SUCCESSFUL SERVICING

Rider's *FREE* House-organ

A publication dedicated to the technical and financial advancement of the radio servicemen.

It will keep you abreast of new developments in the electronic field, timely articles on electronic maintenance, changes in manufacturers' schematics, etc. . . . these are vital to you . . . this FREE service is yours for the asking. . . . It was good before—it will be better in the future!

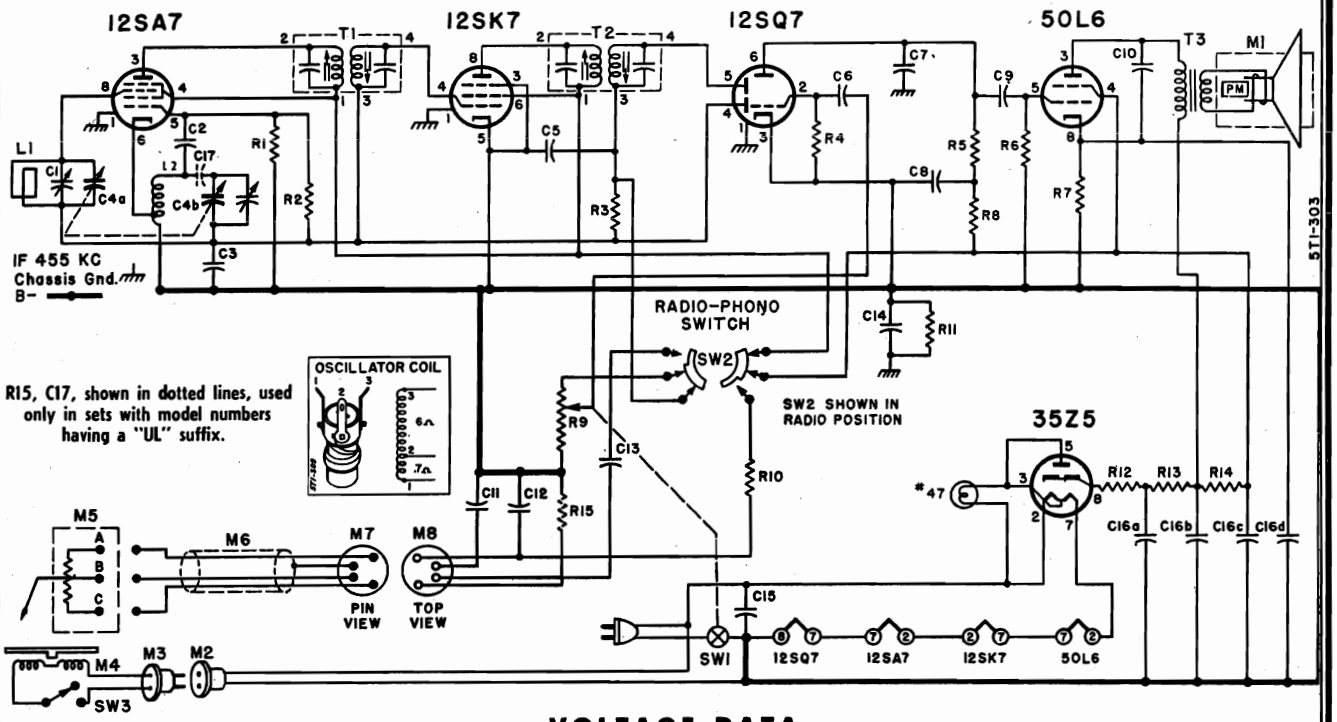
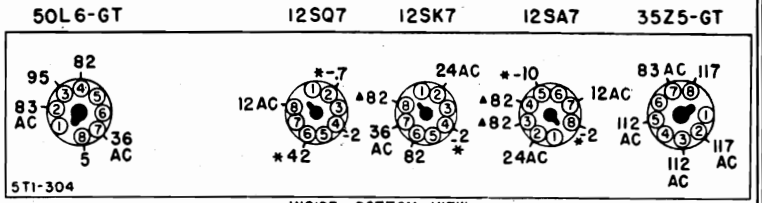
ADMIRAL CORP.

MODEL 5T12, CHASSIS 5T1



VOLTAGE DATA

- All readings made between tube socket terminals and B minus (terminal of On-Off switch).
- Switch in "Radio" position.
- Measured on 117 Volt AC line.
- Volume control minimum; dial turned to low frequency end.
- Voltages measured with Vacuum Tube Voltmeter. Readings taken with a 1000 ohm-per-volt meter will be approximately the same except for those marked with an asterisk * in the voltage chart; these readings will either be lower or practically zero.



INSIDE BOTTOM VIEW

* If taken with a 1000 ohm-per-volt meter, readings will be lower or practically zero.

▲ On "Phono" these voltages will be zero. All other DC readings may be slightly higher.

RESISTORS

Symbol	Description	Part No.

Washer, "C" (Tuning Shaft)	4A 4-6
Washer, Felt	5A 4-11
Washer, Spring (Tuning Shaft)	4A 6-3-0

ALIGNMENT PROCEDURE

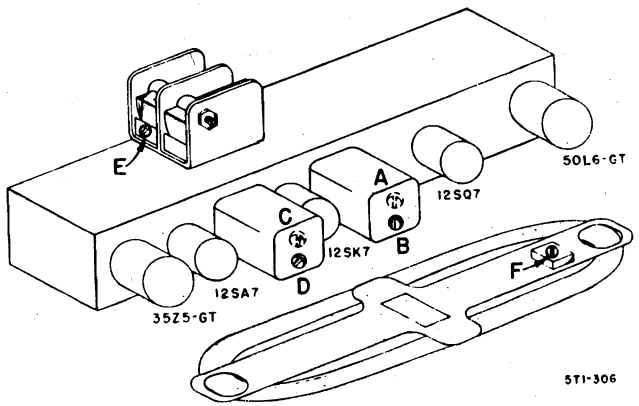
- Check pointer position. With tuning gang closed, the tip of the pointer clip should be over the 1/16" circular punch at the extreme left end of the dial background (see stringing diagram).
- Connect output meter across voice coil.
- Turn receiver volume control full on.
- Loop antenna must be connected and placed in the same relative position to the chassis as when in cabinet.
- Use an isolation transformer if available, otherwise connect a .1 mfd. condenser in series with low side of signal generator and attach to B minus of chassis.
- Use an insulated alignment screwdriver for IF adjustments.
- Use lowest output setting of signal generator capable of producing adequate output meter indication and proceed in the following sequence.
- Repeat adjustments to insure good results.

Step	Dummy Antenna in Series with Signal Generator	Connection of Signal Generator (High Side)	Signal Generator Frequency	Receiver Gang Setting	Trimmer Description	Trimmer Designation	Type of Adjustment
1	250 mmfd. condenser	Tuning condenser, antenna stator	455 KC	Gang fully open	2nd IF 1st IF	A, B C, D (see note below)	Maximum output
2	250 mmfd. condenser	Tuning condenser, antenna stator	1620 KC	Gang fully open	Oscillator	E	Maximum output
3	Loop of several turns of wire, or place generator lead close to receiver loop for adequate signal.	No physical connection (signal by radiation)	1400 KC	Tune in generator signal	Antenna	F (see note below)	Maximum output

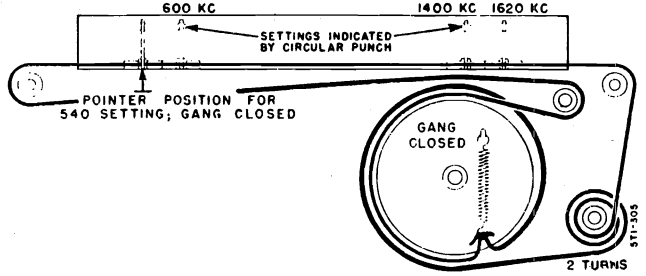
NOTE: Antenna Trimmer "F" must be aligned after chassis and loop are mounted in cabinet. Loop trimmer adjustment is located at the rear of the cabinet.

Trimmers "A" and "C" are adjusted from underside of chassis.

TUBE AND TRIMMER LOCATION



DIAL STRINGING AND POINTER SETTING

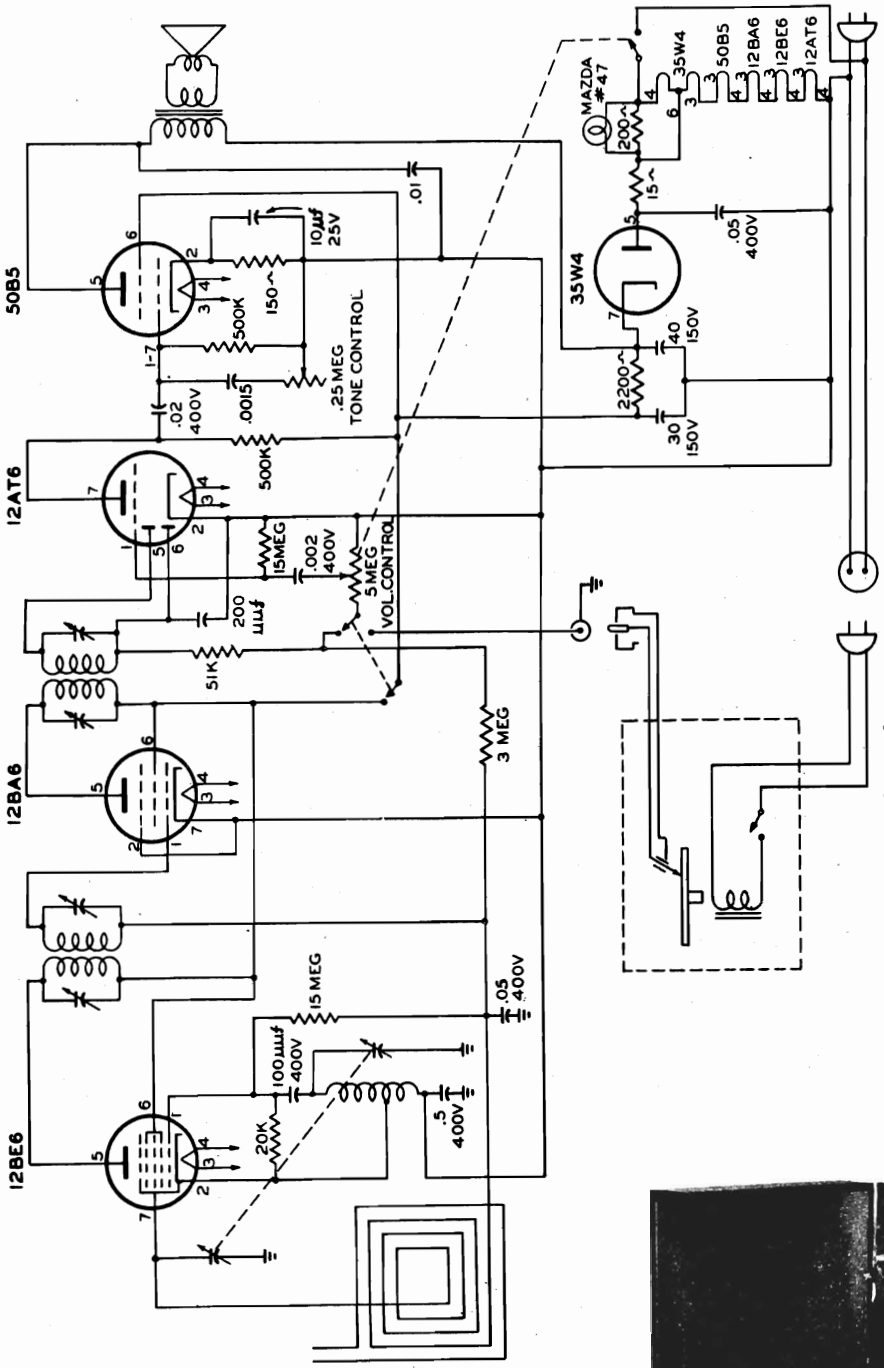


With the gang fully closed, the tip of the pointer clip should be in line with the 1/16" circular punch at the extreme left end of the dial background.

AIRADIO INC.

MODEL 3049

SCHEMATIC DIAGRAM



TYPE: Five tube, single band, superheterodyne with Record Changer.

FREQUENCY RANGE: 540 to 1600 kc.

INTERMEDIATE FREQUENCY: 456 kc.

POWER SUPPLY: a.c.—60 cycle.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 35 watts. (Phonograph: 15 watts additional)

POWER OUTPUT: 1.5 watts.

TUBE COMPLEMENT:

Type	Function
12BE6	Oscillator, mixer
12BA6	I.F. Amplifier
12AT6	Detector, A.V.C. Audio Amplifier
50B5	Power output
35W4	Rectifier

Pilot Lamp: Mazda 47

SO-1059	A.C. outlet (Phono)	RE-1166-507	Resistor, .5 megohm, ½ watt
AS-3361	Dial drive cable assembly	RE-1166-206	Resistor, 20 K ohm, ½ watt
IN-1024	Dial Pointer	RE-1003-154	Resistor, 150 ohm, ½ watt

ALIGNMENT PROCEDURE

1. Turn gang condenser to full mesh position. Set dial pointer on the small dot to the left of the last calibration.
2. Connect the output meter across the voice coil.
3. Connect the output of the Signal Generator to a two-turn loop of wire and place about one foot away from loop on the set.
4. Turn volume full on. Keep output of Signal Generator as low as possible and still get deflection on output meter.

ALIGNMENT CHART

Alignment Sequence	Signal Generator	Position of Dial Pointer	Adjust for Maximum Output
1	456 kc.	Full mesh 55	2nd I.F. (2 trimmers)
2	456 kc.	Full mesh 55	1st I.F. (2 trimmers)
3	1400 kc.	1400	Oscillator Section of Gang Condenser
4	1400 kc.	1400	Antenna Section of Gang Condenser

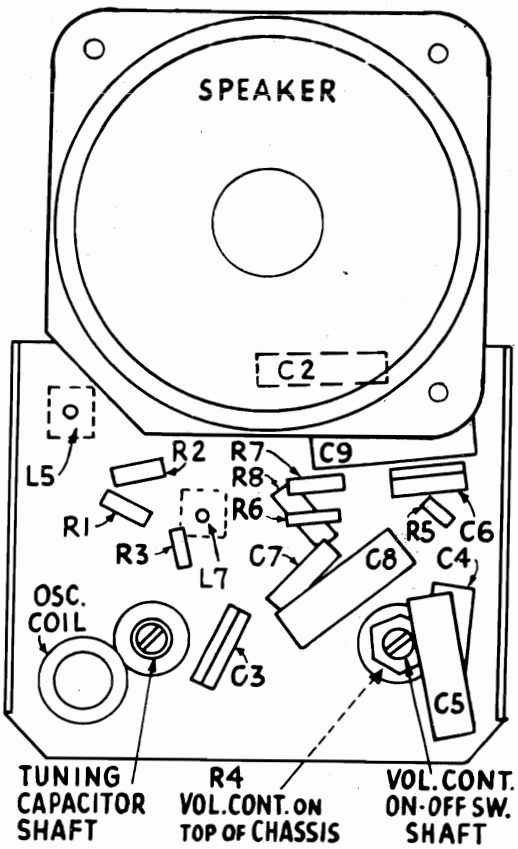
TOP VIEW



BOTTOM VIEW

ALIGNMENT PROCEDURE

IF ALIGNMENT (REMOVE RECEIVER FROM CABINET)

CONNECT AN OUTPUT METER ACROSS THE VOICE COIL. CONNECT THE SIGNAL GENERATOR TO THE STANDARD HAZELTINE LOOP MODEL 1150 AND COUPLE IT LOOSELY TO THE RECEIVER.

SET THE SIGNAL GENERATOR TO 455KC AND FULLY MESH THE RECEIVER TUNING CAPACITOR.

KEEP THE RECEIVER VOLUME CONTROL AT MAX. AND THE OUTPUT OF THE SIGNAL GENERATOR SUFFICIENT TO GIVE A READABLE DEFLECTION ON THE OUTPUT METER. ADJUST FOR MAX. IF TUNING SLUGS L7, L6, L5, L4.

RF OSCILLATOR ADJUSTMENT

PLACE CHASSIS IN CABINET AND SET DIAL POINTER TO 1500 KC. REMOVE KNOB AND REMOVE CHASSIS FROM CABINET. KEEPING THE SAME SETUP AS USED FOR IF ALIGNMENT, SET THE SIGNAL GENERATOR TO 1500 KC AND ADJUST OSCILLATOR TRIMMER C13 FOR MAX. OUTPUT.

SET THE SIGNAL GENERATOR AND RECEIVER TO 1300 KC AND ADJUST ANTENNA TRIMMER C11 FOR MAX. OUTPUT.

AIR KING PRODUCTS CO., INC.

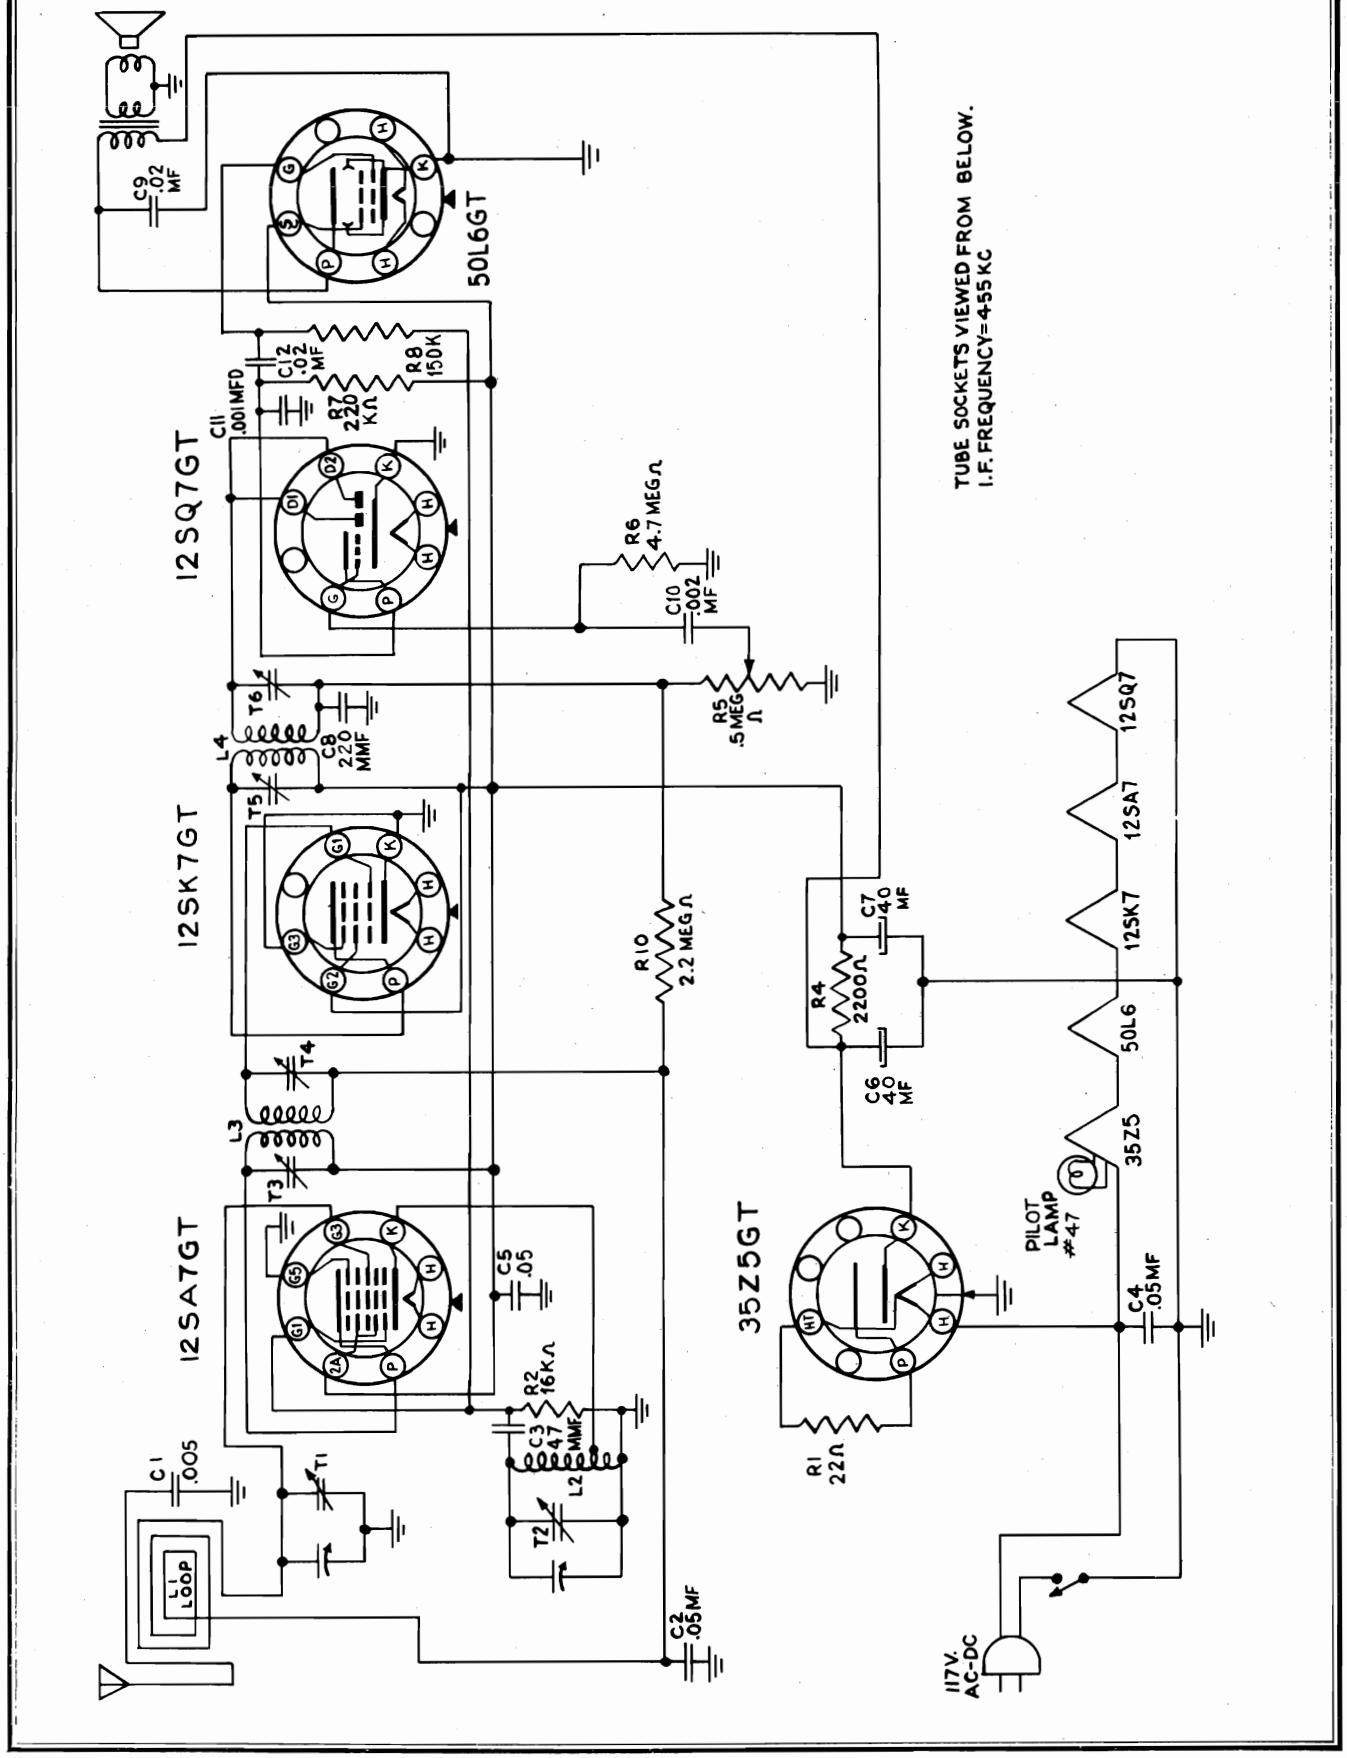
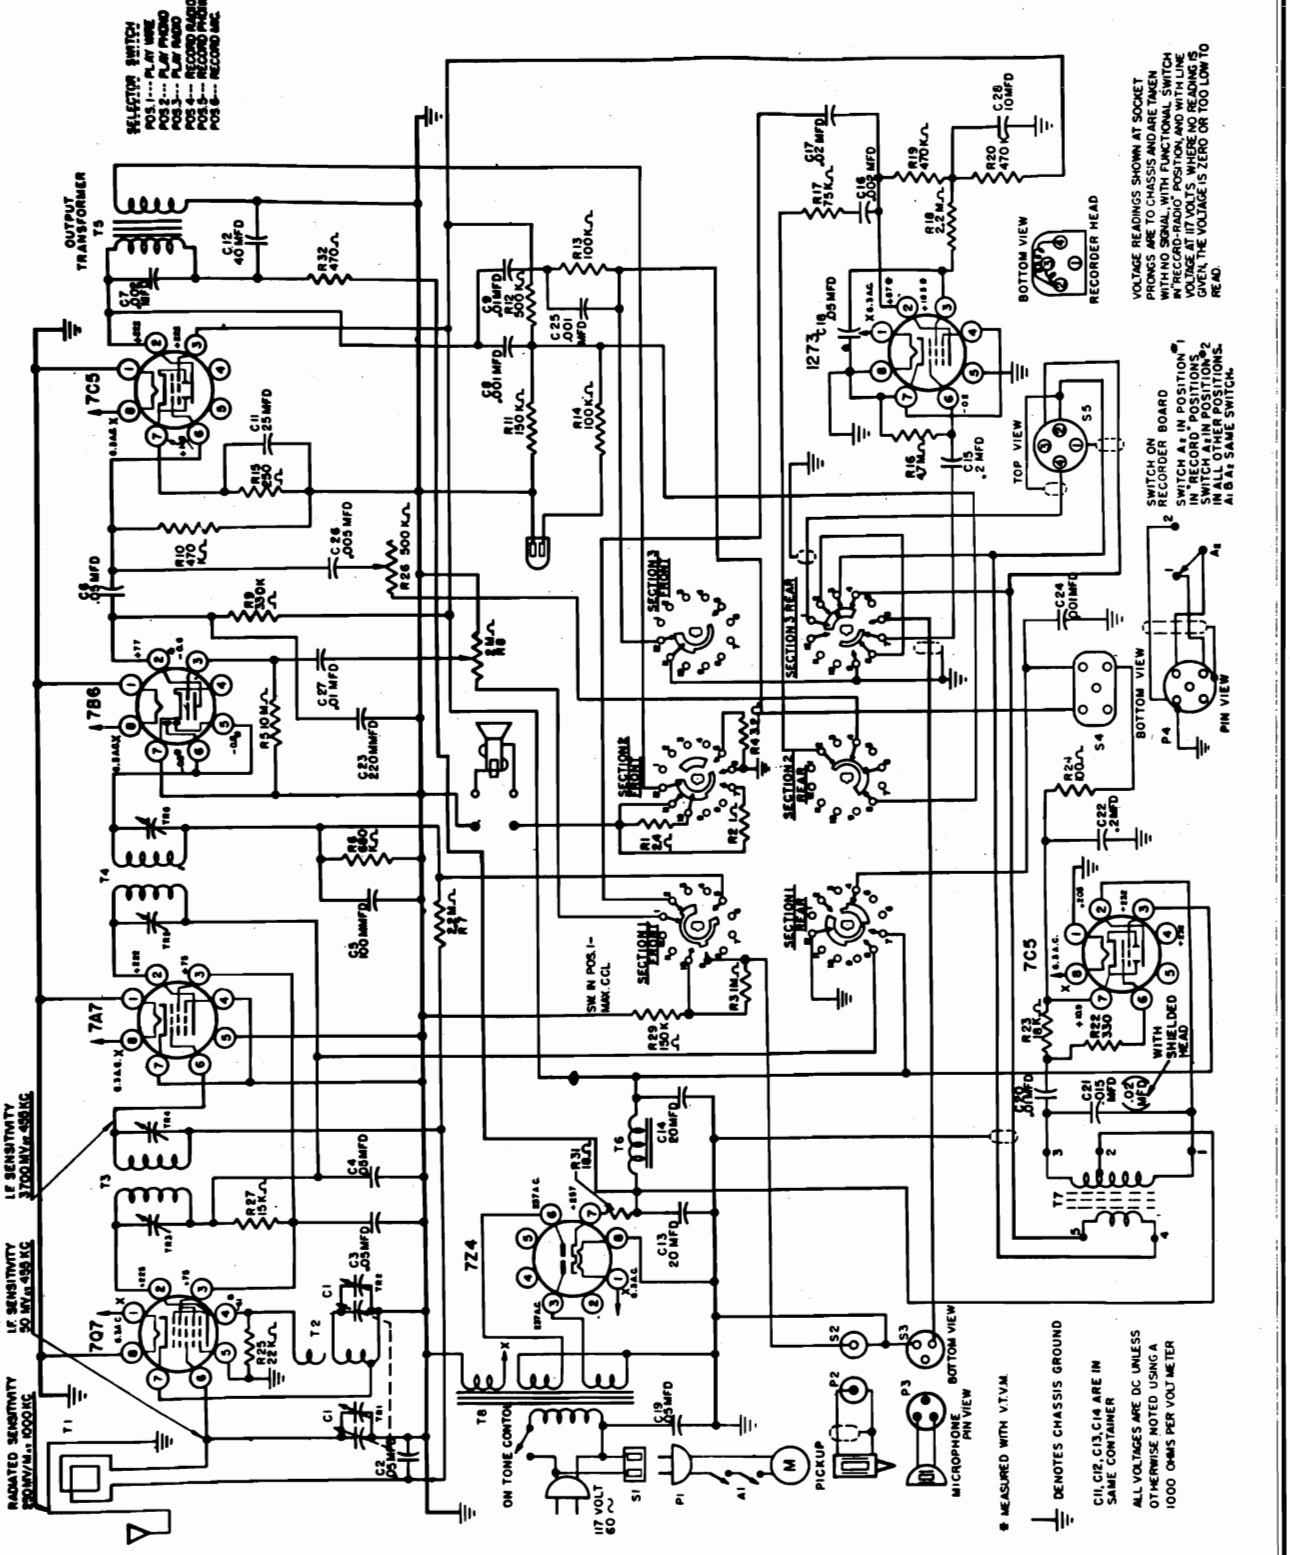
CHASSIS 458-3



MODEL 4700,
CHASSIS 476

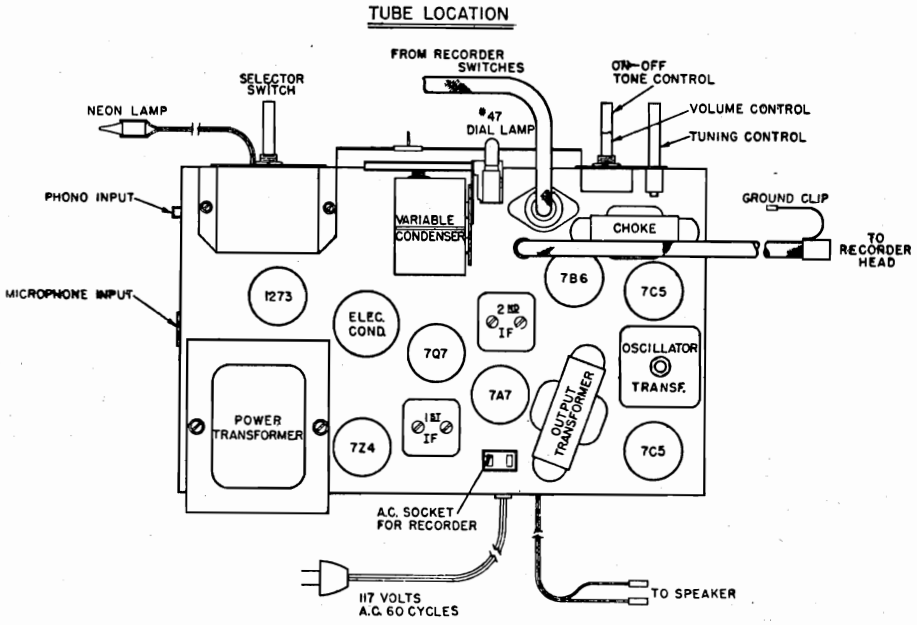
AIR KING PRODUCTS CO., INC.



AIR KING PRODUCTS CO., INC. MODEL 4700, CHASSIS 476

GENERAL DESCRIPTION

This model is a seven-tube superheterodyne receiver with wire recorder. It covers the broadcast frequency range of 540 to 1600 kc. The antenna input and oscillator circuits are tuned by a two gang variable capacitor. A loop antenna is built into the cabinet; provision is also made for the connection of an outside antenna. The wire recorder is designed to record sound magnetically on wire. The standard spool contains enough wire for an hour of continuous recording at two feet per second. The recordings may be played back immediately after the wire has been rewound. The receiver, in addition, can be used for playing phonograph records and listening to radio programs.



TO REMOVE THE RECORDER ASSEMBLY FROM CABINET:

1. Remove the four Phillips Head screws (in each corner of the recorder board) taking care not to drop the flat washers and studs to the bottom of the unit.
2. Disconnect cable from recorder motor switches (see "Tube Location" Drawing for location of cable).
3. Disconnect A.C. Plug from recorder which plugs into chassis.
4. Tilt recorder assembly up from the front end, and disconnect recorder head cable, and ground connection.
5. The wire recorder assembly can now be removed.

TO REMOVE CHASSIS FROM CABINET:

1. Remove Wire Recorder assembly as covered in above paragraph.
2. Remove four knobs.
3. Remove neon bulb from lens by pulling it out through bottom of motor board.
4. Remove three screws at rear of chassis.
5. Remove the two bolts at the sides of the chassis (one is near the 7C5 output tube, and other is near the 1273 preamplifier tube).
6. The chassis can now be removed from cabinet.

MODEL 4700,
CHASSIS 476

AIR KING PRODUCTS CO., INC.

ALIGNMENT PROCEDURE

Power Supply ..... 117 V 60 Cycle A.C. 95 Watts
Frequency Range ..... 540—1600 kc
Intermediate Frequency ..... 455 kc
Power Output ..... 2.25 Watts undistorted, 6 Watts maximum
Loudspeaker ..... 10" P.M. 3.2 or 8 ohm V.C. Impedance

Output Meter Connection ..... Across loud speaker voice coil
Output Meter Reading ..... ½ Watt
Connection of Generator output lead ..... See note below
Connection of Generator ground lead ..... B minus bus.
Generator Modulation ..... 30% at 400 cycles
Position of Volume Control ..... Fully clockwise
Position of Tone Control ..... Counter clockwise
Position of Dial Pointer ..... Variable fully closed
Position of Functional Switch ..... Play radio

FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	POSITION VARIABLE	ADJUST TRIMMER TO MAXIMUM OUTPUT IN ORDER SHOWN
455 kc	0.1 mfd	grid 7Q7	Fully closed	Tr3, Tr4, Tr5, Tr6
1500 kc	* * *	* * *	1500 kc	Tr2
1500 kc	* * *	* * *	1500 kc	Tr1
600 kc	* * *	* * *	600 kc	Check Point

* * * Run a wire from the output terminal of the signal generator near the receiver. No connection is made between the signal generator and the receiver.

The Alignment Procedure should be repeated stage by stage to insure greatest accuracy. Keep the output from signal generator at lowest value to make the A.V.C. action of the receiver ineffective.

OPERATION

The proper operation of this unit is discussed in the customers' instruction book. The most important item is the proper loading of the recording wire. It must be done properly to eliminate "wow". Make sure that the reset button is making contact if the recorder fails to operate.

ELECTRICAL ADJUSTMENTS

To check the erasing voltage of the recorder measure the voltage between pin 2 and 3 of the recorder head with a vacuum tube voltmeter. This measurement should be made with the recorder head attached to the plug of the recorder cable. The voltage at this point should be 4.0 volts minimum (as measured with a V.T.V.M.), with the shielded recorder head, and 2.7 volts minimum with the unshielded recorder head. If it is low, try replacing the 7C5 oscillator tube to increase the voltage.

If there is excessive hum when the unit is in the "Play Wire" position, the hum can be reduced by rotating the hum bucking coil (next to the power transformer) for minimum hum. If this does not entirely eliminate the hum, slide the power transformer shield slightly for minimum hum, and readjust the hum bucking coal. This should be done with the volume control on full.

AIR KING PRODUCTS CO., INC.

MODEL 4700,
CHASSIS 476

MECHANICAL ADJUSTMENTS

The Wire Recorder has been adjusted perfectly at the factory prior to shipment. There are very few things that can go wrong, and they are relatively simple to adjust.

The first thing to check if the recorder unit does not function properly is the centering of the motor. This is done by prying off the dust cap on the recorder board. The dust cap is the small cap which is directly to the rear of the "Reset" assembly, on the recorder board proper. Use a screwdriver, taking care not to mar the finish.

When this cap is removed, the motor spindle will be exposed. The spindle must be in the center of the opening. The centering should be checked using our centering gauge (Part #6815). If the spindle is not in the exact center, loosen the two screws holding the motor assembly, and adjust motor, with centering gauge in place, then tighten screws, and replace the dust cap.

Proper adjustment of the turntable torque is very important. To adjust the torque proceed as follows: With the power connect and wire being wound on the turntable, loosen the lock nut from the adjusting screw underneath the recorder chassis at the rear near the motor. Put your finger on the turntable to add a slight breaking action. Turn the adjusting screw clockwise until the turntable stops rotating, then turn the screw ½ turn counterclockwise. Let the wire continue to run and then switch the lever to "rewind". If the adjustment is correct the turntable should continue to rotate in a counterclockwise direction for about ½ turn before reversing. Tighten the lock nut taking care not to disturb the adjustment of the screw. Recheck the adjustment by going from maximum rewind to play.

If wire does not wind level, rotate the spindle until the cam under the level winding mechanism is at the position which allows the recording head to be at the bottom of its level. In this position the slot in which the wire rides should be approximately 1/64th of an inch above the motor board. If the slot is closer than this, loosen the two screws, holding the recorder head to the slide mechanism (at the bottom of unit) and place additional shims between the slide and the recorder head until the slot is 1/64th of an inch above the motor board. Place the wire on recorder and let it wind onto turntable if the wire rubs on the Reset Switch Trip Lever after about one minute of rewind. The Reset Switch Trip Lever should not depress the wire more than 1/64th of an inch when the cam is in its top position. Let the wire run for awhile and check the way the wire lays into the channel underneath the turntable. With the proper adjustment, it should wind level across the channel. If it piles up on the top of the channel, remove the turntable by loosening the set screw on the turntable spindle, remove the felt washer, and spring. The turntable can now be removed. Remove the turntable and place additional shims underneath the spindle. Replace all parts and recheck to see if the wire is being wound level. If the wire piles up on the bottom of the channel remove some of the shims.

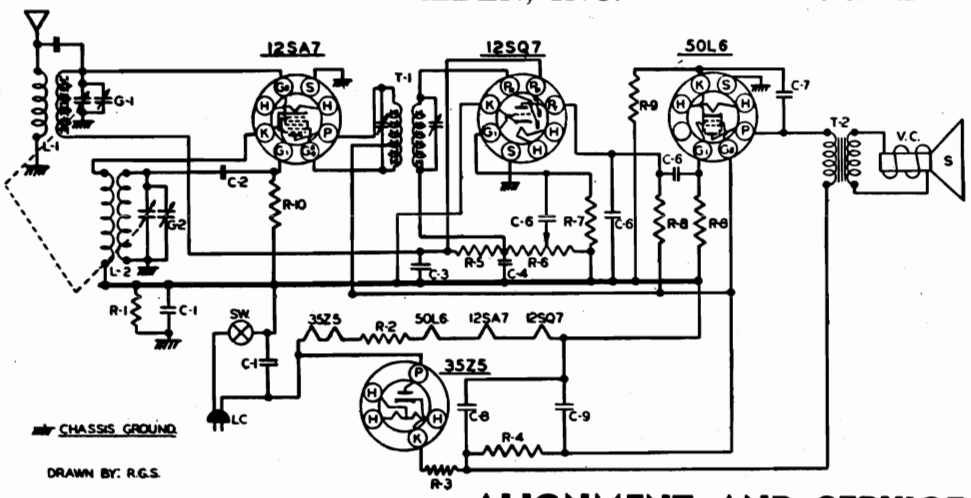
LOCATION OF TUBES

Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube, or some local condition is not responsible for faulty reception.

The Signal Generator may be connected throught a 0.01 mf capacitor (used as dummy antenna) to the lug on RF section of the tuning capacitor. Connect ground clip of generator to the B— terminal. An output meter may be clipped directly across the voice coil lugs. Align the I.F. trimmers and iron core to 455 kc, using least possible input from Signal Generator to avoid developing A.V.C. voltage which would make the tuning adjustments broad.

Provisions are made to align the R.F. trimmers with the receiver in the metal cabinet. Remove the two plug buttons on the right side of the cabinet and connect the Signal Generator leads to two or three turns of heavy wire, forming a self-supporting loop of about 7 or 8 inches diameter, placed about a foot away from the receiver's loop antenna. Again, use the least possible input from the Signal Generator. With the tuning capacitor plates completely out of mesh, and the pointer at the extreme right end of its travel, adjust the oscillator trimmer (on front section of tuning capacitor) to 1625 kc. Readjust both Signal Generator and tuning capacitor to 1550 kc and adjust the RF trimmer (on rear section) for maximum response.



ALIGNMENT AND SERVICE DATA

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1650 KC. An output meter should be connected across the speaker.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser through a .1 MFD. condenser. The ground lead from the generator must be connected to "B" minus under the chassis. Turn the gang condenser to complete minimum capacity. Set the generator to 455 KC. Adjust the trimmers of the I. F. transformer until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1650 KC. Adjust the OSC. trimmer until the 1650 KC signal is tuned in. The gang condenser must be at complete minimum capacity for this adjustment.

THIRD STEP: Remove the generator hot lead and connect it to the antenna hank terminal strip through a 200 MMFD. condenser. With the receiver and generator set at 1400 KC, increase the generator output. Adjust the ANT. trimmer until a maximum signal is noted on the output meter. No further adjustment should be made as the coils and gang condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

TUBE AND TRIMMER LOCATION

⑨ 9.219 OUTPUT TRANSFORMER

LINE VOLTAGE: This receiver is designed for operation on 105-125 Volts, 50-60 Cycles, either Alternating or Direct Current (AC-DC).

POWER CONSUMPTION: 30 Watts.

TUNING RANGE: Broadcast: 540 to 1650 Kilocycles (180 to 555 meters).

DIAL: The Dial Scale is calibrated in Kilocycles times 10 to correspond with newspaper or periodical listings.

TUBES: The tubes used, and their functions, are as follows:

12SA7 Converter — 12SQ7 Detector, Avc and Audio Amp.
14A7 I.F. Amplifier — 50L6 Beam Power Amplifier
35Z5 Rectifier

ALIGNMENT: Should it become necessary at any time to check the alignment of this receiver, proceed as follows:

(1) Set the Signal Generator to 455 KC and connect to the stator lug on the rear section of the Variable Capacitor. Connect the Signal Generator Ground lead to the chassis. Connect a suitable output meter across the Speaker Voice Coil Connections. Turn the Volume Control to the maximum position. Turn the Variable Capacitor to the extreme clockwise position.

(2) Adjust the trimmers located at the top of the first and second I. F. Transformers or the iron cores located at the top and bottom of each I. F. for maximum output as indicated on the Output Meter.

(3) Loosely couple the Signal Generator lead to the Loop and set to 1650 KC.

(4) With Variable Capacitor set at the extreme clockwise position, tune in the 1650 KC signal by means of the Oscillator Trimmer on the Variable Capacitor (front section).

(5) Set the Signal Generator to 1500 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the Antenna Trimmer on the Variable Capacitor (rear section) for maximum output. No other adjustments are necessary.

ALIGNMENT

Remove chassis from cabinet for alignment.

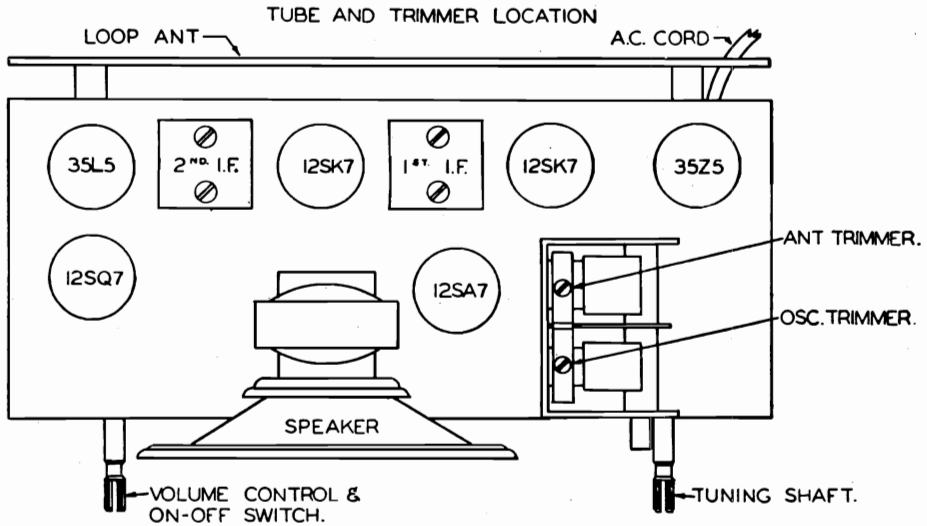
A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1720 KC. An output meter should be connected across the speaker.

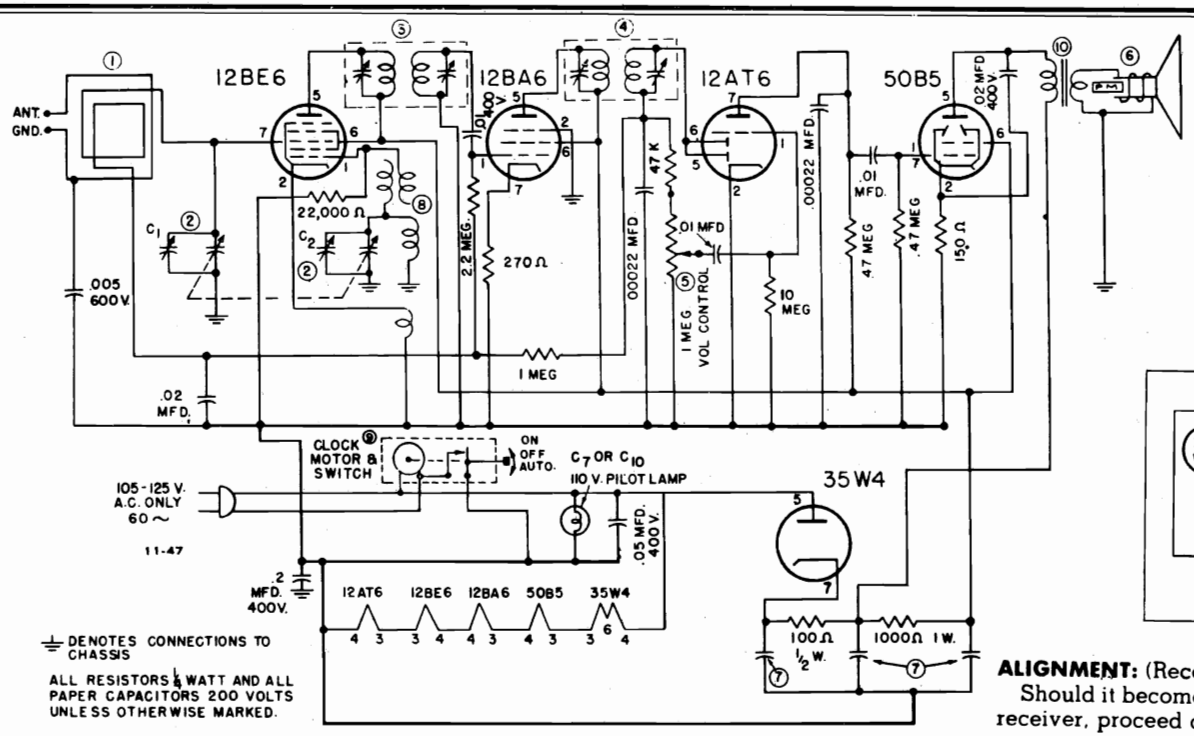
The receiver volume control should be turned to maximum during the I.F. and all subsequent alignments to keep the AVC from working and giving false readings. Keep the generator output as low as possible to prevent overloading.

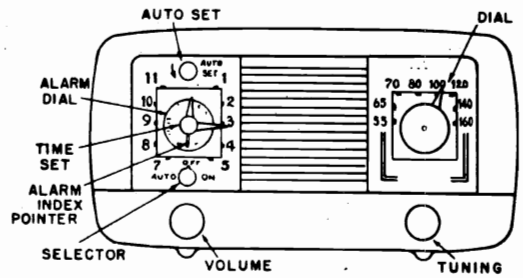
FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD condenser. The ground lead from the generator must be connected to the floating ground buss under the chassis. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

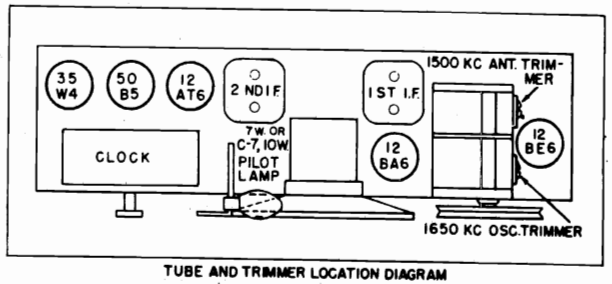
SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1720 KC. The OSC. trimmer is located on the front of the chassis. Adjust this trimmer until the 1720 KC signal is tuned in.

THIRD STEP: Remove the hot lead of the generator from the ANT section of the gang condenser. Connect this lead to the primary of the loop antenna through a 200 MMFD condenser. Adjust the Signal Generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The ANT trimmer is located on the back of the loop antenna. Adjust this trimmer until a maximum reading is noted on the output meter. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.









TUBE AND TRIMMER LOCATION DIAGRAM

① 1.464 LOOP ANTENNA
② 2.213 2 GANG VARIABLE COND.
③ 1.259 1ST I.F. TRANSFORMER
④ 1.409 2ND I.F. TRANSFORMER
⑩ 9.200 OUTPUT TRANSFORMER
⑤ 8.200-11 VOLUME CONTROL
⑥ 30.300 OR 30.316 P.M. SPEAKER
⑦ 5.415-1 ELECTROLYTIC CAP. 20-20-20 MFD.
⑧ 1.402-1 OSCILLATOR COIL
⑨ 36.113 TELECHRON CLOCK ASSEMBLY

TO OPERATE THE RADIO: Turn the Selector knob located at the bottom of the clock face so that its index points to on. This turns on the power to the radio. Next, turn the Volume control knob at the bottom left of the cabinet about half way in the clockwise direction, or to the right. Wait a few seconds for the tubes to warm up. Turn the Tuning control knob so that the dial pointer indicates the frequency of the desired station, tuning carefully for best and clearest reception.

To turn the radio off, turn the Selector knob so that the index points to the upright or center position.

TO OPERATE YOUR "RADALARM" RADIO AS A MUSICAL ALARM: You may set your clock radio to automatically turn on a program you wish to hear during the next eleven hours. Proceed by tuning in the station which will carry the program desired. Then set the Volume control knob at the level you want, as for the regular radio operation. Turn the Auto set knob at the top of the clock face, which rotates the disc forming the alarm dial of the clock.

Stop rotation when the time you desire the radio to go on is directly under the short index pointer on the opposite end of the hour hand. Now turn the Selector knob so that the index points to Auto that is points to the left.

After setting the alarm, if you wish to return to normal radio operation, turn the Selector knob so that the index points to on. Then operate the radio as described in preceding paragraphs. Be sure to turn the Selector knob back to the Auto position if you want a program to be turned on automatically.

TUBES: The tubes used, and their function are as follows:

12BE6 Converter
12BA6 I.F. Amplifier
12AT6 Detector, AVC and Audio Amp.
50B5 Beam Power Amplifier
35W4 Rectifier

LINE VOLTAGE: This clock-radio receiver is designed for operation on 105-125 volts, 60 cycles alternating current only.

POWER CONSUMPTION: 40 Watts.

TUNING RANGE: Broadcast: 540 to 1650 Kilocycles (180 to 555 Meters).

DIAL: The dial scale is calibrated in kilocycles. Example: Read 60 as 600 KC.

ALIGNMENT: (Receiver removed from cabinet)

Should it become necessary at any time to check the alignment of this receiver, proceed as follows:

(1) Set the Signal Generator to 455 KC and connect to the stator lug on the rear section of the variable capacitor. Connect the signal generator ground lead to the chassis. Connect a suitable output meter across the speaker voice coil connections. Turn the volume control to the maximum position. Turn the variable capacitor to the extreme clockwise position.

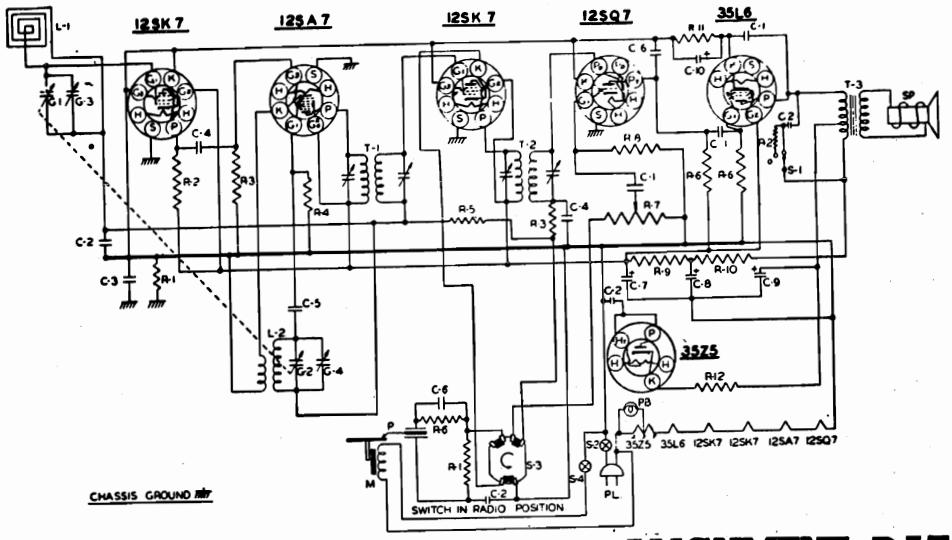
(2) Adjust the trimmers located at the top of the first and second I.F. Transformers for maximum output as indicated on the output meter.

(3) Loosely couple the signal generator lead to the loop and set to 1650 KC.

(4) With the variable capacitor set at the extreme clockwise position, tune in the 1650 KC signal by means of the oscillator trimmer on the variable capacitor (front section).

(5) Set the signal generator to 1500 KC and turn the tuning control so that this frequency is indicated on the dial. Adjust the antenna trimmer on the variable capacitor (rear section) for maximum output. No other adjustments are necessary.

ALDEN, INC. MODEL 1955



ALIGNMENT DATA

Remove the chassis from the cabinet. A Signal Generator with the following frequencies is required: 455 KC, 1400 KC and 1720 KC.

The receiver volume control should be turned to maximum during the I.F. and all subsequent alignments to keep the A.V.C. from working and giving false readings. Turn the tone control to complete left hand position. Keep the generator output as low as possible to prevent overloading.

Connect an output meter across the voice coil of the speaker.
Connect a 20,000 ohm resistor across the loop connector terminals to reflect proper loop impedance.

FIRST STEP: Connect the hot lead from the generator to the "ANT." section of the gang condenser through a .1 MFD. condenser. The ground lead must be connected to the floating ground buss under the chassis. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455 KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator connected in the same manner as in I.F. alignment, adjust the signal generator to 1720 KC. The "O.S.C." trimmer is located on the front section of the gang condenser. Adjust this trimmer until the signal is tuned in. The gang condenser should be at complete minimum capacity for this setting.

THIRD STEP: Remove the generator leads from the chassis. Remove the 20,000 ohm resistor from the loop connector terminals. Reinstall the chassis in the cabinet, connect the loop leads, motor plug and phono pickup leads.

Connect the generator leads to a transmitting loop, made of a few turns of wire, and loosely couple to the receiver loop antenna which is located on the back end of the cabinet. Adjust the generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The "ANT." trimmer is located on the rear section of the gang condenser. Adjust this trimmer until a maximum signal is noted on the output meter.

No further adjustment should be necessary, unless the receiver has been damaged, as the coils and tuning condenser have been specially handled at the factory to insure proper alignment at the lower frequencies.

Operating Instructions

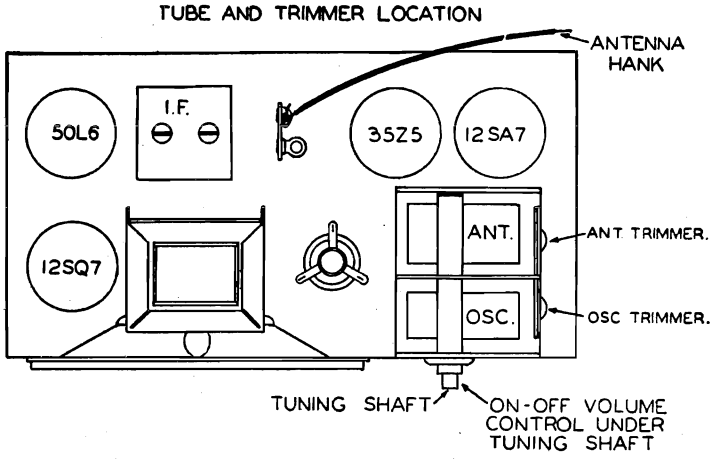
POWER SOURCES: This receiver may be operated on alternating current (AC) of 110 to 125 volts at 60 cycles or on direct current (DC) of 110 to 125 volts. When used on DC, if the tubes light up but set does not play, reverse the cord plug in the power outlet.

CAUTION: Always predetermine voltage of power sources. Never try to plug this receiver into a 220 volt line, as this will cause serious damage.

INSTALLATION: Unwind the power cord and plug into a convenient outlet. This receiver is equipped with an antenna hank, which should be uncoiled and stretched out to its full length for best reception. However, in steel constructed buildings or in distant isolated locations, better results may be obtained by connecting an outdoor antenna to the end of the antenna hank wire. The outdoor antenna should be about 50 feet long, including the lead-in wire.

MODELS 4E-515, 4E-516, 4F-515, 4F-516 ALLIED RADIO CORP.

TUBE AND TRIMMER LOCATION



TL-65

CONTROLS: Two knobs control the operation of this receiver. The lower knob is used to turn the set off and on. It is also used to control volume. Rotate this knob to the right in a clockwise direction and a click will be heard. This turns the receiver on. Allow about thirty seconds for tubes to heat up, then continue to rotate the knob to the right to increase volume. The upper knob is the station selector. Rotate this knob to the right or left to locate your station. By mentally adding a zero to the numbers on the dial, the result will be read directly in kilocycles. To turn off, turn the lower knob to the left in a counterclockwise direction as far as it will go and a click will be heard. The power switch will then be turned off.

ALIGNMENT AND SERVICE DATA

(See Fig. No. 1 For Trimmer Location)

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1650 KC. An output meter should be connected across the speaker.

The volume control of the receiver should be turned to maximum during the I. F. and all subsequent alignment and the generator output as low as possible to prevent the A. V. C. from working and giving false readings.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser through a .1 MFD. condenser. The ground lead from the generator must be connected to "B" minus under the chassis. Turn the gang condenser to complete minimum capacity. Set the generator to 455 KC. Adjust the trimmers of the I. F. transformer until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1650 KC. Adjust the OSC. trimmer until the 1650 KC signal is tuned in. The gang condenser must be at complete minimum capacity for this adjustment.

THIRD STEP: Remove the generator hot lead and connect it to the antenna hank terminal strip through a 200 MMFD. condenser. With the receiver and generator set at 1400 KC, increase the generator output. Adjust the ANT. trimmer until a maximum signal is noted on the output meter. No further adjustment should be made as the coils and gang condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

OPERATING INSTRUCTIONS

POWER SOURCES: This receiver may be operated on alternating current (AC) of 110 to 125 volts at 60 cycles or on direct current (DC) of 110 to 125 volts. When used on DC, if the tubes light up but set does not play, reverse the cord plug in the power outlet.

CAUTION: Always predetermine voltage of power source. Never try to plug this receiver into a 220 volt line, as this will cause serious damage.

INSTALLATION: Unwind the power cord and plug into a convenient outlet. This receiver is equipped with a sensitive loop antenna and under ordinary conditions no external antenna would be required. However, in steel constructed buildings or in distant isolated locations, the reception may be improved by using an outside antenna. This should be a single wire not more than 50 feet long and should be connected to the antenna lead that projects from the back of the receiver. No ground wire is required at any time.

MODELS 5D-250, 5D-251, 5E-250, 5E-251

ALLIED RADIO CORP.

ALIGNMENT AND SERVICE DATA

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1720 KC. An output meter should be connected across the speaker.

The receiver volume control should be turned to maximum during the I.F. and all subsequent alignments to keep the AVC from working and giving false readings. Keep the generator output as low as possible to prevent overloading.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD condenser. The ground lead from the generator must be connected to the floating ground buss under the chassis. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1720 KC. The OSC. trimmer is located on the front of the chassis. Adjust this trimmer until the 1720 KC signal is tuned in.

THIRD STEP: Remove the hot lead of the generator from the ANT section of the gang condenser. Connect this lead to the primary of the loop antenna through a 200 MMFD condenser. Adjust the Signal Generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The ANT trimmer is located on the top of the ANT. section of the gang condenser. Adjust this trimmer until a maximum reading is noted on the output meter. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

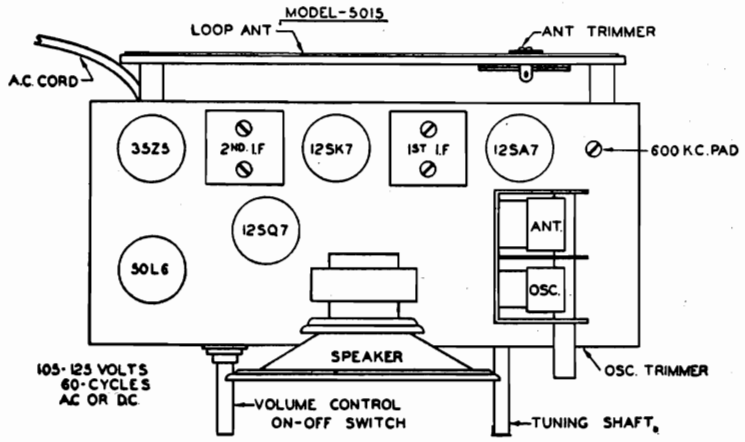

FIGURE-1

CONTROLS: Two knobs control the operation of this receiver. The left hand knob is used to turn set off and on. It is also used to control volume. Rotate knob to your right in a clockwise direction and a click will be heard. This turns receiver on. Allow about 30 seconds for tubes to heat up, then continue to rotate knob to your right to increase volume. The right hand knob is the station selector. Rotate this knob to the right or left to locate your station. By mentally adding a zero to the numbers on the dial, the result will be read directly in kilocycles. To turn set off, turn left hand knob to your left in a counter-clockwise direction as far as it will go and a click will be heard. The power switch will then be turned off.

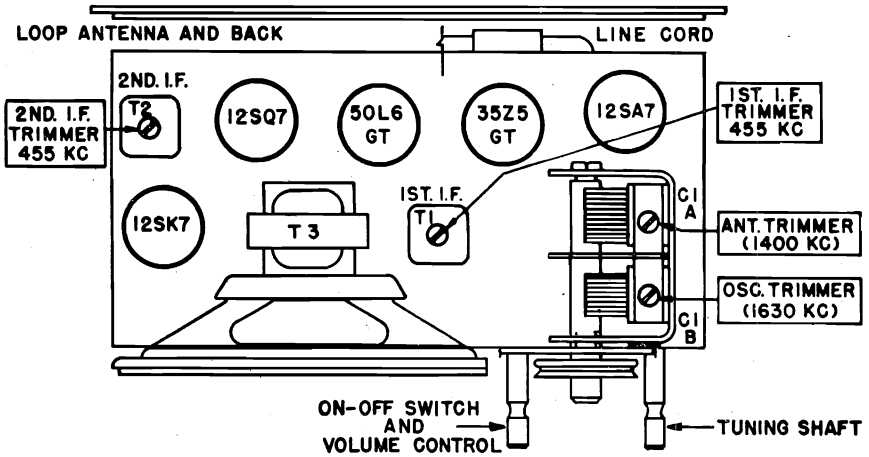
ALIGNMENT PROCEDURE

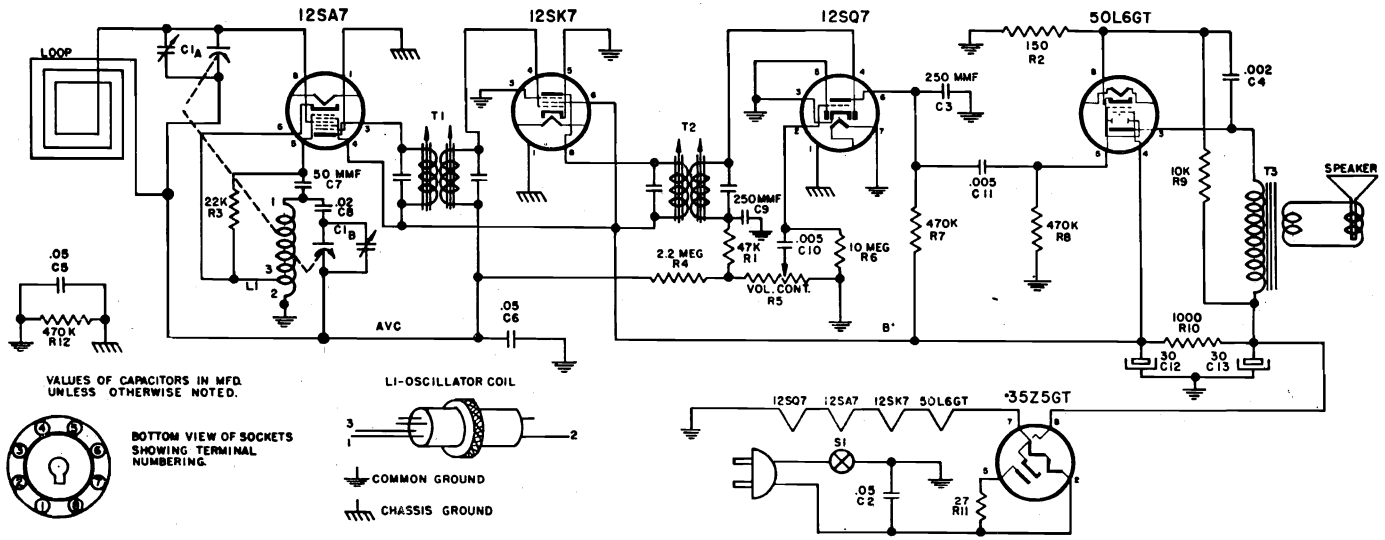
(Continued)

CAUTION: This is an A.C.-D.C. receiver and when aligning the set it is necessary to isolate the Signal Generator or the Receiver from the line by use of a transformer, or place a .2 MFD. condenser in both test leads of the Signal Generator.

Position of Variable	Generator Frequency	Dummy Ant. Mfd.	Generator Connections	Trimmer Adjustment	Trimmer Function
Fully open	455 KC	.1	*12SA7 Grid (Stator of C1A)	T1	Input I.F.
Fully open	455 KC	.1	*12SA7 Grid (Stator of C1A)	T2	Output I.F.
Fully open	1630 KC	.1	*12SA7 Grid (Stator of C1A)	C1B	Oscillator
Tune in signal from generator	1400 KC		Loosely coupled to loop antenna	C1A	Antenna

*Connect ground lead of signal generator to common negative.





ALLIED RADIO CORP.

MODELS 5F-525, 5F-526

INSTALLATION

The loop antenna incorporated in the receiver is sufficient for all normal reception.

When using a DC power supply and after allowing sufficient time for the tubes to warm up the receiver does not operate, remove the line cord plug from the receptacle and reverse. Replace the plug in the reversed position and allow tubes to warm up at which time the receiver will operate.

If an excessive hum is noticed when operating from an AC power source, reverse the line cord plug to determine which position gives the best results.

NOTE: All loop antennas are somewhat directional in their characteristics.

Reception can sometimes be improved and/or local interference reduced by turning the set in a different direction.

OPERATION

To turn the receiver on, rotate the on-off switch and volume control knob (left hand control) clockwise about one-half its range. This supplies power to the receiver. Allow about thirty seconds for the tubes to warm up after which the desired station may be tuned by rotating the station selector (right hand control).

For best tone, tune the desired station with the volume control turned low. This enables you to get the exact point where the station comes in best. Then, adjust the volume to the desired level with volume control.

DESCRIPTION

This model is a 4 tube (plus rectifier) superhetrodyne radio receiver designed for use on 117 volts 60 cycle AC or 117 volts DC power supply.

The tubes used are:—

1—12SA7 Oscillator Converter
1—12SK7 I.F. Amplifier
1—35Z5GT Power Rectifier
1—12SQ7 AVC Detector and 1st Audio
1—50L6GT Power Output

This receiver covers the frequency range from 540 kilocycles to 1630 kilocycles (KC).

ALIGNMENT PROCEDURE

The following alignment procedure is for use only by competent servicemen having the proper equipment.

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, to prevent A.V.C. action from interfering with correct alignment.

With the output meter connected across the voice coil of the speaker, the output meter reading for 50 milli-watts is .4 volts using a signal which is modulated 400 c.p.s.

Adjust all trimmers for maximum output. Repeat alignment procedure given below as a final check.

MODEL 5F-565 ALLIED RADIO CORP.

POWER SOURCES: This receiver is designed for operation on either an external power source or on the enclosed batteries.

AC OR DC OPERATION: This receiver may be operated on 50 to 60 cycle, 110 to 125 volt AC current or 110 to 125 DC current.

CAUTION: Never plug this receiver into a 220 volt line as this will seriously damage the component parts which have been designed for 110 to 125 volt operation only.

To operate on AC or DC open the small door at the right in the back of the cabinet. Pull out the power cord and plug into a convenient outlet of the proper voltage and current. Follow instructions under "Controls."

To operate on the enclosed batteries, follow instructions under "Controls."

ANTENNA: This receiver is equipped with a sensitive loop antenna and requires no external antenna wire. However, due to the directional qualities of the loop some stations may appear to be weak in reception. This condition may be remedied by rotating or changing the position of the receiver.

CONTROLS: This receiver has three control knobs which are located on the front panel of the cabinet.

STATION SELECTOR KNOB: The right hand knob is the station selector. Rotate this knob to the right or left to select your desired station. The dial scale is calibrated in kilocycles. By mentally adding a zero to the numbers on the scale, the result will be read directly in (KC) kilocycles. (i.e., 60 plus 0 equals 600 KC or 140 plus 0 equals 1400 KC).

POWER SELECTOR SWITCH: The left hand knob is the power selector. It has three positions which are indicated on the front panel. The extreme left hand position is the "OFF" position. The small dot on this knob must point to "OFF" when the receiver is not in use. The center position is "AC-DC" and is used when it is desired to operate the receiver from a power line source. The extreme right hand position is "BATT" and is used when it is desired to operate on the enclosed batteries.

AC OPERATION: When an AC power source is used, set the power selector knob to "AC-DC" after the power cord has been plugged into a convenient outlet. The receiver is now ready for operation.

DC OPERATION: If the receiver does not operate after a few seconds, reverse the power cord plug in the outlet and it will operate properly.

TUNING RANGE — 540 KC to 1650 KC

ALIGNMENT AND SERVICE DATA

(See Fig. No. 2 For Trimmer Location)

Remove chassis from cabinet for alignment.

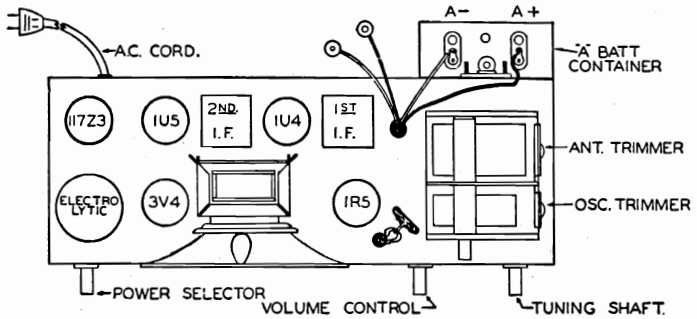
A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1650 KC. An output meter should be connected across the speaker.

The volume control of the receiver should be turned to maximum during the I. F. and all subsequent alignment and the generator output as low as possible to prevent the A. V. C. from working and giving false readings.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser through a .1 MFD. condenser. The ground lead from the generator must be connected to "B" minus under the chassis. Turn the gang condenser to complete minimum capacity. Set the generator to 455 KC. Adjust the movable iron cores in the IF cans. These IF adjustments are made in the top and in the bottom of the can under the chassis. Adjust the cores until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1650 KC. Adjust the OSC. trimmer until the 1650 KC signal is tuned in. The gang condenser must be at complete minimum capacity for this adjustment.

THIRD STEP: Remove the generator leads from the gang condenser and replace the chassis in the cabinet. Loosely couple the generator to the receiver loop by making a complete turn of wire over the outside of the cabinet. With the receiver and generator set at 1400 KC, increase the generator output. Adjust the ANT. trimmer through the hole which is provided in the end of the cabinet until a maximum signal is noted on the output meter. The ANT. trimmer hole in the side of the cabinet is covered by a small plug button. Replace this button after adjustment has been made. No further adjustment should be made as the coils and gang condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.



TL-75

TUBE AND TRIMMER LOCATION
FIGURE-2

BATTERY OPERATION: The power cord is not used for battery operation and may be hanked and put back in the cabinet. Set the power control knob to "BATT" and the receiver is ready for operation on the enclosed batteries.

CAUTION: When the receiver is not in use, the power selector knob must be turned to "OFF." If the knob is allowed to remain in "BATT" position, the batteries will be in use constantly. The volume control does not control the batteries and they are still in operation even though the volume control is turned all the way off.

VOLUME CONTROL: The center knob is the volume control. After the power selector knob has been properly set and the receiver is in operation, rotate the volume control knob to the right to increase volume or to the left to decrease volume.

BATTERY SUPPLIERS

The batteries for this receiver may be purchased from any reliable dealer.

For proper operation this receiver requires two "A" batteries and one "B" battery.

The "A" batteries are size "D" flashlight cells and are made by all battery manufacturers.

The "B" battery is a 67½ volt battery and is made by the following manufacturers:

Eveready	67½ vlt.	#467
Burgess	67½ vlt.	#XX45
General	67½ vlt.	#W45A
Ray-O-Vac	67½ vlt.	#4367

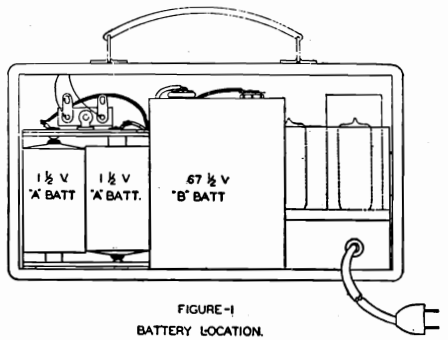


FIGURE-1
BATTERY LOCATION.

BATTERY SUPPLIERS

(See Fig. No. 1)

To replace the batteries in this receiver:

Remove the back.

To the left, looking into the rear of the cabinet is the "A" or flashlight battery container. To the right is the "B" or 67½ volt battery.

To replace the "A" batteries, pull the old batteries out of the container. Replace with fresh batteries, making sure the batteries are inserted according to the diagram on the inside of the container.

To replace the "B" battery, disconnect the snap fastener connectors. Replace with a fresh battery and snap the connectors into place. Replace the battery in the cabinet as shown in Fig. No. 1, making sure that the connector end faces the top of the cabinet.

After the batteries have been installed, replace the back, making sure that the two washers in the bottom of the back fit into the slot near the bottom edge of the cabinet.

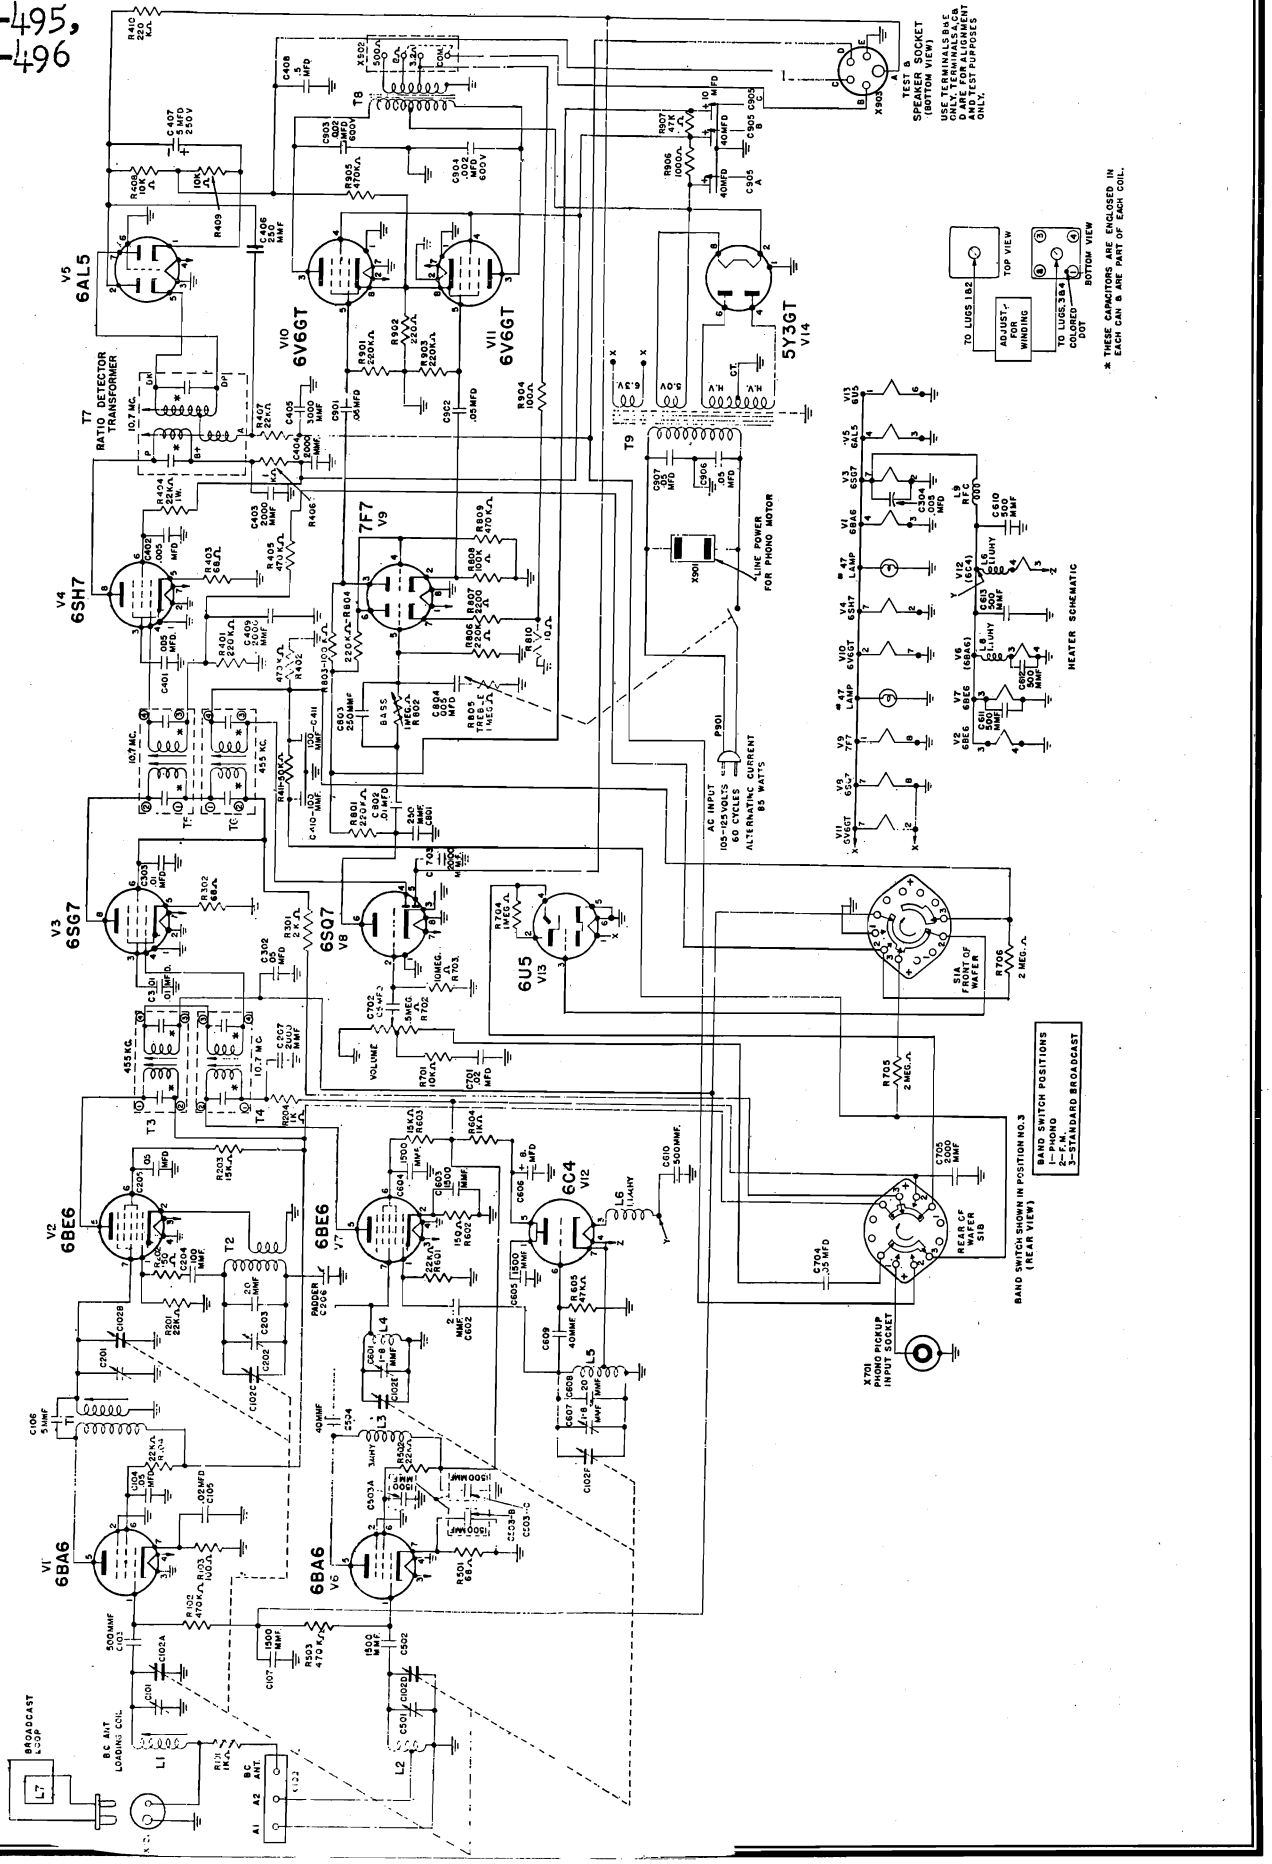
ALLIED RADIO CORP.



ALLIED RADIO CORP.

MODELS 14F-490, 14F-495, 14F-496

This AM-FM superheterodyne radio receiver is designed to operate on 105-125 volts, 60 cycles AC.

The Tuning Ranges are:

AM 525 kc to 1720 kc
FM 88 mc to 108 mc

Tube Complement:
1 Type 6BA6 FM R.F. Amplifier
1 Type 6BA6 AM R.F. Amplifier
1 Type 6BE6 FM Mixer
1 Type 6BE6 AM Oscillator, converter
1 Type 6C4 FM Oscillator
1 Type 6SG7 I.F. Amplifier
1 Type 6SH7 FM Detector Driver
1 Type 6AL5 FM Ratio Detector
1 Type 6SQ7 AM Detector, A.V.C., 1st Audio Amplifier
1 Type 7F7 2nd Audio Amplifier and Phase Inverter
1 Type 6U5 Electron Ray Tuning Indicator
2 Type 6V6/GT Push Pull Power Amplifiers
1 Type 5Y3/GT Full Wave Rectifier

SERVICE NOTES:

Failure of Receiver to Operate May Be Due To:

1. No current at power socket
2. All tubes not firmly in sockets
3. Band switch in wrong position
4. Output impedance jumper on rear of chassis not connected or missing
5. Low signal strength in the particular location. Change position (rotate) of loop, or "folded dipole" antenna, or use an outside antenna
6. Speaker or loop antenna not plugged into sockets

ALIGNMENT PROCEDURE

Alignment Procedure for AM

Equipment Required:
Broadcast Band Signal Generator
Audio Output Meter

A) 1. Set Band Switch to "AM". Advance Volume Control to maximum, set "BASS" Control at minimum, set Treble Control at maximum.

2. Connect output meter across speaker voice coil.

NOTE: During all of these tests it is necessary to reduce the signal generator output so that the receiver output level is maintained at .5 watt.

B) I. F. ALIGNMENT

1) Set signal generator to 455 kc. Connect a .05 mfd condenser in series with the "high" side of the generator output lead to pin #4 of the 6SG7 (V3) I.F. amplifier tube. Peak bottom and top cores of 2nd I.F. (T-6).

2) Connect signal generator ("high" side in series with a .05 mfd condenser) across C201 on variable condenser, peak bottom and top cores of 1st I.F. Transformer (T-3).

C) R. F. ALIGNMENT

1) Connect signal generator to the AM antenna terminal ("high" side in series with a 50 mmf condenser) and ground. Open variable condenser to minimum capacity, set signal generator to 1720 kc, adjust broadcast oscillator trimmer C202 to tune in signal.

2) Close variable condenser to maximum capacity, set signal generator to 535 kc and adjust broadcast band padder (C206) to tune in signal.

3) Repeat step (1).

4) With variable condenser fully meshed move dial pointer to small white line slightly to left of "55" on broadcast band dial scale.

5) Set signal generator to 1500 kc. Tune in signal with Tuning Control. Peak antenna trimmer (C101) and interstage trimmer (C201).

6) Set signal generator to 600 kc, tune in signal with receiver Tuning Control, peak antenna loading coil (L1). Peak interstage transformer (T1).

7) Repeat step (5).

MODELS 14F-490, 14F-495, 14F-496

ALLIED RADIO CORP.

Alignment Procedure for FM

NOTE: Contacts A, C, and D of the speaker socket at the rear of the chassis have been provided for connection to V.T.-V.M. for the alignment of the FM circuits.

Equipment Required:

High Frequency Signal Generator 87.5 mc to 108.5 mc.
Signal Generator capable of delivering .1 volt at 10.7 mc.
Audio Output Meter.
D.C. Vacuum Tube Voltmeter with zero center scale.
Tuning Wand.

A) RATIO DETECTOR ALIGNMENT

1) Connect V.T.V.M. across speaker socket terminals "A" and "C", (A.V.C. Voltage).

2) Feed 10.7 mc unmodulated R.F. signal into 6SH7 (V4) grid, pin #4, through .01 mfd condenser. This signal should be .1 volt.

3) Adjust primary of ratio detector transformer (T-7) for maximum indication on V.T.V.M.

4) Connect zero centered V.T.V.M. across speaker socket terminals "D" and "C".

5) Adjust secondary of ratio detector transformer (T-7) for zero indication.

6) Tune 10.7 mc Signal Generator higher in frequency (about 200 kc) until maximum voltage reading is obtained on V.T.V.M.

Note this voltage, then tune signal generator lower in frequency until maximum voltage of the opposite polarity is obtained. Note this voltage, then if necessary re-adjust primary of the detector (T-7) until the maximum detector voltages are about equal on either the high or low side of 10.7 mc.

B) FM 10.7 Mc I. F. ALIGNMENT

1) Shunt a 100 ohm carbon resistor across the primary of the detector (T-7) lugs "B+" and "P".

2) Connect output meter across speaker.

3) Set volume controls at maximum, bass at minimum.

4) Connect 10.7 mc signal generator (modulated 30%) to the grid (pin #4) of the 6SG7 (V-3) thruogh a .01 mfd condenser and ground.

5) Peak bottom and top cores of (T-5) 2nd I.F.

6) Connect 10.7 mc signal generator (modulated 30%) across the FM interstage trimmer (C601) and ground.

7) Peak bottom and top cores of 1st I.F. (T-4).

8) Remove 1000 ohm shunting resistor from (T17).

NOTE: during all of these tests it is necessary to reduce the signal generator output so that the receiver output level is maintained at .5 watts.

C) FM OSCILLATOR ALIGNMENT

1) Connect the high frequency signal generator across the FM antenna terminals. The ground side of the generator output cable is attached to terminal "A1", a 270 ohm carbon resistor is connected from the "high" side of the generator cable to terminal "A2".

2) Open variable condenser to minimum capacity; set signal generator to 108.5 mc, tune in signal with FM oscillator trimmer (C607).

3) Close variable condenser to maximum capacity: set signal generator to 87.5 mc. To adjust oscillator to signal it may be necessary to spread or squeeze the FM oscillator coil L5 slightly.

4) Repeat steps (2) and (3) if necessary.

D) FM R. F. ALIGNMENT

NOTE: When making the following tests keep the signal generator output at a level that will not cause A.V.C. voltage to rise above 1.5 volts DC.

1) Connect V.T.V.M. across test socket terminals "A" and "C" (A.V.C. Voltage).

2) FM antenna terminal connections as in "C-1".

3) Set signal generator to 108 mc. Tune in signal with the receiver Tuning Control. Peak FM antenna trimmer (C501), peak FM interstage trimmer (C601) for maximum voltage on V. T. V. M.

4) Set signal generator to 88 mc. Tune in signal with the receiver Tuning Control. Check FM antenna coil L2 and FM interstage coil L4 with a tuning wand; if any adjustment is necessary; spread or squeeze the coil turns slightly for maximum indication on V.T.V.M.

5) Repeat steps (3) and (4) if necessary.

this tuner may be used with any audio amplifier or P.A. system if it is powered by an auxiliary power supply capable of delivering 220 Volts @ 60 Ma., well filtered DC and 6.3V. @ 3.5 amps. 60 cycles AC or DC.

The Tuning Ranges are:

AM 535 kc to 1720 kc.

FM 88 mc to 108 mc.

Tube Complement:

1 Type 6BA6 FM R.F. Amplifier.
1 Type 6BA6 AM R.F. Amplifier.
1 Type 6BE6 FM Mixer.
1 Type 6BE6 AM Oscillator, converter.
1 Type 6C4 FM Oscillator.
1 Type 6SG7 I.F. Amplifier.
1 Type 6SH7 FM Detector Driver.
1 Type 6AL5 FM Ratio Detector.
1 Type 6SQ7 A.V.C., 1st Audio Amplifier.
1 Type 6U5 Electron Ray Tuning Indicator.
1 Type 6J5 AM Detector.

SERVICE NOTES:

Failure of Tuner to Operate May Be Due to:

1. Power Supply cable disconnected.
2. "Audio Connector" cable disconnected.
3. Band switch in wrong position.
4. Amplifier power off or gain set too low.
5. Low signal strength in the particular location. Change position (rotate) of loop, or "folded dip ole" antenna, or use an outside antenna.
6. All tubes not firmly in sockets.

ALIGNMENT PROCEDURE

Alignment Procedure for AM

Equipment Required:

Broadcast Band Signal Generator

Audio Output Meter

Power Supply and Amplifier

A) 1. Set Band Switch to "AM". Advance Volume Control to maximum, set "BASS" Control at minimum, set Treble Control at maximum.

2. Connect output meter across speaker voice coil.

NOTE: During all of these tests it is necessary to reduce the signal generator output so that the receiver output level is maintained at .5 watt.

B) I.F. ALIGNMENT

1) Set signal generator to 455 kc. Connect a .05 mfd condenser in series with the "high" side of the generator output lead to pin #4 of the 6SG7 (V3) I.F. amplifier tube. Peak bottom and top cores of 2nd I.F. (T-6).

2) Connect signal generator ("high" side in series with a .05 mfd condenser) across C201 on variable condenser, peak bottom and top cores of 1st I.F. Transformer (T-3).

C) R. F. ALIGNMENT

1) Connect signal generator to the AM antenna terminal ("high" side in series with a 50 mmf condenser) and ground. Open variable condenser to minimum capacity, set signal generator to 1720 kc, adjust broadcast oscillator trimmer C202 to tune in signal.

2) Close variable condenser to maximum capacity, set signal generator to 535 kc and adjust broadcast band padder (C206) to tune in signal.

3) Repeat step (1).

4) With variable condenser fully meshed move dial pointer to small white line slightly to left of "55" on broadcast band dial scale.

5) Set signal generator to 1500 kc. Tune in signal with Tuning Control. Peak antenna trimmer (C101) and interstage trimmer (201).

6) Set signal generator to 600 kc, tune in signal with receiver Tuning Control, peak antenna loading coil (L1). Peak interstage transformer (T1).

7) Repeat step (5).

MODELS 19F-492, 19F-497, 19F-498

ALLIED RADIO CORP.

Alignment Procedure for FM

NOTE: Contacts A, C, and D of the test socket at the rear of the chassis have been provided for connection to V.T.-V.M. for the alignment of the FM circuits.

Equipment Required:

High Frequency Signal Generator 87.5 mc to 108.5 mc.

Signal Generator capable of delivering .1 volt at 10.7 mc.

Audio Output Meter.

D.C. Vacuum Tube Voltmeter with zero center scale.

Tuning Wand.

A) RATIO DETECTOR ALIGNMENT

1) Connect V.T.V.M. across test socket terminals "A" and "C", (A.V.C. Voltage).

2) Feed 10.7 mc unmodulated R.F. signal into 6SH7 (V4) grid, pin #4, through .01 mfd condenser. This signal should be .1 volt.

3) Adjust primary of ratio detector transformer (T-7) for maximum indication on V.T.V.M.

4) Connect zero centered V.T.V.M. across test socket terminals "D" and "C".

5) Adjust secondary of ratio dectector transformer (T-7) for zero indication.

6) Tune 10.7 mc Signal Generator higher in frequency (about 200 kc) until maximum voltage reading is obtained on V.T.V.M.

Note this voltage, then tune signal generator lower in frequency until maximum voltage of the opposite polarity is obtained. Note this voltage, then if necessary re-adjust primary of the detector (T-7) until the maximum detector voltages are about equal on either the high or low side of 10.7 mc.

B) FM 10.7 Mc I. F. ALIGNMENT

1) Shunt a 1000 ohm carbon resistor across the primary of the detector (T-7) lugs "B+" and "P".

2) Connect output meter across speaker.

3) Set volume control at maximum, bass at minimum.

4) Connect 10.7 mc signal generator (modulated 30%) to the grid (pin #4) of the 6SG7 (V-3) through a .01 mfd condenser and ground.

5) Peak bottom and top cores of (T-5) 2nd I.F.

6) Connect 10.7 mc signal generator (modulated 30%) across the FM interstage trimmer (C601) and ground.

7) Peak bottom and top cores of 1st I.F. (T-4).

8) Remove 1000 ohm shunting resistor from (T-7).

NOTE: During all of these tests it is necessary to reduce the signal generator output so that the receiver output level is maintained at .5 watts.

C) FM OSCILLATOR ALIGNMENT

1) Connect the high frequency signal generator across the FM antenna terminals. The ground side of the generator output cable is attached to terminal "A1", a 270 ohm carbon resistor is connected from the "high" side of the generator cable to terminal "A2".

2) Open variable condenser to minimum capacity; set signal generator to 108.5 mc, tune in signal with FM oscillator trimmer (C607).

3) Close variable condenser to maximum capacity; set signal generator to 87.5 mc. To adjust oscillator to signal it may be necessary to spread or squeeze the FM oscillator coil L5 slightly.

4) Repeat steps (2) and (3) if necessary.

D) FM R. F. ALIGNMENT

NOTE: When making the following tests keep the signal generator output at a level that will not cause A.V.C. voltage to rise above 1.5 volts DC.

1) Connect V.T.V.M. across test socket terminals "A" and "C". (A.V.C. Voltage).

2) FM antenna terminal connections as in "C-1".

3) Set signal generator to 108 mc. Tune in signal with the receiver Tuning Control. Peak FM antenna trimmer (C501), peak FM interstage trimmer (C601) for maximum voltage on V. T. V. M.

4) Set signal generator to 88 mc. Tune in signal with the receiver Tuning Control. Check FM antenna coil L2 and FM interstage coil L4 with a tuing wand; if any adjustment is necessary; spread or squeeze the coil turns slightly for maximum indication on V.T.V.M.

5) Repeat steps (3) and (4) if necessary.

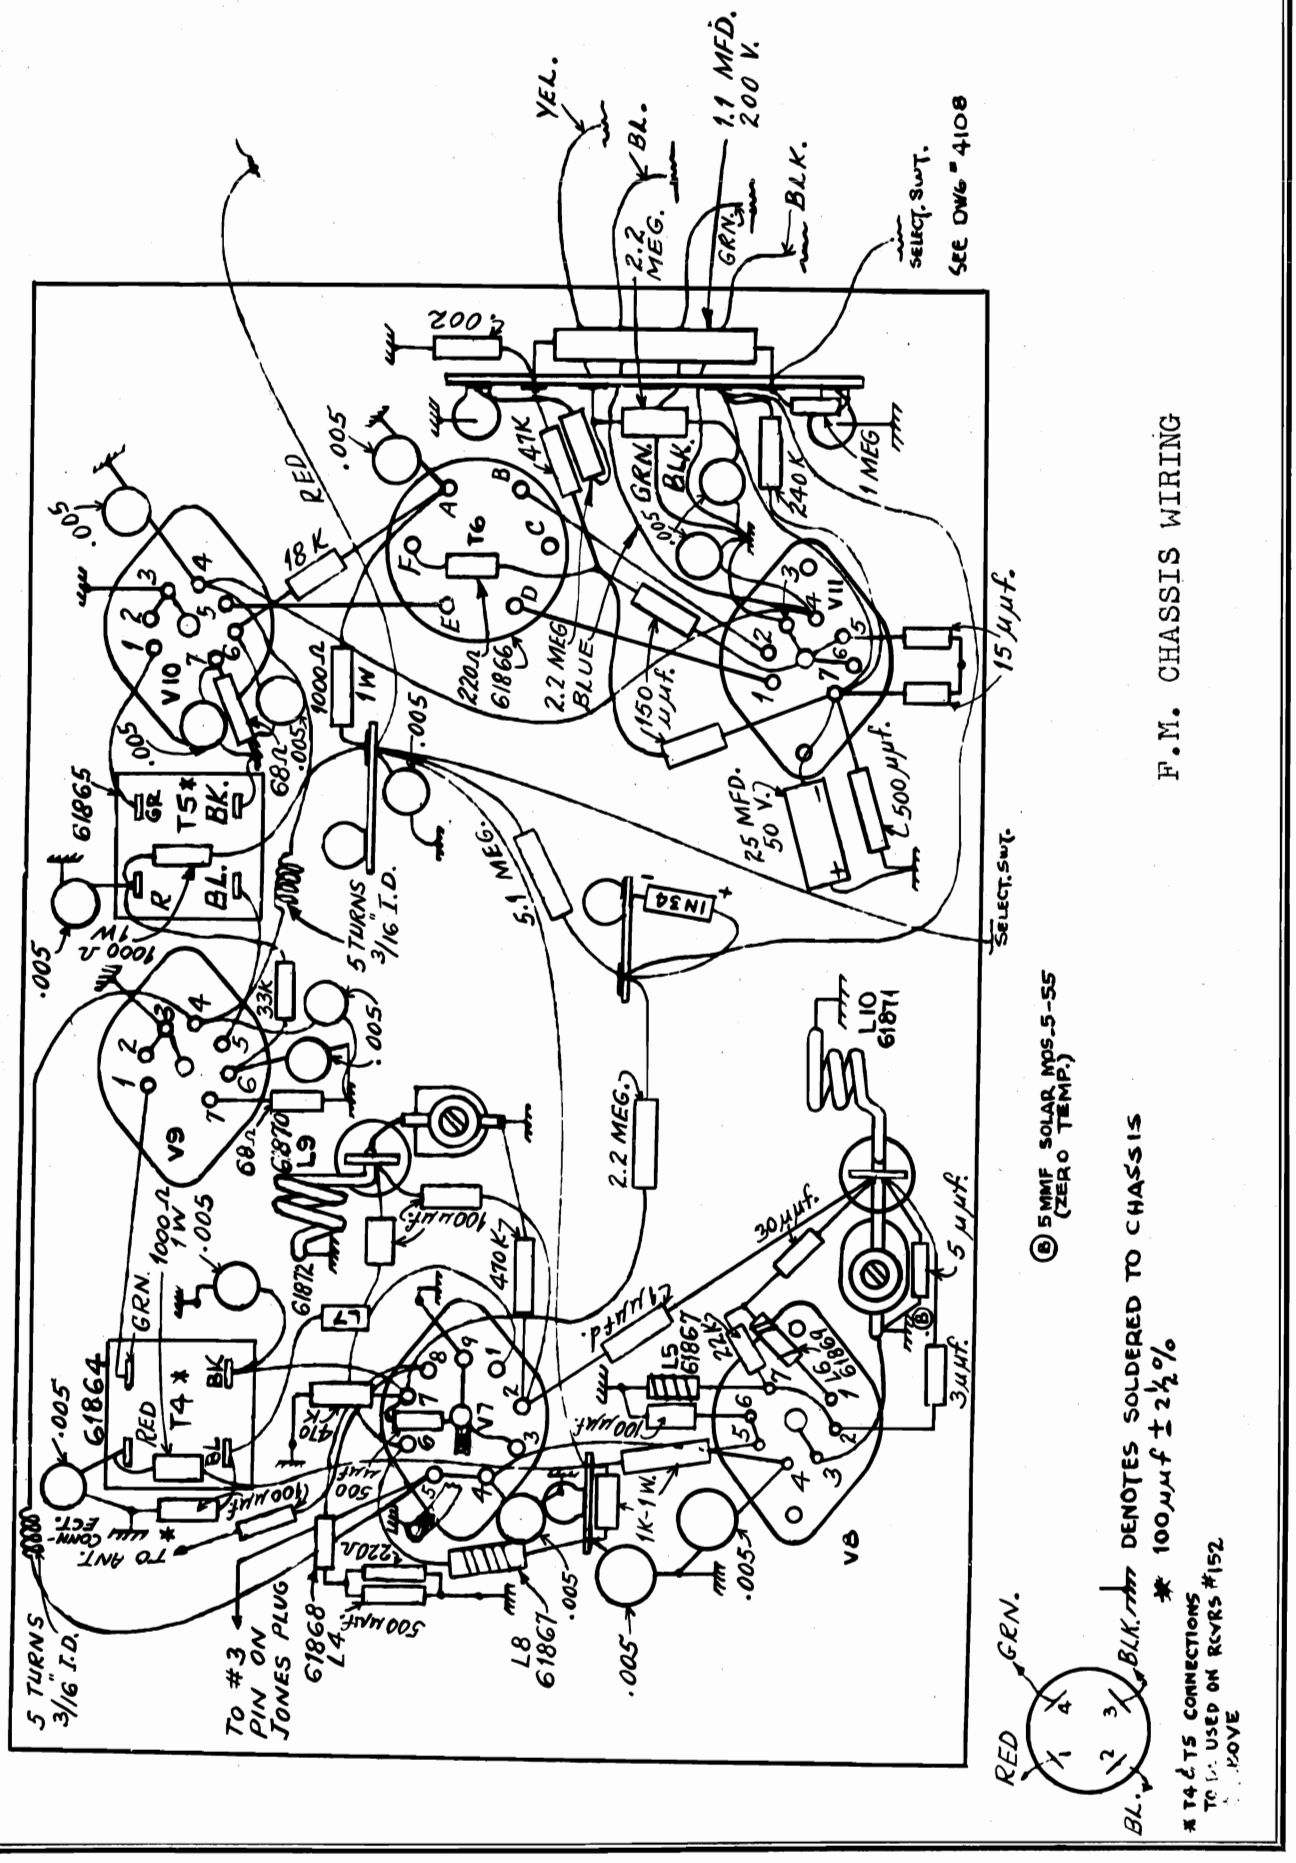
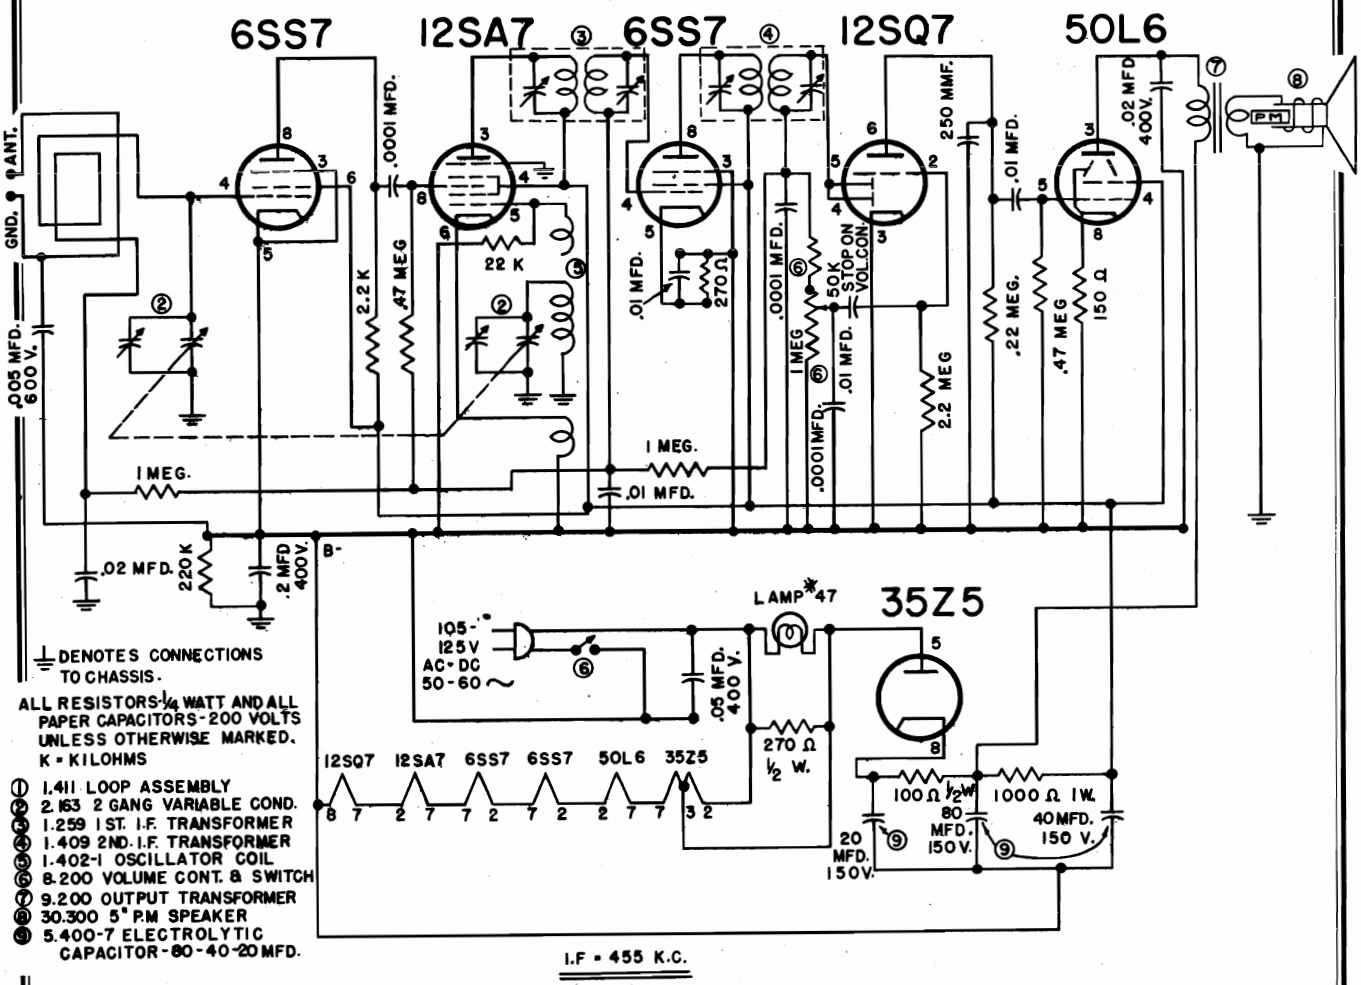
ALTEC LANSING CORP. MODEL 101



ASSOCIATED MERCHANDISING CORP. MODEL 126



LINE VOLTAGE: This receiver is designed for operation on 105-125 Volts, 50-60 Cycles, either Alternating or Direct Current (AC-DC)

POWER CONSUMPTION: 30 Watts.

UNDERWRITER'S LABORATORIES LISTING: This receiver is listed under the Re-examination Service of the Underwriter's Laboratories as indicated by the label attached to the cabinet.

TUNING RANGE: Broadcast: 540 to 1650 Kilocycles (180 to 555 meters).

DIAL: The Dial Scale is calibrated in Kilocycles.

TUBES: The tubes used, and their functions, are as follows:

6SS7 R. F. Amplifier	12SQ7 Detector, Avc and Audio Amp.
12SA7 Converter	50L6GT Beam Power Amplifier
6SS7 I. F. Amplifier	35Z5GT Rectifier

MINOR REASONS FOR FAILURE TO FUNCTION: Defective tubes; defective Volume Control and On-Off Switch; line cord reversed on D. C.; defective line cord plug; or tubes in wrong socket.

ALIGNMENT: Should it become necessary at any time to check the alignment of this receiver, proceed as follows:

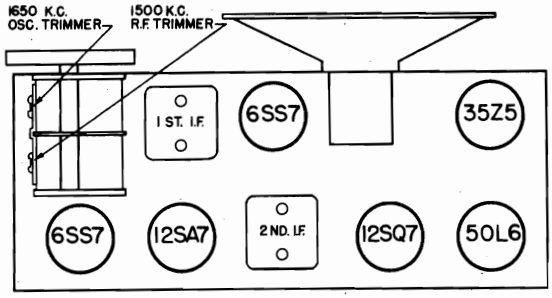
(1) Set the Signal Generator to 455 KC and connect to the grid of the 6SS7 R. F. Amplifier, or to the Stator Lug on the rear section of the Variable Capacitor. Connect the Signal Generator Ground Lead to a "—B" point underneath the chassis. Connect a suitable output meter across the Speaker Voice Coil Connections. First turn the Volume Control to the maximum position. Turn the Variable Capacitor to the extreme clockwise position.

(2) Adjust the trimmers located at the top of the first and second I. F. Transformers for maximum output as indicated on the Output Meter.

(3) Loosely couple the Signal Generator lead to the Loop and set to 1650 KC.

(4) With the Variable Capacitor set at the extreme clockwise position, tune in the 1650 KC signal by means of the Oscillator Trimmer on the Variable Capacitor (front section).

(5) Set the Signal Generator to 1500 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the Antenna Trimmer on the Variable Capacitor (rear section) for maximum output. No other adjustments are necessary.



TRIMMER AND TUBE LOCATION DIAGRAM

INSTALLATION: The Model 126 is complete in every detail for efficient and immediate operation. A self-contained Loop Antenna is included, which will give excellent results in most locations. Due to the directional properties of the Loop, it may be advantageous to turn the receiver to the left or right in noisy locations for maximum signal and minimum noise. A best position for reception can always be found. In unfavorable locations where distant reception is required, a well-constructed outside antenna may be used, and connected to the *green* wire labeled "Ant." at the rear of the Loop. A water or gas pipe may be used as a ground and connected to the *black* wire labeled "Gnd." at the rear of the Loop.

CAUTION: If this receiver is operated on D. C. (Direct Current), and you cannot obtain reception although the tubes are lighted, reverse the line cord plug to obtain the correct polarity. Objectionable hum or noise may also be eliminated on A. C. operation by reversing the line cord plug.

MODEL PR-6

AUDAR INC.

ALIGNMENT PROCEDURE

I.F. ALIGNMENT:

1. The following adjustments have been made at the factory and should not be changed unless necessary, and then only by an authorized service man.
2. Set the signal generator to 455 kilocycles.
3. Connect an output meter so that the output can be determined.
4. Connect the high side of the signal generator output to the antenna lead of the tuner. The ground side of the signal generator output is connected to the common electrical ground through a 0.01 mfd. condenser.
5. Turn the volume control on full and turn the dial drive shaft so that the slugs of the tuner unit are all the way out (high frequency end).
6. Adjust the two I.F. trimmers, tuning each carefully to get the maximum deflection of the output meter.
7. Repeat both adjustments since the adjustment of each I.F. trimmer may effect the other to a certain extent.

OSCILLATOR AND R.F. ALIGNMENT:

1. Connect the high side of the signal generator output to the insulation covering the antenna wire and not the wire itself.
2. Stretch antenna out to its full length.
3. Set the signal generator to 1650 kilocycles. Make sure that the slugs of the tuner are all the way out against the stop. Adjust the oscillator and antenna trimmers for maximum reading on the output meter.
4. Set the signal generator to 540 kilocycles. Turn the dial drive shaft until the slugs of the tuner are all the way in. Adjust the tracking core (screwdriver adjusted slug) to give maximum reading on the output meter.
5. Readjust as in steps 3 and 4.
6. Set signal generator to 1400 kilocycles. Turn the dial drive shaft until the 1400 kilocycle note is heard. Adjust the antenna core (core nearest the trimmers), by turning in or out with fingers, to give maximum reading on the output meter.

VOLTAGE TABLE

TYPE TUBE	1	2	3	4	5	6	7	8

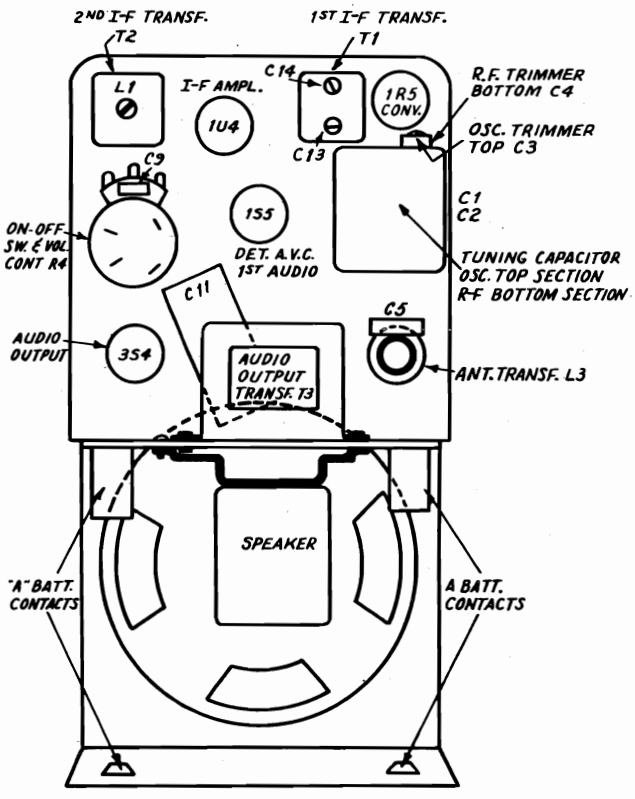
Voltage and resistance measurements were made with respect to chassis ground, and with a B supply voltage of 65 V.D.C.

*With Vol. Cont. full counter clockwise the resistance is 28Ω.
With Vol. Cont. full clockwise the resistance is 1 MEG.



TOP VIEW

ALIGNMENT PROCEDURE

Connect output meter across voice coil.

Connect the signal generator to the standard Hazeltine Loop Model 1150 and couple it loosely to the receiver loop. Set the volume control at maximum, and fully mesh the tuning capacitor.

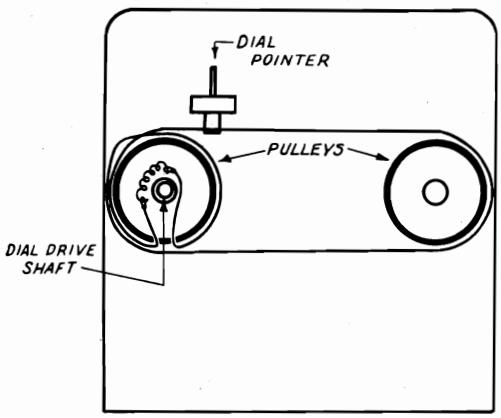
The output of the signal generator should be just sufficient to give a readable deflection on the output meter.

Set the signal generator to 455 kc and adjust i-f trimmers and slugs for maximum output in the following order: L2, L1, C14, C13. Repeat sequence if trimmers were badly maladjusted.

Set the signal generator and receiver to 1500 kc and adjust the oscillator trimmer C4 for maximum output.

Set the signal generator and receiver to 1400 kc and adjust the antenna trimmer C3 for maximum output.

Set the signal generator and receiver to 1500 kc and readjust oscillator trimmer C4 for maximum output



NOTE: TUNING CAPACITOR IN MAXIMUM CAPACITY POSITION

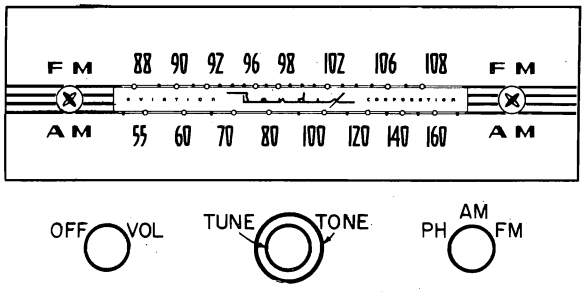

Fig. 2 – Control Layout

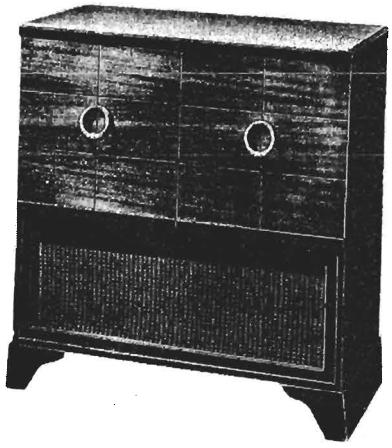

Fig. 1–Models 69M8 & 69M9–Mahogany; 69B8–Blonde

GENERAL

The Bendix Radio Models 69M8, 69B8, and 69M9 employ six tubes and a selenium rectifier to provide reception of the FM band and the AM standard broadcast band. The FM section of this receiver contains a tuned RF stage. The RF stage has its plate voltage removed when the range switch is in any but the FM position. The B+ is removed from the plates of the RF amplifier and mixer oscillator tubes when the band switch is in the PH position. Built in FM and AM antennas are mounted in the cabinet and a terminal board is provided on the rear of the cabinet for attaching external antennas. Each model contains a ten inch permanent magnet type speaker which is driven by a 50L6 audio output tube. Two multi-purpose tubes are used. One, the 19T8, combines the functions of an AM demodulator, FM detector, and first audio amplifier in one envelope. The other multi-purpose tube, the 12AT7, is a double triode and is used as a mixer-oscillator tube.

The power supply required for these models is 105-120 volts 60 cycle AC since a phono motor is included. The radio chassis itself is operative on AC or DC, but the phono motor would be damaged beyond repair if operated on DC.

BENDIX RADIO DIV.

PRELIMINARY ALIGNMENT PROCEDURE

The AM circuits should be aligned before the FM section because of possible interaction between the IF coils. Before attempting to align set allow receiver and test equipment to warm up for at least five minutes. Whenever possible, have a speaker connected to the output and use a 30% amplitude modulated signal in order to identify weak signals in a poorly tuned set. The antenna trimmer for AM which is attached to the loop antenna must be adjusted when the chassis is replaced in the cabinet, since the antenna loop is installed in the cabinet and cannot be removed with the chassis. It may be necessary to adjust the FM antenna trimmer slightly when the chassis is replaced in the cabinet.

TEST EQUIPMENT REQUIRED

Signal Generator
AM 455 KC to 106 MC
FM 10.7 MC & 88-108MC.
Vacuum Tube Voltmeter
(ground or minus must be isolated from power line)
Capacitors, .01 mfd and 100 mmf
Alignment Screwdrivers
Standard Output Meter

AM ALIGNMENT

PRELIMINARY PROCEDURE: With gang condenser closed, set dial pointer to coincide with reference mark etched into dial back plate. See Fig. 5. Place band switch in AM position and use a 30% modulated signal throughout. Connect an output meter across voice coil. Adjust Antenna Trimmer C87 after chassis is installed in the cabinet. Keep input as low as possible while obtaining a stable output meter reading.

GENERATOR FREQUENCY	GENERATOR COUPLING	DUMMY ANTENNA	SPECIAL CONDITIONS	DIAL SETTING	ADJUSTMENTS	REMARKS
1.) 455 KC AM	High Side—Term. #5 gang cond. Low side—common ground	.01 mfd capacitor	Short AM Osc. Term. #1 to common ground	Gang condenser fully open	Top slug of T1, T2, T4 and bottom slug of T4	Adjust for maximum output. Repeat several times to insure maximum output
2.) 1475 KC AM	High side—Term. #3 gang cond. Low side—common ground	100 mmf capacitor	Remove short from Osc. Term. #1	1475 KC Ref. mark	C79	Rock tuning control while adjusting for maximum output
3.) 965 KC AM	"	"		965 KC Ref. mark		* Check Calibration
4.) 580 KC	"	"		580 KC Ref. mark		* Check Calibration

* If calibration does not check within tolerances denoted by etched lines on dial backplate, oscillator gang rotor plates must be bent to obtain proper calibration. This operation is very delicate and should be attempted only by properly trained personnel.

FM ANTENNA

The FM antenna used in Models 69M8, 69B8, and 69M9 will not be found in the Replacement Parts List since the service man, by following the specifications in the drawing, Fig. 3, can very easily and inexpensively make the antenna himself.

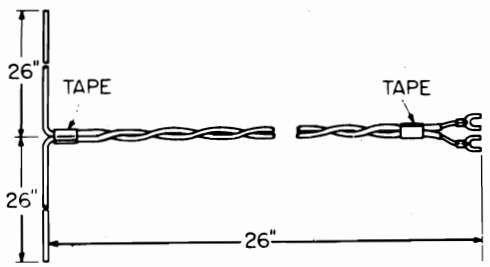

Fig. 3—FM Antenna

BENDIX RADIO DIV.

MODELS 69B8, 69M8, 69M9

FM ALIGNMENT

CW METER METHOD

PRELIMINARY ALIGNMENT PROCEDURE: With gang condenser fully closed, adjust dial pointer to coincide with the reference mark etched into dial back plate. See Fig. 5. Place band switch in FM position. Use 30% amplitude modulated signals when possible.

GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR COUPLING	SPECIAL CONDITIONS	DIAL SETTING	VTVM CONNECTIONS	ADJUSTMENTS	REMARKS
1.) 10.7 MC AM or CW	.01 mfd capacitor	High side—term. #3 Gang Condenser. Low side—common ground	Short FM Osc. Term. #2 of Gang Condenser to common ground	Gang Condenser fully open	+Lead to B— —Lead to Pin #2 of tube 19T8	Bottom slug of T1, T2, Bottom slug of T3	Adjust for maximum AVC reading on VTVM. Repeat adjustment several times to insure maximum reading
2.) Remove Signal Generator		Remove Signal Generator	Short FM Osc. term. #2 of gang condenser to common ground. Two 100K matched resistors in series connected between Pin #2 of tube 19T8 & B—	"	Center Tap of 100K resistors and term. #6 of switch S1C	Adjust VTVM for Zero	While connected to chassis, the VTVM is adjusted to zero by its zero centering control
3.) 10.7 MC AM or CW	.01 mfd capacitor	High side—term. #3 of Gang condenser. Low Side—Common Ground	"	"	"	Top slug of T3	Adjust top slug to produce zero reading on VTVM
4.) Repeat in Step 3.	Steps 1, 2, and 3 until Step 1 produces no change in Step 3 adjustment and bottom of T3 produces no deflection						
5.) 106 MC	FM Dummy Antenna (See Fig. 4)	FM Dummy Antenna (See Fig. 4)	Remove short from Term. #2 of gang condenser. Remove 100K Resistors	106 MC Ref. mark	+Lead to B— —Lead to Pin #2 of tube 19T8	Osc. trimmer C9, then RF, C3c & Ant., C3b	Rock tuning control when adjusting C9 for maximun AVC reading, then adjust C3c and C3b respectively for max.†
6.) 97 MC AM or CW	"	"		97 MC Ref. mark	"		* Check Calibration
7.) 90 MC AM or CW	"	"		90 MC Ref. mark	"		* Check Calibration

† Oscillator operates on high frequency side of incoming signal but it is possible to adjust to the low side. Set Signal Generator to 84.6 MC and if signal is heard readjust oscillator trimmer at signal generator frequency of 106 MC and check again at 84.6 MC. Signal should not be heard.

* If calibration is not within reasonable tolerance at these points, the inductance of the FM oscillator coil must be adjusted. If dial pointer reading is on low frequency side, inductance of oscillator coil is too low and turns of coil must be compressed slightly. If pointer reading is on high frequency side, the coil inductance is too high and coil turns must be spread slightly. Repeat steps 5, 6, and 7 until correct calibration is obtained.

To adjust RF coil, tune receiver to 90 MC and observe AVC reading. Insert into RF coil, the iron core of tuning wand (rod of insulating material one end of which contains an iron core slug and the other end contains a non-ferrous metallic slug). If reading increases, the inductance of coil is too low and, turns must be spread *slightly*. If reading decreases, insert opposite end (non-ferrous) of tuning wand into RF coil. Inductance of coil is too low if reading increases and, turns must be compressed *slightly*. Correct adjustment is obtained when insertion of either end of tuning wand causes the reading to decrease.

The antenna coil inductance is adjusted in the same manner as the RF coil.

MODELS 69B8, 69M8, 69M9

BENDIX RADIO DIV.

VISUAL ALIGNMENT

The ratio detector in the FM section of this radio receiver can be aligned by the so-called Visual Alignment method. This method can be used in conjunction with the CW method by following the procedure outlined below:

1. Perform Step 1 indicated in CW Meter Method Chart.

2. Set Signal Generator to 10.7 MC, FM, with sweep width at maximum possible (should be a minimum of 200 KC). Connect output of generator to terminal #4 of gang condenser and B–.

3. Connect vertical input of cathode ray oscilloscope to terminal #6 of switch S1C and B–, and place a 60 cycle sine wave signal to horizontal input if oscilloscope does not have an internal 60 cycle sweep.

4. Adjust signal generator frequency until "S" curve (Fig. 6) is centered on the horizontal sweep. Curve may be reversed because of internal circuit of oscilloscope.

5. Adjust primary of T3 (top slug) and secondary (bottom slug) for maximum desired "S" curve. A VTVM can be very useful at this point if connected to pin #2 of tube 19T8 and B–. The oscilloscope will then indicate the most linear curve and the VTVM will indicate the maximum AVC voltage.

6. Adjust bottom of slugs of T1 and T2 and then repeat step 5 to insure correct alignment.

7. Continue at this point with the alignment procedure starting with step 5 as outlined in the FM-CW Meter Method.

MODELS 69B8, 69M8, 69M9

BENDIX RADIO DIV.

CHASSIS IDENTIFICATION

The 69M8 and 69B8 chassis are identical and they differ from the 69M9 chassis only in the type of phono input circuit used. Models 69M8 and 69B8 include a dual speed record changer which requires a different phono input circuit than the single speed record changer that is installed in Model 69M9.

Models 69M8 and 69B8 chassis can be identified by the two resistors 470K and 2.2 meg, connected to terminal 4 of switch S1C. Model 69M9 chassis has two resistors, 68K and 330 K, connected to terminal 4 of switch S1C.

CHASSIS CODES

The chassis are coded by a large block letter within a square stamped in ink on the chassis rear apron visible from the back of the cabinet. Although code A chassis normally are not marked, check any unmarked chassis against following chart to insure proper code identification. In this chart the component revisions effected by various changes are listed in the left hand column. Under the right hand columns headed A, B, C, etc., are listed the revisions as applied to each chassis code.

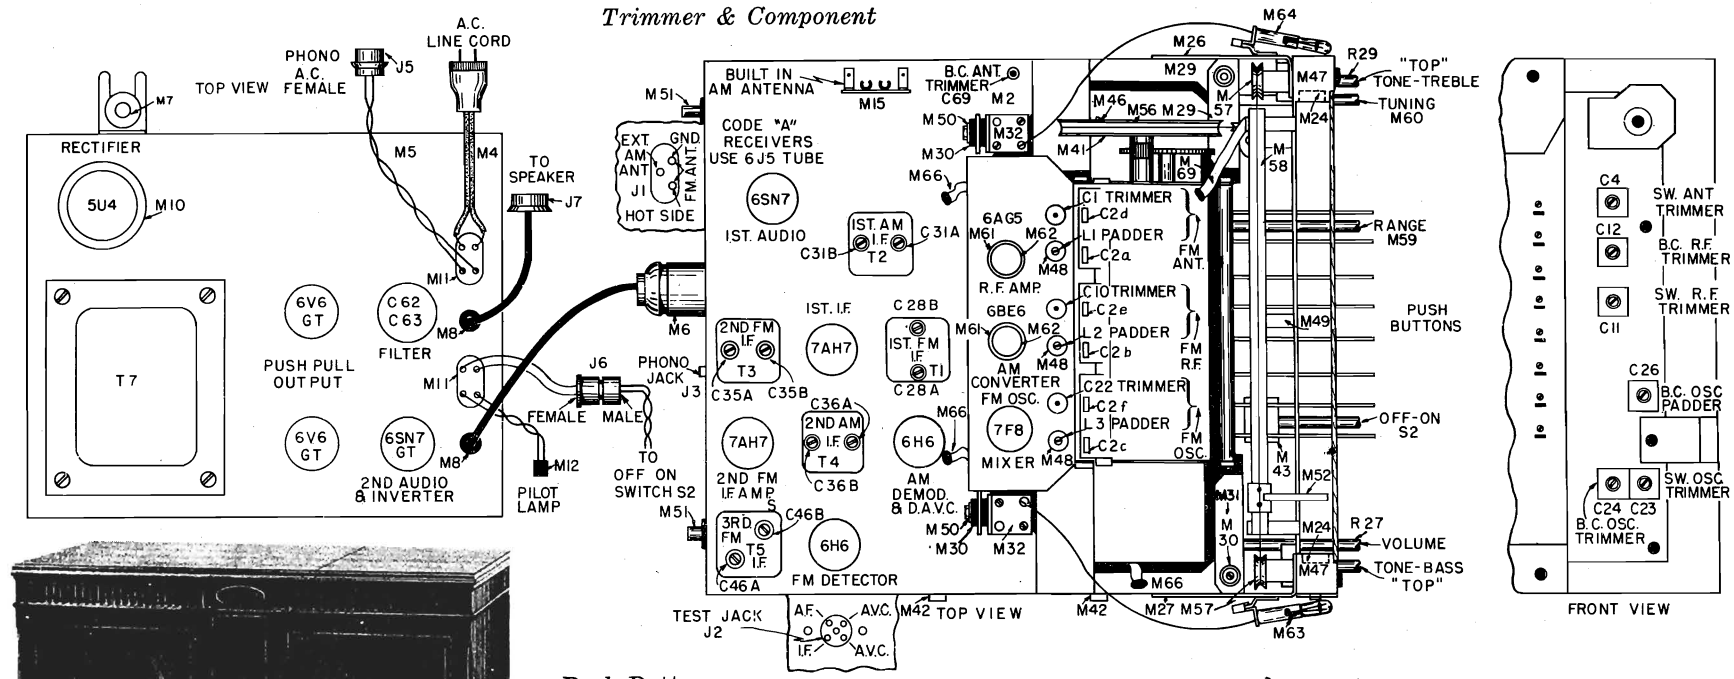
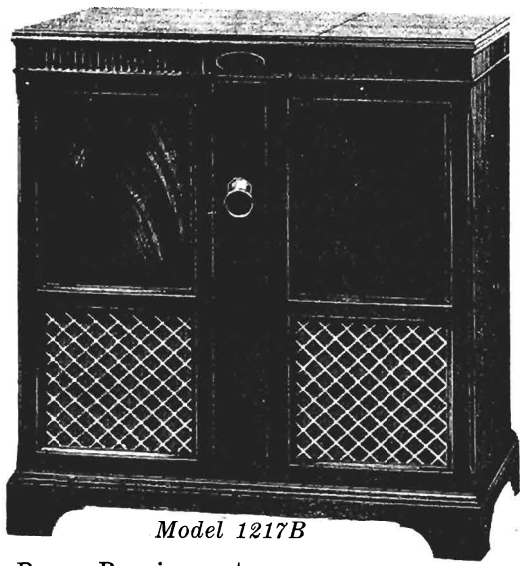
Trimmer & Component





Model 1217B

Power Requirements
105 - 125 volts, 60 cycles AC

Power Consumption (including phonograph)
160 watts

Tuning Frequency Range
AM 540 - 1620 KC
SW AM 5.75 - 15.5 MC
FM 88 - 108 MC

Push-Buttons
8 mechanical type for any AM or FM station.

Loudspeaker
12-inch diameter electro-dynamic.

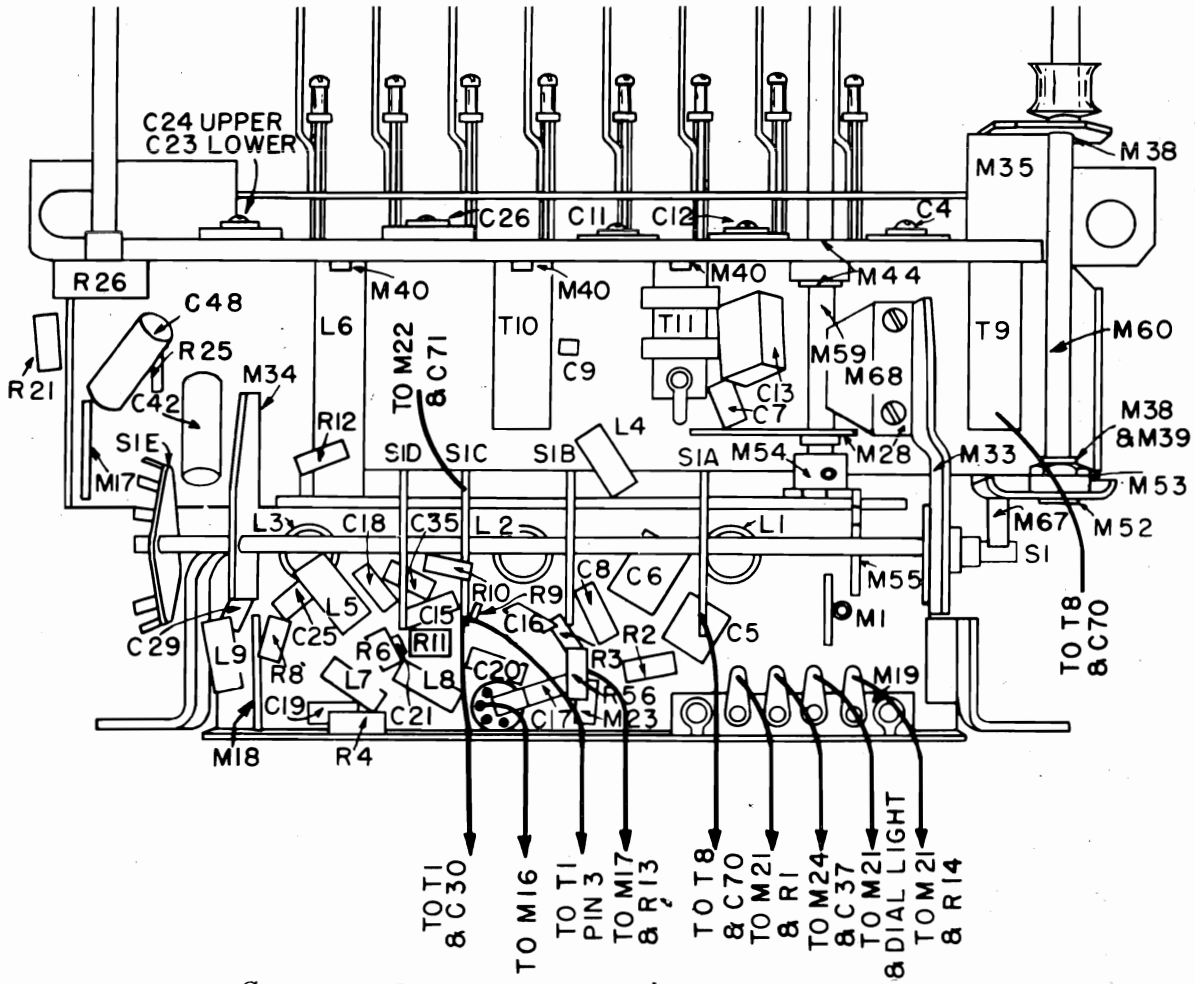
Record Changer
Automatic - twelve 10-inch or ten 12-inch standard records.

Maximum Power Output
12 watts.

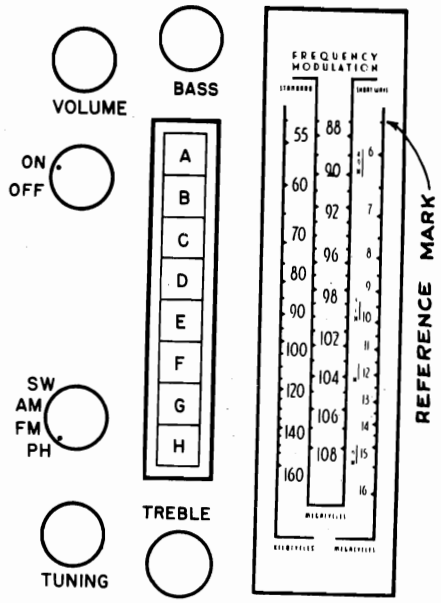
GENERAL TECHNICAL DATA

The Model 1217B radio provides radio reception of the Standard AM Broadcast Band, the Shortwave Band from 6 to 14 megacycles, and the FM Band from 88 to 108 megacycles. Phonograph reproduction is provided through the audio amplifier from a high impedance phono jack located on the radio chassis. A standard superheterodyne circuit is used, with one stage of tuned radio frequency on all three bands. A low impedance loop antenna installed on the back cover of the cabinet is used on both the Standard Broadcast and Shortwave Bands. A built-in dipole antenna is used on the FM Band. An outside antenna for the AM Bands may be connected to the binding screw, marked ANTENNA, on the rear of the cabinet. A 300 ohm outside FM dipole antenna may be connected to the terminals marked FM DIPOLE, but the built-in dipole must be disconnected when an outside antenna is used.

The 7F8 dual triode is used as an oscillator-mixer in the FM circuit and is made inoperative by removing its plate voltages when the range switch (S1) is in any but the FM position. Likewise, the 6BE6 is used as a converter for the Standard Broadcast and Shortwave Bands only, and has no plate voltage applied to it when S1 is in the FM or PH (phono) positions. One half of the 6H6 (pins 3 and 4) AM demodulator tube is used in the delayed A-VC circuit for FM. The first triode section (pins 1, 2 and 3) of the 6SN7 in the radio chassis is used only when the range switch, S1, is in the FM position, but does not have the B plus removed from its plate when S1 is in any of the other three positions.



Component Diagram—Bottom View of Tuner Chassis



Control Layout

CHASSIS CODE CHANGES

CODE "A" AND UNCODED CHASSIS

First audio amplifier was a 6J5.
FM antenna was connected to a tap on the antenna coil (L1) instead of by link.

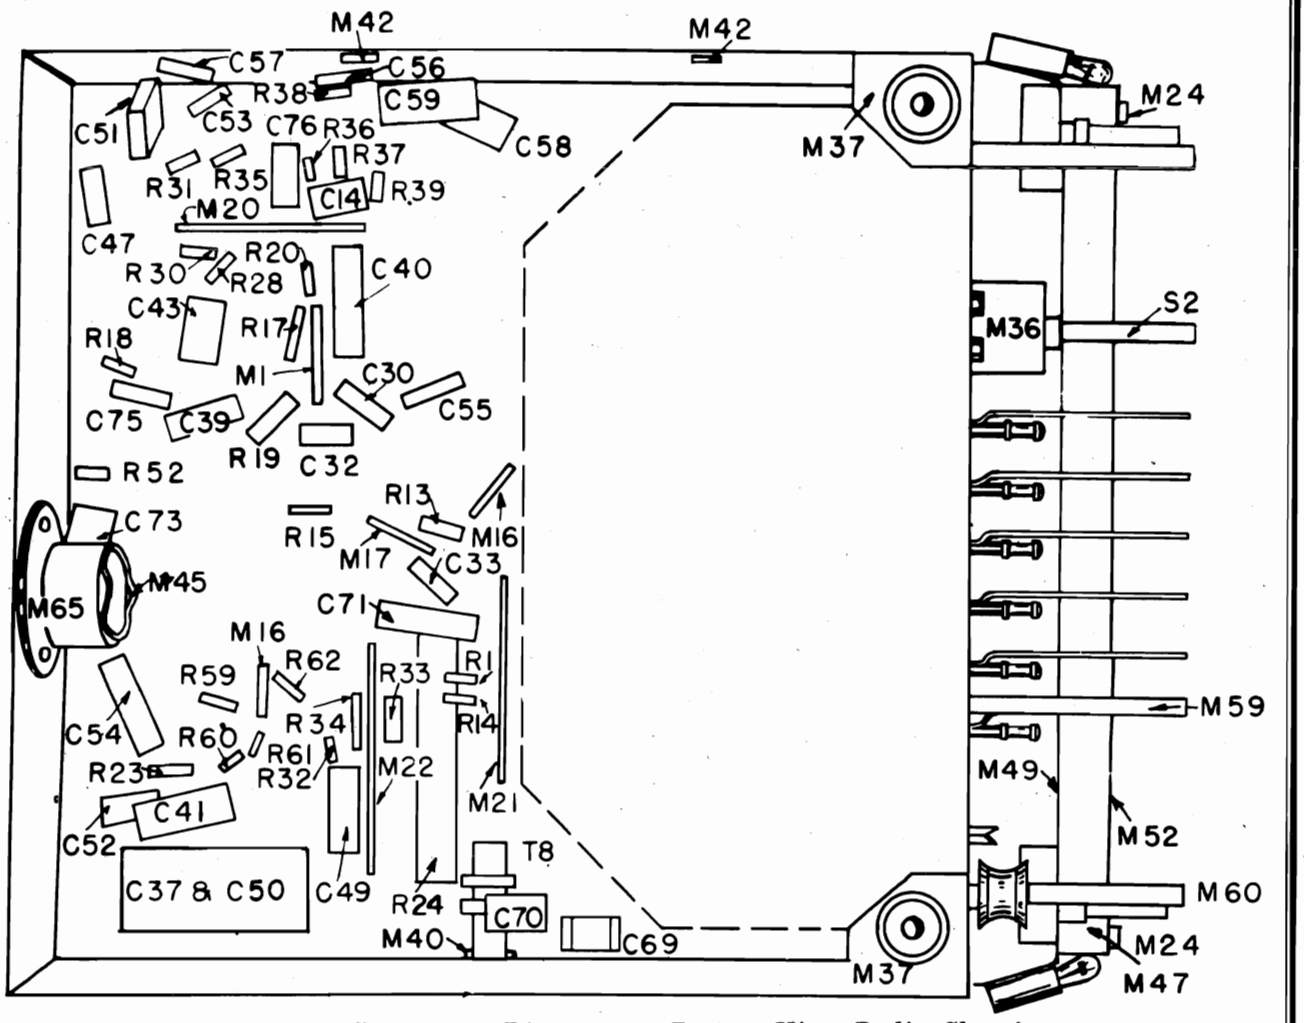
CODE "B" CHASSIS

Some chassis used a 6J5 and some a 6SN7 as a first audio amplifier. Tone compensation network, R54 and C77, removed from phono input lead. RF choke, L9, added in plate circuit of 7F8. R38 in D.A.V.C. circuit of ratio detector changed from 8200 ohms to 10,000. FM antenna input same as in code "A" chassis. Cathode resistor, R12 and capacitor C72 in first 7AH7 removed and R15 connected directly to ground.

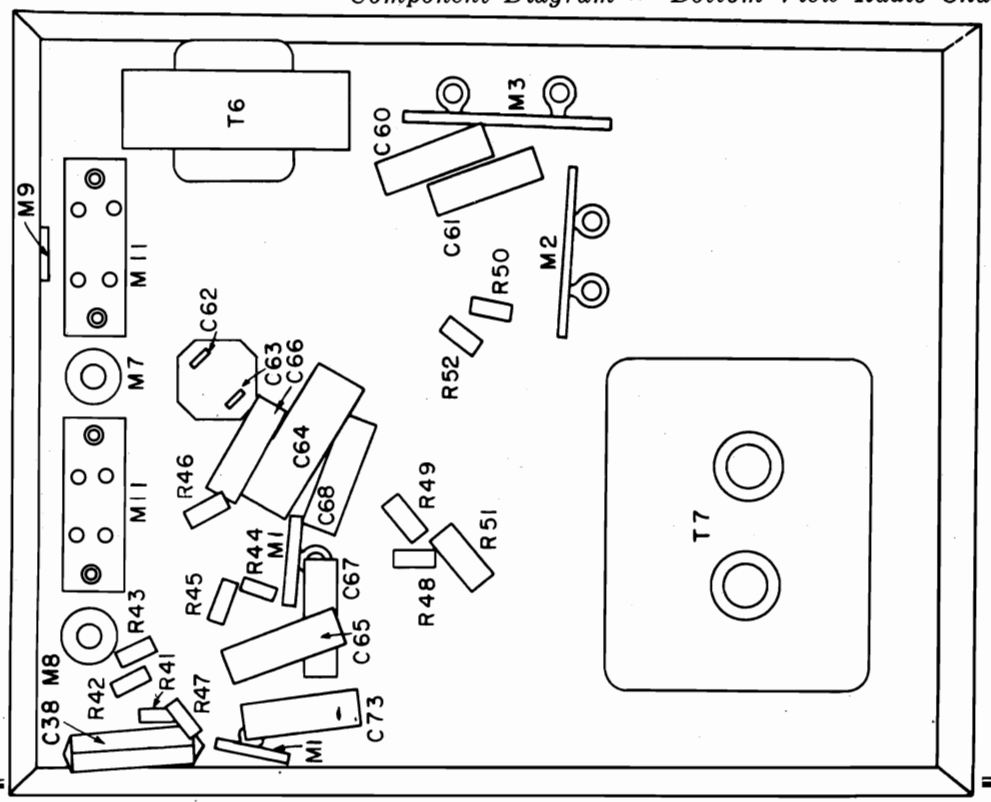
CODE "C" CHASSIS

Included all previous changes.
FM antenna link coupled to antenna coil L1.

BENDIX RADIO DIV. MODEL 1217B



Component Diagram — Bottom View Radio Chassis



Component Diagram Bottom View of Amplifier Chassis

It is not necessary to remove the two chassis from the cabinet if the FM channel only is to be aligned. An FM test socket is provided on the chassis sideplate (facing outward in normal mounting position) at which the various voltages from the ratio detector are available for either meter or oscilloscope measurements.

If the BC and SW channels are to be aligned, it is advisable to remove the radio chassis from the cabinet in order to gain access to the BC and SW AVC voltage used for output indication. It is rather difficult to align the BC and SW RF and IF sections when the volume control is full "ON" because of background noise accompanying the high gain of the audio amplifier. A DC vacuum tube voltmeter connected to the junction of R20 and C40 (lug 3 of S1-E—See Figs. 9 & 10) will provide an accurate and stable indication of RF output, at the AM demodulator, for alignment of the BC and SW bands.

Unless the various circuits of each channel are very much out of alignment, adjustments made in the SW circuits will not affect the BC circuits and adjustments made in the FM circuits will not alter either the BC or SW circuit adjustments. However, if any of these channels are badly out of alignment necessitating considerable adjustment, it is best, after these adjustments have been made, to go back and check the adjustment previously made on the other channels.

An un-modulated (CW) signal of the proper radio frequency may be used for alignment of all three channels (BC, SW, and FM), but it is convenient to use a 400 cycle AM signal during alignment and occasionally advance the volume control to be sure the correct signal is tuned in.

Before making any adjustment, allow the receiver and signal generator to warm up for at least five minutes. IMPORTANT: All adjustments must be made in the order in which they are given; i.e., the BC band must be aligned first, followed by the SW, and last, the FM band.

INSTRUCTIONS FOR REMOVING THE CHASSIS

If, for any reason, it is necessary to remove the radio chassis from the cabinet, proceed as per following instructions:

Remove the power cord plug from the wall receptacle, and remove all control knobs and push-buttons by simply pulling them straight up from the panel. The cabinet back cover and AM loop assembly may be detached from the chassis by pulling the loop leads out of their receptacle on the chassis, after the small wood screws holding the assembly on the cabinet have been removed. The FM antenna is disconnected from the chassis by removing the three prong plug at the rear of the chassis. All power cables and leads may be disconnected at convenient plugs and jacks in the chassis. The speaker is connected to the amplifier chassis by a 5-prong plug on the speaker.

After all connecting leads and cables have been disconnected from the chassis, remove the four hexagon-head machine screws which hold the chassis mounting rails in the cabinet. The two upper machine screws are removed from inside the record changer compartment. The two lower bolts are located below the radio chassis and removed from the chassis side of the cabinet. Note: When replacing the chassis in the cabinet, be sure dial glass is up snug against the control panel when the four mounting screws are tightened and that they are tightened securely.

PUSH-BUTTON ADJUSTMENT

The mechanical type of push-button tuning used with this receiver makes possible the selection of any one of eight pre-selected stations. Any push-button may be adjusted to select any station in the three tuning bands. However, more accurate tuning of the SW and FM stations will be obtained if the lower four buttons E, F, G and H, Figures 2 and 3, are used for stations within these bands.

1. Remove all push-buttons by pulling straight up from the panel.
2. Manually tune in the desired station.
3. Release the screw adjacent to the push-button shank and push the shank in firmly as far as it will go while holding the tuning control knob.
4. Release the shank and tighten the locking screw.
5. Rotate the tuning control to a different position and check the push-button setting by again depressing the shank previously adjusted. The tuning dial should automatically return to the stations previously tuned in. However, in some cases it may not be exactly on the peak frequency of the stations. In such cases, continue as follows:
6. Re-tune the station manually to its peak frequency, and note whether it is necessary to increase or decrease the frequency setting for optimum tuning.
7. If it is necessary to increase the dial frequency setting, then the dial should be set at an additional increase beyond the optimum point (approximately the amount of the increase) and procedures 3, 4, 5 and 6 repeated. The push-button should then tune in the station exactly on its peak frequency.
8. If it is necessary to decrease the dial frequency setting, then the dial should be set at a lower frequency from its optimum point (approximately the amount of the decrease) and the procedure in 3, 4, 5 and 6 repeated.
9. Repeat the above procedures for the remaining seven push-buttons.

After the push-buttons have been set up as previously described, the proper tab with its transparent cover should be inserted together in each push-button knob. The push-buttons should now be placed on the proper shanks.

ALIGNMENT PROCEDURE
MODEL 1217B

EQUIPMENT REQUIRED

Signal Generator
AM, 455 KC to 106 MC

Vacuum Tube Voltmeter
DC up to approximately 20 volts. Ground, or minus, must be isolated from the power line.

FM Test Circuit Plug
See Fig. 4 for details.

.01 mfd. and 50 mmf. (or less) capacitor used for connecting signal generator to receiver.

Alignment Screwdriver
Must be 100% fiber and preferably over 8" in length.

Alignment Socket Wrenches
One 1/4" hexagon - 100% fiber, 8" long.
One 3/8" hexagon - 100% fiber, 6" long.
If the 3/8" wrench has a hole through the handle of sufficient diameter to permit inserting the alignment screwdriver, the locking nuts on L1, L2 and L3 can be loosened or tightened at the same time these padders are adjusted with the screwdriver inside.

AM ALIGNMENT

Turn receiver on and allow to warm up for at least 5 minutes. (Input voltage, 117 volts 60 cycle AC). Set volume control to minimum, bass and treble controls full counterclockwise, range control to BC (third from most counterclockwise position), tuning gang fully closed. Set dial pointer to Reference Mark at low Frequency end of dial as shown on Fig. 3. If built-in AM loop antenna is disconnected, the two contacts of the AM antenna input jack located on top the chassis must be shorted together. C69 and C4 should be adjusted with loop connected.

IF CHANNEL

1. Short #5 terminal on gang (C2-F) to chassis. See Fig. 2.
2. Set signal generator to 455 KC, CW or AM, and connect to #3 gang terminal (C2-E) through a .01 mfd. capacitor. See Fig. 2.
3. Connect low range of V.T.V.M. to junction of R20 and C40 (lug 3 of switch S1-E is a convenient point—See Figs. 9 & 10), and chassis ground, and adjust signal generator attenuator to produce approximately 2 volts of AVC on the V.T.V.M.
4. Adjust C36B, C36A, C31B and C31A for maximum meter reading, keeping signal input to produce approximately 2 volts AVC. Repeat these adjustments until no further improvements can be made in any one of them. NOTE: All adjustments must be made with a completely non-metalic screwdriver.

BC OSCILLATOR ALIGNMENT

1. Remove short from #5 gang terminal.
2. Move signal input from #3 gang terminal to external AM antenna terminal (J1) and set input frequency to 1475 KC CW or AM. (V.T.V.M. remains connected as for IF alignment.)
3. Set tuning control to 1475 KC.
4. Adjust C24, (BC oscillator trimmer) for maximum meter reading.
5. Set signal generator and receiver dial pointer to 580 KC.
6. Adjust BC oscillator padder C26 for maximum meter output. Repeat steps 2 to 6 until oscillator tracks correctly. Any change in C26 will necessitate a readjustment of oscillator trimmer C24.

RF AND ANTENNA ALIGNMENT FOR BC BAND

1. Change coupling capacitor connecting signal generator to AM external antenna terminal from .01 mfd. to 50 mmf. or less. (Terminals of AM loop input jack must be shorted together if loop is disconnected.)
2. Adjust signal generator and receiver tuning control to 1475 KC.
3. Adjust BC oscillator trimmer, C24, BC RF trimmer, C12 and BC antenna trimmer, C69 for maximum output. (If AM loop is disconnected, C69 should be adjusted after chassis is installed in cabinet.)
4. Check overall tracking at 580 KC and 965 KC. Maximum output should occur within the ± 10 KC of the indicated dial pointer reading. If it falls outside these limits, the plates of the gang rotor should be bent to correct tracking, but this is a difficult operation and should be attempted only by experienced technicians.
5. Repeat steps 3 and 4 until no appreciable improvement can be obtained by additional adjustments.

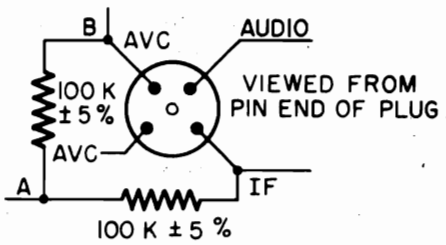
SW ALIGNMENT

1. V.T.V.M. and signal generator connected as for preceding step 5 of BC RF and antenna alignments; range switch in SW (most clockwise position).
2. Set signal generator and tuning control to 15 MC CW.
3. Adjust SW oscillator trimmer (C23), SW RF trimmer (C11), and SW antenna trimmer (C4) for maximum output. NOTE: If circuits are badly out of alignment, it may be necessary to apply the signal first to terminal #3 on gang (C2-E) until oscillator is brought close to correct alignment. The local oscillator frequency in the receiver should be adjusted to the RF *plus* the IF (not below the RF). The correct position can be determined by turning C23 all the way in (clockwise) and then out (counter-clockwise) until the second peak is reached.
4. Tune receiver and signal generator to 6 MC and check calibration and output. Maximum meter reading should be obtained with the dial pointer ± 100 KC of the 6 MC dial reference mark and an AVC output voltage not less than one-half of the AVC voltage obtained at 15 MC, providing the same voltage is applied to the antenna in both cases.

FM ALIGNMENT

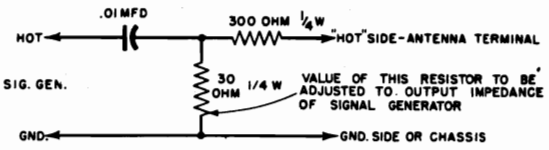
FM IF CHANNEL

1. Set range control to FM (second from most counterclockwise position) and tuning gang to maximum capacity (closed).
2. Insert special FM test circuit plug, detailed below, in test circuit jack J2 located on left side of radio chassis. See Fig. 2.



Test Circuit Plug

3. Connect V.T.V.M. ground or "minus" lead to point "B" and "plus" lead to IF pin on test circuit plug.
4. Connect signal generator to #4 (C2-B) gang terminal through a .01 mfd. capacitor and short #6 gang terminal (C2-C) to chassis. See Fig. 2.
5. Adjust output of signal generator to obtain 10.7 MC CW and approximately 4 volts on V.T.V.M.
6. Adjust C35B, C35A, C28B, C28A, and C46A for *maximum* meter reading, repeating all adjustments several times. NOTE: It may be necessary to apply the 10.7 MC signal to pin 6 of the 1st IF tube (7AH7) and adjust C35B, C35A, and C46A before applying the signal to #4 gang terminal and adjusting C28B and C28A.
7. Change V.T.V.M. "minus" to point "A" (center tap of two 100 K resistors) of test circuit jack and "plus" lead to audio (marked AF on chassis).
8. Turn signal generator OFF and set meter to zero when no signal is applied to IF.
9. Turn signal generator ON and adjust C46B for zero output on meter. It may be possible to obtain two or more points of adjustment at which a zero meter reading can be obtained. The correct one is the one at which the meter passes through zero most sharply with the minimum rotation of C46B.
10. Alternately adjust C46A (3rd FM IF primary) for maximum DC voltage across pins "B" and "IF" (meter connected as for previous IF alignment), and C46B (3rd FM IF secondary) for *minimum* DC voltage from point "A" to "audio." NOTE: In making this adjustment, the signal input level should be adjusted to provide approximately 6 volts DC across pins "B" and "IF" of test jack.
11. Remove short from #6 gang terminal and change signal generator input from gang to FM antenna jack on rear of radio chassis, applying signal through FM dummy antenna circuit shown in Fig. 5.



FM Dummy Antenna

12. V.T.V.M. should be connected from point "B" to "IF" of test circuit plug.
13. Adjust signal generator and tuning control to 106 MC and output to produce approximately 8 volts on V.T.V.M.
14. Using a completely non-metalic ¼" hexagon socket wrench, adjust FM oscillator trimmer (C22), FM RF trimmer (C10) and FM antenna trimmer (C1) for maximum output voltage read on V.T.V.M., rocking the tuning gang slightly as these adjustments are made.
15. Set signal generator and tuning control to 90 MC.
16. Adjust FM oscillator padder (L3), FM RF padder (L2) and FM antenna padder (L1) for maximum output voltage. The ⅜" locknut on these padders must be loosened before adjustments are made and tightened after adjustments are completed.
17. Repeat steps 14, 15 and 16 until maximum output voltage is obtained with the dial pointer at 90 MC and 106 MC when the signal generator is set at these respective frequencies. Any adjustments made under step 16 above must be followed by repeating the adjustments required under step 14.

MODEL 1217D BENDIX RADIO DIV.

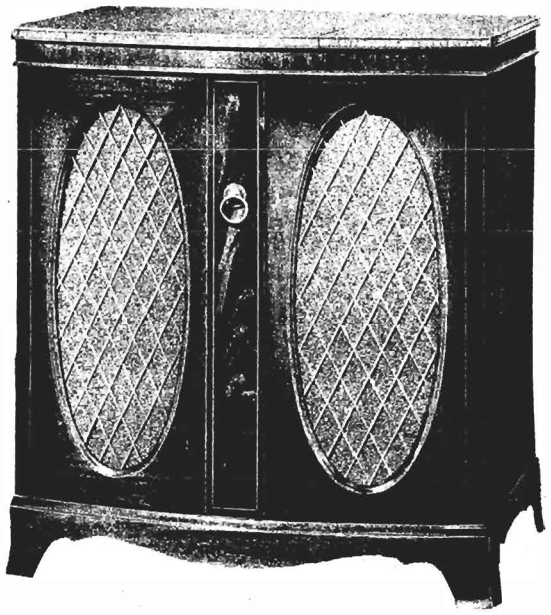

Fig. 1 Model 1217D

SPECIFICATIONS

Power Requirements
105 - 125 volts, 60 cycles AC
Power Consumption (including phonograph)
180 watts
Tuning Frequency Range
AM 540 - 1620 KC
SW AM 6 - 15.5 MC
FM 88 - 108 MC
Tube Complement
1-6AG5, 1-7F8, 1-6BE6, 2-7AH7, 2-6H6, 2-6SN7, 2-6V6GT, 1-5U4G, 1-6AQ6, 1-6BA6, Total 14
Pushbuttons
8 mechanical type for any AM, SW, or FM station.
Loudspeaker
12-inch diameter electro-dynamic.
Record Changer
Automatic - twelve 10-inch or ten 12-inch standard records.
Maximum Power Output
12 watts.
Overall Dimensions
Height 34", width 31", depth 18¼".

CIRCUIT ANALYSIS

The Model 1217D radio provides radio reception of the Standard AM Broadcast Band, the Shortwave Band from 6 to 15.5 megacycles, and the FM Band from 88 to 108 megacycles. Phonograph reproduction is provided through the audio amplifier from a high impedance phono jack located on the radio chassis. A standard superheterodyne circuit is used, with one stage of tuned radio frequency on all three bands. A low impedance loop antenna installed on the back cover of the cabinet is used on both the Standard Broadcast and Shortwave Bands. A built-in dipole antenna is used on the FM Band. An outside antenna for the AM Bands may be connected to the binding screw marked ANTENNA on the rear of the cabinet. A 300 ohm outside FM dipole antenna may be connected to the terminals marked FM DIPOLE but the built-in dipole must be disconnected when an outside antenna is used.

CHASSIS CODE CHANGES

The schematic shown in Fig. 8 is for the code D radio chassis and the code C amplifier chassis. The data given below indicates the circuit changes incorporated in the different chassis as compared to this schematic.

RADIO CHASSIS

CODE C CHASSIS

First audio amplifier, 6SN7, and AM demodulator, 6H6, filaments were connected from pin #1 of J4 to ground, instead of being isolated from ground and in parallel with the FM detector 6H6 filament.

The audio output of the FM detector transformer (T5) was connected directly to pin #1 (grid) of the 6SN7 first audio amplifier. This deleted C85, 86, 87, R72, and 73. Cathode bypass capacitor, C88, was not used; cathode resistor R60 and grid resistor R59 were connected to ground through a common 10K resistor.

De-emphasis filter capacitors in the output circuit of T5, C51 and C53 were .002 mfd and 150 mmf respectively.

The Hush-O-Matic circuit shown in Fig. 9 was used in this chassis.

The 7F8 dual triode is used as an oscillator-mixer in the FM circuit and is made inoperative by removing its plate voltages when the range switch (S1) is in any but the FM position. Likewise, the 6BE6 is used as a converter for the Standard Broadcast and Shortwave Bands only, and has no plate voltage applied to it when S1 is in the FM or PH (phono) positions. One half of the 6H6 (pins 3 and 4) AM demodulator tube is used in the delayed AVC circuit for FM. The first triode section (pins 1, 2 and 3) of the 6SN7 in the radio chassis is used only when the range switch, S1, is in the FM position, but does not have the B plus removed from its plate when S1 is in any of the other three positions. The 6AQ6 and 6BA6 are used as amplifier-rectifier and control tubes for the Hush-O-Matic circuit and are inoperative on radio reception.

AMPLIFIER CHASSIS

CODE B

The hum-balancing potentiometer R76 and the voltage divider network consisting of R74 and R75 were deleted. The transformer filament winding used only for the FM detector (6H6) was center tapped and this tap connected to the cathodes of the 6V6 output tubes.

Some chassis coded B were identical to code C chassis.

ADJUSTMENT OF HUM-BALANCING POTENTIOMETER

The hum-balancing potentiometer, R76, on code C amplifier chassis should be adjusted with the range control in the FM position and the volume control at minimum. Adjust R76 to obtain minimum hum from the loudspeaker.

GENERAL

It is not necessary to remove the two chassis from the cabinet if the FM channel only is to be aligned. An FM test socket is provided on the chassis sideplate (facing outward in normal mounting position) at which the various voltages from the ratio detector are available for either meter or oscilloscope measurements.

If the BC and SW channels are to be aligned, it is advisable to remove the radio chassis from the cabinet in order to gain access to the BC and SW AVC voltage used for output indication. It is rather difficult to align the BC and SW RF and IF sections when the volume control is full "ON" because of background noise accompanying the high gain of the audio amplifier. A DC vacuum tube voltmeter connected to the junction of R20 and C40 (lug 3 of S1-E—See Figs. 7 & 13) will provide an accurate and stable indication of RF output, at the AM demodulator, for alignment of the BC and SW bands.

Unless the various circuits of each channel are very much out of alignment, adjustments made in the SW circuits will not affect the BC circuits and adjustments made in the FM circuits will not alter either the BC or SW circuit adjustments. However, if any of these channels are badly out of alignment necessitating considerable adjustment, it is best, after these adjustments have been made, to go back and check the adjustment previously made on the other channels.

An un-modulated (CW) signal of the proper radio frequency may be used for meter alignment of all three channels (BC, SW, and FM), but it is convenient to use a 400 cycle AM signal during alignment and occasionally advance the volume control to be sure the correct signal is tuned in.

Before making any adjustment, allow the receiver and signal generator to warm up for at least five minutes. IMPORTANT: All adjustments must be made in the order in which they are given; i.e., the BC band must be aligned first, followed by the SW, and last, the FM band.

INSTRUCTIONS FOR REMOVING THE CHASSIS

If, for any reason, it is necessary to remove the radio chassis from the cabinet, proceed as per following instructions:

Remove the power cord plug from the wall receptacle, and remove all control knobs and push-buttons by simply pulling them straight up from the panel. The cabinet back cover and AM loop assembly may be detached from the chassis by pulling the loop leads out of their receptacle on the chassis, after the small wood screws holding the assembly on the cabinet have been removed. The FM antenna is disconnected from the chassis by removing the three prong plug at the rear of the chassis. All power cables and leads may be disconnected at convenient plugs and jacks in the chassis. The speaker is connected to the amplifier chassis by a 5-prong plug on the speaker.

After all connecting leads and cables have been disconnected from the chassis, remove the four hexagon-head machine screws which hold the chassis mounting rails in the cabinet. The two upper machine screws are removed from inside the record changer compartment. The two lower bolts are located below the radio chassis and removed from the chassis side of the cabinet. Note: When replacing the chassis in the cabinet, be sure dial glass is up snug against the control panel when the four mounting screws are tightened and that they are tightened securely.

PUSH-BUTTON ADJUSTMENT

The mechanical type of push-button tuning used with this receiver makes possible the selection of any one of eight pre-selected stations. Any push-button may be adjusted to select any station in the three tuning bands. However, more accurate tuning of the SW and FM stations will be obtained if the lower four buttons E, F, G and H, Figures 2 & 3, are used for stations within these bands.

1. Remove all push-buttons by pulling straight up from the panel.
2. Manually tune in the desired station.
3. Release the screw adjacent to the push-button shank and push the shank in firmly as far as it will go while holding the tuning control knob.
4. Release the shank and tighten the locking screw.
5. Rotate the tuning control to a different position and check the push-button setting by again depressing the shank previously adjusted. The tuning dial should automatically return to the stations previously tuned in. However, in some cases it may not be exactly on the peak frequency of the stations. In such cases, continue as follows:
6. Re-tune the station manually to its peak frequency, and note whether it is necessary to increase or decrease the frequency setting for optimum tuning.
7. If it is necessary to increase the dial frequency setting, then the dial should be set at an additional increase beyond the optimum point (approximately the amount of the increase) and procedures 3, 4, 5 and 6 repeated. The push-button should then tune in the station exactly on its peak frequency.
8. If it is necessary to decrease the dial frequency setting, then the dial should be set at a lower frequency from its optimum point (approximately the amount of the decrease) and the procedure in 3, 4, 5 and 6 repeated.
9. Repeat the above procedures for the remaining seven push-buttons.

After the push-buttons have been set up as previously described, the proper tab with its transparent cover should be inserted together in each push-button knob. The push-buttons should now be placed on the proper shanks.

MODEL 1217D BENDIX RADIO DIV.

ALIGNMENT PROCEDURE

EQUIPMENT REQUIRED

Signal Generator
AM, 455 KC to 106 MC
FM, 10.7 MC and 88 to 108 MC.

Vacuum Tube Voltmeter
DC up to approximately 20 volts. Ground, or minus, must be isolated from the power line.

Oscilloscope

FM Test Circuit Plug
See Fig. 7 for details.

.01 mfd and 50 mmf (or less) capacitor used for connecting signal generator to receiver.

Alignment Screwdriver
Must be 100% non-metalic and preferably over 8" in length.

Alignment Socket Wrenches—must be non-metalic.
One 1/4" hexagon, 8" long.
One 3/8" hexagon, 6" long.
If the 3/8" wrench has a hole through the handle of sufficient diameter to permit inserting the alignment screwdriver, the locking nuts on L1, L2 and L3 can be loosened or tightened at the same time these padders are adjusted with the screwdriver inside.

AM ALIGNMENT

Turn receiver and test instruments on and allow to warm up for at least 5 minutes. (Input voltage, 117 volts 60 cycles AC). Set volume control to minimum, bass and treble controls full counterclockwise, range control to BC (third from most counterclockwise position), tuning gang fully closed. Set dial pointer to Reference Mark at low frequency end of dial as shown on Fig. 6. If built-in AM loop antenna is disconnected, the two contacts of the AM antenna input jack located on top the chassis must be shorted together. C69 and C4 should be adjusted with loop connected.

IF CHANNEL

1. Short #5 terminal on gang (C2-F) to chassis. See Fig. 2.
2. Set signal generator to 455 KC, CW or AM, and connect to #3 gang terminal (C2-E) through a .01 mfd capacitor. See Fig. 2.
3. Connect low range of V.T.V.M. to junction of R20 and C40 (lug 3 of switch S1-E is a convenient point—See Figs. 8 & 13), and chassis ground, and adjust signal generator attenuator to produce approximately 2 volts of AVC on the V.T.V.M.
4. Adjust C24 (BC oscillator trimmer) for maximum meter reading, keeping signal input to produce approximately 2 volts AVC. Repeat these adjustments until no further improvements can be made in any one of them. NOTE: All adjustments must be made with a completely non-metalic screwdriver.

BC OSCILLATOR ALIGNMENT

1. Remove short from #5 gang terminal.
2. Move signal input from #3 gang terminal to external AM antenna terminal (J1) and set input frequency to 1475 KC CW or AM. (V.T.V.M. remains connected as for IF alignment.)
3. Set tuning control to 1475 KC.
4. Adjust C24 (BC oscillator trimmer) for maximum meter reading.
5. Set signal generator and receiver dial pointer to 580 KC.
6. Adjust BC oscillator padder C26 for maximum meter output. Repeat steps 2 to 5 until oscillator tracks correctly. Any change in C26 will necessitate a readjustment of oscillator trimmer C24.

RF AND ANTENNA ALIGNMENT FOR BC BAND

1. Change coupling capacitor connecting signal generator to AM external antenna terminal from .01 mfd to 50 mfd or less. (Terminals of AM loop input jack must be shorted together if loop is disconnected.)
2. Adjust signal generator and receiver tuning control to 1475 KC.
3. Adjust BC oscillator trimmer, C24, BC RF trimmer, C12, and BC antenna trimmer, C69, for maximum output. (If AM loop is disconnected, C69 should be adjusted after chassis is installed in cabinet.) Rock tuning gang slightly for maximum output as adjustments are made.
4. Check overall tracking at 580 KC and 965 KC. Maximum output should occur within the ± 10 KC of the indicated dial pointer reading. If it falls outside these limits, the plates of the gang rotor should be bent to correct tracking, but this is a difficult operation and should be attempted only by experienced technicians. Bending the plates of the gang rotor will likely cause mistracking on the shortwave band.
5. Repeat steps 3 and 4 until no appreciable improvement can be obtained by additional adjustments.

SW ALIGNMENT

1. V.T.V.M. and signal generator remain connected as for preceding step 5 of BC RF and antenna alignments; range switch in SW (most clockwise position).
2. Set signal generator and tuning control to 15 MC CW or AM.
3. Adjust SW oscillator trimmer (C23), SW RF trimmer (C11), and SW antenna trimmer (C4) for maximum output. NOTE: If circuits are badly out of alignment, it may be necessary to apply the signal first to terminal #3 on gang (C2-E) until oscillator is brought close to correct alignment. The local oscillator frequency in the receiver should be adjusted to the RF *plus* the IF (not below the RF). The correct position can be determined by turning C23 all the way in (clockwise) and then out (counter-clockwise) until the second peak is reached.
4. Tune receiver and signal generator to 6 MC and check calibration and output. Maximum meter reading should be obtained with the dial pointer ± 100 KC of the 6 MC dial reference mark and an AVC output voltage not less than one-half of the AVC voltage obtained at 15 MC, providing the same voltage is applied to the antenna in both cases.

FM ALIGNMENT

CW — METER METHOD

Turn receiver and test instruments "ON" and allow to warm up for at least five minutes. (Input voltage, 117 volts 60 cycles AC.) Set volume control to minimum, bass and treble controls full counterclockwise, range control to FM position (second from most counterclockwise position), and tuning gang fully closed. Dial pointer should be over Reference Mark as directed in first paragraph of AM Alignment. Connect FM dummy antenna to FM antenna binding screws on receiver.

1. Insert special FM test circuit plug, detailed below, in test circuit jack J2 located on left side of radio chassis. See Fig. 2 & 7.
2. Connect V.T.V.M. ground or "minus" lead to point "B" and "plus" lead to IF pin on test circuit plug.
3. Connect signal generator to #4 (C2-B) gang terminal through a .01 mfd capacitor and short #6 gang terminal (C2-C) to chassis. See Fig. 2.
4. Adjust output of signal generator to obtain 10.7 MC CW and approximately 4 volts on V.T.V.M.
5. Adjust C35B, C35A, C28B, C28A, and C46A for *maximum* meter reading, repeating all adjustments several times. NOTE: It may be necessary to apply the 10.7 MC signal to pin 6 of the 1st IF tube (7AH7) and adjust C35B, C35A, and C46A before applying the signal to #4 gang terminal and adjusting C28B and C28A.
6. Change V.T.V.M. "minus" to point "A" (center tap of two 100 K resistors) of test circuit jack and "plus" lead to audio (marked AF on chassis).
7. Turn signal generator "OFF" and set meter to zero when no signal is applied to IF.
8. Turn signal generator "ON" and adjust C46B for zero output on meter. It may be possible to obtain two or more points of adjustment at which a zero meter reading can be obtained. The correct one is the one at which the meter passes through zero most sharply with the minimum rotation of C46B.
9. Alternately adjust C46A (3rd FM IF primary) for maximum DC voltage across pins "B" and "IF" (meter connected as for previous IF alignment), and C46B (3rd FM IF secondary) for *minimum* DC voltage from point "A" to "audio." NOTE: In making this adjustment, the signal input level should be adjusted to provide approximately 6 volts DC across pins "B" and "IF" of test jack.
10. Remove short from #6 gang terminal and change signal generator input from gang to FM antenna jack on rear of radio chassis, applying signal through FM dummy antenna circuit shown in Fig. 3.
11. V.T.V.M. should be connected from point "B" to "IF" of test circuit plug.
12. Adjust signal generator and tuning control to 106 MC and output to produce approximately 10 volts on V.T.V.M.
13. Using a completely non-metalic ¼" hexagon socket wrench, adjust FM oscillator trimmer (C22), FM RF trimmer (C10) and FM antenna trimmer (C1) for maximum output voltage read on V.T.V.M., rocking the tuning gang slightly as these adjustments are made. NOTE: Be very careful when adjusting these trimmers, not to spring them and thus cause them to become shorted.
14. Set signal generator and tuning control to 90 MC.
15. Adjust FM oscillator padder (L3), FM RF padder (L2) and FM antenna padder (L1) for maximum output voltage. The ⅜" locknut on these padders must be loosened before adjustments are made and tightened after adjustments are completed.
16. Repeat steps 13, 14 and 15 until maximum output voltage is obtained with the dial pointer at 90 MC and 106 MC when the signal generator is set at these respective frequencies. Any adjustments made under step 15 above must be followed by repeating the adjustments required under step 13.

VISUAL METHOD

The antenna, RF, oscillator and first and second IF stages are aligned with a CW signal in the same manner described under the CW-meter method of alignment. The adjustment of the third IF, or ratio detector, determines to a considerable degree the fidelity and tuning characteristic of the receiver; therefore, the visual method, using an oscilloscope and FM signal, of aligning this stage may give better results then the CW - meter method. Numerous advantages can be given for either method. The best method to use depends not only on the type and quality of the test instruments available, but also on the ability and experience of the technician.

Turn receiver and test instruments "ON" and allow to warm up for at least five minutes. (Input voltage, 117 volts 60 cycles AC.) Set volume control to minimum, bass and treble controls full counterclockwise, range control to FM position (second from most counterclockwise position), and tuning gang fully closed. Dial pointer should be over Reference Mark as directed in first paragraph of AM Alignment. Connect FM dummy antenna to FM antenna binding screws on receiver.

1. Connect V.T.V.M. ground or "minus" lead to AVC pin of test circuit jack (J2) located on left side of radio chassis. (See Fig. 2).

FM ALIGNMENT

VISUAL METHOD—Cont.

The test circuit plug used for the CW - meter method of FM alignment may be used throughout the following visual alignment procedure for providing convenient points of connections to the test circuit jack. The two 100 K resistors connected to the test circuit plug and used during the CW - meter method are not needed when the visual alignment procedure is followed, but do not affect the circuit any great amount and therefore may be disregarded.

2. Connect signal generator to #4 (C2-B) gang terminal through a .01 mfd capacitor and short #6 gang terminal (C2-C) to chassis. See Fig. 2 for gang terminal numbers.
3. Adjust output of signal generator to obtain 10.7 MC CW and approximately 6 volts on the V.T.V.M.
4. Adjust C35B, C35A, C28B, and C46A for maximum meter reading, repeating all adjustments several times.
5. Connect test equipment as shown in Fig. 4. Some oscilloscopes have phasing controls and a 60 cycle sine wave horizontal sweep provided internally. If such an oscilloscope is available, the horizontal input connection and phasing capacitor shown in Fig. 4 are not required. The vertical input to the oscilloscope is connected to the AUDIO pin on the test circuit jack and the ground of the oscilloscope connected to the receiver chassis. Connect V.T.V.M. ground or "minus" lead to point B and "plus" lead to IF pin on test circuit plug.
6. Connect signal generator to #4 (C2B) gang terminal (See Fig. 2) through a .01 mfd capacitor and short #6 gang terminal (C2C) to chassis.
7. Adjust output of signal generator to obtain 10.7 MC FM and approximately 6 volts on the V.T.V.M. The sweep width of the FM signal must be at least 200 KC plus and minus the center frequency. An "S" curve similar to Fig. 5 should now appear on the oscilloscope, but it will likely be necessary to adjust the signal generator frequency slightly in order to properly center this "S" curve on the oscilloscope screen. If a double trace appears, as shown in Fig. 5b, adjust the phasing control (may be built in the oscilloscope or the phasing capacitor shown in Fig. 4) until a single trace is obtained.
8. Adjust C46A (ratio detector primary) to obtain maximum V.T.V.M. reading and C46B (ratio detector secondary) for best symmetrical "S" curve on oscilloscope. Repeat these adjustments several times.
9. Remove short from #6 gang terminal and change signal generator input from gang to FM antenna jack on rear of radio chassis, applying signal through FM dummy antenna circuit shown in Fig. 3.
10. V.T.V.M. should be connected from point "B" to "IF" of test circuit plug.
11. Adjust signal generator and tuning control to 106 MC CW and output to produce approximately 10 volts on V.T.V.M.
12. Using a completely non-metalic ¼" hexagon socket wrench, adjust FM oscillator trimmer (C22), FM RF trimmer (C10) and FM antenna trimmer (C1) for maximum output voltage read on V.T.V.M., rocking the tuning gang slightly as these adjustments are made. NOTE: Be very careful when adjusting these trimmers, not to spring them and thus cause them to become shorted.
13. Set signal generator and tuning control to 90 MC.
14. Adjust FM oscillator padder (L3), FM RF padder (L2) and FM antenna padder (L1) for maximum output voltage. The ⅜" locknut on these padders must be loosened before adjustments are made and tightened after adjustments are completed.
15. Repeat steps 11, 12, 13 and 14 until maximum output voltage is obtained with the dial pointer at 90 MC and 106 MC when the signal generator is set at these respective frequencies. Any adjustments made under step 14 above must be followed by repeating the adjustments required under 12.
16. It is possible to visually align the ratio detector transformer (C46A & C46B) after the oscillator, RF and antenna circuits, have been aligned. In some cases this may be desirable, especially if the output of the FM signal generator is rather low at 10.7 MC. If this method is followed, align the IF channel up through C46A (ratio detector primary) and the oscillator, RF and antenna circuits as directed above, using a CW or AM signal and the V.T.V.M. connected across the ratio detector load resistor. (Point B and IF of the test circuit jack as shown in Fig. 2). Then, with the oscilloscope and V.T.V.M. connected as directed in step 5 above and the signal generator still connected to the FM antenna input through the FM dummy antenna, apply an FM signal of any frequency between 90 and 106 MC and adjust the receiver tuning control to center the resulting "S" curve on the oscilloscope screen. The ratio detector transformer (C46A & C46B) may now be adjusted in exactly the same manner as directed in step 8, except that it may be advisable to adjust the output of the signal generator to produce approximately 10 volts on the V.T.V.M. instead of 8 volts.

DESCRIPTION

This model is a 4-Tube Superhetrodyne radio receiver designed to cover a frequency range of from 535 Kilocycles to 1725 Kilocycles (K.C.). The tubes used are—

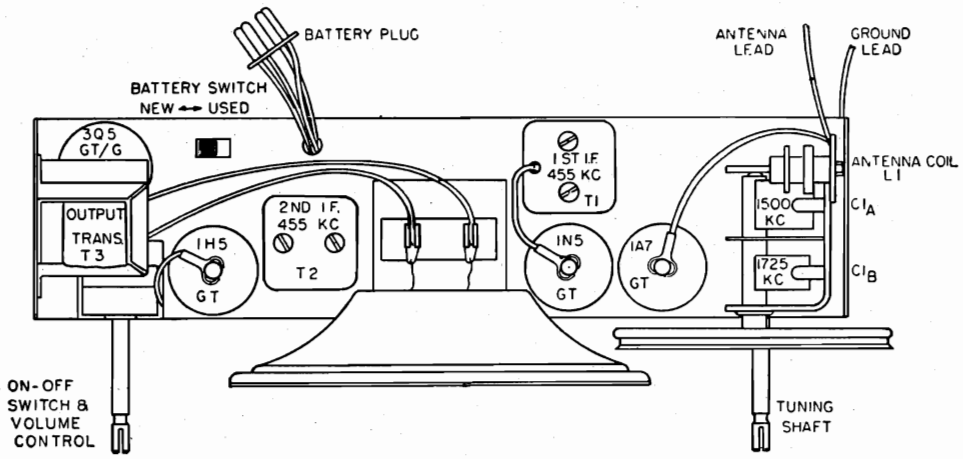
1A7 GT—Osc. Converter
1H5 GT—AVC Det. Audio Amplifier
1N5 GT—I.F. Amplifier
3Q5 GT—Power Output

INSTALLATION

This receiver has been designed to operate from a battery that has the "B" Supply (90V) and the "A" Supply (1-½ V) incorporated into a single unit.

Any one of the following batteries may be used in conjunction with this receiver and after inserting the plug from the radio into the battery it should be placed inside the cabinet in the space provided.

1. Ray-O-Vac . . . . . Their No. "AB" 82 Power Pack
2. Burgess . . . . . Their No. 17G-D60 Power Pack
3. General . . . . . Their No. 60DL 11 L Power Pack
4. Everready . . . . . Their No. 748 Power Pack
5. Everready . . . . . Their No. 758 Power Pack



ALIGNMENT PROCEDURE

With an output meter connected across the voice coil of the speaker, the output meter reading for 50 milliwatts is .4 volts using a signal which is modulated 30% at 400 c.p.s. Follow through the procedure as outlined below for proper alignment.

Connect the signal generator to the grid cap of the 1A7 GT Tube through a .1 MFD. Condenser. Connect the ground lead of the generator to the chassis. Adjust the signal generator to 455 K.C. and set the variable condenser of the receiver to minimum capacity (fully opened). With the volume control full on and minimum output from the signal generator adjust the two trimmers on top of the first and second I.F. transformers for maximum output.

Now connect the signal generator to the antenna connection of the receiver through a .00025 condenser. Adjust the signal generator frequency to 1725 K. C. and set the variable condenser to minimum capacity (fully opened), and adjust the oscillator trimmer (C1B) for maximum output. Set signal generator to 1500 K. C. and tune receiver to signal. Adjust the antenna trimmer (C1A) on the variable condenser for maximum output.

COAST TO COAST STORES

DESCRIPTION

This radio is a 5 tube (including rectifier) superheterodyne radio receiver designed for use on 117 volts 60 cycle AC or 117 volts DC power supply.

The tubes used are:—

1—12SA7 Oscillator Converter	1—12SQ7 AVC Detector and 1st Audio
1—12SK7 I.F. Amplifier	
1—35Z5GT Power Rectifier	1—50L6GT Power Output

This receiver covers the frequency range from 540 kilocycles to 1630 kilocycles (KC).

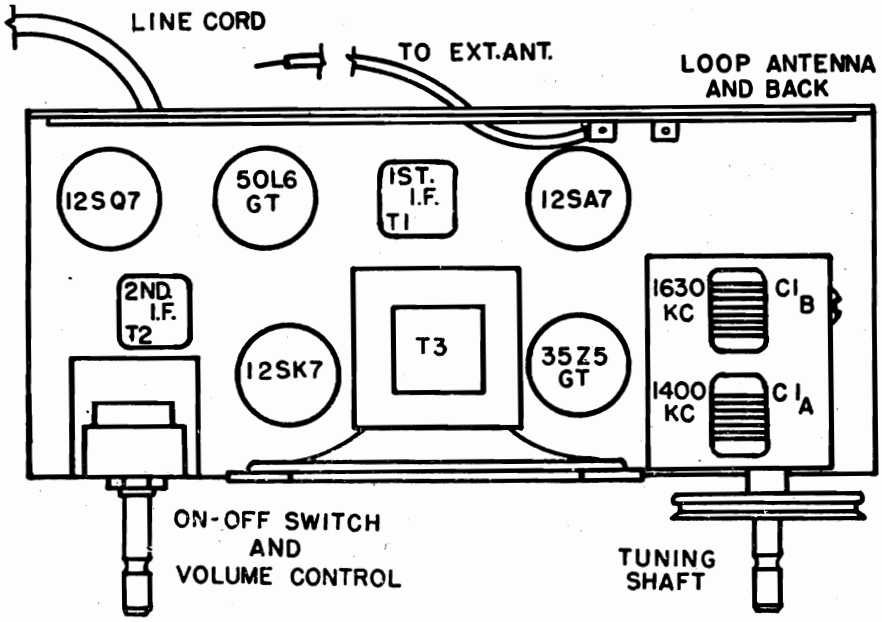
ALIGNMENT PROCEDURE

The following alignment procedure is for use only by competent servicemen having the proper equipment.

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, to prevent A.V.C. action from interfering with correct alignment.

With the output meter connected across the voice coil of the speaker, the output meter reading for 50 milli-watts is .4 volts using a signal which is modulated 400 c.p.s.

Adjust all trimmers for maximum output. Repeat alignment procedure given below as a final check.



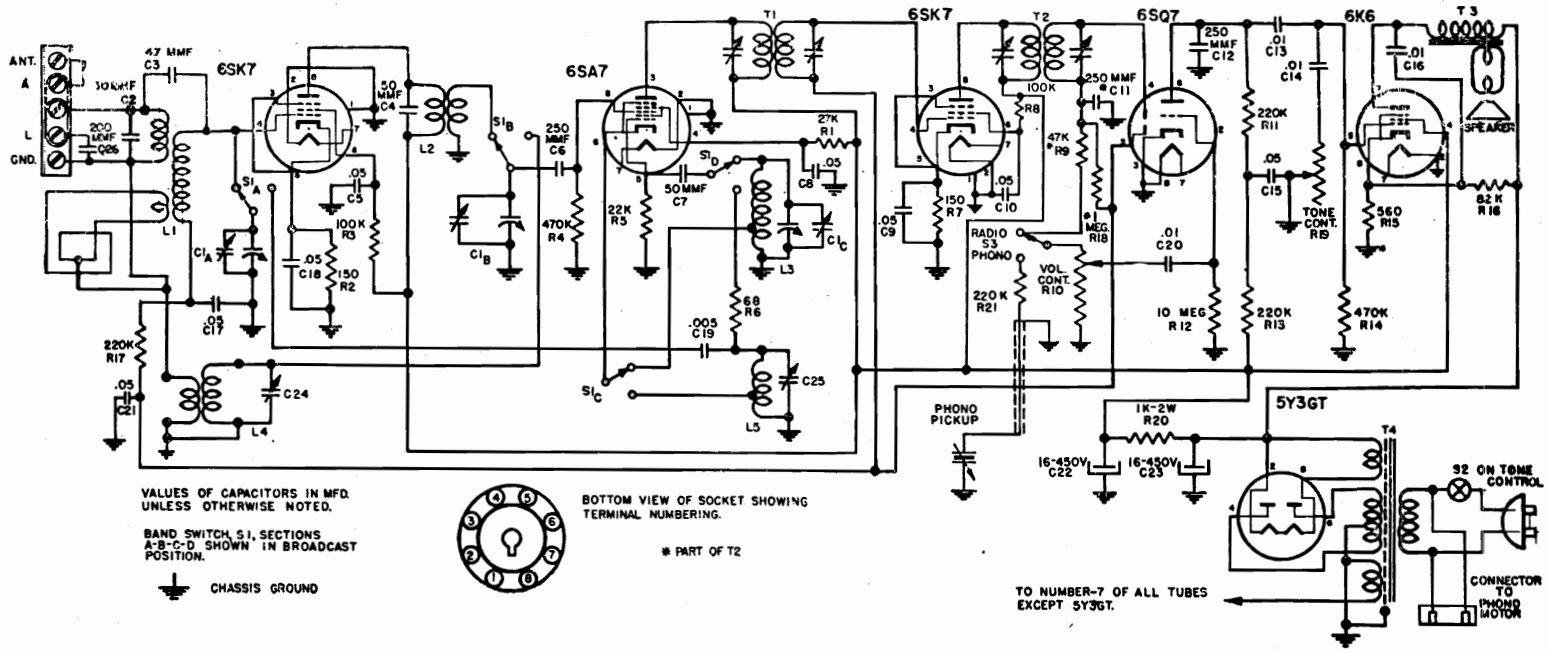
ALIGNMENT PROCEDURE

(*Continued*)

CAUTION: This is an A.C.-D.C. receiver and when aligning the set it is necessary to isolate the Signal Generator or the Receiver from the line by use of a transformer, or place a .2 MFD. condenser in both test leads of the Signal Generator.

Position of Variable	Generator Frequency	Dummy Ant. Mfd.	Generator Connections	Trimmer Adjustment	Trimmer Function
Fully open	455 KC	.1	*12SA7 Grid (Stator of C1A)	T1	Input I.F.
Fully open	455 KC	.1	*12SA7 Grid (Stator of C1A)	T2	Output I.F.
Fully open	1630 KC	.00025	*12SA7 Grid (Stator of C1A)	C1B	Oscillator
Tune in signal from generator	1400 KC	.00025	*Ant. lead from loop	C1A	Antenna

*Connect ground lead of signal generator to chassis.



DESCRIPTION

This Model is a 2 band six tube (including Rectifier) superhetrodyne radio receiver and phonograph combination for operation on 117 volt 60 cycle AC current.

This receiver covers the standard broadcast frequency range, 535 to 1725 Kilocycles (K.C.) and the short wave frequency range from 6 to 18.2 Megacycles (M.C.).

The tubes used are:

6SK7—R. F. Amplifier
6SA7—Mixer—Osc.
6SK7—I. F. Amplifier
6SQ7—Det. AVC—Audio
6K6 GT—Power Output
5Y3 GT—Rectifier

MODELS MD42, MD43, MD44

COAST TO COAST STORES

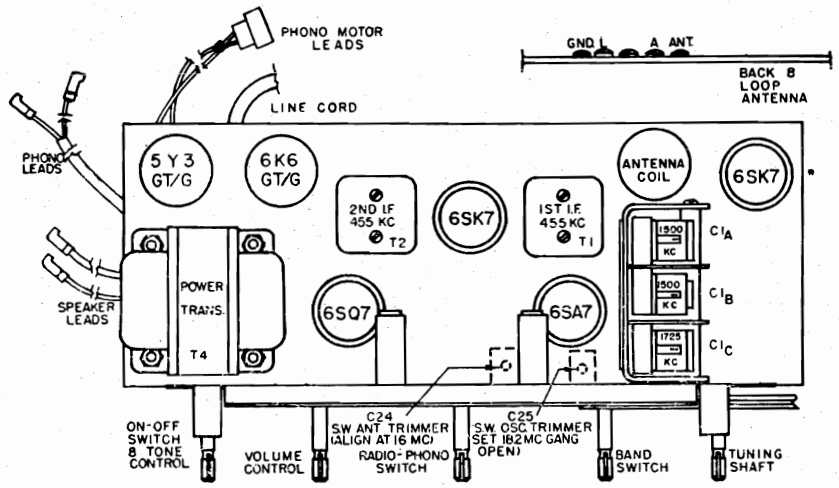


Fig. 2 Tube Positions and Alignment Points

ALIGNMENT PROCEDURE

The following alignment procedure is for use only by competent servicemen having the proper equipment.

With an output meter connected across the voice coil of the speaker, the output meter reading for ½ watt is 1.25 volts using a signal which is modulated 400 c.p.s. Follow through the procedure as outlined below for proper alignment.

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, for accurate alignment.

Position of Variable	Band Switch Position	Generator Freq.	Dummy Ant.	Generator Connections	Trimmer Adjustment	Trimmer Function
Fully Open	BC	455 KC	.1 MFD	6SA7 Grid (Stator of C1B)	T1 T2	I. F.
Fully Open	BC	1725 KC	.00025 MFD	*Ant. Terminal on Loop	C1C	BC Osc.
Tune in signal from Generator	BC	1500 KC	.00025 MFD	*Ant. Terminal on Loop	C1B	R. F.
Tune in signal from Generator	BC	1500 KC	.00025 MFD	*Ant. Terminal on Loop	C1A	BC Ant.
Fully Open	SW	18.2 MC	400 ohms	*Ant. Terminal on Loop	C25	SW Osc.
Tune in signal from Geneartor	SW	16 MC	400 ohms	*Ant. Terminal on Loop	C24	SW Ant.

GROUND lead of generator should be attached to the chassis for all adjustments

C24 and C25 are located under the chassis

For alignment points refer to Figure 2

* Be sure coupling link is in correct position for external antenna operation. See illustration below.

Repeat above alignment procedure as a final check.

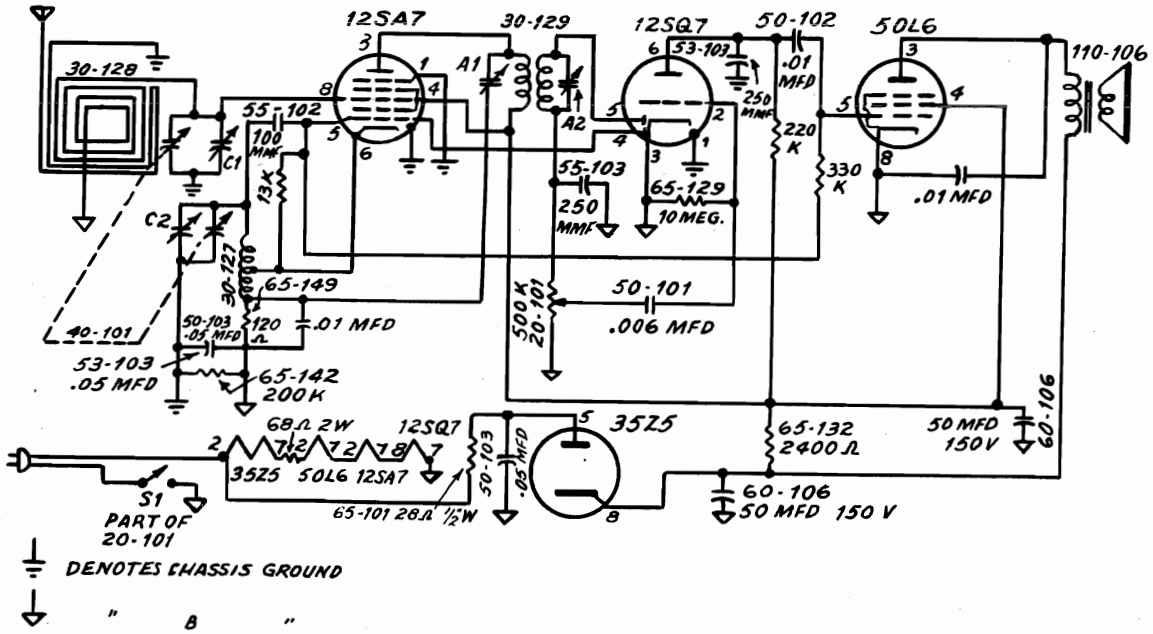
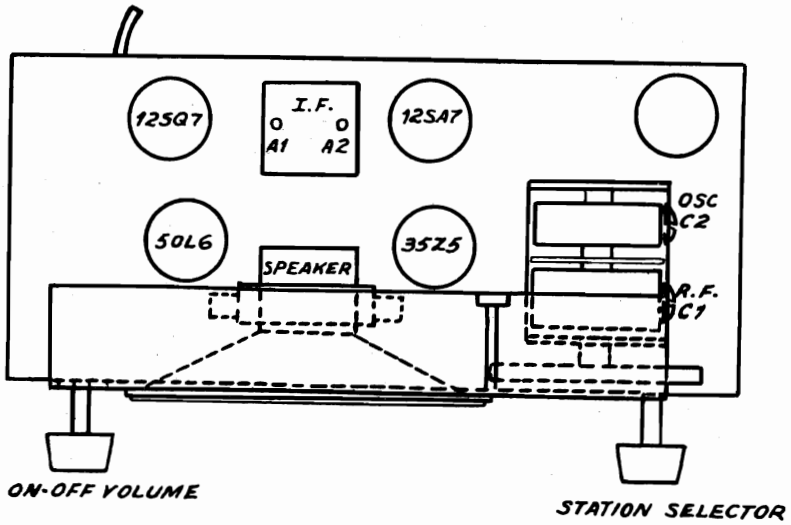
CONCORD RADIO CORP.

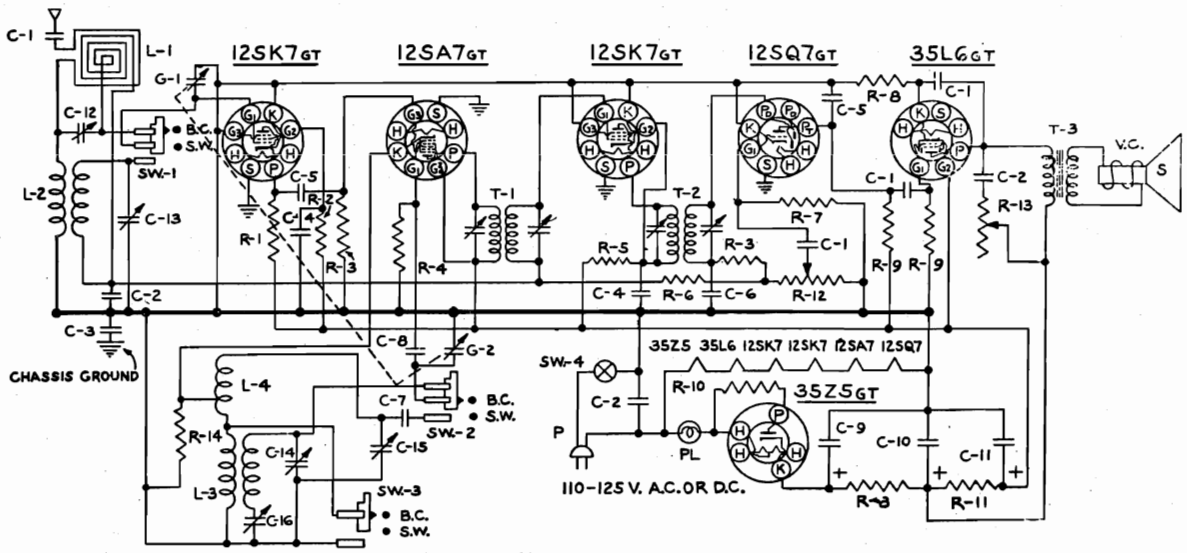
MODEL 1-413





MODEL 1-608

CONCORD RADIO CORP.



Remove the chassis from the cabinet for alignment.

A signal generator is required, having the following frequencies: 455 KC, 1400 KC, 1730 KC. 6 MC, 16 MC, and 18.3 MC. An output meter should be connected across the speaker.

I. F. ALIGNMENT: — Connect the generator lead through a .1 MFD Condenser to the terminal lug on the "Antenna" section of the gang condenser. The ground lead from the generator should be connected to the gang frame. Set the generator at 455 KC. Adjust the trimmer screws in the 1st and 2nd I. F. cans (See Fig. 1) until a maximum reading is noted on the output meter.

The receiver volume control should be turned to maximum during the I. F. and all subsequent alignments, to keep the AVC from working and giving false readings. Keep the generator output as low as possible to prevent overloading.

BC. OR BROADCAST ALIGNMENT: — With the generator leads still connected as in I. F. Alignment, rotate the tuning condenser to complete minimum capacity. Set the generator to 1730 KC. Adjust the BC. oscillator trimmer until the signal is tuned in. Next remove the hot lead of the generator from the "Ant" section of the gang condenser. Connect this lead to the antenna lead wire that projects from the back of the loop antenna through a 200 MMFD condenser. Set the generator to 1400 KC and rotate the tuning condenser until the signal is tuned in. Adjust the BC. antenna trimmer until a maximum reading is noted on the output meter. Set the generator to 600 KC and turn the tuning control until the signal is tuned in. Rock the tuning control back and forth slowly and at the same time adjust the 600 KC pad, slowly to the right or left until a maximum reading is noted on the output meter. It is advisable to return to the 1730 KC adjustment and re-check that setting to make sure it has not changed while padding at 600 KC.

S. W. OR SHORT WAVE ALIGNMENT: — Set the generator at 18.3 MC. Turn the receiver band switch to short band position. Turn the tuning condenser to complete minimum capacity. The generator leads should be connected to the antenna lead wire that projects from the back of the loop antenna through a 400 Ohm resistor. Adjust the S. W. oscillator trimmer slowly until the 18.3 MC signal is tuned in. At this point, it will be well to make sure that the fundamental signal is turned in. Turn up the generator output and tune the receiver to approximately 17.3 MC. At this point the 18.3 MC signal will be heard again but much weaker. This is the image frequency. If the image is not heard, then turn the tuning condenser back to complete minimum and readjust the S. W. oscillator trimmer. Remember, the image must always be heard (at 2 times the I. F. frequency in KC) lower the frequency than the fundamental signal. After the oscillator has been properly set, tune the signal generator to 16 MC and rotate the tuning control until the signal is tuned in. Adjust the S.W. antenna trimmer until a maximum reading is noted on the output meter. It is advisable to rock the gang slowly while adjusting the antenna trimmer. Set the generator to 6 MC and tune the signal in on the receiver. Check the alignment at this frequency. No adjustment should be necessary as the coils have been carefully checked before leaving the factory. A fixed oscillator padding condenser is used at 6 MC.

CONCORD RADIO CORP. MODELS 1-702, 1-704

In order to make a proper alignment, the following equipment is required:

1. A signal generator capable of providing a modulated radio frequency output over the frequencies required.
2. A suitable output meter or sensitive AC voltmeter with a .1 mfd series blocking condenser.
3. A coupling loop, made of three turns of stiff hookup wire, 4 inches in diameter, mounted on a suitable block of wood or stand.
4. A non-metallic screwdriver.

With the receiver on and the volume control at maximum, connect the signal generator to the coupling loop and bring the loop close to the receiver chassis. Adjust the signal generator output to minimum necessary to give a suitable indication on the output meter, which should be connected from B minus to the plate of one output tube. CAUTION: Make sure the output meter is isolated from DC by a series blocking condenser.

Tubes	Fourteen plus rectifier.
Speaker output impedance	500 ohms.
Antenna	Provisions for external long wire antenna for AM bands and a folded dipole (300-ohm) for FM band.
Tuning	Manual and mechanical push buttons. (Five channels for AM and five channels for FM.)
Tuning Range	(BC) 540kc - 1700 kc. (A) 15 mc - 18 mc. (B) 9 mc - 12 mc. (C) 5.8 mc - 18 mc. (FM) 88 mc - 108 mc.
I.F. (AM)	455 kc.
I.F. (FM)	10.7 mc.
Power Supply	105-125 V. 60 cycles A.C.
Power Consumption	180 watts.

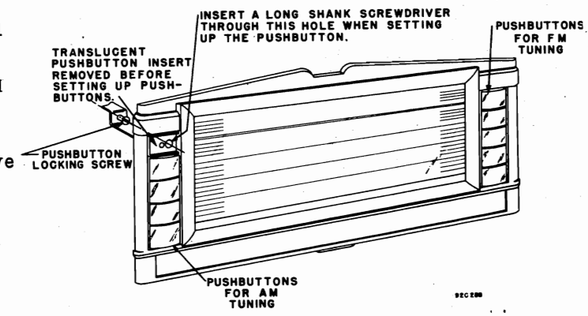

Fig. 1. View showing pushbutton setup.

BUTTON SETTING:

Note - Insulate the muting switch springs before setting the AM buttons.

1. Select any one pushbutton.
2. Pull translucent insert straight out.
3. Insert screw driver blade through large hole of pushbutton into slot of locking screw. (See Fig. 1).
4. Loosen locking screw about one-half turn. (Not more than one full turn.)
5. With pushbutton depressed, carefully tune in desired station with the manual control and tighten the locking screw.

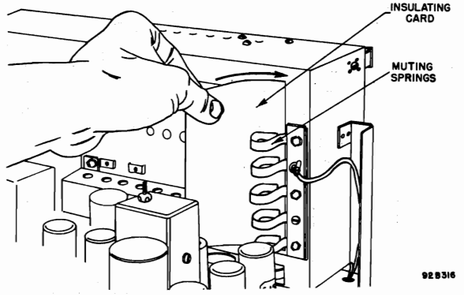

Fig. 3. Insulating the muting switch contacts

CONCORD RADIO CORP.

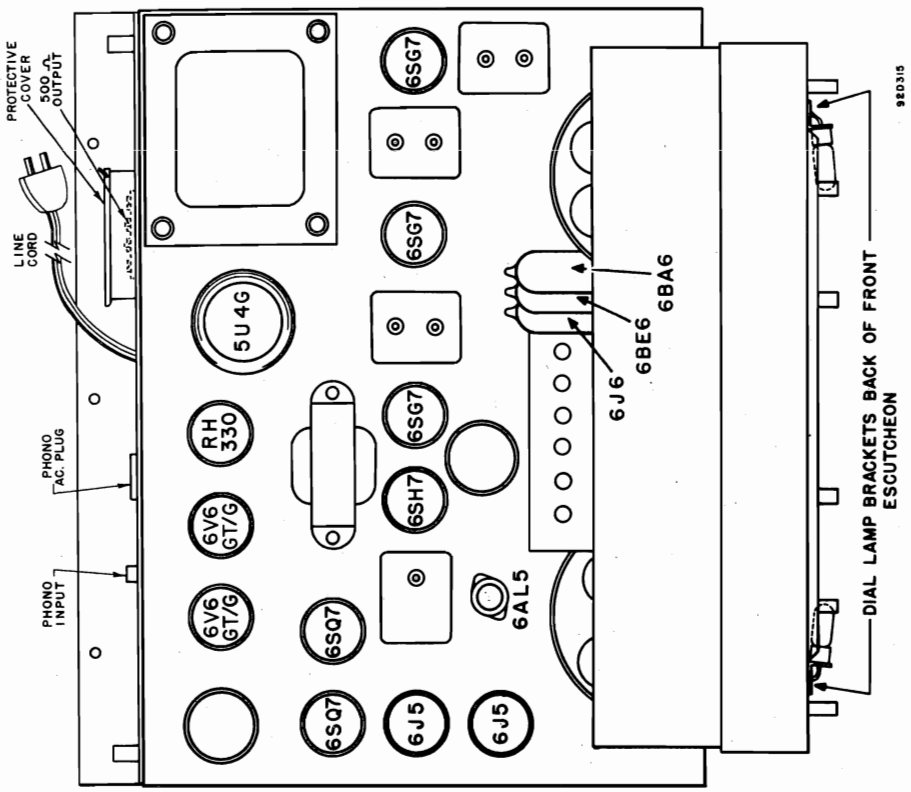

Fig. 10. Top view, location of tubes and dial lamps.

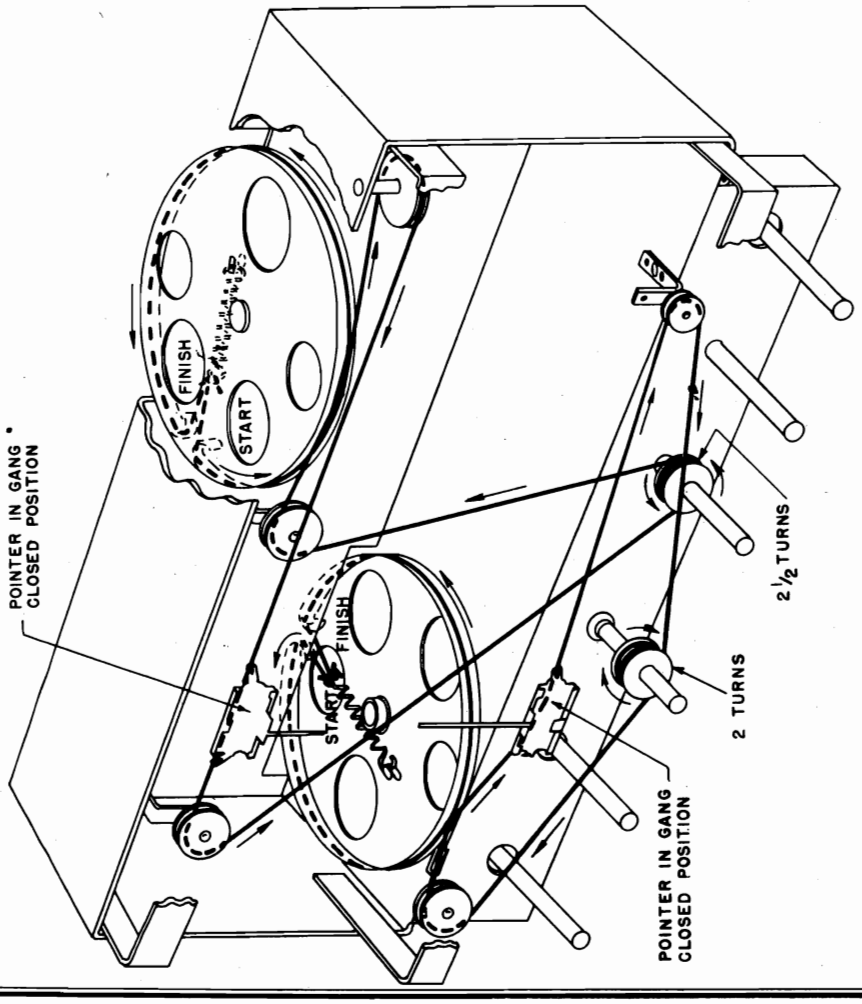

Fig. 9. Dial cable stringing procedure.

REPLACING DIAL LAMP:

Refer to Fig. 10 for location of the two pilot lamps. To gain access to the lamps remove the four front panel screws holding the panel to the cabinet and three chassis screws located under the cabinet. Pull the chassis clear of the cabinet. Unfasten and remove the knobs. Remove the four panel screws holding the panel to the chassis to release the panel exposing the pilot lamps for service. Replace pilot lamps with 6-8V. 150 ma. Mazda #47 equivalent.

ALIGNMENT PROCEDURE:

It will be necessary to remove the receiver chassis from the cabinet and remove the chassis bottom plate to gain access to some of the I. F. transformer iron core adjustments. See Fig. 5.

The receiver is equipped with AUTOMATIC FREQUENCY CONTROL on the "FM" band to compensate for mechanical variations in the push-button mechanism. Correction factor is approximately 5 times: "Take hold" characteristics are: "Before" 100 kc and "Release" before 450 kc at a 0.2 volt input signal.

The standard RMA dummy mentioned in the alignment chart consists of a 200 mmf condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.

ALIGNMENT PROCEDURE

Step	Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Band Switch Pos.	Radio Dial Setting	Adjust	Remarks
1	0.01 mfd cap.	To stator plates of center section of AM tuning cap.	455 kc	"BC"	1000 kc	S3, S6, S2, S5, S1 & S4	Adjust for max. output. TREBLE tone control set at No. 1.

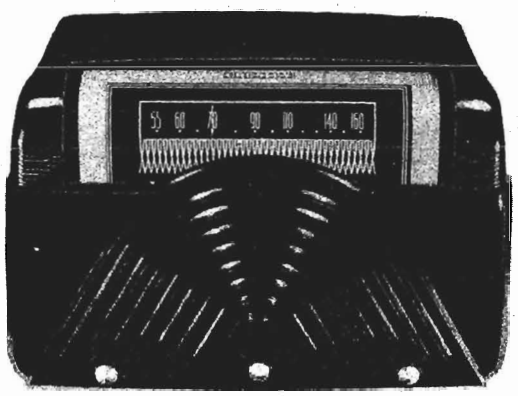
CROSLEY DIV.
AVCO MFG. CORP.

MODEL 9-101
Revised



DESCRIPTION

TYPE: Five-tube, single-band superheterodyne.

FREQUENCY RANGE: 540 to 1600 kc.

INTERMEDIATE FREQUENCY: 455 kc.

POWER SUPPLY: Crosley "A-B" Battery Pack, CR69.

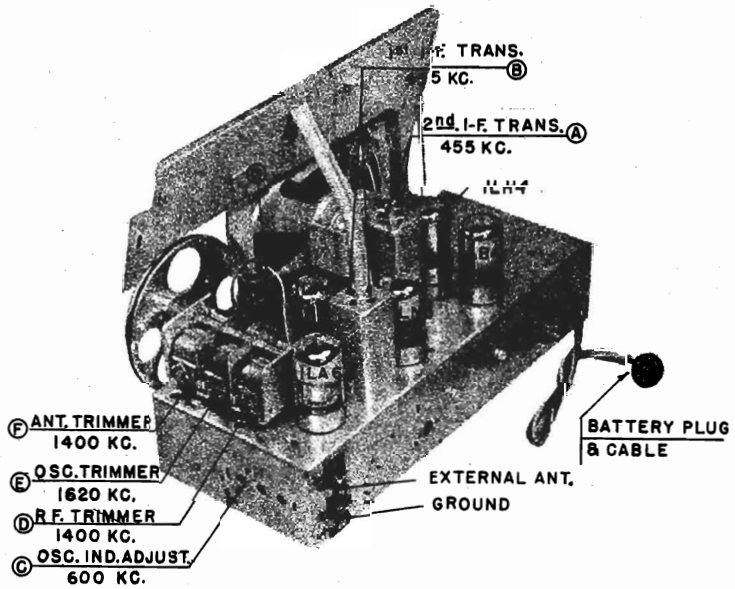
VOLTAGE RATING: 1½ v. "A"; 90 v. "B".

POWER OUTPUT: 175 mw. maximum.

TUBE COMPLEMENT:,

Type	Function
1LA6	Mixer
1LN5	I. F. Amplifier,
1LN5	R. F. Amplifier
1LH4	Detector, AVC 1st A. F. Amplifier
1LB4	A. F. Power Output

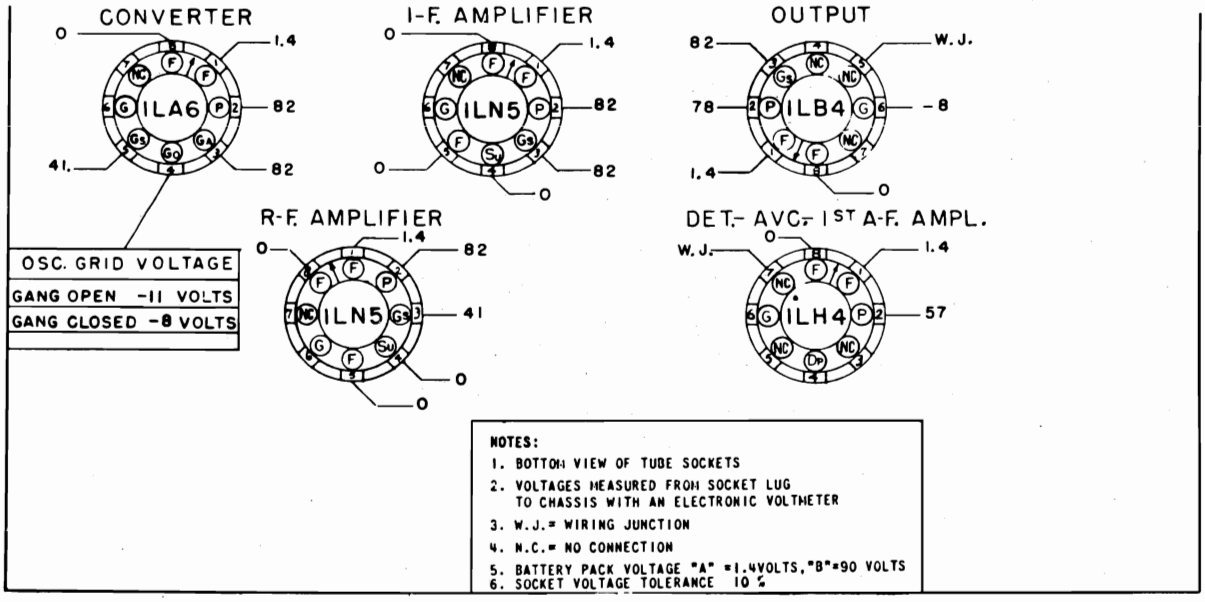
For satisfactory operation it is necessary that an antenna and ground be connected to this receiver.



CHASSIS REAR VIEW

MODEL 9-101
Revised

CROSLEY DIV.
AVCO MFG. CORP.



ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line at the end of the dial scale.

2. Connect the output meter across the speaker voice coil.

3. The r.f. signal input from the signal generator should be fed to the receiver as indicated in the alignment chart. Connect the low side (ground) of the signal generator to the chassis.

4. Turn the tone control to its treble position.

5. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.

ALIGNMENT CHART

Alignment adjustment locations are shown on page 1, Chassis, Rear View.

Alignment Sequence	Signal Generator Output			Position of Dial Pointer or Var. Cond.	Adjust for Maximum Output	Remarks
	Frequency in kc.	In Series With	To			
1	455	.01 mfd.	R.F. Grid	Closed	A & B	
2	600	.01 mfd.	R.F. Grid	600 kc.	C	Preset "G" to ¼ turn from the closed position and "E" to ½ turn from its closed position.
3	1620	.01 mfd.	Ant.	Open	E	
4	1400	200 mmf.	Ant.	Tune to Signal	D & F	
5	600	200 mmf.	Ant.	Tune to Signal	C	Rock Gang.
6	Repeat steps 3, 4, and 5 until circuits align and dial tracks.					
7	Conclude alignment by repeating step 4.

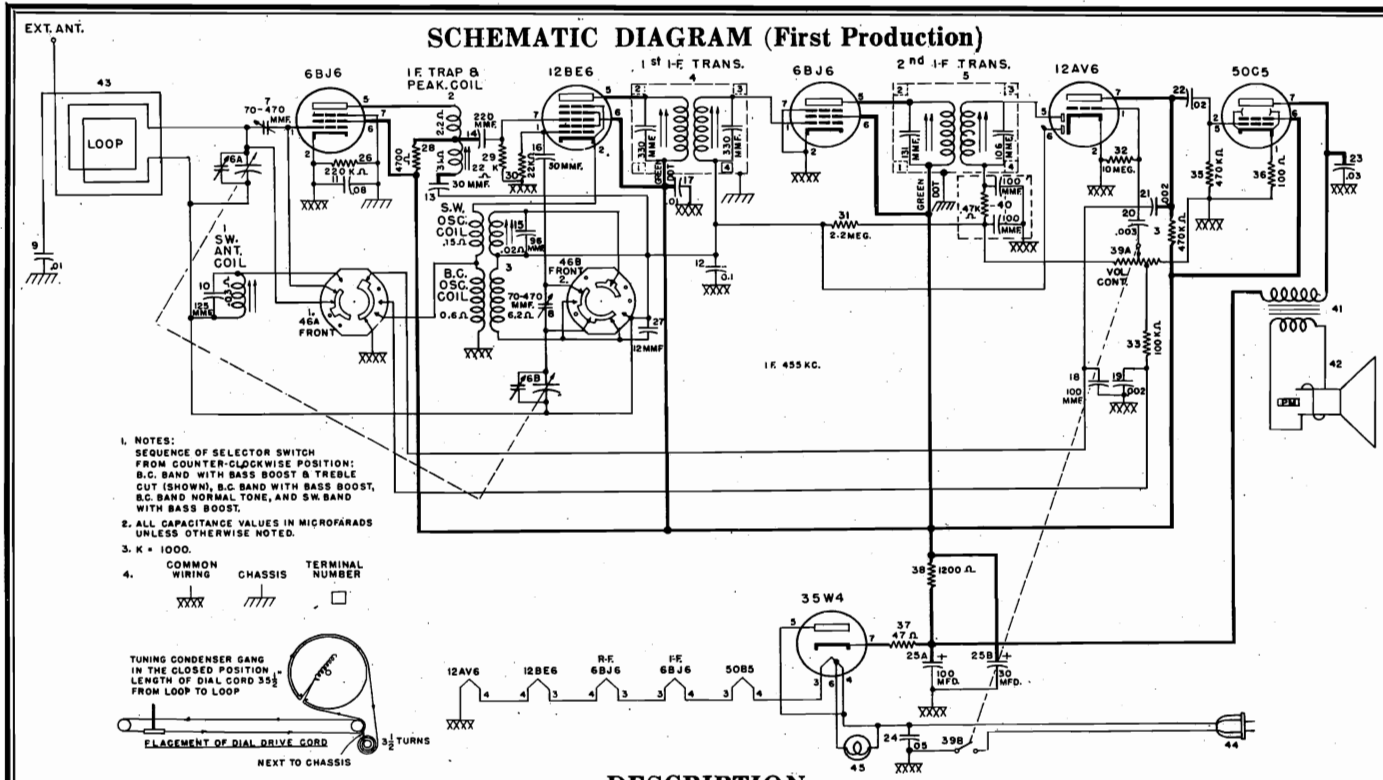
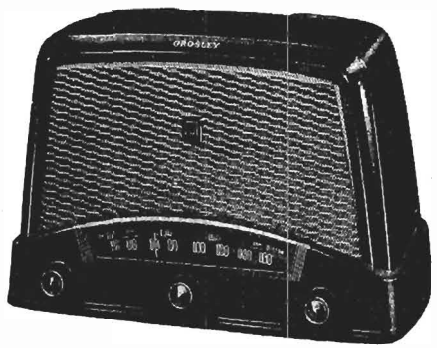
SCHEMATIC DIAGRAM (First Production)





9-105

DESCRIPTION

TYPE: Six-tube, two-band, superheterodyne.

FREQUENCY RANGE: Standard Broadcast Band, 540 to 1600 kc. (Selector Switch, Counter-clockwise or Left.)

Short-wave Band: 9.4 to 11.9 mc. (Selector Switch, Clockwise or Right.)

INTERMEDIATE FREQUENCY: 455 kc.

POWER SUPPLY: a.c.—d.c.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 30 watts nominal.

POWER OUTPUT: 1.5 watt maximum.

TUBE COMPLEMENT:

Type	Function
6BJ6	R.F. Amplifier
12BE6	Mixer
6BJ6	I.F. Amplifier
12AV6	Detector, AVC, 1st A.F. Amplifier
50C5	A.F. Power Output

AVCO MFG. CORP.

When using direct current it may be necessary to reverse the position of the power plug in the electric outlet for correct polarity.

Reversing the position of the power plug when alternating current is used may reduce power hum.

Under no circumstances should a ground be connected to this receiver.

ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line at the end of the dial scale.
2. Connect the output meter across the speaker voice coil.
3. The r.f. signal input from the signal generator should be connected to the external antenna lead. Connect the signal generator ground through a 0.1 mfd. condenser to B— (pin 2 on 6BJ6 tube socket, R.F. Amplifier).
4. Turn the volume control on full and turn the tone switch to maximum treble position; then adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.

ALIGNMENT CHART

Alignment Adjustment Locations are shown on page 1, Chassis, Top View and on page 3, Socket Voltage Chart.

Alignment Sequence	Signal Generator Output			Position of		Adjust for Maximum Output
	Frequency	In Series with	To	Band Switch	Tuning Dial or Tuning Cond.

†3	455 kc	200 mmf.	Ant.	BC	Open	E
4	1620 kc	200 mmf.	Ant.	BC	Open 1620	F
5	1400 kc	200 mmf.	Ant.	BC	Tune in Signal	G
6	12.1 mc	400 ohm	Ant.	SW	Open	H
7	9.4 mc	400 ohm	Ant.	SW	Closed	J
	Repeat adjustments 6 and 7 until circuits align.					
△8	11.8 mc	400 ohm	Ant.	SW	Tune in Signal	K
9	9.6 mc	400 ohm	Ant.	SW	Tune in Signal	L
	Repeat adjustments 6 and 7 until circuits align.					

NOTES:

*I-F Trap Core "E" must be turned counter-clockwise, to stop, before adjusting A, B, C, and D.

†Adjust for minimum signal.—Before making alignment adjustments E through K, the chassis bottom should be in place, and the antenna loop should be moved as far from the chassis as the loop bracket will permit.

△Adjustments K and L must be made while rocking the tuning condenser.

DESCRIPTION

TYPE: Nine tube, two-band superheterodyne.

FREQUENCY RANGE: Standard Broadcast Band:
540 to 1600 kc. (Selector switch at AM position).

FREQUENCY MODULATION BAND: 88 to 108 mc.
Channels 201 to 300.
(Selector switch at FM position).

INTERMEDIATE FREQUENCY: AM Band: 455 kc. FM Band: 10.7 mc.

POWER SUPPLY: 60 cycle a. c.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 90 watts.
20 watts additional for record changer.

POWER OUTPUT: 7 watts maximum.

MODELS 9-204, 9-205M

CROSLEY DIV.
AVCO MFG. CORP.

ALIGNMENT CHART I NOTES (SCOPE METHOD)

1. Align for peak on output meter.
2. Connect two 100,000 ohm resistors in series and connect these resistors from the No. 2 lug of the 6AL5 to the chassis. Connect an electronic voltmeter from the center of these resistors to the shielded lead junction of the 39,000 ohm resistor (75) and the .002 mfd. condenser, (33). Adjust the ratio detector transformer secondary (C) for zero volts on the electronic voltmeter. Remove the two 100,000 ohm resistors.
3. Connect the electronic voltmeter across the 27,000 ohm load resistor (93) and adjust primary of core (D) of the ratio detector transformer (8) for maximum DC output.
4. Connect output of marker generator across sweep generator output. Connect CRO across the 22,000 ohm resistor (72) in the grid circuit of the second I.F. amplifier.
5. CRO connections same as note 4.
6. For dummy antenna see figure 1.
7. Rock gang condenser if necessary while making adjustment.
8. Tune in signal and adjust for greatest sensitivity by forming FM.—R.F. coil.
9. Connect CRO in series with 100,000 ohm resistor to grid (pin 4) of R.F. amplifier and chassis. Remove 7F8 oscillator tube. Connect output of marker generator across output of sweep generator. Adjust (L-M) until pattern and markers approximate figure in alignment chart.

9a. Shunt primary of FM antenna transformer with a 10 ohm carbon resistor and adjust (M) for maximum output. Remove shunt and place it across FM antenna transformer secondary and adjust (L) for maximum output. Remove shunt.

10. Connect BC. dummy loop (Fig. 2) across loop terminals on rear of chassis.

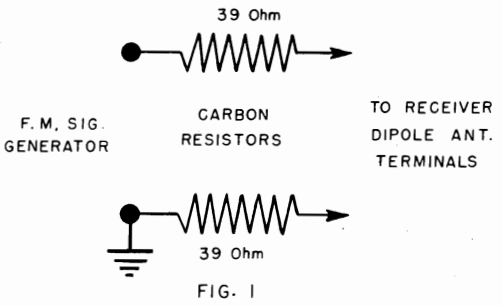

FIG. 1

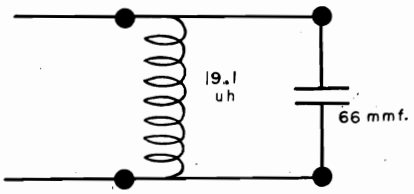

FIG. 2

ALIGNMENT CHART II NOTES

1. Use an unmodulated signal generator, with approximately 100,000 mv. output.
2. Connect two 100,000 ohm resistors in series and connect these resistors from the No. 2 lug of the 6AL5 to the chassis. Connect an electronic voltmeter from the center of these resistors to the shielded lead junction of the 39,000 ohm resistor (75) and the .002 mfd. condenser, (33). Adjust the ratio detector transformer secondary (C) for zero volts on the electronic voltmeter. Remove the two 100,000 ohm resistors.
3. Connect the electronic voltmeter across the 27,000 ohm load resistor (93) and adjust the primary of the core (D) of the ratio detector transformer (8) for maximum DC output.
4. Limit output of signal generator so that the reading on the electronic voltmeter will not exceed 4 volts.
5. Shunt the FM antenna transformer primary with a 10 ohm carbon resistor, and adjust the FM antenna secondary trimmer (M) for maximum output meter reading. Transfer the 10 ohm shunt to the secondary of FM antenna transformer. Adjust FM antenna primary trimmer (L) for maximum output meter reading. Remove the 10 ohm shunt resistor.
6. Connect the BC dummy loop antenna across the loop terminals on the rear of the chassis (see Figure 2,

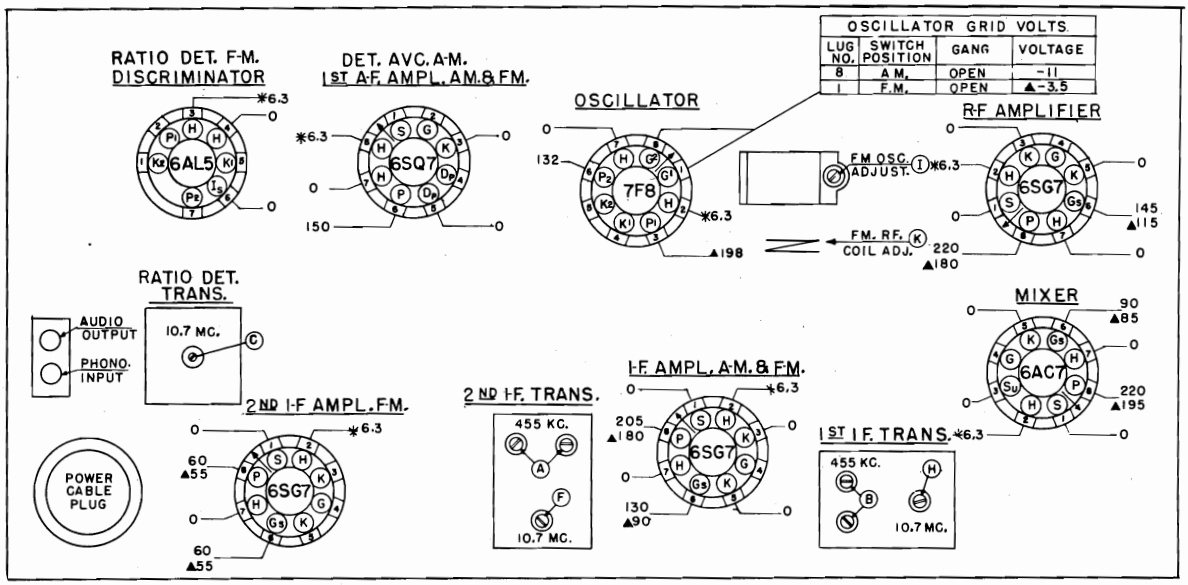
RECEIVER SOCKET VOLTAGE CHART



MODELS 9-204, 9-205M

CROSLEY DIV. AVCO MFG. CORP.
ALIGNMENT PROCEDURE

1. This receiver has been aligned at the factory for best performance, and no attempt should be made to re-align it unless the proper test equipment is available.
2. Turn the tuning condenser to full mesh, against stop, and set the dial pointer at the edge of the clear section of the dial, left of "55."
3. Connect an output meter across the voice coil of the speaker (3.2 ohms).
4. Turn the volume control knob to maximum clockwise position and adjust the signal generator output to produce a noticeable output meter reading. Keep the signal generator output as low as possible to prevent excessive AVC action in the receiver.
5. Feed an R.F. amplitude modulated signal modulated 30% at 400 cycle to the receiver as indicated in the alignment procedure chart. Connect signal generator ground terminal to the chassis of the receiver. When F.M. generator is used, a 30% modulated signal is equal to a deviation of 22.5 kc.
6. Tone control is to be set for maximum treble response.
7. When aligning the broadcast band, the build-in loop antenna or a suitable dummy antenna, consisting of a coil with 19.1 u h. inductance shunted with a 66 mmf. capacitor must be used.
8. While aligning the set, the shorting link on the antenna terminal strip should be removed. After alignment replace the link, unless an external antenna is to be used.

Cross index between frequency calibrations in megacycles on the dial and channel numbers follow:

MEGACYCLES TO CHANNEL NUMBERS

Frequency in Megacycles	Channel No.
87.9	200
88.9	205
89.9	210
90.9	215
91.9	220
92.9	225
93.9	230
94.9	235
95.9	240
96.9	245
97.9	250
98.9	255
99.9	260
100.9	265
101.9	270
102.9	275
103.9	280
104.9	285
105.9	290
106.9	295
107.9	300

To find the frequency in megacycles for CHANNEL NUMBERS between those given above, add .2 megacycle for every whole number added to the CHANNEL NUMBER; for example channel 204 would be 88.7 megacycles and 251 would be 98.1 megacycles.

ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line at the low frequency end of the dial scale.
2. Turn the selector switch to radio position (extreme left).
3. Connect the output meter across the speaker voice coil.
4. The r.f. signal input from the signal generator should be connected through a condenser as indicated in the alignment chart. Connect the signal generator ground to the receiver chassis.

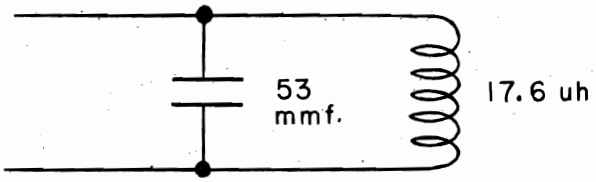

Fig. 1

5. Turn the volume control on full and adjust the signal generator output to produce approximately midscale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.
6. Loop antenna must remain connected at all times or replaced by dummy antenna consisting of a coil with 17.6 uh inductance shunted with a 53 mmf. condenser. See Fig. 1.

DESCRIPTION

TYPE: Six-tube, single band, superheterodyne.

FREQUENCY RANGE: 540 to 1600 kc.

INTERMEDIATE FREQUENCY: 455 kc.

POWER SUPPLY: 60 cycle a. c. only

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 50 watts nominal.
Phono 20 watts additional.

POWER OUTPUT: 2.5 watts maximum

TUBE COMPLEMENT:

TYPE	FUNCTION
7A7	R. F. Amplifier
7Q7	Converter
7A7	I. F. Amplifier
7B6	Detector, AVC, 1st A. F. Amplifier
7B5	A. F. Power Output
5AZ4	Rectifier

SOCKET VOLTAGE CHART

Using 50C5 tube

When using direct current it may be necessary to reverse the position of the power plug in the electric outlet for correct polarity.

Reversing the position of the power plug when alternating current is used may reduce power hum.

Under no circumstances should a ground be connected to this receiver.

ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line at the end of the dial scale.

2. Connect the output meter across the speaker voice coil.

3. The r. f. signal input from the signal generator should be connected to the external antenna clip. Connect the signal generator ground through a 0.1 mfd. condenser to B—(pin 7 on 12BA6 tube socket).

4. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.

ALIGNMENT CHART

Alignment Sequence	Signal Generator Output			Position of Dial Pointer or Tuning Gang	Adjust for Maximum Output
	Frequency in kc.	In Series with	To

DESCRIPTION

TYPE: Eleven tube, two-band superheterodyne.
FREQUENCY RANGE: Standard Broadcast Band:
540 to 1600 kc. (Selector switch at AM position).
FREQUENCY MODULATION BAND: 88 to 108 mc.
Channels 201 to 300.
(Selector switch at FM position).
INTERMEDIATE FREQUENCY: AM Band: 455 kc. FM Band: 10.7 mc.
POWER SUPPLY: 60 cycle a. c.
VOLTAGE RATING: 105-125 volts.
POWER CONSUMPTION: 90 watts.
20 watts additional for record changer.
POWER OUTPUT: 7 watts maximum.

TUBE COMPLEMENT

Type	Function
6SG7	R.F. Amplifier
7F8	Oscillator
6AC7	Mixer
6SG7	I.F. Amp., A.M. & F.M.
6SG7	2nd I.F. Amp. F.M.
6AL5	Ratio Det. F.M.
6SQ7	Det.—AVC. A.M. 1st A.F. Amp., A.M. & F.M.
6SQ7	Phase Inverter
6V6GT/G (2)	Push Pull Output
5Y3GT/G	Rectifier

DIAL BULBS: Type 47, 6.3 v., .15 amp.

NOTE:
Model 9-214M uses Model 700F automatic record changer (Part No. 144489).
See service sheet No. 364 for service information and parts list.
Model 9-214ML uses Model 700FLP automatic record changer (Part No. 145113).
See Service Bulletin No. 375 for service information and parts list.

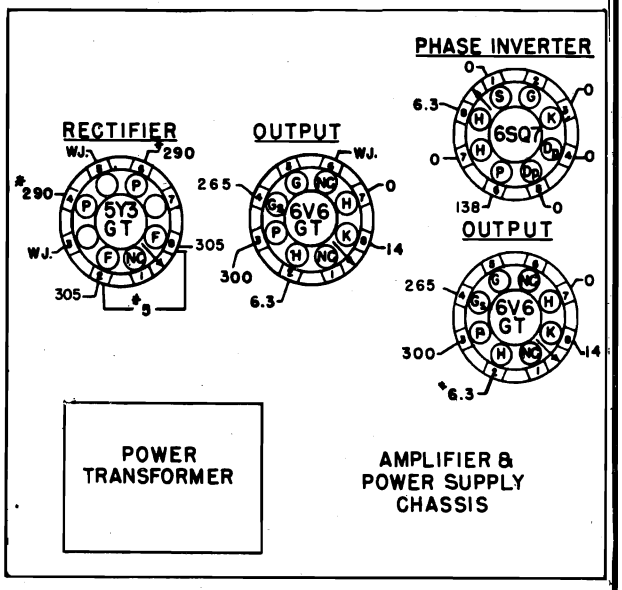
POWER SUPPLY AND AMPLIFIER CHASSIS,



ALIGNMENT PROCEDURE

NOTE:
This receiver has been aligned at the factory for best performance, and no attempt should be made to re-align it unless the proper test equipment is available.

1. Turn the tuning condenser to full mesh, against stop, and set the dial pointer at the edge of the clear section of the dial, left of "55."
2. Connect an output meter across the voice coil of the speaker (3.2 ohms).
3. Feed an R.F. amplitude modulated signal modulated 30% at 400 cycles to the receiver as indicated in the alignment procedure chart. Connect signal generator ground terminal to the chassis of the receiver. When F.M. generator is used, a 30% modulated signal is equal to a deviation of 22.5 kc.
4. Turn the volume control knob to maximum clockwise position and adjust the signal generator output to produce a noticeable output meter reading. Keep the signal generator output as low as possible to prevent excessive AVC action in the receiver.
5. Set the tone control for maximum treble response.
6. When aligning the broadcast band, the built-in loop antenna or a suitable dummy antenna, consisting of a coil with 19.1 u h. inductance shunted with a 66 mmf. capacitor must be used.
7. While aligning the set, the shorting link on the antenna terminal strip should be removed. After alignment replace the link, unless an external antenna is to be used.

13	AM-RF Gen. 1400 KC	200 mmf.	BC Ant. Term. and ground	AM	1400 KC	P & Q		Note 1 & Note 10

NOTES:

1. Align for peak on output meter.
2. Connect two 100,000 ohm resistors in series and connect these resistors from the No. 2 lug of the 6AL5 tube socket to the chassis. Connect an electronic voltmeter from the center of these resistors to the shielded lead junction of the 39,000 ohm resistor (75) and the .002 mfd capacitor, (33). Adjust the ratio detector transformer secondary (C) for zero volts on the electronic voltmeter. Remove the two 100,000 ohm resistors.
3. Connect the electronic voltmeter across the 27,000 ohm load resistor (93) and adjust primary of core (D) of the ratio detector transformer (8) for maximum D.C. output.
4. Connect output of marker generator across sweep generator output. Connect CRO across the 22,000 ohm resistor (72) in the grid circuit of the second I.F. amplifier.
5. CRO connections same as note 4.
6. For dummy antenna see figure 1.
7. Rock gang capacitor if necessary while making adjustment.
8. Tune in signal and adjust for greatest sensitivity by forming FM.—R.F. coil.
9. Connect CRO in series with 100,000 ohm resistor to grid (pin 4) of R.F. amplifier and chassis. Remove 7F8 oscillator tube. Connect output of marker generator across output of sweep generator. Adjust (L-M) until pattern and markers approximate figure in alignment chart.

9a. Shunt primary of FM antenna transformer with a 10 ohm carbon resistor and adjust (M) for maximum output. Remove shunt and place it across FM antenna transformer secondary and adjust (L) for maximum output. Remove shunt.

10. Connect BC. dummy loop (Fig. 2) across loop terminals on rear of chassis.

ALIGNMENT CHART II

(Using output meter and electronic voltmeter)

Alignment Sequence	Signal Gen. Output		To	Position of		Adjust	Remarks
	Frequency	In Series With		Range Switch	Tuning Dial or Tun. Cap.		
1	455 KC	.01 mfd.	1st I.F. grid	AM	Gang open	A	Align for peak on output meter.
2	455 KC	.01 mfd.	Stator 21 plate sect. rear of gang	AM	Gang open	B	Align for peak on output meter.
3	10.7 MC	1000 mmf.	2nd I.F. grid	FM	Gang closed	C	Adjust for zero volts on electronic voltmeter Note 1 & 2.
4	10.7 MC	1000 mmf.	2nd I.F. grid	FM	Gang closed	D	Adjust for max. D.C. output on Elect. voltmeter Note 3.
5	10.7 MC	1000 mmf.	1st I.F. grid	FM	Gang closed	E & F	Adjust for max. D.C. output Note 4.
6	10.7 MC	1000 mmf.	Stator 3 plate sect. rear of gang	FM	Gang closed	G & H	Adjust for max. D.C. output Note 4.
	Repeat steps 3 and 4, 5 and 6 if necessary.						
7	98 MC	FM dummy antenna	Dipole Ant. Terminals	FM	98 MC	I	Adjust for max. reading on output meter.
8	104 MC	FM dummy antenna	Dipole Ant. Terminals	FM	104 MC	J	Adjust for max. reading on output meter, rock gang if necessary while making adjustments.
9	92 MC	FM dummy antenna	Dipole Ant. Terminals	FM	92 MC	K	Adjust for max. sensitivity, the inductance of FM.RF. coil "K" by forming.
	Repeat steps 8 and 9 until no further improvement in sensitivity is noted.						
10	98 MC	FM dummy antenna	Dipole Ant. Terminals	FM	98 MC	L & M	See Note 5.
11	AM-RF Gen. 1400 KC	200 mmf.	BC Ant. Term.	AM	1400 KC	N	See Note 6.
12	AM-RF Gen. 1400 KC	200 mmf.	BC Ant. Term. and ground	AM	1400 KC	P & Q	Note 6. Adj. for max. reading on output meter.

NOTES:

1. Use an unmodulated signal generator, with approximately 100,000 mv. output.
2. Connect two 100,000 ohm resistors in series and connect these resistors from the No. 2 lug of the 6AL5 to the chassis. Connect an electronic voltmeter from the center of these resistors to the shielded lead junction of the 39,000 ohm resistor (75) and the .002 mfd. capacitor, (33). Adjust the ratio detector transformer secondary (C) for zero volts on the electronic voltmeter. Remove the two 100,000 ohm resistors.
3. Connect the electronic voltmeter across the 27,000 ohm load resistor (93) and adjust the primary of the core (D) of the ratio detector transformer (8) for maximum D. C. output.
4. Limit output of signal generator so that the reading on the electronic voltmeter will not exceed 4 volts.
5. Shunt the FM antenna transformer primary with a 10 ohm carbon resistor, and adjust the FM antenna secondary trimmer (M) for maximum output meter reading. Transfer the 10 ohm shunt to the secondary of FM antenna transformer. Adjust FM antenna primary trimmer (L) for maximum output meter reading. Remove the 10 ohm shunt resistor.
6. Connect the BC dummy loop antenna across the loop terminals on the rear of the chassis (see Figure 2,

MEGACYCLES TO CHANNEL NUMBERS

Cross index between frequency calibrations in megacycles on the dial and channel numbers follow:

Frequency in Megacycles	Channel No.	Frequency in Megacycles	Channel No.
87.9	200	98.9	255
88.9	205	99.9	260
89.9	210	100.9	265
90.9	215	101.9	270
91.9	220	102.9	275
92.9	225	103.9	280
93.9	230	104.9	285
94.9	235	105.9	290
95.9	240	106.9	295
96.9	245	107.9	300
97.9	250		

To find the frequency in megacycles for CHANNEL NUMBERS between those given above, add .2 megacycle for every whole number added to the CHANNEL NUMBER; for example channel 204 would be 88.7 megacycles and 251 would be 98.1 megacycles.

ALIGNMENT PROCEDURE

1. Turn the tuning capacitor to the completely closed position against the stop, and set the dial pointer to the reference line at the end of the dial scale.
2. Turn the tone control to the high or treble position.
3. Connect the output meter across the speaker voice coil.
4. The r. f. signal input from the signal generator should be connected to the external antenna post. Connect the signal generator ground to the chassis.
5. Turn the volume control on full, and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.
6. Loop antenna must be connected when making alignments.

ALIGNMENT CHART

Alignment Sequence	Signal Generator Output			Position of		Adjust for Maximum Output
	Frequency in k c.	In Series with	To	Band Switch	Tuning Dial	
1	455	200 mmf.	Ant.	M	1650 KC	A & B
2	455	200 mmf.	Ant.	M	1650 KC	C*
3	15,500	400 ohms	Ant.	S	15.5 MC	D
4	15,000	400 ohms	Ant.	S	20 M	E
5	1650	200 mmf.	Ant.	M	1650 KC	F
6	1400	200 mmf.	Ant.	M	1400 KC	G
7	600	200 mmf.	Ant.	M	500 M	H
*8	1400	200 mmf.	Ant.	M	1400 KC	Recheck G

*Adjust for minimum output (wavetrap). Reversing the position of the power plug may reduce power hum.

NOTE: When aligning the short-wave oscillator trimmer (D), be sure that the circuit is aligned at the correct frequency and not at the image frequency which is 910 kilocycles lower as indicated by the receiver dial. To check: Tune in the generator frequency, then increase the generator output and tune in the image frequency. The image frequency should be weaker than the fundamental and audible 910 kilocycles lower on the receiver dial. If the image cannot be tuned in, the oscillator trimmer is adjusted to the wrong peak. The correct peak is the second one heard as the trimmer adjustment screw is opened from the completely closed position.

SOCKET VOLTAGE CHART

MODELS 68CP, 68CR

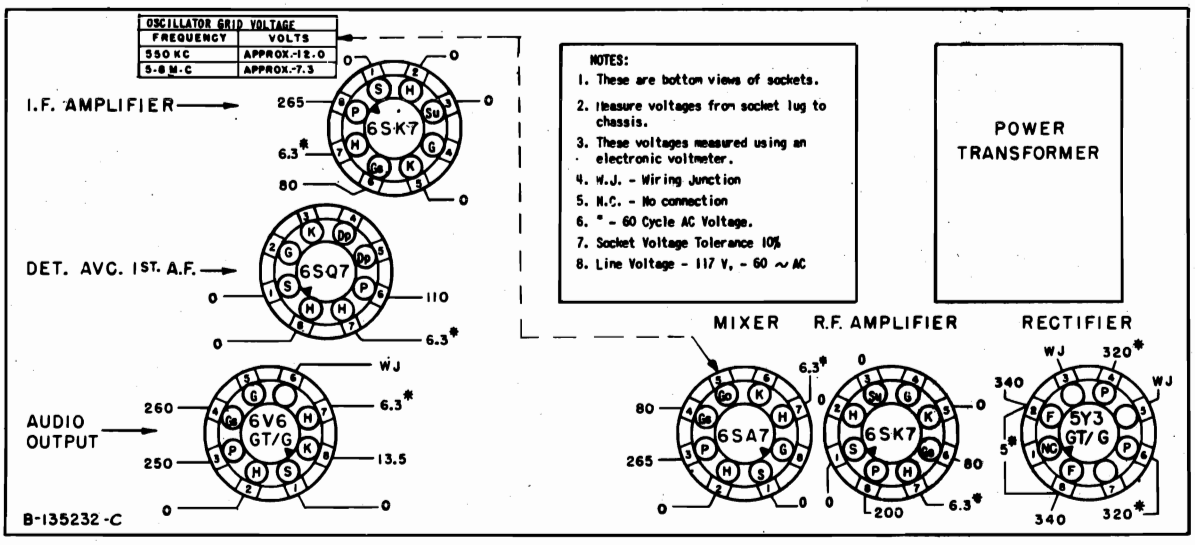
SOCKET VOLTAGE CHART



ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the notch at the right-hand end of the dial background.
2. Connect the output meter across the speaker voice coil and turn tone control to the treble position.
3. The r. f. signal input from the signal generator should be connected to the external antenna post as indicated in the alignment chart. Connect the low side (ground) of the signal generator to the chassis.
4. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain the signal generator output as low as possible to prevent AVC action in the receiver.

NOTE: The signal web antenna must remain connected at all times. If the receiver is removed from cabinet, use a suitable dummy antenna of 4 uh.

ALIGNMENT CHART

Alignment adjustment locations are shown on Chassis, Rear View

Alignment Sequence	Signal Generator Output			Position of		Adjust for Maximum Output
	Frequency	In Series With	To	Band Switch	Variable Condenser	
1	455 kc.	200 mmf.	Ant.	BC	Open	A & B
2	455 kc.	200 mmf.	Ant.	BC	Open	C*
3	15.3 mc.	400 ohms	Ant.	SW	Open	D
4	15 mc.	400 ohms	Ant.	SW	To 15 mc. Signal	E
5	1620 kc.	200 mmf.	Ant.	BC	Open	F
6	1400 kc.	200 mmf.	Ant.	BC	To 1400 kc. Signal	G
7	600 kc.	200 mmf.	Ant.	BC	To 600 kc. Signal	H
8	1400 kc.	200 mmf.	Ant.	BC	To 1400 kc. Signal	Recheck G

*Adjust for Minimum Output (Wave Trap).

NOTE: When aligning the short-wave oscillator trimmer (D), be sure that the circuit is aligned at the correct frequency and not at the image frequency which is 910 kilocycles lower as indicated by the receiver dial. To check: tune in the generator frequency, then increase the generator output and tune in the image frequency. The image frequency should be weaker than the fundamental and audible 910 kilocycles lower on the receiver dial. If the image cannot be tuned in, the oscillator trimmer is adjusted to the wrong peak. The correct peak is the second peak of the trimmer from the closed position.

MODELS 68TA, 68TW

CROSLEY DIV. AVCO MFG. CORP.

ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line at the low frequency end of the dial scale.
2. Turn the tone control to the treble (clockwise) position.
3. Connect the output meter across the speaker voice coil.
4. The r. f. signal input from the signal generator should be connected through a condenser as indicated in the alignment chart. Connect the signal generator ground to the receiver chassis.
5. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.
6. Loop antenna must remain connected at all times.

ALIGNMENT CHART

Alignment adjustments are shown in "CHASSIS, SIDE VIEW,"

Alignment Sequence	Signal Generator Output			Position of Tuning Dial or Var. Cond.	Adjust for Maximum Output
	Frequency in KC	In Series with	To		
1	455	.05 mfd.	Pin 6 7Q7	open	A & B

5	1400	4mmf.	Top Ant. Clip	1400	Rock var. cond. and repeat 3 & 4

DESCRIPTION

TYPE: Six-tube, single band, superheterodyne.

FREQUENCY RANGE: 540 to 1600 kc.

INTERMEDIATE FREQUENCY: 455 kc.

POWER SUPPLY: 60 cycle a. c. only

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 50 watts nominal.

POWER OUTPUT: 2.5 watts maximum

CROSLEY DIV.
AVCO MFG. CORP.

ALIGNMENT PROCEDURE NOTES

1. Sweep alignment (use approximately 500 kc. to sweep).
2. Sweep Generator Output .1 to 1 Volt RMS.
3. Scope connected to center terminal on phono switch.
4. Align for maximum peak amplitude. Peak separation should be 150 to 200 kc.
5. Scope connected to center terminal of 3rd I.F. through 200,000 ohms.
6. Repeat operations 8 and 9 until no charge can be noted in sensitivity.
7. Rock gang.
8. When aligning the shortwave oscillator trimmer, make certain the circuit is aligned at the correct frequency and not at the image frequency which is 910 kilocycles lower in frequency as indicated on the receiver dial. To check, tune in signal generator frequency, then increase the generator output and tune in the image frequency which should be audible, but weaker than the fundamental frequency. If the image can not be tuned in, the oscillator trimmer is adjusted to the wrong peak. The correct peak is the second peak of the trimmer from the closed position.

CIRCUIT

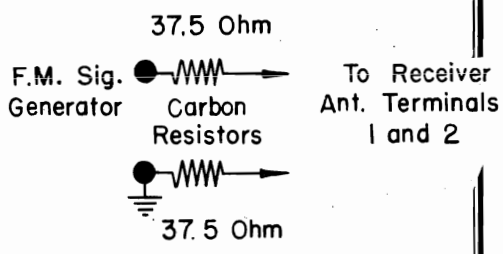

FIG. 1

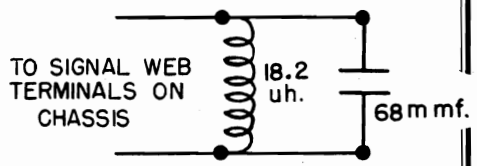

FIG. 2

MEGACYCLES TO CHANNEL NUMBERS

Cross index between frequency calibrations in megacycles on the dial and channel numbers follow:

Frequency in Megacycles	Channel No.	Frequency in Megacycles	Channel No.
87.9	200	98.9	255
88.9	205	99.9	260
89.9	210	100.9	265
90.9	215	101.9	270
91.9	220	102.9	275
92.9	225	103.9	280
93.9	230	104.9	285
94.9	235	105.9	290
95.9	240	106.9	295
96.9	245	107.9	300
97.9	250		

To find the frequency in megacycles for CHANNEL NUMBERS between those given above, add .2 megacycle for every whole number added to the CHANNEL NUMBER; for example Channel 204 would be 88.7 megacycles and 251 would be 98.1 megacycles.

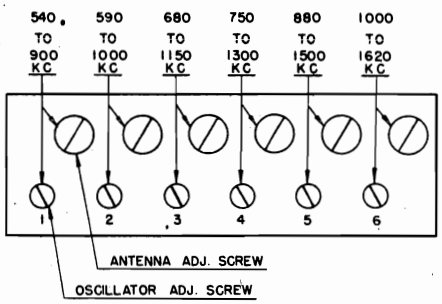
MODELS 148CP, 148CP(W), 148CQ, 148CR

PUSH BUTTON ADJUSTMENT PROCEDURE

Each of the six push buttons, for automatic tuning, has two adjusting screws by which it may be set to any nearby American broadcast station whose frequency in kilocycles is within the kilocycle range covered by that button. To gain access to these screws, carefully pull off the push button. To set No. 1 push button to a desired position, proceed as follows:



1. Turn the ANTENNA ADJ. SCREW clockwise until moderately tight, then turn the OSCILLATOR ADJ. SCREW counterclockwise until the threaded portion extends approximately ¾ inch. **Use a small screw-driver and do not exert pressure.**
2. Turn the band selector switch to the "AM" position and manually tune in the station to which the push button is to be set. The frequency of the station selected must be between 540 and 900 kilocycles. Carefully adjust the tuning control to the point of clearest reception.
3. Turn the band selector switch to the "AUTO" position and slowly turn the OSCILLATOR ADJ. SCREW clockwise until the same station is heard. Adjust the screw for maximum volume.
4. Adjust the ANTENNA ADJ. SCREW for maximum volume.
5. Turn the band selector switch from "AUTO" to "AM" and back again to check if the adjustment has been correctly made. There should be no change in tone quality when switched from one to the other.
6. Place the tab with the call letters of the station, to which the push button has been set, in a celluloid "V" and slide it into the button from the side.
7. The remaining push buttons may be set in a similar manner. No adjustment of master tone control push buttons is required.

ALIGNMENT PROCEDURE

1. This receiver has been aligned at the factory for best performance, and no attempt should be made to re-align it unless the proper test equipment is available.
2. Turn the tuning condenser to full mesh, against stop, and set the dial pointer to the reference line at the end of the dial scale.
3. Release all tone control buttons to the out position.
4. Connect the output meter across the speaker voice coil (3.2 ohms).
5. Feed an R. F. amplitude modulated signal modulated 30% at 400 cycle to the receiver as indicated in the alignment procedure chart. Connect signal generator ground terminal to the chassis of the receiver. When F. M. generator is used, a 30% modulated signal is equal to a deviation of 22.5 kc.
6. Turn the volume control knob to maximum clockwise position and adjust the signal generator output to produce a noticeable output meter reading. Keep signal generator output as low as possible to prevent excessive AVC action in the receiver.
7. The low impedence "Signal Web" antenna should remain connected at all times. If the chassis is removed from cabinet, use a dummy antenna consisting of a 18.2 u.h. coil in parallel with a 68 mmf. capacitor
8. The link must be connected in external antenna position.

MODELS 148CP, 148CP(W), 148CQ, 148CR

DESCRIPTION

TYPE: Fourteen tube, four-band superheterodyne.

FREQUENCY RANGE: American Broadcast Band: 535 to 1620 kc. (Selector switch at AM position).

Police Band: 2.25 to 6.7 mc. (Selector switch at POLICE position).

Short-wave Band: 6.7 to 18.5 mc. (Selector switch at SW position).

Frequency Modulation Band: 88.1 to 107.9 mc. (Selector switch at FM position).

INTERMEDIATE FREQUENCY: AM, Police and SW Bands: 455 kc. FM Band: 10.7 mc.

POWER SUPPLY: 60 cycle a.c. only

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 120 watts.

POWER OUTPUT: 18 watts maximum.

RECORD CHANGERS:
For 148CP, V-M Model 400, RCD.CH 15-1; for 148CP(W) and 148CR, Webster Model 156, RCD.CH. 19-1; for 148CQ, Webster 56, RCD.CH. 15-10.

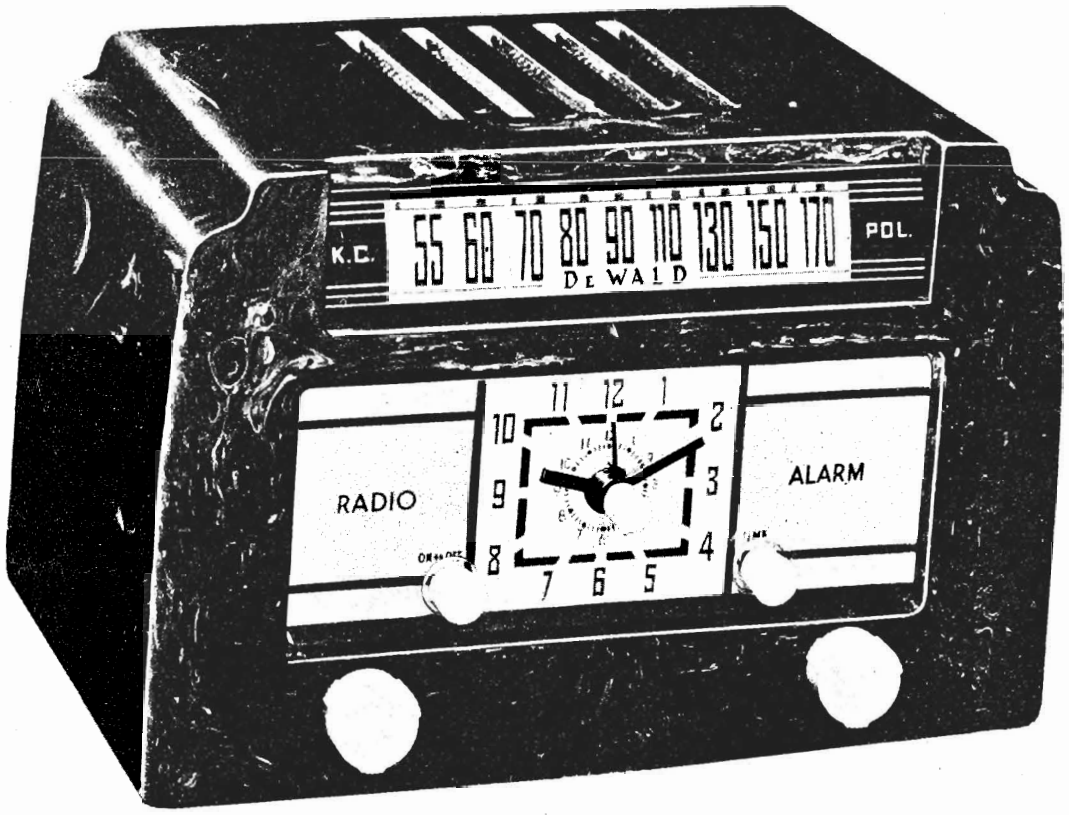
DEWALD RADIO MODEL B-512



TO TURN RADIO ON AUTOMATICALLY:

Tune radio to station and volume desired. With timer switch set at "ON" press in "center" knob and turn until setting hand is at desired time. This operation turns radio off, but it will automatically turn on at the time set.

TO TURN RADIO OFF AUTOMATICALLY:

While radio is playing press in "center" knob and turn until setting hand is at desired time. This setting operation turns radio off. Turn "ON-OFF", by turning knob clockwise and radio will resume playing but will automatically turn off at the time set.

ANTENNA:

The looptenna incorporated in the DeWald Model B-512 receiver makes use of an outside antenna unnecessary in most localities. If additional pick-up is desired, weave an insulated wire through the outer holes of the cabinet back, connect one end to the outside antenna and the other end to an outside ground. See back of cabinet. The looptenna has a directional effect, it may be necessary to change the angle of the receiver for the best reception.

REPLACEMENT PARTS

1001 Antenna Loop
1003 Oscillator Coil
1000 1st I.F. Coil
1002 2nd I.F. Coil
2000 Paper Condensers
2001 Mica Condensers

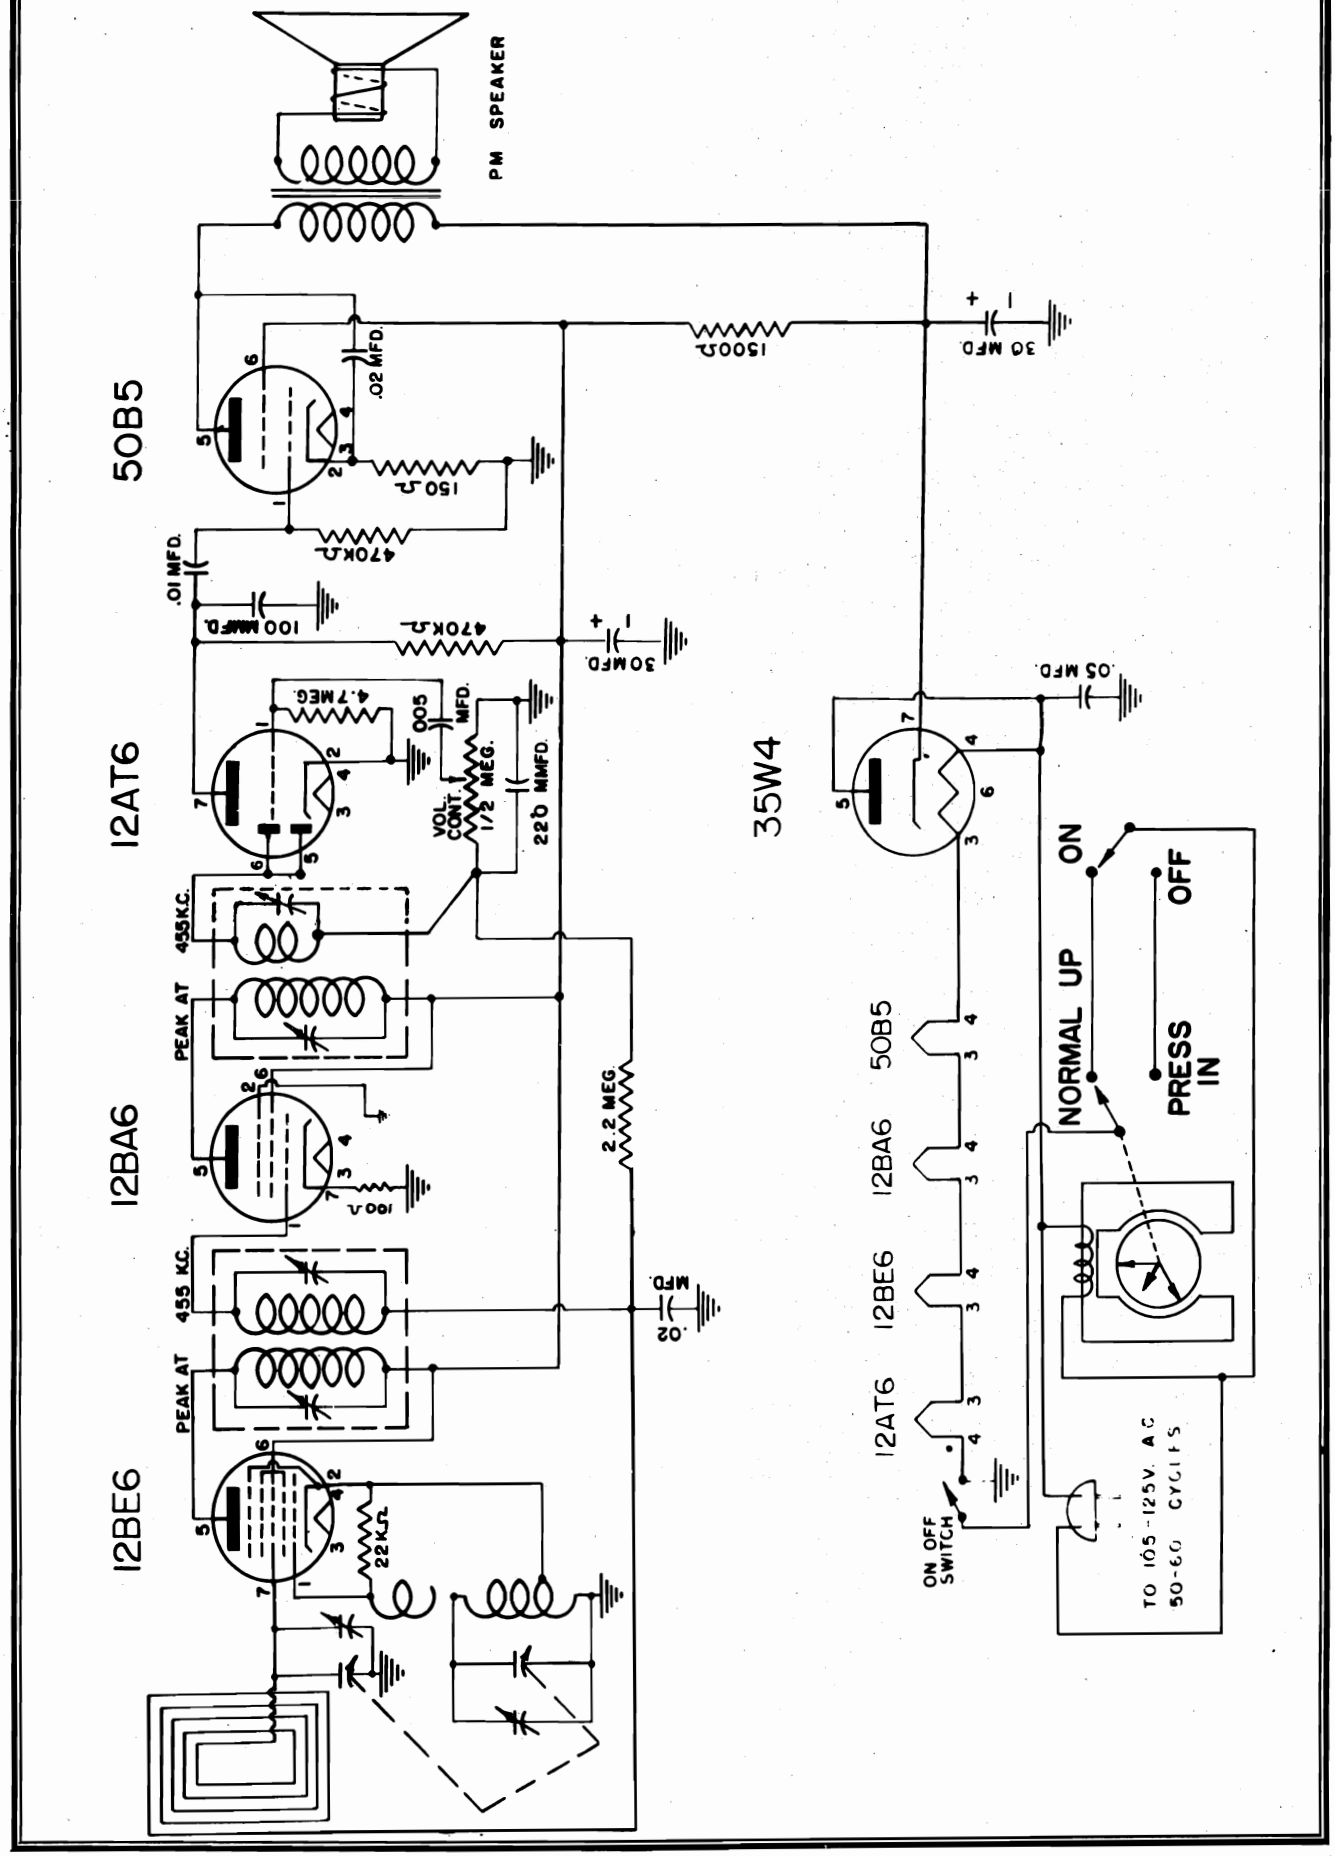
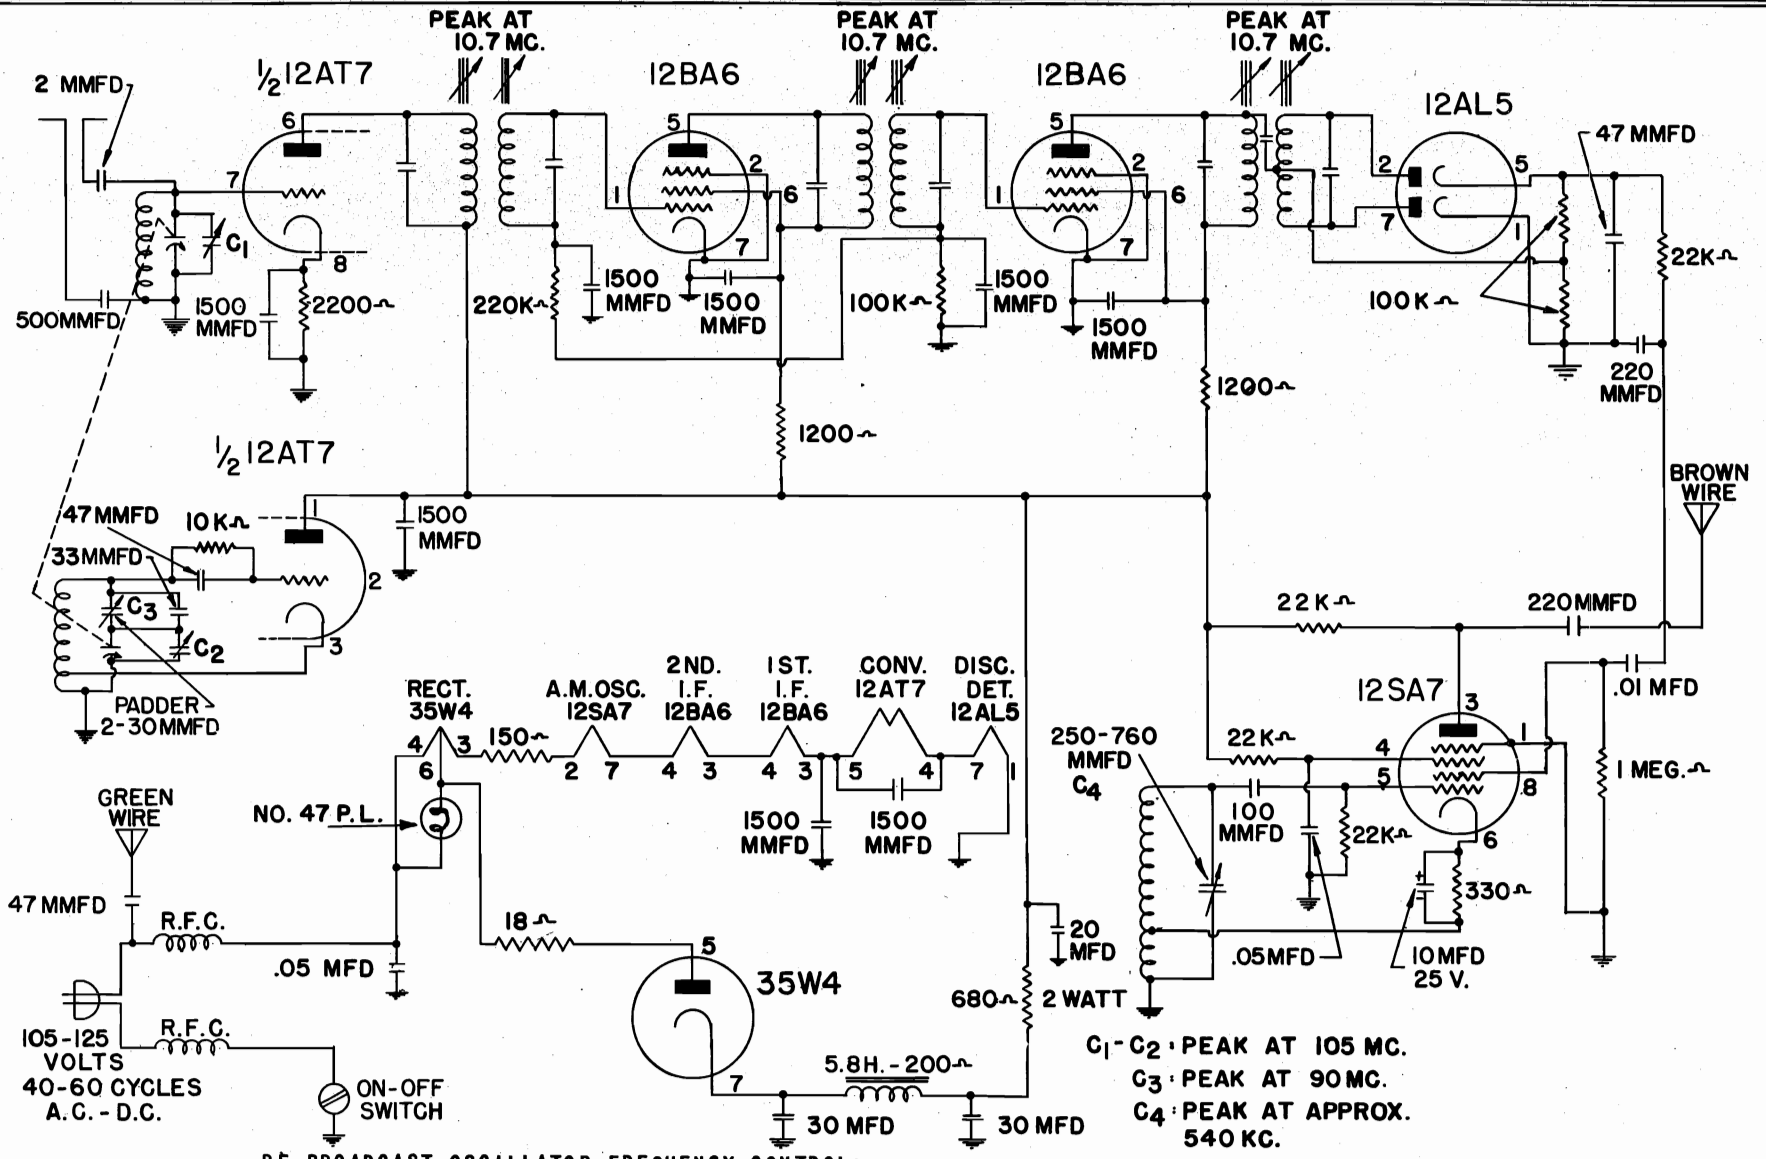
8026 Clock
6013 Crystal Face
#47 Pilot Lamp
8027 Clock Face

MODEL B-512

DEWALD RADIO



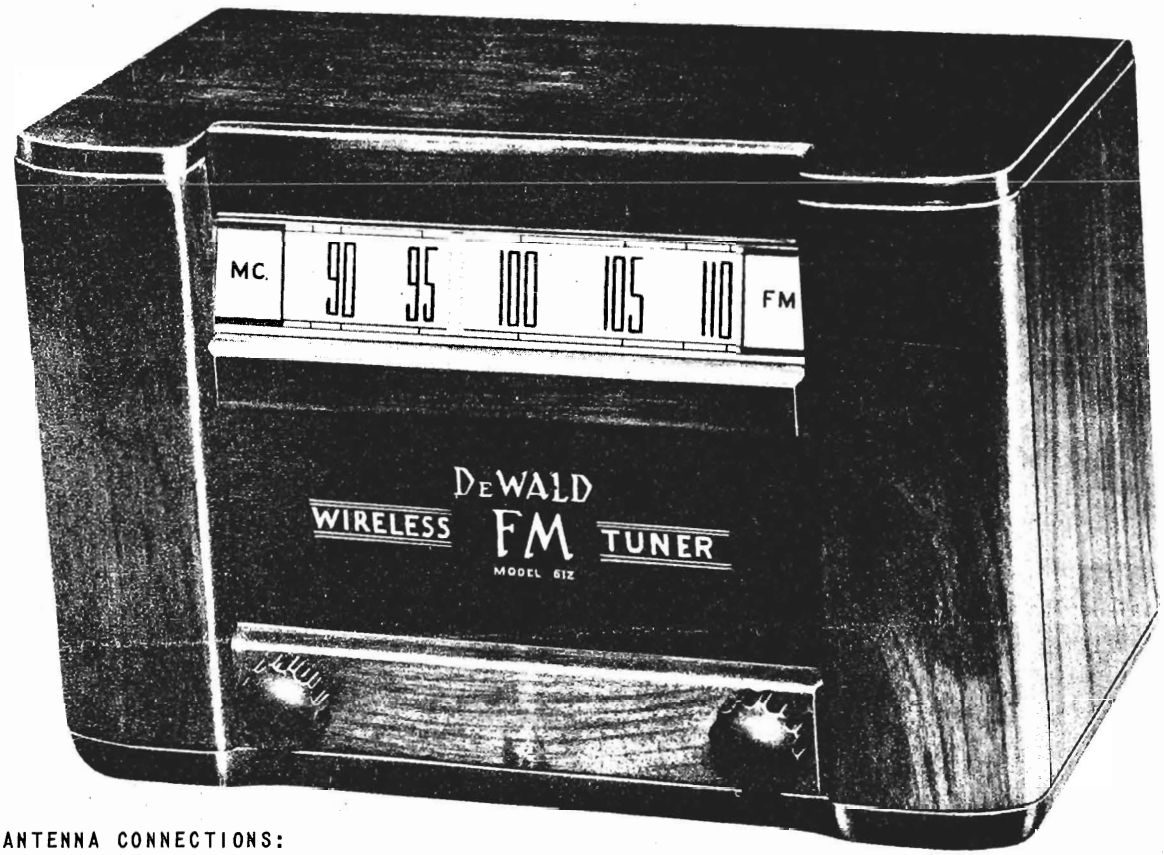


RE-BROADCAST OSCILLATOR FREQUENCY CONTROL:

This control is located on the rear of the tuner chassis and is accessible through the cabinet back. It is a screw driver adjustment to be set at about 540 K.C. on the standard broadcast receiver, or any unused neighboring frequency in the range of 500-750 K.C. This tuner at present is pre-set at 540 K.C. and adjustments are not necessary unless there is interference at this frequency.

MODEL B-612

DEWALD RADIO



ANTENNA CONNECTIONS:

The choice of antenna to be used for the best F. M. reception depends on many factors: location, the type of building, power and distance of the F. M. station. The three main types of antennas are explained below. Test your DeWald F. M. Wireless Tuner and choose the one most practical for your use.

A. **For local high-powered F. M. stations:** The Wireless Tuner is equipped with a permanent **built-in antenna** that will be satisfactory for good reception of most local F. M. stations. This built-in antenna is connected internally by connecting the green wire to the red wire in the rear of the tuner. For best results when using the built-in antenna, keep the electric line cord extended to its full length.

B. **For distant F. M. stations: An outside F. M. dipole antenna** may be found to be necessary when the Wireless Tuner is operated at a great distance from the broadcasting station, or under unusual operating conditions. The outside dipole antenna (equipped with a 300 ohm flat lead-in) should be connected to the red and orange leads, at the rear of tuner, after the green wire has been disconnected from the red wire.

C. **For local weak-powered F. M. stations:** If it is not possible to erect an outside F. M. dipole antenna, an indoor type of antenna, made of 300 ohm flat lead-in wire, can be used. This indoor antenna must be installed so that its horizontal view faces the location of the desired stations.

OPERATION OF THE F. M. TUNER:

After the necessary installation has been made according to the instructions contained in the preceding paragraphs, the electric line cord of the Wireless Tuner may be plugged into an electric wall socket. Turn the ON-OFF switches of both the tuner and your radio receiver to the "ON" position. The brown wire coming out of the rear of the tuner is to be placed approximately 1 foot near the radio receiver loop or antenna lead, if radio receiver has no loop. The radio receiver is to be set at 540 Kc or any nearby clear channel, and the re-broadcast oscillator frequency control slightly adjusted until a rushing sound is heard from your radio receiver. The volume for F. M. reception is regulated by the volume control of your own radio receiver.

The F. M. band is ultra-high frequency. This necessitates precision tuning. Therefore, it is necessary to move the tuning knob of the Wireless Tuner very slowly when tuning in stations. Rotate the tuning knob back and forth several times over the station desired. You will note that the station is "on the button" when all side band noise disappears.

If the Wireless Tuner is connected to an AC-DC type radio receiver operated on AC, a very slight hum may occur when the radio receiver volume control is on full for reception on weak powered stations. If this hum is excessive, reverse the electric line cord plug of your radio receiver or of the Wireless Tuner, or both in the wall socket.

Alignment of the Wireless Tuner

Insulated alignment tools are necessary. The output meter should be a D. C. vacuum tube voltmeter with a range of at least 20 volts. The signal generator should cover the frequencies of 10.7, 90 and 105 M. C. Allow the Wireless Tuner to warm up for at least 5 minutes before making any adjustments. The location of the adjustment screws is indicated clearly on the license label. Follow the following sequence.

I. F. ALIGNMENT:

Connect the signal generator through a .01 mfd condenser to the grid of the 12AT7 converter tube. Connect the low side of the generator through a 1/10th mfd. condenser to tuner chassis. Adjust signal generator to 10.7 mc. Connect VTVM to junction of 100 M -Ohm diode load resistors. Adjust primary and secondary slugs or trimmers of each I. F. for maximum D. C. voltage output. Remove VTVM lead from junction point and connect lead to pin 5 of 12AL5 tube. Adjust secondary slug or trimmer of discriminator for zero D. C. voltage output, (check proper zero set of VTVM. Meter should register reverse polarity when slug or trimmer is rotated through zero output.)

R. F. ALIGNMENT:

Remove signal generator leads from 12AT7 control grid. Connect in series with each generator lead a carbon 150 ohm resistor. Connect the high side generator lead to the red wire, in rear of tuner, and the low side generator lead to the orange wire. Adjust signal generator to 109 Mc. Open the tuner variable condenser for minimum capacity. Peak oscillator section of tuner condenser for maximum signal. Next set signal generator to 105 Mc. Tune in this signal. Adjust R.F. section of receiver variable condenser for maximum signal strength. To adjust the low frequency end, set the tuner and signal generator to 90 Mc. Peak the oscillator padder for maximum output. The variable condenser should be rocked during this operation. Keep the signal generator output as low as possible when making all of these measurements. It is extremely necessary in making the R.F. adjustments, that the fundamental oscillator signal be tuned in and not the image frequency. This can be checked by using a calibrated wavemeter.

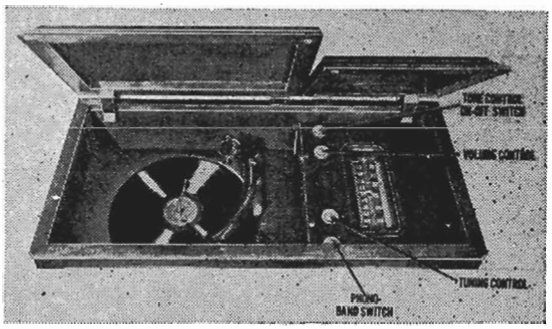
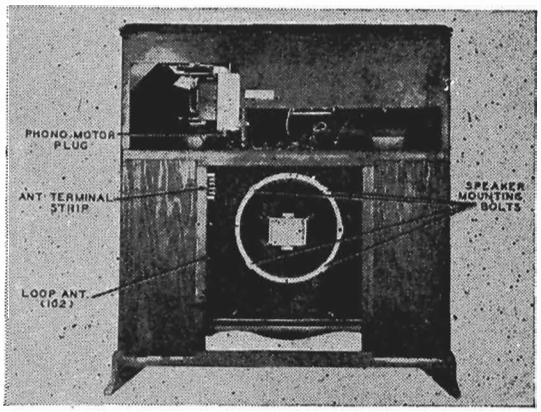
MODEL 537,
CHASSIS 120043

EMERSON RADIO AND PHONO. CORP.





DESCRIPTION

TYPE: Console AM-FM superheterodyne with automatic record changer.

FREQUENCY RANGE:
Broadcast band (AM)—530-1620 kilocycles
Frequency modulation band (FM)—87.75-108.5 megacycles

TYPE OF TUBES:
1—6AG5, r-f amplifier
1—6BE6, converter
2—6BA6, i-f amplifier
2—6AU6, limiter and AM second detector; audio amplifier
1—6AL5, FM ratio detector
2—6V6GT, power output
1—5U4G, rectifier
1—6U5/6G5, tuning eye

POWER SUPPLY: 60-cycle a.c.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 125 watts.

CURRENT DRAIN: 1.0 amp. at 117 volts a.c.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. The color coding of the i-f transformer leads is as follows:

Grid—green	Plate—blue
Grid return—black	B+—red

3. A self-contained loop antenna is provided for broadcast band reception. If it is desired to improve reception of weak stations, however, an additional outdoor antenna may be used. Connect the external antenna to the *outside* terminal on the "AM" side of the terminal strip at the rear of the cabinet. Connect the ground to the adjoining terminal.
4. An internal power line antenna is provided for FM operation in relatively strong signal areas. An external dipole antenna is recommended for best FM operation. To connect dipole, remove the wire from the terminal on the "FM" side of the terminal strips and connect the two dipole leads to the two "FM" terminals. A ground connection is not required for FM operation.

DISASSEMBLY INSTRUCTIONS

1. Remove four push-on type control knobs from top of cabinet.
2. Remove phono motor plug, phono pickup plug, and two speaker plugs from chassis.
3. Remove two Phillips head screws holding antenna terminal strip to chassis.
4. Remove two nuts and washers fastening loop to cabinet.
5. Remove two Phillips head bolts in phono compartment retaining chassis to cabinet.
6. Remove two hex head bolts and washers retaining chassis to cabinet. Remove loop and chassis from rear of cabinet.
7. Remove four nuts fastening speaker to cabinet and remove speaker.

INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1. Voltage readings are in volts and resistance readings in ohms unless otherwise specified.
2. All readings taken in broadcast position except those for items 4, 5 and 6, which should be taken in FM position.
3. D-C voltage measurements are at 20,000 ohms per volt; a-c voltages measured at 1,000 ohms.
4. Socket connections are shown as bottom views.
5. Measured values are from socket pin to common negative.
6. Line voltage maintained at 117 volts for voltage readings.
7. Nominal tolerance on component values makes possible a variation of ± 15% in voltage and resistance readings.
8. Volume control at maximum, no signal applied for voltage measurements.
9. Resistance readings in the B+ circuits may vary widely according to the condition of the filter capacitors.

EMERSON RADIO AND PHONO. CORP.

ALIGNMENT

To set pointer turn variable condenser fully closed and set pointer to last reference mark at low frequency end of dial. To inject signal in Steps 5, 6 and 7, remove 6BE6 and connect wire to pin 1. Replace tube, making certain that wire does not short to shield base. In Step 9, connect two 100,000 ohm resistors in series from pin 7 of 6AL5 to chassis. These resistors should be equal within 5%. After Step 9, turn variable condenser fully counterclockwise and check adjustment of FM tuning unit per dial cord drawing. Loop should be maintained in same relative position to chassis as when receiver is in cabinet. Volume control should be at maximum position; output of signal generator should be no higher than necessary to obtain an output reading. Use an insulated alignment screwdriver for adjusting.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	0.1 mfd.	High side to front stator of variable condenser. Low side to chassis.	455 kc	BC (center position)	High frequency end of dial.	Across voice coil.	A1, A2 A3, A4	Adjust for maximum output.
2	0.1 mfd.	High side to front stator of variable condenser. Low side to chassis.	455 kc	BC (center position)	Low frequency end of dial.	Across voice coil.	A5	Adjust for minimum output.
3	0.05 mfd.	High side to pin 1 (grid) of 6BA6, 2nd I-f tube (4). Low side to chassis.	10.7 mc (unmodulated)	FM (fully clockwise)	High frequency end of dial.	VTVM connected from pin 7 of 6AL5 to chassis.	A6, A7	Adjust for maximum deflection.
4	0.05 mfd.	High side to pin 1 (grid) of 6BA6, 1st I-f tube (3). Low side to chassis.	10.7 mc (unmodulated)	FM (fully clockwise)	High frequency end of dial.	VTVM connected from pin 7 of 6AL5 to chassis.	A8, A9	Adjust for maximum deflection.
5	0.05 mfd.	High side to pin 1 (grid) of 6BE6. Low side to chassis.	10.6 mc unmodulated)	FM (fully clockwise)	High frequency end of dial.	VTVM connected from pin 7 of 6AL5 to chassis.	A10	Adjust for maximum deflection.
6	0.05 mfd.	High side to pin 1 (grid) of 6BE6. Low side to chassis.	10.8 mc (unmodulated)	FM (fully clockwise)	High frequency end of dial.	VTVM connected from pin 7 of 6AL5 to chassis.	A11	Adjust for maximum deflection.
7	0.05 mfd.	High side to pin 1 (grid) of 6BE6. Low side to chassis.	10.7 mc (unmodulated)	FM (fully clockwise)	High frequency end of dial.	VTVM connected from pin 7 of 6AL5 to chassis.	A12	Adjust for maximum deflection.
8	0.05 mfd.	High side to pin 1 (grid) 6AU6, 3rd I-f tube (5). Low side to chassis.	10.7 mc (unmodulated)	FM (fully clockwise)	High frequency end of dial.	VTVM connected from pin 7 of 6AL5 to chassis.	A13	Adjust for maximum deflection.
9	0.05 mfd.	High side to pin 1 (grid) 6AU6, 3rd I-f tube (5). Low side to chassis.	10.7 mc (unmodulated)	FM (fully clockwise)	High frequency end of dial.	VTVM connected from junction of two 100,000 ohm resistors and junction of condensers 31 and 32. (See preliminary alignment notes).	A14	Adjust for zero deflection.
10	150 ohms in series with each lead.	High side to ungrounded FM antenna terminal. Low side to chassis. (Disconnect internal antenna.)	108 mc (unmodulated)	FM (fully clockwise)	108 mc	VTVM connected from pin 7 of 6AL5 to chassis.	A15	Adjust for maximum deflection.
11	150 ohms in series with each lead.	High side to ungrounded FM antenna terminal. Low side to chassis. (Disconnect internal antenna.)	88 mc (unmodulated)	FM (fully clockwise)	88 mc	VTVM connected from pin 7 of 6AL5 to chassis.	A16	Adjust iron core (hold brass in position) for maximum deflection.
12	150 ohms in series with each lead.	High side to ungrounded FM antenna terminal. Low side to chassis. (Disconnect internal antenna.)	98 mc (unmodulated)	FM (fully clockwise)	98 mc	VTVM connected from pin 7 of 6AL5 to chassis.	A16	Adjust iron and brass cores (single screw) for maximum deflection. Repeat steps 10, 11, 12 until no further improvement can be made.
13	150 ohms in series with each lead.	High side to ungrounded FM antenna terminal. Low side to chassis. (Disconnect internal antenna.)	106 mc (unmodulated)	FM (fully clockwise)	Tune for maximum deflection.	VTVM connected from pin 7 of 6AL5 to chassis.	A17, A18	Adjust for maximum deflection.
14	150 ohms in series with each lead.	High side to ungrounded FM antenna terminal. Low side to chassis. (Disconnect internal antenna.)	90 mc (unmodulated)	FM (fully clockwise)	Tune for maximum deflection.	VTVM connected from pin 7 of 6AL5 to chassis.	A19, A20	Adjust iron core (hold brass in position) for maximum deflection.
15	150 ohms in series with each lead.	High side to ungrounded FM antenna terminal. Low side to chassis. (Disconnect internal antenna.)	100 mc (unmodulated)	FM (fully clockwise)	Tune for maximum deflection.	VTVM connected from pin 7 of 6AL5 to chassis.	A19, A20	Adjust iron and brass cores (single screw) for maximum deflection. Repeat steps 13, 14, 15 until no further improvement can be made.
16	200 mmfd.	High side to AM ungrounded lug on antenna terminal strip. Low side to chassis.	1600 kc	BC	1600 kc	Across voice coil.	A21	Adjust for maximum output.
17	200 mmfd.	High side to AM ungrounded lug on antenna terminal strip. Low side to chassis.	1400 kc	BC	Tune for maximum output.	Across voice coil.	A22	Adjust for maximum output.

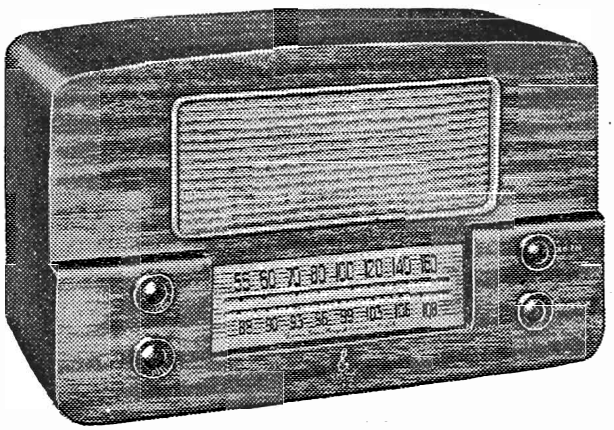
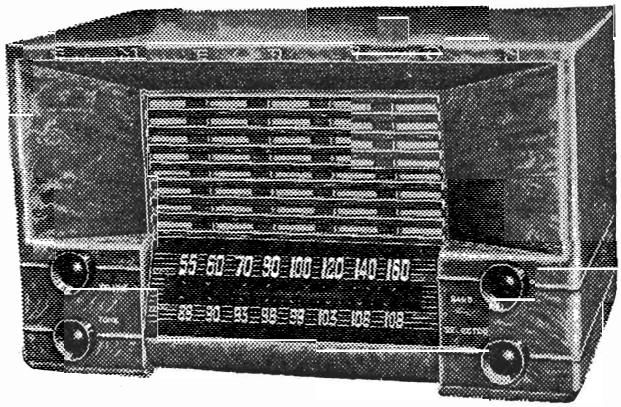
EMERSON RADIO AND PHONO. CORP. MODELS 556, 557, 565, CHASSIS 120018B



MODEL 565



MODEL 557

DESCRIPTION

TYPE: Amplitude modulation (AM) and frequency modulation (FM) superheterodyne.

FREQUENCY RANGE:
Broadcast band (AM)—540-1620 kilocycles
Frequency modulation band (FM)—88-108 megacycles

TYPE OF TUBES:
1—12BA6 FM r-f amplifier
1—12BA7 FM and AM converter
1—12BA6 FM and AM first i-f amplifier
1—12AU6 FM limiter
1—19T8 FM discriminator, AM detector, a.v.c., audio amplifier
1—35B5 Power output
1—Selenium rectifier

POWER SUPPLY: 60 cycle a.c.

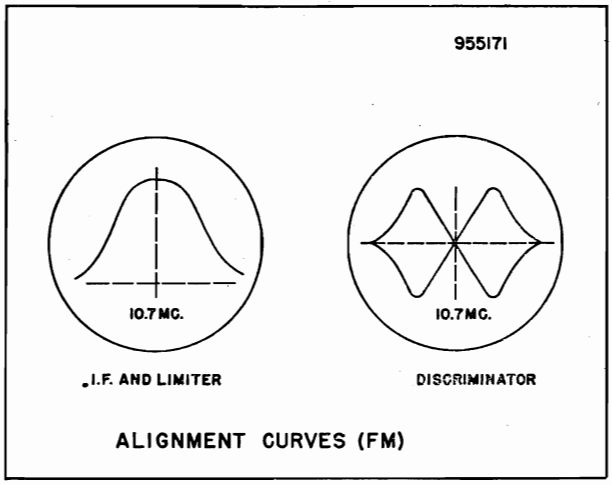
VOLTAGE RATING: 105-125 volts

POWER CONSUMPTION: 35 watts

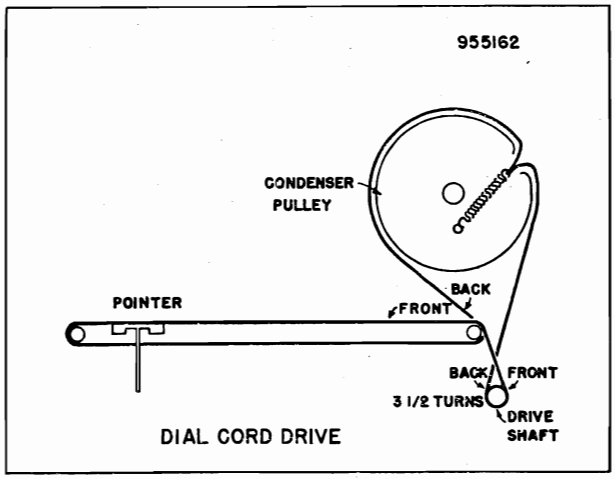
CURRENT DRAIN: 0.30 amps. at 117 volts a.c.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. A self-contained loop antenna is provided for broadcast band reception. For permanent home installation, however, if it is desired to improve reception of weak stations, an additional outdoor antenna may be used. Connect the the outdoor antenna to the screw on the loop terminal strip marked "AM".
3. An internal power line antenna is provided for FM operation in relatively strong signal areas. The line cord should be completely uncoiled for effective operation of this antenna. An external dipole antenna is recommended for maximum FM operation. To connect the dipole, first remove the wire from the screw on the loop terminal strip marked "FM" and connect the dipole leads to the "FM" terminal and "G".
4. A ground connection is not required for AM and FM operation.



ALIGNMENT CURVES (FM)



DIAL CORD DRIVE

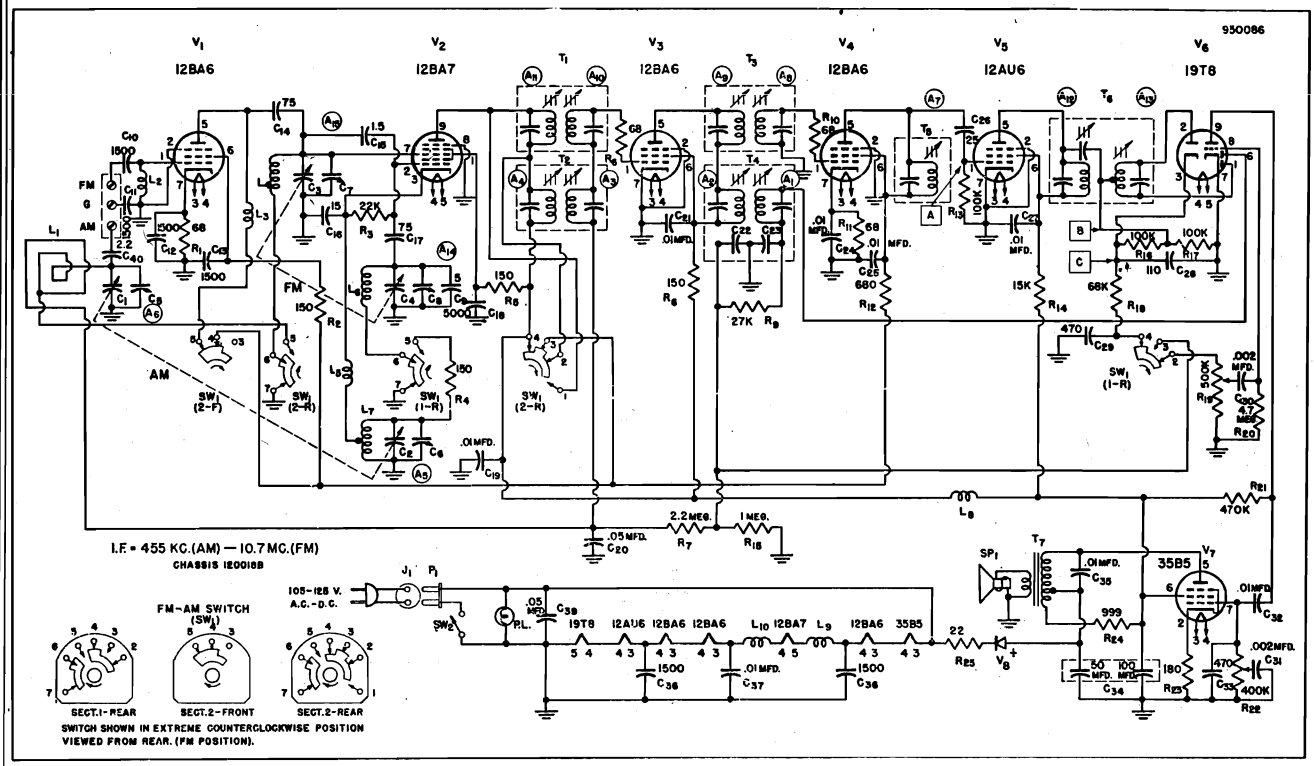
EMERSON RADIO AND PHONO. CORP.



INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1. Voltages readings are in d.c. volts and resistance readings in ohms, unless otherwise specified.
2. D.c. voltage measurements are made at 20,000 ohms-per-volt and a.c. voltages are measured at 1000 ohms-per-volt.
3. Socket connections are shown as bottom views. Values are measured from socket pin to common negative.
4. Line voltage maintained at 117 volts a.c. for voltage readings.
5. Nominal tolerance on component values makes possible a variation of ± 15% in readings.
6. Volume control at maximum, with no sig.... applied and bandswitch in broadcast position (unless otherwise noted), for voltage measurements.

ALIGNMENT INSTRUCTIONS

1. To position pointer, turn variable condenser fully closed and set pointer to reference mark on dial backplate at the low frequency end of the dial.
2. Volume control should be set at maximum position. The output of the signal generator should be no higher than necessary to obtain an output reading. Attenuate the signal input as alignment proceeds. Use an insulated alignment tool for all adjustments.
3. Use isolation transformer if available; otherwise connect a .1 mfd. condenser in series with low side of signal generator to chassis.

AM ALIGNMENT

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	.1 mfd.	High side to Pin 7 (grid) of 12BA7. Low side to chassis.	455 KC.	Broadcast	Tuning condenser fully open.	Across voice coil.	A1, A2, (Trans. T4). A3, A4, (Trans. T2).	Adjust for maximum output. Reduce dummy antenna to .001 mfd. if isolation trans. is not used.
2		Loop	1600 KC.	Broadcast	Tuning condenser fully open.	Across voice coil.	A5, (Trimmer cond. C6).	Form loop of several turns of wire. Radiate signal into receiver loop. Adjust for maximum output.
3		Loop	1400 KC.	Broadcast	Tune for max. output.	Across voice coil.	A6, (Trimmer cond. C5).	Adjust for maximum output.

FM I-F and Disc. Alignment Using AM Signal Generator and VTVM

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RADIO DIAL SETTING	CONNECT VTVM	ADJUST	REMARKS
1	.01 mfd.	High side to Pin 1 (grid) of 12BA6 2nd i.f (V4). Low side to chassis.	10.7 mc. (Unmodulated)	Frequency modulation	Tuning condenser fully open.	Connect d.c. probe to point "A". Common to chassis.	A7, (Trans. T5).	Adjust for maximum output.
2	.01 mfd.	High side to Pin 1 (grid) of 12BA6 1st i-f (V3). Low side o chassis.	10.7 mc. (Unmodulated)	Frequency modulation	Tuning condenser fully open.	Connect d.c. probe to point "A". Common to chassis.	A8, A9, (Trans. T3).	Adjust for maximum output.
3	.01 mfd.	High side to Pin 2 (osc. grid) of 12BA7 conv. (V2). Low side to chassis.	10.7 mc. (Unmodulated)	Frequency modulation	Tuning condenser fully open.	Connect d.c. probe to point "A". Common to chassis.	A10, A11, (Trans. T1).	Adjust for maximum output.
4	.01 mfd.	High side to Pin 1 (grid) of 12BA6 2nd i-f (V4). Low side to chassis.	10.7 mc. (Unmodulated)	Frequency modulation	Tuning condenser fully open.	Connect d.c. probe to point "B". Common to chassis.	A12, (Trans. T6).	Adjust for maximum output.
5	.01 mfd.	"	10.7 mc. (Unmodulated)	Frequency modulation	Tuning condenser fully open.	Connect d.c. probe to point "C". Common to chassis.	A13, (Trans. T6).	Adjust for zero output. Continue with FM r-f alignment.

FM I-F AND DISC. ALIGNMENT USING SWEEP SIGNAL GENERATOR AND OSCILLOSCOPE. Use frequency modulated signal, with 60 cycle modulation and 450 kc. sweep. Use 120 cycle sawtooth sweep voltage in oscilloscope for horizontal deflection.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RADIO DIAL SETTING	CONNECT OSCILLOSCOPE	ADJUST	REMARKS
1	.01 mfd.	High side to Pin 1 (grid) of 12BA6 1st i-f (V3). Low side to chassis.	10.7 mc. (Unmodulated).	Frequency modulation	Tuning condenser fully open.	Vertical input to Point "A". Ground to chassis.	A7, A8, A9, (Trans. T5 and T3).	Adjust for maximum output (height) and symmetry as per i-f alignment curve shown (page 3).
2	.01 mfd.	High side to Pin 2 (osc. grid) of 12BA7 conv. (V2). Low side to chassis.	10.7 mc. (Unmodulated).	Frequency modulation	Tuning condenser fully open.	Vertical input to Point "A". Ground to chassis.	A10, A11, (Trans. T1).	Adjust for maximum output (height) and symmetry as per i-f alignment curve shown (page 3).
3	.01 mfd.	High side to Pin 1 (grid) of 12BA6 2nd i-f (V4). Low side to chassis.	10.7 mc. (Unmodulated).	Frequency modulation	Tuning condenser fully open.	Vertical input to Point "C". Ground to chassis.	A12, A13, (Trans. T6).	Alternately adjust A12 for maximum amplitude and A13 for maximum straightness of cross-over lines, with cross-over occurring at center of pattern as per discriminator alignment curve (page 3). Continue with FM r-f alignment.

FM R-F ALIGNMENT

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RADIO DIAL SETTING	CONNECT VTVM	ADJUST	REMARKS
1	150 ohm resistor in series with each gen. lead.	High side to FM ant. term. Low side to chassis.	108.0 mc. (Unmodulated).	Frequency modulation	Tuning condenser fully open (108.0 mc.)	Connect d.c. probe to point "A". Common to chassis.	A14 (Trimmer cond. C8).	Adjust for maximum output.
2	"	"	106.0 mc.	Frequency modulation	Tune for maximum output.	"	A15 (Trimmer cond. C7).	Adjust for maximum output.

DESCRIPTION

TYPE: Single band (AM) superheterodyne

FREQUENCY RANGE: 540-1620 KC.

TYPES OF TUBES:

1—12SG7 converter
1—6SS7 oscillator
1—6SS7 i-f amplifier
1—12AT6 detector, a.v.c., a-f amplifier
1—50L6GT power output
1—35Z5GT rectifier

POWER SUPPLY: A.c. or d.c.

VOLTAGE RATING: 105-125 volts

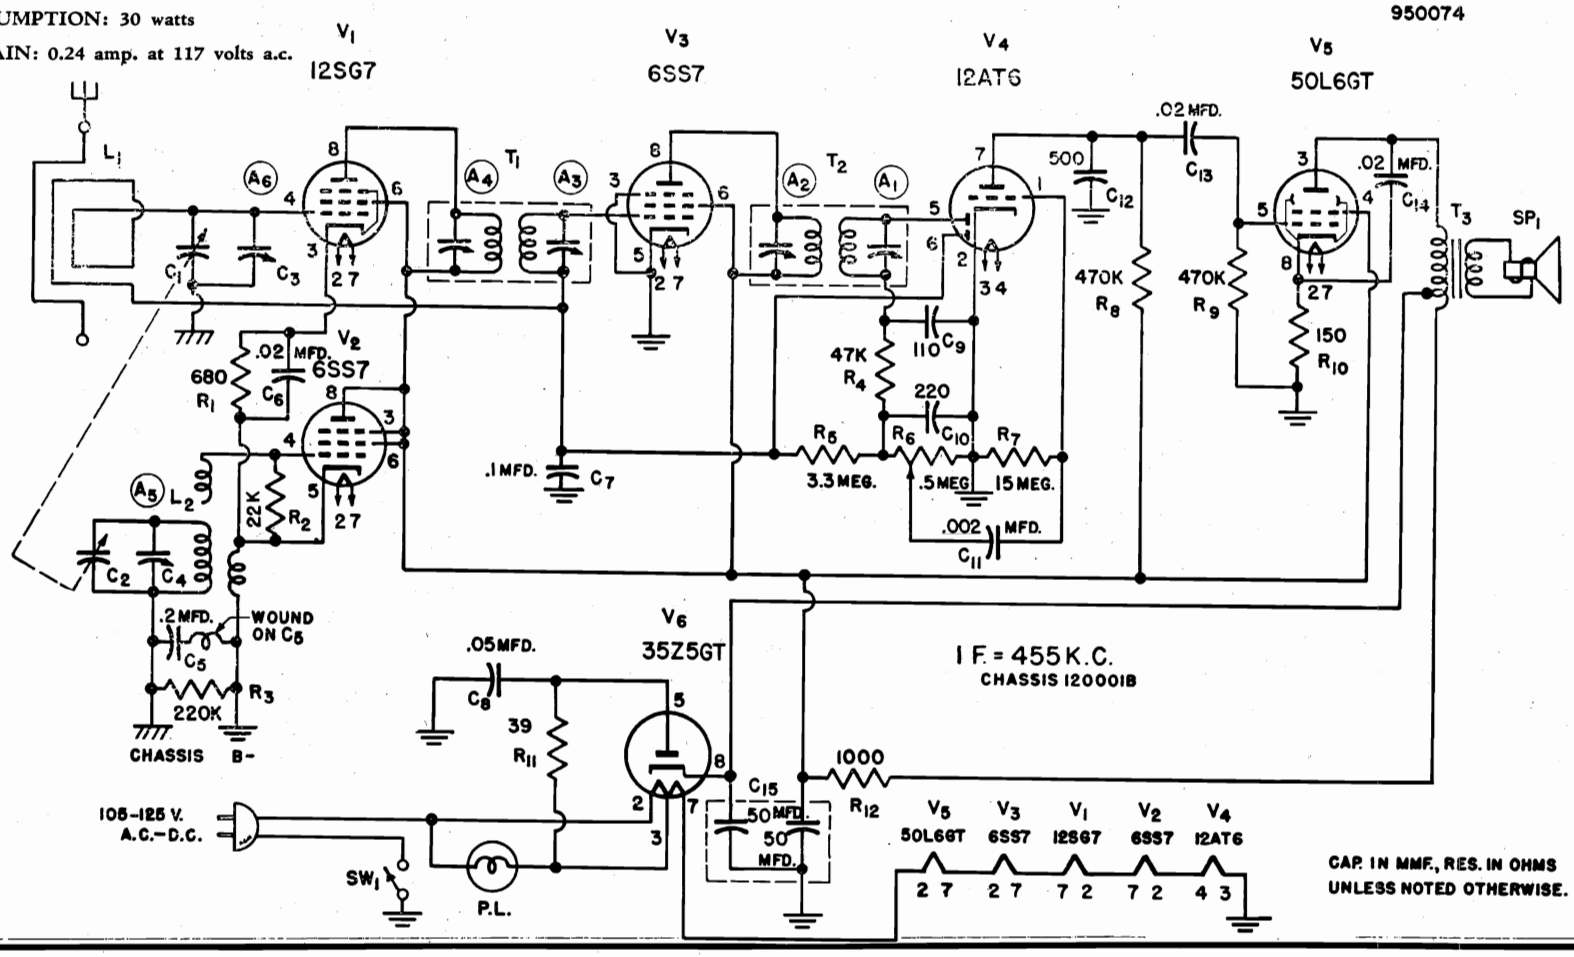
POWER CONSUMPTION: 30 watts

CURRENT DRAIN: 0.24 amp. at 117 volts a.c.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. In aperating the receiver on d.c., it may be necessary to reverse the line plug for correct polarity.
3. The receiver has a self-contained antenna, and does not require additional antenna connections. For permanent home installations, however, if it is desired to improve reception of weak stations, an additional outdoor antenna may be used. For this purpose a lead has been brought out in the rear near the line cord. Use no ground connection.
4. The self-contained loop antenna operates at maximum efficiency when its position is at right angles to the broadcasting source. It is important, therefore, once the station is tuned in, to rotate the cabinet back and forth through a quarter of a circle (90 degrees), leaving it at the position where the station is receiver with maximum volume.

950074



MODEL 561-615, EMERSON RADIO AND PHONO. CORP.
CHASSIS 120001B

INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1. Voltage readings are in d.c. volts and resistance readings in ohms unless otherwise specified.
2. D.c. voltage measurements are at 20,000 ohms-per-volt; a.c. voltages measured at 1,000 ohms-per-volt.
3. Socket connections are shown as bottom views.
4. Measured values are from socket pin to common negative (B—).
5. Line voltage maintained at 117 volts for voltage readings.
6. Nominal tolerance on component values makes possible a variation of ± 15% in voltage and resistance readings.
7. Volume control at maximum with no signal applied, for voltage measurements.

NC = no connection; K = kilohm; meg. = megohm; Inf. = infinity

ALIGNMENT PROCEDURE

1. To set pointer, turn variable condenser fully closed and set pointer at mark near left end of dial backplate.
2. Use isolation transformer if available. If not, connect a 0.1 mfd. condenser in series with low side of signal generator and chassis.
3. Volume control should be at maximum position; output of signal generator should be no higher than necessary to obtain an output reading.
4. Use an insulated alignment screwdriver for adjusting.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	METER OUTPUT	ADJUST	REMARKS
1	0.1 mfd.	High side to pin 4 (grid) of 12SG7 (V1). Low side to chassis.	455 kc	Variable condenser fully open.	Across voice coil.	A1, A2 (2nd i-f trans. T2) A3, A4 (1st i-f trans. EMERSON RADIO AND PHONO. CORP. MODEL 568, CHASSIS 120070A, 120070B

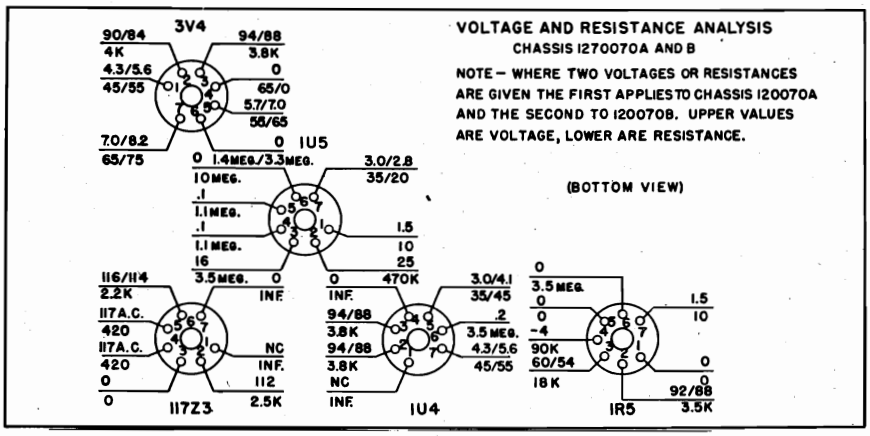
ALIGNMENT PROCEDURE

1. Use battery power when available. When a.c. power is used, connect the line cord through an isolation transformer if available. Otherwise connect a 0.1 mfd. condenser in series with the low side of the signal generator and B—.
2. Set the volume control at maximum. The output of the signal generator should be no higher than that necessary to obtain an output reading. Attenuate the signal input as alignment proceeds. Use an insulated alignment tool.
3. Maintain the loop in the same position relative to the chassis as when the receiver is in the cabinet.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	0.1 mfd.	High side to grid (pin 6) of V1 (1R5). Low side to chassis.	455 KC.	Variable condenser fully open.	Across voice coil	A1, (2nd i-f trans), A2, A3 (1st i-f trans.)	Adjust for maximum output. If a.c. is used, without an isolation transformer, reduce dummy antenna to 200 mmf. to reduce hum modulation.
2	200 mmf.	High side to external antenna lead. Low side to chassis.	1620 KC.	Variable condenser fully open.	Across voice coil	A4 (trimmer cond. C4.)	Adjust for maximum output.
3	200 mmf.	"	1400 KC.	Tune for maximum output.	Across voice coil	A5 (trimmer cond. C2).	Adjust for maximum output.

INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1. Voltage and resistance readings are measured for 117 volt a.c. line operation. Socket connections are shown as bottom views. Measurements are taken from socket pin to chassis (chassis 120070A) or socket pin to common negative (chassis 120070B).
2. Voltages are d.c. unless otherwise indicated, measured with a 20,000 ohms-per-volt meter. A.c. voltages are measured at 1000 ohms-per-volt.
3. For voltage measurements, set volume control at maximum; no signal applied.
4. Nominal tolerance on component values makes possible a variation of ± 15% in voltage and resistance readings.
5. On the voltage and resistance analysis diagram NC denotes no connection; K—kilohms; meg.—megohms; inf.—infinity.



DESCRIPTION

TYPE: Three way (battery, a.c., d.c.) portable superheterodyne.

FREQUENCY RANGE: 540-1620 KC.

TYPE OF TUBES:
1—1R5, pentagrid converter
1—1U4, i-f amplifier
1—1S5, or 1U5, detector, a.v.c., a-f amplifier
1—3V4, power output
1—117Z3 rectifier

POWER SUPPLY: Battery powerpack, or a.c., or d.c.

VOLTAGE RATING:
Line operation—105-125 volts, a.c. or d.c.
Battery operation—7½ volts (chassis 120070A);
9 volts (chassis 120070B) "A" supply
90 volts "B" supply

POWER CONSUMPTION: Line operation 20 watts

CURRENT CONSUMPTION:
"A" battery—.053 amp. (chassis 120070A)
.055 amp. (chassis 120070B)
"B" battery—.013 amp.
117 volts a.c.—.170 amp.

MODEL: 568

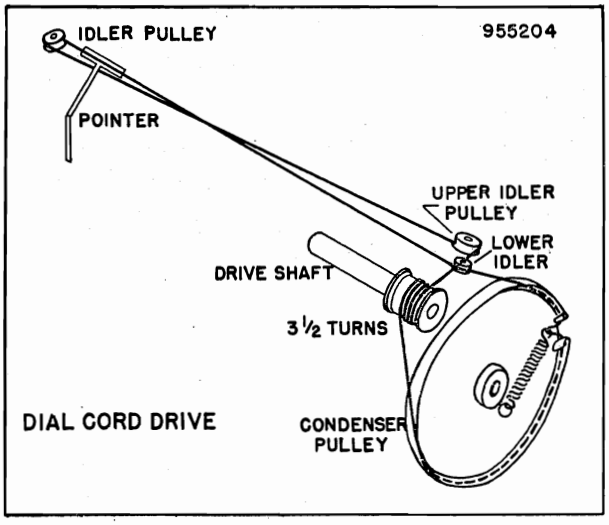
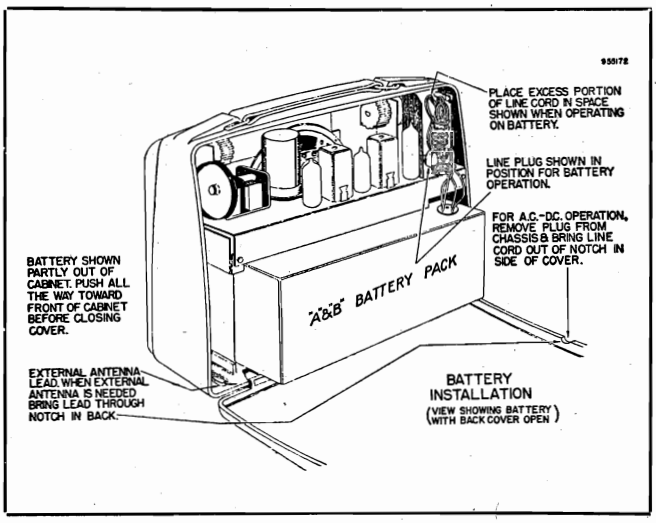
# Replace with parts having same number as that removed.

△ Used on chassis 120070A.
□ Used on chassis 120070B.
° Specify color when ordering.

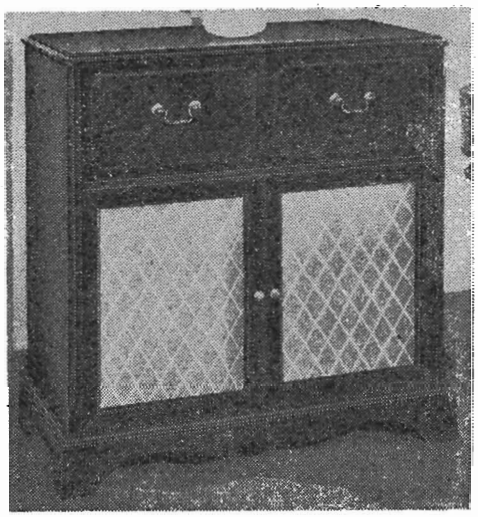




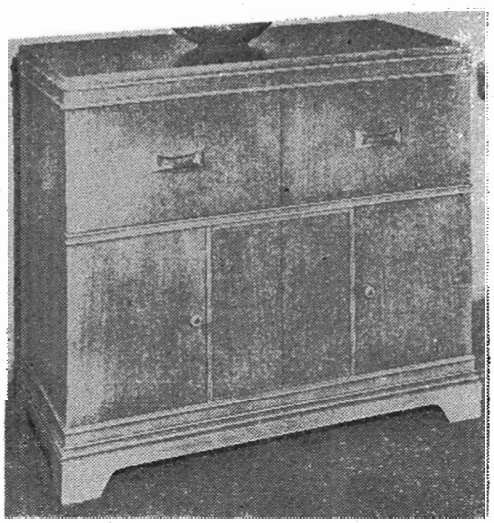
EMERSON RADIO AND PHONO. CORP. MODELS 563, 593, 603, CHASSIS 120063B

DESCRIPTION

TYPE: Console AM-FM superheterodyne with automatic record changer.
FREQUENCY RANGE:
Broadcast band (AM)—535-1620 kilocycles
Frequency modulation band (FM)—88.0 to 108.0 megacycles
1—6AG5, r-f amplifier
1—6BE6, converter
2—6SG7, i-f amplifiers
1—6U5/6G5, tuning eye
1—5U4G, rectifier
1—6S8/GT, AM detector, FM discriminator, audio amplifier
1—6SH7, FM limiter
2—6V6/GT, power output
1—6SQ7, phase inverter
POWER SUPPLY: 60-cycle a.c. only
VOLTAGE RATING: 105-125 volts
POWER CONSUMPTION: 140 watts



MODEL 563



MODEL 593

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. The color coding of the i-f transformer leads is as follows:

Grid—green	Plate—blue
Grid return—black	B+—red

3. A self-contained loop antenna is provided for broadcast band reception. If it is desired to improve reception of weak stations, however, an additional outdoor antenna may be used. Connect the external antenna to the *outside* terminal on the "AM" side of the terminal strip at the rear of the cobinet. Connect the ground to the adjoining terminal.
4. An internal power line antenna is provided for FM operation in relatively strong signal areas. An external dipole antenna is recommended for best FM operation. To connect dipole, remove the wire from the terminal on the "FM" side of the terminal strips and connect the two dipole leads to the two "FM" terminals. A ground connection is not required for FM operation.

DISASSEMBLY INSTRUCTIONS

1. Remove four push-on type control knobs from front of cabinet.
2. Remove phone motor plug, phono pickup plug, and two speaker pin-terminals from chassis.
3. Remove two Phillips head screws holding antenna terminal strip to cabinet.
4. Remove two nuts and washers fastening loop to cabinet.
5. Remove for hex-head bolts in chassis shelf retaining chassis to cabinet.
6. Remove four nuts fastening speaker to cabinet and remove speaker.

AM ALIGNMENT

Volume control should be at maximum position; output of signal generator should be no higher than necessary to obtain an output reading. Use an insulated alignment screw driver for adjusting.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POS.	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	.1 mfd.	High side to Pin No. 1 of V2 6BE6. Low side to chassis.	455 kc	Center position BC.	High frequency end of dial.	Across voice coil.	C-25, C-26 C-58, C-59	Adjust all trimmers for maximum response.
2	.1 mfd.	"	455 kc	"	"	"	C-16 IF-trap trimmer	Adjust for minimum response.
3	200 mmfd.	High side to AM ungrounded lug on antenna terminal strip. Low side to chassis.	1620 kc	"	1620 kc Reference marker on dial backplate.	"	C-4	Adjust for maximum response.
4	200 mmfd.	"	1400 kc	"	Tune in 1400 kc for maximum output.	"	C-3	Adjust for maximum response.

FM IF ALIGNMENT USING FM SIGNAL GENERATOR AND VTVM

Use FM Signal with 60 Cycle Modulation and 500 KC Deviation

	DUMMY ANTENNA	SIGNAL GENERATOR SIGNAL	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POS.	RADIO DIAL SETTING	CONNECT VTVM	ADJUST	REMARKS
1	.005 mfd.	High side to Pin No. 1 V2 6BE6. Low side to chassis.	10.7 mc freq. mod.	Fully clockwise FM position.	High frequency end of dial.	Point "A"	C-23, C-24 C-57, C-56 C-52, C-51	Adjust all trimmers for maximum deflection while attenuating signal so as to read approximately 2 volts at Point "A" during alignment.
2	.005 mfd.	"	10.7 mc freq. mod.	"	"	Point "A"	C-21	Adjust for maximum deflection.

FM IF ALIGNMENT USING AM SIGNAL GENERATOR AND VTVM

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POS.	RADIO DIAL SETTING	CONNECT VTVM	ADJUST	REMARKS
1	.05 mfd.	High side to Pin No. 1 V2 6BE6. Low side to chassis.	10.7 mc unmodulated	Fully clockwise FM pos.	High frequency end of dial.	Point "A"	C-52 C-51	Adjust for maximum deflection.
2	.05 mfd.	"	10.7 mc unmodulated	"	"	"	C-56 C-57	"
3	.05 mfd.	"	10.7 mc unmodulated	"	"	"	C-24 C-23	"
4	.05 mfd.	"	10.7 mc unmodulated	"	"	Point "B"	C-37	"
5	.05 mfd.	"	10.7 mc unmodulated	"	"	Pin No. 5 6S8-V6A	C-36	Adjust for zero minimum deflection

Vol. control in max. pos.

FM DISCRIMINATOR ALIGNMENT

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POS.	RADIO DIAL SETTING	CONNECT VTVM	ADJUST	REMARKS
1	.05 mfd.	High side to Pin No. 1 of 6BE6 V2. Low side to chassis.	10.7 mc freq. mod.	Fully clockwise Pos. FM.	High frequency end of dial.	Point "B"	C-37	Adjust for maximum deflection. Attenuate signal so that reading of approximately 2 volts indicates maximum response of discriminator alignment.
2	.05 mfd.	"	10.7 mc unmodulated	"	"	Connect scope or AC-VTVM across voice coil.	C-36	Adjust for minimum deflection. Making sure that a sharp rise can be obtained if the secondary of discriminator is aligned on either side of minimum deflection setting.

INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1. Voltage readings are in volts and resistance readings in ohms unless otherwise specified.
2. D-C voltage measurements are at 20,000 ohms per volt; a-c voltages measured at 1,000 ohms.
3. Socket connections are shown as bottom views.
4. Measured values are from socket pin to common negative.
5. Line voltage maintained at 117 volts for voltage readings.
6. Nominal tolerance on component values makes possible a variation of ± 15% in voltage and resistance readings.
7. Volume control at maximum, no signal applied for voltage measurements.
8. Resistance readings in the B+ circuits may vary widely according to the condition of the filter capacitors.

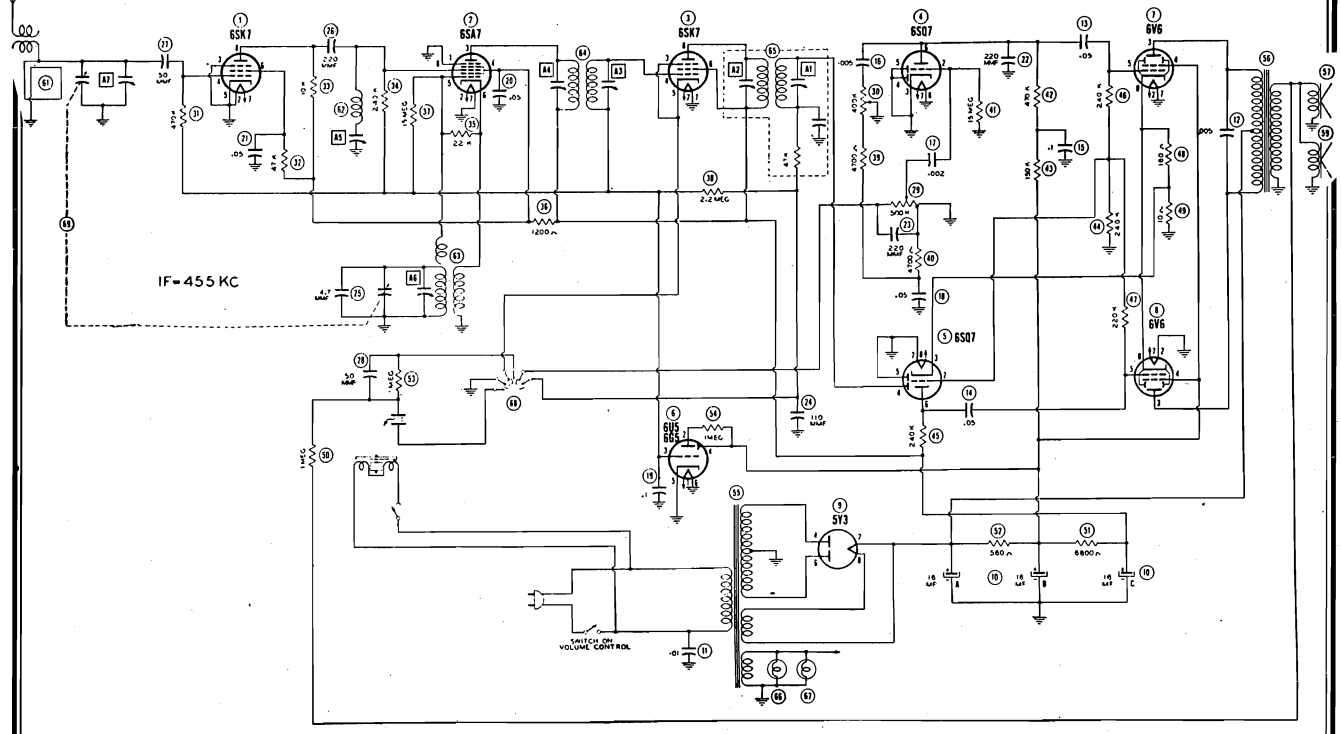
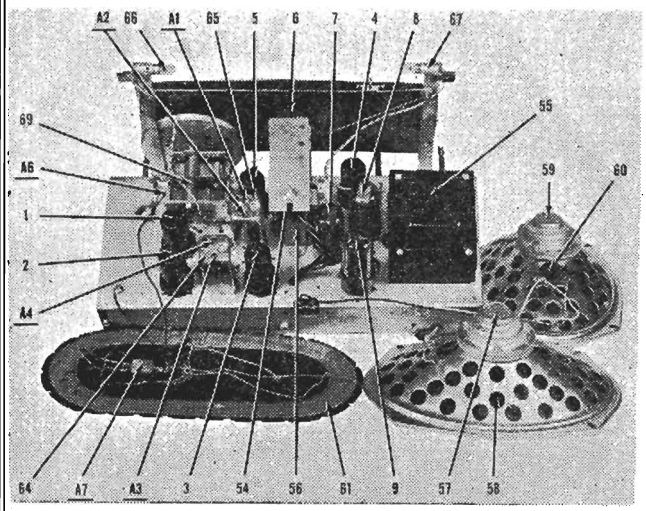
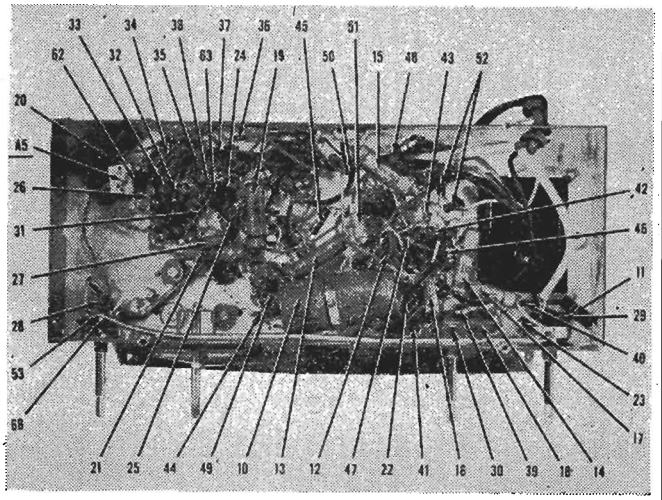
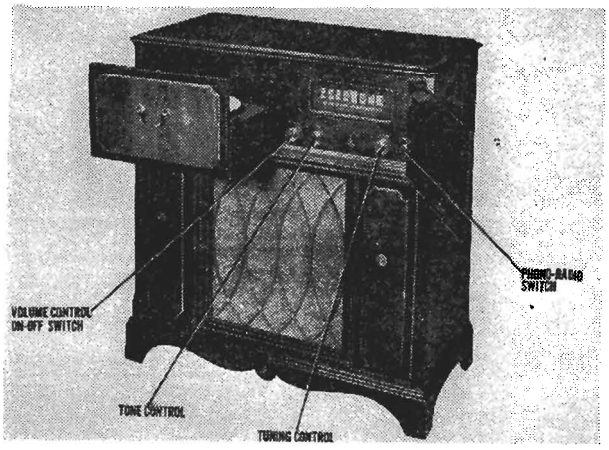
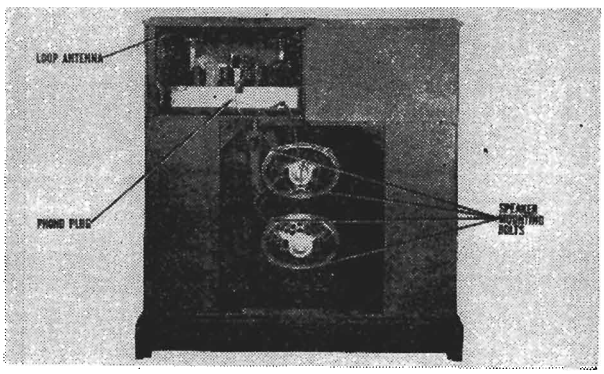
EMERSON RADIO AND PHONO. CORP. MODELS 573, 583, CHASSIS 120039B











ALIGNMENT

To set pointer, turn tuning cap. fully closed and set pointer 2-3/8" from left edge of dial backplate. This is the calibration mark referred to below.

Loop should be maintained in same relative position to chassis as when receiver is in cabinet.

Volume control should be at maximum position; output signal generator should be no higher than necessary to obtain an output reading. Use an insulated alignment schewdriver for adjusting.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	.1 mfd.	High side to pin 8 (grid) of 6SA7. Low side to chassis.	455KC	Tuning cap. fully open.	Across voice coil.	A1, A2, A3, A4	Adjust for maximum output.
2	.1 mfd.	High side to ext. antenna lead. Low side to chassis.	"	Tuning cap. fully closed.	"	A5	Adjust for minimum output.
3	200 mmf.	"	1400KC	5" from calibration mark.	"	A6	Adjust for maximum output.
4	200 mmf.	"	"	Tune for maximum output.	"	A7	Adjust for maximum output.
5	200 mmf.	"	600KC	"	"		Use adjusting turn in rear of loop. Adjust for max. output.

DESCRIPTION

TYPE: Console A.C. superheterodyne phonoradio with automatic record changer.

FREQUENCY RANGE: 540-1620 K.C.

TYPE OF TUBES:

1—6SK7, r-f amplifier
1—6SA7 converter
1—6SK7, i-f amplifier
1—6SQ7, detector—a.v.c. phase inverter
1—6SQ7. a-f amplifier
1—6U5/6G5, tuning eye (omitted on Model 583)
2—6V6GT, power output
1—5Y3GT, rectifier

POWER SUPPLY: 60 cycle a.c.

VOLTAGE RATING: 105-125 volts

POWER CONSUMPTION: 110 watts

CURRENT DRAIN: .73 amp. at 117 volts a.c.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. The color coding of the i-f transformer leads is as follows:

   Grid—green — Plate—blue
   Grid return—black — B+—red

3. The receiver has a self-contained antenna and normally does not require additional antenna or ground connection. For permanent home installations, however, in a location far removed from broadcasting stations, an additional outside antenna may be used. The outside antenna connection should be made to the colored lead at the rear of the cabinet. Ground connection may be used. Connect ground to black lead at rear.
4. The grille-work and tuning eye are omitted on Model 583. Other change noted in parts list.

EMERSON RADIO AND PHONO CORP. MODELS 573, 583
CHASSIS 120039B

INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1—DC Voltage measurements are at 20,000 ohms per volt; AC Voltages measured at 1,000 ohms per volt.
2—Socket connections are shown as bottom views.
3—Measured values are from socket pin to common negative.
4—Line voltage maintained at 117 volts for voltage readings.
5—Nominal tolerance on component values makes possible a variance of ± 10% in voltage and resistance readings.
6—Volume control at maximum, no signal applied for voltage measurements.

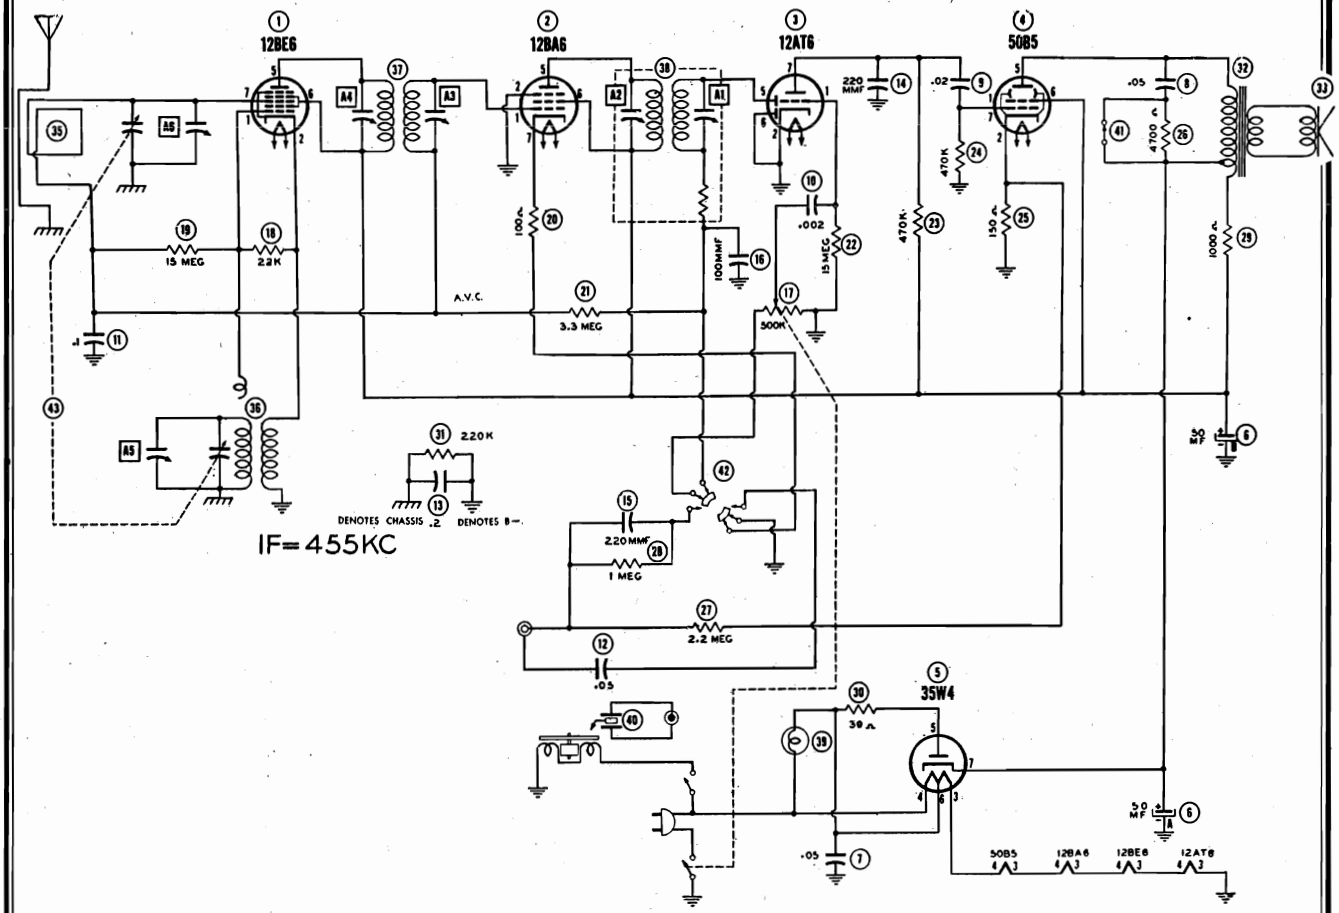
EMERSON RADIO AND PHONO. CORP. MODEL 576, CHASSIS 120069A



FREQUENCY RANGE: 540-1620 kc.

TYPE OF TUBES:
- 1—12BE6, converter
- 1—12BA6, i-f amplifier
- 1—12AT6, detector a.v.c.-a.f. amplifier
- 1—50B5, power output
- 1—35W4, rectifier

POWER SUPPLY: 60 cycle a.c.

VOLTAGE RATING: 105-125 volts

POWER CONSUMPTION: 50 watts

CURRENT DRAIN: .43 amp. at 117 volts a.c.

MODEL 576,
CHASSIS 120069A

EMERSON RADIO AND PHONO. CORP.

ALIGNMENT

To set pointer turn tuning cap. fully closed and set pointer 2¼" from top right edge of dial backplate. This is calibration mark referred to below.

Use isolation transformer if available. If not, connect, a .1 mfd. capacitor in series with low side of signal generator and B—.

Volume control should be at maximum position, output of signal generator should be no higher than necessary to obtain an output reading. Use an insulated alignment screwdriver for adjusting.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	.1 mfd.	High side to Pin 7 (grid) of 12BE6. Low side to B—.	455KC	Tuning cap. fully open.	Across voice coil.	A1, A2, A3, A4	Adjust for maximum output. If isolation transformer is not used, reduce dummy ant. to .001 mfd. to reduce hum modulation.
2	200 mmf.	High side to ext. ant. lead. Low side to ext. ground lead.	1600KC	4¼" from calibration mark.	"	A5	Adjust for maximum output.
3	200 mmf.	" "	1500KC	Tune for maximum output.	"	A6	" " " "

INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1—DC Voltage measurements are at 20,000 ohms per volt; AC Voltages measured at 1000 ohms per volt.
2—Socket connections are shown as bottom views.
3—Measured values are from socket pin to common negative.
4—Line voltage maintained at 117 volts for voltage readings.
5—Nominal tolerance on component values makes possible a variation of ± 15% in voltage and resistance readings.
6—Volume control at maximum, no signal applied for voltage measurements.

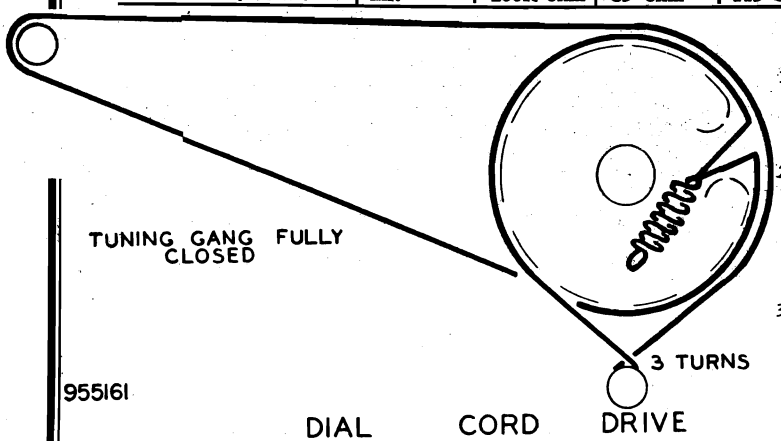
5	35W4	inf.	200K ohm	85 ohm	115 ohm	150 ohm	110 ohm	200K ohm	



GENERAL NOTES

1. If replacements are made or the wiring disturbed in the i-f section of the circuit, the receiver should be carefully realigned.

2. The color coding of the i-f transformer leads is as follows:

Grid—green	Plate—blue
Grid return—black	B+—red

3. The receiver has a self-contained antenna and does not require additional antenna connections. For permanent home installations, however, if it is desired to improve reception of weak stations, an additional outdoor antenna should be used. For this purpose a lead has been brought out of the rear near the line cord.

ALIGNMENT INSTRUCTIONS

1. To position pointer, turn variable condenser fully closed and set pointer to reference mark at low-frequency end of dia backplate.
2. Use isolation transformer if available. If not, connect a .1 mfd. condenser in series with low side of signal generato and B—.
3. Volume control should be at maximum position; radio-phono switch in radio position. Output of signal generator shoul be no higher than necessary to obtain an output reading. Use an insulated screw driver for adjusting.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	.1 mfd.	High side to Pin 7 (grid) of 12BE6. Low side to B—.	455KC	Tuning cond. fully open.	Across voice coil.	A1, A2, A3, A4 (I-f trans. T2 and T1)	Adjust for maximum output. If isolation transformer is not used, reduce dummy ant. to .001 mfd. to reduce hum modulaltion.
2	200 mmf.	High side to ext. ant. lead. Low side to ext. ground	1600KC	Tuning cond. fully open.	Across voice coil.	A5 (Var. cond. trimmer C4).	Adjust for maximum output.
3		High side to ext. ant. lead. Low side to ext. ground	1400KC	Tune for maximum output.	Across voice coil.	A6 (Loop ant. trimmer C5).	Adjust for maximum output.

DESCRIPTION

TYPE: Single band superheterodyne and automatic record changer.

FREQUENCY RANGE: 540-1620 kc.

TYPE OF TUBES:
1—12BE6, pentagrid converter
1—12BA6, i-f amplifier
1—12AT6, detector, a.v.c., a-f amplifier
1—50B5, power output
1—35W4, rectifier

POWER SUPPLY: A.C. only, 60 cycles

VOTAGE RATING: 105-125 volts

POWER CONSUMPTION:
Receiver—30 watts
Phono motor—20 watts

CURRENT DRAIN: 0.24 amp. (for receiver), at 117 volts a.c.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. The receiver has a self-contained antenna and does not require an additional antenna. For permanent installations, however, if it is desired to improve reception of weak stations, an additional outdoor antenna may be connected to the white lead (with colored tracer) at the rear of the cabinet. Connect a ground to the black lead, if desired.
3. The self-contained loop antenna has directional properties. It is important, therefore, once a station is tuned in, that the cabinet be rotated back and forth through a quarter-turn and left at that position where maximum volum is obtained.

DISASSEMBLY INSTRUCTIONS

1. Remove four push-on type control knobs
2. Remove four corner cabinet supports
3. Disconnect phono-motor leads by unscrewing wirenut insulators. Remove phono pickup plug from chassis.
4. Remove remaining two screws holding chassis mounting plate to bottom of cabinet. Remove chassis from cabinet.
5. Remove two center screws holding chassis to mounting board.

	520048	Dial backplate		140108	Cabinet, walnut plastic
	525023	Dial pointer		140196	Cabinet, walnut wood
	280035	Drive shaft		450115	Knob, black
	530002	Drive cord (26")		460076B	Speaker grille (Model 596 only)
	587040	Drive cord spring			

† Specify part numbers when ordering.
# Replace with part having same number as that removed.
* Not supplied separately.
Note: C9, C10, C11, C12 may be combined in one unit, part No. 470310, on some chassis.

EMERSON RADIO AND PHONO. CORP. MODEL 586, CHASSIS 120023B, 120083B

MODEL: 586

DESCRIPTION

TYPE: Console AM-FM superheterodyne, with automatic record changer.

FREQUENCY RANGE:
Broadcast band (AM)—540-1620 kilocycles.
Frequency modulation band (FM)—88-108 megacycles.

TYPE OF TUBES:
1—6BA6 FM r-f amplifier (chassis 120083B only)
1—6SB7Y FM and AM converter
1—6SG7 FM and AM first i-f amplifier
1—6SG7 FM second i-f amplifier
1—6SH7 FM limiter
1—6S8GT FM discriminator, AM detector, a.v.c., audio amplifier
1—6AT6 Phase inverter
2—25L6GT Push-pull power output
1—25Z6GT Rectifier

POWER SUPPLY: 60 cycle a.c.
VOLTAGE RATING: 105-125 volts
POWER CONSUMPTION: 90 watts
CURRENT DRAIN: 0.77 amp. at 117 volts a.c.

GENERAL NOTES

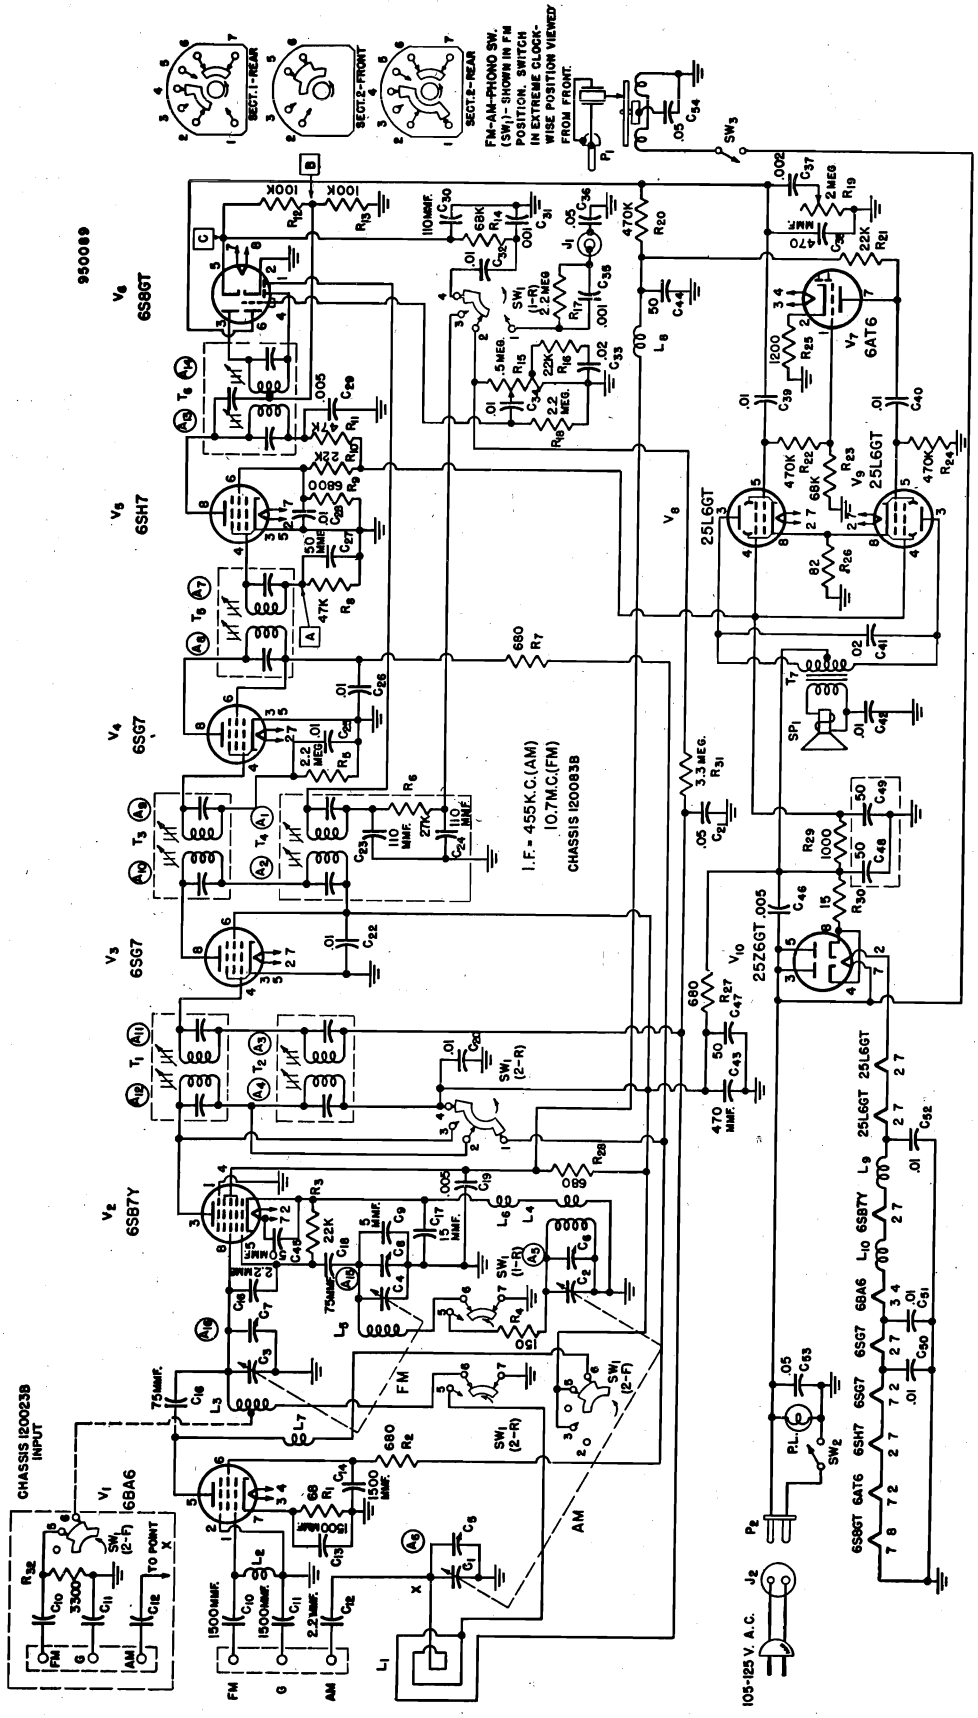
1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. A self-contained loop antenna is provided for broadcast band reception. For permanent home installation, however, if it is desired to improve reception of weak stations, an additional outdoor antenna may be used. Connect the outdoor antenna to the screw on the terminal strip marked "AM".
3. An internal power line antenna is provided for FM operation in relatively strong signal areas. The line cord should be completely uncoiled for effective operation of this antenna. An external dipole antenna is recommended for maximum FM operation. To connect the dipole, first remove the chassis cover at the rear of the cabinet. Then remove the wire from the screw on the terminal strip marked "FM" and connect the dipole leads to the "FM" terminal and "G".
4. A ground connection is not required for AM or FM operation.

DISASSEMBLY INSTRUCTIONS

1. Remove four push-on type knobs at front of cabinet.
2. Remove five screws holding chassis cover in place.
3. Remove phono plug at left side of chassis. Unscrew wire nuts from phono motor leads. Disconnect speaker leads.
4. Unfasten interlock socket by removing two screws from mounting bracket.
5. Remove four chassis mounting bolts and carefully withdraw chassis.

MODEL 586, CHASSIS 120023B, 120083B

EMERSON RADIO AND PHONO. CORP.



EMERSON RADIO AND PHONO. CORP. MODEL 586, CHASSIS 120023B, 120083B

ALIGNMENT INSTRUCTIONS

1. To position pointer, turn variable condenser fully closed and set pointer to reference mark on dial backplate at the low frequency end of the dial.
2. Volume control should be set at maximum position. The output of the signal generator should be no higher than necessary to obtain an output reading. Attenuate the signal input as alignment proceeds. Use an insulated alignment tool for all adjustments.
3. Use isolation transformer if available; otherwise connect a .1 mfd. condenser in series with low side of signal generator to chassis.

AM Alignment

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	.1 mfd.	High side to Pin 8 (grid) of 6SB7Y. Low side to chassis.	455 KC.	Broadcast	Tuning condenser fully open.	Across voice coil.	A1, A2, (Trans. T4). A3, A4, (Trans. T2).	Adjust for maximum output. Reduce dummy antenna to .001 mfd. if isolation trans. is not used.
2		Loop	1600 KC.	Broadcast	Tuning condenser fully open.	Across voice coil.	A5, (Trimmer cond. C6).	Form loop of several turns of wire. Radiate signal into receiver loop. Adjust for maximum output.
3		Loop	1400 KC.	Broadcast	Tune for max. output.	Across voice coil.	A6, (Trimmer cond. C5).	Adjust for maximum output.

FM I-F and Disc. Alignment Using AM Signal Generator and VTVM

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RADIO DIAL SETTING	CONNECT VTVM	ADJUST	REMARKS
1	.01 mfd.	High side to Pin 4 (grid) of 6SG7 2nd i.f (V4). Low side to chassis.	10.7 mc. (Unmodulated)	Frequency modulation	Tuning condenser fully open.	Connect d.c. probe to point "A". Common to chassis.	A7, A8, (Trans. T5).	Adjust for maximum output.
2	.01 mfd.	High side to Pin 4 (grid) of 6SG7 1st i-f (V3). Low side to chassis.	10.7 mc. (Unmodulated)	Frequency modulation	Tuning condenser fully open.	Connect d.c. probe to point "A". Common to chassis.	A9, A10, (Trans. T3).	Adjust for maximum output.
3	.01 mfd.	High side to Pin 5 (osc. grid) of 6SB7Y conv. (V2). Low side to chassis.	10.7 mc. (Unmodulated)	Frequency modulation	Tuning condenser fully open.	Connect d.c. probe to point "A". Common to chassis.	A11, A12, (Trans. T1).	Adjust for maximum output.
4	.01 mfd.	High side to Pin 4 (grid) of 6SG7 2nd i-f (V4). Low side to chassis.	10.7 mc. (Unmodulated)	Frequency modulation	Tuning condenser fully open.	Connect d.c. probe to point "B". Common to chassis.	A13, (Trans. T6).	Adjust for maximum output.
5	.01 mfd.	"	10.7 mc. (Unmodulated)	Frequency modulation	Tuning condenser fully open.	Connect d.c. probe to point "C". Common to chassis.	A14, (Trans. T6).	Adjust for zero output. Continue with FM r-f alignment.

FM I-F and Disc. Alignment Using Sweep Signal Generator and Oscilloscope.

Use frequency modulated signal, with 60 cycle modulation and 450 kc. sweep. Use 120 cycle sawtooth sweep voltage in oscilloscope for horizontal deflection.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RADIO DIAL SETTING	CONNECT OSCILLOSCOPE	ADJUST	REMARKS
1	.01 mfd.	High side to Pin 4 (grid) of 6SG7 1st i-f (V3). Low side to chassis.	10.7 mc. (Unmodulated).	Frequency modulation	Tuning condenser fully open.	Vertical input to Point "A". Ground to chassis.	A7, A8, (Trans. T5). A9, A10, (Trans. T3).	Adjust for maximum output (height) and symmetry as per i-f alignment curve shown (page 5).
2	.01 mfd.	High side to Pin 5 (osc. grid) of 6SB7Y conv. (V2). Low side to chassis.	10.7 mc. (Unmodulated).	Frequency modulation	Tuning condenser fully open.	Vertical input to Point "A". Ground to chassis.	A11, A12, (Trans. T1).	Adjust for maximum output (height) and symmetry as per i-f alignment curve shown (page 5).
3	.01 mfd.	High side to Pin 4 (grid) of 6SG7 2nd i-f (V4). Low side to chassis.	10.7 mc. (Unmodulated).	Frequency modulation	Tuning condenser fully open.	Vertical input to Point "C". Ground to chassis.	A13, A14, (Trans. T6).	Alternately adjust A13 for maximum amplitude and A14 for maximum straightness of cross-over lines, with cross-over occurring at center of pattern as per discriminator alignment curve (page 5). Continue with FM r-f alignment.

FM R-F Alignment

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RADIO DIAL SETTING	CONNECT VTVM	ADJUST	REMARKS
1	150 ohm resistor in series with each gen. lead.	High side to FM ant. term. Low side to chassis.	108.0 mc. (Unmodulated).	Frequency modulation	Tuning condenser fully open (108.0 mc.)	Connect d.c. probe to point "A". Common to chassis.	A15, (Trimmer cond. C8).	Adjust for maximum output.
2	"	"	106.0 mc.	Frequency modulation	Tune for maximum output.	"	A16, (Trimmer cond. C7).	Adjust for maximum output.

MODEL 586, CHASSIS 120023B, 120083B

EMERSON RADIO AND PHONO. CORP.

INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1. Voltage readings are in d.c. volts and resistance readings in ohms, unless otherwise specified.
2. D.c. voltage measurements are made at 20,000 ohms-per-volt and a.c. voltages are measured at 1000 ohms-per-volt.
3. Socket connections are shown as bottom views. Values are measured from socket pin to common negative.
4. Line voltage maitained at 117 volts a.c. for voltage readings.
5. Nominal tolerance on component values makes possible a variation of ± 15% in readings.
6. Volume control at maximum, with no signal applied and bandswitch in broadcast position (unless otherwise noted), for voltage measurements.

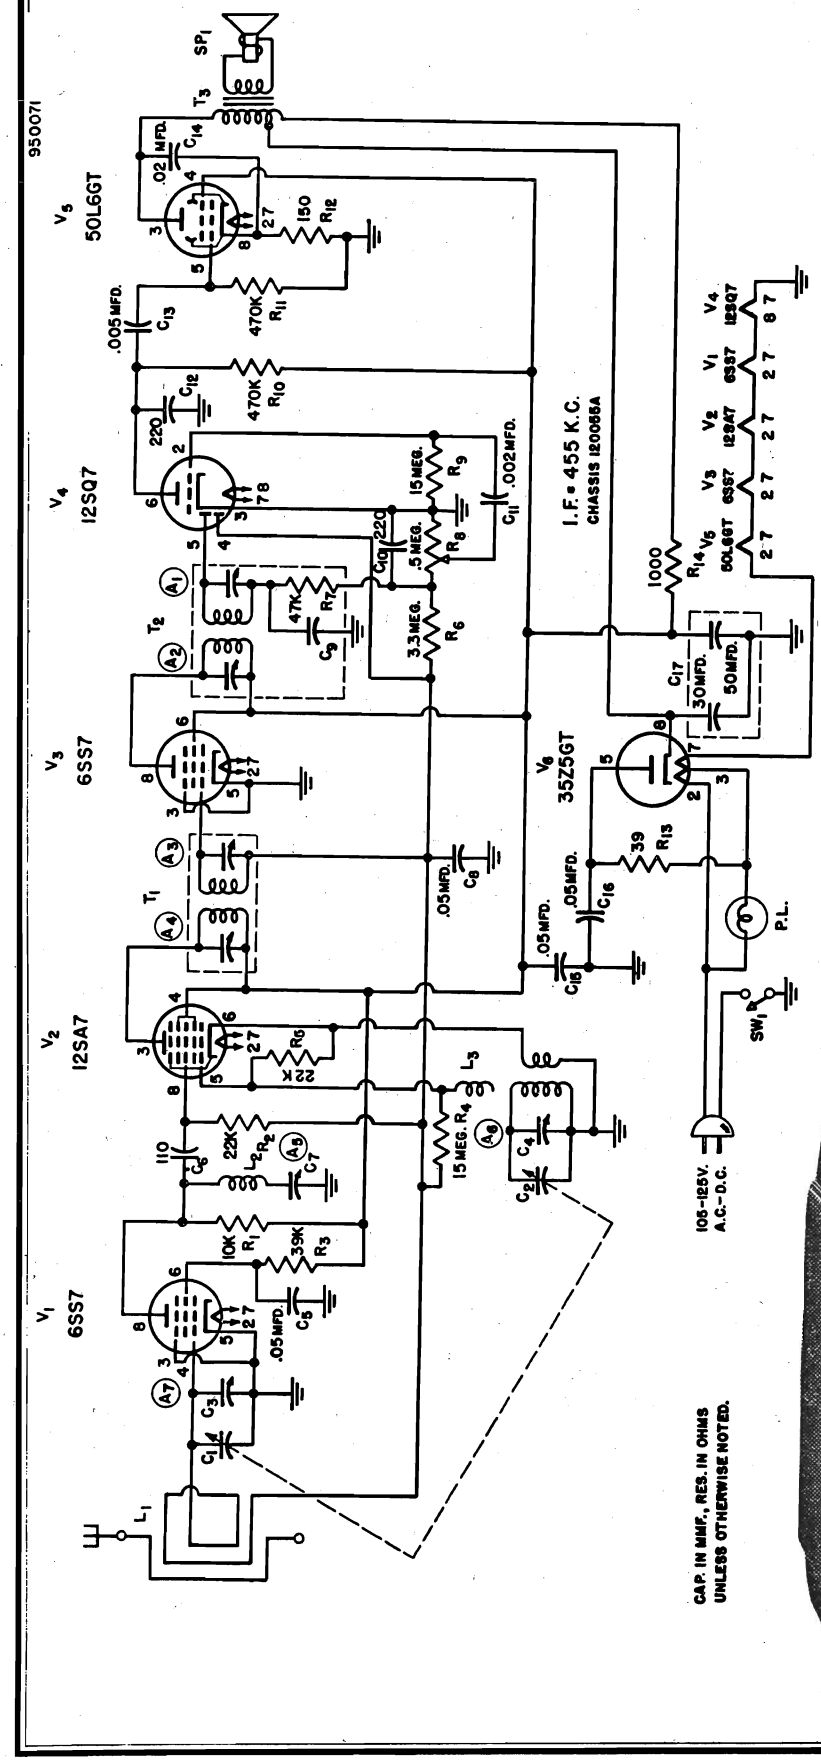
MODEL 591,
CHASSIS 120055A

EMERSON RADIO AND PHONO. CORP.



DESCRIPTION

TYPE: Single band (AM) superheterodyne

FREQUENCY RANGE: 540-1620 kc.

TYPES OF TUBES:
- 1—6SS7 r-f amplifier
- 1—12SA7 converter
- 1—6SS7 i-f amplifier
- 1—12SQ7 detector, a.v.c., audio amplifier
- 1—50L6GT power output
- 1—35Z5GT rectifier

POWER SUPPLY: A.c. or d.c.

VOLTAGE RATING: 105-125 volts

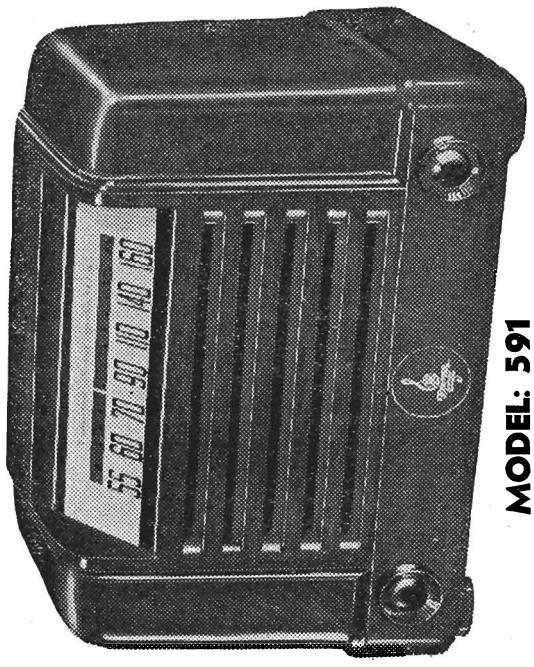
POWER CONSUMPTION: 30 watts

CURRENT DRAIN: 0.24 amp. at 117 volts a.c.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. The receiver has a self-contained antenna and does not require additional antenna connections. For permanent home installations, however, if it is desired to improve reception of weak stations, an additional outdoor antenna may be used. For this purpose a lead has been brought out of the rear near the line cord.
3. The self-contained loop antenna has directional properties. It is important, therefore, once the station is tuned in, that the cabinet be rotated on its base back and forth through a quarter of a circle (90 degrees), and left at the position where the station is received with maximum volume.
4. The color coding of the i-f transformer leads is as follows:

Grid return—black	Plate—blue
Grid—green	Blue+—red



MODEL: 591

EMERSON RADIO AND PHONO. CORP. MODEL 591, CHASSIS 120055A

INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1. Voltages are in volts d.c.; resistances in ohms unless otherwise specified.
2. D.c. voltage measurements are at 20,000 ohms-per-volt; a.c. voltages measured at 1000 ohms-per-volt.
3. Socket connections are shown as bottom views.
4. Measured values are from socket pin to common negative (chassis).
5. Line voltage maintained at 117 volts for voltage readings.
6. Nominal tolerance on component values makes possible a variation of ± 15% in voltage and resistance readings.
7. Volume contral at maximum with no signal applied, for voltage measurements.

ALIGNMENT PROCEDURE

1. To set pointer, turn variable condenser fully closed and set pointer at mark near left end of dial backplate.
2. Use isolation transformer if available. If not, connect a 0.1 mfd. condenser in series with low side of signal generator and chassis.
3. Volume control should be at maximum position; output of signal generator should be no higher than necessary to obtain an output reading.
4. Use an insulated alignment screwdriver for adjusting.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	0.1 mfd.	High side to pin 8 (grid) of 12SA7 (V2). Low side to chassis.	455 KC.	Variable condenser fully open.	Across voice coil.	A1, A2 (2nd i-f trans. T2). A3, A4 (1st i-f trans. T1).	Adjust for maximum output. If isolation transformer is not used, reduce dummy antenna to .001 mfd. to reduce hum modulation.
2	0.1 mfd.	High side to external antenna lead. Low side to chassis.	455 KC.	Variable condenser fully open.	Across voice coil.	A5 (Trimmer) cond. C7).	Adjust for minimum output.
3	200 mmf.	"	1620 KC.	Variable condenser fully open.	Across voice coil.	A 6 (Trimmer) cond. C4).	Adjust for maximum output.
4	200 mmf.	"	1400 KC.	Tune for maximum output.	Across voice coil.	A7 (Trimmer) cond. C3).	Adjust for maximum output.

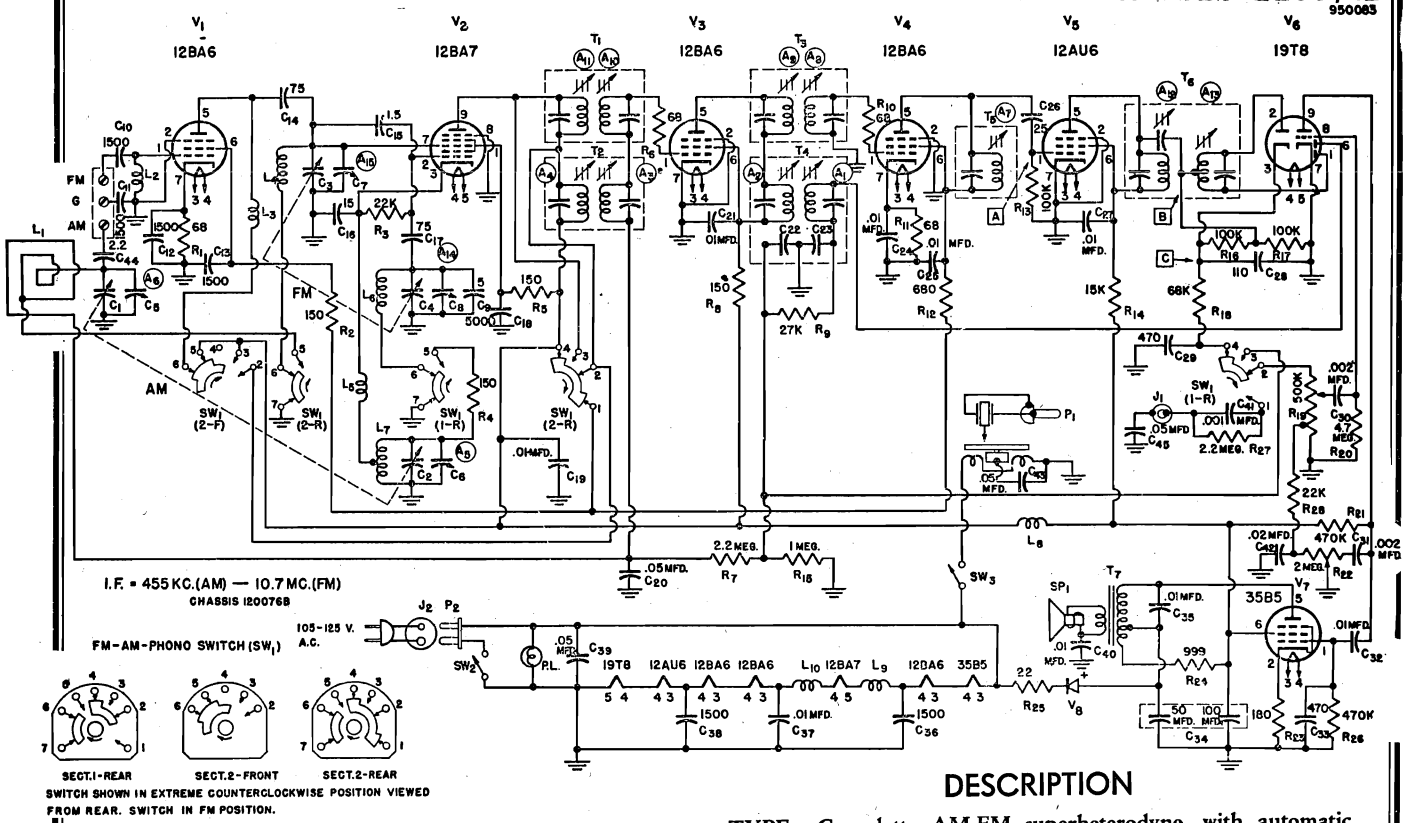
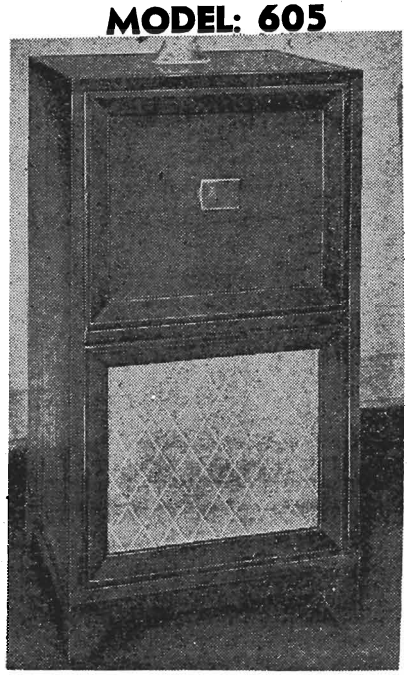
EMERSON RADIO AND PHONO. CORP. MODEL 605, CHASSIS 120076B



DISASSEMBLY INSTRUCTIONS

1. Remove four push-on type knobs at front of cabinet.
2. Remove chassis cover at rear of cabinet.
3. Disconnect speaker and phono-motor leads. Remove phono plug.
4. Remove chassis mounting bolts and carefully withdraw chassis.

MODEL: 605



DESCRIPTION

TYPE: Consolette AM-FM superheterodyne, with automatic record changer.

FREQUENCY RANGE:
Broadcast band (AM)—540-1620 kilocycles.
Frequency modulation band (FM)—88.108 megacycles.

TYPE OF TUBES:
1—12BA6 FM r-f amplifier
1—12BA7 FM and AM converter
1—12BA6 FM and AM first i-f amplifier
1—12BA6 FM second i-f amplifier
1—12AU6 FM limiter
1—19T8 FM discriminator, AM detector, a.v.c., audio amplifier
1—35B5 Power output
1—Selenium rectifier

POWER SUPPLY: 60 cycle a.c.

VOLTAGE RATING: 105-125 volts

POWER CONSUMPTION: 90 watts

CURRENT DRAIN: 0.77 amp. at 117 volts a.c.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. A self-contained loop antenna is provided for broadcast band reception. For permanent home installation, however, if it is desired to improve reception of weak stations, an additional outdoor antenna may be used. Connect the the outdoor antenna to the screw on the loop terminal strip marked "AM".
3. An internal power line antenna is provided for FM operation in relatively strong signal areas. The line cord should be completely uncoiled for effective operation of this antenna. An external dipole antenna is recommended for maximum FM operation. To connect the dipole, first remove the wire from the screw on the loop terminal strip marked "FM" and connect the dipole leads to the "FM" terminal and "G".
4. A ground connection is not required for AM and FM operation.

MODEL 605, EMERSON RADIO AND PHONO. CORP.
CHASSIS 120076B

INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1. Voltages readings are in d.c. volts and resistance readings in ohms, unless otherwise specified.
2. D.c. voltage measurements are made at 20,000 ohms-per-volt and a.c. voltages are measured at 1000 ohms-per-volt.
3. Socket connections are shown as bottom views. Values are measured from socket pin to common negative.
4. Line voltage maintained at 117 volts a.c. for voltage readings.
5. Nominal tolerance on component values makes possible a variation of ± 15% in readings.
6. Volume control at maximum, with no signal applied and bandswitch in broadcast position (unless otherwise noted), for voltage measurements.

DIAL CORD DRIVE

EMERSON RADIO AND PHONO. CORP. MODEL 605, CHASSIS 120076B

ALIGNMENT INSTRUCTIONS

1. To position pointer, turn variable condenser fully closed and set pointer to reference mark on dial backplate at the low frequency end of the dial.
2. Volume control should be set at maximum position. The output of the signal generator should be no higher than necessary to obtain an output reading. Attenuate the signal input as alignment proceeds. Use an insulated alignment tool for all adjustments.
3. Use isolation transformer if available; otherwise connect a .1 mfd. condenser in series with 4ow side of signal generator to chassis.

AM ALIGNMENT

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	.1 mfd.	High side to Pin 7 (grid) of 12BA7. Low side to chassis.	455 KC.	Broadcast	Tuning condenser fully open.	Across voice coil.	A1, A2, (Trans. T4). A3, A4, (Trans. T2).	Adjust for maximum output. Reduce dummy antenna to .001 mfd. if isolation trans. is not used.
2		Loop	1600 KC.	Broadcast	Tuning condenser fully open.	Across voice coil.	A5, (Trimmer cond. C6).	Form loop of several turns of wire. Radiate signal into receiver loop. Adjust for maximum output.
3		Loop	1400 KC.	Broadcast	Tune for max. output.	Across voice coil.	A6, (Trimmer cond. C5).	Adjust for maximum output.

FM I-F and Disc. Alignment Using AM Signal Generator and VTVM

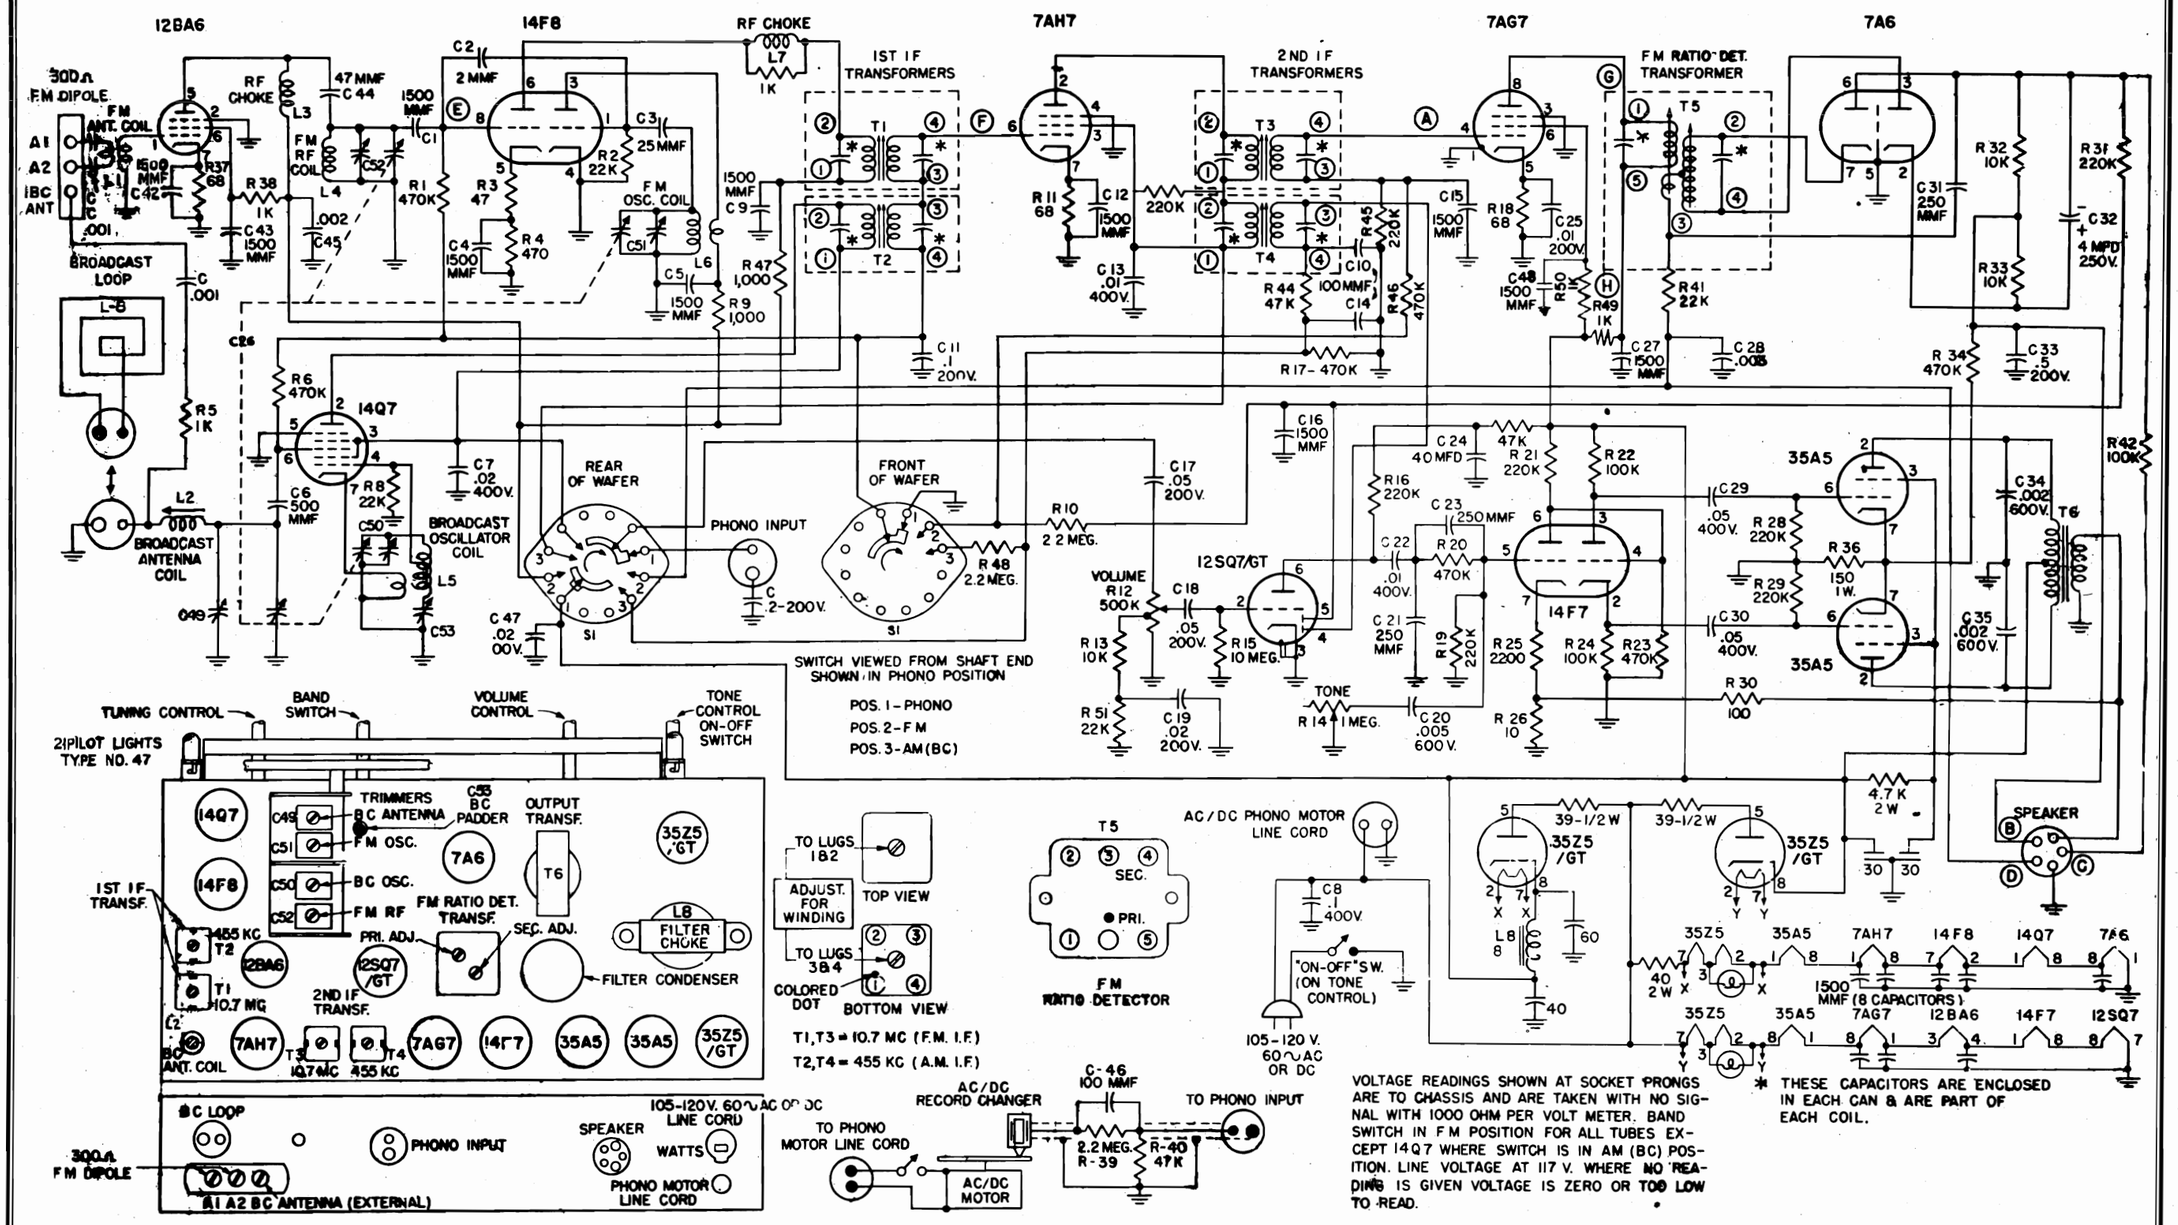
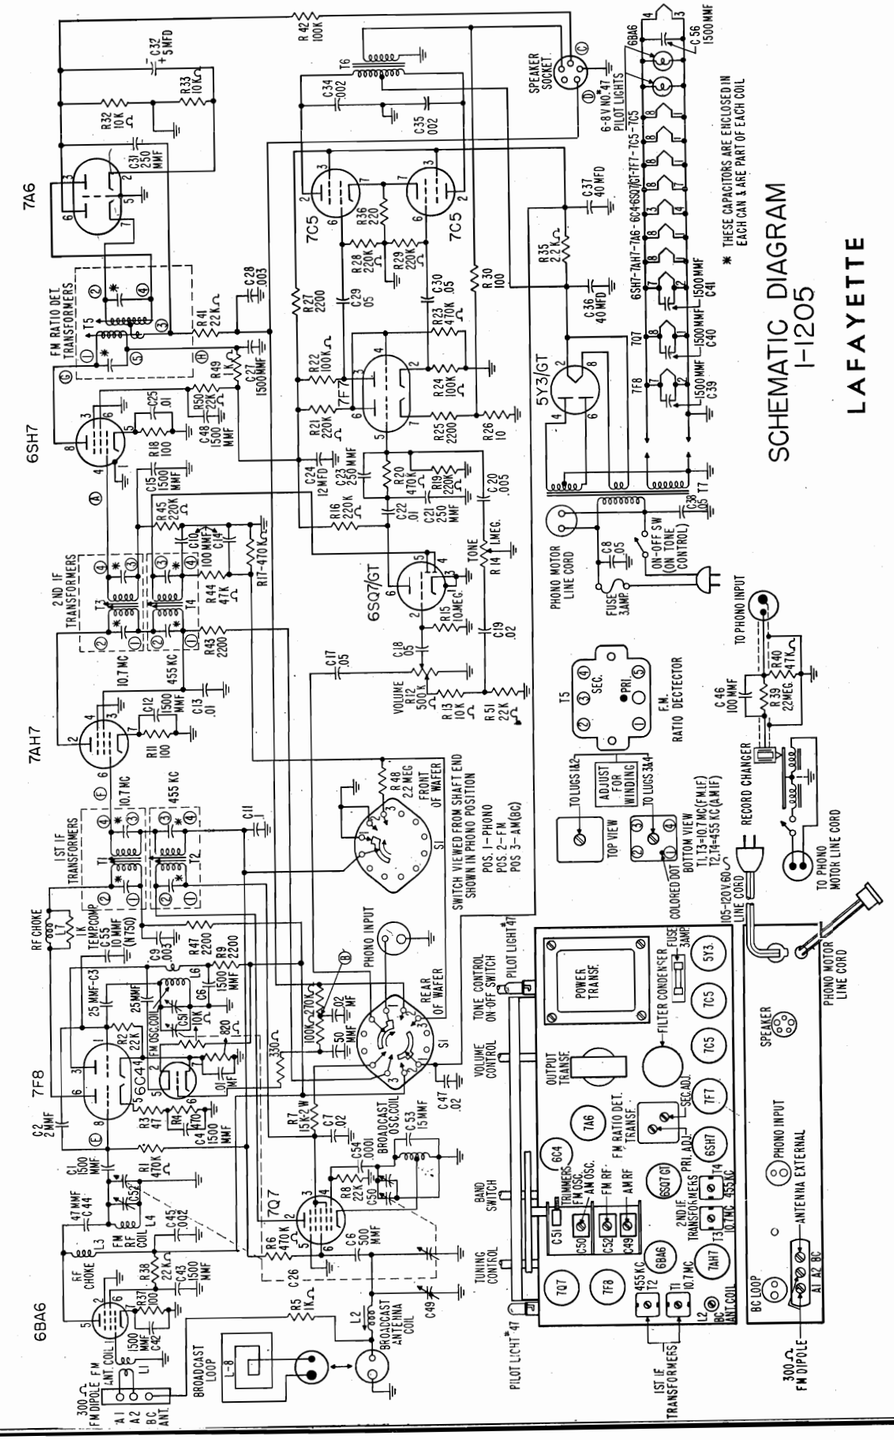
ALIGNMENT CURVES (FM)

ESPEY MFG. COMPANY, INC.

MODEL 7B
AC-DC



RECORD CHANGER: Garrard Model RC60, RCD.CH. 15-1



This Receiver features the latest in A. M. - F. M., Receiver Design. Eleven (11) tubes plus a Rectifier are used in the A. M. — F. M. superheterodyne circuit. separate antennas are supplied for A. M. and F. M. An automatic frequency control tube is used to stabilize the F. M. and simplify tuning.

TUBE COMPLEMENT:

1 Type 6BA6 — F. M. R F. Amplifier
1 Type 7F8 — F. M. Converter
1 Type 7Q7 — A. M. Converter
1 Type 6C4 — Automatic Frequency Control
1 Type 7AH7 — I. F. Amplifier
1 Type 6SH7 — Detector Driver (F.M.)
1 Type 6SQ7 — 1st Audio Amplifier, A. M. Detector
1 Type 7A6 — Ratio Detector
1 Type 7F7 — 2nd Audio Amplifier and phase inverter
2 Type 7C5 — Beam power output.
1 Type 5Y3/GT — Rectifier.

1. OPERATING CONTROLS:

1) The "ON-OFF" power switch and Tone Control is the knob at the extreme left of the set. Turn this control in a clockwise direction until the switch clicks and the dial becomes illuminated. Turning this control further in the same direction will change the tone.

2) The Volume Control is the second knob from the left. Turning this control in a clockwise direction will increase the volume.

3) The Band Switch is the third knob from the left. The extreme counterclockwise position of this knob is for phonograph operation. The center position is for F.M. reception. The extreme clockwise position is for A. M. reception.

4) The Tuning Control is the extreme right hand knob. Turning this knob in either direction will move the dial pointer and select the stations on the A. M. or F. M. Bands.

2. ANTENNAS:

In most cases it will not be necessary to use external antennas, since the receiver is equipped with a loop antenna for AM reception and an indoor type folded dipole antenna for FM reception.

When inadequate reception is obtained from a desired station, it may be necessary to reposition the antennas to favor that station. On AM, the loop should be turned so that the edge faces toward the station desired. On FM, the entire cabinet should be positioned so that the back is broadside to the direction from which the signals are transmitted.

For the reception of weak or distant stations, or for the operation of the receiver in unfavorable locations, provisions are made for the use of external antennas. The folded dipole should be disconnected when an external FM antenna is employed.

Do not disconnect the AM loop when an external antenna is used on standard broadcast.

3. SERVICE NOTES:

Failure of the Receiver to operate may be due to:

1) All tubes not firmly in sockets.
2) No current at power socket.
3) Band Switch in wrong position.
4) Speaker not plugged in.
5) Antennas not attached.
6) Defective fuse in Receiver.

4. ALIGNMENT PROCEDURE FOR A. M.:

Equipment Required:

a) Broadcast Band Signal Generator.
b) Output Meter.

1. Set band switch to AM, advance volume control to full volume setting.

2. Connect output meter across voice coil.

3. Connect the Signal Generator across the broadcast band antenna (Rear) section of the variable condenser. The "high" side of the Generator should connect to the stator section and the "ground" side to the chassis. Adjust the Signal Generator to 455 kc and with the receiver switched on, adjust the first and second I. F. transformers for peak output as shown on the output meter. The signal injected into the receiver should be as small in magnitude as possible, consistent with a useful deflection on the output meter.

4. Connect the "high" side of the Generator to the antenna terminal with a 200mmf condenser inserted in series. Connect the "ground" side of the Generator to the chassis. Tune receiver to 60 on the dial, adjust Signal Generator to 600kc. Adjust the BC antenna coil for maximum deflection on the output meter. Use a weak signal.

5. Tune receiver to 160 on the dial. Adjust Signal Generator to 1600kc. Adjust BC oscillator and BC antenna trimmers for maximum output.

6. Repeat operations 4 and 5.

5. ALIGNMENT PROCEDURE FOR F. M.:

NOTE: *Points A. B. C. D. E. F. G. and H are noted on circuit diagram. Points C, and D have been brought out to the unused contacts of the speaker socket at the rear of the chassis.*

Equipment Required:

a) High frequency Signal Generator with 88-108 Mc tuning range.

b) Signal Generator capable of delivering .1 Volt at 10.7mc.

c) Audio output meter.

d) D. C. vacuum tube voltmeter with zero center scale.

e) Tuning wand.

Disable A.F.C. during alignment of F.M. circuits by short circuiting point "B" to chassis.

A. Ratio Detector Alignment:

1. Connect V.T.V.M. across point "C" and ground, (Detector Voltage).

2. Feed 10.7mc unmodulated R.F. Signal into 6SH7 grid (point A) through .01 ufd. condenser. This signal should be .1 volt.

3. Adjust primary of Ratio Detector (T-5) for maximum voltage indication on V. T. V. M.

4. Connect zero centered V. T. V. M. across point "D" and ground.

5. Adjust secondary of Ratio Detector (T-5) for zero indication.

6. Tune 10.7mc Signal Generator higher in frequency (about 200kc) until maximum voltage reading is obtained on V. T. V. M.; note this voltage, then tune signal generator lower in frequency until maximum voltage of the opposite polarity is obtained. Note this voltage, then if necessary re-adjust primary of the Det. (T-5) until the voltages are about equal on either the high or low side of 10.7 mc.

B. 10.7 *I. F. ALIGNMENT*:

1. Shunt a 1,000-ohm carbon resistor across the primary of the detector (T-5) (Points G and H).

2. Connect output meter across speaker voice coil.

3. Volume and tone controls at maximum clockwise position.

4. Connect 10.7mc (modulated 30%) signal generator through .01ufd. condenser across point "F" and ground.

5. Adjust secondary, then primary of (T-3) for maximum audio output. (Reduce input signal to maintain output at .5-watt level.)

6. Connect 10.7mc 30% modulated signal generator across point "E" and ground.

7. Adjust secondary, then primary of (T-1) for maximum audio output. (Reduce input signal to maintain output at .5-watt level.)

8. Remove 1000-ohm shunting resistor from across primary of (T-5).

C. *OSCILLATOR AND R. F. ALIGNMENT*:

1. Connect V. T. V. M. across point "C" and ground, (detector voltage).

2. Connect 108mc signal generator to FM antenna terminals. If generator impedance is low, put one 150-ohm carbon resistor in series with each of the generator leads. Tune receiver dial to 108 mc.

3. Adjust FM oscillator trimmer (C-51) for maximum V. T. V. M. reading.

4. Adjust FM R.F. trimmer (C-52) for maximum V. T. V. M. reading. During alignment reduce input signal to maintain Detector voltage at 2.V.

5. Repeat steps 3 and 4.

6. Feed a 90mc signal into antenna terminals (as in C-2), tune receiver dial to signal.

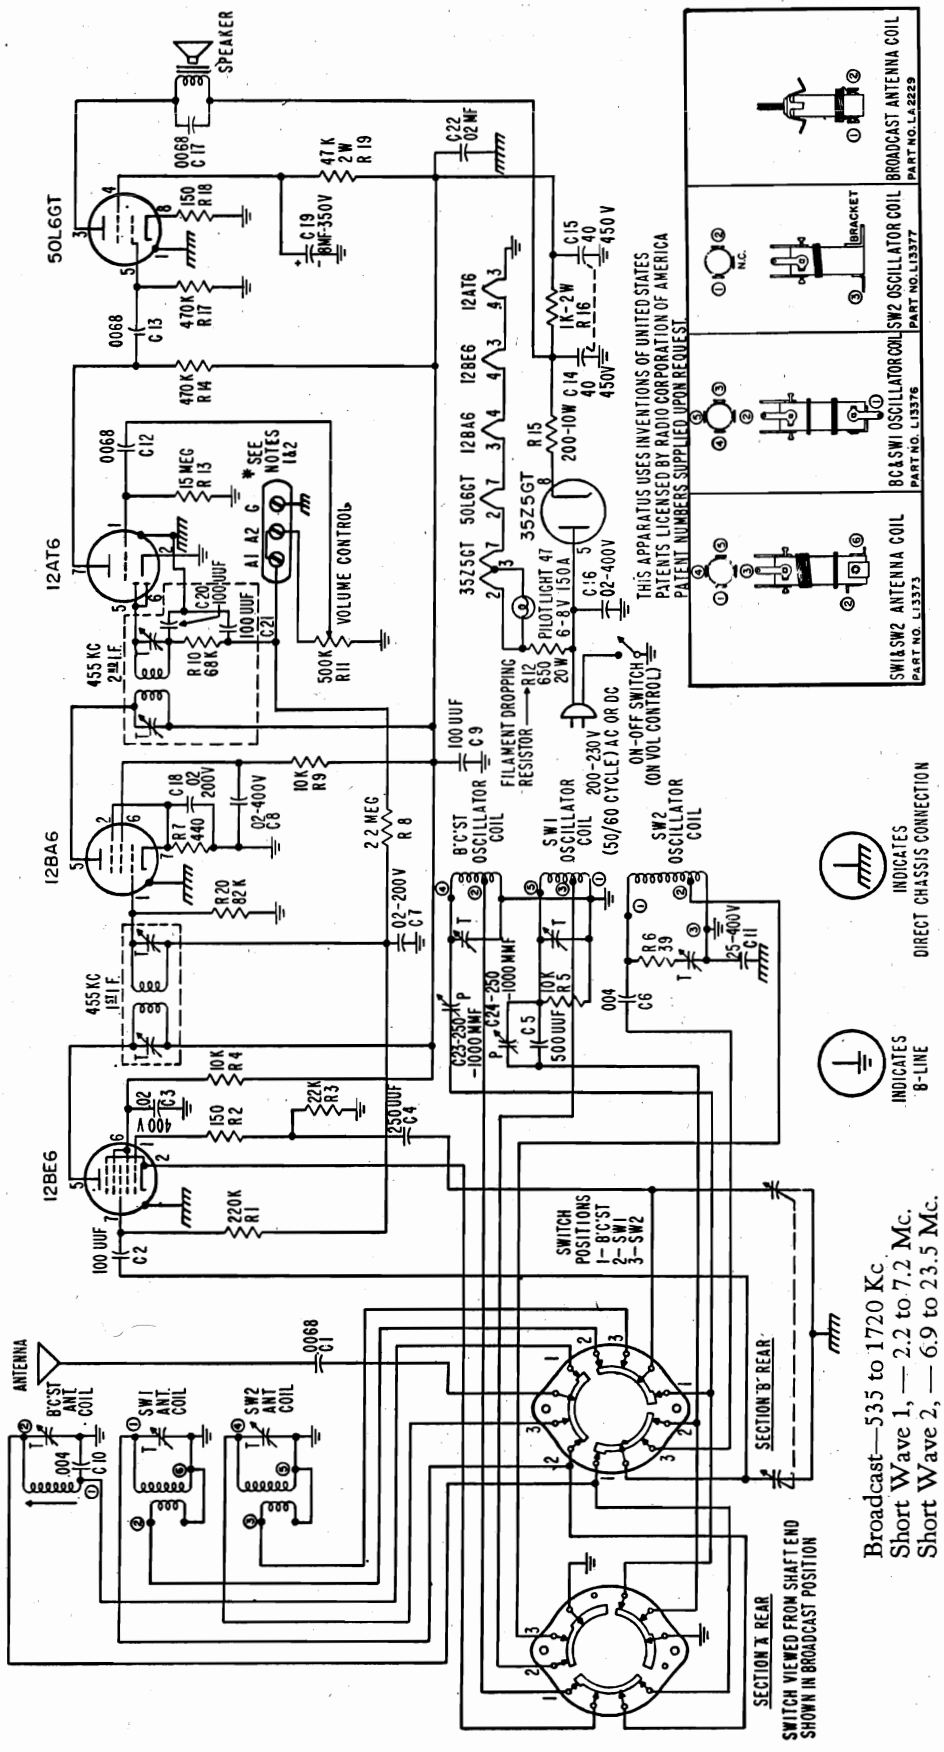
7. Test R. F. coil with tuning wand and if necessary adjust spacing of FM R.F. coil (L-4) for maximum V.T. V.M. reading at 90mc. During alignment reduce input signal to maintain Detector voltage at 2.V.

8. Repeat steps 2 and 4 if necessary.

9. Remove A.F.C. shorting jumper.

MODEL 502K

ESPEY MFG. COMPANY, INC.



Broadcast—535 to 1720 Kc.
Short Wave 1, — 2.2 to 7.2 Mc.
Short Wave 2, — 6.9 to 23.5 Mc.

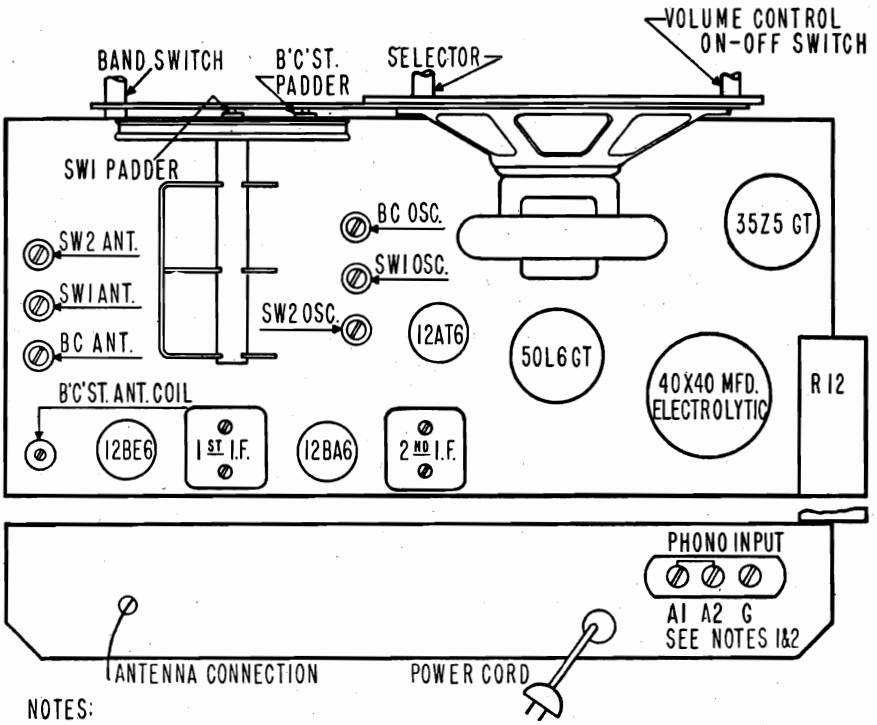
SCHEMATIC DIAGRAM (*figure 2*)

TUBE COMPLEMENT:

1 type 12BE6 — Converter, Oscillator
1 type 12BA6 — I.F. Amplifier
1 type 12AT6 — Detector, A.V.C., First Audio Amplifier
1 type 50L6GT — Beam power output
1 type 35Z5GT — Rectifier

FAILURE OF THE RADIO RECEIVER TO OPERATE MAY BE DUE TO:

1. No current at power socket.
2. Tubes not firmly in sockets.
3. Antenna not connected.
4. Defective tube.
5. Band Switch in wrong position.
6. "Phono" terminal jumper missing or or incorrectly connected.



NOTES:
1—FOR RADIO OPERATION CONNECT JUMPER FROM TERMINAL A1 TO TERMINAL A2.
2—FOR PHONO OPERATION REMOVE A1 TO A2 JUMPER. CONNECT PICKUP ACROSS TERMINAL A2 & G.

Figure 1 Tube and Trimmer Locations Radio Receiver Model 502K

ALIGNMENT PROCEDURE:

Steps	*Connect Output of Generator to*	*Tune Generator to*	*Band Switch to*	*Tune Radio to*	*Adjust the following for maximum peak output*
1.	Tuning condenser stator (RF) in series with .05 mfd.	455 kc	Bcst	Quiet point on high frequency end of dial.	2nd and 1st transformers.
2.	Ant in series with 200 mmf.	1500 kc	Bcst	1500 kc on dial.	BC Osc. Trimmer

Power supply: 40-60 cycles, 105-125V AC
Same voltage on DC

Power consumption: 60 watts

Frequency Range: Standard Broadcast—530-1680 KC
FM—87-109 MC

Speaker: 6" 1.47 oz. Alnico V Magnet
Speaker Transformer: 2000 ohms 400 cycles.
Speaker Voice Coil: 3.2 ohms

ALIGNMENT PROCEDURE

No attempt should be made to realign the various circuits until all other causes have been checked, unless the condition is so obvious as to indicate that realignment is necessary. Then proceed as follows:

A.M.:

Band switch in A.M. position
Volume Control and Tone Control in maximum clockwise position.
Low range A.C. meter connected across voice coil to indicate output.
Keep signal generator attenuated so as to maintain ½ scale reading on output meter.
Make certain that the dial pointer is exactly horizontal when variable condenser is fully meshed.

	Receiver Dial at	Signal Generator Frequency	Dummy Antenna	Connect Signal Generator To:	Refer to Chassis Layout for Location of component to be adjusted
1.	Variable Cond. fully open.	456 KC	.1 MF	Control Grid 6BE6 tube, pin #7.	Adjust L1, L2, L3 and L4 for maximum output.
2.	Variable Cond. fully open.	456 KC	.1 MF	Top of first section of variable condenser (stator of the A.M.-R.F. section.)	Adjust L5 for minimum output.
3.	Variable Cond. fully open.	1680 KC	200 MMF	Terminal #4 on back of loop.	Adjust T1 for maximum output.
4.	1500 KC	1500 KC	200 MMF	Terminal #4 on back of loop.	Adjust T2 for maximum output.
5.	600 KC	600 KC	200 MMF	Terminal #4 on back of loop.	Check tracking and bend slotted end plate (first section) of variable if necessary.

F.M.:

Band switch F.M. position. Allow at least 10 minutes "warming up" period.
Use a standard V.T.V.M. with zero center setting.
Use an A.M. signal generator with no modulation, taking harmonics if fundamentals are not available.
Keep signal generator attenuated so as to maintain approximately a 3 volt reading.
Make certain that the dial pointer is exactly horizontal when variable condenser is fully meshed.

	Receiver Dial at:	Signal Generator Frequency	Signal Generator Connected to:	V.T.V.M. Connected to:	Refer to Chassis Layout for Location of Components to be adjusted
1.	98 MC	10.7 MC	Control grid Pin #1 6BA6 (2nd. I.F.) Socket Series with .01 Condenser.	Across the two 100,000 ohm resistors marked X.	Adjust L6 and L7 for maximum output.
2.	98 MC	10.7 MC	Control grid Pin #7 6BE6 Socket Series with .01 condenser.	"	Shunt L9 with a 680 ohm carbon resistor and adjust L8 for maximum output.
3.	98 MC	10.7 MC	"	"	Shunt L8 with a 680 ohm carbon resistor and adjust L9 for maximum output.

ALIGNMENT PROCEDURE

No attempt should be made to realign the various circuits until all other causes have been checked, unless the condition is so obvious as to indicate that realignment is necessary. Then proceed as follows:
Volume Control full on.
Low range A.C. meter connected across voice coil to indicate output.
Keep signal generator attenuated so as to maintain ½ scale reading on output meter.
Make certain that dial pointer is exactly horizontal when variable condenser is fully meshed.

Receiver Dial at:	Signal Generator	Dummy Antenna	Connect Signal Generator to:	Refer to Chassis Layout for Location of Trimmers
1 Full Open	Exactly 456 KC	.1 MF	Control Grid 12BE6 Tube (Top) Rear Section Variable Condenser	Adjust for Minimum Output T5 Note: On later production this trimmer is eliminated.
2 Full Open	Exactly 1680 KC		Radiating Loop (½ meter) 20" from Receiver	Adjust for Maximum Output T6
3 Approx. 1500 KC	Approx. 1500 KC		Radiating Loop (½ meter) 20" from Receiver	Adjust for Maximum Output T7
4 Approx. 600 KC	Approx. 600 KC		Radiating Loop (½ meter) 20" from Receiver	Check tracking and bend slotted end plate (rear section) of variable if necessary.

EQUIPMENT AND PROCEDURE FOR ALIGNMENT

An output meter and a signal generator are required for proper alignment of these sets. The signal generator should be calibrated at the following points: 455 Kc., 600 Kc., 1000 Kc., 1500 Kc., 3.5 Mc., 8 Mc., 9 Mc. and 20 Mc. All adjustments should be made with the volume control set for maximum, keeping the signal generator output as low as possible to prevent AVC action and incorrect settings.

Connect the low side of the signal generator to the ground terminal on the chassis through a .1 Mfd. condenser. Connect the high side of generator to antenna terminal through dummy load of 200 MMF for broadcast band and a dummy load of 400 ohms for shortwave.

STEPS	DUMMY ANTENNA	SET GENERATOR AT	SET GANG AT	ADJUST	LOCATED	TO OBTAIN

ALIGNMENT OF THE RECEIVER

EQUIPMENT REQUIRED

Signal generator, calibrated at 455 Kc, 600 Kc, and 1500 Kc.
Output Indicator
Insulated Screw Driver

PRELIMINARY INSTRUCTIONS

Volume control is set to maximum. Keep the signal generator output as low as possible to prevent A.V.C. action and incorrect alignment. The use of an excessively strong signal is almost certain to produce misalignment.

Connect the high side of the signal generator to one side of the loop primary. Connect the other side of the primary to the B-lead. The other side of the signal generator should then be connected to the B-lead.

"Whistles" and Heterodynes

Check IF rejection ratio by application of signal generator at the intermediate frequency to the antenna terminals.

A defective wave trap will cause heterodynes.

Low Volume

If low volume of N4 combinations is experienced, we suggest the following:

1. Test tubes.
2. Check alignment of the receiver.

RECEIVER SPECIFICATIONS

*The N4 Uses a 6J7 as Phono Pre-Amplifier,

POWER AND VOLTAGE REQUIREMENTS

185 Watts at 117 Volts ..... 60 Cycles 105 to 125 Volts ..... AC

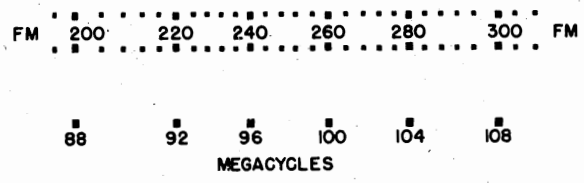
DIAL SCALE

The AM Band conventionally calibrated in Kilocycles

The conversion of FM Dial Scale readings to frequency may be made from the following analysis:

The FM band extends from 88 to 108 mc., each station channel 200 kc., in width, Channel 201, that lowest in frequency, has center frequency at 88.1 mc. Each succeeding channel is successively 200 kc., higher, so channel 202 is centered at 88.3 (200 kc. higher) channel 203 is centered at 88.5 mc., etc.

FM Band is marked with the new Channel Numbers



ANTENNAS

P4 & N4 series instruments both incorporate two internal antennas; a loop antenna used in broadcast band reception and a folded-dipole antenna used for FM reception.

These internal antennas are intended for use only in the presence of adequate field strength, as in large metropolitan areas where local stations supply the majority of desired programs. Neither a loop nor a dipole element which is within the confines of the cabinet can be considered as efficient signal pickup devices and, should field strength requirements be not fulfilled, it will be necessary, for satisfactory reception, to install an efficient outside antenna.

Both the loop and the dipole (internal or external) antennas exhibit certain characteristics of directivity, with which the experienced serviceman is familiar, which should be borne in mind when locating the receiver (or external antenna) in the home.

FARNSWORTH TELEV. & RADIO CORP. MODELS N4, P4, Series, Capehart

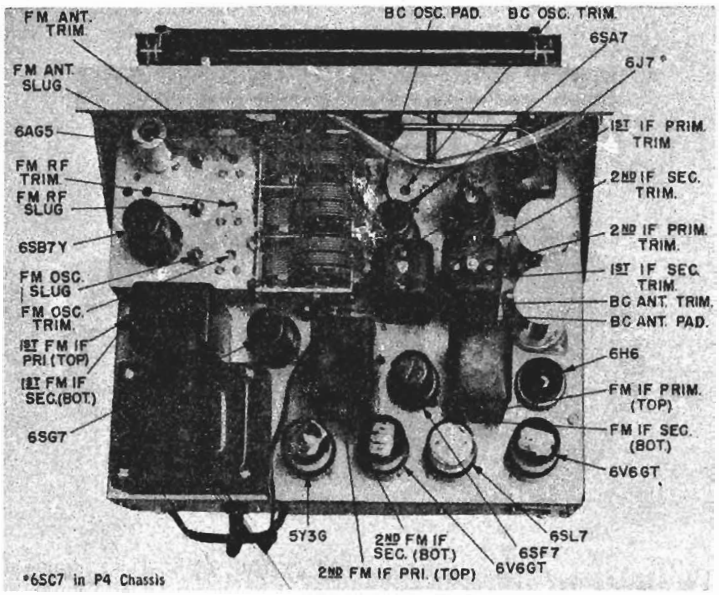
MODIFICATION KIT NO. 41140

The N4 tuner modification kit no. 41140 was issued for the purpose of revising the Phono Pre-Amplifier circuit of the tuner, in the field. This was so that P-71 record changers, using the variable reluctance pickup could be incorporated in N4 instruments already in the field. The kit is also applicable to N4 tuners that are used with the 41E record changers. A kit was also issued for the purpose of revising 41E changers to equal the new 41E-MP, by addition of the variable reluctance pickup, the Noise Eliminator and various other modernizations.

The N4 tuner which has been modified, following the instructions accompanying kit no. 41140, is the electrical equivalent of the P4 tuner

If the N4 tuner is of early production (C-175) then the circuit is different

N4 tuners that have not been modified by modification kit no. 41140 will have the Phono Pre-Amplifier circuit



ALIGNMENT OF THE RECEIVER

Two methods of alignment of P4 & N4 receivers are presented. Service shops possessing a suitable sweep generator and oscilloscope will effect a considerable saving of time by using the first method.

The alternate method using an amplitude modulated signal generator is preferred by some servicemen. This method requires careful attention to details to attain accurate alignment.

GENERAL INSTRUCTIONS

1. Adjustment of Dial Pointer

To prevent misalignment, do not proceed with alignment until dial pointer has been checked for correct mechanical adjustment

2. Test Signal Conditions

All alignment shall be done with only sufficient signal amplitude to provide satisfactory signal to noise ratio, and acceptable pattern size on oscilloscope or readable output on output meter. The use of excessively strong signal is almost certain to produce misalignment.

ALIGNMENT OF FM BAND

1. Equipment required will be an oscilloscope, a frequency modulated signal generator covering the range 87.5 mc to 108.5 mc on fundamentals, a sweep generator producing a signal of 10.7 mc and sweeping at least 150 kc each side of 10.7 mc, and an output meter.

2. The vertical or "Y" axis terminals of the oscilloscope should be connected between pin 3 of the 6H6 discriminator and ground. The sweep voltage of the sweep generator should be fed to the horizontal or "X" axis terminals of the oscilloscope. The 10.7 mc output of the sweep generator should be fed into the grid of the 6SF7 tube through a condenser of approximately 3300 mmfd.

3. Remove the negative lead of the 4 mfd. electrolytic from pin #3 of 6H6 socket. Remove 6SL7 tube from socket. Turn the set on and turn both the tone control and the volume control all the way to the right. Detune the secondary of the third FM IF transformer by turning the bottom slug screw out as far as possible. Adjust the primary top slug screw, until pattern (A) appears on the oscilloscope. Adjust the secondary, bottom slug screw, until pattern "B" is obtained on the oscilloscope and until both sides of this pattern are symmetrical.

4. Remove the 10.7 mc output of the sweep generator from the grid of the 6SF7 tube and connect to the grid of the 6SG7. Align the second FM IF transformer as in paragraph "3."

5. Connect the 10.7 mc output of the sweep generator to the signal grid of the 6SB7Y, (pin 8) detune secondary of the first FM IF transformer and tune primary as before for pattern (A). Tune secondary for pattern "C" and make both sides of pattern as symmetrical as possible. This completes alignment of the FM IF transformers.

6. Reconnect the negative lead of the 4 mfd. electrolyitic to pin #3 of the 6H6 socket and move the oscilloscope leads to the middle terminal on third FM IF (to which tertiary winding connects) and ground. With the sweep generator connected to the 6SB7Y signal grid as before, the discriminator pattern (D) should appear on the oscilloscope if the IF alignment instructions have been followed carefully. Remove the oscilloscope and sweep generator leads and reinstall 6SL7 tube in socket. Never adjust AM IF transformers without rechecking FM IF alignment.

7. Connect the 87.5 to 108.5 mc signal generator to the antenna socket of the receiver through a 300 ohm resistor. The generator should be frequency modulated at some frequency in the audible range. Connect output meter across secondary of

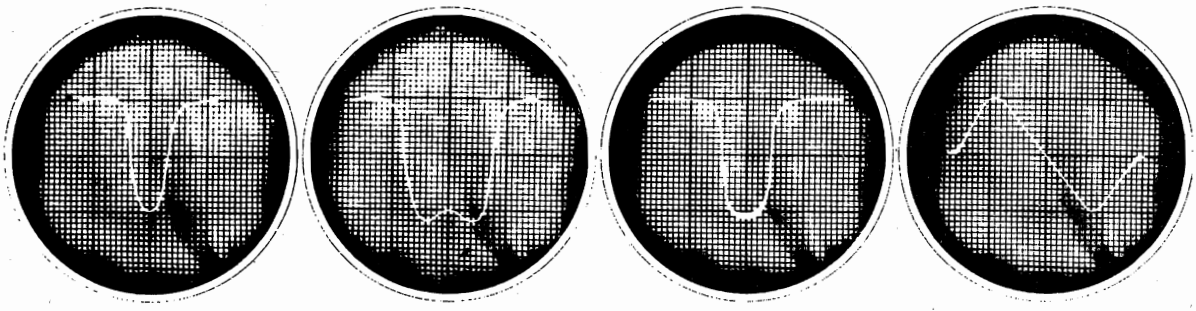
MODELS N4, P4,
Series, Capehart

FARNSWORTH TELEV. & RADIO CORP.

output transformer. Tune receiver to channel 300 FM dial. With signal generator set at 107.9 mc adjust oscillator trimmer condenser, third from front, for maximum reading on output meter. Set signal generator to 87.9 mc and tune receiver to channel 200 on FM dial. Adjust oscillator coil screw, third from front, (see chassis layout) for maximum reading on output meter. Recheck oscillator setting for channel 300.

8. Tune signal generator and receiver to 105 mc (channel 285 approx.). Adjust converter signal grid trimmer condenser, second from front, for maximum reading on output meter. Tune signal generator and receiver to 92 mc, (channel 220 approx.) and adjust converter coil screw, (second from front), to maximum reading on output meter. Recheck converter trimmer setting at 105 mc (channel 285 approx.).

9. Repeat operations of paragraph (7) for antenna trimmer condenser and coil. This completes FM RF alignment.



A B C D

ALTERNATE FM ALIGNMENT PROCEDURE

Necessary Equipment:

Signal generator.

Vacuum tube voltmeter or DC voltmeter 20,000 ohms per volt.

FM IF ALIGNMENT

Adjust dial pointer as outlined in section VII.

Connect voltohmyst from ground to pin #3 of 6H6. Connect generator tuned to 10.7 mc to pin #4 on 6SG7. Turn secondary slug of third FM IF (closest to chassis) out as far as it will turn. Tune primary of third IF for maximum negative voltage. Tune primary and secondary of the second FM IF for maximum output. Move generator to pin #8 of 6SB7Y and tune primary and secondary of first FM IF for maximum output. Next tune secondary of third FM IF to balance to zero volts, using high resistance voltmeter connected to middle terminal of FM IF transformer (tertiary winding).

FM RF ALIGNMENT

With high resistance voltmeter connected between ground and pin #3 on 6H6 socket, connect generator between ground and small pin of dipole antenna socket. Use very short leads on generator and a 300 ohm resistor as a dummy antenna. Set generator to 108.5 mc and gang to minimum and adjust oscillator trimmer for maximum voltage. Go back and check low frequency end. Next set generator at 92 mc, tune in signal on receiver, approximately 220 on dial. Adjust converter and antenna slug for maximum voltage output. Set generator at 105 mfd. Tune in signal on receiver, approximately 280 on dial. Tune converter and antenna trimmer for maximum voltage output. Check adjustment of antenna and converter slugs at 92 mc.

ALIGNMENT INSTRUCTIONS FOR AM BAND

An output meter and a signal generator calibrated at 455 Kc., 600 Kc., 1500 Kc. and 1600 Kc., are required to properly align these receivers on AM band. Keep the output of the signal generator as low as possible to prevent AVC action and false settings. Connect the high side of the generator to the blue wire found at rear of set and low side to the white wire.

STEPS	DUMMY ANTENNA	SET GENERATOR AT	SET GANG AT	ADJUST	LOCATED	TO OBTAIN
1	SET VOLUME AND TONE CONTROLS AT MAXIMUM					
2	.1 Mfd. to converter RF grid	455 Kc.	Minimum	2nd IF Trimmers*	Top of IF Transformers	MAXIMUM OUTPUT
3				1st IF Trimmers**

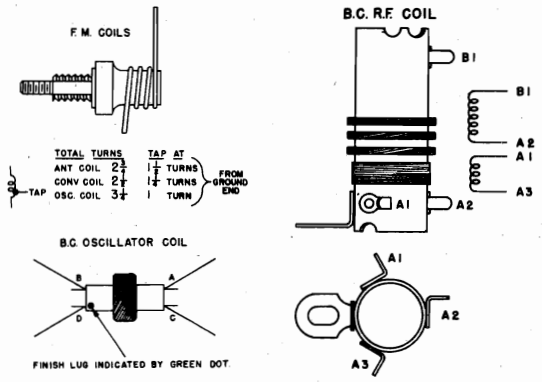
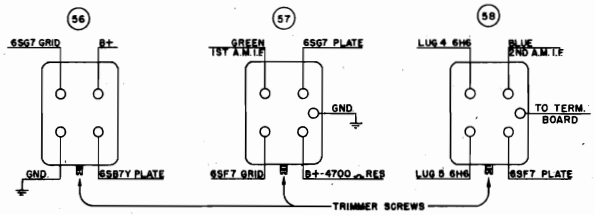
8		600 Kc.	600 Kc.	Peak loading coil slug	See Trimmer Layout	
9	Recheck 1500 Kc.					

* Recheck after FM alignment.
** Not used on early production.

FARNSWORTH TELEV. & RADIO CORP. MODELS N4, P4, Series, Capehart

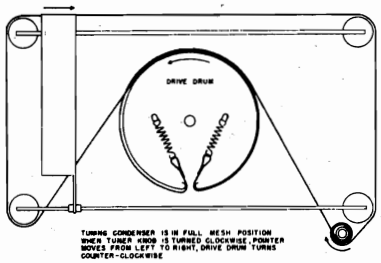
RECEIVER RF-IF COILS





Letters on terminals of coils correspond to similarly lettered terminals on the coils shown in the circuit diagram.

MAINTENANCE OF THE TUNER



1. Adjustments of Dial Pointer

a. Tune receiver to extreme low frequency end of dial and set pointer to index at the last calibration mark of either scale.

b. Carefully determine that the gang condenser plates are completely meshed with the pointer in this position.

Warning: This adjustment is extremely important if subsequent alignment is to provide accurate calibration.

NOTE: The pointer remains dark when the band switch is in the phonograph position.

c. Tune the dial across the entire range and observe that the pointer line is a single sharply defined line of uniform brilliance. If this is not obtained, it indicates that mechanical adjustment of the spacing of the light-box from the dial glass is necessary.

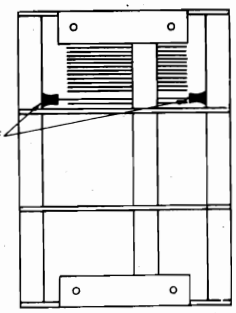
2. "Sticking" Light-Boxes

The traveling light-box may be sticking, causing dial slippage. This may be due to (a) lubricant on rods, (b) bent rods, (c) rough rods, (d) misalignment of rods.

(a) The rods must be free of all lubricants. Lubrication, momentarily helpful, causes gum to form at the light-box mounting, resulting in "sticking." Clean well with carbon tetrachloride.

(b) Bent rods must be accurately straightened or replaced.

(c) Rough portions of the rod surface should be cleaned with crocus cloth until perfectly smooth.



3. Dial Glass Plate

Paint scratched. This is due to the light-box assembly contacting the painted surface. Adjust the horizontal positioning of the light-box for optical focus of the projected line of light, so that (1) focus is maintained throughout the entire path of travel, (2) front of light-box assembly does not at any point touch the scale. The clamps which hold the glass rod in place may be clipped back if necessary.

Touch-up paint may be obtained at automobile service stations.

4. Control Knobs—Eccentric—Loose—How to Remove

A. Knobs eccentric (wobbly motion) or loose. This may be caused by pinching together the two halves of the split-shaft end. One-half section becomes bent toward the axis of the shaft to a greater degree than does the other. Re-form the split portions of the shaft so that they are symmetrical with respect to the axis of the shaft.

B. To remove control knobs.

Loop a heavy cord behind the knob, bringing out the two ends at opposite sides of the knob. Pull both ends firmly. If the cord (both ends) is brought out on one side only, there will be a tendency to cause the difficulty of 4A, above.

5. Microphonics and Feedback

A. Microphonic tubes.

B. Check the variable condenser stator plates to ascertain whether they are loose. If so, apply a laquer cement to the clamp which holds the stator plates to the insulating material.

C. "Twin lead" to antenna binding posts may be stapled to cabinet in taut condition, whereby feedback is introducted mechanically. Re-staple the twin lead, leaving somewhat free and loose.

D. On FM, microphonics and howl may be caused by the lead from stator plate to sub-chassis assembly being taut. Re-solder with less tension in the flat ribbon lead.

NOTE: Oscillator trimmer may have to be readjusted.

E. If howl on the FM position persists, the following may alleviate the condition: Sponge rubber bits added as shown in sketch. Rubbers must be trimmed so that they will not touch rotor plates when the condenser is fully-meshed. Observe dial calibration for any change resulting from increased capacity.

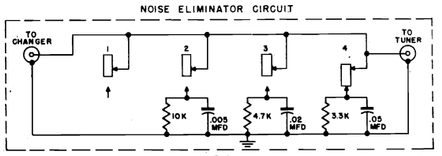
SPECIAL INFORMATION
P-4 SERIES

THE NOISE ELIMINATOR

P4 series instruments are divided into two groups, the instruments using the 41E-MP record changer (100P4 series) and those using the P-71 drop type record changer. The N4 series is also divided in a like manner.

The 41E-MP automatic record changer, used in the 100P4 series instruments, uses the new "Magnetic True Timbre" pickup, which is of the variable reluctance type. The Noise Eliminator used with these instruments is contained in a metal control box which is mounted on the inner wall of the record changer compartment. A schematic diagram of the noise eliminator circuit, as used in the 100P4 series is shown below:



On P4 series instruments using the P-71 record changer the noise eliminator circuit and selector switch are included on the changer itself.

RECORD CHANGER AC CABLES

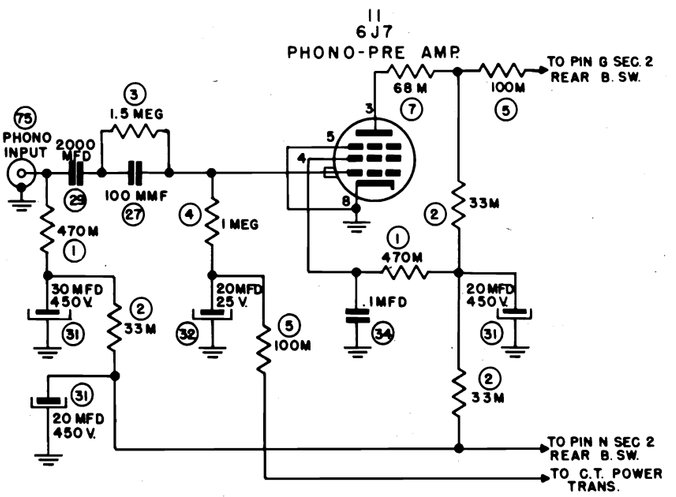
100P4 and 100N4 series instruments use the Record Changer AC Cable, part no. 22182. This cable is a multi-purpose cable, in that it not only supplies A.C. power to the 41E-MP record changer, but also supplies 110 volts to the record changer compartment light and in addition serves to connect the Reject Button to the record changer.

P4 instruments using the P-71 record changer and N4 instruments using the P-63 changer, both use the Record Changer AC Cable, part no. 22184. This cable serves merely as a power carrier to the record changer.

Schematic diagrams of both cables are shown

The 41E-MP & 41E record changers used in the P4 and N4 respectively are identified by a brown dot painted on the bearing cover plate of the main cam support bracket. Early production of the 41E, carrying either no dot or a red dot, are not directly interchangeable in the N4 and P4 without a modification in the wiring of the junction box. Reference should be made to the 41E manual.

This maintenance manual deals with the radio chassis of the instrument. For servicing information on the record changer, reference should be made to the manuals dealing with the 41E, P-71 or the P-63.



The N4 tuner is essentially the same as the P4 tuner, the schematic diagram with exception of the Phono Pre-Amplifier circuit. The Phono Pre-Amplifier, as used in the N4 tuner, is shown in that portion of the schematic reproduced above:

87	04070	Mount. Clamp for Dial Glass Scale
88	04098	Top Dial Support Angle Brkt.
89	13807	Dial Glass Scale Assy.
90	13631	Dial Pointer Box Assy.
91	62115	Rubber Grommet (on bottom of dial Support
92	55261	Tuning Fly Wheel
93	07410	Brg. Assy. for Lower Pointer Guide
94	58552	Mount. Brkt. for Phono AC Switch.
95	55259	Guide Rod (upper & lower) for Pntr. Box Assy.
96	77207	3.3 Meg. Ohm Resistor
97	13889	Pre-Amp. Equalizer Assy.

MISCELLANEOUS PARTS LIST

Part No.	Description
07529	Dial cord and spring assy.
11382	AC phono cable & plug assy. (for two gang N4 chassis, C-175)
17019	Tuning drive drum
22183	AC phono cable and plug assy. for C-226, N4 Chassis and C-235, P4 Chassis
25187	Molded mica cap. 240 mmf +10%
25270	Tubular Elec. cap. 4 mfd. 100V.
25325	Ceramic cap. 60 mmf. +5%
36927	Snap washer (for tuning drive shaft)
36936	Flange sleeve to mount tuning cond.
42185	Pilot light
54144	Bakelite mtg. wafer for fltr. cond.
54161	Ceramic spacer for mtg. trm. cond.
54193	Glass rod pointer for stat. pointer box
55260	Mtg. stud for fibre dial cord pulley
56183	Tuning shaft bearing
56518	Rear mtg. brkt. for tuning condenser
56528	Front mtg. brkt. for 2 gang tun. cond.
58302	Capacitor clip
58335	Min. tube shield
58446	Clamp to hold dial string to pntr. box
58524	Mtg. clip for glass rod sta. pointer
58880	Front mtg. brkt. for 3 gang cond.
59391	Plastic prism for sta. pntr. box
60315	N4 chassis bottom cover
62099	Rubber mtg. grommet for tuning cond.
64351	Spring only for dial cord
64382	Compression spring for pntr. guide bar
80139	Molded octal socket
80319	Miniature tube socket
80344	Pilot light socket and lead
2000-007	#2-56x5/16" R.H.M.S. (to mount plastic prism in pointer box)
2000-071	#3-48x1" lg. R.H.M.S. (adj. screw for pointer guide bar)
11325	Dipole antenna assy. (mounted on cab.)
13581	Speaker network term. board assy. (100 series P4 & N4)
22152	Pickup cable (100N4 & 100P4 series
22156	Pickup cable (for P4 & N4)
22182	Record changer AC cable (100N4 & 100 P4 series
22184	Record changer AC cable (P4 & N4, series)
31419	Escutcheon for Pan. N4 series
31429	Escutcheon for 100N4 & P4 series
36478	#3-48 x ¼" lg. Phillips F.H.M.S. to mount escutcheon mtg. plate
41130	Mounting screw kit for dial escutch.
58461	Special #3-48 tapped nut for escutch. mtg. plate
58546	Escutcheon mtg. plate (metal)
59316	Tuning and volume knob
59373	Tone control knob
80284	5 prong male speaker plug with cap
80362	2 prong male plug for FM dipole ant.
80366	3 prong female connector on phono AC cable (100N4 & 100P4 series)
80368	6 prong female plug and cap for phono AC cable (100N4 & 100P4 series)
80373	Male connector plug for reject switch cable (100N4 & 100 P4 series)
80422	Ant. and ground terminal strip
80463	6 prong male plug and cap for phono AC cable (100N4 & 100P4 series)
81155	Speaker and output trans. assy. (12")
81183	Cone and voice coil assy. (12")
81184	Treble speaker only (100N4 & 100P4)
90194	Reject switch (100N4 & 100P4)

AUTOMATIC RECORD CHANGER

P7		P9 & P10
P-71	Type	P-72 (P9)—P-73 (P10)
78 RPM	Speed	78 RPM

POWER AND VOLTAGE REQUIREMENTS

Power Consumption—105 watts at 117 volts. Voltage—105 to 125 volts at 60 cycles per second.

ANTENNAS--INTERNAL AND EXTERNAL

SECTION III

Two antennas are provided within the cabinet—a Capehart Low Impedence Loop and a Folded Dipole, constructed of 300 ohm "twin lead."

The loop antenna provides signal pickup for broadcast-band AM reception. This antenna is a directional device (its radiation pattern would show greatest signal pickup directly in front and in back of the loop, with very little if any pickup from its sides). Therefore, the reception of a desired weak signal may be improved by swinging the loop to a new position. The loop is fastened to the inner cabinet wall by means of two hinges which permit it to be adjusted. The built-in loop normally provides satisfactory reception, however in locations remote from broadcasting stations or where poor receiving conditions exists, an outdoor antenna will improve reception.

By shorting terminals 3 and 4 on the antenna terminal strip on the rear of the chassis, the outdoor FM dipole (if used) can be utilized as an outdoor antenna for AM reception. However, if a separate AM outdoor antenna is to be used the lead-in from the antenna should be connected to terminal 4 on the antenna terminal strip, on the rear of the chassis.

The half-wave folded dipole within the cabinet is for FM reception, connection being made by a section of 300 ohm transmission line. It should be borne in mind that the dipole is also a directional device. Should the reception of a desired FM station be inadequate after installation in the home, it may be possible to correct the condition by relocating the receiver in the room.

Internal antennas are intended for use only in the presence of adequate field strength, as

MODELS P7, P9, P10, FARNSWORTH TELEV. & RADIO CORP.
Series, Capehart

in large metropolitan areas where local stations supply the majority of desired programs. Neither a loop nor a dipole element which is confined within a cabinet can be considered as efficient signal pickup devices, therefore if field strength requirements are not met, it will be necessary for satisfactory reception, to install an efficient outside antenna.

When an outside dipole is used, disconnect the transmission line to the internal dipole from the Fahenstock clips on the rear of the cabinet and connect the transmission line from the outside dipole to these clips.

The same chassis as used in the P7 instruments is also used as an AM-FM chassis in Capehart Television-Radio-Phono Combinations. In this case an outside television antenna will be connected to the clips at the rear of the cabinet and it will be necessary to connect the antenna terminals on the video chassis to terminals 1 and 2 on the receiver antenna terminal strip.

MAINTENANCE OF THE RECEIVER

SECTION IV

1. Adjustment of Dial Pointer

a. Tune receiver to extreme low frequency end of dial and set pointer to index at the last calibration mark of either scale.

b. Carefully determine that the gang condenser plates are completely meshed with the pointer in this position.

Warning: This adjustment is extremely important if subsequent alignment is to provide accurate calibration.

2. Dial Slippage

a. The dial pointer may be sticking, causing dial slippage. This may be due to (a) lubricant on rod, (b) bent rod, (c) rough rod.

(a) The rod must be free of all lubricants. Lubrication, momentarily helpful, causes gum to form at the pointer mounting, resulting in "sticking." Clean well with carbon tetrachloride.

(b) Bent rods must be accurately straightened or replaced.

(c) Rough portions of the rod surface should be cleaned with crocus cloth until perfectly smooth.

3. Replacing Miniature Tubes

Inadvertently inserting miniature tubes in their sockets incorrectly will result in damage to the tube pins. Therefore extreme care should be taken to see that the tube pins are properly aligned with the tube socket before applying pressure to insert the tube. As an aid to the serviceman we have placed an indicating mark on the miniature tube sockets to show the correct position for the center of the separation space between the first and last pins on the tube. In this manner it is posible to line-up the tube with the socket before exerting pressure.

4 Control Knobs—Eccentric—Loose—How to Remove

a. Knobs eccentric (wobbly motion) or loose.

This may be caused by pinching together the two halves of the split-shaft end. One-half section becomes bent toward the axis of the shaft to a greater degree than does the other. Re-form the split portions of the shaft so that they are symmetrical with respect to the axis of the shaft.

b. To remove control knobs.

Loop a heavy cord behind the knob, bringing out the two ends at opposite sides of the knob. Pull both ends firmly. If the cord (both ends) is brought out on one side only, there will be a tendency to cause the difficulty of 4a, above.

5. Microphonics and Feedback

a. Microphonic tubes.

b. Check the variable condenser stator plates to ascertain whether they are loose. If so, apply a laquer cement to the clamp which holds the stator plates to the insulating material.

c. "Twin lead" to antenna binding posts may be stapled to cabinet in taut condition, whereby feedback is introduced mechanically. Re-staple the twin lead, leaving somewhat free and loose.

d. On FM, microphonics and howl may be caused by the lead from stator plate to subchassis assembly being taut. Re-solder with less tension in the flat ribbon lead.

NOTE: Oscillator trimmer may have to be readjusted.

REMOVING CHASSIS FROM CABINET

Following is the suggested procedure to be employed in removing the receiver and preamplifier chassis from the cabinet for service purposes.

Model 35P7

1. Remove the knobs.

2. Disconnect the A.C. cable and phono input cable from the record changer. To do this simply remove the two palnuts in the front of the record changer slide drawer and lift the drawer up just enough to reach in and remove the plugs from the power socket and the phono output jack on the changer. It will be necessary to unfasten the cables from the changer slide where they are held in place. Upon reassemblying the instrument, be certain that these cables are again fastened so that they will not become entangled in the changer mechanism.

3. Remove the Phono Pre-amplifier chassis by removing the three mounting screws which fasten it to the cabinet wall.

4. Remove the pre-amp output cable from the phono input jack on the receiver chassis and disconnect the pre-amp power cable.

5. Disconnect the speaker cable and antenna leads.

6. Remove the two mounting bolts in rear of the receiver chassis and slide the chassis out on the chassis mounting board. The mounting board will have to be removed to get at the underside of the chassis.

Models 32P9 and 33P9

1. Remove the knobs.
2. Disconnect the a.c. cable and phono input cable from the record changer. The underside of the changer is easily accessible from the rear of the cabinet. Both cables are fastened to the inner wall of the cabinet by means of insulated staples, it will be necessary to remove these staples. Upon reassembling the instrument, be certain that these cables are again fastened as they were.
3. Remove the phono preamplifier chassis by removing the three mounting screws which fasten it to the cabinet wall.
4. Remove the pre-amp output cable from the phono input jack on the receiver chassis and disconnect the pre-amp power cable.
5. Disconnect the speaker cable and antenna leads.
6. Remove the molding from around the glass escutcheon and remove the escutcheon.
7. Remove the chassis mounting bolts. (The chassis is mounted on the wall of the cabinet. The bolts, which are accessible from the record storage compartment, are concealed by plug buttons.) The two top bolts are to be removed first, then loosen the bottom bolt slightly. Grasp the chassis from the top, preferably by placing the fingers under the dial background panel, remove the final mounting bolt with the other hand and then lower the chassis to the bottom of the cabinet.

Model 34P10

1. Use the same procedure as described for models 32P9 and 33P9 with exception of steps 3 and 4. (The 34P10 does not use the phono preamplifier.)

NOTE: It is not necessary to remove the chassis from the cabinet to replace tubes or dial lights or to remove tubes for testing in any of these models. All tubes are accessible from the rear of the cabinet in the 35P7. In the other models there is a removable panel in the partition separating the receiver and record changer compartments. Tubes that are not accessible from the rear of the cabinet are accessible through the opening provided by this panel.

ALIGNMENT OF AM BAND

SECTION VI

EQUIPMENT REQUIRED

A calibrated RF Signal Generator having fundamental frequencies of from 455 KC to 1620 KC.

A Voltohmyst, or some such high resistance type AC voltmeter.

An insulated screwdriver.

GENERAL INSTRUCTIONS

For IF alignment the signal generator is to be connected through a .1 mfd. capacitor to the grid (pin 7) of the 6BE6 AM converter tube.

For RF alignment the signal generator is to be connected through a .1 mfd. capacitor to the RF section of the gang tuning capacitor.

For adjustment of the wavetrap the 455 KC signal should be connected to terminal 4 on the Antenna Terminal Strip on the rear of the chassis. The wavetrap is mounted on the loop antenna.

The AC voltmeter can be connected either across the voice coil of the loud speaker or if the meter range is high enough, from plate to plate of the output tubes, using a .1 mfd. capacitor for isolation.

TABULATION FOR AM ALIGNMENT

See page 11 for Trimmer locations

FM ALIGNMENT

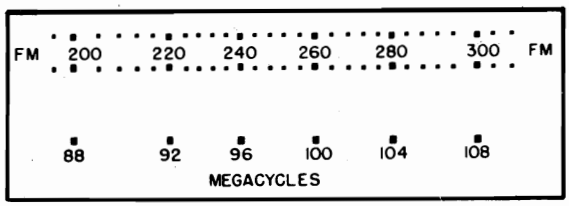
SECTION IX

This section presents information on two methods of alignment of Capehart receivers. Those service shops possessing a suitable Sweep Generator and Oscillograph will effect considerable saving of time, as well as assuring more precise alignment, by using the first method, the sweep generator method. This is the method used in factory alignment.

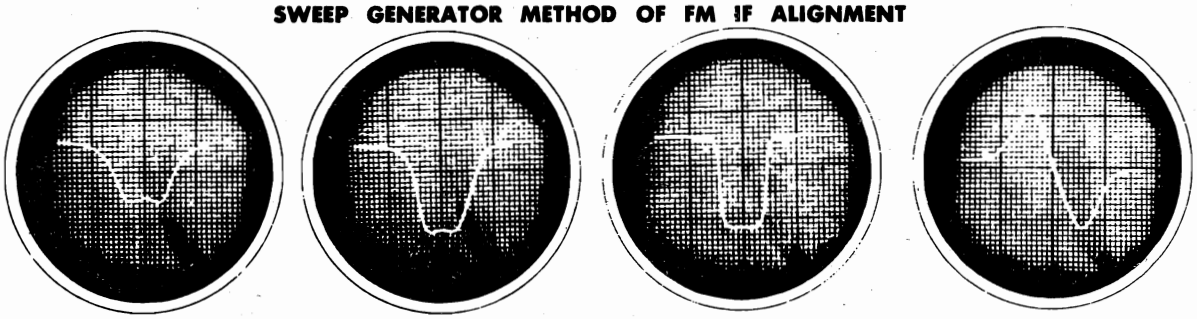
An alternative method, using an amplitude-modulated signal generator, is presented in the second portion of this section, which covers alignment of FM, IF and RF stages.

The conversion of FM dial scale readings to channel numbers can be made, with the help of the charts shown here, from the following analysis:

The FM band extends from 88 to 108 mc., each station channel 200 kc. in width. Channel 201, that lowest in frequency, has center frequency at 88.1 mc. Each succeeding channel is successively 200 kc. higher, so channel 202 is centered at 88.3 (200 kc. higher), channel 203 is centered at 88.5 mc., 206 at 89.1 mc., etc.



SWEEP GENERATOR METHOD OF FM IF ALIGNMENT



(1) (2) (3) (4)

These curves were obtained under ideal conditions and show curves to be expected. They should be duplicated as nearly as possible.

1. Equipment required: Oscilloscope, 10.7 MC Sweep Generator, Voltohmyst and RF Signal Generator.

2. Make connection from vertical deflection amplifier of oscilloscope to pin No. 2 of 6T8 discriminator tube. Make certain that the 4MFD electrolytic condenser is disconnected from this same circuit. It is necessary that the lead to the oscilloscope be shielded, of low total capacity and connection to the receiver isolated by means of a 47K resistor.

3. Connect Sweep Generator to last FM IF grid (pin 4 6SK7) through a .001 MFD coupling capacitor.

4. Connect a 350 mmf. capacitor across the discriminator secondary. Back out discriminator secondary slug (top slug) as far as it will turn. Align primary (bottom slug) to obtain a somewhat broad but single peaked curve. Then remove the 350 mmf. capacitor and tune the secondary to obtain a curve similar to figure 1. This does not constitute a final alignment of the discriminator, but is a convenient expedient to assist in IF alignment.

5. Shift connection of sweep signal generator to the grid of the second FM IF tube.

NOTE: As alignment moves from stage to stage, reduce input instead of reducing oscilloscope gain.

6. Align the third FM IF transformer by first turning the secondary slug all the way out, adjust the primary and then the secondary for a symmetrical flat top pattern, as in Fig. 2.

7. Align second IF transformer in same manner as described in Section 6. Note that the width of the nose of the curve is the same as before, but the sides have become steeper as in Fig. 3.

8. Connect the signal generator to the grid of the mixer tube, in series with a 10,000 resistor and a .001 MFD capacitor or loosely couple by stray capacitance of an insulated wire.

9. Align first FM IF Transformer in the same manner as in Section 6. Note that the sides of the curve have further steepened, but that the nose of the curve has retained approximately the same width as in Fig. 3.

10. Connect 4 MFD electrolytic capacitor, that was previously disconnected.

11. Connect oscilloscope to audio output terminal of the discriminator transformer.

12. With sweep signal input to converter grid, align discriminator transformer for conventional discriminator pattern, as in Fig. 4.

15. Connect the signal generator to the mixer tube grid. With an unmodulated signal at 10.7 MC adjust the input to 190 microvolts. Connect a voltohmyst to the AVC line. Rock the signal generator until the peak is obtained on the voltohmyst. With a 190 microvolt input this peak should read -1 volt.

SIGNAL GENERATOR METHOD

GENERAL INSTRUCTIONS

a. Tune receiver to extreme low frequency end of dial and set pointer to index at the last calibration mark.

b. Carefully determine that the gang condenser plates are completely meshed with the pointer in this position.

WARNING: This adjustment is extremely important if subsequent alignment is to provide accurate calibration.

c. With the pointer at the extreme low end of the range, rotate band switch through all positions and note that the pointer line is accurately indexed on both the AM and FM bands.

Unless otherwise indicated, the receiver controls shall be set as follows during all alignment operations:

a. Set treble tone control to maximum treble position.

b. Set bass tone control to maximum bass position.

c. Set volume control to maximum.

FM IF ALIGNMENT

1. Connect a voltohmyst or high resistance voltmeter on AVC line (negative lead to pin 2 of 6T8 and positive lead to chassis) through a .001 capacitor. Connect on AM signal generator, set at 10.7 MC, to the grid of the last FM IF amplifier. Connect output meter on voice coil of speaker.

2. Turn the secondary slug of the FM detector transformer (top slug) out as far as it will turn. Then, tune the primary (bottom slug) for maximum output (negative voltage) on the voltmeter.

3. Connect generator to grid of second FM IF amplifier (6SK7).

4. Detune the secondary of the 3rd IF transformer by turning out as far as possible.

5. Tune the primary of the 3rd IF transformer for maximum voltage, next tune the secondary for maximum voltage.

NOTE: In each step do not use an input greater than necessary to give three volts AVC.

6. Connect signal generator to grid of first IF amplifier (6SK7).

7. Detune the secondary of the 2nd IF amplifier by turning out as far as possible.

8. Tune the primary of the 2nd IF for maximum voltage, next tune the secondary for maximum voltage.

9. Connect the signal generator to the FM mixer grid (12AT7).

10. Tune the 1st IF transformer as in steps 7 and 8.

11. With the generator still connected to the FM mixer grid and modulated with 400 cycles, about 200 microvolts input, adjust the FM detector secondary slug for minimum output voltage on the output meter which is connected across the voice coil.

FM RF ALIGNMENT

1. Equipment required:
   a. RF Signal Generator. Range 88 to 108 MC.
   b. Output Meter.
   c. Insulated Screw Driver.

2. Connect RF signal generator in series with 330 ohm carbon resistor to "high" side of FM antenna socket. Connect output meter across voice coil of speaker.

3. Set tuning control for pointer to calibrate at 108.

4. Apply 108 MC Signal.

5. Set converter and antenna trimmers at minimum capacity.

6. Adjust oscillator trimmer by tuning from maximum capacity to first signal that is heard, and peak for maximum output.

7. Adjust antenna and converter trimmers for maximum output.

8. Set tuning controls so dial pointer calibrates at 88 MC.

9. Apply 88 MC signal.

10. Adjust oscillator, converter, and antenna slugs to maximum output.

11. Repeat operations 3 to 10 inclusive.

NOTE: The degree of adjustment required in the tuning of the oscillator slug will determine the number of times operations 3 to 10 must be repeated until no further gain in sensitivity is obtained.

12. Carefully tune across the entire FM band for the observance of the dead or weak spots that may be a resultant of improper alignment or defective components. This can be determined by carefully noting the degree of receiver noise, that is, high noise generally is accompanied by good sensitivity.

FARNSWORTH TELEV. & RADIO CORP. MODEL 400M Series, Capehart

GENERAL DESCRIPTION

SECTION 2

It has been our aim in this Service Brochure to include all of the necessary information to guide an experienced service man in locating and correcting all types of service difficulties that may be encountered during normal operation of the instrument. No attempt has been made to include an elementary discussion of the basic fundamentals or principles of operation of the component parts since it is assumed that no attempt will be made to service a Capehart DeLuxe Instrument unless the service man has sufficient technical training or experience to be familiar with the practice and theory involved in fundamental radio circuits and automatic record changing mechanisms.

In the design of the 400 M series Capehart DeLuxe Instruments we have endeavored to not only retain all of the desirable features incorporated in the "K" series, but to improve upon the performance of every unit in keeping with Capehart tradition. When considered as a whole each 400 M series Instrument represents a group of interconnected components of sound design offering the best in radio and record reproduction as we know it today.

The features retained in the tuner are the motor driven selector switch to permit extended and remote control; separate Bass, Master and Treble volume controls, the latter being used in conjunction with a high fidelity switch; and the "FM" band for the reception of frequency modulated signals. For record reproduction we have retained the famous Capehart 16-E Record Changer, which is the only fully automatic, continuous playing record changer on the market today, plus the play control feature which permits playing a predetermined number of selections and then automatically shuts the instrument off.

Again triple unit construction is employed, i.e., separate chassis for the tuner and each amplifier, resulting in improved circuit stability and performance, together with dual speakers for perfect Bass and Treble response. Authentic cabinet styling is a characteristic of all fine Capeharts. Each cabinet bears the stamp of approval of the Walnut and Mahogany Institutes.

The new improvements incorporated in the "M" series DeLuxe Capeharts are the electrically operated play control; improved broadcast and shortwave reception, due to improvements in tubes and circuits; superior "FM" performance, which includes an exclusive Capehart squelch circuit to prevent inter-station noise; band spread tuning on the important 25 and 31 meter bands for added ease of tuning, and improved performance in the motor driven selector switch which has been accomplished by modifications in design.

A brief review of features incorporated in the various units of this instrument will be of considerable assistance in following the circuit diagram and in analyzing circuit difficulties when present. In the event trouble is experienced with an instrument it is important to first localize the condition in a particular unit before an attempt at correction is made. For example, do not "pull a speaker" as has been done, when the pickup crystal is really at fault, and when switching from phono to radio would have disclosed the fact that the reproduction was only bad on record reproduction.

SECTION 3 THE RADIO TUNER

The radio tuner is an assembly complete in itself except for the plate voltage supply which is obtained from the amplifiers, The filament or heater transformer for tubes in the tuner, however, is mounted on the tuner chassis. Electrically, the tuner is of sound design utilizing the the highest quality of parts available and incorporates many modern improvements.

Features which contribute to its performance are as follows:

A. Provision for doublet or regular antenna system with a switch provided to rearrange the input circuit for maximum efficiency with either type system.

B. Tuned "RF" stage on all bands in manual tuning position, and use is made of a high gain 1853/6AB7 tube in this circuit.

C. Separate oscillator and mixer greatly improving stability and conversion gain.

D. Two "IF" stages using permeability tuned iron core "IF" transformers for increased over-all gain and selectivity.

E. Separate "IF" channel for "FM" using air core air tuned "IF" transformers for minimum drift and maximum gain.

F. In the "FM" position a second 6SG7 high gain pentode replaces a 6B8 tube used in the "AM" position, the change being automatically handled by the band switch.

G. Amplified "AVC" which tends to reduce fading and allows substantially constant output with wide variations in signal input.

MODEL 400M FARNSWORTH TELEV. & RADIO CORP.
Series,
Capehart

H. Tuning eye amplifier which assures sufficient deflection of the tuning eye for correct tuning even on weak signals.

I. An exclusive Capehart "FM" squelch circuit for the elimination of noise when tuning from station to station in the "FM" band. This arrangement makes use of a 6SN7GT tube, one section being used as an oscillator operating on approximately 200 KC. and used as a source of voltage for control of the bias on the first audio stage. The other section of the 6SN7GT is used as a grid controlled rectifier for the rectification and control of the squelch voltage applied to the first audio grid.

J. Improved system of push button tuning permitting the setting of any push button to any desired frequency within the broadcast band.

K. Motor driven selector switch allows selection of stations or other services at instrument or for Extended or Remote Control.

L. The incorporation of this switch and a 15 prong socket in the tuner chassis makes possible either remote or extended control of the complete instrument when the necessary extended or remote units are added. The remote and extended control feature of the 400 M instrument greatly increases its flexibility and operating convenience and opens added sales opportunities for the dealer who has not taken advantage of this feature previously.

M. Bass and Treble volume controls allow individual adjustment of the high or low frequency response.

SECTION 4 AUDIO AMPLIFIERS

The first audio stage is located in the tuner chassis. The output of this tube after passing through the Bass and Treble networks is fed into two separate 20 watt audio power amplifiers, the inputs of which are effectively in parallel. The audio power amplifiers make use of the most modern tubes and circuits. Inverse feedback is incorporated effectively lowering the plate impedance of the push-pull parallel connected output tubes and contributes to over-all noise and hum reduction. All of the tubes and components in the audio system are operated conservatively as evidenced by the use of three 5Y3G rectifiers in each amplifier. The operation of the push-pull parallel connected output tubes at conservative voltage rather than using only two such tubes in each output stage operating at higher potentials results in longer tube life.

SECTION 5 SPEAKERS

Two heavy duty electrodynamic speakers are incorporated in each 400 M series instrument. Adequate field excitation is provided and the construction of the speaker is such that the 14" speaker responds to the lower frequencies and the 12" speaker favors the highs. Careful consideration has been given to baffle and cabinet design for high fidelity reproduction.

SECTION 6 CAPEHART 16-E RECORD CHANGER

This record changer is fully automatic, is continuous in operation has a maximum capacity of 20 records, either 10" or 12" or intermixed, and will play either one or both sides of a record as desired. Because of variations in records (thickness and warpage) we recommend that 16 to 18 records generally be loaded in the record magazine.

An outstanding feature of the 16-E Changer is the "True Tangent Tone Arm" which maintains the needle or stylus at the correct tangent with respect to the record groove throughout the playing of the record.

Another important feature not found in other automatic record changers is the heavy duty drive motor and gear reduction unit. This gear reduction unit controls the speed or R.P.M. of the turntable which for perfect reproduction of records must be constant and even. This motor and gear reduction unit in addition to the use of a heavy cast turntable compares with the precision type of equipment generally found in broadcast stations.

SECTION 7 EXTENDED AND REMOTE CONTROL

The Capehart 400 M Series DeLuxe Instruments are designed to permit either Extended or Remote Control. Extended or Remote Control equipment may be added so that Radio or Record reproduction identical to that reproduced at the instrument may be controlled or distributed to any number of rooms around the house or grounds.

FARNSWORTH TELEV. & RADIO CORP. MODEL 400M Series, Capehart

PART 2
OPERATION AND MAINTENANCE RADIO TUNER

SECTION 8 SETTING INSTRUMENT UP FOR OPERATION

The importance of care in checking every part of the equipment in setting up an instrument for operation cannot be over emphasized. This applies when the instrument is being set up on the sales floor for sales demonstration purposes, as well as when delivered to the customer's home. It is obvious that an instrument not properly set up in the dealer's store may fail to perform to its best advantage when demonstrated. An improperly installed instrument in the customer's home means extra service calls, customer dissatisfaction and excessive service costs.

Following is a suggested Inspection Routine, covering "30" important items to check when installing a DeLuxe Capehart Instrument. We request that you at least cover all of these, and if you are thorough in your work, you undoubtedly will add to this list. We would also advise that a check of these "30" items will often be found to quickly isolate service difficulties when trouble is encountered.

SUGGESTED INSPECTION ROUTINE FOR THE INSTALLATION OF CAPEHART DELUXE 400 SERIES INSTRUMENTS

1. Unpacking...Remove the instrument from its shipping case carefully

2. Inspect condition of Cabinet. NOTE: Packing case should be checked carefully. If panel broken, look for concealed damage -- if cabinet damaged due to rough handling in transit consealed damage claim should be filed with "carrier."

3. Remove packing material around the record changer and shipping bolts which hold the changer in place during transit. Put plug buttons in changer base. Remove back covering tuner and amplifier compartments.

4. Insert tubes in proper position in the amplifier, by refering to tube complement label. Put "Eye Tuning" tube in position, making certain not to place tube too far forward as it is likely to press dial scale out of shape.

5. Put in Gear Reduction Unit "Bottle of Oil" supplied with instrument...Be sure to replace oil plug.

6. Important -- Make sure record changer is free floating on mounting rubbers and that all four support rubbers are in proper position. Changer unit position should be shifted slightly until there is no tendency to touch against any part of changer mounting frame.

7. Level Cabinet by adjustable glides. This is important for proper automatic phonograph operation.

8. Check adjustment of clutch tension and clutch shaft assembly connecting gear box to record changer, making certain that it is straight and in line...A tendency to MOTOR RUMBLE or HUM may be prevalent otherwise, and this may also cause uneven turntable speed.

9. Make sure Reverse Arm and Fork Assembly is in correct position by moving this through its normal reverse motion.

10. Make sure Automatic Trip Switch under turntable is in proper position. This means end of lever arm or quadrant should be in the center of the trip switch contacts.

11. Make sure Tone Arm Stop Lever, Part Number 64197, is adjusted properly.

12. Insert New Needle or desired type of permanent point stylus in Pickup.

13. Attach "Control Knobs" to Tuner, putting felts between the knobs and the Escutcheon.

14. Check Line Voltage and Frequency to determine if same agrees with electrical specifications plate on rear of the instrument. Plug instrument into proper source of power supply.

15. Read carefully Operating Instructions accompanying instrument, then...Turn Instrument On.

16. Place a blank phonograph record on turntable. Set all controls, Volume, Bass and Treble in wide open position for acoustic feedback test. RCA Record, Number 49196 is good for this purpose. This test will locate excessive noise or rumble. Shifting the changer into a "free floating position" while this record is playing should clear up any rumble which may be present. If this does not quiet operation, again check for proper positioning of drive shaft between gear box and record changer, try shifting motor and gear box "mounting board" assembly.

17. Properly load 16 or 18 assorted 10" and 12" records in record magazine. Warped or damaged records should not be used. Make sure all record edges are free of "flash"...Records with excessive "flash" and rough edges should be smoothed down with fine sand paper.

18. Put automatic "On-Off" switch in "On Position." Instruments are all shipped with this switch in "Automatic 'OFF' Position."

19. Put selector arm lever in "REPEAT" position. Play one record.
Put selector arm lever in "ONE SIDE" position. Play one record.
Put selector arm lever in "BOTH SIDES" position . Play one record.

The above tests check for proper action of the "Selector Arm Lever." At the same time that the

MODEL 400M Series, FARNSWORTH TELEV. & RADIO CORP.
Capehart

above tests are being made, a visual check for "Feed In" or "Indexing" of the pickup, Trip Action and setting down of records from magazine to turntable can be made.

20. Check Play Control action for indexing and shutting instrument off.

21. Operate Volume, Bass and Treble Controls to observe proper action.

22. Check next for maximum and minimum hum by lifting Pickup off record. When this has been done rotate Volume Control wide open. If excessive hum is present, reverse power line cord or attach good ground connection to instrument. Hum should be negligible except possibly with the volume control in "wide open" position which is seldom if ever necessary during normal operation of the instrument.

23. Check for Quality Reproduction. To do this, use a good record, the quality of and type of reproduction with which you are familiar. Check reproduction of the record at both High and Low Volume Levels.

24. Attach proper "Antenna System." A fine instrument deserves a good antenna. Check reception and calibration of radio tuner on all bands. If a new antenna is required, install a Capehart Stock Number 41-80, or Stock Number 41-79 Dipole especially efficient for reception of "FM" signals.

25. Check action of "Electric Eye" tube, and position, so tuning segments are horizontal.

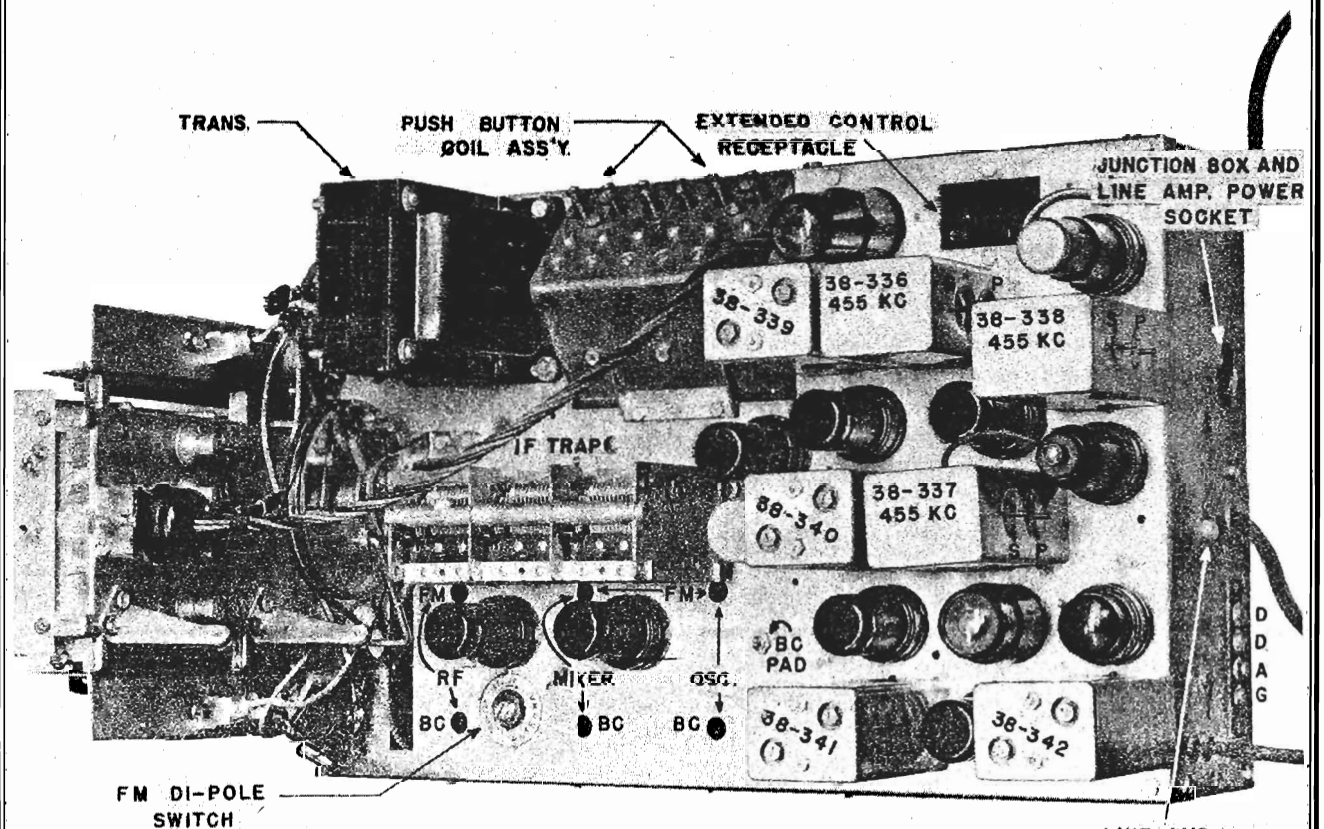
26. Tap tubes in tuner gently to locate any excessively microphonic tubes.

27. By the time the foregoing tests have been conducted, the instrument will have been in operation for 35 or 40 minutes and should be sufficiently warmed up so that the "Push Buttons" may be set without subsequent drift. Set up "Push Buttons" according to instructions accompanying instrument.

28. Attach proper Station Tabs.

29. Replace "back" of cabinet. Carefully clean up cabinet to remove all finger marks. For this purpose a piece of cheese cloth folded into a pad and moistened with water and a few drops of vinegar is very good. The use of furniture polish on Capehart cabinets is not recommended.

30. Instruct customer on all phases of operation of the machine. Personally place in the customer's hands the operation manual which accompanies the instrument.

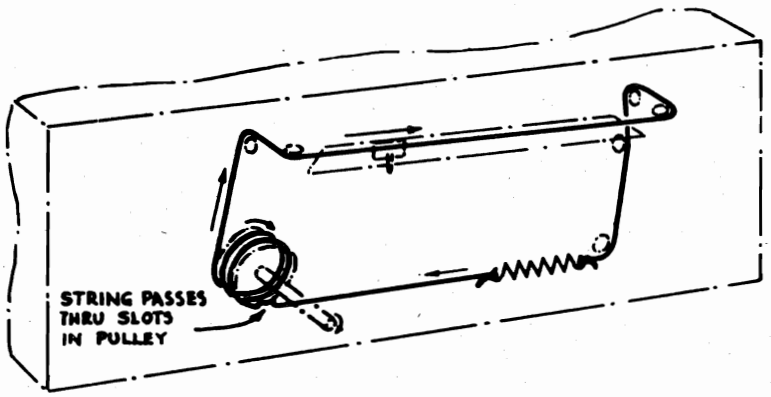


TOP DECK VIEW TUNER CHASSIS

FARNSWORTH TELEV. & RADIO CORP. MODEL 400M Series, Capehart

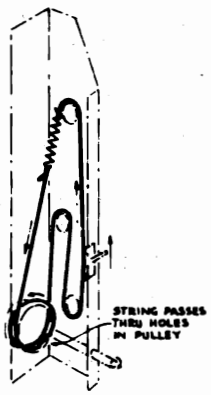
SECTION 9 DRIVE CORD ASSEMBLIES

Quite often in handling a radio chassis the "drive cord" may slip off the controls or pulleys on which it rides. So many different types of mechanical drive methods have been devised depending on the tuner construction or the mechanical genius who designed them that it is impossible for a service man to quickly figure out just how they should be restrung. In this connection we are sure that stringing diagrams below will be found most welcome.



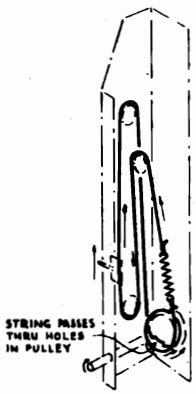
VOLUME CONTROL

Turning knob in clockwise direction causes pointer to move to right.



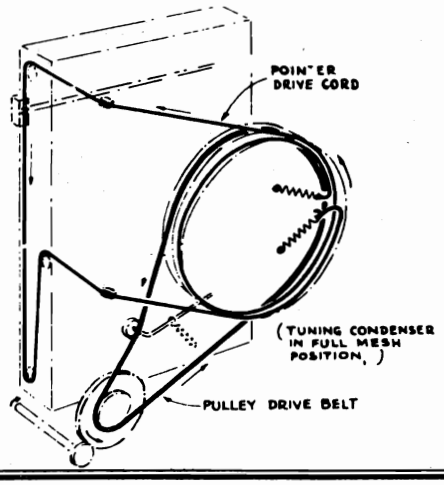
BASS TONE CONTROL

Shaft geared to tone control, turning knob in clockwise direction causes pointer to move upward.



TREBLE TONE CONTROL

Shaft geared to tone control, turning knob in clockwise direction causes pointer to move upward.



METHOD OF DIAL STRINGING

Turning tuning knob counter-clockwise moves pointer from top to bottom, drive drum turns clockwise, viewed from shaft end.

MODEL 400M Series, FARNSWORTH TELEV. & RADIO CORP.
Capehart

SECTION 10 ALIGNMENT OF AM BANDS

EQUIPMENT NECESSARY

A calibrated signal generator having fundamental frequencies from 455 Kc. to 20 Mc. In addition to the signal generator a crystal calibrator is a great convenience.

An indicating device for showing correct alignment, this may be a high resistance A.C. calibrator, a vacuum tube voltmeter, a high resistance D.C. voltmeter (20,000 ohms per volt minimum) or a Cathode Ray oscilloscope.

The A.C. voltmeter can be used either across the voice coil of one of the loud speakers or if the meter range is high enough from plate to plate in the output stage (don't forget a condenser (0.1 Mfd.)) to keep the D.C. out of the meter.

Either the vacuum tube voltmeter or high resistance D.C. voltmeter may be used to read the AVC voltage. This may be connected to pin #4 of the 6AB7 while aligning the I.F. and to pin #4 of the 6B8 while aligning the R.F. Converter and Oscillator.

The use of a Rider Volt Ohmist connected from ground to the AVC Bus is the preferred method as the high input impedance of the meter does not appreciably affect the alignment. And its high sensitivity allows the use of low input voltages.

Special care must be employed when aligning the short wave spread band, for the adjustment of the shunt trimmer affects the adjustment of the series pad. At the high frequency end of the band it is possible to peak the oscillator trimmer and the pad at the low frequency end at the image so in the alignment instructions we have indicated the fundamental frequency and the correct oscillator setting for the image so by resetting the signal generator it is possible to see if the alignment is correctly made. In each case the image is found at a frequency 910 Kc. higher than the fundamental that is if the set is aligned at 12 Mc. when the oscillator using high output is tuned to 12.91 Mc., the signal will be heard if the right peak has been used. This also applies to the short wave band.

ALIGNMENT OF FM BAND

SECTION II

Following are described two (2) methods for the Alignment of the F.M. Band.

Method 1 will require the use of a Cathode Ray Oscilloscope, a sweep frequency generator providing a fundamental frequency at 4.3 Mc and a deviation of at least 150 Kc and also a signal generator with a fundamental high frequency range of 42-50 Mc.

As an indicating device, a meter with at least 10 Meg. ohm internal resistance can be used or as a second choice - a low range micro-ammetor with a 1 Meg. ohm resistor in series.

Method 2 will require the same equipment with the exception of the Oscilloscope and the 4.3 Mc sweep generator.

ALIGNMENT BY METHOD 1

Connect the vertical deflection input of the oscilloscope with a 1 Meg. ohm resistor in series to the grid of the limiter tube. Care must be exercised to maintain the connection of the resistor to the grid of the limiter tube as short as possible to avoid regeneration. The ground terminal of the oscilloscope must be connected to the chassis.

Limiter Alignment - Connect the ground terminal of the 4.3 Mc. I.F. sweep generator to the chassis. Connect the output of the signal generator to the grid of the second I.F. tube with a .1 Mfd. paper condenser in series, adjust the deviation control of the generator for a usable picture on the oscilloscope screen, with the input control of the oscilloscope set at maximum gain. Detune the secondary trimmer of the limiter transformer, adjust the primary trimmer until you obtain a pattern as shown in Figure 1 of the oscilloscope photos. Then adjust the secondary trimmer until you obtain a pattern as shown in Figure 2. The pattern should be kept centered on the oscilloscope screen.

Align 2nd I.F. - Move the signal generator to the grid of the 1st I.F. tube and repeat the same procedure as described for the limiter stage.

Align 1st I.F. - Move the signal generator to the grid of the Mixer tube and repeat the limiter stage procedure.

Align Discriminator - Connect the oscilloscope to the Cathode of the 6H6 F.M. detector which is not grounded. Connect the signal generator to the secondary of the limiter transformer as indicated by A in Figure 6. Adjust the secondary trimmer of the discriminator transformer with an insulated screw driver, for pattern as in Figure 2, then adjust the primary trimmer to obtain symetrical and linear trace and centering of the picture on the oscilloscope screen. It will be necessary to go over the primary and secondary trimmer several times to adjust the stage accurately.

R.F. Alignment F.M. Band - Connect the high frequency generator to the regular antenna terminal with a 400 ohm carbon resistor in series. Make certain the F.M. antenna Selector Switch is in regular position.

Set the signal generator at 50 Mc and adjust the Oscillator trimmer for correct dial calibration at this frequency. Connect high resistance Voltmeter to point A, Figure 4 and then adjust the signal generator to 49.5 Mc adjust the mixer and the R.F. Trimmers for maximum deflection of the meter.

Another indicating device for the R.F. alignment - connect a 0-1 millameter between point A and ground or a low range micro-ammeter with a 1 Meg. ohm resistor as series between C and ground. Tune for maximum deflection of the meter.

Lacking the above meters, the R.F. and Mixer alignment may be trimmed for minimum noise on signal. To avoid false peak when aligning the Mixer and the R.F. Trimmers the gang condenser must be rocked through the signal.

ALIGNMENT BY METHOD 2

Limiter Alignment - Connect one of the indicating meters as shown in Figure 4 or Figure 5.

Feed a 4.3 Mc signal through .1 Mfd. paper condenser to the grid of the second I.F. tube. Place a 1000 ohm carbon resistor across the secondary of the limiter transformer then tune the primary for maximum meter deflection. Remove the 1000 ohm carbon resistor from the secondary and place it across the primary and tune the secondary for maximum meter deflection.

FARNSWORTH TELEV. & RADIO CORP. MODEL 400M Series, Capehart

SECTION 11 ALIGNMENT OF FM BAND

To check how accurate this stage has been aligned tune the signal generator 75 Kc each side of 4.3 Mc. Only a slight loss in maximum meter deflection should be noted.

Align 2nd I.F.F.M. - Move the signal generator to the grid of the 1st I.F. tube and repeat the same procedure described above for the limiter stage.

Align 1st I.F.F.M. - Move the signal generator to the grid of the mixer tube and repeat alignment procedure as described above for the limiter stage.

Discriminator Alignment - Connect a meter to Point A as shown in accompanying illustrations to the ungrounded Cathode.

Feed a 4.3 Mc signal to the grid of the second I.F. tube.

With an insulated screw driver turn the secondary trimmer screw for maximum and minimum capacity. You will note that there are two points where you have maximum meter deflection. Tune to the point between the maximum meter deflections where the meter will read as near zero as possible.

Tune the signal about 150 Kc each side of 4.3 Mc. You will note that the meter deflection rises about equal distance each side of 4.3 Mc. Tune the primary trimmer until you have maximum meter deflection an equal distance each side of 4.3 Mc.

Note: The meter will have to be reversed when reading the other side of the signal.

Another indicating device for the R.F. alignment - connect a 0-1 millameter between point A and ground or a low range micro-ammeter with a 1 Meg. ohm resistor in series between C and ground. Tune for maximum deflection of the meter.

Lacking the above meters, the R.F. and Mixer alignment may be trimmed for minimum noise on signal. To avoid false peak when aligning the Mixer and the R.F. trimmers the gang condenser must be rocked through the signal.

Note: If a high frequency signal generator is not available a standard signal generator which will give good harmonic output between 42 - 50 Mc can be used.

Two methods using a micro-ammeter or a V.T. voltmeter may be used for the alignment of the discriminator are shown in the accompanying illustrations.

It will be necessary to go over the primary and secondary trimmers several times to accurately align this stage.

R.F. Alignment F.M. Band - Connect the high frequency generator to the regular antenna terminal with a 400 ohm carbon resistor in series. Make certain the F.M. antenna Selector Switch is in regular position.

Set the signal generator at 50 Mc and adjust the Oscillator trimmer for correct dial calibration at this frequency. Connect high resistance Voltmeter to point A, Figure 4 and then adjust the signal generator to 49.5 Mc adjust the mixer and the R.F. trimmer for maximum deflection of the meter.

SECTION 22 MOTOR DRIVE - GEAR REDUCTION UNIT - DRIVE SHAFT ALIGNMENT

A silent and smooth operating drive motor, and gear reduction unit properly coupled to the record changer is of utmost importance for perfect reproduction of records. Unless these parts are all functioning properly there is a possibility that waver, or wows may be noticed in the sound reproduction from records. It is also possible that objectionable hum or rumble may be discernable during low passages in records or the change cycle. If such conditions are apparent we suggest a careful check and adjustment in accordance with the procedures which follow.

After freeing the record changer by removing the four hold down bolts used in shipment, make certain that the record changer is floating freely on its rubber mounting supports and that it does not touch the record changer mounting shelf at any point. There should be a feeling of entirely free floating motion when the changer is shaken slightly. If such is the case, it is a good indication of full free floating action. By making sure that the record changer is "free floating" the possibility of acoustic feedback, hum or rumble is eliminated.

Because of the importance for positioning the record changer into a free floating position it is always advisable to check the alignment relation of the record changer drive shaft with respect to the gear reduction unit and between this unit and the drive motor. Unless the correct alignment relationship is maintained excessive hum or rumble may be present as well as the possibility of uneven turntable speed causing waver or wows in the record reproduction.

If the above conditions are apparent with record changer in free floating position, try shifting the gear reduction and motor assembly slightly until a position is found where the difficulty is eliminated or negligible.

NOTE: Drive motors and gear reduction units are "run-in" and aligned on the mounting board at the factory, and will seldom, if ever, require adjustment in the field unless they have been tampered with or in the event the motor has shifted due to rough handling in transit. If hum or rumble persists after trying previous suggestions, loosen the motor and shift slightly locking same back in place when minimum hum position is located.

SECTION 23 SAFETY CLUTCH - PURPOSE AND ADJUSTMENT

The purpose of this feature is to uncouple the record changer from the gear reduction unit in the event a faulty record or improper operation of the machine causes the record changer to jam during some portion of the change cycle.

Essentially this device consists of two metal discs with a leather washer between. The driving power is transmitted from the lower to the upper disc through the leather washer because of the pressure developed by the nut, part 368-2, controlling the pressure of the spring, part 3938. Pressure of the spring determines the amount of back pressure and by its adjustment it may be set so as to cause the clutch to slip if more than normal drive tension or load developes soemwhere in the record changer during its change cycle, thereby acting as a "safety" feature.

SECTION 25 PLAY CONTROL - INSTALLATION - ADJUSTMENTS & MAINTENANCE

1. The following parts comprise a complete play control installation. Play control with cables, plug and switch, compartment light, mounting bracket, two bracket mounting screws, two switch mounting bolts, and four wood screws. Check packing material so no parts are overlooked.

2. The mounting bracket should be installed on the record changer first. See illustration 3.

3. The bracket is mounted on the boss which supports the clutch fork shaft and the reverse cam shaft, on the side of the boss away from the main cam, so the clutch fork shaft sets in the cutout. Pass the two screws that fit the tapped holes in the switch bracket through the old play control bracket holes when mounting the bracket.

4. Remove the plug button from the partition between radio and changer, put the six prong plug, the switch and the cables through the holes in the partition. Fasten the play control on the partition by means of the wood screws being careful not to crack the plastic case by drawing the screws too tight or driving the screws in crooked. Also be sure the record tray clears the play control housing before driving any screws.

5. Fasten the switch to the bracket by means of the two bolts. See illustration. This puts the switch in such a position that the throw out cam can actuate the switch. Of course, the switch goes on the bracket with the leads at the bottom and pointing toward the left (when looking in the back of the cabinet), this brings the spring finger in line with the throw out cam.

6. Remove play control shorting plug (six prong) from junction box and plug in cable from play control. Set play control at any number except zero (off) and run changer through several cycles, if the switch is too close to the throw out cam the relay in the play control will buzz, if not close enough the action will be erratic. Be sure the bolts holding the switch and the screws holding the bracket are properly tightened.

MODEL 400M Series, FARNSWORTH TELEV. & RADIO CORP. Capehart

SECTION 20 OPERATION AND MAINTENANCE 16-E RECORD CHANGER

The "On-Off" relay is used to turn on the 117 volts for the entire set. Due to the fact 117 volts are always on the transformer in the set, the 6.3 volts for the heaters is supplied through one set of contacts on the relay. Another set of contacts supplies the audio amplifiers and another set in conjunction with the selector switch energizes the Reject Relay located in the Junction Box.

This latter relay closes the AC circuit to the Phono motor and the "Phono Relay" also in the Junction Box. Due to the fact the "Phono Relay" contacts are closed until it is energized the AC is also applied to the Clutch Solenoid in the 16-E Changer causing the clutch to be engaged. Thus whenever the "Phono" button is pushed the 16-E goes into cycle to permit the tubes to reach operating temperature before a record is played.

In the 16-E Changer the Clutch Solenoid is energized by the above starting cycle, pressing the Reject Button or by the Automatic Trip Switch. As soon as the change cycle starts the Solenoid Motor Switch opens the Solenoid circuit and shunts the reject relay to keep the motor running until the change cycle is completed even if the "Off" button is pushed.

The Automatic Trip Switch, located under the turntable is actuated by the tone arm moving the trip lever when the needle enters the trip or change groove.

The "Automatic On-Off" switch is used to open the Clutch Solenoid circuit when it is desirable to play records manually.

SECTION 23 SAFETY CLUTCH - PURPOSE AND ADJUSTMENT

The proper method of checking the adjustment of the safety clutch follows. With the record changer in cycle and the record magazine fully loaded apply a slight downward pressure on the bottom of the record magazine, while the magazine is tilting backward. When such pressure is applied it should cause the safety clutch to slip and the turntable should stop revolving. In the event the action of the safety clutch is not as described loosen nut, part 368-2, thereby releasing pressure on spring, 3938, this will permit safety clutch to unload sooner. After this adjustment is made the changer should be put through a number of cycles to make certain that the clutch does not slip at any point in the normal change cycle as this would cause the changer to stall.

The action of this safety clutch should always be checked when the instrument is permanently set up in the customer's home since it acts as a safety device to prevent record breakage or damage to changer in the event of a jam because of reasons previously mentioned. CAUTION: The leather clutch facing should be kept free of oil or grease.

GEAR REDUCTION UNIT

At least once a year the gear reduction unit should be removed, the oil drained, gear box flushed and refilled with 1/2 ounce, No. 10 S.A.E. oil. Stock No. 1315-1.

LUBRICATION

At lesst every six months a few drops of oil should be applied to the drive motor oil cups. See illustration. For this purpose use the special electrical motor oil which is carried by most all oil companies for electric fans, sewing machine motors, etc.

SECTION 24 MOTOR DRIVE ASSEMBLY PARTS

ALIGNMENT PROCEDURE

No attempt should be made to realign the various circuits until all other causes have been checked, unless the condition is so obvious as to indicate that realignment is necessary. Then proceed as follows:

Volume Control full on.

Low range A.C. meter connected across voice coil to indicate output.

Keep signal generator attenuated so as to maintain ½ scale reading on output meter.

Make certain that dial pointer is exactly on index line (top left side of dial plate) when variable condenser is fully meshed.

REMOVE CHASSIS BOTTOM PLATE

CIRCUIT DESCRIPTION

The chassis utilized in these modern Firestone radio receivers incorporates a basic superheterodyne type of circuit that is designed to provide reception from standard broadcast stations in the frequency range of 540 to 1600 KC as well as reception from the new frequency modulation stations that are located in the 88 to 108 MC band. Many of the stages of the complete circuit will be readily recognized as necessary elements of a typical superheterodyne system, however, the detection method that is used for frequency modulation reception embodies an entirely new principle that will be fully explained in this pamphlet. All sections of the circuit have been developed in accordance wtih the most modern radio engineering technique and some of the more prominent features are described in the following paragraphs.

Built-in antennas are provided for reception of AM as well as FM stations. In locations where signal strength is adequate, these built-in antennas will give satisfactory performance but where FM signals are weak, it is desirable to obtain greater signal pick-up by installing an outdoor antenna such as:

FIRESTONE
FOLDED DIPOLE
FM ANTENNA
STOCK NO. 4-D-126

The built-in antenna used for AM reception is a high impedance loop that is mounted on rear edge of cabinet. A specially arranged and accurately cut length of "ribbon-type" high frequency transmission line serves to form the built-in folded dipole antenna for FM reception.

Tuning of the radio frequency circuits of the receiver is accomplished by a sturdily constructed permeability ("slug") tuner. This tuning system provides a means of minimizing the effects of "microphonism" that are inherent in other tuning devices. A high degree of accuracy in calibration and alignment of tuned circuits is also obtained with the permeability tuning system.

An R. F. amplifier stage is utilized to give maximum sensitivity and selectivity as well as high image rejection on FM and manual tuning AM reception.

Both transformer coupled I.F. stages are used for FM and one stage is used for AM. The first and second I.F. transformers have two sets of windings; one set is tuned to 455 KC for AM operation and the other is tuned to 10.7 MC for FM operation. Switching of the windings, to alleviate undesired beat frequencies, is necessary only in the first I.F. transformer.

Detection of amplitude modulated 455 KC signals is accomplished by the 6SQ7 diode rectification circuit and the resulting audio signal is passed to a conventional 6SJ7 audio amplifier stage.

Frequency modulation detection is obtained by an entirely new circuit that is known as the "RATIO DISCRIMINATOR." This FM detector circuit has the unusual ability to reject noise or other brief variations in the amplitude of the signal. The relative insensitivity of the Ratio Discriminator to signal amplitude variation makes it possible to eliminate the use of a "limiter" stage that ordinarily precedes the discriminator in other types of FM detector systems. It will therefore be noted that this receiver utilizes a normal I.F. amplifier stage instead of a low gain limiter stage preceding the FM discriminator. The theory of operation of the Ratio Discriminator is given in a subsequent section.

Two stages of voltage amplification (6SQ7 and 6SJ7) are provided for the audio frequency output from the FM discriminator circuit. The final audio power amplifier stage incorporates a 6V6GT tube in a special inverse feedback arrangement which reduces distortion and contributes to exceptionally good tone quality.

When the receiver is used for phonograph operation, audio voltage and power amplification is accomplished by the 6SJ7 and 6V6GT audio stages. Gain of this system is intentionally limited so that the output tube will not be driven into the high distortion region. This design permits the volume control to be advanced to its maximum position before reaching an audio level where distortion would otherwise cause unintelligible blasting—hence the maximum volume control position approximates the highest sound level that would be obtainable with an acceptable percentage of distortion.

THE RATIO DISCRIMINATOR

(Theory of Operation)

With the introduction of frequency modulated radio transmission it was necessary to devise a means of "detecting" or extracting the audio frequency intelligence from a carrier wave after it was appropriately amplified at the receiver. Since the frequency modulation process involves variation of a given carrier frequency for as much as 75 KC in either direction, it is apparent that the intelligence (or modulating signal) can best be extracted from the wave by a circuit that is capable of "discriminating" or recognizing the frequency of the carrier at any instant. Thus, the receiver circuit which converts FM carrier frequency variations into a corresponding voltage variation has become known as a discriminator.

When considering the function of a discriminator it is important to keep in mind that the output voltage amplitude is determined by the extent of the carrier frequency deviation from its center frequency; **the greater the deviation, the greater the amplitude of the discriminator output voltage—this determines volume of the resultant audible signal.**

The rate at which the FM carrier frequency is being deviated above and below its center value determines the rate at which the discriminator output voltage will vary and therefore it will be seen that **this rate of variation of output voltage corresponds to the audio frequency of the intelligence that was to be extracted from the carrier wave;** rapid variation of carrier frequency causes the discriminator to produce high audio frequencies and vice versa.

Unfortunately the conventional type of discriminator circuit is also sensitive to amplitude variations in the carrier wave and it must be preceded by a limiter stage that is capable of delivering a constant amplitude FM carrier wave to the discriminator. If the limiter stage were omitted, noise signals, which cause a variation in signal amplitude, would pass through the discriminator and would be audible in the output system.

With the advent of the "RATIO" Discriminator, an FM detector circuit was devised which was found to be relatively insensitive to amplitude variation of the incoming signal and therefore the use of a limiter stage could be dispensed with. After careful consideration of the performance of the Ratio Discriminator, Firestone engineers selected it as the means of FM detection in this receiver.

The outstanding difference between the "Ratio" Discriminator and other discriminators is as its name implies—the output voltage is dependent upon the **ratio** of two voltages rather than upon a comparison of these voltages on the basis of magnitude alone. Full significance of this feature will become apparent after studying the following description of the Ratio Discriminator circuit.

Operation of the Ratio Discriminator can best be understood by starting with a simple 3 wire D.C. circuit as an analogy and building up the discriminator circuit in easily comprehended sections. A typical 3 wire D.C. circuit is therefore shown in Fig. 1 and the following performance characteristics should be particularly noted.

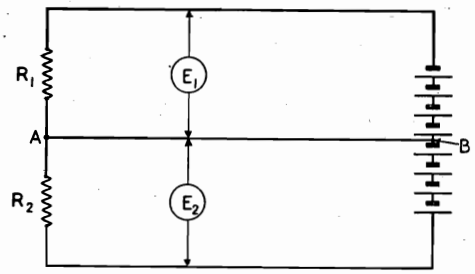

Fig. 1

When resistors R_1 and R_2 are equal, the circuit is said to be balanced and no current will flow in the center conductor A-B providing point B is a center tap on the battery supply voltage. In addition the voltage drop E_1 across resistor R_1 equal to voltage drop E_2 across resistor R_2. If we now introduce batteries of equal voltage in the R_1 and R_2 sec-

tions of the circuit as shown in Fig. 2, the system will remain balanced and although the current changes, there will be no change in the reading of voltmeters E_1 and E_2. It should be noted that the introduction of the batteries (with polarity as indicated), has caused a reduction in current. This current reduction results in a lower voltage drop across both load resistors but the sum of the drop across either resistor plus the battery voltage V must be equal to one-half of the supply voltage which is E_1 or E_2.

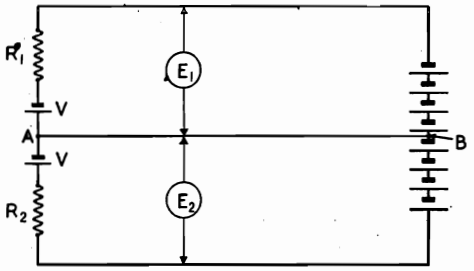

Fig. 2

This principle is made use of in the Ratio Discriminator so as to make it relatively insensitive to variation in amplitude of the incoming signal. By substituting the center tapped secondary winding of an I.F. transformer as shown in Fig. 3 for the two batteries labelled V in Fig. 2 it will be seen that a comparable condition is produced as equal voltages are induced in both halves of the secondary winding. Diode rectifier tubes are substituted for resistor R_1 and R_2 since we are now dealing with A.C. induced voltages that must be rectified. Do not overlook the fact that the plate resistance of the diodes creates a voltage drop and is analogous in that respect to the action of R_1 and R_2.

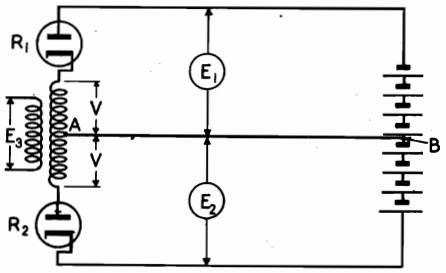

Fig. 3

Observe that irrespective of the magnitude of incoming signal voltage E_3, the voltage V induced in each half of the secondary winding will be equal since it is center-tapped. It has been previously shown that as long as equal voltages V are added to each load section of the 3 wire system, there would be no change in the reading of meters E_1 and E_2 and thus these voltages remain the same irrespective of the variation in the input signal voltage E_3. The **ratio** of the voltages E_1/E_2 also may be said to remain constant with variation in magnitude of incoming signal.

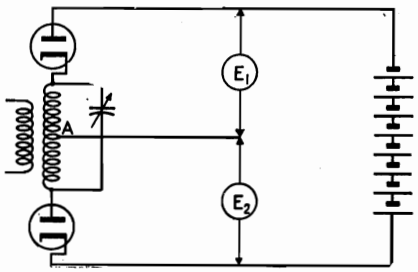

Fig. 4

Fig. 4 shows a slight rearrangement of the same circuit that was illustrated in Fig. 3 with the exception that the I.F. transformer has a condenser across the secondary in order to resonate it to the desired frequency. In addition, the conductor between points A and B has been eliminated since current will not flow thru it as long as the system is balanced. Center tap A on transformer secondary is still retained.

The foregoing circuit has been shown to be insensitive to variations in amplitude of the incoming signal and if it can now be arranged so that it will be capable of "discriminating" between variations in the frequency of the incoming signal, it will prove to be an ideal FM detector. Frequency discrimination can be accomplished by introducing some voltage from the primary of the I.F. transformer in series with the resonant voltage of the secondary so that the vector sum of these two voltages will effectively determine the instantaneous voltage between points A and E as well as between A and F. (These are the voltages that are measured by meters E_1 and E_2). The circuit of Fig. 5 shows how a portion of the primary voltage of the I.F. transformer is introduced into the secondary circuit by means of a tertiary winding on the transformer.

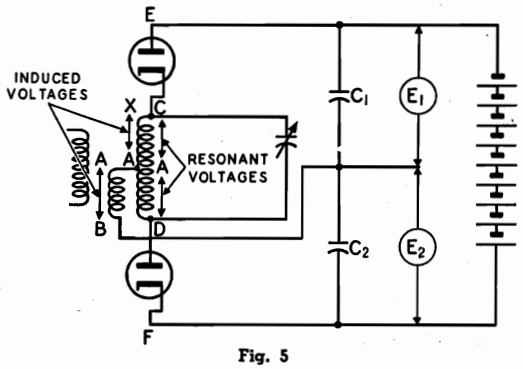

Fig. 5

Condensers C_1 and C_2 have low reactance at the I.F. frequency, however, their reactance is appreciable at audio frequencies and therefore the voltage drop across these condensers will readily follow circuit voltage variations that occur at an audio rate.

If an examination is now made of the conditions that would prevail under each of the following circumstances, it will be possible to determine whether the voltages E_1 and E_2 can be made to vary in accordance with the variation of carrier frequency since that action would follow the intelligence that is contained in the FM signal.

1. Ratio of voltage E_1 to E_2 when frequency of incoming signal is exactly **equal** to the I.F.
2. Ratio of voltage E_1 to E_2 when frequency of incoming signal is **above** I.F.
3. Ratio of voltage E_1 to E_2 when frequency of incoming signal is **below** I.F.

CONDITION #1; INCOMING SIGNAL EQUAL TO I.F.: When this condition prevails, the vector diagram shown in Fig. 6 illustrates how the voltage across tertiary winding AB is added vectorially to the resonant secondary voltage across AC or across AD to produce a resultant voltage that determines the voltage indicated by meters E_1 and E_2.

AX and AB represent the voltages that are coupled into the secondary and tertiary windings of the I.F. transformer. When the secondary is tuned to resonance, the voltage AC (across one-half the resonant circuit) will be 90 degrees ahead of induced voltage AX as well as induced voltage AB. It should be remembered that the phase difference between applied voltage (or induced voltage as in this case) and the voltage developed across an inductance in an A.C. circuit will vary with frequency and only at the resonant frequency will the phase difference be equal to 90 degrees.

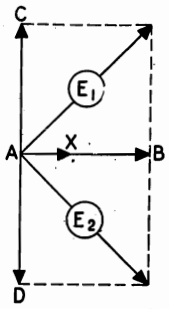

Fig. 6

By again examining the circuit shown in Fig. 5 it may now be appreciated that the voltages read on meters E_1 and E_2 will be respectively proportional to the vector resultant voltages E_1 and E_2 illustrated in Fig. 6 (these resultants represent the vector sum of voltage AB and AC or the vector sum of AB and AD). Since the resultant voltages E_1 and E_2 are equal in magnitude, the voltage from point A to E will equal the voltage from point A to F and hence **meters E_1 and E_2 will have identical readings.**

CONDITION #2; INCOMING SIGNAL ABOVE I.F.: When this condition prevails, the vector diagram shown in Fig. 7 illustrates the phase relation of the induced voltage in the tertiary winding and the resonant voltage in the tuned secondary. Note that the resonant secondary voltage AC does not lead the voltage AB by 90 degrees as was the case when the incoming signal was exactly equal to the I.F.

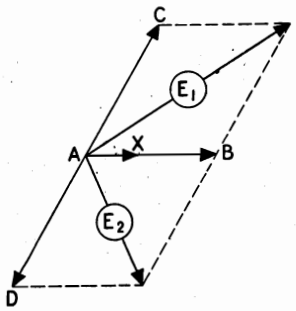

Fig. 7

Vector addition of voltages AB plus AC and AB plus AD produces the respective resultants E_1 and E_2. Since E_1 is obviously larger than E_2, the voltage that appears across the A to E portion of the circuit will be greater than the voltage that appears across the A to F portion. Hence, the reading of meter E_1 is larger than that of meter E_2 and the ratio of E_1/E_2 is **greater than unity.**

CONDITION #3; INCOMING SIGNAL BELOW I.F.: When this condition prevails, the vector diagram shown in Fig. 8 illustrates the phase relation of induced voltage in the tertiary winding and the resonant voltage in the tuned secondary. Note that the resonant secondary voltage AC leads the voltage AB by more than 90 degrees and that the vector resultant E_1 is now smaller than the resultant E_2. In this case the voltage that appears across the A to E portion of the circuit will be smaller than the voltage from A to F. Hence, the reading of meter E_1 is smaller than that of meter E_2 and the ratio of E_1/E_2 is **less than unity.**

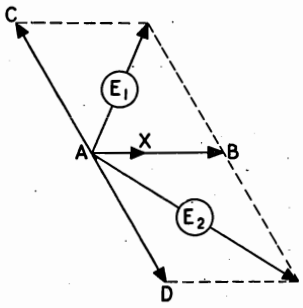

Fig. 8

The manner in which a Ratio Discriminator extracts the intelligence from a frequency modulated carrier by means of a variation in the **ratio** between two voltages should now be apparent from the foregoing discussion and Fig. 9 illustrates the complete discriminator circuit as used in this receiver.

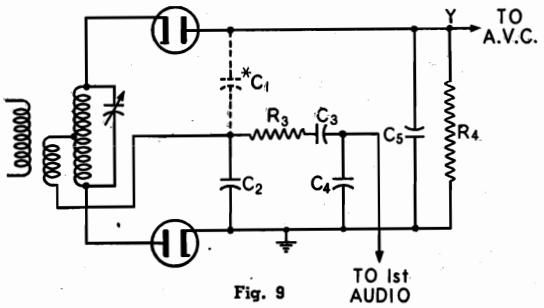

Fig. 9

*Condenser C_1 is represented in the actual circuit by distributed capacitance of associated wiring.

Elimination of the battery that was shown in previous illustrations is accomplished by using a long time constant resistor-condenser combination consisting of R_4 and C_5. Since the two diodes in the discriminator circuit are in series, they will conduct on the same half cycle, and the rectified current thru R_4 will charge condenser C_5 so that the point labelled Y becomes negative. The time constant of R_4-C_5 is about 0.1 second so that the negative potential at point Y will remain constant at even the lowest audio frequencies.

A rapid increase in carrier voltage cannot momentarily increase the voltage across R_4-C_5 due to the large time constant; similarly, a sudden reduction in carrier voltage will not be accompanied by a change in voltage across R_4-C_5. Thus, the voltage across this R-C combination stabilizes the Ratio Discriminator against amplitude modulation. In addition it should be noted that the same voltage serves as an excellent A.V.C. voltage and is used for that purpose in this receiver.

The "threshold" effect that is noticeable in other types of FM limiter-discriminator combinations is absent in the ratio type discriminator and there is no specific minimum carrier level that must be applied (as in the case of a limiter stage) to prevent noise from reaching the audio system.

Since the higher audio frequencies are intentionally emphasized in the frequency modulation transmission process, de-emphasis is used at the receiver in order to provide normal tone rendition and to reduce high frequency noises. De-emphasis is accomplished by resistor R_3 and condensers C_3 and C_4 in the discriminator circuit shown in Fig. 9.

THE FIRESTONE TIRE & RUBBER CO. MODEL 4-A-60

BROADCAST BAND — "AM" — ALIGNMENT PROCEDURE

1. Disconnect leads from FM antenna terminal strip (labelled "A-G-A") at back of chassis; also disconnect speaker plug, AM loop antenna plug and phono plugs. Remove chassis from cabinet.

2. It will be necessary to perform this alignment procedure with the chassis placed relatively close to the cabinet in order to avoid removing the AM loop antenna that is attached to cabinet frame.

3. After conveniently locating chassis with respect to the cabinet, reconnect AM loop antenna plug, speaker plug and brown lead of "External Antenna" coupling turn to blue lead at back of receiver.

4. Connect an output meter across speaker voice coil or from plate of 6V6GT tube to chassis through a 0.1 Mfd. condenser.

5. Connect ground lead of signal generator to receiver chassis.

6. Set volume control to the maximum volume position and use a weak signal from the signal generator.

7. If alignment of both AM and FM channels is required, it is necessary to align the AM channel first; then align FM channel as instructed in preceding section.

8. R.F. leads from slug tuner assembly should be dressed away from wave trap coil and close to chassis.

9. After alignment procedure is completed and chassis has been reinstalled in cabinet, arrange leads to loop antenna so that they are separated from each other as much as possible—avoid twisting or taping these leads together.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	FM-AM PHONO SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
0.1 MFD. Condenser	Terminal K on tuner unit (see Fig. 11).	455 KC	"AM" Center Position	Any position where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
0.1 MFD. Condenser	Terminal K on tuner unit (see Fig. 11).	455 KC	"AM" Center Position	Any position where it does not affect the signal.	5	Wave Trap	Adjust for minimum output.
If positions of movable slugs in the slug tuner assembly have been disturbed (examine cement seal near top of threaded stem on each slug) or if a coil or slug has just been replaced in the tuner assembly, omit the next 5 instructions in this chart and start with the procedure entitled "Slug Tuner Adjustment Procedure—AM Section." Where the tuner assembly has not been disturbed, ignore this instruction and proceed with the next step.							
500 MMFD. Mica Condenser	External Antenna clip at back of Cabinet.	535 KC	"AM" Center Position	Set Slug tuner assembly to fully closed position. Disregard position of dial pointer.	6	Oscillator Trimmer	Adjust for maximum output.
500 MMFD. Mica Condenser	External Antenna clip at back of Cabinet.	1000 KC	"AM" Center Position	Tune to 1000 KC generator signal and check position of dial pointer. If it is set incorrectly, release clip on pointer and repcsition to 1000 KC calibration mark. Note that the 1000 KC mark is located under the last "0" in the numeral "100." Exercise care to set pointer accurately.			
500 MMFD. Mica Condenser	External Antenna clip at back of Cabinet.	1500 KC	"AM" Center Position	Tune to 1500 KC generator signal.	7	Antenna Trimmer	Note the difference between the dial pointer setting and the 1500 KC mark on the scale—do not disturb pointer position even if pointer does not coincide with 1500 KC mark. If the difference does not exceed 20 KC, adjust trimmer No. 7 for maximum output and proceed with next two instructions in this chart. Where the calibration error exceeds 20 KC it is advisable to omit the next two instructions in this chart and adjust the slug tuner as described in the following section.
500 MMFD. Mica Condenser	External Antenna clip at back of Cabinet.	600 KC	"AM" Center Position	Tune to 600 KC generator signal.	8	Antenna Padder	Adjust for maximum output. Try to increase output by detuning padder and retuning receiver dial until maximum output is obtained.
Repeat adjustment of trimmers 7 and 8 until one no longer detunes the other. This completes the AM band alignment procedure. The following procedure should only be used where the conditions described under the heading are encountered.							

MODEL 4-A-60 THE FIRESTONE TIRE & RUBBER CO.

"AM" ALIGNMENT PROCEDURE CONTINUED

SLUG TUNER ADJUSTMENT PROCEDURE — AM SECTION

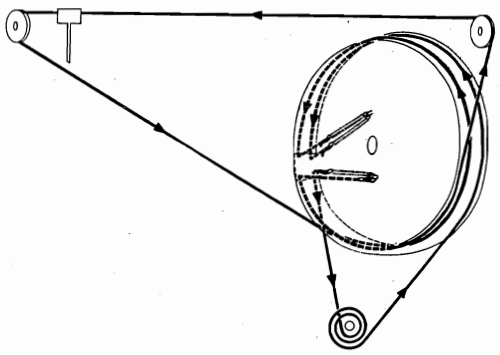
This procedure is to be used only where the positions of slugs in the slug tuner have been disturbed or in event of a coil or slug replacement, or where a serious calibration or tracking error is noted after attempting to align the receiver as described in the preceding section.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	FM-AM PHONO SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
500 MMFD. Mica Condenser	External Antenna clip at back of Cabinet.	535 KC	"AM" Center Position	Set Slug tuner assembly to fully closed position. Disregard position of dial pointer.	9	Oscillator Tuning Slug	The object of this adjustment is to set slug #9 to a position where the oscillator coil reaches maximum inductance at 535 KC. That is accomplished by first backing off trimmer condenser #6 until its plates are well spaced (lowest capacity); then rotate slug #9 and note whether a peak can be obtained on the output meter. If a peak cannot be reached, turn trimmer condenser #6 to a slightly higher capacity setting and repeat adjustment of slug #9 for peak output. **When adjusting this slug, always approach the peak output setting by rotating the slug so that it is moving down into the coil form.** The correct setting of slug #9 is determined when a **definite peak** can be reached with trimmer #6 at the lowest capacity position that permits the coil and condenser to resonate at 535 KC.
500 MMFD. Mica Condenser	External Antenna clip at back of Cabinet.	1500 KC	"AM" Center Position	Set Accurately to 1500 KC mark on scale.	6	Oscillator Trimmer	Adjust for maximum output.
500 MMFD. Mica Condenser	External Antenna clip at back of Cabinet.	535 KC	"AM" Center Position	Set Slug tuner assembly to fully closed position.	10	Oscillator Padder Slug	Adjust to receive 535 KC signal and for maximum output.
Repeat adjustment of oscillator trimmer #6 at 1500 KC and oscillator padder slug at 535 KC until both points are correctly calibrated with the dial scale.							
500 MMFD. Mica Condenser	External Antenna clip at back of Cabinet.	1500 KC	"AM" Center Position	Tune to 1500 KC generator signal.	7	Antenna Trimmer	Adjust for maximum output.
500 MMFD. Mica Condenser	External Antenna clip at back of Cabinet.	1000 KC	"AM" Center Position	Tune to 1000 KC generator signal.	11	Antenna Tuning Slug	Adjust for maximum output.
500 MMFD. Mica Condenser	External Antenna clip at back of Cabinet.	600 KC	"AM" Center Position	Tune to 600 KC generator signal.	8	Antenna Padder	Adjust for maximum output. Try to increase output by detuning padder and retuning receiver dial until maximum output is obtained.
Repeat the three preceding adjustments until no further improvement can be made in output at 1500 KC, 1000 KC and 600 KC. Apply a coating of speaker cement at top of each tuning slug stem to prevent movement.							

DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, turn the main drive drum to maximum **counter-clockwise** position and use following parts:

114955—Clip on end of cord
117057—Cord (7 feet)
119087—Ring for dial cord
113177—Tension Spring



THE FIRESTONE TIRE & RUBBER CO. MODEL 4-A-60

FREQUENCY MODULATION — "FM" — ALIGNMENT PROCEDURE

INSTRUMENTS: Alignment of the FM circuits in this receiver may be accomplished with either a conventional AM type signal generator or an FM signal generator. The output indicator should be an oscilloscope or a vacuum tube voltmefer.

Although it is preferable to use an FM generator and an oscilloscope, reasonably accurate alignment is obtainable when using a conventional AM generator and vacuum tube voltmeter providing proper care is exercised in adjusting the discriminator circuit trimmer condenser.

IMPORTANT: If an AM signal generator is used, it should be capable of producing **fundamental** frequencies of 10.7 MC and 88 to 108 MC—avoid using an AM generator which produces signals in the 88 to 108 MC range by using harmonics higher than the second. Generators which are dependent upon third, fourth or fifth harmonics for output frequencies of 88 to 108 MC will generally produce undesirable spurious beat signals with the local oscillator in the receiver and alignment will be exceedingly difficult.

The following procedure is adaptable for use with either an AM or FM generator and oscilloscope or vacuum tube voltmeter—merely follow the instructions which are applicable to the instruments that are used.

1. If alignment of both AM and FM channels is required it is necessary to align the AM channel first, then align the FM channel as instructed in adjacent chart (AM alignment procedure is given on page 9). Do not attempt to reposition pointer by releasing it from clip on dial cord this is done only during AM alignment.

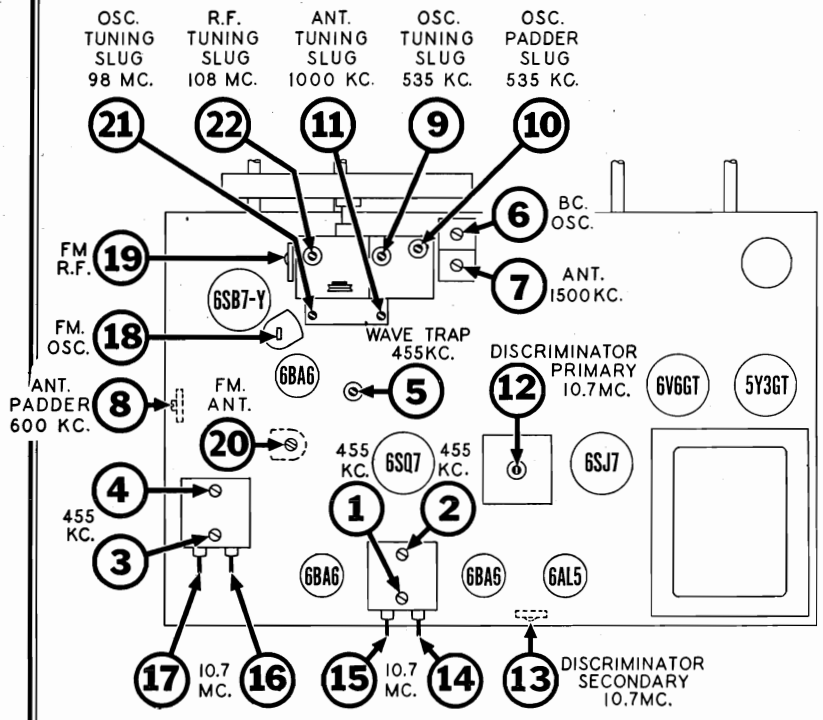
2. Disconnect leads from FM antenna terminal strip (labelled "A-G-A") at back of chassis; also disconnect all other plugs on rear of chassis and remove chassis from cabinet. It is not necessary to remove the built in antennas.

3. Remove speaker from cabinet and reconnect plug to receiver chassis.

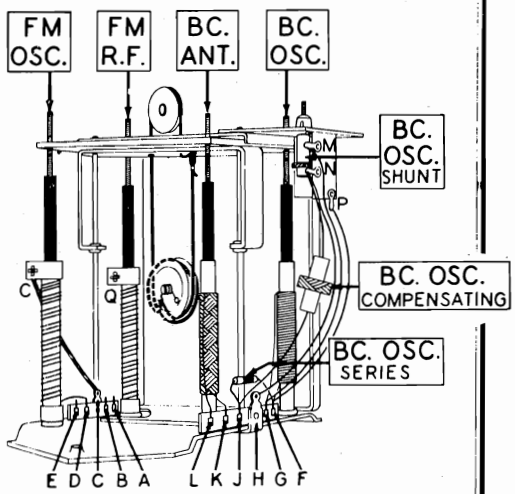
4. A specific setting of the receiver volume control is not required, however, it will be found convenient to leave it in the maximum volume position so that alignment signals will be audible even though the output indication is obtained by a V-T voltmeter or 'scope connected to points in the discriminator circuit.

5. FM circuit leads should be dressed as short and straight as possible, particularly those in the oscillator circuit. I.F. plate and grid leads should also be kept short and straight.

6. Alignment of receiver circuits may now be accomplished by using the procedure in the adjoining chart.



TRIMMER LOCATION CHART



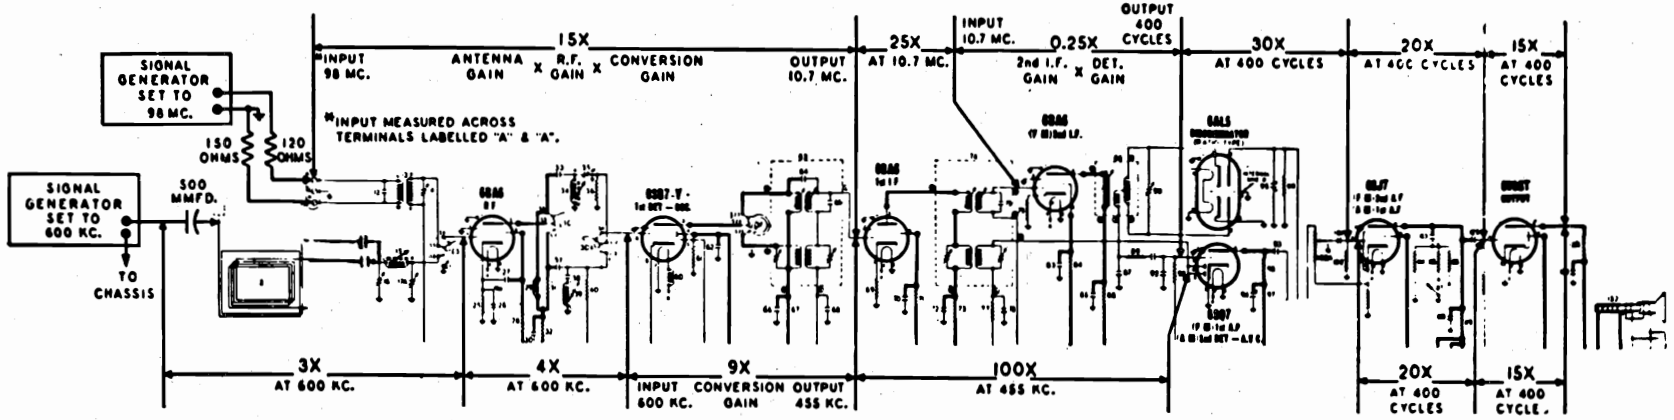
SLUG TUNER ASSEMBLY

STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of each of the stages of this receiver should be measured with an A. C. Vacuum Tube Voltmeter of the high frequency type (uniform response up to 100 MC). A conventional "AM" type signal generator may be used but it must be capable of producing **fundamental** frequencies of 600 KC. and 98 MC—**avoid using a generator that produces the 98 MC. signal by means of harmonics.**

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F., I.F. and Discriminator stages are carefully and accurately aligned by utilizing the alignment procedure given in this manual.
2. Connect Signal Generator as shown below. Note that generator connections differ for "AM" and "FM" measurements.
3. For "AM" measurements, set signal generator to 600 KC. and then carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
4. For "FM" measurements, set signal generator to 98 MC. and then carefully tune radio receiver to this signal by using a D. C. Vacuum Tube Voltmeter as an output indicator—meter must be connected between pin #7 of 6AL5 tube and chassis. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. The values of stage gain which are given here were measured with a fixed bias of 3 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. circuit. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 3 volt battery to A.V.C. at terminal 7 of the 1st I.F. transformer and connect the positive battery lead to the receiver chassis.
6. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit-detuning.



DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.

"FM" ALIGNMENT PROCEDURE CONTINUED

INSTRUCTIONS GIVEN ON PRECEDING PAGE MUST BE FOLLOWED BEFORE USING THIS CHART

SIGNAL GENERATOR CONNECTIONS			OSCILLOSCOPE OR V-T VOLTMETER CONNECTIONS		RECEIVER				TYPE OF ADJUSTMENT AND OUTPUT INDICATION	
CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	CONNECT GROUND LEAD OF SIGNAL GENERATOR TO	FREQUENCY & TYPE OF MODULATION	IF AN OSCILLOSCOPE IS USED, CONNECT IT AS FOLLOWS:	IF A V-T VOLTMETER IS USED, CONNECT IT AS FOLLOWS:	FM-AM-PHONO SWITCH POSITION	DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	ADJUSTMENT AND OUTPUT INDICATION WHEN USING A V-T VOLTMETER	ADJUSTMENT AND OUTPUT INDICATION WHEN USING AN OSCILLOSCOPE
Pin ⌀1 of 6BA6 (FM) 2nd I.F. use a .01 MFD. condenser in series with generator lead.	Receiver chassis in vicinity of 6BA6 (FM) 2nd I.F. tube.	**10.7 MC** AM signal may be 400 cycle modulated or FM signal should preferably be modulated ±300 KC.	Connect vertical amplifier "high" lead in series with an 0.1 MFD. condenser to pin ⌀6 of 6SQ7 tube. Connect scope ground lead to receiver chassis.	Connect common (or ground) terminal of meter to receiver chassis. D.C. probe lead of meter is then connected to pin ⌀7 of the 6AL5 tube.	**FM** Maximum clockwise position	Any position where it does not affect the signal.	12	Discriminator Primary	Set meter to a low D.C. voltage range and adjust trimmer ⌀12 for maximum meter read.ng. (This voltage will be negative.)	Set vertical amplifier of scope for maximum amplification. Where FM signal generator provides an output voltage for synchronization, connect this voltage to "sync" terminals of the scope. Then adjust setting of trimmer ⌀13, before attempting to adjust trimmer ⌀12, until a pattern similar to the following appears on the screen. If pattern does not remain stationary, operate sweep frequency control on scope and also "sync" control until desired result is obtained.  This double "S" curve pattern results when 'scope uses "Sawtooth" horizontal deflection voltage. This single "S" curve pattern results when 'scope uses properly phased "sine wave" horizontal deflection voltage. Adjust trimmer ⌀12 for maximum amplitude and steepness of that portion of the curve between "A" and "C".
Same as above	Same as above	Same as above	Same as above	Before connecting V-T voltmeter, it is necessary to connect two 68,000 ohm resistors (resistance of both units must compare within 1%) in series from pin ⌀7 of the 6AL5 tube to the chassis. Then connect common (or ground) terminal of V-T voltmeter to the junction of these two resistors. D.C. probe lead of meter is now connected to junction of resistor ⌀89 (3300 ohms) and condenser ⌀ 91 (.01 MFD.) which are in the discriminator output circuit.	Same as above	Same as above	13	Discriminator Secondary **Use an insulated phasing tool to adjust this trimmer.**	Set meter for operation on its lowest D.C. voltage range. Note that as trimmer ⌀13 is rotated a point will be found where voltmeter will swing rather sharply from a positive to a negative reading or vice versa. Correct setting of trimmer ⌀13 is obtained when meter reads zero as trimmer is moved through this point. The adjustment is somewhat critical and considerable care must be exercised to set the trimmer for a zero meter indication.	With the 'scope set up as described above, adjust trimmer ⌀13 until the cross-over point "B" is centrally located in both the horizontal and vertical directions; in addition, the portion of the curve between "A" and "C" should be as linear (straight) as possible.
Recheck the two preceding adjustments to be sure that both trimmers are set as accurately as possible to obtain the specified output indication on vacuum tube voltmeter or oscilloscope. Then disconnect and remove the two 68,000 ohm resistors that were used for the vacuum tube voltmeter connection in the 2nd step.										
Pin ⌀1 of 6BA6 (FM) 1st I.F. tube; use a .01 MFD. condenser in series with generator lead.	Receiver chassis in vicinity of 6BA6 (FM) 1st I.F. tube.	Same as above	Same as above	Connect common (or ground) terminal of meter to receiver chassis. D.C. probe lead of meter is then connected to Pin ⌀7 of the 6AL5 tube.	Same as above	Same as above	14 and 15	2nd I.F.	Adjust trimmers ⌀14 and ⌀15 for maximum meter reading.	With 'scope set up as described above, adjust trimmers ⌀14 and ⌀15 for maximum amplitude and steepness of that portion of the pattern between "A" and "C".
Terminal "B" on slug tuner unit (see Fig. 11); use a .01 MFD. condenser in series with generator lead.	Receiver chassis in vicinity of slug tuner unit.	Same as above	Same as above	Same as above	Same as above	Same as above	16 and 17	1st I.F.	Adjust trimmers ⌀16 and ⌀17 for maximum meter reading.	Adjust trimmers ⌀16 and ⌀17 for maximum amplitude and steepness of pattern as described above. If the enlarged pattern now indicates a lack of symmetry, readjust trimmer ⌀13 for correct cross-over point.
If positions of movable slugs in the slug tuner assembly have been disturbed (examine cement seal near top of threaded stem on each slug) or if a coil or slug has just been replaced in the tuner assembly, omit the next 4 instructions in this chart and start with the procedure entitled "Slug Tuner Adjustment Procedure—FM Section." Where the tuner assembly has not been disturbed, ignore this instruction and proceed with the next step.										
Generator output leads must be connected to the two terminals labelled "A" on the "A-G-A" terminal strip at back of chassis. Connect "high" lead to one "A" terminal in series with a 120 ohm resistor and connect generator ground lead to the other "A" terminal in series with a 150 ohm resistor.		**98 MC** AM signal may be 400 cycle modulated or FM signal should preferably be modulated ±300 KC.	Same as above	Same as above	FM Maximum clockwise position	98 MC	18	Oscillator Trimmer	Set trimmer ⌀18 to receive 98 MC. signal and adjust for maximum meter reading.	Adjust trimmer ⌀18 to obtain the symmetrical pattern shown above. Correct setting of trimmer ⌀18 is obtained when cross-over point in pattern is centrally located.
Same as above	Same as above	Same as above	Same as above	Same as above	Same as above	98 MC	19	R.F. Trimmer	Adjust trimmer ⌀19 for maximum meter reading.	Adjust trimmer ⌀19 for maximum amplitude of pattern.
							16 and 17	1st I.F.	Recheck adjustment of these trimmers for maximum meter reading.	Recheck adjustment of these trimmers for maximum amplitude and symmetry of pattern.
Same as above		**90 MC** AM signal may be 400 cycle modulated or FM signal should preferably be modulated ±300 KC.	Same as above	Same as above	Same as above	Tune to 90 MC. generator signal.	20	Antenna Trimmer	Adjust trimmer ⌀20 for maximum meter reading.	Adjust trimmer ⌀20 for maximum amplitude of pattern.
Check calibration and tracking of receiver with input signals of 88 and 108 MC. If difference between dial pointer setting and 88 or 108 MC. calibration mark does not exceed ±0.4 MC. and R.F. circuit is tracking properly, then alignment may be considered satisfactory and no further adjustment is necessary. Where calibration error is greater than ±0.4 MC. it is advisable to adjust the slug tuner as described in the following section.										

SLUG TUNER ADJUSTMENT PROCEDURE — FM SECTION

This procedure is to be used only where the positions of slugs in slug tuner have been disturbed or in event of a coil or slug replacement, or where a serious calibration or tracking error is noted after attempting to align the receiver as described in the preceding section.

Same as above	**88 MC** AM signal may be 400 cycle modulated or FM signal should preferably be modulated ±300 KC.	Same as above	Same as above	Same as above	By means of tuning control knob, set dial pointer to 88 MC. mark on dial.	18	Oscillator Trimmer	Set trimmer ⌀18 to receive 88 MC. signal.	Adjust trimmer ⌀18 to obtain the symmetrical pattern shown above.
						19	R.F. Trimmer	Adjust trimmers ⌀19 and ⌀20 for maximum meter reading.	Adjust trimmers ⌀19 and ⌀20 for maximum amplitude of pattern.
						20	Antenna Trimmer		
Same as above	**98 MC**	Same as above	Same as above	Same as above	By means of tuning control knob, set dial pointer to 98 MC. mark on dial.	21	Oscillator tuning slug	Set slug ⌀21 to receive 98 MC. signal and adjust for maximum meter reading.	Adjust slug ⌀21 to obtain the symmetrical pattern shown above.
Same as above	**108 MC**	Same as above	Same as above	Same as above	By means of tuning control knob, set dial pointer to 108 MC. mark on dial.	—	—	Note heavy braided lead connection to osc. coil; adjust position of this braid until 108 MC. signal is received and meter reading is maximum. Coat braid with speaker cement after correct position is located.	Note heavy braided lead connection to osc. coil; adjust position of this braid until symmetrical pattern shown above is obtained. Coat braid with speaker cement after correct position is located.
						22	R.F. tuning slug	Adjust slug ⌀22 for maximum meter reading.	Adjust slug ⌀22 for maximum amplitude of 'scope pattern.

Repeat the three preceding adjustments until satisfactory calibration and tracking is obtained at 88 MC., 98 MC., and 108 MC. Apply a coating of speaker cement at top of each tuning slug stem to prevent movement.

SOCKET VOLTAGES

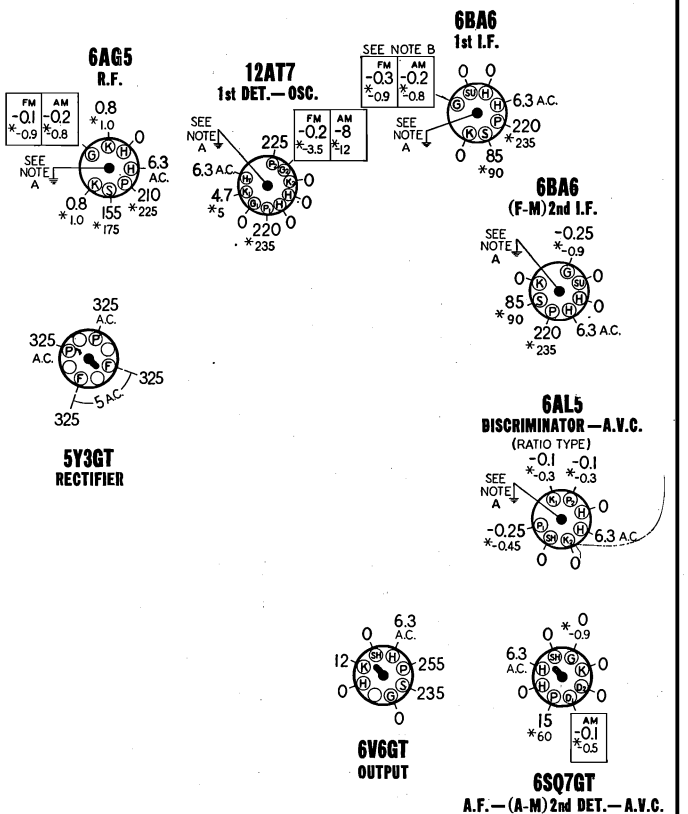
Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.

ALL MEASUREMENTS MADE WITH BAND SWITCH IN "FM" POSITION UNLESS OTHERWISE INDICATED
DIAL TUNED TO 88 MC. FOR "FM" MEASUREMENTS
DIAL TUNED TO 540 KC. FOR "AM" MEASUREMENTS
VOLUME CONTROL SET TO MINIMUM WITH NO SIGNAL
GROUND ALL ANTENNA TERMINALS

BOTTOM VIEW OF CHASSIS

117 VOLT 60 CYCLE A. C. POWER SUPPLY USED FOR THESE MEASUREMENTS.

ALL VOLTAGES MEASURED BETWEEN SOCKET TERMINALS AND CHASSIS.



REAR OF CHASSIS

NOTE A: Grounding of center stud on tube socket is necessary to reduce capacity coupling between other pins. Oscillation may result if this ground is omitted.

NOTE B: Oscillation may occur when meter probe contacts this tube pin. In that event, the vacuum tube voltmeter measurement will be approximately -4.5 volts.

USE OF WIRE RECORDER CONNECTION

A special cable and socket, extending from the rear of the chassis, is provided for the connection of a wire recorder unit which may be obtained as an accessory.

IMPORTANT: It should be noted that a dummy plug is inserted in this socket. The dummy plug contains a jumper connection which is necessary to maintain continuity of the B+ voltage supply line to the R.F., Mixer, and Oscillator stages of the receiver.

Where a wire recorder has been installed, it is necessary that the recorder controls be properly set when normal radio operation is desired otherwise the aforementioned B+ circuit will remain open. See instructions accompanying the recorder unit for proper setting of controls.

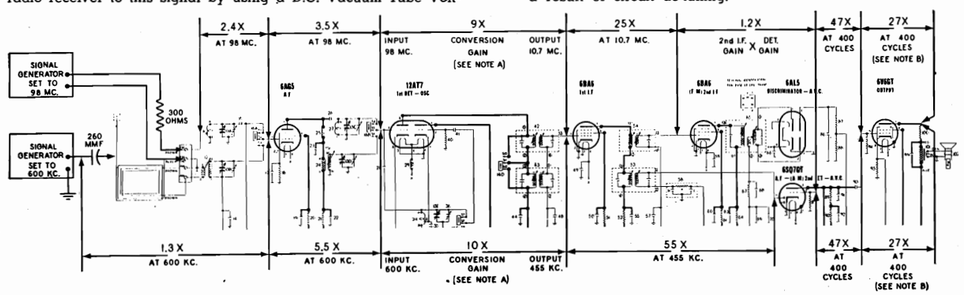
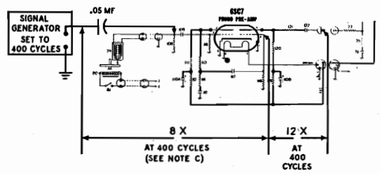
STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of most of the stages of this receiver can be measured with an A.C. Vacuum Tube Voltmeter of the high frequency type. An AM (600 KC.) as well as an FM (98 MC.) signal source is required. For gain measurements in the FM antenna– FM converter—FM 1st I.F. stages, a microvolt calibrated FM signal generator should preferably be used.

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F., I.F. and Discriminator stages are carefully and accurately aligned by utilizing the alignment procedure given in this manual.
2. Connect Signal Generator as shown below. Note that generator connections differ for "AM" and "FM" measurements.
3. For "AM" measurements, set signal generator to 600 KC. (400 cycle modulation) and then carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
4. For "FM" measurements, set signal generator to 98 MC. (400 cycle modulation with 22½ KC. deviation) and then carefully tune radio receiver to this signal by using a D.C. Vacuum Tube Voltmeter as an output indicator meter must be connected between pin No. 7 of 6AL5 tube and chassis. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. The values of stage gain which are given here were measured with a fixed bias of —3 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. system. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 3 volt battery to both A.V.C. supply lines by effecting a common connection to terminal 4 of 2nd FM-I.F. transformer and terminal 2 of 1st AM-I.F. transformer. Then connect the positive battery lead to the receiver chassis.
6. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.





NOTE A: Short oscillator grid (pin 2 of 12AT7) to ground when measuring input voltage at signal grid (pin 7) of 12AT7 tube.

NOTE B: Measured with input voltage of 0.3.

NOTE C: Measured with input voltage of 0.05.

DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown.

BROADCAST BAND —"AM"—ALIGNMENT PROCEDURE

1. Disconnect leads from FM-AM aerial terminal strip (labeled FM-FM-AM-AM) at back of chassis; also disconnect speaker leads and phono plugs. Remove chassis and speaker. If desired, allow speaker to remain in cabinet and connect to receiver by extension leads.
2. Stand chassis on one edge so that all trimmers are accessible.
3. Built-in loop aerial leads do not have to be connected to terminal strip on rear of chassis while I. F. stages are being aligned. Before starting alignment of Ant., R.F., and Osc. stages, the loop aerial must be reconnected to chassis—do not attempt to use extension leads, remove loop aerial from cabinet to facilitate connection to chassis. Loop can be taken out of cabinet by merely lifting so as to release pivot dowel at bottom of frame; then remove screw which holds external aerial clip on top support block so as to release connecting lead.
4. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 55 on the dial. If it is set incorrectly, hold tuning shaft steady and reposition pointer.
5. Connect an output meter across speaker voice coil, or from plate of 6V6GT tube to chassis through a 0.1 Mfd. condenser.
6. Connect ground lead of signal generator to the receiver chassis.
7. Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. Condenser	Lug on trimmer No. 6 at top of gang (see figure below for location of trimmer).	455 KC	AM Broadcast (Middle)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
260 MMFD. Mica Condenser	External Aerial Clip	1500 KC	AM Broadcast (Middle)	1500 KC	5	Broadcast Oscillator	Adjust for maximum output.
260 MMFD. Mica Condenser	External Aerial Clip	1500 KC	AM Broadcast (Middle)	Tune to 1500 Kc. generator signal.	6	Broadcast R.F.	Adjust for maximum output.
					7	Broadcast Antenna	Adjust for maximum output.
260 MMFD. Mica Condenser	External Aerial Clip	600 KC	AM Broadcast (Middle)	Tune to 600 Kc. generator signal.	8	Adjustable core of Broadcast R.F. Coil.	Adjust for maximum output.
					9	Adjustable core of Broadcast Antenna Coil.	Adjust for maximum output.

Repeat adjustment of trimmers 6 & 7 and slugs 8 & 9 until one no longer detunes the other.

NOTE: It is preferable to check the alignment of the I.F. stages in the FM channel after completing AM alignment.

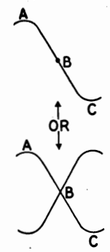
This single "S" curve pattern results when 'scope uses properly phased "sine wave" horizontal deflection voltage.



This double "S" curve pattern results when 'scope uses properly phased "Sawtooth" horizontal deflection voltage whose frequency is twice the modulation frequency of signal generator.

TRIMMER LOCATION CHART

THE FIRESTONE TIRE & RUBBER CO.

MODELS 4-A-64, 4-A-65

FREQUENCY MODULATION—"FM"—ALIGNMENT PROCEDURE

(USING AN OSCILLOSCOPE AND FM "SWEEP" GENERATOR)

INSTRUMENTS: Alignment of the FM circuits in this receiver can be most conveniently accomplished with an FM signal generator. When using this type generator, the output indicator must be an oscilloscope.

1. If alignment of both AM and FM channels is required it is necessary to align the AM channel first, then align the FM channel as instructed in chart below (AM alignment procedure is given on page 8).
2. Disconnect leads from FM-AM aerial terminal strip (labelled FM-FM-AM-AM) at back of chassis; also disconnect speaker leads and phono plugs. Remove chassis and speaker. (If desired, allow speaker to remain in cabinet and connect to receiver by extension leads.)
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 88 on the dial. If it is set incorrectly, hold tuning shaft steady and reposition pointer.
4. A specific setting of the receiver volume control is not required, however, it will be found convenient to leave it in the maximum volume position so that alignment signals will be audible even though the output indication is obtained by an oscilloscope connected to points in the discriminator circuit.
5. Dress FM circuit leads as short and straight as possible, particularly those in the oscillator circuit. I.F. plate and grid leads should also be kept short and straight.
6. **Set band switch to the FM (extreme counter-clockwise) position.**
7. Set tone control to fully counter-clockwise position.

SIGNAL GENERATOR CONNECTIONS	FREQUENCY & TYPE OF MODULATION	OSCILLOSCOPE CONNECTIONS	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect high side in series with an .01 Mfd condenser to lug on trimmer No. 17 at top of gang (see illustration on page 8 for location of trimmer). Connect ground lead to receiver chassis in vicinity of 12AT7 tube.	**10.7 MC** FM signal should preferably be modulated ±400 KC.	Connect vertical amplifier "high" lead to junction of resistor No. 67 (18000 ohms) and condenser No. 70 (.003 Mfd.) which are in discriminator output circuit. Connect scope ground lead to receiver chassis. ——— Set vertical amplifier of scope for maximum amplification. Where FM signal generator provides an output voltage for synchronization, connect this voltage to "sync" terminals of the scope.	Any position where it does not affect the signal.	10	Discriminator Secondary	Before attempting to adjust trimmer No. 10, set trimmers No. 11, 12, 13, 14 and No. 15 for approximately maximum sound output from the speaker (output meter not required). This is done to obtain sufficient signal for an oscilloscope pattern of desirable amplitude when making the following discriminator trimmer adjustment. Adjust setting of trimmer No. 10 until a pattern similar to that shown in Fig. 2 appears on the screen. If pattern does not remain stationary operate sweep frequency control on 'scope and also "sync" control until desired result is obtained. Correct setting of trimmer No. 10 is obtained when crossover point "B" (Fig. 2) is centrally located in both the horizontal and vertical directions; in addition that portion of the curve between "A" and "C" should be as linear (straight) as possible.
Same as above	Same as above	Same as above	Same as above	11	Discriminator Primary	Adjust these trimmers for maximum amplitude and steepness of that portion of the pattern between "A" and "C" (see Fig. 2).
				12 and 13	2nd I.F.	
				14 and 15	1st I.F.	
Recheck adjustments of trimmers No. 10 and No. 11 to be sure that both are set as accurately as possible to obtain correct cross-over point or symmetry of pattern.						
Connect generator "high" side in series with a 300 ohm carbon resistor to end terminal marked "FM" on strip at back of chassis. Generator ground lead must connect to next terminal marked "GND".	**106 MC** FM signal should preferably be modulated ±400 KC.	Same as above	106 MC	16	Oscillator Trimmer	Adjust trimmer No. 16 to obtain the symmetrical pattern shown in Fig. 2. Correct setting of trimmer No. 16 is obtained when cross-over point in pattern is centrally located. **IMPORTANT:** It will be noted that there are two different settings of trimmer No. 16 at which the desired 'scope pattern can be obtained—always select the trimmer setting which is nearest to the low capacity end of its range.
Same as above	Same as above	Same as above	Tune to 106 MC. generator signal.	17	R.F. Trimmer	Adjust trimmer No. 17 for maximum amplitude of pattern.
				18	Antenna Trimmer	Adjust trimmer No. 18 for maximum amplitude of pattern.
				14 and 15	1st I.F.	Recheck adjustment of these trimmers for maximum amplitude of pattern.

Check calibration and tracking of receiver with input signals of 90 and 98 MC. If difference between dial pointer setting and 90 or 98 MC. calibration mark does not exceed ± 0.3 MC. and antenna and R.F. circuits are tracking properly, then alignment may be considered satisfactory and no further adjustment is necessary.

Where the calibration error is greater than ± 0.3 MC. it is advisable to make the following adjustments:

1. If pointer falls above the 90 MC. calibration point, it will be necessary to slightly spread the windings of the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16, 17 and 18 at 106 MC. Should it be found impossible to obtain the 106 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condenser plates.
2. If pointer falls below the 90 MC. calibration point, it will be necessary to push the windings together on the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16, 17 and 18 at 106 MC. Should it be found impossible to obtain the 106 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condenser plates.
3. Correction for mistracking of antenna and R.F. may be accomplished by adjusting coil turns and gang plate spacing in the same manner.

MODELS 4-A-64, 4-A-65

THE FIRESTONE TIRE & RUBBER CO.

FREQUENCY MODULATION—"FM"—ALIGNMENT PROCEDURE
(USING A VACUUM TUBE VOLTMETER AND AM SIGNAL GENERATOR)

INSTRUMENTS: Although it is preferable to use on FM generator and an oscilloscope, reasonably accurate alignment is obtainable when using a conventional AM generator and vacuum tube voltmeter providing proper care is exercised in adjusting the discriminator circuit trimmer.

IMPORTANT: When using an AM signal generator, it should be capable of producing fundamental frequencies of 10.7 MC and 88 to 108 MC — avoid using an AM generator which produces signals in the 88 to 108 MC range by using harmonics higher than the second. Generators which are dependent upon third, fourth or fifth harmonics for output frequencies of 88 to 108 MC will generally produce undesirable spurious beat signals with the local oscillator in the receiver and alignment will be exceedingly difficult.

1. If alignment of both AM and FM channels is required it is necessary to align the AM channel first, then align the FM channel as instructed in chart below (AM alignment procedure is given on the preceding page).
2. Disconnect leads from FM-AM aerial terminal strip (labelled FM-FM-AM-AM) at back of chassis; also disconnect speaker leads and phono plugs. Remove chassis and speaker. If desired, allow speaker to remain in cabinet and connect to receiver by extension leads.
3. With the gang condenser fully meshed, dial pointer should be in the position indicated by the last division below 88 on the dial. If it is set incorrectly, hold tuning shaft steady and reposition pointer.
4. A specific setting of the receiver volume control is not required. However, it will be found convenient to leave it in the maximum volume position so that alignment signals will be audible even though the output indication is obtained by a V-T voltmeter connected to points in the discriminator circuit.
5. Dress FM circuit leads as short and straight as possible, particularly those in the oscillator circuit. I.F. plate and grid leads should also be kept short and straight.
6. Set band switch to the FM (extreme counter-clockwise) position.

SIGNAL GENERATOR CONNECTIONS	FREQUENCY & TYPE OF MODULATION	VACUUM TUBE VOLTMETER CONNECTIONS	RECEIVER DIAL SETTING	TRIMMER OR SLUG NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect high side in series with an .01 Mfd condenser to lug on trimmer No. 17 at top of gang (see illustration on page 8 for location of trimmer). Connect ground lead to receiver chassis in vicinity of 12AT7 tube.	**10.7 MC** AM signal may be 400 cycle modulated.	Connect common (or ground) terminal of meter to receiver chassis. D.C. probe lead of meter is then connected to pin No. 7 of the 6AL5 tube.	Any position where it does not affect the signal.	11	Discriminator Primary	Adjust these trimmers for maximum meter reading—the output voltage will be of negative polarity.
				12 and 13	2nd I.F.	
				14 and 15	1st I.F.	
Same as above	Same as above	Connect common (or ground) terminal of V-T voltmeter to the junction of resistors 87 and 88 in the discriminator circuit. D.C. probe lead of meter is then connected to junction of resistor No. 67 (18,000 ohms) and condenser No. 70 (.003 MFD.) which are in the discriminator output circuit. Set meter for operation on its lowest D.C. voltage range.	Same as above	10	Discriminator Secondary	Note that as trimmer No. 10 is rotated a point will be found where voltmeter will swing from a positive to a negative reading or vice versa. Correct setting of trimmer No. 10 is obtained when meter reads zero as trimmer is moved through this point. The adjustment is somewhat critical and considerable care must be exercised to set the trimmer for a zero meter indication.
Recheck adjustment of trimmers No. 10 and No. 11 to be sure that both are set as accurately as possible to obtain the specified output indication.						
Connect generator "high" side in series with a 300 ohm carbon resistor to end terminal marked "FM" on strip at back of chassis. Generator ground lead must connect to next terminal marked "GND".	**106 MC** AM signal may be 400 cycle modulated.	Connect common (or ground) terminal of meter to receiver chassis. D.C. probe lead of meter is then connected to Pin No. 7 of the 6AL5 tube.	106 MC	16	Oscillator Trimmer	Set trimmer No. 16 to receive 106 MC. signal as indicated by maximum meter reading. IMPORTANT: It will be noted that there are two different settings of trimmer No. 16 at which the 106 MC. signal will be received—always select the trimmer setting which is nearest to the low capacity end of its range.
Same as above	Same as above	Same as above	Tune to 106 MC. generator signal.	17	R.F. Trimmer	Adjust trimmer No. 17 for maximum meter reading.
				18	Antenna Trimmer	Adjust trimmer No. 18 for maximum meter reading.
				14 and 15	1st I.F.	Recheck adjustment of these trimmers for maximum meter reading.

Check calibration and tracking of receiver with input signals of 90 and 98 MC. If difference between dial pointer setting and 90 or 98 MC. calibration mark does not exceed ± 0.3 MC. and antenna and R.F. circuits are tracking properly, then alignment may be considered satisfactory and no further adjustment is necessary.

Where the calibration error is greater than ± 0.3 MC. it is advisable to make the following adjustments:

1. If pointer falls above the 90 MC. calibration point, it will be necessary to slightly spread the windings of the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16, 17 and 18 at 106 MC. Should it be found impossible to obtain the 106 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condenser plates.
2. If pointer falls below the 90 MC. calibration point, it will be necessary to push the windings together on the FM oscillator coil. Then repeat the two preceding adjustments of trimmers 16, 17 and 18 at 106 MC. Should it be found impossible to obtain the 106 MC. signal at the proper point on the dial by adjustment of the trimmers it will then be necessary to adjust the spacing of the gang condsenser plates.
3. Correction for mistracking of antenna and R.F. may be accomplished by adjusting coil turns and gang plate spacing in the same manner as outlined above for the oscillator stage.

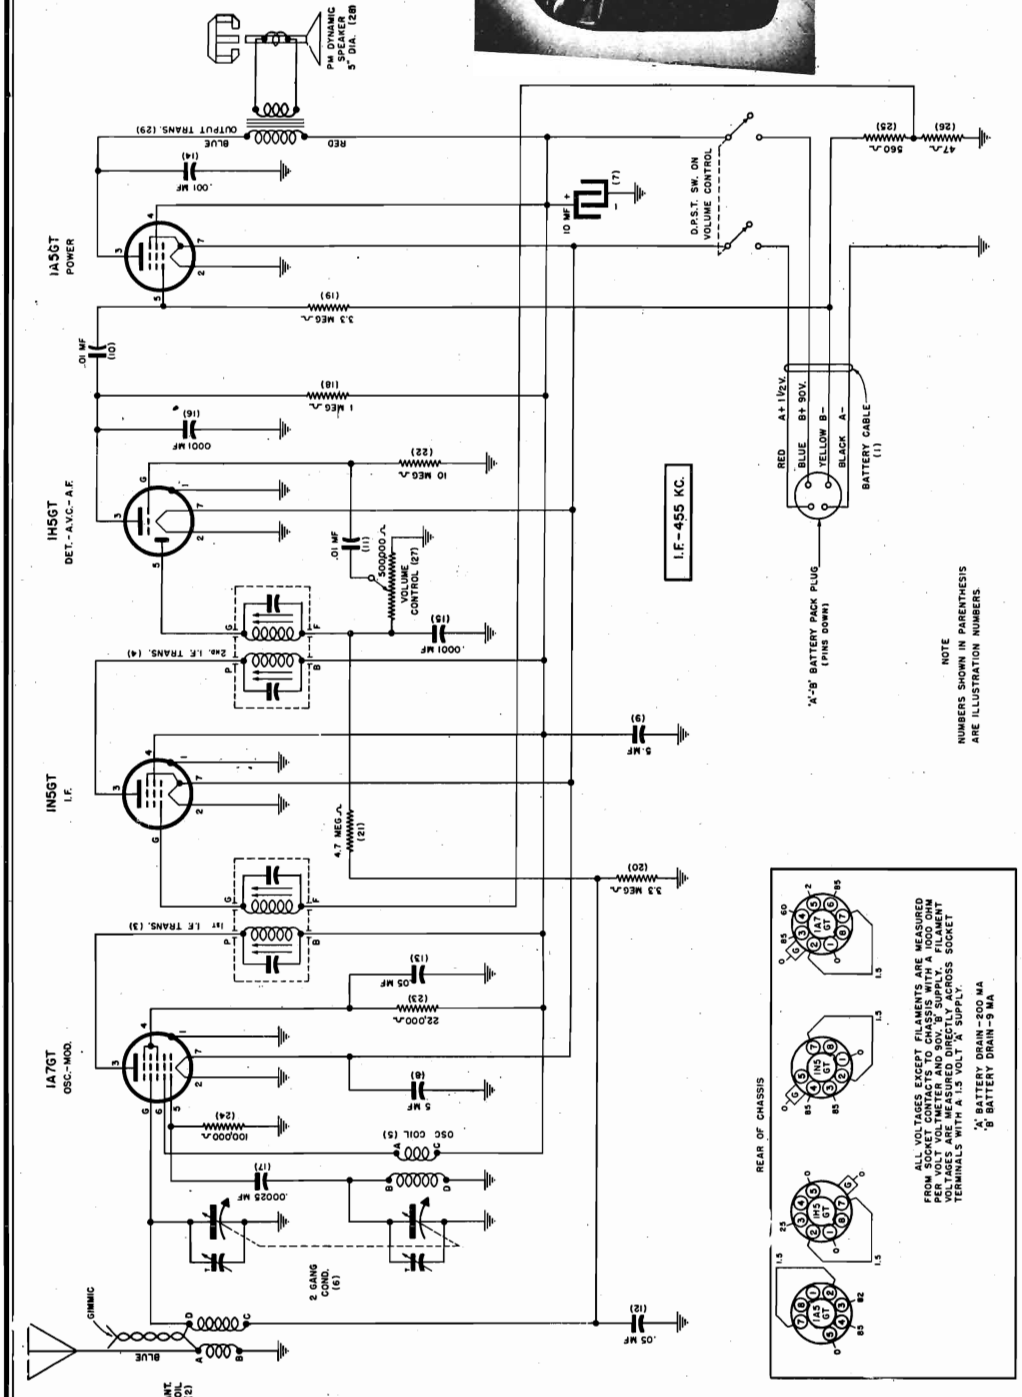
	503780	Socket and Mtg. Ring assy.—Pre-amp tube
	504597	Socket-miniature
	506331	Socket-noval base
	116690	Socket-octal base
	160392	Socket-octal (rectifier)
	505161	Spring-dial cord tension
	505924	Terminal strip (FM-FM-AM-AM)
	506689	Tilt Door assembly—Stock No. 4-A-64 (less hardware)

MODEL 4-A-67

THE FIRESTONE TIRE & RUBBER CO.



POWER SUPPLY	Battery Operated
BATTERY SPECIFICATIONS	1000 hour Firestone Battery Stock No. 4-D-1
TUNING RANGE	528 to 1730 KC
INTERMEDIATE FREQUENCY	455 KC

LOUD SPEAKER	5 Inch P.M.
VOICE COIL IMPEDANCE	3.2 OHM at 400 Cycles
POWER OUTPUT	Undistorted - 100 Milliwatts Maximum - 200 Milliwatts
TUBE COMPLEMENT	1A7GT Oscillator Modulator, 1N5GT IF, 1H5GT Det. AVC, 1A5GT Power Output.

ALIGNMENT PROCEDURE

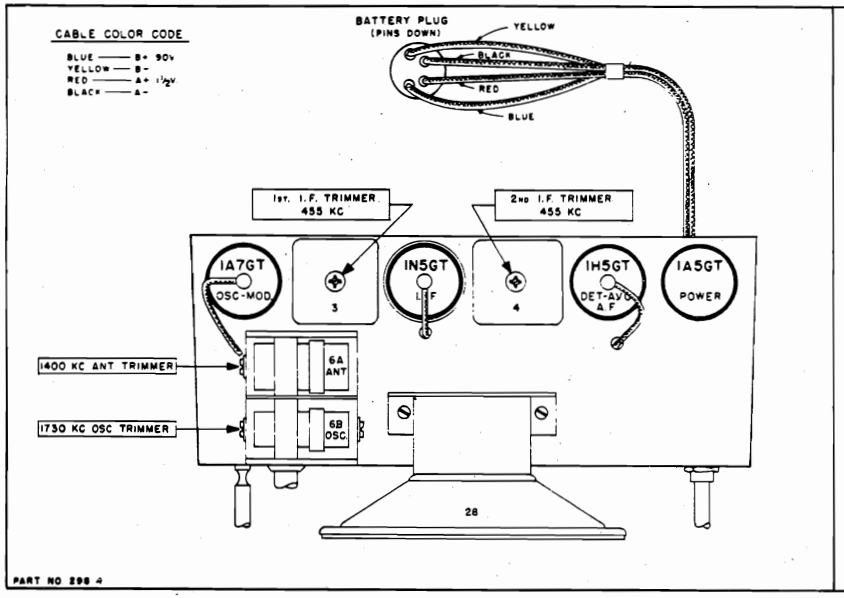
Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. Make the adjustment marked (1) first, (2) next, etc.

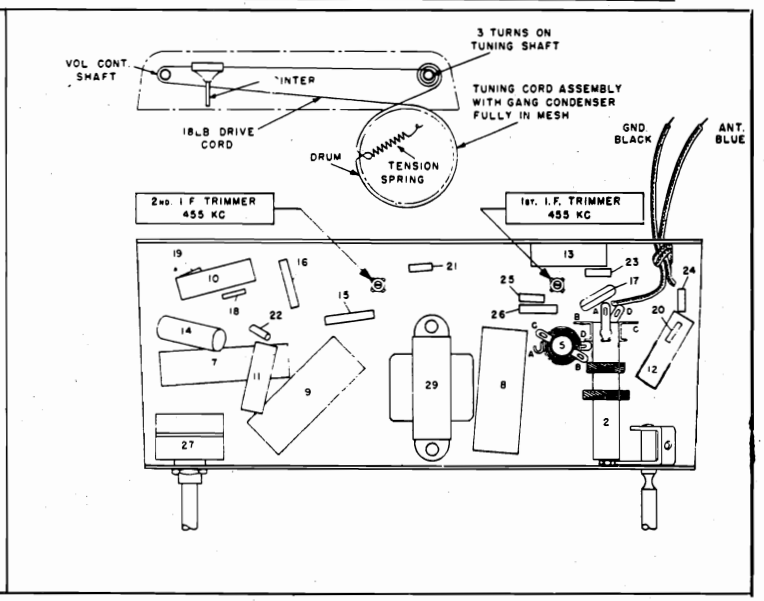
Before starting alignment:

(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line move to correct position.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

Steps	Set receiver dial to:	TEST OSCILLATOR			Refer to parts layout diagram for location of trimmers mentioned below:
		Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	
1	I.F. Any point where no interference signal is received	455 K. C.	.02 MFD. condenser	High side to grid terminal of 1A7GT tube DO NOT REMOVE CAP. Low side to receiver black ground lead.	Adjust each of the second I.F. transformer trimmers for maximum output—then adjust each of the first I.F. trimmers for maximum output.
2	Exactly 1730 K. C.	Exactly 1730 K. C.	.00025 MFD. condenser	Receiver blue antenna lead Receiver black ground lead	Adjust 1730 K. C. oscillator trimmer for maximum output.
3	Exactly 1400 K. C.	Exactly 1400 K. C.	.00025 MFD. condenser	Receiver blue antenna lead Receiver black ground lead	While rocking gang condenser adjust 1400 K. C. antenna trimmer for maximum output.

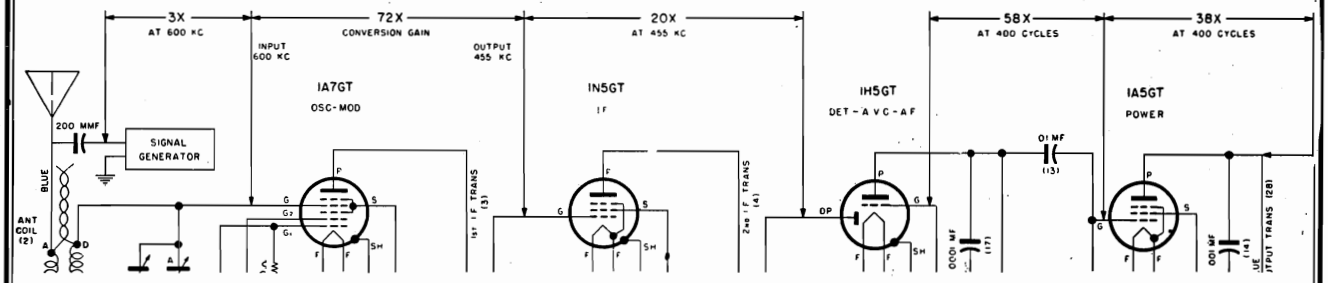




MODEL 4-A-67 THE FIRESTONE TIRE & RUBBER CO.

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. Avacuum tube voltmeter may be used for audio gain measurements. Observe following precautions.

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
3. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gains. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

PARTS LIST

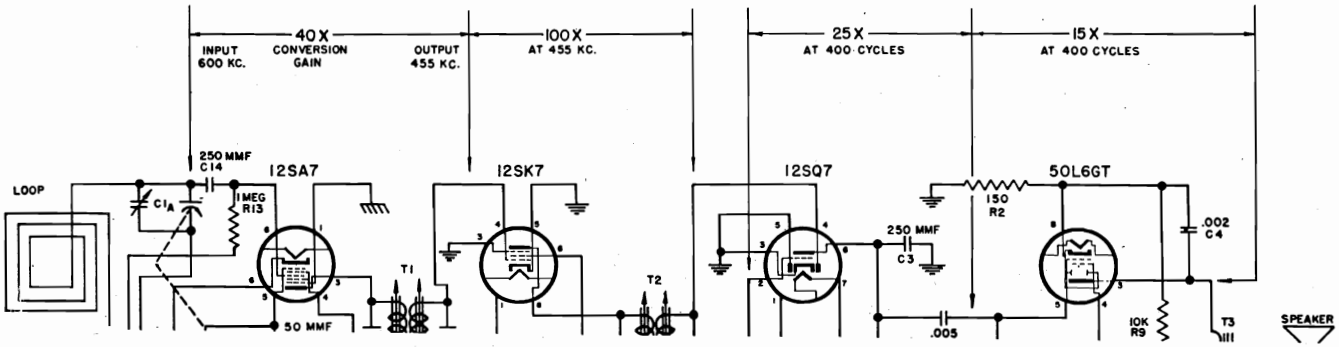
Before proceeding with stage measurements be sure the receiver is properly aligned. R.F. gains can be measured by a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe the following precautions:

1. **For all gain measurements connect the "high" side of a signal generator to the grid of the tuning condenser, C1A, through a .00025 mica condenser. The ground side of the signal generator should be connected to common negative. Use a 600 KC signal with 400 cycle modulation (use nearby frequency if local station interferes).**
2. **Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)**
3. **When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.**



Stage gain measurements can be influenced by the normal manufacturers tolerances allowed in parts, differences in individual tube characteristics, the adjustment of the tuned circuits and variations in line voltage. Careful tuning of the receiver as well as experience in using your test equipment will determine the accuracy of the measurements taken. Due to all of these factors, the stage gains shown in the above diagram are approximate values rather than absolute as it is possible to introduce many variations in these measurements.

ALIGNMENT PROCEDURE

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, to prevent A.V.C. action from interfering with correct alignment.

For alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third. When making alignment:

(a) Use an accurately calibrated test oscillator with some type of output measuring device.

(b) PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET.

Steps	Set receiver dial to:	TEST OSCILLATOR			Refer to parts layout diagram for location of trimmers mentioned below:
		Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	
1	Minimum capacity (fully open)	455 K.C.	.1 MFD. condenser	High side to grid of tuning condenser, C1A. Low side to common negative. (through .25 MFD. Cond.)	Adjust each trimmer on the second I. F. transformer for maximum output—then adjust each trimmer on the first I. F. transformer for maximum output.
2	Minimum capacity (fully open)	Exactly 1630 K.C.	.00025 MFD. condenser	High side to grid of tuning condenser, C1A. Low side to common negative.	Adjust 1630 K.C. oscillator trimmer for maximum output.
3	Approx. 1400 K.C.	Approx. 1400 K.C.	.00025 MFD. condenser	Loosely coupled to loop.	While rocking gang condenser adjust 1400 K.C. antenna trimmer for maximum output.

SPECIFICATIONS

I. F. Frequency
455 KC

Loud Speaker
5 inch P. M.

Voice Coil Impedance
3.2 ohms at 400 cycles

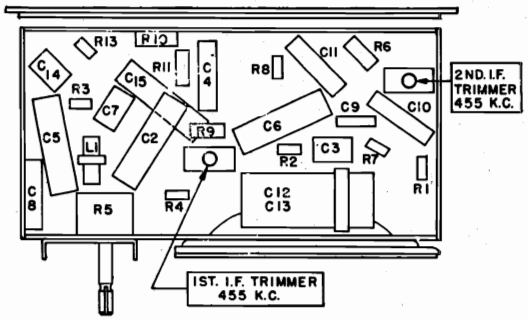
Power Output
Maximum 1.65 watts

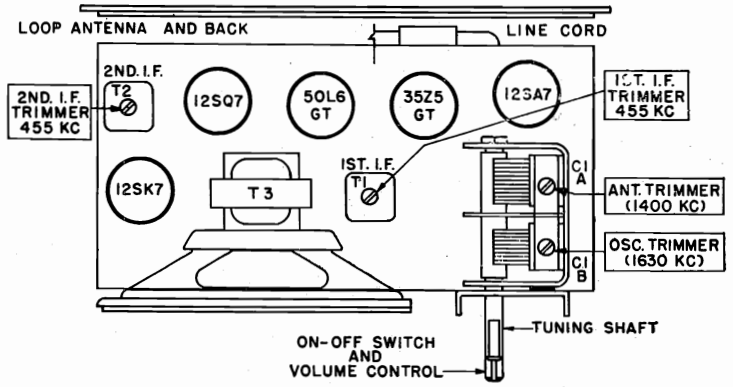
Tube Complement

12SA7 — Oscillator Converter
12SK7 — I. F. Amplifier
12SQ7 — AVC, Detector, 1st Audio
50L6GT — Power Output
35Z5GT — Rectifier

Power Supply
105-125 volts, 50-60 cycles, AC or DC

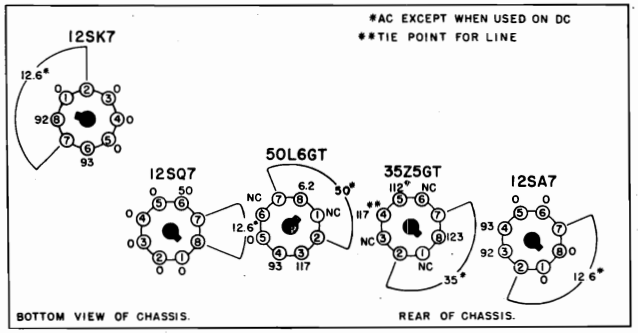
Tuning Range
540 to 1630 KC





VOLTAGE TABLE

(BOTTOM OF CHASSIS)



REAR OF CHASSIS

All voltages except heaters are measured from socket contacts to "common negative." Heater voltages are measured across socket contacts. All voltages measured with a 20,000 ohms per volt meter.

*AC except when used on DC.

ALIGNMENT PROCEDURE

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, to prevent A.V.C. action from interfering with correct alignment.

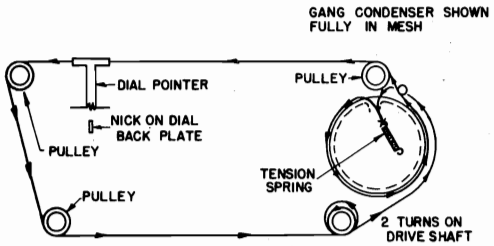
For alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third. Before starting alignment:

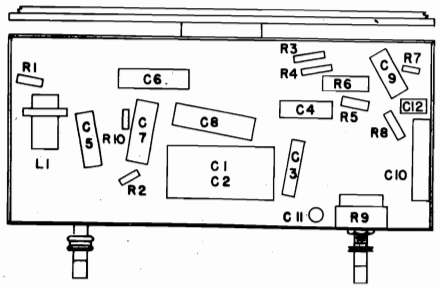
(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial pointer must be exactly even with the last mark at the low frequency end of the dial calibration. If dial pointer is incorrectly set, release pointer clip on dial cord and reposition pointer.

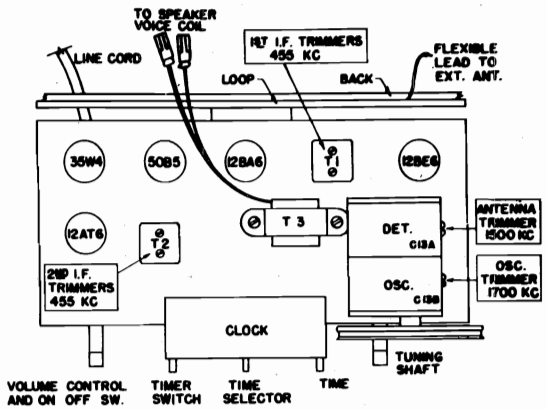
(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET.

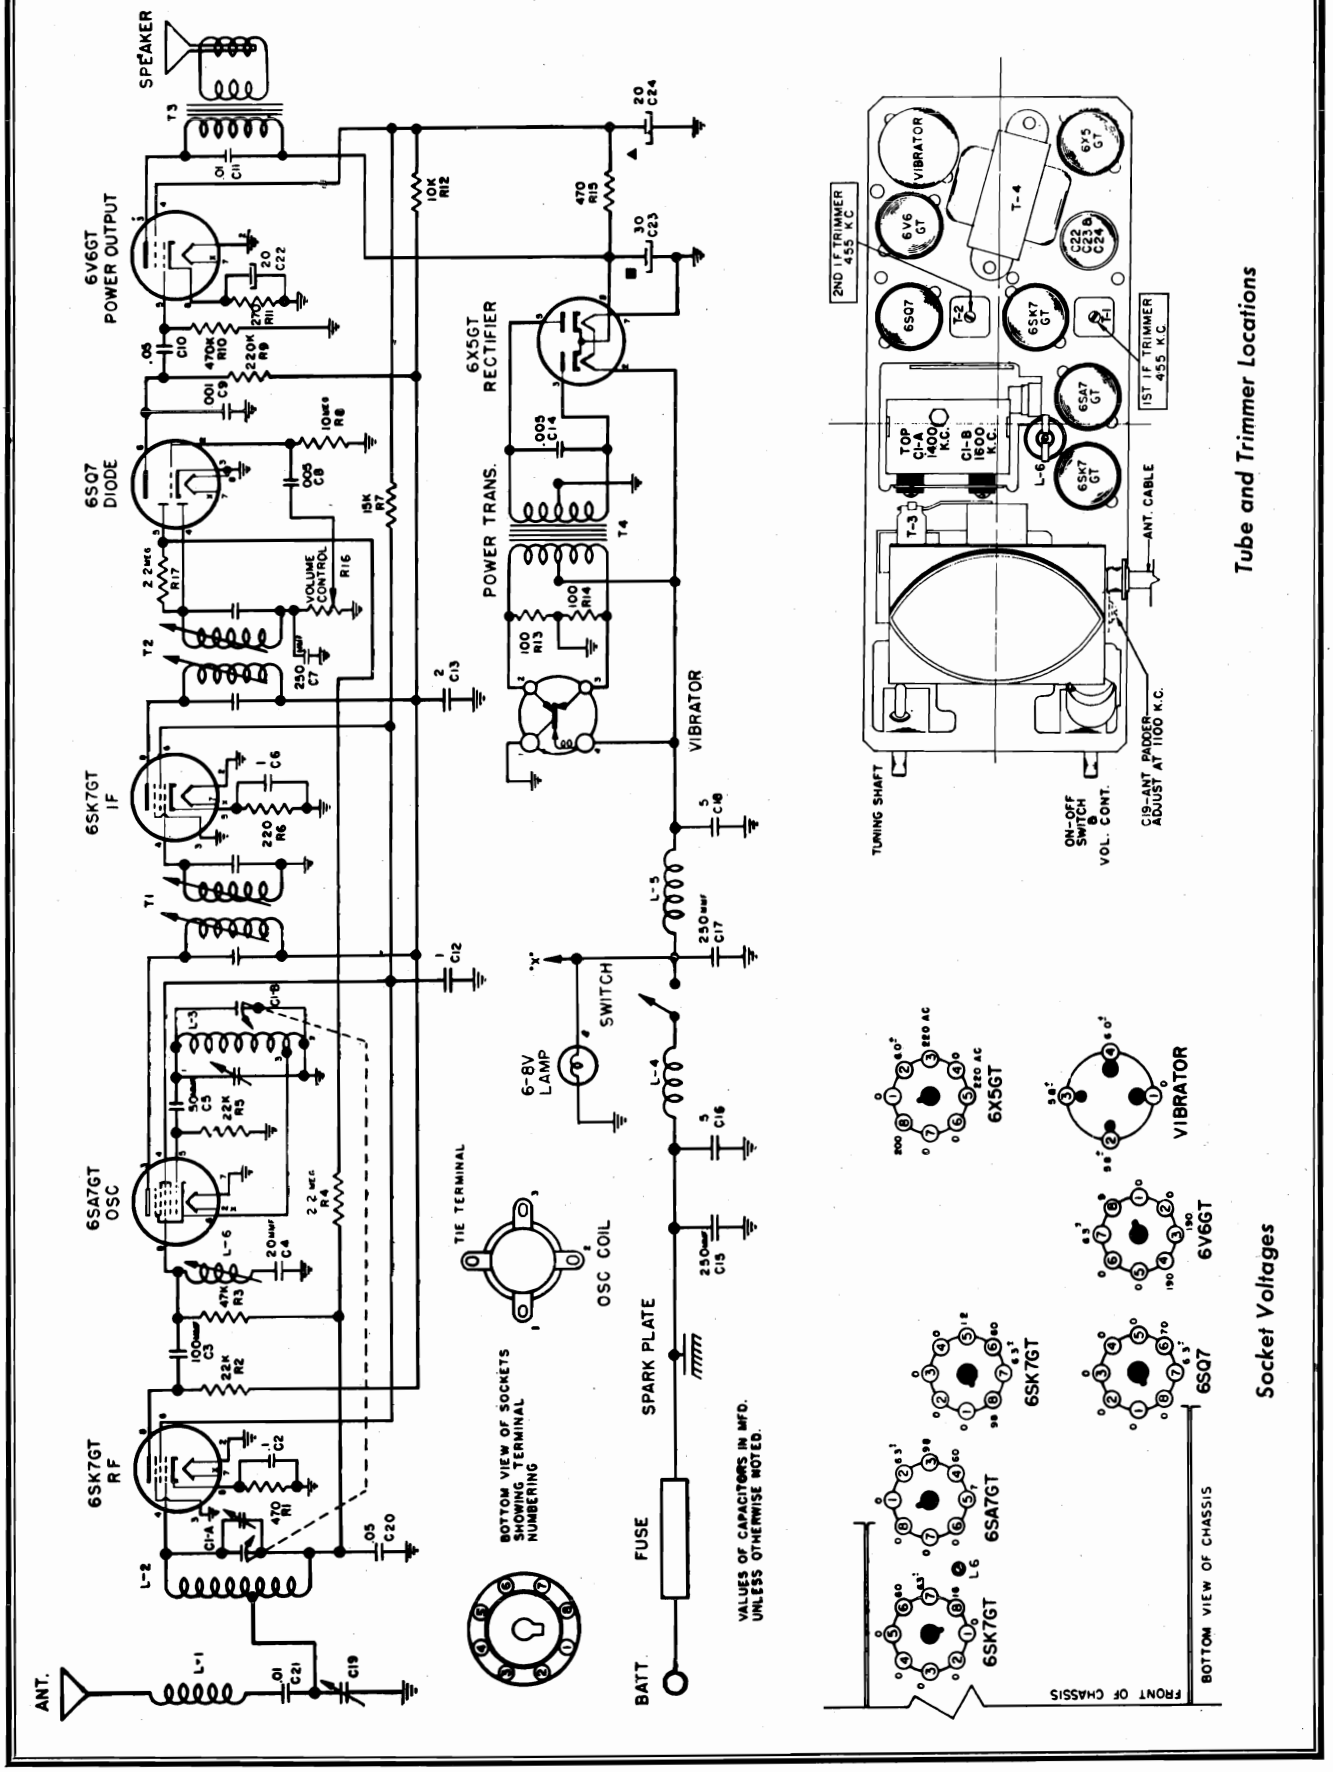
Steps	Set receiver dial to:	TEST OSCILLATOR			Refer to parts layout diagram for location of trimmers mentioned below:
		Adjust test oscillator frequency to:	Use dummy antenna in series with output of test oscillator consisting of:	Attach output of test oscillator to:	
1	Minimum capacity (fully open)	455 K.C.	.1 MFD. condenser	High side to grid of tuning condenser. Low side to B– buss (through .25 MFD. Cond.)	Adjust each trimmer on the second I. F. transformer for maximum output—then adjust each trimmer on the first I. F. transformer for maximum output.
2	Minimum capacity (fully open)	Exactly 1700 K.C.	NONE	High side to receiver antenna lead. Low side to chassis. (Through .25 Mfd. Cond.)	Adjust 1700 K.C. oscillator trimmer for maximum output.
3	Approx. 1500 K.C.	Approx. 1500 K.C.	NONE	High side to receiver antenna lead. Low side to chassis. (Through .25 Mfd. Cond.)	While rocking gang condenser adjust 1500 K.C. antenna trimmer for maximum output.





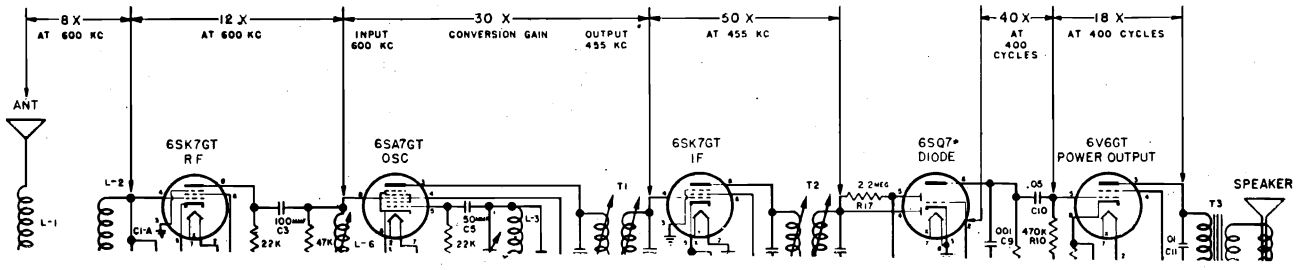


THE FIRESTONE TIRE & RUBBER CO. MODEL 4-B-31, THE ROAMER



Before proceeding with stage measurements be sure the receiver is properly aligned. R.F. gains can be measured by a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe the following precautions:

1. For all gain measurements connect the "high" side of a signal generator to the antenna lead through a .00025 mica condenser. The ground side of the signal generator should be connected to the chassis. Use a 600 KC signal with 400 cycle modulation (use nearby frequency if local station interferes).
2. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
3. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.



Voice Coil Impedance
3.2 ohms at 400 cycles

Power Output
1.2 watts, undistorted
2.5 watts, maximum

Sensitivity
10 microvolts average for 1 watt output

Selectivity
50 KC broad at 1000 times signal, at 1000 KC

Power Supply
6.3 volts DC
4.8 amp. average

Tuning Range
540 to 1600 KC

I.F. Frequency
455 KC

Loud Speaker
4" P.M.

Stage gain measurements can be influenced by the normal manufacturers tolerances allowed in parts, differences in individual tube characteristics, the adjustment of the tuned circuits and variations in input voltage. Careful tuning of the receiver as well as experience in using your test equipment will determine the accuracy of the measurements taken. Due to all of these factors, the stage gains shown in the above diagram are approximate values rather than absolute as it is possible to introduce many variations in these measurements.

ALIGNMENT PROCEDURE

Volume control—Maximum, all adjustments.

No signal applied to antenna.

Power input—6.3 volts

Connect dummy antenna in series with output lead of signal generator.

Connect output meter across voice coil.

Connect ground lead of signal generator to chassis.

Repeat alignment procedure as a final check.

The following equipment is necessary for proper alignment:

Signal generator that will provide the test frequencies as listed.

Non-metallic screwdriver.

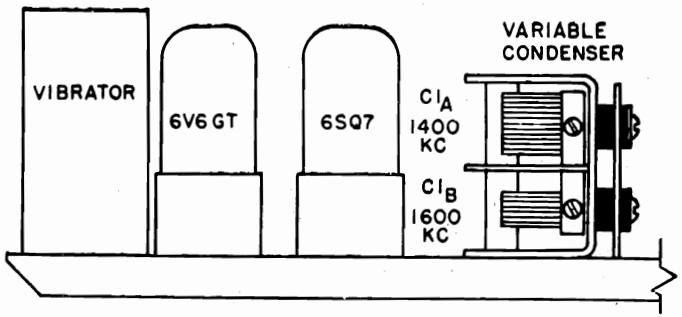
Output meter.

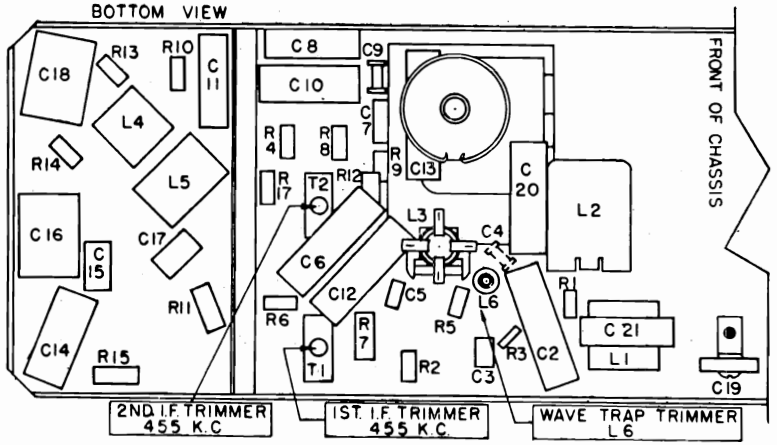
Dummy antennas—.1 MFD., .00025 MFD.

For alignment points refer to Figures 4, 5 and 8.

Dial Setting	*Generator Frequency*	*Dummy Ant.*	*Generator Connections*	*Trimmer Reference*	*Trimmer Adjustment*	*Trimmer Function*
Fully Open	455 KC	.1 MFD.	6SA7 Grid	T2	Maximum	Output I.F.
Fully Open	455 KC	.1 MFD.	6SA7 Grid	T1	Maximum	Input I.F.
Fully Open	455 KC	.00025 MFD.	Ant. lead	L6	Minimum	Wave trap
Fully Open	1600 KC	.00025 MFD.	Ant. lead	C1B	Maximum	Oscillator
Tune in signal from generator	1400 KC	.00025 MFD.	Ant. lead	C1A	Maximum	Antenna

NOTE: The antenna padder condenser, C19, (see Fig. 1) should be adjusted after the radio is installed in the car. Tune the receiver to a weak station at about 1100 KC and adjust this trimmer for maximum volume.





Component Parts Location

MODEL 4-B-31,
THE ROAMER

THE FIRESTONE TIRE & RUBBER CO.

SERVICE NOTES

Voltages taken from the different points of the circuit to the chassis are measured with volume control in maximum position, all tubes in their sockets, no signal applied, and with a volt meter having a resistance of 20,000 ohms per volt. These voltages are clearly shown on the voltage chart, (Fig. 7).

All voltages should be measured with an input voltage of 6.3 volts DC.

To check for open by-pass condensers, shunt each condenser with another one having the same capacity and voltage rating which is known to be good until the defective unit is located.

ALIGNING INSTRUCTION

Never attempt any adjustments on this receiver unless it becomes necessary to replace a coil or transformer, or the adjustments have been tampered with in the field. Always make certain that other circuit components, such as tubes, condensers, resistors, etc., are normal before proceeding with realignment.

If realignment is necessary follow the instructions given under the heading "ALIGNMENT PROCEDURE". After realignment has been completed repeat the procedure as a final check.

DIAL POINTER ADJUSTMENT

If it should become necessary to readjust the dial pointer for correct calibration, this may be easily done without removing the radio from the car by proceeding as follows:

A. Turn tuning knob to the right (clockwise) as far as it will go.

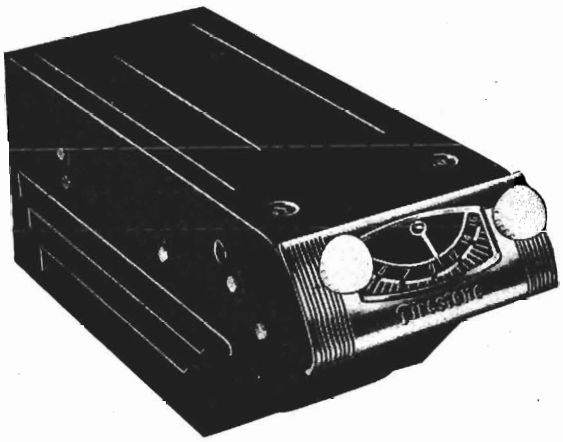
B. Remove snap button located on the right side of the case (viewed from the front), in the extreme upper front corner.

C. Insert screwdriver through hole in case and move dial pointer directly over white dot at high end of dial (1600KC).

D. Tune receiver to station of known frequency in the center of the dial and readjust pointer for more accurate indication, if necessary.

E. Replace snap button into hole in case.

CAUTION: Be careful not to scratch or damage dial scale or dial pointer when making this adjustment.



INSTRUCTIONS FOR REMOVING CHASSIS FROM THE CASE

The bottom cover (the one with the speaker louvers) can be removed to permit servicing of major components, such as tubes and vibrator, by removing the eight (8) screws holding it to the top cover. There are three (3) screws on each side, one (1) in the rear, and one (1) in the front.

CAUTION: Before attempting to remove the top cover, to service condensers, resistors, etc., the screw connecting the spark plate to the "A" terminal (inside case) must be removed. This is a round head screw, and is located on the rear of the case, close to the mounting stud bolt. It is recessed in a ½ inch hole in the case itself, thereby permitting contact with the spark plate.

After removing the spark plate screw, remove the two knobs by pulling forward and remove the eight (8) screws securing the cover to the chassis. Lift the chassis at the rear, at the same time moving it away from the front of the case so that the volume and tuning shafts will clear the holes in the cover.

NOTE: When reinstalling the chassis into the case, be sure the screw connecting the spark plate to the "A" terminal (inside case) is tightened very securely, otherwise the receiver will not operate properly.

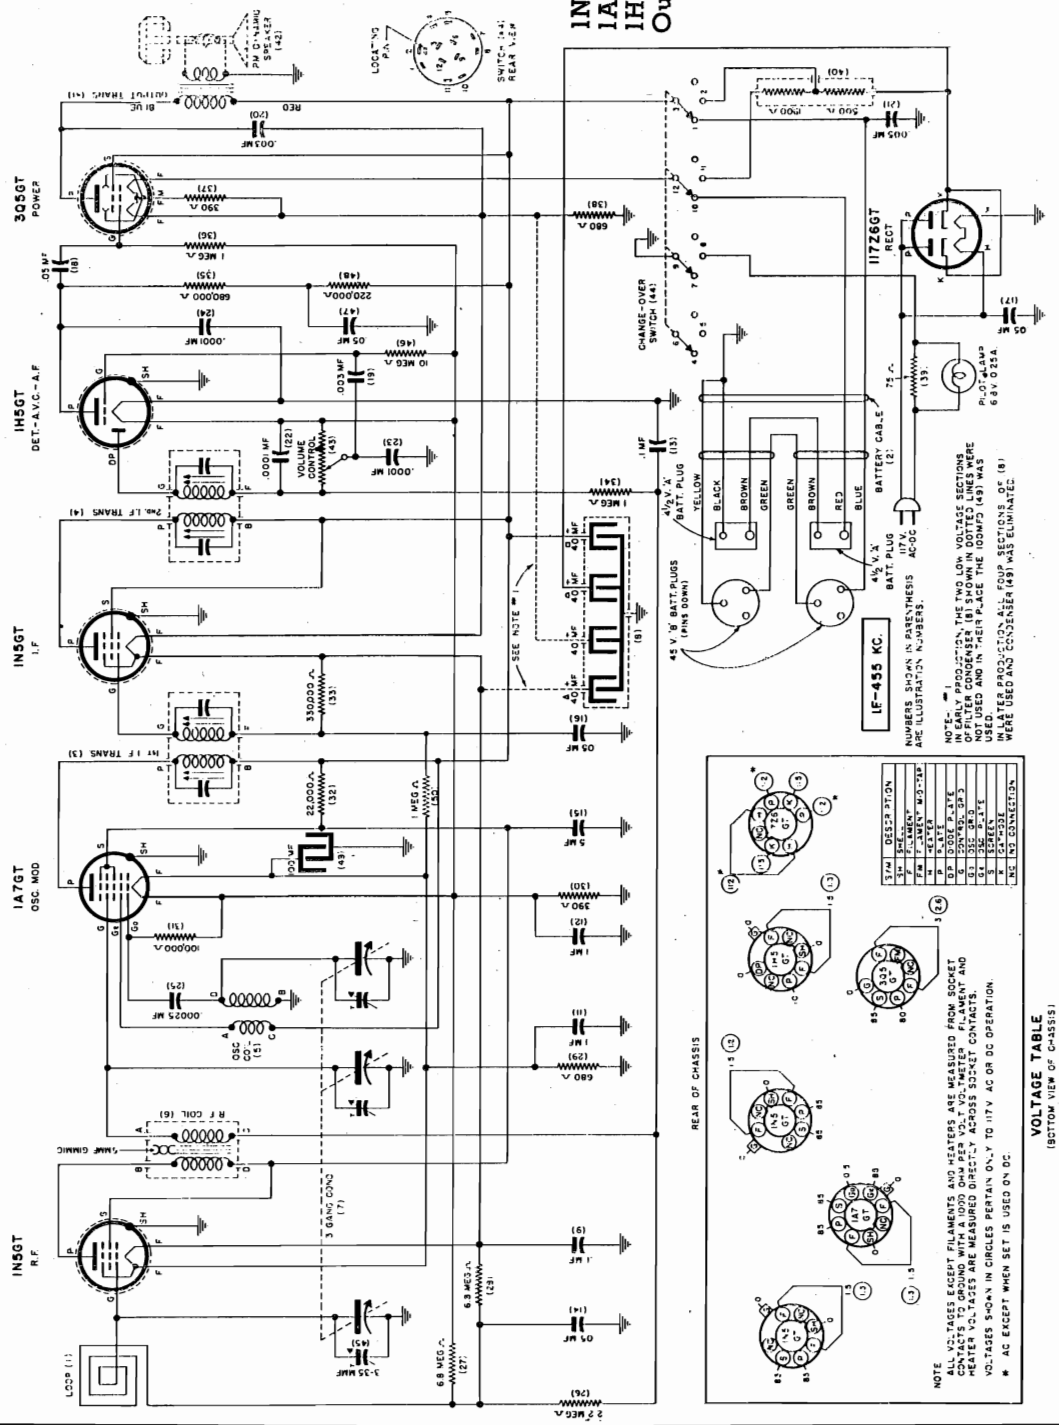
Output, 117Z6GT Rectifier.

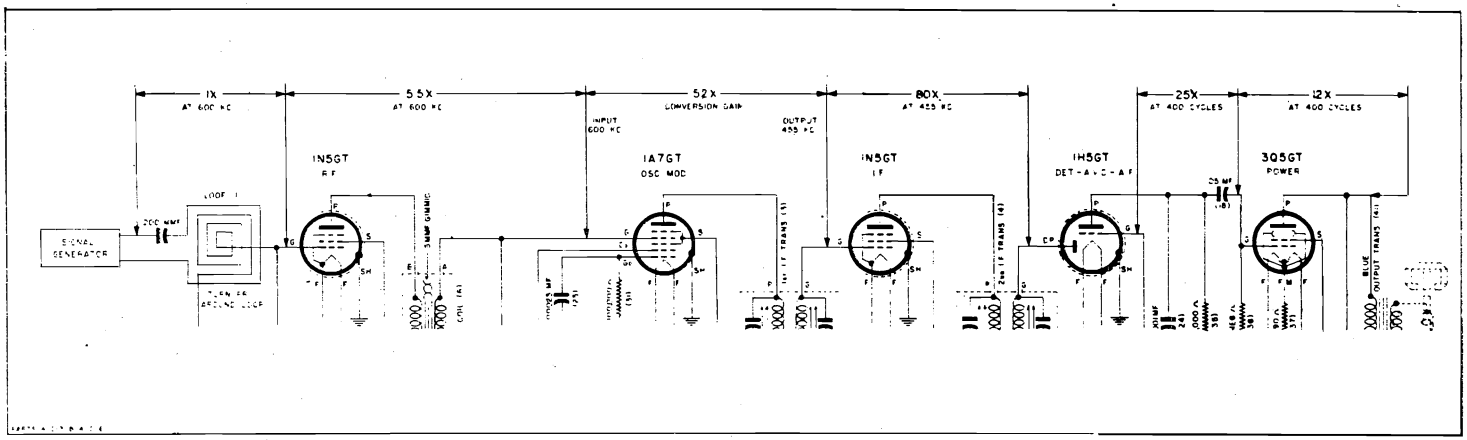


POWER SUPPLY	110-120 Volt AC-DC & Battery
BATTERIES	Two 4½ Volt "A" Firestone Type 4-D-86 Two 45 Volt "B" Firestone Type 4-D-85
TUNING RANGE	1620 to 530 K. C.
INTERMEDIATE FREQ	455 K. C.

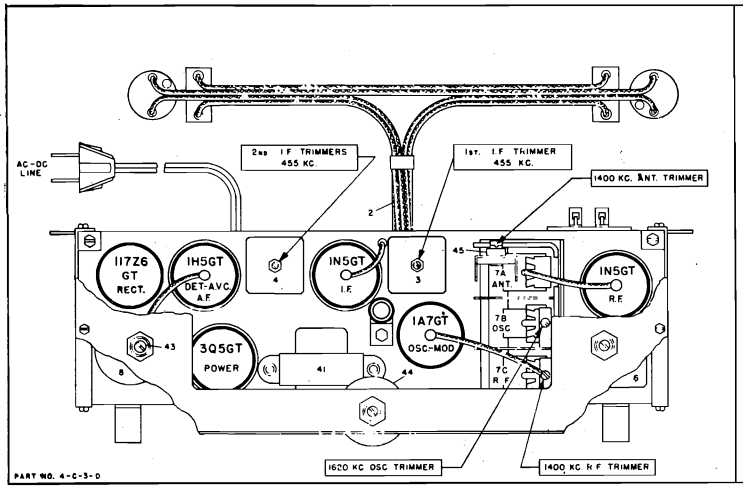
LOUD SPEAKER	5 Inch P. M.
VOICE COIL IMPEDANCE	3.2 Ohms at 400 Cycles
POWER OUTPUT	Undistorted — .25 Watts Maximum — .4 Watts

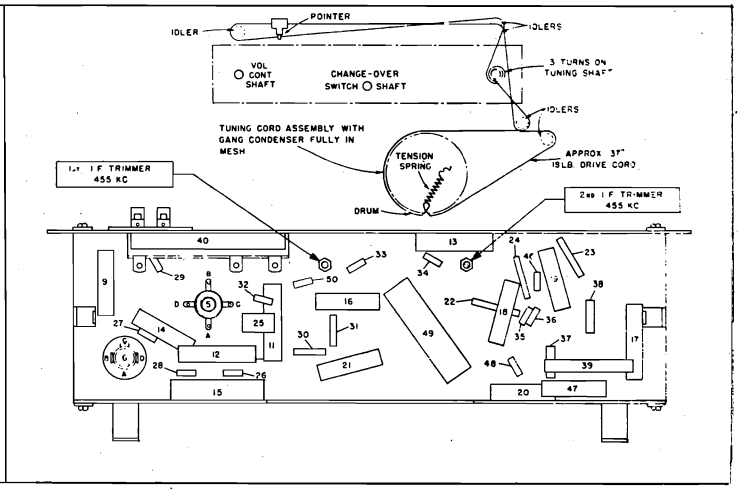
Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
3. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.





MODEL 4-C-3 THE FIRESTONE TIRE & RUBBER CO.

ALIGNMENT PROCEDURE

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. Make the adjustment marked (1) first, (2) next, (3) third, etc.

Before starting alignment:

(a) Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to last line, move to correct position.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) WHEN ADJUSTING 1620 KC OSCILLATOR TRIMMER AND 1400 KC R. F. TRIMMER, remove chassis from cabinet and disconnect the white-green and white-black loop connection wires from the two Fahenstock clips mounted on rear of chassis. Attach a 1 megohm resistor across these Fahenstock clips and feed output of test oscillator across the 1 megohm resistor.

(d) THE 1400 KC LOOP ANTENNA TRIMMER is accessible from the rear of the chassis when the inner back is removed. It should be adjusted only after all other adjustments have been made and with the set mounted in the cabinet, and the loop in an upright position. When aligning the 1400 KC Antenna Trimmer, couple test oscillator to receiver loop by: (1) make loop consisting of five to ten turns of No. 20 to No. 30 size wire, wound on a 2″ or 3″ form; (2) connect this loop across output of test oscillator; (3) place test oscillator loop near radio loop. BE SURE THAT NEITHER LOOP MOVES WHILE ALIGNING.

Steps	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to	Refer to parts layout diagram for location of trimmers mentioned below:
1	Any point where no interfering signal is received	Exactly 455 K. C.	0.2 Mfd. Condenser	High side to grid of 1A7GT tube, Low side to chassis (if non-Underwriter Approved) or Common Negative (if Underwriter Approved).	Adjust each of the 2nd I.F. transformer trimmer adjustment screws for maximum output, then adjust each of the 1st I.F. transformer trimmer adjustment screws for maximum output.

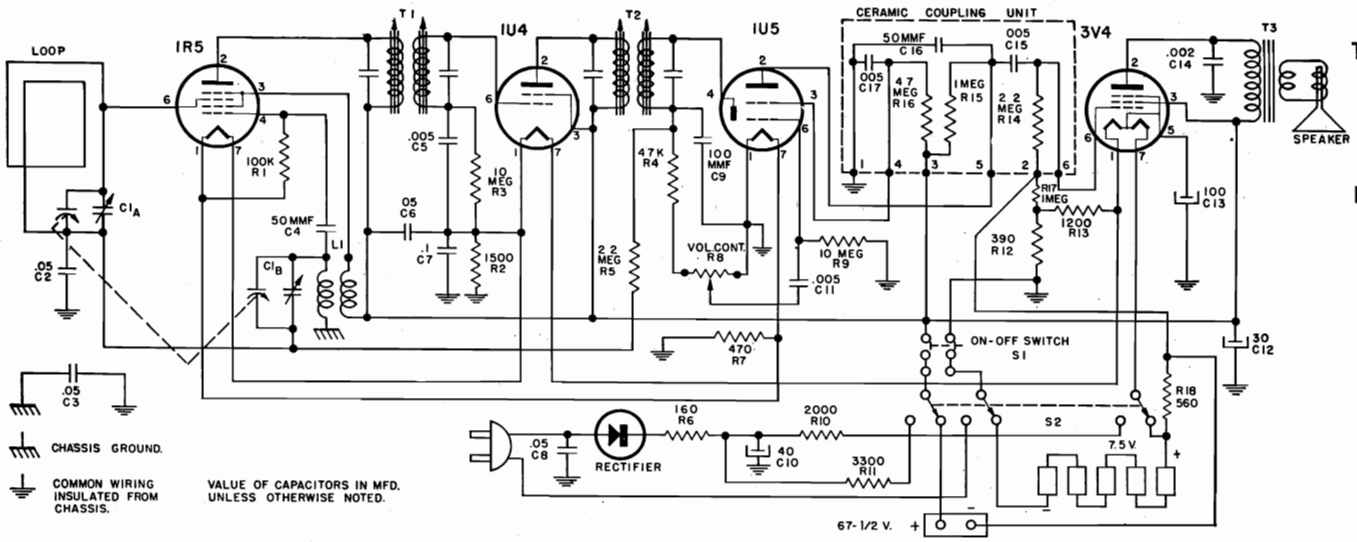
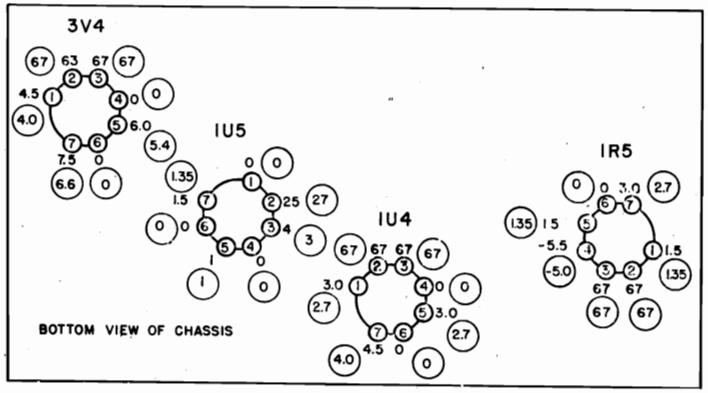
69E92F47	Rivet	For Door Stop

**NOTE No. 1: In early production, the two low voltage sections of filter condenser, Illus. No. 8, Part 25E11, shown in dotted lines on circuit diagram, were not used and in their place the 100 Mfd., Illus. No. 49, Part 25E19 was used.
In later production all four sections of Illus. No. 8, Part 25E11, were used and condenser, Illus. No. 49, Part 25E19, was eliminated.

*NOTE No. 2: CHASSIS MARKED WITH LETTER "A" adjacent to serial number use Part 24E7A Gang Condenser and Part 20E237 Oscillator Coil.
CHASSIS MARKED WITH LETTER "B" adjacent to serial number use Part 24E7B Gang Condenser and Part 20E248 Oscillator Coil.
THESE GANG CONDENSERS AND OSCILLATOR COILS ARE NOT INTERCHANGEABLE.
DO NOT use Part 24E7A Gang Condenser with Part 20E248 Osc. Coil, or Part 24E7B Gang Condenser with Part 20E237 Osc. Coil.





VOLTAGE CHART

All voltages are measured from tube pin to common "B" negative with a 20,000 ohm per volt voltmeter.

Voltages shown in circles are obtained when set is operated on 117 volt current.

Voltages shown outside the circles are obtained when the set is operated on batteries. New batteries in good condition should be used for these measurements.

Tube Complement
- 1R5—Oscillator Converter
- 1U4—I. F. Amplifier
- 1U5—AVC, Detector, 1st Audio
- 3V4—Power Output

Batteries
- Five 1½ volt "A" Firestone Stock No. 7-C-1

I. F. Frequency
455 KC

Loud Speaker
4 inch P.M.

Voice Coil Impedance
3.2 ohms at 400 cycles

Power Output
Maximum 100 milliwatts

Power Supply
105-125 volt 60 cycle AC-DC or Self-Contained batteries

Tuning Range
545 to 1610 KC

ALIGNMENT PROCEDURE

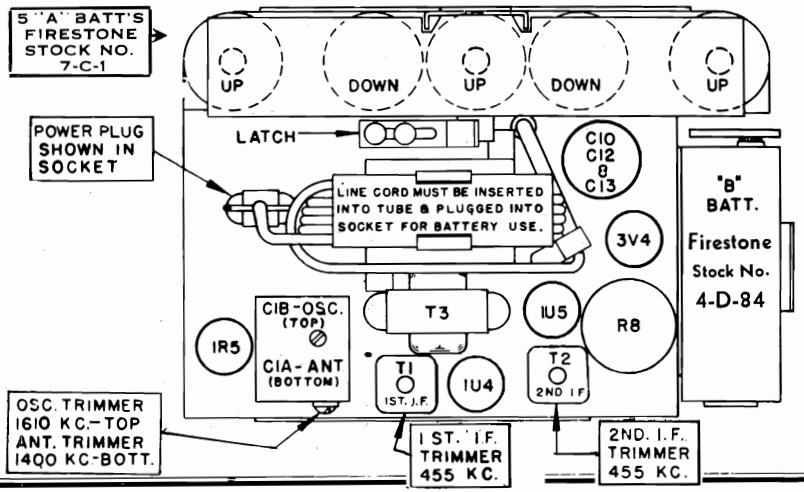
The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, to prevent A.V.C. action from interfering with correct alignment.

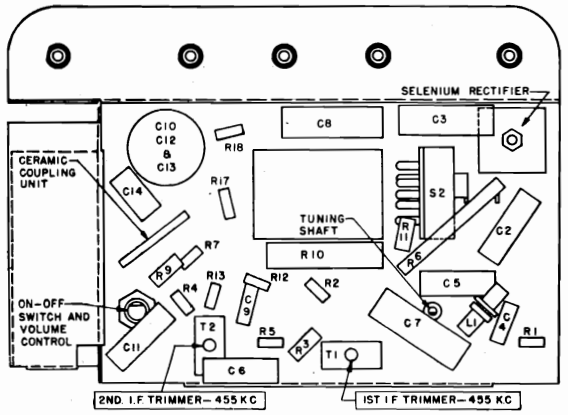
For alignment procedure read tabulations from left to right, and make the adjustment marked (1) first, (2) next, (3) third. Before starting alignment:

(a) Check calibrated dial knob to see that it is positioned correctly. Turn Variable Condenser to its maximum capacity, plates completely in mesh. Adjust the knob so that the right hand edge of the small 5 in the 55 calibration number is in line with the indicator (dot) on the cabinet.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

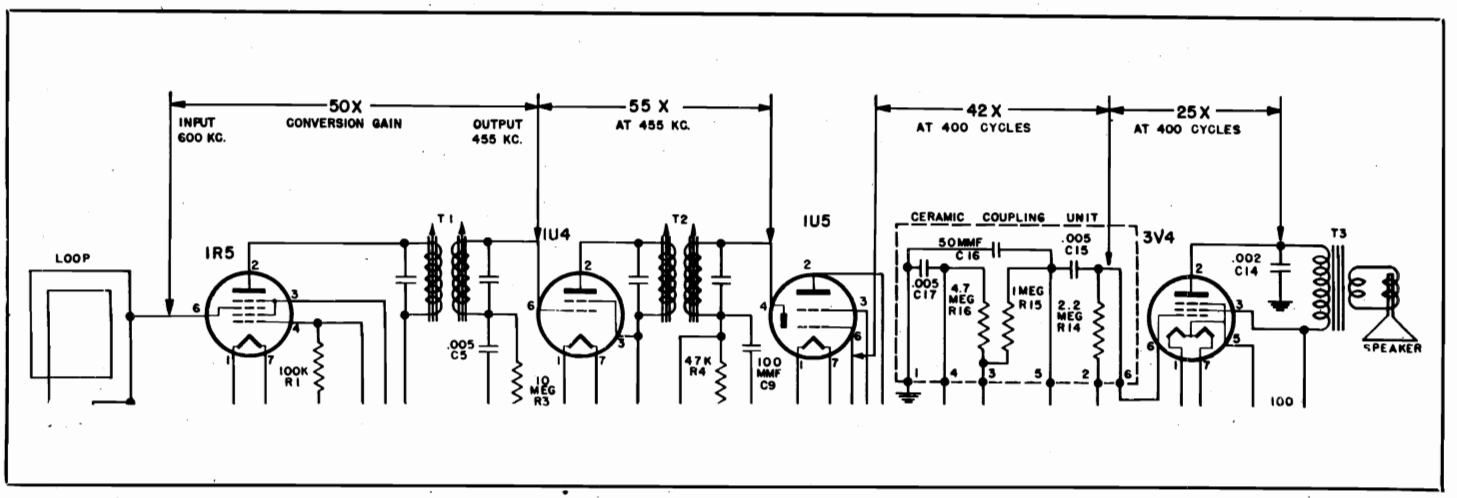
Steps	Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
1	Minimum capacity (fully open)	455 K.C.	.1 MFD. condenser	High side to grid of 1R5 tube. Low side to common negative. (through .25 MFD. Cond.)	Adjust each trimmer on the second I. F. transformer for maximum output—then adjust each trimmer on the first I. F. transformer for maximum output.
2	Minimum capacity (fully open)	Exactly 1610 K.C.	.1 MFD. condenser	High side to grid of 1R5 tube. Low side to common negative.	Adjust 1610 K.C. oscillator trimmer for maximum output.
3	Approx. 1400 K.C.	Approx. 1400 K.C.		Loosely coupled to Loop Antenna	Adjust 1400 K.C. antenna trimmer for maximum output.





Before proceeding with stage measurements be sure the receiver is properly aligned. R.F. gains can be measured by a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe the following precautions:

1. For gain measurements connect the high side of the signal generator through a .1 MFD condenser to the appropriate point as indicated on the diagram below. The ground of the signal generator should be connected to common negative. The RF and IF measurements are made using 30% 400 cycle modulation.
2. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning).
3. When using a "channel" type instrument carefuly tune it for maximum output at desired frequency before making measurements.



Stage gain measurements can be influenced by the normal manufacturers tolerances allowed in parts, differences in individual tube characteristics, the adjustment of the tuned circuits and variations in line voltage. Careful tuning of the receiver as well as experience in using your test equipment will determine the accuracy of the measurements taken. Due to all of these factors, the stage gains shown in the above diagram are approximate values rather than absolute as it is possible to introduce many variations in these measurements.

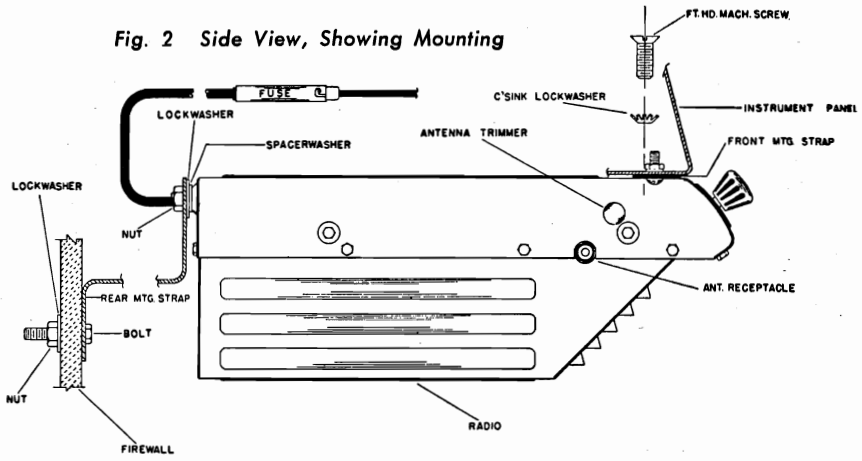
Fig. 1 Front View

OPERATION

To turn the receiver on, rotate the volume control and switch knob (left hand knob) to the right about half its range. After allowing about 30 seconds for the tubes to warm up, the desired station may be tuned by rotating the tuning control (right hand knob) to the desired frequency. The dial scale is calibrated in kilocycles minus the final two zeros. After the station has been properly tuned, the volume may be adjusted by means of the volume control knob. To increase the volume, turn the control to the right; to decrease the volume, turn it to the left. Turning this control to the left as far as it will go, turns the radio off.

Fig. 2 Side View, Showing Mounting



ELECTRICAL SPECIFICATIONS

Power Supply	6.3 volts DC
Current	4.8 amp. average
Frequency Range	540 to 1600 KC
I. F. Frequency	455 KC
Speaker	4" P. M.
Power Output	1.2 watts, undistorted 2.5 watts, maximum
Sensitivity	10 microvolts average for 1 watt output
Selectivity	20 KC broad at 1000 times signal, at 1000 KC

The tube compliment of this receiver is as follows:

1—6SK7GT—R. F. Amplifier.

1—6SA7GT—Converter.

1—6SK7GT—I.F. Amplifier.

1—6SQ7—Detector—AVC—1st audio.

1—6V6GT—Power output.

1—6X5GT—Rectifier.

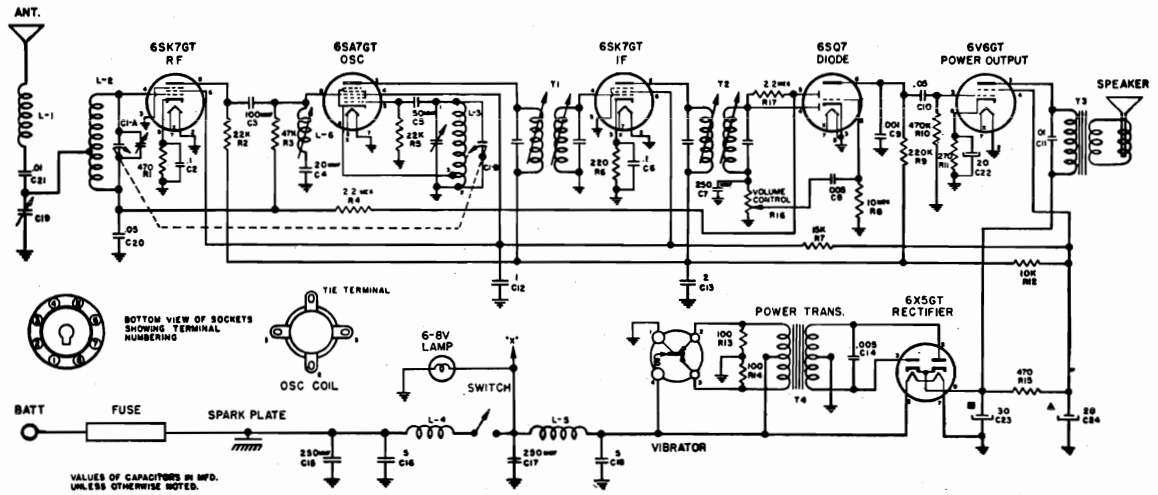

Fig. 3 Schematic Diagram

ALIGNMENT PROCEDURE

Volume control—Maximum, all adjustments.

No signal applied to antenna.

Power input—6.3 volts.

Connect dummy antenna in series with output lead of signal generator.

Connect output meter across volce coil.

Connect ground lead of signal generator to chassis.

Repeat alignment procedure as a final check.

The following equipment is necessary for proper alignment:

Signal generator that will provide the test frequencies as listed.

Non-metallic screwdriver.

Output meter.

Dummy antennas—.1 MFD., .00025 MFD.

For alignment points refer to Figures 4 ad 5.

Dial Setting	Generator Frequency	Dummy Ant.	Generator Connections	Trimmer Reference	Trimmer Adjustment	Trimmer Function
Fully Open	455 KC	.1 MFD.	6SA7 Grid	T2	Maximum	Output I.F.
Fully Open	455 KC	.1 MFD.	6SA7 Grid	T1	Maximum	Input I.F.

Fully Open	1600 KC	.00025 MFD.	Ant. lead	C1B	Maximum	Oscillator
Tune in signal from generator	1400 KC	.00025 MFD.	Ant. lead	C1A	Maximum	Antenna

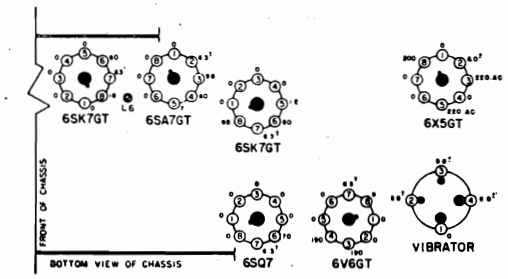

Fig. 4 Socket Voltages

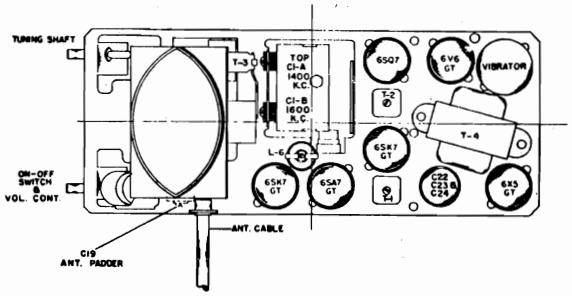

Fig. 5 Tube and Trimmer Locations

SERVICE NOTES

Voltages taken from the different points of the circuit to the chassis are measured with volume control in maximum position, all tubes in their sockets, no signal applied, and with a volt meter having a resistance of 20,000 ohms per volt. These voltages are clearly shown on the voltage chart, (Fig. 4).

All voltages should be measured with an input voltage of 6.3 volts DC.

FINAL ADJUSTMENTS

The input circuit has been especially designed to be used with a low capacity antenna, of the fish pole or whip type.

To adjust the antenna trimmer condenser, carefully tune the receiver to a weak station at approximately 600 kilocycles (K.C.). Remove the snap button covering the antenna trimmer (See Figure 2) and adjust the trimmer for maximum volume. A small screw driver will be needed for this purpose.

ALIGNING INSTRUCTION

Never attempt any adjustments on this receiver unless it becomes necessary to replace a coil or transformer, or the adjustments have been tampered with in the field. Always make certain that other circuit components, such as tubes, condensers, resistors, etc., are normal before proceeding with realignment.

INSTRUCTIONS FOR REMOVING CHASSIS FROM THE CASE

The bottom cover (the one with the speaker louvers) can be removed to permit servicing of major components, such as tubes and vibrator, by removing the eight (8) screws holding it to the top cover. There are three (3) screws on each side, one (1) in the rear, and one (1) in the front.

CAUTION: Before attempting to remove the top cover, to service condensers, resistors, etc., the screw connecting the spark plate to the "A" terminal (inside case) must be removed. This is a round head screw, and is located on the rear of the case, close to the mounting stud bolt. It is recessed in a ½ inch hole in the case itself, thereby permitting contact with the spark plate.

After removing the spark plate screw, remove the two knobs by pulling forward and remove the eight (8) screws securing the cover to the chassis. Lift the chassis at the rear, at the same time moving it away from the front of the case so that the volume and tuning shafts will clear the holes in the cover.

NOTE: When reinstalling the chassis into the case, be sure the screw connecting the spark plate to the "A" terminal (inside case) is tightened very securely, otherwise the receiver will not operate properly.

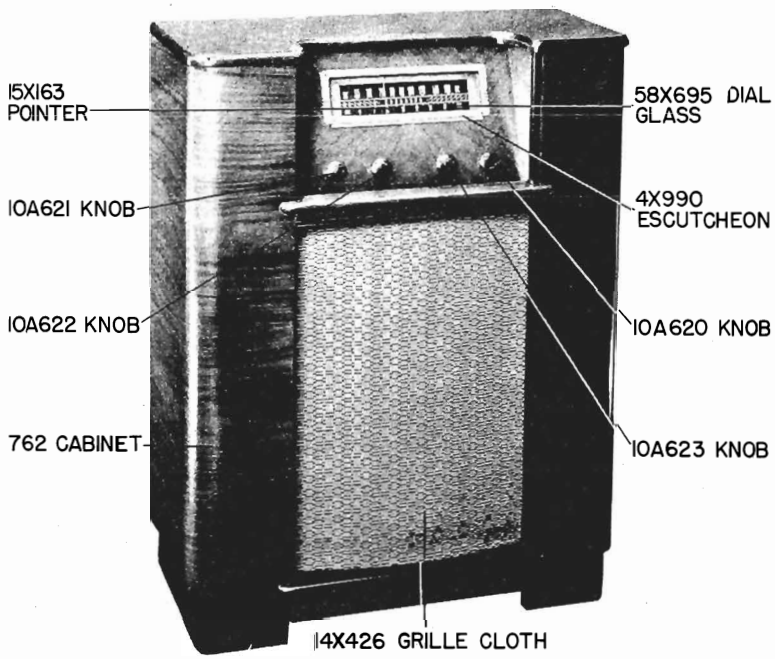
GAMBLE-SKOGMO, INC. MODEL 43-6927



ALIGNMENT PROCEDURE

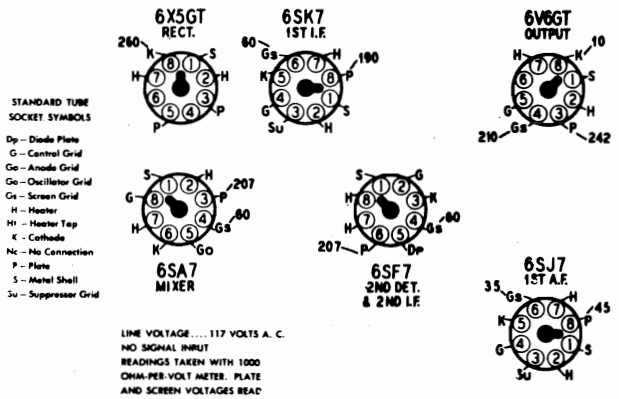
Volume Control—Maximum all adjustments.
Connect radio chassis to ground post of signal generator with a short heavy lead.
Allow chassis and signal generator to "heat up" for several minutes.
The following equipment is required for aligning:

An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter—Non-metallic screwdriver.
Dummy Antennas—.1 mf., 50 mmf., and 400 ohms.

	SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I. F.	455 Kc.	Grid of 6SA7 Pin 8	.1 mf.	B Range	Turn Rotor to Full Open	2nd I.F. (Pri.) and (Sec.) 1st I.F. (Pri.) and (Sec.)
RANGE B	1,620 Kc.	Antenna Lead	50 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B
	1,400 Kc.	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output Set Pointer to 1,400 Kc. (See Note A)	Antenna Range B
	600 Kc.	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output	Oscillator (600 Kc. Padder) Rock Rotor See Note B
	Repeat above steps at 1,620 and 600 Kc. until readjusting the oscillator. Range B Trimmer causes no further improvement of output.					
RANGE D	18.3 Mc.	Antenna Lead	400 ohm	D Range	Turn Rotor to Full Open	Oscillator Range D
	16 Mc.	Antenna Lead	400 ohm	D Range	Tune Rotor to Max. Output	Antenna Range D Rock Rotor—See Note B
	Reassemble chassis in cabinet.					
LOOP RANGE B	1,400 Kc.	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output	Antenna Range B

NOTE A—Set pointer at the 1,400 KC. mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn Rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.



LINE VOLTAGE....117 VOLTS A. C.
NO SIGNAL INPUT
READINGS TAKEN WITH 1000 OHM-PER-VOLT METER. PLATE AND SCREEN VOLTAGES READ ON 500 VOLT SCALE

REMOVAL OF CHASSIS FROM CABINET

Before the chassis can be removed from the cabinet, it will be necessary to pull off the 4 control knobs, remove the three chassis mounting bolts and disconnect the leads from the chassis to the loop antenna, dipole terminals and speaker.

ALIGNMENT PROCEDURE

AM STAGES

Volume Control Maximum all adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following is required for aligning.

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver Dummy Antennas - .1 mf, and 50 mmf.

MODEL 43-6951 GAMBLE-SKOGMO, INC.

FM ALIGNMENT NOTES

Note A - The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the A.V.C. line at the 27 K. ohm resistor and its junction with terminal strip. A signal of .1 volt must be fed into the receiver for this adjustment. Note output voltage on the zero center DC vacuum tube voltmeter.

Note B - Disconnect zero center DC vacuum tube voltmeter from A.V.C. and connect it to the audio takeoff point at the 1 megohm resistor and its junction with the terminal strip. Adjust for zero voltage indication.

Note C - Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

Note D - Remove the 100 K ohm load resistor and solder the lead from pin 7 of 6BE6 tube to the banc switch before attempting to check the antenna and oscillator adjustments.

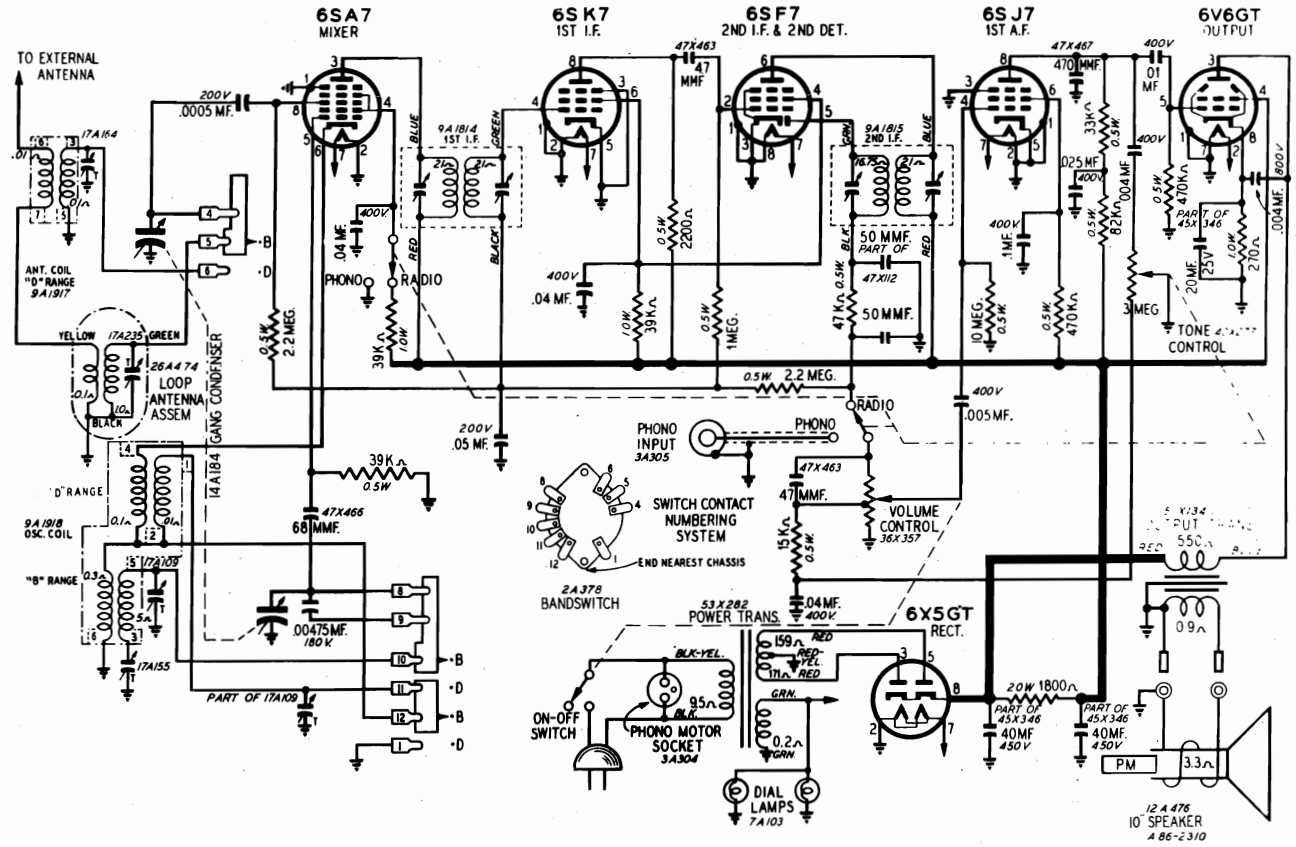
GAMBLE-SKOGMO, INC.

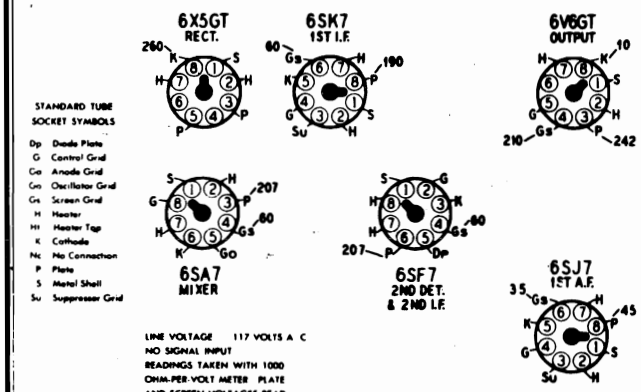
MODELS 43-7603, 43-7604

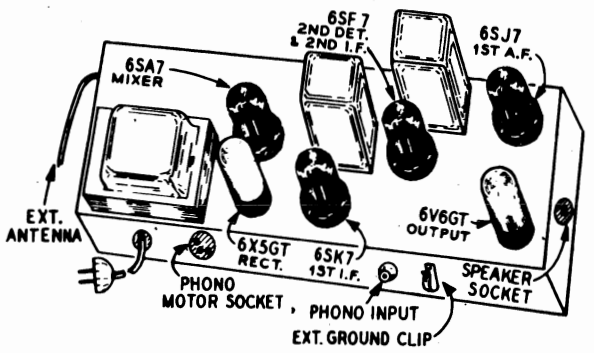
SPECIFICATIONS

6 Tube Superheterodyne, including Rectifier Tube
Speaker.....10" PM Dynamic
Intermediate Frequency.....455 KC
Selectivity..... 40 KC Broad at 1000 Times Signal
Sensitivity (For 0.5 Watt Output, with External Antenna)
B Range .....9 Microvolts Average
D Range .....20 Microvolts Average

Power Supply ..... 102-125 Volts, 60 cycle
Power Consumption (at 117 Volts AC) 45 Watts (norma
65 Watts (phono)
Power Output ..... 4 Watts Maximum 2.3 Wat
10% Harmonics
Tuning Frequency Range
B Range .....540-1600 Kilocycles
D Range .....5.75 - 18.3 Megacycles
Record Changer .....Plays ten 12" or twelve 10"



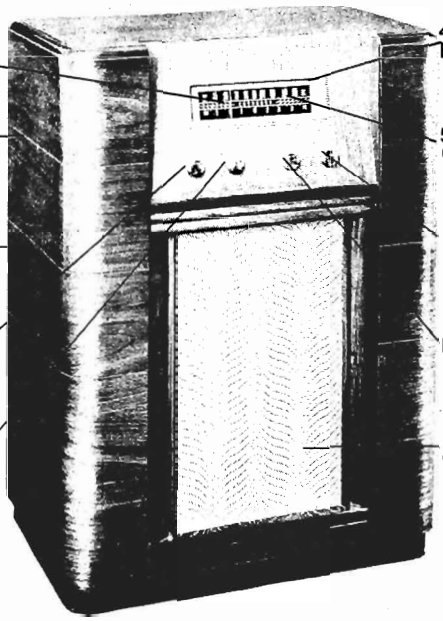




RECORD CHANGER: V-M Model 800, RCD.CH. 17-1

MODELS 43-7603, 43-7604

GAMBLE-SKOGMO, INC.



The automatic record changer is connected to the rear of the chassis through jacks marked "Phono" and "Phono Motor". The "Phono" jack is switched in or out of the audio circuit by a switch controlled by the tone control knob. This switch also shorts out the r-f signal when it is turned to the phono position

ALIGNMENT PROCEDURE

Volume Control—Maximum all adjustments.
Connect radio chassis to ground post of signal generator with a short heavy lead.
Allow chassis and signal generator to "heat up" for several minutes.
The following equipment is required for aligning:

An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter—Non-metallic screwdriver.
Dummy Antennas—.1 mf., 50 mmf., and 400 ohms.

	SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I. F.	455 Kc.	Grid of 6SA7 Pin 8	.1 mf.	B Range	Turn Rotor to Full Open	2nd I.F. (Pri.) and (Sec.) 1st I.F. (Pri.) and (Sec.)
RANGE B	1,620 Kc.	Antenna Lead	50 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B
	1,400 Kc.	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output Set Pointer to 1,400 Kc. (See Note A)	Antenna Range B
	600 Kc.	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output	Oscillator (600 Kc. Padder) Rock Rotor See Note B
	Repeat above steps at 1,620 and 600 Kc. until readjusting the oscillator. Range B Trimmer causes no further improvement of output.					
RANGE D	18.3 Mc.	Antenna Lead	400 ohm	D Range	Turn Rotor to Full Open	Oscillator Range D
	16 Mc.	Antenna Lead	400 ohm	D Range	Tune Rotor to Max. Output	Antenna Range D Rock Rotor—See Note B
LOOP RANGE B	Reassemble chassis in cabinet.					
	1,400 Kc.	Antenna Lead	50 mmf.	B Range	Tune Rotor to Max. Output	Antenna Range B

NOTE A—Set pointer at the 1,400 KC. mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn Rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

GAMBLE-SKOGMO, INC.

MODELS 43-7603, 43-7604

The circuit and tube complement of the receiver are as follows:

1 -	6SA7	1st Detector and Oscillator
1 -	6SK7	1st I-F Amplifier
1 -	6SF7	2nd I-F Amplifier and 2nd Detector
1 -	6SJ7	1st Audio Amplifier
1 -	6V6GT	Power Output
1 -	6X5GT	Rectifier

2 - No. 47 lamps are used for dial illumination.

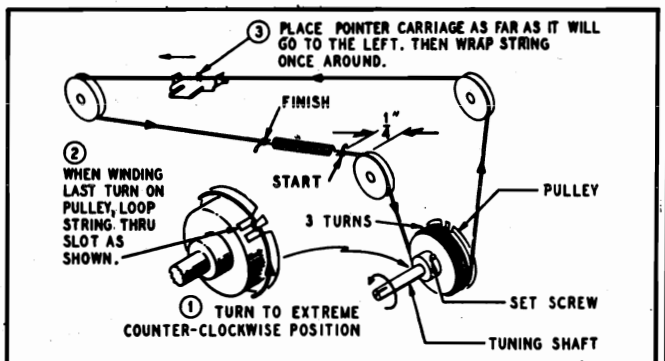
REMOVAL OF CHASSIS FROM CABINET

Before removing chassis, take off escutcheon and pull pointer from pointer carriage.

SPECIFICATIONS

8 Tube Superheterodyne, including rectifier tube
Power Output.....7.5 w. max., 5.5 w. undistorted
Selectivity.....35 kc. broad at 1,000 times signal at 1,000 kc.
Intermediate Frequency.....455 kc.
Speaker.....10 inch electrodynamic. Voice coil impedence 3.2 ohms
Sensitivity.....4 mv .avg. for ½ w. output
Power Supply..105-125 v. A.C. 60 cycles 95 w. (118 w. with phono motor operating)
Tuning.....All bands permeability-tuned
Frequency Ranges.....Broadcast band 540-1,600 kc.
49-meter band 5.96-6.19 mc.
31-meter band 9.1-10 mc.
25-meter band 11.45-12.16 mc.
19-meter band 14.94-15.46 mc.
Antenna.....Built-in; provisions also for external antenna and ground.

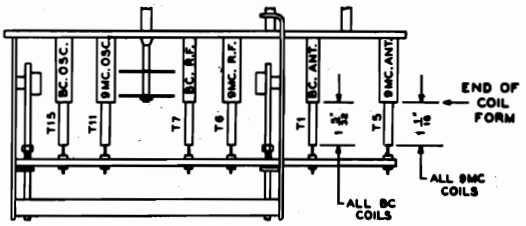


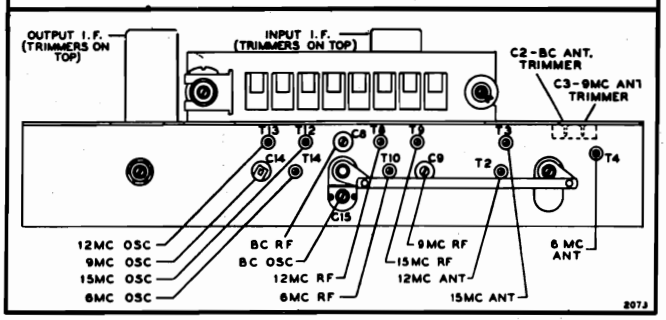
WHEN FINISHED WITH STRINGING, SPRING MUST BE ¼" FROM IDLER AS SHOWN. TO DO THIS:

4. LOOSEN SET SCREW ON PULLEY.
5. HOLD TUNING SHAFT FIRM IN POSITION INDICATED AND TURN PULLEY BY HAND UNTIL SPRING IS ¼" AWAY FROM IDLER.
6. TIGHTEN SET SCREW. NOW SPRING SHOULD TRAVEL BACK AND FORTH WITHOUT TOUCHING THE IDLERS.
7. REPLACE CHASSIS IN CABINET. REPLACE POINTER ON CARRIAGE. TUNE IN STATION OF KNOWN FREQUENCY. HOLD TUNING SHAFT FIRM AND SLIDE POINTER TO CORRECT POSITION ALONG DIAL.
8. GLUE POINTER TO STRING.

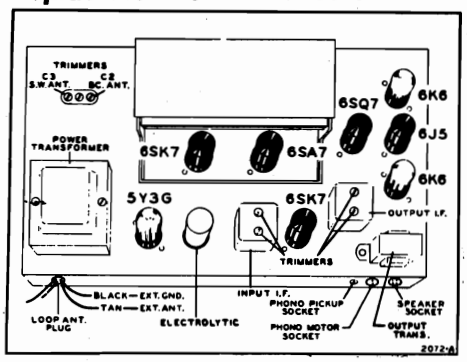
2074

Coils and Trimmers





Replacement of Drive Cord



ALIGNMENT PROCEDURE

CHASSIS VIEW

Mechanical Adjustment—The core tuning bar (see illustration of iron cores) and dial pointer must be adjusted mechanically before any electrical alignment is attempted. Rotate the manual tuning control until the core bar is farthest from the coils. For proper adjustment the bar should be approximately 1/32 of an inch from the two rod guide angles.

With the core bar in this position, adjust the dial pointer to coincide with 1,600 kc. on the dial scale.

Rotate each of the three broadcast coils (see illustration) until the end of the coil is 1-5/32 inches from the end of the coil form. Rotate the three 9-mc. coils until this dimension is 1-1/16 inches from these coils. After these adjustments have been made, the unit can be aligned electrically.

Electrical Adjustment—To align the set make the following preliminary adjustments: Set the tone pushbutton for treble tone; set the volume control at maximum; connect the ground post of the signal generator to the radio chassis; connect the output meter across a 3.2 ohm output load; and allow the receiver and signal generator to warm up for several minutes.

Align the set according to the sequence given in the chart. The indicated dummy antenna is to be connected in series between the signal generator output lead and the receiver. Adjust the set for maximum output; reduce the input as needed to keep the output near 1.3 volts.

Locations of all the trimmers and coils are shown in the illustrations. After adjustment, seal the coil cores with collodion or a similar substance (do not use cement).

BAND SWITCH SETTING	Frequency	SIGNAL GENERATOR Coupling. Capacitor	Connection to Radio	Dial POINTER SETTING	ADJUST TO MAXIMUM OUTPUT (in order shown)

R25	C-9B1-35	4.7 megohms, ½ watt, 20%

COILS AND TRANSFORMERS

T16	108177	Input IF coil complete in can (Range of trimmers: 110-210 mmf)
T17	108176	Output IF coil complete in can (Range of trimmers: 80-140 mmf)
T18	B-12C-10234	Output transformer
T20	104202B	Power transformer

SOCKETS

	121200	Socket, 4-terminal, for loop antenna
	121279	Socket, 5-terminal, for tuner
	A-15B-11538	Socket, 4-terminal, for speaker
	121280	Socket, 1-terminal, for phono pick-up
	121199	Socket, 2-terminal, for phono motor
	121210	Socket, octal, molded (all tubes except 6SK7, IF amp.)
	121273	Socket, octal, laminated (for 6SK7, IF amplifier)
	B-47A-10808	Socket assembly for dial light

MISCELLANEOUS

T19	B-18B-10617	Speaker, 10-inch, electrodynamic
	A-19A-11539	Plug on speaker leads
T21	A-14MA-11066-3	Loop antenna (ribbon only)
T22	A-16A-11113	Choke on loop terminal board
	A-19A-11322	Plug on loop antenna leads
	107401	Phono motor cable assembly
	10724	Connector, for phono pickup leads
	B-6D-10984	Dial scale
	10794	Dial light, 6-8 volts, type T-44 (2 used)
	B-2G-10588-1	Dial pointer
	A-2J-11041	Pointer spring
	1121035	Pointer carriage
	B-53A-10989	String for dial pointer
	120377	Spring for dial pointer string
	107266	Line cord and plug (9 feet)
	112985-14	Escutcheon (for walnut cabinet)
	112985-41	Escutcheon (for mahogany cabinet)
	A-5B-10893-14	Knob, band switch or radio-phono-tone (for walnut cabinet)
	A-5B-10893-41	Knob, band switch or radio-phono-tone (for mahogany cabinet)
	128523-14	Knob, tuning or volume (for walnut cabinet)
	128523-41	Knob, tuning or volume (for mahogany cabinet)
	A-2L-11293	Bandswitch link
	112961	Station call letters

REMOVABLE TUNER ASSEMBLY

CAPACITORS

C1	B-8F-10767	.002 mf, 500 volts, 10%, mica
C2, C3	124143	Dual, broadcast (67-123 mmf) and 9 mc (95-175 mmf) ant. trimmers
C4, C10	B-8F3-121	470 mmf, 500 volts, 10%, mica
C5	C-8D-10771	.1 mf, 200 volts, +20%—10%
C6, C11	C-8D-10760	.1 mf, 400 volts, +20%—10%
C7	B-8F5-101	10 mmf, 500 volts, 10%, silver mica
C8	A-8G-7205	Broadcast RF trimmer (120-220 mmf)
C9	A-8G-7206	9 mc RF trimmer (60-110 mmf)
C12	B-8F3-109	47 mmf, 500 volts, 10%, mica
C13	B-8F-10763	200 mmf, 500 volts, 3%, silver mica
C14	124145	9 mc oscillator trimmer (7-35 mmf)
C15	124144	Broadcast oscillator trimmer (15-27 mmf)

RESISTORS

R1, R4	C-9B1-31	1 megohm, ½ watt, 20%
R2	C-9B1-55	270 ohms, ½ watt, 10%
R3	C-9B1-70	4700 ohms, ½ watt, 10%
R5	C-9B1-46	47 ohms, ½ watt, 10%
R6	C-9B1-79	27,000 ohms, ½ watt, 10%

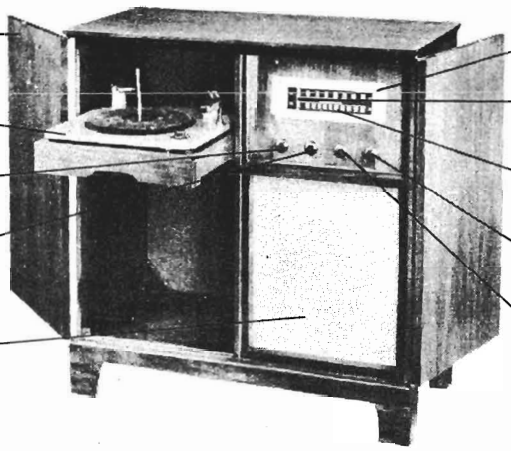
COILS (complete with cores)

T1	111195	Broadcast antenna coil
T2	111191	12-mc antenna coil
T3	111192	15-mc antenna coil
T4	111189	6-mc antenna coil
T5	111190	9-mc antenna coil
T6	10959	9-mc RF coil
T7	10962	Broadcast RF coil
T8	10960	12-mc RF coil
T9	10961	15-mc RF coil
T10	10958	6-mc RF coil
T11	110157	9-mc oscillator coil
T12	110159	15-mc oscillator coil
T13	110158	12-mc oscillator coil
T14	110156	6-mc oscillator coil
T15	110161	Broadcast oscillator coil

MISCELLANEOUS

S1	B-20A-10964	Band switch, antenna
S2	B-20A-10965	Band switch, oscillator and RF
	121210	Socket, molded, for 6SA7
	121171	Socket, laminated, for 6SK7GT
	117907	Tuning shaft
	117798	Pinion gear on tuning shaft
	120393	Spring, intermediate link, under ends of treadle bar
	131251	Washer, "C," on slug tuning bar
	B-2C-7245	Gear segment
	A-2J-7439	Spring clip, for coils
	131316B	Washer "C", for 9-mc coils
	134134	Grommet for core mounting (all broadcast and 9-mc coils)
	134126	Grommet for coil mounting (broadcast RF and antenna coils)
	134125	Grommet for coil mounting (broadcast oscillator coil)
	A-25A-7619	Grommet for all 9-mc coils
	B-202-10475	Pushrod assembly
	120366	Spring, pushrod return
	121281	Plug, 5-prong
	128759-14	Pushbutton, walnut
	128759-41	Pushbutton, mahogany
	131210	Washer, "C", on end plate

MODEL 43-7851 GAMBLE-SKOGMO, INC.



SPECIFICATIONS

7 Tube Superheterodyne.....Including Rectifier Tube
Power Consumption (at 117 Volts AC) 60 Watts (normal)
80 Watts (phono operating)
Selectivity.....AM-50KC Broad at 1000 Times Signal
I.F. FM-200KC Broad at 2 Times Down
I.F. FM-800KC Broad at 200 Times Down
AM Sensitivity...(For 0.5 Watt Output, with external Antenna) 20 mv avg
FM Sensitivity.....(For 0.5 Watt Output) 200 mv avg
Intermediate Frequency.....AM-455KC; FM-10.7 MC
Tuning Range.....AM-540-1600 KC, FM-88-108 MC
Speaker.....10" P.M. Dynamic
Power Output.....4.5 W Max.; 2.5 W 10% Harmonics
Power Supply.....105-125 Volts AC 60 cycles only
Record Changer.....Plays ten 12" or twelve 10"

REMOVAL OF CHASSIS FROM CABINET

Before the chassis can be removed from the cabinet, it will be necessary to pull off the 4 control knobs, remove the three chassis mounting bolts and disconnect the leads from the chassis to the loop antenna, record changer and speaker.

ALIGNMENT PROCEDURE

AM STAGES

Volume Control Maximum all adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following is required for aligning.

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver
Dummy Antennas - .1 mf, and 50 mmf.

GAMBLE-SKOGMO, INC. MODEL 43-7851

1400 KC	External Antenna Lead	Chassis Base	50 mmf	Turn Pointer to 1400 KC See Note A	Antenna Trimmer (AM)

NOTE A - If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

FM STAGES

Allow chassis and signal generator to warm up for several minutes. The following equipment is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver

Dummy Antennas and I-F Loading Resistor- .01 mf 300 ohms and 100 K ohms.

Zero center scale DC vacuum voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for

FM ALIGNMENT NOTES

Note A - The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the A.V.C. line at the 27 K. ohm resistor and its junction with terminal strip. A signal of .1 volt must be fed into the receiver for this adjustment. Note output voltage on the zero center DC vacuum tube voltmeter.

Note B - Disconnect zero center DC vacuum tube voltmeter from A.V.C. and connect it to the audio takeoff point at the 1 megohm resistor and its junction with the terminal strip. Adjust for zero voltage indication.

Note C - Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

Note D - Remove the 100 K ohm load resistor and solder the lead from pin 7 of 6BE6 tube to the band switch before attempting to check the antenna and oscillator adjustments.

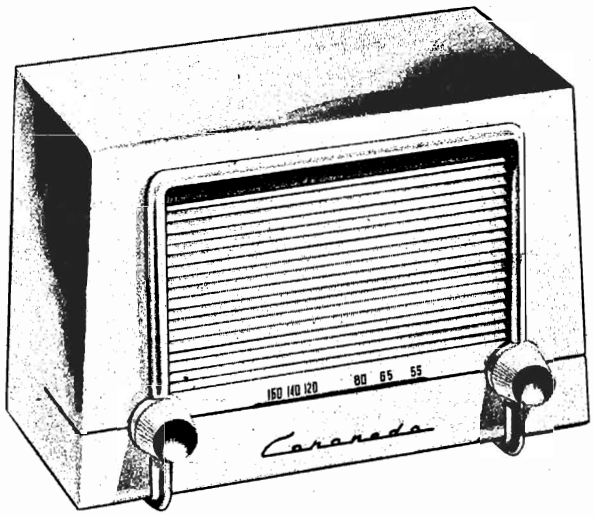
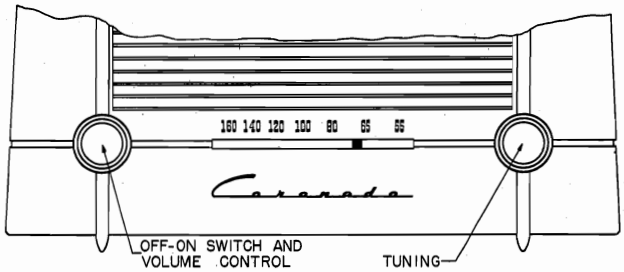
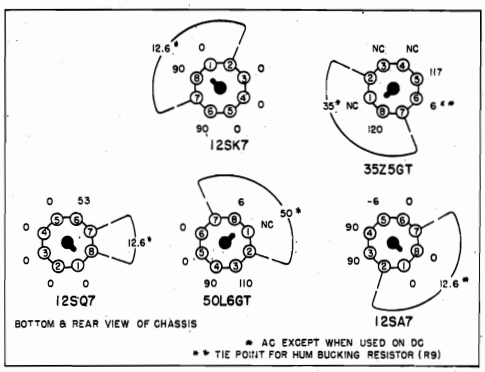
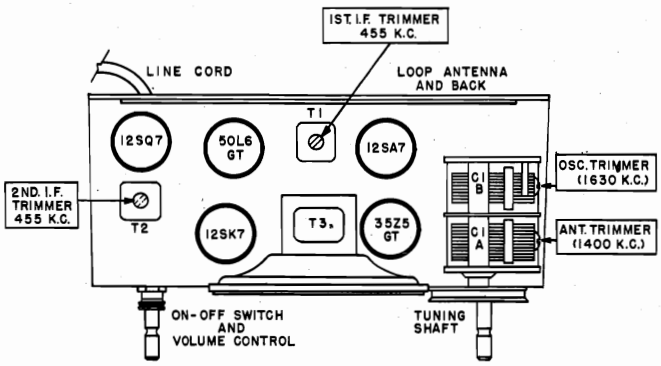
43-8131A, 43-8131B

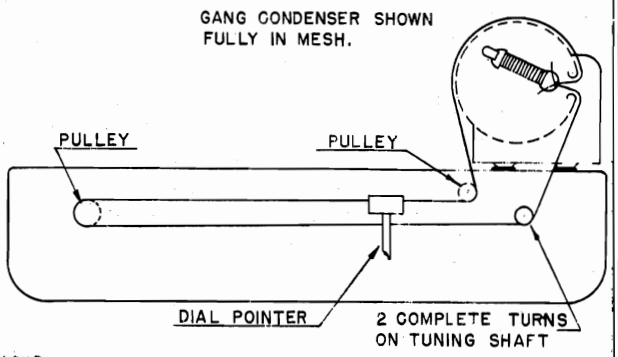
GAMBLE-SKOGMO, INC.











SPECIFICATIONS

Power Supply	117 volts 60 cycle AC, 117 volts DC, 29 watts
Frequency Range	535 KC to 1630 KC
Intermediate Frequency	455 KC
Antenna	Built-in Loop
Tuning	Variable Capacity
Speaker	4", P.M., voice coil impedance 3.2 ohms
Power Output	0.75 watt undistorted, 1.8 watts maximum
Sensitivity	500 uv/m average for 50 milliwatts output
Selectivity	65 KC broad at 1000 times, signal at 1000 KC

Tubes used are as follows:

12SA7 Oscillator-Converter
12SQ7 AVC, Detector and Audio
12SK7 I.F. Amplifier
50L6GT Power Output
35Z5GT Power Rectifier

GAMBLE-SKOGMO, INC.

MODELS 43-8129A, 43-8130A, 43-8130B, 43-8131A, 43-8131B

ALIGNMENT PROCEDURE

The following procedure is for use only by competent servicemen having the proper equipment.

The alignment should be made with volume control fully on, and the output from the Signal Generator as low as possible, to prevent AVC action from interfering with proper alignment.

With the output meter connected across the voice coil of the speaker, the output meter reading for 50 milliwatts is 0.4 volts, using a signal which is modulated 400 c.p.s.

Adjust all trimmers for maximum output. Repeat the alignment procedure given below as a final check.

CAUTION: This is an AC/DC receiver and when aligning the set it is necessary to isolate the Signal Generator or the Receiver from the line by use of a transformer, or to place a .2 MFD condenser in each test lead of the Signal Generator.

	SIGNAL GENERATOR		POSITION	ADJUST FOR
	Frequency	Dummy Antenna	Connection to Radio	OF VARIABLE	MAXIMUM OUTPUT
	455 KC	.1 MFD	12SA7 Grid	Fully	T1 & T2
			Stator C1A	Open	
	1630 KC	.1 MFD	12SA7 Grid	Fully	C1B
			Stator C1A	Open	Oscillator
			Loosely	Tune in	
	1400 KC		Coupled To Loop	Signal Generator	C1A Antenna

Connect low side of Signal Generator to common negative.

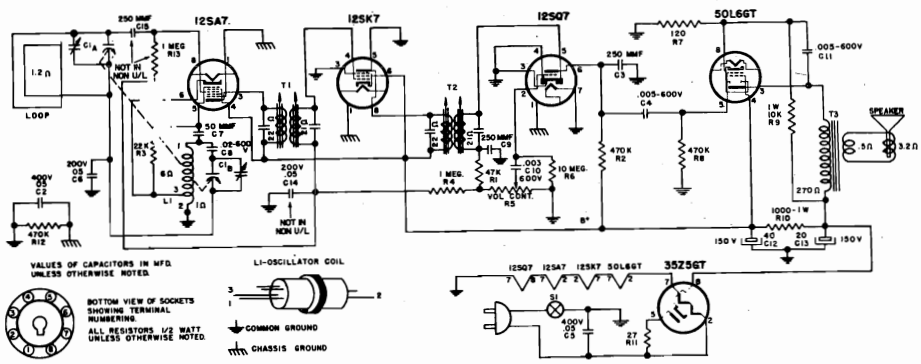

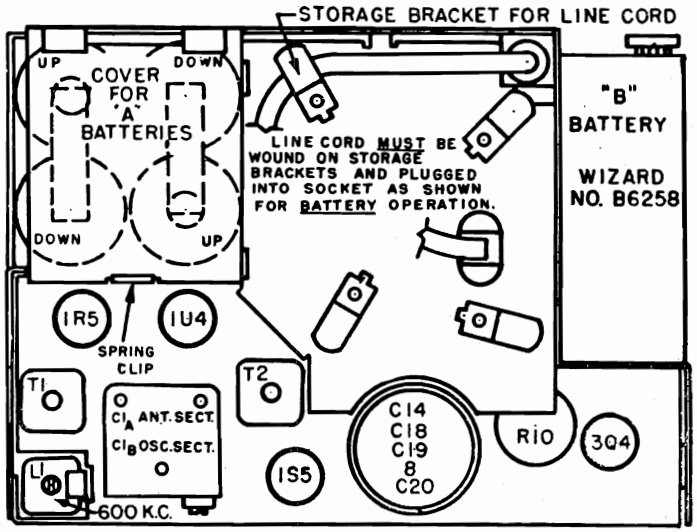

FIG. 2 PICTORIAL DIAGRAM

ELECTRICAL SPECIFICATIONS

Power Supply	117 volts AC/DC, 14 watts
Battery Operation	1 - 67.5 volt "B", 4 - 1.5 volt "A"
Frequency Range	535 KC to 1600 KC
Intermediate Frequency	455 KC
Tuning	Variable Capacity
Speaker	3.5" P.M., 3.2Ω
Power Output	130 Milliwatts max., 65 mw at 10%
Sensitivity for 50 milliwatts	225 μv/m
Selectivity at 1000X, Signal at 1000 KC	60 KC broad

THE TUBES USED ARE:

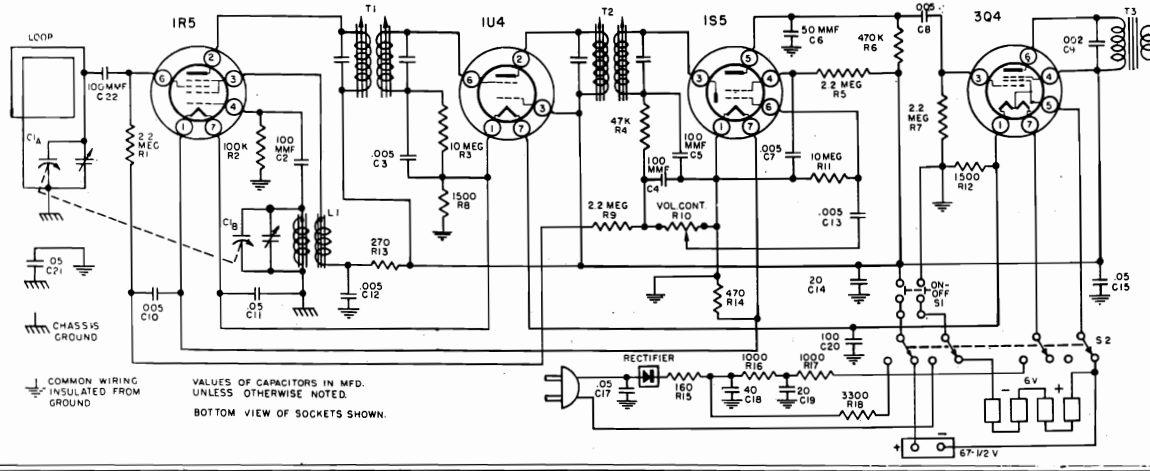
1R5	Oscillator-Converter	3Q4	Power Output
1U4	I.F. Amplifier		
1S5	Detector, AVC, Audio		Selenium Rectifier 75 ma.

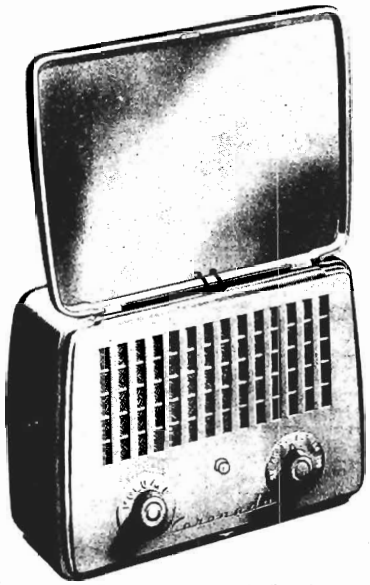
VOLTAGE CHART

All voltages are measured from minus "B" with a 20,000 ohm per volt meter, volume control at maximum, no signal applied, and the radio operating from a 117 volt AC power supply.

NOTE: Normal tolerance on component values may cause a plus or minus of 10% in voltage readings.

TUBE	Pin Numbers						
	1	2	3	4	5	6	7
1R5	1.6	65	67	—8	1.5	0	2.8
1U4	2.8	65	65	0	2.8	0	4.2
1S5	0	0	0	18	20	0	1.5
3Q4	4.2	64	0	65	5.9	64	6.8





ALIGNMENT PROCEDURE

Volume control—Maximum: all adjustments.

Connect ground lead of signal generator to common "B."

Connect dummy antenna in series with output lead of signal generator.

Connect output meter across voice coil of speaker.

For alignment points refer to Figure No. 2.

The following equipment is necessary for proper alignment:

Signal generator that will provide the test frequencies as listed, 30% modulated, 400 c.p.s.

Output meter.

Non-metallic screwdriver.

Dummy antennas— .1 mfd.,

Position of Variable	Generator Frequency	Dummy Ant. Mfd.	Generator Connections	Trimmer Adjustment	Trimmer Function
Fully open	455 KC	.1	*1R5 Grid (Stator of C1A)	T2	Output I.F
Fully open	455 KC	.1	*1R5 Grid (Stator of C1A)	T1	Input I.F.
Fully open	1600 KC	.1	*1R5 Grid (Stator of C1A)	C1B	Oscillator
Tune in signal from generator	1400 KC	—	Loosely coupled to loop	C1A	Antenna
**Tune in signal from generator	600 KC	—	Loosely coupled to loop	L1	600 KC Padder

*Connect ground lead of signal generator to chassis.

**When making this adjustment the variable should be rocked back and forth.

LINE VOLTAGE: This receiver is designed for operation on 105-125 Volts, 50-60 Cycles, either Alternating or Direct Current (AC-DC).

POWER CONSUMPTION: 30 Watts.

TUNING RANGE: Broadcast: 540 to 1650 Kilocycles (180 to 555 meters).

DIAL: The Dial Scale is calibrated in Kilocycles times 10 to correspond with newspaper or periodical listings.

TUBES: The tubes used, and their functions, are as follows:

12SA7 Converter — 12SQ7 Detector, Avc and Audio Amp.
14A7 I.F. Amplifier — 50L6 Beam Power Amplifier
35Z5 Rectifier

ALIGNMENT: Should it become necessary at any time to check the alignment of this receiver, proceed as follows:

(1) Set the Signal Generator to 455 KC and connect to the stator lug on the rear section of the Variable Capacitor. Connect the Signal Generator Ground lead to the chassis. Connect a suitable output meter across the Speaker Voice Coil Connections. Turn the Volume Control to the maximum position. Turn the Variable Capacitor to the extreme clockwise position.

(2) Adjust the trimmers located at the top of the first and second I. F. Transformers or the iron cores located at the top and bottom of each I. F. for maximum output as indicated on the Output Meter.

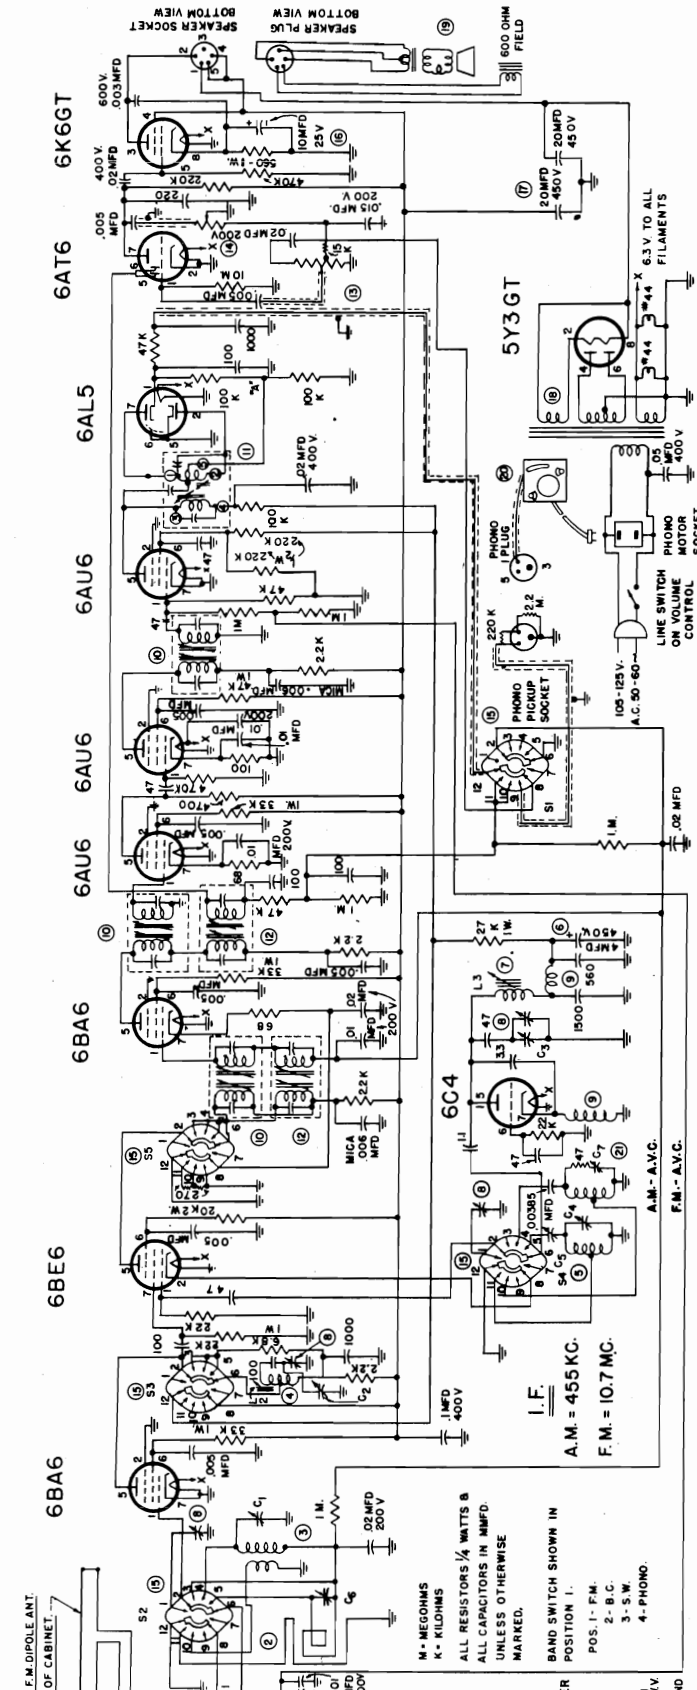
(3) Loosely couple the Signal Generator lead to the Loop and set to 1650 KC.

(4) With Variable Capacitor set at the extreme clockwise position, tune in the 1650 KC signal by means of the Oscillator Trimmer on the Variable Capacitor (front section).

(5) Set the Signal Generator to 1500 KC and turn the Tuning Control so that this frequency is indicated on the dial. Adjust the Antenna Trimmer on the Variable Capacitor (rear section) for maximum output. No other adjustments are necessary.

MODEL 11FMP

GAROD RADIO CORP.



TUNING RANGE:

Broadcast Band: 540 to 1650 Kilocycles (180 to 555 Meters)

Short Wave Band: 5.3 to 18.5 Megacycles (16 to 56 Meters)

F-M Band: 87.5 to 108.5 Megacycles (2.7 to 3.4 Meters)

DIAL SCALES: The Dial Scale is calibrated in Kilocycles for the Broadcast Band, and in Megacycles for the Short Wave and F-M Bands, corresponding with newspaper or periodical listings.

LINE VOLTAGE: This receiver is designed for operation on 105-125 Volts; 60 Cycles, Alternating Current (AC) only.

POWER CONSUMPTION INCLUDING RECORD CHANGER: 100 Watts.

RECORD CHANGER: Seeburg Model K, RCD.CH. 15-2

ANTENNA:

(A) Broadcast Band: A highly selective rotatable loop antenna is provided in the cabinet of the receiver for broadcast reception. The loop antenna should be rotated for maximum signal strength and minimum noise depending on the location of the receiver.

(B) F-M Band: A folded 300 ohm dipole antenna is provided at the rear of the cabinet and is connected to the antenna strip F-M terminal posts marked "D1", "D2" for F-M reception. The folded dipole antenna will give excellent results in most locations providing F-M reception. In unfavorable locations where poor reception is encountered a well constructed outdoor dipole antenna (equipped with a 300 ohm flat lead-in) should be installed by your authorized dealer. The folded dipole connections on the antenna strip at the rear of the cabinet should be disconnected and the outdoor dipole 300 ohm flat lead-in connected to the F-M terminals if used.

(C) Short Wave Band: The folded dipole antenna provided at the rear of the cabinet or an outdoor dipole is automatically connected for use on the shortwave band as an efficient antenna.

In unfavorable locations where distant reception is required, a well constructed outdoor antenna about fifty feet long may be used for broadcast or shortwave reception. The antenna should be connected to the antenna strip terminal post marked "A".

Although the receiver will operate without a ground connection in most locations, a good ground will often reduce noise pick-up on the broadcast and shortwave bands. A good ground connection can be made by connecting to a water pipe, radiator or a pipe driven into the ground. A clamp should be used for making the actual connection. The ground wire from the clamp should be connected to the antenna strip terminal post marked "G" at the rear of the chassis.

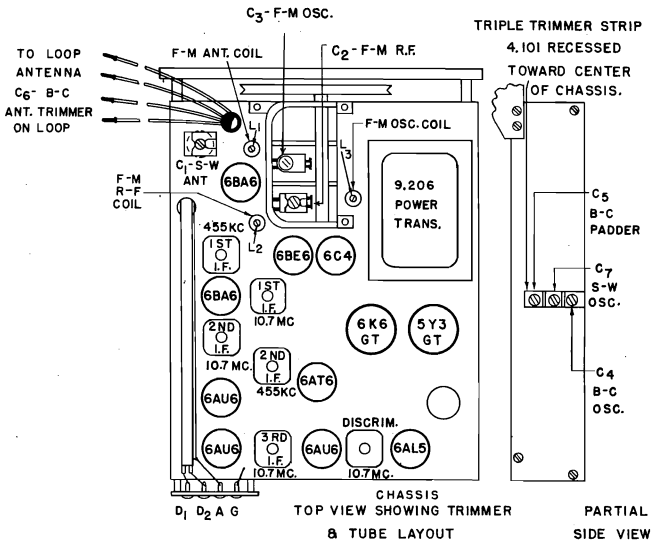
During the alignment procedure, all adjustments should be made under the following conditions:

(A) Line voltage set at 117 volts A.C.

(B) Volume control at maximum position.

(C) Tone control set at extreme left position (tremble).

(D) Minimum input from the signal generator. This procedure should be adhered to, otherwise adjustments will be broad, due to the action of the automatic volume control.



TUBES: The Tubes used, and their function, are as follows:

6BA6 R.F. Amplifier
6BE6 A.M. Converter, F.M. Mixer
6C4 F.M. Oscillator
6BA6 1st I.F. Amp. (AM)
6AU6 2nd I.F. Amp. (FM)
6AU6 3rd I.F. Amp. (FM)
6AU6 FM Limiter
6AL5 FM Discriminator
6AT6 AM Det., AVC and AM-FM Audio Amp.
6K6GT Power Amplifier Pentode
5Y3GT Rectifier

ALIGNMENT

Connect the high side of the signal generator through a 250-mmf. condenser to the antenna lead. The low side of the signal generator output should be connected to the receiver chassis through a .05-mfd. condenser. Connect a suitable output meter across the voice coil leads; then proceed as follows:

1. With gang condenser plates completely closed, the dial pointer should coincide with the horizontal dial line.

2. Tune receiver to the 1500-kc. point on the dial; then align trimmers (C-3 and C-5) on the gang condenser at 1500 kc. for a maximum output meter reading.

Precaution—One side of the power supply is connected to the chassis—do not connect chassis to any external ground.

GENERAL INFORMATION

INTRODUCTION

Model XFM-1, Frequency Modulation Translator, is used in conjunction with any radio receiver designed for quality phono operation.

The r-f stage of this translator is unusual in a number of respects. Variable inductance tuning is employed instead of using a conventional tuning capacitor. This design has two distinct advantages. It provides a highly efficient circuit in our range (88 to 108 megacycles) which would not be possible with the more conventional methods of tuning.

Tuning is accomplished by an "elevator" which consists of a rigid plastic horizontal plate (Figure 1-A) raised and lowered by means of a windlass (Figure 1-B) controlled by the tuning knob at the panel. From this plate are suspended three tuning "vanes" (Figure 1-C) which tune three low-inductance circuits. They are called "guillotine" tuners because of their appearance.

FACTS ABOUT "GUILLOTINE" TUNING

The "guillotine" tuners are designed for the ultra-high frequency of the FM band where special technique is needed to attain high gain and circuit stability. The efficiency of a tuned circuit with a fixed capacity decreases with the inductance so that for high frequencies demanding very low inductance the circuit will be very inefficient. The stray capacities of every wiring assembly represent shunt capacities which offer only a low resistance at high frequencies. This resistance damps the tuned circuit, causing an appreciable drop in the gain. It is, therefore, imperative to reduce the length of any connecting wire as much as possible. Another disadvantage of standard tuning arrangements at these frequencies is that common coupling is obtained through the shaft of a ganged tuning capacitor unless insulated single sections are used (cumbersome and costly). Common coupling of this type tends to cause oscillation or general instability and preclude high gain per stage. The guillotines make possible short leads, completely isolated sections, stable tuning,

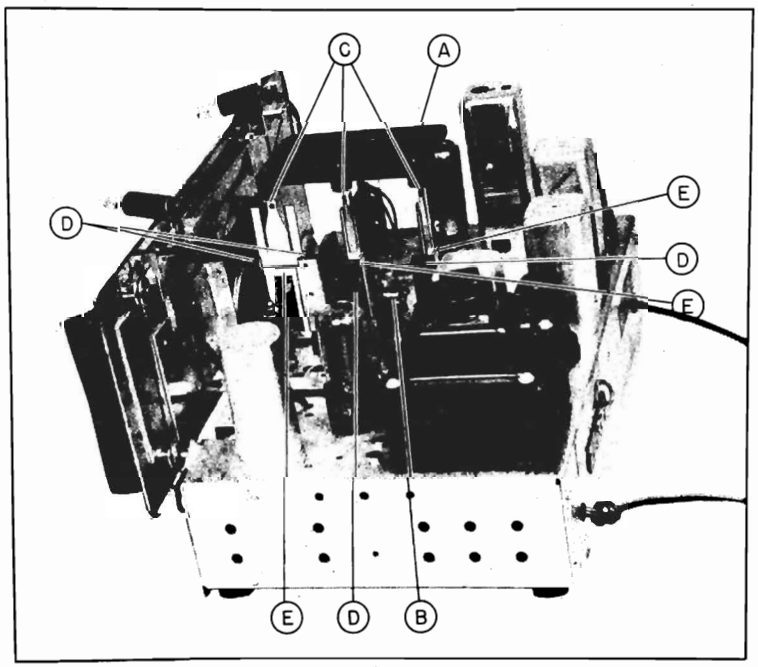

Fig. 1. Chassis with Tuner Assembly

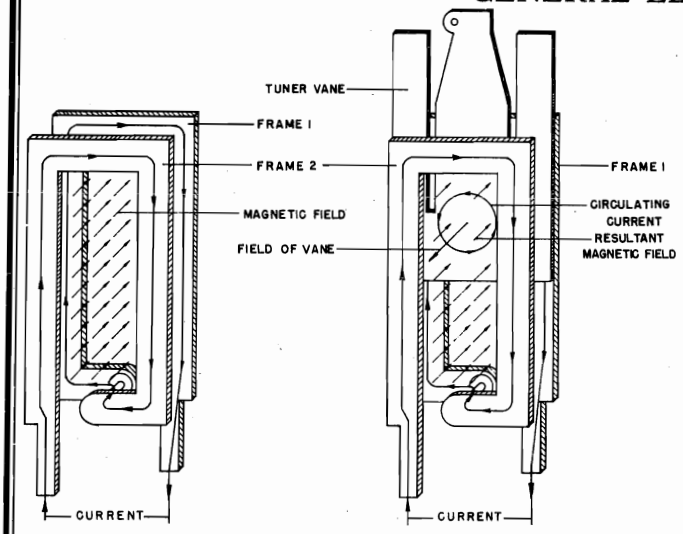

Fig. 2. Principle of Guillotine Tuner

high Q circuits, low shunt capacity, and location of each tuner in the best physical and electrical position in the assembly. Furthermore, since the shunt capacity is small and the inductance is consequently at its highest corresponding value, the additional unavoidable inductance introduced with wiring, band switch, etc., produces a minimum of circuit losses and unbalance.

GUILLOTINE TUNER

The guillotine tuner consists of two identical silver-plated brass frames (Figure 1-E) which form a two-turn square coil when connected at their open ends (Figure 2). They are mounted rigidly between two plastic posts (Figure 1-D). The magnetic field of this two-turn inductance is varied by the insertion of a brass blade between the frames (Figure 2). This solid vane slides up and down between the two turns guided in grooves in the plastic posts so that it passes between the two frames of the coil with a constant clearance. The posts are so moulded and the coil so constructed that the whole assembly is held rigidly at a predetermined spacing. The tuning vane is raised and lowered by the tuning elevator (Figure 1-B). When the elevator is all the way up (set tuned to the lowest frequency), the vane is completely above the coil which then acts as a simple two-turn coil. As the set is tuned towards the high frequencies, the vane moves downwards into the magnetic field of the coil unit, finally it is all the way in. The direction of the field is given by the arrows in Figure 2-A. It should be kept in mind that the inductance of the coil is proportional to the intensity of the linked field. If the vane is inserted between the two frames, the magnetic field (which is fluctuating at a rate determined by the FM frequency) induces in it a circulating current whose direction is such that the field produced by it is directed opposite to the original field (arrow in the opposite direction, Figure 2-B). The result is a decrease of field intensity, and subsequently a lower inductance of the coil. A sliding movement of a metal vane accomplishes, therefore, a change of the inductance of the coil.

The vane reduces this inductance through two principles. First, it acts as a shorted turn and thus reduces inductance directly; second— it provides a barrier between the two turns of the coil which reduces the mutual coupling and this, also, the inductance. It is desirable that the increase of the inductance is uniform with the movement of the vanes. To obtain the desired tuning curve, slots are cut in the blade the form of which once calculated can be kept within the required limits throughout production. The entire unit can be mechanically assembled and does not need any adjustment to insure proper tracking. Since the moving vane is ungrounded, there are no sliding contacts to produce noise while tuning in stations.

The tuners described above are identified as T1, T2, and T3 on the schematic diagram, Figure 5.

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements by vacuum tube voltmeter or similar measuring devices may be used to check circuit performance and isolate trouble. The gain values listed may have tolerances of 20%. Readings taken with low signal so that AVC is not effective.

(1) R-F AND I-F STAGE GAINS

Signal applied through 300-ohm resistor, including signal generator impedance (remove 6AG5):
Dipole terminals to grid of R-F amplifier 6AG5 . . . . . 2 at 98 mc
This check with oscillator tube 6AK5 removed:
Grid of R-F amplifier tube 6AG5 to grid converter tube 6AK5 . . . . . 9 at 98 mc
These checks with oscillator tube 6AK5 removed:
Grid of converter tube 6AK5 to grid of 6SG7 . . 38 at 10.7 mc
Grid of 6SG7 to grid of 6SV7 . . . . . 37 at 10.7 mc
(Adjust grid trimmers with VTVM in place.)

(2) OSCILLATOR GRID BIAS

D-C voltage developed across R5 . . . . . 10 volts at 98 mc

(3) SOCKET PIN VOLTAGES

Figure 6 shows typical tube pin voltages. All readings should be made from the pins to ground unless otherwise stated.

REPLACEMENT OF DRIVE CORDS

DIAL STRINGING

Push the tuning elevator all the way down and string the dial as shown in Figure 3. This illustration shows the stringing as viewed from behind the dial scale, as you would see it when working on it. The number and arrows indicate the progression of the dial cord from start to finish. The procedure will be easier if pulley C is by-passed until the rest of the work is finished. After which, the cord can be pulled tight over that pulley. During the procedure, locate the two brass eyelets so that they fall between pulleys A and B. When finished, crimp the eyelets on the cord in the proper position to act as minimum and maximum stops for the tuning mechanism and clip the pointer on the cable halfway between the eyelets.

Separate detail drawing is given to show the method of attaching the ends of the cord. When stringing the mechanism, load the spring by pulling the hook over the projection at the other end of the spring, string the dial and, as a final step, release the hook so that it pulls up the slack in the dial cord.

ELEVATOR STRINGING

The step-by-step procedure for stringing the elevator windlass is shown in Figure 4. (The view is from the rear of the mechanism.) This is done with the elevator up. Start by inserting the metallic cord in the slot as shown in 1. Then loop the left-hand free and over (2) and solder it to the lug provided at the bottom of the vertical shaft (3). The other free end is then given two turns around the pulley, first on one side of the first half-turn (4–5) and then on the other side (6–7). In making the two loops, the free end of the cord passes on *this* side of the end which is already secured. Similarly, in view 2, the end of which is to be secured to the bottom of the shaft, passes on *this* side of the right-hand free end of the cord. Observe these relationships. Finally, after completing the seven steps shown, pull the upper end of the cord through the hole in the top of the elevator mechanism and solder it to the spring provided.

CONCLUDING COMMENTS

After replacing the dial cord, it may be found that some correction in relative positioning is needed. This can be done by loosening the setscrews in the large drive pulley directly behind the dial scale and repositioning it on the shaft. The object, of course, is to permit the tuning control to drive the elevator through its full tuning range. Slight errors in final settings are not serious since leeway is provided in the location of the dial pointer itself.

ALIGNMENT

EQUIPMENT REQUIRED

1. Test Oscillator with tone modulation. (See Table.)
2. D-C Voltmeter or Microammeter. (See notes 2 and 3.)
3. A-C Voltmeter, 2 volts. (See note 6.)
4. Insulated hex wrench, ¼". (See steps 1, 7.)
5. .01 MF Paper Capacitor. (See Steps 1 to 5.)

Important detailed instructions and references in connection with the Alignment Table which follows are keyed in by means of column 7, headed "See Note." The notes are included in numerical order after the table. They are important—refer to them carefully.

ALIGNMENT TABLE

Step	Signal Generator Frequency	Signal Input Point	Dial Setting	Adjust	See Note	Remarks
		I-F ALIGNMENT				
1	10.7 mc	6SH7 grid thru .01 mf.	....	C51 for zero**	1, 2	Adjust C51 for zero meter reading. Apply 1 volt signal input.
2	See last column	6SH7 grid thru .01 mf.	....	Signal Generator	1, 2	Detune signal generator to point of max. meter reading.
3	As in Step 2	6SG7 grid thru .01 mf.	....	Peak C45	1, 2	
4	10.7 mc	6SV7 grid thru .01 mf.	....	Peak C43 and C44	1, 3	6AQ7GT tube removed from its socket.
5	10.7 mc	6SG7 grid thru .01 mf.	....	Peak C41 and C42	1, 3	6AQ7GT tube removed from its socket.
6	10.7 mc	Conv. grid directly	....	Peak C39 and C40	1, 3, 4	6AQ7GT tube removed from its socket.
		R-F ALIGNMENT				
7	88 mc	Dipole terminals	88 mc—6, 8 to 6.9 in.*	Peak C50	1, 3, 5	Set dial accurately—then adjust C50.
8	98 mc	Dipole terminals	For max. output	Peak C38	1, 3, 6	Tune dial for max. min. output, then peak C38 while rocking dial.
9	98 mc	Dipole terminals	Do not change	Peak C37	1, 3	

*Important! See Note 7.
**Use insulated hex wrench, ¼".

NOTES IN CONNECTION WITH ALIGNMENT TABLE

1. Use unmodulated signal.
2. Connect 20,000-ohm/volt meter from junction of R18 and R16 to chassis. Use ten-volt scale (Steps 1–3).
3. Connect 20,000-ohm/volt meter from grid 4 of 6SH7 to chassis with a 200,000-ohm resistor in series. The resistor must be connected directly to the grid so that capacity loading will be negligible and so that the meter is isolated from the i-f signal voltage. Keep signal generator output down so that the meter indicates not more than one volt at the grid (5 microamperes through 200,000 ohms). (Alignment Steps 4 to 6.)
4. Connect signal generator directly to the converter grid at some convenient point. The generator lead must be shielded up to this connection so that no more than 1/16 inch of exposed lead exists. Ground the shield solidly by clamping it firmly to the chassis or a shield as close to the connection as possible. (Step 6.)
5. Two oscillator settings will give response. The higher frequency response point is the correct one, the other is the image. If in doubt, start with the trimmer screw loosened completely and adjust for the first response.
6. "Rocking" consists of adjusting the indicated adjuster while turning the dial a small amount back-and-forth through peak output. The object is to find the maximum peak. Rocking is necessary and is permissible only when interlocking circuits are being adjusted.
7. Index pointer as follows: Turn pointer to right-hand limit of travel. Mark the dial backplate at a reference edge of the pointer slider. Then set pointer by turning dial knob until the indicated dimension exists between the reference edge and the mark.

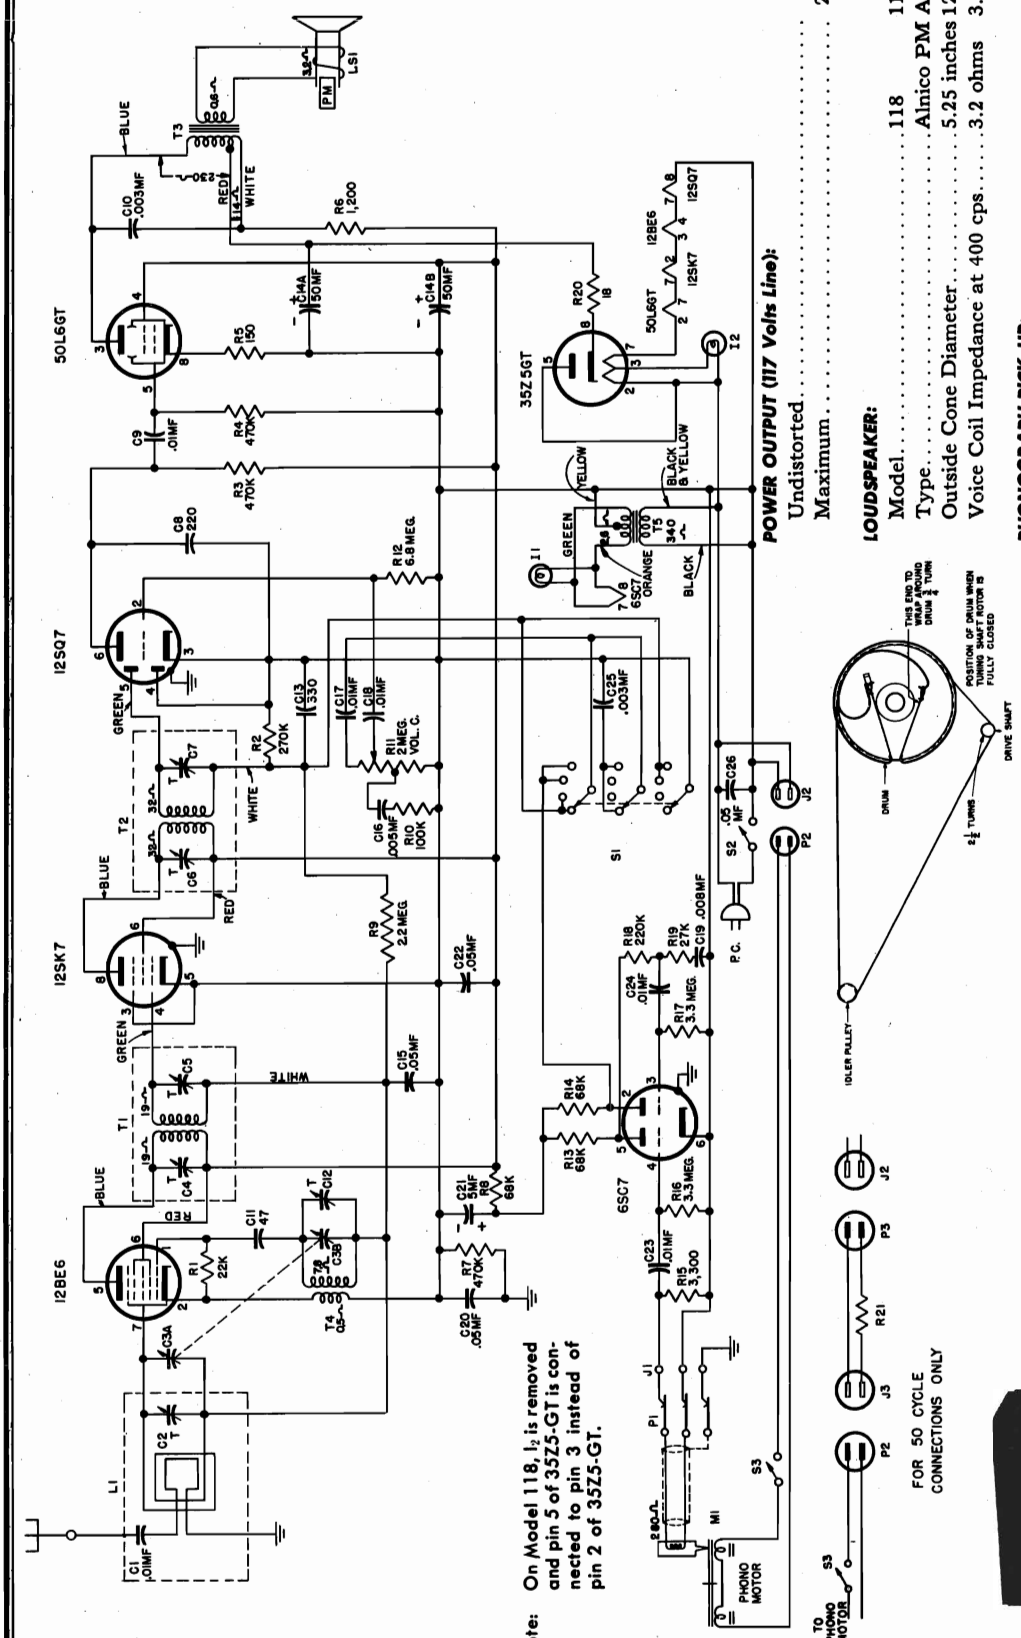
MODELS 118, 119M, 119W

GENERAL ELECTRIC CO.



Note: On Model 118, I_2 is removed and pin 5 of 35Z5-GT is connected to pin 3 instead of pin 2 of 35Z5-GT.

POWER OUTPUT (117 Volts Line):

Undistorted	.95 watts
Maximum	2.2 watts

LOUDSPEAKER:

Model	118	119
Type	Alnico PM	Alnico PM
Outside Cone Diameter	5.25 inches	12 inches
Voice Coil Impedance at 400 cps	3.2 ohms	3.2 ohms

PHONOGRAPH PICK-UP:

Type	Variable Reluctance
D-C Resistance	280 ohms

TUBE COMPLEMENT:

Converter-Oscillator	Type 12BE6
I-F Amplifier	Type 12SK7
Detector and Audio Amplifier	Type 12SQ7
Output	Type 50L6
Phono Preamplifier	Type 6SC7
Rectifier	Type 35Z5
Pilot Lamps	Mazda No. 47

OPERATING FREQUENCIES:

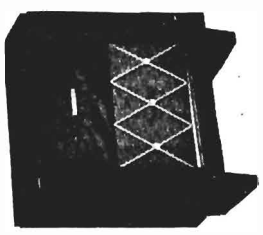
Broadcast Band	540-1600 kc
I-F Amplifier	455 kc

Dial cord stringing

ELECTRICAL (INPUT):

	A5	A6
Voltage (A-C only)	105-125	105-125
Frequency	50 cps	60 cps
Wattage (on Radio)	35	35
Wattage (on Phono)	70	55

119M and 119W



STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements may be made with a vacuum tube voltmeter to check circuit performance and to locate stages which are not operating properly. The gain values listed may have a tolerance of 20 per cent. Readings should be taken with the AVC shorted to B minus.

1. R-F STAGE GAINS.

Antenna to 12BE6 Grid..... 3.5 at 1000 kc
12BE6 Grid to 12SK7 Grid..... 50. at 455 kc

2. AUDIO GAIN.

The power output across the speaker voice coil should be approximately ½ watt with .95 volts at 400 cps applied between the high side of the volume control (R11) and ground.

3. OSCILLATOR GRID BIAS.

The d-c voltage developed across the oscillator grid leak resistor (R1) averages 4.5 volts at 1000 kc.

4. SOCKET PIN VOLTAGES.

Figure 4 shows typical tube pin voltages. All readings should be made from the pins to B minus unless otherwise indicated.

ELECTRICAL CIRCUIT ALIGNMENT

EQUIPMENT REQUIRED:

1. Test oscillator with audio tone modulation.
2. A-C output meter, 1½ volts full scale.
3. Insulated screwdriver.

ALIGNMENT PROCEDURE:

The Alignment Procedure is given in table form. All i-f alignments may be made with the chassis removed from the cabinet. However, the r-f alignments should be made with the chassis and loop mounted in the cabinet, as the relative position of the loop antenna with respect to the chassis materially affects the alignment.

The oscillator trimmer is accessible by tilting the chassis slightly in the cabinet. The antenna trimmer is on the loop and is accessible from the rear of the cabinet. The locations of these trimmers are shown in Figure 3.

The output meter should be connected across the loudspeaker voice coil terminals. The low side of the test oscillator should be connected to B minus; the high side should be connected as indicated in the Alignment Chart. During the entire alignment procedure, the radio volume control should be in its maximum position. The test oscillator output signal should be attenuated so that the output meter reading never exceeds 1¼ volts.

ALIGNMENT CHART

Step	Connect Test-Oscillator To:	Test Oscillator Setting	Dial Setting	Adjust Trimmers For Max. Output
1	12SK7 grid (Pin 4) in series with .05 mf.	455 kc	—	C6 and C7
2	12BE6 grid (Pin 7) in series with .05 mf.	455 kc	—	C4 and C5 Readjust C6 and C7
3	Blue wire on loop in series with 200 mmf. and 470 ohms.	1500 kc	1500 kc	C12 (Osc.); C2 (Ant.)*

Detector—1st Audio	Type 1S5
Audio Output	Type 3V4

POWER SUPPLY:

(AC-DC Operation)

Voltage	105-125 volts
Frequency	50-60 cycles
Power Consumption	25 watts

(Battery Operation)

Battery....Battery Pack Eveready No. 753 or equivalent

GENERAL INFORMATION

The Model 150 portable radio is a five-tube superheterodyne broadcast receiver with a range of 540 to 1600 kc. The power source may be either 105 to 125 volts, 50 to 60 cycles, or direct current when a power outlet is available. The receiver will also operate from its battery source, thus making it independent of external electric power providing excellent operation in any location where external power is not available.

BATTERY—AC or DC Operation.

The left knob turns on the battery provided that the power plug is well inserted into the socket in the chassis.

For AC or DC supply (105-125 volts, 50 to 60 cycle operation) the same knob switches on the power when the power plug is pulled out of its socket in the chassis and inserted into the house outlet.

ELECTRICAL CIRCUIT ALIGNMENT

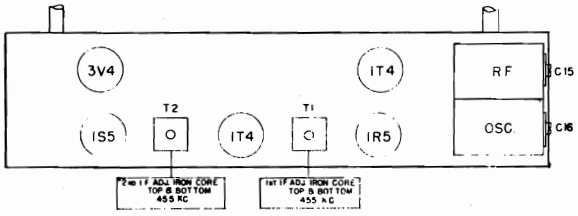
R-F . . . . . 1500 KC
I-F . . . . . 455 KC

EQUIPMENT REQUIRED

1. Test Oscillator with Tone Modulation.
2. AC Output Meter.
3. .05 mf. Paper Capacitor.
4. Insulated Screwdriver.

PROCEDURE—GENERAL

The Alignment Chart gives the alignment procedure with correct sequence of trimmer adjustments. The chassis must be removed from the cabinet during i-f alignment.



Tube and Trimmer Location

The test oscillator output signal should be attenuated so that the output meter reading never exceeds ½ volt. Connect the capacitor listed in column 2 of the Alignment Chart between the "high side" of the test oscillator and the point of input specified.

The output meter should be connected across the voice coil terminals on the speaker. The "low side" of the test oscillator output should be connected to the chassis ground; the "high side" of the oscillator output should be connected as indicated in the Alignment Chart. During the entire alignment procedure, the volume control should be at its maximum position. For alignment of the oscillator and r-f trimmers, the input signal should be inductively coupled to the radio loop antenna by connecting a 4-turn, 6-inch diameter loop of bell wire across the signal generator output terminals, and locate the loop about one foot from the radio loop antenna. To prevent possible errors in peak readings, the position of the loop with respect to the radio loop antenna should not be changed any one set of adjustments.

ALIGNMENT CHART

Step	Test-Osc. Connected to:	Test-Osc. Setting	Pointer Setting	Adjust for Max. Output
1	1T4 I-F grid in series with .05 mfd.	455 KC	550 KC	Iron cores of I-F Transformer T2.
2	1R5 converter grid in series with .05 mfd.	455 KC	550 KC	Iron cores of I-F Transformer T1.
3	Repeat Steps 1 and 2.			
4	Inductively coupled	1500 KC	1500 KC	C15* C16

* Chassis in cabinet and cabinet back (with loop) closed; remove plug button to adjust C15.

STAGE GAIN AND VOLTAGE CHECKS

Stage gain by vacuum tube voltmeter or similar measuring device may be used to check circuit performances and isolate trouble. The gain values listed may have tolerances of 20 per cent. Readings should be taken with low signal input so that the AVC is not effective.

(1) R-F STAGE GAINS

1T4 R-F Grid (Pin 6) to 1R5 Grid (Pin 6) . . . 2.5 @ 1000 KC
1R5 Grid (Pin 6) to 1T4 Grid (Pin 6) . . . . . 30 @ 1000 KC
1T4 Grid (Pin 6) to 1S5 Diode Plate (Pin 3) . . 50 @ 455 KC

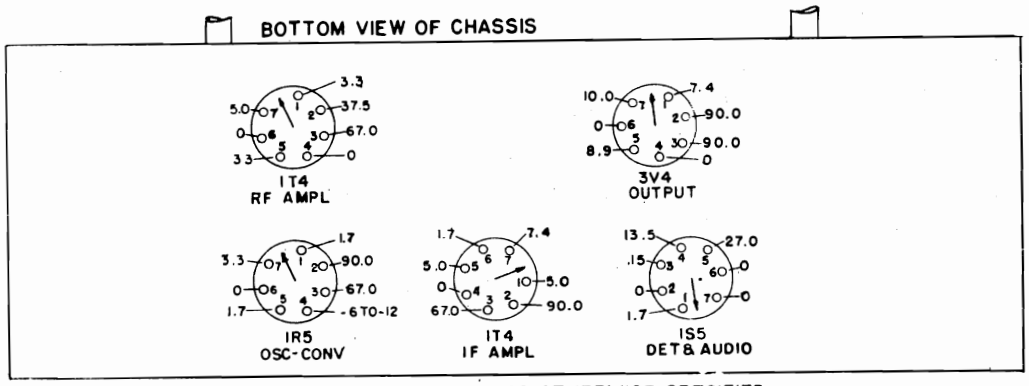
(2) AUDIO GAIN

.020 volt at 400 cycles across volume control (R13) with control set at maximum will give approximately .05 watts output across speaker voice coil.

(3) DC voltage developed across oscillator grid resistor (R9) averages —8 volts at 1000 kc with respect to B minus.

(4) SOCKET PIN VOLTAGES

Figure 3 shows voltages from all tube pins to B—. Voltage readings much lower than those specified may help localize defective components or tubes.



DC VOLTAGES TO GROUND UNLESS OTHERWISE SPECIFIED

SPECIFICATIONS

CABINET:

Height	7⅝ inches
Width	10⅝ inches
Depth	2¾ inches

POWER SUPPLY:

(AC-DC Operation)

Voltage	105–120 volts
Frequency on A-C	50– 60 cycles
Power Consumption	10 watts

(Battery Operation)

2— 1½ volt "A" Batteries, Eveready No. 950 or equivalent.

1—67½ volt "B" Battery, Eveready No. 467 or equivalent.

OPERATING FREQUENCIES:

Broadcast Band	540–1600 KC
I-F Amplifier	455 KC

POWER OUTPUT:

Undistorted	.06 watts
Maximum	.12 watts

LOUDSPEAKER:

Type	Alnico 5 permanent magnet
Size	4 inches
Voice Coil Impedance at 400 Cycles	3.2 ohms

TUBE COMPLEMENT:

Oscillator-Converter	1R5
I-F Amplifier	1T4
Detector Audio Amplifier	1S5
Power Output	3V4

GENERAL INFORMATION

The Model 145 is a portable superheterodyne receiver designed to operate on the broadcast band range of 540 to 1600 kilocycles. This receiver may be operated from a 105 to 120 volt d-c or 50–60 cycle a-c power source, or it may be operated from its own self-contained batteries by switching to the "Bat." position.

A selector switch (S2) on the front panel is used to switch the radio to battery operation or AC-DC operation. The switch on the volume control will turn on and off either battery or AC-DC power depending on the position of switch S2.

ELECTRICAL CIRCUIT ALIGNMENT

EQUIPMENT REQUIRED:

1. Test Oscillator with Tone Modulation.
2. A-C Output Meter.
3. .05 mfd. Capacitor.
4. Insulated Screwdriver.

PROCEDURE:

1. The alignment procedure is given in table form. All i-f adjustments may be made with the chassis removed from the cabinet. The locations of the i-f and r-f adjustments are shown in Figure 1.

2. The output meter should be connected across the voice coil terminals of the speaker. The low side of the test oscillator should be connected to B minus. The high side of the test oscillator should be connected as indicated in the alignment chart.

PRECAUTION: *If the signal generator is A-C operated, use an isolating transformer between the power supply and the radio receiver power input. The use of an isolating capacitor is not recommended, as A-C through the capacitor will introduce hum modulation and/or create the possibility of a burned out signal generator attenuator.*

3. During the entire alignment procedure the volume control should be rotated fully clockwise in its maximum position. The test oscillator should be attenuated so that the output meter doesn't exceed .4 volt.

4. For alignment of the oscillator and r-f trimmer, the input signal should be inductively coupled to the radio loop antenna by connecting a 4-turn, 6-inch diameter loop of bell wire across the signal generator output terminals, and locate the loop about one foot from the radio loop for alignment. To prevent possible errors in peak readings, the position of the loop with respect to the radio loop should not be changed during any one set of adjustments. The chassis should be installed in the cabinet when the r-f adjustment (step 4) is made.

ALIGNMENT CHART

Step	Connect Test Oscillator To:	Test Oscillator Setting	Dial Setting	Adjust for Maximum Output
1	1T4 grid (Pin 6) in series with .05 mfd. cap.	455 KC	550 KC	2nd i-f transformer (T2) primary and secondary cores.
2	1R5 grid (Pin 6) in series with .05 mfd. cap.	455 KC	550 KC	1st i-f transformer (T1) primary and secondary cores.
3	Inductively coupled (see Note 4)	1620 KC	Gang condenser completely open.	C2B for maximum.
4	Inductively coupled (see Note 4)	1500 KC	For max. signal. Set dial pointer at 1500 KC mark on dial scale.	C1B for maximum.

STAGE GAINS AND VOLTAGE CHECKS

Stage gain by vacuum tube voltmeter or similar device may be used to check circuit performance and to isolate trouble. The gain values listed may have tolerances of 20 per cent. Readings should be taken with low signal input so that AVC is not effective.

1. R-F STAGE GAINS.
   1R5 Grid (Pin 6) to 1T4 Grid (Pin 6).....27 at 1000 KC
   1R5 Grid (Pin 6) to 1T4 Grid (Pin 6).....33 at 455 KC
   1T4 Grid (Pin 6) to 1S5 Diode Plate (Pin 3)..60 at 455 KC
2. AUDIO GAIN.
   .05 volt at 400 cycles across the volume control (R6) with volume control set fully clockwise will give approximately .05 watt output or .4 volts across the speaker voice coil.
3. D-c voltage developed across oscillator grid resistor R1 averages 18 volts at 1000 kc.
4. SOCKET PIN VOLTAGES.
   Figure 4 shows voltages from all tube pins to B−. Voltage readings much lower than those specified may help localize defective components or tubes.

GENERAL INFORMATION

The Model 160 Portable Radio is a five-tube superheterodyne broadcast receiver which operates from a built-in rechargeable battery or from 105–125 volts, 50 or 60 cps with a battery in place.

The following paragraphs describe special tests for checking the power supply and the battery of the receiver, and explain some of the special constructional features which will be encountered while servicing the receiver.

1. POWER SUPPLY

All power necessary for the operation of the receiver is supplied by the 2-volt rechargeable battery mounted within the radio. Power to the 1.4 volt tube filaments is supplied by the battery through suitable voltage dropping resistors. The high voltage for the screens and plates of the tubes is furnished by a synchronous vibrator used in conjunction with a step-up power transformer and its associated filter circuit. The synchronous vibrator operates directly from the battery.

The receiver power is obtained from the battery at all times in the manner just described, whether the power cord is connected to a power source or not. When the power cord is connected to a receptacle supplying from 105 to 125 volts, 50 or 60 cps, a-c and the power selector is in either the CHARGE or ON position, the power supplied from the line will be used to charge the battery. The CHARGE position on the three-position power selector switch allows the battery to be charged from the house current when the receiver is not operating. The ON position of the switch permits the radio to be operated with the battery floating on the charger. Under this condition the battery filters the charger's output, maintains the voltage at its proper value and acquires a slow charge, if the voltage is adequate.

The battery charging unit consists of a step-down transformer which converts the line voltage of 117 volts to approximately 5.8 volts center-tapped, and a full wave copper-oxide rectifier which supplies the battery with the d-c charging current.

A charging cable is available which provides an easy means of charging the radio battery from an automobile or a 6-volt storage battery. The cable plug is inserted over the pins provided, see Figure 3, and the plug and socket on the other end of the cable are connected to a 6-volt supply. Complete installation instructions are provided with each cable.

2. CHARGER CHARACTERISTICS

Testing the Operation of the Rectifier Unit—A 1/4 ampere fuse is used in series with the primary of the charger transformer. If the battery does not show any signs of becoming charged after a reasonable length of time, check the fuse. If it is necessary to replace the fuse, use a 1/4-ampere (G.E. No. 2548 or REF-001) fuse.

If one or more of the copper-oxide discs of the rectifier unit are defective, the charger will not operate properly. To test the rectifier unit operation, remove the battery from the unit and reconnect it in series with a d-c ammeter capable of reading at least two amperes. Plug the power cord into a 105–125 volts, 50 or 60 cps, a-c supply, and turn the power selector switch to the CHARGE position. With the a-c line voltage at 117 volts, the average charging current should read about 1.8 amperes at 2.1 volts battery voltage. Care must be exercised in making this test as the charging circuit is of extremely low resistance. Very heavy leads must be used, and the use of an ammeter having only 0.05 ohms resistance will introduce considerable error. If the line voltage is greater than 117 volts, or the battery voltage is lower than 2.1 volts, the charging current will be greater. If the current is much less than 1.8 amperes at the rated line voltage of 117 volts, one or more of the copper-oxide discs may be defective.

Testing the Individual Rectifier Disc—Two rectifier assemblies are used in the receiver, each assembly consisting of two rectifier discs held together by an eyelet. A cross section of a rectifier as-

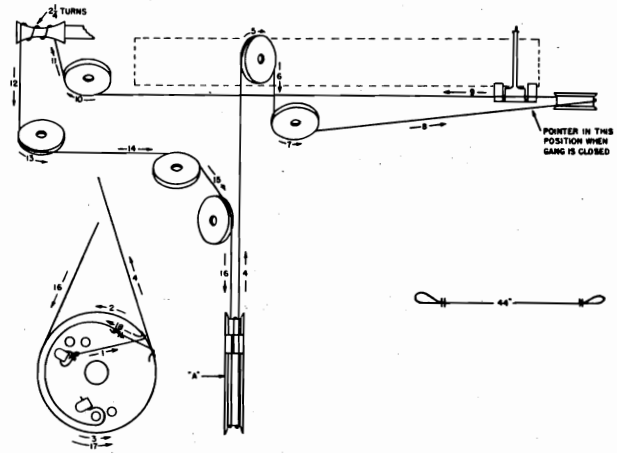

Fig. 1. Dial Stringing Diagram

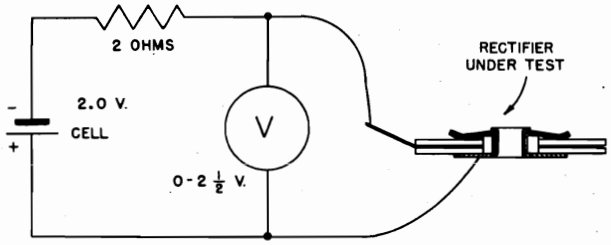

Fig. 2. Rectifier Test Circuit

sembly is shown in Figure 2. The center plate of the assembly is positive and is provided with a soldering tab. A copper-oxide rectifier disc is located on each side of the center plate. The rectifier disc conducts when the proper polarity potential is applied to the copper-oxide surface. The copper oxide is a dark coating which has been plated with nickel to afford a good surface contact to the copper oxide. If either or both of the rectifier discs in an assembly become defective, the entire assembly should be replaced.

To check the rectifier assembly, the following tests are recommended. In the conducting direction, the rectifier assembly should pass 0.5 ampere or more when ½ volt is impressed across it. If a d-c ammeter is not available for measuring currents as high as 0.65 ampere, the circuit shown in Figure 2 can be used for this check. The 2.0-ohm resistor should be fairly accurate. The voltage across the rectifier assembly should read 0.7 volt or less; if this voltage exceeds 0.7 volt, the assembly is defective and should be replaced.

The reverse current flow is as important as the above test and is made as follows: Reverse the battery polarity in the test circuit described for current check, disconnect the voltmeter, and place a milliammeter that will read 10 ma. in series with a lead to one of the battery terminals. A suitable meter fuse should be used in series with the milliammeter to prevent damage to the meter in case the assembly under test is shorted. The reversed current should not exceed 10 ma. If this current is considerably above this value, the rectifier assembly should be discarded.

If a milliammeter is not available, a rough check may be made by measuring the resistance of the assembly in the non-conducting direction on the low resistance range of an ohmmeter. The resistance should measure at least 300 ohms.

3. *REPLACEMENT OF VIBRATORS*

After many hours of service, the reception might become very noisy or fail due to a faulty vibrator. The type used in this receiver is REU-001.

In order to gain access to the vibrator, proceed as follows:

1. Pull out the pins on the handle of the cabinet (Figure 3).
2. Unscrew the five hex screws which hold the chassis in cabinet (one screw at the bottom of cabinet).
3. Slide the chassis out of the cabinet, being careful not to strain the loop leads.
4. Unscrew the three screws at the bottom and one on the top of the power unit.
5. Lift up the outer shield and then replacement of the vibrator is as easy as changing a normal radio tube.

BATTERY INFORMATION

The receiver uses a 2-volt Willard Radio Battery No. 25-2 or equivalent. It has a 25 ampere-hour capacity and should be cared for in the same manner as any storage battery.

CHARGE INDICATORS

The degree of charge of the battery can be determined by raising the back cover of the radio and referring to the charge ball indicators visible through the hole in the metal battery case.

If the battery is fully charged, two indicator balls will be visible at the surface of the liquid in the battery. When the battery discharges, these ball indicators will sink and disappear in the following order:

1. Green indicator sinks when approximately 20 per cent of battery capacity has been discharged.
2. The red ball sinks when battery is 80 per cent discharged.

On charge, the balls rise or float in the reverse order and the charge may be stopped when both balls appear in the opening.

TO CHARGE BATTERY

The battery is charged by merely plugging the receiver power cord in the rated ac power outlet and turning the selector switch to CHARGE. Frequent check should be taken of the charge indicator and when both indicator balls are visible, the battery is adequately charged. Charging the battery after both indicator balls are visible will not harm the battery except it will evaporate the water faster. A completely discharged battery will be restored, usually within 20 to 30 hours.

When operating the receiver from the a-c house current, the battery floats or is being charged at a slow rate. Thus if you wish to operate the receiver even with a fully discharged battery, plug in the power cord in the ac receptacle and turn the power selector switch to the ON position. Prolonged operation in this manner usually will cause the battery potential to stabilize at some voltage determined by the line voltage and the characteristics of the charging circuit components. The degree of charge obtainable with this method of operation likewise is dependent on the line voltage and the characteristics of the charging circuit components.

BATTERY OPERATING INSTRUCTIONS.

1. Add distilled or tap water in the filler cap at sufficiently frequent intervals to keep liquid level at indicator mark as viewed through opening in battery case. Do not overfill as this impairs the nonspill feature. Distilled water is to be preferred, as it does not contain any chemical compound which can contaminate the battery.

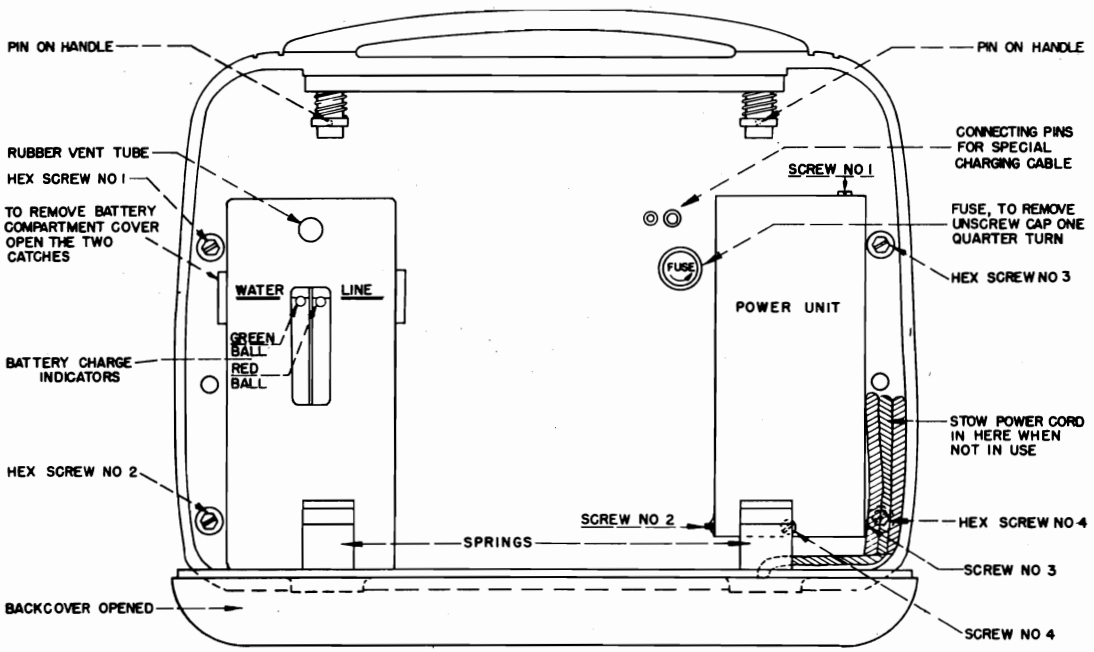

Fig. 3. Rear Compartment Assembly

2. A fully charged battery will operate the radio in the ON position without being connected to an a-c outlet for about 12 to 15 hours before recharging is required. Whenever possible, it is best not to allow the battery to become discharged to the extent that both indicators disappear. However, if both indicators have sunk, the battery should be recharged immediately or within 24 hours.

3. A battery will continually discharge at a slow rate even when not in use. For this reason, monthly checks should be made of the charge condition and the battery placed on charge when necessary. This will prevent damage to the battery, such as freezing during cold weather.

BATTERY INSTALLATION

The following instructions should be carefully followed in installing a battery, or replacing an old one:

1. Remove battery from packing carton.
2. If needed, add water to bring liquid level to indicator mark on battery container. Do not overfill.
3. Raise back cover on radio, remove battery case cover. The latter is removed by lifting two catches.
4. Unplug old battery if present, and replace with new battery.
5. Place battery on charge, if necessary, as described in a previous paragraph, until both indicators are showing in the opening in the case cover.

ELECTRICAL CIRCUIT ALIGNMENT

EQUIPMENT REQUIRED

1. Signal generator with audio tone modulation.
2. A-C output meter, 1 or ½ volts full scale, 1000 ohms/volt.
3. Insulated screwdriver.
4. .05 mf. capacitor.
5. Antenna loop.
6. Shorted one turn loop (for "wanding").
7. Powdered iron cores.

ALIGNMENT PROCEDURE

1. *General*—The alignment procedure is given in table form for convenience. Reference is made to Figure 5 for the trimmer locations. The low side of the signal generator should be connected to the chassis of the receiver for i-f alignment; the high side should be connected as indicated in the Alignment Chart. A meter or some other suitable indicating device must be connected to the output of the receiver.

When aligning the receiver, the volume control on the receiver should be turned to its maximum position. The output signal of the signal generator should be kept as low as possible at all times, the reading of a meter connected across the voice coil leads of the receiver should be kept below ½ volt by changing the signal generator output. If the signal level is too high, the AVC becomes effective and alignment errors might result.

The following paragraphs give greater details regarding the connections of the output meter and the signal generator to the receiver during alignment.

2. *Connecting the Output Meter*—In aligning the receiver some means for indicating differences in the output voltage will be required. A rectifier type a-c meter of 1 or 1½ volts full scale deflection is connected across the speaker voice coil terminals. For alignment of the i-f amplifier, the chassis and the back cover have to be removed from the cabinet (see paragraph 3 of General Information).

In order to be able to tune the i-f amplifier with ease, it is advisable to unsolder the two leads connecting the loop antenna, and solder them together avoiding any undesirable shorting to ground. Now remove the four self-tapping screws holding the speaker mounting plate and slide it out to gain access to the inside of the chassis. Due to the fact that the rectifier discs are mounted on this mounting plate, it is necessary to ground this plate temporarily to the chassis by means of a metal strip or wire to avoid excessive hum.

For the r-f alignment, the chassis can be left in the cabinet and the output meter connected between the auxiliary green voice coil lead provided and chassis.

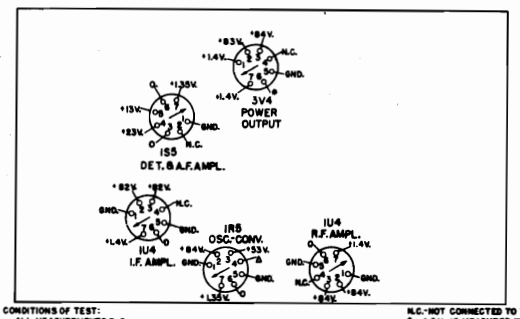
3. *Connecting the Signal Generator*—After aligning the i-f transformer T3, the output of the signal generator should be coupled through a 0.05 mf. capacitor to the grid of the 1R5 oscillator-converter tube. This may be accomplished easily by connecting the capacitor to the stator of C2-B, the middle section of the tuning gang, as this stator is connected directly to the converter grid. The low side of the signal generator output should be connected to the chassis ground to complete the circuit.

For aligning the oscillator and r-f coils, the r-f signal should be inductively coupled by connecting a three- or four-turn, 6-inch diameter loop of bell wire across the signal generator output terminals and then locating the loop about one foot from the radio cover. To prevent possible error in peak readings, the position of the loop with respect to the receiver should not be changed during any one set of adjustments. The adjustment of the iron cores must be made with the cover opened, and during the reading of the output meter the loop must be in normal position (the cover of the receiver must be closed).

For the oscillator adjustment, it is advisable to use the method of "wanding" the radio loop antenna. "Wanding" is the procedure where more or less gain will be indicated by an increase or decrease in output meter readings when a shorted one-turn loop (approximately 10 in. by 5 in.) is coupled to the radio antenna loop. If a gain is indicated, we have to increase the inductance by screwing in the iron core of the oscillator coil T6. In a similar manner, a field of powdered iron cores may be coupled to the loop. In this case a gain would indicate that the oscillator inductance must be decreased. When no gain is apparent with either the shorted turn wand or the iron field wand, the adjustment of the oscillator iron core is peaked.

After the alignment of the oscillator, the r-f transformer T1 should be aligned as follows:

1. The signal is fed over the loop coupled to the radio antenna loop with cover closed. Note the output meter reading.
2. Open the back cover and turn the tuning slug of T1 approximately ½ turn clockwise.
3. Close the back cover and note the new output meter reading. If it has increased, continue to turn the core in the same direction; if it has decreased, reverse the direction. Repeat this procedure until a definite maximum reading is obtained.



CONDITIONS OF TEST:
ALL MEASUREMENTS D-C.
MEASUREMENTS MADE TO GROUND.
MEASUREMENTS MADE WITH 20,000 OHM/VOLT METER
BATTERY VOLTAGE = 2.1 VOLTS.

N.C.-NOT CONNECTED TO TUBE.
Θ -4.5 V., IF MEASURED WITH V.T.V.M.
Δ - READING AFFECTED BY INSTRUMENTS.

ALIGNMENT CHART

Step	Test-Oscillator Connected to:	Test-Oscillator Setting	Pointer Setting	Adjust for Maximum Output
1	1U4 (i-f amplifier) grid (Pin 6) in series with 0.5 mf capacitor.	455 KC	1600 KC (gang condenser open)	Iron cores of i-f transformer T3
2	1R5 converter grid (Pin 6) in series with .05 mf capacitor.	455 KC	1600 KC (gang condenser open)	Iron cores of i-f transformer T2
3	1R5 converter grid (Pin 6) in series with .05 mf capacitor.	455 KC	1600 KC (gang condenser open)	Repeak T3 and T2
4	Inductively coupled to loop antenna.	580 KC	580 KC	Iron core of T6*
5	Inductively coupled to loop antenna.	580 KC	580 KC	Iron core of T1**
6	Inductively coupled to loop antenna.	1500 KC	1500 KC	C3B, C2B, and C1B***
7	Repeat Steps 4, 5, and 6 until both peaks reach maximum.			

*Use "Wanding" method described in text.
**See text for details.
***Chassis in cabinet and cabinet back (with loop) closed; remove plug buttons to adjust trimmers.

STAGE GAINS AND VOLTAGE CHECKS

Stage gain measurements may be made with a vacuum tube voltmeter to check circuit performance and to locate stages which are not operating properly. The gain values listed may have tolerance of 20%.

1. R-F STAGE GAINS.
   R-F Amplifier Grid (1U4 Pin 6) to Oscillator-Converter Grid (1R5 Pin 6).....13 at 1000 KC
   Oscillator-Converter Grid (1R5 Pin 6) to I-F Amplifier Grid (1U4, Pin 6).....26 at 1000 KC
   Oscillator-Converter Grid (1R5, Pin 6) to I-F Amplifier Grid (1U4, Pin 6).....31 at 455 KC
2. AUDIO GAIN
   The power output across the speaker voice coil should be approximately 50 milliwatts with a 400 cps signal of .03 volt applied across the volume control.
3. OSCILLATOR GRID BIAS
   The d-c voltage developed across the oscillator grid leak (Resistor R2) averages 13 volts at 1000 KC.
4. SOCKET PIN VOLTAGE
   Fig. 4 shows typieal tube pin voltages. All readings should be made from the pins to ground unless otherwise indicated.
5. HUM LEVEL
   Across the primary of the output transformer T4 measured in series with 1 mf paper capacitor in series with the meter.....3 volts (With the line cord plugged in; with battery operation alone, the voltage thus measured will be negligible.)

CABINET

	324	328
Model	324	328
Material	Wood	Wood
Color	Mahogany	Blonde
Height	32½ in.	32½ in.
Width	31⅝ in.	31⅝ in.
Depth	16 1/16 in.	16 1/16 in.

ELECTRICAL

Voltage	105–125
Frequency	60 c.p.s
Wattage (Radio)	65 watts
Wattage (Phono)	80 watts

OPERATING FREQUENCIES

AM	540–1620 kc
FM	88–108 mc

INTERMEDIATE FREQUENCIES

AM	455 kc
FM	10.7 mc

POWER OUTPUT

Undistorted	3.0 watts
Maximum	5.0 watts

LOUDSPEAKER

Type	Alnico permanent magnet
Outside Diameter of Cone	12 inches
Voice Coil Impedance at 400 Cycles	3.2 ohms

TUBE COMPLEMENT

(V1) Converter	6BE6
(V2) R-F and 1st FM-IF Amplifier	6BA6
(V3) Second FM and 1st AM-IF Amplifier	6BA6
(V4) FM Limiter	6AU6
(V5) AM Detector, FM Discriminator, and Audio Amplifier	6T8
(V6) Power Output	6V6
(V7) Rectifier	5Y3GT
(V8) Phono Preamplifier	6SC7

PHONOGRAPH PICK-UP

Type	Variable reluctance
D-c Resistance	250 ohms

ANTENNA

AM	Built-in loop or outside antenna
FM	Power cord antenna, or 300 ohm FM dipole antenna

GENERAL

Models 324 and 328 are alike except for cabinet. For service information on the record changer, refer to General Electric publication ER-S-P6.

These models are designed to operate either from built-in antennas or from an external AM antenna or FM dipole antenna. On AM it is merely necessary to connect an external antenna to the terminal screw marked "Antenna." On FM, to operate the receiver from the built-in power line antenna, it is necessary to connect the green wire coming out of the rear of the chassis, to the left-hand terminal screw of the antenna terminal strip. For operation from a 300-ohm FM dipole (G.E. Cat. No. UKA-006 or UKR-006), remove this green wire from the terminal and connect the 300-ohm transmission line (G.E. Cat. No. UWT-002) to the terminals marked "DIPOLE."

On AM operation, the set operates as a five-tube set with the signal being fed directly into the converter grid.

On FM, the set uses a reflex circuit, the Armstrong type discriminator, and a special limiter circuit.

In the reflex circuit, V2 (6BA6) acts both as an r-f amplifier and as the 1st i-f amplifier. The r-f signal is fed into the grid of V2 through the secondary of T1. It is amplified by V2 and tuned at the converter grid by L4, C1B, and trimmer C6. In the converter, the r-f is changed to 10.7 mc i-f, and fed into the primary of T1 and again inserted into the grid of V2, which now acts as an i-f amplifier. The i-f signal is fed from the plate of V2 through choke L9 into the second i-f transformer.

L1 and C3 form a 10.7 mc wave trap to eliminate any i-f signal from the antenna circuit to prevent interference. C4 and L2 are designed to peak at 98 mc with strays to increase the FM r-f sensitivity. At the FM r-f frequencies, the capacitor C46 offers little series impedance to the r-f signal. L9 and C7 form a high-pass filter to pass the FM r-f signal into the converter grid and to shunt the FM i-f frequency into the primary of the second FM i-f transformer.

It should be noted that the FM oscillator coil L8 is a section of 300-ohm line shorted at one end to form a one-turn loop. C11 and C10 are tapped in at each side of the shorted end.

L13 and C27 in the cathode circuit of the limiter tube are series tuned to 10.7 mc. This effectively grounds the cathode for IF. The presence of R21, however, provides a highly degenerative condition for any amplitude modulation applied to the limiter grid. The cathode bias developed by R21 is approximately 85 volts, which makes it necessary to insert onto the grid of V4 from B+80 volts through R38.

In late models of 324 and 328, the variable reluctance pick-up with replaceable stylus was used. When this pick-up was used, the resistor R49 was changed to 15,000 ohms, ½ watt from 6800 ohms, ½ watt.

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements by a vacuum tube voltmeter or similar measuring device may be used to check circuit performance and isolate trouble. The gain values listed may have tolerances of ±20 per cent. Readings should be taken with low signal voltage so that AVC is not effective.

1. R-F AND I-F STAGE GAINS

Signal applied through IRE dummy antenna:

Antenna Post to V2 Grid	4 at 1000 kc
V2 Grid to V3 Grid	60 at 455 kc
Dipole Terminals to V2 Grid	1.3 at 98 mc
V2 to V1 Grid	5 at 98 mc
V1 to V2 Grid	2.6 at 10.7 mc
V2 to V3 Grid	18 at 10.7 mc
V3 to V4 Grid	54 at 10.7 mc

2. AUDIO GAIN

0.05 volts at 400 cps across volume control with volume control set at maximum will give approximately ½ watt output across the speaker voice coil.

3. OSCILLATOR GRID BIAS

D-c voltage developed across R3:
6.5 volts at 1000 kc. (Use 220 K resistor to isolate V.T.V.M.)
4.5 volts at 98 mc. (Use 220 K resistor to isolate V.T.V. M.)

4. SOCKET PIN VOLTAGES

Fig. 3 shows typical tube pin voltages. All readings should be made from the pins to ground, unless otherwise indicated.

5. HUM MEASUREMENT

Hum measured across the voice coil of the speaker with volume control at minimum and Band switch on AM should not exceed 7 millivolts.

On FM, ground limiter grid and measure hum across voice coil with volume control at maximum. Hum should not exceed 15 millivolts.

ALIGNMENT

Two methods of alignment are given: (1) The regular meter alignment as previously used; and (2) Visual alignment, which allows for more precision in aligning the i-f transformers and particularly the discriminator alignment where it is necessary that the negative and positive half cycles of the output wave have equal amplitude and symmetry.

EQUIPMENT REQUIRED FOR METER ALIGNMENT

1. Test oscillator with tone modulation.
2. 20,000 ohm-per-volt voltmeter or microammeter.
3. A-c voltmeter, 2 volts.
4. .01 mfd., paper capacitor.
5. 200,000-ohm resistor, ½ watt.

NOTES IN CONNECTION WITH METER ALIGNMENT CHART

1. Use unmodulated signal.

2. Connect 20,000 ohm-per-volt meter from junction of R26 and R48 to chassis. Use 10-volt scale. Steps 4 and 5.

3. Connect 20,000 ohm-per-volt meter from junction of C40 and R38 to cathode of limiter (Pin 7 of V4) in series with a 200,000-ohm resistor. The resistor must be connected directly to the cathode pin to minimize capacity loading and to isolate the i-f signal from the meter. Keep signal generator down so that meter indicates not more than 1 volt (*5 microamps through 200,000 ohms*).

4. Use 400-cycle modulation.

5. Connect a standard output meter across speaker voice coil. Turn volume control full on. Keep signal generator output down so that output meter indicates not more than ½ watt output during alignment.

6. For alignment of the AM oscillator and R-F trimmer, the signal should be inductively coupled to the loop antenna by connecting a four-turn, six-inch diameter loop of bell wire across the signal generator terminals, and then locate the loop about one foot from the radio loop antenna. To prevent possible errors in peak readings, the position of the loop in respect to the radio loop should not be changed during any one set of adjustments.

7. To align the first FM i-f transformer T1, it is necessary to disconnect the copper strap from the band switch to Pin 7 of V1 (6BE6) by unsoldering the strap from the tube pin connection. Resolder the strap after T1 is aligned.

8. When tuning the secondary of T6 three minimum points will be obtained. The center one is the correct setting. As the transformer is tuned either side of 10.7 mc, the meter reading should increase.

9. Termination impedance of signal generator should be 300 ohms.

10. When detuning the signal generator in Step (4), two maximum meter readings will be obtained, one on each side of 10.7 mc. The primary of T6 should be aligned to maximum when the signal generator is tuned to the smaller of these two peaks.

METER ALIGNMENT CHART

Step No.	Signal Generator Frequency	Signal Input Point	Band Switch	Dial Setting	Adjust	See Note
			AM-IF ALIGNMENT			
1	455 KC	6BE6 grid (Pin 7 of V1) through .01 mfd.	AM	550 KC	Primary and secondary cores of T5 for maximum	4, 5

13	108 MC	Dipole terminals	FM	For maximum output	Adjust C6 for maximum while rocking generator	1, 3, 9
14	10.7 MC	Dipole terminals	FM	.....	Adjust C3 for minimum.	1, 3

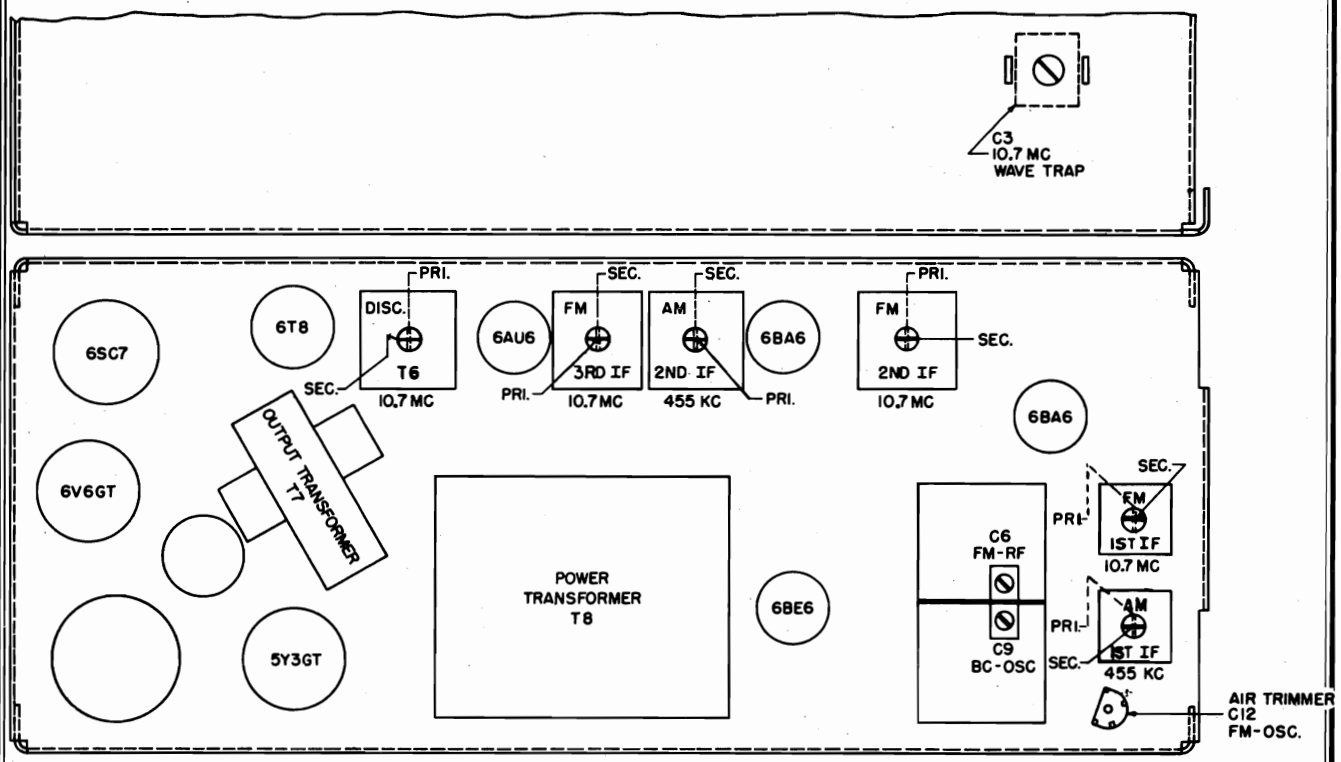

Fig. 1 Tube and Trimmer Location

EQUIPMENT REQUIRED FOR VISUAL ALIGNMENT:

1. General Electric YGS-3 AM and FM signal generator, or equivalent.
2. General Electric CRO-5A oscilloscope, or equivalent.
3. 200,000 ohm, ½ watt resistor.
4. 20,000 ohm-per-volt meter.
5. .01 mfd. paper capacitor.
6. 8 to 10 mfd. Pyranol capacitor.

NOTES IN CONNECTION WITH METER ALIGNMENT CHART

1. Connect vertical plates of scope to the limiter cathode (Pins 2 or 7 of V4) through a 200,000-ohm resistor and chassis. Connect an 8 to 10 mfd. pyranol capacitor between junction of C40 and R38 and ground.

2. Connect vertical plates of scope at junction of R18 and C28 and chassis.

3. Use a 60-cycle, amplitude-modulated signal.

4. In some cases tuning of the converter grid will cause "pulling" of the oscillator and will change the oscillator frequency. After centering the response curve, if peaking of C5 or C6 causes the curve to move off the scope screen, it is necessary to recalibrate the oscillator as in Steps 10 and 12.

5. The termination impedance of the signal generator 300 ohms to properly match the input impedance of this receiver.

6. To align the 1st i-f transformer T1, it is necessary to disconnect the copper strap from Pin 7 of V1 (6BE6) by unsoldering it. Resolder after alignment.

7. For alignment of the AM oscillator and r-f trimmers, the signal should be inductively coupled to the loop antenna by connecting a four-turn six-inch diameter loop of bell wire across the signal generator terminals, and then locate this loop about one foot from the radio loop antenna. To prevent possible errors in peak readings, the position of the loop with respect to the radio loop should not be changed during any one set of adjustments.

8. When using a sweep signal, it is necessary to apply the same sweep voltage to the horizontal plates of the scope as is used to sweep the r-f frequency. It may be necessary to use an RC phase shift network. This may be done by putting a .005 mfd. capacitor across the horizontal plate terminals of the scope and a ½-megohm potentiometer in series with the high side of the horizontal sweep voltage line. The potentiometer should be adjusted for a single trace.

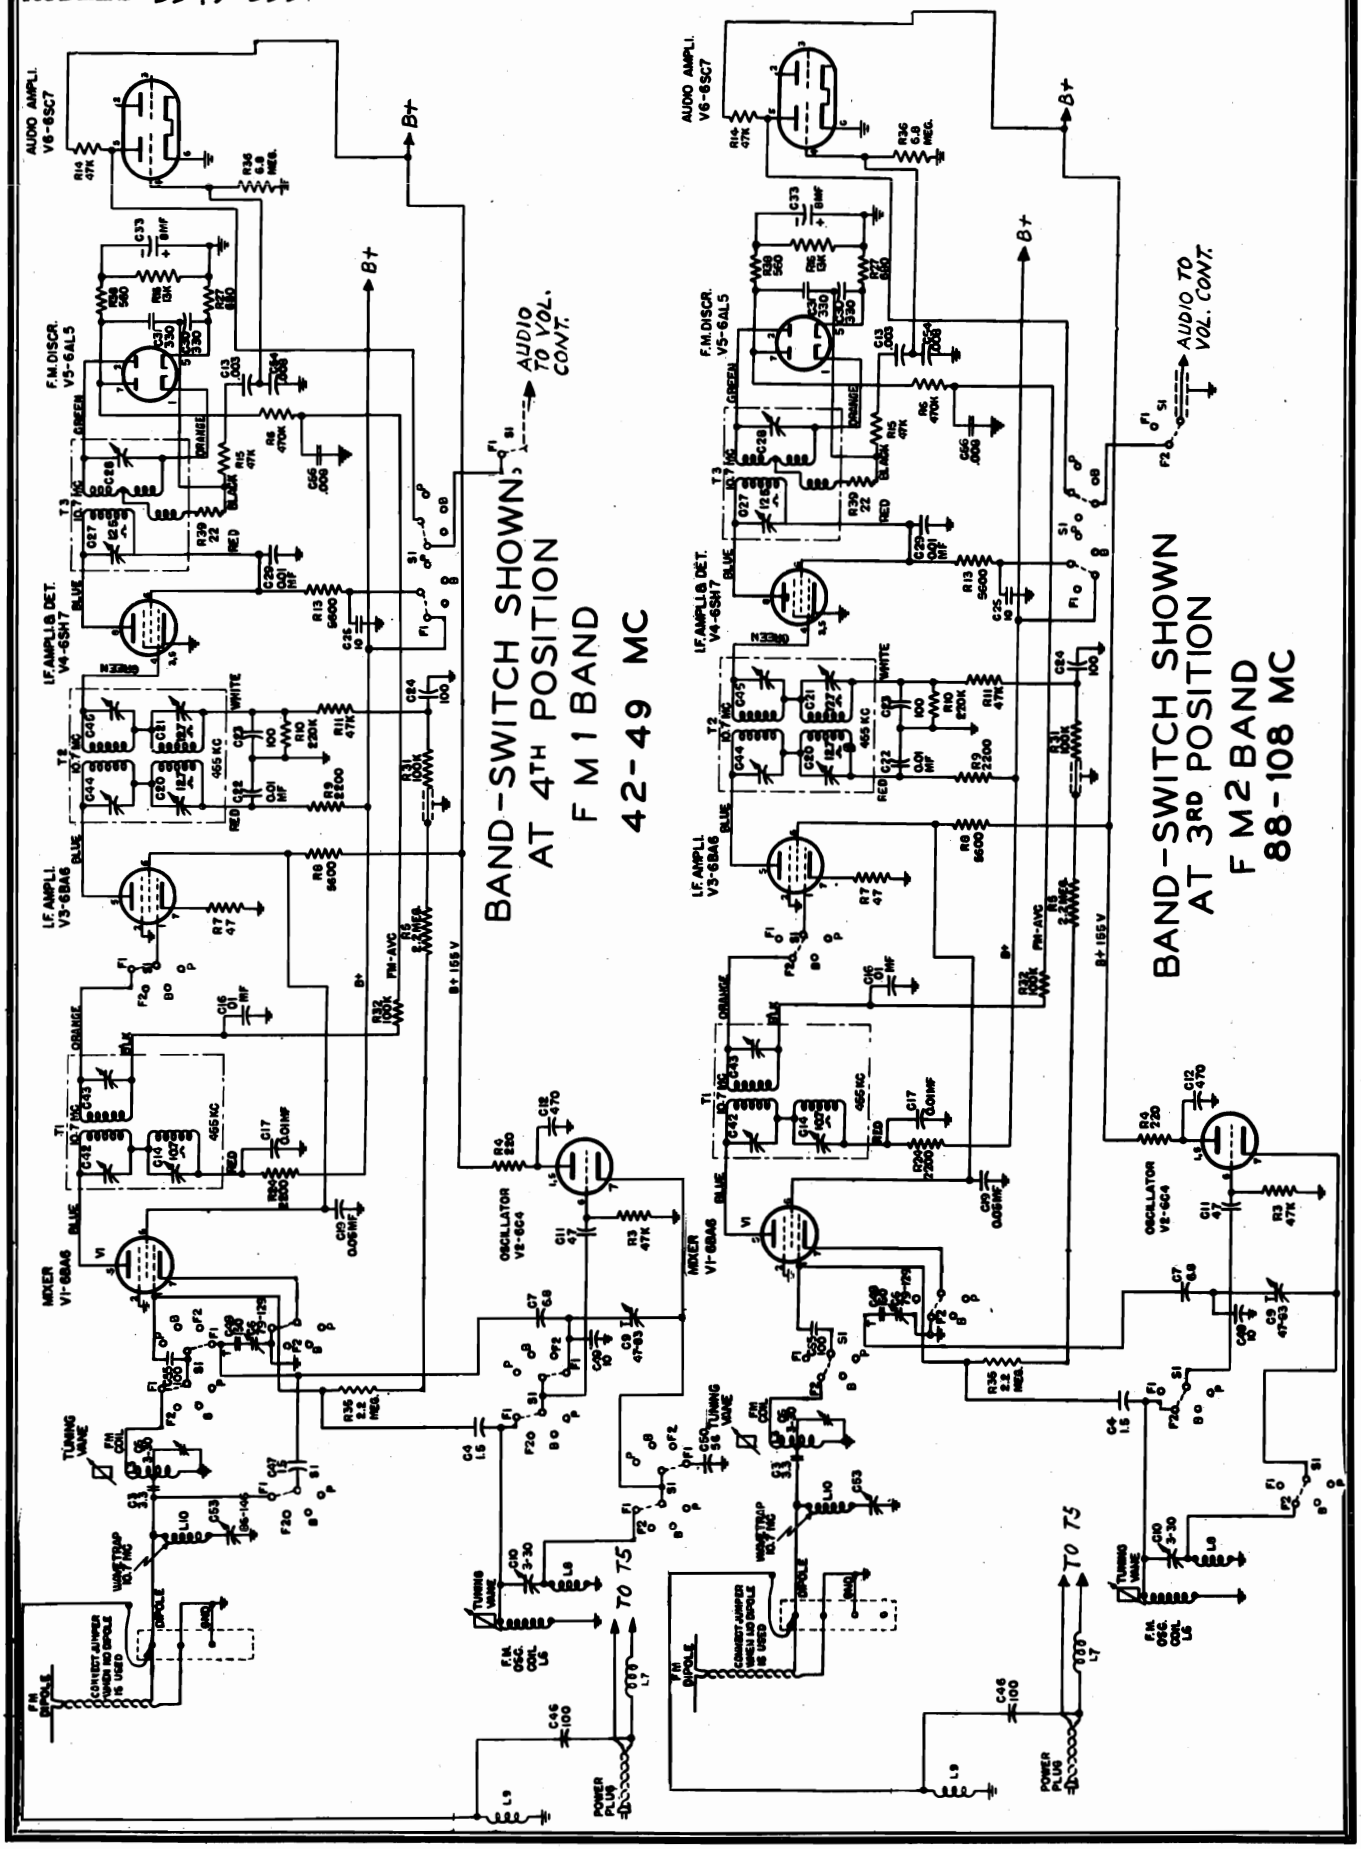
MODELS 354, 355 GENERAL ELECTRIC CO.



THE TUNING SYSTEM:

Variable inductance tuning is employed instead of using a conventional tuning capacitor. It provides a high efficiency FM circuit in the 88-108 megacycle range which would not be possible with the more conventional methods of tuning. Other advantages are also gained but the one mentioned above is the most important.

Tuning is accomplished by an "elevator" which consists of two rigid metal elevator support bars raised and lowered by means of a windlass controlled by the tuning knob at the panel. From these elevator bars are suspended two powdered iron cores which tune the broadcast converter and oscillator coils; and two tuning "vanes" which tune two low-inductance circuits. These latter circuits are employed in both FM bands. They are called "guillotine" tuners because of their appearance.

FACTS ABOUT "GUILLOTINE TUNING":

The "guillotine" tuners are designed primarily for the 88-108 megacycle FM band where special technique is needed to realize high gain and circuit stability. Ordinary coils, tuned by a variable capacitor are inefficient at these frequencies, first because of the low inductances required to reach these frequencies when a variable tuning capacitor is used and, second, because shunt capacity reduces the gain of the amplifier circuit; shunt capacity must be kept very low. Another disadvantage of standard tuning arrangements at these frequencies is that common coupling is obtained through the shaft of a ganged tuning capacitor unless insulated single sections are used which are cumbersome and costly. Common coupling of this type tends to cause oscillations or general instability and precludes high gain per stage. The guillotines make possible short leads, completely isolated sections, stable tuning high Q circuits, low shunt capacity, and location of each tuner in the best physical and electrical position in the assembly. Furthermore, since the shunt capacity is small and the inductance is consequently at its highest corresponding value, the additional unavoidable inductance introduced in the wiring, bandswitch, etc., produces a minimum of circuit losses and unbalance.

The guillotine tuner consists of a heavy, silver-plated, two-turned square coil, rigidly supported between two plastic posts. A flat, solid vane slides up and down between the two turns. It is guided in grooves in the plastic posts so that it passes between the two sections of the coil without touching them. The posts are so moulded and the coil so constructed that the whole assembly is held rigidly at a predetermined spacing. The tuning vane is raised and lowered by the tuning elevator. When the elevator is all the way up (set tuned to the lowest frequency), the vane is completely above the coil which then acts as a simple, two-turn coil. As the set is tuned toward the higher frequencies, the vane moves downward into the field of the coil until, finally, it is all the way in.

The vane reduces the inductance of the coil through two principles. First, it acts as a shorted turn, and thus reduces inductance directly; second, it provides a barrier between the two turns of the coil which reduces the mutual coupling and thus reduces the inductance.

The tuners described above are L3 and L6.

FM BANDS:

Guillotine tuners L3 and L6 are used as the tuned circuits for the converter and local oscillator respectively, in both FM bands. In the higher frequency band, the tuner is used with only a small shunt trimmer for adjusting distributed capacity. In the lower band, a higher value shunt trimmer is used to reduce the frequency. The layout of the band switch tuners and tube sockets is arranged to give the shortest possible leads when the FM bands are in use. The lead lengths in the other band are not nearly so critical.

STANDARD BROADCAST BAND:

This receiver employs a converter and an oscillator which are tuned by iron slugs suspended from the tuning elevator. These tuners are L2 and L5 respectively.

I-F AMPLIFIER:

The i-f amplifier consists of a composite 455 kc and 10.7 mc circuit. The electrical changes required to transfer AM and FM service are made by the band switch. When the switch is in either the FM-1 or FM-2 position, the amplifier operates at 10.7 megacycles and delivers the i-f signal into an FM discriminator circuit. When the switch is in the broadcast position, the amplifier operates at 455 kc. Screen and plate voltage is removed from the 6SH7 amplifier and the tube acts as an AM diode detector. Thus, the AM audio signal appears across R10 while the FM audio signal appears across C54. A section of the band switch switches the audio input circuit from one to the other.

RATIO DETECTOR:

In the ratio detector as used in this set the a-c voltages as applied to the diodes of a ratio detector are the same as the a-c voltages applied to the diodes in a conventional discriminator circuit. The method of obtaining audio from the FM carrier distinguishes the ratio detector from the conventional discriminator.

At resonant frequency the d-c voltage to which C31 and C30 are charged are equal and additive. When the frequency of the FM carrier goes above the center frequency the d-c voltage to which C30 is charged increases and the d-c voltage to which C31 is charged decreases proportional to the increase in frequency. The sum of the voltage of C30 and C31, however, remains the same. When the frequency goes below the center frequency the ratio of the charge on C30 and C31 reverses. The d-c charge of C30 decreases below its charge at center frequency and the d-c charge of C31 increases above its charge at center frequency. The increase and decrease of d-c charge is proportional to the change in frequency while the sum of the two remains constant at all times. The audio is tapped off between C30 and C31 to ground. The d-c voltage across C30 has been shown to vary proportionately to the change in frequency applied to the diodes of the detector tube 6AL5.

The ratio detector is also different from the discriminator in that it needs no limiter stage before it. The large condenser C33—8 mfd. combined with the resistor R16, has a long time constant and serves to limit any sudden change in d-c charge across C30 and C31, which might result from noise impulses.

REPLACEMENT OF DRIVE CORDS

DIAL STRINGING

The dial pointer should be strung as shown in Figure 1.

The tuning elevators should be strung, as shown in Figure 2, with the dial pointer at the extreme right of the dial. The front drum and stringing procedure is shown viewed from the rear of the chassis and the rear drum and stringing procedure is shown viewed from the front of the chassis. Ends X and Y at the conclusion of step 6, in stringing the front and rear elevators, should be connected at opposite ends of spring RMS-004 (not shown) after making one-half turn each around the shaft in opposite directions.

To position the elevator bar for the FM tuner, turn the dial pointer to the extreme right. Loop the elevator strings through the two notches at the end of the elevator bars and adjust the elevator bar above the FM coils to be 2 5/8 inches from the top of the chassis to the top of the elevator bar and cement to the cord with Glyptal. With the guillotine tuning vanes at the bottom, the adjusting screws set at their midpoints on the elevator bar and with spring and guide wires in place, solder guide wire to tuning vane.

To position the elevator bar for the AM slug tuner, turn the dial pointer to the extreme left and set the elevator bar 2⅝ inches from the top of the chassis to top of the elevator bar. Loop the elevator cord through the notches at the ends of the bar and cement to cord with Glyptal. Then turn the dial pointer to extreme right and with the adjusting screws at their midpoints on the elevator bar, position the tuning slugs in the antenna and oscillator coils 3 9/16 inches from the top of the chassis to the top of the slug and solder the guide wire to the top of the adjusting screw.

STAGE GAINS AND VOLTAGE CHECKS

Stage gain measurements by vacuum tube voltmeter or similar measuring devices may be used to check circuit performance and isolate trouble. The gain values listed may have tolerances of 20%. Readings should be taken at low signal input so that AVC is not effective.

1. R-F AND I-F STAGE GAINS.

Signal applied through IRE dummy antenna:
Antenna Post to V1 Grid . . . . . 3 at 1000 KC
These checks with oscillator tube V2 removed:
V1 Grid to V3 Grid . . . . . 78 at 455 KC
V1 Grid to V3 Grid . . . . . 38 at 10.7 MC
V3 Grid to V4 Grid . . . . . 22.5 at 10.7 MC

2. AUDIO GAIN.

.01 volts at pin 4 of V6 with volume control full clockwise will give approximately ½ watt output across the speaker voice coil.

3. OSCILLATOR GRID BIAS.

D-c voltage developed across R.3
11.5 Volts at 1000 KC
3.0 Volts at 45 MC
3.9 Volts at 98 MC

4. SOCKET PIN VOLTAGES.

Figure 4 shows typical tube pin voltages. All readings should be made from the pins to ground unless otherwise indicated.

EQUIPMENT FOR VISUAL ALIGNMENT:

1. General Electric YGS-3 AM and FM signal generator or equivalent.
2. General Electric CRO5A oscilloscope or equivalent.
3. 330,000-ohm resistor, ½ watt.
4. .01 mf. capacitor.
5. 20,000 ohms-per-volt meter.

NOTES IN CONNECTION WITH VISUAL ALIGNMENT TABLE:

1. Connect scope to pin 4 of V4 (6SH7) through resistor 330,000 ohms.
2. The over-all i-f curve on FM with sufficient signal input should have fairly steep skirts, a relatively flat top and symmetry of form.
3. The output curve when aligning the discriminator transformer should have symmetry and the curve should extend an equal distance above and below the horizontal reference axis.
4. Connect scope to V6 (6SC7) pin 4 through 330,000 ohms.

VISUAL ALIGNMENT CHART

STEP	SIGNAL GENERATOR FREQUENCY	SIGNAL INPUT POINT	BAND SWITCH SETTING	DIAL SETTING	ADJUST	SEE NOTE	REMARKS
			I-F VISUAL ALIGNMENT (AM)				
1	455 kc ±20 kc at 60-cycle sweep	6BA6 (V3) grid thru .01 mfd.	STD	.....	Adjust C20 and C21 for maximum amplitude and symmetry of curve.	1	
2	455 kc ±20 kc at 60-cycle sweep	6BA6 (V1) grid thru .01 mfd.	STD	.....	Adjust C14 and C15 for maximum amplitude and symmetry of curve.	1	
			I-F VISUAL ALIGNMENT (FM)				
3	10.7 mc ±300 kc at 60-cycle sweep	6BA6 (V3) grid thru .01 mfd.	FM2	.....	Adjust C44 and C45 for maximum amplitude and symmetry.	1	
4	10.7 mc ±300 kc at 60-cycle sweep	6BA6 (V1) grid thru .01 mfd.	FM2	.....	Adjust C42 and C43 for maximum amplitude of wave and symmetry of curve.	1, 2	
			VISUAL ALIGNMENT OF RATIO DETECTOR				
5	10.7 mc ±300 kc at 60-cycle sweep	6SH7 (V4) pin 4 (grid)	FM2	.....	Adjust C27 to maximum amplitude.	4	
6	10.7 mc ±300 kc at 60-cycle sweep	Same as Step 5	FM2	.....	Adjust C28 for symmetry of curve on scope*	3, 4	*Negative and positive half cycles of curve should have equal amplitude.
7	10.7 mc ±300 kc at 60-cycle sweep	6BA6 (V1) grid thru .01 mfd.	FM2	.....	Adjust C44, C45, C42, and C43 for maximum amplitude	1, 2	
8	10.7 mc ±300 kc at 60-cycle sweep	6BA6 (V1) grid thru .01 mfd.	FM2	.....	Readjust C27 and C28 as in steps 5 and 6	4	

METER ALIGNMENT CHART

STEP	SIGNAL GENERATOR FREQUENCY	SIGNAL INPUT POINT	BAND SWITCH	DIAL SETTING	ADJUST	SEE NOTE	REMARKS
			I-F ALIGNMENT (A-M)				
1	455 kc	6BA6 (V3) grid thru .01 mfd.	STD	.....	C20 and C21 for maximum	4, 5	
2	455 kc	6BA6 (V1) grid thru .01 mfd.	STD	.....	C14 and C15 for maximum	4, 5	
			I-F ALIGNMENT (F-M)				
3	10.7 mc	6SH7 grid thru .01 mfd.	FM2	.....	C27 for maximum	1, 2	Sufficient i-f input to give approx. 0.8 volt across C33.
4	10.7 mc	6SH7 grid thru .01 mfd.	FM2	.....	Peak C28 for minimum audio output	4, 5	Use insulated screwdriver for alignment.
5	10.7 mc	6BA6 (V3) grid thru .01 mfd.	FM2	.....	C44 and C45 for maximum	1, 2	
6	10.7 mc	6BA6 (V1) grid thru .01 mfd.	FM2	.....	C42 and C43 for maximum. Retrim C27, C44 and C45 for maximum.	1, 2	
			R-F ALIGNMENT—FM2 BAND				
7	Align dial pointer with dots at extreme right of scale when tuning knob is turned full clockwise.						
8	98 mc	Dipole terminal	FM2	98 mc	Adjust C10 for maximum	1, 2	
9	98 mc	Dipole terminal	FM2	98 mc	Adjust C5 for maximum*	1, 2	*Rock tuning knob during alignment.
			R-F ALIGNMENT—FM1 BAND				
10	46 mc	Dipole terminal	FM1	46 mc	Adjust C9 for maximum	1, 2	
11	46 mc	Dipole terminal	FM1	46 mc	Adjust C6 for maximum*	1, 2	*Rock tuning knob during alignment.
			R-F ALIGNMENT—BROADCAST				
12	1620 kc	Antenna Post**	STD	Note 6	Adjust C8 and C1 for maximum	4, 5, 6	**Remove green lead from Ant. term. board. Beam-a-scope loop L1 must be connected to chassis.
13	1000 kc	Antenna Post	STD	1000 kc	Adjust iron core in L5 for maximum	4, 5	
14	1000 kc	Antenna Post	STD	1000 kc	Adjust iron core in L2 for maximum	4, 5	
15	Recheck step 12						

ALIGNMENT NOTES

1. Use ***unmodulated*** signal.
2. Connect 20,000 ohms-per-volt meter across C33.
3. Connect 20,000 ohms-per-volt meter from junction of R15 and C13 to chassis.
4. Use 400-cycle modulation.
5. Connect a standard output meter across the speaker voice coil. Turn volume control fully on. Keep signal generator output down so that the meter indicates not more than ½-watt output during alignment.
6. Turn the tuning knob clockwise until the dial pointer is at extreme right of dial scale.

V2 Grid to V3 Grid	22 at 455 kc
V2 Grid to V3 Grid	3.0 at 10.7 mc
V3 Grid to V4 Grid	2.0 at 455 kc
V3 Grid to V4 Grid	57 at 10.7 mc
V4 Grid to V5 Grid	40 at 10.7 mc

2. AUDIO GAIN.

.07 volts at 400 cps across volume control with control set at maximum will give approximately ½ watt output across the speaker voice coil.

3. OSCILLATOR GRID BIAS.

D-c Voltage Developed Across R5:
8.5 volts at 1000 kc.
3.5 volts at 98 mc.

4. SOCKET PIN VOLTAGES.

Figure 3 shows typical tube pin voltages. All readings should be made from the pins to chassis unless otherwise indicated.

ALIGNMENT

Two methods of alignment, (1) the regular meter alignment method as previously used on AM sets, and (2) the visual alignment which allows for much more precision in aligning the i-f transformers and, particularly the discriminator where you can check the output wave shape for distortion, oscillations, and to see that the negative and positive half cycles of the wave have equal amplitude and are symmetrical.

EQUIPMENT REQUIRED FOR METER ALIGNMENT:

1. Test Oscillator with tone modulation.
2. D-C Voltmeter or Microammeter.
3. A-C Voltmeter, 2 volts.
4. .01 mf. paper capacitor.
5. ½ watt resistor of required resistance (note 9).
6. 200 mmf. mica capacitor.

EQUIPMENT REQUIRED FOR VISUAL ALIGNMENT:

1. General Electric YGS-3 AM and FM signal generator, or equivalent.
2. General Electric CRO-5A oscilloscope, or equivalent.
3. 330,000 ohm resistor, ½ watt.
4. 20,000 ohm per volt meter.

NOTES IN CONNECTION WITH METER ALIGNMENT:

(1) Use unmodulated signal.

(2) Connect 20,000 ohm-per-volt meter from junction of R29 and R41.

(3) Connect 20,000 ohm-per-volt meter from grid pin 1 of (V5) 6AU6 limiter to chassis with a 200,000-ohm resistor in series. The resistor must be connected directly to the grid to minimize capacity loading and to isolate the meter from the i-f voltage. Keep signal generator output down so that meter indicates not more than one volt at the grid (5 microamperes through 200,000 ohms) (Alignment Steps 7 through 13).

(4) Use 400-cycle modulation (Steps 1, 2, 3, 15, 16, 17, and 18).

(5) Connect a standard output-meter across speaker voice coil. Turn volume control full on. Keep signal generator output down so that meter indicates not more than ½ watt output (1.26 volts) during alignment. (Steps 1, 2, 3, 15, 16, 17 and 18.)

(6) Two oscillator settings will give response. The higher frequency response is the correct one; the other is the image response. If in doubt, start with the trimmer screw loosened completely and adjust for the first response.

(7) For alignment of the standard band oscillator and r-f trimmers, the input signal should be inductively coupled to the radio loop antenna by connecting a 4-turn, 6-inch diameter loop of bell wire across the signal generator terminals, and then locate the loop about one foot from the radio loop antenna to prevent possible errors in peak readings. The position of the loop in respect to the radio loop antenna should not be changed during any one set of adjustments. Steps 15, 16, 17 and 18.

(8) The lead from the signal generator must be kept as short as possible and it must be kept away from later stages to prevent regeneration. The signal may also be fed in to the tube pin connection from the top of the chassis to prevent regeneration.

(9) A dummy antenna is a resistor in series with the hot lead of the signal generator. The resistance of the resistor plus the termination impedance of the signal generator should equal 300 ohms.

(10) If a dial scale is not available, index the dial pointer as follows: Turn the pointer to the left-hand limit of travel and mark the dial plate at a reference edge of the pointer slide. Then set the pointer by turning the dial knob until the indicated dimension exists between the reference edge and the mark.

NOTES IN CONNECTION WITH VISUAL ALIGNMENT TABLE:

(1) Use FM signal modulated at 60 cps ±300 kc.

(2) Connect vertical plates of scope to the limiter grid (pin 1 of V5) (6AU6) through 200,000 ohm resistor.

(3) Connect vertical plates of scope to the junction of R29 and R41 (FM audio) through 200,000 ohms.

(4) Connect vertical plates of scope at junction of R13 and C28 (AM audio output) through 200,000 ohms.

(5) Use FM signal modulated at 60 cps ±20 kc.

(6) Use a 60 cycle amplitude modulated signal.

(7) If a dial scale is not available, index the dial pointer as follows: Turn the pointer to the left-hand limit of travel and mark the dial plate at a reference edge of the pointer slide. Then set the pointer by turning dial knob until the indicated dimension exists between the reference edge and the mark.

(8) Two oscillator settings will give a response. The higher frequency response is the correct one, the other response is the image. If in doubt, start with the trimmer screw loosened completely and adjust for the *first* response.

(9) In some cases tuning of the converter grid will cause "pulling" of oscillator which will change the oscillator frequency. After centering the response curve on the scope, if peaking of L4 causes the response curve to move off of the screen it is necessary to realign the oscillator for calibration.

(10) A dummy antenna is a resistor in series with the hot lead of the signal generator. The resistance of the resistor plus the termination impedance of the signal generator should equal 300 ohms.

(11) Leads from the signal generator must be kept as short as possible and away from later stages to prevent regeneration. The signal may also be fed to the tube pin connection from the top of the chassis to prevent regeneration.

ALL VOLTAGE AND RESISTANCE MEASUREMENTS MADE WITH RESPECT TO CHASSIS GROUND. AND WITH A LINE VOLTAGE OF 116 V.A.C.

ALIGNMENT PROCEDURE.

Connect output meter across voice coil.

Connect the signal generation to the standard Hazeltine Loop Model 1150 and couple it loosely to the receiver loop. Set the volume control at maximum, and fully mesh the tuning capacitor.

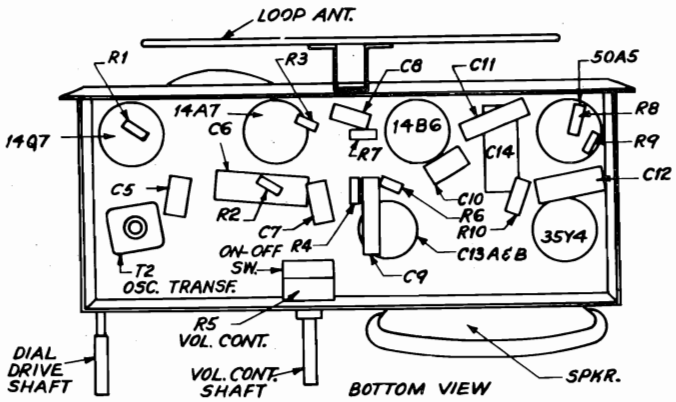
The output of the signal generator should be just sufficient to give a readable deflection on the output meter.

Set the signal generator to 456 kc and adjust i-f slugs for maximum output in the following order: L2, L1. Repeat sequence if trimmers were badly maladjusted.

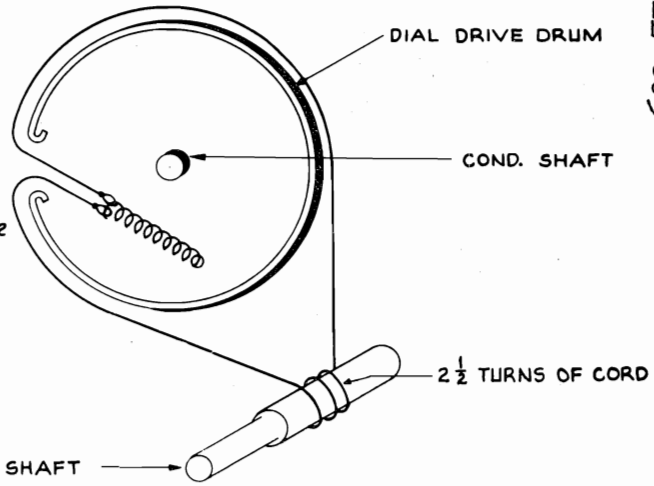
Set the signal generator and receiver to 1600 kc and adjust the oscillator trimmer C2 for maximum output.

Set the signal generator and receiver to 1400 kc and adjust the antenna trimmer C4 for maximum output.

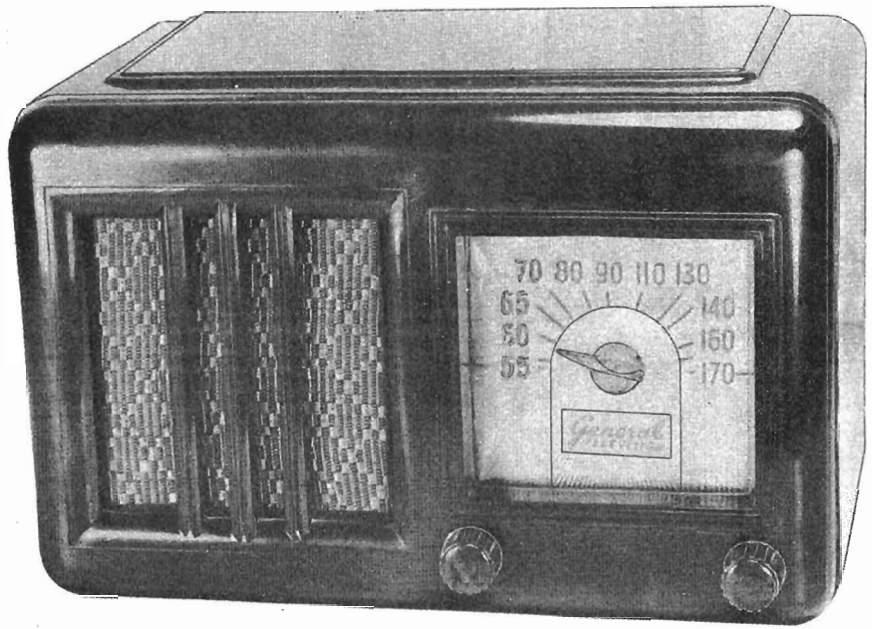
Set the signal generator and receiver to 1600 kc and readjust oscillator trimmer C2 for maximum output.



DIAL DRIVE ASSEMBLY



NOTE: TUNING COND. IN MAX. CAPACITY POSITION



GENERAL TELEV. AND RADIO CORP. MODEL 14A4F

ALIGNMENT PROCEDURE

Connect output meter across the voice coil.

Connect the signal generator to the standard Hazeltine Loop Model 1150 and couple it loosely to the receiver loop. Set the volume control at maximum, and fully mesh the tuning capacitor.

The output of the signal generator should be just sufficient to give a readable deflection on the output meter.

Set the signal generator to 455 kc and adjust i-f trimmers for maximum output in the following order: C9, C8, C7, C6. Repeat sequence if trimmers were badly maladjusted.

Set the signal generator and receiver to 1550 kc and adjust the oscillator trimmer C4 for maximum output.

Set the signal generator and receiver to 1400 kc and adjust the antenna trimmer C2 for maximum output.

Set the signal generator and receiver to 600 kc and adjust the oscillator padder L1 for maximum output while rocking the tuning capacitor.

Set the signal generator and receiver to 1550 kc and readjust oscillator trimmer C4 for maximum output.

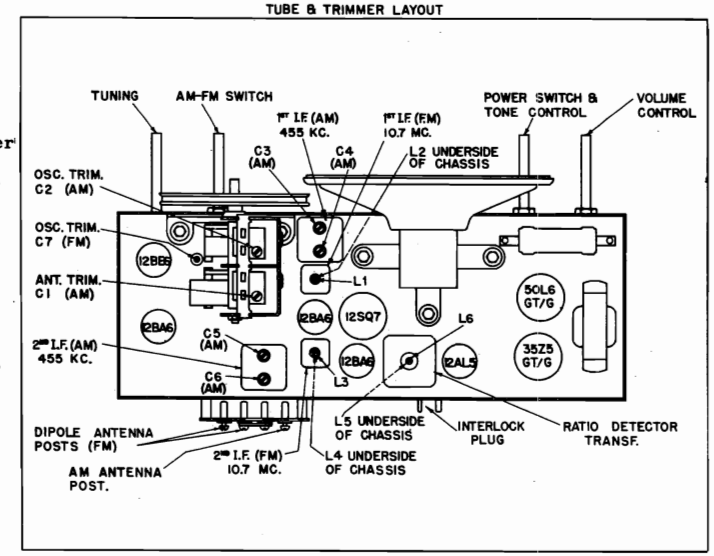
TUBE & TRIMMER LAYOUT



SERVICE AND ALIGNMENT INSTRUCTIONS

CAUTION: The chassis of this receiver is directly connected to one side of the line. When servicing this receiver do not place chassis on a grounded metallic bench.

ALIGNMENT:

Equipment Required: Vacuum tube voltmeter; modulated A-M and F-M signal generator; output meter radiation loop; one .1/400 WV condenser; one 300 ohm resistor; one insulated screw driver.

To insure proper alignment on A-M, the use of a radiation loop is recommended. To radiate a signal connect a loop of about 6" to 8" diameter one turn of #14 or #12 wire across the output of the signal generator and place this loop parallel to the loop of the receiver to be aligned at a distance of 8" or 10".

FOR COMPLETE ALIGNMENT INSTRUCTIONS ON AM AND FM BANDS SEE ALIGNMENT CHART.

To facilitate alignment of the receiver when removed from cabinet, calibration points are provided on the light diffuser plate, which is mounted to the chassis.

CAUTION: The diffuser plate is assembled to the chassis with two P.K. screws. The one at the left is fastened down tight. The one at the right should be backed off about two turns from the tight position in order to permit free expansion of the plate and thereby avoid warpage which may interfere with proper movement of the pointer.

Before aligning close the variable condenser fully counter-clockwise (plates fully closed) and check that pointer coincides with the reference dot (**extreme left dot**) on diffuser plate.

ALIGNMENT PROCEDURE CHART

STEP	SET BAND SWITCH ON	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO-	SET SIGNAL GENERATOR TO	TURN POINTER TO-	READ OUTPUT ON -	ADJUST THE FOLLOWING - KEEP SIGNAL FROM SIGNAL GENERATOR AS LOW AS POSSIBLE

Band switch in "AM" position.
Line voltage 117 volts, 60 cycle AC.

Reference Notes to Alignment Chart

Note 1—Either spread or compress the R.F. section gang plates for maximum output.

Note 2.—The FM section of this receiver operates with delayed A.V.C. This delay must be removed for the alignment procedure, this is accomplished by shorting pin No. 6 on the 6V6. The A.V.C. point is on terminal board at end of 2.2 meg. resistor coming from pin 1 of 6BA6 1st I.F. amplifier. Audio point is on high end of volume control.

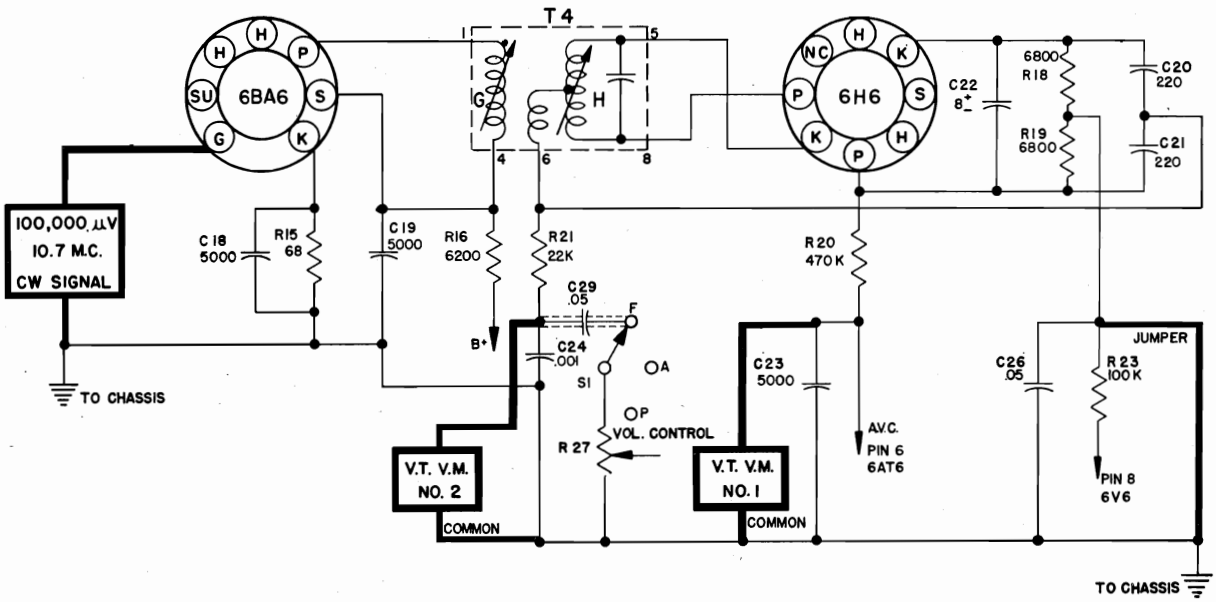
Note 3—The F.M. R.F. and osc. coils are air coils constructed of stiff wire. To adjust these coils for band coverage and tracking, move turns of coil together or apart as required.

RATIO DETECTOR

Proper operation of the ratio detector stage is extremely important for best performance on the FM band of this receiver.

The performance of the ratio detector stage may be checked by closely following the procedure and diagram given below.

RATIO DETECTOR



1. After setting up the S.G. and V.T.V.M., turn the trimmer adjustment screws G & H counter clockwise until the slugs are in the extreme outward position. Trimmer adjustment screw G is located at the underside of the chassis. Trimmer adjustment screw H is located on top of the chassis. For exact locations of these adjustment screws see trimmer location diagram.

2. Now turn adjustment "G" clockwise until VTVM in No. 1 position indicates maximum voltage. This maximum value should be from 1 to 2 volts with input as indicated in above diagram. Then slowly turn adjustment "H" in a clockwise direction, observing VTVM in No. 2 position. It will approach a maximum value and then rapidly drop to zero. If adjustment "H" is turned beyond this point, VTVM in No. 2 position will indicate a polarity change. The proper adjustment of "H" is at the point where the VTVM indicates zero volts between the polarity change.

3. Shift the 10.7 mc. signal to 10.725 mc. (10.7 mc. +25 kc.). VTVM in No. 2 position should now indicate a minus .25 volts minimum.

4. Change the 10.725 mc. signal to 10.675 mc. (10.7 mc. —25 kc.). VTVM in No. 2 position should indicate a plus .25 volts minimum. STEPS 3 and 4 constitute a sensitivity check on the ratio detector transformer.

5. Place the polarity switch of VTVM in No. 2 position to "minus" position and observe VTVM as the frequency of the signal generator is increased above 10.7 mc. It should indicate an increasing positive voltage. Continue increasing the frequency until the meter indicates a peak and begins to decrease. Reduce the generator frequency slightly until the peak is obtained. Record the generator frequency.

6. Set the polarity switch of VTVM to "plus" position. Repeat STEP 5, reducing the generator frequency from 10.7 mc. instead of increasing. Record the generator frequency when VTVM in No. 2 position indicates a peak.

7. The difference between the generator frequencies noted in STEPS 5 and 6 is the "Static Band Width" of the Ratio Detector transformer. This should be approximately 285 kc.

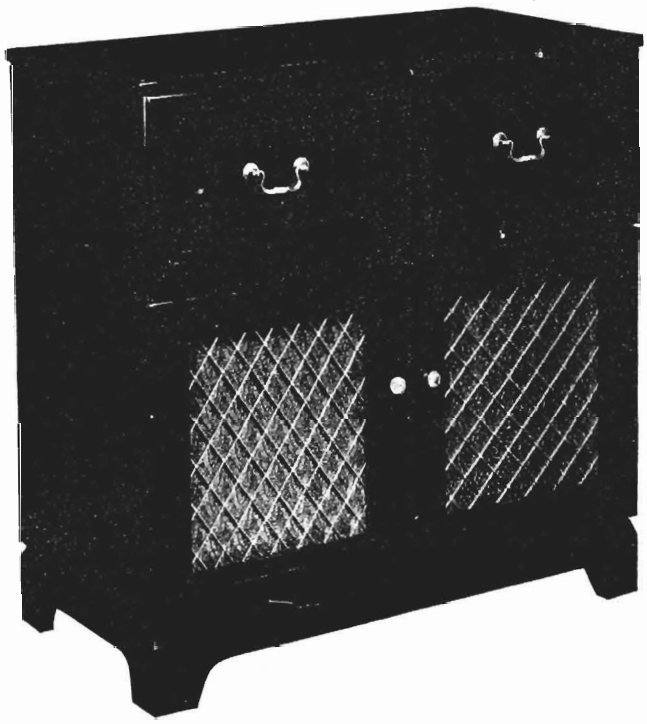
TUBE LAYOUT

GENERAL—Operate this receiver on 117 volt, 60 cycle alternating current (AC). Do not connect this equipment to any other source.



ANTENNA—A built-in loop and folded dipole antennae are provided for reception of AM and FM stations, which eliminate the need for external antennae in the average installation.

If this receiver is installed where AM reception is poor, attach an external antenna to the lead at the back of the built-in loop antenna.

To connect an external FM antenna, first remove the two dipole wires from the "FM" terminals on the top of the radio chassis. Connect the two wires from the external FM antenna to the terminals marked "FM" as shown in above illustration.

GROUND—A ground connection is not required for installation of this receiver.

Before starting alignment, pointer must be set to 87.5 MC. mark with gang fully closed.

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this receiver:

1. AM signal generator with frequency coverage from 455 kc. to 1700 kc.
2. FM or CW signal generator covering the FM band from 87.25 mc. to 108.75 mc. and the 10.7 mc. frequency for FM IF alignment.
3. Vacuum Tube Voltmeter (VTVM).
4. Output meter—to match 4 ohms, 5 watts maximum.
5. Insulated alignment screwdriver.
6. Dummy antenna—0.1 mfd. capacitor, 300 ohm carbon resistor and inductive loop (fashioned from several turns of wire).

NOTE: Oscilloscope equipment not required if aligned according to the following procedure:

TUBE LOCATION

ANTENNA—A built-in loop and folded dipole antennas are provided for reception of AM and FM stations, which eliminate the need for external antennas in the average installation.

If this receiver is installed where reception is poor, separate antennas may be desirable for AM and/or FM reception. For AM reception, a single wire antenna 25 to 100 feet long can be attached to the external antenna clip located near the center of the AM antenna loop fastened to the center panel of the radio compartment. For FM reception, an external dipole antenna can be connected to the right-hand pair of antenna terminals located on the back of the radio chassis (after removing the leads from the cabinet dipole antenna).

GROUND—A ground connection is not required for installation of this receiver.

INSTALLATION

GENERAL—Operate this receiver on 117 volt, 60 cycle alternating current (AC) only.

Before connecting the plug to an electrical outlet, be sure that all the packing material is removed from the set. See that the record changer is floating freely on its mountings.

Be sure that all tubes are firmly seated in their sockets as shown in the tube layout illustration.

All voltages measured to chassis unless otherwise noted.
DC voltages measured with 20,000 ohm/volt meter.
All voltages DC unless otherwise noted.

All measurements made with no signal input to receiver.
* Must be measured with VTVM with 100,000 ohm composition resistor in series with probe.

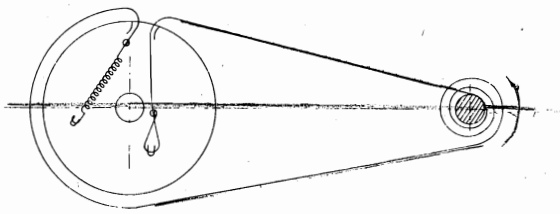
MODELS 93-107, 93-108

THE B. F. GOODRICH COMPANY

CHASSIS REMOVAL—Remove the receiver power cord from the electrical outlet before starting to remove the chassis.

1. Close the tuning condenser by setting to the low end of the band.
2. Remove the four knobs by pulling.
3. Disconnect loop and dipole leads from their respective chassis terminals.
4. Pull the phono-motor plug from the chassis socket.
5. Pull out the phono-pickup plug.
6. Unsolder the speaker leads at the speaker.
7. Remove the four long chassis bolts and slide the chassis out.

NOTE: When reinstalling the chassis, hold the wooden chassis blocks against the chassis and slide the chassis and blocks into the cabinet. The tuning condenser should also be kept closed when handling the chassis.

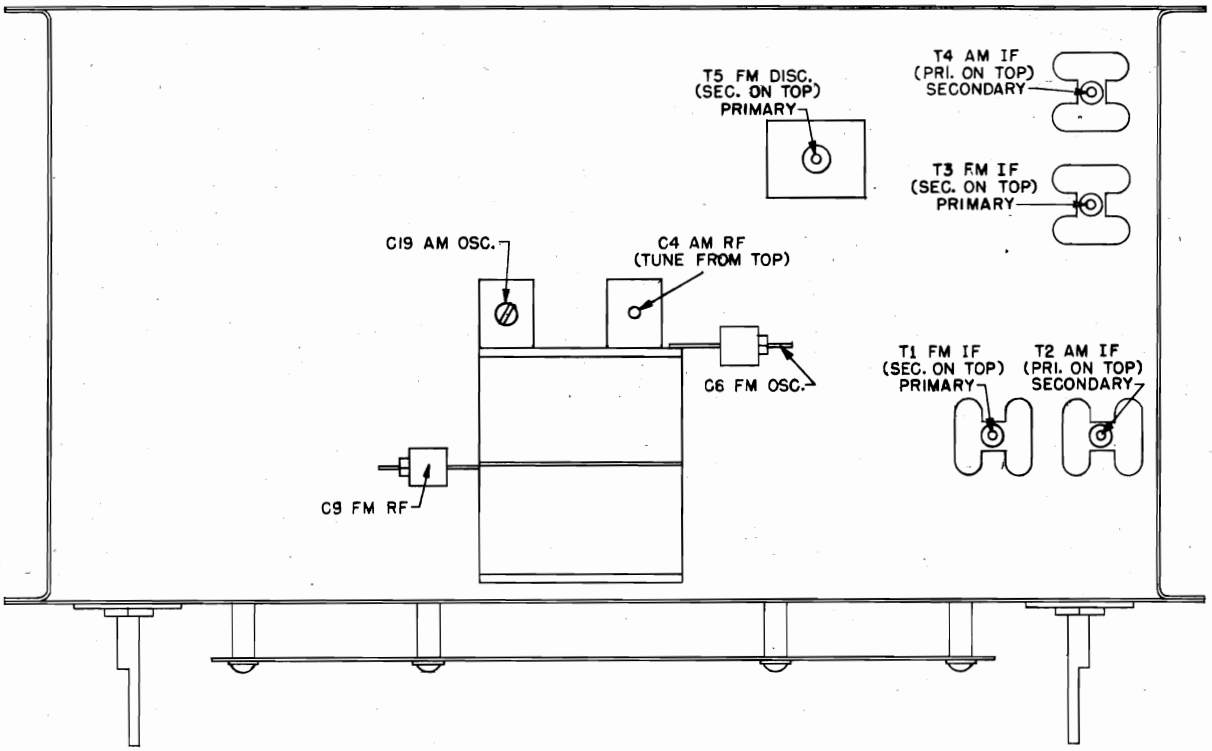


DIAL STRINGING

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this receiver.

1. AM signal generator, 455 kc to 1650 kc.
2. FM or CW signal generator covering the FM band from 88 mc. to 108 mc. and 10.7 mc. for FM IF.
3. Vacuum Tube Voltmeter (VTVM).
4. Output meter.
5. Insulated alignment screwdriver.
6. Dummy antennas—0.1 mfd. capacitor and two 150 ohm composition resistors.
7. Two 100,000 ohm ± 10% composition resistors for ratio detector alignment.



TRIMMER LOCATION—BOTTOM VIEW

Notes on Alignment

1—Before beginning alignment, the pointer must be set at the highest mark on the dial with the tuning condenser fully open.

2—The AM section should be completely aligned before beginning the FM alignment.

3—The set should be allowed to warm up 15 minutes before aligning.

4—An output meter should be connected across the speaker voice coil for AM alignment. Keep the volume control at maximum on AM and use as low a signal input as possible for AM and FM.

5—For AM and FM tracking, bend plates of the variable (RF Section) as required.

6—In FM alignment, care must be taken to set the receiver oscillator frequency 10.7 MC *above* the incoming signal frequency.

7—The dummy antenna for FM alignment is two 150 ohm composition resistors; one in series with each generator lead.

RATIO DETECTOR ALIGNMENT

(T1 and T3 should be tuned before tuning T5.)

TUNING T5 PRIMARY

Locate the ratio detector test points A, B, and C on the schematic diagram. Solder two 100,000 ohm composition resistors in series from point "A" to chassis. Connect a VTVM from point "A" to chassis and feed 10.7 MC CW into the FM antenna terminals. Adjust T5 primary (bottom slug) for maximum reading, setting the generator output to give about one volt meter reading. (An insulated aligning tool should be used for this adjustment.)

TUNING T5 SECONDARY

Connect the VTVM probe to point "C" and the VTVM common or ground lead to the junction of the two 100,000 ohm resistors. Tune T5 secondary until the meter reading reverses polarity. Set the slug at this zero point.

CHECKING BAND WIDTH

Connect the signal generator to the grid of the 2nd FM IF tube. Set the generator to 100,000 microvolts at 10.7 MC CW. Shift the generator frequency above and below 10.7 MC and record the frequencies at which the maximum positive and negative meter readings are obtained. The difference between these two readings is the bandwidth of the ratio detector and should be 250 to 300 KC.

Remove the two 100,000 ohm resistors before beginning the FM RF alignment.

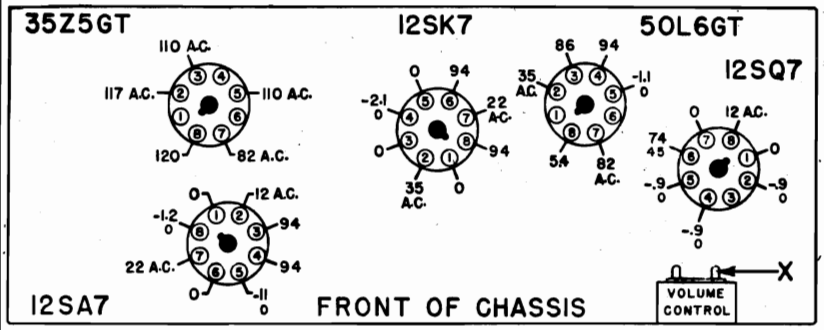
VOLTAGE DATA



Bottom View of Chassis, Showing Voltages

- Readings made between point indicated and Volume Control Lug (Point "X" on drawing).
- Measured on a 117 Volt A.C. line.
- Dial turned to low frequency end, no signal.
- Measured with vacuum tube voltmeter. A second voltage reading is shown made with a 1000 ohm - per-volt meter when use of this instrument would result in appreciably lower readings.

ALIGNMENT PROCEDURE

- Check setting of Pointer Extremes and note correct 600 K.C. and 1400 K.C. positions on Dial Background. (See Dial Diagram.)
- Connect the signal generator ground lead through a .1 mfd. condenser to B— (point "X" on voltage chart).
- Connect Output Meter across Voice Coil of Speaker.
- Turn Receiver Volume Control full on.
- Use lowest Output setting of Signal Generator capable of producing adequate Output Meter indication and then proceed as outlined in chart below.
- Repeat adjustments to insure good results.

NOTE: The B and D adjustments are made from the underside of the chassis.

POWER SUPPLY

This receiver is designed to operate from any AC (Alternating Current) power supply main of 110-120 volts, 50-60 cycles or DC (Direct Current) power supply main of 110-120 volts. If the receiver fails to operate on DC (Direct Current), reverse the power line plug.

On AC only the line plug should be tried both ways and left in the position that gives minimum hum.

MODELS 92505, 92506

ALIGNMENT PROCEDURE

Check setting of Pointer Extremes and note correct 600 K.C. and 1400 K.C. positions on Dial Background. (See Dial Diagram.)

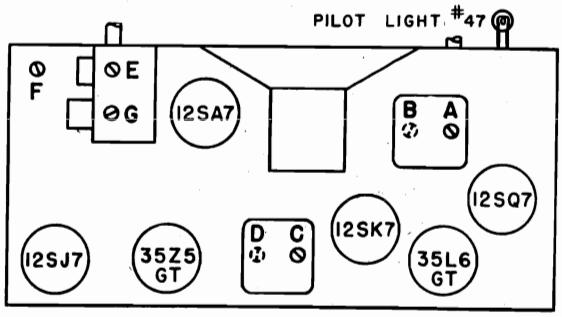
Connect Output Meter across Voice Coil of Speaker.

Turn Receiver Volume Control full on.

Use lowest Output setting of Signal Generator capable of producing adequate Output Meter indication and then proceed as outlined in chart below.

Repeat adjustments to insure good results.

TOP VIEW TUBE & TRIMMER LOCATION

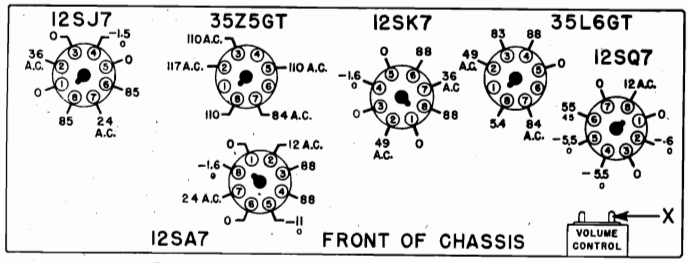


Connect Signal Generator To—	*Dummy Antenna Between Radio and Generator*	*Set Generator Frequency To—*	*Set Receiver Dial Frequency To—*	*Adjust Following Trimmers*	*Type of Adjustment*
12SA7 Control Grid	250 mmfd. Mica Condenser	455 KC.	High frequency end of Dial	A and B—2nd I. F. C and D—1st I. F. (See Note 1 below)	Adjust to maximum Output
External Antenna Wire on Loop	250 mmfd. Mica Condenser	1630 KC.	High frequency end of Dial	E—Osc.	Adjust to maximum Output
External Antenna Wire on Loop	250 mmfd. Mica Condenser	1400 KC.	Tune in Generator signal	F—R. F. (Iron Core)	See Note 2 Below
Loop radiator (or place lead from generator close to loop of set to obtain adequate signal).	No actual connection between set and generator.	1400 KC.	Tune in Generator signal	G—Ant.	Adjust to maximum Output

NOTE 1: The B and D adjustments are made from the underside of the chassis.

NOTE 2: Adjustment F is the threaded stud at the top end of the slug wire. Screw stud up or down in the bakelite for maximum output. Alignment is correct if the output is reduced when the position of the lever arm is changed slightly in either direction (up or down).

VOLTAGE DATA



Bottom View of Chassis, Showing Voltages

- Readings made between point indicated and Volume Control Lug (Point "X" on drawing).
- Measured on a 117 Volt A.C. line.
- Dial turned to low frequency end, no signal.
- Measured with Vacuum Tube voltmeter.
- A second voltage reading is shown made with a 1000 ohm-per-volt meter when use of this instrument would result in appreciably lower readings.

DIAL DRUM POSITION

If the dial drum position is disturbed, it should be carefully re-positioned to insure correct tuning of the permeability tuned coil. With the gang fully meshed, the drum will be properly positioned if the center of the condenser shaft and the dial cable hole on the drum are in a straight line parallel to the chassis base. Note that the dial cable hole should be on the right side (looking at front) of the chassis.

R.F. SLUG POSITION

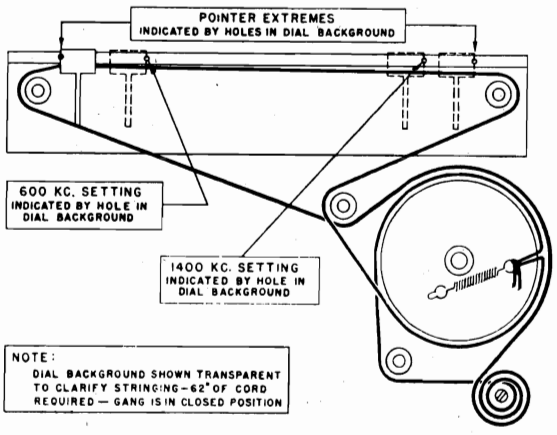
If the tuned coil slug needs replacing or re-positioning, first see that the dial drum is in its proper position. Then with the gang condenser fully meshed and the threaded stud half-way through the bakelite, note that the top of the slug is flush with the top of coil form. Then re-align.

POWER SUPPLY

This receiver is designed to operate from any AC (Alternating Current) power supply main of 110-120 volts, 50-60 cycles or DC (Direct Current) power supply main of 110-120 volts. If the receiver fails to operate on DC (Direct Current), reverse the power line plug.

On AC only the line plug should be tried both ways and left in the position that gives minimum hum.

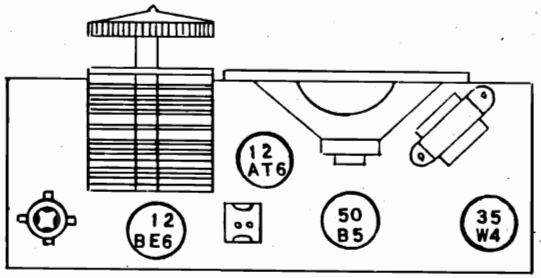
DIAL STRINGING AND POINTER SETTINGS



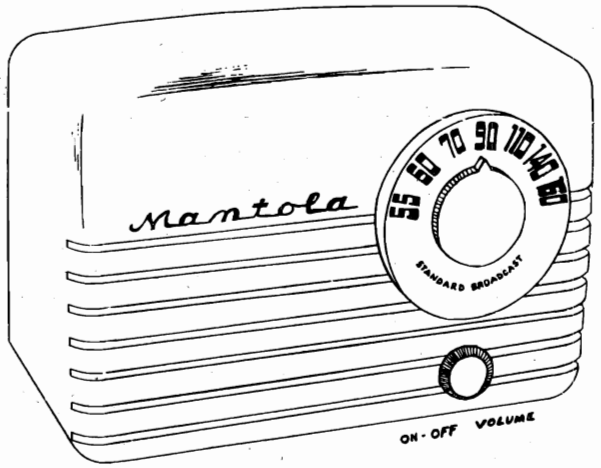
POWER SUPPLY

This receiver is designed to operate on either an A.C. or D.C. power supply. The following operation ratings should be observed:

Voltages ..... 105-125 Volts, A.C. or D.C.
Frequency ..... 50 to 60 cycles on A.C.



Remove back to replace tubes



ALIGNMENT PROCEDURE

- Output meter across 3.5 ohm output load.
- Volume control at maximum for all adjustments.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.

SIGNAL GENERATOR				*SETTING TUNER*	*ADJUST TRIMMERS TO MAXIMUM OUTPUT (in order shown)*
Frequency	*Coupling Factor*	*Connection to Receiver*	*Ground Connection*		
455 kc	.1 mfd	12BE6 Grid	B—	Rotor full open (Plates out of mesh)	Input and output trimmers on IF cans

CHASSIS SERIES "AB"

MODEL 92752,
CHASSIS W

THE B. F. GOODRICH COMPANY

TUBES

Be sure each of the tubes is in place and inserted firmly in its socket.

The tube location of each tube is shown on the card attached to the back of the cabinet. Your receiver is equipped and tested at the factory with the tubes that are shipped with it.

POWER SUPPLY

This receiver is designed to operate on either an A.C. or D.C. power supply. The following operation ratings should be observed:

Voltages.....105 - 125 Volts, A.C. or D.C.

Frequency.....50 to 60 cycles on A.C.

If in doubt as to the voltage and frequency supplied to your home, telephone your local Power Company.

When operating on a D.C. source, it is necessary to insert the power plug with the proper polarity. If the set fails to function after an interval sufficient for the tubes to reach their operating temperature, reverse the power plug in the outlet.

The battery supply to be used with this receiver is as follows:

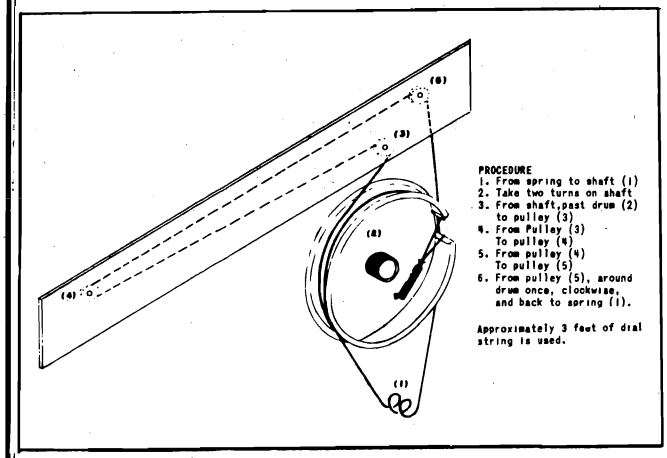
"A" supply ..... $7\frac{1}{2}$ volts.
Use five type "D" flashlight cells.

"B" supply ..... $67\frac{1}{2}$ volts.

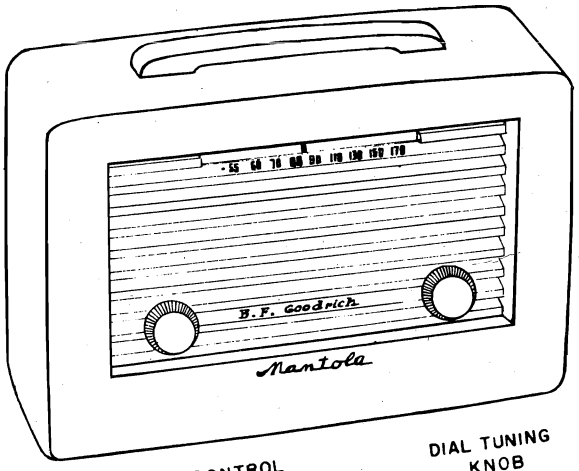
Use B.F. Goodrich No. R35, Ray-O-Vac No. 4367 or equivalent.

ANTENNA SYSTEM

This receiver is equipped with a loop antenna system, which obviates the necessity of using an antenna connection for receiving most local and some distant stations.



Replacement of Drive Cord



When tuning Broadcast Stations, it may be found advisable to rotate the radio about its position of rest until the most distant station regularly enjoyed is heard the clearest. In some vicinities where there is a localized noise interference prevalent, it is best to rotate the radio cabinet to a position which gives a minimum of noise.

OPERATION

TO OPERATE ON AC OR DC

Switch to electric on the slide switch located at the back of the set.

Plug the line cord into the nearest convenient wall outlet through the opening provided in the back.

TO OPERATE ON BATTERIES

To operate on batteries switch to batteries on the slide switch and store the line cord in the space provided.

VOLUME CONTROL and POWER SWITCH

The volume control and power switch are operated by a common control knob at the left of the cabinet. When the control is in extreme counter-clockwise position, the receiver power is off. From this position a slight clockwise rotation will turn the power on and by further clockwise rotation, volume may be increased until the full output of the receiver is obtained. To conserve batteries and tubes, be sure that the receiver is turned off when it is not in use.

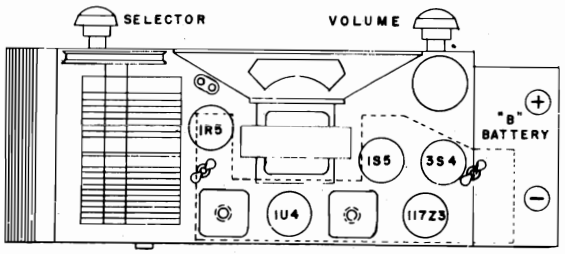
TUNING CONTROL

The knob at the right is the tuning control. Stations are tuned manually by turning this tuning control. The dial calibration numbers are in tenths of the actual kilocycle readings. To convert these calibrations to kilocycles, as is shown in most radio log books, add a "0" to the end of each number. After the desired station is heard, adjust this knob to the point of maximum volume and most realistic reproduction. This position of exact tune is very important as it is only when the receiver is in this position that the full, rich tone is available. The volume control may now be set to give the desired volume.

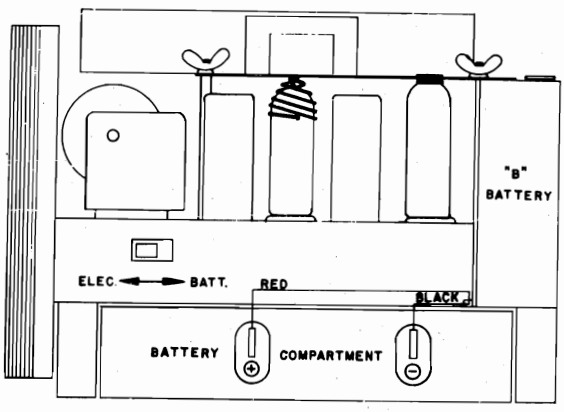
MAINTENANCE

CAUTION

Always remove the power cord from its receptacle before starting to replace tubes or batteries.



TO REPLACE TUBES, UNSCREW WING NUTS, AND REMOVE TUBE SPRING PLATE



Do not allow cells which have become too weak to operate the set properly to remain in the set for any length of time.

REPLACEMENT OF TUBES

To replace tubes, remove the two wing nuts which hold the tube spring plate and lift off the plate. Replace the plate and wing nuts after removal of old tubes.

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts DC or 50-60 cycles AC 15 watts
Batteries	A—7½ volts. 50 ma. B—67½ volts. 8 ma. average.
Frequency Range	530 to 1700 kc.
Intermediate Freq.	455 kc.
Tuning	Two-gang capacitor
Antenna	Built-in loop
Speaker	4 inch PM; voice coil Impedance 3.5 ohms.
Power Output	80 milliwatts undistorted 140 milliwatts maximum
Sensitivity	500 microvolts per meter for 50 milliwatt output
Selectivity	55 kc broad at 1000 times signal at 1000 kc.

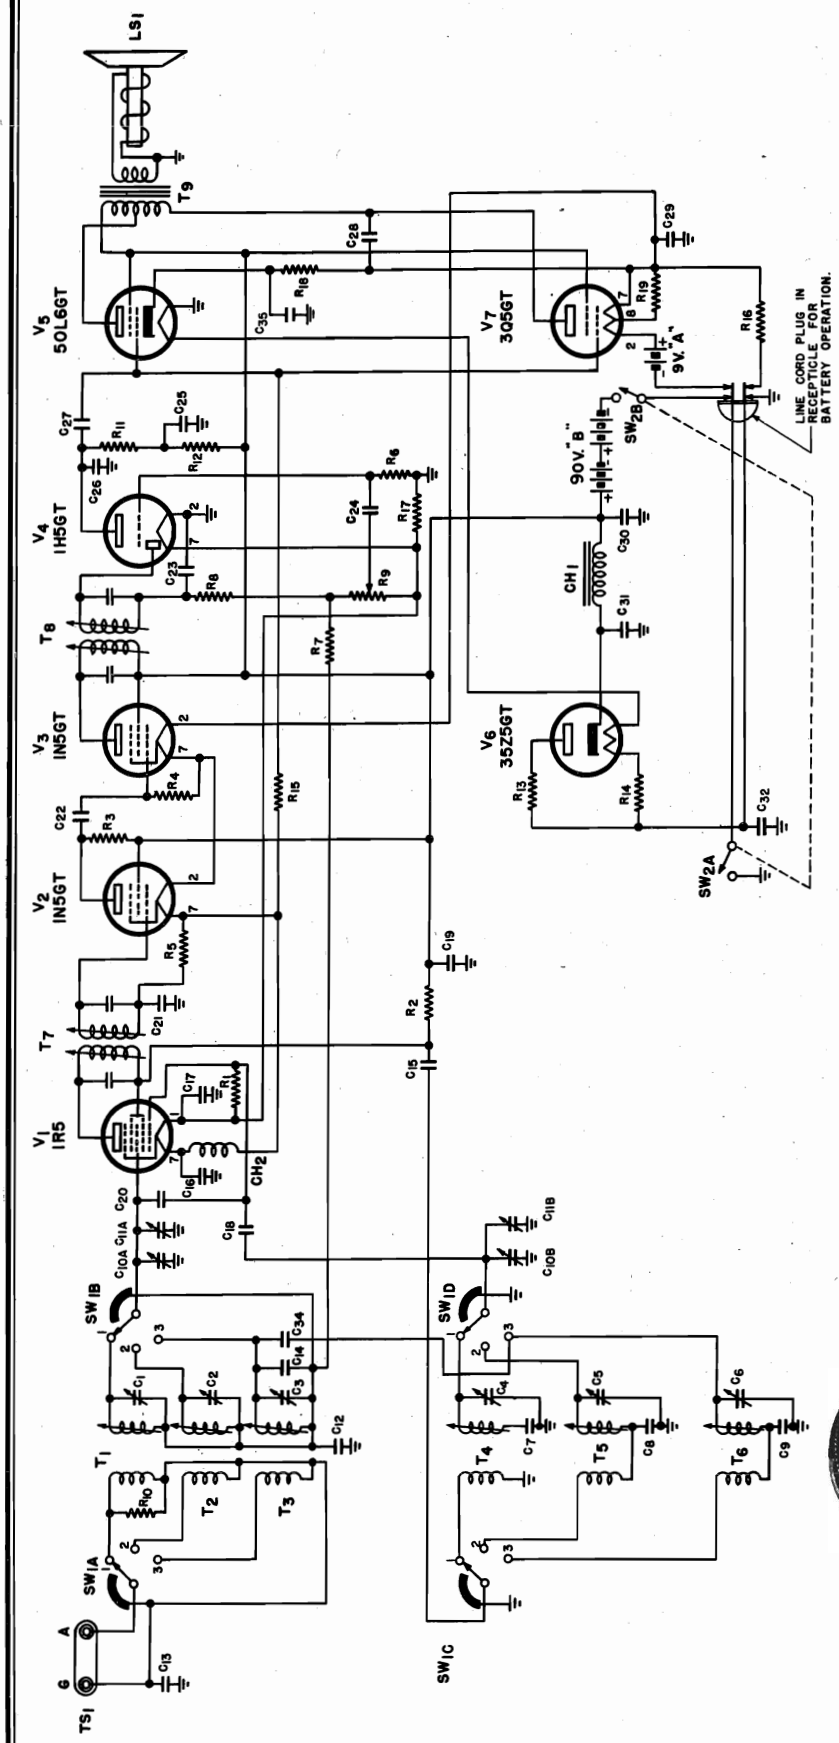
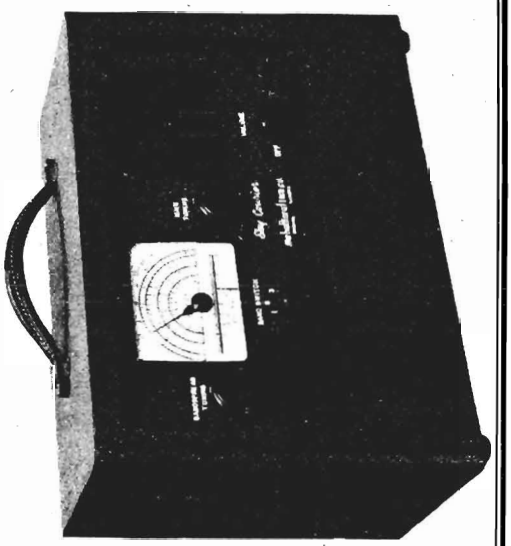
Sky Courier



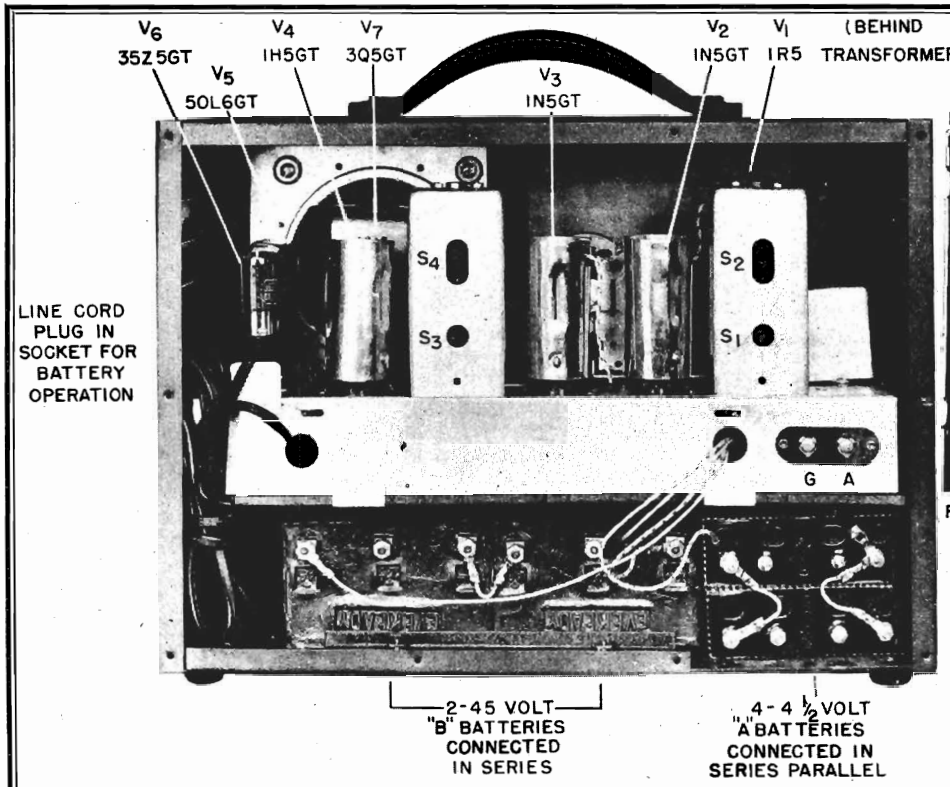


Note: When operating from a 110/125 volt direct current source, it may be necessary to turn the line plug around in the wall socket before the set will operate.

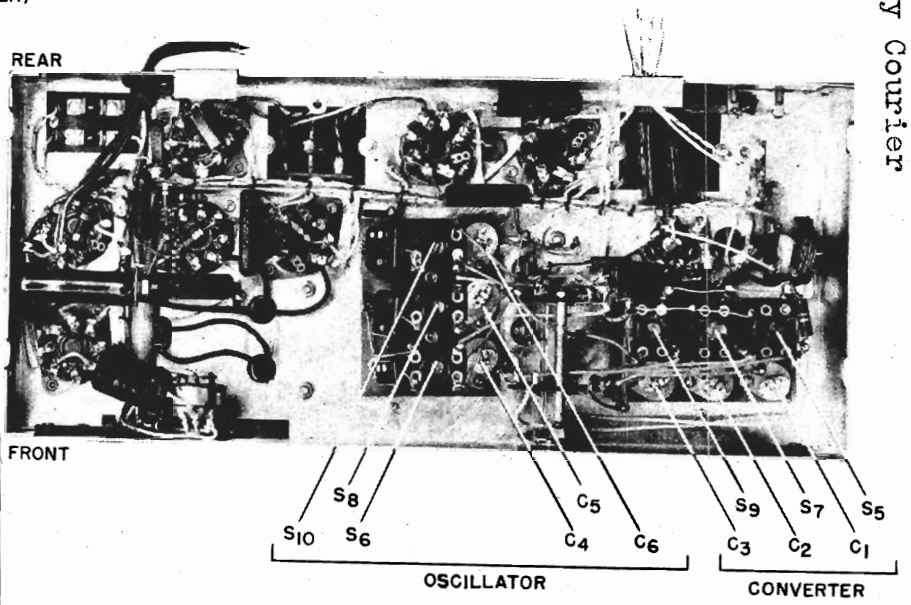
CAUTION: Remove run-down batteries from their compartment to avoid corrosion resulting from the deteriorating cells.

BATTERY -REPLACEMENT

Replace "B" batteries with Burgess #5308 or equivalent.
Replace "A" batteries with four Burgess #2370 Standard Terminal Type or two Burgess G3 Plug Type or equivalent.



REAR VIEW—COVER REMOVED



BOTTOM VIEW OF CHASSIS

ALIGNMENT AND SERVICE

EQUIPMENT REQUIRED -

(1) Signal generator covering 455 KC. to 20 MC. and equipped to provide a 400 cycle modulated signal.

(2) Non-metallic screw driver.

(3) Output meter.

(4) 0.1 mfd. condenser.

(5) 100 mmfd. condenser.

(6) 25 ohm non-inductive resistor.

(7) 400 ohm non-inductive resistor.

THE HALLICRAFTERS CO. MODEL RE-1, Sky Courier

I-F ALIGNMENT -

(1) Connect the "hot" lead of the signal generator to the stator of the front section of the gang condenser through the 0.1 mfd. condenser. Connect the ground lead of the generator to the ground terminal on the antenna terminal strip.

CAUTION - Do not ground the chassis of the receiver directly, make all ground connections to the G terminal of the terminal strip.

(2) Connect the output meter across the speaker terminals.

(3) Turn on the receiver and set the VOLUME control at maximum volume.

(4) Set the BAND SWITCH at BAND 2. and set the MAIN TUNING dial at approx. 7 MC.

(5) Set the signal generator at 455 KC. and turn on the 400 cycle modulation.

(6) Adjust i-f transformer slugs S_1, S_2, S_3 and S_4 for maximum output. Refer to the rear view of the receiver for location of the slug adjustments.

R-F ALIGNMENT -

(1) Connect the "hot" lead of the signal generator to the antenna terminal through the dummy antenna specified in the chart. Leave the ground lead of the generator connected to the ground terminal of the antenna terminal strip.

(2) Leave the output meter connected as for i-f alignment.

(3) Set the VOLUME control for maximum volume.

(4) Set the BAND SWITCH, MAIN TUNING dial, signal generator, trimmer condenser, and slug adjustments as follows:

SET BAND SWITCH	USE DUMMY ANT.	SET RECEIVER & SIGNAL GENERATOR	SET TRIMMER FOR MAX. OUTPUT	SET SLUG FOR MAX. OUTPUT
1	100 mmfd. condenser and 25 ohm resistor	1500 KC.	C_1 and C_4	-
1		600 KC.	-	S_5 and S_6
2		7 MC.	C_2 and C_5	-
2		3 MC.	-	S_7 and S_8
3	400 ohm resistor	18 MC.	C_3 and C_6	-
3		9 MC.	-	S_9 and S_{10}

NOTE: Refer to rear and bottom views of the receiver for location of adjustment screws.

LIST OF REPLACEABLE PARTS.

REF. SYMBOL	NAME OF PART AND DESCRIPTION	FUNCTION	MFG. CODE	CONTR'S. PART NO.
R_1	RESISTOR, 100,000 ohm ± 20%, ½ watt, carbon, insulated, humidity resistant. Same as R_{12}	Oscillator grid return for tube V_1	ASA	RC10AE104M
R_2	RESISTOR, 4,700 ohm ± 10%, ½ watt, carbon, insulated, humidity resistant	Decoupling for tube V_1	ASA	RC10AE472K
R_3	RESISTOR, 22,000 ohm ± 20%, ½ watt, carbon, insulated, humidity resistant	Plate load for tube V_2	ASA	RC10AE223M
R_4	RESISTOR, 470,000 ohm ± 10%, ½ watt, carbon, insulated, humidity resistant. Same as R_{11}, R_{15}	Grid return for tube V_3	ASA	RC10AE474K
R_5	RESISTOR, 2 megohm ± 20%, ½ watt, carbon, insulated, humidity resistant.	Grid return for tube V_2	ASA	RC10AE205M
R_6	RESISTOR, 10 megohm ± 20%, ½ watt, carbon, insulated, humidity resistant.	Grid return for tube V_4	ASA	RC10AE106M
R_7	RESISTOR, 3.3 megohm ± 20%, ½ watt, carbon, insulated, humidity resistant.	A-V-C decoupling	ASA	RC10AE335M
R_8	RESISTOR, 47,000 ohm ± 20%, ½ watt, carbon, insulated, humidity resistant.	Diode load for tube V_4	ASA	RC10AE473M
R_9	RESISTOR, variable, 500,000 ohm ± 20%, bushing 3/8-32 x ½" long, shaft 5/8" long x ¼" dia., includes DPST toggle action switch on rear of control	VOLUME control	CT type 125	25A090
R_{10}	RESISTOR, 10,000 ohm ± 20%, ½ watt, carbon, insulated, humidity resistant	Primary loading for transformer T_1	ASA	RC10AE103M
R_{11}	RESISTOR, same as R_4	Plate load for tube V_4		
R_{12}	RESISTOR, same as R_1	Decoupling for tube V_4		
R_{13}	RESISTOR, two sections, section #1 (R_{13}) 80 ohms ± 5%, 2.5 watts, wire wound; section #2 (R_{14}) 220 ohms ±5%, 6.5 watts, wire wound; 3 solder lug terminals	Surge voltage stabilizing for tube V_6	U type X-1300	24A834
R_{14}		Filament voltage dropping for tubes V_5 and V_6		
R_{15}	RESISTOR, same as R_4	Grid return for tubes V_5 and V_7		
R_{16}	RESISTOR, 680 ohms ± 10%, ½ watt, carbon, insulated, humidity resistant	Filament voltage divider for battery operation	ASA	RC10AE681K
R_{17}	RESISTOR, 270 ohm ± 10%, ½ watt, carbon, insulated, humidity resistant	Shunt for filament of tube V_4	ASA	RC10AE271K
R_{18}	RESISTOR, 47 ohm ± 10%, ½ watt, carbon, insulated, humidity resistant	Cathode bias for tube V_5	ASA	RC21AE470K
R_{19}	RESISTOR, 330 ohm ± 10%, ½ watt, carbon, insulated, humidity resistant	Shunt for filament of tube V_7	ASA	RC10AE331K
C_1	CAPACITOR, adjustable, min. cap. 4 mmfd., max. cap. 20 mmfd., ceramic dielectric, solder lug terminals and mtg.; same as C_2, C_3, C_4, C_5, C_6	Trimmer for transformer T_1	CRL type 820	44A118
C_2	CAPACITOR, same as C_1	Trimmer for transformer T_2		
C_3	CAPACITOR, same as C_1	Trimmer for transformer T_3		
C_4	CAPACITOR, same as C_1	Trimmer for transformer T_4		
C_5	CAPACITOR, same as C_1	Trimmer for transformer T_5		
C_6	CAPACITOR, same as C_1	Trimmer for transformer T_6		
C_7	CAPACITOR, fixed 390 mmfd. ± 5%, 500 V. D-C working, mica dielectric, humidity resistant	Padder transforme T_4	ASA	CM20D391J

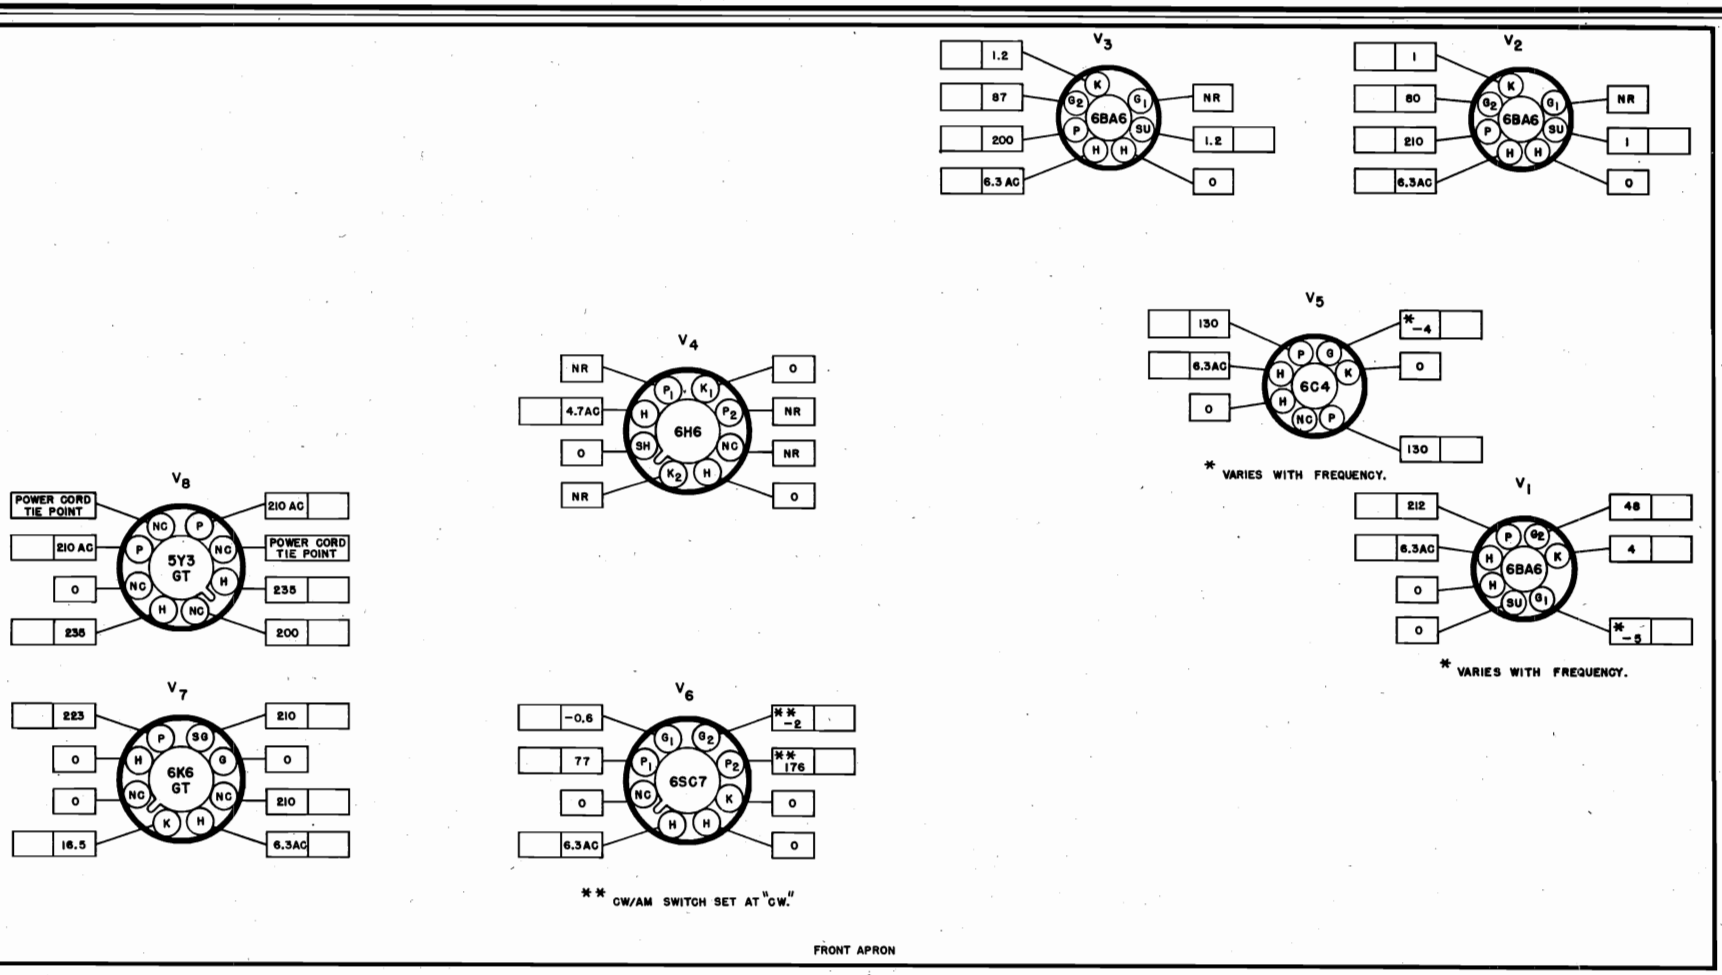
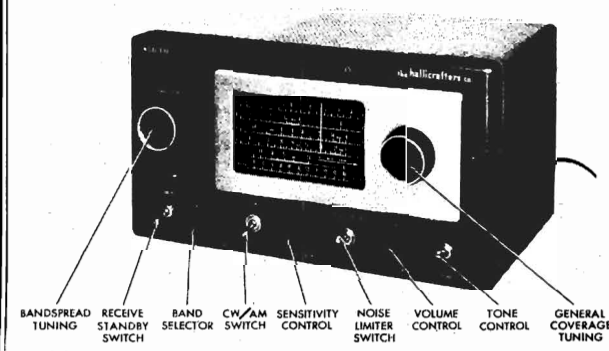
C_{33}	Not used.			
C_{34}	CAPACITOR, same as C_{20}	Coupling between transformers T_3 and T_6 on band #3		
T_1	TRANSFORMER, R-F, 3 unit assembly; unit #1 (T_1) 550-1600 KC., universal windings primary and secondary, Hallowax #2012 impregnation, variable iron core adjustment; unit #2 (T_2) 2.8 - 7.8 MC., universal winding primary, single layer winding secondary, Hallowax #2012 impregnation, variable iron core adjustment; unit #3 (T_3) 7.0 - 19.0 MC., single layer windings primary and secondary, Hallowax #2012 impregnation, variable iron core adjustment; assembly mounted on a xx bakelite board 3" long x 1-3/4" wide x 1/16" thick with 2 mtg. holes 1" apart centered on the board; coils wound on bakelite form 1" long x $\frac{1}{2}$" O.D.	Coupling between antenna and tube V_1 on band #1	GU type 30-5226-2	51C661
T_2		Coupling between antenna and tube V_1 on band #2		
T_3		Coupling between antenna and tube V_1 on band #3		
T_4	TRANSFORMER, R-F, 3 unit assembly; unit #1 (T_4) 550-1600 KC, universal windings primary and secondary, Hallowax #2012 impregnation, variable iron core adjustment unit #2 (T_5) 2.8 - 7.8 MC., single layer windings, Hallowax #2012 impregnation, variable iron core adjustment; unit #3 (T_6) 7.0 - 19.0 MC., single layer interwoven primary and secondary, Hallowax #2012 impregnation, variable iron core adjustment; assembly mounted on a XP bakelite board 3" long x 2-3/8" wide x 1-1/16" thick with 2 mtg. holes 1" apart centered on the board; coils wound on bakelite form 1" long x $\frac{1}{2}$" O.D.	Oscillator inductances for band #1	GU type 30-5225-2	51C660
T_5		Oscillator inductances for band #2		
T_6		Oscillator inductances for band #3		
T_7	TRANSFORMER, I-F, 455 KC., fixed trimmer capacitors, variable iron core tuning, shielded assembly	Coupling between tubes V_1 and V_2	GU type 30-5223-2	50B152
T_8	TRANSFORMER, I-F, 455 KC., fixed trimmer capacitors, variable iron core tuning, shielded assembly	Coupling between tubes V_3 and V_4	GU type 30-5224-2	50B153
T_9	TRANSFORMER, A-F; primary to match a 8000 ohm 3Q5GT tube plate load, tapped to match a 2500 ohm 50L6GT tube plate load; secondary to match 2.3 ohm voice coil; metal case covered with corite wax except on mounting surface; two single hole mtg. feet with 1-3/4" mtg. centers.	Coupling between tube V_5 or V_7 and speaker	F Special	55A064

LIST OF REPLACEABLE PARTS - (Cont'd.)

REF. SYMBOL	NAME OF PART AND DESCRIPTION	FUNCTION	MFG. CODE	CONTR'S. PART NO.
CH_1	CHOKE, filter, 2250 turns of #35 wire wound on a $\frac{1}{2}$" x $\frac{1}{2}$" metal core, rated at 50 milliamperes, entire unit dipped in black corite wax except for mtg. surface; two single hole mtg. feet with 2-1/16" mtg. centers.	Plate voltage inductance for A-C/D-C line operation	F Special	56A082
CH_2	CHOKE, R-F, 37 turns of #22 SCE universal winding, air core, inductance 46 microhenries	R-F filter for filament of tube V_1	GU type 30-5233-2	53B059
SW_{1A}	SWITCH, 2 section, 3 positions, bakelite wafers, mounted by a 3/8-32 bushing $\frac{1}{4}$" long, shaft 7/8" long	Converter stage transformer primary selector	OM Special	60A182
SW_{1B}		Converter stage transformer secondary selector		
SW_{1C}		Oscillator stage transformer primary selector		
SW_{1D}		Oscillator stage transformer secondary selector		
SW_{2A}	SWITCH, DPST, located on the rear or resistor R_9	A-C/D-C line switch		
SW_{2B}		Battery power supply switch		
TS_1	TERMINAL STRIP, two terminals brass solder lugs with 6-32 x 3/8" binding head metal screws, mounted with centers 3/4" apart on a XP brown bakelite strip 2" long x 11/16" wide x 1/16" thick, 2 mtg. holes with centers 1-11/16" apart; marked "A" and "G"	Antenna and ground connections	CN type 1720	88A143
LS_1	SPEAKER; 5 inch semi moisture proof cone; 4.25 ounce field P.M.; 3.8 ohm voice coil; 8" long insulated leads soldered to speaker terminals at one end and a cinch plug (type #2724) at other end; includes a special mtg. plate 4-5/8"x5-1/4" with three 7/16" dia. mtg. holes; mtg. centers 4" x 3-11/16" x 4-1/2"	Loudspeaker	CRI type X-1241	85C024
V_1	TUBE, pentagrid converter, type 1R5	Oscillator and converter	RCA	90J1R5
V_2	TUBE, r-f amplifier pentode, type 1N5GT/G	1st I-F amplifier	RCA	90J1N5GT/G
V_3	TUBE, same as V_2	2nd I-F amplifier		
V_4	TUBE, diode high-mu triode, type 1H5GT/G	Detector and 1st audio amplifier	RCA	90J1H5GT/G
V_5	TUBE, beam power amplifier, type 50L6GT	Audio power amplifier for A-C/D-C operation	RCA	90J50L6GT
V_6	TUBE, half-wave high-vacuum rectifier, type 35Z5GT/G	Rectifier for A-C/D-C operation	RCA	90J35Z5GT/G
V_7	TUBE, beam power amplifier, type 3Q5GT/G	Audio power amplifier for battery operation	RCA	90J3Q5GT/G





NOTES—

1. SOCKET VIEWS ARE BOTTOM VIEWS.
2. ALL VOLTAGES ARE MEASURED BETWEEN TUBE SOCKET TERMINALS AND CHASSIS WITH ZERO SIGNAL INPUT.
3. LINE VOLTAGE ____ 117 V. AC. (60 CYCLES).
4. ALL VOLTAGES SHOWN ARE DC. UNLESS OTHERWISE SPECIFIED.
5. DC VOLTAGES SHOWN WERE MEASURED WITH AN ELECTRONIC VOLTMETER.
6. READINGS TAKEN WITH STANDBY / RECEIVE SWITCH SET AT "RECEIVE"; CW/AM SWITCH SET AT "AM"; NOISE LIMITER SWITCH ON.
7. "NC"—NO CONNECTION. (VOLTAGE SHOWN FOR THIS TERMINAL ONLY WHEN TERMINAL IS USED AS A TIE LUG).
8. "NR"—NOT READABLE. (READING GENERALLY MEANINGLESS).
9. [ ] SPACE PROVIDED FOR SERVICE METER READINGS.

Tube socket voltage chart.

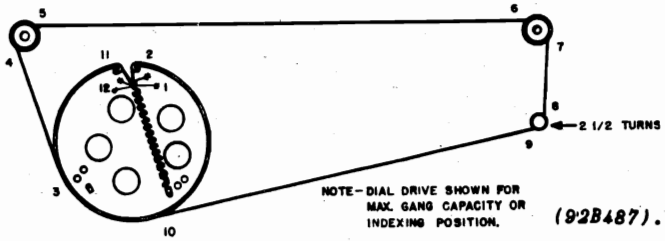
GENERAL

Tubes	Seven plus rectifier
Speaker	5-inch PM
Voice Coil Impedance	3.2 ohms
Headset Output	Low Impedance
Antenna	Provision for external antenna
Tuning	Manual

RESTRINGING DIAL CORD

To restring the general coverage dial cord, cut a 48-inch length of 30 lb. test dial cord and tie one end to the tension spring of the general coverage tuning capacitor drive pulley at position "1" on the diagram. Follow the sequence "1" through "12" and at position "12" stretch the tension spring and tie the cord securely.

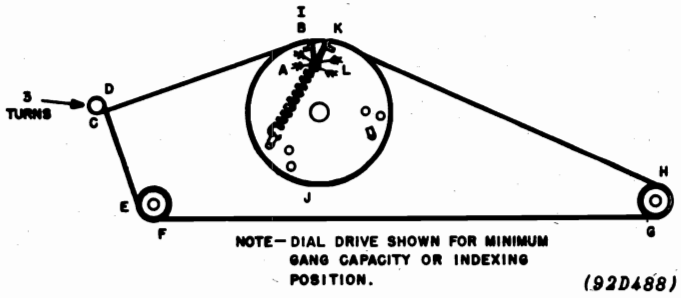
Set the general coverage tuning condenser at maximum capacity and attach and set the pointer in line with the left hand index marker.



Dial cable stringing procedure, general coverage dial.

To restring the band spread dial cord, cut a 36-inch length of 30 lb. test dial cord and follow the procedure as above, starting at position "A" ending at "L".

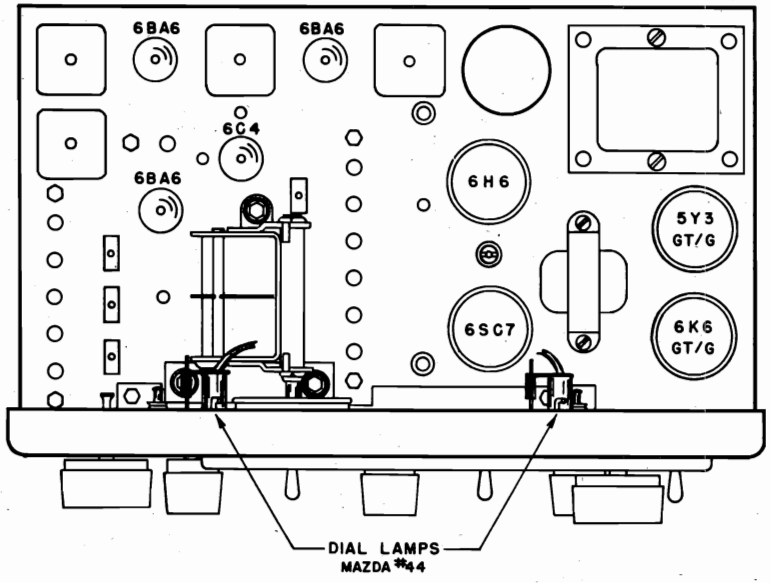
Set the bandspread condenser at minimum capacity and attach and set the pointer at "100" on the logging scale.



Dial cable stringing procedure, band spread dial.

REPLACING LAMPS

Refer to Fig. for the location of the two dial lamps used in the receiver. To gain access to defective lamps, reach in through cabinet cover and unclip the dial lamp sockets. The sockets may then be brought out into the open to change the defective lamp. Replace lamps with 6-8 V. Mazda #44, (Blue bead) lamps or equivalent.



Top view, location of tubes and dial lamps.

ALIGNMENT PROCEDURE

Set the following controls before alignment.

STANBY/RECEIVE	Set at RECEIVE
CW/AM	Set at AM (see step 2)
SENSITIVITY	Set at maximum
NOISE LIMITER	Set at OFF
VOLUME	Set at maximum
TONE switch	Set at HIGH
BANDSPREAD	Set at 100
SPEAKER/PHONES switch	Set at SPEAKER

MODEL S-53 THE HALLICRAFTERS CO.

Remove the receiver chassis from the cabinet to make alignment adjustments. The chassis is held in the cabinet by three screws along both the bottom edge of the front panel and the rear of the cabinet, and two screws on either side of the front panel.

Before starting the alignment procedure, index the general coverage dial pointer on the low frequency end of the range and index the bandspread dial pointer at 100. The general coverage condenser should index at maximum capacity and the bandspread condenser should index at minimum capacity.

ALIGNMENT CHART

Step	Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Band Selector Setting	Receiver Dial Setting	Adjust	Remarks
1	0.1 mfd. capacitor	High side to front stator section of tuning cap. Low side to chassis.	2.075 mc	A	Tuning cap. fully open	S1,S2,S3,S4,S5, S6,S7,S8	Adjust for maximum audio output at speaker voice coil. Use just enough signal generator output to obtain a 50 mw audio level.
2	See step 1.	See step 1.	2.075 mc	A	See step 1.	S9	With the CW/AM switch set at CW, adjust S-9 for zero beat.
3	300 ohm carbon resistor	High side to "A1" on antenna strip. Jumper connected between "A2" and "G"	1500 kc 600 kc	A	1500 kc 600 kc	*A,B *F	Adjust for maximum output as in step 1.
4	See step 3.	See step 3.	6 mc	B	6 mc	*D,E	Adjust for maximum output as in step 1.
5	See step 3.	See step 3.	15 mc	C	15 mc	*F,G	Adjust for maximum output as in step 1.
6	See step 3.	See step 3.	30 mc	D	30 mc	*H,I	Adjust for maximum output as in step 1.
7	See step 3.	See step 3.	52 mc	E	52 mc	*J,K	Adjust for maximum output as in step 1.

*Note - Calibration adjustments.

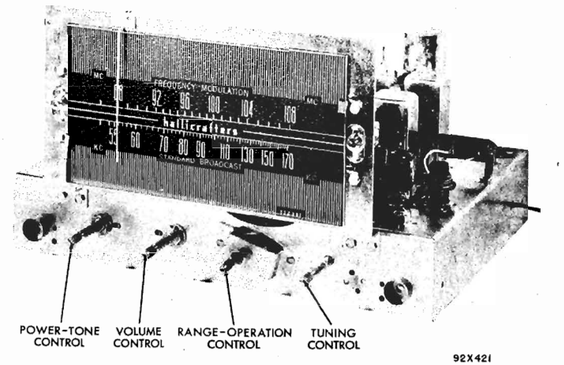
MODELS S-55, S-56 THE HALLICRAFTERS CO.



RESTRINGING DIAL CORD

Restring the dial drive with 30 lb test dial cord. Tie one end to the tension spring and follow the sequence outlined in Fig. 1. Stretch the tension spring and tie the end of the cord securely to the spring as shown.

Set the tuning condenser at maximum capacity (closed), attach the pointer to the string and line it up with the left hand index mark on the dial scale.

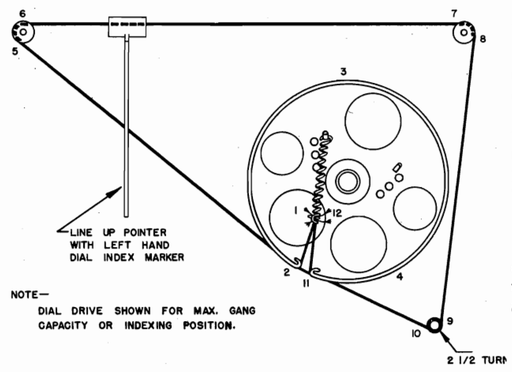


Fig. 1. Dial cable stringing procedure. (92B382.

REPLACING LAMPS

Refer to Fig. 7 for the location of two dial lamps used in the receiver. To gain access to defective lamps, reach in through the cabinet cover and unclip the dial lamp socket by compressing the side springs. The socket may then be brought out into the open to change the defective lamp. Replace all lamps with 6-8 V. Mazda #44 (Blue bead) lamps or equivalent.

ALIGNMENT PROCEDURE

The receiver is equipped with AUTOMATIC FREQUENCY CONTROL on the FM band to compensate for oscillator drift and improve the tuning function on the FM band. The correction factor is approximately 5 times: AFC takes hold 250 kc before the station frequency is reached and releases before tuning 500 kc beyond the station frequency when receiving a 1000 microvolt signal.

The standard RMA dummy specified in the alignment chart consist of a 200 mmf condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.

When making the alignment adjustments set the tone control at NORMAL and the volume control at maximum volume. Use just enough signal generator output to obtain the results indicated on the chart.

THE HALLICRAFTERS CO. MODELS S-55, S-56

ALIGNMENT CHART:

Step	Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Band Switch Pos.	Radio Dial Setting	Adjust	Remarks
1	0.01 mfd. cap.	To high cap. stator of center section.	455 kc	"BC"	1000 kc	A,B,C, D,E	Adjust for max. audio output. Keep audio output below 500 MW to avoid AVC action.
2	0.01 mfd. cap. in series with a 4700 ohm carbon resistor.	To low cap. stator of center section.	10.7 mc	"FM"	90 mc	F,G,H, I,J,K	Adjust for max. voltage as measured between pin #3 of 6H6 and ground with an electronic volt meter. Adjust signal generator output for approx. 2 volts DC at this point.
3	0.01 mfd. cap.	See step 2.	10.7 mc	"FM"	90 mc	L	Adjust for zero voltage as measured between the junction of R27 and R28 and ground with an electronic volt meter.
4	Std RMA dummy	To terminals "A" and "G" on terminal strip TS-2.	1500 kc	"BC"	1500 kc	*M,N,O	Adjust for max. output as in step 1.
5	Two 150 ohm carbon resistors	To terminals "D-D" on terminal strip TS-1.	105 mc	"FM"	105 mc	*P,Q	Adjust for max. voltage as measured across R24 with an electronic volt meter. Adjust signal generator output for approx. 1 volt DC at this point.

*Note - Calibration adjustments.

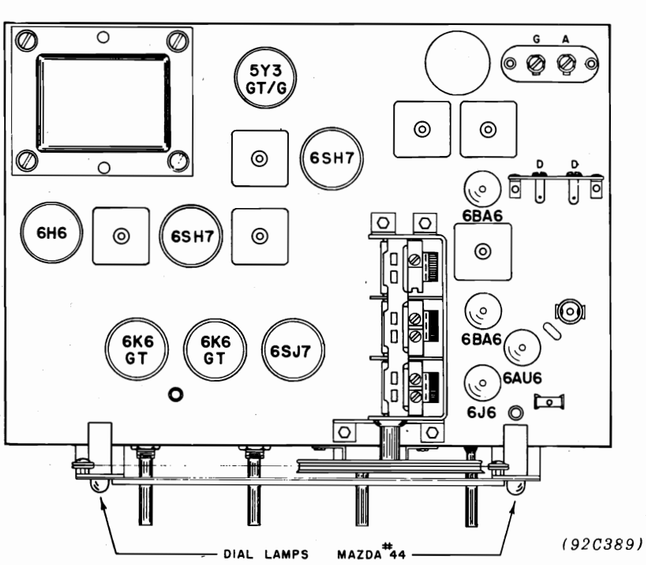

Fig. 7. Top view, location of tubes and dial lamps.

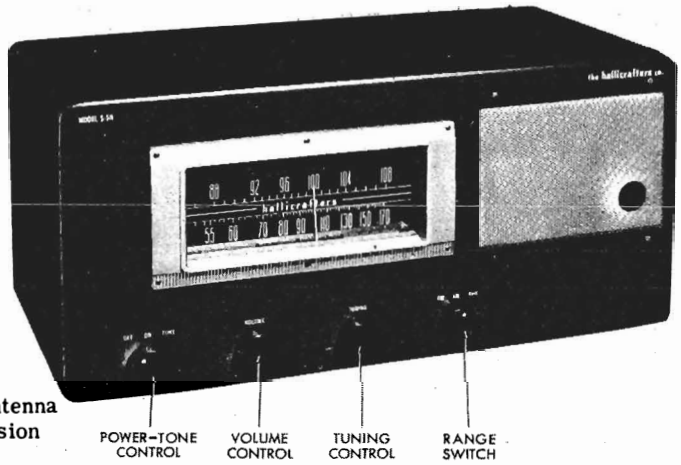
THE HALLICRAFTERS CO. MODEL S-58



GENERAL

Tubes	Six plus rectifier
Speaker	5-inch PM
Voice Coil Impedance	3.2 ohms
Antenna	Provisions for external antenna with 300-ohm transmission line
Phono Input	High Impedance
Tuning	Manual
Frequency Range	Broadcast 540 kc - 1600 kc Frequency Modulation 88 mc - 108 mc
Intermediate Frequency	455 kc/10.7 mc
Power Supply	105-125 V., DC or 60 cycles AC
Power Consumption	28 Watts

ALIGNMENT PROCEDURE

Generator connection	See chart
Generator ground	See chart
Output meter connection	Across voice call
Electronic voltmeter connection	See chart
Volumn control position	Maximum
Tone control position	Optional

The standard RMA dummy specified in the alignment chart consist of a 200 mmf condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.

REPLACING LAMPS

Refer to Fig. 4. for the location of the dial lamps used in receiver. To gain access to the defective lamp, reach in through the cabinet cover and unclip the dial lamp socket by compressing the side springs. The socket may then be brought out into the open to change the defective lamp. Replace defective lamps with 6-8 V. Mazda #47 (Brown bead) lamps or equivalent.

RESTRINGING DIAL CORD

To restring the dial cable, the chassis must be removed from the cabinet. Pull the four control knobs from their shafts, remove the three chassis screws at the bottom of the cabinet and lift the chassis from the cabinet through the top cover. Restringing the dial drive with a 48-inch length of 20 lb. test dial cord following the stringing sequence shown in Fig. 1. With the tuning condenser set at maximum capacity (closed) attach the dial pointer to the drive string and line it up with the left hand index mark on the dial scale.

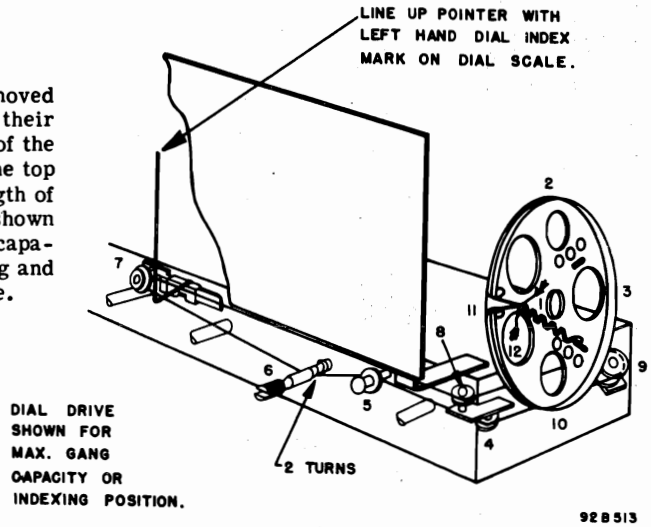


Fig. 1. Dial cable stringing procedure (92B513)

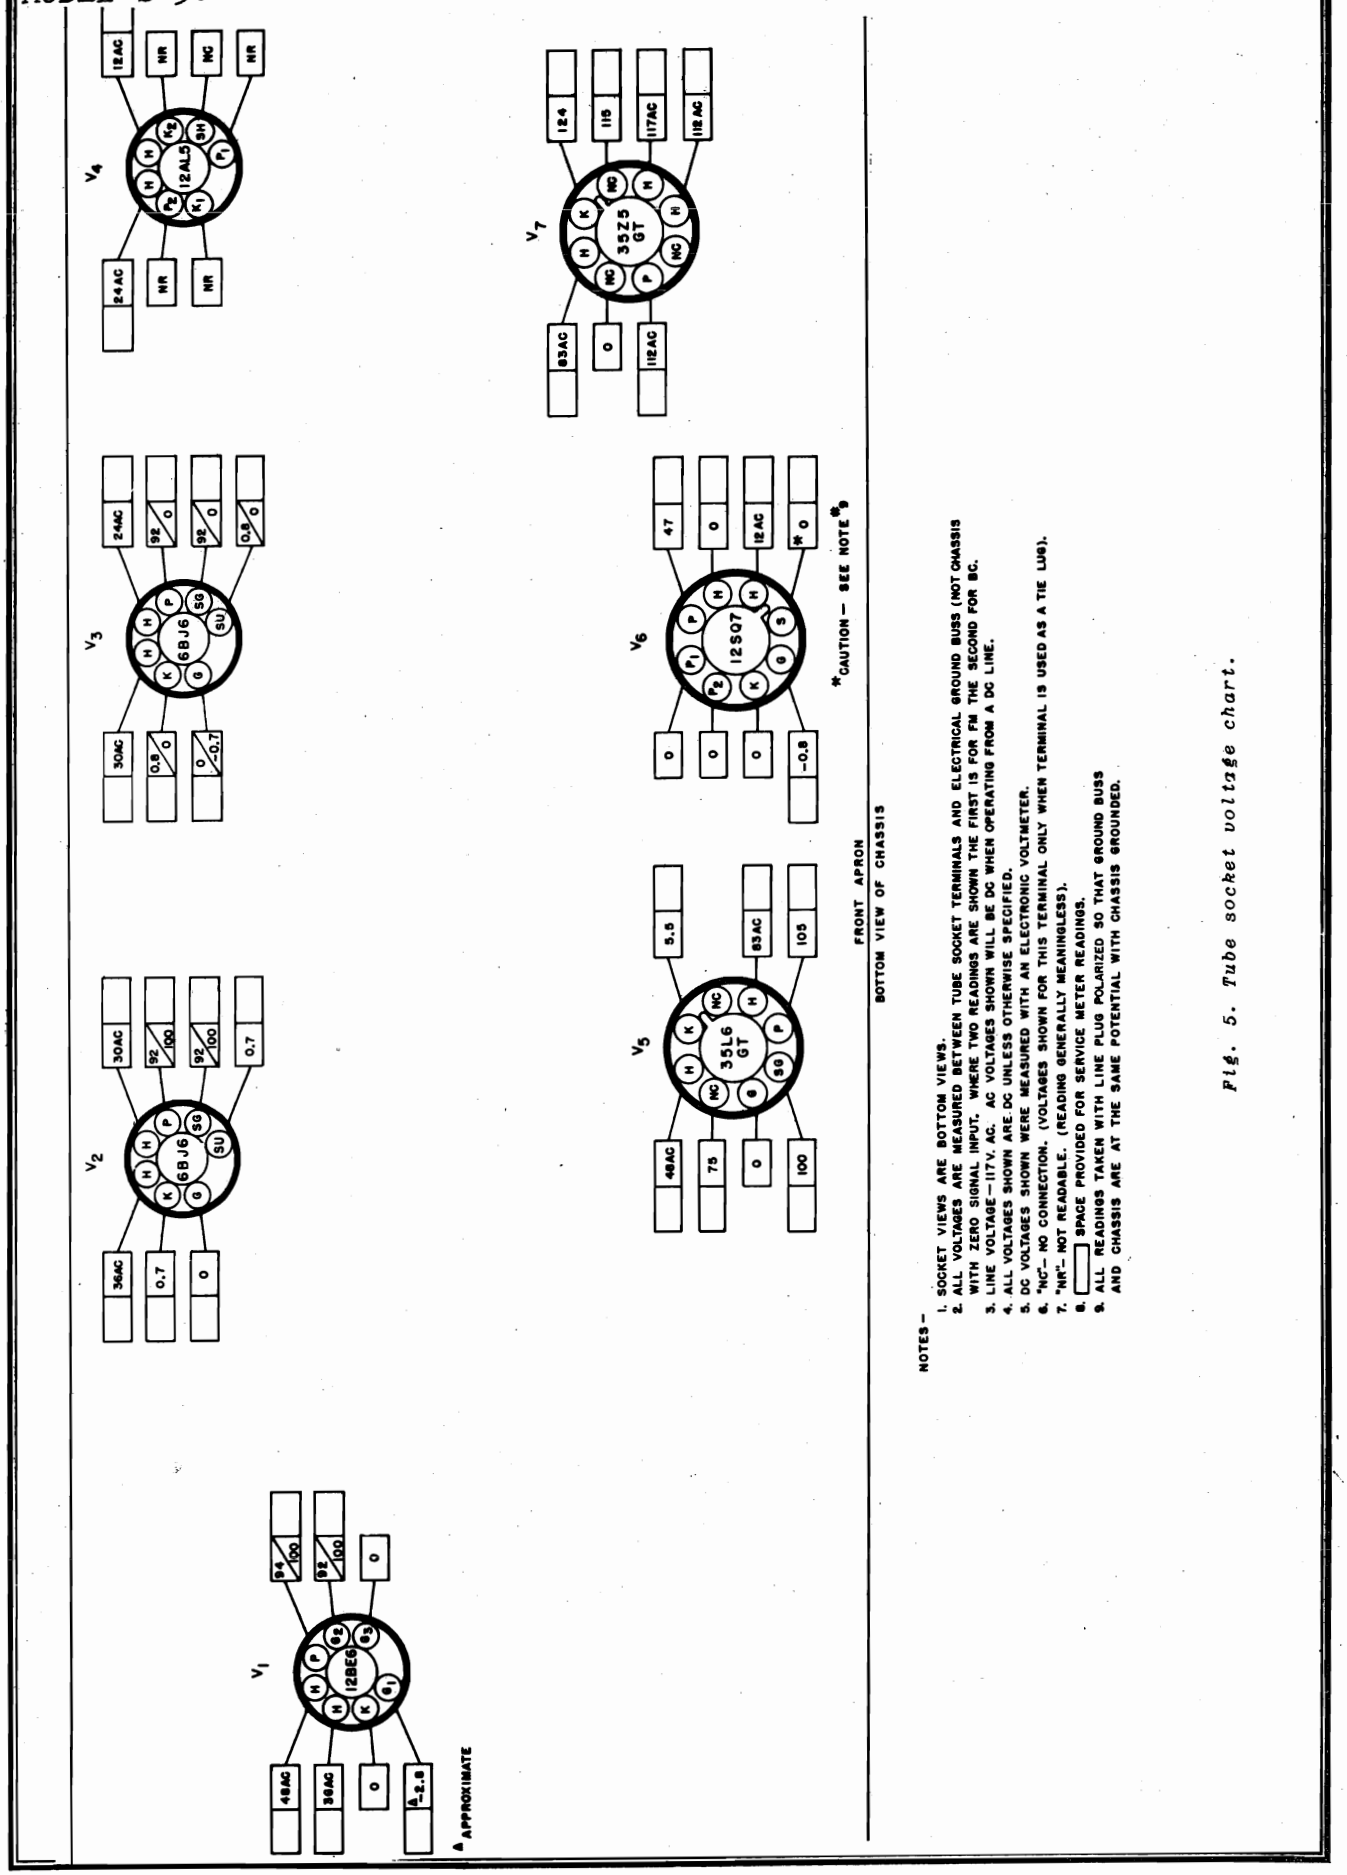
MODEL S-58

THE HALLICRAFTERS CO.



NOTES—

1. SOCKET VIEWS ARE BOTTOM VIEWS.
2. ALL VOLTAGES ARE MEASURED BETWEEN TUBE SOCKET TERMINALS AND ELECTRICAL GROUND BUSS (NOT CHASSIS WITH ZERO SIGNAL INPUT. WHERE TWO READINGS ARE SHOWN THE FIRST IS FOR FM THE SECOND FOR BC.
3. LINE VOLTAGE—117 V. AC. AC VOLTAGES SHOWN WILL BE DC WHEN OPERATING FROM A DC LINE.
4. ALL VOLTAGES SHOWN ARE DC UNLESS OTHERWISE SPECIFIED.
5. DC VOLTAGES SHOWN WERE MEASURED WITH AN ELECTRONIC VOLTMETER.
6. "NC"— NO CONNECTION. (VOLTAGES SHOWN FOR THIS TERMINAL ONLY WHEN TERMINAL IS USED AS A TIE LUG).
7. "NR"— NOT READABLE. (READING GENERALLY MEANINGLESS).
8. [ ] SPACE PROVIDED FOR SERVICE METER READINGS.
9. ALL READINGS TAKEN WITH LINE PLUG POLARIZED SO THAT GROUND BUSS AND CHASSIS ARE AT THE SAME POTENTIAL WITH CHASSIS GROUNDED.

Fig. 5. Tube socket voltage chart.

THE HALLICRAFTERS CO. MODEL S-58

ALIGNMENT CHART

	Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Radio Range Switch Position	Radio Dial Setting	Adjust	Remarks
1.	.01 mfd. cap.	High side to stator plates of high cap. mixer section. Generator ground to chassis.	455 kc	AM	1000 kc	A,B,C,D	Adjust for max. audio output at voice coil. Keep audio output below 50 mw to avoid AVC action.
2.	.01 mfd. cap.	High side to stator plates of low cap. mixer section. Generator ground to chassis.	10.7 mc (No modulation)	FM	100 mc	E,F,G,H	Adjust for max. DC voltage between pin #7 of the 12 AL5 and ground buss. Connect a 500,000 ohm resistor in series with voltmeter probe. Use just enough signal generator output ot obtain approx. 2 volts at the electronic voltmeter.
3.	After completing the adjustments required by step 2. detune the signal generator on each side of 10.7 mc and note the generator dial or frequency reading for one half of the DC voltage measured by the electronic voltmeter. Use just enough signal generator output to obtain a maximum of 2 volts at the center frequency of the IF channel. Set the signal generator frequency at the midpoint of the two readings obtained above and align the FM detector transformer as follows:						
4.	Without changing the setup, adjust the primary of the FM detector transformer (I) for maximum DC voltage. Disconnect the electronic voltmeter probe and reconnect it at the junction of R-13 and 14 using the 500,000-ohm resistor as before for isolation. Adjust the secondary of the FM detector (J) for the null or zero DC voltage. This completes the IF amplifier adjustment.						
5.	Std. RMA dummy	To terminals "D-D" on rear chassis apron. Connect RMA dummy to unbypassed terminal.	1500 kc	AM	1500 kc	*K,L	Adjust for max. audio output as in step 1.
			600 kc	AM	600 kc	*M	
6.	300-ohm carbon resistor	To terminals "D-D" on rear chassis apron. Connect resistor to high side or unbypassed terminal.	108 mc	FM	108 mc	*N,O	Adjust for max. DC voltage as in step 2.

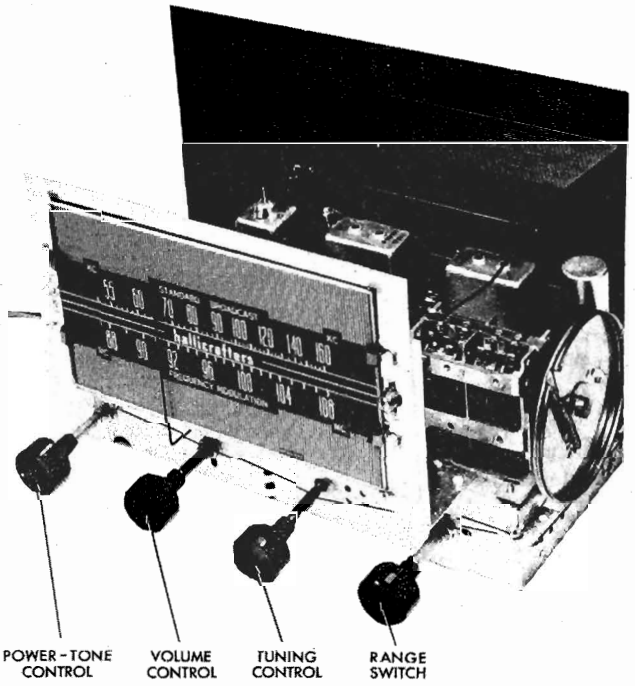
THE HALLICRAFTERS CO. MODEL S-59

GENERAL

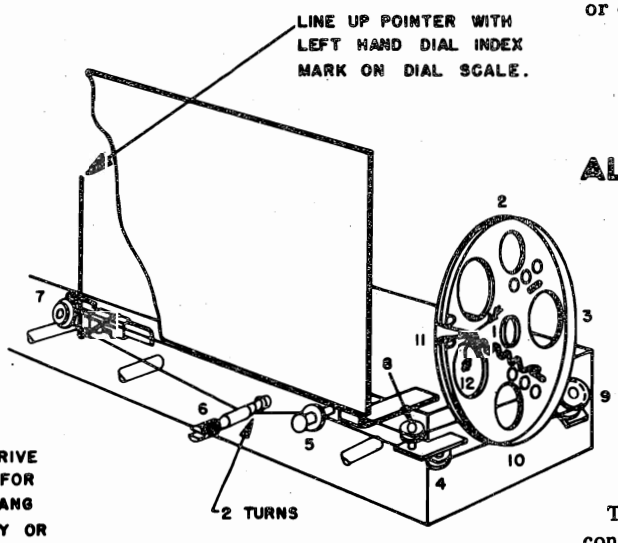
Tubes	Seven plus rectifier
Output Impedance	500 ohms
Antenna	Built-in loop type antenna. Provisions for external antenna
Phono Input	High impedance
Tuning	Manual
Frequency Range	Broadcast 540 kc - 1600 kc Frequency Modulation 88 mc - 108 mc
Intermediate Frequency	455 kc/10.7 mc
Power Supply	105 - 125 V. 60 cycles AC
Power Consumption	60 watts



RESTRINGING DIAL CORD

Restring the dial drive with a 48-inch length of 20 lb. test dial cord. Tie one end to the tension spring and follow the stringing sequence outlined in Fig. 1. Stretch the tension spring and tie the end of the cord securely to the spring as shown.

Set the tuning condenser at maximum capacity (closed), attach the dial pointer to the drive string and line it up with the left hand index mark on the dial scale.



REPLACING LAMPS

Refer to Fig. 4 for the location of the two dial lamps used in the receiver. To gain access to defective lamps, unclip the dial lamp socket by compressing the side springs. Replace defective lamps with 6-8 V. Mazda #44 (Blue bead) lamps or equivalent.

ALIGNMENT

Generator connection	See chart
Generator ground	To chassis
Output meter connection	Across voice coil
Electronic voltmeter connection	See chart
Volume control position	Maximum
Tone control position	Optional

The standard RMA dummy specified in the alignment chart consists of a 200 mmf condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.

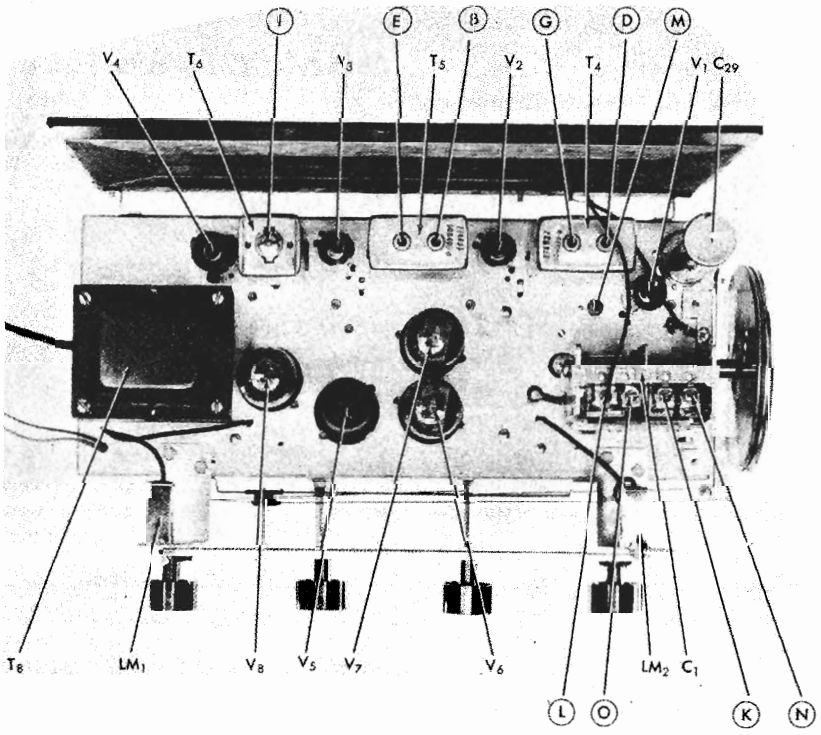
MODEL S-59

THE HALLICRAFTERS CO.

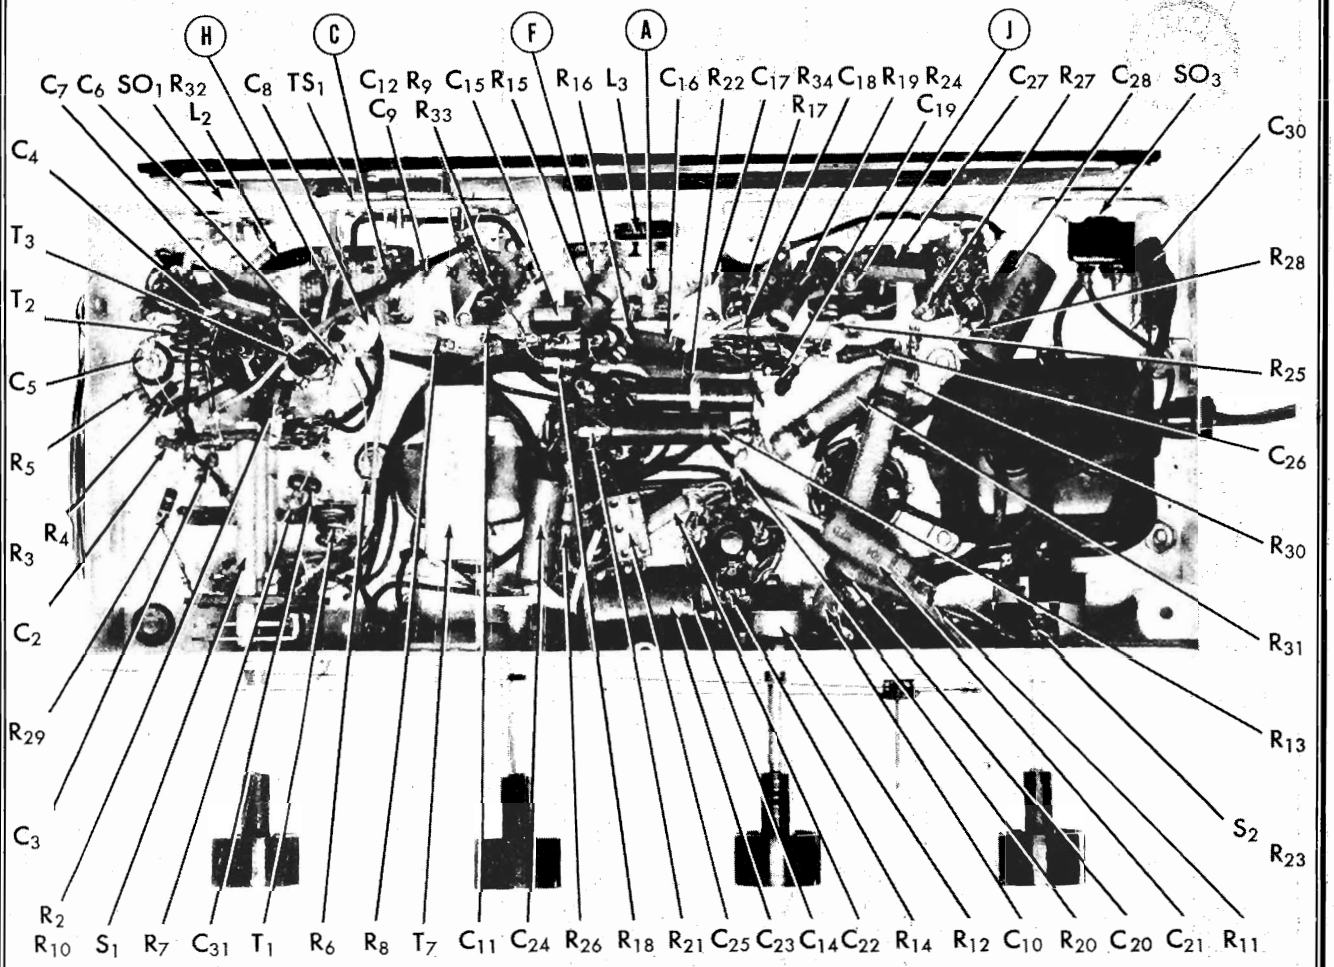
ALIGNMENT CHART

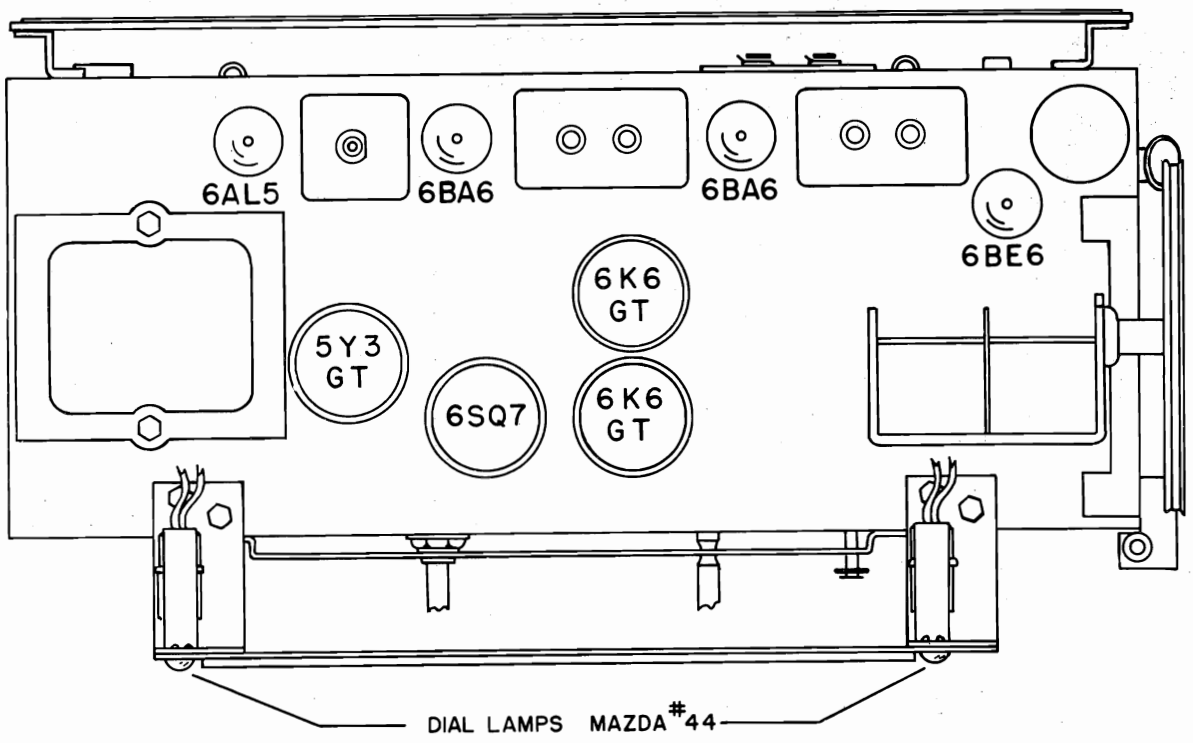
	Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Radio Range Switch Position	Radio Dial Setting	Adjust	Remarks
1.	.01 mfd. cap.	To stator plates of high cap. mixer section	455 kc	2	1000 kc	A,B,C,D	Adjust for max. audio output at voice coil. Keep audio output below 50 mw to avoid AVC action.
2.	.01 mfd. cap.	To stator plates of low cap. mixer section	10.7 mc (No modulation)	1	100 mc	E,F,G,H	Adjust for max. DC voltage between pin #7 of the 6AL5 and chassis. Connect a 500,000 ohm resistor in series with voltmeter probe. Use just enough signal generator output to obtain approx. 2 volts at the electronic voltmeter.
3.	After completing the adjustments required by step 2. detune the signal generator on each side of 10.7 mc and note the generator dial or frequency reading for one half of the DC voltage measured by the electronic voltmeter. Use just enough signal generator output to obtain a maximum of 2 volts at the center frequency of the IF channel. Set the signal generator frequency at the midpoint of the two readings obtained above and align the FM detector transformer as follows:						
4.	Without changing the setup, adjust the primary of the FM detector transformer (I) for maximum DC voltage. Disconnect the electronic voltmeter probe and reconnect it to the junction of R24 and R25 using the 500,000-ohm resistor as before for isolation. Adjust the secondary of the FM detector (J) for the null or zero DC voltage. This completes the IF amplifier adjustment.						
5.	Std. RMA dummy	To BC antenna terminal on back of loop.	1500 kc	2	1500 kc	*K,L	Adjust for max. audio output as in step 1.
			600 kc	2	600 kc	*M	
6.	300-ohm carbon resistor	To terminals "D-D" on rear chassis apron. Connect resistor to high side or ungrounded terminal	108 mc	1	108 mc	*N,O	Adjust for max. DC voltage as in step 2.

*Calibration adjustment.



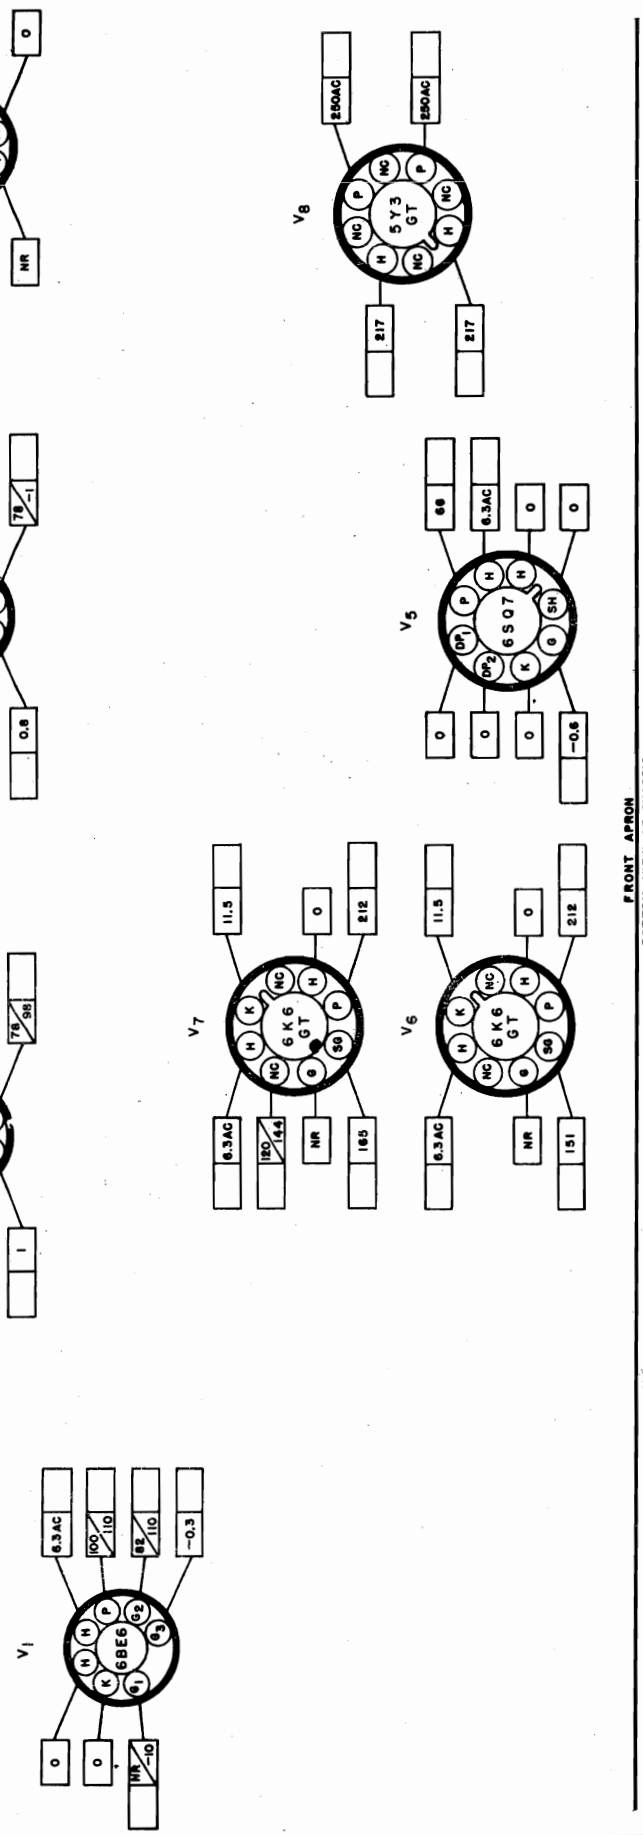
THE HALLICRAFTERS CO. MODEL S-59





MODEL S-59

THE HALLICRAFTERS CO.



NOTES—

1. SOCKET VIEWS ARE BOTTOM VIEWS.
2. ALL VOLTAGES MEASURED BETWEEN TUBE SOCKET TERMINALS AND CHASSIS.
3. LINE VOLTAGE — 117 V. AC.
4. ALL VOLTAGES SHOWN WERE MEASURED WITH AN ELECTRONIC VOLTMETER AND AT ZERO SIGNAL.
5. ALL VOLTAGES ARE DC UNLESS OTHERWISE SPECIFIED.
6. FM/AM WHERE TUBE SOCKET VOLTAGES CHANGE FROM FM TO AM RECEPTION TWO READINGS ARE SHOWN, UPPER LEFT SHOWS FM READINGS — LOWER RIGHT SHOWS AM READINGS.
7. "NC" — NO CONNECTION. READING SHOWN ONLY WHEN TERMINAL IS USED AS A TIE LUG.
8. "NR" — NOT READABLE OR READING GENERALLY MEANINGLESS.
9. ☐ THE BLANK SPACES ARE PROVIDED FOR THE SERVICE METER READING. FILL IN THE ACTUAL READING AS TAKEN WITH YOUR OWN TEST EQUIPMENT USING A NORMAL OPERATING RADIO FOR THESE MEASUREMENTS.
10. TUBES V-1, 2 AND 3 ARE DISABLED DURING PHONO OPERATION.

THE HALLICRAFTERS CO.

REPLACING DIAL AND PILOT LAMPS

Refer to Fig. 11 for location of the two dial lamps used in the receiver. To gain access to them, remove the dial escutcheon. The pilot lamp at the base of the cabinet is removed by slipping the socket assembly straight back a short distance releasing it from its mounting tongue. The defective lamp may now be brought out in the open for replacement. Replace all lamps with 6-8 volt Mazda #44 or equivalent.

ALIGNMENT PROCEDURE

Removal of the receiver chassis from the cabinet requires the use of other calibration means than the dial glass. Calibration strips mounted on the pointer rails are provided for alignment purposes.

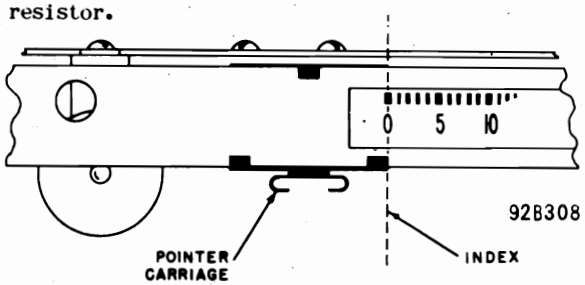
To use these calibration strips, it is necessary to remove the dial plate (brown metal cover) in the following manner.

1. Remove dial pointers - Pull them straight out of their spring clips.
2. Remove the two dial lamp sockets.
3. Remove dial plate fastened to the chassis with seven sheet metal screws.

With the variable condensers fully mashed, the right hand side of the pointer carriage will be indexed to zero on the calibration strips. Refer to Fig. 4.

The receiver is equipped with AUTOMATIC FREQUENCY CONTROL on the FM band to compensate for mechanical variations in the push-button mechanism. The correction factor is approximately 5 times: AFC takes hold 100 kc before the station frequency is reached and released before tuning 450kc passed the station frequency when receiving a 0.1 volt signal.

The standard RMA dummy specified in the alignment chart consists of a 200 mmf condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.



Calibration strip detail.

ALIGNMENT CHART

Step	Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Band Switch Pos.	Radio Dial Setting	Cal. No.	Adjust	Remarks
1	0.01 mfd cap.	To stator plates of center section of AM tuning cap.	455 kc	"BC"	1000 kc	55	S1,S2,S3, S4, & S5	Adjust for max. output.
2	0.01 mfd cap.	To stator plates of center section of FM tuning cap	10.7 mc (No modulation)	"FM"	Mid-scale	55	S6,S7,S8 S9,S10, & S11	Adjust for max. AVC voltage as measured between pin #7 of 6AL5 and ground with a 20,000-ohm per volt meter.
3	0.01 mfd cap.	To stator plates of center section of FM tuning cap.	10.7 mc (No modulation)	"FM"	Mid-scale	55	S12	Adjust for zero voltage as measured between the junction of C55 and C68 ground with a 20,000-ohm per volt meter.
4	Std. RMA dummy.	To terminals "A" and "G" on ant. term. strip	1500 kc	"BC"	1500 kc	82	A*, B, & C	Adjust for max. output
			600 kc	"BC"	600 kc	15.5	D* & S13	
5	Std. RMA	To terminals "A" and "G" on ant. term. strip.	16 mc	"SW"	16 mc	84	E* & F	Adjust for max. output.
6	Two 150 ohm carbon resistors	To "D" terminals on ant. term. stup;	108 mc	"FM"	108 mc	83.5	G*, H & I	Adjust for max. limiter grid voltage as measured between the junction of R33 and R34 and ground with a 20,000-ohm per volt meter

* NOTE - Calibration adjustments.

Bottom view showing alignment points.

GENERAL

Tubes.....Eleven plus rectifier

Speaker.....12-inch PM

Voice Coil Impedance...3.2 ohms

Antenna.....Built-in loop, "AM" Built-in dipole, "FM" and shortwave. Provisions for external antennas.

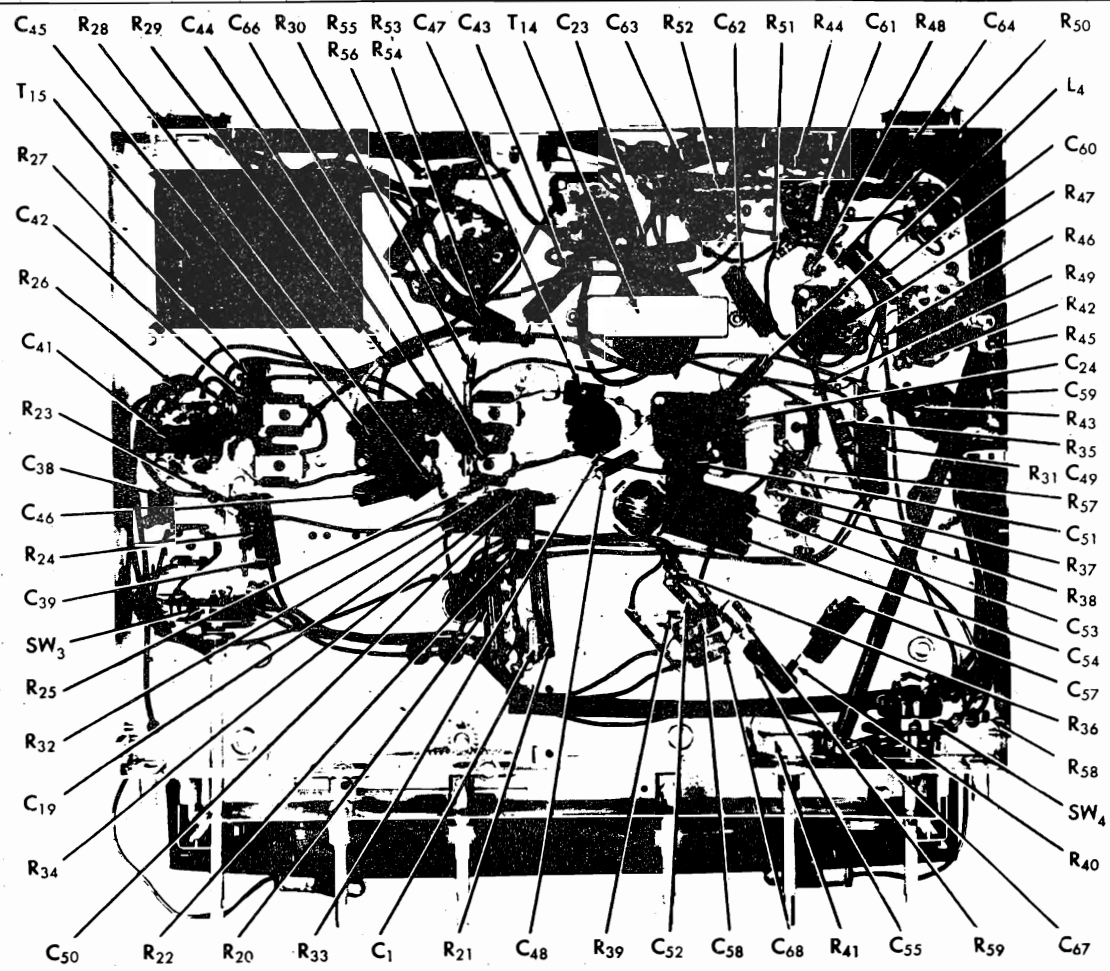
Tuning.....Manual and mechanical push-buttons; five P.B. for "AM", five P.B. for "FM".

Tuning Range.....Band -
BC 550 kc - 1700 kc.
SW 5.8 mc - 18 mc.
FM 88 mc - 108 mc.

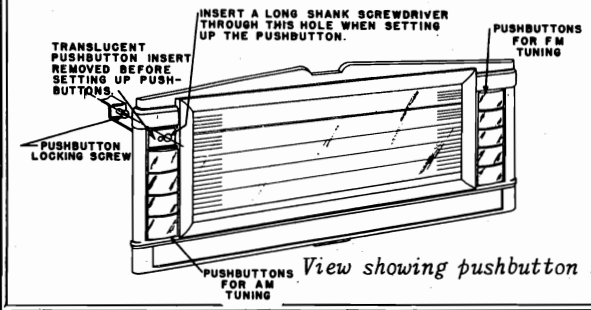
Intermediate Frequency.455 kc/10.7 mc.

Power Supply.....105-125 V. 60 cycles AC.

Power Consumption.....120 Watts (140 watts with changer).



Bottom view of receiver showing component location.



View showing pushbutton setup.

BUTTON SETTING

Insulate the muting switch contacts before setting the left hand group of AM push buttons.

1. Select any one pushbutton.
2. Pull translucent insert straight out.
3. Insert screw driver blade through large hole of pushbutton into slot of locking screw
4. Loosen locking screw about one-half turn (Not more than one full turn.)
5. With pushbutton depressed, carefully tune in desired station with the manual control and tighten the locking screw.
6. Replace the translucent insert with the proper station call letters inserted.

INSERTING CALL LETTERS

1. Slide out metal insert from translucent insert assembly. (See Fig. 2.)
2. Insert desired call letter tab.
3. Replace metal insert behind call letter tab.
4. Replace translucent insert assembly into pushbutton mechanism.

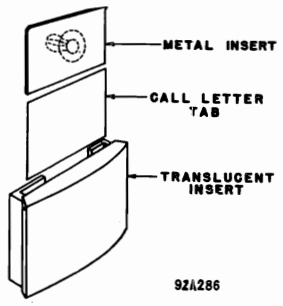


Fig. 2. View showing call letter installation.

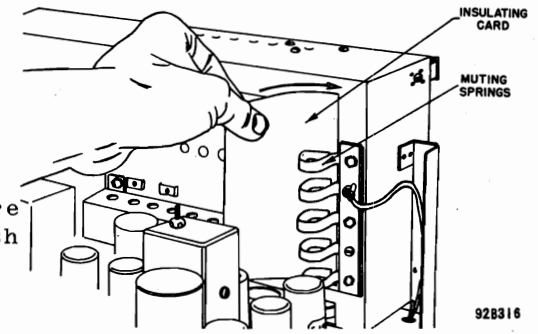

Insulating the muting switch contacts.

MODEL 414 THE HALLICRAFTERS CO.

GENERAL

Tubes	Ten plus rectifier
Speaker	12 inch PM
Voice Coil Impedance	6 ohms
Antenna	Built in loop, "BC" Built in dipole, "FM" Provisions for external antennas
Tuning	Manual
Tuning Range	Broadcast 540 kc - 1750 kc Frequency Modulation 88 mc - 108 mc
Intermediate Frequency	455 kc/21.75 mc.
Power Supply	105-125 V. 50/60 cycles AC
Power Consumption	90 Watts (110 watts with changer)

RESTRINGING DIAL CORD

Restring the dial drive with 30 lb test dial cord. Tie one end to the tension spring and follow the sequence outlined in Fig. 1. Stretch the tension spring and tie the end of the cord securely to the spring as shown.

Set the tuning condenser at maximum capacity (closed), attach the pointer to the string and line it up with the left hand index mark on the dial scale.

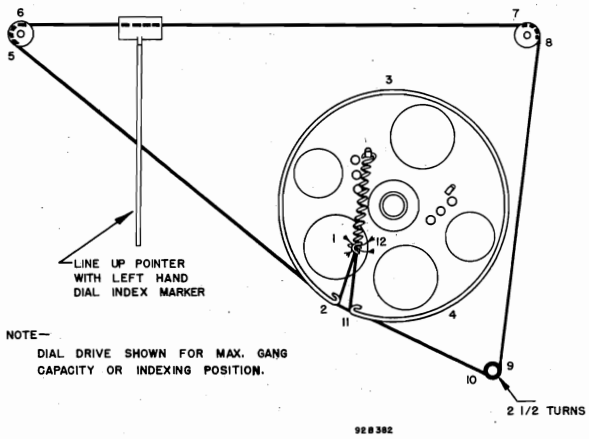

Fig. 1. Dial cable stringing procedure.

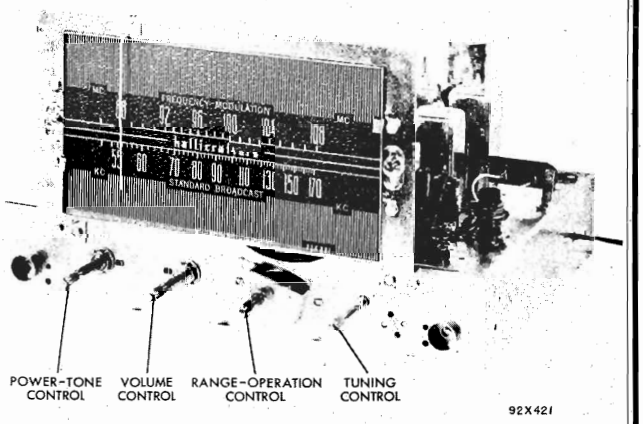
ALIGNMENT PROCEDURE

The receiver is equipped with AUTOMATIC FREQUENCY CONTROL on the FM band to compensate for oscillator drift and improve the tuning function on the FM band. The correction factor is approximately 5 times: AFC takes hold 250 kc before the station frequency is reached and releases before tuning 500 kc beyond the station frequency when receiving a 1000 microvolt signal.

The standard RMA dummy specified in the alignment chart consist of a 200 mmf condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.

When making the alignment adjustments set the tone control at NORMAL and the volume control at maximum volume. Use just enough signal generator output to obtain the results indicated on the chart.



REPLACING LAMPS

Refer to Fig. 7 for the location of two dial lamps used in the receiver. To gain access to defective lamps, reach in through the rear of the cabinet and unclip the dial lamp socket by compressing the side springs. The socket may then be brought out into the open to change the defective lamp. The lamp in the record changer compartment may be reached directly through the compartment door. Replace all lamps with 6-8 V. Mazda #44 (Blue bead) lamps or equivalent.

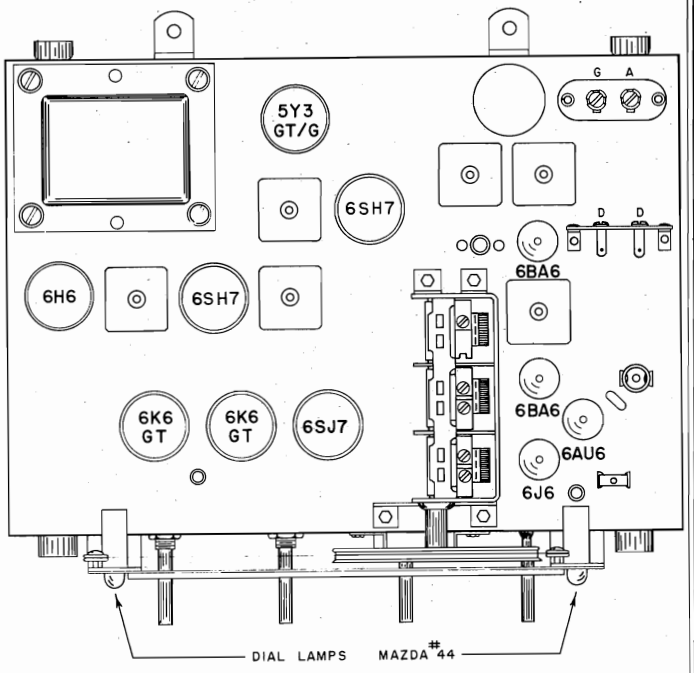


Fig. 7. Top view, location of tubes and dial lamps.

THE HALLICRAFTERS CO. MODEL 414

ALIGNMENT CHART

Step	Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Band Switch Pos.	Radio Dial Setting	Adjust	Remarks
1	0.01 mfd. cap.	To high cap. stator of center section.	455 kc	"BC"	1000 kc	A,B,C, D,E	Adjust for max. output.
2	0.01 mfd. cap. in series with a 4700 ohm carbon resistor.	To low cap. stator of center section.	21.75 mc	"FM"	90 mc	F,G,H, I,J,K	Adjust for max. voltage as measured between pin #3 of 6H6 and ground with an electronic volt meter.
3	0.01 mfd. cap.	See step 2.	21.75 mc	"FM"	90 mc	L	Adjust for zero voltage as measured between the junction of R27 and R28 and ground with an electronic volt meter.
4	Std RMA dummy	To terminals "A" and "G" on terminal strip TS-2.	1500 kc	"BC"	1500 kc	*M,N,O	Adjust for max. output
5	Two 150 ohm carbon resistors	To terminals "D-D" on terminal strip TS-1.	105 mc	"FM"	105 mc	*P,Q	Adjust for max. voltage as measured across R24 with an electronic volt meter.

*Note - Calibration adjustments.

**Note - The intermediate frequency for the FM channel in this receiver is 21.75 megacycles. This is a value which has been standardized by the Radio Manufacturers Association for the television sound channel. A "TLV" position on the band switch and a suitable connector (on the chassis, near the tuning condenser) have been provided so that this receiver can be used with a relatively inexpensive video unit for high-quality television reception.

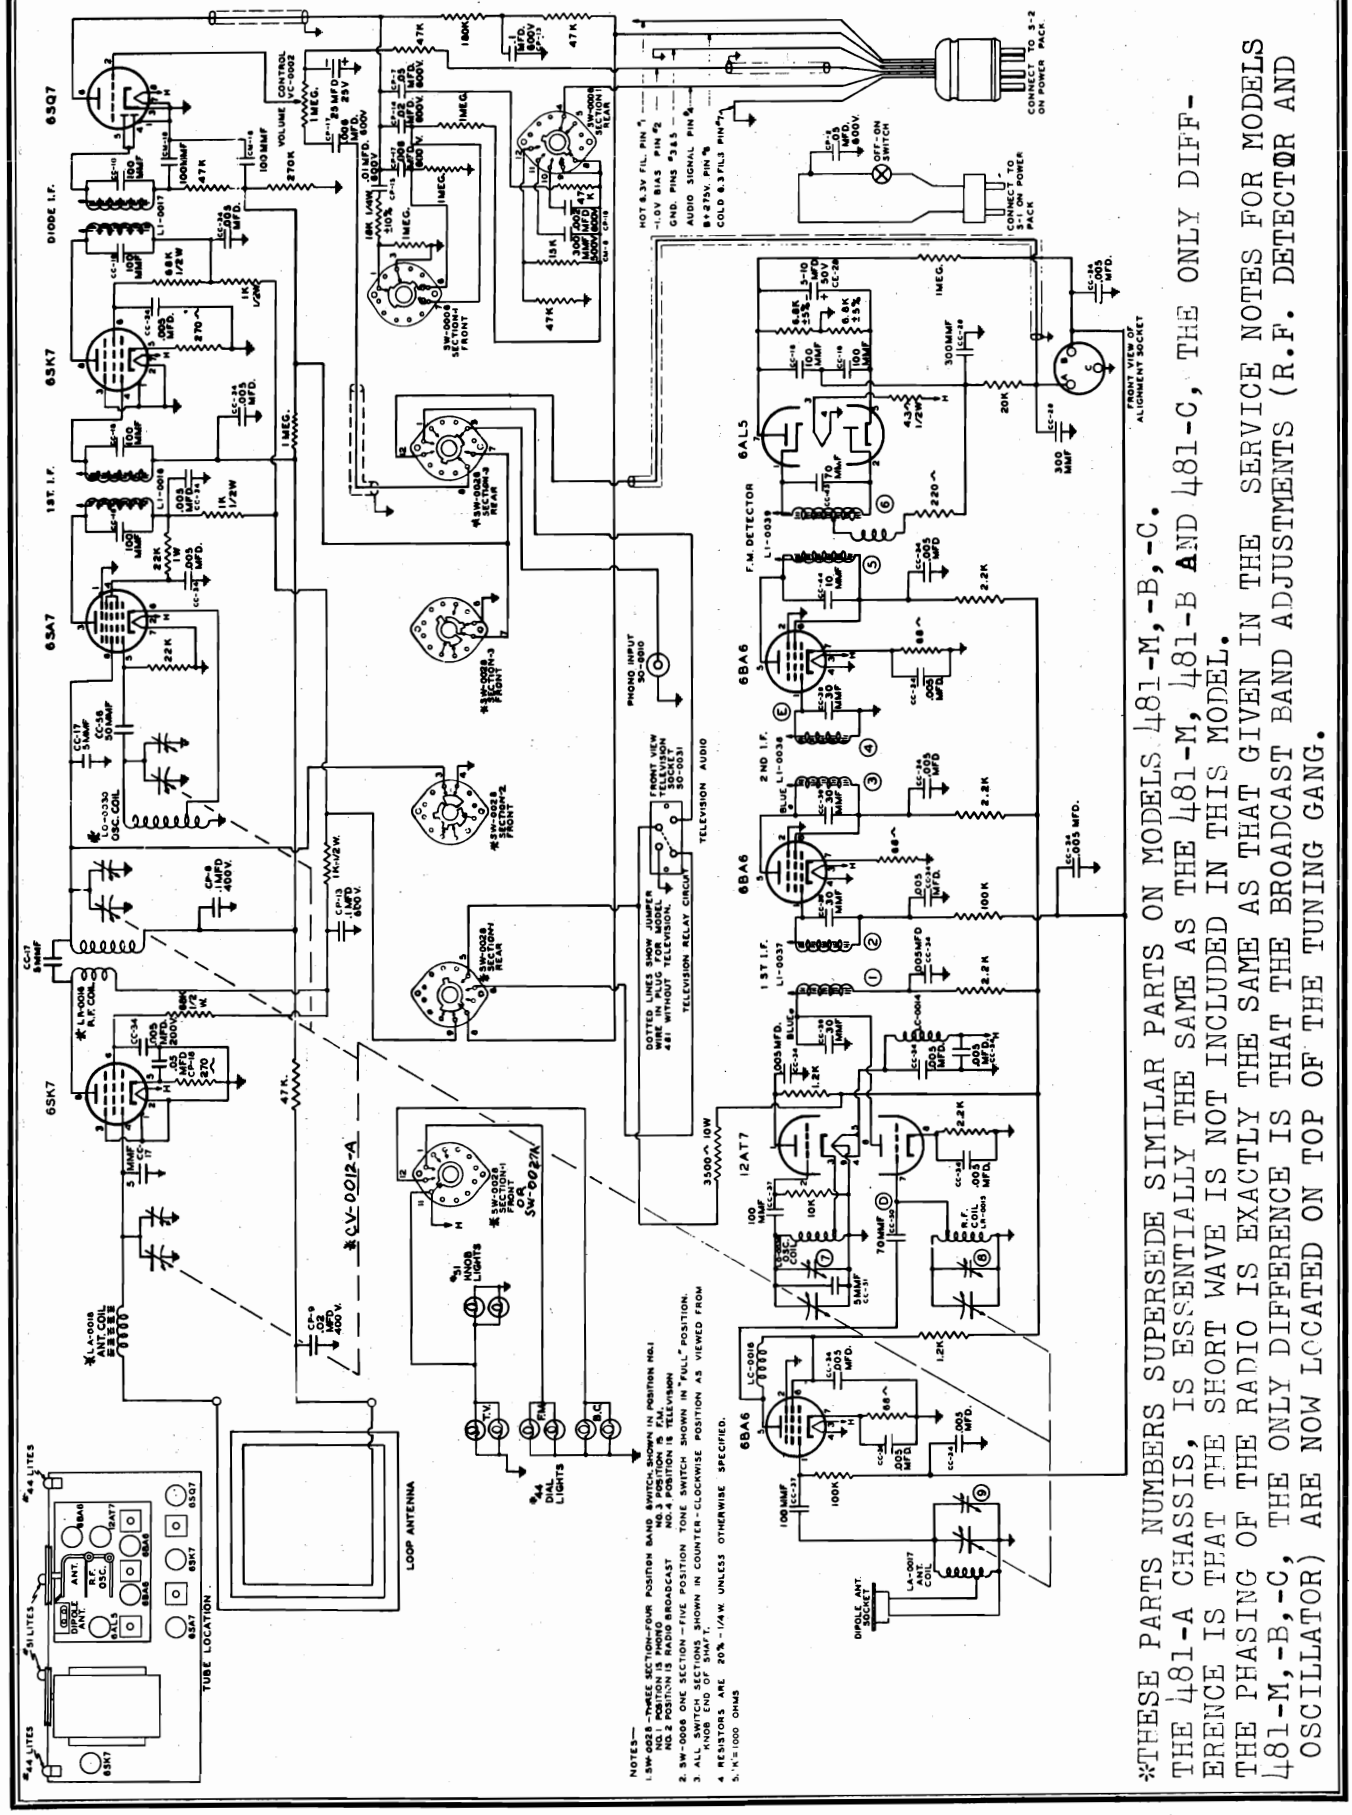
HOWARD RADIO COMPANY

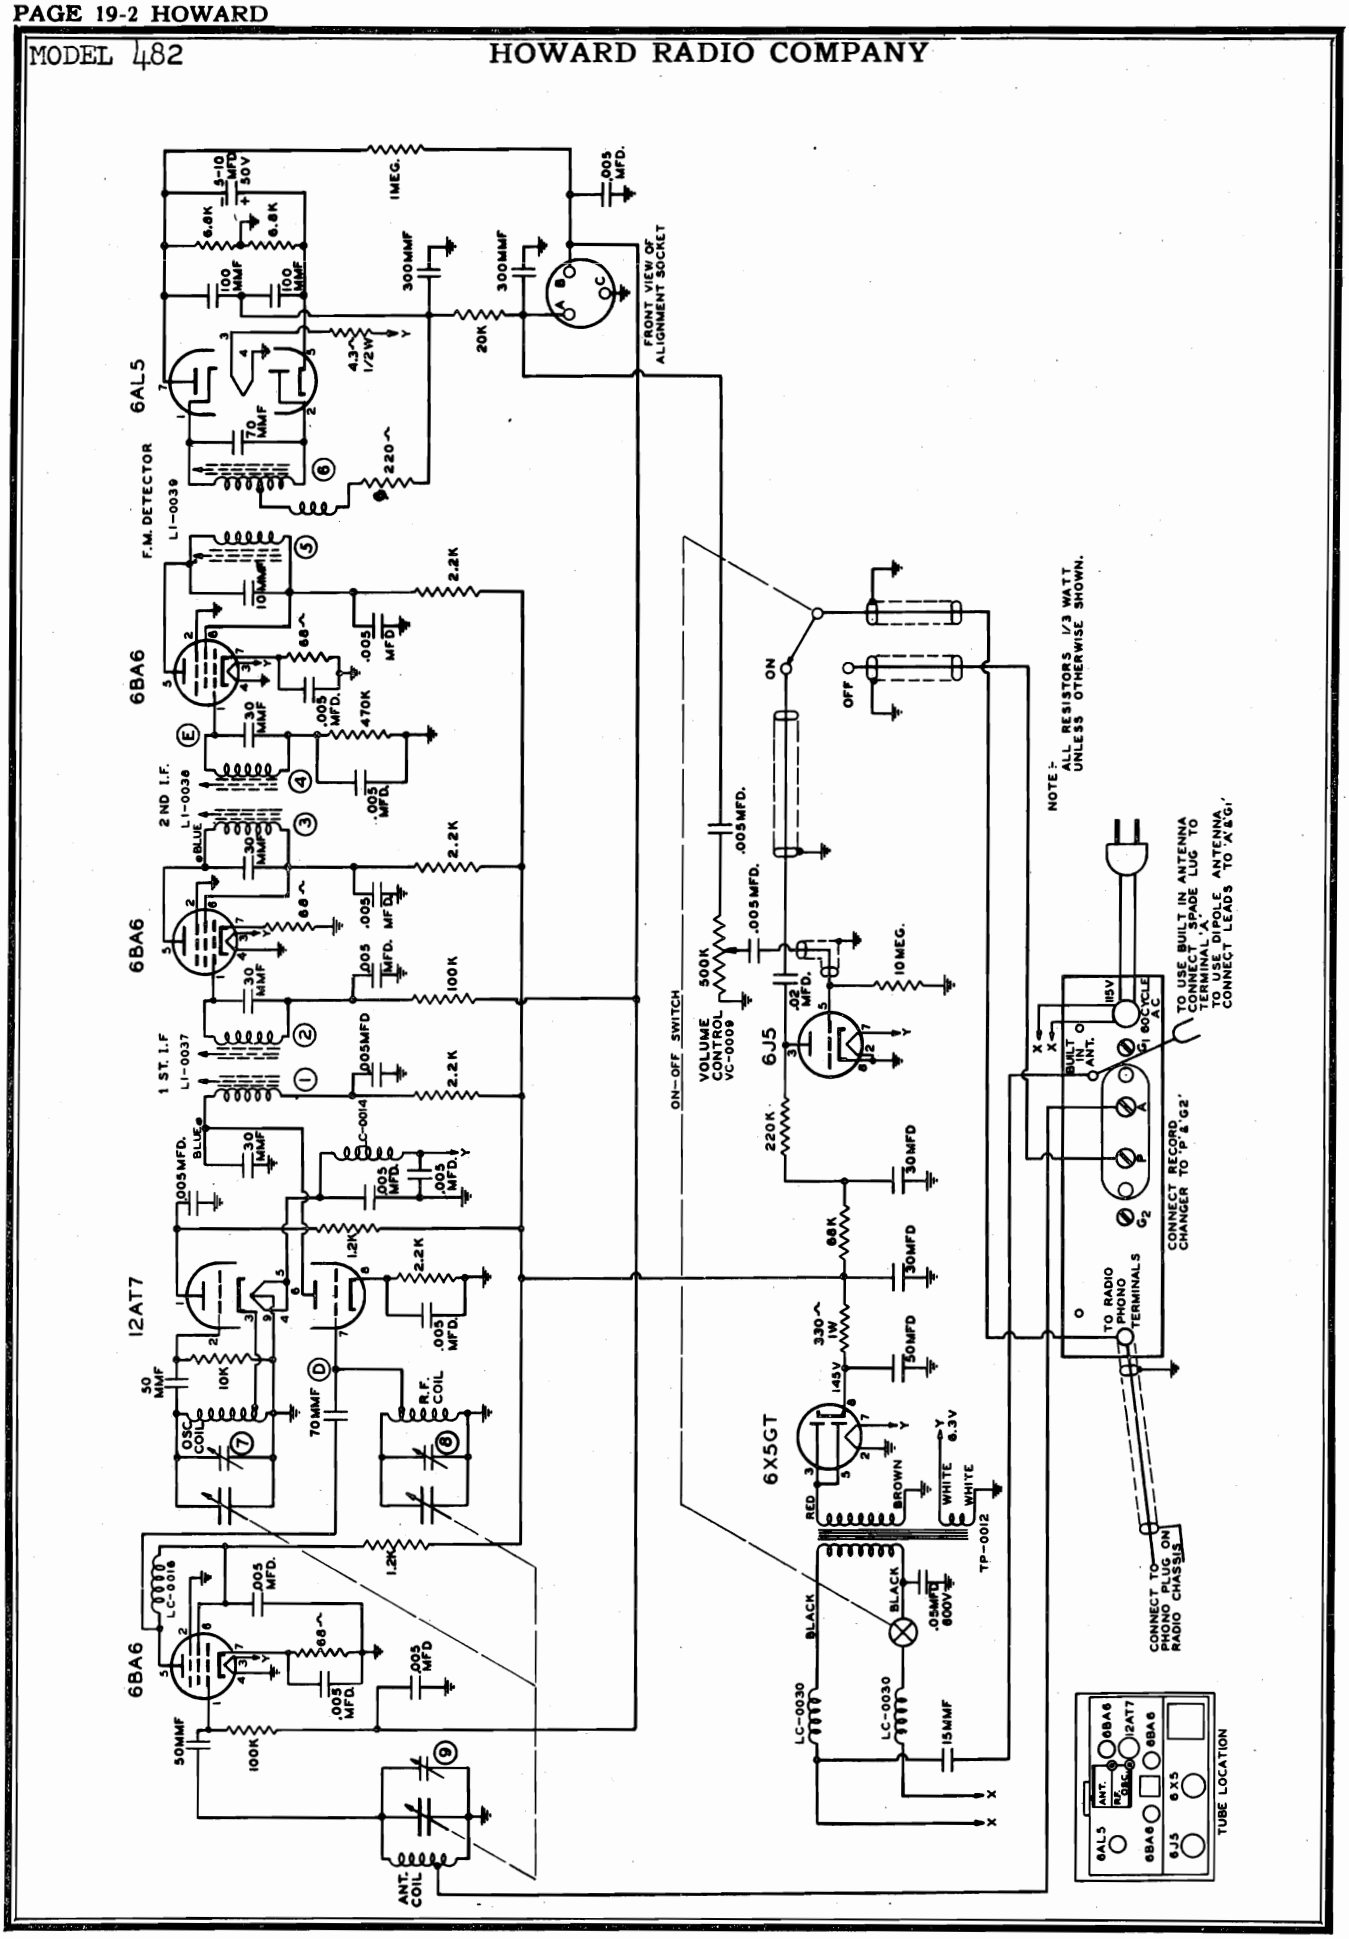
MODEL 481-A



*THESE PARTS NUMBERS SUPERSEDE SIMILAR PARTS ON MODELS 481-M,-B,-C.
THE 481-A CHASSIS, IS ESSENTIALLY THE SAME AS THE 481-M, 481-B AND 481-C, THE ONLY DIFFERENCE IS THAT THE SHORT WAVE IS NOT INCLUDED IN THIS MODEL.
THE PHASING OF THE RADIO IS EXACTLY THE SAME AS THAT GIVEN IN THE SERVICE NOTES FOR MODELS 481-M,-B,-C, THE ONLY DIFFERENCE IS THAT THE BROADCAST BAND ADJUSTMENTS (R.F. DETECTOR AND OSCILLATOR) ARE NOW LOCATED ON TOP OF THE TUNING GANG.

MODEL 482

HOWARD RADIO COMPANY



HOWARD RADIO COMPANY

MODELS 482, 482A

ANTENNA REQUIREMENTS: Although the Howard Model "482" Tuner is the most sensitive built today, the successful operation of your FM Tuner depends on the signal strength of the transmitter and the efficiency of the antenna connected to the Tuner. In localities a number of miles from the sending station, it is advisable that a good antenna be used. It must be remembered that a great many things influence FM reception: elevation, high buildings or hills will intercept the waves and reduce signal strength. Each installation presents a different problem however, in most cases the built-in antenna will provide sufficient signal strength to operate the Tuner. Below are listed the different types of antennas which may be used with the "482" Tuner and a diagram to show how they are connected. The various antennas will be listed according to their efficiency.

1. DIPOLE ANTENNA:- Mounted as high as possible and away from all obstructions. Connect as shown in Fig. 1 using 300 ohm twin lead-in wire. Maximum pickup will be experienced when the arms of the antenna are flatside toward the transmitter.

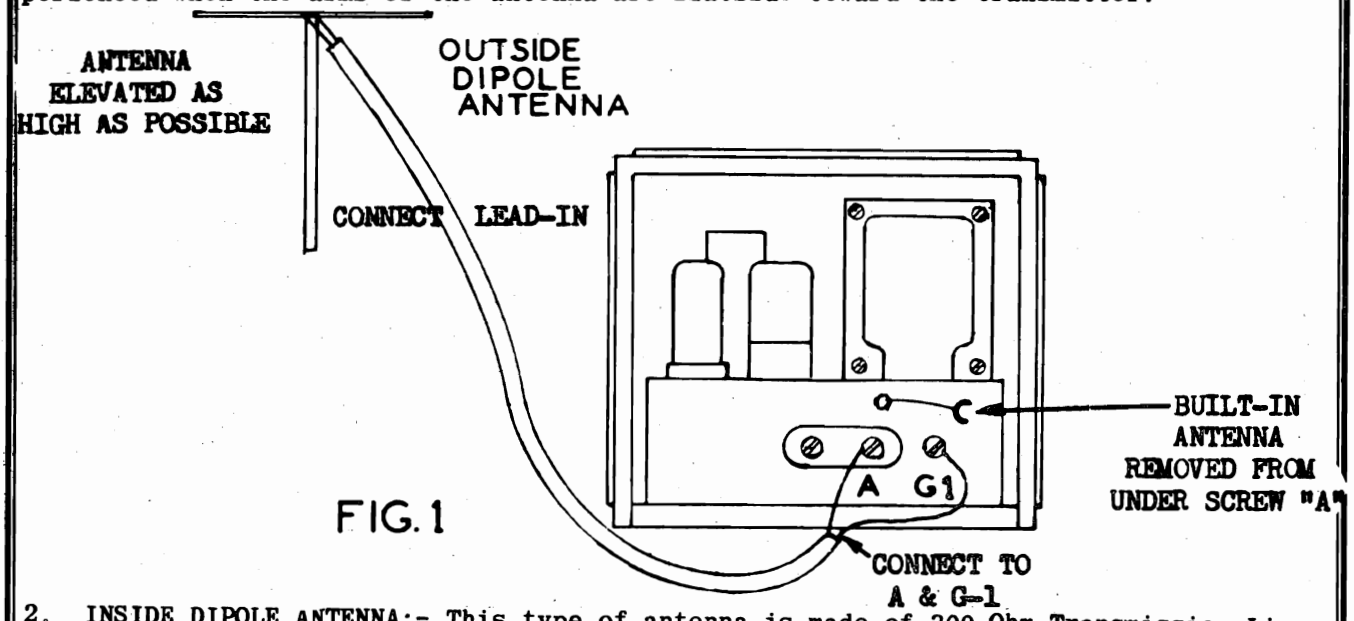


FIG. 1

2. INSIDE DIPOLE ANTENNA:- This type of antenna is made of 300 Ohm Transmission Line (See Fig. 2-A) and may be mounted on the back of the average console radio. Connections to the "482" Tuner are the same as shown in Fig. 2. The following sketch shows a typical installation.

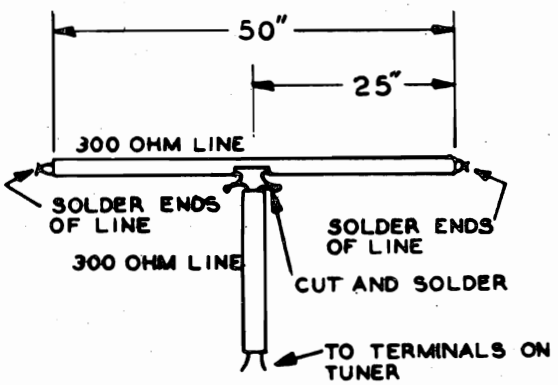

FIG. 2A

CONSTRUCTIONAL DETAILS OF DIPOLE ANTENNA MADE FROM 300 OHM TRANSMISSION LINE.

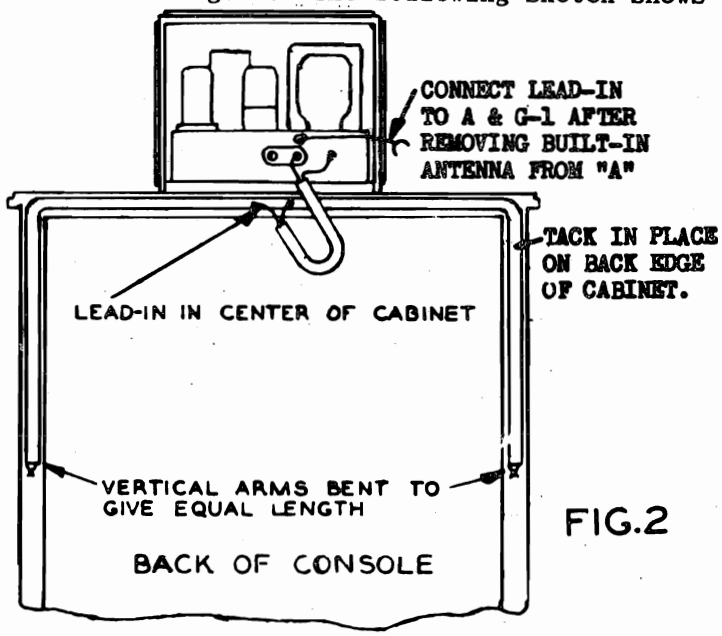

FIG. 2

This type of antenna while economical and easy to install gives excellent results. The arms may also be stretched out and placed under a rug if the cabinet is too small to attach to the back.

MODELS 482, 482A HOWARD RADIO COMPANY

3. **BUILT-IN ANTENNA:-** The antenna built into the "482" Tuner is quite efficient in most localities within the primary coverage area of the transmitter. For best results the line cord should be stretched out straight and away from metal objects. The Tuner is shipped with the built-in antenna attached as shown in Fig. 3.

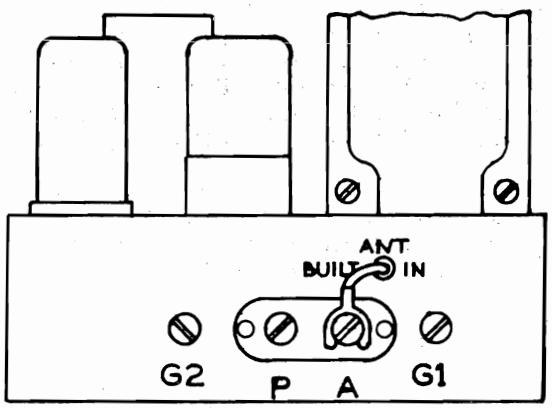

FIG. 3

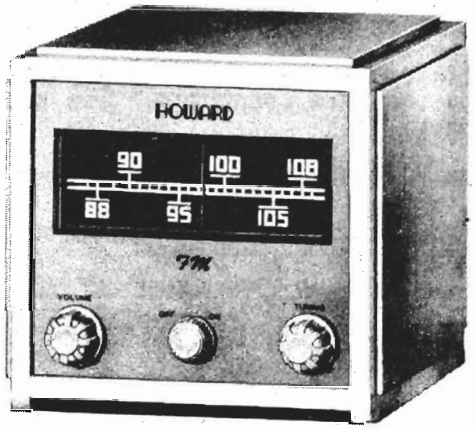
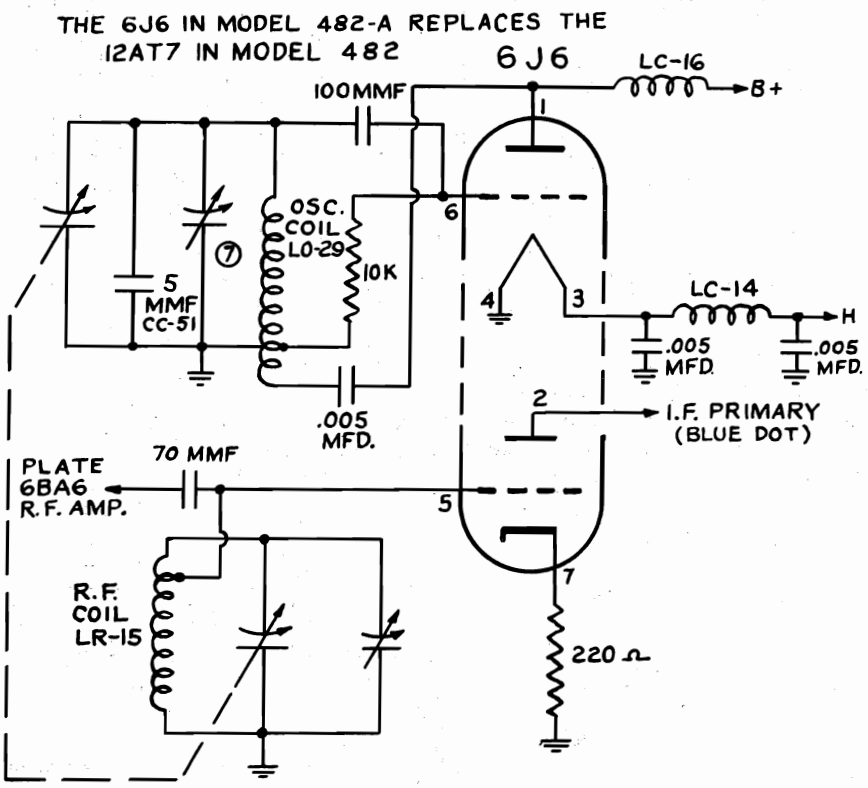


CONNECTIONS TO RADIO RECEIVER



GENERAL:- Most receivers have connections in the rear of the chassis for a phonograph. The type of connection varies with different manufacturers, but it usually is in the form of a terminal strip marked **PHONO** and consists of two screws or a socket. In the following paragraphs each type of connection will be shown with the "482" Tuner connected in the proper manner. It will be necessary for you to determine which of the two screws or which terminal of the plug is "live". By "live" we mean which is the audio connection and which is the ground connection; no voltage capable of giving a shock will be encountered. To determine which is the "live terminal, turn the radio on with the selector switch in the **PHONO** position and volume up; touch the two screws or the plug connections one at a time, the one which produces a loud hum in the speaker is the "live" terminal.

1. **RADIO HAVING NO PHONO CONNECTION:-** In this case it is advisable to call a competent serviceman to make the installation as the "482" Tuner will have to be connected internally to your receiver.

2. RADIO WITH TWO SCREW TERMINALS (OR CLIPS)

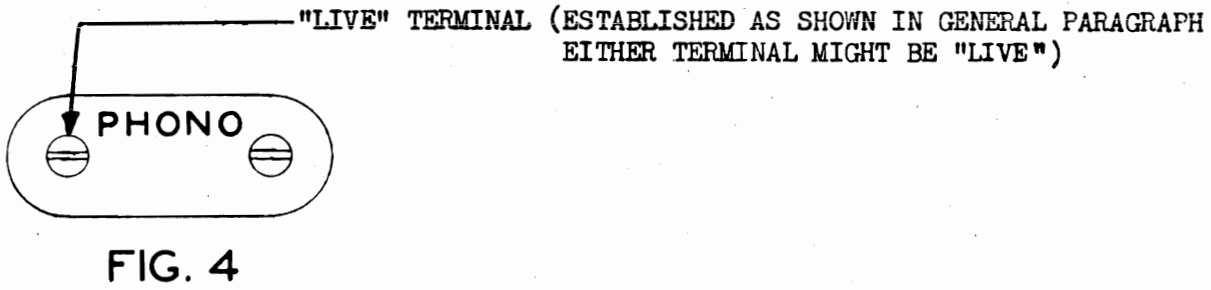


FIG. 4

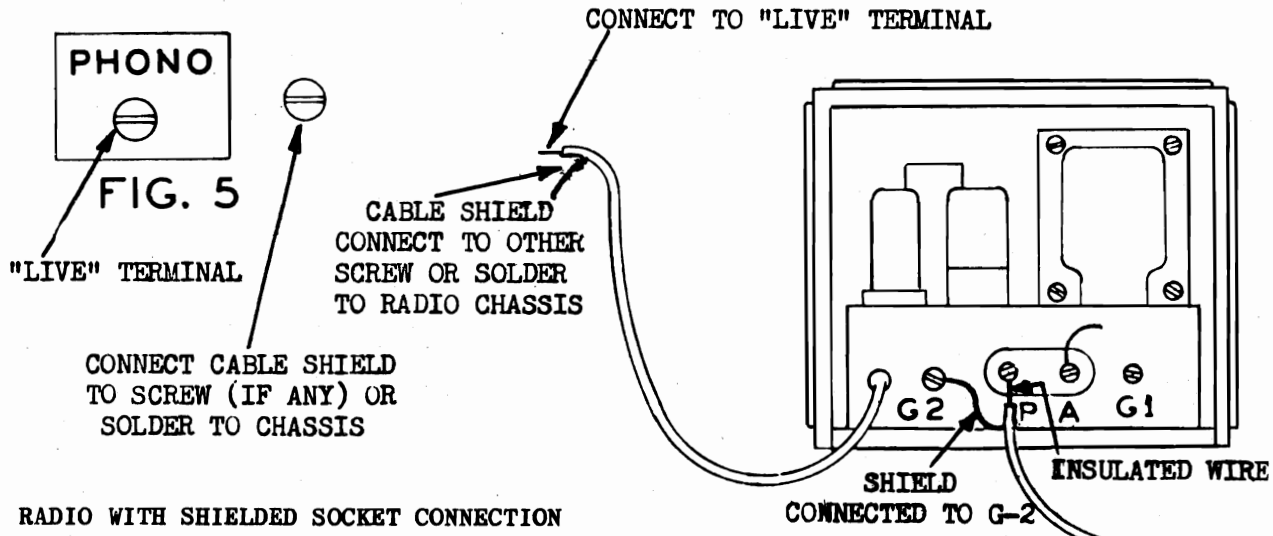
3. RADIO WITH ONE SCREW TERMINAL (OR CLIPS)



4. RADIO WITH SHIELDED SOCKET CONNECTION

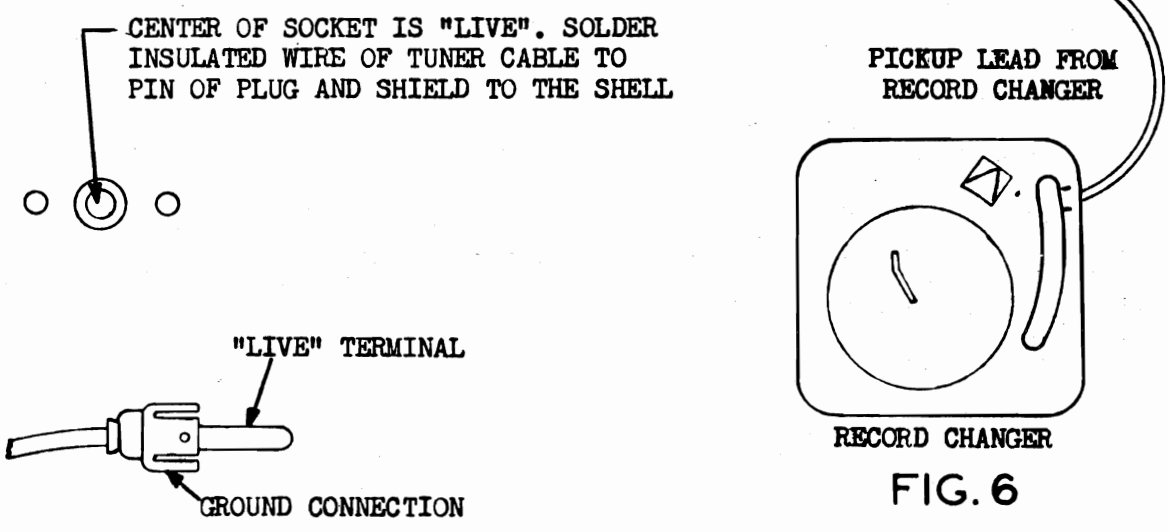


FIG. 6

UNSOLDER PLUG AND CONNECT
TO "P" & G-2 AS SHOWN.

MODELS 482, 482A HOWARD RADIO COMPANY

NOTE:

It is impossible to show all the means used to connect a record player to a radio, but by remembering to find the "live" connection going to the record player and attaching the Tuner insulated lead to this point and the cable shield to the chassis, then your Tuner will be connected properly. Then connect the lead from your record changer that went to the "live" terminal to "P" on your Tuner chassis and the other lead or shield to G-2 then your record player will play normally when the center switch on the "482" Tuner is turned to the left or OFF position.

The "482" Tuner is designed for AC operation only and should never be connected to a DC supply. It operates best with a receiver designed for AC operation as a slight hum may be noticed on high volume if the Tuner is connected to an AC-DC receiver. This may be eliminated by reversing the power cord plug in its socket on either the radio or the Tuner, or both.

TO OPERATE:

Plug power cord into 115 volt, 60 cycle, A.C. power outlet. Turn radio on, place radio in phono position, and turn radio volume control approximately half on. Turn FM Tuner to ON position, use volume control on Tuner to adjust volume level and carefully tune in FM Stations.

3	Ant. and Gnd. Back of Chassis	90 MC.	FM	90 MC.		F.M. - R.F. Ind. Adj.	H & I

A. Signal generator modulation off and turned up to about 100,000 microvolts.
B. Connect electronic volt meter (equivalent to voltohmist) at point "B" of alignment socket as shown on the wiring diagram and turn slug (6) on trimmer location chart to extreme counter-clockwise position. Turn clockwise to 1st peak and adjust to maximum.

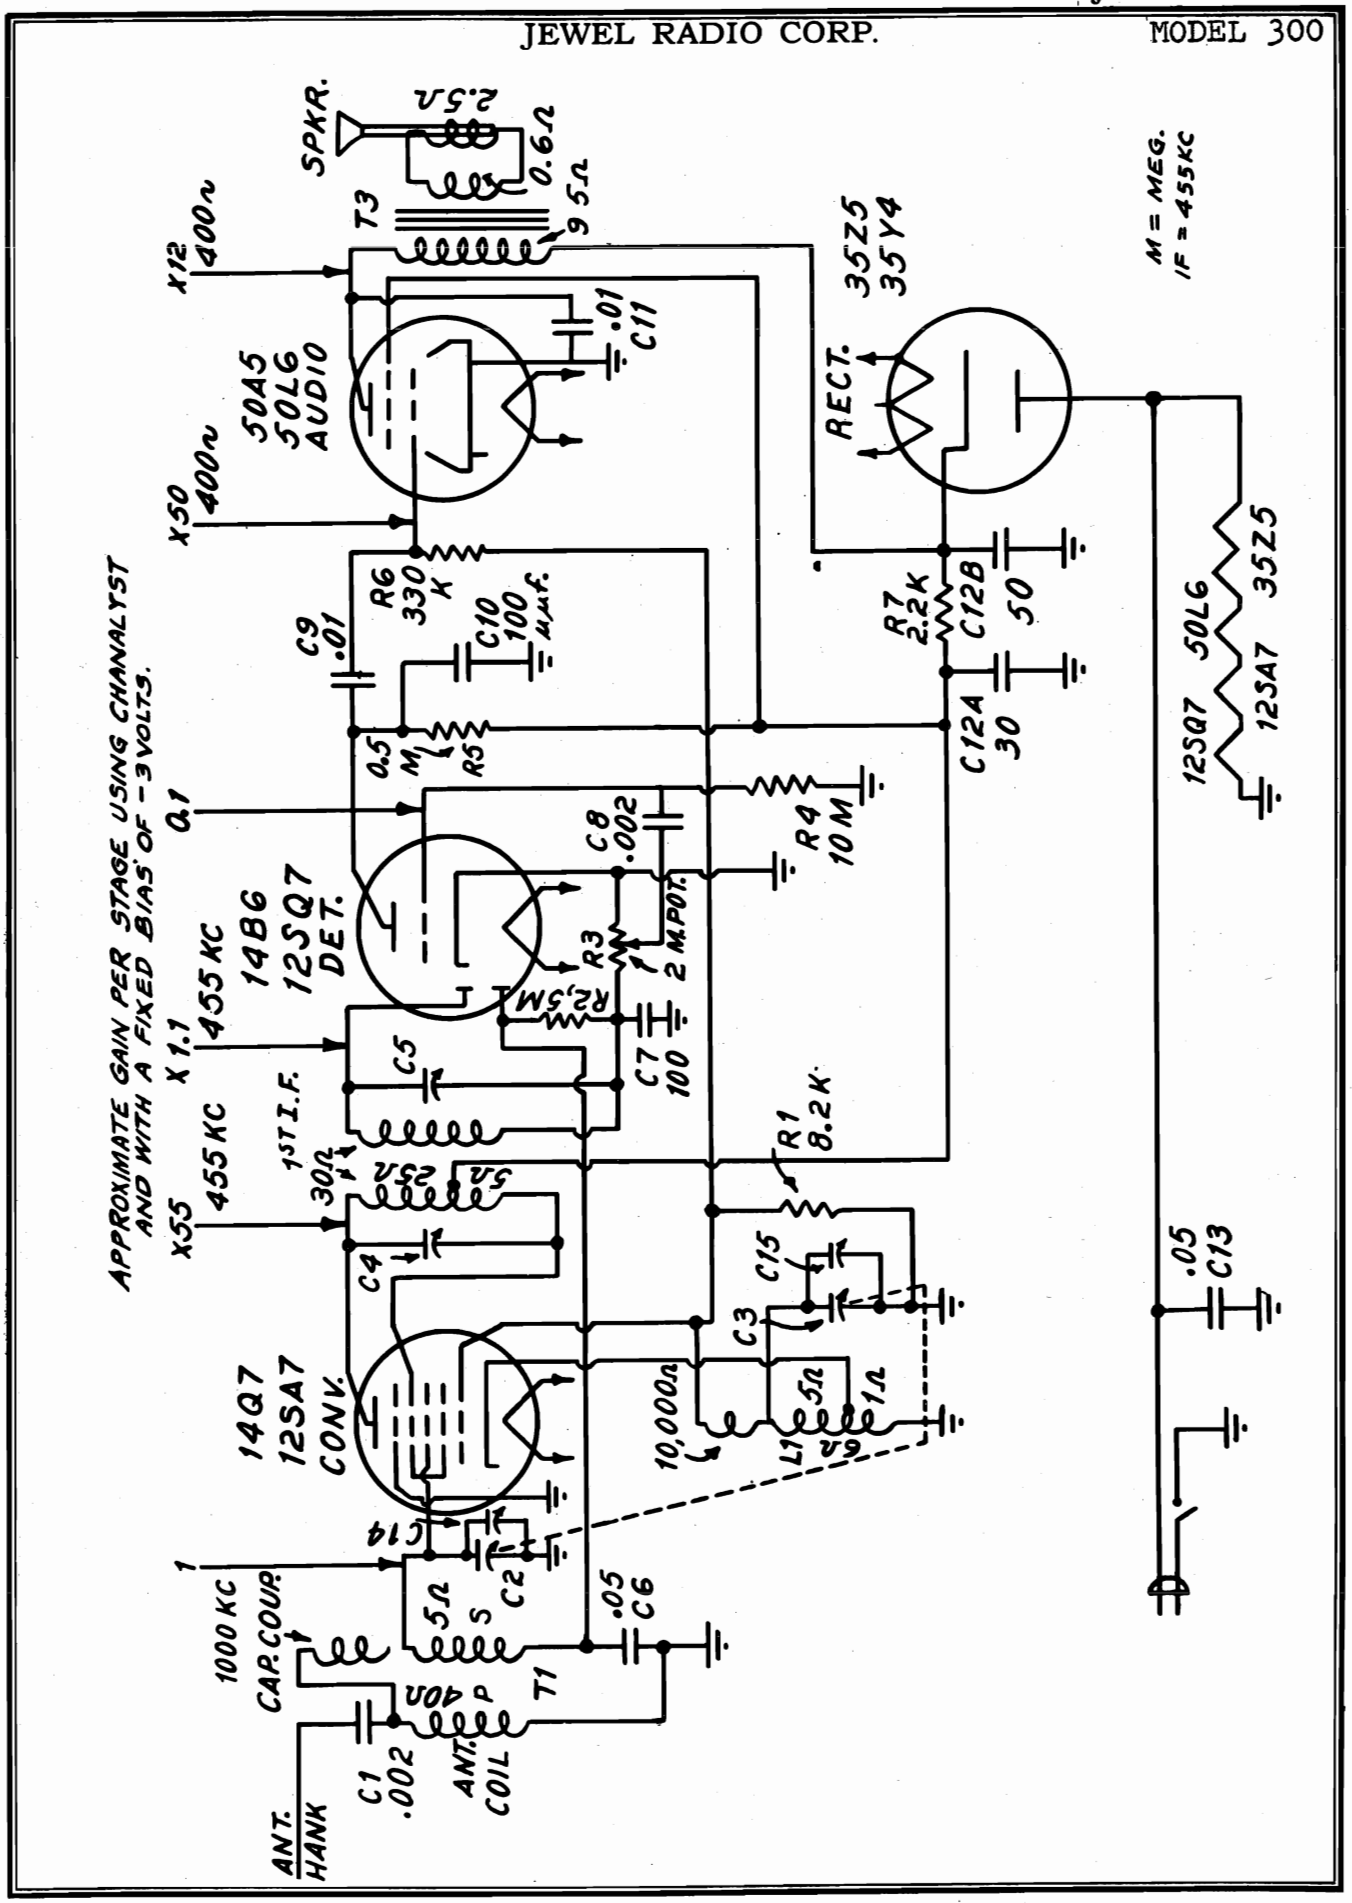
C. Turn slug (5) to extreme counter-clockwise position. Connect electronic voltmeter to Point A of alignment socket and turn slug (5) until voltmeter is to zero voltage. Repeat adjustments given in Notes B & C until no further improvement can be made.

D. Connect voltmeter to Point B and generator at Point D. Adjust (1) (2) (3) (4), then retrim (6). Move voltmeter to Point A and recheck zero voltage (retrim if necessary). These adjustments should be made with input signal necessary to pro duce approximately .7 volts at Point B.

E. Remove built-in antenna from the connection A on back of chassis.
F. Change generator dummy as shown on dummy antenna chart, Picture 3, and modulation on, and fasten generator to A & G-1.
G. Turn the first Detector or R.F. Trimmer (8) well to the left - almost open - so you will not have a locking condition and be able to locate the signal at 105 M.C. when turning Trimmer (7).

H. Should 90 M.C. signal not fall in at 90 M.C. on the dial, adjust F.M. oscillator coil to correct calibration. It is only necessary to press together or open the spacing on one turn of the coil to do so.
I. After adjusting oscillator coil for the correct calibration at 90 M.C., check the detector and antenna coil for proper tracking with the oscillator. If they do not track it will be necessary to adjust the detector and antenna coils for perfect tracking.
J. Repeat adjustments (7) (8) (9) until no further improvement can be made.

JEWEL RADIO CORP. MODEL 300



MODEL 300

JEWEL RADIO CORP.

ALIGNMENT PROCEDURE

Connect output meter across the voice coil.

Couple the signal generator to the hank antenna through a 100 μμf capacitor. Set the volume control at maximum, and fully mesh the tuning capacitor.

The output of the signal generator should be just sufficient to give a readable deflection on the output meter.

Set the signal generator to 455 kc and adjust i-f trimmers for maximum output in the following order: C5, C4. Repeat sequence if trimmers were badly maladjusted.

Set the signal generator and receiver to 1400 kc and adjust the oscillator trimmer C15 for maximum output

Set the signal generator and receiver to 1600 kc and adjust the antenna trimmer C14 for maximum output.

Set the signal generator and receiver to 1400 kc and readjust oscillator trimmer C15 for maximum output.

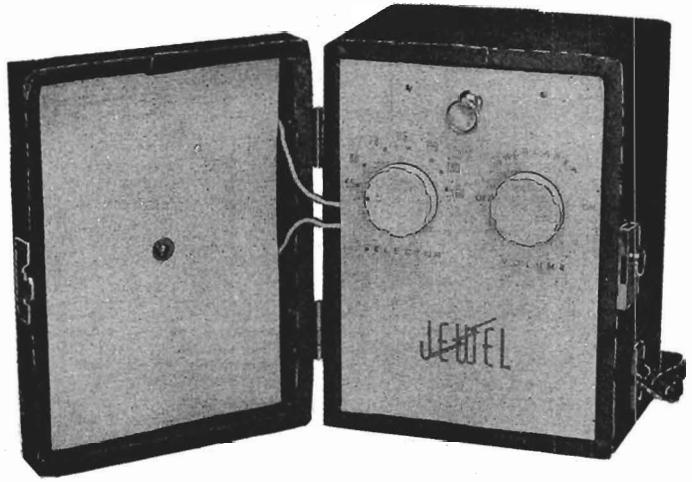
ALL VOLTAGE AND RESISTANCE MEASUREMENTS MADE WITH RESPECT TO CHASSIS GROUND. AND WITH A SUPPLY VOLTAGE OF 67 1/2 DC



ALIGNMENT PROCEDURE

Connect output meter across voice coil.

Connect the signal generation to the standard Hazeltine Loop Model 1150 and couple it loosely to the receiver loop. Set the volume control at maximum, and fully mesh the tuning capacitor.

The output of the signal generator should be just sufficient to give a readable deflection on the output meter.

Set the signal generator to 455 kc and adjust i-f trimmers for maximum output in the following order: C9, C8, C7, C6. Repeat sequence if trimmers were badly maladjusted.

Set the signal generator and receiver to 1620 kc and adjust the oscillator trimmer C4 for maximum output.

Set the signal generator and receiver to 1500 kc and adjust the antenna trimmer C2 for maximum output.

Set the signal generator and receiver to 1620 kc and readjust oscillator trimmer C4 for maximum output.

ALL VOLTAGE AND RESISTANCE MEASUREMENTS MADE WITH RESPECT TO CHASSIS GROUND.
AND WITH A LINE VOLTAGE OF 116 V.A.C.

Alignment Procedure - I.F. Alignment

It is recommended that Visual Alignment be used for the I.F.

The bandpass width of the 456-KC I.F.'s is 20 KC, so a 40-KC swept signal with a center frequency of 456-KC is used to align the I.F.'s.

Connect the Oscilloscope to pin 2 of V104A (7N7) and connect the signal generator to pin 6 of V103 (7B7). Keep the output of the signal generator as low as possible.

If the output impedance of the signal generator is high, it will be necessary to detune the secondary of L104 with C120.

Align L105 with C122 and C121, for a flat top to the I-F response curve, while trying to obtain maximum output.

Move the signal generator to pin 6 of V102 (7B7) and align L104 with C120 and C119 using the same procedure as used for L105.

Move the signal generator to pin 6 of V101 (7B7) and align L103 with C118 and C117 using the same procedure as used in aligning L105 and L104.

The I.F. response curve should be similar to the curve shown below.

Oscillator Alignment

The tuning meter on the front panel of the tuner may be used as an indicator when aligning the R-F and Oscillator section.

Connect the signal generator to the antenna terminal through a 0.01 MF capacitor.

Set the signal generator and tuner to 1300 KC. Output of the signal generator should be such that a reading of approximately 6 on the tuning meter is obtained.

Adjust C101D for maximum output.

Set the signal generator and tuner to 700KC and adjust L106 for maximum output. This procedure should be repeated for accurate calibration.

R-F Alignment

Set the signal generator and tuner to 1300 KC and adjust C101C for maximum output.

Set the signal generator and receiver to 700 KC and adjust L101 for maximum output.

When the tuner is tuned across the signal a succession of 2 peaks should appear on the tuning meter. Both peaks should have equal amplitude, and the dip in the middle should be equal to approximately 1 division on the meter scale. The maximum reading on the tuning meter should be at least 5 when adjusting C101C and L101 for this indication.

This adjustment may have to be repeated before the R-F alignment is satisfactory.

If there are strong stations at approximately 700 KC and 1300 KC, these may be used instead of the signal generator.

MODELS 861-PC, 1281-PC

LEAR, INC.

ALIGNMENT PROCEDURE FOR A.M.:

Equipment Required:

a) Broadcast Band Signal Generator.
b) Output Meter.

1. Set band switch to AM. Advance volume control to full volume setting.

2. Connect output meter across voice coil.

3. Connect the Signal Generator across the broadcast band antenna section of the variable condenser. The "high" side of the Generator should connect to the stator section and the "ground" side to the frame or chassis. Adjust the Signal Generator to 455 kc and with the receiver switched on, adjust the first and second I.F. transformers for peak output as shown on the output meter. The signal injected into the receiver should be as small in magnitude as possible, consistent with a useful deflection on the output meter.

4. Connect the "high" side of the Generator to the antenna terminal with a 200 mmf condenser inserted in series. Connect the "ground" side of the Generator to the chassis. Tune receiver to 60 on the dial, adjust Signal Generator to 600 kc. Adjust the BC padder and the BC antenna coil for maximum deflection on the output meter. Use a weak signal.

5. Tune receiver to 160 on the dial. Adjust Signal Generator to 1600 kc. Adjust BC oscillator and BC antenna trimmers for maximum output.

6. Repeat operations 4 and 5.

ALIGNMENT PROCEDURE FOR F.M.:

Note: Points A. B. C. D. E. F. G. and H are noted on circuit diagram.

Points B, C, and D have been brought out to the unused contacts of the speaker socket at the rear of the chassis.

Equipment Required:

a) High frequency Signal Generator with 88-108 Mc tuning range.
b) Signal Generator capable of delivering .1 V at 10.7 mc.
c) Audio output meter.
d) D.C. vacuum tube voltmeter with zero center scale.

a. Ratio Detector Alignment:

1. Connect V.T.V.M. across points "B" and "C" (A.V.C. Voltage).

2. Feed 10.7 mc unmodulated R.F. signal into 6SH7 grid (point A) through .01 μfd. condenser. This signal should be .1 volt.

3. Adjust primary of Ratio Detector (T-5) for maximum voltage indication on V.T.V.M.

4. Connect zero centered V.T.V.M. across points "B" and "D".

5. Adjust secondary of Ratio Detector (T-5) for zero indication.

6. Tune 10.7 mc Signal Generator higher in frequency (about 200 kc) until maximum voltage reading is obtained on V.T.V.M.; note this voltage, then tune signal generator lower in frequency until maximum voltage of the opposite polarity is obtained. Note this voltage, then if necessary re-adjust primary of the Det. (T-5) until the detector voltages are about equal on either the high or low side of 10.7 mc.

b. 10.7 I.F. Alignment:

1. Shunt a 1,000-ohm carbon resistor across the primary of the detector (T-5) (Points G and H).

2. Connect output meter across speaker voice coil.

3. Volume and tone controls at maximum clockwise position.

4. Connect 10.7 mc (modulated 30% signal generator through .01 μfd. condenser across point "F" and ground.

5. Adjust secondary, then primary of (T-3) for maximum audio output. (Reduce input signal to maintain output at .5-watt level.)

6. Connect 10.7 mc 30% modulated signal generator across point "E" and ground.

7. Adjust secondary, then primary of (T-1) for maximum audio output. (Reduce input signal to maintain output at .5-watt level.)

8. Remove 1000-ohm shunting resistor from across primary of (T-5).

c. Oscillator and R.F. Alignment:

1. Connect V.T.V.M. across "B" and "C" (A.V.C. voltage).

2. Connect 108 mc signal generator to FM antenna terminals. If generator impedance is low, put one 150-ohm carbon resistor in series with each of the generator leads. Tune receiver dial to 108 mc.

3. Adjust FM oscillator trimmer (C-51) for maximum V.T.V.M. reading.

4. Adjust FM R.F. trimmer (C-52) for maximum V.T.V.M. reading. During alignment reduce input signal to maintain A.V.C. voltage at 2 V.

5. Repeat steps 3 and 4.

6. Feed a 90 mc signal into antenna terminals (as in C-2), tune receiver dial to signal.

7. Adjust spacing of FM R.F. coil (L-4) for maximum V.T.V.M. reading at 90 mc. During alignment reduce input signal to maintain A.V.C. voltage at 2 V.

8. Repeat steps 2 and 4 if necessary.

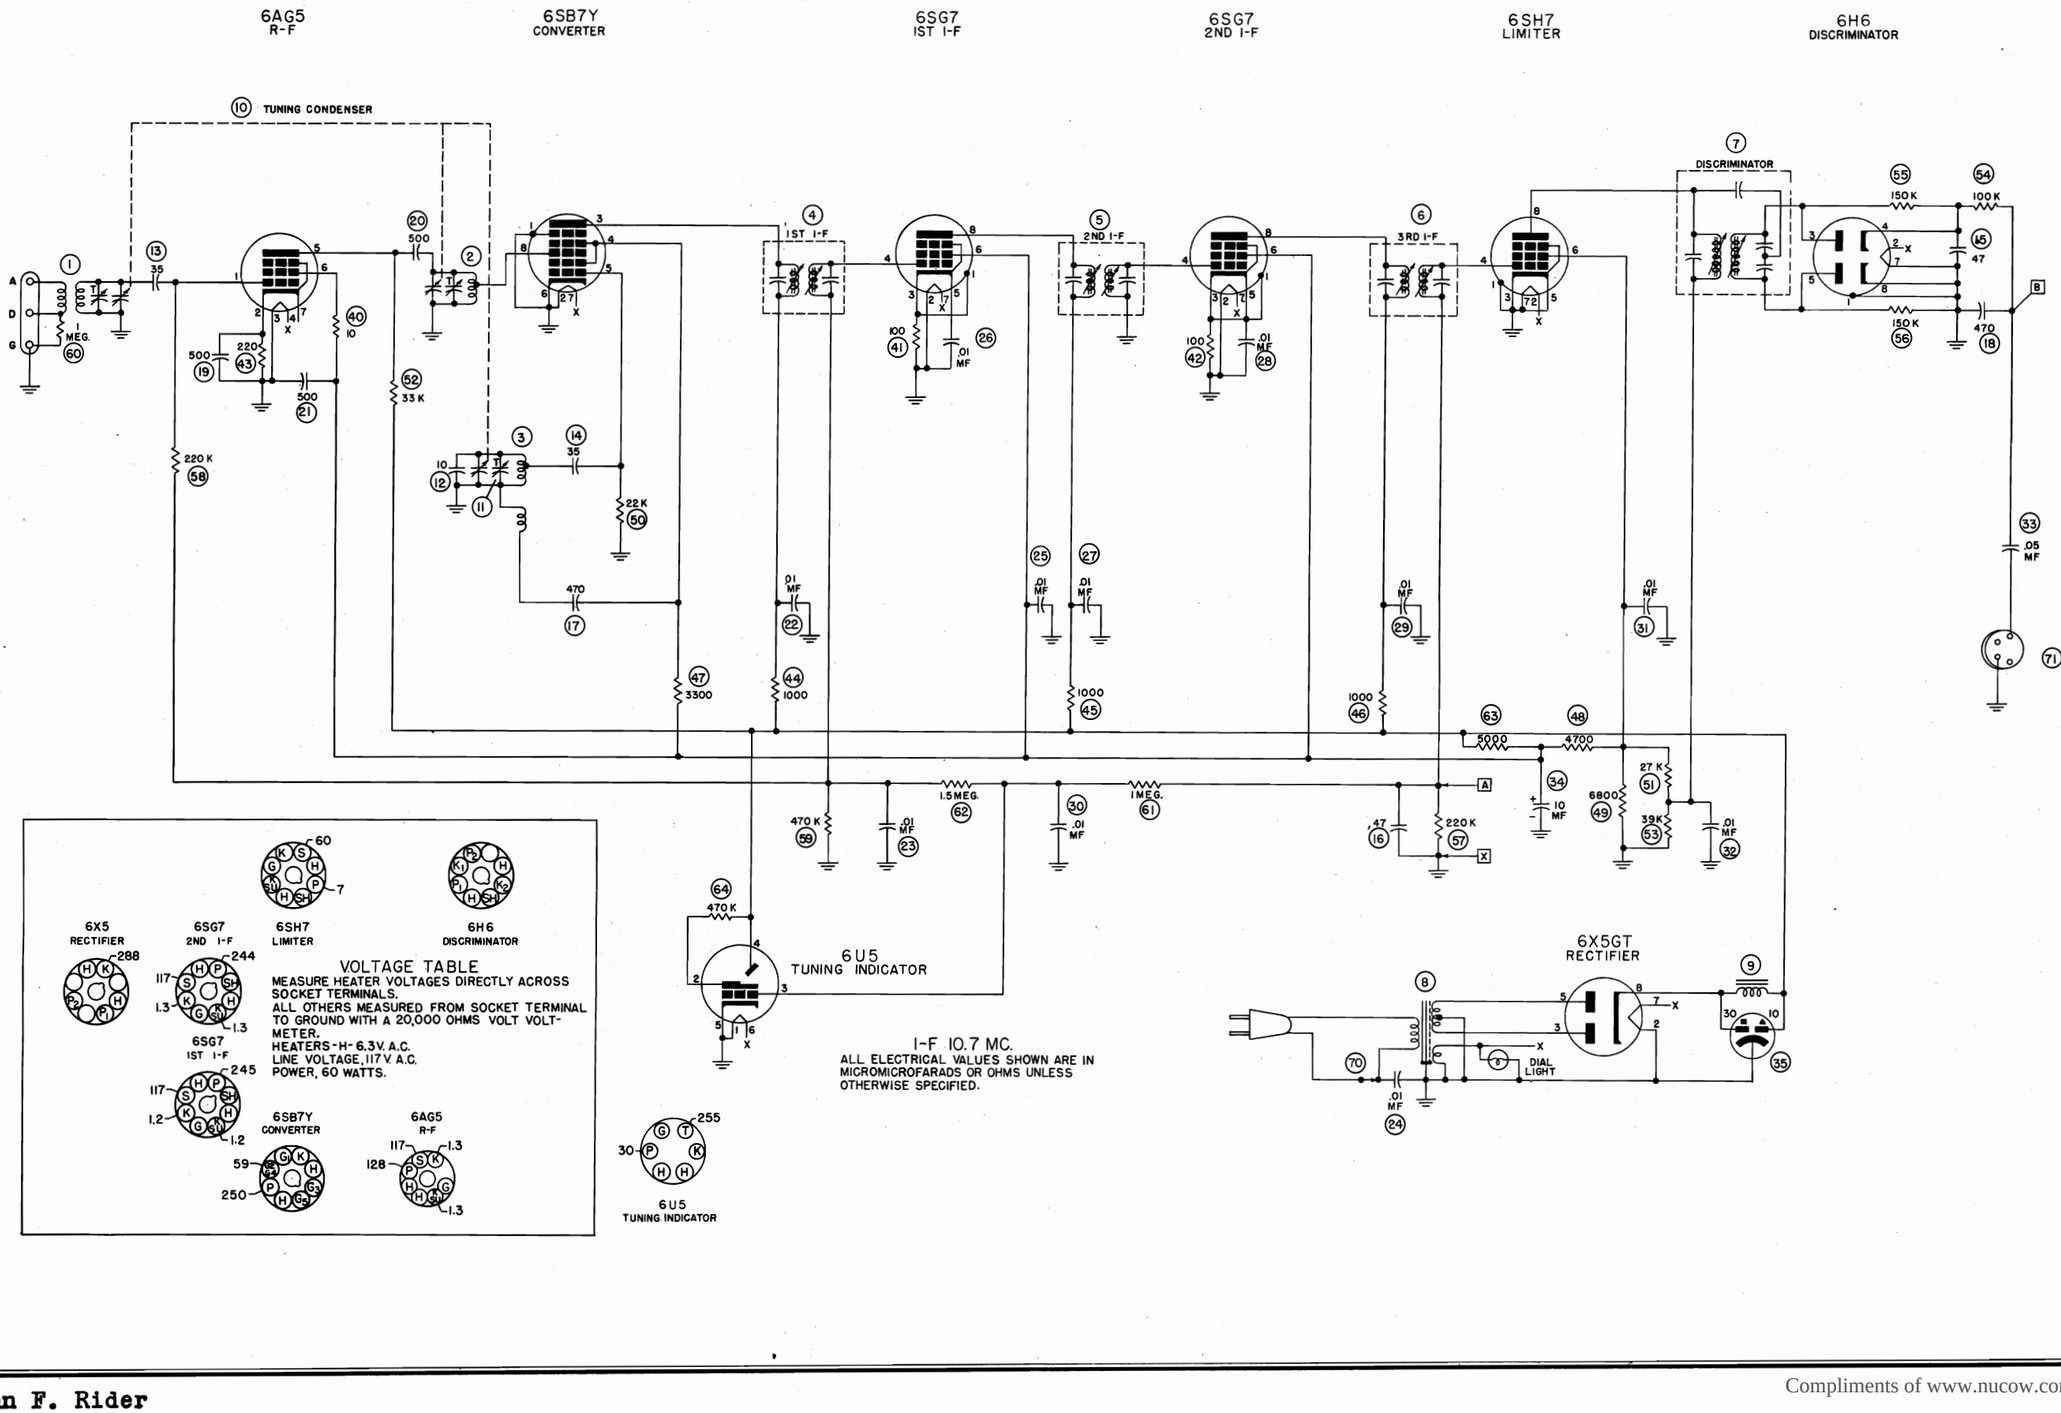
MODEL CR-206

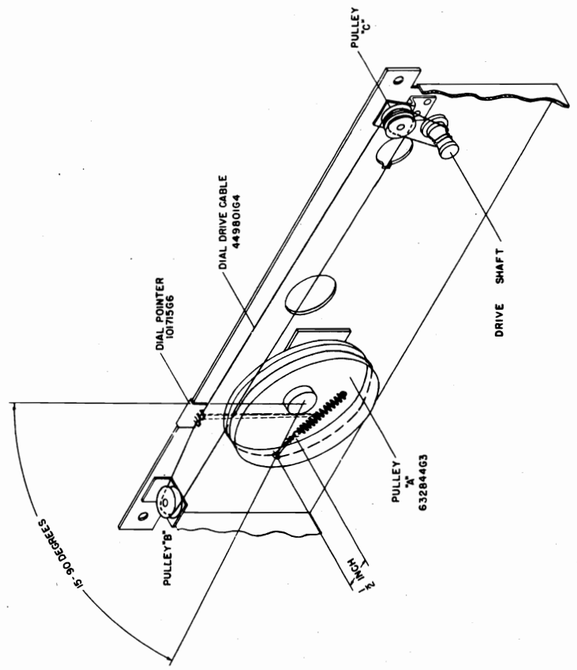


DIAL CORD REPLACEMENT

A single cable transmits motion from the dial tuning knob to rotate the condenser gang and to move the dial pointer. A 30-inch length of string is required to restring this assembly. After the broken cable is removed, turn pulley "A" (see Figure 1) until the condenser gang plates are completely meshed. In this condition, the small hole in the rim of pulley "A" should be within the limits of 15 to 90 degrees to the left of being vertical as shown in Figure 1. If this hole is at a different position from the condition specified, loosen the two screws in the coupling to the condenser gang and turn pulley "A" while holding the condenser plates meshed. Tighten the two set screws after the adjustment has been made.

Lace one end of the new length of cable through the hole in pulley "A" and temporarily fasten it to the hook to which the spring is normally fastened. Make a complete turn around pulley "A" in a counter-clockwise direction, lace it around pulley "B," then across the rear of the dial scale and over the top of the front groove in pulley "C." Proceed down around the tuning shaft for 2½ turns in a clockwise direction and wrapping the cable over pulley "D" from front to back. Continue up over the rear groove of pulley "C" in a clockwise direction for one turn and extend the cable to the left so that the loose end is to the rear of the section of cable that it crosses. The loose end of the cable should now be wound over the top of pulley "A" so that it is nearest the dial frame and into the hole in the pulley groove. Remove the other end of the cable from the hook and while holding both ends taut, insert one end of the spring on the hook in pulley "A." Lace the two free ends of the cable through the opposite end of the spring and pull the cable until the spring is stretched to within ½-inch of the rim on the pulley. Tie a double knot so that the knot is around one coil of the spring, while maintaining tension on the cable.

Turn the tuning control shaft until the condenser gang is completely meshed and slide the dial pointer on its track until it is in line with the last calibration mark at the low frequency end of the dial. Press the crimping lugs on the dial pointer together over the cable. After checking to see that the condenser gang is still completely meshed and the dial pointer is in the position specified previously, apply a few drops of cement to the cable where it is crimped by the pointer. This completes the operation.



ALIGNMENT PROCEDURE

The alignment of this F-M tuner is made in three major steps namely, I-F alignment, Discriminator alignment and R-F alignment. An F-M generator is not required in aligning this F-M tuner. Any *accurately calibrated* signal generator covering a range in the vicinity of 10.7 megacycles may be used in aligning the I-F and the Discriminator stages. For R-F alignment, the generator must cover the tuning range of the tuner or approximately 87 to 110 megacycles. If such a signal generator is not available, this alignment may be made by using an F-M radio station as a frequency standard.

I-F ALIGNMENT

1. Connect the "high" side of the signal generator to Grid 3 (pin #8) of the 6SB7Y converter tube and the "low" side of the generator to the radio chassis.

2. If a vacuum tube voltmeter is available, connect it across the 220,000 ohm resistor in the grid circuit of the 6SH7 limiter tube at points designated "A" and "X" on the schematic diagram (Figure 2) to measure the limiter grid bias voltage. Set the signal generator to exactly 10.7 megacycles and adjust the third, the second and the first i-f transformer trimmers in that order for maximum reading on the meter. A reading of 2 to 8 volts should be considered normal.

3. If a vacuum tube voltmeter is not available, connect a 0-50 or 0-200 microammeter in series with the "ground" end of the 220,000 ohm resistor in the grid circuit of the 6SH7 limiter tube at point "X" on the schematic diagram. Set the signal generator to exactly 10.7 megacycles and adjust the third, the second and the first i-f transformer trimmers in that order for maximum meter readings. A normal reading will be in the range of 10 to 35 microamperes. At the completion of these adjustments, remove the microammeter and ground the 220,000 ohm resistor to the point where it was originally connected.

DISCRIMINATOR ALIGNMENT

The accurate alignment of the discriminator transformer cannot be overemphasized. Incorrect alignment will result in badly distorted reception. The following steps should be followed in the order given:

1. A DC vacuum tube voltmeter is connected to the output circuit by connecting it from ground to point "B" on the schematic diagram. This measures the detector output voltage. Adjust the signal generator frequency to exactly 10.775 megacycles and adjust both trimmers on the discriminator transformer for maximum reading. If the indicated voltage is less than 3 volts readjust the output of the generator until the meter indicates 3 volts or more. Now adjust the signal generator frequency to 10.7 megacycles and turn the trimmer screw on the top of the discriminator until the voltage is zero. *This is an extremely important adjustment.* Reset the generator frequency to 10.775 and record the meter reading.

2. Reverse the meter connections and set the signal generator frequency to 10.625 megacycles. The meter reading now obtained must be within 10% of the reading recorded in the previous operation—if it is not, the discriminator alignment was not done accurately and must be repeated.

3. The discriminator may also be aligned using a 0-50 or 0-200 microammeter if a vacuum tube voltmeter is not available. In this case, the detector output current is measured. Connect the microammeter to the same points specified in paragraph 1 and proceed in the manner outlined in paragraphs 1 and 2 of this section. In the operation described in paragraph 1, the meter reading should be at least 20 microamperes when the trimmers are peaked at 10.775 megacycles; if not, the generator should be adjusted until that value is obtained.

R-F ALIGNMENT

1. Check that the dial pointer is in line with the last mark at the low frequency end of the dial calibration when the condenser gang is fully meshed. If it is not, slide the pointer on its string to the correct position, and crimp the lugs (on the rear of the pointer) tightly around the string and apply a drop of cement to hold the pointer in adjustment.

2. Connect the vacuum tube voltmeter to points "A" and "X" on the schematic diagram or connect a 0-50 or 0-200 microammeter in series with the "ground" end of the 220,000 ohm resistor in the grid circuit of the 6SH7 limiter tube at point "X" on the schematic diagram.

3. An extremely accurate signal generator is a necessity in making the following adjustments and it should be connected to the antenna post through a 300 ohm resistor. If such a generator is not available, connect an F-M antenna to the antenna terminal (A) and use an F-M transmitter for a frequency standard. It is preferable that this station be located in the high frequency end of the band—102 to 108 megacycles.

4. Set the signal generator (if one is used) and the F-M tuner to exactly 108 megacycles—if an F-M station is used as a frequency standard accurately set the tuner to the frequency of the F-M station and adjust the oscillator trimmer for a maximum reading on the meter. Then adjust the antenna trimmer and the r-f trimmer for a maximum meter indication. If too much signal is fed to the tuner, it might appear at several settings of the tuning dial and confuse the adjustment. When the adjustments are completed, the second harmonic of the oscillator frequency will be 10.7 megacycles lower than the signal frequency.

ALIGNMENT PROCEDURE

The alignment of this receiver requires the use of an accurately calibrated r-f signal generator and an output meter. All trimmer condenser locations are shown on the chassis layout diagram, Figure 3. The radio volume control should be turned to maximum and the signal generator output kept as low as possible during alignment to prevent the AVC from operating and giving false readings.

I-F ALIGNMENT

1. Connect the output of the signal generator to the control grid (pin No. 8) of the 6SA7 tube through a .00025 mfd. capacitor. The ground on the signal generator should be connected to the radio chassis ground.
2. Turn the condenser gang until it is completely meshed, (low-frequency end of dial calibration) and set the input selector switch to RAD.
3. Adjust the signal generator to EXACTLY 455 kc. and peak the second i-f transformer and the first i-f transformer trimmers in that order.

BROADCAST BAND ALIGNMENT

1. Remove the signal generator lead from the 6SA7 grid and connect it to the control grid (pin 4) on 6SK7 RF tube.
2. Check the tuning dial pointer adjustment. When the plates of the tuning condenser are completely meshed, the dial pointer must be in line with the last calibration mark at the low frequency end of the dial. If it is not, slide the pointer on its string to the correct position. Be sure to crimp the lugs (on the rear of the pointer) tightly around the string to hold the pointer in adjustment.
3. Set the signal generator and the radio receiver to 1400 kc., adjust the 1400 kc. oscillator trimmer and the 1400 kc. r-f trimmer for maximum output.
4. Adjust the signal generator and the radio receiver to 600 kc. While rocking the gang condenser a few degrees to the right and to the left, adjust the 600 kc. oscillator padder for maximum indication on the output meter. If considerable adjustment was necessary, recheck the 1400 kc. trimmer setting.
5. Form three turns of wire into a loop, connect this loop to the signal generator and loosely couple it to the cabinet antenna.
6. With the signal generator and dial at 1400 kc., adjust the loop antenna trimmer for maximum output.

SPECIAL SERVICE INFORMATION

The following information is provided for the service man who has a vacuum tube voltmeter or a similar measuring instrument available.

DIAL CORD REPLACEMENT

Two separate drive cables are used in the CR-209 dial assembly. One cable is used to transmit the motion from the tuning knob to the large pulley that is coupled to the condenser gang; the other cable actuates the dial pointer whenever the large pulley on the condenser gang is rotated. Separate instructions for replacing either of these cables is given in the following paragraphs.

CONDENSER DRIVE CABLE REPLACEMENT

Remove dial assembly after taking out two screws on each side of chassis. Slide a short length (approximately ½ inch) of sleeving over one end of a length of dial cable, form a small loop and tie a knot in the manner shown on Figure 1. Tie spring to opposite end of cable making length including spring 20¾ inches. Hook loop over the metal hook in pulley "C" and lace the cable through the pulley slot and around the pulley in a counterclockwise direction when viewed from the rear of the chassis keeping the cable to the rear of the pulley groove. Lace the cable around the smaller diameter portion of the tuning control shaft wrapping 2½ turns *from front to back* then around the opposite side of pulley "C" into the pulley through the slot. Hook the end of tension spring "D" in the hole provided in pulley "C"; completing this operation.

DIAL POINTER DRIVE CABLE REPLACEMENT

Remove dial assembly after taking out two screws on each side of chassis. Slip a one-half inch length of sleeving into a 42-inch length of dial cable. Tie the two ends to the loop end of the cable spring "E" securely so that the cable doubled measures 20¾ inches end to end including spring.

Place spring hook in bottom hole and draw cable through slot of pulley "C". Loop one end of cable around pulley "C" in a clockwise direction in front of condenser drive cable (viewing chassis from front) then loop the remaining end around pulley in a counterclockwise direction. Secure both ends of cable to chassis at edge of pulley slot with scotch tape, keeping piece of sleeving on remaining loop of cable.

Replace dial assembly and loop cable over pulley "A". While holding cable taut remove scotch tape and loop cable over pulley "B".

Turn the tuning control shaft until the condenser gang is completely meshed and slide the dial pointer on its track until it is in line with the last calibration mark at the low frequency end of the dial. The short piece of sleeving installed prior to the stringing operation should be slid to the rear of the dial pointer and the crimping lug on the pointer pressed over the sleeving. After checking to make certain that the condenser gang is completely meshed and the dial pointer is in the position specified previously, apply a few drops of cement to each end of the sleeving to which the dial pointer is fastened. This completes the operation.

MODELS CR-210A, CR-210B, CR-210C

THE MAGNAVOX CO.

ALIGNMENT PROCEDURE

The alignment of this receiver requires the use of an accurately calibrated r-f signal generator and an output meter. All trimmer condenser locations are shown on the chassis layout diagram, Figure 3. The radio volume control should be turned to maximum and the signal generator output kept as low as possible during alignment to prevent the AVC from operating and giving false readings.

All alignment adjustments except antenna trimmer adjustment can be made with the loop antenna leads disconnected. When checking overall operation with the signal generator, the generator can be connected across the loop antenna terminals on the rear of the chassis. It is not necessary to remove the loop antenna from the cabinet for alignment of this receiver.

I-F ALIGNMENT

1. Connect the output of the signal generator to the control grid (pin No. 8) of the 6SA7 tube through a .00025 mfd. capacitor. The ground on the signal generator should be connected to the radio chassis ground.
2. Turn the condenser gang until it is completely meshed, (low-frequency end of dial calibration) and set the input selector switch to RAD.
3. Adjust the signal generator to EXACTLY 455 kc. and peak the second i-f transformer and the first i-f transformer trimmers in that order.

BROADCAST BAND ALIGNMENT

1. Remove the signal generator lead from the 6SA7 grid and connect it across H and L on terminal strip on the rear of the chassis. The high side of the signal generator should be connected to H and the signal generator ground to L.
2. Check the tuning dial pointer adjustment. When the plates of the tuning condenser are completely meshed, the dial pointer must be in line with the last calibration mark at the low frequency end of the dial. If it is not, slide the pointer on its string to the correct position. Be sure to crimp the lugs (on the rear of the pointer) tightly around the string to hold the pointer in adjustment.
3. Set the signal generator and the radio receiver to 1400 kc., adjust the 1400 kc. oscillator trimmer and the 1400 kc. r-f trimmer for maximum output.
4. Set the signal generator and radio receiver to 600 kc. Adjust the oscillator and r-f coil slugs for maximum output. If considerable adjustment was necessary re-check the 1400 kc. trimmer settings.
5. Replace chassis in cabinet and connect loop antenna leads to proper terminals on the rear of the chassis.
6. Form three turns of wire into a loop, connect this loop to the signal generator and loosely couple it to the receiver loop antenna.
7. With the signal generator and dial at 1400 kc., adjust the loop antenna trimmer for maximum output.

SPECIAL SERVICE INFORMATION

The following information is provided for the service man who has a vacuum tube voltmeter or a similar measuring instrument available.

STAGE GAINS*

R-F Grid to Converter Grid at:
600 kc. 10

R-F on Converter to I-F Grid at:
600 kc. 53

I-F on Converter Grid to I-F Grid at:
455 kc. (gang closed) 61

I-F Grid to Detector Plate at:
455 kc. 46

OSCILLATOR OUTPUT VOLTAGE

The DC voltage developed across the Oscillator Grid Resistor at:
600 kc. ..... 8.3 V.
or 0.38 ma. through 22,000 ohm Oscillator Grid Resistor (46).

AUDIO GAIN

Voltage required across the Volume Control to produce 0.5 watt speaker output** at 400 cycles is .062 volt with Input Selector Switch in RAD setting.

*Variations of ±20% are permissible. All readings made with sufficient input signal to provide 0.5 watt speaker output.

**0.5 watt speaker output at 400 cycles is equivalent to a reading of 1.22 volts as measured by a high resistance AC voltmeter across the voice coil of speaker.

SPECIFICATIONS

Power supply	117 volts 50/60 cycles AC
Power consumption	70 watts
Power output	6 watts
Intermediate frequency	455 kc.
Tuning frequency range	540–1620 kc.
Speaker:	
Field coil resistance	1500 ohms
Voice coil impedance (400 cycles)	3.0 ohms
Output transformer	6,500/3 ohms

NOTES

ALL ELECTRICAL VALUES SHOWN ARE IN OHMS OR MMF UNLESS OTHERWISE SPECIFIED.

SELECTOR SWITCH SHOWN IN COUNTER-CLOCKWISE POSITION WHEN VIEWED FROM THE FRONT PANEL.

DIAL CORD REPLACEMENT

Two separate drive cables are used in the CR-210 dial assembly. One cable is used to transmit the motion from the tuning knob to the large pulley that is coupled to the condenser gang; the other cable actuates the dial pointer whenever the large pulley on the condenser gang is rotated. Separate instructions for replacing either of these cables is given in the following paragraphs.

CONDENSER DRIVE CABLE REPLACEMENT

Remove dial assembly after taking out two screws on each side of chassis. Slide a short length (approximately ½ inch) of sleeving over one end of a length of dial cable, form a small loop and tie a knot in the manner shown on Figure 1. Tie spring to opposite end of cable making length including spring 20¾ inches. Hook loop over the metal hook in pulley "C" and lace the cable through the pulley slot and around the pulley in a counterclockwise direction when viewed from the rear of the chassis keeping the cable to the rear of the pulley groove. Lace the cable around the smaller diameter portion of the tuning control shaft wrapping 2½ turns *from front to back* then around the opposite side of pulley "C" into the pulley through the slot. Hook the end of tension spring "D" in the hole provided in pulley "C"; completing this operation.

DIAL POINTER DRIVE CABLE REPLACEMENT

Remove dial assembly after taking out two screws on each side of chassis. Slip a one-half inch length of sleeving into a 42-inch length of dial cable. Tie the two ends to the loop end of the cable spring "E" securely so that the cable doubled measures 20¾ inches end to end including spring.

Place spring hook in bottom hole and draw cable through slot of pulley "C". Loop one end of cable around pulley "C" in a clockwise direction in front of condenser drive cable (viewing chassis from front) then loop the remaining end around pulley in a counterclockwise direction. Secure both ends of cable to chassis at edge of pulley slot with scotch tape, keeping piece of sleeving on remaining loop of cable.

Replace dial assembly and loop cable over pulley "A". While holding cable taut remove scotch tape and loop cable over pulley "B".

Turn the tuning control shaft until the condenser gang is completely meshed and slide the dial pointer on its track until it is in line with the last calibration mark at the low frequency end of the dial. The short piece of sleeving installed prior to the stringing operation should be slid to the rear of the dial pointer and the crimping lug on the pointer pressed over the sleeving. After checking to make certain that the condenser gang is completely meshed and the dial pointer is in the position specified previously, apply a few drops of cement to each end of the sleeving to which the dial pointer is fastened. This completes the operation.

SPECIFICATIONS

Power supply ..... 117 volts 50/60 cycles AC
Power consumption ..... *200 watts
Power output ..... 45 watts
Output impedance ..... 15/7.5/1.5 ohms

Tubes:
Power output (push-pull parallel stage) ..... (4) 6L6G
Rectifiers ..... (2) 5U4G

Speakers:	No. 583113 (Bass)	No. 580005 (Tweeter)	(2) No. 583112 (Tweeter)
Field coil resistance	225 ohms	PM	75 ohms
Voice coil resistance	12 ohms	3.2 ohms	†3.2 ohms

*Power consumption is for amplifier and CR-213 radio chassis.
†Voice coil resistance of one speaker.

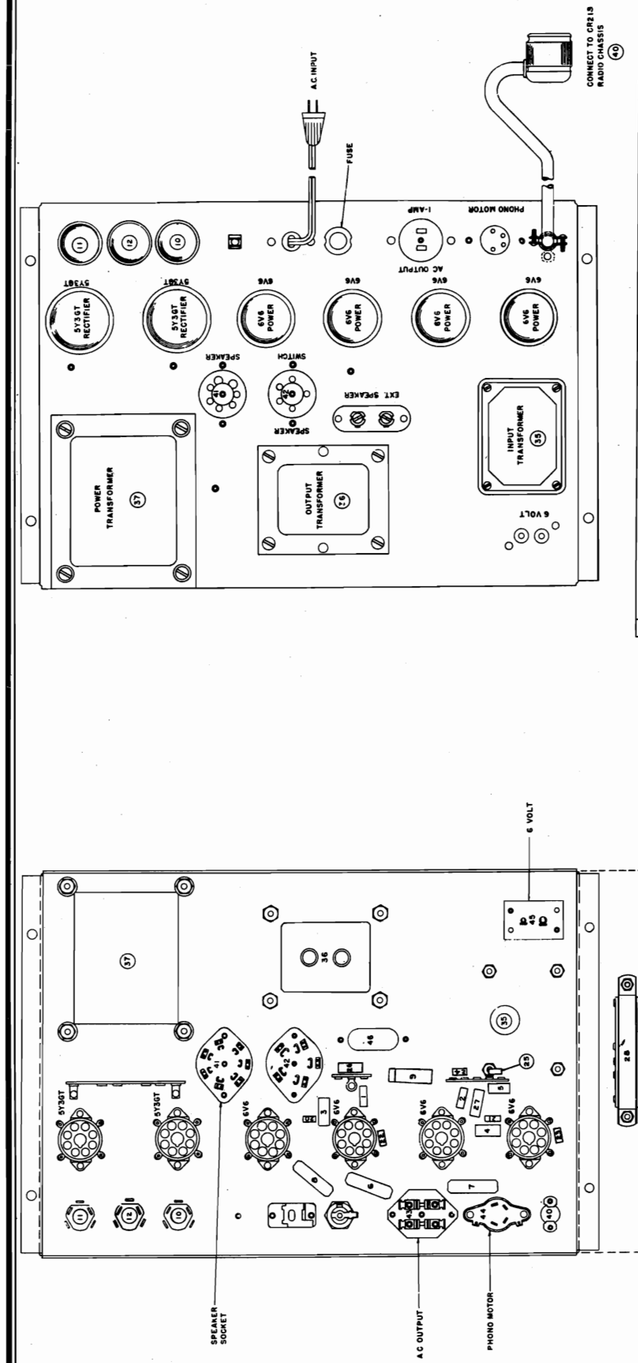
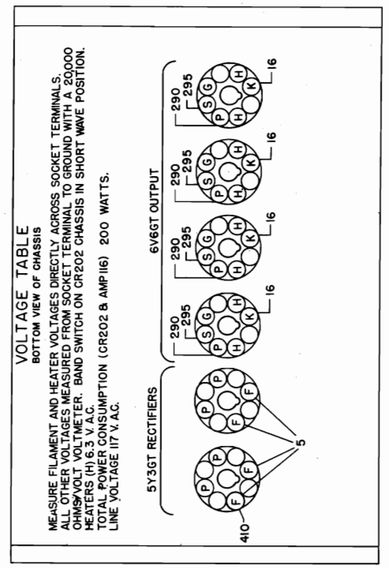
MODEL AMP-116



VOLTAGE TABLE

BOTTOM VIEW OF CHASSIS

MEASURE FILAMENT AND HEATER VOLTAGES DIRECTLY ACROSS SOCKET TERMINALS. ALL OTHER VOLTAGES MEASURED FROM SOCKET TERMINAL TO GROUND WITH A 20000 OHMS/VOLT VOLTMETER. BAND SWITCH ON CR202 CHASSIS IN SHORT WAVE POSITION. HEATERS (H) 6.3 V. A.C.
TOTAL POWER CONSUMPTION (CR202 & AMP116) 200 WATTS.
LINE VOLTAGE 117 V. A.C.



THIS SHORTING PLUG MUST BE INSERTED IN SOCKET ABOVE FOR NORMAL OPERATION. WHEN SPEAKER SELECTOR SWITCH IS USED, REMOVE SHORTING PLUG AND REPLACE IT WITH PLUG SUPPLIED AS PART OF SWITCH ASSEMBLY.

SPEAKER SWITCH ASSEMBLY (OPTIONAL)

THREE POSITION SPEAKER SELECTOR SWITCH SHOWN IN EXTREME COUNTERCLOCKWISE POSITION (NO. 1).

POSITION
1. CABINET SPEAKERS-15 OHMS
2. CABINET AND EXTERNAL SPEAKERS
3. EXTERNAL SPEAKERS - 3 OHMS.

9	6SG7 1st. I.F. Grid	.01mfd.	10.7 MC	FM	88 MC	T3 top	Align for max. voltage at test jack pin 3 Rock gen. over 10.7 MC to check for symmetrical I.F. response.
10	Converter	.01mfd.	10.7 MC	FM	88 MC	T2 top	Align for max. voltage at text jack pin 3 Rock gen. over 10.7 MC to check for symmetrical I.F. response. Re-check peaking of T4, and T3.
11	Converter grid 6BE6	.01mfd.	10.7 MC	FM	88 MC	T5 primary	Align for max. voltage across ½ discriminator Load (un-used Lug bottom of T5 to ground)
12	Converter grid 6B6E	.01mfd.	10.7 MC	FM	88 MC	T5 secondary	Align for zero voltage across full discriminator load (Test jack pin 1 to ground)
13	FM ant.term.	direct	108 MC	FM	108 MC	C10	Scale OSC at 108 MC (max. voltage Test jack pin 3.
14	FM ant.term.	direct	108 MC	FM	108 MC	C8,C3	Align FM RF and Ant. (max. voltage Test jack pin 3.
15	FM ant.term.	direct	88 MC	FM	88 MC	L4	Scale osc. at 88 MC.
16	FM ant.term.	direct	88 MC	FM	88 MC	L3,T1	Align RF and Ant. at 88 MC repeat steps 13, 14, 15, 16 as necessary.

NOTE: 1. A much more satisfactory IF and discriminator alignment may be obtained by using a 10.7 MC Signal generator frequency modulated at an audio frequency and swept approximately 600 KC (±300 KC). An oscilloscope should be connected to Test jack pin 3 and all IF screws adjusted for a symmetrical pattern of highest amptitude. See Fig. 1. For discriminator alignment, connect scope to Test jack pin 1 and adjust T5 for highest symmetrical pattern. See Fig. 2.

NOTE: 2. In all FM alignment calling for a voltage measurement at Test jack pin 3 (limiter grid resistor) keep signal generator output to such a value as will result in approximately 2 volts measured with a vacuum Tube voltmeter such as the Voltohmyst, Vomax or equiv.

RFC-4	3-104	Diode plate choke
S1	11-58	Band switch (R.F.).
S2	11-59	Band switch (pilot lites & audio)
S3	.....	Part of Tone control assembly, A.C. switch.
T1	3-183	F.M. antenna transformer.
T2	3-173	1st I.F. transformer.
T3	3-174	2nd I.F. transformer.
T4	3-175	3rd I.F. transformer.
T5	3-176	Discriminator transformer
T6	2-9	Power transformer
T7	3-186	B.C.-S.W. R.F. transformer.
T8	3-185	S.W. antenna transformer.
T9	52-58	Output transformer (part of speaker ass'y).
	15-81	Tube socket (octal)
	15-87	Phono pick-up socket.
	15-135	Phone A.C. receptacle socket.
	26-2	Dial lite (#47 brown bead).
	26-7	Dial lite (#44 blue bead)
	16-34	Tube shield, for 6BA6 & 6BE6 tubes.
	S-1570	Dial pointer & carriage assembly.
	135-30-2	Dial pointer, lower carriage only
	129-56	Dial cord tension spring.
	S-1329	Dial cord, 62 inches long (#134-7).
	S-1328	Dial cord (for condenser gang).
	117-63	Dial scale F.M.
	117-90	Dial scale B.C.
	117-91	Dial scale S.W.
	**22-58	Speaker, 12" complete with output transformer
	115-45-2	Cabinet, combination console.
	122-44	Dial escutcheon grill
	122-20	Escutcheon glass (large).
	21-32	Record changer, Oak
	117-50	Dial masking plate.
	128-85	Knob, (band switch)
	129-46	Spring, insert for above knob
	128-37	Knob, (tone-tuning-volume).
	S-1330 or S-1863	R.F. shelf & tuning condenser ass'y

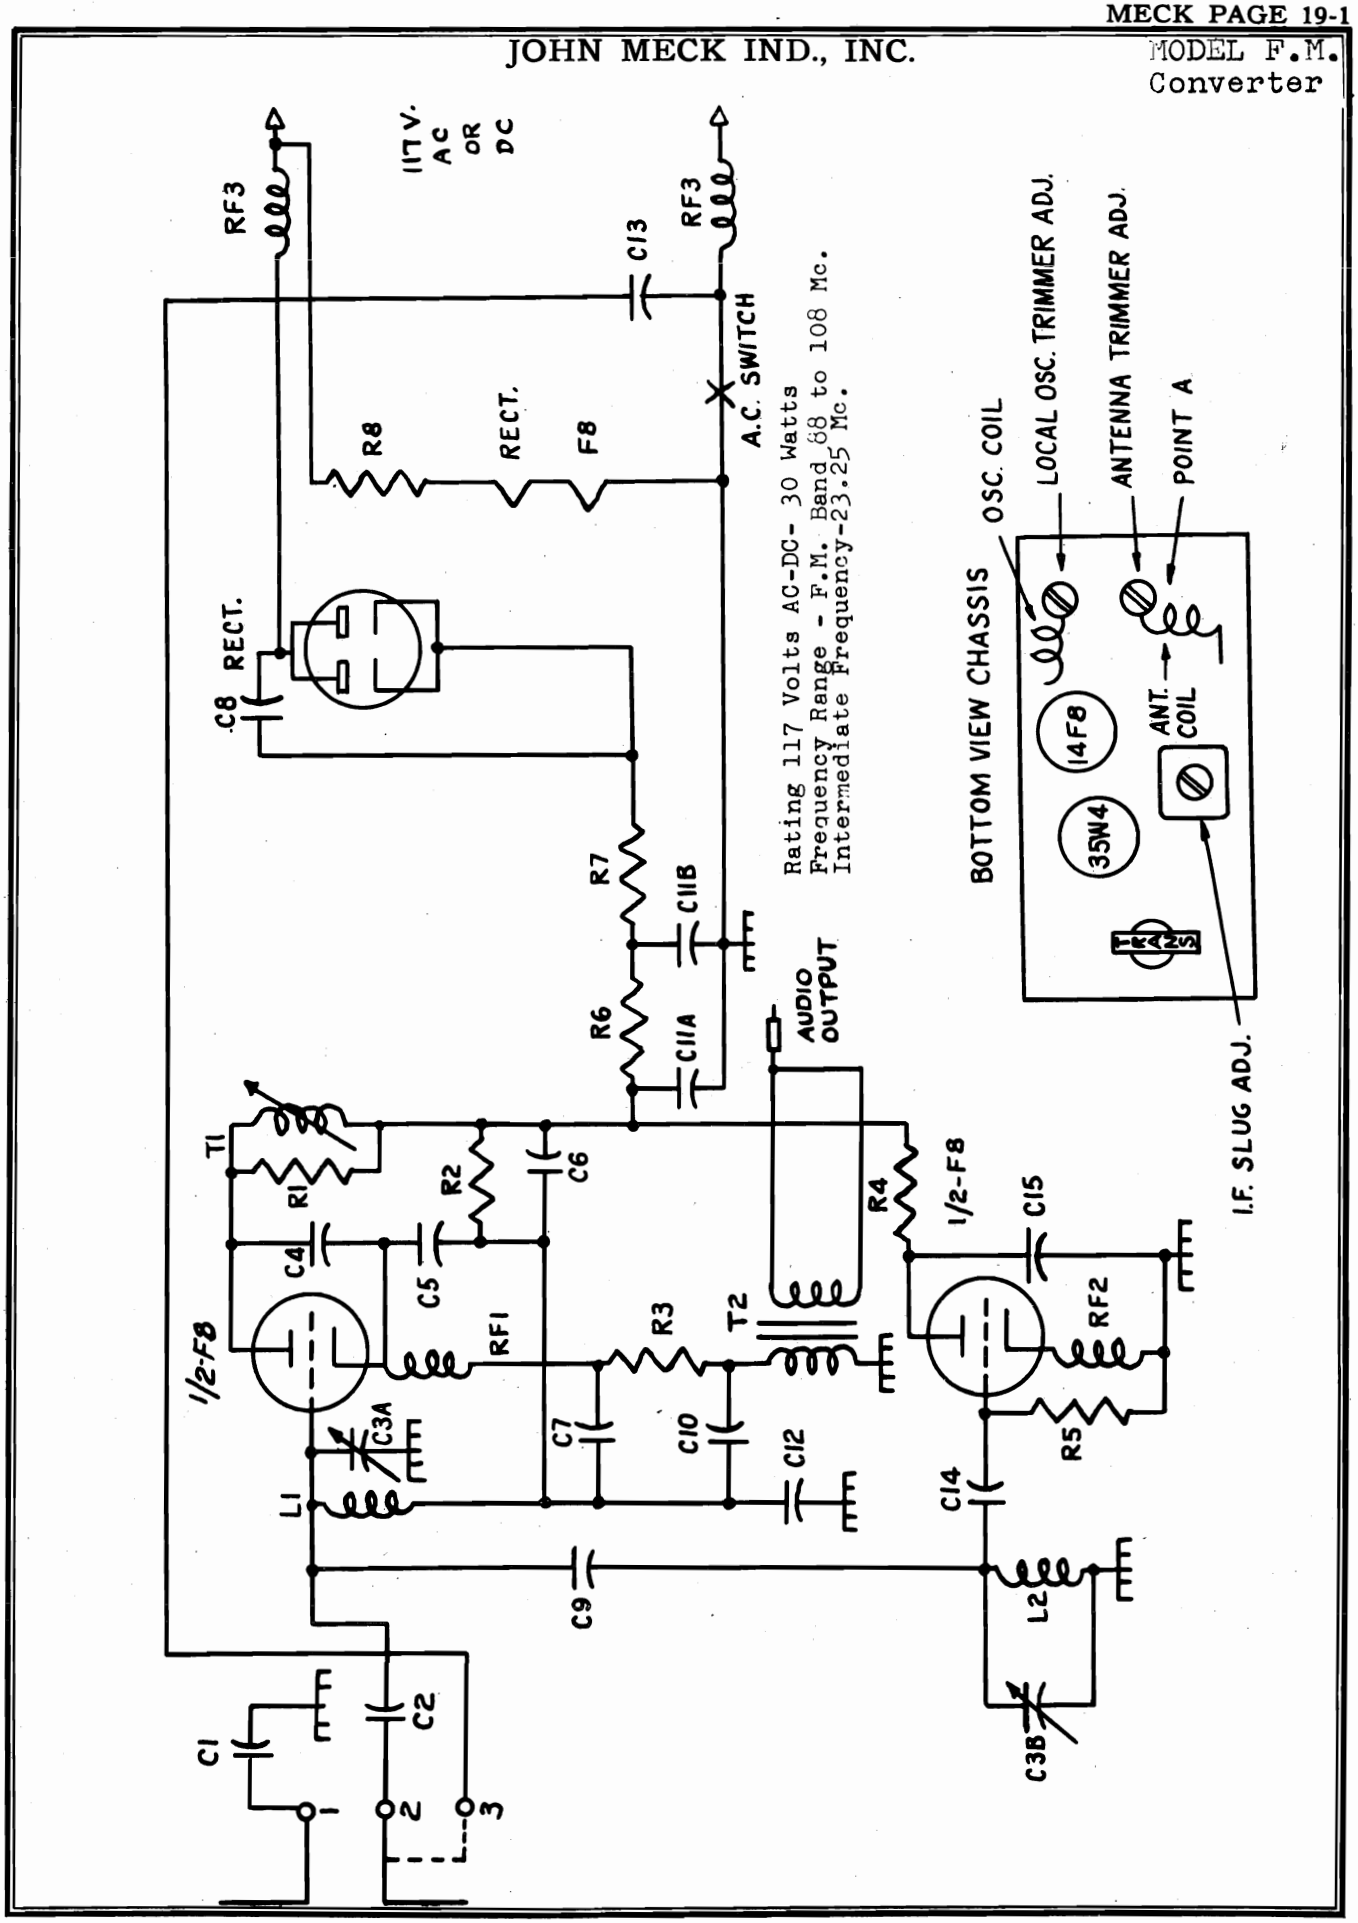
** Speakers marked with a BLUE X have a change of wiring; ref; speaker plug and chassis socket, pin #2 interchanged with pin #5. Change refers to LATE RUN SETS ONLY.

** R29 (700 ohm) Resistor is omitted in chassis using speaker #22-58. Sets using 10" speakers — schematic circuit remains the same.

(TUBES 5Y3GT & 5U4G ARE INTERCHANGEABLE)

JOHN MECK IND., INC.

MODEL F.M. Converter



INSTRUCTIONS

Alignment Notes

GENERAL DESCRIPTION:

In addition to functioning as a converter-oscillator in a superheterodyne circuit, one section comprising of pins 1 - 3 - 4 of the *14F8 double triode, as used in the MECK F.M. Converter, is functioning as super-regenerative detector and I.F. amplifier. Since the super-regenerative amplification is at the intermediate frequency, relatively little energy is radiated from the antenna. Pins 5 - 6 - 8 is the triode section of the *14F8 that is used as a local oscillator for normal superheterodyne action. Detection of the frequency modulation is accomplished by the signal being normally resident on the side of the selectivity curve. This is the reason it is necessary to slightly mistune the received signal for best F.M. reception.

CIRCUIT SYMBOL	PART NUMBER	DESCRIPTION

RF1	TSP-10016	Choke (Inside I.F. Can) & (T1)
RF2	LG-10002	12 Uh. Choke
RF3	LG-10001	Line Cord Inductor
T2	TO-10009	Audio Transformer

The super-regenerative circuit is inherently self-regulating; that is, it acts as if it had good automatic volume control. This super-regenerative circuit has the added feature of an automatic regeneration control, applied to the quench-oscillator Capacitor C-7 and the Resistor R-3, in the cathode controls the quench wave shape, selectivity, and is the quench pulse width control. While the Resistor R-2 and the Capacitor C-6 in the plate circuit regulate the average grid current repetition rate and so controls the regeneration automatically.

The Converter contains a built-in antenna system which is internally connected to Terminal #3. To use the built-in antenna, connect together Terminals #2 and #3, with a short length of wire. In locations unfavorable to F.M. Reception, improved results will be obtained by using an inside or outside dipole antenna. This antenna must be carefully installed and connected to Terminals #1 and #2.

ALIGNMENT CHART

Use A.M. or F.M. Signal Generator

Alignment made with output meter across voice coil of speaker to which the converter is connected.

CIRCUIT ALIGNED	DIAL POINTER	SIGNAL GENERATOR 30% Modulation Freq. Connection	TRIMMER OR SLUG ADJUSTMENT	PROCEDURE
I.F.	108 Mc.	23.25 Mc. through .01 Capacitor to Point A or Pin #1 or F8 Tube	Bottom slug I.F. Can	Adjust for maximum output.
R.F.	105 Mc.	105 Mc. through 300 ohms to Terminal #1 and Terminal #2	Local Osc. Trimmer	Adjust for maximum output.
R.F.	105 Mc.	105 Mc. through 300 ohms to Terminal #1 and Terminal #2	Antenna Trimmer	Adjust for maximum output while rocking variable condenser

ALIGNMENT OF F.M. STATION:

If you do not have the equipment to make the necessary alignment adjustments, the R.F. section may be easily aligned on a local station. With the proper antenna attached, tune in an F.M. station, preferrably between 97 and 108 Mc. Note any difference in calibration and correct accordingly with the local oscillator trimmer. Then adjust the antenna trimmer for maximum output while rocking the variable condenser.

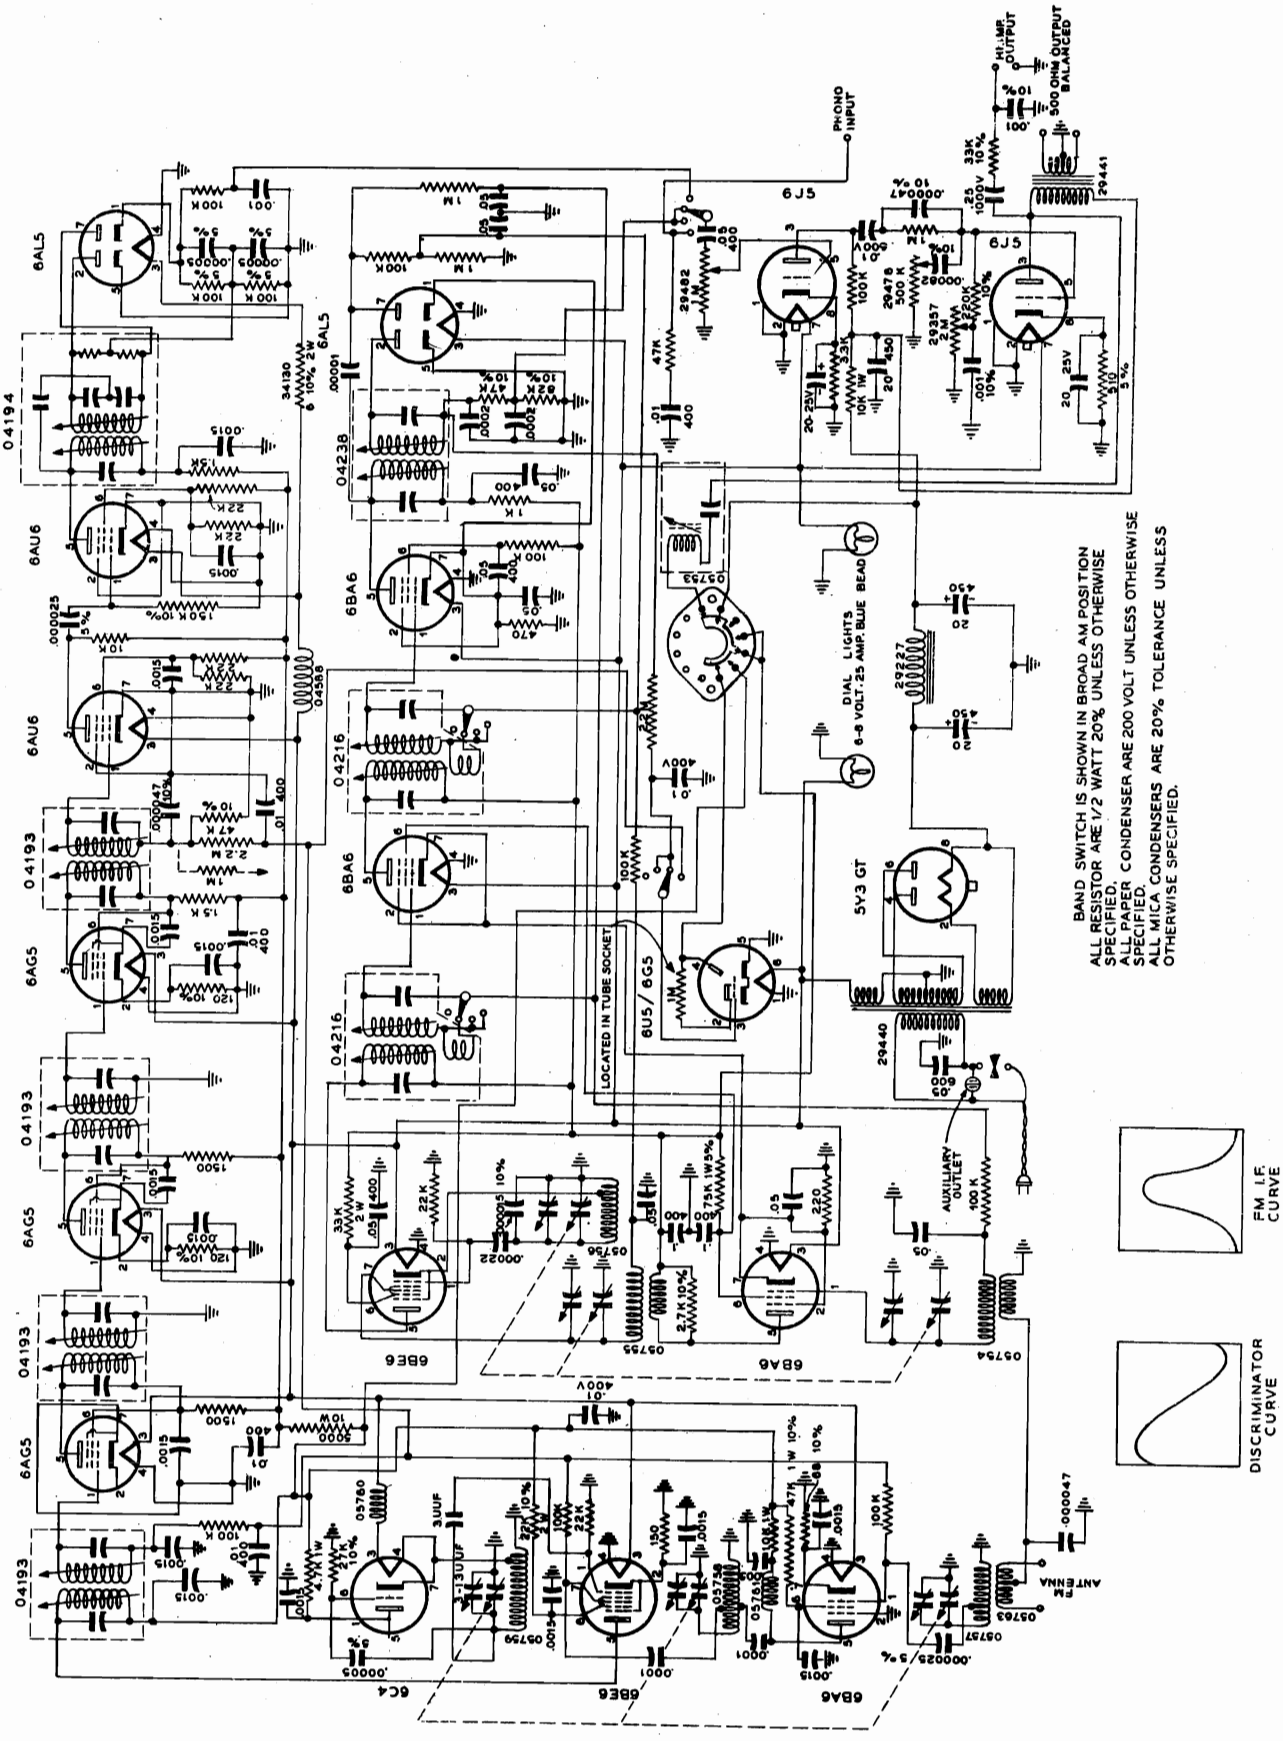
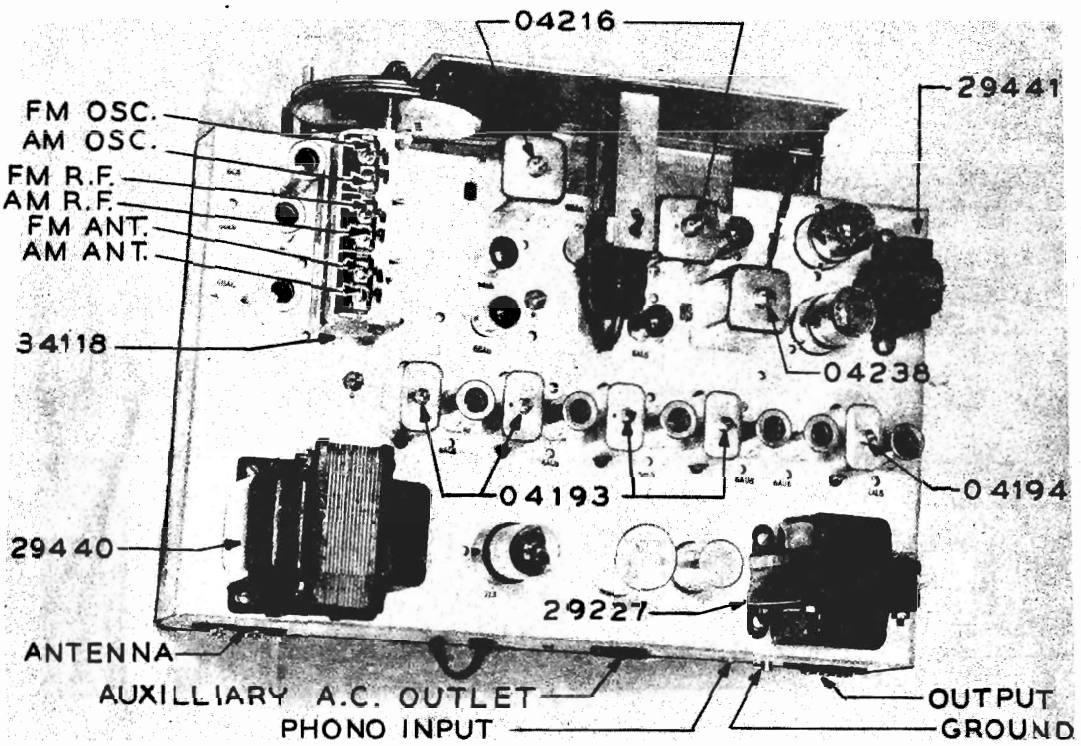
MEISSNER MFG. DIV.
MAGUIRE INDUSTRIES, INC.

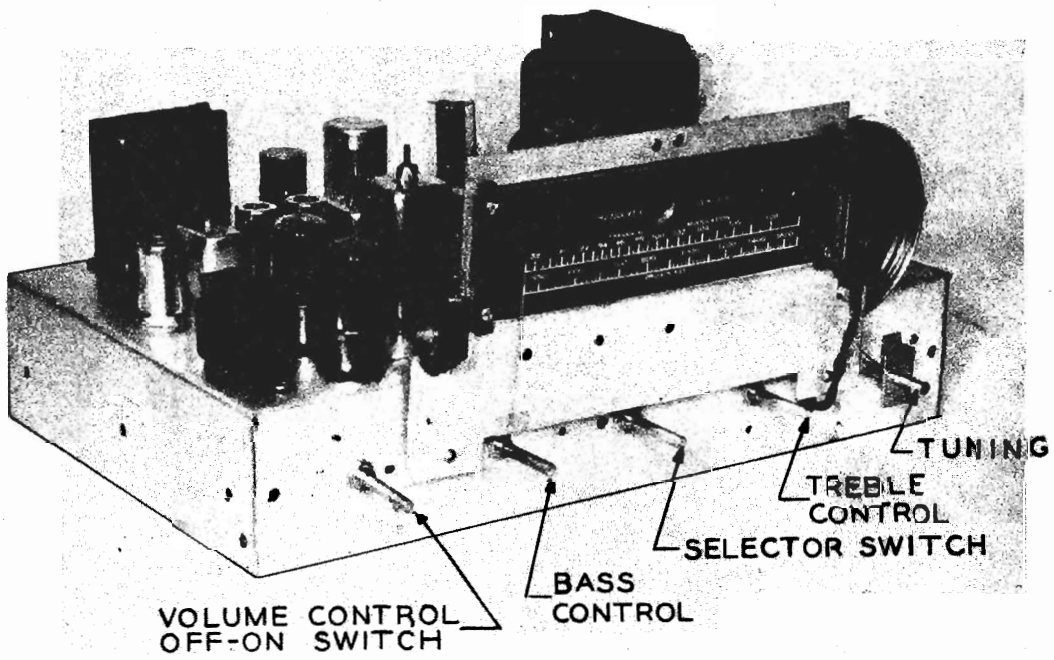
MODEL 9-1091C



MODEL 9-1091C

MEISSNER MFG. DIV.
MAGUIRE INDUSTRIES, INC.





Power Supply 105-125 volts, 50-60 cycles.
CAUTION, DO NOT ATTEMPT TO OPERATE ON OTHER SUPPLY.
Power Consumption 75 watts.
Type of Circuit - Superheterodyne.
Intermediate Frequencies AM 455 kc.
FM 10.7 mc.
Output impedance - 500 ohm balanced and high impedance unbalanced.
Antenna impedance
Broadcast - Standard
F M - - - - 300 ohms.

Alignment AM

The AM alignment may be carried out with an AM signal generator and an output meter. Connect a 500 ohm resistor across the 500 ohm output terminals of the Tuner. The output meter may be connected from the high impedance output terminal to chassis.

For IF alignment introduce a 455 kc. 30% modulated signal into the signal grid of the 6BE6 (Pin #7) through a .1 ufd. coupling condenser. The output of the signal generator should at all times be kept as low as will give a satisfactory reading on the output meter. With the selector switch in the sharp position, adjust the top and bottom adjustments of IF transformers 04216, 04216, and 04238 for maximum output. Now move the selector switch to the broad position and check the symmetry of the IF response curve by swinging the signal generator frequency. The response in the broad position should be double peaked, the dip between the peaks falling at 455 kc. The peaks should be equally spaced on either side of 455 kc. and should be of approximately the same amplitude. The gain in the broad position will be less than the gain in the sharp position. If the above conditions do not exist, then a careful recheck of alignment in the sharp position should be carried out.

For RF alignment introduce a 30% modulated signal through a 200 uuf. dummy antenna to one of the FM antenna terminals. First check dial pointer position by turning the gang condenser to full mesh and setting the pointer to the last reference mark at the low end of the dial scale. With signal generator and Tuner set to 1400 kc., adjust the oscillator trimmer for maximum output, then adjust RF and antenna trimmers for maximum output.

Alignment FM

For FM alignment a frequency modulated generator (60 to 400 cycle modulation, 400 kc. sweep) and an oscilloscope are required. Connect the modulation source on the signal generator into the horizontal amplifier of the oscilloscope. It may be necessary to connect a phase shifting network in this line between the signal generator modulating source and the oscilloscope horizontal amplifier in order to get the correct pattern on the oscilloscope. Connect the Tuner output to the vertical amplifier input of the oscilloscope.

Introduce a 10.7 mc. (400 kc. sweep) signal into the grid of the first 6AU6 limiter tube (Pin #1) through a .01 ufd. condenser. Make the ground connection of the generator to the center post of the 6AU6 socket with as short a lead as

possible. Remove the last 6AG5 IF amplifier tube to avoid the possibility of stray signals coming through the IF system and confusing the discriminator alignment procedure. Adjust the signal generator sweep and signal amplitude, and the oscilloscope for a pattern like the discriminator pattern shown in Fig. 3. Adjust the top adjustment on the 04194 discriminator coil for maximum vertical amplitude on the oscilloscope pattern and adjust the bottom adjustment on this coil for best symmetry of the pattern about the center. Repeat these two adjustments until no further improvement can be made. This completes the adjustment of the discriminator coil. Replace IF tube.

For alignment of the IF amplifier the same oscilloscope set-up is retained except the input to the vertical amplifier. Feed the input to the vertical amplifier with audio taken from the first limiter grid return. This point is identified as point X on the circuit diagram of Fig. 3. Connection should be made to this point through a 1 megohm isolating resistor as shown by dotted line in Fig. 3.

Introduce a 10.7 mc. (400 kc. sweep) signal into the signal grid of the 6BE6 (Pin #7) through a .01 ufd. condenser. Make the ground connection of the signal generator to the center post of the 6BE6 socket with as short a lead as possible. Adjust signal generator and oscilloscope to obtain a pattern like the IF pattern shown in Fig. 3. Adjust top and bottom adjustments on the four 04193 IF coils for maximum amplitude and symmetry of the pattern, keeping the signal level from the generator as low as possible throughout the adjustment. If the pattern tends to become double peaked or badly unsymmetrical during adjustment the trouble is probably due to incorrect placement of some of the connecting leads in the test set-up. Corrections should be made to eliminate the trouble and the adjustments repeated.

For the high frequency adjustments the same oscilloscope set-up may be retained. In connecting the signal generator to the antenna terminals the signal generator is not connected to chassis as in the previous connections. Connect two 150 ohm resistors to the two antenna terminals on the tuner. Connect the other ends of these two resistors to the two generator output terminals. If the setting of the dial pointer has been previously checked during AM alignment it is not necessary to recheck it at this point. Set the signal generator and the Tuner to 106 mc. and adjust the oscillator trimmer (identified in Fig. 1) to bring the pattern to center on the oscilloscope. In case this is possible with two different positions of the oscillator trimmer, use the position of least capacity. Adjust the RF and Antenna trimmers (identified in Fig. 1) for the greatest amplitude of the pattern keeping the generator output as low as possible during the process of adjustment.

NOTE: Normal tolerance on components makes possible a variation of ± 20% in all DC voltage readings.

** Subject to wide variation.

Sensitivity - less than 10 microvolts.
Audio fidelity
  Flat within ± 2 db. from 30 to 15000 cycles.
Band width at 1000 kc.
  Sharp 7 kc.
  Broad 14 kc.
Output
  High impedance 11 volts maximum for 2-1/2% distortion.
  500 ohm 2 volts maximum for 2-1/2% distortion.
Distortion
  2-1/2% at full rated output
  Less at lower levels
Tone control action
  Bass boost at 40 cycles - 12 db.
  Treble suppression at 8000 cycles - 12 db.
Hum
  Maximum - 0.5 micro watts.

Power Amplifier

If this Meissner tuner is to be used with a power amplifier, a power amplifier should be chosen which will give full power output when driven with the maximum output of the Tuner (see "Nominal Performance" ratings). It is not essential that the power amplifier have exactly the right gain, but if best results are to be obtained the gain of the power amplifier should not greatly exceed the requirement. If, for instance, the power amplifier has an input jack for a phonograph pickup, then the Tuner might be fed into this jack through a voltage divider made from a 30,000 ohm potentiometer. This potentiometer should be adjusted to a level where full rated output (11 volts) from the Tuner will just produce full power output from the power amplifier. It is not recommended that the Tuner be fed into the Microphone input jack of a power amplifier.

ALIGNMENT INSTRUCTIONS—READ CAREFULLY BEFORE ATTEMPTING ALIGNMENT

To set pointer, turn tuning capacitor fully closed and set pointer at the last reference mark at the left end of the broadcast band dial. Keep output of signal generator no higher than is necessary to obtain output indication. When aligning FM RF section use dummy antenna and coupling transformer constructed as shown in sketch. Use insulated alignment screwdriver for adjusting.

1—DC Voltage measurements are at 20,000 ohms per volt; AC Voltages measured at 1,000 ohms per volt.
2—Socket connections are shown as bottom views.
3—Measured values are from socket pin to common negative.
4—Line Voltage maintained at 117 volts for voltage readings.
5—Nominal tolerance on component values makes possible a variation of ± 10% in voltage and resistance readings.
6—Volume control at maximum, no signal applied for voltage measurements.

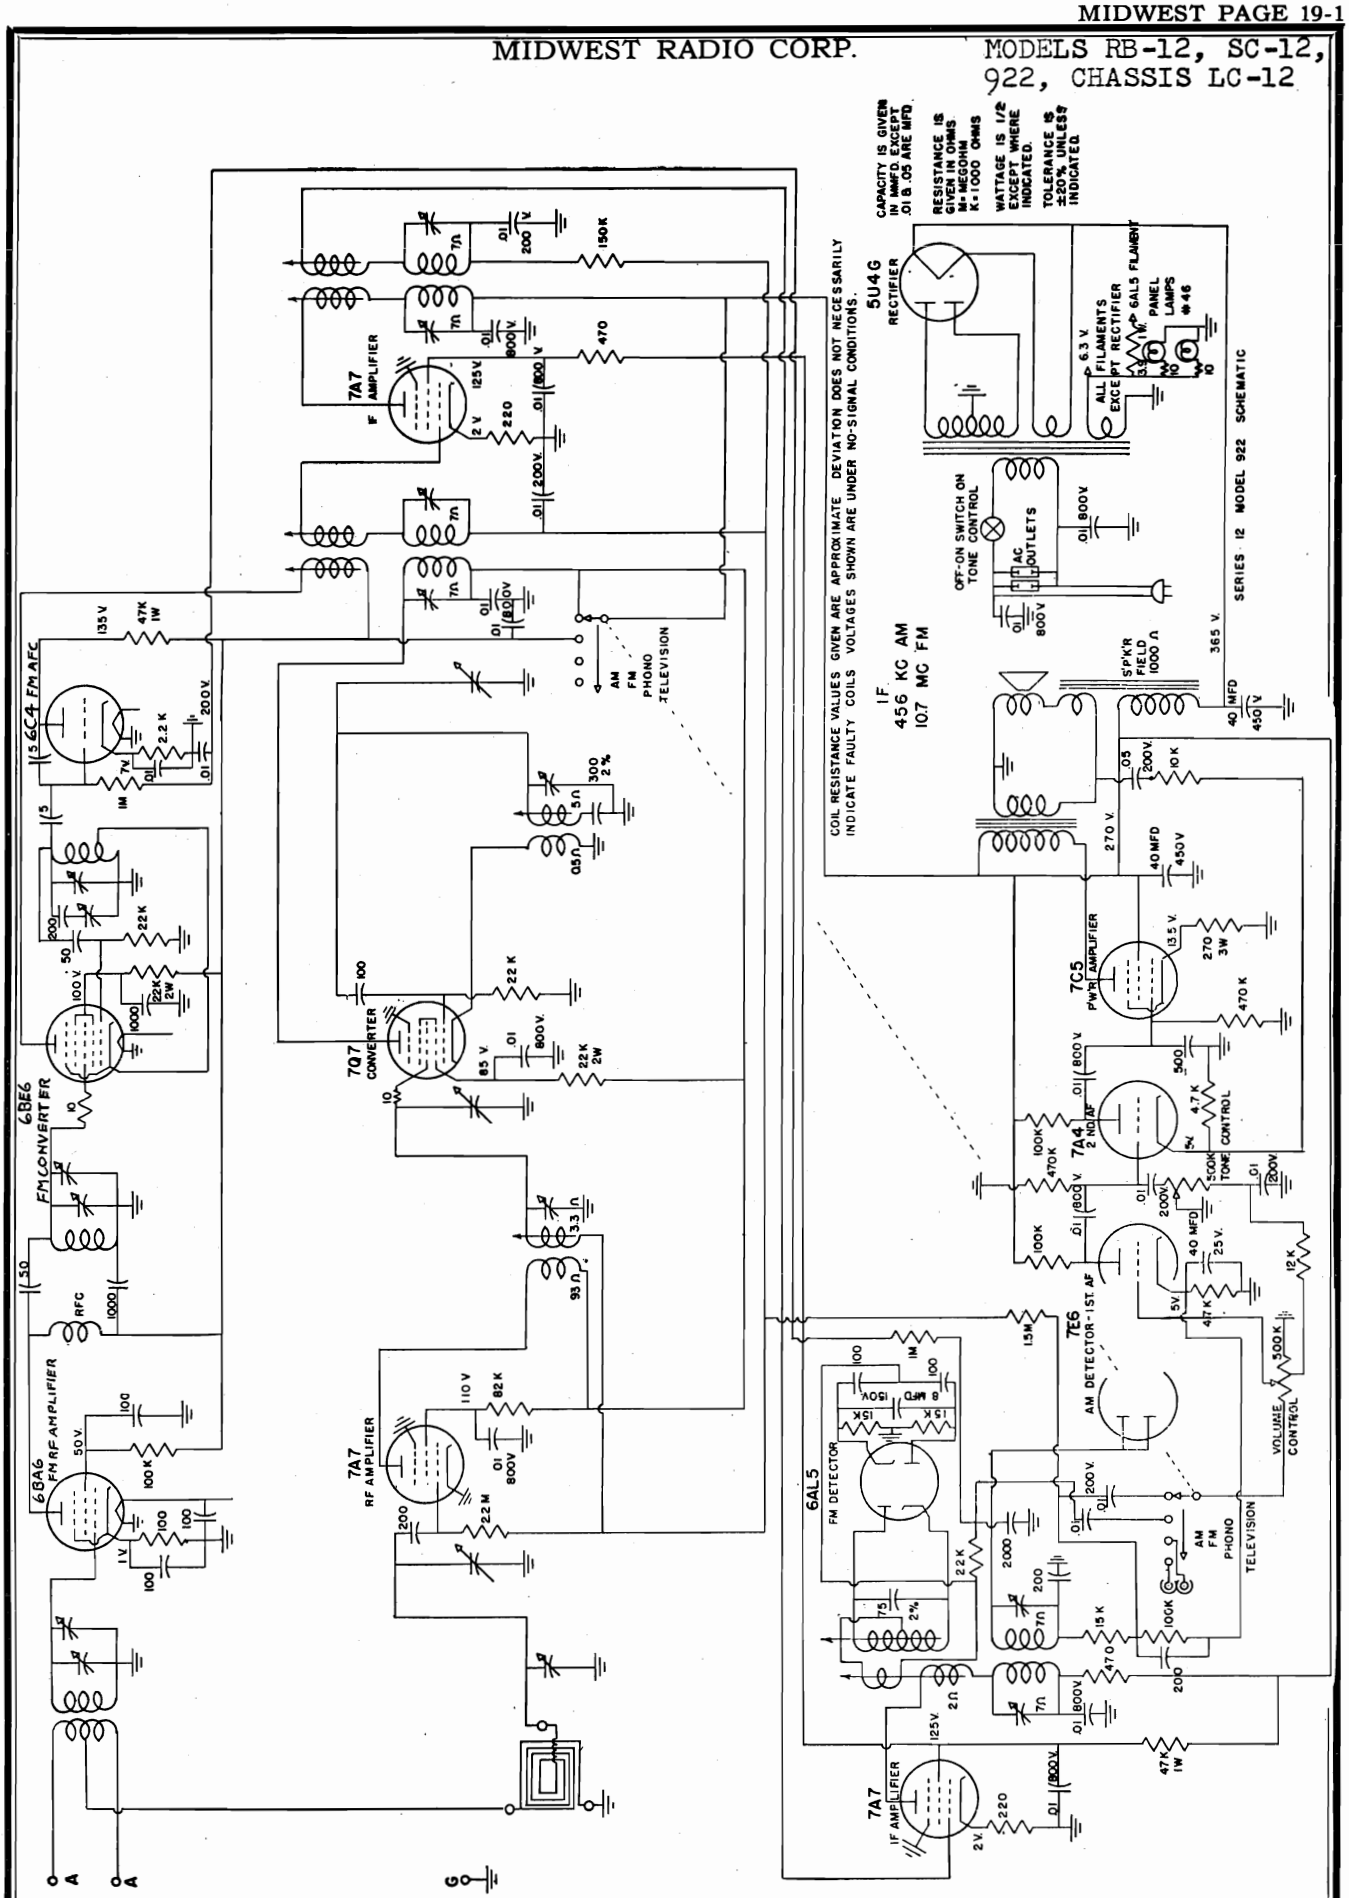
MIDWEST RADIO CORP. MODELS RB-12, SC-12, 922, CHASSIS LC-12



ALIGNMENT — Refer to the alignment chart for step by step procedure. It is preferable to align the FM IF stages with an AM or CW Signal. It should be noted that all adjustment are made for peak avc reading except the secondary of the third transformer. At this point, if you use an AM signal, it may be tuned for minimum audio signal; or the discriminator voltage may be used, reading it with a VTVM, and the secondary may be adjusted to the zero voltage. There may be some discrepancy between these methods, and if it is not excessive, is of no importance.

The FM RF alignment should be made using an FM signal and either avc or audio for peaking. In doing this alignment, or when feeding the IF signal into the FM mixer grid, care must be taken not to move the wiring. If the wiring is displaced so as to affect the inductance of the RF circuits it is difficult to re-establish the RF-Oscillator tracking.

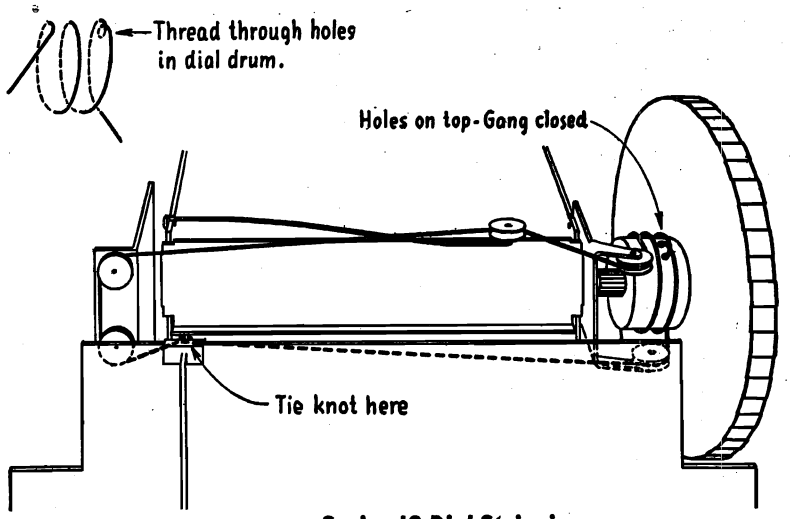
The AM, RF and IF alignment should be done with a VTVM across the avc. The recommended signal value is one which will generate 10 volts of avc. When aligning the "AM" band the loop must be plugged in and you need not adjust the RF padder core. The RF padder is very broad and can be aligned only if the converter grid lead is connected to an RF type VTVM as indicator; this will usually involve a signal level greater than is normally available.

ALIGNMENT CHART

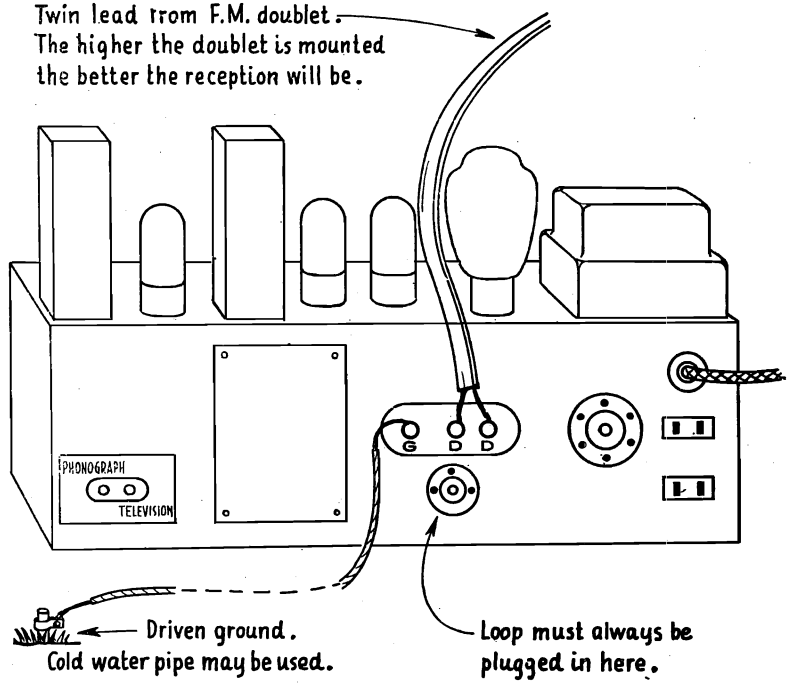
Coupling	Signal	Band Switch	Dial	Adjustment
To 7Q7 converter grid through .05 mfd. capacitor.	456 KC AM	AM	1000 KC	Peak 1st, 2nd and 3rd IF trimmers on top of IF cans.
To "A" on antenna ground terminal strip through 200 mfd. and 400 ohms in series.	1600 KC AM	AM	1600 KC	Peak RF, converter and oscillator trimmers marked "B".
	550 KC AM	AM	550 KC	Peak converter and oscillator padder cores marked "B". Loop must be plugged in. Do not adjust RF.
To 6BE6 mixer grid direct.	10.7 MC AM or CW *	FM	100 MC	Peak core adjustments for avc (around 3 volts) at 1st, 2nd and primary of 3rd IF. Adjust secondary of 3rd IF for audio null from 30% amplitude modulated 10.7 MC IF signal.
To "A" and "A" on doublet terminal strip through a pair 150 ohm resistors.	105 MC FM	FM	105 MC	Peak RF mixer and oscillator trimmers for avc or audio.

*Read text for use of CW for FM-IF alignment.

DIAL STRINGING — Use a light weight flexible dial cord when replacing worn or broken cord such as Beven-Wilcox FSN-25-12.



Series 12 Dial Stringing



Antenna Connections

Note: Order resistors and condensers by value, tolerance and wattage or voltage.

Note: When ordering include serial number of chassis, since Midwest records of changes in parts specifications are kept by that number.

KB-6	Push Buttons, Set of 7
OG-1	Miter Gear, Pair
PC-3	Loop Plug
PC-5	Phono & Television Plug
RV-5	Tone Control
RV-6	Volume Control
SP-5	Speaker
SR-12	Band Switch
TP-8	Power Transformer
*TR-11	1st IF Transformer
*TR-12	2nd IF Transformer
*TR-13	3rd IF Transformer
*UK-12	Mixer Coil Assembly
*UK-13	Oscillator Coil Assembly

To set the push buttons this exact procedure should be followed. A small screw driver will be needed.

1. **Turn on the receiver and allow at least three minutes to warm up.**
2. **Remove the push button by pulling straight out. A hooked instrument will assist in removing the end buttons.**
3. **Loosen the LOCK SCREW at least one half turn.**
4. **Using the screw driver with the blade in the screw slot, push the mechanism in firmly. Hold in during step 5. The mechanism may bind at first. Use sufficient force to break loose so that the push button and tuning control are independent.**
5. **Tune the pointer past the desired station then back to the desired station and make the tuning adjustment as carefully as you know how.**
6. **Tighten the LOCK SCREW.**
7. **Check the setting of this push button by tuning away from the station manually, then pushing in firmly. Pushing the button must return the pointer to the position it had when the LOCK SCREW was tightened. If the station is not now tuned in perfectly repeat the steps 2 to 6 carefully.**
8. **Adjust each of the seven buttons, or as many as you wish to set, exactly as outlined above.**

Any button can be set for any pointer position, however, you may find it more desirable to select the button nearest the pointer position so that each successive adjustment moves the pointer in the same direction. That is, the "M" button will be set for a station at the left of the dial, the "W" button will set for a station near the center, etc.

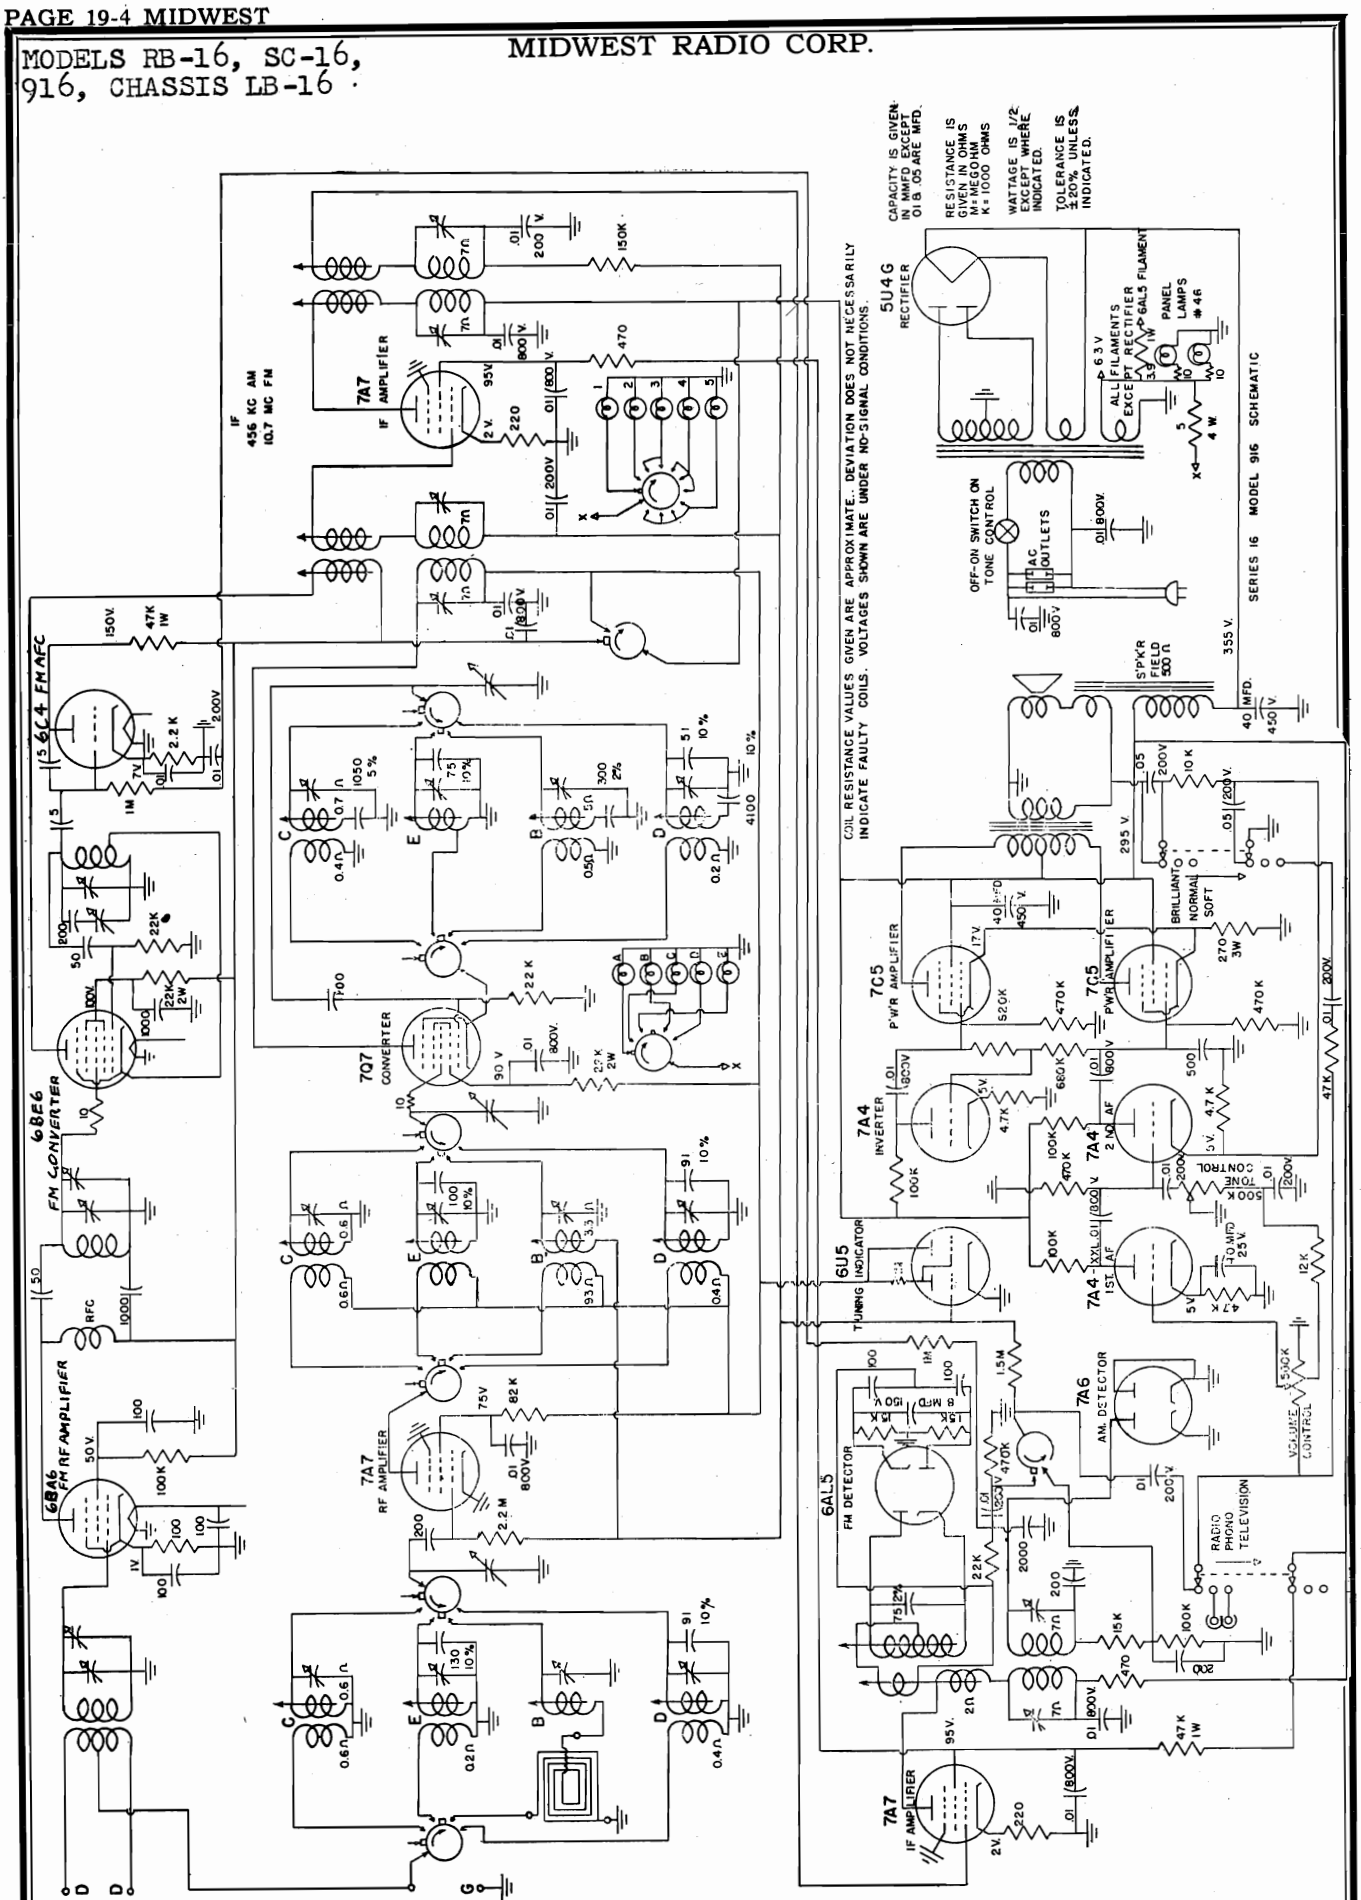
MIDWEST RADIO CORP.



ALIGNMENT — Refer to the alignment chart for step by step procedure. It is preferable to align the FM IF stages with an AM or CW Signal. It should be noted that all adjustment are made for peak avc reading except the secondary of the third transformer. At this point, if you use an AM signal, it may be tuned for minimum audio signal; or the discriminator voltage may be used, reading it with a VTVM, and the secondary may be adjusted to the zero voltage. There may be some discrepancy between these methods, and if it is not excessive, is of no importance.

The FM RF alignment should be made using an FM signal and either avc or audio for peaking. In doing this alignment, or when feeding the IF signal into the FM mixer grid, care must be taken not to move the wiring. If the wiring is displaced so as to affect the inductance of the RF circuits it is difficult to re-establish the RF-Oscillator tracking.

The AM, RF and IF alignment should be done with a VTVM across the avc. The recommended signal value is one which will generate 10 volts of avc. When aligning the "B" band the loop must be plugged in and you need not adjust the RF padder core. The RF padder is very broad and can be aligned only if the converter grid lead is connected to an RF type VTVM as indicator; this will usually involve a signal level greater than is normally available.

ALIGNMENT CHART

Coupling	Signal	Band Switch	Dial	Adjustment
To 7Q7 converter grid through .05 mfd. capacitor.	456 KC AM	B	1000 KC	Peak 1st, 2nd and 3rd IF trimmers on top of IF cans.
To "D" on antenna ground terminal strip through 200 mfd. and 400 ohms in series.	1600 KC AM	B	1600 KC	Peak RF, converter and oscillator trimmers marked "B".
	550 KC AM	B	550 KC	Peak converter and oscillator padder cores marked "B". Loop must be plugged in. Do not adjust RF.
	4.7 MC AM	C	4.7 MC	Peak "C" trimmers.
	1.6 MC AM	C	1.6 MC	Peak "C" cores.
	10 MC AM	D	10 MC	Peak "D" trimmer
	5 MC AM	D	5 MC	Peak "D" cores.
	22 MC AM	E	22 MC	Peak "E" trimmer.
	11.5 MC AM	E	11.5 MC	Peak "E" cores.
To 6BE6 mixer grid direct.	10.7 MC AM or CW *	A	100 MC	Peak core adjustments for avc (around 3 volts) at 1st, 2nd and primary of 3rd IF. Adjust secondary of 3rd IF for audio null from 30% amplitude modulated 10.7 MC IF signal.
To "D" and "D" on doublet terminal strip above "A-G" strip through a pair 150 ohm resistors.	105 MC FM	A	105 MC	Peak RF mixer and oscillator trimmers for avc or audio.

Read text for use of CW for FM-IF alignment.

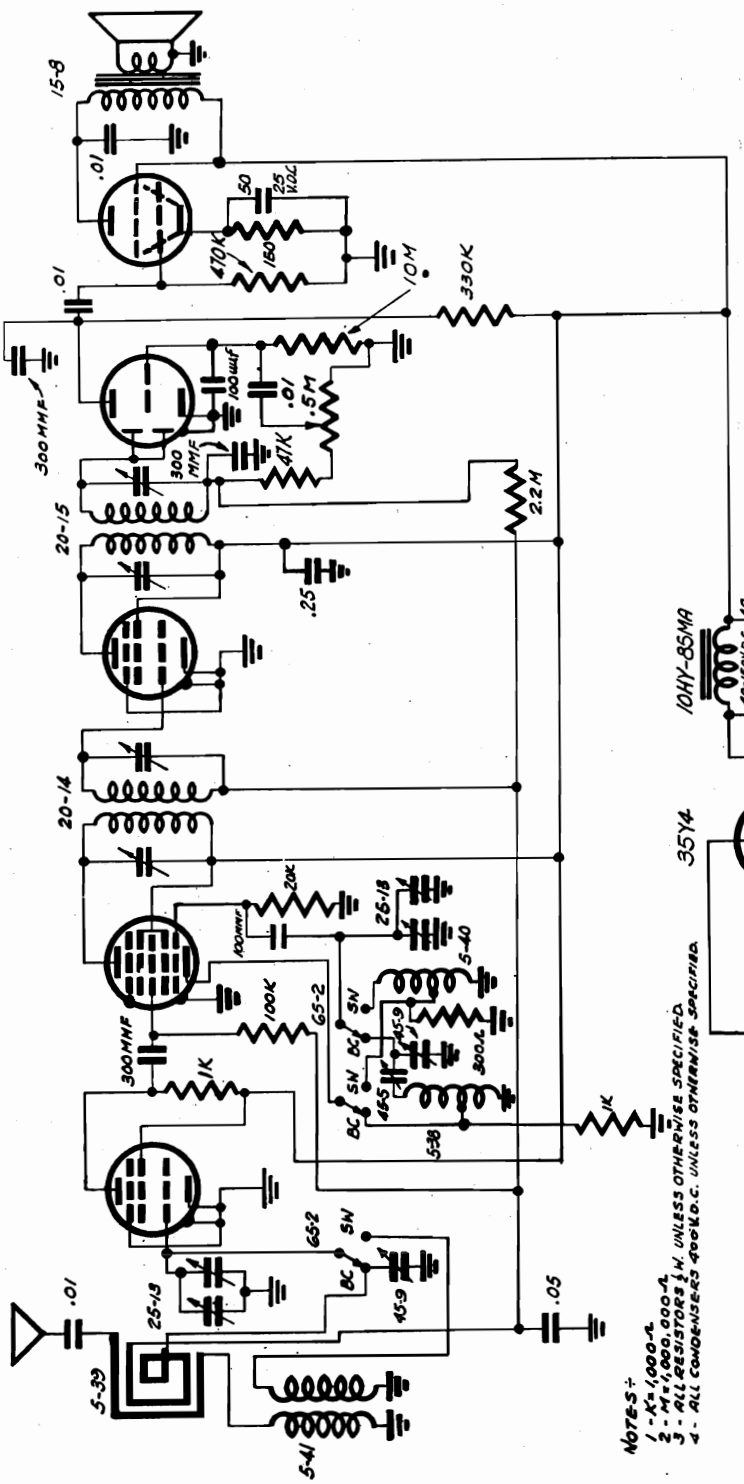
REPLACEMENT PARTS — Certain parts are available on an exchange basis; these are shown on the parts list with an "*."

MINERVA CORP. OF AMERICA

MODEL W-725



Tube Complement:—

1—6SK7 RF Amplifier
1—6SA7 Converter
1—6SK7 IF Amplifier
1—6SQ7 2nd Detector, AVC, 1st Audio
1—50L6 Power Amplifier
1—35Y4 Rectifier

Tuning Range—Standard Broadcast 540—1640 KCS.
International Shortwave 5.4—19 MCS.

Power Supply:—105-125 volts direct current or 50 - 60 cycle alternating current.

ANTENNA

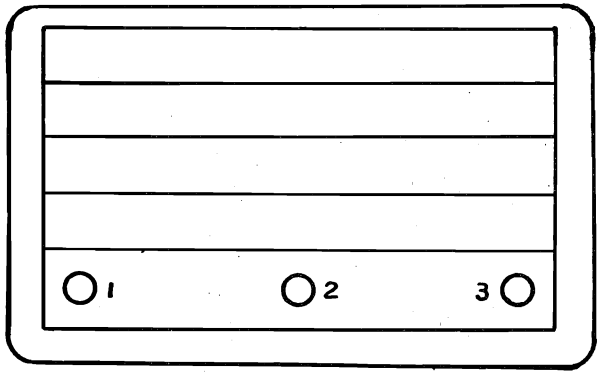
This receiver contains a built-in loop Antenna of excellent design and will give good results even in localities where broadcast signals are weak. It may be necessary, however, to turn the set toward the direction of the desired signal to provide maximum loop pick-up. For best reception of distant stations an external Antenna should be used. A screw connector is provided on the cabinet back for easy connection to an outdoor Antenna. An external Antenna is required for shortwave reception. Where space prohibits an outdoor installation, 10 feet of insulated wire stretched out on the floor will usually give adequate results.

INITIAL ADJUSTMENT

Plug line cord connector into 115 volt current supply outlet. Turn Power Switch (see drawing below) clockwise until a click is heard. Wait one minute for tubes to heat and advance control until a response is heard. If the set does not operate or if a loud hum is heard, remove plug, rotate ½ turn and replace in socket.

CONTROLS

The position and function of the three controls are shown in diagram below:



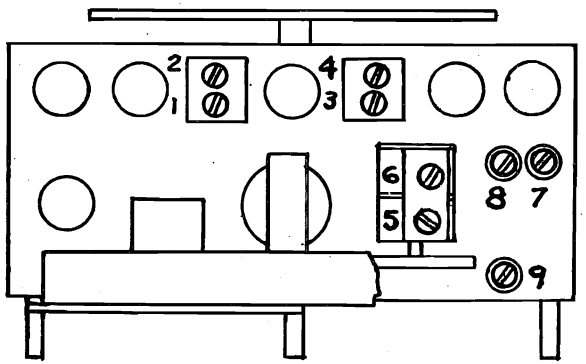
No. 1—Power Switch and Volume Control

No. 2—Tuning Control

No. 3—Band Switch, counter clockwise for broadcast — clockwise for Short-wave.

ALIGNMENT NOTES

The screws for adjusting the IF and RF Amplifiers, together with the frequencies at which adjustment is to be made, are shown in diagrams below.



Generator Connection	*Dummy Antenna*	*Band SW Position*	*Freq.*	*Adjust. Trimmers*

Intermediate frequency	455 kc
Power consumption	30 watts
Selectivity	1. A.C.A.—3 to 1. 2. A.C.A.—12.5 to 1
Sensitivity (for 0.5 watt output)	600 microvolts average
Power output (in voice coil):	
Undistorted	0.8 watts
Maximum	2.5 watts

MODEL M-500

MONITOR EQUIPMENT CORP.

ALIGNMENT PROCEDURE

(Refer to Chassis View)

- Output meter across 3.2-ohm output load.
- Volume control at maximum.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.
- Connect ground post of signal generator to chassis.

SIGNAL GENERATOR			*TUNER SETTING*	*ADJUST FOR MAXIMUM OUTPUT (in order shown)*

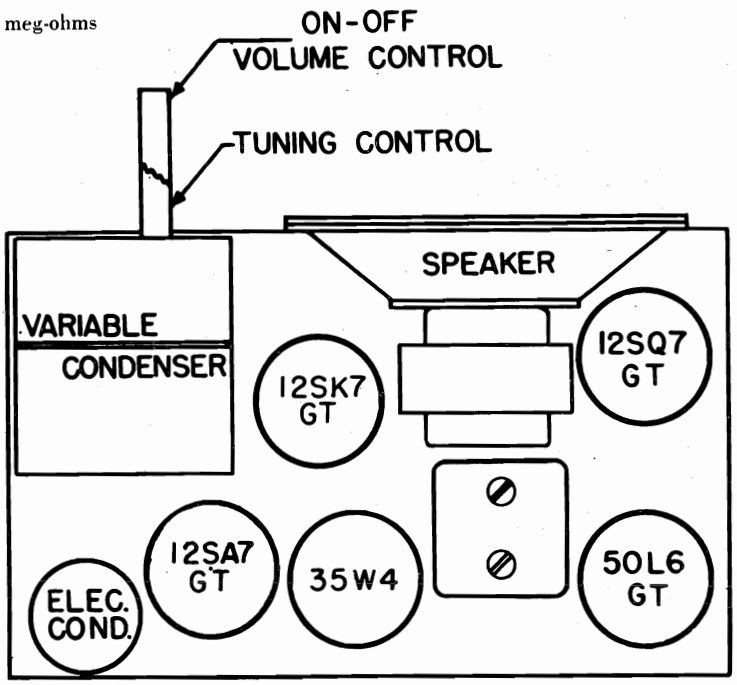
L5	1770	I.F. transformer
L4	1300	Output transformer
L1	62192	Loop

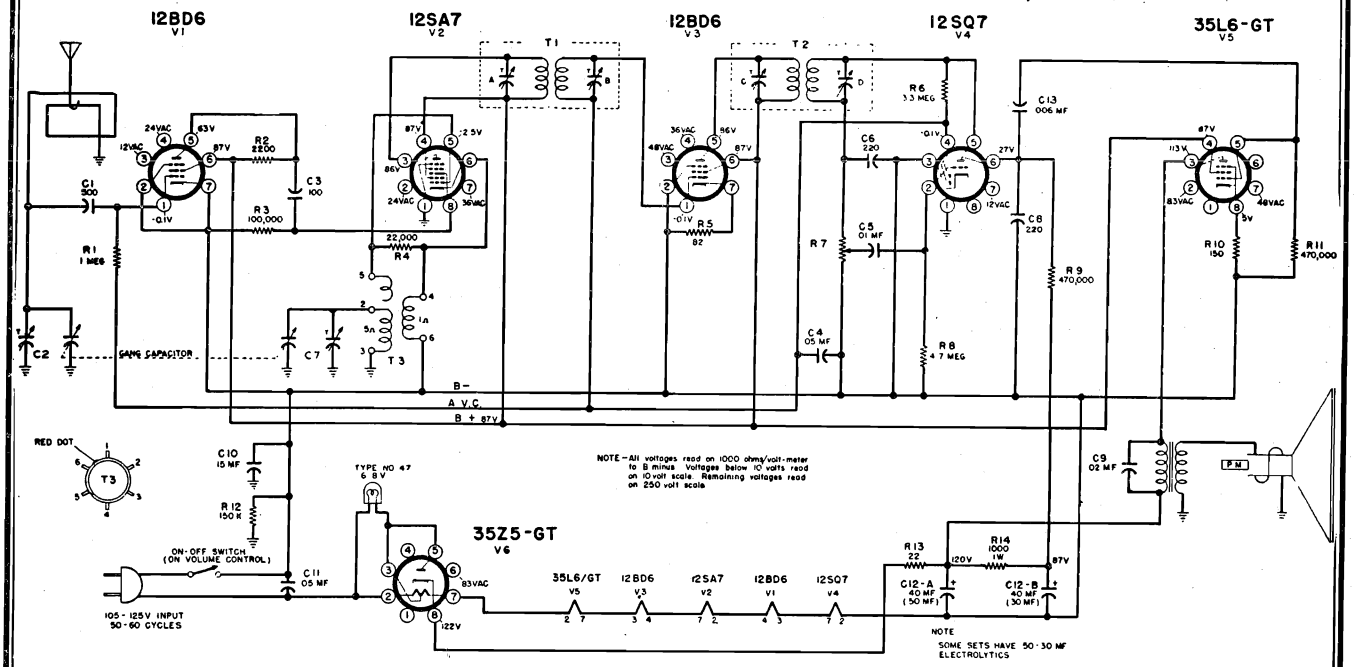


• The values of the resistors and mica capacitors listed above are based on RMA standards. Due to conditions beyond our control some receivers have been shipped with components of pre-standardized values. This receiver will operate equally well with components of either group. An illustration of the differences in both resistors and capacitors follows:

Pre-standardized value—50,000 ohms, 1/3 watt, 10%
RMA value—47,000 ohms, 1/2 watt, 10%
Pre-standardized value—200 mmf, 500 volts, 20%
RMA value—220 mmf, 500 volts, 20%

MONTGOMERY WARD

MODELS 84BR-1517A, 84BR-1518A



NOTE: On some sets slug tuned I.-F.'s are used instead of trimmer tuned I.-F.'s. 108-140Q and 108-145H are trimmer tuned. B-13A-12023-1 and B-13B-12022-1 are slug tuned. The slug tuned I.-F.'s are tuned from the top and bottom (secondary on top, primary on bottom).
When trimmer tuned I.F.'s are used, R5 is 270 ohms.

GENERAL DESCRIPTION

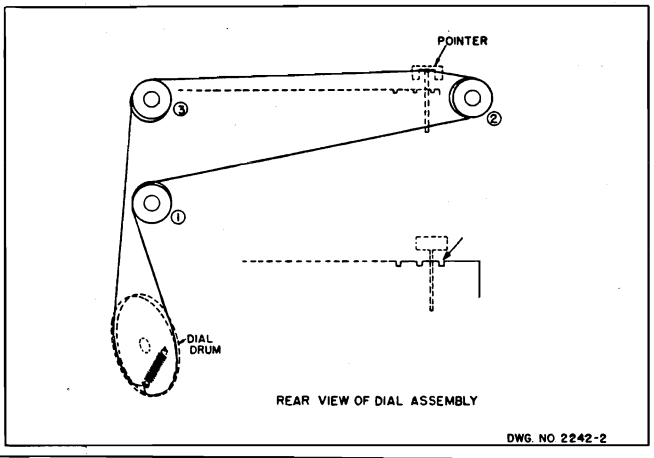
This receiver is a single-band, AC-DC set which uses 5 tubes plus a rectifier. The antenna input and oscillator circuits are tuned by a two-gang capacitor. A loop antenna is built into the cabinet; provision is made also for the connection of an external antenna. AVC voltage is applied to the grids of the R.F.-Amplifier, and IF-amplifier tubes.

ELECTRICAL SPECIFICATIONS

Power Supply.....105 to 125 volts, DC or 50-60 cycle AC, 35 watts.
Frequency Range.....530 to 1650 kc.
Intermediate Freq....455 kc.
Selectivity.....At 1000 kc, 55 kc at 1000 x signal.
Sensitivity.....40 microvolts average for .05 watt output.
Power Output.....0.8 watts undistorted, 1 watt maximum.
Loud Speaker.....5" P.M., v.c. impedance 3.2 ohms.
Tube Complement....12BD6, R. F. stage.
12SA7, converter.
12BD6, I. F. amplifier.
12SQ7, detector, AVC, audio amplifier.
35L6GT, output amplifier.
35Z5GT, rectifier.

REPLACING DIAL POINTER DRIVE CORD—

1. Rotate tuning knob to extreme clockwise position. This closes the tuning condenser. Knob should remain in this postion until installation of cord is completed.
2. Tie cord to loop in spring in drum. Pass around drum in direction shown.
3. Pass over idler pulley number 1, then around idler pulley number 2 as shown.
4. Pass cord over idler pulley number 3, then down around drum as shown. Tie to loop in spring in such a manner that the spring is partly stretched.
5. Place pointer on top edge of dial plate. Guide cord through the three fingers on the back of the pointer.
6. Make sure the tuning knob is in the extreme clockwise position. Slide the dial pointer along the edge of the dial plate until the left edge of the pointer coincides with the right hand notch on the gold background plate, when viewed from the front.
7. Push the cord firmly into the three fingers and clamp them tightly together.



REAR VIEW OF DIAL ASSEMBLY
DWG. NO. 2242-2

MODELS 84BR-1517A, 84BR-1518A

MONTGOMERY WARD

SETTING THE PUSHBUTTONS—The pushbuttons may be used, after proper adjustment, for the automatic tuning of any six stations which you select. They can be set up in any order.

1. Turn on the radio. Allow it to warm up for at least one minute.

2. Push out the call letters of the six stations from the call-letter sheets supplied with this manual.

3. Insert one call-letter tab in the rectangular opening in each of the pushbuttons, in any sequence. Press an acetate tab (supplied in small envelope) into each of the pushbuttons.

4. With the screwdriver supplied, check to see that the locking screw in the center of the tuning knob (see illustration) is loose. If it is not, turn it several turns to the left (counterclockwise).

5. Press the first pushbutton down *all the way*. With one hand hold the button down *firmly* and with the other carefully tune in the desired station. Release the pushbutton.

6. Follow this procedure for each of the five other buttons, adjusting each one for a different station.

7. Rotate the tuning knob on the side of the cabinet as far to the right as it will go. Tighten the locking screw in the center of the knob. IT IS IMPORTANT THAT THIS SCREW BE TIGHTENED VERY FIRMLY.

8. The pushbuttons are now properly set for automatic tuning. Any of the six stations may now be tuned in simply by pressing the proper button down as far as it will go. If it is desired to reset any of the buttons for a new station, loosen the locking screw in the center of the tuning knob, set the pushbutton as described above, and re-tighten the locking screw.

ALIGNMENT PROCEDURE AND RECEIVER STAGE SENSITIVITIES

The signal source must be an accurately calibrated signal generator capable of supplying R. F. signals modulated 30% with a 400-cycle audio signal. A 400-cycle source is necessary for the audio measurement.

The table below lists the sensitivity at various points. All measurements are based on an output of 50-milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm, 5-watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50-milliwatt output with the speaker connected. Variations of plus or minus 25% are usually permissable. Volume control at maximum for all adjustments.

SIGNAL GENERATOR				TUNER SETTING	ADJUST FOR MAXIMUM OUTPUT	INPUT FOR 50-MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection			
455 kc.	.1 mf.	Pin No. 8 of 12SA7	12SQ7 Pin 3	Rotor full open	Trimmers on output and input I.F. cans	100 microvolts
1650 kc.	.1 mf.	Pin No. 8 of 12SA7	12SQ7 Pin 3	Rotor full open	Oscillator trimmer C7 (on bottom)	———
1400 kc.	none	See note A	none	Set dial at 1400	Antenna trimmer C2 (on bottom)	———

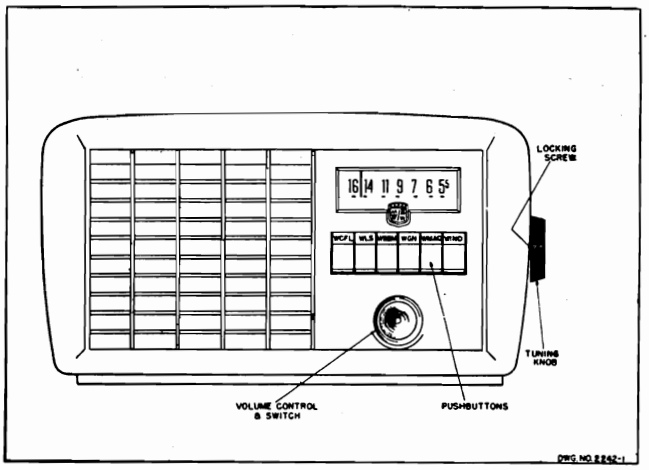
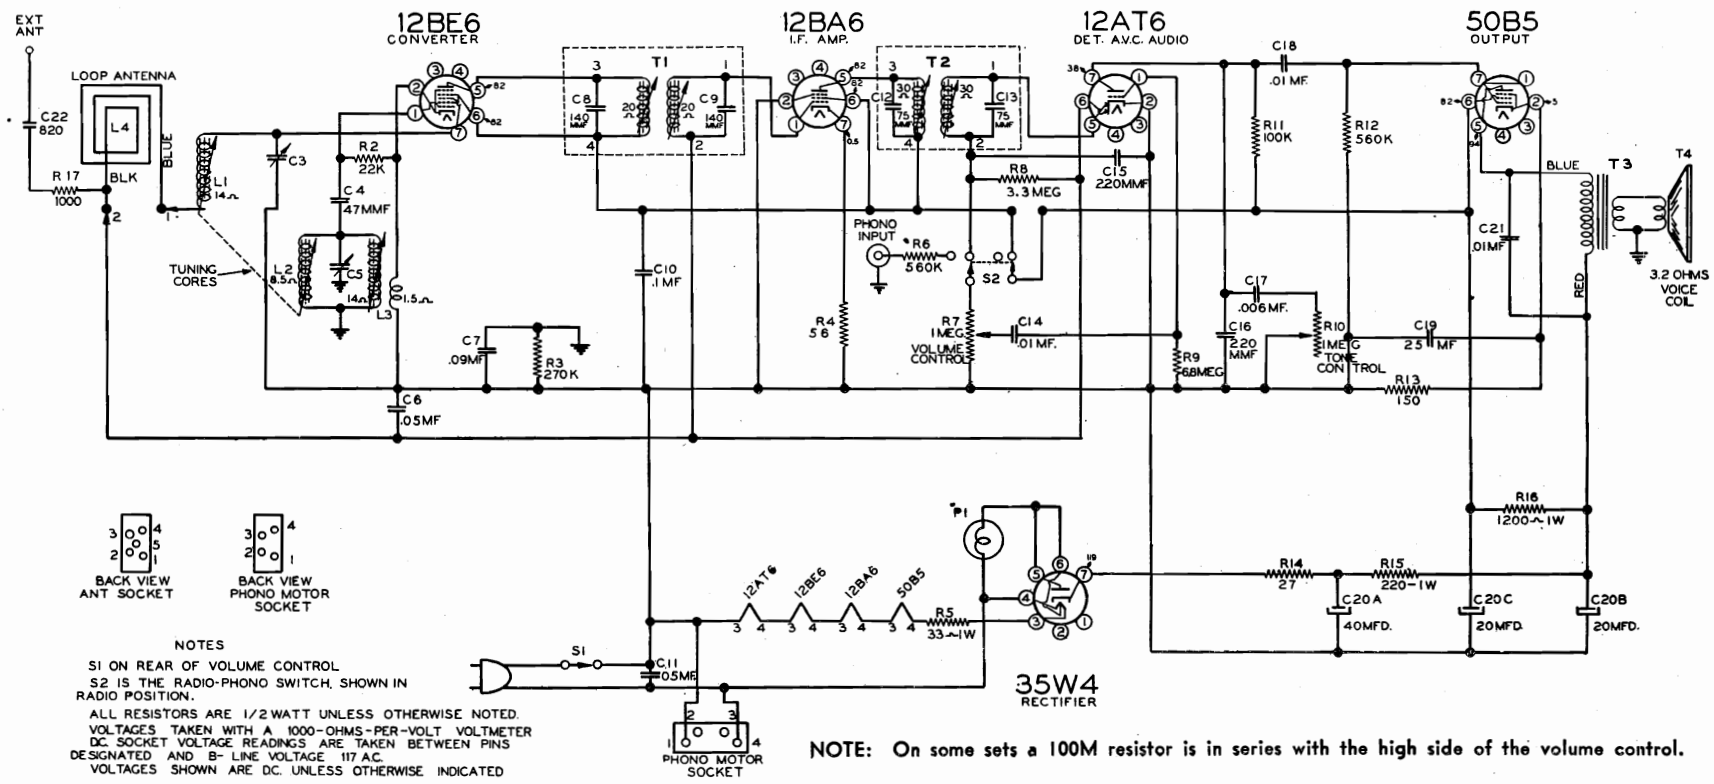
CHASSIS VIEW, SHOWING TUBE LOCATIONS
(See note on I.-F.'s.)





NOTE: On some sets a 100M resistor is in series with the high side of the volume control.

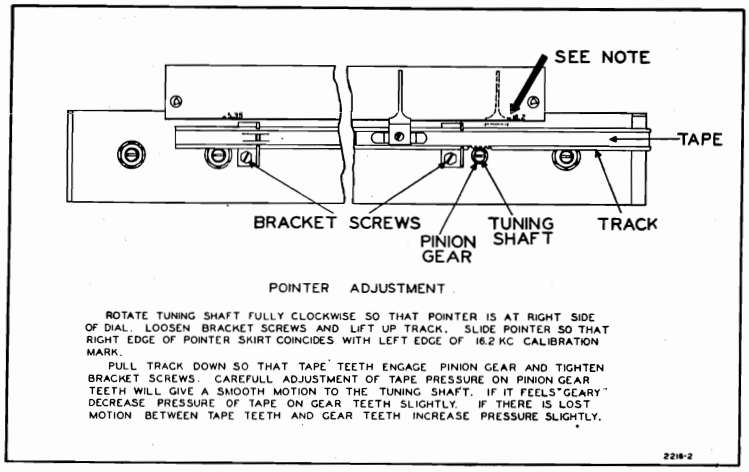
GENERAL DESCRIPTION

This radio-phonograph is a permeability-tuned, AC set using 4 miniature tubes plus a rectifier. A loop antenna is built into the back of the cabinet. A clip is provided for connection of an external antenna. Simple AVC voltage is applied to the converter and IF-amplifier tubes. The filament string is across the AC line.

ELECTRICAL SPECIFICATIONS

Power Supply.....105 to 125 volts; 60 cycles AC, 60 watts.
Frequency Range.....535 to 1620 kc.
Intermediate Freq....455 kc.
Selectivity.....At 1000 kc. 50 kc. at 1000 x signal.
Sensitivity.....10 microvolts average for .05 watts output.
Power Output.....0.75 watts undistorted, 1.0 watts maximum.
Loud Speaker.....4" x 6" oval, P.M., v.c. impedance 3.2 ohms.
Tube Complement.....12BE6, converter
12BA6, I.F. amplifier.
12AT6, detector, AVC, audio amplifier
50B5, output amplifier
35W4, rectifier
Pilot lite, 6-8 volts, T-47.

MONTGOMERY WARD MODEL 84BR-2003C

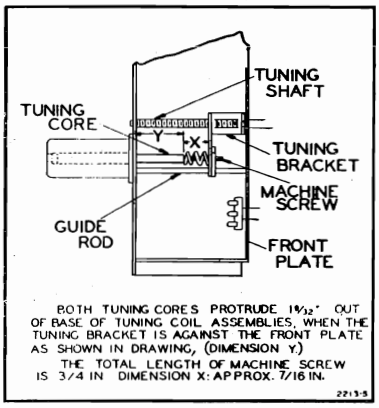


POINTER ADJUSTMENT

ROTATE TUNING SHAFT FULLY CLOCKWISE SO THAT POINTER IS AT RIGHT SIDE OF DIAL. LOOSEN BRACKET SCREWS AND LIFT UP TRACK. SLIDE POINTER SO THAT RIGHT EDGE OF POINTER SKIRT COINCIDES WITH LEFT EDGE OF 16.2 KC CALIBRATION MARK.

PULL TRACK DOWN SO THAT TAPE TEETH ENGAGE PINION GEAR AND TIGHTEN BRACKET SCREWS. CAREFULL ADJUSTMENT OF TAPE PRESSURE ON PINION GEAR TEETH WILL GIVE A SMOOTH MOTION TO THE TUNING SHAFT. IF IT FEELS "GEARY" DECREASE PRESSURE OF TAPE ON GEAR TEETH SLIGHTLY. IF THERE IS LOST MOTION BETWEEN TAPE TEETH AND GEAR TEETH INCREASE PRESSURE SLIGHTLY.

2218-2



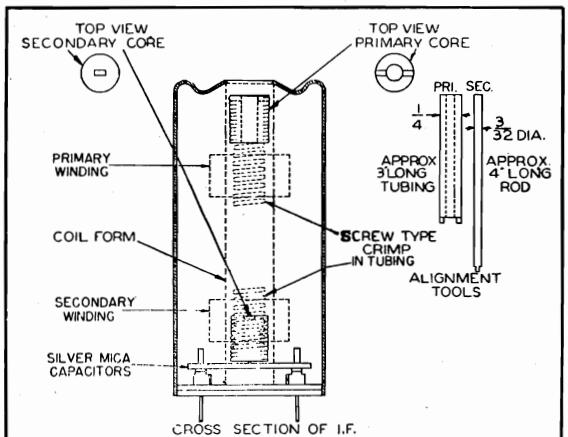
BOTH TUNING CORES PROTRUDE 1 9/32" OUT OF BASE OF TUNING COIL ASSEMBLIES, WHEN THE TUNING BRACKET IS AGAINST THE FRONT PLATE AS SHOWN IN DRAWING, (DIMENSION Y)

THE TOTAL LENGTH OF MACHINE SCREW IS 3/4 IN. DIMENSION X: APPROX. 7/16 IN.

2213-5

NOTE: On some sets, pairs of punch marks on the inside of the tape guide are used as calibration markers. They are in the same relative position as the frequencies shown above. The end of the tape is then used as the indicator line.

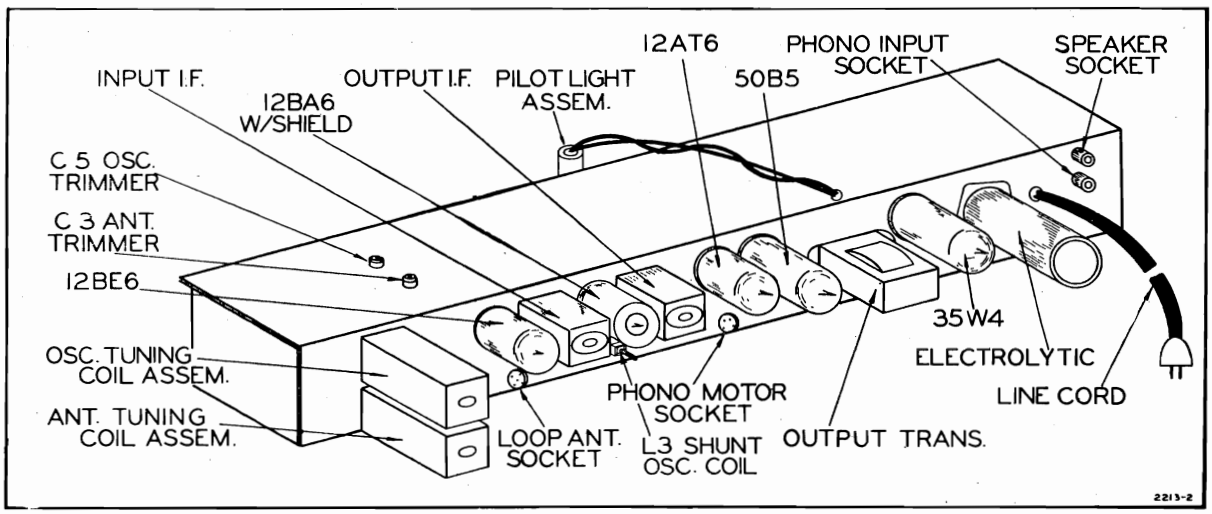
CAUTION: The I.F. transformer construction is such that two resonance peaks occur for each winding, one peak when the slug is above its coil and another peak when the slug is below its coil. Be sure the upper cores are above the top coils and the lower cores are below the bottom coils (see coil drawing).



PRIMARY CORE HAS HOLE THRU THE CENTER TO ALLOW SMALL FIBRE TOOL TO PASS THRU AND ADJUST THE SECONDARY CORE. THE PRIMARY CORE HAS A COMPLETE SLOTTED TOP FOR ADJUSTMENT; SECONDARY CORE HAS A SMALL NITCH IN TOP. BOTH WINDINGS ARE TOP TUNED.

THE SECONDARY ALIGNMENT TOOL PASSES THRU THE CENTER OF THE PRIMARY TOOL, FOR SIZE SEE DETAIL DRAWING.

2213-3



2213-2

NOTE: On some sets, the loop antenna socket is eliminated and leads are brought out thru the hole.

ALIGNMENT PROCEDURE AND RECEIVER STAGE SENSITIVITIES

The signal source must be an accurately calibrated signal generator capable of supplying R. F. signals modulated 30% with a 400-cycle audio signal. A 400-cycle source is necessary for the audio measurement.

The table below lists the sensitivity at various points. All measurements are based on an output of 50-milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm, 5-watt resistor across the secondary winding of the output transformer. A reading of .4 volts AC across this resistor will be equivalent to a 50-milliwatt output with the speaker connected. Variations of plus or minus 25% are usually permissable. Volume control at maximum for all adjustments. Tone control at maximum treble.

SIGNAL GENERATOR				TUNER SETTING	ADJUST FOR MAXIMUM OUTPUT	INPUT FOR 50-MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Radio	Ground Connection			
455 kc.	.1 mf	12BE6, Pin 7	12AT6, Pin 2	Iron cores all the way out	Trimmers on output and input I.F. cans	28 microvolts
1620 kc.	.1 mf	12BE6, Pin 7	12AT6, Pin 2	Iron cores all the way out	Oscillator trimmer C5	———
535 kc.	200 mmf	External antenna clip	12AT6, Pin 2	Iron cores all the way in	Shunt osc. coil L3	11 microvolts
1620 kc.	200 mmf	External antenna clip	12AT6, Pin 2	1620 kc.	Antenna trimmer C3*	8 microvolts
1400 kc.	200 mmf	External antenna clip	12AT6, Pin 2	1400 kc.	Adjust position of ant. core (see coil illustration view)	8 microvolts
400 cycles	.1 mf	12AT6, Pin 1	12AT6, Pin 2	———	———	.03 volts

*After the antenna coil has been tracked at 1400 kc, it is necessary to check the antenna trimmer C3 again at 1620 kc. If no appreciable change in trimmer adjustment is necessary, the coil is in track. If the trimmer requires considerable change, the position of the antenna core at 1400 kc must be readjusted. These two adjustments should be made several times, until no trimmer adjustment is required at 1620 kc.

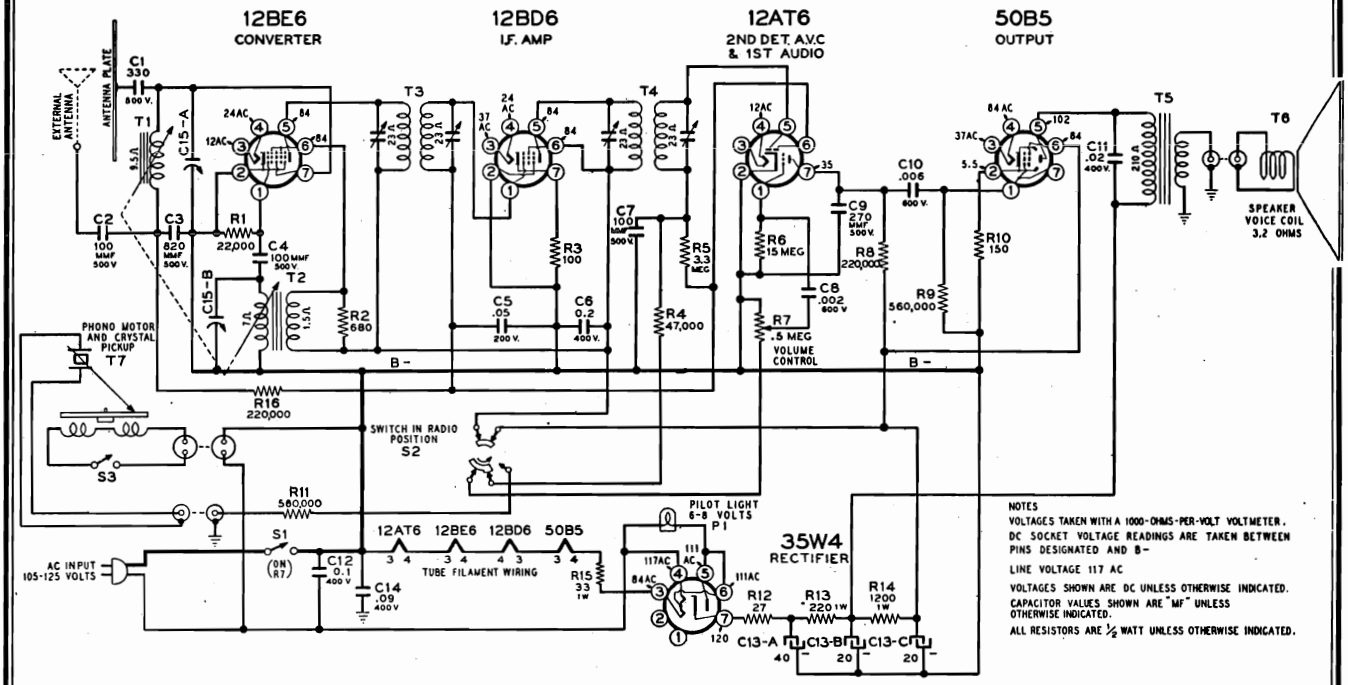
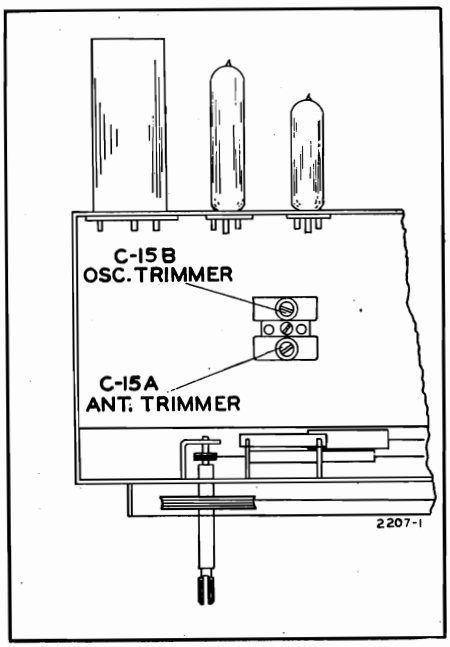
MONTGOMERY WARD

MODEL 84BR-2005A

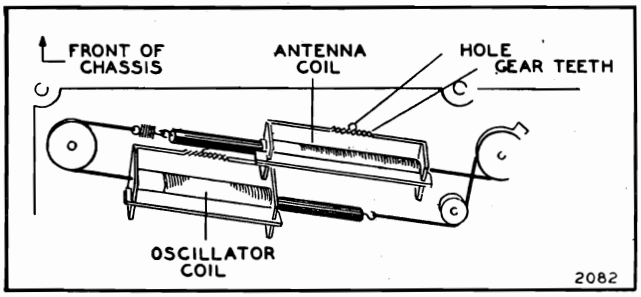


ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts, 60 cycles AC, 55 watts.
Frequency Range	535-1720 kc.
Intermediate Freq.	455 kc.
Antenna	Built-in plate; provisions also for external antenna connection.
Tuning	Permeability.
Speaker	4 x 6-inch, P.M., voice coil impedance 3.2 ohms.
Power Output	0.75 watt undistorted. 1.1 watts maximum.
Sensitivity	34 microvolts average for 50-milliwatts output.
Selectivity	55 kc. broad at 1000 times signal at 1000 kc.

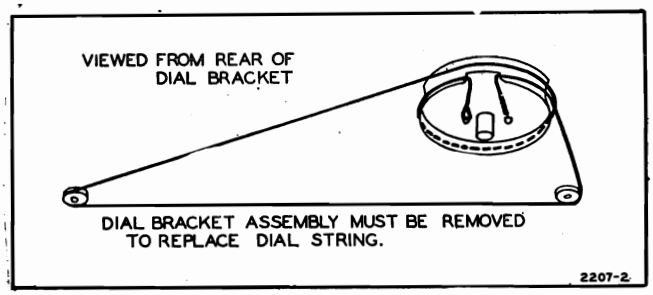


TRIMMER VIEW



VIEW OF COIL ASSEMBLY

The antenna coil assembly is movable left to right. When making the adjustment as required in the alignment procedure, move the coil assembly very slowly, either by hand or by pivoting one edge of a screwdriver blade in the hole and engaging the blade in the gear teeth of the coil form.



DIAL STRINGING VIEW

MODEL 84BR-2005A MONTGOMERY WARD

ALIGNMENT PROCEDURE

(Refer to Chassis and Coil Views)

- Output meter across 3.2-ohm resistive output load.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts which is equal to 50 milliwatts.
- Volume control at maximum for all adjustments.
- Connect ground post of signal generator to B— of radio.

SIGNAL GENERATOR			TUNER SETTING	ADJUST FOR MAXIMUM OUTPUT (in order shown)	INPUT FOR 50-MILLIWATT OUTPUT

MONTGOMERY WARD

GENERAL DESCRIPTION

This is a 2-band, seven tube (plus rectifier) superheterodyne receiver for the reception of both AM and FM stations. It features the most advanced type of FM ratio detector, permeability tuning of both bands, combination double-frequency I.F. coils and miniature tubes. Built-in antennas are provided for broadcast and FM reception; provision is also made for connection of an external broadcast antenna as well as an FM antenna with a 300 ohm lead-in. Both antennas may be connected to the radio at the same time.

The phonograph is equipped with an automatic changer which plays up to ten 12-inch records or twelve 10-inch records at one loading.

ELECTRICAL SPECIFICATIONS

Power Supply	105 to 125 volts, AC, 60-cycles; Chassis only 75 watts. With phono operation 100 watts.
Frequency Ranges	Broadcast Band—535 to 1620 kc. FM Band— 88 to 108 mc.
Intermediate Freq.	AM-455 kc.; FM-10.7 mc.
Selectivity	AM-42 kc. broad at 1000 times signal, measured at 1000 kc. I.F. FM-200 kc. broad at 2 times down. I.F. FM-400 kc. broad at 10 times down.
AM Sensitivity	(For .5 watt output with external antenna)—5 microvolts average.
FM Sensitivity	(For .5 watt output)—25 microvolts average.
Power Output	2 watts, 10% distortion. 4 watts maximum.
Loud Speaker	12" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.
Tube and Lamp Complement	6BA6, FM—AM R.F. stage. 12AT7, FM—AM oscillator and mixer. 6BA6, FM—AM 1st I.F. 6BA6, FM—2nd I.F. 6AL5, FM ratio detector. 6AT6, AM detector. A.F. AMP. and A.V.C. 6AQ5, Audio output. 5Y3, rectifier. T-44 dial lamp (2 used).
Automatic Changer	See Manuals 5058A, 5057B, 5069, 5050A, 5032A.

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissible.

AM - I. F. ALIGNMENT

Band Switch in AM Position. Tune Set to 1400 Kc. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 2400 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T9 AM windings. See top and bottom views	Maximum output Should be ½ watt
455 Kc. Use 70 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T8 AM windings. See top and bottom views	Maximum output Should be ½ watt
400 cycles. Use 60 millivolts	Hot end of volume control and ground	None	Maximum output Should be ½ watt

BROADCAST BAND - R. F. ALIGNMENT

Check pointer so that it coincides with the marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

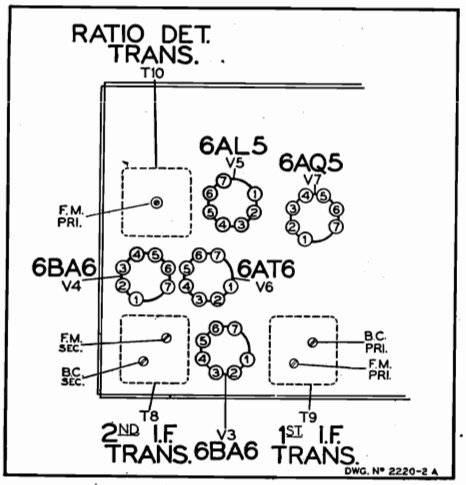
SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc.	AM Antenna and Ground	200 mmf.	C11 Osc. trimmer for maximum
535 Kc.	AM Antenna and Ground	200 mmf.	T5 for maximum ½ watt
1620 Kc. Use 5 microvolts	AM Antenna and Ground	200 mmf.	C4 and C18 for max. ½ watt. See note

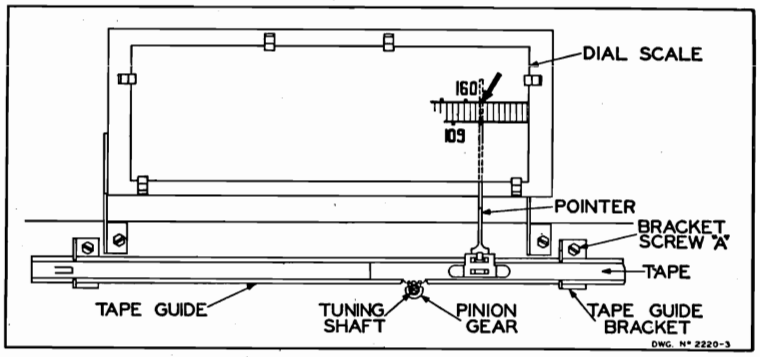
NOTE: Recheck first two adjustments after this adjustment because of inter-locking effects.

MONTGOMERY WARD

MODELS 84BR-2715C, 84BR-2722A

Procedure for disassembly and assembly of dial mechanism.





TO ALIGN POINTER— Loosen bracket screw "A". Then tape guide bracket can be moved up to allow proper meshing of tape teeth with pinion gear. Readjust bracket to eliminate backlash.

ALIGNMENT PROCEDURE

FM Band Section. I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT

No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over long periods of time.

NOTE

The following alignment is based on the use of the new Simpson vacuum tube volt-meter which has a "floating ground". In other words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM - I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	Pin No. 2 of 6AL5 and ground	Primary of T10	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	See note "A"	Secondary of T10	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 no. 2 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of T9 10.7 m.c. windings See top and bottom views	Resonance should be about 3 volts
10.7 Mc. Use about 200 microvolts	Pin No. 2 of 12AT7 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T8 See top and bottom views	Resonance should be about 3 volts

NOTE ON FM - I.F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube volt-meter between the mid-point of the resistors and points zz.

NOTE "B" If T10 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL: Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

MODELS 84BR-2715C, 84BR-2722A

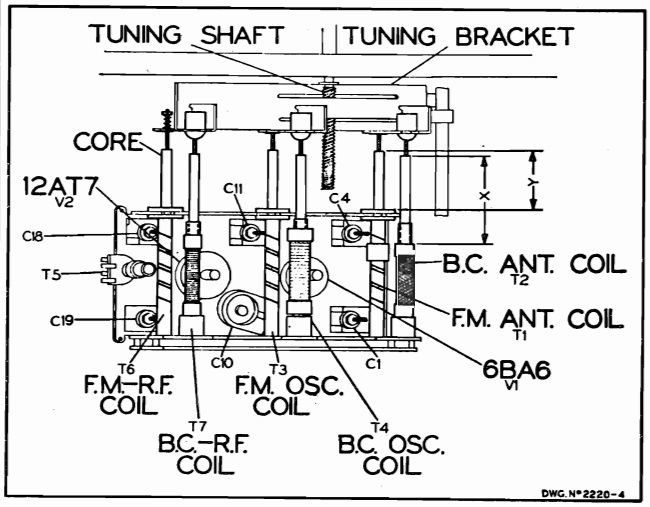
MONTGOMERY WARD

FM - R. F. ALIGNMENT

Check pointer so that it coincides with the marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 25 microvolts	FM Antenna Terminals See note	300 ohms	C10 Osc. C19 R.F. C1 Ant.	Pin No. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however will not produce 3 volts. NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw.



TUNER ADJUSTMENT

With tuner all the way out, dimension "X" should be 1½ inches. "Y" should be 1-1/16 inches. "X" is from the end of the slug to the edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM band. No slug adjustment should be necessary since the slugs are properly set at the factory.

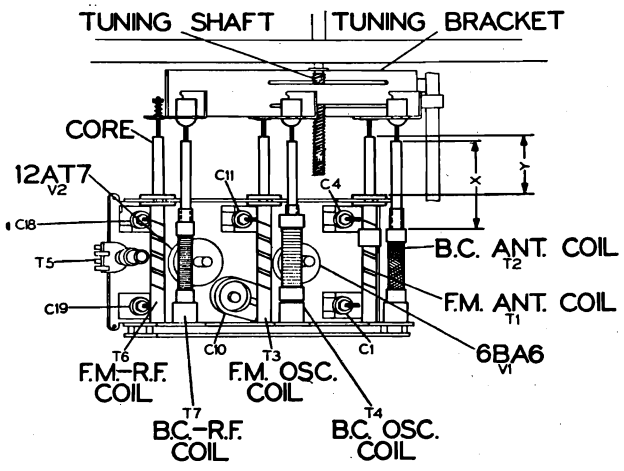
GENERAL DESCRIPTION

This is a 2-band, seven tube (plus rectifier) superheterodyne receiver for the reception of both AM and FM stations. It features the most advanced type of FM ratio detector, permeability tuning of both bands, combination double-frequency I.F. coils and miniature tubes. Built-in antennas are provided for broadcast and FM reception; provision is also made for connection of an external broadcast antenna as well as an FM antenna with a 300 ohm lead-in. Both antennas may be connected to the radio at the same time.

The phonograph is equipped with an automatic changer which plays up to ten 12-inch records or twelve 10-inch records at one loading, and also accommodates the new long-play microgroove records.

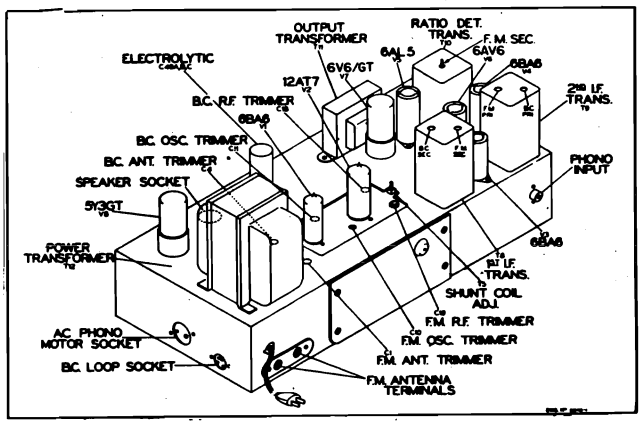
ELECTRICAL SPECIFICATIONS

Power Supply	105 to 125 volts, AC, 60-cycles; Chassis only 75 watts. With phono operation 100 watts.
Frequency Ranges	Broadcast Band—535 to 1620 kc. FM Band— 88 to 108 mc.
Intermediate Freq.	AM-455 kc.; FM-10.7 mc.
Selectivity	AM-42 kc. broad at 1000 times signal, measured at 1000 kc.
	I.F. FM-200 kc. broad at 2 times down.
	I.F. FM-400 kc. broad at 10 times down.
AM Sensitivity	(For .5 watt output with external antenna)—5 microvolts average.
FM Sensitivity	(For .5 watt output)—25 microvolts average.
Power Output	3.2 watts, 10% distortion. 5.5 watts maximum.
Loud Speaker	12" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.
Tube and Lamp Complement	6BA6, FM—AM R.F. stage.
	12AT7, FM—AM oscillator and mixer.
	6BA6, FM—AM 1st I.F.
	6BA6, FM—2nd I.F.
	6AL5, FM ratio detector.
	6AV6, AM detector. A.F. AMP. and A.V.C.
	6V6GT/G, Audio output.
	5Y3, rectifier.
	T-44 dial lamp (2 used).
Automatic Changer	See Manual 5069A.



TUNER ADJUSTMENT

With tuner all the way out, dimension "X" should be 1½ inches. "Y" should be 1-1/16 inches. "X" is from the end of the slug to the edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM band. No slug adjustment should be necessary since the slugs are properly set at the factory.



Chassis—top view

MONTGOMERY WARD

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissible.

AM - I. F. ALIGNMENT

Band Switch in AM Position. Tune Set to 1400 Kc. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 2400 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T9 AM windings. See top and bottom views	Maximum output Should be ½ watt
455 Kc. Use 70 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T8 AM windings. See top and bottom views	Maximum output Should be ½ watt
400 cycles. Use 60 millivolts	Hot end of volume control and ground	None	Maximum output Should be ½ watt

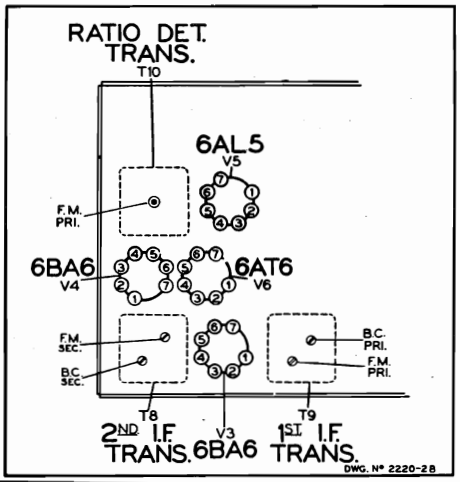
BROADCAST BAND - R. F. ALIGNMENT

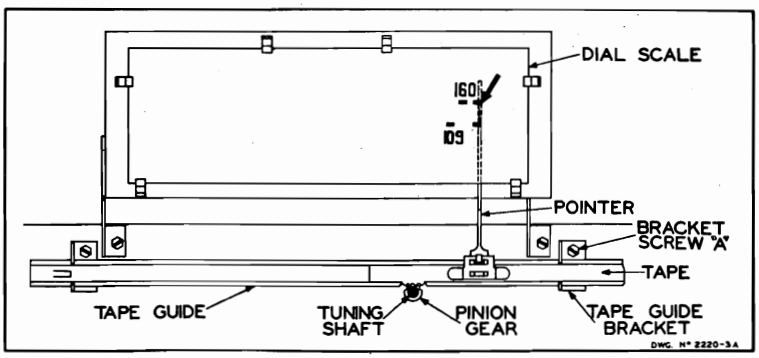
Check pointer so that it coincides with the marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc.	AM Antenna and Ground	200 mmf.	C11 Osc. trimmer for maximum
535 Kc.	AM Antenna and Ground	200 mmf.	T5 for maximum ½ watt
1620 Kc. Use 5 microvolts	AM Antenna and Ground	200 mmf.	C4 and C18 for max. ½ watt. See note

NOTE: Recheck first two adjustments after this adjustment because of inter-locking effects.

Procedure for disassembly and assembly of dial mechanism.





TO ALIGN POINTER— Loosen bracket screw "A". Then tape guide bracket can be moved up to allow proper meshing of tape teeth with pinion gear. Readjust bracket to eliminate backlash.

MONTGOMERY WARD MODEL 84BR-2715D

ALIGNMENT PROCEDURE

FM Band Section. I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT

No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over long periods of time.

NOTE

The following alignment is based on the use of the new Simpson vacuum tube volt-meter which has a "floating ground". In other words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM - I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	Pin No. 2 of 6AL5 and ground	Primary of T10	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	See note "A"	Secondary of T10	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 no. 2 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of T9 10.7 m.c. windings See top and bottom views	Resonance should be about 3 volts
10.7 Mc. Use about 200 microvolts	Pin No. 2 of 12AT7 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T8 See top and bottom views	Resonance should be about 3 volts

NOTE ON FM - I.F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube volt-meter between the mid-point of the resistors and points zz.

NOTE "B" If T10 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL: Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM - R. F. ALIGNMENT

Check pointer so that it coincides with the marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 25 microvolts	FM Antenna Terminals See note	300 ohms	C10 Osc. C19 R.F. C1 Ant.	Pin No. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however will not produce 3 volts. NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw.

MONTGOMERY WARD

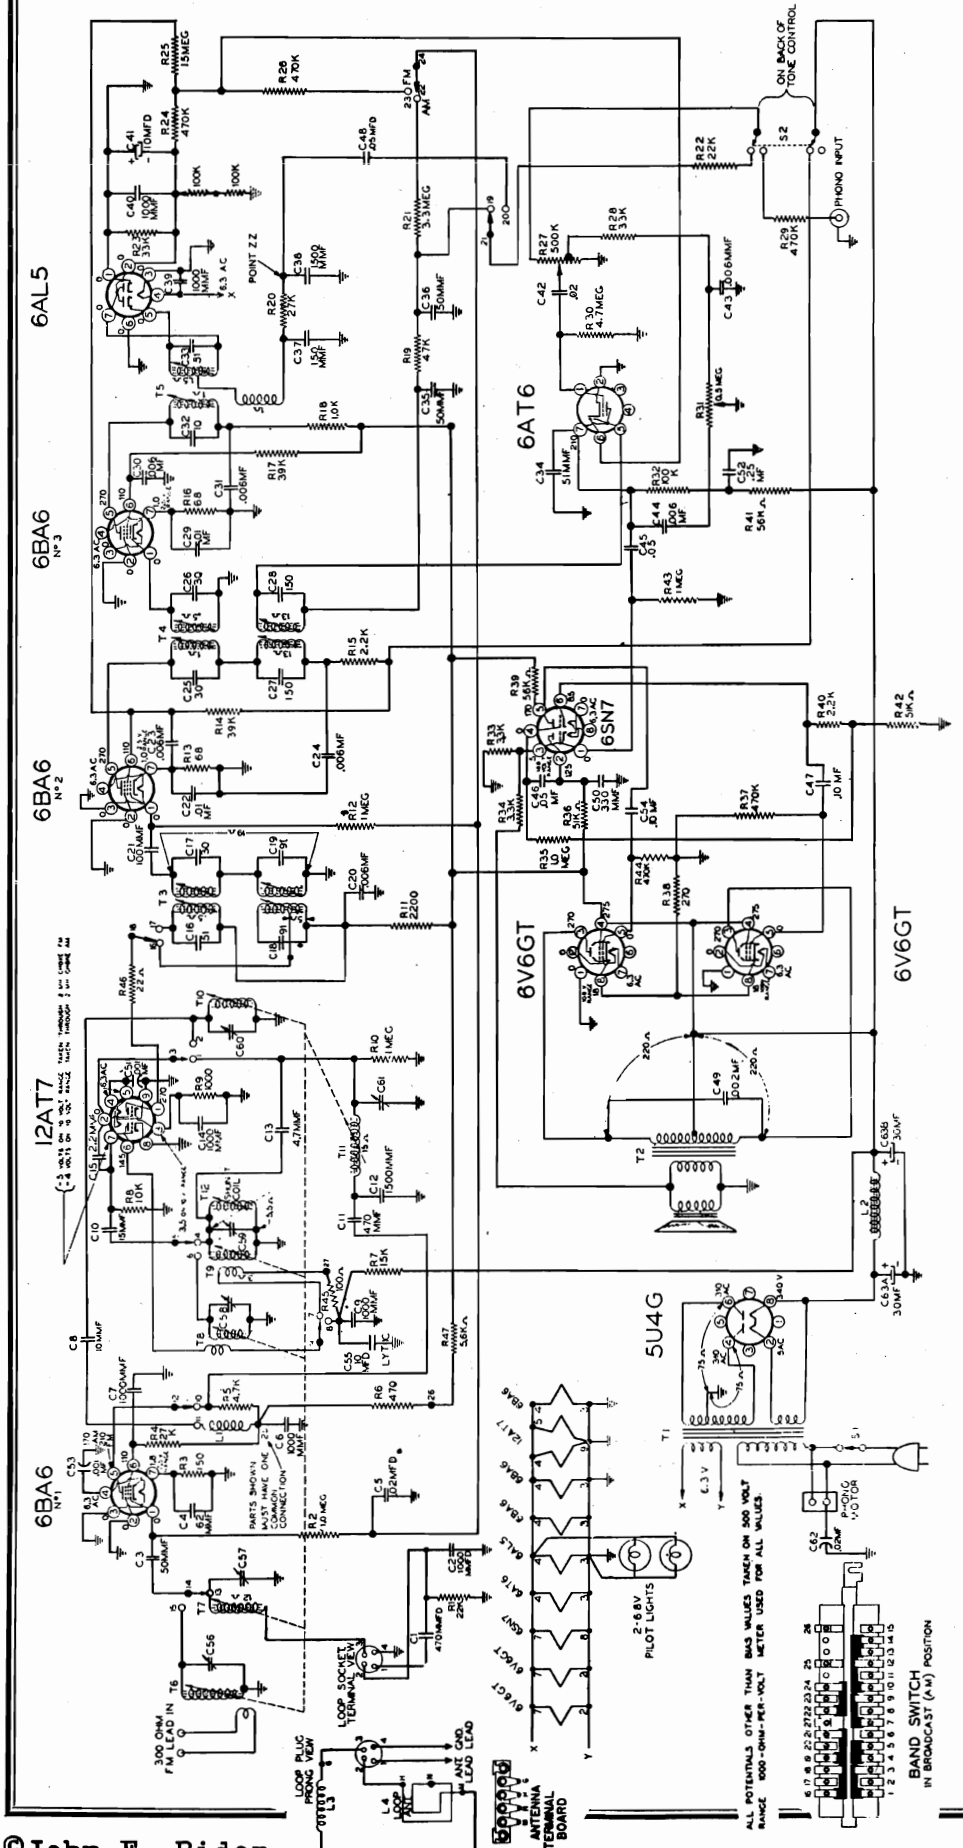
MODEL 84BR-2719A



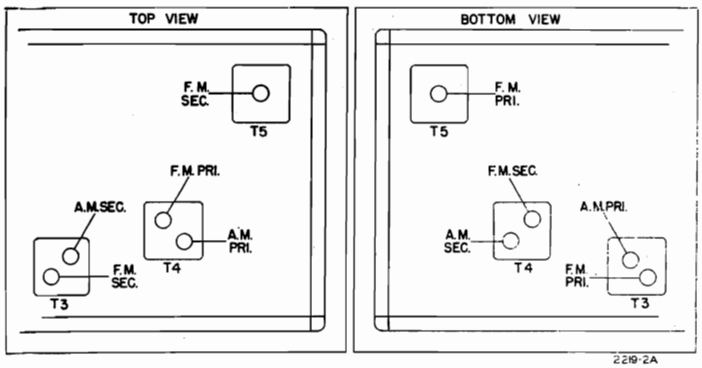
RECORD CHANGER: V-M Model 800, RCD.CH. 17-1

NOTES: On some sets R11 and R15 are 1000 ohms.
The two 100K ohm resistors in series from PIN NO. 2 to ground are connected as shown only when aligning the FM I.F. Refer to FM I.F. alignment procedure.
On some sets C22 is .05 mfd.
On some sets R46—22 ohm resistor is replaced with a 39 ohm resistor, Part no. C-9B1-45.
When T5 is top and bottom tuned, C30 is .01—400 volts, and returned to bottom end of C32. C31 becomes .002—600 volts; C37 becomes 100 mmfd.; R17 is connected to the top of R18 instead of the bottom. A 1000 mmf. condenser is connected between the B+ supply line of the ratio detector assembly and ground.

MODEL 84BR-2719A MONTGOMERY WARD

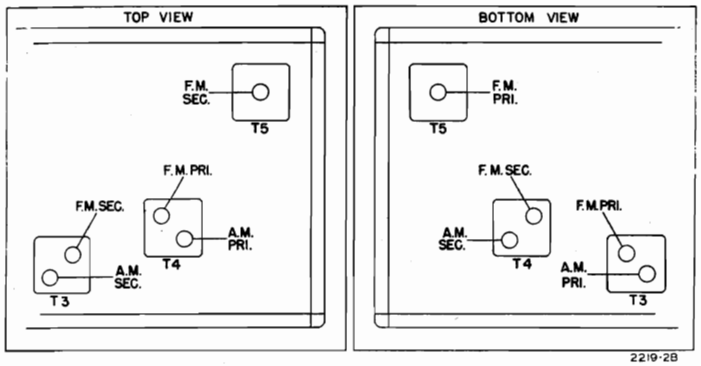
SPECIAL ALIGNMENT INFORMATION

Do not attempt any I.F. alignment until you have referred to the views below. This radio is built with 3 combinations of I. F. coils. Refer to part numbers on the coils. See notes under the circuit diagram.



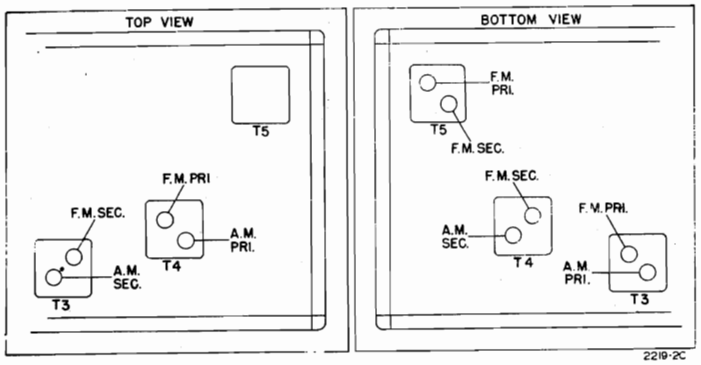
This combination uses the following part numbers:

T3.....B-13A-15473
T4.....B-13B-15474
T5.....B-13M-15475 (top and bottom tuned).



This combination uses the following part numbers:

T3.....C-13A-13009-1
T4.....C-13B-13014-1
T5.....B-13M-15475 (top and bottom tuned).



This combination uses the following part numbers:

T3.....C-13A-13009-1
T4.....C-13B-13014-1
T5.....C-203-11745-1 (bottom tuned). Use this view when T5 has no trimmer on top.

GENERAL DESCRIPTION

This is a 2-band, nine tube (plus rectifier) superheterodyne receiver for the reception of both AM and FM stations. It features the most advanced type of FM ratio detector, permeability tuning of both bands, combination double-frequency I.F. coils and miniature tubes. Built-in antennas are provided for broadcast and FM reception; provision is also made for connection of an external broadcast antenna as well as an FM antenna with a 300 ohm lead-in. Both antennas may be connected to the radio at the same time.

The phonograph is equipped with an automatic changer which plays up to ten 12-inch records or twelve 10-inch records at one loading.

ELECTRICAL SPECIFICATIONS

Power Supply	105 to 125 volts, AC, 60-cycles; Chassis only 122 watts. With phono operation 150 watts.
Frequency Ranges	Broadcast Band—535 to 1620 kc. FM Band—88 to 108 mc.
Intermediate Freq.	AM-455 kc.; FM-10.7 mc.
Selectivity	AM-48 kc. broad at 1000 times signal, measured at 1000 kc.
	I.F. FM-180 kc. broad at 2 times down.
	I.F. FM-320 kc. broad at 10 times down.
AM Sensitivity	(For .5 watt output with external antenna)—3 microvolts average
FM Sensitivity	(For .5 watt output—10 microvolts average.
Power Output	8 watts, 10% distortion. 10 watts maximum.
Loud Speaker	12" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissible.

AM - I. F. ALIGNMENT

Band Switch in AM Position. Tune Set to 1400 Kc. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 1000 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T4 AM windings. See top and bottom views	Maximum output Should be ½ watt
455 Kc. Use 30 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T3 AM windings. See top and bottom views	Maximum output Should be ½ watt
400 cycles. Use 28 millivolts	Hot end of volume control and ground	None	Maximum output Should be ½ watt

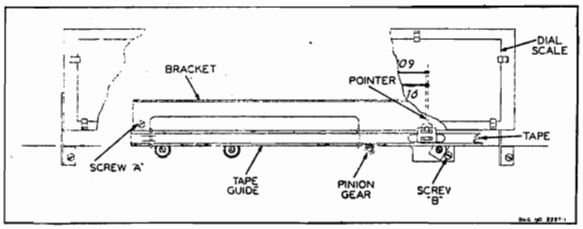
BROADCAST BAND - R. F. ALIGNMENT

Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc.	AM Antenna and Ground	200 mmf.	C59 Osc. trimmer for maximum
535 Kc.	AM Antenna and Ground	200 mmf.	T12 for maximum ½ watt
1620 Kc. Use 3 microvolts	AM Antenna and Ground	200 mmf.	C57 and C61 for max. ½ watt. See note

NOTE: Recheck first two adjustments after this adjustment because of inter-locking effects.

Procedure for disassembly and assembly of dial mechanism



TO ALIGN POINTER—Loosen bracket screw "A". Then tape guide bracket can be moved up to allow proper meshing of tape teeth with pinion gear. Readjust bracket to eliminate backlash.

MODEL 84BR-2719A MONTGOMERY WARD

ALIGNMENT PROCEDURE

FM Band Section. I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT

No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over long periods of time.

NOTE

The following alignment is based on the use of the new Simpson vacuum tube volt-meter which has a "floating ground". In other words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM - I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	Pin no. 2 of 6AL5 and ground	Primary of T5	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	See note "A"	Secondary of T5	Zero. Use zero center scale. See note "B"
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 no. 2 and ground	Pin no. 2 of 6AL5 and ground	Primary and Secondary of T4 10.7 m.c. windings See top and bottom views	Resonance should be about 3 volts
10.7 Mc. Use about 200 microvolts	Pin no. 2 of 12AT7 and ground	Pin no. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T3 See top and bottom views	Resonance should be about 3 volts

NOTES ON FM—I.F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube voltmeter between the mid-point of the resistors and point zz.

NOTE "B" If T5 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL: Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM - R. F. ALIGNMENT

Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 10 microvolts	FM Antenna Terminals See note	300 ohms	C58 Osc. C60 R.F. C56 Ant.	Pin no. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however will not produce 3 volts.

NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw

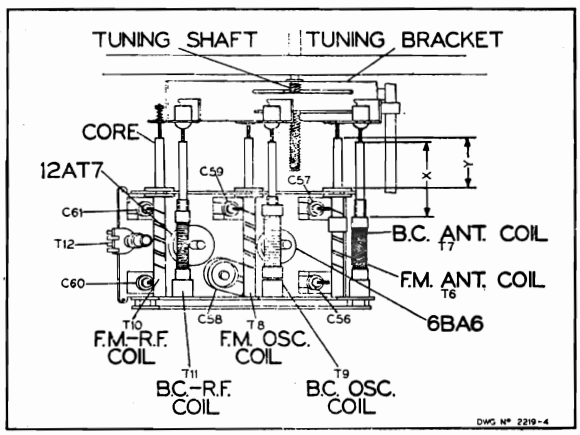
Tube and Lamp Complement.....
- 6BA6, FM—AM R.F. stage.
- 12AT7, FM—AM oscillator and mixer.
- 6BA6, FM—AM 1st I.F.
- 6BA6, FM— 2nd I.F.
- 6AL5, FM— ratio detector.
- 6AT6, AM detector. A. F. AMP. and A.V.C.
- 6SN7, Push-pull. Driver and phase-inverter.
- 5U4G, rectifier.
- 6V6, output.
- 6V6, output.
- T-44 dial lamp (2 used).



TUNER ADJUSTMENT

With tuner all the way out, dimension "X" should be 1½ inches. "Y" should be 1-1/16 inches. "X" is from the end of the slug to the edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM band. No slug adjustment should be necessary since the slugs are properly set at the factory.

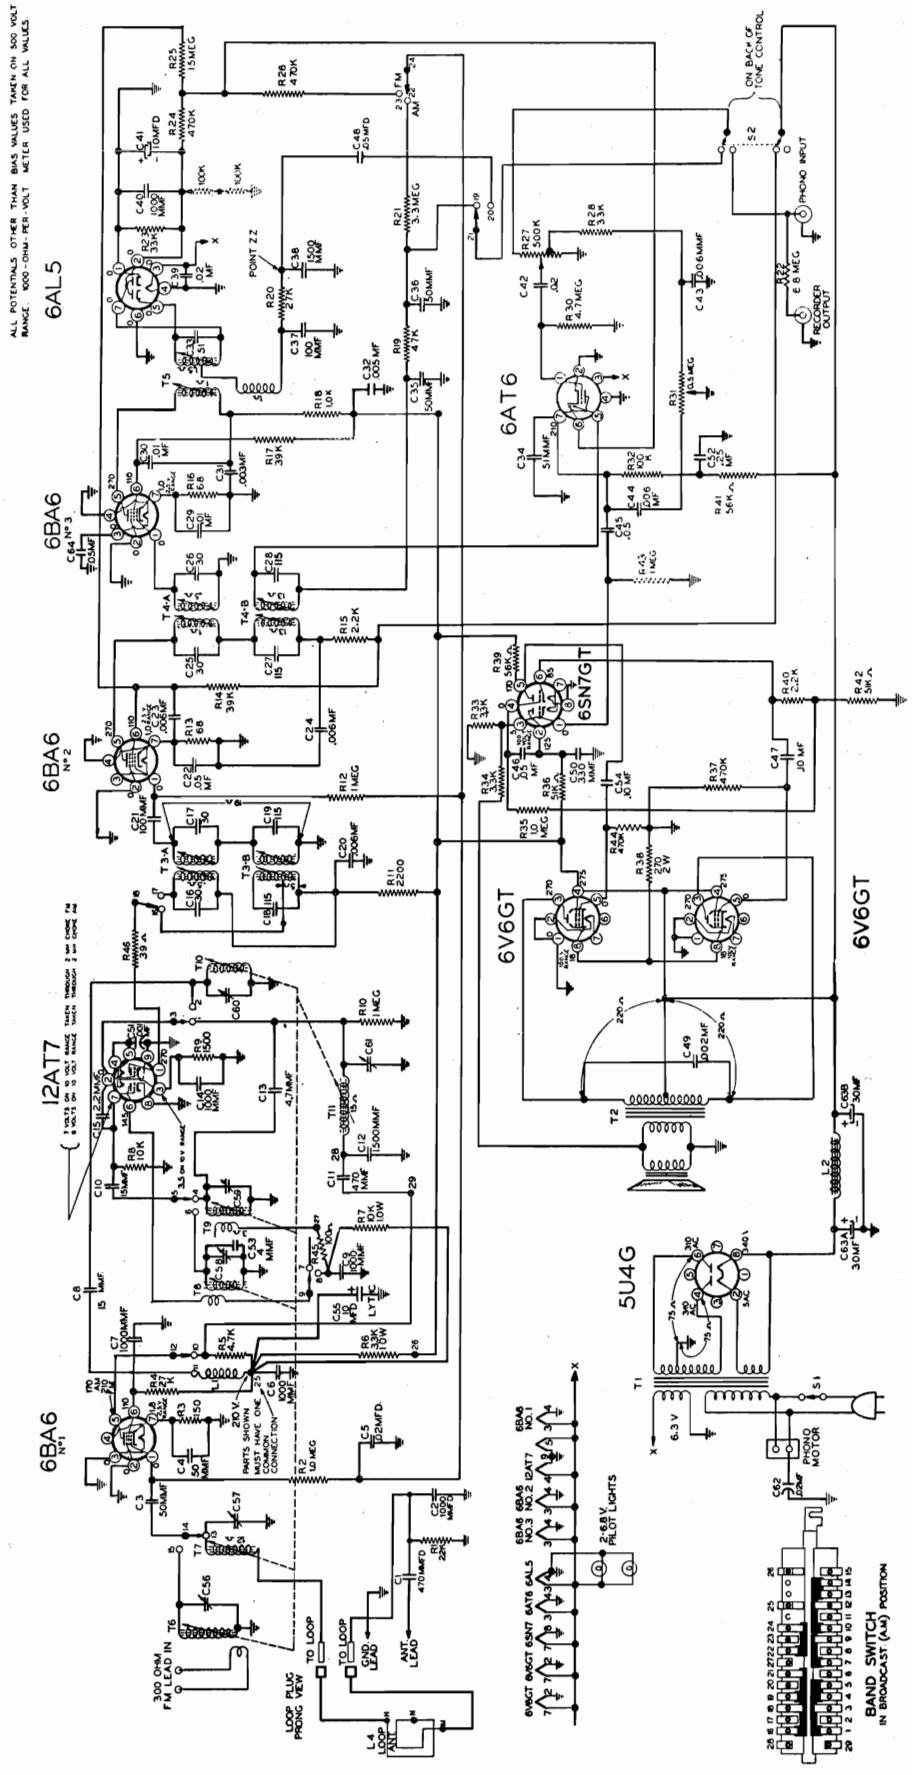
MONTGOMERY WARD

MODEL 84BR-2719B



NOTE: Two 100K ohm resistors in series from Pin No. 2 of the 6AL5 to ground are connected as shown only when aligning the FM I.F. Refer to FM I.F. alignment procedure.

NOTE: B.C. Oscillator Coil T9 and number 7 terminal of slide switch should be connected together.

NOTE: Resistor R22 removed; with shielded wire from recorder output jack to radio side of radio-phono switch S2 added.

MODEL 84BR-2719B MONTGOMERY WARD

GENERAL DESCRIPTION

This is a 2-band, nine tube (plus rectifier) superheterodyne receiver for the reception of both AM and FM stations. It features the most advanced type of FM ratio detector, permeability tuning of both bands, combination double-frequency I.F. coils and miniature tubes. Built-in antennas are provided for broadcast and FM reception; provision is also made for connection of an external broadcast antenna as well as an FM antenna with a 300 ohm lead-in. Both antennas may be connected to the radio at the same time.

The phonograph is equipped with an automatic changer which plays up to ten 12-inch records or twelve 10-inch records at one loading.

ELECTRICAL SPECIFICATIONS

Power Supply.....105 to 125 volts, AC, 60-cycles; Chassis only 122 watts. With phono operation 150 watts.

Frequency Ranges....Broadcast Band—535 to 1620 kc.
FM Band—88 to 108 mc.

Intermediate Freq....AM-455 kc.; FM-10.7 mc.

Selectivity.....AM-48 kc. broad at 1000 times signal, measured at 1000 kc.
I.F. FM-180 kc. broad at 2 times down.
I.F. FM-320 kc. broad at 10 times down.

AM Sensitivity.....(For .5 watt output with external antenna)—3 microvolts average

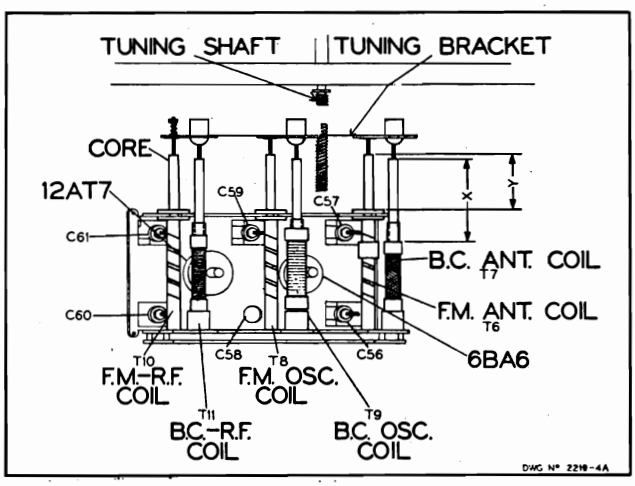
FM Sensitivity.....(For .5 watt output—10 microvolts average.

Power Output.....8 watts, 10% distortion. 10 watts maximum.

Loud Speaker.....12" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.

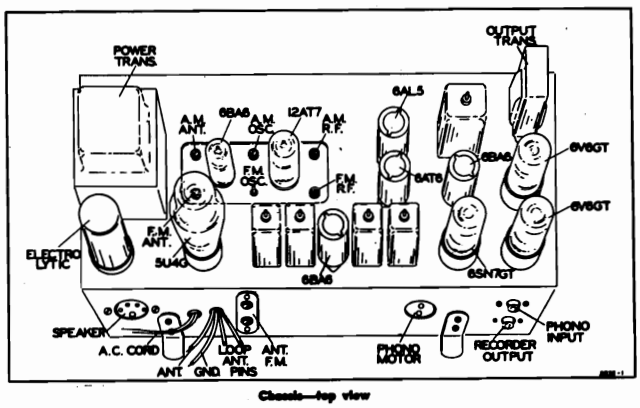
Tube and Lamp Complement.....6BA6, FM—AM R.F. stage.
12AT7, FM—AM oscillator and mixer.
6BA6, FM—AM 1st I.F.
6BA6, FM— 2nd I.F.
6AL5, FM— ratio detector.
6AT6, AM detector.
A. F. AMP. and A.V.C.
6SN7, Push-pull. Driver and phase-inverter.
5U4G, rectifier.
6V6, output.
6V6, output.
T-44 dial lamp (2 used).

Automatic Changer..See Manual ~~5038A~~ 5035 A

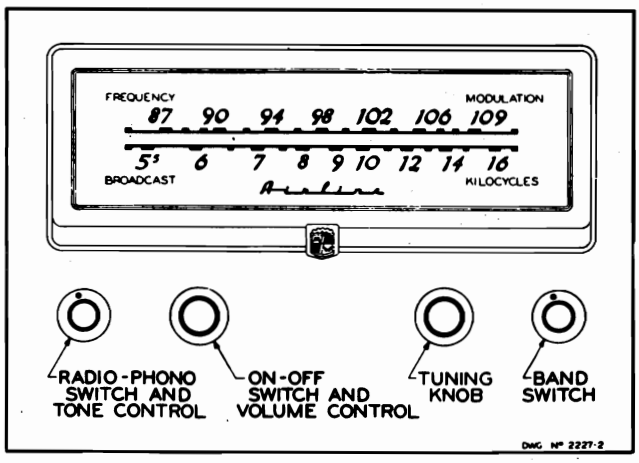


TUNER ADJUSTMENT

With tuner all the way out, dimension "X" should be 1½ inches. "Y" should be 1-1/16 inches. "X" is from the end of the slug to the edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM band. No slug adjustment should be necessary since the slugs are properly set at the factory.



Chassis—top view



MONTGOMERY WARD MODEL 84BR-2719B

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissible.

AM - I. F. ALIGNMENT

Band Switch in AM Position. Tune Set to 1400 Kc. Dummy Antenna .1 Mfd.

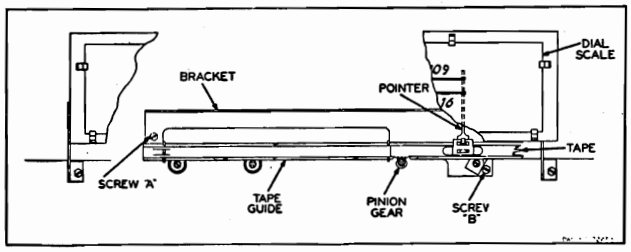
SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 1000 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T4 AM windings. See IF views	Maximum output Should be ½ watt
455 Kc. Use 30 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T3 AM windings. See IF views	Maximum output Should be ½ watt
400 cycles. Use 28 millivolts	Hot end of volume control and ground	None	Maximum output Should be ½ watt

BROADCAST BAND - R. F. ALIGNMENT

Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc. Use 3 microvolts	AM Antenna and Ground	200 mmf.	C59, C57, C61 For maximum, ½ watt

Procedure for disassembly and assembly of dial mechanism



TO ALIGN POINTER—Loosen bracket screw "A". Then tape guide bracket can be moved up to allow proper meshing of tape teeth with pinion gear. Readjust bracket to eliminate backlash.

MODEL 84BR-2719B

MONTGOMERY WARD

ALIGNMENT PROCEDURE

FM Band Section. I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT

No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over long periods of time.

NOTE

The following alignment is based on the use of the new Simpson vacuum tube volt-meter which has a "floating ground". In other words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM - I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	Pin no. 2 of 6AL5 and ground	Primary of T5	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	See note "A"	Secondary of T5	Zero. Use zero center scale. See note "B"
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 no. 2 and ground	Pin no. 2 of 6AL5 and ground	Primary and Secondary of T4A 10.7 m.c. windings See IF views	Resonance should be about 3 volts
10.7 Mc. Use about 200 microvolts	Pin no. 2 of 12AT7 and ground	Pin no. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T3A See IF views	Resonance should be about 3 volts

NOTES ON FM—I.F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube voltmeter between the mid-point of the resistors and point zz.

NOTE "B" If T5 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL: Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM - R. F. ALIGNMENT

Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 10 microvolts	FM Antenna Terminals See note	300 ohms	C58 Osc. C60 R.F. C56 Ant.	Pin no. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however will not produce 3 volts. NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw

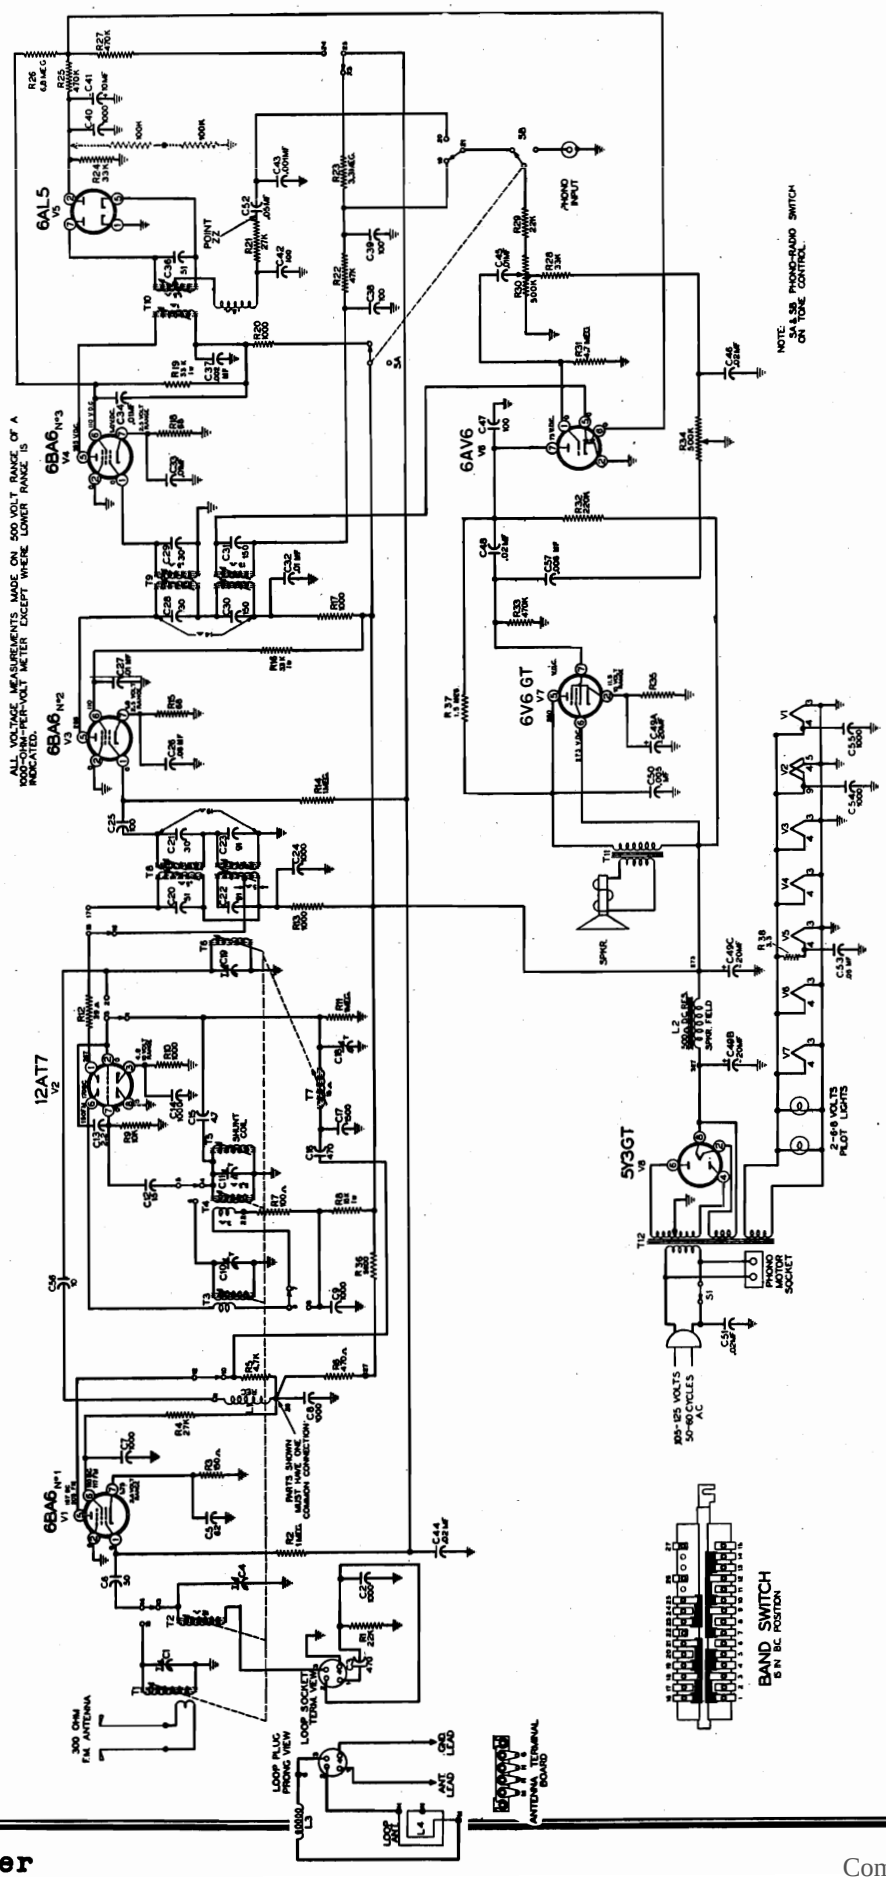
MODEL 84BR-2726A

MONTGOMERY WARD



MONTGOMERY WARD

MODEL 84BR-2726A

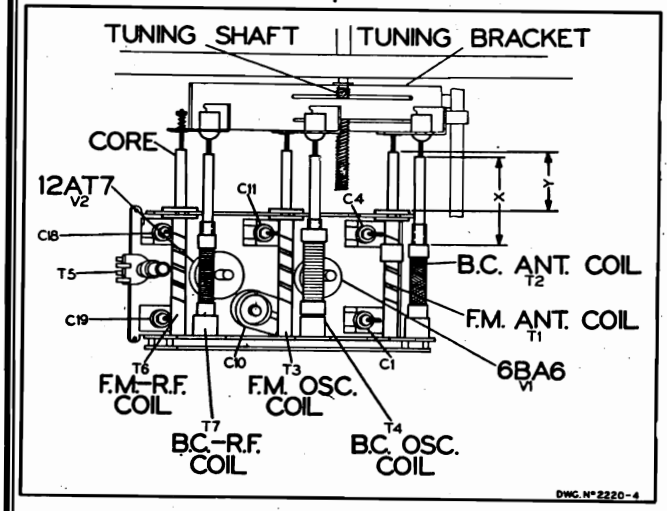
GENERAL DESCRIPTION

This is a 2-band, seven tube (plus rectifier) superheterodyne receiver for the reception of both AM and FM stations. It features the most advanced type of FM ratio detector, permeability tuning of both bands, combination double-frequency I.F. coils and miniature tubes. Built-in antennas are provided for broadcast and FM reception; provision is also made for connection of an external broadcast antenna as well as an FM antenna with a 300 ohm lead-in. Both antennas may be connected to the radio at the same time.

The phonograph is equipped with an automatic changer which plays up to ten 12-inch records or twelve 10-inch records at one loading, and also accommodates the new long-play microgroove records.

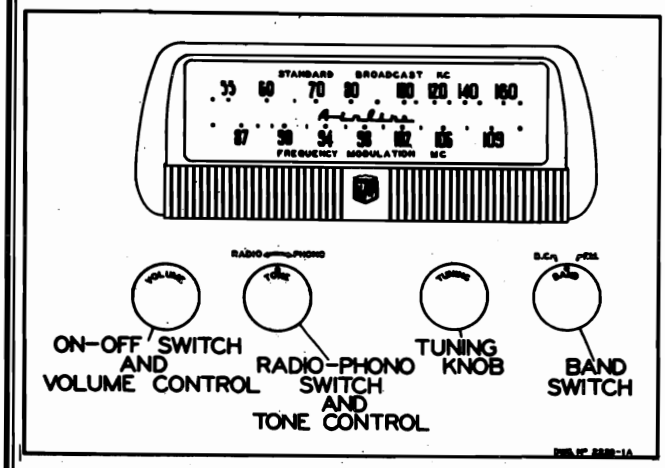
ELECTRICAL SPECIFICATIONS

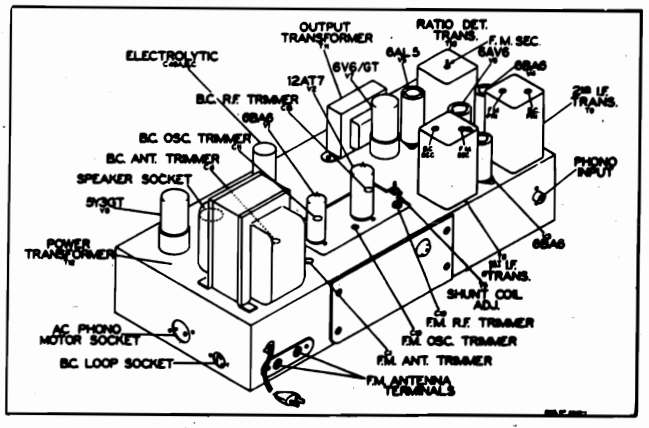
Power Supply	105 to 125 volts, AC, 60-cycles; Chassis only 75 watts. With phono operation 100 watts.
Frequency Ranges	Broadcast Band—535 to 1620 kc. FM Band— 88 to 108 mc.
Intermediate Freq.	AM-455 kc.; FM-10.7 mc.
Selectivity	AM-42 kc. broad at 1000 times signal, measured at 1000 kc.
	I.F. FM-200 kc. broad at 2 times down.
	I.F. FM-400 kc. broad at 10 times down.
AM Sensitivity	(For .5 watt output with external antenna)—5 microvolts average.
FM Sensitivity	(For .5 watt output)—25 microvolts average.
Power Output	3.2 watts, 10% distortion. 5.5 watts maximum.
Loud Speaker	12" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.
Tube and Lamp Complement	6BA6, FM—AM R.F. stage.
	12AT7, FM—AM oscillator and mixer.
	6BA6, FM—AM 1st I.F.
	6BA6, FM—2nd I.F.
	6AL5, FM ratio detector.
	6AV6, AM detector. A.F. AMP. and A.V.C.
	6V6GT/G, Audio output.
	5Y3, rectifier.
	T-44 dial lamp (2 used).
Automatic Changer	See Manual 5068A.



TUNER ADJUSTMENT

With tuner all the way out, dimension "X" should be 1½ inches. "Y" should be 1-1/16 inches. "X" is from the end of the slug to the edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM band. No slug adjustment should be necessary since the slugs are properly set at the factory.





Chassis—top view

MODEL 84BR-2726A

MONTGOMERY WARD

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissible.

AM - I. F. ALIGNMENT

Band Switch in AM Position. Tune Set to 1400 Kc. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 2400 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T9 AM windings. See top and bottom views	Maximum output Should be ½ watt
455 Kc. Use 70 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T8 AM windings. See top and bottom views	Maximum output Should be ½ watt
400 cycles. Use 60 millivolts	Hot end of volume control and ground	None	Maximum output Should be ½ watt

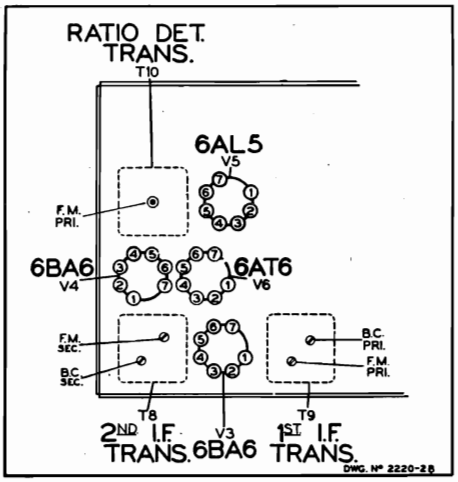
BROADCAST BAND - R. F. ALIGNMENT

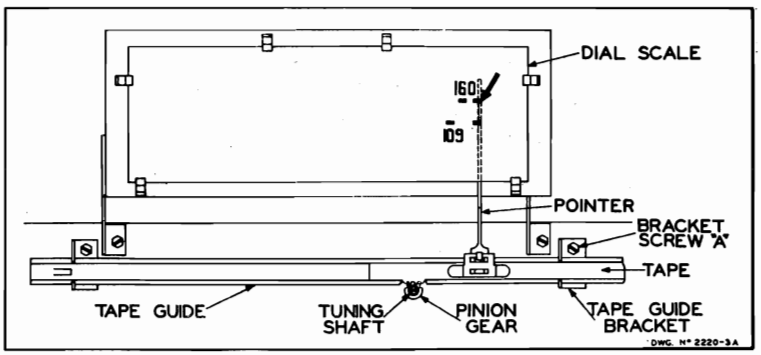
Check pointer so that it coincides with the marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc.	AM Antenna and Ground	200 mmf.	C11 Osc. trimmer for maximum
535 Kc.	AM Antenna and Ground	200 mmf.	T5 for maximum ½ watt
1620 Kc. Use 5 microvolts	AM Antenna and Ground	200 mmf.	C4 and C18 for max. ½ watt. See note

NOTE: Recheck first two adjustments after this adjustment because of inter-locking effects.

Procedure for disassembly and assembly of dial mechanism.





TO ALIGN POINTER— Loosen bracket screw "A". Then tape guide bracket can be moved up to allow proper meshing of tape teeth with pinion gear. Readjust bracket to eliminate backlash.

MONTGOMERY WARD MODEL 84BR-2726A

ALIGNMENT PROCEDURE

FM Band Section. I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT

No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over long periods of time.

NOTE

The following alignment is based on the use of the new Simpson vacuum tube volt-meter which has a "floating ground". In other words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM - I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	Pin No. 2 of 6AL5 and ground	Primary of T10	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	See note "A"	Secondary of T10	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 no. 2 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of T9 10.7 m.c. windings See top and bottom views	Resonance should be about 3 volts
10.7 Mc. Use about 200 microvolts	Pin No. 2 of 12AT7 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T8 See top and bottom views	Resonance should be about 3 volts

NOTE ON FM - I.F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube volt-meter between the mid-point of the resistors and points zz.

NOTE "B" If T10 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL: Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM - R. F. ALIGNMENT

Check pointer so that it coincides with the marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 25 microvolts	FM Antenna Terminals See note	300 ohms	C10 Osc. C19 R.F. C1 Ant.	Pin No. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however will not produce 3 volts. NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw.

MONTGOMERY WARD

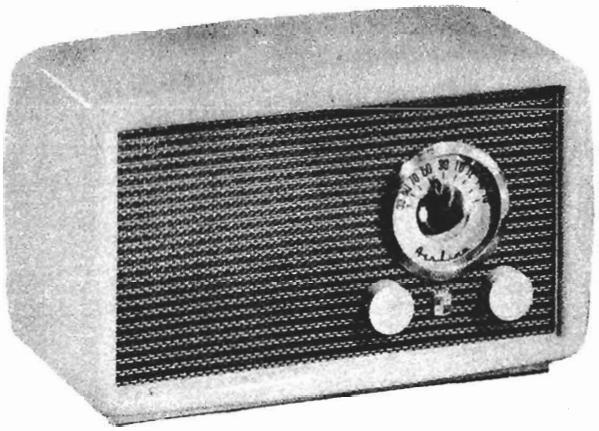
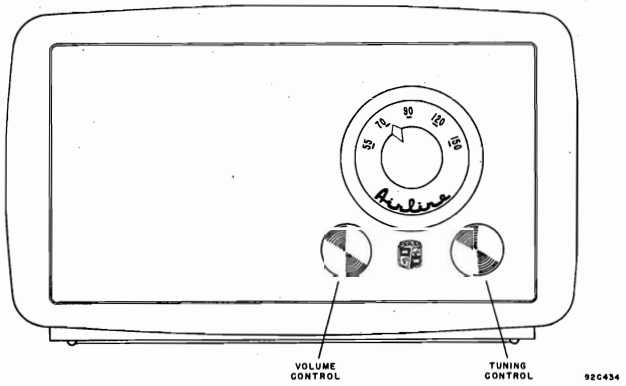
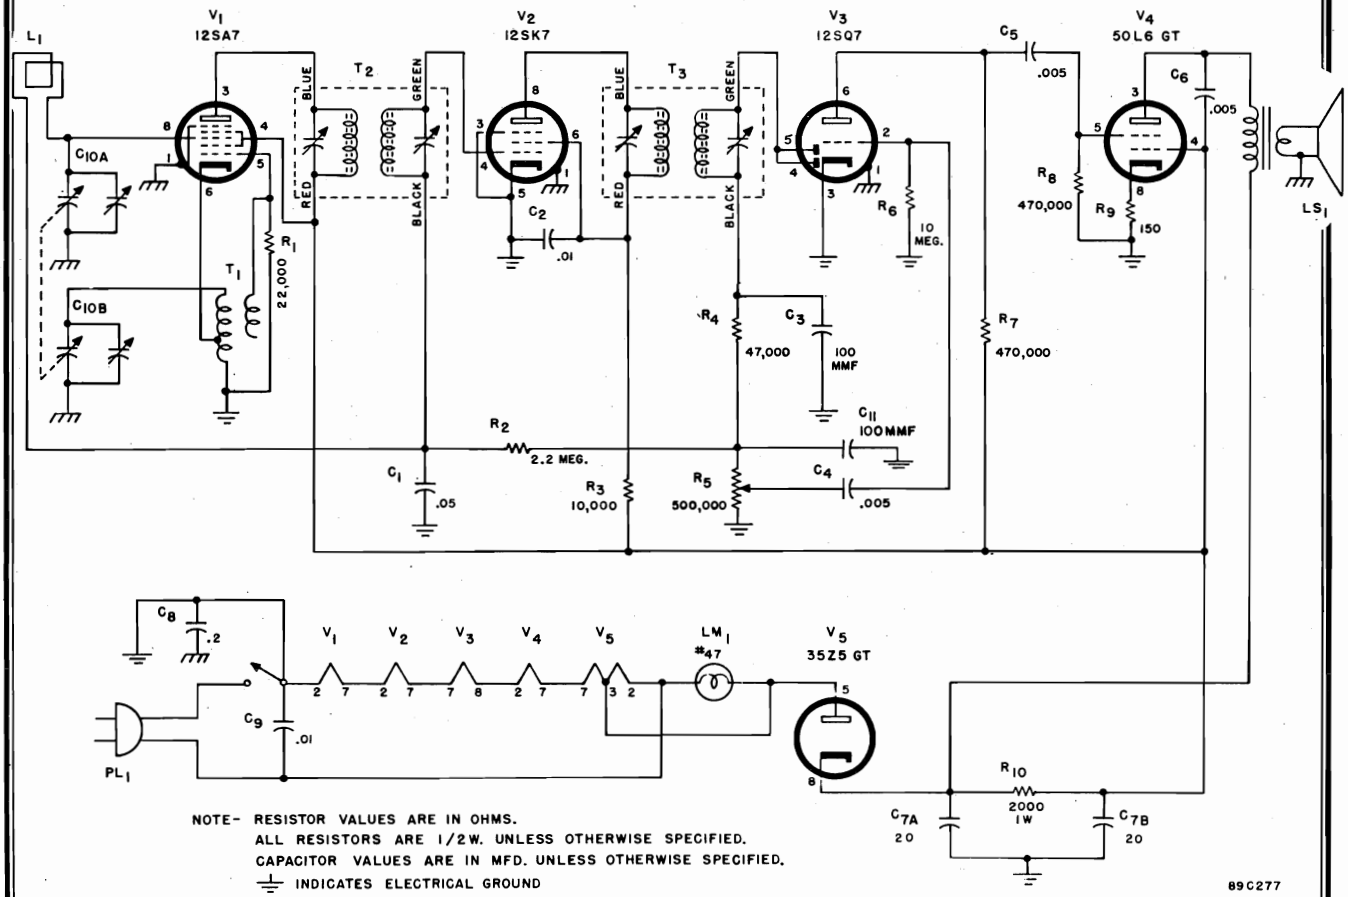
MODELS 84HA-1527A, 84HA-1528A





This radio is a condenser tuned receiver using a cut plate tracking mixer section and employs four tubes in a conventional superheterodyne circuit. The loop provides for signal pickup as well as the inductive component in the tuned circuit of the mixer stage. No provision is made for the use of an external antenna.



NOTE- RESISTOR VALUES ARE IN OHMS.
ALL RESISTORS ARE 1/2W. UNLESS OTHERWISE SPECIFIED.
CAPACITOR VALUES ARE IN MFD. UNLESS OTHERWISE SPECIFIED.

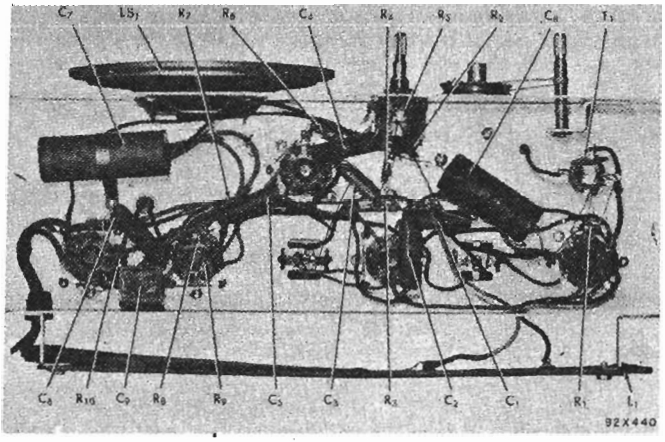
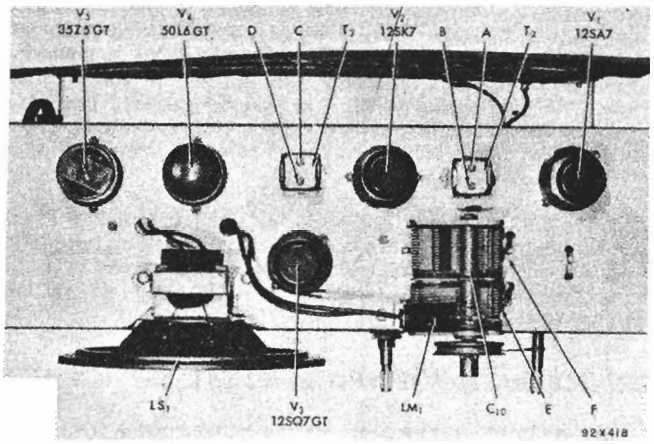
MONTGOMERY WARD

ELECTRICAL SPECIFICATIONS

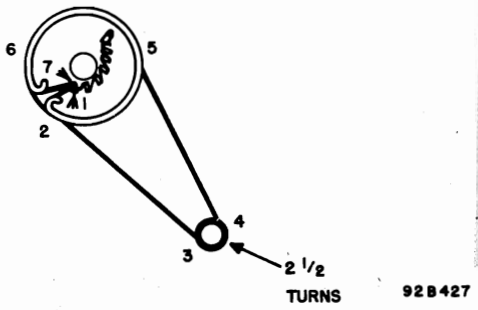
Power Supply	105-125 volts DC or 60 cycle AC, 25 watts
Frequency Range	Broadcast 540-1620 KC
Intermediate Frequency	455 KC
Antenna	Built in loop
Power Output	0.6 watt
Speaker	5 inch P.M.
Voice Coil Impedance	3 ohms
Tube and Dial Lamp Complement	12SA7 Mixer 12SK7 I.F. Amplifier 12SQ7 Detector & Audio 50L6GT Power Amplifier 35Z5GT Rectifier Mazda No. 47 Dial Lamp

For placement of these tubes, see the diagram showing layout.





DIAL CORD STRINGING INSTRUCTIONS



To restring the dial cable, pull the two control knobs and dial pointer from their shafts remove the chassis bolts and pull the chassis from the cabinet. Restring the dial drive with a 12-inch length of 30 lb. test dial cord following the stringing sequence shown in the accompanying illustration. Reinstall the receiver chassis and replace the knobs. Set the tuning condenser at maximum capacity and clip on the dial pointer so that its pointer falls on the left hand limit of the dial scale.

ALIGNMENT PROCEDURE

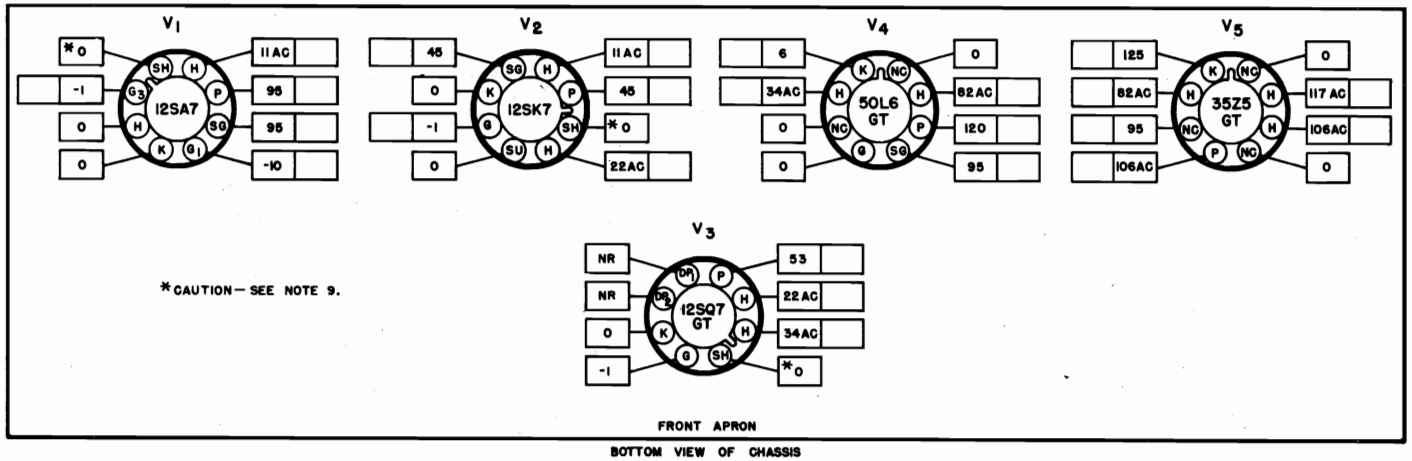
Output meter connection	Across voice coil
Generator ground	To chasis
Volume control position	Maximum

ALIGNMENT CHART

Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Radio Tuned To	Adjust	Remarks
0.01 mfd. cap.	Connect to pin #5 of of 12SA7 through dummy ant.	455 kc	1000 kc	A,B,C.D	Adjust for max. output. IF sensitivity for 50 milliwatt output is approx. 150 microvolts.
None	Do not couple directly to loop, pickup generator signal by radiation only	1500 kc	1500 kc	E*F	Adjust for max. output.

*Note - Calibration adjustment.

TUBE SOCKET VOLTAGE CHART



*CAUTION—SEE NOTE 9.

FRONT APRON

BOTTOM VIEW OF CHASSIS

NOTES-

1. SOCKET VIEWS ARE BOTTOM VIEWS.
2. ALL VOLTAGES ARE MEASURED BETWEEN TUBE SOCKET TERMINALS AND ELECTRICAL GROUND (NOT CHASSIS) WITH ZERO SIGNAL INPUT.
3. LINE VOLTAGE ——117 V. AC.
4. ALL VOLTAGES SHOWN ARE DC UNLESS OTHERWISE SPECIFIED. AC VOLTAGES SHOWN BECOME DC WHEN OPERATING FROM A DC LINE.
5. DC VOLTAGES SHOWN WERE MEASURED WITH AN ELECTRONIC VOLTMETER.
6. "NC"—NO CONNECTION. (VOLTAGE SHOWN FOR THIS TERMINAL ONLY WHEN TERMINAL IS USED AS A TIE LUG).
7. "NR"—NOT READABLE. (READING GENERALLY MEANINGLESS).
8. [ ] SPACE PROVIDED FOR SERVICE METER READINGS.
9. ALL READINGS TAKEN WITH LINE PLUG POLARIZED SO THAT GROUND BUSS AND CHASSIS ARE AT THE SAME POTENTIAL WITH THE CHASSIS GROUNDED.

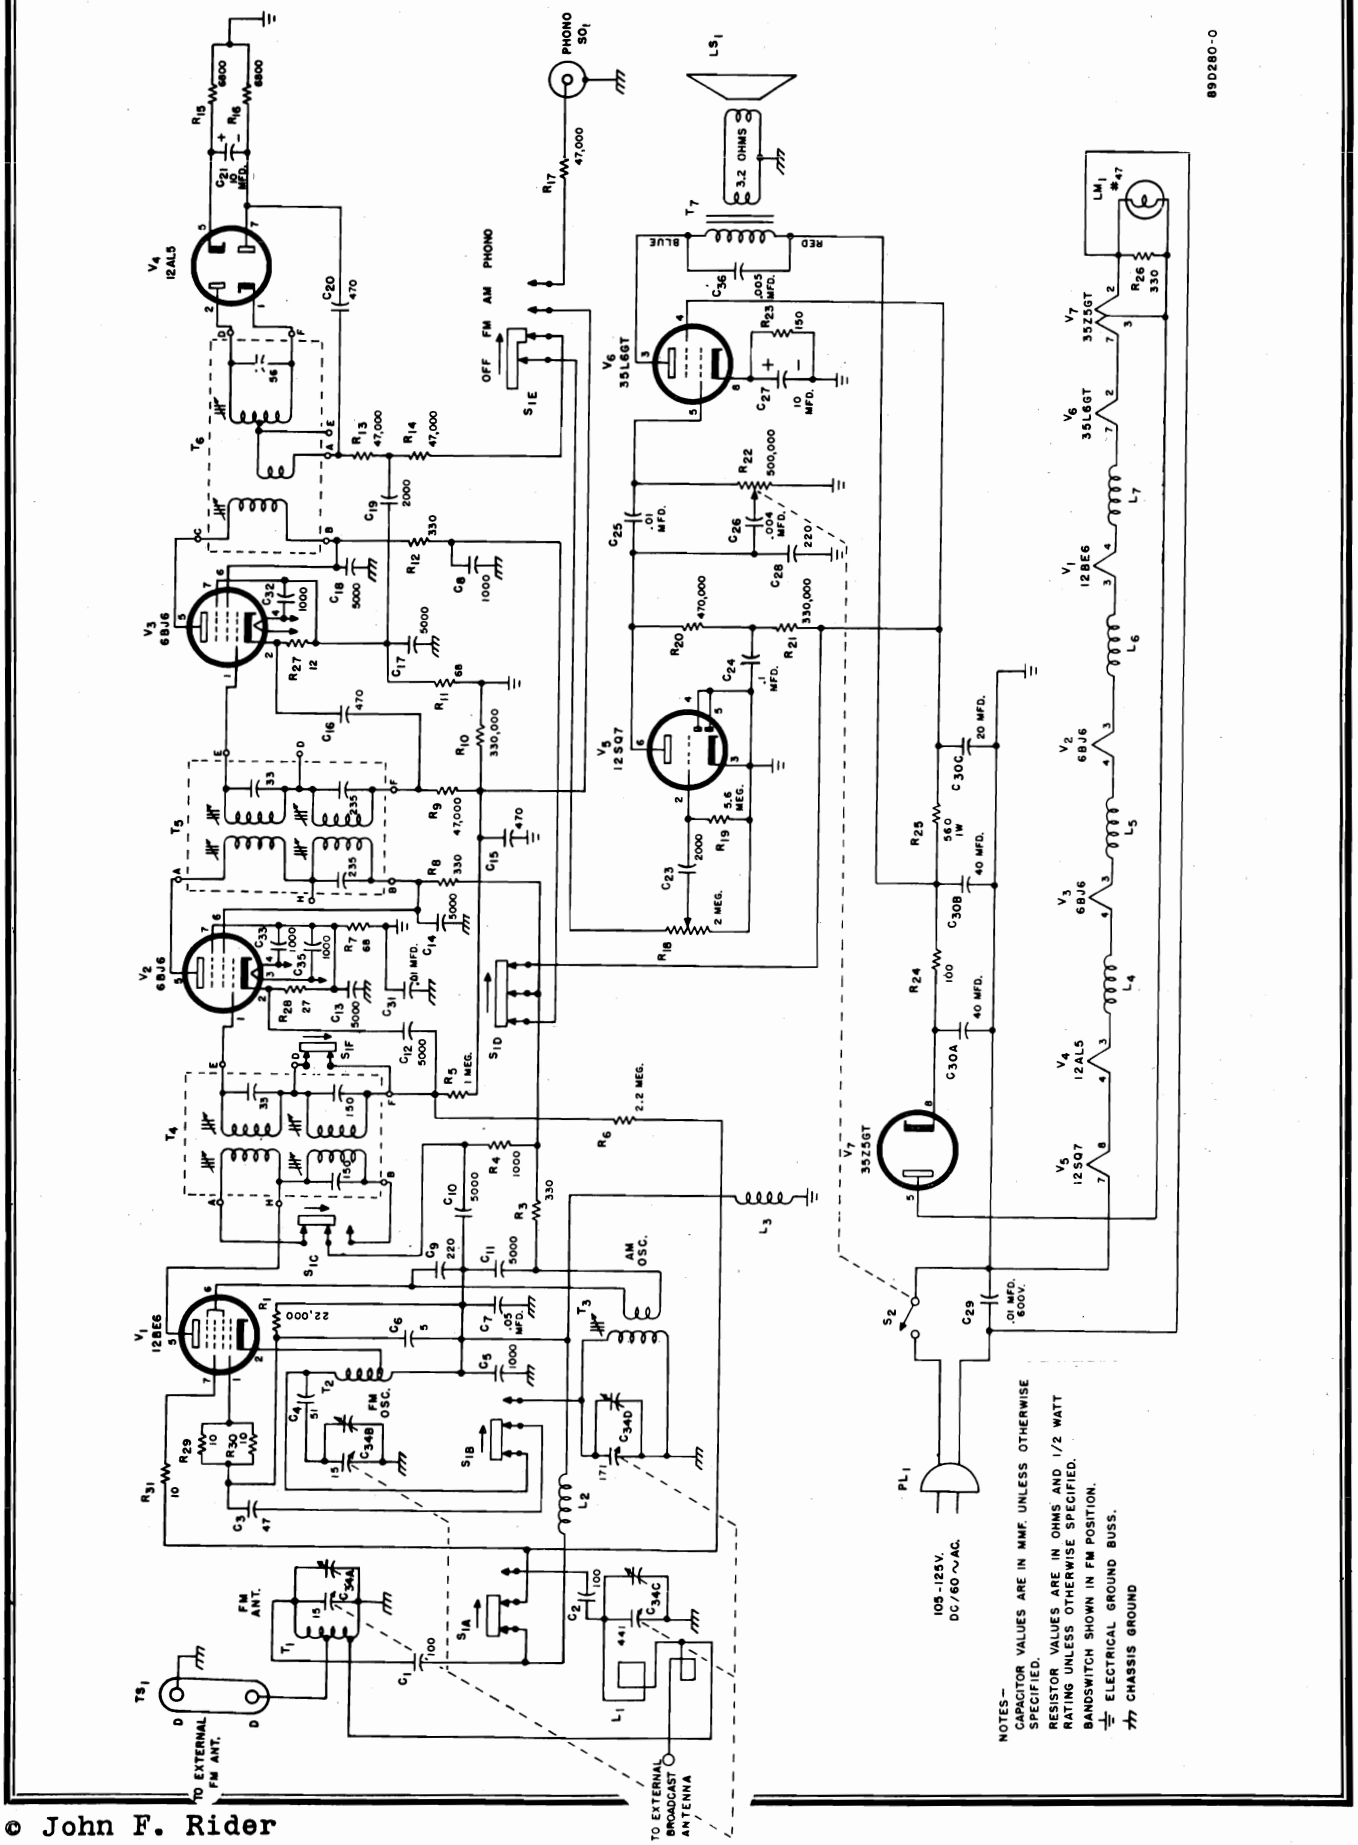
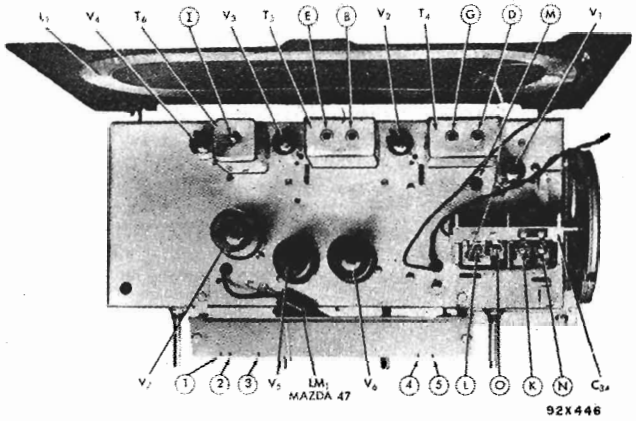
MODEL 84HA-1810A

MONTGOMERY WARD



MONTGOMERY WARD

MODEL 84HA-1810A



This radio is a condenser tuned receiver using a cut plate tracking mixer section in the BC band and uncut plates in a conventional two section gang for FM reception. The built-in loop provides pickup for both the BC and FM bands. The BC section of the loop acts as the mixer stage coil while the FM section of the loop is coupled to the FM mixer stage coil. A single terminal (Back cover) is provided for an external BC antenna and a pair of terminals (D-D) are provided for a 300-ohm FM antenna transmission line for an external FM antenna. For FM reception the IF amplifier consists of two conventional amplifier stages feeding a ratio detector circuit. On the BC band the second IF amplifier stage becomes a conventional diode detector circuit using the control grid on the second IF amplifier tube as a diode plate. Since the receiver operates from AC and DC current, a separate ground buss is used and isolated from the chassis.

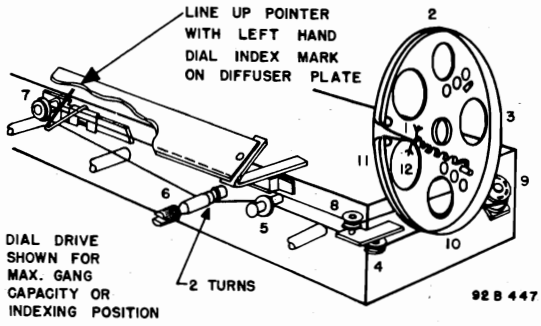
ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts DC or 60 cycle AC, 28 watts
Frequency Range	Broadcast 540-1600 KC Frequency Modulation 88-108 MC
Intermediate Frequency	455 KC/10.7 MC
Antenna	Built in loop. Provisions for external BC and FM antennas.
Power Output	1.5 watts max.
Speaker	4 X 6-inch PM.
Voice Coil Impedance	3.2 ohms
Tube and Dial Lamp Complement	12BE6 Mixer/Osc. 6BJ6, 1st I.F. Amp. 6BJ6, 2nd I.F. Amp. (FM) & Detector (BC) 12AL5 Ratio Detector (FM) 12SQ7 Audio Amp. 35L6GT Power Amp. 35Z5GT Rectifier Mazda No. 47 Dial Lamp

For placement of these tubes, see the diagram showing tube layout.

DIAL CORD STRINGING INSTRUCTIONS

To restring the dial cable, pull the four control knobs from their shafts, remove the chassis bolts and pull the chassis from the cabinet. Restring the dial drive with a 48-inch length of 30-lb. test dial cord following the stringing sequence shown in the accompanying illustration. With the gang condenser at maximum capacity (closed) attach the dial pointer to the drive string and line it up with the left hand #1 index marker on the diffuser plate.



ALIGNMENT PROCEDURE

Generator connection	See chart
Generator ground	To chassis
Output meter connection	Across voice coil
Electronic voltmeter connection	See chart
Volume control position	Maximum
Tone control position	Optional

NOTE - Index marks are provided on the diffuser plate to supplement the dial scale when the chassis is removed from the cabinet for alignment. Check the pointer position with the gang fully closed to make sure it lines up with the first marker before starting the alignment procedure outlined below.

The standard RMA dummy specified in the alignment chart consists of a 200 mmf condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.

The loop antenna must be connected during alignment.

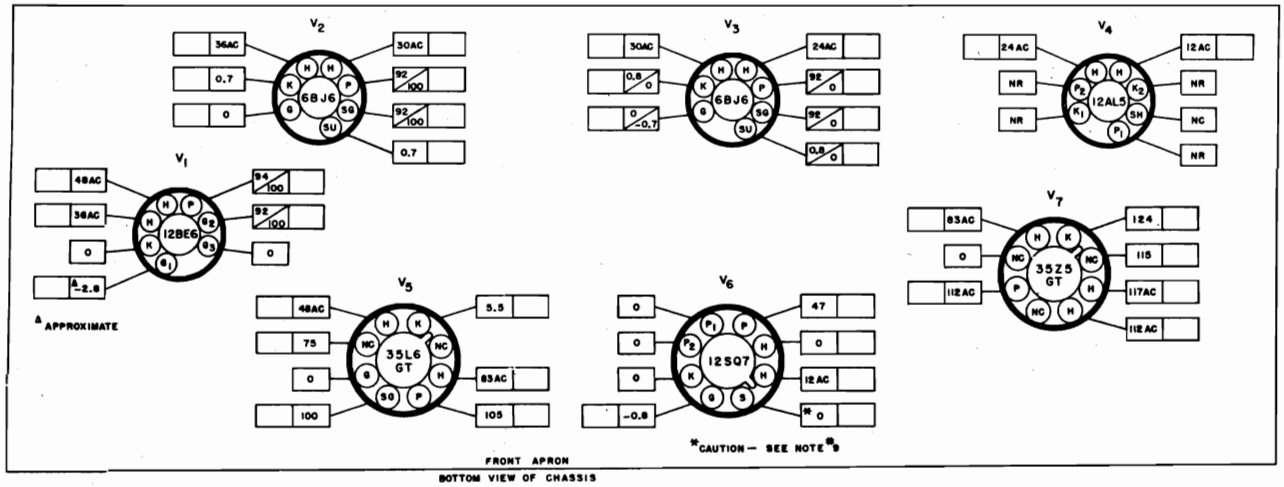
MODEL 84HA-1810A

MONTGOMERY WARD

ALIGNMENT CHART

Step	Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Radio Range Switch Position	Diffuser Plate Index Mark	Adjust	Remarks
1.	.01 mfd.	To stator plates of high cap. mixer section	455 kc	2	None (Midscale)	A,B,C,D	Adjust for max. audio output at voice coil. Keep audio output below 50 mw to avoid AVC action.
2.	.01 mfd. cap.	To stator plates of low cap. mixer section	10.7 mc (No modulation)	1	None (Midscale)	E,F,G,H	Adjust for max. DC voltage between pin #7 of the 6AL5 and ground buss. Connect a 500,000 ohm resistor in series with voltmeter probe. Use just enough signal generator output to obtain approx. 2 volts at the electronic voltmeter.
3.	After completing the adjustments required by step 2. detune the signal generator on each side of 10.7 mc and note the generator dial or frequency reading for one half of the DC voltage measured by the electronic voltmeter. Use just enough signal generator output to obtain a maximum of 2 volts at the center frequency of the IF channel. Set the signal generator frequency at the midpoint of the two readings obtained above and align the FM detector transformer as follows:						
4.	Without changing the setup, adjust the primary of the FM detector transformer (I) for maximum DC voltage. Disconnect the electronic voltmeter probe and reconnect it at the junction of **R13 and R14** using the 500,000-ohm resistor as before for isolation. Adjust the secondary of the FM detector (J) for the null or zero DC voltage. This completes the IF amplifier adjustment.						
5.	Std. RMA dummy	To BC antenna terminal on cabinet back	1500 kc	2	#4	*K,L	Adjust for max. audio output as in step 1.
			600 kc	2	#3	*M	
6.	300-ohm carbon resistor	To terminals "D-D" on rear chassis apron. Connect resistor to high side or ungrounded terminal	108 mc	1	#5	*N,O	Adjust for max. DC voltage as in step 2.

*Calibration adjustment.



NOTES —
1. SOCKET VIEWS ARE BOTTOM VIEWS.
2. ALL VOLTAGES ARE MEASURED BETWEEN TUBE SOCKET TERMINALS AND ELECTRICAL GROUND BUSS (NOT CHASSIS) WITH ZERO SIGNAL INPUT. WHERE TWO READINGS ARE SHOWN THE FIRST IS FOR FM THE SECOND FOR BC.

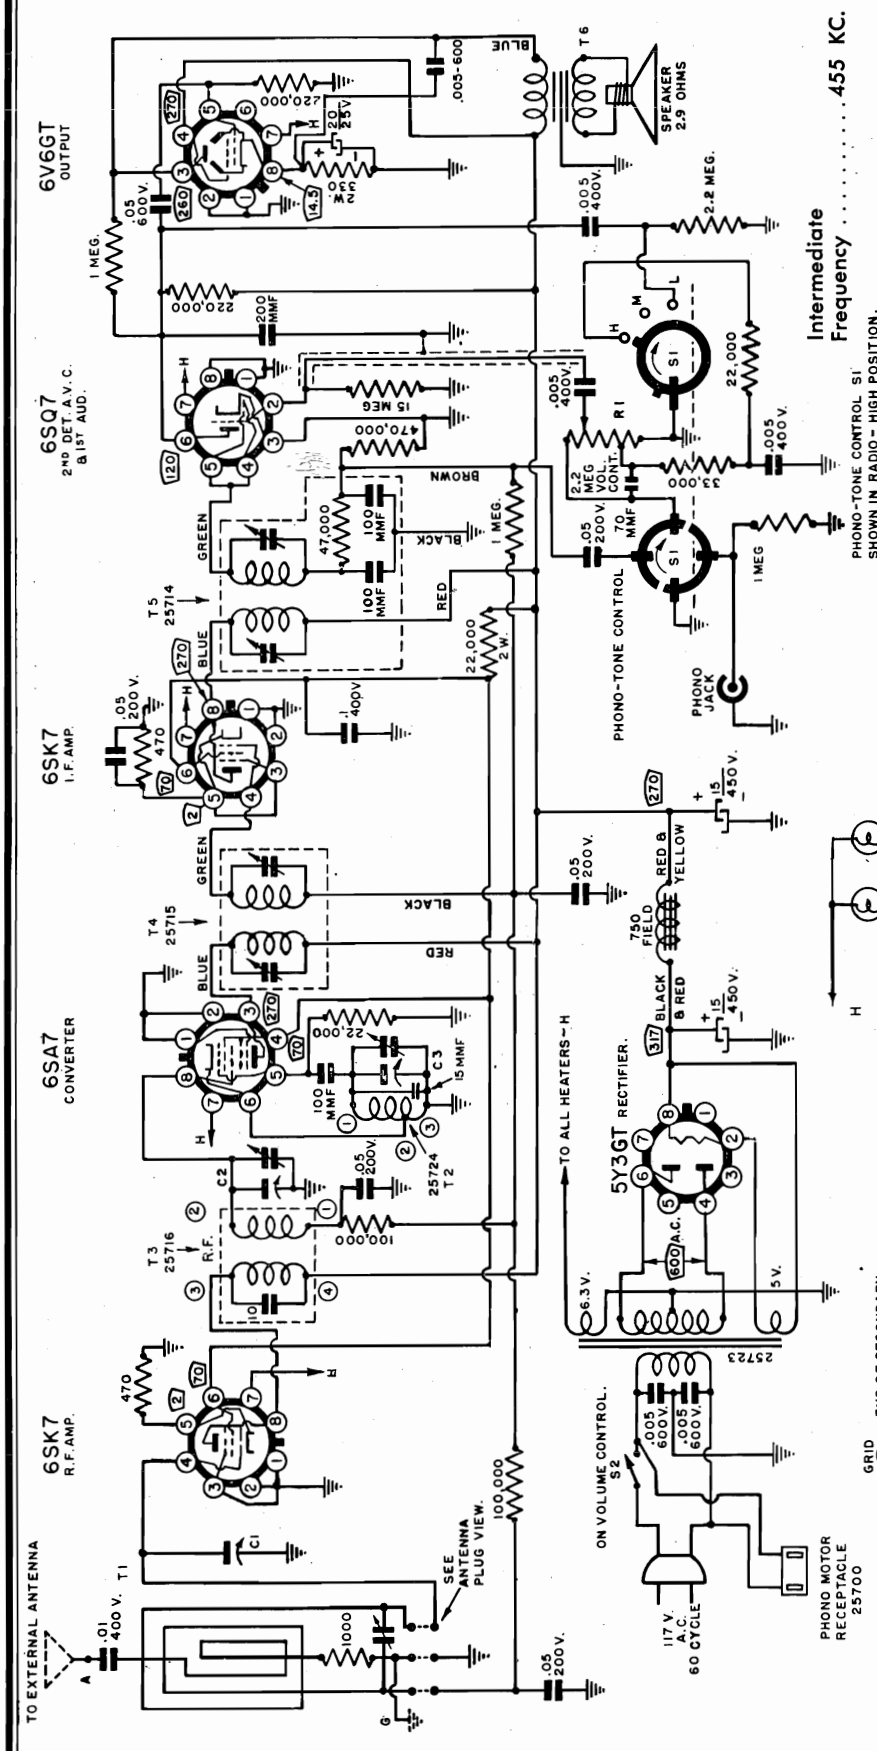
MODEL 84KR-2716A

MONTGOMERY WARD



Intermediate Frequency .....455 KC.

ELECTRICAL SPECIFICATIONS

Power Supply .....105-125 volts AC, 60 cycles, 55 watts. (80 watts phono operating).

Frequency Range ....540 - 1620 KC.

Selectivity .....40 KC broad at 1000 times signal, 1000 KC.

Sensitivity .....(for .5 watt output) with external antenna 5 microvolts average.

Power Output .....6 watts maximum, 3.2 watts 10% distortion.

Loud Speaker .....6x9" EM dynamic, 750 ohms.

Voice Coil Impedance 3.2 ohms at 400 cycles.

ALIGNMENT PROCEDURE

VOLUME CONTROL — MAXIMUM FOR ALL ADJUSTMENTS.

Tone control — In "HIGH" position.

Connect radio chassis to ground connection of Signal Generator.

Allow the chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

A signal generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output indicating meter; non-metallic screw driver.

Dummy antennas — .1 mfd., 200 mmfd.

Place loop antenna in its normal relation to the chassis.

Signal Generator		Connection To Radio	Condenser Setting	Adjust Trimmers To Maximum
Frequency Setting	Dummy Antenna			
455 kc	.1 Mfd.	6SA7, Pin 8	Turn rotor plates to full open	1st IF Transformer. 2nd IF Transformer.
1620 kc	200 Mmfd.	Antenna Lead	Turn rotor plates to full open	Osc. trimmer on tuning condenser.
1400 kc	200 Mmfd.	Antenna Lead	Tune rotor to maximum output.	RF Section trimmer on tuning condenser. Antenna trimmer on loop antenna.

The dial pointer may be adjusted to the scale calibration by slipping the pointer on the dial cord.

RECEIVER STAGE SENSITIVITIES

The following table lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resister across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output with the speaker connected. The volume control must be set to maximum. The signal source must be an accurately calibrated signal generator capable of supply both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
Frequency	Coupling Capacitor	Connection to Reciever	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	External Antenna Lead	Chassis	5 microvolts
1000 kc	.05 mfd.	6SA7 Mixer, Pin 8	Same as above	175 microvolts
455 kc.	.05 mfd.	6SA7 Mixer, Pin 8	Same as above	160 microvolts
455 kc.	.05 mfd.	6SK7 1-F, Pin 4	Same as above	1600 microvolts
400 cycles	.05 mfd.	6SQ7 1st A-F, Pin 2	Same as above	.12 volts
400 cycles	.05 mfd.	6V6GT Output, Pin 5	Same as above	4.32 volts

MONTGOMERY WARD

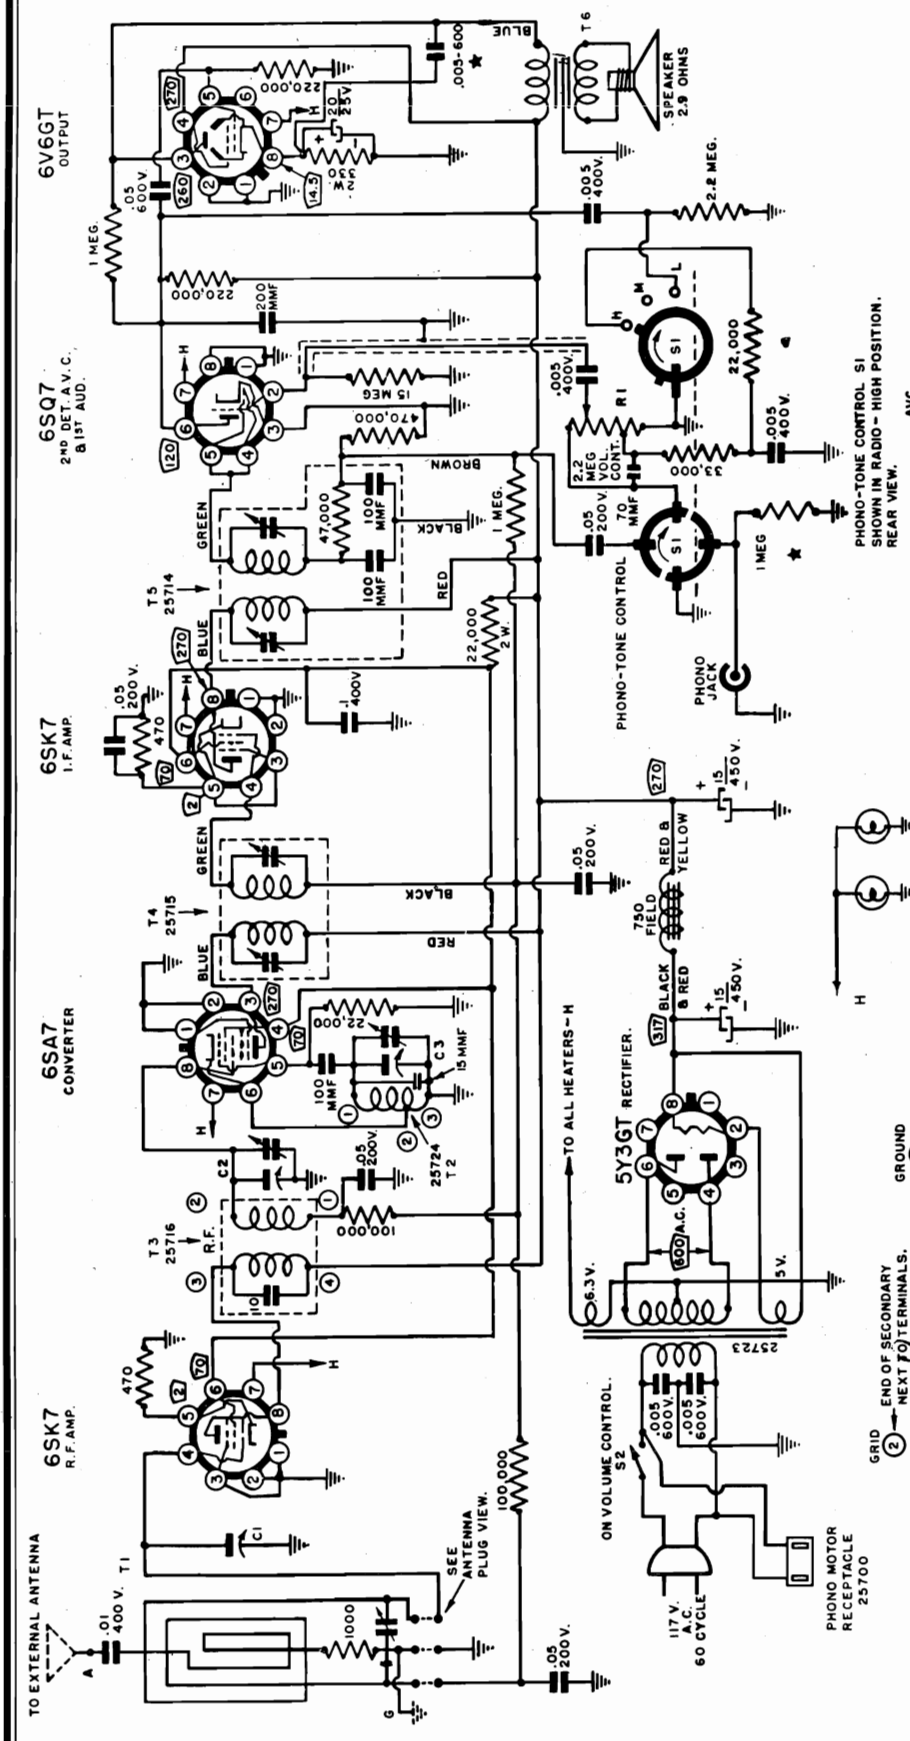
MODEL 84KR-2723A



Power Supply .....105-125 volts AC, 60 cycles, 55 watts. (80 watts phono operating).

Frequency Range .....540 - 1620 KC.

Intermediate Frequency .....455 KC.

Power Output .....6 watts maximum, 3.2 watts 10% distortion.

Loud Speaker .....6x9" EM dynamic, 750 ohms.

Voice Coil Impedance 3.2 ohms at 400 cycles.

Selectivity .....40 KC broad at 1000 times signal, 1000 KC.

Sensitivity .....(for .5 watt output) with external antenna 5 microvolts average.

RECORD CHANGER: V-M Model 800, RCD.CH. 17-1

MODEL 84KR-2723A MONTGOMERY WARD

ALIGNMENT PROCEDURE

VOLUME CONTROL — MAXIMUM FOR ALL ADJUSTMENTS.

Tone control — In "HIGH" position.

Connect radio chassis to ground connection of Signal Generator.

Allow the chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

A signal generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output indicating meter; non-metallic screw driver.

Dummy antennas — .1 mfd., 200 mmfd.

Place loop antenna in its normal relation to the chassis.

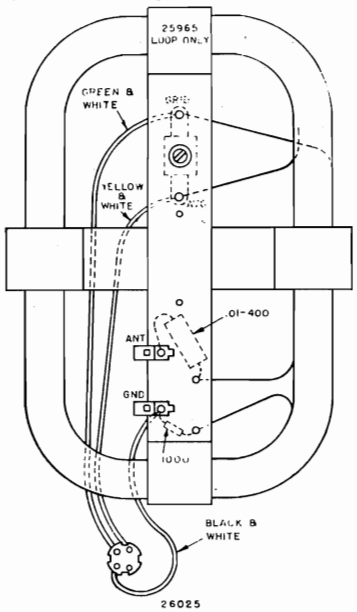
Signal Generator		Connection To Radio	Condenser Setting	Adjust Trimmers To Maximum
Frequency Setting	Dummy Antenna			
455 kc	.1 Mfd.	6SA7, Pin 8	Turn rotor plates to full open	1st IF Transformer. 2nd IF Transformer.
1620 kc	200 Mmfd.	Antenna Lead	Turn rotor plates to full open	Osc. trimmer on tuning condenser.
1400 kc	200 Mmfd.	Antenna Lead	Tune rotor to maximum output.	RF Section trimmer on tuning condenser. Antenna trimmer on loop antenna.

The dial pointer may be adjusted to the scale calibration by slipping the pointer on the dial cord.

RECEIVER STAGE SENSITIVITIES

The following table lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resister across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output with the speaker connected. The volume control must be set to maximum. The signal source must be an accurately calibrated signal generator capable of supply both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
Frequency	Coupling Capacitor	Connection to Reciever	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	External Antenna Lead	Chassis	5 microvolts
1000 kc	.05 mfd.	6SA7 Mixer, Pin 8	Same as above	175 microvolts
455 kc.	.05 mfd.	6SA7 Mixer, Pin 8	Same as above	160 microvolts
455 kc.	.05 mfd.	6SK7 1-F, Pin 4	Same as above	1600 microvolts
400 cycles	.05 mfd.	6SQ7 1st A-F, Pin 2	Same as above	.12 volts
400 cycles	.05 mfd.	6V6GT Output, Pin 5	Same as above	4.32 volts



26025
LOOP ASSEMBLY INCLUDES LOOP, CONDENSER, RESISTOR, WIRE & PLUG.

MODELS 84WG-1804D, 84WG-1806A

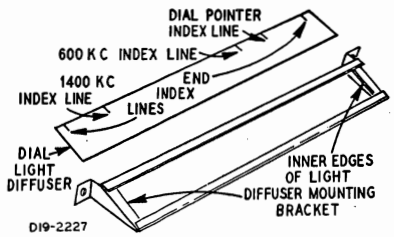
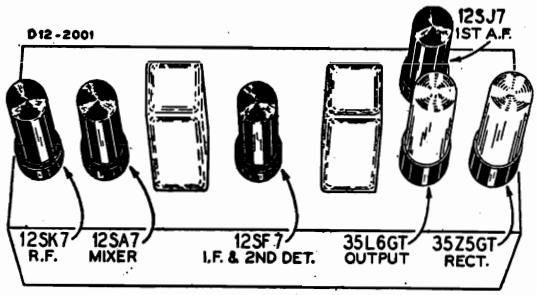
DIAL CALIBRATION

In order to align the receiver, the dial pointer must be positioned on the dial string correctly with reference to the dial. Index lines are provided on the dial light diffuser for this purpose.

Before aligning the receiver (or when replacing the dial light diffuser) check the position of the diffuser strip, making certain that the two end index lines are aligned with the inner edges of the diffuser mounting bracket opening. The bracket should be crimped at one point to prevent movement of the diffuser strip. To position the dial pointer, turn the gang condenser to the fully closed position. The dial pointer should be directly over the dial pointer index line. (See illustration)

The 1400 KC index line is for use when aligning the receiver.

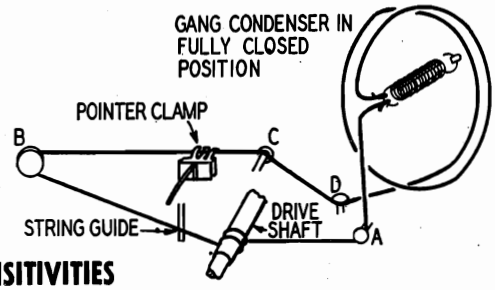




DRIVE CORD REPLACEMENT

Turn the gang condenser to the fully closed position. Use a new 10X44 drive cord assembly and fasten one end to the tension spring. Hook the other end of the tension spring over the tab on the drive pulley. Pass the cord through the slot on the drive pulley rim, under stud A and wind two turns clockwise (from front of chassis) around the tuning shaft. Turns must progress away from chassis. Pass cord over pulley B and stud C under stud D. Pass cord under drive pulley and wind 4 turns counterclockwise around drive pulley Stretch tension spring and fasten free end of cord to spring.

Attach the dial pointer to the cord and position as instructed in paragraph DIAL CALIBRATION.



RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volt AC across this resistor will be equivalent to a 50 milliwatt output. The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR 50 MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	Loop Antenna—External antenna clip	Chassis	19.5 microvolts

ELECTRICAL SPECIFICATIONS

Power Supply.....105-125 volts AC, 25-60 cycles, 35 watts or 105-125 volts DC

Frequency Range.....540-1600 KC

Intermediate Frequency. 455 KC

Selectivity.....At 1000 KC, 50 KC wide at 1000 times signal

Sensitivity..... (for .05 watt output with external antenna) 15 microvolts average

Power Output.....1.3 watts maximum
.75 watt 10% distortion

Loud Speaker.....4"x 6" PM dynamic

Voice Coil Impedance...3.2 ohms at 400 cycles

Tube and Dial Light Complement

1 12SK7 R-F Amplifier
1 12SA7 Mixer
1 12SF7 I-F and 2nd Detector
1 12SJ7 1st A-F
1 35L6GT Power Output
1 35Z5GT Rectifier
1 47 Dial Lamp

TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages except those for the heater and dial lamp are between the socket terminal and "X" point.

The readings were taken with a 1000 ohm-per-volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

Line voltage.....117 volts AC
Volume control.....maximum
Signal input.....none

A variation of ±10% is usually permissible.

GENERAL DESCRIPTION

This model is a five tube (plus rectifier tube) AC console receiver. Controls are provided for tuning, volume, tone, and band selection. The dial scale is calibrated in two bands, the broadcast band in channel numbers to cover frequencies between 540-1600 KC and the short wave band directly in megacycles from 5.75 to 18.3 MC. Other features include a built-in Air Wave Aerial, automatic volume control, beam power audio output stage and a PM dynamic speaker. A switch is provided on the tone control for selection of either radio or phono operation.

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output with the speaker connected. The volume control must be set to maximum. The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
Frequency	**Coupling Capacitor**	**Connection to Receiver**	**Ground Connection**	
1000 kc	200 mmf or RMA Dummy Antenna	External antenna lead	Chassis	9 microvolts
1000 kc	.05 mf	6SA7 Mixer, Pin 8	Same as above	42 microvolts
455 kc	.05 mf	6SA7 Mixer, Pin 8	Same as above	40 microvolts
455 kc	.05 mf	6SK7 1st I-F, Pin 4	Same as above	1075 microvolts

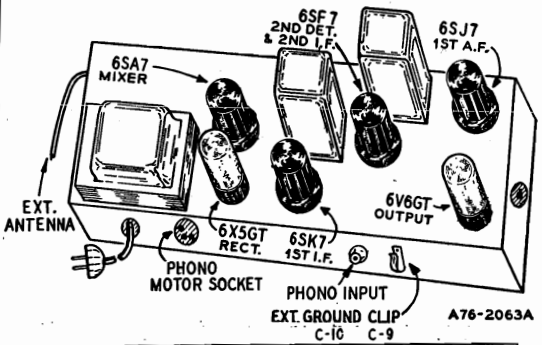
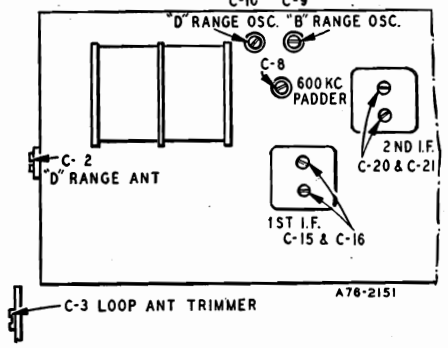
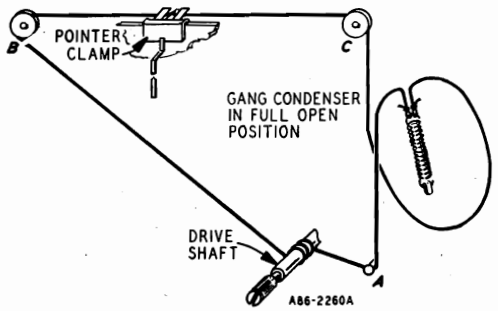
MODEL 84WG-2504D MONTGOMERY WARD





DRIVE CORD REPLACEMENT

Turn the gang condenser to the fully open position. Use a new 10X65 drive cord assembly or a piece of cord 48 inches long and tie one end to the tension spring. Hook the other end of the tension spring to the tab on the drive pulley. Pass the cord through the slot in the drive pulley rim around idler stud A and wind three and one-half turns clockwise around the tuning shaft (turns must progress away from chassis). Then pass cord over idler pulleys B and C. Wrap cord counterclockwise around drive pulley, stretch tension spring and fasten free end of cord to spring.



ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 50 mmf., and 400 ohms:

	SIGNAL GENERATOR		Dummy Antenna	Band Switch Setting	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
	Frequency Setting	Connection at Radio				
I-F	455 kc	6SA7, Pin 8	.1 mf	B Range	Turn Rotor to Full Open	2nd I-F (C-20) & (C-21) 1st I-F (C-15) & (C-16)
RANGE B	1620 kc	Antenna Lead	50 mmf	B Range	Turn Rotor to Full Open	Oscillator Range B (C9)
	1400 kc	Antenna Lead	50 mmf	B Range	Tune Rotor to Max. Output. Set Indicator to 1400 KC. See Note A	Antenna Range B (C3)
	600 kc	Antenna Lead	50 mmf	B Range	Tune Rotor to Max. Output	600 kc (C8) Rock Rotor—See Note B
Repeat above oscillator adjustments at 1620 and 600 KC until readjusting the oscillator Range B Trimmer (C9) causes no further improvement in output.						
RANGE D	18.3 mc	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
	16 mc	Antenna Lead	400 Ohm	D Range	Tune Rotor to Max. Output	Antenna Range D (C2) Rock Rotor—See Note B
LOOP RANGE B	Reassemble chassis in cabinet. 1400 kc	Antenna Lead	50 mmf	B Range	Tune Rotor to Max. Output	Antenna Range B (C3)

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1400 KC on the dial, re-set pointer at the 1400 KC mark on the dial scale.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground.

The readings were taken with a 1000 ohm per volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

Line voltage..... 117 volts AC
Volume control..... maximum
Signal input..... none

A variation of ±10% is usually permissible.

1 5Y3GT Rectifier
2 No. 47 Dial Lamps

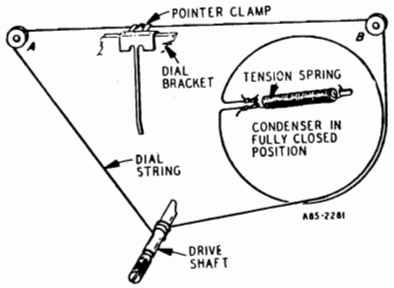
DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X66 drive cord assembly or a new length of cord 46 inches long for the installation. Install the cord as shown in the illustration, winding three turns clockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.



RECEIVER STAGE SENSITIVITIES

AM AND AUDIO STAGES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output.

The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

84WG-2714A,B **SIGNAL GENERATOR**

FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	GROUND CONNECTION	INPUT FOR .5 WATT OUTPUT
1000 KC	200 mmf or RMA Dummy Antenna	External Antenna Lead	Chassis	25 Microvolts
1000 KC	.05 mf	6BE6 Converter Pin 7	Chassis	60 Microvolts
455 KC	.05 mf	6BE6 Converter Pin 7	Chassis	58 Microvolts

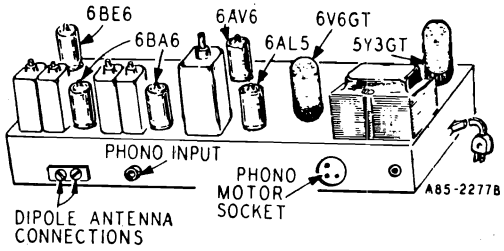
400 cycles	.05 mf	6AV6 1st A-F Pin 1	Chassis	.07 Volt
400 cycles	.05 mf	6V6GT Output Pin 5	Chassis	3.2 Volts



84WG-2714C,D,E

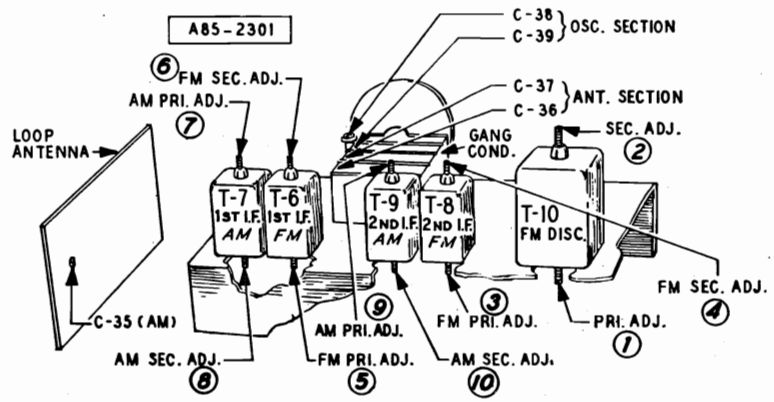
FM STAGES

The tables below lists the sensitivity for the FM stages of the receiver. The receiver must be tuned to 98 MC for all readings. Measurements are based on a .5 watt output the same as for the AM and Audio stage measurements.

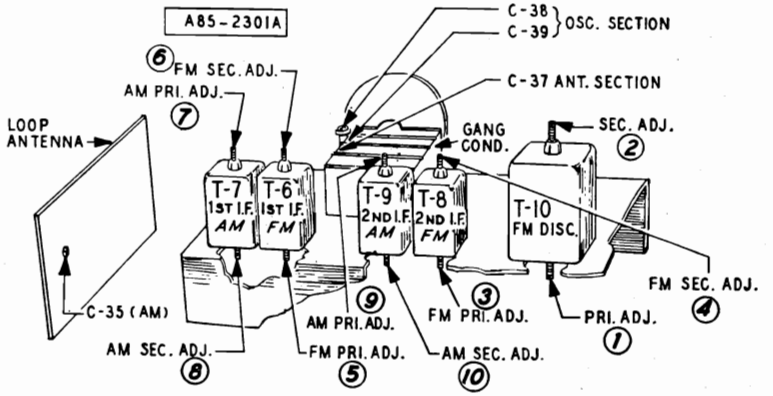
The signal source must be an accurately calibrated signal generator capable of supplying a 98 MC signal modulated by a 400 cycle audio signal. For these measurements the generator must be adjusted for a 22.5 KC deviation. This will correspond to 30% AM modulation.

84WG-2714A,B,C,D,E **SIGNAL GENERATOR**

FREQUENCY	COUPLING TO RECEIVER	CONNECTION TO RECEIVER	GROUND CONNECTION	INPUT FOR .5 WATT OUTPUT
98 MC	300 ohms	External Antenna Lead	Chassis	200 Microvolts
10.7 MC	.01 mf	6BA6 1st I-F Pin 1	Chassis	1,000 Microvolts
10.7 MC	.01 mf	6BA6 2nd I-F Pin 1	Chassis	40,000 Microvolts



84WG-2714A,B,C



84WG-2714D,E

TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC
Signal Input.....None

A variation of ±10% is usually permissible.

ALIGNMENT PROCEDURES

AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR						
FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	CONNECT GROUND TO	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
455 KC	Control Grid 1st 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. Pri. and Sec. (9) and (10)	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	.1 mf	Chassis Base	Rotor Fully Open	1st I.F. Pri. and Sec. (7) and (8)	Maximum Output
1620 KC	Control Grid 6BE6 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	Oscillator C-39	Maximum Output
1400 KC	External Antenna Lead	50 mmf	Chassis Base	Turn Rotor to Max. Output. Set Pointer to 1400 KC See Note A	Antenna C-35	Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

FM STAGES

The following is required for aligning:
An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.
Non-metallic screwdriver.
Dummy Antennas and I-F Loading Resistor — .01 mf, 300 ohms and 100K ohms

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.
(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).
Allow chassis and signal generator to "Heat Up" for several minutes.

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the A.V.C. line at the 27 K. ohm resistor (R-11) and its junction with terminal strip. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from A.V.C. and connect it at the audio takeoff point at the 1 megohm resistor (R-14) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Remove the 100 K. ohm load resistor and solder the lead from pin 7 of 6BE6 tube to the band switch before attempting to check the antenna and oscillator adjustments.

MODEL 84WG-2714D MONTGOMERY WARD

Information applicable to Model "E" receivers is the same as Model "D" and this Supplement.

1. The part number and description of condenser C-6 has been changed and should read as follows:

   C-6 47X476 100 mmf Molded Mica 1

2. A 3.6 ohm resistor has been added in series with the hot side of the heater of the 6AL5 discrininator.

   The part number and description is as follows:

   R-25 43X233 3.6 ohm 0.5 W Wirewound 1

3. Schematic diagram change.

   The wires on lugs 1 and 4 of "SWITCH 1st SEC. FRONT" have been interchanged. This change is shown on the partial schematic below.

ALIGNMENT PROCEDURES
AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR						
FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	CONNECT GROUND TO	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
455 KC	Control Grid 1st 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. C-21 and C-22	Maximum Output
455 KC	Control Grid 6BA7 Pin No. 7 1st Det.	.1 mf	Chassis Base	Rotor Fully Open	1st I.F. Pri. and Sec. (7) and (8)	Maximum Output
1620 KC	Control Grid 6BA7 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	Oscillator C-7	Maximum Output
1400 KC	External Antenna Lead	50 mmf	Chassis Base	Turn Rotor to Max. Output. Set Pointer to 1400 KC See Note A	Antenna C-2	Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

FM STAGES

The following is required for aligning:
An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.
Non-metallic screwdriver.
Dummy Antennas and I-F Loading Resistor—2500 mmf 300 ohms and 100K ohms

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.
(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).
Allow chassis and signal generator to "Heat Up" for several minutes.

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Remove the 100 K. ohm load resistor and solder the lead from pin 7 of 6BA7 tube to the band switch before attempting to check the antenna and oscillator adjustments.

NOTE E—2nd I F trimmers (AM) must be aligned before attempting to adjust 2nd I-F (FM) tuning slug.

RECEIVER STAGE SENSITIVITIES

AM AND AUDIO STAGES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output.

The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

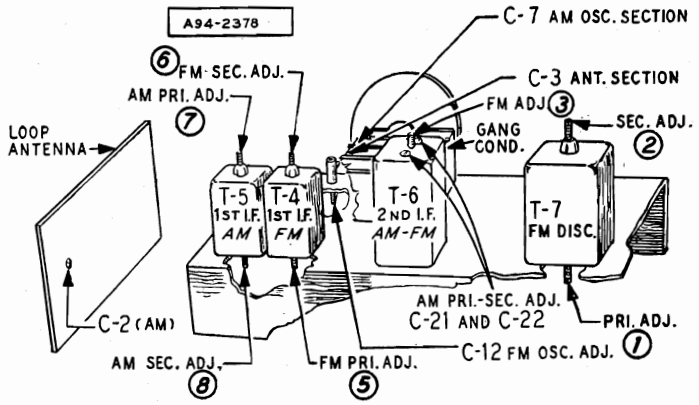
SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	GROUND CONNECTION	
1000 KC	200 mmf or RMA Dummy Antenna	External Antenna Lead	Chassis	10 Microvolts
1000 KC	.01 mf	6BA7 Converter Pin 7	Chassis	40 Microvolts
455 KC	.01 mf	6BA7 Converter Pin 7	Chassis	35 Microvolts
455 KC	.01 mf	6BA6 1st i-F Pin 1	Chassis	2000 Microvolts
400 cycles	.01 mf	6AV6 1st A-F Pin 1	Chassis	.07 Volt
400 cycles	.01 mf	6V6GT Output Pin 5	Chassis	3.2 Volts

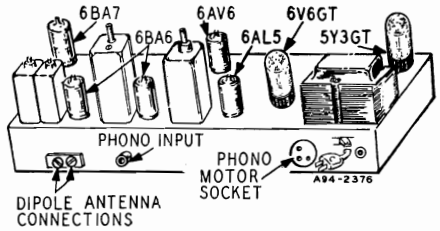
FM STAGES

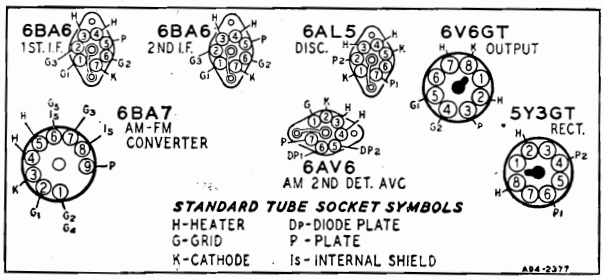
The table below lists the sensitivity for the FM stages of the receiver. The receiver must be tuned to 98 MC for all readings. Measurements are based on a .5 watt output the same as for the AM and Audio stage measurements.

The signal source must be an accurately calibrated signal generator capable of supplying a 98 MC signal modulated by a 400 cycle audio signal. For these measurements the generator must be adjusted for a 22.5 KC deviation. This will correspond to 30% AM modulation.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING TO RECEIVER	CONNECTION TO RECEIVER	GROUND CONNECTION	
98 MC	300 ohms	External Antenna Terminal	Chassis	100 Microvolts
10.7 MC	.01 mf	6BA6 1st I-F Pin 1	Chassis	600 Microvolts
10.7 MC	2500 mmf	6BA6 2nd I-F Pin 1	Chassis	23,000 Microvolts







TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC

Signal Input.....None

A variation of ±10% is usually permissible.

DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X66 drive cord assembly or a new length of cord 46 inches long for the installation. Install the cord as shown in the illustration, winding three turns clockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.

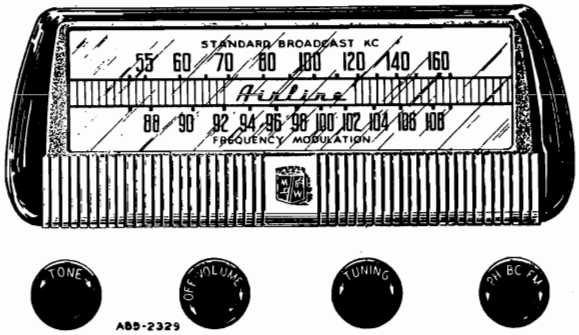
MODEL 84WG-2714G **MONTGOMERY WARD**



GENERAL DESCRIPTION

This is a two band, six tube (plus rectifier tube) receiver with automatic record changer for the reception of both AM and FM stations. The I-F stages use the latest type high gain miniature type tubes and built-in Air Wave Aerials are provided for the FM and Broadcast bands. Features include, compensator circuits to prevent oscillator drift, automatic volume control, beam power output stage, PM dynamic loud speaker and an electrostatic shield in the power transformer to reduce power line noise.

The receiver and record changer are housed in a console combination cabinet with controls provided for tuning, volume, tone and band or phono selection.

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts AC 60 cycles, 60 watts. 80 watts with record changer
Frequency Ranges	Broadcast 540-1600 KC Frequency Modulation 88-108 MC

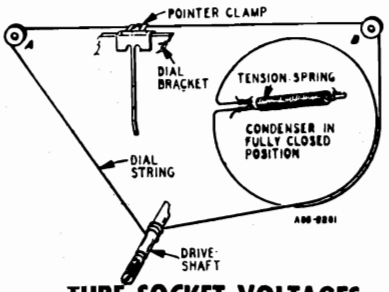
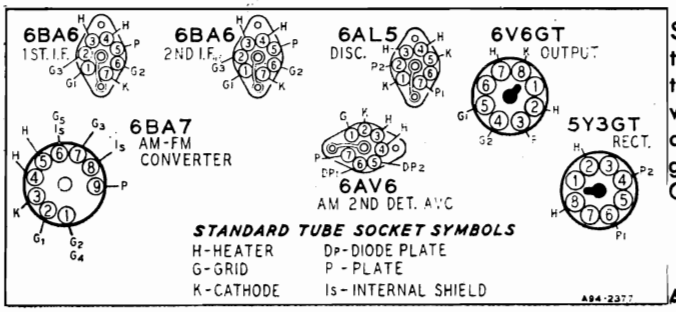
DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X66 drive cord assembly or a new length of cord 46 inches long for the installation. Install the cord as shown in the illustration, winding three turns clockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.





TUBE SOCKET VOLTAGES

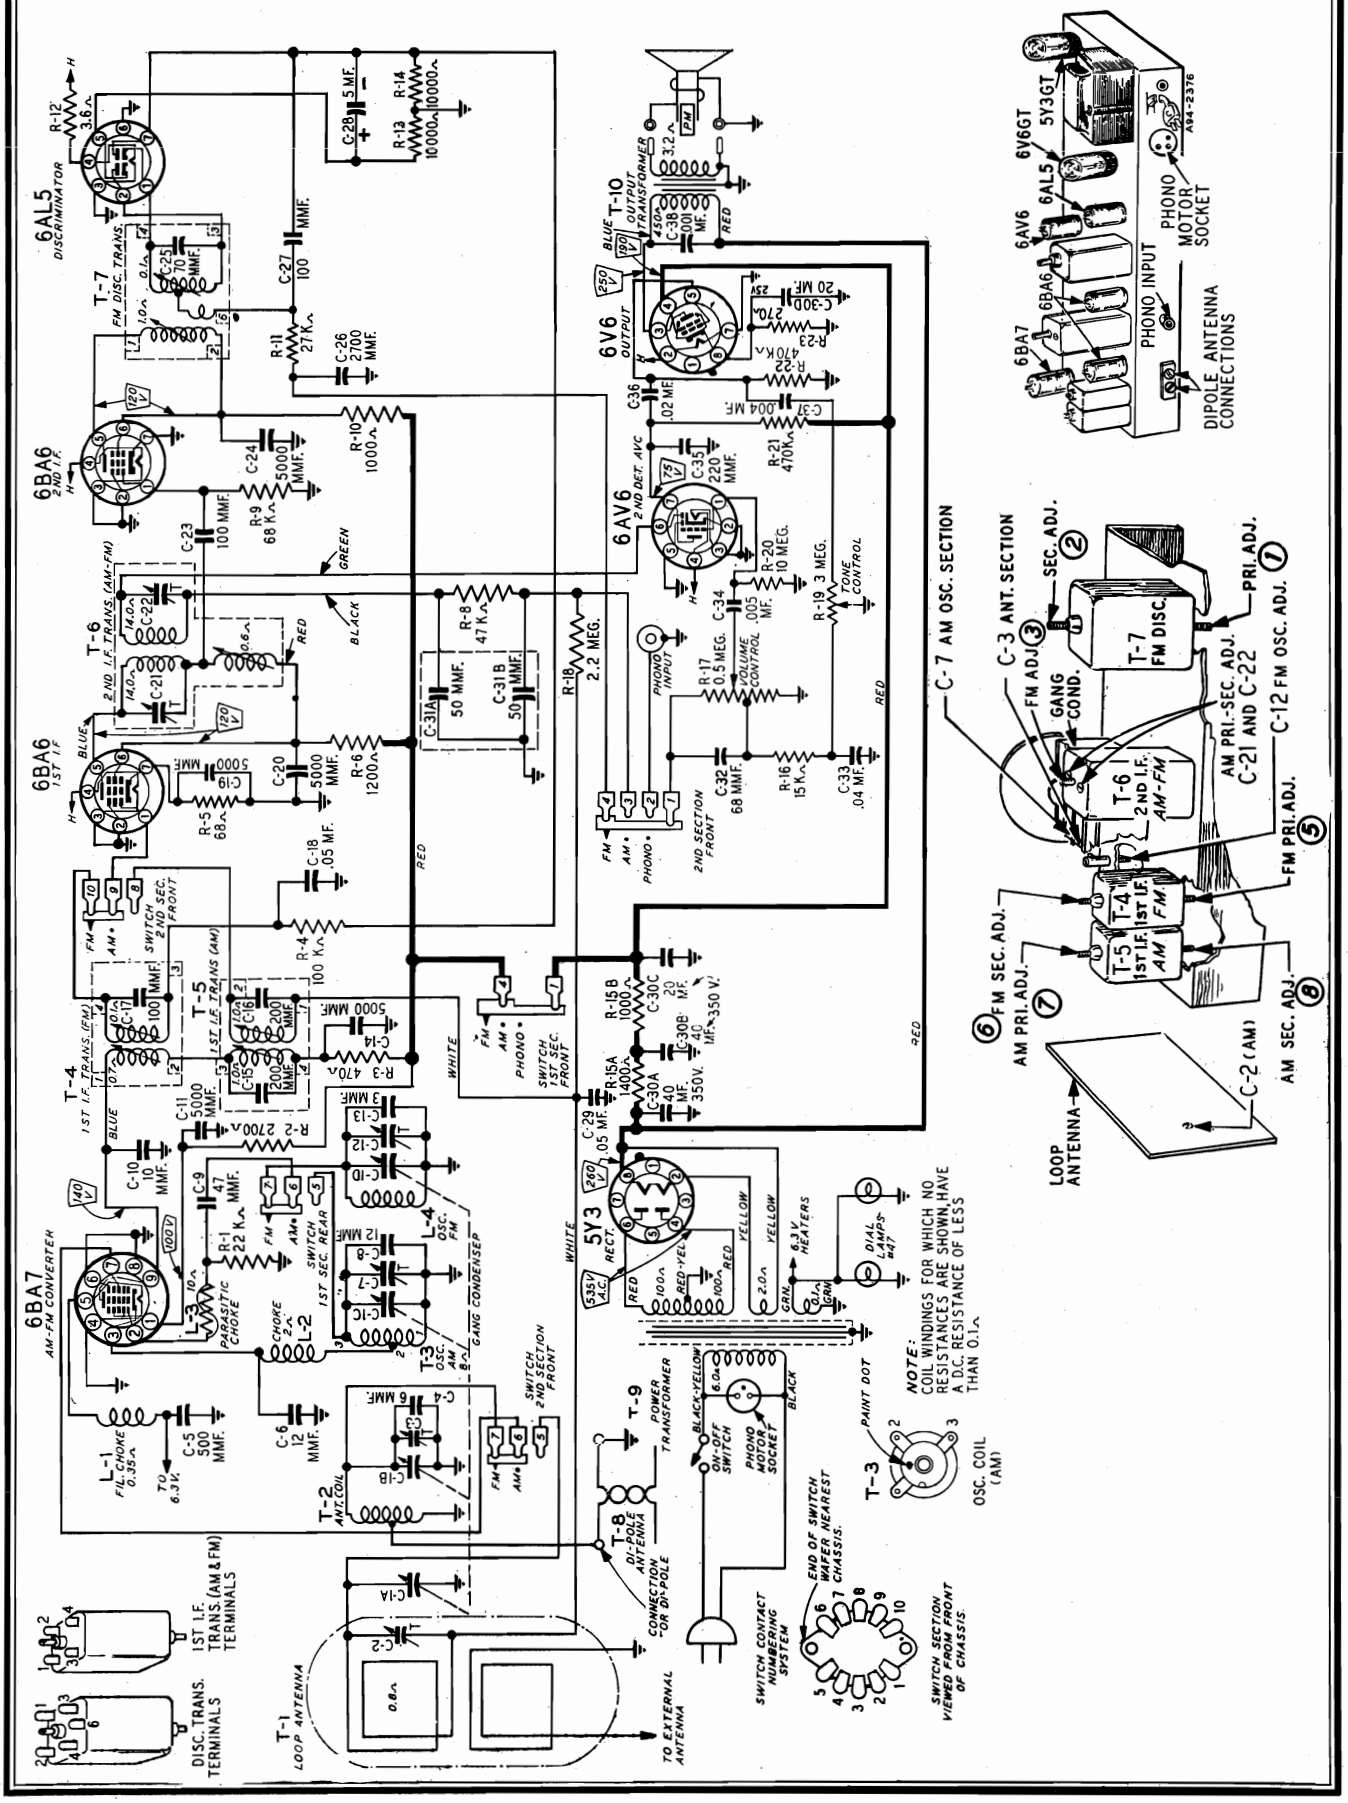
Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC
Signal Input.....None

A variation of ±10% is usually permissible.

MONTGOMERY WARD

MODEL 84WG-2714G



MODEL 84WG-2714G MONTGOMERY WARD

A choke has been added to the circuit to eliminate parasitic oscillation on the FM Band.

PARTS LIST ADDITION

Ref. No.	Part No.	Description	Qty. Used

FM STAGES

The following is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—2500 mmf, 300 ohms and a 3300 ohm .5 watt resistor with short leads.

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).

Allow chassis and signal generator to "Heat Up" for several minutes.

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.

Note output voltage on the zero center DC vacuum tube voltmeter

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Unsolder 3300 ohm resistor from terminals 3 and 4 of 1st I-F transformer and resolder across terminals 1 and 2.

NOTE E—2nd I-F trimmers (AM) must be aligned before attempting to adjust 2nd I-F (FM) tuning slug.

NOTE F—Remove the 3300 ohm load resistor before attempting to check the antenna and oscillator adjustments.

MODEL 84WG-2714G MONTGOMERY WARD

RECEIVER STAGE SENSITIVITIES

AM AND AUDIO STAGES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output. The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	GROUND CONNECTION	INPUT FOR .5 WATT OUTPUT
1000 KC	200 mmf or RMA Dummy Antenna	External Antenna Lead	Chassis	10 Microvolts
1000 KC	.01 mf	6BA7 Converter Pin 7	Chassis	40 Microvolts
455 KC	.01 mf	6BA7 Converter Pin 7	Chassis	35 Microvolts
455 KC	.01 mf	6BA6 1st I-F Pin 1	Chassis	2000 Microvolts
400 cycles	.01 mf	6AV6 1st A-F Pin 1	Chassis	.07 Volt
400 cycles	.01 mf	6V6GT Output Pin 5	Chassis	3.2 Volts

FM STAGES

The table below lists the sensitivity for the FM stages of the receiver. The receiver must be tuned to 98 MC for all readings. Measurements are based on a .5 watt output the same as for the AM and Audio stage measurements.

The signal source must be an accurately calibrated signal generator capable of supplying a 98 MC signal modulated by a 400 cycle audio signal. For these measurements the generator must be adjusted for a 22.5 KC deviation. This will correspond to 30% AM modulation.

SIGNAL GENERATOR				
FREQUENCY	COUPLING TO RECEIVER	CONNECTION TO RECEIVER	GROUND CONNECTION	INPUT FOR .5 WATT OUTPUT
98 MC	300 ohms	External Antenna Terminal	Chassis	100 Microvolts
10.7 MC	.01 mf	6BA6 1st I-F Pin 1	Chassis	600 Microvolts
10.7 MC	2500 mmf	6BA6 2nd I-F Pin 1	Chassis	23,000 Microvolts

ALIGNMENT PROCEDURES

AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR						
FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	CONNECT GROUND TO	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
455 KC	Control Grid 1st 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. Pri. and Sec. (9) and (10)	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	.1 mf	Chassis Base	Rotor Fully Open	1st I.F. Pri. and Sec. (7) and (8)	Maximum Output
1620 KC	Control Grid 6BE6 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	Oscillator C-39	Maximum Output
1400 KC	External Antenna Lead	50 mmf	Chassis Base	Turn Rotor to Max. Output. Set Pointer to 1400 KC See Note A	Antenna C-35	Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

FM STAGES

The following is required for aligning:
An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.
Non-metallic screwdriver.
Dummy Antennas and I-F Loading Resistor — .01 mf, 300 ohms and 100K ohms

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.
(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).
Allow chassis and signal generator to "Heat Up" for several minutes.

	SIGNAL GENERATOR		THROUGH DUMMY ANTENNA	BAND SWITCH SETTING	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
	FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO

	104.5	Same as above	300 ohms	FM	Tune rotor for max. AVC voltage	Ant. C-37	Maximum Deflection
RECHECK ANTENNA & OSC. ADJUSTMENTS IN ORDER GIVEN							

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and AVC line. A signal of .1 volt must be fed into the receiver for this adjustment. Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Remove the 100 K. ohm load resistor and solder the lead from pin 7 of 6BE6 tube to the band switch before attempting to check the antenna and oscillator adjustments.

MONTGOMERY WARD

MODELS 84WG-2015A, 84WG-2015B

RECEIVER STAGE SENSITIVITIES

AM AND AUDIO STAGES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output.

The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

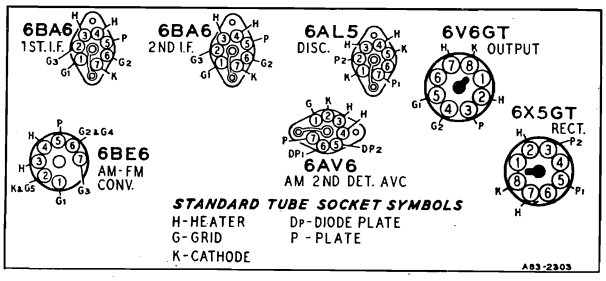
SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	GROUND CONNECTION	
1000 KC	200 mmf or RMA Dummy Antenna	External Antenna Lead	Chassis	25 Microvolts
1000 KC	.05 mf	6BE6 Converter Pin 7	Chassis	60 Microvolts
455 KC	.05 mf	6BE6 Converter Pin 7	Chassis	58 Microvolts
455 KC	.05 mf	6BA6 1st I-F Pin 1	Chassis	2400 Microvolts
400 cycles	.05 mf	6AV6 1st A-F Pin 1	Chassis	.07 Volt
400 cycles	.05 mf	6V6GT Output Pin 5	Chassis	3.2 Volts

FM STAGES

The table below lists the sensitivity for the FM stages of the receiver. The receiver must be tuned to 98 MC for all readings. Measurements are based on a .5 watt output the same as for the AM and Audio stage measurements.

The signal source must be an accurately calibrated signal generator capable of supplying a 98 MC signal modulated by a 400 cycle audio signal. For these measurements the generator must be adjusted for a 22.5 KC deviation. This will correspond to 30% AM modulation.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING TO RECEIVER	CONNECTION TO RECEIVER	GROUND CONNECTION	
98 MC	300 ohms	External Antenna Lead	Chassis	200 Microvolts
10.7 MC	.01 mf	6BA6 1st I-F Pin 1	Chassis	1,000 Microvolts
10.7 MC	.01 mf	6BA6 2nd I-F Pin 1	Chassis	40,000 Microvolts

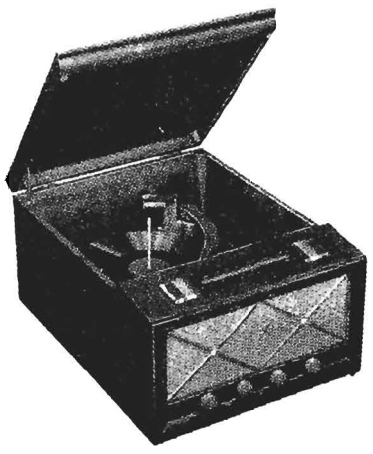


TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC
Signal Input.....None

A variation of ±10% is usually permissible.



DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X70 drive cord assembly or a new length of cord 51 inches long for the installation. Install the cord as shown in the illustration, winding three turns clockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.

50 CYCLE OPERATION

If it is desired to use the record changer on a 50 cycle power supply, it will be necessary to replace the drive sleeve assembly on the record changer motor shaft with a 50 cycle drive sleeve assembly. This assembly is listed in the parts list.

To change the sleeve turn the record selector shelf to the 12" position and lift the turntable off of the record changer. Loosen the set screw holding the drive sleeve on the motor shaft and remove the old sleeve. Install the new 50 cycle drive sleeve and replace the turntable.

MODEL 84WG-2015A

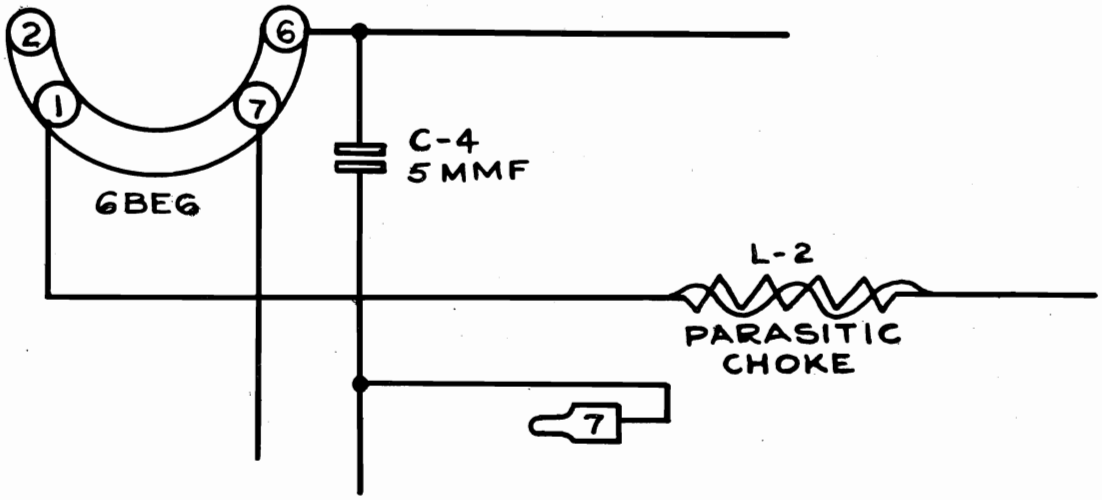
(1) The part number and description of C-6 has been changed. The new description follows:

C-6	47X463	47 MMF	Molded	1 used

(2) The circuit connection of the 5 MMF Capacitor C-4 has been changed. The new circuit connection is shown in the partial schematic below:



MODELS 84WG-2718A, 84WG-2720A

PARTS LIST ADDITION

The description of the new part follows:

Ref. No.	Part No.	Description	Qty. Used
R-48	B84222	2200 ohms 0.5 watt	1

The circuit connection of resistor R-48 is shown in the partial schematic below. This also applies to Model's 84 WG-2718B, 2724A.

RECEIVER STAGE SENSITIVITIES
AM AND AUDIO STAGES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting an 8 ohm, 10 watt resistor across the secondary winding of the output transformer. A reading of 2 volts across this resistor will be equivalent to a .5 watt output.

The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	GROUND CONNECTION	
1000 KC	200 mmf or RMA Dummy Antenna	External Antenna Lead	Chassis	2 Microvolts
1000 KC	.05 mf	6BA6 Interstage Pin 1	Chassis	8 Microvolts
1000 KC	.05 mf	6BE6 Converter Pin 7	Chassis	65 Microvolts
455 KC	.05 mf	6BE6 Converter Pin 7	Chassis	55 Microvolts
455 KC	.05 mf	6BA6 1st I-F Pin 1	Chassis	2500 Microvolts
400 cycles	.05 mf	6AV6 1st A-F Pin 1	Chassis	.05 Volt
400 cycles	.05 mf	6V6GT Output Pin 5	Chassis	2.8 Volts

FM STAGES

The table below lists the sensitivity for the FM stages of the receiver. The receiver must be tuned to 98 MC for all readings. Measurements are based on a .5 watt output the same as for the AM and Audio stage measurements.

The signal source must be an accurately calibrated signal generator capable of supplying a 98 MC signal modulated by a 400 cycle audio signal. For these measurements the generator must be adjusted for a 22.5 KC deviation. This will correspond to 30% AM modulation.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING TO RECEIVER	CONNECTION TO RECEIVER	GROUND CONNECTION	
98 Mc	300 ohms	External Antenna Terminal	External Ant. Terminal	25 Microvolts
10.7 MC	.01 mf	6BA6 1st I-F Pin 1	Chassis	2200 Microvolts
10.7 MC	.01 mf	6BA6 2nd I-F Pin 1	Chassis	50,000 Microvolts

ALIGNMENT PROCEDURE
AM BROADCAST AND SHORT WAVE BAND

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas —.1 mf, 200 mmf and 400 ohms.

Volume Control—Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

	SIGNAL GENERATOR		THROUGH DUMMY ANTENNA	BAND SWITCH SETTING	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
	FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO					
I-F	455 kc	6BE6 Pin 7 and Chassis	.1 mf	Broadcast	Rotor Fully Open	1st I-F Pri. & Sec. (3) & (4) 2nd I.-F. Pri. & Sec. (1) & (2)	Maximum Output
Broadcast	1620 kc	External ant. lead	200 mmf	Broadcast	Rotor Fully Open	Broadcast Oscillator C-70B	
	1400 kc	External ant. lead	200 mmf	Broadcast	Turn Rotor to Max. Output Set pointer to 1400 kc See Note A	Broadcast Interstage C-38B	
	1400 kc	External ant. lead	200 mmf	Broadcast		Loop Antenna C-33	
	600 kc	External ant. lead	200 mmf	Broadcast	Turn Rotor to Max. Output and Rock See Note B	600 kc padder C-56	
Repeat above oscillator adjustments at 1620 and 600 KC until readjusting the oscillator Range B Trimmer C-70B causes no further improvement in output.							
Short Wave	18.3 MC	External ant. lead	400 ohm	Short Wave	Rotor Fully Open	SW Oscillator C-70A	Maximum Output
	17 MC	External ant. lead	400 ohm	Short Wave	Turn Rotor to Max. Output	SW Interstage C-38A "D" Antenna C-31	
Reassemble chassis in cabinet							
Broadcast	1400 kc	External ant. lead	200 mmf	Broadcast	Turn Rotor to Max. Output	Loop Antenna C-33	

After each range is completed, repeat the procedure as a final check.

Note A—If the pointer is not at 1400 KC on the dial, reset pointer at the 1400 KC mark on the dial scale.

Note B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

84WG-2720A, 84WG-2724A

ALIGNMENT PROCEDURE

FM STAGES

The following equipment is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—.01 mf, 300 ohms and 5000 ohms.

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.

Allow chassis and signal generator to warm up for several minutes.

	SIGNAL GENERATOR		THROUGH DUMMY ANTENNA	BAND SWITCH SETTING	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
	FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO					
Discriminator	10.7 MC Note B	6BA6 2nd I-F Pin 1 and Chassis	.01 mf	FM	Rotor Fully Open	Disc. Pri. (5) Note A	Maximum Deflection
	10.7 MC Note B	6BA6 2nd I-F Pin 1 and Chassis	.01 mf	FM	Rotor Fully Open	Disc. Sec. (6) Note C	Zero Center
	10.7 MC Note B	6BA6 2nd I-F Pin 1 and Chassis	.01 mf	FM	Rotor Fully Open	Disc. Pri. (5) Note A	Maximum Deflection
	10.7 MC Note B	6BA6 2nd I-F Pin 1 and Chassis	.01 mf	FM	Rotor Fully Open	Disc. Sec. (6) Note C	Zero Center

Recheck I-F Adjustments in order given							
R-F & Osc.	108.4	Disconnect dipole and connect generator to dipole terminals with resistor in series	300 ohms	FM	Rotor Fully Open	Oscillator C-9 Note G	Maximum Deflection
	104.5	Disconnect dipole and connect generator to dipole terminals with resistor in series	300 ohms	FM	Tune Rotor for Max. AVC voltage	RF. C-5	Maximum Deflection
	104.5	Disconnect dipole and connect generator to dipole terminals with resistor in series	300 ohms	FM	Tune Rotor for Max. AVC voltage	Ant. C-2	Maximum Deflection
Recheck R-F and Osc. Adjustments in order given							

NOTE A—Test Equipment connections are as given in the table. The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line at the 1 megohm resistor R-40 and the band switch terminal for all adjustments except the discriminator secondary adjustment, for which see Note C.

NOTE B—A signal of .1 volt must be fed into the receiver for this adjustment.

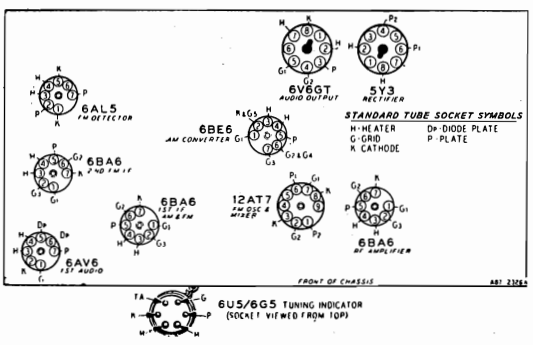
NOTE C—Disconnect zero center DC vacuum tube voltmeter from AVC and reconnect to junction of R-11, C-51 and C-52. Adjust for zero voltage indication.

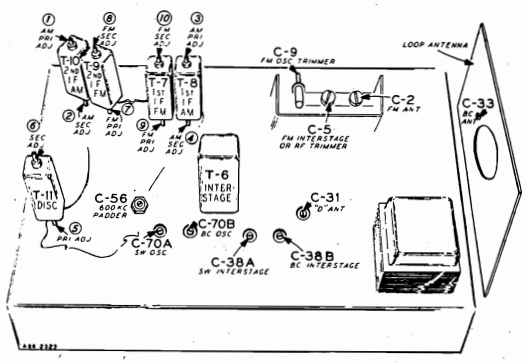
NOTE D—Before adjusting Pri. core connect 5000 ohm load resistor across the 2nd I.F. secondary terminals.

NOTE E—Disconnect 5000 ohm load resistor from secondary terminals and reconnect across the 2nd I.F. primary terminals.

NOTE F—Input can be reduced to 10,000 microvolts.

NOTE G—Oscillator frequency below signal frequency.





TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC

Signal Input.....None

A variation of ±10% is usally permissible.

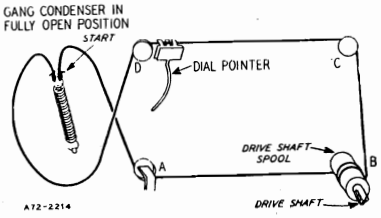
84WG-2720A, 84WG-2724A

MONTGOMERY WARD

DRIVE CORD REPLACEMENT

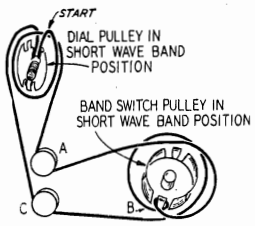
DIAL POINTER CORD

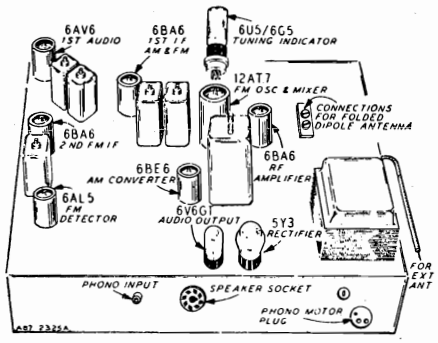
Use a new 10X66 drive cord assembly or a new length of cord 50 inches long for the installation. Install the cord as shown in the illustration, winding three turns counterclockwise around the drive shaft spool with the turns progressing towards the front end of the drive shaft. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.



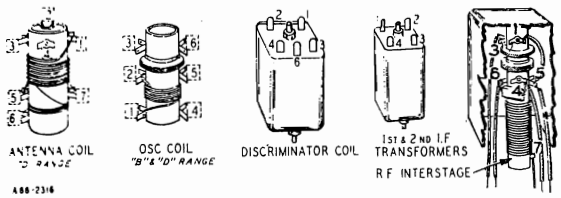
DIAL ROTATION CORD

Use a new 10X60 drive cord assembly or a new length of cord 21 inches long for the installation. Both the dial pulley and the band switch pulley must be turned to the short wave band position as shown in the illustration. Install the new cord exactly as shown then change the position of the band switch several times and note the movement of the dial.





This is a three band, eight tube (plus tuning eye and rectifier tube) receiver with automatic record changer, for the reception of both AM and FM stations. The R-F and I-F stages use the latest type high gain miniature type tubes and built-in Air Wave Aerials are provided for the FM and Broadcast bands. Features include the new Roto-Selector dial with only one band visible at a time, compensator circuits to prevent oscillator drift, automatic volume control, beam power output stage, electro dynamic loud speaker and an electrostatic shield in the power transformer to reduce power line noise.



50 CYCLE AC OPERATION

If it is desired to operate this radio on a 50 cycle 105-125 volt AC power source no changes are necessary to the radio chassis.

If it is desired to use the record changer on a 50 cycle power supply, it will be necessary to replace the drive sleeve assembly on the record changer motor shaft with a 50 cycle drive sleeve assembly. This assembly is listed in the parts list.

To change the sleeve turn the recorder selector shelf to the 12" position and lift the turntable off of the record changer. Loosen the set screw holding the drive sleeve on the motor shaft and remove the old sleeve. Install the new 50 cycle drive sleeve and replace the turntable.

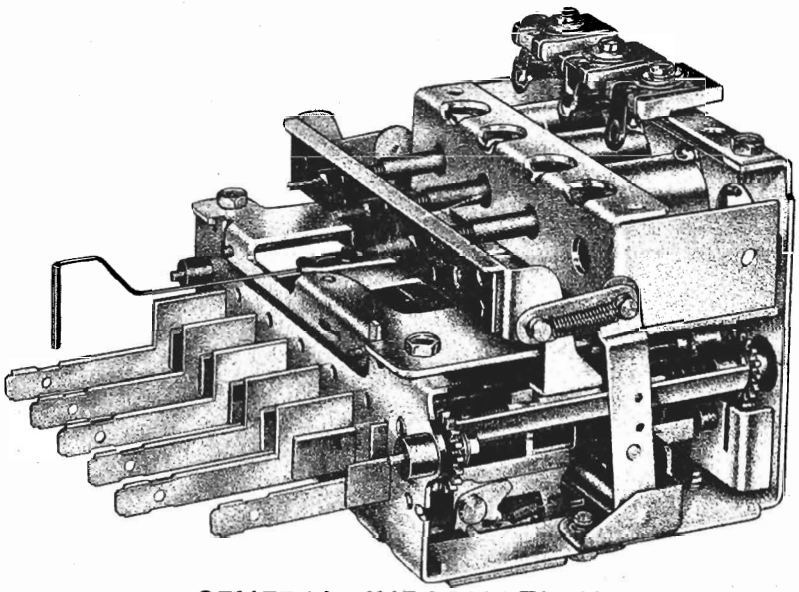
MOTOROLA INC. MODEL AT-58



GENERAL INFORMATION

DESCRIPTION

Automatic Tuner AT-58 is used in Motorola specific auto receivers using Chassis 8A, and also in Model CR8. Tuner AT-58 is adapted to fit any receiver using Chassis 8A or Model CR8 by simply using the correct pointer and push buttons.

This is a 3-gang permeability type tuner, mechanically operated by movement of its push buttons. Five pre-set and one manual tuning positions are provided. The frequency range is 535 to 1600 Kc. The pre-set positions can be set in any sequence to any frequency within this range.

SERVICE TOOLS

The simplicity of the tuner allows easy servicing with:

1. 1/4" open end and 1/4" box end wrench.
2. A stiff steel hook 1/16" diameter made of 1/8" rod, ground down and shaped like a #5 to #10 size crochet hook, to hook and unhook the springs.
3. Slab head wrench for coil adjustment: #2/56 head.

TO REMOVE TOP DECK

Unscrew two #8 sheet metal screws (45) on the back of the tuner and two #8 sheet metal screws (45) on the top front of the tuner. (Do not unscrew screws (45) at trimmer bracket). Before removing top deck, unhook springs (53) and links (25). Grasp top deck and lift up and tip back. This leaves both decks open for servicing. See Figures 1 and 2.

SERVICING LOWER DECK

Looking at the top of the lower deck (with front to you), on the right we have the manual drive lead screw assembly (42). The other 5 assemblies (43) are the station set-up screw assemblies.

Note that all assemblies can be easily lifted out after springs (50) are unhooked.

Note also that unless a push button arm (1) is pushed in, all assemblies lay flat. When a push button arm (1) is pushed in, the assembly is tilted about 30°.

Visual inspection will show correct location of all springs in the assemblies and those which hold down the assemblies.

Note action of gear train as manual knob is turned and push button arm is pushed in so gears mesh. Automatic tuning buttons can be checked for any binding by trying each button at their present setting.

DRIVE ARM ADJUSTMENT

It is very important that the carriage drive assembly (12) be correctly adjusted in its bearings so as not to bind or be too loose and allow it to twist and force the tuner out of alignment.

On the left side of the lower deck, you will find a set screw (47) and lock nut (30) for assembly adjustment. Note that the assembly is floated in the base bracket (7) between two ball bearings (4), one on each end. Adjust by loosening lock nut (30) and then turn set screw (47) so that all bearing play is eliminated but yet carriage drive assembly (12) moves freely. Tighten lock nut (30) after adjustment. Before hooking spring (54), tip the tuner several times to make sure carriage drive assembly (12) is free enough to swing up or down by its own weight.

POINTER REPLACEMENT

The pointer is easily removed by downward and outward pressure to unhook it from the pointer arm (2). Pointer is replaced by reversing procedure. Be sure that the correct pointer is used; pointers vary in length, depending on which receiver tuner is to be used in. See Specific Radio Service Manual (i.e., FD8, OE2, etc.) for part number of pointer.

ANT., RF OR OSC. CORE REPLACEMENT

The tuner cores (18) are easily unscrewed from clip (14) and pulled out when carriage assembly (13) is extended. Note that the cores are coded with a paint dot on the screw portion; always use replacement cores bearing the same color coding. When ordering replacement cores, always specify color coding together with part number.

TO SET THE PUSH BUTTONS

1. Turn receiver "on" and allow it to warm up for a few minutes.

2. Push the first automatic tuning button in as far as it will go and HOLD IT THAT WAY.

3. With the tuning knob, tune in the station you desire to set up. Tune carefully until you are exactly on the station; tuning to either side of it will result in poor tone quality. The pointer will indicate station being set up. Release button and knob after tuning in station.

4. Follow above steps 2 and 3 for the remaining four buttons.

SERVICE INFORMATION

The entire top deck of this tuner may be removed, while tuner is mounted in receiver chassis, allowing complete accessibility to all mechanical parts.

TO REPLACE PARTS ON LOWER DECK

Remove top deck of tuner (follow previous instructions). This exposes the 5-station set up screw assemblies (43) and manual lead screw assembly (42). These may be removed by unhooking springs (50) and lifting them out.

If push button arms or slider arms are to be replaced, it will be necessary to remove spring (54); then take out screws (46) from bottom of tuner to allow bracket (7) to move back and permit push button arm assemblies (1) or slider arms (3) to be removed after springs (53) have been removed.

Patience is required to assemble push button arm assemblies (1) and slider arms (3) back into bracket (7). Reassemble tuner by working in reverse order.

Test all parts of lower deck for free operation before assembling to upper deck.

TO REPLACE TOP DECK

Make sure that carriage drive assembly (12) is tipped back (spring (54) unhooked) and carriage assembly (13) carrying the tuning cores is out. Slip in the top deck, making sure the spring washer (70) on the manual drive assembly (42) is between the drive assembly gear and the back of the base before putting in screws and locking the two decks together.

SERVICE HINTS

1. STATION DRIFT (Push Buttons). Check the flat friction spring (56) for breaks or permanent set.

2. TUNER STICKING. Check collars on manual drive assembly (42). If they are cocked or stuck, replace with new assembly.

3. HARD TUNING FOR PRE-SETTING. Check lubricant on the gear train. It should be Stayput #512 or equal.

4. TWISTING CARRIAGE PLATE. Due to poor setting of carriage drive assembly (12). See "Drive Arm Adjustment".

5. ROUGH DRIVE - Check die cast gears (19,20 & 21). Check for lubrication (Stayput #512). Check manual drive bushings.

6. LATCH BAR JAMMING OUT. Check the latch bar spring (51) on the back. If it is bent out of shape, turn it 180° and reshape. If it is weak-replace.

7. STICKING POINTERS. Check the pointer bearing (6) and make sure the linkage of the assembly is free.

8. POINTER NOT RE-POSITIONING OR SLOPPY ACTION. Be sure to check the torsion spring (58) (on the under side of the top deck) for breakage or slipping from the notches on the base and the pointer link plate (34).

19		44B472721	Gear, idler
20		44A472662	Gear, manual
21		44A472676	Gear, station set-up
22		14A70876	Insulator, coil sleeve
23		14A472680	Insulator, core: bakelite (on carriage plate)
24		45B472696	Lever, stop actuating (on station set-up lead screw)
25		45A472689	Link, drive
26		45A472708	Link, pointer drive
27		4S7683	Lockwasher: #4 internal; cad pl (idler gear mtg)
28		4S7657	Lockwasher: #8 external; cad pl (top deck mtg)
29		2S8376	Nut: 4-40 x 3/16 hex; nkl pl (idler gear mtg)
30		2S7009	Nut: 10-32 x 3/8 hex; cad pl (setscrew lock)
31		35A472695	Pad, felt (push button arm cushion)
32		46A472718	Pawl, trip
33		64B472716	Plate, latch
34		64A472706	Plate, pointer link
35		5S8479	Rivet: .088 x 1/8; steel; nkl pl (latch spring & core ins. mtg)
36		5A472705	Rivet, eccentric shoulder
37		5A472670	Rivet, shoulder (pawl mtg)
38		5A472648	Rivet, shoulder
39		5A472649	Rivet, shoulder
40		47A472678	Rod, drive
41		47A472682	Rod, guide
42		1A472720	Screw Assembly, manual lead: complete with gears, stop & stop actuating lever
43		1A472722	Screw Assembly, station set-up: complete with gear & carriage stop; stop actuating lever not included
44		3S1921	Screw: 2-56 x 1/8 slotted binderhead machine screw; cad pl (pointer bearing mtg)
45		3S7454	Screw: #8 x 1/4 PKZ plain hex head sheet metal screw; cad pl
46		3S7205	Screw: 8-32 x 1/4 slotted hex head locking type machine screw; cad pl (push arm brkt. mtg)
47		3S3852	Setscrew: 10-32 x 3/8 allen head cup point machine screw (tuner drive carriage mtg)
48		26A70878	Shield, coil
49		43A70881	Sleeve, coil: powdered iron
50		41A472675	Spring, coil
51		41A472780	Spring, latch bar
52		41A472694	Spring, coil
53		41A485614	Spring, coil
54		41A472781	Spring, coil
55		41A77595	Spring, coil slug
56		41A472681	Spring, flat friction (on station set-up lead screw)
57		41A472685	Spring, set-up gear
58		41A472659	Spring, torsion
59		35A485615	Strip, anti-rattle; felt (cemented to front of tuner base to prevent push button arms from rattling. NOTE: If this strip is used on tuner not previously equipped with one, replace push button arm springs with stronger springs, Part No. 41A485614)
60		46A472686	Stud
61		46A472657	Stud, link
62		46A472669	Stud, gear mounting
63		46A472672	Stud, locating
64		1X472782	Top Deck Assembly: complete top deck of tuner including coils
65		4S7551	Washer: 9/32 x .120 x .025 thick; brass (idler gear mtg)
66		4K73809	Washer, "C" (drive rod retainer)
67		4A70873	Washer, coil spacer
68		4A74571	Washer, paper
69		4A70956	Washer, slug insulator: bakelite
70		4A473875	Washer, spring (on manual lead screw)

* Specify color of paint dot coding on old part when ordering.

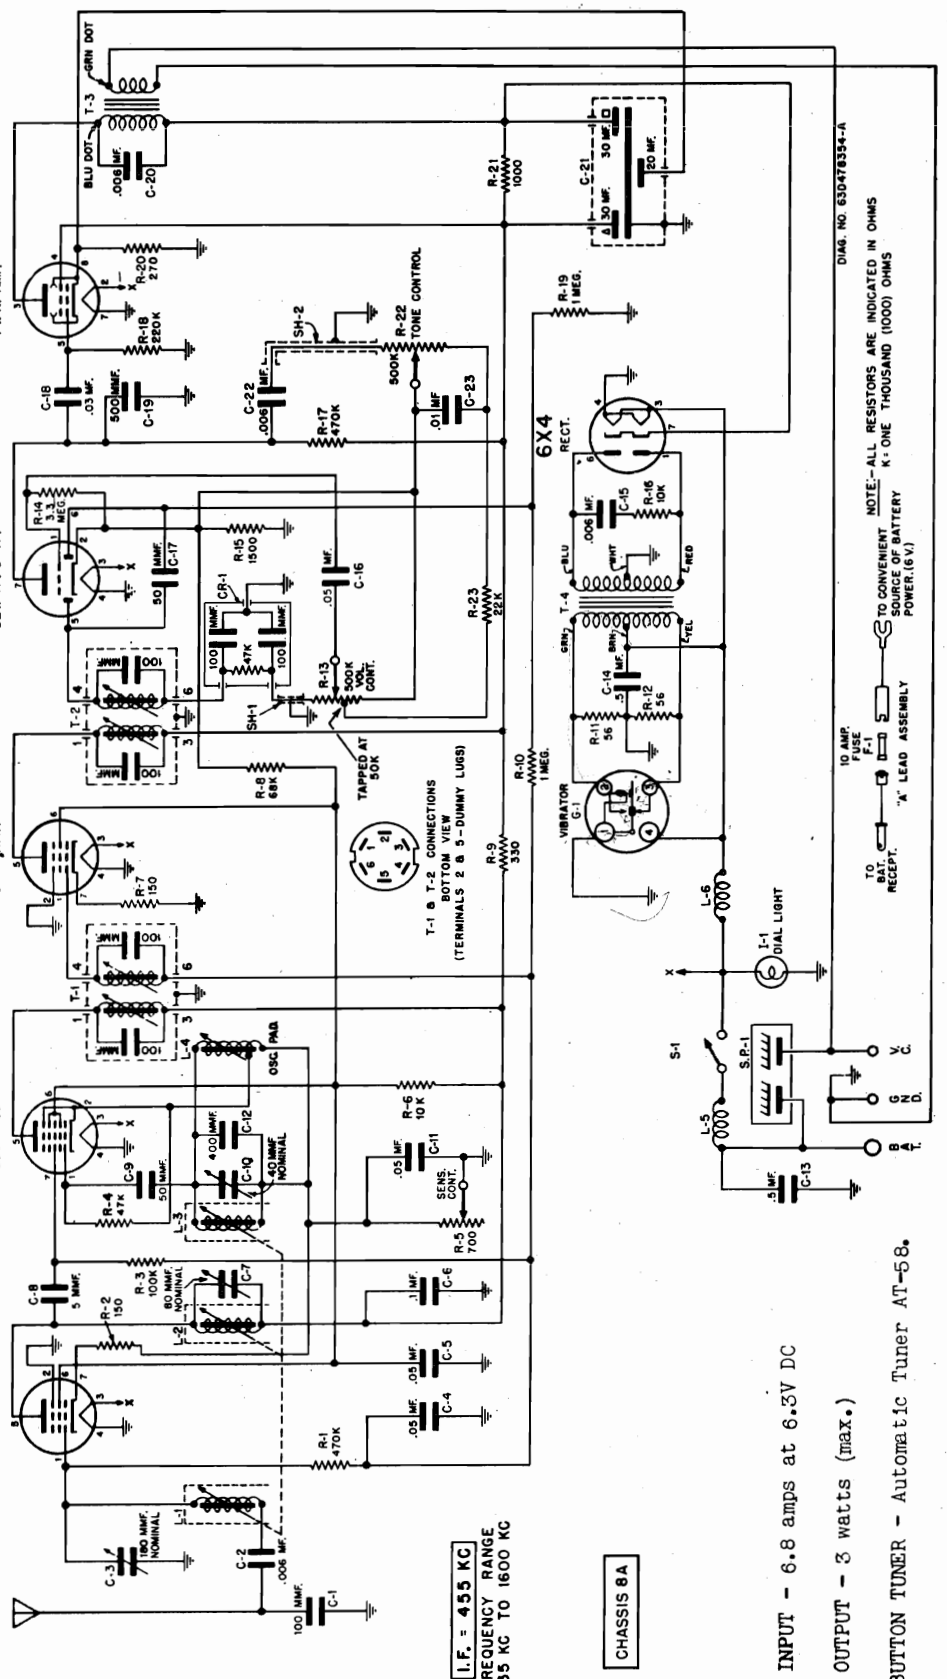
CHASSIS 8A

MOTOROLA INC.

MODELS BK8, BK8X, CT8, FD8, KR8, NH8, 0E2



POWER INPUT - 6.8 amps at 6.3V DC

POWER OUTPUT - 3 watts (max.)

PUSH BUTTON TUNER - Automatic Tuner AT-58.

TO SET THE PUSH BUTTONS

1. Turn radio ON and allow it to warm up for a few minutes.
2. Push the number "1" button in as far as it will go and HOLD IT THAT WAY.
3. With the tuning knob, tune in the station you desire to set up. Tune carefully until you are exactly on the station; tuning to either side of it will result in poor quality. Release button and knob after tuning-in station.
4. Follow above steps 2 and 3 for the remaining four buttons.

ALIGNMENT

EQUIPMENT REQUIRED

1. A special tool for adjusting the tuner cores. Use Alignment Tool, Motorola Part No. 66A76278.

2. A small screwdriver for IF & RF alignment.

3. An accurately calibrated AM modulated signal generator.

4. A low range output meter.

5. A special dummy antenna for RF alignment. Construct dummy antenna as shown in Figure 1. The 21" coaxial lead needed in its construction is the same type as used for lead-in on Motorola car antennas.

PROCEDURE

1. Expose alignment adjustment screws as follows:

Remove the top and bottom covers; replace three front plate screws to hold front plate in position after making sure that the plastic idler gear engages gear on tuner and power switch operating stud engages power switch throw plate. On some models it will also be necessary to remove the escutcheon and escutcheon spacer.

2. Connect a PM speaker (3.2 ohm VC) to VC and GND terminals and connect the output meter across voice coil.

3. Connect a 6 volt storage battery to GND (or chassis) and BAT terminals of receiver; turn receiver on and allow it to warm up for a few minutes. Set receiver volume control at maximum. Push "M" button (far enough so it will lock in) to place tuner in manual position.

4. Sensitivity Control. This control must be set to provide 2 ± 1/2 volts bias on the RF tubes before alignment is started. Measure this voltage between sensitivity control terminal and chassis.

5. For greatest accuracy, keep output of receiver at approximately 1 watt (1 watt = 1.79 volts on output meter) throughout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment.

6. IF & RF ALIGNMENT - See Alignment Chart

IMPORTANT: Do not push in on the alignment tool when adjusting the tuner cores. The slightest inward pressure on the alignment tool may move the tuner carriage and result in inaccurate alignment.

7. SETTING THE SENSITIVITY CONTROL - After alignment is completed, set signal generator to 600 Kc and adjust its output to 1.3 microvolts. Adjust the sensitivity control to provide 1 watt output (1 watt = 1.79 volts on output meter).

8. ANTENNA TRIMMER ADJUSTMENT - Once alignment has been satisfactorily performed, no further adjustment of any alignment screws should be made except to align the antenna trimmer (7) to car antenna after receiver is installed in car. This adjustment should be made with antenna fully extended and receiver set to approximately 1400 Kc. Peak the trimmer for maximum volume of a weak station or background noise between stations.

9. POINTER ADJUSTMENT - The pointer can be moved slightly for calibration correction by turning the eccentric adjustment rivet. This rivet has a 1/4" hex head and is exposed only when tuner is tuned to high frequency end. See Figure 1 for its location.

STEP	TUNER SET TO	DUMMY ANTENNA	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR FREQUENCY	ADJUST TRIMMER OR CORE	REMARKS
1.	High frequency end (cores out)	.1 mf	Hi side - 6BE6 grid (pin #7) Lo side - chassis	455 Kc	1,2,3&4	Peak for maximum in order indicated. Check by repeating procedure.
2.	High frequency end. Cores should project 1-1/8" from cans. (Screw out if necessary).	Special -See Fig. 1.	Ant. receptacle through special dummy.	1605 Kc	5,6 & 7	Peak for max. in order indicated.
3.	Set spacing between carriage plate and coil shield plate to 1-3/8".	"	"	1425 Kc	8, 9 & 10	Peak for max. in order indicated.
4.	Set spacing between carriage plate and coil shield plate to 17/32"	"	"	Turn generator power off.	11	Peak oscillator padder for maximum noise. See *
5.	Approx. 1400 Kc	-	-	-	7	With set installed in car, peak antenna trimmer for maximum noise or volume of a weak station. Car antenna should be fully extended.

* If padder core (11) must be moved more than 1/2 turn from its original position, repeat steps 2, 3 & 4 until it is necessary to move the padder core less than 1/2 turn in this step.

35	39A26088	Wiper, grounding

RECEIVER AND SPEAKER INSTALLATION

Install the antenna following instructions supplied with antenna. (Use Motorola Antenna M-276, M-277, M-280, M-255 or M-306).

Refer to Figure 1 for installation detail.

1. Expose the radio openings in the instrument panel.
2. Screw the four speaker mounting screws into the holes provided in the back of the grille. The screws are thread-forming type and may start hard; use a 1/4" Spin-tite wrench for easier installation. Install the speaker on the screws as shown.
3. Assemble the receiver mounting bracket to instrument panel brace. Do not tighten as yet.
4. Plug antenna lead-in into antenna receptacle located on the top of the set.
5. Remove knobs and mounting nuts from receiver and lift receiver into position behind instrument panel.
6. Holding receiver in position, place mounting nuts on control shaft bushings and tighten securely.
7. Assemble receiver mounting bracket to receiver rear mounting stud. Use the hole which most closely lines up with the receiver rear mounting stud. Adjust position of the mounting bracket so the receiver is supported without any undue strain being placed on the control shafts bushings, then tighten all mounting nuts.
8. If the receiver is installed in a Plymouth car,

POWER INPUT - 9 Amps at 6.3V

POWER OUTPUT - 6 watts (max.)

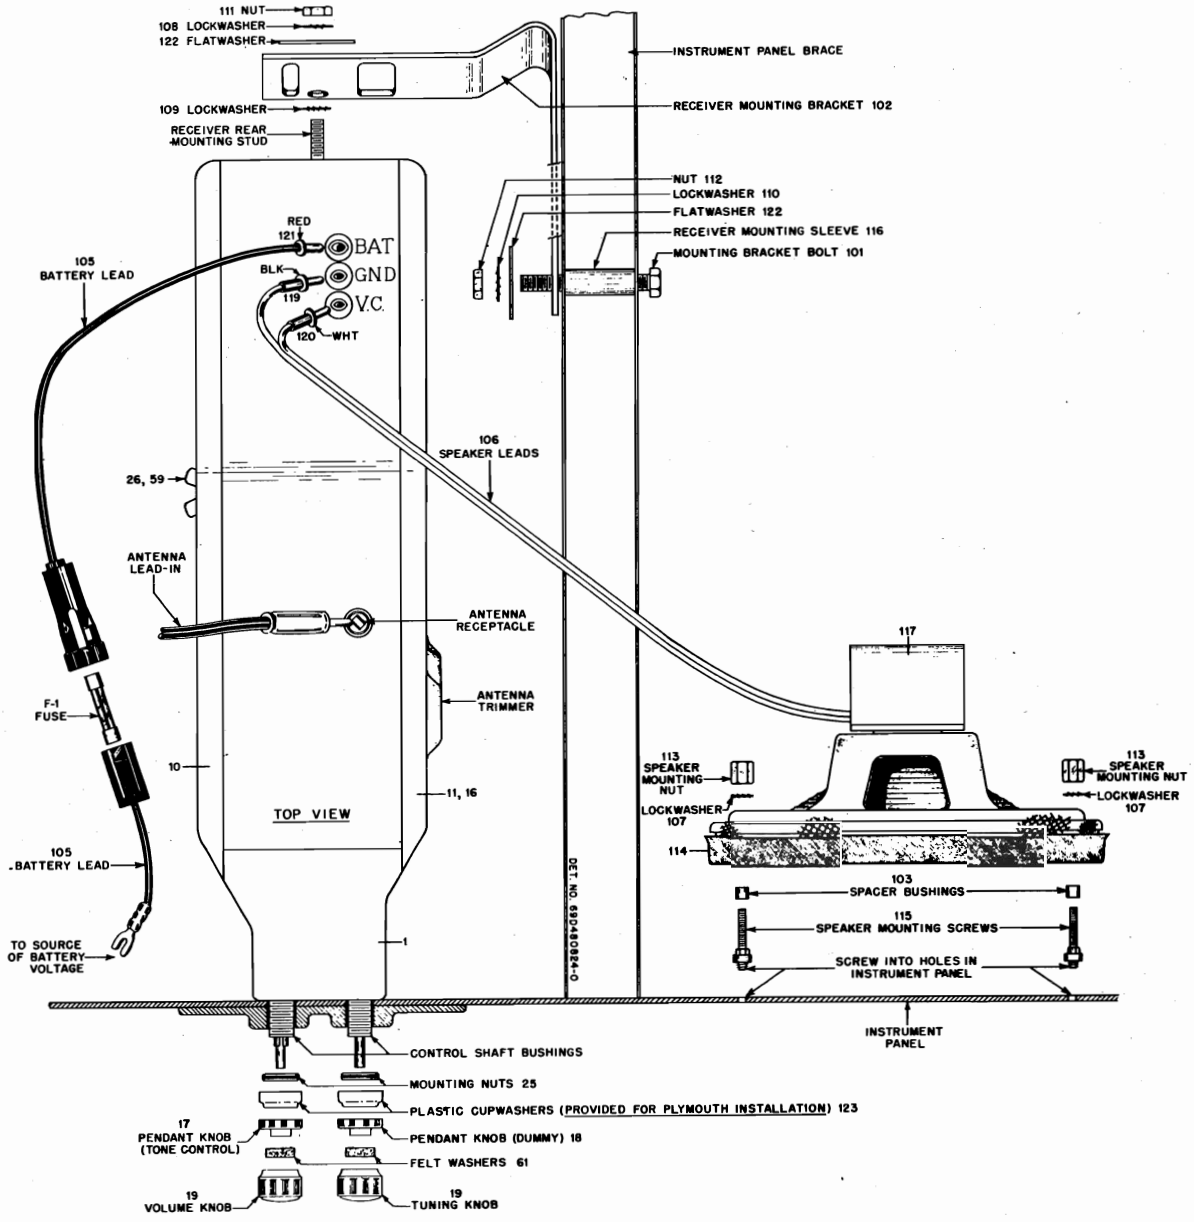

FIGURE 1. RECEIVER & SPEAKER INSTALLATION

use the plastic cup washers to cover the exposed portions of the shaft bushings.
9. Place the tone control and dummy pendant knobs on the shafts.
10. Place a felt washer over each pendant knob.
11. Place knobs on volume and tuning shafts and tighten setscrews securely.
12. Connect speaker leads as shown.
13. Connect the battery lead plug terminal to receiver receptacle marked "BAT" and the lug terminal to a convenient source of battery voltage.
14. Turn radio on. (See OPERATING INSTRUCTIONS). With the dial set to 1400 Kc, the volume control on full, and the antenna fully extended, adjust the antenna trimmer for maximum volume of a weak station or background noise.

TO SET THE PUSH BUTTONS

1. Turn radio on by pushing the top button "in". Allow radio to warm up for a few minutes.
2. Push the number "1" button in as far as it will go and HOLD IT THAT WAY.
3. With the tuning knob, tune in the station you desire to set up. The pointer will indicate the frequency of the station. Tune carefully until you are exactly on the station; tuning to either side of it will result in poor tone quality. Release button and knob after tuning in station.
4. Follow above steps 2 and 3 for the remaining four buttons.

WARNING

Many late model cars develop exceedingly high voltage due to improper adjustment of voltage regulator; this shortens life of radio tubes, vibrator and all other car electrical equipment. If the voltage exceeds 7.4 volts with no load on a fully charged battery when motor is running at a speed which corresponds to 35 miles per hour, the voltage regulator is defective. Have your auto mechanic replace the voltage regulator.

ELIMINATE INTERFERENCE AS FOLLOWS:

1. Install generator capacitor (Part No. 8A4491) as shown in Figure 2. **WARNING:** Do not connect capacitor to field terminal.

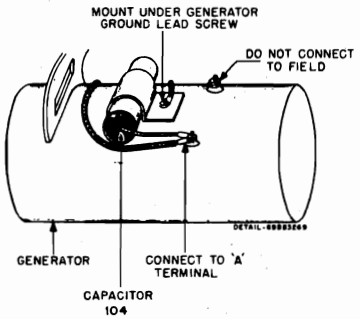

FIGURE 2.

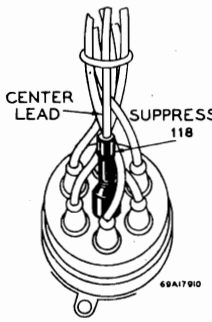

FIGURE 3.

2. Install distributor suppressor as shown in Figure 3.
3. When checking the car for motor noise, clamp the hood down tight. If necessary, install Hood Bond at the shoulder so that the hood makes a good ground to the cowl of the car on the side the antenna is mounted.

OPERATING INSTRUCTIONS

POWER SWITCH. The top button turns the radio ON and OFF. Radio is ON when button is in. Alternate pushes on this button will turn radio on and off.

VOLUME CONTROL. The left-hand knob operates the volume control.

MANUAL TUNING. Push the "M" button in far enough so that it will lock in, then tune stations with the right-hand knob. The dial scale is read in kilocycles by adding one zero to the figures. Always tune carefully until you are exactly on the station; tuning to either side of it will result in poor tone quality.

PUSH BUTTON TUNING. After push buttons have been set up, it is only necessary to push in the button (1, 2, 3, 4 or 5) that has been set to the desired station. Push the button far enough so that it will lock in. The dial pointer will indicate the frequency of the station being received.

TONE CONTROL. Tone can be varied by turning pendant tone knob which is located on the same shaft but behind the volume knob.

ALIGNMENT

EQUIPMENT REQUIRED

1. A special tool for adjusting the tuner cores. Use Alignment Tool, Motorola Part No. 66A76278.
2. A small screwdriver for IF & RF alignment.
3. An accurately calibrated AM modulated signal generator.
4. A low range output meter.
5. A special dummy antenna for RF alignment. Construct dummy antenna as shown in Figure 4. The 21" coaxial lead needed in its construction is the same type as used for lead-in on Motorola car antennas.

PROCEDURE

1. Remove the right and left housing covers. Also remove the chrome plated escutcheon from the front of the set. All adjustments are now exposed.
2. Connect a PM speaker (3.2 ohm VC) to VC and GND. terminals and connect the output meter across the voice coil.
3. Connect a 6 volt storage battery to chassis and BAT. terminals of receiver; turn receiver on and allow it to warm up for a few minutes. Push "M" button to place tuner in manual position. Set re-

ceiver volume control at maximum and tone control to treble (high) position.

4. Sensitivity Control. This control must be set to provide 2 ± 1/2 volts bias on the RF rubes before alignment is started. Measure this voltage between sensitivity control terminal and chassis.

5. For greatest accuracy, keep output of receiver at approximately 1 watt (1 watt = 1.79 volts on output meter) throughout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment.

6. IF ALIGNMENT

A. Connect high side of signal generator through .1 mf capacitor to 6BE6 grid (pin #7) and the low side to chassis. Set generator to 455 Kc and peak adjustments (1, 2, 3 & 4), in this order, for maximum output.

7. RF ALIGNMENT

A. Connect signal generator to antenna receptacle through special dummy antenna (60 mmf capacitor in series with 21" coax lead).

B. With the tuning knob, tune to the extreme high frequency position and screw coil cores out so that at least 1-1/8" of all three cores shall be outside of the coil shield can. Set signal generator to 1605 Kc and peak trimmers (5, 6 & 7), in this order.

C. Turn the tuning knob until carriage plate is spaced exactly 1-3/8" from coil shield plate. Set signal generator to 1425 Kc and adjust coil cores (8, 9 & 10), in this order, for maximum output.

D. Turn the tuning knob until the carriage plate is spaced approx. 17/32" from coil shield plate. Leave signal generator connected but turn signal generator power off. Peak oscillator padder core (11) for maximum noise. If the padder core must be moved more than 1/2 turn from its original position, the carriage plate should be moved to extreme high frequency position, the coil cores (8, 9 & 10) should be screwed out so that 1-1/8" of each core is exposed and steps 7A, B, C & D repeated until it is necessary to move the padder

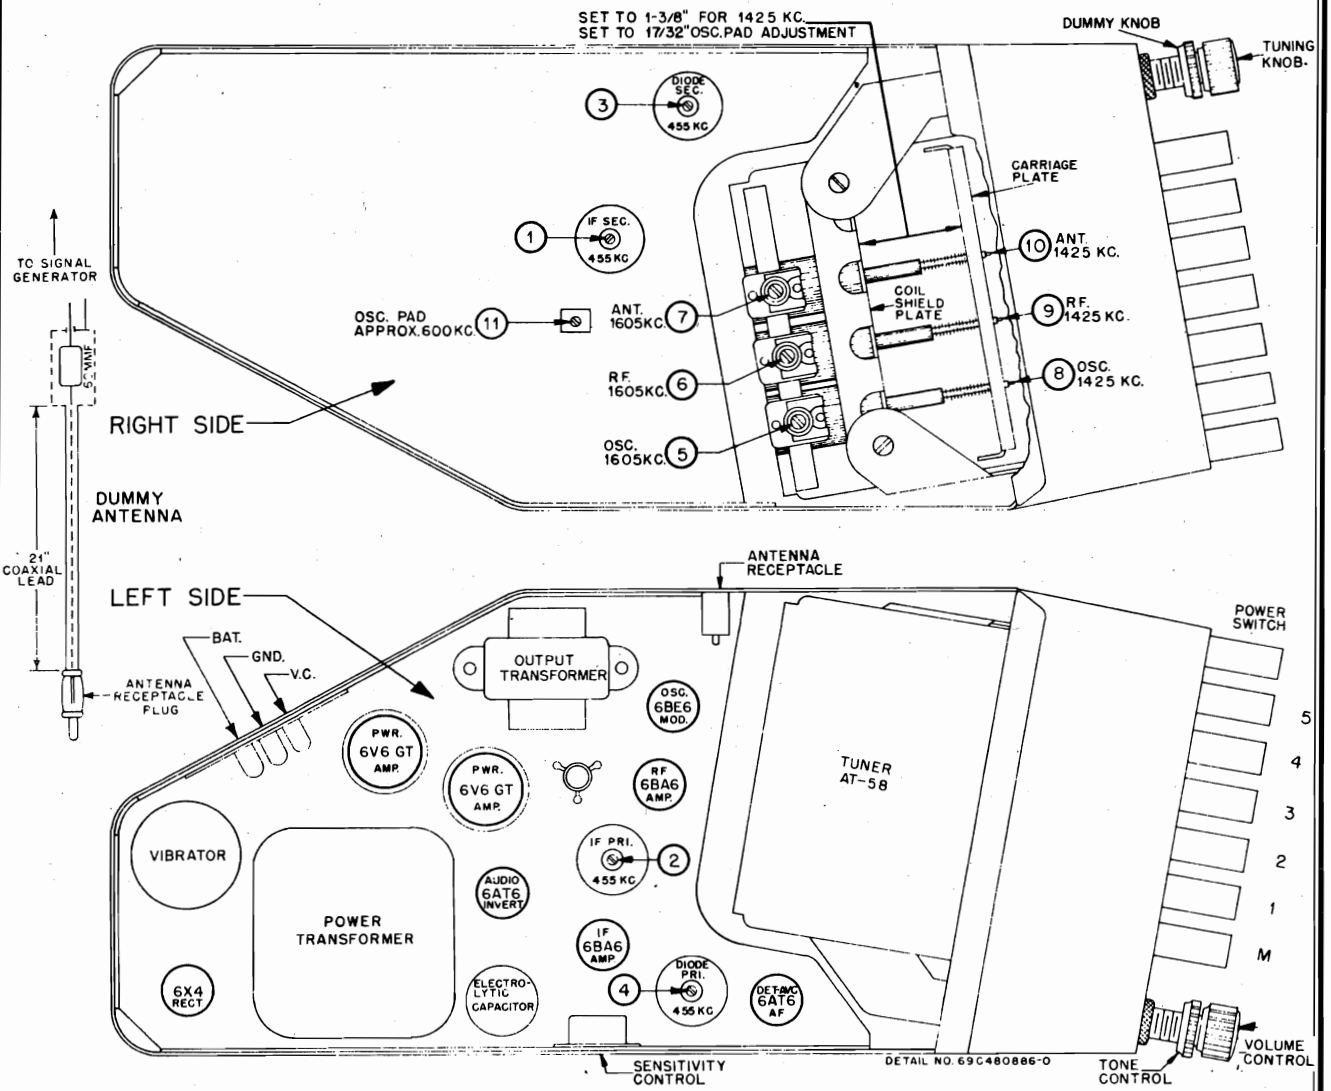

FIGURE 4. TUBE & TRIMMER LOCATIONS

core less than 1/2 turn in this step.

IMPORTANT: Do not push in on the alignment tool when adjusting the tuner cores. The slightest inward pressure on the alignment tool may move the tuner carriage and result in inaccurate alignment.

8. SETTING THE SENSITIVITY CONTROL. After alignment is completed, set signal generator to 600 Kc and adjust its output to 1.3 microvolts. Adjust the sensitivity control to provide 1 watt output (1 watt = 1.79 volts on output meter).

9. ANTENNA TRIMMER ADJUSTMENT. Once steps 7A, B, C, D & 8 have been satisfactorily performed, no further adjustment of any alignment screws should be made except to align the antenna trimmer (7) to car antenna after receiver is installed in car. This adjustment should be made with antenna fully extended and receiver set to approximately 1400 Kc. Peak the trimmer for maximum volume of a weak station or background noise between stations.

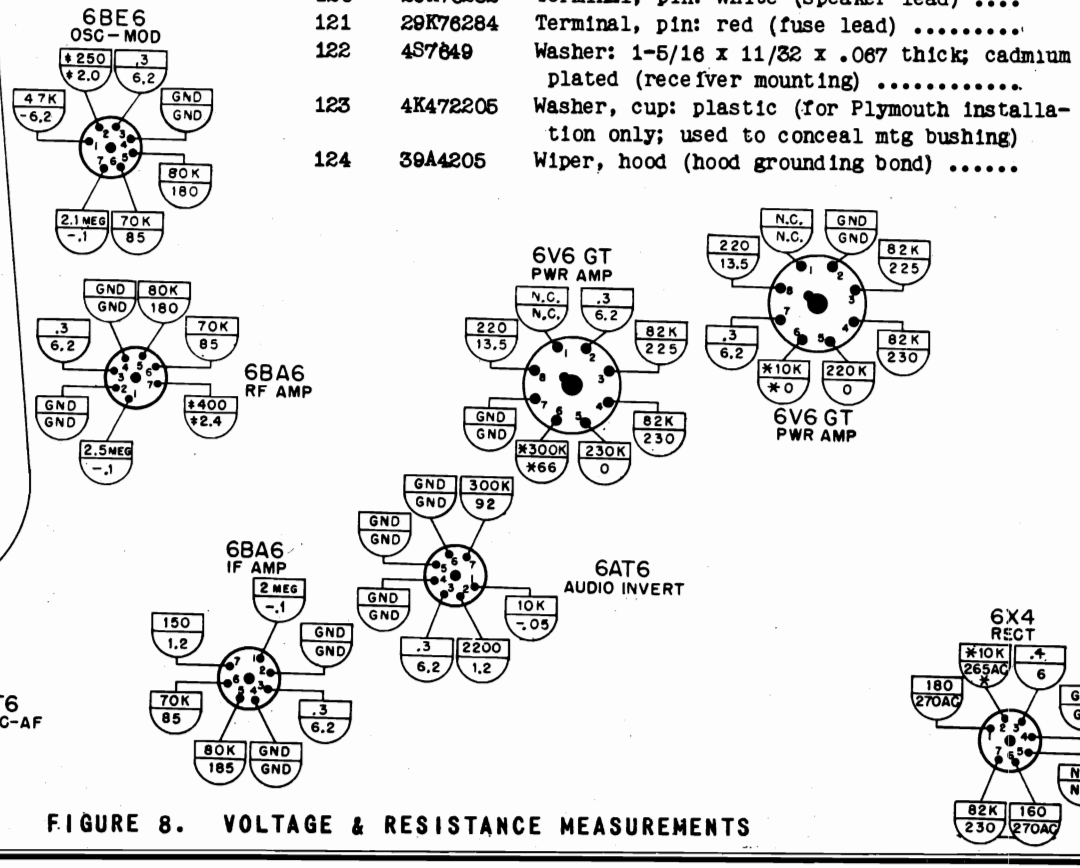

FIGURE 8. VOLTAGE & RESISTANCE MEASUREMENTS

MODEL CR8

MOTOROLA INC.

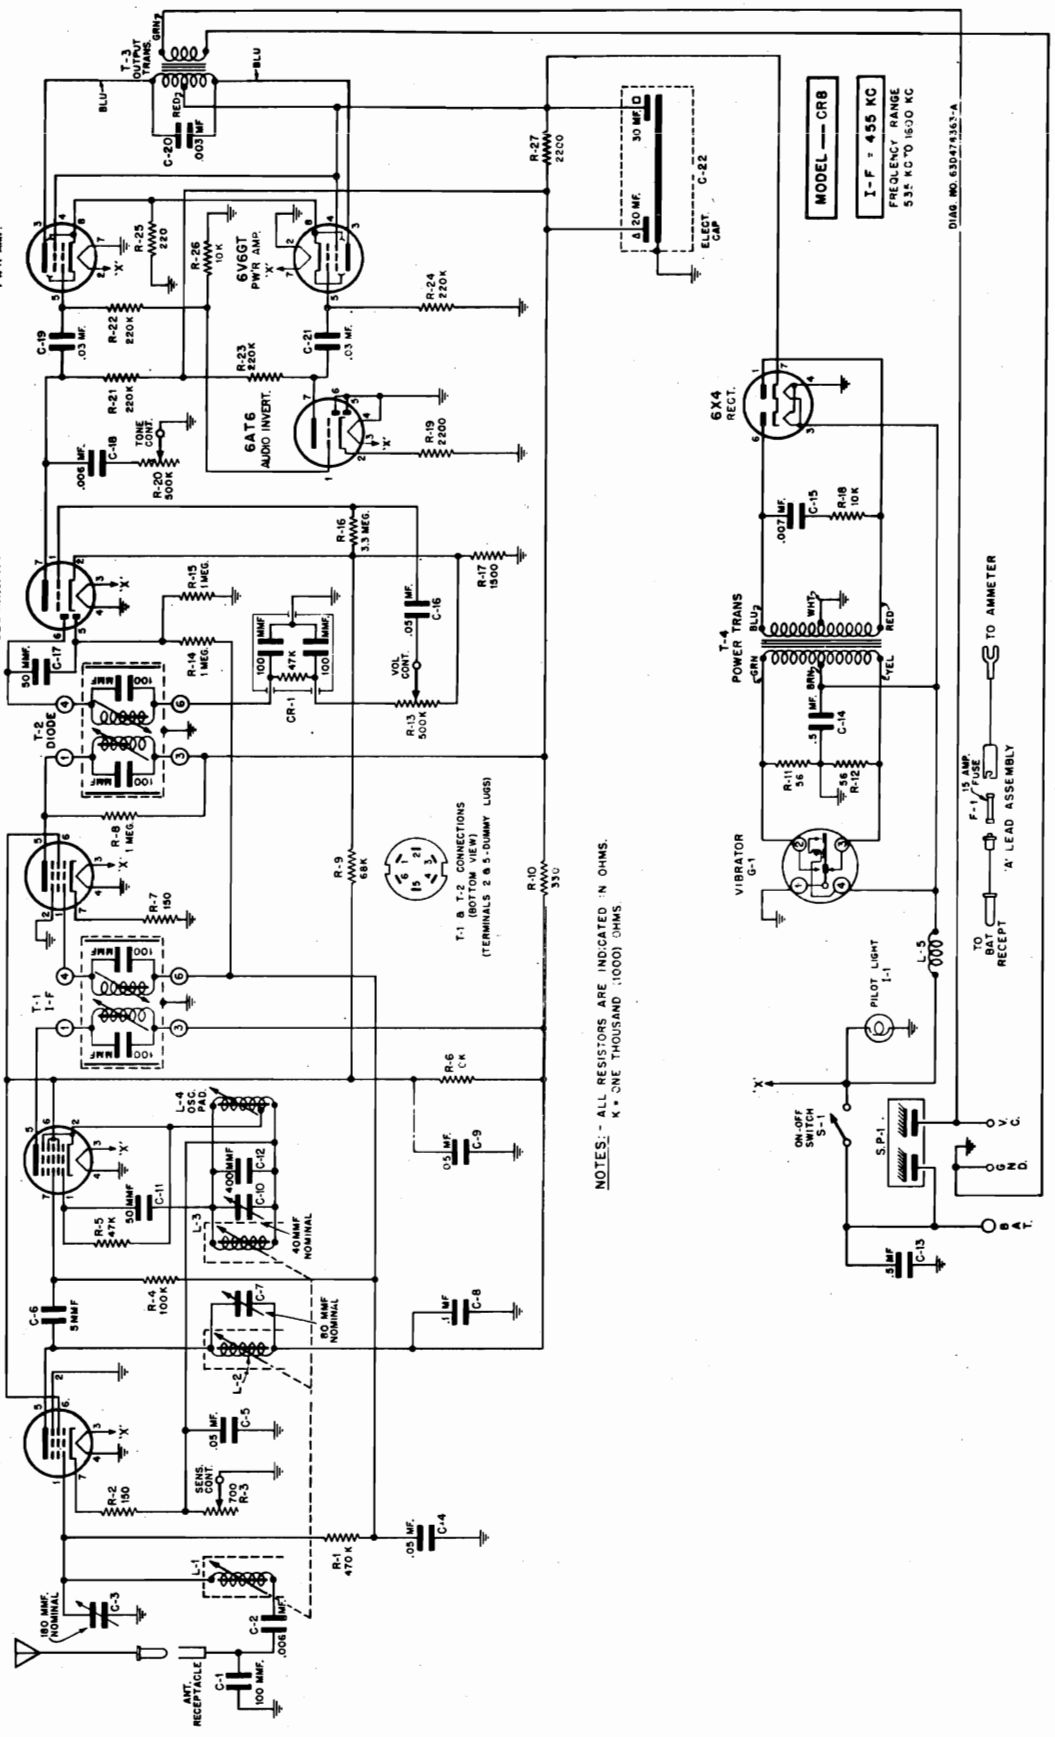

FIGURE 9. SCHEMATIC DIAGRAM

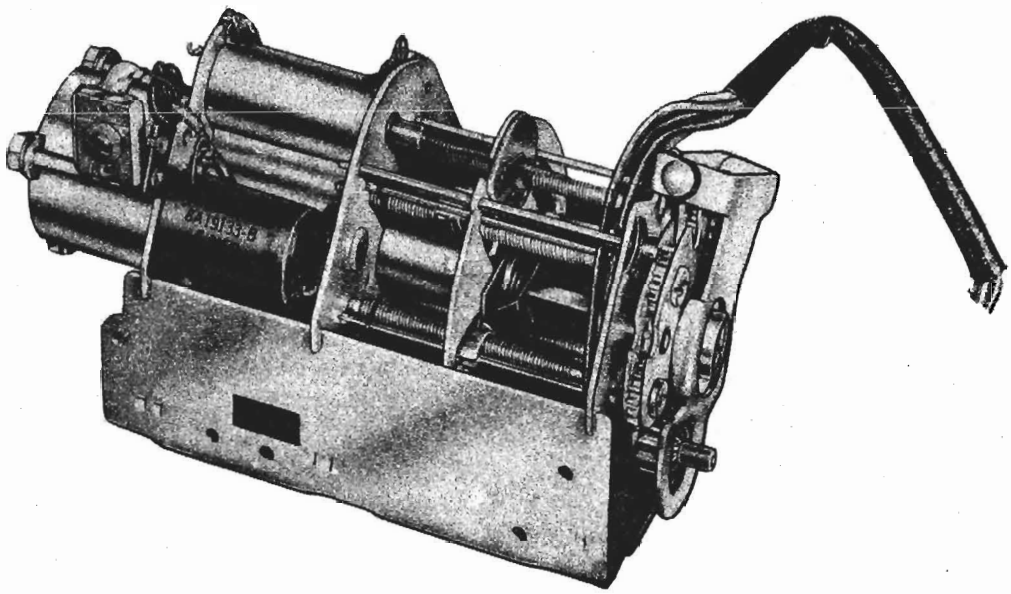
MOTOROLA INC. MODEL ST-56



GENERAL

Solenoid Tuners ST-56 (ST-56 - CR6, ST-56 - FD6 etc.,) are used in 1946 and 1947 Motorola automatic tuning specific auto receivers.

Fundamentally, all ST-56 tuners are the same except for the manual tuning shaft, dial cord pulleys and pushbutton switch lead lengths. These variations are brought about by mechanical differences between the specific receivers in which this tuner is used. The receiver model number is included in the tuner model number to identify which specific receiver the tuner will fit, i.e., ST-56-CR7, ST-56-BK6 etc.

This is a 3 gang permeability type tuner operated by a solenoid. Five pre-set and one manual tuning positions are provided. The frequency range is 535 to 1600 kc. The pre-set positions can be set to any frequency within this range.

The tuner is designed to operate satisfactorily with 4-1/2 to 7.3 volts input. Before attempting any service work on a tuner that operates too slowly or one that doesn't operate at all, check the battery voltage directly at the receiver spark plate. Normally, this voltage is 6.3 volts. At the moment any pushbutton is pressed, the voltage at the spark plate should not drop to less than 4-1/2 volts. If the voltage is less than 4-1/2, it is an indication of poor wiring between the car battery and receiver or a defective car battery.

This tuner depends on "dash-pot" action between the plunger and the solenoid for proper operation. When the fit between the plunger and solenoid is too tight, the air can't get out fast enough. The result is a slow or sluggish operating tuner. All late production tuners have an adjustable air release in the solenoid end plate. Early production tuners that do not have this adjustable air release and operate sluggishly, due to dash-pot action, should have the solenoid end plate replaced with an end plate having the adjustable air release. Order part number 1X76556.

The tuner solenoid coil must be in a horizontal or near horizontal position or the tuner will not operate properly. If it is operated with the coil in a vertical position, the solenoid and carriage return spring may not be strong enough to operate tuner.

MODEL ST-56 MOTOROLA INC.

THEORY OF OPERATION

NOTE: Throughout this paragraph, it is suggested that constant reference be made to Figure 1.

When any push-button is pressed, current flows through the solenoid coil, causing the plunger to pull into the soil. Near the end of the plunger travel, through a ratchet mechanism inside the plunger, the selector switch shaft is rotated 60°, moving the selector switch and stop plate to their new position.

An instant later, the solenoid switch is opened breaking solenoid current and the carriage return spring then pulls the plunger out, closing the solenoid switch again. If the selector switch is now resting at the position selected by the push-button (cut away section of selector switch resting in front of contact selected by push-button), the solenoid plunger will continue to be pulled out until the stop plate is resting on the selected lead screw stop. In the event the selector switch is not resting in the position selected by the push button when the solenoid plunger is on its return trip, the moment the plunger moves out far enough to actuate the solenoid switch, current will again flow through solenoid causing the plunger to be pulled in again. The plungers inward motion again rotates the stop plate and selector switch through another 60°. This last operation is repeated automatically until the selector swtich comes to rest at the position selected by the push-button, at which time the solenoid circuit is opened and the plunger moves out until the stop plate is resting on the selected lead screw stop. The stops are adjusted to the desired positions during the station setting up procedure, through the set-up gear train assembly.

Refer to Figure 2 for mechanics behind station setting-up mechanism detail.

When the button on which a station is to be set up is first pressed, the tuner operates and the stop plate comes to rest against the selected lead screw stop. The pressure of the stop plate against the lead screw stop moves the lead screw forward until its shoulder rests against the tuner and plate. The square end of the lead screw does not engage in the square hole of the set-up gear until the set-up button is pushed in or the station set-up knob is turned (whichever is applicable). A latch on one end of the detent lever engages the gear lever, holding the set-up gear train in contact with the selected lead screw. Now the selected lead screw stop can be moved on its lead screw by turning the manual tuning shaft. None of the other lead screws turn because the stop plate is not resting against them. After the button is set up, pressing any other button will unlatch the gear lever and disengage the lead screw from the set-up gear. See Figure 2.

Since the coil tuning iron cores are attached to the carriage plate and move in unison with the plunger, the point at which they are brought to a stop (by means of the lead screw stop) determines the frequency to which the coils are tuned.

Dash-pot action between the plunger and the solenoid determines the tuner operating speed. The rate at which air is allowed to enter or escape through the adjustable air release determines the speed of the plunger. See Figure 1.

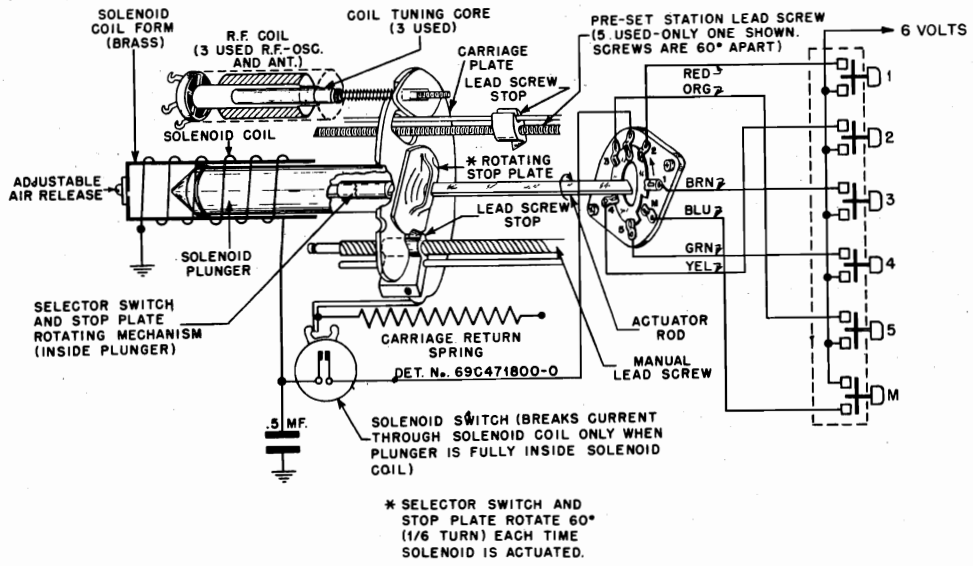


FIGURE 1. TUNER FUNCTIONAL DETAIL

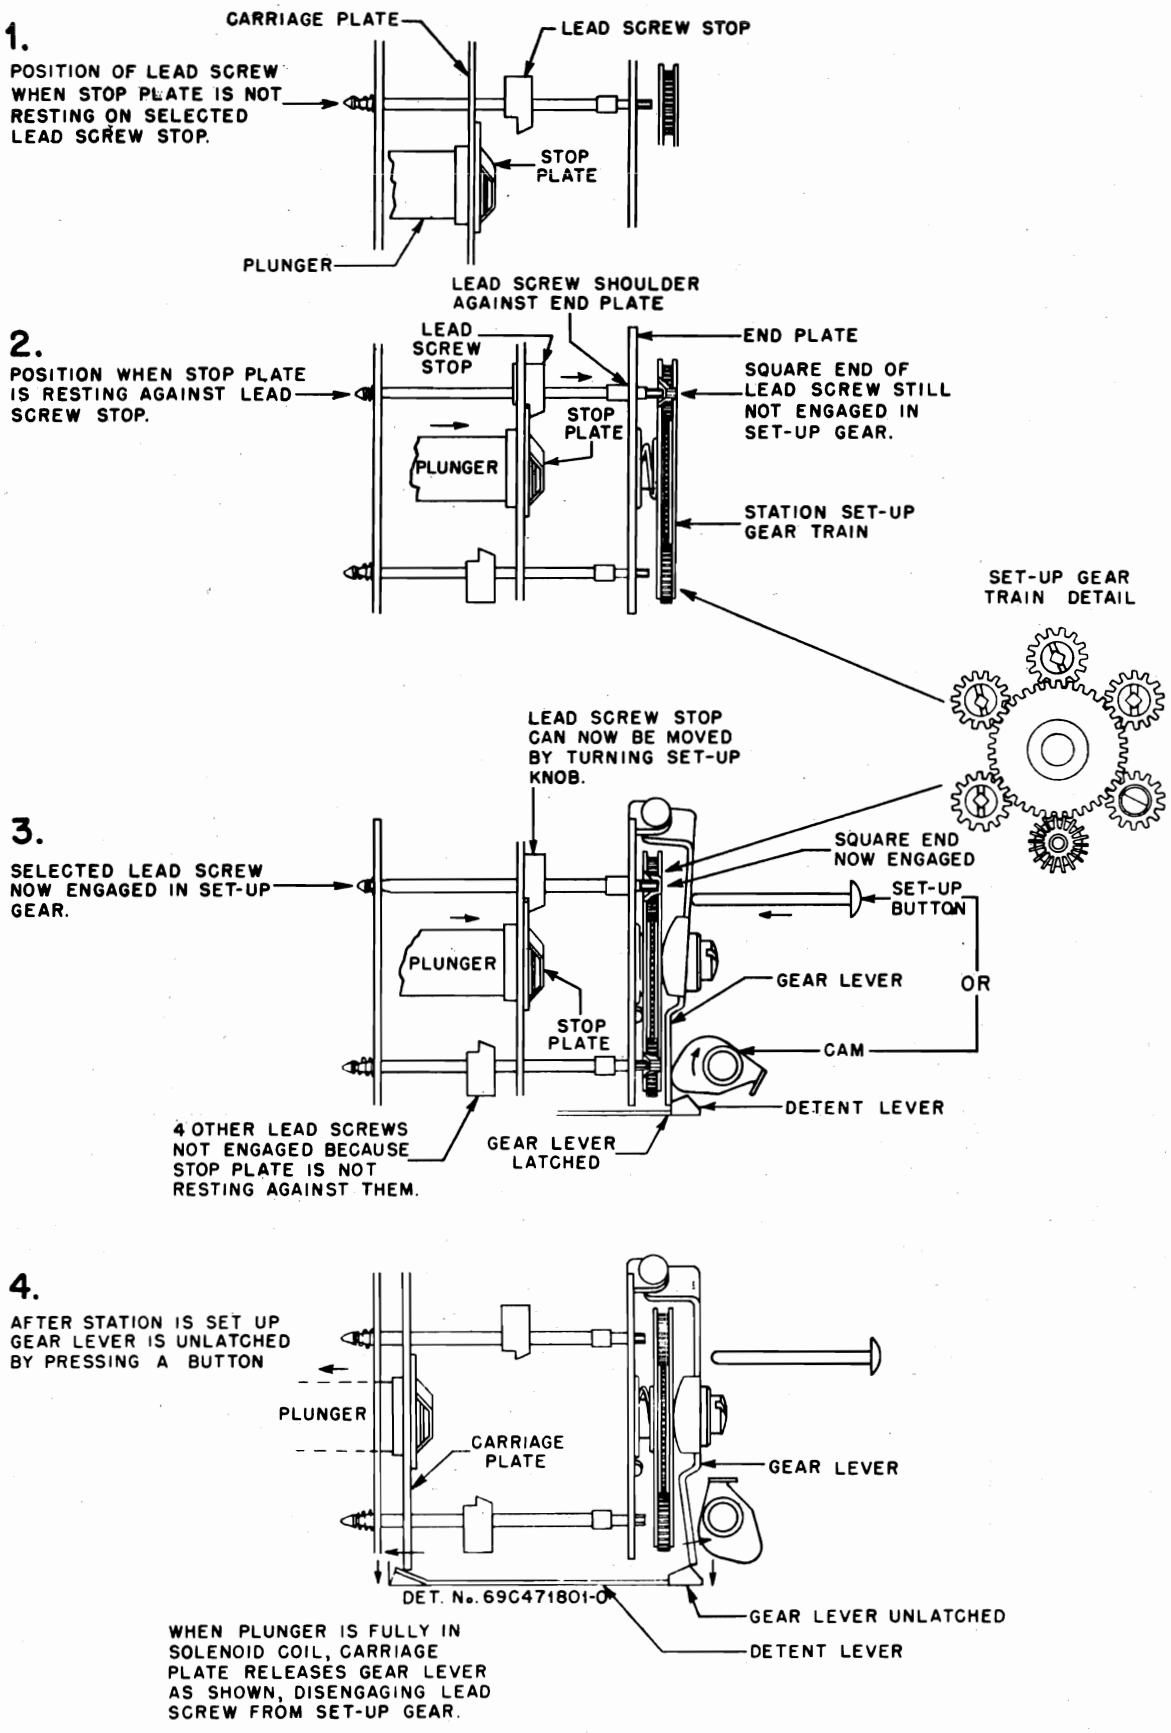

FIGURE 2 STATION SET-UP MECHANISM

TO REMOVE TUNER FROM CHASSIS

Should it become necessary to remove the solenoid tuner from the receiver chassis, proceed as follows:

1. Remove the covers from the set, completely exposing the chassis.
2. Mark all leads connecting tuner to receiver.
3. Disconnect all leads connecting tuner to receiver. Do not unsolder leads from the tuner selector switch; unsolder them at the push-switch. The .5 mf paper capacitor need not be removed.
4. The tuner is held to the chassis by self-tapping screws driven into the sides of the tuner. Do not remove any other screws.

ADJUSTMENTS

AIR RELEASE ADJUSTMENT

The speed at which the tuner operates is governed by dash-pot action of the solenoid plunger within the closed solenoid coil form. The rate at which air is allowed to enter or escape determines the speed of the plunger.

An adjustable air release is provided on all late production tuners. See Fig. 3. To adjust, loosen the screw and move the eccentric washer which covers the air release hole to expose or cover more of the air release hole as required. Early production tuners did not have a solenoid end plate with an adjustable air release. If such a tuner is slow or sluggish because of too much "dash-pot" action, replace the solenoid end plate with the adjustable air release type. Order part number 1X76556.

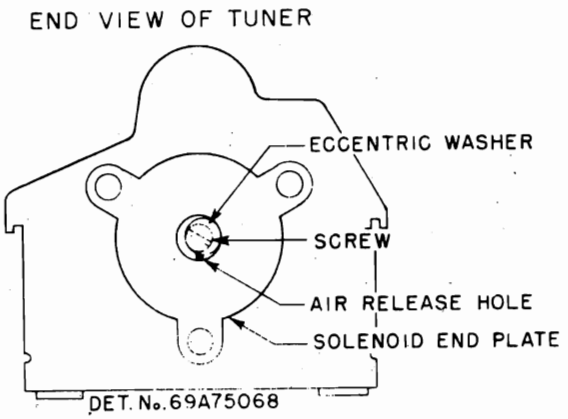

FIGURE 3. AIR RELEASE ADJUSTMENT

1. If tuner operates too slowly, open the air release hole. Open it only far enough to secure reliable operation. Too little "dash-pot" action (air release open too much) may cause the plunger to hammer and sometimes even to make the tuner operate continuously due to the selector switch rotor being turned so rapidly as to overshoot its contacts.
2. If the tuner operates too rapidly increase dash-pot action by closing the air release hole slightly. Close it only enough to eliminate hammering.

PLUNGER RATCHET ADJUSTMENT

The plunger ratchet mechanism in Figure 4. This mechanism rotates the actuator rod which, in turn, rotates the carriage stop plate and the selector switch 60° for each inward motion of the plunger.

If this adjustment is incorrect, tuner may operate continuously once current is applied.

Correct ratchet adjustment is indicated when 1/64 to 1/32" clearance is observed between selector switch contacts and the selector switch rotor as shown in Figure 5. Slowly work the plunger by hand and observe clearance at each contact position. If the average clearance is not 1/64 to 1/32", correction can be made by loosening ratchet adjustment setscrew and turning actuator rod by hand until correct clearance is observed.

Before ratchet adjustment setscrew is finally tightened, push fixed ratchet 1/32" back into plunger. This increases spring tension against rotating ratchet, thus insuring more positive operation.

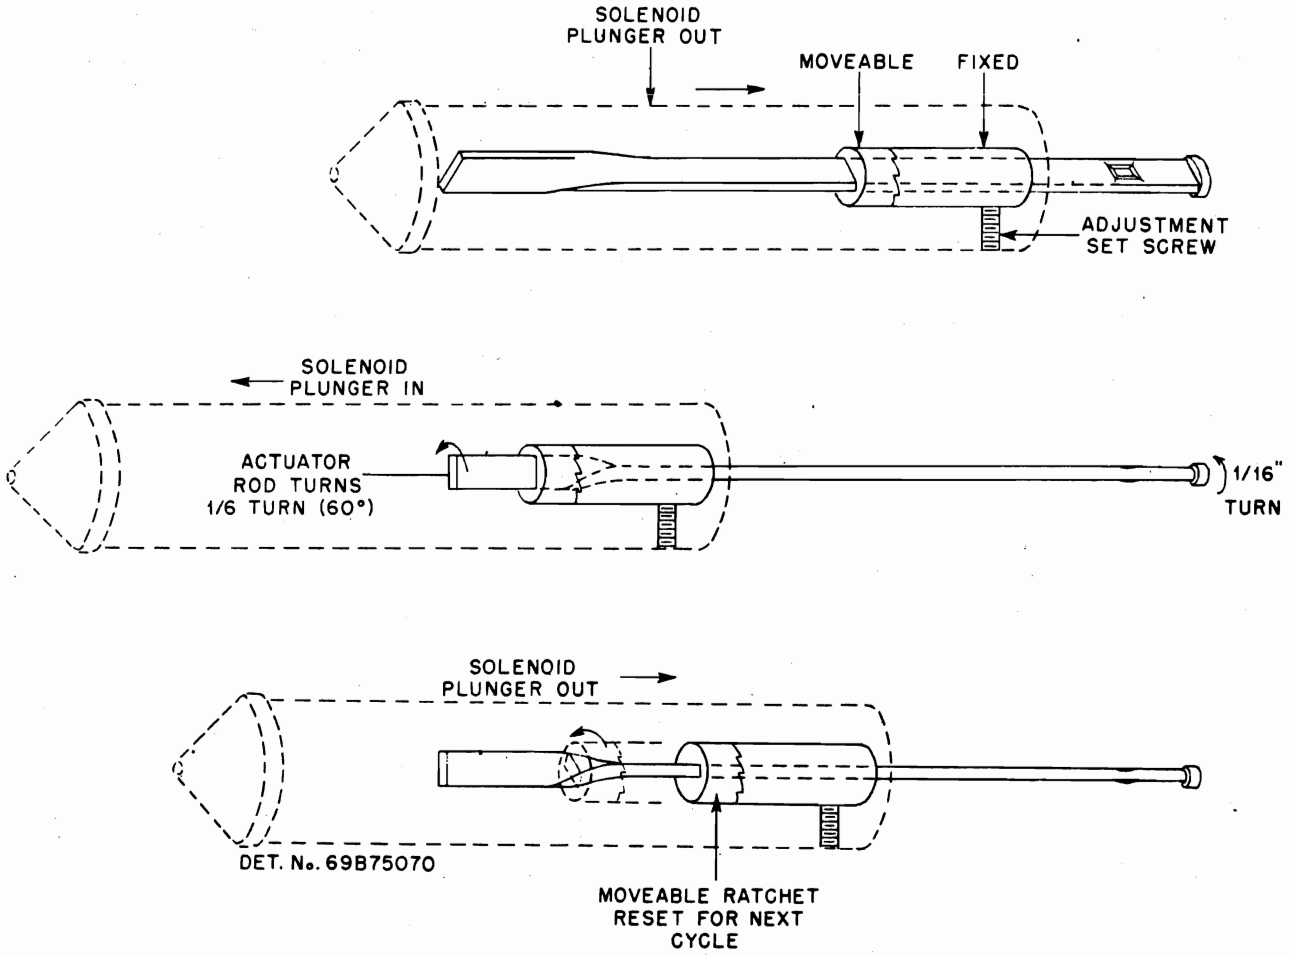

FIGURE 4. PLUNGER RATCHET MECHANISM

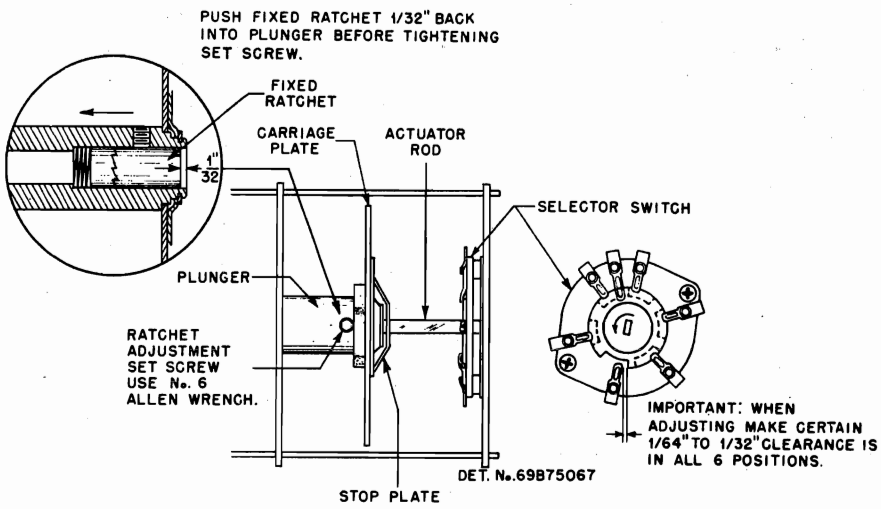

FIGURE 5. PLUNGER RATCHET ADJUSTMENT

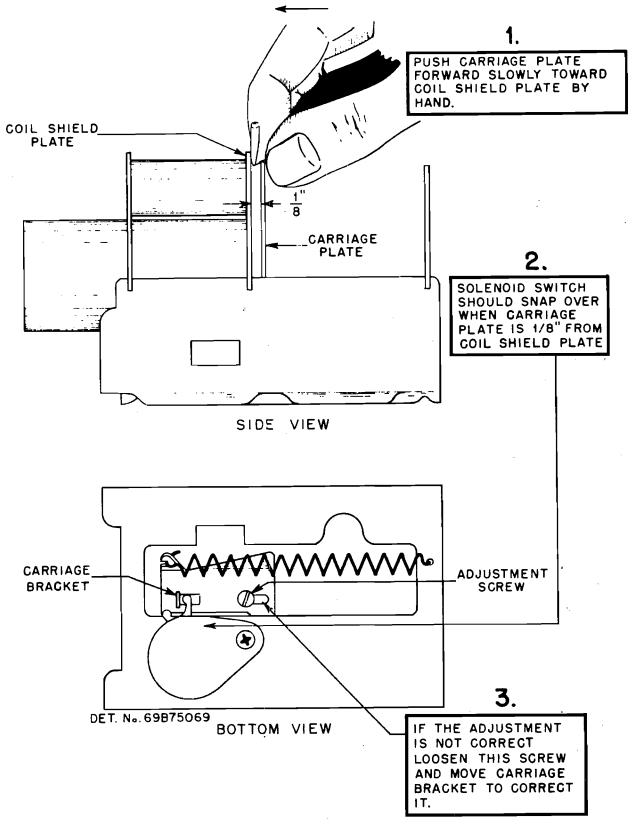

FIGURE 6. SOLENOID SWITCH ADJUSTMENT

SOLENOID SWITCH TRIP ADJUSTMENT

The solenoid switch tripping mechanism should be adjusted as shown in Figure 6.

If the solenoid switch is tripped too early, the ratchet mechanism may fail to operate; if it trips too late, the plunger may hammer violently or should the solenoid switch fail to trip, the plunger would be held within the solenoid.

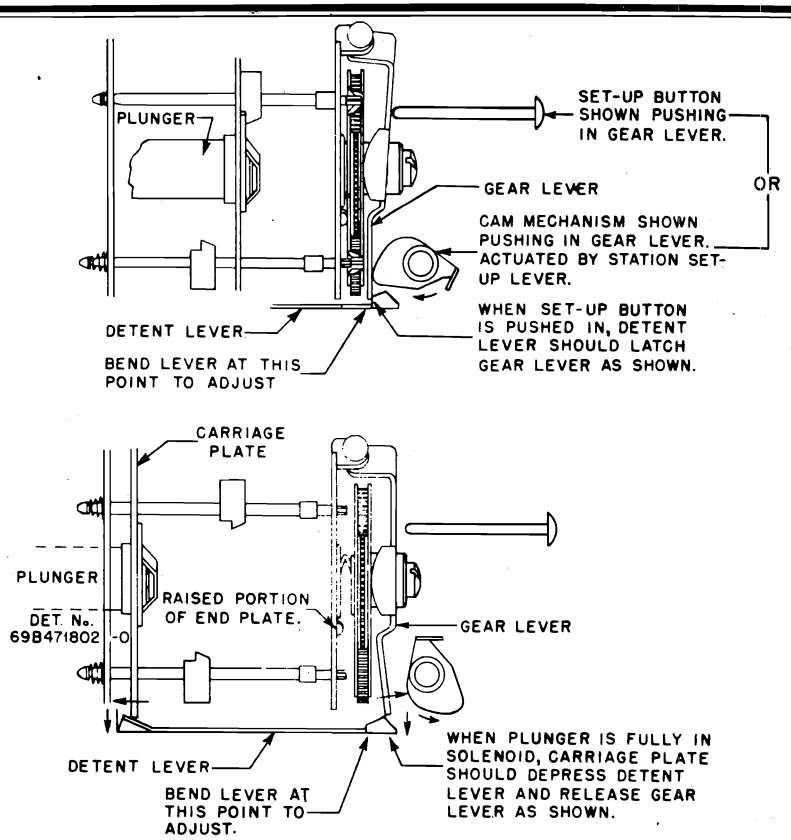

FIGURE 7. GEAR LEVER LATCH ADJUSTMENT

ADJUSTMENT OF GEAR LEVER LATCH

The gear lever latch holds the station set-up gear train in position while setting up stations. Failure of the latch to engage properly when the set-up button is pushed in or the station set-up knob is turned (whichever is applicable) would result in the inability to set up pre-set stations. Failure of the latch to disengage after station is set up would result in faulty automatic tuning because the lead screws might not seat themselves properly against the tuner end plate. Figure 7 above shows the latch detail and adjustment.

SERVICE NOTES

FAILURE OF SOME LEAD SCREW TO ENGAGE IN SET-UP GEARS

If some of the lead screws fail to engage in the set-up gears during station setting up procedure, check the gear lever to see if it is bent. When the set-up button is pushed in and the gear lever latches on the detent lever, the set-up gear train should be parallel with the tuner end plate and the bottom of the gear train should be resting on the raised portions of the tuner end plate.

LUBRICATION

Should lubrication ever be required, it is recommended that a very fine grease, commercially called Lubriplate, or its equivalent, be used.

Remove all old and sticky lubricant with a solvent such as carbon tetrachloride and then, very sparingly, lubricate only the following points:

1. Carriage guide rods.
2. Actuator rod.
3. Manual lead screw.

IMPORTANT

Do not lubricate or permit lubricant to get on Selector Switch contacts. The friction drag is required for proper operation of tuner.

LEAD DRESSING

Make sure that the selector switch and solenoid coil leads are dressed so that carriage plate does not rub against them. Leads rubbing against the carriage plate may cause the tuner to stick, especially at the high frequency end.

REPLACEMENT OF SOLENOID COIL OR SOLENOID PLUNGER

Should replacement of the solenoid coil or solenoid plunger be required, it will be necessary to replace the entire tuner. A close fit between solenoid plunger and solenoid coil form is required; a proper match can only be secured at the factory. When service of this kind is required, return the tuner to the factory for exchange.

ALIGNMENT

In the event that some part of the R.F. circuit has been changed or the adjustments shifted by mishandling, it is suggested that the receiver be realigned. Follow the alignment instructions found in the receiver service manual.

The tuner must be in good working order and assembled onto the chassis before attempting alignment of its tuned circuits.

TO REPLACE ANT. R.F., OR OSC. COILS

IMPORTANT: When ordering replacement coils, order by part number and also specify the color coding (paint dots) on old coil. THE REPLACEMENT COIL SHOULD CARRY THE SAME COLOR CODING AS THE ORIGINAL OR THE TUNER WILL NOT TRACK PROPERLY.

1. If coil is not readily accessible remove the tuner from the chassis as outlined under "TO REMOVE TUNER FROM CHASSIS."
2. Unsolder the two lugs holding the coil to the tuner plate.
3. Carefully remove the old coil. Save the thin paper washer that is found at the base of the coil.
4. Slip the paper washer over the replacement coil and slip coil into shield can.
5. Orient coil so its lugs are in same position as before and resolder to tuner plate.
6. Reassemble tuner and install in receiver.
7. Realign ANT., R.F. and OSC. stages per instructions found in the receiver service manual.

TO REPLACE ANT. R.F. OR OSC COIL TUNING CORES

IMPORTANT: When ordering coil tuning cores, order by part number and also specify the color coding (paint spot) on the old core. ALL 3 TUNING CORES MUST CARRY THE SAME COLOR CODING OR THE TUNER WILL NOT TRACK PROPERLY.

1. The core which tunes the top coil is readily accessible and presents no replacement problem. To reach the two bottom coil tuning cores, remove the tuner from the chassis base as outlined under "TO REMOVE TUNER FROM CHASSIS."
2. Remove the carriage return spring.
3. Move the carriage plate back as far as it can go. The tuning cores can now be screwed "out" or "in" by grasping the portion that sticks out the back of the coil.

MODEL ST-56 MOTOROLA INC.

When installing a new core, make sure that the insulating washer and adjustment clip are replaced properly. The insulating washer goes on the core side; the core adjustment clip has an ear on it and this ear must fit into a hole in the bakelite insulator on the carriage plate. Refer to Figure 8.

4. Replace the carriage return spring.
5. Install tuner in receiver.
6. Realign ANT., R.F. and OSC. stages following the instructions found in the receiver service manual.

PLUNGER RATCHET REMOVAL

The plunger ratchets are not removable from early production tuners. Late production tuners have removable plunger ratchets. To remove ratchets, proceed as follows: (Refer to Figure 8 for parts identification).

1. Remove gear plate mounting screw (49).
2. Pull out actuator rod (37). Don't lose washers (74), (68) & (67).
3. Remove stop plate bracket (89) by sliding it out of the retaining slots.
4. Loosen setscrew (45).
5. The large fixed ratchet (90), small floating ratchet (91) and ratchet spring (92) can now be removed.
6. Reassemble in reverse order.

TUNER HANGS UP

The beginning of this trouble is usually a condition where the tuner "runs wild" (fails to stop at a station). Eventually, the stop plate gets "hung up" by getting on the wrong side of the station stops (51). The cause of the trouble is that the selector switch (65) does not turn the correct amount with each dash of the plunger.

Since the actuator rod (37) determines the rotation of the selector switch, it is usually at fault. Check the twist in the actuator rod. It should be 82 degrees. Also check the fit between the "head" end of the actuator rod (37) and the rotary section of the selector switch (65). We have found that some sloppiness sometimes occurred at this point. If the fit is loose, replace the actuator rod (37). This can be easily done by removing gear plate mounting screw (49).

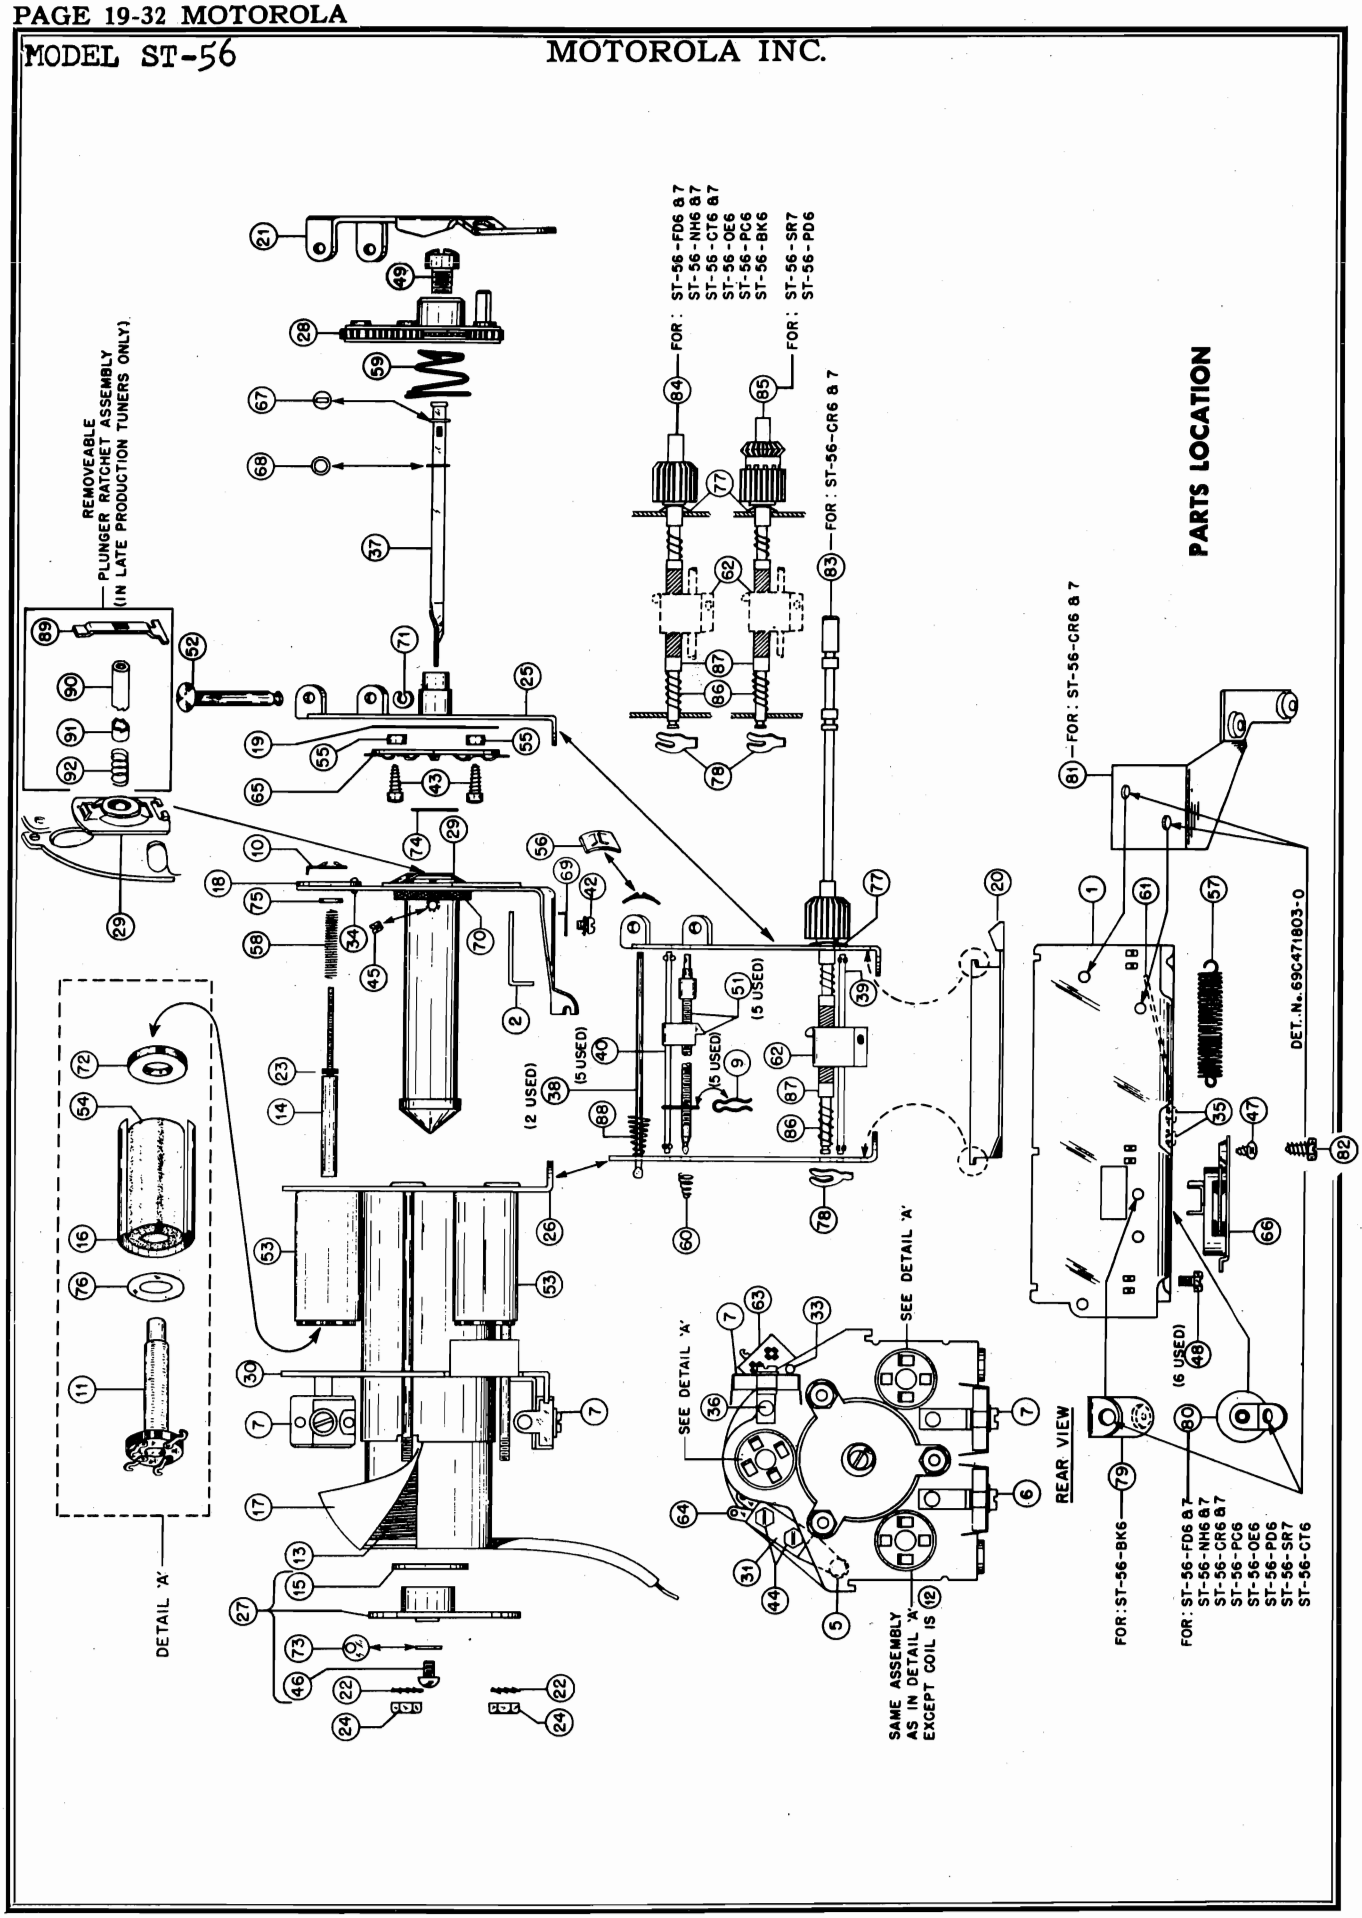
MODEL ST-56

MOTOROLA INC.



MOTOROLA INC. MODELS 58A11, 58A12, CHASSIS HS-158

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment. Follow the procedure carefully.

A low range output meter should be connected across the speaker voice coil. Set receiver volume control to maximum. For greatest accuracy, keep output of receiver at approximately .05 watt thruout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment. (.05 watt = .40 volt on output meter).

If receiver is operated from AC line during alignment, it is suggested that an isolating transformer be used between receiver and power line. If no isolation transformer is used and hum is encountered during alignment, connect the ground side of the signal generator through a .1 mf capacitor to B- instead of the receiver chassis.

Refer to Figure 1 for location of all adjustments.

STEP	DIAL SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET TO	ADJUST TRIMMER	REMARKS
IF ALIGNMENT						
1.	Gang fully opened	.1 mf	Conv. grid*	455 Kc	1,2,3 & 4	Adjust for maximum.
RF ALIGNMENT						
2.	Gang fully opened	-	Radiation loop***	1620 Kc	5	Adjust for maximum. This sets osc. to dial scale**
3.	1400 Kc	-	Radiation loop***	1400 Kc	6	Tune signal for max. with receiver tuning knob, then peak trimmer 6.

* A convenient point is the stator of the antenna section of the tuning capacitor.

** With gang fully closed, pointer should be parallel with chassis; reset if necessary

*** Connect output of signal generator to a 5" diameter, 3 turn loop and bring loop close enough to receiver loop to obtain output of .05 watt (.40V) on output meter. Vary distance between loops to maintain this output during alignment. Minimum distance between loops should never be less than 12".

SERVICE NOTE

The chassis of this receiver is connected directly to the power line. When operating chassis outside of its cabinet (from an AC power line) use an isolating transformer between power line and receiver to reduce possibility of electrical shock.

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment. Follow the procedure carefully.

A low range output meter should be connected to the speaker voice coil terminal and receiver chassis. Set receiver volume control to maximum. For greatest accuracy, keep output of receiver at approximately .05 watt (.05 watt = .40 volt on output meter) throughout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment.

ALIGNMENT PROCEDURE

Refer to Figure 1 for location of all alignment trimmers and cores.

STEP	DIAL SET TO	DUMMY	SIG. GEN. CONNECTED TO	SIG. GEN. SET AT	ADJUST TRIMMER OR CORE	REMARKS
IF ALIGNMENT						
1.	Gang fully opened	.1 mf	Converter Grid & chassis*	455 Kc	1,2,3 & 4	Adjust for maximum.
RF ALIGNMENT						
2.	Gang fully opened	.1 mf	Converter Grid & Chassis*	1620 Kc	5	This sets oscillator to dial scale.
3.	1400 Kc	None	Radiation loop**	1400 Kc	6	Tune signal in on receiver, then adjust loop trimmer (6) for maximum.

* A convenient point for this connection is the stator lug of the loop section of the tuning capacitor.

** Connect output of signal generator to a 5" diameter, 3 turn loop and bring loop close enough to receiver loop to obtain output of 50 milliwatts (.40) on output meter. Vary distance between loops to maintain this output during alignment. Minimum distance between loops should never be less than 12".

MOTOROLA INC. MODELS 58X11, 58X12, CHASSIS HS-125

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment. Follow the procedure carefully.

A low range output meter should be connected across the speaker voice coil. Set receiver volume control to maximum. For greatest accuracy, keep output of receiver at approximately .05 watt thruout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment. (.05 watt = .40 volt on output meter).

If receiver is operated from AC line during alignment, it is suggested that an isolating transformer be used between receiver and power line.

If no isolation transformer is used and hum is encountered during alignment, connect the ground side of the signal generator through a .1 mf capacitor to B- instead of the receiver chassis.

NOTE: Two types of IF & diode transformers are used in this chassis. One type has cores with slotted brass adjustment screws; the other type has threaded cores that move inside a threaded coil form. To adjust the latter type, use a small fibre screwdriver and do not use undue pressure as damage to the core or coil form may result.

Refer to Figure 1 for location of all adjustments.

STEP	DIAL SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET TO	ADJUST TRIMMER OR CORE	REMARKS
IF ALIGNMENT						
1.	Gang fully opened	.1 mf	Converter grid*	455 Kc	1;2,3 & 4	Adjust for maximum.
RF ALIGNMENT						
2.	1600 Kc**	-	Radiation loop***	1600 Kc	5	Adjust for maximum. This sets osc. to dial scale.
3.	1400 Kc	-	Radiation loop***	1400 Kc	6	Tune signal for maximum with receiver tuning knob, then peak trimmer 6.

* A convenient point is the stator of the antenna section of the tuning capacitor.

** First close gang fully and set pointer to calibration mark at left hand side of dial background; then set pointer to 1600 Kc. by turning knob till pointer lines up with right-hand calibration mark.

*** Connect output of signal generator to a 5" diameter, 3 turn loop and bring loop close enough to receiver loop to obtain output of .05 watt (.40V on output meter). Vary distance between loops to maintain this output during alignment. Minimum distance between loops should never be less than 12".

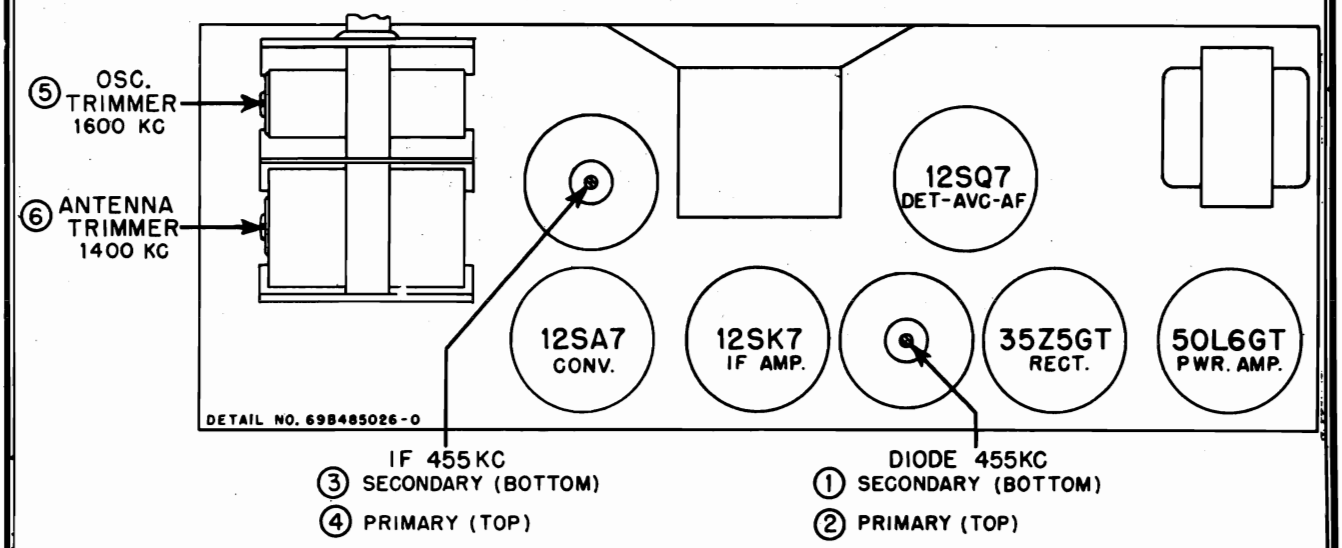

FIGURE 1. CHASSIS HS-125 TUBE & TRIMMER LOCATIONS

MODELS 58X11, 58X12, CHASSIS HS-125

MOTOROLA INC.

SERVICE NOTE

Two types of IF & Diode transformers are being used in this model. One type has iron cores that are tuned by means of slotted brass screws. These transformers must be used with shields having an internal iron core sleeve.

The other type of transformers have threaded cores moving inside of a threaded coil form. These transformers must be used with plain shields.

Replacement transformer should always be of the same type as the original.

COILS		
L-1	24K77323	Antenna Loop: winding only
L-2	24A76192	BC Oscillator coil
L-3	24A77336	Wavetrap
SPEAKER		
LS-1	50C470684	Speaker: 5" PM; 3.2 ohm VC
SWITCHES		
S-1A,B	40K470676	Phono-Radio & Tone
S-2	40A30444	Bass: SPST
S-3	40K471447	Pushswitch, dual (phono motor ON-OFF & REJECT)
TRANSFORMERS		
T-1	24B470038	IF, 455 Kc: includes tuning cores & padding capacitors but less shield
T-2	24B75487	Diode, 455 Kc: includes tuning cores & padding capacitors but less shield
T-3	25B76117	Output Transformer
PILOT LIGHT		
I-1	65A470930	Lamp, incandescent; 117V-10W, clear
CHASSIS PARTS - MECHANICAL		
1	1X478177	Background Bracket, Support & Pullies Assem.
2	7B18748	Bracket, gang mtg
3	7A482882	Bracket, loop support
4	7K470917	Bracket, pilot light mounting
5	7A77337	Bracket, tuning shaft
6	42K75826	Clip, electrolytic mtg
7	11M8944	Cord, dial: 18 lb black
8	5A470651	Cord, line & plug: 6 ft long
9	15A471444	Cover, pushswitch
10	15B470677	Cover, switch (on chassis)
11	35B77311	Dial Background: tan plastic; with reinforcing strip
12	5S7805	Eyelet, snap-in (dial background mtg)
13	5A19658	Eyelet, spacer (gang bracket mtg)
14	37A12691	Grommet, rubber (gang bracket mtg)
15	14A471446	Insulator, pushswitch cover: armite
16	1X484205	Lead Assembly, phono: with 4 pin receptacle & dual push switch
17	1X471449	Lead Assembly, phono pickup: single shielded conductor with one pin plug 43" long
18	32A24815	Lock, line cord: fibre
19	29K5227	Lug, soldering: 6L
20	2S7051	Nut: 3/8-32 x 9/16 hex; Palnut; cad pl (volume control, phono-radio-tone sw. & bass sw. mtg)
21	1X484247	Panel Assembly, cabinet back; less loop winding
22	24C77322	Panel Assembly, cabinet back: complete including loop
23	64A470680	Plate, switch mounting

MODEL 67F14,
CHASSIS HS-122

REF. NO.	PART NO.	DESCRIPTION
24	64A470681	Plate, tuning shaft mounting .....
25	28K71775	Plug: 1 pin (phono pickup lead) .....
26	52A77307	Pointer & Slider Assembly .....
27	49A12646	Pulley, cord: 1/4 groove .....
28	49A21552	Pulley, cord: 1/2 groove .....
29	9K470402	Receptacle: 4 prong(phono receptacle) ..
30	5A71246	Rivet, shoulder: .187 long (cord pulley mtg) .....
31	5A15045	Rivet, shoulder: .437 long (cord pulley mounting) .....
32	5S7707	Rivet: .122 x 5/32 ; steel; nkl pl (replacement socket mtg, etc) .....
33	5S7708	Rivet: .122 x 9/32 steel; nkl pl (line cord lock mtg) .....
34	3S7506	Screw: #6 x 1/4 PKZ plain hex head sheet metal screw (osc coil mtg and back mtg)
35	3S7152	Screw: 6-32 x 1/4 slotted hex head machine screw; steel; cad pl (gang mtg).....
36	3S7350	Screw: 6-32 x 1/4 slotted hex head locking type machine screw; steel; cad pl (gang mtg) .....
37	3S7454	Screw: #8 x 1/4 PKZ plain hex head sheet metal screw; cad pl (switch cover mounting, loop bracket mtg and background bracket assembly mtg) .....
38	3S7507	Screw: #8 x 5/8 PKZ plain hex head sheet metal screw; cad pl (gang mtg) .....
39	3S7205	Screw: 8-32 x 1/4 slotted hex head locking type machine screw; steel; cad pl (spkr mounting) .....
40	1K77694	Shaft & Pulley Assembly (tuning shaft) .
41	1A71049	Shield & Sleeve Assembly (for T-1 & T-2)
42	26A478109	Shield, light & static .....
43	26A72635	Shield, tube .....
44	9A470407	Socket, dial light & bracket .....
45	9A76185	Socket, tube: loctal .....
	or 9A72549	Socket, tube (replacement) use in place of 9A76185 when mounting lugs on chassis are broken .....
46	41A14244	Spring, tension coil (drive cord tension)
47	31K85348	Strip, terminal: 1 insulated lug, #2 mtg
48	31K76184	Strip, terminal: 2 insulated lugs, #1 gnd
49	31K86126	Strip, terminal: 2 insulated lugs, #2 mtg (on rear panel) .....
50	4A70015	Washer, "C" (tuning shaft retainer, ...
51	4S1719	Washer: 3/8 x .140 x .030 thick; steel; cad pl (line cord lock mtg) .....
52	4S7563	Washer: 5/8 x .203 x .033 thick; steel; cad pl (back panel mtg) .....
CABINET PARTS		
101	7A471456	Bracket, switch mounting (phono motor & reject sw mtg) .....
102	38K470830	Button, plug: for 1/4" hole; green (for concealing shipping screw holes in record changer base) .....
103	38B471506	Button, push: "M" .....
104	38K471507	Button, push: "R" .....
105	16K484213	Cabinet, consolette model: wood; mahogany
106	55A72307	Catch, bullet .....
107	13K478036	Cloth, grille .....
108	3A471458	Escutcheon, push button .....
109	13A478037	Grille, cabinet: painted; 3-5/8" .....
110	13K478039	Grille, cabinet: painted; 4-7/8" .....
111	36K478403	Knob, control: mahogany plastic; branded; 7/16" shank (tone-phono-radio) .....
112	36K478402	Knob, control: mahogany plastic; plain; 7/16" shank (volume & tuning) .....
113	36K484200	Knob, control: mahogany plastic; plain; 9/16" shank (BASS) .....
114	35K470657	Pad, felt: 1/2 diameter x 1-16 thick (drawer stop) .....
115	64K478063	Panel, cabinet rear: wood; mahogany finish .....
116	38A25507	Plug, split: 5/8 long; for 1/8 hole; copper oxide finish (holds loop panel to cabinet) .....
117	55K481403	Pull, drawer: statuary bronze .....
118	55K74786	Rail, support: right-hand (phono drawer rail)
119	55K74787	Rail, support: left-hand (phono drawer rail)
120	1X484215	Scale, dial & escutcheon .....
121	3S7401	Screw: #2 x 3/8 Phillips oval head wood screw; antique copper finish (dial scale mounting) .....
122	3S1343	Screw: #4 x 3/8 Phillips oval head wood screw; brass finish (pushbutton escutcheon mounting) .....
123	3S7156	Screw: 6-32 x 3/16 slotted binderhead machine screw; cad pl (phono motor-reject switch mtg) .....
124	3S1314	Screw: #6 x 3/4 round head wood screw (drawer rail mtg) .....
125	3S7526	Screw: #8 x 1-1/8 PKA slotted hex head sheet metal screw; cad pl (chassis mtg)
126	3S7396	Screw: 10-32 x 2" slotted hex head machine screw; copper plated (record changer mounting) .....
127	36K481398	Screw: washer head: statuary bronze finish (pull mtg) .....
128	41A21807	Spring, cushion: bottom (record changer cushion) .....
129	41A28190	Spring, cushion: top (record changer cushion) .....
130	41A478162	Spring, push button insert .....
131	22S7905	Staple, insulated .....
132	55K72308	Strike, bullet: (includes 1/2" nail).....
133	4S8214	Washer: 7/8 x .203 x .067 thick; cad pl (chassis mtg) .....
134	4S7611	Washer: 1/2 x 7/32 x .048 thick; antique copper finish (record changer mtg) ....

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment. Follow the procedure carefully.

A suitable output meter should be connected across the speaker voice coil. Set receiver volume control at maximum. For greatest accuracy, keep output of receiver at approximately .05 watt (.05 watt = .40 volt on output meter) throughout alignment by reducing signal generator output (not receiver volume control) as stages are brought into alignment. Use a fibre screwdriver for aligning the IF & diode transformers.

It is suggested that an isolating transformer be used between receiver and power line. If no isolation transformer is available and hum is encountered during alignment, connect the ground side of the signal generator through a .1 mf capacitor to receiver B- instead of the chassis.

Refer to Figure 2 for location of all alignment trimmers and cores.

STEP	DIAL SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET TO	ADJUST TRIMMER OR CORE	REMARKS
IF ALIGNMENT						
1.	Gang fully opened	.1 mf	6SA7 (conv.) grid*	455 Kc	1,2,3 & 4	Adjust for maximum.
RF ALIGNMENT						
2.	Gang fully opened	-	Radiation loop**	1620 Kc	5	Adjust for maximum output. This sets osc. to dial scale.
3.	1400 Kc	-	Radiation loop**	1400 Kc	6 & 7	Tune signal for maximum with receiver tuning knob, then peak trimmers 6 & 7.

* A convenient point is center stator of the tuning capacitor.

** Connect output of signal generator to a 5" diameter, 3 turn loop and bring loop close enough to receiver loop to obtain output of .05 watts (.40 volt) on output meter. Vary distance between loops to maintain this output during alignment. Distance between loops should never be less than 12".

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment.

It is suggested that an isolation transformer be used between receiver and power line. If no isolation transformer is used and hum is encountered during alignment, connect the ground side of the signal generator output to B- instead of the receiver chassis.

If set oscillates when aligning the broadcast band, connect receiver B- to receiver chassis. **CAUTION: Don't forget to disconnect B- from receiver chassis after alignment!**

An AM (amplitude modulated) signal generator covering the frequencies shown in alignment chart, is used to align the broadcast and FM bands. A low range output meter, connected across the speaker voice coil, is used as an output indicator.

The broadcast alignment is conventional; full instructions are given in the following alignment chart.

The FM band alignment can be satisfactorily performed by following the instructions in the chart. When properly aligned, the discriminator does not respond to amplitude modulation and since an AM type signal generator is used for aligning the FM circuits, it is necessary to detune the discriminator secondary and leave it that way until all of the FM circuits have been aligned. After completing the alignment of the FM circuits, proceed to align the discriminator secondary by applying a 4.3 Mc AM signal to the control grid (pin #7) of the 2nd FM converter tube and adjusting the discriminator secondary core for minimum audio output. No adjustment of the FM circuits should be attempted with AM after the discriminator secondary has been properly aligned.

Use a 30% AM (amplitude modulated) signal throughout entire alignment procedure.

Use an insulated wrench when adjusting the FM tuner trimmers. Order Motorola FM Alignment wrench, part number 66A471864.

A special wrench for adjusting the slotted nuts on the tuner cores will be required also. You can easily fabricate one from a Motorola auto set Volume Control Shaft and Coupling Assembly (Part Number 1B70847, $.30 list) by simply spreading out the forked ends and filing to fit. Solder the assembly together to make it rigid.

ALIGNMENT PROCEDURE WHEN USING AM MODULATED SIGNAL GENERATOR AND STANDARD OUTPUT METER FOR COMPLETE RECEIVER ALIGNMENT

STEP	DIAL SET TO	BAND SW. SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET AT	ADJUST TRIMMER OR CORE	REMARKS
455 Kc IF CHANNEL ALIGNMENT							
1.	1620 Kc	BC	.1 mf	12BE6, (V-2) BC Conv. Grid (Pin #1)	455 Kc	1,2,3 & 4	Adjust for maximum output.
BROADCAST BAND ALIGNMENT							
2.	1620 Kc (gang fully opened)	BC	.1 mf	12BE6 (V-2) BC Conv. Grid (Pin #1)	1620 Kc	5	This sets oscillator to dial. (Calibrate pointer by fully closing gang and noting position of pointer slider. Pointer slider should be in line with right hand hole in dial background bracket as shown in Figure 12.)
3.	1400 Kc	BC	None	Radiation loop*	1400 Kc	6	Tune in signal with receiver tuning knob, then peak trimmer 6.
4.3 Mc IF CHANNEL ALIGNMENT							
4.	-	-	-	-	-	7	Detune discriminator secondary by screwing core out as far as it will go.
5.	(extreme high frequency end)	FM	.001 mf	12AT7 (V-1) 2nd FM Converter Grid (#7 pin)	4.3 Mc.	8,9,10, 11, 12, 13 & 14	Adjust for maximum output.
FM BAND ALIGNMENT							
6.	-	-	-	-	-	15	Check the position of the FM Osc. tuning core 15. Set spacing between the core and bakelite piece to which it is mounted, to two turns from tight by turning tuning core slotted nut.

MOTOROLA INC.

MODELS 77FM21, 77FM22, -22M, -22WM, 77FM23, CHASSIS HS-89, HS-97

(Alignment continued)

STEP	DIAL SET TO	BAND SW. SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET AT	ADJUST TRIMMER OR CORE	REMARKS
7.	98 Mc	FM	None	FM Ant. terminal	98 Mc	18	Tuner is set to 98 Mc by moving cores out with tuning shaft until spacing between bakelite pieces is 1-9/32". See Figure 9. Peak 18 for maximum output.
8.	90 Mc	FM	None	FM Ant. terminal	90 Mc	19 & 20	Tune in signal with receiver tuning knob, then adjust 19 & 20 for maximum output.
9.	105 Mc	FM	None	FM Ant. terminal	105 Mc	16 & 17	Tune in signal with receiver tuning knob, then adjust 16 & 17 for maximum output.
10.	-	-	-	-	-	-	Repeat Steps 8 & 9 several times until further adjustment does not increase the output. Make the final trimmer adjustment at 105 Mc. (i.e., trimmers 19 & 20 at 105 Mc).
11.	105 Mc	FM	None	Radiate signal (or use station after performing Step 12)	105 Mc	19	Adjust for maximum output with built-in antenna connected.
ALIGN DISCRIMINATOR SECONDARY							
12.	-	FM	.001 mf	12AT7 (V-1) 2nd FM Converter Grid (Pin #7)	4.3 Mc	7	Adjust discriminator secondary for minimum response. The correct adjustment is sharply defined minimum response point between the two peaks.

* Connect output of signal generator to a 5" diameter, 3 turn loop and radiate signal into receiver loop. Minimum distance between loops should never be less than 12".

ALIGNMENT PROCEDURE WHEN USING FM SIGNAL GENERATOR AND OSCILLOSCOPE

STEP **OPERATION**

455 Kc IF Channel Alignment

1. Same as Step 1 in Chart I (Use AM signal generator)

Broadcast Band Alignment

2. Same as steps 2 & 3 in Chart I (Use AM signal generator)

4.3 Mc IF Channel Alignment Use FM Signal Generator & Oscilloscope

3. (A) Discriminator

1. Connect the input terminals of the oscilloscope vertical amplifier to the high side of the receiver volume control and B-.

2. Connect the FM generator synchronizing voltage output terminals to a phase shifting network, consisting of a variable 1/2 megohm resistor in series with a .002 mf capacitor. The input to the oscilloscope horizontal amplifier is connected across the .002 mf capacitor. See Figure 10. (This phase shifting network may not work with every oscilloscope. Different values of R & C may be required.)

3. Apply an FM 4.3 Mc signal (125 Kc deviation) through a .001 mf capacitor to the control grid (pin #1) of tube V-4 in the third FM IF Amplifier stage.

MODELS 77FM21, 77FM22, -22M, -22WM, 77FM23, CHASSIS HS-89, HS-97

MOTOROLA INC.

4. Adjust discriminator primary (8) for maximum amplitude. The phase shifting network resistor is adjusted to give only one trace.

5. Adjust discriminator secondary (7) until a symmetrical pattern is obtained, with peaks occurring at about 100 Kc above and below 4.3 Mc and is substantially linear between peaks. The trace should pass through the intersection of the vertical and horizontal axis. The phase shifting network should be adjusted to give only a single pattern at all times. See Figure 11. It will be necessary to go over discriminator primary (8) and secondary (7) adjustments several times before a pattern of maximum amplitude and correct symmetry is obtained.

(B) 4.3 Mc IF Amplifiers

1. Apply an FM 4.3 Mc signal (100 Kc deviation) to the control grid (pin #1) of tube V-3 in the 2nd FM IF amplifier stage, through a .001 mmf capacitor and adjust both primary and secondary cores (9 & 10) to get a symmetrical pattern as before, with peaks occurring at a slightly lower deviation.

2. Apply an FM 4.3 Mc signal (100 Kc deviation) to the control grid (pin #1) of tube V-2 and adjust both primary and secondary cores (11 & 12) until a symmetrical pattern substantially linear between peaks, is obtained.

3. Apply an FM 4.3 Mc signal (100 Kc deviation) to the FM antenna terminal and adjust both primary and secondary cores (13 & 14) until a symmetrical pattern substantially linear between peaks, is obtained.

FM Band Alignment - Use FM Signal Generator & Output Meter

4. Check the position of the FM oscillator tuning core (15). Set the spacing between the core and the bakelite piece to two turns from tight by turning tuning core slotted nut.

5. Connect generator output directly to the receiver FM antenna terminal.

6. Set receiver tuner to 98 Mc by moving cores out with tuning shaft until spacing between bakelite pieces is 1-9/32". See Figure 9. Also set FM signal generator to 98 Mc (22-1/2 Kc deviation). Adjust FM oscillator trimmer (18) for maximum output.

7. Set FM signal generator to 90 Mc (22-1/2 Kc deviation). Tune in signal with receiver tuning knob and then adjust FM variable IF & FM antenna trimmers (19 & 20) for maximum output.

8. Set FM signal generator to 105 Mc (22-1/2 Kc deviation). Tune in signal with receiver tuning knob and then adjust variable IF and antenna cores (16 & 17) for maximum indication on output meter.

Repeat steps 7 & 8 several times until further adjustment does not increase the output. Make the final trimmer adjustment at 105 Mc. (i.e., trimmers 19 & 20 at 105 Mc.)

9. Close FM antenna link on loop panel. Radiate an FM 105 Mc (22-1/2 Kc deviation) signal into FM antenna (line cord). Tune in signal with receiver tuning knob and then repeak FM antenna trimmer (19).

The standard broadcast dial scale is read in kilocycles by adding one "0" to figures. The FM band dial scale is read in megacycles (88 to 108). **NOTE:** When tuning, tune carefully until you are exactly ON the station. Tuning to either side of it will result in poor tone quality and excessive noise. Tuning of FM stations should be done very carefully, as 3 peaks are present; the center peak is the correct one; distortion and low volume are characteristic of the other two peaks.

MOTOROLA INC.

GENERAL INFORMATION

TYPE - BC radio-phonograph combination with loop antenna. A selenium rectifier is used in the power supply. Chassis HS-150 & HS-155 are identical except for dial arrangements.

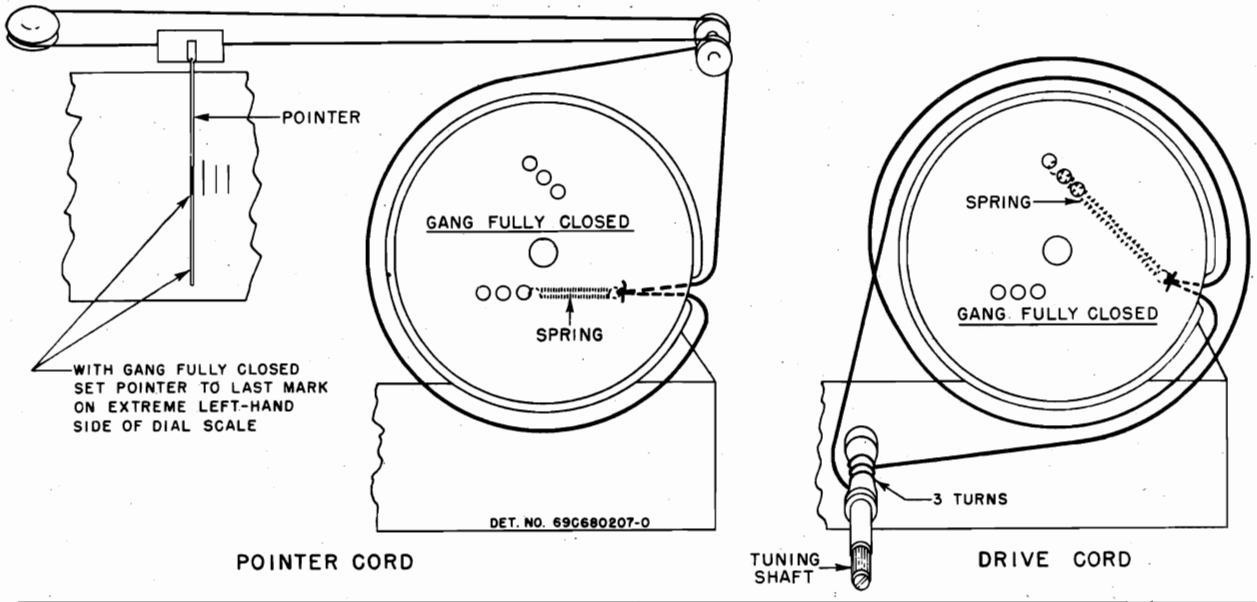
TUNING RANGE - 535 to 1620 Kc

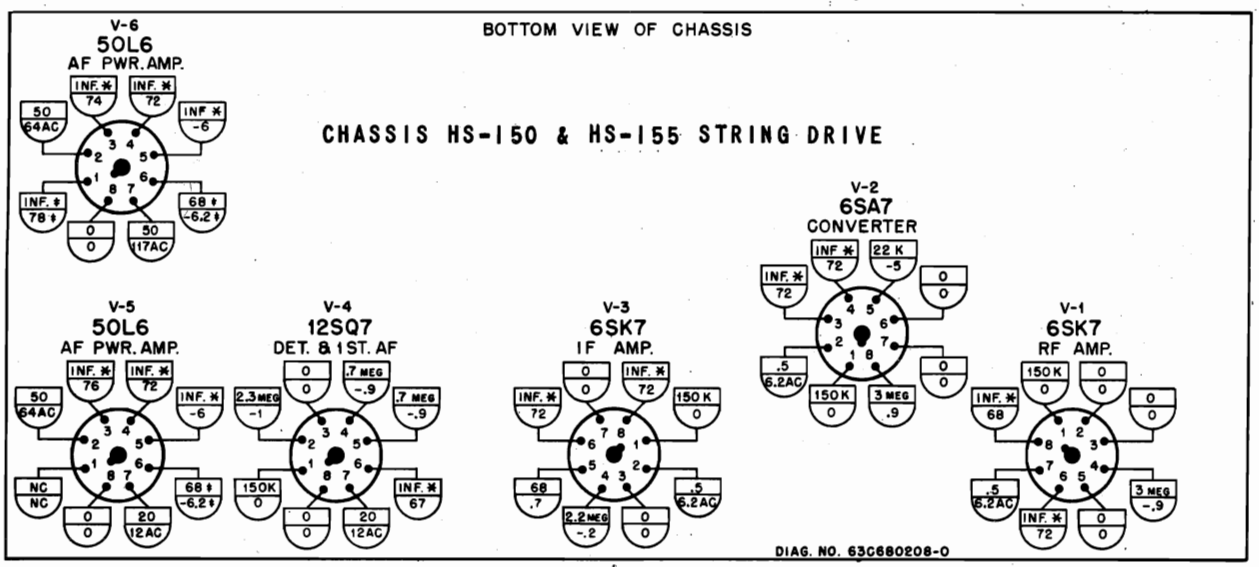
IF FREQUENCY - 455 Kc

TUBE COMPLEMENT - 6SK7 - RF Amplifier
6SA7 - Converter
6SK7 - IF Amplifier
12SQ7 - Detector, AVC & 1st AF Amp
2- 50L6 - Power Amplifiers
Rectifier - Selenium type

POWER SUPPLY - 105-125 volts AC, 60 cycles, 75 watts

RECORD CHANGER - Model RC-34. Refer to Motorola Model RC-34 Service Manual, Part No. 54P484953, for record changer service information and operating instructions.





▭ = RESISTANCE MEASUREMENTS.

◡ = VOLTAGE MEASUREMENTS.

* = MEASUREMENTS MAY VARY DEPENDING ON CONDITION OF ELECTROLYTIC IN CIRCUIT.

K = 1000 (ONE THOUSAND) OHMS.

ŧ = LUG USED AS TIE POINT.

NC = NO CONNECTION.

NOTES:
A VTVM WAS USED FOR ALL MEASUREMENTS.

ALL MEASUREMENTS, EXCEPT FILAMENTS, MADE FROM TUBE BASE PIN TERMINAL TO COMMON NEGATIVE. (SEE SCHEMATIC DIAGRAM)

FILAMENT MEASUREMENTS MADE FROM TUBE BASE TERMINAL TO MINUS SIDE OF LINE INPUT.

ALL VOLTAGES DC UNLESS OTHERWISE SPECIFIED.

INPUT TO SET 117 V. AC.

VOLTAGE TOLERANCE ±10%; RESISTANCE TOLERANCE ±20%.

VOLUME CONTROL AT MINIMUM AND NO STATION TUNED IN.

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment. Follow the procedure carefully.

A low range output meter should be connected across the speaker voice coil. Set receiver volume control to maximum. For greatest accuracy, keep output of receiver at approximately .05 watt thruout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment. (.05 watt = .40 volt on output meter).

It is suggested that an isolation transformer be used between receiver and power line. If no isolation transformer is used and hum is encountered during alignment, connect the ground side of the signal generator through a .1 mf capacitor to receiver common negative (see schematic diagram) instead of the receiver chassis.

Refer to Figure 2 for location of all adjustments.

STEP	DIAL SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET TO	ADJUST TRIMMER OR CORE	REMARKS
IF ALIGNMENT						
1.	Gang fully opened	.1 mf	Conv. grid (pin #8)	455 Kc	1,2,3 & 4	Adjust for maximum output.
RF ALIGNMENT						
2.	Gang fully opened	-	Radiation loop**	1620 Kc	5	Adjust for maximum. This sets osc. to dial scale*
3.	1400 Kc	-	Radiation loop**	1400 Kc	6 & 7	Tune signal for max. with receiver tuning knob, then peak trimmers 6 and 7.

* With gang fully closed, pointer should be in line with mark on extreme left hand side of dial scale.

** Connect output of signal generator to a 5" diameter, 3 turn loop and bring loop close enough to receiver loop to obtain output of .05 watt (.40V) on output meter. Vary distance between loops to maintain this output during alignment. Minimum distance between loops should never be less than 12".

FIGURE 3. CONTROLS

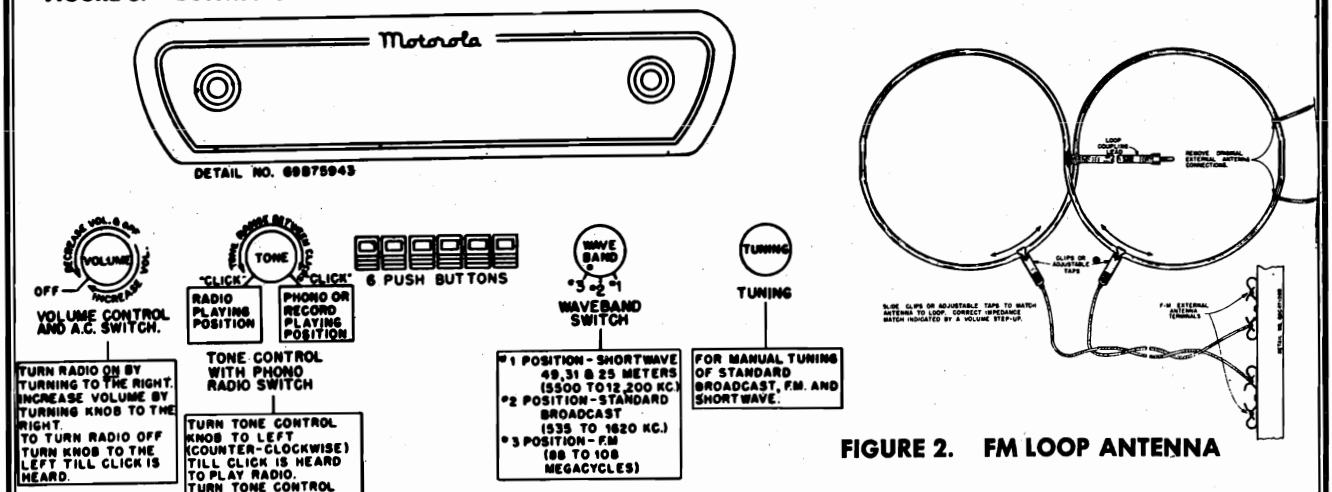

FIGURE 2. FM LOOP ANTENNA

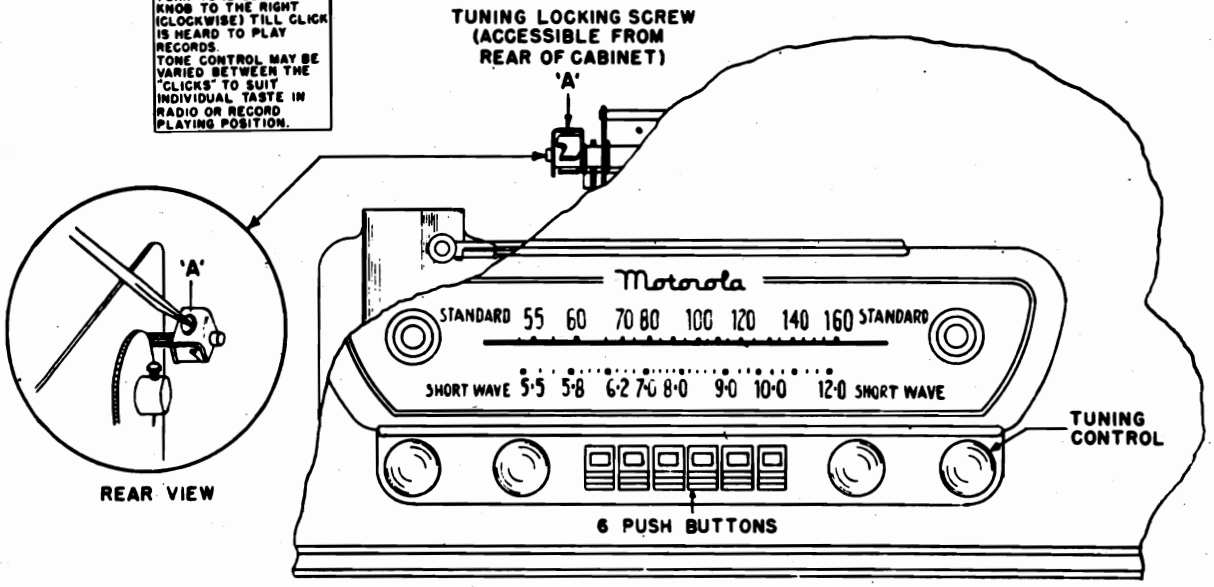

FIGURE 4. TUNER LOCKING SCREW LOCATION

INSTRUCTIONS FOR SETTING AUTOMATIC TUNER PUSH BUTTONS

1. Turn the radio ON and allow it to warm up for a period of at least fifteen minutes.
2. While waiting for the radio to warm up, loosen the tuner locking screw (A) all the way. The locking screw is accessible from the rear of the cabinet. (See Figure 4).
3. Make a list of the frequencies of the local stations you wish to tune in automatically. It is recommended that you select the most powerful stations only.
4. Turn the band switch to FM or BC position, depending on the station being setup, and carefully tune in the first station.

   NOTE: The buttons may be used on either BC, FM, or any combination of AM and FM. BE SURE TO SET THE BAND SWITCH ON THE PROPER BAND!

5. Adjust a signal generator to zero beat with the AM station.

   NOTE: While it is advisable to use a signal generator for accuracy, it is not an absolute necessity. The station signal may be used.

6. Tune to the desired station or to the signal generator, with the tuning knob (right hand control).
7. Holding the tuning knob, push the selected button and HOLD IN UNTIL THE MOTOR STOPS.
8. Repeat steps 6 and 7 for each of the buttons.
9. Carefully tighten the tuner locking screw (A).
10. Check the setting of the button by tuning in the station manually, then push the button set for that station; no effect on volume or tone should be noticed. If not correctly set, readjust--following steps 4 through 9.

FM SERVICE NOTES

In some cases, people are not tuning FM sets properly. FM is more difficult to tune than AM, although Motorola receivers are easier than most. There are three peaks present; the center peak, which is the correct one, is hard to locate. The peaks on either side of the center are slightly distorted. If you get a distorted peak on only <u>one</u> side of the center, the discriminator is probably out of alignment.

Some people expect too much of FM. You cannot expect great distance. The horizon, as viewed from the transmitting antenna, is the normal service area. Many FM stations are now operating on the low power, waiting for new equipment. Reception will improve greatly when power is increased. Most of the bad reports have come from the fringe areas. In many cases reception can be improved by using a dipole antenna, mounted as high above the roof as possible, and aimed directly at the station.

Location of the radio is important when it is operated on its built-in loop antenna. Moving the set even a few feet away from its present location may increase or reduce signal strength by more than 50% because a stronger signal may exist at one location than another. Therefore, in homes where reception is poor, you may be able to improve it by placing the set against another wall. The Motorola figure 8 loop antenna is omnidirectional.

Motorola FM sets use a relatively new circuit known as the Ratio Detector, instead of the usual limiters. The following paragraph of explanation is quoted from the R.C.A. License Laboratory Bulletin:

"Since a circuit of this type is relatively immune to amplitude modulation, it is unnecessary to precede it by a limiter stage. Also, since its immunity is not a direct function of the signal strength, there is no threshold action of the type encountered where limiters are employed."

It has been thought, erroneously, that the use of limiters in an FM receiver is <u>imperative</u> for proper reception. This is not the case. In this connection, it is important to understand that a limiter requires several volts at its grid to become effective. If the received signal strength is too weak to provide the required voltage at the limiter grid, <u>the limiters do not function</u>. This means that below a certain threshold of signal level, the limiters do not work and as a result do not contribute to amplitude (noise) rejection. Furthermore, noise voltages are not purely amplitude modulated, but contain frequency modulated components against which no amplitude rejection device will discriminate.

From the above comparison, you can see that there is little, if any, difference between the two circuits insofar as noise reception is concerned. In either case, low signal levels from the FM stations will result in noise reception, if there is any noise in the neighborhood.

The main advantages of ratio detection, as used in Motorola FM are, first, very little between station noise, and second, easier tuning because the side peaks are slightly subdued (as compared to the limiter type of receiver), making it easier to find the center peak.

ALIGNMENT

ALIGNMENT PROCEDURE WHEN USING AM MODULATED SIGNAL GENERATOR AND STANDARD OUTPUT METER FOR COMPLETE RECEIVER ALIGNMENT.

An AM (amplitude modulated) signal generator covering the frequencies shown in alignment chart, is used to align the broadcast, short wave and FM bands. A low range output meter, connected across the speaker voice coil is used as an output indicator.

The broadcast and short wave alignment is conventional; full instructions are given in the following alignment chart.

The FM band alignment can be satisfactorily performed by following the instructions in the chart. When properly aligned, the discriminator does not respond to amplitude modulation and since an AM type signal generator is used for aligning the FM circuits, it is necessary to detune the discriminator secondary and leave it that way until all of the FM circuits have been aligned. After completing the alignment of the FM circuits, proceed to align the discriminator secondary by applying a 4.3 MC AM signal to the control grid of the 7F8 2nd FM converter tube and adjusting the discriminator secondary core for minimum audio output. No adjustment of the FM circuits should be attempted with AM after the discriminator secondary has been properly aligned.

Use a 30% AM (amplitude modulated) signal throughout entire alignment procedure.

A dial scale should be temporarily mounted or held in position on Chassis HS-38 to facilitate calibration.

Use an insulated screwdriver when adjusting the FM tuner trimmers.

A special wrench for adjusting the slotted nuts on the tuner cores will be required. You can easily fabricate one from a Motorola auto set Volume Control Shaft and Coupling Assembly (Part No. 1B70847, $.30 list) by simply spreading out the forked ends and filing to fit. Solder the assembly together to make it rigid.

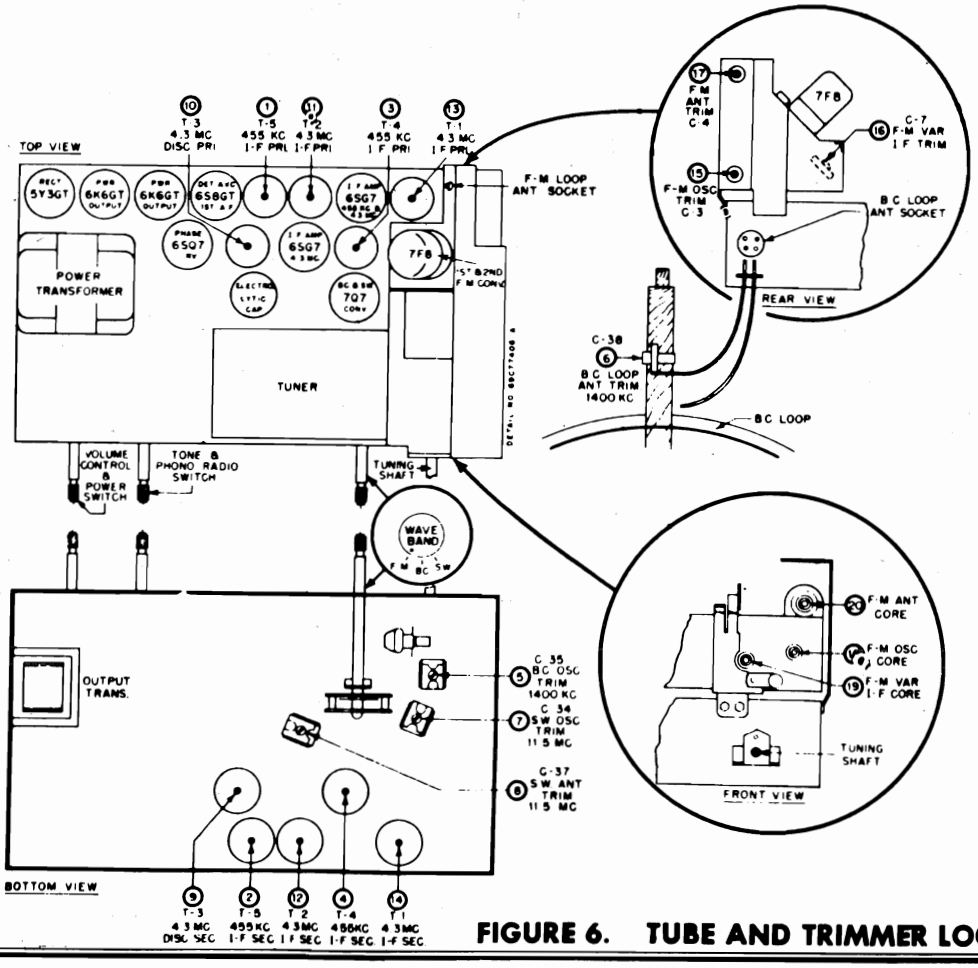

FIGURE 6. TUBE AND TRIMMER LOCATIONS

CHART I. ALIGNMENT PROCEDURE WHEN USING AM MODULATED SIGNAL GENERATOR AND STANDARD OUTPUT METER FOR COMPLETE RECEIVER ALIGNMENT.

STEP	DIAL SET TO	BAND SW. SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET AT	ADJUST TRIMMER OR CORE	REMARKS

CHART II. ALIGNMENT PROCEDURE WHEN USING FM SIGNAL GENERATOR AND OSCILLOSCOPE.

STEP	OPERATION
	455 Kc. I.F. Channel Alignment
1.	Same as step 1 in Chart I (Use AM signal generator)
	Broadcast Band Alignment
2.	Same as steps 2 & 3 in Chart I (Use AM signal generator)
	S. W. Band Alignment
3.	Same as steps 4 & 5 in Chart I (Use AM signal generator)
	4.3 Mc I.F. Channel Alignment Using FM Signal Generator & Oscilloscope
4.	(A) Discriminator -
	1. Connect the input terminals of the oscilloscope vertical amplifier to the high side of the receiver volume control and the chassis.
	2. Connect the FM generator synchronizing voltage output terminals to a phase shifting network, consisting of a variable 1/2 megohm resistor in series with a .002 mf capacitor. The input to the oscilloscope horizontal amplifier is connected across the .002 mf capacitor. See Figure 7. (This phase shifting network may not work with every oscilloscope. Different values of R & C may be required).
	3. Apply an FM 4.3 Mc Signal (125 Kc deviation) through a .01 mf capacitor to the control grid (pin #4) of the 6SG7 tube in the second I.F. amplifier stage.
	4. Screw discriminator secondary core (9) out as far as it will go.
	5. Adjust discriminator primary until the pattern obtained on the scope is symmetrical about the vertical axis. The phase shifting network resistor is adjusted to give only one trace. The pattern obtained is the resonance curve of the primary, whose maximum response should be at exactly 4.3 Mc. (See Figure 8).
	6. Adjust discriminator secondary until a symmetrical pattern is obtained, with peaks occurring at about 100 Kc above and below 4.3 Mc and is substantially linear between peaks. The trace should pass through the intersection of the vertical and horizontal axis. The phase shifting network should be adjusted to give only a single pattern at all times. (See Figure 9).
	(B) 4.3 Mc I.F. Amplifiers -
	1. Apply an FM 4.3 signal (100 Kc deviation) to the control grid (pin #4) of the 6SG7 tube in the 1st I.F. amplifier stage, through a .001 mf capacitor and adjust both primary and secondary cores (11 & 12) to get a symmetrical pattern as before, with peaks occurring at a slightly lower deviation.
	2. Apply an FM 4.3 Mc signal (100 Kc deviation) to the control grid (pin #1) of the 7F8 tube, and adjust both primary and secondary cores (13 & 14) until a symmetrical pattern substantially linear between peaks, is obtained.
	FM Band Alignment
5.	Check the position of the FM oscillator tuning core (18). Set the spacing between the core and the bakelite piece to which it is mounted, to 1/32" by turning tuning core slotted nut.

MOTOROLA INC.

OPERATION

STEP

6. Remove the FM loop and connect generator output directly to the receiver FM loop receptacle.

7. Set receiver dial to 90 Mc and also FM signal generator to 90 Mc. (22-1/2 Kc deviation). Adjust FM oscillator, antenna & variable I.F. trimmers (15, 16 & 17) for maximum indication on output meter. (Output meter should be connected across speaker voice coil).

8. Set receiver dial to 105 Mc and also FM signal generator to 105 Mc (22-1/2 Kc deviation). Adjust FM oscillator, antenna and variable I.F. Cores (18, 19 & 20) for maximum indication on output meter.

9. Repeat steps 7 & 8 several times until further adjustment does not increase the output. Make the final trimmer adjustment at 105 Mc. (i.e. trimmers 15, 16 and 17 at 105 Mc.).

10. Connect FM loop antenna to receiver receptacle. Radiate an FM 105 Mc (22-1/2 Kc deviation) signal into FM loop. Set receiver dial to 105 Mc and adjust trimmer (17) for maximum.

TO SERVICE LONG LIFE PILOT LIGHTS, PROCEED AS FOLLOWS:

1- UNSCREW THE TWO SCREWS MARKED 'A' AND REMOVE BAKELITE ESCUTCHEON 'B'.

2- PULL TOP OF GLASS DIAL SCALE 'C' FORWARD UNTIL DIAL LIGHT HOUSINGS CLEAR CABINET, THEN LIFT GLASS DIAL SCALE CLEAR OF CABINET.

3- REPLACE DEFECTIVE PILOT LIGHT. USE #51 BULBS ONLY.

4- BEFORE REPLACING DIAL SCALE, REMOVE FELT STRIP 'D' FROM BOTTOM ESCUTCHEON 'E'. FLATTEN FELT AND LAY OVER GROOVE IN ESCUTCHEON 'E'.

5- REPLACE DIAL SCALE BY LAYING LOWER EDGE ON FELT IN BOTTOM ESCUTCHEON 'E' AND PRESSING DIAL SCALE DOWN UNTIL PILOT LIGHT HOUSINGS SNAP INTO PLACE.

6- REPLACE UPPER ESCUTCHEON 'B'. MAKE CERTAIN THE TWO FELT STRIPS 'F' ARE PROPERLY PLACED BEFORE FASTENING ESCUTCHEON.

MODEL E-33-T AM-FM TUNER

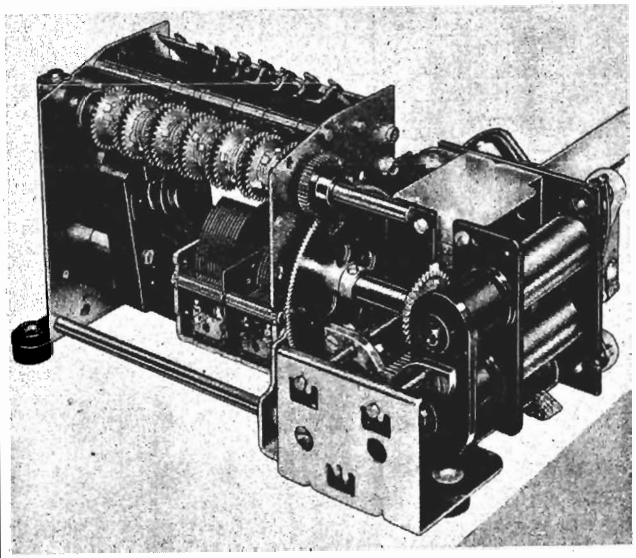

FIGURE 17. MODEL E-33-T FM-AM TUNER

Figure 17 shows the complete AM-FM Tuner E-33-T.

THEORY OF THE FM TUNER

Referring to the functional schematic diagram in Fig. 18, the triode T1 serves both as an oscillator and first converter, and triode T2 serves as the second converter. Oscillator voltage injection for the second converter is obtained through the coupling capacitor from the plate of T_1. T_1 and T_2 are sections of the 7F8 twin-triode tube.

The frequency relationships are given in Fig. 18. The oscillator F_0 beats with the incoming signal F_s to produce the first intermediate frequency F_1, which is variable. F_1 then beats with the same oscillator frequency F_0 in the second converter to produce the second intermediate frequency F_2 which is 4.3 mc. With a 100 mc signal the oscillator frequency is 47.85 mc and the variable intermediate frequency is 52.15 mc.

This system of reception permits the oscillator to be resonated with a high capacitance, 250 micromicrofarads in this case. Consequently, changes in the tube characteristics during warm-up do not produce objectionable changes in oscillator frequency. This contributes materially to the stability of the system.

The actual FM tuner schematic is shown in Figure 19.

INSTRUCTIONS FOR SETTING AUTOMATIC TUNER PUSH BUTTONS

1. Turn the radio ON and allow it to warm up for a period of at least fifteen minutes.

2. While waiting for the radio to warm up, loosen the tuner locking screw (A) all the way. The locking screw is accessible from the rear of the cabinet. (See Figure 12.)

3. Make a list of the frequencies of the local stations you wish to tune in automatically. It is recommended that you select the most powerful stations only.

4. Turn the band switch to FM or BC position, depending on the station being set up, and carefully tune in the first station.

NOTE: The buttons may be used on either BC, FM or any combination of AM and FM. BE SURE TO SET THE BAND SWITCH ON THE PROPER BAND!

5. Adjust a signal generator to zero beat with the station.

NOTE: While it is advisable to use a signal generator for accuracy, it is not an absolute necessity. The station signal may be used.

6. Tune to the desired station or to the signal generator, with the tuning knob.

7. Holding the tuning knob, push the selected button and HOLD IN UNTIL THE MOTOR STOPS.

8. Repeat Steps 6 and 7 for each of the buttons.

9. Carefully tighten the tuner locking screw (A).

10. Check the setting of the button by tuning in the station manually, then push the button set for that station; no effect on volume or tone should be noticed. If not correctly set, readjust--following Steps 4 through 9.

FM SERVICE NOTES

In some cases, people are not tuning FM sets properly. FM is more difficult to tune than AM, although Motorola receivers are easier than most. There are three peaks present; the center peak, which is the correct one, is hard to locate. The peaks on either side of the center are slightly distorted. If you get a distorted peak on only one side of the center, the discriminator is probably out of alignment.

Some people expect too much of FM. You cannot expect great distance. The horizon, as viewed from the transmitting antenna, is the normal service area. Many FM stations are now operating on low power, waiting for new equipment. Reception will improve greatly when power is increased. Most of the bad reports have come from the fringe areas. In many cases, reception can be improved by using a dipole antenna, mounted as high above the roof as possible, and aimed directly at the station.

Location of the radio is important when it is operated on its built-in loop antenna. Moving the set even a few feet away from its present location may increase or reduce signal strength by more than 50% because a stronger signal may exist at one location than another. Therefore, in homes where reception is poor, you may be able to improve it by placing the set against another wall. The Motorola figure 8 loop antenna is omnidirectional.

Motorola FM sets use a relatively new circuit known as the Ratio Detector, instead of the usual limiters. The following paragraph of explanation is quoted from the R.C.A. License Laboratory Bulletin:

"Since a circuit of this type is relatively immune to amplitude modulation, it is unnecessary to precede it by a limiter stage. Also, since its immunity is not a direct function of the signal strength, there is no threshold action of the type encountered where limiters are employed."

It has been thought, erroneously, that the use of limiters in an FM receiver is imperative for proper reception. This is not the case. In this connection, it is important to understand that a limiter requires several volts at its grid to become effective. If the received signal strength is too weak to provide the required voltage at the limiter grid, the limiters do not function. This means that below a certain threshold of signal level, the limiters do not work and, as a result, do not contribute to amplitude (noise) rejection. Furthermore, noise voltages are not purely amplitude modulated, but contain frequency modulated components against which no amplitude rejection device will discriminate.

From the above comparison, you can see that there is little, if any, difference between the two circuits, insofar as noise reception is concerned. In either case, low signal levels from the FM stations will result in noise reception, if there is any noise in the neighborhood.

The main advantages of ratio detection, as used in Motorola FM are, first, very little in-between station noise, and second, easier tuning because the side peaks are slightly subdued (as compared to the limiter type of receiver), making it easier to find the center peak.

MODELS 107F31, 107F31B, CHASSIS HS-87

MOTOROLA INC.

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment.

Use an insulated screwdriver when adjusting the FM tuner trimmers.

A special wrench for adjusting the slotted nuts on the tuner cores will be required. You can easily fabricate one from a Motorola auto set Volume Control Shaft and Coupling Assembly (Part Number 1B70847, $.30 list) by simply spreading out the forked ends and filing to fit. Solder the assembly together to make it rigid.

An AM (30% amplitude modulated) signal generator covering the frequencies shown in Alignment Chart I, is used to align the broadcast and short wave and FM bands. A low range output meter, connected across the speaker voice coil, is used as an output indicator.

The broadcast and short wave band alignment is conventional; instructions are given in the following alignment chart.

The FM band alignment can be satisfactorily performed by following the instructions in the chart. When properly aligned, the discriminator does not respond to amplitude modulation and since an AM type signal generator is used for aligning the FM circuits, it is necessary to detune the discriminator secondary and leave it that way until all of the FM circuits have been aligned. After completing the alignment of the FM circuits, proceed to align the discriminator secondary by applying a 4.3 Mc AM signal to the control grid of the 2nd FM converter tube and adjusting the discriminator secondary core for minimum audio output. No adjustment of the FM circuits should be attempted with AM after the discriminator secondary has been properly aligned.

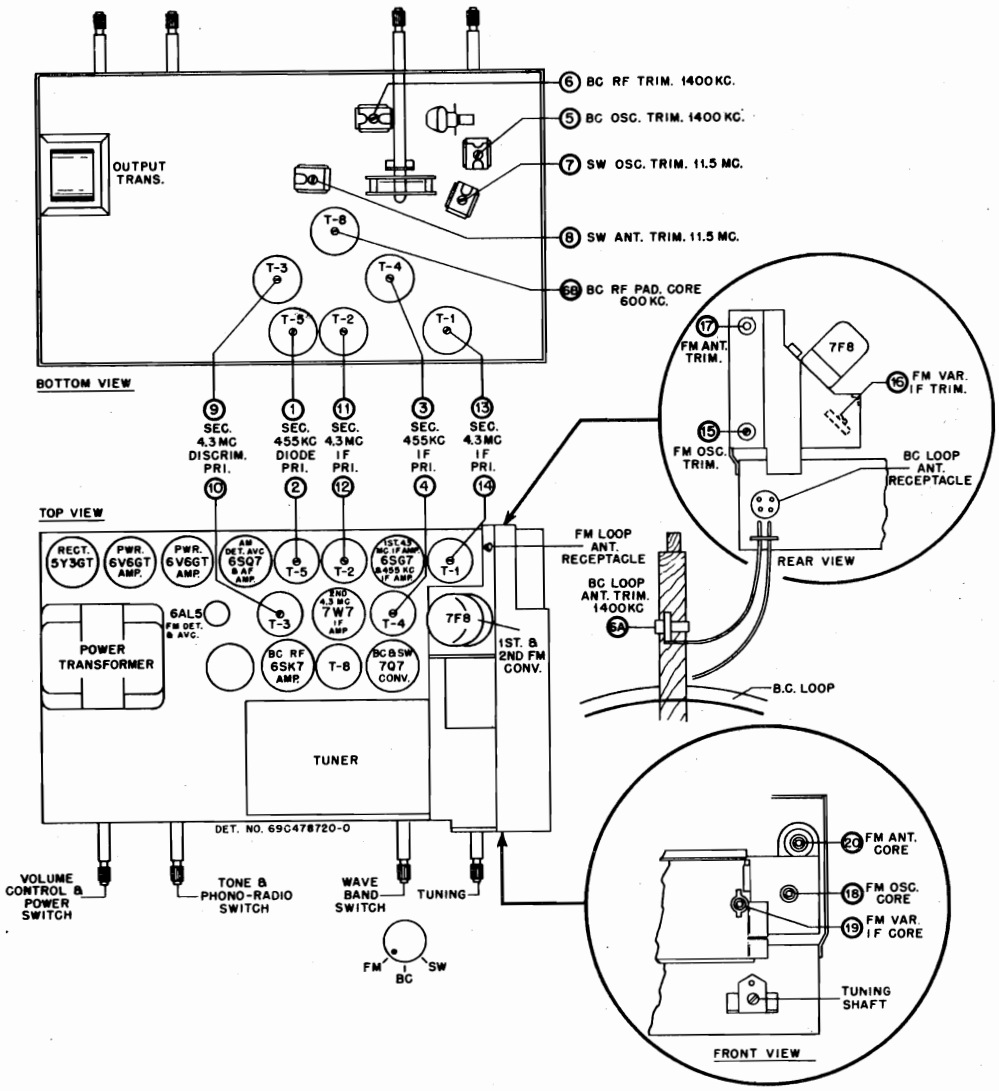

FIGURE 7. TUBE & TRIMMER LOCATIONS

CHART 1. ALIGNMENT PROCEDURE WHEN USING AM MODULATED SIGNAL GENERATOR AND STANDARD OUTPUT METER FOR COMPLETE ALIGNMENT

Refer to Figure 7 for location of all adjustment trimmers and cores.

STEP	DIAL SET TO	BAND SW. SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET AT	ADJUST TRIMMER OR CORE	REMARKS
455 Kc IF CHANNEL ALIGNMENT							
1.	1620 Kc (gang fully opened)	BC	.1 mf	7Q7 BC & SW Conv. Grid (Pin #4) & Chassis	455 Kc	1,2,3 & 4	Adjust for maximum output.
BROADCAST BAND ALIGNMENT							
2.	1400 Kc	BC	.1 mf	7Q7 BC & SW Conv. Grid (Pin #4) & Chassis	1400 Kc	5(BC Osc. Trim)	This sets oscillator to dial. With gang fully meshed, pointer should be at last mark on dial; then set to 1400 Kc and set oscillator.
3.	1400 Kc	BC	None	Radiation Loop *	1400 Kc	6 & 6A (BC RF & Loop Antenna Trimmers)	Adjust for maximum output.
3A	NOTE: The inductance of the BC RF transformer (T-8) is set at time of manufacture by adjusting iron core (6B). No resetting of this core should be made unless it has been tampered with. If so, readjustment can be made as follows: Tune in 600 Kc signal and peak RF pad core (6B). Next tune in 1400 Kc signal and peak trimmer (6). Repeat both adjustments until maximum response is obtained at both ends; the last adjustment should be trimmer (6).						
SW. BAND ALIGNMENT							
4.	11.5 Mc	SW	.1 mf	7Q7 BC & SW Conv. Grid (Pin #4) & Chassis	11.5 Mc	7(SW Osc. Trim)	This sets osc. to dial. Make sure osc. is higher in frequency than the signal by checking image response which should occur with the input signal at 12.41 Mc.
5.	11.5 Mc	SW	50 mmf	SW Ant. Terminal and Chassis	11.5 Mc	8(SW Ant. Coil Trim)	BC loop plug should be disconnected. Adj. for maximum output.
4.3 Mc IF CHANNEL ALIGNMENT							
6.						9(Disc. Sec.)	Detune discriminator secondary by screwing core out as far as it will go.
7.	Extreme high freq. end.	FM	.001 mf	7F8 2nd FM Converter Grid (#1 Pin) & Chassis	4.3 Mc	10, 11, 12, 13 & 14 (4.3 Mc IF)	Adjust for maximum output.
FM BAND ALIGNMENT							
8.						18 (FM Osc. Core)	Check the position of the FM Osc. tuning core 18. Set spacing between the core and bakelite piece to which it is mounted, to 1/32" by turning tuning core slotted nut.
9.	90 Mc	FM	None	FM loop antenna receptacle and chassis; remove FM loop.	90 Mc	15,16 & 17 (FM Osc., Ant. & Variable IF Trim)	Adjust for maximum output.
10.	105 Mc	FM	None	FM loop antenna recep- and chassis; remove FM loop	105 Mc	18,19 & 20 (FM Osc., Ant. & Variable IF cores)	Adjust for maximum output
11.							Repeat steps 9 and 10 several times until further adjustment does not increase the output. Make the final trimmer adjustment at 106 Mc (i.e., trimmers 15, 16 and 17 at 106 Mc.)
12.	105 Mc	FM	None	Radiation Loop *	105 Mc	17 (FM Ant. Trim)	Adjust for maximum output with FM loop antenna connected.
ALIGN DISCRIMINATOR SECONDARY							
13.		FM	.001 mf	7F8 2nd FM Converter Grid (#1 Pin) & Chassis	4.3 Mc	9 (Disc. Sec.)	Adjust discriminator secondary for minimum response. The correct adjustment is the sharply defined minimum response point between the two peaks.

* Connect output of signal generator to a 5" diameter, 3 turn loop & radiate signal into receiver loop. Minimum distance between loops should never be less than 12".

MODELS 107F31,107F31B, MOTOROLA INC.
CHASSIS HS-87

CHART II. ALIGNMENT PROCEDURE WHEN USING FM SIGNAL GENERATOR AND OSCILLOSCOPE

Refer to Figure 7 for location of all adjustment trimmers and cores.

STEP **OPERATION**

455 Kc IF Channel Alignment

1. Same as Step 1 in Chart I (Use AM signal generator)

Broadcast Band Alignment

2. Same as Steps 2, 3 & 3A in Chart I (Use AM signal generator)

SW Band Alignment

3. Same as Steps 4 & 5 in Chart I (Use AM signal generator)

4.3 Mc IF Channel Alignment Using FM Signal Generator & Oscilloscope

4. (A) Discriminator -
   1. Connect the input terminals of the oscilloscope vertical amplifier to the high side of the receiver volume control and the chassis.
   2. Connect the FM generator synchronizing voltage output terminals to a phase shifting network, consisting of a variable 1/2 megohm resistor in series with a .002 mf capacitor. The input to the oscilloscope horizontal amplifier is connected across the .002 mf capacitor. See Figure 8. (This phase shifting network may not work with every oscilloscope. Different values of R & C may be required.
   3. Apply an FM 4.3 Mc signal (125 Kc deviation) through a .01 mf capacitor to the control grid (pin #4) of the 7W7 tube in the second IF amplifier stage.
   4. Screw discriminator secondary core (9) out as far as it will go.
   5. Adjust discriminator primary (10) until the pattern obtained on the scope is symmetrical about the vertical axis. The phase shifting network resistor is adjusted to give only one trace. The pattern obtained is the resonance curve of the primary, whose maximum response should be at exactly 4.3 Mc. (See Figure 9).
   6. Adjust discriminator secondary (9) until a symmetrical pattern is obtained, with peaks occurring at about 100 Kc above and below 4.3 Mc and is substantially linear between peaks. The trace should pass through the intersection of the vertical and horizontal axis. The phase shifting network should be adjusted to give only a single pattern at all times. (See Figure 10).

   (B) 4.3 Mc IF Amplifiers -
   1. Apply an FM 4.3 signal (100 Kc deviation) to the control grid (pin #4) of the 6SG7 tube in the 1st IF amplifier stage, through a .001 mf capacitor and adjust both primary and secondary cores (11 & 12) to get a symmetrical pattern as before, with peaks occurring at a slightly lower deviation.
   2. Apply an FM 4.3 signal (100 Kc deviation) to the control grid (pin #1) of the 7F8 tube, and adjust both primary and secondary cores (13 & 14) until a symmetrical pattern substantially linear between peaks, is obtained.

FM Band Alignment

5. Check the position of the FM oscillator tuning core (18). Set the spacing between the core and the bakelite piece to which it is mounted, to 1/32" by turning tuning core slotted nut.

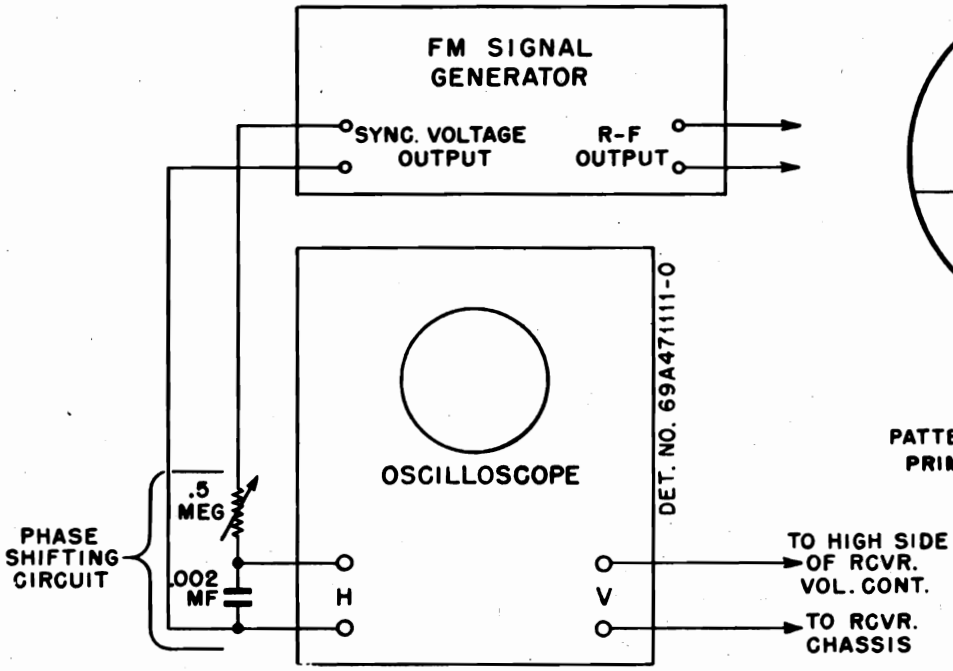
6. Remove the FM loop and connect generator output directly to the receiver FM loop receptacle.

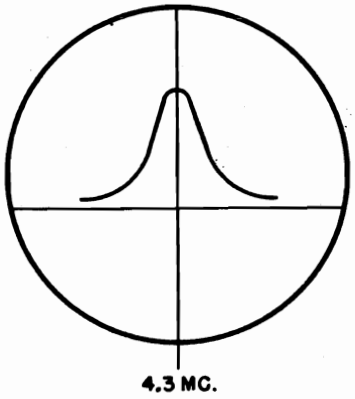
7. Set receiver dial to 90 Mc and also FM signal generator to 90 Mc (22-1/2 Kc deviation). Adjust FM oscillator, antenna and variable IF trimmers (15, 16 & 17) for maximum indication on output meter. (Output meter should be connected across speaker voice coil.)

8. Set receiver dial to 105 Mc and also FM signal generator to 105 Mc (22-1/2 Kc deviation). Adjust FM oscillator, antenna and variable IF cores (18, 19 & 20) for maximum indication on output meter.

9. Repeat Steps 7 and 8 several times until further adjustment does not increase the output. Make the final trimmer adjustment at 105 Mc. (i.e., trimmers 15, 16 & 17 at 105 Mc).

10. Connect FM loop antenna to receiver receptacle. Radiate an FM 105 Mc (22-1/2 Kc deviation) signal into FM loop. Set receiver dial to 105 Mc and adjust trimmer (17) for maximum.





PATTERN WITH DISCRIMINATOR PRIMARY (10) CORRECTLY ADJUSTED

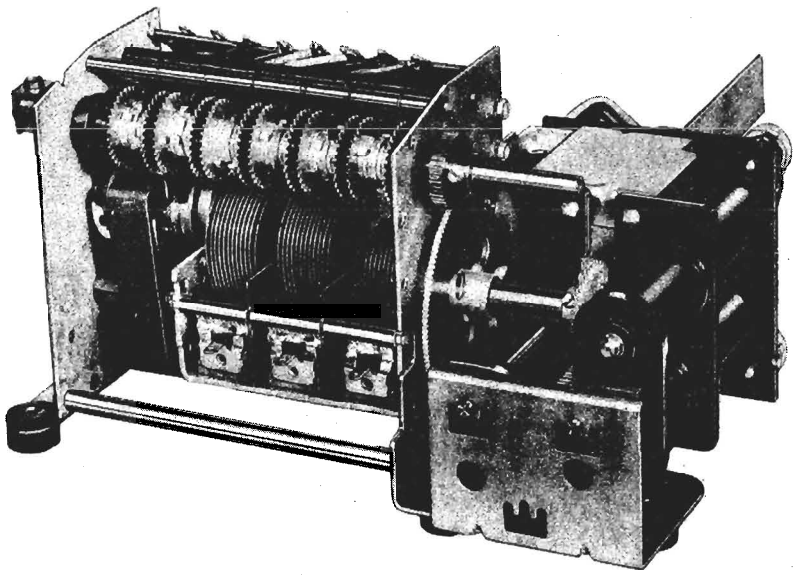

FIGURE 17. MODEL E-34-T AM-FM TUNER

THEORY OF THE FM TUNER

Referring to the functional schematic diagram in Figure 18, the triode T_1 serves both as an oscillator and first converter, and triode T_2 serves as the second converter. Oscillator voltage injection for the second converter is obtained through the coupling capacitor from the plate of T_1. T_1 and T_2 are sections of the 7F8 twin-triode tube.

The frequency relationships are given in Figure 18. The oscillator F_0 beats with the incoming signal F_S to produce the first intermediate frequency F_1, which is variable. F_1 then beats with the same oscillator frequency F_0 in the second converter to produce the second intermediate frequency F_2 which is 4.3 mc. With a 100 mc signal the oscillator frequency is 47.85 mc and the variable intermediate frequency is 52.15 mc.

This system of reception permits the oscillator to be resonated with a high capacitance, 250 micromicrofarads in this case. Consequently, changes in the tube characteristics during warm-up do not produce objectionable changes in oscillator frequency. This contributes materially to the stability of the system.

The actual FM tuner schematic is shown in Figure 20.

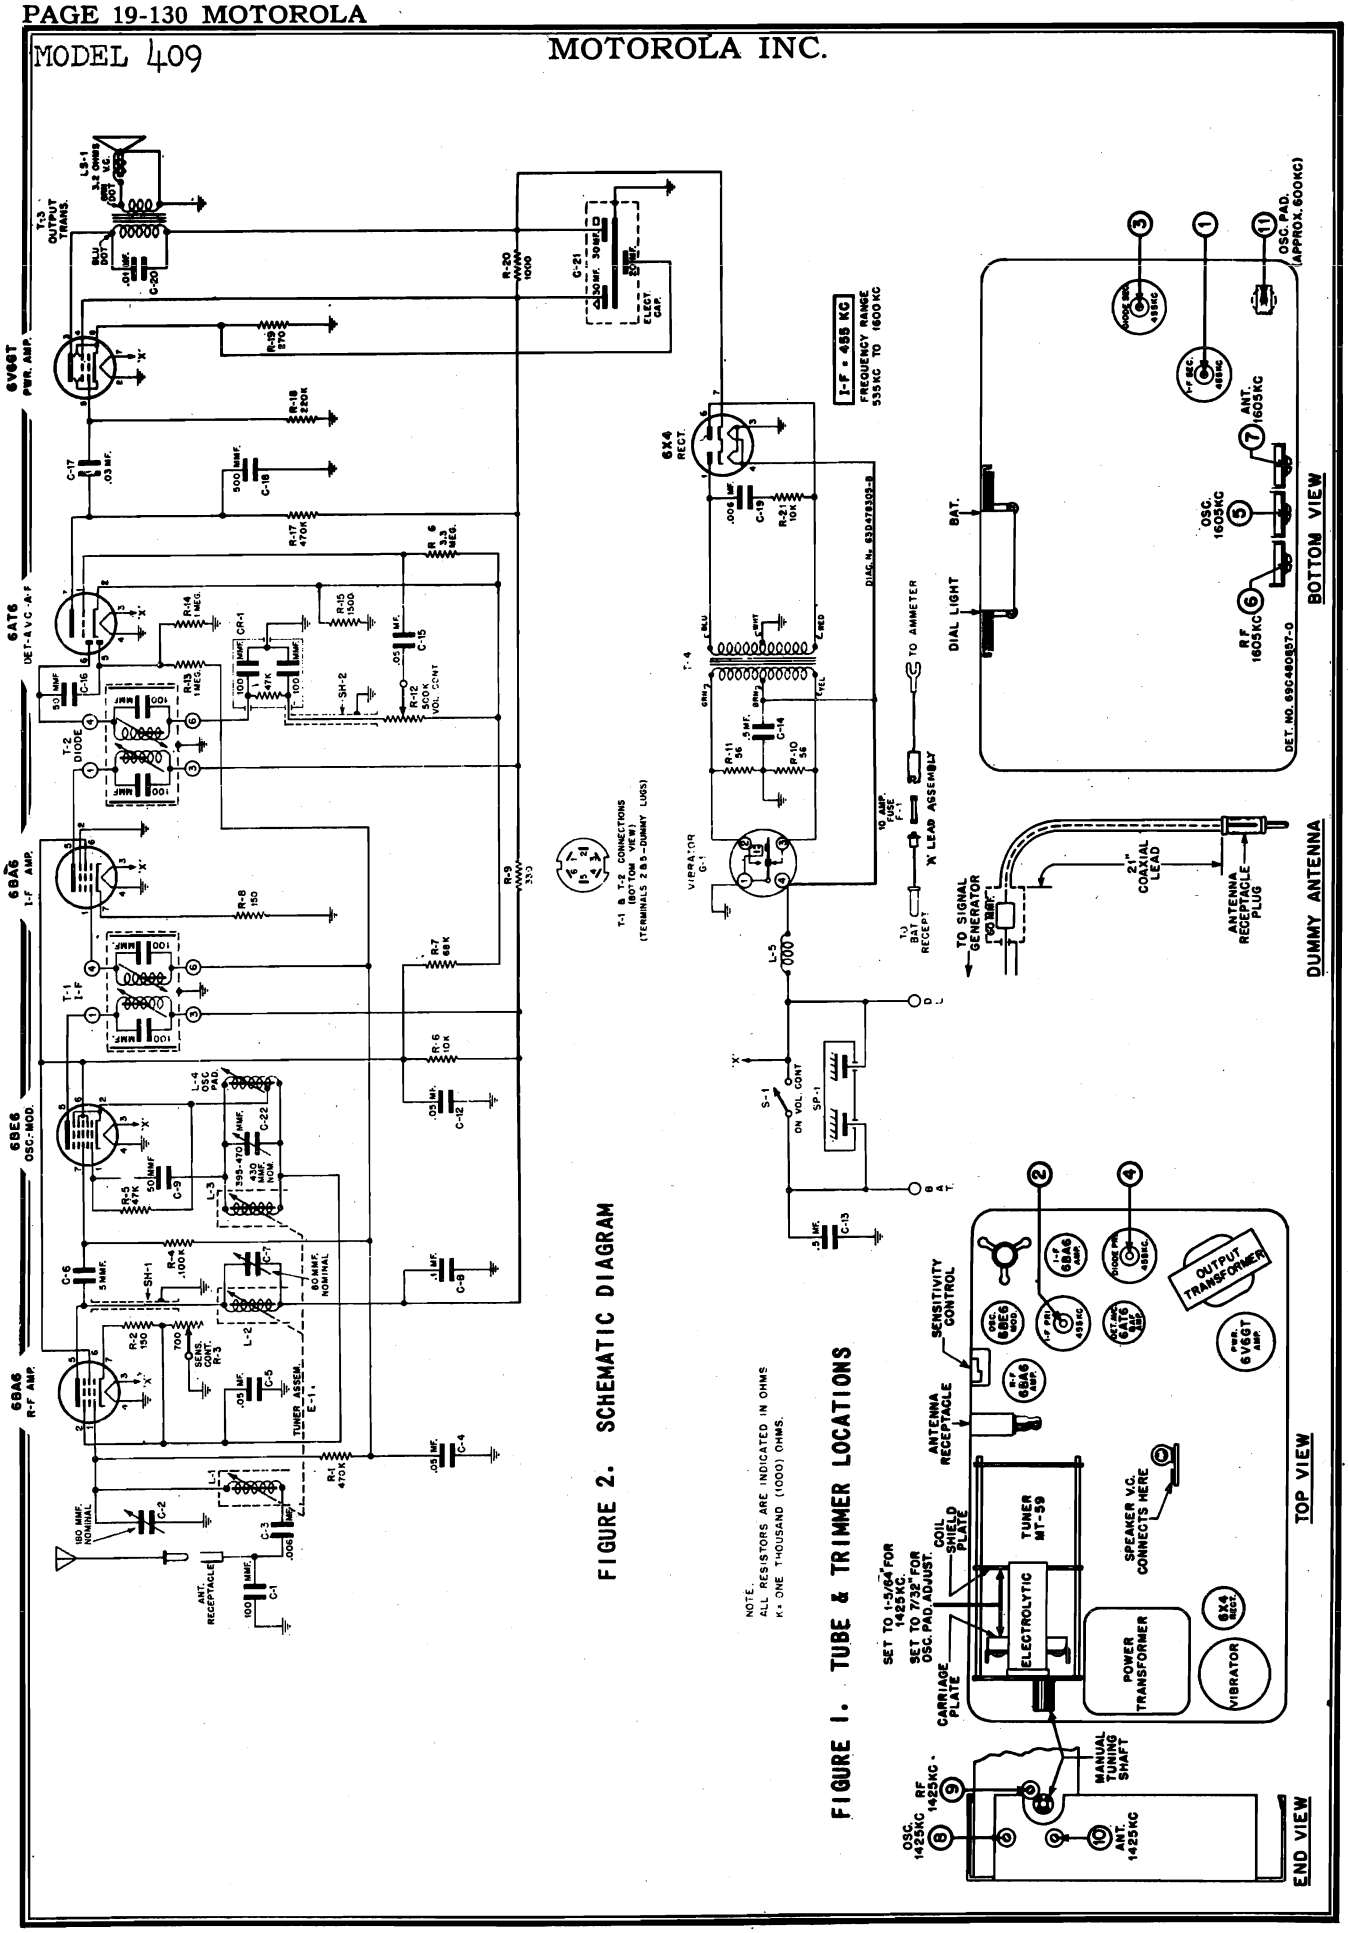
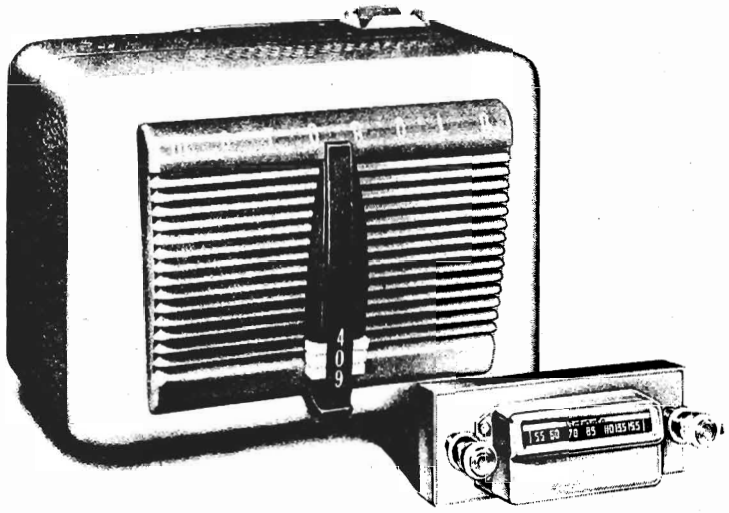
MODEL 409

MOTOROLA INC.



MOTOROLA INC. MODEL 409



ALIGNMENT

EQUIPMENT REQUIRED

1. A special tool for adjusting the tuner cores. Use Alignment Tool, Motorola Part No. 66A76278.
2. A small screwdriver for IF & RF alignment.
3. An accurately calibrated AM modulated signal generator.
4. A low range output meter.
5. A special dummy antenna for RF alignment. Construct dummy antenna as shown in Figure 1. The 21" coaxial lead needed in its construction is the same type as used for lead-in on Motorola car antenna.

PROCEDURE

1. Remove the front and rear housings. All adjustments are now exposed.
2. Connect a PM speaker (3.2 ohm VC) to VC terminal and chassis of receiver and connect the output meter across the voice coil. If the receiver internal speaker is used, ground receiver front housing to chassis.
3. Connect a 6 volt storage battery to chassis and BATT terminal of receiver; turn receiver on and allow it to warm up for a few minutes. Set receiver volume control at maximum.
4. SENSITIVITY CONTROL. This control must be set to provide $2 \pm 1/2$ volts bias on the RF tubes before alignment is started. Measure this voltage between sensitivity control terminal and chassis.
5. For greatest accuracy, keep output of receiver at approximately 1 watt (1 watt = 1.79 volts on output meter) throughout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment.
6. IF ALIGNMENT
   A. Connect high side of signal generator through .1 mf capacitor to 6BE6 grid (pin #7) and the low side to chassis. Set generator to 455 Kc and peak adjustments (1, 2, 3 & 4), in this order, for maximum output.
   B. Check alignment by repeating procedure.
7. RF ALIGNMENT
   A. Connect signal generator to antenna receptacle through special dummy antenna (60 mmf capacitor in series with 21" coax lead).
   B. Move carriage plate (by turning manual tuning shaft) to extreme high frequency position and screw coil cores out so that at least 1-1/8" of all three cores shall be outside of the coil shield can. Set signal generator to 1605 Kc and peak trimmers (5, 6 and 7), in this order.
   C. Move the carriage plate (by turning manual shaft) so carriage plate is spaced exactly 1-5/64" from coil shield plate. Set signal generator to 1425 Kc and adjust coil cores (8, 9 & 10), in this order, for maximum output.
   D. Move carriage plate (by turning manual tuning shaft) so carriage plate is spaced approximately 7/32" from coil shield plate. Leave signal generator connected but turn signal generator power off. Peak oscillator padder core (11) for maximum noise. If the padder core must be moved more than 1/2 turn from its original position, the carriage plate should be moved to extreme high frequency position, the coil cores (8, 9 & 10) should be screwed out so that 1-1/8" of each core is exposed and steps 7A, B, C & D repeated until it is necessary to move the padder core less than 1/2 turn in this step.
   IMPORTANT: Do not push in on the alignment tool when adjusting the tuner cores. The slightest inward pressure on the alignment tool may move the tuner carriage and result in inaccurate alignment.
8. SETTING THE SENSITIVITY CONTROL. After alignment is completed, set signal generator to 600 Kc and adjust its output to 1.3 microvolts. Adjust the sensitivity control to provide 1 watt output (1 watt = 1.79 volts on output meter).
9. ANTENNA TRIMMER ADJUSTMENT. Once steps 7A, B, C, D & 8 have been satisfactorily performed, no further adjustment of any alignment screws should be made except to align the antenna trimmer (7) to car antenna after receiver is installed in car. This adjustment should be made with antenna fully extended and receiver set to approximately 1400 Kc. Peak the trimmer for maximum volume of a weak station or background noise between stations.

REPLACEMENT PARTS LIST

REF. NO.	PART NO.	DESCRIPTION
CHASSIS PARTS - ELECTRICAL		
CAPACITORS		
C-1	21B77562	Ceramic: 100 mmf 500V .....

	1X70646	Receptacle, antenna .....
	5S7771	Rivet: .088 x 3/16 steel; nkl pl (tube socket mtg) .....
	5S7706	Rivet: .122 x 1/8 steel; nkl pl (terminal strip mtg and sensitivity control mtg) ..
	5S7707	Rivet: .122 x 5/32 steel; nkl pl (tube socket mtg) .....
	5S7701	Rivet: .122 x 3/16 steel; nkl pl (vibrator grounding clip mtg and output trans mtg) .
	3S8140	Screw, sheet metal: #8 x 3/16 PKZ plain hex head; cad pl (tuner mtg) .....
	3S7454	Screw, sheet metal: #8 x 1/4 PKZ plain hex head;cad pl (spark plate assembly & capacitor assembly mtg) .....
	3S3397	Screw, sheet metal: #8 x 5/16 PKZ plain hex head; cad pl (pwr trans mtg) ....
	26A472747	Shield, hash .....
	1A71049	Shield & Sleeve Assembly (for T-1 & T-2) .....
	9A70208	Socket, tube: 4 prong (for vibrator) .....
	9A472534	Socket, tube: miniature; 7 prong
	9A6788	Socket, tube: octal .....
	31K37504	Strip, terminal: 1 insulated lug, #1 mtg .....
	31K86126	Strip, terminal: 2 insulated lugs, #2 mtg .....
	31A472573	Strip, terminal: 2 insulated lugs, #2 mtg .....
	7A472614	Support, vol. cont. shaft alignment .....
	4S7555	Washer, flat: 1/4 x .128 x .033 thick; cad pl (output trans mtg) .....
HOUSING PARTS		
	13K580617	Escutcheon (complete) .....
	1X580718	Housing, front: includes 2 grounding wipers; less escutcheon
	15K580640	Housing,rear .....
	5S7730	Rivet: .122 x 1/8 steel; antique copper finish (grounding wiper mtg) .....
	3S7454	Screw, sheet metal: #8 x 1/4 PKZ plain hex head; cad pl (escutcheon mtg) .....
	3S7456	Screw, sheet metal: #8 x 1/4 PKA slotted acorn head; antique copper finish (housing screws) .....
	3S2696	Screw, sheet metal: #10 x 3/8 PKA plain hex washer head; cad pl (spkr mtg) .....
	39K470032	Wiper, grounding .....
ACCESSORIES		
	3A51494	Bolt, 'J' (receiver mtg) ...
	8A4491	Capacitor, generator .....
	1X74340	Lead Assembly, dial light: complete with bulb .....
	9B473111	Lead Assembly, fuse: complete with 10 Amp fuse .....
	4S7653	Lockwasher: 5/16 int-ext; cad pl (receiver mtg) .....
	3S2863	Nut; hex: 5/16-18 x 9/16 cad pl (receiver mtg) .....
	1K75148	Shaft, flexible: with hang; 24" long .....
	6X4141	Suppressor, distributor ....

*Part of Tuner MT-59

NATIONAL COMPANY, INC. MODELS NC-108R, NC-108T

SECTION 1. INSTALLATION

1-1. Installation Procedure

After the NC-108 has been removed from its packing crate proceed as follows:

1. Connect a good external ground (water pipe or radiator) to the G terminal on the antenna terminal strip at the rear of the Receiver. This connection is not absolutely required but, in certain localities, better reception can be achieved by such a connection.

2. Connect the antenna as recommended in Section 1-2.

3. Connect the external audio amplifier, if one is used, as follows: connect the input terminals of the amplifier to the output terminals, X-2, at the rear of the NC-108, terminal 2 is the ground connection. The A.C. line plug of the amplifier may be connected to the A.C. socket, X-1, at the rear of the NC-108. With such a connection both units will receive their power from the same A.C. power source and the A.C. line switch on the NC-108 can be used to turn both units on and off.

4. Connect the power cord, P-1, to a 110/125 volt, 50/60 cycle, A.C. source of supply.

5. Set controls as recommended in Section 2 for the reception of stations.

1-2. Antenna Recommendations

The antenna input circuit of the NC-108 is arranged for operation from either a single-wire type, doublet type antenna or other types having impedances of 70 ohms or more. The input impedance of the antenna circuit is approximately 300 ohms.

The use of an efficient antenna with the NC-108 is strongly recommended if optimum results are to be obtained. Although, if the Receiver is to be operated in localities relatively close to F.M. transmitting stations, a single-wire antenna of from 2 to 10 feet may prove very satisfactory. The two types of antennae shown on Figure No. 2 have proven to be highly efficient. The drawing shows sufficient detail so that either one or the other type of antenna can

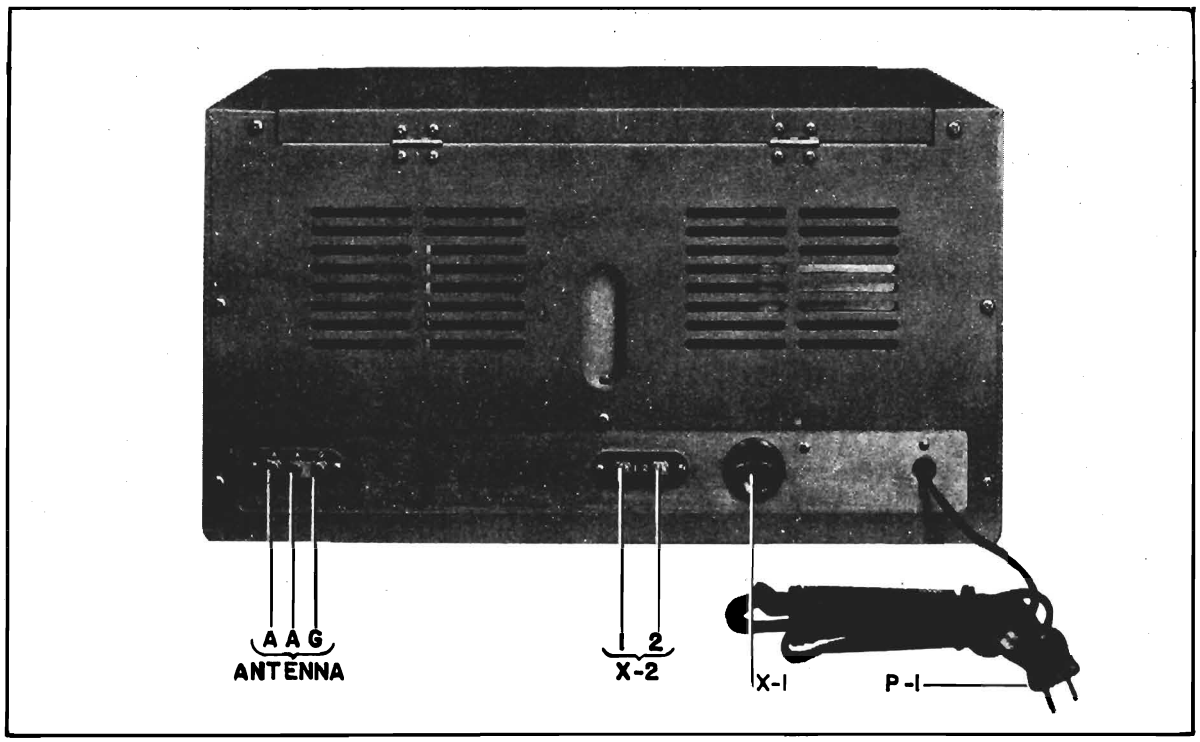

Figure No. 1. Rear View of Receiver

MODELS NC-108R, NC-108T

NATIONAL COMPANY, INC.

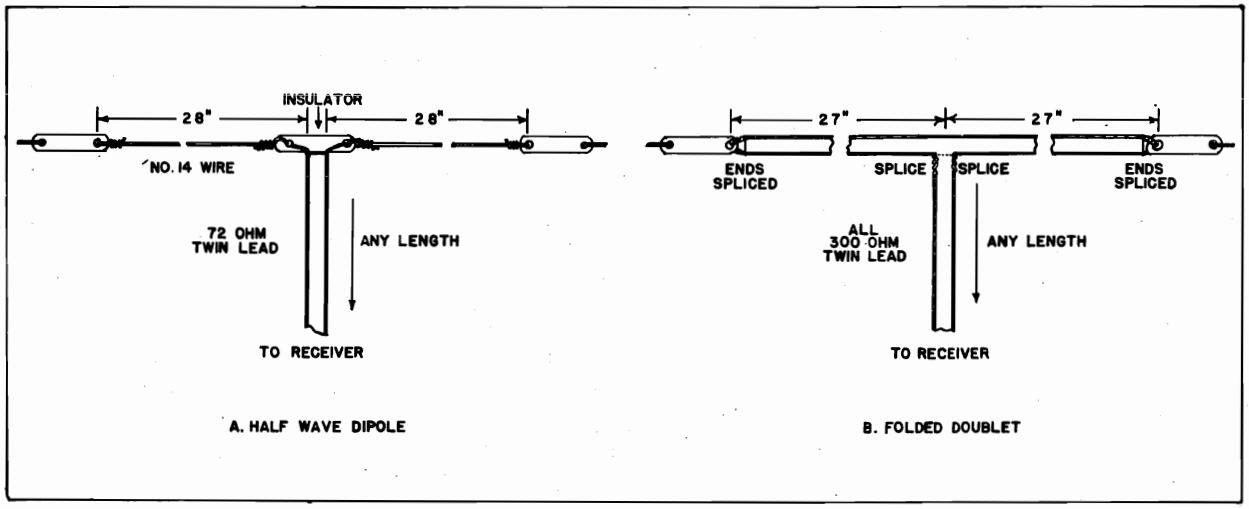

Figure No. 2. Typical Antenna Types

be easily assembled. It will be found that these types of antennae are directional, that is, best results are obtained with the antenna parallel to the transmitting antenna. Only by trial, of course, can the best position for the antenna be determined. There are also available various types of commercial antennae which are very satisfactory. Some of these are directional, while others are designed to give good results no matter what the position of the antenna is, relative to the transmitting antenna. Regardless of which type of antenna is employed, better reception will be obtained if the antenna is mounted in an area free of obstructions. Atop the roof usually proves a good mounting place.

The method of connecting the various types of antennae to the antenna terminal strip at the rear of the Receiver is as follows:

1. Single-wire type--Connect antenna to terminal A at the left of the strip.

2. Doublet type--Connect the antenna feeders to the two terminals marked A.

For either of the above type of connections attaching the metal link on the G terminal to the adjacent A terminal should be tried and left in the position giving the best reception.

SECTION 2. OPERATION

2-1. Operating Instructions

After the NC-108 is properly installed, as outlined in Section 2-1, it is placed in operation by adjusting the receiver controls in the following manner:

1. Set the MONITOR switch at On. This switch silences the loud-speaker on the NC-108 when it is in the Off position. The MONITOR switch positions do not effect the external amplifier-loud-speaker system connected to the NC-108.

2. Turn the VOLUME control to approximately 5. This control adjusts receiver volume from a minimum at zero to a maximum at 10.

3. Turn the TONE control from A.C. Off to zero thus turning On the Receiver and the external audio system, if the A.C. socket, X-1, is used as the power source for the external system. The Tone control progressively adjusts the tonal output of the NC-108 from normal receiver reproduction at 10 to an output at zero, in which the higher tones are subdued, emphasizing the lower tones.

4. Tune in the desired station by means of the Main Tuning knob. The dial scale is calibrated directly in megacycles and also is marked with channel indicating numbers. The correct dial setting for any specific station will be indicated as

follows:

a. NC-108T--maximum closing of the Tuning Eye.

b. NC-108R--maximum deflection of the Tuning Meter pointer.

After the four steps above have been completed, the operator may readjust the VOLUME and TONE controls to achieve the desired output characteristics of volume and tone, respectively.

2-2.. Operation with an External Audio System

After the external amplifier-loudspeaker system, to be used with the NC-108, has been installed as outlined in Section 2-1, operation of both units is accomplished as follows:

1. Initial adjustment of the NC-108 is the same as though it were to be used alone, and the procedure in Section 2-1 should be followed.

2. After the desired station has been properly tuned in on the NC-108, set the MONITOR switch at Off and adjust the external amplifier controls (volume and tone) for the desired output from the external loud-speaker.

It is important that the control adjustments of the NC-108 are accomplished before those of the external amplifier.

It should be noted that use of the A.C. socket, X-1, as the power source for the external audio system will permit extreme flexibility in the placement of units. After the completion of the initial adjustments, the NC-108 may be located at the operating position and the external audio system may be placed at a remote position.

SECTION 3. ALIGNMENT DATA

3-1. General

The alignment of the NC-108 may be divided into two steps:

1. Intermediate Frequency Amplifier Alignment.

2. R.F. Amplifier Alignment
   a. H.F. Oscillator
   b. Mixer and R.F. Amplifier

The necessity for any realignment may be determined by checking the performance of the NC-108 against its normal operation, as outlined in Section 2, and the dial calibration. It is recommended that any indicated realignment be accomplished by experienced personnel.

3-2. I.F. Amplifier Alignment

The intermediate frequency of the NC-108 is 10.7 megacycles. The three I.F. transformers and the ratio detector transformer have permeability tuned iron-core inductors with screw adjustments for alignment purposes. The inductor adjustments L-3, L-5, L-7 and L-11 are accessible from the top inside of the cabinet and the inductor adjustments L-4, L-6, L-8 and L-10 from the bottom inside of the cabinet. See Figure Nos. 3 and 4.

The alignment procedure is as follows:

1. Connect the "high" output lead of an accurately calibrated signal generator to the stator of the mixer portion, C-2C, of the main tuning capacitor and the ground lead to any convenient grounded point on the chassis. Set the signal generator at 10.7 megacycles and turn the modulation off.

2. Connect the D.C. volt probe of a high-impedance vacuum tube voltmeter to the junction of R-27 and C-36 (diode load) and the common lead to chassis. Use the 10 volt scale of the meter.

3. Connect the power cord of the NC-108 to a 110/125 volt, 50/60 cycle, A.C. source of supply.

4. Set the VOLUME control at zero.

5. Set the MONITOR switch at OFF.

6. Set the TONE control at zero.

7. Adjust the attenuator of the signal generator for a reading of approximately 3 volts on the voltmeter. (The diode load voltage is negative with respect to chassis.)

8. Adjust the I.F. inductors L-3 thru L-8 and L-10 for maximum, as indicated on the voltmeter, retarding the attenuator as necessary to maintain a low reading in the

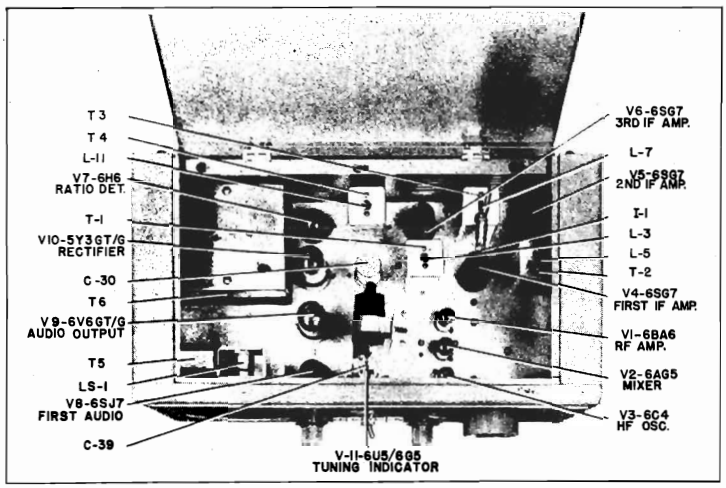

Figure No. 3. Top View of Receiver

vicinity of 3 volts on the voltmeter. The maintenance of a low meter reading is recommended to assure proper alignment.

9. Increase the attenuator of the signal generator until a reading of 10 volts is obtained on the voltmeter.

10. Connect the D.C. volt probe of the voltmeter to the junction of R-29 and C-37. Adjust the secondary inductor L-11 for a reading of 5 volts on the voltmeter without disturbing the setting of the attenuator of the signal generator.

11. Check the voltmeter reading with the voltmeter probe connected to R-27 and C-36. Repeat the adjustments of L-10 and L-11, as necessary, until the voltmeter reading obtained at R-29 and C-37 is one-half the reading at R-27 and C-36.

3-2. R.F. Amplifier Alignment

The R.F. amplifier, mixer and H.F. oscillator stages have variable trimmer capacitors, C-1, C-9 and C-5 respectively, for alignment adjustments. See Figure No. 4. Alignment is accomplished using an accurate test signal of 108 megacycles. The signal source may be a signal generator, crystal oscillator or an F.M. broadcast station of known frequency near the upper frequency limit of the NC-108. The alignment procedure is as follows:

1. Connect the signal source to the two A antenna terminals; disconnect the metal link. In the case where a signal generator is used, make the connection through a 300 ohm dummy antenna. In the case where the signal from an F.M. broadcast station is used, connect the antenna to the antenna terminals.

2. Connect the power cord of the NC-108 to a 110/125 volt, 50/60 cycle, A.C. source of supply.

3. Set the MONITOR switch at On.

4. Set the VOLUME control at approximately 5.

5. Set the TONE control at 10.

6. Set the main tuning dial pointer to the exact frequency of the test signal.

7. Adjust the H.F. oscillator trimmer capacitor, C-5, to receive the test signal.

8. Adjust trimmers C-1 and C-9 for maximum gain as observed on the visual tuning indicator.

9. Check step 7 and repeat steps 7 and 8 as necessary.

SECTION 4. MAINTENANCE AND TEST DATA

4-1. Circuit

A stage outline of the circuit employed in the NC-108 is given below together with the tube associated with each stage:

R.F. Amplifier	6BA6
Mixer	6AG5
H.F. Oscillator	6C4
First I.F. Amplifier	6SG7
Second I.F. Amplifier	6SG7
Third I.F. Amplifier	6SG7

Ratio Detector.....6H6
First Audio.....6SJ7
Audio Output.....6V6GT/G
Rectifier.....5Y3GT/G
Tuning Indicator.....6U5/6G5

The tuning indicator tube, 6U5/6G5, is used on the NC-108T only.

4-2. *General Maintenance Data*

The NC-108 is designed and constructed to assure a long period of uninterrupted service. A few service hints are given below to aid in locating individual components which, due to age or weakness, cause abnormal operation of the NC-108.

Vacuum tube failure may be evidenced by reduction in sensitivity, intermittent operation or an inoperative Receiver. Tubes may be checked in suitable tube testing equipment, or by replacement with tubes of proven quality. Care must be taken that tubes removed for checking are returned to their original sockets. Tubes of the same type will vary slightly in their individual characteristics and selection of a new tube that closely approximates the replaced tube will reduce the necessity of realignment.

Bypass or filter capacitors which become open may cause decreased sensitivity, oscillation, or complete failure of the Receiver. The defective unit can be located by temporarily connecting a good capacitor in parallel with each suspected capacitor. Leaky or short-circuited capacitors can be detected by an ohmmeter check; a zero resistance reading of the ohmmeter will indicate a shorted capacitor.

Defective resistors, sometimes caused by capacitor failure in associated circuits, can be definitely located by measuring the resistance of each resistor. The Schematic Diagram should be consulted to ascertain that any particular resistor under test is not connected in parallel with some other circuit element which might produce a false measurement. An overloaded resistor may be located by visual inspection if the resistor becomes scorched due to excessive heating.

4-3. *Voltage Tabulation*

The measurements of voltage shown on the following table are tabulated using a high-impedance vacuum tube voltmeter with a line voltage of 115 volts and the antenna disconnected. The control settings to be observed are as follows:

1. VOLUME control at zero.
2. Main tuning dial pointer at low frequency limit.
3. TONE control at zero.
4. MONITOR switch at On.

All voltages are measured between specified terminal and chassis.

TUBE TERMINAL	PIN	VOLTS ±15%
R.F. Amp. Grid	1	-.76
R.F. Amp. Plate	5	208

NATIONAL COMPANY, INC.

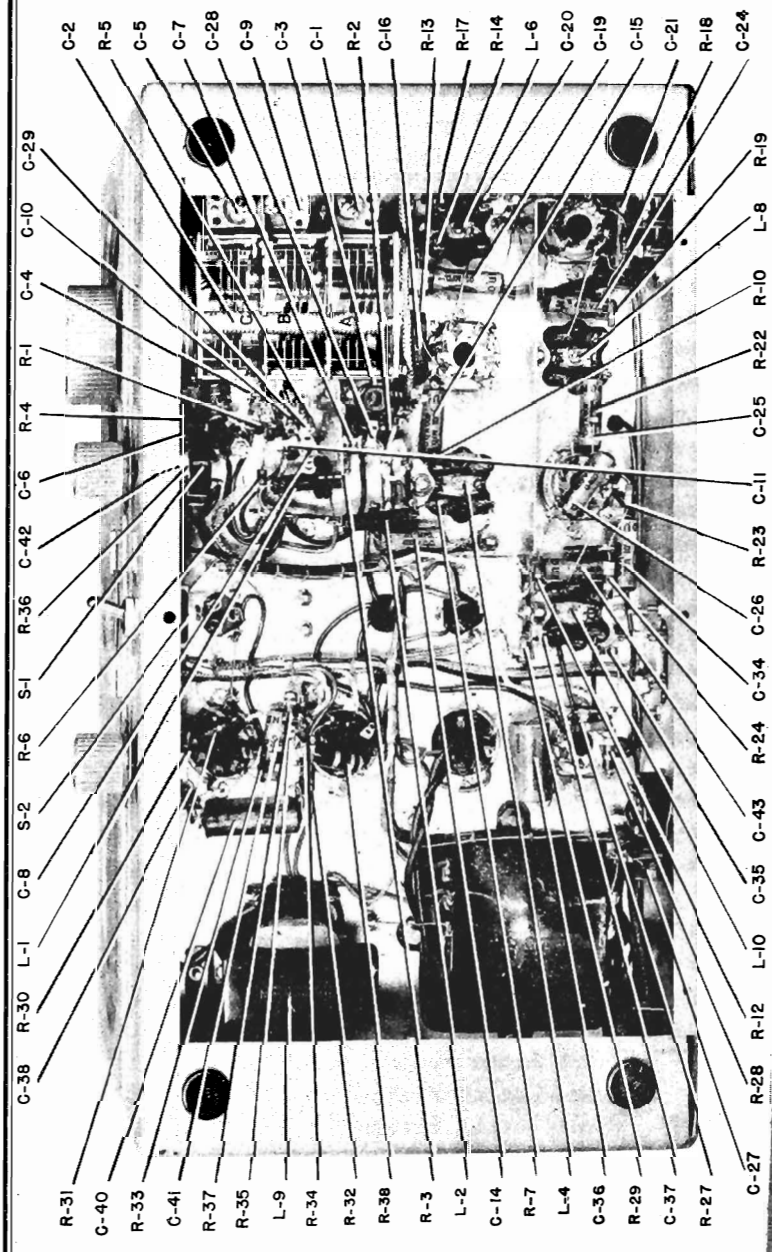

Figure No. 4. Bottom View of Receiver

The only electrical difference between the NC-108T, table model, and the NC-108R, rack model, is in the type of tuning indicator circuit used. The NC-108T employs a tuning eye tube, and the NC-108R employs a milliameter, for use as a visual tuning indicator.

The milliameter pointer on the NC-108R should be at the first scale marker with the Receiver turned on and with no signal input. If correction is required it is made by the screw-adjustment on the bezel of the meter.

Figure No. 5. Schematic Diagram NC-108 Receiver

MODELS NC-108R, NC-108T

NATIONAL COMPANY, INC.

ADDENDA
NC-108 Receiver

1. A DE-EMPHASIS switch is mounted on the top side of the receiver chassis to the right of the power transformer. In the ON position, the de-emphasis circuit, R-29 and C-37, in the NC-108 functions in a manner to remove from the incoming signal the pre-emphasis (over-emphasis of the higher frequency tones) that is ordinarily imposed on the signal at the transmitter. The listener will, therefore, enjoy reproduction approaching "live" programs. In the OFF position, the DE-EMPHASIS switch alters the de-emphasis circuit in the NC-108 and the pre-emphasis on the signal is, for the most part, retained resulting in reproduction in which the higher frequency tones are over-emphasized.

In operation of the NC-108 the listener should select the position of the DE-EMPHASIS switch which provides, for him, the most enjoyable range of frequency tones. For example, if the NC-108 is used with an external amplifier-loud-speaker, either of which has a tendency to subdue the higher frequency tones, setting the DE-EMPHASIS switch at OFF will result in more realistic reproduction. The action of the TONE control is the same as described in paragraph 2-1 of Section 2, except that the range of the control will depend on the setting of the DE-EMPHASIS switch.

Schematically, the DE-EMPHASIS switch is an S.P.S.T. type and is connected between the ground side of capacitor, C-37, and chassis.

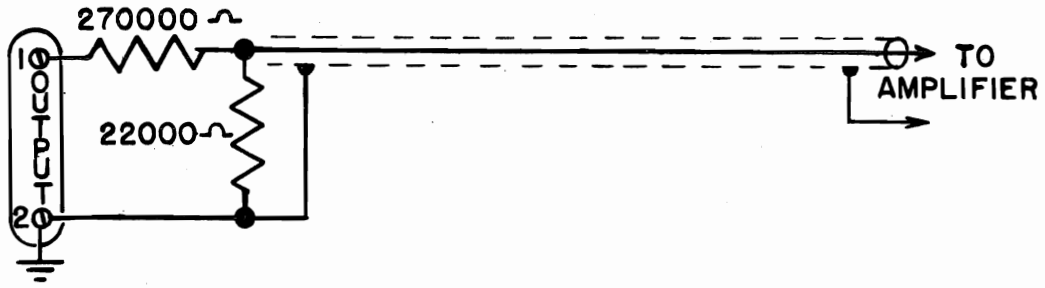
2. The coupling capacitor, C-8, is connected directly to the grid of the mixer tube instead of to the tap on the mixer coil as shown on the Schematic Diagram.

3. The output impedance of the NC-108 is approximately 150,000 ohms and approximately 11 volts, maximum, of undistorted output is available at the output terminals. Most amplifiers have high-impedance input circuits so that the NC-108 will work efficiently with such an amplifier without the use of a matching transformer. The 11 volts of output is more than ample, as the average amplifier requires approximately one volt for operation.

When using the NC-108 with an external amplifier, it is recommended that the interconnection be made using a low-loss shielded cable with a length not exceeding 10 feet and preferably as short as possible. This recommendation is made to prevent the attenuation of high frequency tones due to the capacity of the interconnecting cable.

However, if the NC-108 is to be used in an installation requiring a cable longer than 10 feet, a voltage divider network connected across the output terminals of the NC-108 will compensate for the resulting loss of high-frequency tones due to the longer cable. This network will result in an output with less gain at the NC-108 but this loss in gain can be tolerated when using a high gain amplifier.

The following drawing illustrates the method and components used to install the voltage divider network.



1. *Operating Instructions*

Operating instructions for the NC-183 Receiver are presented here in a non-technical manner to enable those persons not familiar with a communications-type Receiver to operate the NC-183 efficiently with a minimum of effort. To obtain the maximum in listening pleasure it is recommended that these two pages are thoroughly read before operation of the NC-183 is attempted, although no damage to the Receiver can result through improper adjustment of controls. Installation instructions have been intentionally omitted here because it is recommended that an experienced technician install the NC-183. However, in the event that an inexperienced person must, of necessity, install the Receiver, adhering to the instructions given in Section 2-3 of this Instruction Manual will enable him to do so.

The illustration on this page, identifying and locating Receiver controls, shows the operating procedure to follow in the proper sequence. This same procedure follows with a brief explanation of what each control does. The reader should refer to Section 3 of the Instruction Manual if more detailed and technical information is desired. To tune the Broadcast and Short Wave bands the operating instructions are as follows:

1. Set the SEND-RECEIVE switch at RECEIVE. The SEND position of this switch silences the Receiver for a period of time after which immediate resumption of reception may be had by setting the switch at RECEIVE.

2. Set the A.V.C.-M.V.C. switch at A.V.C. Automatic Volume Control is provided when this switch is in the A.V.C. position to compensate for fluctuating volume due to fading.

3. Set the RADIO-PHONO switch at RADIO. The PHONO position of this switch is used when a record player or similar device is connected to the Phono Input jack at the rear of the Receiver.

4. Turn A.F. GAIN control to 5. Adjustment of the audio volume is made with this control from a minimum at 0 to a maximum at 10. The setting given here is for average volume and should be adjusted to suit the listener.

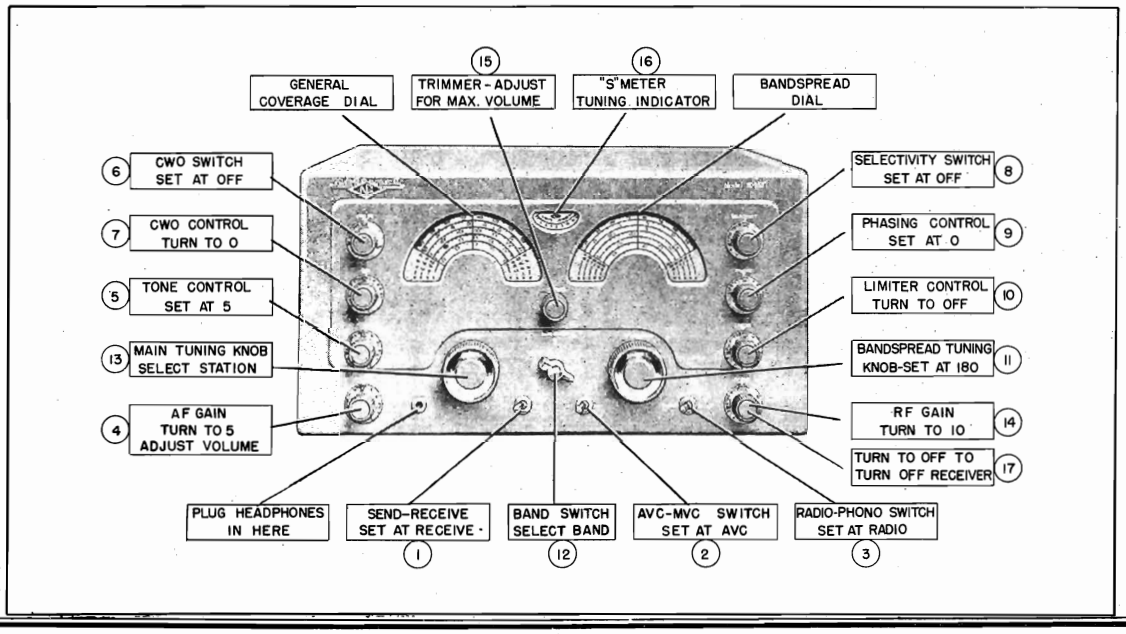
5. Set the TONE control at 5. A variable selection of tonal output from a bass tone at 0 to a tone at 10 in which the highs are predominant is provided by this control. The setting recommended here will give a normal tonal output but may be changed for different types of programs.

6. Set the C.W.O. switch at OFF. This switch is used only for the reception of code signals.

7. Turn the C.W.O. control to 0. This control is used only for the reception of code signals and does not effect receiver performance with the C.W.O. switch at OFF.

8. Set the SELECTIVITY switch at OFF. This switch is generally used only when interference by other stations is encountered. Its operation is somewhat complex and is not recommended for the inexperienced operator. See Section 3 for detailed instructions.

9. Turn the PHASING control to 0. The PHASING control is used in conjunction with the



SELECTIVITY switch.

10. Turn the LIMITER control to OFF. Reduction of interference caused by static, automobile ignition, etc., can be effected by turning on the LIMITER. Its action is increasingly effective as the control is turned towards 10.

11. Turn the BANDSPREAD tuning dial knob to the set mark at 180 on the linear scale of the BANDSPREAD dial. The BANDSPREAD dial knob and scale should be kept at the above setting when the MAIN TUNING dial knob and scale are used. However, the BANDSPREAD dial may be rotated to either side of the set mark if fine tuning is preferred for Short Wave or Amateur bands.

-NOTE-

The operator is now ready to adjust the tuning controls to select the desired station. Let us, for example, suppose that the desired station is one on the Broadcast band at 1,000 kilocycles.

12. Set the BAND SWITCH at E. The BAND SWITCH selects the band of frequencies to be tuned and is marked with designating letters which correspond to the markings at the edges and throughout the dial scales.

13. Turn the MAIN TUNING dial knob to set the pointer on the GENERAL COVERAGE dial at 1.0 on the E band. Stations on the GENERAL COVERAGE dial scale are selected by means of this control.

14. Turn R.F. GAIN control to 10. This is a dual-purpose control; when turned from A.C. OFF to ON the Receiver is turned on; when turned from 0 to 10 the sensitivity (ability to receive weak and distant stations) is progressively increased to a maximum at 10.

15. Adjust the TRIMMER control for maximum volume. After a station has been tuned in, adjust this control for best reception.

16. S-METER. Maximum deflection of the meter pointer indicates the dial and TRIMMER control setting for optimum tuning.

17. Shutting off the Receiver. To shut off the Receiver, turn the R.F. GAIN control to OFF. This is the only adjustment which completely shuts off the Receiver and the only one which need be made.

2. *Frequency Coverage*

The GENERAL COVERAGE dial has five scales; four of which are calibrated directly in megacycles and the other has a linear scale numbered 0 to 200. All markings of the Standard Broadcast Band, E, are bright red for clear identification. The other three scales have red letters throughout their range for band identification plus heavy black underlines locating short-wave features marked F, A, and P indicating Foreign, Amateur and Police bands, respectively. The BAND SWITCH positions are also marked with band letter designations to correspond to the markings at the edges and throughout the dial scales. Newspapers and other publications sometimes give the frequency of stations in kilocycles, and as the dial scales of the NC-183 are calibrated in megacycles conversion from kilocycles to megacycles will facilitate location of the station on the Receiver dial. This is done by pointing off three places to the left of the decimal point on the kilocycle figure, i.e., 1,000. kilocycles becomes 1.0 megacycles.

The following table lists each band by its designating letter and the frequency coverage of that band. The frequencies are listed in both megacycles and kilocycles. Also listed are the frequencies of short-wave features to be found on the various bands.

BAND	FREQUENCY COVERAGE		POLICE	INT. B'DCAST	AMATEUR
	Megacycles	Kilocycles	Megacycles	Megacycles	Megacycles
B	12.0 - 31.0	12,000 - 31,000		15.1 - 15.3 17.7 - 17.9 21.5 - 21.7	14.0 - 14.4 21.0 - 21.5 27.160 - 27.430 28.0 - 29.7
C	4.3 - 12.0	4,300 - 12,000		6.0 - 6.2 9.5 - 9.7 11.7 - 11.9	7.0 - 7.3
D	1.6 - 4.3	1,600 - 4,300	1.6 - 1.8 2.25 - 2.5 2.7 - 2.85		3.5 - 4.0
E	0.54- 1.6	540 - 1,600			

SECTION 1. DESCRIPTION

1-1. *General*

The new NC-183 is a deluxe Radio Receiver featuring performance and versatility "plus". Two R.F. stages give the NC-183 that extra measure of sensitivity and image rejection so often needed to insure uninterrupted reception. A double-diode noise limiter, effective on both phone and code reception, minimizes interference caused by external noise pulses. The selectivity characteristic of the NC-183 is adjustable over a wide range from broadband broadcast requirements to sharp amateur single-signal reception. Voltage regulated high-frequency and beat frequency oscillator circuits assures a minimum of frequency drift for both phone and code reception. Other highlights are an accessory connector socket, a push-pull audio output stage and an S-Meter, with a semi-permanent sensitivity adjustment, for signal strength readings of both phone and code signals.

The NC-183 provides reception of phone and code signals over its entire frequency range of 540 kcs. to 31 mcs. and 48 to 56 mcs. Calibrated bandspread tuning is furnished for the main amateur bands i.e., 6, 10-11, 20, 40 and 80 meters. Separate directly-calibrated dial scales with associated controls are used for general coverage and bandspread tuning.

1-2. *Circuit*

The NC-183 utilizes 14 tubes, plus a voltage regulator and rectifier, in a superhetrodyne circuit featuring circuit refinements such as two R.F. amplifier stages, a separate A.V.C. amplifier, a double-diode noise limiter and a push-pull audio output stage.

The circuit employed on all bands consists of two stages of radio frequency amplification, a first detector and separate stabilized high frequency oscillator, two intermediate frequency amplifier stages, a diode type second detector, an audio limiter, a high gain audio stage, a phase inverter and a push-pull audio output stage. The remainder of the Receiver includes automatic volume control, beat frequency oscillator, voltage regulator and rectifier circuits. The crystal filter is connected between the first detector and first I.F. stages.

1-3. *Tube Complement*

The NC-183 is supplied complete with tubes which are tested in the Receiver at the time of alignment.

The tubes employed are as follows:

First R.F. Amplifier	6SG7
Second R.F. Amplifier	6SG7
First Detector	6SA7
H.F. Oscillator	6J5
First I.F. Amplifier	6SG7
Second I.F. Amplifier	6SG7
Second Detector-A.V.C. Detector	6H6
A.V.C. Amplifier	6AC7
Beat Frequency Oscillator	6SJ7
Noise Limiter	6H6
First Audio	6SJ7
Phase Inverter	6J5
Audio Output (2)	6V6GT/G
Voltage Regulator	OD3/VR-150
Rectifier	5U4G

1-4. *Tuning System*

The main tuning capacitor C-3 and the bandspread tuning capacitor C-4 are connected in parallel on all bands. Separate knobs with associated dial scales are used to operate these two capacitors to tune the frequency range of the Receiver in five bands as follows:

BAND	GENERAL COVERAGE	BANDSPREAD
A		48 - 56 Mc.
B	12 - 31 Mc.	27 - 30 Mc.
		14.0- 14.4 Mc.
C	4.3 - 12 Mc.	7.0- 7.3 Mc.
D	1.6 - 4.3 Mc.	3.5- 4.0 Mc.
E	0.54 - 1.6 Mc.	

As will be noted from the above table calibrated bandspread tuning is provided for the 6, 10-11, 20, 40 and 80 meter ama-

teur bands. This tuning system is extremely flexible, in that bandspread tuning may be employed to tune any portion of any band in the 540 kcs. to 31 mc. range.

Band changing is accomplished by means of a highly efficient bandswitch.

Tuning of the first R.F. stage on all bands can be readily adjusted to compensate for a wide range of antenna loading conditions by means of the front panel mounted antenna compensating capacitor.

1-5. *Noise Limiter*

A new concept in noise limiter design is employed in the NC-183 Receiver. This new limiter could be termed "double action plus" and the noise limiting action is equally effective whether receiving phone or code signals (C.W. oscillator On or Off). A threshold control on the front panel permits adjustments of the level at which limiting action starts.

1-6. *Crystal Filter*

The selectivity characteristic of the NC-183 is made adjustable by means of a crystal filter. This crystal filter is newly designed and incorporates features which make it highly flexible in its adjustments and superior in performance. The crystal filter provides uniform selectivity variation from the broad off position to the sharp number 5 position as well as phasing action for the attenuation of interfering signals.

1-7. *Signal Strength Meter*

An S-Meter for signal strength readings is associated with the A.V.C. circuit. The S-Meter scale is calibrated in S units from 1 to 9 with approximately 5 db per S unit and in db above S9 from 0 to 40 db. An adjustment is provided to enable the operator to change the above calibration if he so desires. For the purpose of comparing strong signals, which cause the S-Meter to read off-scale, with other weaker signals the sensitivity of the S-Meter may be lowered by retarding the R.F. GAIN control. The "no signal" S-Meter reading does not require adjustment.

1-8. *Accessory Connector Socket*

A standard octal socket is mounted on the receiver chassis wired in a manner to permit connection of various accessories such as a narrow-band F.M. adaptor, crystal calibrator, etc. The drawing of the Accessory Connector Socket on the Schematic Diagram shows the various connections made to the pins of this socket and the voltages available. It will be noted that B+ and filament voltages are made available at this socket.

1-9. *Tone Control*

The tonal output of the NC-183 Receiver may be varied to suit the listener by means of the TONE Control. This control is helpful when receiving weak signals through interference.

1-10. *Antenna Input*

Antenna input terminals are provided at the rear of the Receiver. The input circuit is suitable for use with a single wire antenna, a balanced feed line or a low impedance (70 ohm) concentric transmission line. The average input circuit impedance is approximately 300 ohms.

1-11. *Audio Output*

Two audio output circuits are provided:

(1) The audio output leads are brought to the 3 prong output socket, at the rear of the Receiver, having both 8 and 500 ohm terminals and a common ground terminal. The loud-speaker furnished with the NC-183 is fitted with a cable and plug to connect to the 8 ohm terminal on the output socket, the 500 ohm terminal being available for connection to a 500 ohm line. Approximately 8 watts of undistorted audio output power is available at the output socket while the maximum power is 11 watts.

(2) A headphone jack is front-panel mounted and is wired so as to silence the loud-speaker on the insertion of a phone plug. The headphone load impedance is not critical allowing a wide range of headphone types to be used. If greater audio output is desired the headphone jack connection at terminal No. 2 on the audio output transformer (the 8 ohm tap) may be connected to terminal No. 3 (the 500 ohm tap).

1-12. *Phono Input Jack*

A phono input jack is mounted at the rear of the Receiver and can be used to

connect auxiliary apparatus, such as a record player, to the audio system of the Receiver. This input circuit is high impedance and feeds into the 6SJ7 first audio amplifier stage.. The RADIO-PHONO switch on the front panel must be at the Phono position when the phono input jack is used. The AUDIO GAIN and TONE controls are operative with this connection.

Most record players are terminated in a single shielded wire. The phono input jack on the NC-183 is the type that accomodates a phono tip plug and if the record player to be used is not fitted with such a plug one can be easily attached. If the output circuit of the record player is low impedance (less than 100,000 ohms) better results will be obtained if a suitable resistor, with a value as specified for the particular record player, is connected across the phono tip plug to properly load the record player output circuit.

1-13. *Power Supply*

The NC-183 Receiver is designed for operation from a 110/120 volt or 220/240 volt 50/60 cycle power source. The Receiver is shipped from the factory with the power transformer wired for 110/120 volt operation only. A few simple wiring changes in the dual primary circuit of the power transformer are necessary to change the NC-183 for 220/240 volt operation. These changes are made directly on the power transformer terminal lugs and are as follows:

(a) Remove the jumper between terminals 4 and 6 and between 5 and 7.

(b) Connect a jumper between terminals 5 and 6. A drawing of both possible primary circuits is shown on the Schematic Diagram.

Normal power consumption is approximately 125 watts. The built-in power unit supplies all voltages required by the heater and B supply circuits--130 milliamperes at 280 volts and 5.1 amperes at 6.3 volts, respectively. A 2 ampere fuse is connected in one side of the A.C. input line to protect the receiver circuits against any voltage surges in the power line or short circuits in the Receiver. This fuse is mounted in an extractor post at the rear of the Receiver and is easily removed for examination or replacement.

1-14. *Loud-Speaker*

The loud-speaker supplied with the NC-183 is a 10 inch permanent magnet field type and is mounted in a cabinet finished to match the Receiver. The loud-speaker impedance is 8 ohms and the attached plug connects to the 8 ohm Receiver output circuit.

SECTION 2. INSTALLATION

2-1. *Arrangement*

The Receiver and loud-speaker may be arranged in any desired position although it is not recommended that the loud-speaker be placed on top of the Receiver as undesirable "microphonics" may result.

2-2. *Antenna Recommendations*

The antenna input circuit of the Receiver is arranged for operation from either a single-wire antenna, a doublet antenna or other types having impedances of 70 ohms or more. The antenna terminal strip, at the rear of the Receiver, has three terminals, two are for antenna connections and the other for a ground. The ground terminal has connected to it a metal link which is used to ground one antenna lead as necessary. With balanced antenna systems, such as the doublet type, the metal link is not used. With an unbalanced system, such as the single-wire antenna, it is desirable to ground the unused antenna terminal by means of the metal link. For an unbalanced system of the concentric transmission line type, it is recommended that the outside of the concentric line be grounded directly to the ground lug below the antenna terminal strip. The external ground connection to the ground lug below the antenna terminal strip should be maintained at all times.

The most practical antenna for use in installations where the Receiver is to be used over a wide range of frequencies is the single wire type. An antenna length of from 50 to 100 feet is recommended. The

antenna lead-in should be connected to one antenna terminal and the metal link used to ground the other terminal.

For best impedance matching to the antenna input circuit, an antenna with a 70 to 300 ohm transmission line is recommended. If a doublet type with a 70 to 300 ohm balanced transmission line is used the metal grounding link should not be used. For optimum results the antenna should be cut to the proper length corresponding to the desired operating frequency. See Fig. No. 1. It must be remembered that an antenna installation of this type will have maximum efficiency over a narrow band of frequencies near the frequency for which the antenna was designed and will be most useful in installations where the Receiver is tuned to one frequency or narrow band of frequencies. For other frequencies it would be desirable to connect the two transmission line leads together at one antenna terminal and the metal link used to ground the other terminal. The antenna is thus utilized as a single wire type.

In an installation where the Receiver is to be used as the receiving unit in a transmitting station, the most efficient operation will usually result from use of the transmitting antenna as a receiving antenna also. This is especially true if the transmitting antenna is of the multi-element, directional type as the same antenna gain is available for both receiving and transmitting--a very desirable condition. For switching the antenna from transmitter to receiver, an antenna change-over relay with good high-frequency insulation is recommended. A second relay for controlling the transmitter plate supply and the Re-

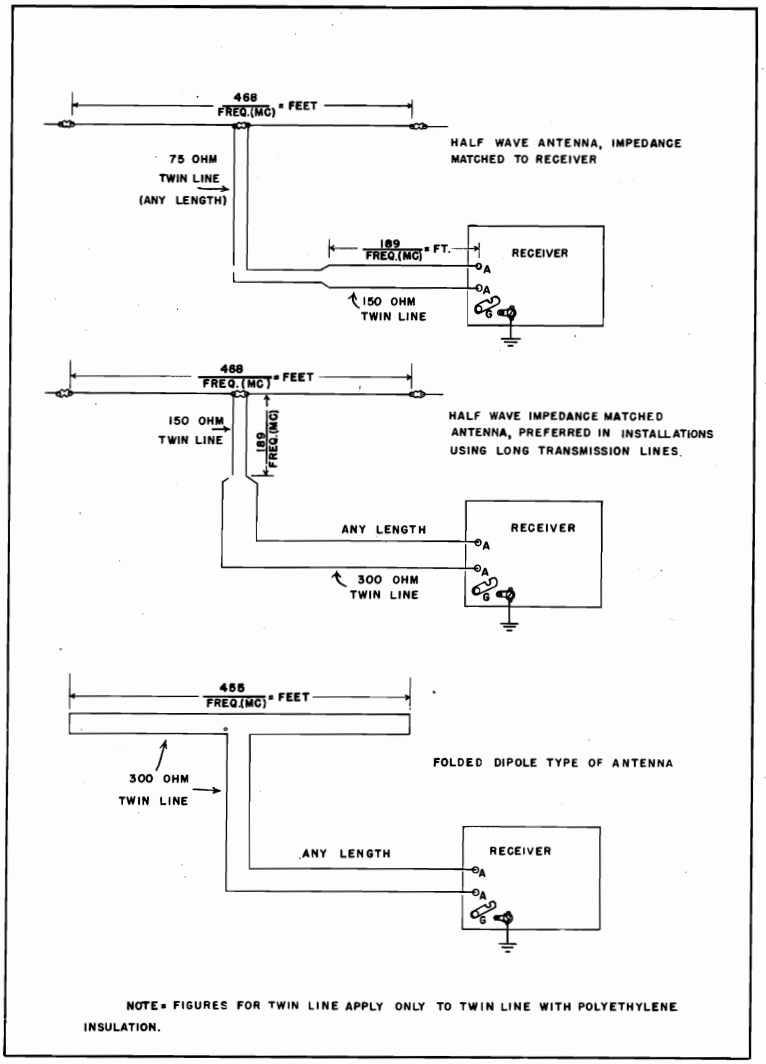


Figure No. 1. Typical Antenna Installations

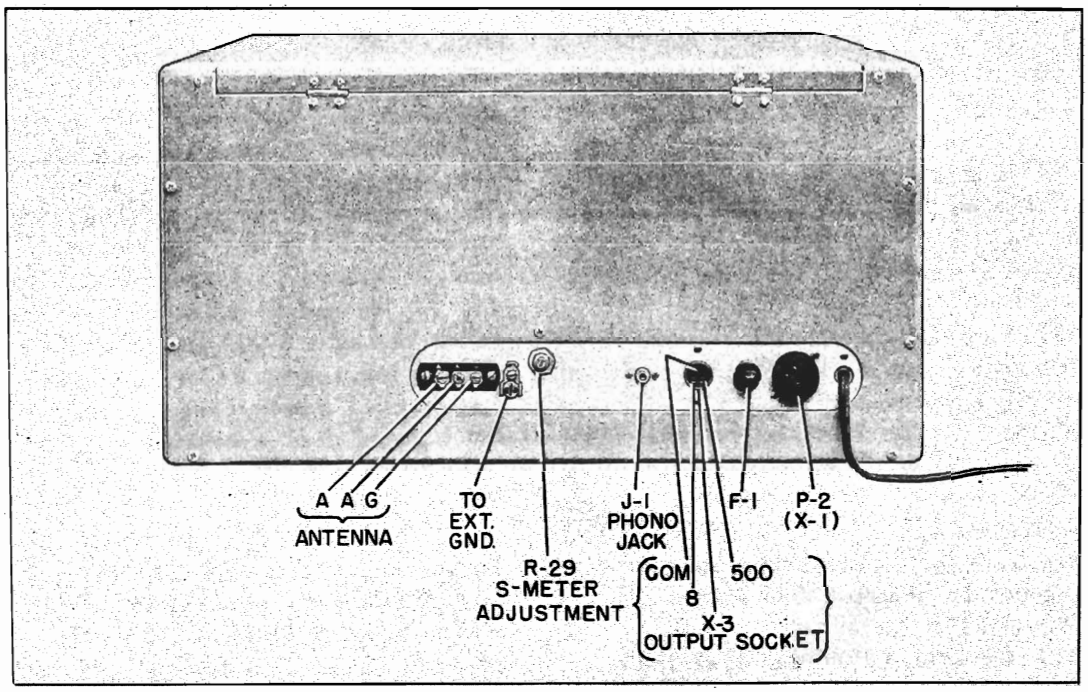

Figure No. 2. Rear View of Receiver

ceiver B+ circuit may be used to achieve single-switch control of the station. This second relay should be a double pole, single throw type having one normally open pair of contacts and one normally closed pair of contacts.

2-3. *Installation Procedure*

After unpacking the Receiver and Speaker procede as follows:

(1) Seat A.C. jumper plug and all tubes firmly in their sockets.

(2) Insert the loud-speaker plug into the three pin output socket at the rear of the Receiver.

(3) Connect a good external ground to the screw-type lug located at the rear of the Receiver below the antenna terminal strip.

(4) Connect the antenna as recommended in paragraph 2-2.

(5) Connect the power cord to a 115 volt, 50/60 cycle AC source of supply.

(6) Set controls as recommended in Section 3 for reception of signals.

-NOTE-

Where the Receiver is located in the field of a relatively powerful transmitter, it is advisable to provide some means of preventing damage to the Receiver antenna coil. If a separate receiving antenna is used, a means for disconnecting or grounding the antenna during transmission periods should be provided.

2-4. *Battery Operation*

The NC-183 may be operated in portable or emergency service by connecting batteries to the terminals of the power socket located at the rear of the Receiver. An octal plug, similar to the A.C. jumper plug, may be wired and used for interconnection between batteries and Receiver. The battery plug used must be wired in accordance with the drawing shown on the Schematic Diagram. A 6 volt heater supply (storage battery) should be connected to terminals 3 and 5 and 135 to 250 volt "B" supply connected to terminals 4 and 8. The recommended "B" voltage supply for battery economy is between 135 and 180 volts. At voltages between 135 and 150 the voltage regulator tube will not ignite affecting a further battery economy. For stand-by operation in all cases it is recommended that a switch be placed in the battery B+ lead for increased battery economy as the "B" switch on the Receiver does not open the B supply circuit to the H.F. oscillator, voltage regulator, and push-pull audio output tubes. A suggested refinement is to include a switch in the A+ lead so that the tube heaters may be turned off when the Receiver is not in use without the necessity of removing the battery plug from the battery socket.

SECTION 3. OPERATION

3-1. *Controls*

All controls are identified by front panel markings for ease of identification. The controls are located in a symmetrical manner and are arranged for ease of operation.

The five positions of the BAND SWITCH are marked with identifying band letters plus numerical identification of the Amateur bands covered on the BANDSPREAD dial scale. These identifying markers correspond to the markers on the dial scale escutcheons. The BAND SWITCH does not have any limit stops so that band changing may be accomplished with a minimum of BAND SWITCH turning.

The GENERAL COVERAGE dial knob operates the main tuning capacitor and turns the main dial scale through a combination pinch drive and anti-backlash gear train. The main dial has five scales; four of which are calibrated directly in frequency, the other having a 0-200 linear scale for auxiliary logging purposes. The main dial escutcheon is marked with frequency limits in megacycles and band letter designations identifying each scale on the dial.

The BANDSPREAD tuning dial knob operates the bandspread tuning capacitor and turns the bandspread dial scale through a combination pinch drive and anti-backlash gear train which is similar to that used for general coverage tuning. The bandspread dial has six scales; five of which are calibrated in frequency for the 6, 10-11, 20, 40 and 80 meter Amateur bands, the other having a 0-200 linear scale for bandspread logging on other than the frequency calibrated bandspread frequencies. The bandspread dial escutcheon is marked with identifying band letters and amateur band designation for each scale.

The TRIMMER control operates a tuning capacitor which is connected across the first R.F. amplifier section of the main tuning capacitor. The TRIMMER control is used to tune the first R.F. amplifier stage properly under a wide variety of antenna loading conditions.

The R.F. GAIN control adjusts the amplification of the R.F. and I.F. amplifier stages. Clockwise rotation of the control (towards 10) increases Receiver gain. The A.C. POWER switch is associated with the R.F. GAIN control and A.C. power is turned ON as the R.F. GAIN control is advanced from A.C. OFF to 0 on the scale.

The A.F. GAIN control adjusts the

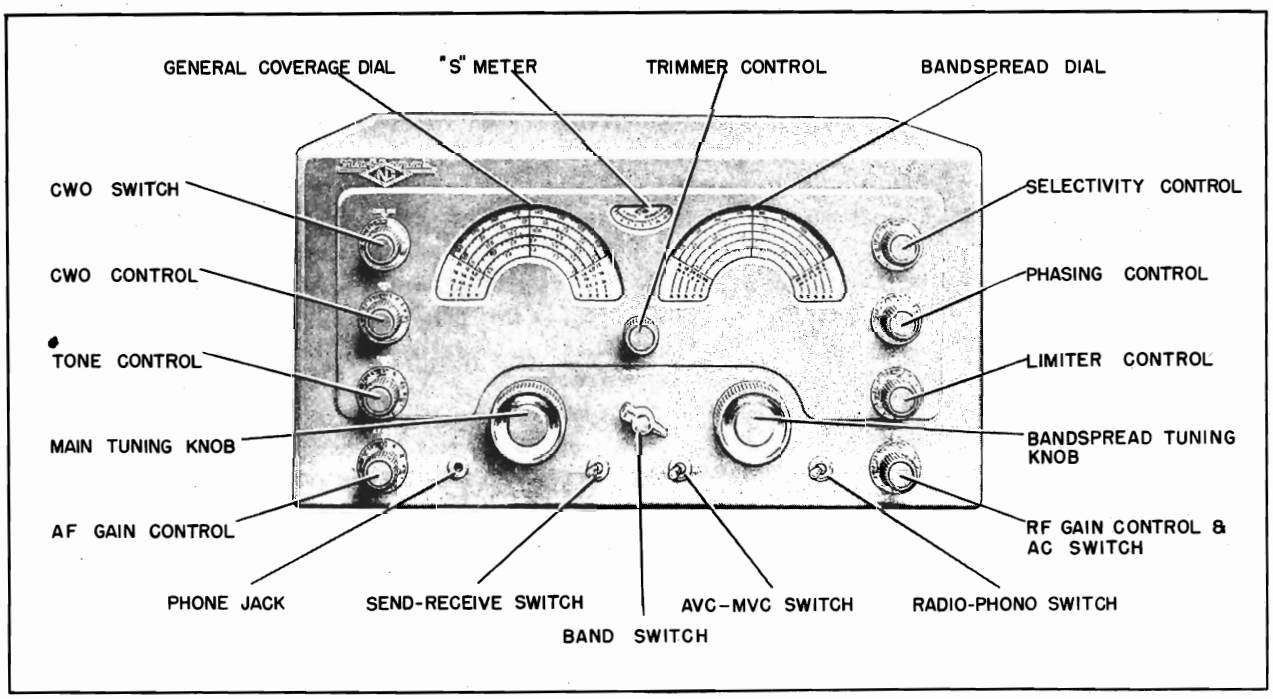

Figure No. 3. Front View of Receiver

amount of audio voltage applied to the first audio tube. Clockwise rotation of the control (towards 10) increases the audio output power of the Receiver. The A.F. GAIN control is operative when an audio signal is applied to the PHONO input jack.

The LIMITER control is used to switch the limiter into the circuit and also to adjust the threshold at which limiting action starts. The limiter is turned ON as the LIMITER control is advanced from OFF to 0 and the threshold is lowered as the control is advanced towards 10. Any noise peak voltages in excess of this adjustable threshold are prevented from reaching the audio amplifier. The limiter circuit is the double-diode type and is equally effective for both phone or code reception.

The TONE control is used to vary the frequency characteristic of the audio output of the Receiver. Turning this control towards 0 on its scale increasingly attenuates the higher frequencies.

The C.W.O. SWITCH and C.W.O. control are only used for the reception of radiotelegraph code signals. The C.W.O. SWITCH is used to turn the C.W. oscillator ON and the C.W.O. control is used to adjust the pitch of the C.W. note. At zero on the C.W.O. scale the C.W. oscillator is tuned to the intermediate frequency of the Receiver.

The PHASING and SELECTIVITY controls adjust the operation of the crystal filter. Receiver selectivity is made progressively sharper as the SELECTIVITY control is turned from OFF towards 5 on its scale. The PHASING control is inoperative with the SELECTIVITY control in the OFF position. The PHASING control is used to attenuate interfering signals and is connected in a bridge circuit so that the bridge can be balanced to reject the undesired signal.

The SEND-RECEIVE switch is used to quiet the Receiver during transmission periods or other times when it is desirable to resume reception immediately (not having to wait for the tubes to warm up). The SEND-RECEIVE switch is connected in the B circuit. See Section 2-4 for use of this switch in battery operation. The SEND-RECEIVE switch should not be used to silence the Receiver after the completion of an operating period.

External (remote) stand-by control of the Receiver may be accomplished by connecting a switch or relay to terminals 1 and 4 of the A.C. jumper plug as shown on the Schematic Diagram. This is a parallel arrangement permitting the SEND-RECEIVE switch to remain operative with the external switch or relay in the circuit.

The A.V.C.-M.V.C. switch is used to adjust the Receiver for either Automatic Volume Control or Manual Volume Control operation. Automatic Volume Control can be used for either phone or code reception. The A.V.C. time constants have been adjusted so that receiver gain does not change appreciably during average code speed reception.

The RADIO-PHONO switch is set at the Phono position when it is desired to use the audio system of the NC-183 in the event a record player or similar apparatus is connected to the Phono Input jack. In the Phono position all receiver circuits but the audio are rendered inoperative; the AUDIO GAIN and TONE controls remain operative. If it is so desired the record player may remain connected to the Receiver and normal receiver operation resumed by setting the RADIO-PHONO switch at Radio.

The screw-type adjustment at the rear of the Receiver is provided to allow the operator to adjust the sensitivity of the S-Meter. The S-Meter is calibrated at National laboratories so that approximately 50 microvolts equals S-9 and roughly 5,000 microvolts equals 40 db above S-9.

3-2. *Phone Reception*

After the equipment is properly installed, as outlined in Section 2, it is placed in operation for the reception of phone signals by adjusting the receiver controls as follows:

1. Set the SEND-RECEIVE at Receive.
2. Set the RADIO-PHONO switch at Radio.
3. Set the A.V.C.-M.V.C. switch at A.V.C.
4. Turn the C.W.O. switch to OFF.
5. Set the SELECTIVITY control at OFF.

6. Set the PHASING control at 0.
7. Set the LIMITER control at OFF.
8. Advance the R.F. GAIN control to a point between 8 and 10.
9. Set the A.F. GAIN control at the point providing the desired audio volume.
10. Adjust the TONE control to give the desired audio characteristic.

The Receiver is now adjusted for the reception of phone signals and will tune to the frequency indicated by the tuning dial and band switch settings. Set the TRIMMER control for maximum S-Meter reading after the desired station has been selected, or alternately in the absence of a signal the TRIMMER may be set for maximum receiver background noise.

The tuning system in the NC-183 is arranged for ease of operation and accuracy of calibration. However, it is necessary that the proper settings of the GENERAL COVERAGE and BANDSPREAD dials be observed to maintain accuracy of calibration. For all general coverage tuning the BANDSPREAD dial must be at the 'Set" mark appearing at approximately 180 on the linear scale. For bandspread tuning the GENERAL COVERAGE dial must be set at the proper point corresponding to the Amateur band being tuned. The various "set points" are marked directly on the GENERAL COVERAGE dial scale and are clearly indicated by a circular marker containing the Amateur band designation. The following table lists the location of the GENERAL COVERAGE dial settings for bandspread tuning of the Amateur bands:

AMATEUR BAND	GENERAL COVERAGE DIAL SETTING
6	198 on linear scale
10-11	30.0 Mc.
20	14.4 Mc.
40	7.3 Mc.
80	4.0 Mc.

Tuning of the 6 meter band is accomplished by use of the BANDSPREAD dial only.

The BAND SWITCH setting determines the band of frequencies which the Receiver will tune at any one time.

With the A.V.C-M.V.C. switch set at the A.V.C. position, the R.F. GAIN control should be advanced as far as receiving conditions permit. However, if background noise proves objectionable, the R.F. GAIN control may be retarded to approximately 6 or 7 to reduce the level of background noise. The operator must remember that automatic volume control action will be restricted unless the R.F. GAIN control is fully advanced. Audio output should be adjusted entirely by means of the A.F. GAIN control.

The A.V.C.-M.V.C. switch may be set at the M.V.C. position to provide increased sensitivity in some cases. With such a setting the operator must be careful not to advance the R.F. GAIN control to a point where I.F. or audio amplifier overload occurs. Such overload is indicated by distortion. In general, the A.F. GAIN control may be set at a fixed position, approximately 5, and the R.F. GAIN control used to adjust the audio volume.

If a signal is weak and partically obscured by background noise and static, best signal-to-noise ratio will be obtained by turning the TONE control toward 0 on its scale. The most effective setting must be determined by trial as too much attenuation of the higher audio frequencies may not prove desirable.

When a signal is accompanied by static peaks or noise pulses of high intensity and short duration, the best signal-to-noise ratio will be obtained by turning the LIMITER control ON and advancing it as necessary. The optimum setting can only be determined by trial as too much limiter action may impair the audio quality.

The selectivity of the Receiver is adjusted by means of the crystal filter SELECTIVITY control. The normal setting of the SELECTIVITY control in phone reception is at one of the positions affording broad selectivity. Positions marked OFF, 1 or 2 are recommended. Selectivity may be progressively increased by turning the SELECTIVITY control to positions 3, 4 or 5. The evidences of increasing selectivity will be the attenuation of the higher frequency audio tones of the signal as well as sharper tuning. Increasing selectivity too much will attenuate these higher tones to such an extent that phone signals may become unintelligible.

The PHASING control is part of the crystal filter and is used to eliminate

or attenuate interfering heterodynes. The PHASING control is inoperative with the SELECTIVITY control in the OFF position but is operative at all other SELECTIVITY control settings. The normal setting of the PHASING control, with the crystal filter ON (SELECTIVITY control at 1,2,3,4 or 5), in phone reception is at 0 on the scale. If, after a signal has been tuned in, an interfering signal causes a heterodyne or whistle the PHASING control should be adjusted until interference is reduced to a minimum. The setting of the PHASING control which provides maximum attenuation of the heterodyne will depend on the pitch of the heterodyne whistle. If the heterodyne is below 1,000 cycles, the optimum PHASING control setting will be near one end of the scale or the other, depending upon whether the interfering signal has a higher or lower frequency than the desired signal.

3-3. *C.W. Reception*

The Receiver is placed in operation for the reception of C.W. signals in the same manner as that outlined for phone reception (Section 3-2) except that the C.W.O. switch should be set at ON and the C.W.O. control set at mid-scale. The C.W. code characters are made audible by the heterodyning action of the C.W. oscillator with the incoming signal. The frequency of the C.W. oscillator can be varied by rotation of the C.W.O. control.

The sensitivity of the Receiver should be adjusted by means of the R.F. GAIN control and the audio volume by means of the A.F. GAIN control. When receiving C.W. characters with slow keying or long pauses during keying it may be desirable to set the A.V.C.-M.V.C. switch at M.V.C. so that the receiver gain does not change during keying pauses. In this case, the A.F. GAIN control should be set at a fixed position, approximately 5, and the audio volume adjusted by means of the R.F. GAIN control. In either of the above cases care should be taken not to advance the R.F. GAIN control to a point where I.F. or audio amplifier overload occurs.

The action of the TONE and LIMITER controls will be similar to that described in Section 3-2. However, in C.W. reception it will be possible to advance these controls considerably further than is desirable in phone reception since any impairing of audio quality is relatively unimportant.

Turning the C.W.O. control to either side of zero will change the characteristic pitch of the receiver background noise thus providing a means of adjusting the audio beat note to the operator's preference. The pitch will become higher as the C.W.O. oscillator is detuned from the I.F. amplifier.

Crystal filter operation for C.W. reception is similar to that described for phone reception (Section 3-2) with the exception that it is possible to utilize maximum selectivity without the loss of audio quality experienced in phone reception. When maximum selectivity is employed, i.e., SELECTIVITY control at 5, tuning is very critical and care must be taken to assure proper tuning. When tuning across the carrier of a received signal the audio beat note is very sharply peaked at a definite audio frequency. The maximum response indicates the proper dial setting. The pitch of the beat note peak may be adjusted by use of the C.W.O. control to provide an audio tone pleasing to copy. With the Receiver tuned to "crystal peak" an interfering signal may be attenuated by proper setting of the PHASING control since this control does not appreciably affect the desired signal.

A distinct advantage in the reception of weak C.W. signals through interference can be realized by use of the "single-signal" properties of the NC-183 Receiver. The C.W. oscillator should be detuned until the pitch of the receiver background noise is roughly 2,000 cycles. Under this condition the audio beat note of any C.W. code signal will show a broad peak in output at approximately 2,000 cycles. This peak is easily found by rotating the tuning dial slowly through the carrier of a received signal. This peak will appear on one side of "zero beat" only and on the other side of "zero beat" the 2,000 cycle note will be considerably weaker. It should be noted that depending on the frequency of the interfering signal better receiving conditions will be obtained by detuning the C.W.O. on one side of zero rather than on the other. The best setting of the C.W.O. con-

trol can only be determined by trial settings on either side of zero until optimum results are obtained.

3-4. *Measurement of Signal Strength*

The S-Meter in the NC-183 Receiver furnishes a means for the measurement of signal strength of incoming phone or code signals. To utilize the S-Meter the following control settings must be observed: R.F. GAIN at 10, A.V.C.-M.V.C. at A.V.C. and SELECTIVITY at OFF. The TRIMMER control should be adjusted for maximum S-Meter reading after a signal has been tuned in. All other control settings will not affect the S-Meter readings.

In instances where a strong signal causes the S-Meter to read off-scale the S-Meter sensitivity may be lowered by retarding the R.F. GAIN control until an on-scale reading is obtained. Without disturbing the setting of the R.F. GAIN control the comparative strength of this strong signal may be compared with other signals.

The sensitivity of the S-Meter is adjusted as outlined in Section 1-7, to meet average operating conditions. The S-Meter sensitivity adjustment at the rear of the Receiver enables the operator to change the sensitivity to meet the needs of his own particular installation.

SECTION 4. SERVICE AND TEST DATA

4-1. *Tube Failures*

The partial or complete failure of a vacuum tube in the Receiver may reduce the sensitivity, produce intermittent operation, or cause the equipment to be completely inoperative. If tube failure is suspected all tubes should be checked in suitable tube testing equipment, or by replacement with tubes of proven quality. Care should be taken that any tubes removed for checking purposes be returned to their original sockets thereby reducing the necessity for realignment.

Tubes of the same type will vary slightly in their individual characteristics and this fact should be borne in mind when replacements become necessary. The high frequency oscillator and I.F. tubes should be chosen with care to select a replacement which most nearly approaches the characteristics of the original tube. A replacement high frequency oscillator tube can be readily checked by noting any change in dial calibration, particularly in the amateur bandspread bands. Substitution of new I.F. amplifier tubes may possibly alter overall gain and selectivity characteristics. Instructions for realignment are given in detail in Section 6-2.

4-2. *Circuit Failures*

All components parts in the NC-183 Receiver have been carefully selected to assure an ample factor of safety. Failure may occur in individual cases and the most common, excluding tubes, will probably be due to breakdown of a capacitor or resistor. Measurement of voltages in accordance with Section 4-4 will most likely indicate where failure has occurred. A bypass capacitor which has failed may cause overload of associated resistors. These resistors should be checked for any change in resistance value. An overloaded or shorted resistor will sometimes be evidenced by scorching or discoloration on the surface of the resistor. An open capacitor, often the cause of oscillation or loss of sensitivity, may be checked by temporarily connecting a good capacitor across it. Intermittently poor connections can usually be located by lightly tapping each part with a piece of insulating material.

4-3. *Stage Gain Measurements*

The sensitivity measurements listed below are made with the Receiver set up as specified in Section 3-2 except that the A.V.C.-M.V.C. switch must be set at M.V.C. and the A.F. GAIN control at 10. An output meter with an impedance to match the Receiver output circuit (8 or 500 ohms) should be connected to the output socket in place of the loud-speaker. A three-prong plug, similar to the loud-speaker plug, can be wired for connection of the output meter to the Receiver. It is important that the

proper output impedance matching be observed, i.e., 8 or 500 ohms depending upon which terminals of the output socket are used.

The high output lead of a signal generator should be connected through a 0.001 capacitor to the pin of the tube as specified in the following table and the ground lead connected to the receiver chassis. The signal generator should be adjusted to deliver a test signal of 455 Kc. plus or minus 2 Kc. either modulated or unmodulated.

The BAND SWITCH must be set at the mid-position between the A and E bands.

With 1 watt output at the audio output socket the test signal should be within the limits specified below:

TERMINAL	TEST SIGNAL
Mixer Grid	13± 3 Microvolts
First IF Grid	170± 30 Microvolts
Sec. Det. Grid	33,000± 6,000 Microvolts

4-4. *Voltage Tabulation*

All voltage measurements should be made using a high-impedance vacuum tube volt-meter. Readings taken with any other type of instrument will differ greatly from those shown on Figure No. 4. The control settings to be observed are shown on Figure No. 4. All voltages are measured between specified terminal and chassis.

SECTION 6. ALIGNMENT DATA

6-1. *General*

All circuits in the NC-183 Receiver are carefully aligned, before shipment, using precision test equipment insuring close conformability to the alignment frequency. No realignment of the various adjustments will be required, therefore, unless the Receiver is tampered with or damaged in transit.

The necessity for any realignment can be determined by checking the performance of the Receiver against its normal operation as outlined in Section 3. In no case should realignment be attempted unless tests indicate that such realignment is necessary. Even then, it must be remembered that the NC-183 is a communications Receiver and should not be serviced or realigned by any individual who does not have a complete understanding of the functioning of the equipment and who has not had previous experience adjusting a similar type of Receiver.

Before proceding with the alignment of any circuit in the Receiver, the equipment must be set up as specified in Section 2-3, except that the antenna lead-in and loudspeaker must be disconnected. An output meter having an 8 or 500 ohm resistive load should be connected to the matching terminal on the Receiver's output socket. If it is so desired a high-impedance A.C. voltmeter may be connected to the phone output jack and used in place of the output meter.

Alignment of the equipment may be divided into two major steps:

(1) I.F. and A.V.C. Amplifier Alignment.

(2) General Coverage and Bandspread Alignment.

(a) H.F. Oscillator

(b) First Detector and R.F. Amplifiers

The circuits must be tuned in the above order when complete alignment is required.

6-2. *I.F. and A.V.C. Amplifier Alignment*

The intermediate frequency of the NC-183 Receiver is 455 kilocycles, plus or minus 2 kilocycles. The exact frequency is determined by the quartz crystal resonator Y-1.

The I.F. transformers, crystal filter, A.V.C. amplifier and C.W. oscillator transformers all have individual permeability-tuned iron core inductors with screw-type adjustments for alignment purposes. These adjustments are located on Figure No. 5.

The preliminary alignment procedure is as follows:

(1) Connect the high output lead of an accurately calibrated signal generator to the stator portion of the detector section of the main tuning capacitor C-3C and the grounded lead to any convenient grounded point on the chassis. This is a direct connection, no dummy antenna being required.

(2) Set the C.W.O. switch at ON.

(3) Set the A.V.C. switch at M.V.C.

(4) Set the PHASING control at 0.

(5) Set the SELECTIVITY control at 5.

(6) Set the A.F. GAIN control at 10.

(7) Set the R.F. GAIN control at 10.

(8) Turn the modulation of the signal generator off to provide a steady C.W. test

signal.

Adjust the output attenuator of the signal generator to provide a signal of approximately 100 microvolts and vary the tuning control of the signal generator slowly between the frequencies of 453 and 457 kilocycles. At some frequency between these limits the I.F. amplifier of the Receiver will show a very sharply peaked response, as indicated on the output meter. This frequency is that of the crystal, Y-1, and I.F. alignment, as outlined below, is made to this frequency. The C.W.O. control must be set to provide an audible beat note; the presence of this beat note can readily be determined by temporarily connecting headphones or a loud-speaker to the Receiver.

While making I.F. amplifier adjustments, it will be necessary to retard the attenuator of the signal generator if I.F. amplifier gain increases to a point where overload occurs. Without altering the frequency setting of the signal generator set the SELECTIVITY and C.W.O. switches at OFF, and turn the modulation of the signal generator ON. The I.F. tuned inductors L-16 through L-21 should, at this point, each be carefully adjusted to give a maximum reading on the output meter. The order in which these adjustments are made is not important.

To align the A.V.C. amplifier turn the A.V.C.-M.V.C. switch to A.V.C. Adjust L-27 of transformer T-3 until a well-defined dip is observed in the output meter readings. The setting of L-27 where this dip occurs will provide maximum A.V.C. action.

Turn the modulation of the signal generator OFF and turn the C.W.O. switch ON and set the C.W.O. control at 0 at which setting the C.W. oscillator should be at zero beat with the test signal. If zero beat does not occur at 0, readjust the tuneable inductor L-28, of transformer T-4 until zero beat does occur with the C.W.O. control set at 0.

6-3. *General Coverage and Bandspread Alignment*

The data given in this section applies to the alignment of the H.F. oscillator, first detector and R.F. amplifier stages. Since the main tuning capacitor and bandspread capacitor are connected in parallel on all bands General Coverage and Bandspread alignment are accomplished simultaneously. The 6 meter band, A, is tuneable by Bandspread tuning only.

The original alignment at National Laboratories is accomplished by the use of precision crystal-controlled test oscillators. No realignment of bands B,C, D and E should be attempted unless a test signal source with an accuracy of better than 1% is available. For band A, 6 meters, the test signal source must have the accuracy of precision calibrated crystals.

The need for realignment of the H.F. oscillator of bands B,C,D or E is indicated when the frequency calibration of the Receiver is in error by more than 2% at the high frequency end of any one band. Realignment of the H.F. oscillator of band A is indicated by a calibration error of 0.01%. Particular care should be taken when adjusting the high frequency oscillator trimmers. It is imperative that the high frequency oscillator is set to operate at a frequency above the first detector and R.F. amplifier frequency and not below. This can be checked by tuning in the image signal which should appear 910 kilocycles lower on the receiver dial. If it is found that the image signal does not appear at this setting the H.F. oscillator is incorrectly adjusted and the capacity of the H.F. oscillator trimmer must be decreased until the image and fundamental signals appear at the correct setting. Bands B, C and D each have an inductance adjustment, L-23, L-24, L-25, and Band E has a variable capacitor, C-56, for H.F. Oscillator alignment at the low frequency check point of these bands. After the H.F. oscillator is correctly calibrated the first detector and R.F. amplifier trimmers should be adjusted for maximum receiver gain as indicated on the output meter.

Correction of tracking errors of the first detector and R.F. amplifier stages at the low frequency check point of bands B, C and D is accomplished by the adjustments listed on the Alignment Chart. The tracking of the first detector and second R.F. amplifier stages may be checked by inserting a tuning wand into the opening of the coil form under test. Receiver gain should decrease the same amount on insertion of the iron or brass end of the tuning wand.

The tracking of the first R.F. amplifier stage of bands B, C and D may be checked by rotating the TRIMMER control, C-2. If two definite peaks in output are observed, while rotating the TRIMMER control, the first R.F. amplifier stage is tracking correctly and the TRIMMER setting at either peak is correct. The lack of a peak in output or the presence of only one peak indicates the stage is not tracking properly and correction should be made.

The locations of the adjustments referred to on the Alignment Chart are shown on Figure No. 7.

The control settings used for alignment are as outlined in Section 3-2 except that the A.V.C.-M.V.C. switch should be at M.V.C. The following Alignment Chart gives the step by step procedure to follow in effecting alignment of each band. It is important that the chart of adjustments is adhered to in the order shown for each band.

ALIGNMENT CHART

Step	Band	Adjust Signal Source To:	Set Gen. Cov. Dial At:	Set Bandspread Dial At:	Adjust To Receive Test Signal	Adjust For Maximum Output
1	A	56 Mc.	⑥ (at 198 on linear scale)	56 Mc.	C-47	C-18, C-9, C-2

CHASSIS RE-232

NOBLITT-SPARKS INDUSTRIES, INC.

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection	Across loudspeaker voice coil
Output meter reading to indicate 200 mw (standard output)	.8 volts
Connection of generator ground lead	Floating ground
Generator modulation	30% 400 cyclees
Position of volume control	Fully clockwise
Position of dial pointer with variable fully closed	Last mark at left end of dial

1. Connect signal generator lead through a .05 uf. condenser to converter grid. Open tuning condenser. Set signal generator to 455 Kc. Tune I. F. Transformers for maximum output.

2. Close tuning condenser and set pointer at end mark of dial. Open tuning condenser. Connect signal generator to test loop or to blue lead on set loop. Set signal generator to 1620 Kc. Tune trimmer on (C15C) oscillator section of tuning condenser for maximum output.

3. Set signal generator to 1400 Kc. Adjust tuning shaft until maximum output is abtained. Tune R. F. trimmer (C15B) and antenna trimmer (C15A) on tuning condenser for greatest output. Reset tuning shaft until output is again a maximum. Retune R. F. and antenna trimmers. Repeat this cycle of operations at 1400 Kc until no further increase of output can be obtained. Keep generator output at a low value to prevent detuning by A. V. C. action.

4. Set signal generator to 600 Kc. Adjust tuning shaft for maximum output. Adjust tuning condenser plates for maximum output.

Approximate stage by stage sensitivities with 117V. AC line voltage and .8 V. output across voice coil, should be: I. F. grid, 455 Kc – 10,000 uv., Mixer grid, 455 Kc – 150 uv., Mixer grid, 1000 Kc – 170 uv; Antenna, 1400 Kc – 100 uv/m.

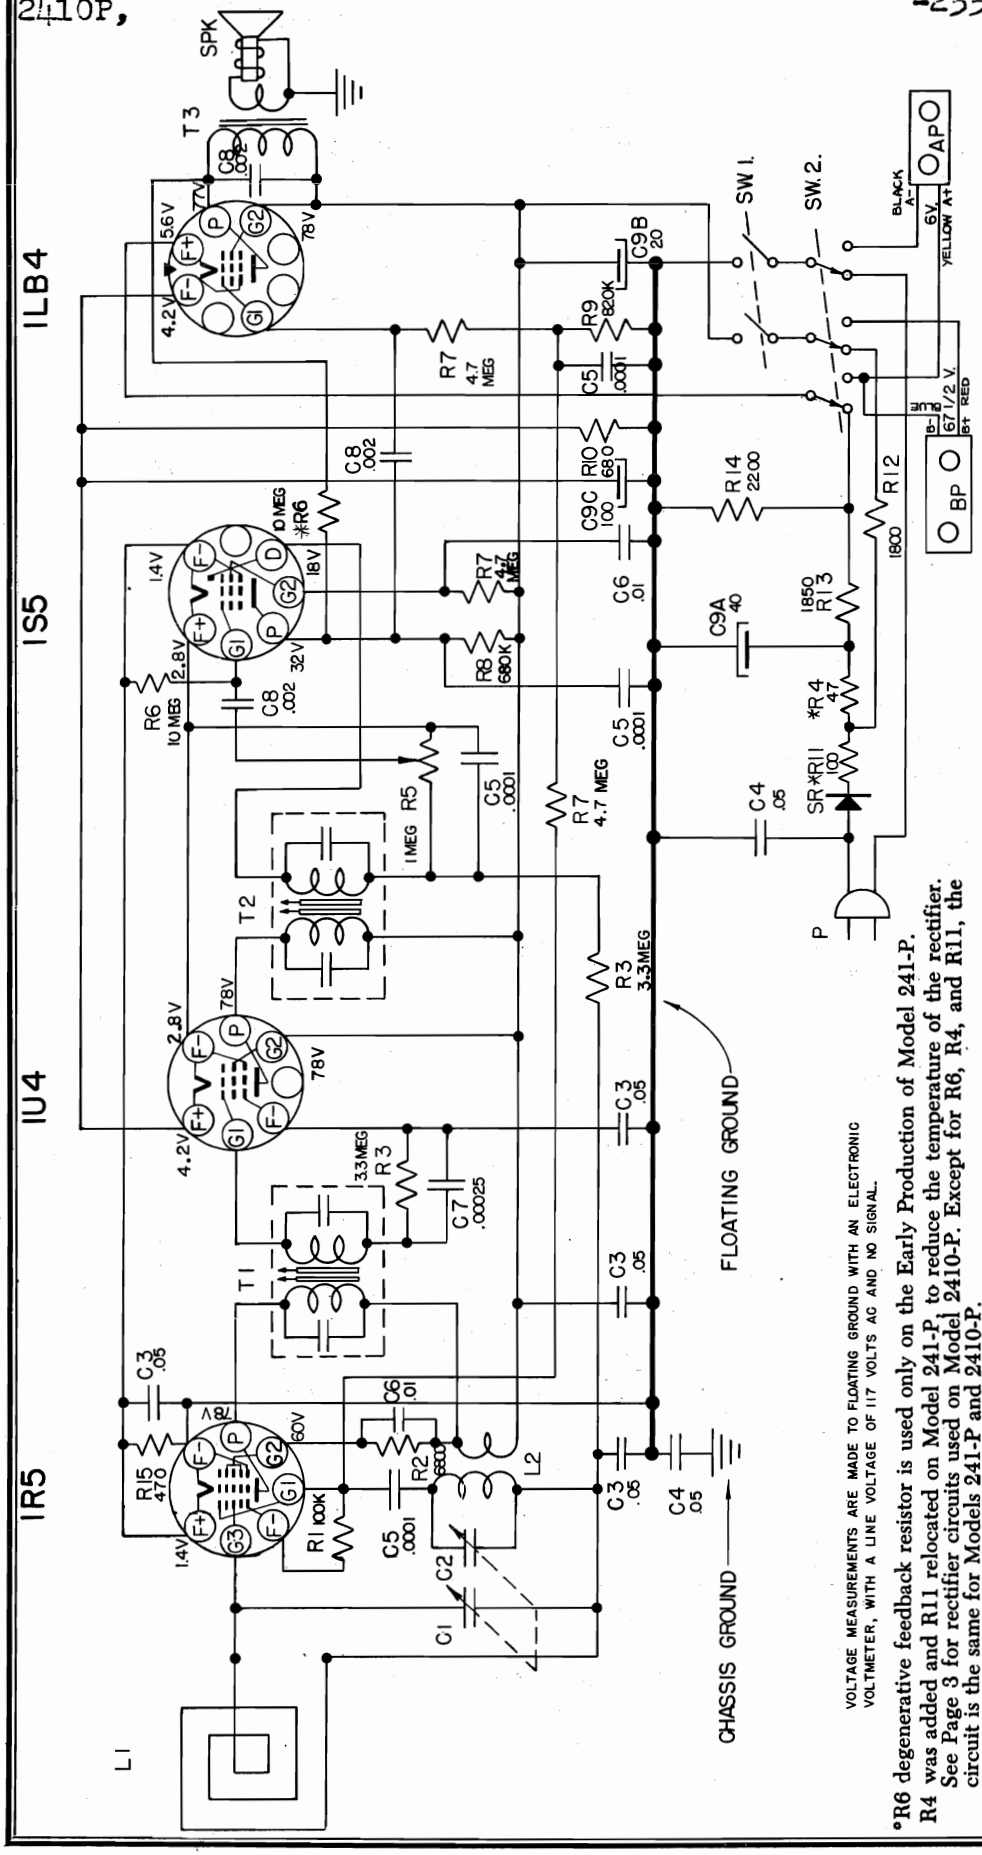
LOCATION OF PARTS UNDER CHASSIS

Models 160T is in a walnut cabinet. Model 161T is in an ivory cabinet. The Chassis is the same in both models.

MODELS 241P, 244P, NOBLITT-SPARKS INDUSTRIES, INC. CHASSIS RE-244, -255, -256, -259, -254
2410P,



VOLTAGE MEASUREMENTS ARE MADE TO FLOATING GROUND WITH AN ELECTRONIC VOLTMETER, WITH A LINE VOLTAGE OF 117 VOLTS AC AND NO SIGNAL.

*R6 degenerative feedback resistor is used only on the Early Production of Model 241-P.
R4 was added and R11 relocated on Model 241-P to reduce the temperature of the rectifier. See Page 3 for rectifier circuits used on Model 2410-P. Except for R6, R4, and R11, the circuit is the same for Models 241-P and 2410-P.

SPECIFICATIONS

FREQUENCY RANGE
Broadcast ---------- 540-1600 kc
IF ---------- 455 kc

TUBES AND FUNCTIONS
1R5 ---------- Mixer-oscillator
1U4 ---------- IF Amp.
1S5 ---------- DET-AVC AF Amp.
1LB4 ---------- Output

POWER SUPPLY
1. 67½ V. B Battery, Eveready Minimax, No. 467 or Equal.
4. 1½ V. D Size Flishlight Cells, 6 Volts total

LOUD SPEAKER
Type: Permanent magnet
Size: 4 Inch
Voice coil impedance ---------- 3.2 Ohms

POWER OUTPUT
Undistorted ---------- .05 Watt
Maximum ---------- .1 Watt
Plate Load ---------- 14,000 ohms

NOBLITT-SPARKS INDUSTRIES, INC. MODELS 241P, 244P, 2410P, CHASSIS RE-244, -255, -256, -259, -254

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection	Across loudspeaker voice coil
Output meter reading to indicate 50 MW (Standard Output)	.4 volts
Dummy antenna value to be used in series with generator output	See chart below
Connection of generator output lead	See chart below
Connection of generator ground lead	Floating ground
Generator modulation	30% 400 cycles
Position of volume control	Fully clockwise

With variable condester closed, place top edge of pointer across center of top hole on dial backing plate.
When adjusting C1, place the set loop the same distance from and in the same position with respect to the chassis and batteries, as it would be when mounted in the cabinet.

Position of Variable	Frequency of Generator	Dummy Antenna	Generator Output Connection	Trimmers Adjusted in Order Shown for Maximum Output	Function of Trimmer
Open	455	.05 mfd.	1R5 Grid (Stator of C1)	Top & Bottom of IF Trans. T2 & T1.	IF
1400	1400		*Test Loop	C2; C1, Trimmers on Variable Condenser	Oscillator Antenna
600	600		*Test Loop	**Check Point	

* Standard Hazeltine Test Loop Model 1150 or 3 turns of wire about 6" diameter, placed about one foot from the set loop.
**If weak, adjust variable condenser plates for maximum output.

The alignment procedure should be repeated in the original order for greatest accuracy. Always keep the output from the signal generator at its lowest possible value to make the AVC action of the receiver ineffective.

ALIGNMENT PROCEDURE

PRELIMINARY.

Output meter connection ---------- Across loudspeaker voice coil
Output meter reading to indicate 200 milliwatts (standard output) ---------- 0.8 volts
Dummy antenna to be in series with signal generator output ---------- See chart below
Connection of generator ground lead ---------- Floating ground
Generator modulation ---------- 30% 400 cycles
Position of Volume Control ---------- Fully clockwise
Position of pointer with variable fully closed ---------- 55 on dial

Position of Variable	Generator Frequency	Dummy Antenna	Generator Output Connection	Trimmers Adjusted	Trimmer Function	Approximate Sensitivity
Open	455 Kc	.05 uf.	12SA7 Grid (Stator of C-1)	2 trimmers on IF. Trans.	IF	3000 uv.
1400 Kc	1400Kc	.00005 uf.	Antenna Lug with Hank Removed	**C-2	Oscillator	360 uv.

**Since the antenna section of the variable has no trimmer, the rotor of the variable should be rocked back and forth on both sides of 1400 Kc while adjusting the oscillator trimmer for maximum output. This is to obtain the combination of rotor and trimmer setting to give perfect tracking of the two sections of the variable condenser and consequently give maximum output.

Check sensitivity at 600 Kc. If weak, adjust antenna section plates for maximum output at 600 Kc. Tracking of the condenser at points other than 1400 Kc is accomplished by bending the outside plates on the variable condenser rotor, which are cut for this purpose. When bending plates to track the condenser at any given frequency, keep in mind the fact that this will effect the tracking at all frequencies below that point. A tuning wand is very helpful in checking the tracking of this condenser, to indicate whether more or less capacity is needed.

The alignment procedure should be repeated stage by stage in the original order for greatest accuracy.

Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

NOBLITT-SPARKS INDUSTRIES, INC.

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection	Across loudspeaker voice coil
Output meter reading to indicate 200 mw (standard output)	.8 volts
Connection of generator ground lead	Floating ground
Generator modulation	30% 400 cyclees
Position of volume control	Fully clockwise
Position of dial pointer with variable fully closed	Last mark at left end of dial

1. Connect signal generator lead through a .05 uf. condenser to converter grid. Open tuning condenser. Set signal generator to 455 Kc. Tune I. F. Transformers for maximum output.

2. Close tuning condenser and set pointer at end mark of dial. Open tuning condenser. Connect signal generator to test loop or to blue lead on set loop. Set signal generator to 1620 Kc. Tune trimmer on (C15C) oscillator section of tuning condenser for maximum output.

3. Set signal generator to 1400 Kc. Adjust tuning shaft until maximum output is abtained. Tune R. F. trimmer (C15B) and antenna trimmer (C15A) on tuning condenser for greatest output. Reset tuning shaft until output is again a maximum. Retune R. F. and antenna trimmers. Repeat this cycle of operations at 1400 Kc until no further increase of output can be obtained. Keep generator output at a low value to prevent detuning by A. V. C. action.

4. Set signal generator to 600 Kc. Adjust tuning shaft for maximum output. Adjust tuning condenser plates for maximum output.

Approximate stage by stage sensitivities with 117V. AC line voltage and .8 V. output across voice coil, should be: I. F. grid, 455 Kc – 10,000 uv., Mixer grid, 455 Kc – 150 uv., Mixer grid, 1000 Kc – 170 uv; Antenna, 1400 Kc – 100 uv/m.

LOCATION OF PARTS UNDER CHASSIS

Model 444-AH is the same as Model 444 except for the handle and cabinet.

Model 442 is wired from the same Schematic Diagram as the Model 444 and 444-AH but has different components as indicated in the Parts List.

Some of the first Model 442 chassis had the same components as the Model 444 chassis except for the chassis base.

The symbol CR1 on the Schematic Diagram represents a capristor which contains a .002 condenser and a 1 megohm resistor in one unit. This is used only on the Model 442.

FREQUENCY RANGE
- Broadcast ..... 540-1600 kc
- IF ..... 455 kc

TUBES AND FUNCTIONS
- 12SA7 ..... Mixer-oscillator
- 12SQ7 ..... Detector-AVC-AF
- 50L6GT ..... Output
- 35Z5GT ..... Rectifier

POWER SUPPLY
- 105-125 Volts AC-DC, 35 Watts

POWER OUTPUT
- Type: Beam tube
- Undistorted ..... .8 Watts
- Maximum ..... 2.5 Watts
- Plate load ..... 2000 ohms

LOUD SPEAKER
- Type: Permanent magnet
- Size: 4 inch
- Voice coil impedance ..... 3.2 ohms

NOBLITT-SPARKS INDUSTRIES, INC.

MODELS 442, 444AH, CHASSIS RE-91, RE-200

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection	Across loudspeaker voice coil
Output meter reading to indicate 200 milliwatts (standard output)	0.8 volts
Dummy antenna to be in series with signal generator output	See chart below
Connection of generator ground lead	Floating ground
Generator modulation	30% 400 cycles
Position of Volume Control	Fully clockwise
Position of pointer with variable fully closed	54 on dial

Position of Variable	Generator Frequency	Dummy Antenna	Generator Output Connection	Trimmers Adjuster	Trimmer Function	Approximate Sensitivity
Open	455 Kc	.05 uf	12SA7 Grid (Stator of C-1)	2 trimmers on top of T-3	IF	3000 uv
1400 Kc	1400 Kc	.00005 uf	Antenna lug with Ant. Removed	**C-2	Oscillator	360 uv

**Since the antenna section of the variable has no trimmer, the rotor of the variable should be rocked back and forth on both sides of 1400 Kc while adjusting the oscillator trimmer for maximum output. This is to obtain the combination of rotor and trimmer setting to give perfect tracking of the two sections of the variable condenser and consequently give maximum output.

Check sensitivity at 600 Kc. If weak, adjust antenna section plates for maximum output at 600 Kc. Tracking of the condenser at points other than 1400 Kc is accomplished by bending the outside plates on the variable condenser rotor, which are cut for this purpose. When bending plates to track the condenser at any given frequency, keep in mind the fact that this will affect the tracking at all frequencies below the point where the plates are bent. A tuning wand is very helpful in checking the tracking of this condenser, to indicate whether more or less capacity is needed.

The alignment procedure should be repeated stage by stage in the original order for greatest accuracy.

Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

NORTHERN RADIO CO.

TYPES N600, N602,
MODELS A, B, C, D,
DQ, DQT, DT, E, ED

TYPE N600 TWO BAND COMMUNICATIONS RECEIVERS
TYPE N602 THREE BAND COMMUNICATIONS RECEIVERS

DESCRIPTION OF EQUIPMENT

The latest Type N600 and N602 Receivers are available in six different models for either direct or alternating current operation. Model A - 6 Volt DC and Model B - 12 Volt DC Receivers are designed for operation from 6 and 12 volt storage batteries, where other sources of power are not available. Model C - 32 Volt DC and Model D -115 Volt DC Receivers are designed especially for marine installations and operate directly from the ship's battery without the use of a built-in power supply. Model E - 115 Volt AC Receiver is primarily designed for land stations and operated from a 115 Volt 50 - 60 cycle a.c. source. Model ED - 115 Volt AC-DC Receiver operates from either source, as implied, and is equally suited for marine or land installations.

The characteristics of the six models are essentially similar, with the exception of the audio frequency amplifier and power supply. The radio frequency components and controls are identical, thus the operation, alignment, servicing, etc., are the same. The following data is pertinent to the six models, describing them collectively where they are similar and individually where they are at variance.

One radio frequency stage of amplification employing a 6K7 eliminates the image frequency signal and insures an effective signal to noise ratio.

A separate oscillator employing a 6J5 reduces frequency drift to a minimum and improves the general stability of the receiver.

A 6L7 mixer converts the incoming signal to the intermediate frequency, where it is amplified by a second 6K7. By the use of iron core intermediate transformers sufficient gain and selectivity are obtained with a single stage. This permits the use of the other 6K7 as a radio frequency amplifier where it is considerably more effective as well as increasing the stability of the receiver.

Detection is accomplished by means of the diode in a type 6Q7. The rectified voltage is filtered and applied to the grids of the previous stages to provide automatic volume control.

When provision is made for c.w. reception, a 6J5 beat frequency oscillator is added. This is coupled into the diode detector to produce an audible tone when beating with the intermediate frequency. Receivers so equipped, are designated by the letter T following the model letter.

The triode section of the 6Q7 amplifies the diode output, functioning as the first audio stage. In the Model A - 6 Volt DC Receiver, the Model B - 12 Volt DC Receiver and the Model E - 115 Volt AC Receiver the power amplifier is a 6F6G, which is driven directly by the first audio stage. The Model C - 32 Volt DC Receiver incorporates a 25L6G Driver stage. This Driver is excited by the first audio stage and, in turn, excites the power amplifier which consists of four 25L6G's connected in push-pull parallel. A single 25L6G power amplifier driven by the first audio stage, is used in the Model D - 115 Volt DC Receiver and the Model ED - 115 Volt AC-DC Receiver.

In receivers equipped with an inter-carrier squelch circuit, the triode section of the 6Q7 functions as the squelch control and a 6F5 is added for the first audio stage. The 6F5 then feeds the respective power amplifiers as described in the preceding paragraph. Receivers so equipped, are designated by the letter Q following the model letter.

An output power of approximately 2½ watts is obtained from the 6F6G power amplifier in the Model A - 6 Volt DC Receiver, Model B - 12 Volt DC Receiver and Model E - 115 Volt AC Receiver. The 25L6G push-pull parallel power amplifier in the Model C - 32 Volt DC Receiver has an output of approximately ½ watt, which provides ample volume from the built-in speaker. In the Model D - 115 Volt DC Receiver and the Model ED - 115 Volt AC-DC Receiver, an output of approximately 2 watts is obtained from the 25L6G power amplifier. The built-in speaker is of the permanent magnet dynamic type.

Plate power for the Model A - 6 Volt DC Receiver and the Model B - 12 Volt DC Receiver is obtained from a built-in power supply of the vibrator type. The Model C - 32 Volt DC Receiver and the Model D - 115 Volt DC Receiver have no built-in power supply, all power being obtained directly from the ship's battery. Plate power for the Model E - 115 Volt AC Receiver is provided by a conventional rectifier-filter system using an 80 tube. In the Model ED - 115 Volt AC-DC Receiver, plate power is obtained from a half-wave rectifier-filter system using a 25Z6GT tube.

TYPES N600, N602,
MODELS A,B,C,D,DQ,
DQT,DT,E,ED

NORTHERN RADIO CO.

Controls

(1) Power switch marked "POWER". This switch functions as the Off-On control for the receiver.

(2) FOR TYPE N600 ONLY

Band Switch marked "BAND A-B". In position "A" the receiver is tuneable over the range between 1550 and 4200 kilocycles. In position "B" the receiver is tuneable between 550 and 1600 kilocycles.

(2) FOR TYPE N602 ONLY

Band Switch marked "BAND A-B-C". In position "A" the receiver is tuneable over the range between 540 and 1680 kilocycles, in position "B" between 1660 and 5350 kilocycles and in position "C" between 5.35 and 15.8 megacycles.

(3) FOR TYPE N600 ONLY

Receiver tuning. A semi-circular dial with a five-to-one reduction drive mechanism is employed as the tuning control. The band A scale is calibrated in kilocycles and the band B scale in megacycles. The dial is illuminated from the rear. A vernier dial with 100 divisions is provided for accurate station logging.

(3) FOR TYPE N602 ONLY

Receiver tuning. A semi-circular dial with a 33 to 1 reduction drive mechanism is employed as the tuning control. The band A and band B scales are calibrated in kilocycles and the band C scale in megacycles. Translucent material is used for the dial to permit illumination from the rear.

(4) Radio frequency gain control marked "SENSITIVITY". This control serves to limit the maximum sensitivity of the receiver.

(5) Audio frequency gain control marked "VOLUME". This controls the audio amplification after detection and functions as the volume control for the receiver.

(6) Tone control marked "TONE". This control reduces the high frequency response of the audio system and is used in receiving thru sharp high-pitched noise.

(7) Inter-carrier squelch control marked "SQUELCH". This control, if incorporated, determines the signal level at which the squelch tube functions to block the first audio grid and silence the receiver.

(8) Speaker - handset switch marked "SPEAKER" and "HANDSET". This switch connects the audio output of the receiver to the built-in speaker or to the receiver portion of the handset, as indicated.

(9) Headphone jack marked "PHONES". When the phones are plugged into the jack, the built-in speaker is disconnected from the circuit.

(10) Remote speaker jack marked "REM. SPKR.". This jack is connected directly across the audio output of the receiver to permit the use of a remote speaker in addition to the built-in speaker.

(11) Dial light switch marked "LIGHTS". This switch functions as the Off-On control for the dial lights, and is provided so that the lights may be turned off when it is necessary to darken the pilot house.

(12) Beat frequency oscillator switch marked "B.F.O.". This switch, if provided, functions as the Off-On control for the beat frequency oscillator, which is used for the reception of code signals.

(13) Beat frequency oscillator pitch control marked "PITCH". This control, if provided, varies the oscillator frequency over a narrow range to permit adjustment of the resultant audio tone.

INSTALLATION

The receiver is usually mounted in the transmitter cabinet, or housed in a separate cabinet which is bolted to the transmitter to form a compact communication unit. When separately housed, the receiver may be mounted in any desired location.

Connections

(1) Power & Control. Power for the receiver is obtained thru the cable or cables at the rear of the chassis. When used in conjunction with a transmitter the proper cables are provided for connection to the power and receiver control circuits in that particular transmitter. If the receiver is used separately, wires may be connected to the cable terminal points for power and external control. If external control is not required, the plate supply line "B break" circuit must be closed and the voice coil line returned to ground on the panel. Refer to drawings for circuit data.

(2) Ground. The receiver is grounded in the usual installation thru connection to the transmitter and between cabinets. If used separately the ground

should be connected to the cabinet. The receiver chassis is insulated from the panel and cabinet to permit a positive or negative ground in the D.C. Models, consequently a direct ground must not be connected to the chassis.

(3) Antenna. The regular receiver antenna connection is made thru the control cable and transmitter. If the receiver is used separately, connection may be made to the cable terminal marked "ANT". Refer to drawings for circuit data.

OPERATION

The operation of the receiver is similar to any regular communications receiver with similar capabilities. The following suggestions will aid in obtaining the most satisfactory results.

Place the receiver in operating condition as follows: Throw the POWER switch to the ON (up) position. Set the BAND switch to the band in which the desired frequency is located. Throw the SPEAKER - HANDSET switch to the SPEAKER position. Throw the LIGHTS switch to the On (up) position. Set the SENSITIVITY control to the point of maximum sensitivity by tuning in a clockwise direction to the end of the 270 degree rotation. If a Squelch Circuit is incorporated, set the SQUELCH control to the non-operating point by turning in a clockwise direction, to the end of the 270 degree rotation until the switch clicks. Then adjust the VOLUME control until some noise is heard. The receiver is now ready for the reception of phone signals. If a Beat Frequency Oscillator is provided, code signals may be received as described in the last paragraph under "General Procedure".

General Procedure

When tuning for a station it is necessary to tune slowly past the point where the station is expected. After having found the station tune on both sides of the best point in order to make sure its location. Operation to one side of the correct spot will result in distorted signals.

During periods when no phone signals are being received the AVC (Automatic Volume Control) will increase the volume to maximum (if the SENSITIVITY control is full on) and some noise will result. The incoming signal, however, reduces the amplification through the AVC action and consequently the noise level. If the prevailing noise level is high the SENSITIVITY control may be turned down to limit the maximum sensitivity of the receiver, or it may be similarly used to prevent very strong local signals from blocking the receiver.

The control to use for setting the signal volume at a comfortable room level is the VOLUME control. If the SENSITIVITY control is used for this purpose the AVC will not function properly.

If a squelch circuit is incorporated, the SQUELCH control should be adjusted for as low a signal level as possible to permit the reception of weak signals. Never adjust beyond the point where average noise drops out, or where only an occasional noise peak is heard. Refer to paragraph 8 under "Alignment" for further data.

If a beat frequency oscillator is provided code signals may be received as follows: Throw the B.F.O. switch to the On (up) position. Set the PITCH control so that the white dot on the knob is up. Tune in the station and adjust to approximately zero beat. Next adjust the PITCH control to obtain the desired beat note, and the SENSITIVITY control to set the r.f. signal at a level which produces a clear tone, as evidenced by a smooth pitch adjustment down to approximately zero beat. Then adjust the VOLUME control to set the signal volume at a comfortable level.

Note: Data relative to the operation of any controls not mentioned in this section will be found under "Controls".

MAINTENANCE

Receiver Alignment

(1) Before proceeding with the alignment, the #6 pin on the 7 prong control cable socket or plug must be connected to the panel to complete the voice coil circuit. It will also be necessary to provide a connection between the #4 and #5 pins to close the B break circuit.

(2) A signal generator set to 456 kilocycles should be used in aligning the intermediate frequency amplifier. Remove the grid clip from the 6L7 and connect the signal generator between grid and ground. If a signal generator is not available, tune in some convenient signal that is not too strong.

(3) For indication of correct tuning, an output meter or high resistance a.c. voltmeter should be connected between the power amplifier plate and chassis. A blocking condenser (.1 uf. or more) must be connected in series with the hot lead to the plate. If a low range meter (15 v. or less) is available, it may be plugged into the phone jack.

(4) Tune the trimmers on top of the I.F. transformers for maximum output meter deflection. It will be found best to experiment with the input level which gives the best indication.

(5) FOR TYPE N600 ONLY

After having tuned the intermediate amplifier, the grid clip should be replaced on the 6L7, the band switch set for band A and a signal of approximately 3500 kilocycles applied to the antenna input. This can be the signal from a distant station or a standard signal generator. Adjust the oscillator trimmer (top right hole in osc. shield can) so the signal is properly tuned in. Then adjust the R.F. and Detector trimmers for maximum signal. These are accessible through the top right holes in the next two shield cans. Refer to drawings for parts location.

(5) FOR TYPE N602 ONLY

After having tuned the intermediate amplifier, the grid clip should be replaced on the 6L7, the band switch set for band A and a signal of approximately 1400 kilocycles applied to the antenna input. This can be the signal from a distant station or a standard signal generator. Adjust the oscillator trimmer (top hole in left side of osc. shield can) so the signal is properly tuned in. Then adjust the R.F. and Detector trimmers for maximum signal. These are accessible through the top holes in the left side of the next two shield cans. Refer to drawings for parts location.

(6) FOR TYPE N600 ONLY

The above procedure should be followed with the band switch set for band B and an input signal of 1400 kilocycles applied to the antenna input. The trimmers for this band are accessible through the top left holes in the three shield cans, directly opposite the band A trimmers.

(6) FOR TYPE N602 ONLY

The above procedure should be followed for bands B and C. Set the band switch to band B, apply a signal of 4000 kilocycles to the antenna input and adjust the band B trimmers, accessible through the center holes in the left side of the shield cans. Then set the band switch to band C, apply a signal of 14 megacycles and adjust the band C trimmers, accessible through the bottom holes in the shield cans.

(7) FOR TYPE N600 ONLY

The signal should now be set to 1800 kilocycles for band A or 600 kilocycles for band B and the receiver tuned to this frequency. The padding condenser for the band being aligned should be adjusted to give maximum output while rocking the tuning condenser slightly to locate the most favorable position. It is advisable to return to the aligning point and repeat the adjustments given for best results. Refer to drawings for parts location.

(7) FOR TYPE N602 ONLY

The signal should now be set to 600 kilocycles for band A or 1800 kilocycles for band B and the receiver tuned to this frequency. The padding condenser for the band being aligned should be adjusted to give maximum output while rocking the tuning condenser slightly to locate the most favorable position. It is advisable to return to the aligning (trimming) point and repeat the adjustments given for best results. No padding adjustment is required for band C. Refer to drawings for parts location.

(8) If a squelch circuit is incorporated, it should be checked for normal operation. Rotating the SQUELCH control in a clockwise direction, decreases the signal level required to overcome the blocking bias and consequently increases the apparent sensitivity of the receiver. At the end of the clockwise rotation, a switch operates to short out the 6Q7 plate - 6F5 grid bias resistor and make the squelch inoperative. If operating properly, the squelch circuit should easily discriminate between signal levels differing by a voltage ratio of 2 to 1, that is, when adjusted so that a nominal signal input of 5 microvolts just drops out, increasing the input to 10 microvolts should bring the signal in again. This operation should hold down to an input of 2 microvolts, or less. If the operation is not normal, check the 6Q7 and 6F5 tubes, and the 6F5 grid bias, cathode and plate voltages. Refer to Test Readings and drawings.

(9) The beat frequency oscillator, if provided, should now be adjusted as follows: Set the receiver tuning dial pointer at about center scale on band A, introduce a modulated signal from the generator, carefully adjust the generator to resonance and cut off the modulation. Then throw the B.F.O. Switch to the On (up) position, set the PITCH Control so that the white dot on the knob is up and adjust the Trimmer on top of the B.F.O. Coil shield until resonance (zero beat) is obtained.

Servicing

When the receiver has been removed from the cabinet for servicing, the #6 pin on the 7 pin control cable socket or plug must be connected to the panel to complete the voice coil circuit. It will also be necessary to provide a connection between the #4 and #5 pins to close the B break circuit.

First the power source should be checked to make sure that all tubes are receiving correct filament and plate voltages, then the tubes should be suspected and replaced with the spares, one at a time, as a check on their operation.

After checking tubes, testing should progress from the receiver output to the input stage by stage eliminating each as it is found to operate properly. Listening in the loud speaker while testing will help greatly. The usual voltmeter and/or ohmmeter tests should be used in isolating the trouble. It is always best to test each stage in a logical definite order, in order to determine the location of the defect. After having found the location of the trouble, it can be quickly eliminated.

CAUTION: The negative side of the power line is common to the chassis in the D.C. Models, but the chassis is insulated from ground (panel and cabinet) to permit operation from a power source with either a negative or positive ground. Consequently, if the positive side of the power line is grounded, the chassis becomes Hot to ground and care must be used when removing same to avoid contact with the cabinet or a blown receiver fuse (F1) will result. Opening both sides of the incoming power line before removing the chassis will prevent this. In this connection it should be noted that all control shafts have an insulating washer between shaft, knob and panel which must not be removed in the event of knob replacement. If the negative side of the power line is grounded, no care need be used. Refer to drawings for circuit data.

and Type N602 Receivers

Model C & CT - 32 Volts, DC

Test Readings

The following test readings indicate average normal operating conditions:

Models	Stage	Tubes	Plate Volts	Screen Volts	Grid Volts	Cath. Volts	°Fil. Volts
C & CT	R.F.A.	6K7	30.0	30.0	*Var.	0.6	6
C & CT	Mixer	6L7	29.5	30.0	x1.5 av.	0.1	6
C & CT	Osc.	6J5	30.0	--	x2.8 av.	0	6
C & CT	I.F.A.	6K7	29.5	30.0	*Var.	0.6	6
C & CT	Det. &	6Q7	*Var.	--	--	0	6
C & CT	1st A.F.	Same	5.5	--	0	0	Same
C & CT	2nd A.F.	25L6GT	22.5	30.5	0	3.0	24
C & CT	A.F.P.A.	4-25L6GT	30.5	32.0	0	2.8	24
CT	B.F.O.	6J5	12.5	--	--	0	6

Input voltage during test - 32 Volts.
Total filament current - Mdl. C, 1.7 Amps. - Mdl. CT, 2 Amps.
Total plate current - 36 Ma.

*Variable - dependent on signal and avc voltage. This also applies to the mixer (detector) control grid not listed above.

xAverage - mixer injection and oscillator grid voltages read with a VTVM having a d.c. input resistance of 11 megohms. These voltages vary over the frequency range.

°Filament voltage readings taken with dropping resistor R23 adjusted for 30 volts across the series-parallel filament circuit.

Note: Normal readings may vary plus or minus 6% from the values given. The maximum variation should not exceed 10%. Readings are taken with the SENSITIVITY (r.f. gain) control set at maximum. All voltages, except filament, are read between the circuit points and chassis. The meter should have a resistance of 1000 ohms per volt and a 50 or 60 volt scale should be used, if comparative readings are to be obtained. Current values may be computed by dividing the voltage across resistors by their resistance. Refer to drawings and "Parts List" for data.

R7	Oscillator grid leak	IRC BT½ 50000 ohms ½ w.
R8	I.F. Amp. grid filter	IRC BT½ .1 megohm ½ w.
R9	I.F. Amp. cathode bias	IRC BW½ 350 ohms ½ w.
R10	I.F. Amp. plate filter	IRC BT½ 3000 ohms ½ w.
R11	Screen dropping	IRC BT1 7500 ohms 1 w.
R12	Diode Det. r.f. filter	IRC BT½ 30000 ohms ½ w.
R13	A.V.C. filter	IRC BT½ .5 megohm ½ w.
R14	A.V.C. load	IRC BT½ .5 megohm ½ w.
R15	Volume (A.F.) control	Centralab A-130 .5 meg. pot.
R16	First A.F. grid coupling	IRC BT½ 1. megohm ½ w.
R17	First A.F. plate coupling	IRC BT½ .25 megohm ½ w.
R18	Pwr. Amp. grid coup.	IRC BT½ .4 megohm ½ w.
R19	Pwr. Amp. cathode bias	IRC BT1 150 ohms 1 w.
R20	Tone control	Centralab AF-115 25000 ohm pot
R21	Handset - receiver shunt	IRC BW1 10 ohms 1w.
R22	Headphone shunt	IRC BW1 10 ohms 1w.
R23	Fil. voltage dropping	Ohmite #0567 200 ohms 50 w.
R24	Dial light voltage drop.	Ohmite #0375 1000 ohms 25 w.

Resistors - Mdl. DQ:

R14	Squelch control	Centralab A-128 .5 meg. pot.
R15	Volume (A.F.) control	Centralab A-132 1. meg. pot.
R16	First A.F. grid coupling	IRC BT½ 1. megohm ½ w.
R25	6Q7 plate - 6F5 block. bias	IRC BT½ 1. megohm ½ w.
R26	Squelch voltage divider	IRC BT1 2000 ohms 1 w.
R27	Squelch voltage divider	IRC BW1/2 200 ohms 1/2w
R28	Squelch voltage dropping	IRC BT2 20000 ohms 2 w.

Resistors - Mdls. DT & DQT:

R29	B.F. Osc. grid leak	IRC BT½ .1 megohm ½ w.
R30	B.F. Osc. plate coup.	IRC BW½ 500 ohms ½ w.
R31	B.F. Osc. plate drop.	IRC BT½ .1 megohm ½ w.

Switches:

S1.1	Ant. coils - primary	Centralab Part D 3P. 3 pos.
S1.2	Ant. coils - secondary	Part of S1.1 assembly
S2.1	R.F. coils - primary	Centralab Part D 3P. 3 pos.
S2.2	R.F. coils - secondary	Part of S2.1 assembly
S3.1	Osc. coils - plate	Centralab Part D 3P. 3 pos.
S3.2	Osc. coils - grid	Part of S3.1 assembly
S4	Power - 115 V. line	H&H #20902-Z D.P.S.T. 3A. tog.
S5	Speaker - Handset	H&H #21189 S.P.D.T. 3A. tog.
S6	Lights - dial	H&H #20992 S.P.S.T. 3A. tog.

Switches - Mdl. DQ:

S7	Squelch Off - On control	Centralab K-16 switch cover Part of R14 assembly

Switches - Mdls. DT & DQT:

S8	B.F. Osc. Off - On control	H&H #20902-Z D.P.S.T. 3A. tog.

NORTHERN RADIO CO. TYPE N600, MODELS D, DQ, DT, DQT

PARTS LIST N600D

Transformers:

T1	I.F. Amp. input	Miller #612-C1 input
T2	I.F. Amp. output	Miller #612-C4 output - diode
T3	A.F. Pwr. Amp. output	NRC #600C-10-1 output

Tubes:

6K7	R.F. Amplifier	Sylvania or equiv. type 6K7
6L7	Mixer	Sylvania or equiv. type 6L7
6J5	Oscillator	Sylvania or equiv. type 6J5
6K7	I.F. Amplifier	Sylvania or equiv. type 6K7
6Q7	Diode Det.- AVC - First A.F.	Sylvania or equiv. type 6Q7
25L6GT	A.F. Power Amplifier	Sylvania or equiv. type 25L6GT See "Note" re metal tubes

Tubes - Mdl. DQ:

6Q7	Diode Det.- AVC - Squelch	Same as above
6F5	First A.F. Amplifier	Sylvania or equiv. type 6F5

Tubes - Mdls. DT & DQT:

6J5	B.F. Oscillator	Sylvania or equiv. type 6J5

Miscellaneous:

Dynamic speaker	Jensen ST-445 or Utah 6P 6" PM
Dial lights	Sylvania S-47 6-8 v. 150 Ma. m.b.b.
Dial light sockets	Drake #206CE dial lig. bkts.
115 V. line fuse F1	Killark or equiv. 3AG 3Amp.
Fuse holder	Littelfuse #341001 extractor post
Headphone jack J1	Mallory #703A Junior
Remote spkr. jack J2	Carter #2A single closed cir.
Band switch knob	Crowe #6144 1-1/8" rd. blk. pointer
Control knobs	Crowe #6132 1-1/8" rd. blk.
Control cable plug CP1	Amphenol #61-CP7S 7 prong
Control cable plugs	Amphenol PF7S & PM7S 7 prong
*Power cable plug CP2	Amphenol #61-CP4 4 prong
Tube sockets	Amphenol S8 8 prong
Tuning dial mechanism	Bud D-1729 vernier dial
Tuning dial scale	NRC #915-10 std. 2 band

*Used only where power is not obtained thru the control cable.

Note: Metal tubes may be replaced with GT tubes, if necessary

Test Readings

The following test readings indicate average normal operating conditions:

Models	Stage	Tubes	Plate Volts	Screen Volts	Grid Volts	Cath. Volts	Fil. Volts
All	R.F.A.	6K7	111.8	71.1	*Var.	1.5	6
All	Mixer	6L7	110.7	71.1	x4.0 av.	1.8	6
All	Osc.	6J5	111.8	--	x9.8 av.	0	6
All	I.F.A.	6K7	101.3	71.1	*Var.	1.4	6
D & DT	Det. &	6Q7	*Var.	--	--	0	6
D & DT	1st A.F.	Same	55.4	--	0	0	Same
All	A.F.P.A.	25L6GT	107.7	111.8	0	7.3	24
DQ & DQT	Det. &	6Q7	*Var.	--	--	0	6
DQ & DQT	Squelch	Same	9.4(Sq.off)	--	*Var.	0	Same
DQ & DQT	1st A.F.	6F5	60.6	--	1.0	10.4	6
DT & DQT	B.F.O.	6J5	26.1	--	--	0	6

Input voltage during test - 115 volts.
Total filament current - .44 Amp.
Total plate current - 75 Ma.

*Variable - dependent on signal and avc voltage. This also applies to the mixer (detector) control grid not listed above.

xAverage - mixer injection and oscillator grid voltages read with a VTVM having a d.c. input resistance of 11 megohms. These voltages vary over the frequency range.

Note: Normal readings may vary plus or minus 6% from the values given. The maximum variation should not exceed 10%. Readings are taken with the SENSITIVITY (r.f. gain) control set at maximum. All voltages are read between the circuit points and chassis, except the filaments and 6F5 grid. The latter is read between the cathode and grid taps on the squelch voltage divider. The meter should have a resistance of 1000 ohms per volt and a 300 volt (or higher) scale should be used where there is much resistance in the circuit, if comparative readings are to be obtained. Current values may be computed by dividing the voltage across resistors by their resistance. Refer to drawings and "Parts List" for data.

L4	Plate power filter choke	Thermador D-9 2H. 125 Ma.

Inductances - Models DT & DQT:

L5	B.F. Osc. coil	Miller #512-C-5 B.F.O. unit

Resistors - All Models:

R1	Sensitivity (R.F.) control	Centralab AF-110 10000 ohm pot.
R2	R.F. Amp. grid filter	IRC BT½ .1 megohm ½ w.
R3	R.F. Amp. cathode bias	IRC BW½ 360 ohms ½ w.
R4	Detector grid filter	IRC BT½ .1 megohm ½ w.
R5	Mixer cathode bias	IRC BW½ 360 ohms ½ w.
R6	Mixer grid leak	IRC BT½ 51000 ohms ½ w.
R7	L3.3 primary shunt	IRC BT½ 1200 ohms ½ w.
R8	Osc. grid leak	IRC BT½ 51000 ohms ½ w.
R9	I.F. Amp. grid filter	IRC BT½ .1 megohm ½ w.
R10	I.F. Amp. cathode bias	IRC BW½ 360 ohms ½ w.
R11	I.F. Amp. plate filter	IRC BT½ 3000 ohms ½ w.
R12	Screen dropping	IRC BT1 7500 ohms 1 w.
R13	Diode Det. r.f. filter	IRC BT½ 30000 ohms ½ w.
R14	A.V.C. filter	IRC BT½ .51 megohm ½ w.
R21	First A.F. grid coupling	IRC BT½ 1. megohm ½ w.
R22	First A.F. plate coupling	IRC BT½ .25 megohm ½ w.
R23	Pwr. Amp. grid coupling	IRC BT½ .39 megohm ½ w.
R24	Pwr. Amp. cathode bias	IRC BT1 150 ohms 1 w.
R25	Tone control	Centralab AF-115 25000 ohm pot.
R26	Headphone shunt	IRC BW1 10 ohms 1w.
R27	Handset-receiver shunt	IRC BW1 10 ohms 1w.
R28	Fil. voltage dropping	Ohmite #0567 200 ohms 50 w.
R29	Dial light voltage drop.	Ohmite #0375 1000 ohms 25 w.
R30	Pwr. Amp. plate filter	IRC BW1 51 ohms 1 w.

Resistors - Models D & DT:

R16	Volume control & AVC load	Centralab A-130 .5 meg. pot.

Resistors - Models DQ & DQT:

R15	Squelch control - A.V.C. load	Centralab A-128 .5 meg. pot.
R16	Volume (A.F.) control	Centralab A-132 1. meg. pot.
R17	Squelch voltage divider	IRC BT1 2000 ohms 1 w.
R18	Squelch voltage divider	IRC BW½ 200 ohms ½ w.
R19	Squelch voltage dropping	IRC BT2 20000 ohms 2 w.
R20	6Q7 plate - 6F5 block. bias	IRC BT½ 1. megohm ½ w.

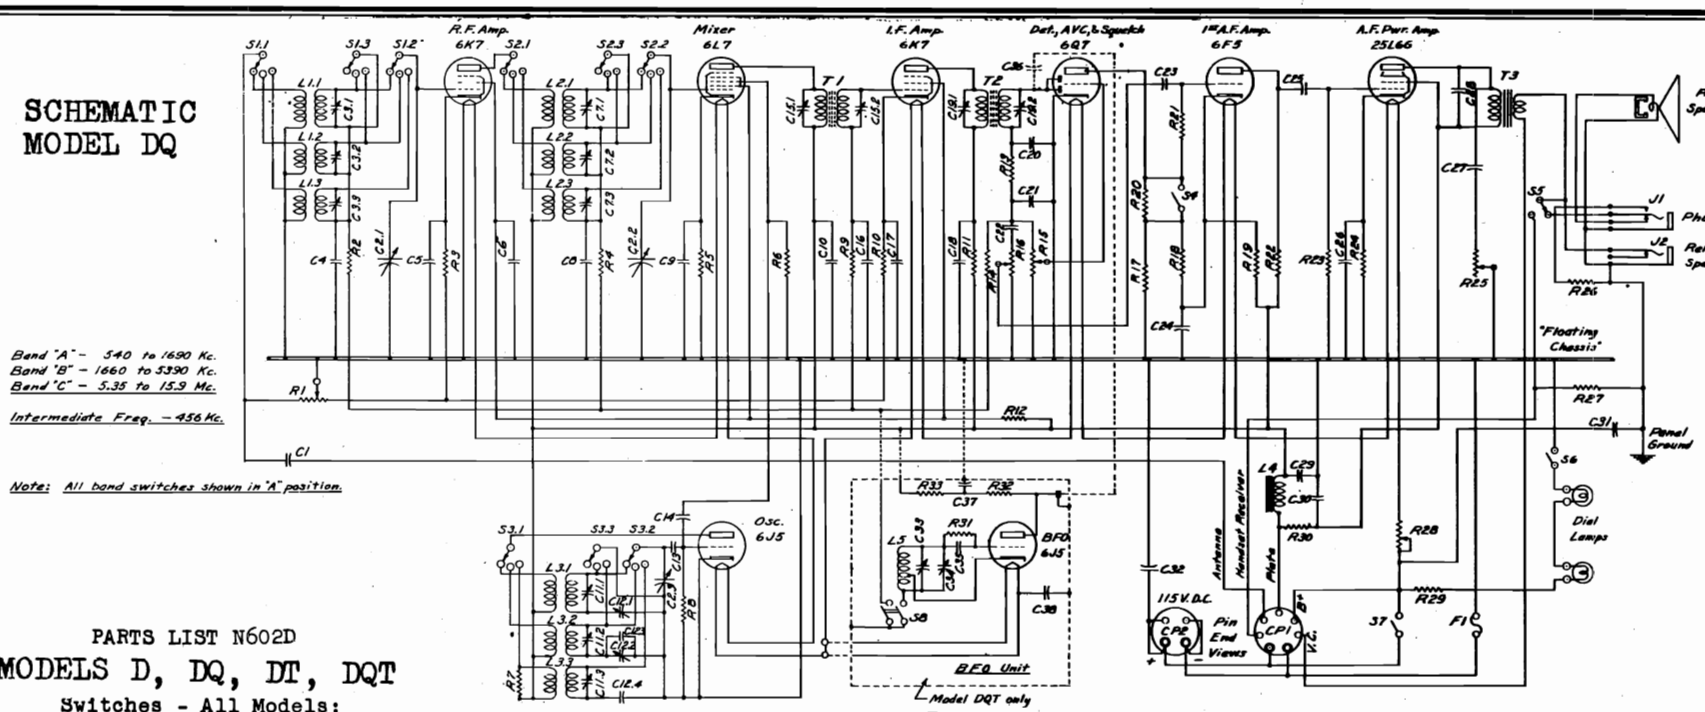
Resistors - Models DT & DQT:

R31	B.F. Osc. grid leak	IRC BT½ .1 megohm ½ w.
R32	B.F. Osc. plate coupling	IRC BW½ 510 ohms ½ w.
R33	B.F. Osc. plate dropping	IRC BT½ .1 megohm ½ w.

Switches - All Models:

S1.1	Ant. coils - primary	Centralab Part D 3P. 3 position
S1.2	Ant. coils - secondary	Part of S1.1 assembly
S1.3	Ant. coils - secondary short.	Part of S1.1 assembly
S2.1	R.F. coils - primary	Centralab Part D 3P. 3 position
S2.2	R.F. coils - secondary	Part of S2.1 assembly
S2.3	R.F. coils - secondary short.	Part of S2.1 assembly
S3.1	Osc. coils - plate	Centralab Part D 3P. 3 position
S3.2	Osc. coils - grid	Part of S3.1 assembly

SCHEMATIC
MODEL DQ



PARTS LIST N602D
MODELS D, DQ, DT, DQT

Switches - All Models:

S3.3	Osc. coils - grid shorting	Part of S3.1 assembly
S5	Speaker-Handset	H&H #21189 S.P.D.T. 3A. tog.
S6	Lights - dial	H&H #20992 S.P.S.T. 3A. tog.
S7	Power - 115 V. line	H&H #20902-Z D.P.S.T. 3A. tog.

Switches - Models DQ & DQT:

S4	Squelch Off-On control	Centralab K-16 switch cover

Switches - Models DT & DQT:

S8	B.F. Osc. Off-On control	H&H #20902-Z D.P.S.T. 3A. tog.

Transformers - All Models:

T1	I.F. Amp. input	Miller #612-C1 input
T2	I.F. Amp. output	Miller #612-C4 output - diode
T3	A.F. Pwr. Amp. output	NRC #602D-10-1 output 23:1

Tubes - All Models:

6K7	R.F. Amplifier	Sylvania or equiv. type 6K7
6L7	Mixer	Sylvania or equiv. type 6L7
6J5	Oscillator	Sylvania or equiv. type 6J5
6K7	I.F. Amplifier	Sylvania or equiv. type 6K7
25L6GT	A.F. Power Amplifier	Sylvania or equiv. type 25L6GT

Tubes - Models D & DT:

6Q7	Diode Det. - AVC - First A.F.	Sylvania or equiv. type 6Q7

See "Note" re metal tubes

Tubes - Models DQ & DQT:

6Q7	Diode Det. - AVC - Squelch	Sylvania or equiv. type 6Q7
6F5	First A.F. Amplifier	Sylvania or equiv. type 6F5

Tubes - Models DT & DQT:

6J5	B.F. Oscillator	Sylvania or equiv. type 6J5

Miscellaneous:

	Dynamic speaker	Jensen ST-445 or Utah 6P 6" PM
	Dial lamps	Sylvania S-47 6-8 V. 150 Ma. m.b.b.
	Dial lamp sockets	Drake #206CE dial light bkts.
F1	115 Volt line fuse	Killark or equiv. 3AG 3 Amp.
	Fuse holder	Littelfuse #341001 extractor post
J1	Headphone jack	Mallory #703A Junior
J2	Remote speaker jack	Carter #2A single closed circuit
	Control cable plugs	Amphenol PF7S & PM7S 7 prong
CP1	Control cable plug - chassis	Amphenol #61-CP7S 7 prong
CP2	*Power cable plug - chassis	Amphenol #61-CP4 4 prong
	Band switch knob	Crowe #6144 1-1/8" rd. blk. pointer
	Control knobs	Crowe #6132 1-1/8" rd. black
	Tube sockets	Amphenol S8 8 prong
	Tuning dial mechanism	NRC #602D-11-1 33:1
	Tuning dial scale	NRC #915-11 std. 3 band

*Used only where power is not obtained thru the control cable.

Note: Metal tubes may be replaced with GT tubes, if necessary.

NORTHERN RADIO CO.

TYPE N602,

602DQ RECEIVER
BOTTOM VIEW

OLYMPIC RADIO & TELEV. INC.

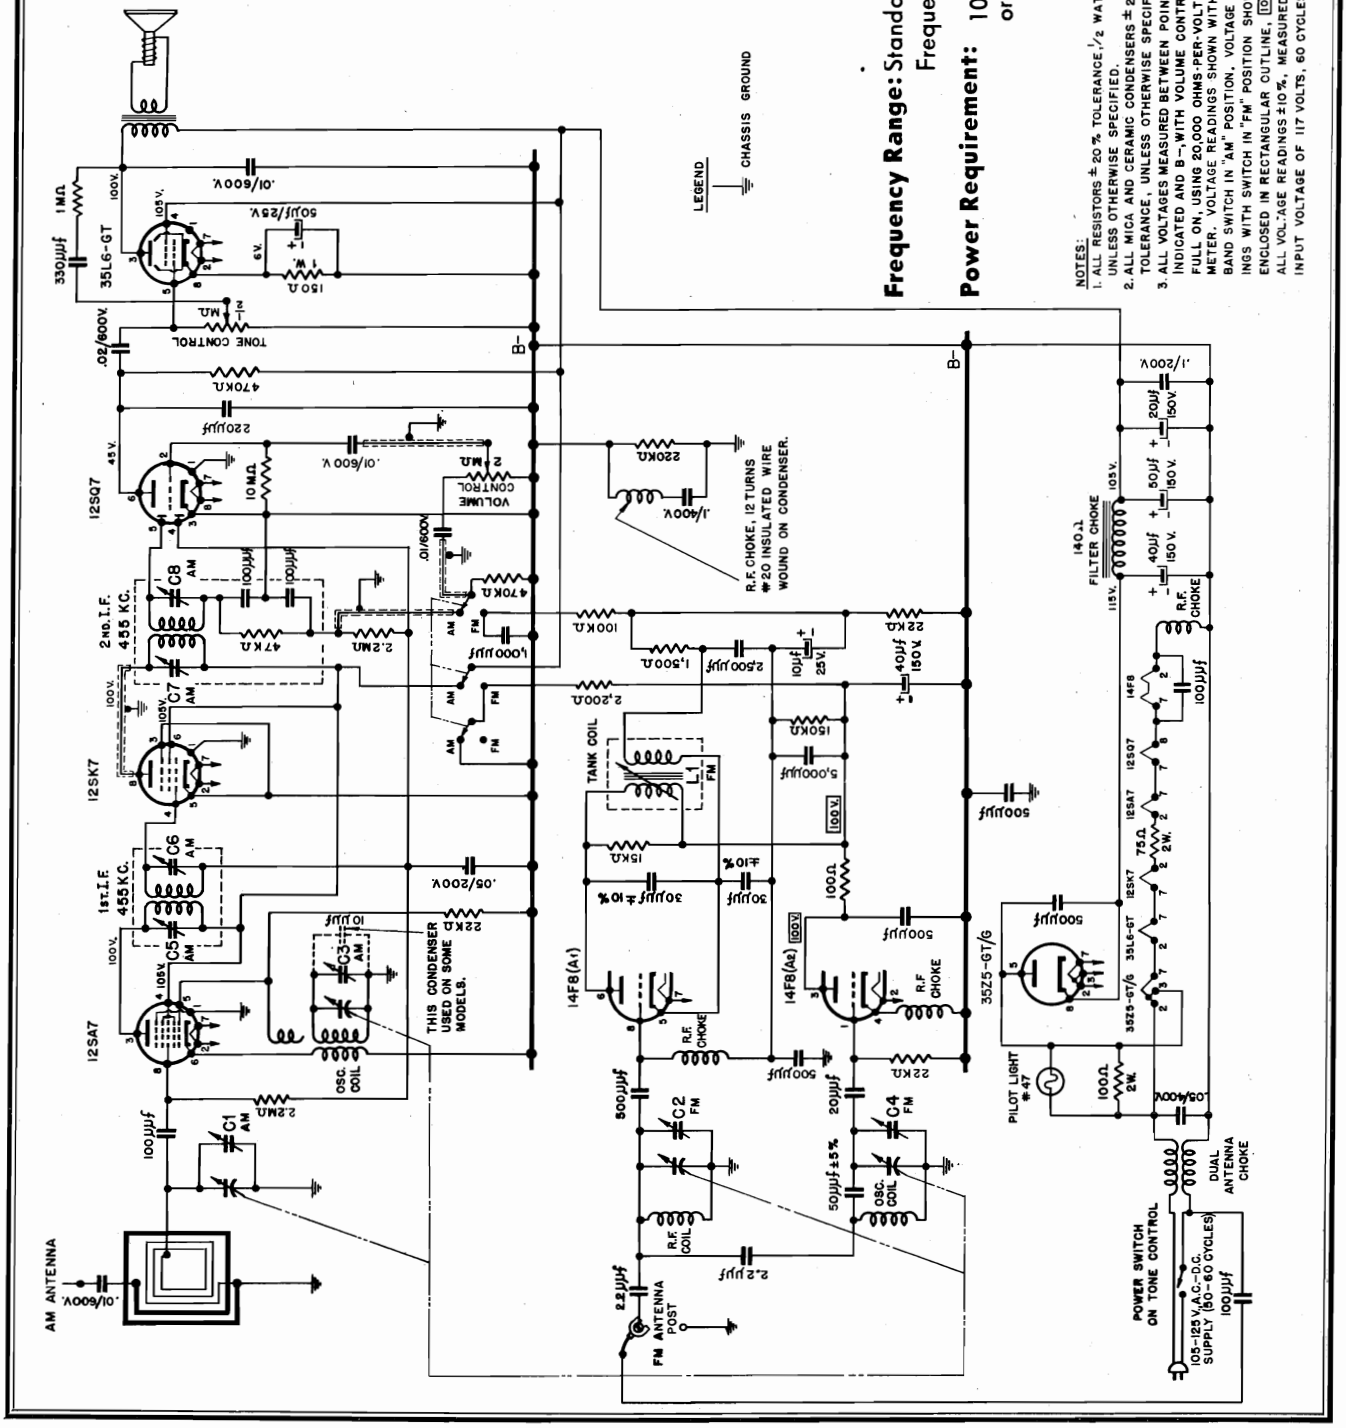
MODELS 7-532V, 7-532W

Model 7-532W Walnut

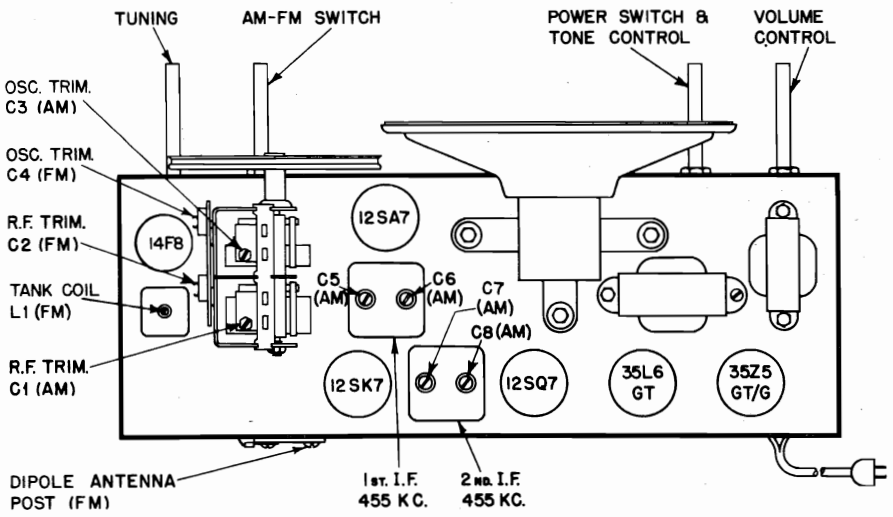
Model 7-532V Ivory

Frequency Range: Standard Broadcast 530-1700 kc.
Frequency Modulation (FM) 88-108 MC

Power Requirement: 105-125 volts a-c 50-60 cycles
or 105-125 volts d-c



TUBE & TRIMMER LAYOUT



ALIGNMENT PROCEDURE CHART

STEP	SET BAND SWITCH ON	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO—	SET SIGNAL GENERATOR TO—	TURN POINTER DIAL TO—	ADJUST THE FOLLOWING FOR MAXIMUM OUTPUT (KEEP SIGNAL FROM SIGNAL GENERATOR AS LOW AS POSSIBLE)
1	A.M.	R.F. SECTION OF VARIABLE CONDENSER OR PIN 4 OF THE 12SK7 TUBE IN SERIES WITH A .1 MFD. 400 VOLT CONDENSER.	455 KC.	EXTREME RIGHT HAND POSITION. (CONDENSER PLATES FULLY OPEN).	C8 AND C7 (2nd. I.F. TRANSFORMER)
2	A.M.	R.F. SECTION OF VARIABLE CONDENSER OR PIN 8 OF THE 12SA7 TUBE IN SERIES WITH A .1 MFD 400 VOLT CONDENSER.	455 KC.	EXTREME RIGHT HAND POSITION. (CONDENSER PLATES FULLY OPEN).	C6 AND C5 (1st. I.F. TRANSFORMER)
3	A.M.	REPEAT STEPS 1 AND 2			
4	A.M.	USE RADIATED SIGNAL (CONNECT BOTH SIDES OF SIGNAL GENERATOR TO RADIATION LOOP).	1700 KC.	1700 KC. CALIBRATION POINT ON DIFFUSER PLATE.	C3 (OSCILLATOR TRIMMER)
5	A.M.		1400 KC.	RESONANCE, APPROXIMATELY 1400 KC. CALIBRATION POINT ON DIFFUSER PLATE.	C1 (ANTENNA TRIMMER)

STEP	SET BAND SWITCH ON	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO—	SET SIGNAL GENERATOR TO—	TURN POINTER DIAL TO—	ADJUST THE FOLLOWING FOR MINIMUM NOISE USING AN UNMODULATED SIGNAL (KEEP SIGNAL FROM SIGNAL GENERATOR AS LOW AS POSSIBLE)
6	F.M.	FM ANTENNA POST IN SERIES WITH A 300 OHM RESISTOR.	21.75 MC.	EXTREME RIGHT HAND POSITION. (CONDENSER PLATES FULLY OPEN).	L1 (TUNING SLUG ON TANK COIL)
7	F.M.		107 MC.	107 MC. CALIBRATION POINT ON DIFFUSER PLATE.	C4 (OSCILLATOR TRIMMER)
8	F.M.		103 MC.	RESONANCE, APPROXIMATELY 103 MC. CALIBRATION POINT ON DIFFUSER PLATE.	C2 (ANTENNA TRIMMER) ROCK VARIABLE FOR MAXIMUM SIGNAL

Note: All tubes and the pilot light may be replaced without removing chassis from cabinet. Remove the cardboard back, and the screw holding the loop to the mounting bracket, then lift loop carefully off the bracket so as to avoid breaking of the wires connecting the loop to the chassis.

SERVICE AND ALIGNMENT INSTRUCTIONS

This receiver has been carefully aligned in the factory and the circuit is unusually stable. Realigning should only be attempted when necessary and only with a proper signal generator and in accordance with the service instructions. The receiver cannot be aligned on modulated signals. To insure proper broadcast alignment it is recommended to use a radiated signal. To radiate the signal connect a loop of about 6" to 8" diameter 1 turn of #14 or #12 wire across the output of the signal generator and place this loop parallel to the loop of the receiver to be aligned at a distance of 8" or 10". For complete alignment instructions on AM and FM Bands see alignment chart.

ALIGNMENT Equipment required: Modulated r-f signal generator, output meter, insulated screw driver, two .1 mfd. 400 volt condensers, one 300 ohm resistor. An FM signal generator is not required for the alignment of this receiver.

With the receiver removed from the cabinet connect output meter across voice coil. Connect ground side of the signal generator in series with a .1/400 volt condenser to the common B—; turn volume control fully on, and keeping the output of the signal generator as low as possible, proceed in the sequence as shown on the alignment chart.

To facilitate alignment of the receiver when removed from cabinet, calibration points are provided on the light diffuser plate, which is mounted to the chassis.

CAUTION: The diffuser strip is assembled to the chassis with 2 PK screws. The one at the left is fastened down tight. The one on the right should be backed off about 2 turns from tight position in order to permit free expansion of the strip and thereby avoid warpage which will interfere with proper movement of the pointer.

Before aligning, close the variable condenser fully counterclockwise (plates fully closed) and check that pointer coincides with the reference dot (extreme left dot) on the diffuser plate.
