maximum treble response (fully counterclockwise). Set the band switch to the broadcast position, and rotate the tuning control until the tuning condenser is fully meshed.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

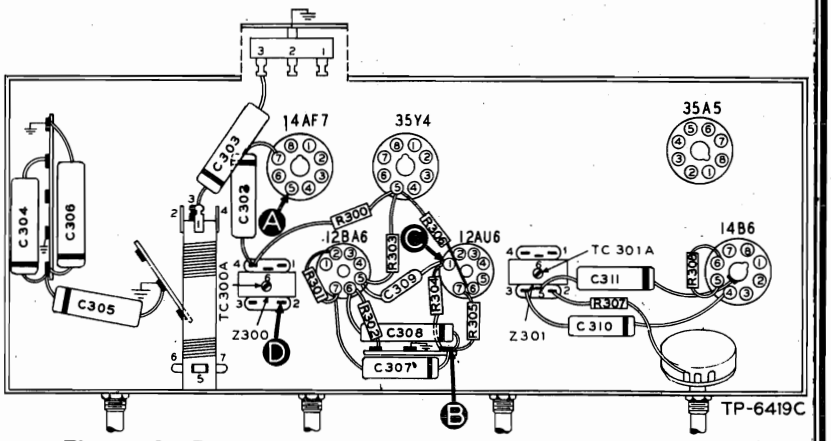

Figure 3. Bottom View, Showing Section 3 Test Points

To provide a complete i-f-amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 14B6, 12AU6. Open: R304, R305, R306, R307, Z301. Shorted: C309, C310, C301C, Z301. Misaligned: Z301.
3	D	Loud, clear output with moderate input.	Defective: 12BA6. Open: R301, R302, R303, C309, Z300. Shorted: C308, C309, Z300.
4	A	Loud, clear output with weak input.	Defective: 14AF7. Open: R401*, R403*, R300, Z300. Shorted: C409*, C302, Z300. Misaligned: Z300.

* This part, located in another section, may cause abnormal indication in this section.

Section 4—R-F and Converter Circuits

TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B–, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the volume control to maximum, and set the tone control for maximum treble response (fully counterclockwise). Set the band switch, the tuning control, and the signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is not obtained in step 1, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

5	C Osc. test; (see note on p. 5)		SW	Rotate through range.	–.8v to –2v	Defective: 14AF7. Open: C403, L402, T400, WS. Shorted: C401C, T400, WS.

SW CIRCUITS

STEP	TEST POINT	SIG. GEN. FREQ.	BAND SWITCH	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
6	A	15 mc.	SW	15 mc.	Same as step 1.	Defective: 14AF7. Open: L401, C404, WS. Shorted: WS, L401.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to B–, test point B; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 4 of 14AF7), test point C. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage, of approximately the value given in the chart (measured with 20,000-ohms-per-volt meter), throughout the tuning range.

MODEL 49-904

PHILCO CORP.

ALIGNMENT PROCEDURE

DIAL—Calibration and pointer-index measurements are shown in figure 8. With tuning condenser fully meshed, set pointer to index mark.

OUTPUT METER—Connect to terminals indicated in figure 7.

SIGNAL GENERATOR—Connect as indicated in chart. Use modulated output.

RADIO CONTROLS—Set volume control to maximum, and tone control fully counterclockwise (treble). Set band switch and tuning control as indicated in chart.

OUTPUT LEVEL—During alignment, adjust signal-generator output to hold output-meter indication below 1.25 volts.

STEP	SIGNAL GENERATOR		RADIO			ADJUST
	CONNECTION TO RADIO	DIAL SETTING	BAND SWITCH	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Ground lead to B–; output lead through .1-mf. condenser to tuning-condenser stator (aerial section).	455 kc.	BC	540 kc.	Adjust, in order given, for maximum output.	TC301B—2nd i-f sec. TC301A—2nd i-f pri. TC3008—1st i-f sec. TC300A—1st i-f pri.
2	Radiating loop (see note below).	580 kc.	BC	580 kc.	Adjust for maximum.	C401A—BC osc. (series)
3	Same as step 2.	1600 kc.	BC	1600 kc.	Adjust for maximum.	C401B—BC osc. (shunt)
4	Same as step 2.	15 mc.	SW	15 mc.	Adjust for maximum on first peak from loose position. Image should be heard with signal generator set at 14.1 mc.	C401C—SW osc.
5	Same as step 2.	15 mc.	SW	15 mc.	Adjust for maximum from tight position.	C400A—SW aerial
6	Same as step 2.	1500 kc.	BC	1500 kc.	Adjust for maximum.	C402—BC aerial
7	Same as step 2.	580 kc.	BC	580 kc.	Adjust for maximum while rocking tuning control.	C401A—BC osc. (series)
8	Same as step 2.				Repeat steps 3 and 7 until no further improvement is noted, then repeat step 3.	

RADIATING LOOP: Make up a 6—8 turn, 6-inch-diameter loop from insulated wire; connect to signal-generator leads and place near radio loop aerial. Make sure that loop aerial is connected to radio.

NOTE:- TC300A AND TC301A ARE LOCATED ON UNDERSIDE OF CHASSIS.

PHONOGRAPH	Philco Automatic Record Player Model M-9C (for service information see manual PR-1599)

Circuit Description

Philco Radio-Phonograph Model 49-1405 is a table-model 5-tube superheterodyne radio with a Model M-9C Automatic Record Changer. For service information on the record changer, refer to the Service Manual (PR-1599) for Model M-9C Automatic Record Changer.

Reception is provided on the standard broadcast band.

The built-in loop aerial normally provides adequate signal pickup; however, a terminal is provided for an external aerial, if additional pickup is required.

The loop works directly into a 12BE6 converter; no series padder is required for the oscillator, as the tuning-condenser plates are shaped for tracking.

The i-f stage employs a 12BA6, operating at 455 kc. Both transformers are permeability-tuned in both primary and secondary windings.

The diode section of a 6AQ6 provides detection and a-v-c voltage; the triode section is the 1st audio amplifier, and is resistance-coupled to a 35L6GT beam-power output amplifier, which works into a PM speaker.

The d-c operating voltages are supplied by a voltage-doubling circuit using a 50Y7GT rectifier and a resistance-capacitance filter.

The 120,000-ohm resistor, R103, is connected between B— and the chassis, to prevent hum due to condenser leakage under high-humidity conditions.

Philco TROUBLE-SHOOTING Procedure

For rapid trouble shooting, the radio circuit is divided into four sections, as follows:

Section 1—the power supply

Section 2—the audio circuits

Section 3—the i-f, detector, and a-v-c circuits

Section 4—the r-f and converter circuits

Test points are specified for each section, and are indicated in the sectionalized schematic diagram. The trouble-shooting procedure given for each section includes a simplified test chart and a bottom view of the chassis showing the locations of the test points and the components of that section.

In each chart, the first step is a master check for determining whether trouble exists in that section, without going through the entire chart.

Failure to obtain the "NORMAL INDICATION" in any given step indicates trouble within the circuit under test.

After isolating the trouble to a single stage, the defect is located by: first, testing the tube; second, measuring tube electrode voltages; third, measuring circuit resistances; fourth, substituting condensers. The trouble revealed should be corrected before testing further.

Preliminary Checks

To avoid possible damage to the radio, the following preliminary checks should be made before turning on the power:

1. Inspect both the top and the bottom of the chassis. Make sure that all tubes are secure in the proper sockets, and look for any broken or shorted connections, burned resistors, or other obvious indications of trouble.

2. Measure the resistance between B+ (pin 4 of the 50Y6GT) and B—, test point B. When the ohmmeter leads are connected in the proper polarity, the highest resistance reading will be obtained. If the reading is lower than 2000 ohms, check condenser C102A for leakage or a short. This resistance value, which is much lower than normal, does not represent a quality check of this condenser; it is the lowest value which will permit the rectifier to operate safely while the voltage checks of Section 1 (power supply) are performed.

MODEL 49-1405 PHILCO CORP.

Section 1—Power Supply

For the tests in this section, use a d-c voltmeter. Connect the negative lead to B—, test point B; connect the positive lead to the test points indicated in the chart. The voltage readings given were taken with a 20,000-ohms-per-volt meter at a line voltage of 117 volts, a.c.

TROUBLE SHOOTING

Turn on the power, and set the volume control to minimum.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 2 (audio circuits); if not, isolate and correct the trouble in this section.

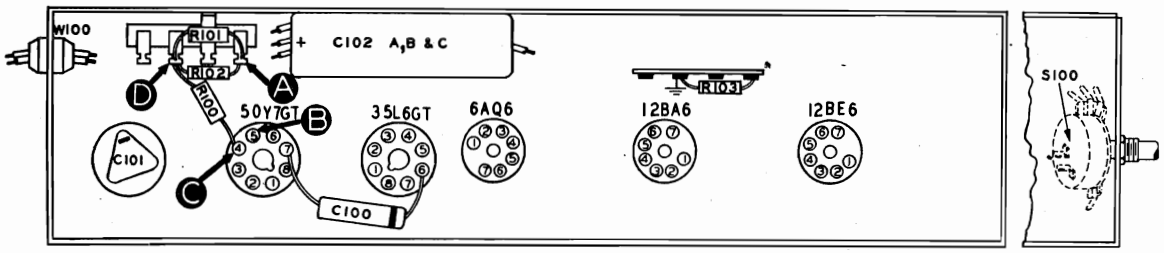

Figure 1. Bottom View, Showing Section 1 Test Points

STEP	TEST POINT	NORMAL INDICATION	ABNORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	120 volts		Trouble in this section. Isolate by the following tests.
2	C	212 volts	No voltage	Defective: 50Y7GT, I100. Shorted: C100, C101, C102A.
			Low voltage	Leaky: C100, C101, C102A.
			High voltage	Open: R100.
3	D	205 volts	No voltage	Defective: 50Y7GT. Shorted: C102B. Open: R100.
			Low voltage	Leaky: C102B.
			High voltage	Open: R101, R102, T200*.
4	A	120 volts	No voltage	Shorted: C102C. Open: R101 and R102 (in parallel).
			Low voltage	Leaky: C102C.

* This part, located in another section, may cause abnormal indication in this section.

Section 2—Audio Circuits

For the tests in this section, use an audio-frequency signal generator. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

TROUBLE SHOOTING

Set the radio volume control to maximum, and the radio-phono switch as indicated in the chart.

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 3 (i-f, detector, and a-v-c circuits); if not, isolate and correct the trouble in this section.

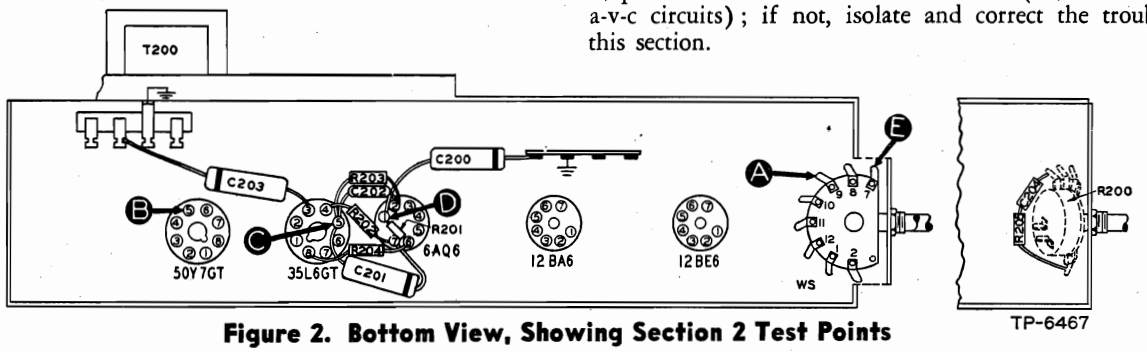

Figure 2. Bottom View, Showing Section 2 Test Points

STEP	TEST POINT	RADIO-PHONO SWITCH	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1 (a)	A	Radio	Loud, clear speaker output with moderate generator input.	Trouble in this section. Isolate by the following tests.
1 (b)	E	Phono		
2	C	Radio	Clear output with strong input.	Defective: LS200, 35L6GT. Shorted: T200, C203, C201, C204, C202. Open: T200, R204, R205, R203. Leaky: C203.
3	D	Radio	Loud, clear output with moderate input.	Defective: 6AQ6. Shorted: C200. Open: C201, R202, R201. Leaky: C201.
4	A	Radio	Loud, clear output with moderate input.	Open: R200 (rotate), C200, WS. Shorted: WS.
5	E	Phono	Same as step 4.	Open or shorted: WS.

Listening Test: Distortion may be caused by leaky C201. Distortion on strong signals may be caused by shorted or leaky C200.

Section 3—I-F, Detector, and A-V-C Circuits

TROUBLE SHOOTING

For the tests in this section, use an r-f signal generator, with modulated output, set at 455 kc. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum, and the radio-phono switch to the radio position. Rotate the tuning control until the tuning condenser is fully meshed.

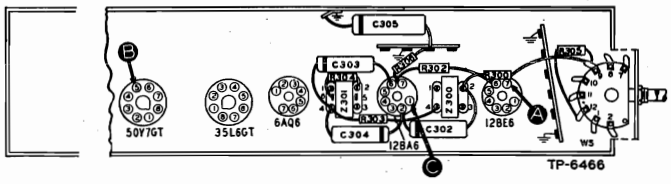

Figure 3. Bottom View, Showing Section 3 Test Points

If the "NORMAL INDICATION" is obtained in step 1, proceed with the tests for Section 4 (r-f and converter circuits); if not, isolate and correct the trouble in this section.

To provide a complete i-f amplifier check, test point A for this section is placed at the grid of the mixer in Section 4; therefore, the effectiveness of step 1 as a master check is dependent upon the condition of certain parts in the mixer circuit. These parts are listed below under "POSSIBLE CAUSE OF ABNORMAL INDICATION."

STEP	TEST POINT	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C	Loud, clear output with strong input.	Defective: 12BA6, 6AQ6. Shorted: C300B, C301A, C301B, C301C, C301D, C303, C304, WS, L300B, L301A, L301B. Open: R302, R303, R304, R305, L300B, L301A, L301B, R301, C301A, C301B. Leaky: C303, C304. Misaligned: Z301.
3	A	Loud, clear output with weak input.	Defective: 12BE6*. Shorted: C400A*, C400B*, C300A, L300A, L300B, C302. Open: L300A, R300, C300A, C300B. Misaligned: Z300.

* This part, located in another section, may cause abnormal indication in this section.

Section 4—R-F and Converter Circuits

TROUBLE SHOOTING

For the tests in this section, with the exception of the oscillator test, use an r-f signal generator with modulated output. Connect the generator ground lead to B—, test point B; connect the output lead through a .1-mf. condenser to the test points indicated in the chart.

Set the radio volume control to maximum, and the radio-phono switch to the radio position. Set the tuning control and signal-generator frequency as indicated in the chart.

If the "NORMAL INDICATION" is obtained in step 1, further tests should be unnecessary; if not, isolate and correct the trouble in this section. If the trouble is not revealed by the tests for this section, check the alignment.

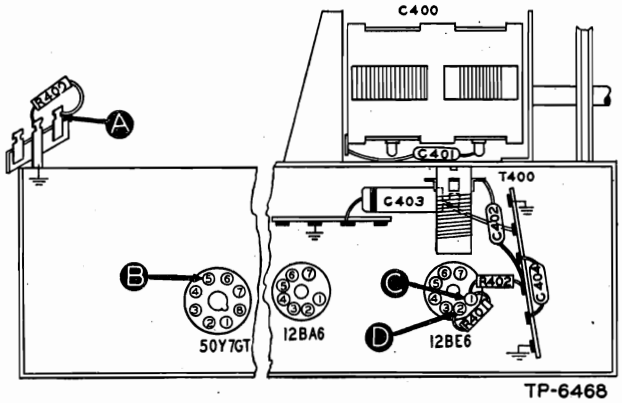

Figure 4. Bottom View, Showing Section 4 Test Points

STEP	TEST POINT	SIG. GEN. FREQ.	RADIO TUNING	NORMAL INDICATION	POSSIBLE CAUSE OF ABNORMAL INDICATION
1	A	1000 kc.	Tune to signal.	Loud, clear speaker output with weak generator input.	Trouble in this section. Isolate by the following tests.
2	C—D Osc. Test (see note below).		Rotate through range.	Negative	Defective: 12BE6. Shorted: C400, C400B, C402, C401, L400A, L400B. Open: C402, L400A, L400B, R401, R402.
3	A	1000 kc.	Tune to signal.	Same as step 1.	Shorted: LA400, C400, C400A. Open: LA400, C404.

OSCILLATOR TEST: Connect the positive lead of a high-resistance voltmeter to the oscillator cathode (pin 2 of 12BE6), test point D; connect the prod end of the negative lead through a 100,000-ohm isolating resistor to the oscillator grid (pin 1 of 12BE6), test point C. Use a suitable meter range, such as 0—10 volts. Proper operation of the oscillator is indicated by negative voltage within the range given in a chart (measured with a 20,000-ohms-per-volt meter) throughout the tuning range.

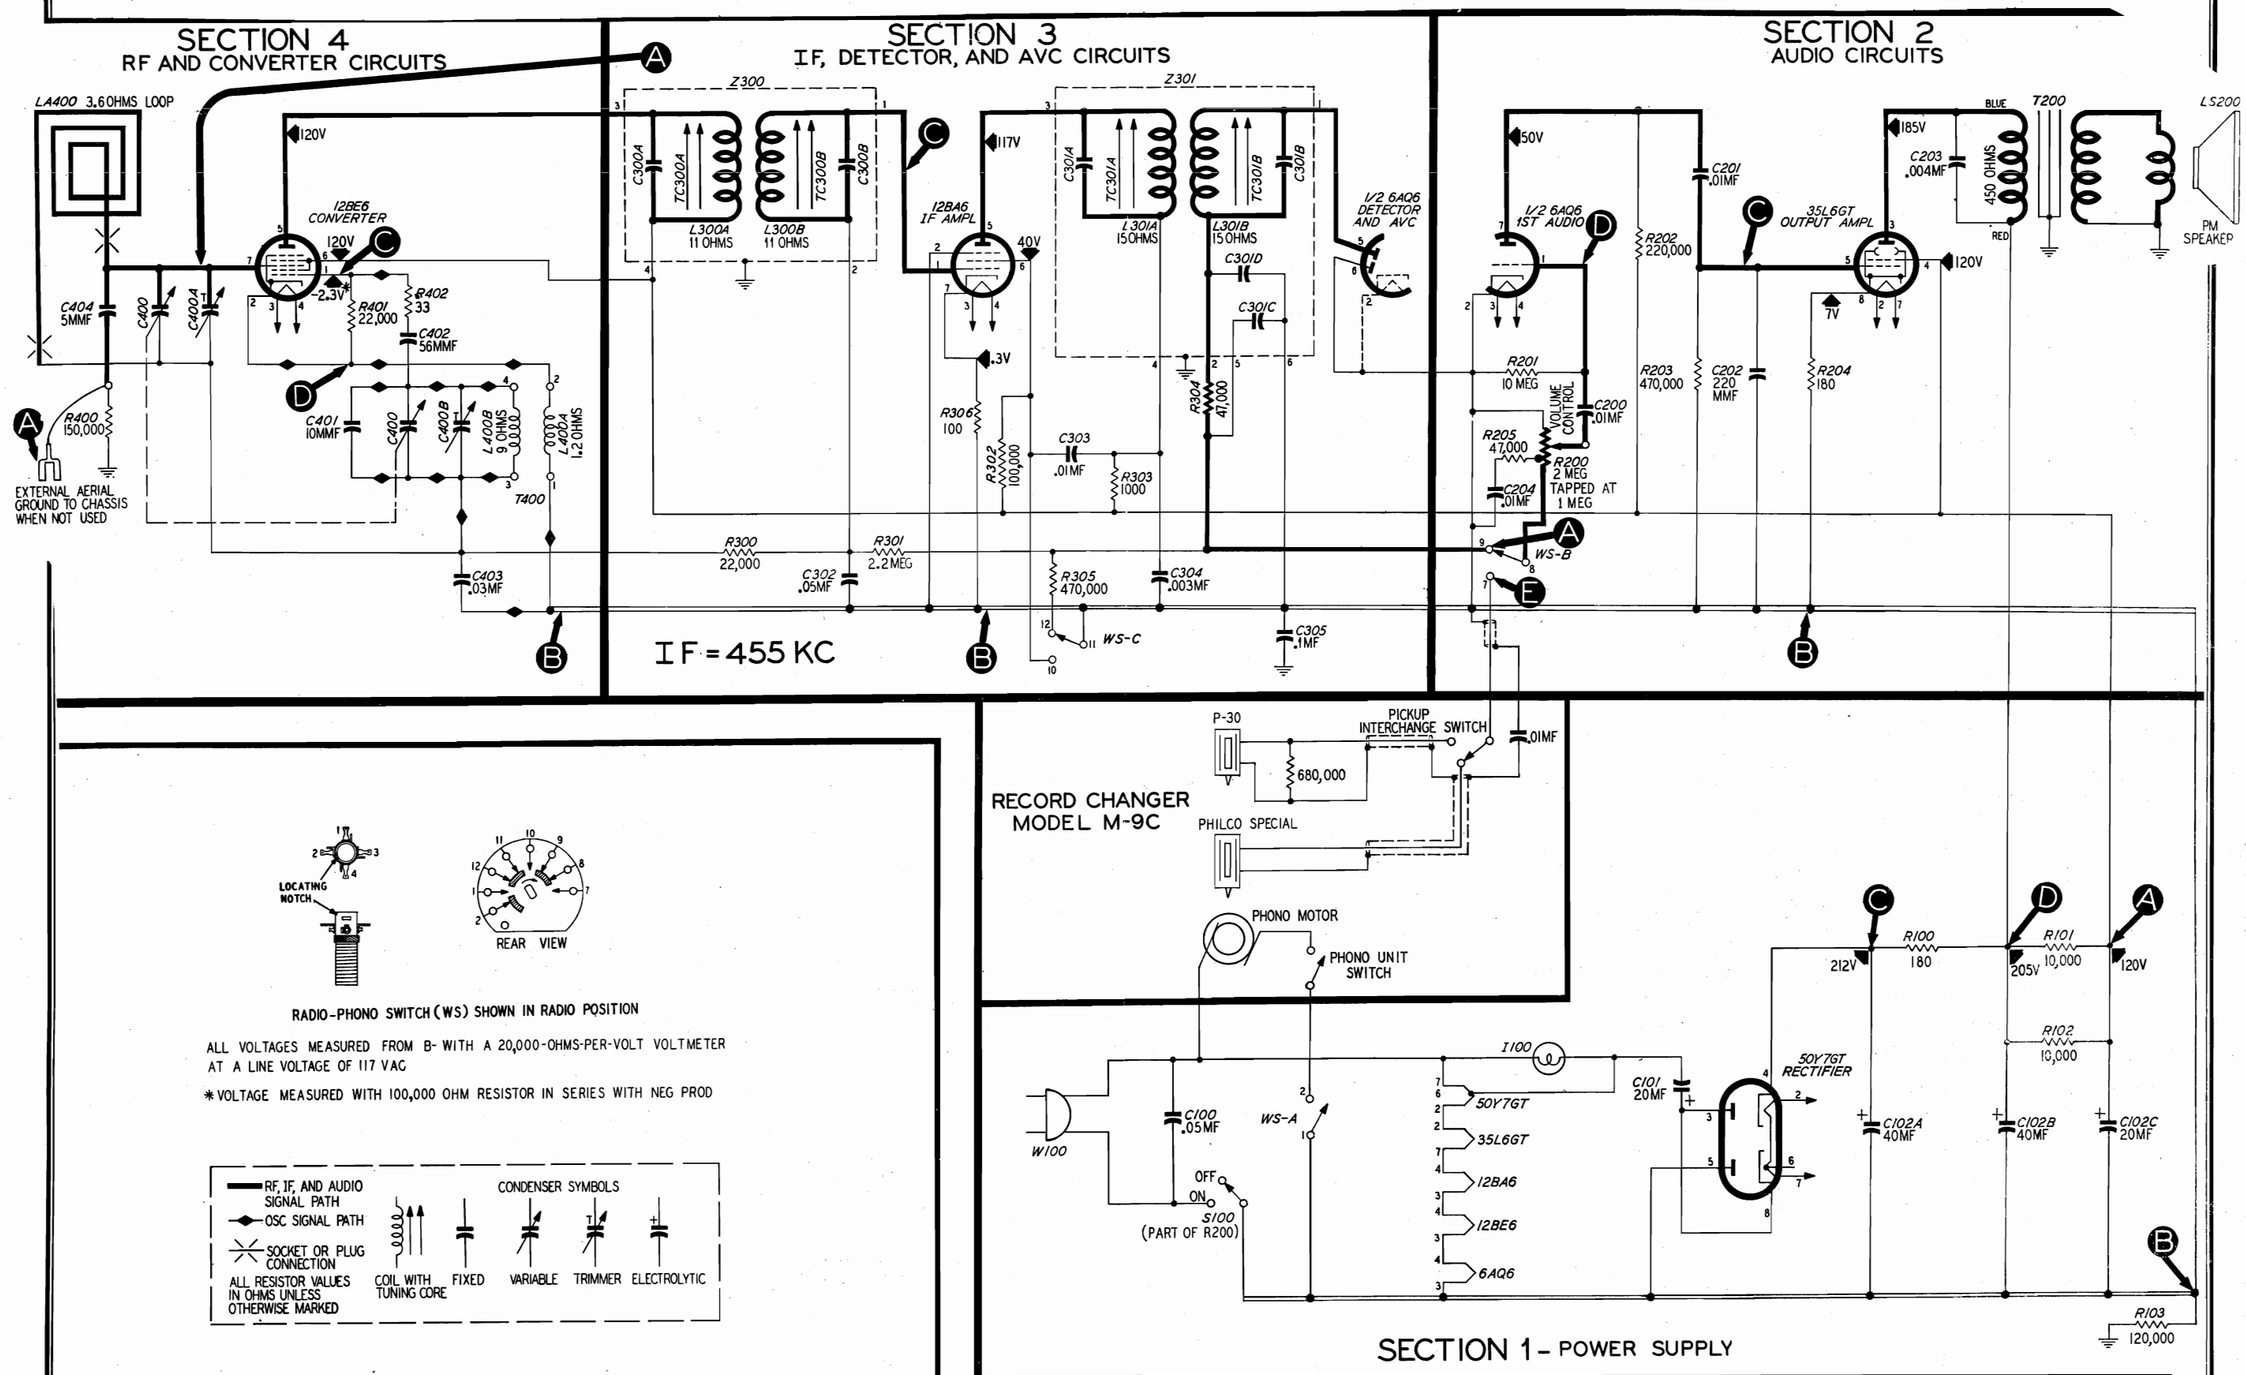

Figure 5. Philco Model 49-1405, Sectionalized Schematic Diagram, Showing Test Points

ALIGNMENT PROCEDURE

DIAL—With tuning condenser fully meshed, set pointer to index mark at low-frequency end of dial, beyond "55".

RADIO CONTROLS—Set volume control to maximum, and radio-phono switch to radio position.

OUTPUT METER—Connect to terminals indicated in figure 6.

SIGNAL GENERATOR—Connect ground lead to B—, test point B in figure 4, and connect output lead as indicated in chart. Use modulated output.

OUTPUT LEVEL—During alignment, adjust signal-generator output to hold output-meter indication below 1.25 volts.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1	Through .1-mf. condenser to external-aerial lead. Make sure that radio loop aerial is connected to radio.	455 kc.	Tuning condenser fully meshed.	Adjust, in order given, for maximum output.	TC301B—2nd i-f sec. TC301A—2nd i-f pri. SEE NOTE TC300B—1st i-f sec. TC300A—1st i-f pri. SEE NOTE
2	Radiating loop (see note below).	1600 kc.	1600 kc.	Adjust for maximum output.	C400B—osc.

RADIATING LOOP: Make up a 6—8-turn, 6-in-diameter loop, using insulated wire; connect to signal-generator leads and place near radio loop aerial.

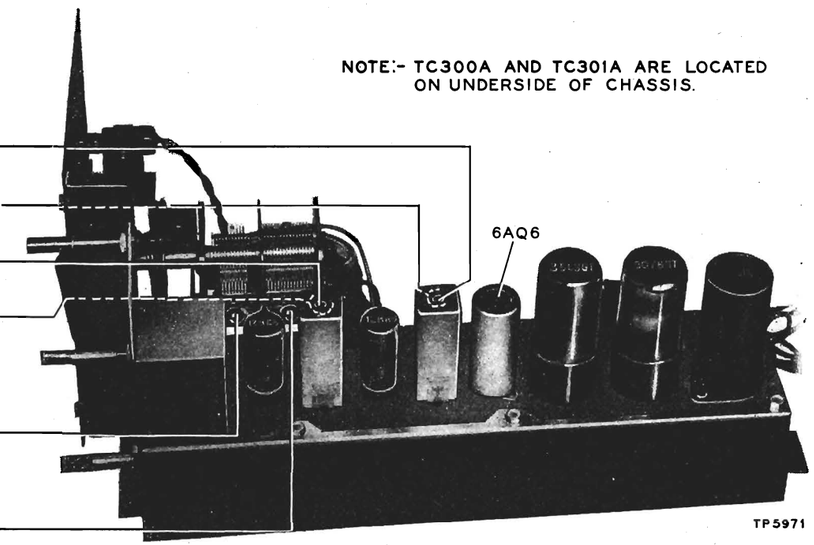

Figure 6. Top View, Showing Trimmer Locations

SYMBOLIZATION

The components in the radio circuit are symbolized according to the types of parts and the sections of the radio in which the parts are located. The prefix letter of the symbol designates the type of part, as follows:

C—condenser
I—pilot lamp
L—choke or coil
LA—loop aerial
LS—loud-speaker
R—resistor
S—switch
T—transformer
W—wire or cable
WS—wafer switch
Z—electrical assembly

The number of the symbol designates the section in which the part is located, as follows:

100-series components are in Section 1—the power supply
200-series components are in Section 2—the audio circuits
300-series components are in Section 3—the i-f, detector, and a-v-c circuits
400-series components are in Section 4—the r-f and converter circuits

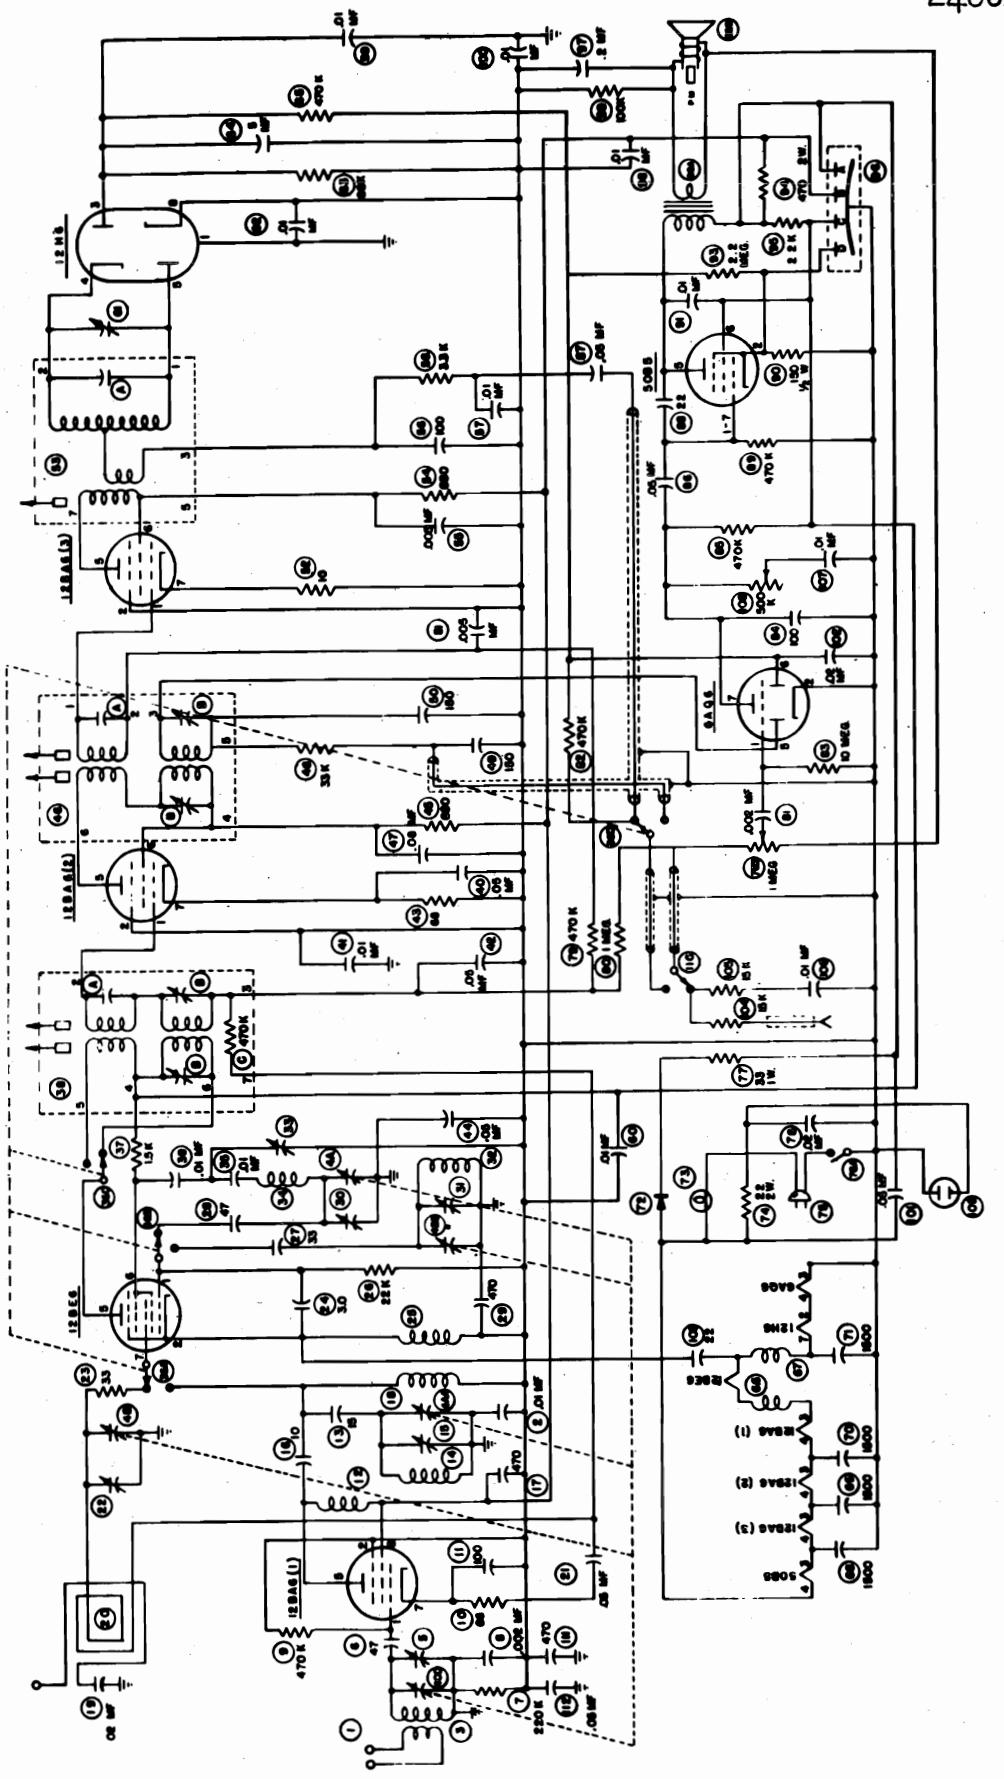
PHILHARMONIC RADIO CORP.

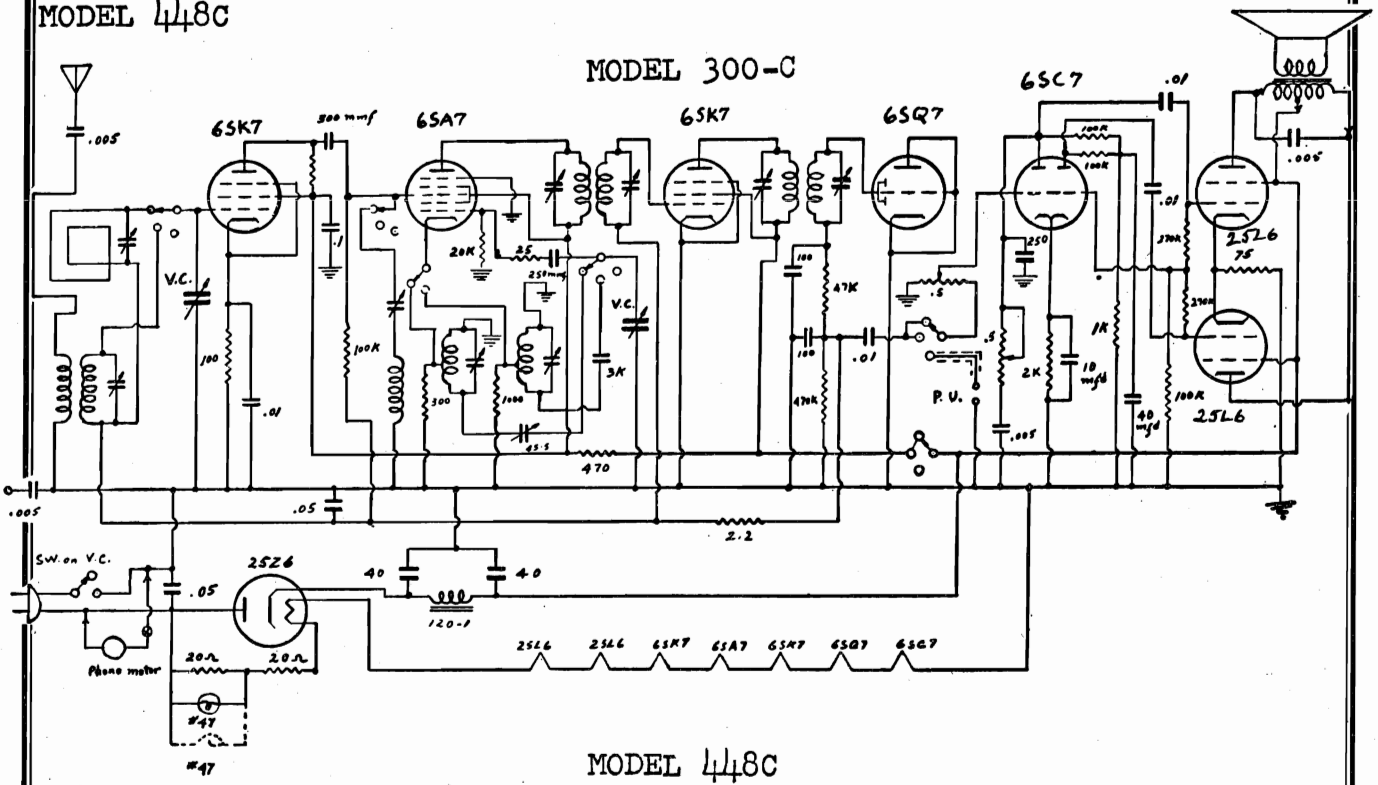
MODELS 248C, 248CB



MODEL 300-C
MODEL 448C

PHILHARMONIC RADIO CORP.

MODEL 300-C



MODEL 448C

TYPE: Twelve-tube FM-AM superheterodyne.

FREQUENCY RANGES: FM, 88-108 Mc.
AM, 540-1600 Kc.

INTERMEDIATE FREQUENCIES: FM, 10.7 Mc. AM, 456 Kc.

POWER SOURCE: 105-125 volts, 60 cycles.

POWER CONSUMPTION:
Radio, 80 watts.
Radio and Phonograph, 102 watts.

INSTALLATION.

ANTENNAS.— For AM operation, the loop antenna attached to the rear of the chassis is generally the most satisfactory. However, terminals marked A and G are provided on the loop for the connection of an external antenna and ground, which may be used if desired.

For the reception of local FM stations, a folded-dipole antenna is provided in the cabinet. If reception of other than strictly local FM stations is desired, a good external FM antenna should be installed and connected with a 300-ohm balanced line to the input terminals on the rear of the chassis next to the phonograph input jack 124. The internal dipole must be disconnected when using the external antenna, and vice-versa.

POWER CONNECTIONS.— Connect the power cord to an alternating-current supply of 105-125 volts, 60 cycles. Be sure that the phonograph-motor cord is plugged into receptacle 121, the speaker plug 123 into receptacle 122, and the phonograph-pickup cord into phonograph jack 124.

CONTROLS.— The control knobs on the front panel perform the following functions. The numbers are from left to right.

1. Power switch and volume control.
2. Tone control. Clockwise rotation gives more high-frequency response.
3. Selector switch. Left position, AM radio; center, FM radio; right, phonograph.
4. Tuning control.

OPERATION.

RADIO.— Start the set by turning the volume control clockwise about one-third of the way.

Set the selector switch on AM or FM as desired.

Turn the tuning control until the pointer indicates the frequency of the desired station. When the station comes in, slowly rotate the knob back and forth and determine the exact center position, where the background noise disappears or is sharply reduced, and the signal comes in clearly with the greatest volume. This is the correct tuning position, and careful adjustment is required, especially on FM, if the full rich-tone capability of the receiver is to be realized. A strong FM station may also be received, with considerable distortion, at positions slightly above and below the correct center position. This condition is quite normal.

Adjust the tone control for the most pleasing operation.

PHONOGRAPH.— Set the selector switch on the right-hand position. Operate the record changer in accordance with the accompanying instructions.

ALIGNMENT PROCEDURE
Read Carefully before Attempting Alignment

A-M ALIGNMENT

1. TUNING CAPACITOR fully meshed. Adjust dial pointer to reference dot at the low-frequency end of the scale.
2. VOLUME CONTROL maximum clockwise.
3. TONE CONTROL maximum clockwise.
4. SELECTOR SWITCH on AM (left-hand position).
5. SIGNAL GENERATOR.— Use standard A-M Signal Generator with approximately 30 per cent modulation at 400 cycles.
6. SIGNAL-GENERATOR COUPLING.-Low side grounded to chassis. High side connected through 0.01 mfd capacitor to coupling point.
7. LOOP COUPLING.— For loop coupling, use a Standard Signal Injection Loop according to specifications. If a standard loop is not available, make a loop with 5 or 6 turns of insulated wire, close-wound on a 3" to 4" diam form. Place the loop coaxially with and at least 10 inches back of the receiver loop. Connect to the signal generator through a resistor of from 100 to 400 ohms.
8. RECEIVER OUTPUT.

   (A) Use a d-c electronic voltmeter similar to the VoltOhmyst, low side to chassis, high side to AVC terminal of loop.
   (B) Use a rectifier-type a-c voltmeter or a standard output meter across the speaker voice coil.

	SIGNAL GENERATOR			RECEIVER	RECEIVER OUTPUT		ADJUST	REMARKS
	FREQ, KC	APPROX. SIGNAL LEVEL	COUPLE TO	DIAL SETTING	(A) AVC VOLTS INCREASE	(B) VOICE COIL, WATTS		
1.	455	800 uv	Pin 8, 6SA7	Near 600	-0.6	2.0	A-12, A-13, A-8, A-9	Adjust for maximum watts or AVC. Check for smooth round-top selectivity curve.
2.	1600	400 uv/m	Loop	1600 (Capacitor wide open)	-0.6	2.0	A-17, A-16	Adjust for maximum output.
3.	1400	400 uv/m	Loop	Near 1400	-0.6	2.0	A-16	Tune to signal and adjust A-16 for maximum output.
4.	600	400uv/m	Loop	Near 600	-0.6	2.0	A-18	Rock tuning control and simultaneously adjust A-18 for maximum output.
5.	Repeat steps 2, 3, and 4 in order until no further improvement can be made.							

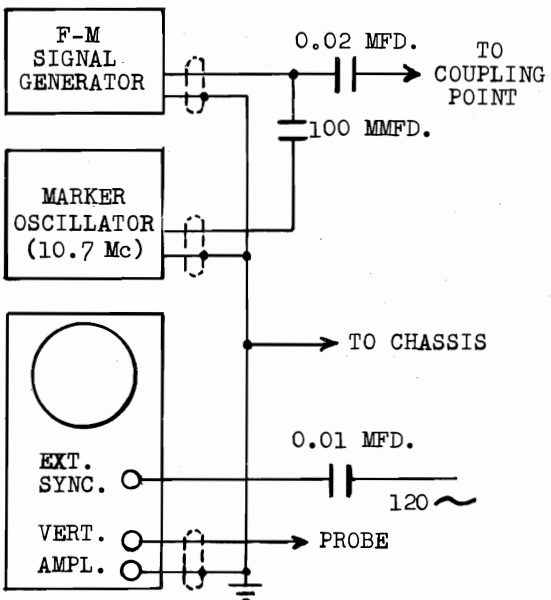

DIAGRAM I. F-M I-F ALIGNMENT.

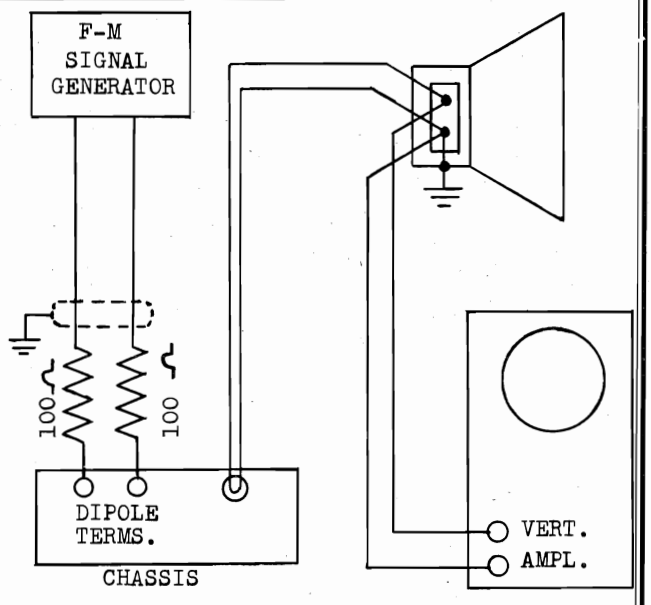

DIAGRAM II. F-M R-F ALIGNMENT.

PHILHARMONIC RADIO CORP. MODEL 448C

F-M ALIGNMENT
Using Frequency-Modulated Signal Generator and Oscilloscope

ALIGNMENT OF I-F STAGES

GENERAL.— When the designated F-M signal from the signal generator is applied to the I-F amplifier or ratio detector, the output at point (A) viewed on an oscilloscope with a 60-cycle linear horizontal sweep is represented by pattern A. Pattern B shows the output at point (B) with the 8 mfd capacitor 33 disconnected. Patterns more useful for alignment purposes are obtained by operating the horizontal linear sweep of the scope at twice the modulation frequency or 120 cycles per second. This gives a double trace on each pattern, one trace representing the increasing-frequency half of the modulation cycle and the other representing decreasing frequencies, patterns I and V. When properly aligned, the two traces of pattern V coincide.

CENTER-FREQUENCY MARKER.— An additional requirement for proper alignment is that the signal generator must operate at the correct center frequency. The 10.7 Mc signal of the marker oscillator is used to check the center frequency. As the F-M signal sweeps its band, it produces a beat frequency with the marker signal, which decreases as the center point is approached and increases on the other side of center. These markers are shown properly centered in patterns II and VI. Because of the amplitude rejection of the ratio detector, it is difficult to determine the center point of the markers in pattern II, but they can readily be located by temporarily shorting terminals 1 and 2 or 2 and 3 of ratio-detector transformer 113. The resulting effect is shown in patterns III and IV. It is advisable to remove the marker signal when adjusting for coincidence of patterns or straightness of crossover lines, but checks should be made with the marker to make sure that the signal generator has not drifted from the correct center frequency. Pattern VII shows the effect when the signal generator is off center. The markers may be entirely separated or partially overlap. To correct this condition, readjust the center frequency of the signal generator until the markers come together and the combined marker length is a minimum, as in pattern VIII. Then realign to give pattern V or VI.

PROCEDURE

F-M SIGNAL GENERATOR, center frequency 10.7 Mc/sec, 225 Kc deviation, 450 Kc total sweep, at 60 cycles/sec. Use only enough output for satisfactory wave forms.

MARKER OSCILLATOR, 10.7 Mc/sec fixed, crystal-controlled or accurately calibrated. Use no more output than necessary. Excessive amplitude will distort the patterns.

COUPLING OF SIGNAL GENERATOR AND MARKER OSCILLATOR.— See Diagram I. Low side to chassis. Combined output through 0.002 mfd to coupling point.

OSCILLOSCOPE.— Vertical amplifier at maximum gain. Linear horizontal sweep synchronized at 120 cycles per second by ripple voltage from pin 2 of rectifier 5Y3GT of the receiver. Do not use internal Y-signal synchronization. This will result in off-center alignment.

SELECTOR SWITCH on FM (center position).

VOLUME AND TONE CONTROLS, maximum clockwise.

HOOKUP, as in Diagram I.

NOTE. Unless receiver is seriously misaligned, omit steps 1 and 2.

	SIGNAL GENERATOR		RADIO DIAL	OSCILLOSCOPE		ADJUST	REMARKS
	CENTER FREQ.	COUPLING POINT		VERTICAL INPUT	PATTERN NO.		
1	10.7 Mc	Pin 4 6SH7	Near 90 Mc. Tune off stations.	High side to point (A). Low side to chassis.	I, II III, IV	A-14 A-15 alternately	Adjust for maximum amplitude, symmetry, and straightness of crossover, as in patterns I and II. Verify position of center-frequency marker as in patterns III and IV.
2	10.7 Mc	Pin 7 6BE6	Near 90 Mc. Tune off stations.	High side to point (B). Low side to chassis.	V, VI	A-11 A-10 A-7 A-6 A-14	Disconnect 8 mfd capacitor 33 from point (B). Adjust for maximum amplitude, symmetry, and coincidence, as in pattern V, maintaining markers in center as in pattern VI.
3	10.7 Mc	Pin 7 6BE6	Near 90 Mc. Tune off stations.	High side to point (A). Low side to chassis.	I, II	A-6 A-7 A-10 A-11 A-14 A-15	Reconnect capacitor 33 to point (B). Recheck adjustments for maximum amplitude, symmetry and straightness of crossover, as in patterns I and II. Check marker positions as in patterns III, IV.

MODEL 448C

PHILHARMONIC RADIO CORP.

F-M ALIGNMENT (Continued)

Alignment of R-F Section

HOOKUP, as in Diagram II.

SELECTOR SWITCH on FM.

VOLUME AND TONE CONTROLS, maximum clockwise.

F-M SIGNAL GENERATOR, 50 Kc deviation, 100 Kc total sweep at any rate from 60 to 400 cycles per second.

OSCILLOSCOPE.— Adjust horizontal sweep to the modulation frequency of the signal generator and lock it into step with the internal (Y-signal) synchronizing control.

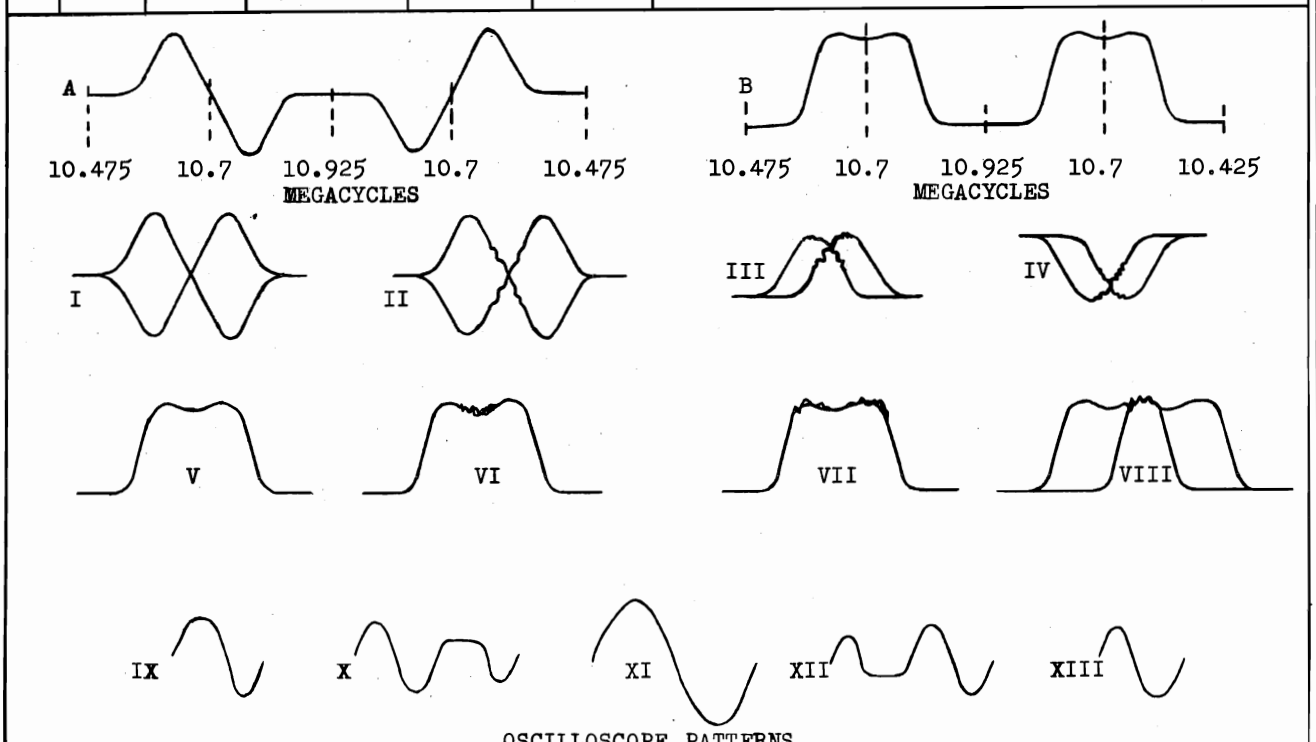
TUNING.— Patterns IX through XIII are wave forms that will show on the oscilloscope as the tuning control is tuned through the F-M signal. Pattern XI represents the correct tuning position; the pattern is a pure sine wave of greater amplitude than the side patterns.

Patterns IX and XIII represent the two side positions where the signal is also received, but distorted and with less amplitude.

CAUTION

When aligning, do not confuse the correct position, Pattern XI, with either side position, Patterns IX and XIII. When tuned correctly, a slight movement of the tuning control to either side will give the highly distorted double-frequency patterns X and XII.

	SIGNAL GENERATOR		RADIO DIAL	ADJUST	TO GIVE SCOPE PATTERN	REMARKS
	FREQ.	DEVIATION				
4	108 Mc	50 Kc	108 (Capacitor open)	A-4 (A-3 tight)	XI	Tighten A-3, then adjust A-4 to produce Pattern XI. If two positions of A-4 are found giving the same amplitude of Pattern XI, use the one of higher frequency (A-4 backed out).
5	87.8 Mc	50 Kc	Capacitor closed.	A-5 (A-3 tight)	XI	Adjust to produce Pattern XI. Repeat steps 4 and 5 until no further adjustment is necessary.
6	105 Mc	50 Kc	Near 105	A-3	XI	Rock tuning control and simultaneously adjust A-3 for maximum amplitude of Pattern XI.
7	90 Mc	50 Kc	Near 90	A-2	XI	Rock tuning control and simultaneously adjust A-2 for maximum amplitude of Pattern XI. Repeat steps 6 and 7 until there is no further improvement.
8	100 Mc	50 Kc	Near 100	A-1	XI	Tune to pattern XI. Adjust A-1 for maximum amplitude.



OSCILLOSCOPE PATTERNS

PHILHARMONIC RADIO CORP. MODEL 448C

F-M ALIGNMENT. MILLER-RESISTOR METHOD

Using An Unmodulated Signal Generator and D-C Electronic Voltmeter.

GENERAL.— For this receiver, the Miller-resistor method, which takes its name from Dr. John M. Miller, is the most satisfactory of the alignment procedures which do not require the use of an F-M signal generator. With this method, resistance loading is applied to all the secondary circuits in the amplifier while the primary circuits are tuned to the desired center frequency. Then the primary circuits are loaded with the proper resistors while the secondary circuits are tuned.

The resistor across the primary reduces the Q of the transformer sufficiently to produce a single-peak response curve so that the secondary can be tuned to frequency. Its removal does not detune the secondary circuit appreciably. A similar effect is produced when the resistor is across the secondary, permitting accurate tuning of the primary. Small half-watt carbon resistors must be used with the shortest possible leads, to avoid over-all regeneration. Solder-tack the resistor across the transformer terminals.

SELECTOR SWITCH, on F-M (center position).

VOLUME AND TONE CONTROLS, maximum clockwise.

SIGNAL GENERATOR, unmodulated, accurately calibrated. Ranges 10 to 11 Mc and 87.5 to 108 Mc. Output adjustable from 100 to 100,000 microvolts. Connect low side to chassis, for steps 1-5.

OUTPUT INDICATOR.— D-C electronic voltmeter, preferably zero center, with input resistance of at least one megohm on low range, which should not exceed five volts full scale.

OUTPUT METER CONNECTIONS.— Probe to point (A), ratio-detector output, zero volts to chassis when correctly adjusted. Probe to point (B), F-M AVC source, reading the increase in negative voltage above the value obtained when no signal is applied. The reading with no signal is caused by the diode and amplifier-tube contact potentials, and will usually be about -0.5 to -0.7 volts.

	SIGNAL GENERATOR		RADIO DIAL.	VTVM TO	MILLER RESISTORS		ADJUST	REMARKS
	FREQ. Mc	COUPLING	TUNE OFF STATIONS	POINT	OHMS	ACROSS		
1	10.7	0.002 mfd to pin 4 6SH7	Near 90 Mc	(B)	6800	1 and 3 of 113	A-14	Adjust for maximum deflection.
2	10.7	"	"	(A)	"	"	A-15	Adjust for zero deflection, between points of sharp polarity reversal. If approach to zero is slow with no reversal, turn A-15 in opposite direction.
3	10.7	0.002 mfd to pin 7 6BE6	"	(B)	6800 6800	3 and 4 of 111 3 and 4 of 109	A-10 A-6	Adjust for maximum deflection.
4	10.7	"	"	(B)	22000 22000	1 and 2 of 111 1 and 2 of 109	A-11 A-7	Adjust for maximum deflection.
5	10.7	"	"	(B)	None	--	--	Move input signal from 10 Mc through 11.5 Mc. Response curve should be flat-topped, symmetrical, and centered at 10.7 Mc. If not, repeat steps 1, 2, 3, 4 carefully.
6	108	See Remarks	108 Mc (Capacitor open)	(B)	None	--	A-4 (A-3 tight)	Signal generator across F-M dipole input terminals with 100-ohm 1/2-watt carbon resistor in each side. Tighten A-3, then adjust A-4 for maximum deflection. See note 1.
7	87.8	"	Near 88 Mc (Capacitor closed)	(B)	--	--	A-5	Adjust for maximum deflection. Repeat steps 6 and 7 until no change in adjustment is required.
8	105	"	Near 105 Mc	(B)	--	--	A-3	Rock tuning control and adjust A-3 for maximum deflection.
9	90	"	Near 90 Mc	(B)	--	--	A-2	Rock tuning control and adjust A-2 for maximum deflection. Repeat 8 and 9.
10	100	"	Near 100 Mc	(B)	--	--	A-1	Rock tuning control and adjust A-1 for maximum deflection.

NOTE 1. If two peaks are found, use position with A-4 backed out (higher frequency).

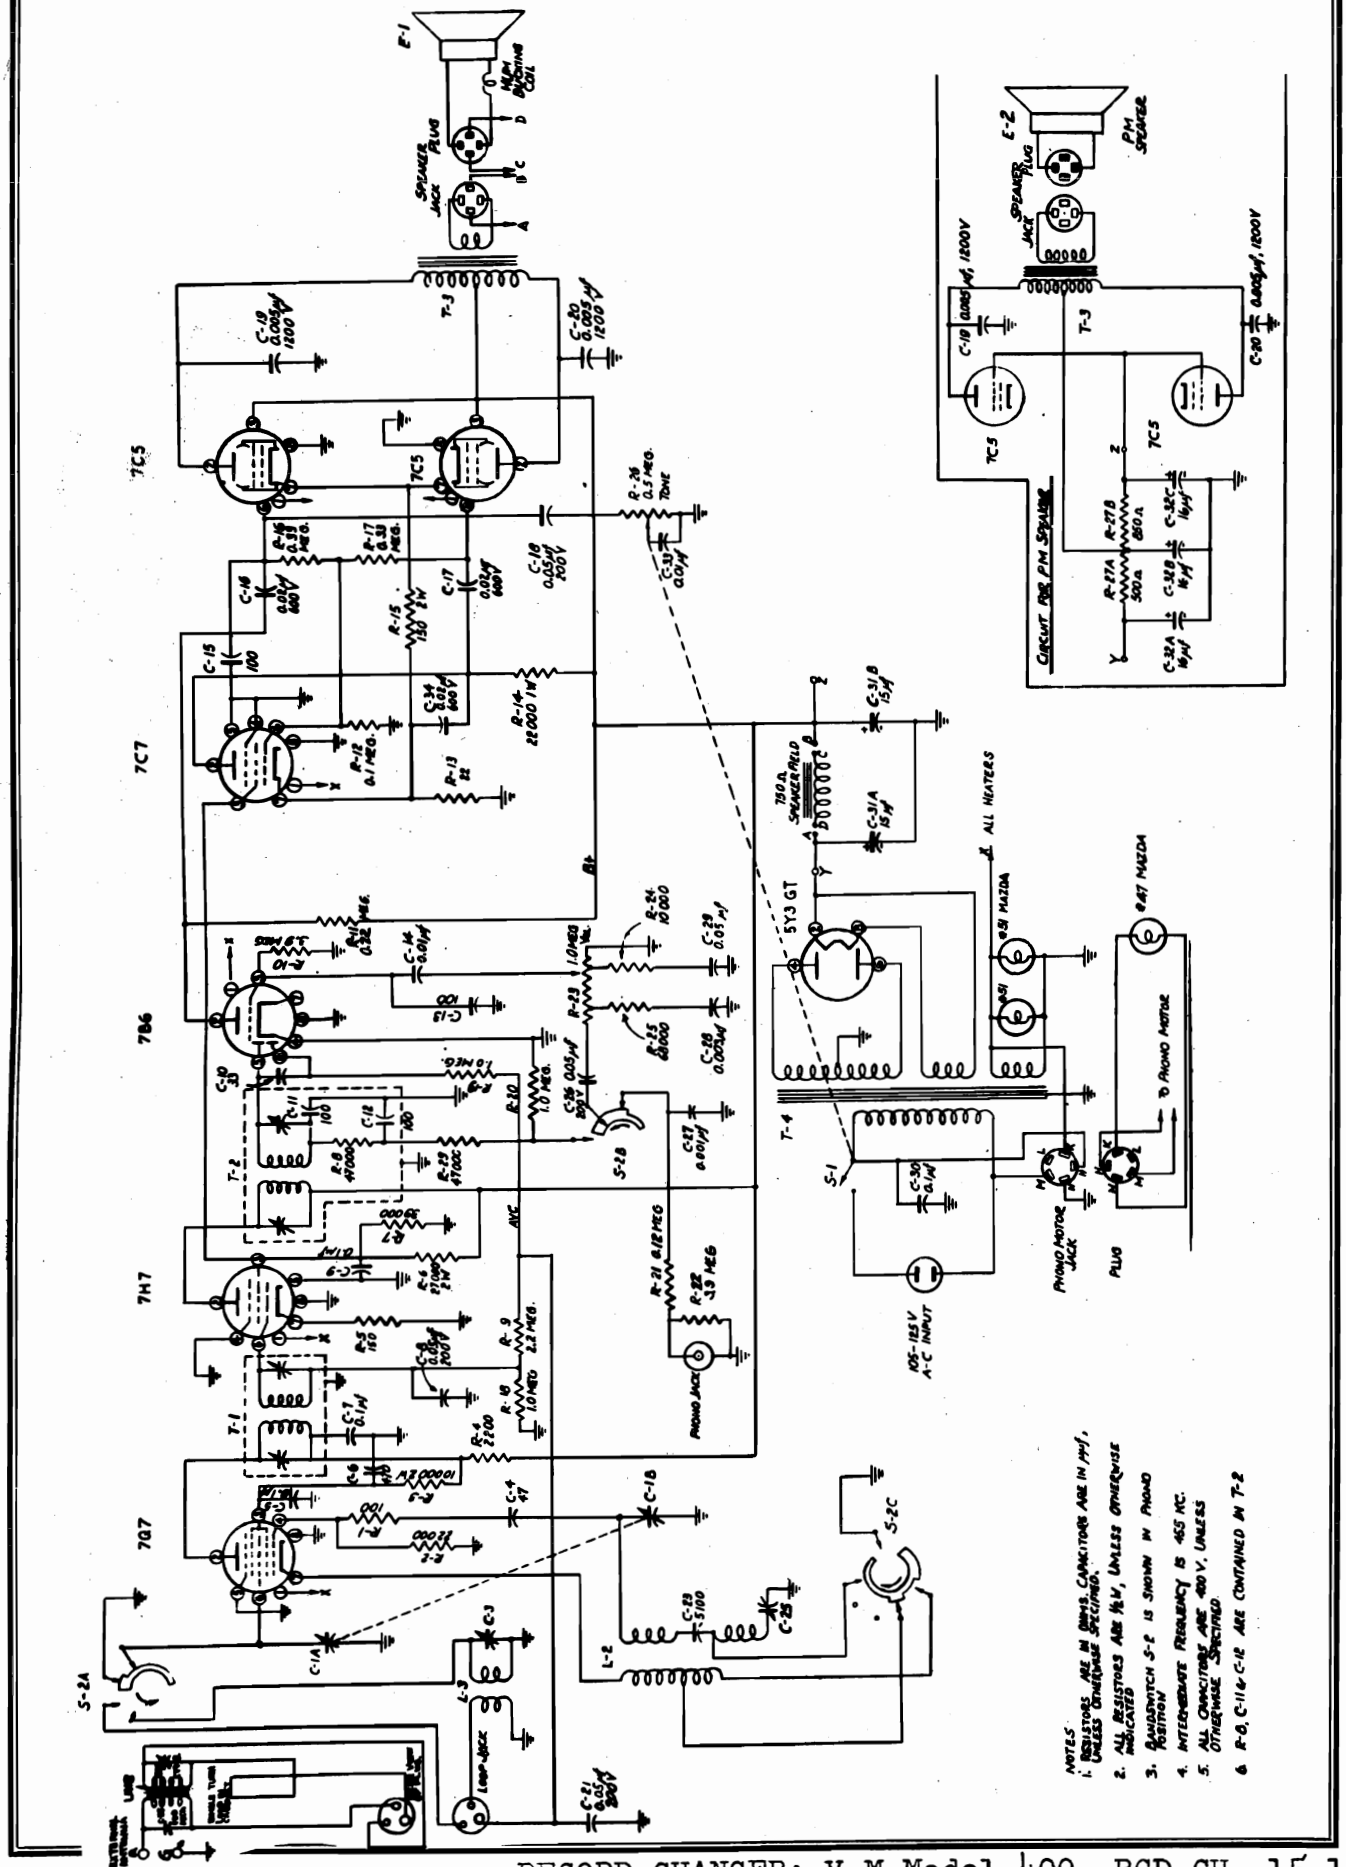
PHILLIPS PETROLEUM CO. MODEL 3-70A



MODEL 3-70A PHILLIPS PETROLEUM CO.

Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube, or some local condition is not responsible for faulty reception. The Signal Generator may be connected through a 0.01 mf capacitor (used as a dummy antenna) to the lug on R. F. section (A) of tuning capacitor. Connect ground clip of generator directly to chassis. Align the I. F. trimmers to 455 K.C., using least possible input from the Signal Generator to avoid developing A.V.C. voltage which would make the tuning adjustments very broad. An output meter may be clipped across the voice coil lugs.

To align broadcast R. F. trimmers, remove the 0.01 mf capacitor and connect the Signal Generator leads to two or three turns of heavy wire, forming a self-supporting loop of about 7 or 8 inches diameter placed about a foot away from the receiver's loop antenna. Again, use the least possible input from the Signal Generator. With the tuning plates completely out of mesh and the pointer at the extreme right end of travel, adjust the broadcast oscillator trimmer, on the under side of the chassis, to 1650 K.C. With tuning capacitor fully meshed adjust the padder on the chassis deck to 535 K.C. Readjust both Signal Generator and tuning capacitor to 1550 K.C. and adjust the R. F. trimmer on the loop for maximum response.

To align the short wave band connect the Signal Generator through a 0.01 mf capacitor and a 400 ohm resistor in series (used as a dummy antenna) to the antenna connection on the loop antenna. With the tuning capacitor plates completely out of mesh, and pointer at the extreme right end of travel, adjust the short wave oscillator trimmer (on the under side of the chassis) to 18.25 magacycles. Readjust both Signal Generator and tuning capacitor to 16 megacycles and adjust short wave antenna coil trimmer for maximum response. With tuning capacitor fully meshed, the receiver should tune to 5.75 megacycles, however no adjustment is required at this point.

For checking purposes five marks are engraved on the front of the dial plate. These represent, in order, the pointer position with the capacitor plates fully meshed and the pointer settings for 600 kc, 8 mc, 16 mc, and 1550 kc.

Pushbuttons: To set pushbuttons remove pushbutton knobs. This will expose a set screw on the shaft of each pushbutton. Starting at one end push a pushbutton down and loosen its set screw. Set the bandswitch to the broadcast position. Hold the pushbutton down and tune the manual tuning control to the station to which the pushbutton is to be set. Still holding the pushbutton down tighten its set screw. The pushbutton may now be released and its knob replaced. It will now select the station to which it was set. The other pushbuttons may be set in a similar manner.

REPLACEMENT PARTS LIST

Circuit Symbol	Part Number	Item	Description
C-1 A & B	CV-9	Capacitor	Variable 2-gang, Push-button
C-2	CT1-1	Capacitor	Trimmer 1.5—15 MMF

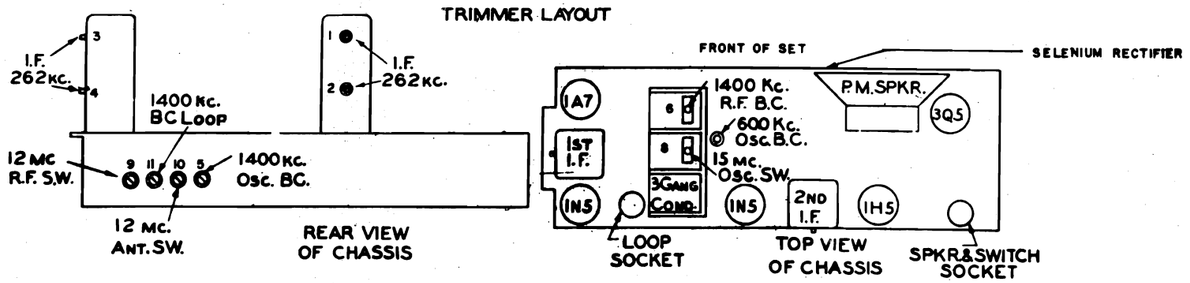
TRIMMER LAYOUT



FOR BATTERY OPERATION

Do not plug the electric cord into the light socket. Push the button marked BATT and the SW or BC button for Shortwave or Broadcast reception, respectively. Rotate the volume control clockwise well past the point where the red flag appears in the dial window. The receiver will become operative immediately.

In order to light the pilot bulb for the dial ON BATTERY OPERATION, the switch button on the lower left-hand ledge inside the front door must be pressed down. When the button is released the light is automatically switched off in order to prolong the life of the batteries.

To turn off the receiver it is necessary only to turn the left-hand knob to the left until the red indicator disappears, regardless of the position of the buttons.

LINE	LINE CORD#	CHARACTERISTICS

	RECEIVER			SIGNAL GENERATOR			ADJUSTMENTS (All maximum output)
STEP	CIRCUIT ALIGNED	BAND SWITCH	DIAL POINTER	FREQUENCY	CONNECTION	DUMMY ANTENNA	
1	IF	BC	Low end of dial	**262 Kc**	Grid of 1A7GT conv.	0.1 mfd.	#1, 2, 3, 4
2	BC	BC	1400 KC	1400 KC	Antenna Post	200 mmfd. mica cap.	First #5 Then #6
3	BC	BC	600 KC	600 KC	Antenna Post	200 mmfd. mica cap.	#7
4	Repeat steps 2 and 3						
5	SW	SW	15 MC	15 MC	Antenna Post	400 ohm carbon resistor	#8
6	SW	SW	Tune in generator	12 MC	Antenna Post	400 ohm carbon resistor	First: #9 Then #10
7	Repeat step 2, trimmer #5 only						
8	BC	BC	Tune in broadcast station near 1400 KC				#11

NOTE: Align step 1 to 7 with chassis out of cabinet, but loop plugged in. Step 8 must be taken with set properly placed in cabinet, and batteries and loop in the normal position.

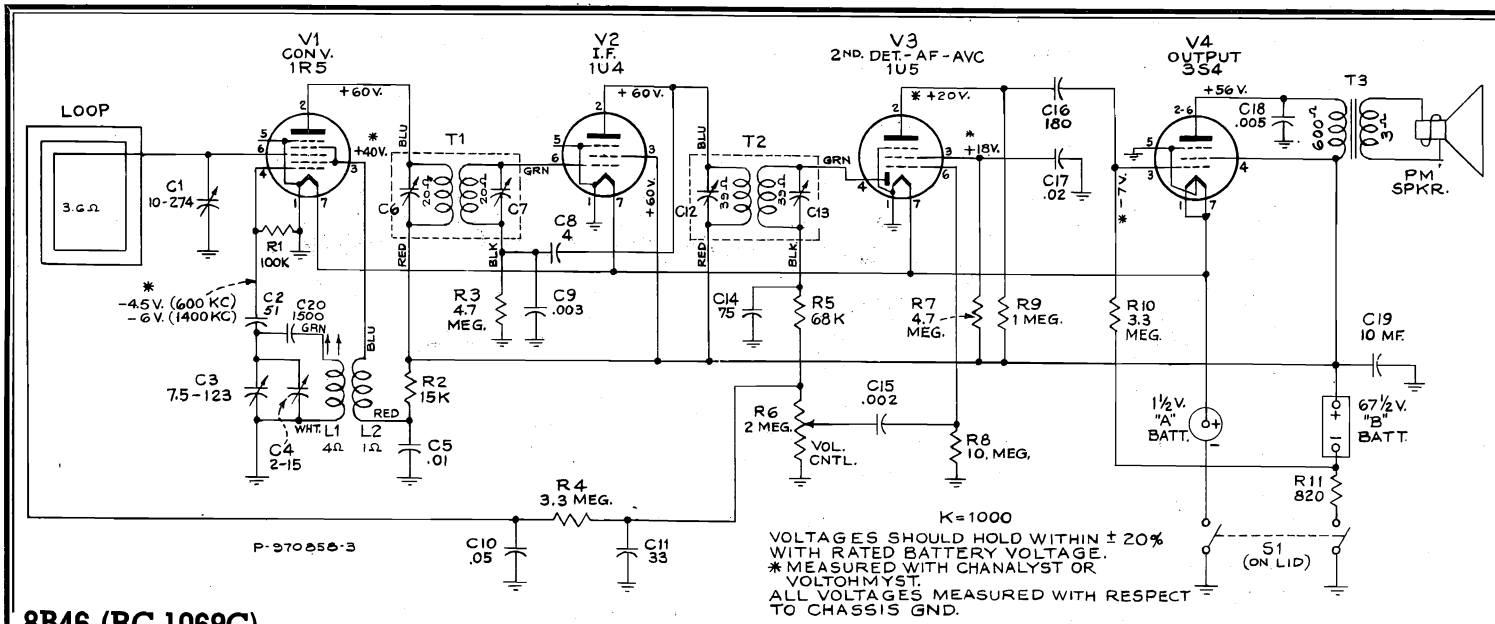
Alignment should be attempted only if a low range A.C. meter, a signal generator, and insulated alignment tools are at your disposal. The A.C. meter is used as an output-meter. The signal generator must cover a frequency range from 450 kc to 16 mc. It is essential that the signal generator be connected to the points indicated in the alignment chart through the proper dummy antenna.

A good connection between the groundpost of the signal generator and the chassis, is necessary. DO NOT connect chassis or generator to an external ground. The output of the signal generator must always be kept at its lowest possible value. This is to prevent the automatic volume control of the receiver from interfering with accurate alignment.

During alignment, the line voltage feeding the receiver power supply should be kept at approximately 117 volts.

The locations of adjustment screws are indicated clearly on the schematic diagram. Alignment adjustments should be made only in the sequence given in the chart.

For all alignments, connect the outputmeter across the voice coil. With the volume control turned fully clockwise tune for a maximum reading.



8B46 (RC-1069C)

Service Data:

The Service Data previously published for Models 8B41, 8B42 and 8B43 will apply to Model 8B46 except for color and the replacement parts listed below.

REPLACEMENT PARTS

CHASSIS ASSEMBLY

RC-1069C

Same as listed for RC-1069, RC-1069A, RC-1069B

EXCEPT

74366 Fastener—Push fastener to hold loop, (2 required) for Model 8B46—tan
74363 Lid—Case top lid complete with lid support and hinges —less loop—Model 8B46—ivory
74365 Loop—Antenna loop complete with connectors—less lid —Model 8B46—ivory
74367 Nameplate—"RCA" nameplate for top lid—Model 8B46

SPEAKER ASSEMBLIES

Same as listed for Models 8B41, 8B42, 8B43

MISCELLANEOUS ASSEMBLIES

74368 Bottom—Case bottom—Model 8B46—ivory
70457 Catch—Spring catch assembly
74016 Center—Case center complete with spring catch
74369 Handle—Carrying handle—Model 8B46—tan
73970 Link—Handle link (2 required)
73943 Screw—#4-40 x 3/16" binder head screw to hold case center

Specifications

Tuning Range ..... 540-1600 kc
Intermediate Frequency ..... 455 kc

Tube Complement:

1. RCA 1R5 ..... Converter
2. RCA 1U4 ..... I.F. Amplifier
3. RCA 1U5 ..... 2nd Det.-A.F. Amp.-A.V.C.
4. RCA 3S4 ..... Output

Loudspeaker (92523-4W):

Size and type ..... 2" x 3" P.M.
Voice coil impedance ..... 11¾ ohms at 1000 cycles

Batteries Required:

Type of Battery	Current Consumption	Approx. Life (Intermittent Service)
"A"—1.5 volt RCA VS 036 or VS 001	0.25 amp.	7 to 10 hrs.
"B"—67.5 volts RCA VS 016	8.5 ma.	40 to 60 hrs.

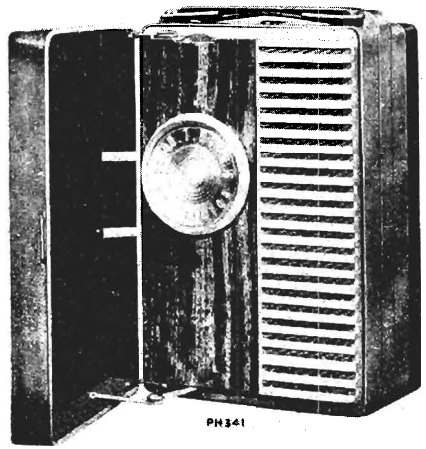
Power Output:

Undistorted ..... 0.05 watt
Maximum ..... 0.10 watt

Dimensions (overall) ..... 6¼" x 4⅜" x 3⅜"

Weight (with batteries) ..... 3½ lbs.

8B41 ..... Black
8B42 .... Brown
8B43 ..... Red



Model 8B46 (Ivory)

RADIO CORP. OF AMERICA
Alignment Procedure

MODELS 8B43, CHASSIS RC-1069B; 8B46 CHASSIS RC-1069C

Output Meter.—Connect meter from top lug of TB5 (plate of 3S4) to ground. Turn volume control to maximum position.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

Alignment Shield.—It is necessary to use a shield during oscillator alignment.

Fig. 3 shows the modifications necessary to convert the center strip portion of a case into a convenient shield to be used as a substitute for the regular case center strip during oscillator alignment.

If a substitute case is not available, a shield may be improvised using a sheet of aluminum (DO NOT USE STEEL) to approximate the shielding effect of the case on the 1R5 tube, tuning condenser and oscillator coil.

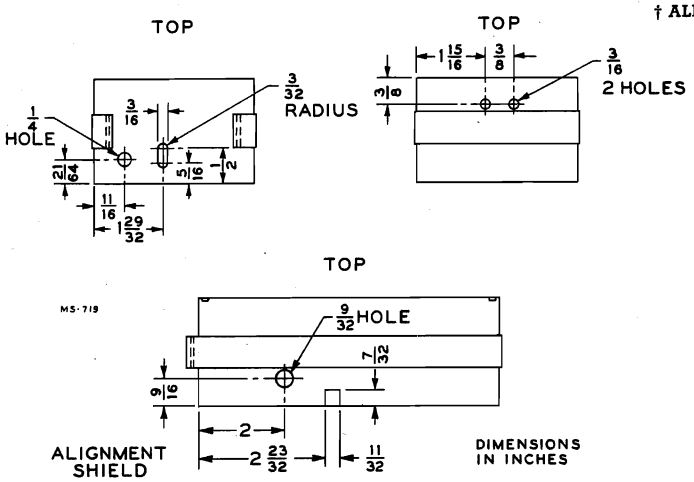
CRITICAL LEAD DRESS

1. Dress blue, green, and black leads of second I.F. transformer as direct as possible. If excess lead exists, dress down side of socket and flat against chassis to transformer opening.
2. Dress audio screen bypass capacitor (C17), and the lead to the volume control, up and underneath the shelf supporting the output transformer.
3. Dress audio coupling capacitor (C15), directly in front of C17, and against the side of the 1st I.F. transformer.
4. Wire in the three capacitors pyramided behind the speaker with enough space at the end of battery holder to allow holder to move when battery is replaced. Dress the ground leads of these capacitors to keep from shorting "+A" to chassis ground.
5. Observe the outside foil connections on all paper capacitors, also the polarity of the electrolytic capacitor, C19.
6. Keep blue and red leads of output transformer above the mounting shelf.
7. Dress leads to gang as far as possible from all metal parts.
8. Dress neutralization bypass capacitor, C9, as near metal chassis as possible.
9. Dress bypass C5 over bottom end of V2 (1U4), tube socket.
10. Dress neutralization capacitor, C8, as near metal chassis as possible.

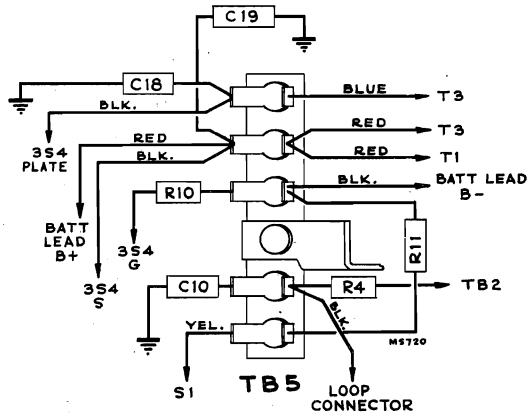
Steps	Connect the high side of test osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output—
1	Connection lug of C1 located on rear of gang in series with .01 mf.	455 kc	Quiet point near 1,600 kc	C12, C13 2nd I-F trans.
2				C6, C7 1st I-F trans.
3		Repeat steps 1 and 2		
4	*Antenna coupling loop	1,400 kc	14 Rock gang	C4 (osc.) †
5		600 kc	60 Rock gang	L1 (osc.) †
6		Repeat steps 4 and 5		

* Steps 4 and 5 require a coupling loop from the signal generator to feed a signal into the receiver loop located in the lid. This loop should be loosely coupled to the receiver loop antenna so as not to disturb the receiver loop inductance.

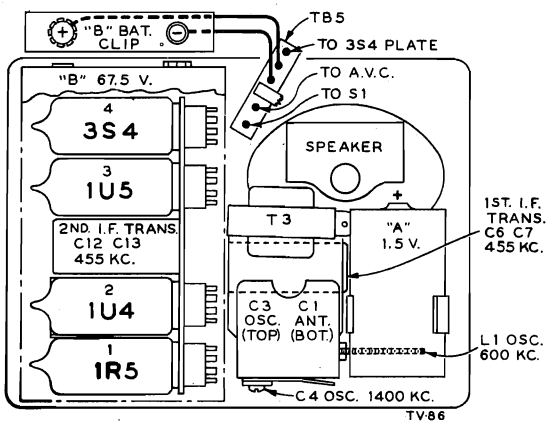
† ALIGNMENT SHIELD MUST BE USED. (See text.)



Alignment Shield



Terminal Board Wiring



Tube and Trimmer Locations

A rubber band should be placed around each tube for cushioning.

Replacement Parts

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES
	RC 1069—8B41, RC 1069A—8B42, RC 1069B—8B43
*73937	Baffle—Speaker baffle and grille cloth
70444	Board—Terminal board (5 contact)
70445	Board—Terminal board (1 contact)
*73947	Capacitor—Variable tuning capacitor (C1, C3, C4)
73153	Capacitor—Ceramic, 4 mmf. (C8)
*73962	Capacitor—Ceramic, 33 mmf. (C11)
73901	Capacitor—Ceramic, 51 mmf. (C2)
*73963	Capacitor—Ceramic, 75 mmf. (C14)
56653	Capacitor—Ceramic, 180 mmf. (C16)
*74093	Capacitor—Ceramic, 1500 mmf. (C20)
*73960	Capacitor—Ceramic, .01 mf. (C5)
72315	Capacitor—Tubular, .002 mf., 200 volts (C15)
*73961	Capacitor—Tubular, .003 mf., 200 volts (C9)
70606	Capacitor—Tubular, .005 mf., 400 volts (C18)
71928	Capacitor—Tubular, .02 mf., 200 volts (C17)
70615	Capacitor—Tubular, .05 mf., 400 volts (C10)
*73964	Capacitor—Electrolytic, 10 mf., 70 volts (C19)
70425	Clip—Spring clip for tuning knob
70443	Coil—Oscillator coil (L1, L2)
70452	Connector—Loop connectors (1 set) complete with eyelets
*73948	Control—Volume control (R6)
*73957	Fastener—Push fastener to hold loop (2 required) for Model 8B41—black
*73958	Fastener—Push fastener to hold loop (2 required) for Model 8B42—brown
*73959	Fastener—Push fastener to hold loop (2 required) for Model 8B43—red
70429	Grommet—Rubber grommet to mount tube support shelf (2 required)
*73950	Hinge—Lid hinge—L.H.—less mounting studs
*73951	Hinge—Lid hinge—R.H.—less mounting studs
72229	Holder—"A" battery holder
*73941	Insulator—Loop connector insulator
*73936	Knob—Calibrated tuning knob
*73946	Knob—Volume control knob
70708	Lead—"B" Battery lead complete
*73924	Lid—Case top lid complete with lid support and hinges —less loop—Model 8B41—black
*73925	Lid—Case top lid complete with lid support and hinges —less loop—Model 8B42—brown
*73926	Lid—Case top lid complete with lid support and hinges —less loop—Model 8B43—red
*73954	Loop—Antenna loop complete with connectors—less lid —Model 8B41—black
*73955	Loop—Antenna loop complete with connectors—less lid —Model 8B42—brown
*73956	Loop—Antenna loop complete with connectors—less lid —Model 8B43—red
*73949	Nameplate—"RCA" nameplate for top lid
*73940	Nut—Speed nut to lock screw clamping speaker to face panel
*73938	Panel—Chrome and mahogany face panel
	Resistor—Fixed, composition, 820 ohms ±10%, ½ watt (R11)
	Resistor—Fixed, composition, 15,000 ohms ±10%, ½ watt (R2)
	Resistor—Fixed, composition, 68,000 ohms ±20%, ½ watt (R5)
	Resistor—Fixed, composition, 100,000 ohms ±10%, ½ watt (R1)
	Resistor—Fixed, composition, 1 megohm ±20%, ½ watt (R9)
	Resistor—Fixed, composition, 3.3 megohms ±20%, ½ watt (R4, R10)
	Resistor—Fixed, composition, 4.7 megohms ±20%, ½ watt (R3, R7)
	Resistor—Fixed, composition, 10 megohms ±20%, ½ watt (R8)
*73944	Screw—#2-56 x 3/16" machine screw to hold lid hinges to face panel (2 required)
*73939	Screw—#4-40 x 5/16" binder head machine screw to clamp speaker to face panel
*73943	Screw—#4-40 x 3/16" binder head screw to fasten face panel to chassis (3 required)
70446	Screw—#6 x ¼" hex head self-tapping screw to mount battery holder
70436	Socket—Tube socket
70423	Spacer—Rubber shock spacer (cemented to case center strip)
*73942	Stud—Lid support stud (face panel end)
*73952	Stud—L.H. lid hinge mounting stud
*73953	Stud—R.H. lid hinge mounting stud
70451	Support—Lid support complete with lid end mounting stud
72230	Support—Tube support shelf less tube sockets and transformer
*73945	Switch—Power switch (S1)
70442	Transformer—First I.F. transformer (T1 [C6, C7])
70437	Transformer—Second I.F. transformer (T2 [C12, C13])
70440	Transformer—Output transformer (T3)
	SPEAKER ASSEMBLIES
	92523-4W
70428	Speaker—2" x 3" P.M. speaker complete with cone and voice coil
	MISCELLANEOUS
*73965	Bottom—Case bottom—Model 8B41—black
*73966	Bottom—Case bottom—Model 8B42—brown
*73967	Bottom—Case bottom—Model 8B43—red
70457	Catch—Spring catch assembly
*74016	Center—Case center complete with spring catch
*73968	Handle—Carrying handle—Model 8B41—black
*74022	Handle—Carrying handle—Model 8B42—brown
*73969	Handle—Carrying handle—Model 8B43—red
*73970	Link—Handle link (2 required)
73943	Screw—#4-40 x 3/16" binder head screw to hold case center

RADIO CORP. OF AMERICA

MODELS 8B41, CHASSIS RC-1069; 8B42 CHASSIS RC-1069A

MODELS 8B43, CHASSIS RC-1069B; 8B46 CHASSIS RC-1069C

Replacement of Component Parts

I. **To remove bottom cover:**
- a. Depress locking spring clip through hole in top of case.
- b. With spring clip depressed, pull cover carefully out and up off the retaining lugs in the bottom of the case center strip.

II. **To replace batteries:**
- a. Remove bottom cover.
- b. Remove, either or both, the "A" and "B" battery as may be necessary. The "B" battery snap fasteners can best be removed by inserting a screwdriver under the snap fastener strip and prying upward.

III. **To remove the case center strip:**
- a. Remove bottom cover.
- b. Remove one screw (A) on the inside at the handle end.
- c. Tilt case center strip and lift.

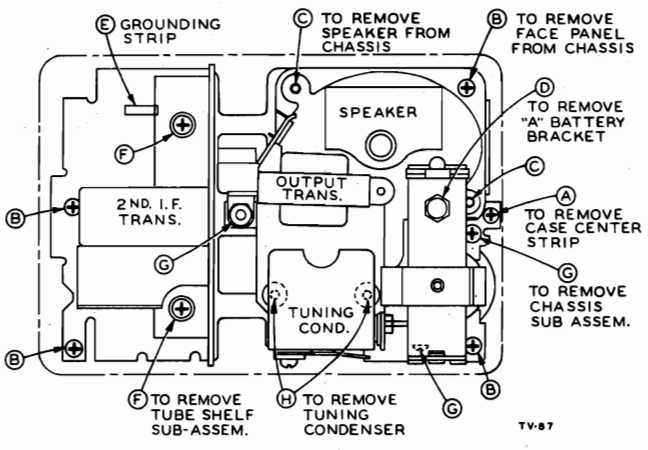
IV. **To replace tubes:**
- a. Remove bottom cover.
- b. Remove "B" battery.
- c. Remove case center strip.
- d. Remove and replace tubes as required.

V. **To remove face panel from chassis plate:**
- a. Remove dial knob (pull off).
- b. Remove bottom cover (I), batteries (II) and case center strip (III).
- c. Unsolder leads to loop connectors.
- d. Remove the four Phillips head screws (B) located at three corners and end close to 2nd I.F. transformer, which hold the chassis to face panel.
- e. The face panel may now be folded back into the case top lid.

VI. **To remove speaker:**
- a. Remove face panel (see item V).
- b. Unsolder voice coil leads.
- c. Remove two Phillips head screws (C) on chassis plate holding speaker.

VII. **To remove output transformer:**
- a. Remove speaker (see item VI).
- b. Unsolder transformer leads.
- c. Remove rivet (use bolt for replacement).
- d. Unsolder mounting lug.

VIII. **To remove chassis subassemblies from chassis plate:**
- a. Remove tubes (see item IV).
- b. Unsolder grounding strap (E) which connects tube shelf to chassis plate.
- c. Unsolder two wires which connect to speaker.
- d. Unsolder two wires attached to switch.
- e. Unsolder leads to loop connectors.
- f. Remove dial knob (pull off).
- g. Remove two screws (F) holding tube shelf to chassis plate.
- h. Remove nut (G) between I.F. transformers.
- i. Remove screw (G) beneath the negative terminal of "A" battery holder, and also screw (G) adjacent to volume control below "A" battery holder.



Chassis Disassembly

IX. **To remove volume control:**
- a. Remove chassis subassembly from chassis plate (see item VIII).
- b. Unsolder the two leads to the "A" battery holder.
- c. Lift up the "A" battery holder by removing the one screw (C) in its base. This holder has a hinge action and must be lifted up and back to remove.
- d. Unsolder volume control leads.
- e. Remove volume control knob (attached to shaft with set screw)
- f. Remove volume control assembly by bending back four lugs.

X. **To remove oscillator coil:**
- a. Same procedure and steps as covered in item VIII for removal of chassis subassembly plus the following.
- b. Unsolder oscillator coil leads.
- c. Remove coil by unsnapping spring mounting clips from angle bracket,

XI. **To remove tuning condenser:**
- a. Remove case center strip (III).
- b. Unsolder two leads and two ceramic capacitors (C2, C20) from tuning condenser.
- c. Remove tuning knob (pull off).
- d. Remove the two screws (H) (accessible through dial knob opening) which hold the tuning condenser to the chassis subassembly.

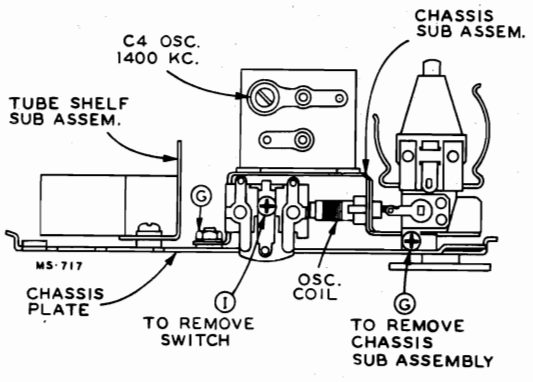
XII. **To remove 1st I-F transformer:**
- a. Remove chassis subassemblies (see item VIII).
- b. Unsolder four leads from 1st I-F transformer.
  1. Blue to screen of 1R5 tube.
  2. Green to grid of 1U4 tube.
  3. Red to B+ terminal of 5 lug terminal board TB5.
  4. Black to terminal board TB2.
- c. Unsolder and bend mounting lugs straight on the I-F transformer can.

XIII. **To remove 2nd I-F transformer:**
- a. Remove chassis subassemblies (see item VIII).
- b. Unsolder four leads from 2nd I-F transformer.
- c. Unsolder and bend mounting lugs straight on the I-F transformer can.

XIV. **To remove loop assembly:**
- a. Remove case center strip (see item III).
- b. Unsolder leads to loop connectors.
- c. Remove snap fasteners holding loop in cover.
- d. Carefully pry out on edge next to catch (opposite hinges).
- e. When reassembling press loop assembly into top lid on the side next to the connectors to cause the plastic projections on the loop assembly to engage in the detents in the top lid.

XV. **To remove switch:**
- a. Remove case center strip (III).
- b. Remove screw (I) which holds switch to chassis plate.
- c. Unsolder the two wires which connect to the switch.
- d. Unsolder switch from chassis plate.

XVI. **To adjust latching of top lid:**
- a. The hinges are attached to the face panel with Phillips head screws (one to each hinge). The mounting holes of the hinges are sufficiently large to permit adjustment of the hinges when the mounting screws are loosened. Tighten screws after adjustment.



Chassis Disassembly

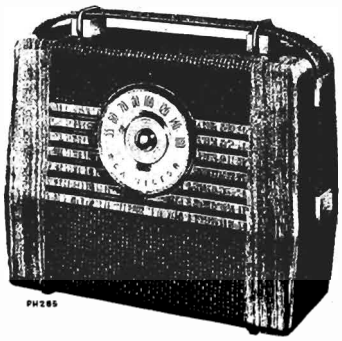
Model 8BX5



Model 8BX55

Specifications

Frequency Range ..... 540-1,600 kc

Intermediate Frequency ..... 455 kc

Power Supply Rating
110 to 125 volts, AC 50 or 60 cycles, or DC....18 watts

Batteries required.....One RCA Battery Pack VS050

Tube Complement
(1) RCA—1R5 .....Converter
(2) RCA—1T4 .....I. F.-Amplifier
(1U4 in RC-1059A)
(3) RCA—1U5 .....2nd Det. AVC. & A.F.-Amplifier
(4) RCA—3V4 .....Power Output
(5) RCA—117Z3 .....Rectifier

Current Consumption
Battery Operation....."A" 60 ma., "B" 10 ma.
(Average life of RCA VS050 Battery
100 hrs. intermittent service.)
Total Rect. Current (117 volt, 60 cycle).....60 ma.

Power Output (AC Operation)
Undistorted ..... .15 watt
Maximum ..... .25 watt
(Output is slightly lower on battery operation)

Loudspeaker .....4 in. P.M. 3.4 ohms at 400 cycles

Cabinet Dimensions
Height.....9½ in. Width.....11 in. Depth.....5 in.

Critical Lead Dress

1. Dress output plate bypass C20 capacitor against chassis
2. Dress output plate lead to output transformer against chassis.
3. Dress audio coupling capacitor C14 (volume control to grid of 1U5) away from chassis, away from audio limiting resistor R8 and to permit adjustment of second I.F. Transformer.
4. Dress all exposed leads away from each other, and away from chassis to prevent short circuits.
5. Dress all filament and ground leads against chassis.
6. Dress filament bypass capacitor C23 and accompanying compensating resistor R15 (volume control to IT4 [or 1U4] socket) against volume control.
7. Dress power line cord away from line-battery switch mechanism.
8. Dress all capacitors and wiring away from oscillator coil.
9. Dress 4 mmf. neutralizing capacitor C7 against A.V.C. bypass capacitor C8 (IT4 [or 1U4] filament to first I.F. trans.).

Alignment Procedure

Cathode Ray Alignment is the preferable method. Connections for the oscilloscope are shown on the schematic diagram.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test oscillator to the receiver chassis and keep the oscillator output as low as possible to avoid AVC action.

Battery operation of the receiver is preferable during alignment; on AC operation an isolation transformer (117v./117v.) may be necessary for the receiver if the test oscillator is also AC operated.

NOTE: Battery or substitute must be in place for ant. alignment (step 5).

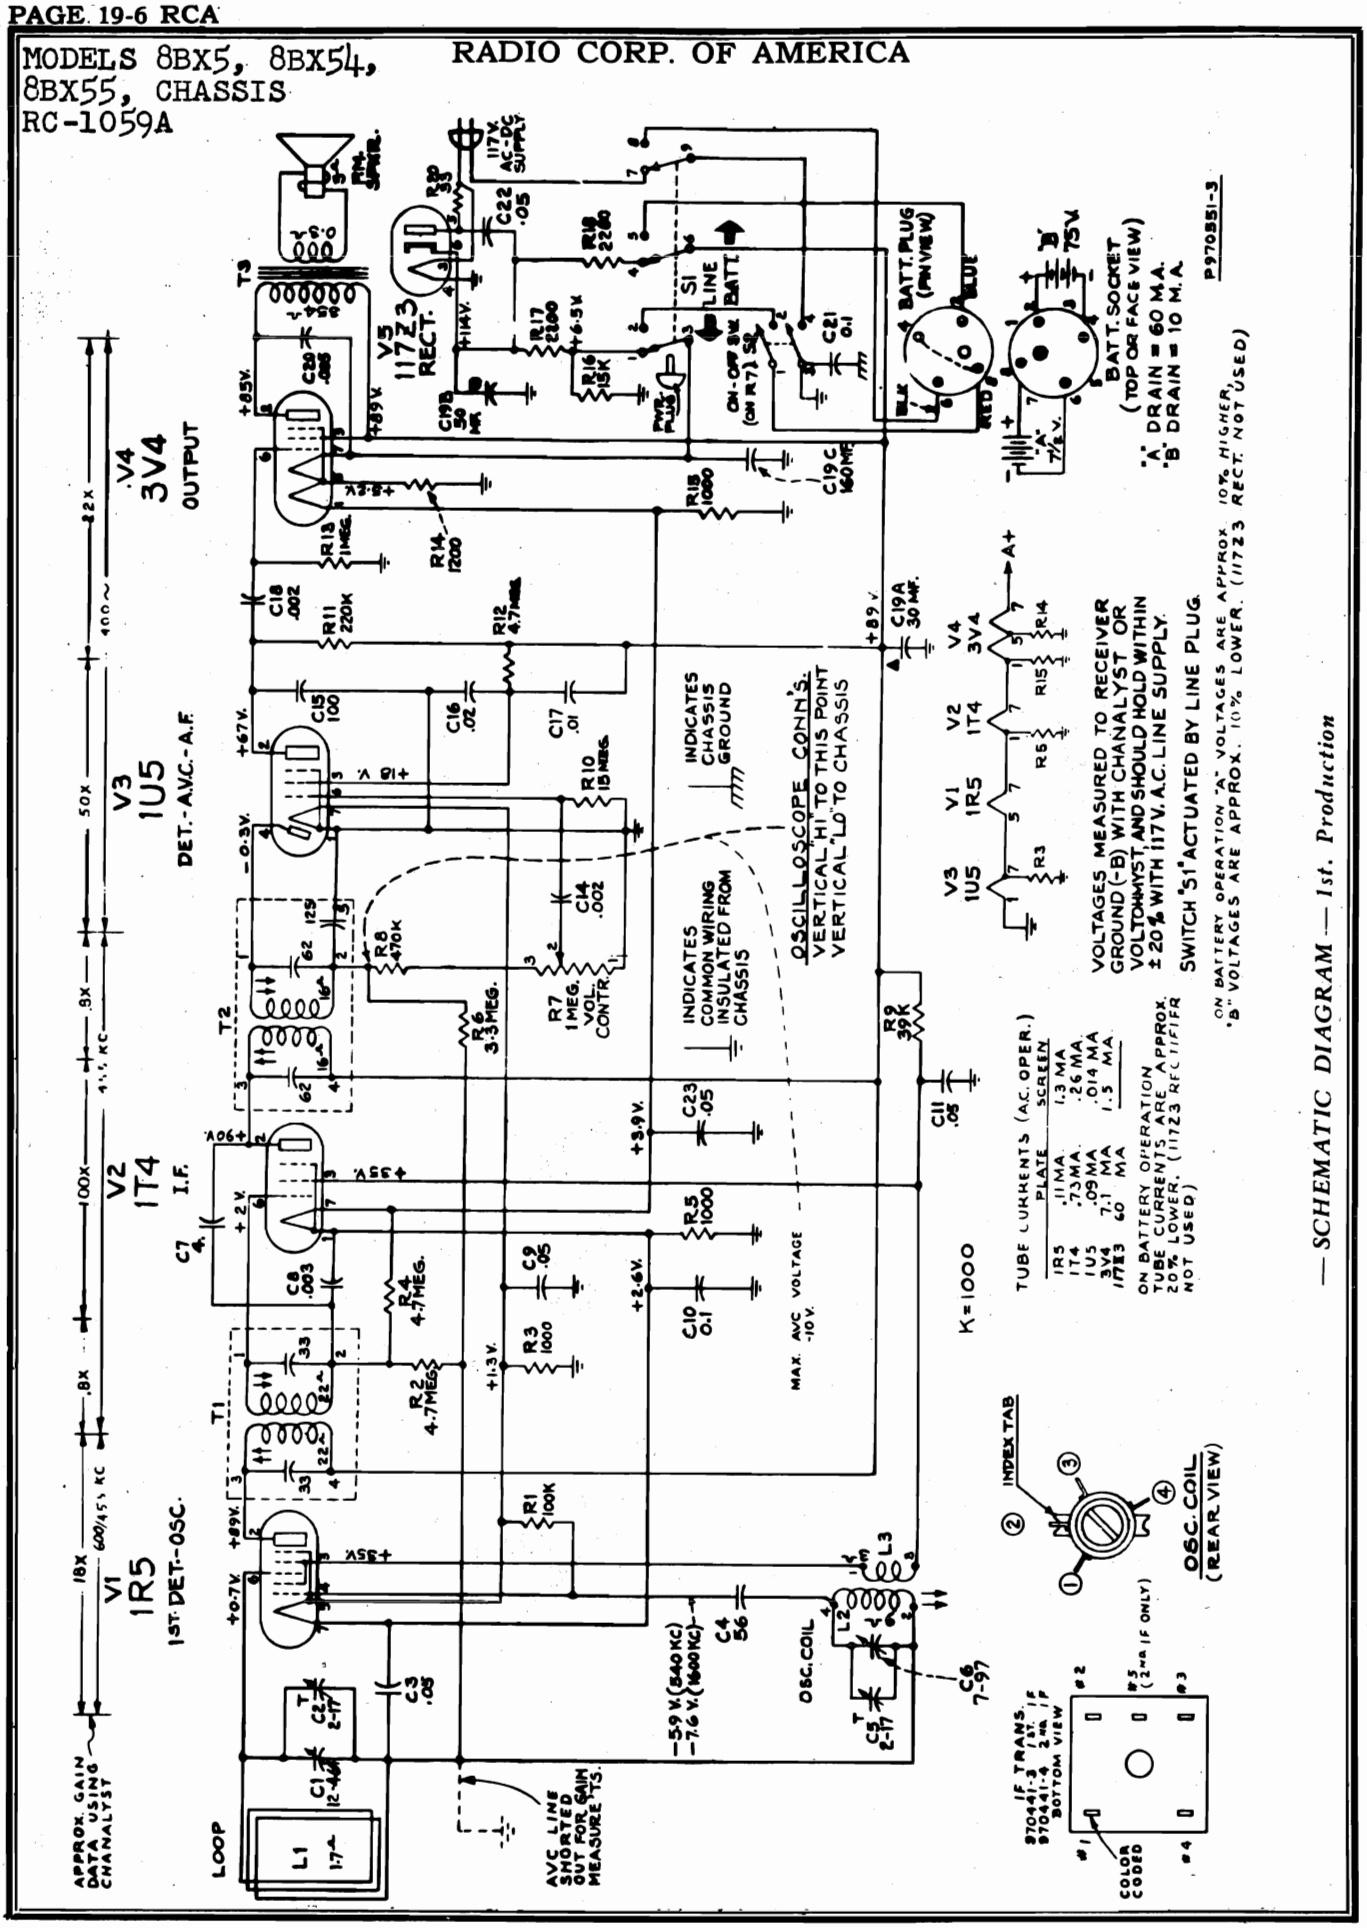
Alignment Tabulation

Step	Connect high side of test oscillator to—	Test oscillator output—	Turn receiver dial to—	Adjust for maximum peak output
1	Disconnect loop—remove chassis—remove bottom plate, connect a 10,000 ohm resistor from C1 stator terminal to tuning condenser frame.			
2	Stator terminal of C1 thru .01 mf. capacitor	455 kc	55	*Top and bottom T2 (2nd. I-F trans.) *Top and bottom T1 (1st. I-F trans.)
3	Remove the 10,000 ohm resistor. Replace bottom cover and install chassis in cabinet. Re-connect loop.			
4	Short wire placed near receiver (for radiated signal)	1600 kc	160	†C5 (osc.)
5		1400 kc	140	†C2 (ant.)
6		600 kc	60	*L2 (osc.) while rocking gang
7		Repeat steps 4, 5 and 6		

NOTES:
*The magnetite cores of L2 and some T2 and T1 do not have visible adjusting screws. The cores have screw driver slots to permit adjustment (use non-metallic screwdriver).
†Adjustable thru hole in side of case which is accessible after unfastening one end of the carrying handle.

MODELS 8BX5, 8BX54, 8BX55, CHASSIS RC-1059A

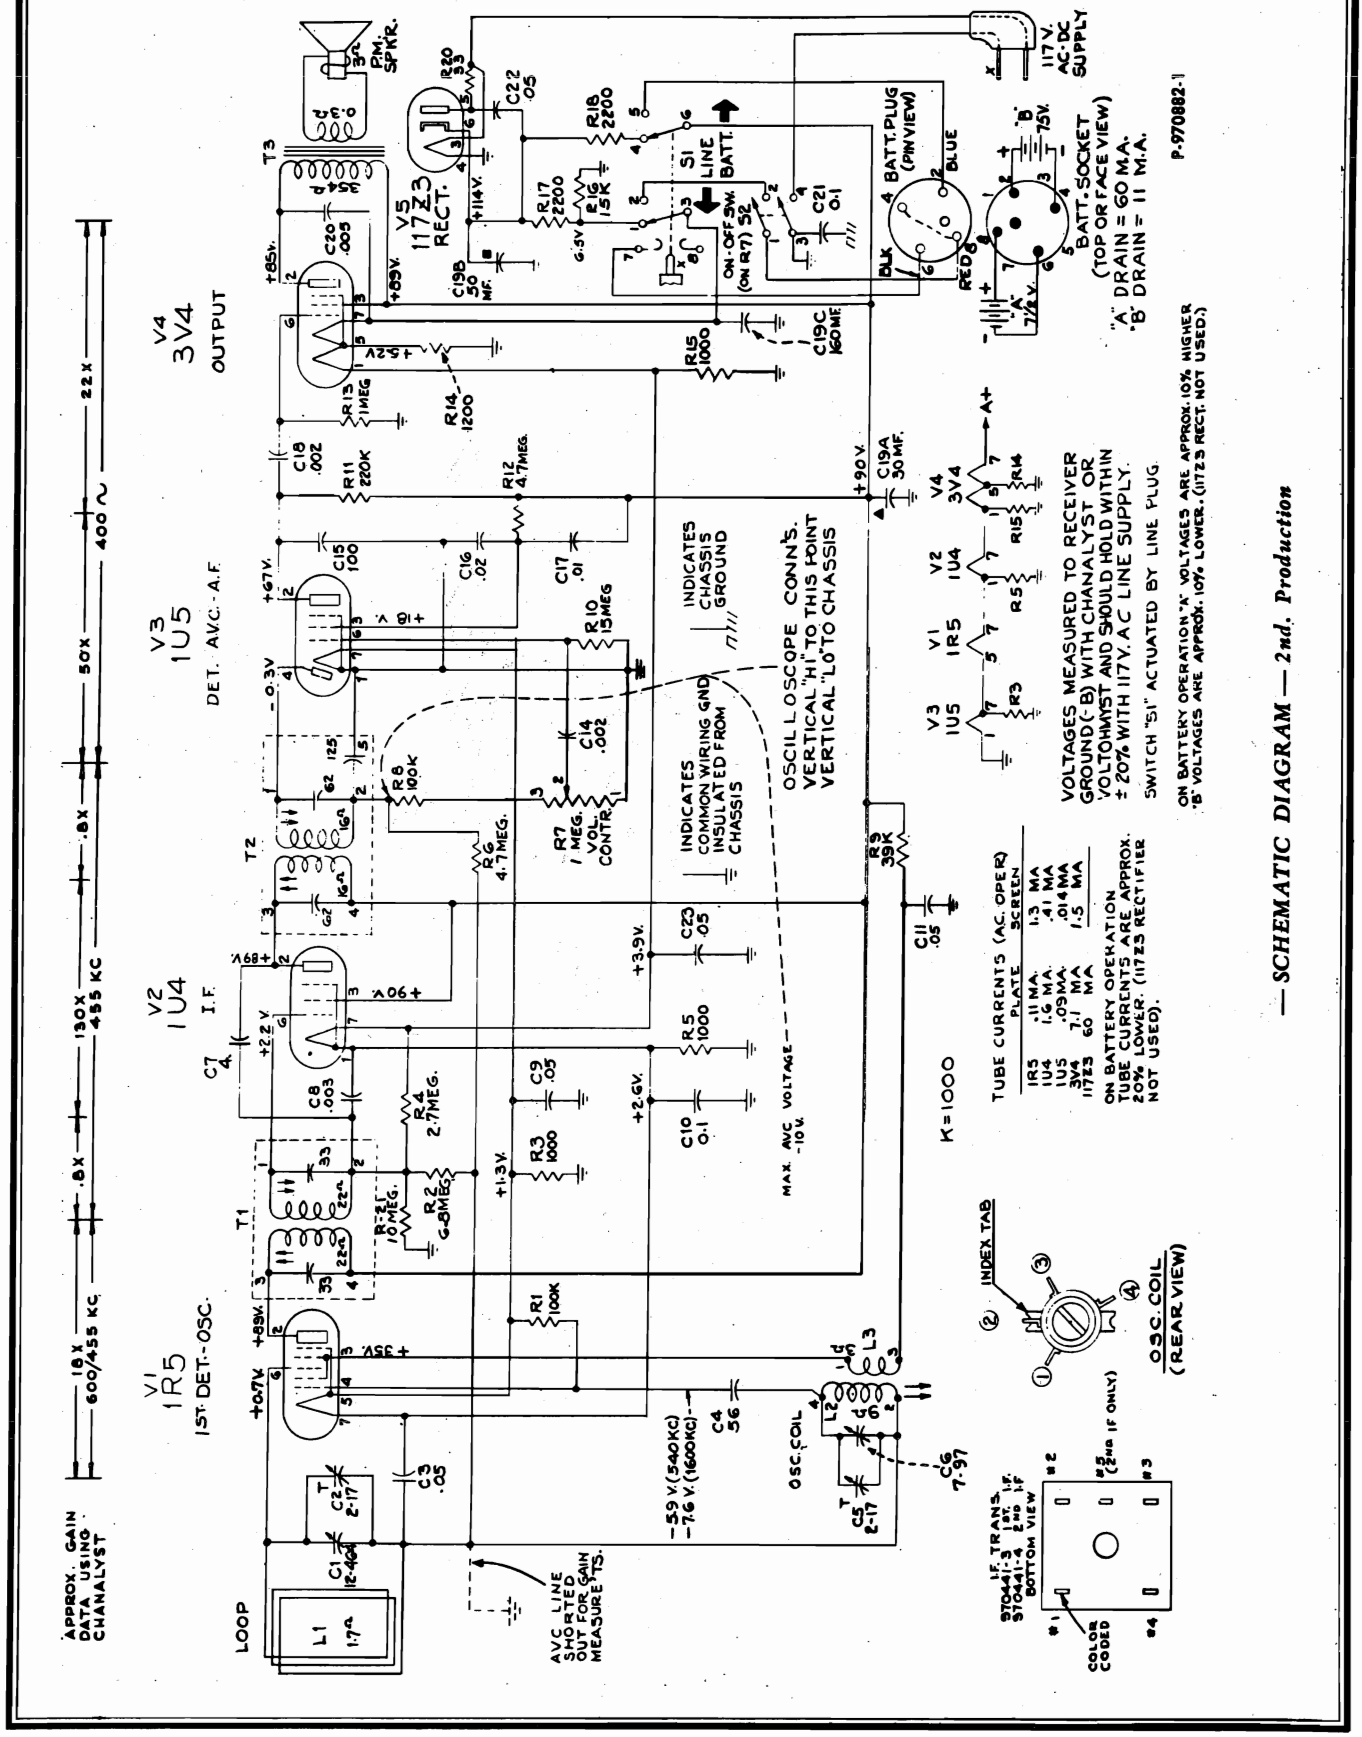
RADIO CORP. OF AMERICA



— *SCHEMATIC DIAGRAM — 1st. Production*

RADIO CORP. OF AMERICA

MODELS 8BX5, 8BX54, 8BX55, CHASSIS RC-1059A



MODELS 8BX5, 8BX54, 8BX55 — RADIO CORP. OF AMERICA — CHASSIS RC-1059, RC-1059A

To Remove Carrying Handle

1. Pull off the volume control knob.
2. Insert a small knife blade between one side of a spring clip and the cabinet as shown below, push upward on the slip shield to disengage the locking of the slip shield to the spring clip. Repeat this procedure on the other side of the spring clip. The slip shield may then be removed by pushing it upward thus disengaging it from the spring clip.
3. Repeat step 2 for each slip shield.
4. Remove the four screws (2 on each side) which hold the carrying handle to the case.

Caution: When re-assembling—make certain that the slip shield and the spring clip is assembled with their locks in the correct relation to each other.

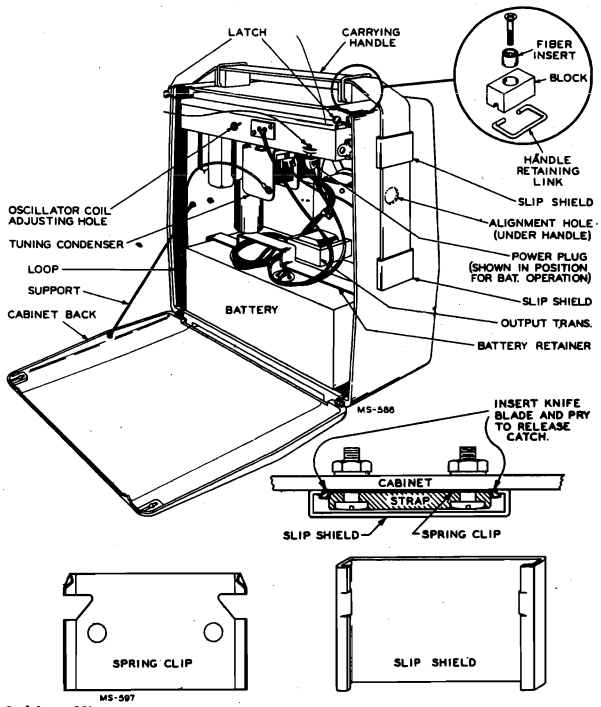
To Remove Chassis

1. Pull off the volume control knob.
2. Close tuning condenser (dial at 55) to prevent possible damage to tuning condenser.
3. Remove dial knob by grasping both sides with the tips of the fingers of both hands and pull to the front —or—close the tuning condenser, open the back, reach in and push outward on the hub of the dial knob.

NOTE: When re-assembling—press inward on the back of the tuning condenser and on the front of the knob to properly seat the hub on the shaft.

4. Remove the two slip shields on the R.H. side of the cabinet (opposite the volume control) and unfasten the end of the carrying handle using the procedure described under, "To Remove Carrying Handle."
5. Unsolder the loop leads.
6. Remove the two screws holding the bottom edge of the speaker to the cabinet.
7. Remove the plug from the battery.
8. Remove the two screws at the top of the cabinet while supporting the chassis with one hand.

NOTE: When re-installing—replace speaker holding screws first but do not securely tighten until the two screws at the top of the cabinet have been tightened.



Cabinet Hinges

The cabinet hinges may be readily removed, they are secured to the cabinet and back by force fit. To remove back from cabinet—pull straight outward on both hinges at the same time.

Simplified Schematic Diagram "FM" Band

Antennas:

These receivers have built-in antennas for standard broadcast (AM) and frequency modulation (FM) reception.

Under average conditions these antennas will provide satisfactory reception. However, provision is made for the use of external antennas if desired — connect as indicated below:

Ground: Connect external ground to "G" terminal.

AM Antenna: Connect a single wire antenna to terminal "A."

FM Antenna: Connect the transmission line from an external FM dipole antenna to "FM" and "G" terminals. Remove the internal FM antenna wire from terminal "FM."

NOTE: *For satisfactory reception on FM—when using the built-in FM antenna—the power cord must be fully extended and must not be coiled or hanked up.*

CHASSIS RC-1060, RC-1060A — RADIO CORP. OF AMERICA — MODELS 8R71, 8R72, 8R74, 8R75, 8R76

7	6X5GT		8	67	67	65

Voltages and currents measured with tuning condenser closed and no signal input should hold within ±20% with rated line voltage.

Note: Plate voltage removed from 6J6 mixer and oscillator tube during "Phono" operation.

Note: FM mixer and oscillator coils are adjustable by increasing or decreasing the spacing between turns. The position of the coils and location of the taps are critical (refer to "Critical Lead Dress").

Alignment Procedure

CORRECT ALIGNMENT OF THE FM BAND REQUIRES THAT THE AM BAND BE ALIGNED FIRST

Alignment Indicators:

An RCA VoltOhmyst or equivalent meter is necessary for measuring developed d-c voltage during FM alignment. Connections are specified in the alignment tabulation. An output meter is also necessary to indicate minimum audio output during FM Ratio Detector alignment. Connect the output meter across the speaker voice coil.

The RCA VoltOhmyst can also be used as an AM alignment indicator, either to measure audio output or to measure a-v-c voltage.

When audio output is being measured the volume control should be turned to maximum.

Signal Generator:

For all alignment operations connect the low side of the signal generator to the receiver chassis. The output should be adjusted to provide accurate resonance indication at all times. If output measurement is used for AM alignment the output of the signal generator should be kept as low as possible to avoid a-v-c action.

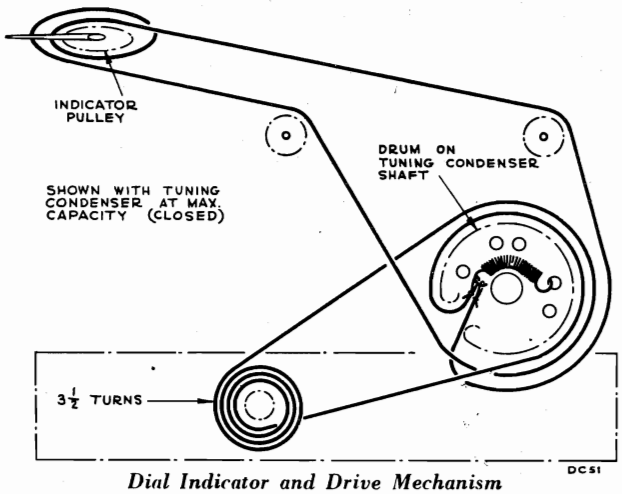
The FM i-f alignment may be checked by means of an FM sweep generator and cathode ray oscilloscope. Connect the output from the sweep generator, which is set to 10.7 mc., to the mixer grid (6J6 Pin No. 5), low side to chassis. Disconnect the 2 mfd. capacitor C33 from the Ratio Detector circuit.

Connect the high side of the oscilloscope to the junction of R25 and R26, low side to chassis. Adjust the sweep generator and oscilloscope to obtain the response curve.

The Ratio Detector characteristic may be viewed by connecting the oscilloscope across the volume control R14. Capacitor C33 should be re-connected before checking the Ratio Detector characteristic.

CRITICAL LEAD DRESS

1. Keep leads of C7 short.
2. Dress R27 away from range switch and pin No. 5 of V1.
3. The ground lead of pin No. 2 of V2 and V3 should be down against chassis. Its length is critical.
4. The AVC lead from R26 to range switch should be dressed against chassis and on front apron side of the output transformer.
5. C43 should have short leads and the color code of the capacitor should go to the coil L4. The capacitor should be cemented down with polystyrene cement at the same time L2 is cemented.
6. The lead from the high side of the loop should be dressed away from tubes.
7. Lead from pin No. 2 of V1 to terminal "A" of 1st I. F. transformer should be dressed against the chassis.
8. Connect C40 directly between the gang condenser and pin No. 1 of V1.
9. Make all FM leads as short as possible.
10. Dress lead from pin No. 5 of V2 to terminal "A" of 2nd I. F. transformer down against chassis.
11. Dress resistor R15 near chassis base.
12. Dress all A. C. leads away from volume control.
13. The lead from "FM" terminal of antenna terminal board to L1 tap should be run around the outside of the 1st I. F. transformer and away from V2.
14. The taps on L1 and L2 are critical. L1 tap should be ¾ turn from the ground end. L2 tap should be 2½ turns from the gang condenser C8.
15. The lead from R32 to terminal No. 9 of S1 should be dressed away from the output transformer.
16. Dress C25 and C26 against the chassis with the shortest lead length possible.
17. The position of L1 and L2 is critical. L1 should be midway between V1 and the 1st I. F. transformer. The end of L2 should be approximately 3/16" from V1.



Dial Indicator and Drive Mechanism

AM Alignment

RANGE SWITCH IN BC POSITION

Steps	Connect high side of sig. gen. to—	Sig. gen. output	Turn radio dial to—	Adjust for peak output
1	C3 in series with .01 mfd.	455 kc.	Quiet point at low freq. end.	AM windings.† T3 bottom core (sec.). T3 top core (pri.).
2				AM windings.† T2 top core (sec.). T2 bottom core (pri.).
3	"A" terminal of terminal board at rear of chassis in series with 220 mmf.	1400 kc.	1400 kc.	C13 osc. C4 ant.
4		600 kc.	600 kc.	L4 osc. (Rock gang.)
5	Repeat Steps 3 and 4.			

† Use alternate loading.

Alternate loading involves the use of a 47,000 ohm resistor to load the AM plate winding while the AM grid winding of the SAME TRANSFORMER is being peaked. Then the grid winding is loaded with the resistor while the plate winding is peaked. Only one winding is loaded at any one time. Remove the 47,000 ohm resistor after T3 and T2 have been aligned.

Oscillator frequency is above signal frequency on both AM and FM.

FM Alignment

RANGE SWITCH IN FM POSITION — VOLUME CONTROL MAXIMUM

Steps	Connect high side of sig. gen. to—	Sig. gen. output	Turn radio dial to—	Adjust for peak output
1	Connect the d-c probe of a VoltOhmyst to the negative lead of the 2 mfd. capacitor C33 and the common lead to chassis. Turn gang condenser to max. capacity (fully meshed).			
2	Pin 1 of 6AU6 in series with .01 mfd.	10.7 mc. modulated 30% 400 cycles AM (Approx. .05 volt).	Max. capacity (fully meshed).	T4 top core for max. d-c voltage across C33. T4 bottom core for min. audio output.*
3	FM ant. term. in series with a 300 ohm resistor. (Remove ant. lead from "FM" term.)	10.7 mc. Adjust to provide 2 to 3 volts indication on VoltOhmyst during alignment.		FM windings.†† T3 top core (sec.). T3 bottom core (pri.).
4				FM windings.†† T2 top core (sec.). T2 bottom core (pri.).
5		106 mc.	106 mc.	L2 osc.** C2 ant. Set C2 at max. capacity while adjusting L2.
6		90 mc.	90 mc.	L1 ant.** (Rock gang.)
7	Repeat Steps 5 and 6 until further adjustment does not improve calibration.			

* Two or more points may be found which lower the audio output. At the correct point the minimum audio output is approached rapidly and is much lower than at any incorrect point.

†† Align T3 and T2 by means of alternate loading as explained under AM alignment. Use a 680 ohm resistor instead of a 47,000 ohm resistor and load the FM windings.

** L1 and L2 are adjustable by increasing or decreasing the spacing between turns.

CHASSIS RC-1060, RC-1060A — RADIO CORP. OF AMERICA — MODELS 8R71, 8R72, 8R74, 8R75, 8R76

Circuit Description

The chassis used in these receivers have a 6J6 tube (V1) (twin triode), one section of which is used as mixer and the other section as oscillator. The FM antenna coil and the FM oscillator coil are placed in such position as to provide coupling between them. A section of the AM oscillator coil is connected in series with the mixer grid input when the range switch is in AM position.

Dual I-F transformers are used, each transformer containing both AM and FM windings. The I-F amplifier is V2 (6BA6).

The range switch has four functions:

(1) Selection of AM or FM ranges.

(2) Selection of AVC supply voltages to be applied to the controlled tubes. Simple AVC is applied to the grids of V1 and V2 on AM. Delayed AVC is used on FM and is applied only to the grid of V2.

(3) Controls application of B+ voltage to the plate circuits of V1 (disconnected for PHONO operation).

(4) Controls audio input to volume control.

The driver V3 (6AU6) and ratio detector V4 (6AL5) circuits are similar to those used in other RCA Victor AM-FM receivers.

The audio voltage controlled by the volume control is amplified by V5 (6AV6) and V6 (6V6GT).

The rectifier V7 is type 6X5GT.

Specifications

Tuning Ranges

Standard Broadcast (AM)..... 540-1,600 kc.
Frequency Modulation (FM)..... 88-108 mc.

Intermediate Frequencies...AM—455 kc., FM—10.7 mc.

Tube Complement

(1) 6J6..... Mixer and Oscillator
(2) 6BA6..... I. F. Amplifier
(3) 6AU6..... Driver
(4) 6AL5..... Ratio Detector
(5) 6AV6..... A. F. Amp.
(6) 6V6GT..... Output
(7) 6AV6.....AM Det—AVC—Ph. Inv.
(8) 6V6GT..... Output
(9) 6X5GT..... Rectifier

Tuning Drive Ratio..... 18:1 (9 turns of knob)

Record Changer (RP-178)

Record Capacity..... Twelve 10-in. or ten 12-in.
Turntable Speed..... 78 r.p.m.

Power Supply Rating..... 115 volts, 60 cycles, 90 watts

Circuit Description

The chassis used in these receivers have a 6J6 tube (V1) (twin triode), one section of which is used as mixer and the other section as oscillator. The FM antenna coil and the FM oscillator coil are placed in such position as to provide coupling between them. A section of the AM oscillator coil is connected in series with the mixer grid input when the range switch is in AM position.

Dual I-F transformers are used, each transformer containing both AM and FM windings. The I-F amplifier is V2 (6BA6).

The range switch has four functions:

(1) Selection of tuning range.
(2) Selection of AVC supply voltages to be applied to the controlled tubes. Simple AVC is applied to the grids of V1 and V2 on AM. Delayed AVC is used on FM and is applied only to the grid of V2.
(3) Controls application of B+ voltage to V1, V2, V3.
(4) Controls audio input to volume control.

The driver V3 (6AU6) and ratio detector V4 (6AL5) circuits are similar to those used in other RCA Victor AM-FM receivers.

The audio system is conventional. It consists of V5 (6AV6 a.f. amp.), V7 (6AV6 ph. inv.), V6 and V8 (6V6GT p. p. output).

The rectifier is V9 (6X5GT).

Loudspeaker

Type 92579-2W (8V90 1st Prod.)..... 8-in. P.M
Type 92569-5W (8V90 2nd Prod.)..... 12 in. P.M.
Type 92569-1KX or 92569-5W (8V91)....12 in. P.M
Voice coil impedance—
92579-2W..... 3.2 ohms at 400 cycles
92569-1KX..... 2.2 ohms at 400 cycles
92569-5W..... 3.2 ohms at 400 cycles

Cabinet Dimensions

	Height	Width	Depth
Model 8V90	33¼ in.	31 1/16 in.	16⅜ in.
Model 8V91	34⅜ in.	36 7/16 in.	18 in.

Dial Lamps (2)..... Type No. 51, 6-8 volts, 0.2 amp.

Jewel Lamp..... Type No. 51, 6-8 volts, 0.2 amp.

Power Output

Maximum..... 7 watts
Undistorted..... 6 watts

Antennas:

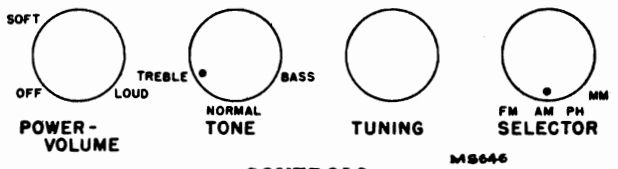
These receivers have built-in antennas for standard broadcast (AM) and frequency modulation (FM) reception.

Under average conditions these antennas will provide satisfactory reception. However, provision is made for the use of external antennas if desired — connect as indicated below:

AM Antenna: Connect a single wire antenna to terminal "A" (used on Model 8V91 only).

FM Antenna: Remove the built-in FM antenna lead from the "FM" terminals of the terminal board. Connect the transmission line of an external FM dipole antenna to these two "FM" terminals.

Ground: Connect external ground to "G" terminal (used on Model 8V91 only). Under certain conditions the use of an external ground is detrimental to FM reception.



CONTROLS

MODEL 8V91, CHASSIS RC-616A, RC-616H — RADIO CORP. OF AMERICA — MODEL 8V90, CHASSIS RC-618, RC-618A

Alignment Procedure

CORRECT ALIGNMENT OF THE FM BAND REQUIRES THAT THE AM BAND BE ALIGNED FIRST

Alignment Indicators:

An RCA VoltOhmyst or equivalent meter is necessary for measuring developed d-c voltage during FM alignment. Connections are specified in the alignment tabulation. An output meter is also necessary to indicate minimum audio output during FM Ratio Detector alignment. Connect the output meter across the speaker voice coil.

The RCA VoltOhmyst can also be used as an AM alignment indicator, either to measure audio output or to measure a-v-c voltage.

When audio output is being measured the volume control should be turned to maximum.

Signal Generator:

For all alignment operations connect the low side of the signal generator to the receiver chassis. The output should be adjusted to provide accurate resonance indication at all times. If output measurement is used for AM alignment the output of the signal generator should be kept as low as possible to avoid a-v-c action.

The FM i-f alignment may be checked by means of an FM sweep generator and cathode ray oscilloscope. Connect the output from the sweep generator, which is set to 10.7 mc., to the mixer grid (6J6 Pin No. 5), low side to chassis. Disconnect the 2 mfd. capacitor C33 from the Ratio Detector circuit.

Connect the high side of the oscilloscope to the junction of R25 and R26, low side to chassis. Adjust the sweep generator and oscilloscope to obtain the response curve.

The Ratio Detector characteristic may be viewed by connecting the oscilloscope across the volume control R14. Capacitor C33 should be re-connected before checking the Ratio Detector characteristic.

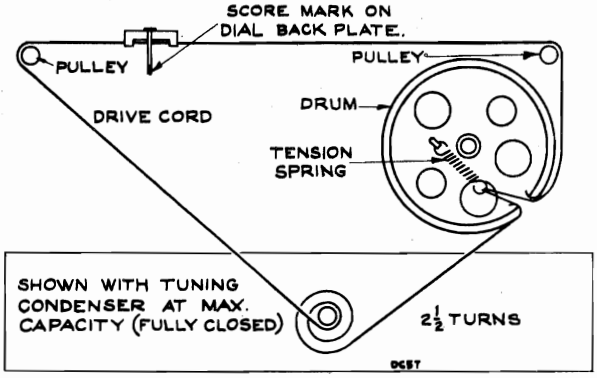
CRITICAL LEAD DRESS

1. Keep leads of C7 short.
2. Dress R27 away from range switch and pin No. 5 of V1.
3. The ground lead of pin No. 2 of V2 and V3 should be down against chassis. Its length is critical.
4. The AVC lead from R26 to range switch should be dressed against chassis and away from 6AU6 driver tube socket.
5. C43 should have short leads and the color code of the capacitor should go to the coil L4. The capacitor should be cemented down with polystyrene cement at the same time L2 is cemented.
6. The lead from the high side of the loop should be dressed away from tubes.
7. Lead from pin No. 2 of V1 to terminal "A" of 1st I. F. transformer should be dressed against the chassis.
8. Connect C40 directly between the gang condenser and pin No. 1 of V1.
9. Make all FM leads as short as possible.
10. Dress lead from pin No. 5 of V2 to terminal "A" of 2nd I. F. transformer down against chassis.
11. Dress resistor R15 near chassis base.
12. Dress all A. C. leads away from volume control.
13. The lead from "FM" terminal of antenna terminal board to L1 tap should be dressed away from V2.
14. The taps on L1 and L2 are critical. L1 tap should be ¾ turn from the ground end. L2 tap should be 2½ turns from the gang condenser C8.
15. Dress C25 and C26 against the chassis with the shortest lead length possible.
16. The position of L1 and L2 is critical. L1 should be midway between V1 and the 1st I. F. transformer. The end of L2 should be approximately 3/16" from V1.

Dial Indicator

With the tuning condenser fully meshed (closed) the indicator should be set to the reference mark on the dial back plate.

Refer to the dial scale reproductions on page 7.



Dial Indicator and Drive Mechanism — Model 8V90

AM Alignment

RANGE SWITCH IN BC POSITION

Steps	Connect high side of sig. gen. to—	Sig. gen. output	Turn radio dial to—	Adjust for peak output
1	C3 in series with .01 mfd.	455 kc.	Quiet point at low freq. end.	AM windings.† T3 bottom core (sec.). T3 top core (pri.).
2				AM windings.† T2 top core (sec.). T2 bottom core (pri.).
3	* "A" terminal of terminal board at rear of chassis in series with 220 mmf.	1400 kc.	1400 kc.	C13 osc. C4 ant.
4		600 kc.	600 kc.	L4 osc. (Rock gang.)
5	Repeat Steps 3 and 4.			

† Use alternate loading.

Alternate loading involves the use of a 47,000 ohm resistor to load the AM plate winding while the AM grid winding of the SAME TRANSFORMER is being peaked. Then the grid winding is loaded with the resistor while the plate winding is peaked. Only one winding is loaded at any one time. Remove the 47,000 ohm resistor after T3 and T2 have been aligned.

Oscillator frequency is above signal frequency on both AM and FM.

* "A" terminal used on Model 8V91 only. Use radiated signal for Model 8V90.

FM Alignment

RANGE SWITCH IN FM POSITION — VOLUME CONTROL MAXIMUM

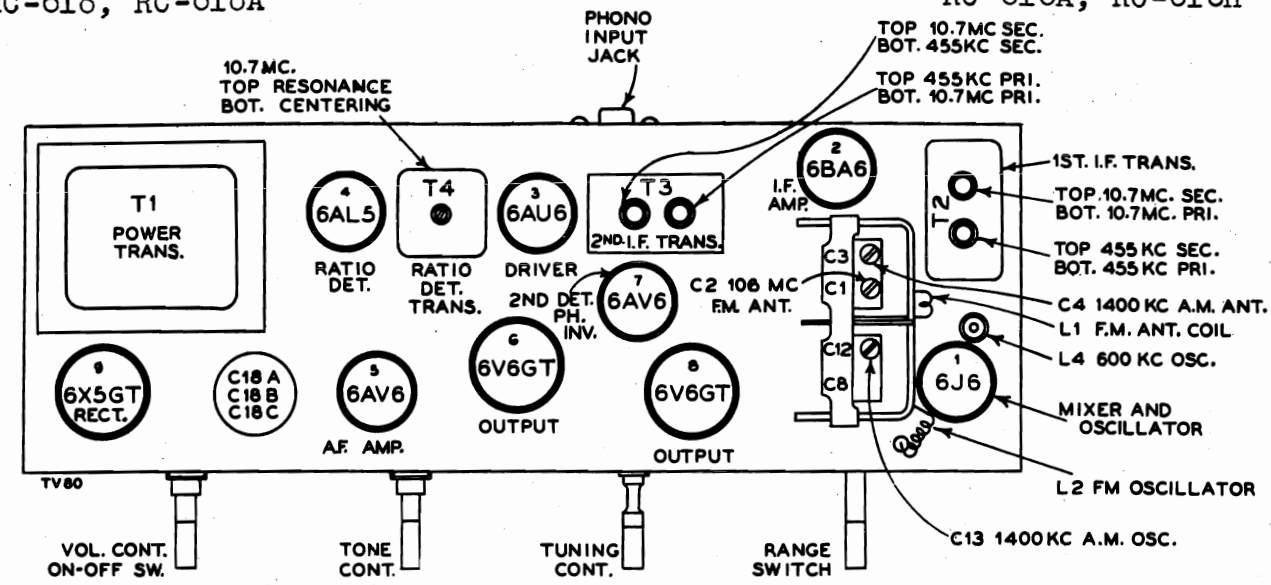
Steps	Connect high side of sig. gen. to—	Sig. gen. output	Turn radio dial to—	Adjust for peak output
1	Connect the d-c probe of a VoltOhmyst to the negative lead of the 2 mfd. capacitor C33 and the common lead to chassis. Turn gang condenser to max. capacity (fully meshed).			
2	Pin 1 of 6AU6 in series with .01 mfd.	10.7 mc. modulated 30% 400 cycles AM (Approx. .05 volt).	Max. capacity (fully meshed).	T4 top core for max. d-c voltage across C33. T4 bottom core for min. audio output.*
3	FM ant. term. in series with a 300 ohm resistor. (Remove ant. lead from "FM" term.)	10.7 mc. Adjust to provide 2 to 3 volts indication on VoltOhmyst during alignment.		FM windings.†† T3 top core (sec.). T3 bottom core (pri.).
4				FM windings.†† T2 top core (sec.). T2 bottom core (pri.).
5		106 mc.	106 mc.	L2 osc.** C2 ant. Set C2 at max. capacity while adjusting L2.
6		90 mc.	90 mc.	L1 ant.** (Rock gang.)
7	Repeat Steps 5 and 6 until further adjustment does not improve calibration.			

* Two or more points may be found which lower the audio output. At the correct point the minimum audio output is approached rapidly and is much lower than at any incorrect point.

†† Align T3 and T2 by means of alternate loading as explained under AM alignment. Use a 680 ohm resistor instead of a 47,000 ohm resistor and load the FM windings.

** L1 and L2 are adjustable by increasing or decreasing the spacing between turns.

MODEL 8V90, CHASSIS RC-618, RC-618A — RADIO CORP. OF AMERICA — MODEL 8V91, CHASSIS RC-616A, RC-616H



Tube and Trimmer Locations

Note: FM mixer and oscillator coils are adjustable by increasing or decreasing the spacing between turns. The position of the coils and location of the taps are critical (refer to "Critical Lead Dress").

SOCKET VOLTAGES

Voltages measured with Chanalyst or VoltOhmyst and should hold within ±20% with rated line voltage. Tuning condenser closed—no signal input.

	Resistor—Fixed, composition, 56,000 ohms, ±10%, 1 watt (R10)
	Resistor—Fixed, composition, 82,000 ohms, ±10%, ½ watt (R42)
	Resistor—Fixed, composition, 100,000 ohms, ±10%, ½ watt (R33, R45)
	Resistor—Fixed, composition, 270,000 ohms, ±10%, ½ watt (R19, R29)
	Resistor—Fixed, composition, 330,000 ohms, ±10%, ½ watt (R28)
	Resistor—Fixed, composition, 470,000 ohms, ±10%, ½ watt (R20, R26, R44)
	Resistor—Fixed, composition, 1 megohm, ±20%, ½ watt (R31)
	Resistor—Fixed, composition, 2.2 megohm, ±20%, ½ watt (R3)
	Resistor—Fixed, composition, 2.7 megohm, ±10%, ½ watt (R46)
	Resistor—Fixed, composition, 3.9 megohm, ±10%, ½ watt (R2)
	Resistor—Fixed, composition, 10 megohms, ±20%, ½ watt (R15, R41)
	Resistor—Fixed, composition, 22 megohms, ±20%, ½ watt (R16)
*73894	Shaft—Tuning knob shaft
31364	Socket—Dial lamp socket
35787	Socket—Phono input socket
73606	Socket—Tube socket, miniature, for tubes V1, V2 and V3
72516	Socket—Tube socket, miniature, for tubes V4, V5 and V7
31251	Socket—Tube socket, wafer, octal, for tubes V6, V8 and V9
31418	Spring—Drive cord spring
*73890	Switch—Selector switch (S1, S2)
*73891	Switch—Tone control switch (S4)
73601	Transformer—Power transformer, 115 volts, 60 cycle (T1)
73745	Transformer—First I.F. transformer—dual (T2)
74019	Transformer—Second I.F. transformer—dual (T3)
73743	Transformer—Ratio detector transformer (T4)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES
	92579-2W
	RL 105A1
*74181	Cap—Dust cap
*73912	Cone—Cone and voice coil assembly
5039	Plug—4 prong male plug for speaker
*73911	Speaker—8" P.M. speaker complete with cone and voice coil—less output transformer and plug
73636	Transformer—Output transformer (T5)
	MISCELLANEOUS
72555	Antenna—F.M. antenna
71599	Bracket—Pilot lamp bracket
72437	Cable—Shielded pickup cable complete with pin plug
13103	Cap—Pilot lamp jewel
71892	Catch—Bullet catch and strike for doors
*73897	Clamp—Dial clamp (2 required)
X1894	Cloth—Grille cloth for blonde instruments
X1893	Cloth—Grille cloth for mahogany finish or walnut instruments
*73904	Decal—Control panel decal for mahogany finish or walnut instruments
*73905	Decal—Control panel decal for blonde instruments
71984	Decal—Trade mark decal (RCA Victor)
71966	Decal—Trade mark decal (Victrola)
*73898	Dial—Glass dial scale
11889	Grommet—Rubber grommet for front apron of chassis (2 required)
72856	Grommet—Rubber grommet for mounting record changer (3 required)
73903	Hinge—Phono compartment door or radio compartment door hinge (1 set)
71822	Hinge—Selector switch or tone control knob—maroon—for mahogany finish or walnut instruments
72824	Knob—Selector switch or tone control knob—brown—for blonde instruments
71821	Knob—Tuning or volume control knob—maroon—for mahogany finish or walnut instruments
72800	Knob—Tuning or volume control knob—brown—for blonde instruments
11765	Lamp—Dial lamp—Mazda 51
*73896	Loop—Antenna loop complete
73109	Nut—Tee nut for mounting record changer (3 required)
*73902	Pull—Phono compartment or radio compartment door pull
73110	Screw—¼-20 x 1¾ fillister head machine screw for mounting record changer (3 required)
30900	Spring—Retaining spring for knob
72936	Stop—Phono compartment or radio compartment door stop

*This is the first time that this Stock No. has appeared in Service Data.
†Stock No. 72953 is a reel containing 250 feet of cord.

RADIO CORP. OF AMERICA

MODELS 8V90, CHASSIS RC-618, RC-618A; 8V91, CHASSIS RC-616A, RC-616H

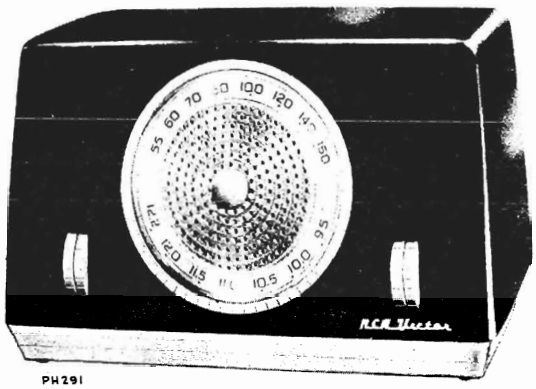
Replacement Parts—Model 8V91—First Prod.

Stock No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC 616A
73610	Board—Terminal board (F.M.-G) with link
73866	Capacitor—Ceramic, 2 mmf. (C9)
31353	Capacitor—Ceramic, 15 mmf. (C42)
39042	Capacitor—Ceramic, 47 mmf. (C26)
73867	Capacitor—Ceramic, 56 mmf. (C43)
33103	Capacitor—Ceramic, 68 mmf. (C40)
48125	Capacitor—Ceramic, 150 mmf. (C7, C19, C38, C50, C53)
39640	Capacitor—Mica, 330 mmf. (C30, C31)
73748	Capacitor—Ceramic, 1500 mmf. (C39)
*73750	Capacitor—Tubular, .002 mfd., 200 volts (C36)
70646	Capacitor—Tubular, .0035 mfd., 1000 v. (C34, C56)
73659	Capacitor—Tubular, .003 mfd., 200 volts (C24)
72573	Capacitor—Tubular, .003 mfd., 400 volts (C28)
71926	Capacitor—Tubular, .005 mfd., 200 volts (C20, C27, C32)
72791	Capacitor—Tubular, .005 mfd., 400 volts (C14, C16, C17, C21, C22)
72120	Capacitor—Tubular, .015 mfd., 200 volts (C52)
71923	Capacitor—Tubular, .01 mfd., 200 volts (C23, C25)
72827	Capacitor—Tubular, .01 mfd., 400 volts (C29, C41, C54)
71928	Capacitor—Tubular, .02 mfd., 200 volts (C51)
73638	Capacitor—Tubular, .02 mfd., 400 volts (C55)
72596	Capacitor—Tubular, .05 mfd., 200 volts (C15)
73747	Capacitor—Electrolytic, 2 mfd., 50 volts (C33)
73372	Capacitor—Electrolytic, comprising 1 section of 30 mfd., 350 volts, 1 section of 30 mfd., 300 volts and 1 section of 20 mfd., 25 volts (C18A, C18B, C18C)
73918	Coil—Antenna coil—F.M. (No. 16 tinned bus wire—8 turns per inch—1¾ turns L. H.—.469 in. I. D.) (L1)
73916	Coil—Oscillator coil—F.M. (No. 16 tinned bus wire—8 turns per inch—4¾ turns R. H.—.469 in. I. D.) (L2)
73744	Coil—Oscillator coil—"A" band (L4)
73607	Condenser—Variable tuning condenser (C1, C2, C3, C4, C8, C12, C13)
70342	Control—Volume control and power switch (R14, S3)
†72953	Cord—Drive cord (approx. 38" overall length required)
73690	Cord—Power cord and plug
72069	Grommet—Rubber grommet for rear mounting feet (2 required)
16058	Grommet—Rubber grommet to mount R-F shelf (4 required)
73710	Indicator—Station selector indicator
71607	Plate—Dial back plate
30868	Plug—2 contact female plug for motor cable
5040	Plug—4 contact female plug for speaker cable
70250	Resistor—Wire wound, 3.9 ohms, 1 watt (R34)
	Resistor—Fixed, composition, 68 ohms ± 10%, ½ watt (R7)
	Resistor—Fixed, composition, 100 ohms ± 10%, ½ watt (R17, R27)
	Resistor—Fixed, composition, 120 ohms ± 10%, ½ watt (R12)
	Resistor—Fixed, composition, 470 ohms ± 10%, 2 watt (R21)
	Resistor—Fixed, composition, 680 ohms ± 20%, ½ watt (R9, R11)
	Resistor—Fixed, composition, 1200 ohms ± 5%, ½ watt (R23)
73637	Resistor—Wire wound, 2200 ohms, 5 watts (R22)
	Resistor—Fixed, composition, 3300 ohms ± 5%, ½ watt (R24)
	Resistor—Fixed, composition, 8200 ohms ± 10%, ½ watt (R43)
	Resistor—Fixed, composition, 10,000 ohms ± 10%, ½ watt (R32)
	Resistor—Fixed, composition, 15,000 ohms ± 10%, ½ watt (R13, R18, R30)
	Resistor—Fixed, composition, 18,000 ohms ±10%, ½ watt (R4)
	Resistor—Fixed, composition, 27,000 ohms ± 10%, ½ watt (R8, R40)
	Resistor—Fixed, composition, 27,000 ohms ± 10%, 1 watt (R5)
	Resistor—Fixed, composition, 33,000 ohms ± 10%, ½ watt (R6)
	Resistor—Fixed, composition, 39,000 ohms ± 10%, ½ watt (R25)
	Resistor—Fixed, composition, 56,000 ohms ± 10%, ½ watt (R10)
	Resistor—Fixed, composition, 82,000 ohms ± 10%, ½ watt (R42)
	Resistor—Fixed, composition, 100,000 ohms ± 10%, ½ watt (R33, R45)
	Resistor—Fixed, composition, 270,000 ohms ± 10%, ½ watt (R19, R29)
	Resistor—Fixed, composition, 330,000 ohms ± 10%, ½ watt (R28)
	Resistor—Fixed, composition, 470,000 ohms ± 10%, ½ watt (R20, R26, R44)
	Resistor—Fixed, composition, 2.2 megohm ± 20%, ½ watt (R3)
	Resistor—Fixed, composition, 3.9 megohm ± 10%, ½ watt (R2)
	Resistor—Fixed, composition, 10 megohms ± 20%, ½ watt (R15, R41)
	Resistor—Fixed, composition, 22 megohms ± 20%, ½ watt (R16)
73605	Shaft—Tuning knob shaft
31364	Socket—Lamp socket
35787	Socket—Phono input socket
72516	Socket—Tube socket, miniature, for tubes V4, V5 and V7
73606	Socket—Tube socket, miniature, for tubes V1, V2 and V3
31251	Socket—Tube socket, octal, for tubes V6, V8 and V9
74305	Spring—Drive cord spring
73603	Support—Dial plate mounting support complete with pulley—R.H.
73604	Support—Dial plate mounting support complete with pulley—L.H.
*73609	Switch—Range switch (S1, S2)
73602	Switch—Tone control switch (S4)
73601	Transformer—Power transformer, 115 volts 60 cycle (T1)
73745	Transformer—First I-F transformer—dual (T2)
74019	Transformer—Second I-F transformer—dual (T3)
73743	Transformer—Ratio detector transformer (T4)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES 92569-5W RL 103B5
13867	Cap—Dust cap
*73934	Cone—Cone complete with voice coil
5039	Plug—4 prong male plug for speaker
*73635	Speaker—12" P.M. speaker complete with cone and voice coil—less output transformer and plug
71145	Suspension—Metal cone suspension
*73636	Transformer—Output transformer (T5)
	SPEAKER ASSEMBLIES 92569-1KX
70574	Cone—Cone and voice coil assembly
5039	Plug—4 prong male plug for speaker
37899	Transformer—Output transformer
	NOTE: When replacing complete speaker, order RCA 73635 (92569-5W)
	MISCELLANEOUS
71864	Antenna—F.M. antenna
*73622	Back—Back cover for blonde instruments
*73621	Back—Back cover for mahogany or walnut instruments
71599	Bracket—Pilot lamp bracket
73626	Bumper—Rubber bumper for actuating link
72437	Cable—Shielded pickup cable complete with pin plug
13103	Cap—Pilot lamp jewel
73613	Carriage—Record changer mounting carriage complete with runners
71892	Catch—Bullet catch and strike for radio or phono compartment doors
71820	Check—Radio compartment door check
X1815	Cloth—Grille cloth for blonde instruments
X1814	Cloth—Grille cloth for mahogany instruments
X1816	Cloth—Grille cloth for walnut instruments
*73755	Decal—Control panel decal for mahogany or walnut instruments
*73756	Decal—Control panel decal for blonde instruments
71966	Decal—Trade mark decal (Victrola)
71910	Decal—Trade mark decal (RCA Victor)
73628	Dial—Glass dial scale
73627	Escutcheon—Dial escutcheon less dial
*73757	Grille—Metal grille
11889	Grommet—Rubber grommet for front apron of chassis
73614	Grommet—Rubber grommet to mount record changer (3 required)
16058	Grommet—Rubber grommet to mount speaker (3 required)
73751	Hinge—Radio or phono compartment door hinge (2 required for each door)
71945	Hinge—Record storage compartment door hinge (2 required for each door)
71822	Knob—Tone control or range switch knob—maroon—for mahogany or walnut instruments
72824	Knob—Tone control or range switch knob—brown—for blonde instruments
71821	Knob—Tuning or volume control knob—maroon—for mahogany or walnut instruments
72800	Knob—Tuning or volume control knob—brown—for blonde instruments
11765	Lamp—Dial lamp—Mazda 51
73616	Link—Actuating link assembly for record changer carriage—R.H.
73617	Link—Actuating link assembly for record changer carriage—L.H.
73611	Loop—Antenna loop complete
73109	Nut—Tee nut to mount record changer (3 required)
71819	Plate—Radio compartment door check mounting plate
31048	Plug—Pin plug for shielded pickup cable
30868	Plug—2 contact female plug for power cable
*73752	Pull—Door pull (2 required) for walnut instruments
*73753	Pull—Door pull (2 required) for mahogany or blonde instruments
73615	Screw—¼-20 x 1½" fillister head machine screw to mount record changer (3 required)
73618	Spring—Connecting spring between link and record changer carriage
71818	Spring—Radio compartment door check spring
30900	Spring—Retaining spring for knobs
73185	Stop—Carriage mechanism stop (2 required)
73612	Track — Carriage mechanism track complete with mounting plate (2 required)
71814	Washer—Rubber washer for radio compartment door check

*This is the first time that this Stock No. has appeared in Service Data.

†Stock No. 72953 is a reel containing 250 feet of cord.

MODELS 8X681, 8X682, RADIO CORP. OF AMERICA
CHASSIS RC-1061



8X681—(Maroon Plastic) *8X682—(Ivory Plastic)*

Specifications

Tuning Ranges

Standard Broadcast ("A" Band)..... 540-1600 kc
Short Wave ("C" Band)..... 9.4-12 mc

Intermediate Frequency..... 455 kc

Tube Complement

(1) RCA 12BA6..... R. F. Amplifier
(2) RCA 12BE6..... Converter
(3) RCA 12BA6..... I. F. Amplifier
(4) RCA 12AT6..... Det. - A.F. - A.V.C.
(5) RCA 35C5..... Output
(6) RCA 35W4..... Rectifier

Dial Lamp..... Type 47, 6.3 volts, 0.15 amp.

Power Supply Rating

115 volts, D.C. or 50 to 60 cycles, A.C. ..... 30 watts

Loudspeaker

Type 92572-5..... 5 in. P.M.
V. C. Impedance..... 3.2 ohms at 400 cycles

Power Output

Undistorted ..... 0.7 watts
Maximum..... 1.1 watts

Cabinet Dimensions

Height.... 8 in. Width.....12¾ in. Depth.....7¼ in.

Tuning Drive Ratio..... 7½:1 (3¾ turns of knob)

NOTE: If reception is not obtained on DC, reverse plug in outlet receptacle. This may also reduce hum on AC operation.

To Remove Chassis from Cabinet

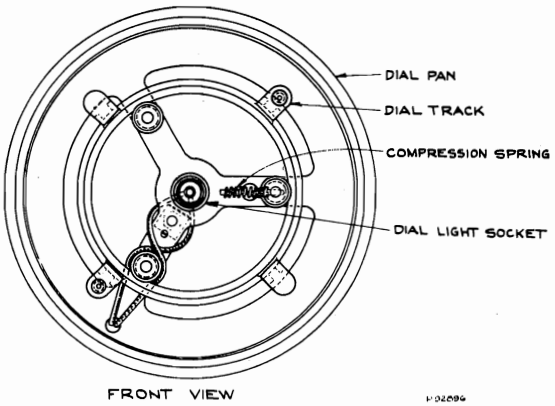
Remove the four screws at the corners of the bottom cover (accessible through holes in the cabinet base). Do not remove the hex head screws which hold the base to the bottom cover. The cabinet may now be lifted off the cabinet base.

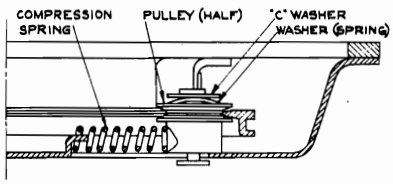
Dial Positioning

If the speaker should be replaced, it will be necessary to readjust the speaker mounting bracket position so that the dial pan will fit against the cabinet when the chassis is re-installed in the cabinet.

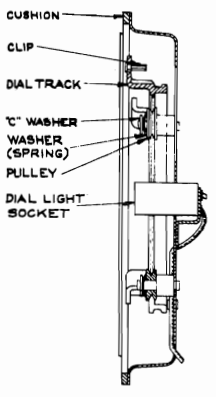
Insulating Washers

The cabinet base is insulated from the chassis bottom cover. When servicing make certain that the insulating washers are in place and properly positioned.





DETAIL OF COMPRESSION SPRING



SIDE VIEW

NOTE: See page 4 regarding changes in late production pan and track assembly.

Dial Pan and Track Assembly

RADIO CORP. OF AMERICA

MODELS 8X681, 8X682,
CHASSIS RC-1061

Alignment Procedure

Test Oscillator.—Connect high side of test oscillator as shown in chart. Connect low side to chassis. Keep the output low to avoid A.V.C. action.

Note.—If the test oscillator is AC operated it may be necessary to use an isolation transformer (115v./115 v.) for the receiver during alignment, and the low side of the test oscillator connected to common wiring at pin No. 2 of 12AT6 socket—reverse line plug if hum is excessive.

Output Meter.—Connect meter across speaker voice coil. Turn volume control to maximum.

Dial Pointer Adjustment.—Rotate tuning condenser to maximum capacity position (plates fully meshed). Adjust dial to position indicated in drawing.

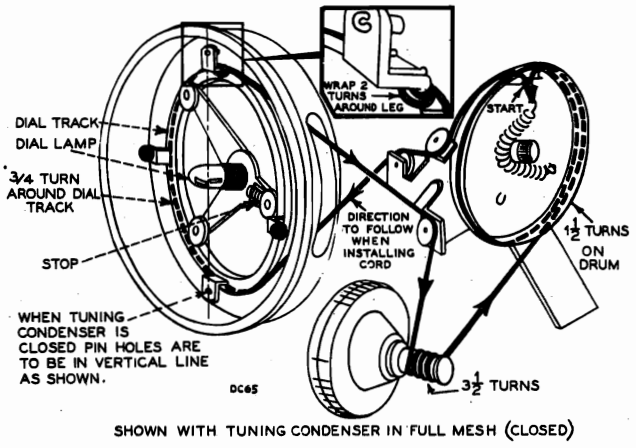
With the dial adjusted as described above mark the dial pan assembly with a pencil to provide a tuning indicator during alignment.

Steps	Connect the high side of the test-osc. to—	Tune test-osc. to—	Range switch	Turn radio dial to—	Adjust for max. output
1	Pin No. 1 of 12BA6 I.F. amp. tube in series with 0.1 mfd.	455 kc	"A"	Quiet point 1600 kc end of dial	Top and bottom T2 2nd I. F. trans.
2	Pin No. 7 of 12BE6 converter tube in series with 0.1 mfd.				Top and bottom T1* 1st I. F. trans.
3	Antenna lead in series with 100 mmfd.	1600 kc	"A"	1600 kc	C14 "A" osc.
4		1400 kc		1400 kc	C2 "A" ant. C10 "A" R. F.
5		600 kc		600 kc	†L8 "A" osc. †L3 "A" R. F.
6	Repeat Steps 3, 4 and 5.				
7	Pin No. 7 of 12BE6 converter in series with 0.1 mfd. capacitor	11.8 mc	"C"	11.8 mc	**C16 "C" osc.
8		9.5 mc		9.5 mc	†L6 "C" osc.
9	Repeat Steps 7 and 8.				
10	Antenna lead in series with 50 mmfd.	11.8 mc	"C"	11.8 mc	**C3 "C" ant.
11		9.5 mc		9.5 mc	†L4 "C" ant.
12	Repeat Steps 10 and 11.				

*Do not readjust T2.

†Rock gang.

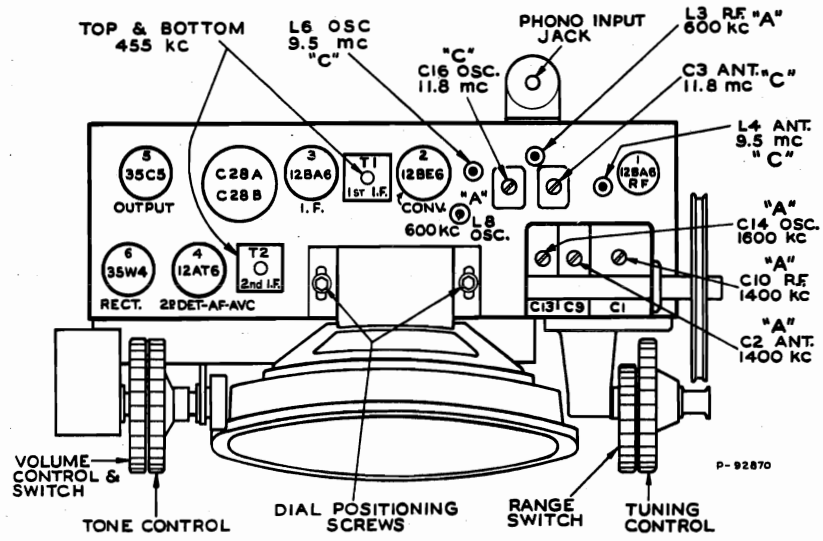
**If two peaks are found use minimum capacity peak on C16 (osc.) and maximum capacity peak on C3 (ant.).



Dial-Indicator and Drive Mechanism

Lead Dress

1. Dress all heater leads down to chassis and as far as possible from all audio grid and plate wiring.
2. Dress power cord to side apron away from coupling capacitors.
3. Dress pilot lamp leads toward chassis bottom and away from audio coupling capacitor.
4. Dress all leads and components away from all coils.
5. Dress lead from range switch to phono socket against switch shield and chassis apron.
6. The antenna lead should be taped up when not in use.



Tube and Trimmer Locations

Cathode Currents

	"A" Band	"C" Band
(1) 12BA6	4.1 ma	6.9 ma
(2) 12BE6	7.3 ma	7.2 ma

Replacement Parts

Stock No.	DESCRIPTION
	CHASSIS ASSEMBLIES RC-1061
*73536	Arm—Range switch actuating arm and hub
71924	Capacitor—Ceramic, 56 mmf. (C11)
39632	Capacitor—Mica, 150 mmf. (C7, C20)
72571	Capacitor—Mica, 330 mmf. (C22)
64641	Capacitor—Mica, 360 mmf. (C5)
73075	Capacitor—Adjustable, 40-370 mmf. (C3, C16)
72791	Capacitor—Tubular, .005 mfd., 400 volts (C23, C25)
71928	Capacitor—Tubular, .02 mfd., 200 volts (C21)
70611	Capacitor—Tubular, .02 mfd., 400 volts (C27)
72596	Capacitor—Tubular, .05 mfd., 200 volts (C12, C15)
70615	Capacitor—Tubular, .05 mfd., 400 volts (C26)
70617	Capacitor—Tubular, 0,1 mfd., 400 volts (C18)
*73520	Capacitor—Electrolytic, comprising 1 section of 80 mfd., 150 volts and 1 section of 50 mfd., 150 volts (C28A, C28B)
*73526	Clip—Tubular clip for fastening dial—located on dial mounting track (2 required)
*73518	Coil—R-F coil—"A" band—complete with adjustable core and stud (L2, L3)
*73519	Coil—Antenna coil—"C" band—complete with adjustable core and stud (L4)
*73517	Coil—Oscillator coil—"C" band—complete with adjustable core and stud (L5, L6)
*73516	Coil—Oscillator coil—"A" band—complete with adjustable core and stud (L7, L8)
*73513	Condenser—Variable tuning condenser (C1, C2, C9, C10, C13, C14)
*73544	Control—Tone control (R12)
*73543	Control—Volume control and power switch (R9, S3)
†72913	Cord—Drive cord (approx. 48" overall length required)
28451	Cover—Insulating cover for electrolytic capacitor
*73522	Dial—Dial and screen assembly
72283	Grommet—Rubber grommet for mounting tuning condenser (3 required) or for mounting capacitor (C3, C16) and bracket (1 required)
33139	Grommet—Rubber grommet for range switch connecting rod (2 required)
*73538	Knob—Range switch knob (thumb wheel type)
*73541	Knob—Tone control knob (thumb wheel type)
*73537	Knob—Tuning knob (thumb wheel type)
*73542	Knob—Volume control and power switch knob (thumb wheel type)
*73512	Loop—Antenna loop complete (L1)
*73484	Pan—Dial pan and cushion—less track, pulleys and lamp socket
*73530	Pulley—Dial track drive pulley (2 required)
*73531	Pulley—Dial track idler pulley (2 half pulleys)
73237	Resistor—Wire wound, 33 ohms, 150 MA (R15)
	Resistor—Fixed, composition, 120 ohms ± 10%, ½ watt (R14)
	Resistor—Fixed, composition, 150 ohms ± 10%, ½ watt (R6)
	Resistor—Fixed, composition, 470 ohms ± 10%, ½ watt (R1)
	Resistor—Fixed, composition, 1200 ohms ± 10%, 1 watt (R16)
	Resistor—Fixed, composition, 8200 ohms ± 10%, ½ watt (R3)
	Resistor—Fixed, composition, 33,000 ohms ± 10%, ½ watt (R2, R4, R8)
	Resistor—Fixed, composition, 220,000 ohms ± 20%, ½ watt (R11)
	Resistor—Fixed, composition, 470,000 ohms ± 20%, ½ watt (R13)
	Resistor—Fixed, composition, 1 megohm ± 20%, ½ watt (R5)
	Resistor—Fixed, composition, 2.2 megohm ± 20%, ½ watt (R7)
	Resistor—Fixed, composition, 4.7 megohm ± 20%, ½ watt (R10)
*73539	Rod—Connecting rod between range switch knob and actuating arm
*73545	Screen—Dial screen only
*73534	Shaft—Range switch and tuning knobs mounting shaft
*73521	Shield—Tube shield
*73529	Socket—Dial lamp socket
73374	Socket—Phono input socket
36069	Socket—Tube socket—for tubes V1, V2, V3, V4
9914	Socket—Tube socket—for tubes V5, V6
*74038	Spring—Drive cord spring
*73527	Spring—Pressure spring for dial track idler pulley
*73528	Stud—Dial track idler pulley mounting stud
*73514	Support—Drive cord pulley support complete with three (3) pulleys
*73535	Switch—Selector switch (S1, S2)
*73525	Track—Die cast pulley track and dial mounting ring less fastener clip
73036	Transformer—First I-F transformer (T1)
73037	Transformer—Second I-F transformer (T2)

*73971	Screen—Ventilating screen—black—for back of cabinet for Model 8X681
*73972	Screen—Ventilating screen—ivory—for back of cabinet for Model 8X682

†Stock No. 72953 is a spool containing 250 ft. of cord.

*This is the first time this Stock No. has appeared in service data.

APPLY TO YOUR RCA DISTRIBUTOR FOR PRICES OF REPLACEMENT PARTS

DIAL PAN AND TRACK ASSEMBLY
(Late Production)

In late production the dial pan and track assembly is changed as follows:

(1) The studs (fixed and idler) are shorter — 19/32" vs. 5/8" overall length.

(2) The two half pulleys are replaced by 1 full pulley (Stock No. 73530).

(3) Spring washers are not used.

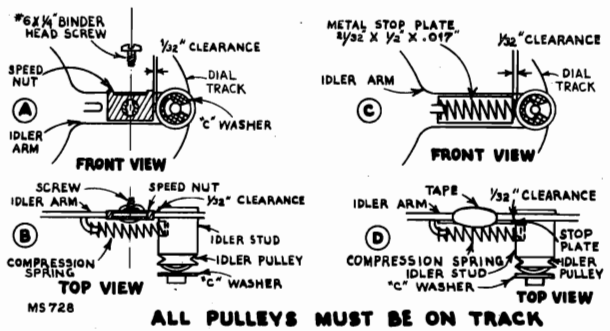
The parts are interchangeable as follows:

(1) Original stud or original pan using 5/8" studs — USE SPRING WASHER — original idler stud (Stock No. 73528) is carried in stock.

(2) Short stud or new pan using 19/32" studs — OMIT SPRING WASHER—new pan (Stock No. 73484) is carried in stock.

(3) The two half pulleys may be replaced by one full pulley—both are carried in stock.

A stop is used to limit the movement of the idler stud, thus preventing the pulleys from jumping off the dial track due to rough handling during shipment. This stop may be either a speed nut and screw (A & B) or a plate taped to the idler arm (C & D).



ALL PULLEYS MUST BE ON TRACK

Alignment Procedure

CORRECT ALIGNMENT OF THE FM BAND REQUIRES THAT THE AM BAND BE ALIGNED FIRST

Output Indicators:

An RCA VoltOhmyst or equivalent meter is necessary for measuring developed d-c voltage during FM alignment. Connections are specified in the alignment tabulation. An output meter is also necessary to indicate minimum audio output during FM Ratio Detector alignment. Connect the output meter across the speaker voice coil.

The RCA VoltOhmyst can also be used as an AM alignment indicator, either to measure audio output or to measure a-v-c voltage.

When audio output is being measured the volume control should be turned to maximum.

Signal Generator:

For all alignment operations except as stated in the tabulation connect the low side of the signal generator to the receiver chassis. The output should be adjusted to provide accurate resonance indication at all times. If output measurement is used for AM alignment the output of the signal generator should be kept as low as possible to avoid a-v-c action.

CAUTION:

The chassis is connected to one side of the power supply. On a.c. operation it is recommended that an isolation transformer (115 v./115 v.) be used for the receiver when servicing.

Oscilloscope Alignment:

The FM I. F. alignment may be checked using a sweep generator and an oscilloscope. Shunt terminals B and C of T3 with a 1,200 ohm resistor. Connect the high side of the oscilloscope to terminal C of T3 in series with a diode probe. Apply the output of the sweep generator (10.7 mc with ±250 kc. sweep) to pin No. 1 of V2 (6BJ6) in series with .01 mf. Low side of the oscilloscope and sweep generator to chassis. This will show the response of T2.

To check the combined response of T1 and T2; connect the sweep generator to the antenna terminal board—high side to No. 2 terminal in series with 300 ohms and low side to No. 1 terminal. Oscilloscope connections as previously connected.

To check the ratio detector response; connect the high side of the oscilloscope direct to terminal No. 8 of S1 rear, low side to chassis, apply the output of the sweep generator to pin No. 1 of V3 (12AU6) in series with .01 mf. Driver plate circuit connected for normal operation (1200 ohm resistor removed). **Note:** It is difficult to observe marker signals in this step—center frequency and sweep width should be previously observed.

Alignment Indicator:

The dial and dial back plate are not attached to the chassis. During alignment a substitute frequency indication must be used. We suggest attaching a paper clip to the dial drive cord so that its movement may be measured—refer to the "Dial Scale" illustration on page 5.

CRITICAL LEAD DRESS

1. All connections in the mixer-oscillator circuit are extremely critical both in regard to lead length and lead dress. Do not disturb unless necessary—make careful notation before servicing if it becomes necessary to disturb this wiring.
2. The ground lead from pin No. 2 of V3 (12AU6 Driver) is critical in length and must be dressed down against chassis.
3. Dress audio coupling capacitor C23 away from output transformer.
4. Dress diode filter unit away from alignment hole in T-2.
5. Dress grid lead of V3 (pin No. 1 of 12AU6) against chassis apron.
6. Dress plate lead of V1 (pin No. 2 of 19J6) against chassis.
7. Dress loop antenna leads so as to prevent contact with external antenna terminal board.
8. All ground connections to chassis should be restored to the original places of connection if disturbed.
9. Dress capacitor C13 down close to range switch so as to clear the projection on the bottom of the cabinet.
10. The FM ant. and osc. coils must be cemented to the coil support to prevent microphonic howl on FM. Amphenol No. 912 cement is recommended for this purpose. Amphenol No. 916 solvent is recommended as solvent if it becomes necessary to loosen the windings.

AM Alignment

RANGE SWITCH IN AM POSITION

Steps	Connect high side of sig. gen. to—	Sig. gen. output	Turn radio dial to—	Adjust for peak output
1	AM ant. section (C3) of tuning cond. in series with .01 mfd.	455 kc.	Quiet point at low freq. end.	AM windings.† T2 bottom core (sec.). T2 top core (pri.).
2				AM windings.† T1 top core (sec.). T1 bottom core (pri.).
3	Short wire placed near loop antenna for radiated signal.	1620 kc.	Extreme high frequency end.	C12 osc.
4		1400 kc.	1400 kc.	C4 ant.
5		600 kc.	600 kc.	L4 osc. (Rock gang.)
6	Repeat Steps 3, 4 and 5.			

† Use alternate loading.

Alternate loading involves the use of a 10,000 ohm resistor to load the AM plate winding while the AM grid winding of the SAME TRANSFORMER is being peaked. Then the grid winding is loaded with the resistor while the plate winding is peaked. Only one winding is loaded at any one time. Remove the 10,000 ohm resistor after T2 and T1 have been aligned.

Oscillator frequency is above signal frequency on both AM and FM.

FM Alignment

RANGE SWITCH IN FM POSITION — VOLUME CONTROL MAXIMUM

Steps	Connect high side of sig. gen. to—	Sig. gen. output	Turn radio dial to—	Adjust for peak output
1	Connect the d-c probe of a VoltOhmyst to the negative lead of the 2 mfd. capacitor C32 and the common lead to chassis. Adjust sig. gen. output to provide approx. —3 v. indication during alignment.			
2	Pin 1 of 12AU6 in series with .01 mfd.	10.7 mc. modulated 30% 400 cycles AM.	Max. capacity (fully meshed).	T3 top core for max. d-c voltage across C32. T3 bottom core for min. audio output.*
3	No. 2 ant. term in series with a 300 ohm resistor. Connect low side to No. 1 terminal. (Remove ant. lead from No. 2 term.)			FM windings.†† T2 top core (sec.). T2 bottom core (pri.).
4				FM windings.†† T1 top core (sec.). T1 bottom core (pri.).
5		106 mc.	106 mc.	L1 osc.** C15 ant.
6		90 mc.	90 mc.	L5 ant.** (Rock gang.)
7	Repeat Steps 5 and 6 until further adjustment does not improve calibration.			

* Two or more points may be found which lower the audio output. At the correct point the minimum audio output is approached rapidly and is much lower than at any incorrect point.

†† Align T2 and T1 by means of alternate loading as explained under AM alignment. Use a 680 ohm resistor instead of a 10,000 ohm resistor and load the FM windings.

** L1 and L5 are adjustable by increasing or decreasing the spacing between turns.

	Resistor—Fixed, composition, 100 ohms, ±20%, ½ watt (R15)
	Resistor—Fixed, composition, 180 ohms, ±10%, ½ watt (R11, R21)
	Resistor—Fixed, composition, 680 ohms, ±20%, ½ watt (R12)
	Resistor—Fixed, composition, 680 ohms, ±10%, ½ watt (R14)
	Resistor—Fixed, composition, 820 ohms, ±10%, ½ watt (R20)
	Resistor—Fixed, composition, 1,000 ohms, ±10%, 1 watt (R22)
	Resistor—Fixed, composition, 1,000 ohms, ±20%, ½ watt (R26)
	Resistor—Fixed, composition, 1,200 ohms, ±5%, ½ watt (R16)
	Resistor—Fixed, composition, 3,300 ohms, ±5%, ½ watt (R17)

*This is the first time that this Stock No. has appeared in Service Data.

Power Supply:

This instrument will operate on 115 volts d.c. or 50 to 60 cycles a.c.

If the receiver does not operate on d.c., reverse the power cord. On a.c., reversal of the cord may reduce hum or improve FM reception.

Antennas:

These receivers have built-in antennas for standard broadcast (AM) and frequency modulation (FM) reception.

Under average conditions these antennas will provide satisfactory reception however provision is made for the use of an external antenna for FM reception if desired.

To use external FM antenna:

1. Remove the wire from under the No. 2 terminal screw of the antenna terminal board. The bare end of this wire should be taped to prevent contact with the antenna terminal screws.
2. Connect the transmission line from an external FM dipole antenna to the No. 1 and No. 2 terminals of the antenna terminal board.

To use built-in FM antenna:

1. The wire extending thru the back of the cabinet must be connected to No. 2 terminal of the antenna terminal board.
2. The power cord should be fully extended and must not be coiled or hanked up.
3. Reversal of the line cord plug may improve reception.

DO NOT USE EXTERNAL GROUND.

CAUTION:

THE CHASSIS IS CONNECTED TO ONE SIDE OF THE POWER SUPPLY. Use caution to prevent contact with pipes, radiators, etc. when servicing with chassis removed from cabinet.

Specifications

Tuning Ranges

Standard Broadcast (AM) ..... 540-1,600 kc.

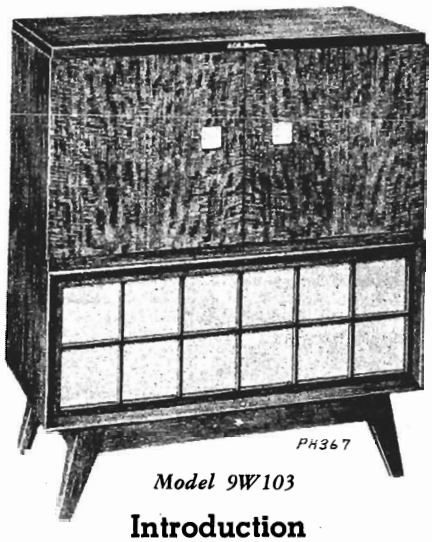
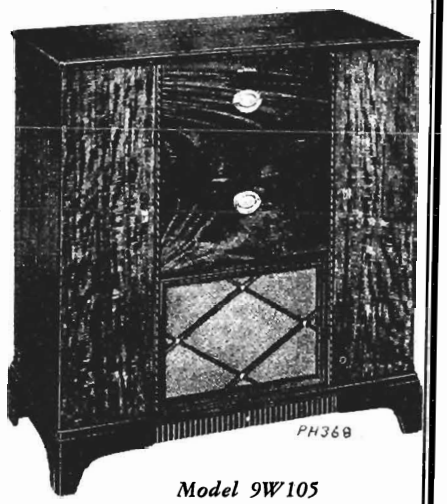
Model 9W101



Model 9W103



Model 9W105

Introduction

All three of these instruments have the new Model RP-168A-1 record changer designed for use with the new Victor seven-inch long playing records. Model 9W105 also has a Model RP-178 record changer for use with the conventional ten- and twelve-inch records.

An auxiliary phono input jack on the back of the chassis of Models 9W101 and 9W103 (input controlled by the selector switch) is provided to permit the use of an auxiliary record player if desired.

Antennas

These receivers have built-in antennas for standard broadcast (AM) and frequency modulation (FM) reception.

Provision is made for the use of an external antenna for FM reception if desired. To use external FM antenna—remove the built-in FM antenna lead from the "FM" terminals of the antenna terminal board Connect the transmission line of an external FM dipole antenna to these two "FM" terminals.

FOR RECORD CHANGER SERVICE INFORMATION REFER TO RP-168 SERIES SERVICE DATA AND RP-178 SERIES SERVICE DATA.

Model 9W103	34 in.	30¼ in.	15¾ in.
Model 9W105	35 in.	34⅝ in.	16⅜ in.

Circuit Description

These instruments have a ten-tube (including rectifier) chassis which is very similar to those used in other RCA Victor radio-phonograph combinations designed for AM-FM reception.

The selector switch has five functions:

(1) Selection of tuning range.
(2) Selection and distribution of a.v.c. voltages.
(3) Application of B+ voltage to tubes V1, V2 and V3.
(4) Selection of audio input applied to the volume control.
(5) Application of a.c. power to the record changer motors.

A one-tube pre-amplifier (6BF6 tube No. V10) is used with the input from the RP-168A-1 record changer.

Alignment Procedure

CORRECT ALIGNMENT OF THE FM BAND REQUIRES THAT THE AM BAND BE ALIGNED FIRST

Alignment Indicators:

An RCA VoltOhmyst or equivalent meter is necessary for measuring developed d-c voltage during FM alignment. Connections are specified in the alignment tabulation. An output meter is also necessary to indicate minimum audio output during FM Ratio Detector alignment. Connect the output meter across the speaker voice coil.

The RCA VoltOhmyst can also be used as an AM alignment indicator, either to measure audio output or to measure a-v-c voltage.

When audio output is being measured the volume control should be turned to maximum.

Signal Generator:

For all alignment operations connect the low side of the signal generator to the receiver chassis. The output should be adjusted to provide accurate resonance indication at all times. If output measurement is used for AM alignment the output of the signal generator should be kept as low as possible to avoid a-v-c action.

Oscilloscope Alignment:

The FM I-F alignment may be checked using a sweep generator and an oscilloscope. Shunt terminals B and C of T3 with a 1200 ohm resistor. Connect the high side of an oscilloscope to terminal C of T3 in series with a diode probe. Apply the output of the sweep generator (10.7 mc. with ±250 kc. sweep) to pin No. 1 of V2 (6BA6) in series with .01 mf. Low side of the oscilloscope and sweep generator to chassis. This will show the response of T2.

To check the combined response of T1 and T2; connect the sweep generator to the FM antenna terminals (remove FM antenna lead) in series with 300 ohms. **Note:** One FM terminal is grounded—it may be necessary to reverse the sweep generator connections. Oscilloscope connections remain as connected.

To check the ratio detector response; connect the high side of the oscilloscope direct to terminal No. 9 of S1, low side to chassis. Apply the output of the sweep generator to pin No. 1 of V3 (6AU6) in series with .01 mf. Driver plate circuit connected for normal operation (1200 ohm resistor removed). **Note:** It is difficult to observe marker signals in this step—center frequency and sweep width should be previously observed.

Response curves illustrated on page 5.

CRITICAL LEAD DRESS

1. Keep leads of C7 short.
2. Dress R27 away from range switch and pin No. 5 of V1.
3. The round lead of pin No. 2 of V2 and V3 should be down against chassis. Its length is critical.
4. The AVC lead from R26 to range switch should be dressed against chassis and away from 6AU6 driver tube socket.
5. C43 should have short leads and the color code of the capacitor should go to the coil L4. The capacitor should be cemented down with polystyrene cement at the same time L2 is cemented.
6. The lead from the high side of the loop should be dressed away from tubes.
7. Lead from pin No. 2 of V1 to terminal "A" of 1st I. F. transformer should be dressed against the chassis.
8. Connect C40 directly between the gang condenser and pin No. 1 of V1.
9. Make all FM leads as short as possible.
10. Dress lead from pin No. 5 of V2 to terminal "A" of 2nd I. F. transformer down against chassis.
11. Dress resistor R15 near chassis base.
12. Dress all A. C. leads away from volume control.
13. The lead from "FM" terminal of antenna terminal board to L1 tap should be dressed away from V2.
14. The taps on L1 and L2 are critical. L1 tap should be ¾ turn from the ground end. L2 tap should be 2½ turns from the gang condenser C8.
15. Dress C25 and C26 against the chassis with the shortest lead length possible.
16. The position of L1 and L2 is critical. L1 should be midway between V1 and the 1st I. F. transformer. The end of L2 should be approximately 3/16" from V1.
17. Capacitor C41 should be secured to the chassis apron with melted wax or cement.
18. FM oscillator coil L2 must be cemented to its support. Amphenol No. 912 cement is recommended for this purpose.

Dial Indicator

With the tuning condenser fully meshed (closed) the indicator should be set to the reference mark on the dial back plate.

Refer to the dial scale reproductions on page 8.

AM Alignment

RANGE SWITCH IN BC POSITION

Steps	Connect high side of sig. gen. to—	Sig. gen. output	Turn radio dial to—	Adjust for peak output
1	C3 in series with .01 mfd.	455 kc.	Quiet point at low freq. end.	AM windings.† T3 bottom core (sec.). T3 top core (pri.).
2				AM windings.† T2 top core (sec.). T2 bottom core (pri.).
3	Short wire placed near loop for radiated signal	1400 kc.	1400 kc.	C13 osc. C4 ant.
4		600 kc.	600 kc.	L4 osc. (Rock gang.)
5		Repeat Steps 3 and 4.		

† Use alternate loading.

Alternate loading involves the use of a 47,000 ohm resistor to load the AM plate winding while the AM grid winding of the SAME TRANSFORMER is being peaked. Then the grid winding is loaded with the resistor while the plate winding is peaked. Only one winding is loaded at any one time. Remove the 47,000 ohm resistor after T3 and T2 have been aligned.

Oscillator frequency is above signal frequency on both AM and FM.

FM Alignment

RANGE SWITCH IN FM POSITION—VOLUME CONTROL MAXIMUM

Steps	Connect high side of sig. gen. to—	Sig. gen. output	Turn radio dial to—	Adjust for peak output
1	Connect the d-c probe of a VoltOhmyst to the negative lead of the 2 mfd. capacitor C33 and the common lead to chassis. Turn gang condenser to max. capacity (fully meshed).			
2	Pin 1 of 6AU6 in series with .01 mfd.	10.7 mc. modulated 30% 400 cycles AM (Approx. .05 volt).	Max. capacity (fully meshed).	T4 top core for max. d-c voltage across C33. T4 bottom core for min. audio output. *
3	FM ant. term. in series with a 300 ohm resistor. (Remove ant. lead from "FM" term.)	10.7 mc. Adjust to provide 2 to 3 volts indication on VoltOhmyst during alignment.		FM windings.†† T3 top core (sec.). T3 bottom core (pri.).
4				FM windings.†† T2 top core (sec.). T2 bottom core (pri.).
5		106 mc.	106 mc.	L2 osc. ** C2 ant. Set C2 at max. capacity while adjusting L2.
6		90 mc.	90 mc.	L1 ant. ** (Rock gang.)
7	Repeat Steps 5 and 6 until further adjustment does not improve calibration.			

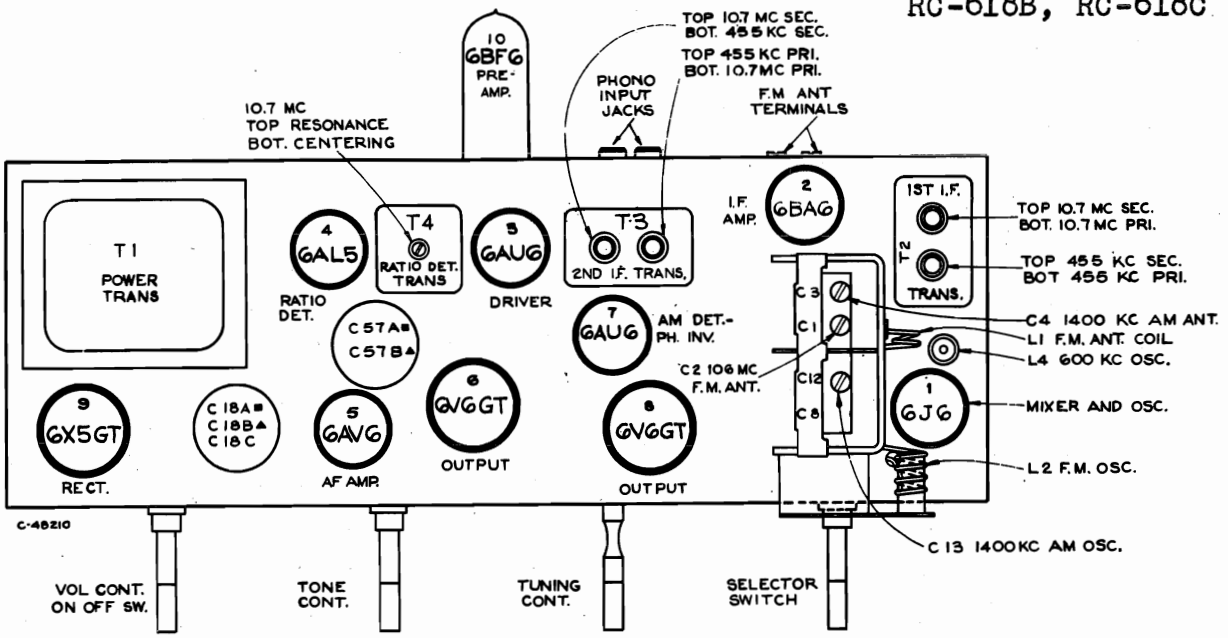
* Two or more points may be found which lower the audio output. At the correct point the minimum audio output is approached rapidly and is much lower than at any incorrect point.

†† Align T3 and T2 by means of alternate loading as explained under AM alignment. Use a 680 ohm resistor instead of a 47,000 ohm resistor and load the FM windings.

** L1 and L2 are adjustable by increasing or decreasing the spacing between turns.

RADIO CORP. OF AMERICA

MODELS 9W101, 9W103, 9W105, CHASSIS RC-618B, RC-618C



Tube and Trimmer Locations

Note: FM mixer and oscillator coils are adjustable by increasing or decreasing the spacing between turns. The position of the coils and location of the taps are critical (refer to "Critical Lead Dress").

Socket Voltages

Voltages measured with Chanalyst or VoltOhmyst and should hold within ±20% with rated line voltage. Tuning condenser closed—no signal input.

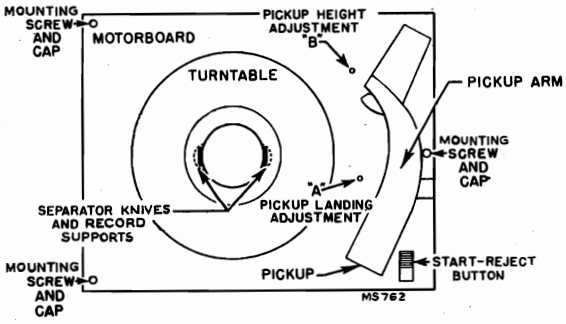
SHIPPING SCREWS

The radio chassis of these instruments is secured to the cabinet with shipping screws (painted red) which, together with wood spacing strips, should be **REMOVED** at the time of installation.

The record changers are each mounted with three screws which should be **LOOSENED** at the time of installation.

On the RP-168A-1 record changer decorative caps cover the mounting screws, unscrew the caps for access to the screws.

REFER TO ILLUSTRATIONS ON PAGES 8 AND 9.



Top View—RP-168A-1 Record Changer

RP-168A-1 RECORD CHANGER

Pickup Landing Adjustment "A"

The pickup point should land half-way between the outer edge of the record and the first music groove.

If the pickup lands inside the starting grooves—turn screw "A" slightly clockwise. If pickup lands outside the starting grooves—turn screw "A" slightly counterclockwise.

Pickup Height Adjustment "B"

During cycle the pickup arm must rise high enough to clear a stack of eight records on the turntable, but not high enough to cause the top of the arm to touch records resting on the record supports.

If pickup does not clear a stack of eight records—turn screw "B" slightly clockwise. If pickup arm touches records on record supports—turn screw "B" slightly counterclockwise.

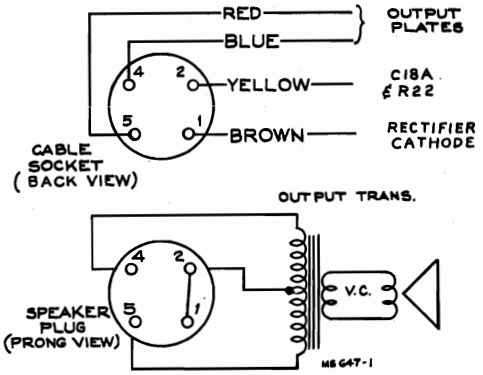
Record Separators

During service work the position of the star wheel on the underside of the record changer may be accidently shifted; this may cause the record separator knives to be extended when in the out of cycle position.

If the separator knives are thus extended—turn the power on so that the turntable is revolving, gently press fingers against the extended knives until they disappear inside the center post—DO THIS ONLY WHILE MECHANISM IS OUT OF CYCLE.

CARE OF SAPPHIRE

The sapphire point on the pickup is protected with a permanent metal guard. Lint may collect to clog the opening in the guard at the sapphire point and cause poor record reproduction. Occasional cleaning may be necessary; brush carefully with a small soft brush.



Speaker Connections.

	Resistor—Fixed, composition, 10 megohms ±20%, ½ watt (R15, R41)
	Resistor—Fixed, composition, 22 megohms ±20%, ½ watt (R16)
73894	Shaft—Tuning knob shaft
31364	Socket—Dial or jewel lamp socket
33514	Socket—Phono input socket (double)
31251	Socket—Tube socket, wafer, octal
73606	Socket—Tube socket, miniature, for tubes V1, V2, V3, V4, V5, V7
73117	Socket—Tube socket, miniature, for 6BF6 tube
31418	Spring—Drive cord spring
74202	Support—Polystyrene support for F.M. osc. coil complete with mounting bracket
73891	Switch—Tone control switch (S4)
*74201	Switch—Selector switch (S1, S2)
73601	Transformer—Power transformer, 115 volt 60 cycle (T1)
73745	Transformer—First I.F. transformer—dual (T2)
74019	Transformer—Second I.F. transformer—dual (T3)
73743	Transformer—Ratio detector transformer (T4)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES
	92569-5W
	RL 103B5
13867	Cap—Dust cap
73934	Cone—Cone and voice coil assembly
31826	Plug—4 prong male plug for speaker
73635	Speaker—12" PM speaker complete with cone and voice coil less output transformer and plug (92569-5W)
71145	Suspension—Metal cone suspension
73636	Transformer—Output transformer (T5)

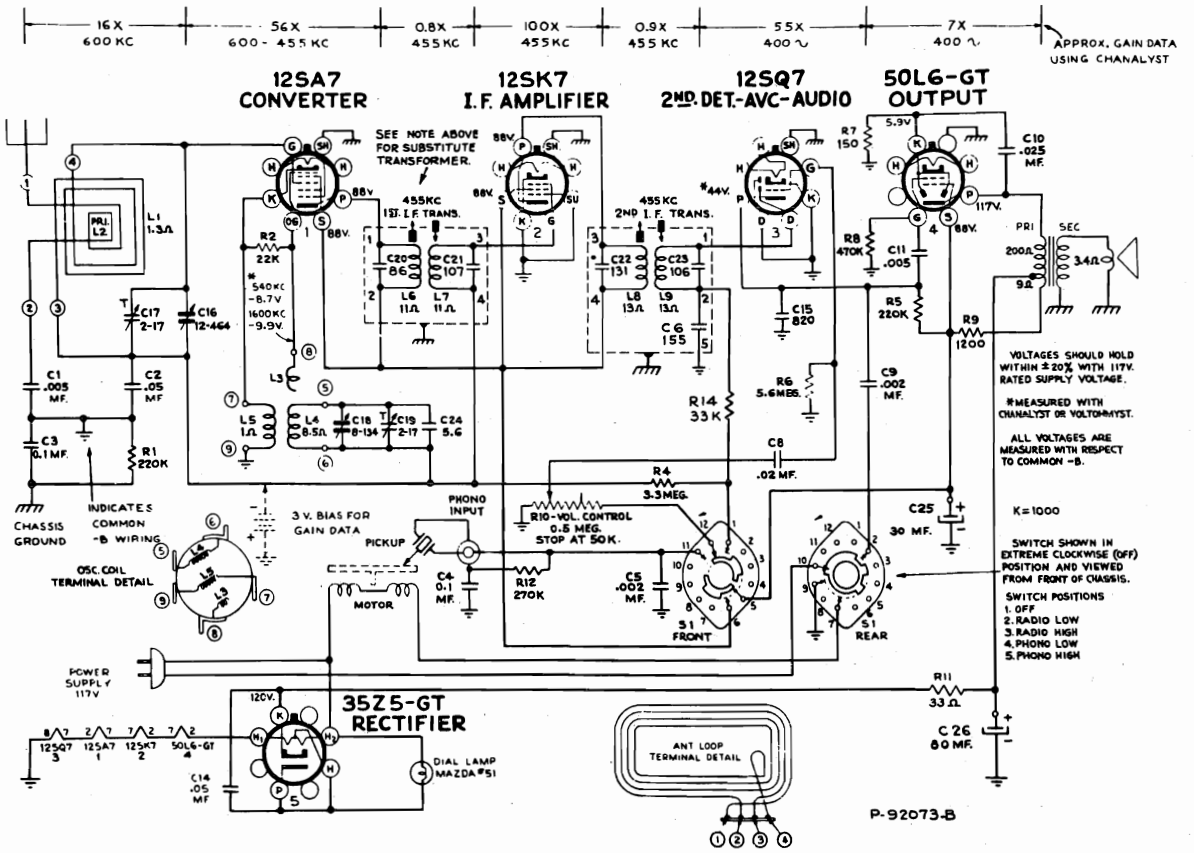
STOCK No.	DESCRIPTION
	MISCELLANEOUS
72555	Antenna—F.M. antenna
*74205	Bezel—Dial scale bezel less dial
74299	Bracket—Jewel lamp bracket for Model 9W105
71599	Bracket—Jewel lamp bracket for Models 9W101 and 9W103
*74268	Button—Rosette button (nail) for grille for Model 9W101
72437	Cable—Shielded pickup cable complete with pin plug (2 required) for Model 9W105
72583	Cable—Shielded pickup cable complete with pin plug for Models 9W101 and 9W103
13103	Cap—Jewel lamp cap
71892	Catch—Bullet catch and strike for doors
74298	Clamp—Dial clamp (2 required)
X1968	Cloth—Grille cloth for Model 9W101
X1973	Cloth—Grille cloth for Model 9W103
X1953	Cloth—Grille cloth for blonde instruments for Model 9W105
X1897	Cloth—Grille cloth for mahogany or walnut instruments for Model 9W105
74209	Cover—Mounting screw cover for RP168A record changer (3 required)
*74275	Decal—Control panel decal for limed oak instruments for Model 9W103
*74274	Decal—Control panel decal for mahogany or walnut instruments for Models 9W101 & 9W103
*74281	Decal—Control panel decal for blonde instruments for Model 9W105
*74280	Decal—Control panel decal for mahogany or walnut instruments for Model 9W105
71768	Decal—Trade mark decal (RCA Victor) for Model 9W101
74273	Decal—Trade mark decal (Victrola) for Models 9W101 and 9W103
71910	Decal—Trade mark decal (RCA Victor) for Model 9W105
71966	Decal—Trade mark decal (Victrola) for Model 9W105
*74203	Dial—Glass dial scale for Models 9W101 and 9W103
*74204	Dial—Glass dial scale for Model 9W105
73180	Emblem—"RCA Victor" emblem for Model 9W103
11889	Grommet—Rubber grommet for front apron chassis (2 required)
72856	Grommet—Rubber grommet for mounting RP178 record changer (3 required)
73903	Hinge—Cabinet door hinge (1 set)
72824	Knob—Tone control or selector switch knob—brown—for blonde or limed oak instruments
71822	Knob—Tone control or selector switch knob—maroon—for mahogany or walnut instruments
72800	Knob—Tuning or volume control knob—brown—for blonde or limed oak instruments
71821	Knob—Tuning or volume control knob—maroon—for mahogany or walnut instruments
11765	Lamp—Dial or jewel lamp—Mazda 51
*74300	Loop—Antenna loop complete for Model 9W105
73896	Loop—Antenna loop complete for Models 9W101 and 9W105
73109	Nut—Tee nut for mounting RP178 record changer (3 required)
74208	Nut—Tee nut for mounting RP-168A-1 record changer (3 required)
73771	Pull—Door pull for record storage compartment door or radio compartment door for Model 9W105
*74276	Pull—Door pull for Model 9W103
*74239	Pull—Door pull for Model 9W101
*74277	Pull—Record changers' drawer pull for Model 9W105
30868	Plug—2 contact female plug for motor cable
30870	Plug—2 prong male plug for motor cable
73184	Runner—Record changer motorboard runner—R.H.—for RP178 changer—Model 9W105
73183	Runner—Record changer motorboard runner—L.H.—for RP178 changer—Model 9W105
*74271	Runner—Record changer motorboard runner—R.H.—for RP168A-1 changer
*74272	Runner—Record changer motorboard runner—L.H.—for RP168A-1 changer
73110	Screw—#1/4-20 x 1¾" fillister head screw for mounting RP178 record changer—Model 9W105
*74278	Screw—#8-30 x ¾" trimit head screw for record changers' drawer pull for Model 9W105
*74424	Screw—#8-32 x 1¾" special screw for mounting RP-168A-1 record changer (3 required)
*74269	Screw—#8-32 x ¾" trimit head screw for door pull (2 required) for Model 9W101
74113	Screw—#8-32 x 1" trimit head screw for door pull for Model 9W103
*74279	Screw—#8-32 x ⅞" trimit head screw for door pull for record storage compartment door and radio compartment door for Model 9W105
*74421	Spring—Conical spring for mounting RP-168A-1 record changer—upper—R.H. side (1 required)
*74422	Spring—Conical spring for mounting RP-168A-1 record changer—upper—L.H. side (2 required)
*74423	Spring—Conical spring for mounting RP-168A-1 record changer—lower (3 required)
30900	Spring—Retaining spring for knobs
72936	Stop—Door stop
73185	Stop—Metal stop for motorboard runners (2 required)
73182	Track—Record changer compartment track (for RP-168A-1 record changer) (2 required)

† Stock No. 72953 is a reel containing 250 feet of cord.

* This is the first time that this Stock No. has appeared in Service Data.

RADIO CORP. OF AMERICA

MODEL 75ZU,
CHASSIS RC-1063A



Replacement Parts

STOCK No.	DESCRIPTION
	CHASSIS ASSEMBLIES
	RC 1063A
70407	Button—Plug button to cover holes for i-f transformers adjustment
70997	Capacitor—Ceramic, 5.6 mmf. (C24)
39650	Capacitor—Mica, 820 mmf. (C15)
70601	Capacitor—Tubular, .002 mfd., 400 volts (C5, C9)
70606	Capacitor—Tubular, .005 mfd., 400 volts (C1, C11)
70612	Capacitor—Tubular .025 mfd. 400 volts (C10)
70611	Capacitor—Tubular .02 mfd. 400 volts (C8)
70615	Capacitor—Tubular .05 mfd. 400 volts (C2, C14)
70617	Capacitor—Tubular, 0.1 mfd., 400 volts (C3, C4)
72312	Capacitor—Electrolytic, comprising 1 section of 30 mfd., 150 volts, and 1 section of 80 mfd., 150 volts (C25, C26)
70403	Coil—Oscillator coil (L3, L4, L5)
*73056	Condenser—Variable tuning condenser and drive drum (C16, C17, C18, C19)
*73057	Control—Volume control (R10)
70392	Cord—Power cord and plug
72953	Cord—Drive cord (approx. 38" overall length required)
*73063	Dial—Dial scale
70397	Gear—Power, radio and phono switch gear
*73014	Gear—Volume control gear—less spring
72283	Grommet—Rubber grommet to mount tuning condenser (3 required)
*73059	Indicator—Station selector indicator
*73010	Loop—Antenna loop complete (L1, L2)
*73055	Plate—Dial back plate less dial
30868	Plug—2 contact female plug for motor cable
*73060	Pulley—Station selector indicator pulley
72313	Resistor—Wire wound, 33 ohms, ¼ watt (R11)
	Resistor—Fixed composition, 150 ohms, ±10%, ½ watt (R7)
	Resistor—Fixed composition, 1200 ohms ±10%, 1 watt (R9)
	Resistor—Fixed composition, 22,000 ohms ±20%, ½ watt (R2)
	Resistor—Fixed composition, 33,000 ohms ±20%, ½ watt (R14)
	Resistor—Fixed composition, 220,000 ohms ±20%, ½ watt (R1, R5)
	Resistor—Fixed composition, 470,000 ohms ±20%, ½ watt (R8)
	Resistor—Fixed composition, 3.3 megohms ±20%, ½ watt (R4)
	Resistor—Fixed composition, 5.6 megohms ±10%, ½ watt (R6)
*73058	Shaft—Tuning knob shaft
*73062	Socket—Lamp socket
35787	Socket—Phono input socket
37605	Socket—Tube socket
70390	Spring—Drive cord tension spring
*73061	Spring—Station selector indicator pulley retaining spring
70396	Spring—Volume control gear tension spring
70394	Switch—Power, radio and phono switch (S1)
73036	Transformer—First I.F. transformer (L6, L7, C20, C21)
73037	Transformer—Second I.F. transformer (L8, L9, C6, C22, C23)
72296	Transformer—Output transformer (T1)
33726	Washer—"C" washer for tuning knob shaft
	SPEAKER ASSEMBLIES
	922258-2
71058	Speaker—4" x 6" P.M. speaker complete with cone and voice coil
	MISCELLANEOUS
71105	Cable—Shielded pickup cable for use with RP-178 record changer
72437	Cable—Shielded pickup cable for use with 960276 record changer
*73077	Crystal—Vinylite dial crystal
X1661	Cloth—Grille cloth
*72894	Foot—Rubber foot (4 required)
*72856	Grommet—Rubber grommet to mount record changer (3 required for RP-178) (4 required for 960276)
72692	Hinge—Lid hinge
*73064	Knob—Power, radio and phono switch knob
*73065	Knob—Tuning knob
*73078	Knob—Volume control knob
11765	Lamp—Dial lamp
73109	Nut—T nut for mounting record changer (3 required for RP-178) (4 required for 960276)
73110	Screw—¼-20 x 1¾ fillister head machine screw for mounting RP-178 record changer (3 required)
73234	Screw—¼-20 x 1½ oval head machine screw for mounting 960276 record changer (4 required)
14270	Spring—Retaining spring for knobs
71824	Stud—Stud and screw to mount one lid hinge
*73067	Support—Lid support

* THIS IS THE FIRST TIME THIS STOCK NUMBER HAS APPEARED IN SERVICE DATA.

RECORD CHANGERS: Model RP-178, RCD.CH. 18-11, or Model 960276, RCD.CH. 19-13

MODEL 75ZU,
CHASSIS RC-1063A

RADIO CORP. OF AMERICA

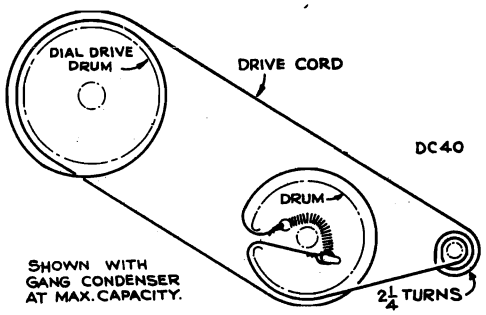
Alignment Procedure

CAUTION.—CLOSE TUNING CONDENSER PLATES COMPLETELY (C-C-W) BEFORE REMOVING CHASSIS FROM CABINET.

Take off both wooden strips on bottom of cabinet by removing wood screws before loosening chassis bolts.

CRITICAL LEAD DRESS.—

1. All heater wires should be dressed close to chassis.
2. Dress lead from switch to phono jack close to chassis and away from power cord.
3. Dress capacitor between 12SQ7 grid and terminal board away from chassis and away from other parts.
4. Dress lead from arm of volume control to terminal board against front apron and away from other leads.
5. In instrument assembly the lead from the rear section of gang to loop shall be dressed away from chassis and other wires to loop.



Test Oscillator.—Connect high side of test oscillator as shown in chart. Connect low side through a .01 mf. capacitor to common "—B." Keep the output signal as low as possible to avoid a.v.c. action.

Speaker and Dial Adjustment.—If the speaker should require replacement or if the position of the speaker mounting bracket is disturbed, reposition as follows:

Mount speaker on bracket, adjust bracket so that front edge of speaker extends ¾ inch in front of chassis base and tighten bracket screws.

Mount chassis on wood base with mounting screws loose, install in cabinet and push chassis forward until speaker contacts grille and then tighten chassis mounting screw. Adjust dial back plate mounting bracket so that the plate is parallel with cabinet.

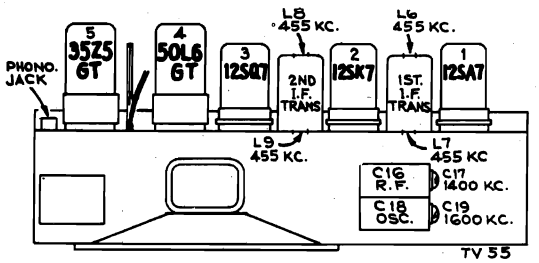
The two wood buttons at the top of the dial back plate should be adjusted to provide the best illumination of the dial and pointer.

Output Meter.—Connect meter across speaker voice coil. Turn volume control clockwise to radio maximum high position (3) for alignment.

Dial Pointer Adjustment.—Rotate tuning condenser fully counter-clockwise (plates fully meshed). Adjust indicator pointer to position illustrated on front page.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	I.F. grid, in series with .01 mfd.	455 kc	Quiet point 600 kc end of dial	L8 and L9 2nd I.F. transformer
2	1st Det. grid in series with .01 mfd.			L6 and L7 *1st I.F. transformer
NOTE.—ANTENNA LOOP AND RECORD CHANGER MUST BE IN CABINET FOR STEPS 3, 4 AND 5				
3	Antenna terminal in series with 220 mmfd.	1600 kc	160	C19 (osc.)
4	Radiated signal	1400 kc	Signal frequency	C17 (ant.)
5	Repeat steps 3 and 4.			

* Do not readjust L8 or L9 when test oscillator is connected to 1st Det.



1st I.F. Trans. Substitution.—The first I.F. transformer may differ from that snown in the schematic diagram. Transformers stamped 970441-1 are as shown in the schematic. Transformers stamped 970441-5 are connected as follows: term. #4 to plate of 12SA7, term. #3 to B+, term. #1 to grid of 12SK7, term. #2 to A.V.C. The d-c resistance of each winding is 16 ohms. The primary capacitor C20 is 131 mmf., the secondary capacitor is 106 mmf.

Electrical and Mechanical Specifications

Frequency Range ..... 540-1,600 kc
Intermediate Frequency ..... 455 kc
Tube Complement
(1) RCA Radiotron 12SA7 ..... Converter
(2) RCA Radiotron 12SK7 ..... I-F Amplifier
(3) RCA Radiotron 12SQ7 ..... 2nd Det., A.V.C., and A-F Amplifier
(4) RCA Radiotron 50L6GT ..... Power Output
(5) RCA Radiotron 35Z5GT ..... Rectifier
Pilot Lamp ..... Mazda No. 51, 6-8 volts, 0.2 amp.
Power Output
Undistorted ..... 1.5 watts
Maximum ..... 2.4 watts
Loudspeaker
Type 922258-2 ..... "PM" 4 x 6 inch elliptical
V.C. Impedance ..... 3.4 ohms at 400 cycles
Power Supply Rating
105-125 volts, A-C, 60 cycles ..... 60 watts

IMPORTANT: Do not plug instrument into a d-c supply.

Access to dial lamp may be obtained by removing sloping panel in record changer compartment.

*70137	Bracket—Dial bracket—L.H.—complete with drive cord pulley
*70136	Bracket—Dial bracket—R.H.—complete with drive cord pulley
71924	Capacitor—Ceramic, 56 mmf. (C5)
71614	Capacitor—Ceramic, 120 mmf. (C18)
70602	Capacitor—Tubular, .0025 mfd., 400 volts (C9, C12)
70646	Capacitor—Tubular, .0035 mfd., 1000 volts (C19, C20)
70601	Capacitor—Tubular, .002 mfd., 400 volts (C7)
70606	Capacitor—Tubular, .005 mfd., 400 volts (C14, C16)
70572	Capacitor—Tubular, .015 mfd., 400 volts (C13)
70610	Capacitor—Tubular, .01 mfd., 400 volts (C6, C10, C17)
70611	Capacitor—Tubular, .02 mfd., 400 volts (C11, C15)
70615	Capacitor—Tubular, .05 mfd., 400 volts (C8)
71976	Capacitor—Electrolytic, comprising 1 section of 20 mfd., 450 volts; 1 section of 30 mfd., 350 volts; and 1 section of 20 mfd., 25 volts (C21A, C21B, C21C)
*70133	Coil—Oscillator coil (L2, L3)
*70139	Condenser—Variable tuning condenser (C1, C2, C3, C4)
70342	Control—Volume control and power switch (R6, S2)
72953	Cord—Drive cord (approx. 49" overall length)
70930	Grommet—Rubber grommet to mount variable condenser (3 required)
71608	Indicator—Station selector indicator
*70138	Plate—Dial back plate
30868	Plug—2 contact female plug for Motor cable
12493	Plug—5 contact female plug for speaker cable
72602	Pulley—Drive cord pulley
	Resistor—Fixed composition, 330 ohms, ±10%, 1 watt (R19)
	Resistor—Fixed composition, 2200 ohms, ±10%, 2 watts (R20)
	Resistor—Fixed composition, 8200 ohms, ±10%, ½ watt (R17)
	Resistor—Fixed composition, 15,000 ohms, ±10%, 2 watts (R2)
	Resistor—Fixed composition, 18,000 ohms, ±10%, ½ watt (R4)
	Resistor—Fixed composition, 22,000 ohms, ±10%, ½ watt (R1)
	Resistor—Fixed composition, 27,000 ohms, ±10%, ½ watt (R5, R7)
	Resistor—Fixed composition, 56,000 ohms, ±10%, ½ watt (R8)
	Resistor—Fixed composition, 100,000 ohms, ±10%, ½ watt (R21)
	Resistor—Fixed composition, 270,000 ohms, ±10%, ½ watt (R10, R11, R13, R14)
	Resistor—Fixed composition, 470,000 ohms, ±10%, ½ watt (R3, R16, R18)
	Resistor—Fixed composition, 2.2 megohms, ±20%, ½ watt (R9)
	Resistor—Fixed composition, 10 megohms, ±20%, ½ watt (R12, R15)

STOCK No.	DESCRIPTION
*70135	Shaft—Tuning knob shaft
31364	Socket—Lamp socket
35787	Socket—Phono input socket
31251	Socket—Tube socket
31418	Spring—Drive cord tension spring
*70134	Switch—Range switch (S1)
70128	Transformer—First I. F. transformer (T1)
70129	Transformer—Second I. F. transformer (T2)
70127	Transformer—Power transformer, 117 volt, 60 cycles (T4)
35969	Washer—"C" Washer for tuning shaft
	SPEAKER ASSEMBLIES 92569-1W RL 103-1
13867	Cap—Dust cap
36145	Cone—Cone and voice coil assembly
71560	Plug—5 prong male plug for speaker
71961	Speaker—12" P.M. speaker complete with cone and voice coil less output transformer and plug
71145	Suspension—Metal cone suspension
37899	Transformer—Output transformer (T3)
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
71599	Bracket—Lamp bracket
13103	Cap—Pilot lamp jewel
*70142	Clamp—Dial clamp (1 set)
X1668	Cloth—Grille cloth
*73084	Decal—Control panel decal
71966	Decal—Trade mark decal (Victrola)
71910	Decal—Trade mark decal (RCA-Victor)
*70141	Dial—Glass dial scale
71764	Hinge—Cabinet lid hinge
71822	Knob—Range switch knob
71821	Knob—Tuning or volume control knob
11765	Lamp—Dial or pilot lamp
*70140	Loop—Antenna loop complete (L1)
71815	Mounting—One set of hardware consisting of four (4) springs, two (2) "C" washers and two (2) rubber washers to mount record changer
30900	Spring—Retaining spring for knobs
*73080	Support—Cabinet lid support—L.H.
*73083	Support—Cabinet lid support—R.H.

CHASSIS RC-615

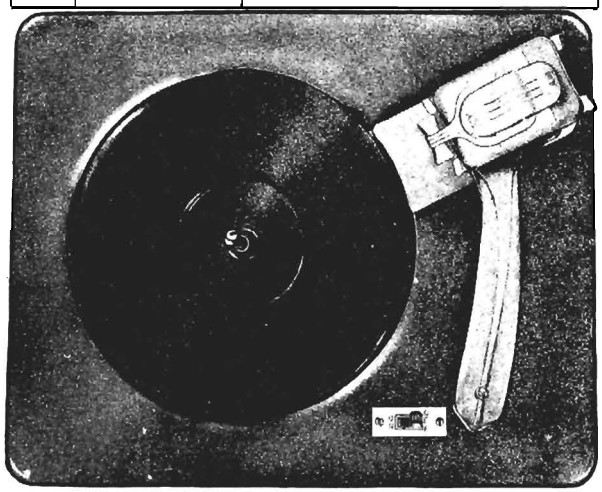
RADIO CORP. OF AMERICA

Alignment Procedure

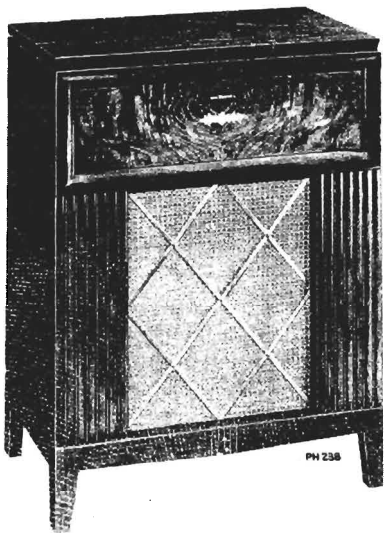
Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

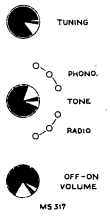
Steps	Connect high side of test oscillator to—	Tune test oscillator to—	Turn radio dial to—	Adjust the following for maximum peak output
1	6SK7 grid in series with .01 mfd.	455 kc.	Broadcast Quiet Point at 550 kc. end of dial	Pri. and Sec. (2nd I-F Trans.)
2	6SA7 grid in series with .01 mfd.			Pri. and Sec. (1st I-F Trans.)
3	Primary lead on loop in series with 200 mmfd.	1,400 kc.	1,400 kc.	C4 (osc.) C2 (ant.)
4		600 kc.	600 kc.	L2 (osc.) Rock gang
5		Repeat steps 3 and 4		



Automatic Record Changer



Model 77V1



Controls

Critical Lead Dress:

1. Dress speaker cable leads down next to chassis.
2. Dress output plate capacitors next to chassis.
3. Dress plate lead of output tube away from grid of audio amplifier.
4. Dress all a-c leads away from volume control down next to chassis.
5. Dress lead from top tap of volume control to range-tone switch along front apron of chassis.
6. Dress R12 and R15 down near chassis base.

Record Capacity ..... Twelve 10-in., Ten 12-in.
Turntable ..... 78 r.p.m. type
Type Pickup ..... Crystal
Motor Power consumption (115 v., 60 cycles) ..... 30 watts

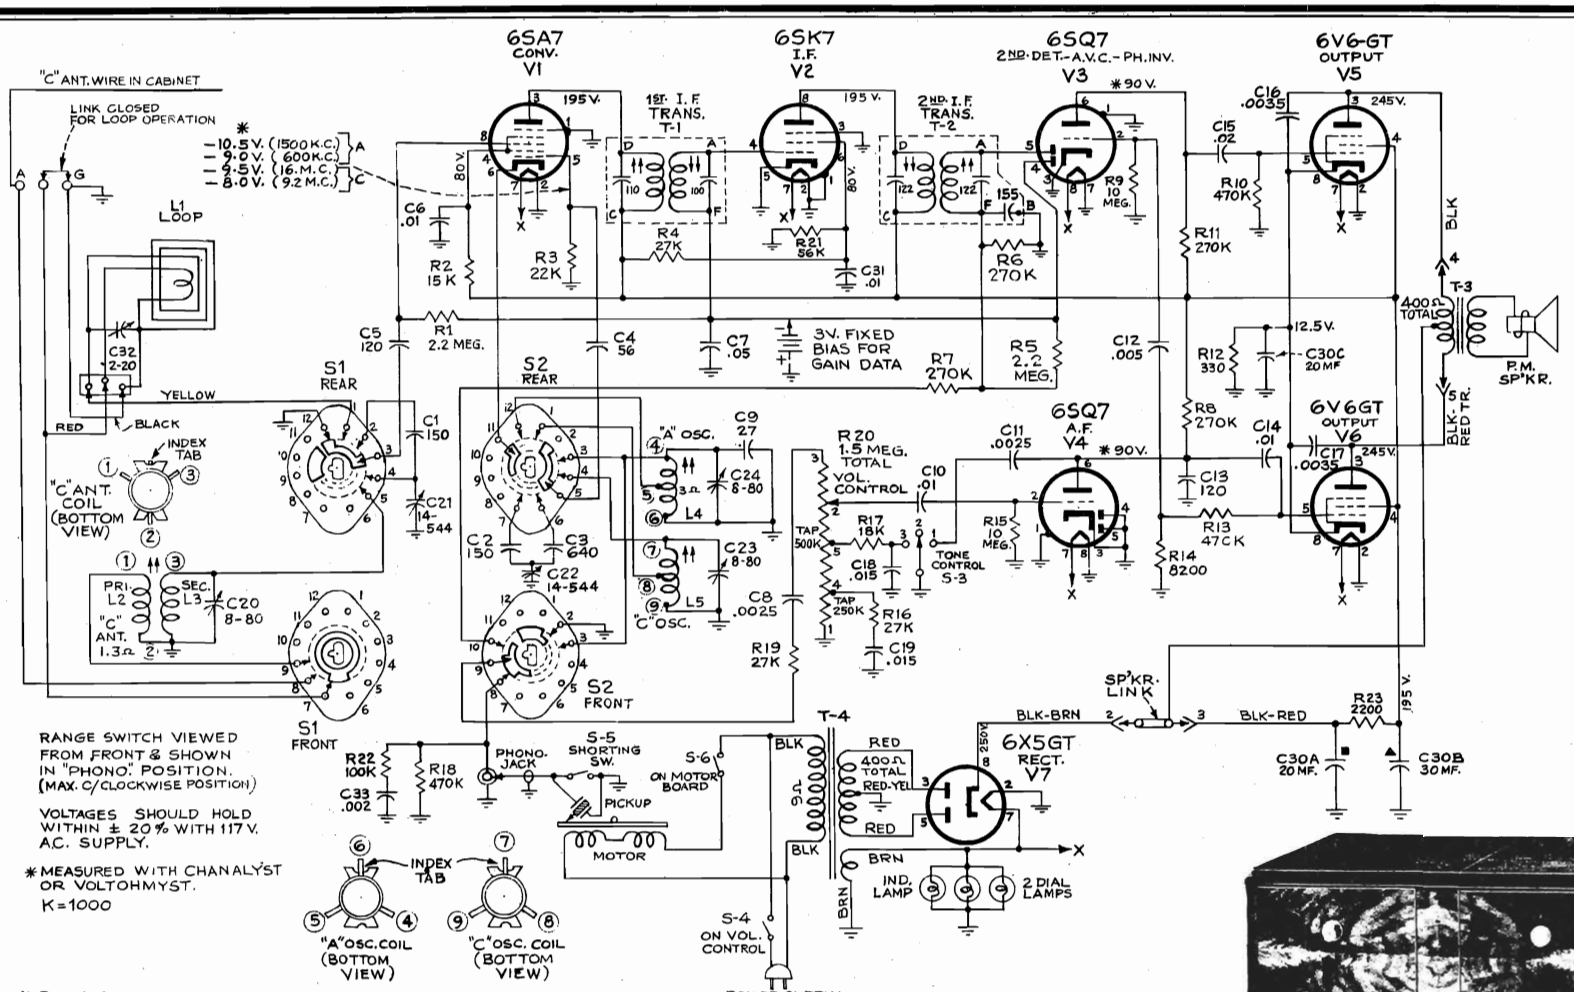
Tuning Drive Ratio 16:1

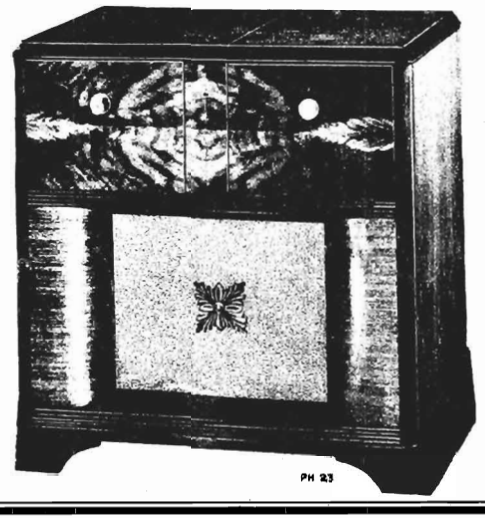
Circuit Description

The receiver is a seven tube superheterodyne employing push-pull power unit. AVC is applied to the converter and i-f tubes. The broadcast band utilizes a standard loop antenna.

RADIO CORP. OF AMERICA

MODEL 77V2, CHASSIS RC-606C





PH 23

Circuit Description

The receiver is a seven tube superheterodyne employing push-pull power output. AVC is applied to the converter and i-f tubes. The broadcast band utilizes a standard loop antenna, and the short wave antenna is a wire tacked in the cabinet.

Frequency Ranges

Standard Broadcast "A"	540-1,600 kc
Short Wave "C"	9.2-16 mc
Intermediate Frequency	455 kc

Tube Complement

(1) RCA-6SA7	1st Det., Oscillator
(2) RCA-6SK7	I-F Amplifier
(3) RCA-6SQ7	2nd Det., A. V. C. and Phase Inverter
(4) RCA-6SQ7	A-F Amplifier

Alignment Procedure

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action

Calibration Scale.—The dial scale printed in this service note may be temporarily attached to the chassis for quick reference during alignment.

Using Printed Dial Scale.—

1. Cut out the printed dial scale, or make a tracing of the scale.
2. With gang at full mesh the pointer should be set to the second reference mark from the left hand end of the dial backing plate.
3. Place the printed dial scale or the tracing under the pointer so that the extreme left scale graduations coincide with the pointer. Use scotch tape to hold the dial scale in place.

Note.—It is not recommended that the glass dial scale in the cabinet be removed as an alignment reference. This glass dial scale is fastened to the bezel with sheet metal lugs bent over the scale to hold it in place. Removing the glass dial scale will necessitate bending the lugs, resulting in their weakening and subsequent breakage.

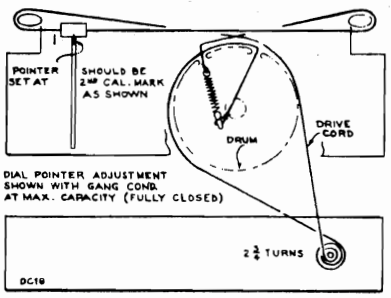
"C" Band Reception.—For best reception on "C" band with an outside antenna, adjust the trimmer screw of C20 on the antenna coil. Turn screw carefully with an insulated screwdriver (RCA Stock No. 31031) while the receiver is tuned to a station in the 31-meter band. If returning to internal antenna at any time, close the link on the center terminal and readjust "C" band antenna trimmer C20 for best reception on 31-meter band.

For additional information, refer to booklet, "RCA Victor Receiver Alignment."

Steps	Connect high side of test oscillator to—	Tune test oscillator to—	Turn radio dial to—	Adjust the following for maximum peak output
1	6SK7 grid in series with .01 mfd.	455 kc.	Broadcast Quiet Point at 550 kc. end of dial	Top and bottom T-1 (2nd I-F Trans.)
2	6SA7 grid in series with .01 mfd.			Top and bottom T-2 (1st I-F Trans.)
3	Yellow lead on loop in series with 200 mmfd. (link closed)	1,400 kc.	Broadcast 1400 kc.	C24 (osc.)
4		600 kc.	Broadcast 600 kc.	L4 (osc.) Rock gang
5		Repeat steps 3 and 4.		
6	Antenna terminal in series with 47 mmfd.	15.2 mc.	Short Wave 15.2 mc.	C23 (osc.)* C20 (ant.)
7		9.5 mc.	Short Wave 9.5 mc.	L5 (osc.) L3 (ant.)
8		Repeat steps 6 and 7		
9	Install and connect chassis in cabinet with link closed. Tune in a radiated signal of 1400 kc. on broadcast band and peak C32 on loop.			

* Use minimum capacity peak if two can be obtained. Check for selection of correct peak by tuning the receiver to approximately 14.3 mc., where a weaker signal should be received.

Oscillator tracks 455 kc. above signal on both bands.



DIAL INDICATOR AND DRIVE MECHANISM

Critical Lead Dress:

1. Dress all A. C. leads away from volume control.
2. Dress lead from top tap of volume control to tone switch along front apron of chassis.
3. Dress R9 and R15 down near chassis base.

Note.—In order to remove the chassis from the cabinet, remove the knobs and the connecting cables, then unscrew the four slotted hex head screws from the two "L" brackets bolted to the rear of the chassis. The chassis may then be slid out toward the bottom rear of the cabinet. Do not remove the hinge screws or the two large nuts in the rear of the chassis. When replacing the chassis, make sure that the tapered pins on the front of the chassis fit into the holes on the metal runners attached to the cabinet door.

71603	Switch—Tone control switch (S3)

STOCK No.	DESCRIPTION
*70128	Transformer—First I-F transformer (T1)
*70129	Transformer—Second I-F transformer (T2)
*70127	Transformer—Power transformer, 117 volts, 60 cycles (T4)
35969	Washer—"C" washer for tuning shaft
	SPEAKER ASSEMBLIES 92569-1W—RL103-1
13867	Cap—Dust cap
36145	Cone—Cone and voice coil assembly
71560	Plug—5 prong male plug for speaker
71961	Speaker—12" PM speaker complete with cone and voice coil less output transformer and plug
71145	Suspension—Metal cone suspension
37899	Transformer—Output transformer (T3)
	NOTE: If stamping on speaker in instrument does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
71819	Bracket—Door check mounting bracket
36461	Button—Plug button
38684	Capacitor—Mica trimmer, 2-20 mmf. (C32)
71820	Check—Radio compartment door check assembly less spring
X1638	Cloth—Grille cloth for walnut instruments
X1639	Cloth—Grille cloth for mahogany instruments
70547	Cover—Compartment lead cover
71769	Decal—Control function decal for walnut or mahogany instruments
71910	Decal—Trade mark decal (RCA Victor)
71966	Decal—Trade mark decal (Victrola)
71817	Dial—Glass dial scale
71816	Escutcheon—Dial scale escutcheon less dial
11889	Grommet—Rubber grommet to cushion chassis front apron (2 required)
72069	Grommet—Rubber grommet for mounting loop
71764	Hinge—Cabinet door hinge (2 required)
13103	Jewel—Pilot lamp cap
71822	Knob—Range switch or tone switch knob
71821	Knob—Volume control or tuning knob
5117	Lamp—Compartment lamp
11765	Lamp—Dial lamp
71813	Loop—Antenna loop complete (L1, C32)
71815	Mounting—One set of hardware to mount record changer—consisting of four springs, two spring washers and two rubber washers
*73187	Pull—Door pull
72324	Shade—Compartment lamp shade
36422	Socket—3 contact socket (female) for loop leads
71818	Spring—Door check spring
30900	Spring—Retaining spring for knobs
71765	Support—Cabinet lid support and hinge
71814	Washer—Rubber washer for door check

MODEL 96X5,

105-125 volts, 60 cycles ..... max. 116 watts

(This instrument can be converted to operate on 50 cycles.)

Pilot Lamps (3) ..... Mazda No. 51 6-8 volts 0.2 amp.
Tuning Drive Ratio 16.25:1

CABINET DIMENSIONS

	Height	Width	Depth
610V1	36"	35-1/16"	18"
610V2	36"	34-9/16"	17-5/8"

Antennas

Under conditions of normal field strength and interference, the RCA Victor antennas installed inside the cabinet will be effective for Frequency Modulation and Standard Broadcasts.

If reception is not satisfactory on one or both of the bands using the built-in cabinet antennas, one or two external antennas may be used. Connections are made to the antenna terminal board in the back of the cabinet. External antennas may be

MS328

erected indoors or outdoors and should be oriented in direction for requirements of best reception. RCA Television Antenna Stock No. 225 or 226 or the equivalent with 300 ohm transmission line is recommended for an FM external antenna. In this case, disconnect the two leads at the two terminals marked "FM" and attach the ends of the two lead wires from the RCA Television Antenna transmission line in their places. To replace the Standard Broadcast antenna, open the link across the terminals A-G and connect the lead-in from the antenna to terminal A. This antenna should consist of a wire 30 to 60 feet or so in length, mounted in a convenient location as high as possible. A ground connection to G should not be necessary but a flexible wire to a waterpipe or other good ground may be used.

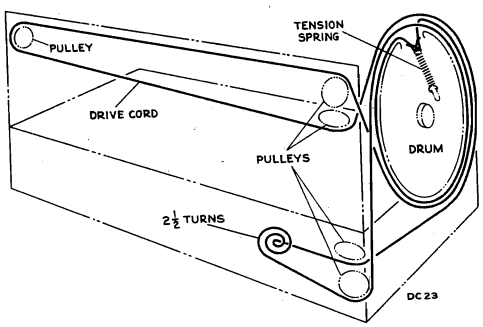
Circuit Description

Models 610V1 and 610V2 have individual built-in antennas for FM and AM coupled to individual 1st Det.-Osc. tubes (6BE6 V1 and V2). The outputs of these two tubes are connected to separate IF transformers (T1 and T2) whose secondaries are in series and connected to the IF amplifier tube (6BA6 V3). The output of V3 is connected to separate IF transformers (T3 and T4) whose primaries are in series. The secondary of T3 (FM IF) is connected to the driver tube (6AU6 V4). The secondary of T4 (AM IF) is connected to the AM second detector (6SQ7 V6). The output of the driver tube (V4) is coupled thru the driver transformer (T5) and ratio detector transformer (T6) to the FM ratio detector tube (6AL5 V5). [In 610V1 the functions of both T5 and T6 are combined in one unit (T5).]

The audio outputs of the AM second detector and the FM ratio detector are connected thru a section of the range switch to the volume control input.

The B+ supply (+245 V) to the plates and screen grids of V1 and V2 is controlled thru a section of the range switch.

Simple AVC is used on AM and is applied to both the IF amplifier (V3) and the AM 1st detector (V2). Delayed AVC is used on FM and is applied only to the IF amplifier (V3). The AVC distribution is controlled thru a section of the range switch.



DIAL INDICATOR AND DRIVE MECHANISM

MODEL 610V1, CHASSIS RC-610C — RADIO CORP. OF AMERICA — MODEL 610V2, CHASSIS RC-610

Alignment Procedure

Alignment Indicators:

An RCA VoltOhmyst or equivalent meter is necessary for measuring developed d-c voltage during FM alignment. Connections are specified in the alignment tabulation below. An output meter is also necessary to indicate minimum audio output during FM Ratio Detector alignment. Connect the output meter across the speaker voice coil.

The RCA VoltOhmyst can also be used as an AM alignment indicator, either to measure audio output or to measure a-v-c voltage.

When audio output is being measured the volume control should be turned to maximum.

Signal Generator:

For all alignment operations, except FM IF-RF, connect the low side of the signal generator to the receiver chassis. The output should be adjusted to provide accurate resonance indication at all times. If output measurement is used for AM alignment the output of the signal generator should be kept as low as possible to avoid a-v-c action.

Calibration Scale.—The dial scale printed in this service note may be temporarily attached to the chassis for quick reference during alignment.

Using Printed Dial Scale.—

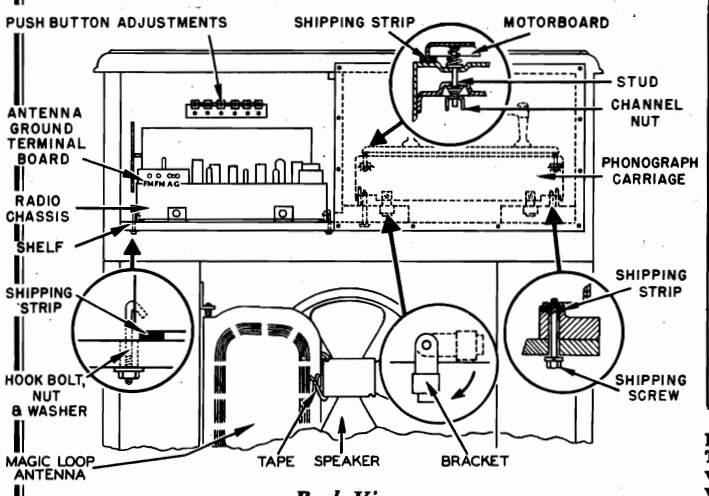
1. Cut out the printed dial scale, or, better still, make a tracing of the scale.
2. With gang at full mesh the pointer should be set to the first reference mark from the left hand end of the dial backing plate.
3. Place the printed dial scale or the tracing under the pointer so that the extreme left scale graduations coincide with the pointer. Use scotch tape to hold the dial scale in place.

Note.—It is not recommended that the glass dial scale in the cabinet be removed as a nalignment reference. This glass dial scale is fastened to the bezel with sheet metal lugs bent over the scale to hold it in place. Removing the glass dial scale will necessitate bending the lugs, resulting in their weakening and subsequent breakage.

610V1 (RC-610C) FM Ratio Detector Alignment

RANGE SWITCH IN FM POSITION—VOL. CONT. MAXIMUM

Steps	Connect high side of sig. gen. to—	Signal generator output	Adjustments and indications
1	Connect the d-c probe of a VoltOhmyst to the negative lead of the 5 mfd. capacitor, C20, the common lead of the VoltOhmyst to chassis.		
2	Pin 1 of driver tube 6AU6 in series with .01 mfd.	10.7 mc. modulated 30% 400 cycles AM (Approx. .1 volt)	Top core T5 for max. d-c across C20 (Approx. 4 volts) Bottom core T5 for minimum audio output
3	Repeat Step 2 until further adjustment does not improve alignment.		



Back View

610V2 (RC-610) FM Ratio Detector Alignment

RANGE SWITCH IN FM POSITION—VOL. CONT. MAXIMUM

Steps	Connect high side of sig. gen. to—	Signal generator output	Adjustments and indications
1	Connect a 680 ohm resistor between pins 5 and 7 of the ratio detector tube 6AL5. Connect the d-c probe of a VoltOhmyst to the negative lead of the 5 mfd. capacitor, C20, the common lead of the VoltOhmyst to chassis.		
2	Pin 1 of driver tube 6AU6 in series with .01 mfd.	10.7 mc. modulated 30% 400 cycles AM (Approx. .25 volt)	Driver trans. T5, for max. d-c across C20 (Approx. 14.5 volts)
3	Disconnect the VoltOhmyst and the 680 ohm resistor from the 6AL5. Connect two 68,000 ohm resistors (within 1% of each other) in series across the 22,000 ohm resistor R17. Connect the common lead of the VoltOhmyst to the center point of the 68,000 ohm resistors and the d-c probe to terminal "A" of the ratio detector trans. T6. Use 30 volt scale of VoltOhmyst first, reducing to lower scale as required.		
4	Same as Step 2	Same as Step 2	†T6 bottom core for zero d-c balance. †T6 top core for min. audio output.
5	Reconnect VoltOhmyst as in Step 1, omitting 680 ohm resistor.		
6	Repeat Step 2.		
7	Remove ALL connections.		

† Near the correct core position the zero point is approached rapidly and continued adjustment causes the indicated polarity to reverse. A slow approach to the zero point is an indication of severe detuning, and the bottom core should be turned in the opposite direction.

The zero d-c balance and the minimum a-f output should occur at the same point. If such is not the case, the two cores should be adjusted until both occur with no further adjustment of either core. It may be advantageous to adjust both cores simultaneously, watching the VoltOhmyst, and an output meter, hooked across the voice coil for the point at which both zero d-c and minimum a-f output occur.

FM IF-RF Alignment

(FM Ratio Detector must be aligned first.)

RANGE SWITCH IN FM POSITION

Steps	Connect sig. gen.	Sig. gen. output	Turn radio dial to—	Adjustment for peak output
1	Connect the d-c probe of a VoltOhmyst to the negative lead of the 5 mfd. capacitor C20 and the common lead to chassis. Turn gang condenser to max. capacity (fully meshed).			
2	High side to one FM ant. term. in series with .01 mfd. Low side to the other FM ant. term.	10.7 mc 30% modulation, 400 cycles AM. Adjust to provide 2 to 3 volts indication on VoltOhmyst during alignment.	Max. capacity (fully meshed)	*Using alternate loading: T3 bottom core (sec.) T3 top core (pri.) T1 bottom core (sec.) T1 top core (pri.)
3	High side to one FM ant. term. in series with a 120 ohm resistor. Low side to the other FM ant. term in series with a 120 ohm resistor.	106 mc	106 mc	C54 osc. C52 ant.
4	Same as Step 3.	90 mc	90 mc	L3 osc. L2 ant.
5	Repeat Steps 3 and 4 until further adjustment does not improve calibration.			

* Alternate loading involves the use of a 680 ohm resistor to load the plate winding while the grid winding of the SAME TRANSFORMER is being peaked. Then the grid winding is loaded with the resistor while the plate winding is peaked. Only one winding is loaded at any one time. Remove the 680 ohm resistor after T3 and T1 have been aligned.

AM Alignment

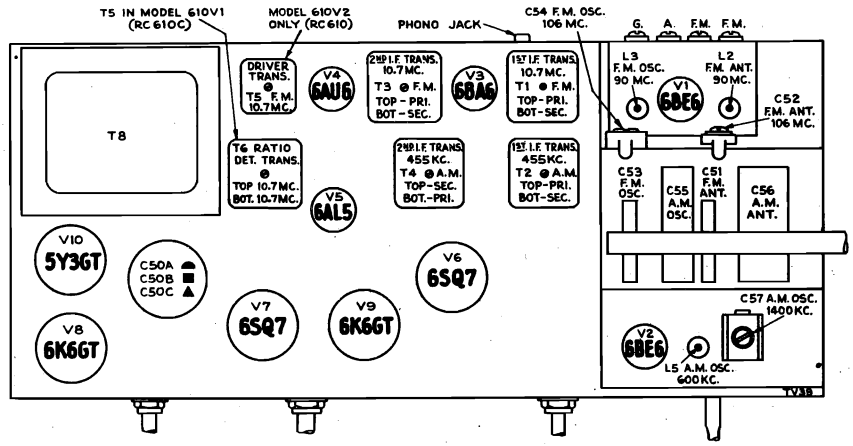
(Correct alignment of the 455 kc. IF requires that the 10.7 mc. IF be aligned previously.)

RANGE SWITCH IN BC POSITION

Steps	Connect high side of sig. gen. to—	Sig. gen. output	Turn radio dial to—	Adjust for peak output
1	AM converter grid 6BE6 V-2 in series with .01 mfd.	455 kc	Quiet point at low freq. end.	*T4 top core (sec.) *T4 bottom core (pri.)
2				*T2 bottom core (sec.) *T2 top core (pri.)
3	"A" terminal of terminal board at rear of chassis in series with 200 mmf. (link open)	1400 kc	1400 kc	C57 osc. C58 ant. (loop)
4		600 kc	600 kc	L5 osc. (Rock gang)
5	Repeat Step 3.			
6	After chassis and loop have been installed in cabinet, adjust C58 for max. output on a weak station near 1400 kc.			

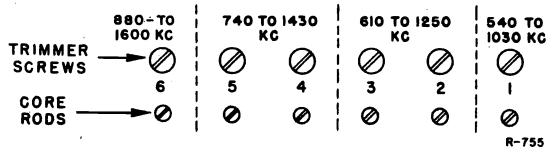
*Align T4 and T2 by means of alternate loading as explained under FM IF-RF alignment. Use a 47,000 ohm resistor instead of a 680 ohm resistor.

Oscillator frequency is above signal frequency on both AM and FM.



Top View Chassis

Push Button Adjustment



The push buttons connect to separate magnetite-core oscillator coils and separate loop circuit trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as RCA Stock No. 31031. Allow about five minutes warm-up period before making adjustments.

The procedure is as follows:

1. Make a list of the desired stations, arranged in order from low to high frequencies.
2. Turn the range switch to the broadcast position and manually tune in the first station on the list.
3. Turn range switch to push-button position and press in the left-hand button.
4. Adjust core rod No. 1 to receive the first station. To secure the best adjustment, rotate the loop for least pickup, and adjust core rod No. 1 for peak output.
5. Adjust trimmer screw No. 1 for peak output on the first station.
6. Proceed in the same manner to adjust for the remaining stations.
7. Repeat adjustments for best results.

On the 880 to 1,600 kc push-button, the higher frequency stations may be received with core rod No. 6 either in or out (oscillator frequency either 455 kc below or 455 kc above the station frequency). The adjustment with this core in its out position (oscillator frequency 455 kc above the station frequency) is the correct one.

NOTE: Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.

Critical Lead Dress

1. Dress capacitor C1 near chassis base.
2. Dress lead from pin 5, V-1, to terminal C, of transformer T1, as near bottom of FM shelf as possible.
3. The lead from capacitor C23 to the high side of the volume control must be dressed next to chassis along front apron.
4. Dress resistor R20 near chassis base.
5. Dress all A.C. leads away from volume control.
6. Solder FM antenna coil primary leads to terminal board with as short a lead length as is practical.
7. Make all FM leads as short as possible.
8. The lead from pin 2, V-3, to chassis ground must be dressed as close to base and as near to the back apron as possible. This lead provides degeneration for the IF stage and neither its length nor the point at which it is grounded to the chassis should be changed.
9. Dress all leads away from the 3300 ohm resistors R28 and R29.

TUBES AND FUNCTIONS

(1) RCA-6K7 ..... R-F Amplifier
(2) RCA-6A8 ..... First Detector—Oscillator
(3) RCA-6K7 ..... I-F Amplifier
(4) RCA-6R7-G ..... Second Det., A-F Amp., and A.V.C.
(5) RCA-6V6-G ..... Power Output
(6) RCA-6V6-G ..... Power Output
Dial Light ..... Mazda No. 51, 7.5 volts, 0.2 ampere

FREQUENCY RANGE ..... 550-1,500 kc

ALIGNMENT FREQUENCIES

260 kc ..... I-F Amplifier
600 kc ..... Osc.
1,400 kc ..... Osc., Det., Ant.

POWER OUTPUT

Undistorted ..... 6 watts
Maximum ..... 8 watts

POWER SUPPLY RATING

Supply Voltage ..... 6.3 volts
Current Drain ..... 9 amperes
Fuse Protection ..... 15 amperes

LOUDSPEAKER

Type ..... 8-inch Electrodynamic
Voice Coil Impedance ..... 3.5 ohms at 400 cycles

Operating Controls ..... Left, Manual tuning; Center, Six station push buttons; Right, Power switch—Volume control (small), Tone control (wing knob)

General Description

The Nash—RCA Model AC-3689 is a six-tube, deluxe, custom-built, superheterodyne automobile radio receiver consisting of three units. (1) The control unit containing the tuning mechanism and radio-frequency circuits; (2) the power unit containing the i-f, audio, and power-supply circuits: and (3) the loudspeaker. The i-f signal output of the first-detector — oscillator tube in the control unit is fed through a shielded cable to the power unit. The capacity of the shielded cable is such as to provide the correct shunt fixed capacity for the first i-f transformer primary, and alignment is made by magnetite cores in the i-f transformers.

Among the many features of this receiver are: Mechanical push button tuning for six stations; r-f amplifier stage; automatic volume control; magnetite core antenna, oscillator, and i-f transformers; ignition suppression filters in the antenna and power-supply circuits; push-pull beam power output stage; continuously variable high-frequency tone control; and an eight-inch, dust-proof electrodynamic loudspeaker.

Manual Tuning Mechanism

The manual tuning shaft is connected by a drive cord to the condenser drive-cord drum and the dial-scale pulley (located under dial scale). The "Drive-cord Hookup" shows the cord arrangement and number of turns around shafts. A three-position spring-tension adjustment is provided on the drive-cord drum to permit adjustment of the drive cord tension. Sufficient tension should be used to ensure freedom from backlash or cord slippage without causing excessive push button friction (spring stretched approximately 1/16 inch). The dial scale may be adjusted by loosening the dial nut and turning the scale until the extreme low-frequency end mark on the scale is aligned to the pointer in the escutcheon, or exactly in the center of the dial opening, while the gang condenser is in full-mesh position. See "Adjustments of push-button mechanism" for mechanical adjustments affecting both manual and push-button tuning.

Push-Button Tuning Mechanism

The push-button tuning mechanism is of the mechanical type wherein the movement of a push button actually turns the tuning condenser to any predetermined setting. The movement is actuated through a push arm, cam, rocker plate, and sector gear, which meshes with a scissor gear directly fastened to the tuning-condenser shaft. The scissor gear prevents backlash between the sector gear and tuning condenser. Since the sector gear is mounted directly on the rocker-plate shaft, the position of the rocker plate will accurately determine the position of the tuning condenser.

The cams, which determine the condenser stop position for each button, are mounted on the push arms and are locked in place by the push buttons and lock shoes, which press firmly against the cams when the push buttons are tightened. The push buttons should be tightened by hand and never forced with pliers or other tools.

ALIGNMENT PROCEDURE

Test Oscillator.—For all alignment operations, connect the low side of the test oscillator to the receiver chassis, and keep the output signal as low as possible to avoid a-v-c action.

Output Meter.—Connect the output meter across the speaker voice-coil and turn the receiver volume control and tone control to maximum (fully clockwise).

Dial Calibration.—Rotate the gang condenser to its full-mesh (maximum-capacity) position and then adjust dial scale so that the last calibration mark at the low-frequency end of dial is aligned to the pointer in the escutcheon.

Note 1.—The control unit and power unit (forming a complete receiver) must be aligned together, as proper alignment of the first i-f transformer is dependent upon the capacity of the interconnecting cable.

*** Note 2.**—The total series capacity for steps 3 to 6 must be 60 mmfd. ±10%. This capacitor must be inserted at the antenna connector of the receiver. The lead from the test oscillator to the 60 mmfd. capacitor may be shielded if desired, but no shielding should be used between capacitor and antenna connector.

† Note 3.—Install top cover of control unit, leaving tube cover off for steps 3 to 6.

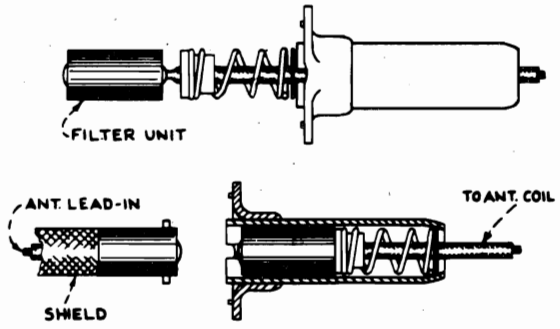
Note 4.—The negative terminal of battery connects to the "A" lead and the positive terminal to receiver case.

Steps	Connect the high side of test-osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	6K7 I-F grid cap in series with .01 mfd.	260 kc	No Signal 550-750 kc	L10 and L11 (2nd I-F Trans.)
2	6A8 Det. grid cap in series with .01 mfd.	260 kc		L8 and L9 (1st I-F Trans.)
3†	*Ant. connector in series with 60 mmfd.	600 kc	600 kc	L7 (osc.)
4†	*Ant. connector in series with 60 mmfd.	1,400 kc	1,400 kc	C14 (osc.) C8 (det.) C3 (ant.)
5†	*Ant. connector in series with 60 mmfd.	600 kc	600 kc (rock)	L7 (osc.)
6†	*Ant. connector in series with 60 mmfd.	1,400 kc	1,400 kc	C14 (osc.) C8 (det.) C3 (ant.)

* See Note 2.
† See Note 3.

Precautionary Lead Dress

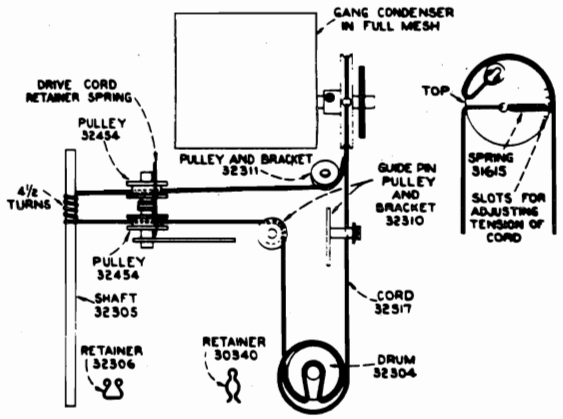
1. All ground leads and leads from C35 and C41 should be as short as possible.
2. Black lead from contact 4 on six-contact socket to terminal "D" on second I-F transformer should be dressed close to chassis and near case.
3. One lug of electrolytic capacitor can must be soldered to chassis.
4. Heater lead from 6K7 I-F to 6R7G should be dressed away from diode terminals.
5. Dress shielded lead from 3-contact socket to terminal board along edge of case, over C35, and away from vibrator socket.
6. Green lead from gang to 6K7 R-F grid must pass through shield clamps to rear of gang and dressed to rear of 6K7 R-F tube.
7. Dress green lead from center section of gang to C14 away from 6K7 R-F grid lead and in front of C9.
8. Dress heavy rubber covered lead from connector cable to 6A8 plate through hole between triangular chassis and case and away from oscillator coil.
9. Dress parts and leads under triangular chassis close to this chassis to prevent possibility of cutting through insulation paper.
10. Yellow lead from antenna to detector coil must be dressed over top of gang.
11. Leads to volume control must be dressed to front of control and away from "A" leads to power switch.
12. Dress all leads clear of gang rotor and push arms.



Antenna Filter

Loudspeaker

The loudspeaker cone may be centered in the usual manner with three celluloid or paper feelers after gently cutting away the front dust cover. A new cover should be cemented in place upon completion of the adjustment.



Drive Cord Hookup

MODEL AC3689,
CHASSIS RC-368,
Nash

RADIO CORP. OF AMERICA

Adjustments of Push-Button Mechanism

The mechanism should be so adjusted that when using either manual tuning or push-button tuning, it operates positively and without bind or backlash. The complete sequence of adjustments are outlined below, however, inspection will generally enable the particular trouble to be located and then only that adjustment and the ones which follow will be necessary without disturbing other adjustments found to be correct. Proceed as follows in the sequence given:

1. Remove dial scale. Loosen coupling set-screws, sector gear set-screws, gang-condenser mounting screws, and bearing-plate screws.
2. Place escutcheon in place and check for proper centering of push buttons in escutcheon. If push buttons are not properly centered, loosen the push-button-unit nuts (underneath) and adjust position of each unit until properly centered. Tighten mounting nuts. The coupling and sector gear must be on rocker-plate shafts but not tightened.
3. Align rocker plates with each other and tighten coupling screws. The position of the set-screws should be such that they definitely clear dial when gang is out of mesh and definitely clear pulley when gang is in full mesh.
4. Rotate rocker-plate shaft to obtain normal position of bearing plate and then tighten screws holding bearing plate.
5. Rotate gang condenser to full mesh, move free (inner) scissor gear one tooth from its free position and then mesh the sector gear with the scissor gear with two end teeth of the sector gear fully meshed. See photograph. Tighten condenser mounting screws. Slide sector gear along shaft until it is correctly aligned with the scissor gear, and with top of rocker plates 1/16 inch from frame tighten screws of sector gear.
6. Adjust mesh of scissor gear with sector gear by shifting gang condenser position. Adjust for minimum backlash without binding.
7. Adjust drive-cord drum on condenser shaft for correct alignment with drive cord, and so that the cord hole is at the top when gang is in full mesh.
8. Lubricate the push arms, rocker-plate shafts, and pulley shafts with light grease or heavy oil (sparingly) to provide free operation, being careful to keep lubricant off of drive cord.
9. With gang condenser fully meshed and drive cord properly installed, adjust dial scale so that the extreme low-frequency end calibration mark is aligned to the pointer in the escutcheon, or exactly in the center of the dial opening.

Adjusting Push Buttons for Stations

The six push buttons should be adjusted for six favorite stations after the receiver is installed and operating.

Any six standard broadcast stations may be chosen. The preferable arrangement is to adjust for stations in the order of frequency, from low to high. Proceed as follows:

1. Loosen the push buttons one-half turn.
2. Using the tuning control, accurately tune in the first station.
3. With station accurately tuned in, press the first push button fully in and then gently release so as not to jar mechanism.
4. Tighten the push button securely with fingers. Do not force with pliers.
5. Proceed in same manner to adjust the other five push buttons.

REPLACEMENT PARTS

STOCK No.	DESCRIPTION
	CONTROL UNIT ASSEMBLIES
32307	Bushing—Station selector knob shaft bushing
32876	Cable—3-conductor shielded speaker cable complete with male plug
32374	Cable—6-conductor shielded volume control cable complete with male plug
32300	Capacitor—Trimmer 2-15 mmfd. (C14)
14021	Capacitor—22 mmfd. (C41)
31707	Capacitor—25 mmfd. (C15)
13057	Capacitor—68 mmfd. (C12)
30433	Capacitor—470 mmfd. (C43)
32362	Capacitor—800 mmfd. (C11)
5148	Capacitor—.007 mfd., 500 volts (C38)
5107	Capacitor—.0025 mfd., 700 volts (C33)
14393	Capacitor—.01 mfd., 300 volts (C2, C5)
4886	Capacitor—.05 mfd., 400 volts (C6, C9)
32308	Case—Control unit case complete with all riveted and welded parts
31977	Coil—Antenna filter (L1)
32301	Coil—Antenna coil—less shield (L2, L3)
32297	Coil—Oscillator and shield (L6, L7)
31600	Coil—R-f coil—less shield (L4, L5)
32292	Condenser—3-gang variable tuning condenser complete with scissors gear, and drive cord drum (C3, C4, C7, C8, C10, C13)
32294	Control—Volume control, tone control, and power switch (R15, R16, S1)
32517	Cord—Dial drive cord
32291	Coupling—R.h. and l.h. tuning mechanisms coupling with screws
32304	Drum—Dial drive drum
32296	Dial—Dial scale and holder
32290	Gear—Tuning mechanism gear sector
11765	Lamp—Dial lamp—Mazda No. 51
32288	Mechanism—L.h. push button tuning mechanism less push buttons (short cam shaft)
32287	Mechanism—R.h. push button tuning mechanism less push buttons (long cam shaft)
32378	Pin—Contact pin for speaker cable
32377	Plug—3-contact male plug and shell for speaker and "A" lead cable
32375	Plug—6-contact male plug and shell for volume control cable
32311	Pulley—Drive cord intermediate pulley on bracket
32310	Pulley—Drive cord intermediate pulley and guide pin on bracket

12201	Resistor—1.5 meg., ½ watt (R7)
5129	Ring—Tube shield ring
12252	Screw—No. 8 x ¼-in. S.T. screw for dash power unit case
32286	Shield—Tube shield comprising 2-halves and 1-ring
32245	Socket—3-contact socket and mounting plate for "A" lead and speaker cable
32244	Socket—6-contact socket and mounting plate for volume control cable
31251	Socket—Octal base tube socket
12241	Socket—6-contact vibrator socket
32236	Transformer—First i-f transformer (L8, L9, C17)
32237	Transformer—Second i-f transformer (L10, L11, C19, C20, C22, C23, R8)
32243	Transformer—Input transformer (L16)
32241	Transformer—Output transformer (T2)
32233	Transformer—Vibrator transformer (T1, L13, C34)
12236	Vibrator—(L18)
	SPEAKER ASSEMBLIES
32315	Cap—Cone center dust cap
32314	Coil—Speaker field coil (L14)
32313	Cone—8-in. speaker cone and voice coil (L15)
32312	Speaker—8-in. dynamic, complete
	MISCELLANEOUS ASSEMBLIES
12291	Body—Fuse holder body (female portion only)
32320	Button—Station selector push button and screw
9829	Cable—Antenna cable approx. 36-in. long, with connector
32438	Capacitor—Ignition coil capacitor
32439	Capacitor—Generator capacitor
4291	Clip—Ammeter clip
32321	Escutcheon—Control panel escutcheon less small dial escutcheon
32322	Escutcheon—Dial escutcheon (small)
4286	Ferrule—Center contact ferrule and bushing for fuse holder
5023	Fuse—15 amp.
4290	Insulator—Fuse holder insulating sleeve
32318	Knob—Dummy knob (1 required)
32316	Knob—Station selector or volume control knob
32319	Knob—Tone control wing knob
32323	Lead—Ammeter "A" lead and clip, complete with female section of fuse holder
13193	Nut—Control unit mounting nut
32317	Screw—No. 8-32 x 7/32-in. headless set screw for knob, Stock No. 32316
32324	Screw—Speaker mounting screws, spacers, washer, and nuts
4284	Spring—Tension spring for fuse holder
12448	Stud—Dash power unit mounting stud, nut, and washers
32437	Suppressor—Distributor suppressor (10,000 ohms)
4285	Washer—Insulating washer for fuse holder
13192	Washer—Felt washer for under control knobs

TUBE COMPLEMENT

1—12BE6 Oscillator and Mixer tube.
1—12BA6 IF Amplifier tube.
1—50B5 Power Output tube.
1—35W4 Rectifier tube.
1—12AT6 Second Detector and First Audio tube.

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Dummy antenna: —.1 mfd., —10 mmf.

GENERATOR	CONNECTION AT RADIO	DUMMY ANTENNA	DIAL	TO TUNE TRIMMERS	REMARKS

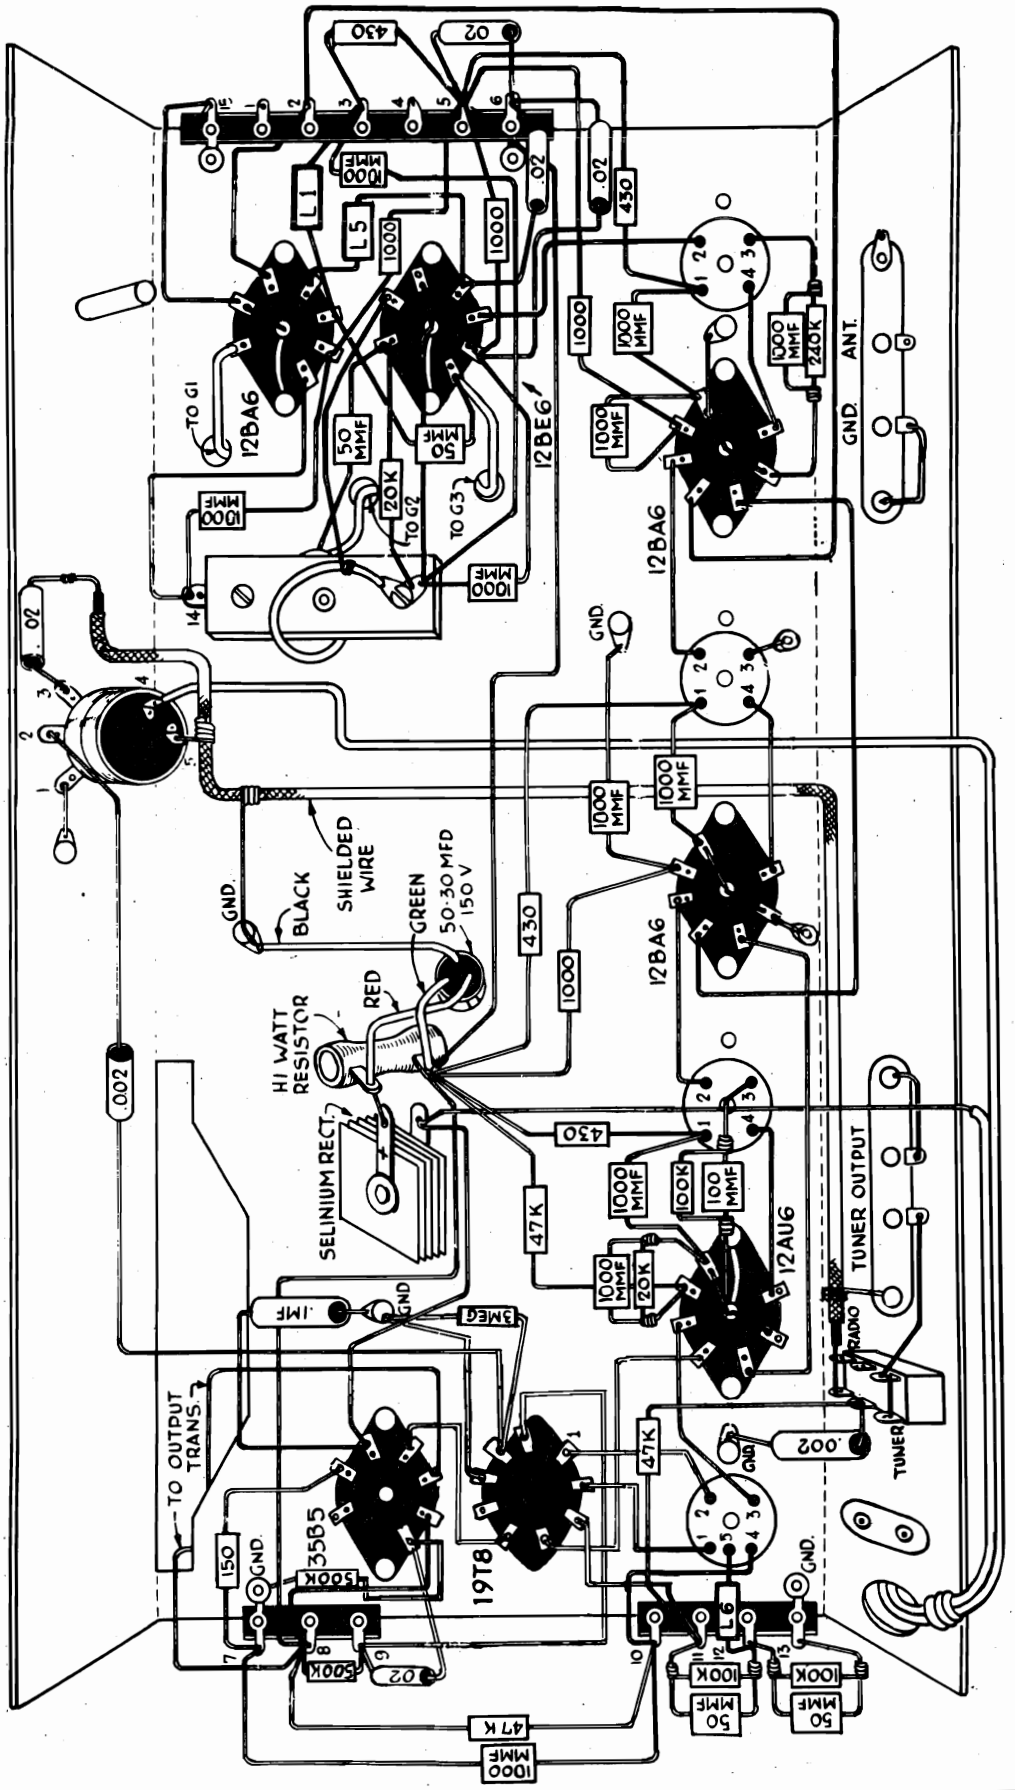
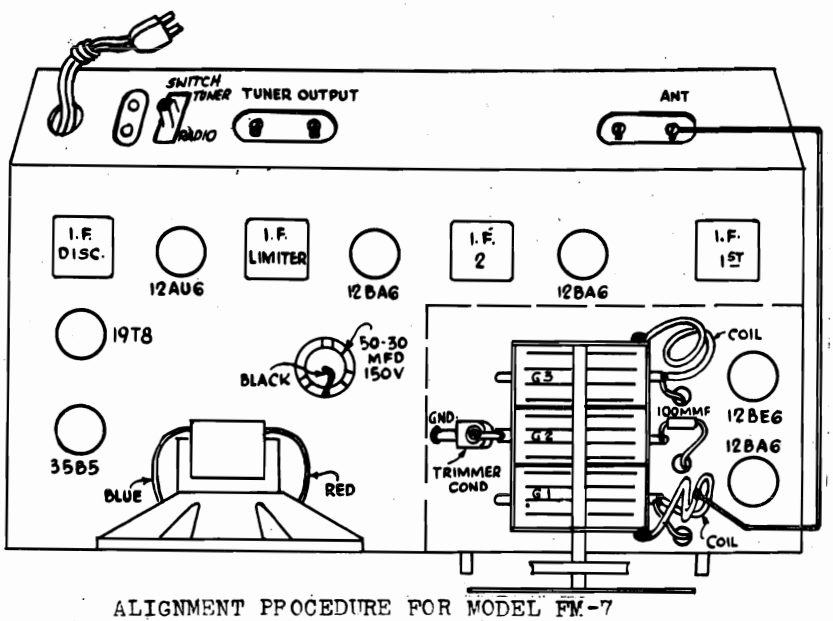
MODEL FM-7 RADIO KITS, INC.



RADIO KITS, INC. MODEL FM-7



ALIGNMENT PROCEDURE FOR MODEL FM-7

Alignment Procedure without the Use of Instruments

The I.F. and discriminator transformers are pretracked at the factory and will require only to be peaked to compensate for the additional capacities that are introduced when the set is wired. A signal should be tuned in and each I.F. transformer starting from the limiter and working to the first I.F. should be aligned for maximum signal.

R.F. Alignment

Set the dial pointer to correspond with the station transmitting on the high-frequency end of the dial (make certain that the station desired to be received is transmitting at the time alignment is attempted). Adjust osicllator trimmer until the station to be received is tuned in at the proper dial setting. Adjust the spacing on the antenna coil for maximum response at the high-frequency end of the dial. A station is then tuned in at the low-frequency end of the band and the spacing of the R.F. coil is then adjusted for maximum response. Spacing of the coil is accomplished with the aid of an insulated fibre tool or a small wooden wedge.

Discriminator Alignment

The bottom slug of the discriminator coil should be adjusted for maximum output.

The top slug of discriminator should be adjusted for clear, undisturbed reception. This adjustment is critical and should be adjusted very slowly, until the proper point is reached. It will be noted as a clear spot between two distorted points one above and the other below resonance.

ALIGNMENT WITH THE USE OF INSTRUMENTS

If instruments are available they should be used for proper alignment. Insert a high sensitivity micro-ammeter in series with the limiter grid resistor at the grounded end (R-13). Set the signal generator at 10.7 mc. Apply this signal to the grid of the limiter and adjust I.F. to the maximum meter reading. The signal generator should be applied on the grid of each preceeding stage and the meter left in the limiter grid circuit and each I.F. adjusted for maximum response. Always reduce the input as the sensitivity increases. When the alignment is completed it should be rechecked by placing the signal generator on the grid of the 12BE6 and each transformer should be repeaked for maximum meter deflection. The I.Fs. are now aligned.

The R.F. Section

Apply a 106 mc signal to the antenna terminal. Adjust oscillator trimmer for maximum response on meter. Then adjust antenna coil spacing for maximum response. Reset the signal generator for 90 megacycles. Set dial to 90 megacycles. Adjust spacing of R.F. coil for maximum response. The R.F. alignment is now completed.

The Discriminator Alignment

Remove the meter from the limiter grid circuit and place a high-sensitivity volt meter in the order of 20,000 ohms per volt or a DC vacumm tube volt meter from R-18 to ground. Apply a 10.7 mc signal to grid of limiter tube. Adjust bottom slug on discriminator I.F. for maximum deflection. Then adjust top slug on the discriminator I.F. for zero (minimum deflection). This completes alignment of the receiver.

SERVICING NOTES

All specifications and measurements based on 117 volts, 60 cycles, and all readings based on a 20,000 ohms per volt meter. All readings are taken with volume control (switch No. 2) in maximum clockwise position. Apply the lowest signallevel from the signal generator.
Output: 50 mw into a 3.2 ohm voice coil impedance.
Approximate reading 0.4 volt.

I.F. ALIGNMENT: With signal generator, set a 455 KC, apply signal through a .1 MFD condenser dummy to R.F. grid of convertor (1R5) or the stator of RF section of the variable condenser (condenser must be fully meshed). Peak I.F. trimmers 1,2,3,4, (top view diagram) to give maximum reading on output meter connected across voice coil. (Note: If for any possible reason the signal does not come through indicating the receiver is way out of alignment, apply the signal to the grid of the I.F. Amplifier (1T4) and tune signal in by trimmers 3,4 of second IF. transformer. Peak for maximum and once this stage is tuned, repeat above procedure).

R.F. ALIGNMENT: With signal generator, set at 1400 KC, apply signal through a dummy antenna (200 mmf condenser) to the antenna loop wire. Set dial of receiver to 1400 KC and peak trimmers 5 & 6 to give maximum reading of output meter. Then set signal generator at 600 KC and tune receiver to 600 KC mark on dial. This setting should fall on calibrated point.

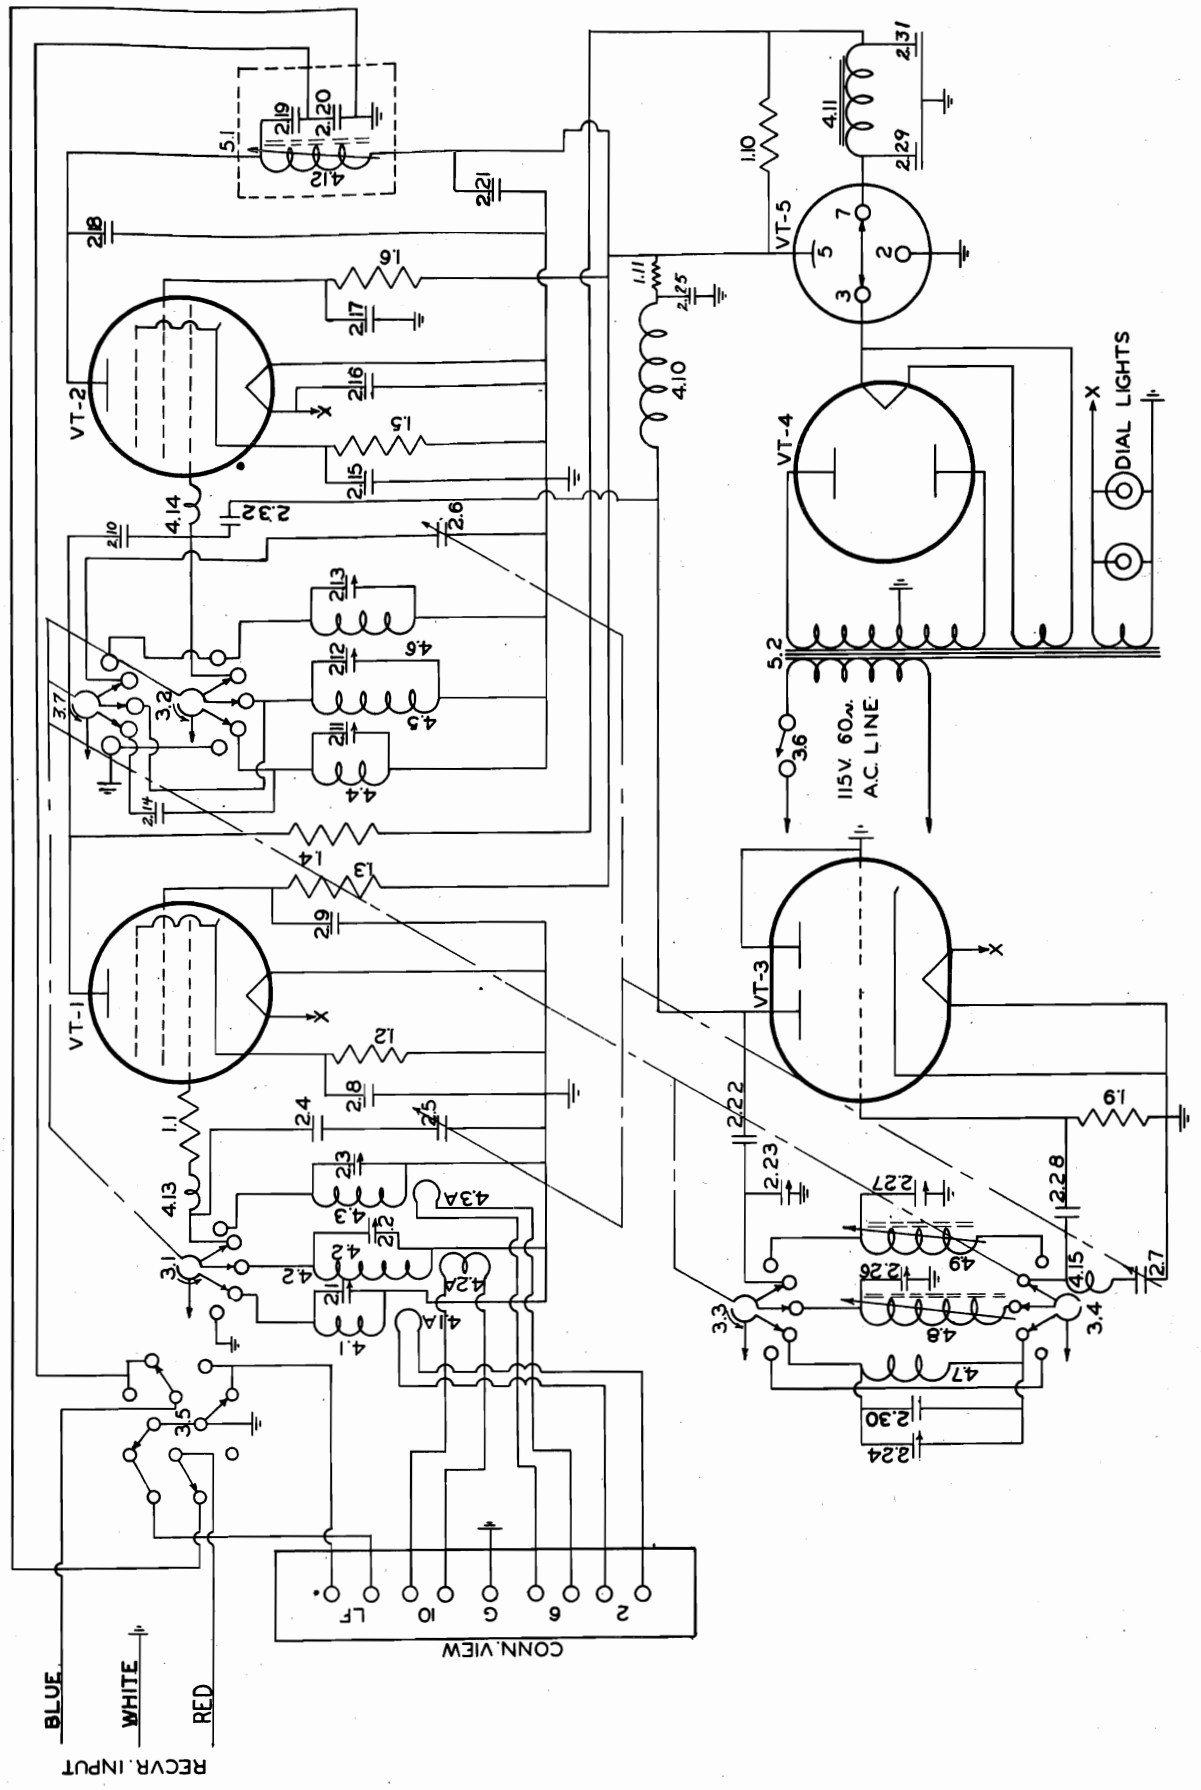
MODEL VHF-152 RADIO MFG. ENGINEERS INC.



RADIO MFG. ENGINEERS INC. MODEL VHF-152

MODEL VHF-152 RADIO MFG. ENGINEERS INC.

The VHF-152 Frequency Converter has been designed for use with a conventional communication type receiver to extend its range to cover the 10, 6 and 2 meter amateur bands. The unit consists of an RF amplifier, a mixer, and a high frequency oscillator. The function of the unit is to convert the very high frequencies received by it to a new fixed frequency of 7 megacycles which is fed to the receiver and amplified and detected in the normal manner. This system of receiving may be described as a double heterodyne system. Its advantages are: high image rejection, since the image is 14 megacycles from the signal; and high selectivity which is provided by the selective low frequency intermediate frequency amplifier of the receiver. The auxiliary controls on the receiver, such as the beat frequency oscillator, the noise limiter, and RF and audio gain controls, function in the normal manner, as does the signal strength meter if the receiver is equipped with one. The RME-45 and RME-84 Receivers are admirably suited for use with the VHF-152 Converter.

Specifications

Power Supply: 115 volts, 50-60 cycles, single phase*
Power Consumption: 40 watts @ 115 volts
Output Frequency: 7 mc (7000 kc)
Frequency Range: 27.5 - 29.8 mc
49.5 - 54.2 mc
143.8 -148.2 mc

*NOTE: On special order the VHF-152 may be obtained with a special power transformer suitable for operation on 115-230 volts 25-60 cycles.

Tube Complement

	Type	Use	Schematic Symbol
1.	6AK5	RF Amplifier	V1
2.	6AK5	Mixer	V2
3.	6J6	Oscillator	V3
4.	5Y3G	Rectifier	V4
5.	VR150	Voltage Regulator	V5

External Connections

To place the VHF-152 in operation the line cord should be plugged into a suitable power source. The standard model is designed for operation on 100-120 volt 50-60 cycle AC line only. Use of the VHF-152 on any other voltage or frequency may result in damage.

The output cable should be connected to the antenna terminal of the receiver. The cable has two shielded leads and a ground lead each ending in a terminal lug. On receivers which have provision for doublet operation, such as the RME-45 and the RME-84, the blue coded lead must be connected to the antenna terminal farthest from the ground terminal. This is the hot side of the converter output. The red lead, or low side, must be connected to the antenna terminal nearest to the ground terminal. The ground braid should be connected to the receiver ground. On receivers not equipped for doublet operation, the blue lead should be connected to the antenna terminal and the red and ground (shield) leads should be connected to the receiver ground. This lead is coded white. Unless the above instructions are followed, the changeover switch will not operate properly.

If an RME DB-20 Preselector is used ahead of the receiver, the connections will be made as above except that the converter output cable connects in the same manner to the DB-20 antenna terminals instead of to the receiver.

Precautions

IMPORTANT - Attempted operation of the VHF-152 on any voltage or frequency than that for which it is designed will result in damage to the unit. The operator must be sure that the supply is correct before plugging in the converter.

Antennas

On frequencies of 30 megacycles and above, the use of a resonant antenna is mandatory. For this reason the VHF-152 is provided with separate antenna connection for each frequency band. On the terminal strip on the rear apron are four sets of two terminals each. These terminals are marked "2" for the 144-148 mc band: "6" for the 50-54 mc band, and "10" for the 28-29.7 mc band. The input impedance for each band has been designed to be 300 ohms so that the owner may make use of the 300 ohm twin lead line now available. The remaining set of two terminals marked "LF" are for connecting the low frequency antenna used with the receiver. This pair of terminals is connected through to the receiver when the antenna changeover switch is turned to "OUT".

Operation and Circuit Details

Introduction

The VHF 152 operates in conjunction with a communication type receiver tuned to approximately 7 mc. The accuracy of setting the receiver will effect the accuracy of calibration of the VHF-152 by the same amount. That is to say if the low frequency receiver is off 100 kilocycles, the calibration of the VHF-152 will also be off by 100 kilocycles. It should be noted that the operator is not bound to use the output frequency of exactly 7.0 mc. If interference is encountered he may move the receiver tuning slightly to a clear channel, realizing that the VHF-152 calibration will change by the same amount the low frequency receiver was moved. If it is necessary to move the receiver frequency so far that the calibration is affected, he may recalibrate by following instructions in Section IV. It is not recommended that the output frequency be moved more than 150 kc higher or lower than 7.0 mc because of tracking troubles that may be encountered. In the factory the I.F. is left aligned at 6950 kc.

In double heterodyne receiving systems spurious signals may be received which are harmonics of the receiver local oscillator. On the VHF-152 two such signals may be received. One signal will be heard at 29.8 mc, which is outside the 28-29.7 mc band. Another may be heard at 52.2 mc. If it is found that this spurious signal falls on a real signal which is desired, the spurious signal may be moved by changing the receiver tuning slightly.

Line Switch

The equipment is turned on by means of the line switch on the right hand side of the control panel.

Changeover Switch

On the left side of the control panel is the changeover switch. When this switch is turned to "IN", the output of the VHF-152 is fed to the receiver input terminals. At the same time the low frequency antenna terminals are

grounded to prevent 7 mc signals from feeding through the VHF-152 to the receiver. When the changeover switch is turned to "OUT" the output of the VHF-152 is grounded and the low frequency "LF" antenna terminals are connected through the receiver. Thus by turning the changeover switch to "OUT" the receiver functions normally.

Band Switch

In the center of the control panel is the band change switch. This switch has three positions marked: 144-148, 50-54, and 28-29.7, and is used to switch the VHF-152 to the desired range.

RF Stage Peaking

When the VHF-152 leaves the factory, the stages are peaked to maximum sensitivity. It may be found that some antennas may reflect a reactance into the RF stage that will detune it slightly. With the antenna for a certain band connected the RF padder for that band may be peaked up by listening to a signal. Figure IV shows the location of the RF padders for each band. To get at the padders it is necessary to remove the bottom cover plate.

IF Stage Peaking

The IF transformer on the VHF-152 is peaked at the factory at 6.95 mc. Different receivers connected to the output may change this tuning slightly. The owner should check the peaking of this transformer with the receiver connected. Peaking is accomplished by turning the screw on the top of the can. The screw should be adjusted for maximum gain as indicated by a received signal or maximum background noise if a signal is not available.
The owner may, if he has an accurate signal source available, recalibrate his converter as discussed in succeeding paragraphs. It should be born in mind that the calibration of the converter is affected by the setting of the companion receiver. Therefore, before attempting to recalibrate the converter, the calibration of the receiver should be checked.

The VHF-152 will drift somewhat during the first three minutes after being turned on and to a much less extent during the next ten or twenty minutes. It is recommended that no attempt be made to recalibrate or align the equipment until it has reached a stable temperature.

All calibrating and alignment should be done with the receiver connected and the changeover switch in the "IN" position.

If the receiver has a carrier level meter such as is on the RME-45, this meter is used as a tuning indicator when peaking the circuits. If the receiver is not equipped with a meter, it will be necessary to connect an audio output meter to the receiver for a tuning indicator. When using an audio output meter, it is necessary to remove the AVC from the receiver.

IF Coil Alignment

As pointed out. the VHF-152 is calibrated and aligned for an output frequency of 6.95 mc. The output tuning is controlled by the screw

on the top of the aluminum can on the top of the chassis. The tr may be peaked with a 6.95 mc signal fed into the mixer grid or with a signal tuned in on the converter. Connection to the mixer grid is most easily made on the stator of the center section of the tuning condenser. In either case, the transformer is adjusted to maximum sensitivity as indicated by the meter on the receiver.

Calibration

Calibration of the VHF-152 should not be attempted unless it is definitely established that the calibration is off.

Calibration is controlled by the oscillator padders. These padders are made accesible by removal of the cabinet bottom plate. Beneath this plate is a second aluminum plate in which are padder access holes. All calibrating and aligning should be done with this cover on.

High beat is used on all bands. That is to say, the oscillator is always 7 mc (approximately) above the received signal. As in the case of all super heterodyne receivers, if sufficient input is used each signal may be received at two points differing by twice the IF frequency. With a signal being received, the padder setting that gives the highest oscillator frequency is the proper setting.

The two low frequency ranges have iron core oscillator coils. The screws for adjusting the inductance of these coils is accessible on the top of the chassis. Unless the screws have been disturbed, adjustment should never be necessary.

RF Alignment

When the calibration is correct, the RF circuits should be aligned. Each of the R-F padders should be adjusted for maximum sensitivity as indicated by the meter on the receiver.

When using a signal generator in aligning the VHF-152 a 300 ohm resistor should be inserted between the signal generator and the antenna terminals in order that the low impedance of the signal generator will not swamp the RF circuit and cause a misalignment of this circuit. Best results will be obtained when the RF circuit is aligned with the antenna connected.

Voltage Charts

As an aid in trouble shooting on the VHF-152, the following chart of voltages at various points in the circuit is tabulated below. Voltage readings should be made with a voltmeter of at least 2000 ohms per volt resistance. Variation of ± 15% may be expected. All voltages are measured from the point indicated to ground.

Circuit	Volts
RF Plate	190
RF Screen	115
RF Cathode	1.9
Mixer Plate	150
Mixer Screen	121
Mixer Cathode	6.0
Osc. Plate	49
Osc. Grid*	-12.0 (10 meters), - 7.0 (6 Meters), - 3.0 (2 Meters)

* Note: With a 2.5 mh choke in series with the voltmeter lead.

ELECTRICAL SPECIFICATIONS

117 volt 60 cycle AC. operation. Power consumption 85 watts. Built in AM Loop and folded Dipole FM antenna. FM tuning range 88mc to 108mc. FM dial calibration in channel numbers and Frequency in megacycles. AM tuning range 540 KC to 1620 KC.

Speaker: 12" PM or two 6" x 9" oval PM Voice Coil Impedance 6 ohms. Power output 9 watts undistorted 12 watts maximum.

ON-OFF SWITCH AND VOLUME CONTROL

Rotate the knob on the extreme right clockwise to turn receiver on. Continued rotation to the right increases volume.

BAND SWITCH

The second knob from the left has 4 positions. Each function is marked on the instrument panel. AM extreme left, FM 2nd position from left, PH for Phono 3rd position from left and TV. for Television sound on extreme right.

TONE CONTROL

The knob on the extreme left consists of two independently variable controls. The larger section varies the high frequency response and the smaller controls bass.

TUNING AND TUNING INDICATOR

The second knob from the right tunes the receiver. In selecting stations tune for maximum closing of the tuning indicator on both AM and FM. The tuning indicator does not operate on Phono or TV.

ALIGNMENT

Before proceeding with alignment of set calibration point must be checked. This is the first line beyond 88 MC. Set Dial pointer to this line with tuning condenser fully meshed.

RADIO WIRE TELEVISION

MODEL F-62

ALIGNMENT PROCEDURE: Realignment of this receiver should never be necessary unless one of the oscillator, antenna, or RF coils has been replaced, and then only the frequency band in which that coil is used will require realignment. Lack of sensitivity, selectivity, and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, inadequate or excessively long antenna, open or grounded bias resistor, bypass condenser, etc. Under no circumstances should realignment be attempted until all other possible sources have been first throughly investigated and have been definitely proven not to be the cause. If an IF tube is replaced it is advisable to realign the IF amplifier, particularly if the replacement tube is one of a different manufacture than the one in the receiver. IT IS IMPERATIVE THAT AN ACCURATELY CALIBRATED OSCILLATOR BE USED WITH SOME TYPE OF OUTPUT MEASURING DEVICE.

INTERMEDIATE ALIGNMENT:

1. Connect the high side of the oscillator output to the control grid of the 6D6 modulator tube. Leave the grid cap disconnected and connect a 1 meg ohm resistor from the modulator grid to the chassis base. Connect the ground side of the oscillator to the receiver ground post.

2. Set the test oscillator frequency to 465 kilocycles (this must be accurate).

3. Align the first intermediate transformer by turning one of the trimmer screws accessible through the holes in the top of the coil shield up and down (increasing and decreasing capacity) until maximum reading is obtained on the output meter, after which adjust the other trimmer screw of the same transformer for maximum sensitivity.

4. Adjust the other intermediate transformer in the same manner.

TO ALIGN THE VARIABLE CONDENSER: It is important when aligning the gang condensers, padder condensers, and trimmer condensers to follow the procedure carefully, otherwise the receiver will be insensitive and the dial calibration will be incorrect. The trimmer and padder condensers will be referred to by number as indicated on the diagram which shows their relative locations.

1. Connect the high output side of the test oscillator through a .00025 Mfd. condenser to the set antenna post, and the ground to the set ground.

2. Place the band selector switch for operation on the 10 to 22 megacycle band, tune the receiver dial to EXACTLY 20 MEGACYCLES and set the test oscillator frequency to EXACTLY 20 MEGACYCLES. THEN TUNE IN THE 20 MEGACYCLE SIGNAL TO MAXIMUM OUTPUT BY ADJUSTING TRIMMER NO. 13. Next, rock the gang condenser slightly to the right and left and adjust trimmers No. 15 and 17 for maximum 20 megacycle signal sensitivity. CARE MUST BE TAKEN SO THAT THE FUNDAMENTAL PEAK AND NOT THE IMAGE PEAK IS USED FOR ALIGNING THE RECEIVER AT 20 MEGACYCLES. When making trimmer No. 13 adjustment always back off the trimmer to minimum capacity and then screw down the trimmer (add capacity) until the first peak, which is the fundamental and the one you are to use, is tuned in. If the trimmer is screwed down beyond the point where this first peak is received, the incorrect image peak will be tuned in. After completing adjustment of trimmers No. 13, 15, and 17 always check to see if the proper peak has been used. To do this leave the test oscillator frequency at 20 megacycles, increase the output of the test oscillator, and tune the receiver dial to approximately 19 megacycles. Vary the receiver dial slightly to the right and left of 19 megacycles and if the fundamental peak was used in aligning at 20 megacycles, the test oscillator signal will be heard at approximately 19 megacycles on the set dial. If it is not possible to receive the signal at approximately 19 megacycles, then the fundamental peak was not used and the 20 megacycle adjustment of trimmers No. 13, 15, and 17 must be gone over and properly adjusted.

3. Leave the band selector switch for operation on the 10 to 22 megacycle band, tune the receiver to 11 megacycles on the dial, and set the test oscillator frequency to approximately 11 megacycles. Then while rocking the geng condenser slightly to the right and left adjust inductance trimmers No. 14 and 16 for maximum sensitivity.

4. Recheck 20 megacycle adjustment of trimmers No. 13, 15, and 17.

5. Place the band selector switch for operation on the 4 to 10 megacycle band and set the receiver dial and the test oscillator frequency to exactly 9 megacycles. When adjusting trimmer No. 10 two peaks, the fundamental and the image peak, will be noticed. CARE MUST BE TAKEN SO THAT THE FUNDAMENTAL PEAK AND NOT THE IMAGE PEAK IS USED FOR ALIGNING THE RECEIVER AT 9 MEGACYCLES. First back off trimmer No. 10 to minimum capacity, next screw down the trimmer (add capacity) until the first peak, which is the fundamental and the one you are to use, is tuned in. When the first peak has been located adjust trimmer No. 10 TO BRING IN THE 9 MEGACYCLE SIGNAL TO MAXIMUM OUTPUT. Next adjust trimmers No. 11 and 12 for maximum 9 megacycle sensitivity. After completing adjustment of trimmers No. 10, 11, and 12 always check to see if the proper peak has been used. To do this leave the test oscillator frequency at 9 megacycles and increase the test oscillator output. Vary the receiver dial slightly to the right and left of 8 megacycles, and if the fundamental peak of trimmer No. 10 was used in aligning at 9 megacycles the test oscillator signal will be heard at approximately 8 megacycles on the receiver dial. If it is not possible to receive the signal, then the fundamental peak was not used and the 9 megacycle adjustment of trimmers No. 10, 11, and 12 must be gone over and properly adjusted.

6. Leave the band selector switch for operation on the 4 to 10 megacycle band and tune the receiver and set the test oscillator frequency to approximately 4.2 megacycles. Then while rocking the gang condenser slightly to the right and left, adjust padder No. 7 for maximum sensitivity.

7. Place the band selector switch for operation on the 1.5 to 4 megacycle band and tune the receiver dial and set the test oscillator frequency to EXACTLY 3.8 MEGACYCLES. THEN BRING IN THE 3.8 MEGACYCLE SIGNAL TO MAXIMUM OUTPUT BY ADJUSTING TRIMMER NO. 1, after which adjust trimmers No. 2 and 3 for maximum sensitivity.

8. With the band selector switch in the same position (1.5 to 4 megacycle band) tune the receiver dial and set the test oscillator frequency to approximately 1.6 megacycles. Then while rocking the gang condenser slightly to the right and left adjust padder condenser No. 8 for maximum 1.6 megacycle signal sensitivity.

9. Adjust the band selector switch for operation on the 1500 to 550 kilocycle band and tune the receiver dial and set the test oscillator frequency to EXACTLY 1400 KILOCYCLES. THEN BRING IN THE 1400 KILOCYCLE SIGNAL TO MAXIMUM OUTPUT BY ADJUSTING TRIMMER NO. 4, AFTER WHICH ADJUST TRIMMERS NO. 5 and 6 FOR MAXIMUM SENSITIVITY.

10. Leave the band selector switch for operation on the 1500 to 550 kilocycle band and tune the receiver dial and set the test oscillator frequency to approximately 600 kilocycles. Next, while rocking the gang condenser slightly to the right and left adjust padder condenser No. 9 for maximum sensitivity.

MODEL F-62 RADIO WIRE TELEVISION

Alignment of all bands will rarely be necessary. If a coil on any one of the bands should become defective and replacement is necessary, then only the band in which the coil was replaced will require realignment. Wherever complete realignment has been made it is recommended that all of the adjustments be gone over again. Generally it will be found that improved results can be obtained if this is done. Assuming that all tubes and component parts of the set are okeh, then extreme inaccuracies in the dial calibration, low sensitivity, and poor selectivity are indications that the alignment procedure has not been followed. Should these conditions be apparent proceed to realign and carefully follow each step in the order given.

MODEL JS-1 RADIO WIRE TELEVISION

ALIGNMENT PROCEDURE

No attempt should be made to realign the various circuits until all other causes have been checked, unless the condition is so obvious as to indicate that realignment is necessary. Then proceed as follows:

Volume Control full on.

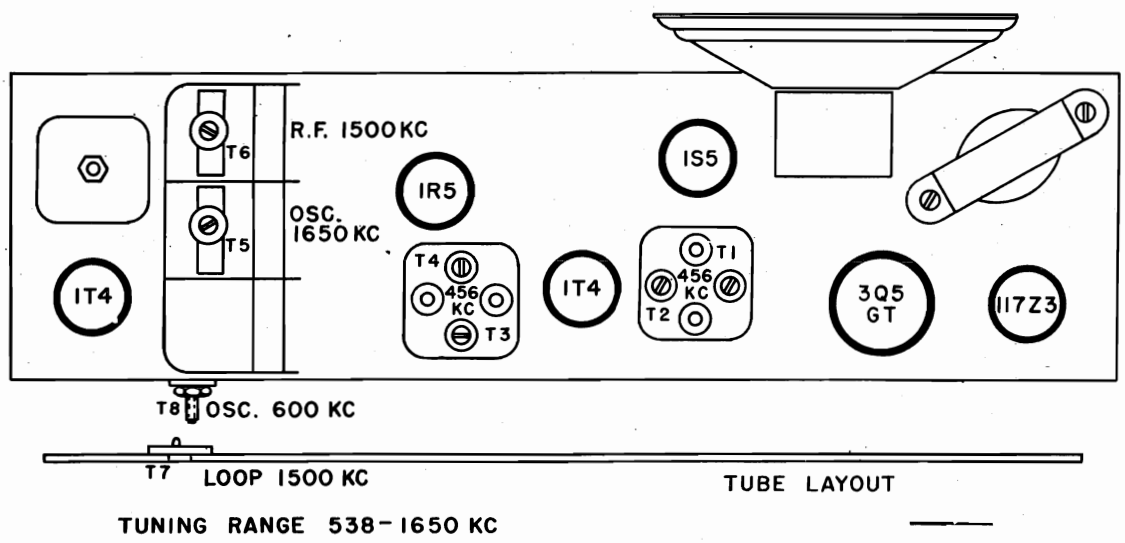
Low range A.C. meter connected across voice coil to indicate output.

Keep signal generator attenuated so as to maintain ½ scale reading on output meter.

Make certain that dial pointer is exactly on index line (top left side of dial plate) when variable condenser is fully meshed.

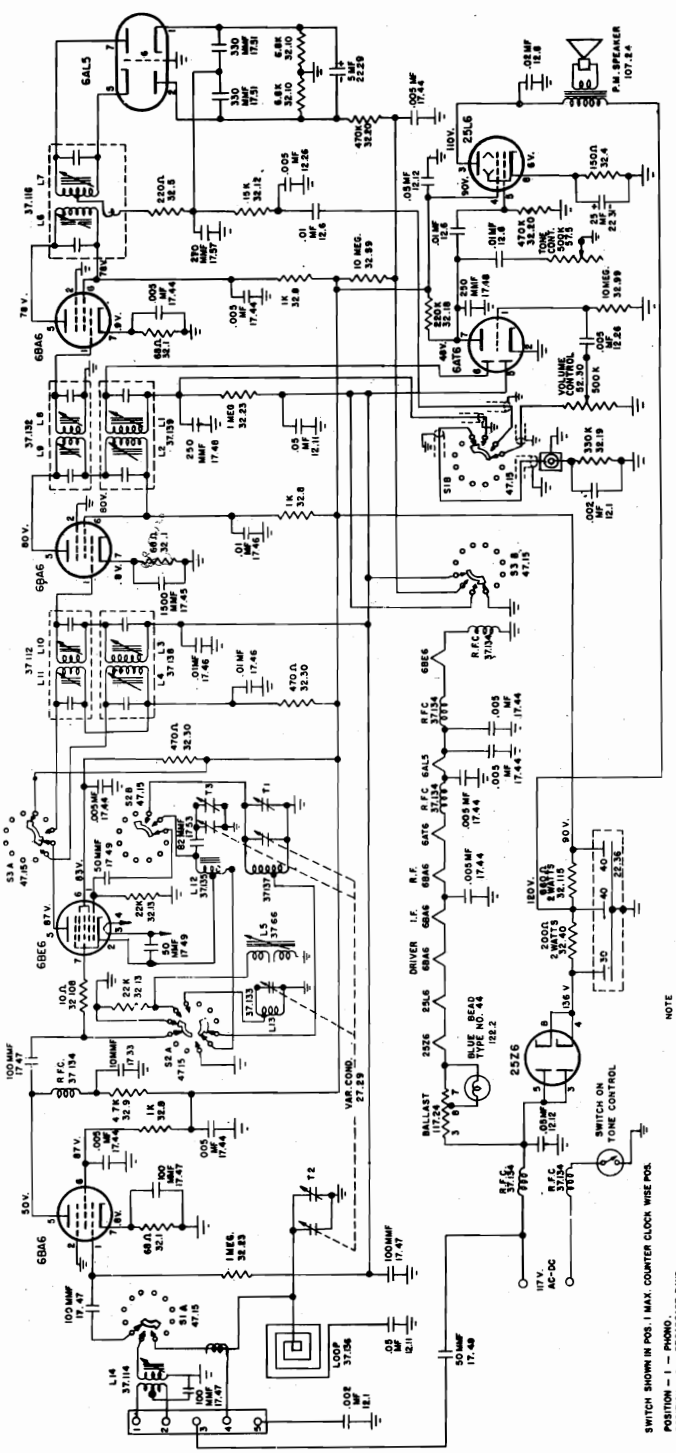
REMOVE CHASSIS BOTTOM PLATE

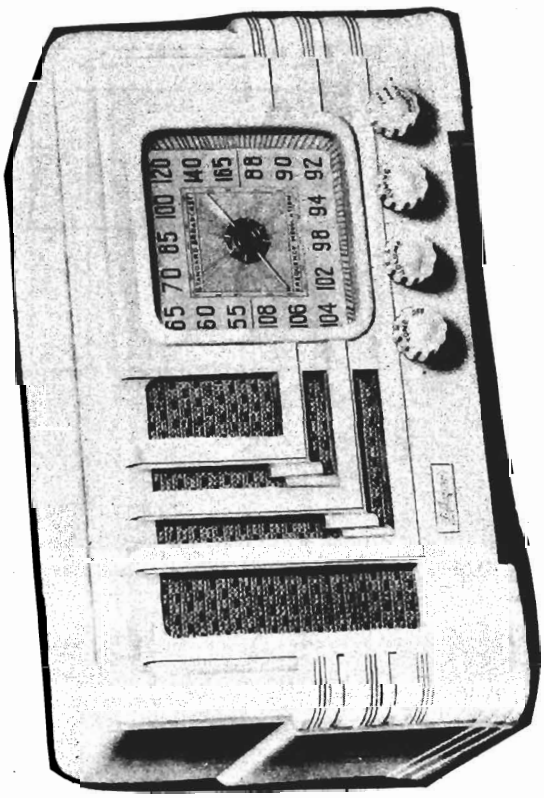
	RECEIVER DIAL AT:	SIGNAL GENERATOR	DUMMY ANTENNA	CONNECT SIGNAL GENERATOR TO:	REFER TO CHASSIS LAYOUT FOR LOCATION OF TRIMMERS
1	Fully closed	Exactly 456 KC	.1 MF	Common Ground and Control Grid 1R5 top front section var. cond.	Adjust for maximum output T1, T2, T3, and T4.
2	Fully closed	Approx. 538 KC	.1 MF	Control Grid 1T4 top rear section var. condenser	Adjust for maximum output T8
3	Fully open	Exactly 1650 KC	.1 MF	Control Grid 1T4 top rear section var. cond.	Adjust for maximum output T5
	REPEAT OPERATIONS 2 and 3.				
4	Approx. 1500 KC	Approx. 1500 KC	.1 MF	Control Grid 1T4 same as No. 3	Adjust for maximum output T6
	The next two operations are performed with the bottom plate on and the chassis in the cabinet — with lid closed				
5	Approx. 1500 KC	Approx. 1500 KC	.1 MF	Radiating Loop 20" from Receiver	Adjust T7 for maximum output
6	Approx. 600 KC	Approx. 600 KC		Radiating Loop 20" from Receiver	Adjust T8 for maximum while rocking variable condenser



RADIO WIRE TELEVISION

MODEL JS-2



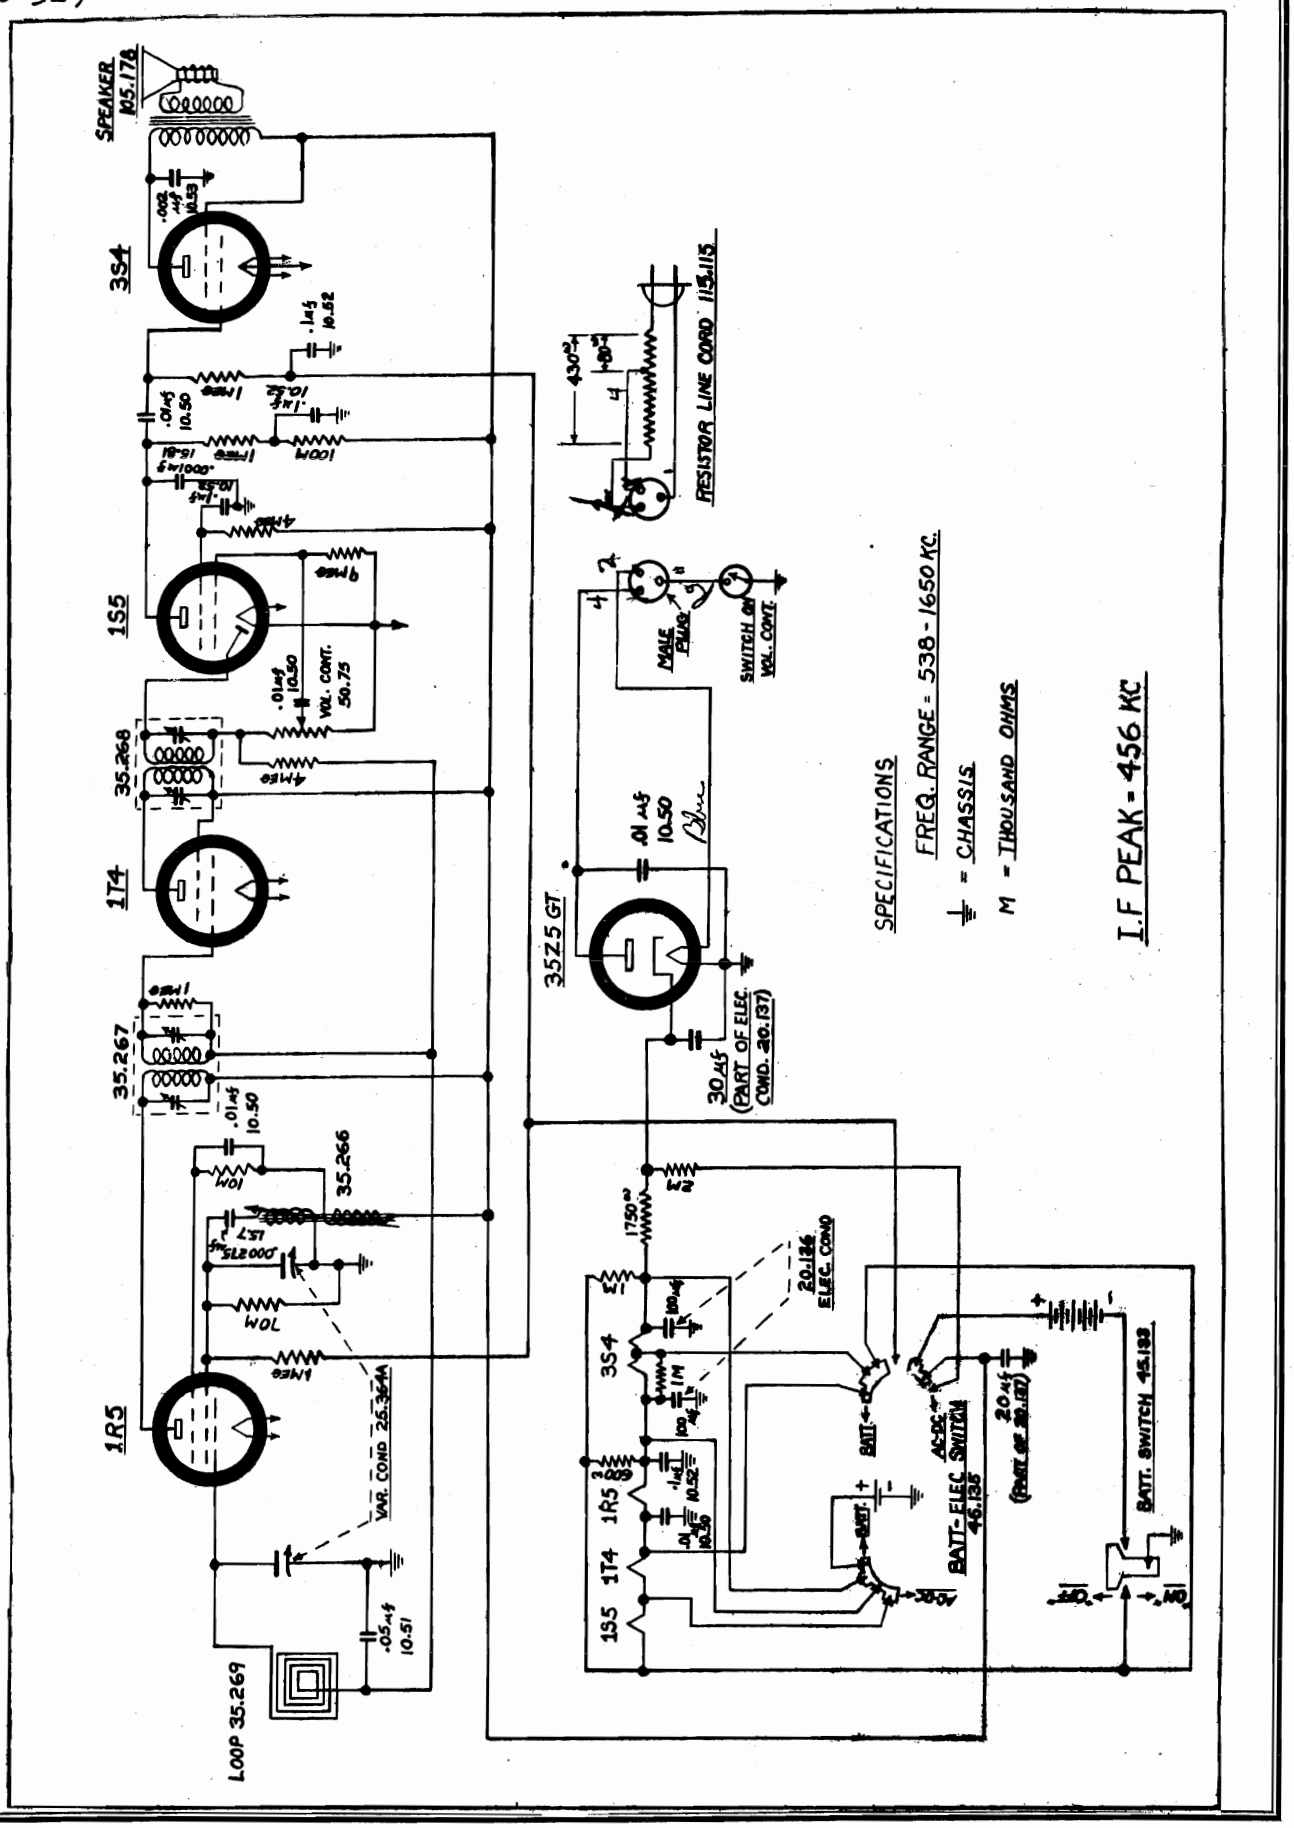


The receiver is designed to operate on 105-125 volts, 40 to 60 cycles, alternating current (AC) or 105-125 volts direct current (DC). The power consumption is 60 watts.

The tuning range on FM is from 87 MC to 109 MC, covering all FM stations from channels 200 to 300. The tuning range for standard broadcast is from 530 to 1680 kilocycles covering the full broadcast range and high fidelity stations with sufficient overlap at both ends of the dial.

MODELS JS-115, JS-319

RADIO WIRE TELEVISION

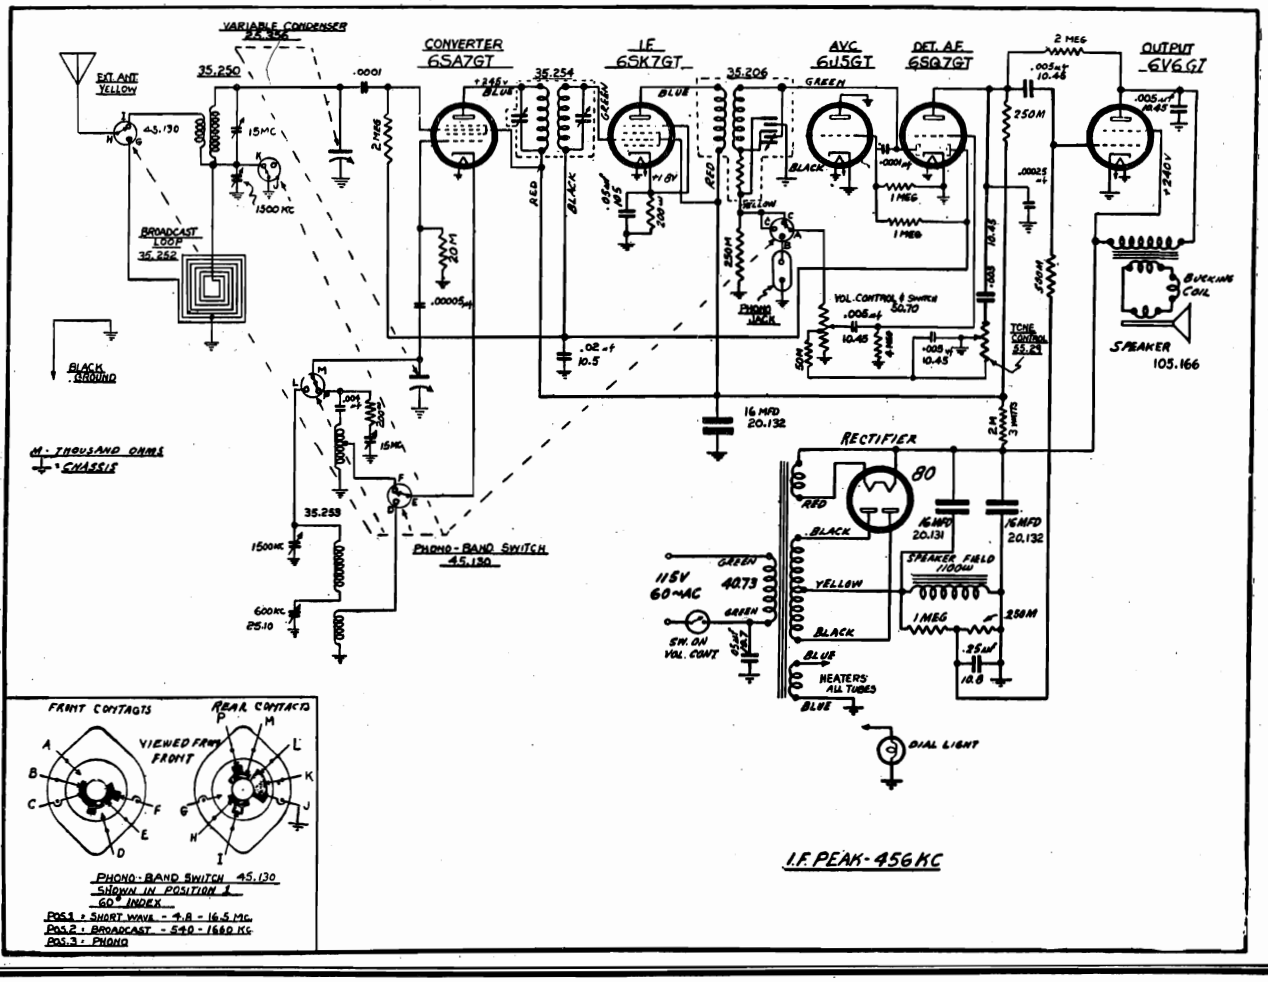


Turn receiver on and wait for tubes to reach operating heat. Adjust Wave Band Switch to desired Wave Band. LEFT for Short Wave; CENTER for Standard Broadcast; and RIGHT connects terminals for phonograph record player in the circuit. The UPPER HALF of the Dial Scale covers the Broadcast Band. The LOWER HALF covers the Short Wave Band. Turn the Vernier Tuning Knob until the desired station (see dial pointer), is heard. Adjust Volume to a satisfactory level after making certain that the station is tuned correctly. Tuning on Short Wave is more critical. Use more care lest worthwhile stations be passed over unnoticed.

A Phonograph Record Player can be attached to the terminals marked "PHONO" in rear of chassis.

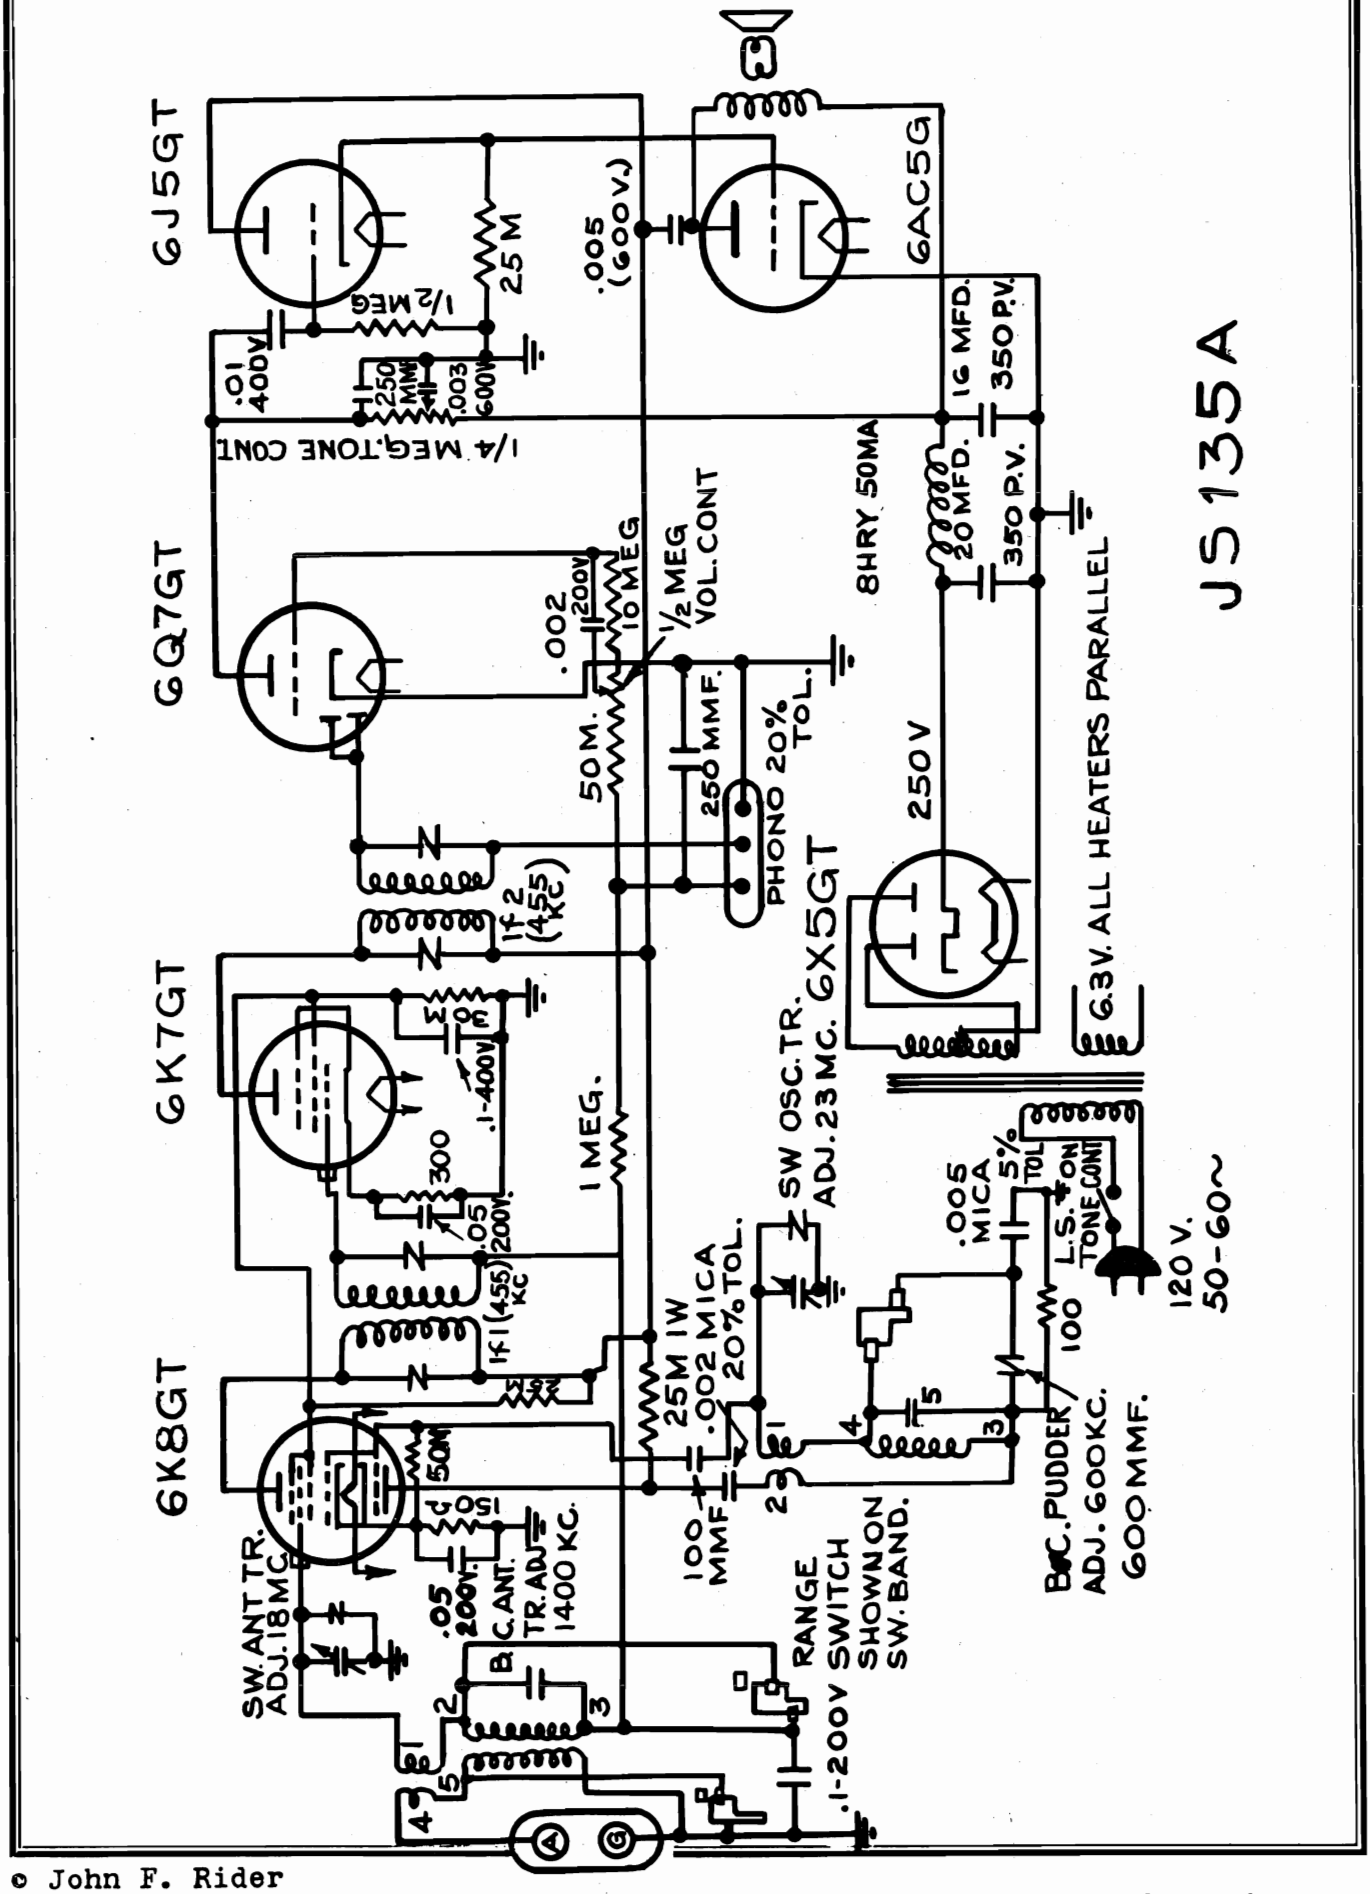
One 6 Volt 250 M. A. lamp is used for dial illumination. Use similar type for replacement.

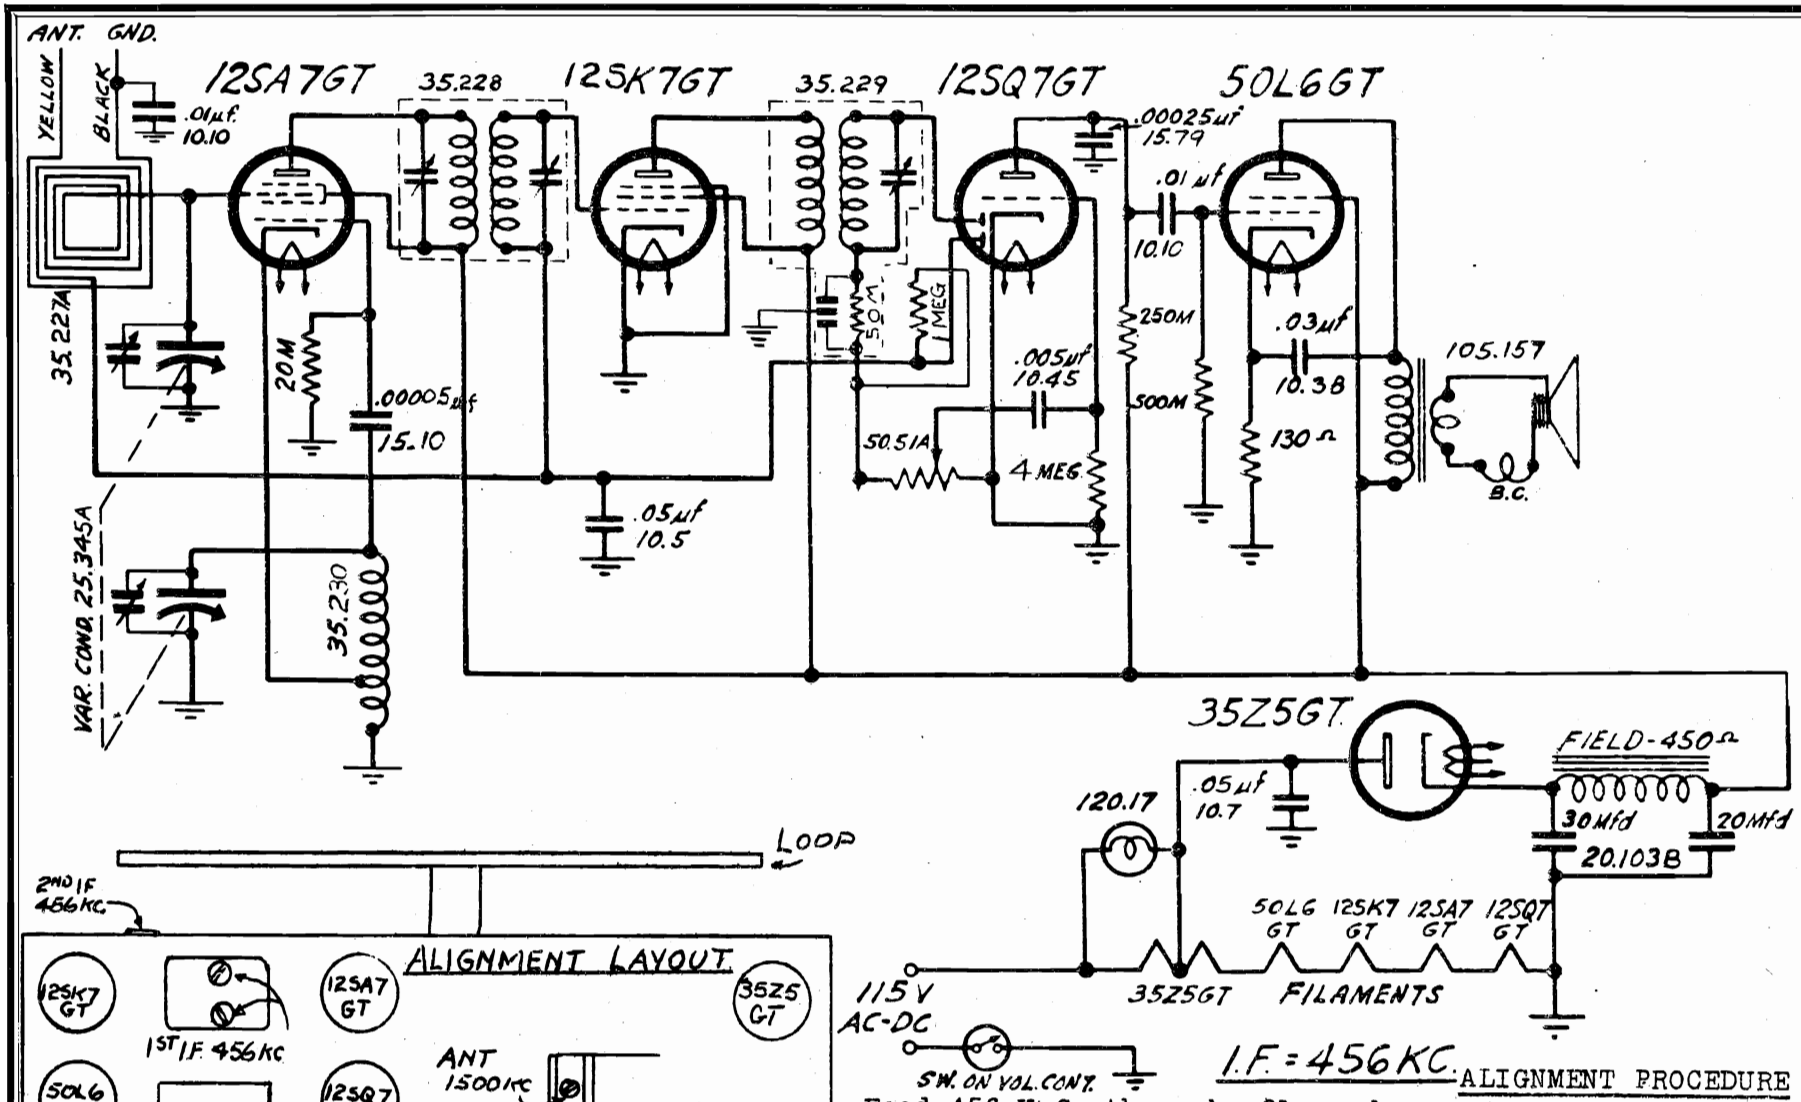
WARNING: Check power line for voltage nad frequency (cycles) to make certain they are the same as specified on label located at rear of the receiver chassis before inserting the receiver power line in electric outlet.



MODEL JS-135A

RADIO WIRE TELEVISION





I.F. = 456 KC. ALIGNMENT PROCEDURE

Feed 456 K.C. through .01 condenser to antenna (rear section of variable condenser. Adjust I.F. trimmers for maximum output.

R.F. -

Set variable condenser to 1500 K.C. Feed 1500 K.C. signal through 100 mmf. condenser to antenna lead (rear of loop). Adjust ant. and osc. trimmers for maximum output. Check sensitivity at 600 K.C. Bend rotor plates if necessary to insure proper tracking.

MODELS JS-173, JS-184, JS-185

RADIO WIRE TELEVISION

WARNING: Check power line for voltage and frequency (cycles) to make certain they are the same as specified on label located at rear of the receiver chassis before inserting the receiver power line in electric outlet.

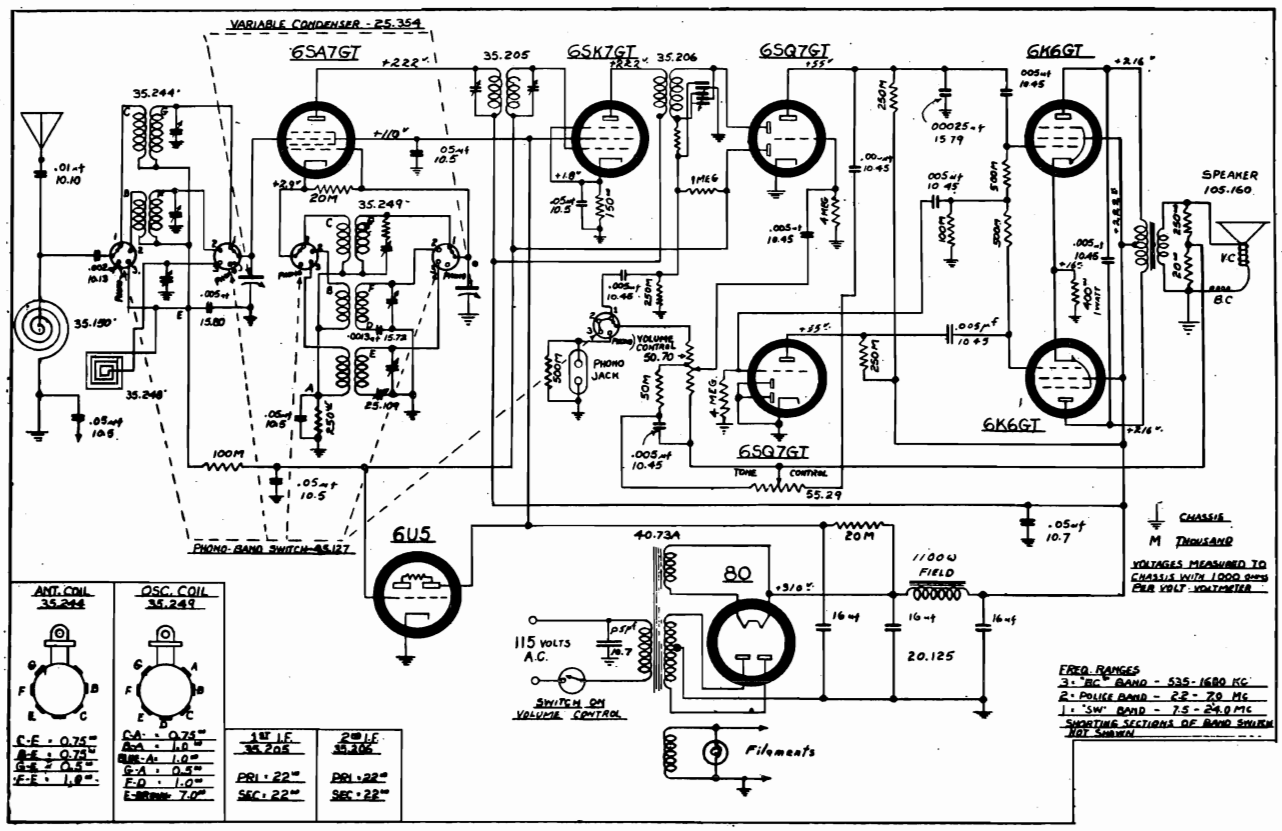
These Receivers must be operated on 60 Cycles, 120 Volt current. Any other type Voltage, if used will result in damage to the receiver.

SHORT WAVE RECEPTION: An external Antenna is absolutely necessary for good reception on either of the Short Wave Bands. This antenna may consist of a short wire strung indoors or preferably a good OUTSIDE ANTENNA.

In installing an antenna to be used with a sensitive short wave receiver every precaution should be observed to keep interfering noises at a minimum. The lead-in and antenna proper should be located as far as possible from any potential source of interference, such as electric signs, elevators, trolley wires, motors, power lines, etc. The antenna should also be as remote as possible from pick up from the ignition systems of passing automobiles. For connection to the antenna, a yellow wire is brought out through the rear of the receiver. Insert the power line plug in the electric outlet and turn the "ON-OFF" switch and Volume Control knob to the right. A few seconds will be required for the tubes to reach operating temperature.

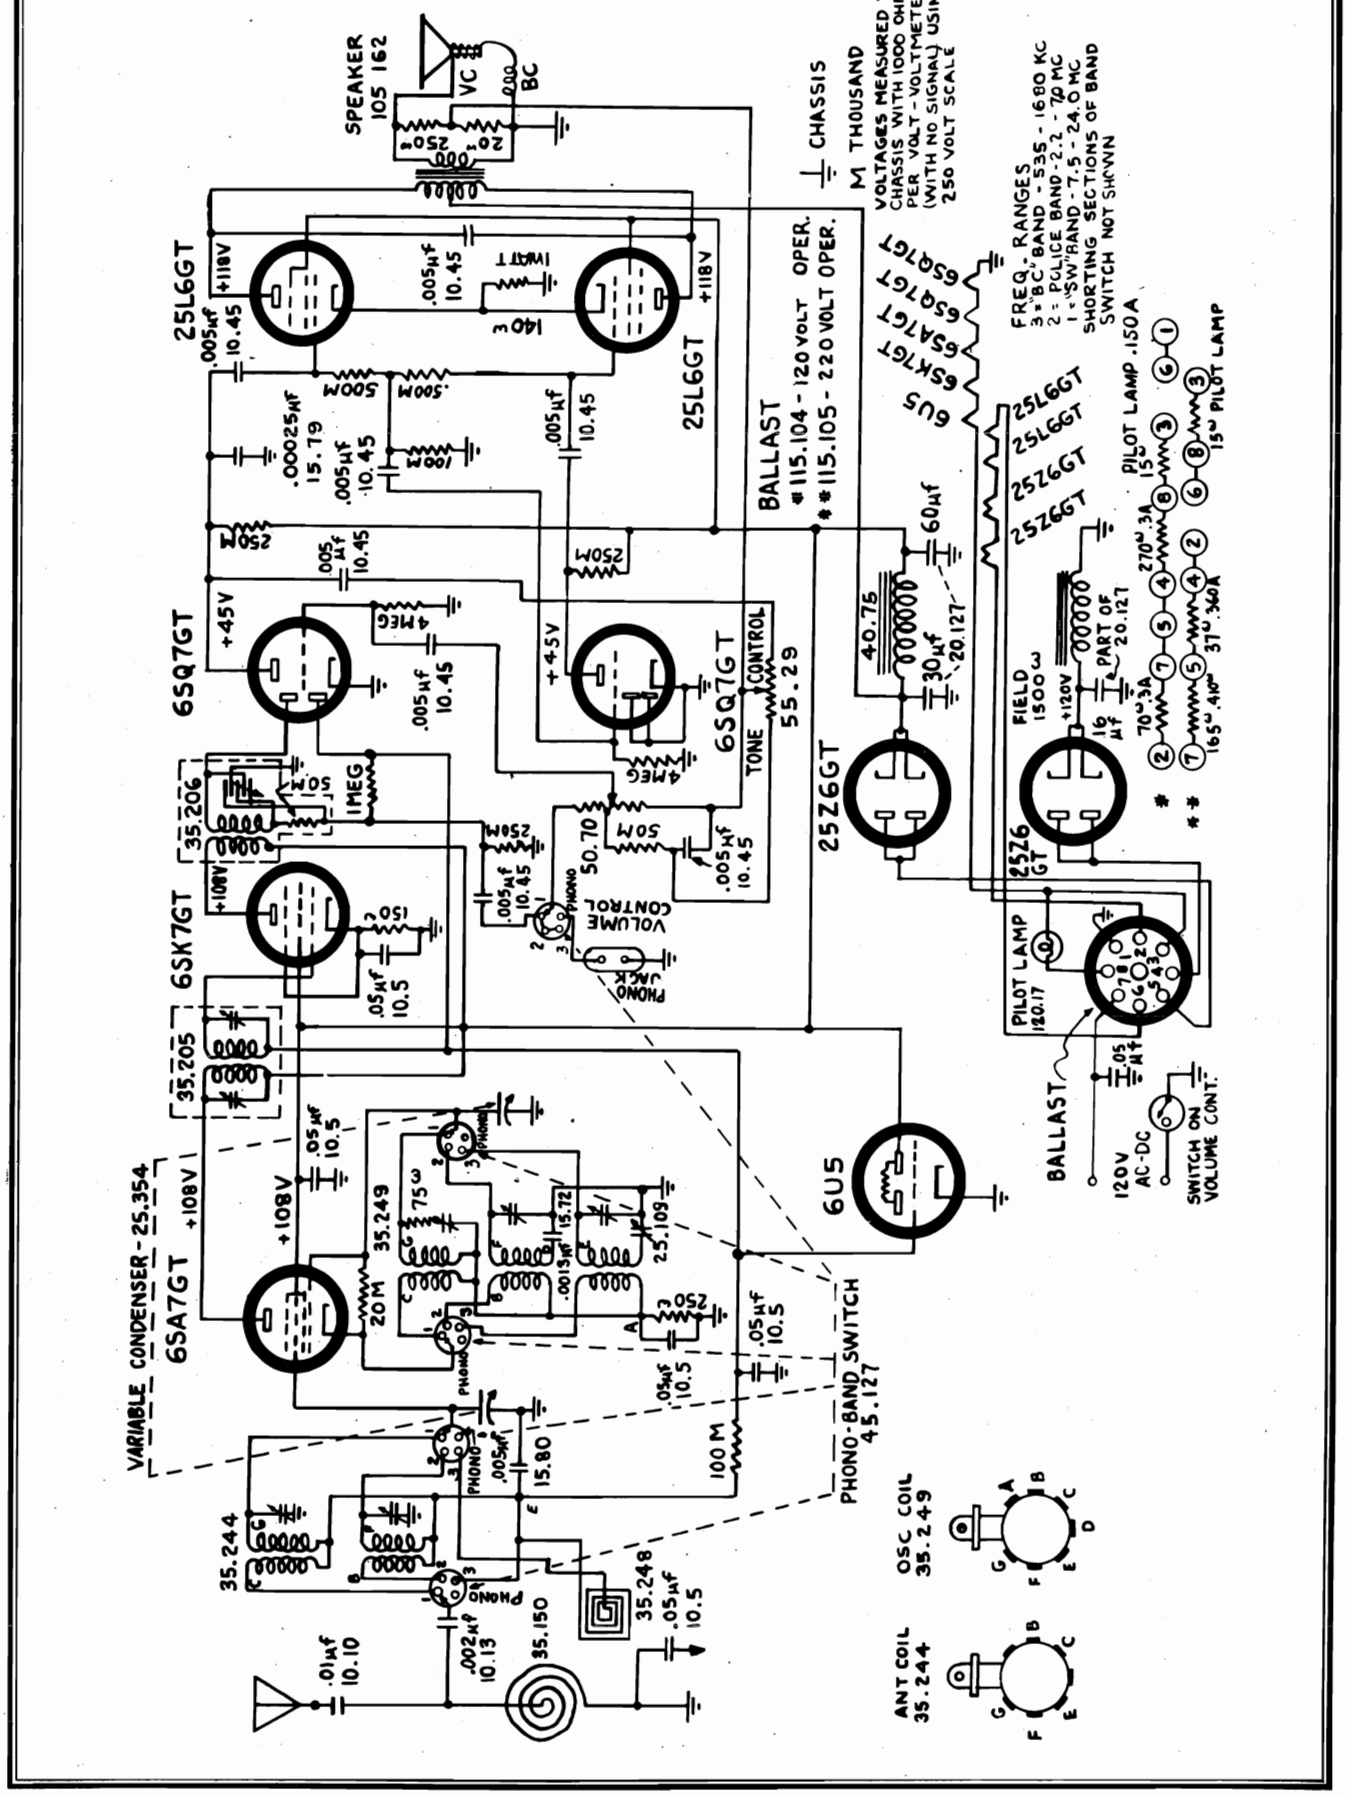
DIAL LAMP: Thse models use one 6-8 Volt, 150 M. A. Lamp. Use similar lamps when replacing or damage will result.

CAUTION: When pilot lamp burns out, replace at once.



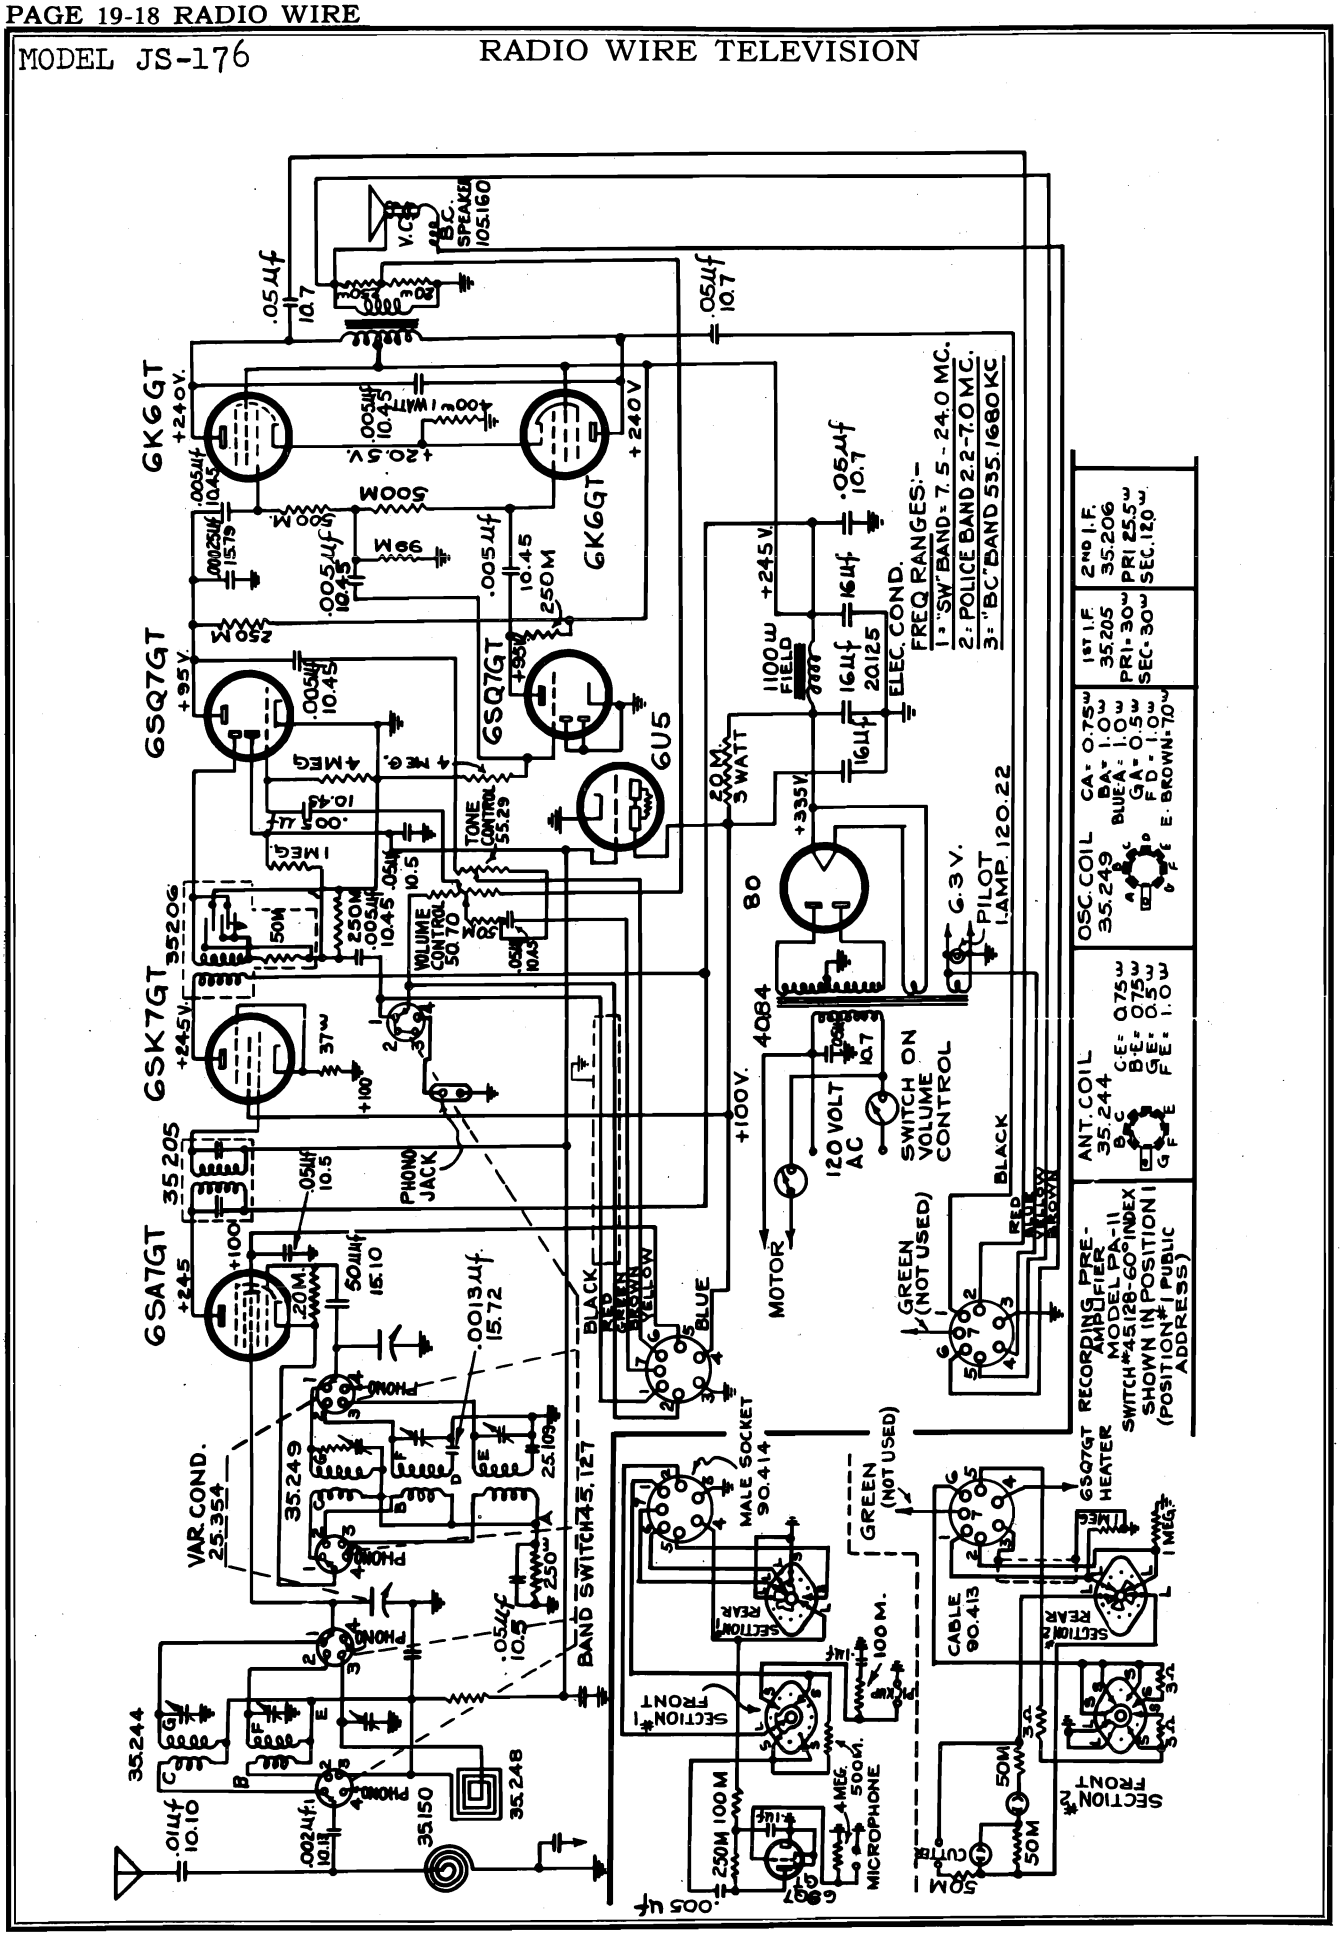
RADIO WIRE TELEVISION

MODEL JS-174



MODEL JS-176

RADIO WIRE TELEVISION



This receiver is equipped for FM (Frequency Modulation); Television and Phonograph Units.

Located on the rear of the chassis is a two pin JACK provided for this purpose. The Band Switch must be in the left position when operating.

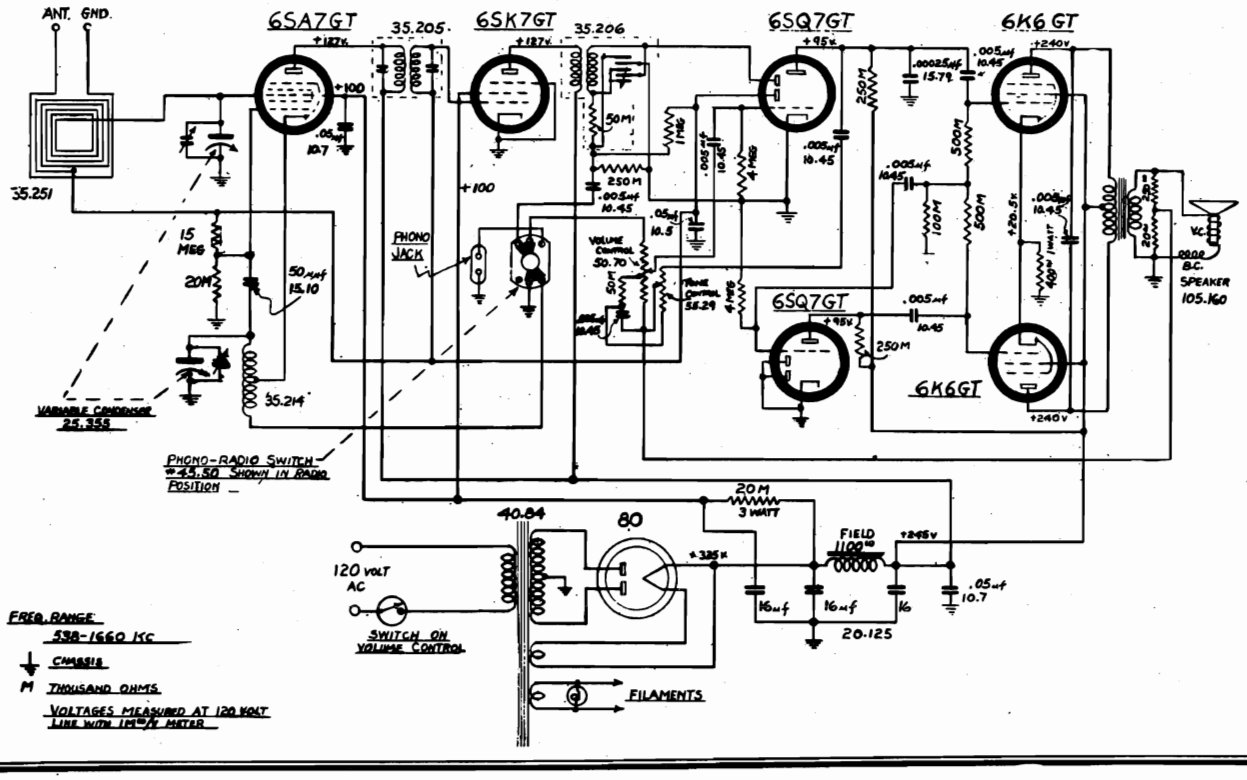
If receiver hums slightly reverse the Power Cord Plug.

TUBE COMPLEMENT: A tube layout chart at the rear of the receiver indicates the type of tubes employed, as well as their location on the receiver chassis. When replacing these tubes replace only with tubes having identical type numbers.

When operating the receiver in a steel re-enforced building or other shielded locations, an outside antenna is recommended. This may be connected to the terminal on the loop marked "AERIAL". A ground may also be connected to the terminal marked "GROUND".

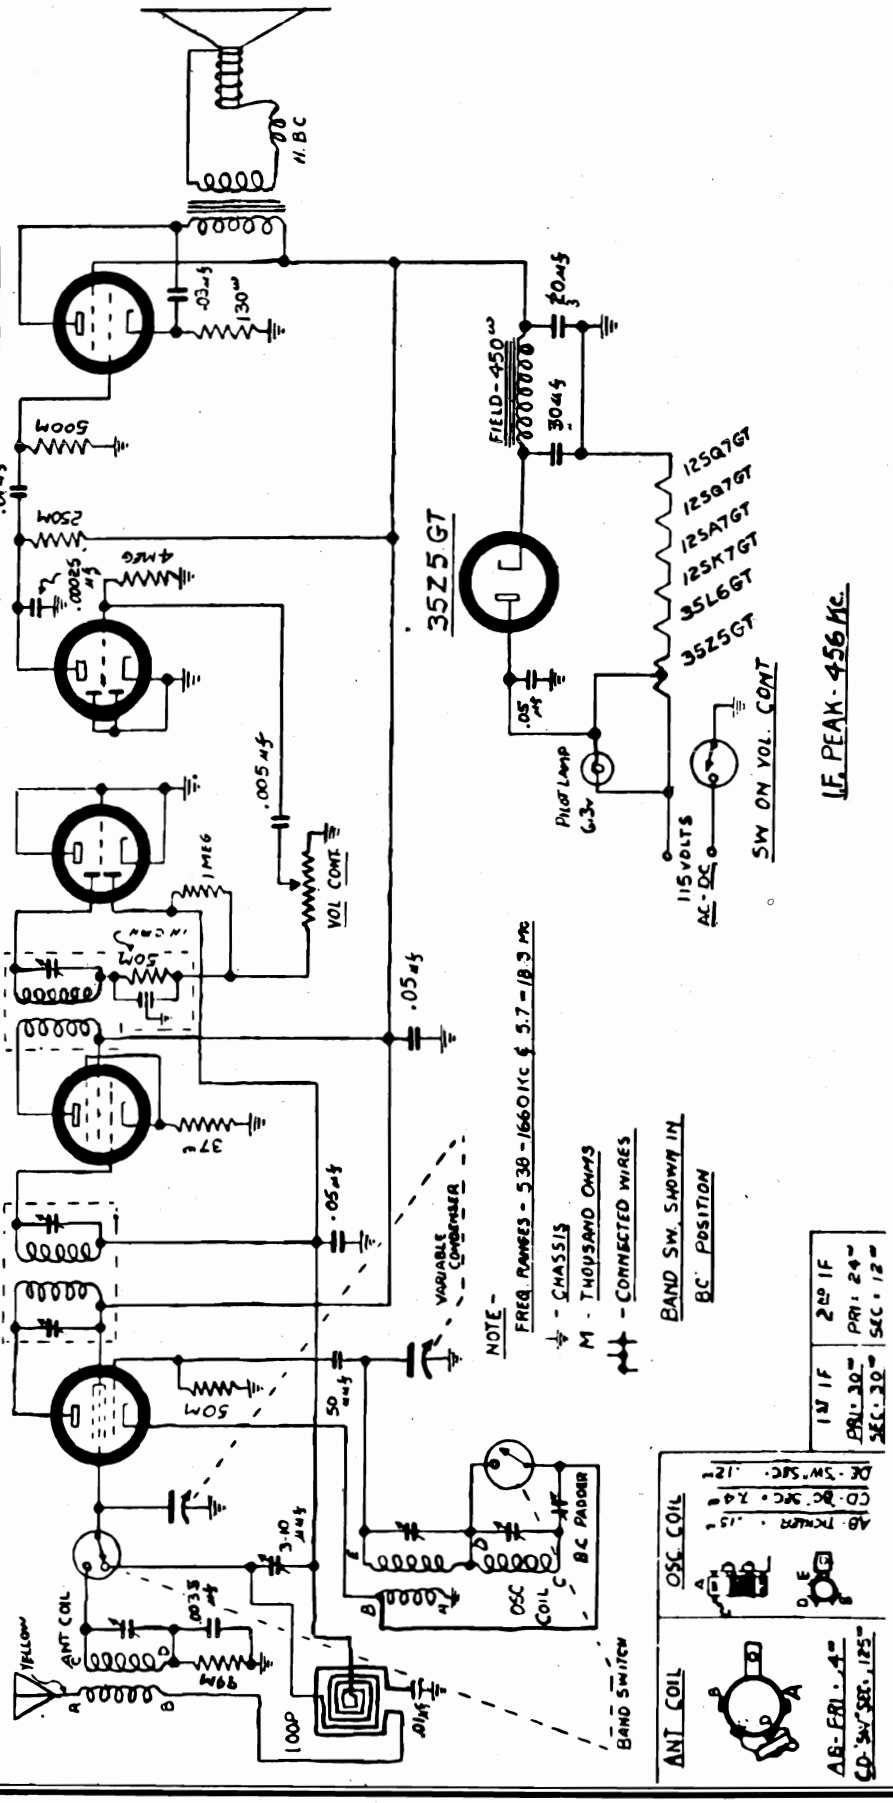
WARNING: Check power line for voltage and frequency (cycles) to make certain they are the same as specified on label located at rear of the receiver chassis, before inserting the power line in electric outlet.

This Receiver is equipped with a ROTATING LOOP ANTENNA. By rotating the Loop Control from left to right or vice versa, reception may be greatly improved. A correct position of the LOOP ANTENNA will result in noise-free reception.



MODELS JS-186, JS-187

RADIO WIRE TELEVISION



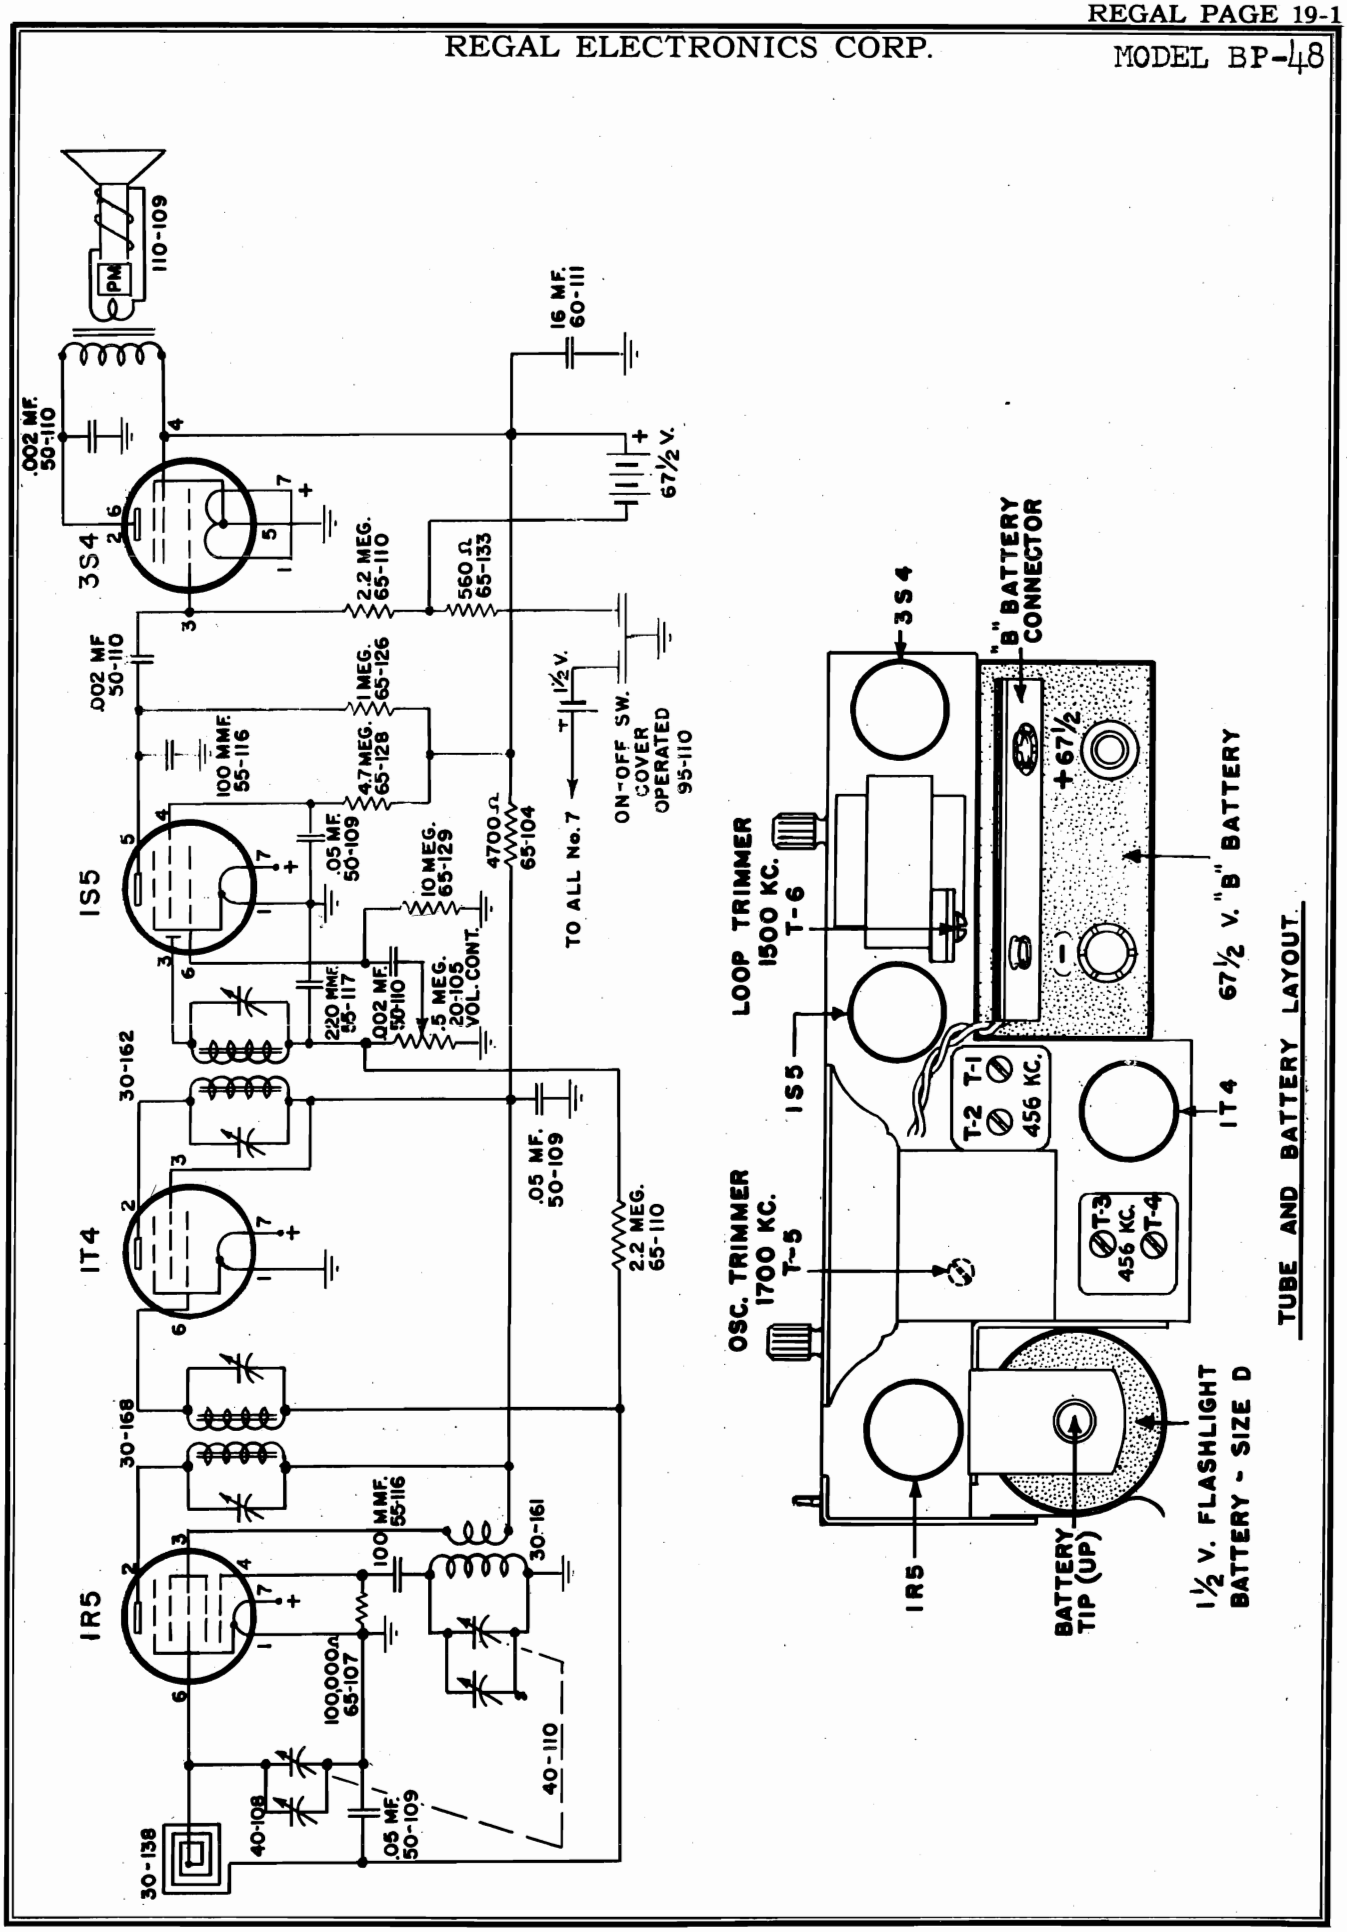
This 6 Tube Superheterodyne is designed to operate on 115 volts, 40 to 60 cycles, alternating current (AC) or 115 volts direct current (DC).

The Tuning Ranges, 533 to 1660 kilocycles (KC) and 5.7 to 18.3 megacycles (MC), cover all the major Domestic and Foreign Short Wave Broadcast, Police, Aircraft and Amateur Bands.

One 6-8 volt 150 M.A. lamp is used to illuminate the dial. Similar lamp should be used for replacement or damage may result.

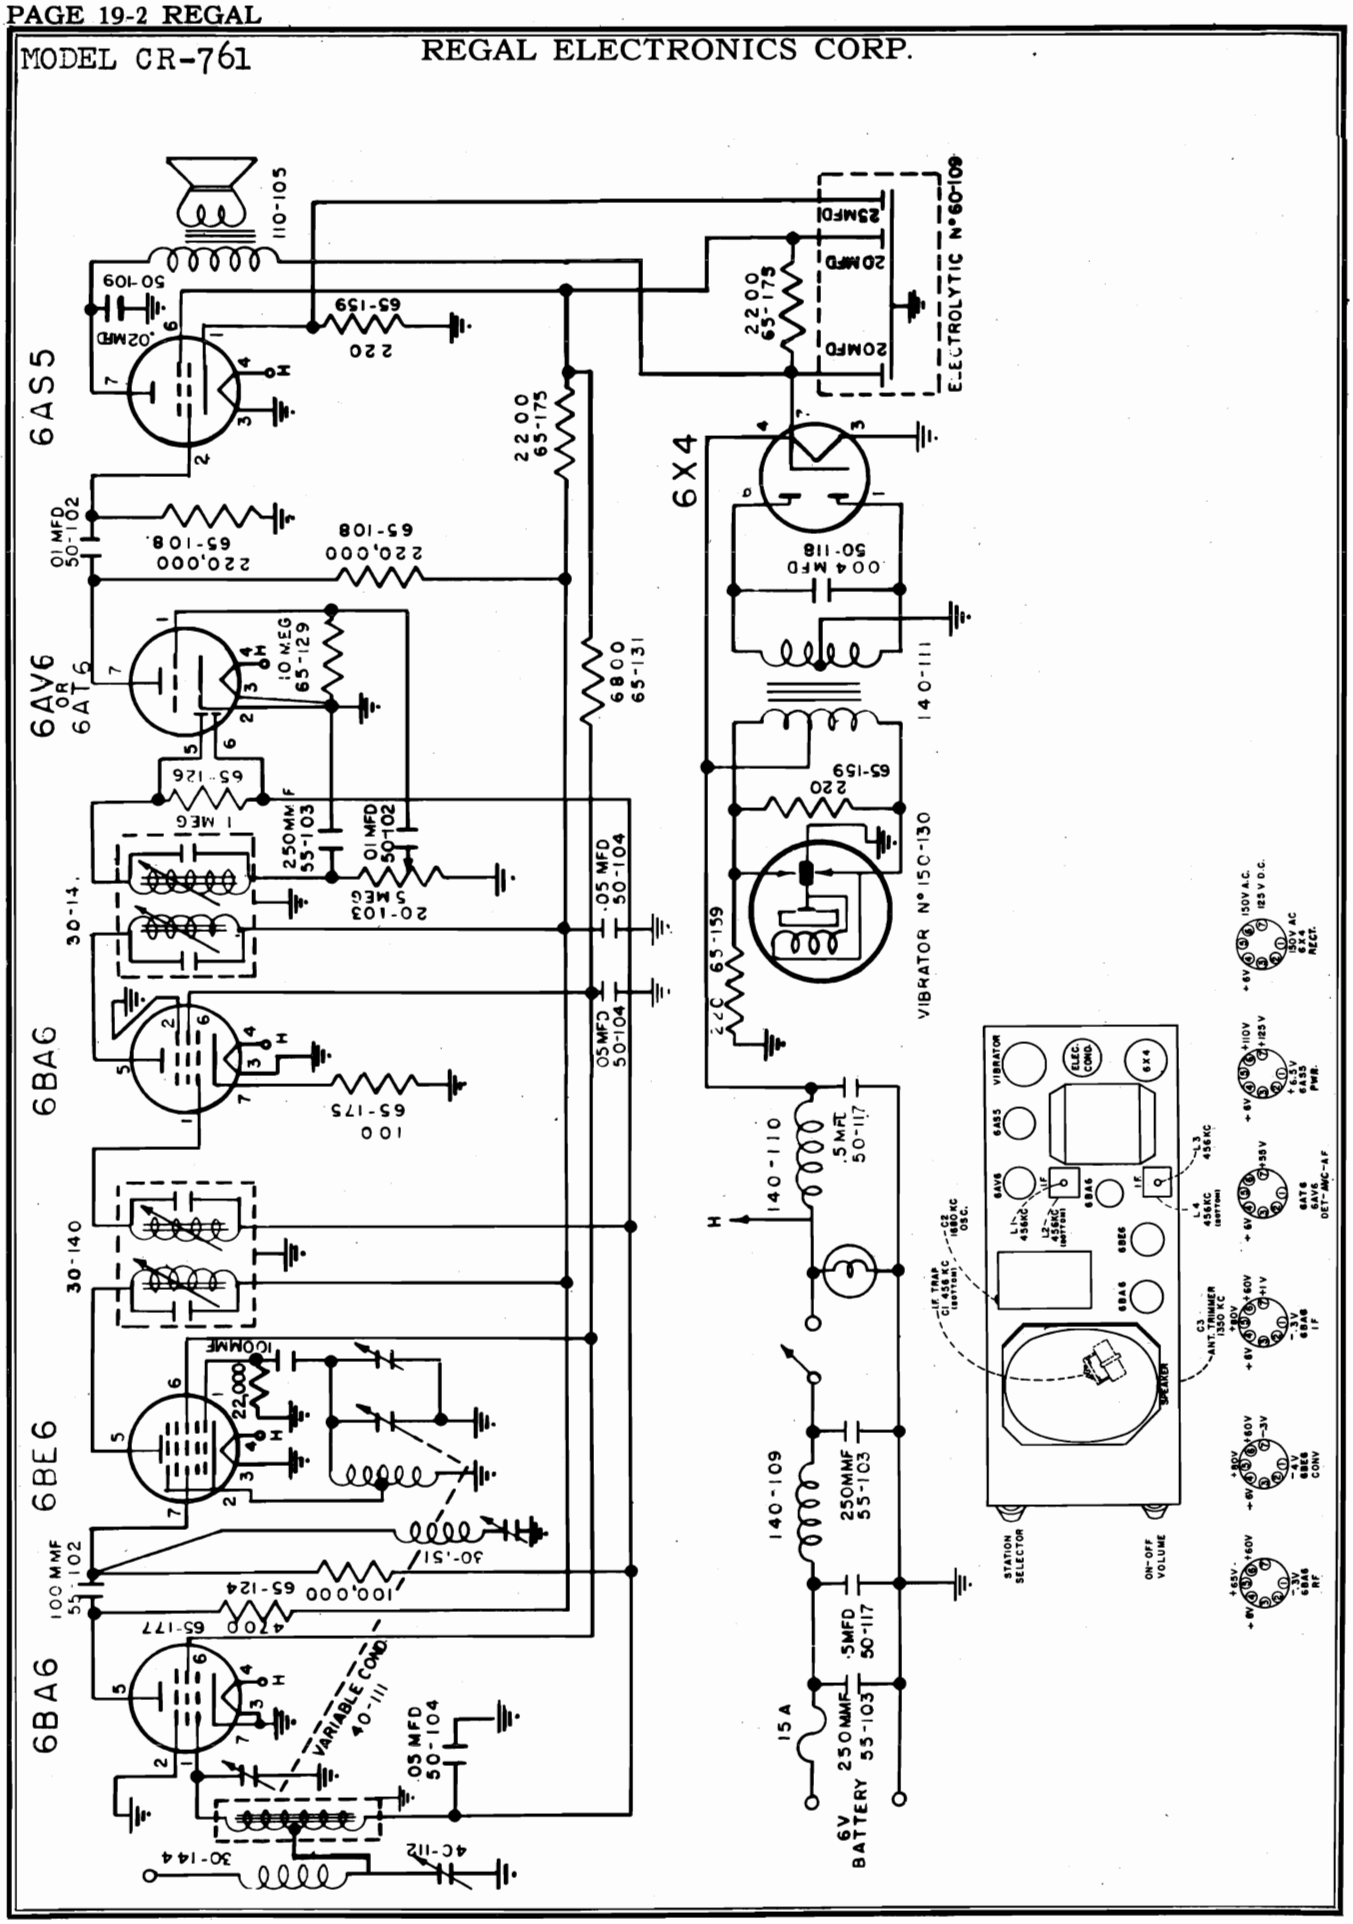
REGAL ELECTRONICS CORP.

MODEL BP-48



MODEL CR-761

REGAL ELECTRONICS CORP.



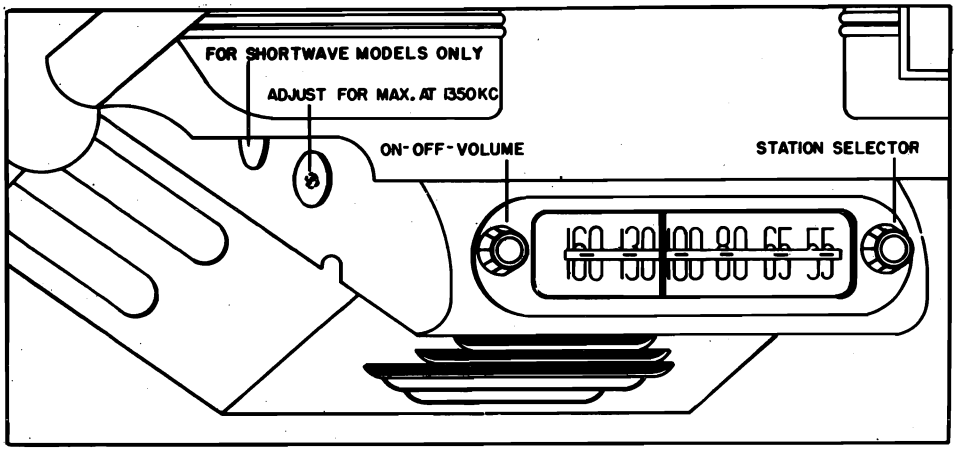


FIGURE 1. RADIO IN POSITION

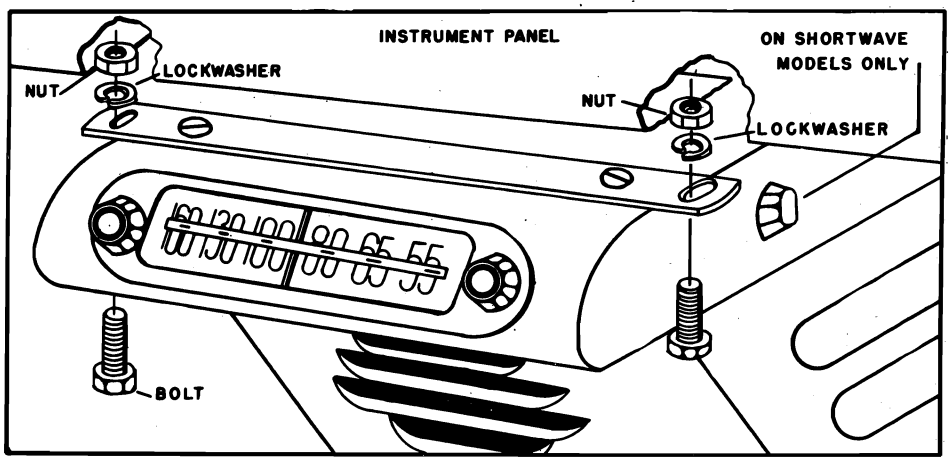

FIGURE 2. FRONT VIEW OF RADIO INSTALLATION

INSTALLATION

This radio is designed to operate at maximum efficiency when used with any good make auto-radio aerial. Install the aerial before proceeding with the installation of the radio. The aerial lead and complete installation instructions are packed with each aerial. The location of the aerial will determine the length of the aerial lead required to reach the radio. The shortest possible aerial lead should be used.

RADIO INSTALLATION: Determine the best possible location for the radio along the lower edge of the instrument panel. Using the front mounting strap as a template, mark and drill two 1/4" holes in the instrument-panel flange.

Fasten the strap to the top of the radio housing with two screws; then attach the fire-wall mounting strap to the stud on the back of the radio. Hold the radio in place, and bend the fire-wall strap to fit the fire wall. Mark and center-punch the location for the mounting-bolt hole on the fire-wall, and drill a 3/8" hole. Before drilling the hole, make certain that there are no obstructions such as ignition coil, battery, etc. on the motor side of the fire wall. Fasten the front mounting strap to the flange of the instrument panel (see figure 2), and bolt the fire-wall mounting strap securely to the fire wall (see figure 3).

CONNECTIONS: Plug the aerial lead into the connector on the radio. Place the fuse in the fuse housing on the "A" lead, and connect the fuse end of the "A" lead to the short lead on the back of the radio. Connect the other end of the "A" lead to the ignition switch or ammeter stud.

ANTENNA COMPENSATOR: An adjustment (see figure 1), reached through a hole on the upper-left side of the radio, near the front, is used to balance the radio to the aerial. With the radio turned on and the aerial fully extended, tune in a weak signal between 1200 kc and 1400 kc on the dial. With the volume control set just high enough to make the program audible, set the trimmer adjustment to obtain maximum signal strength. A small screwdriver is required for this adjustment.
Radio is now ready for operation.

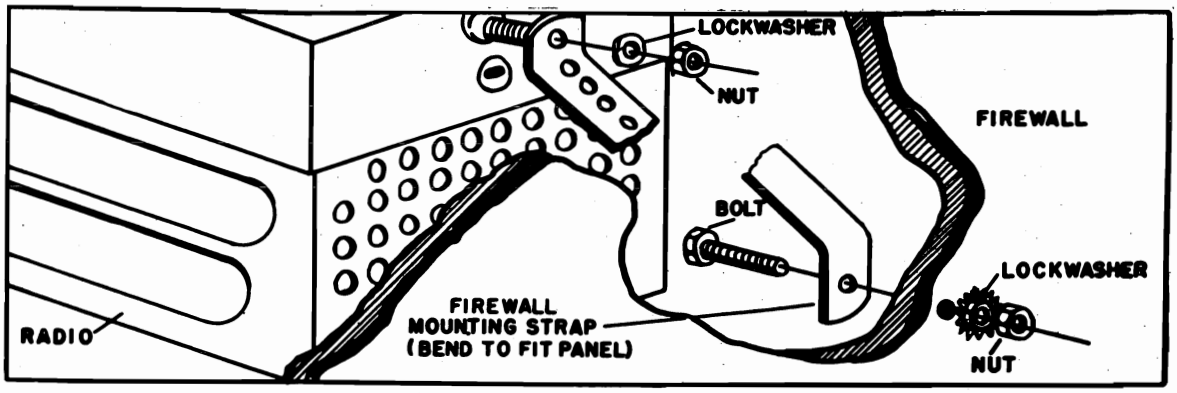

FIGURE 3. REAR VIEW OF RADIO INSTALLATION

ELIMINATION OF INTERFERENCE FROM CAR ELECTRICAL SYSTEM

Remove the coil-to-distributor high-tension lead from the distributor. Cut the lead two inches from the end, and screw the distributor resistor into the coil lead (see figure 4). Then screw the short length into the resistor, and plug the cable into the distributor cap. Two noise-filter condensers are furnished. One condenser must be connected to the output terminal of the generator (never to the field terminal), and the other to the battery side of the ignition coil. The generator-condenser bracket should be fastened to the generator housing, under the screw that holds the field (see figure 5), while the coil-condenser bracket should be fastened under the coil mounting bolts.

In some particularly stubborn cases of motor interference, one or more of the following procedures may be necessary:

A condenser can often be used to advantage on the electrically operated oil gauge or gas gauge. Connect the condenser lead to the terminal of the gauge, and bolt the condenser case securely to the frame or some other grounded part of the car.

Bonding the steering column to the fire wall with a short braid may also be effective. Clean the paint from the steering column at the fire wall where the column enters the motor compartment, and solder on a short piece of braid. Ground the end of the braid to the fire wall.

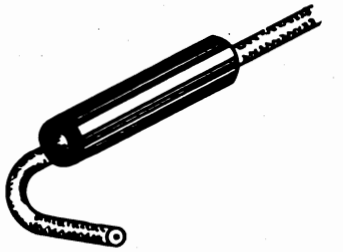

FIGURE 4. DISTRIBUTOR RESISTOR

FIGURE 5. GENERATOR CONDENSER

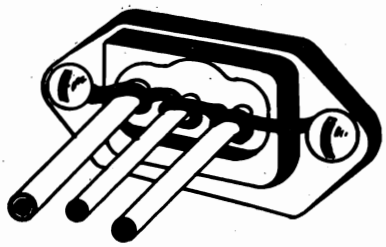

FIGURE 6. BONDING OF FIRE-WALL TUBES

In some cases it may be necessary to ground the tubes and rods coming through the fire wall in order to reduce the interference. Clean them with emery cloth and spot-solder the braid, fastening the end under a convenient screw (see figure 6).

In some cases it may be necessary, to connect an additional condenser to the ammeter or to the ignition switch.

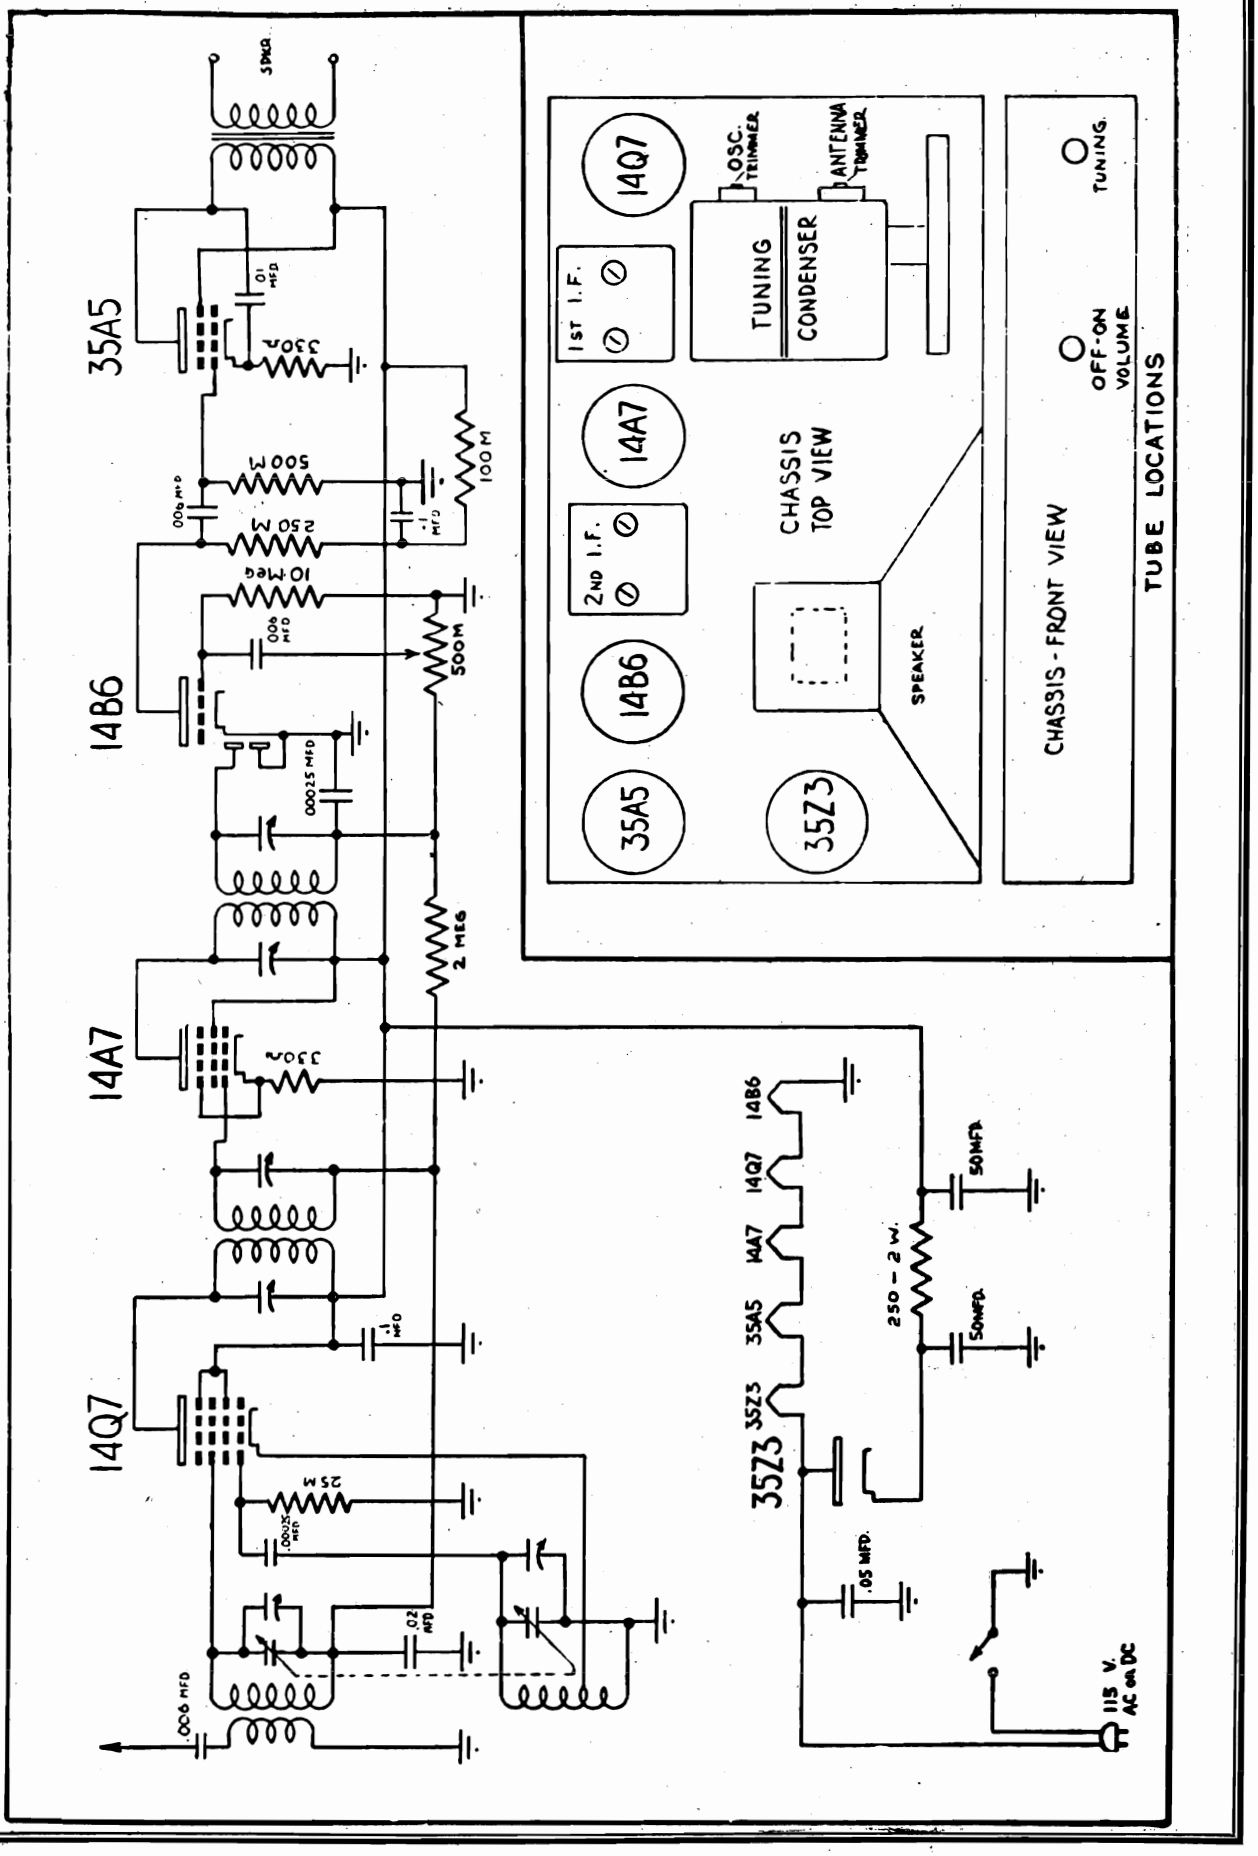
It may be necessary to use a condenser on the voltage regulator. The condenser case should be mounted under one of the voltage-regulator mounting screws, or at some other convenient location, and connected to the battery terminal of the voltage regulator.

Interference from electric clocks can be eliminated by connecting a condenser to the ammeter terminal. The case of the condenser must be securely grounded.

If tire-static interference is noted in a particular installation, static collector springs should be obtained and installed in the front wheels of the car.

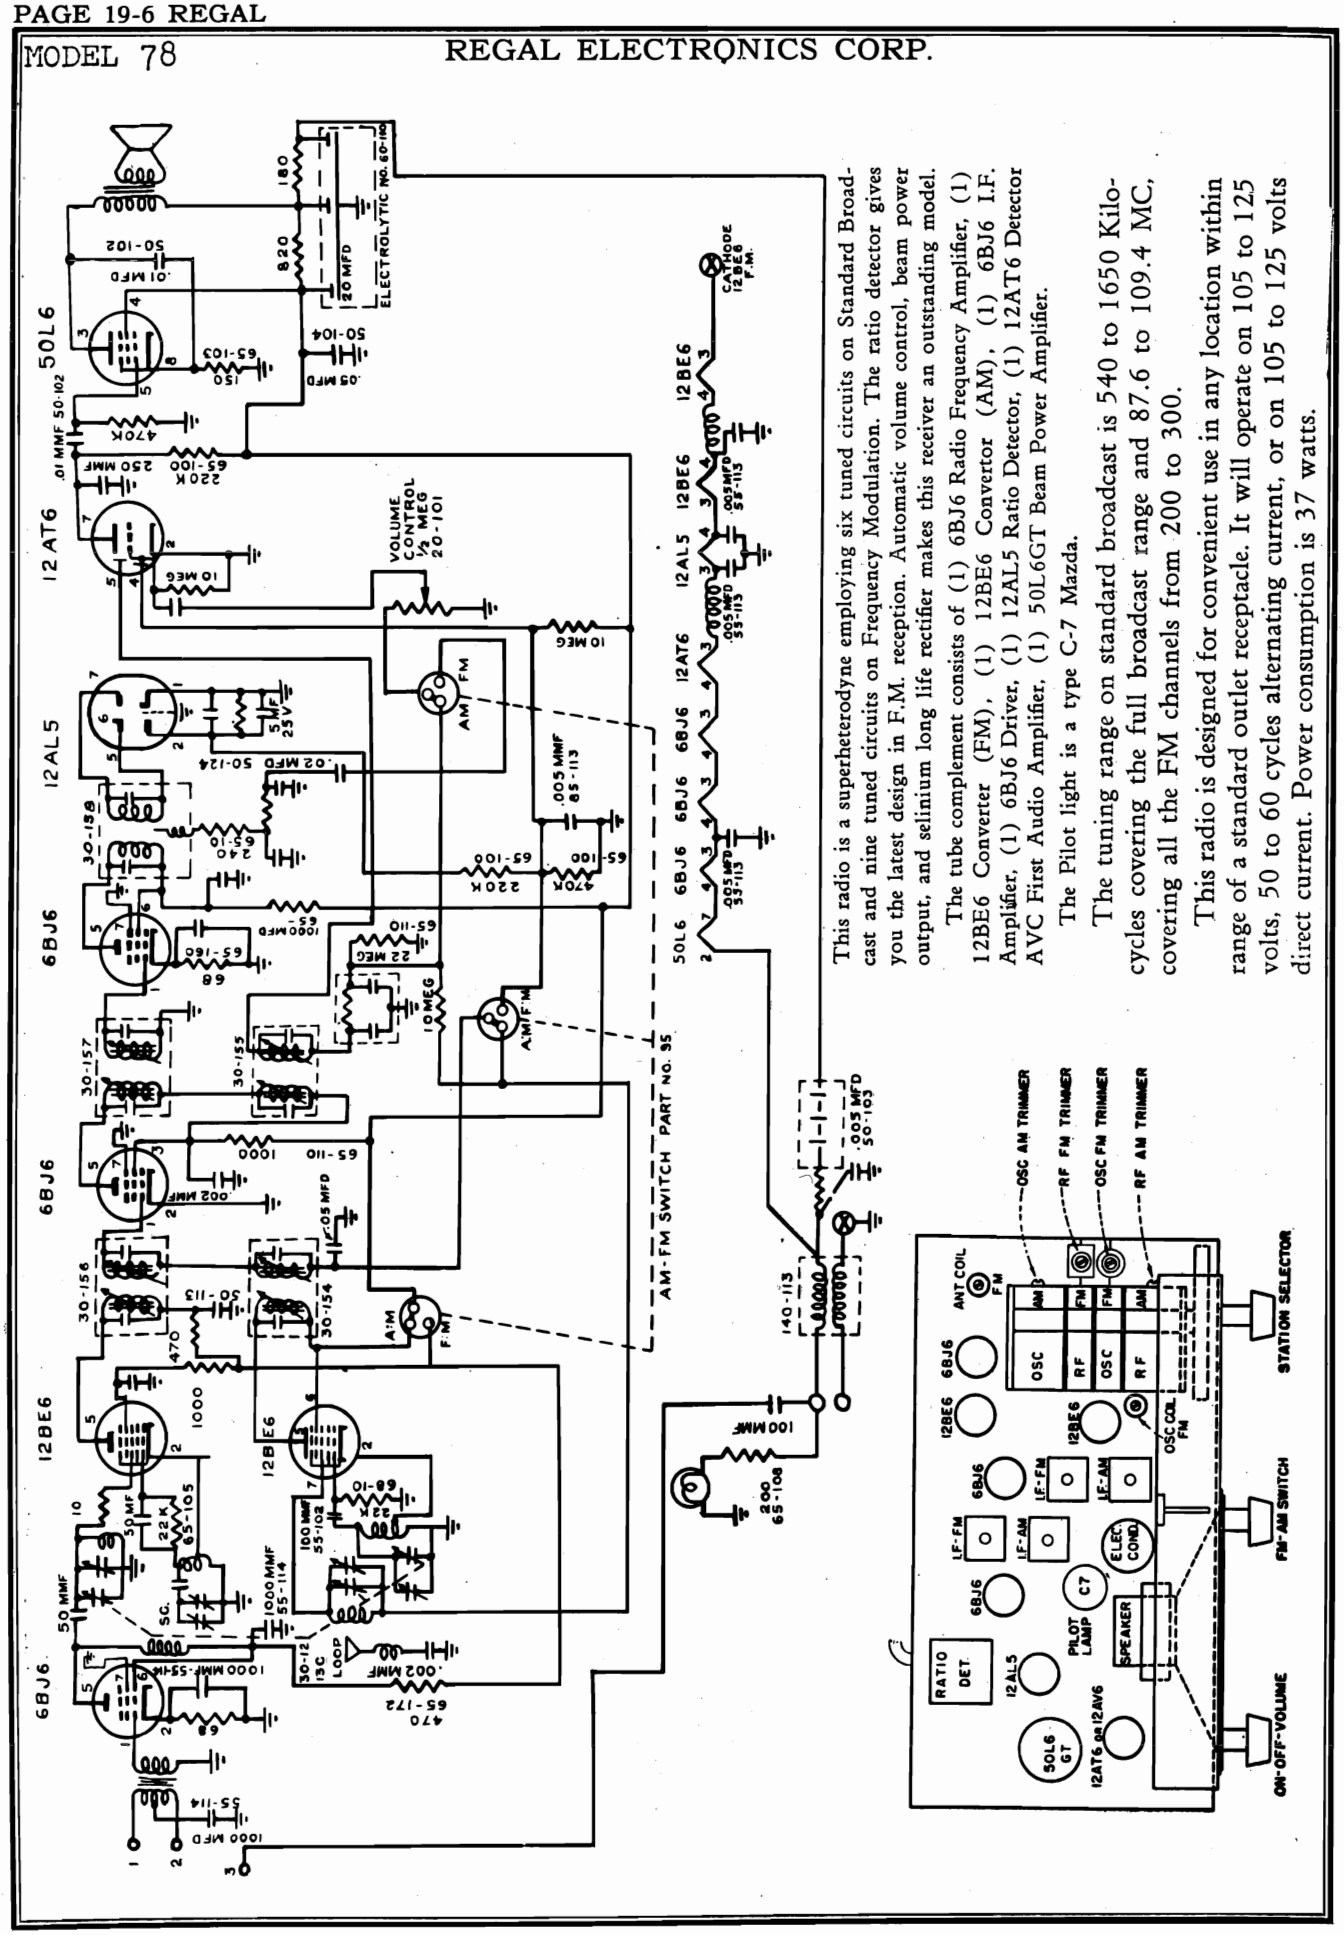
REGAL ELECTRONICS CORP.

MODEL L-43



MODEL 78

REGAL ELECTRONICS CORP.



This radio is a superheterodyne employing six tuned circuits on Standard Broadcast and nine tuned circuits on Frequency Modulation. The ratio detector gives you the latest design in F.M. reception. Automatic volume control, beam power output, and selinium long life rectifier makes this receiver an outstanding model.

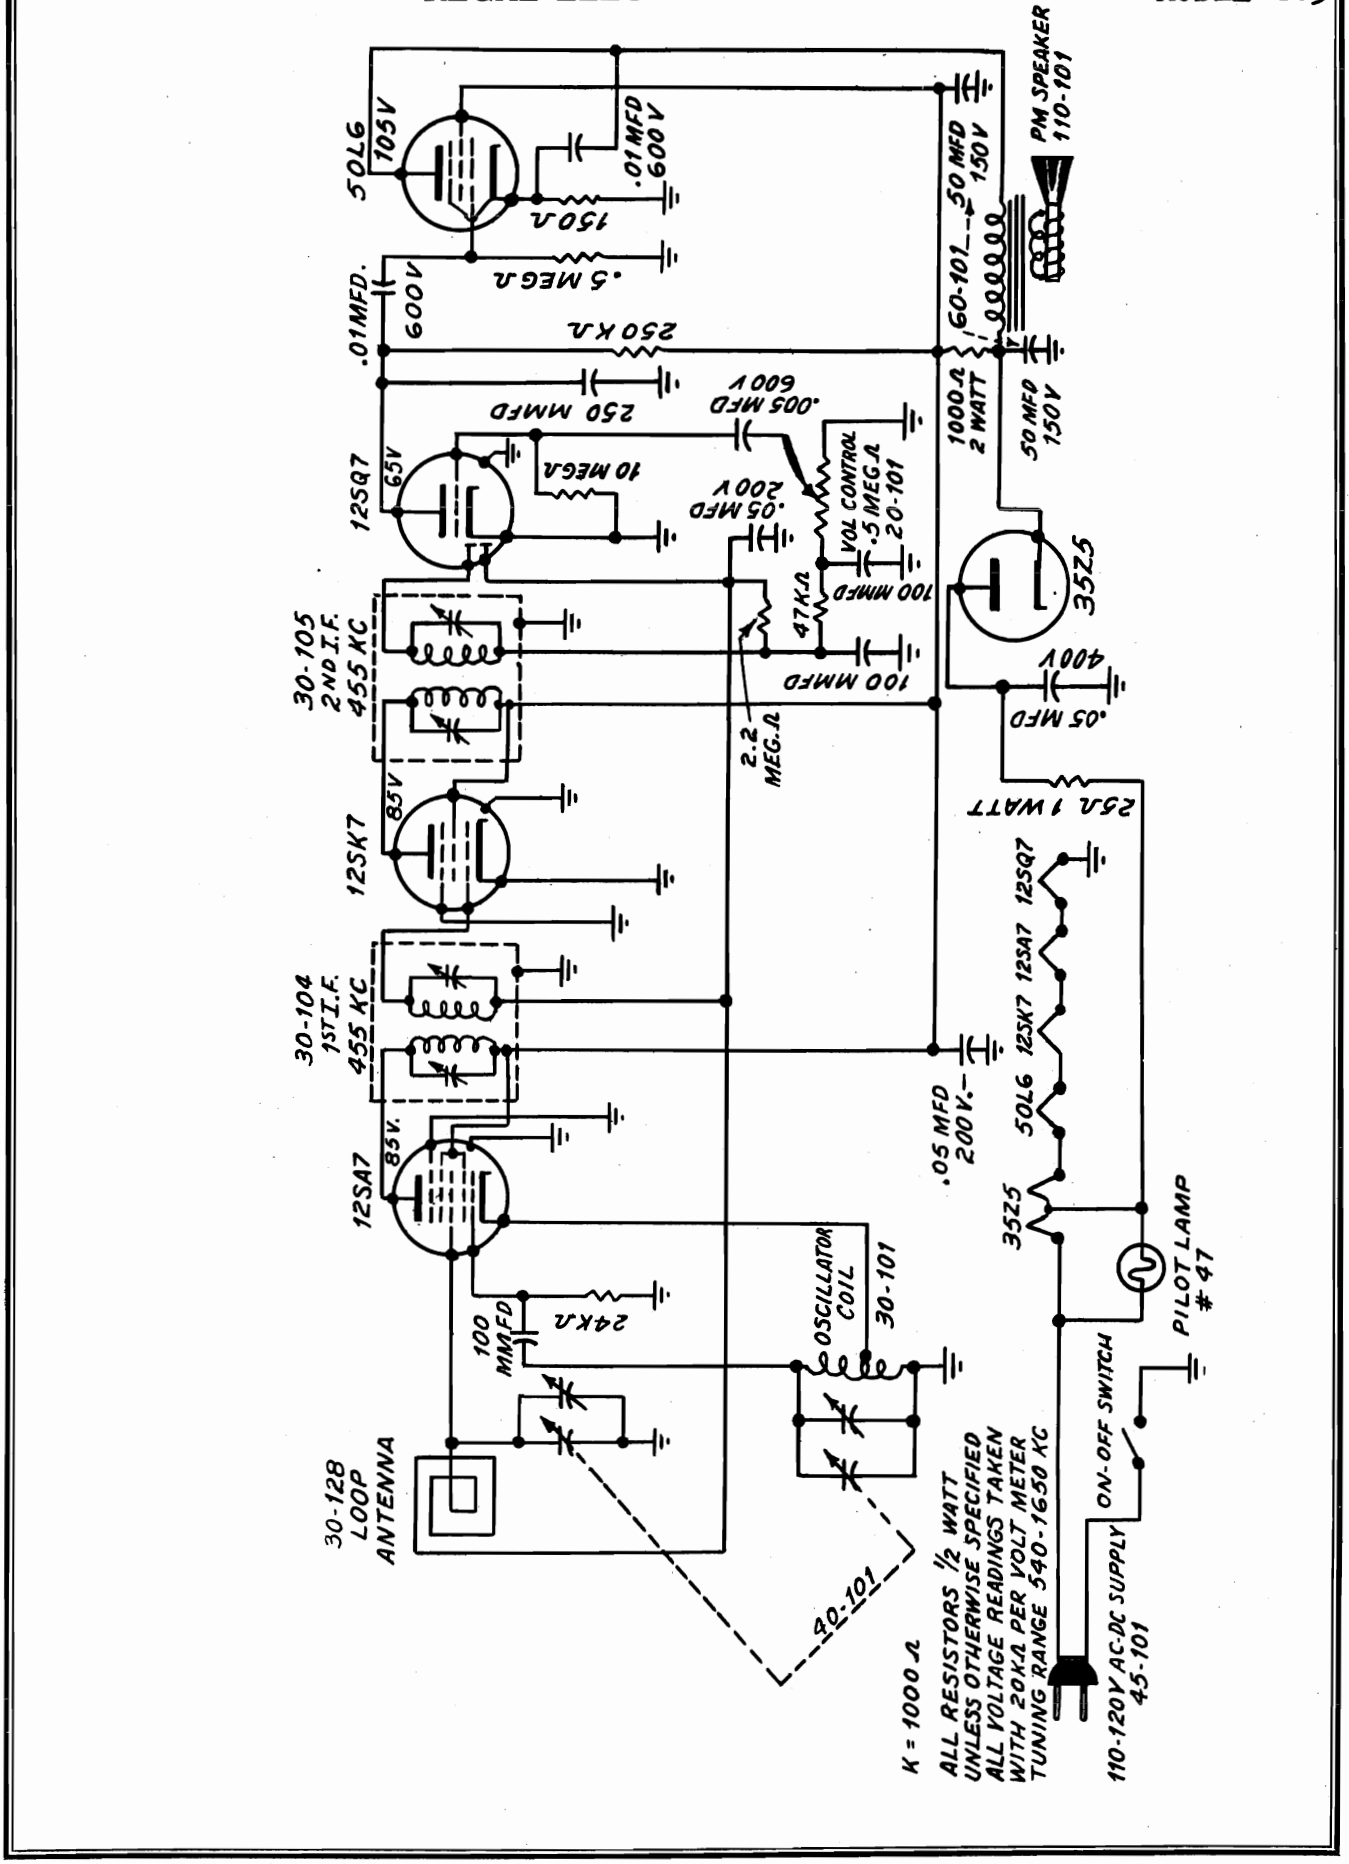
The tube complement consists of (1) 6BJ6 Radio Frequency Amplifier, (1) 12BE6 Converter (FM), (1) 12BE6 Convertor (AM), (1) 6BJ6 I.F. Amplifier, (1) 6BJ6 Driver, (1) 12AL5 Ratio Detector, (1) 12AT6 Detector AVC First Audio Amplifier, (1) 50L6GT Beam Power Amplifier.

The Pilot light is a type C-7 Mazda.

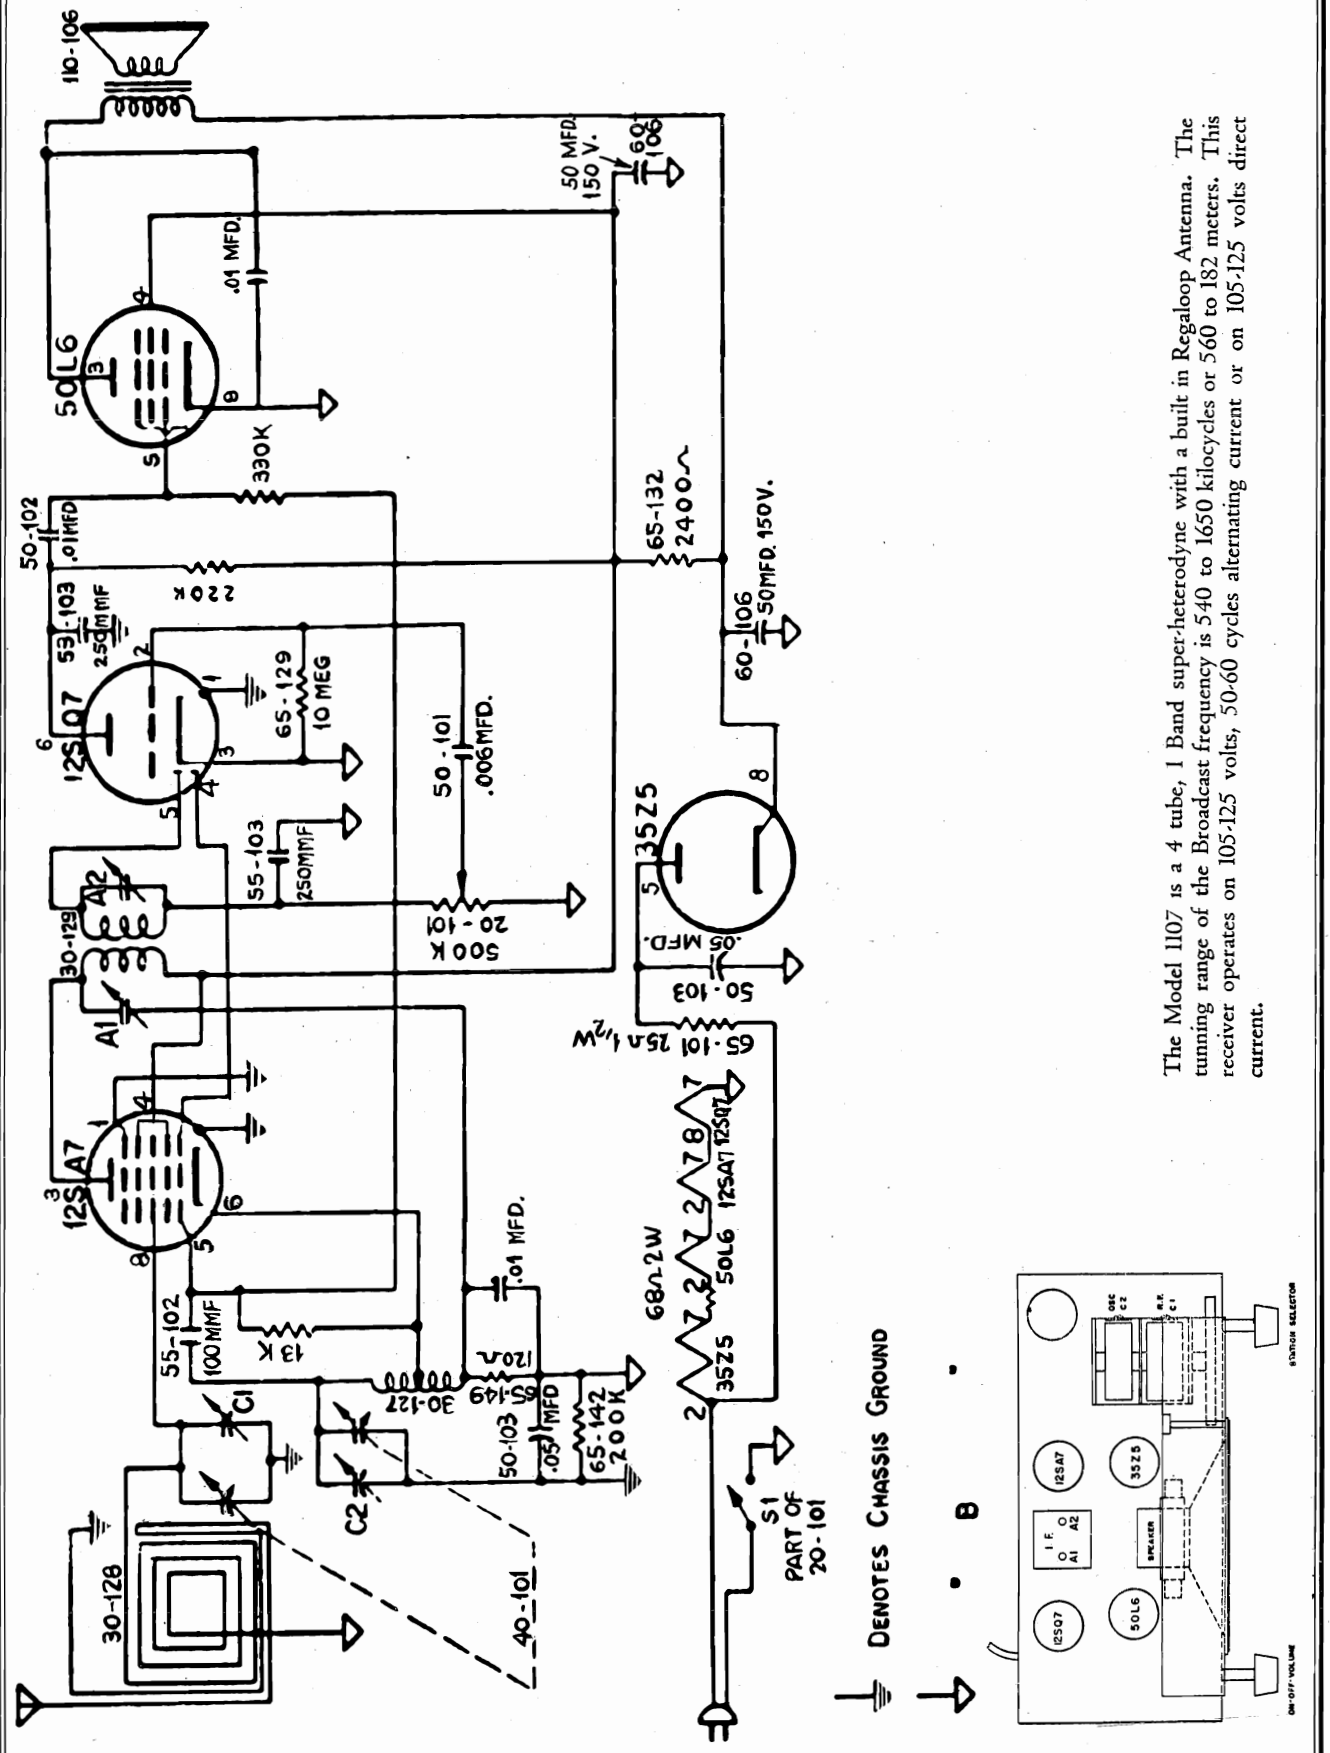
The tuning range on standard broadcast is 540 to 1650 Kilocycles covering the full broadcast range and 87.6 to 109.4 MC, covering all the FM channels from 200 to 300.

This radio is designed for convenient use in any location within range of a standard outlet receptacle. It will operate on 105 to 125 volts, 50 to 60 cycles alternating current, or on 105 to 125 volts direct current. Power consumption is 37 watts.

REGAL ELECTRONICS CORP. MODEL 205

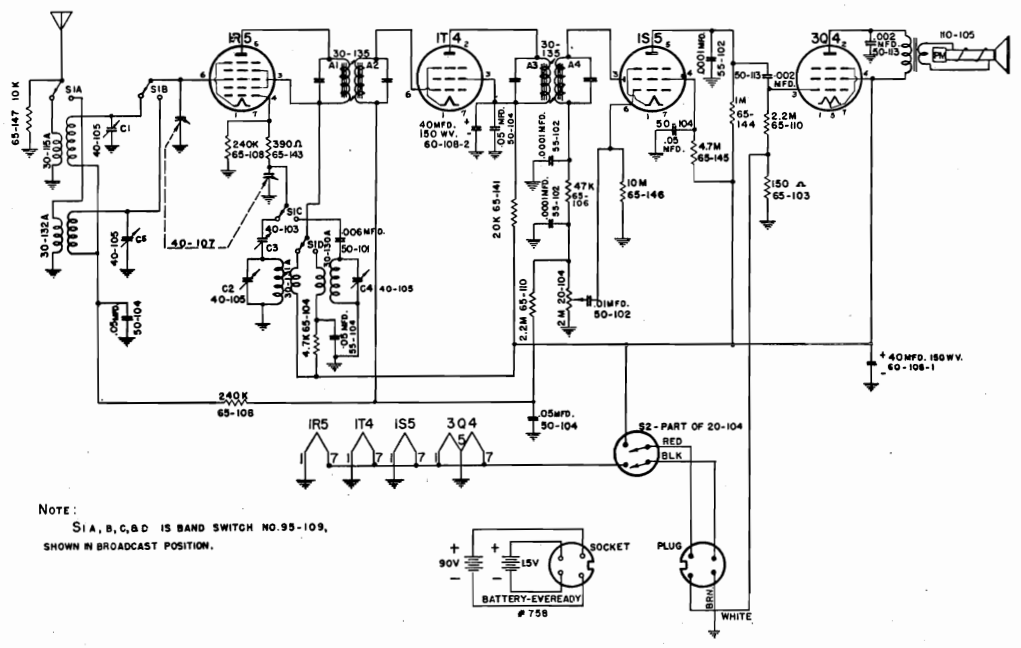


MODEL 1107 REGAL ELECTRONICS CORP.



The Model 1107 is a 4 tube, 1 Band super-heterodyne with a built in Regaloop Antenna. The tuning range of the Broadcast frequency is 540 to 1650 kilocycles or 560 to 182 meters. This receiver operates on 105-125 volts, 50-60 cycles alternating current or on 105-125 volts direct current.

REGAL ELECTRONICS CORP. MODEL 1500



DWG. 130-139 MODEL 1500

THE MODEL 1500 is a 4-tube battery-operated superheterodyne farm radio receiver with two tuning ranges for reception of standard broadcast and short-wave stations. The tuning range of the broadcast frequency is 540 to 1650 kilocycles, or 560 to 182 meters. The short wave frequency is 5.8 to 18.3 in megacycles, or 16 to 49 meters, which include the following 16, 19, 25, 31, 39 and 49 meter bands.

This radio is designed to operate from an Eveready #758 battery pack. This unit has a 90 volt "B" supply and a 1½ volt "A" supply, and is connected to the receiver by means of a 6-foot flexible battery cable and plug.

ELECTRICAL SPECIFICATIONS

THE CIRCUIT OF 1500 is a superheterodyne employing eight tuned circuits for maximum sensitivity and selectivity, with Automatic Volume Control (AVC) and a beam power output system. The tube complement consists of (1) 3Q4 power amplifier, (1) 1S5 Detector, AVC and first audio amplifier, (1) 1T4 IF amplifier, and (1) 1R5 converter.

If your set does not work check your tubes. Make sure each tube is in its socket.

MODEL 1500 REGAL ELECTRONICS CORP.

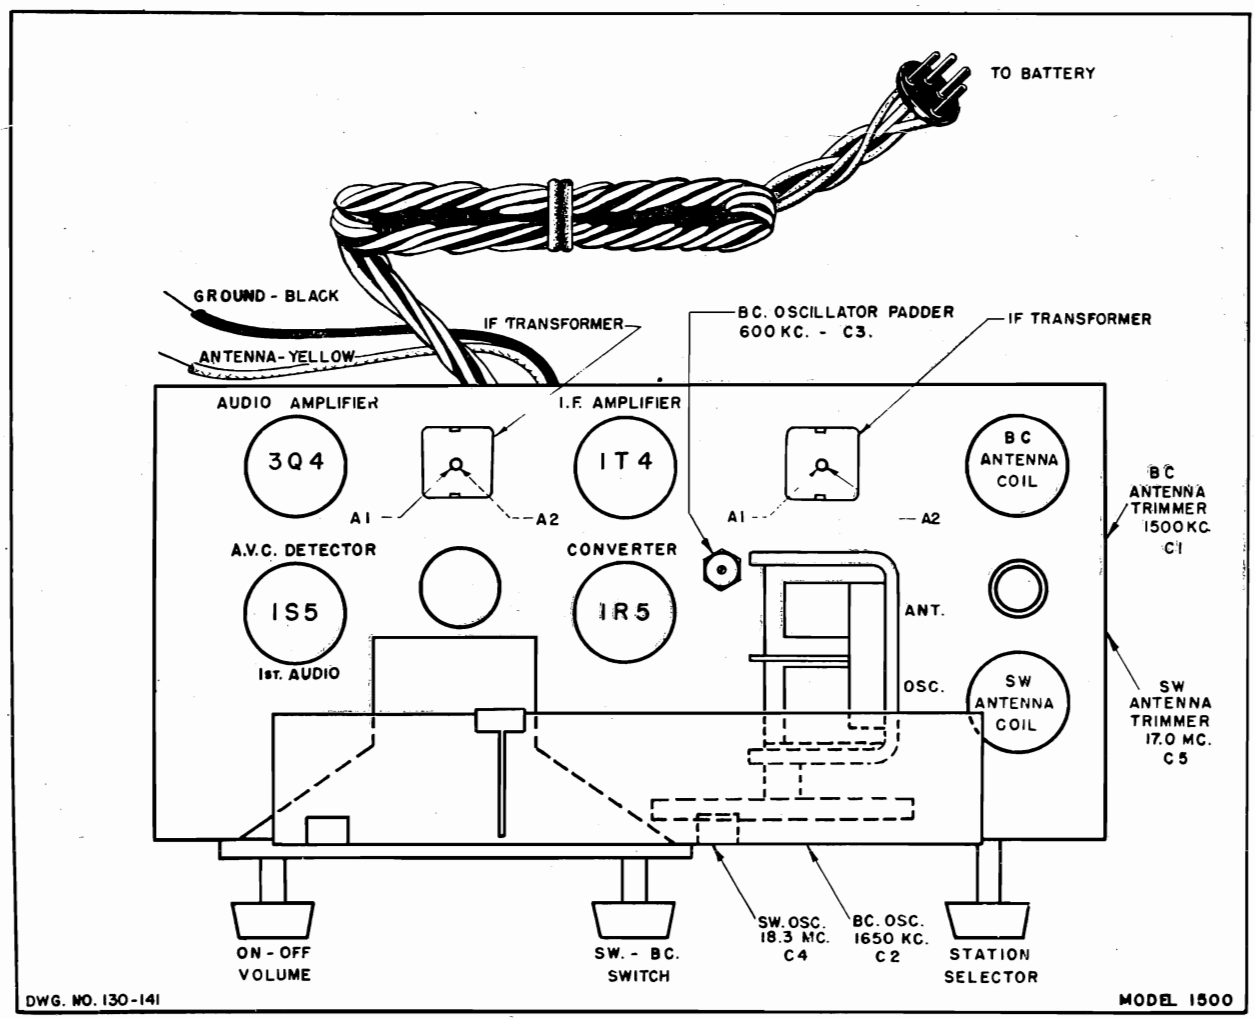
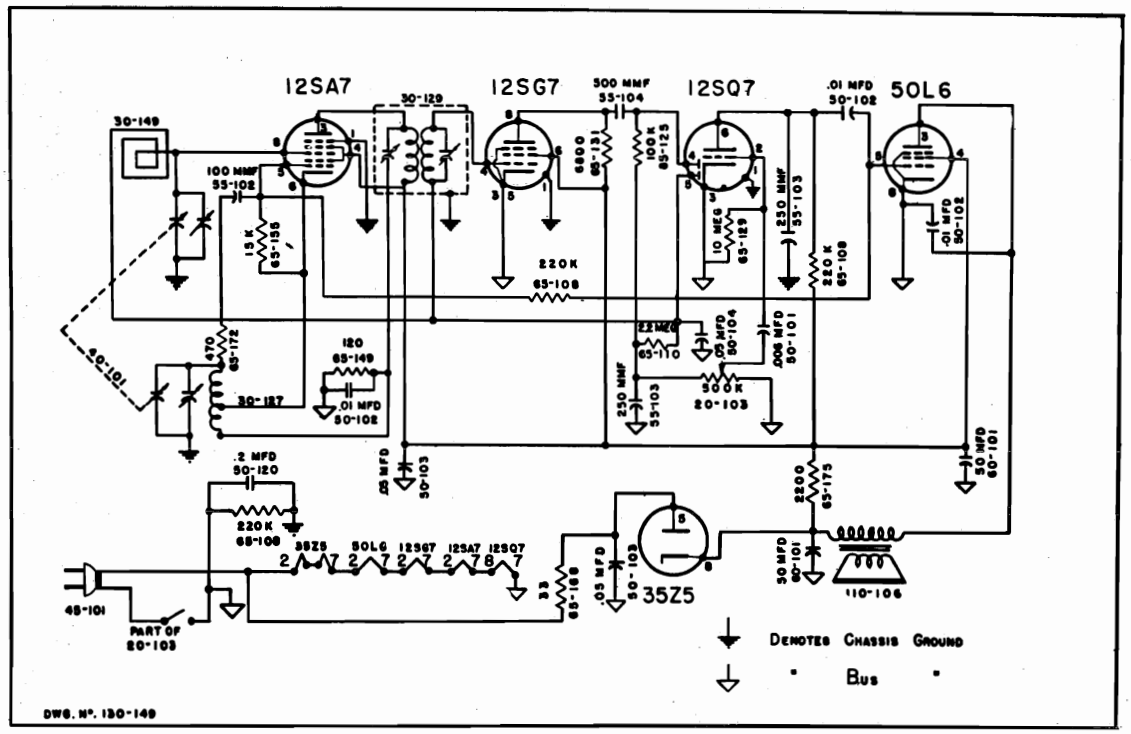
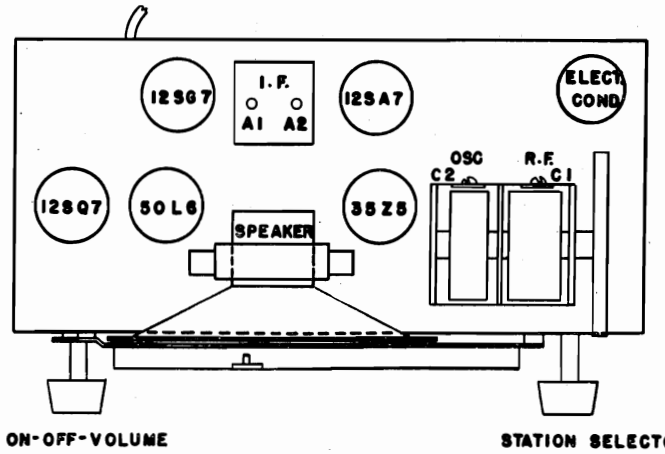
DWG. NO. 130-142 MODEL 1500



DWG. NO. 130-141 MODEL 1500

REGAL ELECTRONICS CORP. MODEL 7251





This Model is a 5 tube, 1 Band super-heterodyne with a built in Regaloop Antenna. The tuning range of the Broadcast Band is 540 to 1650 kilocycles or 560 to 182 meters. This receiver operates on 105-125 volts, 50-60 cycles alternating current or on 105-125 volts direct current.

Antenna

The loop Antenna in this receiver will give good reception under normal conditions. It is directional and the best position may be obtained by slowly rotating the receiver in different directions until the signal volume is at its strongest. For better results on weak signals connect a good outside Antenna. A connection is provided at the rear of the receiver for connecting an outdoor Antenna.

ELECTRICAL SPECIFICATIONS

Super-heterodyne with Beam Power out-put system. TUBES: 1-12SA7, 1-12SG7, 1-12SQ7, 1-50L6, 1-35Z5.

REMLER COMPANY LTD.

MODELS 7110, 7120

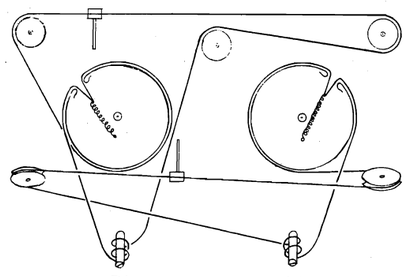
MODEL 7110 - 7120 ALIGNMENT INSTRUCTIONS

Tuning range, Broadcast 540kc-1700kc, Shortwave 5.8mc-18mc, FM 88mc to 108mc.

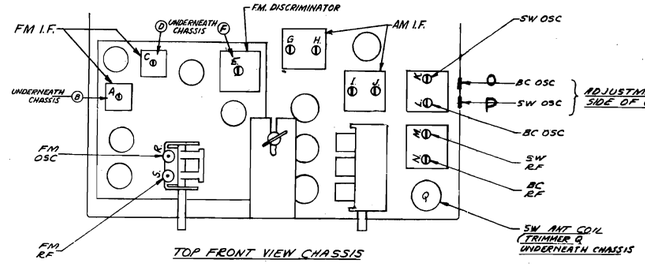
Keep volume control at comfortable listening level, and output from signal generator no higher than necessary to obtain output reading. It is absolutely necessary that an insulated alignment tool be used for all adjustments. The broadcast band antenna loop should remain connected. Connecting link should be open between antenna terminals 3 and 4 on rear of chassis when aligning, but closed when tuning FM stations. Use dial scale provided with these instructions, centered on receiver dial plate. Receiver and signal generator must be turned on at least 10 minutes prior to commencing alignment.

DUMMY ANT.	SIG. GEN. COUPLING	SIG. GEN. FREQ.	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
BROADCAST BAND (Bandswitch on BC)						
.1 mfd	To pin #8 on 6SA7 and ground	950kc	Between stations on high freq. end of band	DC VTVM neg. on point "X" (Lead from grid of 6E5)	G, H, I, J	Aligns I.F. for both broadcast or shortwave bands.
.1 mfd	To Ant.term. strip, screw No. 1	1500kc	1500kc	Same as Above	Turn L until Sig.is heard. then peak N on VTVM.	
.1 mfd	Same as Above	600kc	600kc	Same as Above	Turn O until Sig.is heard.	Repeat preceding step and this step, until neither L nor O requires further adjustments for peak on VTVM.
SHORTWAVE BAND (Bandswitch on SW)						
.1 mfd	To Ant.term. strip, screw No.1. Link open	18mc	18mc	DC VTVM neg. on point "X" (Lead from grid of 6E5)	Turn K until Sig.is heard. then peak H and G on VTVM	
.1 mfd	Same as Above	6mc	6mc	Same as Above	Turn P until Sig.is heard.	Repeat preceding step and this step, until neither K nor P requires further adjustments for peak on VTVM.
FM Band (Bandswitch on FM)						
.1 mfd	To pin 1 on 2nd 6BA6 and ground	10.7mc. Loss than 30 % AM	Between stations at approx. 100mc	DC VTVM neg. on AVC bus (Point "M")	Adjust E for Max.Neg.Volt.	NOTE: All. I.F. alignment must be done without moving the signal generator setting from the 10.7mc point. If it becomes necessary to move the signal generator setting during the process of I.F. alignment, ALL I.F.'s must be realigned when the generator is reset to 10.7mc.
.1 mfd	To pin 1 on 1st 6BA6 and ground	Same as Above	Same as Above	Same as Above	Adjust D and C for Max. Neg. Voltage.	
.1 mfd	Same as Above	Same as Above	Same as Above	DC VTVM neg on Pt. "Z". Pos on ground	Adjust F until VTVM reads zero	Signal generator output must be low enough so that AVC value will be less than 1v. when setting F for zero.
.1 mfd	Point Y	Same as Above	Same as Above	DC VTVM neg. on AVC bus (Point "M")	Adjust B and A for Max. Neg. Voltage.	Repeat preceding 3 steps and this step; after 1st adjustments at this step.
.1 mfd	Ant. term. strip,term. #8 link open	100mc Loss than 30 % AM	100mc	Same as Above	Peak R and S	After completing following step, return to this step and check for accuracy of dial calibration by using input from station of known frequency instead of the 100mc from signal generator.
Remove dummy ant. and connect link betw. ant. term. Pts. 3 and 4	None	None	Tune in any FM station near center of dial, if possible	See Remarks Column	See Remarks Column	Station must be tuned in for maximum AVC neg. voltage by using VTVM on Point "M". After station is tuned in, move VTVM connection to point "Z" and readjust "F" until meter needle excursions are symmetrical about the zero point.

NOTES:
1. Resistors ½ Watt Unless Specified Otherwise.
2. Condensers 600v. Unless Specified Otherwise.
3. Coindensers Having Values Of 33, 68 & 330 Are In mmfd. All Others Are In mfd.



DIAL CORD DRIVE



TOP FRONT VIEW CHASSIS

REMLER COMPANY LTD. MODELS 7110, 7120

OPERATION OF WIRE RECORDER

MODEL 7120

TO INSTALL WIRE:

1. Remove rubber band from spool and press spool onto spindle so that the wire will reel off from the front side of the spool.

2. Hold top of spool with fingertips to prevent unwinding and draw out the celluloid leader past recording head and into channel of turntable.

3. While holding the leader against inner edge of the channel, rotate the turntable by hand until two complete turns of wire are in the channel. See that the wire threads into the recording head. The full length of the leader must be pressed against the inner surface of the channel or speed variations will result.

4. The Model 7120 comes equipped with a quarter hour spool of recording wire. Standard spools of wire are available in quarter hour, half hour and one hour lengths, any of which will fit the wire recorder.

TO SPLICE BROKEN WIRE:

1. Use several inches of the two ends of the wire and tie a common square knot. Draw knot tight and trim ends close.

TO RECORD RADIO PROGRAMS OR PHONOGRAPH RECORDS ON WIRE:

1. Turn radio selector switch to desired position.

2. Turn wire recorder selector switch at left of tuning eye to RECORD.

3. The Magic Eye indicates the volume of the sound being recorded. It will normally flicker as the sound varies in intensity. Turn the recorder VOLUME control until the eye just barely closes but never overlaps. Too much overlapping of the indicator eye may cause distortion or recording at a high level that can not be erased. If the eye is not brought to the closing point, the recorded level may be so low as to allow wire noise to be heard on the playback.

4. Turn motor switch at right hand back corner to RECORD. The small button next to the switch must be depressed when switching to RECORD position.

5. Whatever sound is heard from the loudspeaker is now being recorded. The radio volume and tone controls may be set in any position while recording as they do not affect the program being recorded.

TO RECORD FROM MICROPHONE:

1. Turn recorder selector to MIC.

2. Adjust VOLUME control as in para. 3 above, while speaking into microphone.

3. Turn motor switch to RECORD.

4. Speak in a normal tone of voice, holding the microphone about four inches from the lips.

5. None of the radio controls have any effect while recording from the microphone, except that the power switch must be turned ON.

MODELS 7110, 7120 REMLER COMPANY LTD.

REWINDING AND PLAYBACK:

Before the recording can be played back, the wire must first be rewound to the start of the program. This rewinding is accomplished at a speed of about five times the recording and playback speed.

1. Turn the recorder selector switch to PLAYBACK.

2. Turn the radio volume control to the extreme counter clock-wise position.

3. Turn the motor switch to REWIND.

4. The radio volume control can now be adjusted until the chattering sound is at the desired volume. This sound is the program that has just been recorded running in the reverse direction. After some experience, this sound may be used to judge when the recorded program has been rewound.

5. When the wire has been rewound to the desired point, turn the motor switch to PLAY.

6. The program that has been recorded will now be heard on the radio speaker. The volume and tone may be adjusted with the radio tone and volume controls. The recorder volume control has no effect during the playback.

7. To stop playback at any time, turn motor switch to OFF.

8. If wire is completely wound off of either the spool or turntable, the motor will automatically shut off. In this case, turn the motor switch to OFF, rethread the wire and press reset button to reconnect motor.

9. If a spool of wire is to be stored, REWIND entire length of wire as above and remove spool. Place a rubber band around spool to retain wire.

10. When not using the wire recorder, turn motor switch and recorder selector switch to OFF. Never turn radio power switch or recorder selector switch to OFF until motor switch is turned to OFF and turntable has stopped revolving. If this procedure of first turning the motor switch to OFF position is not followed, the wire is likely to unwind from one spool and not wind onto the other spool, thus causing it to become tangled.

ERASING RECORDED MATERIAL:

The recording may be played and replayed as often as desired without affecting the performance of the record. If it is desired to use the same spool of wire over again, simply REWIND and RECORD right over the old program. The wire will automatically be cleared of previously recorded material at the same time the new recording is being made. If it is desired to erase the program on the wire without recording a new one, the following procedure should be used.

1. Rewind wire to the point at which erasing is to start.

2. Turn recorder selector switch to RECORD.

3. Turn recorder volume control to extreme counter clock-wise position.

4. Turn motor switch to RECORD.

5. Turn motor switch to OFF after desired amount of wire has been erased.

The Models 7110 and 7120 are designed for operation on 115 volt, 60 cycle house current only.

Model 500 Radio-Phonograph is a console combination designed for operation on the AM and the FM broadcast bands and for record reproduction with standard 78 rpm and LP 33 1/3 rpm records. The radio receiver is comprised of two units; a tuner for AM and FM with all controls, and a power unit containing the transformer and rectifying circuits as well as the final audio amplifying circuits. The record player will operate with intermixed 10 and 12 inch records on 78 rpm and will play the new LP, or 33 1/3 rpm records singly using a special pickup provided. A 12 inch diameter, permanent magnet, dynamic speaker is used in a special acoustic compartment. The record changer compartment is lined with sound absorbing material to prevent undesirable acoustic resonances.

INSTALLATION

The Model 500 is shipped with the tuner (Figure 1) and the loudspeaker installed in the cabinet. The power amplifier (Figure 2) and the record changer are shipped in individual cartons.

To install the power amplifier it is necessary only to remove the unit from its packing carton, and place it in the compartment at the left of the speaker housing, as viewed from the rear of the cabinet. Install the unit with connecting sockets outward, that is, with the power transformer on the inside. Fasten the unit to the cabinet floor with the wood screws provided.

To install the record changer remove from packing carton, pull phono drawer fully forward, and set changer on the mounting board making sure that the spring mounts on the changer fit securely in the counterbored holes provided in the mounting panel. While doing this feed the a.c. cord and the pickup cord through the mounting board, making sure that they both clear moving parts of the mechanism. Now remove the board covering the back of the phono compartment. Dress the a.c. cord and the pickup lead in the clear under the mechanism. Fasten the a.c. cord at the right of the phono drawer, viewed from the rear of the cabinet. Then feed the a.c. cord through the right hand hole (the larger one) of the back board and the pickup lead through the left hand hole, and replace phono board. Insert the pickup plug in the socket labeled "PH" at the right rear of the tuner. Insert the a.c. cord of the phono in the a.c. receptacle of the power unit, dressing the cord so that it moves freely when the phono drawer is moved out and in.

Connect the tuner to the power amplifier by means of the outlets provided. The power pack a.c. cord should be plugged into the tuner receptacle labeled "Amplifier" (Figure 3).

NOTE: Do not use the tuner receptacle labeled "Phono" for a.c. supply to the record player. As described above, use the outlet in the power amplifier as this provides better dressing of the record player a.c. cord.

SERVICE ADJUSTMENT

Alignment Procedure

Check position of pointer on the dial scale. When the condenser gang is completely meshed the pointer should be at the last reference mark on the low frequency end of the dial - just beyond 55. The volume control should be fully to the right. The output of the signal generator should be adjusted only high enough to obtain an output reading. Do not use a metallic blade screwdriver for adjusting the IF transformers. Use an insulated blade which will accurately fit the slot in the iron cores. Care should be taken as it is easy to damage the cores with a poorly fitting screwdriver. To align see Figures 1, 3 and 4 and proceed as follows:

1. Connect the signal generator to pin #7 (grid) of the 6BE6 through a .1 mf capacitor and adjust the signal generator to 455 kc. Modulate at 400 cps. Set band switch to AM position, that is, fully to the left. Set the dial to a point of no interference from local broadcasting stations. Connect an a.c. voltmeter across the audio output (speaker) terminals, and adjust T7 and T5, both top and bottom, for maximum deflection of the output meter.

2. Connect the signal generator to pin #2 of loop socket through a 220 mmf condenser. Adjust signal generator to 1500 kc and modulate at 400 cps. Keep band switch in AM position, that is, fully to the left. Set the tuner dial to 1500 kc and adjust C1A, C1E and C1F for maximum deflection of audio output meter.

3. Set signal generator to 600 kc, adjust tuner dial for maximum response and then tune T1 and T11 for maximum deflection of audio output meter.

4. Return signal generator to 1500 kc and repeat operation #2.

5. Return signal generator to 600 kc and repeat operation #3.

6. Connect signal generator to pin #7 of the 6BE6 through a .01 mf coupling condenser. Set generator frequency to 10.7 mc without modulation. Set the band switch one step to the right and put the dial at a point of no interference from local FM stations. Connect audio voltmeter to output of diode filter F1 on lower side of IF transformer T6. Adjust T8, T6 and T4 (top and bottom) for maximum output deflection.

7. Transfer output voltmeter to output of FM discriminator (across C25) and adjust T9 for zero deflection. Be sure that voltmeter goes first plus and then minus (reverse voltmeter terminals) and set finally at zero.

8. Connect signal generator through a 300 ohm carbon resistor to FM antenna post and set to 104 mc modulated (FM) 400 cps. Connect audio voltmeter across output terminals. Adjust C1D, C1C, C1B and the bottom of T9 for maximum deflection of audio output voltmeter. This completes the alignment.

Dial Cord Drive

The correct method of installing the cord of the dial drive is given in Figure 6.

Voltage Readings

The voltage appearing on all sockets is given in Table I. Measurements are taken on the tuner in both AM and FM settings.

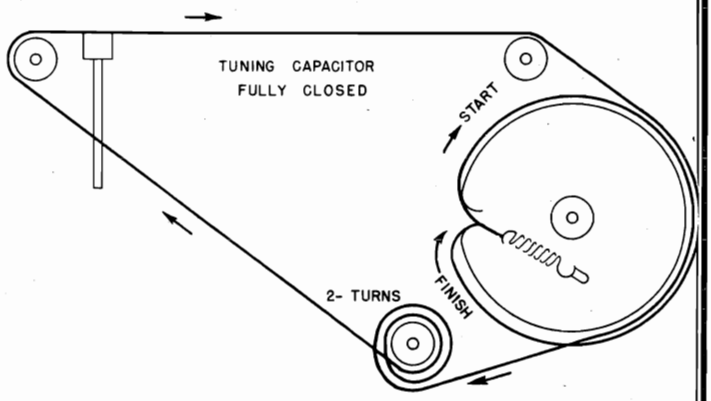

Figure 6 Dial Drive Cord Installation

RECORD CHANGER OPERATION

The Scott Special two speed record changer (standard 78 rpm and long playing 33 1/3 rpm) will operate only on a 105-125 volt 60 cycle power supply.

For reproduction of standard 78 rpm records the record changer is put in operation as follows:

1. Set control on the radio receiver to "PH" position. This is the knob directly to the left of the large tuning knob.
2. Make sure the LP tone arm is firmly in its rest bracket.
3. With the record changer selector control set at "A" (automatic) position, turn back the record stabilizing weight on the record shelf, then load 10 or 12 inch records (or a mixed stack if you desire). Loading should not exceed a 1 1/8 inch stack of records. Now turn the record stabilizing weight over onto the top record.
4. Set the speed control to the 78 rpm position.
5. Press the "ON" button and the record changer will operate. (The changer will shut off automatically after playing the last record.)
6. Adjust the volume control on the radio receiver for the desired output level and the bass and treble controls for desired tone quality.
7. If it is desired to reject a record that is playing, press the "ON" button all the way down and release it.
8. To play records one at a time set the selector control to the "M" position; place the record on the turntable and depress the "ON" button. At the conclusion of the record the changer must be turned off manually by depressing the "OFF" button.

9. The record changer may be stopped at any time while the record is being played, by pressing the "OFF" button. The pickup arm may be picked up off the record and returned to the "OFF" position.

NOTE: At all times when the phono player is not in operation be sure that the speed control is set to the center, or neutral position.

For reproduction of LP (long playing), 33 1/3 rpm records the record changer is put into operation as follows:

1. Remove any records that may happen to be on the turntable.
2. Remove center spindle, place LP record on turntable, center record carefully on turntable and replace spindle.
3. Turn speed control to the 33 1/3 position.
4. Set the selector control to "M" (manual) position.
5. Depress the "ON" button.
6. Remove LP tone arm from its rest bracket and carefully place it in the starting groove of the record.
7. On completion of the record carefully lift tone arm from record and place on rest bracket. Actuate "OFF" button by lifting the standard tone arm and replace, pressing down at the same time in order to operate the switch.

NOTE: When phono player is not in operation be sure that speed control is set at the center, or neutral position.

IMPORTANT: The LP record is fragile and the following precautions should be taken.

1. Handle gently to prevent scratching the soft record surface.
2. When placing pickup on record or removing pickup from record be careful not to damage record grooves by rough usage.
3. Always replace record in its envelope when not in use to prevent dust accumulations on the record surface or physical damage.
4. Keep records at normal room temperature.
5. Be sure that operating instructions are followed carefully. If, by incorrect procedure, the standard 78 rpm pickup should operate, and come to rest on an LP record, the record will be permanently damaged.
6. The LP tone arm should never be used on standard records or on a home recording. This use will seriously damage the pickup needle.

TUBE COMPLEMENT

The tube complement of the Series 500 Radio-Phonograph is as follows:

Symbol	Type	Application	Symbol	Type	Application
V1	6BA6	RF Amplifier	V8	6AL5	2nd Detector, FM
V2	6BE6	Converter AM & FM	V9	6SJ7	Audio Amplifier
V3	6J6	Oscillator, Reactance Mod.	V10	5Y3G	Rectifier
			V11	6J5	Audio Amplifier
V4	6BA6	IF Amplifier	V12	6SN7	Inverter, Driver
V5	6BA6	IF Amplifier, FM & 2nd Detector AM	V13	6L6G	Power Amplifier
			V14	6L6G	Power Amplifier
V6	6AU6	1st Limiter, FM	V15	5Y3G	Rectifier
V7	6AU6	2nd Limiter, FM	V16	5Y3G	Rectifier

FUSE REPLACEMENT

A fuse is provided in the power supply chassis for protection of the electrical circuits against overload. If the fuse blows replace it with a 3 ampere fuse. If the overload was momentary the replacement fuse will put the equipment back in working order. However, if the replacement fuse blows immediately, DO NOT replace it with a fuse of higher rating. The receiver must be checked to find and correct the cause of the overload.

TELEVISION SOUND RECEPTION

Used in conjunction with the Scott Model 6T11 Television Receiver, the high power, high quality audio and acoustic system of the Series 500 may be used in the reproduction of television sound. For this purpose a special audio cable is used to connect the audio output terminal on the 6T11 Television Receiver to the audio input terminal of the Series 500. The switch position "TV" on the Series 500 will make the audio system available for this service.

MODEL 6050, CHASSIS 132.825, 132.825-1, 132.825-2, 132.825-3, 132.825-4

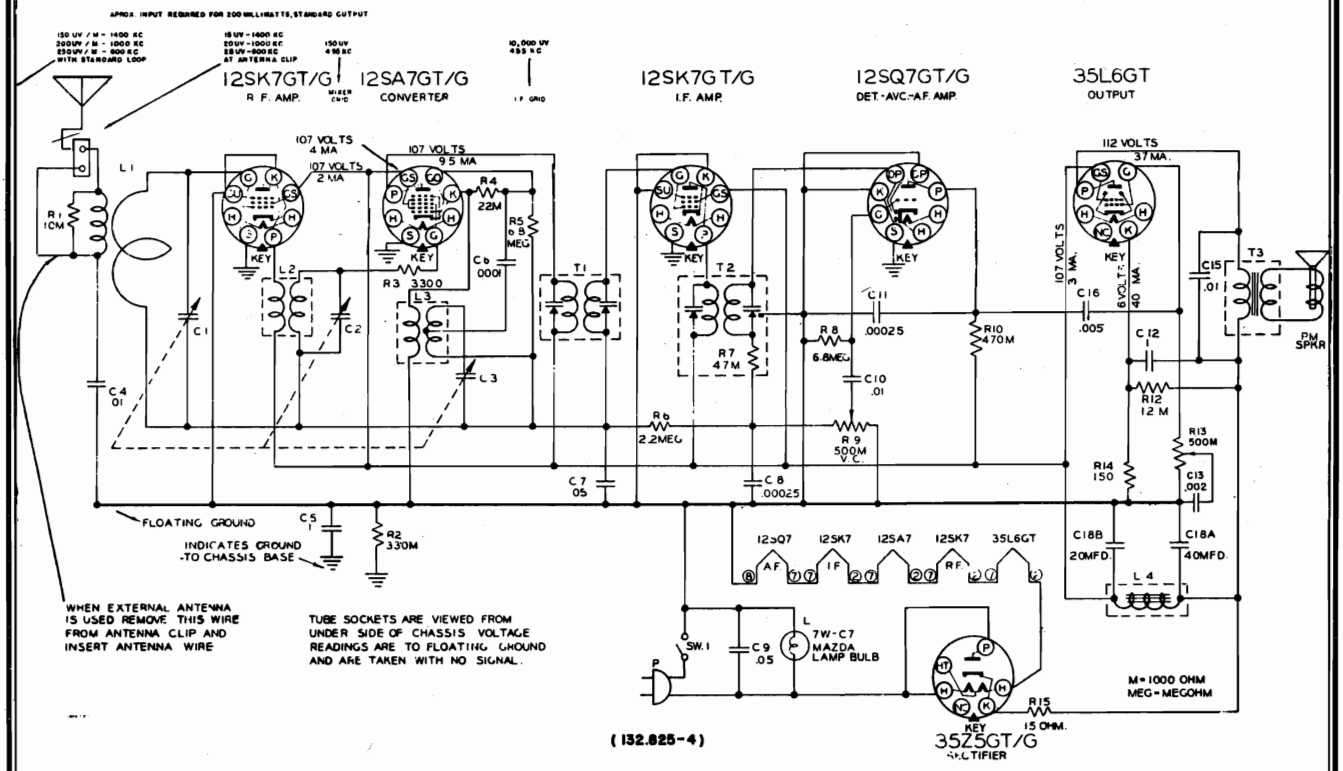
(132.825-3)

SERVICE NOTE: The a-c hum can often be greatly reduced on these chassis by replacing C12 with a 0.03-μf, 400-V capacitor. Sometimes the hum can be further reduced by replacing R12 with a 15,000-ohm, 1-watt resistor.



(132.825-4)

SPECIFICATIONS

Power Supply -- 105-125 Volts AC-DC, 45 Watts Tuning Range Broadcast Band 540-1600 Kc
Power Output Speaker
Undistorted .8 Watts, maximum - 2.5 Watts Voice Coil Impedance 3.2 Ohms

CHASSIS DIFFERENCES

Note: On a few of the 132.825 chassis, a 470 ohm resistor was placed across the heater of the 14R7 tube to equalize the warm up period of the tubes. This is not shown on the Circuit Diagram.

132.825-1

Addition of Suffix Number - I to Chassis Identification Number 132.825 covers the following changes from the 132.825 chassis.

1. Removal of the bass boost circuit to reduce hum.
2. Change in tone control circuit.
3. Circuit changes as follows: Tone control condenser C14, .1 mfd. 200V was C7, .05 mfd., 200v; C8, .01 mfd. 400V fixed tone condenser in output circuit was C12, .02 mfd. 400v; C13, .005 mfd., 600V was .005 mfd., 300V; R9, 470 ohm 1/4 watt resistor added to 14R7 tube socket between heater lugs; C12, .02 mfd., 400V was C7, .05 mfd., 200v, on 12SK7 screen grid to floating ground. C14, .1 mfd., 200V condenser: R8, 6800 ohm 1/4 watt resistor, R9 1,000 ohm 1/4 watt resistor and R12, 10,000 ohm 1/4 watt resistor deleted from cathode circuit of 12 SK7 and 35L6 tubes.
4. Revision of parts price list; schematic diagram: and parts layout.

132.825-2

Addition of Suffix Number 2 to Chassis Identification Number 132.825 covers the following changes from the 132.825-1 chassis.

1. RF coil N18598 is replaced by RF coil N19860.
2. The RF coil location is changed from the top of chassis to under chassis.
3. 470 ohm resistor deleted from 14R7 tube heater circuit.
4. The schematic diagram is redrawn with rearrangement of schematic location symbols in consecutive order from left to right without duplication.
5. Rearrangement of schematic location symbols on parts list and parts location drawings to correspond with schematic diagram.

132.825-3

Addition of Suffix Number - 3 to Chassis Identification Number 132.825 covers the following changes from the 132.825-2 chassis.

1. Addition of 12SQ7 tube and deletion of 14R7 tube.
2. Addition of hum bucking circuit in output stage (C12 & R12) from B+ to cathode of 35L6 tube, to replace the hum bucking circuit used in the 12SK7 screen grid circuit. Resistor R11, 1 megohm, 1/4 watt; and condensers C13, .05 mfd., C12 .02 mfd., and C15 .00025 mfd. deleted.
3. Resistor R10, in the plate circuit of the first audio tube changed from 100,000 ohms to 470,000 ohms.
4. Revision of parts price list: schematic diagram and parts and tube layouts.

Note: All schematic diagrams on the instruction sheets and chassis stickers supplied with radios bearing the chassis number 132.825-3 are incorrect. They show the secondary of the second IF transformer connected to the grid of the 12SQ7 tube, and both diodes of the tube connected to floating ground. The schematic diagram on this RL has been corrected.

132.825-4

Addition of Suffix Number - 4 to the Chassis Identification Number 132.825, covers the following changes from the 132.825-3 chassis.

1. Tone control changes from plate circuit to grid circuit of output tube.
2. Resistor R13, 500,000 ohms, part #N19967 was 20,000 ohms, N19530. Resistor R11, 470,000 ohms 1/4 watt deleted; condenser C13, .002 mfd. 600V was .1 mfd. 200V.
3. Revision of parts price list, and schematic diagram.

PRELIMINARY: ALIGNMENT PROCEDURE

Output meter connection..... Across Speaker Voice Coil
Output meter reading to indicate 200 mw (Standard output)..... .8 Volts
Dummy antenna value used in series with generator output..... See Chart Below
Connection of generator output lead..... See Chart Below
Connection of generator ground lead..... Floating Ground
Generator modulation..... 30% 400 Cycles
Position of volume control..... Fully clockwise
Position of tone control..... Treble
Position of dial pointer with variable fully closed..... Horizontal

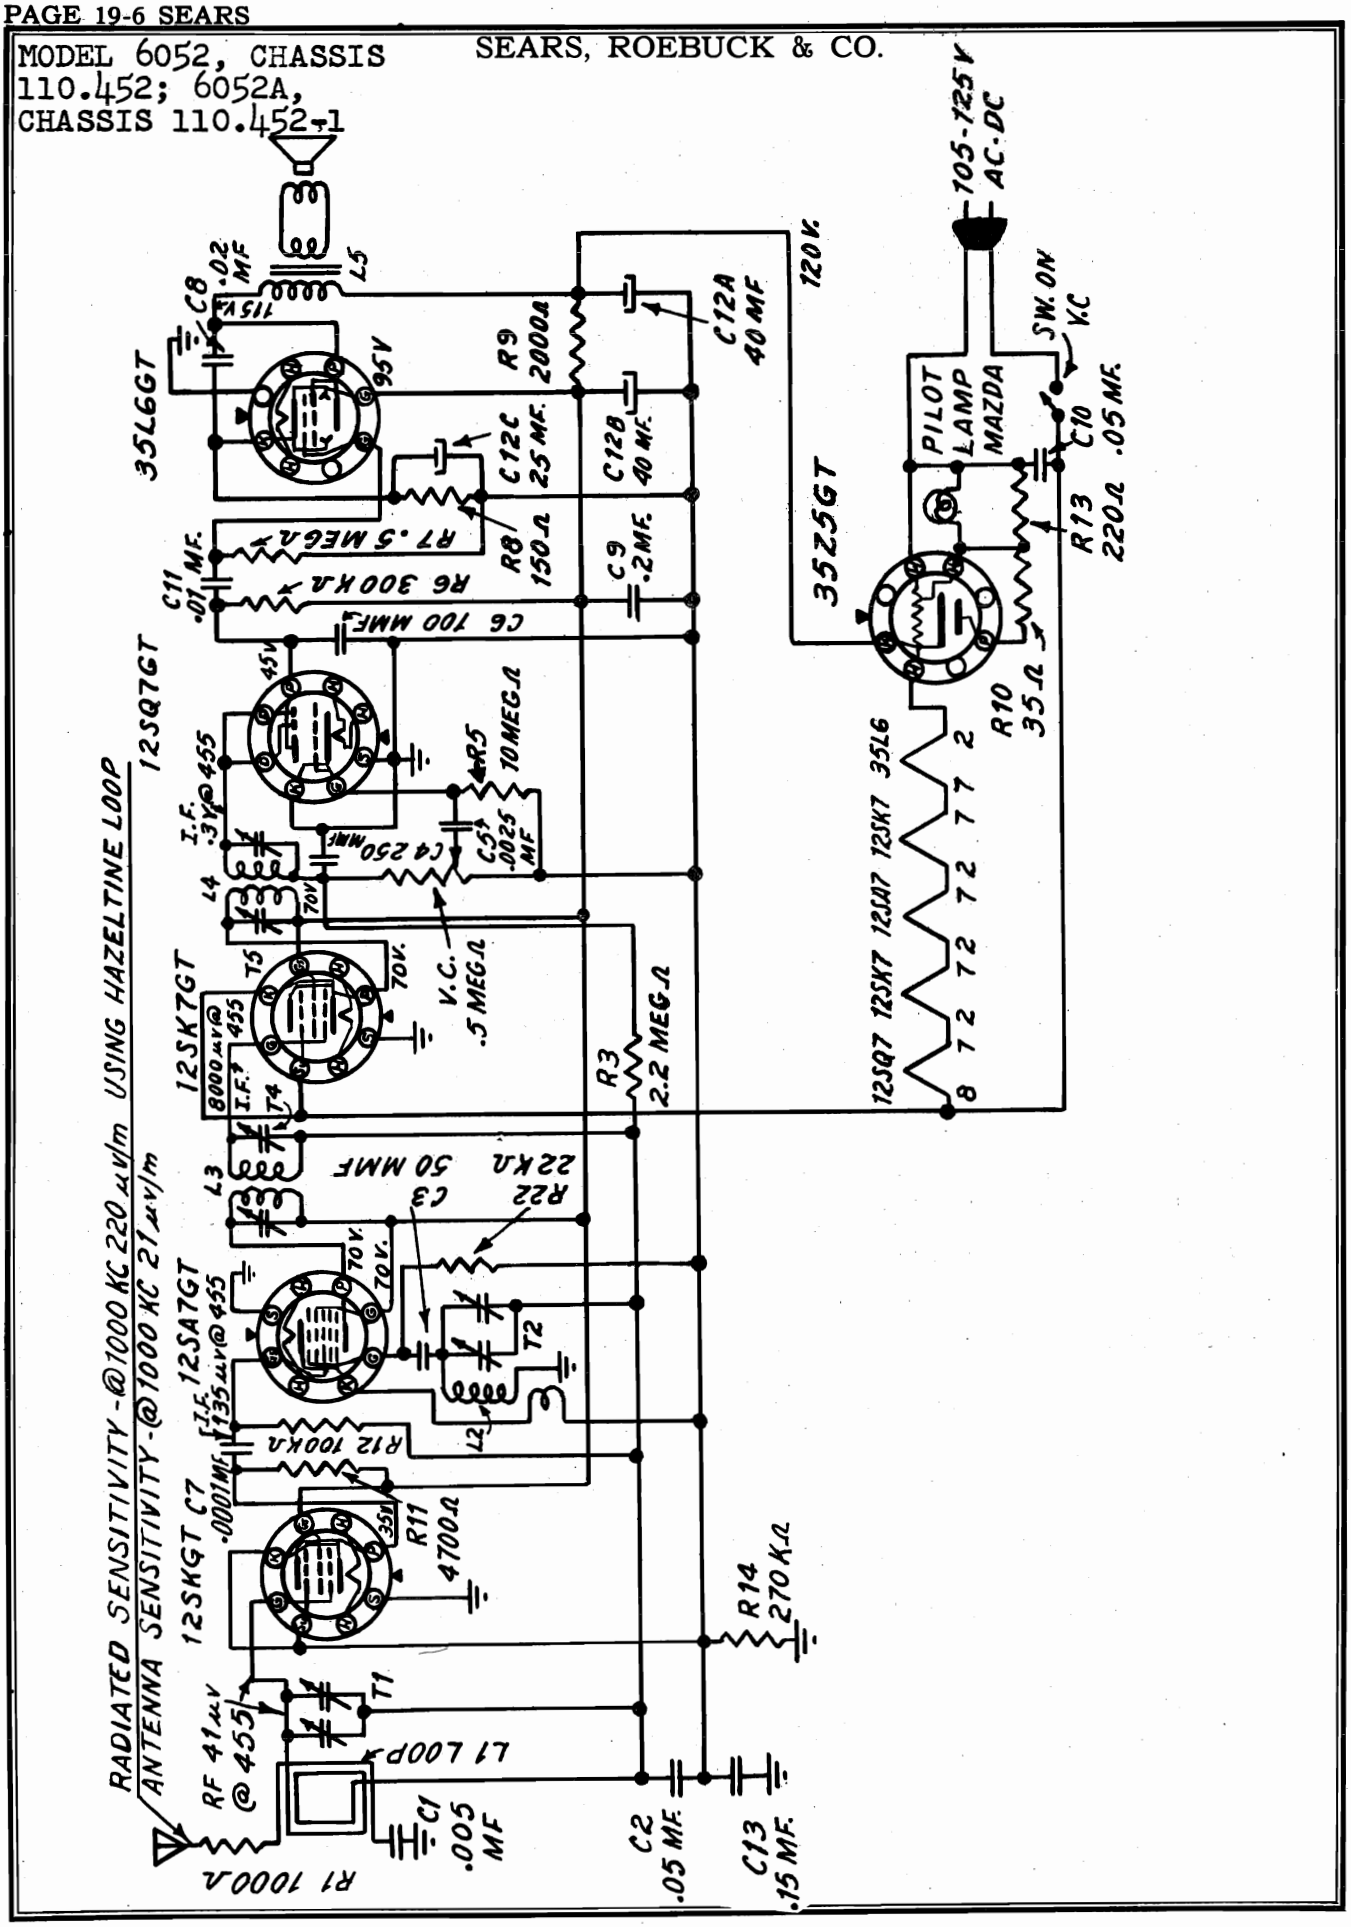
POSITION OF VARIABLE	FREQUENCY OF GENERATOR	DUMMY ANTENNA	GENERATOR OUTPUT CONNECTION	TRIMMERS ADJUSTED IN ORDER SHOWN FOR MAX. OUTPUT	FUNCTION OF TRIMMER
Open	455	.05 mfd.	12SA7 Grid (or Stator of C-2)	Top of 2nd & 1st IF Trans.	IF
1400	1400	.0002 mfd.	Antenna Clip (with black wire removed)	C-3; C-2; & C-1 Trimmers located on variable condenser	Oscillator Mixer RF

IMPORTANT ALIGNMENT NOTES:

1. Place set loop in the same position and at the same distance with respect to the back of the chassis as it would be when the set is mounted in the cabinet, during alignment of the RF stage.
2. If a standard test loop is used with the Signal Generator for alignment of the receiver, the black wire will be left in the antenna clip.
3. The alignment procedure should be repeated in the original order for greatest accuracy. Always keep the output from the signal generator at its lowest possible value to make the A.V.C. action of the receiver ineffective.

MODEL 6052, CHASSIS 110.452; 6052A, CHASSIS 110.452-1

SEARS, ROEBUCK & CO.



SEARS, ROEBUCK & CO.

MODEL 6052, CHASSIS 110.452; 6052A, CHASSIS 110.452-1

ALIGNMENT PROCEDURE

PRELIMINARY

OUTPUT METER CONNECTION . . . . . ACROSS LOUD SPEAKER VOICE COIL
METER READING FOR 1/2 WATT OUTPUT . . . . . 1.26 VOLTS
CONNECTION OF GENERATOR GROUND. . . . . FLOATING GROUND
GENERATOR MODULATION. . . . . APP. 30%. 400 CYCLES
POSITION OF VOLUME CONTROL. . . . . FULLY CLOCKWISE
POSITION OF DIAL POINTER WITH VARIABLE CONDENSER FULLY CLOSED . . . . . LAST LINE ON LEFT HAND SIDE OF SCALE

POSITION OF DIAL POINTER	GENERATOR FREQUENCY	GENERATOR CONNECTION	DUMMY ANTENNA	TRIMMERS ADJUSTED	FUNCTION
1000 KC	455 KC	R. F. GRID OF 12SA7	.2 MFD	T3. T4. T5. T6	I.F.
1500 KC	1500 KC	STANDARD RADIATING LOOP	.0002 MFD	T2. T1	OSC., R. F.
600 KC	600 KC	STANDARD RADIATING LOOP	.00020 MFD	CHECK POINT	*

It is advisable to repeat the entire alignment procedure in the original order to insure greater accuracy.

Always keep the output from the test oscillator at its lowest possible value. As the sensitivity is increased by alignment, the generator output should be reduced correspondingly.

Approximately 90 microvolts per meter input using standard Hazeltine alignment loop 24" from set for 1/2 watt output.

*Check the sensitivity at 600 KC, if weak, adjust antenna section plates for maximum output at 600 KC. Tracking is accomplished by adjusting plates of rotor.

Approximate stage by stage sensitivities are: R. F. Grid - 455 KC - 95 UV
R. F. Grid - 1000 KC - 150 UV, Antenna - 1500 KC - 40 UV, 600 KC - 60 UV

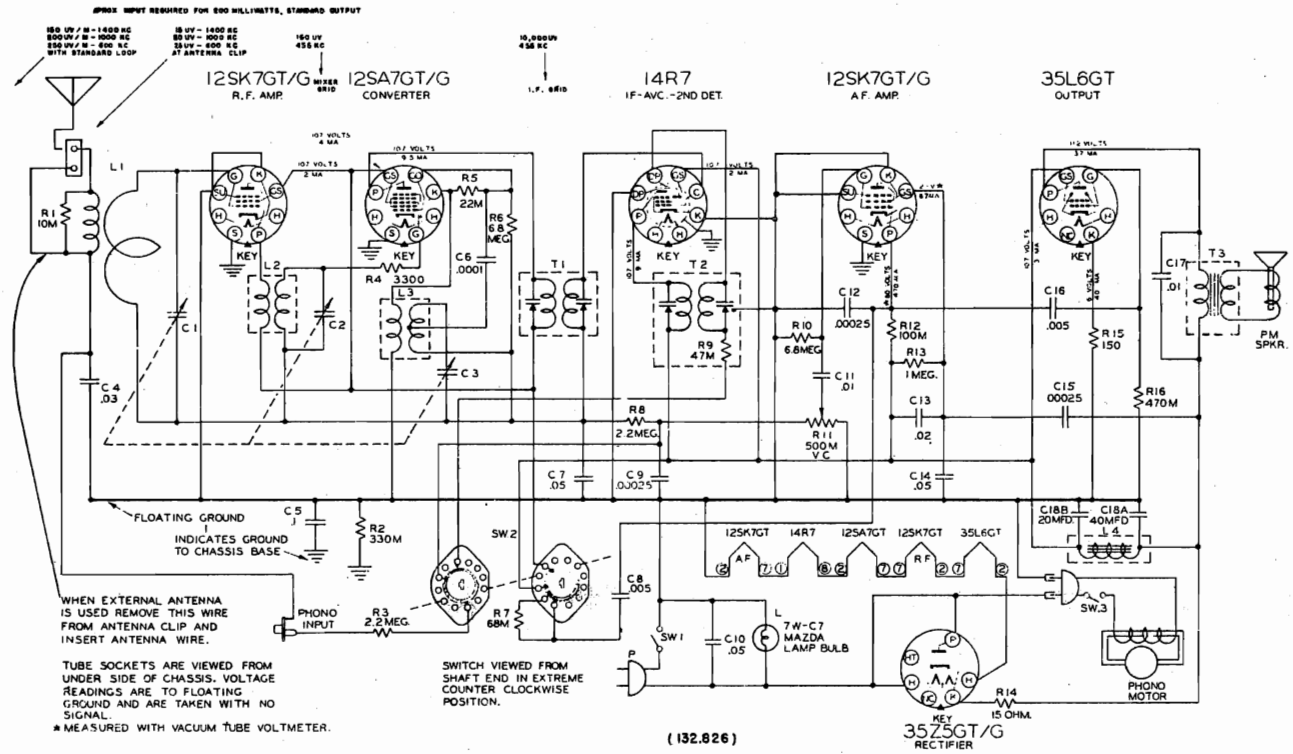
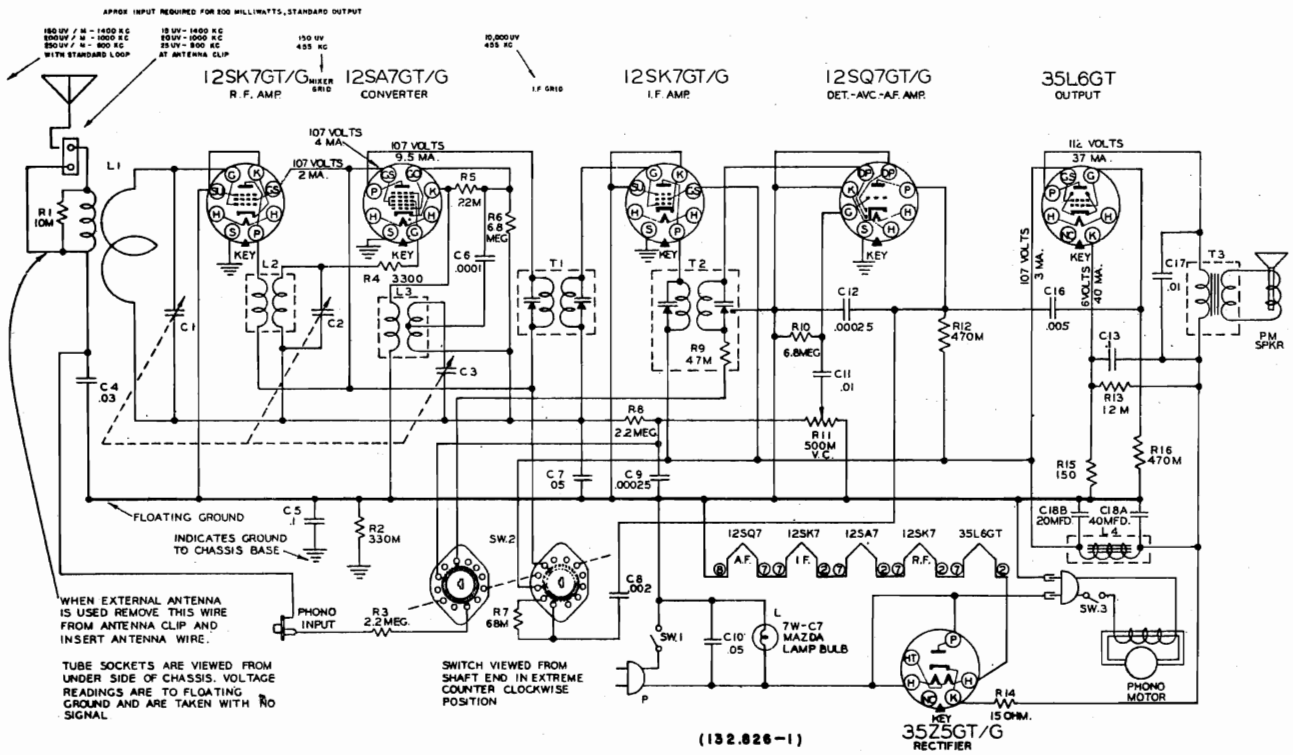
MODEL 6071, CHASSIS 132.826, 132.826-1

SEARS, ROEBUCK & CO.





SERVICE NOTE: The a-c hum can often be greatly reduced on this chassis by replacing C13 with a 0.03-μf, 400-V capacitor. Sometimes the hum can be further reduced by replacing R13 with a 15,000-ohm, 1-watt resistor.

CHASSIS DIFFERENCES

Addition of Suffix Number "1" to Chassis Identification Number 132.826, covers the following changes:

1. Addition of 12SQ7GT/G tube, deletion of 14R7 tube, addition of hum bucking circuit in output circuit to replace the one previously used in the screen circuit of the 12SK7 AF Amp. tube. Change 1st IF coil to increase sensitivity.
2. R12 - 470-M was 100M; R13 - 12M was 1 meg; C8 - .002 uf. was .005 uf; C13 - .1 mfd 400 V was .02 mfd 200 V; C14 & C15 deleted; T1, 1st IF coil, N21009 was N18581.
3. Revision of Parts List Prices, Schematic Diagram, Parts & Tube Layout Drawings.

MODEL 6071, CHASSIS 132.826, 132.826-1

SEARS, ROEBUCK & CO.

SPECIFICATIONS

Power Supply -- 105-125 volts AC, 65 watts
Power Output
Undistorted .8 watts, maximum - 2.5 watts
Tuning Range Broadcast Band 540-1600 Kc
Speaker
Voice Coil Impedance 3.2 Ohms

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection .....Across Speaker Voice Coil
Output meter reading to indicate 200 mw (Standard Output)..... .8 Volts
Dummy antenna value used in series with generator output ..... See Chart Below
Connection of generator output lead..... See Chart Below
Connection of generator ground lead..... Floating Ground
Generator modulation..... 30% 400 Cycles
Position of volume control..... Fully Clockwise
Position of tone control..... Treble
Position of dial pointer with variable fully closed..... Horizontal

POSITION OF VARIABLE	FREQUENCY OF GENERATOR	DUMMY ANTENNA	GENERATOR OUTPUT CONNECTION	TRIMMERS ADJUSTED IN ORDER SHOWN FOR MAX. OUTPUT	FUNCTION OF TRIMMER
Open	455	.05 mfd.	12SA7 Grid (or Stator of C-2)	Top of 2nd & 1st IF Trans.	IF
1400	1400	.0002 mfd.	Antenna Clip (with black wire removed)	C-3; C-2; & C-1 Trimmers located on Variable Condenser	Oscillator Mixer RF

IMPORTANT ALIGNMENT NOTES:

1. Place set loop in the same position and at the same distance with respect to the back of the chassis as it would be when the set is mounted in the cabinet, during alignment of the RF stage.
2. If a standard test loop is used with the Signal Generator for alignment of the receiver, the black wire will be left in the antenna clip.
3. The alignment procedure should be repeated in the original order for greatest accuracy. Always keep the output from the signal generator at its lowest possible value to make the A. V. C. action of the receiver ineffective.

ALIGNMENT PROCEDURE

Preliminary:

Output Meter Connection.....Across Loud Speaker Voice Coil
Output Meter Reading to Indicate 50 Milliwatts (Standard Output).....1.2 Volts
Generator Ground Lead Connection.....Receiver Chassis
Dummy Antenna Value to be in Series with Generator Output.....See Chart Below
Connection of Generator Output Lead.....See Chart Below
Generator Modulation.....30%, 400 Cycles
Position of Volume Control.....Fully on
Position of Tone Control.....Treble
Position of Pointer with Tuner Fully Closed.....Last Line Below 540 Calibration Mark

WAVE BAND SWITCH POSITION	POSITION OF TUNER	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	ADJUSTMENTS (IN ORDER SHOWN)	TRIMMER FUNCTION
BC	Closed	455 KC	.1 Mfd.	7H7 Transl. Grid	T2, T1	I. F.
BC	Open	1750 KC	.0002 Mfd.	Ant. Terminal	C6	Oscillator
BC	1410	1410 KC	.0002 Mfd.	Ant. Terminal	C5, C1	Ant., Transl.
BC	600 (rock)	600 KC	.0002 Mfd.	Ant. Terminal	C7	Padder
SW	Open	18.3 MC	400 Ohms	Ant. Terminal	C10	Oscillator
SW	15 (rock)	15 MC	400 Ohms	Ant. Terminal	C2	Transl.

IMPORTANT ALIGNMENT NOTES

The Alignment must be done in the order given.

The Alignment Procedure should be repeated step by step in the original order for greatest accuracy.

Always keep the output power from the generator at its lowest possible value to prevent the AVC of the receiver from interfering with accurate alignment.

During alignment of the BC Band Padder and the SW Band Translator Trimmers, the Tuner should be rocked through resonance to assure alignment.

Power Output — Undistorted 3.6 Watts — Maximum 6.5 Watts

SPECIFICATIONS

Power Supply:
All models available.....117 Volts 60 Cycles AC 100 Watts

Frequency Range:
Broadcast.....540-1700 KC
Short Wave.....6-18 MC

GENERAL INFORMATION AND SERVICE HINTS

MATCHING THE ANTENNA:

Before proceeding with this adjustment the receiver should be left on for about 15 minutes to warm up.

An adjusting screw, accessible to a screw driver through a hole in the bottom cover of the case, is provided to match the receiver to the car antenna. With the receiver adjusted for "DIAL" tuning, use the Station Selector knob to tune in a very weak station at about 1400 kilocycles, with the volume control fully on. Then turn the adjusting screw to the point affecting maximum volume.

THE PUSH BUTTON TUNING MECHANISM:

Preselection of push button tuned stations is accomplished by settings of the iron cores in the oscillator coils and settings of the trimmer condensers across the antenna coil. The proper coils are selected by a switch which is rotated one step at a time by means of a solenoid, controlled by the tuning push button. Pushing the button also mechanically rotates the station call letter drum.

Each button can be set only to a station within a certain frequency range as follows:

STATION	FREQUENCY RANGE
#1	535 to 920 Kc
#2	630 to 1070 Kc
#3	690 to 1170 Kc
#4	850 to 1450 Kc
#5	950 to 1610 Kc

To set up the mechanism, insert the call letter tabs in their proper frequency order in the call letter drum. The drum is accessible by removing the snap-in button at the top of the push button unit before mounting the unit. One of the positions is for manual tuning. When this position is reached, the manual tuning dial will become illuminated and the receiver can be tuned manually.

Stations are set up by removing the front grille of the receiver, exposing the station tuning screws. The adjusting screws are labeled. The Osc. screw must be adjusted first; then the ANT. screw. Then repeat the two adjustments.

TO SYNCHRONIZE THE MECHANISM, PUSH THE TUNING BUTTON UNTIL THE MANUAL TUNING DIAL BECOMES ILLUMINATED. REMOVE THE PUSH BUTTON CABLE FROM ITS SOCKET IN THE SIDE OF THE RECEIVER CASE AND THEN PUSH THE BUTTON UNTIL THE "DIAL" TAB COMES INTO VIEW. THEN REINSERT THE CABLE PLUG.

Under certain conditions the mechanism may fall out of synchronism if the button is not pushed all the way in and completely released when operating it. The user should be instructed accordingly.

ALIGNMENT PROCEDURE

PRELIMINARY:

Output Meter Connection.....Across Loud Speaker Voice Coil
Output Meter Reading to Indicate Standard Output of 1.0 Watt.....1.78 Volt
Connection of Signal Generator Ground Lead.....Receiver Chassis
Connection of Signal Generator Output Lead.....See Chart Below

MODEL 8010,
CHASSIS 132.840

SEARS, ROEBUCK & CO.

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection ..... Across Speaker Voice Coil
Output meter reading to indicate 200 MW (Standard output) ..... .8 Volt
Generator modulation ..... 30 % 400 Cycles
Position of volume control ..... Fully Clockwise
Dial pointer position with variable condenser closed ..... Last Mark on Dial

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION (HIGH SIDE)	GENERATOR CONNECTION GND. LEAD	ADJUST TRIMMERS ORDER SHOWN	TRIMMER FUNCTION
Open	455 KC	.05 Mfd.	Mixer Grid	Fltg. Gnd.	T2-T1	IF
1400 KC	1400 KC	50 Mmf.	*Ant. Lead	Fltg. Gnd.	C2B	Oscillator
1400 KC	1400 KC	50 Mmf.	*Ant. Lead	Fltg. Gnd.	C2A	Antenna
600 KC	600 KC	50 Mmf.	*Ant. Lead	Fltg. Gnd.	**Check Point	Antenna

IMPORTANT ALIGNMENT NOTES

* Connect generator lead to green wire on loop antenna or a test loop may be used on the generator placed a short distance from the set loop.
**Check sensitivity at 600 KC. If low, adjust antenna section plates of variable for maximum output at 600 KC.
The alignment procedure should be repeated in the original order for greatest accuracy. Always keep the output from the signal generator at its lowest possible value to make the A. V. C. action of the receiver ineffective.

TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO NEG. "B", AND ARE TAKEN WITH NO SIGNAL, AND WITH LINE VOLTAGE AT 117 VOLTS. VOLTAGE READINGS ARE TAKEN WITH A VOLTMETER HAVING A RESISTANCE OF ONE THOUSAND OHMS PER VOLT. WHERE NO READING IS GIVEN THE VOLTAGE IS ZERO OR TOO LOW TO READ.

ALIGNMENT PROCEDURE

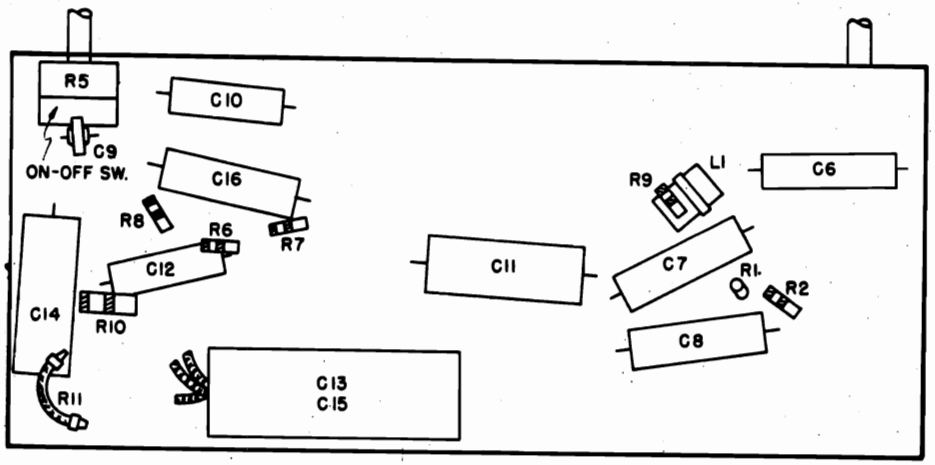
PRELIMINARY

Output Meter reading to indicate 0.05 Watt across voice coil . . . . . 0.4 Volt
Generator ground lead connection . . . . . I.F. alignment-negative "B" lead
. . . . . R.F. alignment-Receiver chassis
Generator Modulation . . . . . 30%, 400 cycles
Position of Volume Control . . . . . Fully on
Position of pointer with tuner fully closed . . . . . Last line to left of 540 Kc. calibration mark on escutcheon or light brown mark about 1 inch from the left hand end on the lower edge of dial background.

Frequency Range:
Broadcast . . . . . 540-1600 KC

Power Output
Undistorted . . . . . 1.0 Watt
Maximum . . . . . 1.5 Watts

Power Supply:
All models available . . . . . 117 Volts DC, 25-60 Cycles AC, 30 Watts



LOCATION OF PARTS UNDER CHASSIS

POSITION OF TUNER	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	TRIMMERS (ADJ. IN ORDER SHOWN)	TRIMMER FUNCTION
Closed	455 Kc.	0.1 mfd.	Transl.-Grid	T2 & T1	I.F.
Fully Open	1650 Kc.	.0002 mfd.	Ant.	C4	Osc.
See Note Below	1410 Kc.	.0002 mfd.	Ant.	C2	Ant.

IMPORTANT ALIGNMENT NOTES

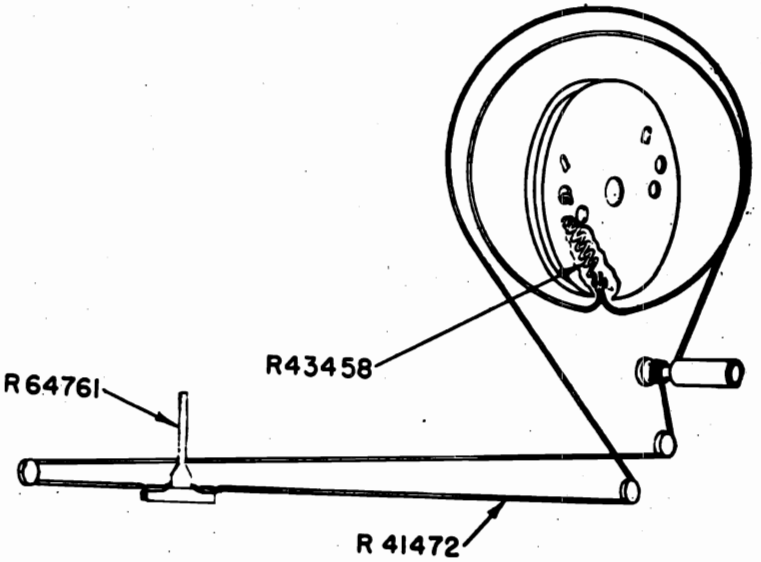
NOTE: It is recommended that an isolation transformer be connected between the radio chassis and the line before aligning receiver on A.C.

The 1410 Kc. calibration point is a light brown mark about 2 inches from the right-hand end on the lower edge of the dial background.

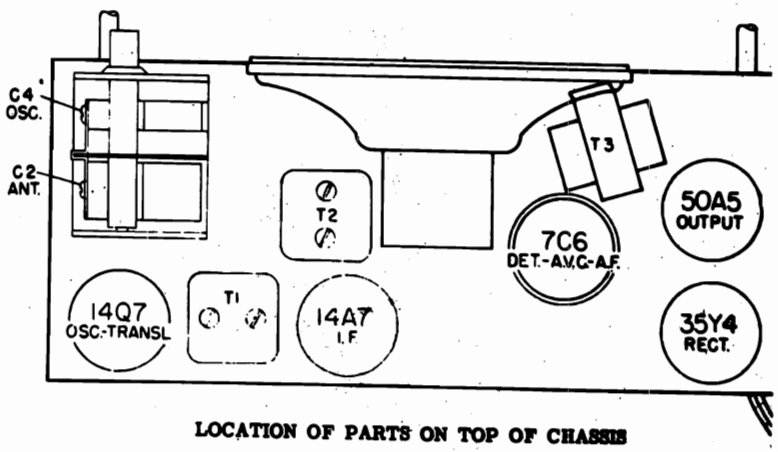
The Alignment must be done in the order given.

The entire Alignment Procedure should be repeated step by step in the original order for greatest accuracy.

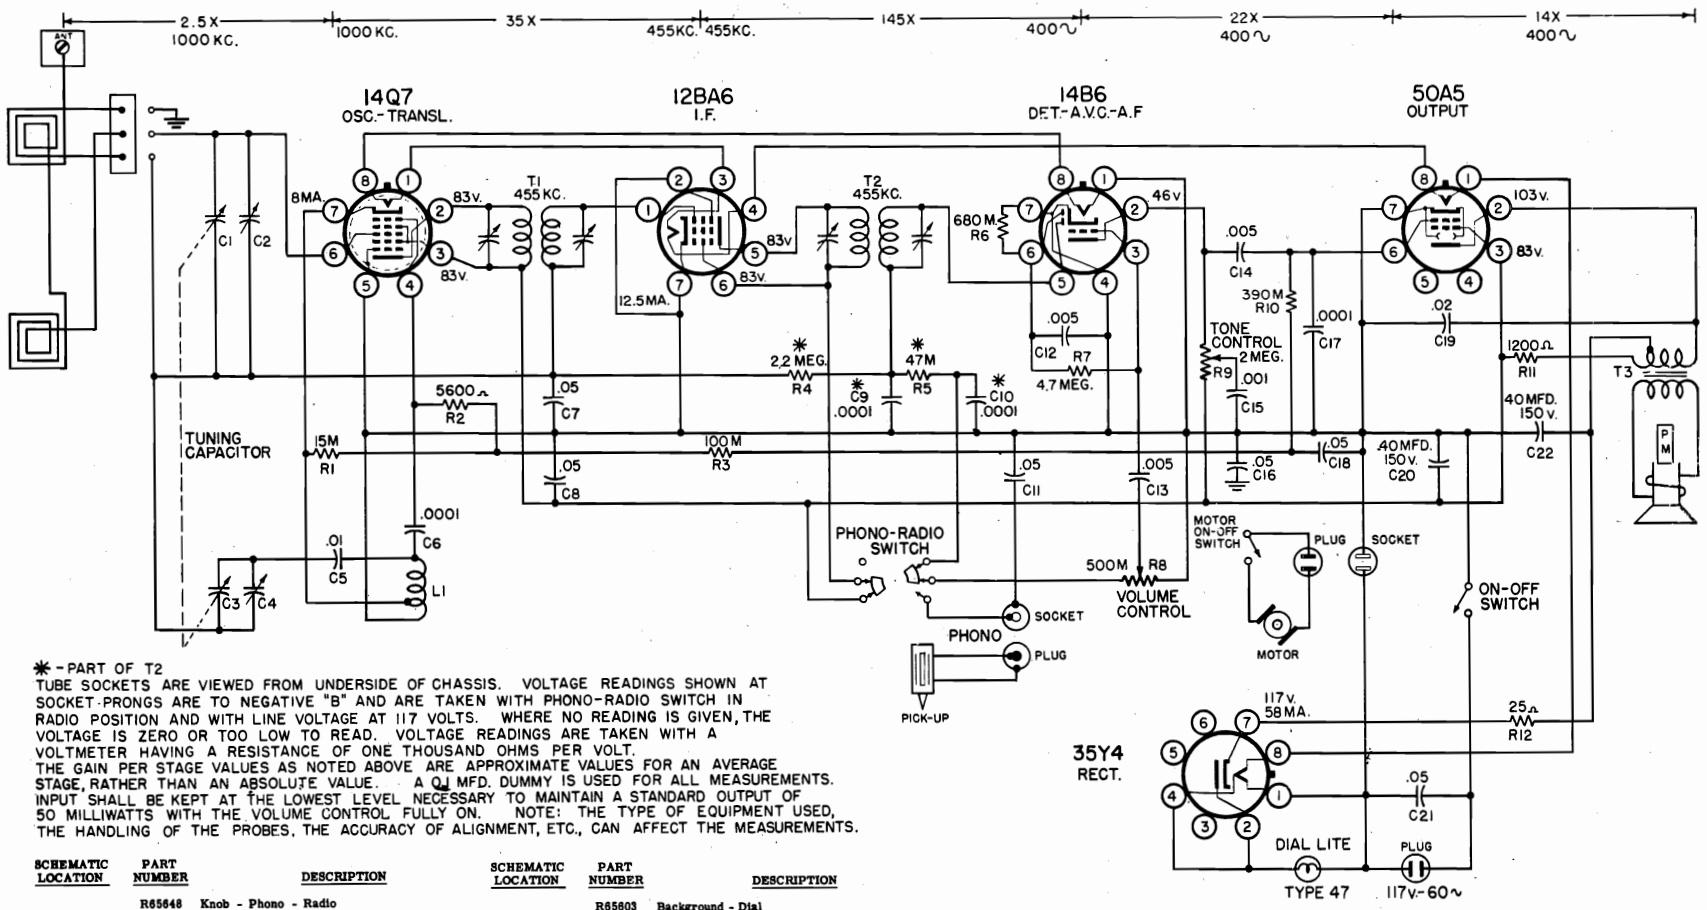
Always keep the output from the generator at its lowest possible value to prevent the AVC of the receiver from interfering with accurate alignment.



STRING AND POINTER HOOKUP



LOCATION OF PARTS ON TOP OF CHASSIS



✱ - PART OF T2

TUBE SOCKETS ARE VIEWED FROM UNDERSIDE OF CHASSIS. VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO NEGATIVE "B" AND ARE TAKEN WITH PHONO-RADIO SWITCH IN RADIO POSITION AND WITH LINE VOLTAGE AT 117 VOLTS. WHERE NO READING IS GIVEN, THE VOLTAGE IS ZERO OR TOO LOW TO READ. VOLTAGE READINGS ARE TAKEN WITH A VOLTMETER HAVING A RESISTANCE OF ONE THOUSAND OHMS PER VOLT.

THE GAIN PER STAGE VALUES AS NOTED ABOVE ARE APPROXIMATE VALUES FOR AN AVERAGE STAGE, RATHER THAN AN ABSOLUTE VALUE. A .01 MFD. DUMMY IS USED FOR ALL MEASUREMENTS. INPUT SHALL BE KEPT AT THE LOWEST LEVEL NECESSARY TO MAINTAIN A STANDARD OUTPUT OF 50 MILLIWATTS WITH THE VOLUME CONTROL FULLY ON. NOTE: THE TYPE OF EQUIPMENT USED, THE HANDLING OF THE PROBES, THE ACCURACY OF ALIGNMENT, ETC., CAN AFFECT THE MEASUREMENTS.

* PART OF T2

TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO NEGATIVE "B" AND ARE TAKEN WITH NO SIGNAL, WITH PHONO-BAND SWITCH IN BC. POSITION, AND WITH LINE VOLTAGE AT 117 VOLTS. VOLTAGES SHOWN ARE TAKEN WITH A VOLTMETER HAVING A RESISTANCE OF ONE THOUSAND OHMS PER VOLT. WHERE NO READING IS GIVEN, THE VOLTAGE IS ZERO OR TOO LOW TO READ.

PHONO-BAND SWITCH IS SHOWN IN EXTREME COUNTER-CLOCKWISE (S.W.) POSITION (VIEWED FROM SHAFT END) AND ROTATES CLOCKWISE FROM S.W. TO BC. TO PHONO. SECTIONS MARKED "REAR" ARE TRANSPARENT VIEWS.

Six Tube Superhetrodyne Receiver with Push Button Tuning and Automatic Record Changer

Chassis 101.833-1A same as 101.833 except those parts

SPECIFICATIONS

Power Supply:
All models available.....117 Volts 60 Cycles AC 60 Watts

Frequency Range:
Broadcast.....540-1600 KC
Short Wave.....6-18 MC

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter reading to indicate 0.05 Watt across voice coil.....0.4 Volt
Generator ground lead connection.....I.F. alignment-negative "B" lead
.....R.F. alignment-Receiver chassis
Generator Modulation.....30%, 400 cycles
Position of volume control.....Fully on
Position of tone control.....Treble
Position of pointer with tuner fully closed.....Last line to left of 540 calibration mark on the dial scale or first light brown mark from the left-hand end on the upper edge of the dial background.

WAVE SWITCH POSITION	POSITION OF TUNER	FREQUENCY GENERATOR	DUMMY ANTENNA	GENERATOR CONNECTION	TRIMMERS (ADJ. IN ORDER SHOWN)	TRIMMER FUNCTION
BC	Closed	455 Kc.	0.1 mfd.	Transl.-Grid	T2 & T1	I.F.
BC	Fully open	1650 Kc.	200 mmfd.	Antenna	C10	Osc.
BC	See Note 1	1400 Kc.	200 mmfd.	Antenna	C7	Transl.
BC	See Note 1	1400 Kc.	200 mmfd.	Antenna	C5	Ant.
BC	See Note 2	600 Kc. (Rock)	200 mmfd.	Antenna	C16	Padder
SW	16.5 Mc.	16.5 Mc.	400 ohms	Antenna	C15	Osc.
SW	See Note 1	14 Mc. (Rock)	400 ohms	Antenna	C9	Transl.
SW	See Note 1	14 Mc. (Rock)	400 ohms	Antenna	C2	Ant.

IMPORTANT ALIGNMENT NOTES:

NOTE 1: The 1400 Kc. & 14 Mc. calibration point is the second light brown mark from the right-hand end on the upper edge of the dial background.

NOTE 2: The 600 Kc. calibration point is the third light brown mark from the left-hand edge of the dial background.

The Alignment must be done in the order given.

The entire Alignment Procedure should be repeated step by step in the original order for greatest accuracy.

Always keep the output from the generator at its lowest possible value to prevent the AVC receiver from interfering with accurate alignment.

During alignment of the "BC" Band Padder and the "SW" Band R.F. and Antenna Trimmers, the tuner should be rocked through resonance to assure alignment.

A	See Note	9.6 Mc.	400 ohms	Antenna	C3 & C18	Ant., Transl.

IMPORTANT ALIGNMENT NOTES.

NOTE: Before alignment of receiver, remove the dial background. The tuner should be positioned at the frequency noted under "GENERATOR FREQUENCY" on the above chart. These frequencies are noted on the dial background mounting plate. "START," shall be considered the position of the tuner fully closed and "FINISH," the position of the tuner at 1725 Kc.

During the alignment of the antenna and translator trimmers on the shortwave spreadbands the tuner should be rocked through resonance to assure alignment.

The alignment must be done in the order given.

The entire alignment procedure should be repeated step by step in the original order for greatest accuracy.

Always keep the output power from the generator at its lowest possible value to prevent the AVC action of the receiver from interfering with accurate alignment.

Before attempting shortwave alignment, the L5 core should be adjusted to a dimension of approximately 1-21/32" from the top of core to the top turn of the winding. This should be done with the tuner in the 1725 Kc. position.

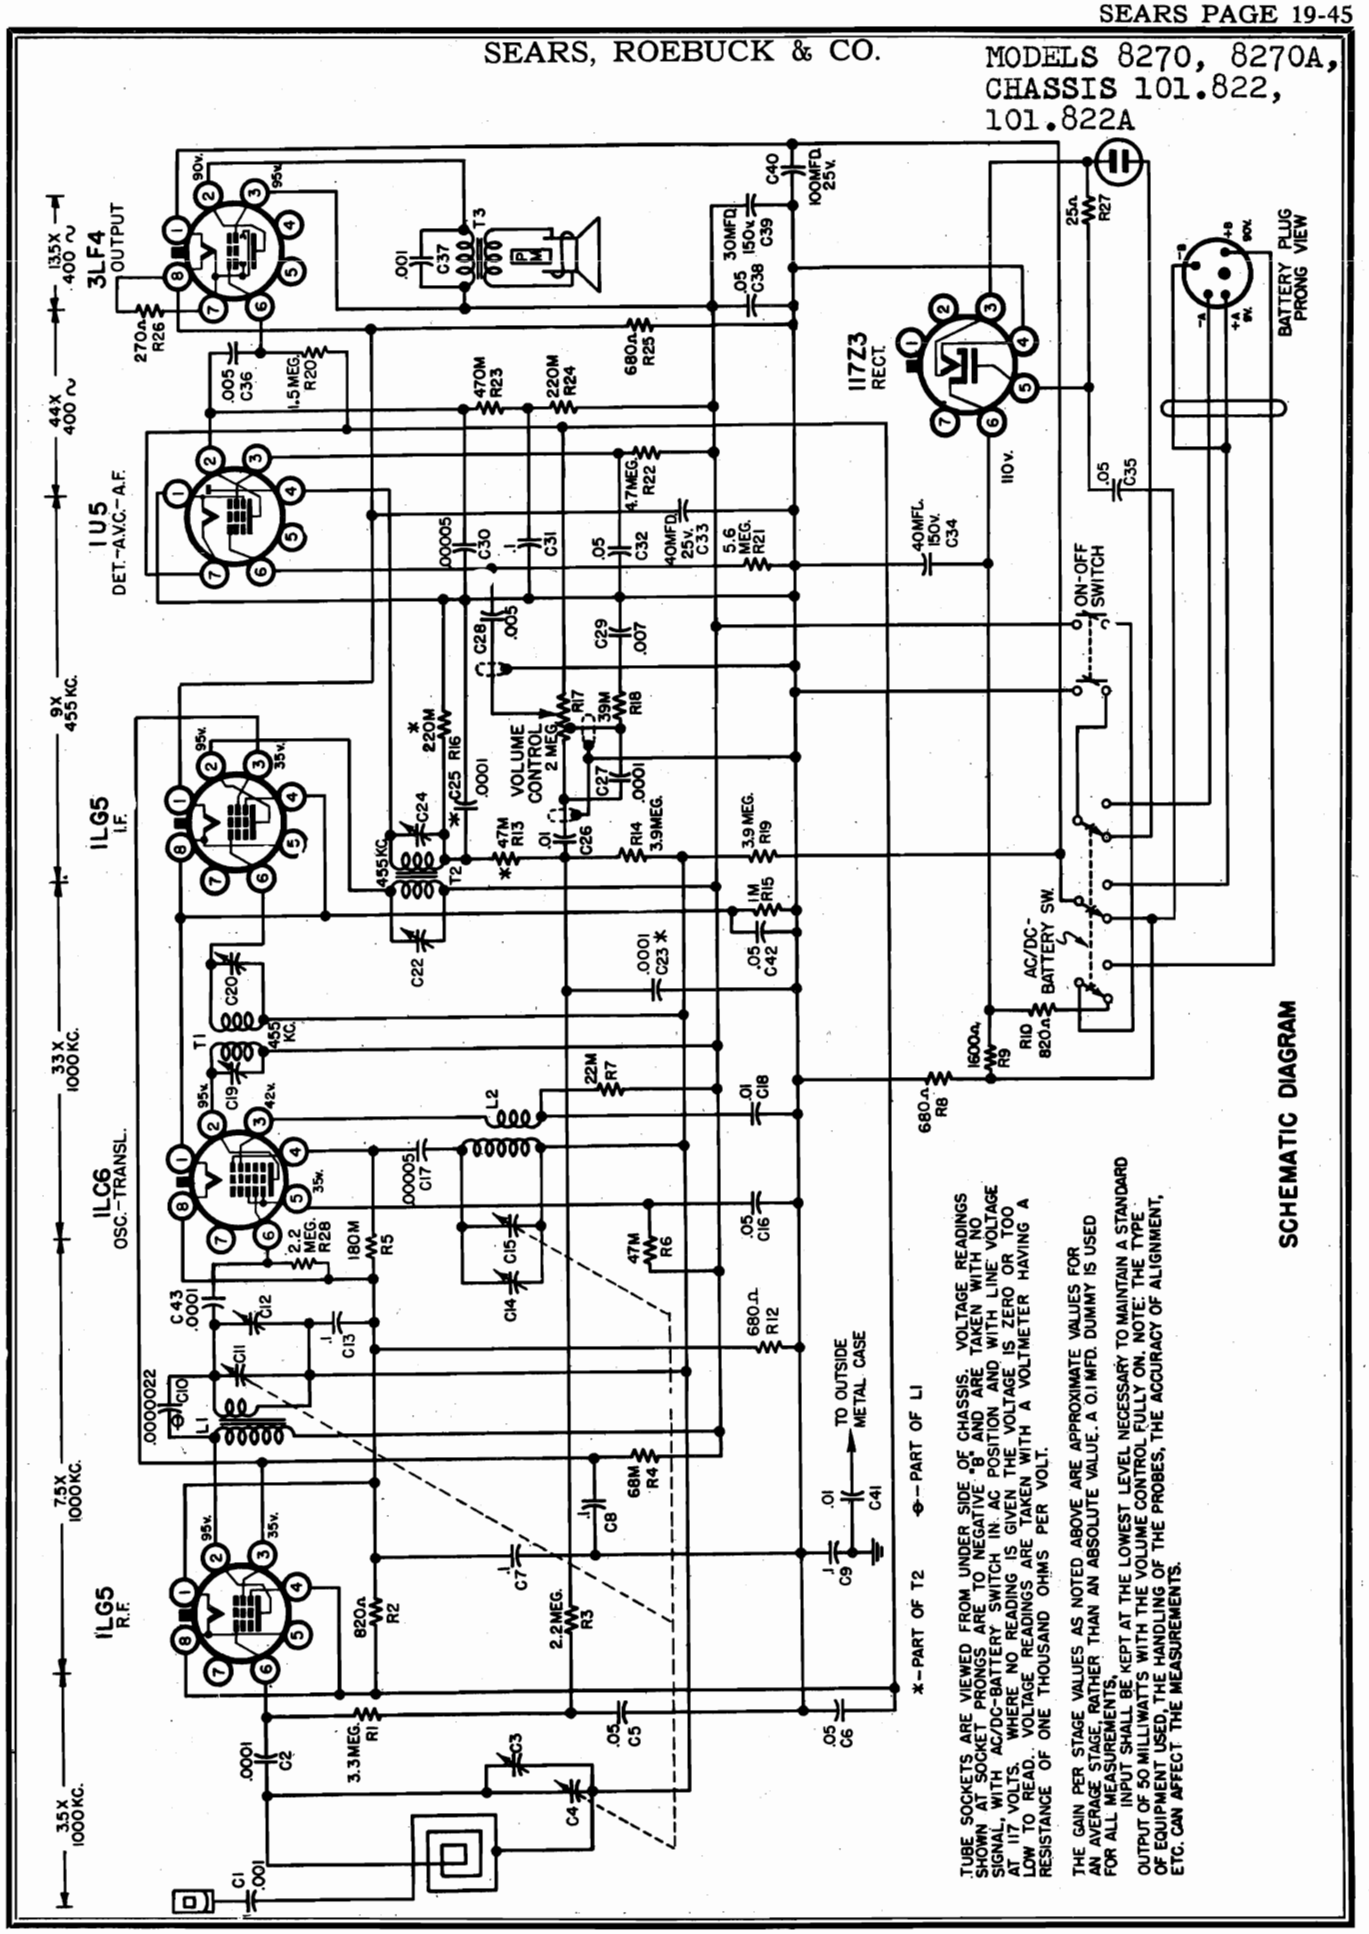
MODELS 8270, 8270A,
CHASSIS 101.822,
101.822A



TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO NEGATIVE "B" AND ARE TAKEN WITH NO SIGNAL, WITH AC/DC-BATTERY SWITCH IN AC POSITION AND WITH LINE VOLTAGE AT 117 VOLTS. WHERE NO READING IS GIVEN THE VOLTAGE IS ZERO OR TOO LOW TO READ. VOLTAGE READINGS ARE TAKEN WITH A VOLTMETER HAVING A RESISTANCE OF ONE THOUSAND OHMS PER VOLT.

THE GAIN PER STAGE VALUES AS NOTED ABOVE ARE APPROXIMATE VALUES FOR AN AVERAGE STAGE, RATHER THAN AN ABSOLUTE VALUE. A 0.1 MFD. DUMMY IS USED FOR ALL MEASUREMENTS.

INPUT SHALL BE KEPT AT THE LOWEST LEVEL NECESSARY TO MAINTAIN A STANDARD OUTPUT OF 50 MILLIWATTS WITH THE VOLUME CONTROL FULLY ON. NOTE: THE TYPE OF EQUIPMENT USED, THE HANDLING OF THE PROBES, THE ACCURACY OF ALIGNMENT, ETC. CAN AFFECT THE MEASUREMENTS.

MODEL 9054,
CHASSIS 101.849

SEARS, ROEBUCK & CO.

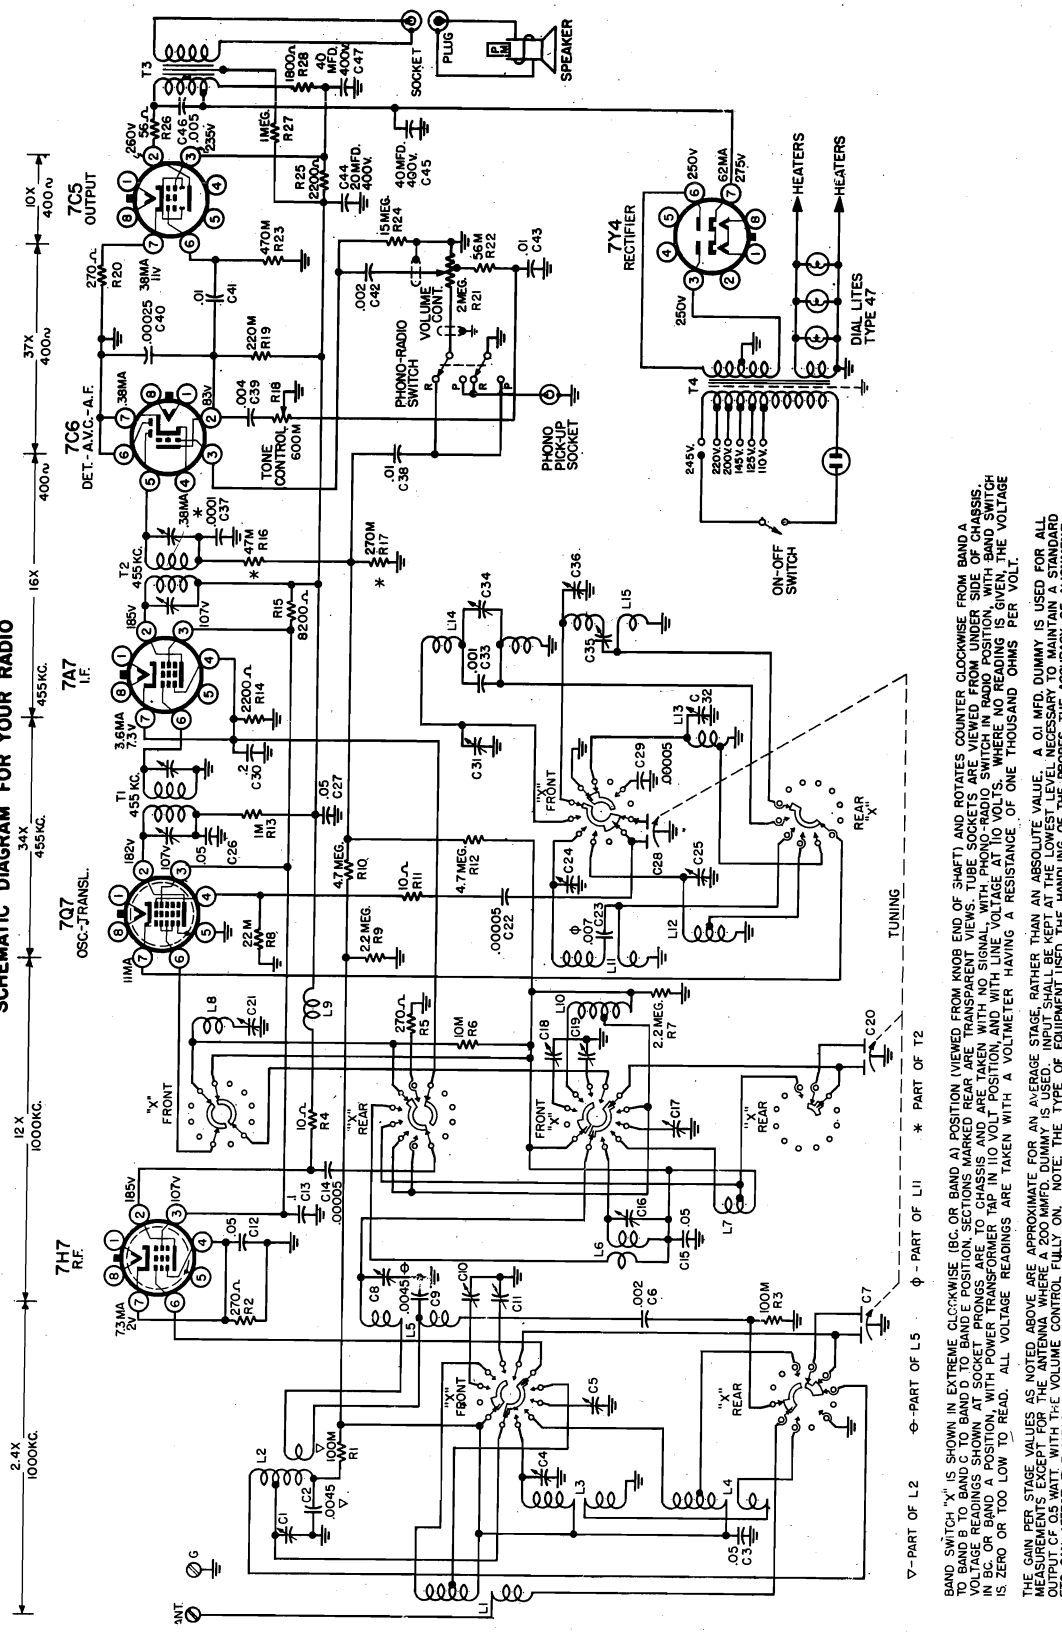
SPECIFICATIONS

Power Supply:
All models available . . . . . 110-125-145-200-245 Volts 40 to 60 Cycle AC - 50 Watts

Frequency Range
Band "A" . . . . . 540-1600 Kc. — Band "D" . . . . . 10.0-15.6 Mc.
Band "B" . . . . . 1.65-4.6 Mc. — Band "E" . . . . . 15.6-22.1 Mc.
Band "C" . . . . . 4.6-10.0 Mc.

Power Output:
Undistorted . . . . . 3.0 Watts
Maximum . . . . . 4.0 Watts

SCHEMATIC DIAGRAM FOR YOUR RADIO



BAND SWITCH "X" IS SHOWN IN EXTREME CLOCKWISE (BC. OR BAND A) POSITION (VIEWED FROM KNOB END OF SHAFT) AND ROTATES COUNTER CLOCKWISE FROM BAND A TO BAND B TO BAND C TO BAND D TO BAND E POSITION. SECTIONS MARKED REAR ARE TRANSPARENT VIEWS. TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TAKEN WITH NO SIGNAL, WITH PHONO-RADIO SWITCH IN RADIO POSITION, WITH BAND SWITCH IN BC. OR BAND A POSITION, WITH POWER TRANSFORMER TAP ON 110 VOLT POSITION, AND WITH LINE VOLTAGE AT 110 VOLTS. WHERE NO READING IS GIVEN, THE VOLTAGE IS ZERO OR TOO LOW TO READ. ALL VOLTAGE READINGS ARE TAKEN WITH A VOLTMETER HAVING A RESISTANCE OF ONE THOUSAND OHMS PER VOLT.

THE GAIN PER STAGE VALUES AS NOTED ABOVE ARE APPROXIMATE FOR AN AVERAGE STAGE, RATHER THAN AN ABSOLUTE VALUE. A .01 MFD. DUMMY IS USED FOR ALL MEASUREMENTS EXCEPT FOR THE ANTENNA WHERE A 200 MMFD. DUMMY IS USED. INPUT SHALL BE KEPT AT THE LOWEST LEVEL NECESSARY TO MAINTAIN A STANDARD OUTPUT OF .05 WATT WITH THE VOLUME CONTROL FULLY ON. NOTE: THE TYPE OF EQUIPMENT USED, THE HANDLING OF THE PROBES, THE ACCURACY OF ALIGNMENT, ETC. CAN AFFECT THE MEASUREMENTS.

Band E	21.6 Mc.	21.6 Mc.	400 ohms	Ant.	C18	Transl.
Band E	21.6 Mc.	21.6 Mc.	400 ohms	Ant.	C10	Ant.
Band D	15.2 Mc.	15.2 Mc.	400 ohms	Ant.	C25	Osc.
Band D	15.2 Mc.	15.2 Mc.	400 ohms	Ant.	C17	Transl.
Band D	15.2 Mc.	15.2 Mc.	400 ohms	Ant.	C5	Ant.

IMPORTANT ALIGNMENT NOTES:

NOTE: The signal generator frequency shall be adjusted for highest response near 455 Kc. for alignment of the I.F. trap.

Band E oscillator operates below the signal frequency. The setting of the oscillator trimmer occurs at the first peak out from tight for the fundamental. All other bands have the oscillator operating above the signal frequency and are to be aligned in the normal manner.

During the alignment of the oscillator padder on bands A and B the tuner should be rocked through resonance to assure alignment.

The alignment must be done in the order given.

The entire alignment procedure should be repeated step by step in the original order for greatest accuracy.

Always keep the output power from the generator at its lowest possible value to prevent the AVC action of the receiver from interfering with accurate alignment.

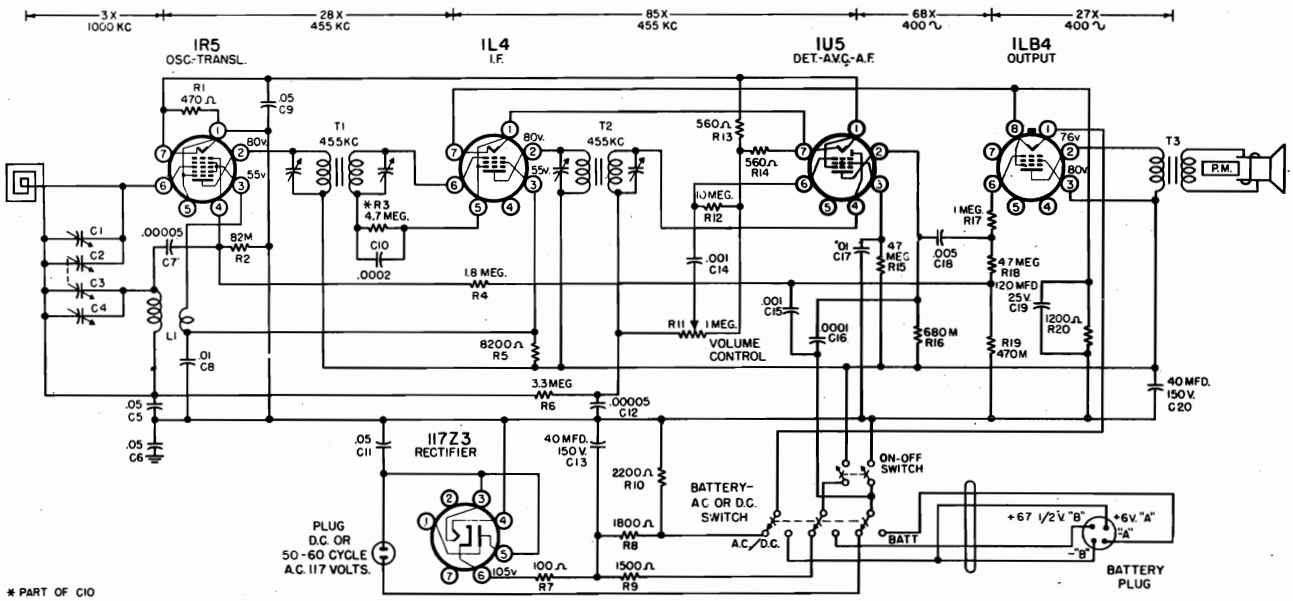
SCHEMATIC DIAGRAM FOR YOUR RADIO



* PART OF C10

TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS. VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO NEG. "B" AND ARE TAKEN WITH NO SIGNAL, AND WITH LINE VOLTAGE AT 117 VOLTS A.C. WHERE NO READING IS GIVEN THE VOLTAGE IS ZERO OR TOO LOW TO READ.
THE GAIN PER STAGE VALUES AS NOTED ABOVE ARE APPROXIMATE VALUES FOR AN AVERAGE STAGE, RATHER THAN AN ABSOLUTE VALUE. A .01 MFD. DUMMY IS USED FOR ALL MEASUREMENTS EXCEPT THE 1000KC WHERE A STANDARD RADIATING LOOP IS USED. INPUT SHALL BE KEPT AT THE LOWEST LEVEL NECESSARY TO MAINTAIN A STANDARD OUTPUT OF 50 MILLIWATTS WITH THE VOLUME CONTROL FULLY ON. NOTE: THE TYPE OF EQUIPMENT USED, THE HANDLING OF THE PROBES THE ACCURACY OF ALIGNMENT, ETC., CAN AFFECT THE MEASUREMENTS.

MODEL 9260,
CHASSIS 101.850

SEARS, ROEBUCK & CO.

SPECIFICATIONS

Power Supply
All models available . . . . . 117 Volt, 50-60 Cycles AC or DC, 15 Watts

Frequency Range
Broadcast . . . . . 540-1600 KC

Power Output
Undistorted . . . . . .05 Watt
Maximum . . . . . 0.1 Watt

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter reading to indicate 0.05 Watt across voice coil. . . . . 0.4 Volts
Generator ground lead connection . . . . . .To B—through 0.1 mfd. capacitor (I.F. Alignment)
Generator modulation . . . . . 30%, 400 cycles
Position of volume control . . . . . Fully on
Position of pointer with tuner fully closed . . . . . Below the 540 kc. calibration mark

POSITION OF TUNER	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	ADJUSTMENTS (IN ORDER SHOWN)	FUNCTION
Closed	455 Kc.	0.1 mfd.	Transl.-Grid	T2 & T1	I.F.
*1400 Kc.	1400 Kc.	200 mmfd.	Hazeltine Loop	C4	Oscillator
*1400 Kc.	1400 Kc.	200 mmfd.	Hazeltine Loop	C1	Antenna

IMPORTANT ALIGNMENT NOTES:

NOTE: It is recommended that an isolation transformer be connected between the radio chassis and the line before aligning the receiver on A.C.

The alignment must be done in the order given.

Always keep the output power from the generator at its lowest possible value to prevent the AVC of the receiver from interfering with accurate alignment.

***Always make these trimmer adjustments with the loop in approximately the same position, with respect to the chassis, as it is when the chassis and loop are mounted in the case.**

FM ALIGNMENT

Instructions for Alignment of the Frequency Modulation I. F. Transformers, Discriminator, Oscillator, R. F. and Antenna Circuits, with AM equipment generally available to the service man.

The equipment necessary for this procedure consists of the following:

D.C. Vacuum Tube Voltmeter of the Volt-Ohmyst Type. An AM Signal Generator that will supply:

(1) A 10.7 M.C. Signal for I F. alignment.

(2) A 105 M.C. and 109 M.C. Signal—a Signal Generator that only goes up to 30 M.C. but which has sufficient fourth harmonics present in the carrier could be used for this purpose.

THE GENERATOR USED NEED NOT BE FREQUENCY MODULATED.

IT IS ALWAYS DESIRABLE TO ALIGN THE "AM" I. F. TRANSFORMERS BEFORE MAKING ANY OF THE "FM" I. F. ADJUSTMENTS, and to RECHECK "AM" I. F. TRIMMERS AFTER COMPLETING "FM" I. F. ADJUSTMENTS.

BE SURE TO MAKE THE "FM" ADJUSTMENTS IN THE ORDER GIVEN BELOW.

(1) PROCEDURE FOR ALIGNMENT OF FM DISCRIMINATOR TRANSFORMER:

(A) Connect the Voltmeter from Pin No. 5 of the 6S8GT tube to chassis.

(B) With a .002 Mfd. Isolation Condenser in series with hot Signal Generator lead, connect generator from Pin No. 1 of the 6AU6 Limiter tube to chassis.

(C) Set Signal Generator to EXACTLY 10.7 M. C.

(D) Adjust 10.7 M. C. Discriminator Primary Trimmer for MAXIMUM reading on Voltmeter.

(E) Leave Signal Generator set at 10.7 M. C. and modulate with a 400 cycle note.

(F) Adjust 10.7 M. C. Secondary Discriminator Trimmer for MINIMUM 400 CYCLE RESPONSE IN THE SPEAKER. IMPORTANT: The reading on the Voltmeter should be ZERO. MINIMUM AUDIO RESPONSE WILL BE RATHER CRITICAL IN ADJUSTMENT.

(G) To check adjustment, swing Signal Generator to one side of 10.7 M. C. until MAXIMUM reading is obtained on Voltmeter and NOTE FREQUENCY and VOLTAGE READING. Then swing Signal Generator to the opposite side of 10.7 M. C. until MAXIMUM reading is obtained on Voltmeter and AGAIN NOTE VOLTAGE AND FREQUENCY READINGS. The two Voltmeter readings should be similar within 3 DB. and the two Signal Frequency readings should be a reasonably equal distance from 10.7 M. C. The difference in K.C. between the center frequency and one side should not exceed the difference between the center frequency and the other side by more than 50 K. C.

NOTE: If reliable FM Generator is available at 10.7 M.C., the procedure outlined in Paragraph (G) will be simplified by aligning to the proper pattern on an Oscilloscope. 100 K. C. deviation should be used.

CAUTION: Care should be taken to align the I. F. stages at the EXACT same center frequency as the Discriminator Coil. Switching from FM to AM on some generators may shift the carrier frequency somewhat.

(2) PROCEDURE FOR ALIGNMENT OF "FM" I. F. TRANSFORMERS:

(A) Connect the Voltmeter from the junction of the two 1 Megohm Resistors, (Illus. 99 and 100) to chassis.

(B) Connect Signal Generator to Input Grid (Pin No. 1) of 7F8 Converter tube.

(C) Set Signal Generator to EXACTLY 10.7 M. C.—if possible, mark the position where this occurs right on the Generator's calibrated dial because **this becomes a reference point** in checking for proper FM I. F. alignment.

(D) Adjust each of the 1st, 2nd and 3rd FM I. F. Transformers' 10.7 M. C. trimmers for MAXIMUM reading on Voltmeter. KEEP OUTPUT OF SIGNAL GENERATOR SO THAT A READING OF APPROXIMATELY 2 to 4 VOLTS IS OBTAINED ON THE VOLTMETER.

(E) After all the above FM I. F. Transformer Trimmer adjustments have been correctly completed, MAKE A NOTE OF THE READING ON THE VOLTMETER.

(F) Next, detune the signal generator to a slightly HIGHER frequency (higher than the 10.7 reference frequency), until the Voltmeter reads ONE-HALF of the figure noted in (E) above, and MAKE A NOTE OF THE GENERATOR FREQUENCY AT WHICH THIS OCCURS.

(G) Now, detune the signal generator to a LOWER frequency (lower than the 10.7 reference frequency), until the Voltmeter again reads ONE-HALF the original figure noted in (E), and AGAIN NOTE THE GENERATOR FREQUENCY AT WHICH THIS OCCURS.

The difference between the two above frequencies obtained in (F) and (G), the one lower than 10.7 M. C. reference point and the one higher, is the "Half-amplitude" Band width of the FM-I. F. system. These two frequencies (F) and (G), should be somewhat uniformly spaced on either side of the 10.7 M. C. (C) reference frequency. A SLIGHT DIFFERENCE IS NOT SERIOUS. Only when one is more than twice as far as the other from the 10.7 M. C. reference frequency, or when there is a double peak, is the discrepancy serious. Assuming the FM I. F. Transformers have been properly adjusted, a double peak, or extremely one-sided "half-amplitude" band width, is usually caused by regeneration or a defective FM I. F. Transformer.

(3) PROCEDURE FOR THE ALIGNMENT OF THE "FM" ANTENNA, R.F., AND OSCILLATOR CIRCUITS:

(A) Leave Voltmeter connected as it was for FM I. F. Alignment.

(B) Connect the hot Signal Generator lead through a 300 Ohm Resistor to the FM Antenna Post, marked "ANT" on back of chassis, and the other lead to the post marked "GND".

(C) Set Signal Generator so that it will deliver a modulated 108 M. C. signal. If the generator available is not de-

signed to deliver a 108 M. C. signal, use a generator covering at least to 30 M. C. and set this generator frequency to 27 M. C.—the fourth harmonic of which will be 108 M. C.

(D) Set Receiver Dial Pointer to EXACTLY 108 M. C.

(E) Adjust 108 M. C. Oscillator Trimmer for MAXIMUM reading on Voltmeter or MAXIMUM signal heard in speaker.

(F) Next, tune the receiver to 104 M. C.

(G) Set Signal Generator to deliver a 104 M. C. modulated signal.

(H) Adjust 104 M. C. Antenna and R. F. Trimmers for MAXIMUM reading on Voltmeter or MAXIMUM signal heard in speaker.

Because it is somewhat helpful to hear the signal, an AM modulation on the 108 M. C. and 104 M. C. signal frequencies may be used for alignment of the FM Oscillator, R. F. and Antenna circuits. With modulated or unmodulated signal, ALWAYS ADJUST FOR MAXIMUM READING ON VOLTMETER. (ADJUSTMENT OF "FM" GANG CONDENSER PLATES AT 98 M.C. AND 90 M. C. MAY BE NECESSARY TO INSURE PROPER TRACKING.)

A FREQUENCY MODULATED SIGNAL GENERATOR may be used instead of an AM signal generator. When a Frequency Modulated Signal Generator is used, it is recommended that an unmodulated carrier be used for all of the above adjustments EXCEPT alignment of the Discriminator Secondary Trimmer. Use a Frequency Modulated signal (100 K.C. deviation) and align Discriminator Secondary for proper pattern on an Oscilloscope.

AM ALIGNMENT PROCEDURE

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. Make the adjustment marked (1) first, (2) next.

Before starting alignment:

(A) Check tuning dial adjustment by turning gang condenser until plates reach maximum capacity stop (completely in mesh) at which point the dial pointer must be exactly even with the last line at the low frequency end of the AM dial calibration. If dial pointer does not point exactly to last line move to correct position.

(B) Use an accurately calibrated test oscillator with some type of output measuring device.

(C) WHEN ADJUSTING THE 1730 KC OSCILLATOR TRIMMER, THE 455 KC TRIMMER, remove chassis from cabinet and disconnect the loop connection wires from the set. Attach a 1 megohm resistor across these connections and feed output of test oscillator across the 1 megohm resistor.

(D) THE 1400 KC LOOP ANTENNA TRIMMER and 600 KC PADDER should be adjusted only after all other adjustments have been made and with the set mounted in the cabinet, and the loop in position. When aligning the 1400 KC Antenna Trimmer and 600 KC Padder, couple test oscillator to receiver loop by: (1) make loop consisting of five to ten turns of No. 20 to No. 30 size wire, wound on a 2″ or 3″ form; (2) connect this loop across output of test oscillator; (3) place test oscillator loop near radio loop. BE SURE THAT NEITHER LOOP MOVES WHILE ALIGNING.

Steps	Place band switch for operation on:	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
1	AM Band position	Any point where no interfering signal is received	Exactly 455 K. C.	0.2 Mfd. Condenser	High side to AM-Osc. stator plates of tuning condenser (15D). Low side to frame of condenser through .01 Mfd. condenser.	Adjust each of the 2nd 455 K. C. AM I. F. transformer trimmers for maximum output, then adjust each of the 1st 455 K. C. I. F. transformer trimmers for maximum output.
2	AM Band position	Rotate gang condenser to maximum capacity	Exactly 455 K. C.	.00025 Condenser	See Paragraph (C) above.	Adjust 455 K. C. trap trimmer for **MINIMUM** 455 K. C. Signal.
		Exactly 1730 K. C.	Exactly 1730 K. C.			Adjust 1730 K. C. oscillator trimmer for maximum output.
		Approx. 1400 K. C.	Approx. 1400 K. C.	See Paragraph (D) above.		Adjust 1400 K. C. AM Ant. trimmer for maximum output.
		Approx. 600 K. C.	Approx. 600 K. C.			While rocking gang condenser, adjust 600 K. C. oscillator padder for **maximum** output.

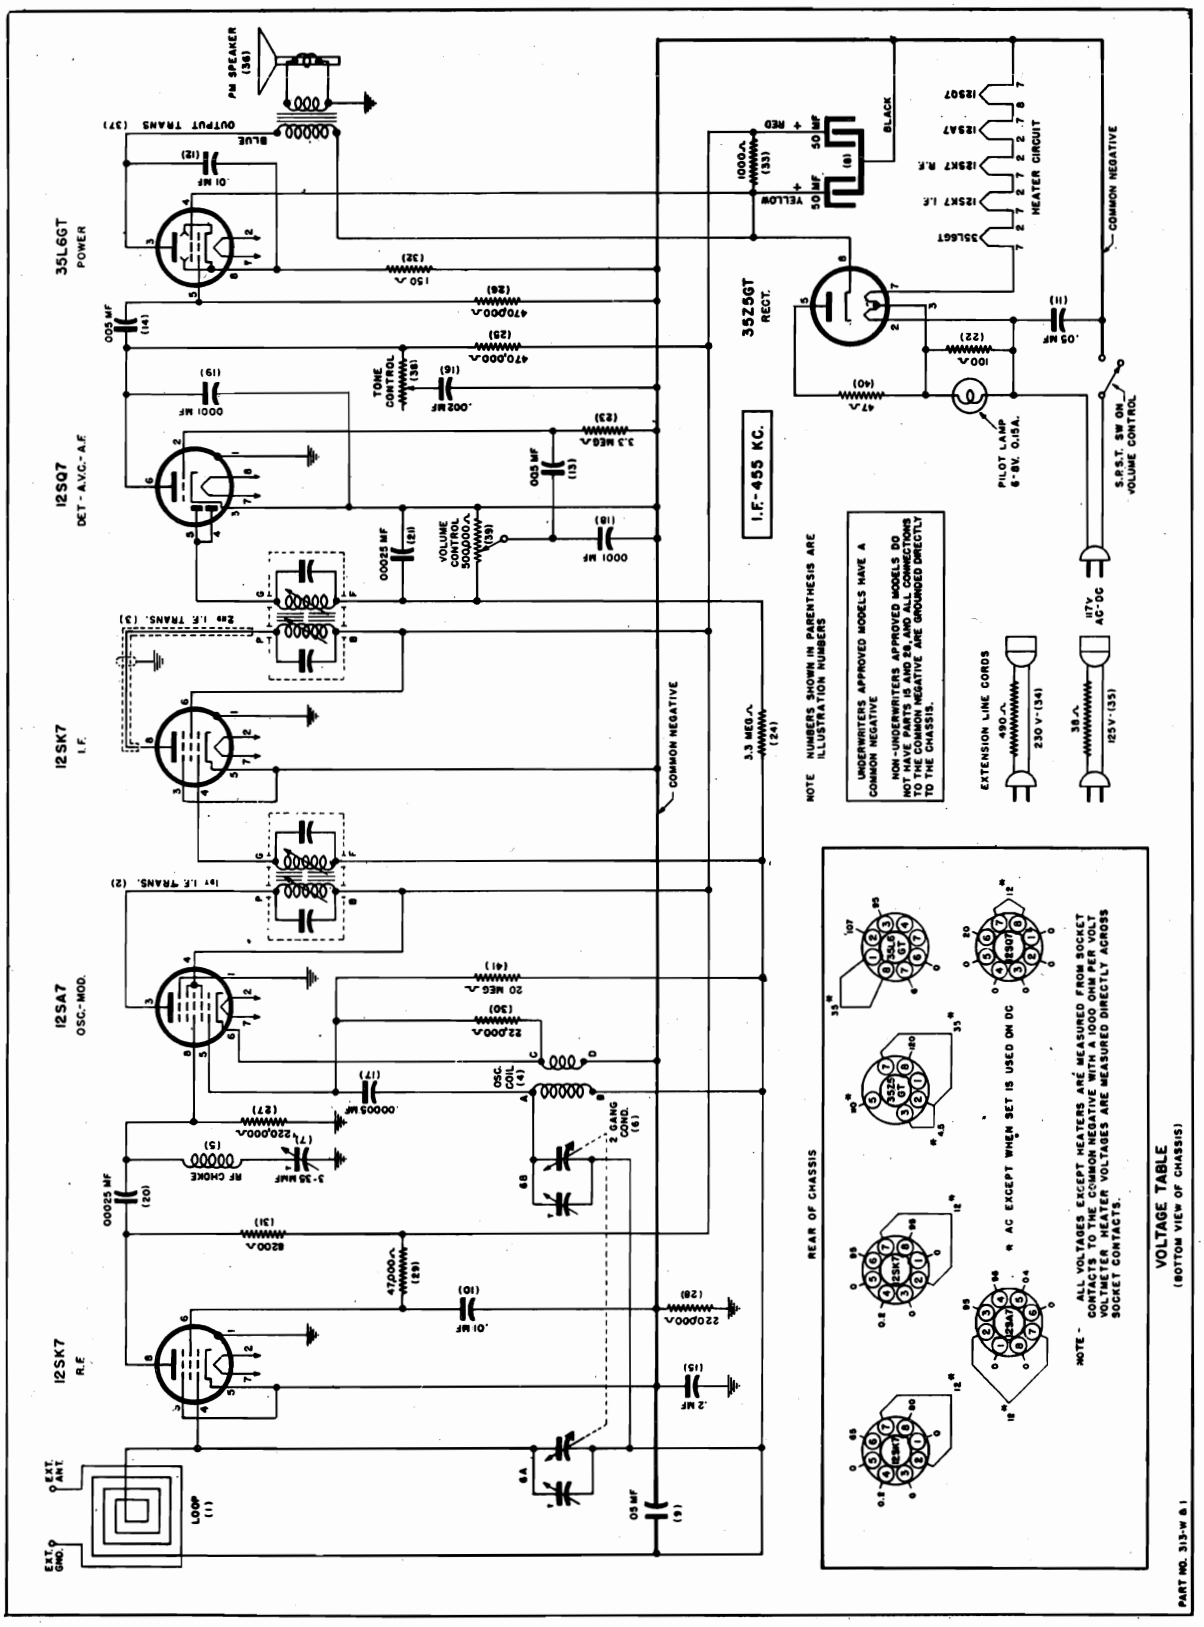
113	23E42	Condenser	Fixed Mica .00025 Mfd.
114	27E225-2	Resistor	Carbon, 2.2 Meg Ohm 1/2 Watt
115	27E102-2	Resistor	Carbon, 1000 Ohm 1/2 Watt
116	23E422	Capacitor	Fixed Paper, .25 Mfd. 400 V.
117	23E416	Capacitor	Fixed Paper, .05 Mfd. 400 V.
118	27E104	Resistor	Carbon, 100,000 Ohm 1/3 Watt
119	27E104	Resistor	Carbon, 100,000 Ohm 1/3 Watt
120	27E104-5	Resistor	Carbon, 100,000 Ohm 2 Watt
121	27E104-5	Resistor	Carbon, 100,000 Ohm 2 Watt

MISCELLANEOUS PARTS

Part No.	Part Name	Description
64E9	Antenna	FM Di Pole
7E116	Back	For Cabinet
53E128	Call Letters	Complete Set Station Call Letter Sheets
53E129	Call Letters	"AM-FM," "Phono," "High," "Med.," "Bass" on Sheet
36E29	Dial Scale	Calibrated Scale
20E270-6	Dial Shaft Assem.	Drive Shaft Assembly
20E253-10	Dial Cord	Drive Cord
65E2	Dial Spring	Tension Spring for Dial Cord
20E174-4	Dial Pointer	Dial Indicator
48E3	Dial Escutcheon	Fits around Dial Scale and Push Buttons for 296M
48E3-2	Dial Escutcheon	Fits around Dial Scale and Push Buttons for 296B
40E2	Dial Light	6-8 Volt .250 Amp. Mazda Type No. 44
37E27-12	Knob	Marked "Tuning" for Model 296M
37E27-14	Knob	Marked "Off-On-Vol." for Model 296M
37E27-34	Knob	Marked "Tuning" for Model 296B
37E27-35	Knob	Marked "Off-On-Vol." for Model 296B
37E46	Knob	Push Button
17E21-2	Plug	2 Prong for Phono-Motor
18E4-2	Post	4 Post Binding
18E4-3	Post	2 Post Binding
7E111	Slide Rail	For Record Changer
17E27	Socket	For Pilot Light
20E184	Socket	2 Contact, Female, for Phono Motor

SENTINEL RADIO CORP.

MODELS 313I, 313W, 1U-313I, 1U-313W



ALIGNMENT PROCEDURE

For alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third.
IMPORTANT: BEFORE ALIGNING, PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET. BE SURE THAT IT DOES NOT MOVE WHILE ALIGNING.

When adjusting 1650 kilocycle oscillator trimmer, 455 K.C. R.F. trimmer and 1400 kilocycle antenna trimmer, connect test oscillator to loop external antenna and ground connections with a .0002 Mfd. capacitor in series with antenna lead.

Steps	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
	Any point where no interfering signal is received	Exactly 455 K. C.	0.2 Mfd. Condenser	High side to grid of 12SA7 tube. Low side to chassis. (To Common Negative in 1U-313 Models.)	Adjust each of the 2nd I.F. transformer trimmer adjustment screws for maximum output, then adjust each of the 1st I.F. transformer trimmer adjustment screws for maximum output.
1	Rotate gang condenser to maximum capacity	Exactly 455 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust R. F. coil trimmer for **minimum** 455 K. C. signal.
2	Rotate gang condenser to minimum capacity	Exactly 1650 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust 1650 K. C. oscillator trimmer for maximum output.
3	Approximately 1400 K. C.	Approx. 1400 K. C.	.0002 Mfd. Condenser	To loop external antenna and ground connections	Adjust 1400 K. C. antenna trimmer for maximum output.

MISCELLANEOUS PARTS

Part No.	Part Name	Description
40E1	Bulb	6-8 Volt, .150 Amp. Type 47
7E149	Cabinet Back	With Loop Antenna
or		
7E150	Cabinet Back	With Loop Antenna
7E46-1	Cabinet	Walnut Plastic
7E46-2	Cabinet	Ivory Plastic
65E2	Dial Cord Spring	Tension Spring
20E253-18	Dial Cord	30" of 18 lb. Drive Cord
20E270-5	Dial Shaft Assem.	Drive Shaft Assembly
20E65	Dial Back Plate	Backplate Assembly, less scale
36E36	Dial Scale	Calibrated Glass Scale
35E23	Dial Pointer	Dial Indicator
37E27-11	Knob	For Walnut Cabinet
37E27-15	Knob	For Ivory Cabinet
17E22	Socket	Dial Light Socket Assembly
10E42	Studs	Trimount for Mounting Back to Cabinet.. 1.20

VOLTAGE RATING

THIS RADIO IS DESIGNED FOR USE ON EITHER:

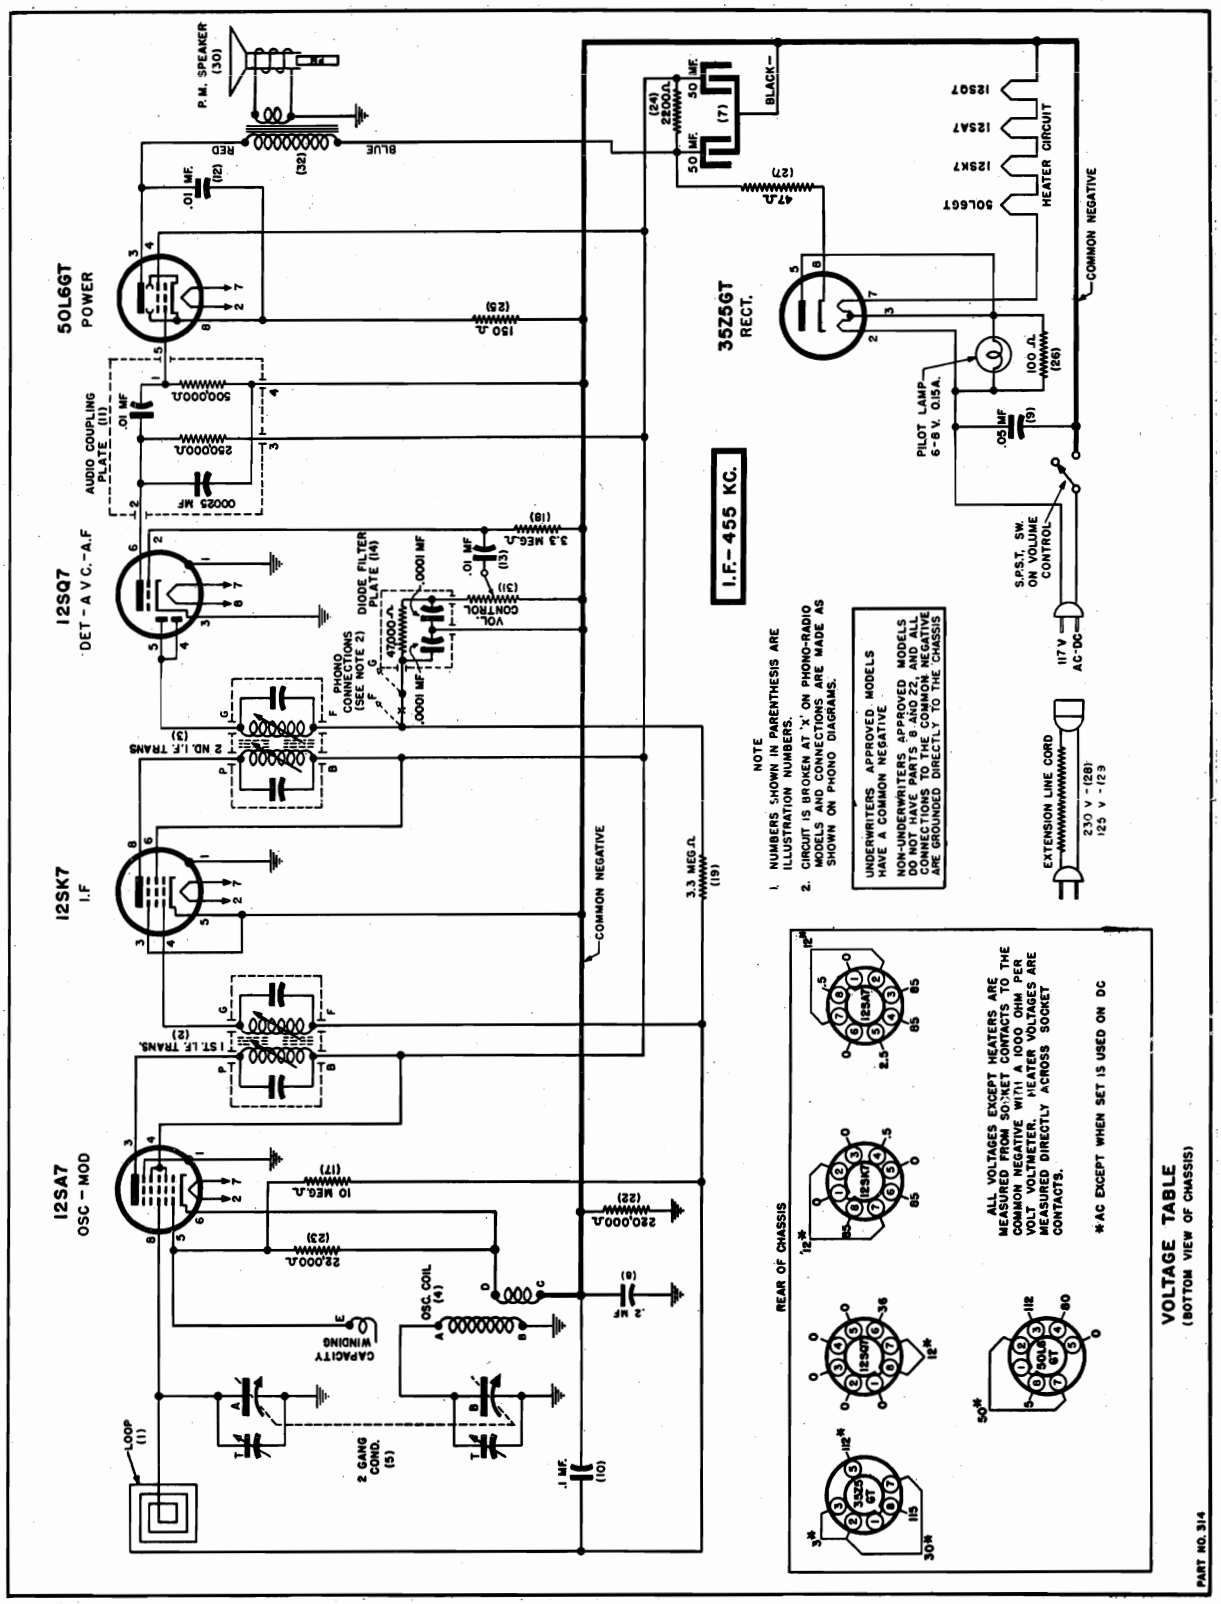
110-120 VOLTS 50-60 CYCLES ALTERNATING CURRENT (AC)

OR

110-120 VOLTS DIRECT CURRENT (DC)

MODELS 314E, 314I, 314W, 1U-314E, 1U-314I, 1U-314W

SENTINEL RADIO CORP.



ALIGNMENT PROCEDURE

For alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third.

Before starting alignment:

(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move to correct position.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET. Couple test oscillator to receiver loop by: (1) make loop consisting of five to ten turns of No. 20 to No. 30 size wire, wound on a 2" or 3" form; (2) connect this loop across output of test oscillator; (3) place test oscillator loop near radio loop. BE SURE THAT NEITHER LOOP MOVES WHILE ALIGNING.

Steps	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
1	Any point where no interfering signal is received.	455 K. C.	.02 MFD. condenser	High side to rear stator plates of tuning condenser. Low side to frame of condenser through a .02 Mfd. blocking condenser.	Adjust each of the second I. F. transformer trimmers for maximum output—then adjust each of the first I. F. trimmers for maximum output.
2	Exactly 1650 K. C.	Exactly 1650 K. C.	.00025 MFD. condenser	See Paragraph (c) Above	Adjust 1650 K. C. oscillator trimmer for maximum output.
3	Approx. 1400 K. C.	Exactly 1400 K. C.	.00025 MFD. condenser	See Paragraph (c) Above	While rocking gang condenser adjust 1400 K. C. antenna trimmer for maximum output.

VOLTAGE RATING

THIS RADIO IS DESIGNED FOR USE ON EITHER:

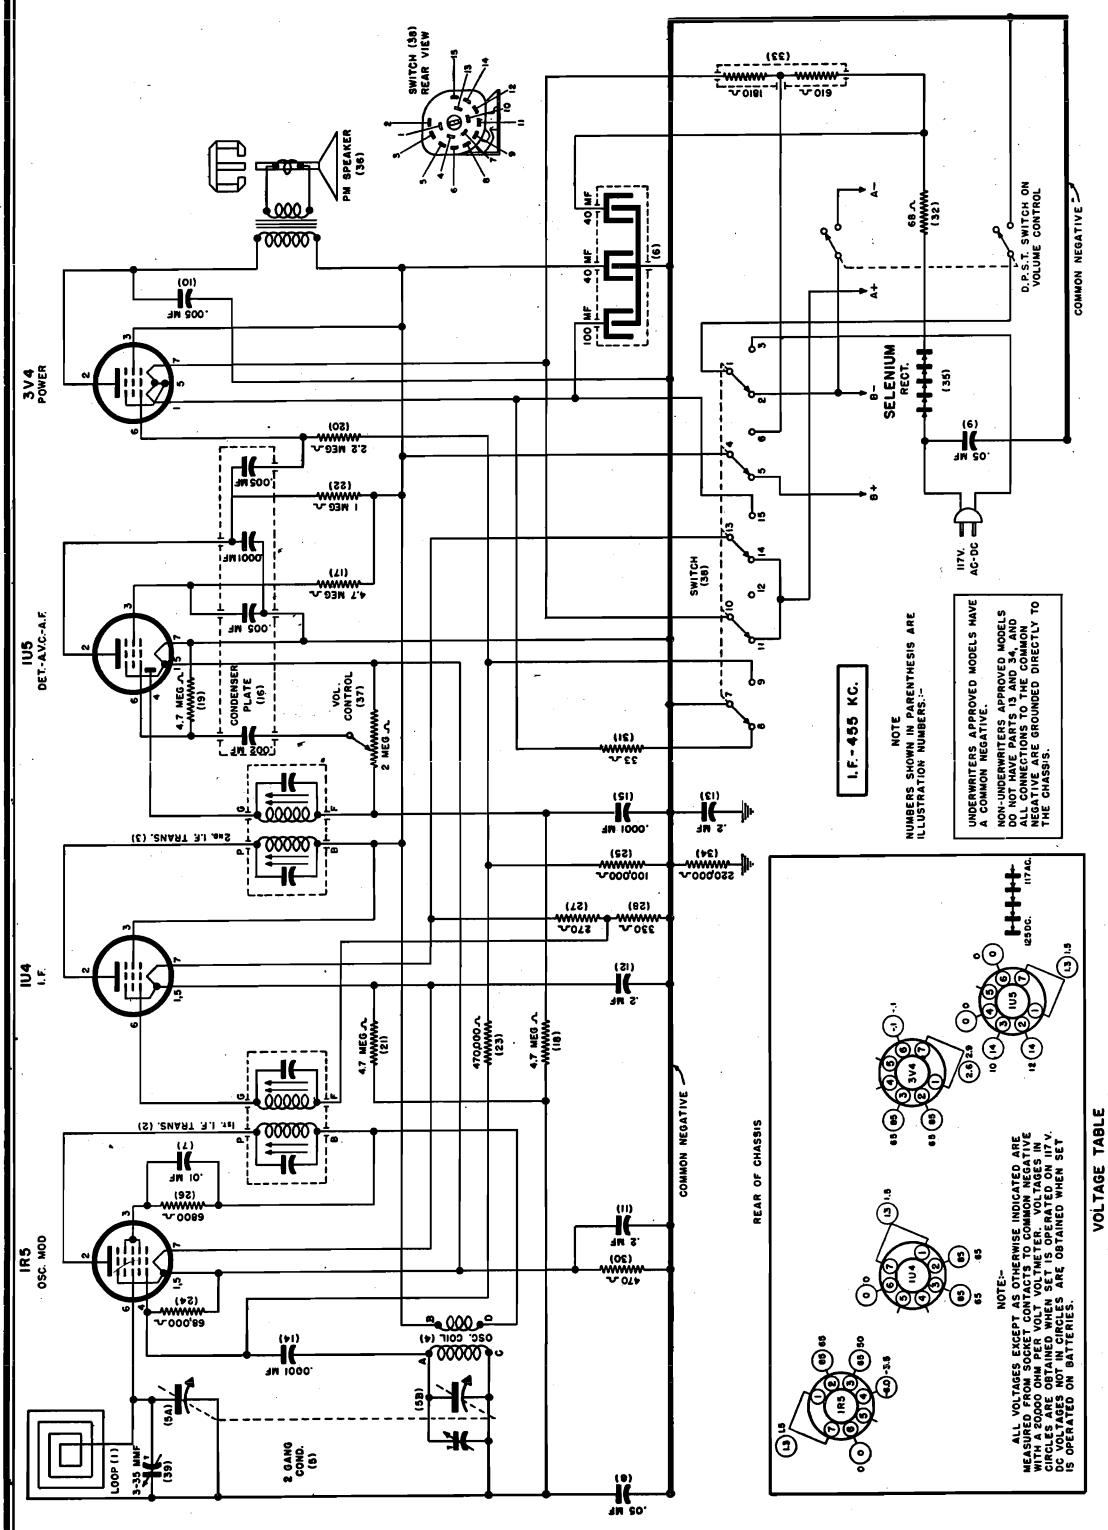
110-120 VOLTS 50-60 CYCLES ALTERNATING CURRENT (AC)

OR

110-120 VOLTS DIRECT CURRENT (DC)

SENTINEL RADIO CORP.

MODELS 316PM, 316PT, 1U-316PM, 1U-316PT



INSTALLATION OF REQUIRED BATTERIES

Diagram shows proper location and connections of the following required types of batteries:

One 4½ Volt "A" Battery, such as SENTINEL Type A38, or Ray-O-Vac P83A or Eveready No. 736A, etc.

One 67½ Volt "B" Battery, such as SENTINEL Type B7634, or Ray-O-Vac 4367 or Eveready No. 467, etc.

NOTE: A 90 Volt "B" Battery, such as Eveready Type No. 490B, may be used in place of the 67½ Volt "B" Battery. The use of a 90 Volt "B" Battery will provide somewhat increased sensitivity and more power output, but this battery will not last quite as long as the 67½ Volt "B" Battery.

POWER SUPPLY

THIS RADIO CAN BE OPERATED ON EITHER:

110 to 120 VOLTS DIRECT CURRENT

OR

110 to 120 VOLTS, 50 to 60 CYCLE, ALTERNATING CURRENT

OR

BATTERIES—WITH ONE 4½ VOLT "A" and ONE 67½ VOLT "B" Battery.

ALIGNMENT PROCEDURE

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure, read tabulations from left to right. Make the adjustment marked (1) first, (2) next, (3) third.
IF RADIO HAS METAL PLATE ON BOTTOM OF CHASSIS BE SURE TO HAVE PLATE MOUNTED ON CHASSIS WHEN ALIGNING SET.

Before starting alignment:

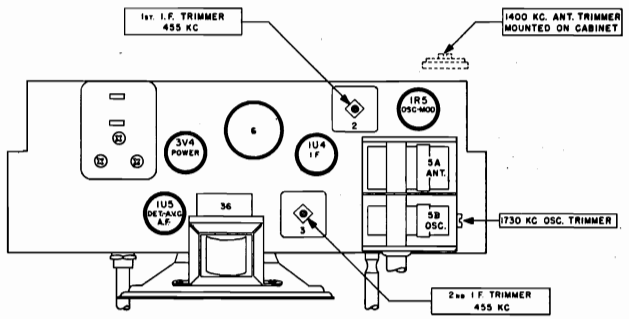
(A) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial indicator must be exactly even with the outside edge of the first 5 in the 55 calibration number at the low frequency end of the dial scale. If dial indicator does not point exactly to the outside edge, move pointer to correct position.

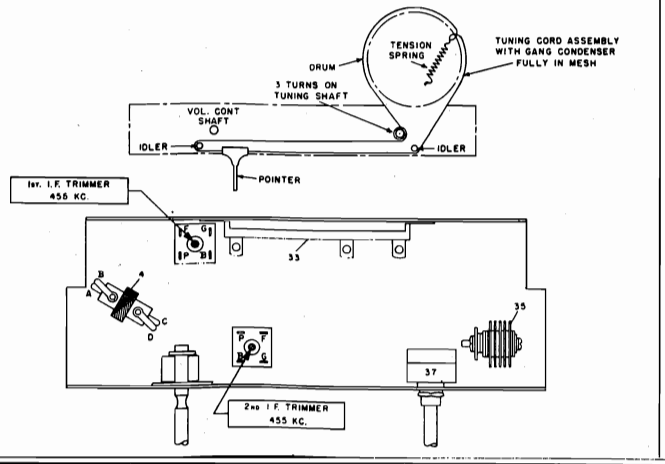
(B) Use an accurately calibrated test oscillator with some type of output measuring device.

(C) WHEN ADJUSTING THE 1730 KC OSCILLATOR TRIMMER, remove chassis from cabinet and disconnect the loop connection wires from the loop terminal strip. Attach a 1 megohm resistor across these connections and feed output of test oscillator across the 1 megohm resistor.

(D) THE 1400 KC LOOP ANTENNA TRIMMER should be adjusted only after all other adjustments have been made and with the set mounted in the cabinet. When aligning the 1400 KC Antenna Trimmer, couple test oscillator to receiver loop by: (1) make loop consisting of five to ten turns of No. 20 to No. 30 size wire, wound on a 2″ or 3″ form; (2) connect this loop across output of test oscillator; (3) place test oscillator loop near radio loop. BE SURE THAT NEITHER LOOP MOVES WHILE ALIGNING.

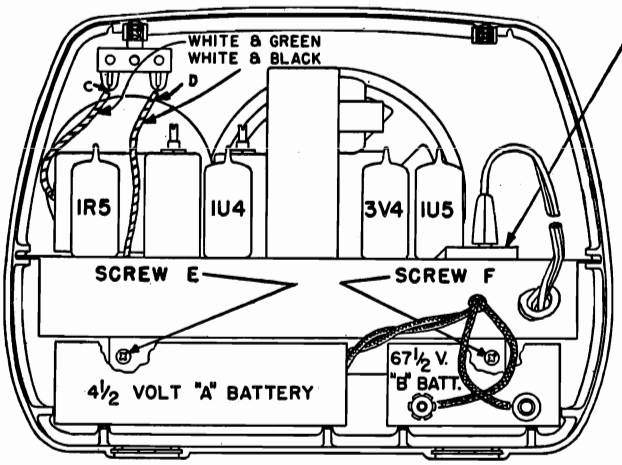
Steps	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to	Refer to parts layout diagram for location of trimmers mentioned below:
1	Any point where no interfering signal is received	Exactly 455 K. C.	0.2 Mfd. Condenser	High side to grid of 1R5 tube. Low side to chassis.	Adjust each of the 2nd I.F. transformer trimmer adjustment screws for maximum output, then adjust each of the 1st I.F. transformer trimmer adjustment screws for maximum output.
2	Rotate gang condenser to minimum capacity	Exactly 1730 K. C.	See paragraph (C) above	See paragraph (C) above	Adjust 1730 K. C. oscillator trimmer for maximum output.
3	Approximately 1400 K. C.	Approx. 1400 K. C.	See paragraph (D) above	See paragraph (D) above	Adjust 1400 K. C. antenna trimmer for maximum output.





SENTINEL RADIO CORP.

MODELS 316PM, 316PT, 1U-316PM, 1U-316PT



FOR BATTERY OPERATION THE AC LINE CORD PLUG MUST BE FIRMLY INSERTED INTO THIS RECEPTACLE.

TO REMOVE CHASSIS FROM CABINET:
1. REMOVE BATTERIES.
2. UNSOLDER ANTENNA WIRES C & D.
3. REMOVE SCREWS E & F.

ALIGNMENT PROCEDURE

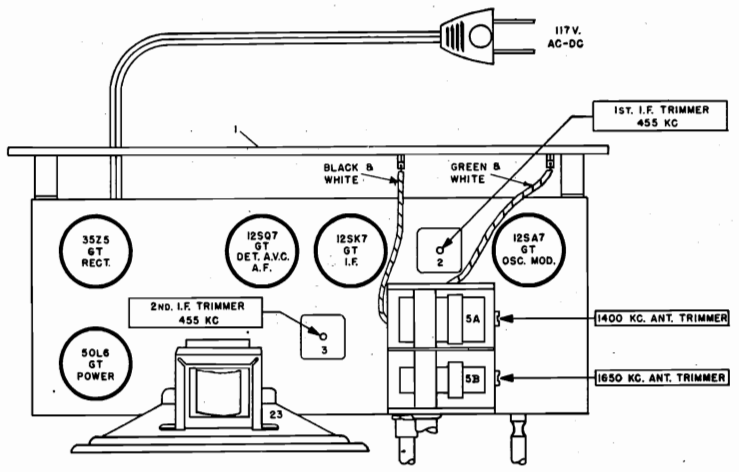
For alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third.

Be sure to:

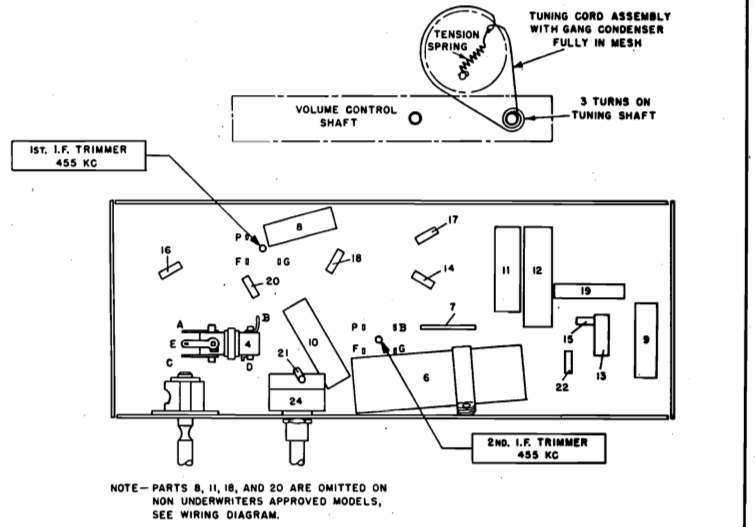
(A) Use an accurately calibrated test oscillator with some type of output measuring device.

(B) WHEN ADJUSTING THE 1620 KC OSCILLATOR TRIMMER AND THE 1400 KC ANTENNA TRIMMER, remove chassis from cabinet and leave the loop attached to the chassis with the two plastic screws. Couple test oscillator to receiver loop by: (1) make loop consisting of five to ten turns of No. 20 to No. 30 size wire, wound on a 2″ or 3″ form; (2) connect this loop across output of test oscillator; (3) place test oscillator loop near radio loop. BE SURE THAT NEITHER LOOP MOVES WHILE ALIGNING.

Steps	Set receiver dial to:	TEST OSCILLATOR			Refer to parts layout diagram for location of trimmers mentioned below:
		Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	
1	Any point where no interfering signal is received.	455 K. C.	.02 MFD. condenser	High side to rear stator plates of tuning condenser. Low side to frame of condenser through a .02 Mfd. blocking condenser.	Adjust each of the second I.F. transformer trimmers for maximum output—then adjust each of the first I.F. trimmers for maximum output.
2	Exactly 1620 K. C.	Exactly 1620 K. C.	See paragraph (B) above	See paragraph (B) above	Adjust 1620 K. C. oscillator trimmer for maximum output.
3	Approx. 1400 K. C.	Approx. 1100 K. C.	See paragraph (B) above	See paragraph (B) above	Adjust 1400 K. C. antenna trimmer for maximum output.



PART NO. 330



NOTE—PARTS 8, 11, 18, AND 20 ARE OMITTED ON NON UNDERWRITERS APPROVED MODELS, SEE WIRING DIAGRAM.

VOLTAGE RATING

THIS RADIO IS DESIGNED FOR USE ON EITHER:
110-120 VOLTS 50-60 CYCLES ALTERNATING CURRENT (AC)
OR
110-120 VOLTS DIRECT CURRENT (DC)

TO SERVICE TUBES, it is necessary to remove the cabinet back by gently pulling out the two trimount studs and removing the two plastic screws, used to hold the back to the cabinet, and detaching the two leads from the loop.

Before remounting the back on the cabinet, be sure to properly re-connect these two leads. The green-white wire must be attached to the terminal which is marked with the word "GREEN" close to it.

ALIGNMENT PROCEDURE

With the receiver in the cabinet, set the dial pointer to 1600 kc and make a light pencil mark on the dial backing plate. Repeat the procedure for 1400 kc. This mark can be easily erased after alignment.

Remove the receiver from the cabinet and connect output meter across voice coil.

Connect the signal generation to the standard Hazeltine Loop Model 1150 and couple it loosely to the receiver loop. Set the volume control at maximum, and fully mesh the tuning capacitor.

The output of the signal generator should be just sufficient to give a readable deflection on the output meter.

Set the signal generator to 455 kc and adjust i-f trimmers for maximum output in the following order: C8, C7, C6, C5. Repeat sequence if trimmers were badly maladjusted.

Set the signal generator and receiver to 1600 kc and adjust the oscillator trimmer C2 for maximum output.

Set the signal generator and receiver to 1400 kc and adjust the antenna trimmer C4 for maximum output.

Set the signal generator and receiver to 1600 kc and readjust oscillator trimmer C2 for maximum output.

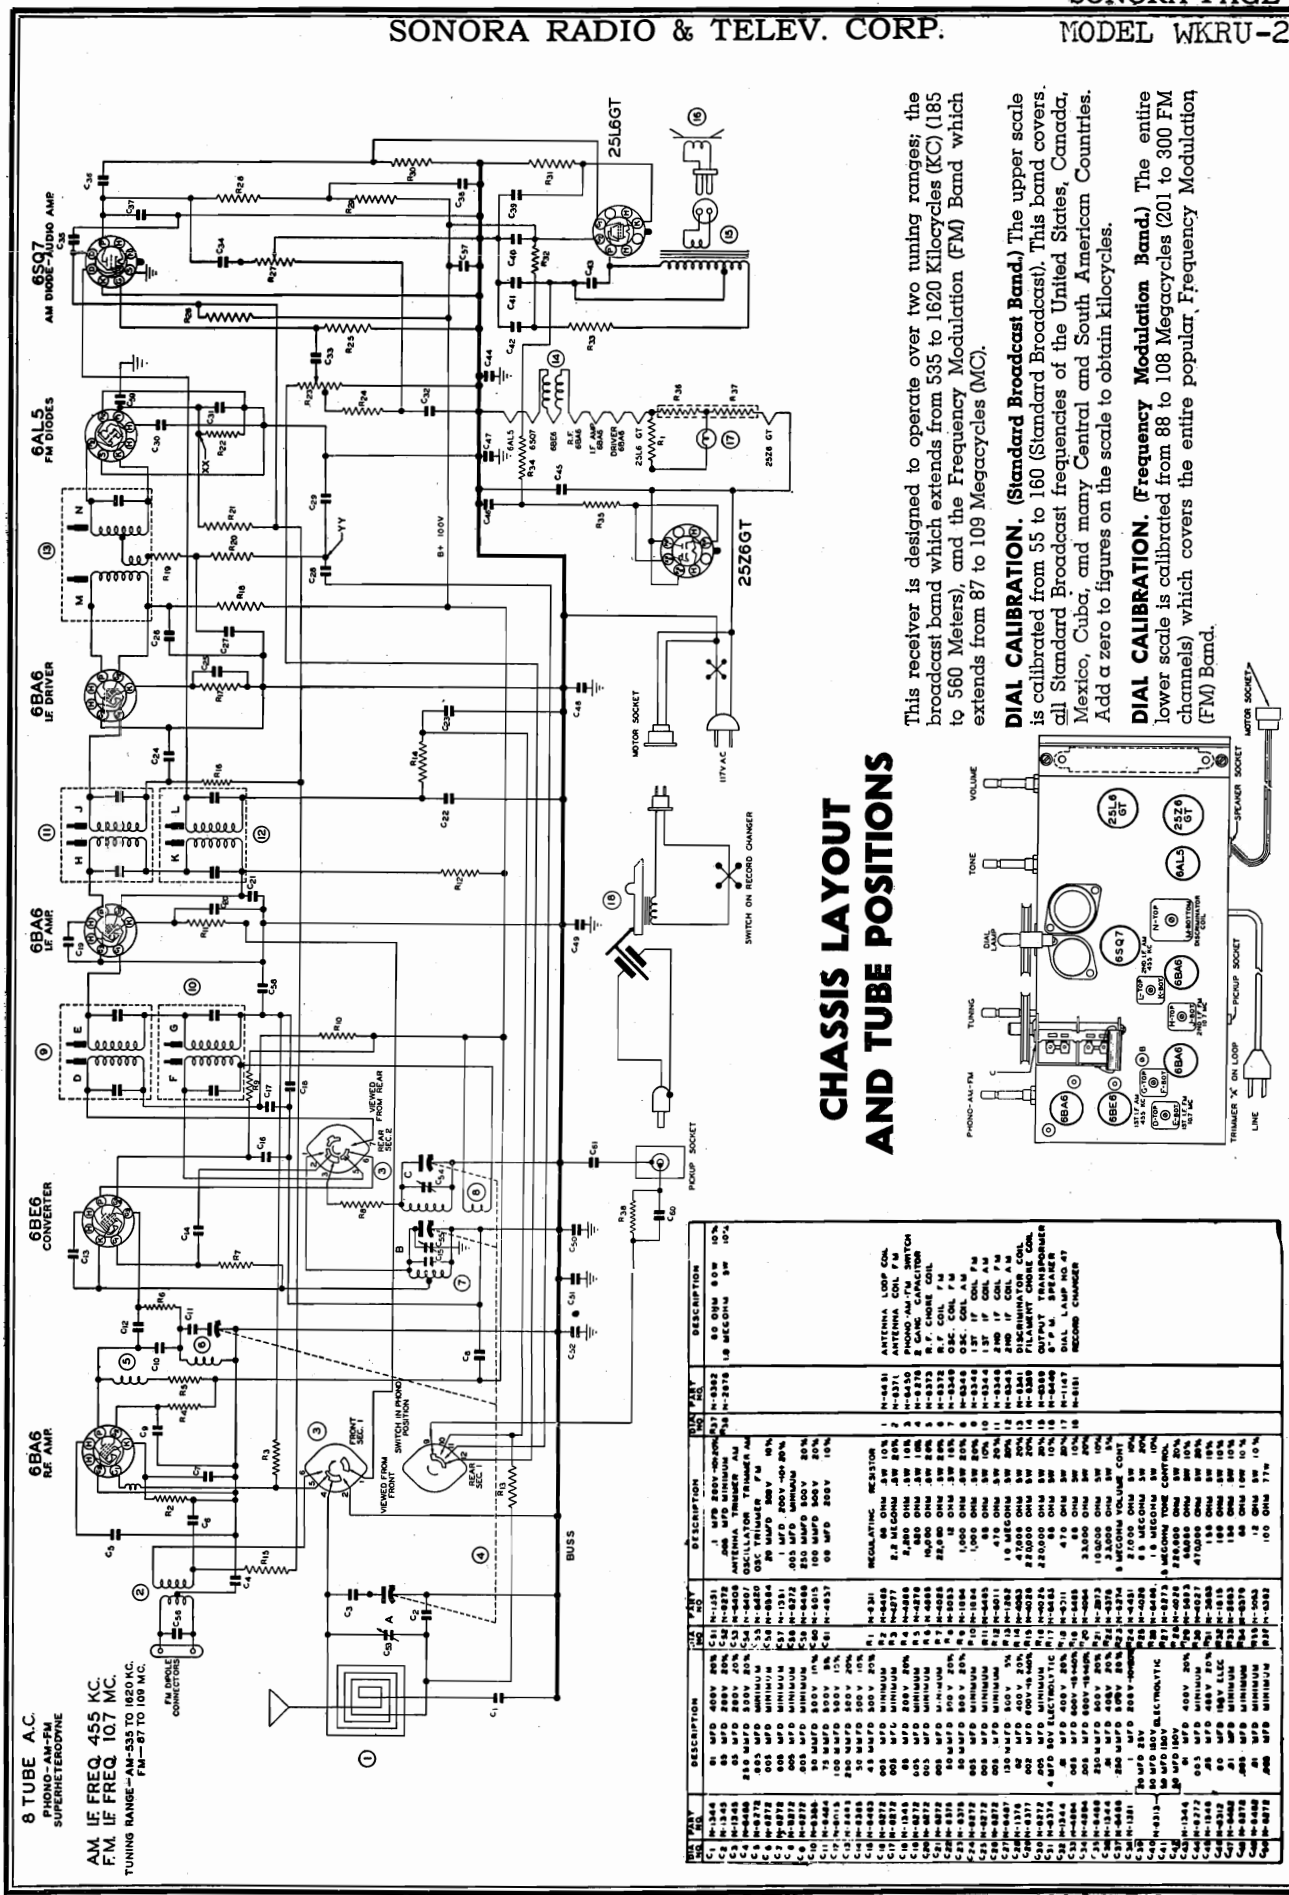
SONORA RADIO & TELEV. CORP. MODEL WKRU-254



CHASSIS LAYOUT AND TUBE POSITIONS

This receiver is designed to operate over two tuning ranges; the broadcast band which extends from 535 to 1620 Kilocycles (KC) (185 to 560 Meters), and the Frequency Modulation (FM) Band which extends from 87 to 109 Megacycles (MC).

DIAL CALIBRATION. (Standard Broadcast Band.) The upper scale is calibrated from 55 to 160 (Standard Broadcast). This band covers all Standard Broadcast frequencies of the United States, Canada, Mexico, Cuba, and many Central and South American Countries. Add a zero to figures on the scale to obtain kilocycles.

DIAL CALIBRATION. (Frequency Modulation Band.) The entire lower scale is calibrated from 88 to 108 Megacycles (201 to 300 FM channels) which covers the entire popular Frequency Modulation (FM) Band.

RECORD CHANGER: Crescent Model C-250, RCD.CH.18-1

MODEL WKRU-254 SONORA RADIO & TELEV. CORP.

SERVICE DATA

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes, such as weak or defective tubes or speaker, open or grounded resistors, or bypass condensers. Never attempt to realign the set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause. It will be necessary to follow the procedure outlined below and to use recommended equipment for satisfactory results.

BROADCAST ALIGNMENT PROCEDURE

EQUIPMENT REQUIRED: Modulated Test Oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC, also an Output Meter to connect across the primary or secondary of the output transformer.

I. F. ALIGNMENT: Put switch in the broadcast position and connect the test oscillator to the converter grid through a .05 condenser. The ground lead of the test oscillator should be connected to the buss of the receiver. Adjust the four I. F. trimmers (F. G, L and K) for maximum reading on the output meter. Always use the peak on the slug which is obtained when screw is out of the can the greatest distance.

R. F. ALIGNMENT: Connect the test oscillator to the antenna lead on the loop through a 100 mmf. condenser. The Loop and Chassis must occupy the same relative positions on the bench as they do in the cabinet. Care should be taken to have no iron or other metal near the loop. Do not make this set-up on a metal bench. Set the gang condenser to the maximum high frequency position and the test oscillator to 1620 KC. Adjust Trimmer "C" to the maximum output. Set test oscillator to 1400 KC and tune in signal with the gang condenser and adjust Trimmer "A" to maximum response. Set test oscillator to 600 KC and tune in signal with gang condenser. Check for damage to gang condenser or coils.

F. M. ALIGNMENT PROCEDURE

EQUIPMENT REQUIRED: F. M. Generator with frequencies of 90, 98, 106, and 109 megacycles, and generator without any modulation which covers 10.7 megacycles, also a zero center microammeter, and a DC Vacuum Tube Voltmeter (An oscilloscope and variable frequency audio oscillator can be used for better results. This method of alignment is described in the last paragraph).

DISCRIMINATOR ALIGNMENT: Connect DC Vacuum Tube Voltmeter between the buss and point "XX" on circuit diagram. Point "XX" is negative potential on the vacuum tube voltmeter. Isolate point "XX" and buss connections to vacuum tube voltmeter with chokes made by wrapping approximately 20 turns of hookup wire around a pencil. This is illustrated in Figure 1. Connect two 100,000 ohm resistors in series. (These resistors must match to 5%.) Connect them from point "XX" to buss. Between junction of 100,000 ohm resistors and the point "YY" connect Zero Center Meter, which is also isolated by the choke described above. These connections are illustrated in Figure 1. Connect test oscillator which is adjusted to 10.7 megacycles to grid of IF Driver through a 250 mmf condenser. Adjust slug "M" to maximum on the vacuum tube voltmeter. Reduce test oscillator to keep vacuum tube voltmeter to around 5 volts. Adjust slug "N" to bring zero center meter to zero point. Slug "N" should never be touched after this alignment.

PRELIMINARY I. F. ALIGNMENT: Connect test oscillator to the converter grid through a 250 mmf. mica condenser. Adjust slugs D, E, H and J to maximum output on the vacuum tube voltmeter. In making these adjustments reduce the generator input to keep the vacuum tube voltmeter at approximately 5 volts when making this adjustment. Always use the peak on the slug which is obtained when the screw is out of the can the greatest distance.

FINAL I. F. ALIGNMENT: Set the test oscillator to 109 MC without frequency modulation and connect it to converter grid. Adjust trimmer "B" for approximate maximum output on the vacuum tube voltmeter and zero center for exact centering. Adjust test oscillator to approximately 25 KC deviation, carefully adjust trimmers D, E, H, J and M for maximum on vacuum tube voltmeter. It may be necessary to shift the frequency of the oscillator slightly to hold the zero center meter on center. In making this adjustment turn up volume control slightly to obtain an audio signal out of the speaker. If this signal is free of distortion, increase the deviation to approximately 75 KC and repeat the above alignment. If this is done carefully there will be no distortion in the speaker with this deviation. If distortion is obtained in the speaker with this deviation, it will be necessary to carefully repeat the I. F. alignment.

R. F. ALIGNMENT: Move the signal generator to the FM antenna terminals, using 150 ohm resistors between the generator terminals and each of the FM antenna terminals. Set the test oscillator to 106 megacycles and tune in signal with gang condenser to obtain approximate maximum on the vacuum tube voltmeter and zero center on the meter. Slightly bend the RF section in the gang condenser for maximum output with vacuum tube voltmeter. Set the signal generator to 98 megacycles, tune in signal with the gang condenser. Repeat the above procedure at this frequency and also at 90 megacycles. Recheck alignment at 106 megacycles.

FINAL ALIGNMENT OF FM IF WITH OSCILLOSCOPE AND VARIABLE AUDIO OSCILLATOR: The oscilloscope and variable audio oscillator should be connected as shown in Figure 2. Adjust the deviation to approximately 25 KC and align trimmers D, E, H, J and M to maximum on the vacuum tube voltmeter while watching the oscilloscope for a straight line. It may be necessary to vary the frequency of the variable audio oscillator in order to make the line straight on the scope. Next increase deviation to approximately 75 KC and repeat procedure, adjusting for maximum or as close to maximum as it is possible to obtain without losing the straight line on the oscilloscope. After all the trimmers have been properly adjusted to a maximum and a straight line on the scope, increase the deviation from approximately 125 to 150 KC. The curves illustrated in Figure 3 should be obtained. In making the above adjustments it may be necessary to make slight variations in the RF frequency in order to hold the zero center meter at the zero point.

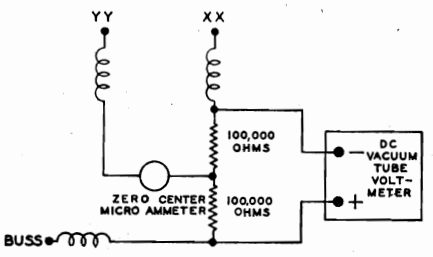


FIG. 1

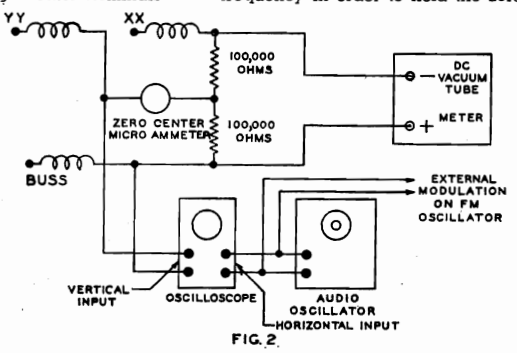

FIG. 2

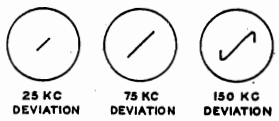

OSCILLOSCOPE PATTERNS

FIG. 3

AERIAL SYSTEM

This receiver has a built-in "Loop" aerial for broadcast reception. Its excellent design is such as to increase pick-up from stations having wide variations in signal strength. The efficiency and selectivity of the loop provide outstanding reception without the use of an external aerial. In or near metal buildings, iron ore deposits or steel structures, or in localities remote from broadcasting stations, reception of the Standard Broadcast Band may require an outside aerial 50 to 100 feet in length including lead-in. Connect the outside aerial to the aerial lead (Blue Wire) located at the rear of the receiver. When using the outside antenna it may be necessary to reverse the power cord plug to eliminate hum or distortion.

The built-in FM aerial is a folded dipole Antenna. Although the receiver performs satisfactorily on the broadcast band, your particular location may require an outside antenna for FM reception. The external aerial for FM reception must be a dipole Antenna with a 300 ohm line, which you may secure from your local Sonora Dealer. The two lead-in leads of the dipole antenna should be attached, one lead under each screw, to the terminal strip located on the cabinet back after removing the FM antenna furnished with the receiver. For best possible reception with an outside dipole, adjust lead length on the lead-in cable on the weakest station. Cut off lead 6 inches at a time and until signal comes in stronger. If cutting off an additional length does not increase signal, you have reached the correct lengths. It is not necessary to cut off more than 2½ feet.

SONORA RADIO & TELEV. CORP. MODELS WLRU-219, WLRU-220A, WLRU-254A; 402F

This receiver is designed to operate over two tuning ranges; the broadcast band which extends from 535 to 1620 Kilocycles (KC) (185 to 560 Meters), and the Frequency Modulation (FM) Band which extends from 87 to 109 Megacycles (MC).

DIAL CALIBRATION. (Standard Broadcast Band.) The upper scale is calibrated from 55 to 160 (Standard Broadcast). This band covers all Standard Broadcast frequencies of the United States, Canada, Mexico, Cuba, and many Central and South American Countries. Add a zero to figures on the scale to obtain kilocycles.

DIAL CALIBRATION. (Frequency Modulation Band.) The entire lower scale is calibrated from 88 to 108 Megacycles (201 to 300 FM channels) which covers the entire popular Frequency Modulation (FM) Band.

BROADCAST ALIGNMENT PROCEDURE

EQUIPMENT REQUIRED: Modulated Test Oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC, also an Output Meter to connect across the primary or secondary of the output transformer.

I. F. ALIGNMENT: Put switch in the broadcast position and connect the test oscillator to the converter grid through a .05 condenser. The ground lead of the test oscillator should be connected to the buss of the receiver. Adjust the four I. F. trimmers (F. G, L and K) for maximum reading on the output meter. Always use the peak on the slug which is obtained when screw is out of the can the greatest distance.

R.F. ALIGNMENT. Connect the test oscillator to the antenna lead on the loop through a 100 mmf. condenser. For the antenna adjustment, it is necessary to connect the loop on the cabinet to the chassis, or use an equivalent dummy. An equivalent dummy can be constructed by winding two turns of hookup wire on a piece of carton material to form a loop 22x35 inches. Set the gang condenser to the maximum high frequency position and the test oscillator to 1620 KC. Adjust Trimmer "C" to the maximum output. Set test oscillator to 1400 KC and tune in signal with the gang condenser and adjust Trimmer "A" to maximum response. Set test oscillator to 600 KC and tune in signal with gang condenser. Check for damage to gang condenser or coils.

F. M. ALIGNMENT PROCEDURE

EQUIPMENT REQUIRED: F. M. Generator with frequencies of 90, 98, 106, and 109 megacycles, and generator without any modulation which covers 10.7 megacycles, also a zero center microammeter, and a DC Vacuum Tube Voltmeter (An oscilloscope and variable frequency audio oscillator can be used for better results. This method of alignment is described in the last paragraph).

DISCRIMINATOR ALIGNMENT: Connect DC Vacuum Tube Voltmeter between the buss and point "XX" on circuit diagram. Point "XX" is negative potential on the vacuum tube voltmeter. I.F. 455 KC.

5 TUBE A.C.-D.C.
SUPERHETERODYNE
SINGLE BAND
PHONO-CHANGER COMBINATION

TUNING RANGE

The receiver is designed to operate over the standard broadcast band which extends from 535 to 1620 Kilocycles (KC) (185 to 560 Meters).

DIAL CALIBRATION. The scale is calibrated from 55 to 160 (Standard Broadcast). This band covers all Standard Broadcast frequencies of the United States, Canada, Mexico, Cuba and many Central and South American Countries. Add a zero to figures on the scale to obtain kilocycles.

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED. OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I. F. ALIGNMENT. Remove chassis from the cabinet. Care should be taken to have no iron or other metal near the loop.

Do not make this set-up on a metal bench. With the gang condenser set at minimum, adjust the test oscillator to 455 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the ground buss, indicated on the circuit diagram. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to the antenna of the set through a 100 mmfd. (.0001) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1620 KC, and adjust the oscillator (or 1620 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

AERIAL SYSTEM

The receiver has a built-in "loop" aerial. Its excellent design is such as to increase pick-up from stations having wide variations in signal strength. The efficiency and selectivity of the loop provide outstanding reception without the use of an external aerial. The "loop" aerial used on this receiver is somewhat directional so reception from weak stations can be improved by turning the set in the proper direction. In or near metal buildings, iron ore deposits or steel structures or in localities remote from broadcasting stations, reception can be improved by using an outside aerial 50 feet to 100 feet in length including lead-in. Connect the outside aerial to the aerial lead. When using the outside aerial it may be necessary to reverse the power cord plug in wall socket to eliminate hum or distortion.

						C2A Ant. Trim.	***
5	Repeat operations (2 and 4).						
6	Check calibration at 600 KC., 1000 KC., and 1500 KC.						

* Pin No. 8 on 12SA7GT Tube.
** Use driver loop as shown
*** Rock dial while adjusting for maximum output.

SPECIAL NOTE: In view of the fact that the metal speaker grill will affect the R. F. alignment on this set, please observe the following instructions when alignment is necessary. After the receiver has been removed from cabinet, turn the chassis in such manner that the speaker faces the metal cabinet grill. Slide chassis up against cabinet so that the metal grill and the loop antenna will be in the same relative position as when the chassis is properly mounted in the cabinet. By using the procedure as outlined in this bulletin the receiver will remain properly aligned when placed back into cabinet.

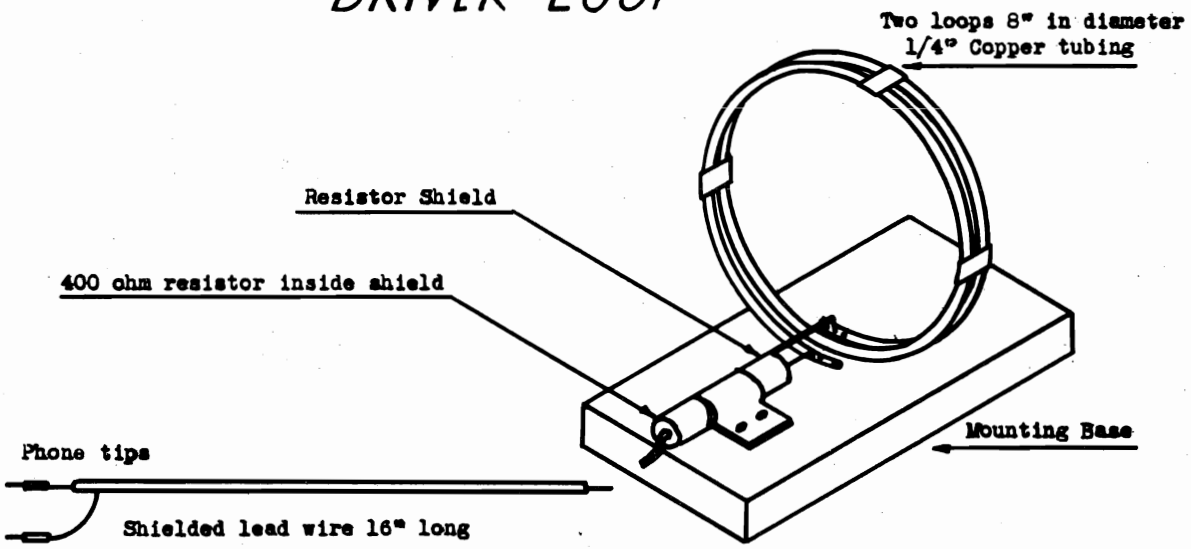
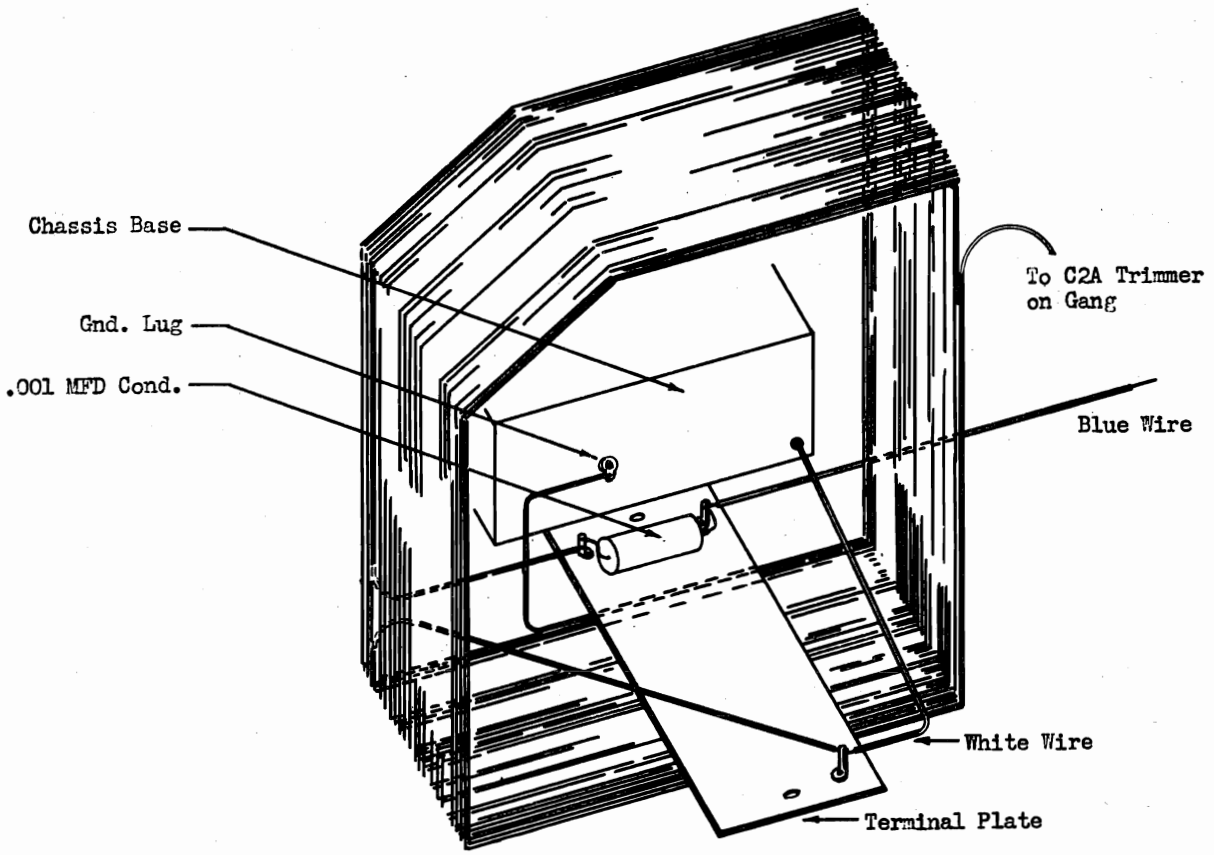
DRIVER LOOP



SPECIFICATIONS

Two loops of 1/4" copper tubing 8" in diameter spaced 1/4" apart with 400 ohms resistor in series. Connecting cable and resistor must be shielded.
The loop should be spaced twice the diameter of the loop from the receiver being aligned to prevent an over modulated signal and poor alignment of the receiver.



Model 5-07PA Loop Hookup

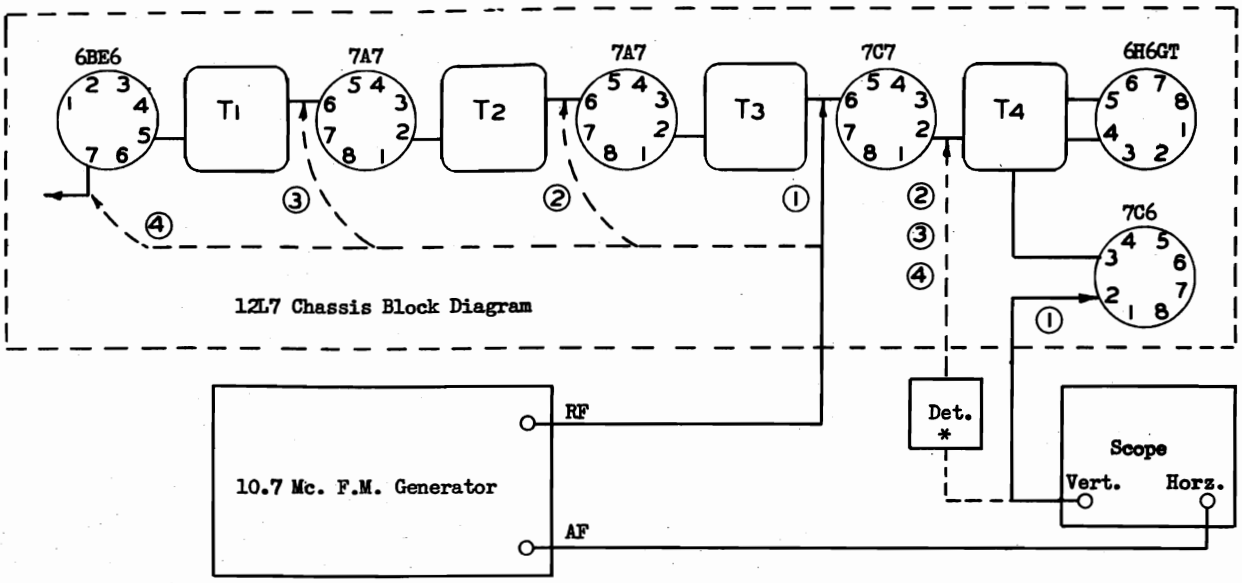
VISUAL I. F.-F. M. ALIGNMENT DATA

DESCRIPTION OF CIRCUIT USED:

A 6H6GT is employed as a ratio detector. This tube is preceded by a 7C7 ratio detector driver and two stages of 10.7 Mc. amplification using type 7A7 tubes. All stages are coupled by transformer coupling. The transformers are of the composite type wherein both 10.7 Mc. and 456 Kc. units are constructed within one can.



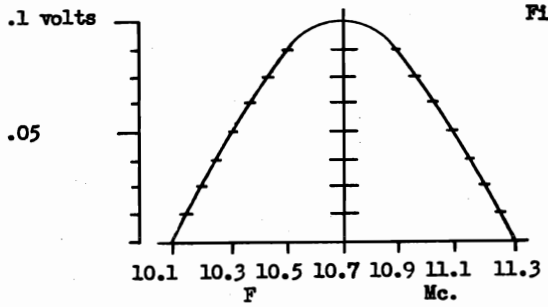
Gen. & Scope Position	Use
1	Align Ratio Detector - Adjust T4
2	Align I.F. - Adjust T3
3	Align I.F. - Adjust T2
4	Align I.F. - Adjust T1
*	See paragraph 3(e) under equipment required.

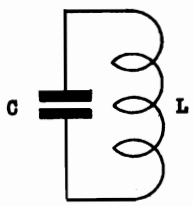
THEORY OF VISUAL ALIGNMENT.

One of the characteristics of a tuned circuit is the fact that when it is excited or driven by a generator such as a vacuum tube or another tuned circuit, the voltage developed across it will vary with slight changes in frequency. This voltage will be greatest when the frequency is equal to the resonant frequency of the circuit and will be less if the frequency is higher or lower than the resonant frequency.

Thus if we were to shift the frequency from high to low or low to high across the resonant frequency and make a record of the voltage across the tuned circuit, we could plot the voltage against frequency and obtain a curve which might look like Fig. 1.

Fig. 1



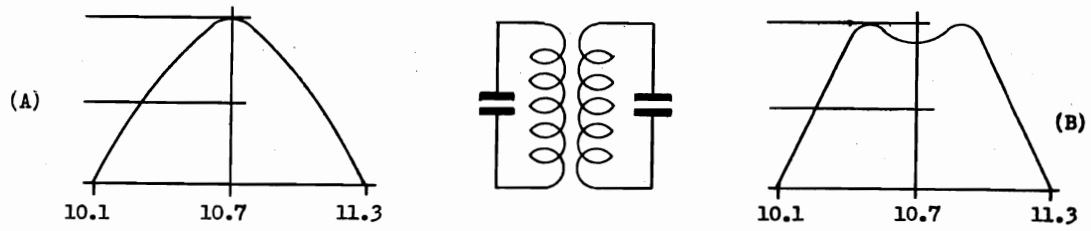


This is the selectivity curve or response curve for the circuit under discussion. This type of circuit may be aligned or adjusted to resonance by simply changing either L or C until maximum voltage is obtained at the resonant frequency. Now if another circuit tuned to the same resonant frequency is coupled to the simple case above, a number of things can happen. First current flowing in one circuit will induce current in the second circuit, the magnitude of this current depending on the degree or amount of coupling between the two circuits. This coupling may be in the form of mutual inductance, mutual capacitance or any impedance common to the two circuits. Now if we repeat the proceedure outlined for obtaining the response curve of a single tuned circuit using the voltage developed across the secondary of the coupled circuit while driving the primary, we may get either

VISUAL I. F.-F. M. ALIGNMENT DATA

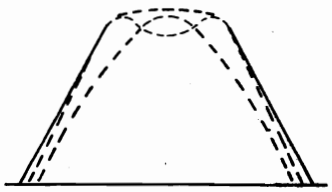
of two types of curves depending on the magnitude of the coupling, (a) in Fig. 2 is a typical curve for two circuits coupled below critical coupling and (b) is a representation of the curve for an overcoupled circuit.

Fig. 2



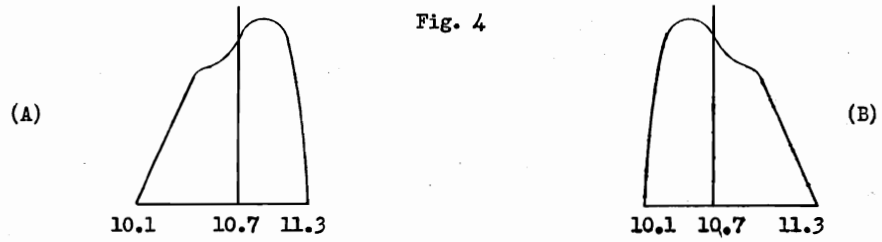
Overcoupled circuits producing a response curve like (b) Fig. 2 are often employed where it is important that the response curve remain approximately flat over a narrow band of frequencies near the resonant frequency. They are also frequently combined with single peaked circuits to produce a response curve like Fig. 3.

Fig. 3



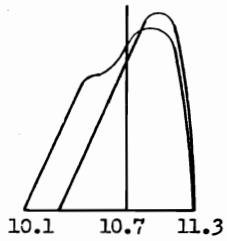
The dotted lines indicate the curves of the individual circuits and the solid curve shows the overall response of the two or more pairs of coupled circuits. Circuits like the above or approaching them in form are desirable in an F.M. receiver where the pass band should be of the order of 200 Kc. Now from the above it is evident that simple peaking both sides of a circuit coupled below critical for maximum voltage will provide optimum alignment but if this proceedure is followed with an overcoupled circuit it is almost a certainty that the two circuits will not be tuned to the resonant frequency but will instead be aligned so that either one or the other is accentuated. The response curve will then look like Fig. 4 (a) or (b).

Fig. 4



Now if this overcoupled circuit is combined with a single peaked circuit (where the coupling is below critical), the misalignment becomes worse, something like Fig. 5.

Fig. 5



From the above it appears that to properly align a receiver using overcoupled IF transformers it will be necessary to take a response curve of each stage and align the circuit so that the two peaks are symmetrical, that is, approximately equal in amplitude and displaced equally from the center frequency. To do this with a CW or AM signal would be laborious and time consuming whereas the use of visual equipment makes it nearly as simple as adjusting a simple single peaked amplifier.

VISUAL I. F.-F. M. ALIGNMENT DATA

Visual alignment test equipment performs the operation of plotting the response curve almost exactly as described above except that instead of manually changing the generator frequency, recording the voltage and then plotting the results, these operations are performed automatically and simultaneously by a combination of electronic circuits. The operation is briefly as follows.

In the signal generator a low AC voltage is applied to a reactance tube modulator which shifts the oscillator frequency from low to high or from high to low at a rate determined by the frequency of the AC voltage and by an amount determined by the AC voltage. The frequency at any instant is then dependant on the AC voltage present at that instant of time. An oscilloscope is provided which may be considered a voltmeter used to read the voltage across the tuned circuit, provided a detector is used to convert the RF to a low audio frequency. This voltage is then applied to the vertical plates and results in a vertical displacement of the spot on the screen. Some of the voltage used to shift the oscillator frequency is also applied to the horizontal plates of the oscilloscope providing a means of displacing the spot horizontally. It is now evident that since that for any given AC voltage only one frequency may be obtained and since that AC voltage will result in an exact amount of spot deflection on the scope we can read the voltage across the circuit under examination by noticing the position of the spot at this exact instant.

Now if we consider the frequency as shifting from low to high 60 times per second and remember that the spot is moving across the screen of the scope 60 times per second at exact synchronization with the change in frequency it is only necessary to apply the voltage from our circuit to the vertical plates to obtain a replica of the response curve on the face of the cathode ray tube. This curve will be repeated 60 times per second if our sweep frequency is 60 cycles. Adjustments to the circuit may now be made and the effect on the response curve noted instantaneously.

EQUIPMENT REQUIRED.

(a) A sweep signal generator with a center frequency of 10.7 Mc. and a total sweep width of at least 400 Kc. This generator should be equipped with filters to remove all spurious oscillator frequencies and limiters should be provided to remove all amplitude modulation. There should also be a crystal oscillator to provide a marker frequency at 10.7 Mc. for accurate determination of the center frequency.

(b) An amplitude modulated signal generator tuned to 456 Kc. This generator should be either crystal controlled or means should be provided for accurate frequency calibration.

(c) An Oscilloscope with either a 3" or 5" tube equipped with both vertical and horizontal amplifiers.

(d) A power output meter with an internal impedance to match the output transformer for use in 456 Kc. alignment.

(e) A diode detector for use in connection with the oscilloscope while aligning the F.M.-I.F. channel. This diode detector may be either a crystal or a two element vacuum tube such as the 6H6. A diode load resistor, coupling condenser, etc. will also be necessary.

ALIGNMENT OF THE 456 KC. I.F.

This alignment adjustment should be made before attempting to align the 10.7 I.F. circuit because of the possible effects on the operation of the F.M. I.F.

Connect the output meter to the receiver. Connect the signal generator output lead to the converter grid. Turn the wave band switch to BC. and the generator to 456 Kc. Using the output meter as an indicator peak the A.M. I.F. trimmers for maximum output.

ALIGNMENT OF THE 10.7 I.F.

Turn the wave band switch to F.M. and the generator to 10.7 Mc. Move the signal generator lead to the grid of the ratio detector driver tube and the scope to the 1st audio plate. Now proceed to align the ratio detector transformer for maximum linearity and minimum noise. This operation can be faciliated by applying a small amount of amplitude modulation along with the F.M. and then adjusting the secondary trimmer for minimum noise. Please note that the adjustment of the secondary circuit, controls to a large extent, the linearity of the pattern and adjustment of the primary is responsible for the gain in the circuit. Fig. 6 will represent a linear detector curve and Fig. 7, a detector curve with noise or A.M. present.

With the generator output lead connected to the grid of the next I.F. amplifier, connect the scope through the temporary detector mentioned previously (3e) to the ratio detector driver plate. Align for maximum output and symmetry.

VISUAL I. F.-F. M. ALIGNMENT DATA

Fig. 6

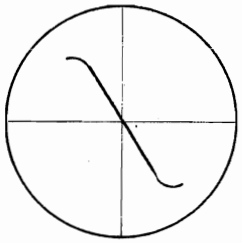

Fig. 7

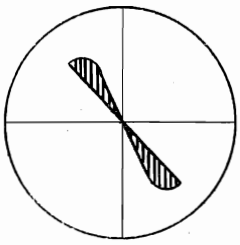
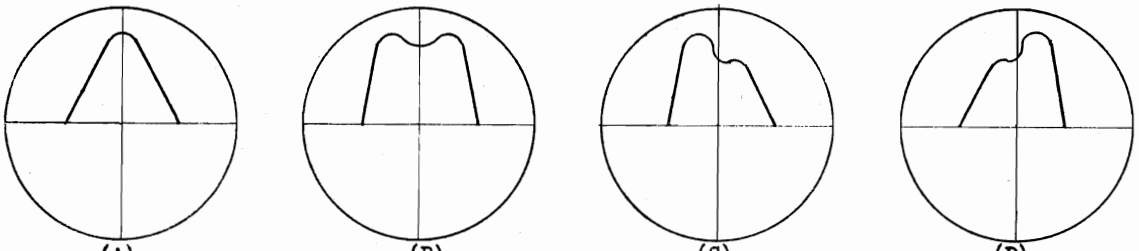


*Move the generator lead to the grid of the next I.F. tube and align the next I.F. transformer. Adjust both trimmer screws for maximum gain, meanwhile maintaining symmetry in the curve. Observe that by alternately adjusting the primary and secondary trimmer, the vertical amplitude can be increased without allowing the response curve to become greatly distorted. Move the generator lead to the grid of the converter tube and align No. 1 I.F. transformer following the same proceedure as above.

Fig. 8, (A), (B), (C), and (D) below represent typical response curves of an overall I.F. amplifier.

Fig. 8



(A) Not Overcoupled Properly Aligned (Right)

(B) Overcoupled Properly Aligned (Right)

(C) Overcoupled Improperly Aligned (Wrong)

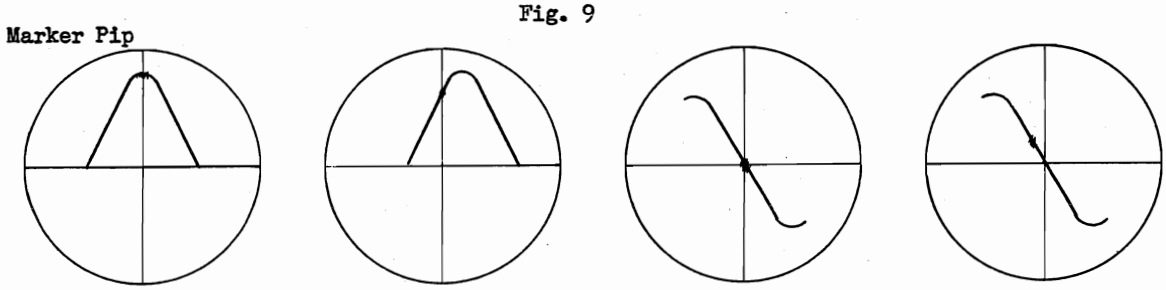
(D) Overcoupled Improperly Aligned (Wrong)

With the generator lead still connected to the converter grid, connect the scope to the 1st audio plate, and check the detector curve for linearity and noise. Should this appear unsatisfactory, a very slight readjustment of the detector secondary alignment may be made at this time. If, however, the adjustment required is very great the entire alignment procedure should be repeated in that the need for adjustment is an indication of incorrect alignment in one of the other stages.

USE OF MARKER FREQUENCIES.

A crystal controlled marker frequency should be provided at 10.7 Mc. The frequency of the sweep oscillator is correct when the pip will appear in the exact center of the sweep and so in the center of the resonance curve. See Fig. 9.

Fig. 9



Right

Wrong Resonance Curve Off Frequency

Right

Wrong Sweep Oscillator Off Frequency

Note that either the sweep oscillator or the circuit alignment may be off frequency.

*This stage may or may not be included depending upon the particular model.

VISUAL I. F.-F. M. ALIGNMENT DATA

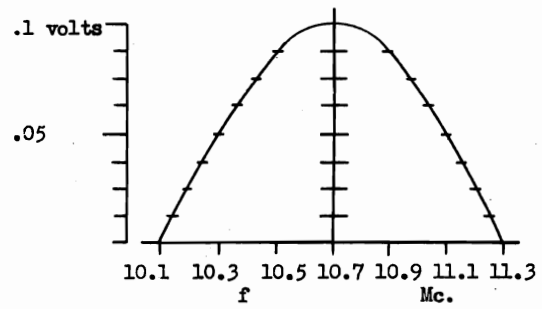
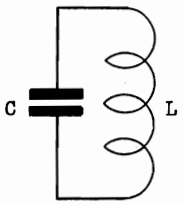
2. THEORY OF VISUAL ALIGNMENT.

One of the characteristics of a tuned circuit is the fact that when it is excited or driven by a generator such as a vacuum tube or another tuned circuit, the voltage developed across it will vary with slight changes in frequency. This voltage will be greatest when the frequency is equal to the resonant frequency of the circuit and will be less if the frequency is higher or lower than the resonant frequency.

Thus if we were to shift the frequency from high to low or low to high across the resonant frequency and make a record of the voltage across the tuned circuit, we could plot the voltage against frequency and obtain a curve which might look like Fig. 1.

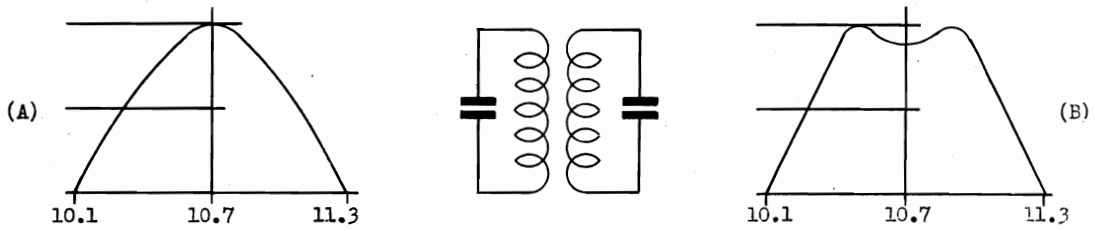
Fig. 1





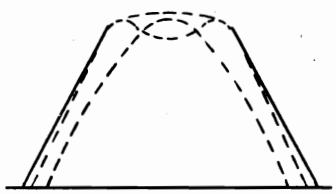
This is the selectivity curve or response curve for the circuit under discussion. This type of circuit may be aligned or adjusted to resonance by simply changing either L or C until maximum voltage is obtained at the resonant frequency. Now if another circuit tuned to the same resonant frequency is coupled to the simple case above, a number of things can happen. First current flowing in one circuit will induce current in the second circuit, the magnitude of this current depending on the degree or amount of coupling between the two circuits. This coupling may be in the form of mutual inductance, mutual capacitance or any impedance common to the two circuits. Now if we repeat the proceedure outlined for obtaining the response curve of a single tuned circuit using the voltage developed across the secondary of the coupled circuit while driving the primary, we may get either of two types of curves depending on the magnitude of the coupling, (a) in Fig. 2 is a typical curve for two circuits coupled below critical coupling and (b) is a representation of the curve for an overcoupled circuit.

Fig. 2



Overcoupled circuits producing a response curve like (b) Fig. 2 are often employed where it is important that the response curve remain approximately flat over a narrow band of frequencies near the resonant frequency. They are also frequently combined with single peaked circuits to produce a response curve like Fig. 3.

Fig. 3



MODELS 1035, 1035A, 1036, 1036A, 1037, 1037A, CHASSIS 9L8

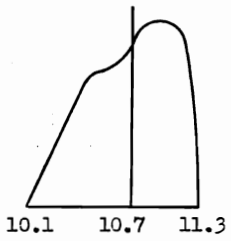
THE SPARKS-WITHINGTON CO.

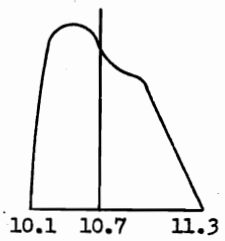
VISUAL I. F.-F. M. ALIGNMENT DATA

The dotted lines indicate the curves of the individual circuits and the solid curve shows the overall response of the two or more pairs of coupled circuits. Circuits like the above or approaching them in form are desirable in an F.M. receiver where the pass band should be of the order of 200 Kc. Now from the above it is evident that simple peaking both sides of a circuit coupled below critical for maximum voltage will provide optimum alignment but if this proceedure is followed with an overcoupled circuit it is almost a certainty that the two circuits will not be tuned to the resonant frequency but will instead be aligned so that either one or the other is accentuated. The response curve will then look like Fig. 4 (a) or (b).

Fig. 4

(A)

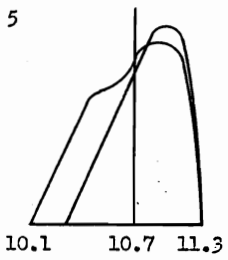




(B)

Now if this overcoupled circuit is combined with a single peaked circuit (where the coupling is below critical), the misalignment becomes worse, something like Fig. 5.

Fig. 5



From the above it appears that to properly align a receiver using overcoupled IF transformers it will be necessary to take a response curve of each stage and align the circuit so that the two peaks are symmetrical, that is, approximately equal in amplitude and displaced equally from the center frequency. To do this with a CW or AM signal would be laborious and time consuming whereas the use of visual equipment makes it nearly as simple as adjusting a simple single peaked amplifier.

Visual alignment test equipment performs the operation of plotting the response curve almost exactly as described above except that instead of manually changing the generator frequency, recording the voltage and then plotting the results, these operations are performed automatically and simultaneously by a combination of electronic circuits. The operation is briefly as follows.

In the signal generator a low AC voltage is applied to a reactance tube modulator which shifts the oscillator frequency from low to high or from high to low at a rate determined by the frequency of the AC voltage and by an amount determined by the AC voltage. The frequency at any instant is then dependant on the AC voltage present at that instant of time. An oscilloscope is provided which may be considered a voltmeter used to read the voltage across the tuned circuit, provided a detector is used to convert the RF to a low audio frequency. This voltage is then applied to the vertical plates and results in a vertical displacement of the spot on the screen. Some of the voltage used to shift the oscillator frequency is also applied to the horizontal plates of the oscilloscope providing a means of displacing the spot horizontally. It is now evident that since that for any given AC voltage only one frequency may be obtained and since that AC voltage will result in an exact amount of spot deflection on the scope we can read the result in an exact amount of spot deflection on the scope we can read the voltage across the circuit under examination by noticing the position of the spot at this exact instant.

Now if we consider the frequency as shifting from low to high 60 times per second and remember that the spot is moving across the screen of the scope 60 times per second at exact synchronization with the change in frequency it is only necessary to apply the voltage from our circuit to the vertical plates to obtain a replica of the response curve on the face of the cathode ray tube. This curve will be repeated 60 times per second if our sweep frequency is 60 cycles. Adjustments to the circuit may now be made and the effect on the response curve noted instantaneously.

VISUAL I. F.-F. M. ALIGNMENT DATA

3. EQUIPMENT REQUIRED.

(a) A sweep signal generator with a center frequency of 10.7 Mc. and a total sweep width of at least 400 Kc. This generator should be equipped with filters to remove all spurious oscillator frequencies and limiters should be provided to remove all amplitude modulation. There should also be a crystal oscillator to provide a marker frequency at 10.7 Mc. for accurate determination of the center frequency.

(b) An amplitude modulated signal generator tuned to 456 Kc. This generator should be either crystal controlled or means should be provided for accurate frequency calibration.

(c) An oscilloscope with either a 3" or 5" tube equipped with both vertical and horizontal amplifiers.

(d) A power output meter with an internal impedance to match the output transformer for use in 456 Kc. alignment.

(e) A diode detector for use in connection with the oscilloscope while aligning the F.M.-I.F. channel. This diode detector may be either a crystal or a two element vacuum tube such as the 6H6. A diode load resistor, coupling condenser, etc. will also be necessary.

4. ALIGNMENT OF THE 456 KC. I. F.

This alignment adjustment should be made before attempting to align the 10.7 I.F. circuit because of the possible effects on the operation of the F.M. I.F.

Connect the output meter to the receiver. Connect the signal generator output lead to the converter grid. Turn the wave band switch to Bc. and the generator to 456 Kc. Using the output meter as an indicator peak the A.M. I.F. trimmers for maximum output.

5. ALIGNMENT OF THE 10.7 I.F.

Turn the wave band switch to F.M. and the generator to 10.7 Mc. Move the signal generator lead to the grid of the ratio detector driver tube and the scope to the 1st audio plate. Now proceed to align the ratio detector transformer for maximum linearity and minimum noise. This operation can be faciliated by applying a small amount of amplitude modulation along with the F.M. and then adjusting the secondary trimmer for minimum noise. Please note that the adjustment of the secondary circuit, controls to a large extent, the linearity of the pattern and adjustment of the primary is responsible for the gain in the circuit. Fig. 6 will represent a linear detector curve and Fig. 7, a detector curve with noise or A.M. present.

Fig. 6

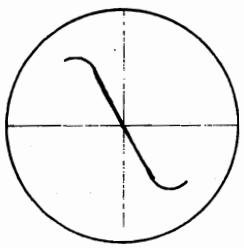

Fig. 7

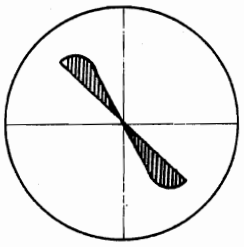

With the generator output lead connected to the grid of the next I.F. amplifier, connect the scope through the temporary detector mentioned previously (3e) to the ratio detector driver plate. Align for maximum output and symmetry.

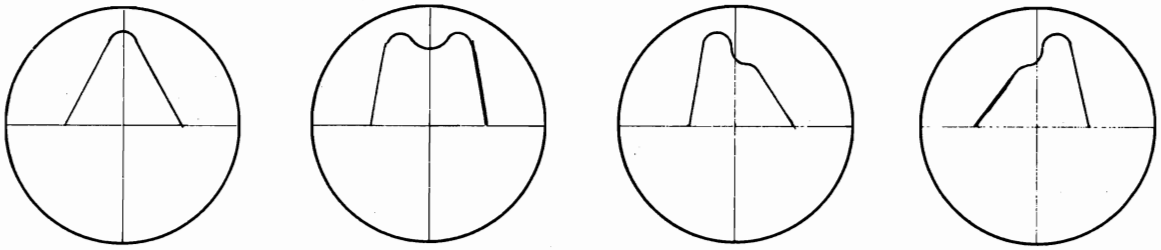
THE SPARKS-WITHINGTON CO.

VISUAL I. F.-F. M. ALIGNMENT DATA

*Move the generator lead to the grid of the next I.F. tube and align the next I.F. transformer. Adjust both trimmer screws for maximum gain, meanwhile maintaining symmetry in the curve. Observe that by alternately adjusting the primary and secondary trimmer, the vertical amplitude can be increased without allowing the response curve to become greatly distorted. Move the generator lead to the grid of the converter tube and align No. 1 I.F. transformer following the same proceedure as above.

Fig. 8, (A), (B), (C), & (D) below represent typical response curves of an overall I.F. amplifier.

Fig. 8



(A) Not Overcoupled Properly Aligned (Right)

(B) Overcoupled Properly Aligned (Right)

(C) Overcoupled Improperly Aligned (Wrong)

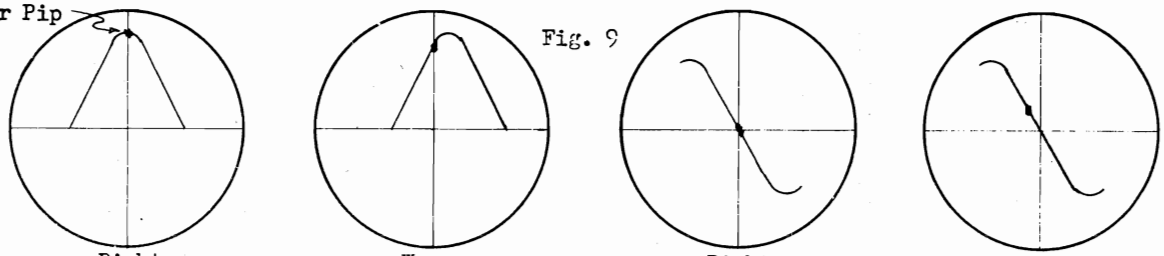
(D) Overcoupled Improperly Aligned (Wrong)

With the generator lead still connected to the converter grid, connect the scope to the 1st audio plate, and check the detector curve for linearity and noise. Should this appear unsatisfactory, a very slight readjustment of the detector secondary alignment may be made at this time. If, however, the adjustment required is very great the entire alignment procedure should be repeated in that the need for adjustment is an indication of incorrect alignment in one of the other stages.

6. USE OF MARKER FREQUENCIES.

A crystal controlled marker frequency should be provided at 10.7 Mc. The frequency of the sweep oscillator is correct when the pip will appear in the exact center of the sweep and so in the center of the resonance curve. See Fig. 9.

Fig. 9



Right

Wrong Resonance Curve Off Frequency

Right

Wrong Sweep Oscillator Off Frequency

Note that either the sweep oscillator or the circuit alignment may be off frequency.

*This stage may or may not be included depending upon the particular model.

MODEL CB-7553

SPIEGEL

This is a 5-tube Superheterodyne radio receiver designed to operate on:

1. 105-125 volts A.C. 60 cycles.
2. *105-125 volts D.C.

This receiver operates on the standard broadcast band, 540-1700 KC.

* Operate phonograph on A.C. only.

Tube Complement:

loctal	*octal*	*miniature*	*function*
V_1—14Q7		12BE6	Osc., Conv.
V_2—14A7		12BA6	I.F. Amp.
V_3—14B6		12AT6	Det., A.V.C., Amp.
V_4—50A5	50L6	50B5	Power Amp.
V_5—35Y4		35W4	Rectifier

Loctal base tubes have a special locking arrangement which holds the tubes securely in the sockets. To remove a tube, use slightly off-side pressure towards socket rivet, thus releasing the socket lock.

ALIGNMENT PROCEDURE.

Steps	*Connect output of oscillator to*	*Tune osc. to*	*Tune radio dial to*	*Adjust the following for max. peak output*
1	Tuning condenser stator (ant.) in series with .01 mfd.	455	Quiet point at high frequency end of dial.	1st and 2nd I.F. Transformers
2	Antenna term. of Ant. loop in series with 100 mmf.	1720	Full clockwise (out of mesh)	Osc. trimmer
3	Antenna term. of Ant. loop in series with 100 mmf.	1500	1500	Ant. trimmer

Output meter is connected across voice coil.

Receiver volume is turned to maximum

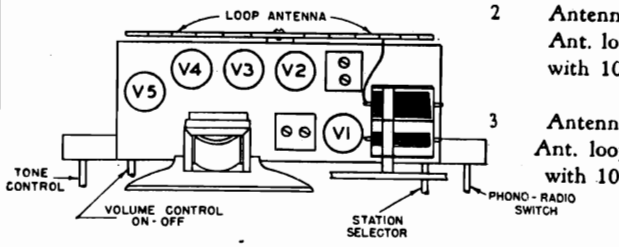

Fig. 3. Tube and Trimmer Locations—4-Control

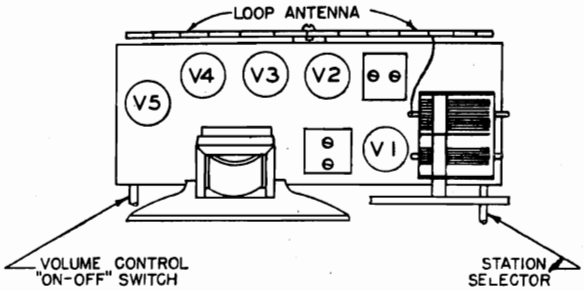

Fig. 1. Tube and Trimmer Locations—2-Control

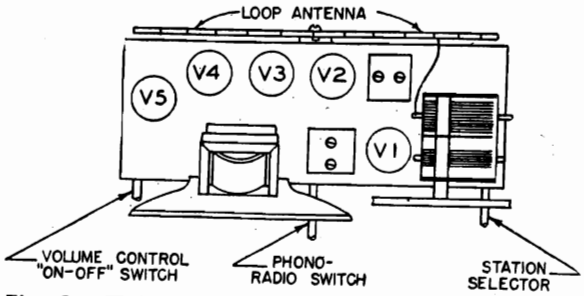

Fig. 2. Tube and Trimmer Locations—3-Control

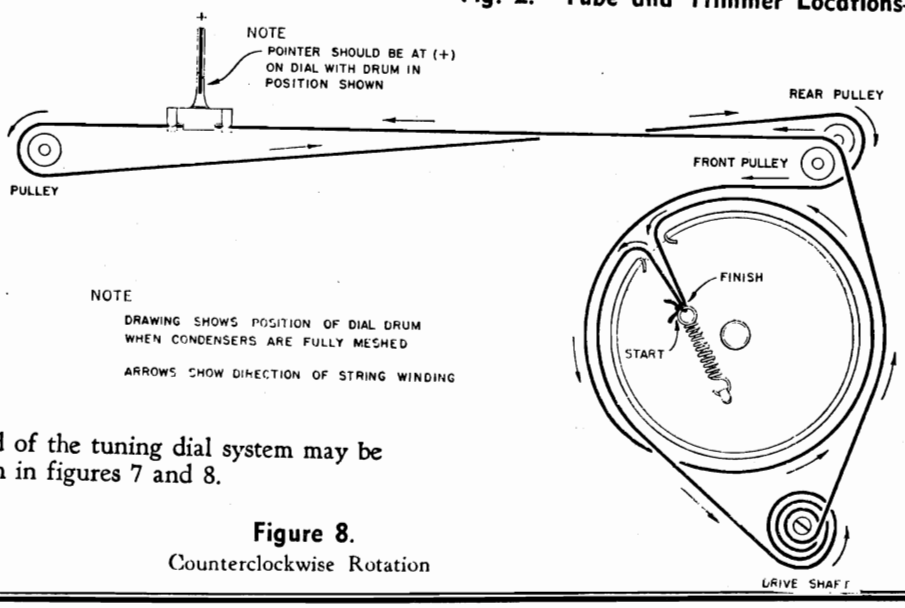
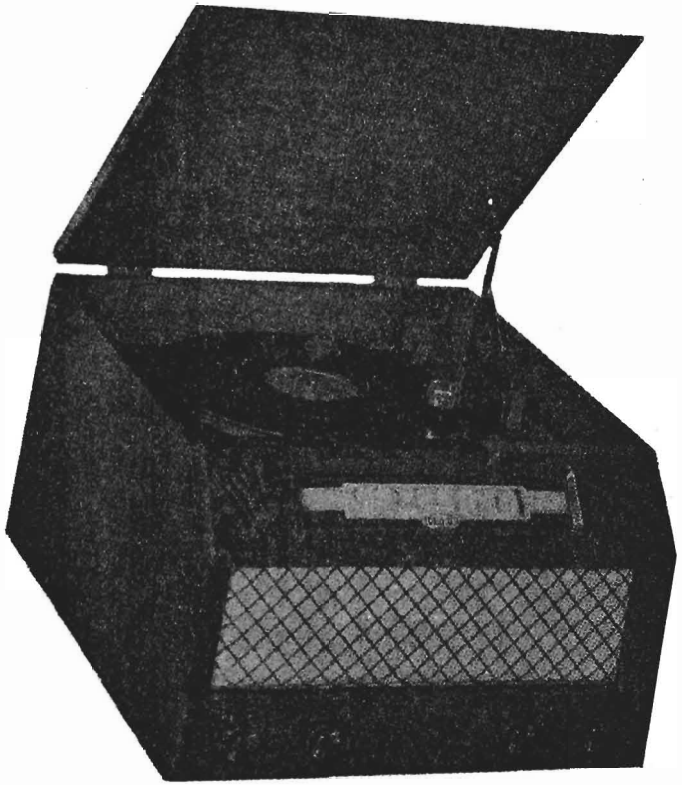


Nylon cord of the tuning dial system may be replaced as shown in figures 7 and 8.

Figure 8.
Counterclockwise Rotation



Operation: The set operates on 110 to 120 volts, 60 cycles A.C. only. Power drain is approximately 25 watts for radio and about 10 watts additional for the motor.

Range: Model G-516 covers the broadcast band from 540 to 1620 kilcycles. Since the scale is calibrated 54 to 160, the actual frequency of the station received is obtained by adding a zero to the dial calibration.

Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube, or some local condition is not responsible for the faulty reception.

The Signal Generator may be connected through a 0.01 mf capacitor (used as dummy antenna) to the lug on RF section (B) of tuning capacitor. Connect ground clip of generator directly to chassis. Align the I. F. trimmers to 455 kc, using least possible input from Signal Generator to avoid developing A.V.C. voltage which would make the tuning adjustments very broad. An output meter may be clipped directly across the voice coil lugs.

To align RF trimmers, remove the 0.01 mf capacitor and connect the Signal Generator leads to two or three turns of heavy wire, forming a self-supporting loop of about 7 or 8 inches diameter, placed about a foot away from the receiver's loop antenna. Again, use the least possible input from the Signal Generator. With the tuning capacitor plates completely out of mesh, and pointer at extreme right end of travel, adjust the oscillator trimmer (A) (on front section of tuning capacitor) to 1700 kc. Readjust both Signal Generator and tuning capacitor to 1550 kc and adjust the RF trimmer (B) (on rear section) for maximum response. With tuning capacitor plates fully meshed, the receiver should tune to 532 kc; however, no adjustment is required at this point. For checking purposes, four fine marks are engraved on the dial plate. These represent, in order, the pointer position with capacitor plates fully meshed, and the pointer setting for 600, 1000 and 1550 kc.

MODEL WAU-243 SPIEGEL

SERVICE DATA

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

TUNING RANGE

This receiver is designed to operate over the standard broadcast band which extends from 535 to 1720 Kilocycles (KC) (174 to 560 Meters).

DIAL CALIBRATION. The scale is calibrated from 55 to 170 (Standard Broadcast). This band covers all Standard Broadcasts frequencies of the United States, Canada, Mexico, Cuba and many Central and South American Countries. Add a zero to figures on the scale to obtain kilocycles.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1720 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I.F. ALIGNMENT. Remove the chassis and loop antenna from the cabinet and set them up on the bench so that they occupy exactly the same respective positions on the bench as they did in the cabinet. Care should be taken to have no iron or other metal near the loop. Do not make this set-up on a metal bench. With the gang condenser set at minimum, adjust the test oscillator to 455 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the ground buss, indicated on the circuit diagram. Align all three I.F. trimmers to peak or maximum reading on the output meter.

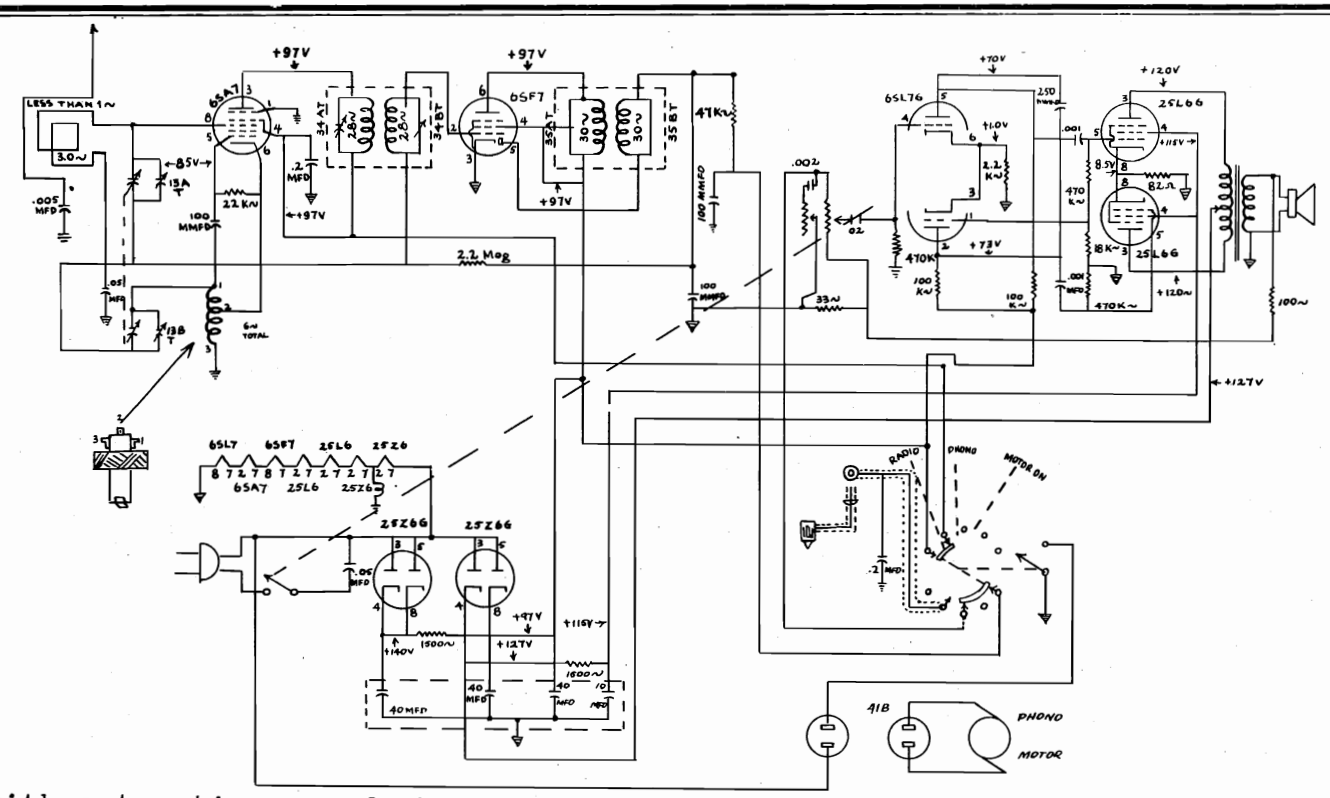
BROADCAST BAND ALIGNMENT. Connect the test oscillator to the antenna of the set through a 100 mmfd. (.0001) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1720 KC, and adjust the oscillator (or 1720 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

AERIAL SYSTEM

This receiver has a built-in "loop" aerial. Its excellent design is such as to increase pick-up from stations having wide variations in signal strength. The efficiency and selectivity of the loop provide outstanding reception without the use of an external aerial. The "loop" aerial used on this receiver is somewhat directional so reception from weak stations can be improved by turning the set in the proper direction. In or near metal buildings, iron ore deposits or steel structures or in localities remote from broadcasting stations, reception can be improved by using an outside aerial 50 feet to 100 feet in length including lead-in. Connect the outside aerial to the aerial lead. When using the outside aerial with AC power supply it may be necessary to reverse the power cord plug in wall socket to eliminate hum or distortion.

TUBES USED

Five tubes are used. (One tube is a rectifier.) Type numbers and locations are shown in the tube location diagram on the cabinet. If tubes are removed from their sockets for test or replacement purposes, make certain that each tube is placed in its proper socket when replacing the tubes in the set. Failure to replace the tubes in their proper sockets may result in damage to the tube, or to the receiver, or both.



Phono-Radio with automatic record changer for alternating (A.C.) current, of 110 to 125 volts at 60 cycles.

1. The knob marked PHONO-RADIO, controls a three position switch. The extreme counter clockwise position is for radio reception. The center position is for FM reception when desired, to be used with an external F.M. tuning unit.

The extreme clockwise position is for phono reception.

2. The knob marked VOLUME, controls the off and on position of the radio receiver and also acts as a master switch by cutting off the current supply to the record changer.

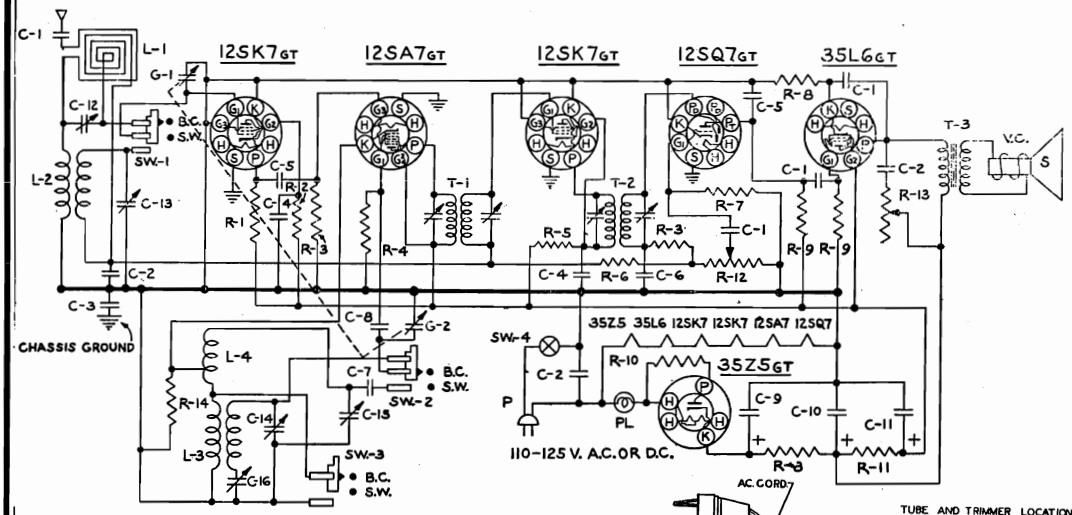
The unit is turned off when the knob is in the extreme left. (Counter clockwise position).

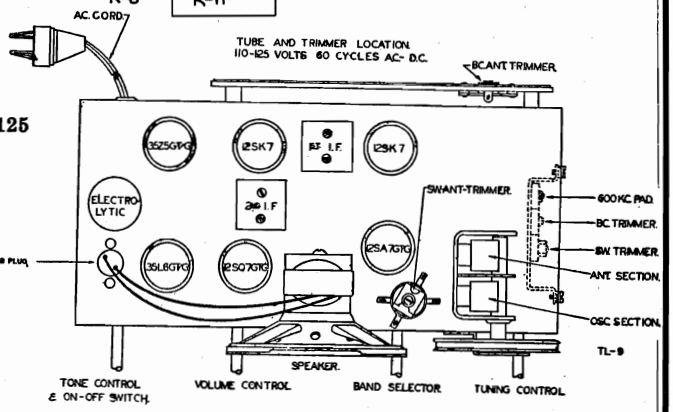
To turn on, turn this knob to the right (clockwise) until a click is heard. Further rotation adjusts the volume.

3. The knob marked TONE, is the tone control which is of the continuously, variable type and may be placed in the most pleasing position to the listener.

4. The knob marked TUNING, is for dialing the broadcast stations.

MODELS 5011, 5012 SPIEGEL





CAUTION

POWER SOURCES: — This receiver will operate either on 110-125 volt A.C., 50-60 cycle current or 110-125 volt D. C. current.

Never plug this receiver into a 220 volt line.

The components in this receiver are designed for 110-125 volt operation only. Any attempt to operate this receiver at a higher than prescribed voltage will cause serious damage.

ALIGNMENT AND SERVICE DATA

Remove the chassis from the cabinet for alignment.

A signal generator is required, having the following frequencies: 455 KC, 1400 KC, 1730 KC. 6 MC, 16 MC, and 18.3 MC. An output meter should be connected across the speaker.

I. F. ALIGNMENT: — Connect the generator lead through a .1 MFD Condenser to the terminal lug on the "Antenna" section of the gang condenser. The ground lead from the generator should be connected to the gang frame. Set the generator at 455 KC. Adjust the trimmer screws in the 1st and 2nd I. F. cans (See Fig. 1) until a maximum reading is noted on the output meter.

The receiver volume control should be turned to maximum during the I. F. and all subsequent alignments, to keep the AVC from working and giving false readings. Keep the generator output as low as possible to prevent overloading.

BC. OR BROADCAST ALIGNMENT: — With the generator leads still connected as in I. F. Alignment, rotate the tuning condenser to complete minimum capacity. Set the generator to 1730 KC. Adjust the BC. oscillator trimmer until the signal is tuned in. Next remove the hot lead of the generator from the "Ant" section of the gang condenser. Connect this lead to the antenna lead wire that projects from the back of the loop antenna through a 200 MMFD condenser. Set the generator to 1400 KC and rotate the tuning condenser until the signal is tuned in. Adjust the BC. antenna trimmer until a maximum reading is noted on the output meter. Set the generator to 600 KC and turn the tuning control until the signal is tuned in. Rock the tuning control back and forth slowly and at the same time adjust the 600 KC pad, slowly to the right or left until a maximum reading is noted on the output meter. It is advisable to return to the 1730 KC adjustment and re-check that setting to make sure it has not changed while padding at 600 KC.

S. W. OR SHORT WAVE ALIGNMENT: — Set the generator at 18.3 MC. Turn the receiver band switch to short band position. Turn the tuning condenser to complete minimum capacity. The generator leads should be connected to the antenna lead wire that projects from the back of the loop antenna through a 400 Ohm resistor. Adjust the S. W. oscillator trimmer slowly until the 18.3 MC signal is tuned in. At this point, it will be well to make sure that the fundamental signal is turned in. Turn up the generator output and tune the receiver to approximately 17.3 MC. At this point the 18.3 MC signal will be heard again but much weaker. This is the image frequency. If the image is not heard, then turn the tuning condenser back to complete minimum and readjust the S. W. oscillator trimmer. Remember, the image must always be heard (at 2 times the I. F. frequency in KC) lower the frequency than the fundamental signal. After the oscillator has been properly set, tune the signal generator to 16 MC and rotate the tuning control until the signal is tuned in. Adjust the S.W. antenna trimmer until a maximum reading is noted on the output meter. It is advisable to rock the gang slowly while adjusting the antenna trimmer. Set the generator to 6 MC and tune the signal in on the receiver. Check the alignment at this frequency. No adjustment should be necessary as the coils have been carefully checked before leaving the factory. A fixed oscillator padding condenser is used at 6 MC.

POWER SOURCES: This receiver is designed for operation on either an external power source or on the enclosed batteries.

AC OR DC OPERATION: This receiver may be operated on 50 to 60 cycle, 110 to 125 volt AC current or 110 to 125 DC current.

CAUTION: Never plug this receiver into a 220 volt line as this will seriously damage the component parts which have been designed for 110 to 125 volt operation only.

To operate on AC or DC open the small door at the lower right hand corner in the back of the cabinet. Pull out the power cord and plug into a convenient outlet of the proper voltage and current. Follow instructions under "Controls."

To operate on the enclosed batteries, follow instructions under "Control."

CONTROLS: This receiver has three control knobs which are located on the front panel of the cabinet.

STATION SELECTOR KNOB: The right hand knob is the station selector. Rotate this knob to the right or left to select your desired station. The dial scale is calibrated in kilocycles. By mentally adding a zero to the numbers on the scale, the result will be read directly in (KC) kilocycles. (i.e., 60 plus 0 equals 600 KC or 140 plus 0 equals 1400 KC).

POWER SELECTOR SWITCH: The center knob is the power selector. It has three positions which are indicated on the front panel. The extreme left hand position is the "OFF" position. The small dot on this knob must point to "OFF" when the receiver is not in use. The center position is "AC-DC" and is used when it is desired to operate the receiver from a power line source. The extreme right hand position is "BATT" and is used when it is desired to operate on the enclosed batteries.

AC OPERATION: When an AC power source is used, set the power selector knob to "AC-DC" after the power cord has been plugged into a convenient outlet. The receiver is now ready for operation.

DC OPERATION: If the receiver does not operate after a few seconds, reverse the power cord plug in the outlet and it will operate properly.

BATTERY OPERATION: The power cord is not used for battery operation and may be hanked and put back in the cabinet. Set the power control knob to "BATT" and the receiver is ready for operation on the enclosed batteries.

CAUTION: When the receiver is not in use, the power selector knob must be turned to "OFF." If the knob is allowed to remain in "BATT" position, the batteries will be in use constantly. The volume control does not control the batteries and they are still in operation even though the volume control is turned all the way off.

VOLUME CONTROL: The left hand knob is the volume control. After the power selector knob has been properly set and the receiver is in operation, rotate the volume control knob to the right to increase volume or to the left to decrease volume.

BATTERY SUPPLIERS

The batteries for this receiver may be purchased from any reliable radio dealer.

For proper operation of this receiver, you must use, two (2) 4½ Volt "A" batteries, and two (2) 45 Volt "B" batteries.

The following is a table of manufacturers and their battery type number.

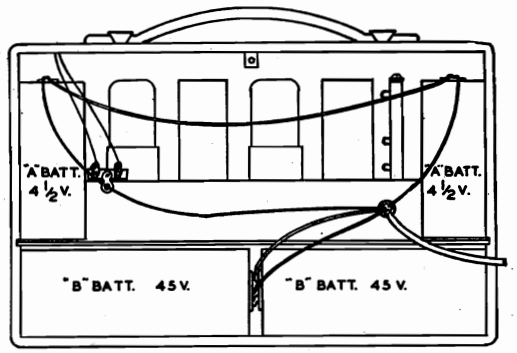
"B" BATTERIES (2 Required)

Mfgr.	Volts	Type No.
Burgess	45 "B"	M30
General	45 "B"	W30B
Bright Star	45 "B"	3033
Usalite	45 "B"	640
Rayovac	45 "B"	P7830
Eveready	45 "B"	482

"A" BATTERIES (2 Required)

Burgess	4½ "A"	G3
General	4½ "A"	3H3
Bright Star	4½ "A"	361
Usalite	4½ "A"	683
Rayovac	4½ "A"	P83A
Eveready	4½ "A"	746

MODEL-5027



BATTERY LOCATION

BATTERY SERVICING

(See Figure No. 1)

To replace batteries, loosen and remove the two screws at the left and right hand corners of the cabinet back. Remove the back and pull out the plug from each battery. Never pull on the wires connected to the plugs as they may break. Always grasp the plug form between the fingers, or use a flat blade to pry out the plug. Observe with care the position of the batteries and plugs when replacing. Be sure that batteries and plugs are replaced as shown in the "Battery Location" diagram. (Figure No. 1)

After the batteries have been installed, replace the back. Make sure that the two wires from the loop antenna are held in place between the brackets of the cabinet and the back by the two fastening screws.

ALIGNMENT AND SERVICE DATA

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1650 KC. An output meter should be connected across the speaker.

The volume control of the receiver should be turned to maximum during the I. F. and all subsequent alignment and the generator output as low as possible to prevent the A. V. C. from working and giving false readings.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser through a .1 MFD. condenser. The ground lead from the generator must be connected to "B" minus under the chassis. Turn the gang condenser to complete minimum capacity. Set the generator to 455 KC. Adjust the trimmers of the first and second I. F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1650 KC. Adjust the OSC. trimmer until the 1650 KC signal is tuned in. The gang condenser must be at complete minimum capacity for this adjustment.

THIRD STEP: Remove the generator leads from the gang condenser and replace the chassis in the cabinet. Loosely couple the generator to the receiver loop by making a complete turn of wire over the outside of the cabinet. With the receiver and generator set at 1400 KC, increase the generator output. Adjust the ANT. trimmer through the hole which is provided in the top of the cabinet until a maximum signal is noted on the output meter. The ANT. trimmer hole in the top of the cabinet is covered by a small plug button. Replace this button after adjustment has been made. No further adjustment should be made as the coils and gang condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

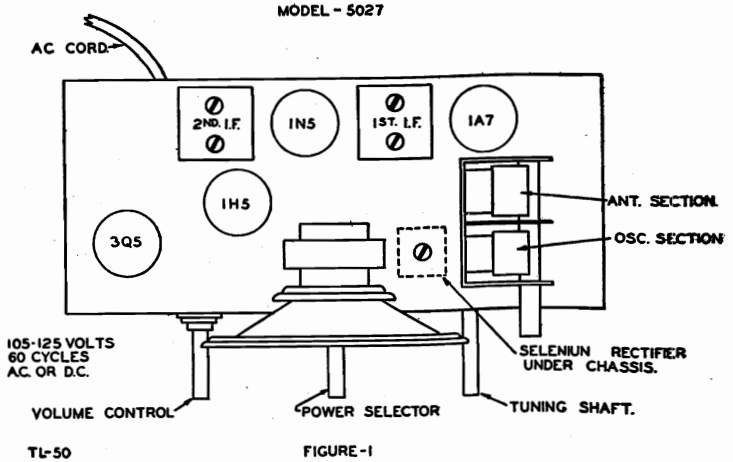
MODEL - 5027



TL-50

FIGURE-1

MODEL 5028 SPIEGEL

POWER SOURCES: This receiver is designed for operation on either an external power source or on the enclosed batteries.

AC OR DC OPERATION: This receiver may be operated on 50 to 60 cycle, 110 to 125 volt AC current or 110 to 125 DC current.

CAUTION: Never plug this receiver into a 220 volt line as this will seriously damage the component parts which have been designed for 110 to 125 volt operation only.

To operate on AC or DC open the small door at the right in the back of the cabinet. Pull out the power cord and plug into a convenient outlet of the proper voltage and current. Follow instructions under "Controls."

To operate on the enclosed batteries, follow instructions under "Controls."

ANTENNA: This receiver is equipped with a sensitive loop antenna and requires no external antenna wire. However, due to the directional qualities of the loop some stations may appear to be weak in reception. This condition may be remedied by rotating or changing the position of the receiver.

CONTROLS: This receiver has three control knobs which are located on the front panel of the cabinet.

STATION SELECTOR KNOB: The right hand knob is the station selector. Rotate this knob to the right or left to select your desired station. The dial scale is calibrated in kilocycles. By mentally adding a zero to the numbers on the scale, the result will be read directly in (KC) kilocycles. (i.e., 60 plus 0 equals 600 KC or 140 plus 0 equals 1400 KC).

POWER SELECTOR SWITCH: The left hand knob is the power selector. It has three positions which are indicated on the front panel. The extreme left hand position is the "OFF" position. The small dot on this knob must point to "OFF" when the receiver is not in use. The center position is "AC-DC" and is used when it is desired to operate the receiver from a power line source. The extreme right hand position is "BATT" and is used when it is desired to operate on the enclosed batteries.

AC OPERATION: When an AC power source is used, set the power selector knob to "AC-DC" after the power cord has been plugged into a convenient outlet. The receiver is now ready for operation.

DC OPERATION: If the receiver does not operate after a few seconds, reverse the power cord plug in the outlet and it will operate properly.

BATTERY OPERATION: The power cord is not used for battery operation and may be hanked and put back in the cabinet. Set the power control knob to "BATT" and the receiver is ready for operation on the enclosed batteries.

CAUTION: When the receiver is not in use, the power selector knob must be turned to "OFF." If the knob is allowed to remain in "BATT" position, the batteries will be in use constantly. The volume control does not control the batteries and they are still in operation even though the volume control is turned all the way off.

VOLUME CONTROL: The center knob is the volume control. After the power selector knob has been properly set and the receiver is in operation, rotate the volume control knob to the right to increase volume or to the left to decrease volume.

BATTERY SUPPLIERS

The batteries for this receiver may be purchased from any reliable dealer.

For proper operation this receiver requires two "A" batteries and one "B" battery.

The "A" batteries are size "D" flashlight cells and are made by all battery manufacturers.

The "B" battery is a 67½ volt battery and is made by the following manufacturers:

Eveready	67½ vlt.	#467
Burgess	67½ vlt.	#XX45
General	67½ vlt.	#W45A
Ray-O-Vac	67½ vlt.	#4367

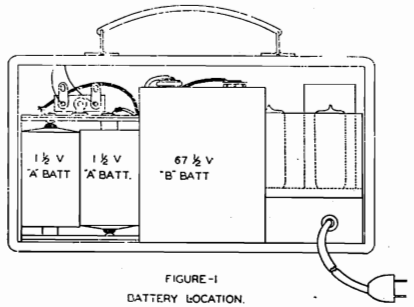

FIGURE-1
BATTERY LOCATION.

BATTERY SERVICING

(See Fig. No. 1)

To replace the batteries in this receiver:

Remove the back.

To the left, looking into the rear of the cabinet is the "A" or flashlight battery container. To the right is the "B" or 67½ volt battery.

To replace the "A" batteries, pull the old batteries out of the container. Replace with fresh batteries, making sure the batteries are inserted according to the diagram on the inside of the container.

To replace the "B" battery, disconnect the snap fastener connectors. Replace with a fresh battery and snap the connectors into place. Replace the battery in the cabinet as shown in Fig. No. 1, making sure that the connector end faces the top of the cabinet.

After the batteries have been installed, replace the back, making sure that the two washers in the bottom of the back fit into the slot near the bottom edge of the cabinet.

ALIGNMENT AND SERVICE DATA

(See Fig. No. 2 For Trimmer Location)

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1650 KC. An output meter should be connected across the speaker.

The volume control of the receiver should be turned to maximum during the I. F. and all subsequent alignment and the generator output as low as possible to prevent the A. V. C. from working and giving false readings.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser through a .1 MFD. condenser. The ground lead from the generator must be connected to "B" minus under the chassis. Turn the gang condenser to complete minimum capacity. Set the generator to 455 KC. Adjust the movable iron cores in the IF cans. These IF adjustments are made in the top and in the bottom of the can under the chassis. Adjust the cores until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1650 KC. Adjust the OSC. trimmer until the 1650 KC signal is tuned in. The gang condenser must be at complete minimum capacity for this adjustment.

THIRD STEP: Remove the generator leads from the gang condenser and replace the chassis in the cabinet. Loosely couple the generator to the receiver loop by making a complete turn of wire over the outside of the cabinet. With the receiver and generator set at 1400 KC, increase the generator output. Adjust the ANT. trimmer through the hole which is provided in the end of the cabinet until a maximum signal is noted on the output meter. The ANT. trimmer hole in the side of the cabinet is covered by a small plug button. Replace this button after adjustment has been made. No further adjustment should be made as the coils and gang condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

ALIGNMENT AND SERVICE DATA

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1720 KC. An output meter should be connected across the speaker.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD condenser. The ground lead from the generator must be connected to the metal frame of the gang condenser. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1720 KC. The OSC. trimmer is located on the front of the chassis between the volume and tuning controls. Adjust this trimmer until the 1720 KC signal is tuned in.

THIRD STEP: Remove the hot lead of the generator from the ANT section of the gang condenser. Connect this lead to the antenna lead wire that projects from the back of the loop antenna through a 200 MMFD condenser. Adjust the Signal Generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The ANT trimmer is located on the back of the loop antenna. Adjust this trimmer until a maximum reading is noted on the output meter. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

ALIGNMENT DATA

MODEL- 6041 SD-69-U

Remove the chassis from the cabinet. A Signal Generator with the following frequencies is required: 455 KC, 1400 KC and 1720 KC.

The receiver volume control should be turned to maximum during the I.F. and all subsequent alignments to keep the A.V.C. from working and giving false readings. Turn the tone control to complete left hand position. Keep the generator output as low as possible to prevent overloading.

Connect an output meter across the voice coil of the speaker.

Connect a 20,000 ohm resistor across the loop connector terminals to reflect the proper loop impedance.

FIRST STEP: Connect the hot lead from the generator to the "ANT." section of the gang condensor through a .1 MFD. condensor. The ground lead must be connected to the floating ground buss under the chassis. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455 KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator connected in the same manner as in I.F. alignment, adjust the signal generator to 1720 KC. The "OSC." trimmer is located on the front section of the gang condenser. Adjust this trimmer until the signal is tuned in. The gang condenser should be at complete minimum capacity for this setting.

THIRD STEP: Remove the generator leads from the chassis. Remove the 20,000 ohm resistor from the loop connector terminals. Reinstall the chassis in the cabinet, connect the loop leads, motor plug and phono pickup leads.

Connect the generator leads to a transmitting loop, made of a few turns of wire, and loosely couple to the receiver loop antenna which is located on the back end of the cabinet. Adjust the generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The "ANT." trimmer is located on the rear section of the gang condenser. Adjust this trimmer until a maximum signal is noted on the output meter.

No further adjustment should be necessary, unless the receiver has been damaged, as the coils and tuning condenser have been specially handled at the factory to insure proper alignment at the lower frequencies.

NOTE (1) PHONO MOTOR PLUG IS ON RADIO-PHONO COMBINATION MODELS ONLY.

I.F PEAK 455 KC

Tube Complement:

1 type 14Q7 Oscillator-Converter
1 type 14A7 I.F. Amplifier
1 type 14B6 Det. A.V.C. and Amplifier
2 type 35A5 Power Amp.
1 type 35Y4 Rectifier

radio receiver designed to operate on:

1. 105-125 volts A.C. 60 cycles.
2. 105-125 volts D.C.*

Power drawn is 50 watts.

Short Wave Reception:

With a good antenna connected to it this receiver is able to pick up foreign and domestic short wave programs. International broadcasts may be heard in the following bands.

49 meter	6.0 — 6.2 Mc
31 meter	9.5 — 9.7 Mc
25 meter	11.7 — 11.9 Mc
19 meter	15.1 — 15.35 Mc
16 meter	17.75 — 17.85 Mc

Amateur radio stations may be heard on the 20 meter band from 14.0 to 14.4 Mc.

SPIEGEL

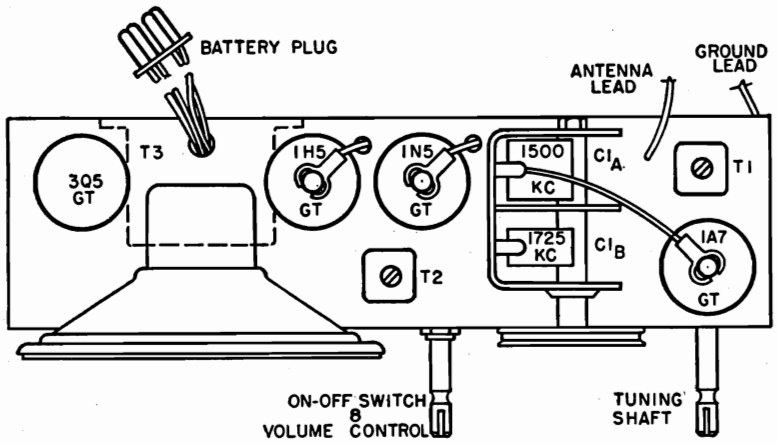
MODEL 13203 SPIEGEL

540 kilocycles to 1725 kilocycles (K.C.). The tubes

1A7 GT—Osc. Converter
1N5 GT—I. F. Amplifier
1H5 GT—AVC Det. Audio Amplifier
3Q5 GT—Power Output

This receiver has been designed to operate on a self-contained battery containing both the "B" battery (90 Volts) and the "A" battery (1½ Volts) such as General #60B6L.



ALIGNMENT PROCEDURE

With an output meter connected across the voice coil of the speaker, the output meter reading for 50 milliwatts is .4 volts using a signal which is modulated 30% at 400 c.p.s. Follow through the procedure as outlined below for proper alignment.

Connect the signal generator to the grid cap of the IA7 GT Tube through a .1 MFD. Condenser. Connect the ground lead of the generator to the chassis. Adjust the signal generator to 455 K.C. and set the variable condenser of the receiver to minimum capacity (fully opened). With the volume control full on and minimum output from the signal generator adjust the two trimmers on the first and second I.F. transformers for maximum output.

Now connect the signal generator to the antenna connection of the receiver through a .00025 condenser. Adjust the signal generator frequency to 1725 K.C. and set the variable condenser to minimum capacity (fully opened), and adjust the oscillator trimmer (C1B) for maximum output. Set signal generator to 1500 K.C. and tune receiver to signal. Adjust the antenna trimmer (C1A) on the variable condenser for maximum output.

50L6GT Power output	0	31ac	85	95	0	30	80ac	6.5

All voltage readings are taken from tube pin to chassis.

All measurements are made with no signal, using a 20,000 ohm per volt meter.

AC input voltage must be maintained at 117 volts for accurate readings.

AC voltages shown are at 1000 ohms per volt.

All voltages shown are approximate.

RESISTANCE CHART

TUBE No.	PIN 1	PIN 2	PIN 3	PIN 4	PIN 5	PIN 6	PIN 7	PIN 8
12BE6 AM—Converter	20K	1	27	18	25K	25K	3 meg.

50L6GT Power output	0	28	25K	25K	450K	250K	70	150

All resistance readings are taken from tube pin to chassis.

Due to manufacturing tolerance on component parts, resistance readings may vary as much as 20%.

All readings are shown in ohms unless otherwise noted.

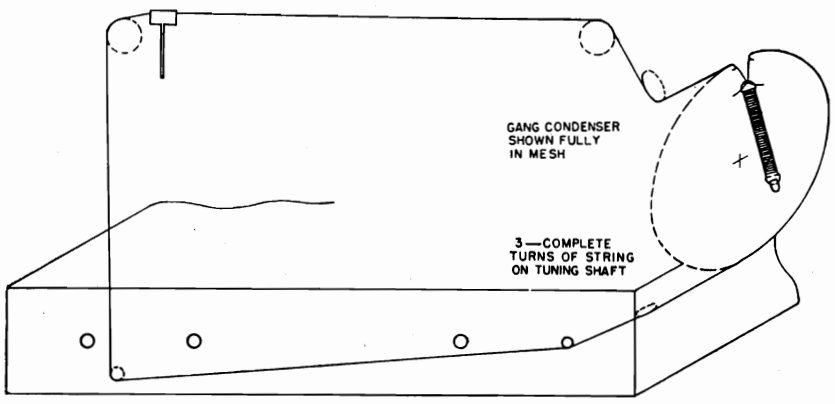

FIG. 2 DIAL CORD STRINGING

MODEL 131504

SPIEGEL

FM-AM radio receiver designed for use on 117 volts 60 cycles AC or DC current.

It covers the standard AM broadcast frequency range, 540-1600 kilocycles (KC) and the FM frequency range from 88 to 108 megacycles (MC).

SPECIFICATIONS

Power Supply	117 volts AC DC
Power Consumption	55 Watts
Frequency Range FM	88 to 108 MC.
Frequency Range AM	540 to 1600 KC.
I.F. frequency FM	10.7 MC.
I.F. frequency AM	455 KC.
Band width, FM, Ratio detector	360 KC.
Band width, FM, 2nd I.F.	280 KC.
Band width, FM, 1st I.F.	240 KC.
Band width, FM, Converter	180 KC.
Tubes	10
Rectifier	Selenium, 150 ma.
Speaker	6" P.M.

The tubes used are as follows:

12BA6	FM, R.F. Amplifier
12BE6	FM, Converter
12BA6	FM, 1st I.F. Amplifier
12BA6	FM, 2nd I.F. Amplifier
12BA6	FM, 3rd I.F. Amplifier
6AL5	FM, Ratio detector
12BE6	AM, Converter
12BA6	AM, I.F. Amplifier
12AT6	AM, Detector-AVC-1st audio
50L6GT	Power output
A83-463	Selenium rectifier
No. 47	Pilot lights (2)

TUBE COMPLEMENT

The tube complement of this receiver consists of the following:

1—6SK7—R.F. Amplifier
1—6SA7—Mixer—OSC.
1—6SK7—I.F. Amplifier
1—6SQ7—Det. AVC—Audio
1—6K6—Power Output
1—5Y3—Rectifier

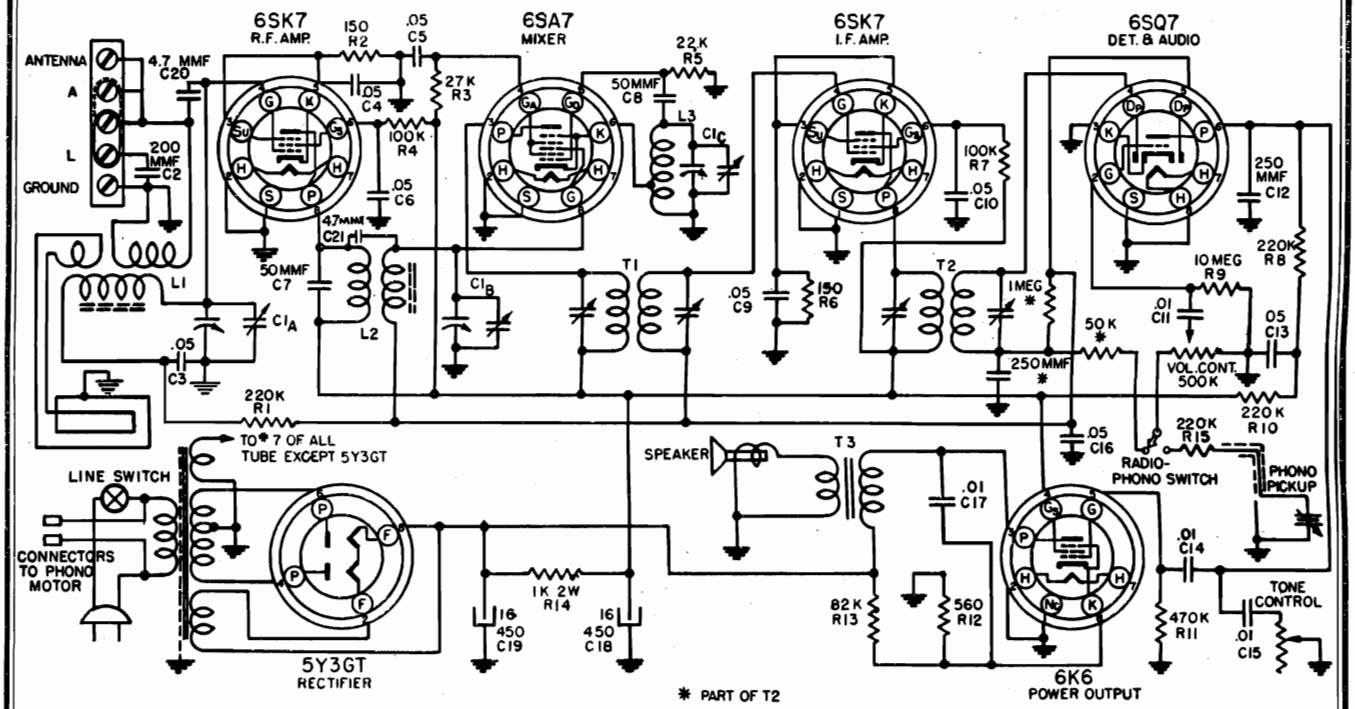

Fig. 2 Schematic Diagram

ALIGNMENT PROCEDURE

Volume control—Maximum: all adjustments.
Tone Control—Treble: Full Clockwise Rotation.
Connect ground lead of signal generator to radio chassis.
Connect dummy antenna in series with output lead of signal generator.
Connect output meter across voice coil of speaker.

The following equipment is necessary for proper alignment:
Signal generator that will provide the test frequencies as listed.
Output meter.
Non-metallic screwdriver.
Dummy antennas—.1 mfd., .00025 mfd.

Position of Variable	Generator Frequency	Dummy Ant. mfd.	Generator Connections	Trimmer Adjustment	Trimmer Function
Minimum Capacity (Fully Opened)	455 K.C.	.1	6SA7 Grid (Stator of CIB)	T1 T2	I. F.
Minimum Capacity (Fully Opened)	1725 K.C.	.00025	*Ant. Terminal on Loop	C1C	Osc.
Tune in signal From Generator	1500 K.C.	.00025	*Ant. Terminal on Loop	C1B	R. F.
Tune in signal From Generator	1500 K.C.	.00025	*Ant. Terminal on Loop	C1A	Ant.

*Be sure coupling link is in correct position for external antenna operation. See Fig 3.

Repeat the above alignment procedure as a final check.

With an output meter connected across the voice coil of the speaker, the output meter reading for ½ watt is 1.25 volts using a signal which is modulated 400 c.p.s.

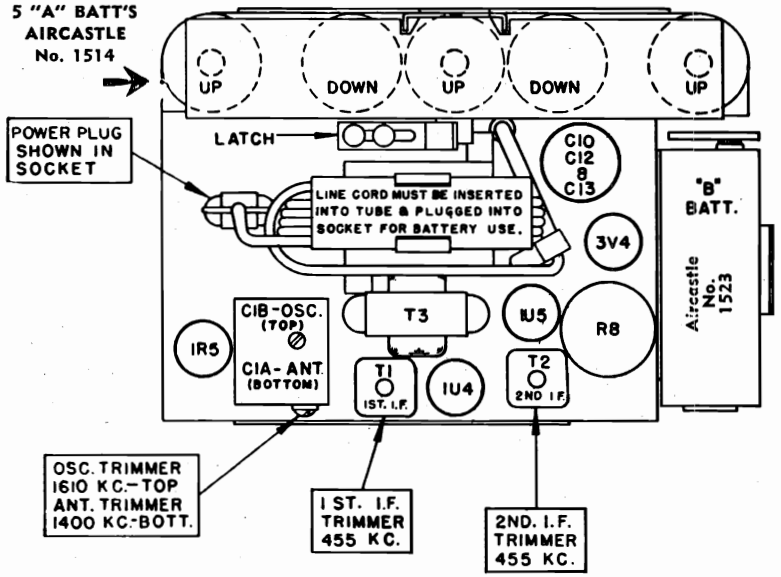
VOLTAGE CHART

All voltages are measured from tube pin to common negative with a 20,000 ohm per volt voltmeter.

Voltages shown in circles are obtained when set is operated on 117 volt current.

Voltages shown outside the circles are obtained when the set is operated on batteries. New batteries in good condition should be used for these measurements.



POWER SUPPLY

This receiver is designed to operate from self contained batteries, or from 105-125 volt AC or DC power supply. One 67½ volt "B" battery Aircastle No. 1523, and five (5) 1½ volt "A" batteries, Aircastle No. 1514, are used for battery operation.

MODEL 147114 SPIEGEL

ALIGNMENT PROCEDURE

Volume conrol—Maximum: all adjustments.

Connect ground lead of signal generator to common negative.

Connect dummy antenna in series with output lead of signal generator.

Connect output meter across voice coil of speaker.

The following equipment is necessary for proper alignment:

Signal generator that will provide the test frequencies as listed, 30% modulated, 400 c.p.s.

Output meter.

Non-metallic screwdriver.

Dummy antenna—.1 mfd.

CAUTION: This is an A.C.-D.C. receiver and if alignment is made with the receiver connected to 117 volts A.C. or D.C., it is necessary to isolate the signal generator or the receiver from the line by use of a transformer, or place a .2 M.F.D. condenser in both test leads of the Signal Generator.

Position of Variable	Generator Frequency	Dummy Ant. Mfd.	Generator Connections	Trimmer Adjustment	Trimmer Function
Fully open	455 KC	.1	*1R5 Grid (Stator of C1A)	T2	Output I.F.

FREQUENCY RANGES
- **Broadcast** ..... 540-1600 KC
- **FM** ..... 88-108 MC

POWER OUTPUT
- **Undistorted** ..... 1 watt
- **Maximum** ..... 2.5 watts

SPEAKER ..... 5" PM Dynamic

INTERMEDIATE FREQUENCY ..... FM—10.7 MC; AM—455 KC

This receiver will operate on either 50 or 60 cycles Alternating Current (A.C.) at 105 to 125 volts or on Direct Current (D.C.) at 105 to 125 volts. Rectified B+ voltage is obtained by using a miniature selenium type rectifier which is noted for reliability and long life.

The built-in antenna used for AM reception is a high impedance loop that is mounted on the rear of the chassis. A 46" length of wire serves as a built-in FM antenna. This wire is connected to the right hand terminal of the pair of terminals labeled "External FM Antenna" and it must be uncoiled and allowed to hang down at back of receiver.

Tuning of the radio frequency circuits of the receiver is accomplished by a 5 section gang condenser. Two sections are used to tune the AM antenna and oscillator circuits, and three sections are used to tune the FM antenna, R.F., and oscillator circuits.

An R.F. amplifier stage is utilized to give maximum sensitivity and selectivity as well as high image rejection on FM reception. Although this stage is switched out of the circuit on AM reception, overall receiver sensitivity is adequate for highly satisfactory reception where station signals are of moderate strength.

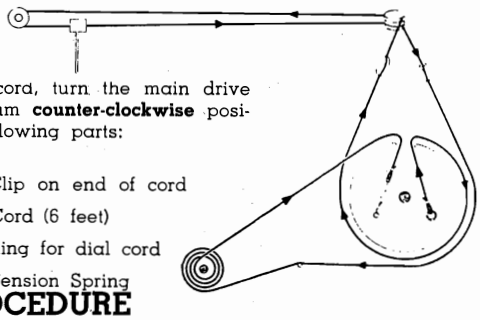
Both transformer coupled I.F. stages are used for FM and one stage is used for AM. The first and second I.F. transformers have two sets of windings; one set is tuned to 455 KC for AM operation and the other is tuned to 10.7 MC for FM operation. Switching of the windings, to alleviate undesired beat frequencies, is necessary only in the first I.F. transformer.

Detection of amplitude modulated 455 KC signals is accomplished by the 6AQ6 diode rectification circuit.

Frequency modulation detection is accomplished by an entirely new circuit that is known as the "RATIO DISCRIMINATOR." This FM detector circuit has the unusual ability to reject noise or other brief variations in amplitude of the signal. The relative insensitivity of the Ratio Discriminator to signal amplitude variation makes it possible to eliminate the use of a "limiter" stage that usually precedes the discriminator in other types of FM detector systems. It will therefore be noted that this receiver utilizes a normal I.F. amplifier stage instead of a low gain limiter stage preceding the FM discriminator.

Audio frequency output from both AM and FM detectors is amplified through the triode section of the 6AQ6. The audio power amplifier stage incorporates a 50B5 tube which is coupled to a permanent magnet dynamic speaker. A special inverse feedback arrangement is used which reduces distortion and contributes to exceptionally good tone quality.

DIAL AND POINTER DRIVE CORD ARRANGEMENT



To string dial cord, turn the main drive drum to maximum **counter-clockwise** position and use following parts:

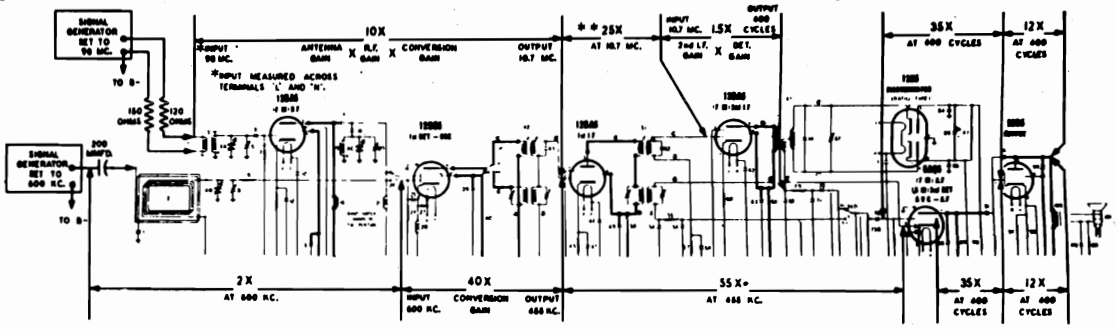
114955—Clip on end of cord
117057—Cord (6 feet)
119087—Ring for dial cord
161384—Tension Spring

STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of each of the stages of this receiver should be measured with an A. C. Vacuum Tube Voltmeter of the high frequency type (uniform response up to 100 MC). A conventional "AM" type signal generator may be used but it must be capable of producing **fundamental** frequencies of 600 KC. and 98 MC—**avoid using a generator that produces the 98 MC. signal by means of harmonics.**

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F., I.F. and Discriminator stages are carefully and accurately aligned by utilizing the alignment procedure given in this manual.
2. Connect Signal Generator as shown below. Note that generator connections differ for "AM" and "FM" measurements.
3. For "AM" measurements, set signal generator to 600 KC. and then carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
4. For "FM" measurements, set signal generator to 98 MC. and then carefully tune radio receiver to this signal by using a D. C. Vacuum Tube Voltmeter as an output indicator—meter must be connected between pin #3 of 12H6 tube and B—. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. The values of stage gain which are given here were measured with a fixed bias of 1.5 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. circuit. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 1.5 volt battery to A.V.C. at terminal 7 of the 1st I.F. transformer and connect the positive battery lead to B—.
6. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain-measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.



** When measuring the gain of this stage with a vacuum tube voltmeter the input signal level for minimum meter indication may cause overloading. Under those conditions the measured gain will be found to be approximately 14X.

DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.

Lettered terminals in illustrations correspond to similarly lettered terminals on the circuit diagram.

NOTE

The above circuit applies to chassis which have a letter "S" or "H" stamped on rear surface adjacent to model number. Chassis which do not show either of these letter designations have the following circuit differences:

1. Resistor No. 7 is connected to A.V.C. instead of B— as shown above.
2. Condensers Nos. 107 and 108 are omitted.
3. Resistor R87 is 33,000 ohms.

Changes 1 and 2 are incorporated in chassis which carry the "S" designation and all three changes appear in chassis with the "H" designation.

These changes were made to increase sensitivity on FM operation.

*Resistor #44 is located in 1st I.F. transformer housing and is connected between terminals ③ and ⑦

(F-M) I.F. 10.7 MC.
(A-M) I.F. 455 KC.

WARNING: Some parts listed below have special characteristics. Do not use substitutes for replacement purposes.

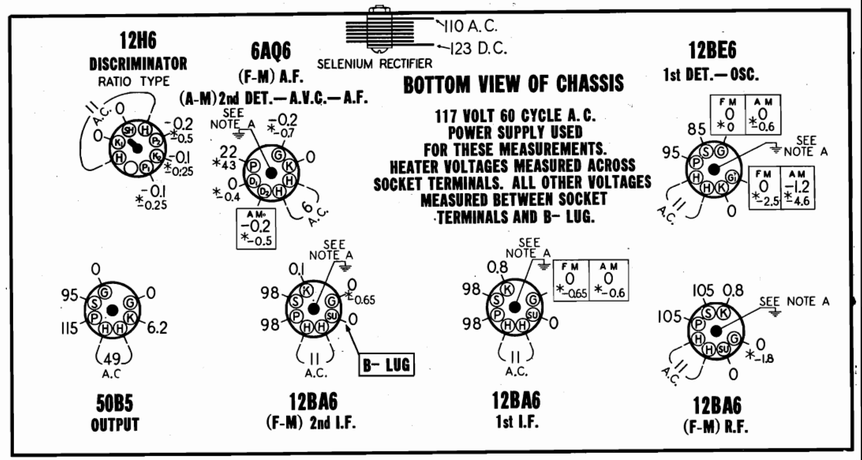
AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and, should it ever be necessary to replace the speaker or output transformer, it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the secondary of the output transformer.

SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.

ALL MEASUREMENTS MADE WITH BAND SWITCH IN "FM" POSITION UNLESS OTHERWISE INDICATED
DIAL TUNED TO 108MC. FOR "FM" MEASUREMENTS
DIAL TUNED TO 540KC. FOR "AM" MEASUREMENTS
VOLUME CONTROL SET TO MINIMUM WITH NO SIGNAL



REAR OF CHASSIS

NOTE A: Grounding of center stud on tube socket is necessary to reduce capacity coupling between other pins. Oscillation may result if this ground is omitted.

FREQUENCY MODULATION — "FM" — ALIGNMENT PROCEDURE

INSTRUMENTS: Alignment of the FM circuits in this receiver may be accomplished with either a conventional AM type signal generator or an FM signal generator. The output indicator should be an oscilloscope or a vacuum tube voltmeter.

Although it is preferable to use an FM generator and an oscilloscope, reasonably accurate alignment is obtainable when using a conventional AM generator and a vacuum tube voltmeter providing proper care is exercised in adjusting the discriminator circuit trimmer condenser.

IMPORTANT: If an AM signal generator is used, it should be capable of producing fundamental frequencies of 10.7 and 88 to 108 MC. Avoid using an AM generator which produces signals in the 88 to 108 MC range by using harmonics higher than the second. Generators which are dependent upon third, fourth or fifth harmonics for frequencies of 88 to 108 MC will generally produce undesireable spurious beat signals with the local oscillator in the receiver and alignment will be exceedingly difficult.

The following procedure is adaptable for use with either an AM or FM generator and oscilloscope or vacuum tube voltmeter merely follow the instructions that are applicable to the instruments that are used.

1. If alignment of both AM and FM channels is required it is necessary to align the AM channel first, then align the FM channel as instructed in the following chart (AM alignment procedure is given on page 7).
2. Before removing the chassis from the cabinet, turn the tuning control until dial pointer is at 98 MC. Then remove chassis and place a pencil mark on dial frame so as to indicate the 98 MC calibration point.
3. Do not attempt to reposition pointer by releasing it from clip on dial card as this is done only during AM alignment.
4. Set the receiver volume control to the maximum volume position.
5. Dress FM circuit leads as short and straight as possible, particularly those in the oscillator circuit. I.F. plate and grid leads should also be kept short and straight.
6. Alignment of receiver circuits may now be accomplished by using the procedure in the chart below.

SIGNAL GENERATOR CONNECTIONS			V-T VOLTMETER OR OSCILLOSCOPE CONNECTIONS		RECEIVER				TYPE OF ADJUSTMENT AND OUTPUT INDICATION	
CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	*CONNECT GROUND LEAD OF SIGNAL GENERATOR TO	FREQUENCY & TYPE OF MODULATION	IF A V-T VOLTMETER IS USED, CONNECT IT AS FOLLOWS:	IF AN OSCILLOSCOPE IS USED, CONNECT IT AS FOLLOWS:	BAND SWITCH POSITION	DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	ADJUSTMENT AND OUTPUT INDICATION WHEN USING A V-T VOLTMETER	ADJUSTMENT AND OUTPUT INDICATION WHEN USING AN OSCILLOSCOPE
Pin ⌀1 of 12BA6 (FM) 2nd I.F. use a .01 MFD. condenser in series with generator lead.	B— in vicinity of 12BA6 (FM) 2nd I.F. tube.	**10.7 MC** AM signal may be 400 cycle modulated or FM signal should preferably be modulated ±300 KC.	Connect common (or ground) terminal of meter to B . D.C. probe lead of meter is then connected to pin ⌀3 of the 12H6 tube.	Connect vertical amplifier "high" lead in series with an 0.1 MFD. condenser to pin ⌀7 of 6AQ6 tube. Connect scope ground lead to B	FM Maximum clockwise position	Any position where it does not affect the signal.	8	Discriminator Primary	Set meter to a low D.C. voltage range and adjust trimmer ⌀8 for maximum meter reading. (This voltage will be negative.)	Set vertical amplifier of scope for maximum amplification. Where FM signal generator provides an output voltage for synchronization, connect this voltage to "sync" terminals of the scope. Then adjust setting of trimmer ⌀9, before attempting to adjust trimmer ⌀8, until a pattern similar to the following appears on the screen. If pattern does not remain stationary, operate sweep frequency control on scope and also "sync" control until desired result is obtained.  This double "S" curve pattern results when scope uses "Sawtooth" horizontal deflection voltage. This single "S" curve pattern results when scope uses properly phased "sine wave" horizontal deflection voltage. Adjust trimmer ⌀8 for maximum amplitude and steepness of that portion of the curve between "A" and "C".
Same as above	Same as above	Same as above	Before connecting V-T voltmeter, it is necessary to connect two 68,000 ohm resistors (resistance of both units must compare within 1%) in series from pin ⌀3 of the 12H6 tube to B—. Then connect common (or ground) terminal of V-T voltmeter to the junction of these two resistors. D.C. probe lead of meter is now connected to junction of resistor ⌀69 (3300 ohms) and condenser ⌀70 (.05 MFD.) which are in the discriminator output circuit.	Same as above	Same as above	Same as above	9	Discriminator Secondary **Use an insulated phasing tool to adjust this trimmer.**	Set meter for operation on its lowest D.C. voltage range. Note that as trimmer ⌀9 is rotated a point will be found where voltmeter will swing rather sharply from a positive to a negative reading or vice versa. Correct setting of trimmer ⌀9 is obtained when meter reads zero as trimmer is moved through this point. The adjustment is somewhat critical and considerable **care must be exercised** to set **the trimmer for a zero meter indication.**	With the 'scope set up as described above, adjust trimmer ⌀9 until the cross-over point "B" is centrally located in both the horizontal and vertical directions; in addition, the portion of the curve between "A" and "C" should be as linear (straight) as possible.
Recheck the two preceding adjustments to be sure that both trimmers are set as accurately as possible to obain the specified output indication on vacuum tube voltmeter or oscilloscope. Then disconnect and remove the two 68,000 ohm resistors that were used for the vacuum tube voltmeter connection in the 2nd step.										
Pin ⌀1 of 12BA6 (FM) 1st I.F. tube; use a .01 MFD. condenser in series with generator lead.	B— in vicinity of 12BA6 (FM) 1st I.F. tube.	Same as above	Connect common (or ground) terminal of meter to B—. D.C. probe lead of meter is then connected to Pin ⌀3 of the 12H6 tube.	Same as above	Same as above	Same as above	10 and 11	2nd I.F.	Adjust trimmers ⌀10 and ⌀11 for maximum meter reading.	With 'scope set up as described above, adjust trimmers ⌀10 and ⌀11 for maximum amplitude and steepness of that portion of the pattern between "A" and "C".
Pin ⌀7 of 12BE6 tube; use a .01 MFD. condenser in series with generator lead.	B— in vicinity of 12BE6 tube.	Same as above	Same as above	Same as above	Same as above	Same as above	12 and 13	1st I.F.	Adjust trimmers ⌀12 and ⌀13 for maximum meter reading.	Adjust trimmers ⌀12 and ⌀13 for maximum amplitude and steepness of pattern as described above. If the enlarged pattern now indicates a lack of symmetry, readjust trimmer ⌀9 for correct cross-over point.
Generator output leads must be connected to the two "External FM Antenna" terminals at back of antenna loop frame. Connect "high" lead to one terminal in series with a 120 ohm resistor and connect generator ground lead to the other terminal in series with a 150 ohm resistor.		**98 MC** AM signal may be 400 cycle modulated or FM signal should preferably be modulated ±300 KC.	Same as above	Same as above	Same as above	98 MC	14	Oscillator Trimmer	Set trimmer ⌀14 to receive 98 MC. signal and adjust for maximum meter reading.	Adjust trimmer ⌀14 to obtain the symmetrical pattern shown above. Correct setting of trimmer ⌀14 is obtained when cross-over point in pattern is centrally located.
Same as above		Same as above	Same as above	Same as above	Same as above	98 MC	15	R.F. Trimmer	Adjust trimmer ⌀15 for maximum meter reading.	Adjust trimmer ⌀15 for maximum amplitude of pattern.
							12 and 13	1st I.F.	Recheck adjustment of these trimmers for maximum meter reading.	Recheck adjustment of these trimmers for maximum amplitude and symmetry of pattern.
Same as above		Same as above	Same as above	Same as above	Same as above	98 MC	16	Antenna Trimmer	Adjust trimmer ⌀16 for maximum meter reading.	Adjust trimmer ⌀16 for maximum amplitude of pattern.
Check calibration and tracking of receiver with input signals of 88 and 108 MC.										

*If your signal generator has an AC-DC type power supply, insert a .25 MFD. condenser in series with the ground lead before making the connections shown above.

BROADCAST BAND — "AM" — ALIGNMENT PROCEDURE

1. Remove chassis and loop antenna from cabinet.
2. With the gang fully meshed, the dial pointer should be in the position indicated by the last mark below 55 on the dial. If it is set incorrectly, release the pointer clip on the dial cord and reposition pointer.
3. During the alignment of this receiver, it will be necessary to set the dial pointer to the following frequencies: 1500 Kc., and 600 Kc. In order to avoid replacing the chassis in the cabinet each time a dial setting is required, it will be found more convenient to mark the required frequency points on the white dial background before starting the alignment.
4. Connect an output meter across speaker voice coil or from plate of the 50B5 tube to B— through a 0.1 Mfd. condenser (see voltage chart for convenient B— connection).
5. Connect ground lead of signal generator to B— lug.
   CAUTION: If your signal generator is designed with an AC-DC type power supply, connect ground lead of signal generator to B— lug through a .25 Mfd. condenser.
6. Set volume control to the maximum volume position and use a weak signal from the signal generator.
7. If alignment of both AM and FM channels is required, it is necessary to align the AM channel first; then align the FM channel as instructed in the preceding section.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
0.1 MFD. Condenser	Pin #7 of 12BE6 tube.	455 KC	Broadcast (counter-clockwise)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.

*The gain of these stages cannot be made with a vacuum tube voltmeter due to the presence of RF voltage from the local oscillator as that voltage prevents a true measurement of the incoming signal. To determine actual gain, use a signal generator with calibrated output so that a signal of known value may be injected at desired points. The ratio of signal generator voltage, applied to successive stages to produce a given audio output will be the gain of that section of the receiver.

DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.

STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of most of the stages of this receiver can be measured with an A.C. Vacuum Tube Voltmeter of the high frequency type. An AM (600 KC.) as well as an FM (98 MC.) signal source is required. For gain measurements in the FM antenna—FM converter—FM 1st I.F. stages, a microvolt calibrated FM signal generator must be used.

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F., I.F. and Discriminator stages are carefully and accurately aligned by utilizing the alignment procedure given in this manual.
2. Connect Signal Generator as shown below. Note that generator connections differ for "AM" and "FM" measurements.
3. For "AM" measurements, set signal generator to 600 KC. (400 cycle modulation) and then carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
4. For "FM" measurements, set signal generator to 98 MC. (400 cycle modulation with 22½ KC. deviation) and then carefully tune radio receiver to this signal by using a D.C. Vacuum Tube Voltmeter as an output indicator—meter must be connected between pin #7 of 6AL5 tube and chassis. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. The values of stage gain which are given here were measured with a fixed bias of 3 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. circuit. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 3 volt battery to A.V.C. at the junctions of resistors #17 and 57 and connect the positive battery lead to the receiver chassis.
6. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.

NOTE

A revision that occurred during production is included in the circuit on this page and it may be identified as follows:

Condenser #77 was formerly connected from terminal S14 (switch section 14B) to ground.

This change was made to provide greater stability in the audio system. Chassis incorporating the change have a letter "S" stamped on rear surface adjacent to model number.

BROADCAST BAND — "AM" — ALIGNMENT PROCEDURE

1. Disconnect leads from FM-AM antenna terminal strip (labelled FM-FM-AM-AM) at back of chassis; also disconnect speaker leads and phono plugs. Remove chassis as well as the two speakers. (If desired, allow speakers to remain in cabinet and connect to receiver by extension leads.)
2. Stand chassis on one edge and space it approximately same distance from loop (attached to back of cabinet) as when installed in cabinet. Reconnect all antenna leads previously connected to the antenna terminal strip. Reconnect the two speakers.
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, hold tuning shaft steady and reposition pointer.
4. Connect an output meter across speaker voice coils, or from plate of 6V6GT tube to chassis through a 0.1 Mfd. condenser.
5. Connect ground lead of signal generator to the receiver chassis.
6. Set volume control at maximum volume position and use a weak signal from the signal generator.
7. After alignment procedure is completed and chassis and loop antenna have been reinstalled in cabinet, arrange leads to loop so that they are separated from each other as much as possible—avoid twisting, taping or extending these leads.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Lug on trimmer #7 at top of gang (see figure below for location of trimmer).	455 KC	AM Broadcast (Middle)	Any point where it does not affect the signal.	1-2	3rd I.F.	Adjust for maximum output. Then repeat adjustment.
					3	2nd I.F.	
					4-5	1st I.F.	
1000 MMFD. Mica Condenser	External Antenna Clip on Cabinet	1500 KC	AM Broadcast (Middle)	1500 KC	6	Broadcast Oscillator	Adjust for maximum output.
1000 MMFD. Mica Condenser	External Antenna Clip on Cabinet	1500 KC	AM Broadcast (Middle)	Tune to 1500 Kc. generator signal.	7	Broadcast Antenna	Adjust for maximum output.
1000 MMFD. Mica Condenser	External Antenna Clip on Cabinet	600 KC	AM Broadcast (Middle)	Tune to 600 Kc. generator signal.	8	Adjustable core of Broadcast Antenna Coil.	Adjust for maximum output.
Repeat adjustment of trimmers 7 and 8 until one no longer detunes the other.							

NOTE: It is preferable to check the alignment of the 2nd IF stage in the FM channel after completing AM alignment.

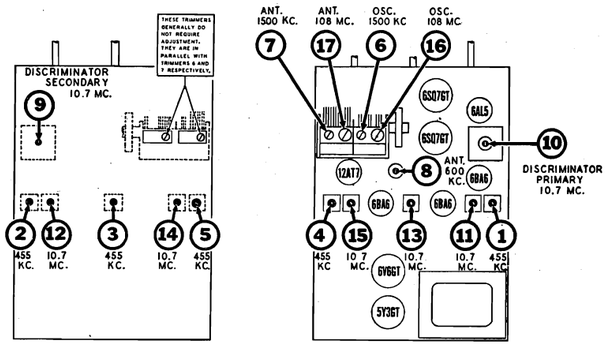

Fig. 1

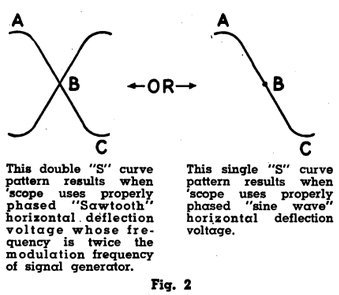
TRIMMER LOCATION CHART



This double "S" curve pattern results when 'scope uses properly phased "Sawtooth" horizontal deflection voltage whose frequency is twice the modulation frequency of signal generator.

This single "S" curve pattern results when 'scope uses properly phased "sine wave" horizontal deflection voltage.

Fig. 2

FREQUENCY MODULATION — "FM" — ALIGNMENT PROCEDURE

(USING A VACUUM TUBE VOLTMETER AND AM SIGNAL GENERATOR)

INSTRUMENTS: Although it is preferable to use an FM generator and an oscilloscope, reasonably accurate alignment is obtainable when using a conventional AM generator and vacuum tube voltmeter providing proper care is exercised in adjusting the discriminator circuit trimmer.

IMPORTANT: When using an AM signal generator, it should be capable of producing fundamental frequencies of 10.7 MC and 88 to 108 MC — avoid using an AM generator which produces signals in the 88 to 108 MC range by using harmonics higher than the second. Generators which are dependent upon third, fourth or fifth harmonics for output frequencies of 88 to 108 MC will generally produce undesirable spurious beat signals with the local oscillator in the receiver and alignment will be exceedingly difficult.

1. If alignment of both AM and FM channels is required it is necessary to align the AM channel first, then align the FM channel as instructed in chart below (AM alignment procedure is given on the preceding page).
2. Disconnect leads from FM-AM antenna terminal strip (labelled FM-FM-AM-AM) at back of chassis; also disconnect speaker leads and phono plugs. Remove chassis as well as the two speakers. (If desired, allow speaker to remain in cabinet and connect to receiver by extension leads.)
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, hold tuning shaft steady and reposition pointer.
4. A specific setting of the receiver volume control is not required. however, it will be found convenient to leave it in the maximum volume position so that alignment signals will be audible even though the output indication is obtained by a V-T voltmeter connected to points in the discriminator circuit.
5. Dress FM circuit leads as short and straight as possible, particularly those in the oscillator circuit. I.F. plate and grid leads should also be kept short and straight.
6. Set band switch to the FM (extreme clockwise) position.

SIGNAL GENERATOR CONNECTIONS	FREQUENCY & TYPE OF MODULATION	VACUUM TUBE VOLTMETER CONNECTIONS	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect high side to Pin #2 of 12AT7. Use a .01 MFD. condenser in series with generator lead. Connect ground lead to receiver chassis in vicinity of 12AT7 tube.	10.7 MC AM signal may be 400 cycle modulated.	Connect common (or ground) terminal of meter to receiver chassis. D.C. probe lead of meter is then connected to pin #7 of the 6AL5 tube.	Any position where it does not affect the signal.	10	Discriminator Primary	Adjust these trimmers for maximum meter reading—the output voltage will be of negative polarity.
				11 and 12	3rd I.F.	
				13	2nd I.F.	
				14 and 15	1st I.F.	
Same as above	Same as above	Before connecting V-T voltmeter, it is necessary to connect two 68,000 ohm resistors (resistance of both units must compare within 1%) in series from pin #7 of the 6AL5 tube to the chassis. Then connect common (or ground) terminal of V-T voltmeter to the junction of these two resistors. D.C. probe lead of meter is now connected to junction of resistor #73 (3300 ohms) and condenser #75 (.02 MFD.) which are in the discriminator output circuit. Set meter for operation on its lowest D.C. voltage range.	Same as above	9	Discriminator Secondary	Note that as trimmer #9 is rotated a point will be found where voltmeter will swing rather sharply from a positive to a negative reading or vice versa. Correct setting of trimmer #9 is obtained when meter reads zero as trimmer is moved through this point. The adjustment is somewhat critical and considerable care must be exercised to set the trimmer for a zero meter indication
Recheck adjustment of trimmers #9 and 10 to be sure that both are set as accurately as possible to obtain the specified output indication on vacuum tube voltmeter. Then disconnect and remove the two 68,000 ohm resistors that were used for the vacuum tube voltmeter connection in the preceding step.						
Generator output leads must be connected to the two "FM" antenna terminals at back of chassis. Insert a 120 Ohm resistor in series with each of the generator leads before connecting to receiver antenna terminals.	108 MC AM signal may be 400 cycle modulated.	Connect common (or ground) terminal of meter to receiver chassis. D.C. probe lead of meter is then connected to Pin #7 of the 6AL5 tube.	108 MC	16	Oscillator Trimmer	Set trimmer #16 to receive 108 MC. signal as indicated by maximum meter reading.
Same as above	Same as above	Same as above	By means of tuning control knob, set dial pointer to 108 MC. mark on dial.	17	Antenna Trimmer	Adjust trimmer #17 for maximum meter reading.
				14 and 15	1st I.F.	Recheck adjustment of these trimmers for maximum meter reading.

Check calibration and tracking of receiver with input signals of 88 and 98 MC. If difference between dial pointer setting and 88 or 98 MC calibration mark does not exceed ± 0.3 MC. and antenna circuit is tracking properly, then alignment may be considered satisfactory and no further adjustment is necessary.

Where the calibration error is greater than ± 0.3 MC. it is advisable to make the following adjustments:

1. If pointer falls above the 88 MC. calibration point, it will be necessary to slightly spread the windings of the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16 and 17 at 108 MC. Should it be found impossible to obtain the 108 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condenser plates.
2. If pointer falls below the 88 MC. calibration point, it will be necessary to push the windings together on the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16 and 17 at 108 MC. Should it be found impossible to obtain the 108 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condenser plates.

FREQUENCY MODULATION — "FM" — ALIGNMENT PROCEDURE

(USING AN OSCILLOSCOPE AND FM "SWEEP" GENERATOR)

INSTRUMENTS: Alignment of the FM circuits in this receiver can be most conveniently accomplished with an FM signal generator. When using this type generator, the output indicator must be an oscilloscope.

1. If alignment of both AM and FM channels is required it is necessary to align the AM channel first, then align the FM channel as instructed in chart below (AM alignment procedure is given on page 4).
2. Disconnect leads from FM-AM antenna terminal strip (labelled FM-FM-AM-AM) at back of chassis; also disconnect speaker leads and phono plugs. Remove chassis as well as the two speakers. (If desired, allow speakers to remain in cabinet and connect to receiver by extension leads.)
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, hold tuning shaft steady and reposition pointer.
4. A specific setting of the receiver volume control is not required, however, it will be found convenient to leave it in the maximum volume position so that alignment signals will be audible even though the output indication is obtained by an oscilloscope connected to points in the discriminator circuit.
5. Dress FM circuit leads as short and straight as possible, particularly those in the oscillator circuit. I.F. plate and grid leads should also be kept short and straight.
6. Set band switch to the FM (extreme clockwise) position.
7. Set tone control to fully counter-clockwise position.

SIGNAL GENERATOR CONNECTIONS	FREQUENCY & TYPE OF MODULATION	OSCILLOSCOPE CONNECTIONS	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect high side to Pin #2 of 12AT7. Use a .01 MFD. condenser in series with generator lead. Connect ground lead to receiver chassis in vicinity of 12AT7 tube.	**10.7 MC** FM signal should preferably be modulated ±300 KC.	Connect vertical amplifier "high" lead in series with an 0.1 MFD. condenser to pin #6 of 6SQ7 1st A.F. tube. Connect scope ground lead to receiver chassis. Set vertical amplifier of scope for maximum amplification. Where FM signal generator provides an output voltage for synchronization, connect this voltage to "sync" terminals of the scope.	Any position where it does not affect the signal.	9	Discriminator Secondary	Before attempting to adjust trimmer #9, set trimmers #10, 11, 12, 13, 14 and #15 for approximately maximum sound output from the speaker (output meter not required). This is done to obtain sufficient signal for an oscilloscope pattern of desirable amplitude when making the following discriminator trimmer adjustment. Adjust setting of trimmer #9 until a pattern similar to that shown in Fig. 2 appears on the screen. If pattern does not remain stationary operate sweep frequency control on 'scope and also "sync" control until desired result is obtained. Correct setting of trimmer #9 is obtained when crossover point "B" (Fig. 2) is centrally located in both the horizontal and vertical directions; in addition that portion of the curve between "A" and "C" should be as linear (straight) as possible.
Same as above	Same as above	Same as above	Same as above	10	Discriminator Primary	Adjust these trimmers for maximum amplitude and steepness of that portion of the pattern between "A" and "C" (see Fig. 2).
				11 and 12	3rd I.F.	
				13	2nd I.F.	
				14 and 15	1st I.F.	
Recheck adjustments of trimmers #9 and 10 to be sure that both are set as accurately as possible to obtain correct cross-over point or symmetry of pattern.						
Generator output leads must be connected to the two "FM" antenna terminals at back of chassis. Insert a 120 Ohm resistor in series with each of the generator leads before connecting to receiver antenna terminals.	**108 MC** FM signal should preferably be modulated ±300 KC.	Same as above	**108 MC**	16	Oscillator Trimmer	Adjust trimmer #16 to obtain the symmetrical pattern shown in Fig. 2. Correct setting of trimmer #16 is obtained when cross-over point in pattern is centrally located.
Same as above	Same as above	Same as above	By means of tuning control knob, set dial pointer to 108 MC. mark on dial.	17	Antenna Trimmer	Adjust trimmer #17 for maximum amplitude of pattern.
				14 and 15	1st I.F.	Recheck adjustment of these trimmers for maximum amplitude of pattern.

Check calibration and tracking of receiver with input signals of 88 and 98 MC. If difference between dial pointer setting and 88 or 98 MC calibration mark does not exceed ± 0.3 MC. and antenna circuit is tracking properly, then alignment may be considered satisfactory and no further adjustment is necessary.

Where the calibration error is greater than ± 0.3 MC. it is advisable to make the following adjustments:

1. If pointer falls above the 88 MC. calibration point, it will be necessary to slightly spread the windings of the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16 and 17 at 108 MC. Should it be found impossible to obtain the 108 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condenser plates.
2. If pointer falls below the 88 MC. calibration point, it will be necessary to push the windings together on the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16 and 17 at 108 MC. Should it be found impossible to obtain the 108 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condenser plates.

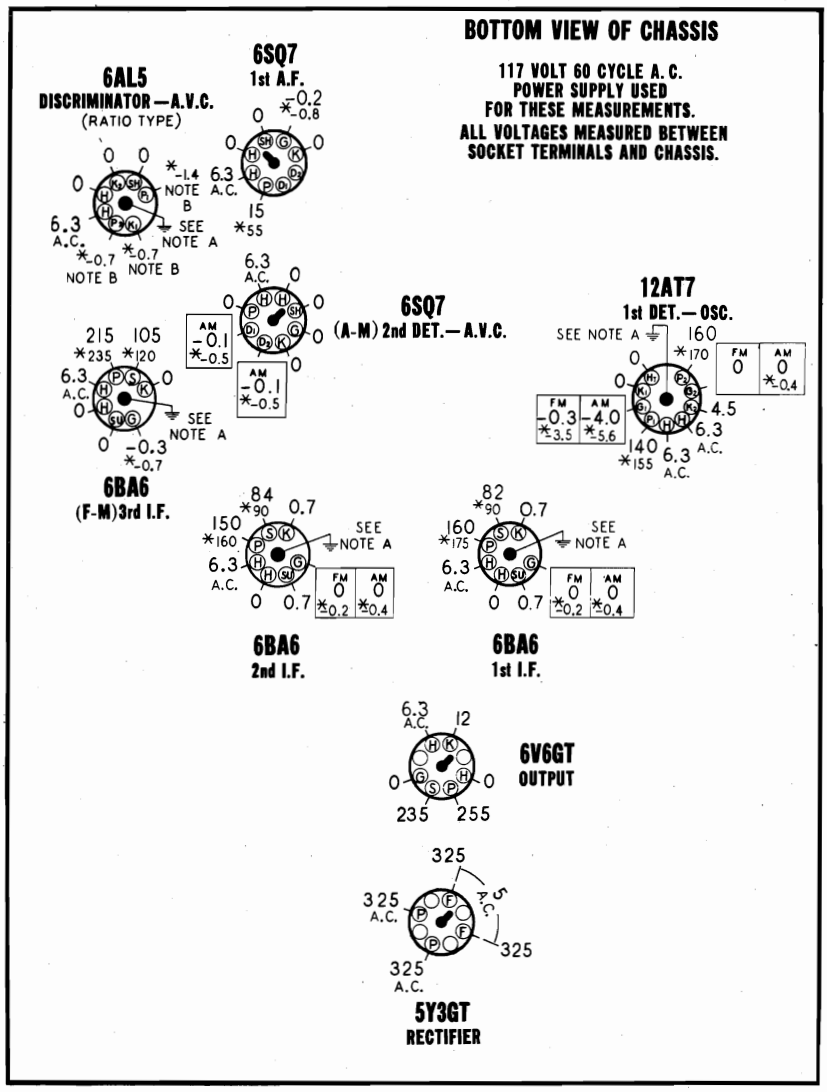
SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.

ALL MEASUREMENTS MADE WITH BAND SWITCH IN "FM" POSITION UNLESS OTHERWISE INDICATED
DIAL TUNED TO 88MC. FOR "FM" MEASUREMENTS
DIAL TUNED TO 540KC. FOR "AM" MEASUREMENTS
VOLUME CONTROL SET TO MINIMUM WITH NO SIGNAL
TONE CONTROL SET TO FULLY CLOCKWISE POSITION
GROUND ALL ANTENNA TERMINALS



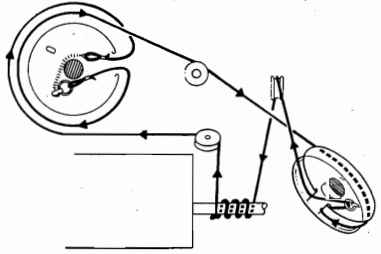
REAR OF CHASSIS

NOTE A: Grounding of center stud on tube socket is necessary to reduce capacity coupling between other pins. Oscillation may result if this ground is omitted.

NOTE B: This measurement should NOT be made with a conventional type voltmeter as circuit may break into oscillation due to coupling thru instrument leads; use a vacuum tube voltmeter with short leads.

DIAL AND POINTER DRIVE CORD ARRANGEMENT

SIDE VIEW
(With dial plate removed)



To string dial cord, first slip pointer off its shaft. Then remove dial scale by taking out the six clips around edges. Dial plate may be taken off by removing the two screws which are visible and accessible at front of chassis. Now set gang condenser to fully open position and use the following parts:

114955 Clip on end of cord
117057 Cord (3 feet)
119087 Ring for dial cord
505161 Tension spring

To replace and properly position pointer see step 3 in "AM-Alignment Procedure" on page 4.

STROMBERG-CARLSON CO.

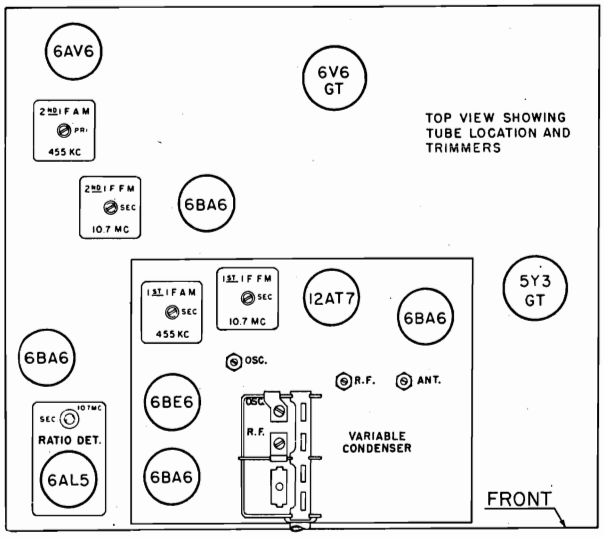
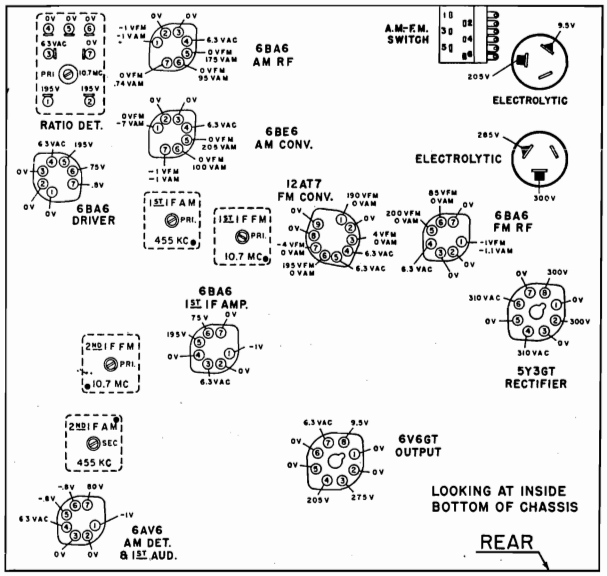
MODELS 1407PFM, PLM

1407 TUBE LOCATION AND VOLTAGE CHARTS





NOTE: Dots on IF trans. indicate the position of the color coded terminals.

ALIGNMENT PROCEDURE 1407

On IF and Radio Detector transformers, primary slugs are under chassis and secondary slugs above chassis.
Adjust AM loop trimmer after chassis is in cabinet for best reception at 1500 Kc.
Adjust dial pointer to marker at top left of dial with condenser plates fully meshed.

A.M. - I.F.

	Band & Pointer	Signal Generator	VTVM or Scope Connection	Adjustment and Notes
1.	AM low end of dial.	455 Kc. 400 cy. mod. to Pin 7 (Grid) of 6BE6 tube through .01 cap.	Term. 2 of AM-FM sw and ground.	Adj. two AM-IF trans., using —3V DC Scale.
2.	"	455 Kc swept 15 Kc.	"	Adjust same for best double-trace curve on scope.

F.M. - I.F.

1.	FM low end of dial.	10.7 Mc. 400 cy. mod. to Pin 2 (Grid) of 12AT7 tube at RF Coil thru .01 capacitor.	"	Detune secondary of ratio det. Adj. two FM-IF trans. and pri. ratio det. trans., using —3 VDC scale.
2.	"	10.7 Mc. swept 150 Kc.	"	Disconnect ground end of C-43 (5 mfd. electrolytic under ratio detector can). Adj. as step 1 for best double-trace curve on scope.
3.	"	"	Terms. 2 & 5 of AM-FM sw.	Be sure VTVM is not grounded. Connect C-43, Adj. sec. ratio det. for 0 voltage.

A.M. - R.F.

1.	AM 1500 Kc.	1500 Kc. 400 cy mod. coupled loosely to loop leads.	Term. 2 of AM-FM sw & ground.	Adj. two trimmers on tuning cond., using low —DC scale.

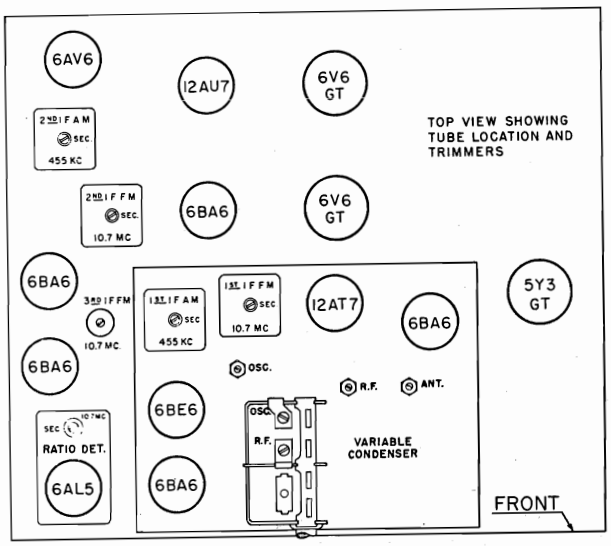
F.M. - R.F.

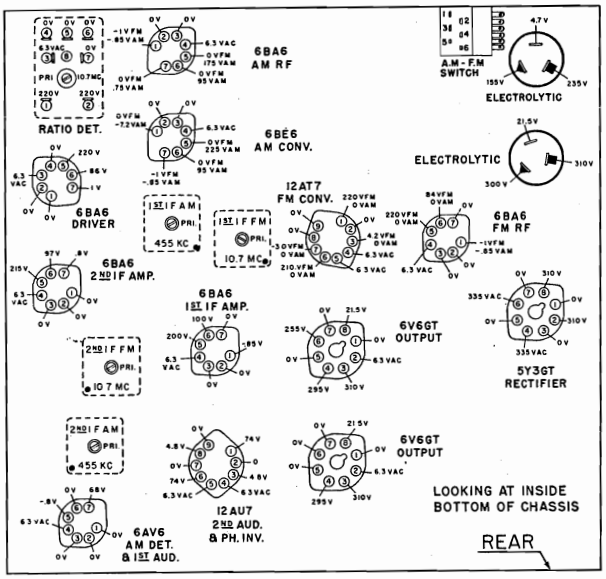
1.	FM 100 mc.	100 Mc. 400 cy. mod. to FM Ant. Terms., thru 270 ohm resistor.	"	Adj. C-17 (Osc.) C-8 (RF) and C-2 (Ant.) on low —DC scale.

Align both IF channels if either is out of adjustment.
Use a non-metallic screwdriver and light pressure for slug adjustment.
2nd AM-IF trans. will be damaged if chassis is placed on left side.
If FM osc. coil is replaced, adjust placement of its ground lead for tracking at 88 mc.

MODEL 1409 Series STROMBERG-CARLSON CO.

1409 TUBE LOCATION AND VOLTAGE CHARTS





NOTE: Dots on IF trans. indicate the position of the color coded terminals.

ALIGNMENT PROCEDURE 1409

On IF and Ratio Detector transformers, primary slugs are under chassis and secondary slugs above chassis.
Adjust AM loop trimmer after chassis is in cabinet for best reception at 1500 Kc.
Adjust dial pointer to marker at top left of dial with condenser plates fully meshed.

A.M. - I.F.

	Band & Pointer	Signal Generator	VTVM or Scope Connection	Adjustment and Notes
1.	AM low end of dial.	455 Kc. 400 cy. mod. to Pin 7 (Grid) of 6BE6 tube through .01 cap.	Term. 2 of AM-FM sw and ground.	Adj. two AM-IF trans., using —3V DC Scale.
2.	"	455 Kc swept 15 Kc.	"	Adjust same for best double-trace curve on scope.

TEMPLETONE RADIO MFG. CORP.

OPERATING INSTRUCTIONS AND SERVICE NOTES

Model G-618 Temple Radio is a 6-tube superheterodyne receiver having an RF stage for increased sensitivity and using the latest type of low-drain electronic tubes.

Operation: The set operates on 110 to 120 volts, 50 or 60 cycles A. C. and 110 to 120 volts D. C. Power drain is approximately 30 watts.

When operated on direct current (D. C.), if no reception is obtained after approximately one minute of warm-up time, reverse the line plug in the power outlet.

Range: Model G-618 covers the broadcast band from 540 to 1620 kilocycles. Since the scale is calibrated 54 to 160, the actual frequency of the station received is obtained by adding a zero to the dial calibration.

Controls: Only two controls are required for operation. The left-hand control puts set into operation, increases the volume with clockwise rotation, and includes the power switch. The right-hand control tunes the dial to the desired station.

Antenna: For normal reception, no outside aerial is required, as more than adequate pickup is obtained by the self-contained loop antenna.

At installations remote from the stations desired to be heard, improved results may be obtained by rotating the receiver for maximum response, as the loop antenna has a marked directional effect on weak signals. Reception can also be improved, and the directional effect reduced, by attaching a length of insulated wire approximately 15 to 25 feet long, to the antenna connection provided at the back of the cabinet. This wire may be laid on the floor along one side of the room, or concealed under the rug. No external ground is required — such ground is automatically provided through the power lines.

Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube, or some local condition is not responsible for faulty reception. An output meter may be clipped directly across the voice coil lugs.

The Signal Generator may be connected through a 0.01 mf capacitor (used as dummy antenna) to the lug on RF section (B)) of tuning capacitor. Connect ground clip of generator to the common negative of the electrolytic capacitor. Align the I. F. trimmers to 455 kc, using least possible input from Signal Generator to avoid developing A.V.C. voltage which would make the tuning adjustments very broad.

To align RF trimmers, remove the 0.01 mf capacitor and connect the Signal Generator leads to two or three turns of heavy wire, forming a self-supporting loop of about 7 or 8 inches diameter, placed about a footaway from the receiver's loop antenna. Again, use the least possible input from the Signal Generator. With the tuning capacitor plates completely out of mesh, and pointer at extreme right end of travel, adjust the oscillator trimmer (A) (on front section of tuning capacitor) to 1700 kc. Readjust both Signal Generator and tuning capacitor to 1550 kc and adjust the RF trimmer (B) (on rear section) for maximum response. With tuning capacitor plates fully meshed, the receiver should tune to 532 kc; however, no adjustment is required at this point. For checking purposes, four fine marks are engraved on the dial plate. These represent, in order, the pointer position with capacitor plates fully meshed, and the pointer setting for 600, 1000 and 1550 kc.

TEMPLETONE RADIO MFG. CORP.

Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube, or some local condition is not responsible for faulty reception. The Signal Generator may be connected through a 0.01 mf capacitor (used as a dummy antenna) to the lug on R. F. section (A) of tuning capacitor. Connect ground clip of generator directly to chassis. Align the I. F. trimmers to 455 K.C., using least possible input from the Signal Generator to avoid developing A.V.C. voltage which would make the tuning adjustments very broad. An output meter may be clipped across the voice coil lugs.

To align broadcast R. F. trimmers, remove the 0.01 mf capacitor and connect the Signal Generator leads to two or three turns of heavy wire, forming a self-supporting loop of about 7 or 8 inches diameter placed about a foot away from the receiver's loop antenna. Again, use the least possible input from the Signal Generator. With the tuning plates completely out of mesh and the pointer at the extreme right end of travel, adjust the broadcast oscillator trimmer, on the under side of the chassis, to 1650 K.C. With tuning capacitor fully meshed adjust the padder on the chassis deck to 535 K.C. Readjust both Signal Generator and tuning capacitor to 1550 K.C. and adjust the R. F. trimmer on the loop for maximum response.

To align the short wave band connect the Signal Generator through a 0.01 mf capacitor and a 400 ohm resistor in series (used as a dummy antenna) to the antenna connection on the loop antenna. With the tuning capacitor plates completely out of mesh, and pointer at the extreme right end of travel, adjust the short wave oscillator trimmer (on the under side of the chassis) to 18.25 magacycles. Readjust both Signal Generator and tuning capacitor to 16 megacycles and adjust short wave antenna coil trimmer for maximum response. With tuning capacitor fully meshed, the receiver should tune to 5.75 megacycles, however, no adjustment is required at this point.

For checking purposes five marks are engraved on the front of the dial plate. These represent, in order, the pointer position with the capacitor plates fully meshed and the pointer settings for 600 kc, 8 mc, 16 mc, and 1550 kc.

Pushbuttons: To set pushbuttons remove pushbutton knobs. This will expose a set screw on the shaft of each pushbutton. Starting at one end push a pushbutton down and loosen its set screw. Set the bandswitch to the broadcast position. Hold the pushbutton down and tune the manual tuning control to the station to which the pushbutton is to be set. Still holding the pushbutton down tighten its set screw. The pushbutton may now be released and its knob replaced. It will now select the station to which it was set. The other pushbuttons may be set in a similar manner.

REPLACEMENT PARTS LIST

Circuit Symbol	Part Number	Item	Description
C-1 A & B	CV-9	Capacitor	Variable 2-gang, Push-button
C-2	CT1-1	Capacitor	Trimmer 1.5—15 MMF

NOTE:

1. All capacitors in $\mu\mu$ farads and 600 volts, all resistors in ohms and ½ watt unless otherwise stated.
2. I. F. 455 kc. and 10.7 mc.
3. B. C. 535 - 1720 kc., S. W. 5.60 - 18.5 mc., F. M. 87.4 - 108.70 mc.
4. Band switch shown in phono position, 1 - phono, 2 - frequency modulation, 3 - standard broadcast, 4 - International short wave bands.

RECORD CHANGER: V-M Model 400, RCD.CH.15-1

Instructions For Removing Radio From Cabinet

Main Chassis:

To remove main chassis from the cabinet it is first necessary to remove the four control knobs by pulling them gently until they come off. Remove all plugs from the rear of the main chassis and power pack chassis. Pull the 5U4G rectifier tube out of the power pack chassis. The four screws holding the chassis may now be removed. The chassis itself may now be taken out by sliding it straight back toward the rear of the cabinet.

Power Pack Chassis:

The power pack chassis may be removed from the cabinet by unscrewing the four large screws holding it to its support shelf. These are accessible from the under side of the cabinet.

Record Changer:

Most adjustments may be made to the record changer without removing it from its drawer. Before attempting to remove the record changer from the cabinet the motor plug and the phono pickup plug must first be removed from the main and power pack chassis. Loosen the cable clamps on the rear of the cabinet sufficiently to lift out cables.

Pull changer drawer forward until it hits its stop. Lift the turntable completely off. Be careful not to lose the spring and loose gear on the spindle of the record changer. Remove retaining washers from the mounting screws at the front and rear of the record changer. The mounting screws may now be removed from the bottom of record changer drawer and the record changer may be lifted out.

Alignment:

No attempt should be made to realign this receiver until it has been determined that a poor tube or some local condition is not responsible for faulty reception. The following is a list of minimum equipment necessary to realign this receiver:

1—AM signal generator covering 455KC, 600KC, 1550KC, 6 MC, 10.7 MC and 18 MC
2—FM signal generator covering 10.7 MC, 92 MC and 106 MC
3—Output meter, rectifier type, approximately 0 to 2 volts RMS
4—Dummy antennas

- 0.01 MFD Capacitor
- 200 MMF Mica Capacitor
- 400 Ohm Resistor
- 300 Ohm Resistor

In the following alignment procedure the high side of the signal generator is connected to the terminal indicated in the "Signal Generator Coupling" column below. The ground side of the signal generator is connected directly to the chassis unless otherwise noted. The output meter should be connected across the voice coil of the speaker for all measurements.

In adjusting the radio frequency trimmers and padders it is advisable to "rock" the variable capacitor gang slightly across the signal being delivered by the signal generator until that particular signal has been accurately peaked.

The location of the following trimmers, padders and terminals can be found by referring to the tube and trimmer location diagram.

ALIGNMENT PROCEDURE:

Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Band Switch Position	Radio Dial Setting	Adjust	Remarks
0.01 MFD	Terminal T-2	455 KC	Broadcast	1700 KC	E-1 C-1 B-1	Adjust for maximum output Repeat for fine adjustment

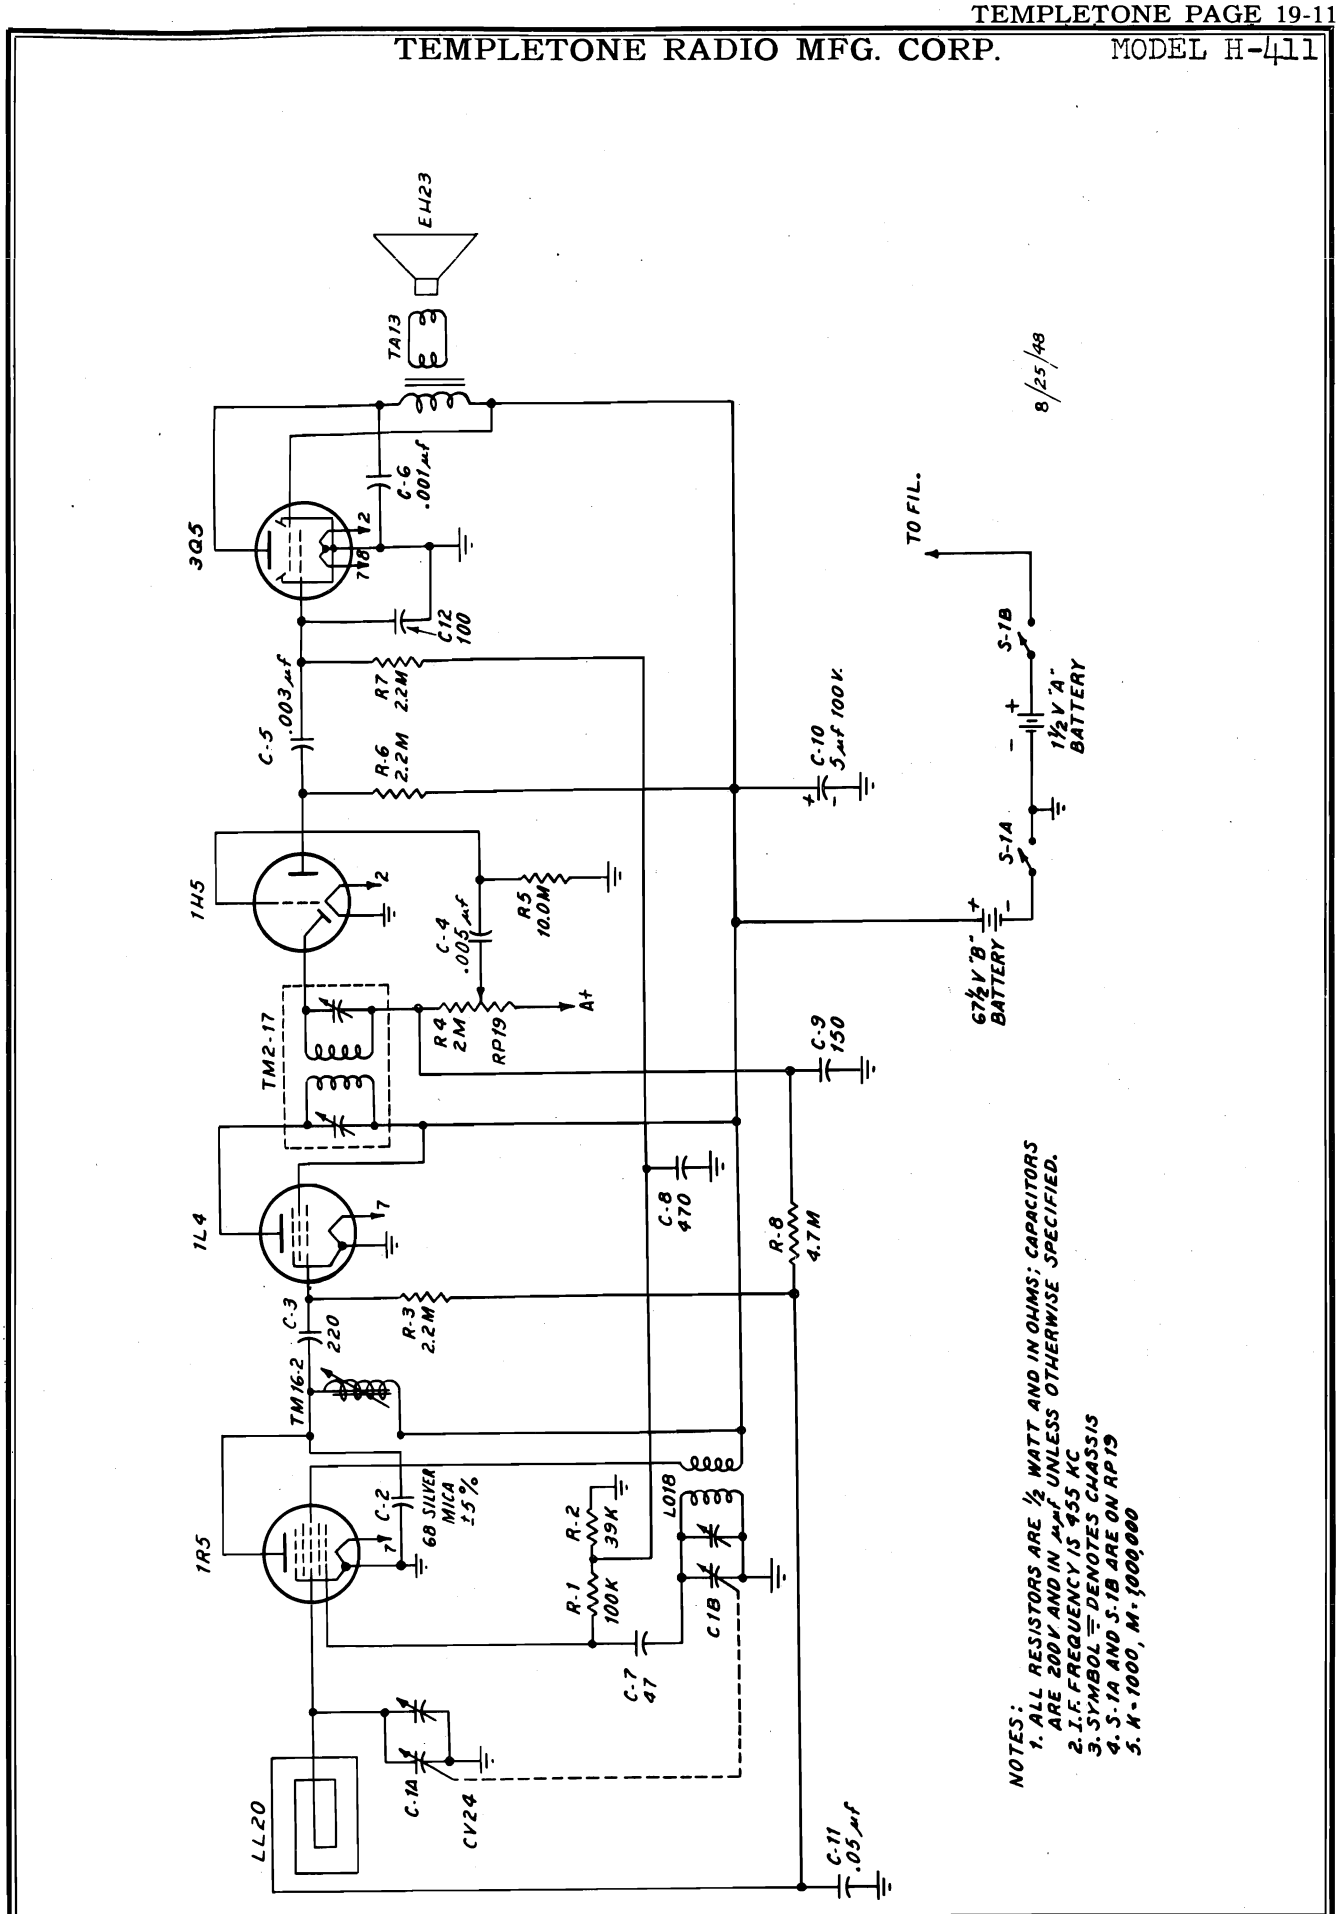
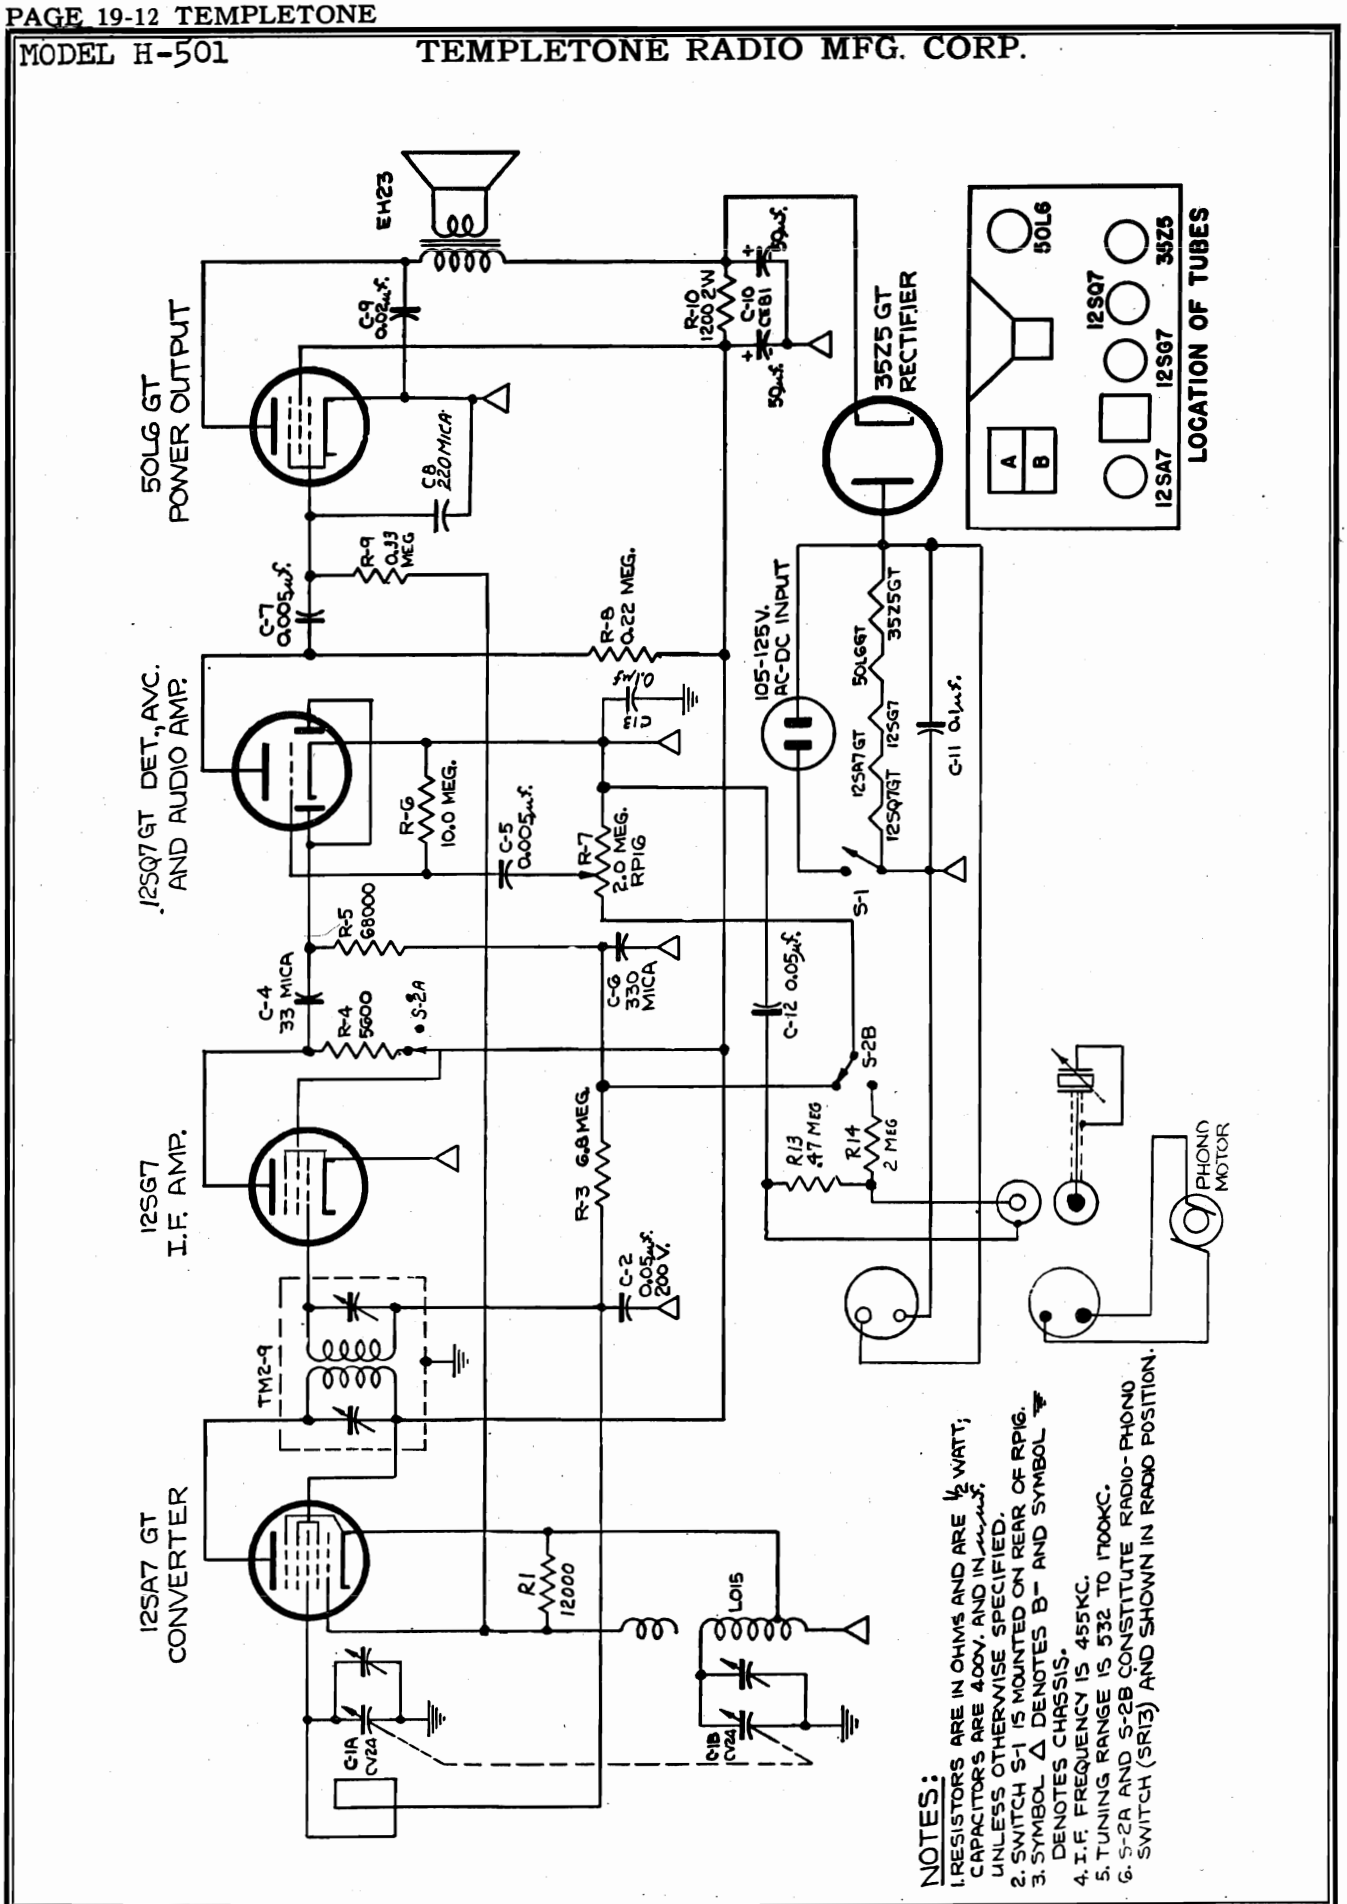
TEMPLETONE RADIO MFG. CORP. MODEL H-411



MODEL H-501 TEMPLETONE RADIO MFG. CORP.



NOTES:
1. RESISTORS ARE IN OHMS AND ARE ½ WATT; CAPACITORS ARE 400V. AND IN μμf. UNLESS OTHERWISE SPECIFIED.
2. SWITCH S-1 IS MOUNTED ON REAR OF RP1G.
3. SYMBOL △ DENOTES B⁻ AND SYMBOL ⏚ DENOTES CHASSIS.
4. I.F. FREQUENCY IS 455KC.
5. TUNING RANGE IS 532 TO 1700KC.
6. S-2A AND S-2B CONSTITUTE RADIO-PHONO SWITCH (SR13) AND SHOWN IN RADIO POSITION.

RECORD CHANGER: Crescent Model C-250, RCD.CH.18-1

OPERATING INSTRUCTIONS AND SERVICE NOTES

This radio-phonograph combination includes a five tube superheterodyne receiver and a smoothly-operating dependable, automatic record changer. It has a built-in sensitive loop antenna, an Alnico V permanent magnet speaker, and full size octal tubes for longer life. The radio chassis and record changer are electrically floating to prevent possibility of hazardous shock.

Operation: The set operates on 105-125 volts 60 cycles AC only. Power drain is approximately 25 watts for radio and 17 watts additional for the record changer.

Range: The complete broadcast band is covered, from 532 to 1700 kilocycles. Since the scale is calibrated from 55 to 170, the actual frequencies are read by adding a zero to the dial calibration.

Controls: Three controls are provided for operating the set. The upper right control tunes to any desired station when pointer knob is rotated. The bottom right control incorporates the on-off switch and volume control. The extreme counter-clockwise position is the "off" position and rotating the knob clockwise turns the set on and increases the volume. The control at the left is the phono-radio switch, which switches from phonograph operation in the counter-clockwise position to radio operation in the clockwise position.

Record Changer: The record changer is completely automatic and will play twelve ten-inch records or ten twelve-inch records. Complete operating instructions for the record changer are included in the record changer instruction sheet.

Antenna: For normal reception no outside aerial is required, as more than adequate pickup is obtained by the self-contained loop antenna. At installations remote from the desired stations, improved results may be obtained by rotating the receiver for maximum response, since the loop has marked directional effects on weak signals.

Alignment: No attempt should be made to re-align this receiver until it has been determined that a poor tube, or some local condition is not responsible for faulty reception. The signal generator may be connected through 0.01 mfd capacitor, used as a dummy antenna to the lug on the RF section of the tuning capacitor. Connect ground clip of generator to a B-point. Align the IF trimmers to 455 kilocycles using least possible input from signal generator, for maximum output as measured across voice coil or speaker.

To align RF, remove 0.01 mfd capacitor and connect signal generator to two or three turns of heavy wire forming a self-supporting loop, about 7 or 8 inches in diameter placed about a foot away from the receiver's loop antenna. Again, use least possible input from the signal generator. With the variable completely open (plates out of mesh) adjust the oscillator trimmer to 1700 kilocycles, then tune the set and signal generator to 1550 kilocycles and adjust RF trimmer for maximum response.

   - PHONO: 4. BASS, 5. MUSIC

RECORD CHANGER: Crescent Model C-250, RCD.CH. 18-1

MODEL H-622 TEMPLETONE RADIO MFG. CORP.

OPERATING INSTRUCTIONS AND SERVICE NOTES

This set is a six-tube, two band, superheterodyne receiver and phonograph combination, using the latest type of low-drain electronic tubes and a smoothly operating, dependable record changer.

Operation: The set operates on 105-125 volts 60 cycles, AC. The power drain is approximately 35 watts on radio operation and 17 watts additional on phonograph operation.

Range: This set has both a broadcast and shortwave range. The complete broadcast band is covered from 532 to 1700 kilocycles. Since the broadcast dial scale is calibrated from 55 to 160, the actual frequency of the station may be obtained by adding zero to the dial calibration. The shortwave band covers from 5.6 to 12.5 megacycles. The shortwave dial scale is calibrated directly in megacycles.

Controls Four controls are provided for the operation of the radio set. The control at the extreme left includes the on-off switch and the volume control. The extreme counter-clockwise position is "off", and rotating the knob clockwise turns the set on and increases the volume. The second control from the left is the phono-radio switch and the tone control. The positions in order, from counter-clockwise to clockwise are: radio bass; radio music; radio treble; phonograph bass and phonograph music. Tone is varied electrically by boosting bass, treble or both, and not by merely reducing the high frequency response. The third control is the bandswitch which switches from broadcast in counter-clockwise position, to shortwave in clockwise position. The last control is the tuning control which permits accurate tuning of the slide rule dial through smooth vernier action.

Record Changer: The record changer is completely automatic and will play up to 12 ten-inch records or 10 twelve-inch records. Complete operating instructions for the record changer are included on a separate instruction sheet. It is provided with a precious metal alloy tipped, long-life needle balanced to give high quality reproduction with the speaker, amplifier and tone arm. It will provide many hours of excellent performance with low record wear.

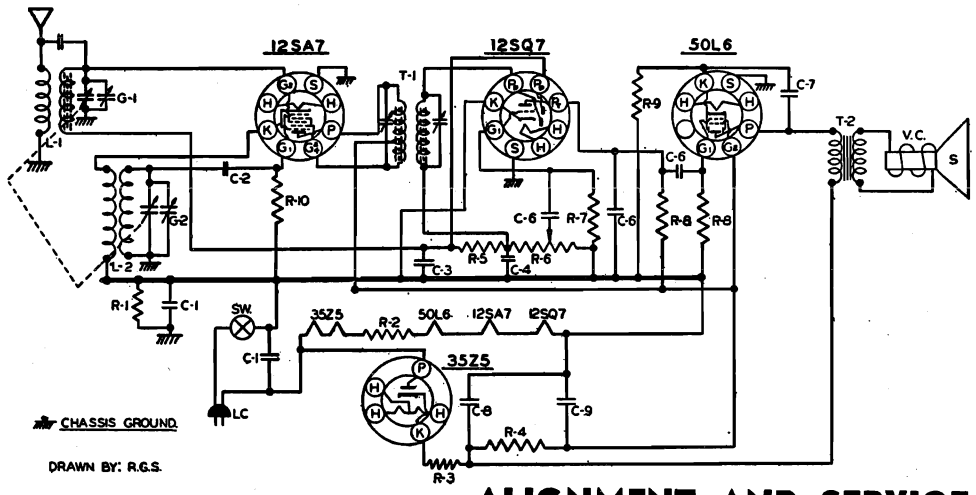
Antenna: For normal reception, no outside antenna is required, as more than adequate pick-up is obtained from the built-in cabinet loop and the high sensitivity of the receiver. In very poor receiving locations improved results may be obtained by connecting an outside aerial to the post marked "A" on the rear of the cabinet.

Alignment: No attempt should be made to re-align this receiver until it has been determined that poor tubes or some local condition is not responsible for faulty reception. The signal generator may be connected through 0.01 mfd capacitor used as a dummy antenna, to the lug on the RF section "B" of the tuning capacitor. Connect ground clip of generator directly to chassis. An output meter may be clipped across the voice coil lug on the speaker. Align IF trimmers to 455 kilocycles, using the least possible input in the signal generator. With tuning plates completely out of mesh (pointer at the extreme right end of travel) the set in broadcast position, adjust the broadcast oscillator trimmer (A) to 1700 kilocycles. Then switch to shortwave and adjust the shortwave oscillator trimmer (D) to 12.5 megacycles. Replace the 01 mfd dummy by a 39 mmfd mica capacitor and connect to antenna terminal "A." Tune set and signal generator to 600 kilocycles and adjust broadcast antenna coil slug for maximum output. Then re-tune set and signal generator to 1550 kilocycles and adjust RF trimmer "B" on tuning capacitor for maximum response. Repeat these adjustments until no further adjustment is required, then switch receiver to shortwave. Tune set and signal generator to 6 megacycles and adjust shortwave antenna coil slug "E" for maximum response. Retune set and signal generator to 10.5 megacycles and tune shortwave antenna, trimmer "C" for maximum response. In these adjustments the tuning control should be rocked for best results. Repeat these adjustments until no further adjustment is needed.

For checking purposes, five marks are engraved on the dial plate. These represent, in order from left to right: the pointer position capacitor plates fully meshed and the pointer settings for 600 kc or 6 mc; 1000 kc, 10.5 mc and 1550 kc.

TRAV-LER RADIO CORP.

MODEL 5054



ALIGNMENT AND SERVICE DATA

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1650 KC. An output meter should be connected across the speaker.

The volume control of the receiver should be turned to maximum during the I. F. and all subsequent alignment and the generator output as low as possible to prevent the A. V. C. from working and giving false readings.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser through a .1 MFD. condenser. The ground lead from the generator must be connected to "B" minus under the chassis. Turn the gang condenser to complete minimum capacity. Set the generator to 455 KC. Adjust the trimmers of the I. F. transformer until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1650 KC. Adjust the OSC. trimmer until the 1650 KC signal is tuned in. The gang condenser must be at complete minimum capacity for this adjustment.

THIRD STEP: Remove the generator hot lead and connect it to the antenna hank terminal strip through a 200 MMFD. condenser. With the receiver and generator set at 1400 KC, increase the generator output. Adjust the ANT. trimmer until a maximum signal is noted on the output meter. No further adjustment should be made as the coils and gang condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

TUBE AND TRIMMER LOCATION

OPERATING INSTRUCTIONS

POWER SOURCES: This receiver may be operated on alternating current (AC) of 110 to 125 volts at 60 cycles or on direct current (DC) of 110 to 125 volts. When used on DC, if the tubes light up but set does not play, reverse the cord plug in the power outlet.

CAUTION: Always predetermine voltage of power source Never try to plug this receiver into a 220 volt line, as this will cause serious damage.

ALIGNMENT

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1720 KC. An output meter should be connected across the speaker.

The receiver volume control should be turned to maximum during the I.F. and all subsequent alignments to keep the AVC from working and giving false readings. Keep the generator output as low as possible to prevent overloading.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD condenser. The ground lead from the generator must be connected to the floating ground buss under the chassis. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1720 KC. The OSC. trimmer is located on the front of the chassis. Adjust this trimmer until the 1720 KC signal is tuned in.

THIRD STEP: Remove the hot lead of the generator from the ANT section of the gang condenser. Connect this lead to the primary of the loop antenna through a 200 MMFD condenser. Adjust the Signal Generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The ANT trimmer is located on the back of the loop antenna. Adjust this trimmer until a maximum reading is noted on the output meter. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

ALIGNMENT DATA

Remove the chassis from the cabinet. A Signal Generator with the following frequencies is required: 455 KC, 1400 KC and 1720 KC.

The receiver volume control should be turned to maximum during the I.F. and all subsequent alignments to keep the A.V.C. from working and giving false readings. Turn the tone control to complete left hand position. Keep the generator output as low as possible to prevent overloading.

Connect an output meter across the voice coil of the speaker.
Connect a 20,000 ohm resistor across the loop connector terminals to reflect proper loop impedance.

FIRST STEP: Connect the hot lead from the generator to the "ANT." section of the gang condenser through a .1 MFD. condenser. The ground lead must be connected to the floating ground buss under the chassis. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455 KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator connected in the same manner as in I.F. alignment, adjust the signal generator to 1720 KC. The "O.S.C." trimmer is located on the front section of the gang condenser. Adjust this trimmer until the signal is tuned in. The gang condenser should be at complete minimum capacity for this setting.

THIRD STEP: Remove the generator leads from the chassis. Remove the 20,000 ohm resistor from the loop connector terminals. Reinstall the chassis in the cabinet, connect the loop leads, motor plug and phono pickup leads.

Connect the generator leads to a transmitting loop, made of a few turns of wire, and loosely couple to the receiver loop antenna which is located on the back end of the cabinet. Adjust the generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The "ANT." trimmer is located on the rear section of the gang condenser. Adjust this trimmer until a maximum signal is noted on the output meter.

No further adjustment should be necessary, unless the receiver has been damaged, as the coils and tuning condenser have been specially handled at the factory to insure proper alignment at the lower frequencies.

TUBE SOCKET VOLTAGE CHART

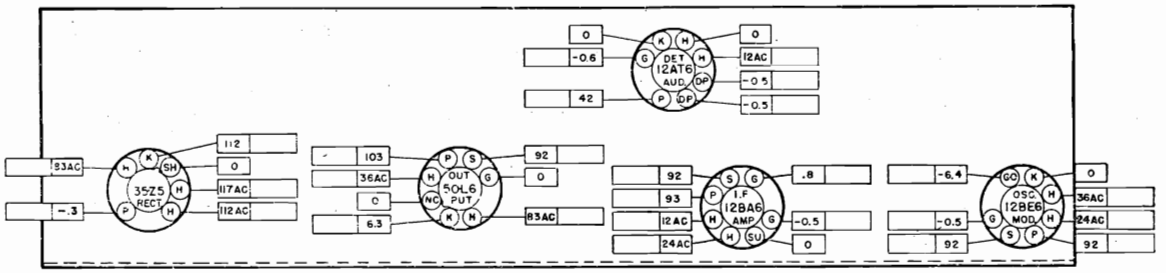
The tube socket voltages, as measured at the factory and under the conditions shown on the schematic diagram, are shown below. The blank spaces are provided so the service man may fill in actual voltage readings as measured with his own equipment. A normal operating radio should be used for these measurements.



Volt Meter Resistance	Ohms Per Volt
Line Voltage	Volts
Voltage Tolerance	±10%

MODEL R-1243

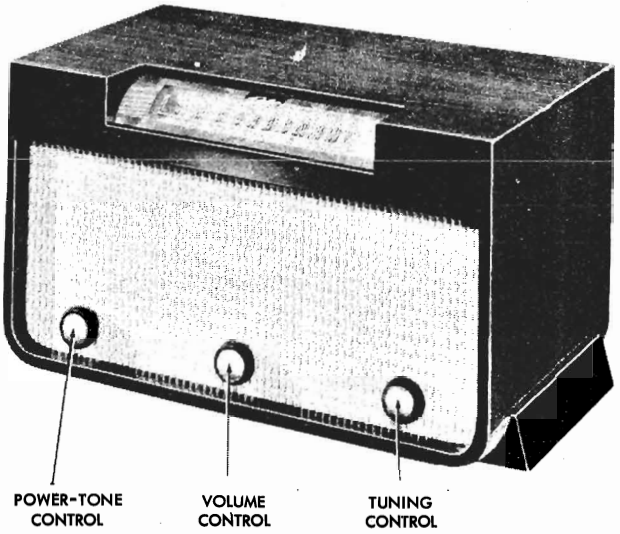
UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

GENERAL

TUBES.....Six
SPEAKER.....5" x 7" Elliptical P.M. Dynamic
TUNING.....Manual
TUNING RANGE.....535-1620 KC
ANTENNA.....Built-in Antenna Plate and External.
POWER SUPPLY.....105-125 V. A.C. 60 Cycles.
POWER CONSUMPTION..50 Watts.



ALIGNMENT PROCEDURE

Output Meter Connections...Across Voice Coil
Generator Ground.....To Chassis
Dummy Antenna.....In Series With Generator
Volume Control Position.....Maximum
Tone Control Position.....Treble

NOTE: Reset Ant. Trimmer after installing receiver in cabinet and connecting up cabinet antenna.

USE THIS ALIGNMENT PROCEDURE WHEN ALIGNING RECEIVERS WITH TUNER STAMPED 50B225.

Series Cond. or Dummy Antenna	Connection at Radio	Set Generator At	Tune Receiver To		Adjust Screws At	To Obtain
		455 KC	1000 KC	A B	2nd IF trimmers	
.00025 Mfd	Antenna	455 KC	1000 KC	C D	1st IF trimmers	Max.
		1625 KC	High Freq. Stop	E F	Osc & Ant trimmers	Output
		1400 KC	Signal Generator	G	Ant coil, slide up or down	

Repeat last two steps until no improvement in output can be made. Caution—Do not change the position of the oscillator coil (H). Adjustment of Ant coil (G) is sufficient.

USE THIS ALIGNMENT PROCEDURE WHEN ALIGNING RECEIVERS WITH TUNER STAMPED 50B199.

Series Cond. or Dummy Antenna	Connection at Radio	Set Generator At	Tune Receiver To		Adjust Screws At	To Obtain
		455 KC	1000 KC	A B	2nd IF trimmers	
		455 KC	1000 KC	C D	1st IF trimmers	
.00025 Mfd	Antenna	1660 KC	High Freq. Stop	E F	Osc & Ant trimmers	Max.
		1400 KC	Signal Generator	H	Ant coil, slide up or down	Output
		Repeat last two steps carefully.				
		600 KC	Signal Generator	I	Osc slug. Rock tuner thru signal	

Caution—Do not change the position of the oscillator coil (G). Adjustment of the antenna coil (H) is sufficient.

Dial Cord Layout

RESTRINGING DIAL CORD

To replace the dial drive cord, cut a 48" length of 18 lb. test dial cord, tie one end to the tension spring and follow the stringing sequence. A series of numbers are used to show the path of the cord. Stretch the tension spring slightly and tie the finished end of the dial cord securely as shown. To position the pointer, turn the tuning shaft to the left as far as it will go and line up the pointer with the index line stamped on the left hand end of the pointer rail.

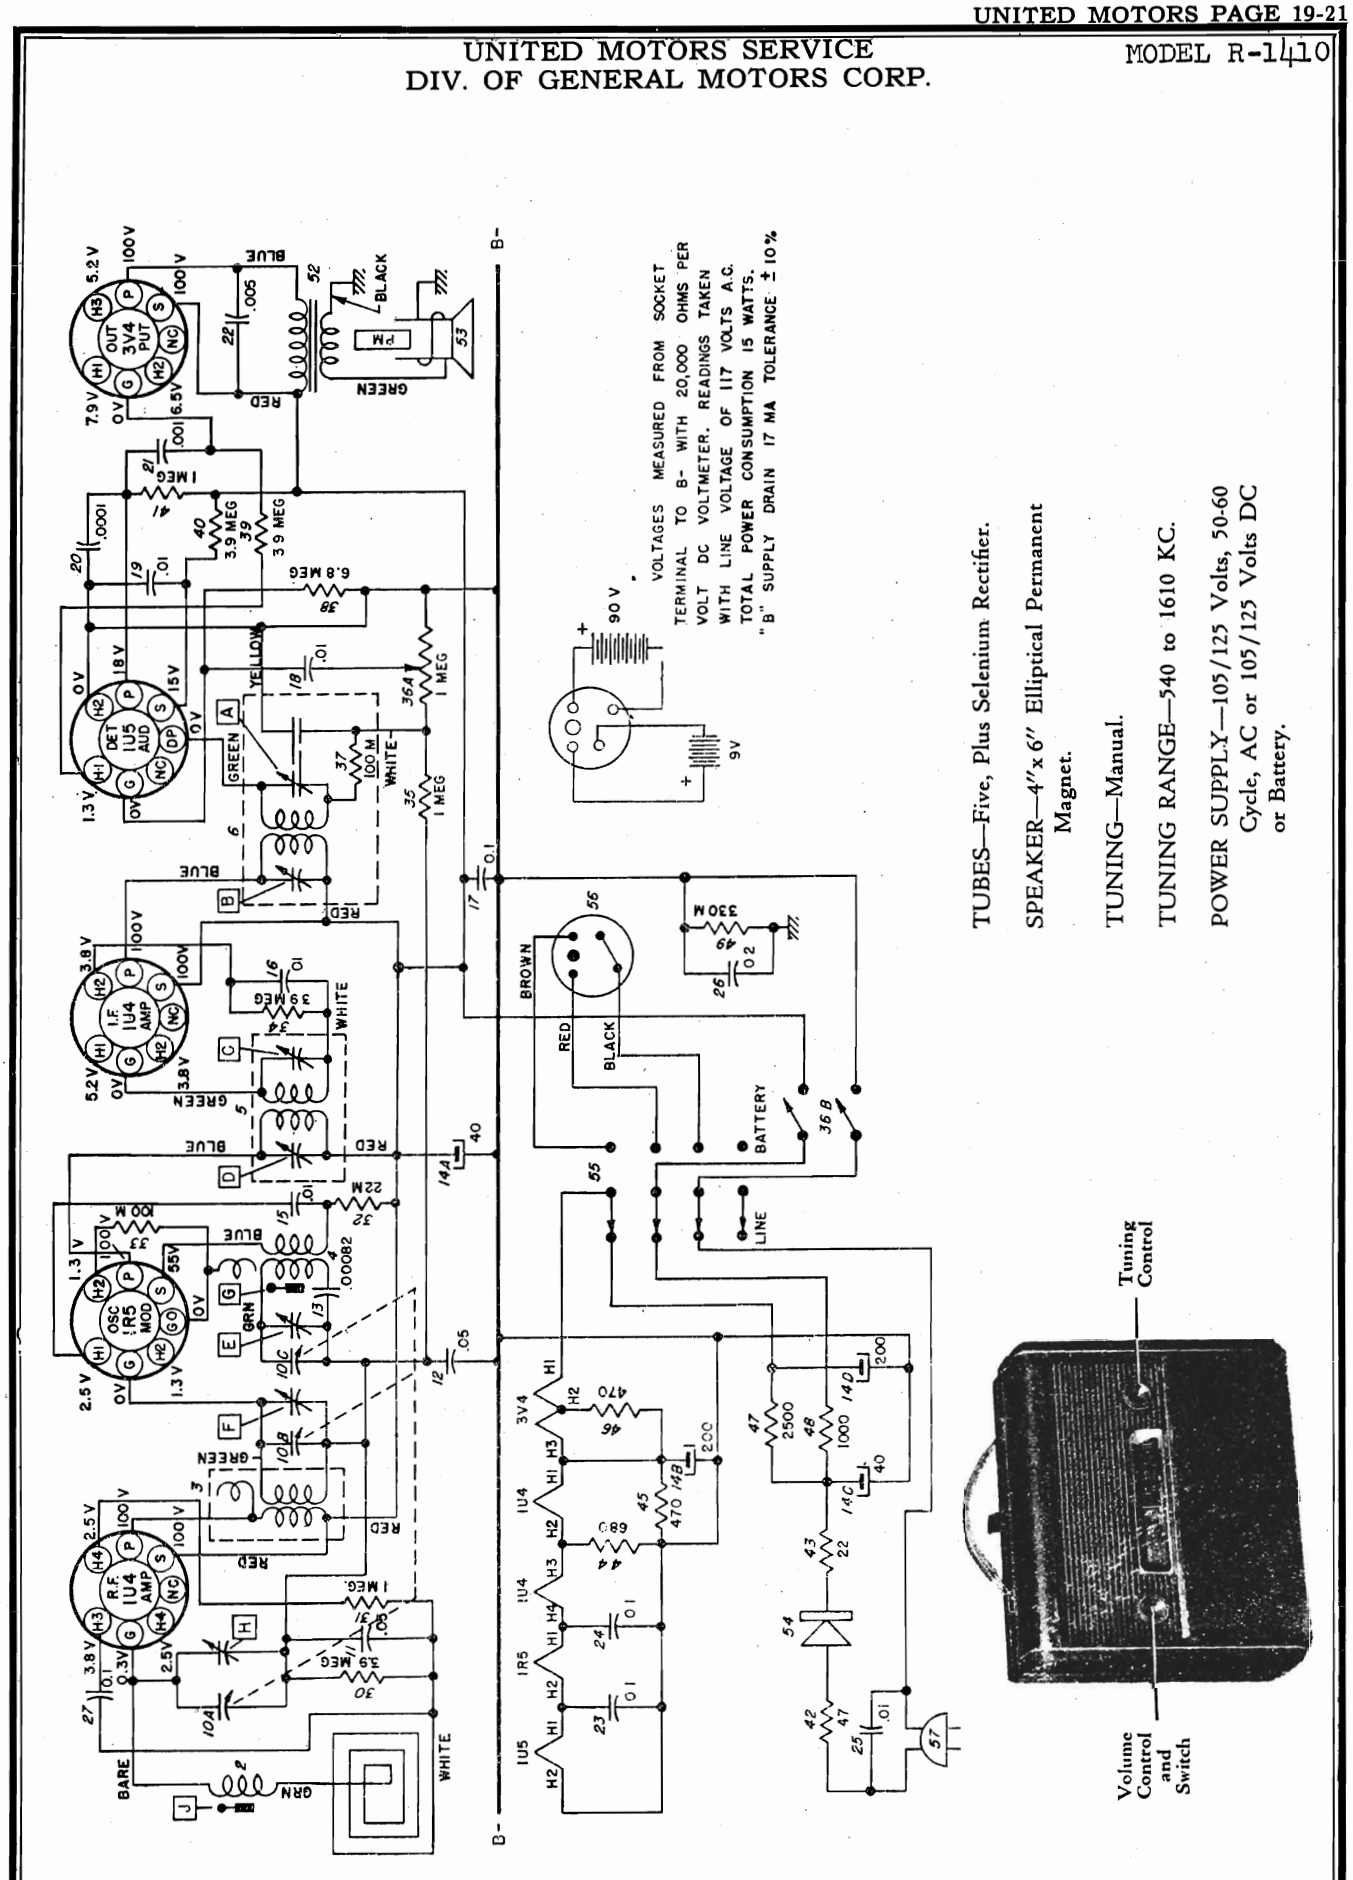
MODEL R-1410



TUBES—Five, Plus Selenium Rectifier.

SPEAKER—4" x 6" Elliptical Permanent Magnet.

TUNING—Manual.

TUNING RANGE—540 to 1610 KC.

POWER SUPPLY—105/125 Volts, 50-60 Cycle, AC or 105/125 Volts DC or Battery.

MODEL R-1410

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

ALIGNMENT PROCEDURE:

Output Meter Connections ..... Across Voice Coil

Generator Return ..... To Receiver Chassis

Dummy Antenna ..... In Series With Generator

Volume Control Position ..... Maximum Volume

Generator Output ..... Minimum for Readable Indication

(For best results align receiver in cabinet with battery in place)

Steps	Series Condenser or Dummy Antenna	Connect Generator To	Signal Generator Frequency	Tune Receiver To	Adjust in Sequence for Max. Output
1	.000220 Mfd	Stator Lug RF* Section of Gang	262 KC	High Frequency Stop	A, B, C, D
2	.000220 Mfd	Stator Lug RF Section of Gang	1615 KC	High Frequency Stop	E
3	.000220 Mfd	Stator Lug of RF Section of Gang	1400 KC	Signal Generator Signal	F
4	.000220 Mfd	Stator Lug of RF Section of Gang	600 KC	Signal Generator Signal	G**
5	None	Test Loop***	1400 KC	Signal Generator Signal	H
6	None	Test Loop	600 KC	Signal Generator Signal	J

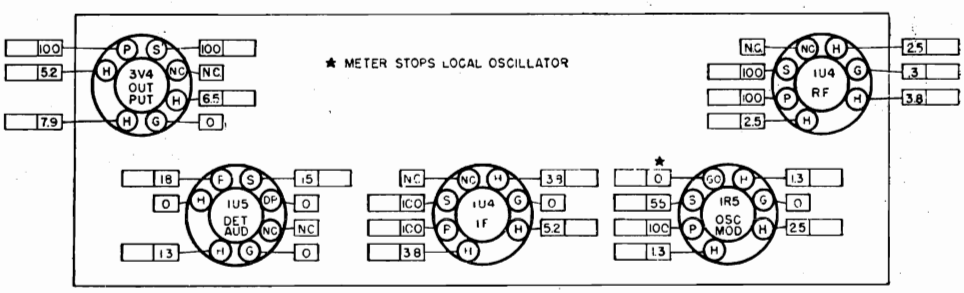
*With loop antenna terminal lugs shorted or loop connected for Steps 1, 2, 3, and 4.

**During this adjustment rock-in gang condenser

***The signal generator may be coupled to the receiver by placing a loop electrically across the output of the signal generator and physically near the receiver loop. This loop may be a loop from another radio, a home made loop of 10 or 15 turns, or other similar devices.

TUBE SOCKET VOLTAGE CHART

The tube socket voltages, as measured at the factory and under the conditions shown on the schematic diagram, are shown below. The blank spaces are provided so the service man may fill in actual voltage readings as measured with his own equipment. A normal operating radio should be used for these measurements.



Volt Meter Resistance ..... **Ohms Per Volt**

Line Voltage ..... **Volts**

Voltage Tolerance ..... ±10%

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

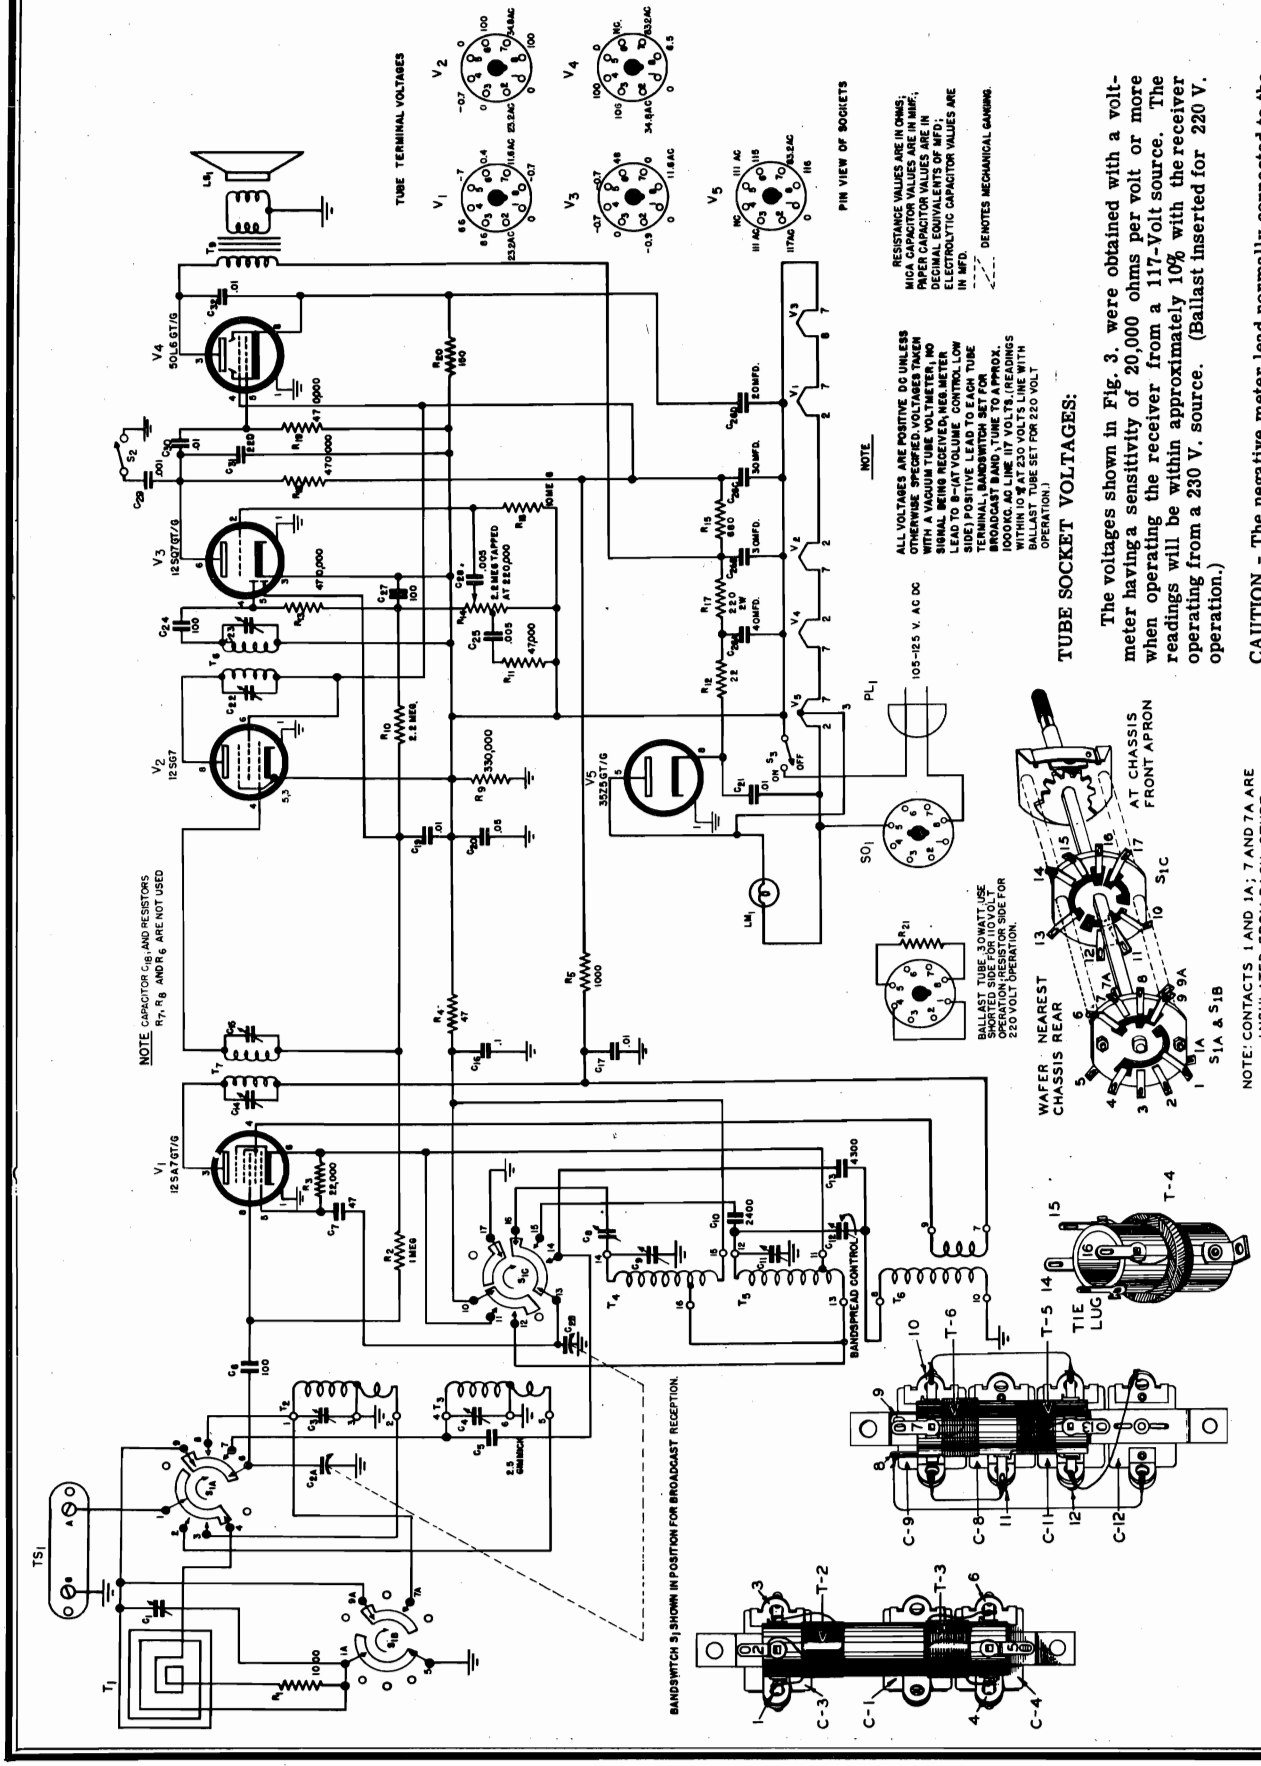
MODEL 508



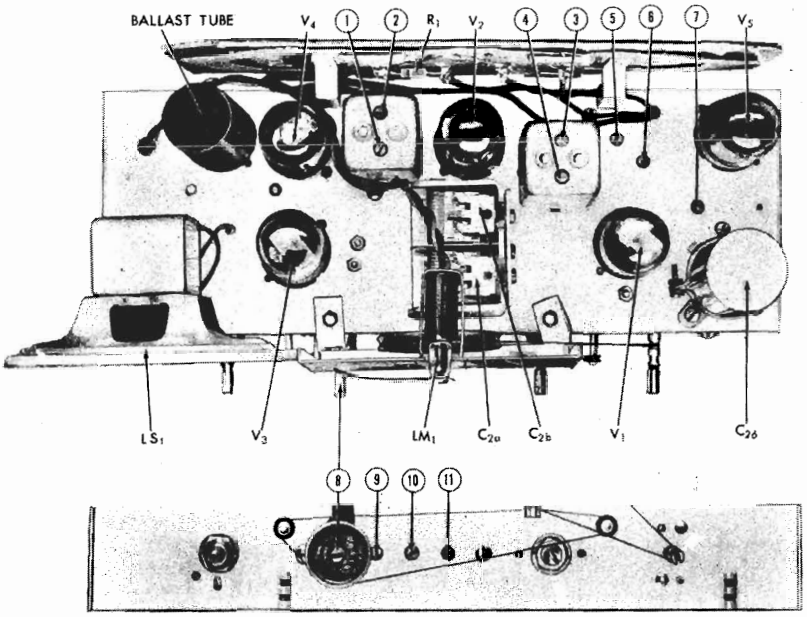
TUBE SOCKET VOLTAGES:

The voltages shown in Fig. 3. were obtained with a voltmeter having a sensitivity of 20,000 ohms per volt or more when operating the receiver from a 117-Volt source. The readings will be within approximately 10% with the receiver operating from a 230 V. source. (Ballast inserted for 220 V. operation.)

CAUTION - The negative meter lead normally connected to the chassis must be connected to the low side of the volume control (electrical ground) in this receiver as in all AC/DC receivers.

MODEL 508

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

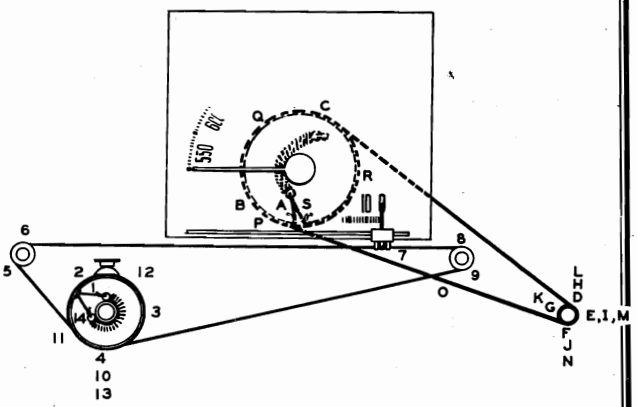


Alignment Points.

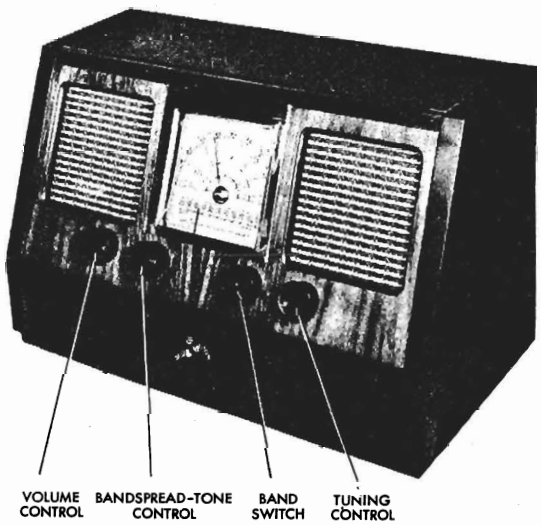
RESTRINGING DIAL CORD:

To restring the main tuning dial cord, cut a 25-inch length of 18 lb test dial cord and tie one end to the tension spring of the main tuning condenser drive pulley at position "A" on the diagram. Follow the letters "A" through "S", winding the cord on the pulley and drive shaft. At position "S", stretch the tension spring and tie the cord securely. With the tuning condenser at maximum capacity, set the pointer as shown in the diagram.

To restring the bandspread tuning dial cord, cut a 30-inch length of 18 lb test dial cord and follow the procedure outlined above, except follow the sequence starting at position "1" and ending at "14". With the pulley in the position shown (maximum clockwise), attach the pointer and index it at zero on the bandspread dial scale. Next loosen the pulley set screws and adjust the pulley shaft so that the signals on the 6.9 to 22 megacycle range follow the dial calibration on the general coverage dial. Reset the set screws with the bandspread pointer set at zero.



Dial Stringing Detail.



POWER SUPPLY:

CAUTION: This radio must be operated from a 105-125 V. or 210-250 V. 60 cycle AC supply or DC supply only. The ballast tube must be correctly inserted in its socket for the line voltage used. When operating from a 210-250 V. supply, the ballast tube must be correctly inserted in its socket for this line voltage ("230 V") to avoid damaging the receiver. If you are in doubt as to the voltage and frequency (AC) rating of the power supplied to your home, consult the local power company representative before connecting the radio to the wall outlet.

BAND SWITCH CONTROL:

The position of the band switch control determines the range of frequencies tuned by the receiver. In position 1 the receiver tunes the 550-1600 KC range. Note that a zero must be added to the dial reading to obtain the frequency of reception in kilocycles. In position 2 and 3 the receiver tunes the ranges 2.2-7.0 MC and 7-22 MC respectively. The frequency of reception for these bands is shown directly in megacycles on the dial scale.

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

MODEL 508

ALIGNMENT:

Output meter connections..... Across speaker voice coil (3 ohms)
Generator ground..... To "G" terminal on ant. terminal strip.
Generator output..... See chart.
Volume control..... Maximum volume.
Bandspread tuning..... At zero.

CAUTION - Check the line ballast. It must be corretly inserted in its socket to correspond to the line voltage of the power source.

ALIGNMENT CHART:

Step	Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Band Switch Pos.	Radio Dial Setting	Adjust	Remarks
1.	.01 mfd. cap.	To stator plates of tuning cond; mixer section	455 kc	1	1500 kc	1,2,3, and 4.	Adjust for max. output
2.	Std RMA dummy	To terminals "A" and "G" of antenna terminal strip	1500 kc	1	1500 kc	*11,6	Adjust for max. output
			600 kc	1	600 kc	*10	
3.	Std RMA dummy	See step 2.	22 mc	3	22 mc	*8	Set oscillator adjustment (8) with the bandspread indicator drive pulley set screw loosened and the pointer set at zero. After making the adjustment, tighten the set screw.
			20 mc	3	20 mc	5	Adjust for max. output.
4.	Std RMA dummy	See step 2.	6 mc	2	6 mc	*9,7	Adjust for max. output.

*Note - Calibration adjustment.
Note - Step 3 must be completed before making the adjustments shown in step 4.

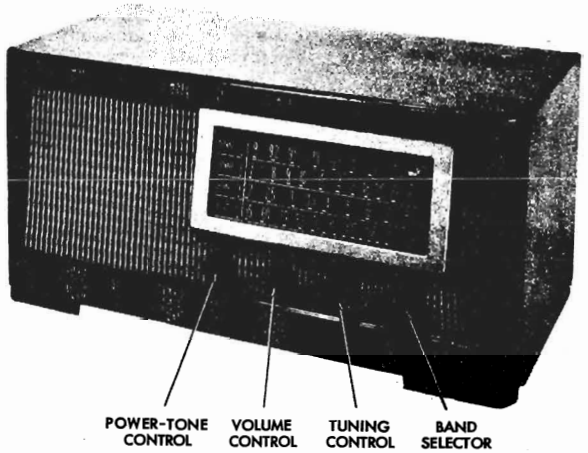
UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

MODEL 608



POWER SUPPLY:

This radio operates from a 105-125 volt or 210-250 volt, 50/60 cycle AC supply only. If you are in doubt as to the voltage and frequency rating of the power available at the outlets, consult the local power company. CAUTION: BEFORE PLUGGING THE POWER CORD INTO THE WALL OUTLET, CHECK TO SEE THAT THE LINE VOLTAGE SWITCH (SW2) IS SET FOR THE LINE VOLTAGE AVAILABLE. Refer to Fig. 5 for the location of this switch. The power receptacle provided for a record player supplies 110 V. AC regardless of the setting of the 110/220 V. switch on the receiver or the source to which the receiver has been connected.

ANTENNA:

A loop antenna has been installed inside the cabinet of the receiver and for reception of local and nearby stations no other additional antenna is usually required.

Metal structures concealed in walls, radiators, or other large metal objects near the receiver prevent best possible pickup of radio signals. Locate your receiver as far as possible from such objects.

For best results, especially at remote points from broadcast stations, an outside antenna about 25 to 100 feet long, including lead-in, may be necessary. The lead-in wire is connected to the terminal marked "A" located on the rear apron of the chassis. To avoid excessive electrical noise, erect the antenna so that its length runs at right angles to nearby power lines, streetcar lines, and other similar types of electrical apparatus. For some installations it will be found desirable to connect a ground wire between the "G" terminal and a suitable ground such as a water pipe or radiator.

LOCATION: Do not place the radio in a warm location, such as on a radiator or over a hot air register. When placing the radio against a wall, leave sufficient clearance for the circulation of air.

BAND SELECTOR - The band selector knob has five positions which perform the following functions in the order of its rotation from left to right.

Position 1 - Phono - When a record player is connected to the power and pick-up receptacle on the rear apron of the receiver, the receiver will operate as a phonograph. The volume and tone controls function as they do for radio reception.

Position 2 - BROADCAST Band - The receiver will tune the standard broadcast band in this position. The receiver frequency is read from the dial scale marked BROADCAST.

Positions 3, 4, 5 - SHORTWAVE Bands - The receiver tunes the shortwave ranges (A-2.2 to 7 mc), (B-7 to 22 mc), and (C-9 to 12 mc) on these last three positions and dial scales SHORTWAVE A,B, and C respectively are used to indicate the receiver frequency directly in megacycles.

CONDITIONS AFFECTING OPERATION

Though your radio may be functioning perfectly, there are circumstances under which prefect radio reception is not possible. These are not always subject to control by any presently known means. In general, the effect on reception is usually greatest when the radio is tuned to a weak station.

DAY AND NIGHT RECEPTION:

You will notice that you are able to receive several more stations during the night than during the day. This is a phenomenon due to the sun's effect on the ionosphere. It is not a peculiairty of your receiver.

FADING:

Fading will be encountered only on distant stations. It will be recognized by a gradual diminishing of volume, sometimes to a point where the signal is no longer heard, followed by a gradual return to normal volume. This happens without any change of the controls of the radio. It is often accompanied by distortion or "garbling" of the signal. By means of the automatic volume control in your receiver this effect is reduced considerably. In severe cases it will be necessary to tune to some other station.

STATIC:

Static, like fading, is not attributable to a defective receiver. It is caused by electrical disturbances in the atmosphere (lightning flashes will be heard as severe static) and the more sensitive the receiver the more static will be heard. It us usually most prevalent in the summer and during storm periods.

STATION INTERFERENCE:

Because of the limited number of channels to which broadcasting stations can be assigned it has been necessary to assign more than one station to a channel. This results in interference between the stations particularly if the desired station is not powerful or if it tends to fade. The interference will take the form of whistles or growls and in some cases the interfering station will actually be louder than the desired station. There is no remedy for this other than to tune to a different station at another point on the dial.

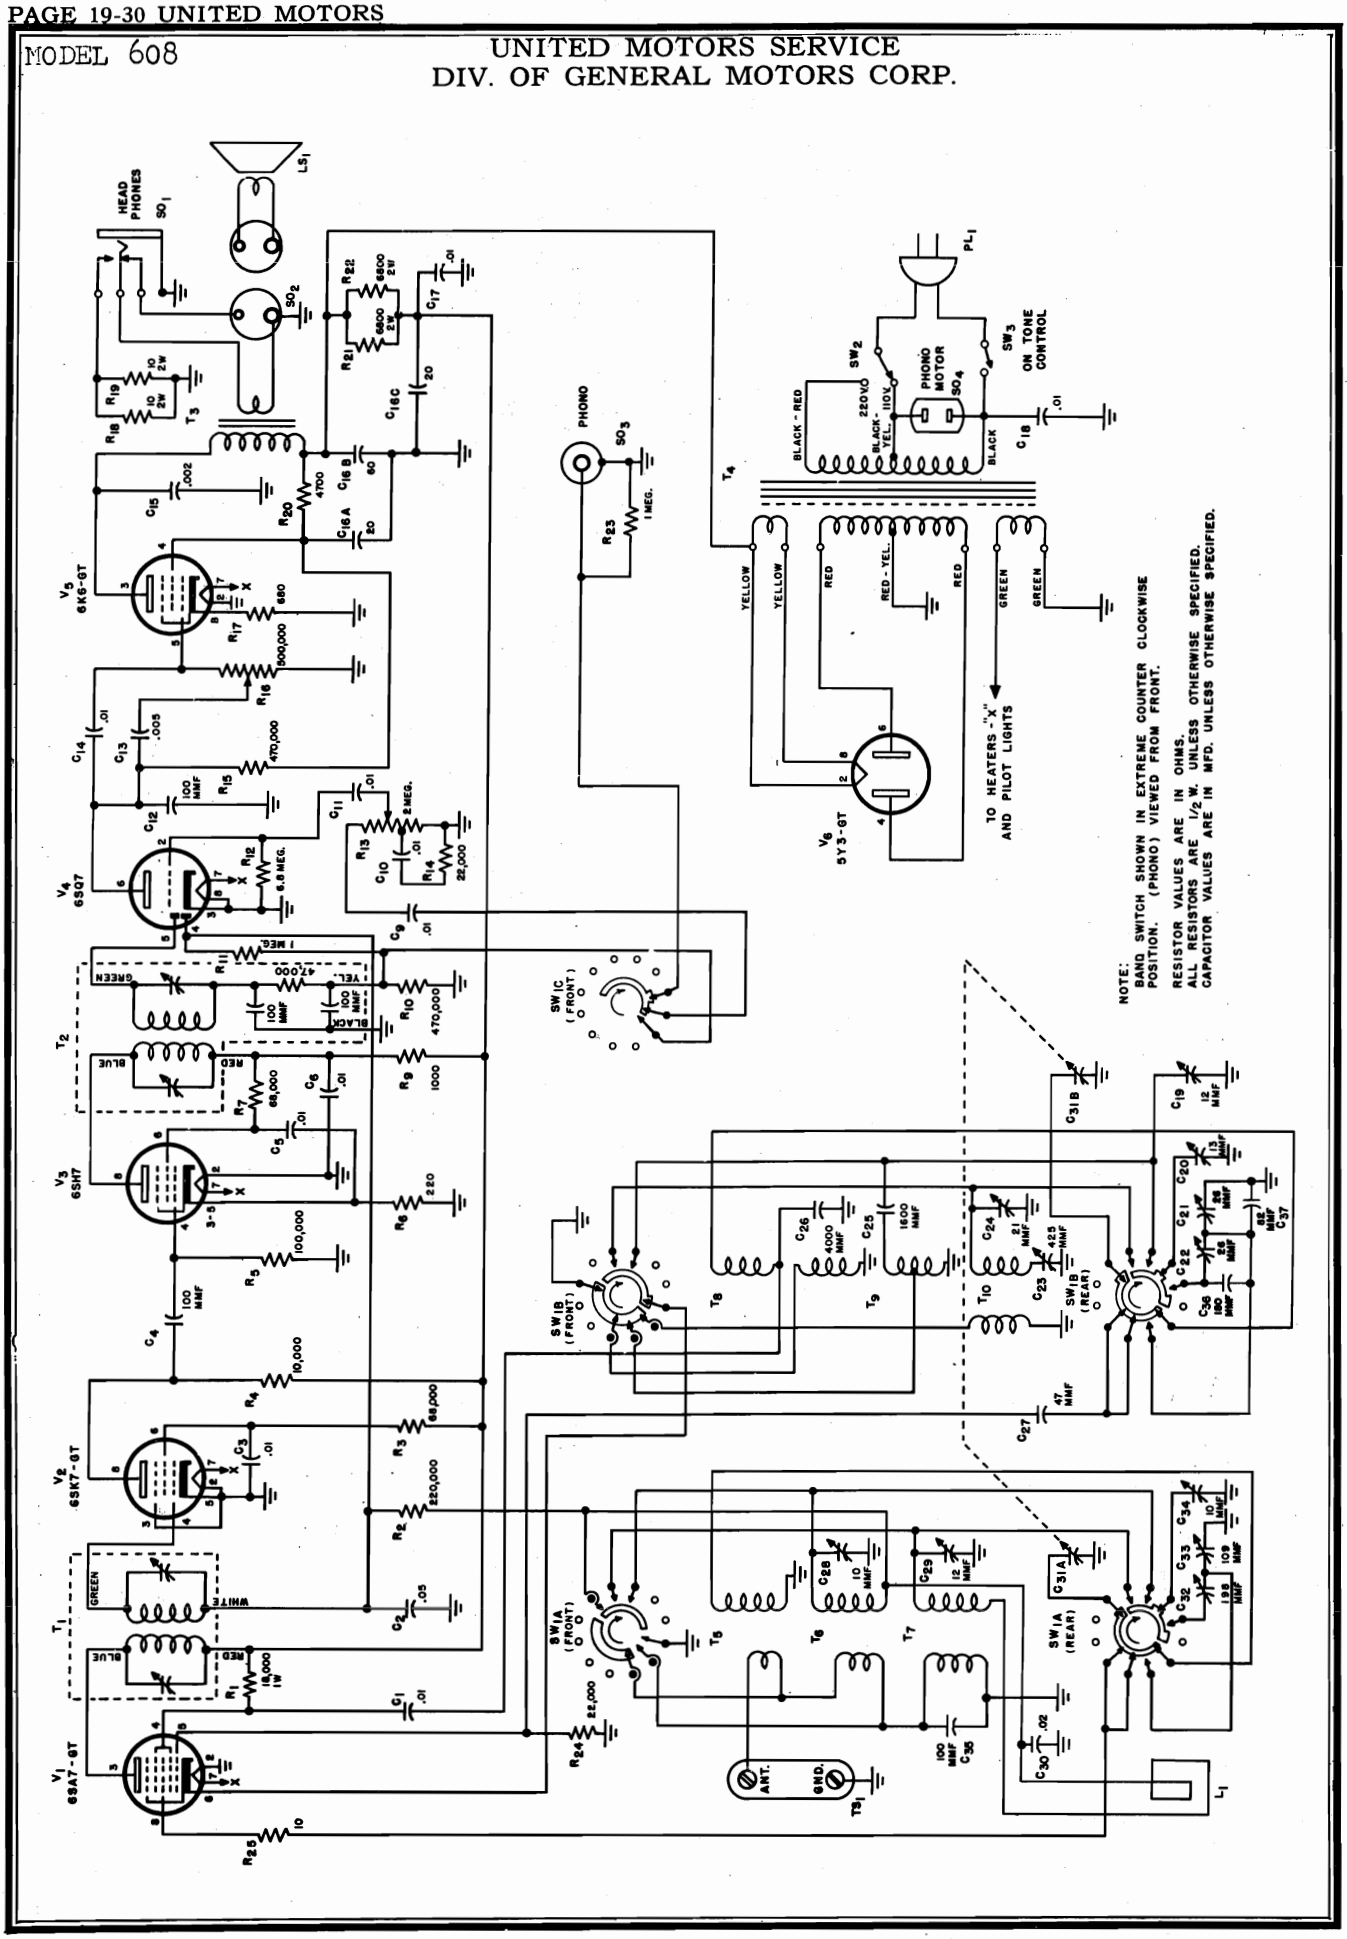
LOCAL INTERFERENCE:

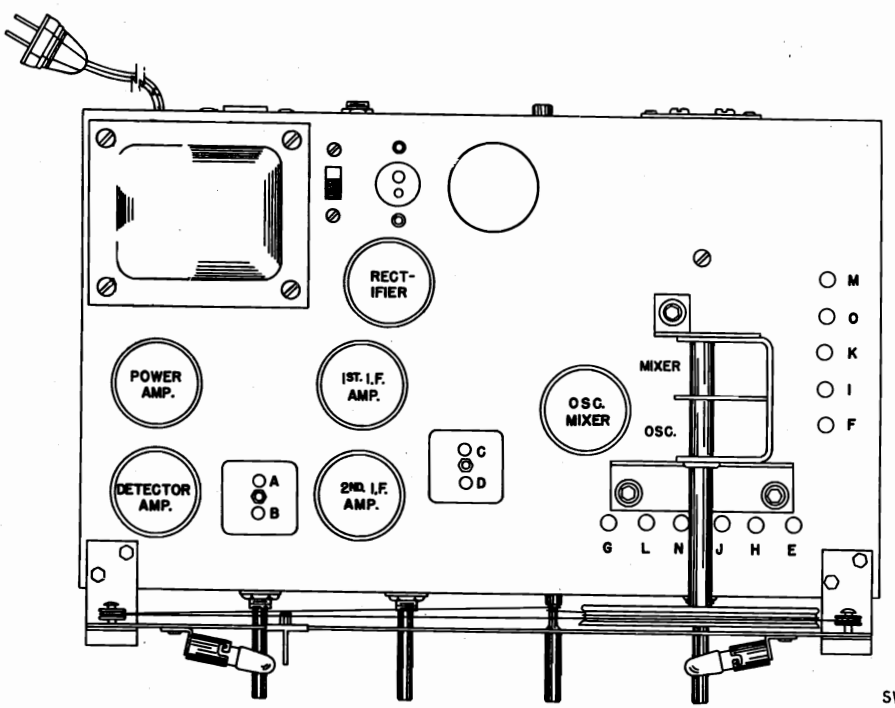
Interference caused by electrical apparatus is known as local or "man made" static. Though somewhat similar to static it can usually be distinguished by its regularity or by some peculiar tone. It is caused by arcing or leaking of current in industrial equipment, appliances, high tension power lines, automobile ignition systems, electric razors, etc. It is usually much more prevalent in cities or industrial areas although rural power lines are a common source.

Local interference can be controlled to some extent by proper filtering of appliances and equipment and to this end present day manufacturers of such equipment are contributing a great deal in improved designs. Power companies are also helpful and cooperative in seeking out and eliminating interference where their equipment is at fault.

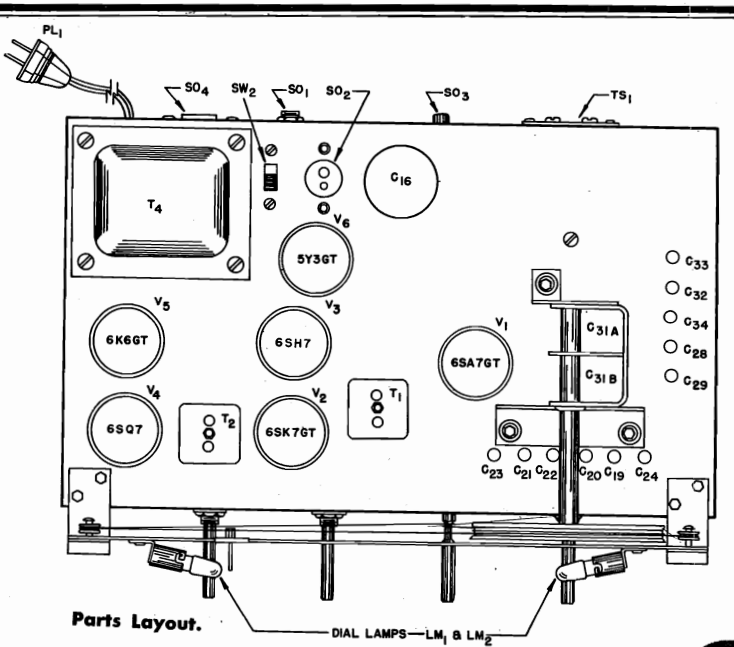
MODEL 608

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

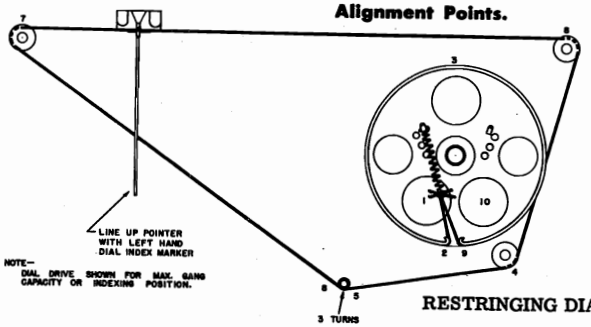




Alignment Points.

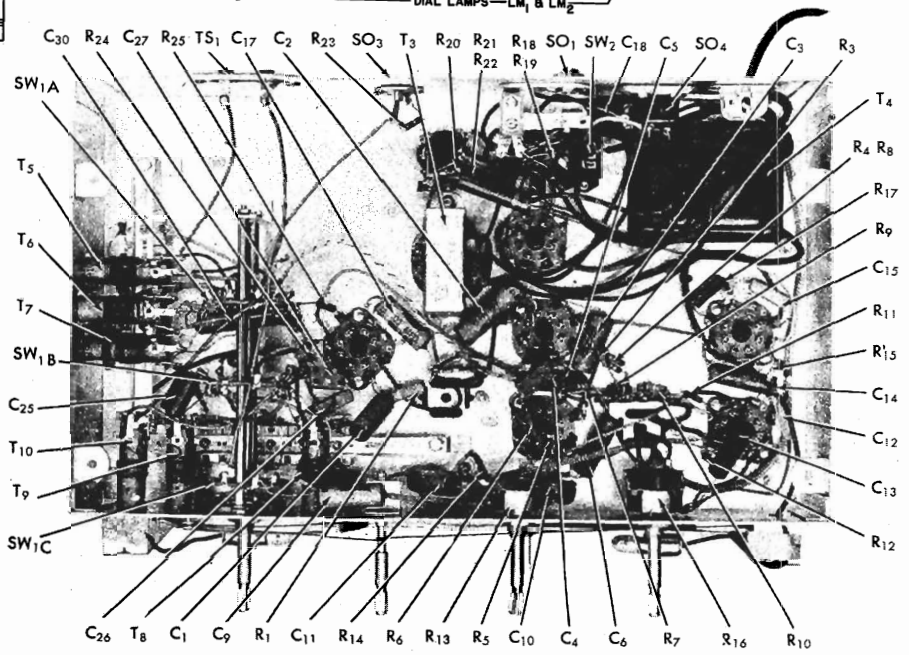


Parts Layout.



RESTRINGING DIAL CORD:

Restring the dial drive with 30 lb. test dial cord. Tie one end to the tension spring and follow the sequence outlined in Fig. 4. Stretch the tension spring and tie the end of the cord securely to the spring as shown. Set the tuning condenser at maximum capacity (closed), attach the pointer to the string and line it up with the left hand index mark on the dial scale.



Parts Layout.

MODEL 608

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

TUBES AND DIAL LAMP REPLACEMENT:

The types of tubes required and their relative position in the receiver are shown in Fig. 5. When installing a replacement tube, insert the center guide pin into the center hole of the tube socket. Rotate the tube until the key on the guide pin drops into the notch in the socket hole. Push down until the base of the tube rests firmly on the socket. To replace dial lamps it will be necessary to remove the chassis from the cabinet. Replace lamps with 6-8 V. Mazda #44 (Blue bead) or equivalent.

SOCKET VOLTAGES:

The voltages shown in the voltage chart were obtained with a 20,000 ohm per volt meter when operating the receiver from a 117-volt a-c source. All voltages are to be measured between the tube pin and chassis. Blanks are provided for your meter readings to establish an average set of readings for this receiver as measured with your test equipment. The normal power consumption for the receiver is 55 watts.

ALIGNMENT:

All connections and adjustments necessary for alignment are accessible from the top of the chassis. The output transformer is located on the under side of the chassis, hence, the output meter connection should be made at the speaker socket. Output voice coil impedance is 3 ohms.

Make all alignment adjustments at maximum volume and refer to the alignment chart for the dial and band switch settings.

The standard RMA dummy antenna specified in the alignment chart consists of a 200 mmf condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400-ohm carbon resistor.

CAUTION - The loop antenna must be connected during alignment.

ALIGNMENT CHART:

Step	Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Band Switch Setting	Receiver Dial Setting	Adjust
1	.01 mfd capacitor	Connect to rear section stator of tuning cap.	455 kc	BC	1000 kc	ABCD
2	Std RMA dummy	Connect to terminals "A" and "G" of antenna terminal strip TS_1.	1500 kc	BC	1500 kc	E*F

GENERAL

MOUNTING—All 1949 Buick Cars.

TUBES—Six, Plus Synchronous Vibrator.

SPEAKER—8" Round, Permanent Magnet.

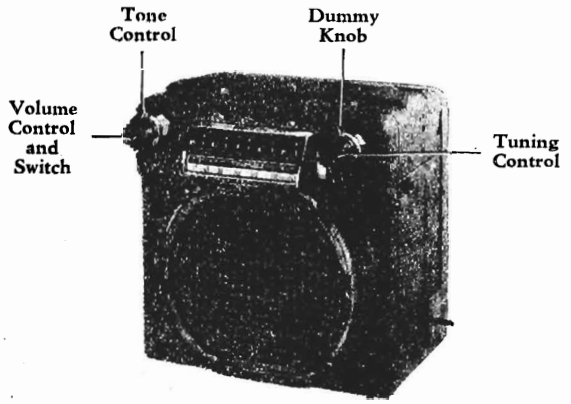
TUNING—Manual and 5 P. B. Mechanical.

ANTENNA TRIMMER COMPENSATION—For Antennas Between 0.000052 — 0.000068 Mfd.

TUNING RANGE—550-1600 KC.

PUSH BUTTON SETUP PROCEDURE

Pull Push Button to the left and out. Tune in desired station manually. Push button all the way in.



MODEL 980782

ALIGNMENT PROCEDURE

Output Meter Connections ..... Across Voice Coil
Generator Return ..... To Receiver Chassis
Dummy Antenna ..... In Series With Generator
Volume Control Position ..... Maximum Volume
Tone Control Position ..... Treble
Generator Output ..... Minimum for Readable Indication

Steps	Series Condenser or Dummy Antenna	Connect Signal Generator to	Signal Generator Frequency	Tune Receiver To	Adjust in Sequence For Max. Output
1	0.1 Mfd.	7Q7 Grid (Pin #6)	260 KC	High Frequency Stop	A, B, C, D
2	0.000056 Mfd.	Antenna Connector	1615 KC	High Frequency Stop	*E, F, G
3	0.000056 Mfd.	Antenna Connector	1400 KC	Signal Generator Signal	J, K
4	0.000056 Mfd.	Antenna Connector	1615 KC	High Frequency Stop	F, G
5	0.000056 Mfd.	Antenna Connector	1000 KC	Signal Generator Signal	L**

*Before making this adjustment check mechanical setting of oscillator core "H." The rear of the core should be 1 25/32" from the mounting end of the coil form. (This measurement is readily made by inserting a suitable plug in the mounting end of the coil form.) Core adjustments should be made with an insulated screw driver, and core studs should be cemented in place with glyptal or household cement after alignment.

**L is the pointer adjustment screw which is on the connecting link, between the pointer assembly and the parallel guide bar. It should be adjusted so that the dial pointer corresponds with the 1000 KC mark on the dial. (On first "0" of "100.")

With the radio installed and the car antenna plugged in adjust the antenna trimmer "G" for maximum volume with the radio tuned to a weak station near 1400 KC (see sticker on case).

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

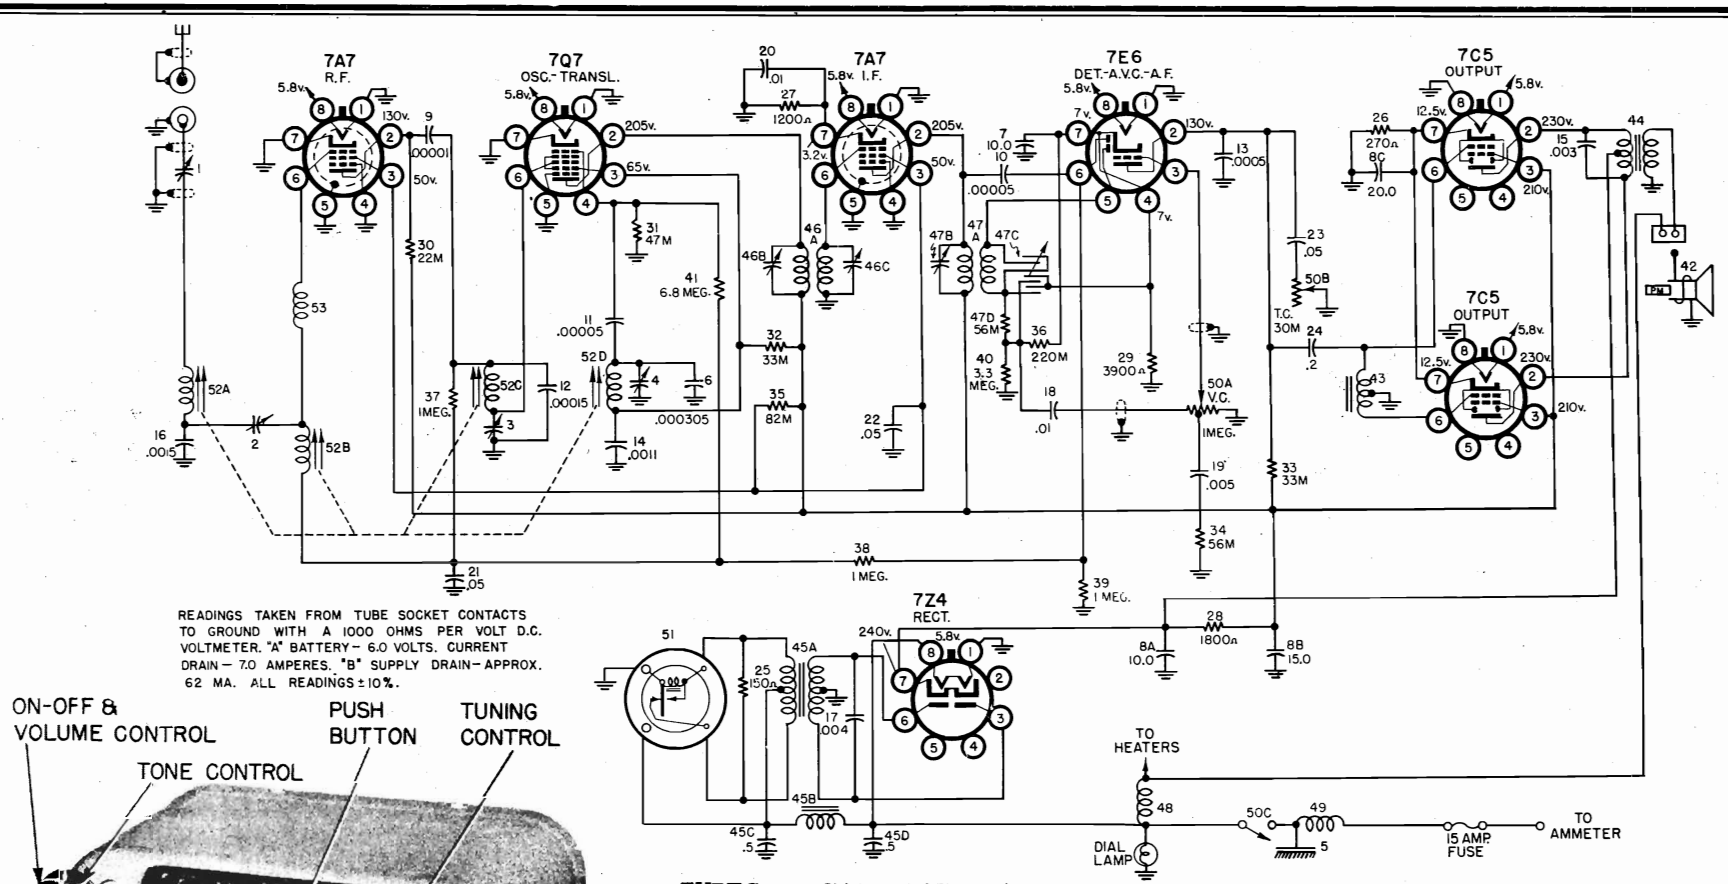
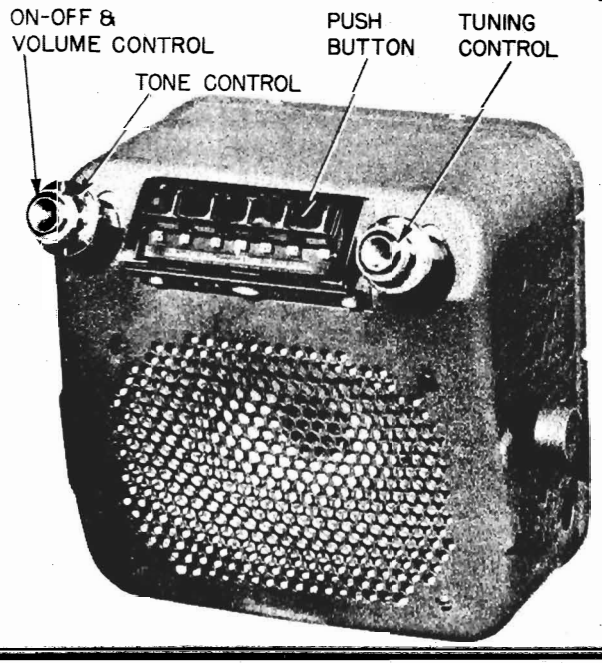
MODEL 98420, Early; Oldsmobile



READINGS TAKEN FROM TUBE SOCKET CONTACTS TO GROUND WITH A 1000 OHMS PER VOLT D.C. VOLTMETER. "A" BATTERY – 6.0 VOLTS. CURRENT DRAIN – 7.0 AMPERES. "B" SUPPLY DRAIN – APPROX. 62 MA. ALL READINGS ± 10%.



TUBES — 7A7, 7Q7, 7A7, 7E6, 7C5, 7C5, 7Z4

SPEAKER — 6" x 9" Elliptical Permanent-Dynamic

TUNING — Manual and 5 P. B.

TUNING RANGE — 535 KC 1610 KC

CAR ANTENNA CAPACITY — 70 mmfd.

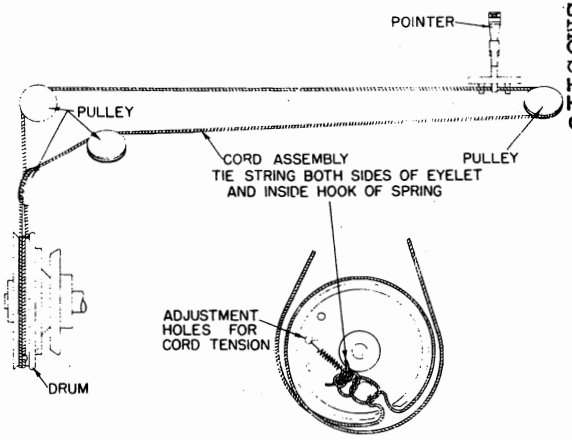
PUSH BUTTON SET-UP

Pull button slightly to the left and then out - tune in manually - depress selected button to set.

ALIGNMENT PROCEDURE

Volume Control maximum.
Tone Control on high position.
Signal Generator Output minimum for satisfactory output indication.

Series Capacitor Or Dummy Antenna	Connect To	Signal Generator Frequency	Adjust Screws In Order
0.1 mfd.	Terminal X (See Parts Layout)	257.5 KC	A, B, C, D
.000070 mfd.	Antenna Terminal	1610 KC	E, H, F, G



Low frequency alignment not required.
Adjust Trimmer "H" to match car antenna (1400 KC) when radio is installed.

MODEL 982421,
Oldsmobile

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

GENERAL

MOUNTING—All 1949 Oldsmobile Cars.

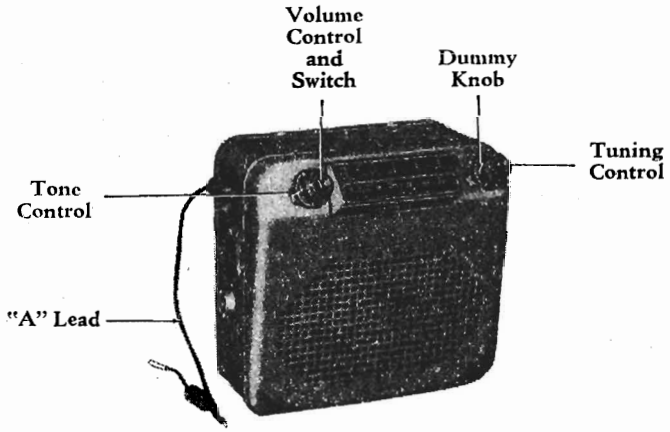
TUBES—Six, Plus Rectifier.

SPEAKER—6″x 9″ Elliptical Permanent Manget.

TUNING—Manual and 5 P. B. Mechanical.

ANTENNA TRIMMER COMPENSATION—For Antennas Between 0.000050 — 0.000070 Mfd.

TUNING RANGE—550 - 1600 KC.



MODEL 982421

PUSHBUTTON SET-UP

Pull pushbutton to the left and out. Tune in desired station manually. Push button all the way in.

ALIGNMENT PROCEDURE:

Output Meter Connections ..... Across Voice Coil
Generator Return ..... To Receiver Chassis
Dummy Antenna ..... In Series With Generator
Volume Control Position ..... Maximum Volume
Tone Control Position ..... Treble
Generator Output ..... Minimum for Readable Indication

Steps	Series Condenser or Dummy Antenna	Connect To	Signal Generator Frequency	Tune Receiver To	Adjust in Sequence For Max. Output
1	0.1 Mfd.	7Q7 Grid (Pin #6)	260 KC	High Frequency Stop	A ,B, C, D
2	0.1 Mfd.	7Q7 Grid (Pin #6)	1615 KC	High Frequency Stop	*E
3	0.000068 Mfd.	Antenna Connector	1615 KC	High Frequency Stop	F, G, H
4	0.000068 Mfd.	Antenna Connector	1400 KC	Signal Generator Signal	K, L, M
5	0.000068 Mfd.	Antenna Connector	1615 KC	High Frequency Stop	F, G, H
6	0.000068 Mfd.	Antenna Connector	1000 KC	Signal Generator Signal	**N

*Before making this adjustment check the mechanical setting of the oscillator core "J." The slotted end of core should be 1 21/32" from the mounting end of the coil form. (This measurement is readily made by inserting a suitable plug in the monting end of the coil form.) Core adjustments should be made with an insulated screwdriver and core studs should be cemented in place with glyptal or household cement after alignment.

**"N" is the pointer adjustment screw which is on the pointer connecting link (see tuner drawing) and should be adjusted so the pointer reads 1000 KC. (On first "0" of "100.")

With the radio installed and the car antenna plugged in adjust the antenna trimmer "H" for maximum volume with the radio tuned to a weak station near 1400 KC. (See sticker on case.)

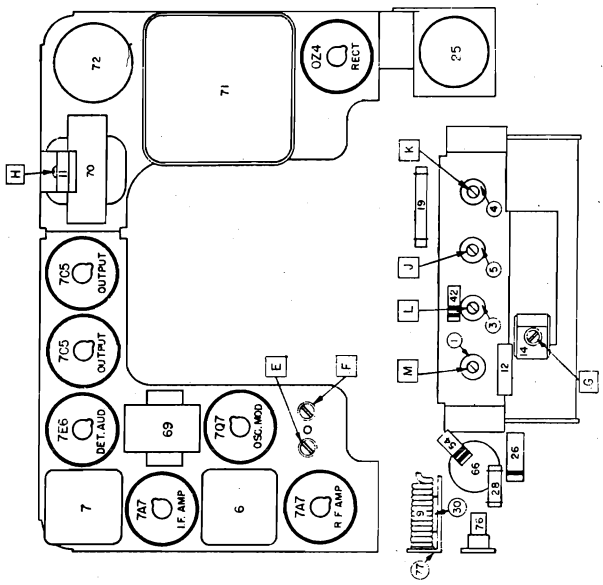
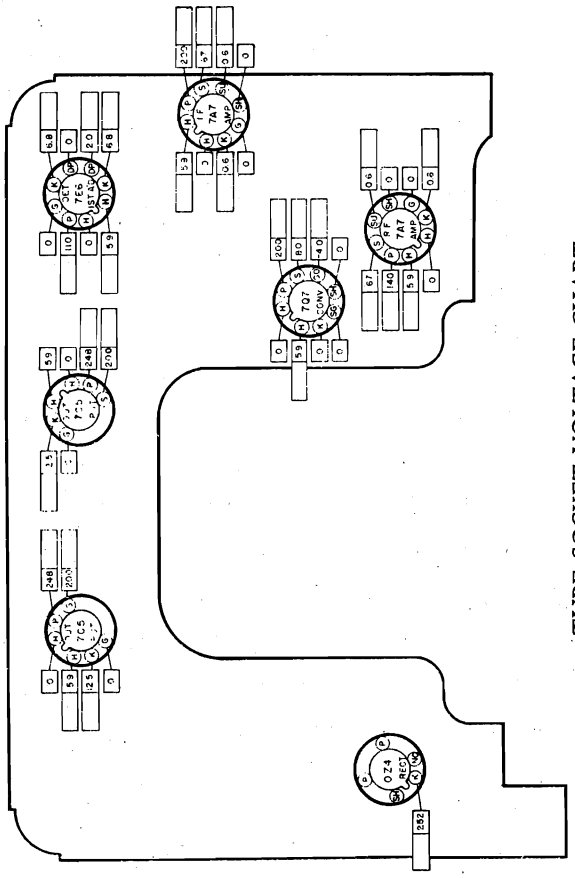
PARTS LAYOUT — CHASSIS VIEW



PARTS LAYOUT — TUBE VIEW

VOLTMETER RESISTANCE ..... OHMS PER VOLT. READING TAKEN WITH ..... VOLTS AT SPARK PLATE. THE VOLTAGES ARE MEASURED FROM TUBE SOCKET TERMINALS TO CHASSIS AND ARE POSITIVE UNLESS MARKED OTHERWISE.



TUBE SOCKET VOLTAGE CHART

The tube socket voltages as measured at the factory and under the conditions shown on the schematic diagram are shown here. The blank spaces are provided so the serviceman may fill in the actual readings as taken with his own equipment. A normal operating radio should be used for these measurements.

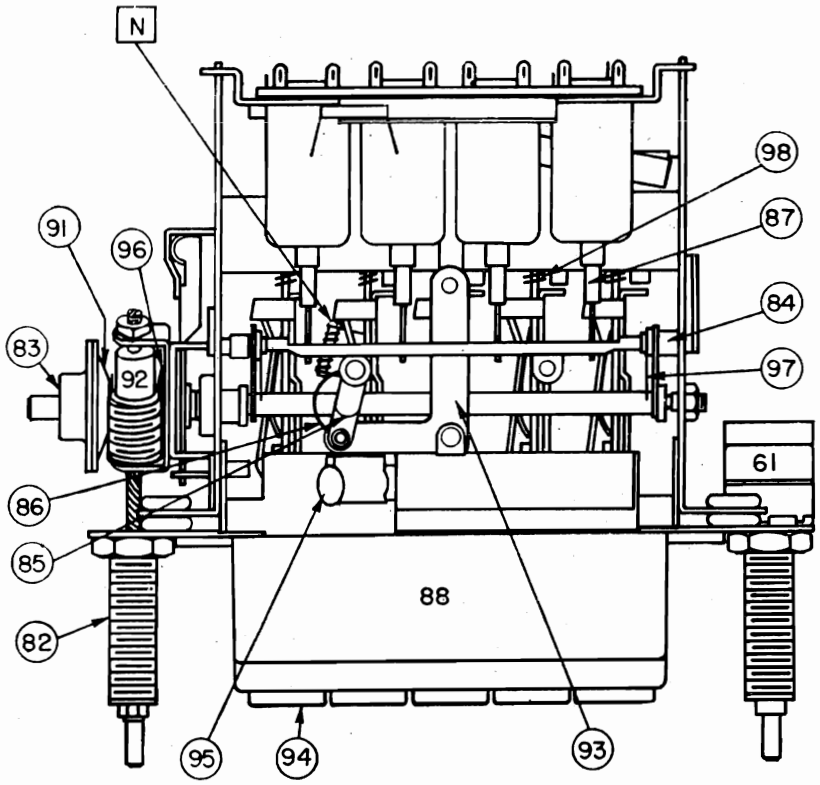
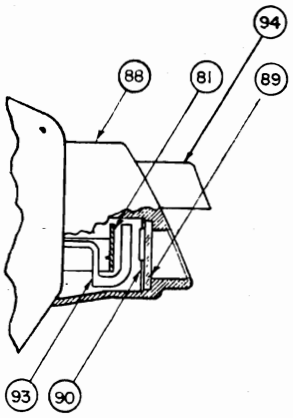
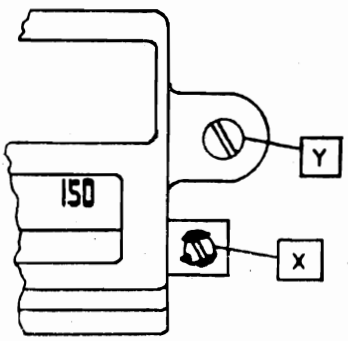
ESCUTCHEON MOUNTING



TUNER



ESCUTCHEON CROSS SECTION



ESCUTCHEON MOUNTING

SPECIAL INSTRUCTIONS

Unless special precautions are taken in removing the dial escutcheon, there is a possibility that the dial pointer tip will be broken. Therefore in removal of the escutcheon the following procedure is recommended.

1. Loosen but do not remove the two screws holding the pointer back plate ("X" in Escutcheon Mounting Drawing Above) and loosen the shellac so that the back plate is free to move.
2. Remove the escutcheon mounting screws "Y" (see Escutcheon Mounting).
3. Carefully lift off the escutcheon (DO NOT FORCE). If the dial backplate is free to move slightly downward the escutcheon will come off easily.

The same caution should be exercised when replacing the escutcheon.

MODEL 982454, Oldsmobile

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

GENERAL

MOUNTING—All 60 and 70 Series 1948 Oldsmobile Cars.

TUBES—Five, plus rectifier.

SPEAKER — 6"x 9" Elliptical, Permanent Magnet.

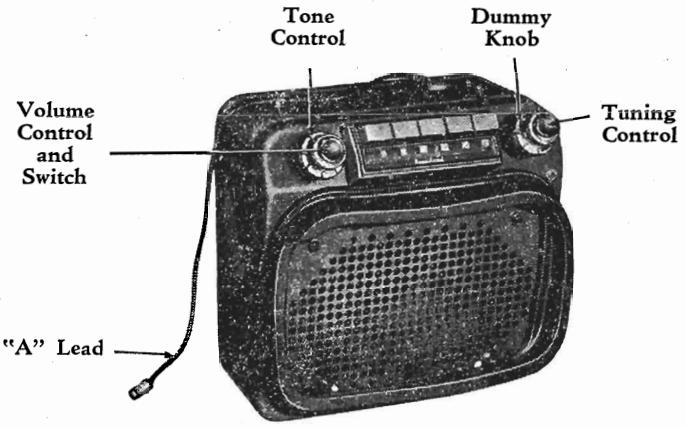
TUNING—Manual and 5 P. B. Mechanical.

ANTENNA TRIMMER COMPENSATION — For Antennas Beween 0.000060 — 0.000080 Mfd.

TUNING RANGE—550-1600 K.C.

PUSH BUTTON SETUP PROCEDURE

Pull Push Button to the left and out. Tune in desired station manually. Push button all the way in.



MODEL 982454

ALIGNMENT PROCEDURE

Output Meter Connections ..... Across Voice Coil
Generator Return ..... To Receiver Chassis
Dummy Antenna ..... In Series With Generator
Volume Control Position ..... Maximum Volume
Tone Control Position ..... Treble
Generator Output ..... Minimum for Readable Indication

Steps	Series Condenser or Dummy Antenna	Connect Signal Generator to	Signal Generator Frequency	Tune Receiver To	Adjust In Sequence For Max. Output
1	0.1 Mfd.	7Q7 Grid (Pin #6)	260 KC	High Frequency Stop	A B, C, D
2	0.000068 Mfd.	Antenna Connector	1615 KC	High Frequency Stop	*E, F, G
3	0.000068 Mfd.	Antenna Connector	600 KC	Signal Generator Signal	J, K
4	0.000068 Mfd.	Antenna Connector	1615 KC	High Frequency Stop	F, G
5	0.000068 Mfd.	Antenna Connector	600 KC	Signal Generator Signal	L**

*Before making this adjustment check mechanical setting of oscillator core "H." The rear of the core should be 1¾" from the mounting end of the coil form. (This measurement is readily made by inserting a suitable plug in the mounting end of the coil form.) Core adjustments should be made with an insulated screw driver, and core studs should be cemented in place with glyptal or household cement after alignment.

**L is the pointer adjustment screw which is on the connecting link, Illus. #88, between the pointer assembly and the parallel guide bar. It should be adjusted so that the dial pointer corresponds with the 600 KC mark on the dial. (Between the "6" and the "0".)

With the radio installed and the car antenna plugged in adjust the antenna trimmer "G" for maximum volume with the radio tuned to a weak station near 1400 KC (see sticker on case).

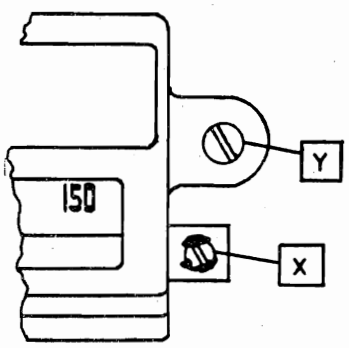
ESCUTCHEON CROSS SECTION



ESCUTCHEON MOUNTING

SPECIAL INSTRUCTIONS

Unless special precautions are taken in removing the dial escutcheon, there is a possibility that the dial pointer tip will be broken. Therefore in removal of the escutcheon the following procedure is recommended.

1. Loosen but do not remove the two screws holding the pointer back plate ("X" in Escutcheon Mounting Drawing Above) and loosen the shellac so that the back plate is free to move.
2. Remove the escutcheon mounting screws "Y" (see Escutcheon Mounting).
3. Carefully lift off the escutcheon (DO NOT FORCE). If the dial backplate is free to move slightly downward the escutcheon will come off easily.

The same caution should be exercised when replacing the escutcheon.

GENERAL

MOUNTING—All 1949 Pontiac Cars.

TUBES—Seven, Plus Rectifier.

SPEAKER—6″ x 9″ Elliptical, Permanent Magnet.

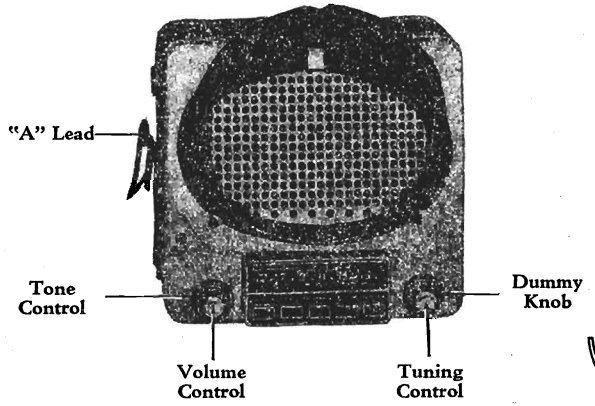
TUNING—Manual and 5 Push Button Mechanical.

ANTENNA TRIMMER COMPENSATION — For Antennas Between 0.000060 - 0.000090 Mfd.

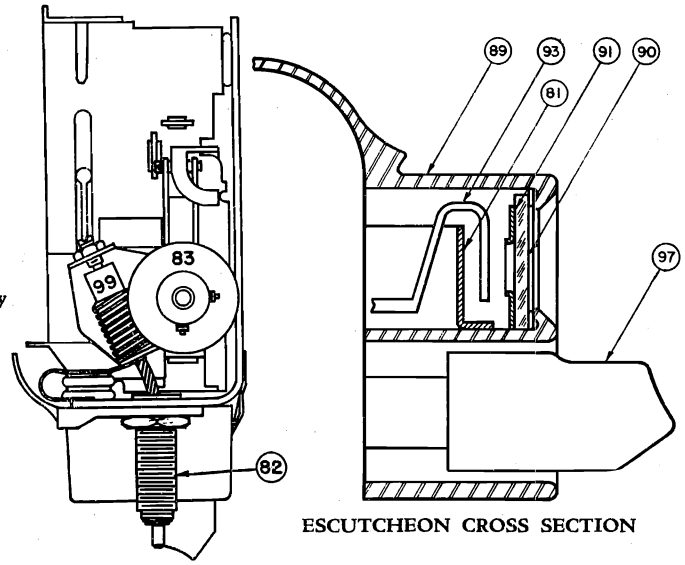
TUNING RANGE — 550-1600 KC.

PUSHBUTTON SET-UP

Pull button to the right and out. Tune in desired station manually. Push button in as far as it will go.



MODEL 984296



ESCUTCHEON CROSS SECTION

ALIGNMENT PROCEDURE

Output Meter Connections ..... Across Voice Coil

Generator Ground ..... Receiver Chassis

Dummy Antenna ..... In Series With Generator

Volume Control Position ..... Maximum Volume

Tone Control Position ..... Treble

Generator Output ..... Minimum for Readable Indication

Steps	Series Condenser or Dummy Antenna	Connect To	Signal Generator Frequency	Tune Receiver To	Adjust in Sequence for Max. Output
1	0.1 Mfd.	7Q7 Grid (Pin #6)	260 KC	High Freq. Stop	A, B, C, D
2	0.000068 Mfd.	Antenna Connector	1615 KC	High Freq. Stop	*E, F, G
3	0.000068 Mfd.	Antenna Connector	1000 KC	Signal Gen. Signal	J, K
4	0.000068 Mfd.	Antenna Connector	1615 KC	High Freq. Stop	F, G
5	0.000068 Mfd.	Antenna Connector	1000 KC	Signal Gen. Signal	L**

*Before making this adjustment check the mechanical setting of the oscillator core "H." The slotted end of the core should be 1 25/32" from the mounting end of the coil form. (This measurement is readily made by inserting a suitable plug in the mounting end of the coil form). Core adjustments are made from the mounting end of the coil form with an insulated screwdriver, and core studs should be sealed with glyptal or household cement after alignment.

**"L" is the pointer adjustment screw on the pointer connecting link (see tuner drawing). Adjust so pointer reads 1000 KC.

With the radio installed and the car antenna plugged in adjust antenna trimmer "G" (see sticker on case) for maximum volume with the radio tuned to a weak station near 1400 KC.

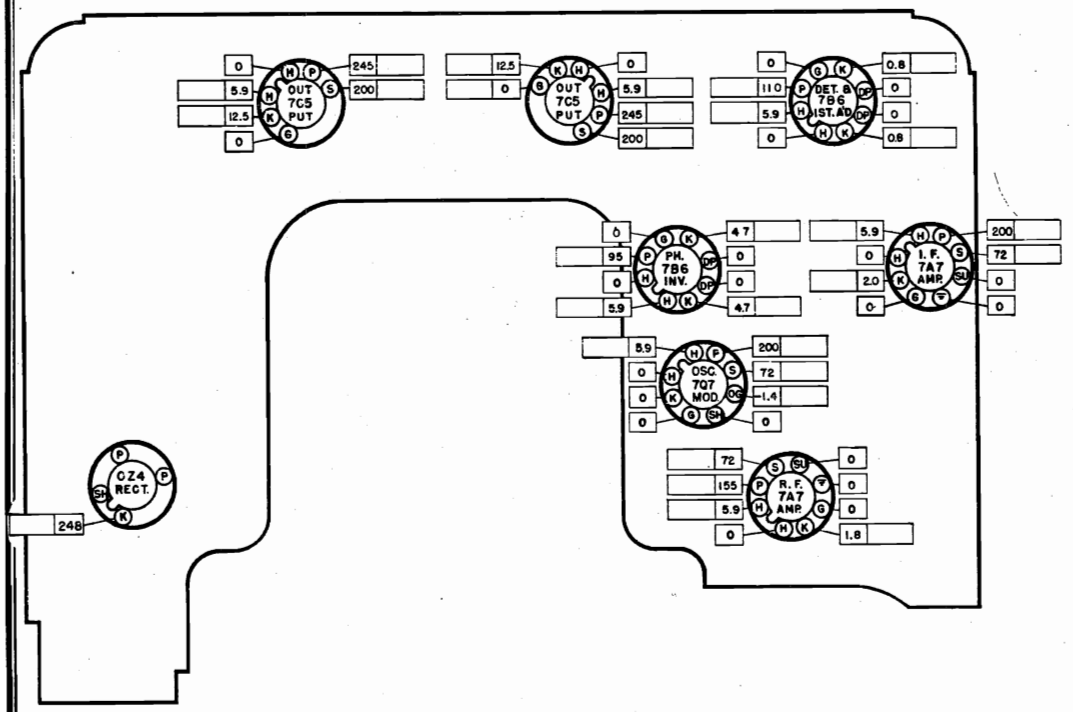
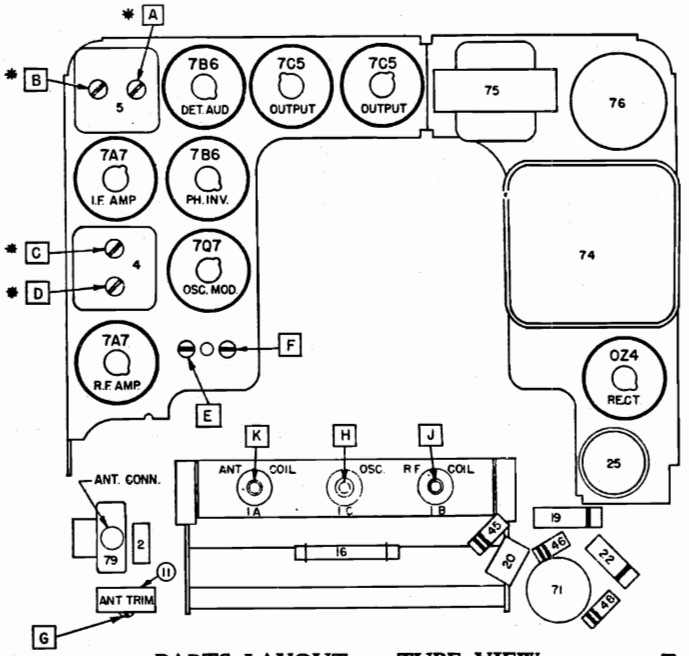
Pontiac

TUBE SOCKET VOLTAGE CHART

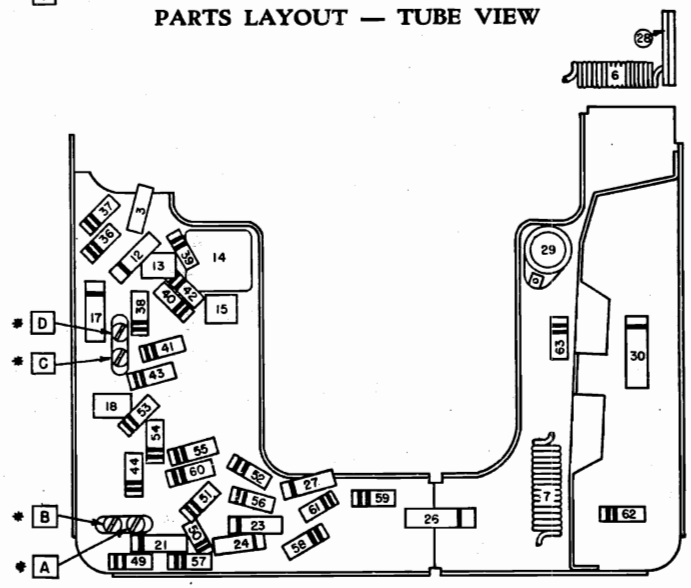


The tube socket voltages, as measured at the factory and under the conditions shown on the Schematic Diagram on Page 3, are shown above. The blank spaces are provided so the serviceman may fill in actual voltage readings as taken with his own equipment. A normal operating radio should be used for these measurements.

Voltmeter resistance is .....ohms per volt. Voltages taken with..... volts at the spark plate. Tolerance on voltages is ± 10%. All readings are taken from socket terminals to chassis.



PARTS LAYOUT — TUBE VIEW



PARTS LAYOUT — CHASSIS VIEW

*Radios with serial numbers starting with "6" have these trimmers on the PARTS side of chassis. Radios with serial numbers starting with "B" have these trimmers on TUBE side of chassis.

GENERAL

MOUNTING—All 1948 Pontiac Cars.

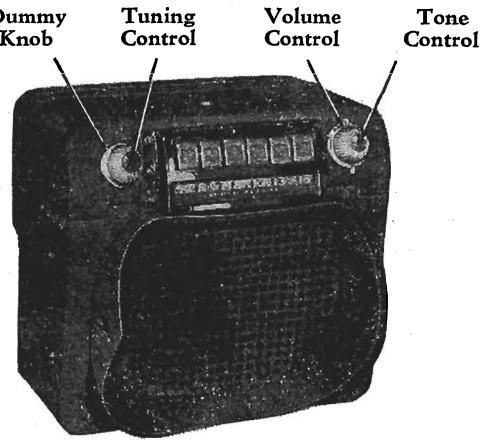
TUBES—Seven, Plus Rectifier.

SPEAKER—6" x 9" Elliptical, Permanent Magnet.

TUNING—Manual and 5 P. B. Solenoid Operated.

ANTENNA TRIMMER CONPENSATION — For Antennas Between 0.000060 - 0.000095 Mfd.

TUNING RANGE — 550-1600 KC.



MODEL 984249

PUSHBUTTON SET-UP

Pull button off. Push set up knob all the way in and release. Turn set up knob until desired station is tuned in. Replace button.

ALIGNMENT PROCEDURE

Output Meter Connections ..... Across Voice Coil

Generator Ground ..... Receiver Chassis

Dummy Antenna ..... In Series With Generator

Volume Control Position ..... Maximum Volume

Tone Control Position ..... Treble

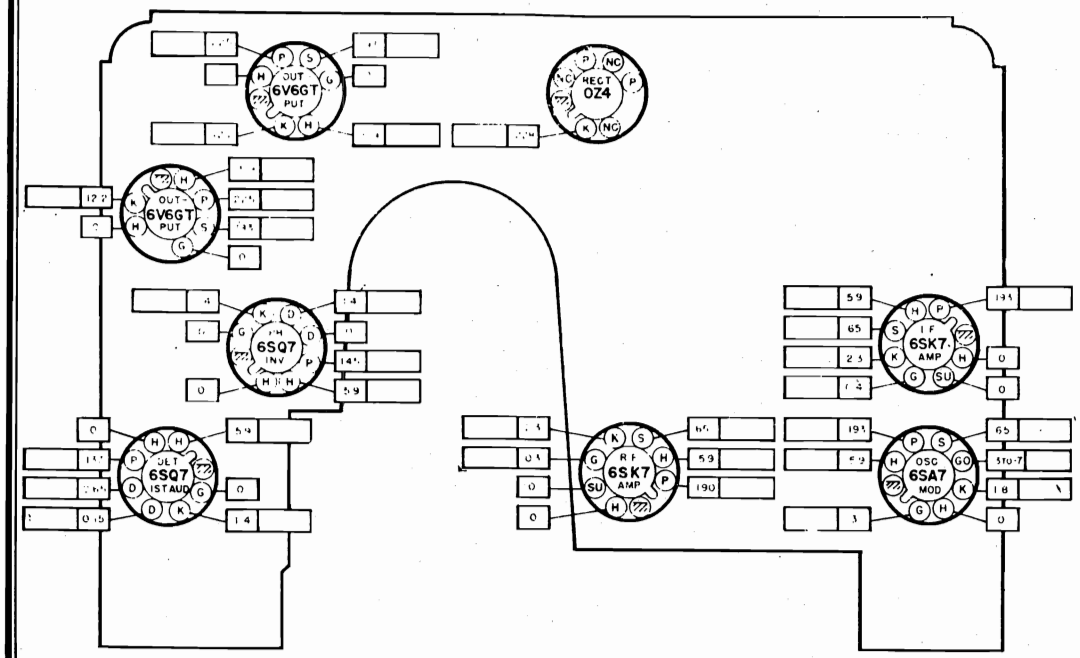
Generator Output ..... Minimum For Readable Indication

Steps	Dummy Antenna or Series Condenser	Connect To	Signal Generator Frequency	Tune Receiver To	Adjust In Order For Max. Output
1	0.1 Mfd.	6SA7 Grid (Pin #8)	260 KC	High Frequency Stop	A, B, C, D
2	0.000068 Mfd.	Antenna Connector	1615 KC	High Frequency Stop	*F, G
3	0.000068 Mfd.	Antenna Connector	1200 KC	Signal Generator Sig.	J, K
4	0.000068 Mfd.	Antenna Connector	1615 KC	High Frequency Stop	F, G

*Before making this adjustment check setting of oscillator core "H." This should be adjusted so that the end opposite the core stud is $1\frac{11}{32}$" from the terminal board end of the coil form. (This measurement is readily made by inserting a suitable plug in the coil form.)

With radio installed and the antenna plugged in adjust trimmer "G" for maximum volume with the radio tuned to a weak station near 1400 KC.

TUBE SOCKET VOLTAGE CHART



The tube socket voltages, as measured at the factory and under the conditions shown on the Schematic Diagram on Page 3, are shown above. The blank spaces are provided so the serviceman may fill in actual voltage readings as taken with his own equiqment. A normal operating radio should be used for these measurements.

Voltmeter resistance is ..... ohms per volt. Voltages taken with..... volts at the spark plate. Tolerance on voltages is ± 10%. All readings are taken from socket terminals to chassis.

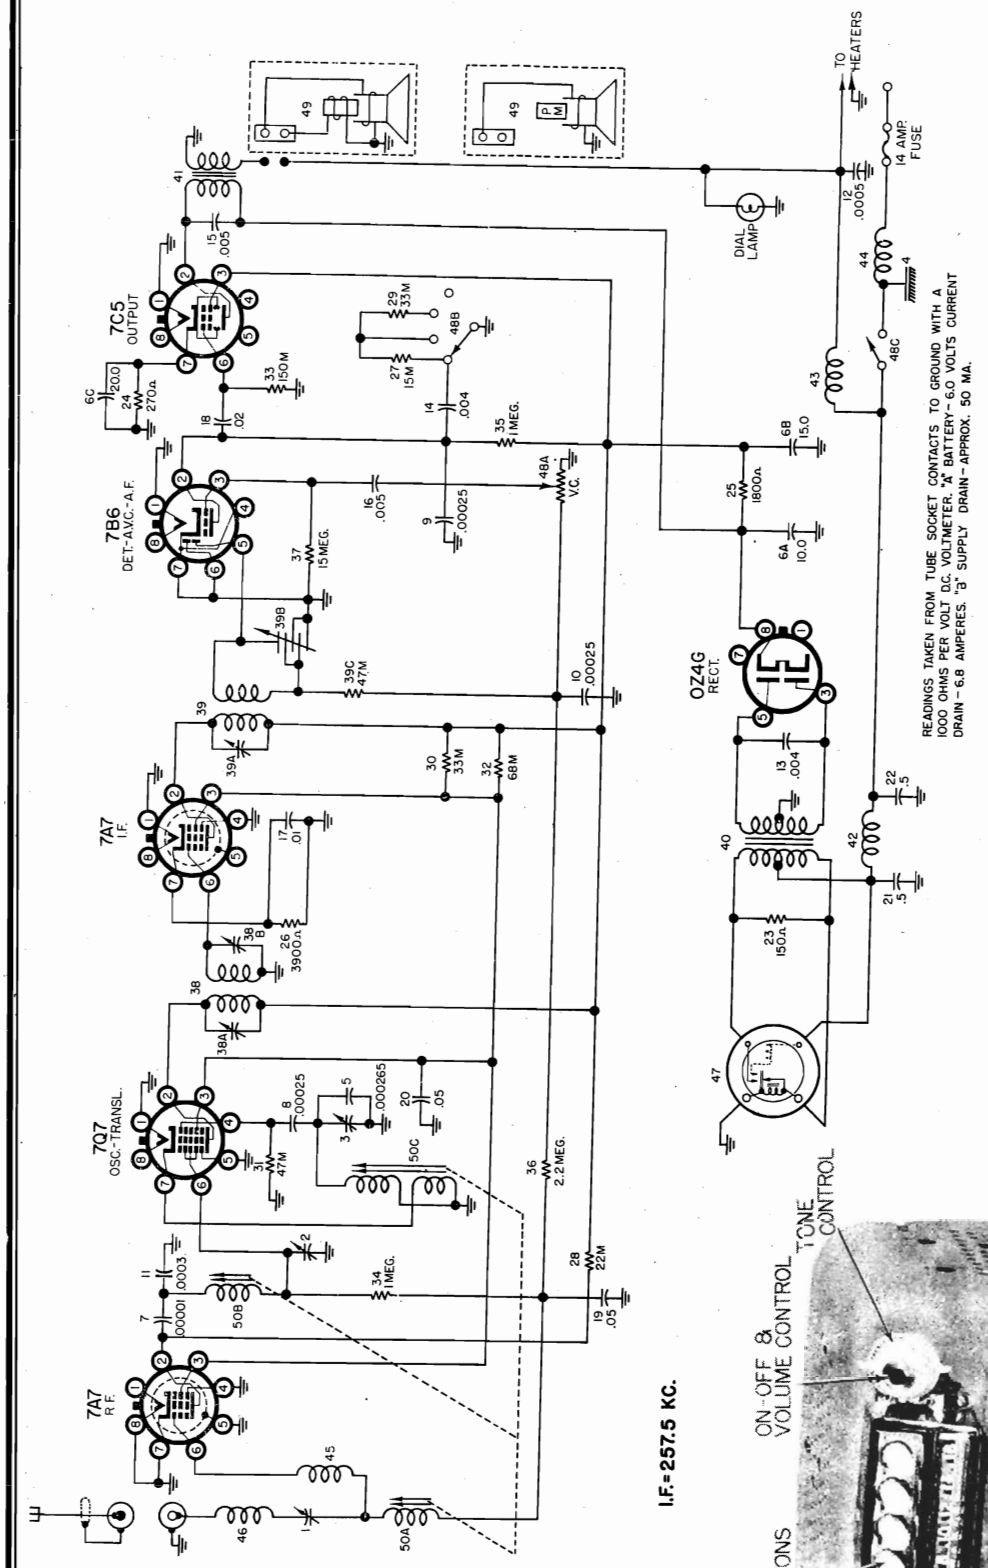
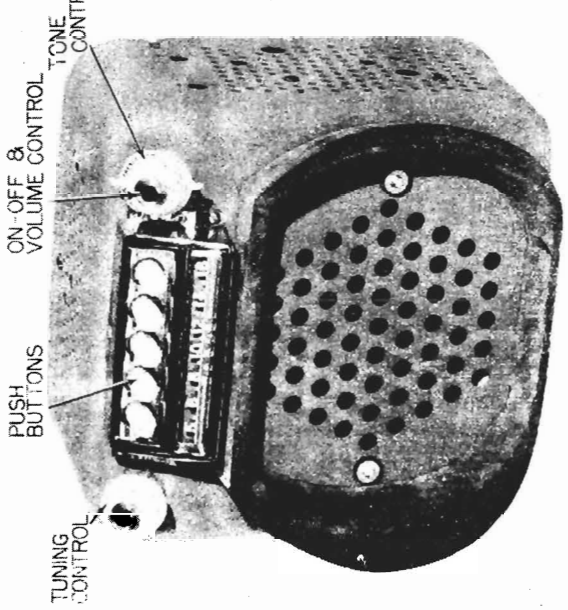
*Cars having a distributor with the center tower of the distributor cap 1⅝" high instead of ⅞" high have a built in distributor suppressor and should not have an external suppressor installed. These distributors are marked "Radio" on the lower flange.

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

MODEL 984273,
Pontiac





SPEAKER — 6" Electro-Dynamic

TUNING — Manual and 5 P. B.

TUNING RANGE — 535 KC — 1610 KC

CAR ANTENNA CAPACITY — 70 mmfd.

ALIGNMENT PROCEDURE

Volume Control maximum.
Tone Control on high position.
Signal Generator Output minimum for satisfactory output indication.

Series Capacitor Or Dummy Antenna	Connect To	Signal Generator Frequency	Adjust Screws In Order
0.1 mfd.	Terminal X (See Parts Layout)	257.5 KC	A, B, C, D
.000070 mfd.	Antenna Terminal	1610 KC	E, F, G

Low frequency alignment not required.
Adjust Trimmer G to match car antenna (1400 KC) when radio is installed.

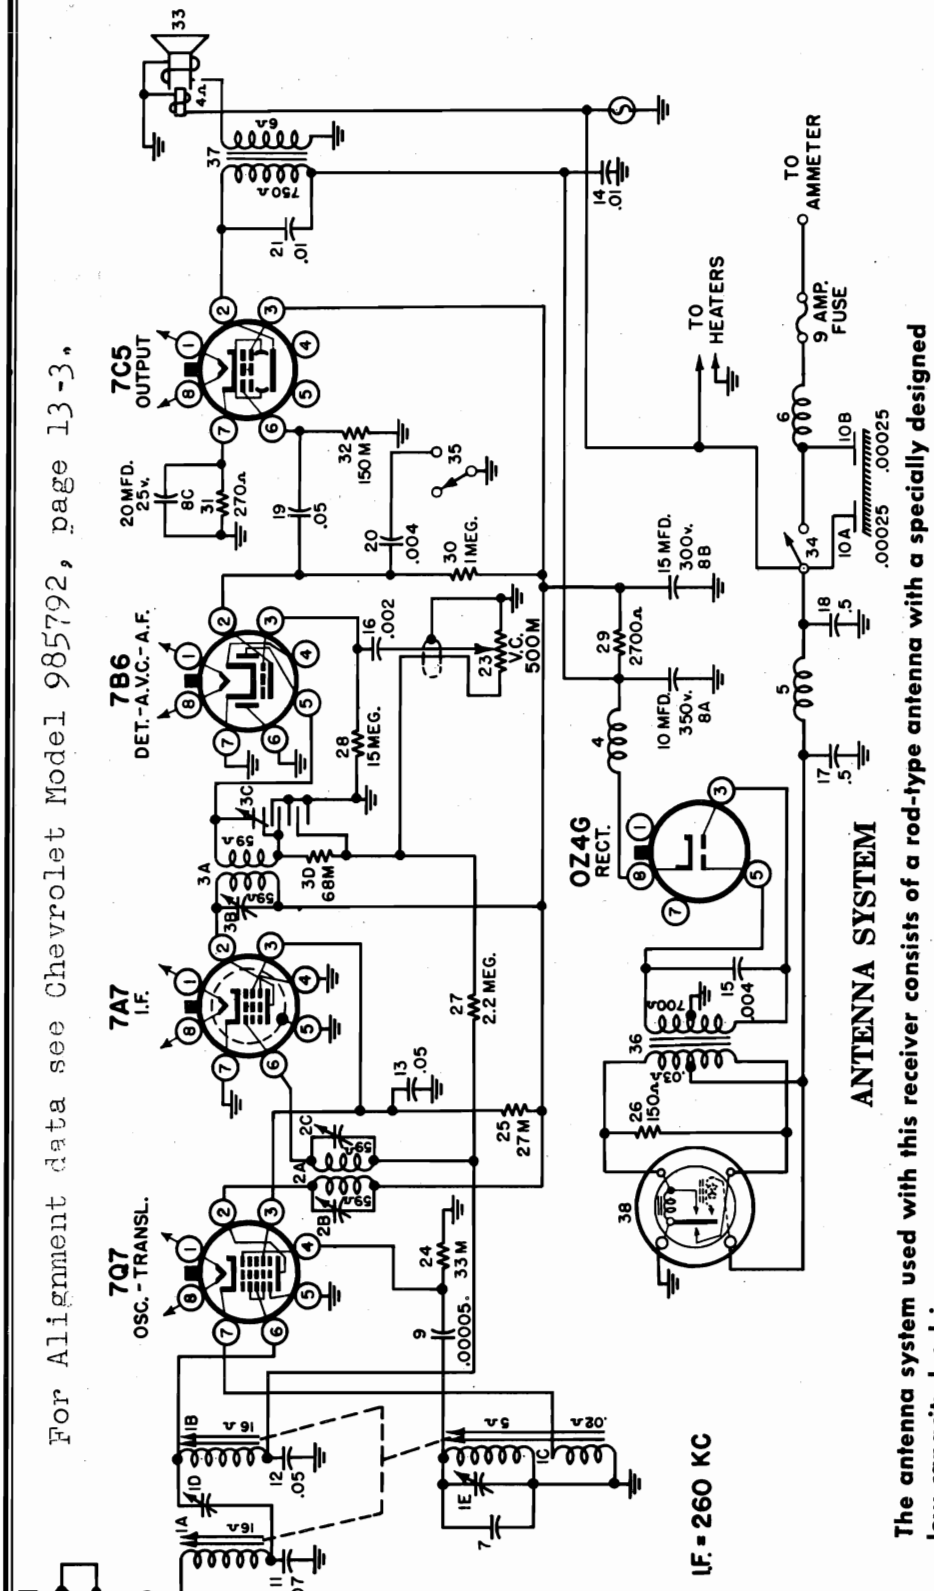
MODEL 986146, Serial B47-1001 and up; Chevrolet

UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.



The antenna system used with this receiver consists of a rod-type antenna with a specially designed low capacity lead-in.

TUBE COMPLEMENT

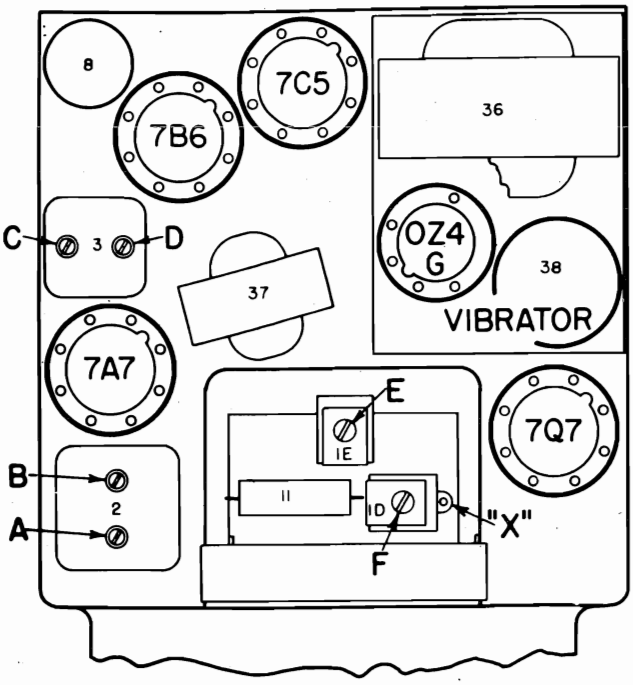
Type	Function	Type	Function
7Q7	Oscillator-Modulator	7C5	Audio Output
7A7	I.F. Amplifier	0Z4G	Rectifier
7B6	Detector A.V.C.-1st Audio		

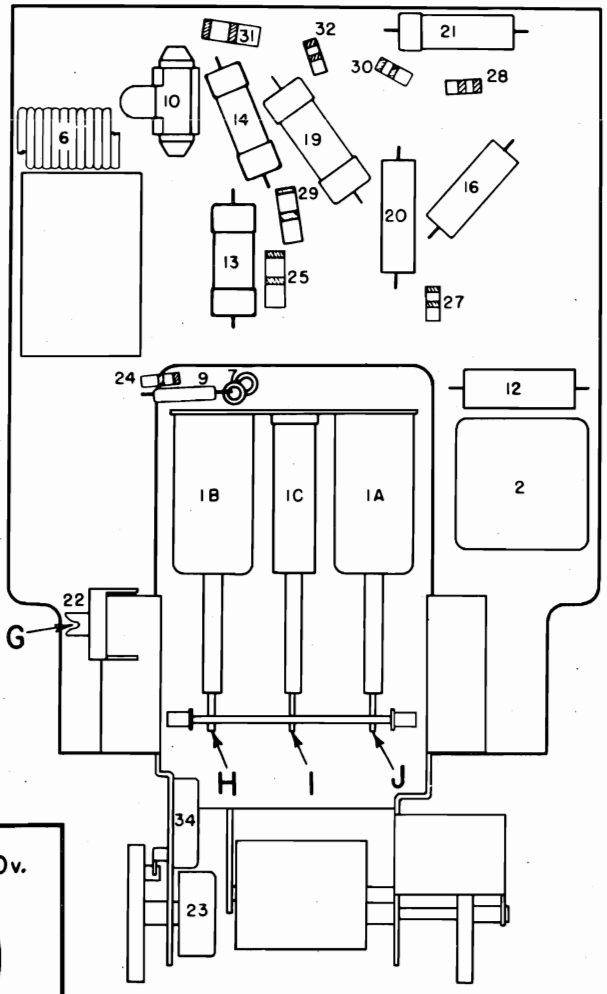
CIRCUIT DESCRIPTION

The circuit used in this receiver is the superheterodyne type, employing the permeability method of tuning. An adjustable condenser is provided for matching the antenna circuit to the antenna. This adjustment is made near the high frequency end of the band (1400 kilocycles).

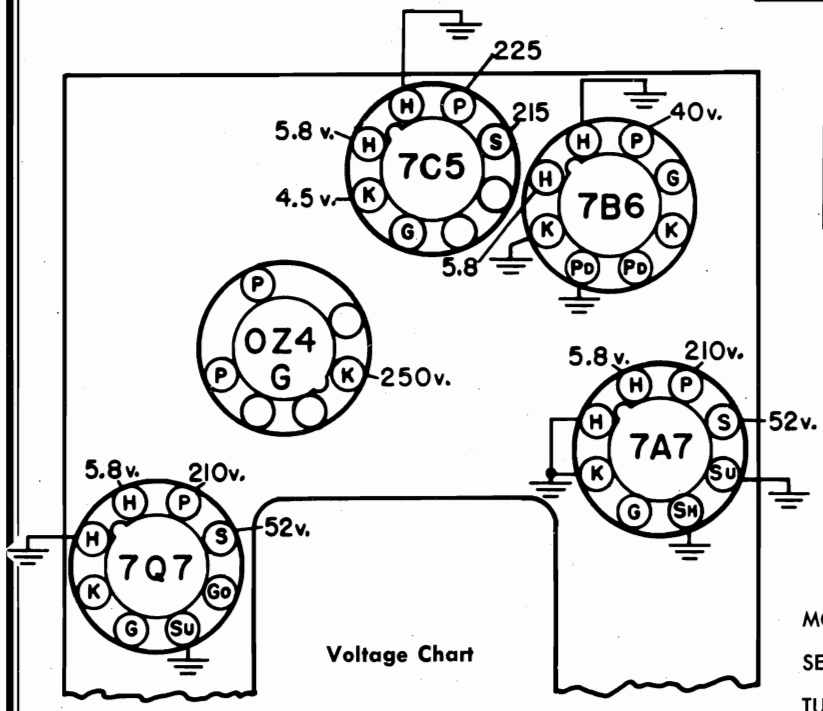
UNITED MOTORS SERVICE
DIV. OF GENERAL MOTORS CORP.

MODEL 986146, Serial B47-1001 and up; Chevrolet





Parts Layout



Voltage Chart

BOTTOM VIEW OF TUBE SOCKETS

READINGS TAKEN FROM TUBE SOCKET CONTACTS TO GROUND WITH A D.C. VOLTMETER HAVING A RESISTANCE OF 1000 OHMS PER VOLT. ALL VOLTAGES EXCEPT THE HEATER VOLTAGES MEASURED ON THE 0-250 VOLT SCALE.
"A" BATTERY 6.0 VOLTS. CURRENT DRAIN 6.2 AMPERES.
"B" SUPPLY DRAIN APPROXIMATELY 45 MA.

DIV. OF GENERAL MOTORS CORP.

MODEL 7258155,
Cadillac

ALIGNMENT PROCEDURE:

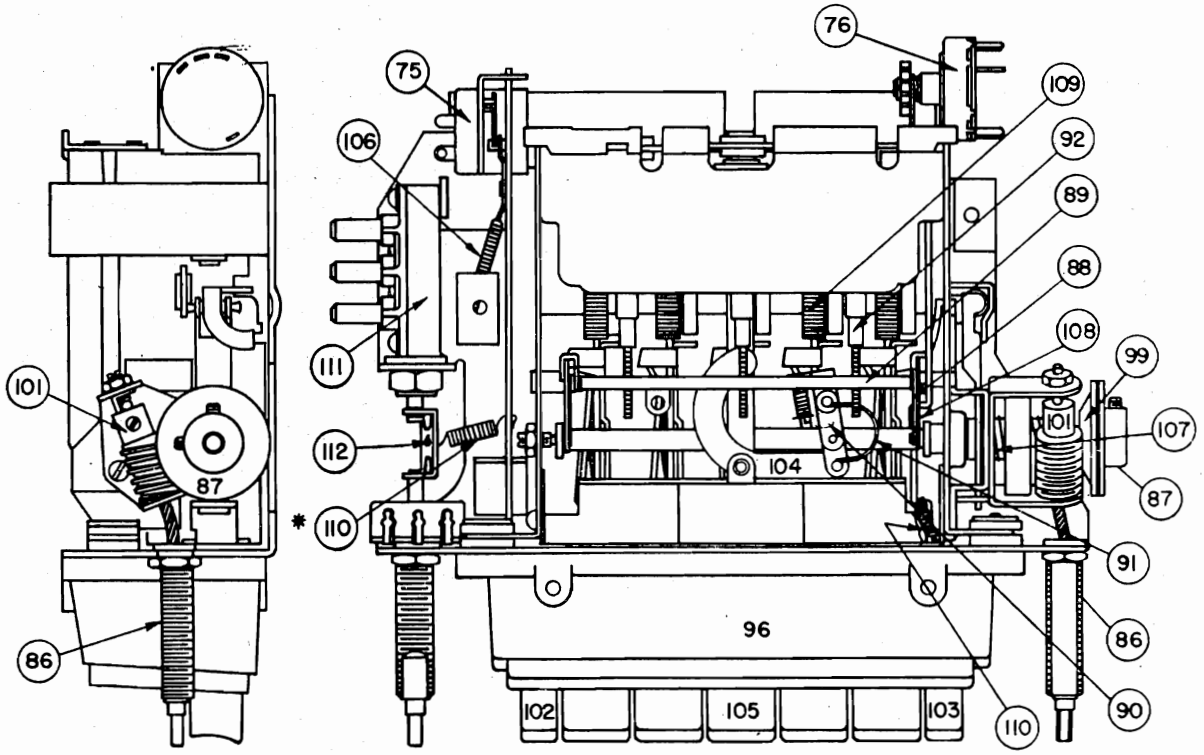
Output Meter Connection ..... Across Voice Coil
Signal Generator Return ..... To Chassis
Dummy Antenna ..... In Series With Generator
Volume Control ..... Maximum Volume
Tone Control ..... Treble
Generator Output ..... Minimum for Readable Indication

Steps	Series Condenser or Dummy Antenna	Connect To	Signal Generator Frequency	Tune Receiver To	Adjust in Sequence for Max. Output
1	0.1 Mfd.	6SA7 Grid (Pin #8)	260 KC	High Freq. Stop	A, B, C, D
2	0.000068 Mfd.	Antenna Connector	1615 KC	High Freq. Stop	*E, F, G
3	0.000068 Mfd.	Antenna Connector	1430 KC	Signal Gen. Signal	J, K
4	0.000068 Mfd.	Antenna Connector	1615 KC	High Freq. Stop	F, G
5	0.000068 Mfd.	Antenna Connector	1000 KC	Signal Gen. Signal	L**

*Before making this adjustment check the mechanical setting of the oscillator core "H." The slotted end of the core should be 1 25/32" from the mounting end of the coil form. (This measurement is readily made by inserting a suitable plug in the mounting end of the coil form). Core adjustments are made from the mounting end of the coil form with an insulated screwdriver, and core studs should be sealed with glyptal or household cement after alignment.

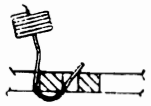
**"L" is the pointer adjustment screw on the pointer connecting link (See tuner drawing). Adjust so pointer reads 1000 KC (on the "10" calibration mark).

With the radio installed and the car antenna plugged in adjust antenna trimmer "G" (See sticker on case) for maximum volume with the radio tuned to a weak station near 1400 KC.

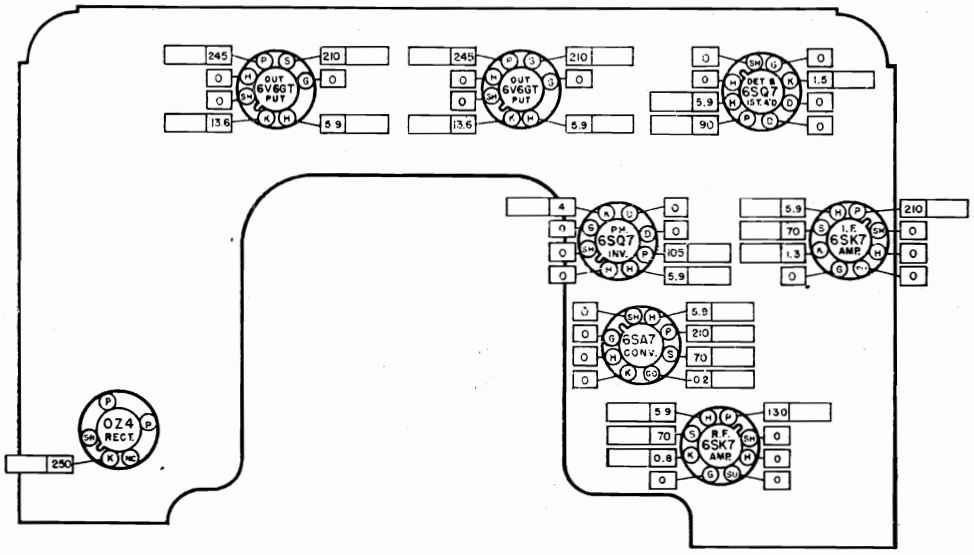


TUNER

*When installing this spring be sure it is fastened through the holes in the Vacuum Valve Yoke and the "On-Off" Button and Plunger as shown.



TUBE SOCKET VOLTAGE CHART



The tube socket voltages, as measured at the factory and under the conditions shown on the schematic diagram, are shown above. The blank spaces are provided so that the serviceman may fill in actual voltage readings as taken with his own equipment. A normal operating radio should be used for these measurements.

Voltmeter resistance..... Ohms Per Volt.

Readings taken with.....Volts At Spark Plate.

All voltages measured from socket terminals to chassis.

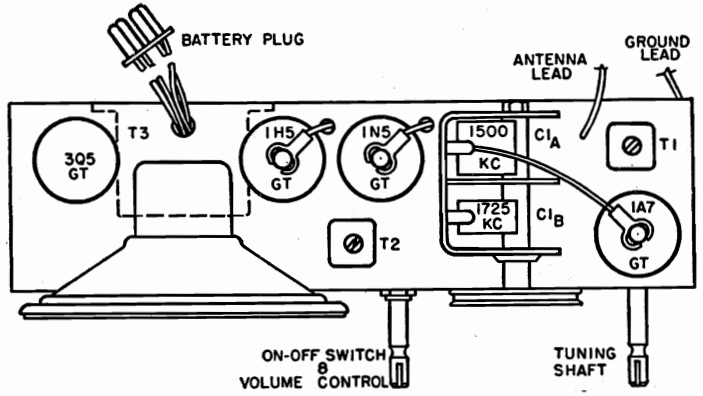
This receiver has been designed to operate on a self-contained battery containing both the "B" battery (90 Volts) and the "A" battery (1½ Volts) such as General #60B6L.

The battery cable coming from the receiver has been made long enough so that it may be used with larger batteries placed outside of the cabinet. Any-one of the following batteries can be used with this receiver when they are placed on the outside of the cabinet: Eveready No. 748, General No. 60DL-11 L, Burgess No. 17G-D60, Ray-O-Vac No. AB 82.



This model is a 4-Tube Superhetrodyne radio receiver designed to cover a frequency range of from 540 kilocycles to 1725 kilocycles (K.C.). The tubes used are —

1A7 GT—Osc. Converter
1N5 GT—I. F. Amplifier
1H5 GT—AVC Det. Audio Amplifier
3Q5 GT—Power Output

ALIGNMENT PROCEDURE

With an output meter connected across the voice coil of the speaker, the output meter reading for 50 milliwatts is .4 volts using a signal which is modulated 30% at 400 c.p.s. Follow through the procedure as outlined below for proper alignment.

Connect the signal generator to the grid cap of the IA7 GT Tube through a .1 MFD. Condenser. Connect the ground lead of the generator to the chassis. Adjust the signal generator to 455 K.C. and set the variable condenser of the receiver to minimum capacity (fully opened). With the volume control full on and minimum output from the signal generator adjust the two trimmers on the first and second I.F. transformers for maximum output.

Now connect the signal generator to the antenna connection of the receiver through a .00025 condenser. Adjust the signal generator frequency to 1725 K.C. and set the variable condenser to minimum capacity (fully opened), and adjust the oscillator trimmer (C1B) for maximum output. Set signal generator to 1500 K.C. and tune receiver to signal. Adjust the antenna trimmer (C1A) on the variable condenser for maximum output.

	A76-49	Terminal, for "B" battery

(See schematic diagram.)

ALIGNMENT PROCEDURE

The following alignment procedure is for use only by competent servicemen having the proper equipment.

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, to prevent A.V.C. action from interfering with correct alignment.

With the output meter connected across the voice coil of the speaker; the output meter reading for 50 milliwatts is .4 volts using a signal which is modulated 400 c.p.s.

Adjust all trimmers for maximum output. Repeat alignment procedure given below as a final check.

For alignment points refer to Figure No. 1.

CAUTION: This is an A.C.-D.C. receiver and if alignment is made with the receiver connected to 117 volts A.C. or D.C., it is necessary to isolate the signal generator or the receiver from the line by use of a transformer, or place a .2 M.F.D. condenser in both test leads of the Signal Generator.

1R5—Mixer, Oscillator
1U4—I.F. Amplifier
1S5—Detector and 1st Audio

6AQ5	Power Output
5Y3	Power Rectifier
No. 47	Pilot Lights (2)

SERVICE NOTES

INSTALLATION

This receiver is shipped from the factory complete with a built-in loop antenna for standard AM broadcast reception. A power-line antenna is used for the reception of FM stations. These antennas will be satisfactory for good reception under normal conditions. Terminals are provided at the back of the radio for connecting external AM and FM antennas, wherever this is found to be desirable as explained below.

When the receiver is to be used under difficult conditions, such as in buildings constructed mainly of steel, or those with steel lath, or, when large buildings, mountains or other objects are between the receiver and the station to be received, it may be necessary to use an external dipole antenna. Remember too, FM reception is limited as to distance and when used outside the primary service area of the transmitter, an outside antenna is very necessary.

The type of dipole to be used depends upon the signal strength of the station in that particular area, as well as conditions of reception as outlined above. There are three types of FM dipole antenna available, the single dipole, the folded dipole, and the non-directional dipole. When the stations to be received are in one general direction, a reflector may be added to either of the first two types to increase their efficiency.

GENERAL

Due to the high frequencies at which FM signals are received the service man must use great care when servicing these sets. Extreme caution must be used regarding the moving of component parts in the R.F. and oscillator circuits of the receiver as those circuits can be detuned in this manner.

If it becomes necessary to replace components such as resistors and condensers they must be replaced with parts of the same size, type, voltage rating and tolerance as called for in the parts list.

When installing new parts they should be placed in the same position as the original, and the leads should be cut to the same length.

ALIGNMENT NOTES

This receiver has been thoroughly inspected and tested at the factory, using the most modern test equipment available, such as FM sweep generators and oscilloscopes. All R.F. and I.F. circuits have been accurately adjusted at the factory and no attempt should be made to realign these circuits unless it is absolutely necessary.

CAUTION: If realignment is necessary be sure the proper test equipment is available, as listed below, before proceeding with the alignment procedure as given

EQUIPMENT USED FOR ALIGNMENT

Vacuum tube voltmeter.

AM Signal generator

FM Sweep generator.

Oscilloscope.

Insulated screw driver.

Dummy antenna:
- .1 MFD condenser
- .00025 MFD mica condenser
- 150 ohm resistor (2)

Output meter.

INSTALLATION

This receiver is shipped from the factory complete with a built-in loop antenna for standard AM broadcast reception. A power-line antenna is used for the reception of FM stations. These antennas will be satisfactory for good reception under normal conditions. Terminals are provided at the back of the radio for connecting external AM and FM antennas, wherever this is found to be desirable as explained below.

When the receiver is to be used under difficult conditions, such as in buildings constructed mainly of steel, or those with steel lath, or, when large buildings, mountains or other objects are between the receiver and the station to be received, it may be necessary to use an external dipole antenna. Remember too, FM reception is limited as to distance and when used outside the primary service area of the transmitter, an outside antenna is very necessary.

The type of dipole to be used depends upon the signal strength of the station in that particular area, as well as conditions of reception as outlined above. There are three types of FM dipole antenna available, the single dipole, the folded dipole, and the non-directional dipole. When the stations to be received are in one general direction, a reflector may be added to either of the first two types to increase their efficiency.

GENERAL

Due to the high frequencies at which FM signals are received the service man must use great care when servicing these sets. Extreme caution must be used regarding the moving of component parts in the R.F. and oscillator circuits of the receiver as those circuits can be detuned in this manner.

If it becomes necessary to replace components such as resistors and condensers they must be replaced with parts of the same size, type, voltage rating and tolerance as called for in the parts list.

When installing new parts they should be placed in the same position as the original, and the leads should be cut to the same length.

ALIGNMENT NOTES

This receiver has been thoroughly inspected and tested at the factory, using the most modern test equipment available, such as FM sweep generators and oscilloscopes. All R.F. and I.F. circuits have been accurately adjusted at the factory and no attempt should be made to realign these circuits unless it is absolutely necessary.

CAUTION: If realignment is necessary be sure the proper test equipment is available, as listed below, before proceeding with the alignment procedure as given

EQUIPMENT USED FOR ALIGNMENT

Vacuum tube voltmeter.

AM Signal generator

FM Sweep generator.

Oscilloscope.

Insulated screw driver.

Dummy antenna:
- .1 MFD condenser
- .00025 MFD mica condenser
- 150 ohm resistor (2)

Output meter.

WARWICK MFG. CORP. MODEL 155 Series

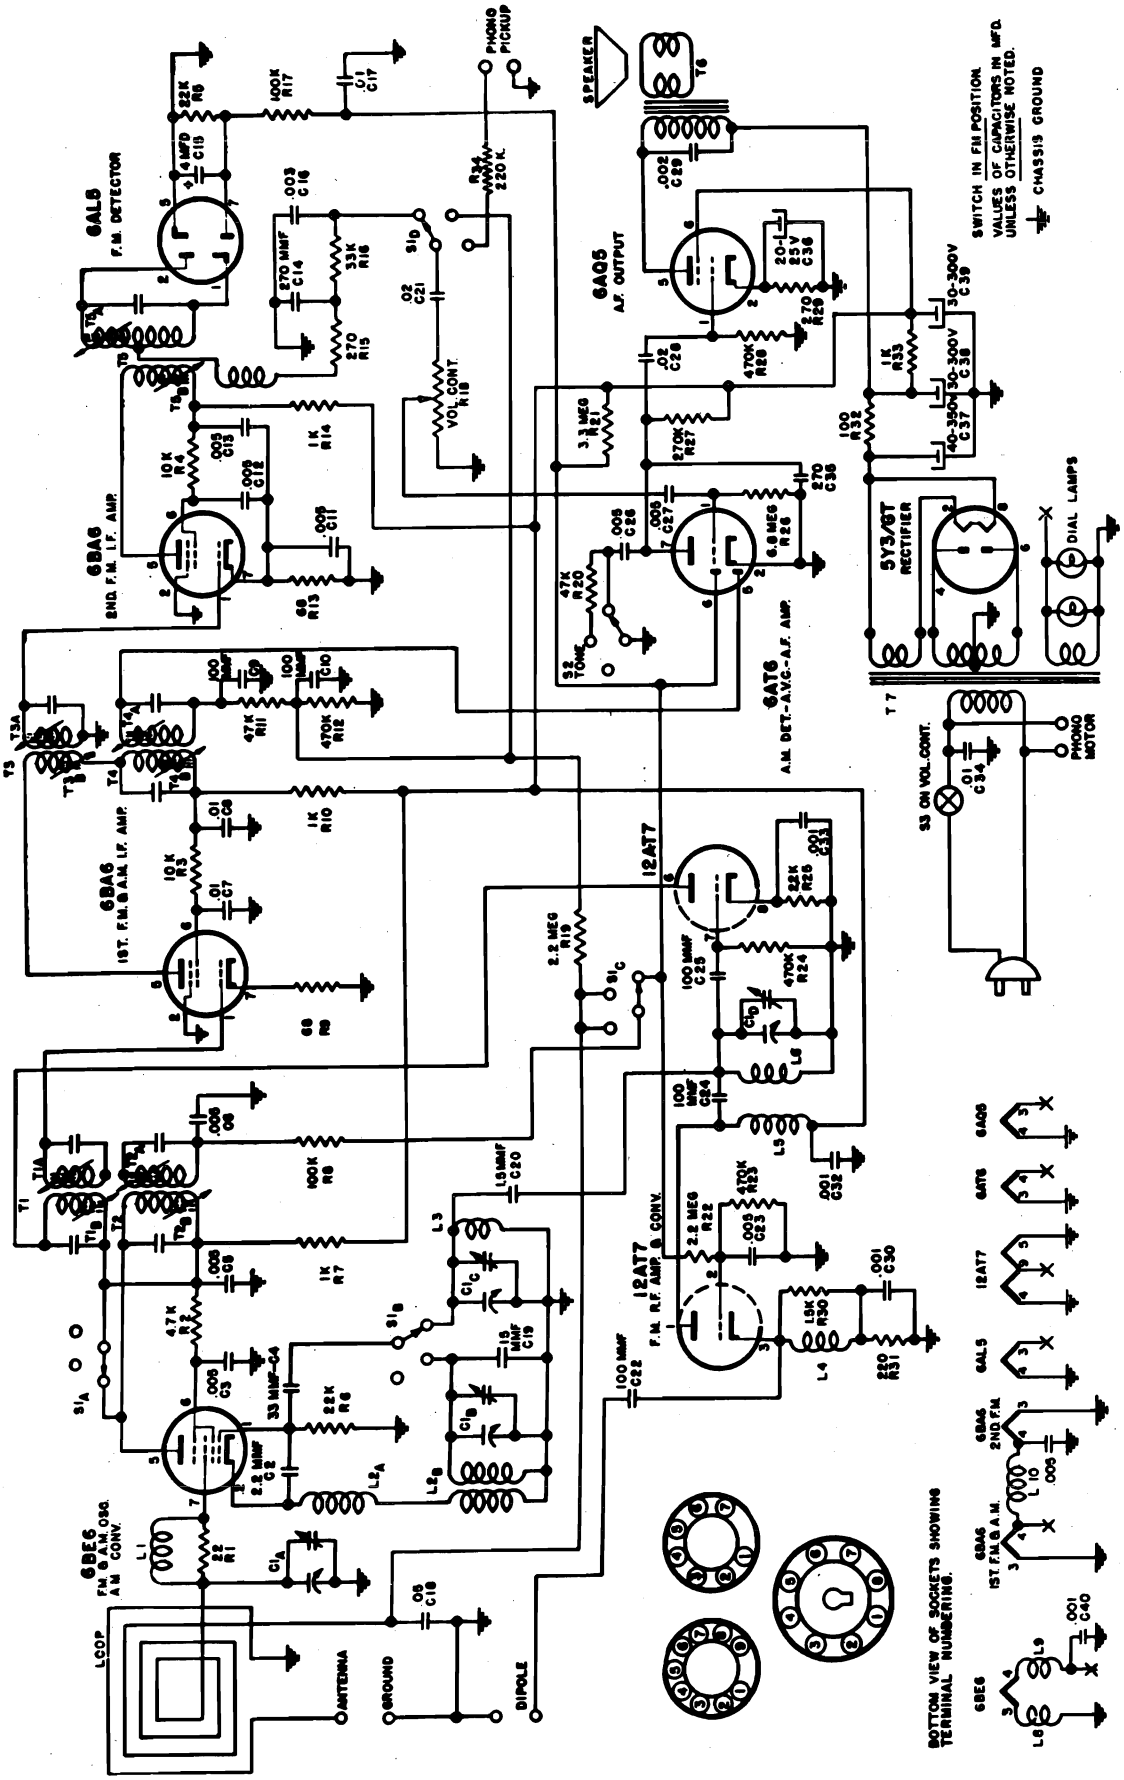

FIG. 1 SCHEMATIC DIAGRAM

MODEL 155 Series WARWICK MFG. CORP.

SPECIFICATIONS

Power Supply	105-125 volts 60 cycle AC only.
Power Consumption	65 Watts
Frequency Range FM	88 to 108 MC.
Frequency Range AM	540 to 1600 KC.
I.F. Frequency FM	10.7 MC.
I.F. Frequency AM	455 KC.
Band width, FM, Ratio Detector	330 KC.
Band width, FM, 1st I.F.	280 KC.
Band width, FM, Converter	220 KC.
Speaker	6¼" P.M.

The tubes used are as follows:

12AT7	FM RF Amplifier, Converter
6BE6	FM Osc, Am Osc, Converter
6BA6	FM-AM, 1st I.F. Amplifier
6BA6	FM-AM, 2nd I.F. Amplifier
6AL5	FM Detector
6AT6	AM Detector, AVC, Audio
6AQ5	Power Output
5Y3	Power Rectifier
No. 47	Pilot Lights (2)

SERVICE NOTES

INSTALLATION

This receiver is shipped from the factory complete with a built-in loop antenna for standard AM broadcast reception. A power-line antenna is used for the reception of FM stations. These antennas will be satisfactory for good reception under normal conditions. Terminals are provided at the back of the radio for connecting external AM and FM antennas, wherever this is found to be desirable as explained below.

When the receiver is to be used under difficult conditions, such as in buildings constructed mainly of steel, or those with steel lath, or, when large buildings, mountains or other objects are between the receiver and the station to be received, it may be necessary to use an external dipole antenna. Remember too, FM reception is limited as to distance and when used outside the primary service area of the transmitter, an outside antenna is very necessary.

The type of dipole to be used depends upon the signal strength of the station in that particular area, as well as conditions of reception as outlined above. There are three types of FM dipole antenna available, the single dipole, the folded dipole, and the non-directional dipole. When the stations to be received are in one general direction, a reflector may be added to either of the first two types to increase their efficiency.

GENERAL

Due to the high frequencies at which FM signals are received the service man must use great care when servicing these sets. Extreme caution must be used regarding the moving of component parts in the R.F. and oscillator circuits of the receiver as those circuits can be detuned in this manner.

If it becomes necessary to replace components such as resistors and condensers they must be replaced with parts of the same size, type, voltage rating and tolerance as called for in the parts list.

When installing new parts they should be placed in the same position as the original, and the leads should be cut to the same length.

ALIGNMENT NOTES

This receiver has been thoroughly inspected and tested at the factory, using the most modern test equipment available, such as FM sweep generators and oscilloscopes. All R.F. and I.F. circuits have been accurately adjusted at the factory and no attempt should be made to realign these circuits unless it is absolutely necessary.

CAUTION: If realignment is necessary be sure the proper test equipment is available, as listed below, before proceeding with the alignment procedure as given on page 5.

EQUIPMENT USED FOR ALIGNMENT

Vacuum tube voltmeter.

AM Signal generator

FM Sweep generator.

Oscilloscope.

Insulated screw driver.

Dummy antenna:
- .1 MFD condenser
- .00025 MFD mica condenser
- 150 ohm resistor (2)

Output meter.

DESCRIPTION

Model 11901 is a 6 tube (including rectifier) superhetrodyne radio receiver designed for operation on 50-60 cycle 105-125 volt, AC current.

The tubes used are:

6SK7	R.F. Amplifier	6SQ7	Det, AVC, audio
6SA7	Mixer, Osc.	6K6GT	Power Output
6SK7	I.F. Amplifier	5Y3GT	Rectifier

This receiver covers the standard broadcast frequency range from 535 to 1725 kilocycles (K.C.) and the shortwave frequency range from 6 to 18.2 Megocycles (MC).

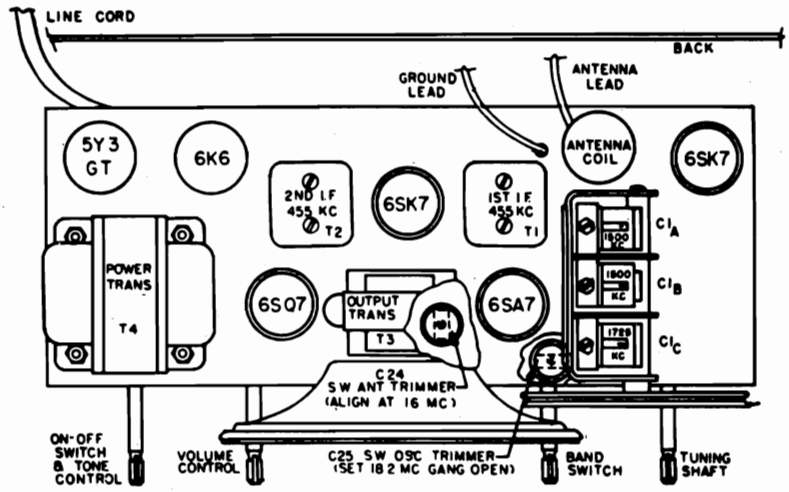

Fig. 2 Tube Positions and Alignment Points

ALIGNMENT PROCEDURE

The following alignment procedure is for use only by competent servicemen having the proper equipment.

With an output meter connected across the voice coil of the speaker, the output meter reading for ½ watt is 1.25 volts, using a signal which is modulated 400 C.P.S. Follow through the procedure as outlined below for proper alignment.

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, for accurate alignment.

Position of Variable	Band Switch Position	Generator Frequency	Dummy Ant.	Generator Connections	Trimmer Adjustment	Trimmer Function
Fully open	BC	455 KC	.1 MFD.	6SA7 Grid (stator of C1B)	T1 T2	I. F.
Fully open	BC	1725 KC	.00025 MFD.	Ant. lead	C1C	BC Osc.
Tune in signal from generator	BC	1500 KC	.00025 MFD.	Ant. lead	C1B	R. F.
Tune in signal from generator	BC	1500 KC	.00025 MFD.	Ant. lead	C1A	BC Ant.
Fully open	SW	18.2 MC	400 ohms	Ant. lead	C25	SW Osc.
Tune in signal from generator	SW	16 MC	400 ohms	Ant. lead	C24	SW Ant.

GROUND lead of generator should be attached to the chassis for all adjustments

C24 and C25 are located under the chassis

For alignment points refer to Figure 2

Repeat alignment procedure as a final check

DESCRIPTION

Model 12001 is a 5 tube (including rectifier) super-heterodyne radio receiver designed for use on 105-125 volt A.C., 60 cycle, or 117 volt D.C. current.

The tubes are:—

1—12SA7	Oscillator, converter	1—50L6GT	Power Output
1—12SK7	I.F. Amplifier	1—35Z5GT	Rectifier
1—12SQ7	AVC, Detector, 1st audio		

This receiver covers the standard broadcast frequency range of 535 to 1725 K.C. (560 to 174 meters), and the Short Wave frequency range of 9 to 18.2 Megacycles (33 to 16.5 meters).

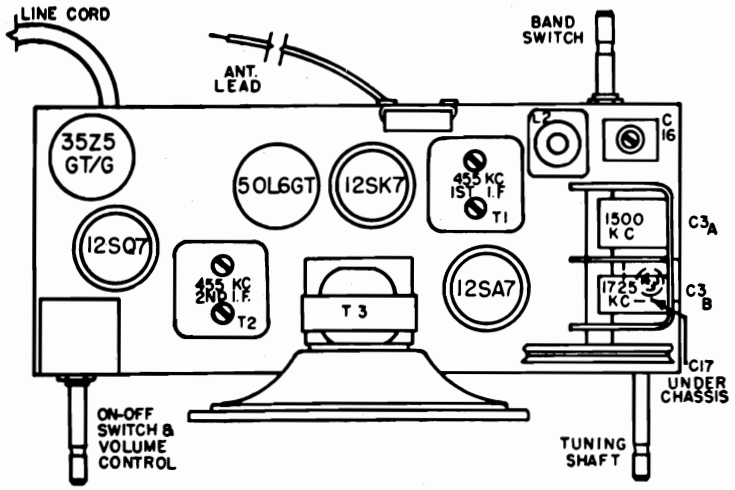
ALIGNMENT PROCEDURE

The following alignment procedure is for use only by competent servicemen having the proper equipment.

The alignment should be made with volume control full on and the output from the signal generator as low as possible to prevent AVC action from interfering with correct alignment.

With the output meter connected across the voice coil of the speaker, the output meter reading for 50 milliwatts is .4 volts, using a signal which is modulated 400 c.p.s.

Adjust all trimmers for maximum output. Repeat alignment procedure as a final check.



ALIGNMENT PROCEDURE—Continued

CAUTION: This is an AC-DC receiver and when aligning the set it is necessary to isolate the signal generator or the receiver from the line by use of a transformer, or place a .2 MFD condenser in both test leads of the signal generator.

Before proceeding with actual alignment the dial pointer must be set to the proper position. With the variable condenser fully open the dial pointer should read 1725 K.C.

Position of Variable	Band Switch Position	Generator Frequency	Dummy Ant.	Generator Connections	Trimmer Adjustment	Trimmer Function
Fully open	B. C.	455 KC	.1 MFD	*12SA7 Grid (Stator of C3A)	T1 - T2	I. F.
Fully open	B. C.	1725 KC	.00025 MFD	*Ant. lead	**C3B	B. C. Oscillator
Tune in signal from generator	B. C.	1400 KC	.00025 MFD	*Ant. lead	**C3A	B. C. Antenna
16 MC	S. W.	16 MC	400 ohms	*Ant. lead	C17	S. W. Oscillator
16 MC	S. W.	16 MC	400 ohms	*Ant. lead	C16	S. W. Antenna

* Connect ground lead of signal generator to "Common B."

** C3A, C3B, are located on variable condenser

NOTE: The above procedure must be followed in exact sequence for proper alignment.

SPECIFICATIONS

Power Supply	117 volts AC 60 cycle
Power Consumption	95 Watts
Frequency Range FM	88 to 108 MC.
Frequency Range AM	540 to 1600 KC.
I.F. frequency FM	10.7 MC.
I.F. frequency AM	455 KC.
Band width, FM, Ratio detector	360 KC.
Band width, FM, 2nd I.F.	280 KC.
Band width, FM, 1st I.F.	240 KC.
Band width, FM, Converter	180 KC.
Tubes	10
Rectifiers	Selenium, 150 ma.
Speaker	10" P.M.

The tubes used are as follows:

12BA6	FM, R.F. Amplifier
12BE6	FM, Converter
12BA6	FM, 1st I.F. Amplifier
12BA6	FM, 2nd I.F. Amplifier
12BA6	FM, 3rd I.F. Amplifier
6AL5	FM, Ratio detector
12BE6	AM, Converter
12BA6	AM, I.F. Amplifier
12AT6	AM, Detector-AVC-1st audio
50L6GT	Power output
A83-463	Selenium rectifier (2)
No. 47	Pilot lights (2)

SERVICE NOTES

INSTALLATION

The loop antenna provided with the receiver will prove adequate for the reception of all AM stations under normal operating conditions. The flexible folded dipole antenna will be adequate for the reception of powerful or near-by FM stations except when the set is used in a building constructed mainly of steel or where FM reception is otherwise difficult. When the radio is used with the inside antenna as provided, it is suggested that you try placing the set in different locations in the room. FM reception especially will vary greatly according to the location of the antenna within the room.

When it is desired to receive FM stations outside of the primary service area, or if the receiver is being used under difficult conditions, the use of an outside dipole antenna is recommended. There are three types of such aerials, namely single dipole, the folded dipole, and the non-directional dipole. To increase the "pick-up" or sensitivity, a reflector may be used with either of the first two types. The proper type of antenna as well as its location are determined by the terrain and distance from the station to be received, the direction, etc. Your local service man will advise you of the proper antenna installation, for your particular area. Two terminals are provided on the back of the set for connecting the outside dipole antenna leads.

FM reception is very directional, and even when using the FM antenna furnished with the receiver, reception can sometimes be very much improved by turning the receiver in a different direction. Be careful not to place the radio close to large metal objects as this might tend to cause reflections or otherwise interfere with good reception.

CAUTION: Always disconnect the line cord before removing the back for tube replacement, etc.

GENERAL

Due to the high frequencies at which FM signals are received the service man must use great care when servicing these sets. Extreme caution must be used regarding the moving of component parts in the R.F. and oscillator circuits of the receiver as those circuits can be detuned in this manner.

If it becomes necessary to replace components such as resistors and condensers they must be replaced with parts of the same size, type, voltage rating and tolerance as called for in the parts list.

When installing new parts they should be placed in the same position as the original, and the leads should be cut to the same length.

ALIGNMENT NOTES

This receiver has been thoroughly inspected and tested at the factory, using the most modern test equipment available, such as FM sweep generators and Oscilloscopes. All I.F. circuit adjustments have been sealed at the factory and no attempt should be made to realign these circuits unless it is absolutely necessary.

CAUTION: If realignment is necessary be sure the proper test equipment is available, as listed below, before proceeding with the alignment procedure as given on page 5. This receiver employs the "double peak" type of I.F. circuits, and can not be satisfactorily aligned with conventional AM equipment. Visual alignment procedures must be used.

EQUIPMENT USED FOR ALIGNMENT

AM Signal generator

FM Sweep generator.

Oscilloscope.

Vacuum tube voltmeter.

Insulated screw driver.

Dummy antenna:
- .1 MFD condenser
- .00025 MFD mica condenser
- 150 ohm resistor (2)

Output meter.

6AL5 FM—Ratio detector	0	—3	0	6ac	—4	0	0	
50L6GT Power output	0	31ac	225	100	0	30	80ac	6.5

All voltage readings are taken from tube pin to chassis.

All measurements are made with no signal, using a 20,000 ohm per volt meter.

AC input voltage must be maintained at 117 volts for accurate readings.

AC voltages shown are at 1000 ohms per volt.

All voltages shown are approximate.

RESISTANCE CHART

TUBE No.	PIN 1	PIN 2	PIN 3	PIN 4	PIN 5	PIN 6	PIN 7	PIN 8
12BE6 AM—Converter	20K	1	27	18	25K	25K	3 meg.	
12BA6 AM—I. F. Amp.	2 meg.	0	70	62	25K	25K	70	
12AT6 AM—Det.-AVC-Audio	10 meg.	0	18	5	470K	120K	540K	
12BA6 FM—R.F. Amp.	1 meg.	0	27	40	25K	25K	70

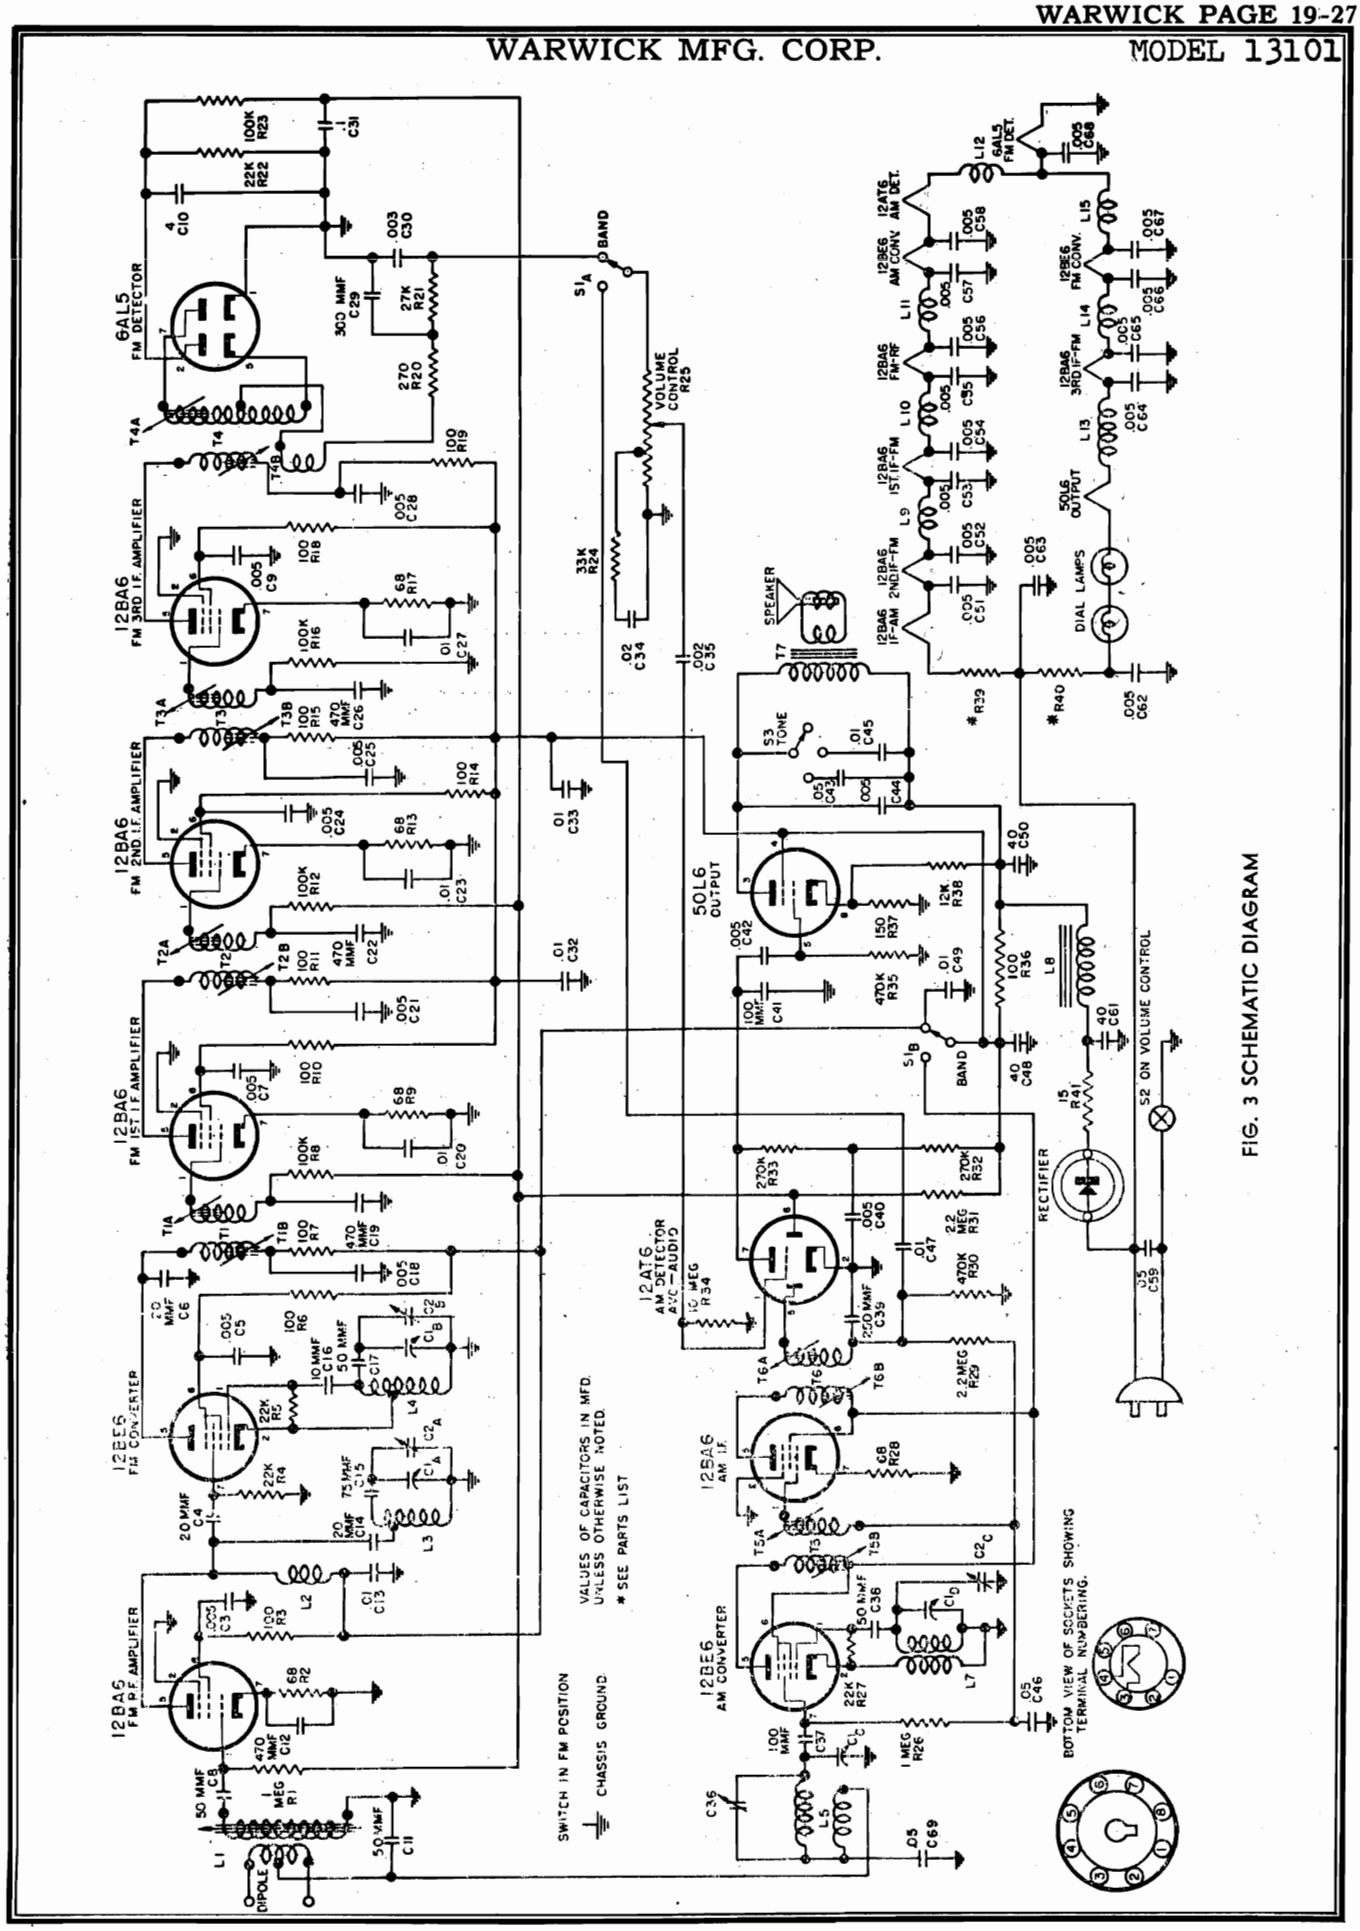

FIG. 3 SCHEMATIC DIAGRAM

MODEL 13101 WARWICK MFG. CORP.

SPECIFICATIONS

Power Supply	117 volts AC-DC
Power Consumption	55 Watts
Frequency Range FM	88 to 108 MC.
Frequency Range AM	540 to 1600 KC.
I.F. frequency FM	10.7 MC.
I.F. frequency AM	455 KC.
Band width, FM, Ratio detector	360 KC.
Band width, FM, 2nd I.F.	280 KC.
Band width, FM, 1st I.F.	240 KC.
Band width, FM, Converter	180 KC.
Tubes	10
Rectifier	Selenium, 150 ma.
Speaker	6" P.M.

The tubes used are as follows:

12BA6	FM, R.F. Amplifier
12BE6	FM, Converter
12BA6	FM, 1st I.F. Amplifier
12BA6	FM, 2nd I.F. Amplifier
12BA6	FM, 3rd I.F. Amplifier
6AL5	FM, Ratio detector
12BE6	AM, Converter
12BA6	AM, I.F. Amplifier
12AT6	AM, Detector-AVC-1st audio
50L6GT	Power output
A83-463	Selenium rectifier
No. 47	Pilot lights (2)

GENERAL SERVICE INFORMATION

INSTALLATION

This receiver is shipped from the factory complete with a flexible, folded dipole antenna. This antenna will be satisfactory for good reception under normal conditions. It should be connected to the two (2) dipole terminals on the back of the cabinet, and then extended to its full length. Since FM signals are directional, reception may be sometimes improved by rotating the extended sections of the flexible antenna in different directions.

This antenna is also used in conjunction with the AM antenna coil for standard AM broadcast reception, and therefore must be connected as described above for reception of standard broadcast stations.

When the receiver is to be used under difficult conditions, such as in buildings constructed mainly of steel, or those with steel lath, or, when large buildings, mountains or other objects are between the receiver and the station to be received, it may be necessary to use an external dipol antenna. Remember too, FM reception is limited as to distance and when used outside the primary service area of the transmitter, an outside antenna is very necessary.

The type of dipole to be used depends upon the signal strength of the station in that particular area, as well as conditions of reception as outlined above. There are three types of FM dipole antenna available, the single dipole, the folded dipole, and the non-directional dipole. When the stations to be received are in one general direction, a reflector may be added to either of the first two types to increase their efficiency.

GENERAL

Due to the high frequencies at which FM signals are received the service man must use great care when servicing these sets. Extreme caution must be used regarding the moving of component parts in the R.F. and oscillator circuits of the receiver as those circuits can be detuned in this manner.

If it becomes necessary to replace components such as resistors and condensers they must be replaced with parts of the same size, type, voltage rating and tolerance as called for in the parts list.

When installing new parts they should be placed in the same position as the original, and the leads should be cut to the same length.

ALIGNMENT NOTES

This receiver has been thoroughly inspected and tested at the factory, using the most modern test equipment available, such as FM sweep generators and Oscilloscopes. All I.F. circuit adjustments have been sealed at the factory and no attempt should be made to realign these circuits unless it is absolutely necessary.

CAUTION: If realignment is necessary be sure the proper test equipment is available, as listed below, before proceeding with the alignment procedure as given on page 5. This receiver employs the "double peak" type of I.F. circuits, and can not be satisfactorily aligned with conventional AM equipment. Visual alignment procedures must be used.

EQUIPMENT USED FOR ALIGNMENT

Vacuum tube voltmeter.

AM Signal generator

FM Sweep generator.

Oscilloscope.

Insulated screw driver.

Dummy antenna:

.1 MFD condenser
.00025 MFD mica condenser
150 ohm resistor (2)

Output meter.

All voltage readings are taken from tube pin to chassis.

All measurements are made with no signal, using a 20,000 ohm per volt meter.

AC input voltage must be maintained at 117 volts for accurate readings.

AC voltages shown are at 1000 ohms per volt.

All voltages shown are approximate.

All resistance readings are taken from tube pin to chassis.

Due to manufacturing tolerance on component parts, resistance readings may vary as much as 20%.

All readings are shown in ohms unless otherwise noted.

MODEL 13915

WARWICK MFG. CORP.

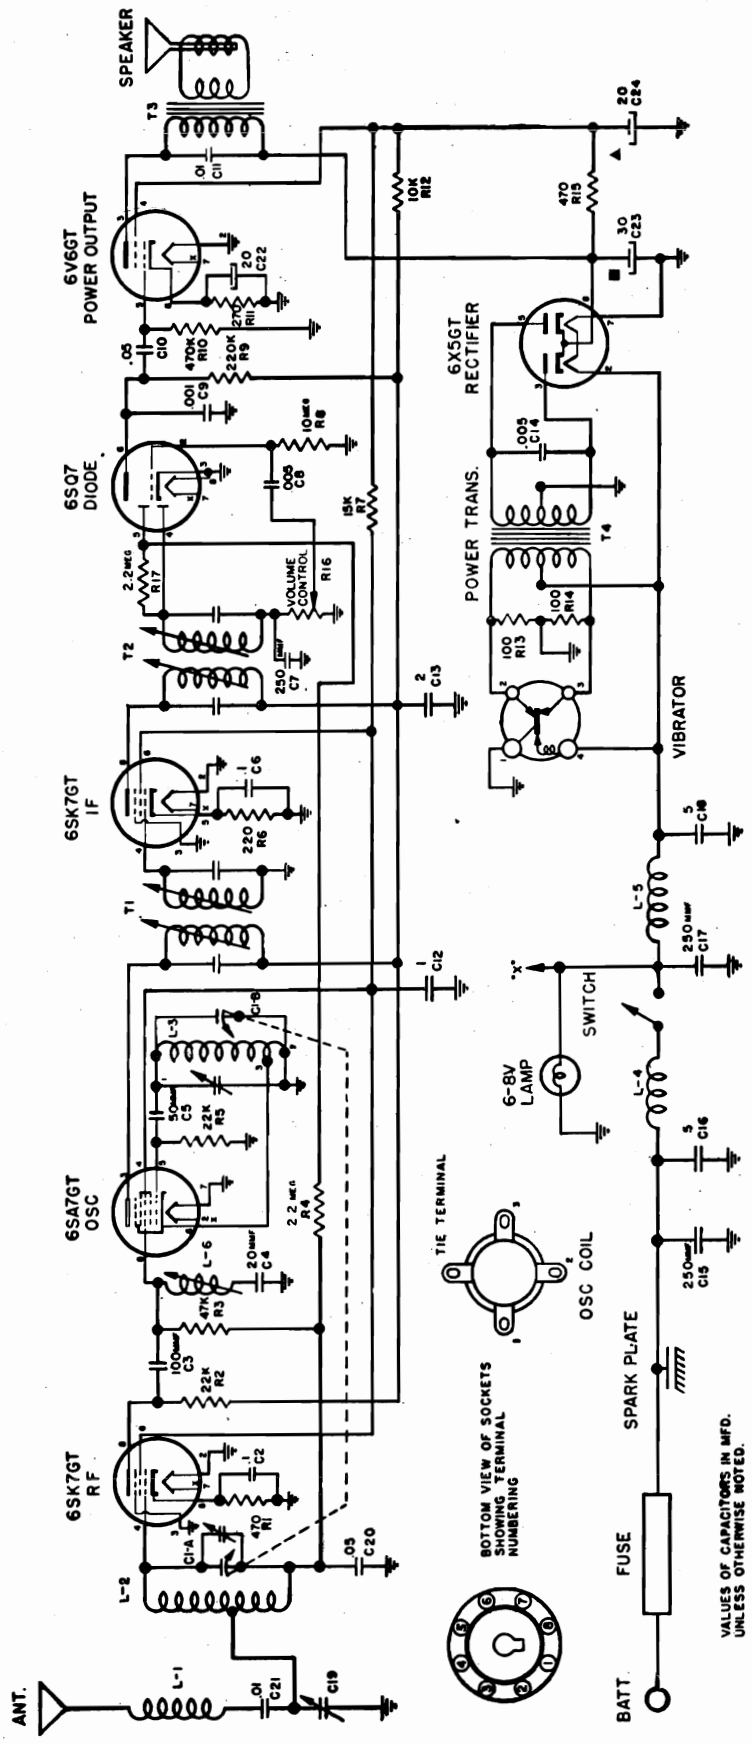

Fig. 3 Schematic Diagram

INSTALLATION

This radio comes to you complete with all hardware necessary for mounting, and also with a distributor suppressor, ammeter condenser and generator condenser. By referring to Figures 1 and 2, and following the instructions outlined below, you will find that it is very simple to install.

First determine where the receiver is to be mounted by holding it with the hands in the approximate location in the car. Using the front mounting bracket as a template, mark and drill two 5/8" holes in the instrument panel flange. Now secure the mounting bracket to the radio receiver with the screws provided, and then mount the front of the radio to the instrument panel, using the bolts, lock washers and nuts provided for this purpose. The back of the radio is supported by means of the rear mounting strap. The mounting strap should be formed to the correct angles, as illustrated in Figure 2, so that it can then be fastened to the fire wall. After marking and center-punching the fire wall at the correct location, drill with a 3/8" drill. The mounting strap is then secured to the radio and fastened to the fire wall of the car with the 1/4" bolt, lock washer and nut furnished with the receiver.

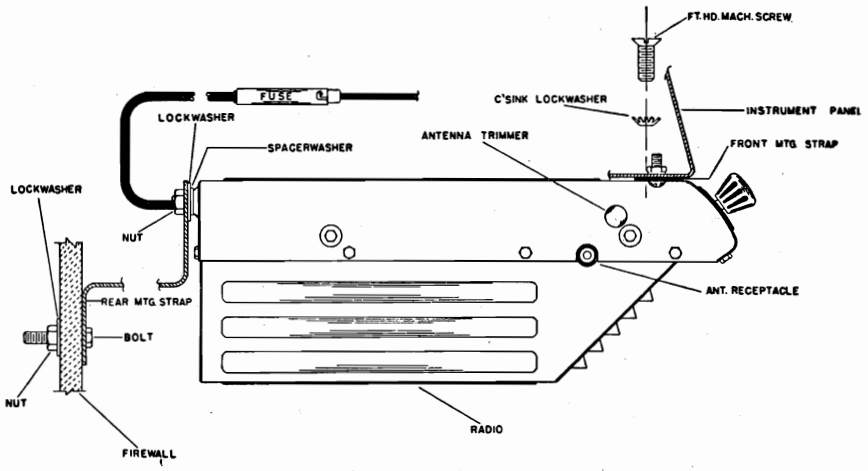

Fig. 2 Side View, Showing Mounting

CONNECTING THE RADIO

The antenna cable should be connected to the radio by inserting the jack into the socket provided on the side of the radio. Connect the battery cable to the hot side of the ammeter behind the instrument panel. The fuse should then be inserted into the cable receptor.

FINAL ADJUSTMENTS

The input circuit has been especially designed to be used with a low capacity antenna, of the fish pole or whip type.

To adjust the antenna trimmer condenser, carefully tune the receiver to a weak station at approximately 600 kilocycles (K.C.). Remove the snap button covering the antenna trimmer (See Figure 2) and adjust the trimmer for maximum volume. A small screw driver will be needed for this purpose.

ACCESSORIES FURNISHED FOR INSTALLATION

All of the parts that are needed for installing this receiver are furnished in the Mounting Parts Kit, part No. S84-192, and the Suppression and Misc. Parts Kit, part No. S84-230, as listed below. Also supplied are the rear mounting strap, part No. B31-134, and the front mounting plate, part No. A31-138.

NOTE: For shipping, the two control knobs have been removed from the tuning and volume control shafts. To install the knobs, line up the flat side of the knob spring, (inside knob) with the flat side of the control shaft and push the knob forward until it stops.

S84-192 MOUNTING PARTS KIT

- 1 1/4" Bolt
- 2 1/4" Lock Washers
- 2 1/4" Hexagon Nuts
- 2 10-32 x 5/8" Screws
- 2 External Tooth Lock Washers
- 2 Internal Tooth Lock Washers
- 2 10-32 Hexagon Nuts

S84-230 SUPPRESSION KIT & MISC. PARTS

- 1 S84-233 "A" lead assem.
- 1 A43-10 Fuse
- 2 A52-256 Control knobs
- 1 A81-13 Sleeve (for fuse)
- 1 S84-193 Suppression Kit consisting of:
  - 2 .5 MFD Condensers
  - 1 Distributor Suppressor
  - 20" Wire Braid

MODEL 13915 WARWICK MFG. CORP.

ELIMINATING MOTOR NOISE

IMPORTANT: Special care should be taken when mounting the radio to make sure all paint, grease, rust, etc., is removed from all three mounting points. A good electrical contact at these points will aid materially in eliminating motor noise.

GENERATOR CONDENSER

The generator condenser must be connected to the battery terminal of the generator in all cases. If your car is equipped with a generator using an automatic regulator, make sure the condenser IS NOT fastened to the field winding terminal. If in doubt, your local car dealer can advise you as to where the car manufacturer recommends connecting it.

DISTRIBUTOR SUPPRESSOR

Remove the coil to distributor high tension lead from the distributor. Cut the lead two inches from the end, and screw the distributor resistor on to the coil lead, then screw the short length into the resistor and plug the cable into the distributor cap.

AMMETER CONDENSER

A .5 MFD bypass condenser is furnished for attaching to the ammeter. This should be connected to either side of the ammeter with the ground lug fastened to a good ground nearby. In most cases the use of this condenser, the distributor suppressor, and the generator condenser, will eliminate all objectionable ignition interference.

ELECTRICAL ACCESSORIES

In some cases, it may be found that car accessories such as electric heaters, lighters, automatic relays, or gauges, may cause interference while in operation. Proper procedure in such cases is to try another by-pass condenser from ground to the suspected accessory until the source of the interference is found. The condenser then should be permanently mounted in this location.

HIGH AND LOW TENSION LEADS

In many cases the low tension battery leads, etc., are grouped together with the high tension wires. These leads will very often pick up motor noise and feed it into the receiver through the battery circuit. In cases such as these it will be necessary to separate the low tension from the high tension wires and run them through another hole if they run from the engine compartment up to the instrument panel. This condition is particularly true on the V-8 Ford, as the battery and primary leads run through a special tube which also houses the high tension leads. Shield and ground these leads.

IGNITION COILS

In cars where the ignition coil is located on the back side of the instrument panel it is often necessary to use an additional condenser. It must be installed from the battery side of the ignition coil to the closest ground on the instrument panel.

Short leads are very important. Where coils are mounted either on the instrument panel or in the driver's compartment, it may be necessary to shield the high tension lead from the coil to the distributor.

WHEEL STATIC

Wheel Static is a form of interference caused by the rotation of the front wheels of the car, and it is, of course, only noticed when the car is in motion. If this form of interference is present it can be eliminated by installing wheel static collector springs between the inner hub cap and the spindle shaft.

BONDING OF FIRE WALL TUBES

Bonding the steering column to the fire wall with a short braid may also be effective. Clean the paint from the steering column at the fire wall where the column enters the motor compartment, and solder on a short piece of braid. Ground the end of the braid to the fire wall.

In some cases it may be necessary to ground the tubes and rods coming through the fire wall in order to reduce the interference. Clean them with emery cloth and spot-solder the braid, fastening the end under a convenient screw. A ¼" piece of wire braid 20 inches long is furnished in the suppression kit assembly for this purpose.

WARWICK MFG. CORP. MODEL 13915

ELECTRICAL SPECIFICATIONS

Power Supply	6.3 volts DC
Current	4.8 amp. average
Frequency Range	540 to 1600 KC
I. F. Frequency	455 KC
Speaker	4" P. M.
Power Output	1.2 watts, undistorted 2.5 watts, maximum
Sensitivity	10 microvolts average for 1 watt output
Selectivity	20 KC broad at 1000 times signal, at 1000 KC

SERVICE NOTES

Voltages taken from the different points of the circuit to the chassis are measured with volume control in maximum position, all tubes in their sockets, no signal applied, and with a volt meter having a resistance of 20,000 ohms per volt. These voltages are clearly shown on the voltage chart, (Fig. 4).

All voltages should be measured with an input voltage of 6.3 volts DC.

To check for open by-pass condensers, shunt each condenser with another one having the same capacity and voltage rating which is known to be good until the defective unit is located.

ALIGNING INSTRUCTION

Never attempt any adjustments on this receiver unless it becomes necessary to replace a coil or transformer, or the adjustments have been tampered with in the field. Always make certain that other circuit components, such as tubes, condensers, resistors, etc., are normal before proceeding with realignment.

If realignment is necessary follow the instructions given under the heading "ALIGNMENT PROCEDURE". After realignment has been completed repeat the procedure as a final check.

The tube compliment of this receiver is as follows:

1—6SK7GT—R. F. Amplifier.

1—6SA7GT—Converter.

1—6SK7GT—I.F. Amplifier.

1—6SQ7—Detector—AVC—1st audio.

1—6V6GT—Power output.

1—6X5GT—Rectifier.

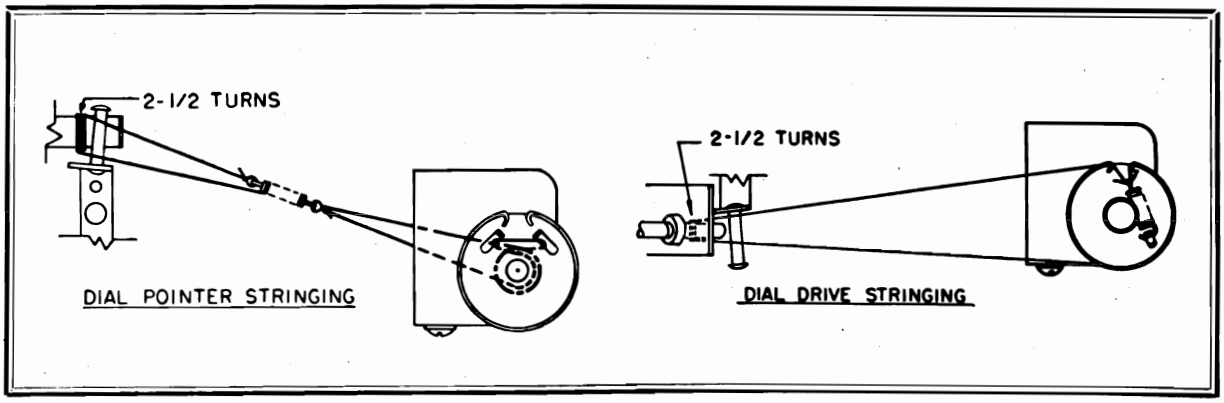
INSTRUCTIONS FOR REMOVING CHASSIS FROM THE CASE

The bottom cover (the one with the speaker louvers) can be removed to permit servicing of major components, such as tubes and vibrator, by removing the eight (8) screws holding it to the top cover. There are three (3) screws on each side, one (1) in the rear, and one (1) in the front.

CAUTION: Before attempting to remove the top cover, to service condensers, resistors, etc., the screw connecting the spark plate to the "A" terminal (inside case) must be removed. This is a round head screw, and is located on the rear of the case, close to the mounting stud bolt. It is recessed in a ½ inch hole in the case itself, thereby permitting contact with the spark plate.

After removing the spark plate screw, remove the two knobs by pulling forward and remove the eight (8) screws securing the cover to the chassis. Lift the chassis at the rear, at the same time moving it away from the front of the case so that the volume and tuning shafts will clear the holes in the cover.

NOTE: When reinstalling the chassis into the case, be sure the screw connecting the spark plate to the "A" terminal (inside case) is tightened very securely, otherwise the receiver will not operate properly.



ALIGNMENT PROCEDURE

Volume control—Maximum, all adjustments.

No signal applied to antenna.

Power input—6.3 volts.

Connect dummy antenna in series with output lead of signal generator.

Connect output meter across voice coil.

Connect ground lead of signal generator to chassis.

Repeat alignment procedure as a final check.

The following equipment is necessary for proper alignment:

Signal generator that will provide the test frequencies as listed.

Non-metallic screwdriver.

Output meter.

Dummy antennas—.1 MFD., .00025 MFD.

For alignment points refer to Figures 4 ad 5.

Dial Setting	*Generator Frequency*	*Dummy Ant.*	*Generator Connections*	*Trimmer Reference*	*Trimmer Adjustment*	*Trimmer Function*

MODEL 14515

WARWICK MFG. CORP.

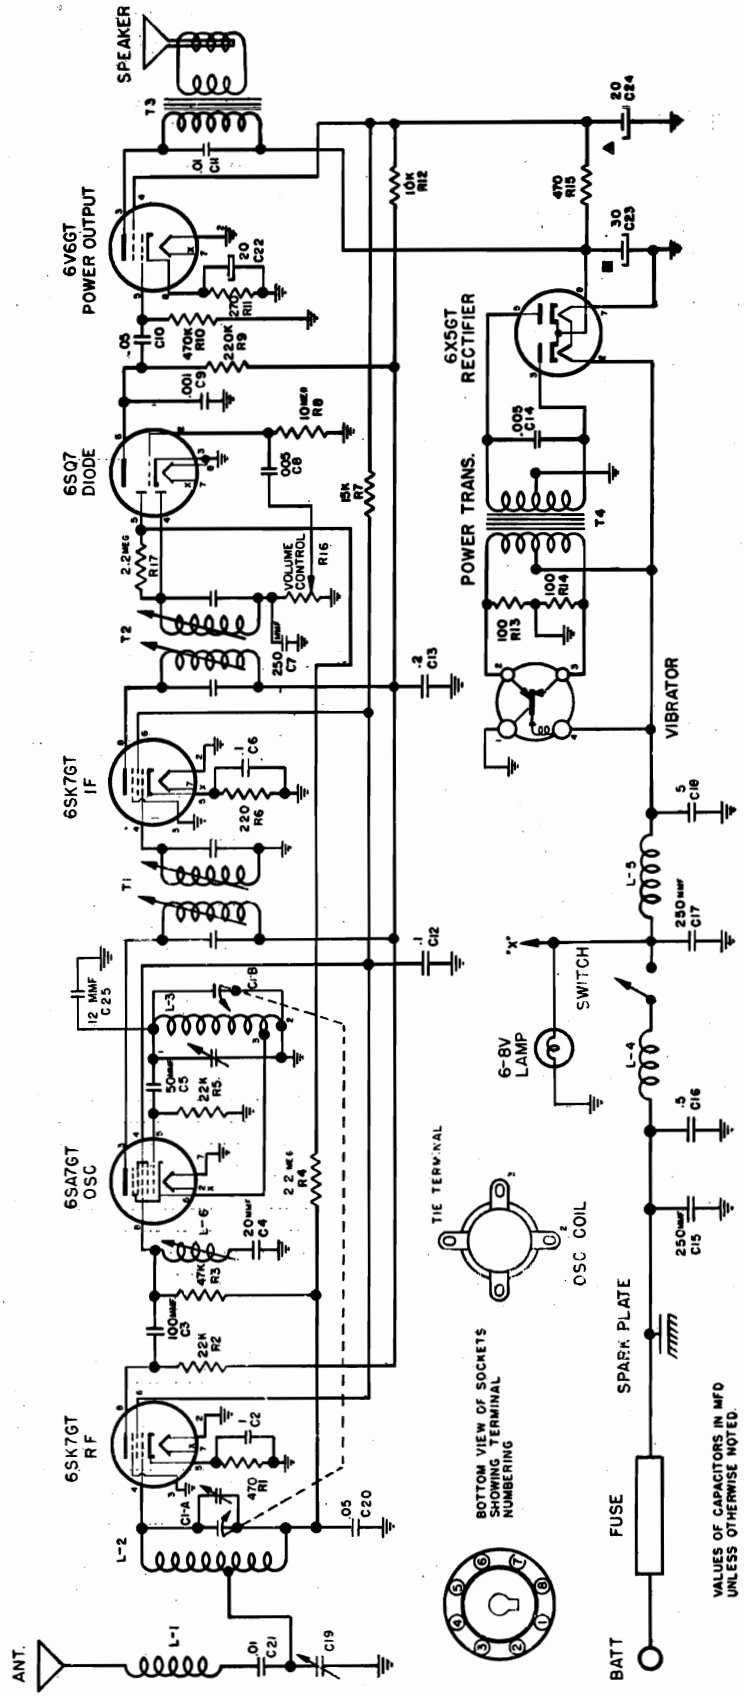

Fig. 3 Schematic Diagram

INSTALLATION

This radio comes to you complete with all hardware necessary for mounting, and also with a distributor suppressor, ammeter condenser and generator condenser. By referring to Figures 1 and 2, and following the instructions outlined below, you will find that it is very simple to install.

First determine where the receiver is to be mounted by holding it with the hands in the approximate location in the car. Using the front mounting bracket as a template, mark and drill two 5/8" holes in the instrument panel flange. Now secure the mounting bracket to the radio receiver with the screws provided, and then mount the front of the radio to the instrument panel, using the bolts, lock washers and nuts provided for this purpose. The back of the radio is supported by means of the rear mounting strap. The mounting strap should be formed to the correct angles, as illustrated in Figure 2, so that it can then be fastened to the fire wall. After marking and center-punching the fire wall at the correct location, drill with a 3/8" drill. The mounting strap is then secured to the radio and fastened to the fire wall of the car with the 1/4" bolt, lock washer and nut furnished with the receiver.

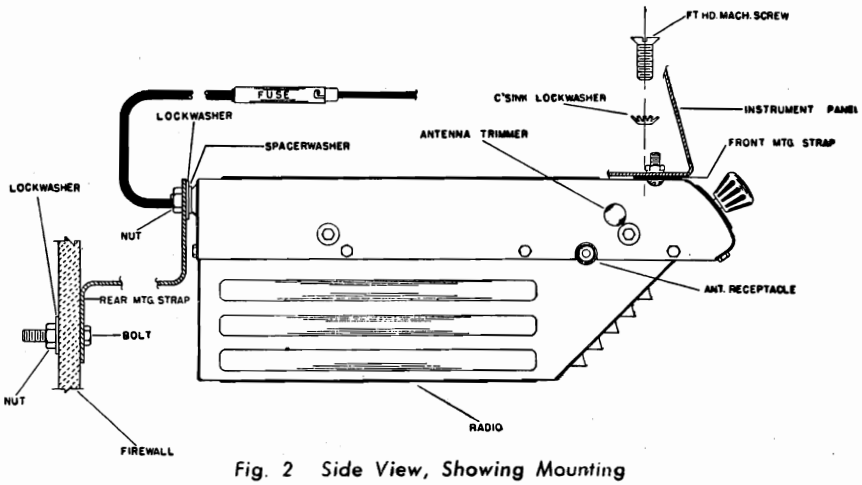

Fig. 2 Side View, Showing Mounting

CONNECTING THE RADIO

The antenna cable should be connected to the radio by inserting the jack into the socket provided on the side of the radio. Connect the battery cable to the hot side of the ammeter behind the instrument panel. The fuse should then be inserted into the cable receptor.

FINAL ADJUSTMENTS

The input circuit has been especially designed to be used with a low capacity antenna, of the fish pole or whip type.

To adjust the antenna trimmer condenser, carefully tune the receiver to a weak station at approximately 600 kilocycles (K.C.). Remove the snap button covering the antenna trimmer (See Figure 2) and adjust the trimmer for maximum volume. A small screw driver will be needed for this purpose.

ACCESSORIES FURNISHED FOR INSTALLATION

All of the parts that are needed for installing this receiver are furnished in the Mounting Parts Kit, part No. S84-192, and the Suppression and Misc. Parts Kit, part No. S84-230, as listed below. Also supplied are the rear mounting strap, part No. B31-134, and the front mounting plate, part No. A31-138.

NOTE: For shipping, the two control knobs have been removed from the tuning and volume control shafts. To install the knobs, line up the flat side of the knob spring, (inside knob) with the flat side of the control shaft and push the knob forward until it stops.

S84-192 MOUNTING PARTS KIT

- 1 1/4" Bolt
- 2 1/4" Lock Washers
- 2 1/4" Hexagon Nuts
- 2 10-32 x 5/8" Screws
- 2 10-32 x 3/8" Screws
- 2 External Tooth Lock Washers
- 2 Internal Tooth Lock Washers
- 2 10-32 Hexagon Nuts
- 1 Washer Spacer

S84-230 SUPPRESSION KIT & MISC. PARTS

- 1 S84-233 "A" lead assem.
- 1 A43-10 Fuse
- 2 A52-256 Control knobs
- 1 A81-13 Sleeve (for fuse)
- 1 S84-193 Suppression Kit consisting of:
  - 2 .5 MFD Condensers
  - 1 Distributor Suppressor
  - 20" Wire Braid

MODEL 14515 WARWICK MFG. CORP.

ELIMINATING MOTOR NOISE

IMPORTANT: Special care should be taken when mounting the radio to make sure all paint, grease, rust, etc., is removed from all three mounting points. A good electrical contact at these points will aid materially in eliminating motor noise.

GENERATOR CONDENSER

The generator condenser must be connected to the battery terminal of the generator in all cases. If your car is equipped with a generator using an automatic regulator, make sure the condenser IS NOT fastened to the field winding terminal. If in doubt, your local car dealer can advise you as to where the car manufacturer recommends connecting it.

DISTRIBUTOR SUPPRESSOR

Remove the coil to distributor high tension lead from the distributor. Cut the lead two inches from the end, and screw the distributor resistor on to the coil lead, then screw the short length into the resistor and plug the cable into the distributor cap.

AMMETER CONDENSER

A .5 MFD bypass condenser is furnished for attaching to the ammeter. This should be connected to either side of the ammeter with the ground lug fastened to a good ground nearby. In most cases the use of this condenser, the distributor suppressor, and the generator condenser, will eliminate all objectionable ignition interference.

ELECTRICAL ACCESSORIES

In some cases, it may be found that car accessories such as electric heaters, lighters, automatic relays, or gauges, may cause interference while in operation. Proper procedure in such cases is to try another by-pass condenser from ground to the suspected accessory until the source of the interference is found. The condenser then should be permanently mounted in this location.

HIGH AND LOW TENSION LEADS

In many cases the low tension battery leads, etc., are grouped together with the high tension wires. These leads will very often pick up motor noise and feed it into the receiver through the battery circuit. In cases such as these it will be necessary to separate the low tension from the high tension wires and run them through another hole if they run from the engine compartment up to the instrument panel. This condition is particularly true on the V-8 Ford, as the battery and primary leads run through a special tube which also houses the high tension leads. Shield and ground these leads.

IGNITION COILS

In cars where the ignition coil is located on the back side of the instrument panel it is often necessary to use an additional condenser. It must be installed from the battery side of the ignition coil to the closest ground on the instrument panel.

Short leads are very important. Where coils are mounted either on the instrument panel or in the driver's compartment, it may be necessary to shield the high tension lead from the coil to the distributor.

WHEEL STATIC

Wheel Static is a form of interference caused by the rotation of the front wheels of the car, and it is, of course, only noticed when the car is in motion. If this form of interference is present it can be eliminated by installing wheel static collector springs between the inner hub cap and the spindle shaft.

BONDING OF FIRE WALL TUBES

Bonding the steering column to the fire wall with a short braid may also be effective. Clean the paint from the steering column at the fire wall where the column enters the motor compartment, and solder on a short piece of braid. Ground the end of the braid to the fire wall.

In some cases it may be necessary to ground the tubes and rods coming through the fire wall in order to reduce the interference. Clean them with emery cloth and spot-solder the braid, fastening the end under a convenient screw. A 1/4" piece of wire braid 20 inches long is furnished in the suppression kit assembly for this purpose.

WARWICK MFG. CORP. MODEL 14515

ELECTRICAL SPECIFICATIONS

Power Supply	6.3 volts DC
Current	4.8 amp. average
Frequency Range	540 to 1600 KC
I. F. Frequency	455 KC
Speaker	4" P. M.
Power Output	1.2 watts, undistorted 2.5 watts, maximum
Sensitivity	10 microvolts average for 1 watt output
Selectivity	20 KC broad at 1000 times signal, at 1000 KC

SERVICE NOTES

Voltages taken from the different points of the circuit to the chassis are measured with volume control in maximum position, all tubes in their sockets, no signal applied, and with a volt meter having a resistance of 20,000 ohms per volt. These voltages are clearly shown on the voltage chart, (Fig. 4).

All voltages should be measured with an input voltage of 6.3 volts DC.

To check for open by-pass condensers, shunt each condenser with another one having the same capacity and voltage rating which is known to be good until the defective unit is located.

ALIGNING INSTRUCTION

Never attempt any adjustments on this receiver unless it becomes necessary to replace a coil or transformer, or the adjustments have been tampered with in the field. Always make certain that other circuit components, such as tubes, condensers, resistors, etc., are normal before proceeding with realignment.

If realignment is necessary follow the instructions given under the heading "ALIGNMENT PROCEDURE". After realignment has been completed repeat the procedure as a final check.

The tube compliment of this receiver is as follows:

1—6SK7GT—R. F. Amplifier.

1—6SA7GT—Converter.

1—6SK7GT—I.F. Amplifier.

1—6SQ7—Detector—AVC—1st audio.

1—6V6GT—Power output.

1—6X5GT—Rectifier.

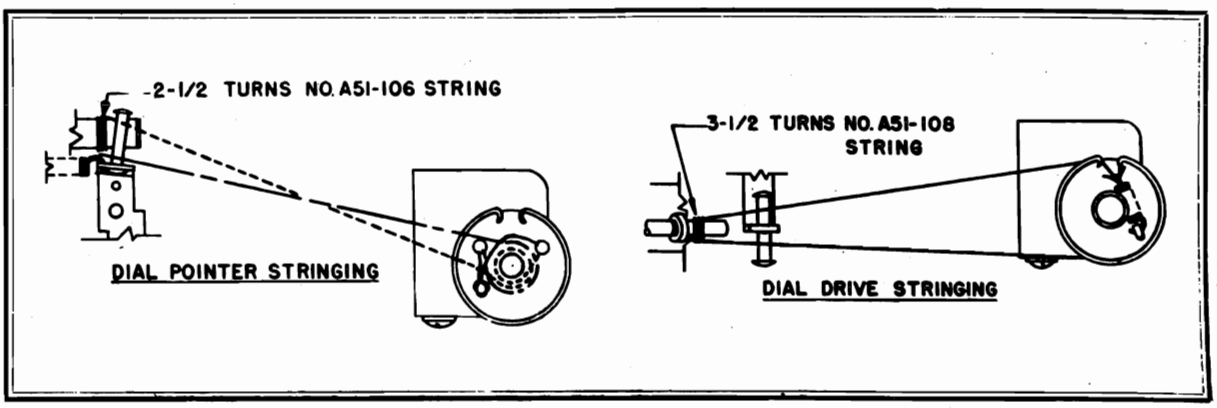
INSTRUCTIONS FOR REMOVING CHASSIS FROM THE CASE

The bottom cover (the one with the speaker louvers) can be removed to permit servicing of major components, such as tubes and vibrator, by removing the eight (8) screws holding it to the top cover. There are three (3) screws on each side, one (1) in the rear, and one (1) in the front.

CAUTION: Before attempting to remove the top cover, to service condensers, resistors, etc., the screw connecting the spark plate to the "A" terminal (inside case) must be removed. This is a round head screw, and is located on the rear of the case, close to the mounting stud bolt. It is recessed in a ½ inch hole in the case itself, thereby permitting contact with the spark plate.

After removing the spark plate screw, remove the two knobs by pulling forward and remove the eight (8) screws securing the cover to the chassis. Lift the chassis at the rear, at the same time moving it away from the front of the case so that the volume and tuning shafts will clear the holes in the cover.

NOTE: When reinstalling the chassis into the case, be sure the screw connecting the spark plate to the "A" terminal (inside case) is tightened very securely, otherwise the receiver will not operate properly.



ALIGNMENT PROCEDURE

Volume control—Maximum, all adjustments.

No signal applied to antenna.

Power input—6.3 volts.

Connect dummy antenna in series with output lead of signal generator.

Connect output meter across voice coil.

Connect ground lead of signal generator to chassis.

Repeat alignment procedure as a final check.

The following equipment is necessary for proper alignment:

Signal generator that will provide the test frequencies as listed.

Non-metallic screwdriver.

Output meter.

Dummy antennas—.1 MFD., .00025 MFD.

For alignment points refer to Figures 4 ad 5.

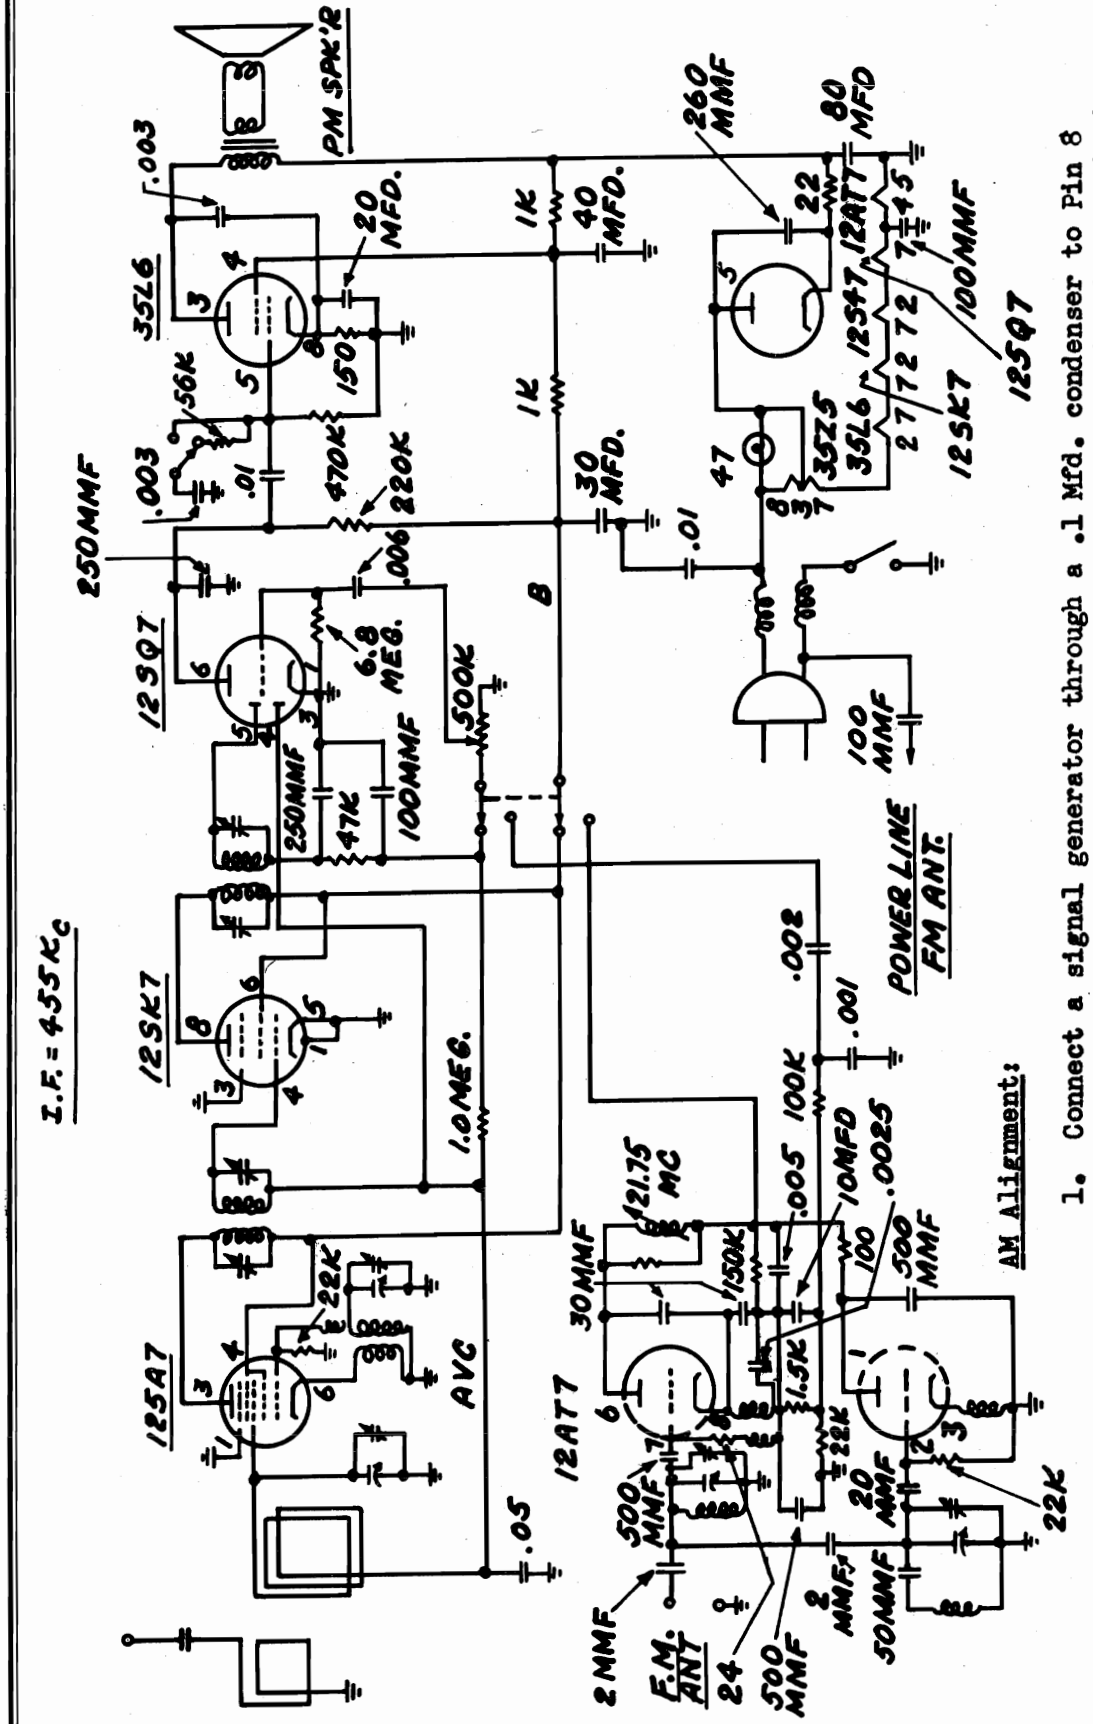
WATTERSON RADIO MFG. CORP. MODEL 4800



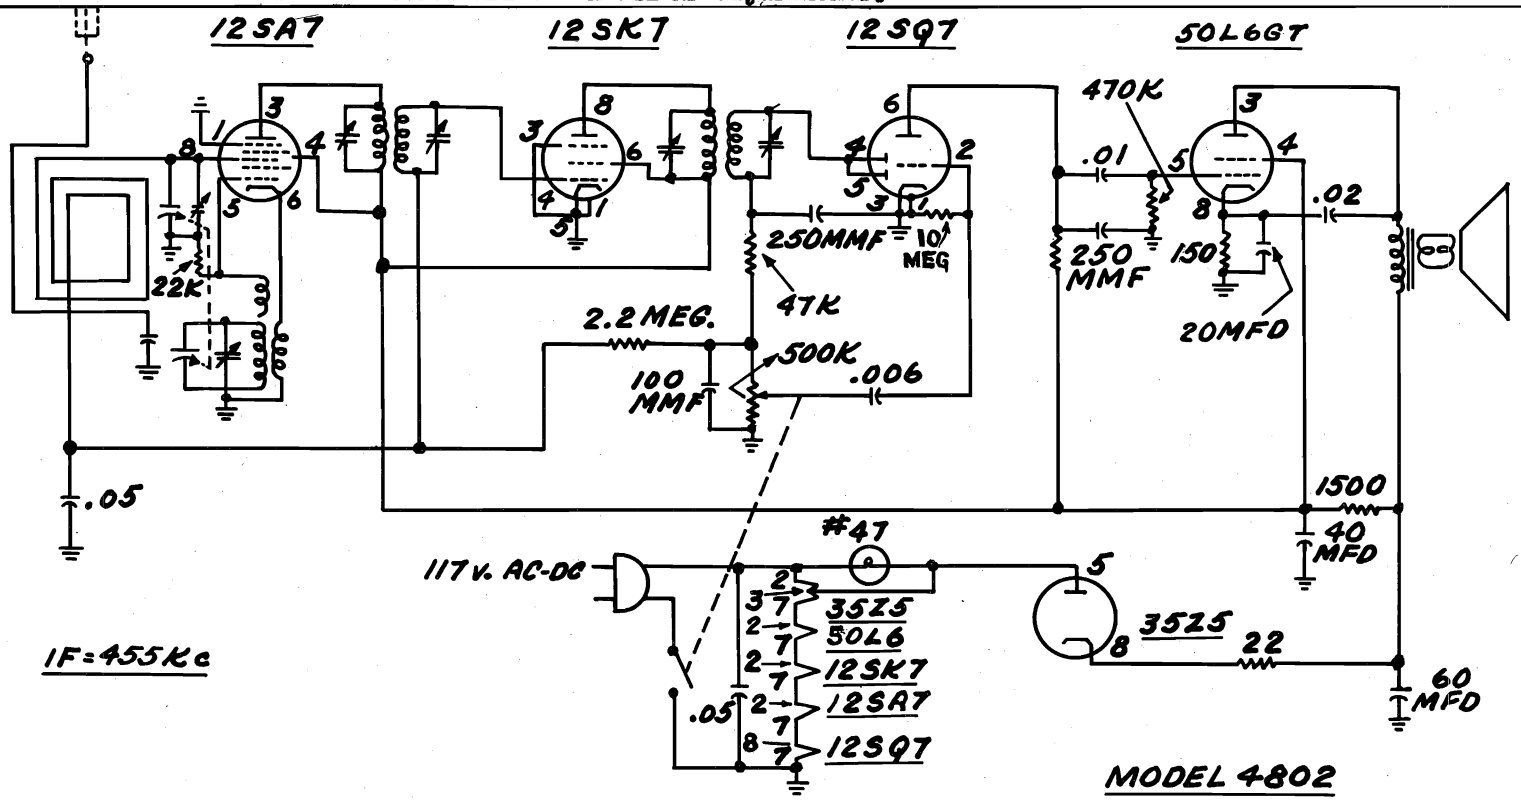
Use an unmodulated signal and tune for minimum noise in all FM adjustments.

FM Alignment:

MODEL 4800 AM/FM

1. Connect a signal generator to the FM ant. terminals. Using a 21.75 Mc. signal, tune the IF slug adjustment for minimum noise making sure slug is at the tuning point nearest top of can. There is another tuning point with the slug screwed farther down into the coil which produces unwanted coupling.

2. With a 150 ohm resistor in each lead, connect a high frequency generator to the FM ant. Terminals. Set ant. trimmer to maximum capacity. Use enough signal to give a definite dip in noise but do not block the receiver. Set the osc. section to track from 87.5 Mc. to 108.5 Mc. by trimming on the high end and adjusting the osc. coil spacing on the low end. Check each of these adjustments several times. Next, with the generator set at 103 Mc. Tune in this signal on the receiver. While rocking the dial slightly, tune the ant. trimmer for minimum noise. Use an insulated screw driver on all RF adjustments.

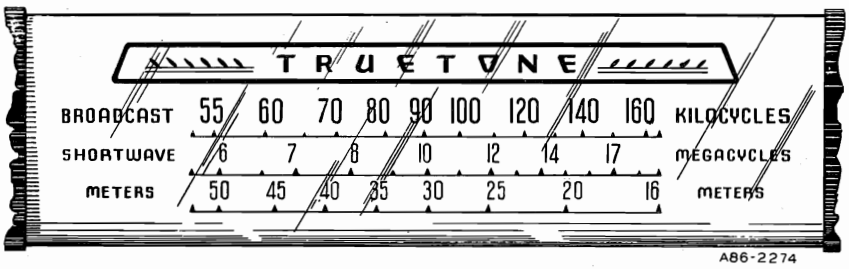


WESTERN AUTO SUPPLY CO. MODEL D1835B

SHORT WAVE BAND

5.75 to 18.3 Megacycles

This band is calibrated in both megacycles and meters. The principal international short wave stations will be found in the 16, 19, 25, 31 and 49 meter bands.



BROADCAST BAND

540 to 1600 Kilocycles

This band is calibrated in channel numbers. Add a zero to the dial number to get the kilocycle number.

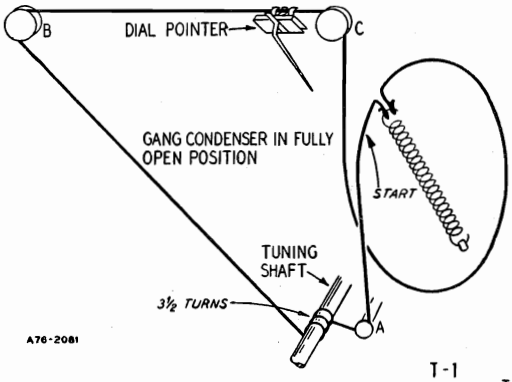
ON-OFF SWITCH AND VOLUME CONTROL

Turn radio on by turning knob to the right. A click will be heard—wait 30 seconds for tubes to heat. Continuing to turn the knob to the right will increase the volume.

TONE CONTROL AND PHONO-RADIO SWITCH

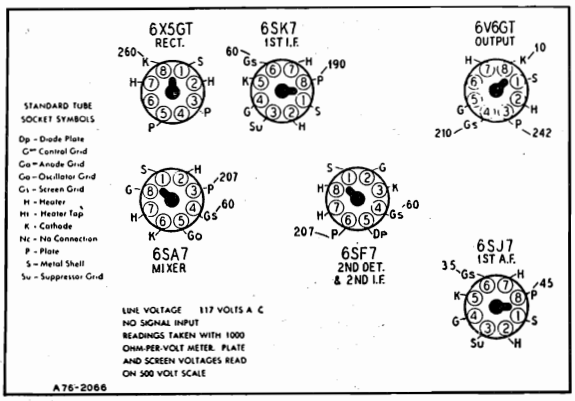
PHONO-RADIO SWITCH—For radio reception, turn knob completely to the left. A click will be heard, if the knob was in the phono position. For phonograph reproduction, turn knob completely to the right. (See page 2 for Record Player Connections). A click will be heard, if the knob was in the radio position.

TONE CONTROL—When knob is turned to the right, a brilliant tone is obtained and when turned to the left, a deep bass effect is produced. Do not turn knob past the stop position when adjusting the tone or the position of the Phono-Radio Switch will be changed as explained above.



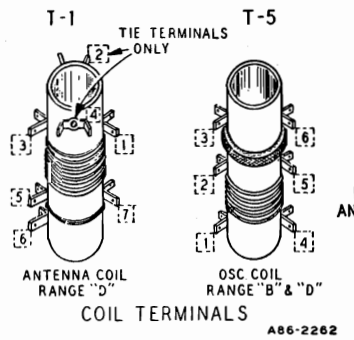
BAND SWITCH

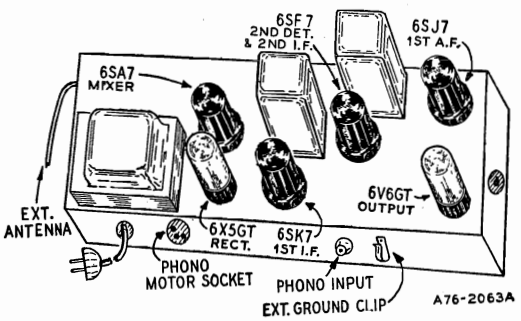
This knob has two positions. The position to the left provides reception on the standard Broadcast Band. The position to the right switches the tuning to the Short Wave Band.



DRIVE CORD REPLACEMENT

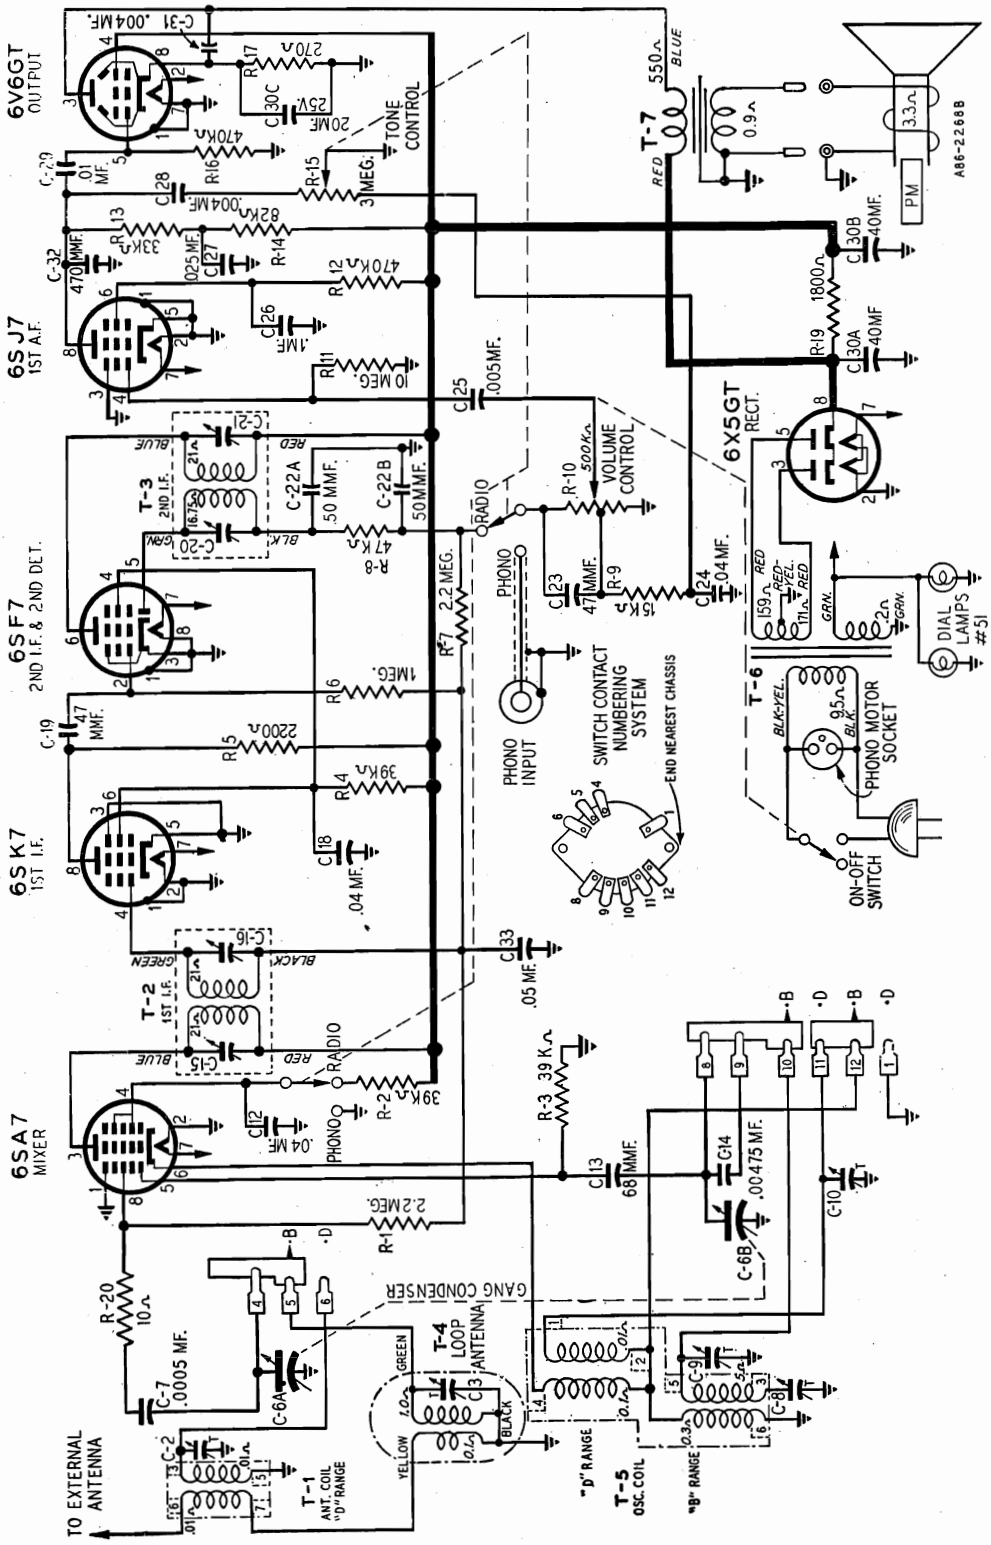
The drive cord should be replaced as shown on the accompanying illustration using a new 10X66 drive cord assembly for the purpose. After the cord has been installed, stretch the tension spring and fasten the free end of the cord to it.





MODEL D1835B

WESTERN AUTO SUPPLY CO.



WESTERN AUTO SUPPLY CO. MODEL D1835B

ALIGNMENT PROCEDURE

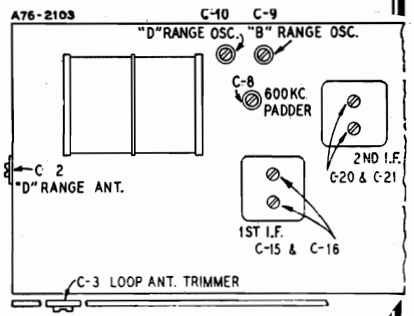
Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide ... accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter—Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 50 mmf., and 400 ohms.

	SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I.F.	455 KC	Grid of 6SA7 Pin 8	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C15) & (C16) 2nd I.F. (C20) & (C21)
RANGE B	1620 KC	Antenna Lead	50 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C9)
	1400 KC	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output	Ant. Range B (C3)
	600 KC	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output	600 KC (C8) See Note B
	Repeat above steps at 1620 and 600 KC until readjusting the oscillator Range B Trimmer (C9) causes no further improvement in output.					
RANGE D	18.3 MC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
	16 MC	Antenna Lead	400 Ohm	D Range	Tune Rotor to Max. Output	Ant. Range D (C2) Rock Rotor—See Note B
LOOP RANGE B	Reassemble chassis in cabinet. 1400 KC	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output See Note A	Ant. Range B (C3)



NOTE A—Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn rotor back and forth, and adjust the trimmer until peak of greatest intensity is obtained.

SPECIFICATIONS

Power Consumption .....45 Watts (At 117 volts AC)

B Range .....540 to 1600 KC
D Range .....5.75 to18.3 MC

Sensitivity (For .05 watt output—External Antenna).
B Range .....9 Microvolts Average
D Range .....20 Microvolts Average

REMOVAL OF CHASSIS FROM CABINET

Before removing the chassis from the cabinet it will be necessary to detach the dial pointer from the dial string. To do this, spread the tabs on the pointer and pull the dial string off the pointer.

The dial lamp socket assemblies may be disengaged from the cabinet mounting by squeezing together and pulling away from the cabinet mounting, the spring bracket to which the dial lamp socket is mounted. Take care not to bend or damage the large drive pulley on the gang condenser while doing this.

When replacing the chassis in the cabinet it will be necessary to tune in a station of a known frequency and move the dial pointer until that frequency is indicated on the dial and then attach the pointer to the dial string. Take care not to scuff or cut the dial string or bend the pointer during this operation.

REPLACEMENT PARTS LIST

NOTICE: There is a model number label on the chassis. This label identifies the radio as to chassis, dial and issue letter. When ordering parts or writing, give ALL information appearing on this label.

MISCELLANEOUS

12A486	12" P.M. Speaker

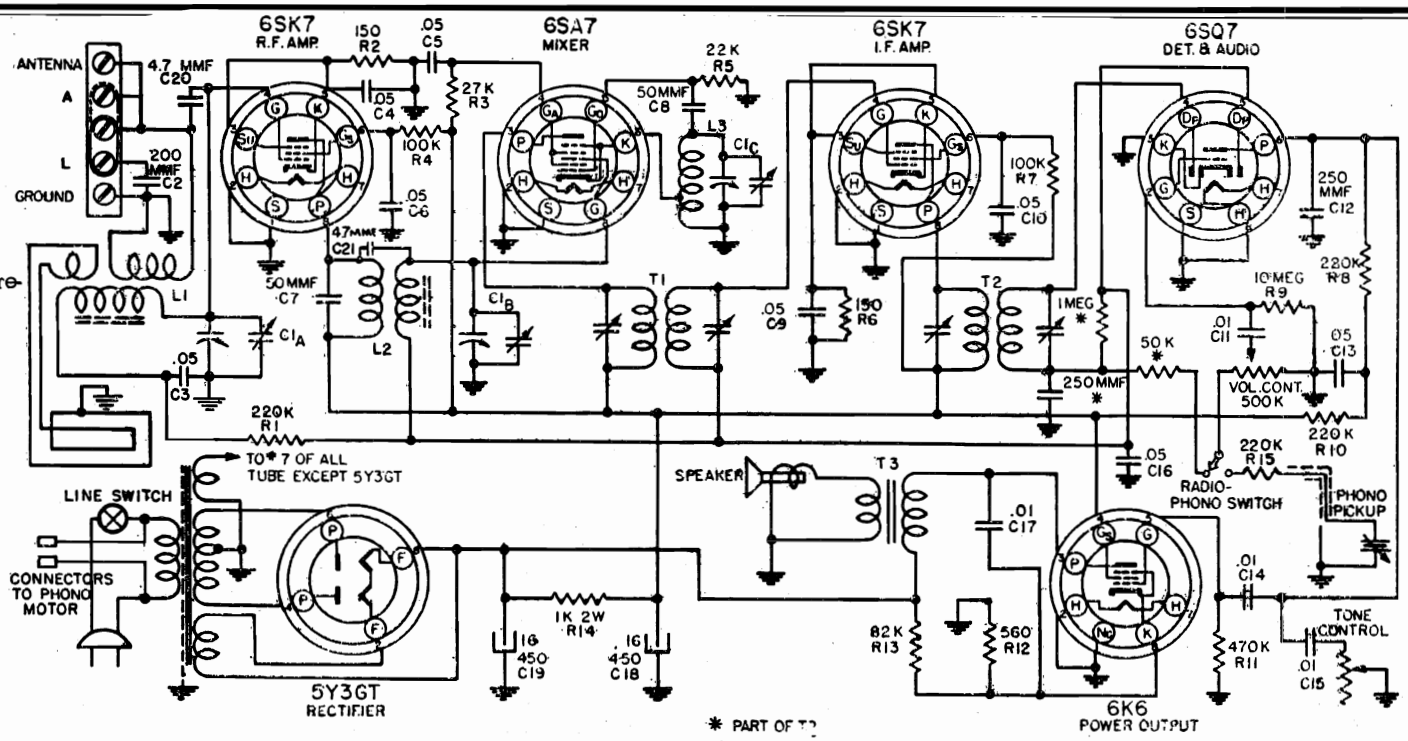
TUBE COMPLEMENT

The tube complement of this receiver consists of the following:

1—6SK7—R.F. Amplifier
1—6SA7—Mixer—OSC.
1—6SK7—I.F. Amplifier
1—6SQ7—Det. AVC—Audio
1—6K6—Power Output
1—5Y3—Rectifier



SOCKET VOLTAGES

All voltages are measured with a 1000 ohm per volt meter on the 150 volt scale, with no signal. To obtain an accurate voltage check the A.C. line voltage must be 117 volts. Where no voltage is shown the voltage is O or cannot be read with this type of voltmeter.

SERVICE NOTES

Voltages taken from the different points of the circuit to the chassis are measured with volume control in maximum position, all tubes in their sockets and with a volt meter having a resistance of 1000 ohms per volt, using the 150 volt scale. These voltages are clearly indicated on the voltage chart. (Fig. 2).

All voltages should be measured with an A.C. line voltage of 117 volts.

To check for open by-pass condensers, shunt each condenser with another one having the same capacity and voltage rating which is known to be good until the defective unit is located.

ALIGNING INSTRUCTIONS

Never attempt any adjustments on this receiver unless it becomes necessary to replace a coil or transformer, or the adjustments have been tampered with in the field. Always make certain that other circuit components, such as tubes, condensers, resistors, etc., are normal before proceeding with realignment.

If realignment is necessary follow the instructions given under the heading "ALIGNMENT PROCEDURE" on the next page. After realignment has been completed repeat the procedure as a final check.

REMOVING CHASSIS FROM CABINET

The dial pointer must be removed from the pointer rail assembly, and cabinet before the chassis can be taken from the cabinet. This can be done by detaching the dial cord from the pointer and sliding the pointer to the right (viewed from the rear of the cabinet) as far as it will go. The dial pointer can now be removed from the cabinet.

The chassis can now be removed in the conventional manner by taking out the four chassis mounting bolts after disconnecting the speaker and phono leads.

WESTERN AUTO SUPPLY CO. MODEL D1840

ALIGNMENT PROCEDURE

Volume control—Maximum: all adjustments.
Tone Control—Treble: Full Clockwise Rotation.
Connect ground lead of signal generator to radio chassis.

Connect dummy antenna in series with output lead of signal generator.

Connect output meter across voice coil of speaker.

The following equipment is necessary for proper alignment

Signal generator that will provide the test frequencies as listed.

Output meter.

Non-metallic screwdriver.

Dummy antennas—.1 mfd., 00025 mfd.

Position of Variable	Generator Frequency	Dummy Ant. mfd.	Generator Connections	Trimmer Adjustment	Trimmer Function
Minimum Capacity (Fully Opened)	455 K.C.	.1	6SA7 Grid (Stator of C1B)	T1 T2	I. F.
Minimum Capacity (Fully Opened)	1725 K.C.	.00025	*Ant. Terminal on Loop	C1C	Osc.
Tune in signal From Generator	1500 K.C.	.00025	*Ant. Terminal on Loop	C1B	R. F.
Tune in signal From Generator	1500 K.C.	.00025	*Ant. Terminal on Loop	C1A	Ant.

*Be sure coupling link is in correct position for external antenna operation. See illustration below (Fig. 4).

Repeat the above alignment procedure as a final check.

With an output meter connected across the voice coil of the speaker, the output meter reading for ½ watt is 1.25 volts using a signal which is modulated 400 c.p.s.

WESTERN AUTO SUPPLY CO. MODEL D1850

ELECTRICAL SPECIFICATIONS

Power Supply.....105 to 125 volts, AC, 60-cycles; Chassis only 122 watts. With phono operation 150 watts.

Frequency Range....Broadcast Band—535 to 1620 kc. FM Band—88 to 108 mc.

Intermediate Freq...AM-455 kc; FM-10.7 mc.

Selectivity.....AM-48 kc. broad at 1000 times signal, measured at 1000 kc. I.F. FM-180 kc. broad at 2 times down. I.F. FM-320 kc. broad at 10 times down.

AM Sensitivity.....(For .5 watt output with external antenna)—3 microvolts average.

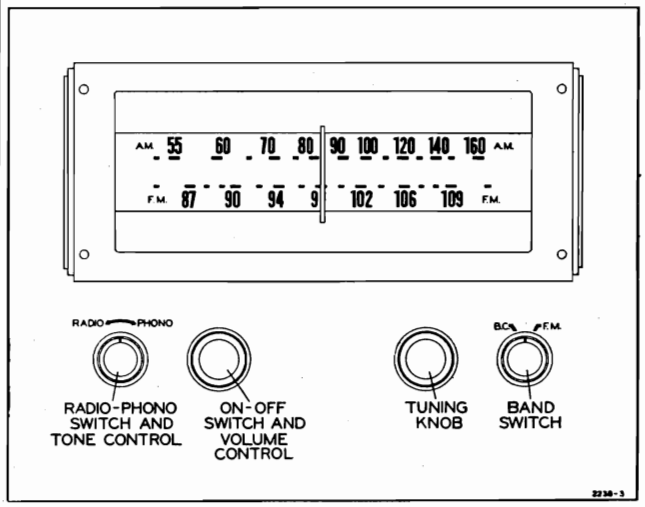
FM Sensitivity.....(For .5 watt output)—10 microvolts average.

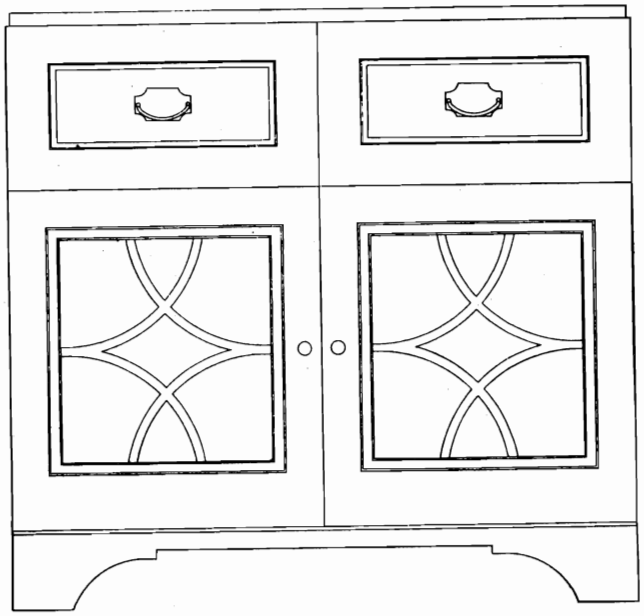
Power Output.....8 watts. 10% distortion. 10 watts maximum.

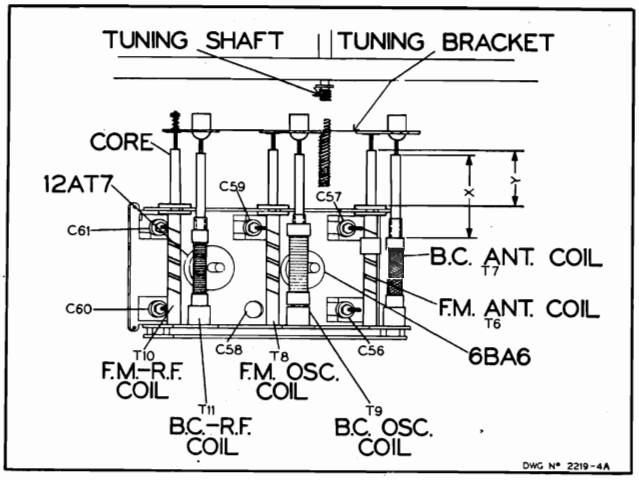
Loud Speaker.....12" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.

Tube and Lamp Complement.....6BA6, FM—AM R.F. stage.
12AT7, FM—AM oscillator and mixer.
6BA6, FM—AM—1st I.F.
6BA6, FM—2nd I.F.
6AL5, FM—ratio detector.
6AT6, AM detector.
A. F. AMP. and A.V.C.
6SN7, Push-Pull. Driver and phase-inverter.
5U4G, rectifier.
6V6, output.
6V6, output.
T-44 dial lamp (2 used).

Automatic changer..Oak 6666 with P-93 Cartridge.

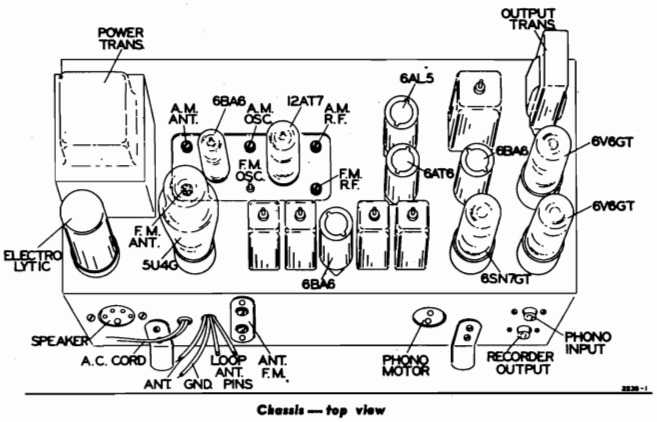






TUNER ADJUSTMENT

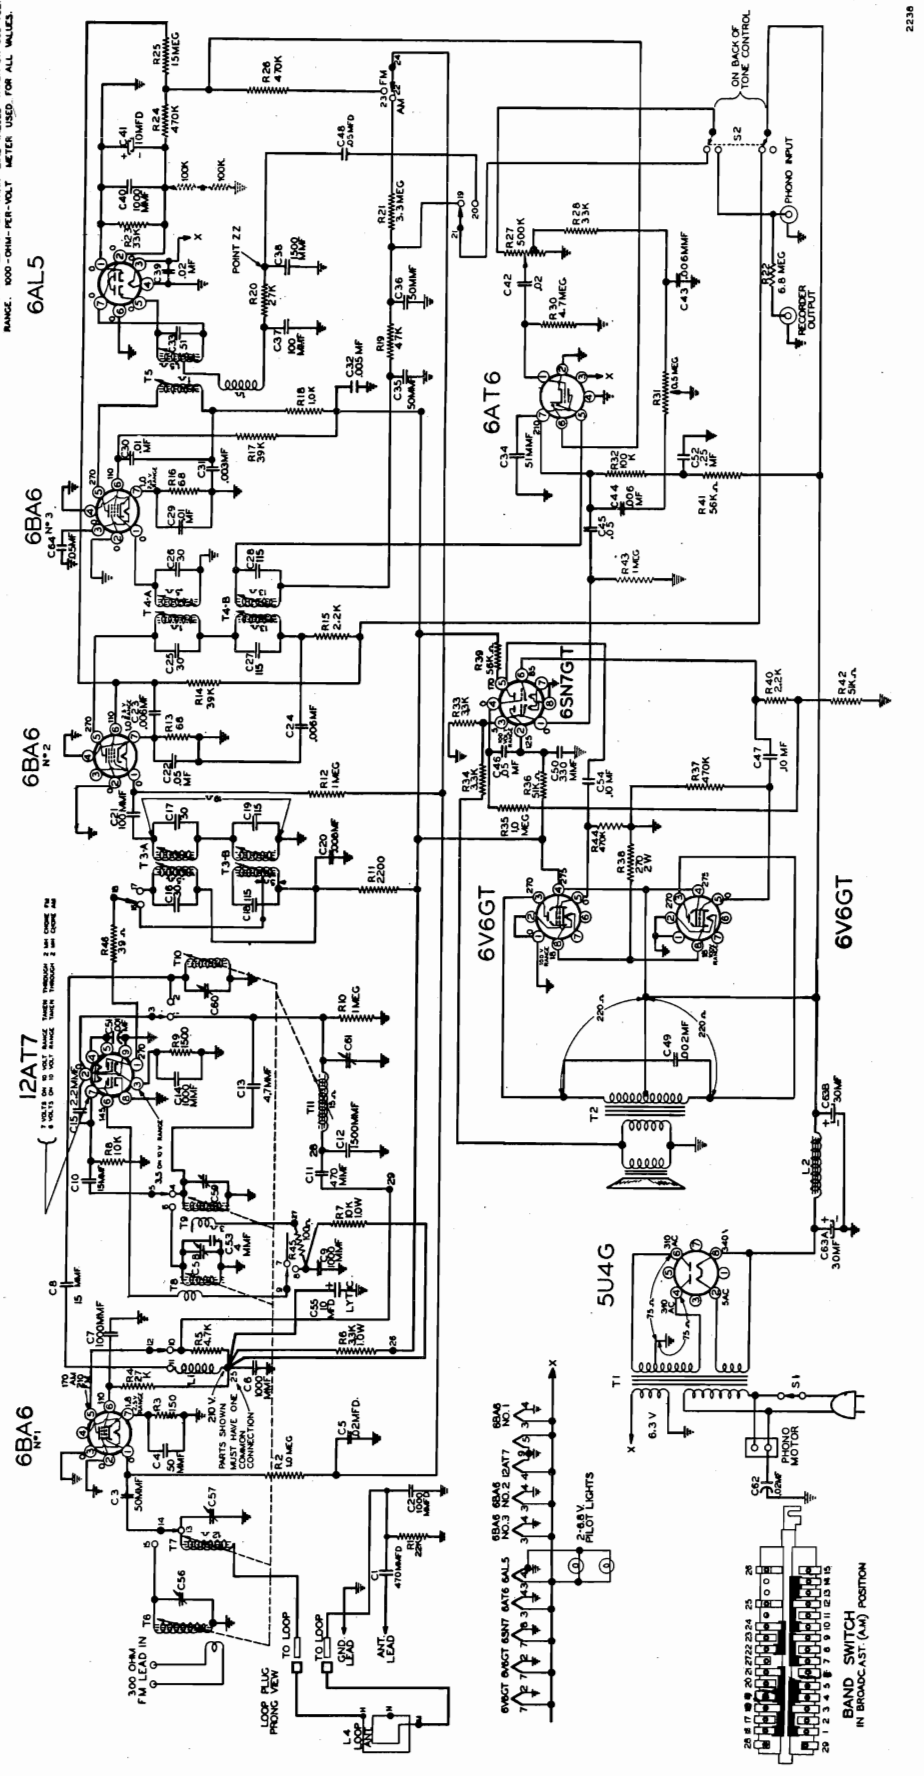
With tuner all the way out, dimension "X" should be 1½ inches. "Y" should be 1-1/32 inches. "X" is from the end of the slug to edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM Band. No slug adjustment should be necessary since the slugs are properly set at the factory.



Chassis — top view

MODEL D1850

WESTERN AUTO SUPPLY CO.



NOTE: Two 100K ohm resistors in series from Pin No. 2 of the 6AL5 to ground are connected as shown only when aligning the FM I. F. Refer to FM I. F. alignment procedure.

NOTE: B.C. Oscillator Coil T9 and number 7 terminal of slide switch should be connected together.

NOTE: Resistor R22 removed; with shielded wire from recorder output jack to radio side of radio-phono switch S2 added.

RECORD CHANGER: Oak Model 6666, RCD CH 15-1

WESTERN AUTO SUPPLY CO. MODEL D1850

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissable.

AM-I.F. ALIGNMENT

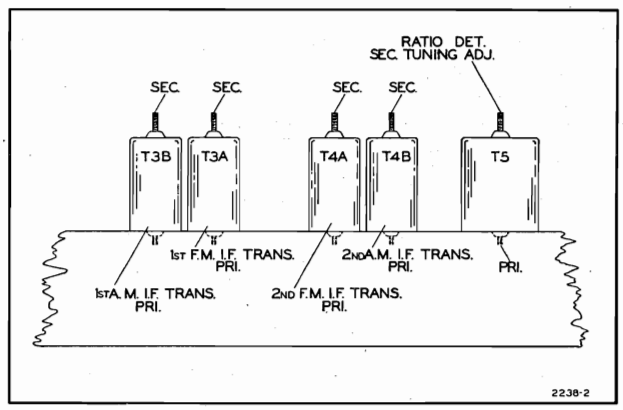
Band Switch in AM Position. Tune Set to 1400 *Kc. Dummy Antenna* .1 *Mfd.*

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 1000 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T4B AM windings See I. F. view	Maximum output Should be ½ watt.
455 Kc. Use 30 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T3B AM windings See I. F. view	Maximum output Should be ½ watt.
400 cycles. Use 28 millivolts	Hot end of volume control and ground	None	Maximum output Should be ½ watt.

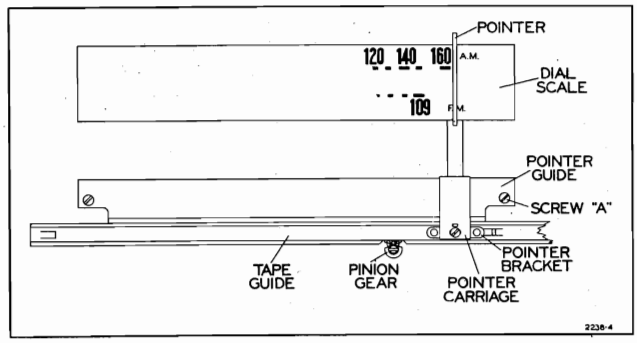
BROADCAST BAND-R.F. ALIGNMENT

Check pointer so that it coincides with the right hand marker to the extreme right when iron cores are all the way out.
For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQ.	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc. Use 3 microvolts	AM Antenna and Ground	200 mmf.	C59, C57, C61. For maximum, ½ watt



I. F. VIEW



DIAL ADJUSTMENT VIEW

Loosen screw "A" so that teeth of tape can be properly meshed with pinion gear to give proper pointer travel.

MODEL D1850 WESTERN AUTO SUPPLY CO.

ALIGNMENT PROCEDURE

FM Band Section I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT— No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over a long period of time.

NOTE— The following alignment is based on the use of the new Simpson vacuum tube voltmeter which has a "floating ground". In other words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM-I.F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENT TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 No. 3 and ground	Pin No. 2 of 6AL5 and ground	Primary of T5	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 No. 3 and ground	See note "A"	Secondary of T5	Resonance should be about 3 volts
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of T4A 10.7 m.c. windings See I.F. view	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 200 microvolts	Pin No. 2 of 12AT7 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T3A See I.F. view	Resonance should be about 3 volts

NOTES ON FM — I. F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube voltmeter between the mid-point of the resistors and point zz.

NOTE "B" If T5 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL: Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM-R.F. ALIGNMENT

Check pointer so that it coincides with the right hand marker to the extreme right when iron cores are all the way out.
For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 10 microvolts	FM Antenna Terminals See note	300 ohms	C58 Osc. C60 R. F. C56 Ant.	Pin No. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however, will not produce 3 volts.

NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw.

MODEL D1946

WESTERN AUTO SUPPLY CO.

ELECTRICAL SPECIFICATIONS

Power Consumption—
117 volts AC 60 watts normal
85 watts phono operating

Power Output—
4.5 watts maximum
2.5 watts 10% distortion

Speaker—8" PM dynamic

Frequency Ranges—
Broadcast 540-1600 KC
Frequency Modulation 88-108 MC

Intermediate Frequency—
AM 455 KC — FM 10.7 MC

Selectivity — AM — 45 KC broad at 1000 times signal, measured at 1000 KC
I.F. FM—200 KC broad at 2 times down
I.F. FM—950 KC broad at 200 times down

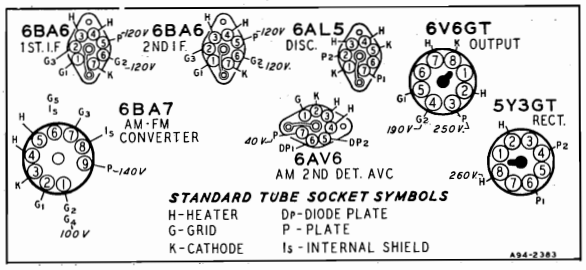
AM Sensitivity—(For .5 watt output with external antenna)
10 microvolts average

FM Sensitivity—(For .5 watt output)
100 microvolts average

TUBE SOCKET VOLTAGES

Socket voltages are shown on the Bottom Socket diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage .....117 Volts AC
Signal Input .....None
A Variation of ±10% is usually permissible.



REMOVAL OF CHASSIS FROM CABINET

Before removing the chassis from the cabinet it will be necessary to detach the dial pointer from the dial string. To do this, spread the tabs on the pointer and pull the dial string off the pointer.

The dial lamp socket assembly may be disengaged from the cabinet mounting by squeezing together and pulling away from the cabinet mounting, the spring bracket to which the dial lamp socket is mounted. Take care not to bend or damage the large drive pulley on the gang condenser while doing this.

When replacing the chassis in the cabinet it will be necessary to tune in a station of a known frequency and move the dial pointer until that frequency is indicated on the dial and then attach the pointer to the dial string. Take care not to scuff or cut the dial string or bend the pointer during this operation.

DRIVE CORD REPLACEMENT

Replacement of the drive cord may be accomplished as shown in the illustration. For this purpose use the new drive cord assembly listed in the Replacement Parts List. Turn the gang condenser until the plates are fully meshed. Then install the string as shown, winding three turns clockwise around the tuning shaft with the turns progressing away from the chassis. After the cord is installed, rotate the tuning shaft several times in order to take up any slack in the cord.

ALIGNMENT PROCEDURES

AM STAGES

Volume Control Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50 mmf.

SIGNAL GENERATOR					
FREQUENCY SETTING	CONNECTION AT RADIO	GROUND CONNECTION	DUMMY ANTENNA	GANG CONDENSER SETTING	ADJUST TUNING SLUGS AND TRIMMERS
455 KC	Control Grid 1st 6BA6 Pin No. 1	Chassis Base	.1 mf	Turn Rotor to Full Open	2nd I.F. C-21 & C-22
455 KC	Control Grid 6BA7 Pin No. 7 1st Det.	Same as above	.1 mf	Turn Rotor to Full Open	1st I.F. Pri. & Sec.
1620 KC	Control Grid 6BA7 Pin No. 7	Same as above	.1 mf	Turn Rotor to Full Open	Oscillator C-7
1400 KC	External Antenna Lead	Same as above	50 mmf	Turn Dial to 1400 KC. See Note A	Antenna C-2

NOTE A—Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

FM STAGES

Allow chassis and signal generator to warm up for several minutes. The following equipment is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—2500 mmf, 300 ohms and a 3300 ohm .5 watt resistor with short leads.

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.)

	SIGNAL GENERATOR

	RECHECK ANTENNA & OSC. ADJUSTMENTS IN ORDER GIVEN					

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it to the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Unsolder 3300 ohm resistor from terminals 3 and 4 of 1st I-F transformer and resolder across terminals 1 and 2.

NOTE E—2nd I-F Trimmers (AM) must be aligned before attempting to adjust 2nd I-F (FM) tuning slug.

NOTE F—Remove the 3300 ohm load resistor before attempting to check the antenna and oscillator adjustments.

WESTERN AUTO SUPPLY CO. MODEL D1946

REPLACEMENT PARTS LIST

NOTICE: There is a Model Number label on the chassis. This label identifies the radio as to chassis, dial and issue letter. When ordering parts or writing, give ALL information appearing on this label.

MISCELLANEOUS

12A477	8" PM Speaker
2A373	Band Change Switch
3A303	Molded Octal Tube Socket

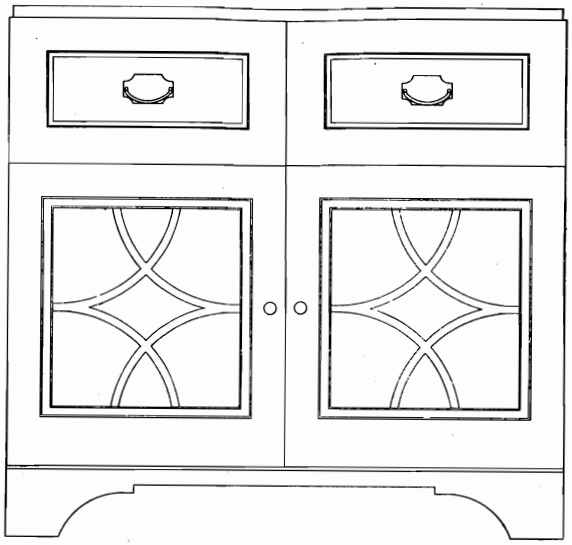
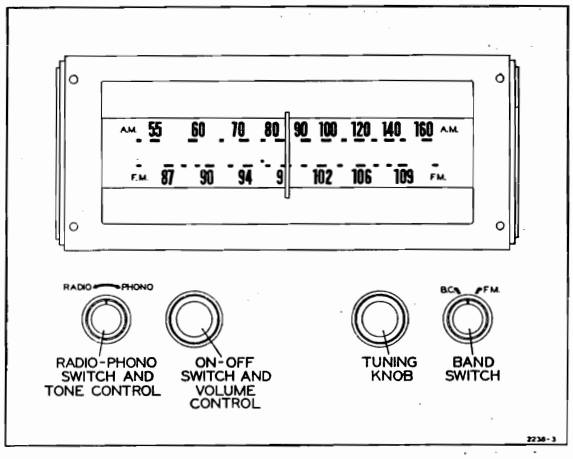
MODEL D1950 WESTERN AUTO SUPPLY CO.





ELECTRICAL SPECIFICATIONS

Power Supply.....105 to 125 volts, AC, 60-cycles; Chassis only 122 watts. With phono operation 150 watts.

Frequency Range....Broadcast Band—535 to 1620 kc. FM Band—88 to 108 mc.

Intermediate Freq...AM-455 kc; FM-10.7 mc.

Selectivity.....AM-48 kc. broad at 1000 times signal, measured at 1000 kc.
I.F. FM-180 kc. broad at 2 times down.
I.F. FM-320 kc. broad at 10 times down.

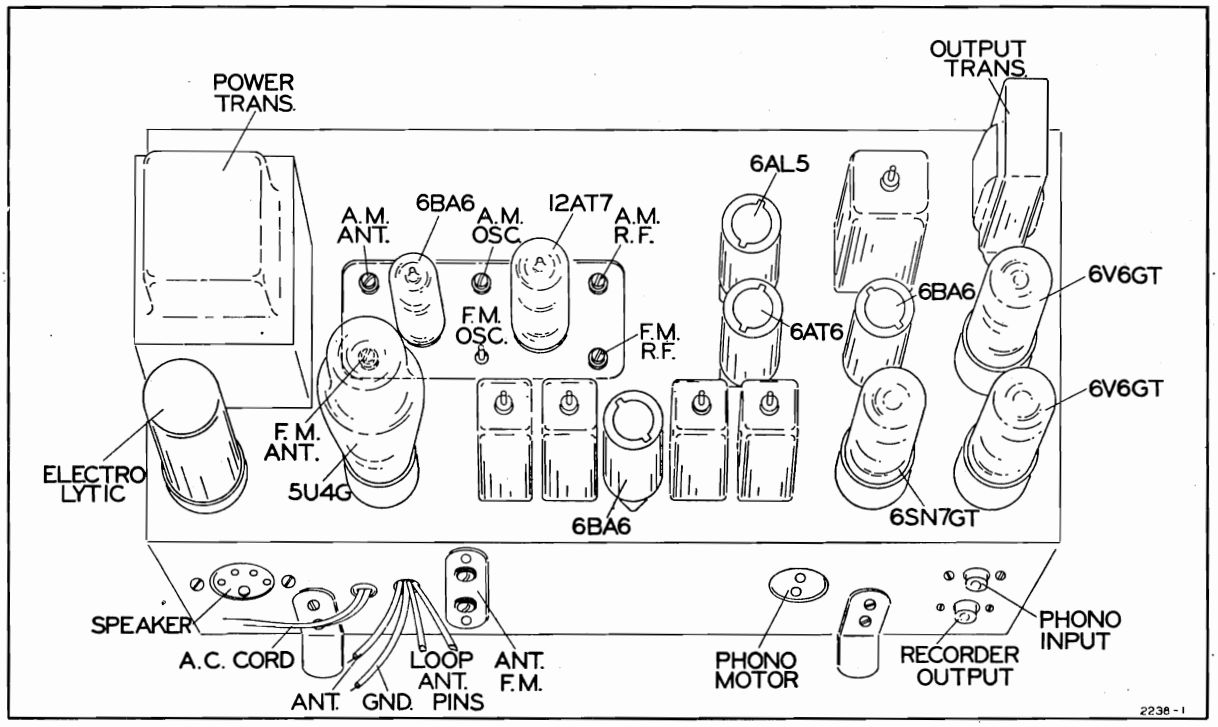
AM Sensitivity.....(For .5 watt output with external antenna)—3 microvolts average.

FM Sensitivity.....(For .5 watt output)—10 microvolts average.

Power Output.....8 watts. 10% distortion. 10 watts maximum.

Loud Speaker.....12" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.

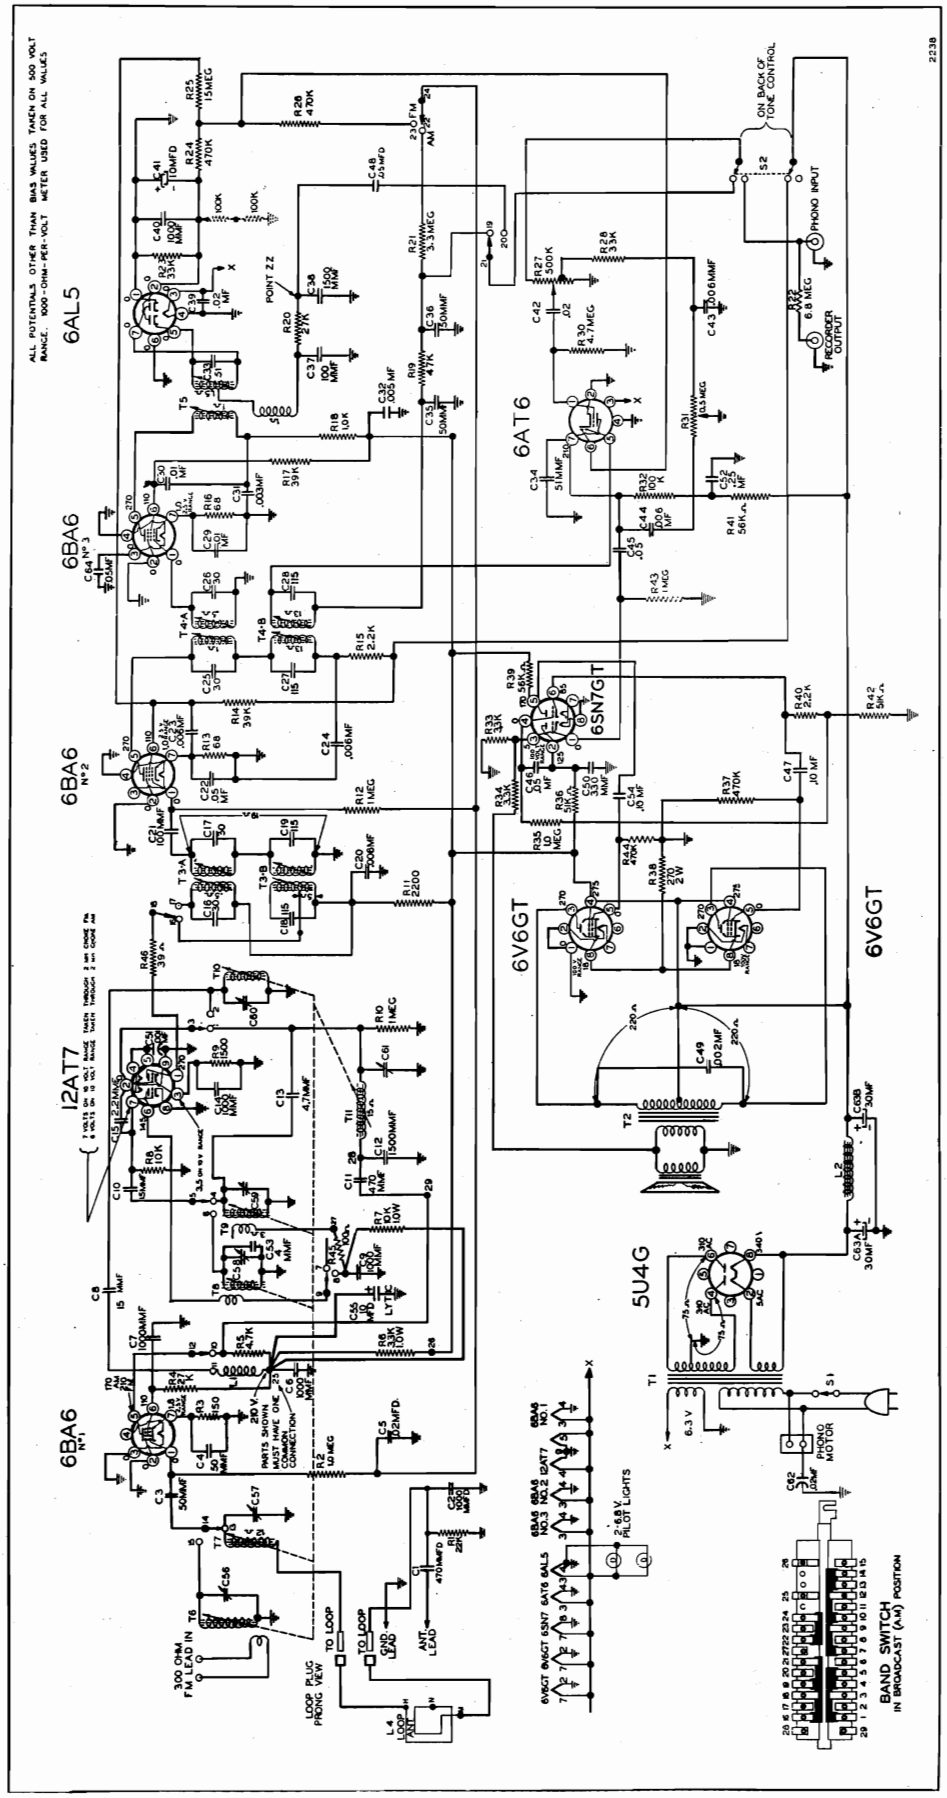
Tube and Lamp Complement.....6BA6, FM—AM R.F. stage.
12AT7, FM—AM oscillator and mixer.
6BA6, FM—AM—1st I.F.
6BA6, FM—2nd I.F.
6AL5, FM—ratio detector.
6AT6, AM detector.
A. F. AMP. and A.V.C.
6SN7, Push-Pull. Driver and phase-inverter.
5U4G, rectifier.
6V6, output.
6V6, output.
T-44 dial lamp (2 used).



Chassis — top view

WESTERN AUTO SUPPLY CO.

MODEL D1950



NOTE: Two 100K ohm resistors in series from Pin No. 2 of the 6AL5 to ground are connected as shown only when aligning the FM I. F. Refer to FM I. F. alignment procedure.

NOTE: B.C. Oscillator Coil T9 and number 7 terminal of slide switch should be connected together.

NOTE: A 3.3 ohm resistor C-9B1-1069 is connected between Pin 3 of 6AL5 and the filament line (X) in some productions.

MODEL D1950

WESTERN AUTO SUPPLY CO.

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissable.

AM-I. F. ALIGNMENT

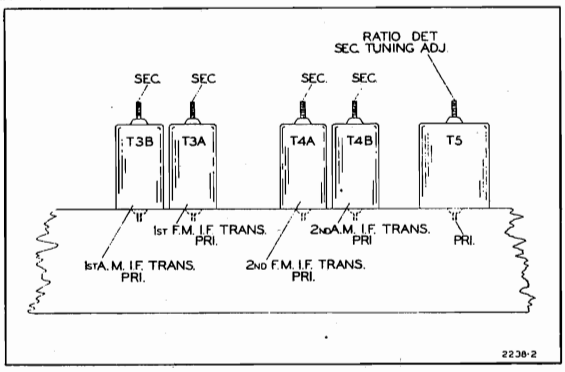
Band Switch in AM Position. Tune Set to 1400 Kc. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 1000 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T4B AM windings See I. F. view	Maximum output Should be ½ watt.
455 Kc. Use 30 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T3B AM windings See I. F. view	Maximum output Should be ½ watt.
400 cycles. Use 28 millivolts	Hot end of volume control and ground	None	Maximum output Should be ½ watt.

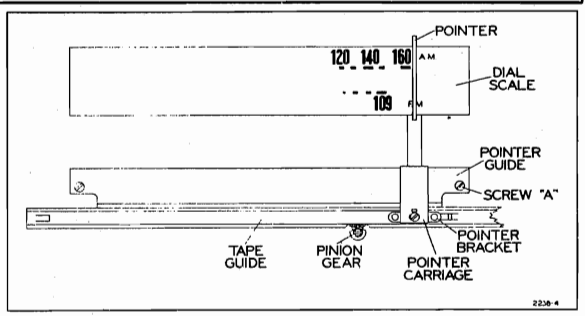
BROADCAST BAND-R.F. ALIGNMENT

Check pointer so that it coincides with the right hand marker to the extreme right when iron cores are all the way out.
For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQ.	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc. Use 3 microvolts	AM Antenna and Ground	200 mmf.	C59, C57, C61. For maximum, ½ watt

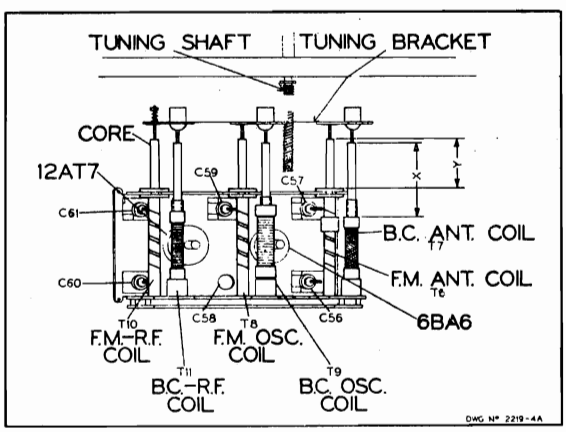


I. F. VIEW



DIAL ADJUSTMENT VIEW

Loosen screw "A" so that teeth of tape can be properly meshed with pinion gear to give proper pointer travel.



TUNER ADJUSTMENT

With tuner all the way out, dimension "X" should be 1½ inches. "Y" should be 1-1/32 inches. "X" is from the end of the slug to edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM Band. No slug adjustment should be necessary since the slugs are properly set at the factory.

WESTERN AUTO SUPPLY CO. MODEL D1950

ALIGNMENT PROCEDURE

FM Band Section I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT— No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over a long period of time.

NOTE— The following alignment is based on the use of the new Simpson vacuum tube voltmeter which has a "floating ground". In other words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM-I.F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENT TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 No. 3 and ground	Pin No. 2 of 6AL5 and ground	Primary of T5	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 No. 3 and ground	See note "A"	Secondary of T5	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of T4A 10.7 m.c. windings See I.F. view	Resonance should be about 3 volts
10.7 Mc. Use about 200 microvolts	Pin No. 2 of 12AT7 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T3A See I.F. view	Resonance should be about 3 volts

NOTES ON FM—I.F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube voltmeter between the mid-point of the resistors and point zz.

NOTE "B" If T5 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL: Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM-R.F. ALIGNMENT

Check pointer so that it coincides with the right hand marker to the extreme right when iron cores are all the way out.
For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 10 microvolts	FM Antenna Terminals See note	300 ohms	C58 Osc. C60 R. F. C56 Ant.	Pin No. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however, will not produce 3 volts.

NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw.

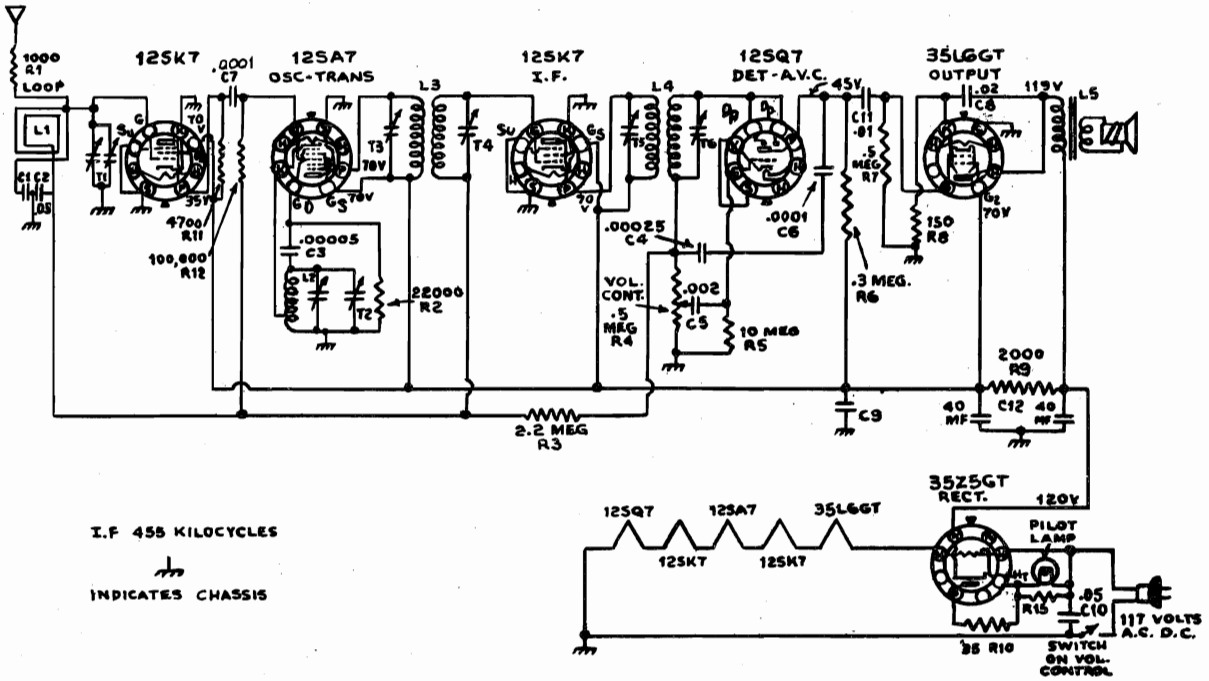
WESTERN AUTO SUPPLY CO.

MODEL D2690, 1st Type



ALIGNMENT PROCEDURE

Output meter connections.....Across primary output transformer

Connection of generator ground.....Chassis

Generator modulation.....App. 30% @ 400 cycles

Position of volume control.....Fully Clockwise

POSITION OF DIAL POINTER	GENERATOR FREQUENCY	GENERATOR CONNECTION	TRIMMERS ADJUSTED	TRIMMER FUNCTION
540 kc	455 kc	12SA7GT	T3, T4, T5, T6	I. F.
1500 kc	1500 kc	* * * See Note Below	T2, T1	Osc., R. F.

IMPORTANT ALIGNMENT NOTES

It is advisable to repeat the entire alignment procedure in the original order to insure greater accuracy.

Always keep the output from the test oscillator at its lowest possible value. As the sensitivity is increased by alignment, the generator output should be reduced correspondingly.

***Run a wire from the output terminal of the generator near the receiver. However, no connection is made between the signal generator and the receiver.

MODEL D2718B

WESTERN AUTO SUPPLY CO.

BROADCAST AND SHORT WAVE RADIO WITH BUILT-IN LOOP AERIAL

7 TUBE AC-DC
(Including Rectifier)
2 BANDS

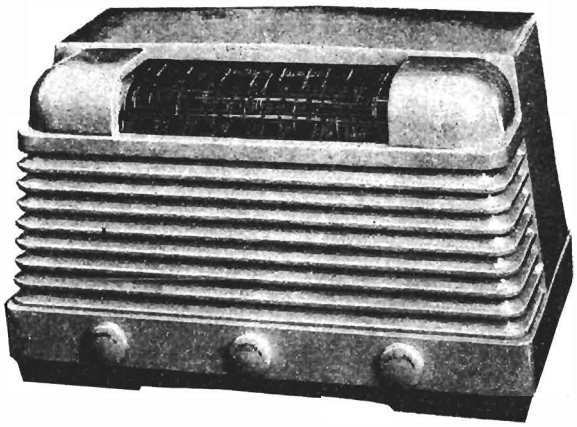
SHORT WAVE BAND

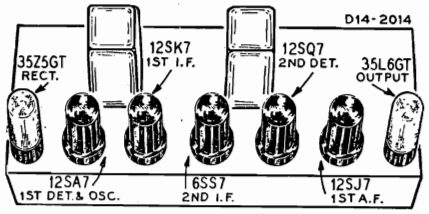
6 to 18 Megacycles

This band is calibrated in megacycles. The 16, 19, 25, 31 and 49 meter bands, in which the principal international short wave broadcasts will be heard, are located in this band.

These bands will be found on the dial as follows:

16 Meter Band...17.7—17.9 MC
19 Meter Band...15.1—15.3 MC
25 Meter Band...11.7—11.9 MC
31 Meter Band... 9.5— 9.7 MC
49 Meter Band... 6— 6.2 MC





BROADCAST BAND

540 to 1600 Kilocycles

This band is calibrated in channel numbers. Add a zero to the dial number to get the kilocycle number.

CHECK YOUR LINE VOLTAGE

Unless otherwise marked, this radio must be operated on a power supply of 105-125 volts AC, 50 to 60 cycles only, or 105-125 volts DC.

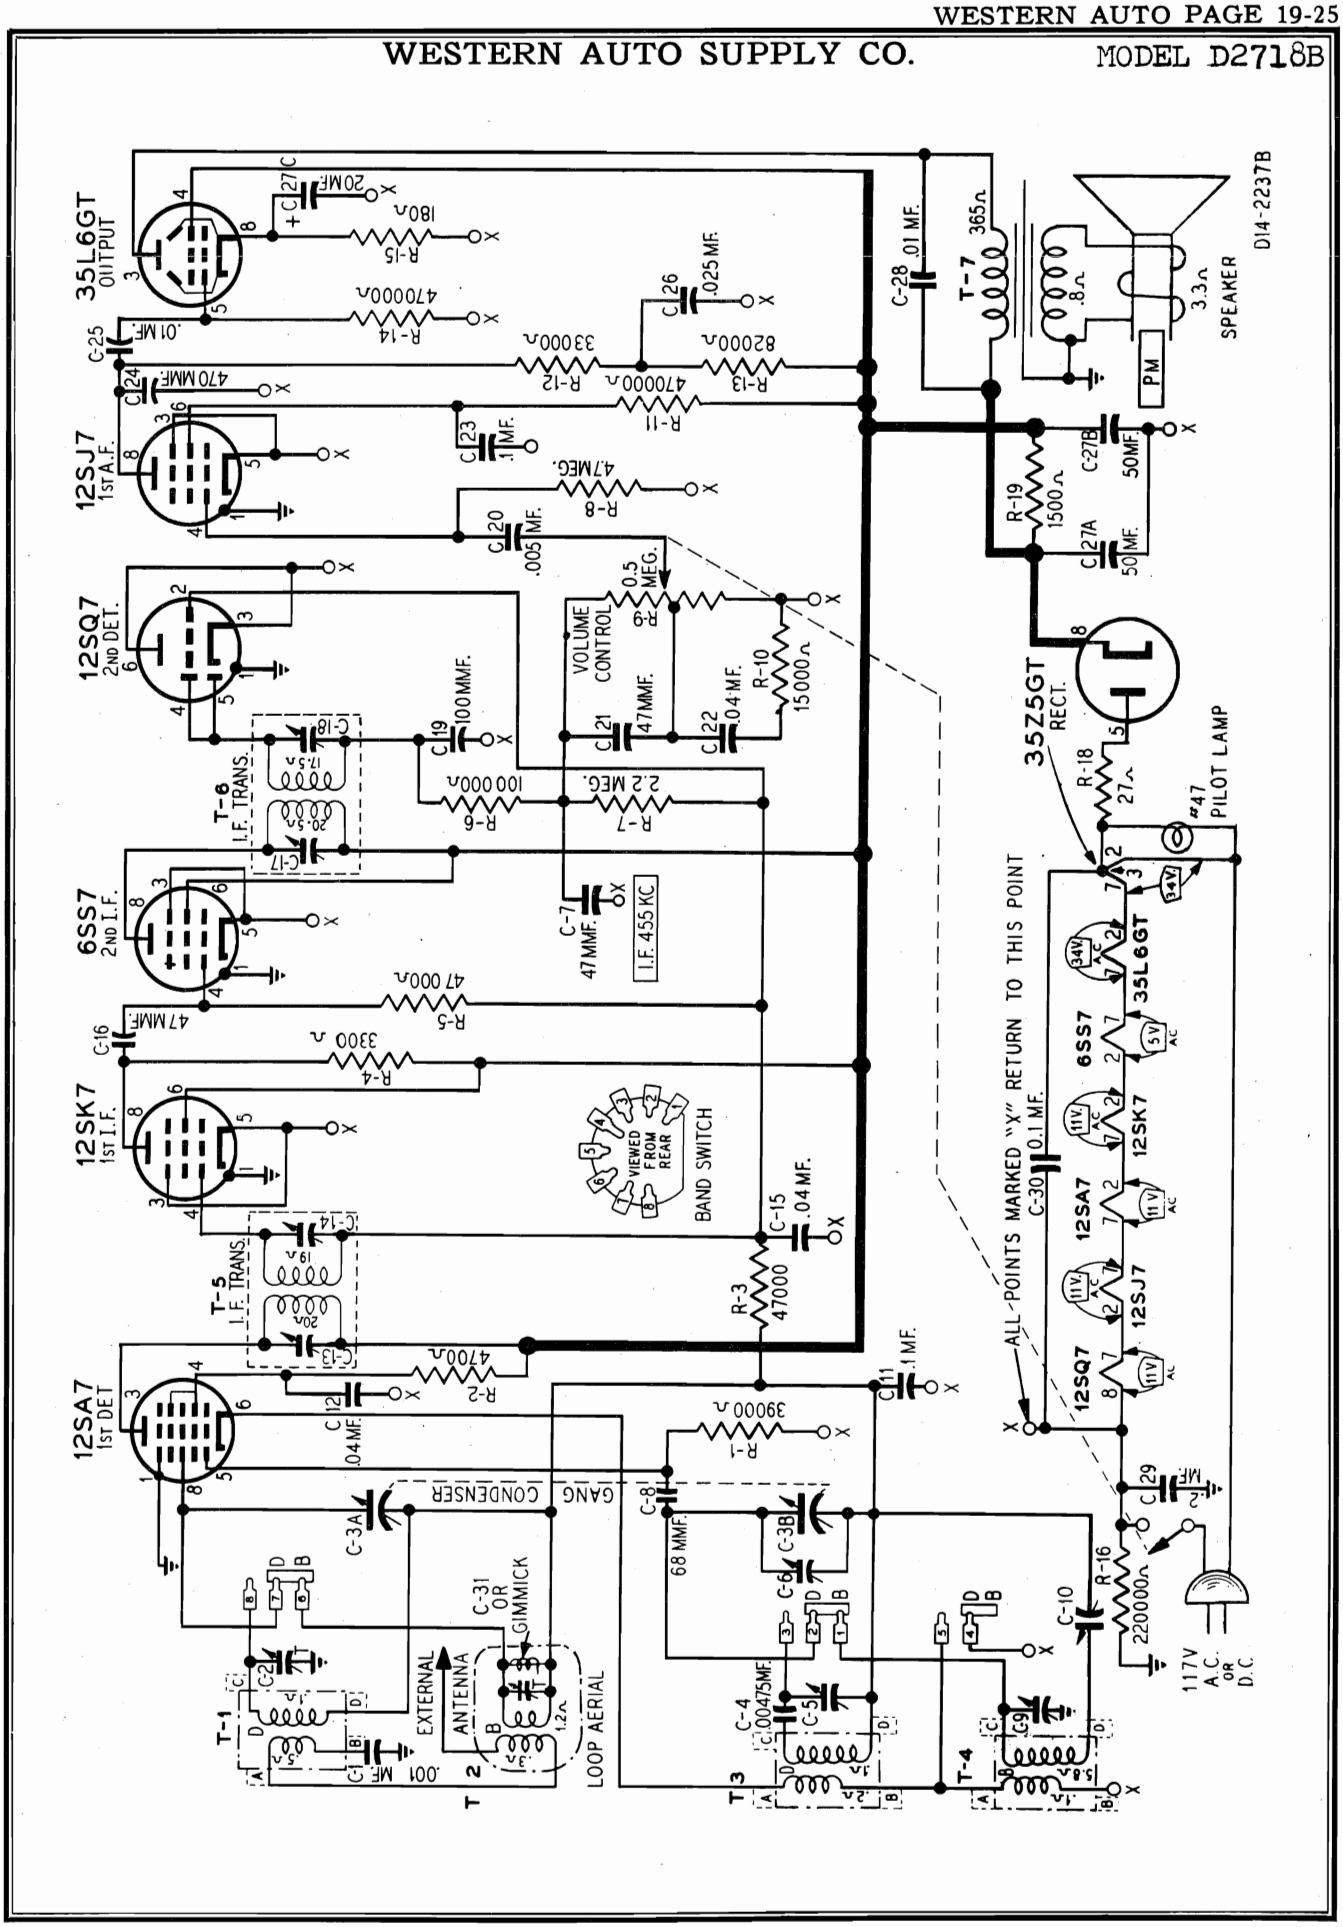
WESTERN AUTO SUPPLY CO. MODEL D2718B



ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The equipment in column at right is required for Aligning:

Signal Generator which will provide an accurately calibrated signal at test frequencies as listed.

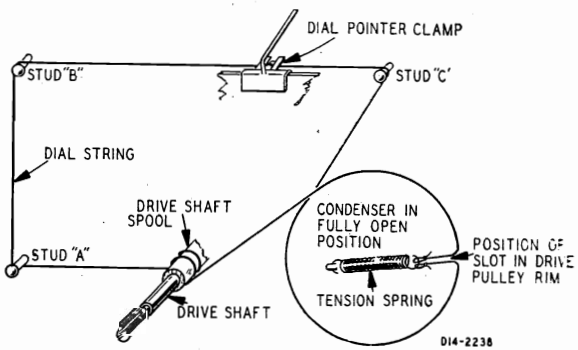
Output indicating Meter; Non-Metallic Screwdriver.

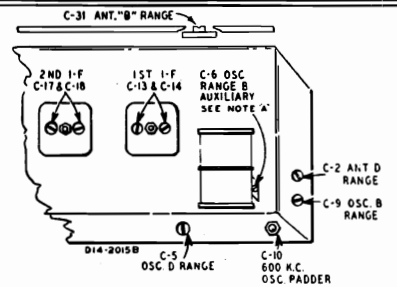
Dummy Antennas—.1 mf., 50 mmf., and 400 ohm.

SIGNAL GENERATOR						
FREQUENCY SETTING	ANTENNA CONNECTION	GROUND CONNECTION	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
I.F. 455 KC	Signal Grid of 1st Det. Connect at Stator of Large Gang Section.	Point "X" 12SK7— 1st I-F Prong No. 3	.1 mf.	B Range	Turn Rotor to Fully Open Position	1st I.F. (C13) & (C14) 2nd I.F. (C17) & (C18)
RANGE B 1600 KC	External Antenna Clip	Point "X"	50 mmf.	B Range	Turn Rotor to Fully Open Position	Oscillator Range B (C9) See Note A
1400 KC Note D	External Antenna Clip	Point "X"	50 mmf.	B Range	Turn Rotor to Max. Output. Set pointer to 1400 KC See Note C	Antenna Range B (C-31)
600 KC	External Antenna Clip	Point "X"	50 mmf.	B Range	Turn Rotor to Max. Output and Rock	600 KC Padder (C10) Rock Rotor See Note B
Repeat above oscillator adjustments at 1600 and 600 KC until readjusting the oscillator Range B Trimmer (C9) causes no further improvement of output.						
RANGE D 18.3 MC	External Antenna Clip	Point "X"	400 Ohm	D Range	Turn Rotor to Fully Open Position	Oscillator Range D (C5)
17 MC	External Antenna Clip	Point "X"	400 Ohm	D Range	Turn Rotor to Max. Output	Ant. Range D (C2)
Loop Range B 1400 KC Note D	Reassemble chassis in cabinet External Antenna Clip	Chassis	50 mmf.	B Range	Turn Rotor to Max. Output	Ant. Range B (C-31)

DRIVE CORD REPLACEMENT

Use a new 10X51 drive cord assembly or a piece of new cord 45" long for this installation. Turn the large drive pulley counterclockwise until the gang condenser is in the fully open position, then fasten one end of the new drive cord to one end of the tension spring. Hook the other end of the tension spring over the tab on the drive pulley, pass the drive cord through the slot in the drive pulley rim and wind it ½ turn counterclockwise around the top of the drive pulley. Wind 2 turns around the drive shaft spool with the turns progressing towards the chassis. Continue with the cord around idler studs A, B and C as shown in the illustration. Wind the cord ¾ turn counterclockwise around the large drive pulley, pass it through the slot in the pulley rim and fasten the end to the tension spring. Rotate the tuning shaft several turns to take up any slack in the drive cord, then attach the dial pointer to the cord.





ALIGNMENT NOTES

NOTE A—Adjust Oscillator Range B (C9) trimmer on side of chassis. Oscillator Range B (C6) auxiliary trimmer on gang condenser is adjusted at factory and ordinarily need not be readjusted in the field.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

NOTE C—Attach pointer to drive cord and position at 1400 KC mark on dial scale.

NOTE D—Some receivers have a "gimmick" capacity formed by twisting two wires together on the loop antenna in place of the Antenna Range B Trimmer, C-31. When aligning receivers having the "gimmick" capacity, proceed as instructed in the Alignment Procedure Table but omit the steps at 1400 KC involving C-31.

The "gimmick" capacity is set at the factory and normally will not require adjustments when realigning the receiver. Adjustment is obtained by twisting or untwisting the wires.

On receivers having the "gimmick" the dial pointer should be set at 1600 KC rather than as instructed in Note C.

On receivers having neither a trimmer or a "gimmick", the dial pointer should also be set at 1600 KC.

SPECIFICATIONS

Power Consumption.....42 Watts (At 117 volts AC)
Power Output.....1.5 Watts Maximum .9 Watt 10% Harmonics
Selectivity.....49KC Broad at 1000 times Signal
Intermediate Frequency.....455 KC
Speaker.....4"x6" oval PM Dynamic
Tuning Frequency Range
B Range.....540 to 1600 KC
D Range.....6000 to 18,000 KC
Sensitivity (For .05 watt output—External Antenna).
B range.....9 Microvolts Average
D Range.....30 Microvolts Average

1—12BA6 IF Amplifier tube
1—12AT6 Detector—AVC—First Audio tube
1—50B5 Power Output tube
1—35W4 Rectifier tube

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Dummy antenna: — .1 mfd. — RMA loop.

NOTE: Intermediate Frequency and Oscillator adjustments may be made with the loop disconnected provided a resistor of 10,000 to 50,000 ohms is substituted to close the 12BE6 grid circuit. The loop alignment must be done with the loop and chassis mounted in operating position in the cabinet. A single turn loosely coupled to loop may be substituted for RMA loop.

* Loop trimmer accessible through back of cabinet.

GENERATOR	CONNECTION AT RADIO	DUMMY ANTENNA	DIAL	TO TUNE TRIMMERS	REMARKS
IF 455 kc.	12BE6 grid	.1 mfd.	HF end	IF trimmers C D E F	Tune to max.

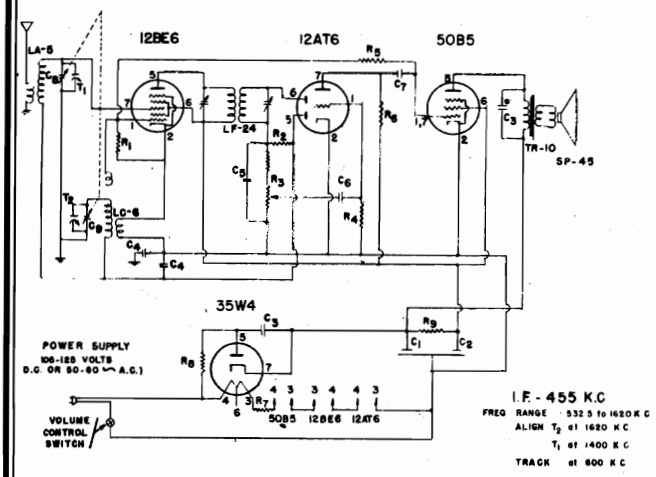
Remove back to replace tubes



CHASSIS SERIES "AG"

ELECTRICAL SPECIFICATIONS

Power Supply .....105-125 Volts D.C. or 50-60 Cycles A.C. 30 Watts

Frequency Range .....532.5 to 1620 kc.

Intermediate Freq......455 kc.

Tuning .....Two gang capacitor

Speaker .....4 inch PM 3.5 ohm voice coil impedance

Power Output .....1 watt undistorted 1.5 watt maximum

Sensitivity .....800 Microvolts at 50 milli-watts Output

Selectivity .....120 kc broad at 1000 times signal at 1000 kc.

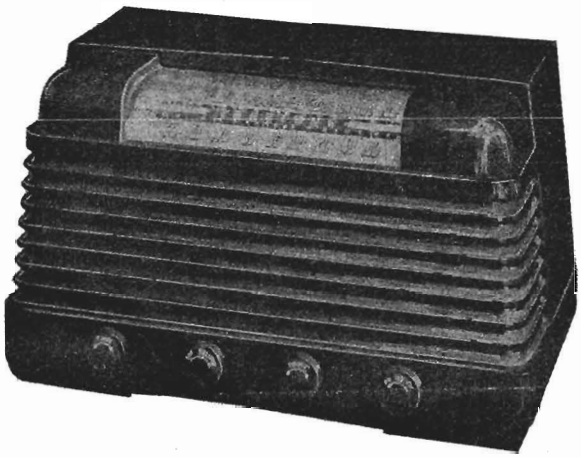
ALIGNMENT PROCEDURE

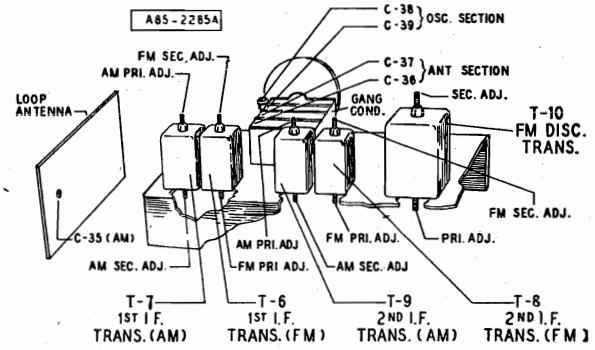
- Output meter across 3.5 ohm output load.
- Volume control at maximum for all adjustments.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.

SIGNAL GENERATOR				*SETTING TUNER*	*ADJUST TRIMMERS TO MAXIMUM OUTPUT (in order shown)*
Frequency	*Coupling Factor*	*Connection to Receiver*	*Ground Connection*		
455 kc	.1 mfd	12BE6 Grid	B—	Rotor full open (Plates out of mesh)	Input and output trimmers on IF cans
1620 kc	.1 mfd	12BE6 Grid	B—	Rotor full open (Plates out of mesh)	Oscillator trimmer T2
1400 kc	75 mmf	Hank	B—	1400 kc	Antenna trimmer T1

WESTERN AUTO SUPPLY CO.

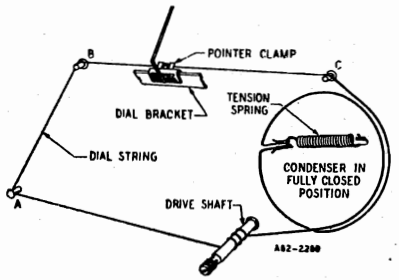
MODELS D2819A, D2819B, D2819C, D2819D, D2819E

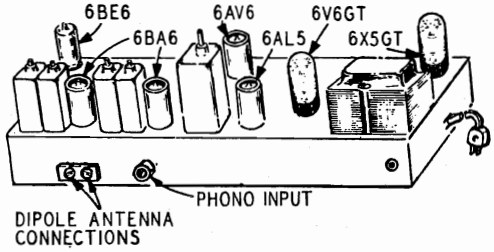


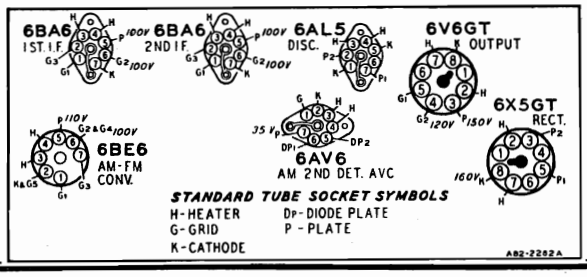


DRIVE CORD REPLACEMENT

Replacement of the drive cord may be accomplished as shown in the illustration. For this purpose use the new drive cord assembly listed in the Replacement Parts List. Turn the gang condenser until the plates are fully meshed. Then install the string as shown, winding three turns clockwise around the tuning shaft with the turns progressing away from the chassis. After the cord is installed, rotate the tuning shaft several times in order to take up any slack in the cord.







RECORD PLAYER AND TELEVISION SOUND CONNECTIONS

For models not equipped with built-in record player, a socket marked PHONO is provided on the back of the chassis for connections to an external record player or automatic record changer. When it is desired to play records through the radio, insert the connector on the cable of any standard record player into this socket. Turn the phono-radio switch to the phono position and use the volume control to adjust the sound level.

When television programs become available in your community, the audio amplifier and speaker of this radio may be used in conjunction with a Television Picture Receiver and sound converter to reproduce the sound portion of the television programs. Simply insert the connector on the cable of the Television Converter into the socket marked PHONO and operate the receiver in the same manner as described in the foregoing paragraph.

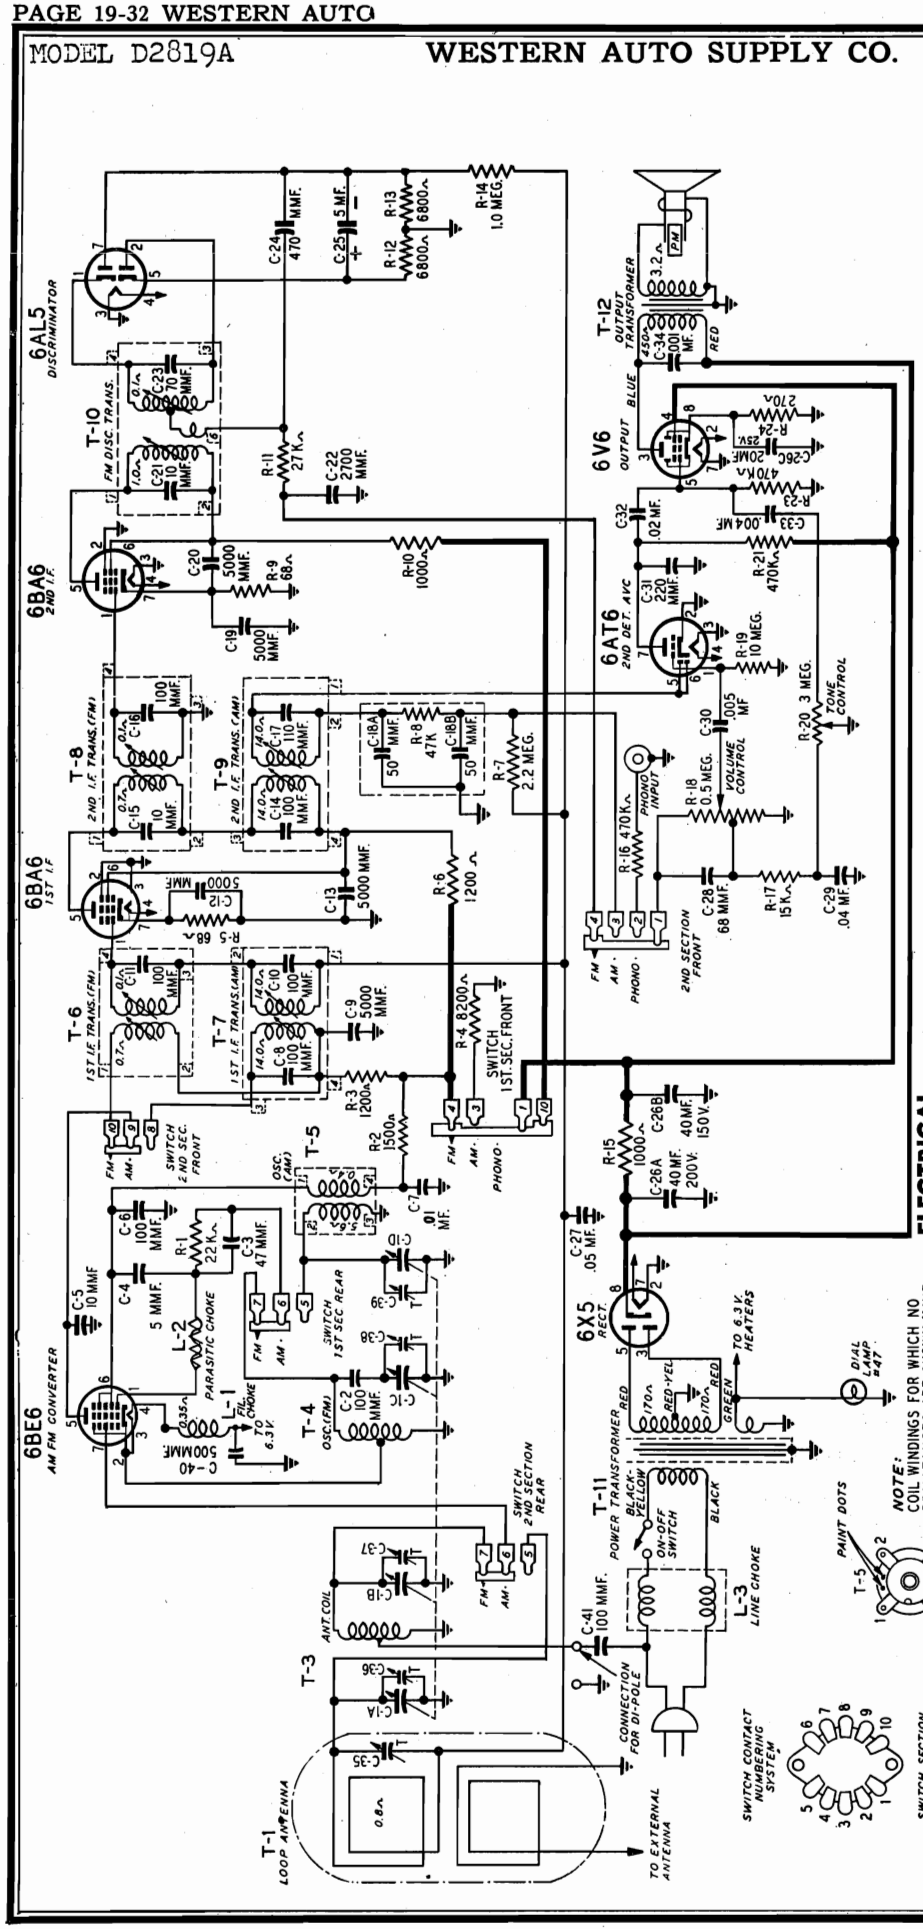
TUBE SOCKET VOLTAGES

Socket voltages are shown on the Bottom Socket diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage .....117 Volts AC
Signal Input .....None
A Variation of ±10% is usually permissible.

MODEL D2819A

WESTERN AUTO SUPPLY CO.



ELECTRICAL SPECIFICATIONS

Power Consumption—
117 volts AC—35 watts

Power Output—
1.5 watts maximum
.9 watts 10% distortion

Speaker—4 x 6 inch oval PM dynamic

Frequency Ranges—
Broadcast 540-1600 KC
Frequency modulation 88-108 MC

Intermediate Frequency—
AM 455 KC — FM 10.7 MC

Selectivity — AM — 60 KC broad at 1000 times signal, measured at 1000 KC
I.F. FM—200 KC broad at 2 times down
I.F. FM—800 KC broad at 200 times down

AM Sensitivity—(For .5 watt output with external antenna)
40 microvolts average

FM Sensitivity—(For .5 watt output)
300 microvolts average

WESTERN AUTO SUPPLY CO.

ALIGNMENT PROCEDURES

AM STAGES

Volume Control Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50 mmf.

SIGNAL GENERATOR					
FREQUENCY SETTING	CONNECTION AT RADIO	GROUND CONNECTION	DUMMY ANTENNA	GANG CONDENSER SETTING	ADJUST TUNING SLUGS (I-F ONLY) TRIMMERS (OSC. & ANT.)
455 KC	Control Grid 1st 6BA6 Pin No. 1	Chassis Base	.1 mf	Turn Rotor to Full Open	2nd I.F. Pri. & Sec.
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	Same as above	.1 mf	Turn Rotor to Full Open	1st I.F. Pri. & Sec.
1620 KC	Control Grid 6BE6 Pin No. 7	Same as above	.1 mf	Turn Rotor to Full Open	Oscillator C-39
1400 KC	External Antenna Lead	Same as above	50 mmf	Turn Dial to 1400 KC. See Note A	Antenna C-35

NOTE A—Attach pointer to drive cord and position at 1400 KC mark on dial scale.

FM STAGES

Allow chassis and signal generator to warm up for several minutes. The following equipment is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—.01 mf, 300 ohms and 100 K ohms.

Zero center scale DC vaccum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.)

	SIGNAL GENERATOR					
	FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUSTMENT FOR MAX. METER DEFLECTION

	10.7 MC	Unsolder lead from Pin 7 to band switch. Insert 100K ohm resistor between Pin 7 & Ground and feed signal into Pin 7 of 6BE6	.01 mf	FM	Same as above	1st I-F Pri. Note C
	10.7 MC	Same as above	.01 mf	FM	Same as above	1st I-F Sec. Note C
	RECHECK I-F ADJUSTMENTS IN ORDER GIVEN					
Ant. & Osc.	108.5 Note D	Disconnect built-in line antenna and connect generator to dipole terminals with resistor in series.	300 ohms	FM	Rotor to Full Open	Osc. C-38
	104.5	Same as above	300 ohms	FM	Tune rotor for max. AVC voltage	Ant. C-37
	RECHECK ANTENNA & OSC. ADJUSTMENTS IN ORDER GIVEN					

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the A.V.C. line at the 27 K. ohm resistor (R-11) and its junction with terminal strip. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from A.V.C. and connect it to the audio takeoff point at the 1 megohm resistor (R-14) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Remove the 100 K ohm load resistor and solder the lead from pin 7 of 6BE6 tube to the band switch before attempting to check the antenna and oscillator coil adjustments.

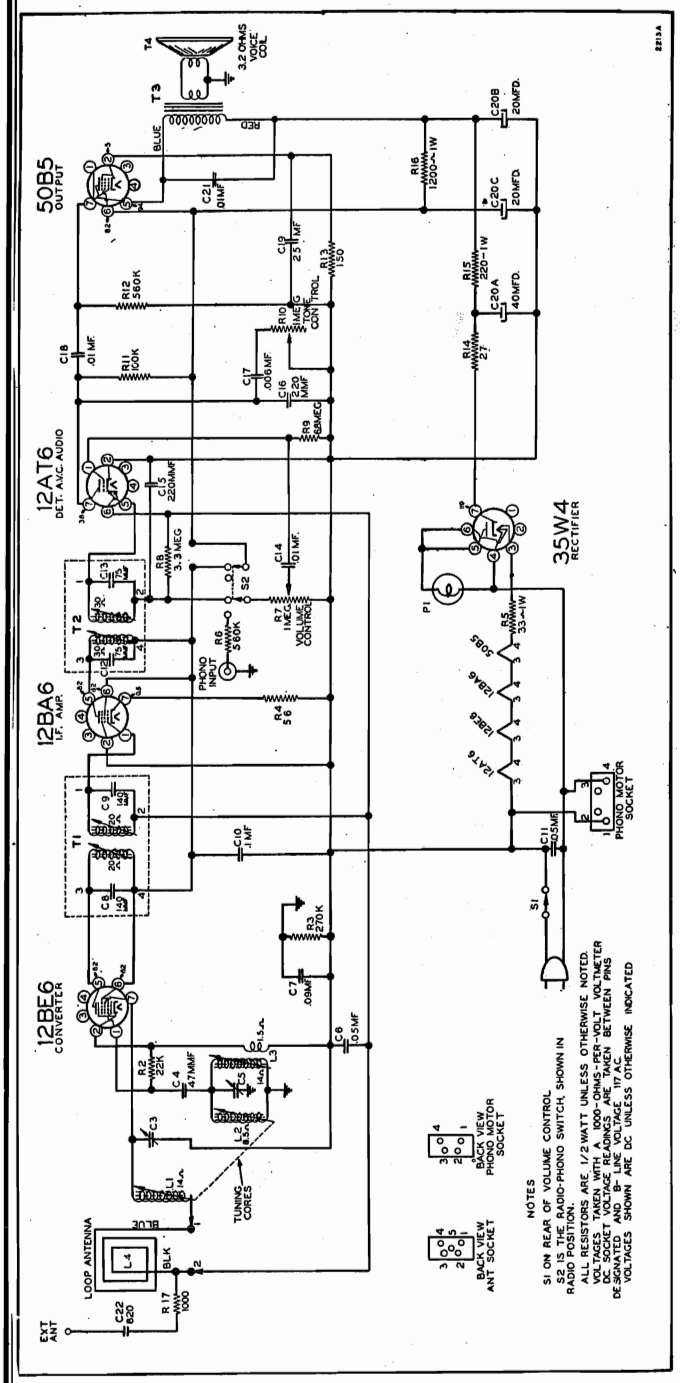
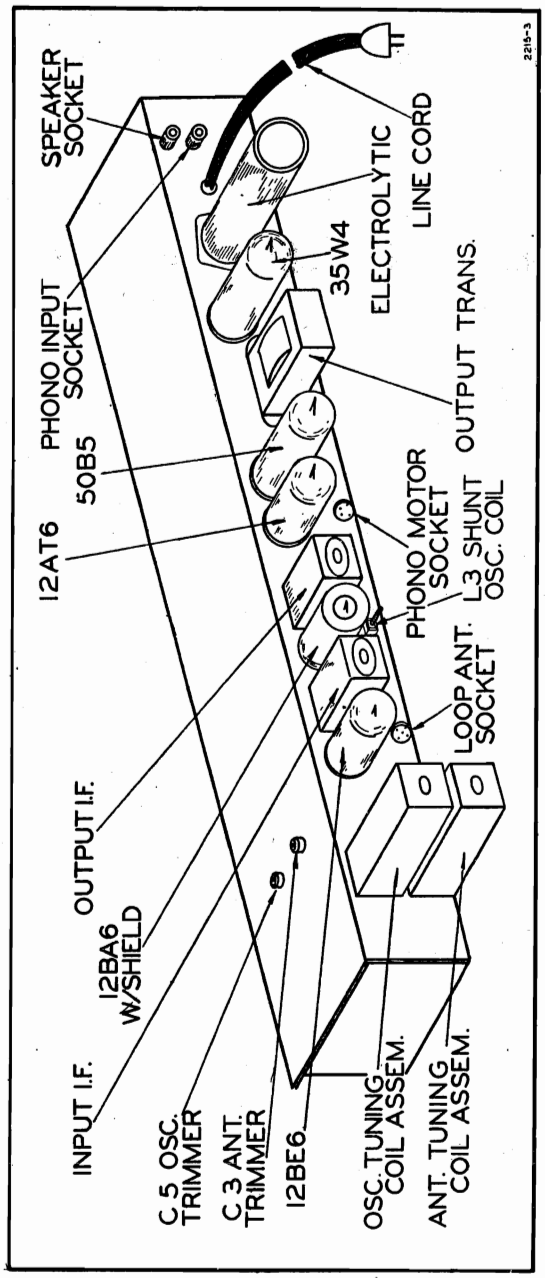
MODEL D2851

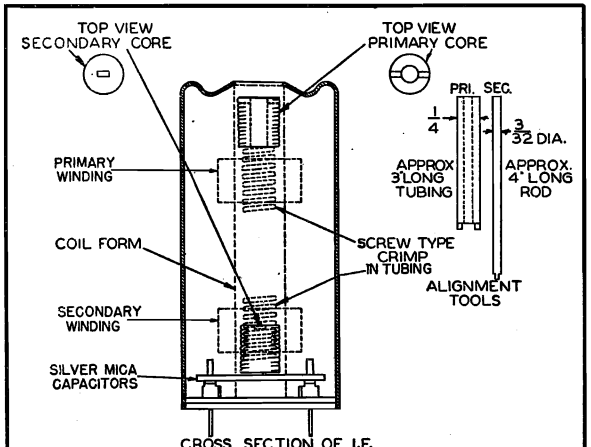
WESTERN AUTO SUPPLY CO.



On some sets a 100M ohm resistor is in series with the high side of volume control. On some sets R5 is eliminated.



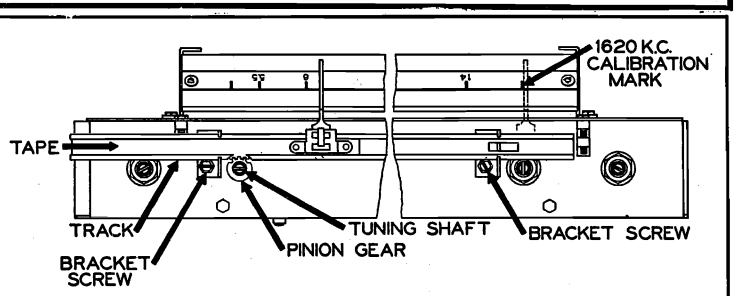
SIGNAL GENERATOR				TUNER SETTING	ADJUST FOR MAXIMUM OUTPUT	INPUT FOR 50 MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection			
455 kc.	.1 mf.	12BE6, Pin 7	12AT6, Pin 2	Iron cores all the way out	Cores in output and input I.F. cans	28 microvolts
1620 kc.	.1 mf.	12BE6, Pin 7	12AT6, Pin 2	Iron cores all the way out	Oscillator trimmer C5	———
535 kc.	200 mmf	External antenna clip	12AT6, Pin 2	Iron cores all the way in	Shunt osc. coil L3	11 microvolts
1620 kc.	200 mmf	External antenna clip	12AT6, Pin 2	1620 kc.	Antenna trimmer C3*	8 microvolts
1400 kc.	200 mmf	External antenna clip	12AT6, Pin 2	1400 kc.	Adjust position of ant. core (see coil illustration view)	8 microvolts
400 cycles	.1 mf.	12AT6, Pin 1	12AT6, Pin 2	———	———	.03 volts



PRIMARY CORE HAS HOLE THRU THE CENTER TO ALLOW SMALL FIBRE TOOL TO PASS THRU AND ADJUST THE SECONDARY CORE. THE PRIMARY CORE HAS A COMPLETE SLOTTED TOP FOR ADJUSTMENT; SECONDARY CORE HAS A SMALL NITCH IN TOP. BOTH WINDINGS ARE TOP TUNED.

THE SECONDARY ALIGNMENT TOOL PASSES THRU THE CENTER OF THE PRIMARY TOOL, FOR SIZE SEE DETAIL DRAWING.

2213-3

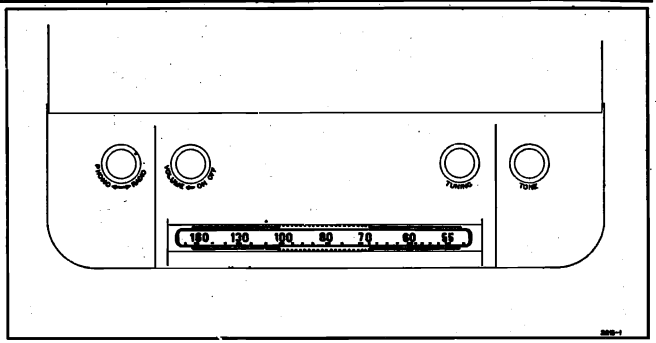


POINTER ADJUSTMENT

ROTATE TUNING SHAFT FULLY CLOCKWISE SO THAT POINTER IS AT RIGHT SIDE OF DIAL. LOOSEN BRACKET SCREWS AND LIFT UP TRACK. SLIDE POINTER SO THAT LEFT EDGE OF THE POINTER COINCIDES WITH RIGHT EDGE OF 1620 K.C. CALIBRATION MARK.

PULL TRACK DOWN SO THAT TAPE TEETH ENGAGE PINION GEAR AND TIGHTEN BRACKET SCREWS. CAREFULL ADJUSTMENT OF TAPE PRESSURE ON PINION GEAR TEETH WILL GIVE A SMOOTH MOTION TO THE TUNING SHAFT. IF IT FEELS "GEARY" DECREASE PRESSURE OF TAPE ON GEAR TEETH SLIGHTLY. IF THERE IS LOST MOTION BETWEEN TAPE TEETH AND GEAR TEETH INCREASE PRESSURE SLIGHTLY.

DWG. N° 2215-2



Tube Complement....12BE6, converter
12BA6, I.F. amplifier.
12AT6, detector, AVC, audio amplifier.
50B5, output amplifier.
35W4, rectifier.
Pilot lite, 6-8 volts, T-47.

ALIGNMENT PROCEDURE

- Output meter across 3.5 ohm output load.
- Volume control at maximum for all adjustments.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.

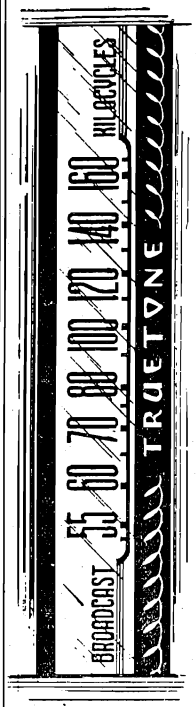
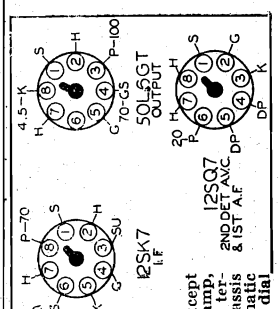
MODEL D2910

WESTERN AUTO SUPPLY CO.

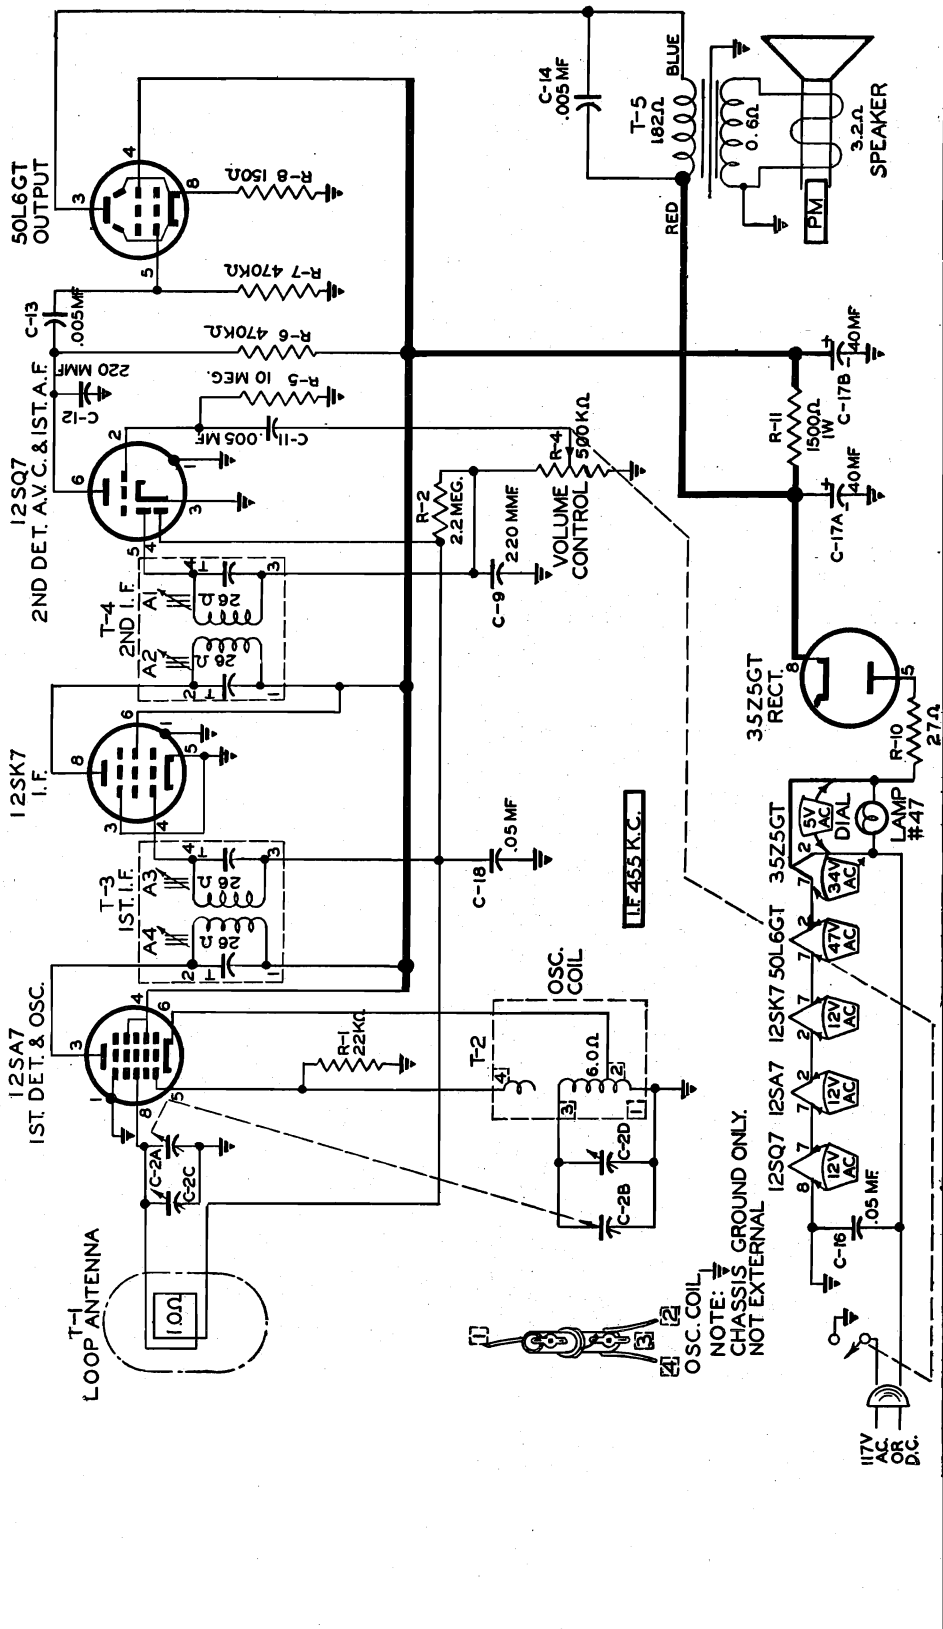




Line Voltage 117 Volts A. C.
No Signal input. No Signal input. Readings taken with 1000 OHM per volt meter plate and screen voltages read on 500 volt scale.

All voltages, except heaters and dial lamp, are between socket terminals and chassis ground. See schematic for heaters and dial lamp voltages.

F. W. Mc2910 818



WESTERN AUTO SUPPLY CO. MODEL D2910

SPECIFICATIONS

5 Tube Superheterodyne, including Rectifier Tube

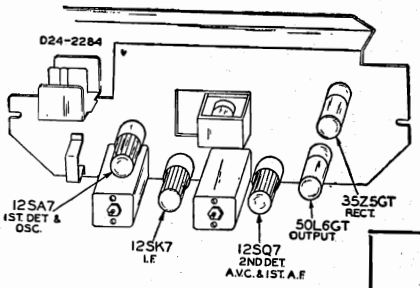
Tuning Frequency Range ..... 540 to 1600 KC

Power Consumption ..... 30 watts (At 117 volts AC

Power Output ..... 1.5 watt maximum, 9 watt (10% distortion)

Intermediate Frequency ..... 455 KC

Speaker ..... 5" PM Dynamic



CHECK YOUR LINE VOLTAGE

Unless otherwise marked, this radio must be operated on a power supply of 105-125 volts AC, 50 to 60 cycles only, or 105-125 volts DC.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustjustments.

Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The equipment in column at right is requqired for aligning:

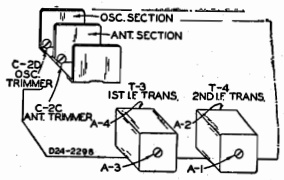
Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter: Non-Metalic Screwdriver.

Dummy Antennas—.1 mf., 50 mmf.

Blocking Condenser—.1 mf.

SIGNAL GENERATOR				GANG	ADJUST TRIMMERS TO MAXIMUM
FREQUENCY SETTING	ANTENNA CONNECTION	GROUND CONNECTION	DUMMY ANTENNA	CONDENSER SETTING	(See Trimmer Illustration)
455 K C	Control Grid 12SK7—I. F. Prong No. 4	Chassis Base Through .1 mf. Condenser	.1 mf.	Turn Rotor to full open	2nd I. F. A2 & A1
455 K C	Control Grid 12SA7—1st Det. Prong No. 8	Same As Above	.1 mf.	Turn Rotor to full open	1st I. F. A4 & A3
1620 KC	Control Grid 12SA7—1st Det. Prong No. 8	Same As Above	.1 mf.	Turn Rotor to full open	Oscillator (C-2D)
1400 KC	Reassemble chassis in cabinet See Note B	Same As Above	50 mmf.	Set pointer to 1400 KC. See Note A	Antenna (C-2C)



NOTE—Attach pointer to drive cord and position at 1400 KC mark on dial scale.

NOTE B—Wind 2 turn loop of heavy enameled wire 6" diameter connect to signal generator Place loop of wire 6" from loop on set and in the same plane.

DRIVE CORD REPLACEMENT

Turn the large drive pulley to the fully closed position. Use a new 10x66 drive cord assembly or a piece of cord 43 inches long and fasten one end to the tension spring and fasten the other end of the spring to the drive pulley. Install the cord as shown in the illustration. Wind 2¾ turns counterclockwise around the tuning shaft with the turns progressing toward the front of the chassis. After string is installed, stretch the tension spring and fasten free end of cord to spring.

TUBE COMPLEMENT

The tube complement of this receiver consists of the following:

1—6SK7—R.F. Amplifier

1—6SA7—Mixer—OSC.

1—6SK7—I.F. Amplifier

1—6SQ7—Det. AVC—Audio

1—6K6—Power Output

1—5Y3—Rectifier

POWER SUPPLY

This receiver is designed to operate from a power source of 117 volts A.C. 60 cycle current

Frequency - Range
535-1725 KC

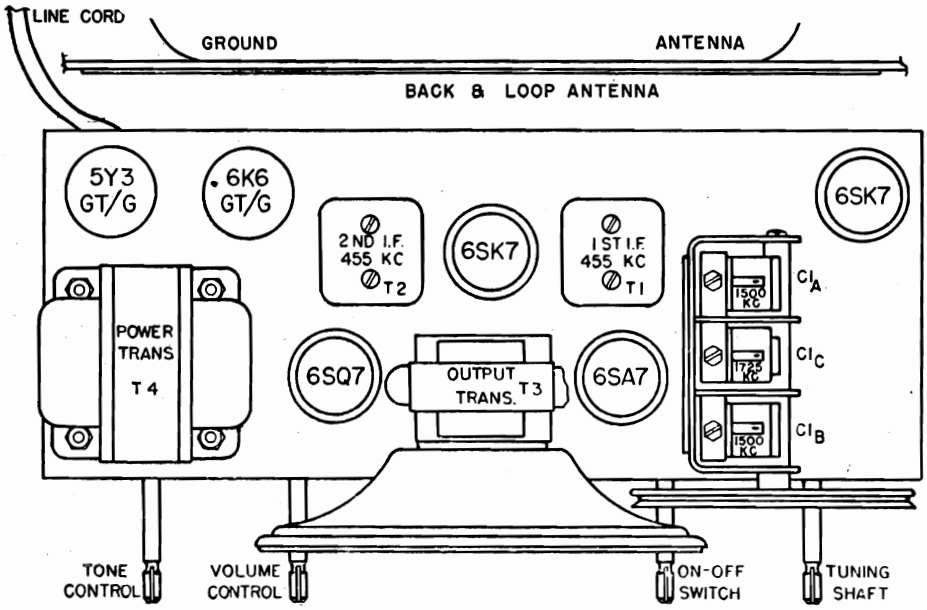

Fig 1 Chassis, Top View

SERVICE NOTES

Voltages taken from the different points of the circuit to the chassis are measured with volume control in maximum position, all tubes in their sockets and with a volt meter having a resistance of 1000 ohms per volt, using the 150 volt scale. These voltages are clearly indicated on the voltage chart. (Fig. 2).

All voltages should be measured with an A.C. line voltage of 117 volts.

To check for open by-pass condensers, shunt each condenser with another one having the same capacity and voltage rating which is known to be good until the defective unit is located.

ALIGNING INSTRUCTIONS

Never attempt any adjustments on this receiver unless it becomes necessary to replace a coil or transformer, or the adjustments have been tampered with in the field. Always make certain that other circuit components, such as tubes, condensers, resistors, etc., are normal before proceeding with realignment.

If realignment is necessary follow the instructions given under the heading "ALIGNMENT PROCEDURE" on the nert page. After realignment has been completed repeat the procedure as a final check.

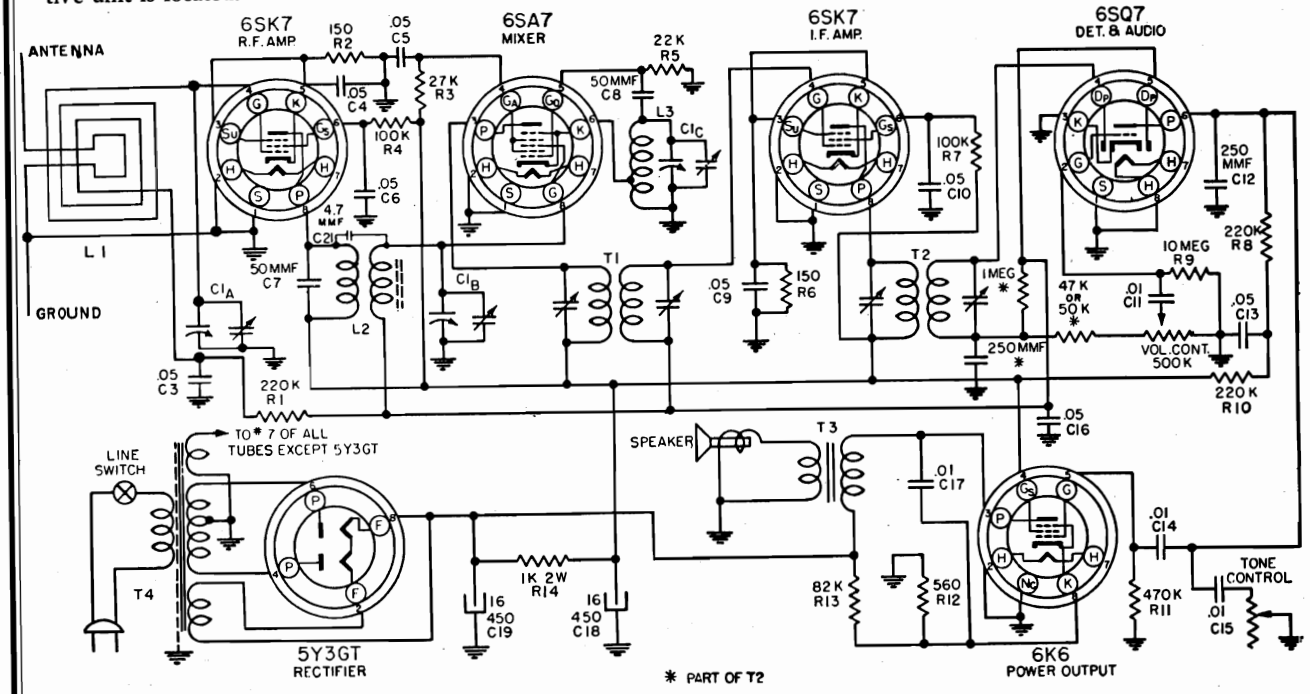

Fig. 3 Schematic Diagram

ALIGNMENT PROCEDURE

Volume control—Maximum: all adjustments.

Tone Control—Treble: Full Clockwise Rotation.

Connect dummy antenna in series with output lead of signal generator.

Connect output meter across voice coil of speaker.

The following equipment is necessary for proper alignment:

Signal generator that will provide the test frequencies as listed.
Output meter.
Non-metallic screwdriver.
Dummy antennas—.1 mfd., .00025 mfd.

Position of Variable	*Generator Frequency*	*Dummy Ant. mfd.*	*Generator Connections*	*Trimmer Adjustment*	*Trimmer Function*
Minimum Capacity (Fully Opened)	455 K.C.	.1	High side to 6SA7 grid Low side to chassis	T1 T2	I. F.
Minimum Capacity (Fully Opened)	1725 K.C.	.00025	High side to ant. lead Low side to ground lead	C1C	Osc.
Tune in signal From Generator	1500 K.C.	.00025	High side to ant. lead Low side to ground lead	C1B	R. F.
Tune in signal from Generator	1500 K.C.	.00025	High side to ant. lead Low side to ground lead	C1A	Ant.

Repeat the above alignment procedure as a final check.

With an output meter connected across the voice coil of the speaker, the output meter reading for ½ watt is 1.25 volts using a signal which is modulated 400 c.p.s.

	C82-59	Loop antenna
	D83-602	Cabinet back

SOCKET VOLTAGES

All voltages are measured with a 1000 ohm per volt meter on the 150 volt scale, with no signal. To obtain an accurate voltage check the A.C. line voltage must be 117 volts. Where no voltage is shown the voltage is O or cannot be read with this type of voltmeter.

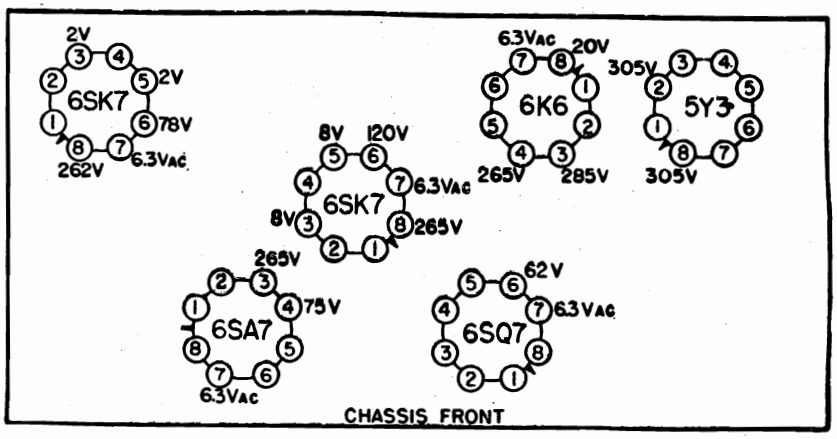

Fig. 2—Chassis, Bottom View

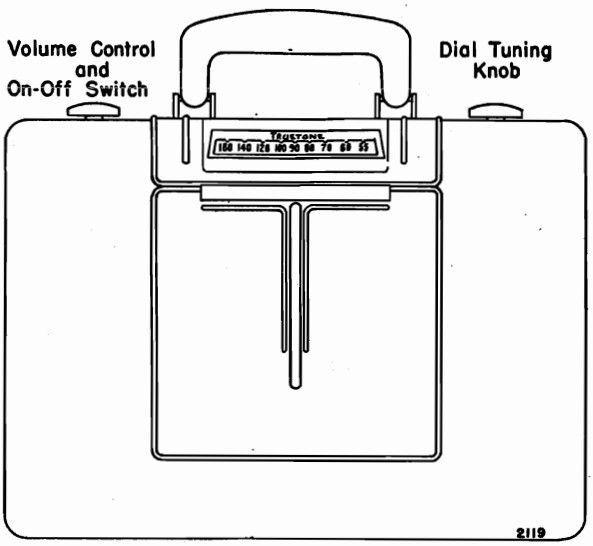
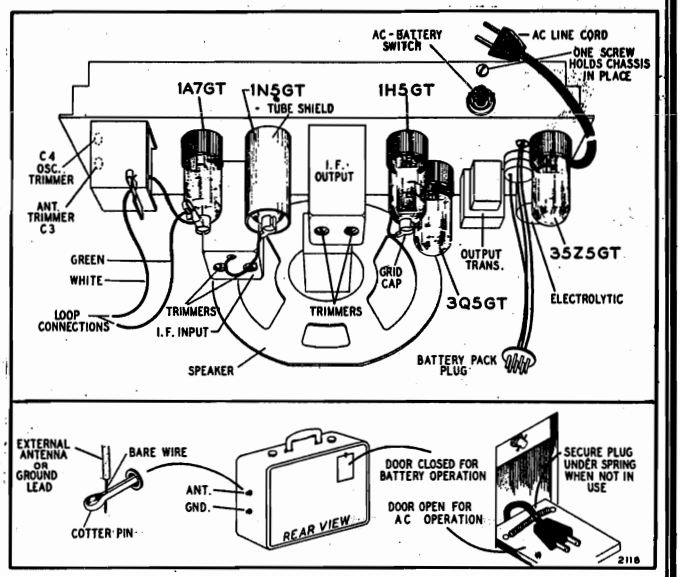
WESTERN AUTO SUPPLY CO. MODEL D3619





Chassis View

LINE VOLTAGE

If the set is to be operated from a house receptacle, the voltage, unless otherwise indicated, must be 105-125-volt DC (direct current) or 105-125-volt, 50-60 cycle AC (alternating current). If you are in doubt as to the voltage of the power supply, consult your local power company.

BATTERY PACK

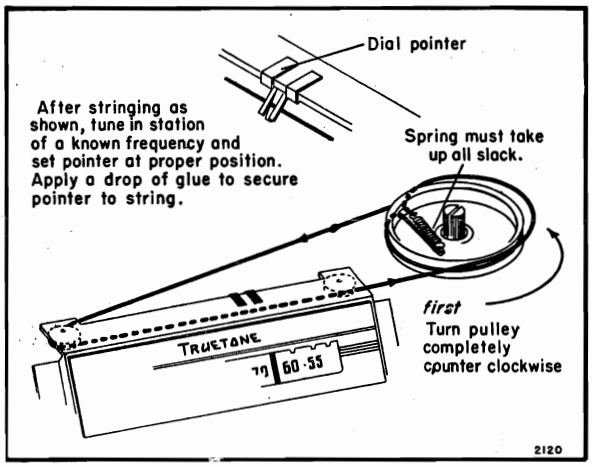
The battery pack used with this radio must contain a 7½-volt "A" battery and a 90-volt "B" battery. Use Wizard Battery Pack No. B6460 or No. B6470.

PILOT LIGHT

If the pilot lamp burns out, the set should not be operated on AC or DC power until a new lamp has been installed. Failure to heed this caution may result in a burned-out 35Z5GT tube.

ELECTRICAL SPECIFICATIONS

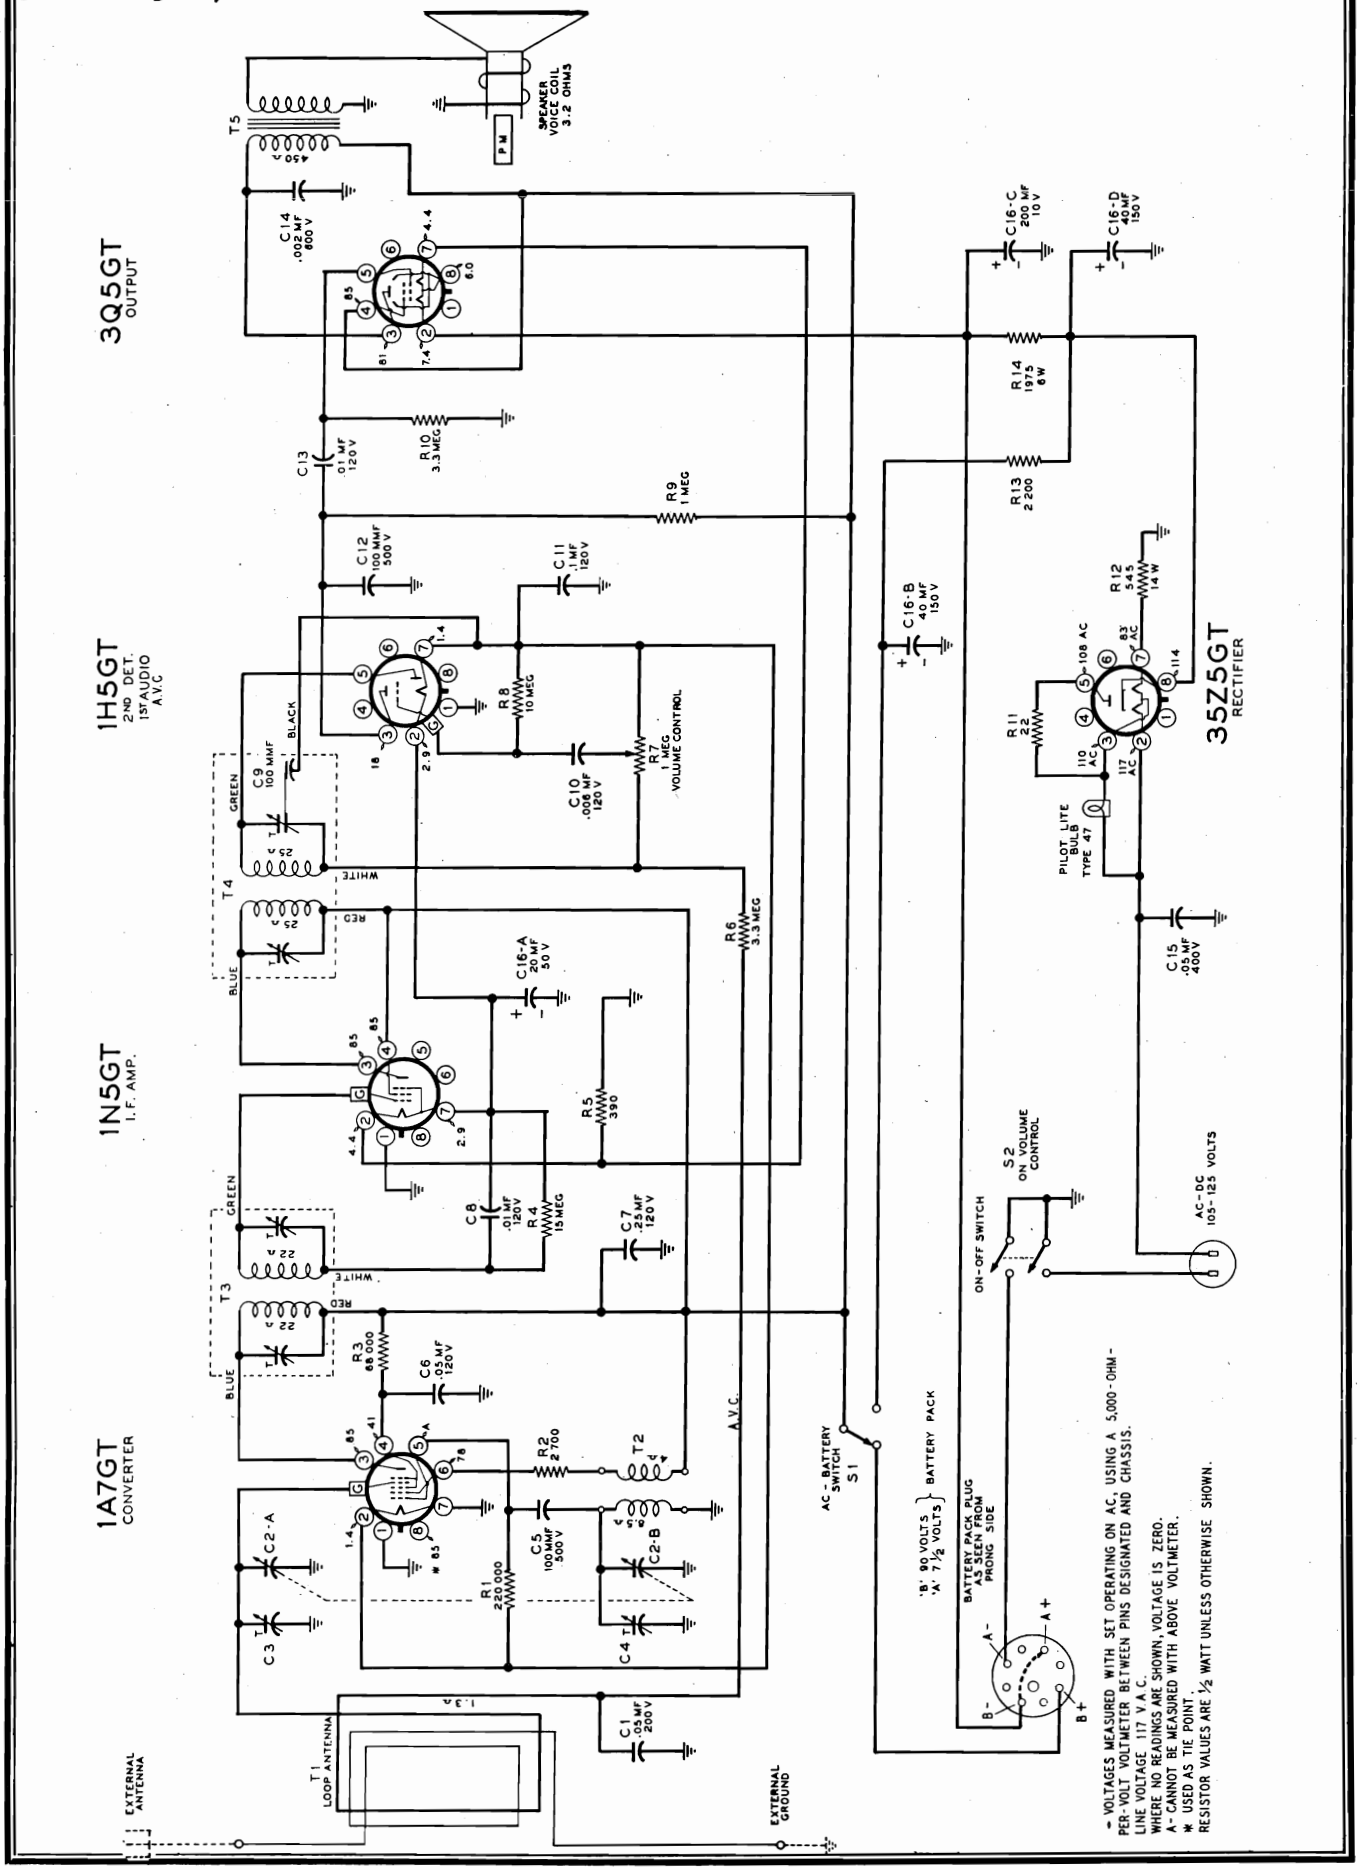
Power Supply.....105 to 125 volts DC or 50-60 cycle AC, 29 watts.
Battery: A—7½ volts, 50 ma.
B—90 volts, 11 ma.
Frequency Range.....530 to 1650 kc.
Intermediate Freq...... 455 kc.
Tuning.....Two-gang capacitor
Antenna..... Built-in loop. Provisions also for external antenna and ground.
Speaker.....5-inch; P.M.; voice coil impedance 3.2 ohms.
Power Output..... 150 milliwatts undistorted.
250 milliwatts maximum.
Sensitivity.....30 microvolts average for 50-milliwatt output.
Selectivity..... 43 kc broad at 1000 times signal at 1000 kc.



Replacement of Dial Pointer Drive Cord

MODEL D3619

WESTERN AUTO SUPPLY CO.



- VOLTAGES MEASURED WITH SET OPERATING ON AC, USING A 5,000-OHM-PER-VOLT VOLTMETER BETWEEN PINS DESIGNATED AND CHASSIS.
LINE VOLTAGE 117 V A.C.
WHERE NO READINGS ARE SHOWN, VOLTAGE IS ZERO.
A- CANNOT BE MEASURED WITH ABOVE VOLTMETER.
✱ USED AS TIE POINT.
RESISTOR VALUES ARE ½ WATT UNLESS OTHERWISE SHOWN.

WESTERN AUTO SUPPLY CO. MODEL D3619

ALIGNMENT PROCEDURE

- Output meter across 3.2-ohm output load.
- Volume control at maximum for all adjustments.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.

SIGNAL GENERATOR				SETTING TUNER	ADJUST TRIMMERS TO MAXIMUM OUTPUT (in order shown)
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection		
455 kc	.1 mf	1A7GT grid cap*	Chassis	Rotor full open (plates out of mesh)	Input and output trimmers on IF cans
1650 kc	.1 mf	1A7GT grid cap*	Chassis	Rotor full open (plates out of mesh)	Oscillator trimmer C4
1400 kc†	200 mmf	External antenna clip	External ground clip	1400 kc	Antenna trimmer C3

* If loop is not connected when making this adjustment, substitute a 1-megohm resistor across the loop leads.

† For this adjustment chassis should be remounted in cabinet and loop connected. Antenna trimmer can be reached through a hole in the side of the cabinet.

WESTERN AUTO SUPPLY CO.

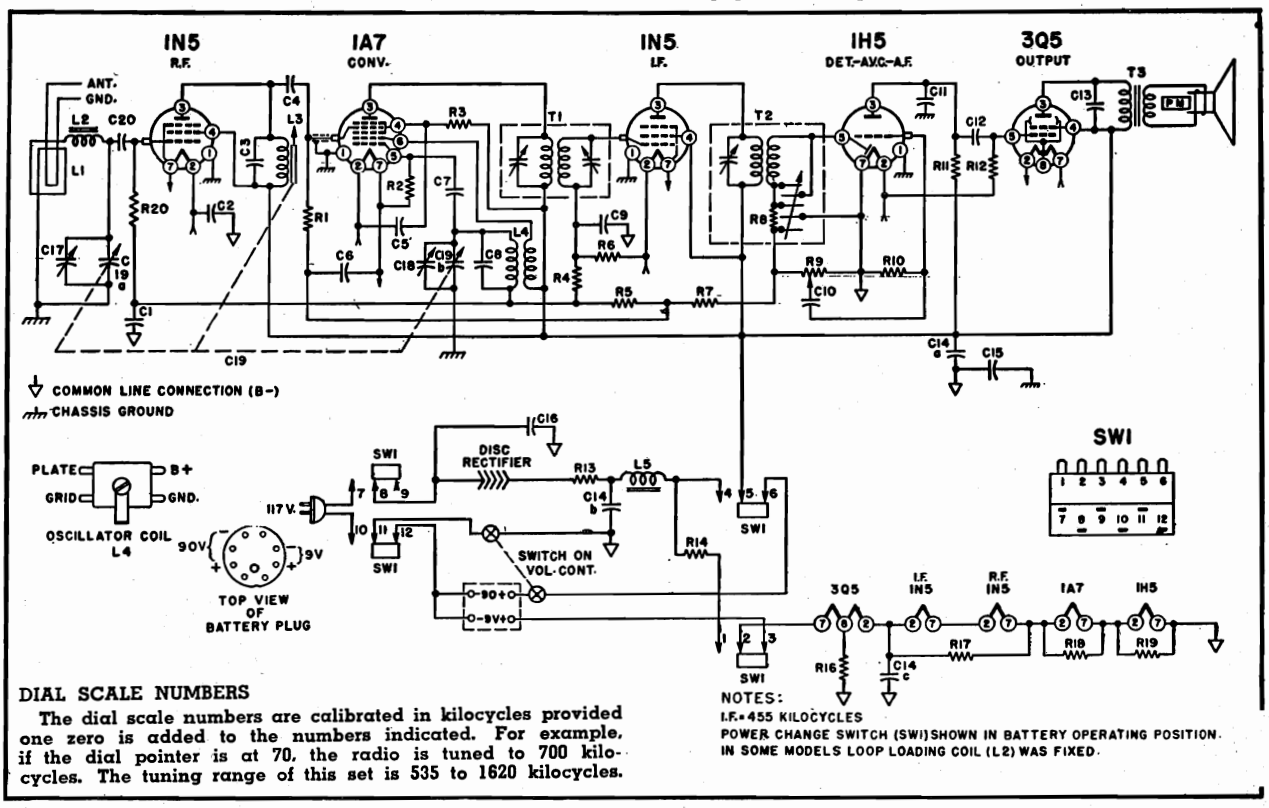
MODELS D3630, D3630N

POWER SUPPLY

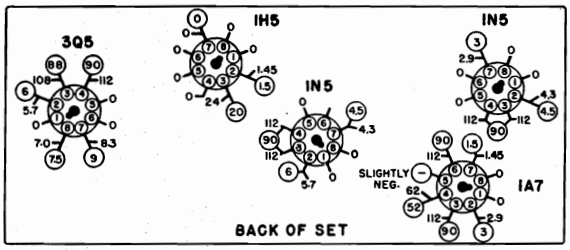
This receiver is designed to operate on either a Battery Pack; or any AC (Alternating Current) power supply line of 105 to 125 volts, 50 to 60 cycles; or DC (Direct Current) power supply line of 105 to 125 volts.

BATTERY

Any one of the following battery packs may be used in this portable radio: Western Auto Supply Wizard B6460 or B6470, Ensign AB50, Ensign AB49, General 60A-6F6-5, General 60B-6F6-5, Burgess F6A60, Burgess G6M60, Eveready 754, Ray-O-Vac AB878 or Ray-O-Vac AB994. For best results, use Western Auto Supply Wizard B6460 (Standard) or B6470 (Deluxe) battery packs for replacement.



VOLTAGE CHART



VOLTAGE DATA

1. Voltage readings circled (O) are for Battery Operation.
2. All readings made between Tube Socket Terminals and Pin No. 7 on the 1H5.
3. A.C. Voltages measured on a 117 Volt A.C. line.
4. Battery Voltages measured with a fresh battery.
5. Dial turned to low frequency end, no signal.
6. All Voltages measured with a 1000 ohm-per-volt meter.

WESTERN AUTO SUPPLY CO.

MODELS D3630, D3630N

1. Be sure both set and signal generator are thoroughly warmed up before starting alignment.
2. Make alignment, using a battery whenever possible.
3. Disconnect Loop Antenna leads from clips on set and remove chassis from cabinet.
4. Connect a 50,000 ohm carbon resistor across the two clips from which the Loop Antenna was removed.
5. Connect Output Meter across the Voice Coil.
6. Connect a fresh battery to the set.
7. Turn receiver Volume Control full on.

Step	*Dummy Antenna Used in Series with Signal Generator*	*Connect High Side Signal Generator to*	*Signal Generator Frequency*	*Gang Condenser Setting*	*Trimmer Description and Designation*	*Type of Adjustment*
1	.00025 Mfd. when using A.C. .1 Mfd. when using Battery	Grid Cap 1A7	455 K.C.	Any point where it does not affect Signal	2nd I.F. (A), (B). 1st I.F. (C), (D).	Maximum Deflection. Then repeat
2	.00025 Mfd. when using A.C. .1 Mfd. when using Battery	Grid Cap 1N5	1620 K.C.	Rotor full open (Plates out of mesh)	Oscillator Trimmer (G)	Maximum Deflection.
3	.00025 Mfd. when using A.C. .1 Mfd. when using Battery	Grid Cap 1N5	1400 K.C.	Tune in Generator Signal	R.F. Slug (H)	Maximum Deflection.
4	Replace Set in Cabinet					
5	.00025 Mfd.	Antenna and Ground Leads	1400 K.C.	Tune in Generator Signal	Antenna Trimmer (F)	Maximum Deflection.
6	Disregard the next two steps if the set being aligned is a model with a fixed loop loading coil (L2).					
7	.00025 Mfd.	Antenna and Ground Leads	600 K.C.	Tune in Generator Signal	Loop Loading Coil Slug (E)	Maximum Deflection.
8	.00025 Mfd.	Antenna and Ground Leads	1400 K.C.	Tune in Generator Signal	Reset Antenna Trimmer (F)	Maximum Deflection.

Seal adjusting screw on the loop loading coil with any quick drying cement.

REPLACING R.F. TUNING SLUG

If the R.F. Tuning Slug has to be changed, use the following procedure. Set the gang condenser to the point where the plates are fully meshed. Screw the slug adjusting screw about halfway down. Place the slug in the coil in such a position that the top of the slug is flush with the top of the Coil. Solder the slug wire to the adjusting screw. Be sure that the position of the slug does not change during the soldering and that the slug wire is straight. Proceed to re-align the set as shown in the chart.

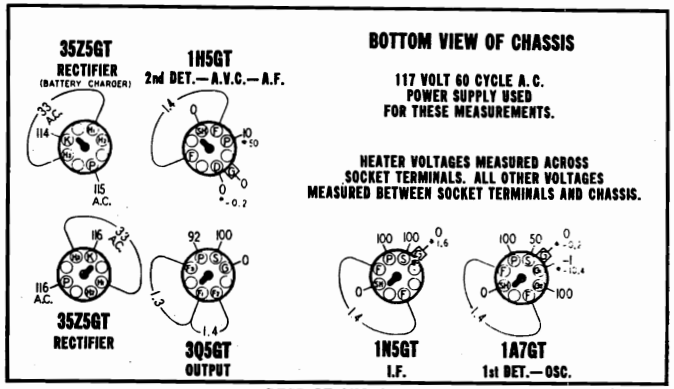
SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*).

VOLUME ON FULL WITH NO SIGNAL **DIAL TUNED TO 540 KC.**

"AC-DC—BAT.—CHARGE" SWITCH IN "AC-DC" POSITION



REAR OF CHASSIS

*—Measured with vacuum tube voltmeter.

WESTERN AUTO SUPPLY CO.

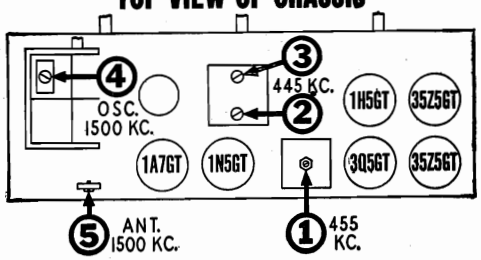
MODEL D3635

ALIGNMENT PROCEDURE

1. Slide chassis partially out of cabinet by removing staples at each side of wood shelf and pulling entire shelf back about 2 inches. Do not disturb connections to loop antenna.
2. Connect an output meter across the voice coil of the speaker or between the plate of the 3Q5GT output tube and chassis through a .1 mfd. condenser.
3. Connect the ground lead of the signal generator to chassis through a .25 mfd. condenser.
4. Set the volume control in the maximum position and use a weak signal from the generator.
5. Set "AC-DC—BAT.—CHARGE" Switch in "AC-DC" position.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIG. GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
300 MMFD. Condenser	Grid Cap of 1A7GT Tube	455 KC.	Any Point Where It Does Not Affect Signal	1	2nd I.F.	Loosen lock nut. Adjust screw for maximum output.
				2-3	1st I.F.	Adjust for maximum output. Recheck 1, 2 and 3 for maximum output and tighten lock nut on 1.
300 MMFD. Condenser	Center Terminal on Antenna Terminal Strip at bottom of cabinet.	1500 KC.	1500 KC. (Slide set into cabinet and replace pointer to set dial.)	4	Broadcast Oscillator (Shunt)	Adjust trimmer for maximum output.
300 MMFD. Condenser	Center Terminal on Antenna Terminal Strip at bottom of cabinet.	1500 KC.	Tune to 1500 KC. Generator Signal	5	Broadcast Antenna	Adjust for maximum output. Slide chassis all the way into cabinet when making this adjustment.

TOP VIEW OF CHASSIS



INDICATOR LAMP

The flashing neon lamp on the dial face indicates condition of batteries. This lamp is included in an oscillating (R-C) circuit which is designed to oscillate at approximately 3 pulses per second when batteries are in a fully charged condition. As the battery voltage decreases with use, number of pulses per second decreases.

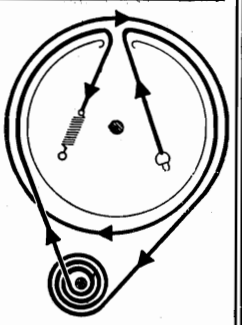
This lamp will only show the true condition of the batteries when the Selector Switch is in the "Battery" position. Lamp flashes more rapidly during charging or "AC-DC" operation.

When battery voltage is low (approximately 72 volts) the lamp flashes more slowly (about once per second). The set should not be operated from battery power after this point is reached and batteries should be recharged immediately. Charge for at least twice the time they were used and as soon as possible after they are run down. As batteries age it is necessary to charge for a longer period. For longest battery life, charge immediately after using.

IMPORTANT:
1. Completely dead batteries cannot be recharged.
2. When set is connected to a DC line, check for correct polarity by operating it before attempting to charge the batteries.
3. Batteries will be discharged if ON-OFF switch is left ON when power cord is not connected to wall outlet.

CHARGING CIRCUIT

The battery charging circuit consists of a 35Z5GT rectifier and a suitable resistor voltage dividing network. This circuit provides a very low charging current when the receiver is operated on AC-DC and is just enough to maintain the batteries but will not charge them. A separate charging position is provided for the regular charging operation. A charging rate of approximately ⅓ the discharge rate is used to give best results.



DIAL DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

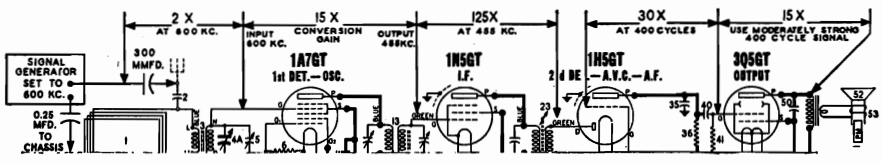
114955	Clip on end of cord
117057	Cord (28 inches)
119087	Ring for dial cord
161384	Tension Spring

APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements.

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes).
2. For R.F. and I.F. measurements connect negative terminal of a 1½-volt battery to A.V.C. lead and positive terminal to chassis. This provides a definite operating point.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning).
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 1½ volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

MODEL D3635 WESTERN AUTO SUPPLY CO.

CHARGING THE BATTERY

The specially developed electronic circuit used for charging the battery will produce best results if battery deterioration has not progressed too far. Check the battery frequently as described in the previous section. To use the built-in charger proceed as follows:

1. Plug the power cord into wall outlet.
2. Turn Selector Switch to "AC-DC" position and turn On-Off Switch to "ON" position.
3. Make sure that radio operates properly before attempting to use the charger. This is especially important when the radio power cord is connected to a D.C. (Direct Current) power supply. After you are sure the radio operates properly, turn the Selector Switch to the "CHARGE" position.
4. Allow the set to operate in this manner and charge the battery for at least twice as many hours as battery was previously used.
5. **After charging is completed be sure to turn the radio On-Off Switch to the "OFF" position. If this switch is left on and the power cord is disconnected from the wall outlet, the battery will discharge.**

If the receiver is equipped with individual "A" and "B" batteries instead of a single unit battery pack, the built-in charging circuits will recharge all four batteries.

THE DIAL SCALE is calibrated to cover frequencies between 540 Kc and 1600 Kc. Add a zero to dial number to obtain the frequency in kilocycles (Kc). Examples: When pointer is set to 90, radio is tuned to 900 Kc. See your newspaper for frequencies of local stations.

INSTALLATION

The bottom compartment of the cabinet provides adequate space to accommodate a single unit battery pack (or individual "A" and "B" batteries if desired). **Any of the following single unit type battery packs may be used as a suitable power supply for this receiver.**

WIZARD B6460
EVEREADY 754
GENERAL 60A-6F6-5
RAY-O-VAC AB-878 or AB-994
BURGESS G6BB60 or F6A60

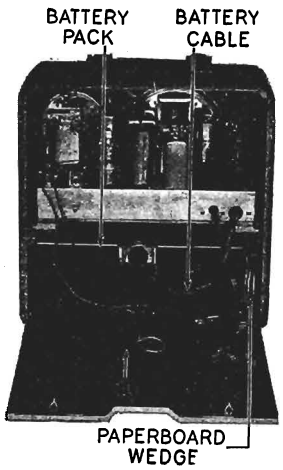


FIG. 1

Place the battery in the bottom compartment of the cabinet and wedge a piece of corrugated paperboard between the battery and the wall of the cabinet (see Fig. 1). The paperboard serves to hold the battery in a fixed position.

After the battery is installed in the cabinet it must be connected to the cable extending from the rear of the radio chassis. This cable is equipped with a special plug that will fit the receptacle in any of the single unit battery packs whose type numbers are listed above.

Where it is desired to use individual "A" and "B" batteries instead of the single unit battery pack, it will be necessary to obtain a special adapter cable (part 500746) in order to connect the separate batteries to the radio. Four batteries (two 4½ volt "A" batteries and two 45 volt "B" batteries) would be required for this type of installation. The following batteries will satisfactorily fit in the space provided:

4½ Volt "A" Battery (2 required)
Wizard B6135
Ray-O-Vac P83A
Eveready 746
Burgess G3

45 Volt "B" Battery (2 required)
Wizard B6241
Ray-O-Vac P7830
Eveready 482
Burgess M-30

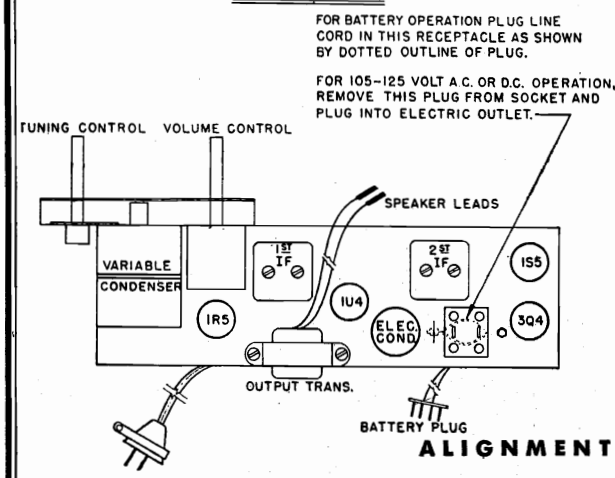
CONNECTING RADIO TO ELECTRIC POWER SUPPLY: The rubber covered power cord and plug, which is coiled up and placed inside the cabinet when the radio is battery operated, must be connected to an electric power outlet if you wish to operate the radio from the power line. The power cord must also be connected to the electric power outlet when using the special battery charger in this receiver.

IMPORTANT: Before connecting the power cord to the electric power outlet, close the back of the cabinet. Do not handle the metal chassis or attempt to remove tubes after the power cord is connected.

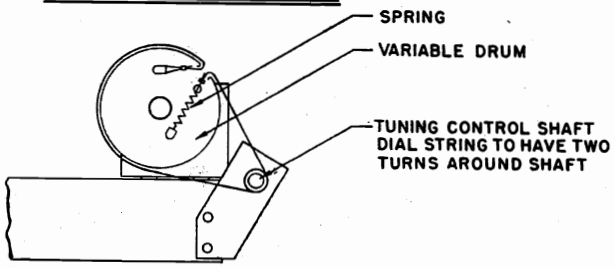
When connecting the radio to the electric power outlet be sure that outlet will supply the proper current and voltage. This radio may be connected to either 50 or 60 cycle Alternating Current (A.C.) at 105 to 125 volts or Direct Current (D.C.) at 105 to 125 volts. If in doubt as to the voltage and type of current which is supplied by an electric power outlet, call local power company.

If a Direct Current power supply is used and the radio does not operate after it has been turned on for approximately one minute, reverse plug connection at wall outlet.

TUBE LOCATION



DIAL STRINGING DIAGRAM



ALIGNMENT PROCEDURE

- Output Meter across 3.2 ohm output load
- Volume control at maximum
- Align for maximum output. Reduce input as needed to keep ouput near 0.05 watts
- Connect ground post of signal generator to chassis

SIGNAL GENERATOR

Frequency	*Connection to Radio*	*Dummy Antenna*	*Tuner Setting*	*Adjust for Maximum Output (in order shown)*
455 KC	Center of antenna section of Gang	0.2 mf	Any	Trimmers on I.F. Can
1500 KC	* *	* *	Set pointer at second dot from end. On dial pan	Oscillator Trimmer on Gang.
1500 KC	* *	* *	Set pointer at second dot from end. On dial pan	R.F. Trimmer on Gang

** Run a wire from Output Terminal of the Generator near the Receiver. However, no connection is made between the signal generator and the Receiver.

ALIGNMENT PROCEDURE

BROADCAST AND SHORT WAVE BANDS

Connect an output meter across the speaker voice coil.

With the volume control set for maximum output and the signal from the generator attenuated to avoid A.V.C. action, proceed as follows:

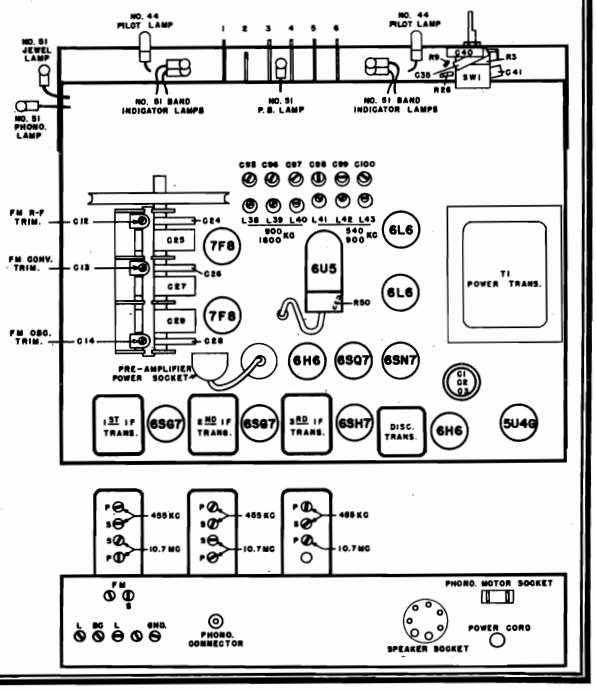
Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1.	Set selector switch to "AM"			
2.	Pin #4 on 6SG7, 2nd I-F amplifier tube through a 0.1 mfd capacitor	455 kc	550 kc	455 kc secondary and primary trimmers of 3rd I-F for max. output.
3.	Pin #4 on 6SG7, 1st I-F amplifier tube through a 0.1 mfd capacitor	455 kc	550 kc	455 kc secondary and primary trimmers of 2nd I-F for max. output.
4.	Pin #1 on 7F8, converter tube through a 0.1 mfd capacitor	455 kc	550 kc	455 kc secondary and primary trimmers of 1st I-F for max. output.
5.	Converter section of gang (C27) through a 0.1 mfd capacitor	455 kc	550 kc	Carefully "peak" all 455 kc I-F transformers for max. output.
6.	B.C. antenna terminal through a 200 mmf capacitor	1500 kc	1500 kc	B.C. oscillator trimmer (C11) for max. output.
7.	Radiated signal (no actual connection)	1400 kc	1400 kc	B.C. converter (C9) and antenna (C8) trimmers for max. output.
8.	B.C. antenna terminal through a 200 mmf capacitor	600 kc	600 kc	B.C. oscillator padder (C10) for max. output. Rock gang while aligning padder.
9.	Recheck steps 6, 7, and 8.			
10.	Set selector switch to "SW-1"			
11.	Short wave antenna terminal through a 400 ohm resistor (center terminal marked "L")	9 mc	9 mc	Short Wave #1 oscillator trimmer (C21) for max. output.*
12.	Short wave antenna terminal through a 400 ohm resistor (center terminal marked "L")	9 mc	9 mc	Short Wave #1 converter (C18) and antenna (C15) trimmers for max. output. Rock gang while adjusting trimmers.
13.	Set selector switch to "SW-2"			
14.	Short wave antenna terminal through a 400 ohm resistor (center terminal marked "L")	18 mc	18 mc	Short Wave #2 oscillator trimmer (C23) for max. output.*

FREQUENCY RANGES:

Standard Broadcast ..... 540 to 1615 kc.
Short Wave 1 ..... 5 to 10 mc.
Short Wave 2 ..... 12 to 20 mc.
Frequency Modulation ..... 88 to 108 mc.

TUBE COMPLEMENT:

1 7F8 ..... R-F Amp.
1 7F8 ..... Conv.-Osc.
2 6SG7 ..... 1st and 2nd I-F Amp.
1 6SH7 ..... Limiter (FM)
1 6H6 ..... Ratio Det. (FM)
1 6H6 or 6H6GT ..... Det. and AVC (AM)
1 6SQ7 ..... A-F Amp.
1 6SN7 or 6SN7GT ..... Driver
2 6L6 or 6L6GA ..... Power Output Amp.
1 6U5 ..... Tuning Indicator
1 5U4G ..... Rectifier
1 6SC7 ..... Phono. Pre-Amp.



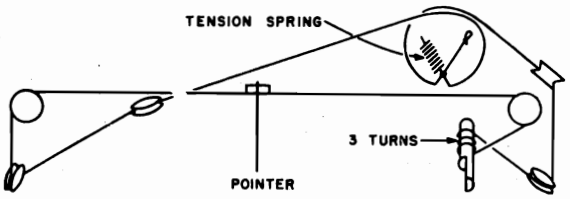
WESTINGHOUSE ELECTRIC CORP. MODEL H-169

PUSH BUTTONS

Push buttons 1 to 3 are designed to receive stations from 900 to 1600 kc; push buttons 4 to 6 receive stations from 540 to 900 kc.

Refer to Fig. 3 for adjustor locations, and then proceed as follows:

1. Turn on radio and allow it to warm for five minutes.
2. Set the selector on AM, and tune in the desired station of the highest frequency (900 to 1600 kc).
3. Re-set the selector to PUSH BUTTONS and depress No. 1 push button (right button viewed from the front).
4. Adjust C95 for maximum receiver output (either a station or static will be heard depending on the setting of L38). Now adjust L38 until the desired station is heard. It may be necessary to re-adjust C95 at intervals to maintain receiver sensitivity.
5. Make a final adjustment of L38 for correct tuning and C95 for maximum output.
6. Return the selector to AM to make certain that the push button has been set on the desired station.
7. Adjust the remaining push buttons in the same manner.



BROADCAST AND SHORT WAVE BANDS

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
15.	Short wave antenna terminal through a 400 ohm resistor (center terminal marked "L")	18 mc	18 mc	Short Wave #2 converter (C20) and antenna (C17) trimmers for max. output.
16.	Short wave antenna terminal through a 400 ohm resistor (center terminal marked "L")	12 mc	12 mc	Short Wave #2 oscillator padder (C22) to receive 12 mc signal.
17.	Short wave antenna terminal through a 400 ohm resistor (center terminal marked "L")	12 mc	12 mc	Short Wave #2 converter (C19) and antenna (C16) padders for max. output.
18.	Repeat steps 14, 15, 16 and 17 until calibration and tracking is correct.			

FM BAND

Do not align the 10.7 mc I-F circuits until all 455 kc I-F adjustments have been completed.

1.	Set selector switch to "FM"			
2.	Connect a vacuum tube voltmeter between point X (see Figs. 1 and 2) and ground (chassis).			
3.	Pin #4 on 6SH7 limiter tube through a .001 mfd capacitor	UNMODULATED 10.7 mc	88 mc	Secondary of discriminator transformer (C94) for *zero* voltage.
4.	Re-connect the vacuum tube voltmeter to pin #3 on the 6H6 ratio detector tube.			
5.	Pin #4 on 6SH7 limiter tube through a .001 mfd capacitor	UNMODULATED 10.7 mc	88 mc	Primary of discriminator transformer (L34) for max. voltage.
6.	Pin #4 on 6SG7 2nd I-F tube through a .001 mfd capacitor	UNMODULATED 10.7 mc	88 mc	10.7 mc. pri. of 3rd I-F trans. for max. voltage.
7.	Pin #4 on 6SG7 1st I-F tube through a .001 mfd capacitor	UNMODULATED 10.7 mc	88 mc	10.7 mc. pri. and sec. of 2nd I-F trans. for max. voltage.
8.	Pin #1 of 7F8 converter tube through a .001 mfd capacitor	UNMODULATED 10.7 mc	88 mc	10.7 mc. pri. and sec. of 1st I-F trans. for max. voltage.
9.	Pin #1 of 7F8 converter tube through a .001 mfd capacitor	UNMODULATED 10.7 mc	88 mc	Recheck all 10.7 mc. I-F adjustments and discriminator primary (L34) adjustment.
10.	Re-connect the vacuum tube voltmeter to point X.			
11.	Stator of FM tuning capacitor (C26) through a .001 mfd capacitor	UNMODULATED 10.7 mc	88 mc	Secondary of discriminator trans. (C94) for *zero* voltage.
12.	Re-connect the vacuum tube voltmeter to pin #3 on the 6H6 ratio detector.			
13.	FM antenna terminals through a 72 ohm resistor (low side of generator to "S" terminal)	UNMODULATED 105 mc	105 mc	FM oscillator trimmer (C14) for max. voltage.
14.	FM antenna terminals through a 72 ohm resistor (low side of generator to "S" terminal)	UNMODULATED 105 mc	105 mc	FM converter (C13) and R-F (C12) trimmers for max. voltage.
15.	Re-check steps 13 and 14.

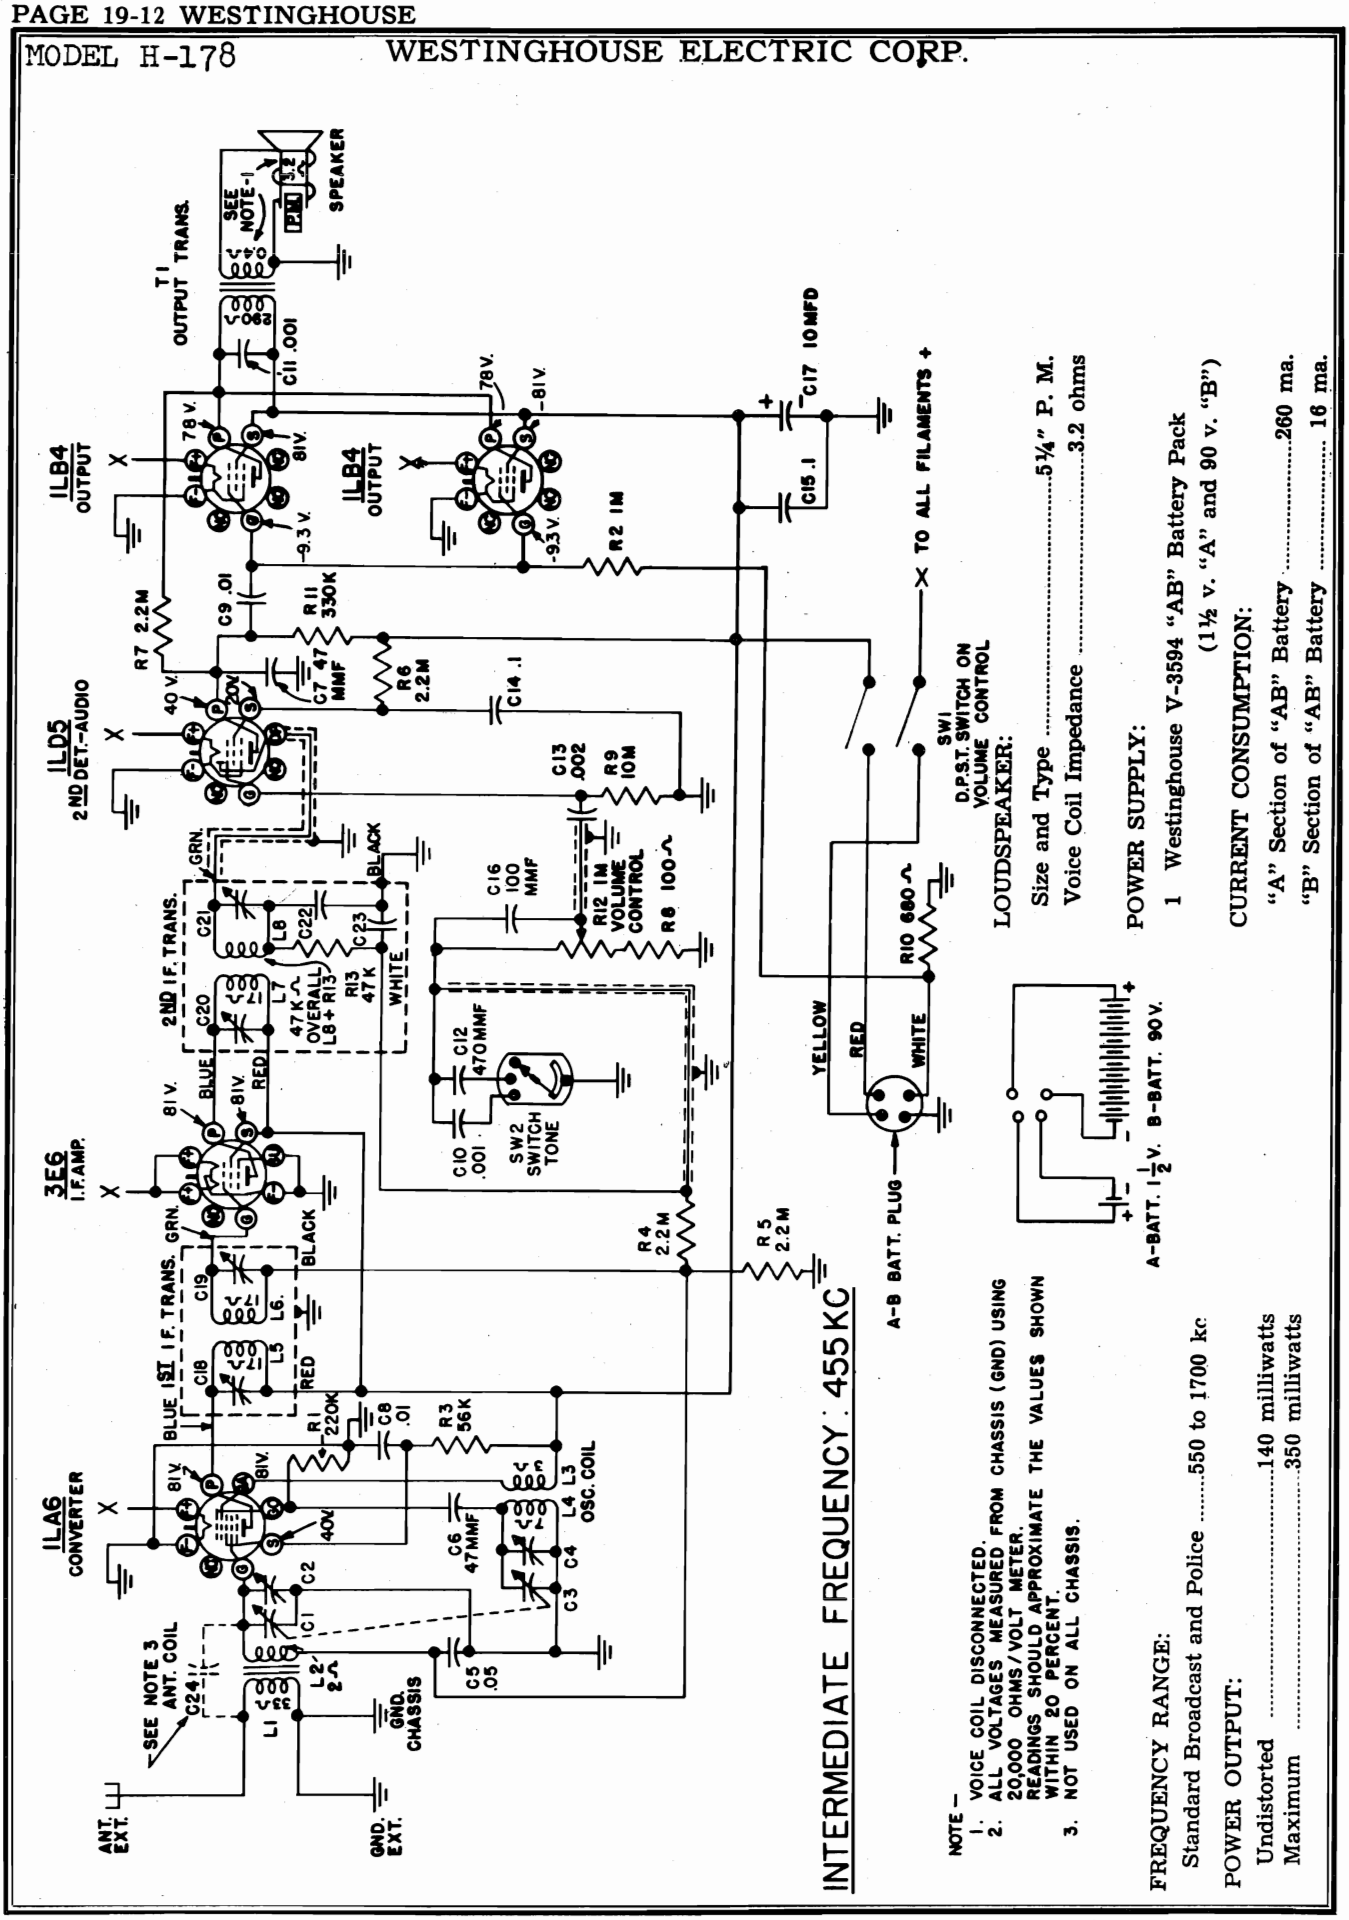
V-5109	Dial Background, rivet assembly
V-5112	Dial, glass
V-5171	Escutcheon, push button
V-4902	Glide, furniture
V-5060-1	Grille Cloth Assembly, speaker box (mahogany)
V-5060-2	Grille Cloth Assembly, speaker box (blonde)
V-5059-1	Grille Cloth, top (mahogany)
V-5074	Grille Cloth, top (blonde)
V-5123	Grille, metal, speaker
V-3345S-4	Grommet, variable capacitor mounting
V-5067-1	Hinge, center, split door (mahogany)
V-5067-2	Hinge, center, split door (blonde)
V-5363-1	Hinge, lower left hand(mahogany)

WESTINGHOUSE ELECTRIC CORP. MODEL H-169

Part No.	Description
V-5170	Retainer, molding for V-5169
V-5188	Rosette, brass
V-5173	Screw, #2-56, for front glass plate
V-3429-8	Screw, #10-32 Hex Head, chassis mounting
V-5187-1	Screw, mounting, for front glass plate
V-5110	Shaft, tuning
V-3344S-2	Sleeve, spacer, variable capacitor mounting
V-3353-5	Slide Mechanism, left hand
V-3353-6	Slide Mechanism, right hand
V-3393-4	Socket, A-C power, phono
V-5117-2	Socket Assembly, tube (7F8)
V-4933	Socket, molded octal, for pre-amplifier
V-4195	Socket, molded octal tube (6L6)
V-3275S	Socket, molded octal tube (5U4G)
V-3246	Socket, octal tube (wafer)
V-5181	Socket, pilot light, jewel
V-5237	Socket, pilot light, phono
V-5183	Socket, pilot light, push buttons
V-5180-3	Socket, pilot light, (SW1, SW2, BC, FM)
V-5192	Socket, 7 contact for speaker
V-5193	Socket, tuning eye (plus R50)
V-5182	Sockets, pilot light, edge lights
V-5354	Spacer, Neoprene, for speaker turntable
V-5160	Speaker, 12" Electro-Dynamic
V-5161	Speaker, 5" x 7" P.M. (plus C32)
V-3248S	Spring, dial drive
V-3258S	Spring, knob
V-5233	Spring, speaker turntable
V-5065-1	Strike, bullet catch (mahogany)
V-5065-2	Strike, bullet catch (blonde)
V-5168-1	Strip, felt, 5/16" x 15" (mahogany)
V-5168-2	Strip, felt, 5/16" x 15" (blonde)
V-5234	Stud, bearing, for speaker turntable
V-3167S-1	Stud, pulley, threaded
V-5235	Stud, threaded, for speaker turntable
V-3261-3	Switch, push button (SW10A, SW10B)
V-5135	Switch, selector, (SW2, SW3, SW4, SW5, SW6, SW7, SW8, SW9)
V-5152	Tab, AM and SW1
V-5185	Tab, FM and SW2
V-5174	Tabs, station
V-3482	Teenut, for speaker box
V-5144	Terminal Board, ANT-GND
V-3417	Terminal Board, FM antenna
V-5136	Transformer, driver (L21, L22)
V-5373	Transformer, 1st I-F (C83, C84, C85, C101, C102, L23, L24, L25, L26)
V-5374	Transformer, 2nd I-F (C86, C87, C88, C89, R49, L27, L28, L29, L30)
V-5375	Transformer, 3rd I-F (C90, C91, C92, L31, L32, L33)
V-5212	Transformer, discriminator (C93, C94, L34, L35, L36, L37)
V-5137	Transformer, power
V-3274S	Tube Holder
V-3317	Tuner, push button
V-5222	Turntable Assembly, for speaker box
V-3506S-1	Washer, chassis mounting, Neoprene
V-3752S	Washer, felt, for knobs
V-3267S-3	Washer, flat, chassis mounting
V-3267S-10	Washer, flat, record changer mounting
V-3215S	Washer, spring, for tuning shaft
V-5175	Windows, station tab

Part No.	Description
V-5363-2	Hinge, lower right hand (mahogany)
V-5363-3	Hinge, lower left hand (blonde)
V-5363-4	Hinge, lower right hand (blonde)
V-5179-1	Jewel, pilot light
V-5155-1	Knob, band (mahogany)
V-5155-2	Knob, band (blonde)
V-4362-4	Knob, tone, front (mahogany)
V-4362-5	Knob, tone, front (blonde)
V-5028-2	Knob, tone, rear
V-5095-1	Knob, volume and tuning (mahogany)
V-5095-2	Knob, volume and tuning (blonde)
No. 44	Lamp, pilot light
No. 51	Lamp, pilot light
V-3283-4	Loop Assembly
V-5169	Molding, bronze strip, front
V-5365-1	Molding, plastic, for lower doors (mahogany)
V-5365-2	Molding, plastic, for lower doors (blonde)
V-5205	Nut, speed, for front glass plate
V-5236	Plate, anchor, 1½" x 1½"
V-5158-1	Plate Assembly, front glass (mahogany)
V-5158-2	Plate Assembly, front glass(blonde)
V-5229	Plate, bottom, for speaker turntable
V-5230	Plate, mounting, for speaker turntable
V-5231	Plate, top, for speaker turntable
V-5133	Pointer
V-5062	Pull, door, lower (mahogany)
V-5305	Pull, door, lower (blonde)
V-5061	Pull, door, upper (mahogany)
V-5306	Pull, door, upper (blonde)
V-3166S	Pulley, 7/16 dia.
V-5166-1	Push button
V-5232	Race, bearing, for speaker turntable
V-5203	Reflector, dial
V-5134	Resistor, 190 ohms 4 w. (R4)
V-5340	Resistor, 290 ohms 2.3 w. (R5)
RC10AE102M	Resistor, 1000 ohms 1/4 w. (R6)
RC20AE393K	Resistor, 39K ½ w. (R7)
RC10AE274M	Resistor, 270K 1/4 w. (R8, R9, R10)
RC20AE682K	Resistor, 6800 ohms ½ w. (R11)
RC10AE105M	Resistor, 1.0 megohm 1/4 w. (R12, R13, R15, R16, R17)
RC10AE104K	Resistor, 100K 1/4 w. (R14, R18, R19)
RC10AE273K	Resistor, 27K 1/4 w. (R20)
RC10AE473M	Resistor, 47K 1/4 w. (R21)
RC10AE222M	Resistor, 2200 ohms 1/4 w. (R22)
RC10AE683M	Resistor, 68K 1/4 w. (R23)
RC10AE225M	Resistor, 2.2 megohms 1/4 w. (R24, R25)
RC10AE273M	Resistor, 27K 1/4 w. (R26)
RC10AE153J	Resistor, 15K 1/4 w. (R27, R28)
RC20AE330K	Resistor, 33 ohms ½ w. (R29, R30)
RC10AE223K	Resistor, 22K 1/4 w. (R31)
RC10AE680M	Resistor, 68 ohms 1/4 w. (R32)
RC10AE274K	Resistor, 270K 1/4 w. (R33, R34)
RC20AE333M	Resistor, 33K ½ w. (R35)
RC10AE154K	Resistor, 150K 1/4 w. (R36)
RC10AE474M	Resistor, 470K 1/4 w. (R37)
RC40AE223K	Resistor, 22K 2 w. (R38)
RC30AE333K	Resistor, 33K 1 w. (R39, R40)
RC20AE103K	Resistor, 10K ½ w. (R41)
RC10AE222K	Resistor, 2200 ohms 1/4 w. (R42)
RC20AE471K	Resistor, 470 ohms ½ w. (R43, R44)
RC40AE682K	Resistor, 6800 ohms 2 w. (R45)
RC30AE332K	Resistor, 3300 ohms 1 w. (R46, R47)
RC10AE221K	Resistor, 220 ohms ½ w. (R48)

MODEL H-178 WESTINGHOUSE ELECTRIC CORP.



NOTE –
1. VOICE COIL DISCONNECTED.
2. ALL VOLTAGES MEASURED FROM CHASSIS (GND) USING 20,000 OHMS/VOLT METER. READINGS SHOULD APPROXIMATE THE VALUES SHOWN WITHIN 20 PERCENT.
3. NOT USED ON ALL CHASSIS.

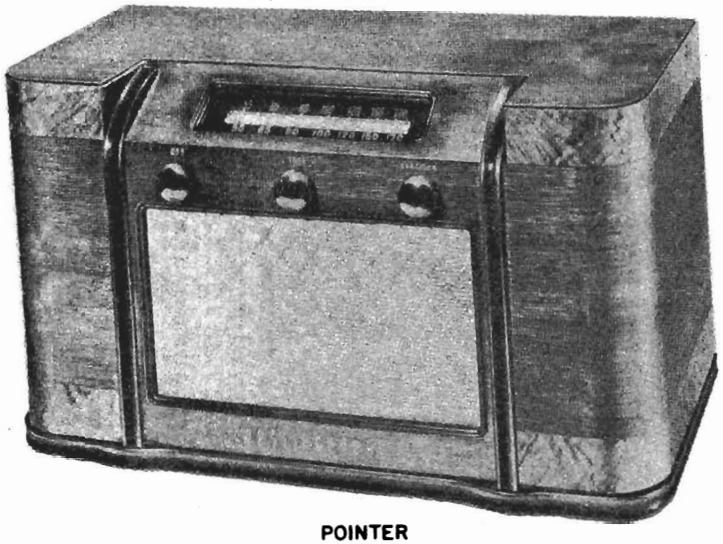
FREQUENCY RANGE:
Standard Broadcast and Police .....550 to 1700 kc

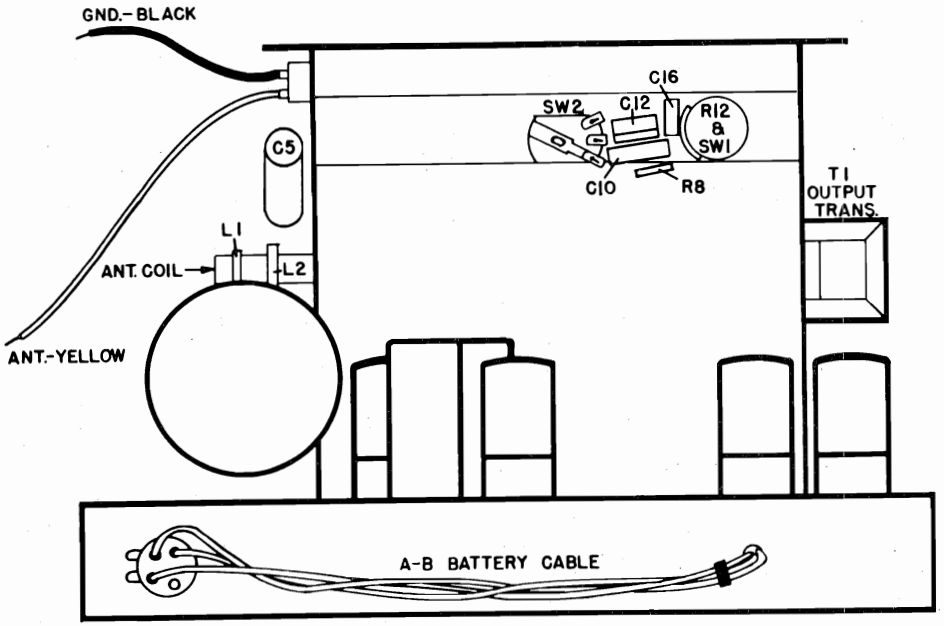
POWER OUTPUT:
Undistorted .....140 milliwatts
Maximum .....350 milliwatts

LOUDSPEAKER:
Size and Type .....5¼" P. M.
Voice Coil Impedance .....3.2 ohms

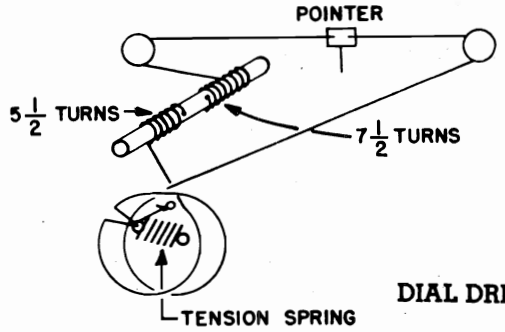
POWER SUPPLY:
1 Westinghouse V-3594 "AB" Battery Pack (1½ v. "A" and 90 v. "B")

CURRENT CONSUMPTION:
"A" Section of "AB" Battery .....260 ma.
"B" Section of "AB" Battery .....16 ma.

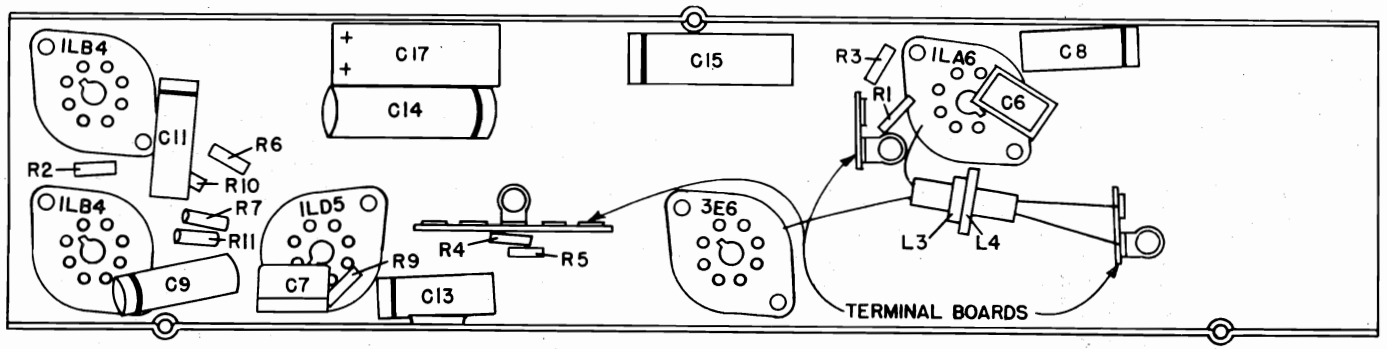




REAR VIEW OF CHASSIS

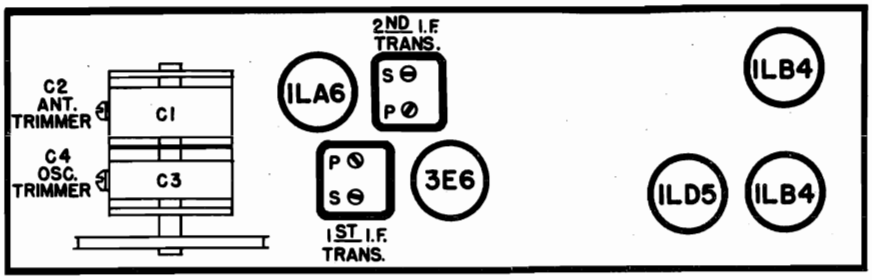


DIAL DRIVE MECHANISM



BOTTOM VIEW OF CHASSIS

MODEL H-178 WESTINGHOUSE ELECTRIC CORP.



CHASSIS LAYOUT

ALIGNMENT

Before beginning alignment, make certain that the dial pointer aligns with the dot on the extreme high-frequency end of the dial when the tuning capacitor is set for minimum capacity.

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid A. V. C. action.

Step	Connect Signal Generator to—	Signal Generator Frequency	Radio Dial Setting	Adjust
1	3E6 control grid through 0.1 mfd capacitor	455 kc	550 kc	Secondary and Primary trimmers of 2nd I-F trans. for max. output.
2	1LA6 control grid through 0.1 mfd capacitor	455 kc	550 kc	Secondary and Primary trimmers of 1st I-F trans. for max. output.
3	Antenna terminal through 200 mmf capacitor	455 kc	550 kc	"Peak" all I-F trimmers.
4	Antenna terminal through 200 mmf capacitor	1500 kc	1500 kc	Oscillator trimmer for max. output.
5	Antenna terminal through 200 mmf capacitor	1500 kc	1500 kc	Antenna trimmer for max. output.

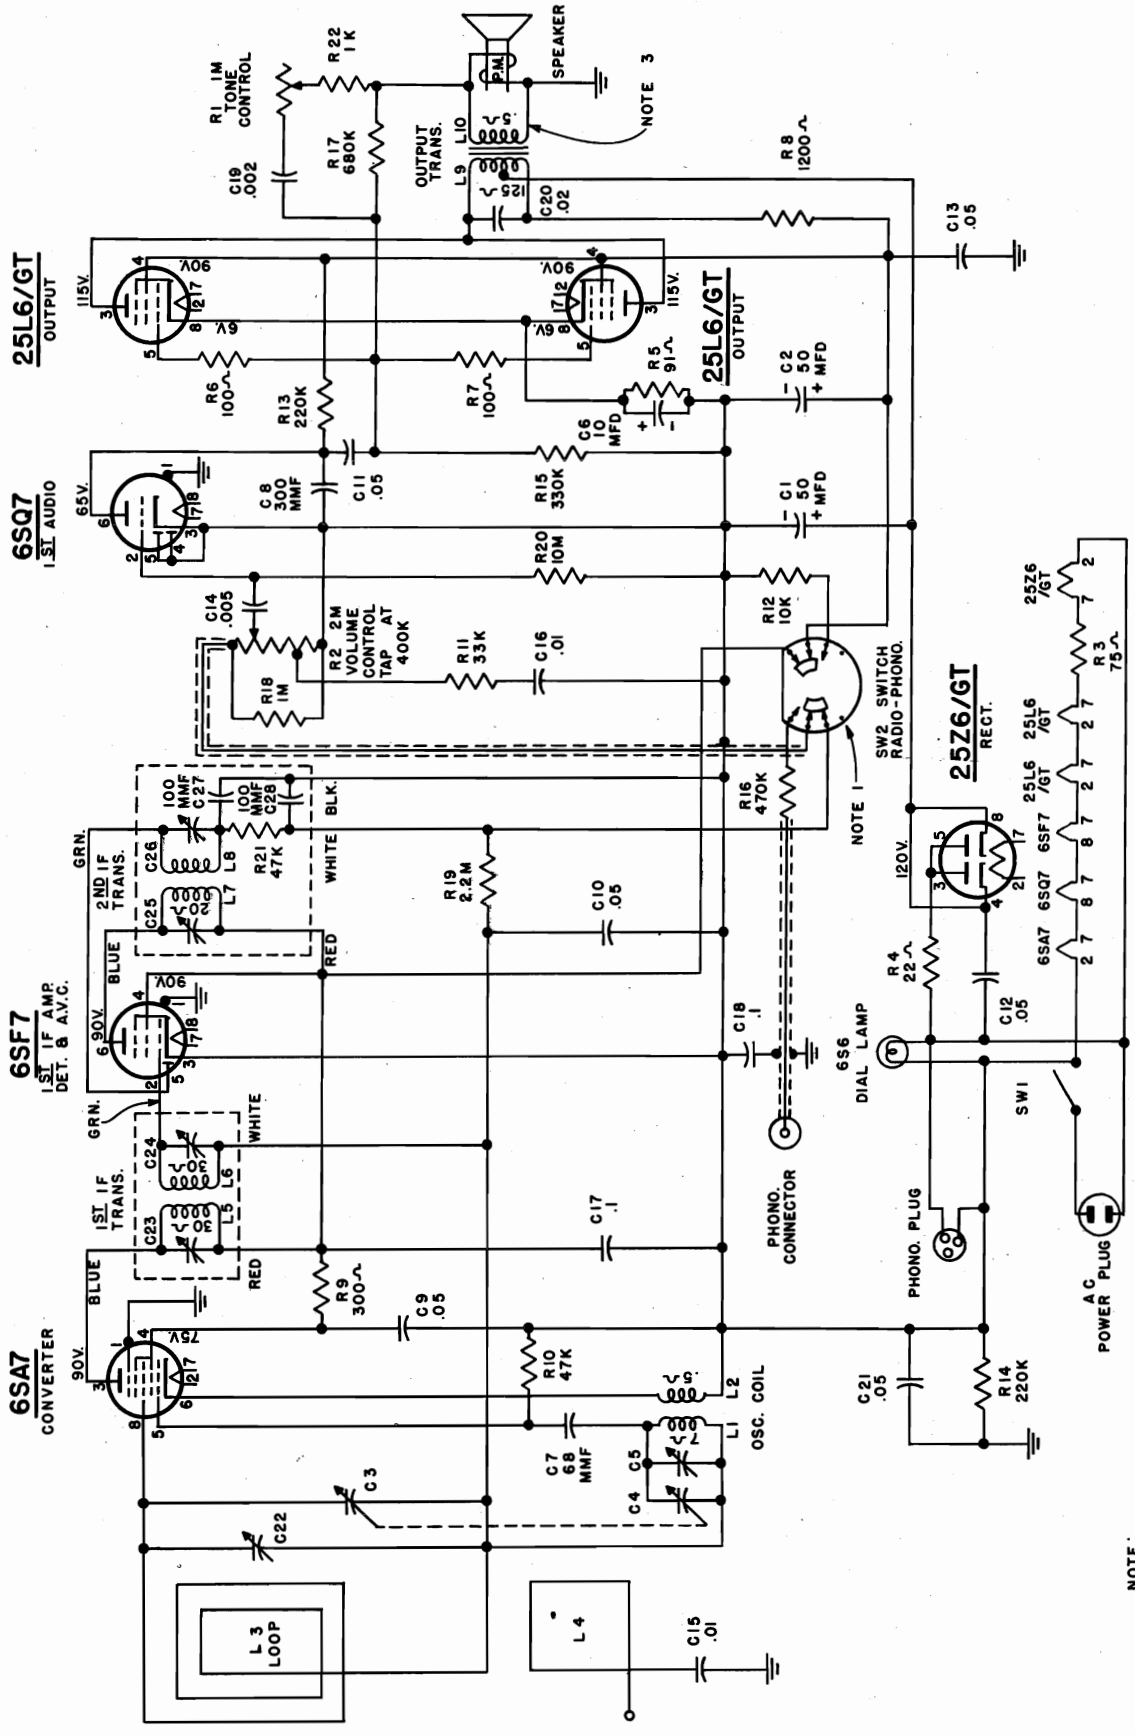
PARTS LIST FOR MODEL H-178

When ordering parts specify model number of set in addition to part number and description of part.

Part No.	Description
V-3603	Background, dial
V-3593	Baffle, speaker
V-3594	Battery, "A-B"
V-3550	Bracket, dial mounting
V-3551	Bracket, pulley stud assembly
V-3600	Bracket, speaker mounting
V-3555	Bracket, tuning shaft mounting
V-3580	Bracket, variable capacitor
V-1147-1	Cabinet
V-5324	Cable Assembly, battery
V-3569	Capacitor, variable 2 gang (C1, C2, C3, C4)
RCP10W2503A	Capacitor, .05 mfd 200 v. (C5)
RCM20A470K	Capacitor, 47 mmf mica (C6, C7)
RCP10W4103A	Capacitor, .01 mfd 400 v. (C8, C9)
RCP10W6102K	Capacitor, .001 mfd 600 v. (C10, C11)
RCM20A471K	Capacitor, 470 mmf mica (C12)
RCP10W6202A	Capacitor, .002 mfd 600 v. (C13)
RCP10W2104A	Capacitor, 0.1 mfd 200 v. (C14, C15)
RCM20A101M	Capacitor, 100 mmf mica (C16)
V-3581	Capacitor, electrolytic, tubular 10 mfd 150 v. (C17)
V-3562	Clamp, dial
V-3567	Coil, antenna (L1, L2, C24)
V-3582	Coil, oscillator (L3, L4)
V-3564	Control, volume, 2 meg. (R12) with switch (SW1)
V-4157S-66	Cord, dial drive
V-3596	Decal, OFF
V-3662	Decal, STATIONS
V-3660	Decal, TONE
V-3665	Decal, WESTINGHOUSE
V-3559	Dial, glass

Part No.	Description
V-3489S-1	Foot, rubber
V-3592-2	Grille Cloth
V-3268	Grommet, variable condenser mounting
V-3331-1	Knob, volume-switch
V-3331-3	Knob, tone
V-3331-2	Knob, tuning
V-3585	Plug, battery cable
V-3558	Pointer Assembly
V-3166S	Pulley, 7/16" dia.
RC10AE224M	Resistor, 220K ¼ w. (R1)
RC10AE105M	Resistor, 1.0 meg. ¼ w. (R2)
RC10AE563M	Resistor, 56K ¼ w. (R3)
RC10AE225M	Resistor, 2.2 meg. ¼ w. (R4, R5, R6, R7)
RC10AE101M	Resistor, 100 ohms ¼ w. (R8)
RC10AE106M	Resistor, 10.0 meg. ¼ w. (R9)
RC10AE681K	Resistor, 680 ohms ¼ w. (R10)
RC10AE334M	Resistor, 330K ¼ W. (R11)
V-3573	Socket, loktal, miniature tube
V-3601	Speaker, 5¼" P. M.
V-3248S	Spring, dial drive
V-3258S	Spring, knobs
V-3563	Switch, tone (SW2)
V-3574	Terminal Board, 2 lugs
V-3575	Terminal Board, 5 lugs
V-3576	Transformer, output (T1)
V-3577	Transformer, 1st I-F (L5, L6, C18, C19)
V-3578	Transformer, 2nd I-F (L7, L8, C20, C21, C22, C23, R13)
V-3556	Tuning Shaft Assembly
V-3752S	Washer, felt
V-3267S-4	Washer, flat, chassis mounting
V-3237	Washer, cup, variable capacitor Mounting

WESTINGHOUSE ELECTRIC CORP. MODELS H-183, H-183A



RECORD CHANGERS: For H-183, Gen. Ins. Model 205, RCD.CH. 15-5; For H-183A, Gen Ins. Model 700, RCD.CH. 19-1

ALIGNMENT

The use of an isolation transformer in the power line is recommended.

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid A. V. C. action.

Step	Connect Signal Generator to—	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Pin No. 2 of 6SF7 tube through a 200 mmf capacitor	455 kc	540 kc	Secondary and primary of 2nd I-F transformer for maximum output.
2	Stator of tuning capacitor (C3) through a 200 mmf capacitor	455 kc	540 kc	Secondary and primary of 1st I-F transformer for maximum output.
3	Recheck 1st and 2nd I-F transformers.			
4	Antenna terminal through a 200 mmf capacitor	1615 kc	1615 kc	Oscillator trimmer (C5) for maximum output.
5	Radiated signal (no actual connection)	1400 kc	1400 kc	Antenna trimmer (C22) for maximum output.

FREQUENCY RANGE .....540 to 1615 kc.

INTERMEDIATE FREQUENCY .....455 kc.

TUBE COMPLEMENT:

1 6SA7 .....Converter
1 6SF7 .....1st I-F Amp., Det., and AVC
1 6SQ7 .....1st Audio
2 25L6GT .....Output
1 25Z6GT .....Rectifier

PILOT LAMP ....Westinghouse No. 6S6 120 v., .05 amp.

POWER OUTPUT:

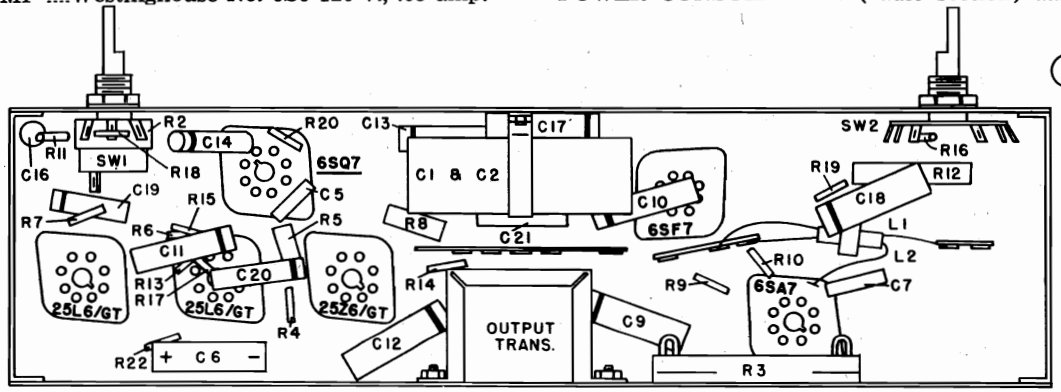
Undistorted .....2 watts
Maximum .....2.5 watts

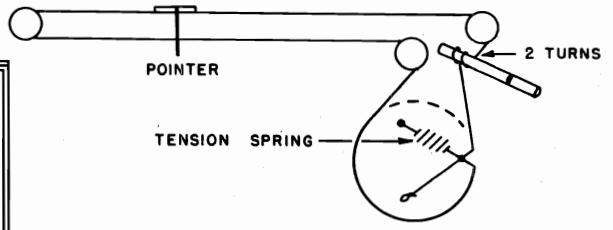
LOUDSPEAKER .....10" PM

OPERATING VOLTAGES (radio section only):

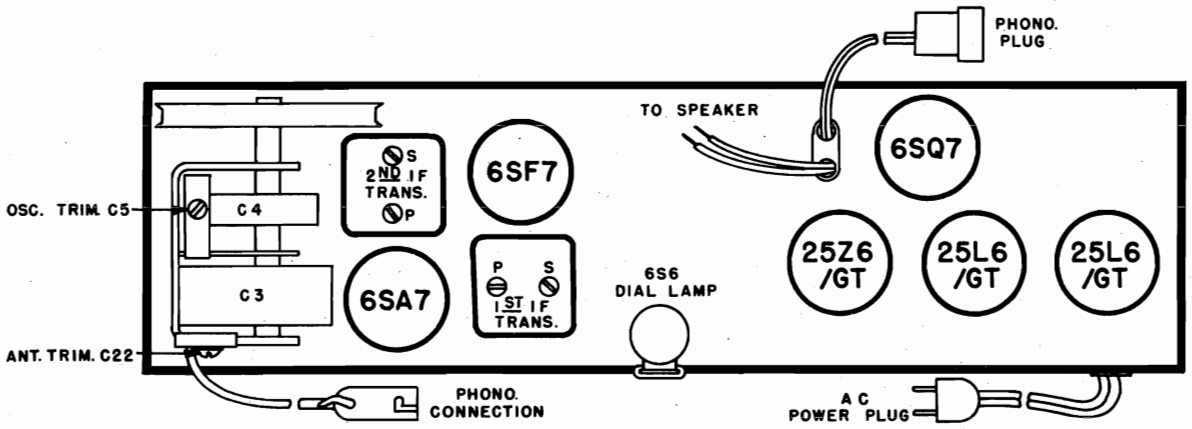
105 to 120 volts, 50-60 cycles or 105 to 120 volts, D.C.

POWER CONSUMPTION (radio section) .....35 watts





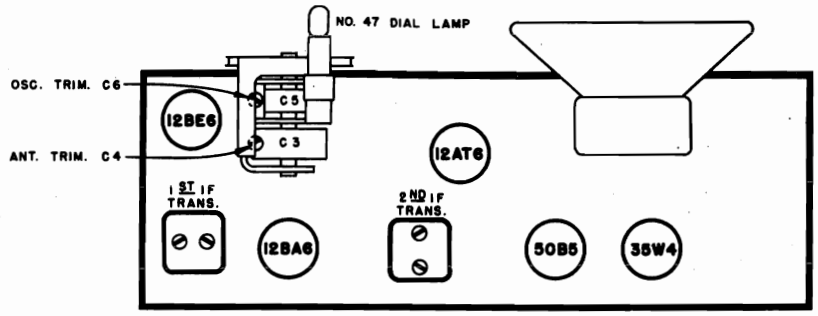
WESTINGHOUSE ELECTRIC CORP. MODELS H-183, H-183A



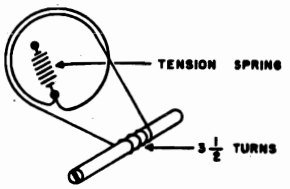
Part No.	Description
V-3166S	Pulley, 7/16 dia.
V-3321	Rail, pointer
V-4994	Resistor, 75 ohms 2 w. (R3)
RC20AE220M	Resistor, 22 ohms ½ w. (R4)
RC30AE910J	Resistor, 91 ohms 1 w. (R5)
RC10AE101M	Resistor, 100 ohms ¼ w. (R6, R7)
RC40AE122K	Resistor, 1200 ohms 2 w. (R8)
RC10AE332M	Resistor, 3300 ohms ¼ w. (R9)
RC10AE473M	Resistor, 47,000 ohms ¼ w. (R10)
RC10AE333M	Resistor, 33,000 ohms ¼ w. (R11)
RC40AE103M	Resistor, 10,000 ohms 2 w. (R12)
RC10AE224M	Resistor, 220,000 ohms ¼ w. (R13, R14)
RC10AE334M	Resistor, 330,000 ohms ¼ w. (R15)
RC10AE474M	Resistor, 470,000 ohms ¼ w. (R16)
RC10AE684M	Resistor, 680,000 ohms ¼ w. (R17)
RC10AE105M	Resistor, 1 megohm ¼ w. (R18)
RC10AE225M	Resistor, 2.2 megohms ¼ w. (R19)
RC10AE106M	Resistor, 10M ¼ w. (R20)
RC10AE102M	Resistor, 1000 ohms ¼ w. (R22)
V-3322	Shaft, tuning
V-5620	Shield, light
V-3344-1	Sleeve, spacer
V-5631-1	Slide Mechanism, left hand
V-5631-2	Slide Mechanism, right hand
V-5619-1	Socket, dial lamp
V-3163	Socket, octal No. 1 ground
V-3246S	Socket, octal tube
V-5571	Speaker, 10" P. M.
V-3248S	Spring, dial drive
V-3258S	Spring, knob
V-5628-1	Strike, bullet catch
V-3301	Switch, radio-phono (SW2)
V-3482	Teenut, phono mounting (H-183)
V-3328	Transformer, 1st I-F (C23, C24, L5, L6)
V-3329	Transformer, 2nd I-F (R21, C25, C26, C27, C28, L7, L8)
V-5430	Transformer, output (L9, L10)
V-3668S	Washer, felt (knobs)
V-3267S-10	Washer, flat (record changer mounting for H-183A)
V-3267S-4	Washer, flat (chassis and record changer mounting for H-183 and chassis mounting for H-183A)

Part No.	Description
V-5580	Bracket, dial lamp
V-5584	Cable and Socket, phono power
V-5593	Capacitor, electrolytic 50-50 mfd (C1, C2)
V-5586	Capacitor, variable 2-gang (C3, C4, C5)
V-5621	Capacitor, electrolytic cartridge 10 mfd (C6)
RCM20A680M	Capacitor, 68 mmf mica (C7)
RCM20A301M	Capacitor, 300 mmf mica (C8)
RCP10W4503A	Capacitor, .05 mfd 400 v. (C9, C10, C11, C12, C13)
RCP10W6502A	Capacitor, .005 mfd 600 v. (C14)
RCP10W4103A	Capacitor, .01 mfd 400 v. (C15, C16)
RCP10W4104A	Capacitor, .1 mfd 400 v. (C17, C18)
RCP10W4202A	Capacitor, .002 mfd 400 v. (C19)
RCP10W4203A	Capacitor, .02 mfd 400 v. (C20)
V-5618-1	Capacitor, .05 mfd 400 v. (C21)
V-4992	Capacitor, trimmer, antenna (C22)
V-5627-1	Catch, bullet
V-5622	Clip, dial mounting
V-3473	Coil, oscillator (L1, L2)
V-5585	Connector, phono, female
V-3303	Control, tone (R1)
V-5617	Control, volume (R2) and switch (SW1)
V-4304-15	Cord Assembly, dial drive
V-3663	Decal, radio-phono
V-3662	Decal, stations
V-3660	Decal, tone
V-3661	Decal, volume
V-5567	Dial, plastic
V-5569	Escutcheon
V-5629	Glide, furniture
V-5625-1	Grille Cloth
V-3766	Grommet, fibre
V-3345-7	Grommet, phono mounting (H-183)
V-5630-1	Hinge, door
V-3667-6	Knob, radio-phono
V-3262-5	Knob, tone and band
V-3667-5	Knob, volume
No. 6S6	Lamp, dial
V-5583	Loop, antenna
V-5632-1	Nameplate
V-3712S	Needle, phono
V-3366-2	Pin, escutcheon-nameplate mounting
V-5577	Pointer, dial
V-5626-1	Pull, door

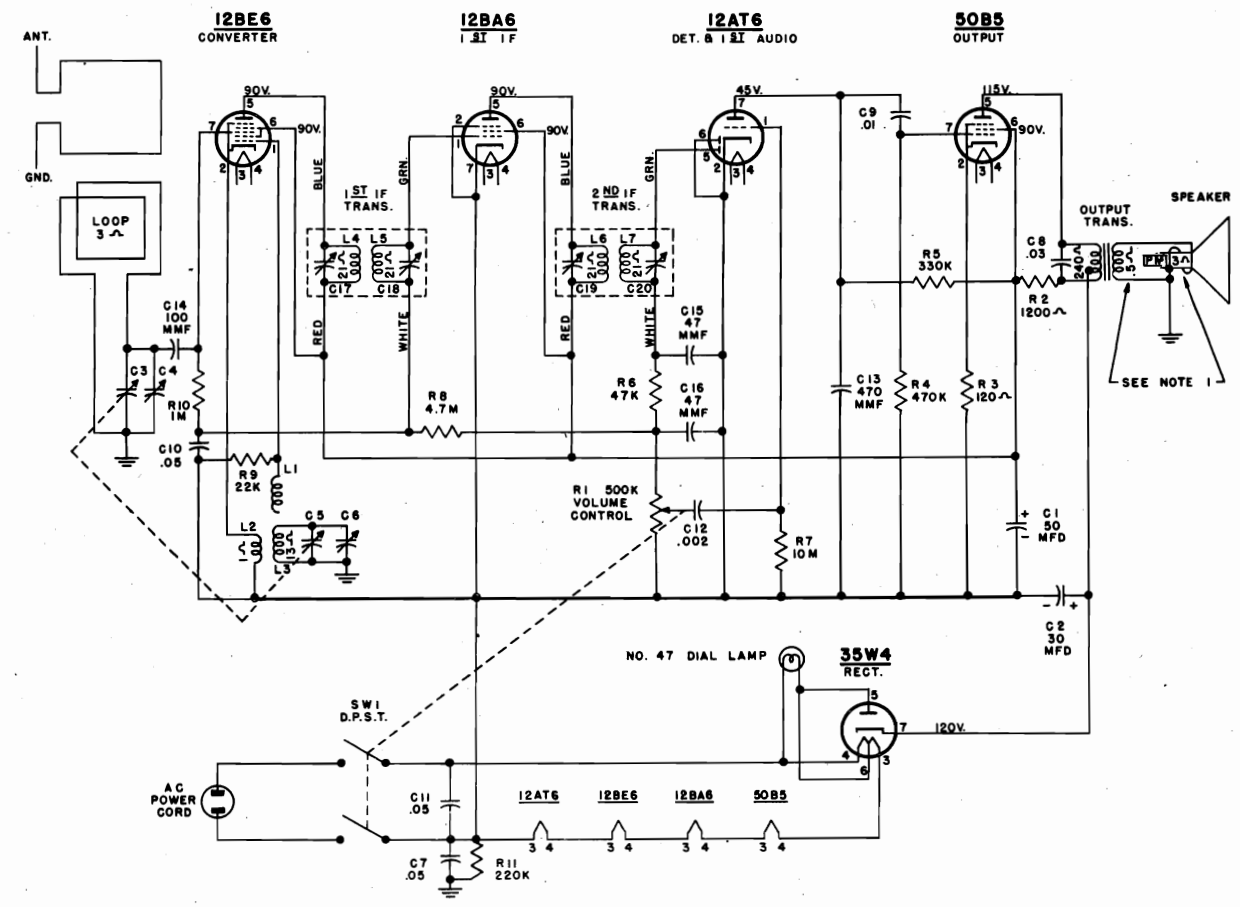
MODEL H-188 WESTINGHOUSE ELECTRIC CORP.



CHASSIS NO. V-2133



Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1.	Stator of antenna tuning capacitor (C3) through a 0.1 mfd capacitor	455 kc	minimum capacity	Trimmers in 1st and 2nd I-F trans. for max. output
	NOTE: If the I-F transformers are badly mis-aligned, it may be impossible to obtain sufficient output using the above system. In this event, it will be necessary to align each transformer separately. Start with the last I-F transformer and work forward, connecting the signal generator to the control grid of the tube preceding the transformer under alignment.			
2.	Recheck Step 1 adjustments.			
3.	Radiated signal (no actual connection)	1615 kc	minimum capacity	Osc. trimmer (C6) for max. output
4.	Radiated signal (no actual connection)	1400 kc	tune to signal	Ant. trimmer (C4) for max. output (rock-in adjustment)



NOTE:
1. VOICE COIL DISCONNECTED.
2. ALL VOLTAGES MEASURED FROM CIRCUIT (GND.) USING 20,000 OHM/VOLT METER—LINE VOLTAGE 117 V.A.C. VOLTAGES SHOULD BE AS SHOWN ± 20 PER CENT.

ALIGNMENT

It is recommended that the chassis be isolated from the power line by means of an isolation transformer.

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output and the signal generator attenuated to avoid AVC action.

WESTINGHOUSE ELECTRIC CORP.

ALIGNMENT

BROADCAST BAND

Completely mesh the tuning capacitor plates and set the dial pointer to the end mark on the dial scale.

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output, the tone control set for maximum treble, and the signal generator output attenuated to avoid A.V.C. action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to AM.			
2	Stator of tuning capacitor (C41) through a 0.1 mfd capacitor	455 kc	maximum capacity	455 kc. pri. of 3rd I-F trans., sec. and pri. of 2nd I-F trans., and sec. and pri. of 1st I-F trans. for max. output
	NOTE: If the I-F transformers are badly mis-aligned, it may be impossible to obtain sufficient output using the above system. In this event, it will be necessary to align each transformer separately. Start with the last I-F transformer and work forward, connecting the signal generator to the control grid of the tube preceding the transformer under alignment.			
3	Radiated signal (no actual connection)	1600 kc	1600 kc	AM osc. trimmer (C40) for max. output
4	Radiated signal (no actual connection)	1400 kc	tune to signal	AM ant. trimmer (C47) for max. output (rock-in adjustment)

FM BAND

Do not align the 10.7 mc. I-F circuits until all 455 kc. I-F adjustments have been completed.

1	Set the band switch to FM.			
2	Connect two 100,000 ohm resistors (the resistances must be equal within 5 percent) between pin #1 of the 6AL5 tube and ground as shown in Fig. 4.			
3	Connect a V.T.V.M. between points "X" and "Y" (see Fig. 4).			
4	Pin #1 of the 6BA6, 1st I-F amp. through a .001 mfd mica capacitor	10.7 mc	maximum capacity	Sec. of discriminator trans. for *zero* voltage (the voltage will go positive on one side of the correct setting and negative on the other side)
5	Connect the V.T.V.M. between point "Z" and ground.			
6	Pin #1 of the 6BA6, 1st I-F amp. through a .001 mfd mica capacitor	10.7 mc	maximum capacity	Pri. of discriminator trans., 10.7 mc. sec. and pri. of 3rd I-F trans., and 10.7 mc. sec. and pri. of 2nd I-F trans. for max. voltage
7	Using the same sig. generator and V.T.V.M. connections as in Step 6, adjust the sig. generator output until the V.T.V.M. indicates 4 volts. Use this sig. generator setting to perform Step 9.			
8	Reconnect the V.T.V.M. between points "X" and "Y".			
9	Pin #1 of the 6BA6, 1st I-F amp. through a .001 mfd mica capacitor	10.7 mc	maximum capacity	Sec. of discriminator trans. for *zero* voltage. The voltage will change polarity as the sec. is tuned through resonance — tune carefully for exact zero
10	Remove the two 100,000 ohm resistors which were inserted in Step 2.			
11	Reconnect the V.T.V.M. between point "Z" and ground.			
12	Pin #1 of the 6BA6, 1st I-F amp. through a .001 mfd mica capacitor	10.7 mc	maximum capacity	Recheck pri. of discriminator trans. for max. voltage
13	Stator of FM tuning capacitor (C42) through a .01 mfd mica capacitor	10.7 mc	maximum capacity	Sec. and pri. of 10.7 mc. 1st I-F trans. for max. voltage
14	Ant. terminal #2 through a 300 ohm resistor	108 mc	108 mc	FM osc. trimmer (C46) for max. voltage*
15	Ant. terminal #2 through a 300 ohm resistor	105 mc	tune to signal	FM ant. trimmer (C45) for max. voltage (rock-in adjustment)**

*After adjusting the oscillator trimmer at 108 mc., check dial calibration by tuning the receiver to an 88 mc. signal from the generator. If the dial pointer indicates 88 mc., no further oscillator adjustments are necessary. If the pointer is on the high frequency side of 88 mc., slightly expand the length of the oscillator coil (L8); if the pointer is on the low frequency side of 88 mc., slightly compress the oscillator coil. Re-adjust the oscillator trimmer at 108 mc., and again check the calibration. Repeat this process until calibration is correct.

**After adjusting the antenna trimmer at 105 mc., check tracking by tuning to a 90 mc. signal from the generator and re-adjusting the antenna trimmer for max. output. If the peak setting is the same at 90 mc. as it was at 105 mc., no further adjustments are necessary. If the trimmer capacitance must be increased to obtain max. output at 90 mc., slightly compress the antenna coil (L5); if the capacitance must be decreased, slightly expand the coil. Re-adjust the antenna trimmer at 105 mc., and again check the tracking. Repeat this process until tracking is correct.

Model H-204A is identical in external appearance with Model H-204. The similarity of these models extends also to the chassis, where the same chassis layout, adjustment points, and basic circuit exist. However, a low-impedance loop antenna is used in Model H-204, while the H-204A incorporates a high-impedance loop with a slightly different input circuit.

The service notes for Models H-202 and H-204, with the exception of the schematic diagram and a few of the items on the parts list, apply to the Model H-204A. The necessary parts information is given below,

With the exception of items that are equivalent to those listed below, all items that apply to the Model H-204, as listed in the H-202 and H-204 service notes, apply also to the Model H-204A.

The parts listed below apply only to Model H-204A.

WESTINGHOUSE ELECTRIC CORP. MODELS H-202, H-204, H-204A, CHASSIS V-2128-2

CAUTION: One side of the power line is connected directly to the chassis in this model. Care must be exercised to avoid contacting the radio chassis and ground at the same time — ***SERIOUS SHOCK MAY RESULT.*** When making repairs or adjustments to the radio, it is recommended that the chassis be isolated from the power line by means of an isolation transformer.

ALIGNMENT

BROADCAST BAND

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set band switch to AM.			
2	Pin #1 of 12BA6 (1st I-F) tube through a 0.1 mfd capacitor	455 kc	minimum capacity	Sec. and pri. of 455 kc 2nd I-F trans. for max. output
3	Stator of tuning capacitor (C59) through a 0.1 mfd capacitor	455 kc	minimum capacity	Sec. and pri. of 455 kc 1st I-F 1st I-F trans. for max. output
4	Radiated signal (no actual connection)	1615 kc	minimum capacity	AM osc. trimmer (C64) for max. output
5	Radiated signal (no actual connection)	1400 kc	1400 kc	AM ant. trimmer (C58) for max. output

FM BAND

Do not align 10.7 mc. I-F circuits until 455 kc I-F adjustments have been completed.

1	Set band switch to FM.			
2	Connect a V.T.V.M. between point "X" and ground (See Fig. 4).			
3	Pin #1 of 12BA6 (Ratio det. driver) tube through a .002 mfd capacitor	10.7 mc	minimum capacity	Pri. of discriminator trans. for max. voltage
4	With the V.T.V.M. and signal generator connected as in Step 3, adjust the output of the signal generator until a reading of 2.5 volts is obtained on the V.T.V.M. Use this signal generator setting when performing Step 6.			
5	Connect the V.T.V.M. between points "Y" and "Z" (See Fig. 4).			
6	Same as Step 3.	10.7 mc	minimum capacity	Sec. of discriminator trans. for *zero* voltage. The voltage will change polarity as the trimmer is tuned through resonance — tune carefully for zero
7	Reconnect the V.T.V.M. between point "X" and ground.			
8	Same as Step 3.	10.7 mc	minimum capacity	Pri. of discriminator trans. for max. voltage
9	Pin #1 of 12BA6 (1st I-F) tube through a .002 mfd capacitor	10.7 mc	minimum capacity	Sec. and pri. of 10.7 mc 2nd I-F trans. for max. voltage
10	Pin #7 of 12AT7 tube through a .002 mfd capacitor	10.7 mc	minimum capacity	Sec. and pri. of 10.7 mc 1st I-F trans. for max. voltage
NOTE:	*Do not attempt to peak the 2nd I-F transformer or discriminator transformer with the signal generator connected as in Step 10.*			
11	FM ant. terminals through a 300 ohm non-inductive resistor	108 mc	minimum capacity	FM osc. trimmer (C65) for max. voltage
12	Check calibration as explained below*.			
13	Same as Step 11.	105 mc	105 mc	FM R-F trimmer (C63) for max. voltage (rock in adjustment)
14	Check tracking as explained below**.			

*To check dial calibration, completely mesh the tuning capacitor plates and vary the signal generator frequency until the signal is maximum on the V.T.V.M. If at this setting, the generator frequency is 88 mc., no further oscillator adjustments are required. If the generator is higher in frequency than 88 mc., slightly compress the FM oscillator coil (L14); if the generator frequency is lower than 88 mc., slightly expand the FM oscillator coil (L14). Repeat Steps 11 and 12 until the receiver tunes to 108 mc. with the tuning capacitor fully open and 88 mc. with the tuning capacitor fully closed.

**Tune the receiver to a 90 mc. signal from the generator and adjust the FM R-F trimmer for maximum voltage. If the "peak" setting is the same at 90 mc. as it was at 105 mc., no further adjustment is necessary. If the trimmer capacitance must be increased for maximum voltage at 90 mc., slightly compress the FM R-F coil (L16); if the trimmer capacitance must be decreased for maximum voltage at 90 mc., slightly expand the FM R-F coil (L16). Re-adjust the FM R-F trimmer at 105 mc., and again check the tracking. Repeat this process until the tracking is correct.

WESTINGHOUSE ELECTRIC CORP. MODELS H-203, H-212

H-203

H-212

SPECIFICATIONS

FREQUENCY RANGES:

Amplitude Modulation .... 540 to 1600 kc.
Frequency Modulation ..... 88 to 108 mc.

INTERMEDIATE FREQUENCIES:

Amplitude Modulation ..... 455 kc.
Frequency Modulation ..... 10.7 mc.

TUBE COMPLEMENT:

1 12AT7 ..... R-F Amp. and Mixer (FM)
1 6BE6 H-F Osc. (AM/FM) and converter(AM)
1 6BA6 ..... I-F Amp.
1 6BA6 ..... I-F Driver (FM)
1 6AL5 ..... Ratio Det. (FM)
1 6AV6 ..... Det. & AVC (AM) and A-F Amp.
1 6V6GT ..... Output Amp.
1 5Y3GT ..... Rectifier

PILOT LAMPS:

2 Westinghouse No. 47 ... 6.3 v., 0.15 a.

POWER OUTPUT:

Undistorted ..... 3.5 watts
Maximum ..... 6 watts

LOUDSPEAKER:

H-203 ..... 10" P.M.
H-212 ..... 8" P.M.

OPERATING VOLTAGE:

..... 105 to 120 volts, 60 cycles A-C

POWER CONSUMPTION:

H-203 ..... 110 watts
H-212 ..... 85 watts

SERVICE NOTES

For information on the V-4944-2 record changer used with Model H-203, refer to the V-4944 Automatic Record Changer Service Notes. However, when ordering replacement parts, specify the items listed below rather than the corresponding parts as listed in the V-4944 Service Notes. The following parts are for the V-4944-2 changer only.

Loc.	Part No.	Description
9	V-7962	Pickup Cable with Connector (28")
13	V-7689	Cartridge, crystal (P-30)
15	V-7963	Nut, needle retaining (for P-30 cartridge)
(Last item on parts list)	V-7964	Needle, phonograph (for P-30 cartridge)

WESTINGHOUSE ELECTRIC CORP. MODELS H-203, H-212, CHASSIS V-2137

ALIGNMENT

BROADCAST BAND

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output, the tone control set for maximum treble, and the signal generator output attenuated to avoid A.V.C. action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to AM.			
2	Stator of tuning capacitor (C51) through a 0.1 mfd capacitor	455 kc.	maximum capacity	455 kc. pri. and sec. of 1st and 2nd I-F trans. for max. output
	NOTE: If the I-F transformers are badly mis-aligned, it may be impossible to obtain sufficient output using the above system. In this event, it will be necessary to align each transformer separately. Start with the last I-F transformer and work forward, connecting the signal generator to the control grid of the tube preceding the transformer under alignment.			
3	Radiated signal (no actual connection)	1600 kc.	1600 kc.	AM osc. trimmer (C55) for max. output
4	Radiated signal (no actual connection)	1400 kc.	tune to signal	AM ant. trimmer (C57) for max. output (rock-in adjustment)

FM BAND

Do not align the FM circuits until all AM adjustments have been completed.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to FM.			
2	Connect two 100,000 ohm resistors (the resistances must be equal within 5 percent) between pin #7 of the 6AL5 tube and ground as shown on the schematic diagram.			
3	Connect a V.T.V.M. between points "X" and "Y" (see schematic diagram).			
4	Stator of FM osc. section (C50) on tuning capacitor through a .01 mfd mica capacitor	10.7 mc.	maximum capacity	Sec. of ratio det. trans. for *zero* (use medium strength signal)
5	Connect the V.T.V.M. between point "Z" and ground.			
6	Same as step 4	10.7 mc.	maximum capacity	Pri. of ratio det. trans. and pri. and sec. of 10.7 mc. 1st and 2nd I-F trans. for max.
	NOTE: The pri. of the ratio det. trans. peaks in two places. Use the peak with the slug farthest out.			
7	Reconnect the V.T.V.M. between points "X" and "Y", and increase the signal strength 2 times.			
8	Same as step 4	10.7 mc.	maximum capacity	Recheck sec. of ratio det. trans. for *zero* voltage
9	Reconnect the V.T.V.M. between point "Z" and ground.			
10	Same as step 4	10.7 mc.	maximum capacity	Pri. of ratio det. trans. for maximum voltage
11	Remove the two 100,000 ohm resistors that were inserted in step 2.			
12	FM ant. terminal through a 300 ohm non-inductive resistor	105 mc.	105 mc.	FM osc. trimmer (C54) for maximum output
13	Same as step 12	105 mc.	105 mc.	FM ant. trimmer (C56) for maximum output

CHASSIS V-2144 and V-2144-1

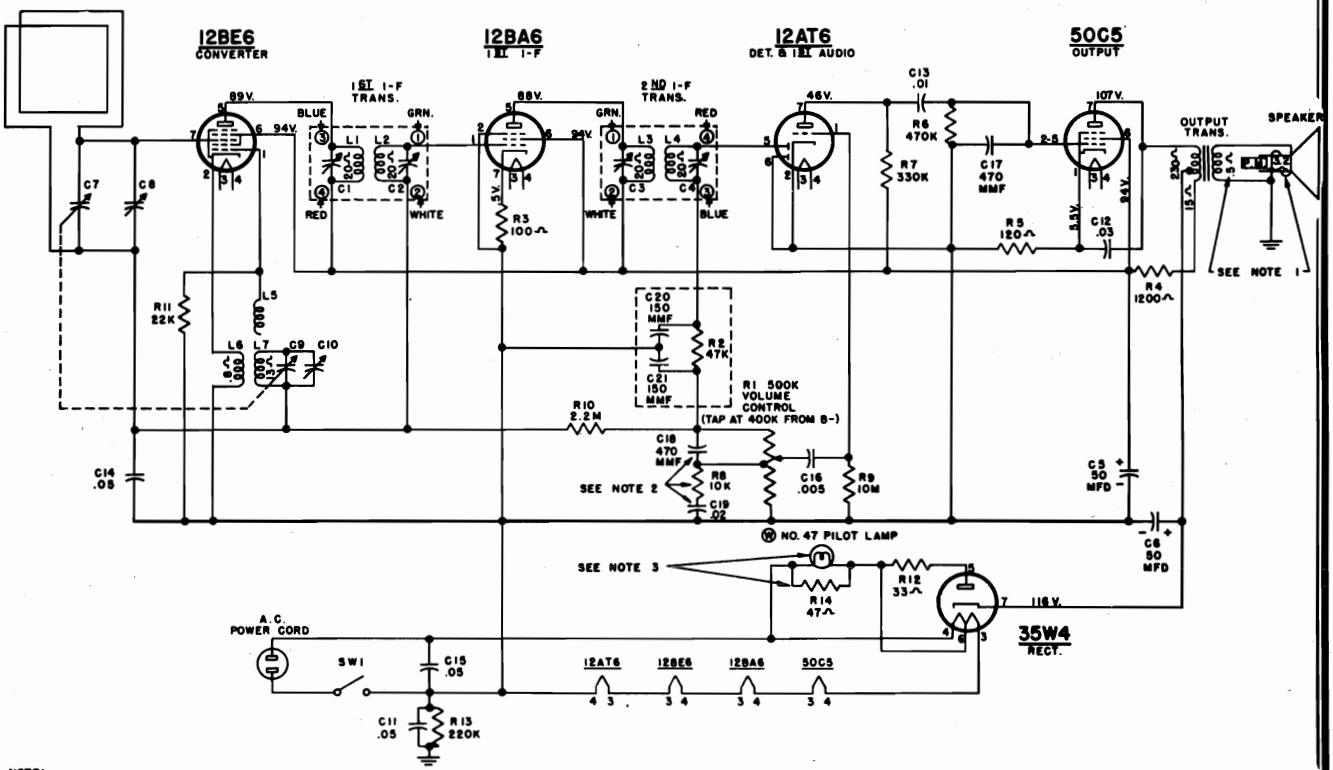
FIG. 3 — BOTTOM VIEW



NOTE:
1. VOICE COIL DISCONNECTED FOR RESISTANCE MEASUREMENT.
2. C18, C19 AND R8 ARE NOT USED IN V-2144 CHASSIS (H-210).
3. THE PILOT LAMP IS USED IN THE V-2144-1 CHASSIS (H-211)ONLY. R14 IS USED IN THE V-2144 CHASSIS (H-210) IN PLACE OF THE PILOT LAMP.
4. ALL VOLTAGES MEASURED FROM COMMON NEGATIVE LINE USING A 20,000 OHMS PER VOLT METER. LINE VOLTAGE 117 V.A.C. VOLTAGES SHOULD BE AS SHOWN ± 20 PER CENT.

WESTINGHOUSE ELECTRIC CORP. MODELS H-210, H-211, CHASSIS V-2144, V-2144-1

ALIGNMENT

It is recommended that the chassis be isolated from the power line by means of an isolation transformer.

Make certain that the dial pointer is correctly positioned on the dial cord.

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1.	Stator of R-F tuning capacitor (C7) through a 0.1 mfd capacitor	455 kc.	maximum capacity	Pri. and sec. of 1st and 2nd I-F transformers for max. output
	NOTE: If the I-F transformers are badly mis-aligned, it may be impossible to obtain sufficient output to use the above system. In this event, it will be necessary to align each transformer separately. Start with the last I-F transformer and work forward, connecting the signal generator to the control grid of the tube preceding the transformer under alignment.			
2.	Radiated signal (no actual connection)	1615 kc.	minimum capacity	Osc. trimmer (C10) for max. output
3.	Radiated signal (no actual connection	1400 kc.	1400 kc.	Ant. trimmer (C8) for max. output

Radio Feed Through on Microphone Recording.

In some localities where signal strength is great, difficulty has been encountered with the radio signal "leaking through" on Microphone Recording. This trouble is eliminated by removing the orange wire connecting pin No. 4 on the 6J7 tube socket to terminal J on the push-button switch.

All 7E40 and 7E44 models with serial numbers above 803,108 will have this lead removed.

On all chassis with serial number 804,045 and up, R53 in the phono circuit has been changed from 820 K to 470 K. This compensates for variance in values of the volume control and provides greater voltage to the audio section of the 6SQ7 phono amplifier tube.

If low phonograph gain is encountered on chassis with serial numbers <u>below</u> 804,045, R53 should be changed to 470 K to increase the gain.

WILCOX-GAY CORP.

MODELS 7E40, 7E44

Alignment Data

An OUTPUT METER or other indication device should be used for accuracy in making ganging adjustments. If an output meter is not available, the tuning indicator may be used as an output indicator. Resonance of the circuits will be indicated by the maximum closing of the tuning eye.

ALIGNMENT OF STANDARD BROADCAST (AM) BAND.

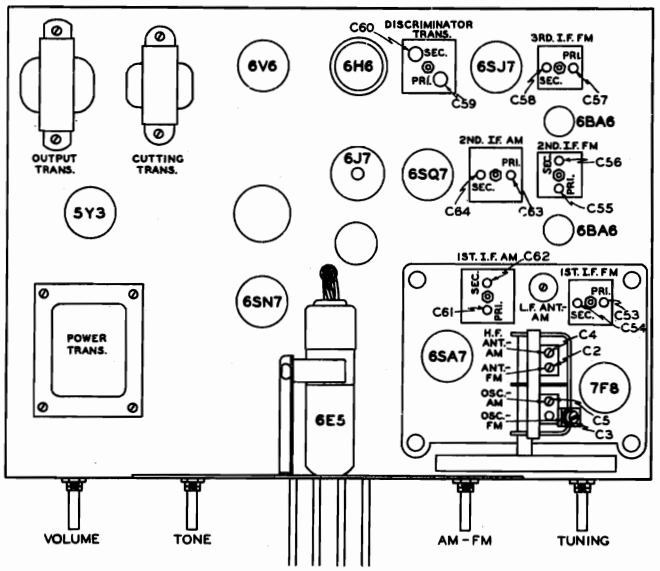
1. Connect signal generator to lug on-ANT. AM section of variable condenser.
2. Set volume control to near maximum.
3. Set tuning dial at 1500 K.C.
4. Set signal generator at 456 K.C.
5. Align trimmers in the following order:

1. Secondary 2nd. I.F. (C-64)
2. Primary 2nd. I.F. (C-63)
3. Secondary 1st. I.F. (C-62)
4. Primary 1st. I.F. (C-61)

Note: Repeat procedure to obtain greatest accuracy in the adjustment of the trimmer condensers.

6. Turn condenser gang to full maximum capacity and check position of dial pointer with reference line on the scale which is the second graduation to the left of the 550 K.C. calibration.
7. If chassis is out of the cabinet, signal generator should be connected across the loop antenna socket when adjusting AM oscillator trimmer C-5, and for an approximate adjustment of trimmer C-4 and L.F. antenna iron core. Final adjustment must be made with the chassis in cabinet and with loop plugged in.

   Signal generator is then connected to antenna and ground terminals on cabinet. Trimmer C-4 and antenna coil slug are adjusted for maximum indication of the tuning eye at the frequencies listed below.



MODELS 7E40, 7E44

WILCOX-GAY CORP.

A loading coil, can be substituted for the loop for bench alignment but the final adjustment of trimmer C-4 and L.F. antenna coil slug should be made with the chassis in cabinet. To make this loading coil, close wind 50 turns of #24 enamel wire on a 3/4" O.D. bakelite form. An antenna can be coupled to the ungrounded side of this coil through a .0001 mfd. condenser.

SIGNAL GENERATOR FREQUENCY	DIAL SETTING	TRIMMER
1400 K.C.	1400 K.C.	Osc. (C-5)
1400 K.C.	1400 K.C.	Det. (C-4)
600 K.C.	600 K.C.	L.F. ANT.-AM

Note: Repeat procedure to obtain greatest accuracy in the adjustment of the trimmer condensers.

ALIGNMENT OF FREQUENCY MODULATION (FM) BAND.

An unmodulated signal generator with output at 10.7 MC and 100 MC is required for FM alignment. A vacuum tube voltmeter or a high resistance voltmeter, at least 20,000 OHMS per volt, is required to measure limiter grid voltage and discriminator output voltage.

FM alignment can be accomplished with an FM signal generator and oscilloscope. Instructions for this type of alignment are furnished by the manufacturers of FM signal generators.

I.F. SECTION

1. Connect 10.7 MC Signal Generator across ANT.FM section, (copper plates), of tuning condenser gang.
2. Connect VTVM or high resistance voltmeter across R-34 with positive terminal to ground.
3. Adjust trimmers C58, C57, C56, C55, C54 and C53 in order listed for maximum voltmeter reading.

Note: Reduce output from signal generator as alignment progresses so that the limiter grid voltage does not exceed 5 volts.

4. With signal generator connected as above, remove voltmeter from limiter grid and connect across discriminator load resistor, R39.
5. Adjust trimmer C-59 on Disc. Transformer for maximum voltmeter reading.
6. Connect voltmeter from 6H6 pin #4 to ground.
7. Adjust trimmer C-60 on Disc. Transformer for zero reading on voltmeter.

Note: When trimmer C-60 is adjusted correctly, slight detuning will give a positive voltage reading in one direction and a negative reading in the other.

R.F. SECTION

1. Disconnect FM antenna and connect signal generator with 150 ohm resistor in each lead to FM ANT terminals.
2. Connect voltmeter across R-34.
3. Set signal generator and radio dial pointer at 100 MC.
4. Adjust trimmer C-3 (OSC FM) to bring in signal.

Note: Two settings of this trimmer will give a response. The correct adjustment is the one for least capacity.

5. Adjust trimmer C-2 (ANT FM) for maximum voltmeter reading.

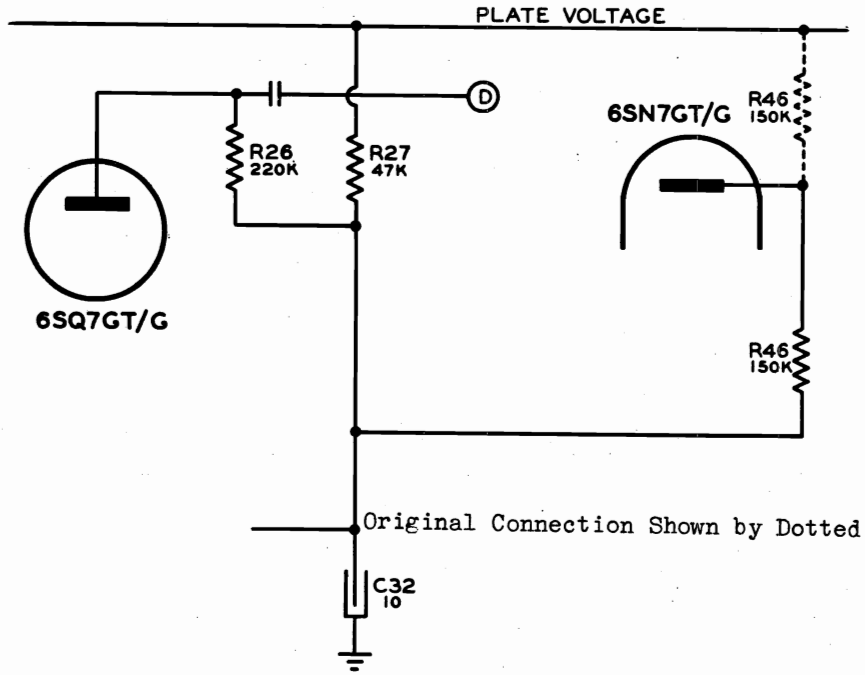
CORRECTION FOR EXCESSIVE AC HUM ON 7E MODELS

(Serial Nos. 800,000 to 801,055 Incl.)

Due to variance in tube characteristics, AC hum in some cases was objectionable on the first production run on 7E Models.

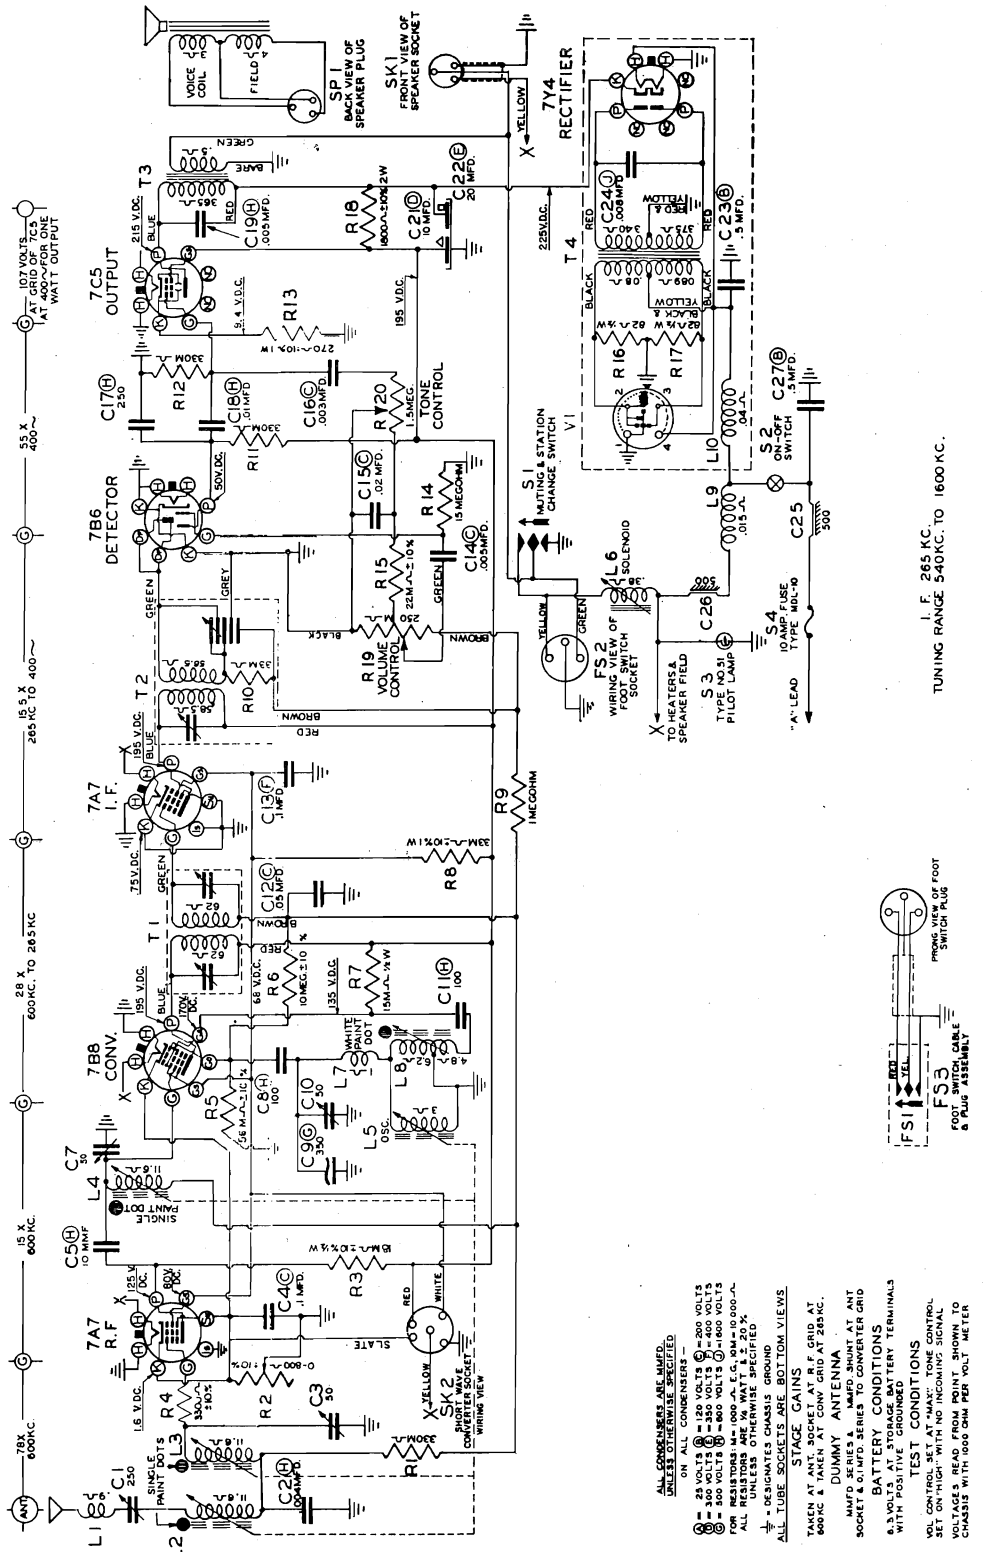
On all chassis with serial numbers above 801,055 the plate resistor (R46) of the audio section of the 6SN7 GT/G tube is connected to the junction of Resistor (R27) and Filter Capacitor (C32) instead of directly to the plate supply.

This change, shown below, takes care of tube variances and should be made, when necessary, in the field.



ZENITH RADIO CORP.

MODEL 6MN788E,
Nash



SETTING THE AUTOMATIC TUNER

Pressing the Push-Bar at the right below the dial repeatedly will cause the tuning mechanism to change through a cycle of six positions. Five of the automatic positions may be set for favorite local stations while the sixth position, at which "M" appears on the indicator drum, is used for selecting stations manually.

Allow the receiver to operate for at least fifteen minutes to bring the operating temperature up to normal before making the following automatic tuning settings.

Using "M" position as a reference point, the remaining five positions may be adjusted in succession to any desired dial setting. Setting these stations in sequence according to their frequencies beginning at the lowest frequency for number 1, and progressing through to the high frequency end of the dial for number 5 is the recommended practice to simplify the identification of each automatic tuned station.

1. Press station selector bar until number 1 appears in station indicator window.
2. Pull manual tuning knob outward to engage the automatic mechanism.
3. Select the station desired and tune to its frequency by turning tuning knob. Tune very carefully for clearest reception.
4. Press station selector bar, pull manual tuning knob outward, and tune in station desired for No. 2 position. Use same procedure for positions No. 3, 4 and 5.

NOTE: When "M" appears in the station indicator window, the manual tuning knob must be pulled outward and rotated to select the stations manually.

POWER

Under no circumstances should this receiver be connected to direct current (D.C.).

6B16AT — This chassis is designed to operate on 25 cycles alternating current (A.C.) and may be adjusted for use on 110–125–190–220 or 240 volts by means of the switch on top of the transformer.

6B16BT — This chassis is designed to operate on 50 to 100 cycle alternating current (A.C.) and may be adjusted for use on either 115 or 225 volts by means of the switch on the power transformer.

6B16CT — This chassis is designed to operate on 50 to 60 cycle alternating current (A.C.) and may be adjusted for use on either 95, 115 or 150 volts by means of the switch on the power transformer.

The total power consumption is 50 watts.

TUBES

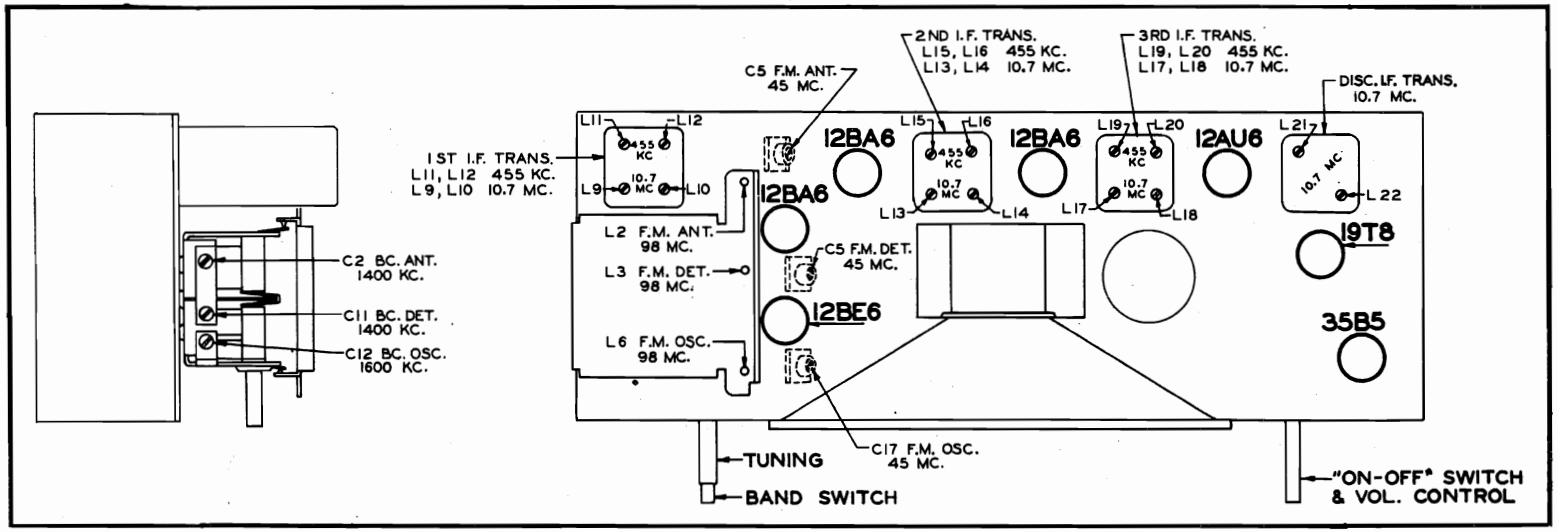
BAND-SWITCH SHOWN
AT 3RD POSITION CLOCKWISE.
F-M BAND
42-48.5 MC



TUBE AND TRIMMER LOCATION

The 7E01 chassis incorporates a superheterodyne circuit with two stages of IF, and one stage of RF amplification on all bands.

When adjustments are made on the 7E01 or any AC-DC chassis, a line isolation transformer (110 V input to 110 V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground, and if there is any indication of voltage, reverse the plug before handling the set.

AM Alignment: The alignment of this chassis on the standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustment will be impossible.

FM RF Alignment: The same coil slug arrangement which tunes the 100 MC FM band also tunes the 45 MC band. However, on 45 MC the band switch connects trimmer condensers in parallel and padding wires in series with the 100 MC coils. The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM I.F.'s. Observe the same precautions when making adjustments.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

The tone control is of the low impedance type in which a portion of the audio voltage is taken from the voice coil and fed back into the grid of the first audio. The voltage is fed back out of phase. R25, 26 and C25 determine the characteristic of the feed back voltage. A much greater variation of tone can be had by this system.

The filter circuits of chassis 7E01 incorporate new features. An examination of the schematic drawing will show the output transformer tapped slightly off center. This tap is the B + connection from filter capacitor C26 off the selenium rectifier to the 35B5 plate. The lower connection of the output transformer feeds B + to the rest of the tubes in the receiver. Current flowing through the upper windings of the output transformer to the 35B5 produces a magnetic field which is 180° out of phase with the magnetic field produced by current flowing in the opposite direction through the output transformer to the rest of the receiver, therefore, most of the AC hum is cancelled. Further reductoon of hum is accomplished by filtering through resistors R22 and R23 capacitors C27 and C28.

This development in filtering systems allows a higher effective plate voltage on the 35B5 for increased power output.

NOTE: The output transformer must be replaced with an exact duplicate, Part No. 95-1035 be sure to add the speaker code letter to the transformer Part Number when ordering replacements.

ALIGNMENT PROCEDURE

Operation	Connect Oscillator to	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 7 12BE6 Converter	.05 Mfd.	455 KC. Modulated	BC	600 Kc.	L-11, 12, 15, 16, 19 and 20	Align I. F. channel for maximum output.
2	2 turns loosely cpld. to wavemagnet		1600 Kc. Modulated	BC	1600 Kc.	C12	Set oscillator to dial scale.
3	2 turns loosely cpld. cpld. to wavemagnet		1400 Kc. Modulated	BC	1400 Kc.	C11 and C2	Align det. and ant. stages.
4 (a)	Pin 1 (grid) on 12AU6 limiter.	.05 Mfd.	10.7 Mc. Unmodulated	FM 45		L21 coil slug Primary discr.	Align primary of discriminator for maximum reading.
5 (b)	Pin 1 (grid) on 12AU6 limiter.	.05 Mfd.	10.7 Mc. Unmodulated	FM 45		L22 coil slug sec. of discr.	Adjust secondary of discriminator for zero reading.
6 (c)	Pin 1 (grid) on 12BA6 2nd IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 45		L17 and L18 Prim. and Sec. of 3rd IF trans.	Align 3rd IF transformer for maximum reading.
7 (c)	Pin 1 (grid) on 12BA6 1st IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 45		L13 and L14 Prim. and Sec. of 2nd IF transformer	Align 2nd IF transformer for maximum reading.
8 (c)	Pin 7 (grid) on 12BE6 converter tube socket	.05 Mfd.	10.7 Mc. Unmodulated	FM 45		L9 and L10 Prim. and Sec. of 1st IF transformer	Align 1st IF transformer for maximum reading.
9 (c)(d)	Antenna Post F (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L6 Osc. Coil Slug	Set Oscillator to dial scale.
10 (c)(d)		270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L3 and L2 Det. and RF coil Slugs	Align det. and ant. stages to maximum reading.
11 (c)		270 ohms	45 Mc. Unmodulated	FM 45	45 Mc.	C17	Set oscillator to dial scale.
12 (c)		270 ohms	45 Mc. Unmodulated	FM 45	45 Mc.	C5 Det., C5 Ant.	Align detector and ant. stages for maximum reading.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 6 on discriminator transformer to chassis (half discriminator load).

(b) Vacuum Tube Voltmeter Lug 3 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter Lug 3 on 3rd IF transformer (Limiter Grid).

(d) Loosen Slugs by applying a hot iron to the cement.

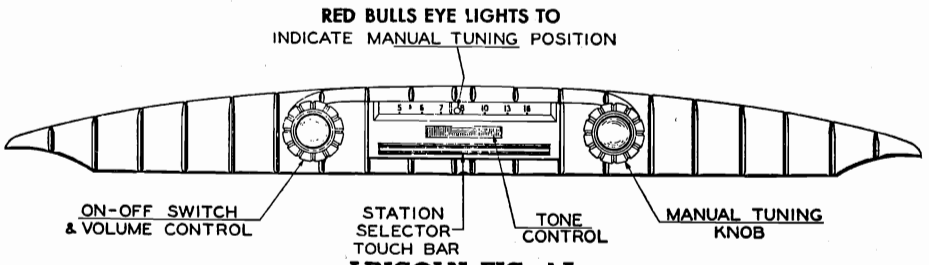
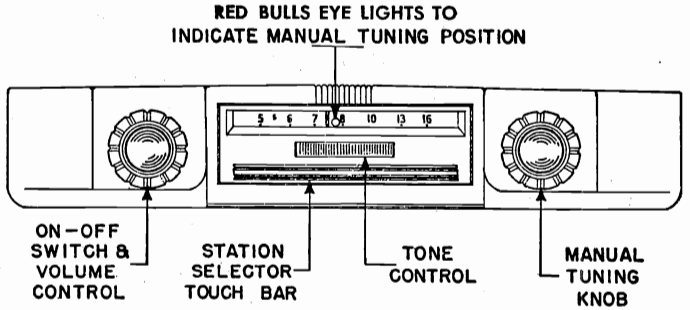
63-1940	R17	4.7 Megohm (Insulated) . . . .1/2 W.
		MISCELLANEOUS
12-1070		Wavemagnet Mounting Bracket
14-848		Model 820W - Plastic Cabinet (7H820W)
14-1020		Model 820 - Bakelite Cabinet (7H820)
19-139		Cabinet Back Retaining Clip (4 used)
49-608		7½" P. M. Speaker 208-608 and Voice Coil
54-30		#8-32 x 5/16" x 7/64" Hex Nut - Steel N.P. (6 used)
54-139		#3/8-32 x 9/16" Palnut - Type 9N-Steel-Cad. (2 used)
54-226		Speed Nut - Tinnerman #C518B-014-27 (3 used)
57-1269		I.F. Transformer Terminal Plate
58-168		Two Prong Plug
73-30		#6-32 x 1/4" Hex Hd. Set Screw - Cuppoint (2 used)
78-782		Socket - Miniature Tube (7 Contact) (2 used)
78-788		Socket - Miniature Tube (9 Contact)
78-794		Socket - Miniature Tube (7 Contact) (3 used)
78-795		Socket - Miniature Tube (7 Contact)
83-1063		Threaded Insert (used on all I.F. Transformers)
83-1064		Threaded Insert (used on all I.F. and Discriminator Transformers)
83-1090		Insulating Strip (58-168)
83-1479		Insulating Strip
83-1480		Insulating Strip
83-1503		Tone Arm Insulating Strip
85-417		Band Switch (use S-14168)
93-2		.016 x .134 x 1/4" Brass Washer
93-94		Bakelite Shoulder Washer

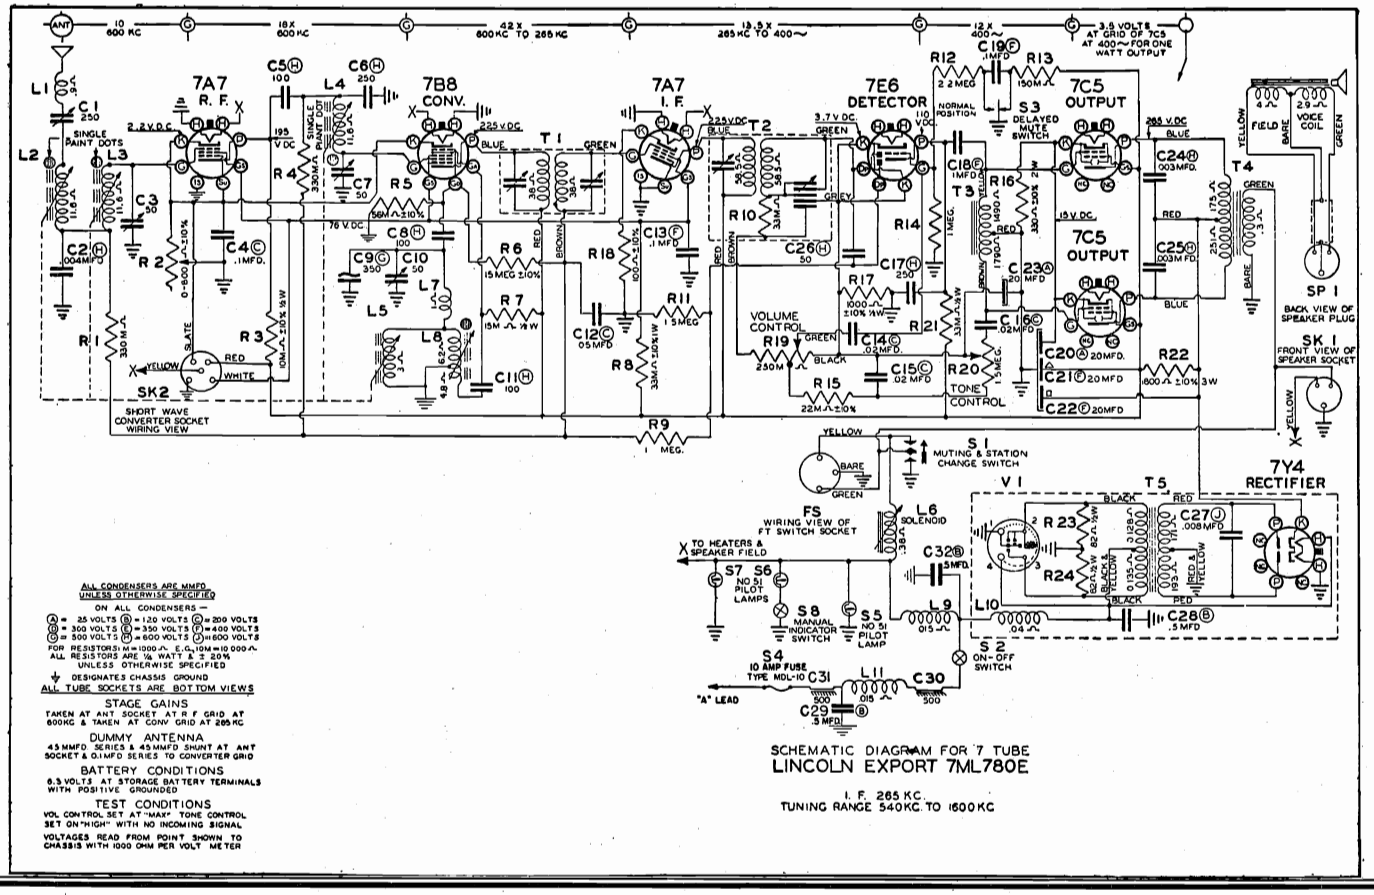
OPERATING INSTRUCTIONS



LINCOLN FIG. 1A



LINCOLN CONTINENTAL FIG. 1B



SCHEMATIC DIAGRAM FOR 7 TUBE
LINCOLN EXPORT 7ML780E

I. F. 265 KC.
TUNING RANGE 540 KC. TO 1600 KC

MODEL 7ML780E, Lincoln

ZENITH RADIO CORP.

Lincoln Receiver Installation

1—Remove the cardboard cover from the speaker hole in the center of the instrument panel. Do not discard the nuts. Remove the bezel from the instrument panel by loosening the nuts on the underside.

2—Remove the protective cover from the speaker. Install the speaker on the rear of the grille so the cable is toward the left. Use the nuts that held the instrument panel hole cover in place.

3—Hang the hook bolts "A" in the holes provided for them in the dash so that the hooks are turned away from the receiver.

4—Place the receiver in position and slip the threaded end of the hook bolts through the upper hanger brackets.

5—Apply lock washers "B" and wing nuts "C" to the hook bolts and tighten them sufficiently to hold the receiver in place while installing the lower support brackets "D." Fasten the tapped end of the brackets to the instrument panel, using spacer washers "F," lock washers "B", and oval head screws "E." Fasten the other end of the bracket to the lower angle bracket of the receiver. Tighten all screws and nuts so that the receiver is held firmly in place (Fig. 2).

6—Connect the "A" lead to the battery terminal of the circuit breaker on the firewall. (Fig. 3.)

7—Connect the speaker cable and the antenna lead-in cable to the receiver and turn the power on.

8—Place the escutcheon plate, furnished with the receiver, over the tuning and volume control shafts and fasten it in place with the two 8/32" flat head screws furnished in the installation kit.

9—Fit tuning and volume control knobs to their respective shafts.

NOTE: Tuning control knob is fastened to the shaft with a set screw. Shaft has a milled recess for the screw.

Lincoln Continental Receiver Installation

The Continental Radio installation is similar to the Lincoln installation with the exception of the speaker.

To install the Continental speaker, remove the speaker grille which is held in place by four nuts on the back of the instrument panel. Place the speaker in position through the front of instrument panel so the cable is to the left. Fasten securely with the four No. 10/32 machine screws and lock washers. Replace the grille and proceed with the installation of the receiver as instructed under Lincoln Receiver installation. Note position of bracket D in figure 2A.

Foot Control Switch Installation

1—Remove the floor mat around the clutch and brake pedals.

2—Drill a hole in each of the three extrusions in the floor, between the clutch and brake pedals, with a No. 27 drill. (Fig. 3.)

3—Fasten the foot control switch in place with the sheet metal screws furnished. Dress the cable so that the plug can be inserted into the foot switch cable receptacle at the left side of the receiver as shown in figure 2.

4—Cut a hole in the floor mat for the foot switch button. Install the foot switch eyelet (furnished in the installation kit) in the hole. Replace the floor mat. A piece of 1⅛" pipe that has been sharpened on the inside of one end may be used to cut the hole.

ANTENNA. The new Lincoln antenna is especially designed to work satisfactorily with this receiver. The installation instructions are included with the antenna.

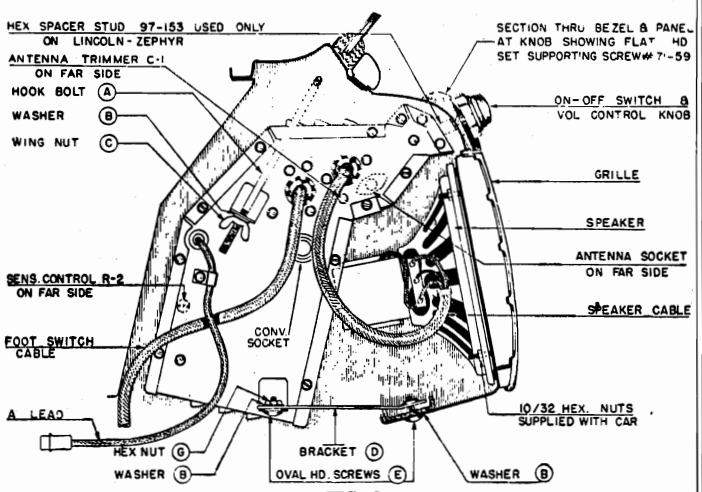


FIG. 2

IMPORTANT: 1200 K.C. ANTENNA ADJUSTMENT. After the receiver has operated for approximately 15 minutes, tune in a weak station near 1200 Kc. Adjust the antenna trimmer (C1, Fig. 2) for maximum signal.

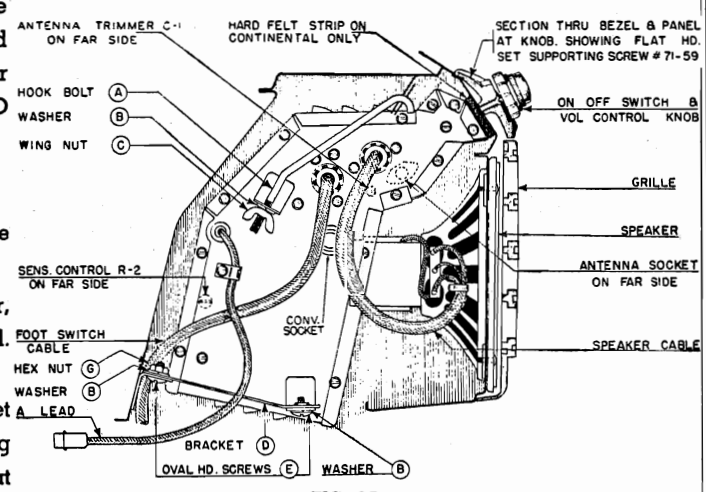

FIG. 2A

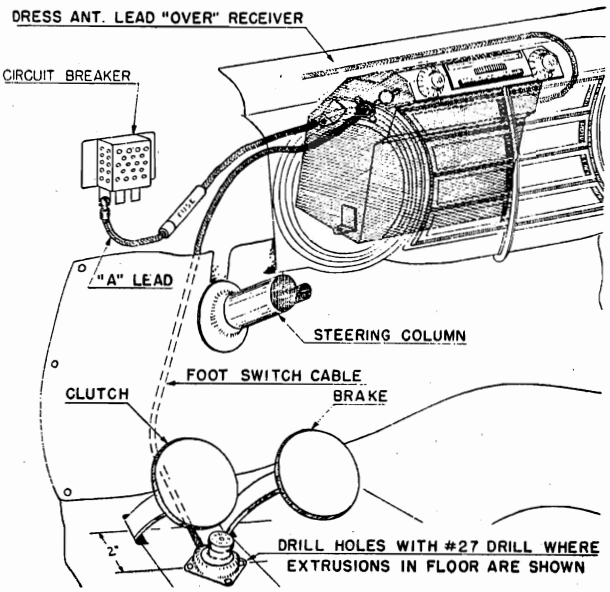

FIG. 3

Setting the Touch-Bar Tuning

Pressing the station selector touch-bar six times will cause the tuning mechanism to change through a cycle of six positions. Five of the Adjust-O-Matic positions may be set for favorite local stations. A red dot will appear in the tuning scale background when the Adjust-O-Matic is in the sixth position. This position may be used for selecting stations manually.

Using the manual (DIAL) position as a reference point, the remaining five positions may be adjusted in succession to any desired dial settings. Setting the stations in sequence according to their frequencies, beginning at the low frequency and progressing through to the high frequency end of the dial, is the recommended practice for simplifying the identification of each Adjust-O-Matic station.

Turn the receiver on and allow it to operate for at least fifteen minutes to bring the temperature up to normal before making the following Adjust-O-Matic settings.

1—Press station selector touch-bar (Figs. 1A and 1B) until red dot appears in dial scale background. Press the touch-bar once more to advance Adjust-O-Matic mechanism to No. 1 position.

2—Pull manual tuning knob outward to engage the Adjust-O-Matic mechanism.

3—Select the station desired and tune to its frequency by turning the tuning knob. Tune very carefully for clearest reception.

CAUTION: DO NOT ATTEMPT TO FORCE THE KNOB IN. The knob will automatically return to the "IN" position when the station selector touch bar or the foot switch is operated.

4—Press station selector bar, pull tuning knob outward, and tune in station desired for No. 2 position. Use same procedure for positions No. 3, 4 and 5. Note: When the red dot appears in the tuning scale background, the manual tuning knob must be pulled outward and rotated to select the stations manually.

Interference Elimination

IMPORTANT: Use the utmost care in the following operations to insure freedom from interference. Be sure that clean contacts are made when connecting condensers in the car. If necessary, clean away paint or dirt with emery paper to make good ground. Tighten all bolts and nuts securely.

1. Mount the voltage regulator condenser No. 22-1192 and the ground strap No. S-9343 on "ground" terminal of the voltage regulator. (Fig. 4.) Connect the lead of the condenser to the ARM. terminal of the voltage regulator. Connect the end of the ground strap to the lower, left hand voltage regulator mounting screw. (Fig. 4.)

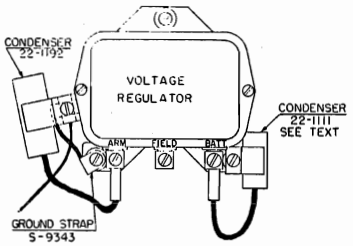

FIG. 4

2. Mount condenser No. 22-1111 under the lower right hand voltage regulator mounting bolt, and connect the lead to the BATT. terminal of the voltage regulator. (Fig. 4).

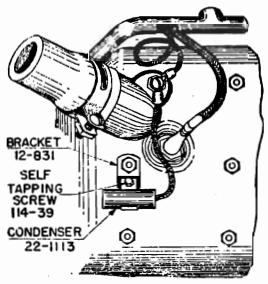

FIG. 5

3. Install the water temperature gauge condenser No. 22-1113 with its separate bracket (which fastens under one of the cylinder head nuts.) (Fig. 5.)

4. Install the condenser No. 22-1113 on the oil gauge unit. (Fig. 6.)

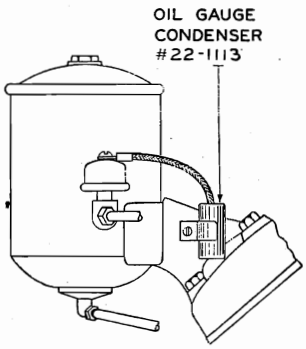

FIG. 6

5. Install the motor hood grounding spring. (Fig. 7.)

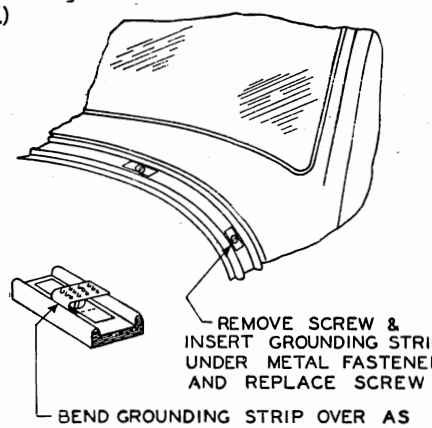

FIG. 7

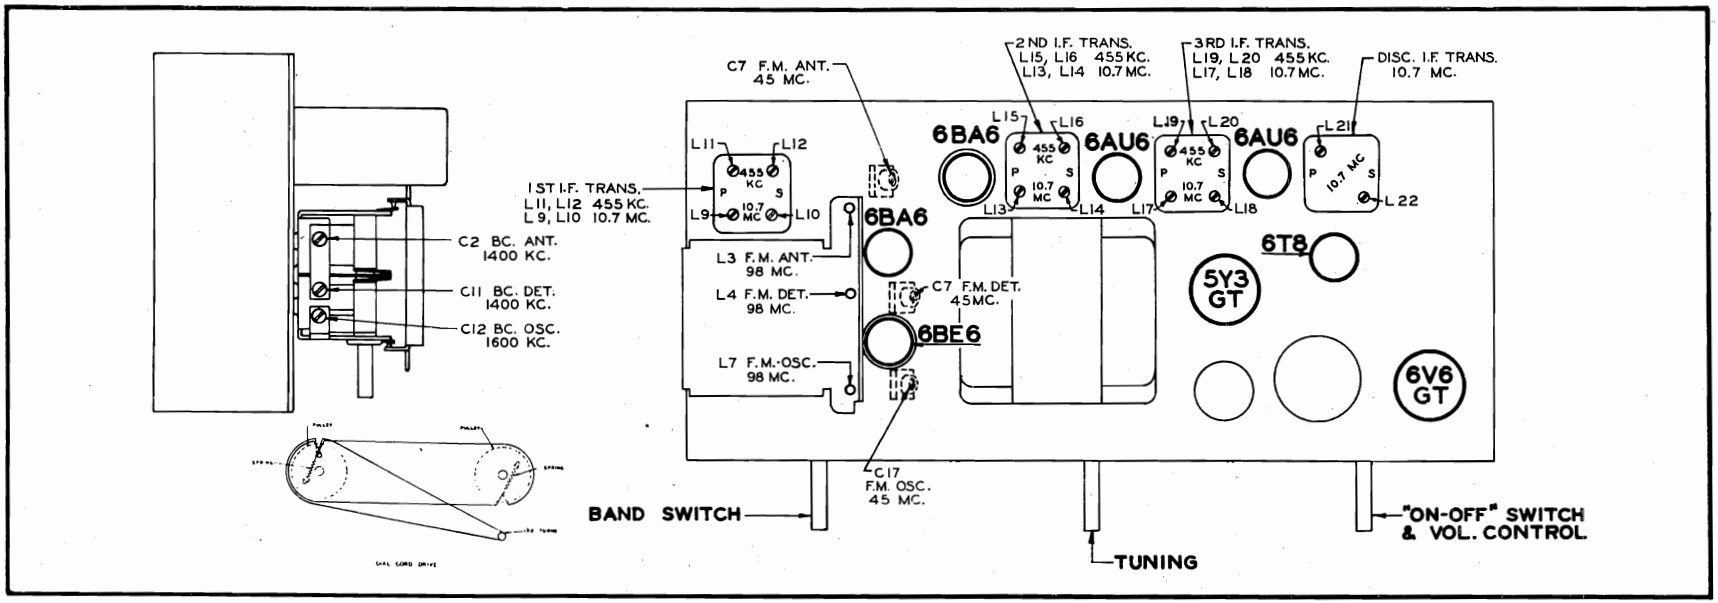

TUBE, TRIMMER LOCATION AND DIAL CABLE DRAWING

The 8E20 chassis incorporates a superheterodyne circuit with two stages of IF, and one stage of RF amplification on all bands.

The Radiorgan tone control is of the low impedance type in which a portion of the audio voltage is taken from the speaker voice coil and fed back out of phase into the grid of the first audio. The characteristic of the feedback voltage is determined by the setting of the Radiorgan buttons. To attenuate the high notes, more highs are fed back. To attenuate the low notes, more lows are fed back. For normal reproduction, both highs and lows are fed back and results in no overall change in tone.

AM Alignment: The alignment of this chassis on the standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms.. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustment will be impossible.

FM RF Alignment: The same coil slug arrangement which tunes the 100 MC FM band also tunes the 45 MC band. However, on 45 MC the band switch connects trimmer condensers in parallel and padding wires in series with the 100 MC coils. The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z800I) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

NOTE: The output transformer must be replaced with an exact duplicate, Part No. 95-1096. Be sure to add the speaker code letter to the transformer Part Number when ordering replacements.

ALIGNMENT PROCEDURE

Operation	Connect Oscillator to	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 7 6BE6 Converter	.05 Mfd.	455 KC. Modulated	BC	600 Kc.	L-11, 12, 15, 16, 19 and 20.	Align I. F. channel for maximum output
2	2 turns loosely cpld. to wavemagnet.		1600 Kc. Modulated	BC	1600 Kc.	C12	Set oscillator to dial scale.
3			1400 Kc. Modulated	BC	1400 Kc.	C11 and C2	Align det. and ant. stages.
4 (a)	Pin 1 (grid) on 6AU6 Limiter	.05 Mfd.	10.7 Mc Unmodulated	FM	45	L21 coil slug Primary discr.	Align primary of discriminator for maximum reading.
5 (b)		.05 Mfd.	10.7 Mc Unmodulated	FM	45	L22 coil slug sec. of discr.	Adjust secondary of discriminator for zero reading.
6 (c)	Pin 1 (grid) on 6AU6 2nd IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM	45	L17 and L18 Prim. and Sec. of 3rd IF trans.	Align 3rd IF transformer for maximum reading.
7 (c)	Pin 1 (grid) on 6BA6 1st IF.	.05 Mfd	10.7 Mc Unmodulated	FM	45	L13 and L14 Prim. and Sec. of 2nd IF transformer	Align 2nd IF transformer for maximum reading.
8 (c)	Pin 7 (grid) on 6BE6 converter tube	.05 Mfd.	10.7 Mc. Unmodulated	FM	45	L9 and L10 Prim. and Sec. of 1st IF transformer	Align 1st IF transformer for maximum reading
9 (c)(d)	FM Antenna Post (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM	100	L7 Osc. Coil Slug	Set Oscillator to dial scale.
10 (c)(d)		270 ohms	98 Mc. Unmodulated	FM	100	L4 and L3 Det. and RF coil Slugs	Align det. and ant. stages to maximum reading.
11 (c)		270 ohms	45 Mc. Unmodulated	FM	45	C17	Set oscillator to dial scale.
12 (c)		270 ohms	45 Mc. Unmodulated	FM	45	C7 Det., C7 Ant.	Align detector and ant. stages for maximum reading.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 200,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments. The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 6 on discriminator transformer to chassis (half discriminator load).
(b) Vacuum Tube Voltmeter Lug 3 on discriminator transformer to chassis (full discriminator load).
(c) Vacuum Tube Voltmeter Lug 3 on 3rd IF transformer (Limiter Grid).
(d) Loosen Slugs by applying a hot iron to the cement.

TUBE AND TRIMMER LOCATION

TO THE SERVICE MAN:

The 9E21 chassis incorporates a superheterodyne circuit with two stages of IF, and one stage of RF amplification on all bands.

The Radiorgan tone control is of the low impedance type in which a portion of the audio voltage is taken from the speaker voice coil and fed back out of phase into the grid of the first audio. The characteristic of the feedback voltage is determined by the setting of the Radiorgan buttons. To attenuate the high notes, more highs are fed back. To attenuate the low notes, more lows are fed back. For normal reproduction, both highs and lows are fed back and results in no overall change in tone.

The 6BA6 1st IF tube is also the phono pre-amplifier. The output from the phono oscillator is fed to the grid of the 6BA6 through C21 and R14. The amplified output is taken from the screen grid and fed back through R12 and C20 into the volume control circuit and the grid of the 6T8 1st audio amplifier.

AM Alignment: The alignment of this chassis on the standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustment will be impossible.

FM RF Alignment: The same coil slug arrangement which tunes the 100 MC FM band also tunes the 45 MC band. However, on 45 MC the band switch connects trimmer condensers in parallel and padding wires in series with the 100 MC coils. The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM IF's. Observe the same precautions when making adjustments.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

NOTE: The output transformer must be replaced with an exact duplicate, Part No. 95-1063. Be sure to add the speaker code letter to the tranformer Part Number when ordering replacements.

ALIGNMENT PROCEDURE

Operation	Connect Oscillator to	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 7 6BE6 Converter	.05 Mfd.	455 KC. Modulated	BC	600 Kc.	L-11, 12, 15, 16, 19 and 20.	Align I. F. channel for maximum output
2	2 turns loosely cpld. to wavemagnet.		1600 Kc. Modulated	BC	1600 Kc.	C12	Set oscillator to dial scale.
3			1400 Kc. Modulated	BC	1400 Kc.	C11 and C2	Align det. and ant. stages.
4 (a)	Pin 1 (grid) on 6AU6 Limiter	.05 Mfd.	10.7 Mc Unmodulated	FM 45		L21 coil slug Primary discr.	Align primary of discriminator for maximum reading.
5 (b)		.05 Mfd.	10.7 Mc Unmodulated	FM 45		L22 coil slug sec. of discr.	Adjust secondary of discriminator for zero reading.
6 (c)	Pin 1 (grid) on 6AU6 2nd IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 45		L17 and L18 Prim. and Sec. of 3rd IF trans.	Align 3rd IF transformer for maximum reading.
7 (c)	Pin 1 (grid) on 6BA6 1st IF.	.05 Mfd	10.7 Mc Unmodulated	FM 45		L13 and L14 Prim. and Sec. of 2nd IF transformer	Align 2nd IF transformer for maximum reading.
8 (c)	Pin 7 (grid) on 6BE6 converter tube	.05 Mfd.	10.7 Mc. Unmodulated	FM 45		L9 and L10 Prim. and Sec. of 1st IF transformer	Align 1st IF transformer for maximum reading
9 (c)(d)	FM Antenna Post (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc,	L7 Osc. Coil Slug	Set Oscillator to dial scale.
10 (c)(d)		270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L4 and L3 Det. and RF coil Slugs	Align det. and ant. stages to maximum reading.
11 (c)		270 ohms	45 Mc. Unmodulated	FM 45	45 Mc.	C17	Set oscillator to dial scale.
12 (c)		270 ohms	45 Mc. Unmodulated	FM 45	45 Mc.	C7 Det., C7 Ant.	Align detector and ant. stages for maximum reading.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless a IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 200,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 6 on discriminator transformer to chassis (half discriminator load).

(b) Vacuum Tube Voltmeter Lug 3 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter Lug 3 on 3rd IF transformer (Limiter Grid).

(d) Loosen Slugs by applying a hot iron to the cement.

TUBE TRIMMER LOCATION AND DIAL CABLE DRAWING

The 9F22 chassis incorporates a superheterodyne circuit with two stages of IF, and one stage of RF amplification on all bands.

The Radiorgan tone control is of the low impedance type in which a portion of the audio voltage is taken from the speaker voice coil and fed back out of phase into the grid of the first audio. The characteristic of the feedback voltage is determined by the setting of the Radiorgan buttons. To attenuate the high notes, more highs are fed back. To attenuate the low notes, more lows are fed back. For normal reproduction, both highs and lows are fed back and results in no overall change in tone.

The 6BA6 1st IF tube is also the phono pre-amplifier. The output from the phono oscillator is fed to the grid of the 6BA6 through C19 and R11. The amplified output is taken from the screen grid and fed back through R12, and C12 into the volume control circuit and the grid of the 6T8 1st audio amplifier.

AM Alignment: The alignment of this chassis on the standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool or the threads in the coil forms will strip and adjustment will be impossible.

FM RF Alignment: A coil slug arrangement tunes the 100 MC FM band. The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM IF's. Observe the same precautions when making adjustments.

FM Discriminotor Alignment: When the secondary of the discriminotor is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

NOTE: The output transformer must be replaced with an exact duplicate, Part No. 95-1063. Be sure to add the speaker code letter to the transformer Part Number when ordering replacements.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z800I) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

ALIGNMENT PROCEDURE

Operation	Connect Oscillator to	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 7 6BE6 Converter	.05 Mfd.	455 Kc. Modulated	BC	600 Kc.	L-10, 11, 14, 15 16, 18 and 19.	Align I. F. channel for maximum output.
2	2 turns loosely cpld. to wavemagnet.		1600 Kc Modulated	BC	1600 Kc.	C4	Set oscillator to dial scale.
3			1400 Kc. Modulated	BC	1400 Kc.	C3 and C2	Align det, and ant. stages.
4 (a)	Pin 1 (grid) on 6AU6 Limiter	.05 Mfd.	10.7 Mc Unmodulated	FM 100		L20 coil slug Primary discr.	Align primary of discriminator for maximum reading.
5 (b)		.05 Mfd.	10.7 Mc Unmodulated	FM 100		L21 coil slug sec. of discr.	Adjust secondary of discrimina-or for zero reading.
6 (c)	Pin 1 (grid) on 6AU6 2nd IF.	.05 Mfd.	10.7 Mc Unmodulated	FM 100		L16 and L17 Prim. and Sec. of 3rd IF trans.	Align 3rd IF transformer for maximum reading.
7 (c)	Pin 1 (grid) on 6BA6 1st IF.	.05 Mfd.	10.7 Mc Unmodulated	FM 100		L12 and L13 Prim. and Sec. of 2nd IF transformer	Align 2nd IF transformer for maximum reading.
8 (c)	Pin 7 (grid) on 6BE6 converter tube	.05 Mfd.	10.7 Mc Unmodulated	FM 100		L8 and L9 Prim. and Sec. of 1st IF transformer	Align 1st IF transformer for maximum reading.
9 (c)(d)	FM Antenna Post (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L6 Osc. Coil Slug	Set Oscillator to dial scale.
10 (c)(d)		270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L4 and L3 Det. and RF coil Slugs	Align det. and ant. stages to maximum reading.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 200,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 6 on discriminator transformer to chassis (half discriminator load).

(b) Vacuum Tube Voltmeter Lug 3 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter Lug 3 on 3rd IF transformer (Limiter Grid).

(d) Loosen Slugs by applying a hot iron to the cement.

MODEL 14H789,
CHASSIS 13D22

ZENITH RADIO CORP.

The 11C21 chassis incorporate a superheterodyne circuit with two stages of IF, and one stage of RF amplification on all hands.

AM Alignment: The alignment of this chassis on the short wave and standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool (fiber screw driver) or the threads in the coil forms will strip and adjustment will be impossible.

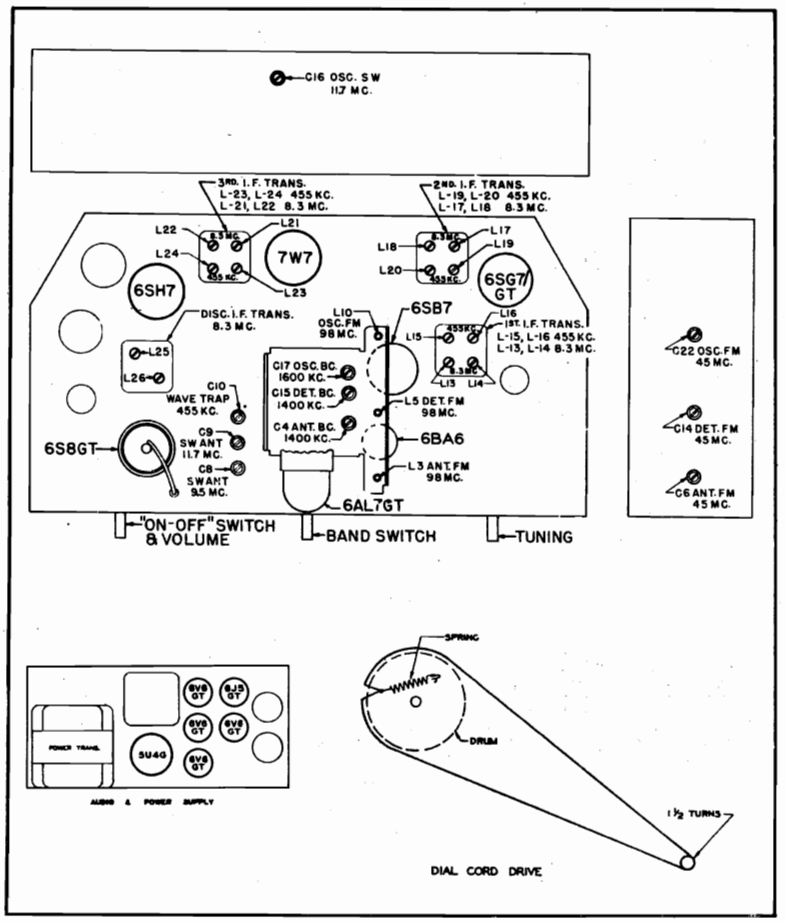
FM RF Alignment: The same coil slug arrangement which tunes the 100 MC FM band also tunes the 45 MC band. However, on 45 MC the band switch connects trimmer condensers in parallel and padding wires in series with the 100 MC coils. The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counterclockwise. After adjustments the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM I.F. s. Observe the same precautions when making adjustments. The second 8.3 Mc IF stage is overcoupled. Overcoupling gives a wide band pass with good sensitivity. When an overcoupled stage is aligned with an unmodulated signal, the stage must be loaded. A 300 ohm carbon resistor soldered across the secondary of the second IF transformer provides a satisfactory load for this circuit. The resistor leads must be kept short to reduce the distributed capacity of the circuit.

When aligning a loaded stage, it will be found that considerable signal from the generator will be required, and that it will tune broadly. THE LOAD RESISTOR MUST BE REMOVED AFTER ALIGNMENT.

If the signal generator used does not have sufficient output to overcome the temporary loss caused by the load resistor, the load resistance may be increased or the signal fed into the preceding stage.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 9) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when this meter starts to go to the left (negative) of zero will give the same results.



TUBE TRIMMER LOCATION AND DIAL CABLE DRAWING

ALIGNMENT PROCEDURE

Operation	Connect Oscillator to	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 8 on Converter Tube 6SB7 socket	.05 Mfd.	455 Kc. Modulated	BC	600 Kc.	L15,16,19,20,23 and 24	Align I.F. channel for maximum output
2	Pin 1 on R.F. tube 6AG5 socket	.05 Mfd.	455 Kc. Modulated	Aut.	Press any button on Auto.	C10	Adjust wavetrap to minimum
3	2 Turns loosely coupled to wavemag.		1600 Kc. Modulated	BC	1600 Kc.	C17	Set oscillator to dial scale
4	2 Turns loosely coupled to wavemag.		1400 Kc. Modulated	BC	1400 Kc.	C15 & C4	Align det. and ant. stages.
5	Antenna Post (Remove line ant.)	400 ohms	11.7 Mc. Modulated	SW	11.7 Mc.	C16	Set oscillator to dial scale
6	Antenna Post (Remove line ant.)	400 ohms	11.7 Mc. Modulated	SW	11.7 Mc.	C9	Align ant. stage
7	Antenna Post (Remove line ant.)	400 ohms	9.7 Mc. Modulated	SW	9.7 Mc.	C8	Align ant. stage Repeat Oper. 6 for maximum output
8 (a)	Pin 4 grid on 6SH7 limiter socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L25 coil slug primary disc.	Align primary of discriminator for maximum reading
9 (b)	Pin 4 grid on 6SH7 limiter socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L26 coil slug sec. of discr.	Adjust secondary of discr. for zero reading
10 (c)	Pin 6 (grid) on 7W7 2nd IF tube socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L21 & L22 prim. & sec. of 3rd IF transformer	Align 3rd IF transformer for maximum reading
11 (c) (d)	Pin 4 (grid) on 6SG7 1st IF tube socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L17 & L18 prim. & sec. of 2nd IF transformer	Align 2nd IF transformer for maximum reading
12 (c) (d)	Pin 8 (grid) on 6SB7 converter tube socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L13 & L14 prim. & sec. of 1st IF transformer	Align 1st IF transformer for maximum reading
13 (c)	Antenna Post (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L10 Osc. coil Slug	Set oscillator to dial scale
14 (c)	Antenna Post (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L5 and L3 Det. and RF coil slugs	Align det. and Ant. stage to maximum reading
15 (c)	Antenna Post (Remove line ant.)	270 ohms	45 Mc. Unmodulated	FM 45	45 Mc.	C22	Set oscillator to dial scale
16 (c)	Antenna Post (Remove line ant.)	270 ohms	45 Mc. Unmodulated	FM 45	45 Mc.	C14 and C6	Align detector and ant. stages for maximum reading

IMPORTANT: Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

A correct alignment can only be made if the following procedure is followed.

A vacuum tube voltmeter with an isolation resistor of 200,000 ohms in series with the hot lead will serve for FM adjustments. This lead must be shielded

An ordinary AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter pin 5 on discriminator transformer to chassis (half discriminator load.)

(b) Vacuum Tube Voltmeter pin 7 on discriminator transformer to chassis (full discriminator load.)

(c) Vacuum Tube Voltmeter 6SH7 limiter grid (pin 4 to chassis).

(d) 300 ohm ½ watt carbon resistor soldered across the secondary L18 (pin 2 and 3 of 2nd IF trans.). The leads to the resistor must be as short as possible and the resistor removed before operation 13 is started.

DIAL CORD DRIVE

ALIGNMENT

THE CHASSIS MUST BE REMOVED FROM THE CABINET IN ORDER TO ALIGN THE RECEIVER. CONNECT THE OUTPUT METER ACROSS THE VOICE COIL. CONNECT THE SIGNAL GENERATOR TO THE STANDARD HAZELTINE MODEL 1150 LOOP, AND COUPLE LOOSELY TO THE RECEIVER LOOP. SET THE RECEIVER VOLUME CONTROL AT MAXIMUM. THE TUNING CONDENSER PLATES SHOULD BE FULLY MESHED WHEN THE DIAL POINTER IS AT THE INDEX MARK AT THE LOW FREQUENCY END OF THE DIAL. THE SIGNAL GENERATOR OUTPUT SHOULD BE JUST SUFFICIENT TO OBTAIN HALF SCALE DEFLECTION ON THE LOWEST SCALE OF THE OUTPUT METER. SET THE SIGNAL GENERATOR TO 455 KC. ADJUST THE I.F. TUNING SLUGS FOR MAXIMUM OUTPUT IN THE FOLLOWING SEQUENCE; L4, L3, L2, L1. SET THE GENERATOR AND RECEIVER TO 1600 KC AND ADJUST OSCILLATOR TRIMMER C2 FOR MAXIMUM OUTPUT. SET THE GENERATOR AND RECEIVER TO 1400 KC AND ADJUST R.F. TRIMMER C4 FOR MAXIMUM OUTPUT

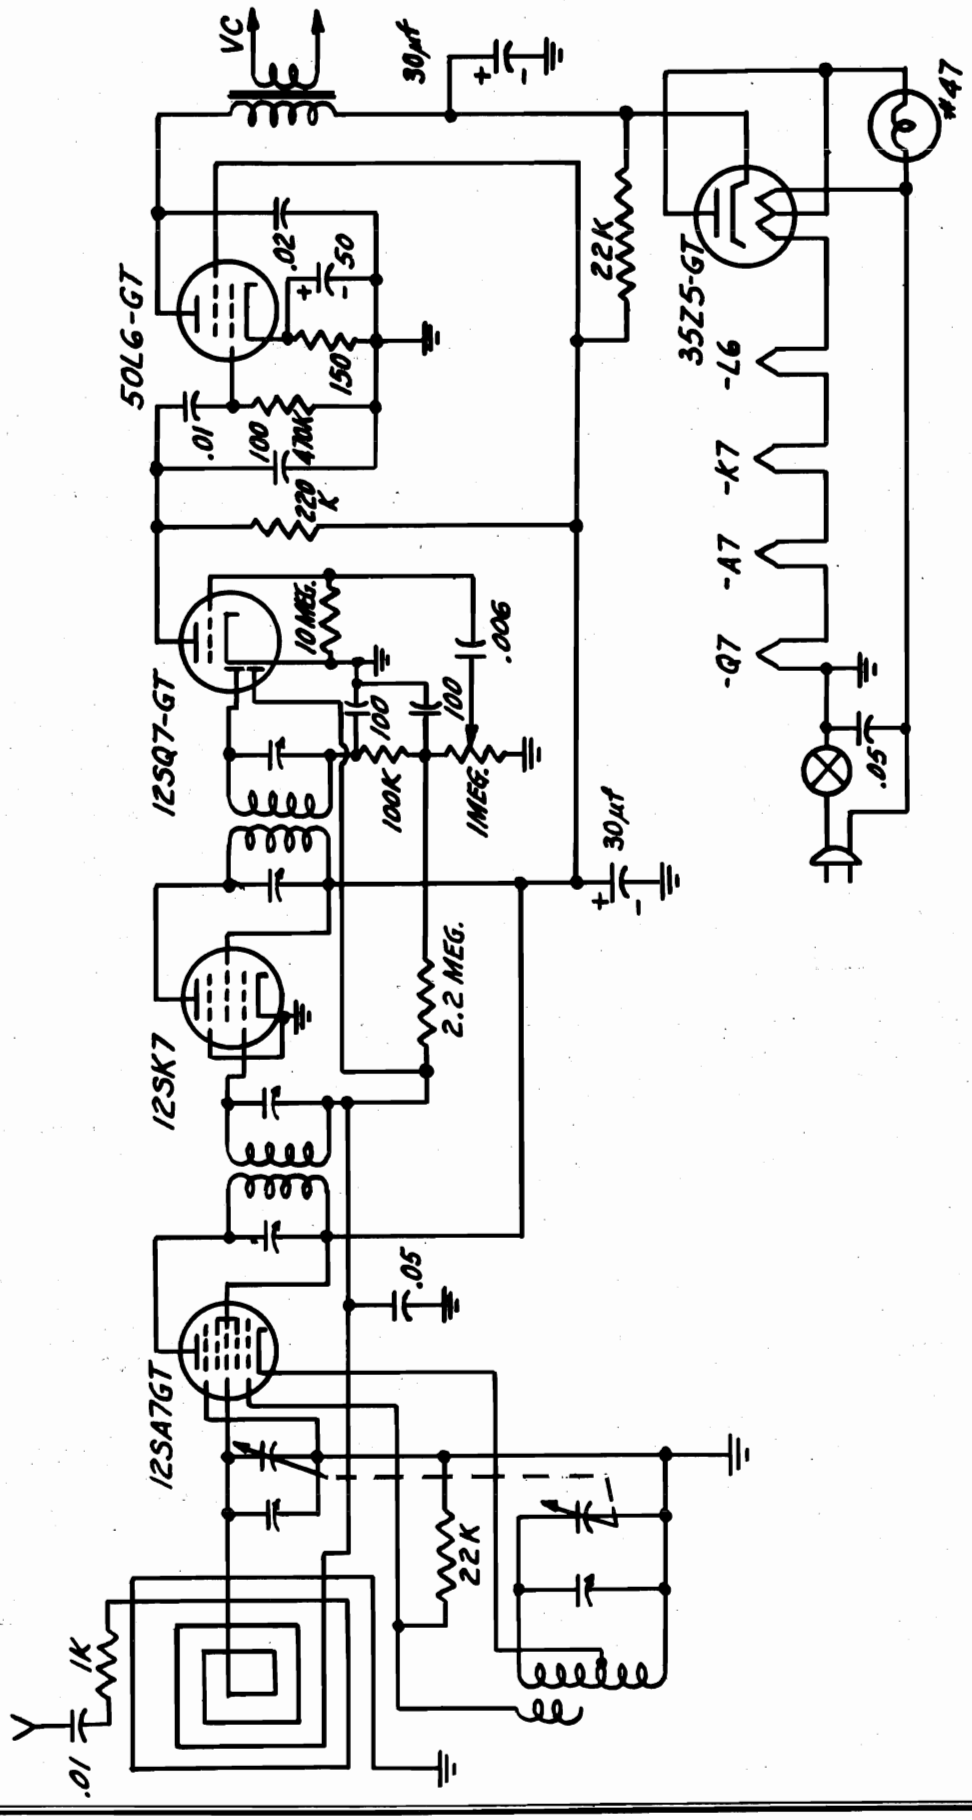
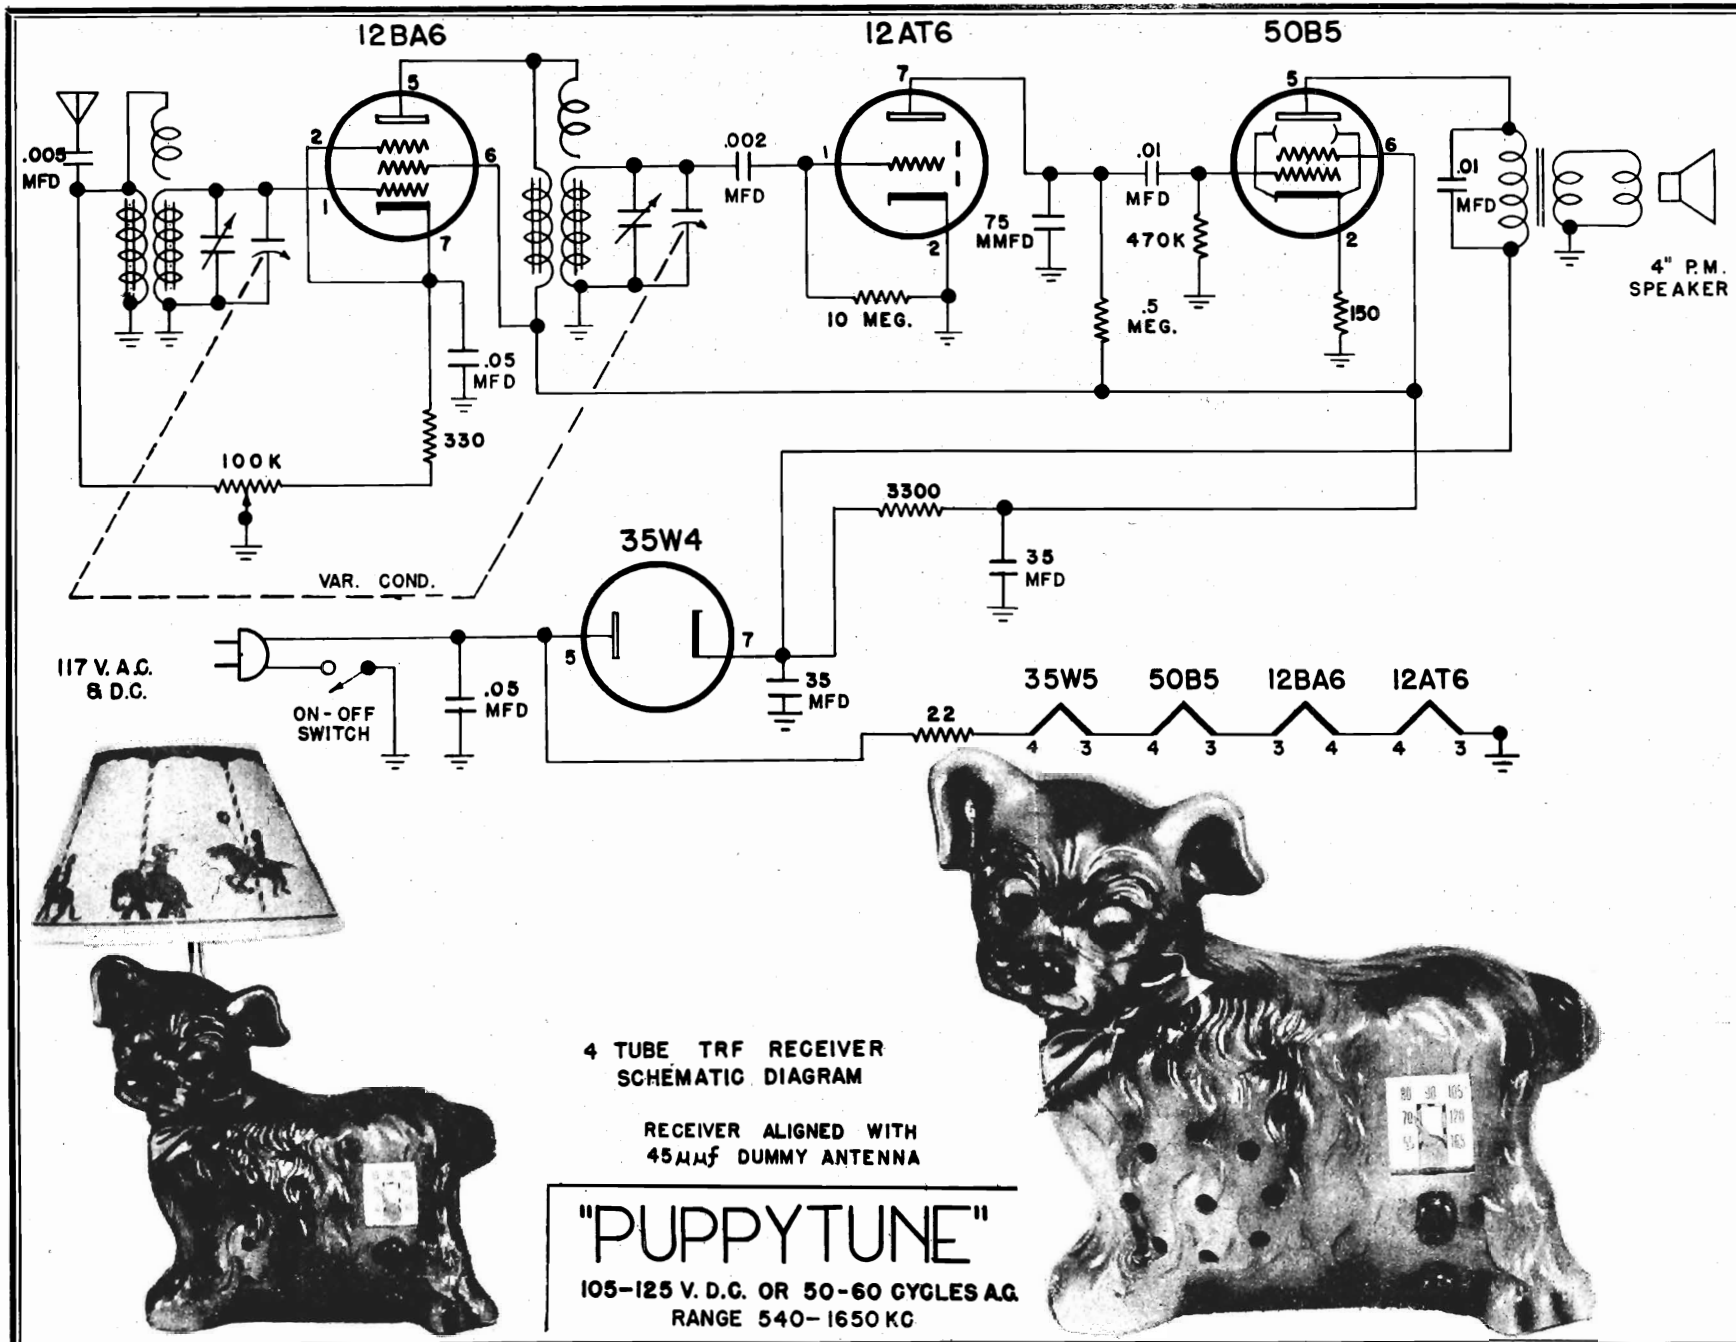
CHASSIS SERIES "R"

MODEL 5 tube, AC-DC

KERNWOOD RADIO CORP.



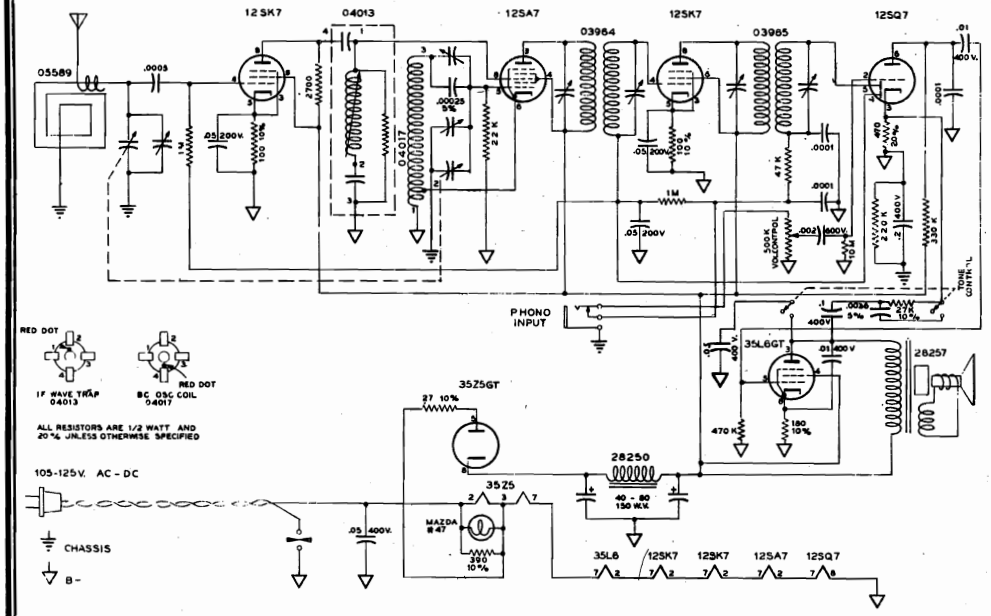


4 TUBE TRF RECEIVER
SCHEMATIC DIAGRAM

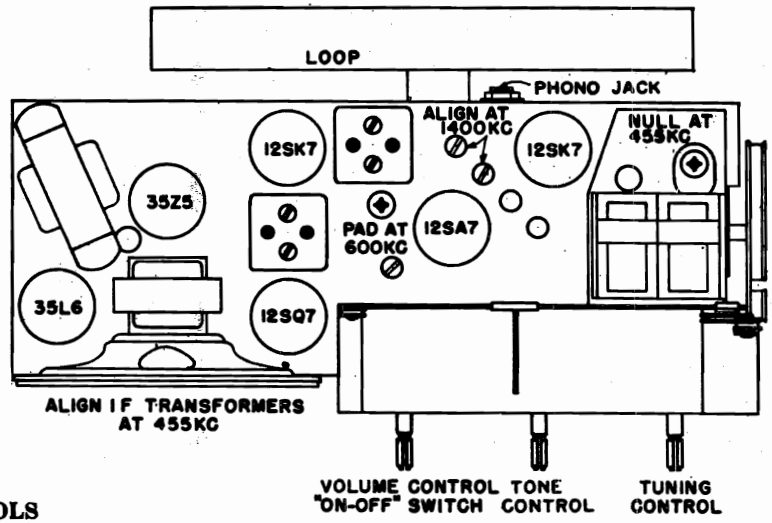
RECEIVER ALIGNED WITH
45μμf DUMMY ANTENNA

"PUPPYTUNE"

105-125 V. D.C. OR 50-60 CYCLES A.C.
RANGE 540-1650 KC



TUBE LAYOUT



CONTROLS

TONE CONTROL: (Center knob).

Turn knob counter-clockwise for maximum bass and clockwise for maximum treble response.

VOLUME CONTROL: (Left-hand knob).

Turning knob clockwise turns the receiver on and turning further increases the volume.

TUNING CONTROL: (Right-hand knob).

This knob is used to select stations. Tune station until it is at maximum clearness. Never attempt to reduce the volume by detuning the station—always use the volume control.

OPERATION

Turn the "On-Off" switch and volume control clockwise about half its range. This supplies power to the receiver. After allowing the tubes to warm up, tune in the desired station by rotating the tuning control. For best results, tune the desired station with the volume turned low. This enables you to get the exact point where the station comes in best. Then adjust the volume control

To operate the receiver as a phonograph amplifier, insert phonograph plug in jack on rear of chassis. Turn "On-Off" switch and volume control clockwise about half its range and adjust tone control to desired position. For normal radio reception the phono plug must be withdrawn from the jack.

This is a 6-tube superheterodyne radio receiver, with provision for phonograph input, for operation on 105-125 volt AC or DC power supply. The tubes used are a 12SK7 as an R.F. amplifier, a 12SA7 as an oscillator-converter, a 12SK7 as an I.F. amplifier, a 12SQ7 as an AVC, detector, and 1st audio amplifier, a 35L6 as an output, and a 35Z5 as a power rectifier.

The broadcast band covers a frequency range from 535 to 1620 kilocycles. The dial is calibrated in kilocycles (KC) (less the final zero).

Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube, or some local condition is not responsible for faulty reception. An output meter may be clipped directly across the voice coil lugs.

The Signal Generator may be connected through a 0.01 mf capacitor (used as dummy antenna) to the lug on RF section (B) of tuning capacitor. Connect ground clip of generator directly to chassis. Align the I. F. trimmers to 455 kc, using least possible input from Signal Generator to avoid developing A.V.C. voltage which would make the tuning adjustments very broad.

Range: Model G-515 covers the broadcast band from 540 to 1620 kilocycles. Since the scale is calibrated 54 to 160, the actual frequency of the station received is obtained by adding a zero to the dial calibration.

To align RF trimmers remove the 0.01 mf capacitor and connect the Signal Generator leads or two or three turns of heavy wire, forming a self-supporting loop of about 7 or 8 inches diameter, placed about a foot away from the receiver's loop antenna. Again, use the least possible input from the Signal Generator. With the tuning capacitor plates completely out of mesh, and pointer at extreme right end of travel, adjust the oscillator trimmer (A) (on front section of tuning capacitor) to 1700 kc. Readjust both Signal Generator and tuning capacitor to 1550 kc and adjust the RF trimmer (B) (on rear section) for maximum response.. With tuning capacitor plates fully meshed, the receiver should tune to 532 kc; however, no adjustment is required at this point. For checking purposes, four fine marks are engraved on the dial plate. These represent, in order, the pointer position with capacitor plates fully meshed, and the pointer settings for 600, 1000 and 1550 kc.

Bendix Par 80

This model appears on *pages 18-1 through 18-5 of Rider's Volume XVIII.* On late production model PAR 80 receivers, a rubber grommet has been added over the battery switch lead at the metal shield to prevent eventual wear and shorting of the lead. If servicing of this receiver indicates excessive wear of the battery switch lead, a small standard grommet of suitable size may be added at point where the lead enters the switch shield.

Bendix 110, 110W, 111, 111W, 112, 114, and 115

These models appear on *pages 18-6 through 18-8 of Rider's Volume XVIII.* On recent models of this series a circuit change has been made which adds a coupling plate, stock number AC0C00, between the first audio tube, 12SQ7, and the output tube, 50L6, in lieu of the following components used on earlier receivers:

Plate-load resistor, R5, stock no. RC1H54; grid resistor, R7, stock no. RC1H58; Plate r-f bypass capacitor, C8 stock CP4T20.

These parts are eliminated when coupling plate, stock no. AC0C00 is used, although installation is otherwise interchangeable. To use the coupling plate may cause a slight increase in the plate voltage of the 12SQ7 tube, but no adverse effect is made on the receiver. The resistance measured from the grid of the 50L6 tube to common B- is approximately 450K, while the resistance measured from the plate of the 12SQ7 tube to common B- will give a reading which increases approximately 10 megohms in magnitude, caused by the charging of the filter capacitors since the receivers have no d-c return to ground.

Bendix 626

This model appears on *pages 16-1 through 16-3 of Rider's Volume XVI.* Either of two coils may be found in this model. In some, an r-f coil making use of a small capacitor (3.3 $\mu\mu$f) between the start of the secondary winding and the finish of the primary winding is used, while in others an r-f coil with an added tertiary winding is used in lieu of the capacitor. These coils, when properly used, are interchangeable, and in the future only r-f coils with the tertiary winding will be provided as replacements.

If, in the receiver to be repaired, the coil requiring the 3.3-$\mu\mu$f capacitor is replaced with the other type, eliminate the 3.3-$\mu\mu$f capacitor from the circuit.

Bendix 646A

This model appears on *pages 15-5 and 15-6 of Rider's Volume XV.* The change involves a revision in the replacement parts list as follows:

In the cabinet components section of the parts list on *page 15-6,* substitute the stock number HZ0S04 for the existing stock number HZ0L01 which is incorrect. The nomenclature and identification of the component part is correct as listed.

Crosley 9-101

This model appears on *pages 18-1 through 18-3 of Rider's Volume XVIII.* Recently it was discovered that in some areas, the oscillator coil (Part No. 142975) developed trouble due to corrosive tape. To avoid possible complaints in the field, it is recommended that the coil be replaced with a new coil (Part No. 145105).

Bendix 847B

This model appears on *pages 17-7 through 17-14 of Rider's Volume XVII.* The replacement parts list on *page 17-13* should be revised as follows:

The r-f oscillator chassis assembly bearing the stock number AR0B00 is no longer stocked as a complete replacement assembly. This chassis can be repaired satisfactorily in the field and the necessary component parts may be obtained as separate stock items, when desired.

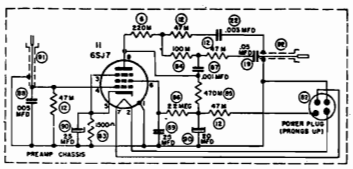
Crosley 9-201, 9-202M, 9-203B

These models appear on *pages 18-14 through 18-19 of Rider's Volume XVIII.* The part number of item 83 (volume control) was shown on *page 18-19* as 39368-14. This number should be 39368-18. To use the No. 39368-18 control on these models, it will be necessary also to use a No. 39-370-2 plug-in type knurled shaft.

Farnsworth GK-111, GK-112, GK-114, GK-115

These models are the same as model GK-100, appearing on *pages 17-3 through 17-10 of Rider's Volume XVII,* except that they employ the P56MP record changer instead of the P56.

The P56MP record changer is a reluctance type pickup and, therefore, additional amplification in the phono circuit is necessary. A 6SJ7 tube has been added to the phono circuit, as shown in the accompanying diagram.



The circuit of the 6SJ7 tube that was added so that a reluctance pickup could be used in Farnsworth Models GK-111,-112, -114,-115.

The following parts should be added to the parts list:

Part No.	*Description*
78057	Volume control, 3 megohms
94204	Power transformer
94239	Output transformer
13772	Speaker
38696	Loop antenna for GK-111, GK-112
38859	Loop antenna for GK-114
26032	Loop antenna trimmer, GK-114
22169	Pickup cable
22170	Output cable
22171	Power adapter cable
25431	Capacitor, electrolytic, 20 μf, 450 v, 25 μf, 25 v
25432	Capacitor, 0.001 μf, 200 v
25433	Capacitor, 0.25 μf, 600 v
H-273	Cabinet for GK-114
H-291	Cabinet for GK-111 Mah.
H-292-1	Cabinet for GK-112 C
H-292-2	Cabinet for GK-112 Bl.

Federal 1027, 1035

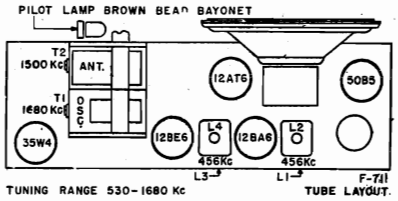
Basically, these models are the same both in chassis and cabinet as model 1025 which appears on *pages 16-1 through 16-4 of Rider's Volume XVI.* However, differences exist in the exterior cabinet finish and color of these models.

Federal 1034

This model is essentially the same as model 1024 which appears on *pages 16-1 through 16-4 of Rider's Volume XVI.* The only modification has been in the cabinet

Fada 711, 740

These models appear on *pages 17-15, 17-20, and 17-24 of Rider's Volume XVII.* The socket layout on *page 17-15* applies only to model 740. The socket layout for model 711 is shown herewith. The schematic and parts list refer to both models.



Socket layout for the Fada model 711.

Firestone R3157A

This model is the same as Model S7427-2 appearing on *pages 12-19,20, 12-21, 12-6, and C.S. 12-4 and C.S. 12-5 of Rider's Volume XII.*

General Electric P4

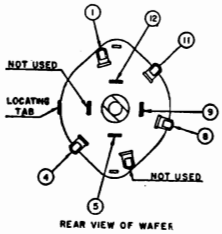
This model appears on *RCD. CH. Pages 17-5 through 17-9 of Rider's Volume XVII.* The sound of a metallic click and audible thump through the receiver speaker is usually traced to the operation of the velocity trip mechanism. This is caused by too much tension of the Clutch Tension Spring (reference 29 in Fig. 3 on *RCD. CH. Page 17-7*) binding the velocity trip lever. Adjustment may be made, reducing spring tension to prevent binding and still maintain normal operation.

In earlier production, a limited quantity of record changers employed a flat spring type clip fitted over the pickup arm pivot shaft. The clip was brought to bear upon the clutch tension spring, compressing the spring to the proper friction upon the velocity trip lever as was necessary for proper changer operation. To provide a more positive adjustment, later productions use a Clutch Spring Tension Collar, in lieu of the original clip, which makes a more convenient, accurate, and more permanent adjustment.

If extreme difficulty is experienced in proper adjustment of the earlier production changers, the spring clip may be replaced with the collar, Cat. No. RMX-080. A detailed view of the later version of record adjustment is shown in Fig. 6 on *RCD. CH. 17-8.*

GE 250

This model appears on *pages 15-32 through 15-36 of Rider's Volume XV.* The switch that is supplied under the number RSW-009 is of a different construction than the original flat-wafer switch. The accompanying figure shows the numbers which correspond to those in the schematic diagram.



Construction of the wafer switch replacement for the General Electric 250.

GE 41, 42, 43

These models appear on *pages 17-1,2 through 17-15 of Rider's Volume XVII.* The following changes should be made. Add Cat. No. REF-003, line fuse F201, 3AG, 5 amp., 250 volts, to the parts list and add this to the schematic diagram of the Special Power Unit on *page 17-3.* The fuse should be placed in series with the power transformer primary and the power cord. Besides the addition of a fuse, the safety will be further increased by placing a sheet of asbestos underneath the power unit to cover the ventilation slots. Thus, even in the case of overload, the hot tar of the over-heated transformer is prevented from dropping on the floor.

Add Cat. No. RSV-001, Switch—power ON-OFF switch to the parts list. Replacement is readily made by merely bending the mounting taps.

To adjust for minimum hum level, turn the volume control until the audio output is zero and vary resistor R201 (which is parallel to the filaments and center-tapped to the chassis, forming an effective hum balancing circuit).

General Electric 41, 42, 43, 44, 45

These models appear on *pages 17-1,2 through 17-15 of Rider's Volume XVII.* A sliding type switch has been added in series with R67 (8200 ohms) connecting the resistor to the phonograph pickup input jack, J3. This switch is on the receiver chassis back apron with its respective label indicating High Fidelity and Normal, the open and closed positions, respectively.

In the replacement parts list under Cat. No. RSS-003, add the item: High Fidelity-Normal switch.

General Electric 50

This model will be found on *pages 15-1 through 15-4 of Rider's Volume XV.* This change covers a correction to the original parts list in the model 50 where Cat. No. RHS-001 was changed to RMX-006 for a tuning assembly and spacer.

A further correction is necessary in the item description since only the tuning shaft and drive pulley (assembled) is supplied under RMX-006. The spacer is the tuning shaft bearing, and is catalogued as a separate item under RHJ-001. The original parts listing of the drive pulley under this number has been deleted.

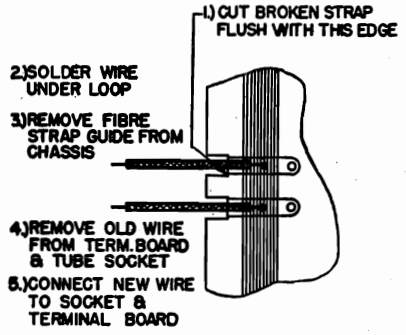
GE 140

This model appears on *pages 17-21 through 17-23 of Rider's Volume XVII.* The following changes should be made in the parts list: From Cat. No. RAD-027 remove the statement "(with loop connecting strips only)." Change Cat. No. RCC-075 to read RCC-080. Delete Cat. Nos. RDK-098, RHC-008, and RMX-103. Add the following parts.

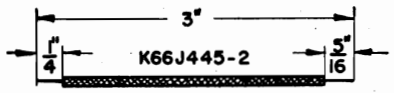
RDK-106	Knob—door catch knob
RCE-002	Strap—loop contact strap
RHE-002	Eyelets—spacer eyelets for escutcheon screws RHS-016
RHE-003	Eyelet—used for loop contact strap
RHR-002	Rivets—door hinge rivets (power cord access)
RHS-015	Screw—self tapping (used for cabinet door cover)
RHS-016	Screw—Phillips, flat-head, mounts bottom of escutcheon

The following procedure is recommended for repairing broken antenna loop connecting straps.

The broken straps should be cut back flush with the inside edge of the notch on the loop. The flexible wire is then used to make connections from the loop to the inside of the receiver. Consult the accompanying diagrams for loop connecting details and wire specifications. Carefully lift the section of the loop to allow connecting the specified pieces of wire and solder



WIRE DETAILS



2 REQUIRED PER SET

Above, the loop connecting details of the General Electric Model 140. The wire details for the antenna loop connections are shown in the lower figure.

wires to remainder of loose straps. Remove the fibre strap guide which originally insulated the loop straps within the cabinet. Remove original wire leads and pieces of loop strap connected inside the cabinet to the chassis terminal strip and pin 6 of the 1R5 oscillator-converter tube socket. Solder the new leads from the antenna loop directly to the terminal board and tube socket. Make certain that the inside of the loop is connected to pin 6 of the 1R5 tube socket. The following procedure is recommended to replace a speaker in this model.

1—Unsolder leads on speaker, using small tip iron.
2—Unsolder 90-μf capacitor (C14) at terminal strip.
3—Without unsoldering, remove dual 40-μf capacitor (C20) from mounting clip.
4—Using long screwdriver (8 inches or longer) loosen screws holding speaker to chassis.
5—Remove nuts holding speaker to front panel.
6—Lift up left end of resistor mounting plate and then lift out speaker.

If the antenna straps which interconnect the antenna in the receiver cover with the radio chassis circuit break, the following replacement procedure is recommended:

1—Bend up insulating material covering set end of antenna strips by inserting the tip of a long-nose pliers and twisting gently so as not to tear material.
2—Unsolder wires from loop strips in receiver.
3—Remove screws holding door cover.
4—Lift loop at point midway between hinges to expose strip rivets and unsolder loop from loop strips.
5—Remove rivet or rivets as needed, taking care not to damage loop or loop back.
6—Replace broken straps by new members, Cat. No. RCE-002, and rivet it in place with eyelets, Cat. No. RHE-003.

In order to replace the rectifier disc assembly, SR, proceed as follows:

1—Remove two mounting screws from the power switch, S1 (door switch).
2—Dress power switch away from mounting plate, providing more access to underside of top chassis deck.
3—Unsolder leads to rectifier disc assembly.
4—Push aside components underneath rectifier assembly mounting screw until screw can be loosened.

General Electric 210, 211, 212

These models appear on *pages 18-21 through 18-25 of Rider's Volume XVIII.* Change the third column (Signal Input Point) of the alignment charts on *page 18-23* to read: 12BE6 grid (pin 7 of V2). See note 7.

The parts list on *page 18-25* should be changed as follows: Change catalogue number UOP-557 to UOP-558 for Speaker 5¼-inch PM. Add the reference symbol R32 to Cat. No. URD-141—Resistor—6.8 meg., ½w., carbon.

The following changes have been made in the schematic diagram on *page 18-21.* Where capacitor C38 is shown terminating at ground on this schematic, later model receivers have this ground connection removed and the capacitor is terminated at the junction of the antenna input and capacitor C14. Capacitor C36 should be added and connected from the junction point of R29, pilot lamp I1, and pin 4 of V7 to ground. Resistor R32, which has been added to replacement parts list above, is connected from the junction of R8 and C4 (AVC filter) to the cathode, pin 2, of output tube V6.

This resistor, R32, has been added to increase the converter stage gain when operating in the A-M position because of a change in performance characteristics relative to grid cut-off of the 12BE6 tube.

General Electric 230 Kaiser-Frazer

This model appears on *pages 18-26 through 18-28 of Rider's Volume XVIII.* The change involves a substitution of catalog numbers in the replacement parts list as follows:

Cat. No. URE-035 and URF-055 are catalogued for carbon-type resistors. These numbers are to be replaced for numbers specifying wirewound resistors, RRW-037 becoming the Cat. No. for R13 and RRW-036 the number for R18.

General Electric 502

This model appears on *pages 17-4 through 17-8 and pages 17-39,40 through 17-47 of Rider's Volume XVII.* The changes involve a schematic correcton and a correction in the value of a component in the replacement parts list.

The schematic diagram which shows an open circuit in the screen grids of the 6V6 tubes, V10 and V11, should be corrected to show the screen grids connected to the 260-volt B-plus line.

In the listing of Cat. No. RCW-1028, the capacitor value was mistakenly given as 22-$\mu\mu$f. The capacitors listed are actually 100-$\mu\mu$f and RCW-1028 should be changed to read 100-$\mu\mu$f.

Hallicrafters SX-42

This model appears on *pages 17-6 through 17-13 of Rider's Volume XVII.* The following service hints apply to the S-Meter operation.

SYMPTOM NO. 1:

Meter fails to zero on AM.

ANALYSIS:

Assuming that all connections and other circuits, including AVC, are normal . . .

1) The line voltage is low, or
2) The first RF tube is weak

SYMPTOM NO. 2:

Zero adjustment appears too critical. Does not hold.

ANALYSIS:

The leads to the outside terminals of the "Zero Set" potentiometer should be disconnected, reversed, and reconnected.

SYMPTOM NO. 3:

Meter fails to zero on FM

ANALYSIS:

1) Adjust meter indicator mechanically with zero set on the meter.
2) Replace 7A4 tube
3) Replace R-68 with lower resistance if indicator remains on right side of FM zero
4) Replace R-68 with higher resistance if indicator remains on left side of FM zero

REMARKS:

The internal resistance of the meters is not specified, and depends on the supplier. The resistance ranges from 12 to 50 ohms.

The meter has a range of 5 ma. on a linear scale. The FM zero is arbitrarily calibrated at 1.4 ma.

An arbitrary figure of 60 m.v. to the antenna terminal was used for S-9 on the 20 meter band. Each S-unit represents 6 db variation.

60 m.v. to the antenna terminal of the receiver represents roughly a field strength of 15 m.v. per meter.

Hoffman C504, C514

These models are the same as model B504 appearing on *pages 17-1 and pages 17-3,4 through 17-7 of Rider's Volume XVII,* except for the following. Push-pull parallel 6K6 tubes are used in the output instead of push-pull 6V6 tubes. See Fig. 1.

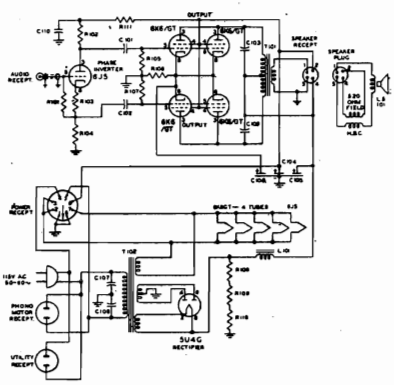


Fig. 1. Changes in the output stages of the Hoffman Models C504 and C514.

A resistance-capacitance filter (R111 and C110) has been inserted in the B-plus line feeding the phase inverter stage in order to reduce the inherent hum level of the receiver to a satisfactory level. See Fig. 1.

An "entertainment panel" has been wired into the tuner chassis to provide microphone input, a speaker on-off switch, a pillow speaker plug, and an auxilliary phono input to be used either for television sound or wire recorder input. See Fig. 2.

On the recorder amplifier, the screen-dropping resistor (R11) has been changed from 0.1 megohm to 2.2 megohms and the cathode resistor (R2) changed from 2200

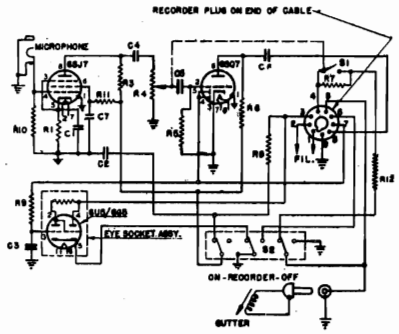

Fig. 2. Changes made to accomodate the "entertainment panel" of the Hoffman C504.

ohms to 4700 ohms. This change allows the screen current of the 6SJ7 to be self-regulating to eliminate variations in gain between various 6SJ7 tubes.

Several changes were made in the late production. A 270,000-ohm resistor was added across the phono input jack of the radio chassis. This resistor was on the record changer (960260-2) in the early production (Serial Nos. B-1001 to B-6000 and B-28,500 to B-30,000).

The location of the resistor may be checked by measuring the shunt resistance across the phono input jack of the radio chassis and across the phono output cable of the changer mechanism.

Hoffman C502 and C512, Chassis 113

These models are the same as Model B502, Chassis 113, appearing on *pages 17-1 to 17-6 of Rider's Volume XVII,* except for the following changes. Four 6K6-GT tubes are used in push-pull parallel in the output stage instead of the 6V6 tubes in push-pull.

An "entertainment panel" has been wired into the tuner chassis to provide microphone input, a speaker off-on switch, a pillow speaker plug, and an auxiliary phono input to be used either for television sound or wire recorder input. See Fig. 1.

A resistance-capacity filter R111 and C110, has been inserted in the B-plus line of the phase inverter stage in order to reduce the inherent hum level of the receiver, as shown in Fig. 2.

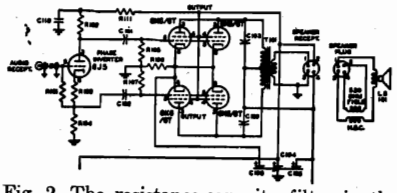

Fig. 2. The resistance-capacity filter in the Hoffman models C502 and C512.

The following changes should be made in the parts list:

Symbol	Description	Hoff. No.
C60	0.005 μf, 600 V, tubular, paper	4102
R16, R20, R50	100,000 ohms ± 20%, ½ watt	4511
R21, R48	47,000 ohms, ± 20%, ½ watt	4504
R49	10 megohms, ± 20%, ½ watt	4506
R27, R46	0.22 megohm, ± 20%, ½ watt	4500
R47, R51	0.47 megohm, ± 20%, ½ watt	4506
C110	10 μf, 450 V, electrolytic	4203
R111	10,000 ohms, ± 20%, ½ watt	4515

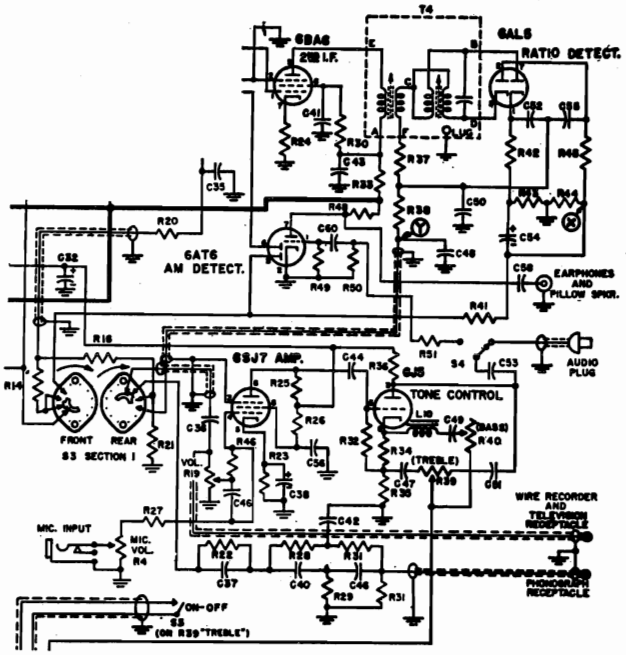

Fig. 1. The entertainment panel that is wired into the Hoffman models C502 and C512.

Majestic 5AK781

This model is the same as model 5AK731 found on *pages 17-3 and 17-4 of Rider's Volume XVII,* except for the following changes in the parts list.

Part No.	Description
S-1441	Dial cord assembly
S-1448	Output transformer
21-29	Aero record changer
115-49-1	Cabinet, (Aero cut out) Blonde, walnut, or mahogany
122-47	Escutcheon plate, metal
128-62	Knobs, tuning and volume
128-80	Knob, phono - radio
101-485	Screw, mounting chassis
106-124	Washer, mounting chassis

Majestic 7BK758

This model is the same as Model 7JK777R appearing on *pages 17-5 and 17-6 of Rider's Volume XVII,* except for the dial scale. The dial scale used is part no. 117-78.

Majestic 12FM782, Chassis 12C20E

This model is the same as Model 12FM778, Chassis 12B26E, appearing on *pages 17-27, 28 to 17-33 of Rider's Volume* XVII, except that it does not have push-buttons and indicator lights for "Records and "F.M."

The following additions should be made to the parts list.

Part #	Description
115-45-2	Cabinet—console combination
21-32	Changer, oak
22-43	Speaker, 12" including output transformer
20-27	A-m loop antenna (less cover)
122-20	Escutcheon glass (large)
122-44	Dial grill
128-37	Knob (vol-tuning-tone)
128-85	Knob (band switch)
128-46	Spring insert for above knob

Midwest 98

This model is the same as model RM-8, appearing on *pages 18-1 through 18-3 of Rider's Volume XVIII,* except that two pilot lamps have been added. Each #46 pilot lamp is in series with a 10-ohm resistor, and each series combination is in parallel with the other. One end of the parallel combination is connected to the 6.3-volt filament line and the other end is grounded.

Noblitt-Sparks 182TFM, Chassis RE-237

This model appears in *Rider's Volume XVII, pages 17-9,10 through 17-15.* At the start of production, the glass oscillator trimmer "14" was mounted to the bracket on the variable capacitor with a brass nut and had a locking nut to hold tension on the adjusting screw. When this locking nut was tightened down enough to prevent it from working loose while adjusting the trimmer, the tension on the screw was too great for production alignment. To correct this trouble, the locking nut was tightened down to give the proper tension and then soldered to the bracket to prevent it from working loose. This was a difficult solder operation, and the trimmer screw would still work loose after being run in and out a few times, due to a cutting action between the lock nut and the threads on the screw. To correct this trouble, the locking nut was removed and the bracket revised to use a piece of No. 14 music wire to apply tension to the adjusting screw. (See Fig. 1.) The trimmer is much more stable with the new arrangement

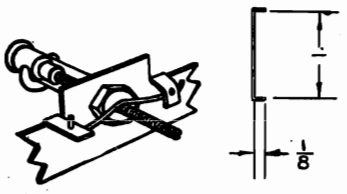

Fig. 1, left, shows the music wire spring applied to the adjusting screw.
Fig. 2, right, shows the music wire spring.

On some trimmers, the threads for the mounting nut did not go down far enough to allow the nut to tighten down against the bracket. A No. 12 lockwasher has been added under the mounting nut to assure a good tight contact between the trimmer and the bracket. If a set is found where the capacity of the oscillator trimmer changes or the trimmer is noisy, the following procedure is recommended:

See that the trimmer mounting to the bracket is tight. Since the trimmer glass is almost sure to break if an attempt is made to tighten the mounting nut after the opposite end of the trimmer has been soldered in place, it is suggested that the trimmer be soldered to the back side of the bracket before attempting to tighten the nut (use care in soldering, apply heat from soldering iron to the bracket to prevent breaking trimmer glass).

Remove the locking nut and replace it with the music wire spring, part number A21902, Fig. 3, by soldering the two metal lugs, part number A21889, Fig. 2 on the present bracket, as shown in Fig. 1.

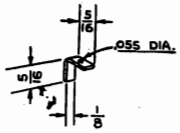

Fig. 3. Two lugs of this type are used as shown in Fig. 1 above.

AM-IF Alignment

Two peaks may be obtained with the 455 i-f slugs; one with the slug tuned almost all the way in and another with the slug tuned almost all the way out. When such is the case, the peak with the slug tuned out should be used.

Noisy F-M Reception

If the set is noisy on f.m., check the six ground leads from the variable capacitor to the chassis to make sure none of them are broken. One broken ground lead will not only make the set noisy, but can also effect the alignment of the set.

Ceramic Capacitors

Care must be taken in placement of ceramic capacitors to prevent shorts which would occur if any part of the capacitor touched other metal parts.

FADING . . . If fading occurs, check the shielded audio leads. One lead should be connected from the center lug of the volume control to the audio coupling capacitor on the stand-off insulator. The other lead should be connected from the right-hand terminal of the control to the band-change switch. If these two leads are reversed, the AVC will be ineffective.

ANTENNA . . . On some of the first sets produced, the primary and secondary windings of the antenna-coupling transformers T1, were shorted together, causing the antenna terminals on the back of the set to be grounded to the chassis. This should be carefully checked before connecting an external antenna to the set, because one position of the a-c plug in the outlet will place 110 volts between the antenna and any grounded object. This would be a shock hazard, and if the antenna became grounded the r-f choke in the a-c leads in the set would burn out.

OSCILLATION . . . If oscillation is encountered, try dressing the yellow filament leads, in the i-f section of the receiver, down against the chassis and away from the tube sockets. Also, see that all grounded leads on the variable capacitor are soldered and not broken.

Some cases of regeneration in the FM i-f circuit have been encountered. This can be detected by a high discriminator voltage, and also a high avc voltage with no signal input. Replacing the 0.005-μf 2nd i-f cathode-bypass capacitor, C32, with a 0.002-μf 350-volt ceramic capacitor will correct this in most cases.

22-OHM RESISTOR BURNS . . . Some receivers have a ¼-watt 22-ohm fusing resistor in the B-plus circuit. If this resistor burns, replace it with a 1-watt resistor. CAUTION . . . First check the B-plus current to see that it does not exceed approximately 100 milliamperes. If the current is greater than this value, some other trouble exists in the receiver and this must be corrected in order to prevent damage to other parts in the receiver.

FLOATING R-F UNIT . . . . On some sets the complete r-f assembly is mounted on rubber to prevent microphonics. When servicing these sets, be sure that the ground leads between the r-f assembly and the chassis are securely soldered.

INSULATING CONTROL SHAFTS . . . Some sets have been found with the flat metal washer under the insulating fibre washer on the tone control, volume control and band switch. This would be a shock hazard if a knob was left off the shaft and should be corrected by removing the metal washer and placing it on top of the fibre washer.

The following changes should be made on the schematic diagram:

1. A B- connection was added between R10 and L15.
2. A 220-ohm resistor, R15, has been added across the antenna terminals.
3. Antenna coil L4 has been relocated. In the original schematic it was in series with C1, and the series combination was shunted by C1A. The modification consists of placing C1 and C1A in shunt with each other, and placing L4 in series with this shunt combination and the top connection of L1, the point which is connected to the AM terminal of the selector switch.

The following changes should be made in the parts list:

1. R5 should be C20060-221 resistor, 220 ohms, ¼ watt
2. P.S. — A21709 parasitic suppressor should be added
3. C10 should be C20204-500 capacitor, 0.00005-μf., 500 V, ceramic
4. R8, 22-ohm fusing resistor should be 1 watt, C20103-220
5. A19328-4 grommet, rubber, Mtg., RF Assy.
6. A19138-3 eyelet spacer, Mtg., RF Assy.

Montgomery Ward 64WG-1050B, 1050D, 74WG-1050D

These models are the same as Model 64WG-1050A on *pages 15-75 to 15-77 of Rider's Volume XV*, except for the following changes. The 0.1-μf capacitor C-11, is connected between pin 1 of the 1R5 oscillator-detector tube and the common negative circuit instead of the chassis ground.

In the D models, a 1000-ohm resistor, R-13, is connected between pin 7 of the 3S4 output tube and the common negative circuit. The following should be added to the parts list.

Ref. No.	Part No.	Description
R-13	B84102	100 ohms, 0.05 watt, carbon

Montgomery Ward 64WG-1050C

This model is the same as Model 64WG-1050A on *pages 15-75 to 15-77 of Rider's Volume XV*, except for the following changes. The 1500-ohm resistor R-3 is now connected from the center tap of the filament of the 3S4 output tube to the common negative circuit, lug 4 on the changeover switch, instead of to the positive filament lead (pin 7) of the 1S5 oscillator-detector tube, lug 9 of the changeover switch.

A 100-ohm resistor R-12 has been connected between R-11 and the selenium rectifier.

Ref. No.	Part No.	Description
R-12	D84101	100 ohms, 2.0 watt, carbon

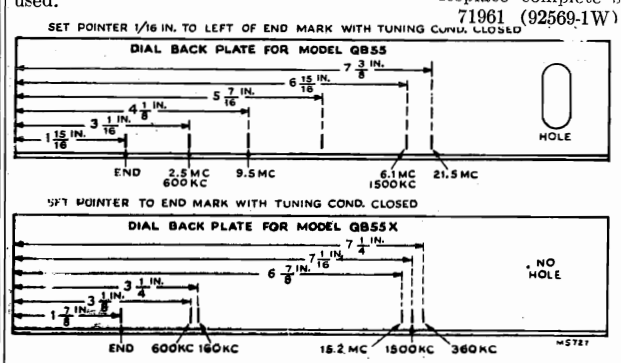
RCA QB55X Chassis RC-563-K

This model appears on *pages 17-9 through 17-11 of Rider's Volume XVII*. In some chassis two 2000-μμf capacitors in parallel are used in place of the specified 3900-μμf capacitor C7.

RCA QB55, QB55X

Model QB55, chassis RC-563A, appears *on pages 15-27 through 15-29 of Rider's Volume XV*. Model QB55X, chassis RC-563K, appears on *pages 17-9 through 17-11 of Rider's Volume XVII*. A viscoloid damper has been added to the stator plates of the oscillator section of the tuning capacitor to reduce microphonics on short wave reception.

Some of these sets have dial back plates without the score marks which may be used as a reference during alignment The glass dial scale may be removed from the cabinet and used as a reference during alignment, or the check points indicated in the accompanying diagram may be used.



Check points to be used when aligning the RCA models QB55 and QB55X

RCA Q109 (RC-602), Q109X (RC-602A)

The following voltage - current table should be added to the service data appearing in *Rider's Manual Volume 18, pages RCA 18-3 through 18-10.*

Socket Voltages — Cathode Currents
Local-Phono-Distant Switch in Distant Position.

	Tube	Plate Volts	Screen Volts	Cathode Volts	Cathode Current
1	6SG7	137	112	0	13.1 ma
2	6SA7	260	103	0	12.2
3	6SK7	235	103	1.3	13.3
4	6SQ7	86*	.....	0	0.4
5	6F6G	257	260	19.2	23.5
6	6F6G	257	260	19.2	23.5
7	6AT6	90*	.....	0	0.7
8	6U5	260	21*	0	2.1
9	5Y3G	.....	.....	355.	90.0

*Measured with Chanalyst or Voltohmyst

In LOCAL position the cathode circuit of the 6SG7, the RF amplifier, is opened ("A" Band only) and the voltages are correspondingly higher due to the absence of cathode current in this tube.

The stock number of the speaker cone should be changed to read:

No. 70972 Cone — Cone and voice coil assembly

RCA Q10, Q10A, Q10A2, Q10-2, Q10-3, Q110

This material appears in *Rider's Manual Volume 15, pages 15-5 through 15-7.* In the event that regeneration develops in the receiver, it may be due to a resonant condition due to electrolytic capacitor C21 being parallel with capacitor C11 (0.1-μf). Three methods have been used at the factory to correct this condition. These are:

(1) C11 may be 0.05-μf instead of 0.1-μf
(2) An additional 0.1-μf capacitor may be added in parallel with C11
(3) The RED and GREEN leads of the electrolytic capacitor (C21 and C22) may be interchanged

In some chassis, R1 may be 2.0 megohms instead of 2.2 megohms.

RCA 8V7, 67V1, 67AV1, 710V2

Model 8V7 appears on *pages 18-15 through 18-16 of Rider's Volume XVIII.* Models 67V1, 67AV1 appear on *pages 16-35 through 16-39 of Rider's Volume XVI.* Model 710V2 appears on *pages 18-55 through 18-60 of Rider's Volume XVIII.* An alternate Speaker (stamped 92569-1K) has been used as a substitute for the listed speaker (or speakers) in these models.

Add the following to the parts list: Under "Speaker Assemblies" add the following: 92569-1K.

70574 Cone—Cone and voice coil assembly.
31539 Plug—5 prong male plug for speaker.
37899 Transformer—Output transformer.
Replace complete speaker with Stock No. 71961 (92569-1W).

RCA 66X11, 66X12, 66X13

These models appear on *pages 17-29 through 17-30 of Rider's Volume XVII.* Some oscillator coils which were specified for the first production (RC-1046A, RC-1046, RC-1046B) of these models have been used on the second production (RC-1046C, RC-1046D, RC-1046E).

Some oscillator coils and associated coupling capacitors (C19) which were specified for the second production have been used on the first production.

If replacement is necessary — use the specified parts — the range of inductance adjustment may be insufficient if used otherwise.

RCA QU-62

This model appears on *pages 17-13,14 through 17-20 of Rider's Volume XVII.* In some instruments the speakers listed following have been used as alternates for the speakers listed in the parts list.

Speaker Assemblies 92520-1K

70574 Cone—cone and voice coil assembly
5118 Plug — 3 prong male plug for speaker
70686 Speaker—12" PM speaker complete with cone and voice coil less plug
(Used as alternate for PM speaker stamped 92469-4W)

Speaker Assemblies 92516-2K

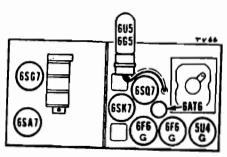
70574 Cone—cone and voice coil assembly
5119 Plug—3 contact female plug for speaker
31539 Plug — 5 prong male plug for speaker
70573 Speaker—12" EM speaker complete with cone and voice coil less output transformer and plugs
70688 Transformer—output transformer (T4)
(Used as alternate for EM speaker stamped 92566-3W)

The alternate speakers will not fit on the mounting bolts used with the original speakers. If a replacement which differs from the original equipment speaker becomes necessary, it is suggested that the mounting bolts be cut off and the replacement speaker mounted using rubber grommets, spacers, and wood screws.

The top view of this model is shown on *page 17-18 of Rider's Volume XVII.* The tuning capacitor has six sections—C1 and C2 Ant, C14 and C15 R.F., and C11 and C31 Osc. The tube and trimmer location view shows only C1, C14 and C31, which are used on the "A" and "B" bands only.

The following change should be made in the parts list on *page 17-20.* Replace Stock No. 31970 spring with Stock No. 31418 spring—Drive or indicator cord spring.

The instrument label used on some instruments is incorrect in showing tube locations. The r-f shelf assembly should be turned 90° clockwise. The correct tube locations are illustrated in the accompanying diagram.



The correct tube locations for the RCA Model QU-62.

RCA QU-61

This was published in *Rider's Manual Volume 15, page 15-55*. The following pertains to the power-supply ratings for this receiver.

Only one power-supply rating (Symbol Rating D) is applicable to QU-61. As manufactured it may be operated on 100 to 260 volts, 50-60 cycles. A universal type of transformer having five voltage ranges is used. The desired range may be selected by the proper positioning of a link beneath a cover on the top of the power transformer as follows:

110 position	100 to 115 volts
125 position	115 to 135 volts
150 position	135 to 165 volts
210 position	165 to 230 volts
240 position	230 to 260 volts

The receiver is shipped with this link in the 240-volt position.

CAUTION . . . Remove the power cord from the line receptacle before changing the position of the link.

The record changer is made for operation on a 60-cycle power supply but may be converted to 50-cycle operation by the addition of a conversion spring to the motor shaft.

Change in Replacement Parts:

Stock No. 34183 Transformer

Delete "For Specification Ratings A and C"

Add "For Specification Rating "D"

Stock No. 39786 Transformer

(No phonograph motors are available to permit operation of this instrument on 25-cycle current. However, this transformer may be used for operation on 105 to 125 volts, 50-60 cycles.)

RCA 8X521, 8X522

These models appear on *pages 18-43 through 18-44 of Rider's Volume XVIII*. On late production sets, slotted holes are provided in the tuning capacitor mounting bracket, and washers (maximum of five required) are used on the tuning capacitor shaft (between dial knob and capacitor) to permit adjustment of the dial. If the cabinet or tuning capacitor should be replaced, it may be necessary to adjust the mounting of the tuning capacitor or change the number of washers to prevent rubbing of the dial on the cabinet.

The following changes should be made in the parts list:

Delete: 70601 Capacitor — tubular, 0.002 μf (C9)

Add: 74063 Capacitor — ceramic 200 $\mu\mu$f (C9)

74183 Washer — vellutex washer for dial knob clearance

RCA 54B5

This model appears on *pages 16-28 through 16-30 of Rider's Volume XVI*.

The following addition should be made to the parts list.

70708 Lead—battery lead assembly

RCA Radiola 61-10 (RC-1023A and RC-1023C)

This material appears in *Rider's Manual Volume 15, pages 15-33, 15-51, and 15-52*. In some of the 1023A chassis, two 10-$\mu\mu$f capacitors are used in parallel in place of the specified 22-$\mu\mu$f capacitor, C-15.

In the case of the 1023C chassis, service data given for the 1023A chassis will apply in toto.

RCA 711V2

This model appears on *pages 17-44 to 17-55 of Rider's Volume XVII*. Interference has been noted on the broadcast band in certain localities. This interference appears in the background of certain stations or between stations, and generally takes the form of code or amateur voice. An abnormal quantity of whistles when tuning across the band is also present. Connecting an external antenna to the set merely makes the condition worse.

A production change has been made to overcome this condition. Receivers having this change may be identified by the letter L following the serial number on the radio chassis. The antenna coil L3 has been removed and a different loop antenna installed. These changes may be made as follows.

1. Remove radio chassis.
2. Refer to illustration and remove the red lead connected from the loop loading coil L3 to terminal 8 of S4.
3. Unsolder the blue lead from loop loading coil L3 and connect this lead to terminal 8 of S4. L3 may be left in the chassis without leads connected to it.
4. Remove the loop cable from loop and from the terminal board on the rear of the cabinet.
5. Remove the lug from the end of the yellow loop lead and solder this lead to terminal 5 on the antenna terminal board on the radio chassis.
6. Re-install the radio chassis.
7. Clip off pin 5 on chassis end of the five-conductor flexible antenna cable and file the remainder of the pin smoth with surface of plug.
8. Plug the five-conductor cable into the antenna terminal board on chassis (see sketch). Note that with one pin removed, the plug can be moved one pin to the right and plugged in, making incorrect contact.
9. Carefully pull the yellow lead down ward along the five-conductor cable far enough to permit taping it to the plug portion of this cable to prevent the yellow lead from breaking at the soldered joint at terminal 5 when flexed by opening of the radio door.
10. Connect the red and black loop leads to the rear terminals 4 and 5 respectively from which they were originally removed. Close link from 4 to 5 if an external antenna is not used. If an external antenna is used, it may be connected as described on *page 17-54 of Rider's Volume XVII*.
11. Remove the screw from terminal 6 in the antenna board on rear of cabinet to avoid improper connection in the future.
12. Remove the old loop and install the new loop in its place.
13. Plug the loop cable into the new loop.
14. Peak the loop trimmer on a weak station around 1400 kc.
15. If a test oscillator is available, the low-frequency oscillator core (L12) adjustment should be made while rocking the gang through 600 kc, to obtain maximum output. Repeak loop trimmer again at 1400 kc.
16. Grounding one of the the f-m antenna terminals (connect terminal 1 to 5) on the board on the rear of the cabinet may prove advantageous to reduce excess signals if an external f-m antenna is used.

NOTE: The new loop referred to above may be identified by a green paint dot on one metal mounting bracket. Also, the large coil has 20 turns of wire with only a few turns, or no turns, visible through the holes near the edge of the loop frame. The original loop contains 13 turns, all of which are visible through the holes near the edge.

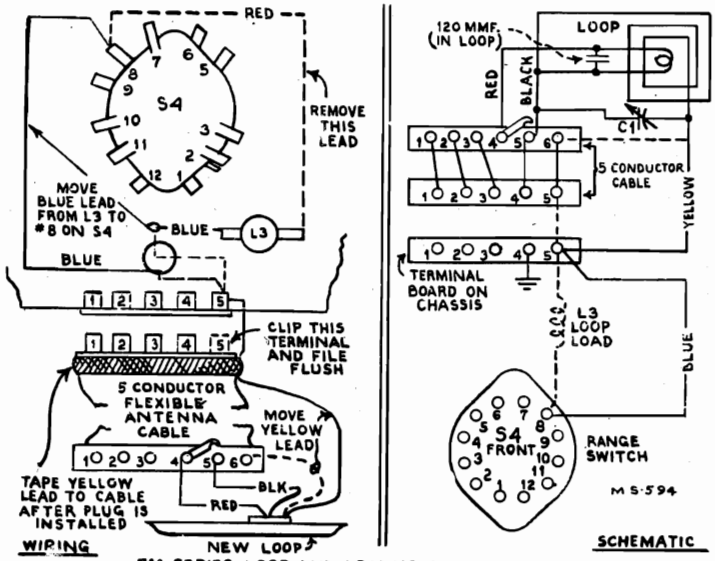
The leads which are not shown in the accompanying diagrams need no change.

Delete 71863 cable from the parts list and add the following.

73250 Cable—five-conductor molded antenna lead in cable

71614 Capacitor—120 $\mu\mu$f, ceramic — in shunt with the loop primary

73480 Loop—antenna loop complete. For receivers without loop loading coil.



711 SERIES LOOP AND LOADING COIL WIRING CHANGE

(BROKEN LINES INDICATE ORIGINAL WIRING REMOVED)

Necessary connections for the new loop for the RCA model 711V2

RCA 66BX, Chassis RC-1040B

This model is the same as model 66BX, Chassis RC-1040 appearing *on pages 15-87 and 15-88 of Rider's Volume XV*, except for the following changes:

Chassis RC-1040B uses a 3V4 output tube and a selenium rectifier. Resistor R3 and capacitor C8 in the converter stage are omitted.

Resistor R17 in the power supply has been changed in value to 2650 ohms. Resistor R20 (2700 ohms) replaces resistor R18 in the power-supply circuit. A 33-ohm resistor (R31) has been added between the selenium rectifier and the "hot" side of capacitor C33. Capacitor C33 is now grounded. See Fig. 1.

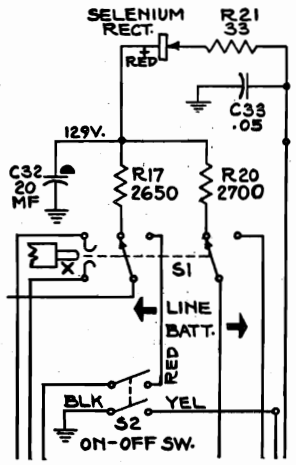


Fig. 1. Power supply of the RCA Chassis RC-1040B.

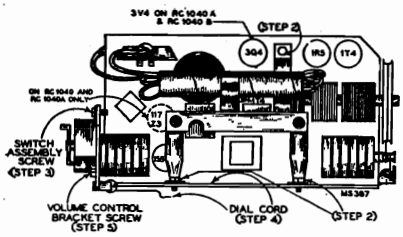
If the volume control needs replacement, the following steps should be followed. See Figs. 2 and 3.

1. Remove the 3V4 power output tube.
2. Remove the three screws holding the power cord bracket assembly. (Do not damage insulating washers.)
3. Remove the screw holding the switch assembly and remove the switch.
4. Remove the dial cord from the pulley.
5. Remove the screw holding the volume control bracket assembly.
6. Loosen the screw which maintains pressure on the expansion assembly.
7. Remove the drum.
8. Remove the expansion assembly from the volume control shaft.
9. Remove the nut holding the volume control to the bracket.

The following changes should be made in the parts list. Delete the following:



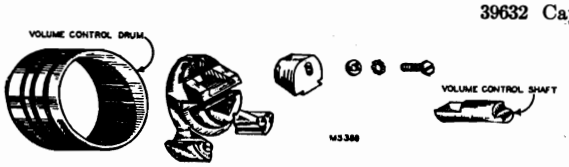


Fig. 2, above. Parts layout of RCA chassis RC-1040B. Fig. 3, left. Volume control dissassembly.

Stock No.	Description
38875	Resistor—1800 ohms, 1 watt (R18)
71038	Resistor — ballast resistor, 2300 ohms, 6 watt (R17)
30649	Resistor — 2.2 megohms, ¼ watt (R3)
70392	Cord — power cord
31709	Capacitor — ceramic 6.8-μμf (C7)

Add the following parts to the parts list.

Stock No.	Description
39043	Capacitor—Ceramic, 6.8-μμf (C7)
70022	Cord — power cord
72283	Grommet — rubber grommet to mount tuning capacitor (4 required)
72543	Rectifier — selenium rectifier
71290	Resistor—33 ohms, 1 watt (R21)
30930	Resistor — 1800 ohms, ¼ watt (R6, R15)
72760	Resistor — ballast resistor, 2650 ohms, 7 watt (R17)
14421	Resistor—2700 ohms, 1 watt (R20)
72541	Socket — tube socket - miniature - 7 prong bottom mounted with shield
72980	Side — case side — l.h. with decorative ribs at top, bottom, and both sides.
72979	Side — case side — r.h. (loop side) less capacitor assembly with decorative ribs at top, bottom, and both sides.

RCA Radiola 62-1 (RC-1017A)

This appeared in *Rider's Manual Volume 16, pages RCA 16-33 and 16-34.* A 270,000-ohm resistor, R12, is connected across the phono input between the center contact of the phono jack. One lead of the resistor joins the contact which goes to switch S1 and the other lead joins the jack at the point where C4 is connected to it.

RCA 65U-1

Rider's Volume 15, pages RCA 15-85 and 15-86 list models 65U and 65AU. These are the same as model 65U-1. The difference is found in the cabinets. The U and AU models have a rounded top at the front and the U-1 has a beveled top in front.

RCA 67V1, Chassis RC-606C

This model appears on *pages 16-35 through 16-39 of Rider's Volume XVI.* Resistor R18 which was originally 470,000 ohms, appears in some chassis as 330,000 ohms and in some chassis as 220,000 ohms.

RCA 67V1, 67AV1

These models appear on *pages 16-35 to 16-39 of Rider's Volume XVI.* In late production models, resistor R18 connected from the phono jack to ground has been changed from 120,000 ohms to 330,000 ohms.

RCA 75X11, 75X12 (RC-1050)

The following changes have been made in the wiring. The circuit appears in *Rider's Manual Volume 18 pages RCA 18-49 and 18-50.*

Capacitor C18 is now connected between pin #3 and pin #8 of the 35Z5GT rectifier. The service data indicates that it is connected between pin #3 of the above rectifier tube and the junction of R17 and C19.

Add to the parts list the following; under the heading of Chassis Assemblies:

39632 Capacitor-Mica 150-μμf (C13)

RCA 75X11, 75X12 (RC-1050A)

These models are the same as models 75X11 and 75X12, chassis RC-1050, appearing in *Rider's Volume 18 on pages RCA 18-49 and 18-50* except for differences in the i-f transformers. Here are the listing of the i-f transformer part numbers for the two different chassis.

Chassis RC-1050 uses:
- 1st IF trans. stamped 922246-7, Stock No. 71558
- 2nd IF trans. stamped 940351-2, Stock No. 71631

Chassis RC-1050A uses:
- 1st IF trans. stamped 922246-11, Stock No. 70128
- 2nd IF trans. stamped 922246-12, Stock No. 70129

Connections to the i-f transformers are identical for both chassis. Capacitors C8 and C9 of the 2nd i-f transformer stamped 922246-12 (RC-1050A) are 122-μμf each; the windings of this transformer have a d-c resistance of 13 ohms each

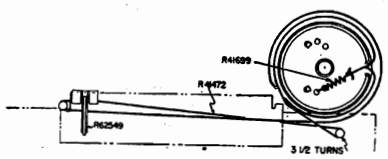
RCA 76ZX12

This receiver is in *Rider's Manual Volume 18, pages RCA 18-51, 18-52.* The following corrections are made in the parts lists. Under the miscellaneous heading

Delete No. 36886 Knob and
Add No. 70414 Knob—control knob ivory for 76ZX12

Sears 6686, Chassis 101.851

This model appears on *page 17-1 of Rider's Volume XVII.* It has been found that the dial cord slips on some of these models. To help correct this condition, it will be necessary to replace the present dial cord with a longer dial cord to change the pointer hookup. The new cord should be cut about 40 inches long and should measure 16¾ inches folded after assembly to the dial string tension spring. See the accompanying diagram for correct hookup.



Dial cord hookup for Sears chassis 101.831

Dial slippage may be due to a tight ganged tuning capacitor. If light lubrication does not correct the condition, the thrust adjusting screw on the rear of the tuning gang may be backed off very slightly and securely locked in the new adjustment. Use great care to avoid excessive loosening as the rotor and stator plates may short. The set may require realignment after this adjustment.

If frequency shift occurs, the following change is recommended to correct the condition:

1. Remove the screw and mica and bend up the leaf of the capacitor shunted across the a-m oscillator trimmer capacitor, C23.
2. Replace this part with a 15-μμf ± 10% ceramic capacitor.
3. Realign the a-m band of the radio receiver.

This change is being incorporated in production and will be effective on all sets shipped after September 30, 1948.

Sears 6230A, Ch. 101.802-1

This model is the same as model 6230, ch. 101.802, which appears on *pages 15-15 through 15-18 of Rider's Volume XV*, except for the following change.

A phono jack has been added to the circuit. This phono jack is connected to the control grid (pin 6) of the 1LB4 output tube. Physically, the jack is located on the top of the chassis in the rear left corner near transformer T3.

Sears Roebuck 6362, 6363, 6364, Chassis 101.581

These models appear on *pages 11-64, 11-80, and 11-82 of Rider's Volume XI.* If frequency shift in the a-m band occurs, the following should be done. Remove the screw and mica and bend up the leaf of the capacitor shunted across the a-m oscillator trimmer capacitor C23. Replace this part with a 15-$\mu\mu$f, 10% ceramic capacitor. Then realign the a-m band as outlined on *page 11-82 of Rider's Volume XI.* This change is being incorporated in the present production of these models.

Sears Roebuck 7054, 8052, 8053

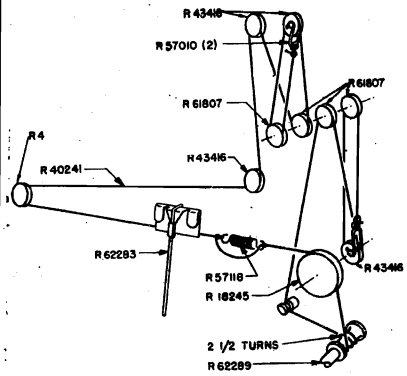
Models 8052 and 8053 are similar to Model 7054, but include the change shown on page 3 of the September issue of *Successful Servicing.* Model 7054 appears on *pages 16-1 through 16-3 of Rider's Volume XVI.* It has been found that some of the failures of the 35Y4 rectifier tube in these models can be prevented by adding a shunt resistor of 270 ohms across pins number 1 and 4 of the 35Y4 tube. This change was not made in production, so it is suggested that it be made in service when this type of failure is encountered.

Sears 7230, Ch. 101.802A

Basically, this model is the same as model 6230, ch. 101.802, which appears on *pages 15-15 through 15-18 of Rider's Volume XV.* However, it differs in the following respects.

A phono jack has been mounted on the top of the chassis in the left rear corner near transformer T3. This jack is connected to the grid (pin 6) of the 1LB4 output tube.

Also, the dial cord and pointer arrangement has been changed to the hookup shown in the accompanying diagram.



Dial cord arrangement for the Sears Model 7230

The battery supply used with this model is Cat. No. 6306 Battery Pack.

Sparks Withington 1005,6,7,8

These models appear in *Rider's Manual Volume XVIII, pages 18-3 through 18-10.* The signal generator frequency in operation 9 in the alignment chart on *page 18-5* should be changed to read 10.7 megacycles.

Sears 7100, Ch. 101.811-1

Model 7100, Ch. 101.811, appears on *pages 16-1, 16-4, 16-5, and 16-8 of Rider's Volume XVI.* A change has been made in the circuit as follows:

A tone-control network consisting of resistor R16 and capacitor C24 has been connected from the plate (pin 2) to the cathode (pin 7) of the 7C6 tube. In order to accommodate this added circuit, some rearrangement has been made in the position of parts on the bottom of the chassis.

Stromberg-Carlson 1204

This 1949 model is similar to the previously manufactured Model 1204, appearing on *pages 18-4 through 18-6 of Rider's Volume XVIII.* The following changes provide complete servicing information:

Remove C-4 and R-5 and ground the cathode of the r-f amplifier (Pin 7).

Remove C-29 and R-20 and ground the cathode of the 1st i-f amplifier (Pin 7).

Remove C-37 and R-22 and ground the cathode of the 2nd i-f amplifier (Pin 7).

Short out L-18 and R-7 in the screen of the r-f amplifier (Pin 6).

Change R-9 from 680 ohms to 2200 ohms with an r-f choke wound on the resistor and connected in parallel with it.

Remove C-30 and short out R-34 in the screen of the 1st i-f amplifier (Pin 6).

Remove C-38 and short out R-24 in the screen of the 2nd i-f amplifier (Pin 6).

Add a 0.1-μf capacitor from Pin 8 to ground and from pin 3 to ground on the 12H6 f-m detector.

Add a 10-megohm, ½-watt resistor from the grid (Pin 7) of the converter to the avc string.

Add a 220,000-ohm, ½-watt resistor from terminal 5 to terminal 7 of 1st i-f transformer.

Disconnect Pin 5 of 2nd i-f transformer from ground and insert a 0.01-μf capacitor from Pin 5 to ground. Connect Pin 5 to the avc string through a 100,000-ohm, ½-watt resistor.

Change the converter, 1st i-f amplifier, and 2nd i-f amplifier B-plus line to feed from the low side of the filter choke.

Stromberg-Carlson 1210, 1408

The information for Model 1210 appears on *pages 17-1 through 17-7 of Rider's Volume XVII.* The 1408 is the same except that it is being manufactured in two cabinet styles, the blonde 1408 M6A (108119) and the mahogany 1408 PLM (10811), both equipped with the VM-800 record changer and the 1210 radio chassis.

Now that the low-frequency f-m band is practically non-existent, these two models can be modified to give greater sensitivity on the high-frequency f-m band at the sacrifice of the low-frequency f-m sensitivity. This is done by changing the built-in f-m dipole on the back of the cabinet. Use the following procedure:

Remove the original dipole attached to the rear of the cabinet.

Cut a piece of 300-ohm transmission line to 57 inches in length. This will be the new dipole.

Short the two parallel leads together at each lend of this transmission line and solder.

At the center of *one* of the wires in the 300-ohm line, break the lead and connect another piece of 300-ohm line long enough to reach from the top of the cabinet to the dipole antenna terminals on the 1210 chassis. Solder the connection.

Attach the 57-inch length of line to the cabinet, dressing it so that it is kept away from the a-m loop and so that the center of the dipole is at the center of the cabinet at the top.

Connect the other end of the lead-in to the f-m antenna terminals of the 1210 chassis.

Stromberg-Carlson 1400, 1400 Special

These models are the same as Model 1200, appearing on *pages 18-1 through 18-3 of Rider's Volume XVIII,* except for the following changes. Omit R-9 (220 ohms) and connect the screen grid of the converter (12BA6, Pin 6) to the screen grid i-f amplifier (12BE6, Pin 6).

Omit C-2 (.05 μf). Omit the dial lamp. Omit R-14 (120 ohms 2 watt) and jumper the former terminals of the resistor to make the heater string continuous.

The difference between these models is that Model 1400 has a dial with the numbers on the curved lens while Model 1400 Special has a dial with numbers on the flat glass plate behind the curved lens.

Teletone 149, 157

These models are the same as model 135 which appears on *page Misc. 16-11 of Rider's Volume XVI.*

United Motors R-705

Add to the material on this model appearing in *Rider's Volume XVII, pages 17-1 through 17-6* (the Electro-Tuner in *Volume XVIII, pages 18-6 and 18-7*), the Service Part #7256226, Fuse Block.

Ignition interference on an R-705 recently installed in a new convertible Studebaker Commander has been suppressed through the following procedure.

To eliminate chassis pickup:

Sand edges of the case and cover the chassis unit and install additional cinch clips to insure a tight cover to case fit. Bond motor to firewall with part #6022 Braid. Bond heater control wire sheath to firewall at entrance point of firewall. Use one-inch braid. Soldering the braid to control wire sheath is not recommended. A mechanical connection is more desirable since there is less danger of soldering the control wire and sheath together.

To eliminate antenna pickup:

Bond antenna base to instrument panel using as short a length of braid as possible. Install a choke coil in antenna circuit. This may be accomplished by wiring choke part #1214382 into the chassis at the antenna connector or using part #555382 adapter. This latter part is available only through the Oldsmobile Lansing Parts Department Stores "A", Lansing, Michigan.

Westinghouse H-124

This model is the same as Model H-125 which appears on *pages 15-8 through 15-10 of Rider's Volume XV*, except that the side panels of the H-124 cabinet are a darker shade of green. The following items have been added to the parts list:

Part No.	Description
V-3461-3	Cover, left hand
V-3459-3	Cover, right hand

Westinghouse H-186, H-187

This model appears on *pages 18-26 through 18-30 of Rider's Volume XVIII.* The 0.1-μf resonant-type capacitor (C33) is not used on late production chassis. This capacitor is shown connected between the B-plus line and ground in the schematic diagram on *page 18-26.*

Westinghouse H-164, H-166, H-166A, H-167

These models appear on *pages 18-12 through 18-19 of Rider's Volume XVIII.* The changes are as follows:

The notes under Figs. 1 and 4 should be revised to read: "All V-2119 chassis have 1st and 2nd i-f transformer adjustments as shown by the dotted line." The dotted-line adjusting points apply to current production chassis as well as to early models. The adjusting points shown in Fig. 3 apply to the V-2119-1 chassis which was also used in the above models.

Early models of the V-2119 chassis used a V-3295 power transformer which required a voltage-dropping resistor (R50) between the rectifier tube and the filter input to provide the correct voltage at the input to the filter. The V-2119-1 chassis and late models of the V-2119 chassis use a different power transformer (stock numbered V-4761) and the voltage-dropping resistor, R50, is no longer required.

Capacitor C76, which is shown connected between the B-plus line and ground in the schematic diagram on page 18-13, is not being used on late production chassis.

The items listed below are incorrectly listed in the replacement parts list. They should be changed to read as follows:

RC30AE332K	Resistor, 3,300 ohms, 1 w. (R31)
V-4886-1	Choke, filament (L2, L3)

Westinghouse H-165

This model appears on *pages 17-12 through 17-14 of Rider's Volume XVII.* The switch for this model was listed as a complete assembly including a wafer section (SW1) and an a-c switch section (SW2). In cases where the a-c switch is defective, but the remainder of the switch is not damaged, repairs can most easily be made by replacing the a-c section only. For this reason, the a-c section of the switch assembly is listed below as an addition to the parts list.

Part No.	Description
V-4803-1	Switch, a-c (SW2) and mounting plate

Westinghouse H-185 and H-195

These models appear on *pages 18-23 through 18-25 of Rider's Volume XVIII.* The changes are as follows:

The value of R3 on the schematic diagram should read 220 ohms instead of 220K ohms as shown.

The 220K resistor, R7, which was previously connected between the common negative line and the chassis, is not being used in late production chassis. Also in later production chassis, the value of R9 was changed from 3,300 ohms to 1,800 ohms.

In later production receivers, an adjustment hole was provided in the right side of the model H-185 cabinet. It is recommended that the r-f trimmer (C6) be adjusted with the chassis in the cabinet and the rear cover closed. The plug that fits this hole is listed below.

The following items should be added to the parts lists:

RC20AE182K	Resistor, 1,800 ohms, ½ w. (R9)
V-1157-4	Cabinet, plastic (H-185 grey)
V-4836-6	Plug, button (H-185 grey cabinet)
V-4836-5	Plug, button (H-185 maroon cabinet)

Westinghouse H-153, H-155, H-156, H-171, H-171A, H-171C, H-184

These models are electrically the same as Model H-122, appearing on *pages 15-5 through 15-7 of Rider's Volume XV.* The cabinets differ from that of Model H-122.

The parts list should be changed to include the following:

Item	Part No.	Description
31	V-3360	Loop, antenna (H-171 Mah., H-171A, H-171C, H-184)
31	V-4364	Loop, antenna (H-153, H-171 Blonde and Limed Oak)
31	V-4373	Loop, antenna (H-156)
35	V-4079	Receptacle (H-153, H-171)
65	V-5405	Socket, molded power (H-171, H-171C)
65	V-3393-1	Socket, receiver, a-c power (H-153)
	V-3412	Background, dial (H-153, H-171, H-171A, H-171C, H-184)
	V-4376	Background, dial (H-156)
	V-4891	Baffle and grill cloth assembly (H-155)
	V-3677	Baffle, cardboard (H-156)
	V-3532	Bar, flat, record changer mounting (H-153, H-171, H-171C)
	V-3489S-1	Bumper (cabinet foot for H-153, H-155, H-156)
	V-6021-1	Bumper, ⅝" dia., self-adhering (H-184)
	V-6021-2	Bumper, ½" x 2", self-adhering (H-184)
	V-5725	Bumper, bottom cover mounting (H-184)
	V-1125-1	Cabinet (radio section — H-153, H-171 Blonde and Limed Oak)
	V-1126	Cabinet (H-155)
	V-1128	Cabinet (H-156)
	V-1158-1	Cabinet, less radio section (H-184)
	V-5056	Catch, bullet (H-171 Blonde and Limed Oak)
	V-5286	Catch, bullet (H-171 Mah., H-171A, H-171C)
	V-3219S-1	Cord, dial drive (spool)
	V-5047	Cover, back (H-171 Blonde and Limed Oak)
	V-5287	Cover, back (H-171 Mahogany)
	V-5734	Cover, bottom (H-184)
	V-3663	Decal, radio-phono (H-155, H-156)
	V-3662	Decal, stations (H-155, H-156)
	V-3660	Decal, tone (H-155, H-156)
	V-3661	Decal, volume (H-155, H-156)
	V-3665	Decal, Westinghouse (H-155, H-156)
	V-3647	Dial (H-155)
	V-4344	Dial (H-156)
	V-7009-1	Door, front (H-171 Limed Oak)
	V-7009-2	Door, front (H-171 Blonde)
	V-7011	Door, front (H-171 Mah., H-171A, H-171C)
	V-3829	Felt Strip, ¼" x 1/16" x 8⅜" (H-153, H-171, H-171A, H-171C, H-184)
	V-4902	Glide, furniture (H-171, H-171A, H-171C)
	V-4228	Grille Cloth (H-156)
	V-3345-5	Grommet, variable capacitor mounting.
	V-4973	Hinge, door (H-171 Blonde and Limed Oak)
	V-5355-1	Hinge, door (H-171 Mah., H-171A, H-171C)
	V-3510	Hinge, lid (H-171 Mah., H-171A, H-171C)
	V-4321	Hinge, lid (H-153, H-171 Blonde and Limed Oak)
	V-5836	Knob, door (H-171A, H-171C)
	V-4362-2	Knob, radio-phono (H-153, H-171 Blonde and Limed Oak.)
	V-4371-2	Knob, radio-phono (H-156)
	V-4361	Knob, tuning and tone (H-153, H-171 Blonde and Limed Oak)
	V-3697-3	Knob, tuning and tone (H-156)
	V-4362-1	Knob, volume (H-153, H-171 Blonde and Limed Oak)
	V-4371-1	Knob, volume (H-156)
	V-3333S-2	Medallion (H-153, H-155, H-171 Blonde and Limed Oak)
	V-3894	Nameplate, Westinghouse (H-153, H-171, H-171A, H-171C)
	V-6024-1	Plate, hinge (H-184)
	V-4365	Pointer, (H-153, H-171 Blonde and Limed Oak)
	V-4384	Pointer (H-156)
	V-3836-1	Pointer assembly, including pointer, mount and slide (H-171 Mah., H-171A, H-171C, H-184)
	V-3836-2	Pointer assembly, including pointer, mount and slide (H-155)
	V-3370	Pointer slide assembly, including pointer mount and pointer slide (H-153, H-171 Blonde and Limed Oak)
	V-3166S	Pulley, 7/16" dia.
	V-4379	Rail assembly, pointer (H-156)
	RC20AE334M	Resistor, 330K ½ w.(part of record changer)
	V-3322	Shaft, tuning
	V-3530	Spacer, felt, 1/16" x ⅜" x 1" (H-171A, H-171C)
	V-4323	Spacer, felt, 1/16" x ⅜" x 1" (H-153, H-171 Blonde and Limed Oak)
	V-5057	Strike, bullet catch (H-171 Blonde and Limed Oak)
	V-5290	Strike, bullet catch (H-171 Mah., H-171A, H-171C)
	V-4324	Support, lid (H-153, H-171 Blonde and Limed Oak)
	V-5291	Support, lid (H-171 Mah., H-171A, H-171C)
	V-3752S	Washer, felt, for small knobs (H-171 Mah., H-171A, H-171C, H-184)
	V-4366	Washer, felt, for small knobs (H-153, H-171 Blonde and Limed Oak)
	V-3668S	Washer, felt, for knobs (H-155)
	V-5277-1	Washer, felt, for knobs (H-156)
	V-5762	Washer, fibre, phono mounting (H-171A, H-184)
	V-3267S-4	Washer, flat, chassis mounting
	V-3215S	Washer, spring
	V-3356	Window, dial (H-153, H-171, H-171A, H-171C, H-184)

Wilcox-Gay 8J10

This model appears on *pages 18-1 and 18-2 of Rider's Volume XVIII.* Several changes have been made in late production receivers. For receivers with serial numbers 14,940 and up, the grid of the 6B36 tube is grounded when the function switch is set in the "RECORD MIKE" position. This helps eliminate high-frequency noise disturbances when recording from the microphone. On receivers with serial numbers 14,939 and below, the yellow wire connected to pin #2 on the 6B36 socket should be moved to pin #7.

The output transformer (81-2106) on all receivers with serial numbers 25,001 and up, has been replaced by a tapped primary transformer (81-2109-1) with a neon limiter lamp (45-2023) connected across the yellow and red primary leads, as shown in Fig. 1.

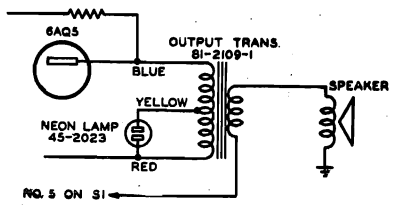


Fig. 1. New output transformer and limiter circuit of the Wilcox-Gay 8J10.

This supersedes the previous limiting circuit using two neon lamps across the secondary leads of the output transformer.

The single neon lamp limits the amount of voltage to the crystal so that the crystal will not be damaged by the application of excessively strong signals.

Several cases have been reported where the coupling capacitor C13 has shorted due to excessive peak voltages. The shorting of this capacitor places the d-c plate voltage directly across the crystal record-playback head, resulting in "burned-out" or cracked crystals.

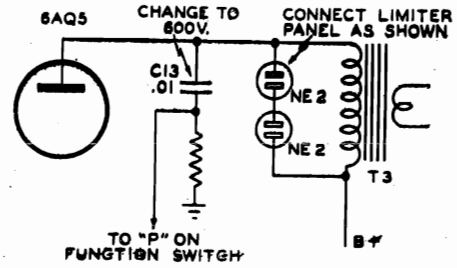

Fig. 2. To eliminate crystal failure, these changes should be made.

To eliminate crystal failure from this source, on all chassis having the double neon bulb limiter panel and the 400-volt coupling capacitor, the capacitor should be changed to one having a 600-volt rating and the dual limiter panel should be connected directly across the primary of the output transformer. See Fig. 2. Every set with the dual limiter that is returned for service should have this change made. Failure of C13 is eliminated on late models by using the tapped-primary transformer described previously.

Wilcox-Gay 6B10, 6B20, 6B30, 6B40, and 6B42

These models are the same as Model 6B10, Late, *on page 15-4 of Rider's Volume XV*, except for the following changes. a 0.00005-μf capacitor (C34) has been connected across R38.

A 6E5 tube has been substituted for the 6U5; the socket connections are the same. A 6SJ7GT tube has been substituted for the 6J7GT formerly used. The socket connections for the 6SJ7GT are:

1 No connection	5 Cathode
2 Heater	6 Screen Grid
3 Suppressor Grid	7 Heater
4 Grid	8 Plate

Tie points are utilized for voltage measurements, see the accompanying voltage chart.

Zenith S 13200

This model is the same as Model S-11468 on *RCD. CH. Pages 15-1 through 15-8 of Rider's Volume XV*, except that the Model S 13200 has a Cobra tone arm and a muting switch.

Zenith 6R886, Chassis 6E02

This model appears on *pages 17-16 and 17-17 of Rider's Volume XVII*. In some cases when microphonics are encountered, replacing the 6C4 tube mounted at the top of the chassis alleviates this condition. The 6C4 tube is easily accessible after the screen in the record changer compartment is removed.

Zenith 7R887, Chassis 7E22

This model appears on *pages 18-33,34 through 18-36 of Rider's Volume XVIII*. When replacing defective or burned out tubes in this receiver, care must be taken that the 6SK7 i-f amplifier tube be replaced only with another 6SK7. Use of a 6SK7GT or G tube will result in extreme oscillation which can be controlled only by the use of the 6SK7 metal tube.

TYPICAL VOLTAGE CHART

TUBE	VOLTAGE TO GROUND PIN NO.							
	1	2	3	4	5	6	7	8
6A8	0	13	240	80	-10	156	13	2.6

FARNSWORTH TELEV. & RADIO CORP. MODEL P71, Capehart

SETTING UP CHANGER FOR OPERATION

Section 2

UNPACKING

Before operating the record changer, the following procedure should be followed:

Remove all packing material and pieces of tape from changer compartment.

Remove locking screw from back side of changer compartment.

Remove the cardboard spacers between turntable and cabinet shelf.

Remove shipping bolts from floating panel.

See that changer and mounting panel float upon the spring mountings.

See that gears and cam tracks are lubricated (can be checked by observation while in cabinet).

See that levers have not been displaced during transit.

Check needle and pickup for damage.

Run changer by hand through cycle to discover any binding.

See that the changer is level.

CHECKING THE CHANGER

Check the needle landing with full stack of records, intermixed. This is done by loading the spindle shelf with 10 records, both 10″ and 12″ and pressing the control button to reject a record and put the changer into operation. The stabilizer arms must be moved into the recess in the spindle to prevent interference in loading the records. Allow the first record to play through and trip, observing the needle landing on several 10″ and 12″ records, then trip records up to and including nine. Allow the ninth record to play through and feed number ten automatically, observe needle landing, automatic trip and automatic shut-off.

Check electrical operation by turning radio program switch to phono position and playing a record. The noise eliminator should be checked in each position by listening to reproduction. As a rule, old worn records should be played while the switch is in the No. 1 position. Position 2 is for normal records, while No. 3 gives wide-range reproduction from the new high-fidelity recordings.

DEFECTIVE RECORDS

This record changer is adjusted to operate with standard records. Records that are undersized, too thick, or with deformed center holes, cannot be expected to operate properly on this or any other changer. Trip grooves that are not standard may result in erratic tripping. Records should be examined for faults before making adjustments to the changer.

DESCRIPTION AND OPERATION OF THE CHANGER

Section 3

RECORD LOADING

The record spindle shelf is to be loaded to a maximum of 12 ten inch, 10 twelve inch, or to the red line on the spindle with both sizes, intermixed. The stabilizer arms must be moved into the recess of the spindle to prevent interference in loading the records.

The tone arm set-down is always in 10″ position unless a 12″ record has just been dropped from the spindle shelf. In dropping to the turntable, the 12″ record strikes the intercepter lever #58698, contacting the tone arm swing lever #58698, imparting movement to the tone arm lift lever #58694 and causing the tone arm to be set down to 12″ position.

RECORD CHANGING

After the changer is loaded with records, the control button is pressed to start the record change cycle. Rotation of the main cam will actuate the compression lever causing the compression rod to depress the inner-spindle assembly. The four-prong spring support (spindle shelf) has receded into the outer spindle and the rubber sleeve on the spindle, being compressed, has expanded, and therefore holds all but the bottom record which descends to the turntable. Then the tone arm return lever moves the tone arm into position to be lowered to the record by following the cam track. The tone arm moves across the record until the selection is finished and the trip mechanism functions. Finally, the tone arm is lifted and carried over the record until clear of the record stack and the next record is released, completing one change cycle. In this manner all the records in the stack are played.

AUTOMATIC STOP

The weight of the records on the spindle allows the record lift lever to follow the contour of the main cam. When the last selection is played, a spring lifts the record lift lever into position to move the automatic stop pawl inward. The main cam carries the stop pawl into engagement with the switch lever, thus stopping the changer.

MODEL P71, FARNSWORTH TELEV. & RADIO CORP.
Capehart

SPRING MOUNTING

The changer is solidly mounted on a panel which is floated upon spring mountings. These spring mountings eliminate rumble or feedback and insulate the changer from any cabinet vibration occasioned by the sound waves emanating from the speaker. This vibration, if transmitted through the tone arm to the pickup, would be amplified in the audio system of the radio and passed into the speaker again. The spring mountings also cushion the changer from sudden jars or shocks.

To remove the changer from the cabinet, remove four acorn nuts located on the corners of the mounting panel and lift panel out of cabinet. In some cases it is necessary to remove the cabinet drawer before removing the mounting panel.

On the underside of changer loosen screw next to spindle (paragraph B, section 7), and turn lock so that turntable may be removed from changer. Remove three screws and lift changer out of mounting panel.

CYCLE OF OPERATION

Section 4

STUDYING THE CYCLE

The record change cycle consists of the sequence of motions required to move the pickup into position on a record, play the record, remove the pickup and place a record into position. Since movements of various parts are being performed simultaneously, it is impossible to follow all of the actions at one time. A suggested method is to select one certain cycle of operation. For example the raising of the tone arm, moving it over the record and the replacement on the record may be studied while running the changer slowly by hand. After the motions associated with the tone arm are understood, another portion of the changer may be observed.

TRIP ASSEMBLY

Motion of the tone arm is transmitted through the tone arm crank to the tone arm lever and pin assembly #15194 which is secured to the tone arm support tube with lever #58695. When the needle enters the trip grooves of a record, the increased velocity of movement impels the tone arm lever against the starting reset lever #58853. The starting reset lever then engages the starting pawl on the turntable hub.

THE CHANGE CYCLE

The turntable is driven through an idler pulley by the electric motor, the turntable being free on the spindle. A gear on the turntable hub meshes with the main cam gear. Several teeth are left off the main cam to stop it in playing position. After a selection has been played, the trip mechanism moves the starting reset lever, which is part of the main cam assembly #13672, forward at the right speed and correct distance to permit it to mesh properly with the starting pawl on the turntable hub. As the main cam rotates, the tone arm lift lever #58694 lifts the tone arm upward and the tone arm return lever moves the tone arm over the record. The compression lever #57240 will actuate the compression rod #55424, which will in turn depress the inner-spindle assembly #11379. During this cycle the rubber sleeve #62152 has expanded and is holding all but the bottom record. At the same time the spindle shelf recedes into the outer spindle #55334, dropping the bottom record to the turntable. By following the cam track the tone arm return lever moves the tone arm into position to lower the pickup needle to the starting groove in the record. The main cam is now in playing position, disengaged from the turntable hub gear. One change cycle has been completed.

PICTORIAL REPRESENTATION

The following series of photographs, with a corresponding brief explanation of each phase, are inserted to illustrate the movements of pertinent parts of the changer during a change of record cycle.

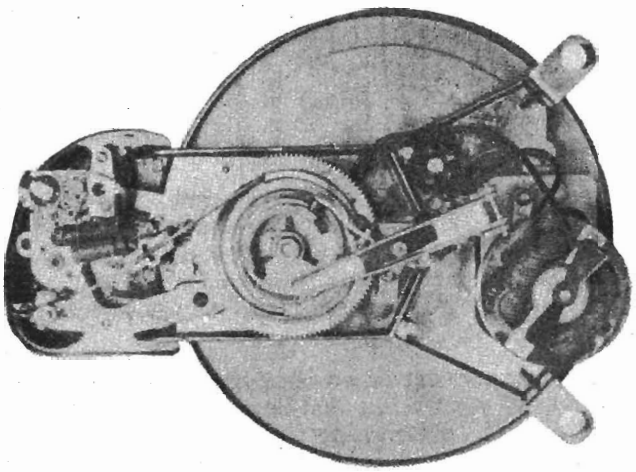

FIGURE A

The main cam is driven through the gear on the turntable hub. When a change cycle is completed, the main cam disengages from the turntable gear because several teeth are left off the main cam gear. The tone arm is in position on the record and free to follow the playing groove. This phase of cycle is called the playing position.

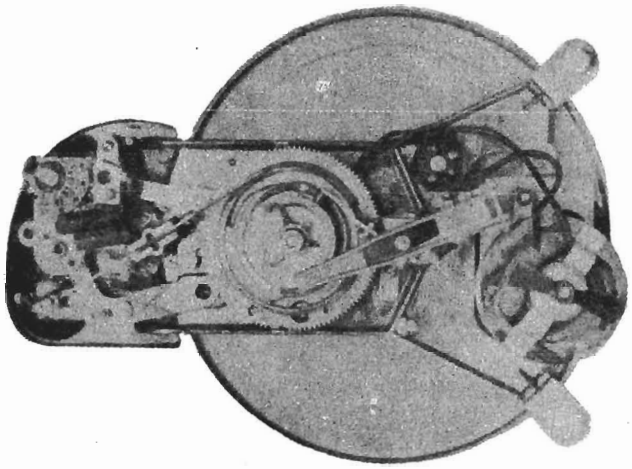

FIGURE B

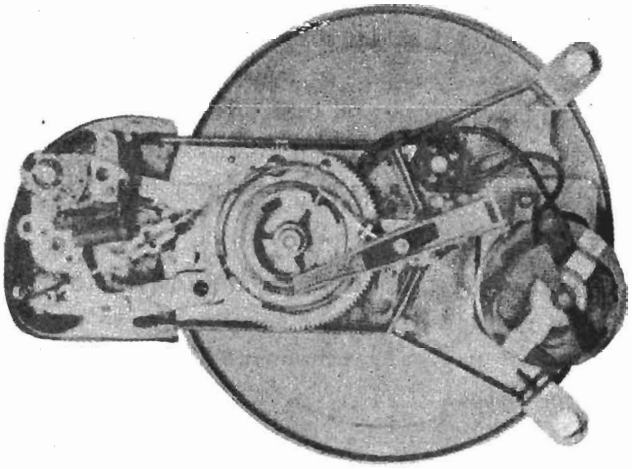

FIGURE C

The change cycle has just begun. The tone arm lift lever has raised the tone arm from the record and the tone arm return lever has started to move the tone arm away from the turntable. The compression lever assembly has started to pull the compression rod, thus beginning to recede the spindle shelf into the outer spindle and expanding the rubber sleeve on the spindle.

The tone arm has moved outward, clear of the turntable, and the spindle shelf has fully receded into the outer spindle, dropping the bottom record to the turntable. The rest of the record stack is held by the expanded rubber sleeve. The spindle shelf has started to return to its former position.

CHANGER LUBRICATION

Section 5

The record changer should be lubricated and cleaned periodically or when a major part or assembly is replaced. Dirt, old oil, or grease may be removed with carbon tetrachloride or other similar cleaning fluid.

Use only a good grade of electric motor oil.

Care should be exercised to prevent an excess of oil being used on any part and that no oil gets on the velocity trip assembly, motor pulley, idler pulley or turntable rim. There is a self-lubricating type bearing in the turntable with an oil reservoir which may be filled through the four holes in the turntable hub.

Once a year a thin coat of light grease of the vaseline type may be applied to all surfaces of the main cam that contact lift levers and record lift lever roller. Also grease all working parts on the main cam and oil other moving parts (see figures D & E) except those that rely upon friction, i.e., contact surfaces being dry.

PRECAUTIONS

With mechanical devices, much information pertinent to lubrication can be obtained by observation. Obviously, it will be seen that certain parts of rotating or sliding machinery must be lubricated,

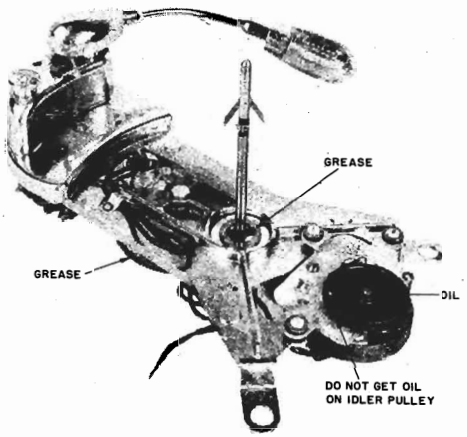

FIGURE D

MODEL P71, FARNSWORTH TELEV. & RADIO CORP.
Capehart

but that other parts depend upon contact surfaces being dry and free from foreign substances, such as grease, so that proper friction exists. Where lubrication is indicated, it should be applied judiciously, avoiding any excess lubricant that may be transferred or thrown to some part designed for dry operation.

Inspect parts not requiring lubrication to make certain they are clean. Always be sure to use the type of oil or grease recommended for lubricating specified items.

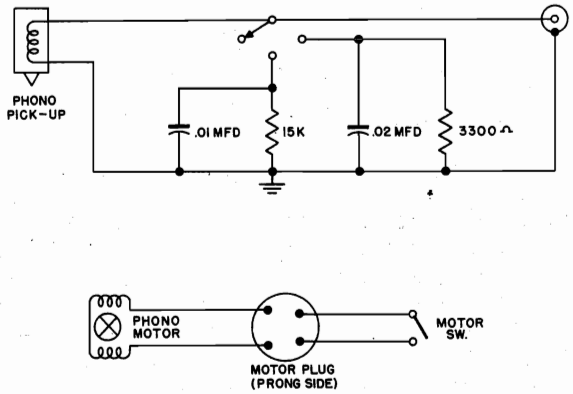

FIGURE 9—Circuit Diagrams

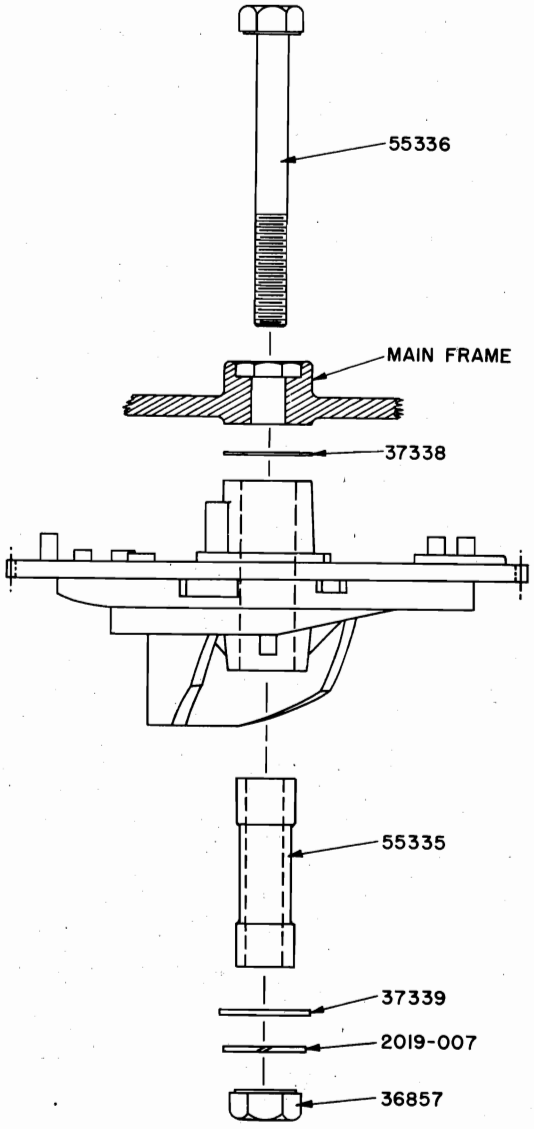

FIGURE 10—Cam Mounting Assembly

PARTS REPLACEMENT

Section 7

A. REASSEMBLING PARTS

When repairs are being made, a careful check should be made of all moving parts in order to make sure that no binding occurs. Check all moving parts for binding before springs are connected.

All levers which operate on shoulder studs should be assembled with the burred side of the retaining washer away from the lever to prevent the washer from binding on the lever.

B. TO REMOVE AND REPLACE TURNTABLE

Remove the changer from the cabinet, and from the bottom side of the main frame (near the spindle) loosen the screw which holds the turntable down, so that it is clear of the pinion gear. The turntable may then be raised from the top side of the changer. Care must be taken not to damage the cork washers next to the bearing.

MODEL P71, FARNSWORTH TELEV. & RADIO CORP.
Capehart

When replacing the turntable, see that the cork washer 60597, then the bearing race 58716, bearing retainer 13816, and another bearing race and cork washer are installed in this sequence (see Figure 1). Align these parts with the center spindle. When pushing the turntable over the spring assembly, push firmly but cautiously, avoiding too much pressure which may damage the springs. When the turntable is in place, move hold-down into groove in turntable hub and tighten screw.

C. TO REMOVE IDLER PULLEY

After the turntable has been removed, the idler pulley can be removed by slipping off the small hairpin cotter on the end of the idler pulley shaft.

When replacing the pulley a single drop of oil should be used on the pulley shaft.

CAUTION:

Do not allow oil to get on either the idler pulley or the turntable rim.

D. TO REMOVE AND REPLACE SPINDLE ASSEMBLY

Remove nuts from bottom of compression rod. Lift compression lever 57240 out of position. Remove E washers and record lift bracket 58700. Pull spindle assembly out from top side. Do not attempt to repair assemblies but replace with new parts. To reassemble, push assembly inside of outer spindle from the top. Put record lift bracket in place and install E washers. Swing compression lever into position and install flat spring 58789, nuts 37344 and 2015-002 and No. 3 lockwasher. Tighten nuts on compression lever until rubber sleeve on spindle reaches .330" to .337" diameter when fully compressed. Use Glyptal to secure lock nuts.

E. TO REMOVE AND INSTALL MAIN CAM ASSEMBLY (Fig. 1)

Remove turntable (paragraph B). Remove nuts from bottom of spindle and turn compression lever back to clear cam. Disconnect spring from tone arm lift lever 58694. Remove nut 36857 from under side of cam and withdraw bolt 55336 from top side of changer. Slide cam out carefully so as not to bend any levers on baseplate side. Adjust screw 55397 so that tension on starting reset lever 58853 is 6 to 8 grams. Use Glyptal on bottom side of screw. To reinstall the cam replace cam shim 37338, slide bolt through from top side of changer and slide cam into place being sure that spacing shim 37338 is not lost. Cam should have insert spacer 55335. Use flat washer 37339, lockwasher 2019-007 and hex nut 36857. Reinstall tone arm lift lever 58694 and attach spring 64431. Swing compression lever into place and install flat spring, two nuts and lockwasher. Secure these nuts with Glyptal after spindle assembly has been adjusted. Reassemble turntable (paragraph B.)

F. TO REMOVE AND INSTALL TONE SWITCH & BRACKET ASS'Y 13825

Disconnect pickup lead wires from socket 80030. Remove two screws which hold bracket to baseplate. Lift bracket from assembly.

To reinstall, insert tone switch coupling 64464 between rejects plunger 55420 and switch 90243. Replace screws 2000-157 and lock washers 2019-004. Resolder pickup wires to socket; the black wire should be connected to the center terminal.

G. TO REMOVE AND REPLACE TONE KNOB & PLUNGER ASSEMBLY 09353

Remove Tone Switch and bracket assembly 13825 (paragraph F). Lift plunger assembly out from top side. Unscrew reject knob 59486 while holding shaft 55420 rigid. Remove spring 64474 and knob 57262 by lifting over top of shaft. To reassemble, place knob 57262 on shaft. Drop spring into knob and screw reject knob onto shaft. Push assembly in from top side of changer so that pointer is on markings on baseplate. Reinstall tone switch and bracket assembly (paragraph F).

H. SHIPPING CHANGER

The changer is solidly mounted on a mounting board. The mounting board is mounted upon free-floating springs.

When shipping the changer, a hold-down bolt should always be used on each side of the changer mounting board to hold the changer securely in the cabinet. A cardboard spacer ⅛" thick should be placed adjacent to the shipping bolts between the mounting board and the cabinet. The tone arm may be held securely to the outer edge of the turntable by arranging a cardboard strip to fit over the spindle and hold the tone arm down.

I. INSERTING PHONO PLUG

The phono input plug must be inserted into the phono socket as far as possible to avoid "grid hum". If hum presists, check ground connection of socket.

OPERATIONAL ADJUSTMENTS

Section 8

J. TONE ARM HEIGHT ADJUSTMENT

Load a 10" record on the spindle and turn the turntable by hand through cycle until the tone arm is at its highest point. From bottom side of changer, loosen hex nut 2015-007 and adjust screw 37511 to tone arm height desired. Tighten locknut on lift lever.

To remove lift lever 58694, release spring 54431 and withdraw lever from slot. To reinstall, insert pin 55325 in lift lever. Insert lift lever in slot and connect spring.

FARNSWORTH TELEV. & RADIO CORP. MODEL P71, Capehart

K. NEEDLE LANDING ADJUSTMENT

Place a 10" record on spindle and press reject button. Changer should continue in cycle until coming into playing position. Observe whether or not the needle lands in starting groove (about 3/32" from outside edge of record). If needle lands too close to outer edge of record, turn top tone arm adjusting screw 55328 with coin in direction indicated on baseplate. If needle landing was too far from outer edge of record, turn adjusting screw in opposite direction. Hold top of spindle down and press reject button to check needle landing.

12" needle landing will usually not require adjustment. If required, it should be made only after 10" adjustment has been corrected. For erratic needle landing, check the wire leads to see that they do not bind or interfer with the tone arm.

L. VELOCITY TRIP ADJUSTMENT

Break the seal on the adjustment screw 55397 which is located in hole in bottom of cam near spindle. Turn to the left to tighten until the tone arm will trip on the record. To check adjustment lever 58706 on cam should contact both lugs on turntable hub when tone arm is in last playing grooves of record before tripping. Seal screw thread with Glyptal to prevent screw from coming out of adjustment.

M. RECORD FEED

1. DOES NOT DROP RECORDS
   a. See that stabilizer arms are not down under the record stack.
   b. Check vertical clearance in spindle. Should be approx. 1/64".
   c. Check the records to see that the label is not extended into the center hole.
2. DROPS MORE THAN ONE RECORD
   a. Check center hole of record for being chipped or oversized. (This changer will not chip or break records).
   b. If 12" record hangs on interceptor lever 58698, check slot in changer head for burrs. This lever should move freely with a slight drag on the side of the slot.
3. CHANGER DOES NOT START
   a. If changer does not start immediately, press reject button a second time.

N. REPRODUCTION

1. No response.
   a. Audio system. Check with radio reception.
   b. Pickup leads shorted.
   c. Pickup cartridge dead. Try new cartridge.
2. Distorted tone.
   a. Worn needle.
   b. "WOWS" or variance in speed.
      (1) Oil on idler pulley and turntable rim.
   c. Warped records.
   d. Defective pickup cartridge.
      1. Use of badly chipped records or records with breaks.
      2. Dropping tone arm on record.
3. Thumping noise.
   a. Groove in idler pulley worn by motor drive pulley. Result of idler pulley being held stationary with motor running.
      1. Sand idler pulley smooth or replace pulley.
4. "Grid Hum".
   a. Insert phono input plug into phono socket as far as possible.
   b. Check electrical ground connection of phono socket.
5. Mechanical Hum.
   Check alignment of turntable motor armature.
   b. Check if phono plug and line cord are in their respective sockets.
   c. If further trouble, turn turntable several revolutions to be sure that changer was not shut off during cycle. Press reject button to start.

4. CHANGER SHUT-OFF

Changer should shut off after last record is played. Spindle should have approx. 3/32" vertical motion when no records are on spindle. One 10" record should be sufficient weight to depress spindle so that changer will not shut off. If changer does not shut off or if it shuts off before last record is played, see that spindle is not sticking. It should have a free vertical motion. Also check stop pawl for binding.

PARTS

Part No.	Description	Part No.	Description

37341	#8-32 x 7/8" Hex Head Bolt (for tone arm crank assy.)
37343	#3 x 5/16" o.d. flat washer (on bottom of record spindle)
37344	#3-48 Special Hex Nut (Spindle Height Adj. nut)
37390	"E" Washer (small) for record spindle
37421	"E" Washer (to mount idler pulley, idler pulley Brkt. and Ventilator Fan)
37511	#10-32 x 5/8" H.H.M.S. (on tone arm lift lever)
37512	"E" Washer (large) for record spindle
37646	Mounting Bolt (for mtg. changer to mtg. board) (two required)
54308	Thrust Washer for Idler Pulley and Idler pulley Brkt.
54309	Thrust Washer for Motor Ventilator Fan
55325	Lift Lever Pin
55328	Tone Arm Set Down Adjustment Stud
55329	Pin For Tone Arm Interceptor Lever
55332	Pin For Compression Lever
55333	Pin For Record Lift Lever
55334	Outer Spindle
55335	Cam Spacer (inside Main Cam Hub)
55336	Mounting Bolt for Main Cam
55337	Motor Mtg. Spacer
55339	Tone Arm Hinge Pin
55341	Tone Arm Lift Rod
55345	Sleeve Support Washer For Record Spindle
55395	Hinge Pin for Reject Link
55396	Mounting Pin For Starting Lever
55397	Trip Adjustment Screw
55416	Mounting Bolt (One required to mount changer to mounting board)
55420	Manual Reject Plunger Rod
57248	Main Cam Switch
57254	Tone arm end housing
58863	Retainer Spring for Pickup
58692	Interceptor Reset Lever
58693	Switch & Reject Lever
58694	Tone Arm Lift Lever
58697	Tone arm adjustment lever
58698	Tone Arm Interceptor lever
58701	Turntable Hold Down Brkt.
58702	Bearing Support Washer (Under Turntable Bearing)
58706	Starting Lever
58707	Reject lever (on main cam)
58708	Tone Arm Hold Out Lever
58709	Hold Out Locking Lever
58716	Bearing Race Washer (for turntable)
58789	Compression Spring
58851	Tone Switch Bracket
58852	Manual Reject Link
58853	Starting Reset Lever
58854	Starting Lever Spring
58862	Tone Arm Tube Only (Chrome)
58971	Ventilator Fan for phono motor
59486	Reject Button for P-71
60597	Cork Washer for Turntable Bearing (for turntable)
62152	Rubber Sleeve for Record Spindle
62173	Rubber Motor Mtg. Grommets
64429	Reset Spring
64430	Reject Spring
64431	Lift Lever Spring
64433	Spring For Tone Arm Adjusjtmnet
64434	Spring For Tone Arm Interceptor Lever
64437	Tone Arm Counterbalance Spring
64452	Cam switch spring
64464	Switch Release Spring
64465	Tone Switch Coupling Link
64466	Spring For Tone Arm Hold Out Lever
64467	Trip Spring
64471	Spring For Idler Pulley
64474	Spring For Reject Button
64476	Lead-in Spring
71238	Magnetic Pickup (Less Housing)
77240	3300 ohm ½ watt resistor
77426	15K ohm ½ watt resistor
80030	Phono Output Jack
80150	4 Prong Motor Plug (male)
80327	2 Prong Molded Pickup Socket
90243	Tone Selector Switch
92256	Felt Washer For Turntable Bearing
92335	Felt Washer For Motor Ventilator Fan
2003-155	#6-32 x ¼" F H.M.S. (to mount tone arm adjusting lever)
2006-011	#2-56 x 7/16 Fil. H.M.S. (to mount cam switch)
2015-001	#2-56 Std. Hex nut (to mount cam switch)
2015-002	#3-48 Std. Hex nut (lock nut for spindle height adj.)
2015-007	#10-32 Std. Hex Nut
2017-004	#8 i.d. x 3/8" o.d. flat washer (for tone arm crank assy.)
2019-007	¼" S.P. Int. Lockwasher (to mount main cam)
2085-205	#6-32 x ¼" Truss H.M.S. (for mtg. reject lever)
2085-215	Motor Mtg. Bolt #6-32 x 5/8"

SPECIFICATIONS

Power Consumption at 117 volts .....18 watts Type of Pickup.....Variable Reluctance

Voltage Rating .....105 to 125 volts at 60 cycles Type of Needle .....Permanent Osmium Point

MOUNTING HARDWARE FOR P-71 RECORD CHANGER

09271	Mtg. spring assy. for 21P-4, 24P-4, 26P-4, 29P-4 and 30P-4
09362	Mtg. spring assy. (used on late 31P-4 and all other not previously listed)
09365	Mtg. spring assy. (used on early 31P-4)
37066	Acorn palnut (four required)
37646	Mounting bolt (for mtg. changer to mtg. board) two required
55416	Mounting bolt (for mtg. changer to mtg. board) one required

FARNSWORTH TELEV. & RADIO CORP. MODEL 16-E, Capehart

ELECTRICAL CIRCUIT

Most service men working on Capehart instruments have had considerable experience with radio and phono radio combinations and can handle both. However, some service men have asked for an explanation of the electrical-mechanical trip system of the 16-E, so a schematic diagram of the changer circuit as used on the 400M is given on page 5.

In the 400M series when the Phono Button on the tuner is pushed, the "Off-On" Relay is actuated as is the "Selector Motor" Relay. These relays are located in the tuner. The "Off-On" Relay holds itself closed until the "Off" button is pushed, this operates the "locking" Relay which opens the "Off-On" Relay Coil Circuit. In the 100 series, the "Off-On" Switch is mechanically operated and is ganged with the volume control shaft.

In the 400M the "Off-On" Relay is used to turn on the power for the entire instrument; except for the 18V transformer in the tuner chassis, which is always connected to the 117 Volt line, so the relays can be operated at will. One set of the "Off-On" relay contacts is used to keep its coil energized until the "Off" button is pressed, at which time the holding circuit is opened and the relay restored to normal. Another set of contacts is used for the 6.3 Volts for the heaters and pilot lights in the tuner. Another set of contacts completes the 117 volt supply for the Amplifiers, Phono Motor (if phono is selected) and the "Reject" Relay (located in the Junction Box). In the 100 series instruments, the AC phono switch is ganged with the program switch. When the program switch is turned to phono position, 117 VAC is supplied to the phono motor and reject relay (located in cabinet junction box). Due to the fact that the contacts of this Relay are closed until the coil is energized, the 117 volts are applied to the clutch Solenoid in the Record Changer. This causes the Record Changer to go through its cycle, unless the Automatic Switch is in "Off" position, before playing a record, thus the tubes are given time to reach operating temperature.

In the 400M models, the "Selector Motor" relay controls the Phono-Radio indicator lights as well as the Dial Scale lights, the "Phono" Relay (in the Junction Box), the Selector Motor and "Mutes" the signal when the program service is changed by a push button.

In the Record Changer the Clutch Solenoid is energized by the Phono Button (the program switch phono position on all 100 K. & M. series), the Reject Button, or the Automatic Trip Switch.

When the Reject Button is pressed, the Clutch Solenoid is energized by the "Remote Reject" Relay (in the Junction Box).

When the needle enters the trip or change groove in the record, the motion of the Tone Arm actuates the Automatic Trip Switch which energizes the Clutch Solenoid.

Whenever the Clutch Solenoid is energized, the changer goes into cycle. As soon as the cycle is started, the solenoid circuit is opened by breaking the top and center contacts of the motor solenoid switch. If the instrument is turned off during the cycle the changer continues to complete the cycle due to the center and bottom contacts of the Motor Solenoid switch by passing the motor switch contacts of the Phono Relay and Off-On Relay.

The Automatic Trip Switch, located under the Turntable, is actuated by the movement of the Stop Trip Lever being transferred by the Tone Arm. On the underside of the turntable there is a fibre pin which moves the Stop Trip Lever back. During each revolution of the turntable, the fibre pin hits the lever, thus resetting the stop trip lever until the needle enters the change groove; this causes the Clutch Solenoid to be energized by closing the Automatic Trip Switch. The automatic "Off-On" switch is used to open the Clutch Solenoid circuit, in the eveni it is desirable to use the instrument manually.

MECHANICAL OPERATION

The best approach to a knowledge of the 16-E changer is to accept it on the basis that it is really "Four Changers in One". A study of each of the four fundamentals will enable a quick analysis of trouble.

The first operation, (Manual), is accomplished by placing the Automatic Switch in the "Off" position, thus opening the Clutch Solenoid circuit so the changer mechanism is not connected to the Drive Shaft at the end of a record.

The second operation, (Repeat), is accomplished by throwing the Automatic Switch to "On" position and the Selector Lever to the "Repeat" Position. Then, at the completion of a record, the Automatic Trip Switch actuates the Clutch Solenoid, thus connecting the changer mechanism to the motor. The steps that follow are:

1. Pickup Arm is elevated.
2. Pickup Arm is swung clear of the Record Tray.
3. The Record Magazine tilts but does not discharge a record.
4. The Record Magazine starts to return, as does the Pickup Arm.
5. While the Record Magazine is completing its return the Pickup Arm engages the Stop Arm, the needle is lowered to the record, and the cycle is complete.
6. No record is released from the record magazine during the repeat cycle since the record release lever has been pulled away from the Main Cam by the Selector Lever.

During the change cycle the Pickup is short-circuited by a muting switch.

The third operation, (Play one side).

1. Pickup Arm is elevated.
2. Pickup Arm swings clear of Record Tray.
3. Record Tray lifts to deliver record to Magazine.
4. As record in Record Tray strikes Record Support Pins, another record is discharged from the Magazine.
5. After record is expelled from the Magazine, the Record Tray returns part way and pauses.
6. Magazine tilts, and waits to deliver record to Record Tray, which starts down again.
7. Record Tray again pauses to allow record to settle over Spindle.
8. Magazine returns to normal position as does Record Tray.
9. Pickup Arm swings in and engages Stop Arm. This positions pickup over record and then needle is lowered to record.

The fourth operation, (Play both sides).

1. Pickup Arm is elevated and swings clear of the Record Tray.
2. The Record Reverse Arm and Guide swing around in front of the magazine.
3. The Record Tray places the record against the Reversing Arm and starts back to normal position, pausing midway.
4. The Magazine tilts to slide the reversed record onto the Record Tray, pauses in its return until the record touches the front of the Tray, and then returns to normal position.
5. The record settles over the spindle.
6. The Tray returns to normal position.
7. Pickup Arm swings against Stop Arm.
8. Needle is lowered on record.

STEP BY STEP DESCRIPTION

REPEAT CYCLE. At the completion of the record the needle enters the change groove, swinging the Pickup Arm, thus closing the Automatic Trip Switch, and energizing the Clutch Solenoid. Energizing of the Clutch Solenoid engages the two clutch sections, starting the change cycle. At the time the Clutch sections are engaged, the Clutch Solenoid Circuit is opened by breaking top and center contacts of the motor solenoid switch. Cycle is completed even though main switch is turned off since the center and bottom contacts of the Motor Solenoid Switch by-passes the motor contacts of the phono-motor relay and main on-off Relay causing the motor to run until cycle is completed.

The Pickup elevation is accomplished by the Pickup Lift Cam raising the Pickup Lift Shaft. As soon as the Pickup is fully elevated, the Pickup Arm is swung clear of the record by the Pickup Swing Cam rotating the Pickup Arm Swing Lever. Due to the fact that the mechanism is in cycle, the Magazine is tilted by the Main Cam operating the Magazine Slide Arm. Just after the Magazine starts to return to the normal position, the Pickup Arm starts to lower and swing into playing position. When moving in, the Pickup Arm Lever Hook engages with the Pickup Arm Stop Lever. With 12" records the Rubber Roller at the end of the Stop Lever touches the edge of the record and stops the inward motion of the Pickup Arm. On 10 inch records this is done by an adjustable machine screw striking a stop which is a part of the baseplate casting. The Pickup Arm is swung against the Stop Lever by the Pickup Arm Friction Cam. The Pickup Arm Stop Lever swings back out of the way after the needle has touched the record, but before the full weight of the pickup is on the needle.

ONE SIDE CYCLE

To play one side of the record, the Selector Lever is moved to the One Side position (middle). This engages the Clutch to allow the Record Tray to be lifted by the Main Cam through the Record Tray Cam Follower. When this Clutch en-

gages, the Record Separator Hook Arm and Roller Assembly swings over the periphery of the Main Cam.

After playing the record, the needle enters the change groove, thereby closing the Automatic Trip Switch and energizes the Clutch Solenoid. This action engages the Driving Clutch, and the change cycle starts with the Pickup Arm being elevated and swung clear of the Record Tray, which lifts the record off the Turntable and delivers it to the Magazine. Just before the tray with the record reaches the point where the record touches the sloping face of the Record Support Pins, a record is ejected from the Magazine by the Record Separator. When the changer is in cycle, the Main Cam revolves; on its periphery is a raised portion that lifts the Record Separator Hook Arm and Roller Assembly, drawing the Record Separator Hook down, thereby raising the Record Separator and three records. One record is lifted to the shoulder of the Lower Record Support Assembly and the Hook which is part of the Record Separator, and located on the center line of the Lower Record Support Assembly, engages the two bottom records of the stack and lifts them slightly. This assists in the discharge of the record from the Magazine by forcing the second and third record back against the first record, thereby helping to push it off the separator knife into the record well. The record drops to the Rubber Bumpers in the well while the Record Tray is delivering a record to the Magazine. The tray starts downward and its curved tailpiece lifts the record as the Magazine starts to tilt. The Record Tray pauses midway on its downward trip until the Magazine moves to the highest horizontal point, thus allowing the record to slide out; the Magazine then remains stationary until the record slides against the front of the Record Tray which has resumed its downward movement, only pausing to allow the Magazine to lower the center hole of the record over the Spindle. The Record Tray returns to normal position as does the Magazine, the Pickup Arm swings in and is lowered, as in the repeat cycle, and the Clutch is disengaged by the Clutch Throwout Cam striking the Clutch Throwout Lever.

BOTH SIDES CYCLE

To play Both Sides, the Record Reverse Cam Shaft Lever moves the Record Reverse Cam so that it engages with the Record Reverse Cam Pin in the Reverse Cam Shaft. In the other positions, the Reverse Cam floats on the Cam Shaft and does not rotate with the Shaft. The Record Reverse Arm and Roller rides over the face of the reverse cam and operates the reverse arm assembly thru an adjustable drive rod.

After the Pickup is elevated, the Record Reverse Arm and Guide Assembly swings around in front of the Magazine. When it gets to the reversing position and the Tone Arm is clear of the Record Tray, the Tray raises. As the Tray raises, the record slides back against the Rear Rubber Bumpers, and the Tray compresses the spring arms of the Record Reversing Guide. The record hits the slanting face of the Support Pins while the Tray continues up, and the record slides up these faces to the top surface of the Support Pins. When the Record Tray starts to return, the spring tension of the Record Guide pushes the bottom edge of the record off the support pins and as the record Tray pauses midway to the normal or playing position, the Magazine tilts, causing the record to slide down the Record Guide. The Magazine reaches its furthest excursion and returns part way, where it pauses, and the Record Tray continues downward to nearly the normal position. About the time the record hits the front of the Tray, the Magazine returns to the normal position after the record has dropped over the Spindle. The Record Tray then returns to normal, and the Pickup Arm is returned as in the repeat and one side conditions.

If one carefully watches the Magazine in the Both Sides Position, it will be noted the travel of the Magazine is shorter in the "Reversing" cycle than in the change cycle. On the side of the Main Cam, away from the rear of the instrument, there are two cam tracks. On the Magazine Slide Arm there are two rollers on a rocker arm, and when the Repeat, Play One Side and the change cycle of play Both Sides are in use, the outer cam track is engaged. On one side of the Record Reverse Cam is a pin which shifts the arm and moves the rocker so the inner cam track is used to change the Magazine travel. On the arm is another pin, which is struck by the Magazine Slide Arm Cam, changing the roller in use, also the cam track. Due to the fact that the Reverse Cam Shaft runs half as fast as the Main Shaft, the above action occurs every two cycles. The Record Reverse Cam, making only one-half turn per cycle, raises the Reverse Arm and Roller every other cycle, and in raising it, the Reversing Arm and Guide are swung around in front of the Magazine. When the Reversing Arm and Guide swing in front of the Magazine, the Record Separator Hook Arm and Roller are swung away from the Main Cam to prevent discharge of a record from the Magazine in the "Reversing" cycle.

Due to the impossibility of covering the action of each part in the changer in the brief description above, it is essential that every service man spend considerable time observing the action of each part of the changer under each of the four conditions outlined above.

MODEL 16-E, Capehart

FARNSWORTH TELEV. & RADIO CORP.

MOTOR DRIVE
GEAR REDUCTION – DRIVE SHAFT ALIGNMENT

A silent and smooth operating drive motor and gear reduction unit, properly coupled to the record changer, is of utmost importance for perfect reproduction of records. Unless these parts are all functioning properly, there is a possibility that waver or wows may be noticed in the sound reproduction from records. It is also possible that an objectionable hum or rumble may be discernible during low passages in records or the change cycle. If such conditions are apparent, we suggest a careful check and adjustment in accordance with the procedures which follow.

After freeing the record changer by removing the four hold down bolts used in shipment, make certain that the record changer is floating freely on its rubber mounting supports, and that it does not touch the record changer mounting shelf at any point. There should be a feeling of entirely free floating motion when the changer is shaken slightly. If such is the case, it is a good indication of full free floating action. By making sure that the record changer is "Free floating" the possibility of acoustic feed-back, hum, or rumble is eliminated.

Because of the importance for positioning the record changer into a free floating position, it is always advisable to check the alignment of the record changer drive shaft with respect to the gear reduction unit and between this unit and the drive motor. Unless the correct relationship is maintained, excessive hum or rumble may be present as well as the possibility of uneven turntable speed causing waver or wows in the record reproduction.

If the above conditions are apparent with record changer in free floating position, shift the gear reduction unit and motor assembly slightly until a position is found where the difficulty is eliminated or negligible. It may be necessary to enlarge mounting holes in the motor and gear unit assembly mounting board.

NOTE: Drive motors and gear reduction units are "run-in" and aligned on the mounting board at the factory, and will seldom, if ever, require adjustment in the field unless they have been tampered with, or in the event the motor has shifted due to rough handling in transit. If hum or rumble persists after trying previous suggestions, loosen the motor and shift slightly locking it in place when minimum hum position is located.

SAFETY CLUTCH—PURPOSE AND ADJUSTMENT

The purpose of this feature is to uncouple the record changer from the gear reduction unit in the event a faulty record or improper operation of the machine causes the record changer to jam during some portion of the change cycle.

Essentially, this device consists of two metal discs with a leather washer between. The driving power is transmitted from the lower to the upper disc through the leather washer because of the pressure developed by the nut, part 368-2, controlling the pressure of the spring, part 3938. Pressure of the spring determines the amount of back pressure, and by its adjustment, it may be set so as to cause the clutch to slip if more than normal drive tension or load develops somewhere in the record changer during its change cycle, thereby acting as a "safety" feature.

The proper method of checking the adjustment of the safety clutch follows. With the record changer in cycle and the record magazine fully loaded, apply a slight downward pressure on the bottom of the record magazine, while the magazine is tilting backward. When such pressure is applied, it should cause the safety clutch to slip and the turntable should stop revolving. In the event the action of the safety clutch is not as described, loosen nut, part 368-2, thereby releasing pressure on spring, 3938, this will permit safety clutch to unload sooner. After this adjustment is made, the changer should be put through a number of cycles to make certain that the clutch does not slip at any point in the normal change cycle as this would cause the changer to stall.

The action of this safety clutch should always be checked when the instrument is permanently set up in the customer's home since it acts as a safety device to prevent record breakage or damage to changer in the event of a jam because of reasons previously mentioned. CAUTION: The leather clutch facing should be kept free from oil or grease.

NOTE: The Safety Clutch is locked together by use of a "C" washer in the end of the shaft. If unable to make proper adjustment after clutch has been slipping, remove clutch assembly and examine to determine if washer is out of position. If the washer is lost and none is at hand, the end of the shaft may be drilled and a small cotter key used to hold assembly together.

GEAR REDUCTION UNIT

At least once a year the gear reduction unit should be checked to make certain it contains the proper amount of oil. It should contain one-half ounce, No. 10 S.A.E. oil. Stock No. 1315-1.

LUBRICATION

At least every six months a few drops of oil should be applied to the drive motor oil cups. See illustration. For this purpose, use the special electrical motor oil which is carried by most all oil companies for electric fans, sewing machine motor, etc.

FARNSWORTH TELEV. & RADIO CORP. MODEL 16-E, Capehart

ELECTRIC PLAY CONTROL—M SERIES—Cont.

1. The following parts comprise a complete play control installation. Play control with cables, plug and switch, compartment light, mounting bracket, two bracket mounting screws, two switch mounting bolts, and four wood screws. Check packing material so no parts are overlooked.

2. The mounting bracket should be installed on the record changer first, see illustration.

3. The bracket is mounted on the boss which supports the clutch fork shaft and the reverse cam shaft, on the side of the boss away from the main cam, so the clutch fork shaft sets in the cutout. Pass the two screws that fit the tapped holes in the switch bracket through the old play control bracket holes when mounting the bracket.

4. Remove the plug button from the partition between radio and changer, put the six prong plug, the switch and the cables through the holes in the partition. Fasten the play control on the partition by means of the wood screws being careful not to crack the plastic case by drawing the screws too tight or driving the screws in crooked. Also be sure the record tray clears the play control housing before driving any screws.

5. Fasten the switch to the bracket by means of the two bolts. See illustration. This puts the switch in such a position that the throwout cam can actuate the switch. Of course, the switch goes on the bracket with the leads at the bottom and pointing toward the left (when looking in the back of the cabinet), this brings the spring finger in line with the throwout cam.

6. Remove play control shorting plug (six prong) from junction box and plug in cable from play control. Set play control at any number except zero (off) and run changer through several cycles. If the switch is too close to the throwout cam, the relay in the play control will buzz; if not close enough, the action will be erratic. Be sure the bolts holding the switch and the screws holding the bracket are properly tightened.

MECHANICAL PLAY CONTROL MODELS PRIOR TO M SERIES

TO ADJUST THE PLAY CONTROL

When setting a play control, the counter should reset at Zero just as the needle touches the record. That is, the play control cam, on the record changer main shaft, should be from 1/4" to 1/2" beyond the plunger after the main clutch has disengaged. The control cable is put in the hole in the plunger and the set screw tightened, then the cable housing should be held in place by the set screw—do not set the screw tight. Turn the bar knob pointer back and forth over the play control dial, if the pointer catches or binds, slip the cable housing away from the bracket slightly, until the pointer runs free, then run the changer through a cycle to see that the play control resets properly, then tighten the screw.

When adjusting the play control, which is in the record compartment, after removing the wood screws which mount the control to the shelf, remove the clips holding the 110-volt leads to the switch. Then remove the pointer and the two round head machine screws from the back. The stop spring of the stop spring and ball assembly, No. 66324, should be tangent to the gear and the ball should be in the space between the last and the next to the last tooth, before the blank space in the gear tooth. With the ball in this position, the set screw in the collar at the rear of the unit should be firmly against the stop pin. To make this adjustment, loosen the set screw, while holding the gear, move the collar, then tighten the set screw. In this position, the switch pin, No. 48202, should hold the switch open and permit the switch to close when the gear is advanced one tooth. The stop bracket, No. 4450, for the resetting dog, should allow the dog to advance only one tooth at a time, if it picks up more than one tooth, move the stop toward the dog until it advances only one tooth at a time.

The resetting dog, No. 3839, should not ride on the gear tooth, as this will prevent turning the pointer toward one hundred. Shift the stud, No. 4354, until the dog clears the tooth, then check the alignment of the plunger tube and the cable housing stud, for if the cable is bent here, the play control may fail to function.

When replacing the pointer, No. 6062, turn the shaft to the position, where the switch is open, then turn the shaft ONE notch or stop toward the one hundred, at this point, set the indicator on ZERO and set up the set screw, checking to see that the pointer does not ride on the dial at any point.

If trouble is experienced examine the cable for kinks or rust spots, in any case do not substitute music wire as it does not have the proper hardness and probably will not be the correct diameter, if it is too large, it will bind; if too small, it will kink.

Powdered graphite blown in cable or mixed with light oil and run in cable will improve operation.

QUESTIONS AND ANSWERS

To assist the service men, who have not had the advantage of factory training nor experience servicing the Capehart 16E Record Changer, we have prepared this section, which covers the more common complaints reported by users, dealer's service departments, our salesmen and field engineers.

Of course, there are many factors responsible for the troubles encountered. Below we are listing some of them.

1. Customers—Failure to properly load or operate the instrument. Friends who drop in and think they know all about everything. Owner not having been properly instructed or their general inability nor desire to learn.

2. Records—Variations from standards, rough edges, thickness, warped, etc.

3. Adjustments—Not proper due to:

A. Improper operation of instrument.

B. Misuse and neglect.

C. Wear, due to lack of oil and grease.

D. Improper inter-relation of parts due to adjustments of one section without complete follow through on other related parts.

Below are listed some of the more common complaints, along with some of the possible causes, and reference to the service notes where adjustments may be found. These are not complete as it is impossible to cover every case but we believe they will help the service man over the rough spots.

1. Waver and Wow, poor tone. May be caused by any one or all of the following: Refer motor drive—Gear Reduction Unit—Drive Shaft Alignment section.

A. Loose set screws in motor to turntable shaft and couplings.

B. Loose rivets in flexible couplings.

C. Leather coupling oil soaked and/or soft.

D. Improper alignment of gear reduction shaft with turntable shaft. Must be within 1/4 inch. Remove top universal and use shaft for aligning.

E. Lack and grade of oil in gear reduction unit.

F. Defective crystal pickup.

2. Needle drops off edge of record or fails to feed in at times.

A. Instrument not level. Check and level at base plate near tone arm—not cabinet.

B. Pickup brush gone, worn or improperly adjusted. Must extend 1/32 inch below standard length needle and no other length needle should be used.

C. Pickup arm stop lever and/or stop lever hook improperly adjusted. Refer Fig. 9A and 13A.

D. Improper adjustment of Tone Arm feed in cam. Refer Fig. 8.
Clearance between cam and tone arm lift level should be about 1/32 inch when changer is in play position.

E. Tension too great on pickup stop lever spring. Refer Part No. 3984.

F. Pickup stop lever rubber roller worn or out of round. See Part No. 5044.

G. Rough edges on 12″ records causing pickup and tone arm to jerk and jump as rubber roller on stop lever comes in contact with record.

3. Failure to trip properly. (Too soon or too late).

A. Not sufficient tension or too much tension on trip lever friction joint.

B. Movable trip switch arm bearing stuck. This occurs near salt water and in humid climates.

C. Check for dirt and corrosion between trip lever arm and base plate at friction contact mounting. Clean and apply drop of light oil.

D. Check complete adjustment.

4. Excessive amount of tick at end of record.

A. Tension too great on trip arm lever friction. Back off adjusting screw, clean and oil between base plate and lever at point of mounting.

B. Place piece of rubber tubing or tape on end of trip lever where contact is made with tone arm trip bracket.

5. Excessive record wear.

A. Worn needles.

B. Friction on trip switch lever too great causing wear near end of record.

C. Improper adjustment and alignment of True Tangent Tone Arm. Pickup should be in straight alignment with tone arm

MODEL 16-E, Capehart — FARNSWORTH TELEV. & RADIO CORP.

QUESTIONS AND ANSWERS—Cont.

when needle is 1½ inches from center spindle of turntable shaft.

D. Tone arm binding in mounting or resting on tone arm feed in cam due to improper adjustment of cam. Refer Fig. 8.

6. Clutch disengages before completion of cycle.

A. Insufficient tension on Solenoid wedge spring. Refer Fig. 12B.

B. Solenoid Torsion spring in wrong hole for action desired.

C. Improper adjustment motor solenoid switch—Excessive upward tension on clutch lever. Refer Fig. 10.

D. Clearance between drive and driven sections of clutch. Refer Fig. 7.

E. Excessive upward tension from muting switch on clutch lever.

F. Improper adjustment of Clutch Throwout lever. Clutch only partly engaging. Refer Fig. 10.

G. Any binding of clutch action causing clutch to not completely engage or disengage.

7. Changer continues to cycle without playing record.

A. Improper adjustment of clutch throwout lever. Spring part No. 3990, holding clutch throwout lever too high—misses clutch throwout cam.

B. Solenoid Torsion spring in top hole instead of center or bottom. Refer Fig. 10.

C. If buzzing sound is heard at end of cycle look for reject button stuck, trip switch contacts stuck or reject relay contacts closed (should be open during phonograph operation).

8. Record breakage.

A. Clean with oil soaked cloth all polished surfaces on magazine and record tray with which records come in contact.

B. Check adjustment of magazine, especially back stop. Refer "B" Fig. 3.

C. Improper adjustment of vertical bumper guide. Refer Fig. 2.

D. Note—If record break is half moon shape record has stuck on slide rails and came out late. If crack from edge toward center hole, magazine is adjusted too far forward. If chipped on edges, including V shape breaks, damage is caused in turn over position and requires complete cleaning of record tray near lower rubber bumpers and cleaning of reverse arm upright polished surfaces. Also polish and check adjustment record support pins. Refer Fig. 2.

9. Noise when 12″ records drop.

A. Record caught between record reverse arm and record tray prohibiting return of reverse arm.

B. Record reverse arm jammed or out of position with reverse arm crank. Refer Fig. G.

C. Excessive records in magazine—not more than 18.

D. Bent reverse arm and roller. Refer Fig. 4.

10. Records fail to unload from magazine occasionally.

A. Insufficient records. Should be 6 or more. Six to fifteen records for best operation.

B. Warped records and/or chips on edges.

C. Improper adjustment of record separator—adjusted too low. Refer Fig. 2.

FARNSWORTH TELEV. & RADIO CORP. MODEL 16-E, Capehart

MECHANICAL ADJUSTMENTS 16-E RECORD CHANGER

Due to the fact that certain critical shortages have developed in the metals used in the 16-E Record Changer, we are listing in the parts lists the standard parts, which have been used in the past, as well as those parts consisting of the newer metals. Beginning with the Serial Number 20,000, a new base of cast iron was incorporated. A new magazine is now being used, as well as a zinc record tray. With the new tray, because of its extra weight, a counterbalance spring and the necessary fittings are required, these fittings are shown on page 35. A list of these parts is included in the parts price list and these parts are marked with an *.

In making all adjustments of the assemblies on the top of the record changer the turntable is the datum point.

Before attempting any adjustments the service man should learn to disengage clutch while changer is in cycle by placing thumb of left hand on top of clutch fork and forefinger under fork. Lift with finger to disengage clutch and press with thumb to engage clutch. This makes it possible to stop changer in any desired position while motor is running.

ADJUSTMENTS

1. TO LOCATE AND ADJUST THE RECORD TRAY (6687) (Fig. F).

If it becomes necessary to replace a record tray, the first tooth of the driver quadrant (6257) (Fig. F) should mesh with the second tooth of the driven quadrant of the record tray (3515) (Fig. F). This is to permit proper adjustment of the tray height, which adjustment is covered below.

An easy way to locate tray and match with gears is to place selector lever in repeat position. This releases quadrant gear (6257) (Fig. F). Then place selector lever in one side position and lift quadrant until it snaps in male and female clutch position. The tray may then simply be placed around turntable and pins inserted. Place selector lever again in repeat position and lift tray for examination. Teeth should then be properly meshed. Changer should be in play position when this adjustment is made.

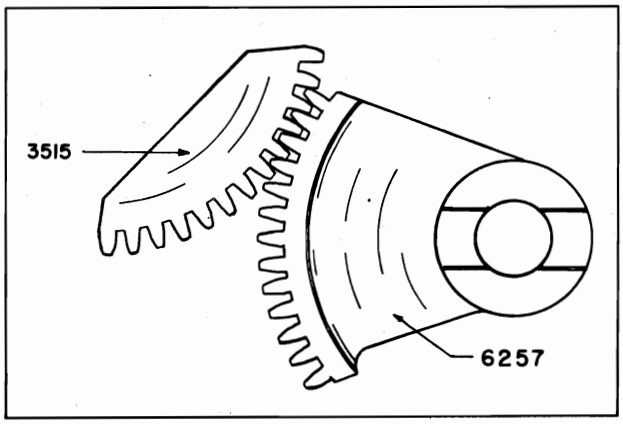

FIGURE F. RECORD TRAY GEARS

After the gears are properly meshed, the record tray should be adjusted sidewise until the turntable is uniformly spaced within the tray at the time when the record tray is raised until the front end of the 10" felts are level with the turntable felt. After the tray has been properly positioned sidewise, tighten the two Allen set screws holding the record tray pivot pins, then check to see that no side play exists.

TO ADJUST THE RECORD TRAY ELEVATION:

With the record control lever (6231) (Fig. 9B) in the "One Side" position, run the record changer thru a cycle until the large hole in the main cam is exactly half way past the upper edge of the record tray cam follower as shown at "A" in Fig. 5. In this position the front points of the 10 inch felts in the record tray should be level with the turntable felt (a straight edge should be used). If the level is not the same, loosen the nut on the back of the eccentric screw (3237) (Fig. 5). Adjust this screw until the felts are the same heights, then while holding the screw to prevent its turning, tighten the nut.

Unless this adjustment is carefully made, the record center hole will miss the spindle, for if the tray is too low the records will slide over the 10" stop in the tray, while if the tray is too high they will land with the spindle hole behind the spindle.

2. TO LOCATE AND ADJUST THE RECORD MAGAZINE (6686) (Fig. 1).

Before attempting any adjustment of the record magazine, make certain that the center of the right hand magazine pivot pin (34132) (Fig. 2) is exactly 8 3/8" above the base plate. This is shown in Fig. 2. This height is very critical and may be the cause of records not being properly delivered to the record tray. If this height is found to be incorrect, it can be adjusted by striking the buckhorn with a rubber hammer. Strike the underside if the height is less than 8 3/8". If more, strike the upper side of the buckhorn.

MODEL 16-E, FARNSWORTH TELEV. & RADIO CORP.
Capehart

MECHANICAL ADJUSTMENTS—Cont.

TO POSITION RECORD MAGAZINE:

The record magazine may be moved sideways by loosening the two set screws located underneath the magazine pivot pins in the magazine support assembly (Buckhorn) (6684) (Fig. 1). The correct position of the record magazine is determined by the position of the pin in the Record Reverse Crank with respect to the slot in the Record Reverse Fork. The illustration Fig. G, below, shows this clearly. After this position has been reached, the magazine should be securely fastened by the Allen set screws which are located in the Magazine Support Assembly.

Swing the Record Reverse Arm around in front of the magazine to determine if the Record Guide strikes either of the Record Support Pins (34138) (Fig. 12A). If the guide strikes either of the support pins, it will be necessary to bend the interfering pin so that clearance is secured.

Next move the Record Selector Arm to the Repeat Position. This disengages the Record Repeat Sliding Clutch and permits lifting the Record Tray. After placing a 10" record on the turntable and slowly raising the tray by hand, the record should hit the pins simultaneously about halfway between top and bottom of the angle surface of the pins. If it does not, it will be necessary to bend the pins until the record does. This adjustment is predicated upon the fact that the rear record bumpers are in good shape (not unequally worn). If an adjustment of the pins is made, see that clearance is maintained between the Support Pins and the Record Reversing Arm and Guide, as well as the holes in the Record Tray.

If the magazine has been replaced or moved, the Magazine Stop Screw, "B" Fig. 5, may need readjustment. The correct adjustment is made when the changer is in the playing position. The record separator must be engaged by hook—and should just touch the vertical portion of it. In this position the record reverse arm should rest against the stop tubing, and the record reverse crank should be in the fork of the record reverse arm as shown in the accompanying illustration. This view is shown with reverse arm in Reverse Position and looking down.

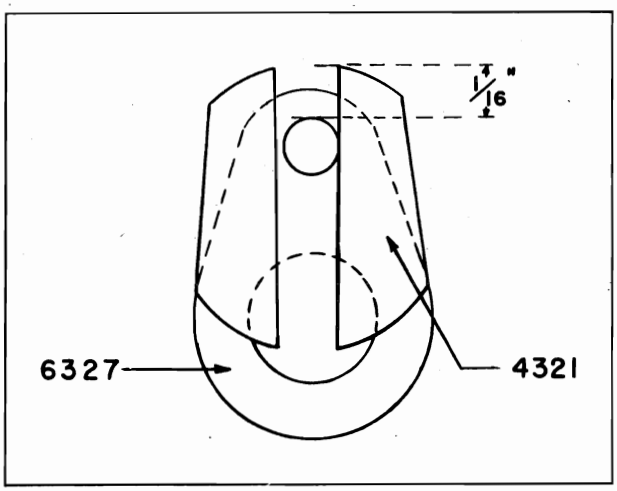

FIGURE G. REVERSE PINION CRANK AND PIN ASSEMBLY

If it is necessary to shift the magazine, the final check should be to determine that the Record Separator Hook (4323) (Fig. 2) does not bind in the slot at the end of the Record Separator Arm, (6445) (Fig. 1). The adjustment of this separator arm is covered in part 5 of this section.

3. MAGAZINE LINK ADJUSTING SCREWS ("A") (Fig. 2).

The Record Magazine should always return snugly against the Magazine Stop Screw ("B") (Fig. 5). If it does not, it is necessary to place selector lever in repeat position and loosen the two adjusting screws on the magazine actuating link to a sliding tension, and run the changer thru its cycle until the magazine attains the position shown in Fig. 2. Stop the cycle either by disengaging the turntable clutch, or by disconnecting the A. C. line cord. Press downward on the lower part of the magazine thus lengthening the Magazine Link Assembly. Now resume the cycle, and when the magazine touches the Magazine Stop Screw, the Magazine Link will adjust itself, after which the adjusting screws on the link assembly should be tightened securely.

4. TO ADJUST AND POSITION THE RECORD REVERSE GUIDE (6444) (Fig. 1).

When a 12" record is placed in the Magazine, the Record Reverse Guide should be parallel to this record at the time when the guide is swung from its normal resting position to a position in front of the magazine, snugly against the rubber bumper as shown in Fig. 2. This is known as the Reversing Position.

If the guide is parallel with the 12" record, it should return and rest against the rubber bumper on the Magazine Support Assembly, in such a position as is shown in Fig. 1. If the Eccentric Cam (3825) (Fig. 11) is properly adjusted, the guide will rest against the rubber bumper; however, if the Record Reverse Guide does not properly return, loosen the screw holding the Eccentric Cam and rotate the Cam slightly until the correct position is secured.

If the Reverse Guide does not return to the rubber bumper, check the position of the Crank Pin in the Record Reverse Fork (under Magazine Adjustments and Fig. "B").

If the Eccentric Cam is turned too far, the Reverse Guide will not swing around far enough to rest easily on the rubber bumper (5043) (Fig. 1) while in the playing position.

FARNSWORTH TELEV. & RADIO CORP. MODEL 16-E, Capehart

MECHANICAL ADJUSTMENTS—Cont.

With the Record Selector Lever in the Both Sides position, run the changer thru a cycle until the point is reached where the Record Reverse Guide swings in front of the magazine. In this position the Crank Pin should touch the side of the Record Reverse Fork, that is, toward the magazine without binding. To adjust the position of the Crank Pin, while the Record Reverse Guide is in the reversing position, loosen the lock nut marked "D" Fig. 11. Next, remove the shoulder screw that holds the Reverse Assembly Link Rod to the gear quadrant, (3550) (Fig. 11) and adjust the length of the Link Rod by turning the end which has just been disconnected. After correctly positioning the Crank Pin tighten the lock nut.

5. TO ADJUST RECORD SEPARATOR (Figs. 1 & 2).

With a 10" record in the magazine, the upper edge of the Record Separator (6445) (Fig. 1) should be flush with the top of the Lower Support. To adjust the position of the Record Separator, move the Record Separator Stop to the position desired by loosening the two screws holding this stop. This stop (4520) is shown clearly in Fig. 2 and is located at the bottom of the right hand side of the magazine. The Record Separator Hook should then be adjusted.

6. TO ADJUST THE RECORD SEPARATOR HOOK (4323) (Fig. 2).

As the Record Separator Hook should enter the slot in the end of the Record Separator without binding, it will be necessary to readjust the Record Separator Hook in the event it has been necessary to adjust the Separator Stop. To adjust the Hook, loosen Nut (99-12-3) (Fig. 2) and turn the Hook, which is threaded, until it enters the slot in the Record Separator freely.

NOTE: IF IT IS EVER NECESSARY TO RE-ADJUST THE HOOK, BE SURE TO CHECK THE HEIGHT OF MAGAZINE PIVOT PIN (SEC. 2).

Be sure the screw marked "E" in Fig. 11 is screwed all the way in and locked with the nut. This prevents the Separator Hook from ejecting a record from the magazine during the Reverse Cycle, allowing the record to be caught under the returning magazine, due to its inability to reach the turntable while another record is being reversed.

7. TO ADJUST TONE ARM HEIGHT

When an unwarped 12" record is placed on the turntable, the outer edges of this record should coincide with the center of the rubber roller at the end of the Stop Lever (64197) (Fig. 9A). Run the changer through a cycle until the Tone Arm Lever Hook just touches the Stop Lever. The correct tone arm height is secured when the center of the Tone Arm Hook is the same height as the top of the Stop Lever. To effect this adjustment, lift the tone arm by hand, thus making accessible two Allen set screws, normally covered by the Tone Arm Base. After adjustment, and before finally tightening these set screws, check the clearance between the Pickup Head and the Record Tray. This should be 5/8" while the tray is in the process of raising or lowering with the Pickup Arm swung back by the swing cam, i. e., during either the One Side or Both Sides cycle. The tone arm lever hook should clear through the slot in the stop lever when changer is in play position.

8. TO ADJUST THE PICKUP ELEVATION

After the Pickup Arm Lever Hook has moved the Stop Lever in to the needle landing position, the Hook moves down the Stop Lever. In its downward journey, it pauses momentarily before the Hook, and then enters the Slot in the Stop Lever, thus permitting the Stop Lever to swing to its normal position. If the record changer is stopped at this point in its cycle, it will be found that the ball at the end of the pickup arm lift shaft is at the point marked "F" on the Lift Cam (6449) (Fig. 8).

With the needle, which is to be used in the Pickup, and the Lift Shaft at "F", lift the Pickup and allow the needle to drop off the edge of the Record. The needle point should extend below the playing surface a distance equal to half the thickness of the record.

To make this adjustment, turn screw 99-22-29 (Fig. 13A) until the correct position of the needle is reached. Be sure to retighten the lock nut.

THIS ADJUSTMENT IS IMPORTANT, DUE TO THE VARIOUS LENGTHS OF DIFFERENT BRANDS OF NEEDLES. UNLESS THIS ADJUSTMENT IS CHECKED, IT MAY CAUSE THE NEEDLE TO FALL OFF THE RECORD BEFORE ENTERING THE PLAYING GROOVES.

9. TO ADJUST PICKUP FEED-IN

An examination of the Pickup Friction Cam will disclose the fact that there is a flat leather portion that applies friction to hold the Pickup Arm Lever Hook against the Stop Lever until the weight of the pickup is transferred to the needle. This friction should be applied long enough to prevent the needle falling off the record, but if maintained too long, the needle may skip across the first few playing grooves, and thus miss playing the first portion of the record.

Before adjusting tone arm feed-in cam, be

MODEL 16-E, FARNSWORTH TELEV. & RADIO CORP.
Capehart

MECHANICAL ADJUSTMENTS—Cont.

sure no end play exists in main shaft, otherwise position will vary as main shaft shifts position.

In the earlier model changers this Friction Cam is held on the shaft by a taper pin as well as two Allen set screws. However, later models employed the Allen screws only. If it is necessary to advance or retard this Friction Cam, do not tighten BOTH screws until the proper position is secured, as the set screws have cup points, and after being set up tightly, leave an imprint in the shaft and thus have a tendency to "pull back" into the old position. On instruments where the set screws have been tightened, it might be well to remove the main shaft, and smooth out the old screw marks before attempting to reset this cam. Rotating the cam in the direction of its normal rotation relieves the pressure on the pick-up arm earlier.

10. TO ADJUST THE MAGNETIC PICKUP

Remove the Pickup Cover and check the location of the Stylus with respect to the Pole Pieces (569) (Fig. 6). This stylus should be centrally located in respect to these poles. To adjust the stylus the spool assembly may be shifted, after the set screws (99-28-3) have been loosened. When tightening the set screws, exercise care not to crack the bakelite bobbin. When checking the pickup, carefully examine the rubbers as they harden and split. Due to age, the majority of complaints are traceable to this fact. It should not be necessary to caution against steel chips getting into the assembly.

11. TO ADJUST NEEDLE LANDING

The 12" landing should be adjusted first. In Figs. 5 and 13A the Stop Lever Hook (5658) is shown. In the normal or playing position its flat face is parallel with the bottom of the slot in the Stop Lever, and when engaged with the Stop Lever, the adjacent faces of the Stop Lever and the Lever Hook are parallel. The Lever Hook is adjusted by loosening the Bristol Set Screw No. 99-28-31 (Fig. 6 & 13A) located in the bottom of the Center Bolt, which is the pivot for the Pickup Head Bracket. The Lever Hook should be adjusted to allow the needle to land 3/32" from the edge of a 12" record. Be sure the Bristol set screw is retightened. Next, place a 10" record on the turntable and adjust screw 99-18-20, which is located in the Stop Lever (Fig. 9A) until the needle lands 3/32" from the edge of the 10" record.

CAUTION—The Lever Hook should not bind when going through the slot in the stop lever.

12. TO ADJUST CLUTCH THROWOUT LEVER & CAM (6460) (Fig. 10).

The Clutch Throwout Lever & Cam is adjusted by loosening the shoulder screw holding the cam to the lever, and adjusting the cam until it just clears the point of the Clutch Throwout Cam which is located on the main shaft. This adjustment must be made with the changer in the playing position, i. e., when the Pickup Arm Lift Shaft is in its lowest position, as shown in Fig. 8. Unless sufficient clearance is secured, the changer may jam; excess clearance will cause the changer to cycle without playing records.

The wire spring (3990) (Fig. 10) must lift the cam far enough to clear the Clutch Throwout Cam, otherwise the changer will jam; if it holds the cam too high the changer will continue to cycle.

13. TO ADJUST SOLENOID WEDGE SPRING (39132) (Fig. 12B).

The Wedge Spring is located on one of the three spacers used to mount the solenoid plate and is directly over the solenoid coil. Its purpose is to prevent clutch bounce or chatter when the clutch engages. It may be bent to proper tension by means of a long screwdriver. If the clutch disengages before a change cycle is completed, it is advisable to increase the tension of this spring.

14. TO ADJUST REVERSE CAM SHIFT LEVER (5326) (Fig. 3).

When the Record Selector Lever (Fig. 9B) is moved to the "Both Sides" position, the Record Control Rod Pin (34145) (Fig. 9B) moves the Record Control Shaft, which in turn moves the Reverse Cam Shift Lever. This causes the Reverse Cam (6325) (Fig. 4) to engage with the Reverse Cam Pin (34144) (Fig. 4). The Shift Lever should be positioned on the Control Shaft so that the Reverse Cam is free of the Reverse Cam Pin in the "Repeat" and "One Side" cycles, but is firmly engaged in the "Both Sides" cycles. Under no circumstances should the Shift Lever be positioned so as to bind the Reverse Cam.

15. TO ADJUST RECORD REPEAT LOCK LEVER (5334) (Fig. 3).

This lever is to prevent accidental shifting of the Record Selector Lever during the change cycle. In the playing position, the tip of this lever should clear the Clutch to Solenoid Lever by 3/16" while moving under it. In the "Repeat" cycle, this lever is on the side of the Clutch Solenoid Lever away from the Main Cam. In the other two cycles it encloses the Clutch Solenoid Lever.

16. TO ADJUST REVERSE CAM LOCK LEVER (5339) (Fig. 3).

This lever serves the same purpose as the Record Repeat Lock Lever and should clear the Clutch Solenoid Lever by 1/16" while moving

MECHANICAL ADJUSTMENTS—Cont.

under it in the playing position. During the "Both Sides" cycle, it is on the side of the Clutch Solenoid Lever, towards the Main Cam, and in the other two cycles it encloses the Clutch Solenoid Lever.

17. TO ADJUST RECORD REPEAT CLUTCH LEVER (5332) (Fig. 3).

The Sliding Clutch permits disengagement of the Record Tray Driving Quadrant during the "Repeat" Cycle, when the same record is used. The Clutch Lever should allow the clutch to engage firmly in the "One Side" and "Both Sides" cycles, but be entirely disengaged in the Repeat Cycle. The Clutch Lever is secured to its shaft by means of an Allen Set Screw.

18. TO LOCATE MAIN CAM SHAFT

Both end bushings of the Main Cam Shaft are movable, and are used to position the Main Cam Shaft. To position this shaft, loosen the H. H. Cap Screws (99-26-9) (Fig. 11) holding the bushings, then move the shaft until the ball in the end of the Tone Arm Lift Rod is exactly centered on the Lift Cam as shown in Fig. 8. When tightening the Cap Screws, be careful not to crush the Durex Bushings or crack the split bearings located near the turntable shaft.

19. TO ADJUST AUTOMATIC TRIP SWITCH (2792) (Fig. 9B)

This switch is located underneath the turntable and is actuated by the motion of the Tone Arm being transmitted to the Trip Arms thru their associated Friction Joint.

To adjust this switch, remove the long trip arm from the Switch Cover and the two F. H. M. S. holding this cover. There should be 1/32" clearance between the switch points. Replace the turntable on its spindle, and move the tone arm toward the turntable spindle so that the trip quadrant moves the trip arm about 1/4", then turn the turntable one complete revolution. This rotation is for the purpose of having the Fibre Trip Pin, at the bottom of the turntable, reset the Trip Arm. Remove the turntable, and check the position of the trip arm in respect to the movable contact arm which should be equidistant from both bakelite insulators. In order to position the trip arm, loosen both screws holding the switch and adjust it until there is approximately 1/32" clearance between each bakelite insulator and the trip arm. Recheck this position before replacing the cover. When replacing the trip arm through the slot in the cover, be sure that it is between the bakelite insulators, otherwise it may make contact with one side of the A. C. line and cause a fuse to blow.

A single strand of wire is soldered from one side of the A. C. line to the movable arm of the switch for the purpose of preventing chattering, which may occur if the current flows only through the bearings to the arm.

20. TO ADJUST SOLENOID MOTOR SWITCH (Fig. 10).

The Solenoid Motor Switch is located underneath the cast cover (5226) (Fig. 3) and is used to disconnect the Solenoid Coil during the change cycle and to shunt the phono relay contacts in order to keep the motor running until the change cycle is completed, even though the instrument is turned off. This switch is actuated by the Clutch to Solenoid Lever.

The cover (5226) is secured by a bolt at one end, and a screw at the other. When the clutch is disengaged, the upper contacts should make good electrical contact, and there should be approximately 3/32" clearance between the bottom contacts. When the clutch engages, the upper contacts should remain closed until the bottom contacts close, after which they should open. When the clutch is fully engaged, the bottom contacts should be closed, and there should be approximately 3/32" clearance between the upper contacts. To adjust the switch, loosen the screw (or screws) holding the bakelite insulator to the solenoid plate.

21. TO ADJUST AUTOMATIC TRIP SWITCH FRICTION JOINT

This friction joint is located underneath the record tray, and is used to transmit the motion of the tone arm to the Automatic Trip Switch by means of the two Trip Arms.

Place the Selector Lever (9B) in the Repeat position and raise the record tray. A flat spring, which can be adjusted by a screw, holds the two trip arms together against a cork washer. The tension of the flat spring determines the friction between the two trip arms. If the tension is too great, the changer will cycle before completing a record, and if not great enough, the changer may not trip at the completion of a record.

On some instruments a "Thump" may be heard through the speakers during each revolution at the time when the Turntable Fibre Pin strikes the Trip Arm. This motion is transmitted to the needle point, and may be reduced or eliminated by proper adjustment of the Friction Joint. In some stubborn cases it may be necessary to place a small piece of surgical rubber tubing over, or to wrap several layers of cellophane tape around the Trip Quadrant where it touches the Trip Arm, which will effectively kill the thump.

MODEL 16-E, Capehart — FARNSWORTH TELEV. & RADIO CORP.

MECHANICAL ADJUSTMENTS—Cont.

22. TO ADJUST VERTICAL BUMPER GUIDE (6693) (Fig. 1).

This Guide, located behind the Lower Support Assembly, is used to guide the record when it drops to the rubber bumpers and also when the record is being raised by the rear of the record tray (elevating hook). The guide should be just far enough back from the lower record support to allow a 12" record to drop freely upon the rubber bumpers, and the lower points of this guide should be far enough forward to tilt a 12" record sufficiently to go freely behind the two points of the upper record support. If the lower points of the guide do not extend forward enough, there is danger of the record bouncing against the points of the upper record support and being chipped. When adjusting the Vertical Bumper Guide, make certain that the elevating hook (rear portion of the record tray) has clearance, otherwise the record tray will not return to its correct position.

23. TO ADJUST CLUTCH CLEARANCE.

In order to insure proper disengagement of the Driven Clutch (6326) (Fig. 7) and the Driving Clutch 3630, the clearance should be .020" when the changer is in the playing position. This clearance is obtained by loosening screw marked "G" Fig. 10 and moving the Clutch Fork. Be sure screw "G" is tightened after correct clearance is obtained.

24. OILING INSTRUCTIONS.

Due to careful design and precision workmanship the Capehart 16-E Record Changer requires a minimum of oiling or mechanical adjustment.

Some 16-E Record Changers produced in the past have had all cams, gears and sliding surfaces coated with graphite grease. These coated surfaces should be greased with white vaseline, which will replace the oil that has been used up during operation.

An occasional LIGHT coat of vaseline should be applied to all faces of the magazine at the points where the records come in sliding contact during the cycle, apply vaseline then wipe off with the fingers.

A good grade of light machine oil should be used on the sliding clutches (except motor slip clutch) reverse cam shaft, and eccentric shoulder screws.

DO NOT OIL DUREX BUSHINGS. DO NOT USE AN EXCESS OF LUBRICANT.

Later production changers used Lubriplate instead of Graphite.

On these, all surfaces of the main cam, the reverse cam, and the tone arm lift cam that come into contact with rollers should be coated with a film of Lubriplate. Lubriplate can be purchased at almost any electrical supply or hardware store.

The drive motor should have its oil cup filled every six months.

The Gear Reduction unit used with the Emerson motor should be checked to make certain it contains the proper amount of No. 10 S.A.E. oil. (Amount required—1/2 oz.).

In the Gear Box of the Bodine Motor, the grease should be replaced each year. This grease may be 75% Vaseline and 25% S.A.E. 40 Motor Oil.

25. TO REPLACE RECORD REVERSE CAM.

There are two methods used in removing a broken Record Reverse Cam, the first being to remove the Turntable Drive Shaft, the second, to drop the Main Cam Shaft.

To remove the Turntable Drive Shaft see Fig. 7.

1. Mark the Drive and Driven Gears in order that they can be again meshed in the same position. (This should be done regardless of which ever method is used).

2. Remove turntable shaft.

3. Knock out the taper pin from the Driven Gear (on Reverse Cam Shaft) also the Reverse Cam Pin.

4. Move the Reverse Cam Shaft away from the Main Cam until the Reverse Cam drops off the shaft.

5. When replacing the Reverse Cam, make certain that the Reverse Cam Shift Lever is properly engaged in the slot in the Reverse Cam, before pinning the Driven Gear to the Shaft. Remember this is a taper pin and only goes in one way. Consequently, the shaft has to be properly aligned or the pin will not enter. Next replace the Reverse Cam Pin. Replace the Turntable Drive Shaft and check. If the Reverse Cam Shaft is only partly withdrawn, the gears will remain properly meshed.

6. Check in order to determine that the Reverse Arm and Roller Assembly does not ride on the Reverse Cam; about 1/16" clearance should be maintained. The shaft of the Reverse Arm may be shifted by loosening the set screw that holds the end of the shaft nearest the Main Cam.

TO REMOVE THE MAIN SHAFT

Put the instrument in playing position. Remove the Eccentric Shoulder Screw holding the Magazine Slide Arm, and the screw holding the recoil slide arm. Loosen the single H. H. Cap Screw

MECHANICAL ADJUSTMENTS—Cont.

holding the front Durex Bushing; remove this Bushing, and the bearing cap that holds the rear Durex bushing. Work the shaft backwards out of the front bearing hole.

Knock the taper pin out of the Driven Gear, and remove the collar from the front end of the Reverse Cam Shaft. Move this shaft toward the rear until the Reverse Cam drops off the Shaft. Replace with a new cam, put gear on shaft, push shaft through Durex bushing and replace collar. Replace taper pin in gear.

Replace the Main Shaft and put Durex bushing on front end, after which mesh the driver and driven gears in accordance with the guide marks previously made. If the gears are properly meshed, the Reverse Cam will slide under the Reverse Arm and Roller Assembly without binding at the time the selector arm is moved into the "Both Sides" position. Rotate the Reverse Cam 180° with the fingers, and again move the Selector Arm to the "Both Sides" position. It should go in without binding. Replace the rear bushing and bearing cap. Replace the Magazine and Record Tray Slide Arms, and adjust the Record Tray height.

26. TO REMOVE RECORD CHANGER FROM CABINET

As the new series (beginning at 20,000) are equipped with cast iron bases, heavier magazines, and record trays, exceptional care must be exercised when removing a changer to prevent marring the cabinet.

After disconnecting the pickup and shorting leads, the play control cable and the drive shaft, remove the middle screw of the three holding the upper record support, and the shoulder screw 3239 (Fig. 1). Removal of the shoulder screw permits the magazine to be swung parallel with the base. Next, swing the Record Reverse Arm around in front of the magazine by raising the Record Reverse Arm Lock until the Reverse Arm is in front of the magazine. Then, release the Lock which will hold the Record Reverse Arm in place.

Lift the changer up and tilt it to clear the shelf, then remove it through the back of the cabinet.

As it is possible to mar the cabinet; the shelf, the top, and side of the cabinet, should be protected in some manner while removing and installing the changer.

27. ALIGNMENT OF TRUE TANGENT PICKUP

When properly aligned, the pickup head and the tone arm for a straight line when the needle is 1 1/2" from the center of the turntable drive shaft. To adjust, loosen the nut (43160) (Fig. 14A) and turn the steering rod (43148) until the correct adjustment is secured. After adjusting, determine that there is still 5/8" clearance between the Record Tray and the Pickup Head.

NEVER USE STEERING ARM TO ADJUST NEEDLE LANDING.

TURNTABLE DRIVE SHAFT

When it becomes necessary to remove the turntable drive shaft, it is necessary to remove the upper flexible coupling and the Turntable Collar No. 66111. After the collar is removed, the shaft may be raised until the Woodruff Key (99-38-2) is exposed. Grasp the upper end of the key in a pair of pliers and roll the key out of the driven clutch. After the key is removed, the shaft may be lifted out of the changer. If the Clutch is disassembled, be sure the thrust washer (4210) is not lost.

PARTS LIST—FIGURE 14

Part No.	Description
56-1085	Spring Bracket
36-801	1/4-20 x 1 1/4" R. H. M. S.
99-14-1	1/4-20 Hex Nut
64-309	Record Tray Spring
56-1104	Spring Spacer

FIGURE 14—ADDITIONAL PARTS REQUIRED FOR ZINC TRAY

If it is necessary to replace the aluminum tray used on changers having a serial number below 20,000, it is necessary to add the above parts, which are necessary due to the additional weight of the zinc tray which is now available.

The bell crank which is used to swing the magazine must have a 1/4-20 hole tapped in the location shown; 1/4" from one edge and 5/16" from the other edge. A No. 7 drill is used for the hole, and a plug tap should be used for threading the hole.

When assembling the screw (36-801), nut (99-14-1) and spacer (56-1104), 1/16" space should be left between the spacer and screw head to allow free motion of the tray spring (64-309).

Assemble spring bracket (56-1085) under the nut holding the tray slide arm roller, as shown in the illustration above. The spring should be used in the middle hole of the bracket.

At the point marked "X" in the illustration there is a guide mark and a semi-circular spot has been milled in the cam track. It is necessary that this track be bent so the semi-circular spot is flush with the remainder of the cam wall. This can be done best by means of an iron block and heavy hammer. Hit the block with the hammer until the track is straight. This is necessary to prevent the spring holding the tray lift shaft so the sliding clutch cannot be properly engaged when changing from Repeat to One or Both Sides.

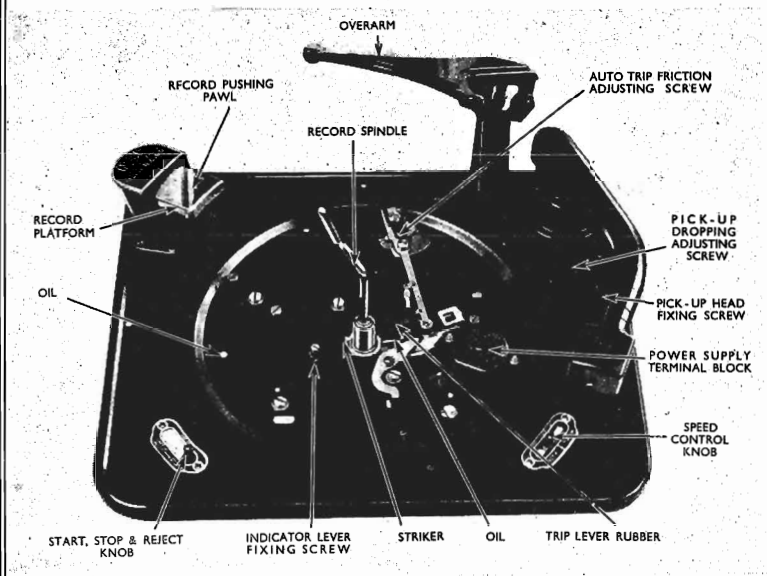
GARRARD ENG. & MFG. CO. LTD. MODEL 65



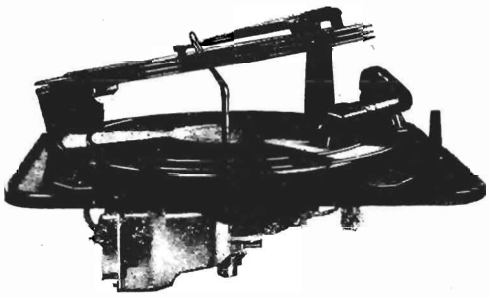


Diagram 1

OPERATING INSTRUCTIONS

The "GARRARD" Record Changer will play any number of records up to eight 10″ and 12″ mixed in any order.

To operate, proceed in the following order:—

1. If a permanent needle is not used insert a needle—the type that will play 10 or more records—in the pick-up; lift the Pick-up Arm to do this.
2. Place the record spindle in position, the sloping part leaning towards the record platform, raise overarm, and place any number up to eight records on the record spindle, their lower edge resting on the record platform, then lower overarm.
3. Move the left-hand knob to "Start." The motor will start and the Changer operate.
   When the last record has been played, the Changer will automatically stop.
   To remove records, raise overarm and withdraw the record spindle.
   To reject a record, move the left-hand knob to the reject position.
   The Changer can be stopped by moving the left-hand knob to the "Stop" position.

If the Changer is switched off while a record is playing, that record will be automatically rejected, and the next record commence when switching on again.

If desired a 10″ record may be repeated any number of times by placing the record on the turntable, raising the overarm and switching on with no records on the record spindle. When it is desired to stop the record, lower the overarm, and the Changer will automatically switch off at the end of the record.

This cannot be done with 12″ records as the pick-up arm will automatically come to the 10″ position when there are no records on the platform.

Should the Record Changer be stopped with the pick-up arm not on its rest, the pick-up should not be handled, but the left-hand knob moved to "Start," the pick-up will then return to its rest.

When the Changer is fitted with a High Fidelity Pick-up of any type, extra care should be taken to avoid accidental damage to the pick-up, and attention should be given to the following points:—

The Changer should not be switched off either by the switch on the Changer, the switch on the set, or the house switch during its changing cycle, as this may lead to the pick-up being lowered on to the turntable covering when the Changer is next used.

If it is suspected that the Changer has been switched off in the wrong position, place a 12″ record on the Turntable before switching on.

Do not use badly warped records, they may not drop and the pick-up will lower on the Turntable covering, also badly warped records will give trouble by slipping during playing. Care should be taken in storing records to prevent contact with dirt and dust which sets up abrasive action and causes rapid wear.

NEEDLES.

It is emphasized that if for any reason the needle, whether of the permanent or semi-permanent type, is taken out of the pick-up head after it has played even only a part of a record, it should be discarded and not used again, as a small flat is worn on the side of the needle tip which rests on the record and as the needle cannot be put back into the pick-up without turning it slightly the flat will not rest on the record in its original position, and will form a cutting edge to tear up the record groove.

MODEL 65

GARRARD ENG. & MFG. CO. LTD.

INSTALLATION

DIMENSIONS.

The cabinet space required for fitting is 15½in. long by 13¼in. with 5½in. clearance above and 4½in. clearance below unit plate.

FITTING TO CABINET.

(i) The "GARRARD" Automatic Record Changer is supplied with Spring Suspension to prevent acoustic feedback occurring between the loud speaker and the pick-up. Ample clearance should be left between the edges of the unit plate and the cabinet to allow the Record Changer to float freely. Diagram 2 illustrates the assembly of the spring suspension.

In cases where there is no possibility of acoustic feed-back occurring such as where the loud speaker is in a separate cabinet, the spring suspension is not necessary and the Changer can be screwed down to the motor board with four of the wood screws supplied for the spring suspension.

Two additional holes will be found in the unit plate, these are for transit fixing screws which should be used to fix the Changer rigid to the cabinet during transit, and removed on final installation. These are only necessary when using the spring suspension.

(ii) If desired, a template for cutting the motor board when fitting the Record Changer into the cabinet may be obtained on application to The Garrard Eng. & Mfg. Co. Ltd. After installation see that the Changer is level by placing a spirit level on a record on the turntable. If not level, adjust by means of the spring suspension fixing nuts. Finally, the nuts and threads of the spring suspension fixing screws should be coated with a locking paint such as shellac varnish to prevent the nuts working loose due to vibration.

SPEED SETTING.

Due to the wide voltage range of the motors it may be necessary on some power supplies when installing the unit to make a slight re-adjustment of the speed Indicator Lever so that the speed of the Turntable corresponds with that shown on the Indicator scale.

To set the speed on alternating current power supply of 50 or 60 cycles use the "GARRARD" Stroboscopic Speed Indicator enclosed with each Record Changer. To set speed on direct current power supply or supplies having frequencies other than those covered by the stroboscope, the turntable should be checked with a watch. Set speed so that turntable revolves at 78 r.p.m., remove the turntable and carefully loosen the screw holding the indicator lever to the vertical brake shaft, move the indicator lever to the centre position on the indicator plate and tighten up the screw (diagram 3). On some models the screw is not accessible from the top of the unit. In this case lift the changer from the cabinet and adjust the screw from underneath the unit plate. The speed should now be correct.

One side of the stroboscopic speed indicator is designed for use in adjusting speed on a 50 cycle, and the other side a 60 cycle power supply.

VOLTAGE.

The "GARRARD" Model R.C.65 Record Changer is made in two types:—

R.C.65/D.16 Dual Voltage Range 100/130 and 200/250 volts 40/60 cycles.

R.C.65/U.16 Universal Voltage Range 100/130 and 200/250 volts D.C. and A.C. 25/60 cycles.

On installation, the links in the terminal block should be set to the correct position to correspond with the voltage of the power supply, as shown in diagrams 4 to 7.

A red terminal block cover is fitted to the Universal type (R.C. 65/U.16).

A brown terminal block cover is fitted to the A.C. type (R.C. 65/D.16).

The motor should be earthed by connecting a lead from the earthing tag, located under one of the motor end cover screws and a good earth connection.

When adapting an A.C./D.C. (Universal) Radio Receiver, Amplifier or one using a D.C. Power Pack for the reproduction of gramophone records, a pick-up transformer or condensers in series with the pick-up leads should be fitted, otherwise the pick-up circuit becomes alive. Also, the leads from the radio set or amplifier to the pick-up should be as short as possible to prevent picking up mains hum.

SERVICE ADJUSTMENTS

MOTORS.

The R.C. 65/D.16 is fitted with a governor controlled Induction Motor for use on A.C. only. The stator coils are connected in series on the high voltage range and in parallel on the low voltage range.

The R.C. 65/U.16 is fitted with a governor controlled series wound universal motor for use on A.C. or D.C., and in this case the windings are connected in series with a voltage dropping resistance, a portion of which is shorted out when the motor is used on the low voltage range. A condenser is connected across a section of the resistance to keep the motor torque constant over the frequency range when on A.C.

OILING.

Due to the oil retaining bearings, the motor only requires oiling at intervals depending upon the length of time the Record Changer is used. Lift off the Turntable and the oil holes (diagram 1) are accessable. A few drops of "GARRARD" or thin lubricating oil are sufficient.

Wavy or watery reproduction of the record is often due to dry governor pads. These should be lubricated by saturating the felt pads with a thin oil. Occasionally the governor will rattle badly and the reproduction will be distorted. This is caused by the surface of the governor spindle, on which the governor sleeve slides as the balls fly outwards, becoming dry, and it should be lubricated with a thick oil.

Thick oil should on no account be used for the motor bearings.

STARTING FAILURES.

If the motor fails to start when the control knob is turned to the Start position, first check the power supply and ascertain that the current is reaching the motor terminals. Give the turntable a turn by hand to help it round, in case, when the Record Changer was last used, the motor was switched off during the changing cycle, in which case it is possible for the motor to be unable to start under the full load of the Record Changing Mechanism.

Disconnect the mains supply and examine the terminal block to see that the leads and nuts are tight, also examine the switch contacts, clean and adjust if necessary. If a thick oil has been used to lubricate the motor bearings, the motor will appear weak, and possibly not start. It will be necessary to dismantle the motor, and clean away all traces of the thick oil, it is, therefore, essential to lubricate the motor bearings with a good quality thin machine oil.

In the case of the U.16 Motor periodical examination of the carbon brushes should be made. If they are allowed to become dirty or worn, brush noises will occur, and occasionally the motor may run unsteadily or stop. The brushes can be cleaned by lightly scraping the contact surface with a penknife. The brushes should be a perfectly free sliding fit in the brush tubes. It is essential the brushes should be replaced in the same holder and in the same way round as originally found.

New brushes are $\frac{9}{16}$" long under the Springs. When worn down to $\frac{3}{8}$", they should be replaced. To remove the brushes unscrew the brush caps and the brushes can be withdrawn. If the copper Commutator upon which the brushes rest has become corroded, dirty or greasy, it should be cleaned with a rag damped with petrol or lighter fuel. When finally replacing the brushes always ensure that the brush caps are screwed up tight. Should the motor get too hot first see that the voltage changeover links are set correctly to correspond with the voltage of the power supply. To check the motor windings insert a milliameter in either motor lead. The maximum current should not exceed:—

R.C. 65/D.16	High Range	0.11 amp.
	Low Range 50 cycles	0.22 amp.
	Low Range 60 cycles	0.24 amp.
R.C. 65/U.16	High Range A.C.	0.15 amp.
	Low Range A.C.	0.14 amp.
	High Range D.C.	0.16 amp.
	Low Range D.C.	0.19 amp.

If readings in excess of the above figures are obtained, the motor units or coils should be returned to our Service Department for examination.

If the motor has to be removed from the Record Changer, disconnect the switch leads from the switch and remove the clips holding the leads, then remove the motor fixing screws and the motor can be withdrawn. When withdrawing the motor note carefully how the divided speed control lever parts in two, so that it may be correctly re-assembled when the motor is replaced.

Now refit this screw in an adjacent hole according to the adjustment required. Moving the screw to a hole nearer the platform lengthens the link and increases the inward movement of the platform. By moving the screw in the opposite direction the link is shortened and the outward movement of the platform increased. The permissible adjustment is one hole in either side of existing position of the screw.

RECORDS FAILING TO DROP.

If the records fail to drop correctly, the angle of the record spindle should be checked from the template printed at the end of this manual and corrected if necessary, using great care in doing this as the thin neck of the spindle is very easily broken if unduly bent. If the spindle is correct slide off the name plate on the record platform cover and examine the record pushing pawl (diagram 8). It will be noted that the lower rear tail of this pawl engages a stop at the back of the platform as the platform moves back when a 10" record is to be played. When a 12" record holds the pawl down the lower tip passes over the stop. When the platform is in the playing position, that is, when the changing cycle has finished and the needle is playing the record there should be a gap of approximately $\frac{1}{8}$" between the rear of the pushing pawl and the front of the stop. If this gap is incorrect, the stop can be adjusted by releasing its two fixing screws and moving it backwards or forwards as necessary, finally retightening the screws.

OVERARM.

Note that when a batch of records is on the record spindle and the overarm is lowered thereon, only the pad nearest to the platform should rest on the records. There should be a gap of approximately $\frac{1}{8}$" between the other pad and the surface of the top record. This side of the overarm only comes into action when the last record is a 10". It then prevents the record tipping as the platform moves back leaving the record balanced on the record spindle.

RECORD SPINDLE.

Should an intermittent squeak develop it is probably due to the anti-slip sleeve on the spindle having become dry and may be cured by putting a spot of thin oil between the sleeve and the spindle.

TEMPLATE FOR R.C.65 RECORD SPINDLE.

Should the record spindle be accidentally bent out of position through being dropped or other reasons, the record dropping will be affected. If trouble is experienced with erratic record dropping, lay the record spindle on template and check that it conforms to the shape thereof.

MODEL 65

GARRARD ENG. & MFG. CO. LTD.

PICK-UP DROPPING POSITION.

The pick-up arm has been finely adjusted so that the needle comes on to 10in. records in a 9⅝in. diameter circle and 12in. records in a 11⅝in. diameter circle. These positions were arrived at after checking a very wide selection of records of various makes.

There may be a few records where the record track starts further away from the centre, (i.e., nearer the edge), and in these exceptional cases the needle may alight on the record a few grooves from the start. If the pick-up dropping position were set for these exceptional discs it would not be suitable for average records.

Should the dropping position of the pick-up require adjustment the pick-up adjusting screw — accessible through a hole in the unit plate (diagram 1)—should be turned with the Changer in its start position; that is, with the pick-up arm on its rest.

The pick-up adjusting screw should be turned either to the right or left, according to requirements. A quarter of a turn in either direction will give you the maximum adjustment. After adjustment, switch on, check the dropping position and re-adjust if necessary.

PICK-UP HEIGHT.

The Pick-up should lift sufficiently high for a long needle to just clear the surface of the eighth record on the turntable when the pick-up returns to its rest. If it is necessary to adjust the amount of lift look for the "Adjustment for pick-up lift" shown on diagram 3.

When viewing from back of the Record Changer, this adjustment is immediately underneath the pick-up arm pivot spindle and appears as two similar screw heads. The left-hand head is the locking screw and the right-hand head is the eccentric adjustment screw. To adjust this, first operate the changer and stop when the pick-up arm is moving back across the record to its rest. Loosen the two nuts on the back of the screws, then turn the eccentric adjustment screw as necessary to give the correct height. One half a turn of this screw will give the maximum amount of adjustment. After making the necessary correction, re-tighten the nuts on the back of the screws.

AUTO-TRIP MECHANISM.

The satisfactory operation of the Record Changer depends upon the operation of the auto trip. Occasional adjustment of the auto trip friction spring may, therefore be necessary.

If, at the end of a record, the auto trip does not operate—that is, the pick-up remains at the end of a record—first see that the record has a run-off groove in its centre (as only records with run-off grooves can be played automatically on Record Changers). If the record is in order in this respect see that the trip lever is clear of the unit plate, since any added friction here will prevent it moving in towards the striker. If it is quite free, increase the tension of the friction spring by turning the auto trip friction adjustment screw (see diagram 1) in a counter-clockwise direction; about half a turn is all that should be necessary. This screw is accessible on removing the turntable. Should the changer operate before the end of a record, or a bumping or tapping noise be audible, first examine the trip lever rubber and if it is worn, give it half a turn to present a new surface to the striker. If badly worn, renew. If trip lever rubber is in good condition, reduce the tension of the friction spring by giving the auto trip friction adjusting screw (see diagram 1) half a turn in a clockwise direction.

RECORD PLATFORM ADJUSTMENT.

When despatched from our Works the record platform is set to accomodate records of average dimensions. Occasionally, however, records may be found outside the normal limits; if necessary, therefore, the platform may be adjusted to take them.

To control the platform movement are two adjustable links, each fitted with two screws. One link, with its pivot at the bottom of the platform lever, controls the platform tilt, whilst the other controls the distance the platform pushes inward (see diagram 8).

It is this latter link which may be adjusted to accept records differing from the normal in diameter. To do this, loosen the screw further away from the platform and remove the other screw.

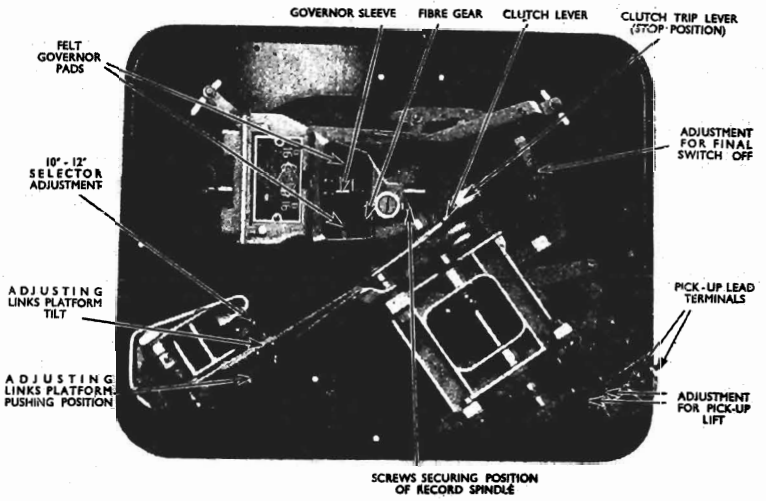

Diagram 8.

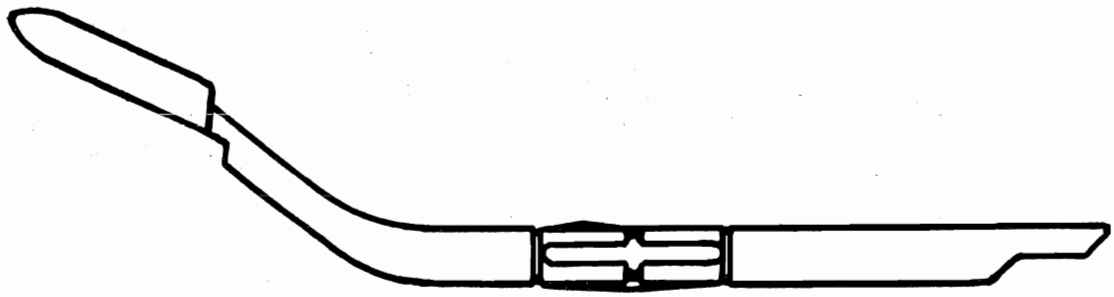

Diagram 9.

ADJUSTMENT TO PICK-UP

"GARRARD" Magnetic types of pick-up are interchangeable with the Crystal type or vice-versa without alteration to the pick-up arm on these Record Changers, provided the pick-up is fitted in a "GARRARD" Head.

All "GARRARD" pick-up heads are of the plug-in type, connections being made by two plugs and sockets at the back of pick-up head.

To remove the pick-up head, unscrew the pick-up fixing screw, withdraw the pick-up, easing the pick-up lead under the arm, and remove the two plug connections from back of pick-up.

If reproduction ceases, or becomes distorted when fitted with a "GARRARD" standard magnetic pick-up, first make sure that the amplifier is in order. Should this be found satisfactory, a slight adjustment to the pick-up may be necessary or the damping rubber may need renewing.

To examine the pick-up proceed as follows: Unscrew the two screws to be found underneath the head, (do not touch the two screws located on each side of the needle), and remove the pick-up unit from the head, then, viewing the front of the pick-up examine the armature to see that it is in the centre of the gap between the pole pieces.

If it is touching one of the pole pieces it must be re-centred. To do this, loosen the two screws holding the adjusting plate, sliding the latter until the armature is in the centre, then retighten the screws.

If the armature will not retain its centre position, it will be necessary to renew the damping rubber. This can be done by removing the adjusting plate, replacing the rubber and re-assembling the plate.

Adjust the plate until the armature is centred before tightening the screws.

The top damping rubber tends to perish in time. It should, therefore, be replaced whenever it appears that the needle stiffness has increased, otherwise excessive record wear may occur.

Distortion may be caused by dirt or foreign matter in the gap between the pole pieces. To remedy, remove the adjusting plate and damping rubber and clean gap.

The pick-up coil winding can be checked for continuity with an ohmmeter.

If a Crystal or High Fidelity Pick-up is suspect, the pick-up head should be returned for examination. A continuity test cannot be carried out on Crystal pick-ups with an ohmmeter.

Crystal Cartridges or High Fidelity Pick-ups must not be opened or the manufacturers will disclaim all responsibility.

GARRARD ENG. & MFG. CO. LTD.

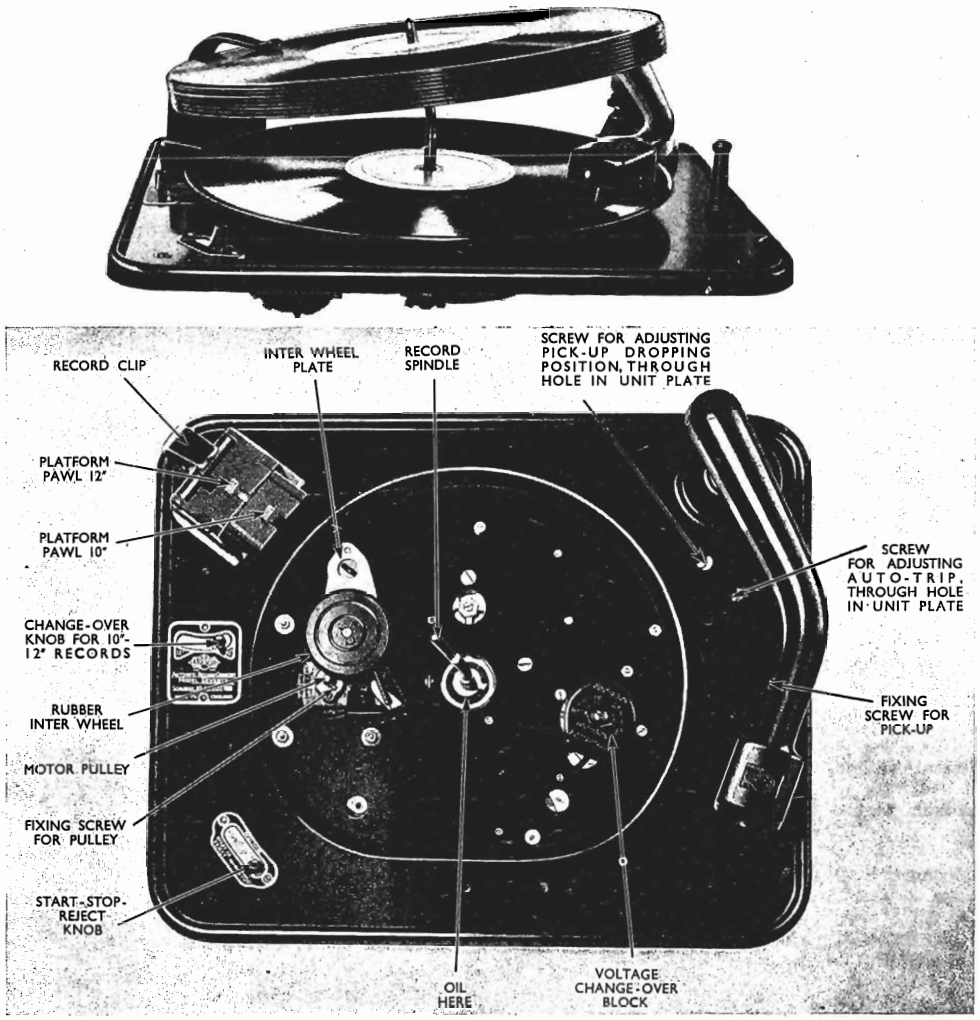

Diagram 1.

OPERATING INSTRUCTIONS

The "GARRARD" Model R.C.70 Automatic Record Changer will play any number of records up to ten 10″ records or ten 12″, not mixed.

To operate the Record Changer proceed in the following order:—

1. If a permanent needle is not used, lift the pick-up head and insert a needle of the type that will play ten or more records. On some models the pick-up head will turn to facilitate needle changing.
2. Place the record spindle in position, the sloping part leaning toward the record platform. Set the record selector knob to 10″ or 12″ according to the size of the records it is desired to play, raise the record clip and place any number up to ten records on the record spindle, their lower edge resting on the record platform, then lower the record clip.
3. Move the front left-hand knob to "Start." The motor will commence to run and the changer operate. When the last record has played, the changer will automatically switch off. To remove the records, raise the record clip and withdraw the record spindle.

To reject a record, move the left-hand knob to the "Reject" position.

The changer can be switched off by moving the left-hand knob to the "Stop" position. If this is done while a record is playing, that record will be automatically rejected and the next record commenced when switching on again.

If desired, one record may be repeated any number of times by placing the record on the turntable, setting the Selector Knob to the size of the record, and switching on with no records on the record spindle and the record clip raised.

When it is desired to stop the record, lower the Record Clip and the changer will automatically switch off at the end of the record.

NOTE.

Should the record changer be stopped with the Pick-up Arm not on its rest, the pick-up should not be handled but the left-hand knob moved to "Start." The Pick-up Arm will then return to its rest.

When the Changer is fitted with a High Fidelity Pick-up of any type, extra care should be taken to avoid accidental damage to the Pick-up and attention should be given to the following points:—

The Changer should not be switched off, either by the switch on the changer, the switch on the set, or the house switch during its changing cycle as this may lead to the pick-up being lowered on the turntable felt when the changer is next used. If it is suspected that the changer has been switched off in the wrong position, place a 12″ record on the turntable before switching on.

Do not use badly warped records, they may not drop and the pick-up would lower on the turntable felt, also badly warped records will give trouble by slipping during playing.

Care should be taken in storing records to prevent contact with dirt and dust which sets up abrasive action and causes rapid wear.

MAINTENANCE.

The motor and intermediate wheel bearings being the oil retaining type will rarely need lubricating. When the need for oil is apparent a few drops of fine machine oil is all that is necessary.

The rubber rim on the intermediate wheel **must** be kept free of oil.

INSTALLATION

DIMENSIONS.

The Cabinet space required for fitting is 15½ ins. long by 13 ins. wide with 5½ ins clearance above and 2½ ins. clearance below the plate.

loudspeaker and pick-up. Ample clearance should be left betweeen the edges of the unit plate and the cabinet to allow the Record Changer to float freely. Diagram 2 illustrates the assembly of the spring suspension.

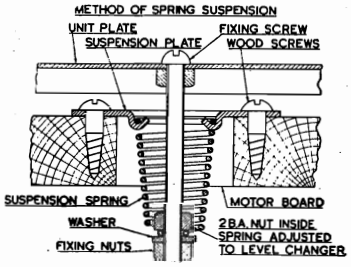

Diagram 2.

In cases where there is no possibility of acoustic feed back occurring, such as where the loud speaker is in a separate cabinet, the spring suspension is not necessary and the changer can be screwed down to the motor board with four of the wood screws supplied for the spring suspension.

Two additional holes will be found in the unit plate; these are for transit fixing screws which should be used to fix the changer rigid to the cabinet during transit and removed on final installation. These are only necessary when using the spring suspension.

If desired, a template for cutting the motor board when fitting the record changer into a cabinet may be obtained on application to The Garrard Engineering & Manufacturing Co. Ltd.

After installation see that the Changer is level by placing a spirit level on a record on the turntable. If not level, adiust by means of the spring suspension fixing nuts. Finally, the nuts and threads of the spring suspension fixing screws should be coated with a locking paint such as shellac varnish to prevent the nuts working loose due to vibration.

FITTING TO CABINET.

The "GARRARD" Model R.C.70 Automatic Record Changer is supplied with spring suspensions to prevent acoustic feed back occurring between the

VOLTAGE.

The "GARRARD" Model R.C.70 Record Changer is suitable for use on 100/130 and 200/250 volts 50 cycles.

A motor driving pulley can be supplied for 40 or 60 cycle mains if desired.

On installation, the links on the terminal block should be set to the correct position to correspond to the voltage of the power supply as shown in diagrams 3 and 4.

The links are set for operating on the 200/250 volts range when the changer leaves the factory, and need only be altered if it is required for use on the 100/130 volt range.

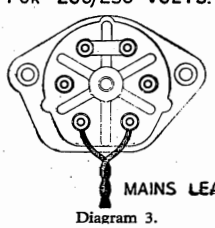

Diagram 3.

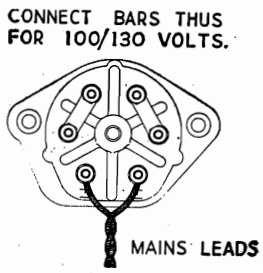

Diagram 4.

The motor should be earthed by connecting a lead from the earthing tag, located under one of the motor end cover screws and a good earth connection.

When adapting an A.C./D.C. (Universal) Radio Receiver, Amplifier or one using a A.C./D.C. Power Pack for the reproduction of gramophone records, a pick-up transformer or condensers in series with the pick-up leads should be fitted, otherwise the pick-up circuit becomes alive. Also the leads from the radio set or amplifier to the pick-up should be as short as possible.

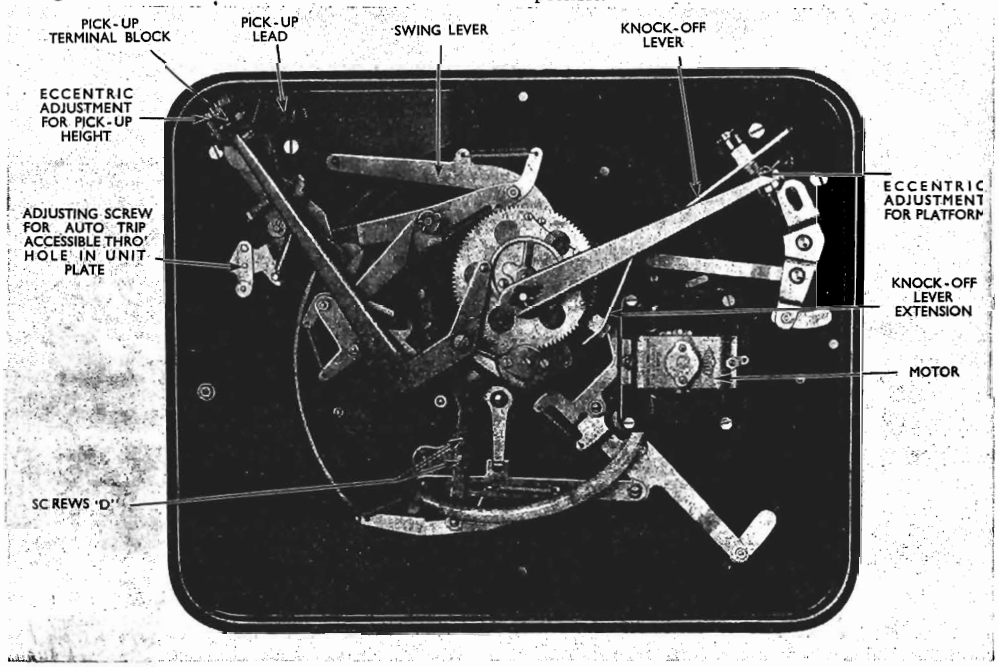

Diagram 5.

SERVICE ADJUSTMENTS

SPEED.

No adjustment for speed is provided on this model, there being no governor, and the motor being of the constant speeed induction type, maintains the turntable at 78 r.p.m.

It is essential that the driving surface of the small brass pulley on the motor spindle, the rubber tyred pulley and the drum of the turntable, be kept absolutely free from all oil or grease. If the speed should become slow or varying, this is the first point that should be checked, and the pulley drum and Intermediate wheel should be cleaned with a rag and a few spots of petrol or lighter fuel.

MOTORS.

If the motor fails to start when the control knob is turned to "start," first check the power supply and ascertain if current is reaching the motor terminals.

Next disconnect the mains supply and examine the terminal block and see that the leads and screws are tight, also examine the switch contacts accessible underneath, clean and adjust if necessary.

If a thick oil has been used to lubricate the motor bearings the motor will appear weak or will not start. It will be necessary to dismantle the motor and clean away all traces of the thick oil. It is, therefore, essential to lubricate the motor bearings with a good quality thin oil.

Should the motor get too hot, see that the voltage change over links are set correctly to correspond with the voltage of the power supply. If correct, check the motor windings by inserting an A.C. milli-ammeter in either motor lead. The maximum current consumption should not exceed 100/130 volts, 50 cycles, 0.26 amp., 200/250 volts, 50 cycles, 0.13 amp.

If readings in excess of the above figures are obtained, the motor unit should be returned for examination.

To remove the motor, first make sure the electricity supply is disconnected, then remove the insulated plate on the underside of the terminal block, underneath the plate will be disclosed the nuts on the screws securing the terminal block to the unit plate—these should be unscrewed and the screws lifted out. The terminal block will then be free from the unit plate and only attached to the motor leads.

Next, while supporting the motor underneath, unscrew the nuts on the three suspension screws, which secure the motor to the unit plate. Before drawing the motor away from the unit plate, make a careful note of the sequence of steel and rubber washers on each suspension screw in order to reassemble correctly when refitting the motor. This is important as the height of the motor in relation to the intermediate wheel is critical.

PICK-UP DROPPING POSITION.

The Pick-up Arm has been finely adjusted so that the needle comes on to 10 in. records in a 9⅝ in. diameter circle and 12 in. records in a 11⅝ in. diameter circle. These positions were arrived at after checking a very wide selection of records of various makes.

There may be a few records where the record track starts further away from the centre (i.e., nearer the edge), and in these exceptional cases the needle may alight on the record a few grooves from the start of the record. If the pick-up dropping position were set for these exceptional records it would not be suitable for average records.

Should the dropping position of the pick-up require adjustment, the pick-up adjusting screw — accessible through a hole in the unit plate, see Diagram 1, should be turned with the changer in its start position, that is, with the pick-up arm on its rest.

The pick-up adjusting screw should be turned either to the right or left, according to requirements. A quarter of a turn in either direction will give you the maximum adjustment. After adjustment, switch on, check the dropping position and re-adjust if necessary.

PICK-UP HEIGHT.

If desired the pick-up height can be adjusted by loosening the nut securing the "Eccentric adjustment for pick-up height," Diagram 5, and adjust the eccentric pivot with screwdriver in slot at back. Finally re-tighten locking nut.

CAUTION.

When making any adjustments to the Pick-up Arm, it should NEVER on any account be forced into position. If the turntable is turned by hand it should NOT be turned backwards.

If the pick-up does not run into the record grooves after alighting on the record edge, see that the record changer is level by placing a spirit level on a record on the turntable. Also make sure that the flexible wire leading to the pick-up is not twisted or held in such a manner as to prevent the free movement of the pick-up arm; also see that the associated levers are free.

AUTO TRIP MECHANISM.

The auto trip mechanism is set to operate when the needle reaches a 1⅛ in. radius, or if it oscillates in an eccentric groove.

Occasionally records having a smaller or larger radius at the end of the playing grooves, are encountered. If it is desired to adjust the mechanism to take these exceptional records, the screw visible through hole in unit plate (Diagram 1) should be adjusted.

To make the trip operate earlier for larger radius records loosen the screw, and holding the pick-up arm steady, move the screw a shade towards the turntable. To make the trip operate later for small radius records, move the screw away from the turntable.

After each adjustment check with record, and re-adjust if necessary. Finally retighten the screw.

It is emphasised that this screw should be moved a barely visible amount at each adjustment.

RECORD PLATFORM ADJUSTMENT.

When despatched from our Works the record platform is set to accommodate records of average dimensions. Occasionally, however, records may be found outside the normal limits; if necessary, therefore, the platform may be adjusted to take them.

To set the platform, the nut locking the "Eccentric adjustment" for Platform, Diagram 5, should be loosened, and with the mechanism set for 12 inch records, the pick-up arm in the playing position, and the largest 12 inch record available loaded on the platform, turn the "Eccentric Adjustment" until there is a gap of not more than ⅛" between the edge of the record and the front edge of the platform pawl. Finally retighten the locking nut.

If the changer fails to drop either 10" or 12" records, the above adjustment should be carried out.

AUTO STOP.

When the last record on the platform drops on to the turntable, it allows the record clip to fall and this unlocks the auto stop which should switch off the motor at the end of the record. If when the last record has been played and the record clip has fallen the mechanism does not automatically stop, the following procedure should be carried out.

1. Compare the underside of the record changer with diagram in the Service Manual and find the "Swing Lever" and the "Knock-off Lever." Note that in the upper edge of the knock-off lever there is a step. With the record clip lowered and the needle removed from the pick-up head, start the changer with a hand on the turntable, slow it down to the slowest possible speed at which the mechanism will operate. Move the control lever to the "Reject" position. The swing lever should now move outwards until it engages the step on the knock-off lever and should remain engaged until the record changer switches off. If the swing lever does not engage the step but passes over it, proceed as at (a) to correct. If the swing lever engages in the step, set as at (b) following.

(a) Load two records on the platform spindle in the usual way. Lower the record clip and start the changer The first record will now drop on to the turntable leaving one remaining on the platform. Again, with the hand operating as a brake to slow down the turntable, move the control lever to the "Reject" position. The tip of the step on the knock-off lever should now clear the surface of the swing lever in its outward movement by 1/64". If this dimension is incorrect, stop the changer when the swing lever is directly over the step in the knock-off lever. The knock-off lever is divided into two parts which are held together by a screw

and a rivet. Loosen the screw to adjust the height of the lever until the 1/64" clearance is obtained, then retighten the screw. Finally re-check the changer with the record clip lowered to ensure that the swing lever engages the step. Should the auto stop still fail to operate, set as at (b) below.

(b) Loosen the screws at D (Diagram 5) and bring the two parts of the lever together in order to shorten slightly the effective length and retighten the screws. Check and repeat the adjustment if necessary until changer operates correctly.

PICK-UP.

"GARRARD" Magnetic types of pick-ups are interchangeable with the Crystal type or vice-versa without alteration to the pick-up arm on these Record Changers, provided the pick-up is fitted in a "GARRARD" head.

All "GARRARD" pick-up heads are of the plug-in type, connections being made by two plugs and sockets at the back of the pick-up head.

To remove the pick-up head, unscrew the pick-up fixing screw, withdraw the pick-up, easing the pick-up lead under the arm, and remove the two plug connections from back of pick-up.

If reproduction ceases, or becomes distorted when fitted with a "GARRARD" standard magnetic pick-up, first make sure that the amplifier is in order. Should this be found satisfactory, a slight adjustment to the pick-up may be necessary or the damping rubber may need renewing.

To examine the pick-up proceed as follows:—

Unscrew the two screws located underneath the Base Plate of the Pick-up Head, when the plate carrying the pick-up unit can be removed from the cover. Be careful not to loosen or disturb the two screws located one each side of the needle holder on the inclined portion of the base plate, otherwise the adjustment of the pole pieces will be upset. By viewing the pick-up unit from the front, examine the armature to see that it is in the centre of the gap between the pole pieces.

If it is touching one of the pole pieces, it must be re-centred.

To do this, loosen the two screws holding the adjusting plate, sliding the latter until the armature is in the centre, then tighten the screws.

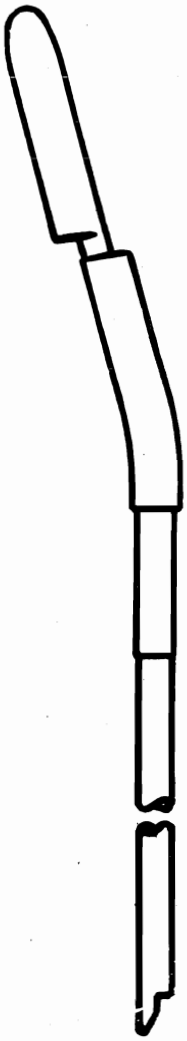

Diagram 6.

If the armature will not retain its centre position, it will be necessary to renew the damping rubber. This can be done by removing the adjusting plate, replacing the rubber and re-assembling of the plate.

Adjust the plate until the armature is centred before tightening the screws.

The top damping rubber tends to perish in time. It should, therefore, be replaced whenever it appears that the needle stiffness has increased, otherwise excessive record wear may occur.

The pick-up coil winding can be checked for continuity with an ohmmeter.

If a Crystal or High Fidelity pick-up is suspect, the pick-up head should be returned for examination. A continuity test cannot be carried out on Crystal pick-ups with an ohmmeter.

Crystal Cartridges or High Fidelity Pick-ups must not be opened or the manufacturers will disclaim all responsibility.

TEMPLATE FOR RC 70 RECORD SPINDLE.

Should the record spindle be accidentally bent out of position through being dropped or other reasons, the record dropping will be affected. If trouble is experienced with erratic record dropping, lay the record spindle on the template and check that it conforms to the shape thereof.

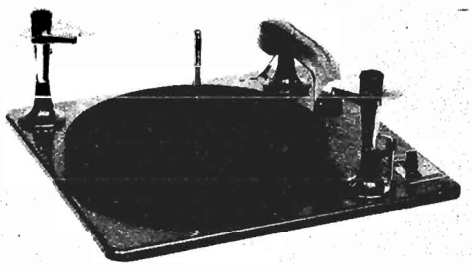
GENERAL ELECTRIC CO. MODEL P2



GENERAL

This record changer is designed to operate from a power supply of 105-125 volts a-c, 60 cps. It will automatically play twelve 10-inch records or ten 12-inch records at a single loading.

MANUAL OPERATION

1. Turn selector arm knobs so that the blades will permit a record to slip down the spindle onto the turntable.
2. Move the control knob to the MANUAL position.
3. Gently place tone arm on the first groove of record and when finished playing return the tone arm to its rest position.
4. Stop turntable rotation by moving switch plate knob to the OFF position.

AUTOMATIC OPERATION

1. Lift and rotate the selector knobs and position them for 10-inch or 12-inch records, as desired. The arrow should point directly at the spindle.
2. Place up to either twelve 10-inch or ten 12-inch records on selector arms. Do not intermix 10- and 12-inch records.
3. Move control knob on switch plate to REJECT position and release it. The changer will now play the entire stack and repeat the last record.
4. To shut off the record changer before or after all records are played, move control knob to OFF and lift the tone arm and move out to the rest position.
5. If you wish to reject a record before it has finished playing, move the control knob to REJECT and release it. The changer will reject the record and then continue to play the remainder of the stack.
6. To unload records, turn the control knob to OFF. Remove any remaining records on the selector arms. Lift and turn selector arm knob until arm clears records, then remove records from turntable.

OPERATION PRECAUTIONS

1. Use only unwarped records for automatic operation. For warped, odd-size or home-recorded records, play as for manual operation.
2. Never use force to start or stop the motor or any part of the record changing mechanism.
3. Do not store the records on the record post or on the turntable as they may warp, especially if the temperature is high.
4. Do not allow oil or grease to come in contact with the drive wheels or any rubber part.

LUBRICATION

Use light grease (Lubriplate or equivalent) on the following:
1. Cam surfaces.
2. Gear teeth.

Use light machine oil on the following:
1. All shafts.
2. Turntable spindle.

Do not lubricate:
1. Clutch engagement lever (6).
2. Idler wheel rim.
3. Turntable rim.

PICK-UP

A special General Electric magnetic pick-up is used with this changer which will give superior results from the standpoint of high fidelity, low surface noise, and negligible record wear. This pick-up is not replaceable with a crystal pick-up as the ratio of output levels of the two types is at least 70 to 1, the pick-up supplied having an extremely low output.

The pick-up is supplied with a semi-permanent type stylus. Dust and foreign matter should be removed with a soft brush. Make sure the stylus arm is centered between stops. The clearance should be maintained on both sides at 9 to 11 mils.

CYCLE OF OPERATION

NOTE—All reference numbers used in this explanation are shown on an illustration.

INITIATING THE CYCLE:

Pushing the *control button* (50) from OFF to REJECT positions turns the power ON and starts the changer into automatic operation. This movement transferred to the *control slide* (1) causes the *power switch* (2) to be actuated by its arm which rides in the eccentric groove (A) in the control slide. Simultaneously, the *control slide* (1) moves the *reject slide* (4) towards the center of the record changer, which moves the *trip lever* (5) sufficiently to disengage it from the *clutch engagement lever* (6). This *clutch engagement lever* (6) and *trip lever* (5) are mounted on the *drive gear* (8). When the *control knob* is released, it returns from REJECT to AUTO position.

CYCLING:

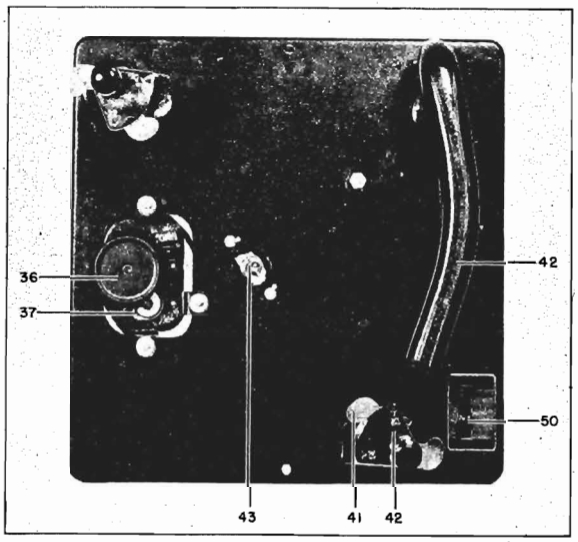
The release of the *clutch engagement lever* (6) caused the *lug* (D) on the rotating *pinion gear* (7) to strike the extended portion of the *clutch engagement lever* (6) so as to push the *drive gear* (8) sufficiently so that its teeth enmesh with the *pinion gear* (7). (The open section of the *drive gear* (8) permits the pinion gear to rotate freely, except during the change cycle.) The rotation of the *drive gear* (8) results in the following cam actions:

1. The vertical *cam* (E) moves the tone arm *lift pin* (9), thus raising the tone arm.

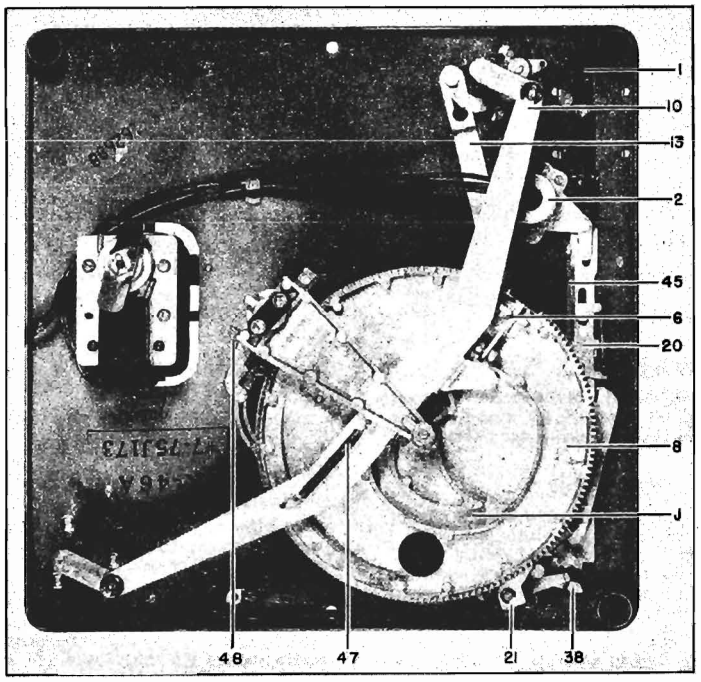
2. The *cam* (J) actuates the *drive link* (10) that induces a quarter turn by which the *selector arms* (42) release a record.

3. Surface (H) on the locked *tone arm lever* (11) resets the trip by latching the *clutch engagement lever* (6) to the *trip lever* (5).

4. Cam surface (G) moves the tone arm *latch lever* (21) so as to unlatch the *tone arm lever* (11) at the point of latching. Thereafter the *stud* (K) on the *tone arm lever* (11) follows the receding *cam* (F).



Top View of Record Changer



Bottom View of Record Changer

5. Spring pressure from the ***tone arm locator*** (12) moves the ***tone arm lever*** (11) and tone arm toward the record. Selector arm settings determine the point at which the ***tone arm locator*** (12) stops at the surface on the ***reset slide*** (13).

6. ***Stud*** (K) is contacted by the ***retard lever*** (14) holding it in position during the time of the lowering of the needle on the record.

7. ***Tone arm lift pin*** (9) follows the vertical ***cam*** (E) on the ***drive gear*** (8) and lowers the tone arm to the record. After the needle has touched the record, the ***booster spring*** (15) exerts a slight pressure, causing the needle to enter the starting groove of the record.

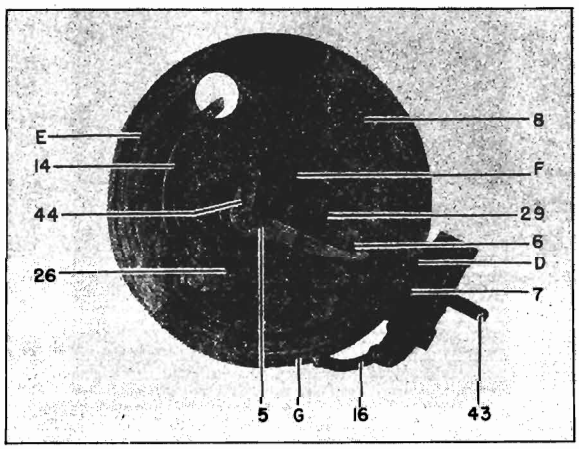
8. As the needle starts in the groove, ***drive gear*** (8) completes its rotation and is locked in open-tooth position by the drive gear ***stop lever*** (16) in the detent in the ***cam*** (G).

TRIP ACTION:

When the record has finished playing, the needle enters a center spiral groove of the record. This starts a new change cycle by either of two actions releasing the ***clutch engagement lever*** (6).

1. Minimum diameter cut-off occurs when the ***trip shoe*** (17) strikes the ***trip lever*** (5).

2. Eccentric groove cut-off occurs when the tone arm is moved away from the ***spindle*** (43). The sawtooth edge of the ***trip plate*** (fastened to tone arm lever, 11) engages and moves the ***trip dog,*** causing the ***trip lever*** (5) to function.



Drive Gear Assembly

MANUAL OPERATION:

With the control knob in the MAN position, the ***control slide*** (1) causes four conditions to exist.

1. The ***motor switch*** (2) is turned ON.

2. The end of the ***control slide*** (1) acting through the manual ***latch lock*** (38) partially disengages the ***tone arm latch lever*** (21) from its locked position. It now serves as a detent for the tone arm while in rest position and prevents its movement due to accidental bumping.

3. The ***manual lockout*** (20) on the ***control slide*** prevents the ***tone arm locator*** (12) from moving inward, thereby permitting free movement of the tone arm by hand.

4. The ***reject slide*** (4) is in position so that the ***clutch engagement lever*** (6) is held, preventing tripping.

SERVICE ADJUSTMENTS

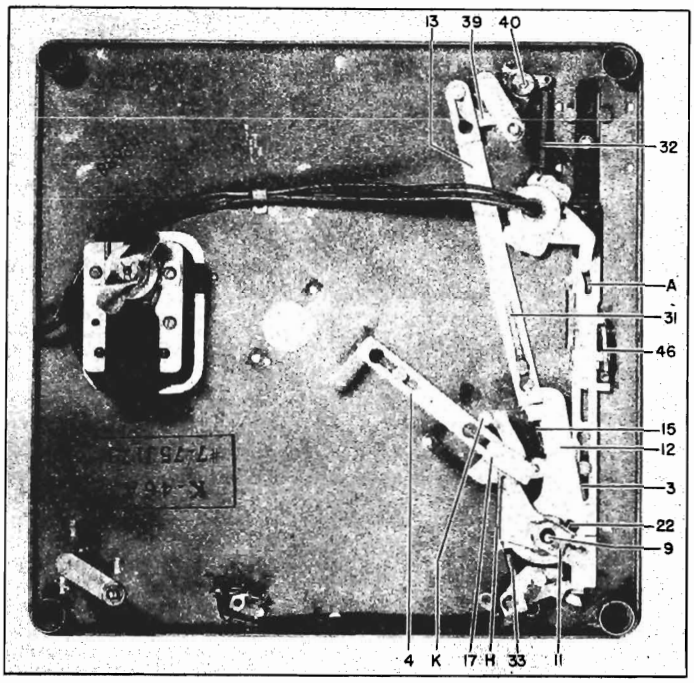
A. SELECTOR ARM AND BLADE (41) (42):

The leading edge of the ***blades*** (41) must be smoothly rounded and well polished. The ***blades*** (41) must be very free in their mounting so that they will return to normal position by their own weight. The ***selector arms*** (42) must be parallel with each other, and must be synchronized so that a record will drop evenly onto the turntable.

If the blades need adjustment, place a 10-inch record of average thickness (.074 in.) on the selector arms and manually rotate the turntable clockwise until the selector blade contacts the record. The blade must rise after it first contacts the edge of the record. This rising action results whenever pressure is applied to the leading edge of the ***selector blade*** (41). The blade may be adjusted by bending, very slightly, to correct position (use pliers with tape-lined jaws). The height to which blades are set must be less than the minimum record thickness, otherwise the blade will attempt to change two records at a time, due to the cam action which ***always*** operates in an ***up direction.*** When necessary, make the same adjustment on the 12-inch selector blades, using a 12-inch record (approx. .090 in. thick).

B. INCORRECT LOCATOR SPRING TENSION (33):

Insufficient tension in the ***locator spring*** (33) will produce erratic or incorrect tone arm landing since the ***locator*** (12) will not seat in the fixed 10-inch or 12-inch indexing position. It will also result in jerky action of the ***tone arm*** (42), since the ***tone arm lever*** (11) will not accurately follow the cam surface of the ***drive gear*** (8).



Bottom View of Record Changer Less Drive Gear

Excessive tension in the *locator spring* (33) will result in a stiff, heavily loaded "feel" as the tone arm is moved into rest position. It may also produce a stiff action of the *control slide* (1) and cause increased wear of the moving parts.

C. *TONE ARM HEIGHT:*

The height to which the *tone arm* (42) rises is correct when there is an approximate $\frac{1}{16}$-inch clearance between it and the bottom of a 10-inch record on the *selector arms* (42). This clearance is regulated by the tone arm *adjusting screw* (23), see Figure 5.

The down position of the tone arm is fixed by *lug* (R) on the tone arm hinge assembly. The correct height is that which will allow the bottom edge of the tone arm and cartridge to clear the turntable surface by approximately $\frac{1}{16}$ inch. This adjustment may be corrected by a slight bend of the *lug* (R).

D. *TONE ARM POSITIONING:*

If the tone arm landing is not corrected by adjustment B, the following procedure may be used: Set the *control knob* (50) in the OFF position with power plug out and place a 10-inch record on the turntable. Set the selector arms (10-inch) so the arrows point directly at the spindle. Loosen the Allen socket *cap screw* (22) just enough to allow the *tone arm lever* (11) to still hold its position. Line up the tone arm's outer edge evenly with the panel edge. This gives the tone arm an approximate setting. Push the control knob to REJECT and release it. Rotate the turntable clockwise and observe where the needle first touches the record. This should be about one-eighth inch from the edge. Variations should be corrected by slipping the *tone arm lever* (11) in the correct direction. *Caution*—Before tightening the Allen screw, make certain that there is enough vertical clearance in the tone arm shaft to avoid binding while the tone arm swings.

E. *STYLUS PRESSURE:*

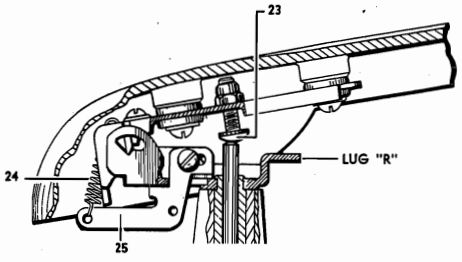
The stylus pressure on the record is controlled by the *counter-balance spring* (24) in back of the tone arm. The pressure is variable through the counter-balance adjusting *slide* (25). The needle pressure should be 1–1½ ozs.

F. *TRIP SHOE (17):*

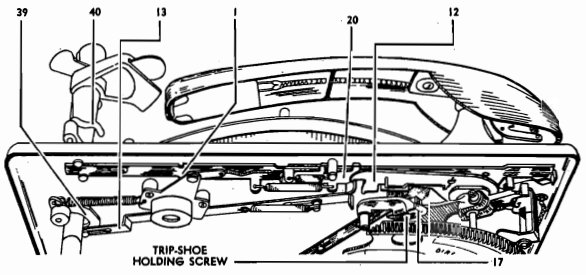
The *trip shoe* (17) located on *tone arm lever* (11) is movable and loosening its holding screw permits it to be adjusted as required. This adjustment is correct when the needle is 1⅞ inches from the record center and the trip shoe pushes the *trip lever* (5) which releases the *clutch engagement lever* (6).

G. *TURNTABLE REMOVAL:*

The turntable should be removed by lifting carefully, tapping spindle *lightly* if necessary. This will expose top spindle bearing. When replacing turntable, the slot in hub must seat properly over the spindle pin. (Rotate 180 deg for best fit.) Push idler wheel in while lowering, so rubber rim will not be damaged by turntable edge.



Tone Arm Adjustments



Bottom View of Record Changer

MODEL P2 GENERAL ELECTRIC CO.

TROUBLE SHOOTING CHART

SYMPTOMS	REMEDIES OR CAUSES
RECORD SELECTION	
1. Record jams, prevents changer from working.	1. (a) Check adjustment A. (b) Odd-sized, warped, or damaged records. Play in "MAN" position.
2. Record drops from one side only.	2. (a) Check center hole in records—probably too large. (b) Check adjustment A.
3. Records drop more than one at a time.	3. (a) Check adjustment A.
TONE ARM MOVEMENT	
1. Needle lands incorrectly.	1. (a) Check adjustment B. (b) Tone arm *retard lever* (14) binds; check spring. (c) Check adjustment D.
2. Needle fails to feed in after landing.	2. (a) Check *booster spring* (15)—probably too weak.
3. Needle lands properly on record but slides in on record.	3. (a) Check for broken stylus in pick-up. (b) *Booster spring* (15) too strong. (c) Check adjustment C.
4. Tone arm hits bottom record on selector arms during cycling.	4. (a) Check adjustment C.
TRIPPING-CYCLING	
1. Changer fails to trip.	1. (a) Check adjustment F. (b) Tight tone arm lead wire. (c) *Clutch engagement lever* (6) not unlatching. Clean, do not lubricate. (d) *Trip lever* (5) binding at pivot point and failing to unlatch *engagement lever* (6).
2. Changer repeats tripping.	2. (a) *Clutch engagement lever* (6) fails to latch. Examine *trip lever* (5) for bind or weak *trip lever spring* (29). (b) Control knob binding in REJECT position. Check *control slide* (1) or its associated assembly. (c) Failure of *stop lever* (16) to properly detent drive gear.
MOTOR	
1. Change is sluggish or motor overheats.	1. (a) Check lubrication—oil old or gummy. (b) Incorrect line voltage. (c) Defective motor winding. (d) Check binding of moving parts.
2. Motor rumble or "wow" heard in record reproduction.	2. (a) Worn rubber rim on drive wheel. (b) Shipping bolts not removed from motor board. (c) Check for binding of spindle. Oil sparingly if necessary.

REPLACEMENT PARTS LIST

Cat. No.	Symbol	Description
RAC-017		COVER—Switch cover

All Series 700 Record Changers are of the single post, fully automatic drop type, featuring single button control and eccentric spindle cam record selection. The series 700R Record Changer has the record support platform in the left rear corner. Series 700F has the record support platform in the left front corner.

OPERATION

Starting - when the switch Button (58-73096) is moved to the "ON" position, power is connected to the Motor (56-73555) causing the Turntable Assy. (66A74682) to rotate, and automatic cycling, which is required to drop the first record, is accomplished by pulling the Switch Plate (10-74368) in the direction indicated by the arrow. When automatic cycling is started the Manual Trip Lever (55-73102) is advanced until it contacts the Cam Trip Lever (55A74833) mounted on the Main Cam (43-73159) which moved sufficiently to permit the spring loaded Pinion Actuating Lever (55A74813) to function, which, in turn, lifts the floating brass Pinion Assy. (28A73704) directly beneath the spindle so that a projection on this floating Brass Pinion is caused to engage a finger on the adjustable collar (65-73595) fastened to the Turntable Hub.

The combination of the foregoing causes the turntable to become connected with the Main Cam which through its single revolution performs all of the required change cycle functions. It is to be noted that, except during the change cycle, the motor power is used only to revolve the Turntable.

Cycling - As the Main Cam rotates, the spring loaded lever which actuates the Floating Pinion is automatically depressed and thus reset for the next change cycle.

At the end of the change cycle the Motor power is disconnected from the change mechanism when the Plastic Washer mounted on the Floating Brass Pinion drops into a depression on the top edge of the rim of the Main Cam. This position, called home position of the Main Cam, is retained by a Leaf Spring (33-72963) detented in the cam hub.

Record Selection - Record Selection is accomplished during one complete revolution of the Eccentric Cam Assy (43A72960) at the top of the lower section of the spindle. This portion of the change cycle is accomplished when the extended section of teeth of the Main Cam engages and rotates the Spindle Cam Pinion (28-73084). The home, or in line position of the Record Selection Eccentric Cam is retained by a Leaf Spring (33-73135) which detents into a slot in the underside of the Spindle Cam Pinion. Successive record drops are accomplished by a repetition of this action.

MODELS 700F, 700R GENERAL INSTRUMENT CORP.

Pickup Arm Movement - The movement of the Tone Arm Ass'y. (69A73087) during cycle is controlled entirely by the surface and grooving of the Main Cam. These movements are picked up by the Sweep Lever Assy. (55A73045). After a record has been played or when it is rejected, the Trip mechanism causes the Main Cam to rotate which, in turn, lifts the Tone Arm off the records sweeping it clear to permit a record to drop and returning it to the edge of the record. The Tone Arm Support mechanism is so designed to permit the Tone Arm to be handled during any part of the change cycle without damage to the mechanism. This is accomplished by two spring loaded Mating Cams (43-73069) (43-73113) which disengage when any restraint prevents it from following the motions of the Sweep Lever. The Tone Arm is also vertically spring loaded allowing it to be lifted upward to an almost vertical position to permit ready changing of needles or cartridge.

Automatic Trip - This trip is so designed that it will start the automatic cycling mechanism when the Tone Arm moves toward the Spindle at a rate of speed greater than 1/8" per revolution of the Turntable. This Trip, therefore, is practically universal as it will operate on any center leading groove or center eccentric circle groove records conformin g to RMA specifications. However, the Trip does not become operative except within a distance of approximately 3" from the Spindle. Thus, manual resetting of the Tone Arm is possible at distances greater than 3" from the Spindle.

The Velocity Trip is composed of three major elements: The Trip Lever Assy (55A73042), the "V" Lever (55-72966) and the Crescent Lever (55-73066). The Trip Lever and "V" Lever work together through a Friction Clutch (10-72953), the tension for which is maintained by a Coil Spring (33-73334) which is one of the elements in the assembly of these two parts. As the Tone Arm moves toward the spindle center, the sickle shaped section of the Sweep Lever comes into contact with one leg of the "V" lever causing the tip of the Trip Lever to move toward the center of the Turntable by energy transmitted through the Friction Clutch. This movement continues until the tip of the Trip Lever is in the range of the Finger of the adjustable Collar mounted on the Turntable H ub. Once this position is attained and so long as the movement of the needle toward the Spindle is less than 1/8" per revolution the tip of the Trip Lever will be retarded from further movement by being pushed away once during each revolution of the Turntable. This retarding movement means that the Friction Clutch slips a corresponding amount. When the needle moves into a fast spiral or an eccentric center groove of the record, the tip of the Trip Lever will move so rapidly toward the center of the Spindle it will allow the tip of the Crescent Lever to slide off the flat surface of the Cam Trip Lever and engage itself behind the Lever. In the next revolution of the Turntable the finger on the adjustable Collar will force the Trip Lever outward causing the Crescent Lever to move the Cam Trip Lever far enough to unlatch the Floating Pinion Actuating Lever, thus setting up the change cycle as previously described.

10" and 12" Operation - The 10" and 12" indexing is determined by the main cam by allowing the sweep lever pin to enter either the 10" or 12" indexing track. This switching is controlled by means of a Frog (12-73060) which is moved from one side to another by the Frog Actuating Lever Assy. (55A73886 Rear) or (55A74605 Front) extending from the Record Support Ass'y. (62A73129 Rear) or 62A74720 Front). This lever shunts the sweep lever pin into the indexing track dependent upon whether the record support is pushed toward or away from the spindle for 10" or 12" records.

ADJUSTMENTS

Tone Arm Index - The tone arm should be indexed at the start of every record approximately 1/8" from the edge for both the 10" and 12". If the needle index is too far in or out, this this may be corrected by loosening one of the two set screws found in the lower cam located in the bottom of the tone arm approximately ½" above the top of the motorboard, and advancing the other set screw sufficiently to bring about proper indexing. The proper setting having been obtained, both screws should be locked tightly. This action is accomplished by means of the two screws contacting a flat on the vertical shaft at an angle that will cause the shaft to turn with any movement of either screw.

Adjustment of Record Support - When the record is centralized with the lower part of the spindle, the record support platform in both 10" and 12" position should clear the edge of the record by approximately .015" (1/64). To move this setting for the 12" record, it is necessary to advance or retract the set screw nearest the spindle on the upper part of the support beneath the motorboard. The screw farthest away from the spindle will adjust the 12" position in a similar manner.

Spindle Alignment - If the spindle eccentric cam is not lined up perfectly with the lower part of the spindle while out of cycle, the main cam should be moved to its home position as determined by its detent spring and the spindle pinion gear should also be moved to its home position as determined by its detent spring. Loosen the set screws in the hub of the spindle pinion gear and line up the eccentric with the spindle, then tighten set screws.

The spindle cap should be positioned so that the slide is pointing towards the center of the record support. This may be positioned by loosening the screws on the square retaining bar found in the lower bracket. There should be approximately .005 total vertical play in the spindle assembly after both adjustments to prevent binding.

Main Cam Frog Movement - When the record support is in the 12" position, the phosphor bronze spring that actuates the 10" or 12" selector Frog pin should be high enough to clear the frog pin. When the record support is in the 10" position this spring should cause an interference with the frog pin enough to move it into position to shunt the sweep lever pin into the 10" indexing track. This spring is slit for the purpose of easy adjustment. If this spring does not move the frog enough, it should be rebent to do this. It should be remembered that the frog is so constructed that as the sweep lever pin goes past it, it will automatically reset the frog in the 12" position, and to play a 10" record this pin must be reset by the spring everytime.

Removing Turntable - To remove the turntable for any reason, remove the small horseshoe-like spring found around the spindle near the turntable top. Then make sure that the trip lever is moved far enough away from the turntable center to allow it to clear the extremities of the bakelite washer of the floating pinion. The turnable may then be removed by lifting up. In replacing the turntable care should be taken to see that the idler tire is properly positioned within the I.D. of the turntable and that the trip lever is also out of the way so that it will not be bent by the bakelite pinion gear washer.

Adjustment of Tone Arm Height - If tone arm needle does not clear a stack of records, loosen the set screw securing the vertical tone arm shaft underneath the motorboard and raise the shaft up. In some extreme cases the zinc sweep lever itself may be bent. If the needle is set too high to play the first record, retract the set screw found on the top of the motorboard directly behind the tone arm.

DIFFICULTIES

Failure to Feed Record - This could be caused by the spindle eccentric cam not lining up with the lower spindle sleeve at the end of its cycle. First determine whether the detent spring is in the pinion depression. If this is so, and it is still out of alignment, loosen the screw and adjust as previously explained under SPINDLE ALIGNMENT. Secondly, check the position of the record support as previously explained. Check the record thickness for a maximum of .10" at center hole (RMA maximum thickness).

Drops two or more Records at Once.- Check thickness of record at center hole. Record should be not less than .070" at this point. If the records are within this RMA minimum, check the spindle slide. It should be flush to .020" below the bottom of the spindle cap. If it is too low file it off, if it is too high remove the pin in the cap and file the slot to get the proper dimension. This pin is held in the cap by a light knurl fit and can be easily replaced. Be careful not to bend the spindle rod during this process.

If two records still drop, check the record support setting (see above). N ote: Proper record diamenter for all settings of the record support should be:

9-7/8" ± 1/32 for the 10" record
11-7/8" ± 1/32 for the 12" record (RMA STANDARDS)

Continuous Trip - This is caused by the floating pinion not dropping far enough away from the projection of the collar on the turntable hub. Make sure the main cam is in home position and that the floating pinion falls in the depression of the cam edge and remains there until the record is completed. Rotate the turntable to make sure that the collar clears it by approximately 1/32. Reject the changer and check to insure approximately 3/64 or better engagement with the collar finger. Check the manual trip lever to make sure it clears the cam trip lever.

No Tripping - If the changer wont trip manually, check the manual trip lever to make sure it moves the cam trip lever enough to unlatch the pinion actuating lever. This action should occur before the switch plate reaches its maximum allowable rotation.

No Automatic Trip - Check the pickup lead to make sure it is not binding the tone arm movement, particularly as the needle approaches the spindle. Check the V lever to make sure it rotates freely and the clutch has movement. Put the cam in home position and make sure the crescent trip lever is free and contacts the flat side of the cam trip lever. Move the V lever and make sure the clutch imparts enough force to the trip lever to allow the crescent lever to move along the flat and drop behind the trip lever. There should be no friction or binds in any of these mechanisms. Non-tripping can be caused by any binds or by too tight or light a spring load on the crescent. This spring load is adjustable by anchoring the crescent lever spring in any one of three holes.

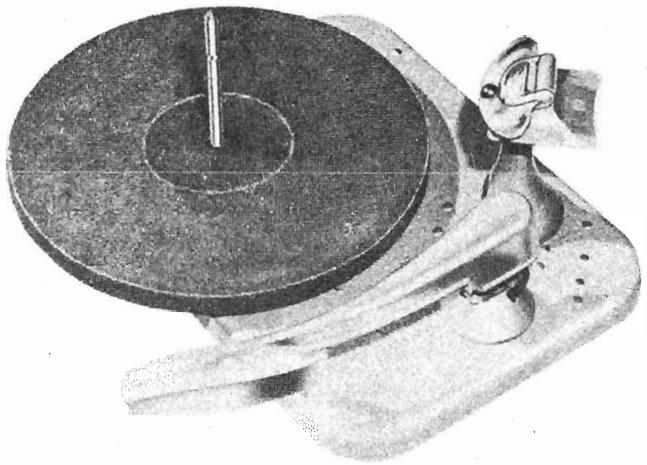
MOTOROLA INC.

MODELS RC-30-A, RC-34, RC-35



GENERAL INFORMATION

RECORD CHANGER RC-30-A. Record Changer RC-30-A is a single-post changer designed to play automatically, 10 ten-inch or 8 twelve-inch records, not intermixed. The "motor" and "reject" switches required to operate this changer are part of the radio receiver. Pushing the "R" button will energize an electro-magnet and start the changing cycle. However, from then on, at the end of each record, the cycle is started mechanically and the trip coil is no longer required.

That method of rejecting records is the essential difference between the RC-30 and the RC-30-A changers. The RC-30 used an electrical solenoid coil each time a record was dropped.

The top appearance of the two changers is identical, but the RC-30-A can easily be identified on the under side by the position of the rejecting coil. The coil is near the gear arm on the RC-30, but it is close to the outer edge of the mounting plate on the RC-30-A.

RECORD CHANGER RC-34. Same as RC-30-A except all painted parts are red mahogany (instead of green) and rubber shock mounts are used in place of spring cushions for mounting changer in radio cabinet.

RECORD CHANGER RC-35. Same as RC-30-A except all painted parts are red mahogany instead of green.

IMPORTANT POINTS TO REMEMBER WHEN SERVICING RECORD CHANGERS

WARNING: Do not lift the record changer by record post or record support platform. Always lift the changer by its base only.

IMPORTANT: Final adjustments on record changer are to be made with the changer horizontal and supported by its 4 corners. AVOID DISTORTING THE BASE WHEN MAKING FINAL ADJUSTMENTS.

CHECK THE RECORD FIRST

Before attempting to service or adjust the record changer, check the records first to make sure they are not causing the trouble. This instrument will handle most of the 10 or 12 inch records available on the market, but it is not guaranteed to handle all of them. Records must be in good mechanical condition and should not be chipped, particularly around the center hole. Do not try to play automatically, records that are too thick, too thin, or that are oversized or undersized, in regard to the diameter of record or center hole. Do not mix 10 and 12 inch records on the changer.

Warped records can slip on the turntable and introduce "WOWS". Such records may be flattened by placing between the two pieces of flat plate glass and then heating in the sun or oven. Do not overheat. Allow record to cool for several hours before removing glass.

Old records, made before the days of automatic record changers, may not change automatically, due to the difference in thickness, or to lack of the proper groove at the finish. Most of the old records, however, may be played one at a time.

RECORD CHANGER OPERATION

(Throughout the following instructions, refer to Figure 1).

WHICH RECORDS CAN BE PLAYED

As many as 10 ten-inch or 8 twelve-inch records may be placed on the record changer which will play them all in sequence, repeating the last record until the instrument is turned "OFF". Do not overload the instrument by attempting to stack more records on it at one time.

This record changer will accommodate most 10 and 12 inch records now available on the market, but is not guaranteed to handle all of them. Records must be in good condition, as no record changer will operate properly with chipped or warped records. Records in which the center hole is worn or chipped should not be played automatically on this changer.

Occasionally, a new record may fit tightly over the center spindle due to the label attached to the record not being properly centered. This condition may be readily remedied by reaming out the center hole with a hexagonal lead pencil.

When operating this automatic record changer, play only the size record for which the adjustment on the record support plate indicates. Do not inter-mix 10 and 12 inch records.

MODELS RC-30-A, RC-34, RC-35

MOTOROLA INC.

TO LOAD RECORDS

1. Adjust the Record Support Plate

The turning of the record support plate automatically adjusts the changer for either ten or twelve-inch records. For playing ten-inch records the numeral (10) will be nearest the record post.

2. Adjust the Record Clamp

This clamp is mounted on the record support plate, and serves to steady the stack of records. Flip it away from the turntable.

3. Turn the record post cap so it is out of line with the record post.

4. Load the Records

Place the records over the record post so they rest on the record support plate and on the small ledge formed by the record release eccentric offset in the spindle. Records may be loaded and played one at a time, or as many as 10 ten-inch or 8 twelve inch records may be loaded at one time. Do not try to play a larger quantity.

5. Readjust the Record Holding Clamp

Flip the record holding clamp back over the record support so it rests on the rim of the top record and holds the stack of records steady.

TO PLAY RECORDS AUTOMATICALLY

1. Turn radio "ON" and set the PHONO-RADIO selector control to PHONO position.

2. Push the "M" button in. The button will lock in and the turntable will now revolve.

3. Momentarily push the "R" button. The first record of the stack will drop to the turntable and be played. After all records have been played in turn, the instrument will repeat the last record until it is turned off. Pushing in the "M" button will now stop the turntable. The "R" button may be pushed in to reject a record before it has been completely played.

NOTE: Never touch the pickup arm when the instrument is in a changing cycle. Should you move it out of adjustment, stop the changer and gently move the pickup arm from side to side until you hear it "snap" back into position.

TO UNLOAD RECORDS

1. Allow the instrument to go through its complete cycle and start to play the last record over.

2. As soon as this occurs, push the "M" button to stop turntable. (Alternate pushes start and stop the motor).

3. Lift the pickup arm off the record and place it on its resting post.

4. Turn the record post cap so it is in line with the record post.

5. Lift the records off.

HOW TO REPLACE NEEDLE

This record player is equipped with a permanent point long-life needle that is good for several thousand plays unless damaged by mishandling. To replace phonograph needle, loosen the small knurled nut that holds the needle in place. The nut is accessible from the bottom of pickup arm. Use a pair of long nose pliers or tweezers to avoid damaging the crystal cartridge. Recommended replacement needle is Motorola Part No. 47K471596.

CAUTION: Standard type needles will not work.

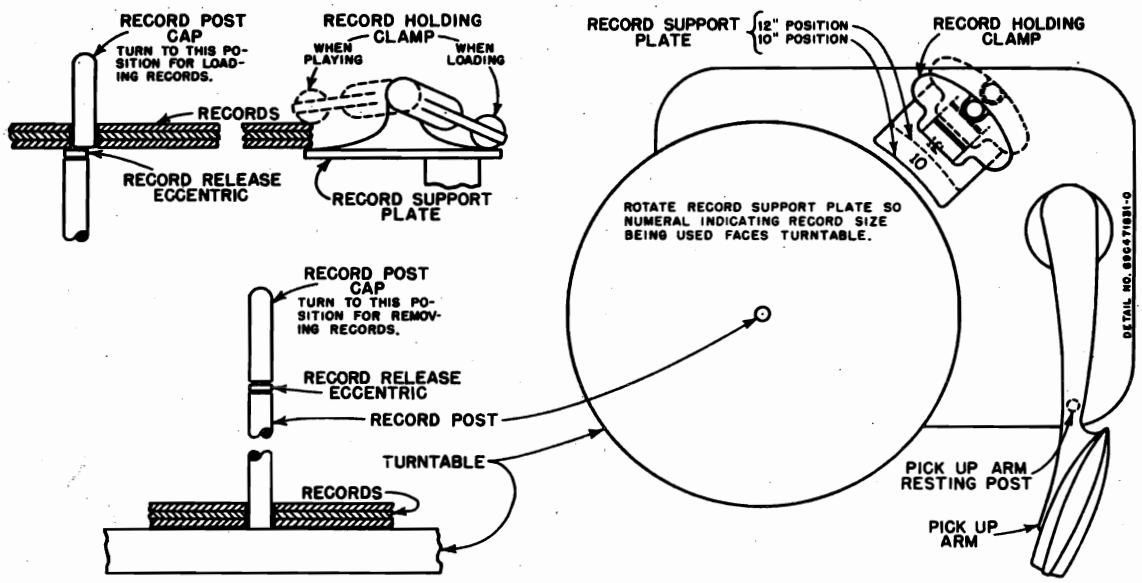


FIGURE 1. OPERATING INSTRUCTION DETAIL

MOTOROLA INC. MODELS RC-30-A, RC-34, RC-35

THEORY OF OPERATION

NOTE: *Numbers in parenthesis ( ) refer to parts shown in Figures 2, 3, 4, 5 & 6.*

The turntable is rim driven. Power is transmitted to it from the motor shaft by means of a rubber-tired drive wheel (84). The record post (48) does not revolve; it is fixed to the record changer base.

The heart of the record changer is the cam wheel (11). On it are cast all the cams, extrusions, etc., required to perform all the operations during the changing cycle. See Figure 2.

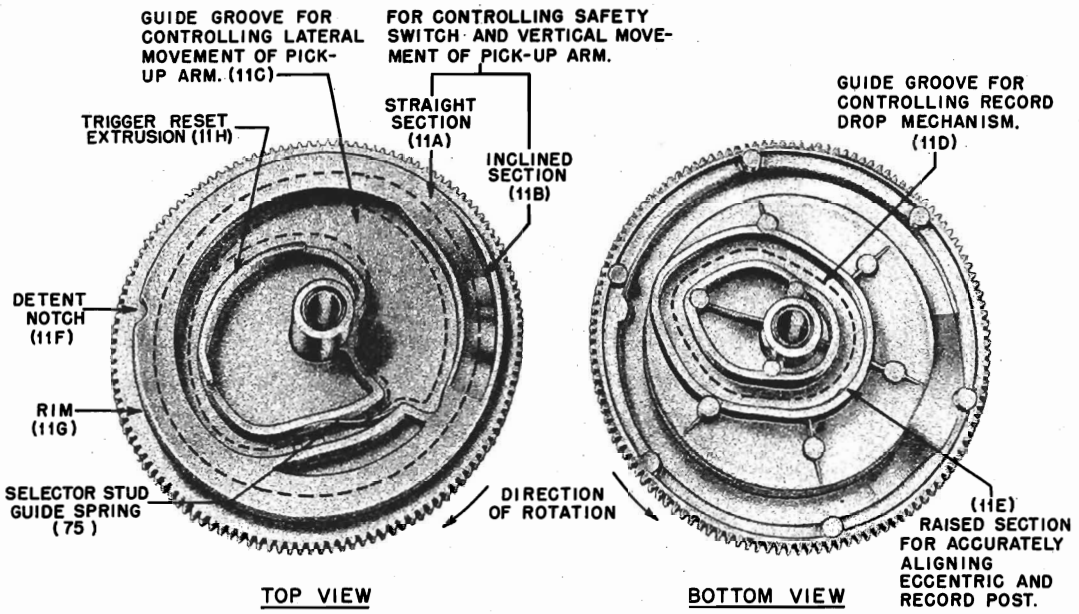

FIGURE 2. CAM WHEEL

The only mechanism that operates during the playing of a record, is the motor and turntable. The changing mechanism is disengaged until the change cycle starts.

The change cycle starts when the phono pickup needle comes within 1-7/8" of the record post. This causes screw (55) on trip arm (82) to actuate trip link (97) which trips the trigger by moving the latch arm (96) and allowing the small trip arm (105) to slip from its notch. Now spring (103) through bell crank lever (94) moves the drive arm (22) so that drive pulley (23) comes in contact with the inside rim of the revolving turntable, starting the change cycle.

With the same motion of the bell crank lever, its roller (94A) leaves the detent notch (11F) in the rim of the cam wheel and the cam wheel revolves. The roller (94A) now rides on the rim (11G) of the cam wheel and in this manner, holds the drive pulley (23) firmly against the turntable. The pressure with which the drive pulley bears against the turntable is adjusted by means of eccentric stud (94B).

As the cam wheel revolves, the pickup lift rod (54) rides up the inclined section (11B), lifting the pickup arm off the record. After the pickup arm is elevated, continued rotation of the cam wheel swings the pickup arm outward. The lateral movement of the arm is controlled by the selector stud (82A) which rides in a specially shaped groove (11C) in the cam wheel.

The gear arm roller (25A), riding in the specially shaped groove (11D) located on the bottom of the cam wheel, controls the dropping of records. Movement of the gear arm (25) causes the eccentric (24) to turn through 180°. When the eccentric (24) is in line with cap (12), it picks up a record and when it rotates back into line with the record post (48), the record is dropped onto the turntable.

Continued rotation of the cam wheel swings the pickup arm (by action of the selector stud (82A) riding in groove 11C) back over the first groove in the record and the arm is gently lowered onto the record when the inclined section (11B) reaches the pickup lift rod (54).

As the cam wheel approaches the full 360 degree point of its rotation, the trigger reset extrusion (11H) pushes against the trigger reset roller (105A) of the small trip arm, causing the trigger to be "cocked" ready for the next cycle, and in the same motion applies spring tension through the torsion spring (103) to the bell crank lever (109) so that when the cam wheel detent notch (11F) reaches the bell crank lever roller (94A), the roller falls into it pulling the cycle drive pulley (23) away from the turntable rim and the cam wheel stops, ending the cycle.

After the drive pulley is pulled away from the turntable, its motion is arrested immediately by a brake (See Figure 3) to prevent re-cycling.

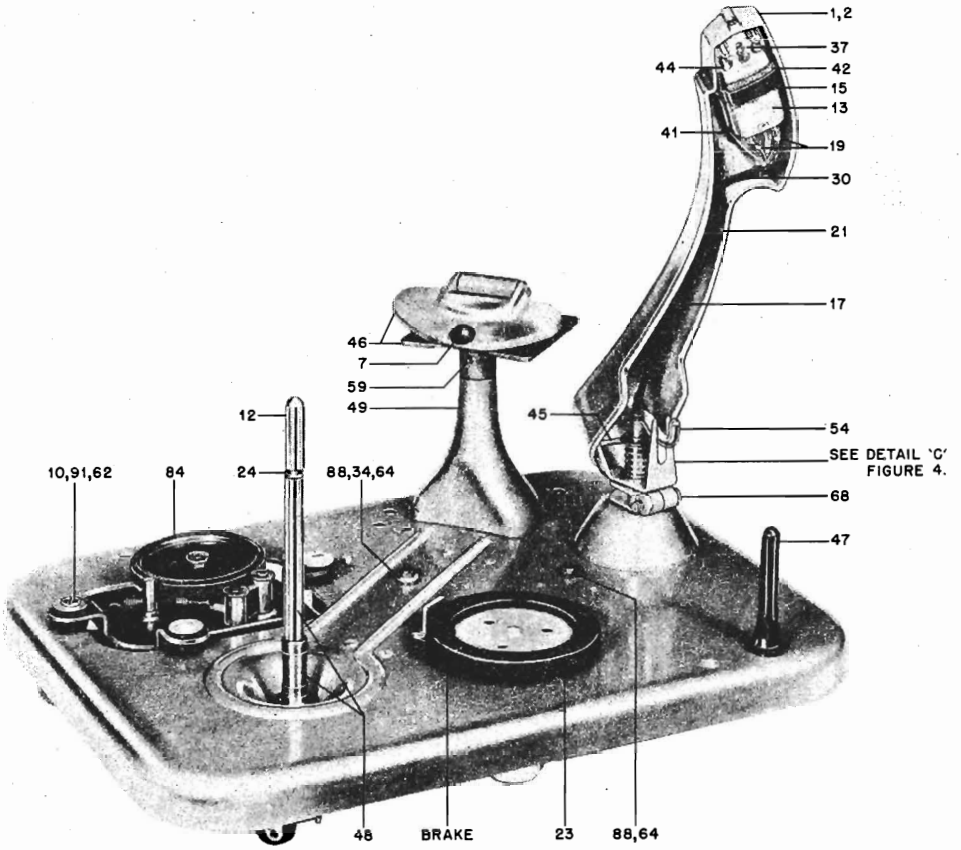

FIGURE 3. PARTS LOCATION - TOP VIEW

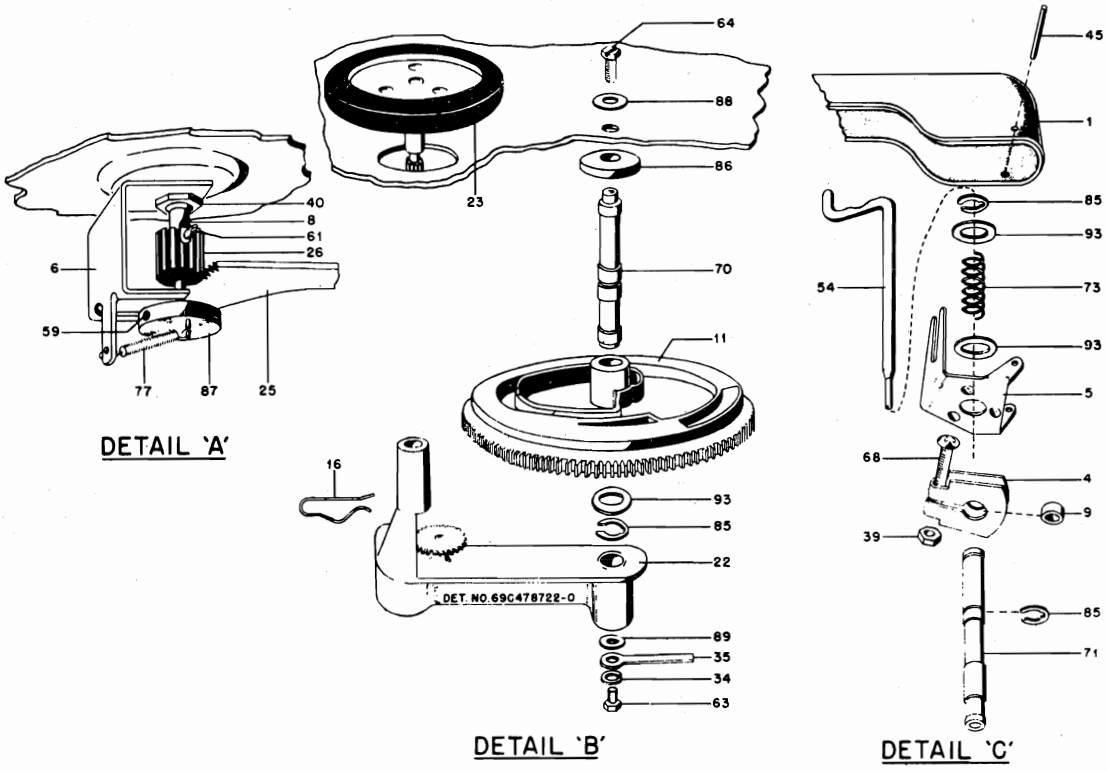

FIGURE 4. PARTS LOCATION - DETAILED ASSEMBLIES

MOTOROLA INC. MODELS RC-30A, RC-34, RC-35

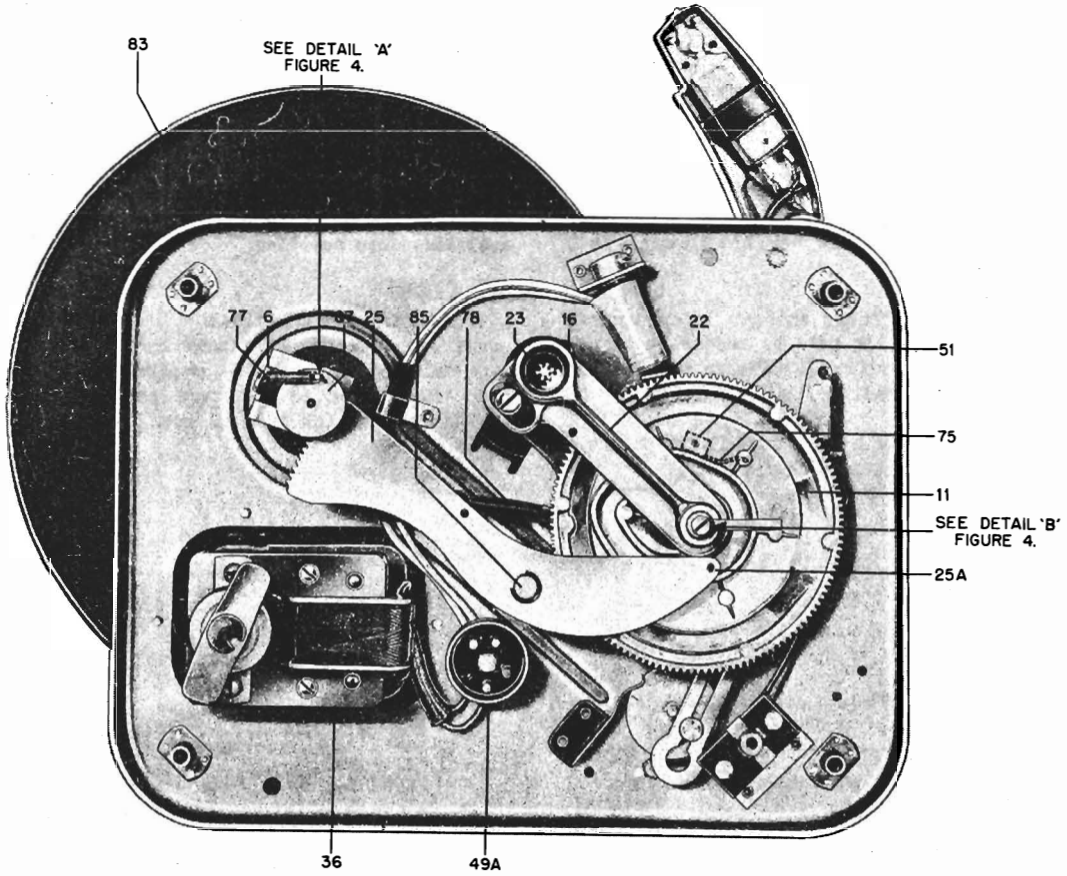

FIGURE 5. PARTS LOCATION - BOTTOM - COMPLETE

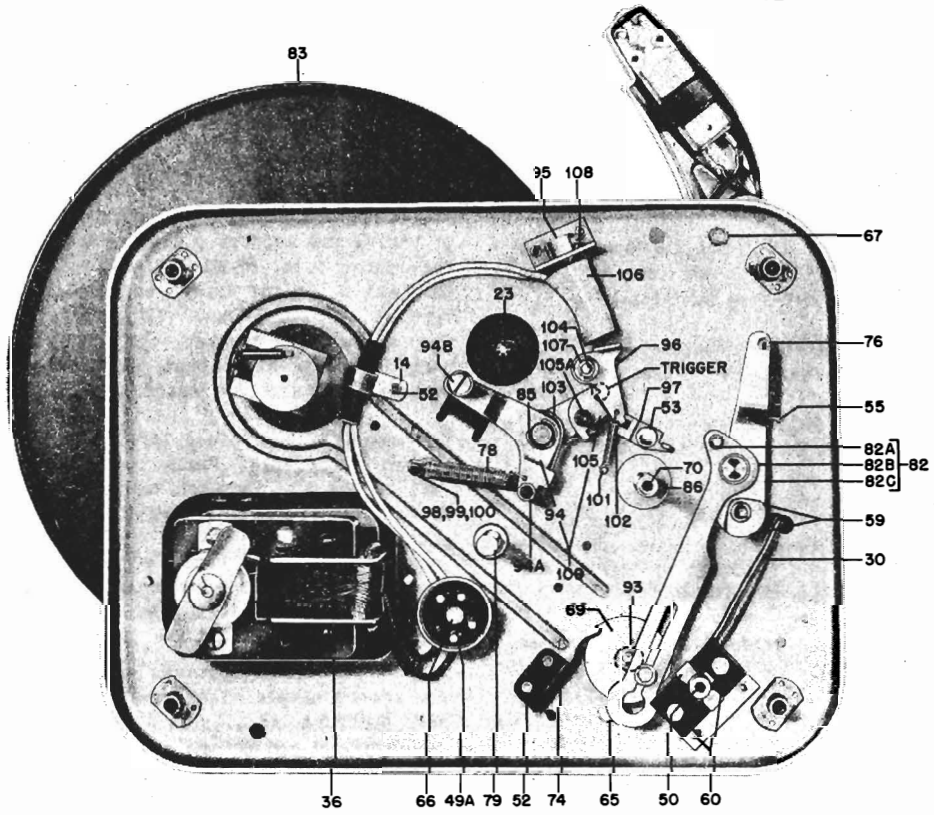

FIGURE 6. PARTS LOCATION - BOTTOM - PARTLY DISASSEMBLED

Turning the record support plate (46), to accommodate the size record being used, automatically sets the mechanism so the needle set-down point will be correct for the size records being played. Selector lever (82B) is moved by the stud on selector plate (69), changing the angle between trip arm (82C) and selector lever (82B).

An external momentary contact (REJECT) switch is used to manually start the change cycle or to reject a record before it has been completely played. Pushing the "R" button will energize the trip coil (106) and will move the latch arm (96), allowing the changer to cycle as previously described.

A special clutch device, built into the base of the pickup arm, prevents damage to the mechanism should the arm be accidentally touched while the instrument is in cycle. Should the arm be accidentally moved out of adjustment, stop the changer and move the arm from side to side until you hear it snap back into position.

USE OF TEST CORD

To operate this record changer independently of the radio receiver, it will be necessary to obtain or construct a test cord. Figure 8 shows the hookup and parts required.

A ready-made cord can be obtained from Motorola -Order Part No. 1X471448 - List $2.70. It will only be necessary to attach a wall outlet plug to the red and gray leads to prepare this cord for use. The black lead is not used and can be cut off. (This cord is the same as used on some 1947 Motorola home sets).

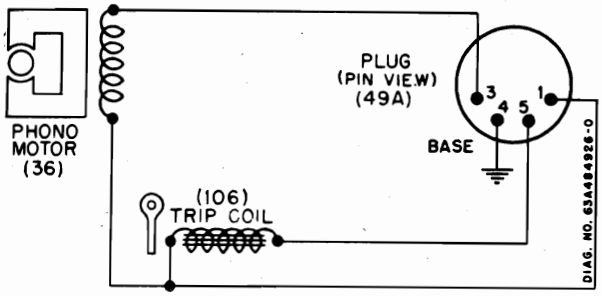

FIGURE 7. RC-30-A WIRING DIAGRAM

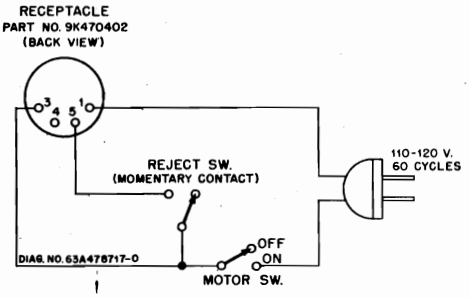

FIGURE 8. TEST CORD WIRING DIAGRAM

ADJUSTMENTS

NOTE: *Reference numbers in parenthesis refer to Figures 3, 4, 5 & 6.*

ECCENTRIC STUD ADJUSTMENT

This adjustment is one of the most important for dependable cycling of the record changer. It must be followed closely, as too tight an adjustment will cause slow cycling and undue motor wear, or the changer may keep cycling continuously; a loose adjustment may prevent changer from cycling at all.

1. Set changer in cycle and stop turntable when pickup arm comes back to within one inch of right of turntable (almost the set-down position.)

2. Loosen eccentric stud (94B) completely, so drive pulley (23) moves completely free of the turntable.

3. Rotate turntable by hand (counterclockwise) 90° (1/4 turn) and back (clockwise). Pickup arm should not move.

4. With a screwdriver, turn eccentric stud until pickup arm begins to move when rotating turntable by hand clockwise. Do not hold screwdriver on eccentric stud while checking adjustment.

5. When pickup arm moves down with the clockwise rotation of turntable without slipping, but not up with counterclockwise rotation, the critical position of the adjustment has been reached.

6. Then tighten the eccentric just far enough to pick up the pickup arm when rotating the turntable counterclockwise and setting is complete.

7. To check for too tight adjustment, complete cycle of changer with motor operating. Complete change cycle should not take more than 7 seconds; if it takes longer, eccentric stud should be readjusted.

RECORD SUPPORT PLATFORM ADJUSTMENT

It is important that all points on the "lip" of the record support platform be equi-distant from the center point of the spindle. This will assure that all points of the record will leave the platform at the same time. If the record support is too far out of alignment, the record would actually hang on the point nearest the spindle and fail to drop properly from the record post.

1. Turn the spindle cap (12) so it is in line with record post (48). Turn record support platform (46) to the 10" position, making sure it is turned so that the selector spring (74) falls into the detent notch.

2. Place a standard 10" record on the record spindle and hold it in line with the record support platform (46) and eccentric (24).

3. If parts are adjusted and aligned correctly, the record should clear the lip of the record support platform equally at all points and the gap between record and record support platform should be just large enough to let the record clear the platform.

NOTE: The 10" record used should have a diameter of 9-7/8" ± 1/64".

4. If one point of the record support platform (46) is nearer the record than the other, the position of the platform may be adjusted after loosening the two Allen head screws (59) located directly under record support platform (46). (Use a #6 Allen head driver -Motorola Part No. 66X10704).

5. Spacing between the record post (48) and record support platform (46) can be varied by loosening the two screws (65) located underneath record support post (49). Correct spacing is indicated as in Step 3 above.

NOTE: A "standard gauge" (Motorola Part Number 66A75278) can be used in place of a record when adjusting the platform.

6. **TEST:** After tightening the setscrews, test the adjustment by running a ten-inch record through a complete cycle and check the point where the needle falls. If the needle misses the record by one inch, the record support platform (46) is 180 degrees out of line with the detent plate (69) and should be turned one-half turn without turning the detent plate.

NEEDLE SET-DOWN POINT

1. Turn the record support to the twelve-inch position.

2. Place a standard twelve-inch record on the turntable.

3. Start the changer and allow it to go through its cycle.

4. Note the point at which the needle contacts the record. It should contact the record in the middle of the area between the first groove and the edge of the record.

5. If the needle doesn't come down at the proper point, cycle the changer and stop it just as the pickup arm is coming down on the record.

6. Place a full stack (eight) of twelve-inch records on the turntable.

IMPORTANT: It is imperative to make this adjustment while the selector stud (82A) is still riding in the groove of the cam wheel (11). If the record player is stopped just before the needle contacts the top record of a full stack of records, the selector stud (82A) will still be in the cam wheel groove and the pickup arm will not be free to move annoyingly about while the adjustment is being made. This is the reason for using a full stack of records on the turntable. If excessive pickup arm side play is noted at this point, check selector stud guide spring (75) on cam wheel. Excessive play between the selector stud (82A) and cam wheel groove will prevent needle from coming down at exactly the same spot on the record each time.

7. Loosen the adjustment lockscrew (68) and then move the pickup arm until phono needle is positioned correctly over the middle of the area between the edge and the first groove in the record.

8. After adjustment, tighten the adjustment lockscrew.

9. Check the adjustment by putting the changer through its cycle.

10. If necessary, repeat above steps.

11. Check adjustment, using a 10 inch record. If necessary, make minor compromise adjustments so needle will come down properly on both ten and twelve-inch records.

TRIP ADJUSTMENT

This adjustment must be made after the needle set-down point has been adjusted.

1. Draw a 3-3/4" diameter circle on a piece of paper, punch out a 1/4" diameter hole in exact center of the circle and slip the paper over the record post.

2. Turn the support platform to 12 inch record position.

3. Cycle the changer once; at end of cycle, pickup arm will rest along side turntable. Do not turn off changer.

4. Grasp the pickup arm and slowly move it towards the record post. As the pickup needle crosses the circle line, a click should be heard, indicating start of change cycle.

5. If change cycle start does not occur as needle crosses circle line, adjust screw (55) on trip arm (82) till cycle starts at correct point. Turn adjustment screw (55) clockwise if change cycle starts after needle crosses circle line, and counterclockwise if change cycle starts too soon.

RECORD DROP MECHANISM

Cycle the record changer once. At the end of the change cycle, stop the changer and carefully observe the position of the eccentric (24) with respect to record post (48). They should line up perfectly. If not, re-adjust as described below:

1. Put the record changer in cycle and slowly revolve the turntable by hand until the gear arm roller (25A) is resting on the raised section (11E) of the record drop groove on the cam wheel. The raised section of the groove is very small and resembles what is often taken for "flash" on castings. It serves to narrow down the groove at this point and in this manner, insures closer alignment of the eccentric (24) and record post (48).

2. Loosen the slab head setscrew (61) in the spindle gear (26). The eccentric (24) will now turn freely.

3. Turn the eccentric (24) so it is in perfect alignment with the record post (48).

4. Tighten slab head setscrew (61) in spindle gear (26). WARNING: DO NOT USE EXCESSIVE PRESSURE WHEN TIGHTENING SLAB HEAD SETSCREW. EXCESSIVE PRESSURE MAY DENT THE ECCENTRIC TUBE AND CAUSE BINDING.

VERTICAL ADJUSTMENT OF PICK-UP ARM

The pickup lift rod (54) controls the vertical movement of the pickup arm. If this adjustment is not correct, the needle may not rest properly on the first record, the needle may not clear a full stack of records, or the pickup arm may rub against the bottom record on the support post.

MODELS RC-30A, RC-34, RC-35

MOTOROLA INC.

1. After the changer has completed its cycle and pickup arm is resting in playing position, stop the changer. The pickup lift rod (54) will now be resting on the bottom of the inclined section (11B) of the cam wheel (11) and the pickup arm will be at its lowest point of vertical travel.

2. The pickup now should be resting by the side of the turntable and the needle should be exactly level with the top of the turntable. If it isn't, lift the pickup arm straight up, exposing the pick-up lift rod (54). With long nose pliers, bend the pickup lift rod (along its flat portion) in the required direction till the pickup needle point is exactly level with the top of the turntable.

LUBRICATION

Factory lubrication should be sufficient for a long period of service. However, if the record changer is subjected to severe operation conditions, it is best to clean and re-lubricate all moving parts.

Use Univis P-48 oil (Motorola Part Number 11M2340) on the eccentric and tube assembly (24) and Stay-Put grease (Motorola Part No. 11M476047) on all other moving parts. Use grease and oil sparingly; do not overlubricate.

CAUTION: Do not allow grease or oil to come in contact with any rubber parts. The motor spindle and inside rim of turntable must be perfectly clean of grease. If grease gets on any of these surfaces, it should be removed immediately with carbon-tetrachloride.

SERVICE INFORMATION

MECHANISM IS SLOW IN STARTING OR MOTOR HEATS UP

1. Check lubrication.

2. Dirt in bearings. Wash dirt out with carbon tetrachloride or similar solvent and re-lubricate. Use Univis P-48 oil in the phono motor and turntable bearings and Stay-Put grease on all other bearings and moving parts.

3. Check line voltage and frequency.

4. Motor damaged. Replace motor.

5. Room temperature abnormally low.

6. Eccentric stud adjustment (94B) set at maximum throw, causing cycle drive wheel to drag on turntable rim. Correct by setting eccentric stud per instructions under ECCENTRIC STUD ADJUSTMENT.

7. Slow motor. Replace motor.

8. Grease on rubber rim idler wheel and/or inner rim of turntable. Clean off with carbon tetrachloride.

MOTOR FAILS TO RUN

1. Check to see that power is being supplied to motor.

2. Trouble in motor winding. If easily seen, repair; otherwise, replace.

3. Damaged or frozen bearings. Replace motor.

4. Gummed oil or foreign material between armature and pole-piece. Clean out.

SQUEAKS OR OTHER NOISES DURING PLAYING OF RECORDS

1. Check lubrication (if squeaks are heard, they will usually be found to come from the records - not from mechanism.)

2. Compare the squeaks with and without a load of records. If squeak disappears when records are removed, then noise is obviously from records. Correct by rubbing a little wax on the record post.

CHANGER IS NOISY WHEN IN CYCLE

1. Check lubrication.

2. See if any part has become loose or bent and is rubbing against a moving part.

3. Check center post eccentric tube (24) lubrication.

"WOW" IN RECORD REPRODUCTION

1. Record is warped or otherwise defective, or the instrument is not being operated at normal room temperature (70°F). See CHECK THE RECORD FIRST.

2. May be caused by slippage due to grease on idler wheel or inside rim of turntable.

PICK-UP ARM TRIPS OUT OF GROOVES

1. Record changer not level.

2. Pickup arm shaft (71) binding in bearing.

(A) Ream out the hole.

(B) Sometimes the trip arm (82) may be too close to the base, causing a bind. To remedy, loosen its two setscrews (59) and space slightly.

3. Selector lever (82B) may be bent out of shape and binding against detent plate (69). Straighten.

4. Selector lever (82B) slot or retaining rivet on detent plate (69) may be undersize or oversize, respectively, effectively causing a binding feeling on the pickup arm. Correct by spreading slot in selector lever (82B).

5. Needle defective. Replace.

CHANGER KEEPS CYCLING

1. Eccentric stud adjustment (94B) set too tight. Correct per instructions found under ECCENTRIC STUD ADJUSTMENT.

2. Defective reject switch on radio. Repair or replace.

3. Bell crank arm (94) or drive arm (22) binding on their shafts.

RECORD WILL NOT DROP WHILE CYCLING

1. Eccentric (24) out of line with record post (48). Correct as shown in ADJUSTMENT OF RECORD DROP MECHANISM.

2. Setscrew (61) loose on spindle gear. Tighten after readjusting.

3. Record platform (46) not set correctly. See RECORD SUPPORT PLATFORM ADJUSTMENT.

CHANGER WILL NOT CYCLE

1. Open trip coil (106). Replace.

2. Defective wiring.

3. Binding drive arm (22), bell crank arm (94) or cam wheel (11) on shafts. Replace parts or remove burrs.

4. Eccentric adjustment stud (94B) set at minimum throw. Cycling drive wheel (23) is not against inner rim of turntable. Correct by setting up as shown under ECCENTRIC STUD ADJUSTMENT.

5. Record finish groove may be too far from center. Trip switch will not be actuated until needle comes within 1-7/8" of record post. Use standard records.

DESCRIPTION OF OPERATING CYCLE

Power for the motor is applied through the on-off switch. The turntable is rim-driven by a rubber-tired idler wheel mounted between the motor shaft and the turntable rim.

The turntable hub is a combined shaft and gear (figure 1). This small hub gear engages a large cam gear (figure 2) when the retractable segment of the cam gear is brought into position by the action of the trip mechanism; the cam gear, in turn, operates the changer mechanism.

The tone arm is operated by two link assemblies attached to actuator levers (figure 3) which are in contact with the cam surface of the cam gear.

The record-shelf push-off mechanism is connected, through a series of bars (figure 4), to a push-off actuator; the mechanism is operated when a roller on the cam gear comes in contact with the actuator.

The trip mechanism is operated by a trip finger, riding over a ratchet screw (figure 5), which starts the change cycle when the needle is traveling in the eccentric finish groove of the record. The trip mechanism is locked in a disengaged position when the control button is in the manual position.

PHILCO RADIO-PHONOGRAPH TROUBLE-SHOOTING PROCEDURE

The following tests are given for quickly localizing trouble in either the radio or phonograph section of the radio-phonograph combination. Be sure to make each test, in the order given, before removing either the radio chassis or the record changer from the cabinet. If the trouble is found to be in the audio amplifier, refer to the radio service manual for the particular model under test. If the trouble is in some part of the record changer, refer to this record-changer manual.

Audio-Amplifier Test

The audio amplifier is common to both the radio and the phonograph sections of the combinations using the M-8 changer.

Tune in a station, and note the volume and tone quality. If the performance is abnormal, refer to the radio service manual for the particular model under test, and correct the trouble.

Pickup Test

Play a familiar record on the phonograph, and again note the volume and tone quality.

NOTE

It is advisable to carry a familiar record as a part of the service test equipment.

If distortion is noted when playing the record, first try a new needle. If the distortion continues, a faulty crystal pickup is indicated.

Changer-Mechanism Test

The following series of record-changer operating tests is given for quickly locating any troubles that may be encountered. Each test should be performed with several records before making any adjustments.

Set the record shelf to the 10″ position and place the tone arm on the rest post (figure 6). Place a 10″ record over the spindle and onto the record shelf.

Push the control button to REJ (reject), and observe the record-dropping action. The record should fall smoothly, the edge leaving the lips of the record shelf *after* the center has started to fall.

TP-4103

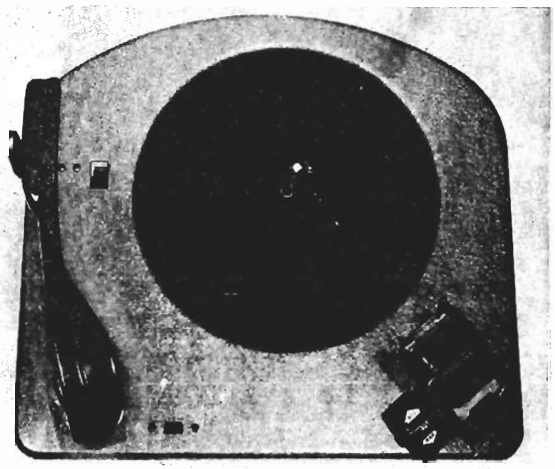

Figure 6—CHANGER, RECORD SHELF IN 10″ POSITION

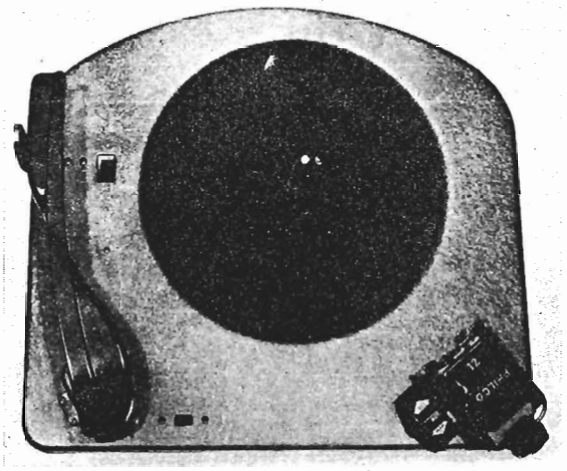


TP-4105

Figure 7—CHANGER, RECORD SHELF IN 12" POSITION

The tone arm should rise from the rest post, and the needle should come down on the record, starting about 1/8" from the outer edge.

Play the record through and observe the tripping action; the trip mechanism should operate within the first two or three revolutions after the needle has entered the eccentric finish groove.

Remove the record from the turntable and set the record shelf to the 12" position (figure 7). Place a 12" record over the spindle and onto the record shelf. Push the control button to REJ., and observe the record-dropping action. The record should leave the lips of the record shelf *after* the center has started to fall. Refer to - - - - - the record-shelf adjustment, if needed. The tone arm should rise from the rest post, and the needle should come down on the record, starting about 1/8" from the outer edge.

Play the record through and observe the tripping action. Trip adjustments are given on page 10.

Observe whether the lower edge of the tone arm, during a change cycle, clears the top of the hook on the tone-arm rest post by a minimum of 1/8". Take the tone arm off the rest post, and place the pickup over the changer base plate; the needle point should clear the base plate by at least 1/16", and should be no higher than the turntable top.

Turntable and Motor Test

NOTE

Before making this test, warm up the motor by allowing it to run for at least ten minutes.

Set the control button to MAN. (manual), load the turntable with ten 12" records, and place the tone arm on the top record.

Place a stroboscope disc, such as Philco Part No. 45-2900, on the record, and illuminate the disc with a lamp (preferably a neon bulb) operated on 60-cycle a.c. The dots in the row calibrated for 78 r.p.m. should appear to remain stationary, or drift *very* slowly, but smoothly, backward or forward.

If the turntable speed is steady, but is appreciably below 78 r.p.m., refer to the lubrication data on the turntable upper bearing, motor bearings, and motor idler plate, given under CLEANING AND LUBRICATION, - - - - if the lubrication appears to be adequate, the motor is probably defective.

Unsteady drift of the dots on the stroboscope disc indicates uneven turntable speed, the cause of wows; see UNEVEN TURNTABLE SPEED (WOWS),

CLEANING AND LUBRICATION

The M-8 record changer, like any other mechanism, requires lubrication after long periods of use. Whenever a major part or assembly is to be replaced, the changer should be cleaned and lubricated. Carbon tetrachloride or other similar cleaning fluids may be used to remove old gease, oil, and dirt. Apply lubricants sparingly. All lubrication points are shown in figures 8 and 9. It may be necessary to remove some parts and assemblies in order to lubricate their bearings—for example, the actuator and cam gear must be removed to lubricate the actuator stud and the cam-gear spindle.

PARTS NOT TO BE LUBRICATED

The following parts should not be lubricated at any time: Trip receiver; trip finger; ratchet screw on trip plate; selector.

PARTS TO BE GREASED

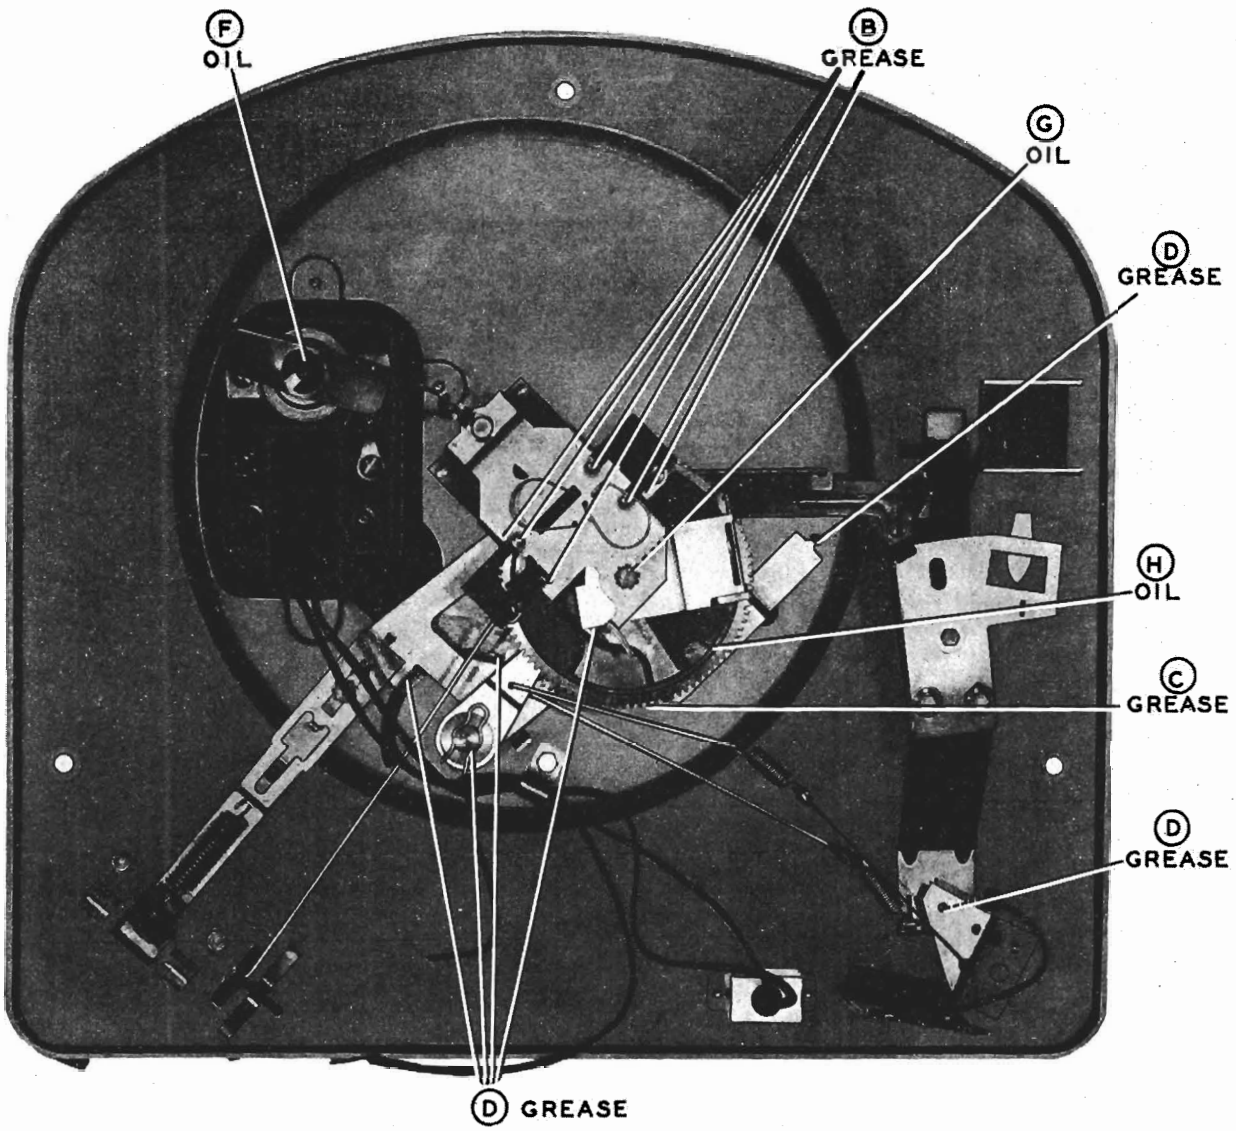
The following parts are to be lubricated with a grease having the consistency of vaseline:

Record-Shelf Assembly (point A of figure 9)
Four protruding dimples.

Bridge Assembly and Slider Control Bar (point B of figure 8)
Three dimples and four upturned ears.

Cam Gear (point C of figure 8)
Cam-gear teeth, cam surfaces, and cam-gear spindle.

Main Assembly (points D, figures 8, 9, and 13)
Trip-plate ear where contact is made with gear segment.
Actuator stud.
All parts with ears sliding on changer base plate.
Index-lever surface which slides on base plate.
Push-off-actuator dimples which slide on base plate.
Turntable shaft (upper bearing).
Tone-arm shaft.



TP-4107

Figure 8—BOTTOM VIEW OF CHANGER, SHOWING LUBRICATION POINTS

PARTS TO BE OILED

The following parts are to be lubricated with S.A.E. 20 oil:

Tone Arm (point E of figure 9)

Tone-arm pivot pin where pin rides in elongated hole of tone arm—apply one drop with a pointed rod.

Motor (points F, figures 8 and 9)

Motor idler plate—one or two drops in each dimple.

Motor bearings.

Trip-Plate Bushings (point G of figure 8)

Cam-Gear Roller (point H of figure 8)

CAUTION

Do not get any oil or grease on the motor shaft or the idler-wheel tire. Should this occur, remove the oil or grease immediately with carbon tetrachloride.

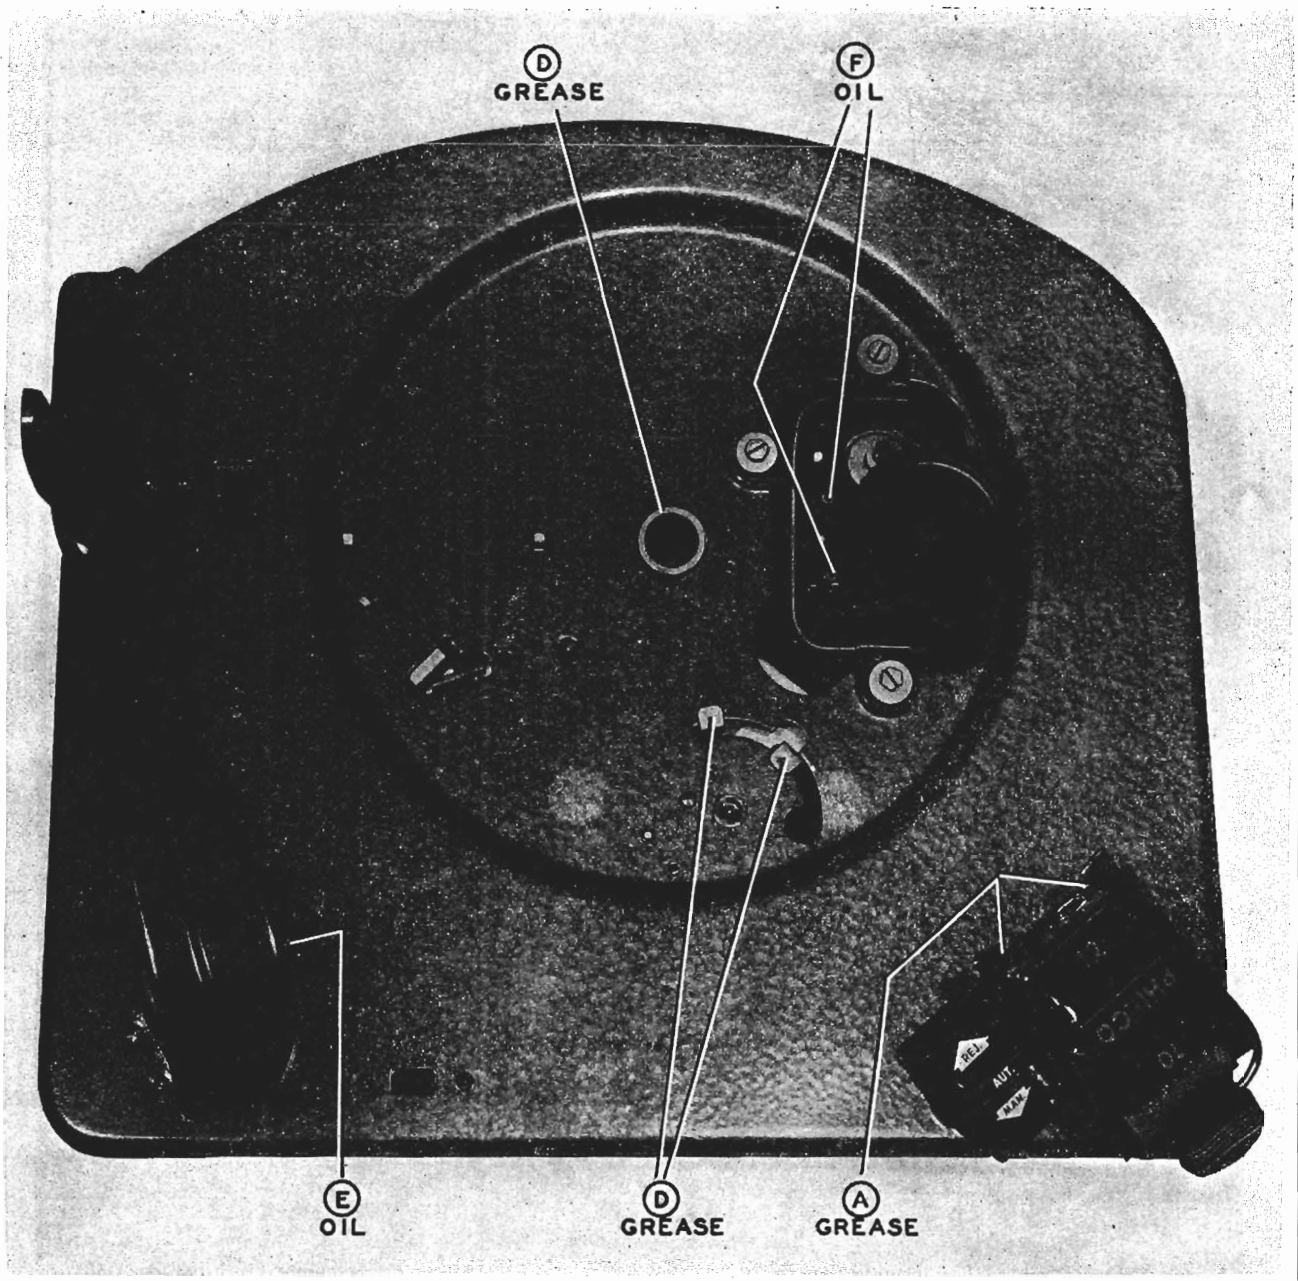


Figure 9—TOP VIEW OF CHANGER, SHOWING LUBRICATION POINTS TP-4106

ADJUSTMENTS

10″ Index Adjustment

Set a 10″ record on the turntable; push the control button to REJ., and rotate the turntable 4½ turns by hand. The tone arm should then be approximately ½″ above the record.

Loosen the clamp screw on the trip arm (figure 10). Hold the tone arm (steady) ⅛″ in from the edge of the record, and set the trip arm so that the trip-arm stop is in contact with the selector hinge. See figure 10.

Tighten the clamp screw, leaving 1/32″ vertical play, or clearance, between the trip arm and the base plate.

12″ Index Adjustment

Make the 10″ index adjustment first. The 12″ indexing will ordinarily be satisfactory after the 10″ adjustment is made; if not, bend the selector, 56-4618FA3, slightly to the right or left as required for proper indexing of the needle on the record, as shown in figure 11.

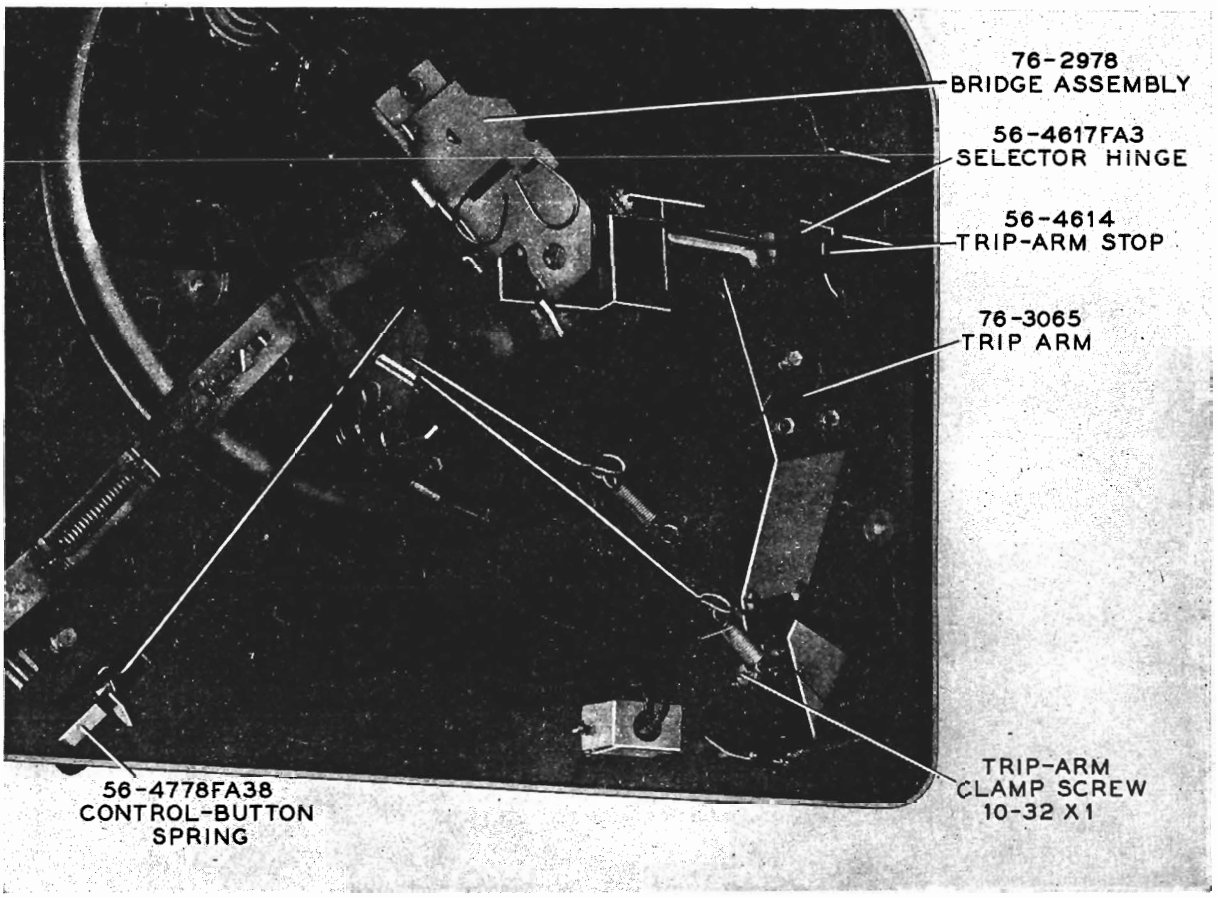

Figure 10—10″ INDEXING ADJUSTMENT TP-4101

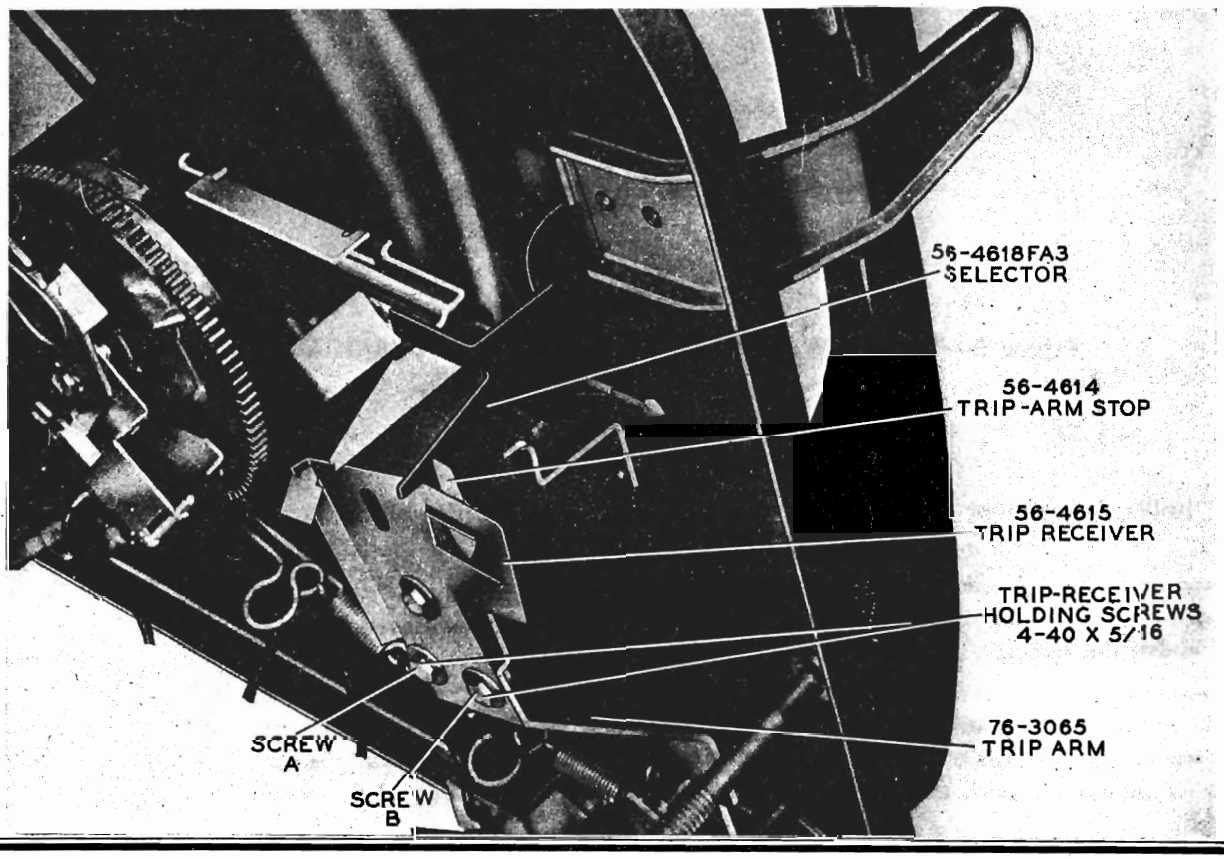
Figure 11—12″ INDEXING AND TRIP-RECEIVER ADJUSTMENTS TP-4104



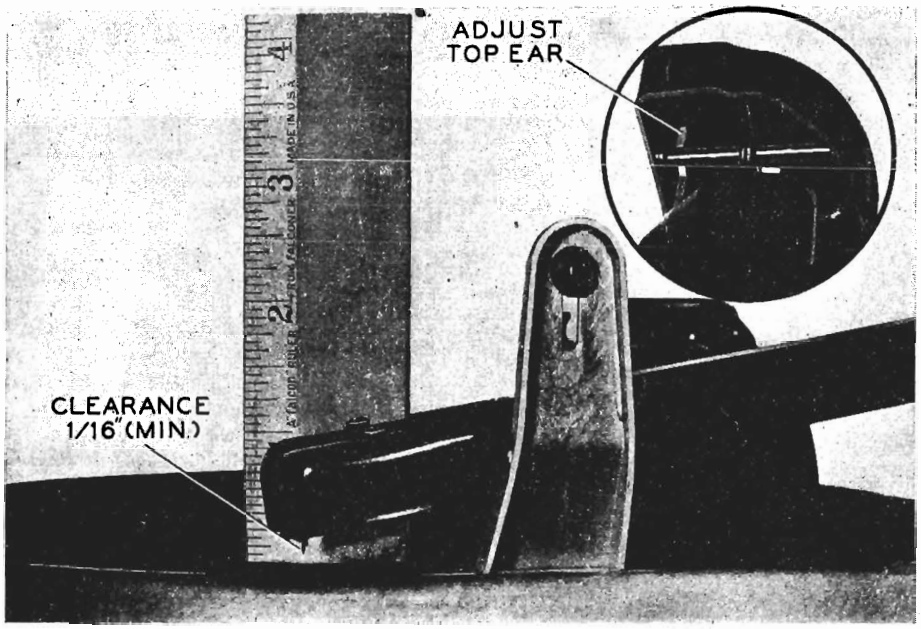


Figure 12—TONE-ARM HEIGHT ADJUSTMENT

Tone-Arm Height and Lift Adjustments

With the changer out of cycle (change cycle completed; tone arm lowered), and the tone arm off the rest post, the needle point should clear the changer base plate by at least 1/16", and should not be higher than the turntable top. See figure 12. To adjust the height, shape the *top* ear of the tone-arm swivel, shown in figure 12 (bending the ear downward raises the tone arm).

To adjust the lift, take the tone arm off the rest post, push the control button to REJ., and rotate the turntable (approximately 1½ turns) by hand until the tone arm comes against the rest post. See figure 13; the lower edge of the tone arm should clear the top of the protruding hook on the rest post by not less than ⅛", and not more than ¼". Adjust by shaping the *lower* ear of the tone-arm swivel (bending the ear downward raises the tone arm).

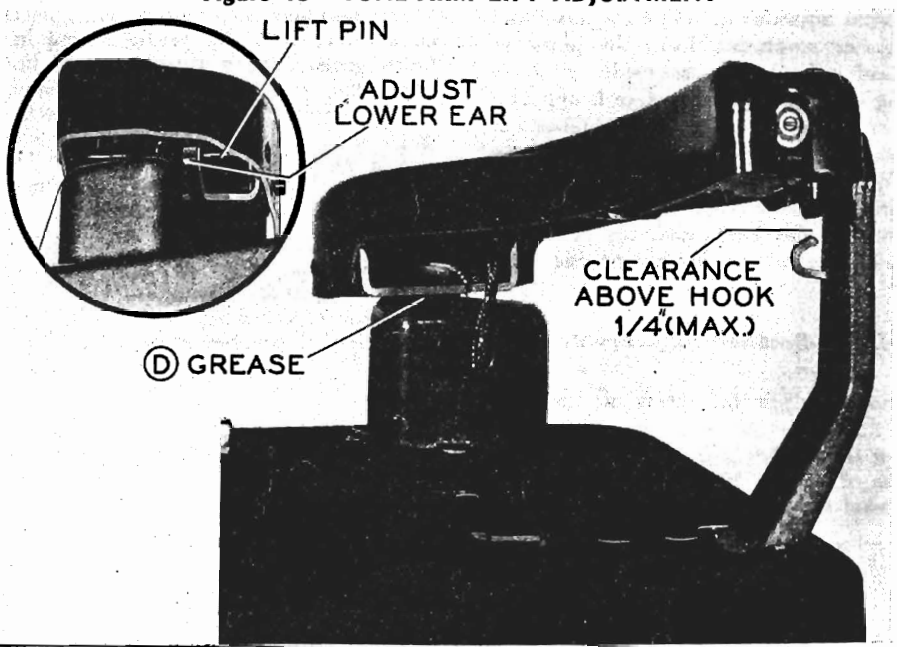
Tone-Arm Vertical and Horizontal Timing Adjustments

NOTE

Before making these adjustments, make the tone-arm height and lift adjustments given above.

For the vertical adjustment, start with the changer out of cycle, push the control button to REJ., and rotate the turntable, by hand, three-quarters of a revolution; this setting can be obtained more accurately by making a mark on the turntable to coincide with some starting point. At the three-quarter-revolution point, the leading edge of the cam surface is approximately ¼" from the end of the lift actuator lever; this is the lower actuator lever, shown in figure 14. Adjust the wire loop of the short link (link, cord, and spring assembly), attached to the tone-arm lift pin, by squeezing or opening the loop until the tone-arm lift pin makes contact with the lower ear of the tone-arm swivel (figure 13).

Figure 13—TONE-ARM LIFT ADJUSTMENT



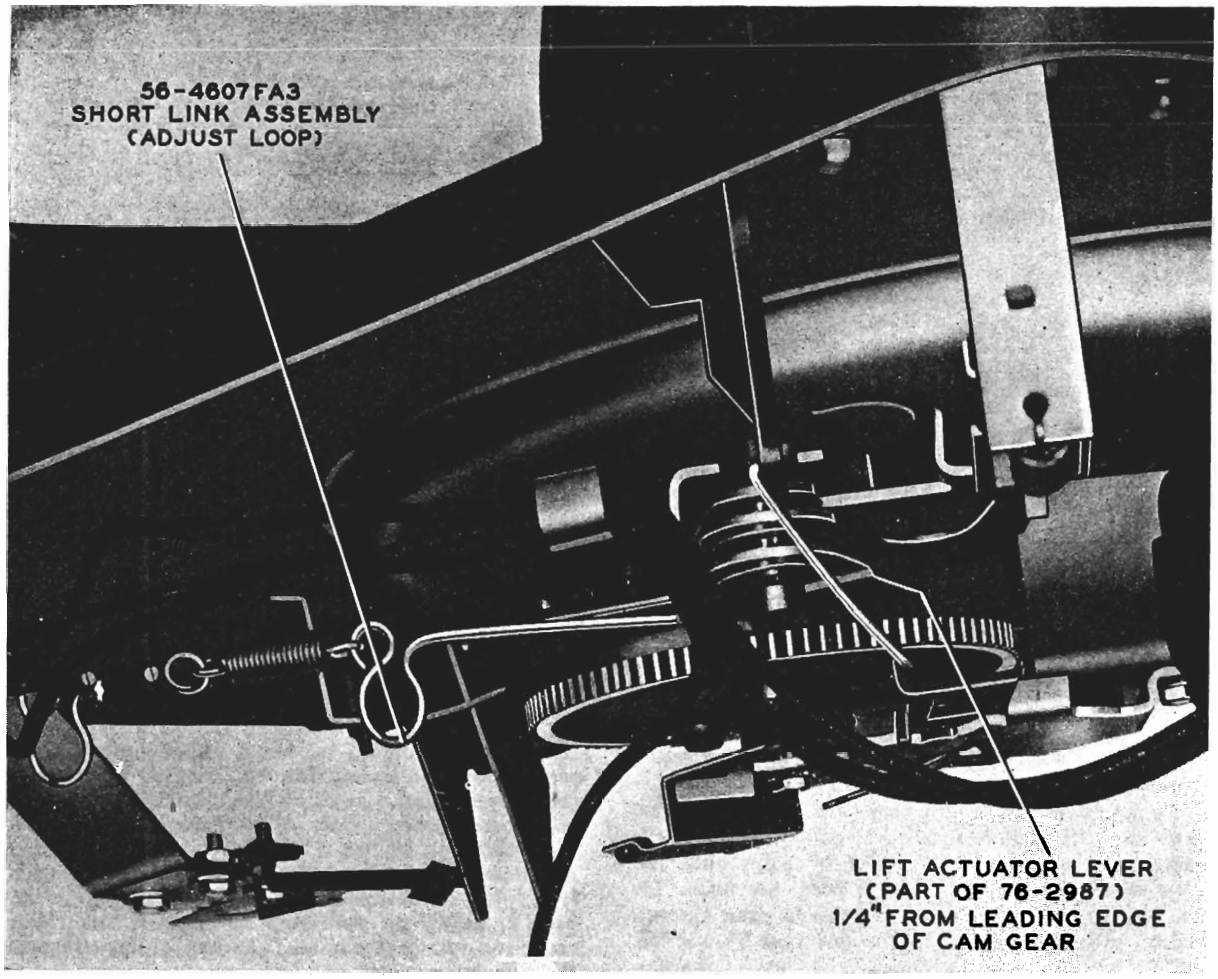


Figure 14—TONE-ARM VERTICAL TIMING ADJUSTMENT TP-4116

For the horizontal adjustment, rotate the turntable another three-quarter revolution from the point at which the vertical adjustment was made. At this point, the leading edge of the cam surface is approximately ¼" from the end of the horizontal-return actuator lever; this is the upper actuator lever, shown in figure 15. Adjust the wire loop of the long link and spring assembly, attached to the trip arm, by squeezing or opening the loop until the tone arm makes contact with the rubber bumper on the tone-arm rest post.

Trip-Finger and Trip-Receiver Adjustments

For the trip-finger adjustment, move the tone arm toward the spindle. Adjust the screw on the trip-receiver plate (figure 16) so that the trip finger, when riding over the ratchet screw on the trip plate, assumes an angle of 25° to 30° with respect to the screw. Do *not* bend the trip finger to obtain the correct angle.

For the trip-receiver adjustment, place the tone arm on a record with the needle resting in the eccentric finish groove. The vertical center line of the trip finger should coincide with the center line of the ratchet screw. To adjust the centering of the trip finger over the ratchet screw, loosen screw B slightly, and screw A completely (see figure 11). Rotate the trip receiver about screw B, as a center, to obtain the correct adjustment (see figure 16). Tighten the screws.

Approximately ⅛" of the trip-arm stop should engage the selector (see figure 11). To adjust the engagement of the trip-arm stop, loosen screw A slightly, and screw B completely (see figure 11). Rotate the trip receiver about screw A, as a center, to obtain the correct adjustment. Tighten the screws.

The above adjustments will affect each other slightly; therefore, it may be necessary to repeat each adjustment until both are correct.

After making the above adjustments, it will be necessary to correct the index adjustments.

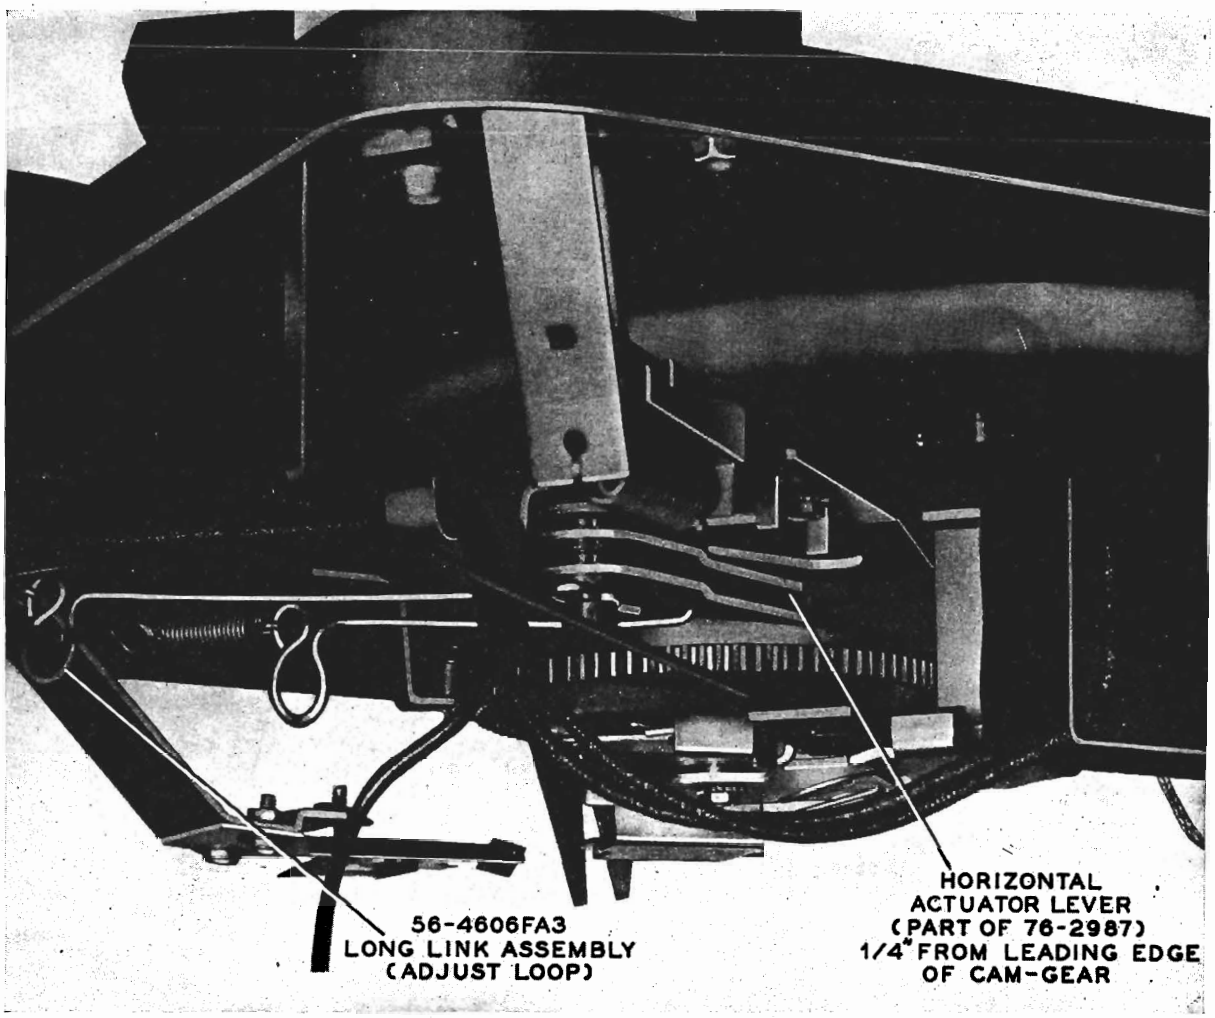

Figure 15—TONE-ARM HORIZONTAL TIMING ADJUSTMENT TP-4129

Record-Shelf Adjustment

Place the shelf in the 10″ position, and the changer out of cycle. Place the Philco record-shelf gauge, 45-1470 (also used for M-4), over the spindle and onto the record shelf, as shown in figure 17. Loosen the two hex-head screws which hold the record-shelf assembly to the changer base plate (figure 18). Move the record-shelf assembly away from the record spindle until the large curved part of the gauge drops even with the record-shelf lips, as shown in figure 17. Now push the record shelf and gauge lightly against the spindle, taking out all play toward the spindle; keep the lips of the record shelf in even contact with the edge of the gauge. Tighten the two hex-head screws.

Push-Off Adjustment

Push the control button to REJ., and rotate the turntable 2½ revolutions, by hand; at this point, the push-off actuator is in its most forward position, in contact with the roller on the cam gear (see figure 19). Loosen the push-off-bar locking screw, shown in figure 18. Squeeze the push-off-bar ears toward each other to the point where the slider blade on the record shelf extends $\frac{1}{32}$″ beyond the lips of the shelf. Tighten the hex-head locking screw.

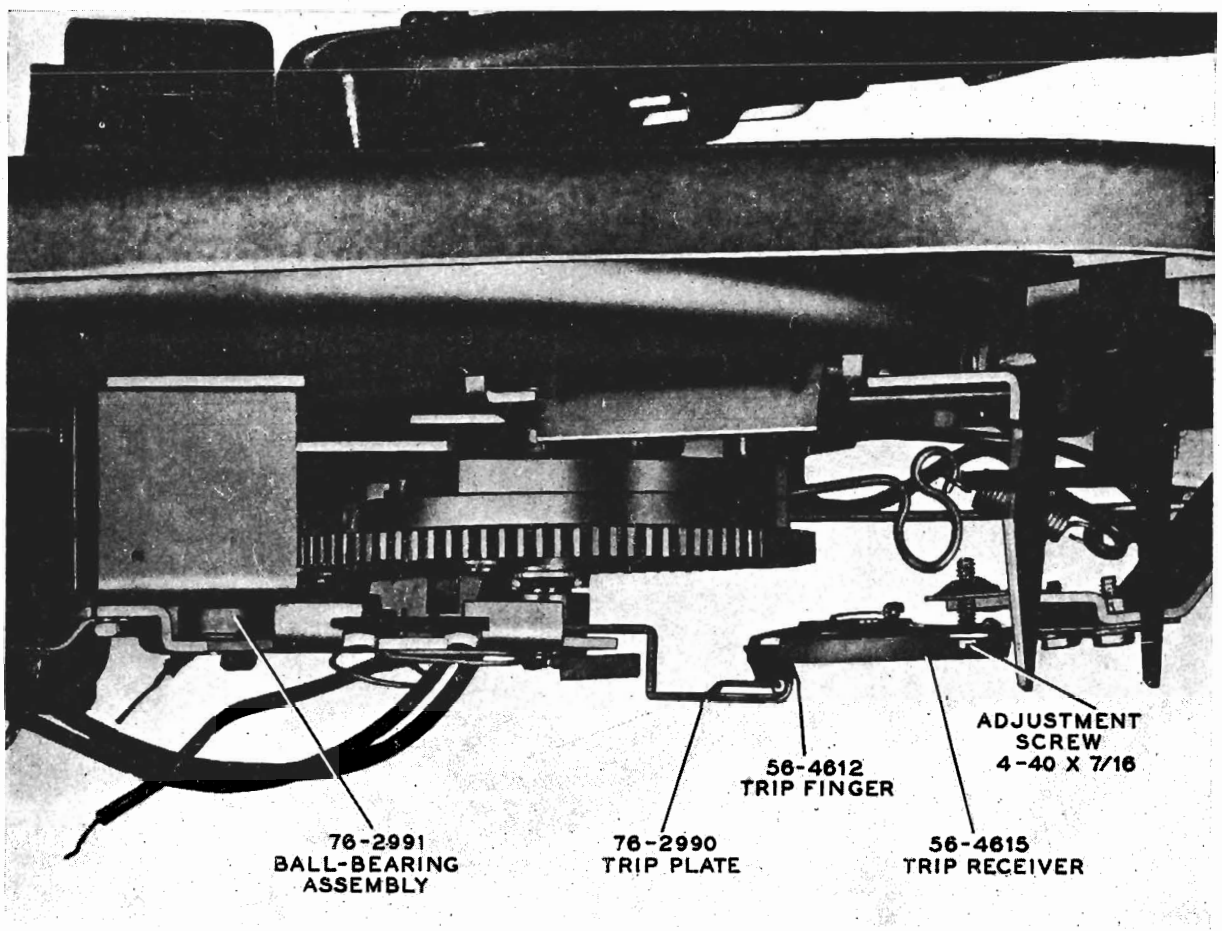

Figure 16—TRIP-FINGER ADJUSTMENT TP-4135

Figure 17—SPECIAL GAUGE, SHOWN IN CORRECT POSITION ON RECORD SHELF AND SPINDLE

TP-4121

Uneven Turntable Speed (Wows)

Uneven turntable speed (wows) may be caused by the following:

Dirt under and around the turntable or idler-wheel assembly. Remove the turntable and clean out the dirt. Be careful to lift the turntable straight up. When replacing the turntable, be sure the idler is behind the turntable rim before the turntable is fully lowered (the spindle may be used to hold the idler back).

Flat or worn spots, or grease, on the rubber tire of the idler wheel.

Defective turntable shaft or bearing assembly.

Replace the defective parts as directed under REPLACEMENT OF PARTS AND ASSEMBLIES.

Lack of lubrication on idler-wheel assembly. Follow the directions under CLEANING AND LUBRICATION

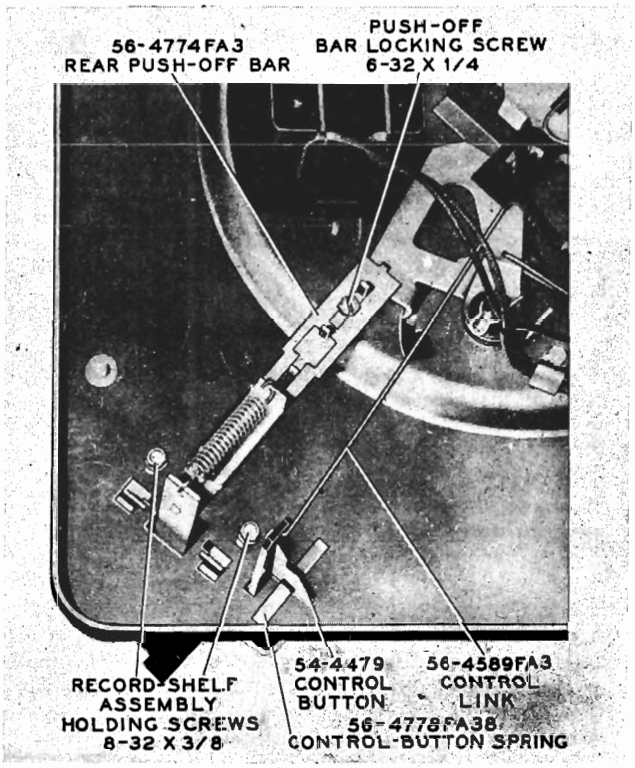

Figure 18—PUSH-OFF-LEVER ADJUSTMENT

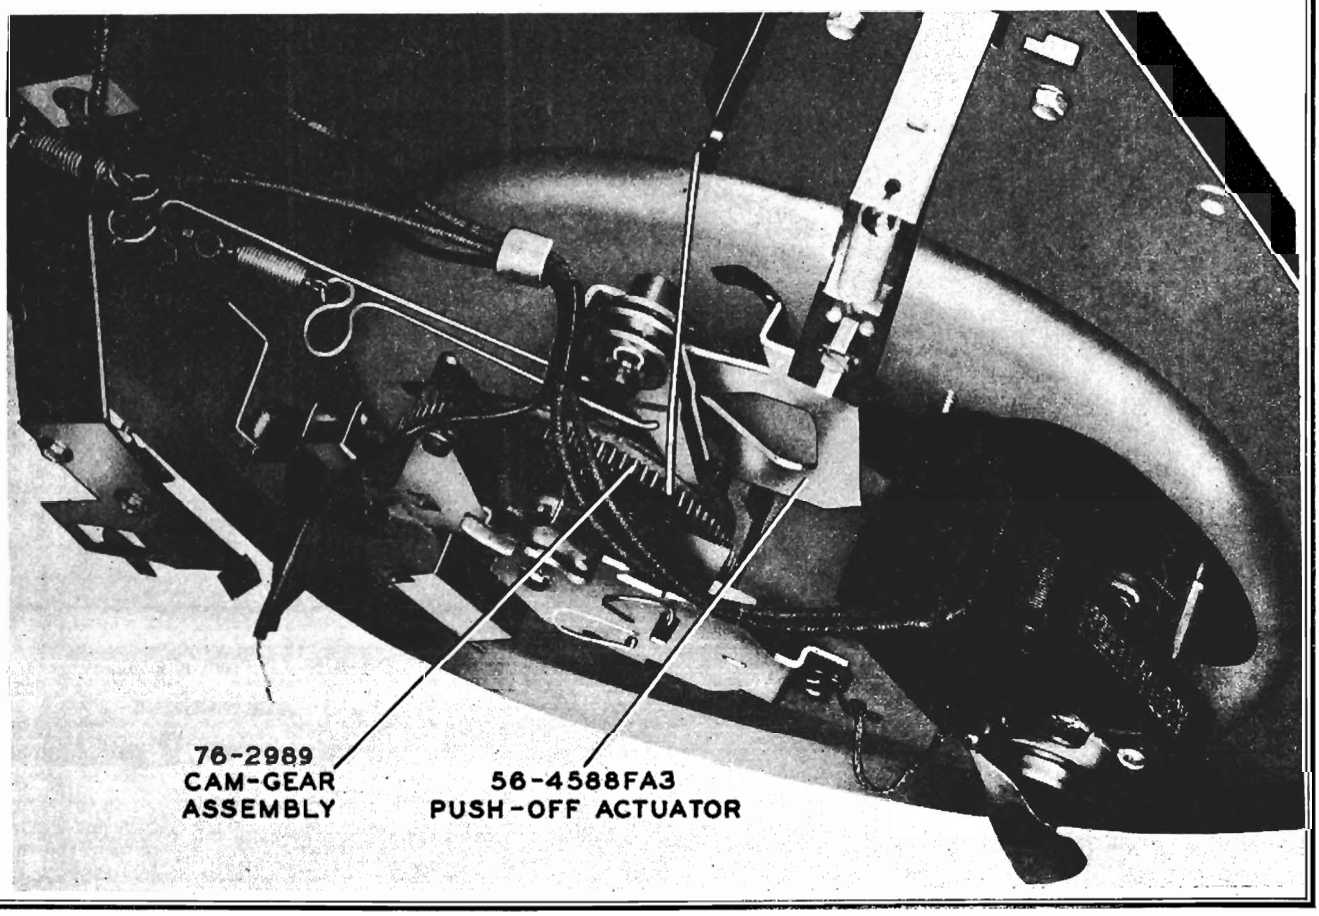
Figure 19—PUSH-OFF ACTUATOR AGAINST CAM ROLLER

TP-4134



REPLACEMENT OF PARTS AND ASSEMBLIES

The following procedures are recommended for correct replacement of parts and assemblies. The part should be replaced by reversing the order of removal, and adjusted according to the directions given in the ADJUSTMENTS section of this manual.

When any part is to be removed, the control button should be in the AUT. (automatic) position, and the changer should be out of cycle.

1. Needle

There are two types of needle chucks, depending upon the type of pickup cartridge in the tone arm. One type of chuck has a setscrew, for vertical needle insertion; the other has a knurled nut, for horizontal needle insertion.

To remove needle from tone arm, loosen setscrew or knurled nut in front of crystal cartridge, and pull needle out.

2. Crystal-Pickup Cartridge

At the present time, the pickup cartridge may be either of two types, one identified by vertical needle insertion, and the other by horizontal needle insertion. The cartridge type may be identified by the part number stamped on the bottom of the cartridge. Since the loading circuit in the radio differs for each type of pickup, the two cartridges are not interchangeable.

a. Bring tone arm toward center of turntable.

b. Remove the two screws, nuts, lock washers, and spacers which hold cartridge to tone arm.

c. Drop cartridge below tone arm sufficiently to allow removal of the two clips from cartridge, as shown in figure 20. If pickup leads are shielded, unsolder shield.

NOTE

When mounting cartridge, be sure to insert long spacer in side toward spindle. For cartridge 35-2643, use mounting spacers 56-4601 and 56-4601-1; for cartridge 35-2671-1, use mounting spacers 56-4601-2 and 56-4601-3.

3. Motor

a. Push control button to MAN. position.

b. Remove spindle. Remove turntable by pulling straight out.

c. Remove switch cover, and unsolder motor lead from switch contact.

d. Loosen screw of clamp which holds wire against base plate, and pull wire through clamp.

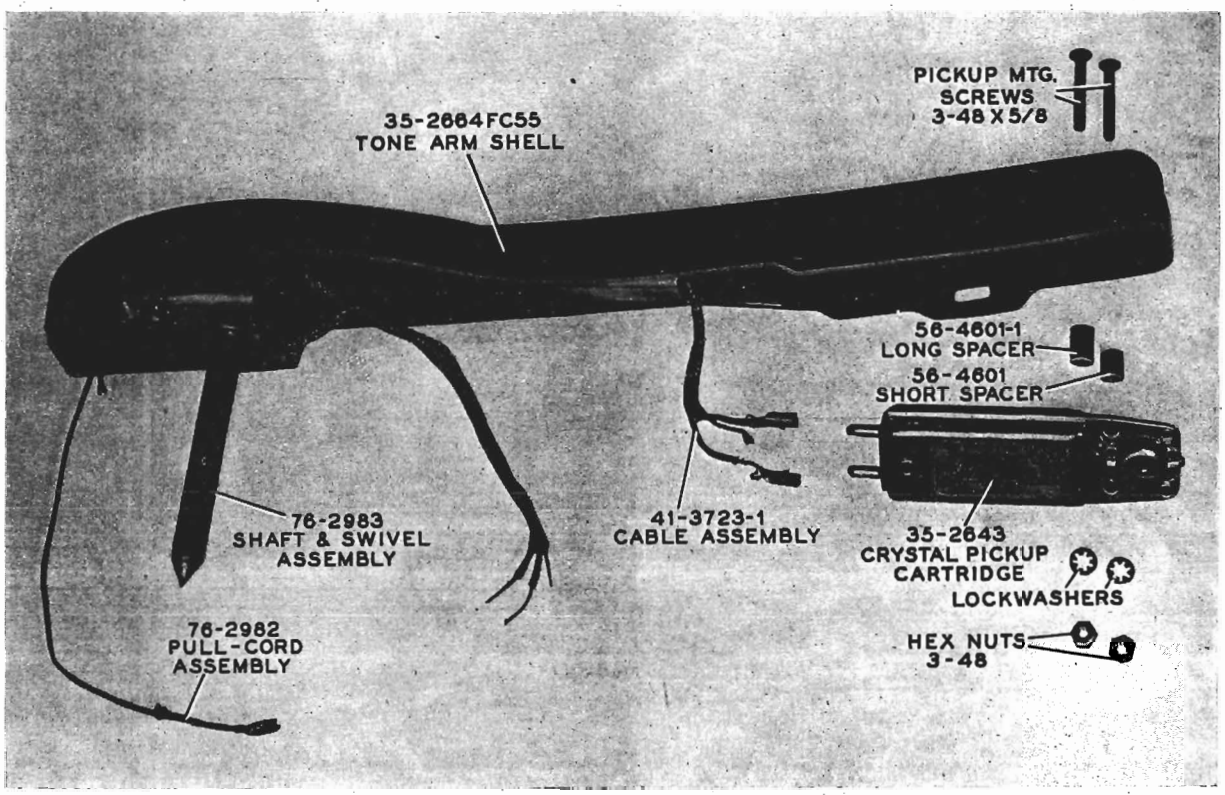
e. Unsolder second motor lead from power plug or disconnect at splice from chassis power lead, whichever is used.

f. Remove ground lead from lug on motor.

g. Remove the three screws, washers, and bushings from motor frame (figure 21), and lift motor out.

Figure 20—TONE ARM (35-2663), CRYSTAL CARTRIDGE (35-2643) REMOVED

TP-4130



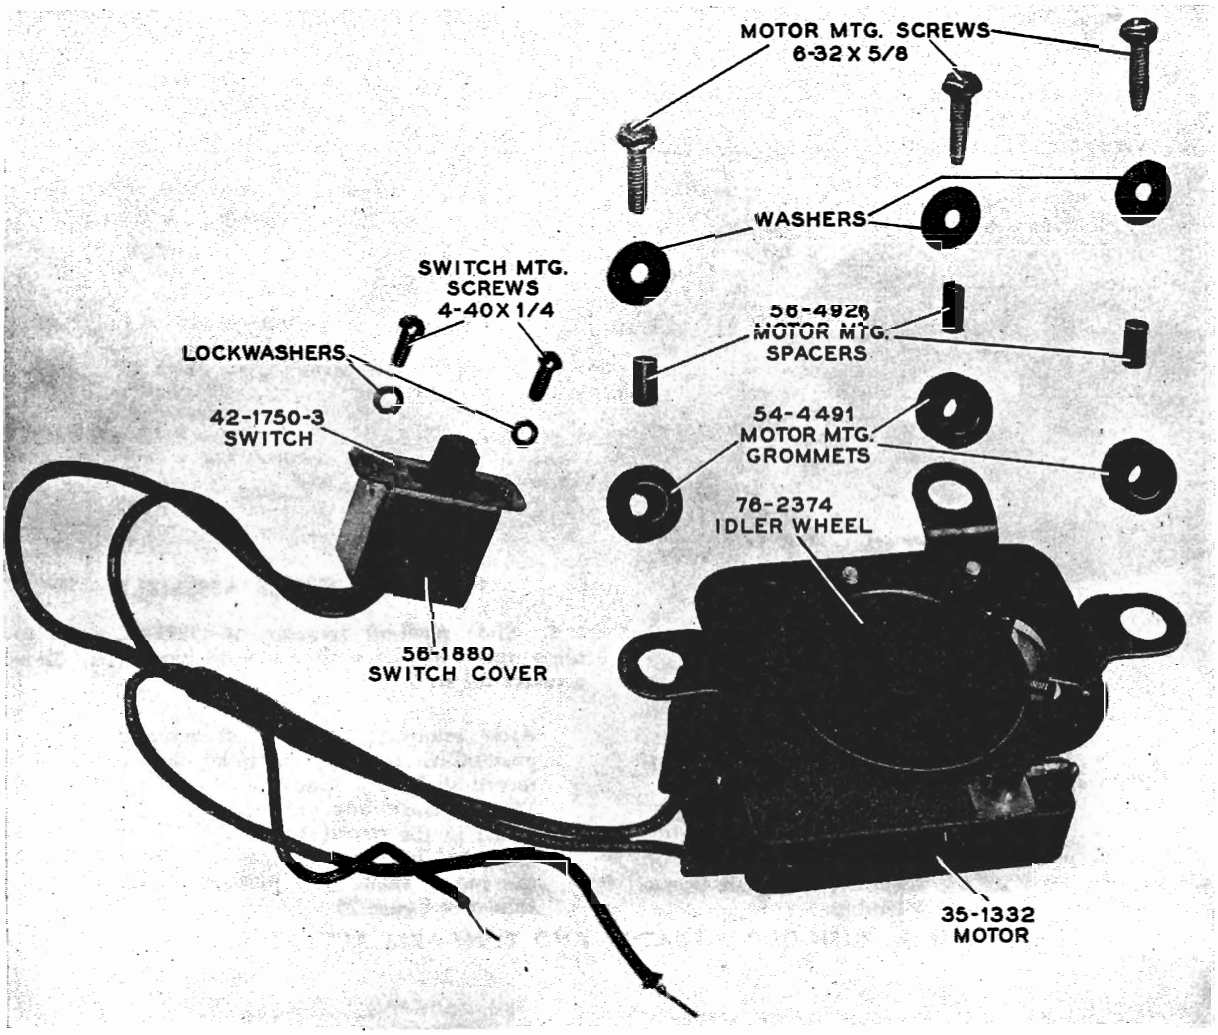


Figure 21—MOTOR, SWITCH, AND MOUNTING HARDWARE TP-4133

4. Tone-Arm Assembly

a. Unsolder tone-arm lead wires from terminal panel on underside of changer base plate.

b. Remove pull cord from spring and short link, 56-4607FA3.

c. Loosen clamp screw which holds trip arm to tone-arm shaft, 76-2983 (figure 22). Lift out tone arm and shaft.

5. Bridge Assembly

a. Remove the two hex-head screws from bridge plate.

b. Remove link rod, 56-4589FA3, from slider control bar. Complete assembly of bridge is shown in figure 23.

6. Trip Plate

a. Remove bridge assembly, 76-2978, as directed in paragraph 5.

b. Slide trip plate, 76-2990, off cam-gear spindle.

7. Cam-Gear Assembly

a. Remove bridge assembly and trip plate, as directed in paragraphs 5 and 6.

b. Remove ball-bearing assembly, 76-2991 (figure 16), by pulling it off.

c. Remove large hairpin, 1W42706FA1, from cam-gear spindle, and slide washer off.

d. Slide cam gear off spindle. Figure 24 shows cam-gear assembly.

8. Tone-Arm Actuator Levers

a. Remove large hairpin, 1W42706FA1, from actuator stud.

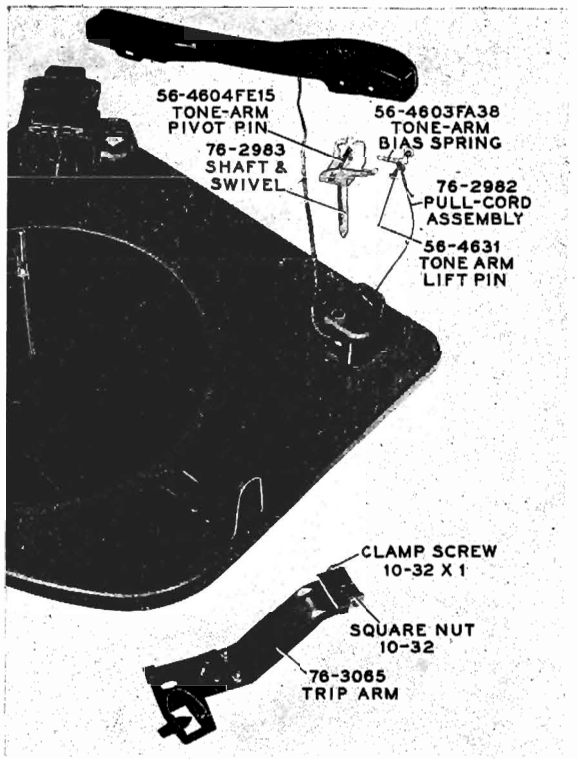
b. Slide lower actuator lever from stud, and remove short link, 56-4607FA3.

c. Remove upper actuator lever from stud, and disengage long link, 56-4606FA3. Figure 24 shows actuator-lever assembly.

9. Push-Off Actuator

a. Remove two motor-mounting screws, and loosen the third one; swing motor to one side.

b. Remove tone-arm actuator levers, 76-2987, as directed in paragraph 8.



TP-4132

Figure 22—TONE ARM AND TRIP ARM, REMOVED

c. Press push-off rod, 56-4595FA3, and push-off hanger bar, 56-4596FA3, together, and pull downward, releasing the entire assembly.

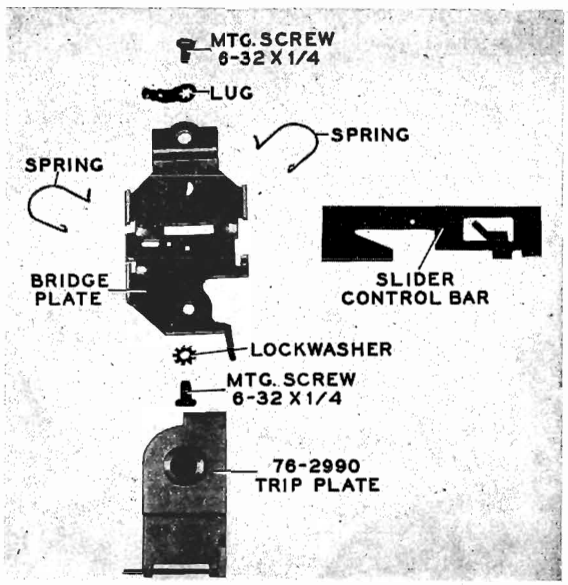


Figure 23—BRIDGE ASSEMBLY TP-4180

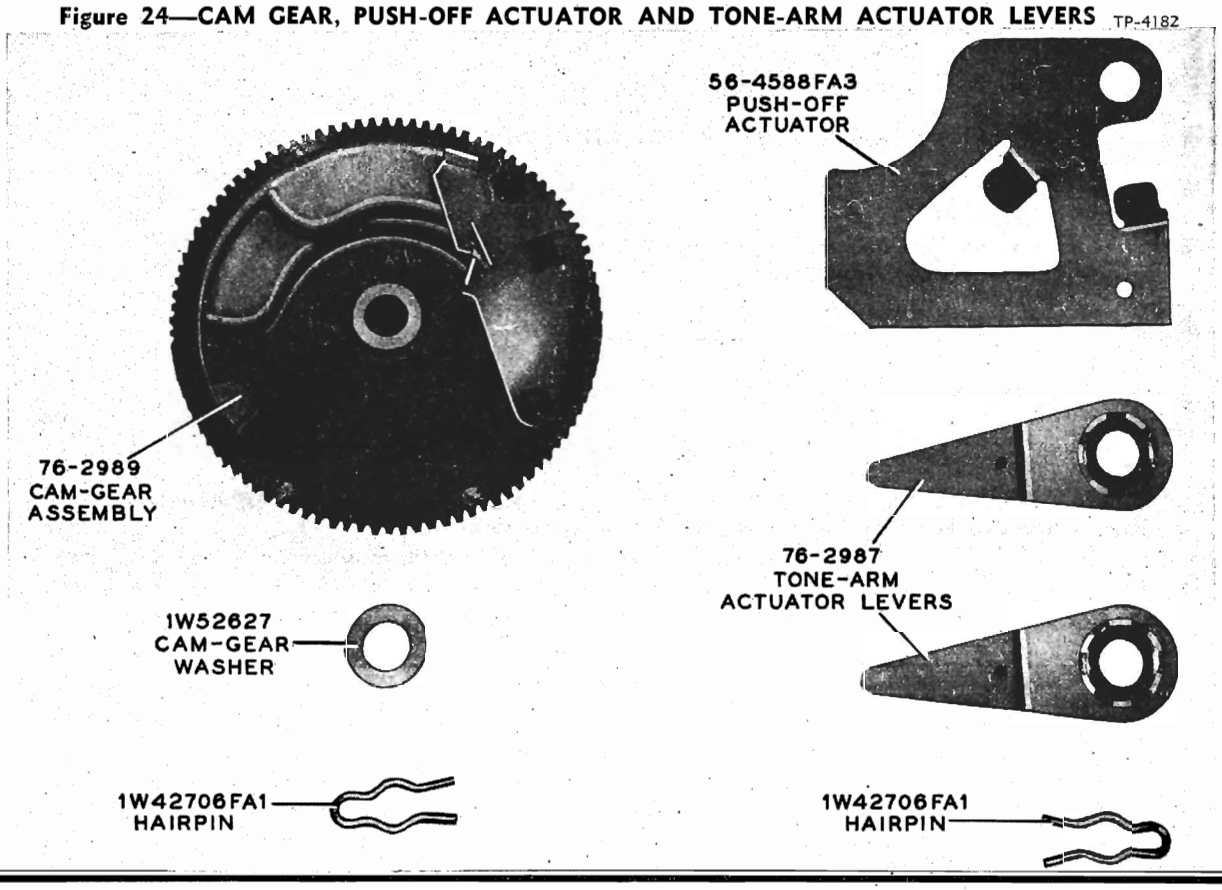
d. Slide push-off actuator, 56-4588FA3, over, to align upturned ears with cutout in base plate. Slide actuator off stud.

NOTE

After removing the push-off actuator and push-off-bar assembly, the slider blade on the record shelf may slide out of the assembly. When reassembling, this blade should be inserted in the record-shelf assembly with the elongated hole toward the 12″ position of the record shelf. The push-off assembly is shown in figure 25.

Figure 24—CAM GEAR, PUSH-OFF ACTUATOR AND TONE-ARM ACTUATOR LEVERS TP-4182



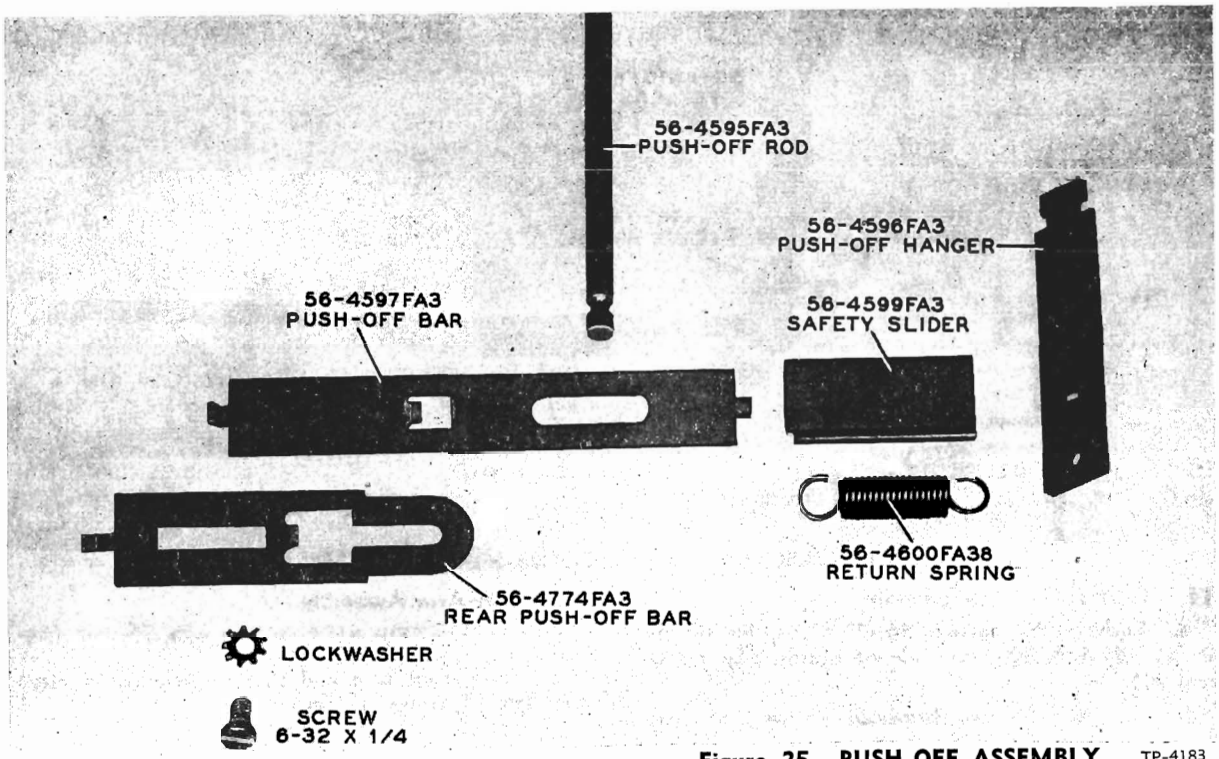


Figure 25—PUSH-OFF ASSEMBLY TP-4183

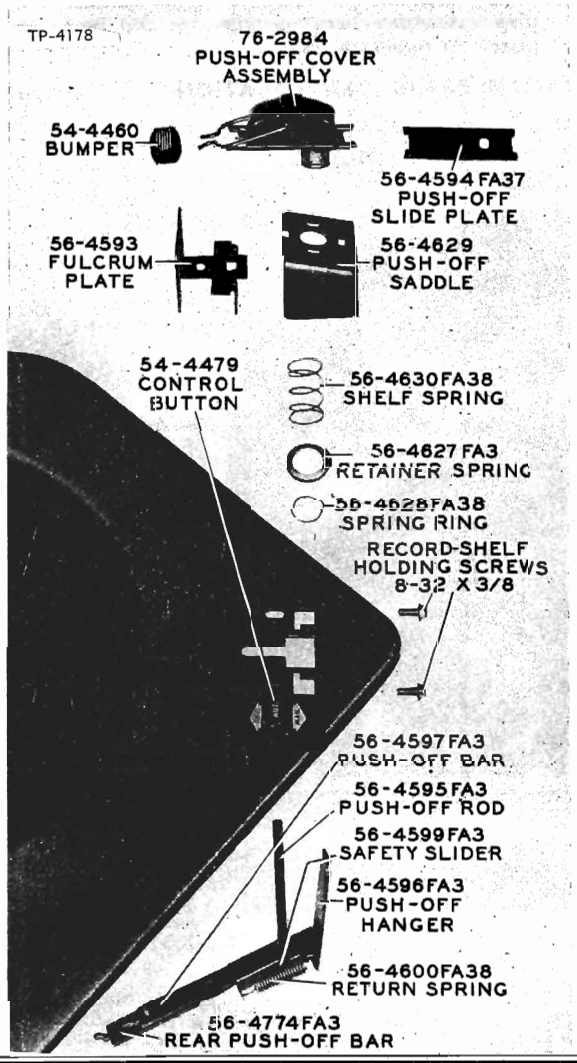

Figure 26—RECORD-SHELF AND PUSH-OFF ASSEMBLIES REMOVED

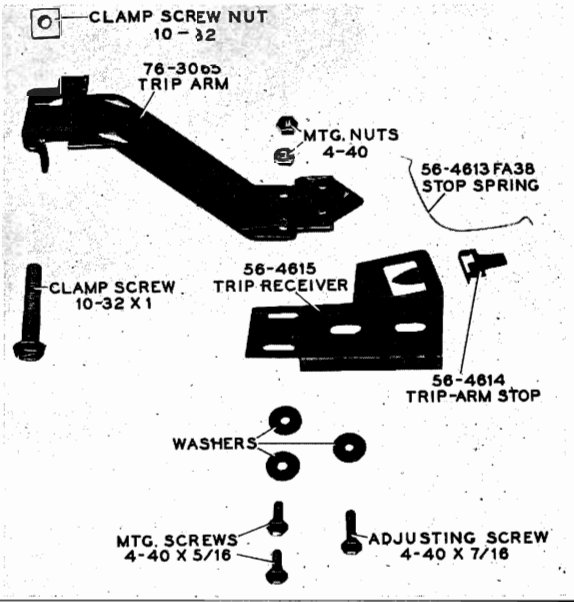
10. Record-Shelf Assembly

a. Remove push-off actuator assembly as directed in paragraph 9.

b. Remove the two hex-head screws which hold record-shelf assembly to base plate (figure 18).

c. Align ears on record-shelf assembly with cut-out on base plate. Lift out record-shelf assembly. Record-shelf assembly is shown in figure 26.

Figure 27—TRIP-ARM AND TRIP-RECEIVER ASSEMBLIES TP-4227



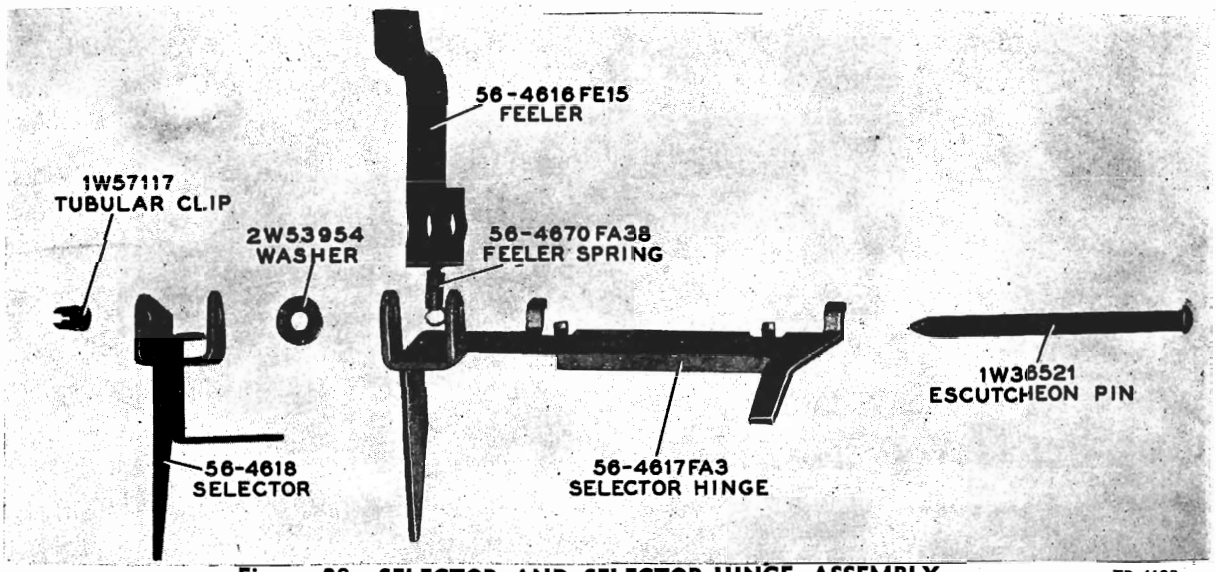


Figure 28—SELECTOR AND SELECTOR-HINGE ASSEMBLY TP-4123

11. Control-Button Assembly

a. Remove flat spring, 56-4778FA38, by sliding it laterally through underside of button (figures 10 and 18).

b. Remove the two hex-head screws and drop bridge assembly, 76-2978 (shown in figure 10).

c. Disengage control link, 56-4589FA3, from underside of control button. Lift out control button.

12. Trip-Arm Assembly

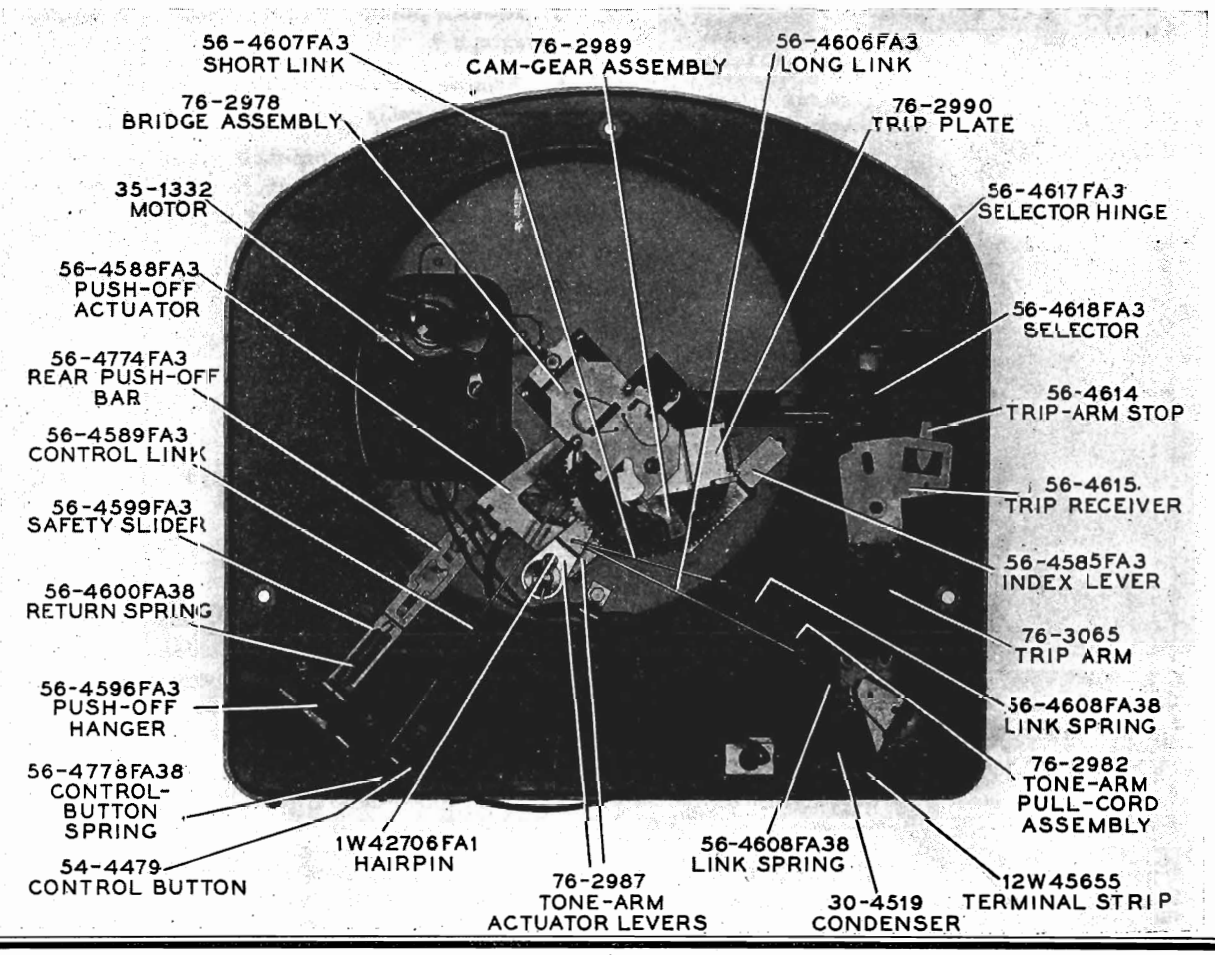
a. Loosen clamp screw on trip arm, 76-3065 (figure 27).

b. Raise tone arm and shaft sufficiently to clear trip arm. Remove trip arm.

NOTE

When assembling, maintain $\frac{1}{32}$" vertical play (clearance between trip arm and base plate) in tone-arm shaft.

Figure 29—BOTTOM VIEW OF CHANGER, WITH PARTS IDENTIFICATION TP-4107



13. Trip-Receiver Assembly

Remove the three screws, washers, and nuts from trip arm (figure 27).

Remove trip receiver.

14. Selector Assembly

Remove cam gear as directed in paragraph 7. Remove feeler spring from attachment point on motor board. Tilt selector assembly, and remove from base plate.

NOTE

When assembling selector assembly, be sure to maintain .005" clearance between selector hinge, 56-4617FA3, and washer, 2W53954. For correct assembly refer to figures 28 and 11.

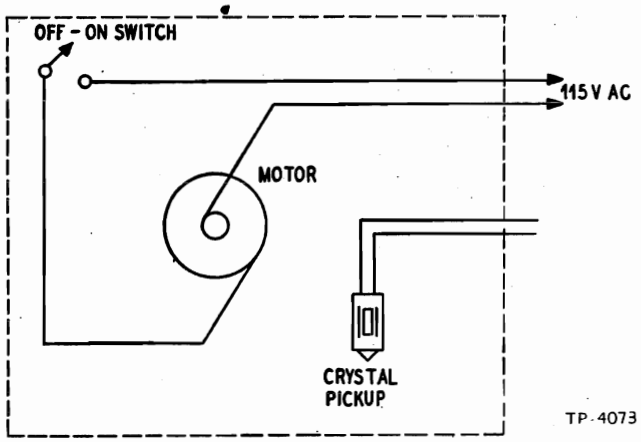


Figure 30—CHANGER WIRING DIAGRAM

TP-4101A TP-4181

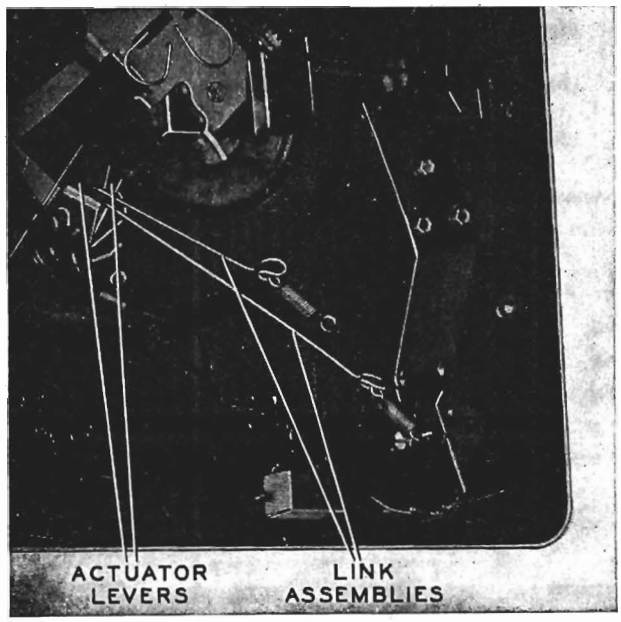

Figure 3—LINK ASSEMBLIES AND ACTUATOR LEVERS

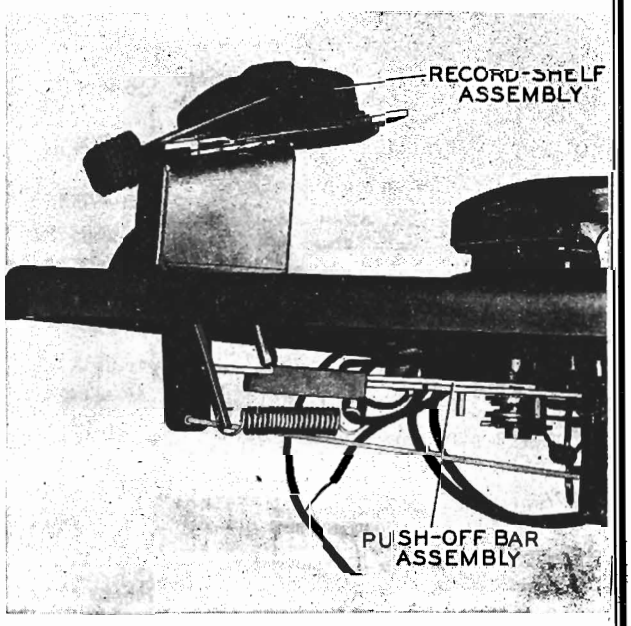

Figure 4—RECORD-SHELF AND PUSH-OFF ASSEMBLIES

DESCRIPTION OF OPERATING CYCLE

Power for the motor is applied through the on-off switch. The turntable is rim-driven by a rubber-tired idler wheel mounted between the motor shaft and the turntable rim.

The turntable hub is a combined shaft and gear (figure 1). This small hub gear engages a large cam gear (figure 2) when the retractable segment of the cam gear is brought into position by the action of the trip mechanism; the cam gear, in turn, operates the changer mechanism.

The tone arm is operated by two link assemblies attached to actuator levers (figure 3) which are in contact with the cam surface of the cam gear.

The record-shelf push-off mechanism is connected, through a series of bars (figure 4), to a push-off actuator; the mechanism is operated when a roller on the cam gear comes in contact with the actuator.

The trip mechanism is operated by a trip finger, riding over a ratchet screw (figure 5), which starts the change cycle when the needle is traveling in the eccentric finish groove of the record. The trip mechanism is locked in a disengaged position when the control button is in the manual position.

PHILCO RADIO-PHONOGRAPH TROUBLE-SHOOTING PROCEDURE

The following tests are given for quickly localizing trouble in either the radio or phonograph section of the radio-phonograph combination. Be sure to make each test, in the order given, before removing either the radio chassis or the record changer from the cabinet. If the trouble is found to be in the audio amplifier, refer to the radio service manual for the particular model under test. If the trouble is in some part of the record changer, refer to this record-changer manual.

Audio-Amplifier Test

The audio amplifier is common to both the radio and the phonograph sections of the combinations using the M-9 changer.

Tune in a station, and note the volume and tone quality. If the performance is abnormal, refer to the radio service manual for the particular model under test, and correct the trouble.

Pickup Test

Play a familiar record on the phonograph, and again note the volume and tone quality.

NOTE

It is advisable to carry a familiar record as a part of the service test equipment.

If distortion is noted when playing the record, first try a new needle. If the distortion continues, a faulty crystal pickup is indicated.

Changer-Mechanism Test

The following series of record-changer operating tests is given for quickly locating any troubles that may be encountered. Each test should be performed with several records before making any adjustments.

Set the record shelf to the 10″ position and place the tone arm on the rest post. Place a 10″ record over the spindle and onto the record shelf.

Push the control button to REJ. (reject), and observe the record-dropping action. The record should fall smoothly, the edge leaving the lips of the record shelf *after* the center has started to fall.

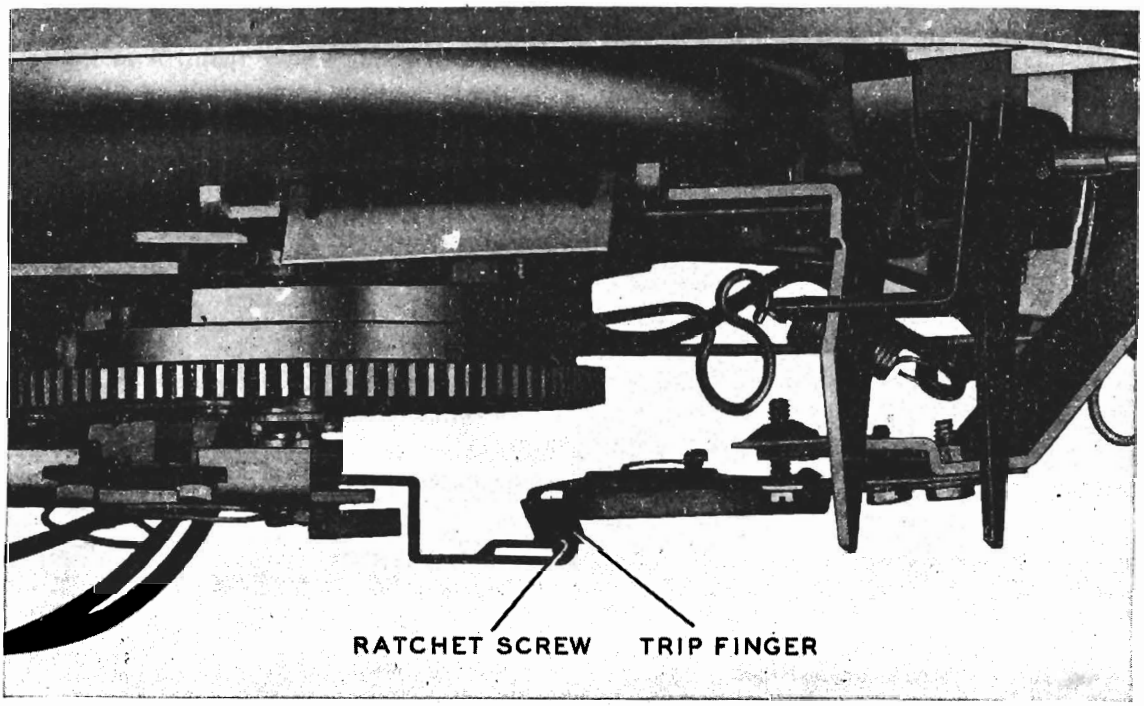

Figure 5—TRIP FINGER AND RATCHET SCREW TP-4135-1

The tone arm should rise from the rest post, and the needle should come down on the record, starting about 1/8" from the outer edge.

Play the record through and observe the tripping action; the trip mechanism should operate within the first two or three revolutions after the needle has entered the eccentric finish groove.

Remove the record from the turntable and turn the record shelf to the 12" position. Place a 12" record over the spindle and onto the record shelf. Push the control button to REJ., and observe the record-dropping action. The record should leave the lips of the record shelf *after* the center has started to fall. Refer to page 11 for the record-shelf adjustment, if needed. The tone arm should rise from the rest post, and the needle should come down on the record, starting about 1/8" from the outer edge.

Play the record through and observe the tripping action.

Observe whether the lower edge of the tone arm, during a change cycle, clears the top of the hook on the tone-arm rest post by a minimum of 1/8". Take the tone arm off the rest post, and place the pickup over the changer base plate; the needle point should clear the base plate by at least 1/16", and should be no higher than the turntable top.

Turntable and Motor Test

NOTE

Before making this test, warm up the motor by allowing it to run for at least ten minutes.

Set the control button to MAN. (manual), load the turntable with ten 12" records, and place the tone arm on the top record.

Place a stroboscope disc, such as Philco Part No. 45-2900, on the record, and illuminate the disc with a lamp (preferably a neon bulb) operated on 60-cycle a.c. The dots in the row calibrated for 78 r.p.m. should appear to remain stationary, or drift *very* slowly, but smoothly, backward or forward.

If the turntable speed is steady, but is appreciably below 78 r.p.m., refer to the lubrication data on the turntable upper bearing, motor bearings, and motor idler plate, given under CLEANING AND LUBRICATION, — — — — if the lubrication appears to be adequate, the motor is probably defective.

Unsteady drift of the dots on the stroboscope disc indicates uneven turntable speed, the cause of wows; see UNEVEN TURNTABLE SPEED (WOWS).

CLEANING AND LUBRICATION

The M-9 record changer, like any other mechanism, requires lubrication after long periods of use. Whenever a major part or assembly is to be replaced, the changer should be cleaned and lubricated. Carbon tetrachloride or other similar cleaning fluids may be used to remove old grease, oil, and dirt. Apply lubricants sparingly. All lubrication points are shown in figures 6 and 7. It may be necessary to remove some parts and assemblies in order to lubricate their bearings—for example, the actuator and cam gear must be removed to lubricate the actuator stud and the cam-gear spindle.

PARTS NOT TO BE LUBRICATED

The following parts should not be lubricated at any time: Trip receiver; trip finger; ratchet screw on trip plate; selector.

PARTS TO BE GREASED

The following parts are to be lubricated with a grease having the consistency of vaseline:

Record-Shelf Assembly (point A of figure 7)

Four protruding dimples.

Bridge Assembly and Slider Control Bar (point B of figure 6)

Three dimples and four upturned ears.

Cam Gear (point C of figure 6)

Cam-gear teeth, cam surfaces, and cam-gear spindle.

Main Assembly (points D, figures 6, 7, and 11)

Trip-plate ear where contact is made with gear segment.

Actuator stud.

All parts with ears sliding on changer base plate.

Index-lever surface which slides on base plate.

Push-off-actuator dimples which slide on base plate.

Turntable shaft (upper bearing).

Tone-arm shaft.

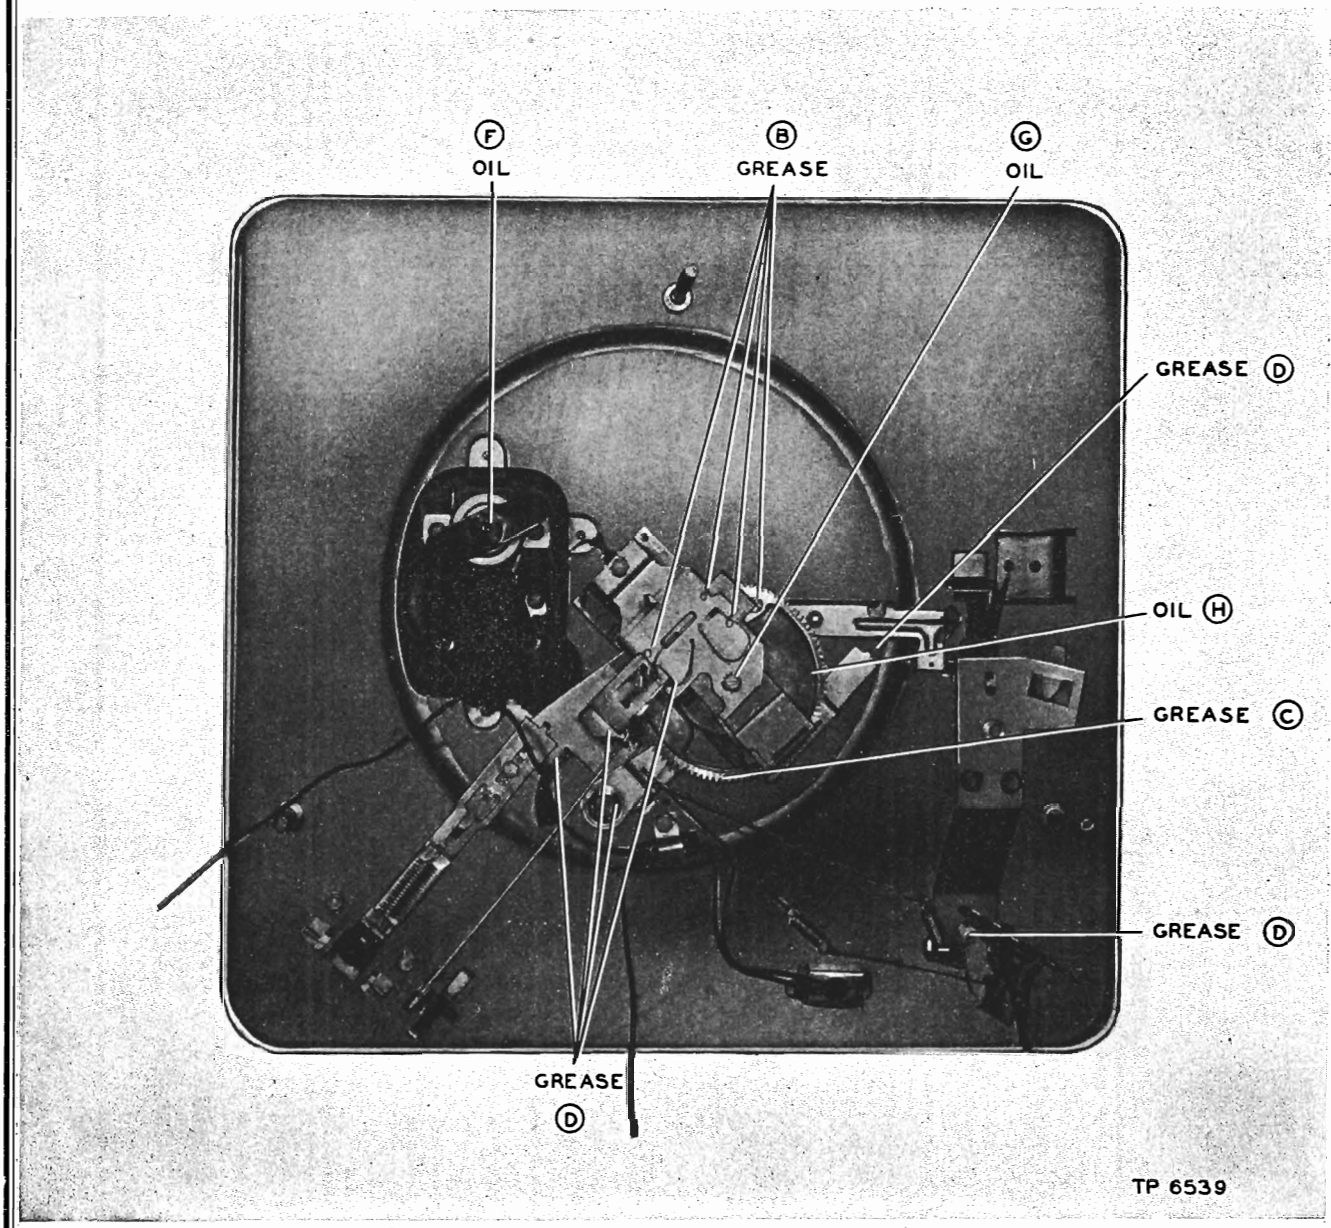

Figure 6—BOTTOM VIEW OF CHANGER, SHOWING LUBRICATION POINTS

PARTS TO BE OILED

The following parts are to be lubricated with S.A.E. 20 oil:

Tone Arm (point E of figure 7)

Tone-arm pivot pin where pin rides in elongated hole of tone arm—apply one drop with a pointed rod.

Motor (points F, figures 6 and 7)

Motor idler plate—one or two drops in each dimple.

Motor bearings.

Trip-Plate Bushings (point G of figure 6)

Cam-Gear Roller (point H of figure 6)

CAUTION

Do not get any oil or grease on the motor shaft or the idler-wheel tire. Should this occur, remove the oil or grease immediately with carbon tetrachloride.

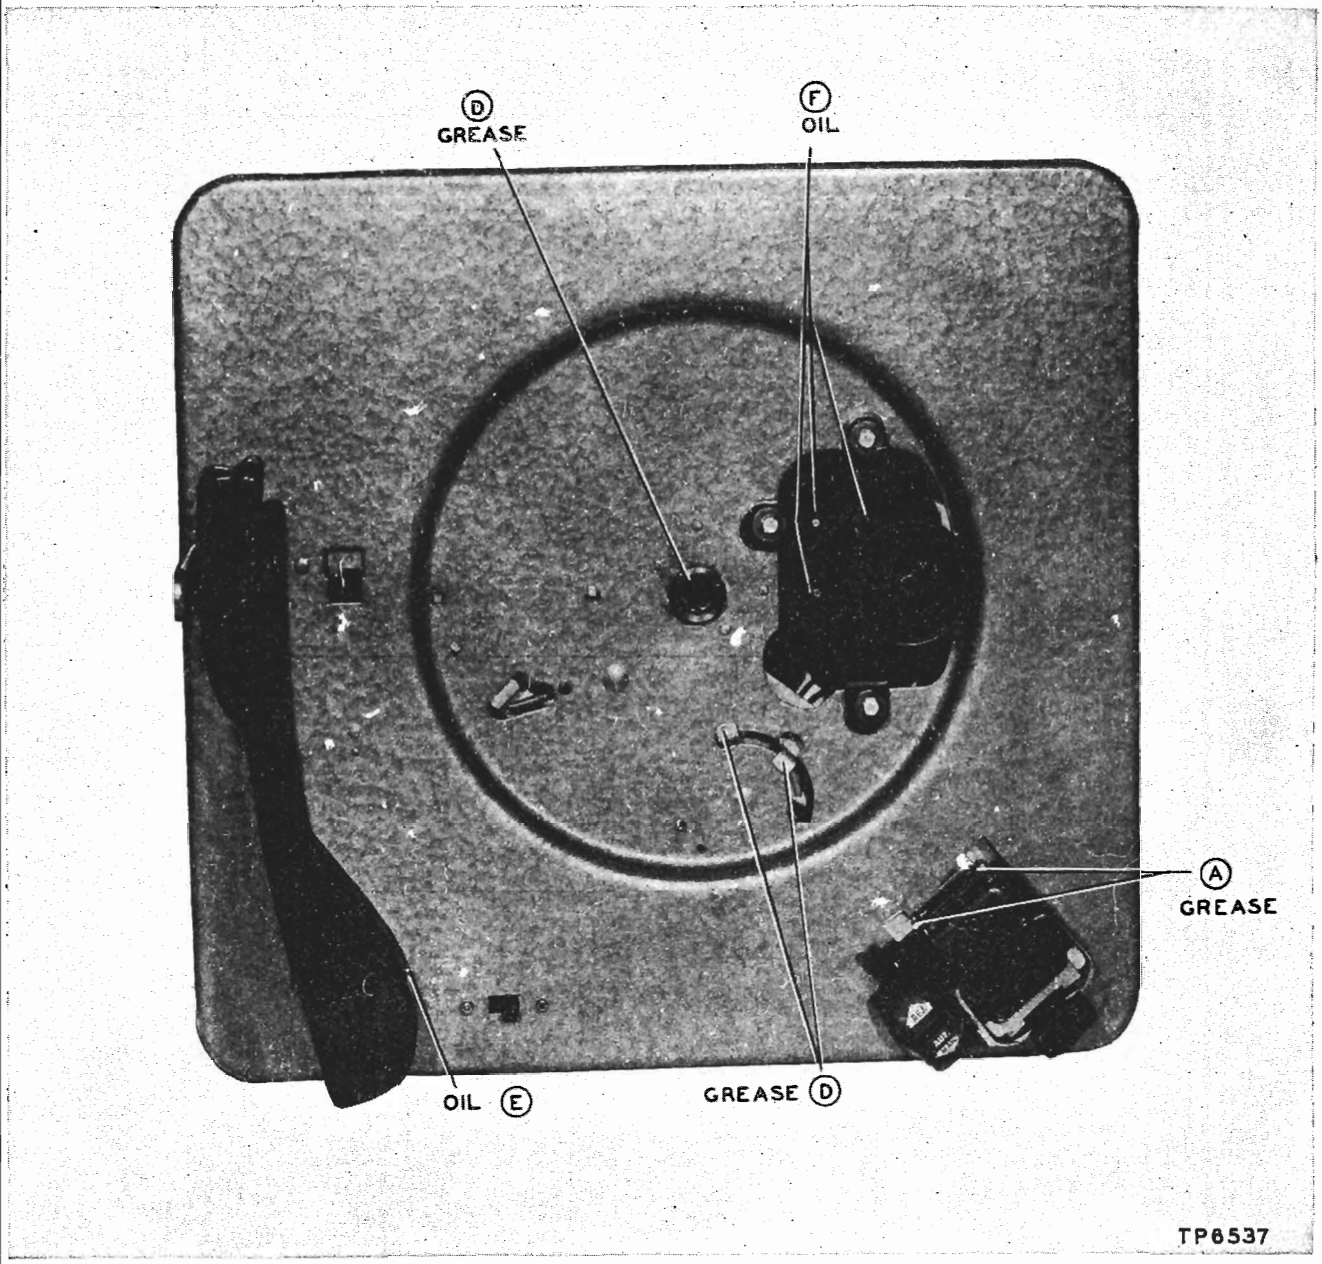

Figure 7—TOP VIEW OF CHANGER, SHOWING LUBRICATION POINTS

ADJUSTMENTS

10″ Index Adjustment

Set a 10″ record on the turntable; push the control button to REJ., and rotate the turntable 4½ turns by hand. The tone arm should then be approximately ½″ above the record.

Loosen the clamp screw on the trip arm (figure 8). Hold the tone arm (steady) ⅛″ in from the edge of the record, and set the trip arm so that the trip-arm stop is in contact with the selector hinge. See figure 8.

Tighten the clamp screw, leaving $\frac{1}{32}$″ vertical play, or clearance, between the trip arm and the base plate.

12″ Index Adjustment

Make the 10″ index adjustment first. The 12″ indexing will ordinarily be satisfactory after the 10″ adjustment is made; if not, bend the selector, 56-4618FA3, slightly to the right or left as required for proper indexing of the needle on the record, as shown in figure 9.

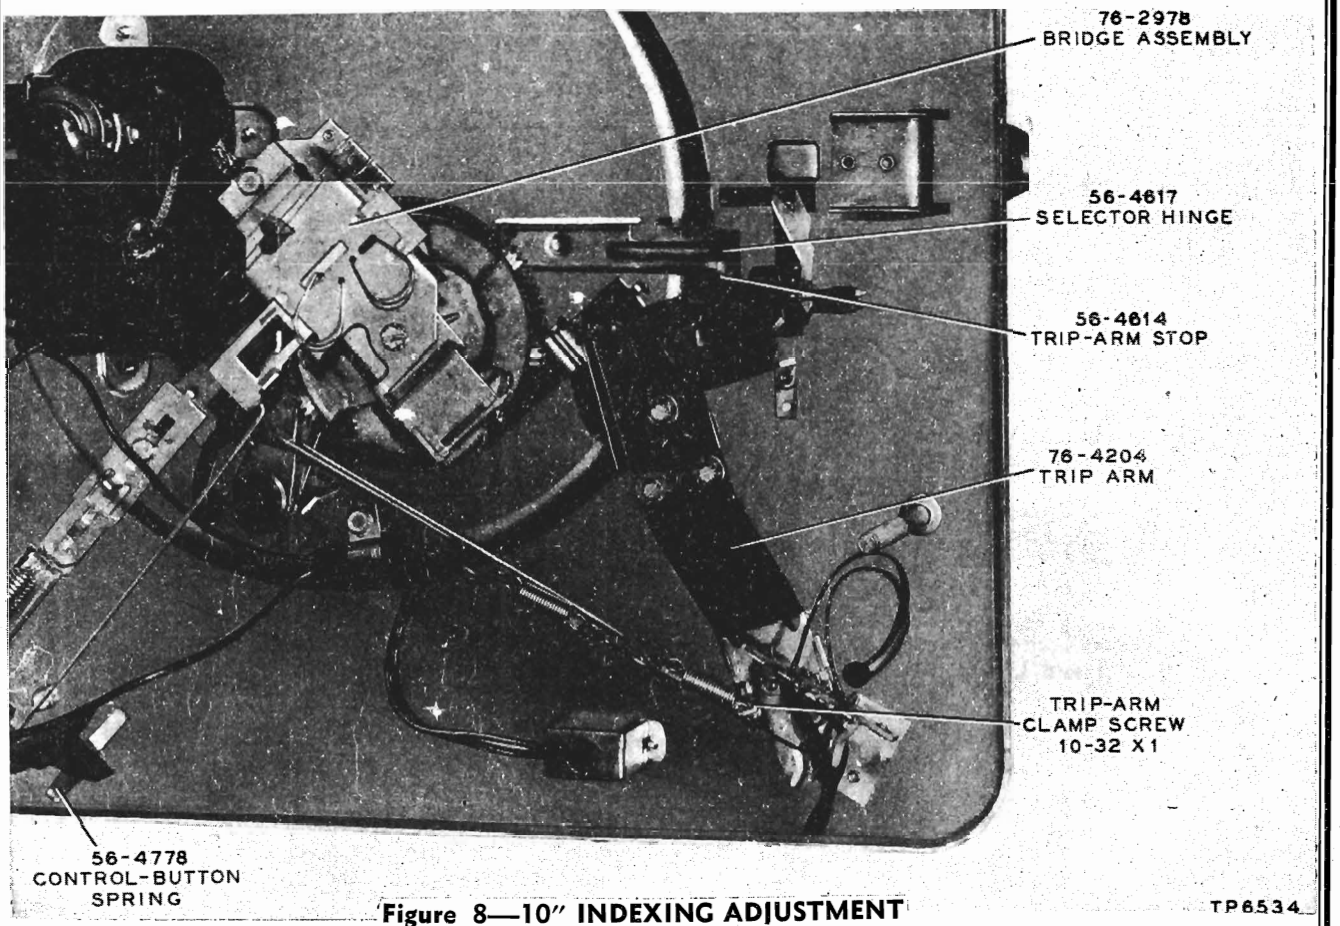

Figure 8—10″ INDEXING ADJUSTMENT TP6534

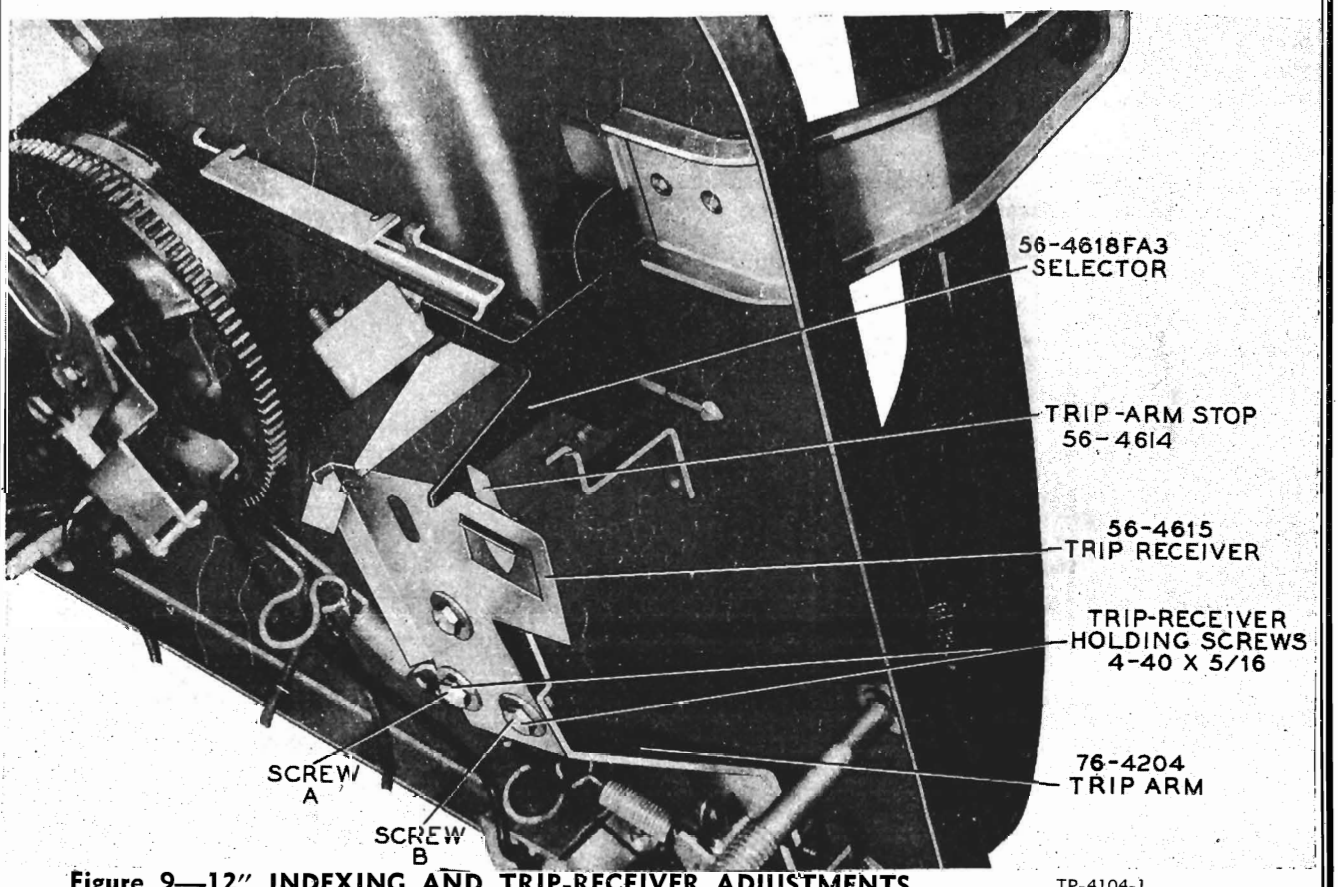

Figure 9—12″ INDEXING AND TRIP-RECEIVER ADJUSTMENTS TP-4104-1

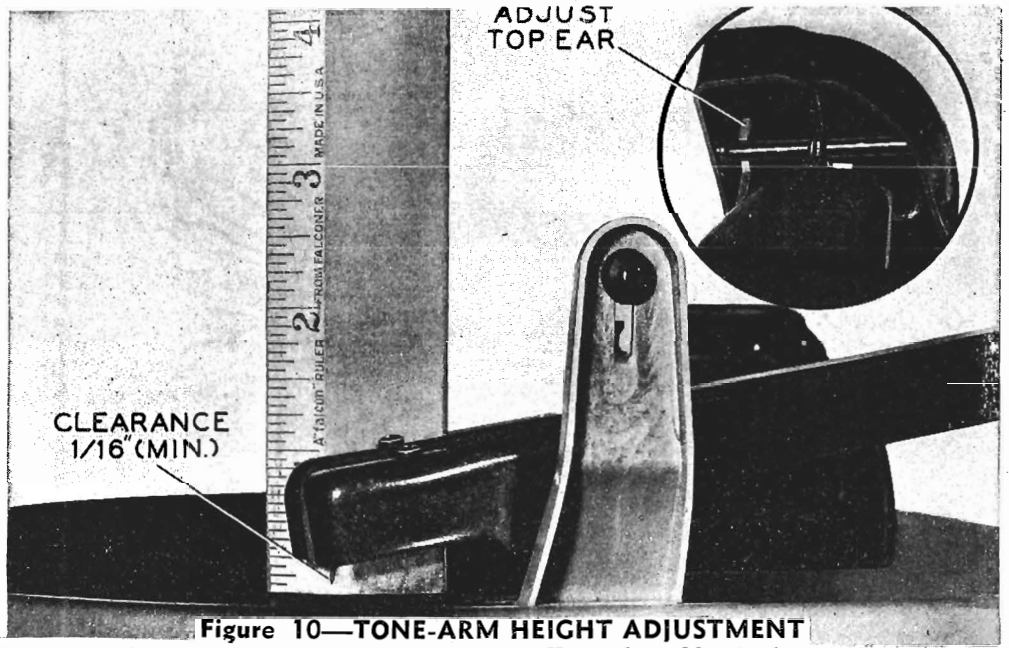

Figure 10—TONE-ARM HEIGHT ADJUSTMENT

TP-4000

Tone-Arm Height and Lift Adjustments

With the changer out of cycle (change cycle completed; tone arm lowered), and the tone arm off the rest post, the needle point should clear the changer base plate by at least 1/16", and should not be higher than the turntable top. See figure 10. To adjust the height, shape the *top* ear of the tone-arm swivel, shown in figure 10 (bending the ear downward raises the tone arm).

To adjust the lift, take the tone arm off the rest post, push the control button to REJ., and rotate the turntable (approximately 1½ turns) by hand until the tone arm comes against the rest post. See figure 11; the lower edge of the tone arm should clear the top of the protruding hook on the rest post by not less than ⅛", and not more than ¼". Adjust by shaping the *lower* ear of the tone-arm swivel (bending the ear downward raises the tone arm).

Tone-Arm Vertical and Horizontal Timing Adjustments

NOTE

Before making these adjustments, make the tone-arm height and lift adjustments given above.

For the vertical adjustment, start with the changer out of cycle, push the control button to REJ., and rotate the turntable, by hand, three-quarters of a revolution; this setting can be obtained more accurately by making a mark on the turntable to coincide with some starting point. At the three-quarter-revolution point, the leading edge of the cam surface is approximately ¼" from the end of the lift actuator lever; this is the lower actuator lever, shown in figure 12. Adjust the wire loop of the short link (link, cord, and spring assembly), attached to the tone-arm lift pin, by squeezing or opening the loop until the tone-arm lift pin makes contact with the lower ear of the tone-arm swivel (figure 11).

TP-4102

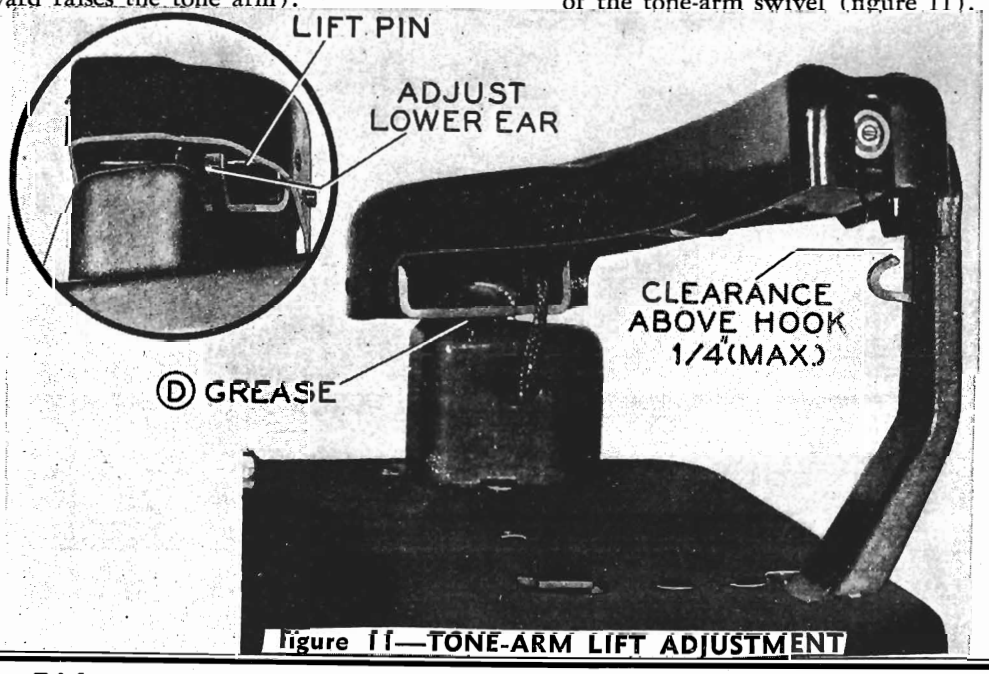

Figure 11—TONE-ARM LIFT ADJUSTMENT

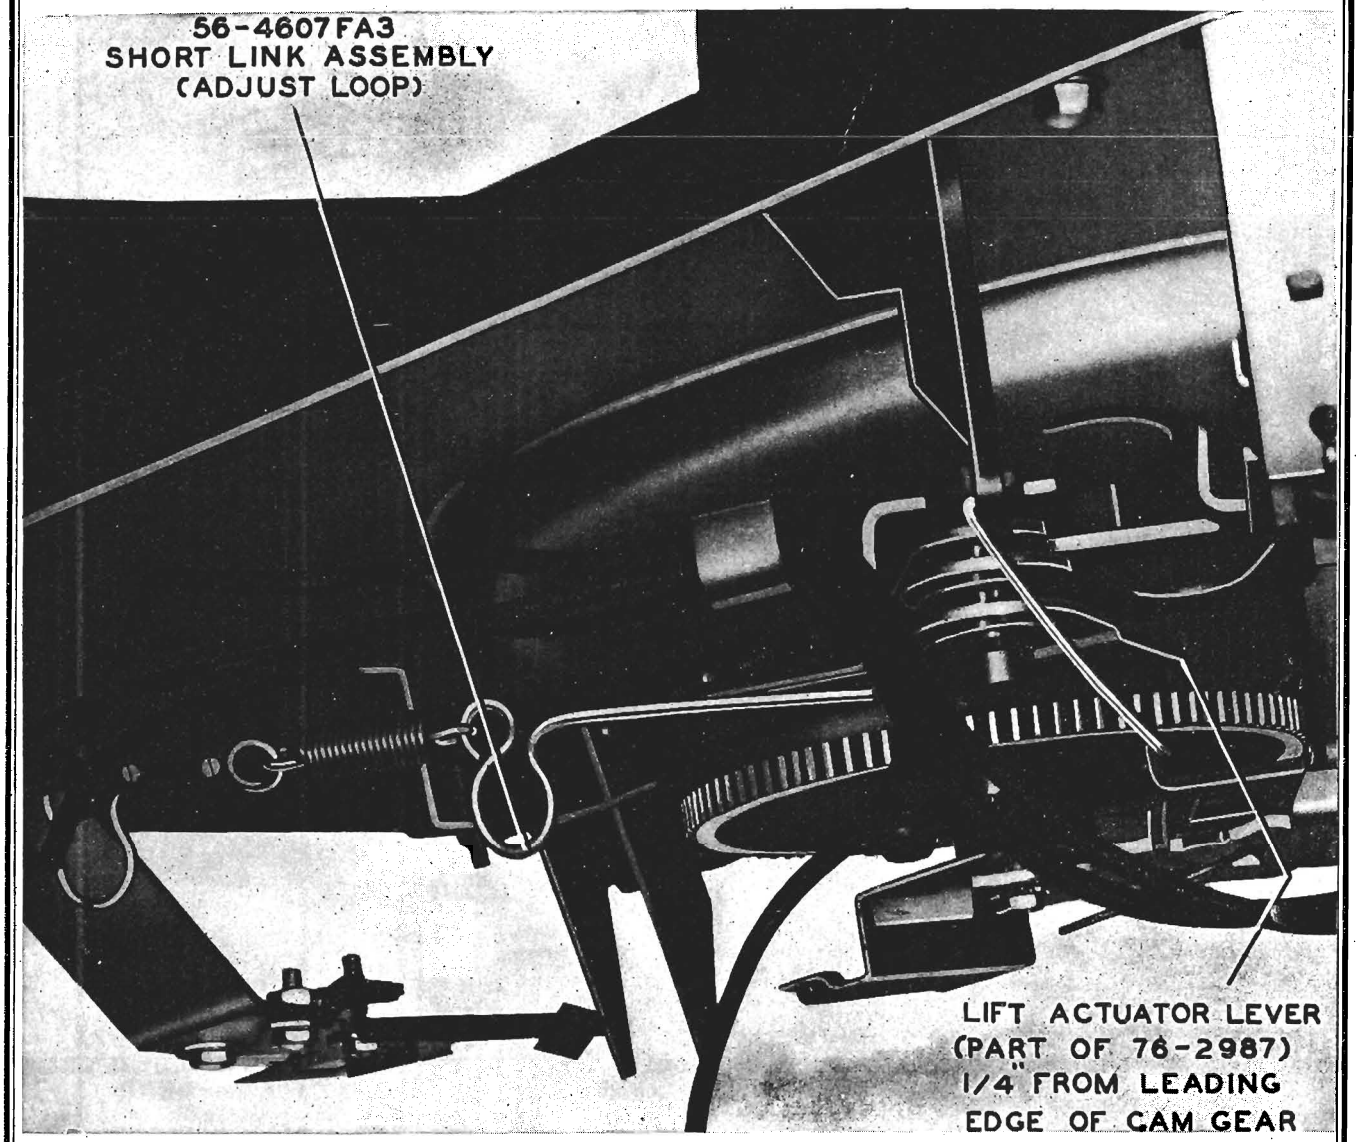

Figure 12—TONE-ARM VERTICAL TIMING ADJUSTMENT TP-4116-1

For the horizontal adjustment, rotate the turntable another three-quarter revolution from the point at which the vertical adjustment was made. At this point, the leading edge of the cam surface is approximately ¼" from the end of the horizontal-return actuator lever; this is the upper actuator lever, shown in figure 13. Adjust the wire loop of the long link and spring assembly, attached to the trip arm, by squeezing or opening the loop until the tone arm makes contact with the rubber bumper on the tone-arm rest post.

Trip-Finger and Trip-Receiver Adjustments

For the trip-finger adjustment, move the tone arm toward the spindle. Adjust the screw on the trip-receiver plate (figure 14) so that the trip finger, when riding over the ratchet screw on the trip plate, assumes an angle of 25° to 30° with respect to the screw. Do *not* bend the trip finger to obtain the correct angle.

For the trip-receiver adjustment, place the tone arm on a record with the needle resting in the eccentric finish groove. The vertical center line of the trip finger should coincide with the center line of the ratchet screw. To adjust the centering of the trip finger over the ratchet screw, loosen screw B slightly, and screw A completely (see figure 9). Rotate the trip receiver about screw B, as a center, to obtain the correct adjustment (see figure 14). Tighten the screws.

Approximately ⅛" of the trip-arm stop should engage the selector (see figure 9). To adjust the engagement of the trip-arm stop, loosen screw A slightly, and screw B completely (see figure 9). Rotate the trip receiver about screw A, as a center, to obtain the correct adjustment. Tighten the screws.

The above adjustments will affect each other slightly; therefore, it may be necessary to repeat each adjustment until both are correct.

After making the above adjustments, it will be necessary to correct the index adjustments.

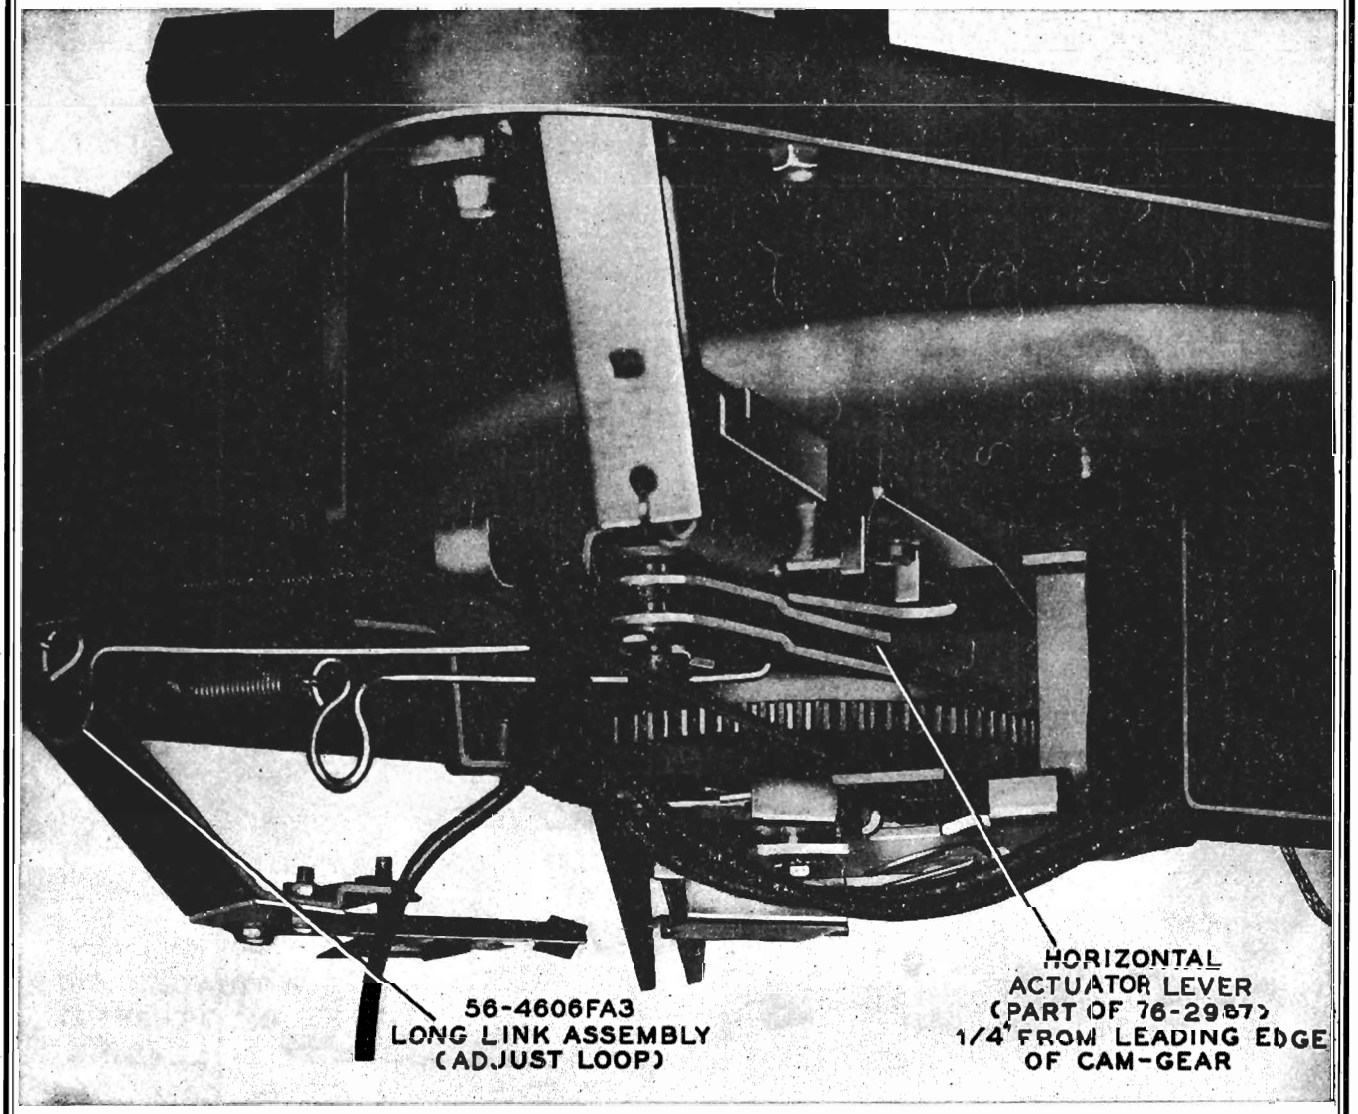

Figure 13—TONE-ARM HORIZONTAL TIMING ADJUSTMENT TP-4129

Record-Shelf Adjustment

Place the shelf in the 10″ position, and the changer out of cycle. Place the Philco record-shelf gauge, 45-1470 (also used for M-4), over the spindle and onto the record shelf, as shown in figure 15. Loosen the two hex-head screws which hold the record-shelf assembly to the changer base plate (figure 16). Move the record-shelf assembly away from the record spindle until the large curved part of the gauge drops even with the record-shelf lips, as shown in figure 15. Now push the record shelf and gauge lightly against the spindle, taking out all play toward the spindle; keep the lips of the record shelf in even contact with the edge of the gauge. Tighten the two hex-head screws.

Push-Off Adjustment

Push the control button to REJ., and rotate the turntable 2½ revolutions, by hand; at this point, the push-off actuator is in its most forward position, in contact with the roller on the cam gear (see figure 17). Loosen the push-off-bar locking screw, shown in figure 16. Squeeze the push-off-bar ears toward each other to the point where the slider blade on the record shelf extends $\frac{1}{32}$″ beyond the lips of the shelf. Tighten the hex-head locking screw.

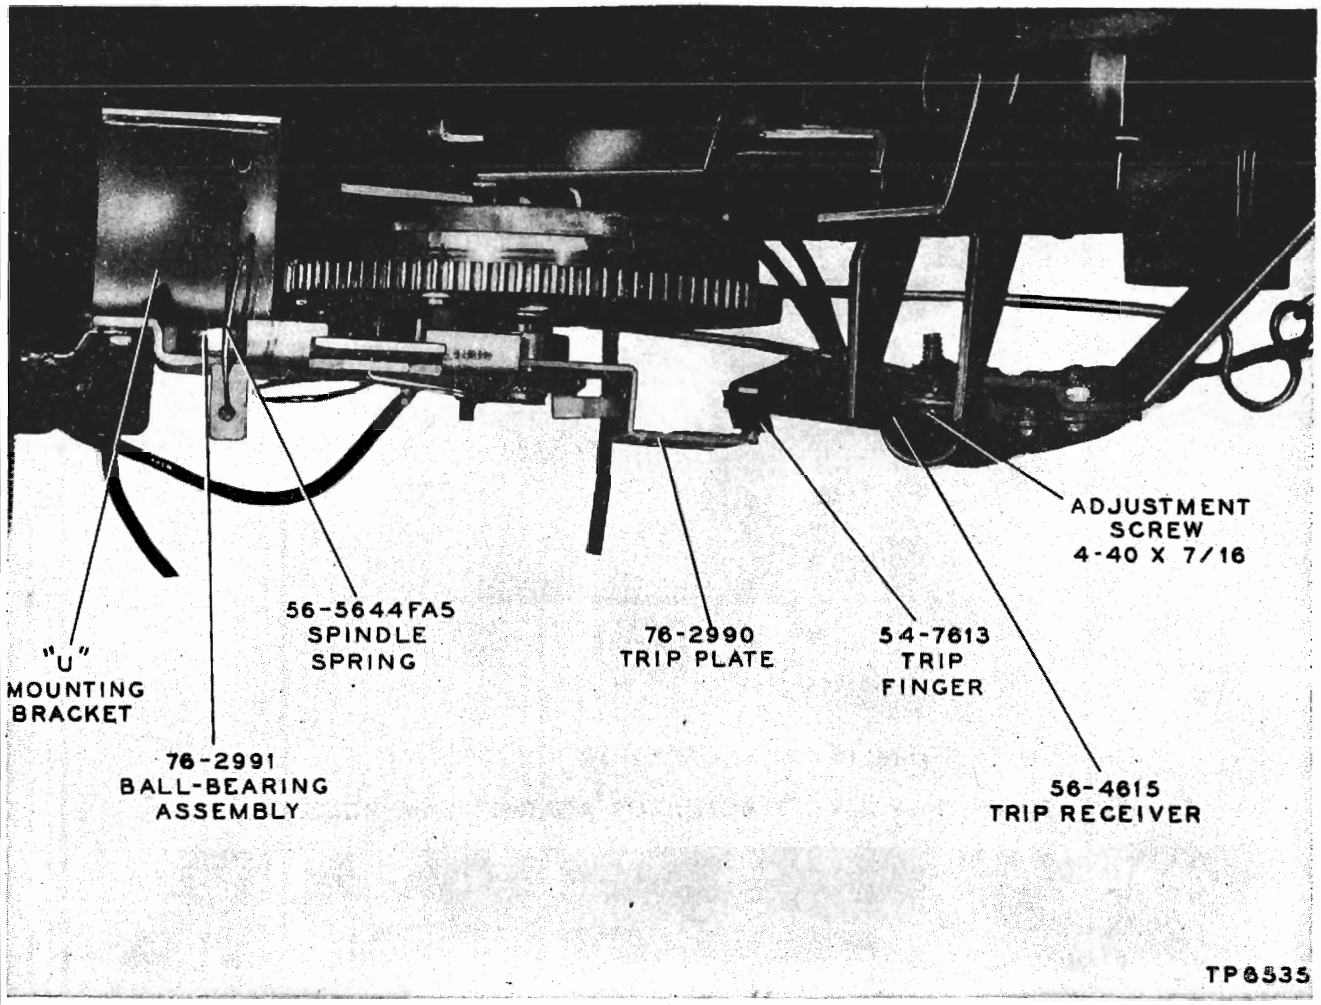

Figure 14—TRIP-FINGER ADJUSTMENT

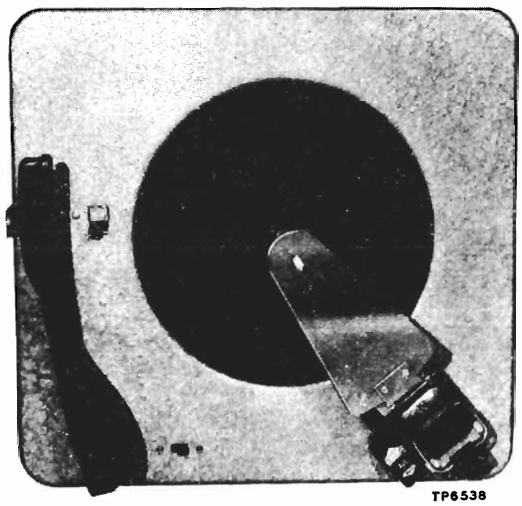
Figure 15—SPECIAL GAUGE, SHOWN IN CORRECT POSITION ON RECORD SHELF AND SPINDLE



Uneven Turntable Speed (Wows)

Uneven turntable speed (wows) may be caused by the following:

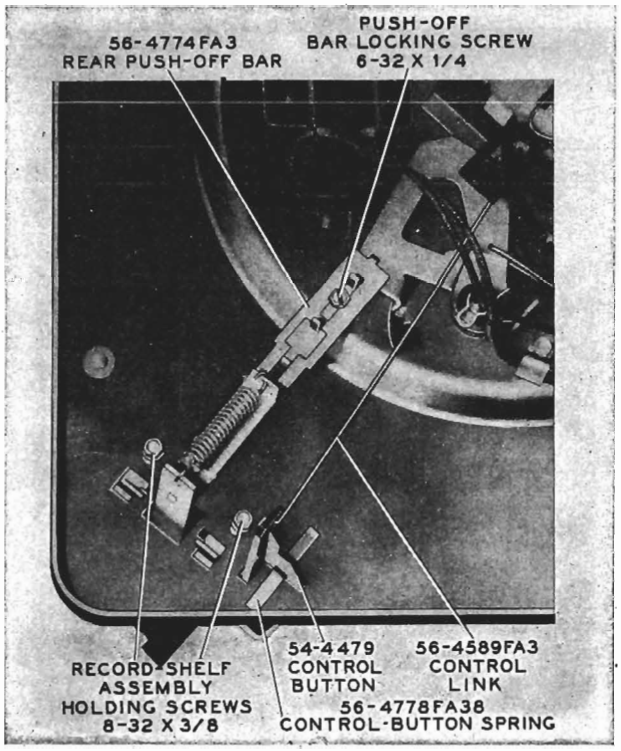
Dirt under and around the turntable or idler-wheel assembly. Remove the turntable (see Spindle and Turntable)- - - - - and clean out the dirt. Be careful to lift the turntable straight up. When replacing the turntable, be sure the idler is behind the turntable rim before the turntable is fully lowered.

Flat or worn spots, or grease, on the rubber tire of the idler wheel.

Defective turntable shaft or bearing assembly.

Replace the defective parts as directed under REPLACEMENT OF PARTS AND ASSEMBLIES.

Lack of lubrication on idler-wheel assembly. Follow the directions under CLEANING AND LUBRICATION.

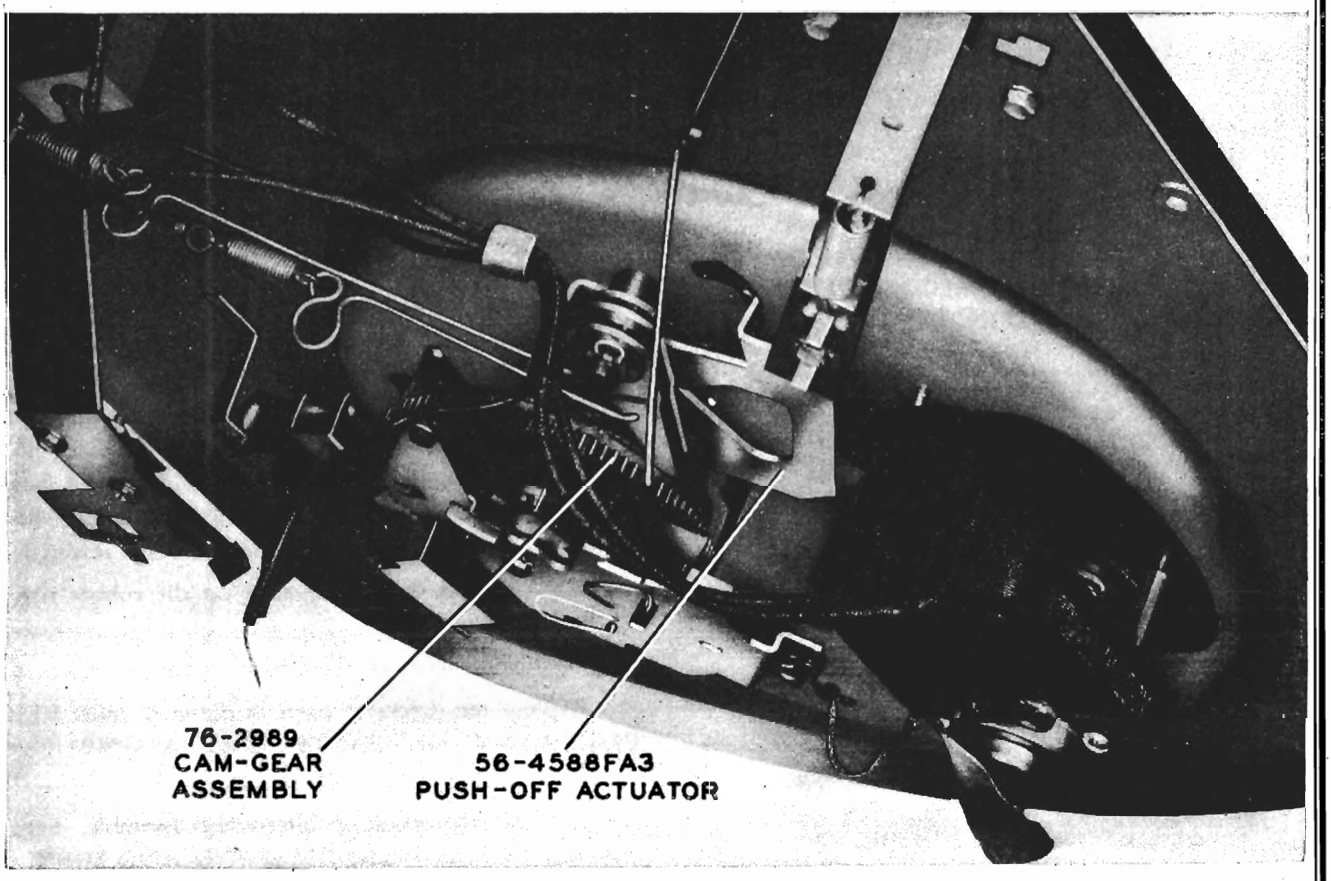


TP-4117A

Figure 16—PUSH-OFF-LEVER ADJUSTMENT

Figure 17—PUSH-OFF ACTUATOR AGAINST CAM ROLLER

TP-4134



REPLACEMENT OF PARTS AND ASSEMBLIES

The following procedures are recommended for correct replacement of parts and assemblies. The part should be replaced by reversing the order of removal, and adjusted according to the directions given in the ADJUSTMENTS section of this manual.

When any part is to be removed, the control button should be in the AUT. (automatic) position, and the changer should be out of cycle.

1. Needle

To remove the needle, loosen knurled nut from under front end of crystal cartridge, and slide needle out horizontally.

When replacing needle, tighten thumb nut and add a dab of cement in thumb-nut hole to prevent nut from loosening due to vibration.

2. Crystal Pickup Cartridge

a. Bring tone arm toward center of turntable.

b. Remove the two screws, nuts, lock washers, and spacers which hold cartridge to tone arm.

c. Drop cartridge below tone arm sufficiently to allow removal of the two clips from cartridge, as shown in figure 18. If pickup leads are shielded, unsolder shield.

NOTE

When mounting cartridge, be sure to insert long spacer in side toward spindle.

2A. Spindle and Turntable

a. Unhook both ends of spindle spring from "V" mounting bracket (figure 14).

b. Uncoil spring wire through spindle hole.

c. Pull out spindle.

d. Remove turntable by pulling straight up.

3. Motor

a. Push control button to MAN. position.

b. Remove spindle and turntable, as directed in paragraph 2A.

c. Remove switch cover, and unsolder motor lead from switch contact.

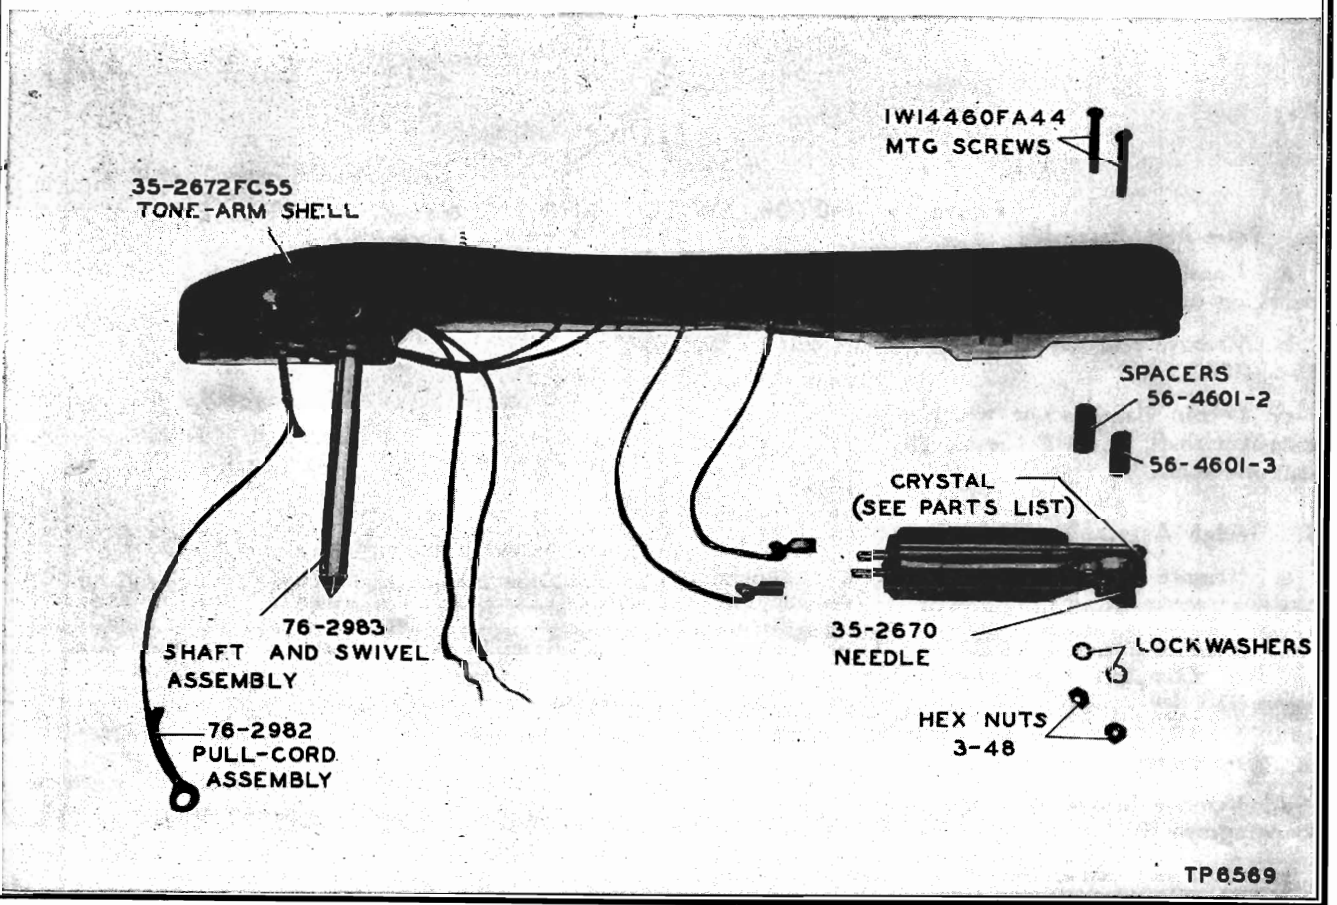
d. Loosen screw of clamp which holds wire against base plate, and pull wire through clamp.

e. Unsolder second motor lead from power plug or disconnect at splice from chassis power lead, whichever is used.

f. Remove ground lead from lug on motor.

g. Remove the three screws, washers, and bushings from motor frame (figure 19), and lift motor out.

Figure 18—TONE ARM (35-2663-2), CRYSTAL CARTRIDGE REMOVED



MODEL M-9 PHILCO CORP.

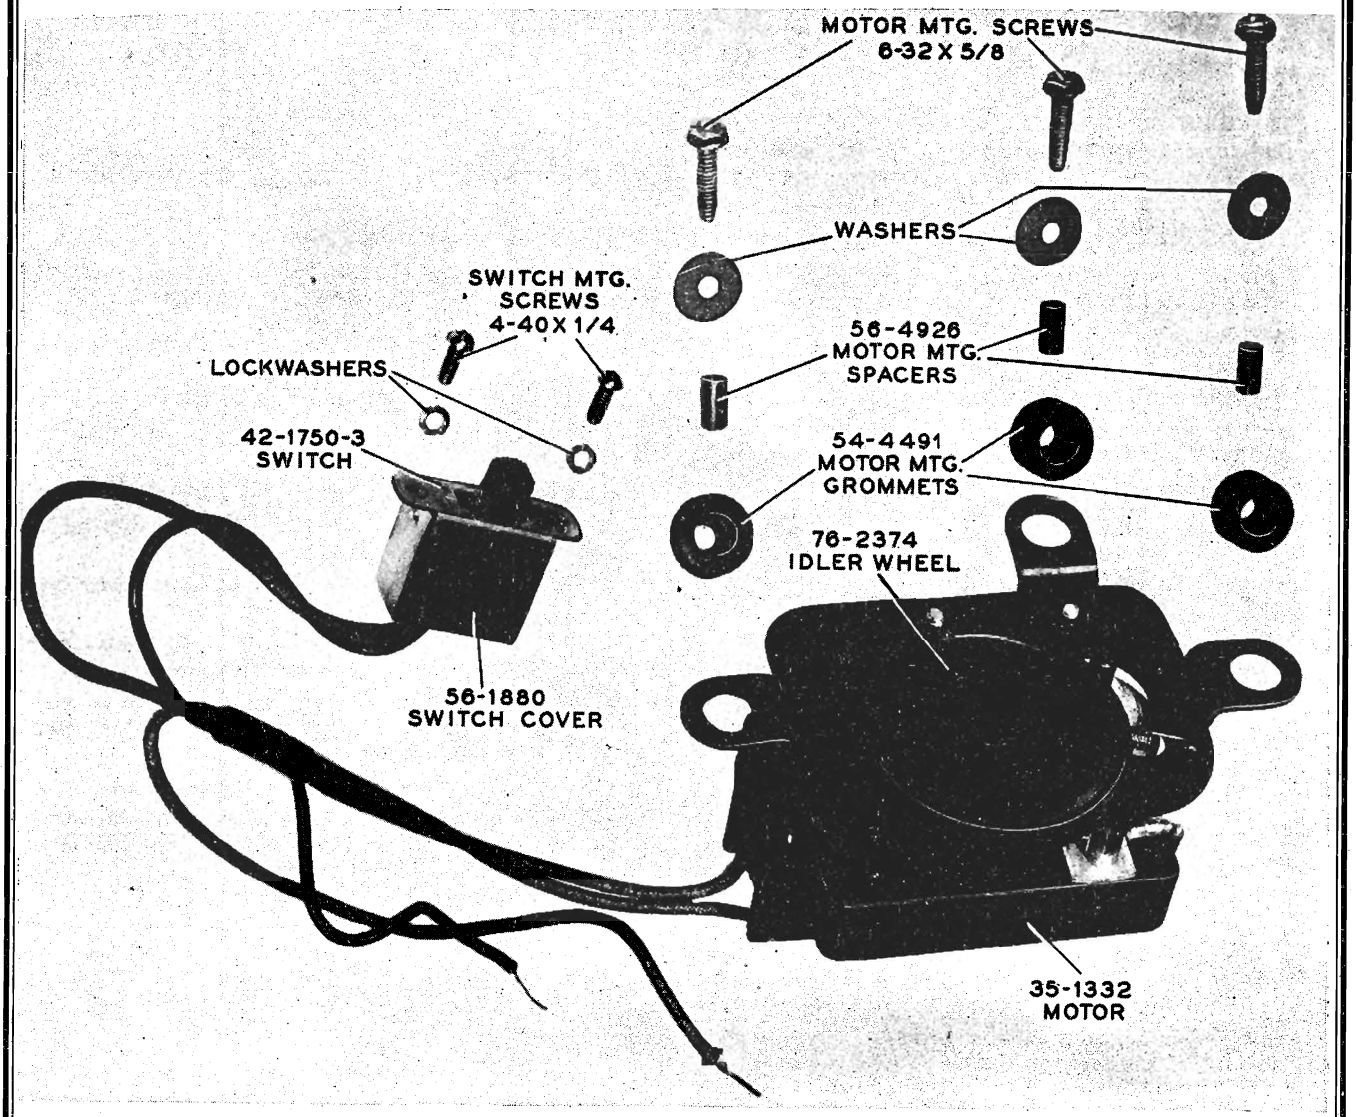


Figure 19—MOTOR, SWITCH, AND MOUNTING HARDWARE TP-4133

4. Tone-Arm Assembly

a. Unsolder tone-arm lead wires from terminal panel on underside of changer base plate.

b. Remove pull cord from spring and short link, 56-4607FA3.

c. Loosen clamp screw which holds trip arm to tone-arm shaft, 76-2983 (figure 20). Lift out tone arm and shaft.

5. Bridge Assembly

a. Remove spindle spring; then remove the two hex-head screws from bridge plate.

b. Remove link rod, 56-4589FA3, from slider control bar. Complete assembly of bridge is shown in figure 21.

6. Trip Plate

a. Remove bridge assembly, 76-2978, as directed in paragraph 5.

b. Slide trip plate, 76-2990, off cam-gear spindle.

7. Cam-Gear Assembly

a. Remove bridge assembly and trip plate, as directed in paragraphs 5 and 6.

b. Remove ball-bearing assembly, 76-2991 (figure 16), by pulling it off.

c. Remove "E" washer, 1W60980FE5.

d. Slide cam gear off spindle. Figure 22 shows cam-gear assembly.

8. Tone-Arm Actuator Levers

a. Remove "E" washer, 1W60980FE5.

b. Slide lower actuator lever from stud, and remove short link, 56-4607FA3.

c. Remove upper actuator lever from stud, and disengage long link, 56-4606FA3. Figure 22 shows actuator-lever assembly.

9. Push-Off Actuator

a. Remove two motor-mounting screws, and loosen the third one; swing motor to one side.

b. Remove tone-arm actuator levers, 76-2987, as directed in paragraph 8.

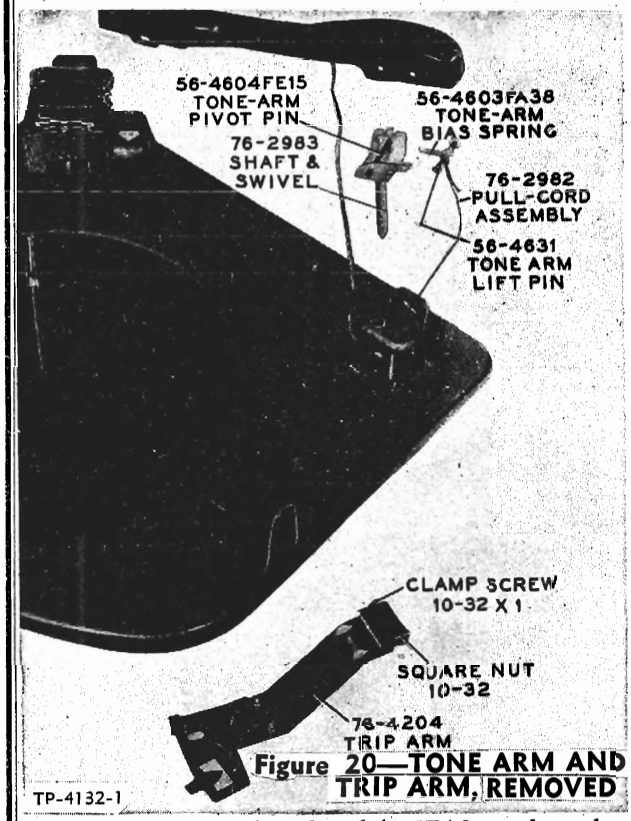

Figure 20—TONE ARM AND TRIP ARM, REMOVED

c. Press push-off rod, 56-4595FA3, and push-off hanger bar, 56-4596FA3, together, and pull downward, releasing the entire assembly.

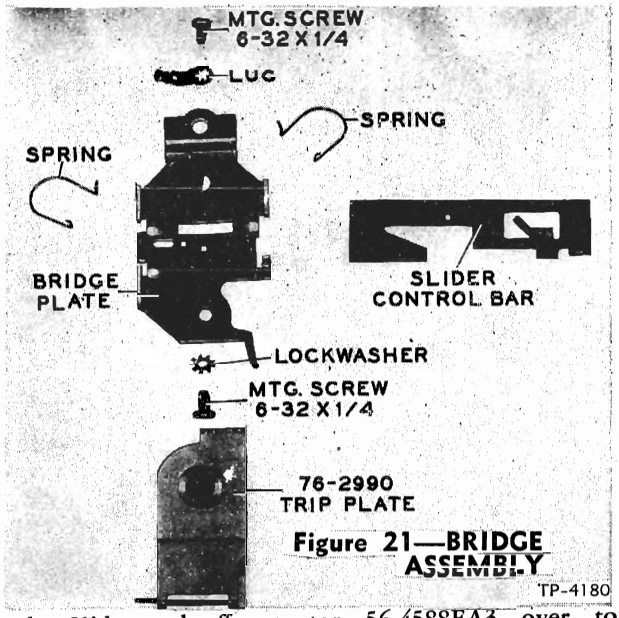

Figure 21—BRIDGE ASSEMBLY

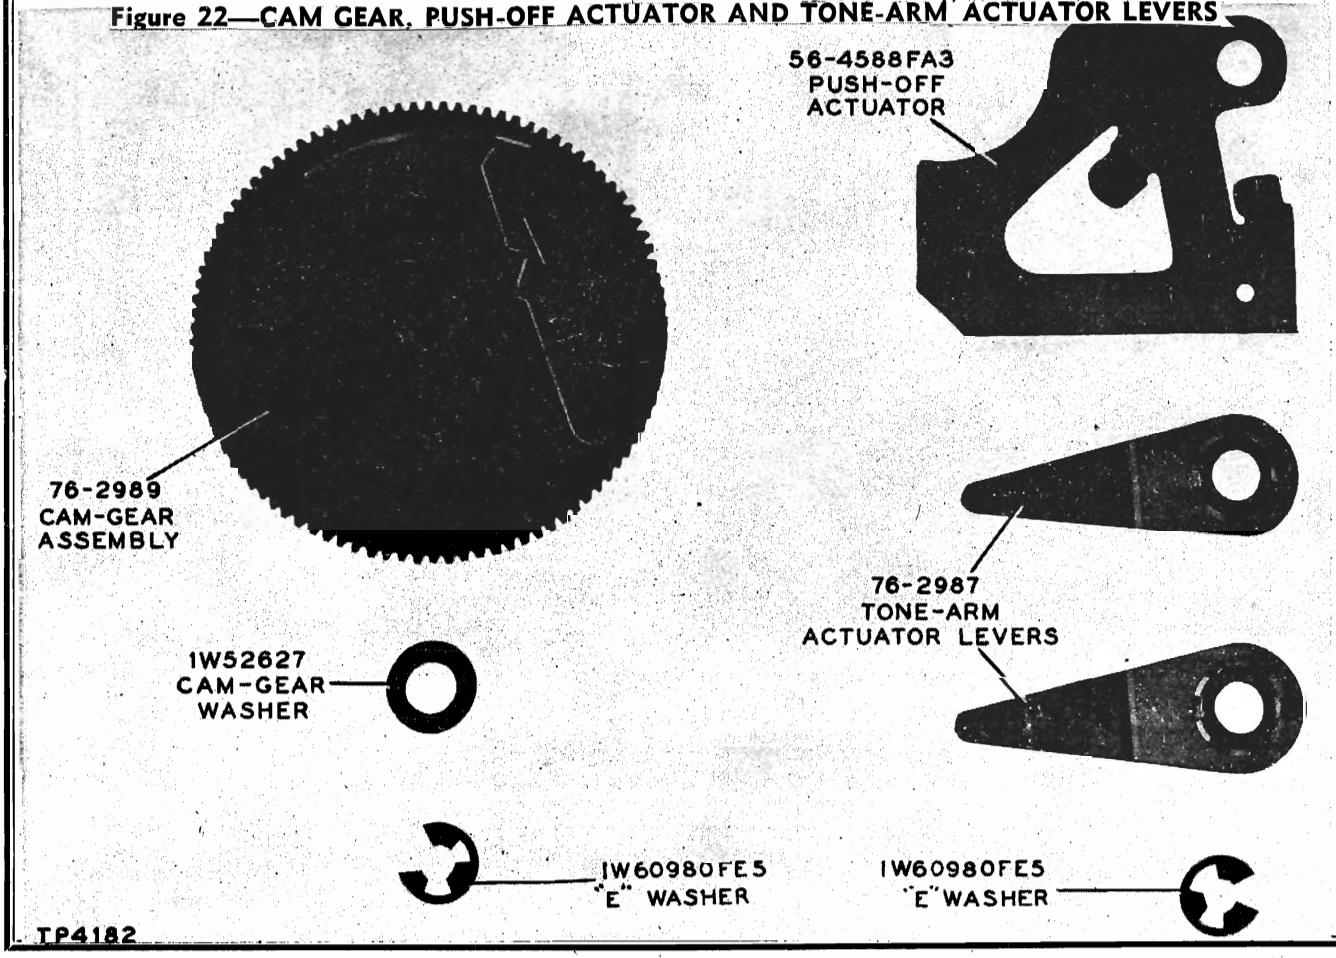
d. Slide push-off actuator, 56-4588FA3, over, to align upturned ears with cutout in base plate. Slide actuator off stud.

NOTE After removing the push-off actuator and push-off-bar assembly, the slider blade on the record shelf may slide out of the assembly. When reassembling, this blade should be inserted in the record-shelf assembly with the elongated hole toward the 12″ position of the record shelf. The push-off assembly is shown in figure 23.

Figure 22—CAM GEAR, PUSH-OFF ACTUATOR AND TONE-ARM ACTUATOR LEVERS



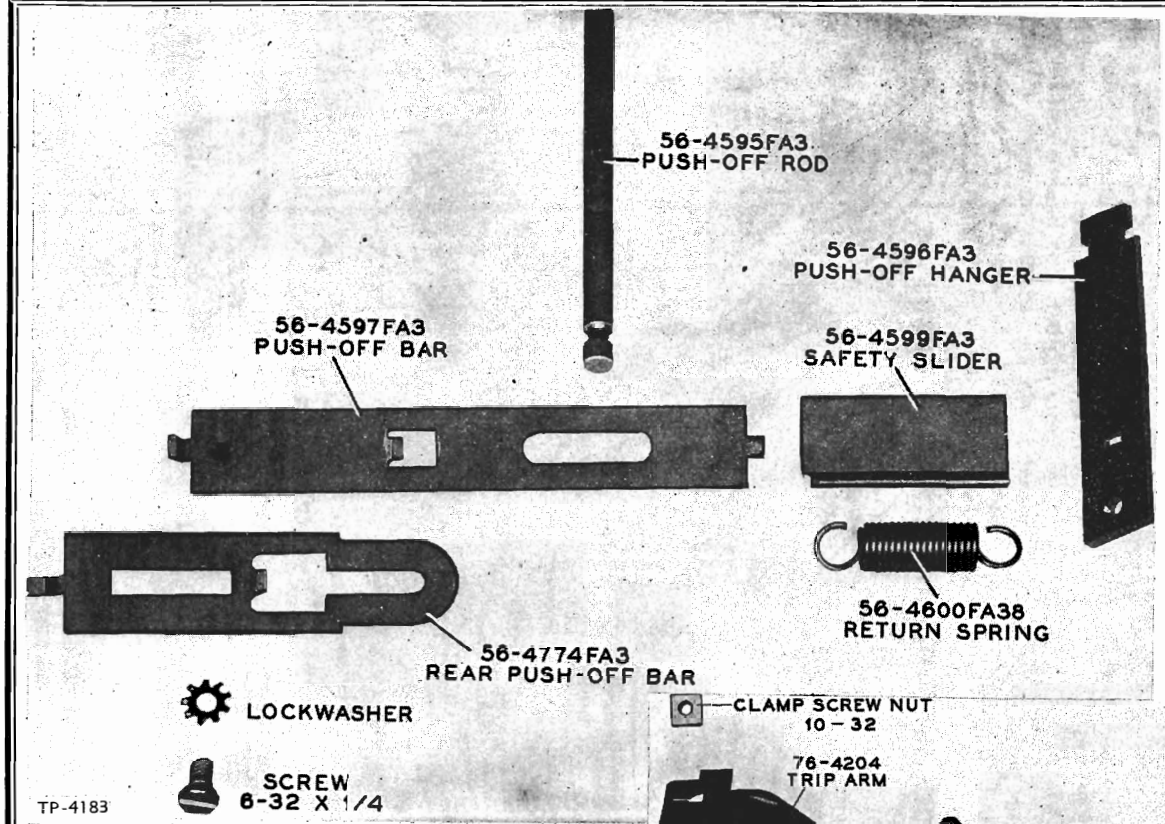


Figure 23—PUSH-OFF ASSEMBLY

10. Record-Shelf Assembly

a. Remove push-off actuator assembly as directed in paragraph 9.

b. Remove the two hex-head screws which hold record-shelf assembly to base plate (figure 16).

c. Align ears on record-shelf assembly with cut-out on base plate. Lift out record-shelf assembly. Record-shelf assembly is shown in figure 24.

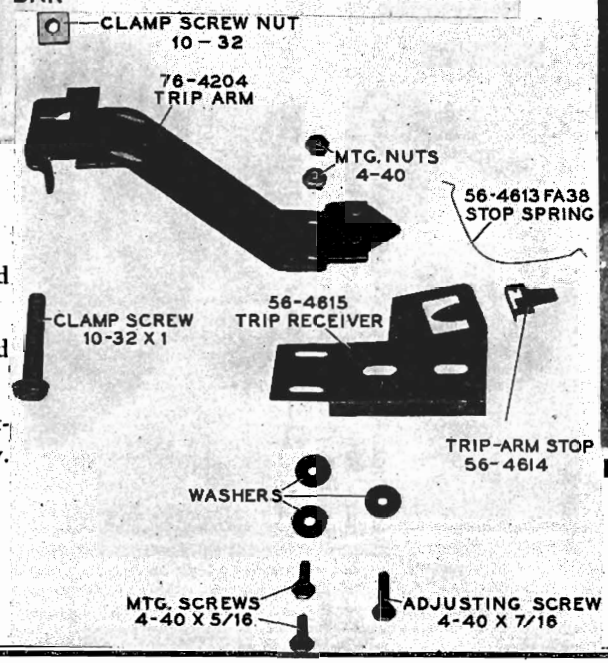

Figure 25—TRIP-ARM AND TRIP-RECEIVER ASSEMBLIES

TP-4227-1

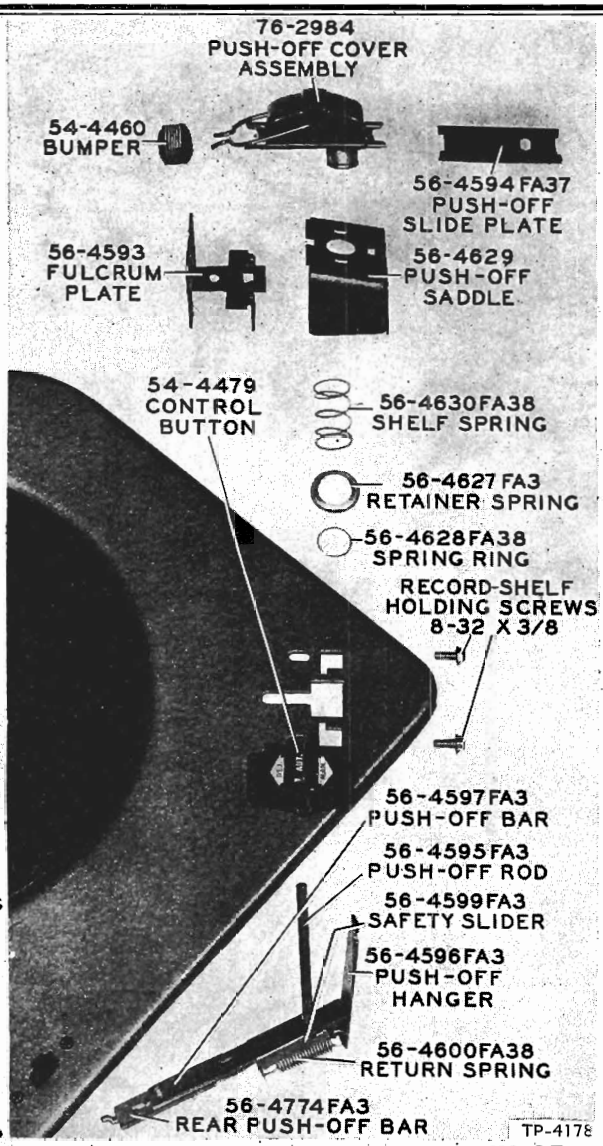

Figure 24—RECORD-SHELF AND PUSH-OFF ASSEMBLIES, REMOVED

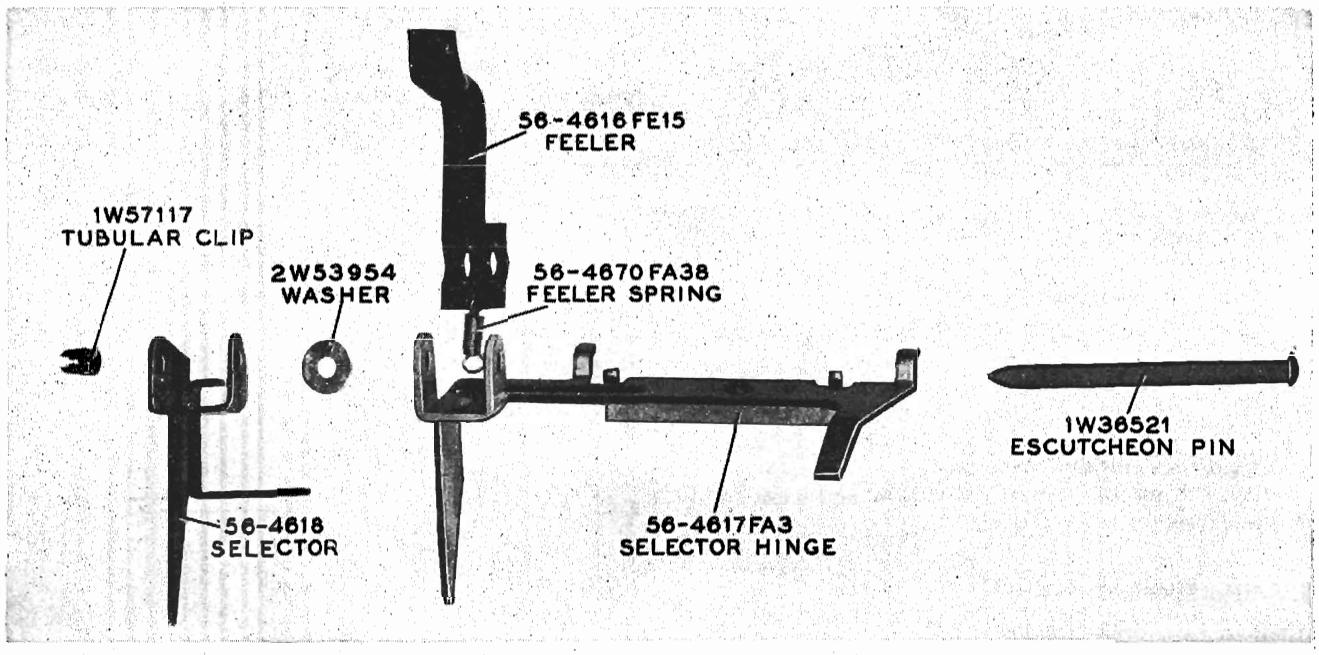

Figure 26—SELECTOR AND SELECTOR-HINGE ASSEMBLY TP-4123

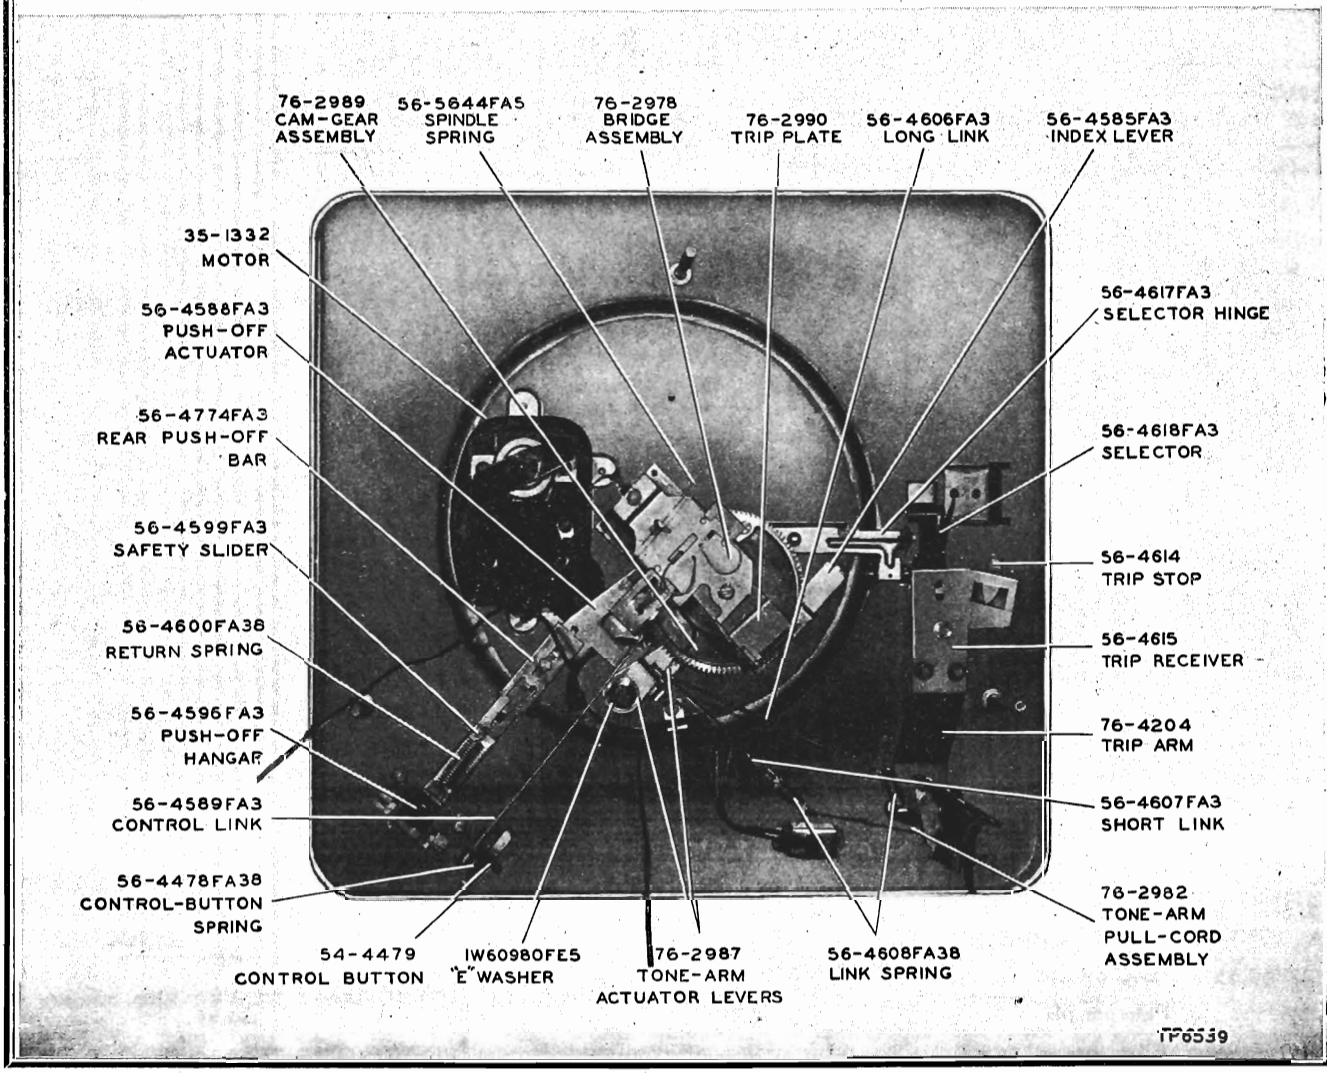
Figure 27—BOTTOM VIEW OF CHANGER, WITH PARTS IDENTIFICATION



11. Control-Button Assembly

a. Remove flat spring, 56-4778FA38, by sliding it laterally through underside of button (figures 8 and 16).

b. Remove the two hex-head screws and drop bridge assembly, 76-2978 (shown in figure 8).

c. Disengage control link, 56-4589FA3, from underside of control button. Lift out control button.

12. Trip-Arm Assembly

a. Loosen clamp screw on trip arm, 76-4204 (figure 25).

b. Raise tone arm and shaft sufficiently to clear trip arm. Remove trip arm.

NOTE

When assembling, maintain 1/32" vertical play (clearance between trip arm and base plate) in tone-arm shaft.

13. Trip-Receiver Assembly

Remove the three screws, washers, and nuts from trip arm (figure 25).

Remove trip receiver.

14. Selector Assembly

Remove cam gear as directed in paragraph 7. Remove feeler spring from attachment point on motor board. Tilt selector assembly, and remove from base plate.

NOTE

When assembling selector assembly, be sure to maintain .005" clearance between selector hinge, 56-4617FA3, and washer, 2W53954. For correct assembly refer to figures 26 and 9.

TP-6667

Figure 1. Philco Record Changer and Record Player Combination, Model M-9C

INTRODUCTION

The Philco Automatic Record Changer and Record Player Model M-9C, figure 1, which is used in several 1949 Philco radio-phonograph combinations, incorporates the use of two tone arms. One tone arm is used in conjunction with the record-changer mechanism, which plays ten 12″ records or twelve 10″ records automatically at the standard speed of 78 r.p.m. The other tone arm is used manually, to play the new Columbia Long Playing Records at a speed of 33-1/3 r.p.m.; the record player shuts off automatically at the end of the Long Playing Record.

DESCRIPTION OF OPERATING CYCLES

Power is applied to the motor through an off-on switch and a mercury switch which is controlled by the position of the record-player tone arm. The two switches are connected in series.

A control is mounted on each side of the record-shelf assembly. The REJ.—AUT.—MAN. control controls the record-changer section of the combination. The STD. PLAY—LONG PLAY control has two functions. When it is pushed to LONG PLAY, a link underneath the base plate pulls a selector lever mounted on the base plate. The selector lever is connected to a shift lever which is part of the motor. On this shift lever is mounted a pulley which is connected by a belt to the motor shaft, as shown in figure 2. When the control is in LONG PLAY position, this pulley, which is larger in diameter than the motor shaft, engages and drives the idler wheel, which in turn drives the turntable at the slow speed of 33-1/3 r.p.m. When the control is at STD. PLAY, the larger pulley is retracted and the motor shaft engages the idler wheel, to provide a turntable speed of 78 r.p.m. By action of the STD. PLAY—LONG PLAY control, the double-pole, single-throw switch, mounted on the base plate under the turntable, is actuated. To this switch are connected the output leads of the two tone arms. When the control is at LONG PLAY position,

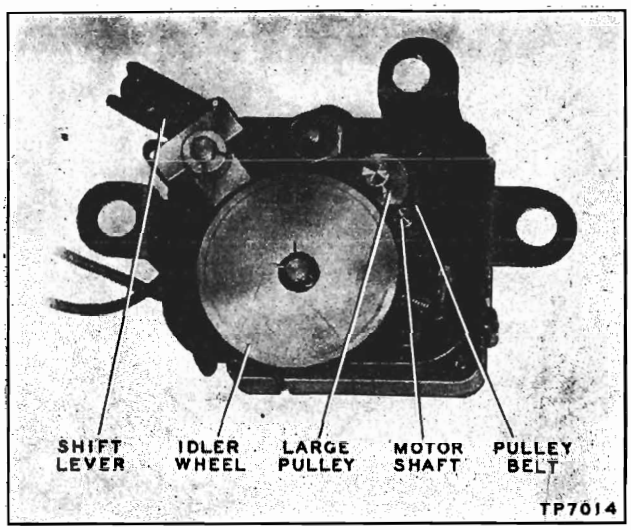

Figure 2. Motor, Showing Pulley, Bolt, and Shift Lever

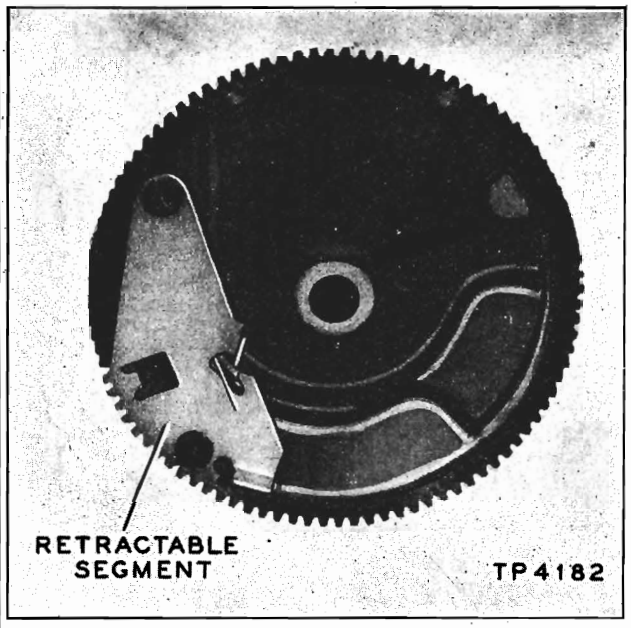

Figure 3. Cam Gear, Showing Retractable Segment

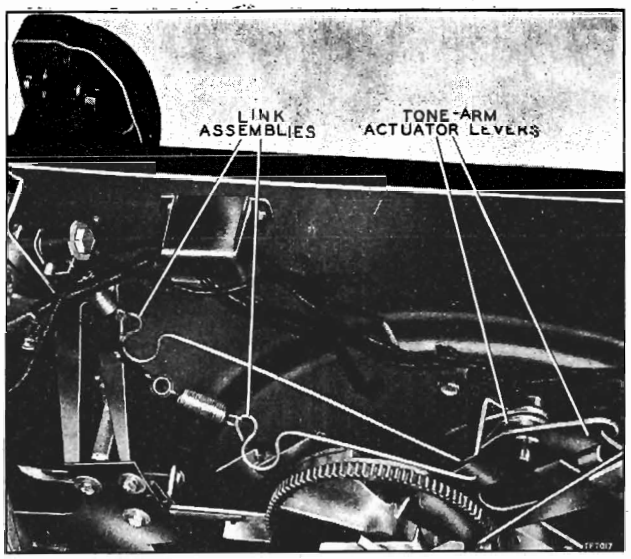

Figure 4. Link Assemblies and Actuator Levers

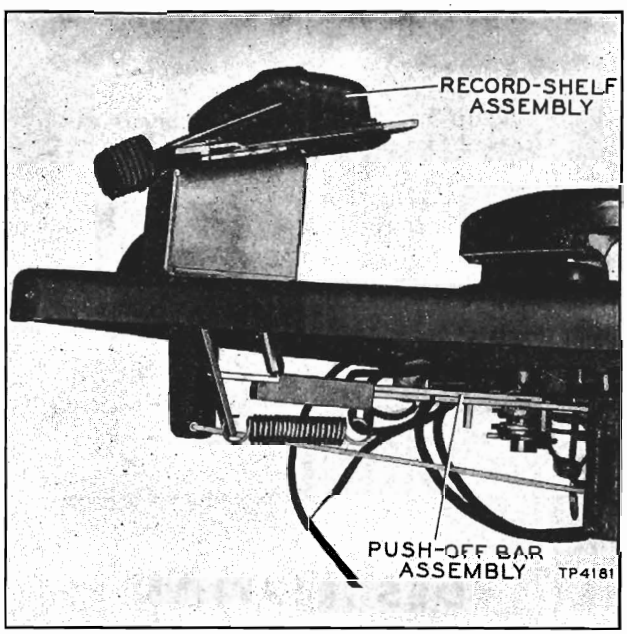

Figure 5. Record-Shelf and Push-Off Assemblies

the switch cuts out the output from the record-changer tone arm and closes the circuit for the record-player tone arm. When the control is at STD. PLAY, the reverse action takes place.

The record-changer change cycle takes place when the turntable hub gear, which is part of the turntable shaft, engages the cam gear through a retractable segment mounted on the cam gear; see figure 3. This retractable segment is brought into position by the action of the trip mechanism. The cam then operates the changer mechanism.

The record-changer tone arm is operated by two link assemblies (figure 4) attached to actuator levers, which are in contact with the cam surface of the cam gear. The record-shelf push-off mechanism is connected through a series of bars, to a push-off actuator (figure 5). The mechanism is operated when a roller, mounted on the cam gear, comes in contact with the actuator. The trip mechanism is operated by a trip finger riding over a ratchet screw (figure 6), which starts the change cycle when the needle is traveling in the eccentric finish groove of the record. The trip mechanism is locked in a disengaged position when the REJ.—AUT.—MAN. control is in the MAN. position.

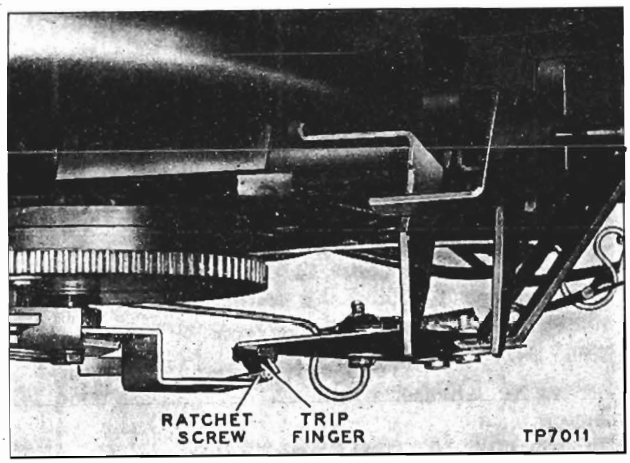

Figure 6. Trip Finger and Ratchet Screw

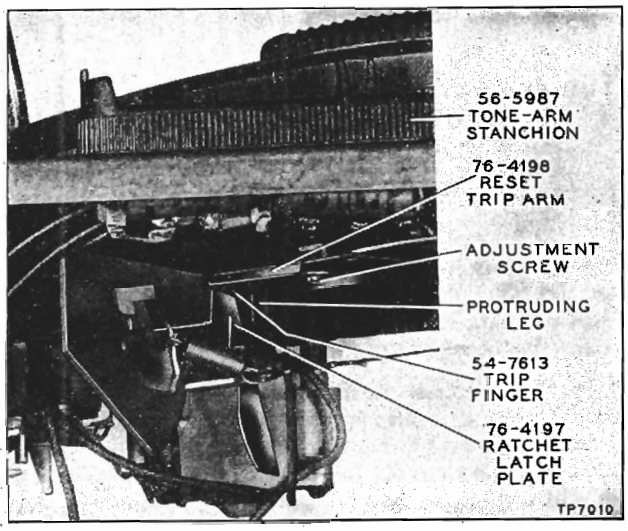

Figure 7. Trip Assembly, Showing Trip Finger Riding Over Ratchet Plate

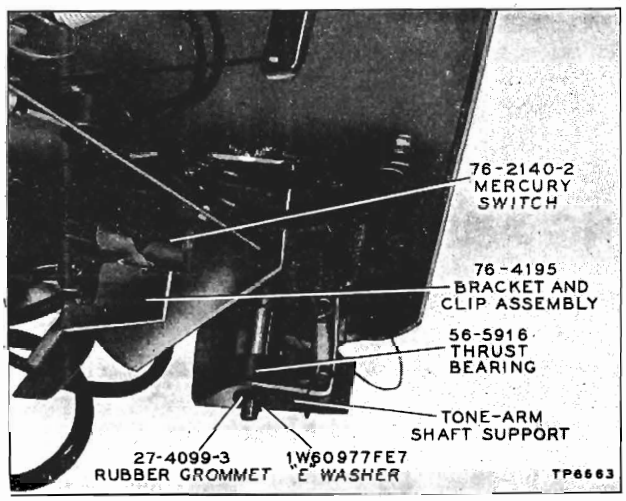

Figure 8. Mercury Switch, Shown in ON Position

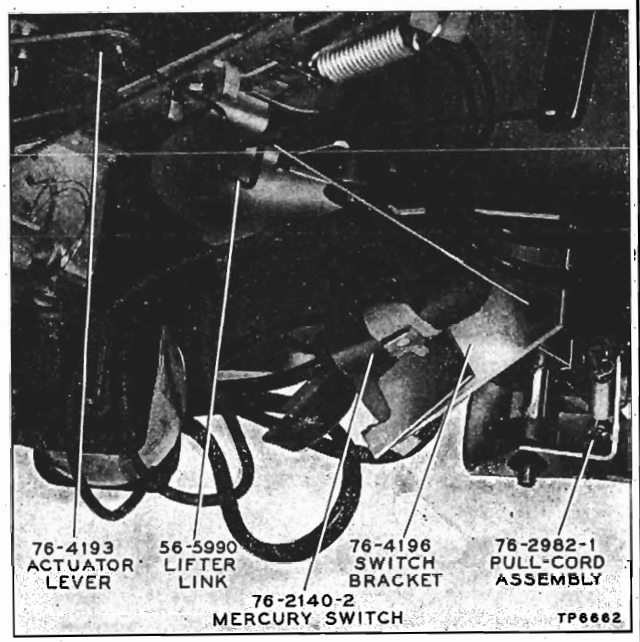

Figure 9. Mercury Switch, Shown in OFF Position

The record-player section contains a separate tone arm. Attached to this tone arm is a reset and trip-arm assembly, which has a protruding leg and trip finger (figure 7). When the tone arm of the record player is resting on the rest post, the leg on the reset trip arm contacts an ear of the bracket-clip assembly (mounted on the switch bracket), and this tips the mercury switch mounted on it to the ON position, (figure 8). The motor circuit is now controlled only by the on-off switch.

When the record-player tone-arm needle is traveling in the eccentric finish groove of the record, the trip finger, which is mounted on the reset trip arm, rides over a ratchet on the ratchet latch plate. The ratchet latch plate is mounted on the switch assembly (figure 7), and trips the latch, causing the bracket-clip assembly to drop and tip the mercury switch to the OFF position (figure 9). This opens the motor circuit and stops the turntable.

A pull cord and link assembly is attached to the record-player tone arm, and is connected to a link-actuator lever. This permits the tone arm to be lifted and set on its rest post if the record changer is put into a change cycle. The pull-cord assembly, Part No. 76-2982-1, and the link-actuator lever, Part No. 76-4193, are shown in figure 9.

RECORD-CHANGER TESTING AND TROUBLE-SHOOTING PROCEDURE

Pickup Test

Play a familiar record on the phonograph and note the volume and tone quality.

NOTE

It is advisable to carry a familiar record as a part of the service test equipment.

If distortion is noted, try a new needle. If the distortion persists, a faulty crystal pickup is indicated; refer to page 12.

Changer-Mechanism Test

The following series of record-changer operating tests is given for quickly locating any trouble that may be encountered. Each test should be performed with several records before making any adjustments.

Set the record shelf to the 10″ position and place the tone arm on the rest post. Place a 10″ record over the spindle and onto the record shelf. Push the STD. PLAY—LONG PLAY control to STD. PLAY.

Push the REJ.—AUT.—MAN. control to REJ. and observe the record-dropping action. The record should fall smoothly, with the edge of the record leaving the lips of the record shelf *after* the center has started to fall. Adjustment of the record shelf is given on page 9.

The tone arm should rise from the rest post, and the needle should come down on the record, about ⅛″ from the outer edge. The index adjustment is given on page 7.

Play the record through and observe the tripping action; the trip mechanism should operate within the first two or three revolutions after the needle has entered the eccentric finish groove. Trip adjustments are given on page 9.

Remove the record from the turntable and set the record shelf to the 12″ position. Place a 12″ record over the spindle and onto the record shelf. Push the REJ.—AUT.—MAN. control to REJ., and observe the record-dropping action. The edge of the record should leave the lips of the record shelf *after* the center has started to fall. (Refer to page 9 for the record-shelf adjustment, if needed.) The tone arm should rise from the rest post and the needle should come down on the record, about ⅛″ from the outer edge. If the index adjustment is required, refer to page 7.

Observe whether the lower edge of the tone arm, during a change cycle, clears the top of the hook on the tone-arm rest post by a minimum of ⅛″. Take the tone arm off the rest post, and place the pickup over the changer base plate; the needle point should clear the base plate by at least $\frac{1}{16}$″, and should be no higher than the turntable top. Lift and height adjustments are given on page 7.

Turntable and Motor Test

NOTE

Before making this test, warm up the motor by allowing it to run for at least ten minutes.

Set the REJ.—AUT.—MAN. control to MAN., and set the STD. PLAY—LONG PLAY control to STD. PLAY. Load the turntable with ten 12″ records, and place the tone arm on the top record.

Place a stroboscope disc, such as Philco Part No. 45-1614, on the record, and illuminate the disc with a lamp (preferably a neon bulb) operated on 60-cycle a.c. The dots in the row calibrated for 78 r.p.m. should appear to remain stationary, or to drift very slowly, but smoothly, backward or forward.

If the turntable speed is steady, but is appreciably below 78 r.p.m., refer to the lubrication date on the turntable upper bearing, and check the idler wheel, idler spring, wiring, etc.

Unsteady drift of the dots on the stroboscope disc indicates uneven turntable speed, which is the cause of wows; see UNEVEN TURNTABLE SPEED (WOWS), page 11.

RECORD-CHANGER CLEANING AND LUBRICATION

The Model M-9C record changer, like any other mechanism, requires lubrication after long periods of use. Whenever a major part or an assembly is to be replaced, the changer should be cleaned and lubricated. Carbon tetrachloride or other similar cleaning fluids may be used to remove old grease, oil, and dirt. Apply lubricants sparingly.

All lubrication points are shown in figures 10 and 11. It may be necessary to remove some parts and assemblies in order to lubricate their bearings—for example, the actuator and cam gear must be removed to lubricate the actuator stud and the cam-gear spindle.

PARTS NOT TO BE LUBRICATED

The following parts should not be lubricated at any time: Trip receiver, trip finger, ratchet screw on trip plate, selector, and all parts of the record-player section.

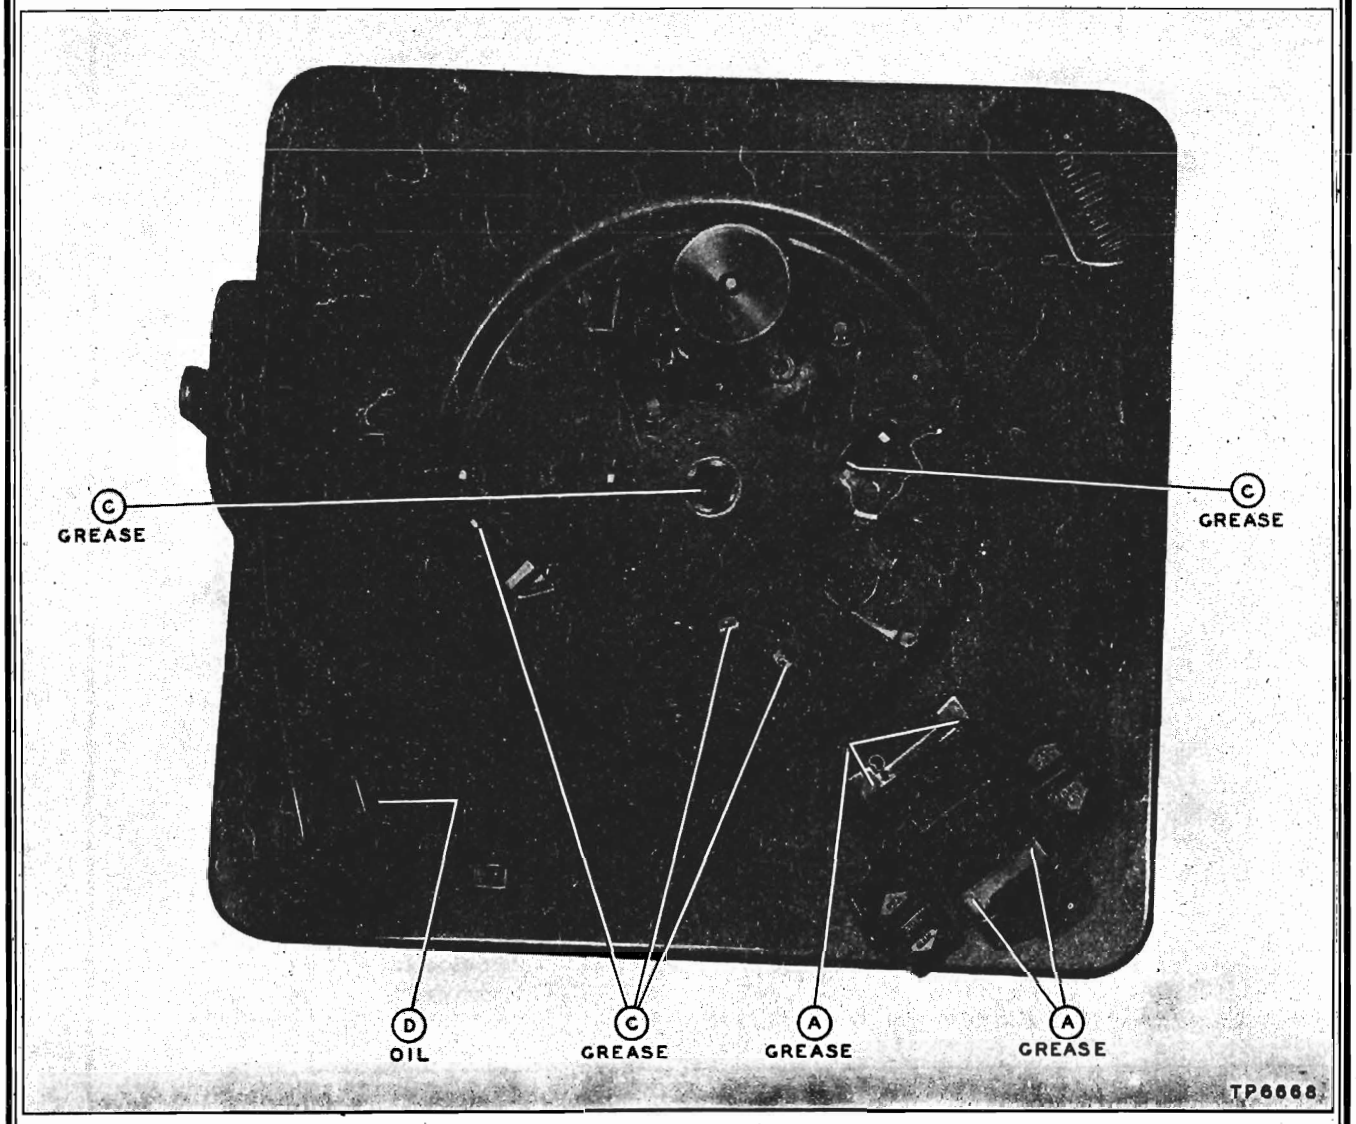

Figure 10. Top View, Showing Lubrication Points

PARTS TO BE GREASED

The following parts are to be lubricated with a grease having the consistency of vaseline:

Record-Shelf Assembly (Point A of Figure 10)
Four protruding dimples.

Bridge Assembly and Slider Control Bar (Point B of Figure 11)
Three dimples and four upturned ears.

Cam Gear (Point C of Figure 11)
Cam-gear teeth, cam surfaces, and cam-gear spindle.

Main Assembly (Points C of Figures 10 and 11)
Trip-plate ear where contact is made with gear segment.
Actuator stud.
All parts with ears sliding on changer base plate.
Index-lever surface which slides on base plate.
Push-off-actuator dimples which slide on base plate.
Turntable shaft (upper bearing).
Tone-arm shaft.

PARTS TO BE OILED

The following parts are to be lubricated with S.A.E. 20 oil:

Tone Arm (Point D of Figure 10)
Tone-arm pivot pin where pin rides in elongated hole of tone arm—apply one drop with a pointed rod.

Trip-Plate Bushings (Point E of Figure 11)

Spindle (Point E of Figure 11)

Cam-Gear Roller (Point E of Figure 11)

CAUTION

Do not get any oil or grease on the motor shaft or the idler-wheel tire. Should this occur, remove the oil or grease immediately with carbon tetrachloride.

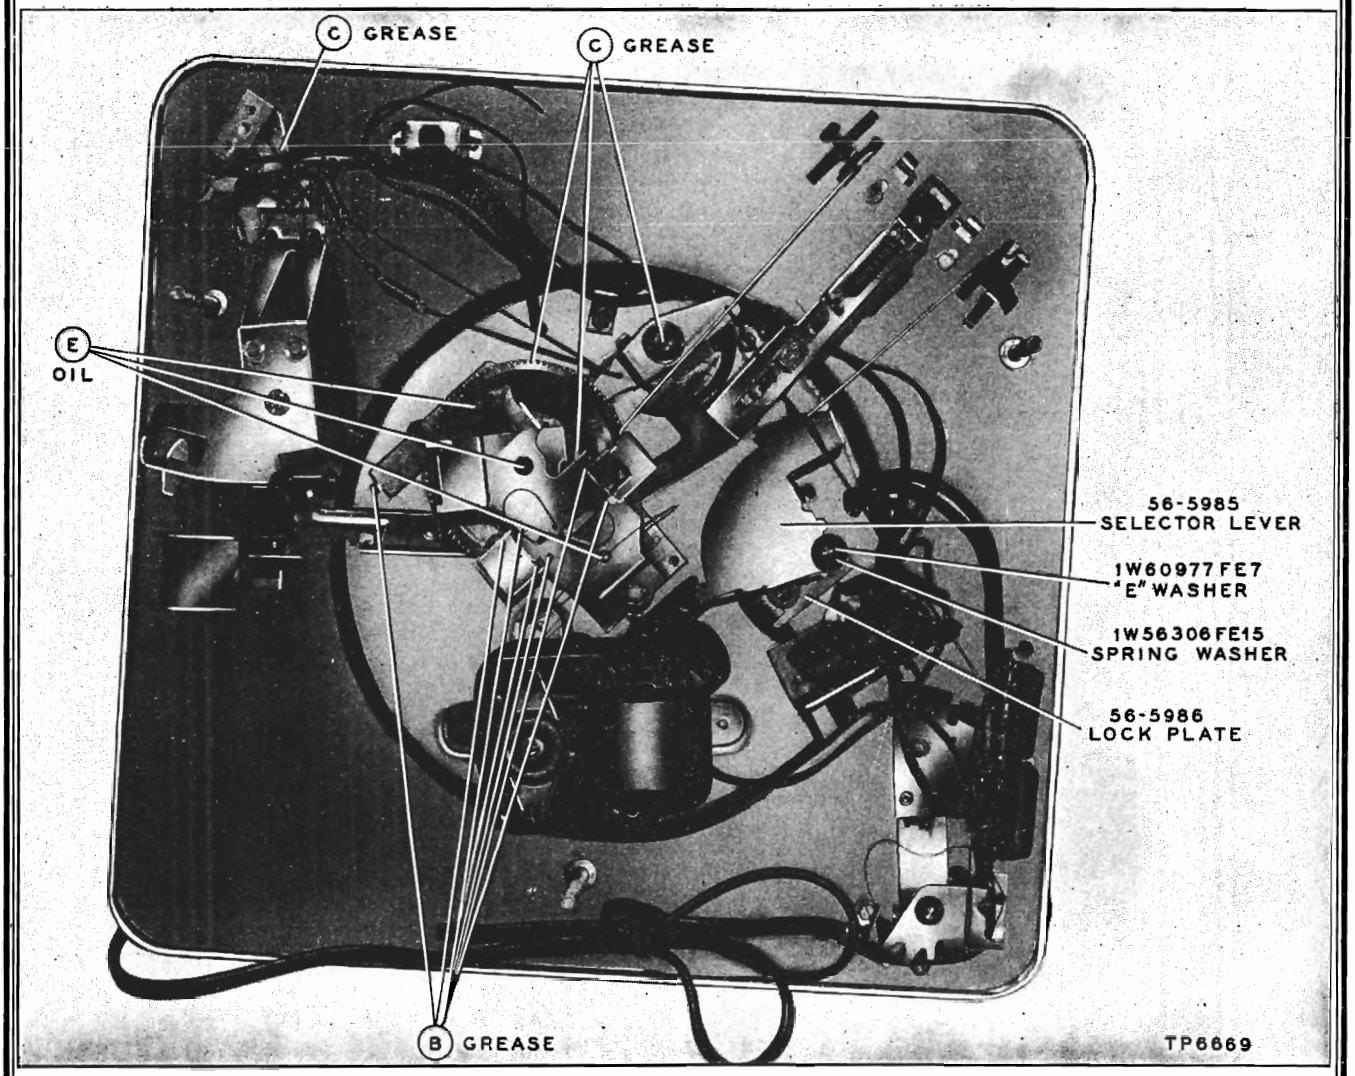

Figure 11. Bottom View, Showing Lubrication Points

RECORD-CHANGER ADJUSTMENTS

10″ Index Adjustment

Place a 10″ record on the turntable, push the REJ.—AUT.—MAN. control to REJ., and rotate the turntable 4½ turns by hand. The tone arm should then be approximately ½″ above the record.

Loosen the clamp screw on the trip arm (figure 12). Hold the tone arm (steady) ⅛″ in from the edge of the record, and set the trip arm so that the trip-arm stop is in contact with the selector hinge (Part No. 56-4617FA3). See figure 13.

Tighten the clamp screw, leaving $\frac{1}{32}$″ vertical play, or clearance, between the trip arm and the base plate.

12″ Index Adjustment

Make the 10″ index adjustment first. The 12″ indexing will ordinarily be satisfactory after the 10″ adjustment is made; if not, bend the selector, Part No. 56-4618FE15, slightly to the right or left as required for proper indexing of the needle on the record, as shown in figure 14.

Tone-Arm Height and Lift Adjustments

With the changer out of cycle (change cycle completed; tone arm lowered), and the tone arm off the rest post, the needle point should clear the changer base plate by at least $\frac{1}{16}$″, and should not be higher than the turntable top. To adjust the height, shape the top ear of the tone-arm swivel, shown in figure 15 (bending the ear downward raises the tone arm).

To adjust the lift, take the tone arm off the rest post, push the REJ.—AUT.—MAN. control to REJ., and rotate the turntable approximately 1½ turns by

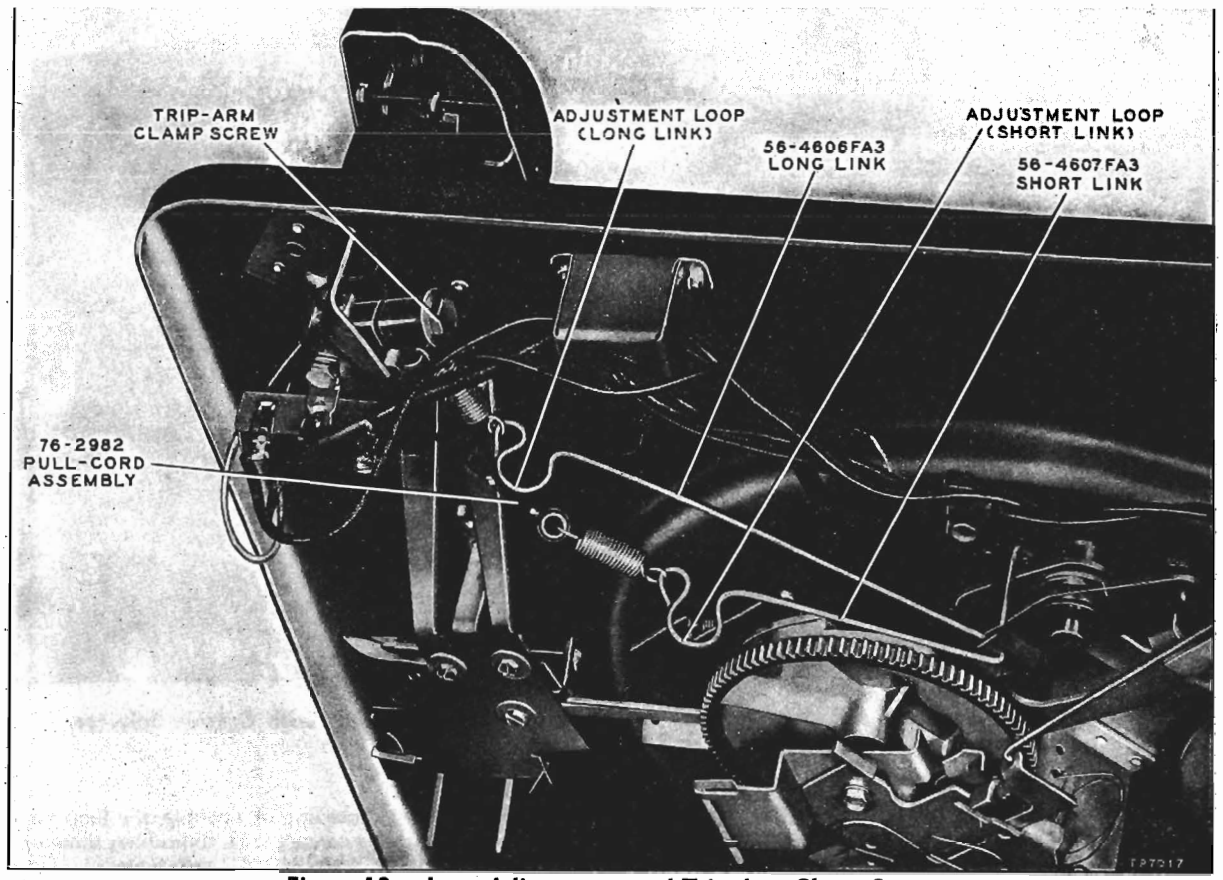

Figure 12. Loop Adjustments and Trip-Arm Clamp Screw

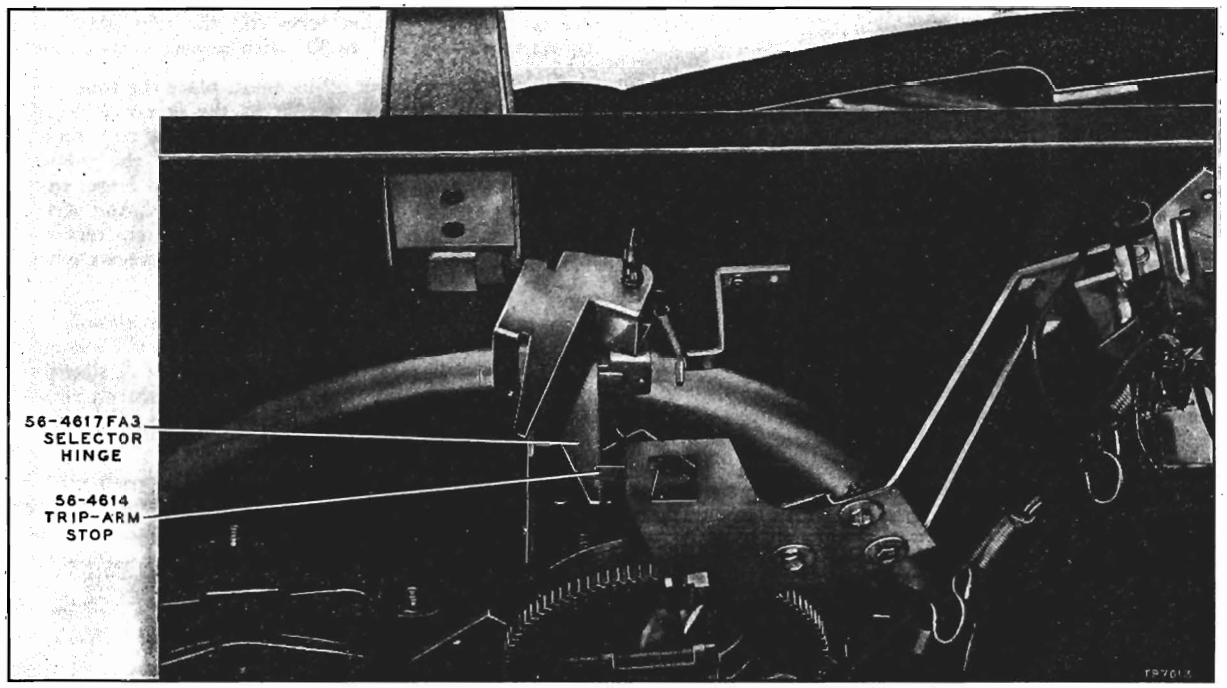

Figure 13. 10″ Indexing Adjustment

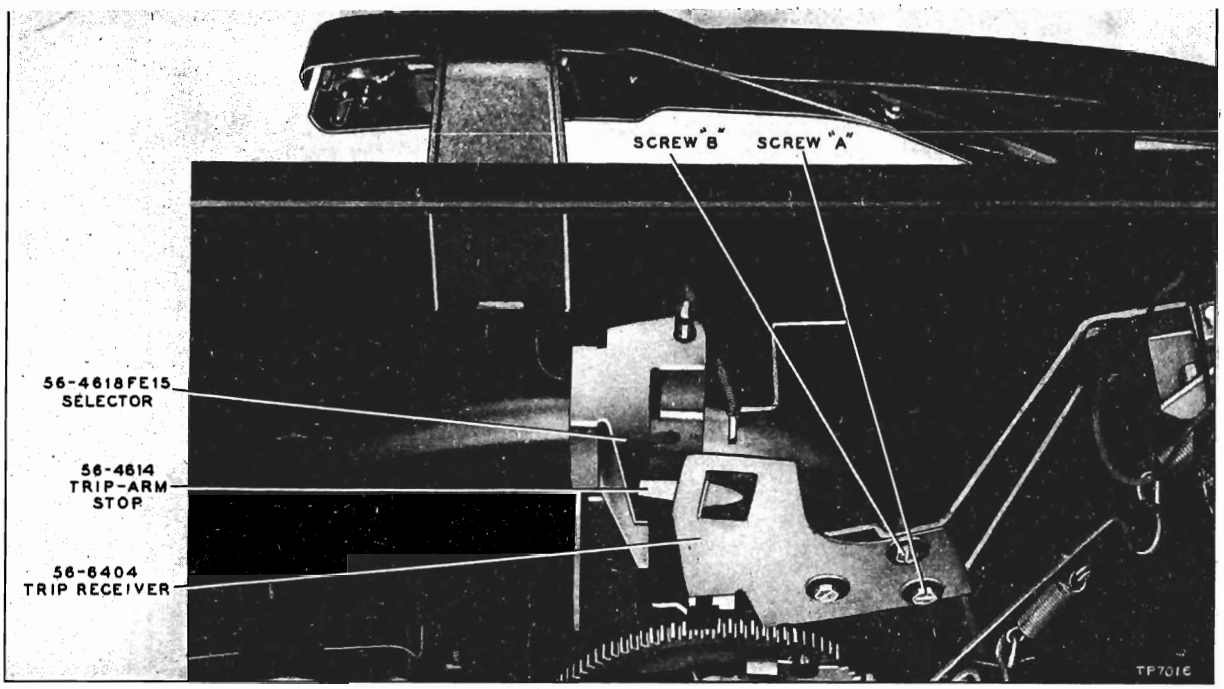

Figure 14. 12″ Indexing Adjustment, Showing Trip Stop Arm in Contact with Outside Selector

hand until the tone arm comes against the rest post. The lower edge of the tone arm should clear the top of the protruding hook on the rest post by not less than ⅛″, and not more than ¼″. Adjust by shaping the lower ear of the tone-arm swivel, shown in figure 16 (bending the ear downward raises the tone arm).

Tone-Arm Vertical and Horizontal Timing Adjustments

NOTE

Before making these adjustments, make the tone-arm height and lift adjustments given above.

For the vertical adjustment, start with the changer out of cycle. Push the REJ.—AUT.—MAN. control to REJ., and rotate the turntable, by hand, three-quarters of a revolution; this setting can be obtained more accurately by making a mark on the turntable to coincide with some starting point. At the three-quarter-revolution point, the leading edge of the cam surface is approximately ¼″ from the end of the lift actuator lever, Part No. 76-4193; this is the lower actuator lever, shown in figure 17. Adjust the wire loop of the short link, cord, and spring assembly (figure 12), attached to the tone-arm lift pin, by squeezing or opening the loop until the tone-arm lift pin makes contact with the lower ear of the tone-arm swivel.

For the horizontal adjustment, rotate the turntable another three-quarters revolution from the point at which the vertical adjustment was made. At this point, the leading edge of the cam surface is approximately ¼″ from the end of the horizontal-return actuator lever; this is the upper actuator lever, Part No. 76-2987, shown in figure 18. Adjust the wire loop of the long link and spring assembly (figure 12), attached to the trip arm, by squeezing or opening the loop until the tone arm makes contact with the rubber bumper on the tone-arm rest post.

Trip-Finger and Trip-Receiver Adjustments

For the trip-finger adjustment, move the tone arm toward the spindle. Adjust the screw on the trip-receiver plate (figure 19) so that the trip finger, when riding over the ratchet screw on the trip plate, assumes an angle of 25° to 30° with respect to the screw.

For the trip-receiver adjustment, place the tone arm on a record with the needle in the eccentric finish groove. The vertical center line of the trip finger should coincide with the center line of the ratchet screw. To adjust the centering of the trip finger over the ratchet screw, loosen screw B slightly, and screw A completely; see figure 19. Rotate the trip receiver about screw B, as a center. Tighten the screws when the trip finger is centered.

Approximately ⅛″ of the trip-arm stop should engage the selector; see figure 19. To adjust the engagement of the trip-arm stop, loosen screw A slightly, and screw B completely. Rotate the trip receiver about screw A, as a center, to obtain the correct adjustment. Tighten the screws.

The above adjustments will affect each other slightly; therefore, it may be necessary to repeat each adjustment until both are correct. After making the above adjustments, it will be necessary to correct the index adjustments.

Record-Shelf Adjustment

Place the shelf in the 10″ position, and the changer out of cycle. Place the Philco record-shelf gauge, Part No. 45-1470 (also used for M-4), over the spindle and

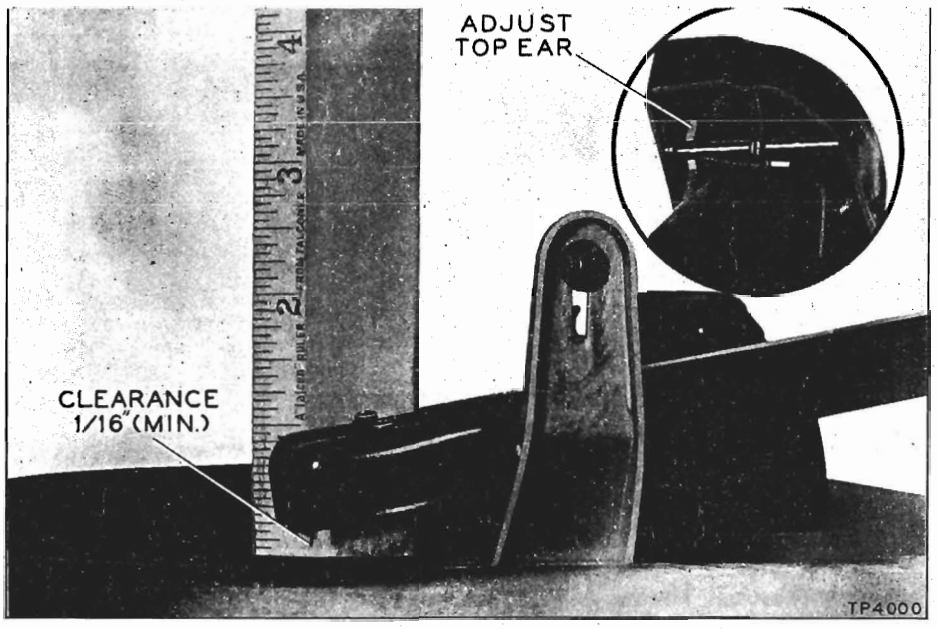

Figure 15. Tone-Arm Height Adjustment

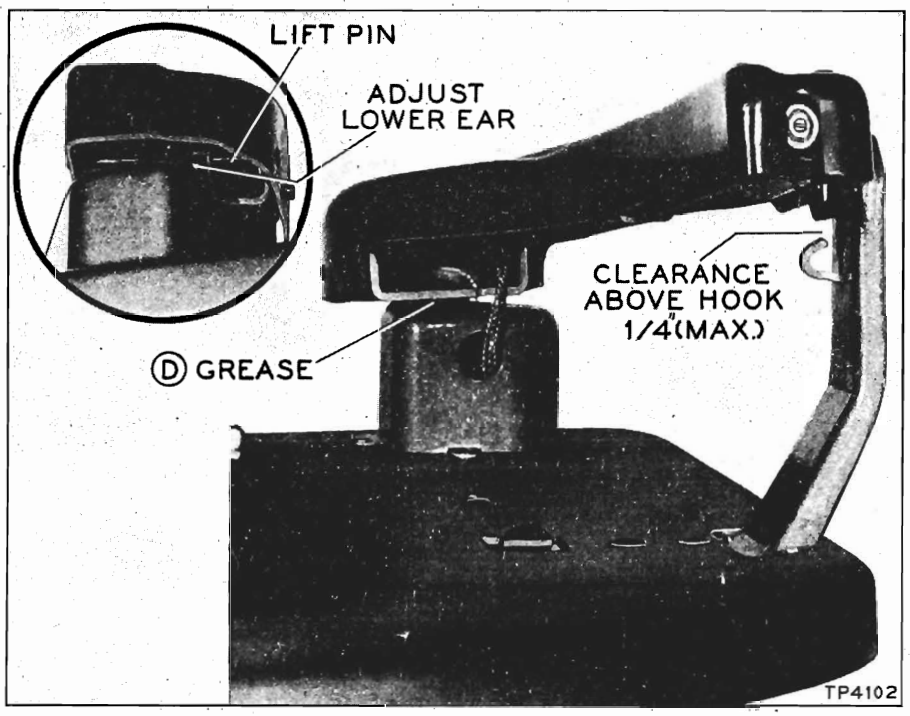
onto the record shelf, as shown in figure 20. Loosen the two hex-head screws which hold the record-shelf assembly to the changer base plate. Move the record-shelf assembly away from the record spindle until the large curved part of the gauge drops even with the record-shelf lips, as shown in figure 20. Now push the record shelf and gauge lightly against the spindle, taking out all play toward the spindle; keep the lips of the record shelf in even contact with the edge of the gauge. Tighten the two hex-head screws.

Push-Off Adjustment

Push the REJ.—AUT.—MAN. control to REJ., and rotate the turntable 2½ revolutions, by hand; at this point, the push-off actuator, Part No. 56-4588FA3, is in its most forward position, in contact with the roller on the cam gear; see figure 21. Loosen the push-off-bar locking screw, shown in figure 21. Squeeze the push-off-bar ears toward each other to the point where the slider blade on the record shelf extends $\frac{1}{32}$" beyond the lips of the shelf. Tighten the hex-head locking screw.

Figure 16. Tone-Arm Lift Adjustment



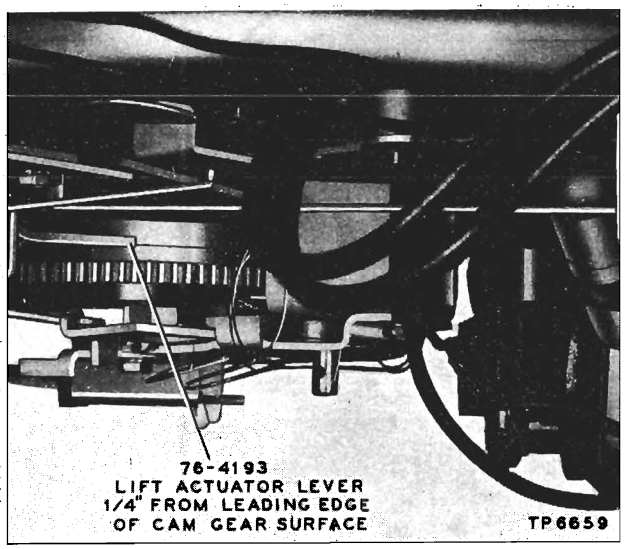


Figure 17. Tone-Arm Vertical Timing Adjustment, Showing Lower Actuator Lever in Contact with Cam Gear

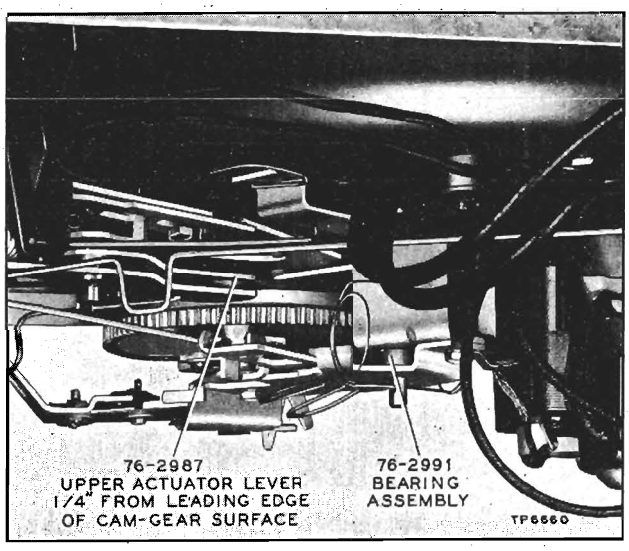

Figure 18. Tone-Arm Horizontal Timing Adjustment, Showing Upper Actuator Lever in Contact with Cam Gear

Uneven Turntable Speed (Wows)

Uneven turntable speed (wows) may be caused by the following:

Dirt under and around the turntable or idler-wheel assembly. Remove the turntable and clean out the dirt. Be careful to lift the turntable straight up after removing the spindle first (see page 12). When replacing the turntable, be sure that the idler is behind the turntable rim before the turntable is fully lowered (the spindle may be used to hold the idler back).

Flat or worn spots, or grease, on the rubber tire of the idler wheel.

Defective turntable shaft or bearing assembly.

Replace the defective parts as directed under REPLACEMENT OF PARTS AND ASSEMBLIES, page 12. If the 33-1/3 r.p.m. speed is incorrect, replace pulley belt, Part No. 45-6479 (remove idler wheel to replace belt).

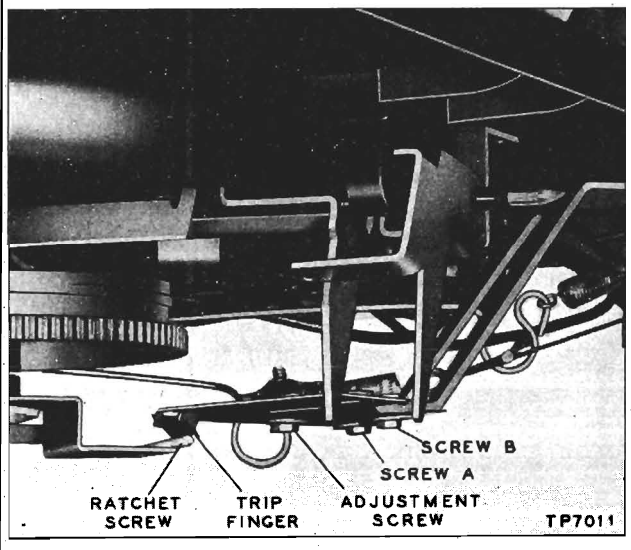

Figure 19. Trip-Finger and Trip-Receiver Adjustments

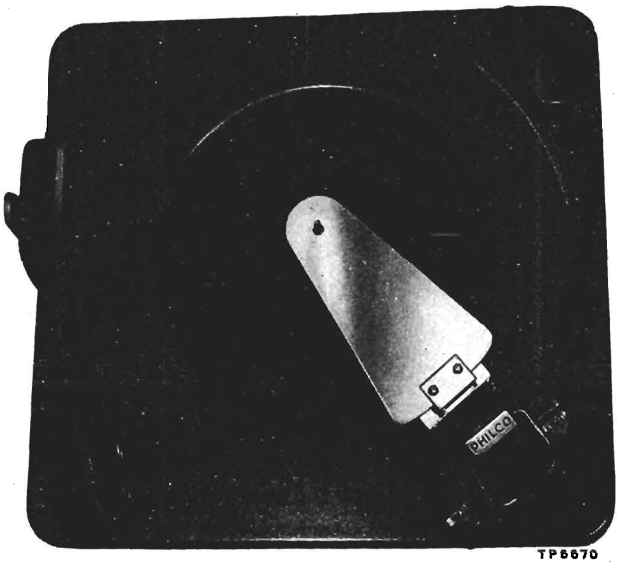

Figure 20. Shelf Gauge, Shown in Correct Position on Record Shelf and Spindle

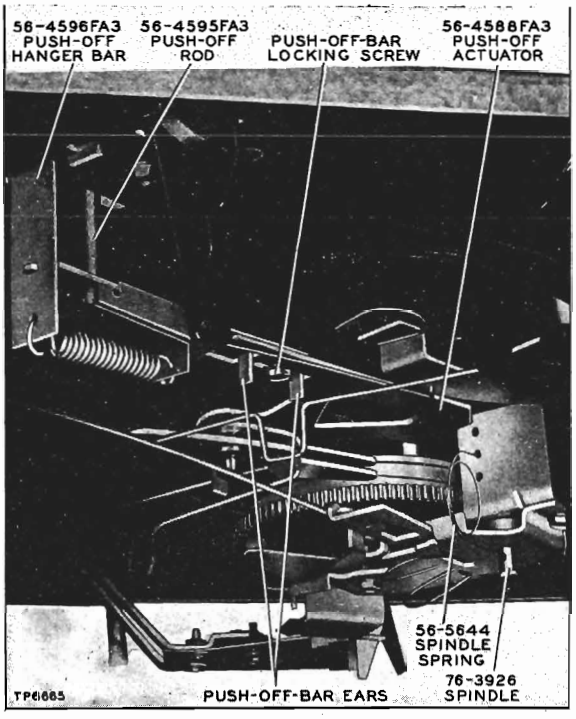

Figure 21. Push-Off Adjustment, Showing Push-Off Actuator in Contact with Roller on Cam Gear

REPLACEMENT OF PARTS AND ASSEMBLIES ON RECORD CHANGER

The following procedures are recommended for correct replacement of parts and assemblies on the record changer. The part should be replaced by reversing the order of removal, and adjusted according to the directions given in the RECORD-CHANGER ADJUSTMENTS section of this manual.

When any part is to be removed, the REJ.—AUT.—MAN. control should be in the AUT. position, and the changer should be out of cycle.

1. Needle, Part No. 45-1597

To remove needle, loosen knurled nut under crystal cartridge, and pull needle out.

2. Crystal-Pickup Cartridge, Part No. 35-2671-1

a. Bring tone arm toward center of turntable.

b. Remove the two screws, nuts, lock washers, and spacers which hold cartridge to tone arm.

c. Drop cartridge below tone arm sufficiently to allow removal of the two clips from cartridge, as shown in figure 22. If pickup leads are shielded, unsolder shield.

NOTE

When mounting cartridge, be sure to insert long spacer in side toward spindle.

3. Spindle, Part No. 76-3926

a. Unhook both ends of spindle spring, Part No. 56-5644, from "U"-shaped bracket mounted under changer base plate (figure 21).

b. Uncoil ends of spring through spindle.

c. Pull out spindle.

4. Motor, Part No. 35-1371

a. Push REJ.—AUT.—MAN. control to MAN. position.

b. Remove spindle as directed in paragraph 3 above.

c. Unsolder motor lead from mercury switch.

d. Disconnect second motor lead by unsoldering it at splice from switch lead. The motor assembly is shown in figure 23.

e. Remove ground lead from lug on motor.

f. Remove the three screws, washers, and bushings from motor frame (figure 23), and lift out motor.

5. Tone-Arm Assembly, Part No. 35-2663-2

a. Unsolder tone-arm leads from terminal panel on underside of changer base plate.

b. Loosen clamp screw which holds trip arm to tone-arm shaft, Part No. 76-2983FA2 (figure 12). Lift out tone arm and shaft. The tone-arm assembly is shown in figure 22.

6. Bridge Assembly, Part No. 76-2978

a. Remove the two hex-head screws from bridge plate.

b. Remove link rod, Part No. 56-4589FA3, from slider control bar. Complete assembly of bridge is shown in figure 24.

7. Trip Plate, Part No. 76-2990

a. Remove bridge assembly, Part No. 76-2978, as directed in paragraph 6 above.

b. Slide trip plate, Part No. 76-2990, off cam-gear spindle.

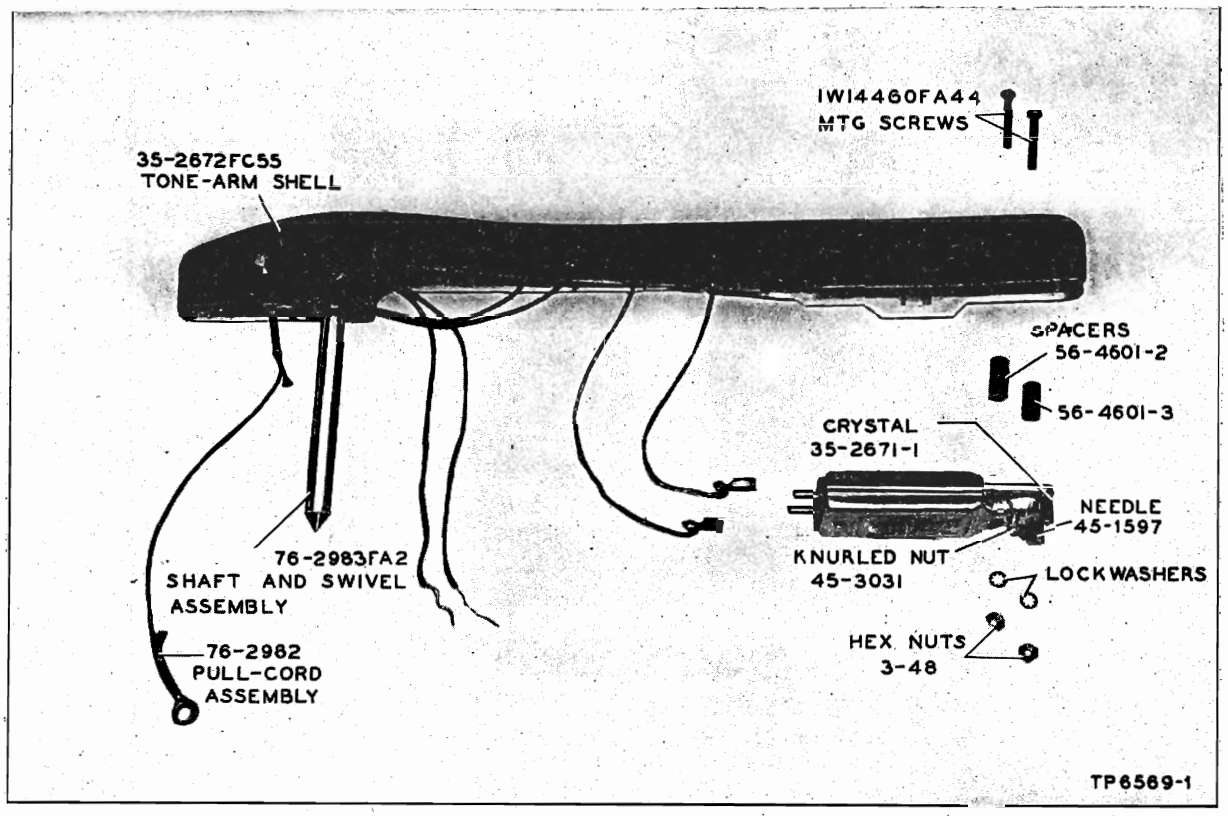

Figure 22. Record-Changer Tone-Arm Assembly, Part No. 35-2663-2

8. Cam-Gear Assembly, Part No. 76-2989

a. Remove bridge assembly and trip plate as directed in paragraphs 6 and 7 above.

b. Remove ball-bearing assembly, Part No. 76-2991 (figure 18), by pulling it off.

c. Remove large "E" washer, Part No. 1W60980FE5, from cam-gear spindle, and slide off cam washer, Part No. 1W52627.

d. Slide cam gear off spindle. The cam-gear assembly is shown in figure 25.

9. Tone-Arm-Actuator Levers, Part No. 76-2987

a. Remove "E" washer, Part No. 1W60980FE5, from actuator stud.

b. Disengage short link, Part No. 56-4607FA3, from link spring.

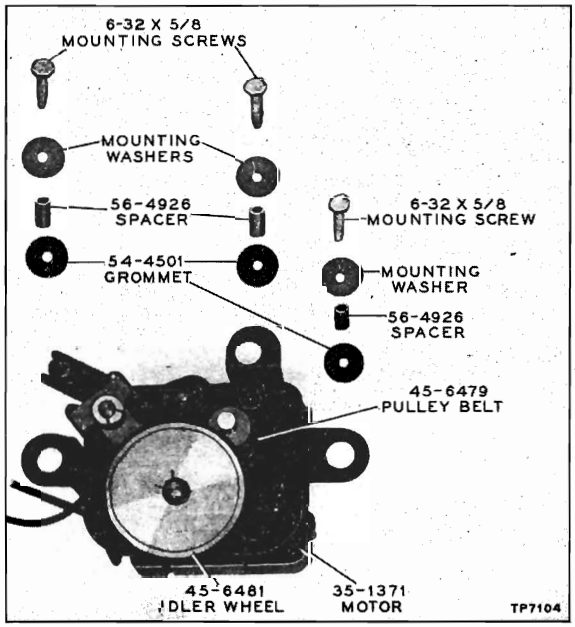

Figure 23. Motor Assembly

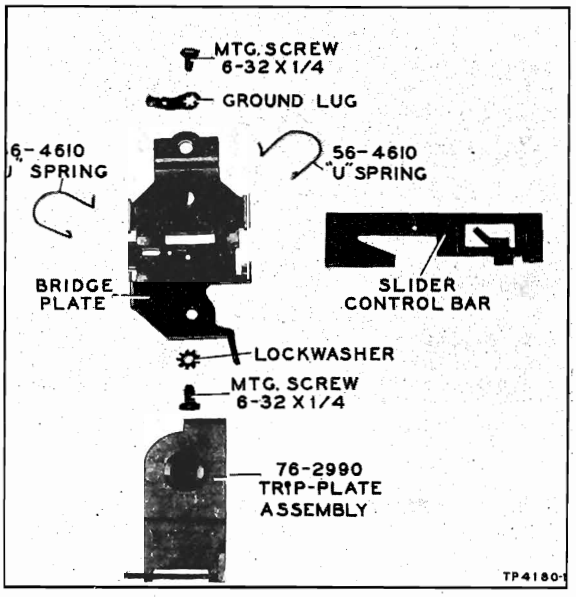

Figure 24. Bridge Assembly

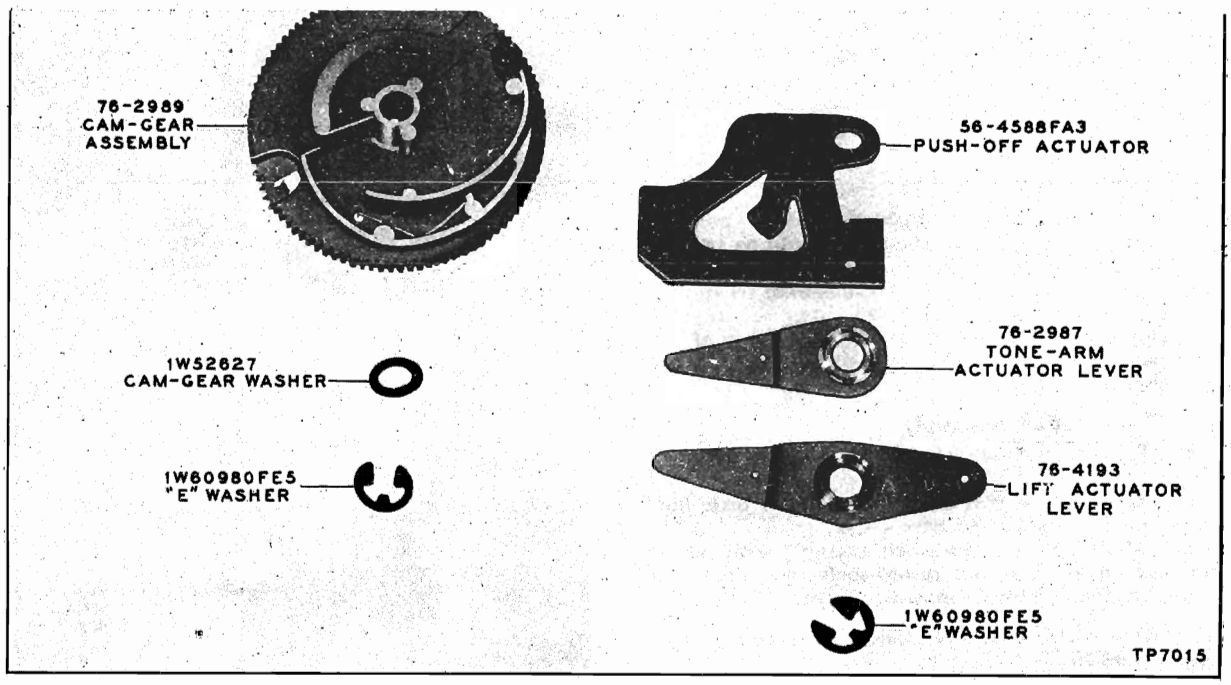

Figure 25. Cam-Gear Assembly and Actuator Levers

c. Slide lower actuator lever from stud.

d. Disengage lifter link, Part No. 56-5990, from actuator lever.

e. Remove upper actuator lever from stud, and disengage long link, Part No. 56-4606FA3. The actuator-lever assembly is shown in figure 25.

10. Push-Off Actuator, Part No. 56-4588FA3

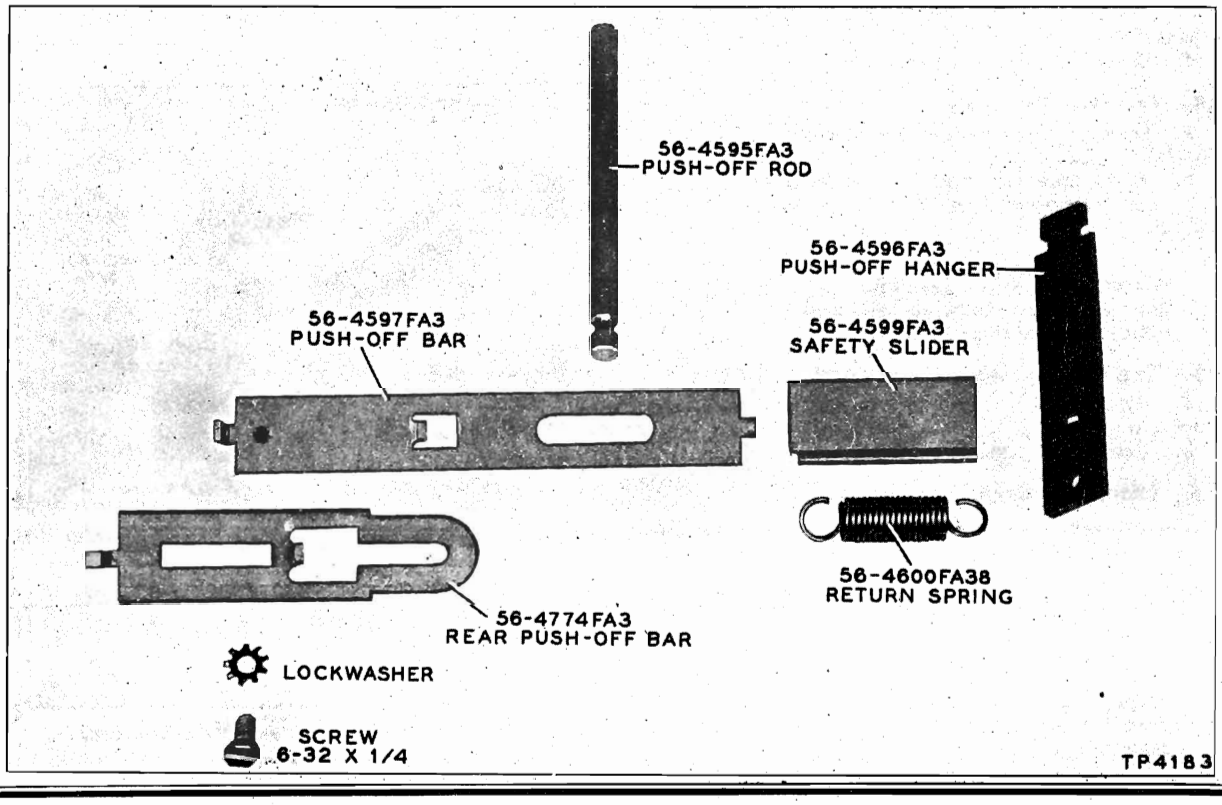
a. Remove selector lever, Part No. 56-5985, as directed on page 20, paragraph 8.

b. Remove tone-arm actuator levers as directed in paragraph 9 above.

c. Press push-off rod, Part No. 56-4595FA3, and push-off hanger bar, Part No. 56-4596FA3 (figure 21), together and pull downward, to release the entire assembly.

d. Slide push-off actuator, Part No. 56-4588FA3, over, to align upturned ears with cut out in base plate. Slide actuator off stud.

Figure 26. Push-Off Assembly



NOTE

After removing the push-off actuator and push-off-bar assembly, the slider blade on the record shelf may slide out of the assembly. When reassembling, this blade should be inserted in the record-shelf assembly, with the elongated hole toward the 12″ position of the record shelf. The push-off assembly is shown in figure 26.

11. Record-Shelf Assembly

a. Remove push-off assembly as directed in step c of paragraph 10.

b. Remove the two hex-head screws which hold record-shelf assembly to base plate.

c. Align ears on record-shelf assembly with cut out on base plate. Lift out record-shelf assembly. The record-shelf assembly is shown in figure 27.

12. REJ.—AUT.—MAN. Control Assembly, Part No. 54-4479-1

a. Remove flat spring, Part No. 56-4778FA38, by sliding it laterally through underside of button (figure 21).

b. Remove the two hex-head screws, and drop bridge assembly, Part No. 76-2978.

c. Disengage control link, Part No. 56-4589FA3, from underside of control button (figure 8). Lift out control button.

13. STD. PLAY—LONG PLAY Control, Part No. 54-4634

a. Remove flat spring, Part No. 56-4778FA38, by sliding it laterally through underside of button.

b. Remove selector lever, Part No. 56-5985, as directed in paragraph 8, page 20.

c. Disengage selector link, Part No. 56-5991, from selector lever (figure 8).

d. Lift out control button.

14. Trip-Arm Assembly

a. Loosen clamp screw on trip arm, Part No. 76-4204 (figure 12).

b. Raise tone arm and shaft sufficiently to clear trip arm. Remove trip arm, and disengage link spring.

NOTE

When assembling, maintain $\frac{1}{32}$″ vertical play (clearance between trip arm and base plate) in tone-arm shaft.

15. Trip-Receiver Assembly, Part No. 56-6404

a. Remove the three screws, washers, and nuts from trip arm (figure 28).

b. Remove trip receiver.

16. Selector Assembly

Remove cam gear as directed in paragraph 8. Remove feeler spring from attachment point on motor board. Tilt selector assembly, and remove from base plate.

NOTE

When assembling selector assembly, be sure to maintain .005″ clearance between selector hinge, Part No. 56-4617FA3, and washer, Part No. 2W53954. For correct assembly, refer to figure 29.

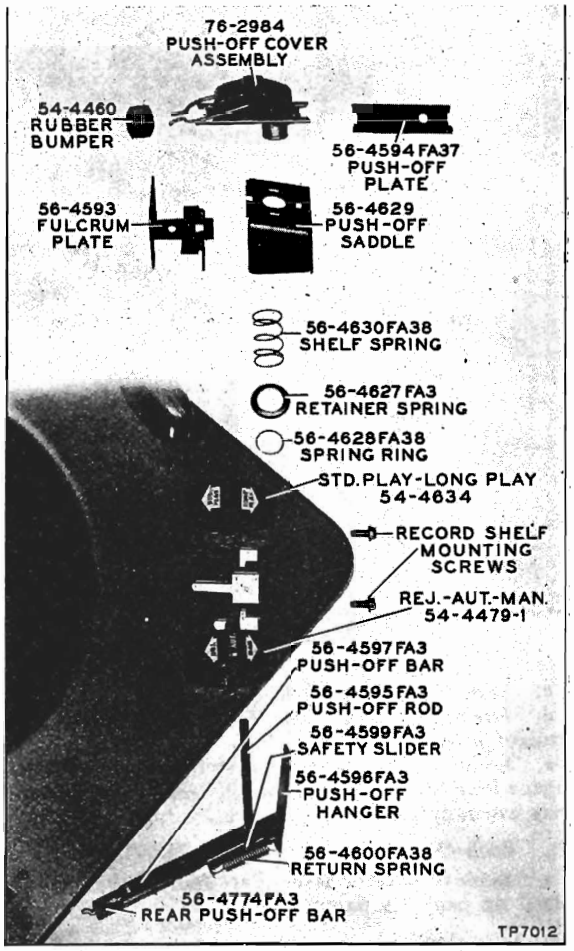


Figure 27. Record-Shelf Assembly

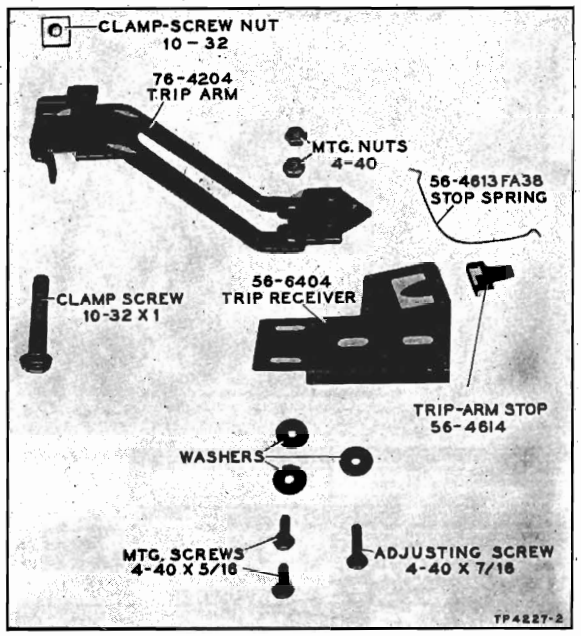

Figure 28. Trip-Arm and Trip-Receiver Assemblies

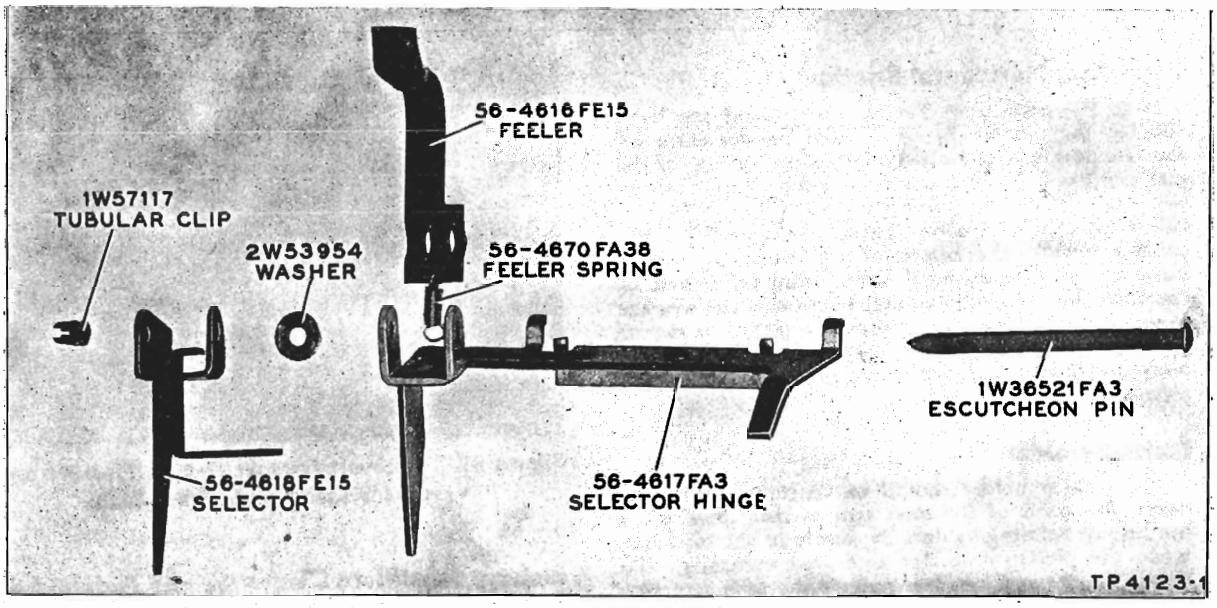

Figure 29. Selector Assembly

RECORD-PLAYER TESTING AND TROUBLE-SHOOTING PROCEDURE

Pick-Up and Needle Test

Place a 12" Columbia Long Playing Record on the turntable, lift the tone arm from the rest post, and place it on the starting groove of the record. Listen to the tone of the record. If distortion is noted, replace crystal cartridge as directed on page 12. If trouble persists, check for loose wiring, bad contact points, etc.

Shut-Off Test

Place the tone arm in the finish groove of the record and observe the shut-off action. The record player should shut off within three revolutions of the turntable, after the pickup needle has entered the finish groove of the record. The trip adjustments are shown on page 9.

Clearance Test

Remove the record from the turntable and place the tone arm over the base plate. Observe whether there is a minimum of $\frac{1}{16}$" clearance between the needle point and base plate. Refer to page 7 for adjustment.

Turntable and Motor Test

Allow the motor to run for at least five minutes; then place a stroboscope, such as Philco Part No. 45-1614, on the turntable, and illuminate the disc with a lamp operating on 60-cycle a.c. The dots in the row calibrated for 33⅓ r.p.m. should appear to remain stationary or to drift very slowly, but smoothly, forward and backward. If the dots are moving in either direction very fast or with a jerky motion, refer to UNEVEN TURNTABLE SPEED (WOWS), page 11.

RECORD-PLAYER ADJUSTMENTS

Tone-Arm Needle Pressure and Vertical Friction

Hold the Philco Gram Scale, Part No. 45-9531, on its side and set the pointer to the center line of the scale. This is the 0 point, and each small division on either side of 0 is equal to one gram. After the scale has been set to 0, place it on the turntable with the guard on the scale in an open position, at right angles to the scale, as shown in figure 30. Now set the needle of the tone arm into the hole at the end of the pointer and observe the reading on the scale. This reading is the needle pressure; the correct needle pressure is 6 to 7½ grams.

To determine the vertical friction proceed as follows: Press down on the head of the pickup, then let it return to its normal position, and note the reading. Raise the pickup slightly, then gently lower it to the normal position, and again note the reading. The vertical friction is the difference between the two readings obtained. For example: if the scale reading is 7¼ grams after the pickup is depressed and released, and is 6¾ grams after the pickup is raised and lowered, the vertical friction is 7¼ minus 6¾ or ½ gram. The vertical friction should not exceed 2 grams.

Tone-Arm Horizontal Friction

Hold the gram scale flat in the palm of the hand and set the pointer to "0". Take the tone-arm off the rest post, and place a counterweight on top of the rear end until the tone arm is balanced in a horizontal position. Place the pointer of the scale against the side of the pickup head (figure 31) and move the pickup toward the center of the turntable. Then move the pickup outward, away from the center of the turntable. The horizontal friction is the average of the two readings taken, when the pickup is moved both inward and outward. At no time should it take more than 2 grams pressure on the pointer to move the tone arm.

Pickup Holder

The pickup holder should be centrally spaced between the walls of the tone arm so that there is no binding or rubbing against the inside of the tone arm when the pickup cartridge is moved vertically. To obtain proper spacing, first remove the tone arm (see page 19); loosen the screw which holds the pickup bracket mounting. Move the mounting until it is centrally spaced between the walls of the tone arm, and maintain $\frac{1}{32}$" clearance between the tip of the ears on the holder and the inside surface at the front end of the tone arm, as shown in figure 33.

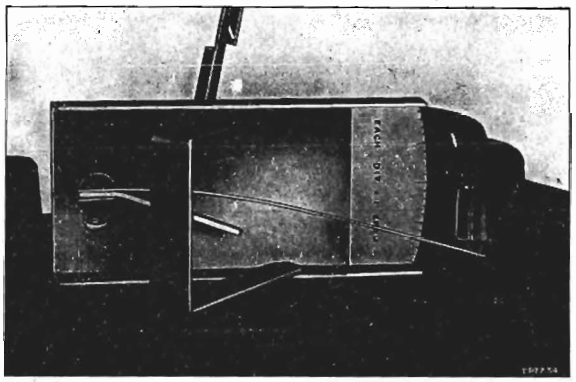

Figure 30. Measurement of Needle Pressure and Vertical Friction with Gram Scale

Pickup-Base-Plate Clearance and Height Adjustment

With the tone arm off the rest post and resting over the base plate, the needle should be at least $\frac{1}{16}$" and not more than $\frac{3}{16}$" above the base plate, as shown in figure 34. To adjust, grasp the tone arm and raise or lower (whichever is required) with a little pressure

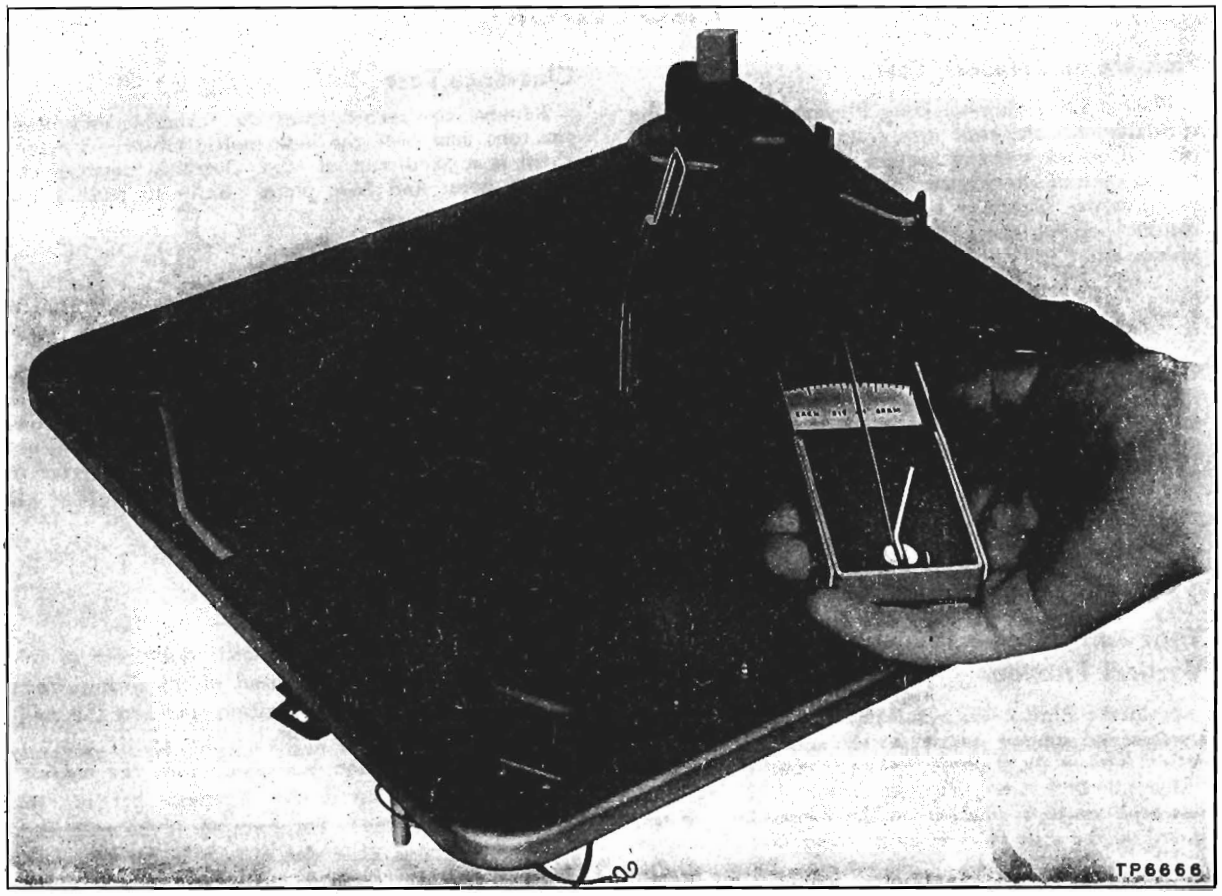

Figure 31. Measurement of Horizontal Pressure

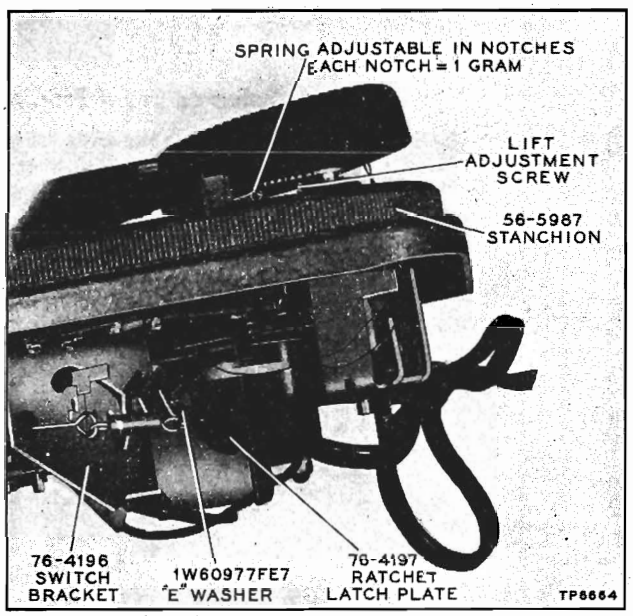

Figure 32. Needle-Pressure Adjustment

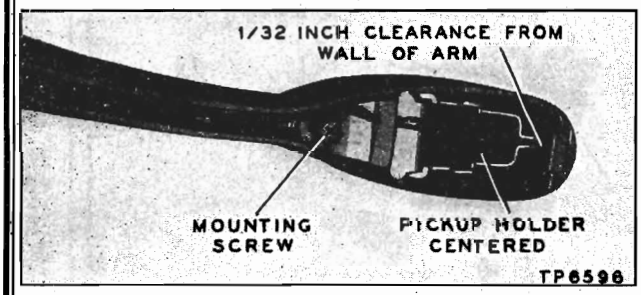

Figure 33. Pickup-Holder Adjustment

to obtain the correct clearance. Then adjust the screw on the pivot assembly (figure 32) so that the tone arm will clear the rest hook on the stanchion, Part No. 56-5987.

Trip-Switch Adjustments

With the tone-arm on the rest post, the mercury switch attached to the bracket-and-clip assembly, Part No. 76-4195, should be in a horizontal or ON position, as shown in figure 8. To adjust, loosen the reset-trip-arm clamp screw (figure 35), and while holding the tone arm on the rest post, move the trip arm until the leg on the reset trip arm engages the bracket-and-clip ear, and at the same time, the long ear of the bracket and clip is approximately $\frac{1}{32}$" above the cut-out notch on the ratchet-plate assembly, Part No. 76-4197, as shown in figure 35.

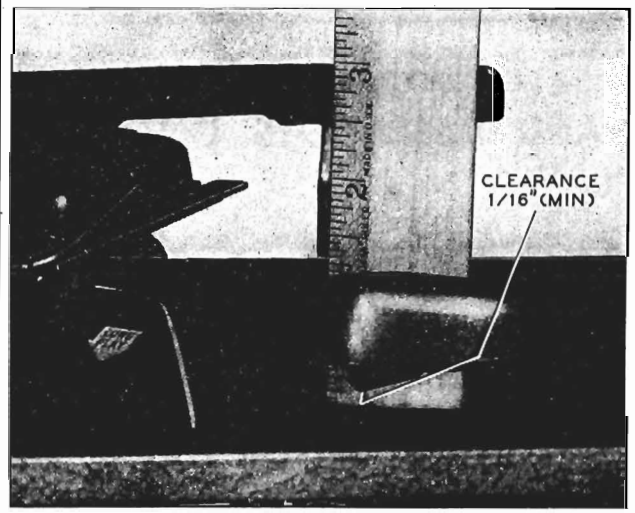

Figure 34. Tone-Arm Height Adjustment

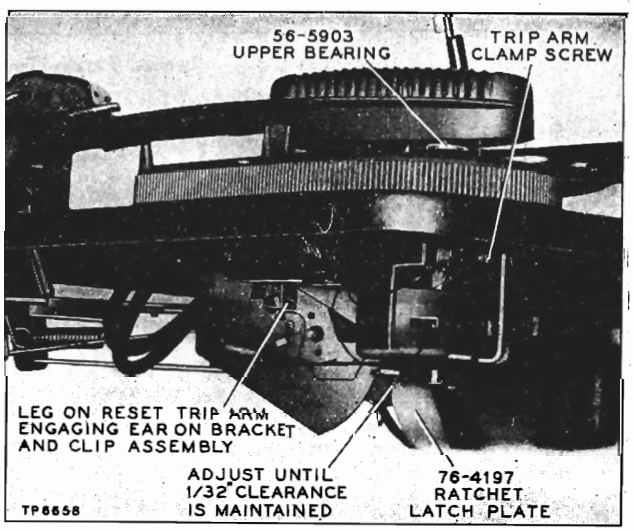

Figure 35. Trip-Switch Adjustment

Trip-Finger Adjustments

Place the tone-arm needle in the finish groove of a record, and observe the trip finger riding over the ratchet on the ratchet-plate assembly, Part No. 76-4197. The trip finger should assume an angle of 25° to 30° while riding over the ratchet, as shown in figure 7. Adjust the screw on the trip-arm receiver to obtain the proper angle.

Selector-Lever Stop Adjustment

The selector-lever "throw" is adjusted by loosening the screw in the lock plate, Part No. 56-5986 (figure 11), and centering the lock plate so that when the STD. PLAY—LONG PLAY control is in either position, the shift lever on the motor will not bind against either side.

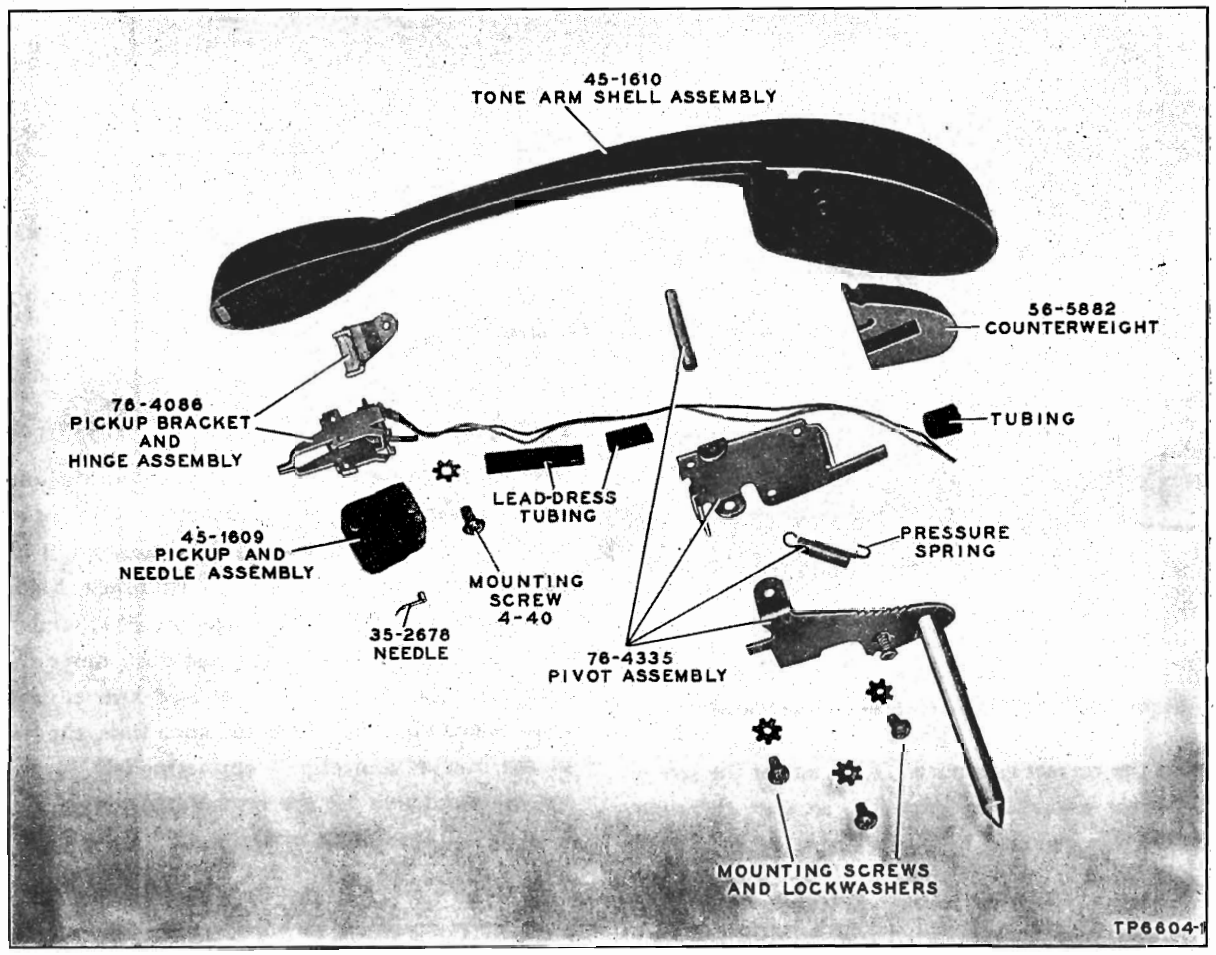

Figure 36. Record-Player Tone-Arm Assembly, Part No. 35-2686

REPLACEMENT OF PARTS AND ASSEMBLIES ON RECORD PLAYER

1. Crystal-Cartridge Assembly, Part No. 45-1609

To remove the crystal cartridge, grasp the crystal by its sides, and pull it down and out. When replacing the cartridge, push it up into the head of the tone arm, until it is seated in position.

2. Tone-Arm Assembly, Part No. 35-2686

a. Unsolder tone-arm leads from terminal panel on underside of changer base plate. The tone-arm assembly is shown in figure 36.

b. Unhook pull cord, Part No. 76-2982-1, from spring and link assembly, Part No. 56-5990 (figure 9).

c. Loosen clamp screw which holds reset trip arm to tone-arm shaft.

d. Lift out tone arm.

3. Tone-Arm Thrust Bearing, Part No. 56-5916

a. Remove tone arm as directed in paragraph 2 above.

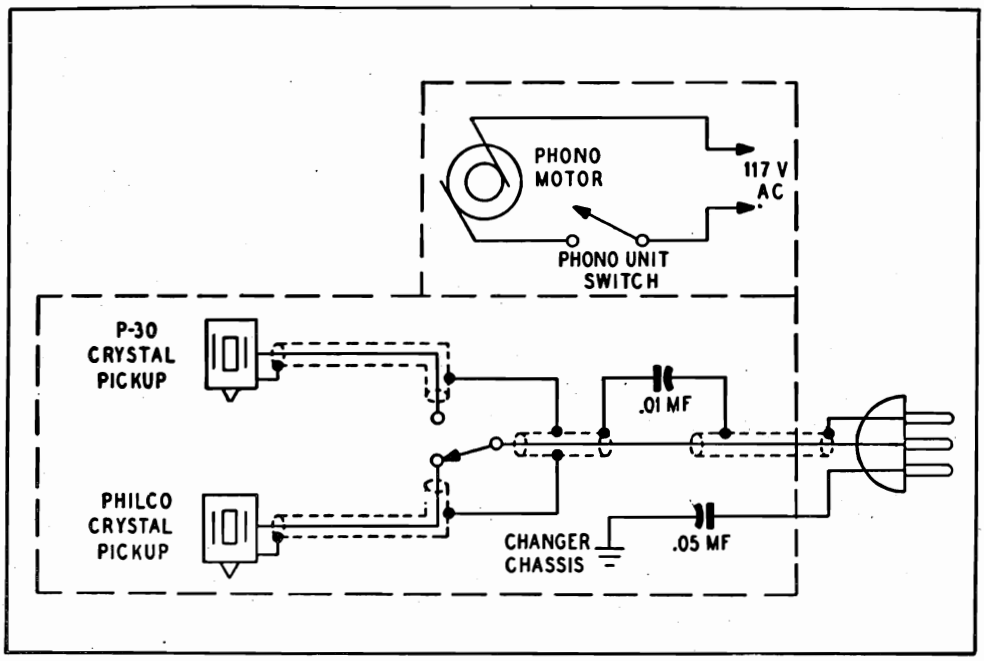

Figure 37. Model M-9C, Wiring Diagram

b. Remove "E" washer, Part No. 1W60977FE7, from bearing shaft (figure 8).

c. Lift bearing out of rubber grommet, Part No. 27-4099-3, mounted on tone-arm-shaft support.

4. Tone-Arm Stanchion, Part No. 56-5987

a. Remove tone arm as directed in paragraph 2 above.

b. Remove hex-head screw from each end of tone-arm stanchion, under changer base plate.

c. Lift out stanchion (figure 7).

5. Tone-Arm Upper Bearing, Part No. 56-5903

a. Remove tone-arm stanchion, Part No. 56-5987, as directed in paragraph 4 above.

b. Remove "E" washer, Part No. 1W60981FE7, from bearing shaft mounted on tone-arm stanchion (figure 35).

c. Remove bearing from grommet, Part No. 54-4624, by sliding it out from underside of stanchion.

6. Ratchet Latch Plate, Part No. 76-4197

a. Remove "E" washer, Part No. 1W60977FE7, from switch bracket, Part No. 76-4196 (figure 32).

b. Slide ratchet plate off switch bracket.

7. Switch Bracket, Part No. 76-4196

a. Remove mercury switch, Part No. 76-2140-2, from clip.

b. Unhook pull-cord spring, Part No. 76-2982-1, from link.

c. Remove two hex-head screws which hold switch bracket to base plate.

d. Unhook link from actuator.

8. Selector Lever, Part No. 56-5985

a. Remove "E" washer, Part No. 1W60977FE7, from stud which mounts selector lever, Part No. 56-5985, underneath base plate (figure 11).

b. Remove spring washer, Part No. 1W56306FE15, from stud.

c. Remove "U"-shaped spring, Part No. 56-5995, between selector lever and base plate.

d. Loosen lock-plate screw (figure 11).

e. Loosen motor-mounting screws and cock motor to one side.

f. Set STD. PLAY—LONG PLAY control to STD. PLAY position.

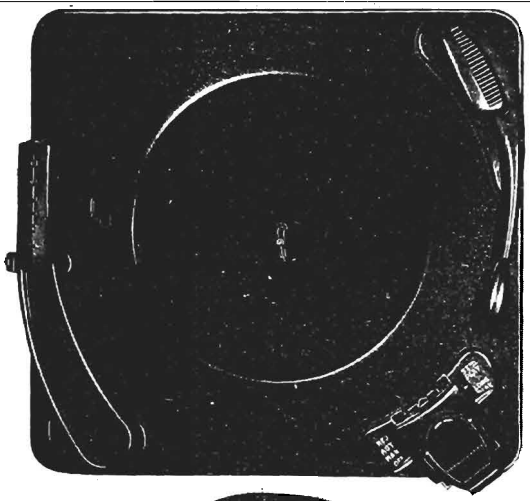
g. Align ears of selector lever with cut out on base plate, and pull out selector lever from stud on underside of base plate.

h. Disengage selector lever from control-button link.

MODEL M-9C PHILCO CORP.

REPLACEMENT PARTS LIST

Service Part No.	Description
35-1371	Motor
35-2663-2	Tone-arm assembly, record changer
35-2671-1	Crystal, standard
35-2672FC55	Tone-arm shell
35-2678	Needle for special crystal
35-2686	Tone-arm assembly, record player
35-3066-2	Turntable
41-3869-2	Cable and plug
42-1750-3	Switch, motor
42-1873	Switch
45-1597	Needle
45-1609	Pickup-and-needle assembly
45-1610	Tone-arm assembly (shell)
45-3031	Nut, knurled
45-6479	Pulley belt
45-6481	Idler wheel
54-4479-1	Control, REJ.—AUT.—MAN.
54-4460	Bumper
54-4501	Motor-mounting grommet
54-4634	Control, STD. PLAY—LONG PLAY
54-7613	Trip finger
56-1880	Cover, switch
56-2832FA3	Clamp, cable
56-4585FA3	Index lever
56-4588FA3	Actuator, push-off
56-4589FA3	Link, control
56-4593	Plate, fulcrum
56-4594FA37	Plate, push-off slide
56-4595FA3	Rod, push-off
56-4596FA3	Hanger, push-off
56-4597FA3	Bar, push-off
56-4599FA3	Slider, safety
56-4600FA38	Spring, return
56-4601-2	Spacer
56-4601-3	Spacer
56-4603FA38	Index spring
56-4604FE15	Pin, tone-arm pivot
56-4606FA3	Link, long
56-4607FA3	Link, short
56-4608FA38	Spring
56-4610	Spring, "U" (bridge assembly)
56-4613FA38	Stop spring
56-4614	Trip-arm stop
56-4616FE15	Feeler (selector assembly)
56-4617FA3	Hinge (selector assembly)
56-4618FE15	Selector
56-4626-1FA7	Record shelf
56-4627FA3	Retainer, spring (record-shelf assembly)
56-4628FA38	Spring, ring
56-4629	Saddle, push-off (record-shelf assembly)
56-4630FA38	Spring, record shelf
56-4631FA15	Pin, tone-arm lift
56-4670FA38	Spring, feeler (selector assembly)
56-4774FA3	Bar, push-off (rear)
56-4778FA38	Spring, control knob
56-4926	Spacer, motor
56-5644	Spring, spindle
56-5882	Counterweight
56-5903	Bearing, upper
56-5916	Thrust bearing
56-5981	Trip receiver, record-player tone arm
56-5985	Lever, selector
56-5986	Plate, lock
56-5987	Stanchion, record-changer tone arm
56-5990	Link, lifter
56-5991	Link, selector
56-5995	Spring, "U" (selector lever)
56-6404	Trip receiver, record-player tone arm
76-2140-2	Switch, mercury
76-2978	Bridge assembly
76-2982	Pull-cord assembly, record-changer tone arm
76-2982-1	Pull-cord assembly, record-player tone arm
76-2983FA2	Shaft and swivel, record-changer tone arm
76-2984	Push-off, cover
76-2987	Actuator lever, record-changer tone arm
76-2989	Cam-gear assembly
76-2990	Trip-plate assembly
76-2991	Bearing assembly
76-3926	Spindle
76-4086	Bracket (pickup and hinge)
76-4192	Base plate
76-4193	Actuator, lift lever
76-4194	Trip-switch assembly
76-4195	Bracket-and-clip assembly
76-4196	Switch-bracket assembly
76-4197	Ratchet latch plate
76-4198	Reset trip arm
76-4204	Trip arm (subassembly)
76-4335	Pivot assembly, record-player tone arm
1W14460FA44	Screw (3-48x⅝"), crystal mounting
1W36521FA3	Pin, escutcheon
1W52627	Cam-gear washer
1W56306FE15	Spring washer, selector-lever assembly
1W57117	Tubular clip
1W60977FE7	"E" washer (for selector lever, ratchet plate, and thrust bearing)
1W60980FE5	"E" washer (for cam and actuator stud)
1W60981FE7	"E" washer (for upper bearing)
2W53954	Washer, selector assembly



INTRODUCTION

The Philco DeLuxe Automatic Record Changer and Record Player Combination, Model M-12C, is used in several Philco Radio-Phonograph combinations. It incorporates two tone arms. The changer tone arm is used with the record-changer mechanism to play ten 12″ records or twelve 10″ records, automatically, at the standard speed of 78 r.p.m. The long-play tone arm is used with the manual record player, which plays the new Columbia Long-Playing Records (33⅓ r.p.m.). This tone arm employs the new Philco Balanced-Fidelity Reproducer, which applies the extremely low needle pressure of ⅕ ounce. The motor is shut off automatically at the end of the record.

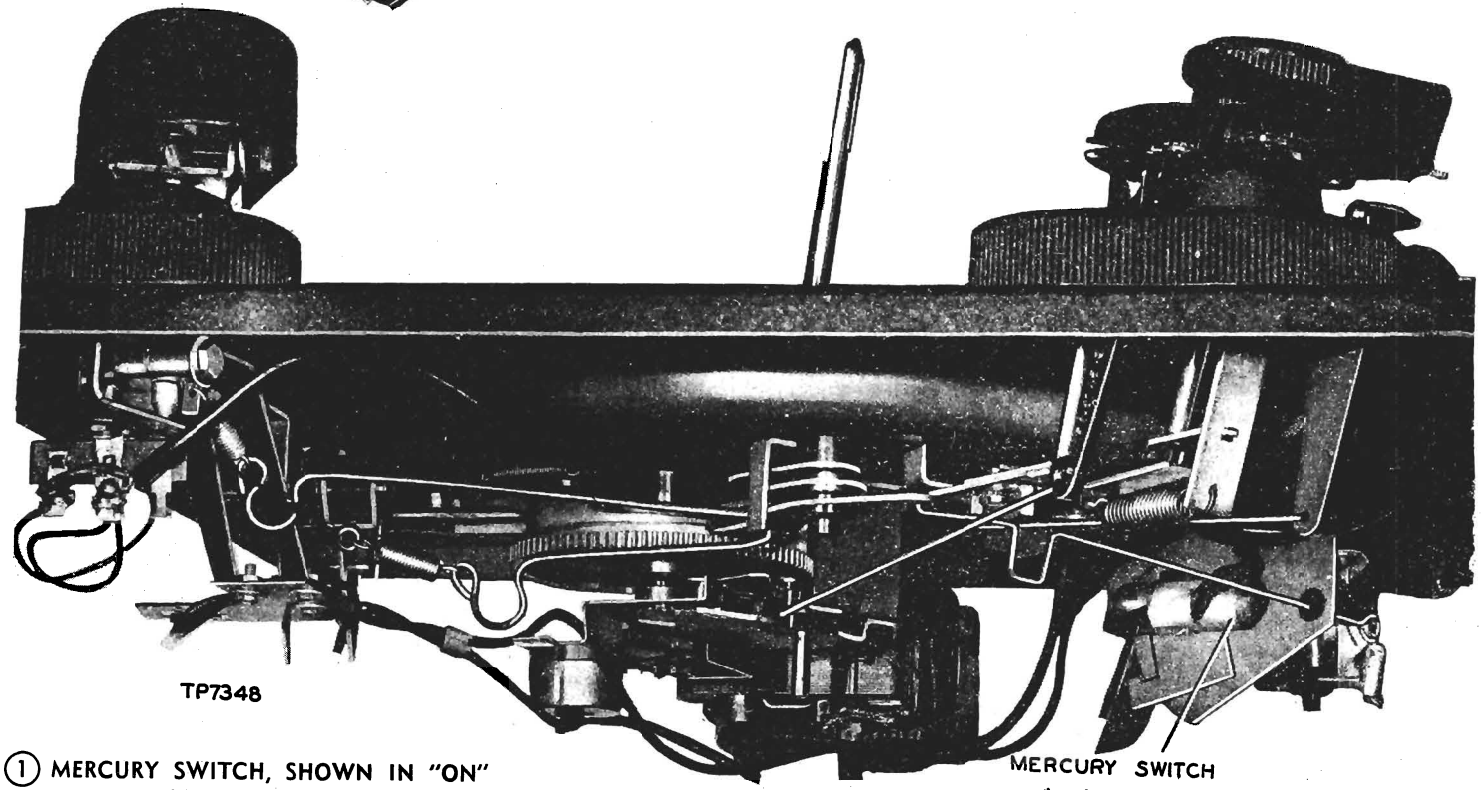


FIGURE (1) MERCURY SWITCH, SHOWN IN "ON" POSITION

DESCRIPTION OF OPERATING CYCLES

Power for the motor is obtained through two switches connected in series electrically. One is an on-off switch mounted on the bridge assembly, Part No. 76-3998 (figure 7), and is operated manually by the control button with positions OFF, MAN, AUT, and REJ. This button is located to the left of the record-shelf assembly on the top of the record changer.

The other switch is a mercury-type switch, mounted on a switch bracket, and is operated by the long-play tone arm. When the tone arm is on the rest post, a leg on the reset trip arm, connected to the tone-arm shaft, is in contact with an ear on the bracket-and-clip assembly to which the mercury switch is attached, and the switch is set in the "on" position (figure 1); when the switch is in this position, the motor circuit is controlled by the OFF-MAN-AUT-REJ control.

When the long-play tone arm is placed on a record, the mercury switch is held in the "on" position by a ratchet latch plate mounted on the switch-bracket assembly (figure 20); this ratchet plate has a cutout, in which rests a protruding ear of the bracket-and-clip assembly which contains the mercury switch. As the tone arm enters the finish groove of a record, a trip finger (attached to the reset trip arm) rides over the ratchet latch plate and trips it; this releases the bracket-and-clip assembly, causing the mercury switch to tip into the "off" position (see figure 2), thus opening the motor circuit and stopping the turntable.

The record changer has two speeds, controlled by the play control button, with positions ST'D PLAY and LONG PLAY. This button is located to the right of the record-shelf assembly on the top of the record changer. When the play control is set to ST'D PLAY, the idler wheel on the motor engages the motor shaft directly, driving the turntable at a speed of 78 r.p.m. When the play control is set to LONG PLAY, a selector link, one end of which is attached to the base of the control under the changer, actuates a selector lever mounted on the changer base plate. This selector lever engages a shift lever mounted on the motor (figure 3). A large pulley on the shift lever is connected to the motor shaft by means of a small rubber belt. The idler wheel engages this large pulley, driving the turntable at a speed of 33⅓ r.p.m. The play control also actuates a single-pole, double-throw switch, which is mounted on the base plate under the turntable (figure 3). The output leads of the two tone arms are connected to this switch. When the play control is set to the LONG PLAY position, the switch cuts off the output of the changer tone arm, and closes the circuit for the long-play tone arm. The reverse of this action takes place when the play control is set to the ST'D PLAY position.

The changer mechanism of the record changer is brought into action when a small retractable gear segment, mounted on the cam gear, is released, and engages the hub gear of the turntable shaft, causing the cam gear to be driven. While a record is playing, the retractable gear segment is held in the retracted position by the trip-plate ear; the segment is released either manually, by pushing the OFF-MAN-AUT-REJ control to REJ, or automatically, when the changer tone arm follows the finish groove of a record; automatic tripping is initiated by the trip arm, which is attached to the tone-arm shaft, and which rides over the trip-plate ratchet screw, causing the cam-gear segment to be released.

The tone arm of the record changer is operated by two link assemblies (figure 12) attached to actuator levers, which are in contact with the cam surface of the cam gear. When the cam gear starts, the lower actuator lever is pushed outward first, and the short link assembly attached to it raises the tone arm off the record. (The same action also raises the long-play tone arm, at the end of a record, by means of the long link assembly, which is also attached to the lower actuator lever.) As the cam gear continues to turn, the upper actuator lever is pushed outward, and its link assembly pulls the tone arm out against the rest post; at this instant, a roller on the cam gear makes contact with the push-off actuator (which is connected to the record-shelf assembly through a series of push-off bars), and operates the record-dropping mechanism.

TESTING AND TROUBLE-SHOOTING PROCEDURE

The following series of operating tests is given to aid in localizing troubles. Each test should be performed with several good records before making any adjustments.

With both tone arms on their rest posts, set the record shelf to the 10″ position, and place a 10″ record over the spindle and onto the record shelf. Set the play control to ST'D PLAY, and push the OFF-MAN-AUT-REJ control knob to REJ. Observe the record-dropping action; the record should fall smoothly onto the turntable. The tone arm should rise from the rest post, and the needle should come down on the record at about ⅛″ from the outer edge. Play the record through, and observe the tripping action; the trip mechanism should operate within the first two or three revolutions after the needle has entered the eccentric finish groove of the record.

Remove the record from the turntable, turn the record shelf to the 12″ position, place a 12″ record on the spindle and record shelf, and repeat the above testing procedure.

During a change cycle, the lower edge of the tone arm should clear the top of the rest-post hook by a minimum of ⅛″.

Remove the record from the turntable, place the changer tone arm over the changer base plate, and observe the clearance between the needle point and the base plate; the clearance should be not less than 1/16″; however, the needle should be no higher than the top of the turntable.

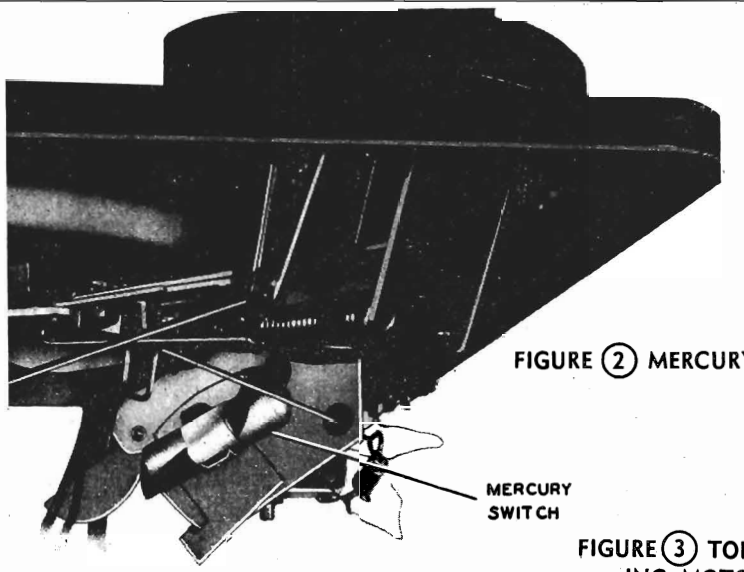

FIGURE (2) MERCURY SWITCH, SHOWN IN "OFF" POSITION

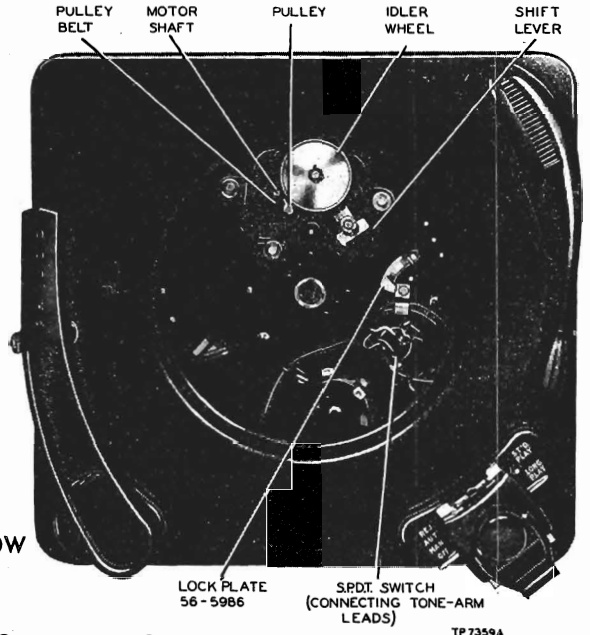

FIGURE (3) TOP VIEW, TURNTABLE REMOVED, SHOWING MOTOR ASSEMBLY AND SPDT SWITCH

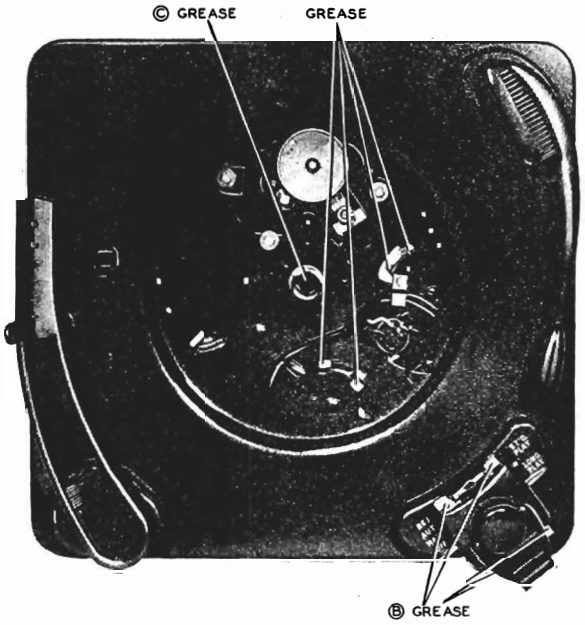

FIGURE (4) TOP VIEW, SHOWING LUBRICATION POINTS

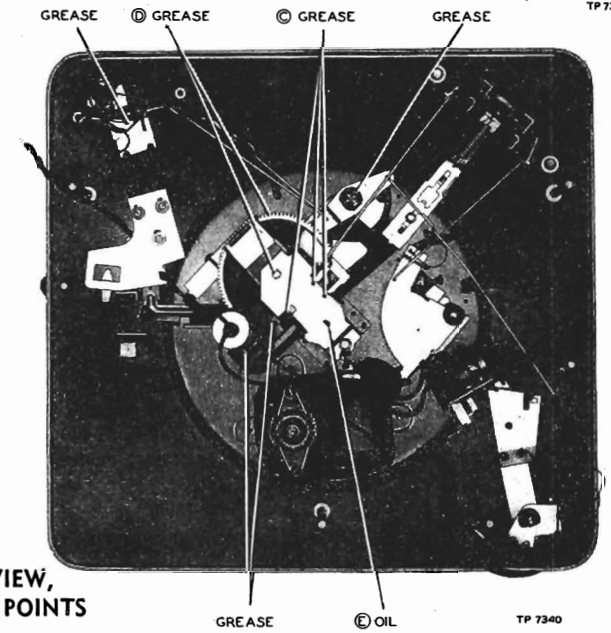

FIGURE (5) BOTTOM VIEW, SHOWING LUBRICATION POINTS

TESTING AND TROUBLE-SHOOTING PROCEDURE (Continued)

Place the tone arm on the rest post, set the OFF-MAN-AUT-REJ control to MAN, and the play control to LONG PLAY. Place a 12″ Columbia Long-Playing (micro-groove) record on the turntable, and set the long-play tone arm on the record. Play the record for a few minutes and listen to its tone, then place the tone arm in the finish groove of the record, and observe the shut-off action. The turntable should stop within three revolutions after the tone arm has entered the finish groove.

Remove the record from the turntable, place the tone arm over the base plate, and observe the clearance between the needle point and the base plate; the clearance should be not less than $\frac{1}{16}$″. Now raise the tone arm over the rest post; it should clear the post by a maximum of $\frac{1}{32}$″.

TURNTABLE AND MOTOR TEST

Place a stroboscope disc, such as the Philco Part No. 45-1614, on the turntable, and illuminate the disc with a lamp operating on 60-cycle a.c. Set the OFF-MAN-AUT-REJ control to MAN, and the play control to LONG PLAY, and observe the dots in the row calibrated for 33⅓ r.p.m. on the stroboscope disc. The dots should appear to remain stationary, or have very little drift, either to the right or to the left.

Remove the stroboscope disc from the turntable, place a stack of ten 12″ records onto the turntable, and place the stroboscope disc on the top record. Set the play control to ST'D PLAY, set the OFF-MAN-AUT-REJ control to MAN, and illuminate the stroboscope with a lamp operating on 60-cycle a.c. Observe the dots in the row calibrated for 78 r.p.m.; they, too, should appear to remain stationary, or have very little drift to the right or left.

CLEANING AND LUBRICATION

When the record changer is brought in for service, it should be well cleaned, by using carbon tetrachloride. Remove all dirt and all grease and oil. When applying new grease and oil, use it sparingly. All lubrication points are shown in figures 4 and 5. It may be necessary to remove some parts and assemblies in order to lubricate them properly. For example, the cam gear and actuator levers should be removed to lubricate the cam-gear spindle and the actuator stud.

PARTS NOT TO BE LUBRICATED

The following parts should not be lubricated at any time:

Both trip receivers and trip fingers.
Ratchet screw on trip plate.
Selector assembly.
All parts of long-play tone arm and its subassemblies
All parts of trip-switch assembly.

PARTS TO BE GREASED

Record-Shelf Assembly

Each of four dimples, and both sides of slide plate (point B of figure 4).

Bridge Assembly

Three dimples (points C of figure 5).

Cam Gear

Cam-gear teeth and all outer surfaces of gear (points D of figure 5).

Main Assembly

Cam-gear spindle.
Actuator stud.
Turntable-shaft upper bearing (point C of figure 4).
Changer tone-arm-shaft base (fill dimple with grease).
All assemblies that have ears, and dimples that slide on the main base plate.

PARTS TO BE OILED

Use S.A.E. 20 oil on the following parts:

Trip-Plate Bushing

Apply one or two drops to inside of bushing.

Spindle

Apply one or two drops to base of spindle where it slides vertically in the bridge plate (point E of figure 5).

SERVICING THE RECORD CHANGER

Some of the record-changer troubles that may be encountered, also the methods of servicing, are given below. The serviceman should become thoroughly familiar with the operation of all parts in the mechanisms before attempting to service the record changer. Some troubles may be caused by a lack of lubrication or an accumulation of dirt. Before making the final tests and adjustments, make sure that the changer is well cleaned and lubricated.

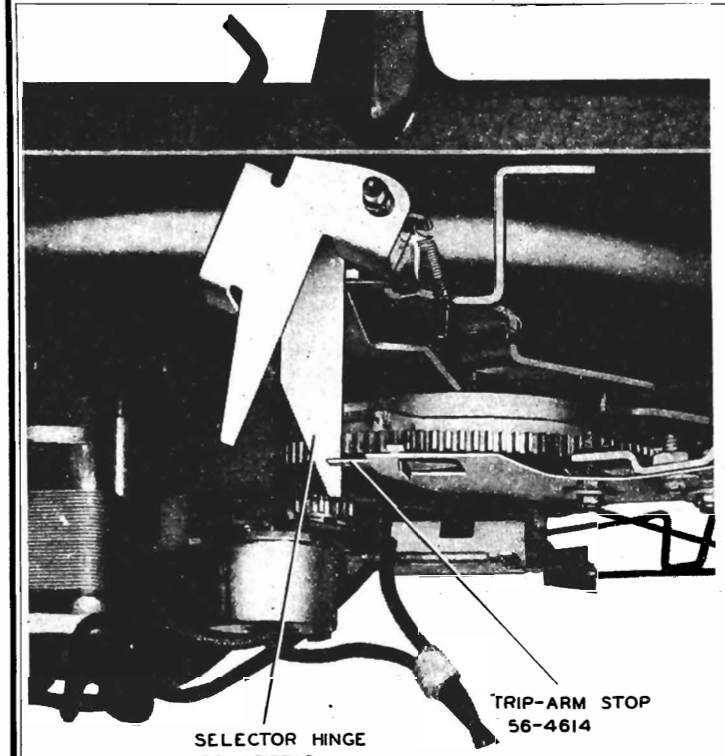

FIGURE (6) 10" INDEX SET-DOWN ADJUSTMENT

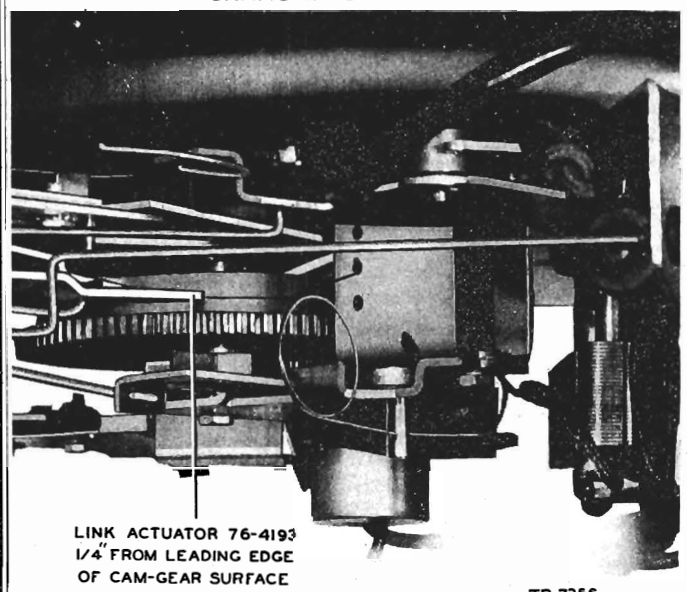
FIGURE (10) VERTICAL TIMING ADJUSTMENT—
CHANGER TONE ARM



TP 7356

FIGURE (11) HORIZONTAL TIMING ADJUSTMENT—
CHANGER TONE ARM

CORRECTION OF TROUBLES

1. **Changer tone arm fails to rise off the rest post when the OFF-MAN-AUT-REJ control is set to REJ.**
   Changer tone arm does not clear the top record when a full stack of records (ten 12", or twelve 10") is on the turntable.
   Check the tone-arm height and lift adjustments, as directed on page 15, and the tone-arm vertical and horizontal timing adjustments, as directed

2. **Changer tone-arm needle does not set down on the record properly. Changer tone arm sets on the record, then falls off.**
   Check the 10" and 12" index and set-down adjustments.

   Check to determine whether the changer is level.

3. **Sound is distorted, weak, or intermittent, on the changer tone arm.**
   Replace the needle Make sure that the knurled thumb nut on the chuck is tightened securely.
   Replace the crystal
   Check for bad wiring connections.
   Check the tone arm for binding. Absence of vertical end play in the tone-arm shaft will cause excessive horizontal drag, resulting in distortion or groove jumping.
   Check for uneven turntable speed

4. **Changer fails to cycle at the end of a record.**
   Check the trip-finger adjustment Observe whether the records being used contain an eccentric finish groove in the center.

5. **Changer fails to drop the record automatically. Record holes becoming enlarged.**
   Check the record-shelf and push-off adjustments.

6. **Long-play tone arm does not raise and lower on the rest post when the changer is put into cycle, or does not clear the rest post when lifted off the record.**
   Check the tone-arm height clearance and the raise adjustment.

7. **Sound is distorted, weak, or intermittent, on the long-play tone arm.**
   Try a new needle and cartridge
   Check all wiring.
   Make sure that only long-playing records are being used at the slow speed.
   Check the speed with a stroboscope disc, as directed
   Check the selector-lever throw adjustment.
   Check the pulley belt on the motor, as direct
   Check the needle pressure, the horizontal friction, and the pickup holder adjustments

CORRECTION OF TROUBLES (Continued)

8. **Record changer fails to shut off when the long-play tone arm rides the eccentric finish groove of a long-play record.**

Check the trip-finger and the trip-switch adjustments (page 21).

Check the mercury switch; when it is properly set in the clip assembly, the red dot on the switch should be on top.

ADJUSTMENTS FOR THE RECORD CHANGER

10″ Index or Set Down

Set a 10″ record on the turntable, push the OFF-MAN-AUT-REJ control to REJ, and rotate the turntable by hand approximately 4½ turns. The tone-arm needle should be ½″ above the record at this point. Loosen the clamp screw on the trip arm slightly (figure 12); then hold the tone arm steady, ⅛″ in from the edge of the record, and set the trip arm so that the trip-arm stop, 56-4614, is in contact with the inside selector hinge, 56-4617FA3, as shown in figure 6.

Tighten the clamp screw, leaving 1/32″ vertical play, or clearance, between the trip arm and the base plate.

12″ Index or Set Down

Make the 10″ index adjustment first, then remove the 10″ record from the turntable and place a 12″ record in its place. Reject the changer, and rotate the turntable until the needle point is ½″ above the record. The trip-arm stop should be against the outside selector, 56-4618FE15, as shown in figure 7.

Ordinarily, the 12″ index is satisfactory after the 10″ index adjustment is made; if not, bend the selector slightly to the right or left, as required, for the proper set-down of the needle on the record (⅛″ in from the edge of the record).

Trip Finger

With a record on the turntable, place the tone arm in the finish groove of the record. The trip finger, 54-7613, is now riding over the ratchet screw of the trip plate, 76-2990, as shown in figure 8. The trip finger should assume an angle of 25° to 30° with respect to the ratchet screw. To obtain the correct angle, adjust the screw on the trip receiver, 56-5981, as indicated in figure 8. Make certain that the vertical center line of the trip finger coincides with the center line of the ratchet screw. To obtain this alignment, loosen screw "A" slightly, and screw "B" completely, on the trip receiver, 56-5981, and swing the trip receiver to the right or left until the trip finger is centered over the ratchet screw; then tighten the screws

When this adjustment is made, care should be taken to prevent the trip receiver from being pulled in toward the trip arm too far, as this will prevent the trip-arm stop, 56-4614, from engaging the selector hinge by a minimum of ⅛″, as shown in figure 7. A happy medium between the above adjustments should be reached.

Also, the index, or set-down, adjustment may be slightly affected when making the above adjustments, so it is well to remember that these three adjustments are interrelated, and that, when any one of them is made, the other two should be rechecked.

Tone-Arm Height and Lift

With the changer out of cycle, and the tone arm free, set the arm over the base plate. The needle point should be approximately 1/16″ above the base plate. To adjust, bend the protruding ear of the swivel post (bending the ear upward increases the clearance), shown in figure 9. Now raise the tone arm to its maximum height, and place it against the rest post. There should be a minimum of ⅛″ clearance between the lower edge of the tone arm and the top of the rest-post hook. Adjust the ear on the swivel post until a compromise is reached between the correct rest-post clearance and base-plate clearance.

Tone-Arm Vertical and Horizontal Timing

Before making these adjustments, make the tone-arm height and lift adjustments described above.

For the vertical adjustment, start with the changer out of cycle, push the OFF-MAN-AUT-REJ control to REJ, and rotate the turntable ¾ of a revolution by hand. At this point, the leading edge of the cam is approximately ¼″ from the end of the link actuator, 76-4193 (this is the lower actuator lever shown in figure 10). Adjust the wire loop of the *short* link (56-4607FA3 in figure 12) until the ear of the tone-arm swivel post makes contact with the lower end of the cutout on the tone-arm pivot assembly.

For the horizontal adjustment, start with the changer out of cycle, and rotate the turntable 1½ revolutions by hand. At this point, the upper leading edge of the cam gear is approximately ¼″ from the upper actuator lever, 76-2987 (shown in figure 11). Adjust the wire loop of the *long* link (56-4606FA3 in figure 12) by squeezing or spreading it until the tone arm is up against the rubber bumper on the rest post.

Record Shelf

Set the record shelf to the 10″ position, with the changer out of cycle. Place the Philco record-shelf gauge, 45-1470, over the spindle and onto the record shelf, as shown in figure 13. Loosen the two hex-head screws that hold the record-shelf assembly to the changer base plate. Move the record-

FIGURE (23) LONG-PLAY TONE-ARM ASSEMBLY (35-2686)

ADJUSTMENTS FOR THE RECORD CHANGER (Continued)

shelf assembly away from the spindle until the large curved part of the gauge drops even with the record-shelf lips. Now push the record shelf and gauge lightly against the spindle, taking out all play toward the spindle; keep the lips of the record shelf in even contact with the edge of the gauge. Tighten the two hex-head screws.

Push-Off

With the changer out of cycle, push the OFF-MAN-AUT-REJ control to REJ, and rotate the turntable 2½ revolutions by hand; at this point, the push-off actuator, 56-4588FA3, is in its most forward position, in contact with the roller on the cam gear, as shown in figure 14. Loosen the push-off-bar locking screw and squeeze the push-off ears toward each other until the slide plate on the record shelf extends 1/32" beyond the lips of the shelf. Tighten the hex-head push-off-bar screw.

LONG-PLAY TONE ARM ADJUSTMENTS

Vertical Friction

Use the Philco gram scale, 45-9531. Calibrate the scale to zero by holding it on its side and setting the pointer to the center line of the scale. The center is the "0" point, and each small division on either side of "0" is equal to one gram.

After the scale has been calibrated to zero, place the scale on the changer base, with the guard on the scale in an open position, at right angles to the scale, as shown in figure 15. Set the needle of the long-play tone arm into the hole at the end of the pointer. Press down on the head of the pickup, and let it spring back; then note the reading on the scale. Raise the pickup, let it return slowly, and note the reading on the scale. The average of the two readings taken is the needle pressure; the difference between the two readings is the vertical friction. The correct needle pressure is between 6 and 7½ grams. The vertical friction should not exceed 2 grams.

Needle Pressure

To adjust the needle pressure, move the tone arm toward the center of the turntable; unhook the spring from the notch on the pivot assembly (below the rear end of the tone arm), and place the spring into a different notch. Each notch represents a change of one gram in needle pressure. After changing the spring into a different notch, measure the needle pressure again with the gram scale. Figure 16 shows the notches on the pivot assembly.

Horizontal Friction

Calibrate the gram scale by laying it flat, face-up. Set the pointer to zero with the scale in this position.

Place a counterweight on top of the rear end of the tone arm; move the counterweight until the tone arm is balanced horizontally, and the needle point clears the turntable. Hold the gram scale face-up, place its pointer against the side of the pick-up, and push the tone arm horizontally, as shown in figure 17. Note the reading on the gram scale while moving the tone arm throughout its entire travel (outside of the trip range). At no time should it require more than 2 grams of pressure to move the tone arm.

Pickup Holder

The pickup cartridge holder should be centrally spaced between the walls of the tone arm, so that there is no binding or rubbing against the inside of the tone arm when the cartridge is moved vertically.

To obtain the proper spacing, first remove the tone arm, as directed on page 24; loosen the screw which holds the pickup-bracket mounting. Move the mounting until it is centrally spaced between the walls of the tone arm; maintain a 1/32" clearance between the tip of the ears on the holder and the inside surface at the front end of the tone arm, as shown in figure 18.

Tone-Arm Base-Plate Clearance

With the tone arm off the rest post and over the base plate, the needle should be at least 1/16", and not more than 3/16", above the base plate. To adjust, grasp the tone arm and raise or lower it (whichever is required) with a little pressure, to obtain the correct clearance. To lower the tone arm, it may be necessary to remove the turntable and bring the pickup toward the center; this position affords sufficient leverage to permit bending the tone arm downward. (See page 23 for removal of the spindle; remove the turntable by pulling it straight up.)

Tone-Arm Height Clearance

The tone arm should clear the rest-post hook at its highest point by a maximum of 1/32". This clearance can be obtained by adjusting the hex-head screw on the pivot assembly, shown in figure 19.

Tone-Arm Raise

Should the record changer be put through a change cycle with the long-play tone arm set on a record, the tone arm should lift from the record automatically, and set down on the rest post; during any further changer cycling, this tone arm should merely raise and lower on its rest post. To obtain the correct action, adjust the square loop of the lifter link, 56-5990, shown in figure 14, so that the tone arm is lifted firmly against the height-adjustment screw when the pickup is at its maximum height over the rest post.

When the changer is out of cycle, the pull-cord assembly, 76-2982-1 (figure 20), should be slack, allowing the tone arm to be freely-moved, manually, anywhere on the record.

MODEL M-12C PHILCO CORP.

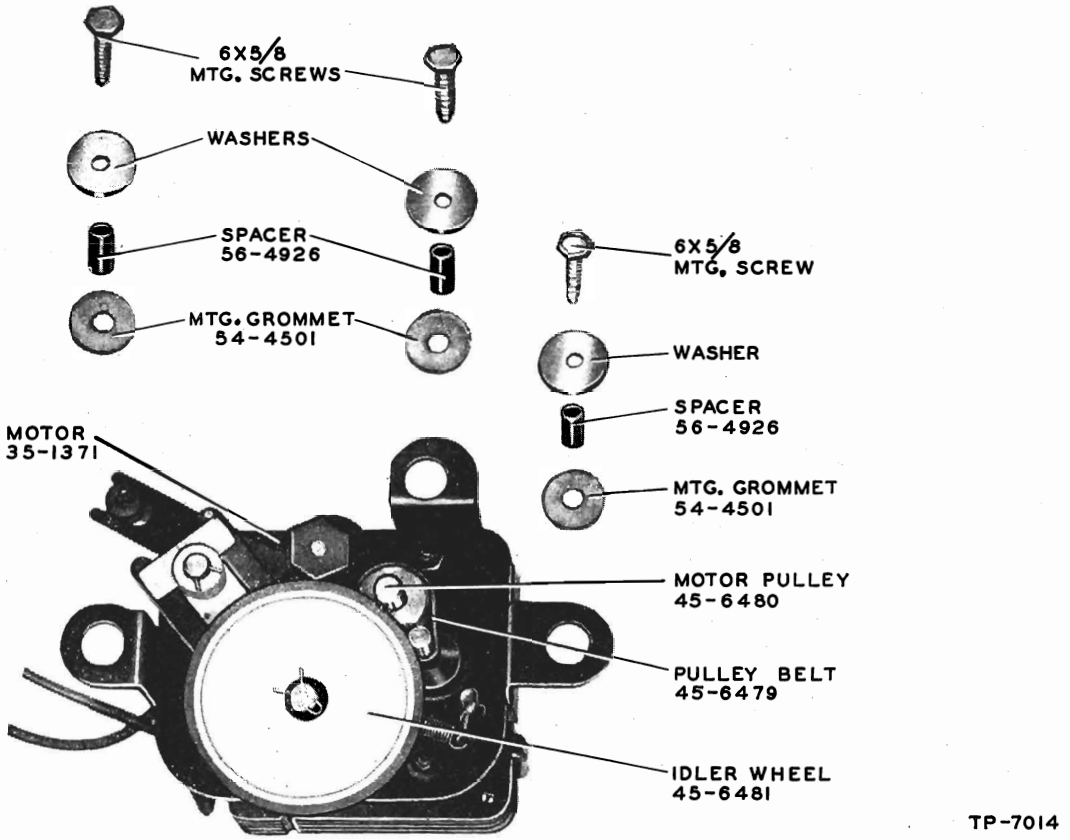

FIGURE (24) MOTOR ASSEMBLY (35-1371)

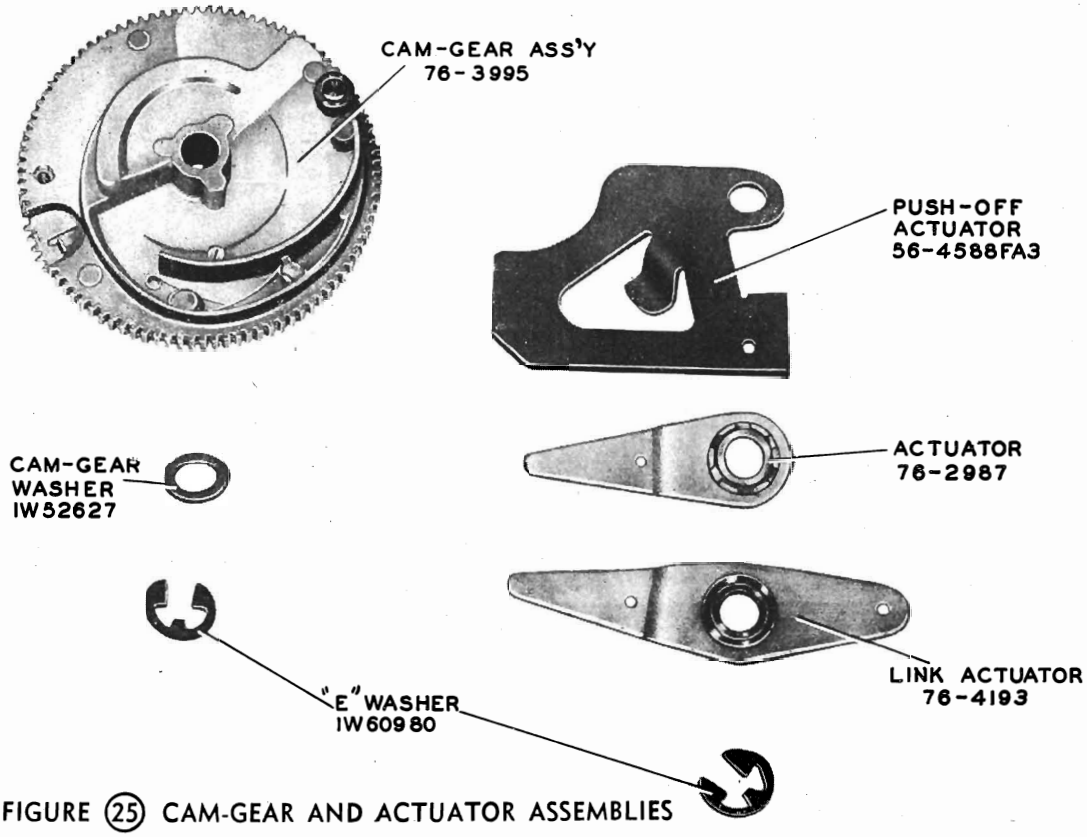

FIGURE (25) CAM-GEAR AND ACTUATOR ASSEMBLIES

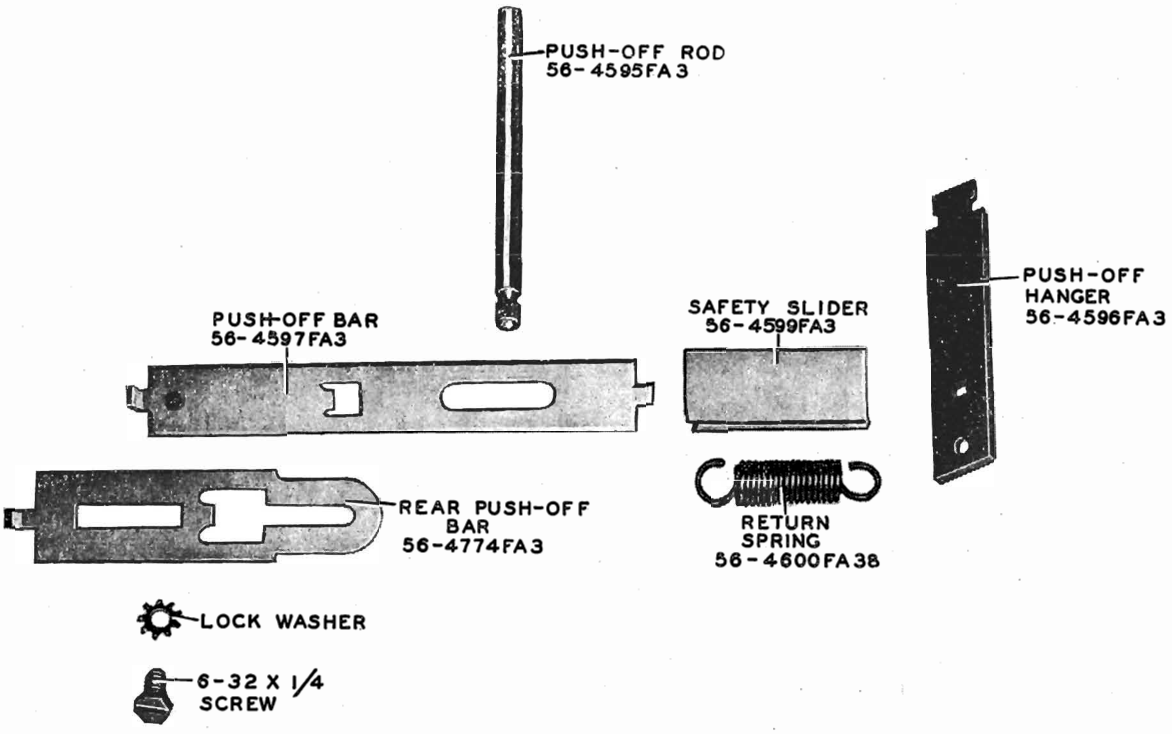

FIGURE (26) PUSH-OFF ASSEMBLY

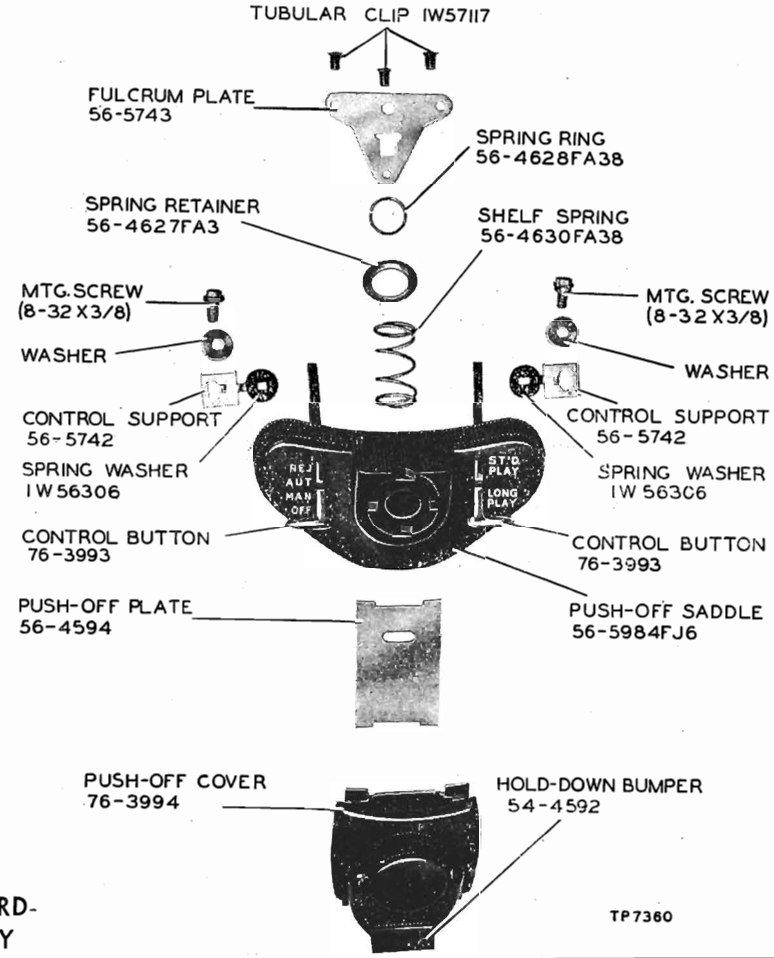

FIGURE (27) RECORD-SHELF ASSEMBLY

TRIP ADJUSTMENTS

Trip Finger

When the pickup needle is in the eccentric groove of a long-playing record, the trip finger should be riding over the ratchet latch, 76-4197, at an angle of 25° to 30°. To obtain the correct angle, adjust the screw shown in figure 20.

Trip Switch

When the pickup is set on the rest post, the mercury switch should be latched in the "on" position. To adjust the switch, loosen the clamp screw on the reset trip arm, 76-4198, hold the pickup on the rest post, and move the reset trip arm outward until its protruding leg contacts the short ear on the bracket-and-clip assembly, 76-4195; there should be a maximum of 1/32" clearance between the long ear on the bracket-and-clip assembly and the cutout shelf on the ratchet latch, 76-4197. See figure 21.

When tightening the clamp screw, maintain 1/32" vertical end play in the tone-arm shaft.

Selector-Lever Throw

The lock plate, 56-5986 (figure 3), is adjusted by loosening the hex-head screw under the base plate and moving the lock plate so that, when the play control is set to either position, the selector-lever throw does not cause the shift-speed lever on the motor to bind against the mechanical stop on the motor.

UNEVEN TURNTABLE SPEED (WOWS)

Uneven turntable speed can be caused by the following conditions:

a. Dirt under and around the idler-wheel assembly.

b. Idler-wheel spring loose or missing.

c. Flat spot on idler-wheel tire.

(For the 33⅓ r.p.m. speed, a loose or worn pulley belt can result in a slow speed. To replace the pulley belt, push the idler-wheel assembly aside.)

REPLACEMENT OF PARTS AND ASSEMBLIES

The following procedures are recommended for the correct removal of parts and assemblies. The parts should be replaced by reversing the order of removal. Adjustments should be made according to the directions given in the Adjustment section of the manual.

1. Needles

To remove the needle from the standard crystal on the changer tone arm, loosen the knurled nut under the crystal and pull the needle out.

To remove the needle from the special cartridge of the long-play tone arm, grasp the sides of the cartridge with the fingernails and pull it out; then pry out the needle with the fingernail or knife point. When replacing this needle, align the keyway on the needle shaft with the slot in the chuck on the cartridge, then push the needle into the cartridge. Replace the cartridge by pushing it until it is firmly seated.

2. Crystal Cartridge, 35-2671-1

a. Bring changer tone arm toward center of turntable

b. Remove the two screws and lock washers that hold cartridge to tone arm.

c. Drop cartridge below tone arm sufficiently to allow the removal of the two clips from cartridge. Figure 22 shows the cartridge assembly.

3. Spindle, 76-3926

a. Unhook both ends of spindle spring, 56-5644, from the "U"-shaped bracket mounted under changer base. See figure 11.

b. Uncoil spring through spindle and remove spring.

c. Pull out spindle.

4. Changer-Tone-Arm Assembly, 35-2675

a. Unsolder tone-arm wires from terminal panel on under side of changer base plate.

b. Remove pull cord from link spring.

c. Loosen clamp screw that holds trip arm to tone-arm shaft (figure 12).

d. Lift out tone arm. Figure 22 shows the tone-arm assembly.

Note: When the tone arm is replaced on the changer, be sure to maintain 1/32" vertical end play between the trip arm and the changer base plate.

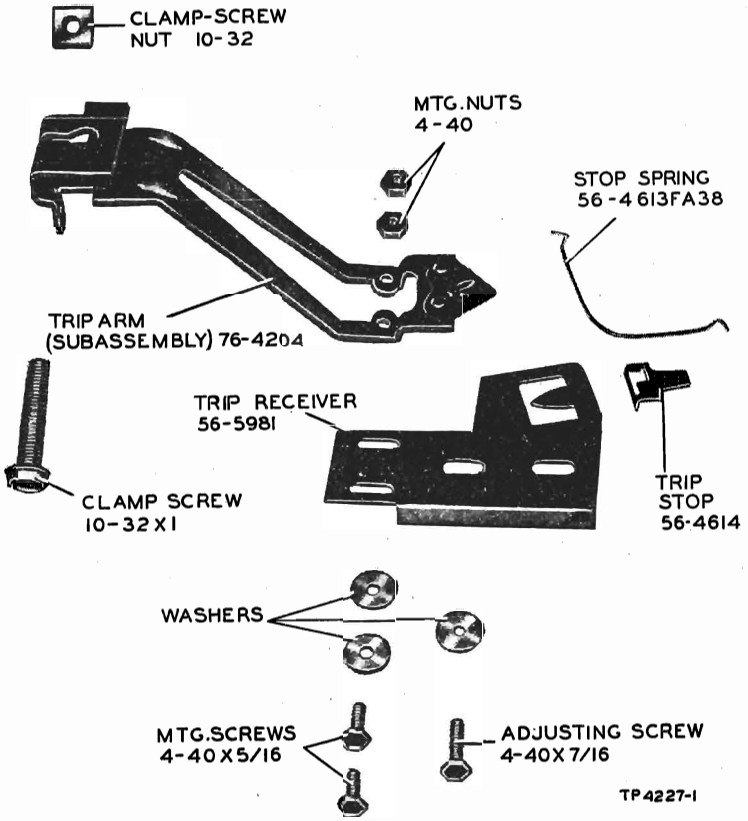

FIGURE (28) TRIP-ARM AND TRIP-RECEIVER ASSEMBLIES

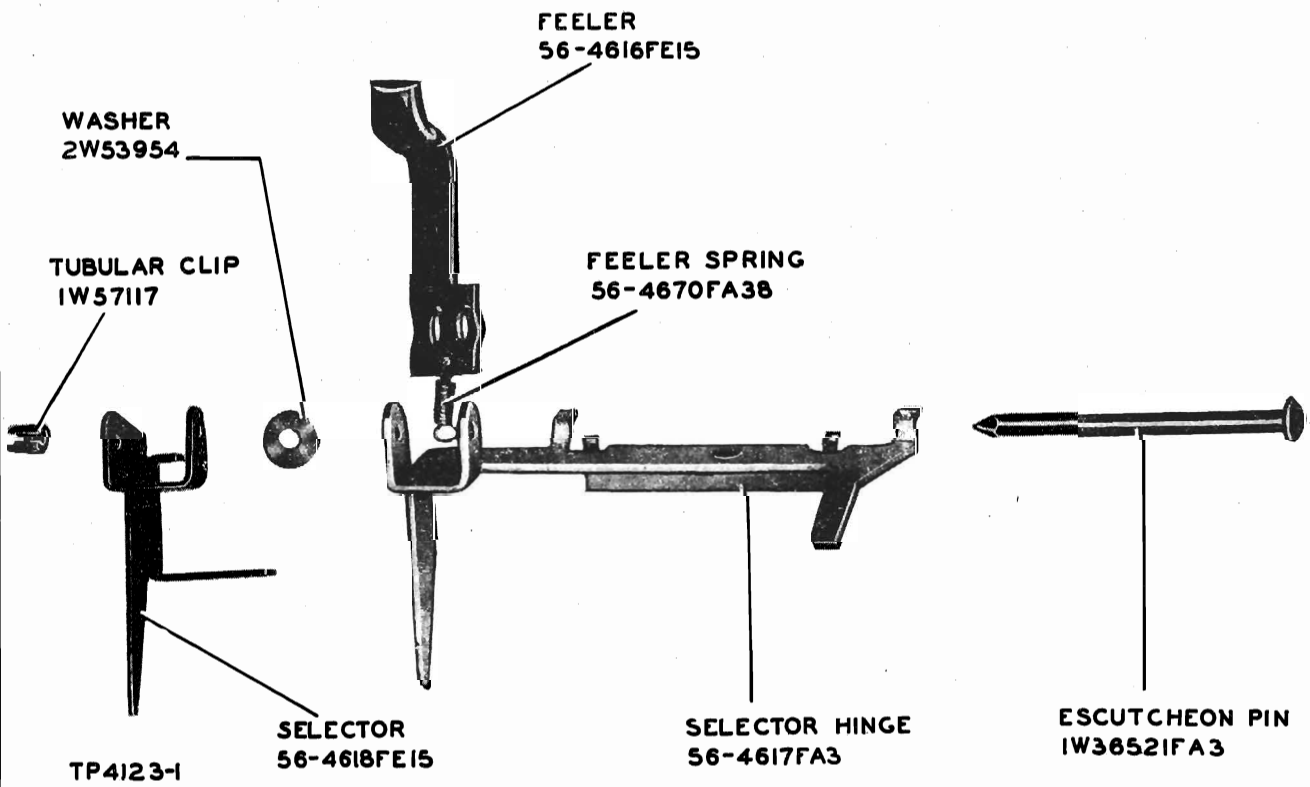

FIGURE (29) SELECTOR ASSEMBLY

REPLACEMENT OF PARTS AND ASSEMBLIES (Continued)

5. Long-Play-Tone-Arm Assembly, 35-2686

a. Unsolder tone-arm leads from terminal panel on underside of changer base plate.
b. Remove pull cord from lifter-link spring.
c. Loosen the clamp screw that holds the reset trip arm to the tone-arm pivot shaft.
d. Lift out tone arm. Figure 23 shows the tone-arm assembly.

6. Motor Assembly, 35-1371

a. Remove spindle as directed in paragraph 3
b. Unsolder motor lead from mercury switch.
c. Unsolder motor lead from switch mounted on bridge assembly.
d. Remove ground lead from one side of bridge assembly.
e. Remove the three screws, washers, and spacers from motor frame. Figure 24 shows the correct assembly.
f. Lift motor out.

7. Bridge Asembly, 76-3998

a. Remove the two hex-head screws from bridge plate.
b. Disengage the link control rod, 56-4589FA3, from the slider control bar.

8. Cam-Gear Assembly, 76-3995

a. Remove bridge assembly as directed in paragraph 7.
b. Slide trip plate off cam-gear spindle.
c. Remove turntable lower bearing, 76-2991, from "U"-shaped mounting bracket by pulling it off.
d. Remove large "E" washer, 1W60980, from cam-gear spindle.
e. Slide cam washer, 1W52627, off cam spindle.
f. Slide cam gear off spindle.

9. Tone-Arm Actuator Levers

a. Remove short link, 56-4607FA3, from link spring.
b. Remove "E" washer, 1W60980, from actuator stud.
c. Slide link actuator, 76-4193, from stud.
d. Disengage lifter link, 56-5990, from link actuator.
e. Remove long link, 56-4606FA3, from link spring.
f. Slide actuator lever, 76-2987, from stud. Figure 25 shows the actuator levers.

10. Push-Off Actuator, 56-4588FA3

a. Remove actuator levers as directed in paragraph 9.
b. Remove selector lever, 56-5985, as directed in paragraph 19.
c. Press push-off rod, 56-4595FA3, and push-off hanger bar, 56-4596FA3, together and pull downward to release the entire assembly.
d. Slide push-off actuator over to align upturned ears with cutout in base plate.
e. Slide actuator off stud.

Note: When removing the push-off assembly, the slide plate, 56-4594, on the record shelf may slide out of the assembly. When reassembling, this blade should be inserted in the record-shelf assembly with the elongated hole toward the 12-inch position of the record shelf. The push-off assembly is shown in figure 26.

11. Control Button (OFF-MAN-AUT-REJ), 76-3993

a. Remove bridge assembly, 76-3998, as directed in paragraph 7.
b. Disengage control link rod, 56-4589FA3, from control button.
c. Remove hex-head screw that holds record shelf to changer base plate.
d. Remove control-button support, 56-5742, from control button.
e. Lift control button out through record-shelf saddle.

12. Control Button (Play), 76-3993

a. Remove selector lever, 56-5985, as directed in paragraph 19.
b. Disengage selector link, 56-5991, from control button.
c. Remove the hex-head screw that holds the record-shelf assembly to the changer base plate.
d. Remove control-button support, 56-5742, from control button.
e. Lift control button out through record-shelf saddle.

13. Record-Shelf Assembly

a. Remove both control buttons as directed in paragraphs 11 and 12.
b. Lift out entire record-shelf assembly through top of changer base plate. Figure 27 shows the assembly of the record shelf

14. Trip-Arm Assembly, 76-4204

a. Loosen clamp screw on trip arm, 76,4204. See figure 12.
b. Raise tone arm and shaft sufficiently to clear trip arm.
c. Remove trip arm and disengage link spring. Figure 28 shows the trip-arm and trip-receiver assembly.

Note: When assembling the trip-arm assembly, maintain $\frac{1}{32}$" vertical end play between the trip arm and the changer base plate.

15. Selector Assembly

a. Remove cam gear as directed in paragraph 8.
b. Remove feeler spring, 56-4670FA38, from bracket on changer base plate.
c. Tilt selector assembly and remove it from changer base plate. Figure 29 shows the assembly.

16. Long-Play-Tone-Arm Thrust Bearing, 56-5916

a. Remove long-play-tone-arm assembly, 35-2686, as directed in paragraph 5.
b. Remove "E" washer, 1W60977, from thrust-bearing shaft.
c. Lift thrust bearing out of the rubber grommet mounted on the long-play-tone-arm-shaft-support bracket. See figure 21.

17. Long-Play-Tone-Arm Stanchion, 56-5987

a. Remove long-play-tone-arm assembly, 35-2686, as directed in paragraph 5.
b. Remove the hex-head screws that hold stanchion to changer base plate.
c. Lift stanchion off base plate. See figure 19.

REPLACEMENT OF PARTS AND ASSEMBLIES (Concluded)

18. Long-Play-Tone-Arm Upper Bearing, 56-5903

a. Remove long-play-tone-arm stanchion, 56-5987, as directed in paragraph 17.
b. Remove "E" washer, 1W60981, from upper-bearing shaft mounted on long-play-tone-arm stanchion (figure 19).
c. Remove upper bearing from rubber grommet mounted on long-play-tone-arm stanchion.

19. Selector Lever, 56-5985

a. Remove "E" washer, 1W60977, from stud which mounts selector lever on changer base plate. See figure 14.
b. Remove spring washer, 1W56306, from stud.
c. Remove "U"-shaped detent spring, 56-5995, between selector lever and changer base plate.
d. Loosen lock-plate screw.
e. Align ears of selector lever with cutout slots on changer base plate.
f. Remove selector lever from stud.
g. Disengage selector link, 56-5991, from selector lever

76-4086	Bracket (pickup and hinge)
76-4193	Link, actuator
76-4194	Trip switch
76-4195	Bracket-and-clip assembly
76-4196	Switch bracket
76-4197	Latch assembly
76-4198	Reset and trip
76-4201	Base-plate assembly
76-4204	Trip arm (subassembly)
76-4335	Pivot assembly
1W14460	Screw, 4-40 x ¼, crystal mtg.
1W36521FA3	Pin (escutcheon)
1W52627	Cam-gear washer
1W56306	Spring washer
1W57117	Tubular clip
1W60977	"E" washer, small
1W60980	"E" washer, medium
1W60981	"E" washer, large
2W53954	Washer, selector assembly

DESCRIPTION OF OPERATION

Power for the motor circuit is controlled by two mercury switches. These switches are inserted into clips; one of these clips is a part of a latch-plate-and-clip assembly, Part No. 76-4237, and the other is a part of a reset-plate-and-clip assembly, Part No. 76-4238. These two plate-and-clip assemblies are mounted on a switch-bracket assembly, Part No. 76-4235, which is located underneath the base plate, as shown in figure 1.

The tipping of the mercury switches to the OFF and ON position is accomplished by the trip arm, which is attached to the tone-arm shaft, and therefore is controlled by the tone arm.

When the tone arm is pulled back and set on its rest post, a protruding leg on the trip arm contacts the reset-plate-and-clip assembly, Part No. 76-4238, and raises it upward and tips the mercury switch mounted on it to the OFF position, as shown in figure 1. By the same action, the reset plate contacts an ear on the latch-plate-and-clip assembly, Part No. 76-4237, and holds it in an up, or horizontal, position. This tips the mercury switch mounted on it to the ON position, as shown in figure 1.

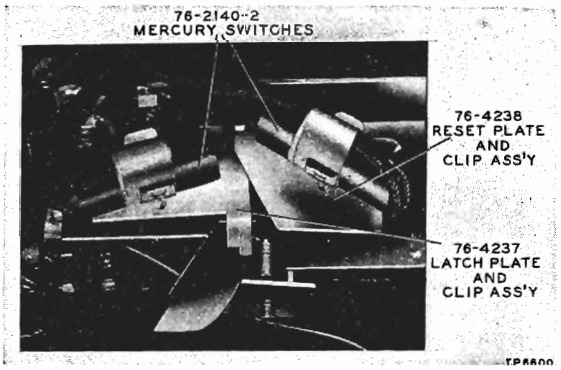

Figure 1

The two mercury switches are electrically connected in series. Since one of them is in the OFF position when the tone arm is on the rest post, the motor circuit is open and no power is supplied to the motor. When the tone arm is taken off the rest post and placed on a record, the reset-plate-and-clip assembly is permitted to drop down, tipping its mercury switch to the ON position. See figure 2. The motor circuit is now closed, and the record player is turned on.

During the playing of a record, a trip finger mounted on the trip arm rides over a ratchet on the latch-and-bushing assembly, Part No. 76-4197; see figure 3. When the pick-up needle enters the eccentric finish groove at the end of the record, the trip arm, which is connected to the tone arm through the tone-arm shaft, will oscillate in a forward and backward motion, causing the trip finger to trip the latch-and-bushing assembly, Part. No. 76-4197. This permits the latch-plate-and-clip assembly to drop down, and tip its mercury switch to the OFF position. The motor circuit is now open, and the record player is turned off.

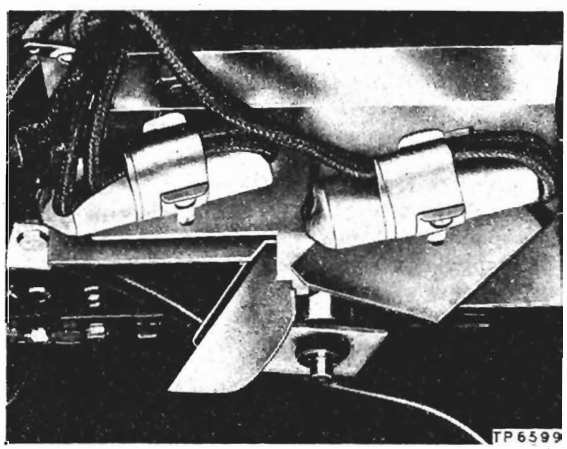

Figure 2

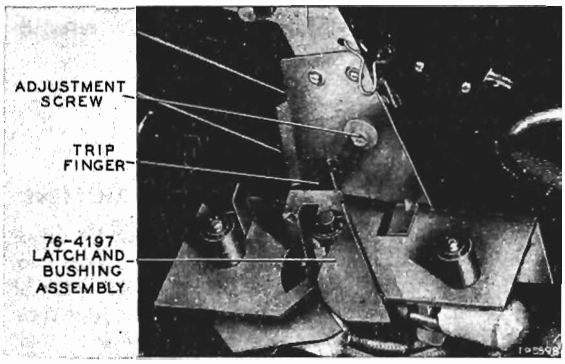

Figure 3

TESTS

STARTING

With the tone arm on the rest post, place a 12-inch Columbia Long Playing Record on the turntable, lift the tone arm from the rest post, and place it on the starting groove of the record. The turntable should start immediately after the tone arm is off the rest post. If not, refer to page for the adjustment of the switches.

PICKUP AND NEEDLE

After the tone arm has been placed on the record, listen to its tone. If distortion is noted, replace the crystal cartridge as directed on page . If the trouble continues, check for loose wiring leads, bad contacts, etc.

SHUTOFF

Place the tone arm in the finish groove of the record, and observe the shutoff action. The record player should shut off within three revolutions of the turntable, after the pickup needle has entered the finish groove of the record. Refer to page for trip-finger adjustments.

BASE-PLATE CLEARANCE

Remove the record from the turntable, and place the tone arm over the base plate. Note whether there is a minimum of ⅛-inch clearance between the needle point and the base plate. Refer to page for the base-plate-clearance adjustment.

TURNTABLE AND MOTOR

Allow the motor to run for at least 10 minutes, then place a stroboscope disc such as Philco Part No. 45-9531 on the turntable, and illuminate the disc with a lamp operating on 60-cycle a.c. The dots in the row calibrated for 33⅓ r.p.m. should appear to remain stationary or drift very slowly, but smoothly, forward or backward. If the dots are moving in either direction very fast or in a jerky motion, refer to "Uneven Turntable Speed and Rumble."

ADJUSTMENTS

NEEDLE PRESSURE AND VERTICAL FRICTION

Needle pressure and vertical friction can be measured by means of the Philco Gram Scale, Part No. 45-9532. The scale consists of a long, flat pointer spring set in a movable pivot. The end of the scale has a number of divisions, with each division equal to one gram. The center line is zero.

Hold the scale on its edge, with the setscrew up, and set the pointer spring to the midpoint, or zero, position. Lift the tone arm slightly off the rest post and place the needle point in the dimple in the pointer spring. Lift the tone arm approximately ½ inch with the scale, as shown in figure 4, and note the reading. Then lower the scale ½ inch again and note the reading; see figure 4A. The midpoint between the two readings is the needle pressure, and the difference between the two readings is the vertical friction. The needle pressure should be not less than 5 grams and not more than 7 grams, and the vertical friction should be not more than 2 grams.

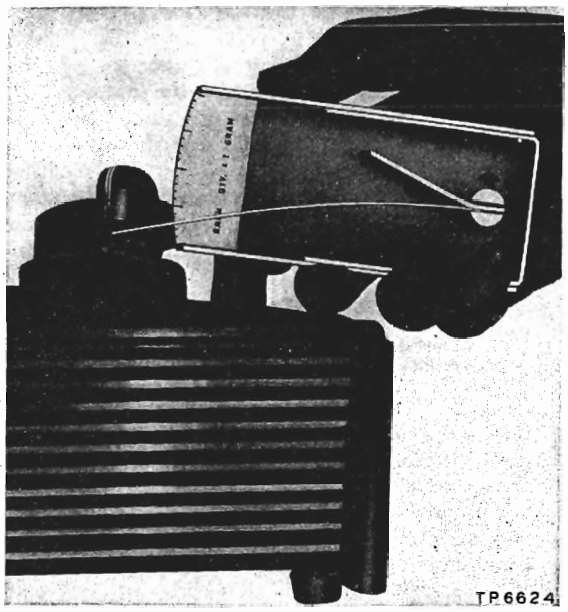

Figure 4

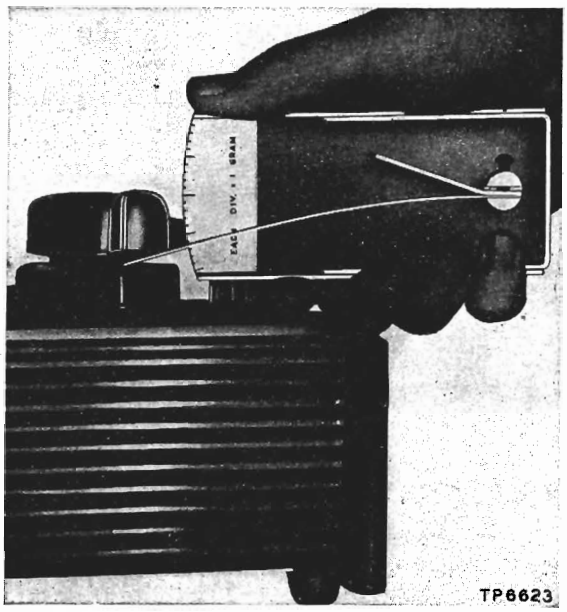

Figure 4A

Example:

With the scale attached and the tone arm raised ½ inch, the reading is 7 grams. With the tone arm lowered, the reading is 6¼ grams. The midpoint between the two readings, or the needle pressure, is approximately 6⅝ grams. The differ-

ence between the two readings, or the vertical friction, is ¾ gram.

To obtain the correct needle pressure, bring the tone arm to the center of the turntable and unhook the spring, shown in figure 6, from the notch of the pivot-and-shaft assembly, Part No. 76-4092. Place the spring in different notches until the correct needle pressure is obtained.

HORIZONTAL FRICTION

Lay the Philco Gram Scale, Part No. 45-9532, flat with the scale divisions up, and set the pointer spring to the midpoint, or zero, position.

Take the tone arm off the rest post and place a weight on top of the back section of the tone arm. Move the weight until the tone arm is balanced in a horizontal position.

Hold the scale so that the pointer spring bears against the side of the tone-arm head as shown in figure 5; move the tone arm with the spring toward the center of the turntable, and note the reading while the tone arm is being moved horizontally.

At no time should the reading be more than 3 grams.

PICKUP HOLDER

The pickup holder should be centrally spaced between the walls of the tone arm so that the pickup cartridge does not bind or rub against the inside of the tone-arm wall when the cartridge is move vertically.

To obtain the proper spacing, first remove the tone arm (see page); loosen the screw which holds the pickup-bracket mounting. Move the mounting until it is centrally spaced between the walls of the tone arm; maintain a $\frac{1}{32}$-inch clearance between the tip of the ears on the holder and the inside surface at the front end of the tone arm, as shown in figure 7.

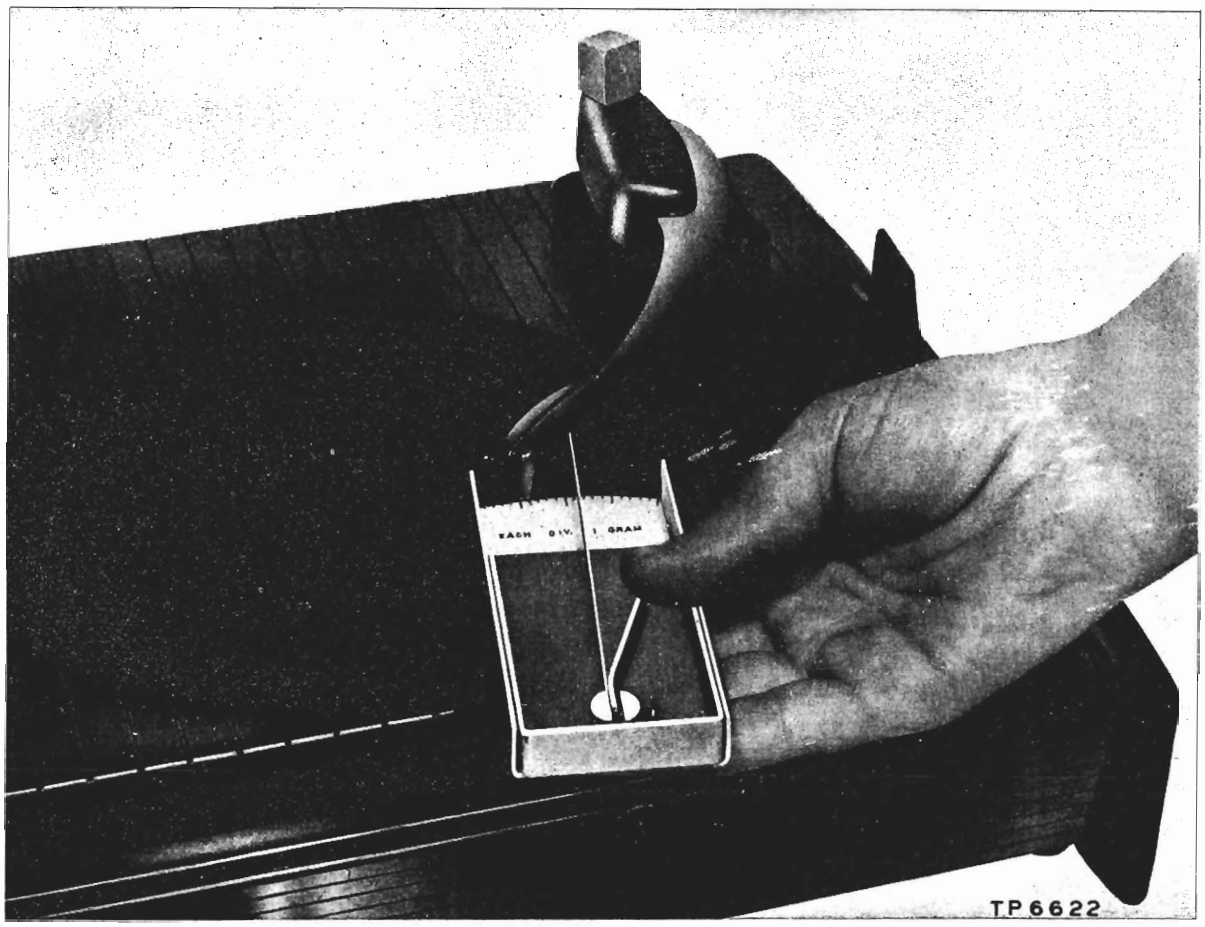

Figure 5

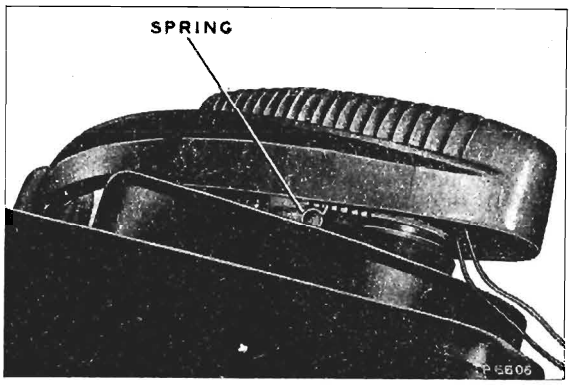

Figure 6

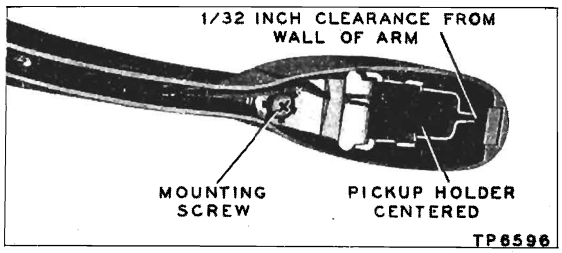

Figure 7

TONE-ARM BASE-PLATE CLEARANCE

With the tone arm off the rest post and lying over the base plate, as shown in figure 8, the needle should be at least 1/8-inch, and not more than 3/16-inch, above the base plate. If the clearance is incorrect, grasp the tone arm and raise or lower it, whichever is required) with a little pressure to obtain the correct clearance.

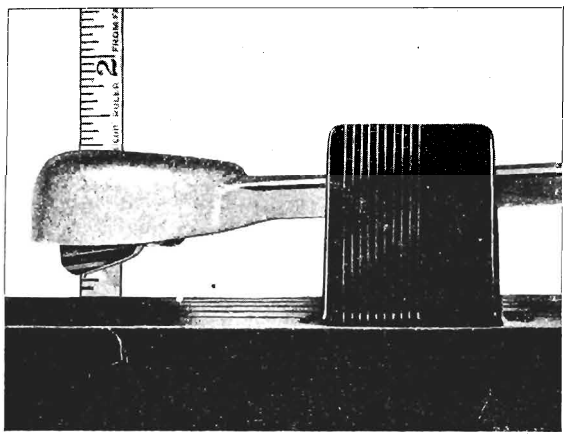

Figure 8

TRIP SWITCH

With the tone arm on the rest post, both the reset-plate switch, Part No. 76-4238, and the latch-plate switch, Part No. 76-4237, should be in a horizontal position, as shown in figure 1. To adjust, turn the record player around and, from the rear, loosen the trip-arm clamp screw. Hold the tone arm on the rest post, and move the trip arm until the trip-arm leg engages the reset-latch ear. At the same time, the latch-plate ear should be approximately 1/32 inch above the cut-out on the ratchet-plate-latch assembly, Part No. 76-4197. Refer to figure 9 for the correct position of the latch ears. After the adjustments are made, tighten the clamp screw on the trip arm.

Note: Before tightening the clamp screw, be sure to leave .010-inch vertical clearance between the spacer in the trip arm and the tone-arm-shaft support.

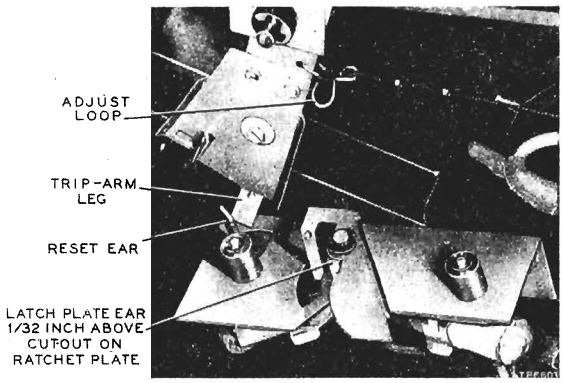

Figure 9

TRIP FINGER

Place the tone-arm needle in the finish groove of a record, and from underneath the rear of the record player observe the trip finger riding over the ratchet on the latch-bushing assembly. The trip finger should assume an angle of 25° to 30° while riding over the ratchet, as shown in figure 3. Adjust the screw on the trip arm to obtain the proper angle.

TRIP-FINGER CENTERING

The trip-finger center line should be directly over the ratchet on the latch-and-bushing assembly when the tone-arm needle is in the finish groove of the record. To adjust, remove the mercury switches from their clips by pulling them out. Loosen the two nuts which hold the switch-assembly bracket, Part No. 76-4235, to the base plate. Move the switch bracket until the trip-finger center is directly over the ratchet. Tighten the switch-bracket nuts and insert the mercury switches, in the clips, in the correct positions.

Note: Be sure that sufficient clearance between the mercury switches is maintained, or they may bind against each other when tripped.

IDLER PULL CORD

The idler wheel should be disengaged from the motor shaft when the tone arm is on the rest post. It should re-engage when the needle is approximately $\frac{1}{16}$-inch from the edge of a 12-inch record. To adjust, tighten or spread the loop of the pull cord attached to the trip arm. See figure 7.

UNEVEN TURNTABLE SPEED AND RUMBLE

Remove the turntable by removing the E washer from the spindle and pulling the turntable up. Clean all dirt from the idler-wheel assembly and the inside rim of the turntable. Examine the idler wheel and the rim of the turntable for bumps. Replace the idler wheel or turntable if any bumps are found. Some rumble can be caused by looseness of one or more of the motor mounting screws, or by hardening of the rubber grommets on the motor frame.

REPLACEMENT OF PARTS AND ASSEMBLIES

The following procedures are recommended for the correct replacement of parts and assemblies. The part should be replaced by reversing the order of removal, and should be adjusted as directed in the "Adjustments" section of this manual.

CRYSTAL-CARTRIDGE ASSEMBLY, PART No. 45-1609

To remove the crystal cartridge, grasp the crystal by its sides and pull it down and out. When replacing the cartridge, push it up into the head of the tone arm until it is completely seated.

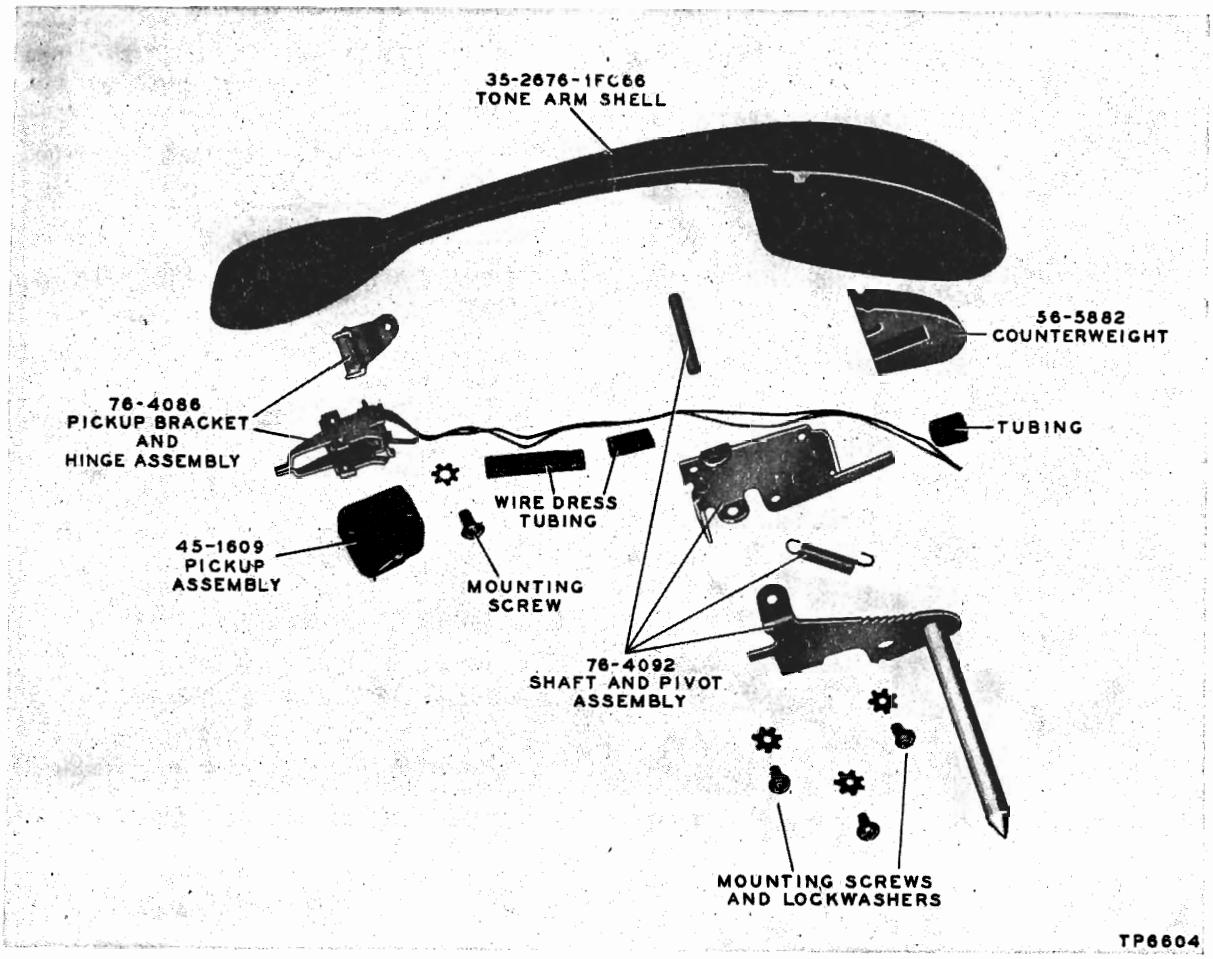

Figure 10

MOTOR, PART No. 35-1359 OR 35-1361

1. Remove E washer from spindle.
2. Lift out turntable.
3. Remove idler pull cord from idler bracket.
4. Unsolder motor leads.
5. Remove the three mounting screws.
6. Lift out motor.

TONE-ARM ASSEMBLY, PART No. 35-2681

1. Unsolder tone-arm lead wires from terminal panel on underside of record-player base plate.
2. Loosen clamp screw which holds trip arm to tone-arm shaft.
3. Lift out tone arm. Be careful not to lose fiber spacer on tone-arm shaft. Refer to figure 10 for correct assembly of tone arm.

TONE-ARM THRUST BEARING, PART No. 56-5916

1. Remove tone-arm assembly as directed under "Tone-Arm Assembly, Part No. 35-2681."
2. Remove E washer, Part No. 1W60977FE7, from bearing shaft; see figure 11.
3. Lift bearing out of grommet, Part No. 27-4099-3, mounted on tone-arm-shaft support, Part No. 56-5827.

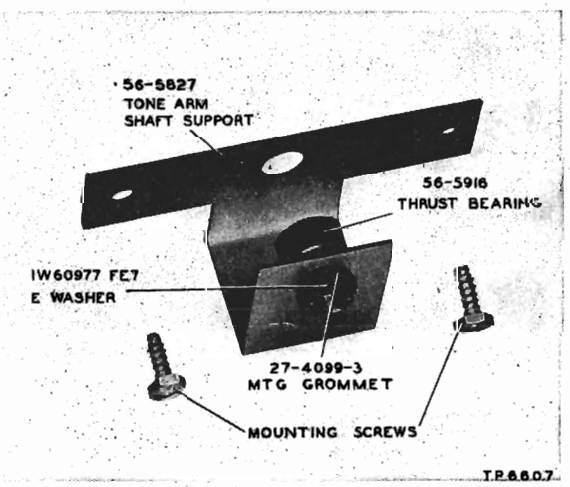

Figure 11

TONE-ARM UPPER BEARING, PART No. 56-5903

1. Remove tone-arm assembly as directed under "Tone-Arm Assembly, Part No. 35-2681."
2. Remove E washer, Part No. 1W60981FE7, from upper bearing at top of tone-arm housing.
3. Lift out bearing from underneath base plate.

TONE-ARM-SHAFT SUPPORT, PART No. 56-5827

1. Remove tone-arm assembly as directed under "Tone-Arm Assembly, Part No. 35-2681."
2. Remove the two mounting screws from underneath base plate.

RESET-PLATE-AND-CLIP ASSEMBLY, PART No. 76-4238

1. Remove mercury switch from clip.
2. Remove E washer, Part No. 1W60971FE7, from shaft of reset plate mounted on switch assembly; see figure 12.
3. Slide reset plate out of brass bushing from switch assembly.

LATCH-PLATE-AND-CLIP ASSEMBLY, PART No. 76-4237

1. Remove reset plate, Part No. 76-4238, as directed in paragraph above.
2. Remove E washer, Part No. 1W60971FE7, from latch-plate shaft.
3. Slide latch plate out of brass bushing from switch assembly.

RATCHET-LATCH ASSEMBLY, PART No. 76-4197

1. Remove E washer, Part No. 1W60977FE7; see figure 12.
2. Slide ratchet-latch assembly off switch assembly.

SWITCH ASSEMBLY, PART No. 76-4235

1. Remove mercury switch from latch-plate clip.
2. Remove the two hex-head nuts which hold switch assembly to base plate.

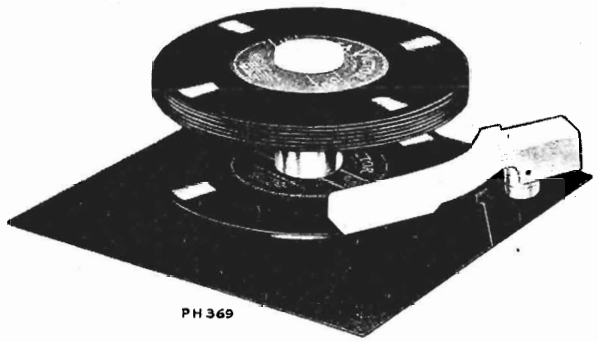
1W56920FE7	Speed clip, tone-arm rest
1W60971FE7	E washer, switch assembly
1W60977FE7	E washer, thrust bearing
1W60981FE7	E washer, upper bearing
11W52604	Fiber washer

RADIO CORP. OF AMERICA

MODEL RP-168, Series



The basic RP168 mechanism includes the metal sub-panel and all necessary operating parts except the tone arm and trip lever assemblies. Instruments using the cabinet as the motor board will have additional items (other than the tone arm and trip lever assemblies) listed in the Service Data issued for the individual models.

RP-168-1: Record changer mechanism plus tone arm assembly RMP-129-1; instrument cabinet is used as record changer motor board. Used in Models 9JY and 9EY3.

RP-168A-1: Record changer mechanism plus tone arm assembly RMP-129-1 and metal motor board. Used in Models 9W101, 9W103, 9W105, 9TW333, 9TW390 and 9Y7.

Complete record changer parts listing (except output cable), included in this Service Data. Different types and lengths of output cables are used—listed in Service Data of Individual Instruments.

RP-168A-2: Record changer mechanism plus tone arm assembly RMP-130-1 and metal motor board. Used in Berkshire Models.

AUTOMATIC OPERATION

1. Place a stack of records over the center post, with the desired selections upward the last record to be played on top.
2. Apply power to drive motor.
3. Push the "start-reject" knob to "start" and let go. The mechanism will automatically play in sequence one side of each record stacked on the separator shelves.
4. To reject a record being played push the "start-reject" knob to "reject."
5. At conclusion of playing and as the last record is being repeated, lift tone arm and place on rest. Push "on-off" knob to the "off" position.

SPECIFICATIONS

This mechanism is designed to play automatically a series of eight new RCA seven-inch fine groove records.

RPM	45
Pickup	Crystal
Sapphire dia.	.0009 inches
Pickup voltage output	Medium
Pickup force	5 grams

CAUTION

1. Avoid handling the tone arm when the mechanism is in cycle.
2. Do not use force to release a jam.
3. Do not try to remove the records on the turntable if the turntable is stopped in cycle.
4. Do not try to operate the mechanism if the separator knives protrude from the center post when the mechanism is out of cycle.

   Turn Power control on. The turntable revolves. Press finger gently against protruding discs until they disappear inside the holder. Do not do this during a change cycle.

LUBRICATION

A light machine oil (SAE No. 10) should be used to oil the bearings of the drive motor.

On all bearing surfaces, excepting the motor bearings, Houghton STA-PUT No. 320, or equivalent, should be used. On all other sliding surfaces, STA-PUT No. 512, or equivalent, is recommended. STA-PUT can be purchased from E. F. Houghton & Co., 303 W. Lehigh Ave., Philadelphia, Pa.

(Do not oil or grease record separator shelves.)

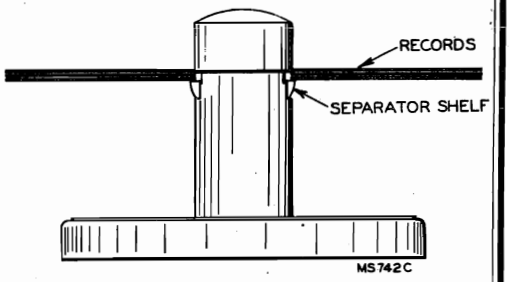
It is important that the drive motor spindle and the rubber tire on the idler wheel be kept clean and free from oil or grease, dirt, or any foreign material at all times. Carbon tetrachloride or naphtha is satisfactory for cleaning these parts.

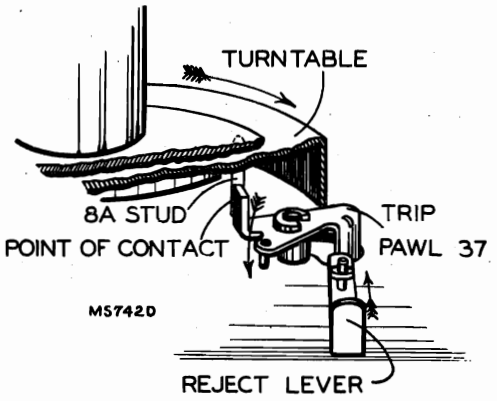
MODEL RP-168, Series

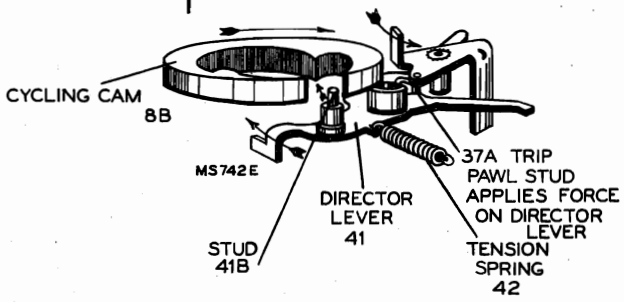
RADIO CORP. OF AMERICA

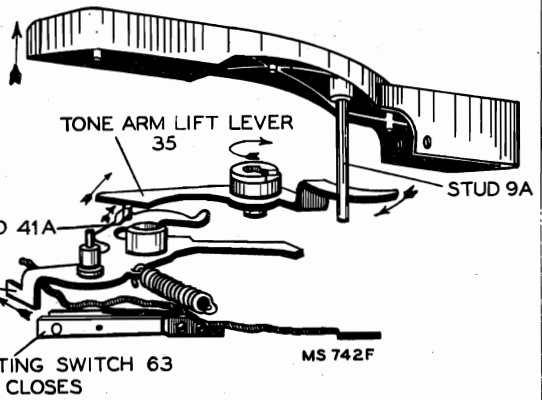
CYCLE OF OPERATION RP-168

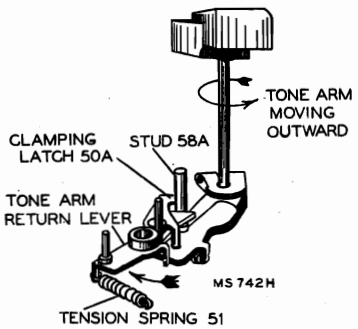
	Function	Explanation
	Place records over the center post and turn the power on	1. Records rest on separator shelves protruding from either side of the center post.
Operator	Push start-reject knob	1. Start-reject knob which is linked to start-reject slide (45A) moves trip pawl (37) into tripping position. 2. As the turntable rotates the small projection (8A) extending from the underside of the turntable contacts end of trip pawl.
Automatic Cycle	Tone arm rises	1. As the turntable continues to rotate it carries the trip pawl (37) along for a short distance. 2. The stud (37A) on trip pawl applies force against director lever (41) in opposition to tension spring (42). This force continues to be applied until the stud (41B) on the director lever has been forced through the slot and into the cycling cam (8B). 3. The end (41C) of the director lever extending below the motor board moves away allowing the muting switch (63) to close. 4. At the same time the stud (41A) pushes the tone arm lift lever (35) which in turn raises the tone arm.
	Tone arm moves out	1. The end (41E) of the director lever (41) contacts stud (58A) on trip lever (58), starting the tone arm on its outward movement. 2 The stud (58A) on trip lever contacts tone arm return lever (50), pushing it outward against the tension spring (51). 3. As the tone arm reaches its outermost position, it is locked in position by the latch (50A) clamping the stud (58A) on the end of the tone arm return lever.

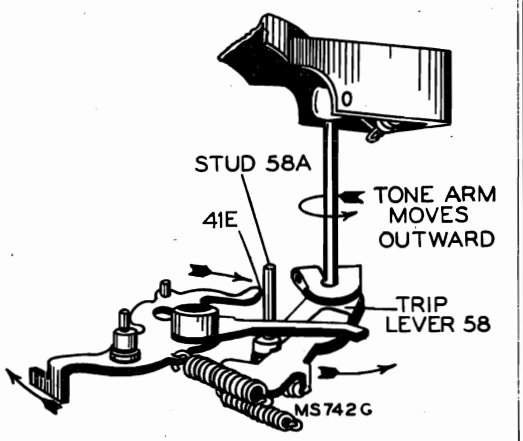












RADIO CORP. OF AMERICA

MODEL RP-168, Series

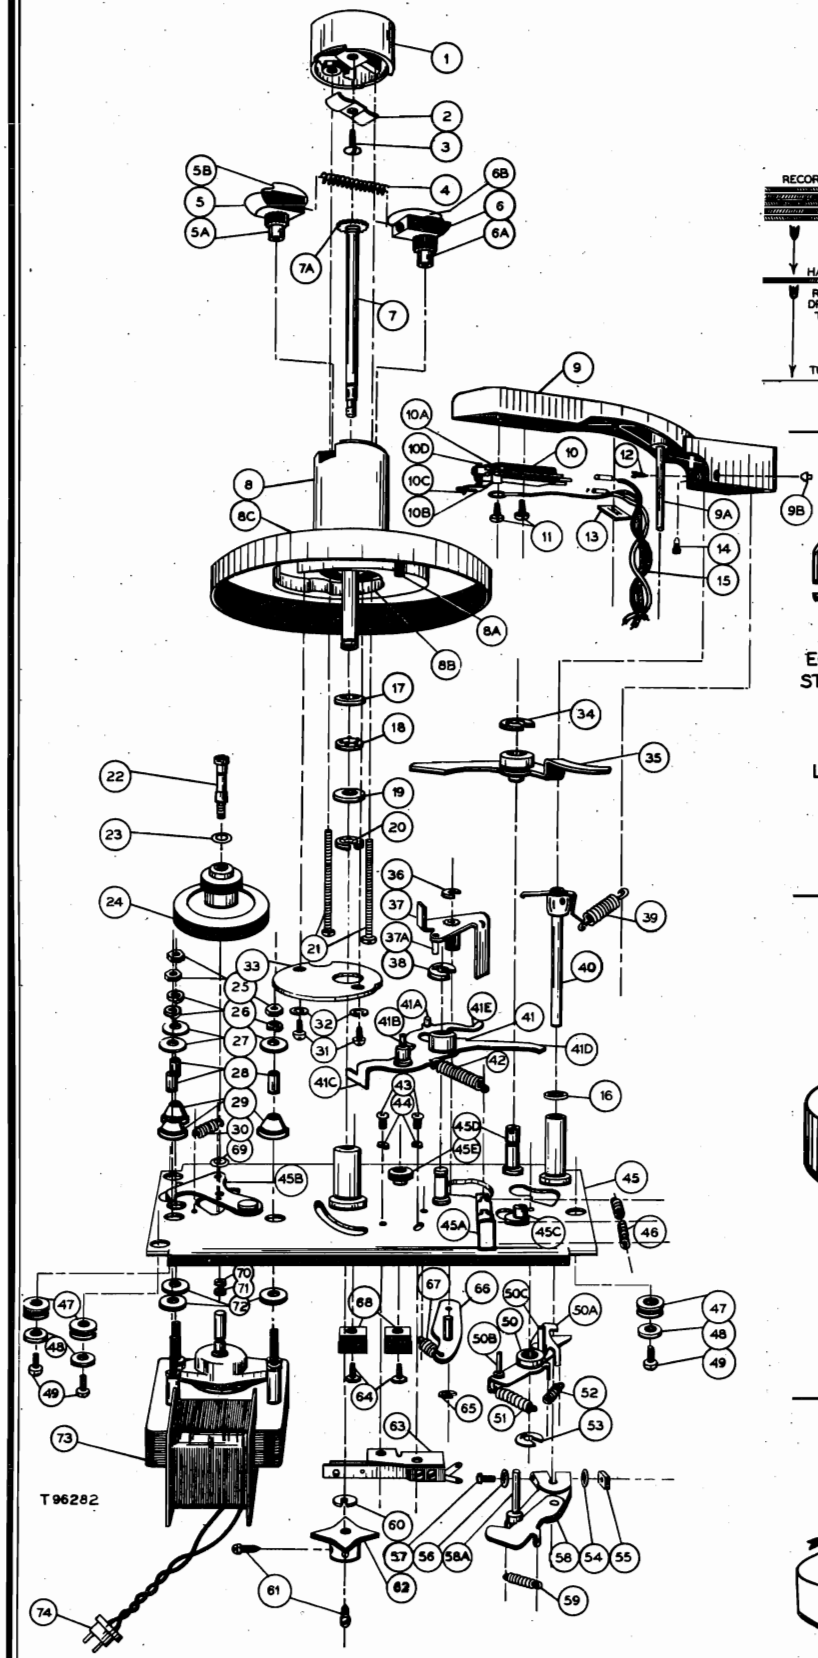


Fig. 1

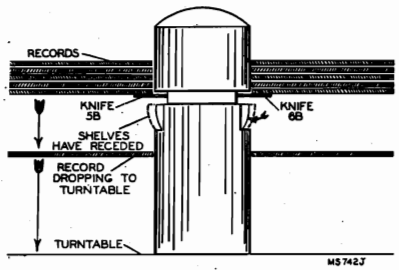
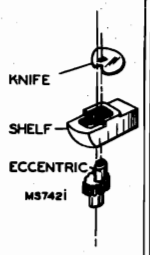
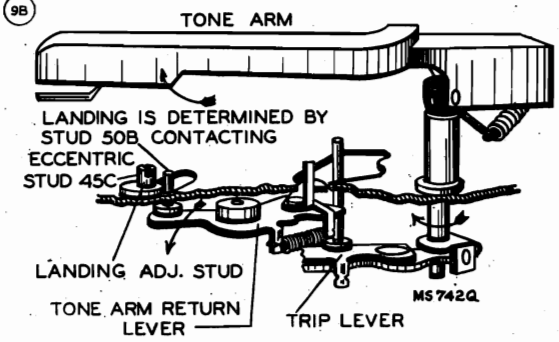
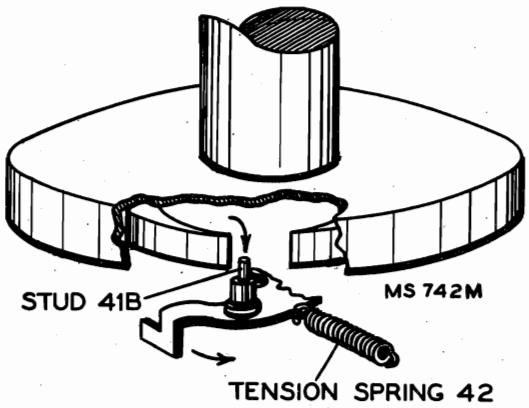
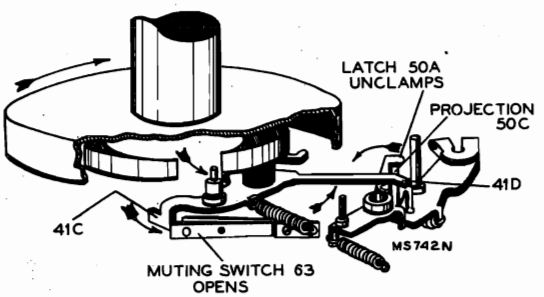




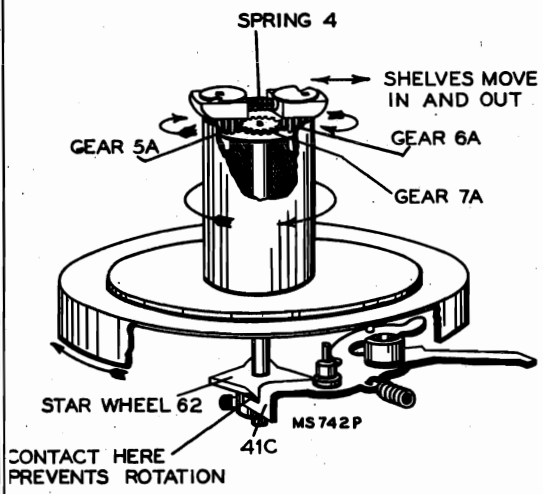






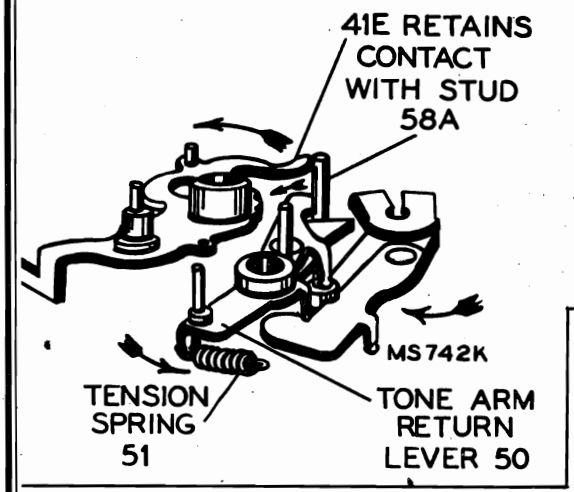
MODEL RP-168,
Series

RADIO CORP. OF AMERICA



Separator knives separate the lower record from the stack and allows the record to drop to the turntable

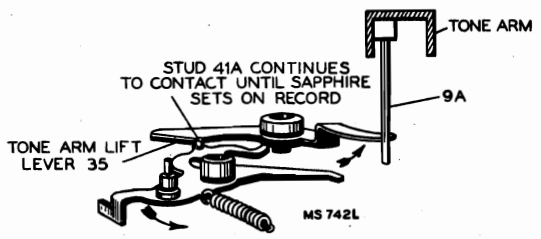
1. While the tone arm is moving outward the end (41C) of the director lever (41) extending below the motor board, contacts and prevents the star wheel (62) from rotating.
2. Since the turntable continues to rotate and the star wheel and shaft remain stationary. The two small gears (5A and 6A) embedded in the upper section of the center post rotate around the gear (7A) on the upper end of the star wheel shaft (7).
3. The eccentric extending from the upper end of the two embedded gears runs in a slot in the separator shelves (5 and 6). This produces the necessary action which causes the shelves to move in against the tension of spring (4).
4. As the shelves recede the separator knives (5B and 6B mounted above each separator shelf, separate the lower record of the stack and support the remaining stack while the lower record drops to the turntable.



Tone arm moves in for landing

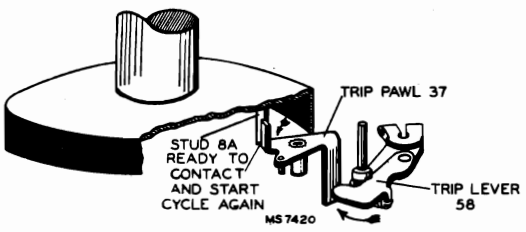
1. As the locator lever (41) continues to move toward the out of cycle position the end of the locator lever (41E) retains contact with the stud (58A) on the trip lever (58). This contact stabilizes the inward movement of the tone arm which is being pushed in by the tone arm return lever (50).
2. The inward movement of the tone arm is stopped directly above the landing position due to the stud (50B) on tone arm return lever coming in contact with the eccentric stud (45C).

Tone arm lowers sapphire to the record



1. The stud (41A) on director lever (41) continues to contact tone arm elevating lever (35) and lowers the sapphire on the start of the record.
2. As the turntable completes on revolution the stud (41B) on director lever is pulled through the slot in the cycling cam by the force produced by tension spring (42).
3. While the stud (41B) on director lever slides through the slot in the cam and assumes the out of cycle position, the end of the director lever (41D) contacts projection (50C) and unlatches the tone arm return lever (50).
4. The end (41C) of the director lever below the motor board moves away from the star wheel and opens muting switch.

Record plays



1. After the selection has been completed the sapphire moves into the tripping groove. At this time the trip lever (58) pushes the trip pawl (37) into position for engagement with the stud (8A) on the under side of the turntable.
2. This contact between stud (8A) and the trip pawl (37) starts another change cycle and the next record is moved into position for playing.

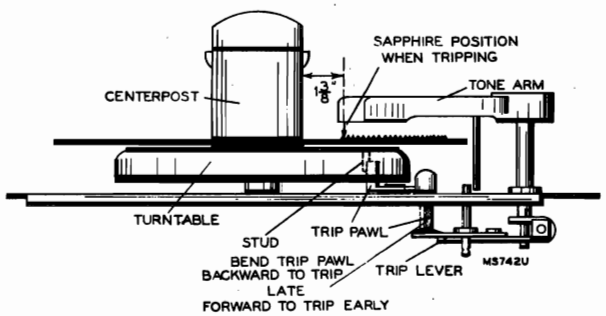
33726	36	Washer—"C" washer for trip pawl
*74072	37	Pawl—Trip pawl
35969	38	Washer—"C" washer for director lever
*74076	41	Lever—Director lever
*74084	42	Spring—Director lever spring (.195" O.D. x .732"—23¼ turns)
	43	Screw—No. 6-32 screw to mount muting switch
	44	Lockwasher—No. 6 lockwasher (external) to mount muting switch
*74070	45	Base—Sub-base assembly complete with all staked and riveted parts including idler lever and reject lever
*74082	45E	Washer—Felt washer (½" O.D. x ¼" I.D. x 3/16" thick)
*74086	46	Spring—Reject lever spring (.203" O.D. x 13/16"—34¾ turns)
*74074	50	Lever—Return lever (includes spring No. 61)
*74085	51	Spring—Return lever actuating spring (.195" O.D. x 29/32"—37½ turns)
*74075	52	Spring—Return lever latch spring (.180" O.D. x .535"—21½ turns)
35969	53	Washer—"C" washer for tone arm return lever
33726	60	Washer—"C" washer for star wheel shaft
*74083	61	Screw—No. 6-32 x .281" cone point set screw for star wheel (2 required)
*74081	62	Wheel—Star wheel
*74088	63	Switch—Muting switch
33726	65	Washer—"C" washer for trip pawl lever
*74245	66	Lever—Trip pawl lever
*74100	67	Spring—Trip pawl take-up spring (.195" O.D. x ⅝"—20½ turns)
*74102	69	Washer—Dampening washer for idler wheel (bottom)
	70	Lockwasher—No. 4 lockwasher for idler wheel mounting stud
	71	Nut—No. 4-40 hex nut for idler wheel mounting stud
*74071	73	Motor—105/125 volts, 60 cycles
		MODEL RP-168A-1
		NOTE: Parts listed for mechanism RP-168 plus the following are those parts for the above Record Changer. (For Pickup and Arm Assembly RMP-129-1, see separate listing.)
*74256	16	Washer—Vellutex washer
*74099	58	Lever—Trip lever (includes spring No. 59)
74060	59	Spring—Trip lever spring (.171" O.D. x .695"—43 turns)
73549		Emblem—"RCA-Victor" emblem
*74210		Knob—Reject control knob
*74211		Lever—Reject lever actuating lever
*74184		Motorboard—Motorboard complete with welded brackets and stud—less rest and operating parts
*74212		Nut—Speed nut for reject control knob
*74185		Rest—Pickup arm rest
33726		Washer—"C" washer for mounting reject lever actuating lever
		MODEL RMP-129-1 Pickup and Arm Assembly (Used with 9EY3, 9JY and RP-168A)
*74041	9	Arm—Pickup arm shell and stud less cystal, cable and rear pivot arm
*74061	9B	Pivot—Tone arm pivot
*74067	10	Crystal—Crystal cartridge complete including sapphire and guard
*74065	10A	Screw—No. 2-56 x 3/16" fillister head screw to mount crystal (2 required) or needle guard (2 required)
*74069	10B	Guard—Needle guard
*74068	10C	Sapphire—Sapphire and holder
*74230	10D	Washer—Washer and nut to mount sapphire and holder
74065	11	Screw—No. 2-56 x 3/16" fillister head screw to mount crystal (2 required) or needle guard (2 required)
*74062	12	Screw—No. 8-32 x 13/32" cone point pivot adjusting screw
38458	13	Nut—Speed nut to hold pickup cable
74410	14	Screw—No. 4-40 x 3/16" fillister head set screw to lock pivot screw 74062
*74066	15	Cable—Twisted pickup cable (12") complete with connectors
*74060	39	Spring—Pivot arm spring (.171" O.D. x 695"—43 turns)
*74059	40	Arm—Pivot arm and shaft

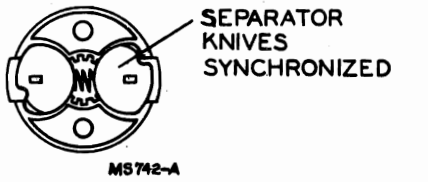
TRIPPING ADJUSTMENT

The tripping should occur after the sapphire leaves the last playing groove. This point of tripping should be when the sapphire is 1⅜ inches from the side of the centerpost. Bend end of trip pawl as required.



TIMING OF SEPARATOR KNIVES

1. Make certain the two embedded gears (5 and 6) are meshed with gear (7A) on the upper end of the star wheel shaft so the action of the separator knives are synchronized.
2. Loosen the two set screws (61) sufficiently to permit the star wheel to rotate without disturbing the shaft (7).
3. Position the separator knives as indicated in figure (3).
4. Push reject lever and rotate the turntable slowly by hand until the end (41C) of the director lever moves in far enough, so when the star wheel is rotated it contacts by the amount as indicated in figure (2).
5. Tighten the two set screws (61) and rotate the mechanism through a complete cycle.
   The separator knives must rotate 360° and return to the starting position as indicated in figure (3).



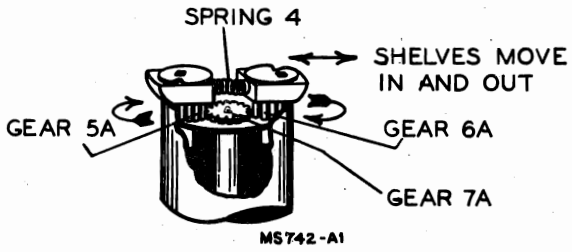


Fig. 3

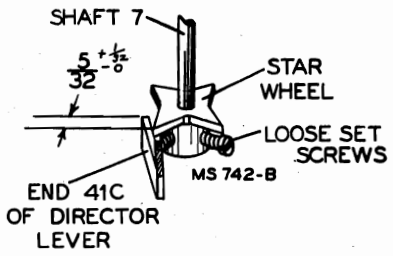

Fig. 2

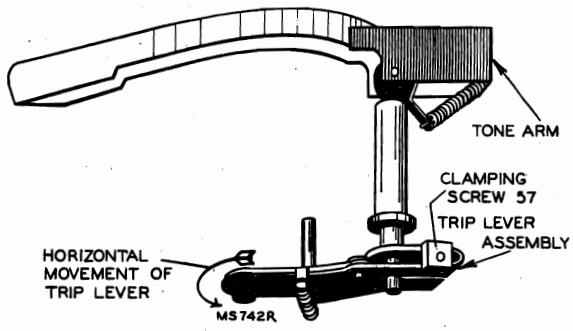

Fig. 4

PICKUP LANDING ADJUSTMENT

1. Assemble the tone arm and trip lever assemblies as shown in figure (4). Leave the clamping screw (57) loose enough to permit horizontal movement of the trip lever on the shaft. (Allow approx. .010 inch vertical end play.)
2. Turn the eccentric landing adjustment stud (45C) to determine the inward and outward limit of adjustment, then turn it to a setting half way between the limits. Fig. 6. (Screwdriver slot approx. 30° from parallel with front edge of subpanel, in a counter-clockwise direction.)
3. Place a record on the turntable, push the reject lever and slowly rotate the turntable until the sapphire is just ready to set on the start of the record.
4. Hold the trip lever and move the tone arm by hand until sapphire is in position halfway between the music grooves and the edge of the record.
5. Tighten clamp screw (57), apply power and run the mechanism through cycle. (Note the sapphire landing position.)
6. The exact landing position of the sapphire can be adjusted by turning the eccentric landing adjustment screw (45C). (Do not attempt to correct a landing error of more than ± 1/32", with the eccentric screw driver adjustment stud.)

   Sapphire landing position should be (2 5/8") ± 1/64" from the side of the center post as shown in figure (5).

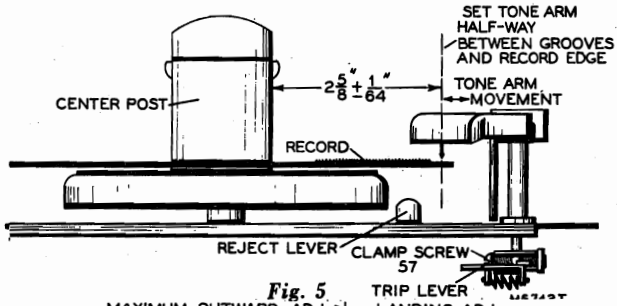

Fig. 5

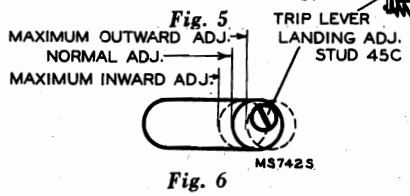

Fig. 6

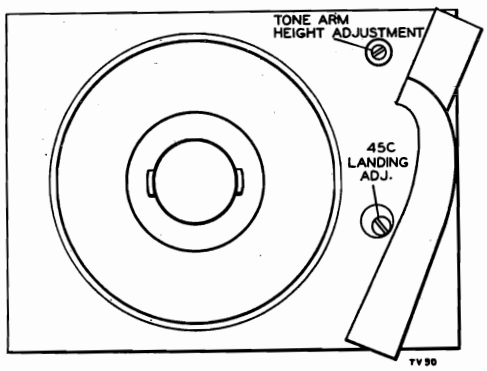

Fig. 7

RADIO CORP. OF AMERICA

MODEL RP-168, Series

OUT OF CYCLE HEIGHT OF TONE ARM

Bend tone arm lug so the sapphire point is approximately 1/16" above the motor board as shown in the sketch.

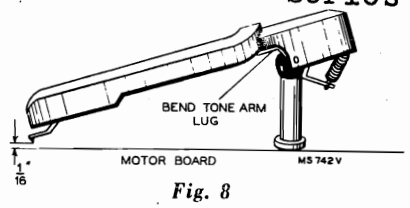

Fig. 8

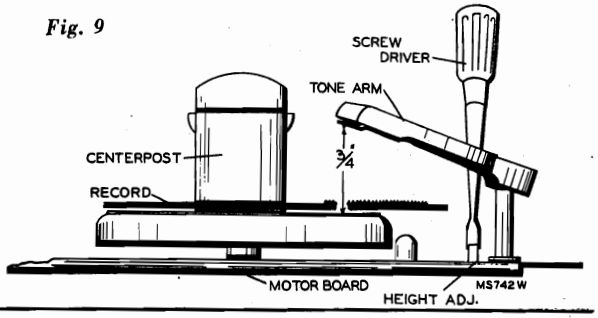
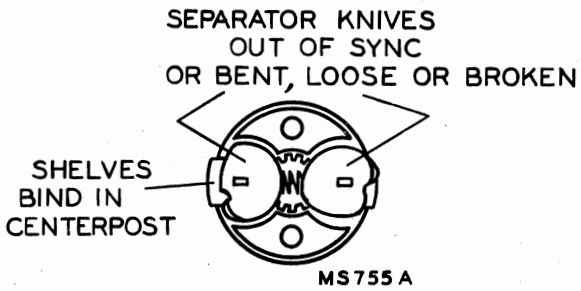
TONE ARM IN CYCLE HEIGHT ADJUSTMENT

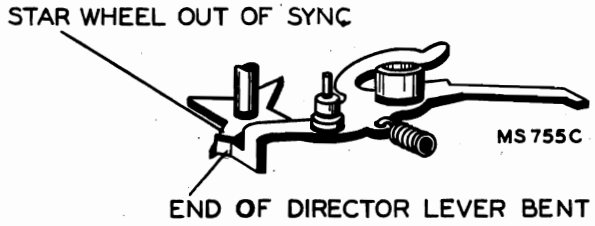
Set the mechanism in cycle. Turn the turntable by hand, until the tone arm has reached its maximum height. By means of a screwdriver turn the height adjustment stud until the distance between the top of the turntable and the sapphire point is ¾". Turning the stud clockwise will raise the arm and counter-clockwise will lower the arm.

Fig. 9



IMPROPER RECORD SEPARATION





To insure proper dropping of records and avoid tilting of stack. It is important that the separator shelves move in and out freely. It is therefore essential that the shelves be free from burrs, grease, grit or dirt in general.

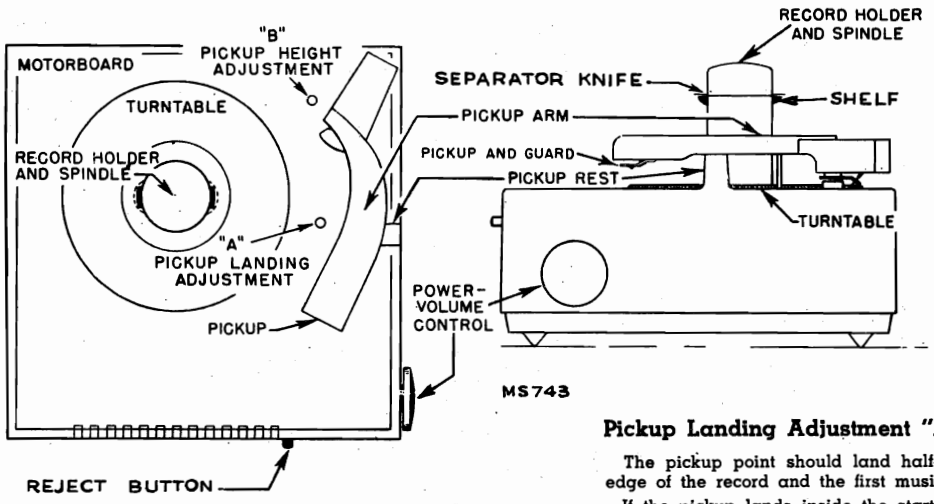
Schematic Diagram



Top and Side Views

Record Separators

In the out of cycle position the record separator knives or discs are normally concealed inside the center post. During service the position of the star wheel on the underside of the record changer may be accidently shifted; this may cause the separator knives to be extended when they should be concealed.

If the separator knives are thus extended—turn the power on so that the turntable is revolving, gently press fingers against the extended knives until they disappear inside the center post—DO THIS ONLY WHILE MECHANISM IS OUT OF CYCLE.

Record Changer Mounting

The cabinet is used as the motor board of the record changer. The record changer is attached to the cabinet with three screws, grommets and spacers. THE PICKUP ARM MUST BE REMOVED BEFORE THE RECORD CHANGER CAN BE REMOVED—REFER TO RP-168 SERIES SERVICE DATA.

To Remove Chassis

Remove the four screws at the corners of the bottom cover, separate the motor power plug and socket and remove the pickup cable from its socket on the amplifier chassis.

Elongated holes permit the speaker position to be adjusted. If the speaker should be replaced or its mounting bracket loosened, the speaker mounting bracket screws should not be tightened until after the bottom cover is assembled to the cabinet.

Pickup Landing Adjustment "A"

The pickup point should land half-way between the outer edge of the record and the first music groove.

If the pickup lands inside the starting grooves—turn screw "A" slightly clockwise. If pickup lands outside the starting grooves—turn screw "A" slightly counterclockwise.

Pickup Height Adjustment "B"

During cycle the pickup arm must rise high enough to clear a stack of eight records on the turntable, but not high enough to cause the top of the arm to touch records resting on the record supports.

If pickup does not clear a stack of eight records—turn screw "B" slightly clockwise. If pickup arm touches records on record supports—turn screw "B" slightly counterclockwise.

RADIO CORP. OF AMERICA

Connecting Record Changer Attachment to Radio Receivers

RCA Radios with Phono Jack

Plug male connector on the end of the "Phono" lead into the female connector on the receiver chassis. If set is provided with a phono switch, push or turn the "Phono" switch to "Phono" position, and operate the Record Changer Attachment according to instructions. If no switch is provided, use maximum setting of volume control on attachment, and minimum setting of radio volume control which will give acceptable volume, and tune receiver off frequency from any very strong station. In some instances the radio volume control will have the effect of a tone control.

RCA Type No. 202W1 Record Player Selector

This selector switch may be used for combined operation of two record players through one phono input jack. A choice of two types of input jacks and output cable plugs are provided.

Radio-Phonograph Combinations

Most radio-phonograph combinations use resistors and/or capacitors for tone compensation in the phono input circuit.

Where unsatisfactory reproduction is obtained with Model 9JY connected into the phono jack of such instruments, we suggest that Model 9JY be connected as indicated for radios which do not have a phono jack.

Radios Without Phono Jack

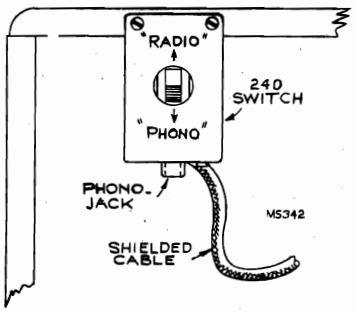
Methods of connecting the Record Changer Attachment to various types of audio systems are given in the accompanying text and illustrations. The data given requires that an RCA Type No. 240X1 (Formerly Stock No. 240) Radio-Phono switch be used for switching from radio to phonograph, as desired. For ease in connecting the "phono" lead to the switch, the male plug on the end of the lead matches the phono jack on the switch.

In general, the Record Changer Attachment must be used with radio receivers having at least two stages of high-gain audio amplification. The output of the Record Changer Attachment should be connected to the input of the first audio tube, and at the same time the output of the radio receiver portion of the chassis should be shorted or opened, to prevent radio signals being heard while the Record Changer Attachment is in operation.

Installation of Switch

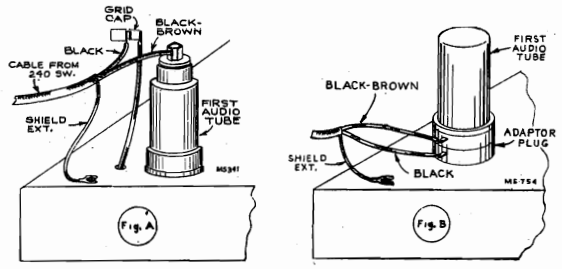
Fasten the bracket to the cabinet in such a position that the switch may be easily reached. For wooden cabinets, a suggested place is the upper rear edge of the cabinet. If the radio has a plastic cabinet, the bracket may be fastened to the chassis by self-tapping screws or soldering. **In the case of a.c.-d.c sets, the bracket should not be fastened to the chassis.** In such cases, a wooden block may be fastened to the chassis and the bracket screwed to the wooden block, care being exercised that there is no metallic path from the bracket to the chassis.

Connect the braided shield extension to the radio chassis by either soldering or placing the spade lug under a mounting screw.



On a.c.-d.c. sets it is necessary to isolate the cable shield from the chassis. This is best done by connecting the shield to the chassis through a .25 mfd 300-volt condenser. Care should be taken that the shield braiding and switch bracket do not come in contact with the chassis.

If the common-negative wiring in the a.c.-d.c. set is isolated from the set chassis, connect the cable shield, through a .25 mfd. capacitor, to the common-negative wiring, and not to the chassis.

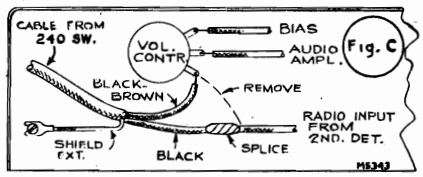


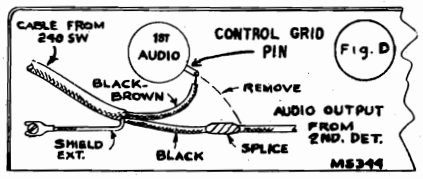
For radio receivers in which the 1st-audio tube has a top grid cap—see Fig. A:

1. Disconnect the grid lead from the first audio tube.
2. Connect the cap on the black lead to the clip on the grid lead, as shown above.
3. Connect the clip on the black-brown lead to the grid cap at the top of the first audio tube, bending the terminal if necessary to proper size for a metal tube cap.
4. Insert the plug on the end of the record player lead into the jack on the bracket.
5. Secure or position the connection cable assembly so that the cap and clip terminals are well separated from each other and other metal parts.

For radio receivers in which the 1st-audio tube is type 6SQ7, 6SR7, 12SQ7 or 12SR7—see Fig. B:

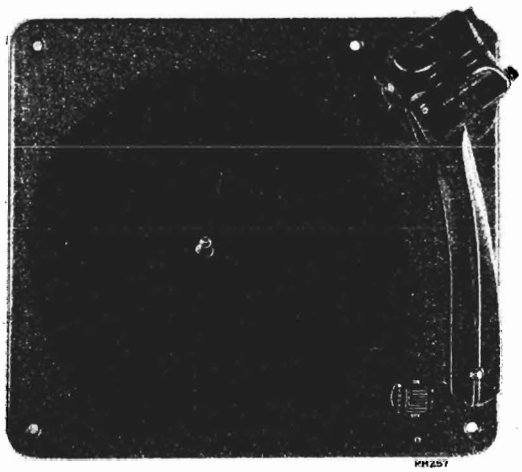
1. Use adaptor plug RCA Stock No. 37798.
2. Remove the 1st audio tube.
3. Solder the switch leads to the adaptor plug terminals—black to bottom lug—black-brown to top lug.
4. Tape terminals to prevent short circuits when installed in set.
5. Insert the adaptor into the 1st audio tube socket.
6. Insert the 1st audio tube into the adaptor.
7. Insert the plug on the end of the record player lead into the jack on the bracket.





For other radio receivers in which the 1st-audio tube does not have a grid cap; connection to volume control input—see Fig. C, connection to 1st-audio tube control grid—see Fig. D:

1. Unsolder the lead from the volume control lug indicated in Fig. C or from the control grid pin indicated in Fig. D. It is usually necessary to remove the chassis from the cabinet to do this.
2. Solder the black-brown lead (remove clip) to the lug or pin disconnected in Step 1.
3. Solder the black lead (remove plug) to the lead disconnected in Step 1. Tape the joint to prevent short circuits.
4. Insert the plug on the end of the record player lead into the jack on the bracket.



Manual Operation

1. Rotate the record separator shelf clockwise for 10-inch or counterclockwise for 12-inch position (numerals 10 or 12 pointing towards center post).
2. Place the record to be played on the turntable and turn the power switch on.
3. Move the control knob to manual and to the on position.
4. Press down firmly but momentarily on the end of the tone arm and let go. The pickup will land automatically on the start of the record. When the selection is completed the pickup will ride the eccentric groove until the pickup is placed on the rest manually.
5. Turn power switch off manually.
6. Remove the record by raising straight up without tilting.

Automatic Operation

1. With the power switch in the off position rotate the record support shelf as required for 10- or 12-inch records until the record size indicated on the support cover is pointing toward the center post. (Rotate clockwise for 10-inch and counterclockwise for 12-inch records).
2. Place the records to be played in a stack with desired selections upward and in proper sequence with the last record on top. Load them on the changer by placing them over the center post and resting on the record support shelf. Place record stabilizing clip on top of the record stack.
3. Push the control knob to automatic and to the on position.
4. Press down firmly but momentarily on the end of the tone arm and let go. The changer will continue to play one side of each record of the entire stack automatically.
   The tone arm can be moved to the rest position any time the mechanism is not in cycle.
5. Turn the power switch off and remove the stack from the turntable by placing fingers of both hands directly opposite and under the stack. Then lift straight up—"don't tilt" or squeeze stack. Turning the support shelf one-fourth turn facilitates removal of records.

Cautions

1. Avoid handling the tone arm or rotating record support assembly while mechanism is in cycle.
2. Never turn the power switch off, leaving the mechanism in cycle for an extended period of time.
3. Do not allow the records to remain on supports when not in use.
4. Do not allow oil or grease to come in contact with any rubber parts.
5. Do not install instrument near source of heat. Excessive heat may damage the pickup cartridge.

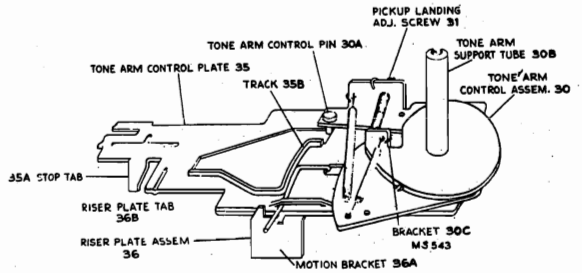


FIG. 2

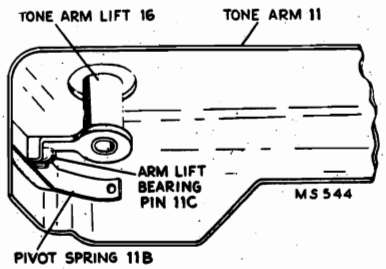

FIG. 3

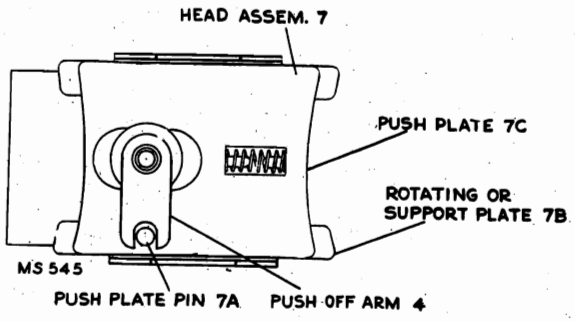

FIG. 4

FUNCTIONS OF PRINCIPAL PARTS

Head Assembly—7, 7A, 7B, 7C
Supports outer edge of record stack and pushes the record off notch in center post and allows it to drop to the turntable while the mechanism is going through cycle.

Center Post—53
Supports the entire stack of records, and together with the offset notch and latch in the center post, provides a means for separating records.

Tone Arm Lift Assembly—16
Couples tone arm to riser plate 36 through arm lift shaft 47, thereby transferring the action for the vertical motion of the tone arm during change cycle.

Arm Control Assembly—30
Provides a tie between tube 30B, bracket 30C and tone arm support bracket 18, thereby directing the horizontal movement of the tone arm during change cycle. Arm control pin 30A slides along track in arm control plate 35, and in so doing, determines the point of landing of the pickup and the point of trip of the mechanism. It also incorporates landing adjusting screw 31.

Arm Control Plate Assembly 35, 35A, 35B, 35C
Incorporates a track 35B which controls the pickup landing and the tripping of the mechanism.
Stop tab 35A functions as portion of the tripping device, stud 35C, contacting push-off cam 47A controls, the point of landing for both 10- and 12-inch records.

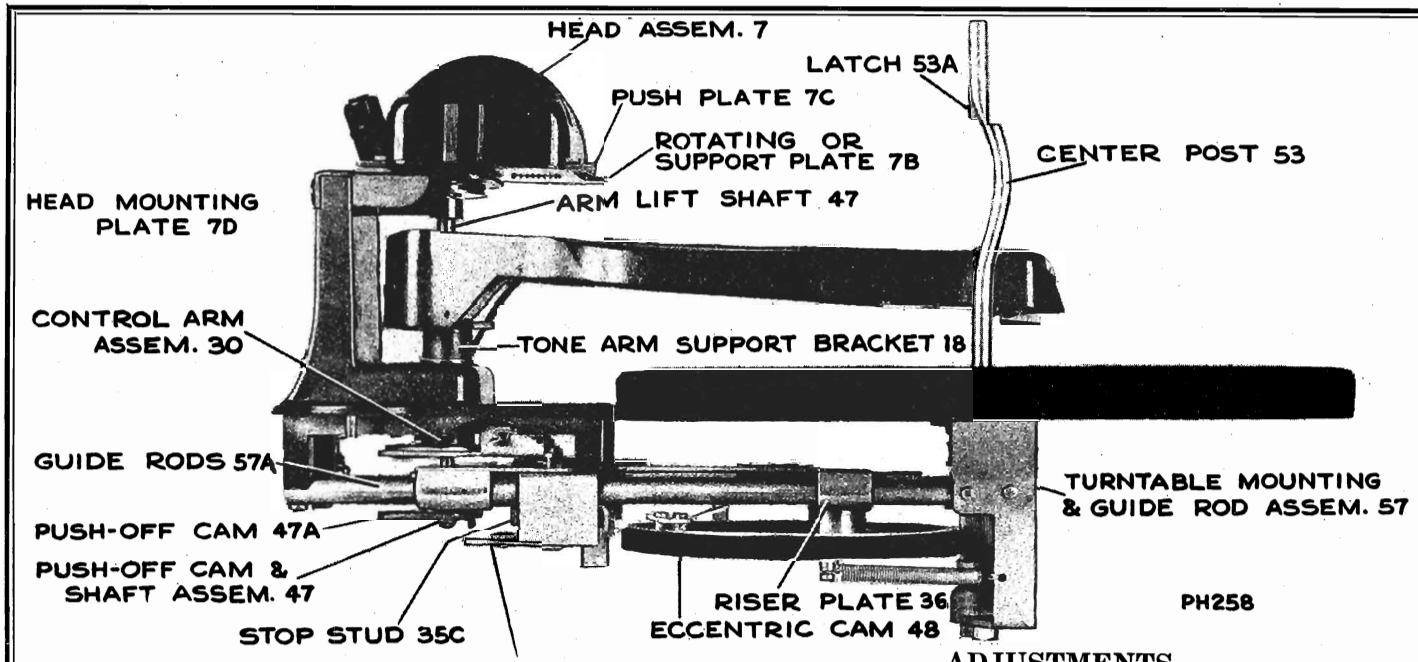

FIG. 1

Riser Plate Assembly—36, 36A, 36B, 36C
Provides mounting for eccentric cam 48, and incorporates an inclined track 36C, which controls the vertical movement of the tone arm.
Riser plate tab 36B pushes against curved portion of cam on arm control assembly 30, providing a control for the horizontal movement of tone arm during change cycle. Riser plate bracket 36A contacting push-off cam 47A provides the necessary motion for push plate 7C.

Eccentric Cam—48
Transfers motion from turntable to riser plate 36 while cycling.

Push-Off Cam and Shaft Assembly—47, 47A
Provides a means of mechanically coupling tone arm lift 16 and push plate 7 assemblies to main cycling mechanism. Cam 47A contacting stud 35C controls the position of arm control plate while in cycle, which determines the landing point of the pickup on 10- or 12-inch records.

Turntable Mounting and Guide Rod Assembly—57, 57A
Incorporates the main bearings for the turntable and provides a mounting for guide rods 57A.

Manual Lockout Lever—59
Consists of a small lever which forms a stop for stud 35C. This prevents arm control plate 35 from moving forward and disengaging stop catch 45 when the mechanism is operated in the manual position.

ADJUSTMENTS

Tone Arm Adjustment
The tone arm height should be so adjusted as to permit the sapphire to engage and ride in the grooves of one record placed on the turntable, but at the same time prevent the tone arm from touching the records on the supports while the mechanism is going through cycle, fig. 5.

1. With the mechanism out of cycle, lift tone arm and check, and make certain tone arm lift 16 engages pin 11C as shown in fig. 6.
2. With the pickup near the edge of the record, loosen the set screw, holding collar 10, fig. 9, and moving it up or down on shaft 47, so as to have the conditions indicated in sketch, fig. 5.

Preliminary Landing Adjustments
An accessible landing adjustment screw 31 is provided, but if for any reason the tone arm support bracket has become loose or removed, proceed as follows:

1. With the mechanism out of cycle turn adjustment screw 31, fig. 8, clockwise as far as it will go, then turn counterclockwise two or three full turns.
2. Set head assembly for 12-inch position; place a 12-inch record on turntable.
3. Press down on the reject button and rotate the turntable by hand, causing the mechanism to cycle until the pickup is about to land on the record. In this position, the arm control pin 30A is in a position on track 35B as indicated by "s" and adjustment screw 31 remains against bracket 30C as indicated in fig. 8.

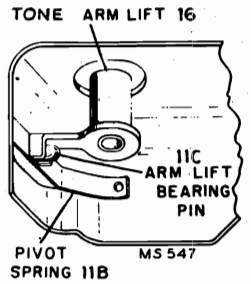

FIG. 6

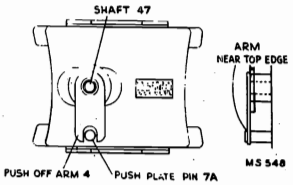

FIG. 7

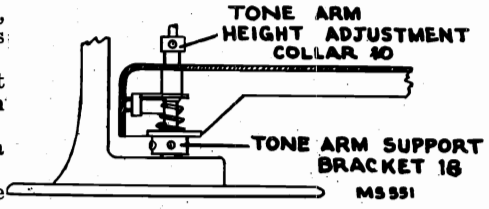

FIG. 9

4. Loosen the two set screws holding the tone arm support bracket.
5. While holding this position, indicated in step 2, place the sapphire in the starting groove of the record and tighten the two set screws in the tone arm support bracket.

Final Landing Adjustment

The exact landing adjustment can be made by pressing the reject button and rotating the turntable by hand until the pickup is about to land. Then turn adjustment screw 31, fig. 8, until the sapphire is directly above the starting groove of the record. If the mechanism continues to land incorrectly after this adjustment has been made, compensate the difference by turning the screw 31 slightly. Turning screw counter-clockwise will move the landing towards the center post.

Positioning Push-Off Arm

1. With the mechanism out of cycle, turn the push-off cam 47A so that its arm makes a 90° angle with the slide bars as shown in fig. 10. Make certain the large radius side of cam is toward the stud 35C when the support post is in the 12-inch position.
2. Place push-off arm 4 over push-off cam shaft 47, and engage push-off plate pin 7A near the top edge, fig. 7. Tighten set screws.
3. Press down on reject button and rotate the turntable slowly by hand, making certain push plate does not reach its limit before riser plate motion bracket has reached the end of its outward travel. If the push plate should reach its limit, deviate slightly from the 90° angle but make certain that the mechanism operates satisfactorily on both 10" and 12" records.
4. Check this for 10- and 12-inch setting.

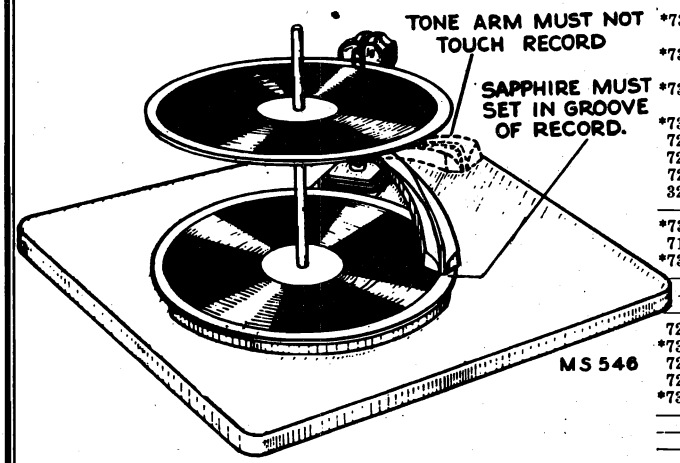

FIG. 5

Replacement Parts

STOCK No.	ILL. No.	DESCRIPTION
*73338	1	Cover—
*73337	2	Pad—Hold down pad and arm
71232	3	Spring—Hold down spring
72458	4	Arm—Push off arm
37458	5	Screw—#6-32 x ⅛" set screw
*73339	6	Plate—Hold down plate
71177	6A	Spring—Hairpin spring
*73340	7	Head—Head assembly including
———	7A	Push pin }
———	7B	Rotating plate } Part of 7
———	7C	Push plate }
71209	8	Spring—Push plate spring
71201	9	Screw—#6-32 x 3/16" Bristo head set screw
72461	10	Collar—Lift adjusting collar
*73342	11	Arm—Pickup arm shell complete with

71191	37	Spring—Recoil spring
*73353	38	Rest—Pickup arm rest and start-reject button
*73354	39	Lever—Reject lever
71228	40	Spring—Reject lever spring
———	†41	Screw—self tapping screws for mounting item 39
*73355	42	Trigger—Reject trigger (wire)
———	43	Terminal—Terminal strip
71177	44	Spring—Hair pin spring
*73352	45	Catch—Reject catch
72486	46	Spring—Reject catch support spring
72478	47	Cam—Push off cam including
———	47A	—Shaft (part of 47)
72479	48	Cam—Eccentric cam and tire
71198	48A	Tire—Rubber tire for eccentric cam
72480	49	Spring—Eccentric cam spring
———	†50	Washer—Washer used to mount eccentric cam (#8 washer approx. 9/16" O.D.)
———	†51	Washer—Lock washer (#8)
———	†52	Screw—Eccentric cam mounting screw (#8 x 32 x ¼" binder head)
71235	53	Centerpost—
*73348	54	Turntable—
71239	55	Washer—One set of cork washers for turntable
71238	56	Bearing—Turntable thrust bearing (including 2 steel washers)
*73349	57	Support—Turntable mounting support including guide rods
*73350	58	Screw—#6 x ⅝" fillister head set screw to mount turntable support (4 required)
*73351	59	Control—Reject manual control including
———	59A	—Arm (Part of 59)
71228	60	Spring—Reject arm spring
72926	61	Roller—Turntable shaft knurled roller
71200	62	Screw—#8-32 x ⅛" bristo head set screw to fastern knurled roller (2 required)
———	†63	Washer—lockwasher for mounting centerpost
71236	64	Nut—Hex nut for centerpost
———	†65	Screw—#8 R.H. ¼" screw to mount turntable support
71183	66	Motor—Motor (117 volt, 60 cycle) complete with drive idler, tension spring, mounting grommets, shaft bushing and mounting bracket—less power cord
71413	66A	Wheel—Drive idler wheel for motor stamped 407B9
71177	66B	Pin—Cotter pin (hairpin spring) for drive idler wheel
71414	66C	Spring—Drive idler wheel tension spring for motor stamped 407B9
*71244	66D	Grommets—Motor mounting grommets
*73359	67	Fastener—Snap fastener to mount motor (3 required)
*73360	68	Grommet—Rubber grommet to mount record changer (4 required)
*73361	69	Stud—Record changer mounting stud (4 required)
———	†70	Washer—#10 Flat washer (OD ½")
———	71	Screw—Phillips #10 x 32 x ½" flat head counter sunk screw used to connect shock mounts to motor board
30870	72	Plug—2 prong male AC plug

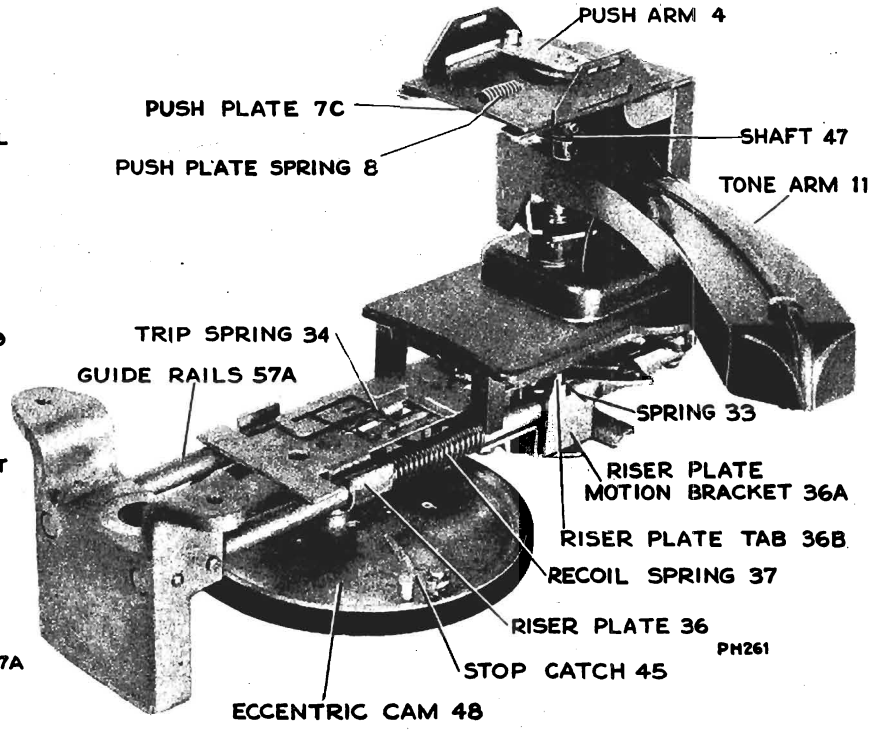

FIG. 12

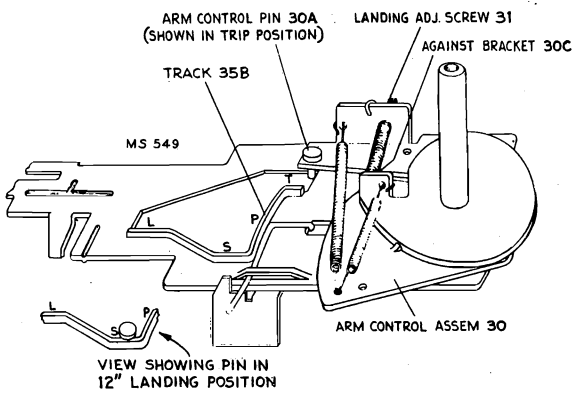

FIG. 8

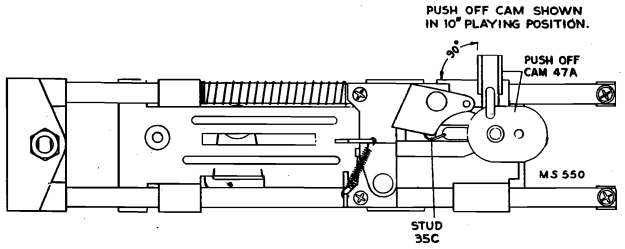

FIG. 10

RADIO CORP. OF AMERICA

MODEL 960276

CYCLE OF OPERATION

Turn record support to 10- or 12-inch position as desired and place a stack of records on supports.	1. Turning the record support positions the push-off cam 47A through the linkage of push-off arm 4 and push-off shaft 47. In so doing it determines the amount of movement of control plate 35 which in turn governs pickup landing.
Start-reject button.	1. Press down on tone arm; this actuates button on which it is resting. 2. Start-reject button actuates reject lever. 3. Reject lever transfers action to reject latch 59A through coupling wire 42. 4. The unlatching of reject latch allows eccentric cam 48 to be pulled against rotating knurled roller 61 which starts cycle.
Record plays.	1. While the record is being played and the tone arm moves towards the center of the record, the arm control pin 30A on arm control assembly 30 moves along track 35B as designated by "P," fig. 13. 2. As pickup moves into trip groove on record, tone arm control pin 30A moves into recess in control plate 35 at point indicated by "T," fig. 13. 3. Trip spring 34 pulls arm control plate 35 towards center post 53, and in so doing allows stop tab 35A on arm control plate 35 to disengage stop catch 45 on eccentric arm 48. **(In manual operation the manual lockout lever holds stud 35C thereby preventing arm control plate from moving forward and starting cycle.)**
Cycling starts.	1. Spring 49 pulls eccentric cam 48, causing rubber tire 48A to engage rotating knurled roller 61. 2. Eccentric cam 48 mounted on riser plate forces the riser plate assembly back along the guide rails 57A away from center post 53. 3. As riser plate moves, the push-off cam and shaft assembly 47 rides along the inclined track 36C of the riser plate 36. 4. This action results in the push-off cam and shaft assembly 47 being pulled down.
Tone arm raises and moves out.	1. The tone arm lift 16 sliding on shaft 47 is pulled downward, contacting lift bearing pin 11C, and causing tone arm to raise and clear record. 2. The riser plate tab 36B contacting curved portion of arm control assembly 30, which is coupled to tone arm support bracket assembly, causes the tone arm to be moved outward away from, and clear of the edge of the records. Arm control plate is also being carried along by tab 36B contacting spring 33.
Record is separated and drops to turntable.	1. As riser plate 36 continues to travel further along guide rods 57A, the riser plate motion bracket 36A contacts and rotates the push-off cam and shaft assembly 47. 2. Push-off arm 3, being coupled to push-off cam and shaft assembly 47, is rotated, causing push plate 7C to push record off of projection on center-post and dropping it to the turntable. **Note:** The small separator latch in the end of the center post functions as a thickness gauge, allowing only one record to be pushed off the projection at one time.
Tone arm is returned and is positioned for landing.	1. As eccentric cam 48 is returning to minimum diameter (out of cycle position), riser plate is being pushed back to normal position by recoil spring 37. At the same time, the push plate spring 8 is pushing the push plate 7C and push-off arm 4 back to normal position. 2. The portion of arm control assembly mounting the control pin, and the control bracket 30C, are hinged on the plate forming part of assembly 30. Since the pin 30A has followed the track 35B and the curved portion of bracket 30C was forced out by motion of tab 36B, the tension of spring 26 is tending to pull them together as the riser plate is returning to normal position. The governing factor in determining how far the bracket will be pulled in, is the setting of the landing adjustment screw 31.
Pickup lands.	1. During part of the change cycle when riser plate is in the outermost position, and carrying arm control plate along by tab 36B contacting spring 33, the stud 35C is stopped by cam 47A. This acts as a gauge to determine the point of contact of pin 30A on arm control track 35B. This cam having two different radii will govern the distance arm control plate can travel since this is set when the record size change is made. If the smaller radius side of cam 47A is toward stud 35C, the arm control pin 30A will ride portion of track 35B designated by "L," causing the pickup to land on 10-inch records. On the other hand, if the larger radius portion of cam is toward the stud, the pin will ride along track designated by "S," which determines landing point on 12-inch records.

RECORD DAMAGE

The spindle shelf and the top of spindle shaft should be free from burrs or rough edges to avoid scratching records or damaging record center holes. The record shelf edge should be smooth and be rounded only to a minute radius. Never round the bottom edge of the record separator latch.

A slight application of wax on the spindle shaft will prevent "squeal" of a stack of records.

LUBRICATION

Motor

Motor is lubricated at factory to provide normal operation for a long period of time.

If it becomes necessary to lubricate, use SAE #10 motor oil to saturate the felt wicks on the motor bearings.

Main Bearing

Use STA-PUT #512 or SAE #30 motor oil.

Slides and Levers

Use STA-PUT #512.

STA-PUT can be purchased from E. F. Houghton & Co., 303 W. Lehigh Ave., Phila., Pa.

REPLACEMENT OF SAPPHIRE

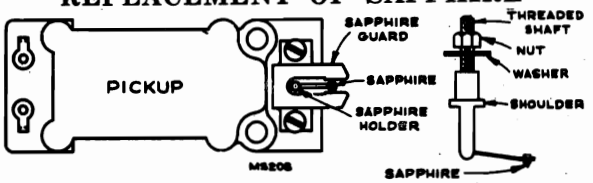

FIG. 48

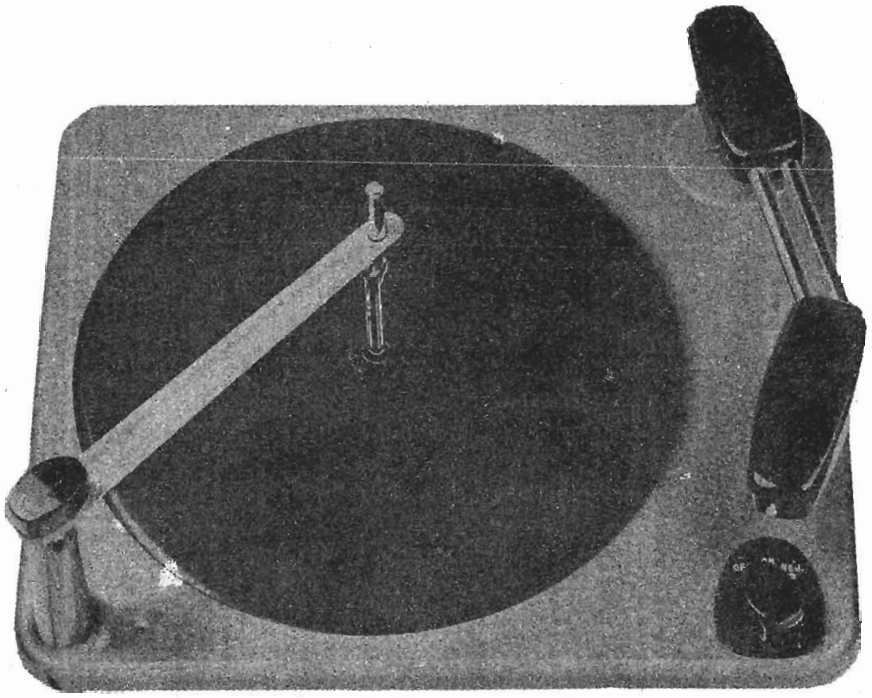
Caution: Never bend the sapphire support wire. Extreme care should be used when loosening the nut so that the twisting motion does not break the crystal. Remove the two screws holding the sapphire guard in place and remove guard. Remove the small nut and washer on the threaded shaft of the sapphire holder and gently push the shaft through the hole in the armature shaft until the sapphire holder assembly comes free. Do not use force or the crystal may be broken.

Insert threaded shaft of replacement sapphire holder through armature shaft and replace the washer and nut. Make sure that the sapphire is in the correct position. Take hold at the lower end of the shaft with a pair of pliers while tightening the nut, being very careful so as not to strip the threads or break the crystal. Replace the sapphire guard, positioning it by means of the oversize screw slots. Make certain that the sapphire and its supporting wire are centered in the guard. Tighten the guard screws. Before using, check to see that the sapphire projects far enough (approx. .020) beyond the guard so that the guard will not strike the record. If necessary, bend the guard a little.

SEARS, ROEBUCK & CO.

MODELS 101.211, 101.211-1, 101.211-2, 101.211-3, 101.211-4



The Models 101.211-1 and 101.211-1 are designed to automatically change as many as ten 12-inch, twelve 10-inch or ten intermixed records of standard commercial dimension with a minimum of record wear and to manually play any standard record up to twelve inches in diameter and to automatically shut off after last record has been played.

Model Differences:

Both Record Changers are similar, however, plastic parts on the 101.211-1 are finished in dark brown.

Chassis 101.211-2 same as 101.211-1 except uses ungrounded Syntronic pickup cartridge in pick-up arm with adapter plate.

101.211-3 - Chassis same as 101.211-1 except uses new style pickup arm with ungrounded Syntronic pickup cartridge.

101.211-4 - Chassis same as 101.211-3 except uses grounded Syntronic pickup cartridge.

Power Requirments

These changers have been designed to operate on 110 Volt 60 Cycle A. C. current unless otherwise indicated.

SEARS, ROEBUCK & CO. MODELS 101.211, 101.211-1, 101.211-2, 101.211-3, 101.211-4

RECORDS

The mechanism will operate automatically on all standard records. In case of records not having the standard "trip groove" (a spiral groove near the center of record) when tone arm reaches end of record, turn control knob to "REJ" to bring next record to playing position.

Warped, worn, disheu or dirty records will cause poor reproduction. Records should be stored away from heat in a record album or laid flat. Clean records periodically with a soft, lint-free cloth.

AUTOMATIC OPERATION

Loading:

(1) Pull straight up on record support knob (1) until record support (3) clears spindle.
(2) Swing record support in either direction until pin in shaft drops into locating groove. As many as ten 12-inch, twelve 10-inch or ten intermixed records may be loaded at one time.
(3) Carefully place records on spindle and lower to offset shoulder.
(4) Steady records with one hand and replace record support over spindle. Gently press down on record support knob until records are held parallel with turntable.

Starting:

To start operation of record changer, turn control knob (25) clockwise to "REJ" and release. Changer will operate automatically until last record has been played. Control knob then turns to "OFF" position, pickup arm (21) returns to rest and machine automatically stops.

Reject:

To reject a record at any time while it is playing, turn control knob to "REJ" and release.

Manual Stopping:

To turn off changer before last record has been played, turn control knob to "OFF", lift pickup arm from record and replace on rest.

Unloading:

To remove records from turntable, lift up on record support knob and swing record support in either direction until pin in shaft drops in locating groove. Carefully lift entire stack of records straight up.

CAUTION: When loading or unloading changer, use care to prevent bending spindle. Records should never be left on the offset portion of the spindle as they may warp. If changer is turned off before all records have been played, remove unplayed records from spindle or operate "Reject" until all records have dropped to turntable.

MANUAL OPERATION

Starting:

(1) To play single records or home recordings, pull straight up on record support knob until record support clears spindle. Swing record support in either direction until pin in shaft drops into locating groove.
(2) Lower record to offset shoulder of spindle and tilt toward back of tone arm. Carefully work record past offset shoulder.
(3) Turn control knob to "ON" and push down on trip lever (51) located near back of tone arm. Machine will then operate independently of cycling mechanism - PROVIDED - tone arm is moved all the way in to the spindle before it is returned to the rest after the record is played. When playing "inside out" records, move tone arm all the way in to spindle before setting it down on first playing grooves of the record.

Repeating:

(1) To repeat a 10-inch record, remove any records remaining above offset shoulder of spindle.
(2) Pull straight up on record support knob until record support clears spindle.
(3) Swing record support in either direction until pin in shaft drops into locating groove.
(4) Carefully lift records from spindle. Do not replace record support over spindle. Changer will repeat the record on the turntable until control knob is turned to "OFF".

MODELS 101.211, 101.211-1, 101.211-2, 101.211-3, 101.211-4 SEARS, ROEBUCK & CO.

LUBRICATION

No lubrication should be necessary for the life of the changer, but in cases of unusual use or high operating temperature, the changer should be lubricated as follows:
(1) Hinge bearing (97).
(2) Ratchet arm (102) and set down locater plate (101).
(3) Cam faces on lift arm (48), lift arm bearing, and lift arm cutoff rod bearings.
(4) Between lever spring (46) and cutoff rod (42).
(5) Heart shaped cam track on cam (51) and cam bearing (50).
(6) Spindle, between roller plunger (80) and roller spring housing (78) and between the roller spring housing and the spindle body.
(7) Turntable ball bearing (76).

Apply a small quantity of light machine oil to:
(1) Pickup arm locater assembly bearing (98) and ball bearing in pickup arm post (90).
(2) Ratchet pawl bearing (28).
(3) Trip rod bearings (30) and (61).
(4) Control lever bearing (35).

ADJUSTMENTS

NEEDLE SET DOWN: The set down position of the needle is adjusted by means of the two adjusting screws (10) & (15). If the needle is setting down too far out on the record, loosen the back screw (10) about 1/4 turn and tighten the front screw (15) to lock the adjustment in place. If the needle is setting down too far in on the record, loosen the front screw and tighten the back screw.

PICKUP ARM HEIGHT: The pickup arm height is adjusted by the screw (13) located on top of the tone arm lift rod. Turn the screw out or in until the underneath side of the tone arm clears the rest by 1/8" to 3/16".

SERVICE INFORMATION

CONTROL KNOB CANNOT BE TURNED TO "ON" POSITION

Machine stalled in cycle. Turn turntable carefully by hand until the control knob is free.

TURNTABLE DOES NOT REVOLVE WHEN CONTROL KNOB IS TURNED TO "ON" POSITION:

1. Machine stalled in cycle. Turn turntable carefully by hand until it starts rotating under its own power.
2. No current at motor:
   (a) Check to determine if current is reaching A. C. leads of changer.
   (b) Check switch to determine if it is closing.
   (c) Check wiring and soldered terminals in changer.
3. Motor defective:
   Remove turntable to allow motor to operate without load. If current is reaching the motor and pulley does not rotate, the motor is defective. Repair or replace.
4. Motor idler wheel not engaging turntable rim.
   If motor pulley is turning but turntable is not:
   (a) Check motor idler assembly to determine if it is free to contact the motor pulley and the turntable.
   (b) Wipe off the inside rim of the turntable to remove flock or if oily, clean turntable rim and rubber tire of idler wheel with carbon tetrachloride.
5. Turntable bearing tight:
   Hold idler away from turntable or remove idler wheel and rotate turntable by hand to see if it is free. If binding occurs, remove turntable, clean out foreign matter and lubricate with light oil.

CHANGER DOES NOT CYCLE WHEN CONTROL KNOB IS TURNED TO "REJ" POSITION:

1. Changer stalled or motor not driving turntable. See "TURNTABLE DOES NOT REVOLVE WHEN CONTROL KNOB IS TURNED TO "ON" POSITION".
2. Manual reject not actuating trip:
   Turn control knob to "REJ" position, hold and see if leg on control lever (44) is contacting the stud on the bottom of the ratchet casting (34) and turning the trip rod (60) sufficiently to allow the trip rod to disengage the trip.

3. Trip not actuating clutch:
When the trip rod (60) is turned, if the clutch pawl (63) does not move forward, engaging the pinion teeth, check for a loose pawl spring (49) or binding between the clutch pawl and the cam. If binding occurs, clean out foreign matter and check for freedom but do not oil.

RECORD DOES NOT DROP WHEN CHANGER CYCLES:

1. Spindle pusher shaft broken:
If the pusher shaft (74) is broken, the roller assembly (78) will drop out of the spindle (70). To replace the roller assembly, loosen the spindle screw (77) and remove the spindle. Slip the pusher shaft return spring (85) over the pusher shaft and insert the roller assembly in the spindle. Turn the milled flat section at the top of the pusher shaft until it faces out of the milled opening in the spindle. Press up on the roller until it raises about 1/8". Hook the pusher (71) around the pusher pin (72) and press the pusher back until it touches the spindle body. Push down and back on the pusher and slightly up on the bottom of the roller assembly until the pusher snaps into place.
2. Pusher in spindle not moving far enough forward to eject a record:
The pusher (71) should move up inside the spindle body, then move forward until it has reached a point flush with, or a maximum of .010" beyond the spindle body. To assure tha the pusher is all the way forward, the spindle roller should be raised high enough by the lift arm (48) at the top of the cam face to slightly compress the roller spring (81). See "TURNTABLE STALLS DURING CYCLE" - 7. If the roller spring is compressed and the pusher does not move far enough forward to eject a record, the spindle should be replaced. If a record is not pushed completely off the ledge, it may hang up on the spindle momentarily, then drop on the pickup arm when it moves in over the turntable.
3. Lift arm screw loose:
Check screw (47) to determine if it is turned all the way in.
4. Pusher raises outside spindle body:
When the changer cycles, the pusher (71) should first rise up inside the spindle body, then move forward inside the center hole in the record. If the pusher rises outside the spindle body, it will raise the record instead of pushing it off the spindle ledge. Check the pusher shaft (74) to see if it is straight. If the shaft is bent, it will force the pusher forward prematurely.
5. Lift arm roller broken off:
If the lift arm roller (53) is broken off, the lift arm (48) will not turn when the cam (51) revolves.

TWO RECORDS DROP AT ONCE:

1. Hole in record too large:
Check the diameter of the hole in the record. An oversize hole will cause two records to drop at once.
2. Spindle slide not fully down:
If the spindle slide is not all the way down, more than one record may be dropped at a time.
   (a) Check the slide to be sure it is free and does not bind at any point. Clean out foreign matter or straighten if necessary. Do not oil.
   (b) When records are placed on the spindle, be sure the slide is all the way down. The slide will normally raise slightly as a record is being dropped but it should return to place immediately.
3. Record support binding on spindle or bent out of square with the shaft.
The record support must be able to slide freely by gravity down the spindle. If the support does not follow the records down as they are being ejected, two or more records may be ejected at once.
If binding occurs:
   (a) Check the spindle to determine if it is straight. Bend carefully with the fingers if necessary.
   (b) Straighten the record support (3) if it is not square with the record support shaft.
   (c) If the hole in the record support is not centered over the spindle after checking (a) and (b), bend the support shaft post on the base plate until the hole in the record support is centered over the spindle.
   (d) When the pin in the record support shaft has just entered the slot in the record support shaft post on the base plate, the play in the record support as it is swung from one side to the other should be equal on both sides of the spindle. To correct bent position, hold the support shaft and carefully force the record support into the proper position. If the support is loose on the shaft, remove the knob and re-stake with hammer and punch.
4. Record pusher defective:
The record pusher (71) may be deformed, etc. This may cause two records to drop at once. Replace the pusher.

MODELS 101.211, 101.211-1, 101.211-2, 101.211-3, 101.211-4 SEARS, ROEBUCK & CO.

RECORD HITS PICKUP ARM:

1. Pusher in spindle not moving far enough forward to eject record. See "RECORD DOES NOT DROP WHEN CHANGER CYCLES". - 2.
2. Lift arm screw loose:
   Tighten lift arm screw (47).
3. Pusher extending beyond outside diameter of spindle:
   Cycle changer by hand until roller assembly (78) is at the top of its travel. Using new record as a gauge pass it over spindle to see if it binds at any point. File off high points on pusher (71) with a fine file until record will pass freely over spindle.
4. Pickup arm not adjusted properly:
   The adjustment procedure for the needle set down point is given under "ADJUSTMENTS" If the hinge bearing (97) has been removed or the hinge bearing set screw (9) has been loosened, the relationship between the hinge bearing and the pickup arm locater assembly (98) must be reset. The procedure is as follows:
   Loosen the set screw (9) sufficiently to allow the hinge bearing to slide on the pickup arm locater assembly shaft. The set screw may be adjusted with an Allen wrench through the hole in the adjusting ring (11) located between the two adjusting screws (10) and (15). Place a 1/32" shim between the set down locater (101)and the ratchet arm (102). Turn the control knob to the "OFF" position. Place the pickup arm on the rest. In this position the arm extending from the set down locater should be engaged by the turned up leg on the control lever (44). Take up all the play between the parts by pressing up on the bottom of the ratchet arm and down on the top of the hinge bearing. Tighten the hinge body set screw (9) and remove the shim.

NEEDLE DOES NOT SET DOWN ON 10" RECORD IN PROPER POSITION:

1. Pickup arm not adjusted properly. See "RECORD HITS PICKUP ARM" - 4.
2. Hinge catch does not return to 10" record position when changer cycles.
   (a) Stop the machine in mid cycle when the lift arm (48) has moved as far out as it will go and is about to move back to its starting position. Lift the pickup arm and see if there is a gap of at least 1/64" between the end of the leg on the catch (16) and outside step on the adjusting ring (11). The catch should be free to allow it to be pulled forward against the stop at the end of the leg on the adjusting ring. If there is not enough gap, check the setting of the hinge body and the pickup arm locater, see "RECORD HITS PICKUP ARM" - 4. If the setting is correct, the cam face on the lift arm (48) which contacts the round stud on the bottom of the ratchet arm (26) may be bent. The ratchet arm should be forced around far enough to bring the pickup arm out until the stop on the bottom of the hinge casting meets the stop in the base plate; then, to assure that the pickup arm is out as far as it will go, the lift arm should move the ratchet arm a few degrees further around, which will slightly compress the safety spring (93) and hold the pickup arm out firmly against the stop.
   (b) Lubricate the hinge bearing with lubriplate. Do not use heavy grease. If the bearing between the hinge bearing and hinge body binds, the safety spring will compress instead of bringing the hinge body around firmly against the stop.
3. Binding between safety spring and ratchet arm:
   If the safety spring (93) binds against the ratchet arm and does not hold the casting on the bottom of the pickup arm locater assembly (98) against the stop inside the ratchet arm, irregular needle set down will result. Disassemble the pickup arm locater assembly (98) by removing the lift arm (48), loosening the hinge bearing set screw (9) and pulling the ratchet arm and pickup arm locater assemblies down from the bottom of the changer. Hold the pickup arm locater shaft in one hand, turn the ratchet arm assembly to slightly compress the safety spring, release, and see if the safety spring returns the pickup locater casting firmly against the stop surface in the ratchet arm assembly. If binding occurs, remove the safety spring, see if the pickup arm locater casting turns freely in the ratchet arm casting. Remove burrs or sharp edge on end of safety spring, stretch safety spring a little to increase tension and replace.
4. Hinge catch does not disengage from the hinge cam:
   When the trip lever (7) has been depressed, it is held in the position until the catch (16) is disengaged, see "NEEDLE DOES NOT SET DOWN ON 12" RECORD IN PROPER POSITION" - 6. When the cycle is completed, if the catch does not disengage from the hinge cam (18):
   (a) Check to determine if the leg on the catch (16) is sliding down the incline on the leg on the adjusting ring (11), see "NEEDLE DOES NOT SET DOWN ON 12" RECORD IN PROPER POSITION" - 7.
   (b) The catch (16) and the hinge cam (18) are not disengaging when the catch leg is resting on the inside step on the adjusting ring. If this occurs, file the edge of the catch which contacts the hinge cam until the two parts have a clearance between them of about 1/64" when the leg on the catch is on the inside step on the adjusting ring.

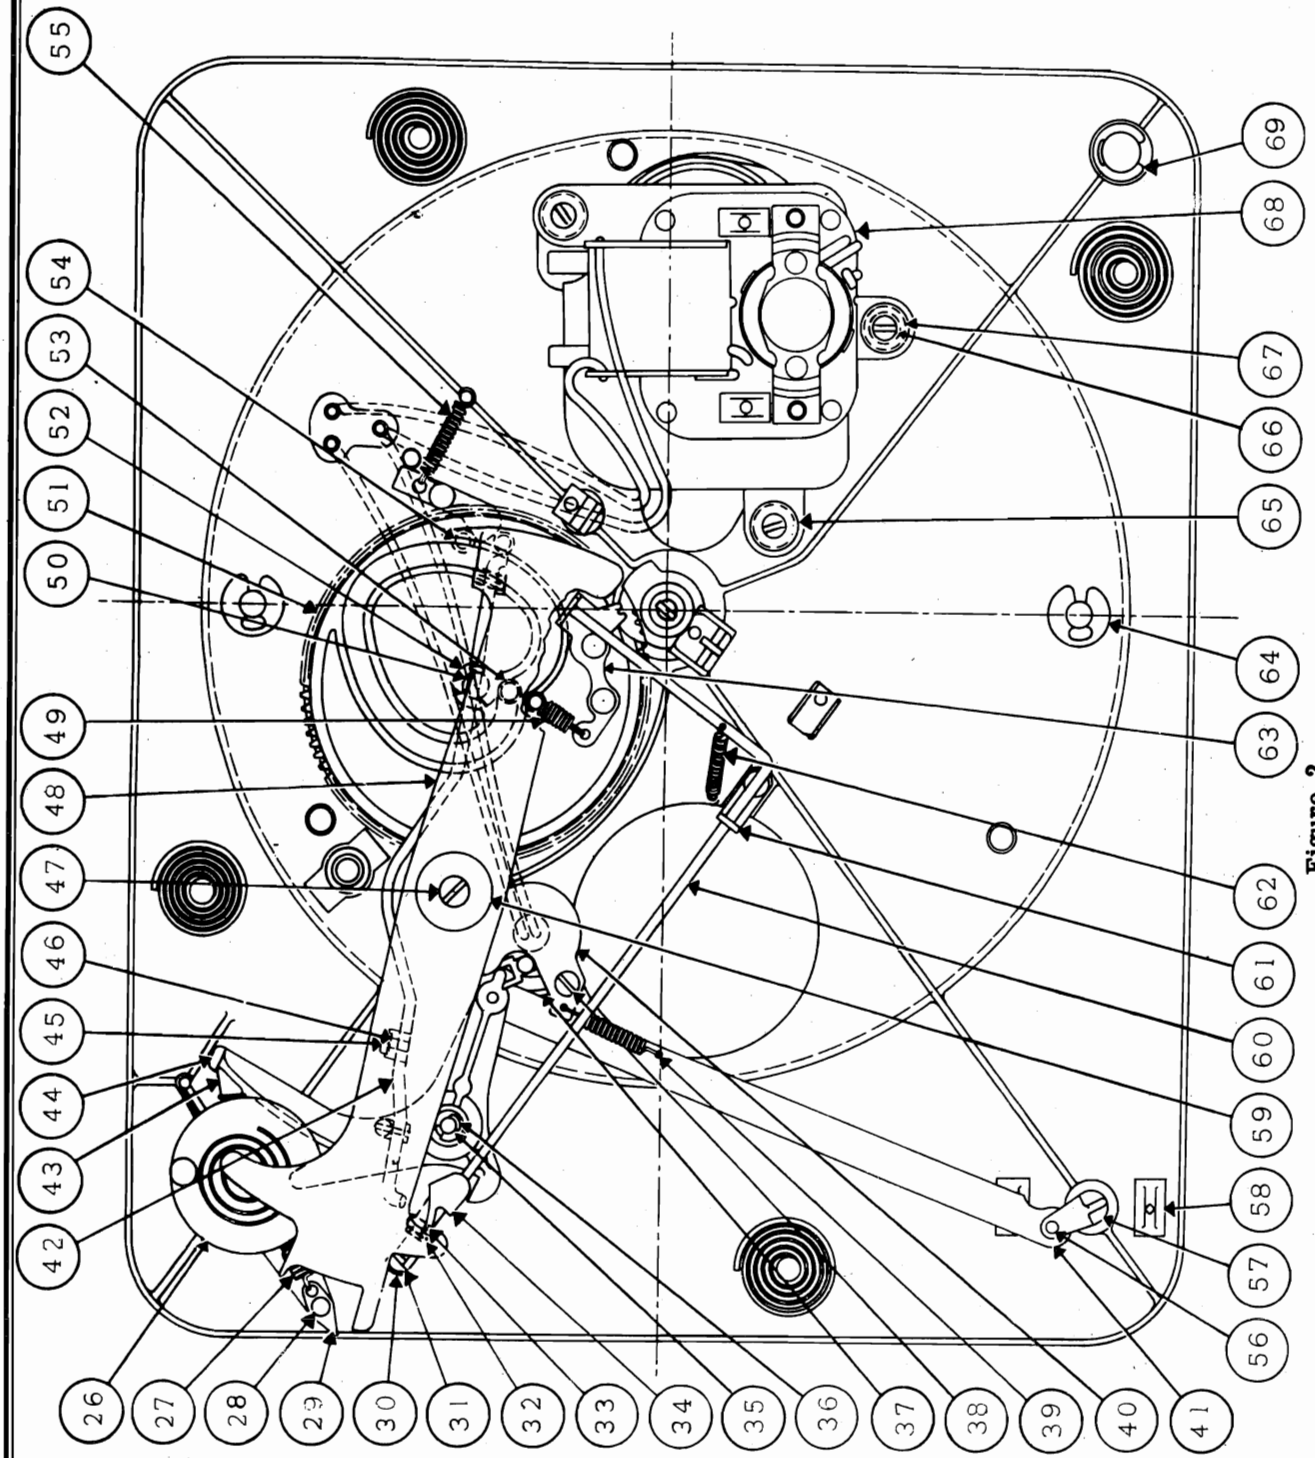

Figure 2

SEARS, ROEBUCK & CO. MODELS 101.211, 101.211-1, 101.211-2, 101.211-3, 101.211-4

NEEDLE DOES NOT SET DOWN ON 12" RECORD IN PROPER POSITION:

1. Diameter of 12" record undersize:
   The set down position of the needle for 12" records is determined by the edge of the record striking the trip lever (7). If a 12" record has a diameter of less than the standard size of 11 7/8" plus or minus 1/32", it may fail to depress the trip lever far enough.
2. Enlarged center hole in record:
   An enlarged center hole might fail to set the trip lever because it could produce the same effect as a small record.
3. Pickup arm not adjusted properly:
   See "RECORD HITS PICKUP ARM" - 4.
4. Binding between safety spring and ratchet arm:
   See "NEEDLE DOES NOT SET DOWN ON 10" RECORD IN PROPER POSITION" - 3.
5. Trip lever does not cock when 12" record drops:
   Allow a 12" record to drop to the turntable and shut off the changer just after it falls, before the pickup arm has a chance to move in over the record. The trip lever (7) should be forced down until the step on the hinge cam (18) passes the edge of the catch (16), preventing the hinge cam and the trip lever from returning to their original position. If the trip lever does not stay down in a depressed position:
   (a) Check the catch (16) to see if it is free to move forward and engage the hinge cam.
   (b) If the stop on the hinge body (14) is defective, it might allow the pickup arm to move too far out, thus moving the trip lever away from the spindle. This will produce the same effect as an undersized record.
6. Hinge catch does not go into inside step on adjusting ring when trip lever is depressed:
   When the trip lever (7) is tripped by a falling 12" record, the leg on the catch (16) should be moved out over the incline between the inside and outside steps on the adjusting ring leg and held in that position by the shoulder on the hinge cam (18) until the pickup arm starts to move in over the record. When this occurs, the leg on the catch should contact the incline and be moved out as it slides down the incline until the catch is disengaged and the trip lever can snap back up to a horizontal position. If the leg on the catch is not moved out far enough to enable it to slide down the incline, file about the 1/64" chamfer on the edge of the catch leg which contacts the incline.
   Check for binding between hinge body (14) and hinge bearing (97). Burrs on the bearing surfaces or lack of lubrication may prevent the hinge bearing from turning freely.

NEEDLE DOES NOT TRACK ACROSS RECORD PROPERLY:

1. Ratchet arm does not disengage from the set down locater when a cycle is completed.
   (a) There should be a 1/32" gap between the ratchet arm and the set down locater when the machine is not in cycle. If the gap is small enough to allow the parts to touch and bind as the needle moves across the record, the hinge bearing must be reset. See "RECORD HITS PICKUP ARM" - 4.
2. Hinge bearing binds.
   Place a block under the back end of the tone arm to prevent the needle from touching the turntable. With sensitive gram scale, check the amount of force required to move the pickup arm across the turntable. The force required should not exceed 2 grams. If the pressure required is excessive:
   (a) Check the ratchet arm and set down locater for binding. See 1, above.
   (b) Check the bearing in the pickup arm post for binding. The bearing is located below the hinge bearing (97). To inspect it, loosen the set screw (9) in the hinge bearing. Un-solder the pickup leads and pull them out through the hole in the hinge bearing. Pull up on the hinge and pickup assemblies. Clean foreign matter or corrosion from the bearings; Lubricate with light oil. To reset position, see "RECORD HITS PICKUP ARM" - 4.

CHANGER TRIPS BEFORE NEEDLE REACHES END OF RECORD:

1. Hole in record too large:
   If hole in record is too large, the grooves may turn eccentric with the spindle and cause premature tripping.
2. Binding in trip rod bearings:
   With the trip released, check the trip rod for play in the bearings. It should be free to turn without binding.

CHANGER DOES NOT CYCLE WHEN RECORD HAS BEEN PLAYED:

1. Binding in trip rod bearings. See "CHANGER TRIPS BEFORE NEEDLE REACHES END OF RECORD" - 4.
2. No eccentric trip groove on record:
   All standard records made today have an eccentric trip groove, but some records made in the past did not have this groove. When records of this type are being played the control knob must be turned to "REJ" at the end of the record.

MODELS 101.211,
101.211-1, 101.211-2,
101.211-3, 101.211-4

SEARS, ROEBUCK & CO.

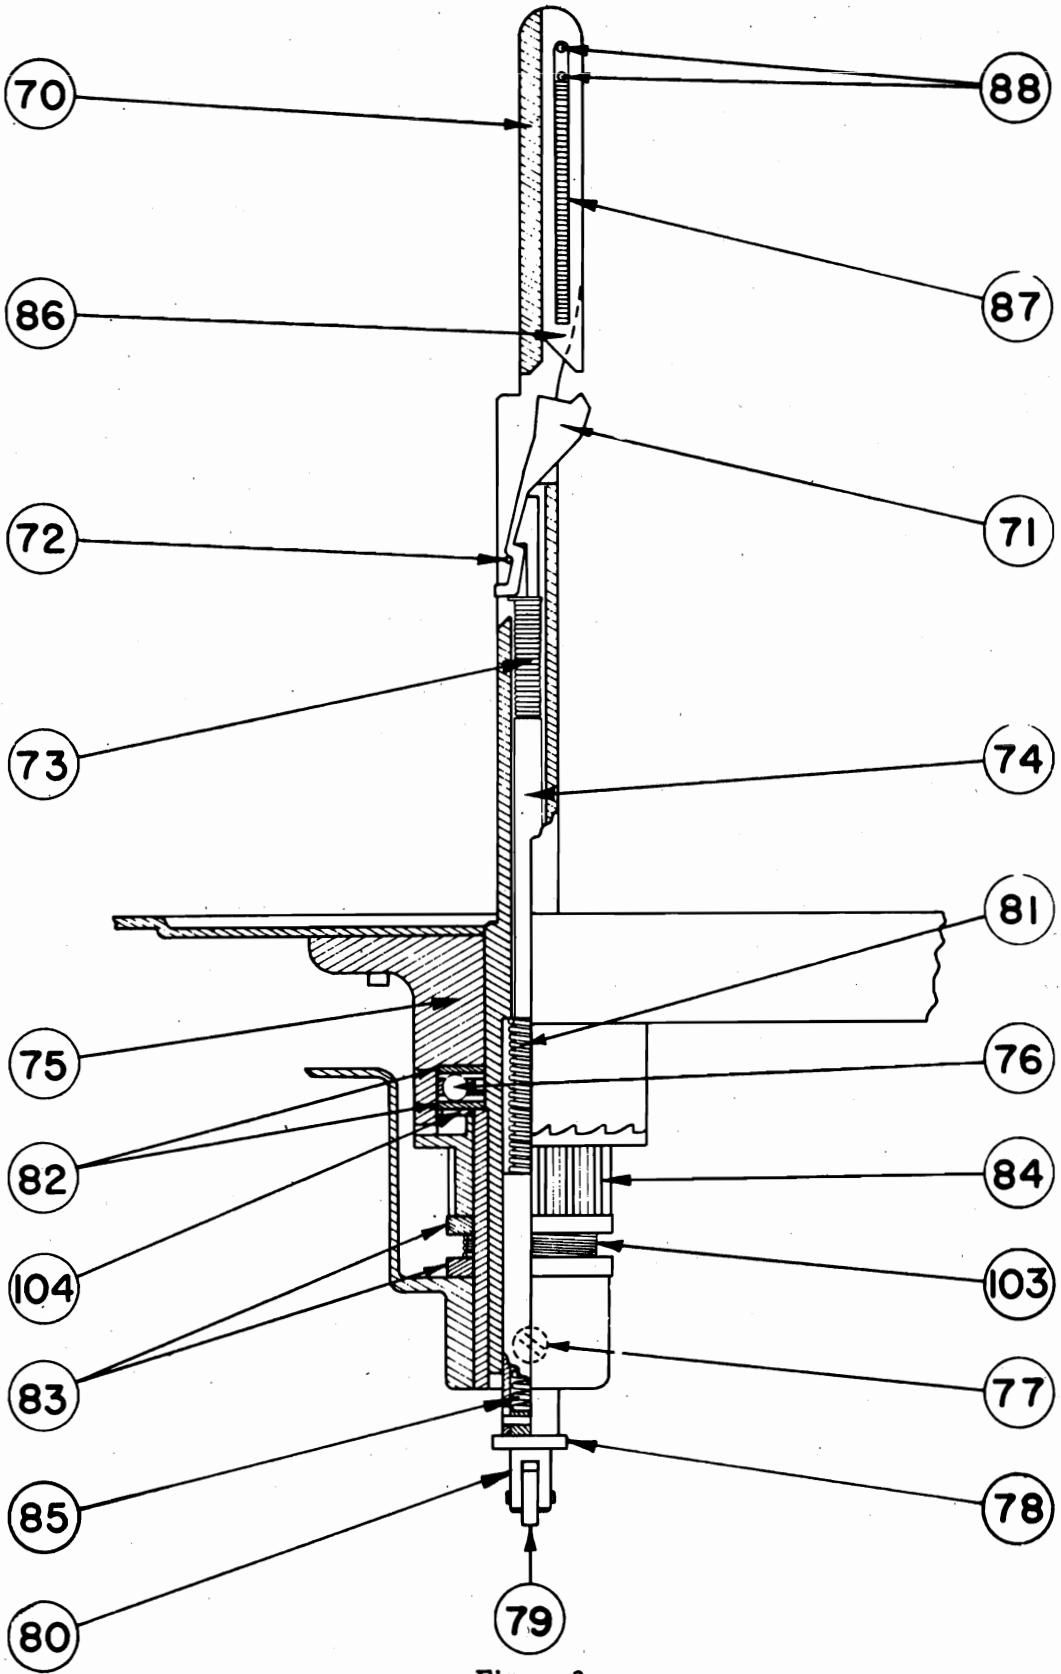

Figure 3

3. Ratchet pawl not engaging the ratchet sector:
The ratchet pawl (29) must press against the ratchet sector forcing it back when the motion of the pickup arm is reversed. If the pawl does not contact the ratchet sector or slides over it:
   (a) Check the pawl (29) for burrs around the hole.
   (b) Be sure the pawl is free to turn on the bearing. If the drive pin (28) is driven down too far causing binding, the pin may be relieved by tapping up on the shank.
   (c) Check the pawl spring (27) for insufficient tension.
   (d) Check the point on the pawl. It should be sharp to enable it to dig into the ratchet teeth. Sharpen with stone if necessary.
4. Ratchet sector too far away from ratchet pawl:
If the ratchet sector (34) is too far away from the pawl (29), the eccentric motion required to operate the trip will be excessive. If necessary, bend the trip bracket slightly to reduce this distance. If the sector is too close to the pawl, excessive trip pressure will result.
5. Needle jumps out of eccentric groove in record:
   (a) Check trip pressure, it should not exceed 8 grams for the trip shown in Fig. 2. If the pressure is excessive, see "CHANGER TRIPS BEFORE NEEDLE REACHES END OF RECORD" - 4 above.
   (b) The record may be defective. The trip groove is often too shallow. Check with a record which is known to be good.
   (c) The point on the needle may be bad. Check for a worn point.
   (d) There may be binding in the pickup bearing or ratchet arm. See 1 and 2, "NEEDLE DOES NOT TRACK ACROSS RECORD PROPERLY".
6. Clutch pawl binding on cam face:
On the trip mechanism shown in Fig. 2 the clutch pawl (63) must be free to move forward and engage the pinion gear teeth when the trip rod releases it. Check for burrs or foreign matter lodged between the pawl and the cam. Do not oil as this might collect dirt and gum up the pawl.

PICKUP ARM STRIKES RECORDS ON SPINDLE WHEN IT RAISES OR PICKUP ARM REST WHEN IT MOVES OUT:

Pickup arm height not adjusted properly. See instructions for adjusting the pickup arm height under "ADJUSTMENTS".

TURNTABLE SPEED TOO SLOW:

1. Binding in turntable bearing: Check the turntable bearing for freedom. Hold the motor idler wheel (2) out of engagement with the turntable and spin the turntable by hand to see if it turns readily and coasts for a long time. Clean out the bearings to remove foreign matter and lubricate with light oil.
2. Motor pulley too small in diameter: Replace the motor pulley with one having a greater diameter.
3. Line voltage too low: The line voltage should not be less than 100 volts or the turntable may be too slow.
4. Operating temperature too low. If the machine has been stored in a cold place or operated in surroundings at a temperature of less than 60° F., the turntable speed may be too slow.

TURNTABLE SPEED TOO FAST:

Motor pulley too large in diameter. Replace the pulley with one having a smaller diameter or grind one or two thousandths off the pulley.

TURNTABLE STALLS DURING CYCLE:

1. Motor idler not engaging turntable. See "TURNTABLE DOES NOT REVOLVE WHEN CONTROL KNOB IS TURNED TO "ON" POSITION" - 4.
2. Turntable bearing tight. See "TURNTABLE DOES NOT REVOLVE WHEN CONTROL KNOB IS TURNED TO "ON" POSITION" - 5.
3. Operating temperature too low. See "TURNTABLE SPEED TOO SLOW" - 4.
4. Line voltage too low: The line voltage should not be less than 100 volts.
5. Binding in drive mechanism:
   (a) Remove lift arm (48) and hold idler (2) away from turntable or remove idler wheel. Cycle machine, turning turntable slowly by hand. The cam should turn freely for the complete revolution without binding at any point. If binding occurs check for foreign matter in the gear teeth, a bent cam bearing or bent spindle bushing.
   (b) Replace lift arm, loosen spindle screw (77) and raise spindle high enough to clear the lift arm cam when the machine cycles. Hold the pickup arm lift rod (94) up so the end of the lift rod does not contact the lift arm cam. Cycle the machine by hand. The entire cycle should be free, without binding at any point. If binding occurs, check the lift arm bearing for freedom and the lift arm roller to be sure it is not bent causing binding in the cam track.

MODELS 101.211, 101.211-1, 101.211-2

SEARS, ROEBUCK & CO.

6. **Binding between pickup arm lift rod and lift arm cam face:** Cycle machine stopping it halfway through the cycle just as the lift arm is about to return. Lift pickup arm and raise lift rod (94) by pulling up on the adjusting screw (13) as high as it will go. Feel the lift arm (48) for play. The lift rod may still touch the lift arm cam face, but it should not bind. If binding occurs, the lift arm bearing may be bent or the fiber washer (59) under the lift arm should be removed to lower the lift arm.
7. **Spindle roller spring compressed too far.** Cycle the changer and watch the relationship between the bottom of the roller spring housing (78) and the roller (79). Just before the top of the lift arm cam raise is reached, the roller spring housing should stop its upward motion and the roller should continue up .005" to .047" more, slightly compressing the roller spring (81). If the spring compresses too much, the changer may stall on the shut off cycle. Check the lift arm bearing to determine if it is square with the base plate. It should be 90° to the base plate within 1/4°. If it is bent, carefully pound into place with a soft mallet. If it is straight and the roller spring is being compressed too much, remove the fiber washer (59) between the lift arm and the steel washer under it. The dimension on the spindle between the shoulder on which it rests and the bottom of the roller should be 1 7/8" plus or minus .010". An oversize spindle could also cause a binding condition.
8. **Motor weak.** In cases where everything checks all right but the changer still stalls in cycle, the motor may be weak.

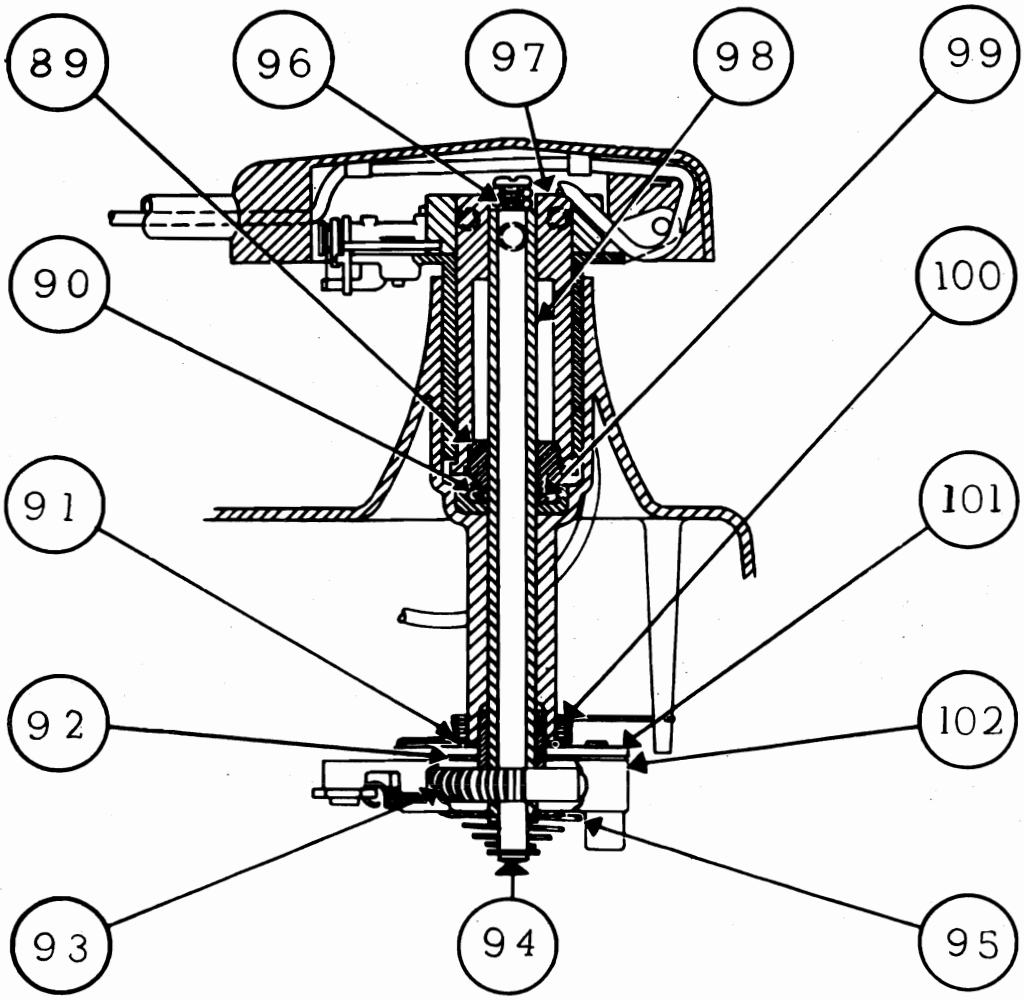

Figure 4

CHANGER CONTINUES TO CYCLE:

1. Trip catch not engaging properly. See 2, "CHANGER TRIPS BEFORE NEEDLE REACHES END OF RECORD".
2. Insufficient tension on trip spring. See 3, same as above.
3. Binding in trip rod bearings. See 4, same as above.
4. Defective trip catch. See 5, "CHANGER DOES NOT CYCLE WHEN RECORD HAS BEEN PLAYED".
5. Reject control holding trip open. Check the control knob (25), control link (41), and control lever (44) for binding to determine if the control assembly is holding the trip in a disengaged position.
6. Trip rod not holding clutch pawl out of engagement with pinion teeth. On changers having the trip shown in Fig. 2, the end of the trip rod (60) should contact the bent up section of the clutch pawl (63) and push the pawl out of engagement with the pinion teeth. If the trip rod is not free to meet the clutch pawl, continuous cycling will result.
   (a) See if the trip spring (62) is in place.
   (b) Check the trip rod (60) for freedom in its bearings.

NOISE DURING PLAYING OF RECORD:

1. Rumble:
   (a) From motor: If a low pitched rumbling sound comes from the loud speaker while a record is being played, check the motor grommets (67) to be sure the motor is freely suspended on them. The motor lead wires should have slack to allow the motor to float. Motor rumble may also come from an out of balance motor rotor. In this case, the motor should be replaced.
   (b) From bearings: Defective turntable bearings can cause rumble. Check for foreign matter in the bearings, defective balls, binding between balls and ball retainer. Rough surface on washers. Clean ball bearing, sleeve bearing and washers, lubricate with lubriplate or light oil.
2. Defective motor idler wheel:
   A rapid thumping sound while the motor is running may indicate a flat spot on the motor idler wheel (2). Remove the turntable and check the rubber tire on the idler. If the surface of the rubber tire is not smooth and even, replace the idler.
3. Defective needle:
   A bad needle will cause loud needle scratch or hiss through both the speaker and the air directly from the needle. For reduced needle scratch and "needle talk" use a needle with high vertical compliance such as an offset "dog leg" type needle.
4. Defective record:
   Worn or defective records cause needle scratch and distortion of the recorded sound. If the record is warped, it may slip on the other records causing "wow", a waver in the recorded sound. An enlarged hole in the record can also cause "wow".
5. Turntable scrapes:
   If a scraping sound occurs as the turntable revolves, check:
   (a) Turntable warped, causing outer rim to rise and fall.
   (b) Motor idler (2) bent.
   (c) Wires beneath turntable rubbing.
6. Squeaks:
   Squeaking sound as changer operates indicates lack of oil. Lubricate points indicated under "LUBRICATION".

NOISE DURING CYCLING:

1. Squeaks: See "LUBRICATION".
2. Grinding sound indicates lack of lubrication or worn parts:
   Lubricate spindle roller assembly in bearing between it and spindle body.

DISTORTION OF RECORDED SOUND:

1. Defective needle. See 3, "NOISE DURING PLAYING OF RECORD".
2. Defective record. See 4, "NOISE DURING PLAYING OF RECORD".
3. Defective pickup cartridge:
   When the cartridge is defective, the recorded sound may be distorted, weak or stop entirely.
4. Defective amplifier:
   Check phonograph, amplifier and speaker.

MODELS 101.211, 101.211-1, 101.211-2, 101.211-3, 101.211-4 SEARS, ROEBUCK & CO.

NO SOUND DURING PLAYING:

1. Defective cartridge. See 3, "DISTORTION OF RECORDED SOUND" - 4.
2. Defective wiring:
   Check pickup leads for a shorted or open lead.
3. Defective amplifier. See "DISTORTION OF RECORDED SOUND" - 4.

EXCESSIVE RECORD WEAR:

1. Binding in pickup arm. See 1 and 2, "NEEDLE DOES NOT TRACK ACROSS RECORD PROPERLY".
2. Defective needle. See 3, "NOISE DURING PLAYING OF RECORD".
3. Excessive needle pressure:
   The pickup arm is designed to give the proper needle pressure when an aluminum cased cartridge is used. If a cartridge with a die-cast housing is used, a compensating spring must be used to bring the needle pressure down to the usual standard of 1 oz. to 1½ oz. If the needle pressure is too great on a compensating spring, bend the long end of the spring.

CHANGER DOES NOT SHUT OFF AFTER LAST RECORD HAS BEEN PLAYED:

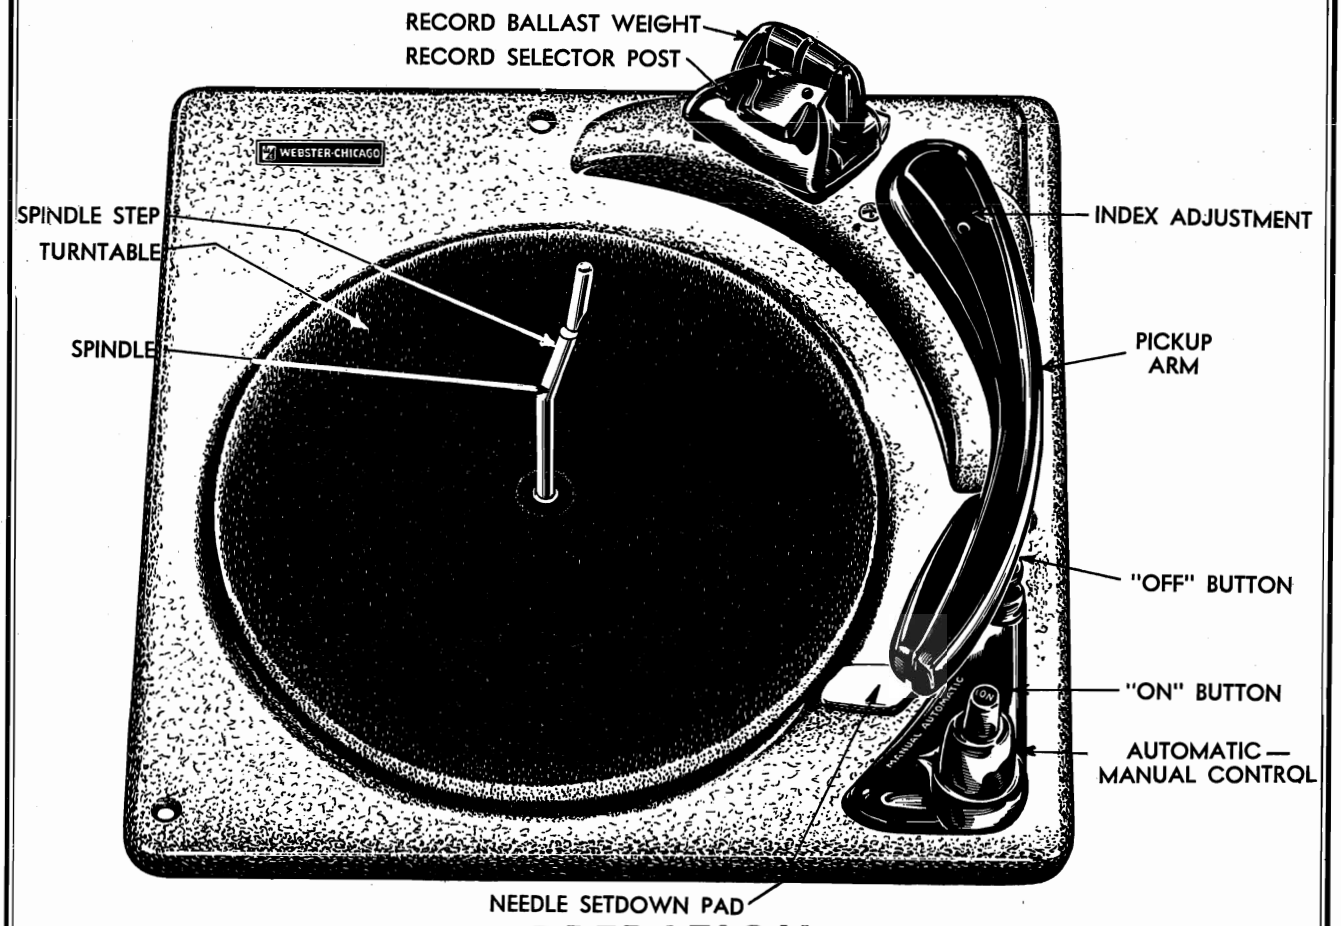
1. Record support binding on spindle:
   The record support (3) must rest on the offset shoulder of the spindle or the changer will not shut off.
   See 3, "TWO RECORDS DROP AT ONCE".
2. Changer stalls during shut off cycle.
   See "TURNTABLE SECTIONS; under "SERVICE INFORMATION.
3. Cutoff rod not engaging shoulder on spindle roller spring housing.
   On the shut off cycle, the end of the cutoff rod (42) should contact the shoulder on the bottom of the spindle roller spring housing (78) and turn the cutoff rod over 90°. If the end of the cutoff rod passes under the roller spring housing as the machine cycles, on the shut off cycle, check:
   (a) The record support to be sure it is resting on the spindle shoulder, see 1, above.
   (b) The spindle to see if it is being held down in place by the spindle screw (77).
   (c) The lift arm screw (47) to be sure it is tight.
   (d) The bent up end of the cutoff rod (42) may be short. Replace if necessary.

PICKUP ARM DOES NOT SET DOWN ON REST AFTER LAST RECORD HAS BEEN PLAYED:

Control lever does not engage set down locater.
On the shut off cycle, one leg of the control lever (44) should catch the set down locater (43) holding it to prevent the return spring (100) from pulling the pickup arm in. The pickup arm should be held against the stop in the base plate. In this position, the nest in the pickup arm should be directly above the pickup rest.

CHANGER SHUTS OFF PREMATURELY:

1. Spindle roller spring compressed too far. See 7, "TURNTABLE STALLS DURING CYCLE".
2. Roller spring in spindle too weak:
   When the bottom record of a stack of ten 12" records is being ejected from the spindle ledge, the roller spring (81) should not compress until just before the roller reaches the top of the cam incline on the lift arm. If the roller spring is compressed under the load of a full stack of records it may cause premature shut off. Replace the roller assembly (78) if necessary.
3. Record too thick:
   The changer is designed to play standard records. If an old style 1/8" thick record is used, the changer will shut off instead of dropping the record.
4. Cutoff rod not being reset:
   After the shut off cycle, when the cutoff rod (42) has been turned to throw the switch to the "OFF" position, it should be returned to its original position the next time the machine cycles by the bent up end of the cutoff rod, contacting the round stud on one leg of the control lever (44). The flat spring (46) acting against the cutoff rod should throw the rod against its stop on the lift arm (48) and hold it there. If the cutoff rod is not fully turned, the bent up end next to the spindle may stick up high enough to prematurely contact the shoulder on the roller spring housing (78).
   (a) Check the lever spring (46) for tension. Remove and bend slightly to increase tension if necessary.
   (b) Lubricate the cutoff rod bearings and around the lever spring with lubriplate or oil.
   (c) Check the clearance between the end of the cutoff rod (42) which passes under the control lever (44) and the bottom of the round stud on the control lever. When the cutoff rod is in its normal operating position, it should not clear the bottom of the round stud by more than enough to completely turn the end of the cutoff rod from a vertical position back to a horizontal position.



OPERATION

MOTOR

Connect the motor cord to a source of 105-115 volt 60 cycle current only. If it is desired to operate the changer on 50 cycle current, a special motor pulley (Part No. 17X412-11) must be used in place of the one supplied with the changer in order to drive the turntable at the required speed of 78 R.P.M.

Do not under any circumstances connect the motor to a source of direct current or alternating current of any other frequencies.

PICKUP

The high impedance crystal cartridge supplied may be of the fixed permanent point or removable needle type. If it is the latter, use a needle which is not more than $1\frac{1}{16}$ inches long for most satisfactory results.

Some desirable qualities of a good needle are faithful reproduction, low surface scratch or hiss, long wearing qualities, minimum record wear and rugged construction.

The Webster-Chicago Nylon Needles are particularly adaptable for use with your Webster "156". The "Knee-action" of the nylon knee permits the needle to ride the record groove in a gentle, floating motion, protects valuable records from unnecessary wear . . . virtually eliminates breakage of the sapphire tip if accidentally dropped . . . greatly lengthens needle life . . . produces a pleasing harmonious tonal balance and delivers remarkably authentic reproduction. DO NOT USE SINGLE PLAY OR CACTUS NEEDLES FOR AUTOMATIC OPERATION.

OPERATION — AUTOMATIC

1. Turn the Record Selector Post to "10," or "12" for ten or twelve inch records.
2. Turn the Selector Control (sleeve of ON button) to AUTOMATIC.
3. With the Record Ballast Weight turned back, place up to ten 12" records, or twelve 10" records on the spindle so that the bottom record rests on the step of the spindle and the shelf of the Record Selector Post.
4. Turn the Record Ballast Weight forward to rest on the top record.
5. Press the ON button.

To "reject" any record while playing in the AUTOMATIC position, press the ON button.

NOTE: The OFF button may be pressed during any portion of the change cycle. The Pickup Arm may be moved manually at any time without damage to the mechanism. However, after

the last record has been played, the Pickup Arm is automatically locked in position and should not be handled until it has come to rest on the OFF button.

6. After the last record has been played, the entire stack may be removed from the turntable at one time. The simplest procedure is as follows:
   a. Turn the Record Ballast Weight out of position.
   b. Place the fingers of both hands under opposite edges of the bottom record.
   c. Do not apply pressure to the top record. (Keep your thumbs free.)
   d. Lift the stack of records straight up, following the contours of the spindle. This permits the stack of records to follow the curve of the spindle without binding and greatly facilitates the removal of the stack.

OPERATION — MANUAL

1. Turn the Record Selector Post to the 12" position. (This is not essential but permits more clearance in loading and unloading records.)
2. Turn the Selector Switch (sleeve of ON button) to MANUAL.
3. Place a record on the Turntable. It may facilitate this operation if the record is placed over the spindle at an angle, with the edge of the record held below the level of the Record Selector Post Shelf. Records may be removed in this same manner.
4. Press the ON button.
5. Place the needle gently on the edge of the record. Do not lift the Pickup Arm too high as this will cause it to catch in the Automatic Stop Lock position. Particular care should be exercised if your pickup has a sapphire point needle. Although the sapphire is very hard and long wearing, it is extremely brittle and may be fractured or chipped if dropped on the record.
6. To stop the mechanism at any time, press the OFF button.

SERVICE INFORMATION AND ADJUSTMENTS

All units are accurately adjusted, lubricated and tested at the factory. However service repairs and adjustments sometimes become necessary. This bulletin should be studied carefully before making any adjustments or replacing parts.

Service parts are available from your Webster-Chicago distributor. All parts must be ordered by piece part number and also record changer model and production number, stamped on the under side of the main plate.

The functions and most probably misadjustments of the main assemblies are as follows (reference numbers refer to the exploded view)

THE AUTOMATIC TRIP FAILS TO FUNCTION

The Main Cam Assembly (38) and Actuating Gear (36) are the heart of the record changer. The Main Cam Assembly drives the mechanisms associated with the action of the Pickup Arm (5) and the Record Selector assemblies. It, in turn, is driven by the gear train (29, 30, 31) and the Turntable which is rim driven by the phonograph motor.

The Main Cam Assembly and Actuating Gear is put in motion or "tripped" by means of the "automatic" trip or by the manually operated "reject" trip. When the movement of the Pickup Arm toward the spindle is greater than ⅛" in ½ revolution of the Turntable, the Automatic Trip Arm (33) trips the Velocity Trip and Roller Assembly (37). This releases the Actuating Pawl on the Main Cam Assembly (38), allowing it to engage the Main Cam Actuating Gear (36) and driving it through the change cycle. The pressure from the Automatic Trip Arm required to actuate the trip mechanism is negligible.

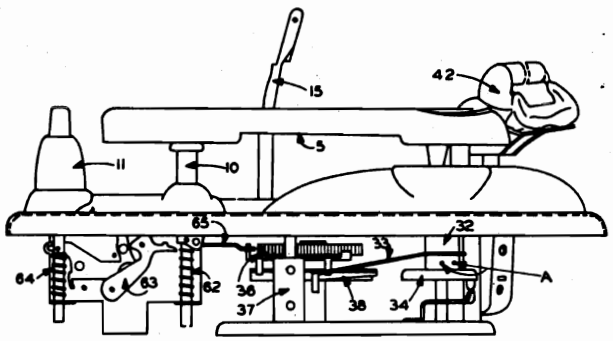


Fig. 1

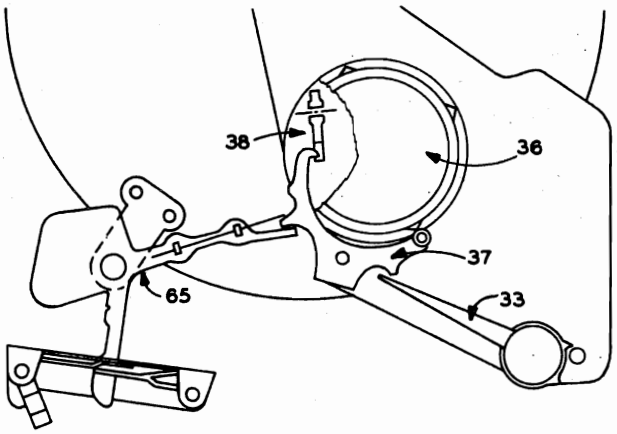

Fig. 2

The Automatic Trip Arm (33) follows the movement of the Pickup Arm through a weighted friction clutch (32). This clutch must be kept free of oil and grease. Should it become necessary, clean the clutch parts with carbon tetrachloride. This clutch should operate the trip mechanism without placing undue drag on the movement of the pickup arm.

Also check for:

1. Velocity Trip and Roller Assembly binding.
2. Slight burr on end of the actuating pawl or on the underside of the Velocity Trip hook.
3. Actuating Pawl stuck (part of Main Cam Assembly (38) engaged by the hook end of the Velocity Trip and Roller Assembly (37).
4. Automatic Trip Arm (33) bent and not hitting the Velocity Trip and Roller Assembly (37).
5. Automatic Trip Arm (33) fails to touch the Velocity Trip and Roller Assembly.
6. Velocity Trip and Roller Assembly (37) rubbing on the underside of the Main Cam Actuating Gear (36).
7. No velocity lead-in groove or eccentric groove in the center of record.
8. Foreign matter in record groove.
9. Badly worn record.
10. Badly bent or worn needle.

IF THE "REJECT" TRIP FAILS TO FUNCTION

When the "On" button is pressed, the hair spring of the "reject" trip lever arm (65), actuates the Velocity Trip and Arm Assembly, putting the change mechanism in cycle.

Check for:

1. "Reject" trip hair spring of Lever (65) bent or broken.
2. Velocity Trip and Roller Assembly (37) binding.
3. Actuating Pawl (part of Main Cam Assembly 38) stuck.

IF THE MECHANISM CONTINUES TO CYCLE

At the completion of the change cycle, the Actuating Pawl is disengaged from the Main Cam Assembly Actuating Gear (36) by the hook end of the Velocity Trip and Roller Assembly (37) which has been returned to its normal position by the reset points on the Main Cam Drive Gear (Fig. 3). This hook should be adjusted for about 1/64" clearance from the bottom of the Main Cam Drive Gear (36), Fig. 1. Greater clearance may permit the pawl to bounce past the hook and reengage, causing the mechanism to continue to cycle.

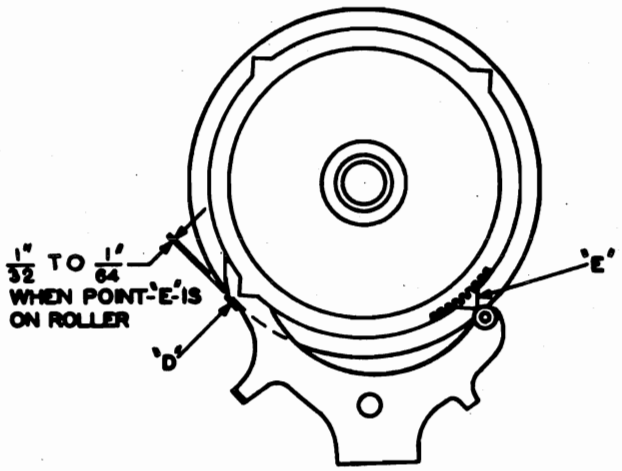
If the clearance between the lip on the Velocity Trip Lever and the edge of the Main Cam is too small, it will prevent the hook end of the Velocity Trip Lever from engaging the trigger. Adjust the clearance between the lip (D, Figs. 3 and 5) on the Velocity Trip Lever of the Main Cam to be within 1/64" when the roller is contacting the point of one of the protrusions on the Actuating Gear.

Also check for:

1. Velocity Trip and Roller Assembly (37) rubbing on Main Cam Actuating Gear (36).
2. Manual Trip Lever (65) binding.
3. "Disengage Roller" broken on Velocity Trip and Roller Assembly (37).

PICKUP ARM LIFT TOO HIGH OR TOO LOW

The vertical movement of the pickup arm is controlled by the angle of the Pickup Arm Raising Lever (40), Fig. 4. The needle should approach the top record of a full stack of 10" records on the turntable with approximately 1/8" clearance.



ADJUST IF NECESSARY BY BENDING AT POINT "D".

Fig. 3

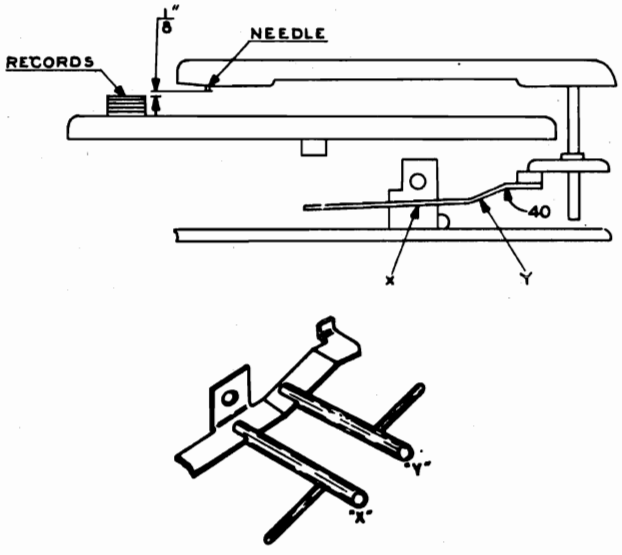


Fig. 4

To adjust:

1. Put a full stack of 10" records ON THE TURNTABLE.
2. Press the "On" button and rotate the Turntable clockwise until the needle clears the top record of the stack by about 1/8".
3. Be sure the notch in the Pickup Arm raising disc (34) engages the pickup arm raising lever (40).
4. If the needle does not clear the top record or if it raises too high, adjust by bending the pickup arm raising lever at the point indicated in Fig. 4.

CAUTION: All adjusting bends should be made slowly, using slight but firm, easy pressure.

Be sure the set screws of (A of Fig. 1) of the pickup arm raising disc are not loose and are properly positioned in the alignment holes as explained in the paragraph on Needle Setdown Indexing.

NEEDLE SET DOWN INDEXING INCORRECT

The horizontal movement of the pickup arm (5) is controlled by the eccentric excursion of the Pickup Arm Raising Lever (40) moving the Pickup Arm Raising Disc (34) when actuated by the Main Cam Assembly (38). The eccentric screw (part of 6), accessible through the top of the pickup arm (5), should take care of any normal position adjustment. Turn this screw clockwise to index the needle in toward the spindle and counter-clockwise to index the needle out away from the spindle.

Should further adjustment be necessary, proceed as follows:

1. Set the eccentric screw, just mentioned, to a middle position.
2. Set the Record Selector Post (42) to the 10" position.
3. Operate the mechanism by revolving the Turntable manually until the needle drops to within 1/8" of a 10" record on the turntable.
4. Be sure the notch in the Pickup Arm Raising Disc (34) engages the Pickup Arm Raising Lever (40).
5. With a No. 8 Bristol wrench in each of the set screws of the Pickup Arm Raising Disc (35) as indicated in A, Fig. 1, alternately loosen one screw and tighten the other until the needle rests above the record lead-in groove at the desired point.
6. Complete the change cycle of the mechanism and position the Pickup Arm on the "off" button (10). If necessary, bend the tongue of the Pickup Arm Raising Disc closer to or away from the Base Plate Post until the Pickup Arm is correctly seated on the "off" button when the tongue is touching the Base Plate Post.

NOTE: All adjusting bends should be slight but firm, easy bends.

7. Be sure that both set screws are tight when this adjustment is completed.
8. Turn the Record Selector Post to 12" and check the needle drop on a 12" record. Make any additional adjustments with the eccentric screw mentioned previously.

PICKUP ARM DROPS OFF THE "OFF" BUTTON

The upturned end of the pickup arm pivot shaft bracket (35) prevents the pickup arm from falling off the "off" button. There should be approximately 1/64" clearance between the tongue of the Pickup Arm Raising Disc (34) and the bottom of the groove formed by the bracket and the Base Plate Post. Bend the Bracket end up or down to secure proper positioning of the disc tongue and the Pivot bracket. Be careful to bend the end only or the Bracket will bind on the Pickup Arm Pivot Shaft (7).

The Bracket should not be too high or the disc tongue will rub on it when the needle approaches the edge of a 12" record, causing "glide in" on the first few grooves of the record.

CHANGE CYCLE STARTS BEFORE END OF RECORD

If the trip assembly chatters while the changer is running, or if the changer cycles before the entire record is played, there is probably insufficient clearance between the hook end of the Velocity Trip and Roller Assembly (37) and the Actuating Gear (36). This clearance should be adjusted to be within 1/32" to 1/64" by bending the lever at point "C" shown in Fig. 5.

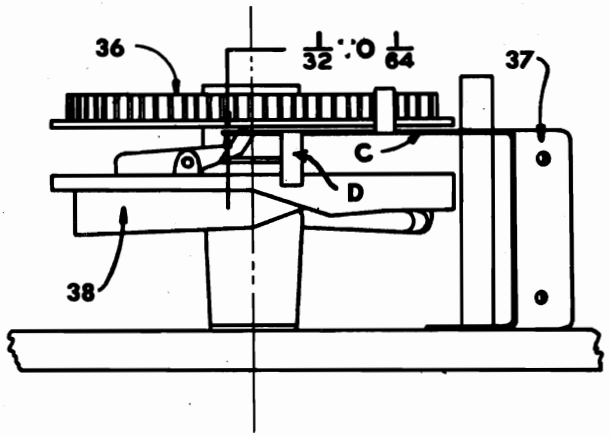

Fig. 5

MORE THAN ONE RECORD IS DROPPED DURING A CHANGE CYCLE

The floating latch at the top of the Record Spindle is so spaced that only one record at a time can slide between the heel of the latch and the step of the spindle. The hole in the latch is elongated

so that the latch can slip into the spindle recess when records are being removed.
If more than one record is dropped at a time, it will be found to be due to:

1. Foreign matter in spindle recess causing the latch to stick.
2. Exceptionally thin records. Standard records are .075" - .090" thick.

RECORD DROPS ON PICKUP ARM

As the change cycle is started, the first motion of the inclined outer bottom surface of the Main Cam (38) causes the Record Selector Post (42) to move toward the Spindle about 3/32 inch. This position is maintained until the Pickup Arm has made its full outward lateral excursion at which time the Record Selector Post again moves toward the spindle, causing the bottom record to drop into playing position.

If the Record Selector Post (42) has been bent back, away from the Record Spindle, it is possible for a standard record to rest on the spindle step with its edge just over the edge of the Record Selector Post shelf. Then as the change cycle is started, the record is pushed off the spindle by the initial movement of the Record Selector Post, so that it drops on the Pickup Arm.

To correct this condition, the Rocker Arm Assembly must be adjusted so that the Record Selector Post is brought nearer to the spindle. This adjustment is made in the following manner:

1. With the mechanism at rest, remove the Turntable and replace the Record Spindle. Set the Record Selector Post to the position for playing 12-inch records and place a 12-inch record on the Record Spindle.
2. Insert a short screwdriver through the motorboard opening into the screw slot as shown at "A" in Fig. 6. Clockwise rotation of the screw will increase the distance between the Record Spindle and the Record Selector Post; counterclockwise rotation will decrease it.

It is recommended that the distance between the edge of the record and the step of the Rcord Slector Post be held to just over 1/32 of an inch so that records with rough or sharply beveled edges will not catch on the outer edge of the Record Selector Post.

CAUTION: Be certain that a standard size record is used in making this adjustment. A standard 10" record measures 9 7/8" ± 1/32" diameter. A standard 12" record measures 11 7/8" ± 1/32" diameter.

PUSH OFF POST ANGLE INCORRECT

The Record Selector Post should be adjusted so that the curve of the shelf matches the curve of the record. See Fig. 7.

To adjust this angle:

1. Turn the Record Selector Post to the "10" position.
2. Place a ten-inch record on the Spindle in the normal position for automatic playing.
3. With a No. 8 Bristol wrench in each of the set screws (point A, Fig. 7), alternately loosen one and tighten the other until the Record Selector post angle is correct. Be sure that both set screws are tight at the completion of this adjustment.

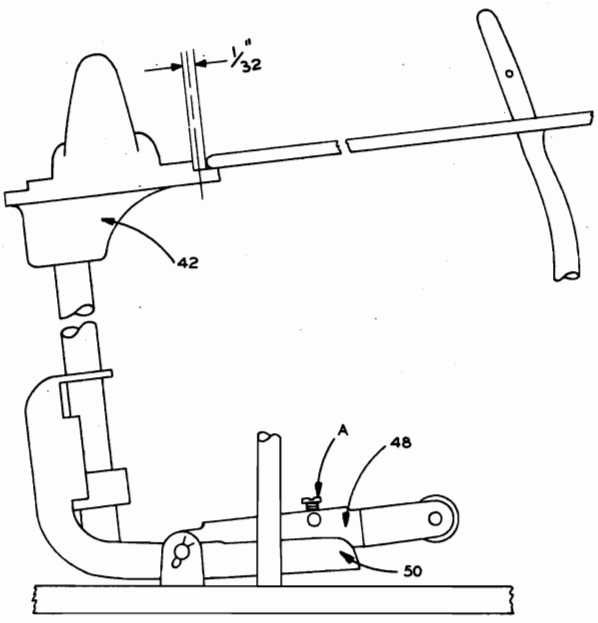

Fig. 6

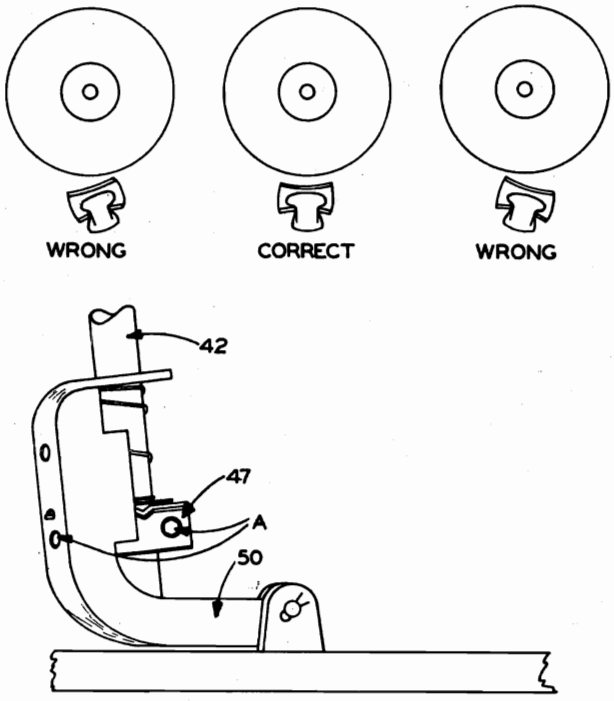

Fig. 7

ERRATIC INDEXING

Indexing in the 10" or the 12" position is controlled through the presence or absence of pressure from the Compression Spring (47A) on the Pickup Arm Raising Lever (40). The compression on this spring is changed as the Record Selector Post (42) is changed to the 10" or 12" position. Improper adjustment of the spring tension will result in erratic indexing. In the 12" position, the spring should be just free. In the 10" position, the compression of the spring holds the stud of the Pickup Arm Raising Lever (40) against the outside edge of the groove, forcing the stud to travel the inside edge or the outside edge of the groove in the bottom of the Main Cam (38).

To adjust:

Bend the slotted arm (part of 40) for proper tension and smooth clearance of the spring guide arm (47).

GLIDE IN ON 12" RECORDS

1. Check tension of compression spring (47A) as explained above. Spring should be free in 12" position.
2. Remove any cause of friction in Index Lever (47).
3. Tongue of Pickup Arm Raising Disc (34) should not touch beveled edge of pickup arm pivot shaft bracket (35) when the needle is on the edge of a 12" record. Bend the end of the bracket if necessary.

"WOW"

If the speed of the Turntable varies during each revolution, check:

1. Defective Idler wheel (24).
2. Dirt or foreign matter inside the rim of the Turntable.

LAST RECORD CONTINUES TO PLAY

1. Check the record spindle to be sure that it moves up and down freely.
2. With no records on the spindle, check the Automatic Shut Off Lock Lever (44). The lower hook end of this arm ("C") shoud catch the Pickup Arm Raising Disc (34) at the beginning of the cycle to prevent travel of the Pickup Arm, causing it to drop on the OFF button. With no records on the Spindle and with the mechanism at rest, this hook should clear the top of the Pickup Arm Raising Disc by 1/32". Adjust, if necessary, by inserting a screw driver in the hole in the bottom base plate and bending lip "D". Never attempt to move the Pickup Arm Raising Disc up or down.
3. The elevated hook "A" on the Automatic Shut Off Lock Lever will sometimes lock with the bracket "B" on the Record Selector Post (50) if the drop of the record is delayed. More clearance can be obtained by bending the elevated hook "A" away from the bracket.

LAST RECORD DOES NOT PLAY

The weight of the records on the Spindle keeps the Automatic Shut Off Lock Lever (44) from dropping and engaging the Pickup Arm Raising Disc (38), thus permitting the mechanism to continue to cycle.

The Push Off Post (50) moves forward slightly at the beginning of each change cycle. The bracket "B" on this post is then underneath the elevated hook "A" on the Automatic Shut Off Lock Lever (44). This forward movement takes place before the last record drops so the change cycle should continue. However the dropping of the last record releases the Automatic Shut Off Lock Lever, permitting it to drop and shut off the mechanism when the change cycle starts after the last record.

If the last record does not play:

1. Bend the elevated hook "A", Fig. 8 forward so that it will overlap the Push Off Post bracket "H" about 1/32" with a record on the spindle.

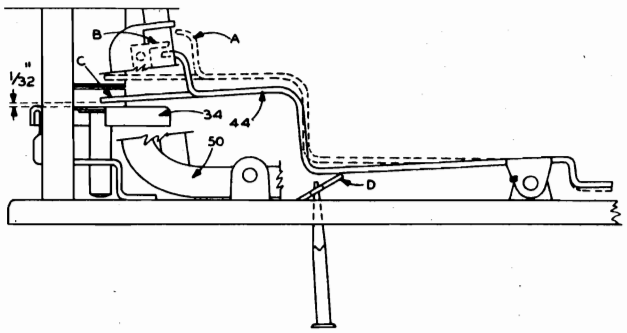

Fig. 8

MOTOR DOES NOT SHUT OFF

1. OFF button stuck.
2. Defective switch.
3. OFF button Shaft Spring (62) has too much tension.
4. Roller on Switch Lever binding.
5. Switch Lever binding on switch frame.
6. Excessive counterbalancing on Pickup Arm.

REPLACEMENT OF PARTS

REPLACE PICKUP CARTRIDGE

1. Press upward on the clip fastener at the forward end of the Pickup Mounting Bracket and raise the Pickup Arm to a vertical position.
2. Remove the screws holding the cartridge in place and replace the cartridge.

REPLACE PICKUP ARM

1. Press upward on the clip fastener at the forward end of the Pickup Arm Mounting Bracket.
2. Raise arm to vertical position.
3. Remove screws holding arm and bracket.
4. After the new Pickup Arm has been installed, press the arm and the Mounting Bracket together until the clip latches.

REMOVE THE SUB-PLATE ASSEMBLY

In the event that it becomes necessary to replace any of the major parts in the sub-plate assembly, the entire assembly should first be removed from the motorboard.

1. Remove the Record Spindle which is held in by a clip under the sub-plate.
2. Remove the Turntable.
3. Remove the Pickup Arm in the manner outlined previously.
4. Unhook the Rocker Arm Return spring.
5. Remove the Rocker Arm Pivot Pin.
6. Remove the five No. 8-32 x 3/4 R.H. screws holding the sub-plate studs and the No. 8-32 x 3/8 R.H. screw holding the center post to the motorboard. Note that one of the 8-32 x 1/4 R.H. screws is accessible through the Pickup Arm hole in the Crescent Assembly.

It should not be necessary to remove the Crescent Assembly except for replacement or to remove the complete Rocker Arm Assembly.

REPLACING THE SUB-PLATE ASSEMBLY

1. Reverse the above procedure making certain that all parts fall into their proper positions.
2. Particularly note the Selector Lever and Selector Lever Compression Spring to see that they are in position with the lever through the slot in the Pickup Arm Raising Lever Bracket.

REPLACE PICKUP ARM BRACKET AND SHAFT ASSEMBLY

1. Loosen Bristol screws in Pickup Arm Raising Disc.
2. Remove Disc and Clutch parts by sliding them off the bottom of the Pickup Arm Shaft and pull shaft out of changer from above.

To replace, reverse the procedure and adjust the Pickup Arm Raising Disc for proper operation.

REPLACE RECORD POST AND ROCKER ARM ASSEMBLY

1. Remove the Pickup Arm Assembly.
2. Remove the four nuts under the main plate which hold the Crescent Assembly.
3. Unhook the Rocker Arm Return Spring.
4. Remove the Rocker Arm Pivot Pin.
5. Lift out the Record Selector Post, Rocker Arm and Crescent Assembly as a unit.
6. In replacing the Rocker Arm Assembly, note paragraph "Replacing the Sub-Plate Assembly."

LUBRICATION

Model 156 Record Changers leave the factory completely oiled and lubricated. Under normal conditions this should be sufficient for approximately one year or 1,000 hours of operation. When operated under extreme conditions of dust or heat, this operation should be performed more frequently as required.

NOTE: AVOID EXCESSIVE LUBRICATION.

Do not permit any oil or grease to get on the rubber idler drive wheel or the Motor Sleeve (Illus. 11 and 21, Fig. 4), on turntable drive rim or on the automatic trip arm clutch. Any oil or grease on these points should be removed using carbon tetrachloride.

The recommended lubricants and points of lubrication are as follows:

A — No. 10 OIL (Apply With Small Oil Can Or Medicine Dropper)

1. Motor Bearings. Saturate top and bottom felts.
2. Pickup Arm Shaft (Illus. 22, Fig. 6). Apply one drop each to bottom bearing point, bracket hole and hole through Main Base Plate.
3. Ball Bearing Assembly (Illus. 7, Fig. 4).
4. Idler Wheel Felt (Illus. 13, Fig. 4).

B — LUBRIPLATE (Apply With Small Brush)

1. Idler Wheel Link (Illus. 16, Fig. 4).
2. Turntable Shaft Stud.
3. Pickup Arm Hinge Pins.
4. Knife edge of Raising Lever (Illus. 33, Fig. 7).
5. Main Cam Bearing. (It is necessary to remove the sub-plate Assembly to lubriplate this bearing. See paragraph Mechanical Repairs "C" To Remove the Sub-Plate Assembly.)

C — STA-PUT (Apply With Small Brush)

1. Teeth of Main Cam Actuating Gear (Illus. 43, Fig. 7).
2. Track of Main Cam Gear (Illus. 42, Fig. 7).
3. Teeth of Large and Small idler gears (Illus. 9, Fig. 4).
4. Raising lever Bracket bearing surfaces (Illus. 33, Fig. 7).

ZENITH RADIO CORP. MODELS S-13675, S-14002, S-14006, S-14008

GENERAL

Service notes for models S-13675, S-14002, S-14006, and S-14008 have been combined in this manual. Except for slight mechanical, electrical and color variations, these models are alike. The adjustments that the serviceman will be called to make will be the same for all models.

Models S-13675 (maroon) and S-14006 (black) have the automatic shut-off feature and are identical mechanically. Models S-14002 (maroon) and S-14008 (black) have slight electrical differences.

For convenience, the Operating Instructions supplied with each Record Changer are summarized as follows: The Record Changer will automatically play up to fourteen 10 inch or twelve 12 inch records at one loading, or up to twelve 10 and 12 inch records intermixed. The Record Stack rests on the Spindle and the Record Shelf. The Selector Sprocket drives the Ejector Cam which pushes the records off the Shelf and Spindle allowing them to drop on the Turntable. To load for automatic operation, swing the Pressure Bar to the right, place the stack of records on the Spindle, swing the Pressure Bar to the left until it rests on the record stack, set the OFF-MAN-AUTO switch to AUTO and press the Record Change button. Models S-14002 and S-14008 will play the entire selection of records and repeat the last record until turned off. Models S-13675 and S-14006 will automatically shut off after the last record is played.

For manual operation set the OFF-MAN-AUTO switch to MAN and play the records singly as on a non-automatic record player.

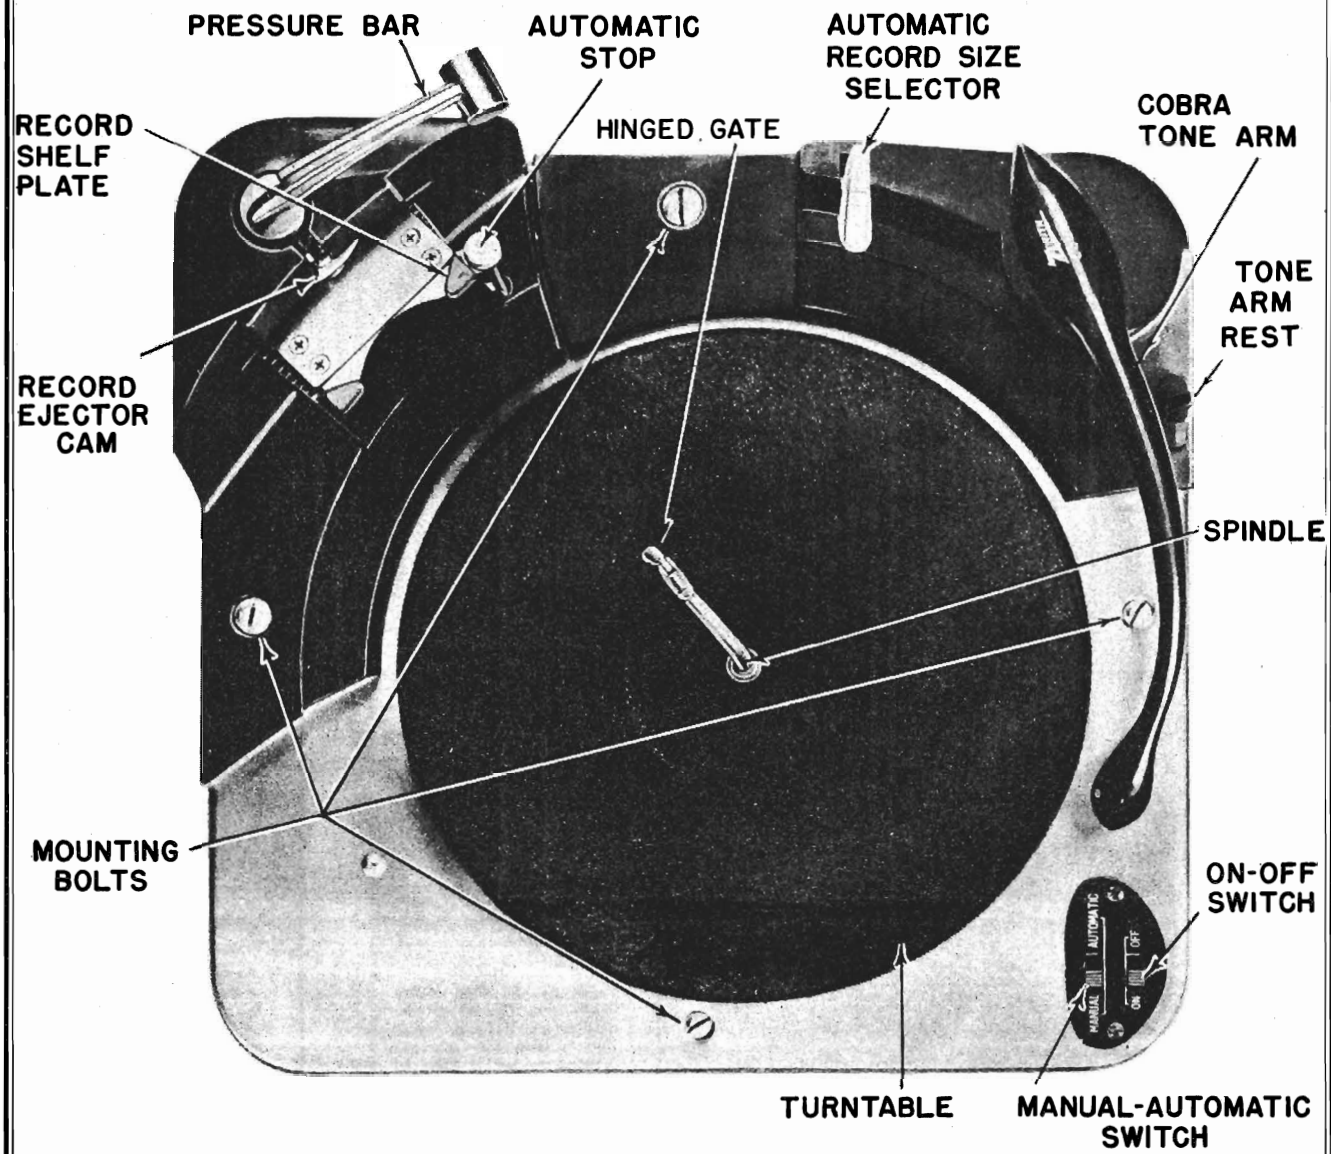

Fig. 1. Top View S-13675 and S-14006 Record Changers.

ZENITH RADIO CORP.

DESCRIPTION OF CYCLING

The phono motor friction drives the idler wheel. The idler wheel rim drives the turntable, and the turntable shaft. To the turntable shaft is attached the segmented clutch drive plate. The pawl on the clutch drive sprocket assembly engages the drive plate, causing the sprocket to rotate. The pawl pusher lever on the clutch release arm assembly causes the clutch to engage or disengage.

Closing either the trip switch or the record change switch energizes the solenoid. The magnetic flux of the solenoid attracts the clutch release lever causing the mechanism to trip and move the pawl pusher lever away from the clutch pawl. This action allows the clutch pawl spring to pull the pawl into position for the drive plate segment to engage and start the clutch sprocket rotating. The clutch sprocket is meshed with the chain drive sprocket and the chain drives the selector and timing sprockets.

The timing sprocket completes 7 functions through 360° rotation. These functions are as follows: 1. Applies the tone arm brake. The brake lever is actuated by the brake stud on the timing sprocket. The brake prevents coasting and erratic landing of the needle. 2. The inclined groove pushes the lift pin upward. The lift pin raises and lowers the tone arm. 3. The locating pin laterally swings the tone arm off the record stack. 4. The locating pin or bushing swings the tone arm over the starting groove of the record. With 12" records, the locating pin swings the tone arm in while the locating bushing swings the tone arm with 10" records. The locating bushing is pushed upward by the discriminator trip plate. 5. The reset stud resets the clutch trip mechanism and moves the pawl pusher lever in the path of the clutch pawl. 6. The lift pin lowers the tone arm over the starting groove of the record. 7. The brake stud releases the brake. When the clutch pawl hits the pawl pusher lever, the clutch is disengaged.

The selector sprocket actuates the record ejector cam, and must be timed with the timing sprocket to drop the records on the turntable when the tone arm is at its greatest outward swing. This occurs immediately after the No. 3 function of the timing sprocket.

As the record is played, the tone arm gradually moves toward the center. The ratchet on the tone arm control lever moves toward the pawl on the trip switch lever. As the ratchet comes in contact with the pawl, the oscillating action produced by the eccentric groove on the record causes the trip switch to close, complete the solenoid circuit and repeat the cycle. If the record does not have an eccentric groove, the position trip will close the trip switch and start the next cycle.

Noise and microphonics are eliminated by muting the phono pre-amplifier during the record change cycle. The tone arm brake lever actuates the muting switch. When the contacts are closed, a low reactance capacitor is connected across the audio output making the amplifier inoperative during the change cycle.

LUBRICATION

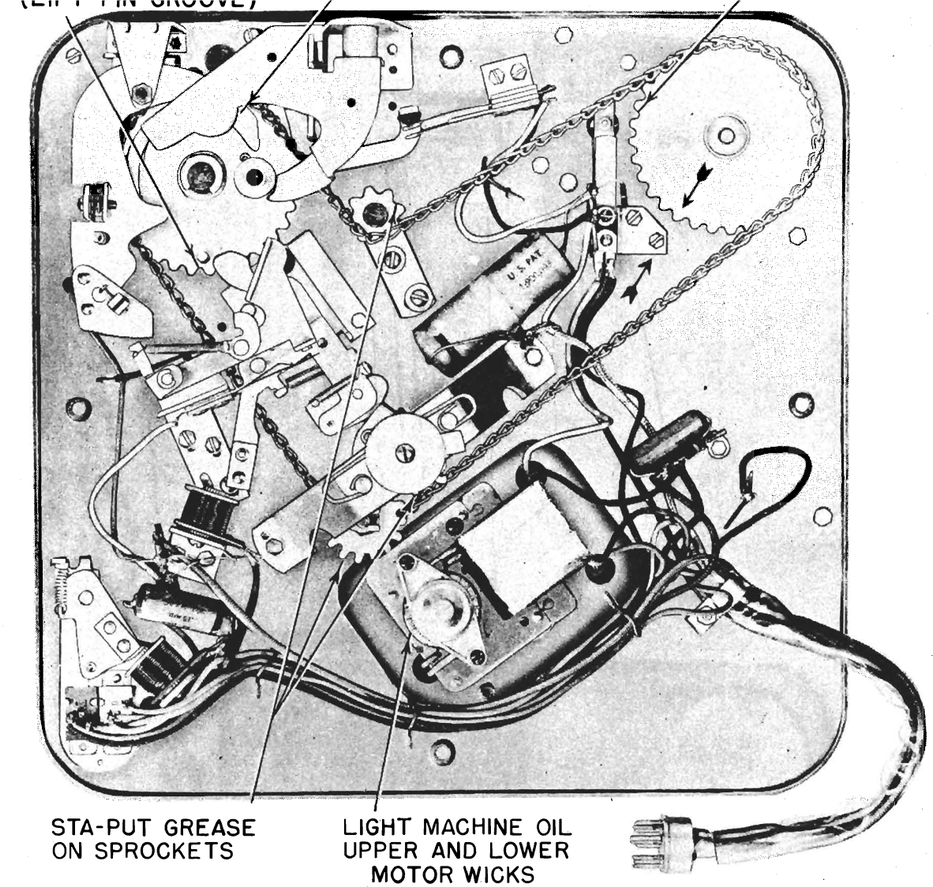

Fig. 6. Lubrication Bottom of Record Changer.

Sta-Put grease No. 512 (light grease of the vaseline type) and light machine oil of No. 10 consistency are used for lubrication throughout.

Figures 6 and 7 indicate the points to be lubricated and the type of lubricant to use. The Motor has two oil wicks, which should be saturated with oil. The Record Spindle Guide Bearing, Idler Wheel Bearing, Lower Drive Shaft Bearing, Drive Shaft Thrust Bearing and the Motor Bearings are of the OILITE type and require very little attention. If squeaks develop, be certain that they are not caused by friction between the Spindle and records on the Turntable. A thin coat of wax on the Spindle will remedy this condition.

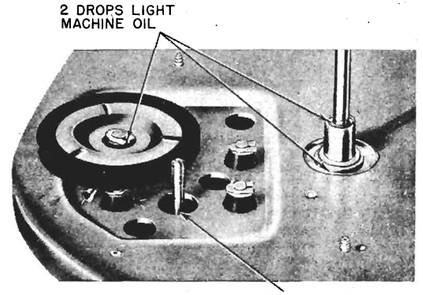

Fig. 7. Lubrication Top of Record Changer.

THEORY OF THE COBRA RADIONIC PICKUP

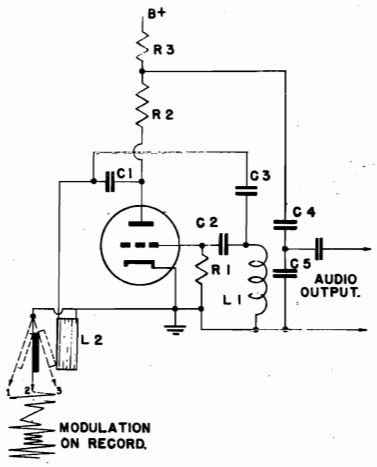

Fig. 8. Simplified Circuit of Oscillator.

The operation of the Cobra pickup is considerably different from Crystal and Dynamic pickups. These pickups generate audio power, while the Cobra controls power generated by a radio frequency oscillator. The triode tube is a modulated oscillator, detector and audio amplifier. The oscillator operates at a frequency of 2.5 Mc. Modulation is accomplished by changing the energy losses in a tuned circuit. These losses may be represented by an equivalent resistance in series with the reactance of the coil. The ratio of the resistance to the reactance determines the efficiency or Q of the coil. The amplitude of the RF voltage developed across this coil by the oscillator will vary with changes in Q.

The grid coil L_1 and other components of the oscillator are mounted in the receiver chassis, while the plate coil L_2 is in the Needle Cartridge with the vane and needle assembly. The coil is fixed and has 40 turns of No. 40 wire (approximate DC resistance 2½ ohms). The stainless steel vane, which is in the field of the coil, is spot welded to the osmium-iridium tipped stylus. Any movement of the stylus will cause a corresponding movement of the vane. As the stylus and vane follow the modulations in the record, changes in the mutual inductance between the vane and coil occur (see Fig. 8). In position 2 the vane is at rest, and a constant RF voltage appears across the plate coil. As the vane is set in motion and reaches position 1, it is at its greatest outward swing from the coil, resulting in low mutual inductance, low reflected resistance, higher Q, and a higher RF voltage across the coil. In position 3 it is at its greatest inward swing; resulting in a high mutual inductance, high reflected resistance, lower Q and a lower RF voltage. It can be seen that the amplitude of the RF voltage which appears across the coil will vary with changes in Q, satisfying the condition for amplitude modulation. The position of the vane changes both the Q and L of the coil. Changes in L shift the frequency slightly, and a certain amount of frequency modulation is present, but since there is no frequency discrimination it remains undetected.

Since the grid and plate coils are part of a single tuned circuit any variations of amplitude of the RF voltage brought about by the changes in Q across the plate coil will also appear across the grid Coil L_1 causing a shift in the average plate current through the plate load resistor across which the audio output voltage is developed. Plate bend detection takes place since only the positive half of the grid swing causes an increase in the average plate current. These changes in the average plate current appear as audio voltage across the plate load resistor.

The 2.5 Mc. RF voltage and the audio voltage both appear at the plate of the oscillator triode. R_2, C_4 and C_5 filter out the RF voltage allowing only the audio component to the grid of the pre-amplifier where it is amplified and reproduced by the loud-speaker.

ADJUSTMENTS

1. Tone Arm Set Down Adjustment.

The Tone Arm Set Down Adjustment determines the landing position of the needle on the starting groove of the record. The adjustment screw can be reached with a screwdriver (Fig. 10). The tone arm must be held in the rest position while the adjustment is made. Clockwise rotation of the screw moves the tone arm in, while counter-clockwise rotation moves it out.

2. Tone Arm Height Adjustment.

The Tone Arm vertical rise is governed by the Lift Pin. The Lift Pin is adjustable (see Fig. 9). Too long a Lift Pin will cause the Tone Arm to hit the underside of the records on the Spindle. If the Lift Pin is short, the needle will not clear fourteen records on the Turntable. To make the proper adjustment, trip the Clutch by hand and rotate the Turntable clockwise until the Tone Arm starts to swing toward the Spindle. Gently push the Tone Arm as close to the Spindle as it will go, place a record on the Spindle and observe the spacing between it and the Tone Arm. The spacing "A" (Fig. 11), should be approximately the thickness of a record.

Fig. 9. Lift Pin.

If the spacing is incorrect, lift the Tone Arm, remove the Lift Pin, and adjust the Lift Pin to the proper length.

3. Trip Switch Adjustment.

As the record is played, the ratchet on the tone arm pivot shaft engages the trip pawl. The oscillating action developed by the eccentric groove on the record closes the trip switch contacts and allows the solenoid to become energized. The magnetic flux attracts the trip lever which moves the pawl pusher lever from the path of the clutch pawl. This allows the clutch to engage and start the next cycle.

The gap between the trip switch contacts should be approximately 1/16". If the spacing is incorrect, bend the contact spring. If the contact spring tension is too great, the needle may not follow the oscillating groove on the record. To adjust the spring tension, insert a screwdriver between the contact and guide springs and bend the contact spring (Fig. 10) until an approximate pressure of one ounce is necessary to move the contact spring from the guide spring. Be certain that the contact spring exerts some pressure on the guide spring after adjustment.

The spacing between the trip magnet and trip lever should be approximately 3/32".

MODELS S-13675, S-14002, S-14006, S-14008

ZENITH RADIO CORP.

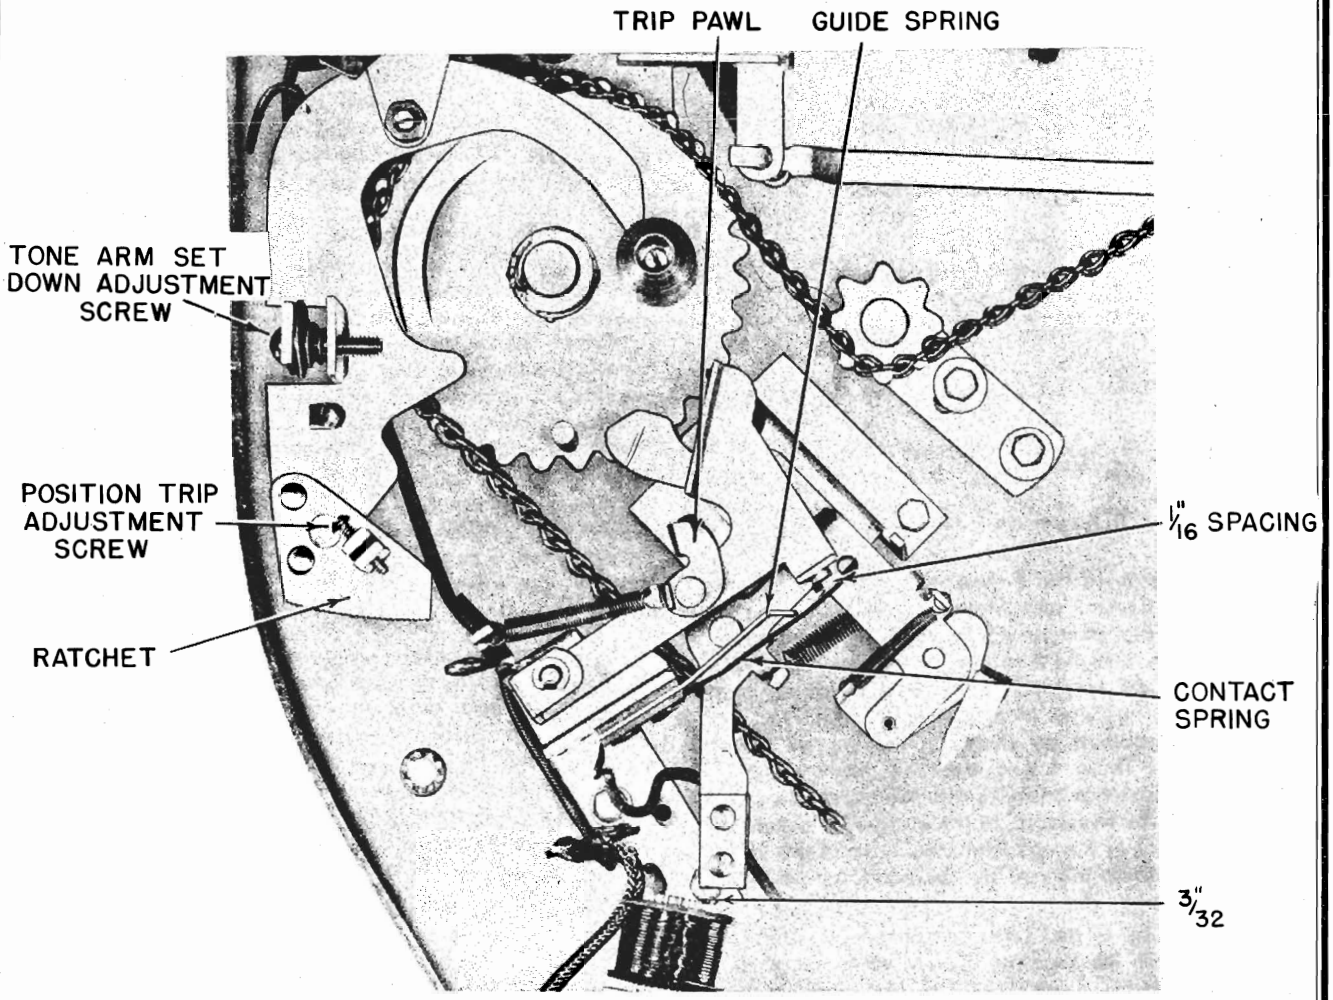

Fig. 10: Tone Arm Set Down, Position Trip and Trip Switch Adjustments.

4. Position Trip Adjustment.

The Position Trip does not depend on an eccentric groove in the record to start the record change cycle, but will trip the mechanism whenever the needle comes within a pre-determined distance from the Spindle. Older type records that do not have an eccentric groove can in most cases be played automatically by the proper adjustment of the Position Trip. Under normal conditions with the needle approximately 1⅞" from the center of the Spindle, adjust the Position Trip Adjustment Screw (Fig. 10) until the Trip Switch contacts close. This distance is generally satisfactory since no modern record will be cut off before it has completed its play, and none will fail to trip the mechanism at the end. In special cases, screw the Position Trip Adjustment Screw clockwise for earlier tripping and counter-clockwise for later tripping as the individual case may be.

It may be impossible to find an adjustment that will always trip the mechanism and never cut off on all type records, and in these special cases the record must be played manually.

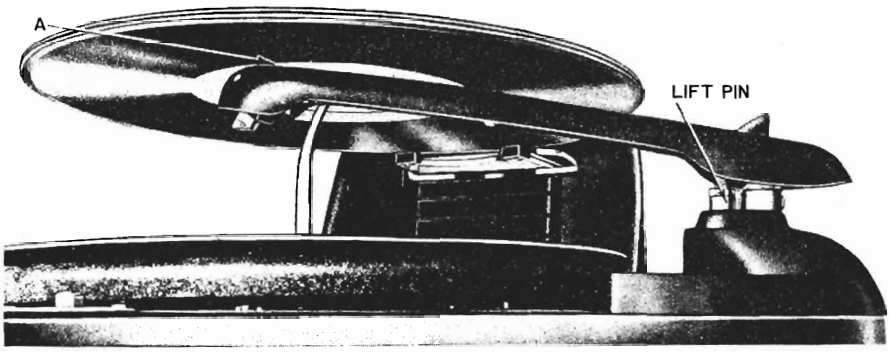

Fig. 11. Tone Arm Height Adjustment.

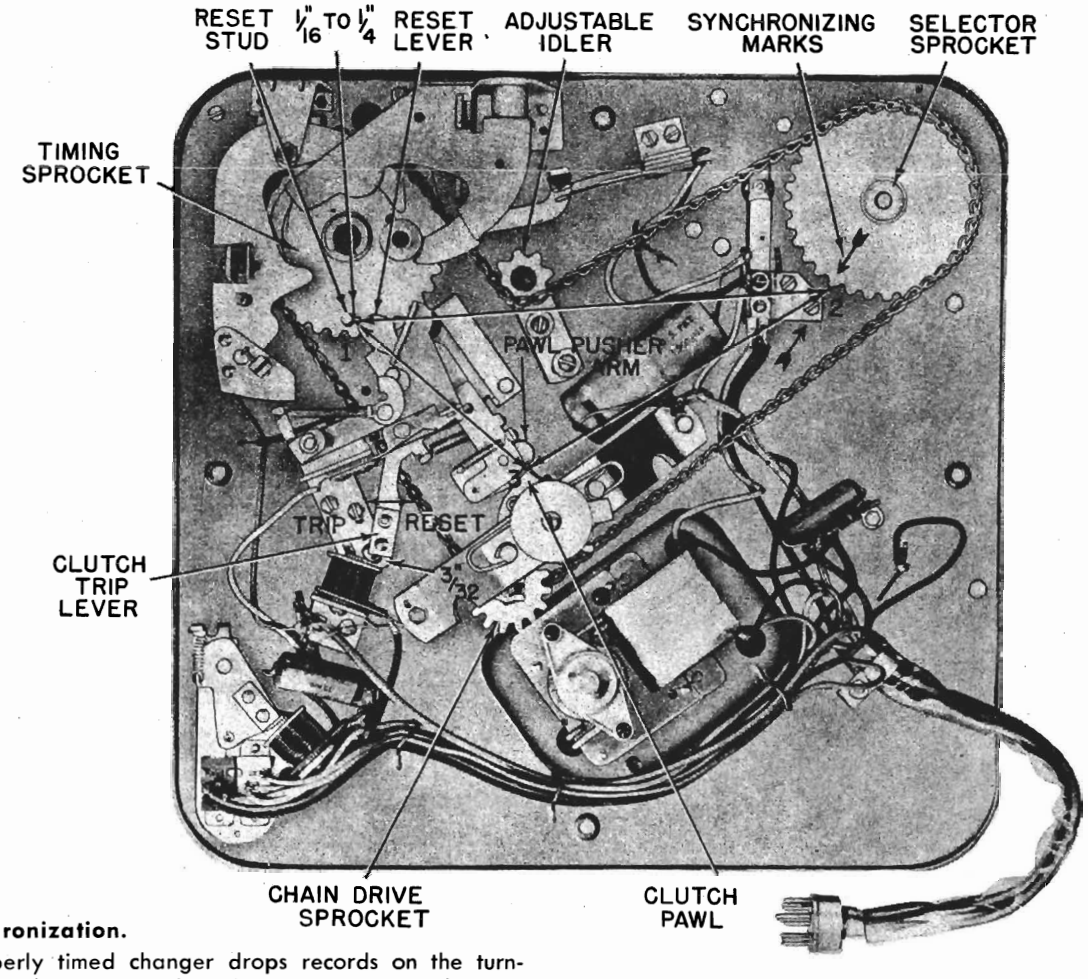

Fig. 12. Synchronization.

5. Synchronization.

A properly timed changer drops records on the turntable when the tone arm is at its greatest outward swing. Improper timing results in the records hitting the tone arm. The record changer is kept in time by the drive chain. If the chain is removed, the changer must be synchronized.

Fig. 12 indicates the correct position of the timing sprocket, selector sprocket and the clutch. To synchronize, study Fig. 12 and proceed as follows:

1. Reset the clutch trip lever.

2. Turn the timing sprocket until the reset stud is approximately 1/16" from the reset lever (1). Turn the selector sprocket until the synchronizing mark lines up with the mark on the base plate (2). THESE POSITIONS MUST BE MAINTAINED DURING THE NEXT OPERATION.

3. Thread the chain over the timing sprocket, chain drive sprocket, adjustable idler, selector sprocket and set the adjustable idler for medium tension of the chain. Check the position of the synchronizing marks and the reset stud.

4. Remove the retaining washer and lift the chain drive sprocket until the gears disengage.

5. Turn the clutch until the clutch pawl touches the pawl pusher lever (3).

6. Lower the chain drive sprocket until it engages the clutch gears and reinsert the retaining washer.

REMOVING THE TURNTABLE

Hold the clutch by inserting a wide blade screwdriver against the spindle bracket and a segment of the drive plate. Apply a twisting, pulling force to the turntable.

Before seating the turntable, be certain that the idler wheel is pushed inside the turntable rim.

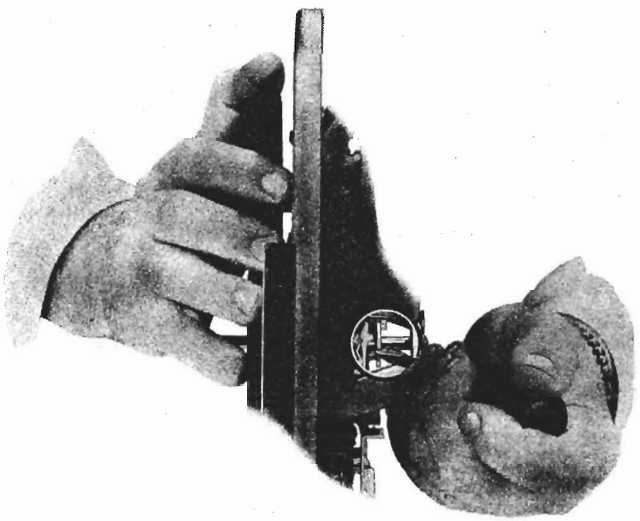

Fig. 13. Removing the Turntable.

MODELS S-13675, S-14002, S-14006, S-14008

ZENITH RADIO CORP.

REPLACING THE MOTOR

When a replacement Motor is ordered, include the line voltage and frequency of the receiver.

To replace the Motor, unsolder the connecting leads, remove the Turntable, the three retaining washers and allow the Motor to drop out. When the Motor is installed do not draw the connecting leads tight as this will prevent the Motor from "floating" on its mounts. Be certain that the retaining washers are crimped and the leads securely soldered and taped.

REPLACING THE CHAIN

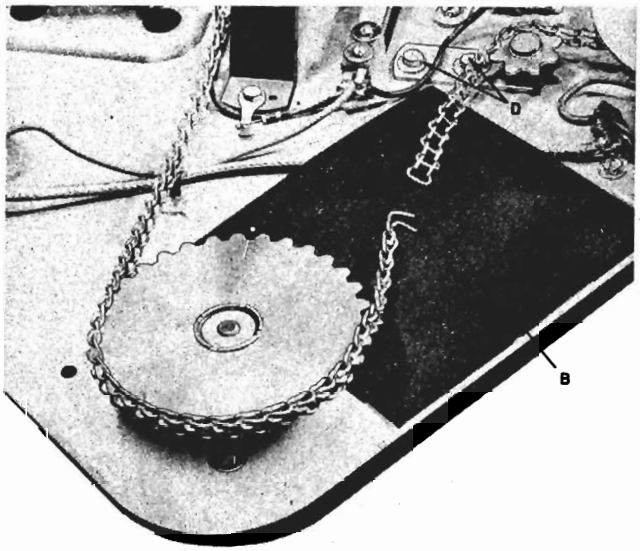

Fig. 14. Replacing the Chain.

The chain may be removed by loosening the adjustable idler (Screws "D," Fig. 14), and opening one of the links (B). It will be noted that on some models the open ends of the links face inward while on others outward as in Fig. 14. The reason for this is to get the quietest operation. Normally the open ends of the links will face outward with all replacement chains.

After the chain is threaded in place, carefully close the open link and be certain that there is no stiffness in its action. Read the paragraph on Synchronization before the chain is permanently installed.

TROUBLE SHOOTING

SQUEAKS OR NOISES DURING PLAYING OF RECORDS.

a. Friction between the records on the turntable and the spindle will occasionally cause squeaks. A thin coat of wax applied to the spindle will remedy this condition.
b. Check lubrication.

MECHANISM STARTS SLOWLY AND MOTOR GETS HOT.

a. Check line voltage and frequency.
b. Check lubrication.
c. Motor windings damaged.
d. Room temperature abnormally low.

PRESSING RECORD CHANGE BUTTON ON RECEIVER PANEL DOES NOT START THE RECORD CHANGE CYCLE.

a. See that the OFF-MAN-AUTO switch is set to AUTO.
b. Check Record Change Switch.
c. Check electrical continuity of solenoid circuit.
d. Check the solenoid energizing voltage.

MOTOR FAILS TO RUN EVEN WHEN IT IS DISCONNECTED FROM CHANGER AND PROPER VOLTAGE AND FREQUENCY APPLIED DIRECTLY TO THE TWO INPUT LEADS OF THE WINDING.

a. Open windings.
b. Damaged or frozen bearings.
c. Lower Bearing Support Bracket bent. Remove and straighten bracket—Re-center armature.

RUMBLE AND MICROPHONICS DURING REPRODUCTION.

a. Changer not "floated" properly. Loosen mounting bolts.
b. Motor retaining rings rubbing on the idler wheel.
c. Motor leads pulled too tight preventing motor from "floating" freely.
d. Noisy Phono Oscillator tube.
e. Impression on Idler Wheel.

NEEDLE SETS DOWN PROPERLY ON RECORD BUT SLIDES OVER THE RECORD GROOVES.

a. Cabinet tilted.
b. Badly worn or broken needle cartridge.

NEEDLE FAILS TO CLEAR MAXIMUM LOAD OF RECORDS ON THE TURNTABLE.

a. Check Tone Arm height adjustment. (Adjustment 2.)

CHANGER CYCLES WITH OFF-MAN-AUTO SWITCH ON MAN.

a. Check OFF-MAN-AUTO switch.
b. Reset stud does not engage clutch reset lever.

TONE ARM FALLS OFF RECORD.

a. Check Tone Arm set down adjustment. (Adjustment 1.)
b. Check Tone Arm Pivot Bracket.
c. Changer not level.

TONE ARM SET-DOWN POSITION VARIES.

a. Check Tone Arm Brake and Spring.
b. Tight Tone Arm Connecting Leads.

RECORD IS NOT HEARD ALTHOUGH CHANGER OPERATES.

a. See that the Phono Radio switch is on Phono.
b. Check receiver audio by listening to radio.
c. Check the phono oscillator tube.
d. Check Needle Cartridge.
e. Check Tone Arm Housing for broken leads.

TONE ARM SETS DOWN TOO FAR IN OR OUT ON RECORD.

a. Check Tone Arm set down adjustment. (Adjustment 1.)

CHANGER CONTINUES TO CYCLE.

a. Check Trip switch adjustment. (Adjustment 3.)
b. Check Record Change switch.
c. Clutch release mechanism sticks.
d. Pawl pusher lever not reset by reset stud.

CHANGER WILL NOT CYCLE UPON COMPLETION OF RECORD.

a. See that the OFF-MAN-AUTO switch is set to AUTO.
b. Be certain the record has an eccentric center groove.
c. Check Trip switch.

Fig. 15. Checking Spindle Centering.

RECORD CENTER HOLE WEAR.

a. Record centers oversize.

b. A bent spindle will cause center hole wear due to impeded record injection. To check the spindle position, place a 10" record as shown in Fig. 15. If the spindle is properly centered, a triangle will be formed with the metal ends of the record shelf plate.

SQUEAKS WHEN CHANGER IS IN CYCLE.

a. Friction between Lift Pin and Timing Sprocket. Apply a thin coat of Sta-Put.

MOTOR RUNS BUT TURNTABLE SLIPS OR STOPS.

a. Turntable not fully seated. Tap gently.

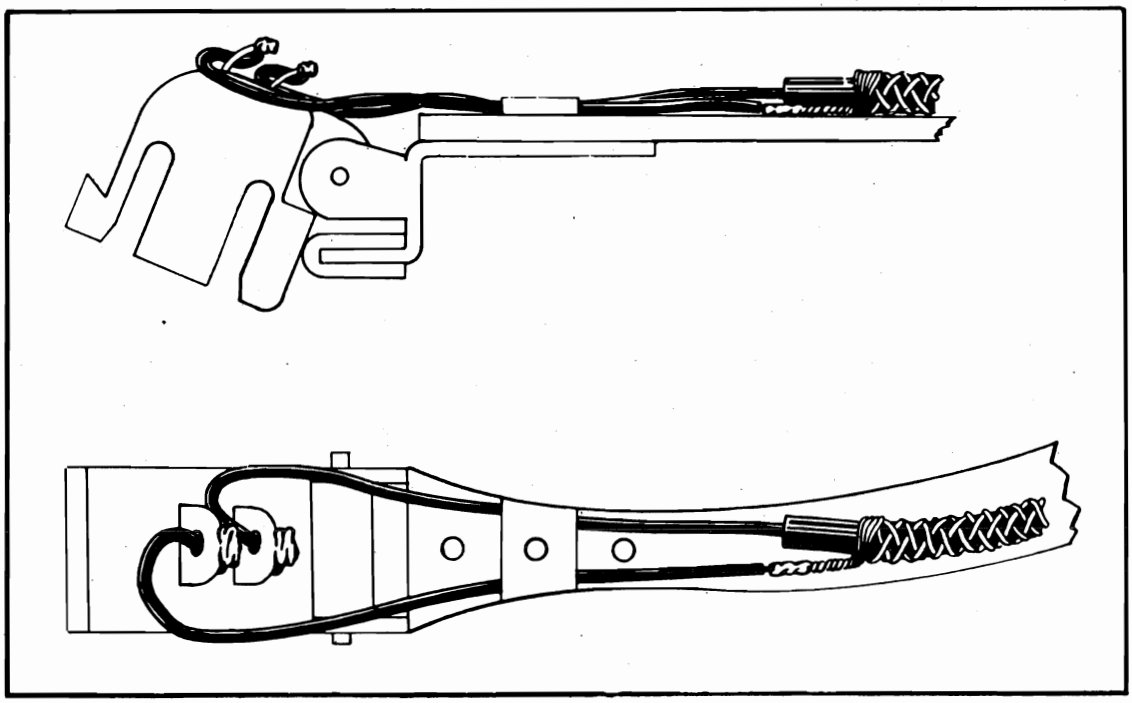

Fig. 16. Needle Cartridge Socket Connection.

Fig. 16 shows how the leads are connected to the Needle Cartridge Socket. The lead and insulation are run through the hole in the contact and the lead is soldered with a light soldering iron. Great care must be exercised, and very little heat applied as the socket is made of lucite and will burn easily. The complete lead and socket are supplied as S-12633.

114-89	No. 8-32 x 5/16" Hex. Acorn Hd. M.S.—Steel N.P.
114-201	No. 8 x 5/16" Hex. Hd. Slotted Self Tapping Screw—STAN-TAP—Cad. Pl.
114-248	No. 6-20 x 5/16" Hex. Hd. Slotted Self Tapping Screw—Shakeproof Type 25—Steel Cad. Pl.
114-262	No. 8 x 7/16" Hex. Hd. Slotted Self Tapping Screw—STAN-TAP—Cadmium
117-132	Shut-Off Switch Lever (S-13675, S-14006)
125-61	Rubber Grommet—Motor Mtg.
128-21	Record Ejector Cam (S-11668)
141-108	A.C. Phono Motor—60 Cycles
141-109	A.C. Phono Motor—60 Cycles (S-14002)
148-83	Cobra Tone Arm Housing (S-13675, S-14006)
148-51	Bakelite Housing
166-30	Rubber Bumper
166-41	Rubber Bumper
187-9	Push Rod (Automatic Stop S-13675, S-14006)
188-27	Retaining Ring
188-32	Retaining Ring
188-52	Retaining Ring
214-4	Sprocket Drive Chain
S-10732	Idler Assembly
S-11111	Turntable Shaft and Bearing Assembly
S-11118	Idler Wheel Assembly
S-11473	Cobra Needle Cartridge
S-11657	Idler Wheel Stud and Washer Assembly
S-11668	Record Ejector Cam and Shaft Assembly
S-11671	Pressure Arm and Bracket Assembly
S-11672	Record Support Plate Assembly
S-11674	Record Support Plate Mounting Bracket Assembly
S-11675	Discriminator Mtg. Bkt. Assembly (S-14002, S-14006 and S-14008)
S-11683	Selector Sprocket and Bushing Assembly
S-11983	Idler Wheel and Rubber Drive Ring Assembly
S-12038	Record Ejector Housing Cover Assembly (S-14006, S-14008)
S-12507	Record Spindle Assembly
S-12633	Needle Cartridge Socket and Cable Assembly
S-12686	Cam and Washer Assembly
S-12859	Discriminator Knob and Plate Assembly
S-13060	Cobra Tone Arm Hinge Plate and Swivel Bracket Assembly
S-13062	Cobra Tone Arm Hinge Plate, Swivel Bracket, Needle Cartridge Socket and Cable Assembly
S-13063	Cobra Tone Arm Assembly (S-14006, S-14008)
S-13423	Record Support Plate and Bracket Assembly (S-13675)
S-13426	Muting Switch Assembly (S-13675, S-14006, S-14008)
S-13430	Automatic Stop Switch Assembly (S-13675, S-14006).
S-13461	Record Ejector Housing Cover Assembly (S-13675, S-14002)
S-13466	Cobra Tone Arm Assembly (S-13675, S-14002)
S-13494	Record Support Plate Mounting Bracket Assembly (S-13675)
S-13496	Discriminator Mounting Bracket Assembly (S-13675)
S-13497	Bracket and Spring Assembly
S-13872	Trip Plate and Bushing Assembly
S-13894	Clutch Pawl Assembly
S-13895	Drive Sprocket and Bushing Assembly
S-13896	Turntable Drive Shaft Bearing Assembly
S-13900	Timing Sprocket Assembly
S-13901	Trip Switch Assembly
S-13902	Tone Arm Pivot Shaft and Bracket Assembly
S-13903	Clutch Release Arm Assembly
S-13904	Shut-Off Switch Assembly (S-13675, S-14006)
S-13913	Magnet Assembly
S-13915	Cable Assembly (S-13675, S-14006, S-14008)
S-13929	Main Base Plate Assembly (S-13675)
S-13931	Turntable Assembly
S-14229	Cable Assembly (S-14002)
S-14312	Main Base Plate Assembly
S-14313	Muting Switch Assembly (S-14002)
S-14314	Main Base Plate Assembly (S-14008)
S-14581	Trip Lever Mounting Bracket Assembly
S-14582	Trip Lever and Pawl Assembly
S-14665	Main Base Plate Assembly (S-14006)
S-14666	Record Support Plate Mounting Bracket Assembly (S-14006)

Unless Specified, Parts Apply to All Models.
