RIDER 100% GROUP
VOLUMES I to IX

If you are the holder of a 1938 Rider 100% Group Certificate for Volumes I to VIII, send in the coupon below and we will send your new Certificates and Counter Display for Volumes I to IX.

If you are the owner of Rider's Volumes I to VIII inclusive and have not yet sent for your Rider 100% Group Certificate, send in the title pages of Rider's Volumes I to VIII and the coupon below and we will send you the 1939 Certificates and Counter Display.

100%ERS, NOTICE

In the event you have all the Rider Manuals, but do not have the title page for each, send in those title pages that you do have together with a letter stating that you are the owner of the volume or volumes for which you have no title pages. This letter must be affirmed or sworn to before a duly authorized official, such as a notary public.

In the case of men who are the owners of the Rider Combination Manual, that was distributed through RCA or Cunningham, send in the title page of that for credit on Volumes I, II, and III. Those of you who obtained your Rider Manuals, on tube deals, are entitled to the Rider 100% Group Certificate if you are the owner of Volumes I to IX.

Please be sure to specify what name you wish to appear on your certificate and *please print this name.*

6T AC 3 BAND SUPERHETERODYNE RECEIVER

ANTENNA AND GROUND CONNECTIONS. An antenna from 50 to 100 feet long is recommended. A good ground wire is absolutely essential on this receiver.

POWER SUPPLY. This receiver is designed to operate from the 115-135 or 220 A.C. 50 cycle lines. The voltage change is accomplished by removing the cover from the power transformer and connecting the flexible lead to the desired voltage terminal.

LOCATION OF CONTROLS. The knob on the lower right is the on-off switch and the tone control. The knob on the lower left is the volume control and the knob directly below the selector knob is the wave change switch.

OPERATION. Turn station selector knob to secure desired stations. When tuning in a set, set tuning control carefully to maximum station volume, then adjust volume to desired level with volume control knob.

INSTRUCTIONS FOR ADJUSTING AUTOMATIC TUNING CONTROL

Refer to the diagram underneath cabinet and see which set of adjustment screws will have a tuning range that includes the frequency of the station desired. This is the pair of screws to be adjusted for this particular station. The ranges are listed under each pair of adjustment screws.
(WJZ's transmitting frequency, 760 kc., will be included in the range listed as 600-1000 kc. This pair of screws are to be adjusted for WJZ.)

From the same diagram, after finding where the proper pair of adjustment screws are located, trace dotted line connecting these screws to one of the push buttons. This is the button which, after the adjustments are completed, will tune in the station.
(For WJZ, the dotted line from the set of adjustment screws tuning from 600-1000 kc. connects to button No. 3.)

Push button located by paragraph 4 "IN."
(Push button No. 3 "IN" for WJZ.)

Turn volume control knob on full (to the extreme right) and adjust screw marked "O" until desired station is heard. (In this case until WJZ is heard.) If when making this adjustment, a number of stations can be brought in as the screw is turned and it is doubtful which station is the correct one, press button No. 6 (Manual Tuning) "IN" and move dial pointer by turning station selector knob, to the number on the dial that corresponds to the frequency of the station. (Turn pointer to 76 on the dial. This corresponds to WJZ's frequency 760 kc. The number on the dial must be multiplied by ten to give the frequency in kilocycles.) Listening to the program being broadcast will identify the station when adjusting screw "O."

Adjust screw marked "A" for maximum volume, retarding the volume control and readjusting if necessary. This completes the adjustments for this particular station.

MODEL No. 850

ANTENNA The antenna built into the set will perform to give best results in most localities. However, in communities located more than 100 miles away from a broadcasting station, an outside antenna of 50 to 75 feet may be necessary for better performance. This antenna should be attached to the end of the built in antenna hank.

Alignment,Coils
Parts

Lack of sensitivity, selectivity or poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, inadequate or excessively long antenna, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proven not to be the cause.

NOTE: BE SURE TO FOLLOW PROCEDURE CAREFULLY WHEN ALIGNING, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT.

IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER.

ALIGNING 1720-535 KILOCYCLE BAND:

(a) Connect the ground lead of the test oscillator to the rotor frame of the gang condenser and the other test oscillator lead to the receiver antenna lead through a .00025 Mfd. series condenser.

(b) Check tuning dial adjustment by turning gang condenser until plates touch maximum capacity stop, (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If the dial needle does not point exactly to the last line, move needle to correct position.

(c) Adjust band selector switch for operation on 1720-535 kilocycle band, set test oscillator frequency and receiver dial to 1400 kilocycles.

(d) Adjust trimmers mounted on top of gang condenser for maximum 1400 kilocycle test oscillator signal output.

(e) Check dial calibration and sensitivity at 1000 kilocycles, 700 kilocycles and 600 kilocycles. If gang condenser plates have not been bent and if antenna and R.F. coils are in good condition the gang condenser will properly track all over the band. If sensitivity is low and dial calibration incorrect, it may be necessary to bend the condenser plates at above frequencies to properly align the receiver.

IMPORTANT: Bending of plates is to be avoided if at all possible.

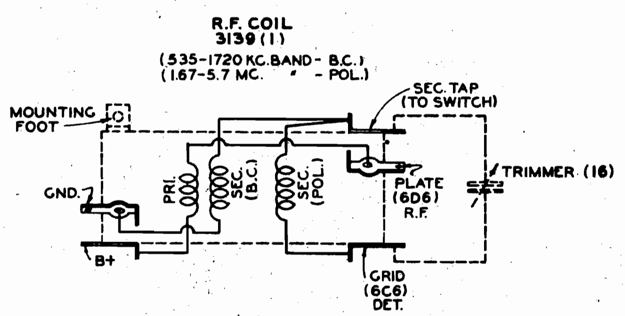
ALIGNING 1.67-5.7 MEGACYCLE BAND:

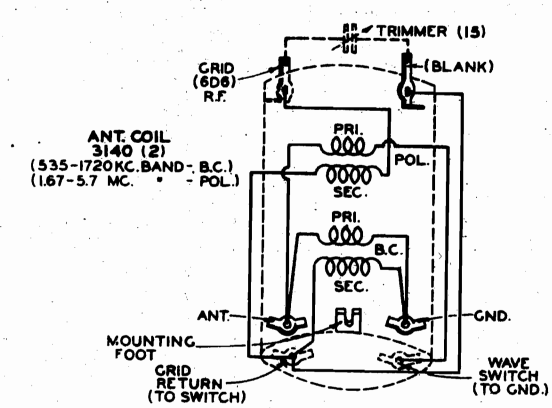
(a) Replace ·00025 Mfd. test oscillator lead series condenser with a 400 ohm resistor. Adjust band selector switch for operation on 1.67 to 5.7 megacycle band and tune receiver dial and set test oscillator frequency to EXACTLY 4.5 megacycles.

(b) Adjust the two trimmers mounted on the antenna and R.F. coil, one of which is located underneath the chassis, and one on top of the chassis for maximum 4.5 megacycle test oscillator signal response.

(c) Check dial calibration at 3 megacycles and 1.7 megacycles, BUT DO NOT BEND GANG CONDENSER PLATES ON THIS BAND.

(d) To assure adequate sensitivity regeneration is present on this band. Receiver should oscillate around 2.5 megacycles when the volume control is at maximum volume position. If oscillation cannot be controlled with volume control, oscillation may be reduced by spreading out or uncoiling a few turns of the coupling coil, which is located underneath the chassis between the wave switch and volume control.





Illus. No.	Part No.	Part Name	Description	List Price

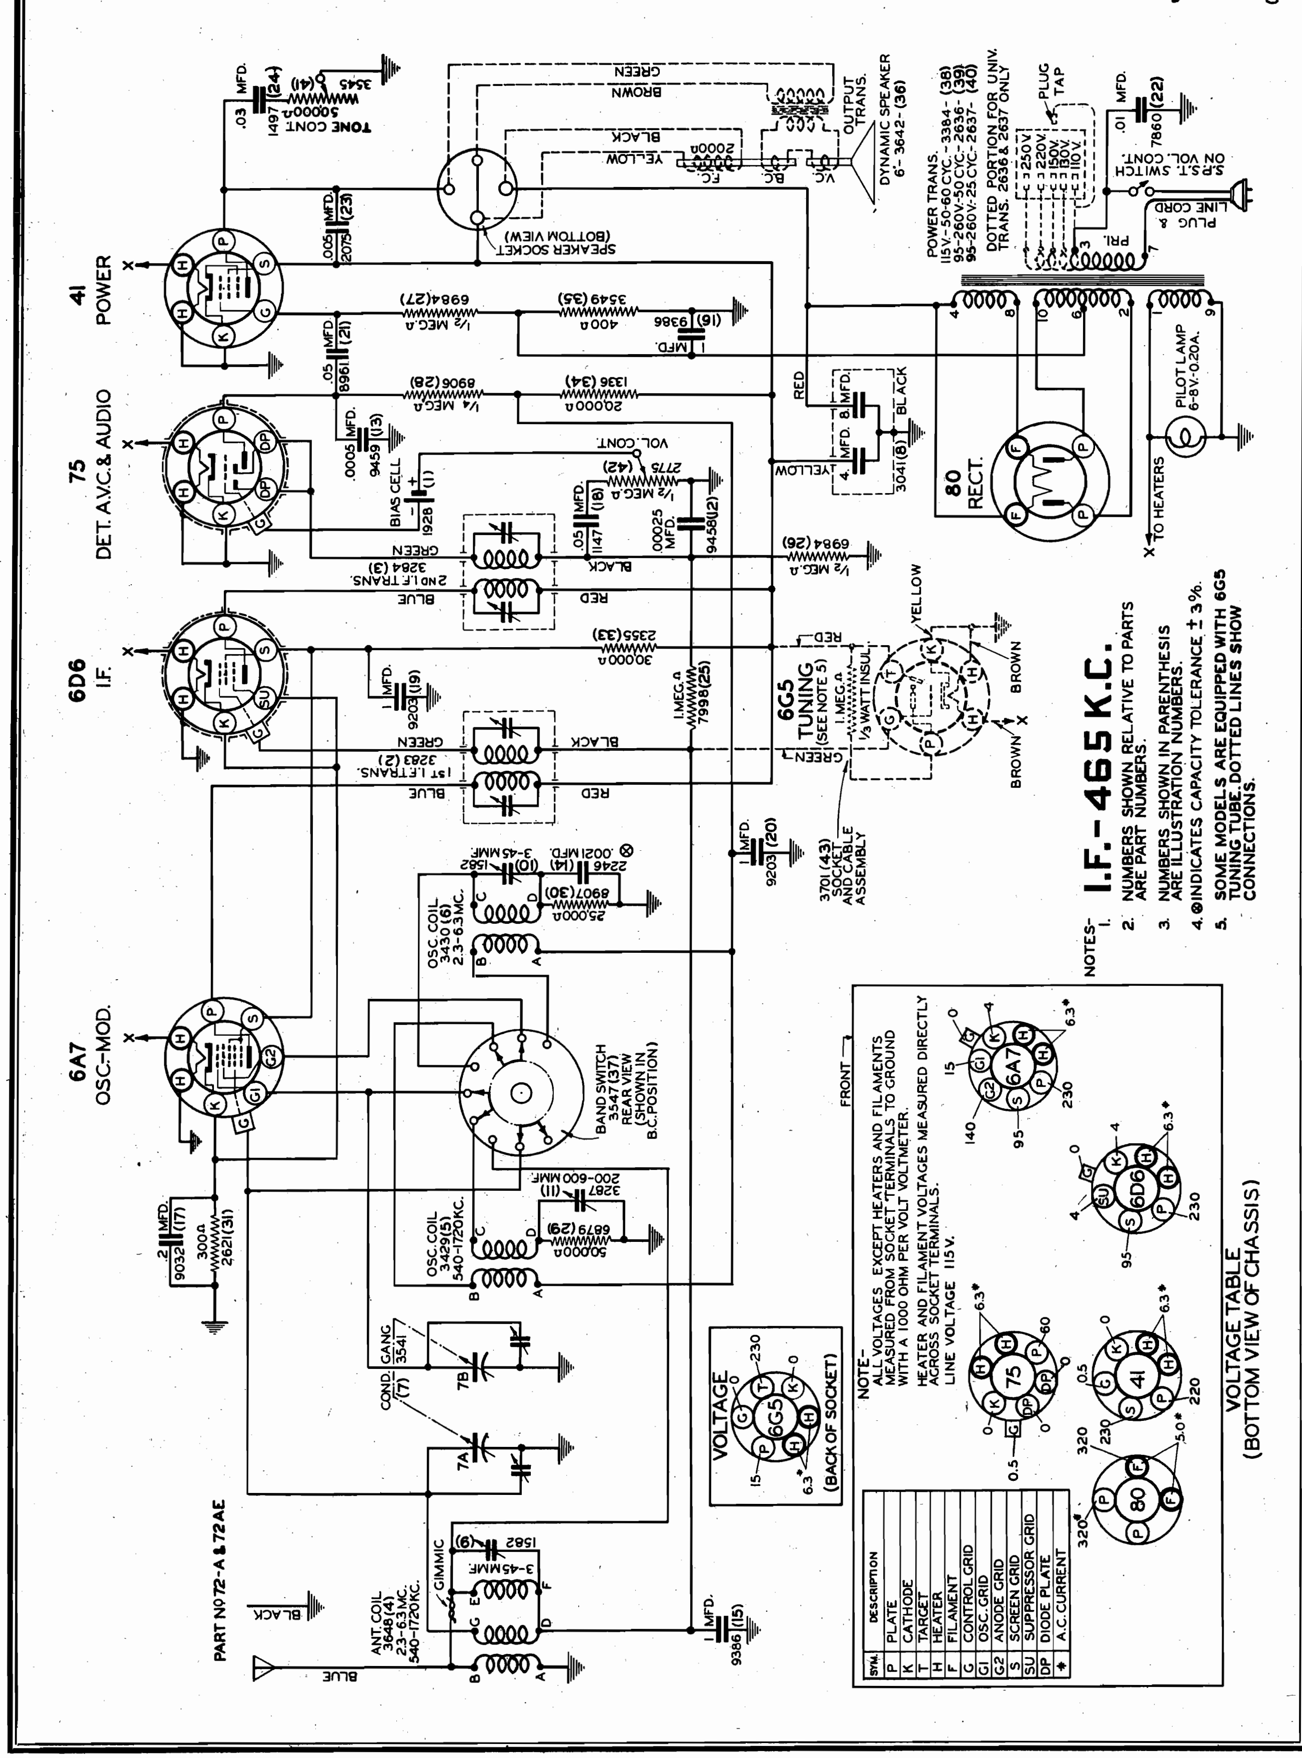
Part No. 69U

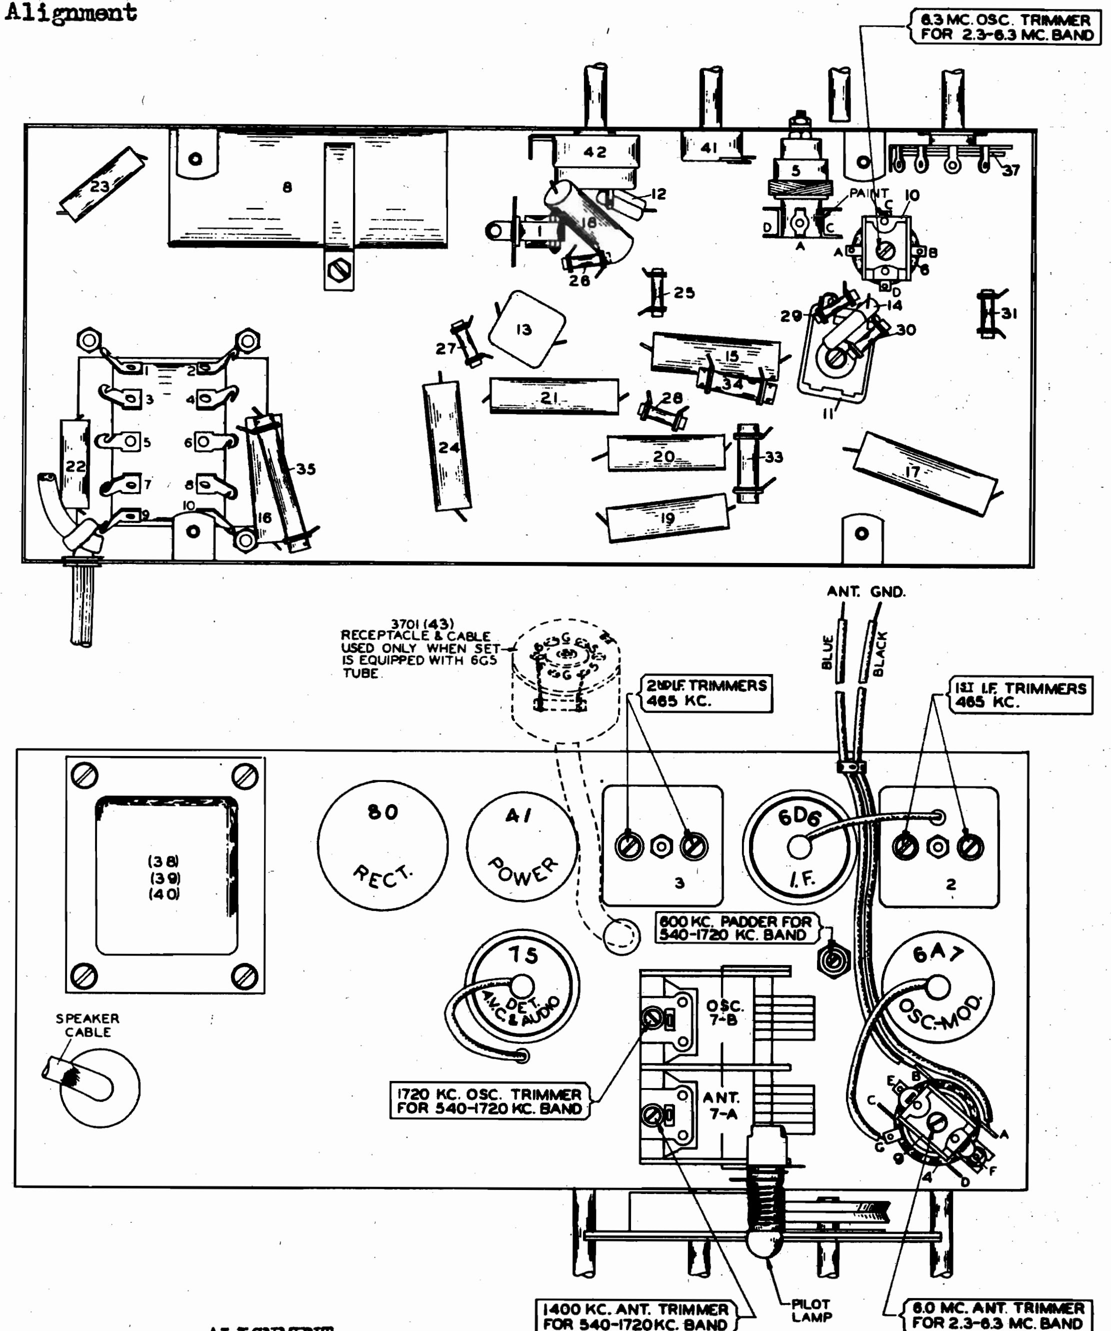
ALLIED RADIO CORP.

MODEL A9741
Chassis 72A
Schematic, Voltage



MODEL A9741
Chassis 72A
Socket, Layout, Trimmers
Alignment

ALLIED RADIO CORP.



Some of these models are equipped with a 6G5 Cathode ray visual tuning indicator tube. The parts and connections shown in dotted lines on the circuit and parts layout diagrams are used only when the 6G5 tube is incorporated in the receiver.

ALIGNMENT

I.F.--CONNECT TEST OSCILLATOR TO 6A7 GRID CAP THROUGH a .02Mfd COND. (DO NOT REMOVE THE GRID CLIP) AND CHASSIS GROUND. TURN VOL. CONT. TO FULL ON. PEAK 2nd and 1st I.F. TRANS. TRIMMERS TO MAX. AT 465 K.C.

R.F.--CONNECT TEST OSCILLATOR TO RECEIVER ANT. THROUGH A .00025Mfd COND AND TO CHASSIS

B.C. 1720 TO 540 KC BAND — GROUND. TURN GANG CONDENSER TO FULLY CLOSED POSITION-DIAL POINTER SHOULD BE AT LAST LINE AT LOW-FREQ. END OF DIAL CALIBRATION (SHIFT POINTER IF NECESSARY). SET REC. DIAL & TEST OSC. FREQ. TO 1720 K.C.--ADJUST OSC. H.F. TRIMMER TO MAXIMUM PEAK (TRIMMER IS ON TOP OF REAR SECTION OF GANG COND.). SHIFT REC. DIAL & TEST OSC. TO 1400 K.C.--ADJUST ANT. TRIMMER TO MAX. (FRONT SECT. OF GANG COND.). SHIFT TO 600 K.C.**ADJUST OSC. PADDER (THROUGH HOLE IN TOP OF CHASSIS NEXT TO GANG COND.) TO MAX. PEAK WHILE ROCKING TUNING COND.

R.F.-- S.W. 2.3 to 6.3 MC — SUBSTITUTE 400 ohm RES. FOR .00025Mfd COND. ABOVE. SET BAND-SELECTOR SWITCH TO S.W. POSITION--TUNE REC. DIAL & TEST OSC. TO 6.3 MEGACYCLES--ADJUST THE 6.3 MC TRIMMER (OSCILLATOR H.F.) TO MAXIMUM PEAK. SHIFT REC. DIAL & TEST OSC. TO THE 6.0 MC POSITION--ADJUST THE 6.0 MC ANTENNA TRIMMER TO MAXIMUM PEAK.

REPEAT ALL ADJUSTMENTS SEVERAL TIMES-USING LOWEST POSSIBLE TEST OSCILLATOR OUTPUT.

NOTE:

Some of these model receivers were equipped with "Teleye" the cathode ray visual tuning indicator. A 6E5 tube was used in early production models, which was replaced by a 6G5 tube in later production. The parts and connections shown in the dotted lines on the complete circuit diagram are used only when a 6G5 "Teleye" tube is incorporated in the receiver. The schem. diag. shows 6E5 tube connections.

ALIGNMENT PROCEDURE: No. 76A

SHOULD REALIGNMENT BE NECESSARY, THERE ARE SEVERAL PRECAUTIONS THAT MUST BE CAREFULLY OBSERVED, THESE ARE:

1. Do not align set until it has reached normal operating temperature. Place the receiver in operation at least 15 minutes before attempting to realign the set.
2. The importance of using the proper type of test equipment and FOLLOWING THE ALIGNMENT PROCEDURE EXACTLY AS GIVEN CANNOT BE TOO STRONGLY EMPHASIZED—failure to do so will result in low sensitivity, poor selectivity, incorrect dial calibration, distortion and unsatisfactory operation of the automatic frequency control.
3. It is absolutely necessary that an accurately calibrated test oscillator with some type of output measuring device and a double scale milliammeter—0 to 1 M. A. and 0 to 5 M.A. be used.
4. To assure most accurate adjustment always carefully repeat all adjustments several times.
5. Once the alignment of the receiver has been completed, do not change the oscillator control tube, particularly with one of a different make.

ALIGNING I.F. STAGE AT 465 KILOCYCLES:

(a) Place automatic frequency control in the maximum left hand A.F.C. "off" position.

(b) Attach the ground lead of the test oscillator to the chassis. Connect the other lead to the grid cap of the 6A8 tube through a .02 Mfd. series condenser. DO NOT REMOVE GRID CLIP.

(c) Set test oscillator to EXACTLY 465 kilocycles and turn volume control on full.

(d) Remove shields held in position by snap fasteners over A.F.C. test jack and over trimmer screw holes in the first and second I.F. transformer shield cans.

(e) Peak second I.F. transformer trimmers for maximum 465 kilocycle output by adjusting the two trimmers accessible through the two top holes in the second I.F. transformer shield can. DO NOT TOUCH DISCRIMINATOR (BOTTOM) SCREW.

(f) Peak each of the first I.F. transformer trimmers for maximum 465 kilocycle signal output.

ALIGNING 1720-540 KILOCYCLE BAND:

(a) Check tuning dial adjustment by turning gang condenser until plates touch maximum capacity stop (completely in mesh), at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If the dial needle does not point exactly to the last line, move needle to correct position.

(b) Remove test oscillator lead from grid of 6A8 tube and connect to receiver "A" antenna post through a .00025 Mfd. condenser.

(c) Adjust A.F.C. control to maximum left hand A.F.C. "off" position and band selector switch for operation on the 1720-540 kilocycle band.

(d) Set test oscillator frequency and receiver dial to EXACTLY 1720 kilocycles, and BRING IN 1720 KILOCYCLE TEST OSCILLATOR SIGNAL TO MAXIMUM OUTPUT BY ADJUSTING 1720 KILOCYCLE OSCILLATOR TRIMMER.

(e) Tune receiver dial and set test oscillator frequency to EXACTLY 1400 kilocycles. Adjust 1400 K.C. R.F. and antenna trimmers for maximum sensitivity.

(f) Set test oscillator frequency and receiver dial to approximately 600 kilocycles. Then while rocking gang condenser slightly to right and left, adjust 600 K.C. oscillator padder for maximum signal response.

ALIGNING DISCRIMINATOR CIRCUIT:

(a) After completing 1720-540 kilocycle adjustment, set test oscillator to EXACTLY 465 KILOCYCLES and connect to grid of 6A8 tube through a .02 Mfd. Condenser—insert lead of double scale 0 to 1 and 0 to 5 milliammeter into A.F.C. test jack located on top of chassis adjacent to the 6L7 tube. To avoid possibility of damaging the meter should one of the milliammeter leads short to the metal chassis, ALWAYS TURN OFF RECEIVER WHEN INSERTING OR REMOVING MILLIAMMETER LEADS FROM A.F.C. TEST JACK.

(b) Short out A.F.C. mute switch by grounding the second from the left (looking at the front of the chassis) of the four lugs mounted on top of the dial assembly. The proper lug to ground is indicated in the "Note X" on chassis top parts view.

(c) Turn receiver on, place A.F.C. switch knob in A.F.C. "on" position and if meter needle jumps off scale adjust output of test oscillator until an approximate 2 M.A. deflection is obtained on the 0 to 5 milliammeter scale.

(d) Place band selector switch for operation on 1720-540 K.C. broadcast band—and set receiver dial somewhere near 1000 kilocycles at a point where no station is heard.

(e) Rotate A.F.C. switch knob from A.F.C. "on" to A.F.C. "off" position and note whether the milliammeter reading changes as the position of the A.F.C. switch is changed. No change in reading indicates proper discriminator trimmer adjustment, while a noticeable change indicates improper discriminator trimmer adjustment.

(f) IMPORTANT: DO NOT ADJUST DISCRIMINATOR TRIMMER UNLESS IT IS ABSOLUTELY NECESSARY. Place A.F.C. switch in A.F.C. "off" position and note milliammeter reading, then place A.F.C. switch in A.F.C. "on" position and CAREFULLY ADJUST DISCRIMINATOR TRIMMER UNTIL MILLIAMMETER READING IS EXACTLY THE SAME AS IT WAS WITH THE A.F.C. SWITCH IN THE "OFF" POSITION.

NOTE: As the discriminator trimmer screw is screwed in (increasing capacity) the milliammeter reading should decrease and as the discriminator trimmer is unscrewed (decreasing capacity) the milliammeter reading should increase. IF WHEN ADJUSTING THE DISCRIMINATOR TRIMMER THE MILLIAMMETER READING DOES NOT SHARPLY INCREASE OR DECREASE AS THE TRIMMER IS ADJUSTED EVEN AFTER SEVERAL TURNS OF THE TRIMMER SCREW, THIS DOES NOT INDICATE PROPER BALANCING BUT DOES INDICATE INCORRECT ADJUSTMENT AND THE DISCRIMINATOR TRIMMER SHOULD BE SET TO ABOUT ½ CAPACITY AND THE ADJUSTMENT OF THE DISCRIMINATOR TRIMMER MADE ALL OVER AGAIN.

ALIGNING 1.68-5.6 MEGACYCLE BAND:

(a) Replace .00025 Mfd. test oscillator antenna lead series condenser with a 400 ohm resistor.

(b) Adjust band selector switch to 1.68-5.6 megacycles, tune receiver dial and set test oscillator frequency to EXACTLY 5.6 megacycles. Bring in 5.6 megacycle test signal to maximum output by adjusting 5.6 M. C. oscillator trimmer.

(c) Tune receiver dial and test oscillator frequency to EXACTLY 5 Megacycles and adjust 5 M.C. antenna trimmer for maximum sensitivity.

ALIGNING 5.55-18.5 MEGACYCLE BAND:

(a) Leave 400 ohm resistor in series with test oscillator lead and place band selector switch for operation on 5.55-18.5 megacycle band, tune receiver dial and set test oscillator frequency to EXACTLY 18.5 megacycles.

(b) Adjust 18.5 M.C. oscillator trimmer to bring in 18.5 megacycle test signal to maximum output.

NOTE: When adjusting this trimmer two peaks, the fundamental and the image peak will be noticed. CARE MUST BE TAKEN THAT THE FUNDAMENTAL PEAK AND NOT THE IMAGE PEAK IS USED FOR ALIGNING THE RECEIVER AT 18.5 MEGACYCLES. Always back off the trimmer to minimum capacity, then screw down the trimmer (add capacity) until the FIRST peak which is the fundamental and the proper one to use is tuned in. If the trimmer is screwed down beyond the point where the first peak is received the incorrect image peak will be tuned in. After completing adjustment of the oscillator trimmer at 18.5 megacycles, always check to see if the proper peak has been used. To do this leave test oscillator frequency at 18.5 megacycles, increase the output of the test oscillator and tune receiver dial to approximately 17.5 megacycles. Then vary the receiver dial slightly to the right and left of 17.5 megacycles, and if the fundamental peak was used in aligning at 18.5 megacycles the test oscillator signal will be heard at approximately 17.5 megacycles on the receiver dial.

(c) Tune receiver dial and set test oscillator frequency to EXACTLY 15 megacycles.

(c) Rock gang condenser slightly to right and left and adjust 15 M.C. antenna trimmer for maximum 15 megacycle test signal response.

To assure more accurate trimmer setting, repeat all above adjustments several times always using lowest possible test oscillator output consistent with readable output meter scale deflection.

"Automatic-Flash" tuning

1. Lay station call letter tab sheet on flat surface and with a razor or sharp knife cut out desired tabs by cutting around the black edges of each required station tab.
2. Unscrew the two knurled head screws mounted on front of the glass frame and then holding onto the screws pull dial glass away from the cabinet.
3. To illustrate the proper setting and installation of the metal holder and station call letter tabs, the receiver is shipped from the factory with a tab properly set for Station WGN, 720 kilocycles. Carefully study the way the call letter tab and celluloid envelope is inserted in the metal holder, and if WGN is not one of the selected stations, remove WGN celluloid envelope and call letter tab by sliding the celluloid envelope out through the top of the metal holder. See "B" in diagram.
4. Turn Automatic Frequency and Inter-Station Noise Silencer Control to maximum left hand position.
5. As it is desirable to begin setting metal tab holders at the low frequency end of the broadcast band (540 kilocycles) carefully tune in the selected station which broadcasts on the lowest frequency—least number of kilocycles.
6. By using the metal holder tool (see "A" in diagram) or by grasping with the finger tips, carefully slide the metal holder which is closest to the low frequency end of the broadcast band (540 kilocycles) . . . along the metal rail to which the 12 metal holders are clipped . . . until a narrow light appears directly below the metal tab holder being adjusted.
7. Place paper tab having call letters and frequency of station tuned in inside of celluloid envelope . . . insert the celluloid envelope with curved end to the rear . . . into the top of the metal holder (see "A" in diagram) . . . and push the envelope down until the curved end of the celluloid envelope fits into the curved top of the metal holder.
8. Turn Automatic Frequency and Inter-Station Silencer Control to the maximum right hand "Automatic-Flash" position. **Slowly tune slightly to the right and left of the station tuned in and if the metal tab holder is properly set, the white figures of the call letter tab will be illuminated at approximately the same instant the station is heard.** IF THE CALL LETTER TAB IS ILLUMINATED AND THE STATION IS NOT HEARD, OR IF THE SIGNAL IS DISTORTED, THE METAL TAB HOLDER IS INCORRECTLY SET AND IT WILL BE NECESSARY TO MOVE THE METAL TAB HOLDER TO THE CORRECT POSITION. See paragraphs 5 and 6 for proper procedure.
9. After metal holder is properly adjusted for the selected station operating on the lowest frequency, set a station call letter metal tab holder for the station operating on the next lowest frequency, continuing on in this way until a tab holder is set for all the selected stations.

After the call letter tab metal holders are adjusted so that when the station is tuned in with greatest clarity the light in back of the call letter tab illuminates the tab, the adjustment of the tabs is completed and thereafter will require no attention except when moved from their position by tampering or when an additional station tab is included which would disturb the position of the other tabs.

NOTE: A distorted signal and motorboating sound that is heard just as the station tab is illuminated and only when the A.F.C. switch is in the A.F.C. "on" position is generally caused by the mute switch contact not making good contact to the metal tab holder due to:

(a) Dirt or corrosion on contact surface of tab holder or rail.

(b) The rail to which the metal tab holders are clipped may be sprung forward preventing contact between the mute switch and the metal tab holder.

To determine whether the cause is due to poor contact, press slightly inward near the middle of the rail, and if the motorboating sound is eliminated and the signal is heard with normal clarity, it is a positive indication that the rail will have to be bent in slightly or—the contact surface of the metal holder is dirty or—the mute switch tension spring is bent back or has lost its resiliency.

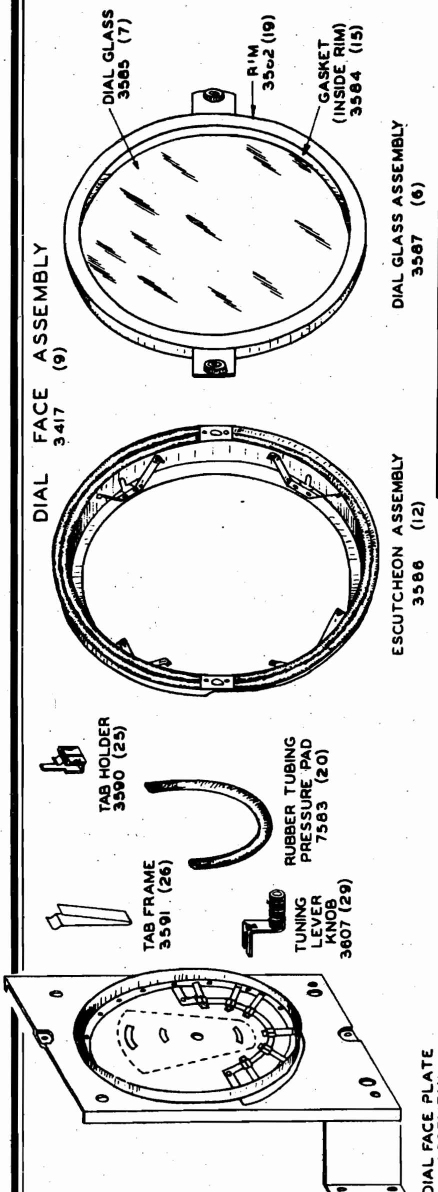
If the rail requires adjustment place thumbs near the upper right and left ends of the rail and press slightly inward until proper contact is made to all metal holders. While the rail will naturally come forward slightly after pressure is released, do not attempt to force the rail inward with too much pressure at one time. Several adjustments are better than extreme force which would cause the opaque screen to break.

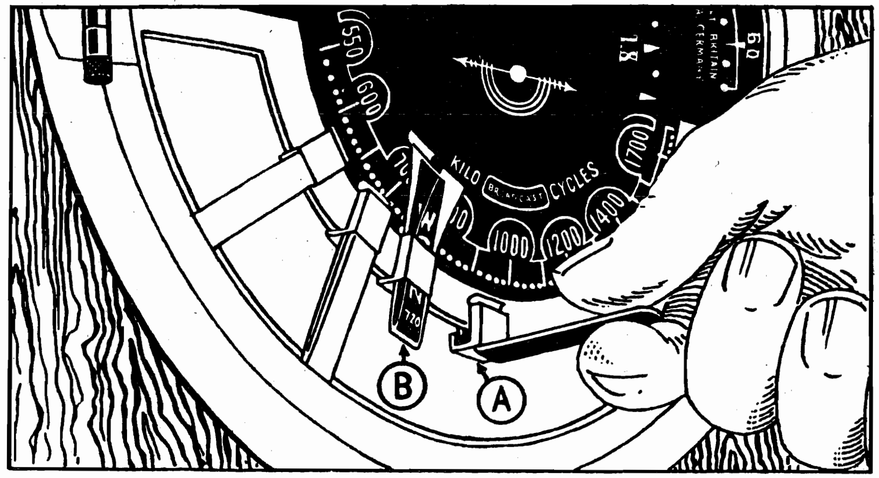
If the metal tab holders move as the tuning lever is rotated, the tabs have probably been sprung, which can be corrected by removing them from the rail and slightly squeezing the tab with a pair of long nosed pliers so as to decrease the clearance between the rear contact portion of the metal tab and the front portion.

Dial Assembly, Parts Data

ALLIED RADIO CORP.

MODELS A9757, A9758
Chassis 76A





Above Diagram shows method of inserting and setting tabs.

PROCEDURE FOR REMOVING RECEIVER FROM CABINET.

1. Unscrew the two knurled head screws mounted on front of the glass frame and then holding onto the screws pull dial glass away from the cabinet.
2. Swing 'rapid tuning' lever to center position as shown, **loosen** (do not remove) **screw thru hole in bottom center,** and remove lever knob.
3. Loosen set screws on all five tuning knobs, and remove knobs from shafts. (Not shown in sketch).
4. Remove four bolts at bottom side of chassis mtg. shelf (not shown in sketch.)
5. Remove wood screws on the pressure brackets at rear of chassis (not shown in sketch) and then slide receiver out of cabinet.
6. When replacing receiver in cabinet, reverse entire procedure given above.

NOTES:—

Alignment, Coils, Parts

ALLIED RADIO CORP.

Alignment of this receiver should never be necessary unless one of the coils has been replaced.

Lack of sensitivity, selectivity or poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, improperly connected or low batteries, open or grounded bias resistor, bypass condenser, inadequate or excessively long antenna, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proven not to be the cause.

NOTE: BE SURE TO FOLLOW PROCEDURE CAREFULY WHEN ALIGNING, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT.

IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER.

ALIGNING I. F. STAGE AT 465 KILOCYCLES:

(a) Connect the ground lead of the test oscillator to the chassis or set ground lead. Connect the other lead of the test oscillator to the grid cap of the 1C6 tube through a .02 Mfd. series condenser. DO NOT REMOVE GRID CLIP.

(b) Set test oscillator to EXACTLY 465 kilocycles and turn receiver volume control on full.

(c) Peak each of the second I. F. transformer trimmers.

(d) Peak each of the first I. F. transformer trimmers.
To assure most accurate trimmer setting repeat above adjustment several times always using lowest possible test oscillator output consistent with readable output meter scale deflection.

ALIGNING ANTENNA AND OSCILLATOR CIRCUIT:

(a) Remove test oscillator lead from grid of the 1C6 tube and attach it to the receiver antenna lead through a .00025 Mfd. series condenser.

(b) Check tuning dial adjustment by turning gang condenser until plates touch maximum capacity stop (completely in mesh), at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If the dial needle does not point exactly to the last line move needle to correct position.

(c) Set receiver dial and test oscillator frequency to EXACTLY 1720 kilocycles.

(d) Bring in 1720 KC test oscillator signal to maximum output by adjusting the trimmer condenser mounted on top of the oscillator section of the gang condenser.
Looking at the front of the receiver the rear section of the gang condenser is the oscillator section.

(e) Tune receiver dial and set test oscillator frequency to EXACTLY 1400 kilocycles.

(f) Adjust trimmer on top of the front section gang condenser (antenna section) for maximum 1400 kilocycle test signal response.

(g) Tune receiver dial and set test oscillator frequency to approximately 600 kilocycles.

(h) While rocking the tuning condenser back and forth adjust 600 KC oscillator padder condenser which is accessible through the hole in the top of the chassis adjacent to the gang condenser for maximum 600 kilocycle signal response.

Alignment, Parts

GENERAL DATA

The alignment of this receiver requires the use of a test oscillator which will cover the frequencies of 456, 600, 1400, 1800, 4000, 6000, and 14,000 KC and an output meter which is to be connection across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible, to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE

The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast Band should always be the next procedure; after which, either or both of the Short Wave Bands may be aligned.

I.F. ALIGNMENT

Adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (6A8) through a .05 or .1 mfd. condenser. The ground on the test oscillator can be connected to the chassis ground. Align all five I.F. trimmers to peak or maximum reading on the output meter. As there are two stages of I.F. in this receiver, there will be consequently three I.F. transformers to align.

BROADCAST BAND ALIGNMENT

550 to 1700 K.C.

Adjust the oscillator to 1400 KC and connect the output to the antenna post marked "A" through a .001 md. mica condenser to give the equivalent of an antenna about 60 feet. Set the receiver pointer to 1400 KC and adjust the broadcast oscillator trimmer to peak. (See drawing for location.) After this has been carefully done, the next step is to adjust the front trimmer of the gang condenser to peak. The front condenser section tunes the pre-amplifier stage. Then adjust the Broalcast Band R. F. trimmer to peak. This trimmer aligns the grid or input circuit of the 6A8 tube. (See drawing for position of Broadcast R. F. trimmer). Next, re-set the dial pointer on the receiver and the test oscillator to 600 KC. Slowly increase or decrease the B. C. oscillator padding condenser and at the same time continuously tune back and forth across the signal with the receiver until the maximum reading is obtained on the output meter. This adjustment may seem a little complicated but is the easiest way to adjust the oscillator to the R.F. section. (For location of B.C. padding condenser see drawing.) Return to 1400 KC and again go over the adjustments of this frequency to be certain that they were not put slightly out of alignment when adjustment was made at 600 KC. This completes the correct sequence of operations in properly aligning the receiver for the Broadcast Band.

FOREIGN BAND ALIGNMENT

5.5 to 18 megacycles

The Foreign Band of 19 to 49 meters can be adjusted by the two trimmers marked and illustrated in the drawing as S.W. oscillator and S.W. trimmer. In preparing the test oscillator for alignment of this band, connect a 400 ohm carbon resistor in series with the .0001 mfd. condenser on the output lead of the test oscillator. Set the receiver pointer to 14,000 KC (also test oscillator).

Then proceed to adjust these two trimmers for peak at 14,000 KC (adjust oscillator trimmer first) and as the inherent design of the circuit has been expressly developed for simplicity in servicing, only these two adjustments are necessary for aligning this band. NOTE: Always start this procedure by having the oscillator coil trimmer loose (out all the way), and the antenna coil trimmer fairly tight (in all the way); otherwise it is possible to make a false alignment on the image frequency. In order to prevent alignment on the image frequency, it is suggested that the following check be made: Readjust the pointer to 13,100 KC where the image frequency should be found. If properly aligned, the image frequency will be found to be weaker. If, however, the signal at 13,100 KC is found to be stronger than the signal at 14,000 KC, it signifies that alignment was incorrectly made on the image frequency.

POLICE BAND

1700 to 5400 K.C.

In preparing the test oscillator for alignment of this band, connect a 400 ohm carbon resistor in series with a .0001 mfd. condenser on the output lead of the test oscillator. This resistor is used with the test oscillator only on the Short Wave Bands and should not be used for Broadcast Band alignment.

Set the receiver pointer to 4000 KC (also test oscillator) and adjust the Police Band oscillator circuit trimmer to peak.

After this has been carefully done, the next step is to adjust the Police Band antenna trimmer to peak.

Now reset the dial pointer and the test oscillator to 1800 KC in preparation for adjusting the police band padding condenser.

Slowly increase or decrease the oscillator padding condenser and at the same time continuously tune back and forth across the signal with the receiver until the maximum reading is obtained on the output meter. This adjustment may seem a little complicated, but is the easiest way to correctly adjust the oscillator to the R.F. or antenna section. Return to 4000 KC and again go over the adjustments of this frequency to be certain that they were not put slightly out of alignment when adjustment was made 1800 KC.

If it is found that in returning to 4000 KC the pointer is accurately on scale, no further adjustment should be necessary (in this recheck). If the pointer is found off scale, it may be corrected and put on scale by readjustment of the police band oscillator trimmer. Alignment of the pointer can only be corrected by adjustment of the oscillator trimmer.

IMPORTANT: The Police Band Oscillator Trimmer, Police Band Antenna Trimmer Police Band Padding Trimmer are the only three adjustments required in aligning this band.

This receiver is designed to operate from a power supply main of 110-120 volts, 60 cycle alternating current (AC). Never plug into a DC outlet.

WAVE TRAP ADJUSTMENT

At the rear of the chassis near the Antenna and Ground posts is an adjustment screw connected to a trap circuit for elimination of code interference when operating on the broadcast band. If code interference is encountered adjustment of this screw will filter it out. It is to be used only if such interference is experienced in broadcast reception. It's use prevents code transmitters operating on a frequency around 456 K. C. from being received by the I. F. amplifier which is tuned to 456 K. C.

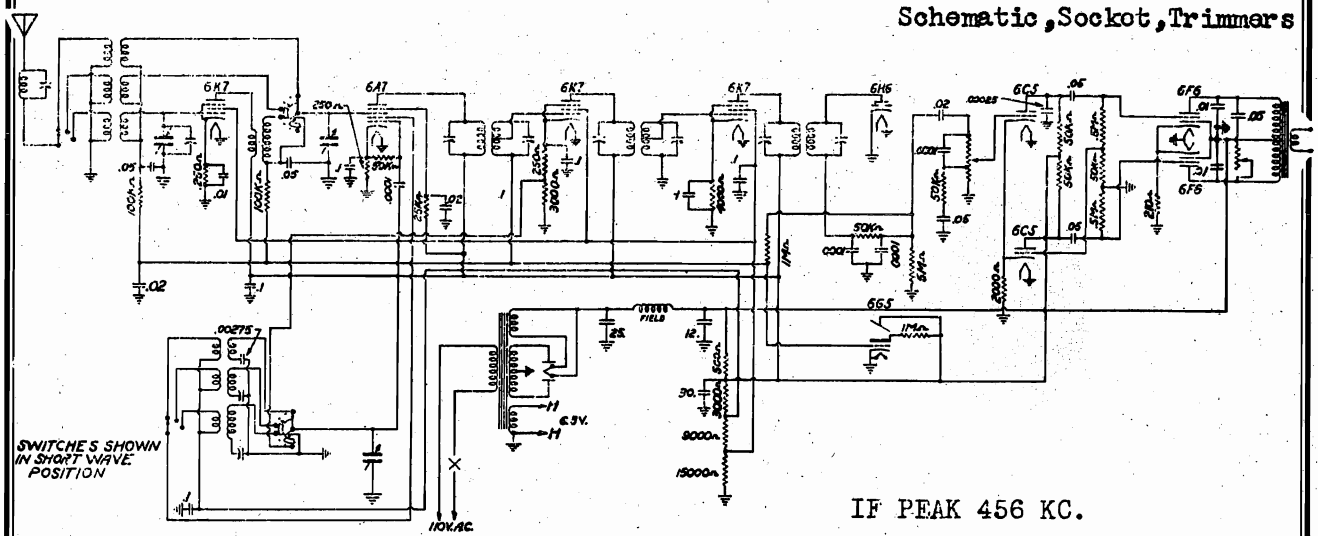
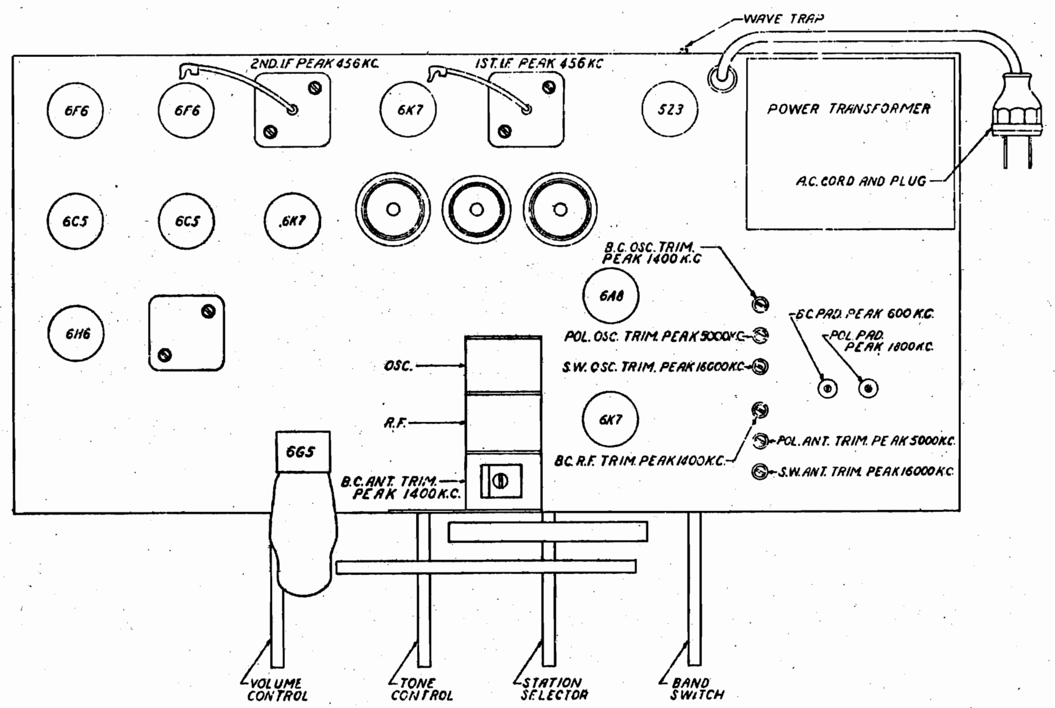
A9854
Chassis AM7
Schematic, Socket, Trimmers



IF PEAK 456 KC.



The dial is calibrated with each band covering 340 degrees of tuning scale length and are each concentric with the center of the dial face. The innermost scale is calibrated from 150 to 375 K.C. (2000 to 800 meters) and covers the range necessary for receiving governmental time and weather reports. The second band from the center is for standard broadcasts covering from 550 to 1700 K.C. (175 to 545 meters). The third band from the center covers the intermediate short wave length broadcasts of Police, Amateur, Aircraft and ships and extends from 1700 to 5400 K.C. (55 to 180 meters). The fourth band covers all of the principle short wave channels for reception from countries all over the world. This band carries a calibration of from 5.5 to 18 megacycles (16.4 to 55 meters.) This short wave scale is the one which includes the five internationally assigned bands—the 19, 25, 31, 39 and 49 meter channels.

ALLIED RADIO CORP.

Chassis AM7
Alignment, Parts

GENERAL DATA

The alignment of this receiver requires the use of a test oscillator which will cover the frequencies of 456, 600, 1400, 1800, 4000, 6000, and 14,000 KC and an output meter which is to be connection across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible, to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE

The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast Band should always be the next procedure; after which, either or both of the Short Wave Bands may be aligned.

I.F. ALIGNMENT

Adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (6A8) through a .05 or .1 mfd. condenser. The ground on the test oscillator can be connected to the chassis ground. Align all five I.F. trimmers to peak or maximum reading on the output meter. As there are two stages of I.F. in this receiver, there will be consequently three I.F. transformers to align.

BROADCAST BAND ALIGNMENT

Adjust the oscillator to 1400 KC and connect the output to the antenna post marked "A" through a .001 md. mica condenser to give the equivalent of an antenna about 60 feet. Set the receiver pointer to 1400 KC and adjust the broadcast oscillator trimmer to peak. (See drawing for location.) After this has been carefully done, the next step is to adjust the front trimmer of the gang condenser to peak. The front condenser section tunes the pre-amplifier stage. Then adjust the Broalcast Band R. F. trimmer to peak. This trimmer aligns the grid or input circuit of the 6A8 tube. (See drawing for position of Broadcas R. F. trimmer). Next, re-set the dial pointer on the receiver and the test oscillator to 600 KC. Slowly increase or decrease the B. C. oscillator padding condenser and at the same time continuously tune back and forth across the signal with the receiver until the maximum reading is obtained on the output meter. This adjustment may seem a little complicated but is the easiest way to adjust the oscillator to the R.F. section. (For location of B.C. padding condenser see drawing.) Return to 1400 KC and again go over the adjusments of this frequency to be certain that they were not put slightly out of alignment when adjustment was made at 600 KC.

This completes the correct sequence of operations in properly aligning the receiver for the Broadcast Band.

FOREIGN BAND ALIGNMENT

The Foreign Band of 19 to 49 meters can be adjusted by the two trimmers marked and illustrated in the drawing as S.W. oscillator and S.W. trimmer. In preparing the test oscillator for alignment of this band, connect a 400 ohm carbon resistor in series with the .0001 mfd. condenser on the output lead of the test oscillator. Set the receiver pointer to 14,000 KC (also test oscillator).

Then proceed to adjust these two trimmers for peak at 14,000 KC (adjust oscillator trimmer first) and as the inherent design of the circuit has been expressly developed for simplicity in servicing, only these two adjustments are necessary for aligning this band. NOTE: Always start this procedure by having the oscillator coil trimmer loose (out all the way), and the antenna coil trimmer fairly tight (in all the way); otherwise it is possible to make a false alignment on the image frequency. In order to prevent alignment on the image frequency, it is suggested that the following check be made: Readjust the pointer to 13,100 KC where the image frequency should be found. If properly aligned, the image frequency will be found to be weaker. If, however, the signal at 13,100 KC is found to be stronger than the signal at 14,000 KC, it signifies that alignment was incorrectly made on the image frequency.

POLICE BAND

In preparing the test oscillator for alignment of this band, connect a 400 ohm carbon resistor in series with a .0001 mfd. condenser on the output lead of the test oscillator. This resistor is used with the test oscillator only on the Short Wave Bands and should not be used for Broadcast Band alignment.

Set the receiver pointer to 4000 KC (also test oscillator) and adjust the Police Band oscillator circuit trimmer to peak.

After this has been carefully done, the next step is to adjust the Police Band antenna trimmer to peak.

Now reset the dial pointer and the test oscillator to 1800 KC in preparation for adjusting the police band padding condenser.

Slowly increase or decrease the oscillator padding condenser and at the same time continuously tune back and forth across the signal with the receiver until the maximum reading is obtained on the output meter. This adjustment may seem a little complicated, but is the easiest way to correctly adjust the oscillator to the R.F. or antenna section. Return to 4000 KC and again go over the adjustments of this frequency to be certain that they were not put slightly out of alignment when adjustment was made 1800 KC.

If it is found that in returning to 4000 KC the pointer is accurately on scale, no further adjustment should be necessary (in this recheck). If the pointer is found off scale, it may be corrected and put on scale by readjustment of the police band oscillator trimmer. Alignment of the pointer can only be corrected by adjustment of the oscillator trimmer.

IMPORTANT: The Police Band Oscillator Trimmer, Police Band Antenna Trimmer Police Band Padding Trimmer are the only three adjustments required in aligning this band.

WAVE TRAP ADJUSTMENT

At the rear of the chassis near the Antenna and Ground posts is an adjustment screw connected to a trap circuit for elimination of code interference when operating on the broadcast band. If code interference is encountered adjustment of this screw will filter it out. It is to be used only if such interference is experienced in broadcast reception. It's use prevents code transmitters operating on a frequency around 456 K. C. from being received by the I. F. amplifier which is tuned to 456 K. C.

This receiver is designed to operate from a power supply main of 110-120 volts, 60 cycle alternating current (AC). Never plug into a DC outlet.

If it is suspected that the oscillator has stopped but is doubtful due to the presence of the usual amount of noise level, it is suggested that the oscillator plate voltage be checked. To ascertain whether the tube is oscillating, ground the oscillator grid of the 6A8 (short stator and rotor plates of oscillator section on gang condenser). If oscillating properly, grounding the grid will cause an appreciable drop in oscillator voltage. Grounding or shorting the stator and grid components should be accomplished by grounding the stator mounting nut to the frame of the condenser with a screw-driver or any metallic conductor.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT.

TRIMMER AND PADDING CONDENSERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE CIRCUIT DIAGRAM.

ALIGNING I. F. STAGE AT 465 KILOCYCLES:

(a) Attach the ground lead of the test oscillator to the chassis. Connect the other lead to the grid cap of the 6L7 tube through a .02 Mfd. series condenser. DO NOT REMOVE GRID CLIP.
(b) Set test oscillator to EXACTLY 465 kilocycles and turn receiver volume control on full.
(c) Peak each of the second I. F. transformer trimmers.
(d) Peak each of the first I. F. transformer trimmers.

To assure most accurate trimmer setting repeat above adjustment several times always using lowest possible test oscillator output consistent with readable output meter scale deflection.

ALIGNING 1800-540 KILOCYCLE BAND:

(a) Adjust band selector switch for operation on the 1800-540 kilocycle band, remove test oscillator lead from grid of 6L7 tube and connect to receiver antenna terminal through a .00025 Mfd. series condenser.
(b) Set test oscillator frequency and receiver dial to EXACTLY 1800 kilocycles, and bring in 1800 kilocycle test oscillator signal to maximum output by adjusting 1800 kilocycle oscillator trimmer.
(c) Tune receiver dial and set test oscillator frequency to EXACTLY 1500 kilocycles. Adjust 1500 K. C. R. F. and ant. trimmers for maximum sensitivity.
(d) Set test oscillator frequency and receiver dial to approximately 600 kilocycles. Then while rocking gang condenser slightly to right and left, adjust 600 K. C. oscillator padder for maximum signal response.

ALIGNING 1.8-6.3 MEGACYCLE BAND:

(a) Replace .00025 Mfd. antenna series condenser with 400 ohm resistor, adjust band selector switch to 1.8-6.3 megacycles band, tune receiver dial and set test oscillator frequency to EXACTLY 6.3 megacycles. Bring in 6.3 megacycle test oscillator signal to maximum output by adjusting 6.3 M.C. oscillator trimmer.
(b) Tune receiver dial and set test oscillator frequency to EXACTLY 6 megacycles. Then adjust 6 M.C. ant and R.F. trimmers for maximum sensitivity.

ALIGNING 6.1-21 MEGACYCLE BAND:

(a) Place band selector switch for operation on 6.1-21 megacycle band, tune receiver dial and set test oscillator frequency to EXACTLY 21 megacycles.
(b) Adjust 21 M. C. oscillator trimmer to bring in 21 megacycle test signal to maximum output.

NOTE: When adjusting this trimmer two peaks, the fundamental and the image peak will be noticed. CARE MUST BE TAKEN THAT THE FUNDAMENTAL PEAK AND NOT THE IMAGE PEAK IS USED FOR ALIGNING THE RECEIVER AT 21 MEGACYCLES. Always back off the trimmer to minimum capacity, then screw down the trimmer (add capacity) until the first peak which is the fundamental and the proper one to use is tuned in. If the trimmer is screwed down beyond the point where the first peak is received, the incorrect image peak will be tuned in. After completing adjustment of the oscillator trimmer at 21 megacycles always check to see if the proper peak has been used. To do this leave test oscillator frequency at 21 megacycles, increase the output of the test oscillator and tune receiver dial to approximately 20 megacycles. Then vary the receiver dial slightly to the right and left of 20 megacycles, and if the fundamental peak was used in aligning at 21 megacycles the test oscillator signal will be heard at approximately 20 megacycles on the receiver dial.

(c) Tune receiver dial and set test oscillator frequency to EXACTLY 18 megacycles.
(d) Adjust 18 M. C. antenna and R. F. trimmers for maximum 18 megacycle test signal response.

ALIGNING 390-140 KILOCYCLE BAND:

(a) Adjust band selector switch for operation on 390 to 140 kilocycle band, tune receiver dial and set test oscillator frequency to EXACTLY 390 kilocycles.
(b) Bring in 390 Kilocycle test signal to maximum output by adjusting 390 K. C. oscillator trimmer.
(c) Tune receiver dial and set test oscillator frequency to EXACTLY 350 kilocycles. Adjust 350 K. C. ant. and R. F. trimmers for maximum sensitivity.
(d) Tune receiver dial and set test oscillator frequency to approximately 150 kilocycles, then while rocking gang condenser slightly to right and left adjust 150 kilocycle oscillator padder for maximum sensitivity.

ALLIED RADIO CORP.

Alignments

CHASSIS MODEL No. 46A
A. C. Superheterodyne Receiver

ALIGNMENT PROCEDURE:

Realignment of this receiver should never be necessary unless one of the oscillator, antenna, or I. F. coils has been replaced. Lack of sensitivity, selectivity, and poor tone quality may be due to any one or a combination of causes, such as weak or defective tubes or speaker, inadequate or excessively long antenna, open or grounded bias resistor, bypass condenser, etc. Under no circumstances should realignment be attempted until all other possible sources have been first thoroughly investigated and have been definitely proven not to be the cause.

If an I. F. tube is replaced it is advisable to realign the I. F. Amplifier particularly if the replacement tube is one of a different manufacture than the one in the receiver. It is important when aligning to carefully follow the procedure in the order given, otherwise the receiver will lack sensitivity and the dial calibration will be incorrect.

IT IS IMPERATIVE THAT AN ACCURATELY CALIBRATED OSCILLATOR BE USED WITH SOME TYPE OF OUTPUT MEASURING DEVICE.

INTERMEDIATE ALIGNMENT:

1. Connect the high side of the test oscillator output to the control grid of the 6D6 modulator tube through a .02 Mfd. condenser. Leave the grid cap connected to the grid terminal of the tube, and connect the ground side of the test oscillator to the receiver ground.

2. Set the test oscillator frequency to 465 kilocycles (this must be accurate).

3. Align the second intermediate transformer by turning one of the trimmer screws accessible through holes in the top of the transformer shields up and down (increasing and decreasing capacity) until maximum reading is obtained on the output meter, after which adjust the other trimmer screw of the same transformer for maximum sensitivity.

4. Adjust the first intermediate transformer in the same manner as the second I. F. transformer.

TO ALIGN THE VARIABLE CONDENSER:

It is important when aligning the gang condenser, padding and trimmer condensers to follow the procedure carefully, otherwise the receiver will be insensitive and the dial calibration will be incorrect. The padding and trimmer condensers located underneath the chassis will be referred to by their function as indicated on the circuit diagram.

1. Connect the high output side of the test oscillator through a 400 ohm resistor to the receiver antenna lead and the low side to the set ground.

2. Place the band selector switch for operation on the 5.8 to 18.1 megacycle band, tune the receiver dial, and set the test oscillator frequency to EXACTLY 18.1 MEGACYCLES.

Tune in the 18.1 MEGACYCLE SIGNAL TO MAXIMUM OUTPUT BY ADJUSTING THE 18.1 MEGACYCLE OSCILLATOR TRIMMER. When adjusting this trimmer two peaks, the fundamental and the image peak will be noticed. CARE MUST BE TAKEN THAT THE FUNDAMENTAL PEAK AND NOT THE IMAGE PEAK IS USED FOR ALIGNING THE RECEIVER at 18.1 MEGACYCLES. Always back off the trimmer to minimum capacity, then screw down the trimmer (add capacity) until the first peak which is the fundamental and the proper one to use is tuned in. If the trimmer is screwed down beyond the point where the first peak is received, the incorrect image peak will be tuned in. After completing adjustment of the oscillator trimmer at 18.1 megacycles always check to see if the proper peak has been used. To do this leave the test oscillator frequency at 18.1 megacycles, increase the output of the test oscillator and tune the receiver dial to approximately 17.1 megacycles, and if the fundamental peak was used in aligning at 18.1 megacycles the test oscillator signal will be heard at approximately 17.1 megacycles on the receiver dial. If it is not possible to receive the signal, then the fundamental peak was not used and the 18.1 megacycle oscillator trimmer must be properly readjusted.

3. With band selector switch set for operation on 5.8 to 18.1 megacycle band tune the receiver dial and set test oscillator frequency to EXACTLY 16 MEGACYCLES. Adjust 16 megacycle antenna trimmer for maximum 16 megacycle signal sensitivity.

4. Place band selector switch for operation on 1.7 to 5.8 megacycle band, tune the receiver dial, and set test oscillator frequency to EXACTLY 5.8 MEGACYCLES. BRING IN 5.8 MEGACYCLE SIGNAL TO MAXIMUM OUTPUT by adjusting 5.8 megacycle oscillator trimmer.

5. With the band selector switch set for operation on the 1.7 to 5.8 megacycle band tune receiver dial and set test oscillator frequency to EXACTLY 5 MEGACYCLES. Then adjust 5 megacycle antenna trimmer for maximum 5 megacycle signal sensitivity.

6. Replace the 400 ohm resister in series with test oscillator lead with a 200 Mmfd. condenser, place the band selector switch for operation on the 540 to 1720 kilocycle band, tune receiver dial, and set test oscillator frequency to EXACTLY 1720 KILOCYCLES. NEXT BRING IN THE 1720 KILOCYCLE SIGNAL TO MAXIMUM OUTPUT BY ADJUSTING 1720 KILOCYCLE OSCILLATOR TRIMMER.

7. With band selector switch placed for operation on the 540 to 1720 kilocycle band set test oscillator frequency and receiver dial to EXACTLY 1400 KILOCYCLES. Adjust 1400 kilocycle preselector and antenna trimmers for maximum 1400 kilocycle signal sensitivity.

Model 68B-68BE— Six Volt Storage Battery Operated Three Band Superheterodyne Receiver

ALIGNMENT PROCEDURE:

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, low battery voltage, open or grounded bias resistor, bypass condenser, inadequate or excessively long antenna, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proven not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMER AND PADDING CONDENSERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE CIRCUIT DIAGRAM.

ALIGNING I.F. STAGE AT 465 KILOCYCLES:

(a) Attach the ground lead of the test oscillator to the chassis. Connect the other lead to the grid cap of the 6A7 tube through a .02 Mfd. series condenser. DO NOT REMOVE GRID CLIP.
(b) Set test oscillator to EXACTLY 465 kilocycles and turn receiver volume control on full.
(c) Peak each of the second I.F. transformer trimmers.
(d) Peak each of the first I.F. transformer trimmers.

ALIGNING 1720-535 KILOCYCLE BAND:

(a) Check tuning dial adjustment by turning gang condenser until plates touch maximum capacity stop (completely in mesh), at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If the dial needle does not point exactly to the last line move needle to correct position.
(b) Remove test oscillator lead from grid of 6A7 tube and connect to receiver antenna lead through a .00025 Mfd. series condenser.
(c) Adjust band selector switch for operation on the 1720-535 kilocycle band.
(d) Set test oscillator frequency and receiver dial to EXACTLY 1720 kilocycles, and BRING IN 1720 KILOCYCLE TEST OSCILLATOR SIGNAL TO MAXIMUM OUTPUT BY ADJUSTING 1720 KILOCYCLE OSCILLATOR TRIMMER.
(e) Tune receiver dial and set test oscillator frequency to EXACTLY 1400 kilocycles. Adjust 1400 K.C. preselector and antenna trimmers for maximum sensitivity.
(f) Set test oscillator frequency and receiver dial to approximately 600 kilocycles. Then while rocking gang condenser slightly to right and left, adjust 600 K.C. oscillator padder for maximum signal response.

ALIGNING 1.8-5.8 MEGACYCLE BAND:

(a) Replace .00025 Mfd. test oscillator antenna lead series condenser with a 400 ohm resistor.
(b) Adjust band selector switch to 1.8-5.8 megacycles, tune receiver dial and set test oscillator frequency to EXACTLY 5.8 megacycles. Bring in 5.8 megacycle test signal to maximum output by adjusting 5.8 M.C. oscillator trimmer.
(c) Tune receiver dial and test oscillator frequency to EXACTLY 5 megacycles, and adjust 5 M.C. antenna trimmer for maximum sensitivity.

ALIGNING 5.8-18.3 MEGACYCLE BAND:

(a) Leave 400 ohm resistor in series with test oscillator lead and place band selector switch for operation on 5.8-18.3 megacycle band, tune receiver dial and set test oscillator frequency to EXACTLY 18 megacycles.
(b) Adjust 18 M.C. oscillator trimmer to bring in 18 megacycle test signal to maximum output.

NOTE: When adjusting this trimmer two peaks, the fundamental and the image peak will be noticed. CARE MUST BE TAKEN THAT THE FUNDAMENTAL PEAK AND NOT THE IMAGE PEAK IS USED FOR ALIGNING THE RECEIVER AT 18 MEGACYCLES. Always back off the trimmer to minimum capacity, then screw down the trimmer (add capacity) until the FIRST PEAK which is the fundamental and the proper one to use is tuned in. If the trimmer is screwed down beyond the point where the first peak is received the incorrect image peak will be tuned in. After completing adjustment of the oscillator trimmer at 18 megacycles, always check to see if the proper peak has been used. To do this leave test oscillator frequency at 18 megacycles, increase the output of the test oscillator and tune receiver dial to approximately 17 megacycles. Then vary the receiver dial slightly to the right and left of 17 megacycles, and if the fundamental peak was used in aligning at 18 megacycles the test oscillator signal will be heard at approximately 17 megacycles on the receiver dial.

(c) Tune receiver dial and set test oscillator frequency to EXACTLY 15 megacycles.
(d) Rock gang condenser slightly to right and left and adjust 15 M.C. antenna trimmer for maximum 15 megacycle test signal response.

To assure more accurate trimmer setting, repeat all above adjustments several times always using lowest possible test oscillator output consistent with readable output meter scale deflection.

46 A-Cont.

8. Leave band selector switch for operation on 540 to 1720 kilocycle band, tune receiver dial and set test oscillator frequency to approximately 600 kilocycles. While rocking gang condenser slightly to right and left adjust 600 kilocycle oscillator padder for maximum sensitivity.

Alignment,Parts

ALIGNING I.F.STAGE AT 465 KILOCYCLES:

(a) Attach the ground lead of the test oscillator to the chassis. Connect the other lead to the grid cap of the 6A7 tube through a .02 Mfd. series condenser. DO NOT REMOVE GRID CLIP.
(b) Set test oscillator to EXACTLY 465 kilocycles and turn receiver volume control on full.
(c) Peak each of the second I. F. transformer trimmers.
(d) Peak each of the first I.F. transformer trimmers.
To assure most accurate trimmer setting repeat above adjustment several times always using lowest possible test oscillator output consistent with readable output meter scale deflection.

ALIGNING 1720-536 KILOCYCLE BAND:

(a) Check tuning dial adjustment by turning gang condenser until plates touch maximum capacity stop (completely in mesh), at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If the dial needle does not point exactly to the last line move needle to correct position.
(b) Remove test oscillator lead from grid of 6A7 tube and connect to receiver antenna post through a .00025 Mfd. series condenser.
(c) Adjust band selector switch for operation on the 1720-536 kilocycle band.
(d) Set test oscillator frequency and receiver dial to EXACTLY 1720 kilocycles, and BRING IN 1720 KILOCYCLE TEST OSCILLATOR SIGNAL TO MAXIMUM OUTPUT BY ADJUSTING 1720 KILOCYCLE OSCILLATOR TRIMMER.
(e) Tune receiver dial and set test oscillator frequency to EXACTLY 1500 kilocycles. Adjust 1500 K.C., R.F. and antenna trimmers for maximum sensitivity.
(e) Set test oscillator frequency and receiver dial to approximately 600 kilocycles. Then while rocking gang condenser slightly to right and left, adjust 600 K. C. oscillator padder for maximum signal response.

ALIGNING 1.58-5.75 MEGACYCLE BAND:

(a) Replace .00025 Mfd. test oscillator antenna lead series condenser with a 400 ohm resistor.
(b) Adjust band selector switch to 1.58-5.75 megacycles, tune receiver dial and set test oscillator frequency to EXACTLY 5.75 megacycles. Bring in 5.75 megacycle test band signal to maximum output by adjusting 5.75 M.C. oscillator trimmer.
(c) Tune receiver dial and test oscillator frequency to EXACTLY 5 Megacycles, and adjust 5 M.C. antenna and R.F. trimmers for maximum sensitivity.
(d) Set test oscillator and receiver dial to approximately 1.8 megacycles. Then while rotating gang condenser slightly to right and left adjust 1.8 megacycle oscillator padder.

ALIGNING 5.65-20.25 MEGACYCLE BAND:

(a) Leave 400 ohm resistor in series with test oscillator lead and place band selector switch for operation on 5.65-20.25 megacycle band, tune receiver dial and set test oscillator frequency to EXACTLY 20.25 megacycles.

(b) Adjust 20.25 M.C. oscillator trimmer to bring in 20.25 megacycle test signal to maximum output.

NOTE: When adjusting this trimmer two peaks, the fundamental and the image peak will be noticed. CARE MUST BE TAKEN THAT THE FUNDAMENTAL PEAK AND NOT THE IMAGE PEAK IS USED FOR ALIGNING THE RECEIVER AT 20.25 MEGACYCLES. Always back off the trimmer to minimum capacity, then screw down the trimmer (add capacity) until the first peak which is the fundamental and the proper one to use is tuned in. If the trimmer is screwed down beyond the point where the first peak is received the incorrect image peak will be tuned in. After completing adjustment of the oscillator trimmer at 20.25 megacycles always check to see if the proper peak has been used. To do this leave test oscillator frequency at 20.25 megacycles, increase the output of the test oscillator and tune receiver dial to approximately 19.25 megacycles. Then vary the receiver dial slightly to the right and left of 19.25 megacycles, and if the fundamental peak was used in aligning at 20.25 megacycles the test oscillator signal will be heard at approximately 19.25 megacycles on the receiver dial.

(c) Tune receiver dial and set test oscillator frequency to EXACTLY 18 megacycles.

(d) Rock gang condenser slightly to right and left and adjust 18 M.C. antenna and R.F. trimmers for maximum 18 megacycle test signal response.

Prices are subject to change without notice.

Alignment

The following alignment instructions are given with the assumption that the Service Station has a signal generator capable of accurately covering the range of the receiver.

The only other apparatus necessary is a meter connected in the output stage to indicate resonance. This can be an 0 to 3 Volt AC meter connected across the voice coil of the speaker of preferably an output meter connected in the plate circuit of the power tube in series with an 8 Mfd. paper condenser.

I. THE I.F. STAGES

The intermediate frequency stages are aligned in the usual manner by feeding 465 K.C. into the grid of the mixer tube 6A7.

The two trimmers in each of the I.F. cans should be very carefully peaked to resonance as they are very critical and will greatly affect the performance of the set. These are trimmers Nos. C-26, 27, 28, 29 on Figure 2.

Always use as low an output as possible from the signal generator when making the various adjustments.

The sensitivity of the I.F. system alone will be found to be between 15 and 20 Microvolts.

II. ALIGNMENT OF THE SHORT WAVE BAND 5.5 TO 18 M.C.

First check the position of the dial hand by rotating the variable condenser to full capacity. The hand then should be in line with the lines that divide the dial in half. If the hand is off position it can be lined up by loosening the center screw.

1. Turn band switch all the way to the right for the 5.5 to 18 M.C. Band (Yellow), and set dial hand to 17 M.C.
2. Refer to Figure 3 and with a 17 M.C. signal from the generator, peak oscillator, trimmer condenser C-42 to 17 M.C.
3. Adjust trimmer C-6 of the antenna circuit to 17 M.C. after the above mentioned oscillator trimmer has been set.

III. ALIGNMENT OF SHORT WAVE BAND 1.7 TO 5.5 M.C.

1. With the band switch in the middle position, (Blue) and the dial hand set to 5 M.C., peak trimmer C-40 of the oscillator circuit to 5 M.C.
2. Adjust Antenna stage trimmer C-5 to 5 M.C. after the above oscillator trimmer has been set.

NOTE: After adjusting the two high bands at 17 megacycles and 5 megacycles the test oscillator input to antenna should be increased and receiver dial advanced to .9 megacycle lower and note if test oscillator signal is heard.

In case there is no response, the oscillator trimmers have been pulled down too tightly. The trimmers should be released until this condition exists, then go back to original point of alignment - reduce antenna input voltage and correct the trimmer adjustment.

EXAMPLE: The receiver has been adjusted to 17 megacycles. Tune receiver to approximately 16.9 M.C.

Increase oscillator signal by "opening up" the attenuator. Move the dial back and forth at 16.9 M.C.

If no signal is heard, let oscillator trimmer off until it is heard at 16.9 M.C.

Reduce signal voltage from generator, go back to 17 M.C. and slightly correct this last trimmer adjustment.

The same thing applies to the 5 M.C. adjustment.

IV. THE ALIGNMENT OF THE BROADCAST BAND

1. Set Band Switch to the 550-1700 K.C. band, and the hand to 1400 K.C.
2. Peak oscillator trimmer C-38 to 1400 K.C., then the R.F. Trimmer C-4 and the antenna stage trimmer C-13 on the variable condenser to 1400 K.C.
3. Rotate dial hand to 550 K.C. and adjust padding condenser C-37 to 550 K.C.
4. Re-check dial at 1400 K.C. as mentioned in (1) and (2).
5. Points in the middle of the dial may be checked and if necessary the plates of the oscillator section of the variable condenser (back section) may be bent for alignment.

V. NOTES

1. Seal all trimmers after their final adjustment.
2. Be sure that the settings are being made to the true fundamental signal from the oscillator and not on a harmonic or image frequency.
3. The normal voltage readings at the sockets are given in a separate chart on the following pages.
4. It is advisable to check the position of the tuning eye tube to make certain that it is not pushed against the inside of the dial card. With the adjustment screw on the bracket, allow a small amount of clearance between the end of the tube and the dial to avoid any possibility of the heat from the tube affecting the dial card.

SERVICE DATA

INSTRUCTIONS FOR INSTALLING FM-205 POWER TRANSFORMER IN ANDREA RADIO MODELS 1C5, 2C5, AND CHASSIS C5S, C5L.

Original production of receiver models 1C5, 2C5, chassis C5L, C5S, incorporated a two (2) tapped primary transformer for 120 or 240 volt, 50/60 cycle power lines. The voltage regulator socket used was of five (5) prongs with only two (2) of the five (5) prongs (marked 120-240) used.

Later production of these models used a four (4) tapped primary transformer in place of the above two tap unit. On these later models the voltage regulator socket was marked 100-120-150-220-250. Positions 100 and 120 were joined together.

All transformer replacement shipments will be of the four (4) tapped type FM-205. In receivers which are equipped with two (2) tap units and replacement is made with a four (4) tap FM-205, use ONLY the two taps needed, tapeing the extra two taps to eliminate short circuits. For convenience, all four taps may be wired up to the voltage regulator socket in such a manner as to have equivalent primary taps correspond to the socket marking.

The line voltage variation through which each primary tap may be used is as follows:

TAP	LINE VOLTAGE RANGE
120	105-130
150	135-160
220	205-230
250	235-260

The following is the color coding of the transformer primary taps:

ORIGINAL TWO TAPPED FM-205

Primary tap 120 - red & white tracer.
" " 240 - green
" Line - red

PRESENT PRODUCTION FOUR TAPPED FM-205

Primary tap 120 - red & yellow tracer
" " 150 - yellow
" " 220 - brown
" " 250 - green
" Line - red

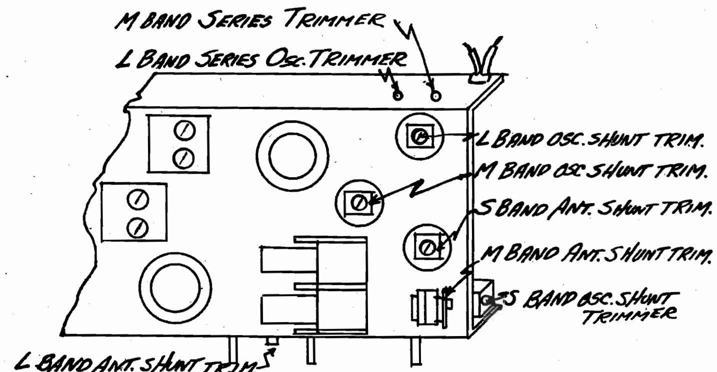
The design of this receiver is such that one band can be aligned regardless of order without disturbing the alignment on the other bands.

WARNING: Models 510, 511, Chassis UC5L and UC5S receivers are of the Universal type (AC or DC), hence the receiver chassis is at line potential. A ground wire must never be attached to the chassis directly, or damage to the receiver may result.

If the signal generator is grounded, be certain no direct connection is made to the receiver proper on Models 510 and 511. The antenna and ground leads of the receiver are isolated by means of condensers in the receiver. (see circuit diagram)

ALIGN	FREQUENCY	DUMMY ANT.	TUBE	SWITCH
I.F.	470KC	.1 MFD.	6A7(grid)	--
"S"	15,000 KC	400 OHMS	--	RIGHT
"M"	1400 KC	.00025 MFD.	--	CENTER
"M"	600 KC	.00025 MFD.	--	CENTER

I.F.
High potential lead in series with .1 mfd. condenser to grid of 6A7 tube. Adjust trimmers on first and second I.F. transformers, to maximum output.
"S" (Short Wave)
Signal generator high potential lead in series with 400 ohm resistor to reciever antenna lead (RED). Receiver Ground wire to low side of signal generator output. Adjust antenna coil trimmer for maximum output.
"M" (Medium Wave)
Replace 400 ohm resistor with .00025 mfd. condenser. Set signal at 1400 KC. Adjust antenna shunt trimmer to maximum output.
With connections as for 1400 KC, set signal generator at 600KC. Adjust "M" oscillator series trimmer to maximum output (rotate gang condenser back and forth). Recheck adjustment at 1400KC as before.
"L" (Long Wave) This band included only in UC5L and C5L Chassis.
With signal at 150KC, .1 mfd condenser as dummy antenna, connection to 6A7 grid as in previous adjustments; adjust L.W. series oscillator trimmer to LOUDEST output signal.
Set generator at 335 KC. Adjust L.W. oscillator shunt trimmer to signal and readjust.
Set dial and generator at 150 Kc. Readjust L.W. series oscillator trimmer as before. Then repeat at 335KC as before.
Adjust antenna coil shunt trimmer for maximun output.
Then adjust L.W. series oscillator trimmer with dial and generator at 150 KC for maximum output. Repeat adjustment of antenna coil shunt trimmer for maximum output. Repeat adjustment of L.W. series oscillator trimmer with dial and generator at 150 KC.
Repeat these last two adjustments until the alignment is no longer improved.



December 2, 1936.

WARNING: These Receivers incorporate a I volt bias electrolytic cell in the 75 tube grid circuit.
Current must never be taken from this cell. All measurements must be made with a high resistance voltmeter. NEVER SHORT.
Be certain the 75 tube cap does not touch the chassis for any length of time.

Universal Voltage Taps: AC models have taps for 100-120, 115-135, 140-160, 210-230, and 240-260 volts. AC-DC models have taps for 95-110, 110-130, 140-160, 210-230, and 240-260 volts. **AC Frequency:** AC models operate on 50-60 cycles. AC-DC models operate on 40-60 cycles.

470 KC. I. F. ALIGNMENT

Connect the high-potential lead of the signal generator in series with a .1 mfd. condenser to the grid of the 6K8 tube. Set the generator at 470 kc., and adjust the output until a small deflection is obtained in the output meter. Adjust the trimmer condensers on the top of the 1st and 2nd I.F. transformers (see circuit diagram) for maximum deflection on the output meter. After this adjustment has been made, disconnect the generator from the grid of the 6K8 tube. This completes the alignment of the I.F. system.

"S" BAND ALIGNMENT

Connect the high-potential lead from the generator in series with a 400-ohm resistor to the antenna (red) lead of the set, and the low side of the generator to the ground (black) lead of the set. Put the wave band switch at the S position, adjust the generator to 21,500 kc., and the receiver to 21.5 mc. Vary the S band oscillator shunt trimmer slowly from maximum to minimum. You will hear the signal at two settings of the trimmer, one nearer the minimum capacity (plates open) and one near the maximum capacity (plates closed). The setting near minimum capacity is correct, because the setting near maximum capacity is at the image frequency.

Now adjust the antenna shunt trimmer. During this adjustment, be sure to rock the gang condenser back and forth slowly each time you make an adjustment of the trimmer. As you continue to do this, you will reach a point where further turning of the trimmer screw, while rocking the gang condenser, will not increase the signal response. This is the correct adjustment.

A simple method of determining if the receiver and generator are tuned for correct alignment is as follows:

Set the signal generator at 21,500 kc. and tune the receiver slowly from 20,000 to 22,500 kc. Two signals should be heard, 940 kc. apart. One will be lower in frequency than 21,500 kc. and the other will be higher. The higher frequency, as indicated on the dial, is the correct aligning frequency, and the lower one is the image.

As a further check, leave the receiver tuned to the higher frequency. Very slowly, increase the generator frequency from 21,500 kc to about 22,500 kc.

A signal will be heard near 22,500 kc. if all the settings are correct for alignment. If there is no signal, the original settings were on the image frequency. In that case, you must start again from the beginning, in order to be sure of accurate results.

After you have found the correct settings, the image, or lower, frequency response on the receiver will always sound weaker than the true signal.

"I" BAND ALIGNMENT

With the signal generator connected in accordance with the preceding instructions, set the generator at 6,000 kc., turn the wave band switch to the I position, and adjust the dial to 6 mc. Following the procedure just described, adjust the I band oscillator shunt trimmer for maximum signal response. Next, adjust the I band antenna shunt trimmer. Rock the gang condenser back and forth slowly as you adjust the trimmer, in accordance with the instructions for the S band adjustment. This completes the adjustment for the I band.

"M" BAND ALIGNMENT

Replace the 400-ohm resistor in the generator lead by a .00025 mfd. condenser. Set the generator at 1,500 kc., turn the wave band switch to the M position, and set the dial of the receiver at 200 m. Adjust the M band oscillator shunt trimmer for maximum signal response. Next adjust the antenna shunt trimmer for maximum response.

This band must be aligned at 600 kc. also. Set the generator accordingly, and tune the receiver to 500 m. Adjust the M band oscillator series trimmer for maximum response. During this adjustment, be sure to rock the gang condenser for each small change of capacity of the series trimmer. When this adjustment has been completed, recheck the antenna adjustment at 1,500 kc. This completes the adjustment of the M band.

"L" BAND ALIGNMENT

Models 1-E-6 and 631, as well as chassis PE6L and PUE6L, have the long wave band also, as indicated by "L" on the wave band switch.

Connect the high-potential lead from the generator in series with a .1 mfd. condenser to the grid of the 6K8 tube. Set the generator at 150 kc. and the receiver at 2,000 m. Turn the wave band switch to the L position. Adjust the L band series oscillator trimmer for maximum response. This adjustment is required because of the wide frequency range obtained by adjusting this series oscillator trimmer. Due to this wide change in frequency, it is possible that a response will be obtained at several points, but the correct setting is indicated by maximum response.

Next, set the generator at 400 kc. and the receiver at 750 m., and adjust the L band oscillator shunt trimmer for maximum response. When this has been done, it is necessary to reset the generator at 150 kc., the receiver at 2,000 m., and to readjust the L band series oscillator trimmer in accordance with the preceding instructions.

Now, set the generator at 400 kc., the receiver at 750 m., and repeat the adjustment of the L band oscillator shunt trimmer for maximum response.

Without changing the settings of the generator and receiver, remove the generator lead from the grid of the 6K8, replace the .1 mfd. condenser with a .00025 mfd. condenser, and connect the lead to the antenna wire on the set. Adjust the L band antenna shunt trimmer for maximum response.

Next, set the generator at 150 kc., the receiver at 2,000 m., and align the L band series oscillator trimmer for maximum response. Be sure to rock the gang condenser for each adjustment of the trimmer.

Finnally, set the generator at 400 kc., the receiver at 750 m., and readjust the L band antenna shunt trimmer. This completes the adjustment of the L band.

BIAS CELL

This receiver incorporates a bias cell in the grid of the audio tube, as shown in the wiring diagram. In case you remove the cell, handle it with the greatest care. Do not put your fingers across the terminals, for this will have the effect of short-circuiting the electrodes, and the voltage will not return to normal for several hours.

NEVER test this cell with an ordinary voltmeter. Since this a "no-current" cell, the only way to test it accurately is with a vacuum tube voltmeter. Always insert the cell in the mounting assembly so that the metal container (negative side) contacts the cell-holder pin with the black dot. This cell can be expected to render at least three years' service before it requires replacement.

SETTING BUTTON CONTROLS

Make a list of the stations: Set down the call letters of the six stations required, and put them in the order of their kilocycle ratings, the lowest at the top of the list. The kilocycle tuning ranges of the button controls are:

TOP BUTTON	No. 1 —	530 to 1,000 kc.
	No. 2 —	580 to 1,050 kc.
	No. 3 —	700 to 1,250 kc.
	No. 4 —	700 to 1,250 kc.
	No. 5 —	800 to 1,450 kc.
BOTTOM BUTTON	No. 6 —	1,100 to 1,600 kc.

It is necessary, of course, to choose stations whose kilocycle ratings come within these button tuning ranges. The ranges given in the list above are conservative. Consequently, it may be possible to tune in a station which is just outside the range of any particular button control. For example, on button No. 3, although the range is shown as 700 to 1,250 kc., it may be possible to tune a station on 600 kc. or one on 1,300 kc.

MARKING THE BUTTONS

Remember the transparent disks: When you have made up your station list, locate the call letters on the station-call marker sheets, and punch them out carefully. If lettered markers are not provided for the stations you want, use the blank markers, and print the station letters on them.

Keeping the markers in the same order as your kilocycle list, press them into buttons, starting at the top. Do not attempt to glue them in place. Instead, put a transparent disk over each marker. That will hold it in place permanently. Use the end of a lead pencil to press the disks into position. In case you want to change a marker, you can pry it out with the point of a pin.

ADJUSTING THE CONTROLS

Do this with great care: Put the wave band switch in the M position, for dial tuning on the broadcast or medium band. Tune in the station whose call letters you have put on the top button. When you have adjusted the tuning accurately, turn the wave band switch to position A. Push in the top button until it locks, and turn the volume control to maximum.

When the set has been turned on for at least 10 minutes, so that it has become thoroughly warm, remove the rear dust cover from the cabinet. You will then see that the button controls are arranged in pairs, numbered 1 to 6. In each pair, the antenna adjustment (ANT.) is at the left, and the oscillator adjustment (OSC.) adjustment at the right.

Use a thin-blade screwdriver to adjust the screws. Do not force a thick blade into the slots. First adjust the No. 1 oscillator screw until you hear the station you tuned in previously with the dial. If the speaker breaks into a howl during this adjustment, turn the No. 1 antenna screw to the right or left until the howl stops. After you have an accurate setting of the oscillator screw, adjust the No. 1 antenna screw for maximum volume.

Finally, for a still sharper setting, cut the volume so that you can barely hear your station. If necessary, disconnect the antenna lead and twist it lightly around the insulated portion of the red wire. Again, adjust the No. 1 oscillator and antenna screws for maximum response from your station.

To check the accuracy of the settings, turn the wave band switch to position M. The station should sound practically the same whether the switch is in the A or M position. If there is considerable difference, the station was not tuned accurately with the dial or else the corresponding button controls were not set correctly.

Repeat the same routine for button No. 2, adjusting the No. 2 oscillator and antenna screws, and continue the process in the same way for the other controls.

To change any button to another station, if the station's kilocycle rating is within the range of the corresponding controls, it is only necessary to put in a new button marker, and to reset the controls in accordance with the preceding instructions.

FINAL ADJUSTMENT

After the preliminary adjustments have been made carefully and accurately, go over each one again, starting from the beginning, and follow the same order. This is essential, in order to assure absolute accuracy of the settings.

After all adjustments have been made, replace the dust cover on the rear of the cabinet, and make sure that the antenna is connected again.

IMPORTANT!

If you find it necessary to replace any part in this receiver, bear this in mind: In order to maintain the high performance standards of Andrea Radio receivers, the components parts on all Andrea models are held to exceedingly close tolerance limits. Furthermore, Andrea components are given the exclusive "Climate Sealed" treatment which protects them from all weather and temperature conditions. Conseqeutly, standard Andrea Radio replacement parts must be used for all service work, for the substitution of ordinary, stock items will result in inferior performance.

MODEL 5E6
Chassis PE6L
MODEL 6E6
Chassis PE6S

ANDREA RADIO CORP.

Schematic,Phono,Notes

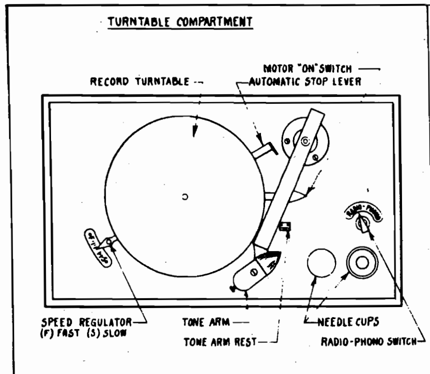

FIG.1

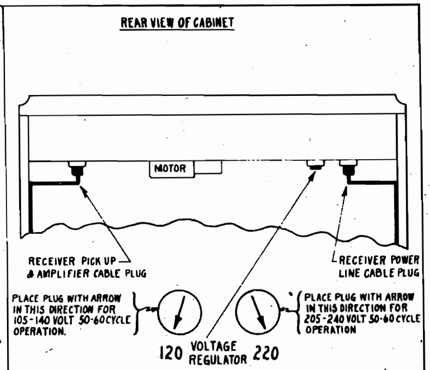

FIG.2

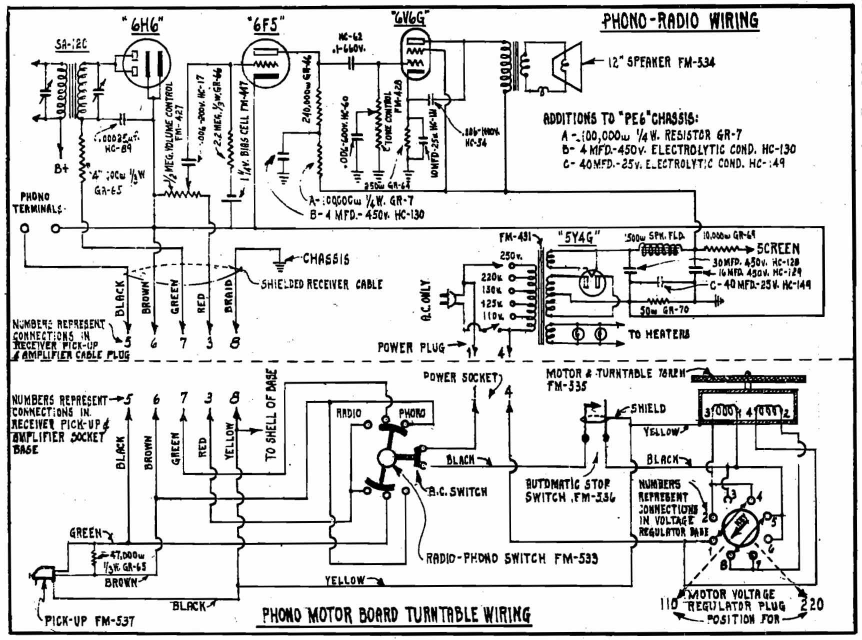

INSTRUCTIONS FOR INSTALLING AND OPERATING ANDREA AC PHONOGRAPH MODELS MODELS 5-E-6 AND 6-E-6

WARNING!

For protection in shipping, the radio chassis of this combination is bolted tightly to the shelf on which it is mounted. Before connecting this instrument to the power line, loosen the four mounting bolts, located under the shelf by turning them out about 6 turns, in order that the chassis can float freely on the shock-absorbing strips. Unless this is done, objectionable noises may be set up in the loud speaker.

MOTOR VOLTAGE:

Andrea phonograph combinations are connected at the factory for use on 205-240 volts, 50-60 cycles. Under the mounting shelf there is a socket with a plug, shown in Fig. 2. When the arrow on the plug points toward 120 volts, the motor can be used on 105 to 140 volts AC. When the arrow points toward 220 volts, the motor can be used on 205 to 240 volts, 50-60 cycles. To change the connections, remove this motor-voltage regulator plug, and turn it so that the arrow points toward the voltage required, and insert the plug again.

RECEIVER VOLTAGE:

Note that the motor voltage regulator plug does not control the radio receiver. Therefore, you must be sure to have the service man check the line voltage tap on the radio receiver power transformer.

RADIO-PHONOGRAPH SWITCH:

Fig. 1 shows the arrangement of the phonograph turntable controls. The radio-phonograph switch, when in the RADIO position, connects the speaker for radio reception. When this switch is turned to the PHONO position, current is connected to the turntable motor, and the pick-up and the speaker are connected for reproducing phonograph records.

VOLUME & TONE CONTROL:

The volume control and tone control on the front of the cabinet regulate both the radio and the phonograph.

FOR OTHER DATA,SEE PAGES COVERING CHASSIS PE6L AND PE6S

TURNTABLE SPEED:

Recordings are made with the turntable moving at the rate of 78 revolutions per minute. Consequently, the best reproduction is obtained at that speed. Put the record on the turntable, with a slip of paper part way under it so that the paper can be used as a revolution counter. Then adjust the speed control, fast or slow, until the turntable revolves 78 times each minute.

AUTOMATIC STOP:

When the radio-phono switch is in the PHONO position, the current is connected to the motor, but it still can be cut off by the upright automatic stop lever that extends from beneath the turntable, or the motor can be turned on by the flat lever which projects from under the turntable. The small upright lever, marked "Automatic Stop", Fig. 1, will turn the motor off when the electric pick-up needle enters the eccentric groove at the end of the record. As this occurs, the tone arm swings against the lever thereby automatically releasing the power switch.

PHONOGRAPH NEEDLES:

Although various types of needles are sold for use in phonographs only the standard size loud or medium needles are recommended. Special needles may be entirely unsuited for use on this machine, and may result in loss of tone quality. There is a wedge-shaped groove under the head of the pick-up to direct the needle into the mounting hole. When you become acquainted with the use of this needle guide, you will find it a very easy matter to change needles quickly.

Voltage Taps: Line voltage switch provided for operation on 100-120, 115-135, 140-160, 210-230, and 240-260 volts.

AC Frequency: Power transformer designed for 50-60 cycles.

BAND SWITCH

Band switch controls button tuning, manual tuning, and phonograph: The right hand, outside knob on the Standard Tuning or Long Wave Tuning sets is marked:

Standard Tuning	Long Wave Tuning
S I M A P	S I M L A P

S—Short Wave I—Intermediate Short Waves M—Broadcast or Medium Waves.
L—Long Waves A—Automatic button tuning on broadcast or medium waves
P—Phonograph.

Automatic push button tuning operates only on the broadcast or medium wave band when the switch is in the "A" position. Manual tuning must be used for the other wave bands. On the table models and consoles, the phonograph pick-up terminals are connected to the high-fidelity audio-amplifier when the band switch is in the "P" position. On the combination models, turning the band switch to the P position turns on the current for the phonograph motor and connects the pick-up to the amplifier.

ALIGNMENT INSTRUCTIONS

MODELS 2D5,3D5,4D5-CHASSIS D5L

Accuracy can only be obtained when small input signals from the ALL WAVE signal generator to the receiver are used.
An output meter for visual signal indication must also be used.
All aligning frequencies and location are shown on circuit diagram.

470 K.C. I.F. AMPLIFIER ALIGNMENT

A - Connect high potential output lead of signal generator to an .05 mfd. condenser, connect other side of condenser to grid of 6A7 tube.
B - Connect ground of generator to receiver ground.
C - Turn wave band switch to medium band position. (Right hand knob turned to right.)
D - Adjust both trimmers on the 1st and 2nd I.F. transformers for maximum output, using a copper oxide output meter connected across the voice coil.
E - Retrim each I.F. transformer condenser carefully for maximum output.

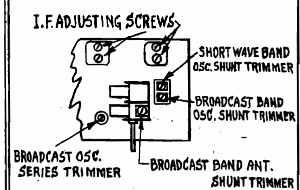
MEDIUM BAND ALIGNMENT "M" SCALE

A - Turn station selector knob till gang condenser plates are all in.
B - Scale pointer position must be flush with bottom of outside scale line marked "O" or calibrated scale will read incorrectly.
C - Replace .05 mfd. condenser with .00025 mfd. (250 mmf.). Set generator to 1500 KC (200 meters) along with receiver pointer.
D - Adjust medium band oscillator shunt trimmer carefully until signal is heard. Thereafter never touch this trimmer. Should signal be heard, trimmer need not be adjusted.
E - Adjust medium band antenna shunt trimmer on gang condenser for maximum output deflection.
F - Set receiver dial at 500 meters (600 KC) along with signal generator.
G - Adjust medium band oscillator series trimmer (see diagram) while turning the station selector knob back and forth about the signal for each change in trimmer setting. If the gang condenser is not turned for each trimmer adjustment, false alignment will result.
H - Reset generator for 1500 KC (200 meters) and tune in signal on receiver. Retrim antenna shunt trimmer carefully for maximum output.

LONG WAVE BAND ALIGNMENT "L" SCALE

A - Set signal generator for 150 KC (2000 meters) and connect generator high potential lead in series with .05 mfd. condenser to grid of 6A7 tube.
B - Set receiver dial to 2000 meters.
C - Adjust L.W. series oscillator shunt trimmer until signal reaches maximum deflection on the output meter.
D - Set generator and receiver dial to 333 KC (900 meters), and adjust L.W. oscillator shunt trimmer until the signal reaches maximum deflection in the output meter.
E - Repeat B and C
F - Repeat D
G - Remove generator lead from grid of 6A7. Replace .05 mfd. condenser with a .00025 mfd. condenser and connect to antenna lead of receiver.
H - Set generator and receiver dial to 333 K.C. (900 meters)
I - Adjust antenna coil shunt trimmer for maximum deflection on the output meter.
J - Set generator and receiver dial to 150 KC (2000 meters) and adjust L.W. oscillator series trimmer for maximum deflection while rotating dial slowly about signal.
K - Repeat I

ALIGNING COND. LOCATIONS & FREQUENCIES



I.F. FREQUENCY = 470 KC.
ALIGNING FREQUENCIES:
BROADCAST BAND: 600 KC OR 500 METERS, 1500 KC OR 200 METERS
SHORT WAVE BAND: 6 MC. OR 50 METERS

ALIGNMENT PROCEDURE

MODEL 6D5 - CHASSIS PD5
MODEL 8D5 - CHASSIS PD5E
MODELS 2D5,3D5,4D5- CHASSIS D5,D5E,D5S

Accuracy can only be obtained when small input signals from the ALL WAVE Signal Generator to the receiver are used.
An output meter for visual signal indication must also be used.
All aligning frequencies and locations are shown on circuit diagram.

470 KC I.F. AMPLIFIER ALIGNMENT

A - Connect high potential output lead of signal generator to a .05 mfd. condenser; connect other side of condenser to grid of 6A7 tube.
B - Connect ground of generator to receiver ground.
C - Turn wave band switch to Broadcast position. (left hand knob turned to right)
D - Adjust both trimmers on the 1st and 2nd I.F. transformers for maximum output, using a copper oxide output meter connected across the voice coil.
E - Retrim each I.F. transformer condenser carefully for maximum output.

BROADCAST ALIGNMENT "M" BAND

A - Turn station selector knob till gang condenser plates are all in.
B - Scale pointer position must be flush with bottom of outside scale line marked "O", or calibrated scale will read incorrectly.
C - Replace .05 mfd. condenser with .00025 mfd. (250 mmf.). Set generator to 1500 KC along with receiver pointer on 1500 KC of scale.
D - Adjust Broadcast oscillator shunt trimmer carefully until signal is heard. Thereafter, never touch this trimmer. Should signal be heard, trimmer need not be adjusted.
E - Adjust Broadcast Antenna shunt trimmer on gang condenser for maximum output deflection.
F - Set receiver dial at 600 KC, along with signal generator.
G - Adjust Broadcast oscillator series trimmer (see diagram), while turning the station selector knob back and forth about the signal for each change in trimmer setting. If the gang condenser is not turned for each trimmer adjustment, false alignment will result.
H - Set generator for 1500 KC, and tune in signal on receiver. Retrim antenna shunt trimmer carefully for maximum output.

SHORT WAVE BAND "S" SCALE ALIGNMENT

A - Replace .00025 mfd. condenser with 400 ohm resistor. Set generator to 6000 KC (6 megacycles). Turn band selector knob to right and tune in signal.
B - Adjust short wave band "oscillator" shunt trimmer while turning the station selector knob back and forth about the signal for each trimmer adjustment, until maximum output deflection on the meter is obtained.
If the gang condenser is not rotated for each trimmer adjustment, false alignment and weak performance will result.

Audible methods of alignment must never be used.
No other adjustments on this band are required.

(Chassis Numbers PE66L and PE66S)

SERVICE DATA

FOR SETTING PUSH BUTTONS, NOTES ON BIAS CELL,
SEE MODELS 1530,1,3,etc.CHASSIS NO. PUE-L,-S.

WARNING!

Always remove the line plug from the electric outlet before removing the chassis from the cabinet. Also—connect the speaker plug to the receiver before switching on the power. Otherwise, damage will result.

I. F. REALIGNMENT GENERALLY SUFFICIENT

As a rule, it is not necessary to readjust the short wave oscillator and antenna shunt and series trimmers unless they have been tampered with, or require replacing. Consequently, careful realignment of the I.F. system is all that requires attention, ordinarily. Before making any adjustments, tune in one particular station and note the quality of reception so that you can check the improvement after the I.F. system has been realigned.

USE SIGNAL GENERATOR AND OUTPUT VOLTMETER

For realigning, use a signal generator to supply a modulated carrier of 150, 400, 470, 600, 1,500 and 18,000 kc., plus an output voltmeter. Alignment by any other means is not recommended. Your service test generator should be checked frequently for change in calibration by getting a zero beat between the generator and broadcast stations of known frequency.

SPECIAL NOTES

Always check the pointer setting on the scale before you start alignment adjustments. Otherwise, inaccuracies will be introduced. When the variable plates are completely closed, the pointer should be set exactly on the small gold scratch lines which appear on the right and left top side of the tuning scale.

NOTES ON REALIGNING THE BANDS

During the aligning measurements, the output of the signal generator must be kept so low that it will not cause the AVC circuit in the set to function. In other words, when the volume control on the set is turned to maximum, the output should not show more than .5 volt across the voice coil, or 50 milliwatts in the plate circuit of the output tube.

Generally, at frequencies above 7,000 kc., the signal generator frequency will change with each adjustment of the generator output attenuator control. Hence, the receiver must be retuned each time the attenuator is adjusted.

Some generators cause trouble by direct radiation to the set at frequencies above 8 mc. Experience indicates that more accurate alignment is possible when the generator is separated by several feet from the receiver under test, in order to eliminate this direct pickup.

Alignment can be carried out on these models at any band without affecting any of the other bands.

ALIGNMENT INSTRUCTIONS

470 KC. I. F. ALIGNMENT

Connect the high-potential lead of the signal generator in series with a .1 mfd. condenser to the grid of the 6K8 tube. Set the generator at 470 kc., and adjust the output until a small deflection is obtained in the output meter. Adjust the trimmer condensers on the top of the 1st and 2nd I.F. transformers (see circuit diagram) for maximum deflection on the output meter. After this adjustment has been made, disconnect the generator from the grid of the 6K8 tube. This completes the alignment of the I.F. system.

"S" BAND ALIGNMENT

Connect the high-potential lead from the generator in series with a 400-ohm resistor to the antenna (red) lead of the set, and the low side of the generator to the ground (black) lead of the set. Put the wave band switch at the S position, adjust the generator to 18,000 kc., and the receiver to 18 mc. Vary the S band oscillator shunt trimmer slowly from maximum to minimum. You will hear the signal at two settings of the trimmer, one nearer the minimum capacity (plates open) and one near the maximum capacity (plates closed). The setting near minimum capacity is correct, because the setting near maximum capacity is at the image frequency.

Now adjust the antenna shunt trimmer. During this adjustment, be sure to rock the gang condenser back and forth slowly each time you make an adjustment of the trimmer. As you continue to do this, you will reach a point where further turning of the trimmer screw, while rocking the gang condenser, will not increase the signal response. This is the correct adjustment.

A simple method of determining if the receiver and generator are tuned for correct alignment is as follows:

Set the signal generator at 18,000 kc. and tune the receiver s[illegible] from 17,500 to 18,500 kc. Two signals should be heard, 940 kc. apart. One will be lower in frequency than 18,000 kc. and the other will be higher. The higher frequency, as indicated on the dial, is the correct aligning frequency, and the lower one is the image.

As a further check, leave the receiver tuned to the higher frequency. Very slowly, increase the generator frequency from 18,000 kc. to about 20,000 kc.

A signal will be heard near 19,000 kc. if all the settings are correct for alignment. If there is no signal, the original settings were on the image frequency. In that case, you must start again from the beginning, in order to be sure of accurate results.

After you have found the correct settings, the image, or lower, frequency response on the receiver will always sound weaker than the true signal.

"M" BAND ALIGNMENT

Replace the 400-ohm resistor in the generator lead by a .00025 mfd. condenser. Set the generator at 1,500 kc., turn the wave band switch to the M position, and set the dial of the receiver at 200 m. Adjust the M band oscillator shunt trimmer for maximum signal response. Next adjust the antenna shunt trimmer for maximum response.

This band must be aligned at 600 kc. also. Set the generator accordingly, and tune the receiver to 500 m. Adjust the M band oscillator series trimmer for maximum response. During this adjustment, be sure to rock the gang condenser for each small change of capacity of the series trimmer. When this adjustment has been completed, recheck the antenna adjustment at 1,500 kc. This completes the adjustment of the M band.

"L" BAND ALIGNMENT

Mode 11-E-6. chassis PE66L, have the long wave band also, as indicated by "L" on the wave band switch.

Connect the high-potential lead from the generator in series with a .1 mfd. condenser to the grid of the 6K8 tube. Set the generator at 150 kc. and the receiver at 2,000 m. Turn the wave band switch to the L position. Adjust the L band series oscillator trimmer for maximum response. This adjustment is required because of the wide frequency range obtained by adjusting this series oscillator trimmer. Due to this wide change in frequency, it is possible that a response will be obtained at several points, but the correct setting is indicated by maximum response.

Next, set the generator at 400 kc. and the receiver at 750 m., and adjust the L band oscillator shunt trimmer for maximum response. When this has been done, it is necessary to reset the generator at 150 kc., the receiver at 2,000 m., and to readjust the L band series oscillator trimmer in accordance with the preceding instructions.

Now, set the generator at 400 kc., the receiver at 750 m., and repeat the adjustment of the L band oscillator shunt trimmer for maximum response.

Without changing the settings of the generator and receiver, remove the generator lead from the grid of the 6K8, replace the .1 mfd. condenser with a .00025 mfd. condenser, and connect the lead to the antenna wire on the set. Adjust the L band antenna shunt trimmer for maximum response.

Next, set the generator at 150 kc., the receiver at 2,000 m., and align the L band series oscillator trimmer for maximum response. Be sure to rock the gang condenser for each adjustment of the trimmer.

Finnally, set the generator at 400 kc., the receiver at 750 m., and readjust the L band antenna shunt trimmer. This completes the adjustment of the L band.

ADJUSTING THE CONTROLS

Do this with great care: Put the wave band switch in the M position, for dial tuning on the broadcast or medium band. Tune in the station whose call letters you have put on the top button. When you have adjusted the tuning accurately, turn the wave band switch to position A. Push in the top button until it locks, and turn the volume control to maximum.

Turn on the set, and let it run for at least 10 minutes, so that it will become thoroughly warm. You will see that the button controls are arranged in pairs, numbered 1 to 6. In each pair, the antenna adjustment (ANT.) is at the left, and the oscillator adjustment (OSC.) is at the right.

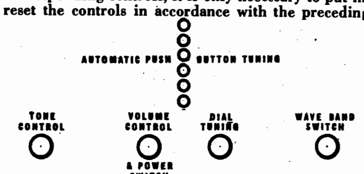
Use a thin-blade screwdriver to adjust the screws. Do not force a thick blade into the slots. First adjust the No. 1 oscillator screw until you hear the station you tuned in previously with the dial. If the speaker breaks into a howl during this adjustment, turn the No. 1 antenna screw to the right or left until the howl stops. After you have an accurate setting of the oscillator screw, adjust the No. 1 antenna screw for maximum volume.

To check the accuracy of the settings, turn the wave band switch to position M. The station should sound practically the same whether the switch is in the A or M position. If there is considerable difference, the station was not tuned accurately with the dial or else the corresponding button controls were not set correctly.

Repeat the same routine for button No. 2, adjusting the No. 2 oscillator and antenna screws, and continue the process in the same way for the other controls.

Finally, for a still sharper setting, cut the volume so that you can barely hear your station. If necessary, disconnect the antenna lead and twist it lightly around the insulated portion of the red wire. Again, adjust the No. 1 oscillator and antenna screws for maximum response from your station.

To change any button to another station, if the station's kilocycle rating is within the range of the corresponding controls, it is only necessary to put in a new button marker, and to reset the controls in accordance with the preceding instructions.



AUTOMATIC OR DIAL TUNING

Wave Band Switch controls push button or dial tuning: The right hand, outside knob on Standard Tuning or Long Wave Tuning is marked:

Standard Tuning	Long Wave Tuning
S M A	S M L A

S—Short waves M—Broadcast or medium waves
L—Long waves A—Automatic button tuning on broadcast or medium waves

Automatic push button tuning operates only on the broadcast or medium wave band, when the switch is in the A position. In other positions, the dial must be used.

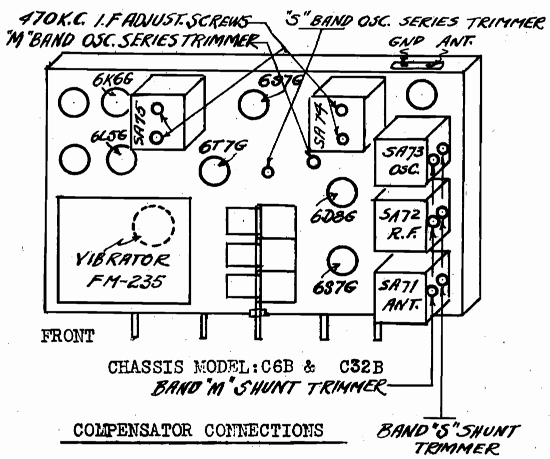
" 32C6B is for 32 volt service and covers two ranges "M" & "S"

470 K.C. I.F. ADJUSTMENT

1. Connect high potential output lead from test generator in series with a .1 mfd. condenser to the grid of the 6D8G tube.
2. Connect output voltmeter (copper oxide rectifier type) across voice coil of speaker.
3. Set generator to supply a modulated 470 K.C. signal. Adjust generator output attenuator until a small output reading is obtained on the output voltmeter.
4. Adjust both trimmers on top of the first and second I.F. transformers for maximum output.
5. Retrim slightly the first I.F. trimmer.

The I.F. is then aligned correctly.



CHASSIS MODEL: C6B & C32B

COMPENSATOR CONNECTIONS

ALIGNING FREQUENCIES:-

"M" (MEDIUM WAVE BAND)
ANT.-R.F.-OSC. SHUNT TRIMMERS 1400 K.C.
"M" BAND OSC. SERIES TRIMMER ONLY 600 K.C.

"S" (SHORT WAVE BAND)
ANT.-R.F.-OSC. SHUNT TRIMMERS 15 MEGACYCLES
"S" BAND OSC SERIES TRIMMER ONLY 6 MEGACYCLES

MEDIUM BAND "M" ALIGNMENT

Set test generator for 1400 K.C. Connect high potential lead of test generator in series with a .1 mfd. condenser to grid of 6D8G tube.

Tune receiver to 1400 K.C. (214.3 meters) on the tuning scale. If signal is not heard, leave scale pointer set to 1400 K.C. (214.3) meters and adjust oscillator coil shunt trimmer slowly and carefully until signal is heard.

The oscillator coil of receiver and dial are now set correctly, assuming the test generator frequency is correct. Otherwise, the dial calibration will be wrong.

Remove test generator hot lead from 6D8G grid. Replace .1 mfd. condenser with 250 mmf. (.00025 mfd.) and connect to antenna terminal of receiver "A", all other settings to remain the same.

Adjust R.F. coil shunt trimmer and antenna coil shunt trimmer for maximum output deflection.

Retune test generator to 600 K.C. (500 meters) and tune receiver to 600 K.C. (500 meters) until signal is heard.

Adjust oscillator coil series trimmer slowly while rotating the gang condenser slowly about the signal for each small adjustment of the series trimmer until any further adjustment of the series trimmer decreases the output signal. This signifies the aligning point has been reached. During this adjustment never touch the antenna R.F. or oscillator shunt trimmers.

Reset test generator to 1400 K.C., tune in signal on receiver, adjust antenna and R.F. shunt trimmers slightly for maximum output, never the oscillator shunt trimmer.

The "M" band is now aligned.

SHORT WAVE "S" BAND ALIGNMENT

Turn wave band selector switch to the right "S" band. Replace 250 mmf. (.00025 mfd.) condenser with 400 ohm resistor. Set generator frequency for 15000 K.C.

Align R.F. shunt trimmer for maximum output deflection. During this adjustment be certain to rotate the station selector knob back and forth slowly for each small R.F. shunt trimmer change.

Align antenna shunt trimmer for maximum output deflection. Be sure to rotate station selector knob back and forth slowly for each small antenna shunt trimmer change. Retrim R.F. shunt trimmer for any small change. Check to see that alignment has not been made on the Image.

Set test generator to 6000 K.C., retune receiver until signal is heard. Adjust oscillator series trimmer slowly while rotating the gang condenser around about the signal for each small adjustment of the series trimmer until further adjustment of the series trimmer decreases the output signal.

Never touch the antenna R.F. and oscillator shunt trimmer during this adjustment.

Reset test generator to 15000 K.C., tune receiver until correct signal is heard. Retouch antenna and R.F. shunt trimmer for final critical setting. During this final adjustment never touch the oscillator shunt trimmer.

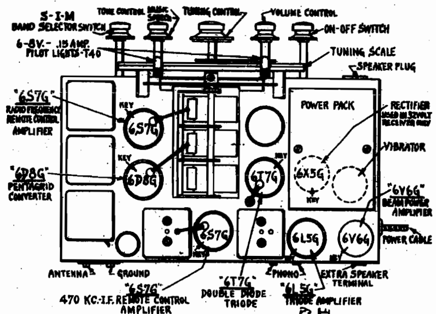
Andrea Radio

CHASSIS NO. E6B - MODEL NOS. 626, 627, 628
FOR USE WITH A 6 VOLT WET ACCUMULATOR.



470 KC. ALIGNMENT:

1. Connect the high-potential output lead from your test generator in series with a .1 mfd. condenser to the grid of the 6D8G tube.

2. Connect the output voltmeter (copper oxide rectifier type) across the voice coil of the speaker.

3. Set the generator at 470 kc. and adjust the generator output attenuator until a small output reading is obtained on the output meter.

4. Adjust both trimmers on the top of the first and the second IF transformers (see diagram) for maximum output.

5. Retrim the first IF trimmer carefully. This completes the IF alignment.

MEDIUM BAND "M" ALIGNMENT:

1. Turn the wave band selector switch on the set to the M position and set the generator for 1,400 kc. Connect the high-potential lead of the generator in series with a .1 mfd. condenser to the grid of the 6D8G tube. Tune the receiver to 1,400 kc. (214.3 m.) on the tuning scale. If no signal is heard, leave the scale pointer at 1,400 kc., and adjust the oscillator coil shunt trimmer slowly until a signal is heard.
2. The oscillator coil of the receiver and the dial are now set correctly, assuming that the test generator calibration is correct.

3. Remove the generator lead from the grid of the 6D8G. Replacing the .1 mfd. condenser by a .00025 mfd. condenser, connect the lead to the antenna terminal of the receiver, leaving all the other settings the same.

4. Adjust the RF coil shunt trimmer, and the ANT coil shunt trimmer for maximum signal response.

5. Retune the generator to 600 kc. (500 m.), and tune the receiver to this same frequency.

6. Adjust the oscillator coil series trimmer slowly, while rotating the gang condenser back and forth slightly for each small adjustment of the series trimmer. Continue this until a further adjustment of the trimmer does not increase the signal further. During this adjustment, do not touch the ANT, RF, or OSC shunt trimmers.

7. Reset the test generator and the receiver to 1,400 kc. Tune the test signal accurately on the receiver. Adjust the ANT and RF shunt trimmers slightly for the maximum output. DO NOT ADJUST THE OSC SHUNT TRIMMER. This completes the alignment of the M band.

SHORT WAVE "S" BAND ALIGNMENT:

1. Turn the wave band selector switch on the receiver to the "S" position. Replace the .00025 mfd. condenser with a 400-ohm resistor.

2. The following adjustment is necessary only if the dial calibration is badly out of line. Otherwise, proceed with steps 3 and 4:

Set the signal generator at 21,500 kc. and the receiver at 21.5 mc. Adjust the oscillator shunt trimmer slowly between maximum and minimum. A signal will be heard at two settings of this trimmer, one near the minimum capacity (plates open), and the other, near the maximum capacity (plates closed). This trimmer should be left at the position where the signal is heard near the minimum capacity. The adjustment near the maximum capacity is the image frequency setting, as can be determined from the previous explanation of image frequency.

3. Align the RF shunt trimmer for maximum signal. During this adjustment, be certain to rotate the gang condenser back and forth for each small adjustment of the RF shunt trimmer.

4. Align the antenna shunt trimmer for maximum signal. During this adjustment, be certain to rock the gang condenser back and forth for each small change of the antenna shunt trimmer until you have obtained maximum signal response. Retrim the RF shunt trimmer for any small change. Check to see that the alignment was not made on the image frequency. (See previous notes.)

5. Set the generator to 9,000 kc., and retune the receiver until the signal is picked up. Adjust the OSC series trimmer slowly, rocking the gang condenser for each small change of the trimmer, until you cannot increase the signal further. DO NOT TOUCH THE ANT, RF, OR OSC SHUNT TRIMMERS DURING THIS ADJUSTMENT.

6. Reset the generator at 21,500 kc., and retune the receiver until the signal is picked up. Retune the ANT and RF shunt trimmers for final, critical setting. During this adjustment, do not touch the OSC shunt trimmer. The S band is now aligned.

SPECIAL "S" BAND ALIGNMENT CHECK:

If you are not experienced in the S band alignment you can check the individual coils very simply in this manner:

Apply the generator signal through a .1 mfd. condenser to the grid of the 6D8G and carry out the procedure outlined above. This will tell you whether the OSC shunt trimmer only is adjusted correctly, or the right signal setting has been used on the test generator. In this case ONLY the image and fundamental will have the same intensity.

When you are sure that the oscillator circuit is correct, put the signal on the grid of the 6S7G RF tube, and repeat the procedure on the RF coil. In this case, when the alignment is correct, the image will be lower in volume than the fundamental.

Replace the .1 mfd. condenser in the generator lead with a 400-ohm resistor and connect it to the antenna terminal of the set. Repeat the adjustment procedure outlined above for the antenna circuit.

This method assures you of correct individual alignment on each coil. Finally, touch up each coil except the OSC as outlined above in 3 and 4.

INTERMEDIATE "I" BAND ALIGNMENT:

Put the wave band switch at the I position, set the generator at 8,000 kc., and the receiver at 8 mc. Align the ANT and RF shunt trimmers for maximum signal. Be sure to rock the gang condenser during this adjustment. Then set the signal generator at 3,000 kc. and the receiver at 3 mc. Adjust the OSC series trimmer for maximum signal, rocking the gang condenser for each small adjustment of the trimmer. Reset the generator at 8,000 kc. and the set at 8 mc. and retrim the ANT and RF shunt trimmers for maximum signal. This completes the alignment of the I band.

CONNECTING THE RECEIVER:- Models 626,627,628 for 6volt service, are furnished with a connecting cable terminating in clips. One clip is stamped ( ), the other ( ). The ( ) must always be connected to the POSITIVE( ) accumulator terminal or DAMAGE TO THE RECEIVER WILL RESUL and the Manufacturer's Guarantee voided. The ( ) connects to the negative accumulator terminal.

In installing the receiver, the accumulator should be kept within the length of the receiver "A" cable leads. NEVER ATTEMPT TO INCREASE THE LENGTH, OTHERWISE PERFORMANCE MAY BE IMPAIRED.

Models 726, 727, and 728 for 32 volt D.C. come equipped with line cord and plug for insertion in 32volt D.C. outlet

PHONOGRAPH CONNECTIONS:- This receiver incorporates "PHONO" connections whereby the high quality audio system can be used to electrically reproduce phonograph records. For this purpose, a high impedance pickup or a low impedance unit with a matching transformer, may be inserted in the PHONO connection at the rear of the chassis. The regular volume control will regulate the phonograph volume. To again use the receiver for radio, the pickup connections must be removed, or poor radio reception will result.

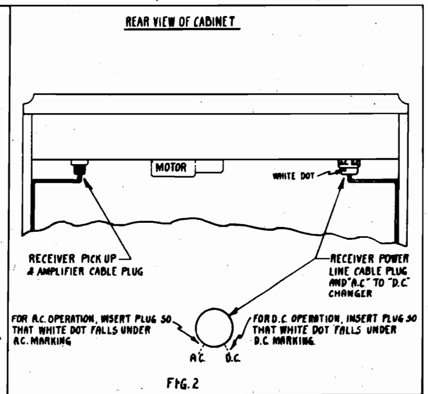

FIG. 2

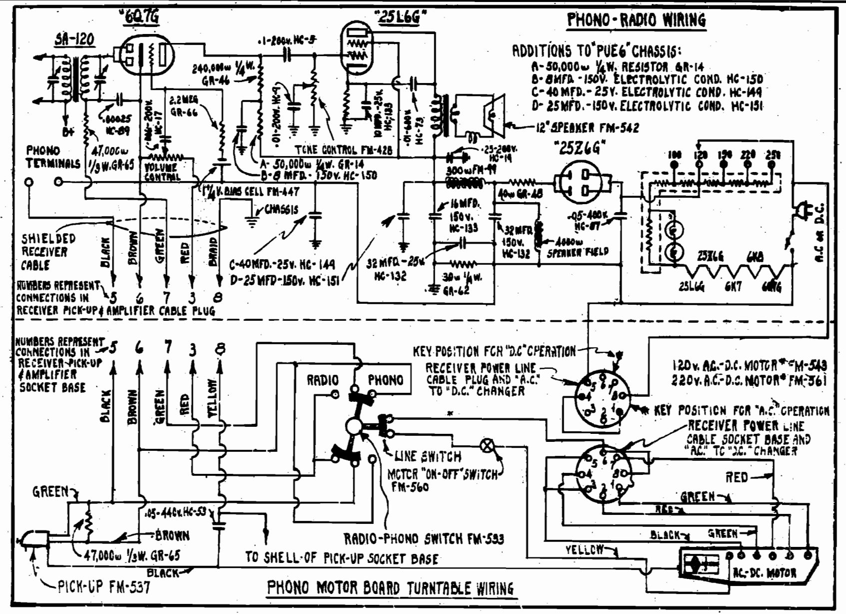

INSTRUCTIONS FOR INSTALLING AND OPERATING ANDREA AC-DC PHONOGRAPH MODELS 634 - 635

WARNING!

For protection in shipping, the radio chassis of this combination is bolted tightly to the shelf on which it is mounted. Before connecting this instrument to the power line, loosen the four mounting bolts, located under the shelf by turning them out about 6 turns, in order that the chassis can float freely on the shock-absorbing strips. Unless this is done, objectionable noises may be set up in the loud speaker.

MOTOR VOLTAGE:

Andrea phonograph combinations are connected at the factory for use on 110-130 V., 50-60 cycles AC, or 110-130 V. DC. Other voltages for AC-DC models are available only on special order. To change the connections for AC, or DC-current, remove the plug shown in Fig. 2, and turn it so that the white dot points toward the current required, and insert the plug again.

RECEIVER VOLTAGE:

Be sure to have the service man check the line voltage tap on the radio receiver chassis. This controls the radio ONLY, and does NOT change the phonograph motor.

RADIO-PHONOGRAPH SWITCH:

Fig. 1 shows the arrangement of the phonograph turntable controls. The radio-phonograph switch, when in the RADIO position, connects the speaker for radio reception. When this switch is turned to the PHONO position, current is connected to the turntable motor, and the pick-up, and the speaker are connected for reproducing phonograph records. The phono-motor can be turned on or off independently by the motor control switch, shown in Fig. 1.

VOLUME & TONE CONTROL

The volume control and tone control on the front of the cabinet regulate both the radio and phonograph.

TURNTABLE SPEED:

Recordings are made with the turntable moving at the rate of 78 revolutions per minute. Consequently, the best reproduction is obtained at that speed. Put the record on the turntable, with a slip of paper part way under it so that the paper can be used as a revolution counter. Then adjust the speed control fast or slow, until the turntable revolves 78 times each minute.

PHONOGRAPH NEEDLES:

Although various types of needles are sold for use in phonographs only the standard size loud or medium needles are recommended. Special needles may be entirely unsuited for use on this machine and may result in loss of tone quality. There is a wedge-shaped groove under the head of the pick-up to direct the needle into the mounting hole. When you become acquainted with the use of this needle guide, you will find it a very easy matter to change needles quickly.

SPECIAL NOTES:

Always keep your records covered. Otherwise dirt will collect in the record grooves, resulting in high needle scratch and poor quality. Always store the records in a cool place. Be sure to replace needle after each playing. Never allow the pick-up to fall on the needle point.

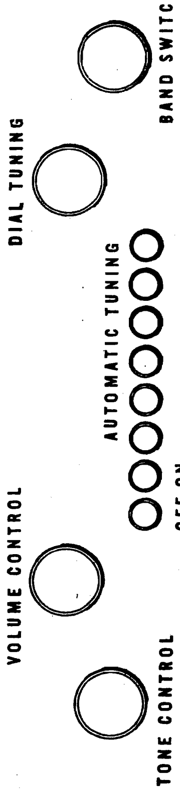
MODELS 1531,1533,1535,1537,Chassis PUEL
Schematic,Coils,Trimmers,Data,Parts



Automatic push button tuning operates only on the broadcast or medium wave band when the switch is in the "A" position. Manual tuning must be used for the other wave bands. On the table models and consoles, the phonograph pick-up terminals are connected to the high-fidelity audio-amplifier when the band switch is in the "P" position. On the combination models, turning the band switch to the P position turns on the current for the phonograph motor and connects the pick-up to the amplifier.

IMPORTANT AC-DC MODEL NOTES

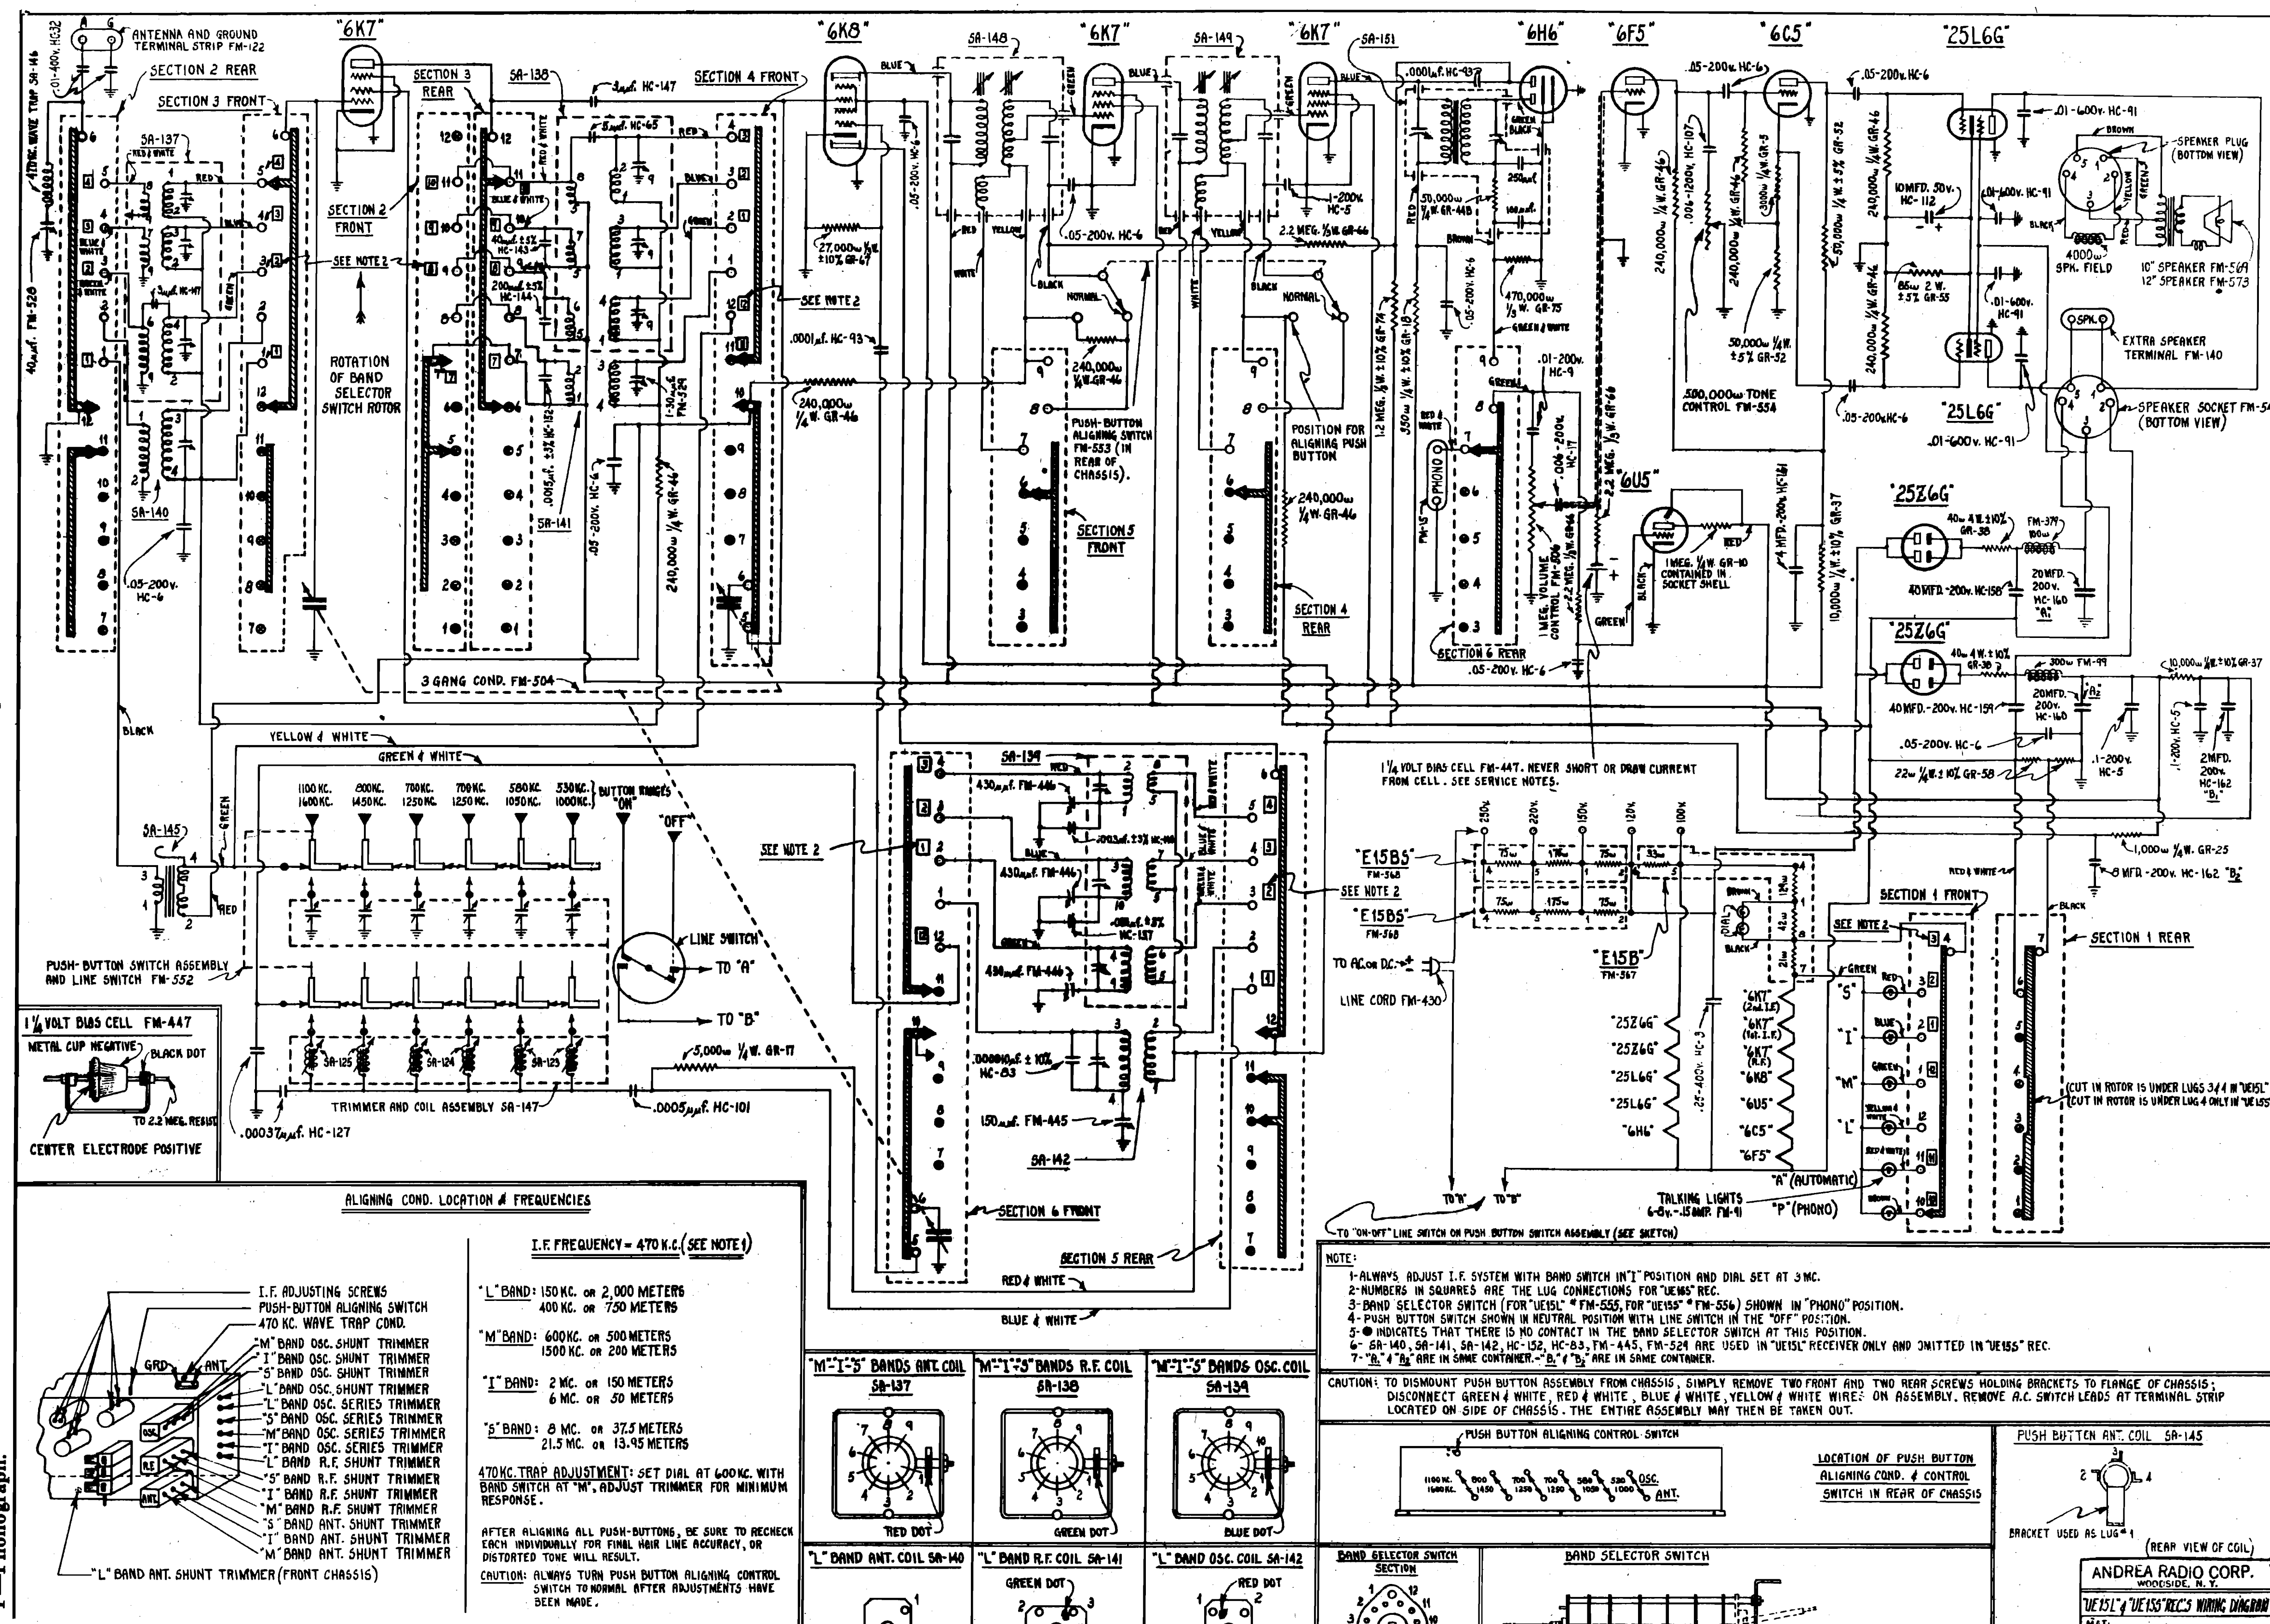
Special notes on connecting AC-DC sets: NEVER connect a ground wire directly to the metal chassis. The external ground wire must be connected ONLY to the ground (black) lead. ALWAYS disconnect the power from the set before removing the rear dust cover, to avoid electric shock. When operating an AC-DC set on direct current, if no signals are heard after the set has been turned on for one minute, reverse the plug in the electric light socket.

BAND SWITCH

Band switch controls button tuning, manual tuning, and phonograph: The right hand, outside knob on the Standard Tuning or Long Wave Tuning sets is marked:

Standard Tuning	Long Wave Tuning
S I M A P	S I M L A P

S—Short Wave I—Intermediate Short Waves M—Broadcast or Medium Waves. L—Long Waves A—Automatic button tuning on broadcast or medium waves P—Phonograph.



AC-DC Voltage Taps and Frequency: Switch on models 1530 and 1531 provides for operation on 90-110, 110-130, 140-160, 210-230, and 240 to 260 volts, 40-60 cycles.

(Chassis Numbers PUE L and PUE S)

I. F. REALIGNMENT GENERALLY SUFFICIENT

As a rule, it is not necessary to readjust the short wave oscillator and antenna shunt and series trimmers unless they have been tampered with, or require replacing. Consequently, careful realignment of the I.F. system is all that requires attention, ordinarily. Before making any adjustments, tune in one particular station and note the quality of reception so that you can check the improvement after the I.F. system has been realigned.

NOTES ON REALIGNING THE BANDS

During the aligning measurements, the output of the signal generator must be kept so low that it will not cause the AVC circuit in the set to function. In other words, when the volume control on the set is turned to maximum, the output should not show more than .5 volt across the voice coil, or 50 milliwatts in the plate circuit of the output tube.

Generally, at frequencies above 7,000 kc., the signal generator frequency will change with each adjustment of the generator output attenuator control. Hence, the receiver must be retuned each time the attenuator is adjusted.

Some generators cause trouble by direct radiation to the set at frequencies above 8 mc. Experience indicates that more accurate alignment is possible when the generator is separated by several feet from the receiver under test, in order to eliminate this direct pickup.

Alignment can be carried out on these models at any band without affecting any of the other bands.

470 KC. I. F. ALIGNMENT

During the alignment of the I.F. system, be sure that the push-button alignment switch, located at the rear of chassis, is turned to the position marked "HERE while adjusting buttons". After the alignment has been completed, the switch must be turned to the position marked "HERE for normal operation" Otherwise, the alignment will not be accurate.

Connect the high-potential lead of the signal generator, in series with a .1 mfd. condenser, to the grid of the 6K8 tube. Turn the wave band switch to "I" Band. Set the generator at 470 kc., and adjust the output until a small deflection is obtained in the output meter. Adjust the screws on the side of the 1st and 2nd I.F. transformers (See circuit diagram) for maximum deflection on the output meter. When this has been completed, touch up each adjustment again for the final setting. Next, disconnect the generator from the grid of the 6K8 tube. This completes the alignment of the I.F. system.

"S" BAND ALIGNMENT

Turn the wave band switch to the "S" position, and connect the high-potential lead of the generator, in series with a .1 mfd. condenser, to the grid of the 6K8 tube.

The following oscillator adjustment is necessary only if the dial calibration is considerably out of line. If it is not, align only the R.F. and Antenna trimmers.

Set the signal generator at 21,500 kc. and the receiver at 21,5 mc. Adjust the oscillator shunt trimmer slowly between maximum and minimum. A signal will be heard at two settings of the trimmer, one near the minimum capacity (plates open), and the other near the maximum capacity (plates closed). Set the trimmer at the point where the signal is heard near the minimum capacity. The adjustment near the maximum capacity is at the image frequency. This will tell you whether the OSC shunt trimmer only is adjusted correctly, or the right signal setting has been used on the test generator. In this case ONLY the image and fundamental will have the same intensity.

Remove the generator from 6K8 and put it on 6K7 R.F. tube control connection. Align the R.F. shunt trimmer for maximum signal. During this adjustment, be certain to rotate the gang condenser back and forth for each small adjustment of the R.F. shunt trimmer. Remove the generator connection from 6K7 and connect it in series with 400 ohm. resistor to the "Ant" terminal of the receiver. Align the antenna shunt trimmer for maximum signal. During this process, rock the gang condenser back and forth for each small change of the antenna shunt trimmer, until you have obtained maximum response. Touch up the R.F. shunt trimmer for final setting. Check to see that alignment was not made on image signal (See section following).

Set the generator at 8,000 kc., and adjust the receiver to pick up the signal. Adjust the oscillator series trimmer carefully, rocking the gang condenser for each small change of the trimmer, until you obtain maximum response.

Do not touch the antenna, R.F., or oscillator shunt trimmers during this adjustment.

Set the generator at 21,500 kc., and tune the receiver for that signal. Retune the antenna and R.F. shunt trimmers for exact, final settings. During this adjustment, do not touch the oscillator shunt trimmer. This completes the adjustment of the "S" band.

FUNDAMENTAL AND IMAGE FREQUENCY NOTES:

A simple method of checking the receiver and signal generator to determine if they are tuned for correct alignment is as follows:

Set the signal generator at 21,500 kc. and tune the receiver slowly from about 20,000 kc. to 22,500 kc. Two signals should be heard, 940 kc. apart. One of them will be lower in frequency than 21,500 kc., and the other will be higher. The higher frequency, as indicated on the dial, is the correct aligning frequency, and the lower one is the image.

As an additional check, leave the receiver tuned to the higher frequency. Very slowly, increase the generator frequency from 21,500 kc. to about 22,500 kc. A signal will be heard near 22,500 kc. if all the settings are correct for alignment. If there is no signal, the original settings were on the image frequency. In that case, you must start again from the beginning, in order to be sure of accurate results.

After you have found the correct settings, the image, or lower, frequency response on the receiver will always sound weaker than the true signal.

INTERMEDIATE "I" BAND ALIGNMENT:

Put the wave band switch at the "I" position, set the generator at 6,000 kc., and the receiver at 6 mc. Align the ANT and R.F. shunt trimmers for maximum signal. Be sure to rock the gang condenser during this adjustment. Then set the signal generator at 2,000 kc. and the receiver at 2 mc. Adjust the OSC series trimmer for maximum signal, rocking the gang condenser for each small adjustment of the trimmer. Reset the generator at 6,000 kc. and the set at 6 mc. and retrim the ANT and R.F. shunt trimmers for maximum signal. This completes the alignment of the "I" band.

MEDIUM BAND "M" ALIGNMENT:

1. Turn the wave band selector switch on the set to the "M" position and set the generator for 1,500 kc. Connect the high-potential lead of the generator, in series with a .1 mfd. condenser, to the grid of the 6K8 tube. Tune the receiver to 1,500 kc., (200 m.) on the tuning scale. If no signal is heard, leave the scale pointer at 1,500 kc., and adjust the oscillator coil shunt trimmer slowly until a signal is heard.

2. The oscillator coil of the receiver and the dial are now set correctly, assuming that the test generator calibration is correct.

3. Remove the generator lead from the grid of the 6K8. Replacing the .1 mfd. condenser by a .00025 mfd. condenser, connect the lead to the antenna terminal of the receiver, leaving all the other settings the same.

4. Adjust the R.F. coil shunt trimmer, and the ANT coil shunt trimmer of the "M" band for maximum signal response.

5. Retune the generator to 600 kc. (500 m.), and tune the receiver to this same frequency.

6. Adjust the oscillator coil series trimmer slowly, while rotating the gang condenser back and forth slightly for each small adjustment of the series trimmer. Continue this until a further adjustment of the trimmer does not increase the signal. During this adjustment, do not touch the ANT, R.F., or OSC shunt trimmers.

7. Reset the test generator and the receiver to 1,500 kc. Tune the test signal accurately on the receiver. Adjust the ANT and R.F. shunt trimmers lightly for the maximum output. DO NOT ADJUST THE OSC SHUNT TRIMMER. This completes the alignment of the "M" band.

470 KC. CODE REJECTION CIRCUIT ALIGNMENT:

Set wave band switch on "M" position and tune receiver to 530 kc. Connect the high-potential lead of generator in series with a .00025 mfd. (250 mmf.) condenser to Antenna terminal of receiver. Then turn signal generator to 470 kc. and increase output until a loud signal is heard. Adjust 470 kc. code condenser for MINIMUM SIGNAL. This must be done carefully otherwise poor results may occur.

"L" BAND ALIGNMENT

1. Turn the wave band selector switch to the "L" position. Set signal generator for 150 kc. and connect generator high-potential lead in series with a .1 mfd. condenser to the grid of 6K8 tube.

2. Set receiver dial to 150 kc. (2,000 meters).

3. Adjust the L.W. series oscillator trimmer until the loudest signal is heard. This point is required because of the wide frequency range the L.W. series oscillator trimmer has on the oscillator frequency. Due to this wide change in frequency it is possible that several different adjustment points in the L.W. oscillator series trimmer will produce output signals, but only one of these is correct (the loudest).

4. Set the generator and receiver dial to 400 kc. (750 meters) and adjust the L.W. oscillator shunt trimmer until a signal is heard.

5. After readjusting the L.W. oscillator shunt trimmer, it is very important that the generator and the set dial be set for 150 kc. (2,000 meters) and the L.W. series oscillator trimmer readjusted in accordance with paragraph 3. Set the generator and receiver dials back to 400 kc. (750 meters) and adjust L.W. oscillator shunt trimmer until a signal is heard.

6. Remove generator lead from the grid of the 6K8. Replace the .1 mfd. condenser with a .00025 mfd. condenser, and connect the lead to the antenna terminal of the receiver.

7. Set generator and receiver dial to 400 kc. (750 meters).

8. Adjust the antenna and the R.F. shunt trimmers for maximum output deflection.

9. Change the generator and receiver to 150 kc. (2,000 meters). Adjust the L.W. series oscillator trimmer for maximum deflection. BE CERTAIN TO ROTATE GANG CONDENSER FOR EACH ADJUSTMENT OF THE SERIES TRIMMER.

10. Repeat the adjustments set forth in paragraphs 7 and 8, or the receiver will not be aligned correctly because of the effect described in paragraph 3.

11. After carrying out instruction 10, be sure to repeat 9.

12. Both 8 and 9 must be repeated until it is noticed that the trimmers no longer improve the alignment. The long wave band is now aligned.

SPECIAL NOTES

To remove the push-button assembly from the chassis, simply take out the four screws holding the brackets to the front and rear flange of the chassis, and unsolder the AC switch leads at the side of the chassis plus the yellow and white lead on the push-button switch, and the blue and white, red and white, and green and white wires on the terminal strip. (See circuit diagram.) In this way any servicing is easily handled. The receiver, of course, can be operated and worked normally without this assembly on all bands except the "A" band.
In case the assembly has been removed, it is advisable to readjust each button after remounting.

BIAS CELL

This receiver incorporates a bias cell in the grid of the audio tube, as shown in the wiring diagram. In case you remove the cell, handle it with the greatest care. Do not put your fingers across the terminals, for this will have the effect of short-circuiting the electrodes, and the voltage will not return to normal for several hours.

NEVER test this cell with an ordinary voltmeter. Since this a "no-current" cell, the only way to test it accurately is with a vacuum tube voltmeter. Always insert the cell in the mounting assembly so that the metal container (negative side) contacts the cell-holder pin with the black dot. This cell can be expected to render at least three years' service before it requires replacement.

SETTING BUTTON CONTROLS CHASSIS NUMBERS PUE-L, PUE-S.

Accurate adjustments can be made easily: The simplicity of the Andrea Radio push button controls, requiring only the use of a thin-blade screwdriver, makes it easy to set them accurately. This is essential, for unless the controls are set exactly, the tone quality will be destroyed.

CHOOSING YOUR STATIONS

Make a list of the stations: Set down the call letters of the six stations required, and put them in the order of their kilocycles rating, the lowest at the top, corresponding to Station 1 selecting button at the left. The kilocycle tuning ranges of the button controls are:

Extreme Left	**OFF**
	ON
	Station 1— 530 to 1000 kc.
	Station 2— 580 to 1050 kc.
	Station 3— 700 to 1250 kc.
	Station 4— 700 to 1250 kc.
	Station 5— 800 to 1450 kc.
Extreme Right	**Station 6—1100 to 1600 kc.**

It is necessary, of course, to choose stations whose kilocycle ratings come within these button tuning ranges. The ranges given in the list above are conservative. Consequently, it may be possible to tune in a station which is just outside the range of any particular button control. For example, on Station 3, although, the range is shown as 700-1250 kc., it may be possible to tune in a station on 660 kc., or one on 1300 kc.

MARKING THE BUTTONS

Remember the transparent disks: When you have made up your station list, locate the call letters on the station-call marker sheets, and punch them out carefully. If lettered markers are not provided for the stations you want, use the blank markers, and print the station letters on them.

First insert the "OFF" marker in the extreme left hand button, and the "ON" marker in the adjacent button. Then, after selecting the proper markers for the stations on your list, insert the markers in the same order as your kilocycle list, starting with Station 1 on the third button from the left. Don't attempt to glue the markers in place. Instead, put a transparent disc over each marker, that will hold it in place permanently. Use the end of a lead pencil to press these discs into position. In case you want to change a marker, you can pry it out with the point of a pin.

ADJUSTING THE CONTROLS

Remember to set the button adjusting switch: At the rear of the chassis is a switch with a red knob. While adjusting the controls, and only at that time, the knob should be turned to the upper position. Put the wave band switch in the "M" position, for dial tuning.

Tune in the station using call letters you have put on the first button. Then turn the band switch to position "A". Push in the button you are going to adjust, and turn the volume control to maximum.
When the set has been turned "ON" for at least 10 minutes so that it has become thoroughly warm, you will be ready to make the button adjustments.

The adjusting screws can be reached easily through holes at the rear of the chassis. Each button has two adjustment controls marked "ANT" and "OSC", in pairs. The pair corresponding to the Station 6 on your list is at the extreme left. This set is so designed that the tuning indicator operates with the push-buttons as well as with manual tuning. Therefore, you can adjust the controls with absolute accuracy by watching the opening and closing of the indicator. The exact setting for each adjustment is obtained when the ray is closed as far as possible.

Use a thin-blade screwdriver to adjust the screws. Don't force a thick blade into the slots. First adjust the oscillator screw for Station 1, turning it until you hear the station you tuned in previously on the dial. If the speaker breaks into a howl during this adjustment, turn the Station 1 antenna screw to the right or left until the howl stops. After you have an accurate setting of the oscillator screw, adjust the corresponding antenna screw for maximum volume. The final adjustment should be made by turning the oscillator screw while you watch the opening of the Mystic Ray. Then, in the same way, get a final adjustment for the antenna screw. For a still sharper setting, disconnect the antenna lead. Connect a 6-inch length of insulated wire to the antenna terminal and twist the antenna lead lightly around it. Again, adjust the oscillator and antenna screws for maximum response from each station.

To check the accuracy of the settings, turn the wave band switch to position M. The station should sound practically the same whether the switch is in the A or M position. If there is considerable difference, the station was not tuned accurately with the dial or else the corresponding button controls were not set correctly.

Repeat the same routine for button No. 2, adjusting the No. 2 oscillator and antenna screws, and continue the process in the same way for the other controls.

To change any button to another station, if the station's kilocycle rating is within the range of the corresponding controls, it is only necessary to put in a new button marker, and to reset the controls in accordance with the preceding instructions.

PHONOGRAPH RECORDS

Table model: On the table models, connections are provided at the rear of the chassis for plugging in an electric phonograph pick-up, used with a separate turntable. When the band switch is in the "P" position, the pick-up terminals at the back of the chassis are connected to the amplifier.

Console models: The console models use the same cabinet as the combination models, so that you can have a phonograph turntable and pick-up installed in the phonograph compartment provided at any time. The pick-up, which should be plugged into the terminals at the back of the chassis, is connected to the amplifier when the band switch is in the "P" position.

Combination models: These models are so wired that, when the band switch is turned to the "P" position, current is connected to the turntable motor and the pick-up is connected to the amplifier. On all three types of models, the volume control and the tone control operate with the phonograph.

AUTOMATIC TUNING

Buttons cut in high-fidelity circuits: An important improvement in Andrea push-button tuning is the use of high-fidelity circuits which are cut in when any push-button is operated. This provides extra tone quality for your favorite local stations. At the same time, extra selectivity is obtained on manual tuning.

CAUTION

This is very important: When all adjustments have been made, it is necessary to touch up each one again, to assure absolute accuracy. After this has been done, turn the switch with the red knob, at the rear of the chassis, to the lower position marked "HERE for normal operation". Otherwise, loss of efficiency will result. Last of all, make sure that the antenna is connected again.

IMPORTANT!

If you find it necessary to replace any part in this receiver, bear this in mind: In order to maintain the high performance standards of Andrea Radio receivers, the components parts on all Andrea models are held to exceedingly close tolerance limits. Furthermore, Andrea components are given the exclusive "Climate Sealed" treatment which protects them from all weather and temperature conditions. Consequently, standard Andrea Radio replacement parts must be used for all service work, for the substitution of ordinary, stock items will result in inferior performance.

TALKING LIGHTS

Position of band switch indicated by Talking Lights: The different colored lights on the dial indicate the wave band which is in use, or shows when automatic tuning or the phonograph pick-up are cut in.

ALIGNMENT PROCEDURE

The following instructions are for the sole use of professional radio service men in the event that the receiver should require serviceing.

I. F. Alignment. The intermediate frequency to which this set should be adjusted is 456 K.C. To align the intermediate frequency transformers properly, a signal generator emitting a signal of 456 K.C. should be coupled to the signal control grid of the 6A7 tube through a .5 mmfd condenser. An output meter should be connected across the voice coil of the speaker. The four trimmers mounted internally in the top of the two I. F. cans should be adjusted to resonance. The output of the signal generator should be attentuated so as to provide the weakest possible signal necessary to produce a .5 volt deflection on the output meter.

R. F. Alignment. Adjust the signal generator to 17.4 MC. Feed this signal into the antenna lead of the receiver through a 400 ohm resistor. Rotate the band switch on the receiver to the Short Wave position and set the tuning dial to 17.4 on the Short Wave Scale. Adjust the trimmer on the rear section for maximum signal output. Rotate the Band Switch to the broadcast position. Replace the 400 ohm resistor in the Oscillator lead with a 200 mmfd condenser. Set the signal generator to 1560 K.C. and tune the receiver to the same frequency. Adjust the small trimmer condenser which is located near the Oscillator coil underneath the Chassis, to maximum signal response. Attentuate the output of the signal generator to the extent necessary for maintaining a deflection of .5 volts on the output meter and adjust the trimmer mounted on the front section of the variable condenser to resonance. Set the signal generator and the receiver at 600 K.C. and adjust the padder condenser for optimum response. Repeat the last two adjustments to insure accuracy of alignment. Rotate the Band Switch to the Short Wave position and with the signal generator and receiver tuned to 15 MC, adjust the small trimmer condenser which is located near the Short Wave Antenna coil. This last operation should be made with the 400 ohm resistor in the antenna circuit.

It is imperative that all adjustments be made with the minimum signal necessary to obtain the designated deflection on the output meter. This will obviate any difficulty arising from the A.V.C. action of the receiver, and will permit adjustment to absolute resonance.

FREQUENCY RANGES :
BAND A - 549 to 1555 KC
BAND B - 2.23 to 6.36 MC
BAND C - 5.75 to 16.6 MC

I.F. ALIGNMENT
Couple the signal generator to the signal control grid of the 6A7 tube through .5 mfd. condenser. Signal from the generator adjusted to .5 volt output meter deflection. Adjust the four I.F. trimmers on transformers to resonance.
WAVETRAP - The trimmer condenser C21 is next adjusted at 456 KC. Signal should be fed to the antenna terminal of receiver. Adjust for minimum response.

R. F. Alignment. Rotate the band switch to the extreme counter-clockwise or "A" band position. Set the receiver dial at 1400 KC. Advance the volume control to maximum. Adjust the signal generator to 1400 KC and feed this signal to the receiver by connecting a 200 mmfd fixed condenser between the signal generator lead and the receiver antenna lead. With a weak signal adjust the band "A" oscillator trimmer to resonance. Then adjust band "A" antenna trimmer for maximum response. Rotate both the receiver dial and signal generator dial to 600 KC. Adjust the padder condenser to resonance. This adjustment is located on the top of the chassis pan between the composite broadcast and short wave antenna coil and the variable condenser. It will be necessary to repeat both the high frequency trimming and low frequency padding adjustments to insure correct alignment. In making final adjustments it is desirable that the signal generator output be attentuated sufficiently so that the output meter connected across the speaker voice coil does not greatly exceed .5 volt deflection at maximum response.

Rotate the band switch clockwise to the intermediate or "B" band position. Replace the 200 mmfd condenser in the signal generator output lead with a 400 ohm resistor. Set the receiver and the signal generator to 5.5 megacycles. Adjust the "B" band oscillator trimmer and then the "B" band antenna trimmer to resonance, at all times keeping the signal output from the generator as low as practical.

Rotate the band switch to the extreme clockwise or "C" band position. Set the receiver and signal generator to 15 megacycles as indicated on their respective dials. Adjust the "C" band oscillator trimmer and then the "C" band antenna trimmer to resonance. It is of particular importance in making these adjustments that the receiver should not be tuned to the image instead of the desired signal. This difficulty can largely be avoided by extreme attentuation of the signal generator output.

The normal alignment of this receiver requires that its oscillator operate at a frequency 456 KC higher than that of the tuner. The simplest way of distinguishing the correct operating point on the oscillator trimmer from the image response point is to start with the trimmer screw set down fairly tight, then to slowly turn the screw out. First one response and then a second will be heard. The second response is the correct one. If only one response is heard over the whole trimmer range, it will be the correct one.

ALIGNMENT PROCEDURE AND INSTRUCTIONS FOR ADJUSTING THE AUTOMATIC SELECTOR UNIT

1. Select six local stations which ordinarily comprise the principal source of entertainment. These must be stations which can be depended upon to provide good reception at all times.

2. Arrange these stations in the order of their frequency (KC) assignments. The frequency assignment for any station may be found in any newspaper listing or a radio call book. For purposes of convenience in adjustment, each button has been assigned a letter from "A" to "F" as indicated in the following table.
It will be noted that each button operates only over a definite frequency range. For this reason, it is necessary that the station with the lowest frequency (nearest to the 550 KC end of the broadcast band) should be assigned to button "A". Button "B" would be used for the station of the next lowest frequency. This procedure is followed throughout. Button "F" is used for the station of highest frequency (nearest the 1500 KC end of band).

3 Mounted on the rear of the Automatic unit below the 12 adjustment screws is a strip showing the purpose of each adjustment screw. This strip shows that there are two adjustments for each station button; one is the oscillator adjustment, and the other the antenna adjustment.These are noted on the strip as "A" osc., "A" ant., "B" osc., "B" ant. etc.

4. Switch the set on by rotating the volume control knob to the right. Rotate the band switch to the broadcast position as indicated on the card mounted behind the knobs on the front panel. Carefully tune in the station which has been selected for position "A". Note the program received from that station. This will provide a simple method of identifying the station while adjusting the selector unit.

5. Rotate the band switch to the Automatic position. Press the extreme left-hand button on the front panel inward until it is engaged by the latch. This controls station position "A".

6. With a small screw driver adjust the setting marked "A" osc. until the desired program is heard. It is often possible to receive the same program at several points of adjustment. The correct point will provide the loudest response. Carefully adjust the screw which is marked "A" ant. for complete resonance. On powerful local stations it may be necessary to disconnect the antenna to find the correct antenna screw adjustment.

7. Rotate the band switch to the broadcast position again, then tune in the station which has been selected for position "B". Observe the nature of its program and rotate the band switch to the Automatic position. Depress the control button "B". Adjust the screw marked "B" osc. and then the screw marked "B" ant. in the same manner as was previously done for position "A".

8. Following the same procedure, adjust the remaining four station positions.

9. Repeat the six station adjustments in the same order as originally made.

10. Remove the Escutcheon plate from the front of the control unit. Detach the call letters of the six stations selected from the call letter sheet furnished with the receiver. Moisten the gummed backed of each of the six call tabs and affix them within the marked section of the celluloid plates which are mounted behind the Escutcheon. Each call tab should be positioned in the space directly above the shaft controlling the station which it identifies.

I. F. Alignment. The intermediate frequency to which this set should be adjusted is 456 KC. To align the intermediate frequency transformers properly, a signal generator emitting a signal of 456 KC should be coupled to the signal control grid of the 6A7 tube through a .5 mfd condenser. An output meter should be connected across the voice coil of the speaker. The four trimmers mounted internally in the top of the two I. F. cans should be adjusted to resonance. The output of the signal generator should be attentuated so as to provide the weakest signal necessary to produce a .5 volt deflection on the output meter when resonance is achieved.

R. F. Alignment. Rotate the band switch to position "B". This is the position which is second from the extreme counter-clockwise (Automatic) position. Set the receiver dial at 1400 KC. Advance the volume control to maximum. Adjust the signal generator to 1400 KC and feed this signal to the receiver by connecting a 200 mmfd fixed condenser between the signal generator lead and the receiver antenna lead. With a weak signal adjust the band "B" oscillator trimmer to resonance. Then adjust band "B" antenna trimmer for maximum response. Rotate both the receiver dial and signal generator dial to 600 KC. Adjust the padder condenser to resonance. This adjustment is located on the top of the chassis pan mid-way between the "B" band oscillator coil and the first I. F. Transformer. It will be necessary to repeat both the high frequency trimming and low frequency padding adjustments to insure correct alignment. In making final adjustments it is desirable that the signal generator output be attentuated sufficiently so that the output meter connected across the speaker voice coil does not greatly exceed .5 volt deflection at maximum response.

Rotate the band switch clockwise to the third or "C" band position. Replace the 200 mmfd condenser in the signal generator output lead with a 400 ohm resistor. Set the receiver and the signal generator to 5.5. megacycles. Adjust the "C" band oscillator and then the "C" band antenna trimmer to resonance, at all times keeping the signal output from the generator as low as practical.

Rotate the band switch to the extreme clockwise or "D" band position. Set the receiver and signal generator to 14 megacycles as indicated on their respective dials. Adjust the "D" band oscillator trimmer and then the "D" band antenna trimmer to resonance. It is of particular importance in making these adjustments that the receiver should not be tuned to the image instead of the desired signal. This difficulty can largely be avoided by extreme attentuation of the signal generator output.

The normal alignment of this receiver requires that its oscillator operate at a frequency 456 KC higher than that of the tuner. The simplest way of distinguishing the correct operating point on the oscillator trimmer from the image response point is to start with the trimmer screw set down fairly tight, then to slowly turn the screw out. First one response and then a second will be heard. The second response is the correct one. If only one response is heard over the whole trimmer range, it will be the correct one.

456 KC Trap Alignment. In regions adjacent to commercial radio telegraph transmitters code interference is often experienced because of the seepage of these code signals through the intermediate frequency system. A wave trap is incorporated in this receiver to eliminate this condition. To adjust this trap circuit a 456 KC signal should be fed from the signal generator into the antenna circuit of the receiver. This signal should be of a fairly high order. Adjust the wave trap trimmer condenser until minimum response is obtained.

ALIGNING I.F. TRANSFORMERS

Part No. 10895D Output I. F. Transformer

Part No. 10896E Input I. F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6S7G tube, and adjust the output I.F. transformer (No. 10895D) to resonance.
   (b) Move oscillator output clip from grid of 6S7G to grid of 6D8G and adjust input I.F. transformer (No. 10896E) to resonance.
   (c) With oscillator still connected to 6D8G, readjust output I.F. transformer (10895D) if necessary.

R.F. ALIGNMENT: (535-1720 K. C.)

1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 100 mmf. condenser to the antenna lead and chassis ground and make the following adjustments:
   (a) with external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser.
   (c) Check sensitivity at 600 and 1000 kilocycles.

(Serial No. 8C136800 and up)

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K. C.):

Part No. 108-106B Output I.F. Transformer
Part No. 108-105B Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser in its minimum capacity position, plates entirely out of mesh, make the following adjustments:

(a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6S7G tube, and adjust the output I.F. transformer (No. 108-106B) to resonance.

(b) With "Dummy 1" still connected, move oscillator output clip from grid of 6S7G to grid cap of 6D8G and adjust input I.F. transformer (No. 108-105B) to resonance.

SHORT WAVE BAND ALIGNMENT:
5.5 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the antenna and ground leads, make the following adjustments:

(a) Move dial pointer to 17 megacycles and adjust short wave oscillator trimmer to resonance.

This adjustment is the trimmer mounted on the top of rear section of the variable gang condenser (see Fig. 1, top view).

(b) Adjust short wave antenna trimmer (Adjustment Number 1), to resonance (see Fig. 3, bottom view).

BROADCAST BAND ALIGNMENT:
535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to antenna and ground leads make following adjustments:

(a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment number 3, see bottom view of chassis, Fig. 3).

(b) Re-set external oscillator to 1400 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (adjustment number 2), to resonance.

(c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (adjustment number 4), to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3).

(d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.

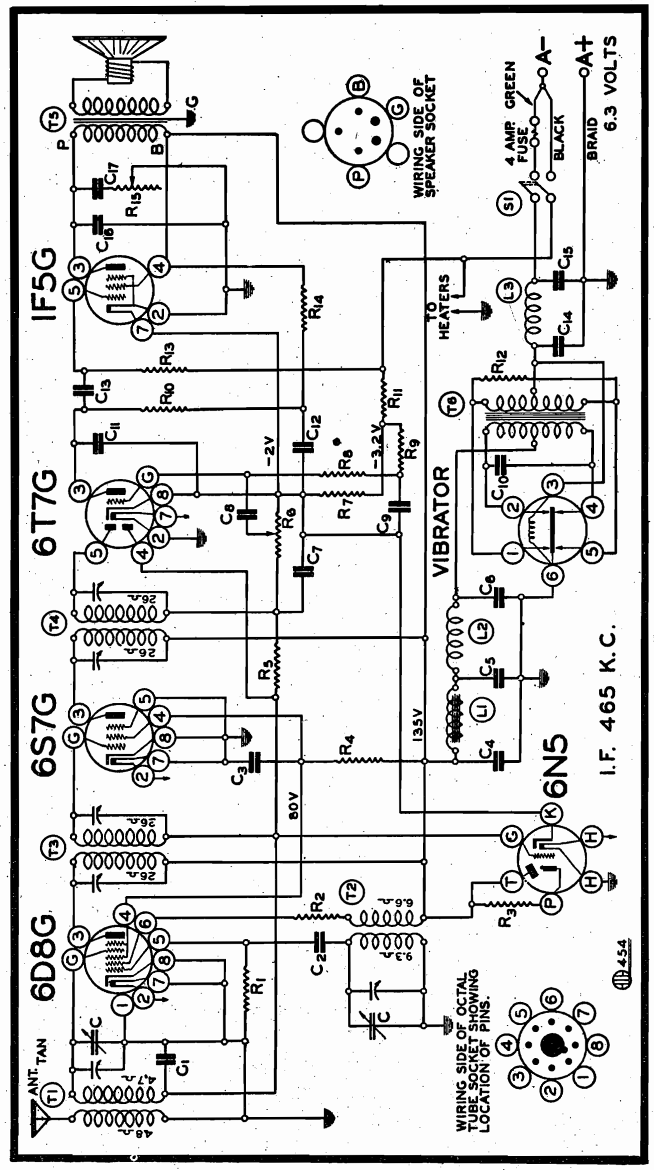
(e) Check for tracking and sensitivity at 1400, 1000, and 600 kilocycles. **Under no circumstances bend plates of variable condenser sections to correct tracking.**

MODEL 504 Series A
Schematic, Socket
Trimmers, Parts
Alignment, Voltage

BELMONT RADIO CORP.

IN ORDER TO PREVENT SIGNAL FROM ACTING UPON AVC AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.

All voltages are to be measured with 6.3 volts input to receiver. Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.



Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

ALIGNING I.F. TRANSFORMERS: (465 K. C.):

Part No. 108-85 Output I.F. Transformer.

Part No. 108-84 Input I.F. Transformer.

These I.F. Transformers have two adjustments, both of which are accessible from the top of chassis (see fig. 1, top view).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments.
   (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6S7G tube, and adjust the output I.F. transformer (No. 108-85) to resonance.
   (b) Move oscillator output clip from grid of 6S7G to grid cap of 6D8G and adjust input I.F. transformer (No. 108-84) to resonance.
   (c) With oscillator still connected to 6D8G readjust output I.F. transformer (108-85) if necessary.

R. F. ALIGNMENT: (535-1720 K.C.)

1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmf. condenser to tan antenna and black ground leads and make the following adjustments:
   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer (rear of gang condenser).
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick-up oscillator signal and adjust antenna trimmer to resonance (front section of gang condenser)
   (c) Check sensitivity at 600 and 1000 kilocycles.

MODEL 517 Series A Schematic, Voltage Socket, Trimmers

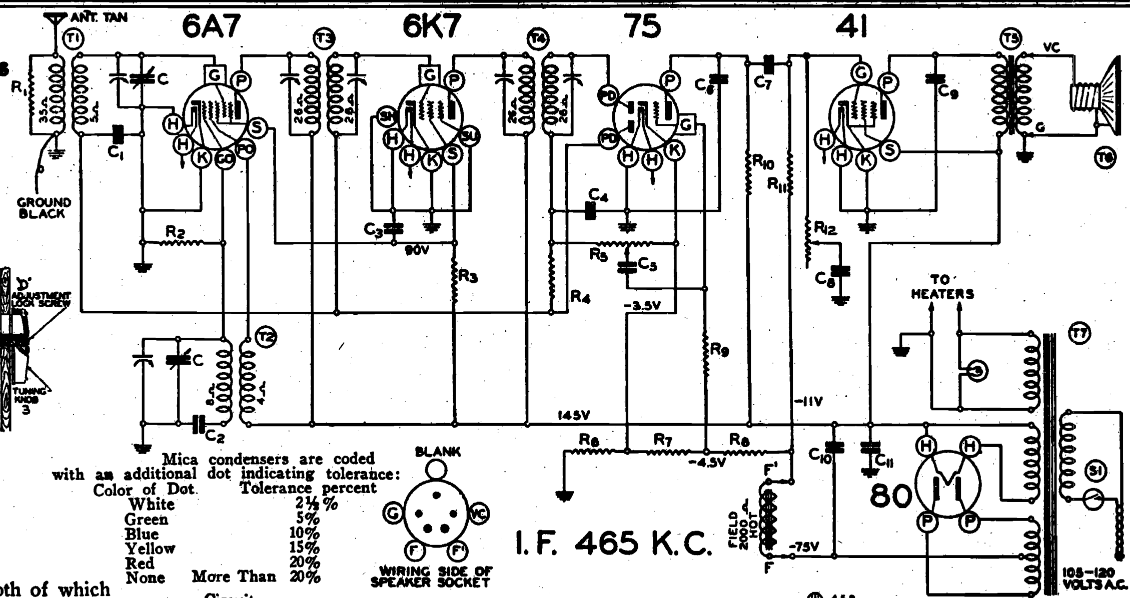
Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with 115 volts on the primary of the power transformer.

MODEL 517

SERIES A

535 - 1720 Kilocycles



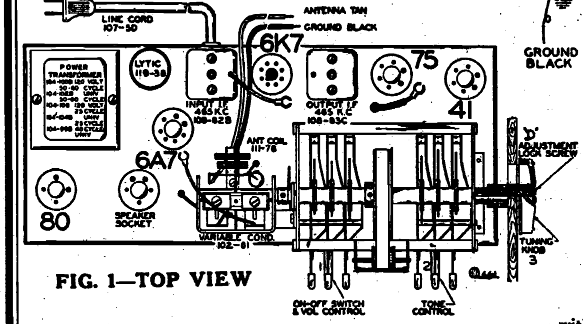


FIG. 1—TOP VIEW

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-83C Output I.F. Transformer
Part No. 108-82B Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-83C) to resonance.
   (b) Move oscillator output clip from grid of 6K7 to grid of 6A7 and adjust input I.F. transformer (No. 108-82B) to resonance.
   (c) With oscillator still connected to 6A7, readjust output I.F. transformer (108-83C) if necessary.

R.F. ALIGNMENT: (535-1720 K.C.)

1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmf. condenser to the antenna lead and chassis ground and make the following adjustments:
   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
   (c) Check sensitivity at 600 and 1000 kilocycles.

Mica condensers are coded with an additional dot indicating tolerance:

Color of Dot.	Tolerance percent
White	2½%
Green	5%
Blue	10%
Yellow	15%
Red	20%
None	More Than 20%

(No. 7K 866000 and up)

128-109		Wood Knob (Spring Type)
128-126		Special Tuning Knob

PROCEDURE FOR SETTING THE "PRESTO-MATIC" LEVERS:

There are six levers on the dial by means of which six stations may be selected.

Press down any one of the six "Presto-matic" levers. Holding it down, tune in by means of knob No. 3 any one of your favorite stations. Turn the tuning knob very slowly back and forth until the signal is clearest. The station will then be accurately tuned in.

Release the lever and press down any other "Presto-matic" lever and again hold it down, tune in by means of knob No. 3 another favorite station.

When you have selected all your favorite stations, hold tuning knob No. 3 securely and with a coin or a screw driver, tighten the special locking screw ("D") in the center of the tuning knob, (See Fig. 1).

This screw will lock in place all the stations you have selected on the "Presto-matic" levers. (Note: Locking Screw "D" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, hold tuning knob No. 3 securely, loosen locking screw ("D") and select the new station as explained.

ALIGNING I.F. TRANSFORMERS: (465 K.C.)

1. **With volume control full on and with variable condenser at its minimum capacity position, plates entirely out of mesh, and with external oscillator set at 465 K.C. connected in series with a .1 mfd. condenser, to the grid of the 1A6 tube (cap at top of tube), adjust I.F. transformers, parts number 108-67 and 108-68, to resonance. Both of these transformers have two (2) adjustments each, they are accessible from the tops of the cans (for location see top view).**

   Use as a resonance indicator an output meter connected across the outside terminals of the speaker or by means of an adapter to the plate and screen of the type 950 output tube. Maximum deflection of the volt meter indicates resonance.

   Use only enough signal to get a readily readable output.

   A low range output meter or the low scale of a multi-range meter should be used.

BROADCAST BAND ALIGNMENT:

1. **Set external oscillator to 1720 K.C. and connect it in series with a 200 mmfd. condenser to the antenna and ground posts.**
   - **(a)** With variable condenser in its minimum capacity position, plates entirely out of mesh, adjust oscillator trimmer (rear section of variable condenser) to resonance.
   - **(b) Re-set external oscillator to 1400 K.C. Rotate variable condenser, pick up signal and adjust antenna trimmer (front section of variable condenser) to resonance.**
   - **(c) Re-set external oscillator to 600 K.C., move dial pointer to 600 K.C., and adjust series pad, part number 124-14 (see top view), to resonance. While making this adjustment, slowly rock variable condenser to and fro until maximum output is obtained.**
   - **(d) Check for sensitivity at 1400, 1000, 600 K.C. DO NOT BEND PLATES.**

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

All voltages as indicated on diagram, are measured with a new set of batteries.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I. F. TRANSFORMERS: (465 K.C.):

Part No. 108-79C Output I. F. Transformer
Part No. 108-78C Interstage I. F. Transformer
Part No. 108-116 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1 Top View).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to minimum capacity (plates out of mesh), make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 1D5G 2nd. I.F. Tube and adjust the output I.F. transformer (No. 108-79C) to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 1D5G 2nd. I.F. Tube to grid cap of 1D5G 1st. I.F. Tube and adjust interstage I.F. transformer (No. 108-78C) to resonance.
   (c) Move oscillator to grid cap of 1C7G and adjust input I.F. transformer (No. 108-116).

SHORT WAVE BAND ALIGNMENT:

5.5 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the antenna and ground leads, make the following adjustments:
   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator trimmer to resonance.

   This adjustment is the trimmer mounted on the top of front section of the variable gang condenser (see Fig. 1, top view).

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

The approximate current consumption is "A"—420 ma., "B"—16 ma.

   (b) Adjust short wave antenna trimmer (Adjustment "Z"), to resonance (see Fig. 3, bottom view).

BROADCAST BAND ALIGNMENT:

535 to 1750 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation and with external oscillator connected in series with "Dummy 2" to antenna and ground leads make following adjustments:
   (a) Set external oscillator and dial on radio to 1400 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment "Y"), (see bottom view of Chassis, Fig. 3). Tune gang condenser slowly back and forth while making this adjustment.
   (b) Re-set external oscillator to 600 K.C., and adjus broadcast series pad (adjustment "X") to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the front flange of the chassis. (See bottom view of chassis, Fig. 3.)
   (c) Repeat adjustment "a" and "b" until sensitivity is at its maximum, also check to see that radio tunes to 1750 K.C.
   (d) Check for tracking and sensitivity at 1400, 1000, and 600 kilocycles. **Under no circumstances bend plates of variable condenser sections to correct tracking.**

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:

There are six levers on the dial by means of which six stations may be selected,

Press down any one of the six levers. Holding it down, tune in by means of tuning knob No. 3 any one of your favorite stations. Turn the tuning knob very slowly back and forth until signal is clearest. The station will then be accurately tuned in. Adjust the volume by means of the volume control knob to the desired intensity.

Release this lever and press down any other lever. Hold this lever down and tune in by means of knob No. 3 another favorite station.

Follow this procedure until stations have been set on all the levers.

Rotate the tuning knob (No. 3) to the right (clockwise) as far as it will turn. Now remove from the right side of the cabinet the metal button, and, with a screw driver inserted through the hole, tighten the reset locking adjustment screw "5", (see Fig. 1). It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the levers. (Note: Reset Lock Screw "5" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, loosen the reset locking screw "5" four or five complete turns; select the new station as explained. (Note: If the dial mechanism works hard when setting up a new station for one of the automatic tuner levers, it is due to the locking screw being too tight. Loosen the reset locking screw "5" until the dial mechanism works freely with the tuner lever pressed down).

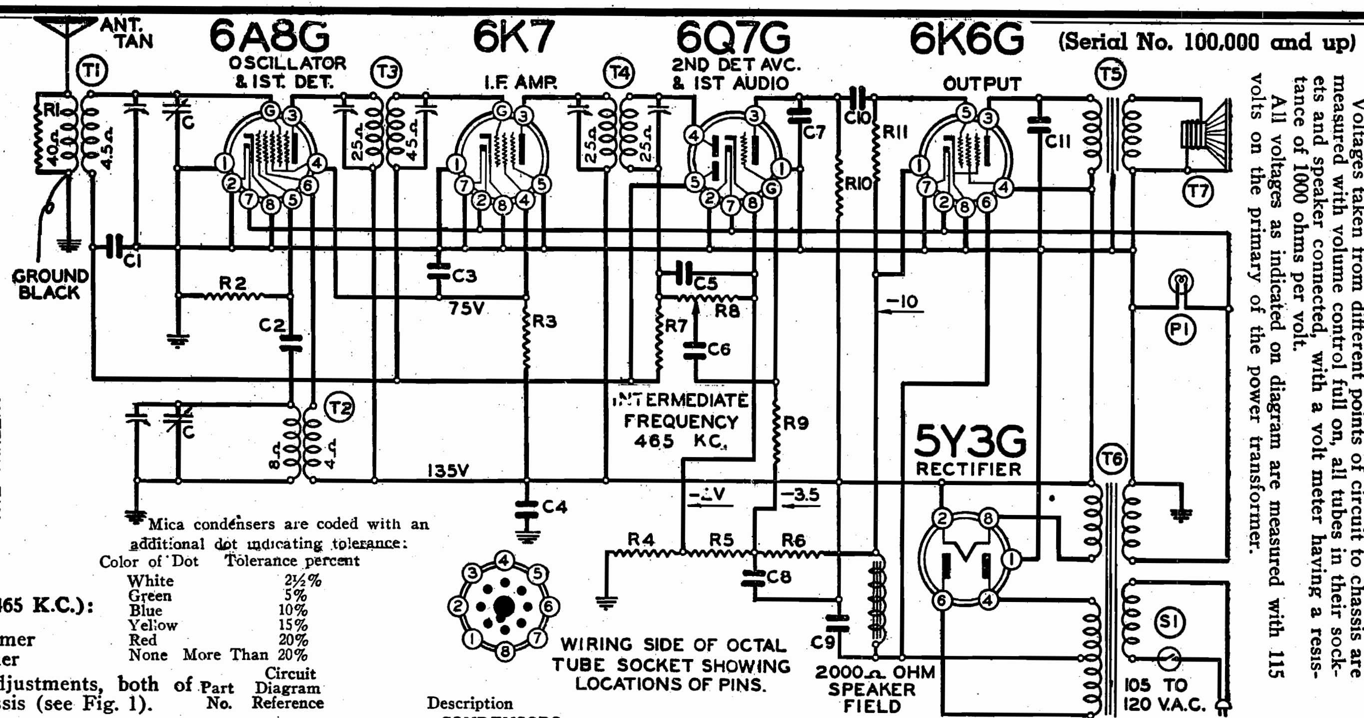
BE SURE TO RETIGHTEN THE RESET LOCK SCREW, otherwise the stations will not stay adjusted to the levers.

MODEL 526
Schematic, Socket
Trimmers, Voltage
Alignment, Parts

BELMONT RADIO CORP.

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with 115 volts on the primary of the power transformer.



Mica condensers are coded with an additional dot indicating tolerance:

Color of Dot	Tolerance percent
White	2½%
Green	5%
Blue	10%
Yellow	15%
Red	20%
None	More Than 20%

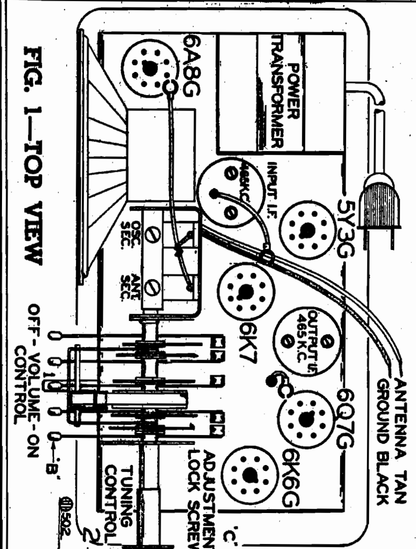


FIG. 1—TOP VIEW

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:

There are five levers on the dial by means of which five stations may be selected,

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 2) the station indicated on the station call letter tab above this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab above this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Now hold tuning knob securely with left hand to prevent it from turning, or Rotate the tuning knob (No. 2) to the right (clockwise) as far as it will turn, and with a coin (half dollar), tighten the special locking screw ("C") in the center of the tuning knob, (See Fig. 1).

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, hold the tuning knob No. 2 securely and with a coin loosen the locking screw "C" one or two turns; select the new station as explained. **Be sure to retighten the locking screw,** otherwise the stations you have selected will not stay adjusted to the levers.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No.108-95B Output I.F. Transformer
Part No. 108-96 Input I. F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condensor, to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-95B) to resonance.
   (b) Move oscillator output clip from grid of 6K7 to grid of 6A8G and adjust input I.F. transformer (No. 108-96) to resonance.
   (c) With oscillator still connected to 6A8G, readjust output I.F. transformer (108-95B) if necessary.

R.F. ALIGNMENT: (535-1720 K.C.)

1. With the gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 100 mmf. condensor to the antenna lead and chassis ground and make the following adjustments:
   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
   (c) Check sensitivity at 600 and 1000 kilocycles.

ALIGNING I.F. TRANSFORMERS: (470 K.C.):

Part No. 108-95D Output I.F. Transformer
Part No. 108-117E Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 470 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6K7G tube, and adjust the output I.F. transformer (No. 108-95D) to resonance.
   (b) Move oscillator output clip from grid of 6K7G to grid of 6A8G and adjust input transformer (No. 108-117E) to resonance.
   (c) With oscillator still connected to 6A8G, readjust output I.F. transformer (108-95D) if necessary.

R.F. ALIGNMENT: (530-1720 K.C.)

1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 100 mmf. condenser to the antenna lead and chassis ground and make the following adjustments:
   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
   (c) Check sensitivity at 660 and 1000 kilocycles.

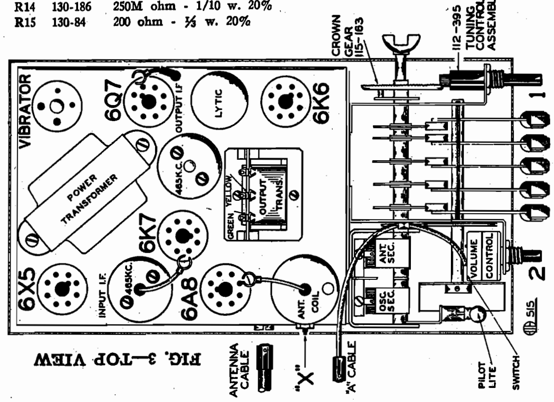

FIG. 3—TOP VIEW

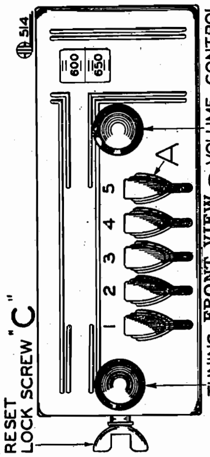


FRONT VIEW FIG. 2

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

In order to prevent signal from acting upon A.V.C. and affecting accuracy of voltage measurements, aerial and ground leads should be short circuited while making measurements.

All voltages are to be measured with 6.3 volts input to receiver. Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

DUMMY ANTENNAS

The dummy antennas referred to in the following instructions are:

"I.F. Dummy" —A .5 mfd. condenser connected in series with the test oscillator output lead.

"Broadcast Dummy"—A 175 mmfd. condenser connected in series with the output lead of the test oscillator.

I.F. ALIGNMENT: (465 K.C.)

1. With variable condenser in its minimum capacity position (plates entirely out of mesh) and with volume control full on, connect test oscillator set at 465 K.C. in series with I.F. dummy antenna, to grid of 6K7 I.F. tube.
2. Adjust trimmer condensers of output I.F. transformer No. 108-95C to resonance with oscillator.
3. Move test oscillator connection to grid of 6A8 tube and adjust trimmer condensers of input I.F. transformer No. 108-96D to resonance with oscillator. There are two adjustments on each and they are accessible from the top of the transformer shield and should be adjusted with an insulated screw driver. (See Fig. 3—top view, page 3.)

BROADCAST ALIGNMENT

1. With variable condenser in its minimum capacity position, connect test oscillator set at 1550 K.C. in series with broadcast dummy to the antenna lead of receiver.
2. Adjust oscillator trimmer of variable condenser to resonance. (This adjustment is the rear section of the two-gang condenser—see top view, Fig. 3).
3. Shift test oscillator to 1400 K.C. and pick up signal by rotating condenser and adjust antenna trimmer (front section of gang condenser) to resonance (see top view, Fig. 3).
4. Re-set test oscillator to 600 K.C. and rotate variable condenser to 600 K.C. Adjust series pad in the antenna circuit for maximum gain. This pad is mounted on the side of the antenna can, adjustment "X."
5. Go back and check 1400 K.C. If adjustment is made here, check 600 K.C. again.
6. Check for sensitivity at 1000 K.C. by setting test oscillator to this frequency and picking up the signal by rotating variable condenser. Under no circumstances bend plates of variable condenser sections to correct tracking.

ADJUST ANTENNA TRIMMER with radio mounted in place

Tune in a weak signal at approximately 600 K.C. with volume control about three-fourths on. Adjust trimmer screw "X" until maximum output is obtained.

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS

There are five levers on the dial by means of which five stations may be selected, (See "A" Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including five.

Any order of grouping can be used, either by assigning call letters for the levers alphabetically or arranging them to correspond with the calibration on the dial scale, namely starting with the lowest frequency station on the right and so on up in frequency to the highest frequency station on the left.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 1) the station you have assigned to this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station assigned to this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Now rotate the tuning knob (No. 1) to the right (clockwise) as far as it will turn, and tighten the special locking screw ("C") located on left side of tuner dial assembly (See Fig. 2).

It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

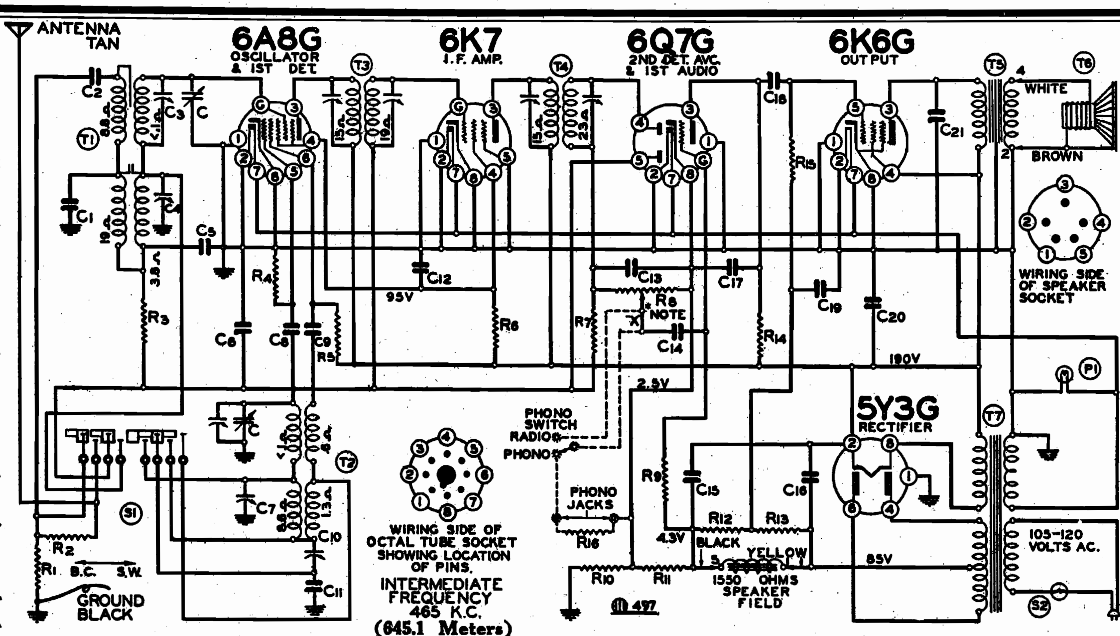
If you should desire to change any station you selected to another, loosen the locking screw "C" one or two turns, select the new station as explained. Be sure to retighten the locking screw, otherwise the stations you have selected will not stay adjusted to the levers.

MODEL 583 Export Series A
Schematic, Voltage

BELMONT RADIO CORP.

Socket, Trimmers
Parts

*NOTE:—When phono connections are made, wire marked "X" should be cut and phono connections made as indicated by dotted lines. Resistor R16 and phono jacks should be added.



INTERMEDIATE FREQUENCY 465 K.C. (645.1 Meters)

All voltages are to be measured with 115 volts on the primary of the power transformer.

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

FREQUENCY RANGE 535 to 1720 K.C. (Kilocycles) 5.45 to 18.3 M.C. (Megacycles)

POWER SUPPLY:

Receivers of this model which are to be used on voltages or frequencies other than 110-130-230 volts, 40-60 cycles are so marked. (Standard chassis is equipped with regular 105-115 volt 50/60 cycle Power Transformer). The power consumption of this receiver is 55 watts. (See taps on top of power transformer.)

110 Tap: For line voltages of 100 to 125 volts.
130 Tap: For line voltages of 125 to 145 volts.
230 Tap: For line voltages of 210 to 250 volts.

To remove the chassis from the cabinet, remove the four bolts which are used to fasten the chassis to the cabinet bottom; remove the special locking screw in the center of the tuning knob on the side of the cabinet; pull the knobs off their shafts and pull off the six button lever keys on front of dial.

Tuner, Alignment, Note

BELMONT RADIO CORP.

MODEL 582 SERIES "A" (Serial No. 7L894500 and up) SERIES "B" (Serial No. 8B106200 and up)

PROCEDURE FOR SETTING THE AUTOMATIC TUNER LEVERS:

There are six levers on the dial by means of which six stations may be selected, (See "B", Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including 6.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

Above each automatic tuner lever an opening in the escutcheon is provided for inserting the call letter tabs, (See "A" Fig. 2). Any order of grouping can be used, either by arranging the call letters alphabetically or grouping them to correspond with the calibration on the dial scale, namely starting with the lowest frequency station on the right and so on up in frequency to the highest frequency station on the left.

Insert the call letter tabs in the rectangular openings in the escutcheon above each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Press down any one of the automatic tuner levers. Hold it down, and by means of the tuning knob No. 3, tune in very carefully the station you have selected for this lever. Turn the tuning knob very slowly back and forth until the signal is clearest. The station will then be accurately tuned in.

Release the lever and press down another automatic tuner lever. Hold it down and carefully tune-in the station indicated on the station call letter tab above this lever.

Follow this procedure until you have selected all of your favorite stations. Hold tuning knob securely with left hand to prevent it from turning and with a coin (half dollar), tighten the special locking screw ("C") in the center of the tuning knob, (See Fig. 1).

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, hold the tuning knob No. 3 securely and with a coin loosen the locking screw "C" one or two turns; select the new station as explained. **Be sure to retighten the locking screw,** otherwise the stations you have selected will not stay adjusted to the levers.

To remove the chassis from the cabinet, remove the four bolts which are used to fasten the chassis to the cabinet bottom; remove the special locking screw in the center of the tuning knob on the side of the cabinet; pull the knobs off their shafts and pull off the six button lever keys on front of dial.

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-106F Output I.F. Transformer
Part No. 108-105E Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with variable condenser in its minimum capacity position, plates entirely out of mesh, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-106F) to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap of 6A8G and adjust input I.F. transformer (No. 108-105E) to resonance.

SHORT WAVE BAND ALIGNMENT:
2000 to 7000 Kilocycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 6 megacycles and connected in series with "Dummy 3" to the antenna and ground leads, make the following adjustments:
   (a) Move dial pointer to 6 megacycles and adjust short wave oscillator trimmer to resonance.
   This adjustment is the trimmer mounted on the top of rear section of the variable gang condenser (see Fig. 1, top view, adjustment number 7).
   (b) Adjust short wave antenna trimmer (Adjustment Number 3), to resonance (see Fig. 3, bottom view).

BROADCAST BAND ALIGNMENT:
535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to antenna and ground leads make following adjustments:
   (a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment number 1, see bottom view of chassis, Fig. 3).
   (b) Re-set external oscillator to 1400 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (adjustment number 2), to resonance.
   (c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (adjustment number 4), to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3).
   (d) Repeat adjustments "a" and "c" until sensitivity is at its maximum.
   (e) Set external oscillator to 1890 K.C. (Image of 960 K. C.) and tune in the signal at 960 K.C. on the dial. Adjust the wire capacitor, (Adjustment number 6) by twisting the two wires until a **Minimum** output is obtained on output meter.
   (f) Set external oscillator to 2630 K.C. (Image of 1700 K.C.) and tune in the signal at 1700 K.C. on the dial. Adjust the wire capacitor (Adjustment number 5), by moving the wire either toward or away from the coil winding until a **Minimum** output is obtained on output meter.
   (g) Repeat adjustments (e) and (f) until the **sensitivity is at a Minimum.**
   (h) Recheck the broadcast antenna trimmer (Adjustment number 2).
   (i) Recheck the short wave antenna trimmer (Adjustment number 3).

Series "A" receivers (Serial Numbers 7L894500 and up) have several differences from Series "B" (Serial Numbers 8B106200 and up). These are shown on the schematic page with a portion of the schematic.

SERVICE DATA

TUBES:

The tube complement of this chassis consists of the following octal base glass and metal tubes:

The type and function of each tube is as follows:

1—Type 6K8 Triode Hexode, First Detector-oscillator.

1—Type 6S7G Remote Cut-Off Pentode, I. F. Amplifier (465 K. C.)

1—Type 6T7G Duplex Diode Triode Second Detector, A. V. C. and First Audio.

2—Type 1H4G Triode Parallel Drivers.

1—Type 1J6G Push-Pull Class B Output Amplifier.

SERVICE NOTES:

Voltage taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages are to be measured with 6.3 volts input to receiver.

Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good. If fuse blows out frequently and insulating sleeve has been properly placed over fuse, the trouble is probably in the vibrator, it should be replaced. Do not attempt to make any adjustments on the vibrators.

Excessive hum, stuttering, low volume and a reduction in all D. C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

ALIGNING INSTRUCTIONS:

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low battery voltage, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet.

PROCEDURE FOR SETTING THE AUTOMATIC TUNER LEVERS:

There are six levers on the dial by means of which six stations may be selected, (See "B", Fig. 2).

Make up a list of local stations you tune in regularly; any number up to and including 6.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

Above each automatic tuner lever an opening in the escutcheon is provided for inserting the call letter tabs, (See "A" Fig. 2). Any order of grouping can be used, either by arranging the call letters alphabetically or grouping them to correspond with the calibration on the dial scale, namely starting with the lowest frequency station on the right and so on up in frequency to the highest frequency station on the left.

Insert the call letter tabs in the rectangular openings in the escutcheon above each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 4) the station indicated on the station call letter tab above this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab above this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Rotate the tuning knob (No. 4) to the right (clockwise) as far as it will turn. Now remove from the right side of the cabinet the metal button, and, with a screw driver inserted through the hole, tighten the reset locking adjustment screw "C" "5," (See Fig. 1). It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the levers. (Note: Reset Lock Screw "C," "5" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, loosen the reset locking screw "C", "5" four or five complete turns; select the new station as explained. (Note: If the dial mechanism works hard when setting up a new station for one of the automatic tuner levers, it is due to the locking screw being too tight. Loosen the reset locking screw "C," "5" until the dial mechanism works freely with the tuner lever pressed down).

BE SURE TO RETIGHTEN THE RESET LOCK SCREW, otherwise the stations will not stay adjusted to the levers.

The automatic dial is now set up for quick tuning. Press down on the lever and—your favorite station is selected.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mf., 200 mmf., and 400 ohms.

BAND	Signal Generator: Frequency Setting	Signal Generator: Dummy Antenna	Signal Generator: Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6S7	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6K8	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND	16 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set dial at 16 MC	Trimmer (C 6) (See Fig. 3)	Short wave Oscillator	Adjust to maximum output
	16 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Dial set at 16 MC	Trimmer (C 4) (See Fig. 3)	Short wave Antenna	Adjust to maximum output
BROAD-CAST BAND	1720 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Trimmer (C 7) (See Fig. 3)	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set dial at 1400 Kc.	Trimmer (C 5) (See Fig. 3)	Broadcast Antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set dial at 600 Kc.	Trimmer (C 10) (See Fig. 3)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")
IMAGE REJECTION ADJUST-MENTS	2100 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 1170 Kc. on dial	Wire capacitor (CB) (See circuit diagram)	Image rejection	Adjust by twisting for minimum output. (See note "B")
	2630 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 1700 Kc. on Dial	(Wire capacitor (CA) (See circuit diagram)	Image rejection	Adjust by moving for minimum output. (See note "C")

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

NOTE "B" 1170KC is the image frequency of 2100KC. Adjust wire capacity (CB) by twisting the two wires until a minimum output is obtained.

NOTE "C" 1700KC is the image frequency of 2630KC. Adjust wire capacity (CA) by moving the wire either toward or away from the antenna coil winding until a minimum output is obtained on the output meter.

- Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.
- After each band is completed, repeat the procedure as a final check.

BAND SWITCH	BAND	FREQUENCY RANGE

BELMONT RADIO CORP.

DESCRIPTION

TUBES:
DESCRIPTION:

The tube complement of this chassis consists of the following octal base glass tubes which are interchangeable with metal tubes.

The type and function of each tube is as follows:

1—Type 6A8G Pentagrid Mixer, First Detector-oscillator.
1—Type 6K7G Remote Cut-Off Pentode, I.F. Amplifier (470 K.C.).
1—Type 6Q7G Duplex-Diode Triode Second Detector, A.V.C. and First Audio.
1—Type 25L6G Beam Output Amplifier
1—Type 25Z6G High Vacuum Rectifier.
1—Type L49B Ballast Tube.

ALIGNMENT PROCEDURE

CHASSIS MODEL 632

Series A

- Volume control—Maximum all adjustments.
- Connect B - of radio chassis to ground post of signal generator through .1 Mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.
- Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.
- Repeat the procedure as a final check.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mf., 100 mmf.

BAND	SIGNAL GENERATOR Frequency Setting	SIGNAL GENERATOR Dummy Antenna	Connect on to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	470 Kc.	.1 MFD.	Grid of 6K7G	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	470 Kc.	.1 MFD.	Grid of 6A8G	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROAD CAST BAND	1720 Kc.	100 mmf.	Antenna Lead	Rotor full open (Plates out of mesh)	Trimmer—Top of rear section of gang (See Fig. 1)	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	100 mmf.	Antenna Lead	Set dial at 1400 Kc.	Trimmer—Top of front section of gang (See Fig. 1)	Broadcast Antenna	Adjust to maximum output

SERVICE NOTES:

Voltage taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages are to be measured with 115 volts A.C. input to receiver.

Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating which is know to be good, until the defective unit is located.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good.

Excessive hum, stuttering, low volume and a reduction in all D. C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

ALIGNING INSTRUCTIONS:

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltage, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet.

TO REMOVE CHASSIS FROM THE CABINET:

Remove the four bolts which are used to fasten the chassis to the cabinet shelf; pull the knobs off their shafts and pull off the five buttons on the automatic levers.

ALIGNING INSTRUCTIONS

BAND	Frequency Setting	SIGNAL GENERATOR Dummy Antenna	SIGNAL GENERATOR Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6K7	Broadcast (Extreme left, rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6K8	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND	17 Mc.	400 ohms	Antenna lead	Short wave (Extreme right rotation)	Set dial at 17 MC	Trimmer (C 7) (See Fig. 3)	Short wave Oscillator	Adjust to maximum output
	17 Mc.	400 ohms	Antenna lead	Short wave (Extreme right rotation)	Dial set at 17 MC	Trimmer (C 4) (See Fig. 3)	Short wave Antenna	Adjust to maximum output
BROAD-CAST BAND	1720 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Trimmer (C 8) (See Fig. 3)	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set dial at 1400 Kc.	Trimmer (C 5) (See Fig. 3)	Broadcast Antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set dial at 600 Kc.	Trimmer (C 11) (See Fig. 3)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")
IMAGE REJECTION ADJUST-MENTS	2100 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 1170 Kc. on dial	Wire capacitor (CB) (See circuit diagram)	Image rejection	Adjust by twisting for minimum output. (See note "B")
	2630 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 1700 Kc. on dial	Wire capacitor (CA) (See circuit diagram)	Image rejection	Adjust by moving for minimum output. (See note "C")

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

NOTE "B" 2100KC is the image frequency of 1170 KC. Adjust wire capacity (CB) by twisting the two wires until a minimum output is obtained.

NOTE "C" 2630KC is the image frequency of 1700KC. Adjust wire capacity (CA) by moving the wire either toward or away from the antenna coil winding until a minimum output is obtained on the output meter.

SEE NOTES MARKED • , ALIGNMENT OF MODEL 611 SERIES A.

PROCEDURE FOR SETTING THE AUTOMATIC TUNER LEVERS:

There are six levers on the dial by means of which six stations may be selected, (See "B", Fig. 2).

Make up a list of local stations you tune in regularly; any number up to and including 6.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

Above each automatic tuner lever an opening in the escutcheon is provided for inserting the call letter tabs, (See "A" Fig. 2). Any order of grouping can be used, either by arranging the call letters alphabetically or grouping them to correspond with the calibration on the dial scale, namely starting with the lowest frequency station on the right and so on up in frequency to the highest frequency station on the left.

Insert the call letter tabs in the rectangular openings in the escutcheon above each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 3) the station indicated on the station call letter tab above this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab above this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Rotate the tuning knob (No. 3) to the right (clockwise) as far as it will turn. Now remove from the right side of the cabinet the metal button, and, with a screw driver inserted through the hole, tighten the reset locking adjustment screw "C" (See Fig. 1). It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the levers. (Note: Reset Lock Screw "C", is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, loosen the reset locking screw "C", four or five complete turns; select the new station as explained. (Note: If the dial mechanism works hard when setting up a new station for one of the automatic tuner levers, it is due to the locking screw being too tight. Loosen the reset locking screw "C", until the dial mechanism works freely with the tuner lever pressed down).

BE SURE TO RETIGHTEN THE RESET LOCK SCREW, otherwise the stations will not stay adjusted to the levers.

The automatic dial is now set up for quick tuning. Press down on the lever and—your favorite station is selected.

TUBES:

The tube complement of this chassis consists of the following octal base glass and metal tubes:

The type and function of each tube is as follows:

1—Type 6K8 Triode Hexode, First Detector-oscillator.
1—Type 6K7 Remote Cut-Off Pentode, I. F. Amplifier (465 K. C.)
1—Type 6Q7G Duplex Diode Triode Second Detector, A. V. C. and First Audio.
1—Type 6P5G Driver Stage.
1—Type 6AC5G Positive Grid Triode Output Amplifier.
1—Type 5Y3G High Vacuum Rectifier.

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 25, 40 and 60 cycles and with primary taps for 110, 130, and 230 volts.

SERVICE NOTES:

Voltage taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on the voltage chart are measured with 115 volts on the primary of the power transformer.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D. C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

CONNECTIONS TO BATTERY

The battery cable, number 107-82, (red wire with fuse receptacle at one end and terminal lug at other end) must be connected to battery terminal of ammeter. At the same time connect ammeter capacitor, number 148-3, to battery terminal of ammeter, other end of condenser to any convenient grounded screw on back of instrument panel. Make certain that insulating sleeve is slipped over fuse when fuse is placed in receptacle, before connecting to short battery cable from receiver.

When connected properly, the discharge due to current drawn by the receiver should not indicate on the ammeter. This is important, since if improperly connected, as shown by the deflection of ammeter, additional motor interference may be encountered.

MODEL 667
Alignment, Data
Wiring Data, Notes

BELMONT RADIO CORP.

SERVICE NOTES

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

In order to prevent signal from acting upon A.V.C. and affecting accuracy of voltage measurements, aerial and ground leads should be short circuited while making measurements.

All voltages are to be measured with 6.3 volts input to receiver. Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

DESCRIPTION

Model No. 667 is a six-tube superheterodyne receiver having a tuning range of 530 K.C. to 1550 K.C., operates from a 6.0 volt storage battery and uses the automotive type 6.3 volt tubes. The "B" supply is obtained from a vibrator with a tube rectifier.

The I.F. frequency used is 262.5 K.C., the R.F. end of the receiver consisting of a high gain iron core antenna coil which gives high signal to noise ratio and an R.F. stage especially designed to give high image rejection and high I.F. attenuation. The I.F. transformers are designed to give high gain and selectivity and yet to have a broad nose for ease of tuning and hi-fidelity response. They are of the air core type and wound with solid wire to give *minimum* drift and variation of gain due to climatic changes.

This receiver has been carefully designed to facilitate servicing, the top and bottom covers are both removable and are fastened in place by spring clips, self tapping screws and trimount buttons.

DUMMY ANTENNAS

The dummy antennas referred to in the following instructions are:

"I.F. Dummy" —A .5 mfd. condenser connected in series with the test oscillator output lead.

"Broadcast Dummy"—A 175 mmfd. condenser connected in series with the output lead of the test oscillator.

RESONANCE INDICATOR

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 6F6 output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

I.F. ALIGNMENT: (262.5 K.C.)

1. With variable condenser in its minimum capacity position (plates entirely out of mesh) and with volume control full on, connect test oscillator set at 262.5 K.C. in series with I.F. dummy antenna, to grid of 6K7 I.F. tube.
2. Adjust trimmer condensers of output I.F. transformer No. 108-102 to resonance with oscillator.
3. Move test oscillator connection to grid of 6A8 tube and adjust trimmer condensers of input I.F. transformer No. 108-101 to resonance with oscillator. See top view for location of these transformers. There are two adjustments on each and they are accessible from the top of the transformer shield and should be adjusted with an insulated screw driver.

BROADCAST ALIGNMENT

1. With variable condenser in its minimum capacity position, connect test oscillator set at 1550 K.C. in series with broadcast dummy to the antenna lead of receiver.
2. Adjust oscillator trimmer of variable condenser to resonance. (This adjustment is on the middle section of the three-gang condenser—see top view, Fig. 2).
3. Shift test oscillator to 1400 K.C. and pick up signal by rotating condenser and adjust R.F. and antenna trimmers to resonance (see top view, Fig. 2).
4. Re-set test oscillator to 600 K.C. and rotate variable condenser to 600 K.C. Adjust series pad in the antenna circuit, rocking gang condenser to and fro at the same time adjusting series pad for maximum gain. This pad is mounted on the side of the antenna can.
5. Go back and check 1400 K.C. If adjustment is made here, check 600 K.C. again.
6. Check for sensitivity at 1000 K.C. by setting test oscillator to this frequency and picking up the signal by rotating variable condenser. Under no circumstances bend plates of variable condenser sections to correct tracking.

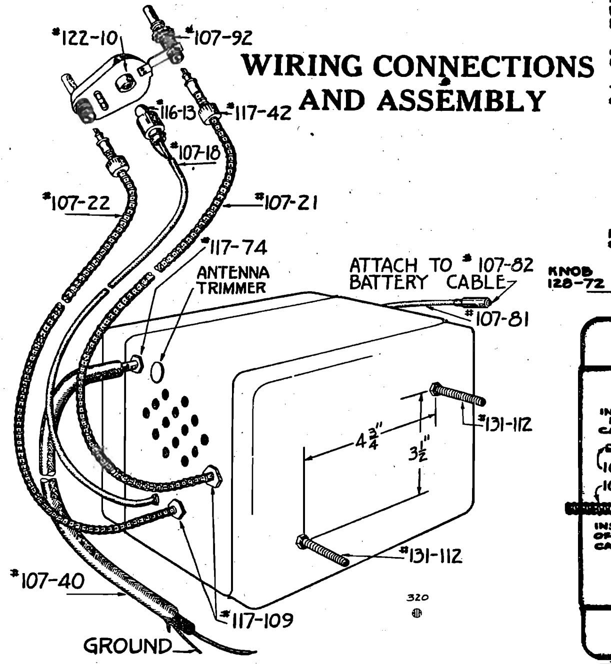
CITY-COUNTRY SWITCH

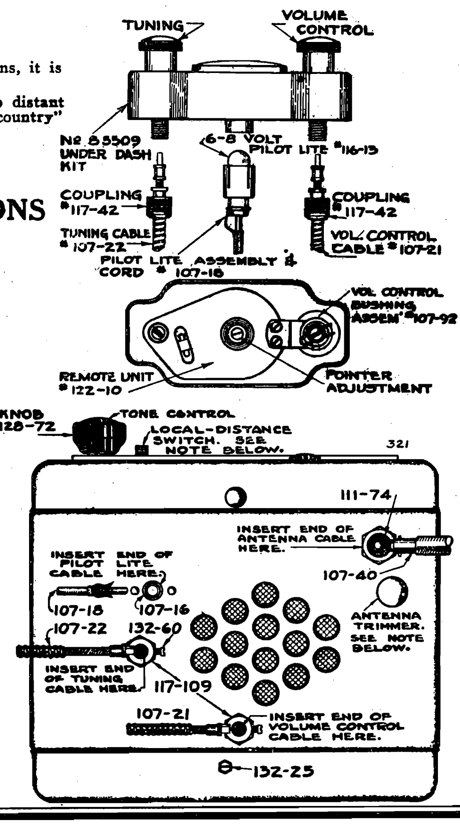
This switch is located on the chassis cover.

City—While driving in the city or close to broadcasting stations, it is best to turn the knob to the "city" position for least noise.

Country—When driving in the country, or when listening to distant stations, best results are obtained with the knob turned to the "country" position. In this position the sensitivity is at a maximum.

WIRING CONNECTIONS AND ASSEMBLY





ADJUSTING ANTENNA TRIMMER

Tune in a weak signal at approximately 600 KC with the volume control about three-fourths on. Turn the adjusting screw of the antenna trimmer up or down until maximum output is obtained. See Fig. 1 for location of this trimmer.

DIAL ADJUSTMENT

Tune set to some station of a known frequency (between 800 and 1200 K.C.), hold selector knob, then remove pilot light assembly from back of remote head and with a screw driver adjust the slotted screw through this opening and in this way adjust the dial pointer to the correct frequency setting.

AUTO RADIO
(Serial No. 30,001 and up)
(Serial No. 42,000 and up)

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:

There are six levers on the dial by means of which six stations may be selected. (See "B" Fig. 2).

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 2) the station indicated on the station call letter tab above this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab above this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Now Rotate the turning knob (No. 2) to the left (counter clockwise) as far as it will turn, and tighten the special reset lock screw ("C") located on left side of remote turner unit. (See Fig. 2).

It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Reset lock screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, loosen the locking screw "C" one or two turns; select the new station as explained. **Be sure to retighten the locking** screw, otherwise the stations you have selected will not stay adjusted to the levers.

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

In order to prevent signal from acting upon A.V.C. and affecting accuracy of voltage measurements, aerial and ground leads should be short circuited while making measurements.

All voltages are to be measured with 6.3 volts input to receiver.

Receivers bearing Serial Numbers from 30001 and up, had several differences from those bearing Serial Numbers from 42000 and up. These are shown on the schematic page with portions of the schematic.

Remote Tuner Units are matched to each radio unit at the factory; therefore it is important in such cases where another Remote Tuner Unit is required to replace the original one, that the entire Remote Unit be rebalanced to match the Radio Unit.

ADJUSTING ANTENNA TRIMMER (SET IN CAR)

Tune in a weak signal at approximately 1400 KC with the volume control about three-fourths on. Turn the adjusting screw of the antenna trimmer up or down until maximum output is obtained. See Fig. 4, adjustment "A" on side of remote tuner unit.

DUMMY ANTENNAS

The dummy antennas referred to in the following instructions are:

"I.F. Dummy" —A .5 mfd. condenser connected in series with the test oscillator output lead.

"Broadcast Dummy"—A 175 mmfd. cendenser connected in series with the output lead of the test oscillator.

I.F. ALIGNMENT: (465 K.C.)

IMPORTANT:
To align the output I.F. transformer without using a cathode ray oscillograph a 10M ohm resistor must be shunted across the tertiary coil of this unit.

Connect the resistor as indicated by points "Y" and "Z" on the circuit diagram as follows.

Locate the wires coming from the bottom of the output I.F. coil assembly on the underside of the radio chassis.

The white lead with green tracer which is connected to diode plate terminal No. 5 on the 6Q7 tube socket is one point and the white lead with brown tracer which is connected to the end terminal of the terminal strip is the other point. Proceed as follows:

1. With the dial of the Remote Tuner Unit set at 1400 K.C. and with volume control full on, connect test oscillator set at 465 K.C. in series with I.F. dummy to grid of 6K7 I.F. tube.
2. Adjust trimmers "G" and "H" of output I.F. transformer for maximum gain, (See Fig. 3, top view).
3. Disconnect the 10M ohm resistor which has been shunted across the tertiary winding and adjust trimmer "I" for maximum gain.
   (a) This transformer is now correctly tuned. Under no circumstances re-adjust trimmers "G" and "H" after the 10M ohm resistor has been removed.
   (b) For alignment of the output I.F. transformer using a cathode ray oscillograph the 10M ohm resistor is not used and the procedure is similar to the alignment of any two circuit I.F. transformer; merely tune for a symmetrical curve of maximum amplitude.
   (c) Output connections for the cathode ray oscillograph should be made to pin No. 8 on 6Q7 tube socket and to the end terminal on the terminal strip; at this point the diode load resistors terminate.
4. Move test oscillator connection to grid of 6A8 tube and adjust trimmer condensers "E" and "F" of input I.F. transformer for maximum gain.

NOTE: A red dot on top of output I.F. can designates location of trimmer "G"

BROADCAST ALIGNMENT:

1. With the dial on the Remote Tuner Unit set at 1560 K. C., connect test oscillator set at 1560 K. C. in series with broadcast dummy to the antenna lead of receiver.
2. Adjust oscillator trimmer (adjustment "C", on back of Remote Tuner Unit) to resonance. (See Fig. 4, back view).
3. Re-set test oscillator to 1400 K.C. and pick up signal by rotating dial on Remote Tuner Unit. Adjust R. F. trimmer (adjustment "B", on back of Remote Tuner Unit), and Antenna Trimmer (adjusment "A", on side of Remote Tuner Unit), to resonance.
4. Re-set test oscillator to 600 K.C. and rotate Remote Tuner Unit dial to 600 K. C.
   Adjust shunt oscillator adjustment "D", rotating dial to and fro at the same time adjusting shunt oscillator for maximum gain. This adjustment is accessible from the top of the radio chassis, (See Fig. 3, top view).
5. Go back and check 1400 K. C. If adjustment is made here, check 600 K. C. again.

MODEL 691
Alignments

BELMONT RADIO CORP.

CHASSIS MODEL 583 SERIES "A"

DUMMY ANTENNAS: **(Serial No. 8A977900 and up)**

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-112B Output I.F. Transformer
Part No. 108-111B Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with variable condenser in its minimum capacity position, plates entirely out of mesh, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-112B) to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap of 6A8G and adjust input I.F. transformer (No. 108-111B) to resonance.

SHORT WAVE BAND ALIGNMENT:
5.45 to 18.3 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 16 megacycles and connected in series with "Dummy 3" to the antenna and ground leads, make the following adjustments:
   (a) Move dial pointer to 16 megacycles and adjust short wave oscillator trimmer to resonance.
   This adjustment is the trimmer mounted on the top of rear section of the variable gang condenser (see Fig. 1, top view, adjustment number 7).
   (b) Adjust short wave antenna trimmer (Adjustment Number 3). to resonance (see Fig. 3, bottom view).

BROADCAST BAND ALIGNMENT:
535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to antenna and ground leads make following adjustments:
   (a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment number 1, see bottom view of chassis, Fig. 3).
   (b) Re-set external oscillator to 1400 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (adjustment number 2), to resonance.
   (c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (adjustment number 4), to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3).
   (d) Repeat adjustments "a" and "c" until sensitivity is at its maximum.
   (e) Set external oscillator to 2100 K.C. (Image of 1170 K.C.) and tune in the signal at 1170 K.C. on the dial. Adjust the wire capacitor, (Adjustment number 6) by twisting the two wires until a **Minimum** output is obtained on output meter.
   (f) Set external oscillator to 2630 K.C. (Image of 1700 K.C.) and tune in the signal at 1700 K.C. on the dial. Adjust the wire capacitor (Adjustment number 5), by moving the wire either toward or away from the coil winding until a **Minimum** output is obtained on output meter.
   (g) Repeat adjustments (e) and (f) until the **sensitivity is at a Minimum.**
   (h) Recheck the broadcast antenna trimmer (Adjustment number 2).
   (i) Recheck the short wave antenna trimmer (Adjustment number 3).

MODEL 691 SERIES A (Serial No. J7850200 and up)

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

IN ORDER TO PREVENT SIGNAL FROM ACTING UPON AVC AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.

All voltages are to be measured with 115 volts on the primary of the power transformer.

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-110 Output I.F. Transformer
Part No. 108-109 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-110) to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap of 6L7 and adjust input I.F. transformer (No. 108-109) to resonance.

BROADCAST BAND ALIGNMENT:
535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to tan antenna lead and black ground lead, make following adjustments:
   (a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance (adjustment number 1; see bottom view of coil assembly. Fig. 3.)
   (b) Re-set external oscillator to 1550 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (Adjustment number 4) to resonance; also adjust preselector trimmer which is mounted on the top of the rear section of the three gang variable tuning condenser to resonance. (See top view of chassis, Fig. 1, for location of this adjustment.)
   (c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3.)
   (d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.
   (e) Check for tracking and sensitivity at 1000 kilocycles. **Under no circumstances bend plates of variable condenser sections to correct tracking.**

SHORT WAVE BAND ALIGNMENT:
5.2 to 18.1 Megacycles

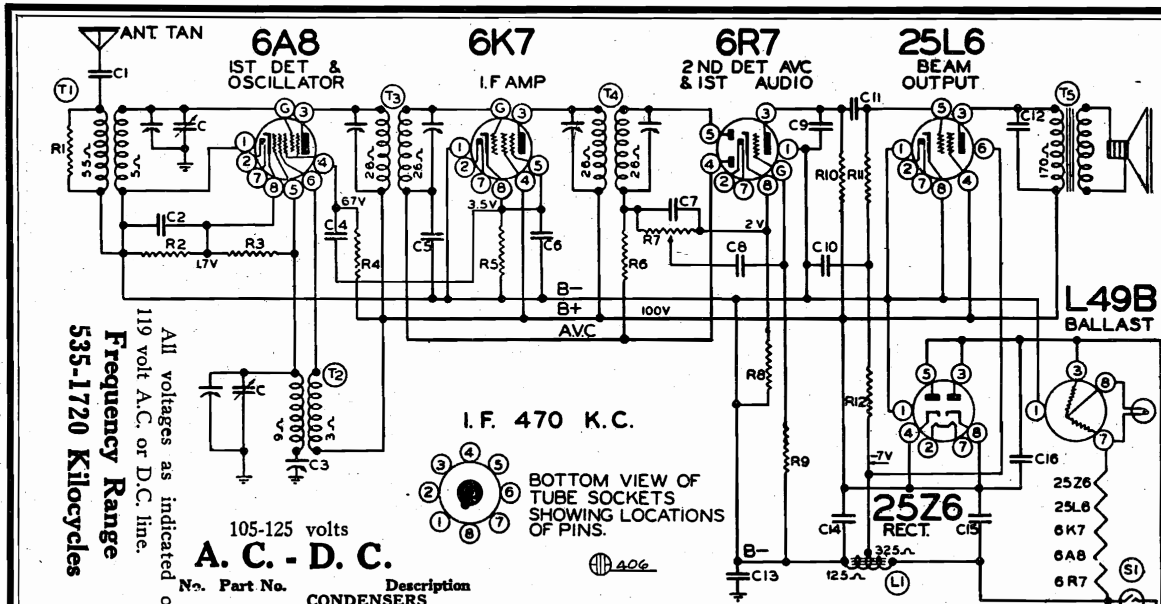
1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator (Adjustment number 3) and short wave antenna (Adjustment number 6) to resonance.
   (b) Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check sensitivity.
   (c) Re-set external oscillator and check set at 18.1 megacycles and 5.2 megacycles for band coverage.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental. An example of this is an image of a fundamental 17 megacycle signal appears near 16.1 megacycles.

MIDDLE WAVE BAND ALIGNMENT:
1695 to 5500 Kilocycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5000 kilocycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments.
   (a) Move dial pointer to 5000 kilocycles and adjust middle wave oscillator (Adjustment number 2) and middle wave antenna (Adjustment number 5) to resonance.
   (b) Re-set external oscillator to 1800 kilocycles and pick up signal by rotating variable condenser and check sensitivity.
   (c) Re-set external oscillator and check set at 5500 kilocycles and 1695 kilocycles for band coverage.
   (d) Recheck broadcast band alignment.

BELMONT RADIO CORP.



All voltages as indicated on diagram are measured with 119 volt A.C. or D.C. line.

More Than 20%	None

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

ALIGNING I.F. TRANSFORMERS: (470 K.C.):

Part No. 108-83B Output I.F. Transformer

Part No. 108-82B Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:

   (a) Connect external oscillator set at 470 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6K7G tube, and adjust the output I.F. transformer (No. 108-83B) to resonance.

   (b) Move oscillator output clip from grid of 6K7G to grid of 6A8G and adjust input I.F. transformer (No. 108-82B) to resonance.

   (c) With oscillator still connected to 6A8G, readjust output I.F. transformer (108-83B) if necessary.

R.F. ALIGNMENT: (535-1720 K.C.)

1. Unsolder the antenna wire from its terminal on the antenna coil and with gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 50 mmf. condenser to the antenna terminal on the antenna coil and chassis ground and make the following adjustments:

   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).

   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).

   (c) Check sensitivity at 600 and 1000 kilocycles.

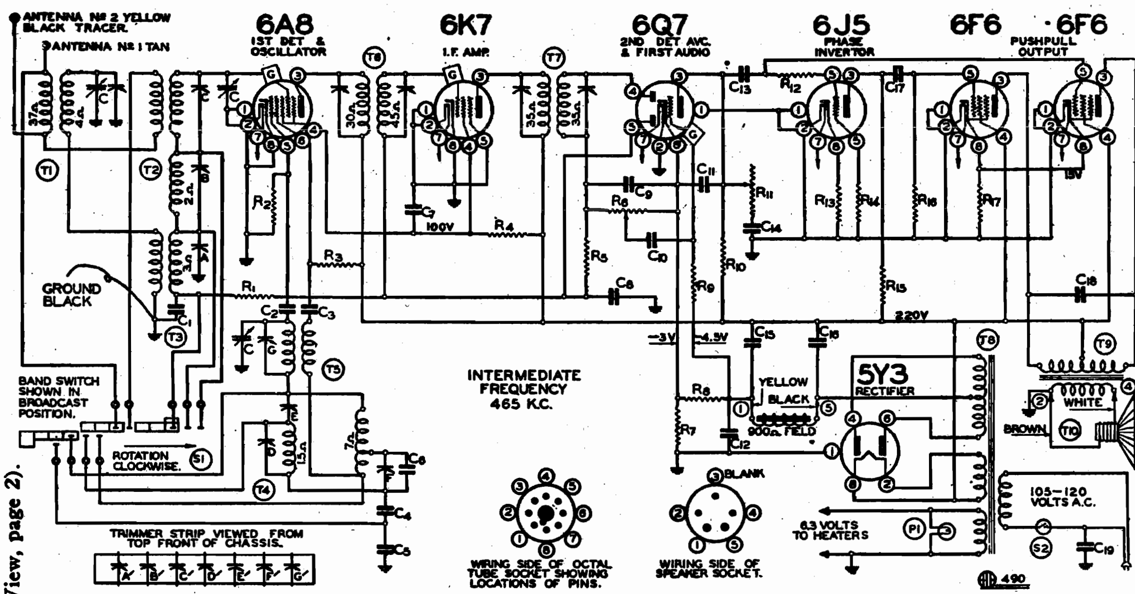
BELMONT RADIO CORP.

For conventional types of antennas connect the tan wire to the antenna lead and the yellow with black tracer and the black wire together to the ground lead.

When a doublet antenna is used connect the tan wire and the yellow with black tracer wire to the doublet antenna and the solid black wire to the ground lead. (See Fig. 1—Top View, page 2).



Mica condensers are coded with an additional dot indicating tolerance:

Color of Dot	Tolerance percent
White	2½%
Green	5%
Blue	10%
Yellow	15%
Red	20%
None	More Than 20%

FREQUENCY RANGE

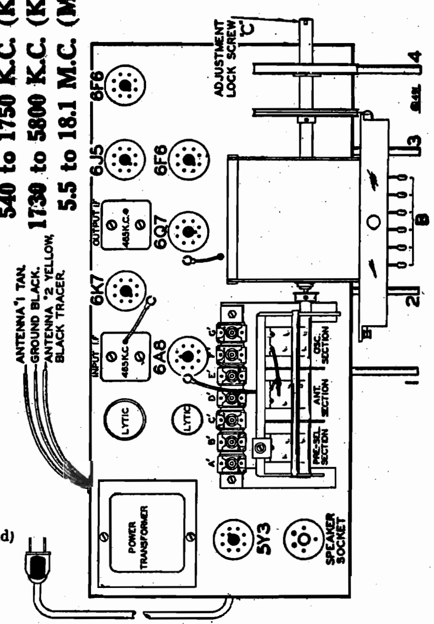

FIG. 1—TOP VIEW

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

IN ORDER TO PREVENT SIGNAL FROM ACTING UPON AVC AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.

All voltages are to be measured with 115 volts on the primary of the power transformer.

Receivers of this model which are to be used on voltages or frequencies other than 105-115 volts, 60 cycles are so marked. The power consumption of this receiver is 75 watts.

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

In order to prevent signal from acting upon A. V. C. and affecting accuracy of voltage measurements, aerial and ground leads should be short circuited while making measurements.

All voltages are to be measured with 6.3 volts input to receiver. Resistances of coils and transformer windings are indicated in ohms on the schematic circuit diagram.

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

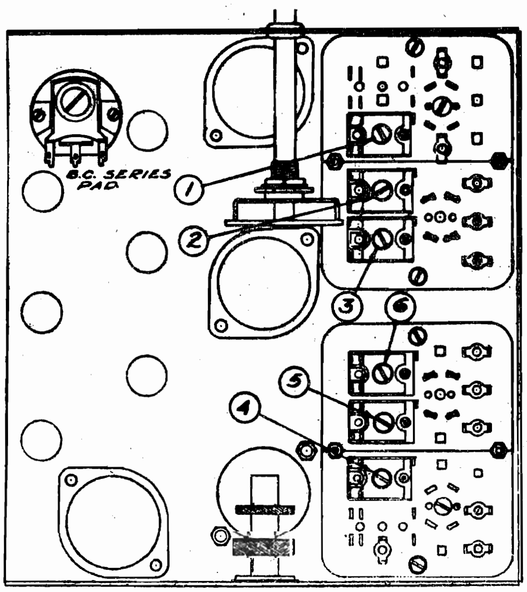
Part No. 108-79 Output I.F. Transformer
Part No. 108-78 Interstage I.F. Transformer
Part No. 108-77 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:

(a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 34 tube, and adjust the output I.F. transformer (No. 108-79) to resonance.

(b) With "Dummy 1" still connected, move oscillator output clip from grid of 34 to grid cap to 1A4 and adjust interstage I.F. transformer (No. 108-78) to resonance.



BOTTOM VIEW SHOWING TRIMMERS

(c) Move oscillator to grid cap of 1A6 and adjust input I.F. transformer (No. 108-77).

BROADCAST BAND ALIGNMENT:

535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to antenna and ground posts, make following adjustments:

(a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment number 1; see bottom view of coil assembly, Fig. 3).

(b) Re-set external oscillator to 1550 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (adjustment number 4) to resonance; also adjust preselector trimmer which is mounted on the top of the rear section of the three gang variable tuning condenser to resonance. (See top view of chassis, Fig. 1, for location of this adjustment).

(c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3).

(d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.

(e) Check for tracking and sensitivity at 1000 kilocycles. **Under no circumstances bend plates of variable condenser sections to correct tracking.**

SHORT WAVE BAND ALIGNMENT:

5.2 to 18.3 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the antenna and ground posts, make the following adjustments:

(a) Move dial pointer to 17 megacycles and adjust short wave oscillator (adjustment number 3) and short wave antenna (adjustment number 6) to resonance.

(b) Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check sensitivity.

(c) Re-set external oscillator and check set at 18.1 megacycles and 5.3 megacycles for band coverage.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental on the receiver dial. As an example of this a fundamental 18.3 megacycle signal can be tuned in not only at 18.3 on the dial but also at approximately 17.4 megacycles.

MIDDLE WAVE BAND ALIGNMENT:

1695 to 5500 Kilocycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5000 kilocycles and connected in series with "Dummy 3" to the antenna and ground posts make the following adjustments:

(a) Move dial pointer to 5000 kilocycles and adjust middle wave oscillator (adjustment number 2) and middle wave antenna (adjustment number 5) to resonance.

(b) Re-set external oscillator to 1800 kilocycles and pick up signal by rotating variable condenser and check sensitivity.

(c) Re-set external oscillator and check set at 5400 kilocycles and 1700 kilocycles for band coverage.

MODEL 842 Series A
Alignment, Trimmers

BELMONT RADIO CORP.

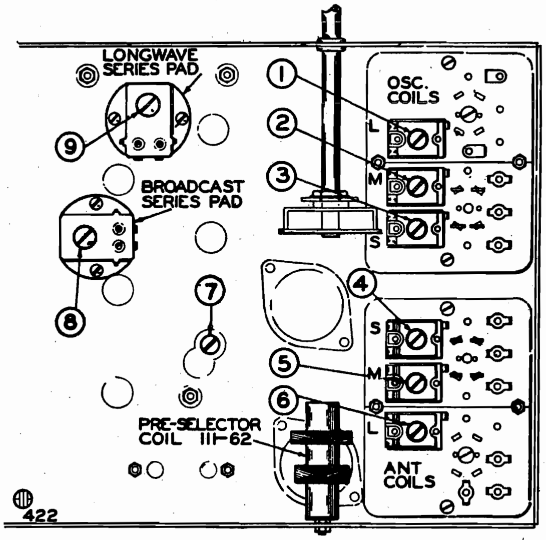

FIG. 3—BOTTOM VIEW SHOWING TRIMMERS

DUMMY ANTENNAS:

The following dummy antennas are used in aligning the receiver, and are referred to in the following alignment instructions as "Dummy 1," "Dummy 2," and "Dummy 3."

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Medium and long wave) — Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.) (645.1 METERS)

Part No. 108-106 Output I.F. Transformer
Part No. 108-105 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the medium position, (center of its rotation), and with the variable condenser set to minimum capacity make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with 'Dummy 1", to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-106) to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap of 6A8G and adjust input I.F. transformer (No. 108-105) to resonance.

SHORT WAVE BAND ALIGNMENT:

16.5 Meters (18.1 Mc) to 56.5 Meters (5.35 Mc).

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles (17.6 meters) and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Move dial pointer to 17 megacycles (17.6 meters) and adjust short wave oscillator (Adjustment number 3) and short wave antenna (Adjustment number 4) to resonance.
   (b) Re-set external oscillator to 6 megacycles (50 meters) and pick up signal by rotating variable condenser and check sensitivity.
   (c) Re-set external oscillator and check set at 18.1 megacycles (16.5 meters) and 5.3 megacycles (56.5 meters) for band coverage.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental. An example of this is an image of a fundamental 17 megacycle signal appears near 16.1 megacycles.

MEDIUM BAND ALIGNMENT:

588 Meters (510 K.C.) to 187 Meters (1600 K.C.)

1. With band changing switch in the medium wave position, center of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to tan antenna lead and black ground lead, make following adjustments.
   (a) Set external oscillator to 187 meters (1600 K.C.) and adjust medium wave oscillator trimmer to resonance (adjustment number 2; see bottom view of coil assembly. Fig. 3.)
   (b) Re-set external oscillator to 214 meters (1400 K.C.), rotate variable gang condenser and pick up signal. Adjust medium wave antenna trimmer (Adjustment number 5) to resonance; also adjust preselector trimmer condenser to resonance, (Adjustment number 7; see Bottom View, Fig. 3).
   (c) Re-set external oscillator to 500 meters (600 K.C.), and adjust medium wave series pad to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3, Adjustment 8).
   (d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.
   (e) Check for tracking and sensitivity at 300 meters (1000 K.C.) **Under no circumstances bend plates of variable condenser sections to correct tracking.**

IMPORTANT: This band must be completely rechecked after the long wave band has been adjusted.

LONG WAVE BAND ALIGNMENT:

860 Meters (350 K.C.) to 2150 Meters (140 K.C.)

1. With band changing switch in the long wave position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to tan antenna lead and black ground lead, make following adjustments:
   (a) Set external oscillator to 860 meters (350 K.C.), and adjust long wave oscillator trimmer to resonance (adjustment number 1; see bottom view of coil assembly. Fig. 3.)
   (b) Re-set external oscillator to 925 meters (325 K.C.), rotate variable gang condenser and pick up signal. Adjust long wave antenna trimmer (Adjustment number 6) to resonance.
   (c) Re-set external oscillator to 2000 meters (150 K.C.), and adjust long wave series pad to resonance by rotating condenser to approximately 2000 meters, rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3, Adjustment 9).
   (d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.

IMPORTANT: This band must be completely rechecked after the medium wave band has been rechecked.

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

IN ORDER TO PREVENT SIGNAL FROM ACTING UPON AVC AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.

All voltages are to be measured with 115 volts on the primary of the power transformer.

Receivers of this model which are to be used on voltages or frequencies other than 105-115 volts, 60 cycles are so marked. The power consumption of this receiver is 75 watts.

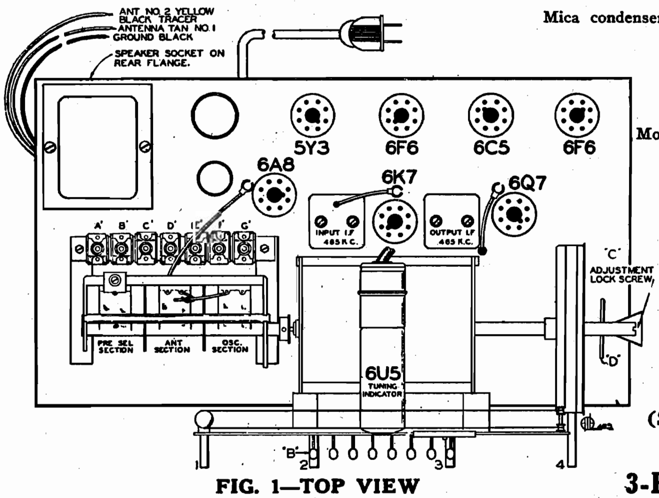

FIG. 1—TOP VIEW

CHASSIS MODEL 860 Series A

(Serial No. 7L897400 and up)

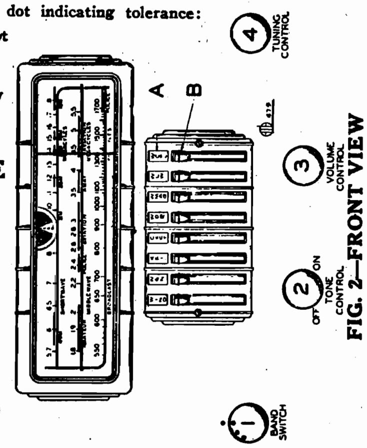

FIG. 2—FRONT VIEW

3-Band All-Wave A.C. Superheterodyne Receiver

MODEL 761
MODEL 860
Alignment, Tuner

BELMONT RADIO CORP.

TO REMOVE THE CHASSIS FROM THE CABINET:
Remove the four bolts which are used to fasten the chassis to the cabinet shelf; pull the knobs off their shafts and pull off the six button lever keys on front of dial.

MODEL 761 Series A (Serial No. 8A973750 and up)

DUMMY ANTENNAS:
The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):
Part No. 108-106E Output I.F. Transformer
Part No. 108-105 Input I.F. Transformer

These I. F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view, Fig. 1).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-106E) to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap of 6A8 and adjust input I.F. transformer (No. 108-105) to resonance.

BROADCAST BAND ALIGNMENT:
540 to 1750 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to tan antenna lead and black ground lead, make following adjustments:
   (a) Set external oscillator to 1750 K.C. and adjust broadcast oscillator trimmer to resonance (adjustment E'; see top view, Fig. 1).
   (b) Re-set external oscillator to 1400 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (Adjustment A') to resonance; also adjust preselector trimmer which is mounted on the top of the rear section of the three gang variable tuning condenser to resonance. (See top view of chassis, Fig. 1, for location of this adjustment.)
   (c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (Adjustment F') to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained.
   (d) Repeat adjustments "a" and "c" until sensitivity is at its maximum.
   (e) Check for tracking and sensitivity at 1000 kilocycles. **Under no circumstances bend plates of variable condenser sections to correct tracking.**

SHORT WAVE BAND ALIGNMENT:
5.5 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator (Adjustment G') and short wave antenna (Adjustment C') to resonance.
   (b) Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check sensitivity.
   (c) Re-set external oscillator and check set at 18.1 megacycles and 5.5 megacycles for band coverage.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental. An example of this is an image of a fundamental 17 megacycle signal appears near 16.1 megacycles.

MIDDLE WAVE BAND ALIGNMENT:
1730 to 5800 Kilocycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5000 kilocycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Move dial pointer to 5000 kilocycles and adjust middle wave oscillator (Adjustment D') and middle wave antenna (Adjustment B') to resonance.
   (b) Re-set external oscillator to 1900 kilocycles and pick up signal by rotating variable condenser and check sensitivity.
   (c) Re-check broadcast band alignment.

PROCEDURE FOR SETTING THE AUTOMATIC TUNER LEVERS:

There are six levers on the dial by means of which six stations may be selected, (See "B", Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including 6.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

Above each automatic tuner lever an opening in the escutcheon is provided for inserting the call letter tabs, (See "A" Fig. 2). Any order of grouping may be used, however, it is recommended that the left hand four automatic levers be used for high frequency stations (1750 to 1000 K.C.) and the right hand four automatic levers for low frequency stations (1000 to 540 K.C.).

Insert the call letter tabs in the rectangular openings in the escutcheon above each of the automatic tuner levers. One of **the small celluloid tabs supplied should be snapped into place** over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 4) the station indicated on the station call letter tab above this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab above this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Rotate the tuning knob (No. 4) to the right (clockwise) as far as it will turn. Now remove from the right side of the cabinet the metal button, and, with a screw driver inserted through the hole, tighten the locking adjustment screw "C". It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, loosen the locking screw "C" four or five complete turns; select the new station as explained. (Note: If the dial mechanism works hard when setting up a new station for one of the automatic tuner levers, it is due to the locking screw being too tight. Loosen the locking screw "C" until the dial mechanism works freely with the tuner lever pressed down.)

BE SURE TO RETIGHTEN the LOCKING SCREW: otherwise the stations you have selected will not stay adjusted to the levers.

MODEL 860 SERIES A (Serial No. 7L897400 and up)

PROCEDURE FOR SETTING THE AUTOMATIC TUNER LEVERS:

There are eight levers on the dial by means of which eight stations may be selected, (See "B", Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including 8.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

Above each automatic tuner lever an opening in the escutcheon is provided for inserting the call letter tabs, (See "A" Fig. 2). Any order of grouping may be used, however, it is recommended that the left hand four automatic levers be used for high frequency stations (1750 to 1000 K.C.) and the right hand four automatic levers for low frequency stations (1000 to 540 K.C.).

Insert the call letter tabs in the rectangular openings in the escutcheon above each of the automatic tuner levers. One of **the small celluloid tabs supplied should be snapped into place** over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 4) the station indicated on the station call letter tab above this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) noting the width of the shadow indicated on the screen of the cathode-ray tuning eye. Minimum width on the eye indicates the ideal tuning position (resonance). The station will then be clearest and accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab above this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Rotate the tuning knob (No. 4) to the right (clockwise) as far as it will turn. Now remove from the right side of the cabinet the metal button, and, with a screw driver inserted through the hole, tighten the locking adjustment screw "C". It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT. If a screw driver is not available, the locking screw can be tightened by reaching in from the back of the cabinet, and, by means of the pin "D" (see Fig. 1), rotate the locking screw shaft to the right (clockwise) until thoroughly tight.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, loosen the locking screw "C" four or five complete turns; select the new station as explained. (Note: If the dial mechanism works hard when setting up a new station for one of the automatic tuner levers, it is due to the locking screw being too tight. Loosen the locking screw "C" until the dial mechanism works freely with the tuner lever pressed down.)

BE SURE TO RETIGHTEN the LOCKING SCREW: otherwise the stations you have selected will not stay adjusted to the levers.

DUMMY ANTENNAS:
The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):
Part No. 108-106E Output I.F. Transformer
Part No. 108-105D Input I.F. Transformer

These I. F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view, Fig. 1).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-106E) to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap of 6A8G and adjust input I.F. transformer (No. 108-105D) to resonance.

BROADCAST BAND ALIGNMENT:
540 to 1750 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to tan antenna lead and black ground lead, make following adjustments:
   (a) Set external oscillator to 1750 K.C. and adjust broadcast oscillator trimmer to resonance (adjustment E'; see top view, Fig. 1).
   (b) Re-set external oscillator to 1400 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (Adjustment A') to resonance; also adjust preselector trimmer which is mounted on the top of the rear section of the three gang variable tuning condenser to resonance. (See top view of chassis, Fig. 1, for location of this adjustment.)
   (c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (Adjustment F') to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained.
   (d) Repeat adjustments "a" and "c" until sensitivity is at its maximum.
   (e) Check for tracking and sensitivity at 1000 kilocycles. **Under no circumstances bend plates of variable condenser sections to correct tracking.**

SHORT WAVE BAND ALIGNMENT:
5.5 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator (Adjustment G') and short wave antenna (Adjustment C') to resonance.
   (b) Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check sensitivity.
   (c) Re-set external oscillator and check set at 18.1 megacycles and 5.5 megacycles for band coverage.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental. An example of this is an image of a fundamental 17 megacycle signal appears near 16.1 megacycles.

MIDDLE WAVE BAND ALIGNMENT:
1730 to 5800 Kilocycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5000 kilocycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Move dial pointer to 5000 kilocycles and adjust middle wave oscillator (Adjustment D') and middle wave antenna (Adjustment B') to resonance.
   (b) Re-set external oscillator to 1900 kilocycles and pick up signal by rotating variable condenser and check sensitivity.
   (c) Re-check broadcast band alignment.

1—Type 6F6G—pentode output amplifier.
1—Type 5Y3G or 5W4—high vacuum rectifier.
1—Type 6G5 Cathode ray tuning indicator.

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

IN ORDER TO PREVENT SIGNAL FROM ACTING UPON AVC AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.

All voltages are to be measured with 115 volts on the primary of the power transformer.

Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagrams.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D.C. voltages is usually caused by a shorted electrolytic condenser, open by-pass condensers frequently cause oscillation and distorted tone.

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-92 Output I.F. Transformer
Part No. 108-93 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-92) to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap of 6J7 and adjust input I.F. transformer (No. 108-93) to resonance.

BROADCAST BAND ALIGNMENT:

535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to antenna and ground leads make following adjustments:
   (a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment number 4; see bottom view of coil assembly, Fig. 3)
   (b) Re-set external oscillator to 1400 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast R.F. trimmer (adjustment number 6) and broadcast antenna trimmer (adjustment number 7), to resonance.
   (c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (adjustment number 3), to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3).
   (d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.
   (e) Check for tracking and sensitivity at 1400, 1000, and 600 kilocycles. **Under no circumstances bend plates of variable condenser sections to correct tracking.**

SHORT WAVE BAND ALIGNMENT:

5.35 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the antenna and ground leads, make the following adjustments:
   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator trimmer (adjustment number 1) to resonance.
   (b) Adjust short wave R.F. trimmer (adjustment number 8), and short wave antenna trimmer (adjustment number 9), to resonance.
   (c) Re-set external oscillator and check set at 18.1 megacycles and 6 megacycles for band coverage and sensitivity.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental on the receiver dial. As an example of this a fundamental 17 megacycle signal can be tuned in not only at 17 on the dial but also at approximately 16.1 megacycles.

MIDDLE WAVE BAND ALIGNMENT:

1695 to 5500 Kilocycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5 megacycles and connected in series with "Dummy 3" to the antenna and ground leads make the following adjustments:
   (a) Move dial pointer to 5 megacycles and adjust middle wave oscillator trimmer (adjustment number 2) to resonance.
   (b) Adjust middle wave R.F. trimmer (adjustment number 10), and middle wave antenna trimmer (adjustment number 5), to resonance.
   (c) Re-set external oscillator and check sensitivity at 1800 kilocycles.
   (d) Recheck broadcast band alignment.

MODEL 1175
Alignment

BELMONT RADIO CORP.

CHASSIS No. 910 Series A

DUMMY ANTENNAS:
The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1," "Dummy 2," and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS (465 K.C.)
Part No. 108119 Output I.F. Transformer
Part No. 108118 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 3).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), the tone control turned to treble position, the phono switch in number 1 position sharp, (counter clockwise), and with the variable condenser set to minimum capacity (plates entirely out of mesh), make the following adjustments:
   - (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1," to the control grid cap of the type 6K7 I.F. tube and adjust the output I.F. transformer 108119 to resonance.
   - (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap to 6A8 and adjust input I.F. transformer (108118) to resonance.

SHORT WAVE BAND ALIGNMENT:
8.0 to 24.0 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 22 Megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments: (See Fig. 3).
   - (a) Move dial pointer to 22 Megacycles and adjust short wave oscillator (adjustment C13), short wave R.F. (adjustment C7) and short wave antenna (adjustment C1) to resonance.
   - (b) Re-set external oscillator to 9 Megacycles and pick up signal by rotating variable condenser and check for sensitivity.

   NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental. As an example of this a fundamental 22 megacycle signal can be tuned in not only at 22 on the dial. but also at approximately 21 megacycles.

MIDDLE WAVE ALIGNMENT:
2.35 to 7.0 Megacycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 6 Megacycles connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments. (See Fig. 3).
   - (a) Rotate condenser, pick up signal and adjust middle wave oscillator (adjustment C14), middle wave R.F. (adjustment C8) middle wave antenna (adjustment C2) to resonance.
   - (b) Re-set external oscillator to 2.5 megacycles and pick up signal by rotating variable condenser and check sensitivity.

BROADCAST BAND ALIGNMENT:
540 to 1750 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with external oscillator set at 1750 Kilocycles and connected in series with "Dummy 2" to the tan antenna and black ground lead, make the following adjustments. (See Fig. 3).
   - (a) Move dial pointer to 1750 Kilocycles and adjust broadcast oscillator trimmer (adjustment C15) to resonance.
   - (b) Re-set external oscillator to 1400 Kilocycles, move dial pointer to 1400 Kilocycles and adjust broadcast antenna trimmer, (adjustment C3) and broadcast R.F. trimmer (adjustment C9) to resonance.
   - (c) With external oscillator set at 600 K.C. adjust broadcast series pad (adjustment C21) to resonance with oscillator. Keep set in tune with oscillator by slowly rocking to and fro the variable condenser until maximum output is obtained.
   - (d) Repeat adjustments (a) and (c) until sensitivity is at its maximum.
   - (e) Check for tracking and sensitivity at 1000 Kilocycles.

   UNDER NO CIRCUMSTANCES BEND PLATES OF VARIABLE CONDENSER TO CORRECT TRACKING.

MODEL 1175 SERIES A

DUMMY ANTENNAS:
The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1," "Dummy 2," and "Dummy 3."

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS (465 K.C.)
Part No. 108-114 Output I.F. Transformer
Part No. 108-113 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view Fig. 1).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), the tone control on "Hi" part of the sharp position (as much right rotation as possible without operating the Hi Fidelity switch), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   - (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1," to the control grid cap of the type 6K7 I.F. tube and adjust the output I.F. transformer 108-114 to resonance.
   - (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap to 6J7 and adjust input I.F. transformer (108-113) to resonance.
   - (c) With oscillator still connected to 6J7, re-adjust output I.F. transformer if necessary.

BROADCAST BAND ALIGNMENT:
535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with external oscillator set at 1720 Kilocycles and connected in series with "Dummy 2" to the tan antenna and black ground lead, make the following adjustments:
   - (a) Move dial pointer to 1720 Kilocycles and adjust broadcast oscillator trimmer (adjustment I) to resonance. See bottom view, Fig. 3.
   - (b) Re-set external oscillator to 1400 Kilocycles, move dial pointer to 1400 Kilocycles and adjust broadcast antenna trimmer, (adjustment A) and broadcast R.F. trimmer (adjustment D) to resonance.
   - (c) With external oscillator set at 600 K.C. adjust broadcast series pad (adjustment J) to resonance with oscillator. Keep set in tune with oscillator by slowly rocking to and fro the variable condenser until maximum output is obtained.
   - (d) Repeat adjustments (a) and (c) until sensitivity is at its maximum.
   - (e) Check for tracking and sensitivity at 1000 Kilocycles. UNDER NO CIRCUMSTANCES BEND PLATES OF VARIABLE CONDENSER TO CORRECT TRACKING.

SHORT WAVE BAND ALIGNMENT:
5.35 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 Megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   - (a) Move dial pointer to 17 Megacycles and adjust short wave oscillator (adjustment G), short wave R.F. (adjustment F) and short wave antenna (adjustment C) to resonance.
   - (b) Re-set external oscillator to 6 Megacycles and pick up signal by rotating variable condenser and check for sensitivity.

   NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental. As an example of this a fundamental 17 megacycle signal can be tuned in not only at 17 on the dial, but also at approximately 16.1 megacycles.

MIDDLE WAVE ALIGNMENT:
1695 to 5500 Kilocycles

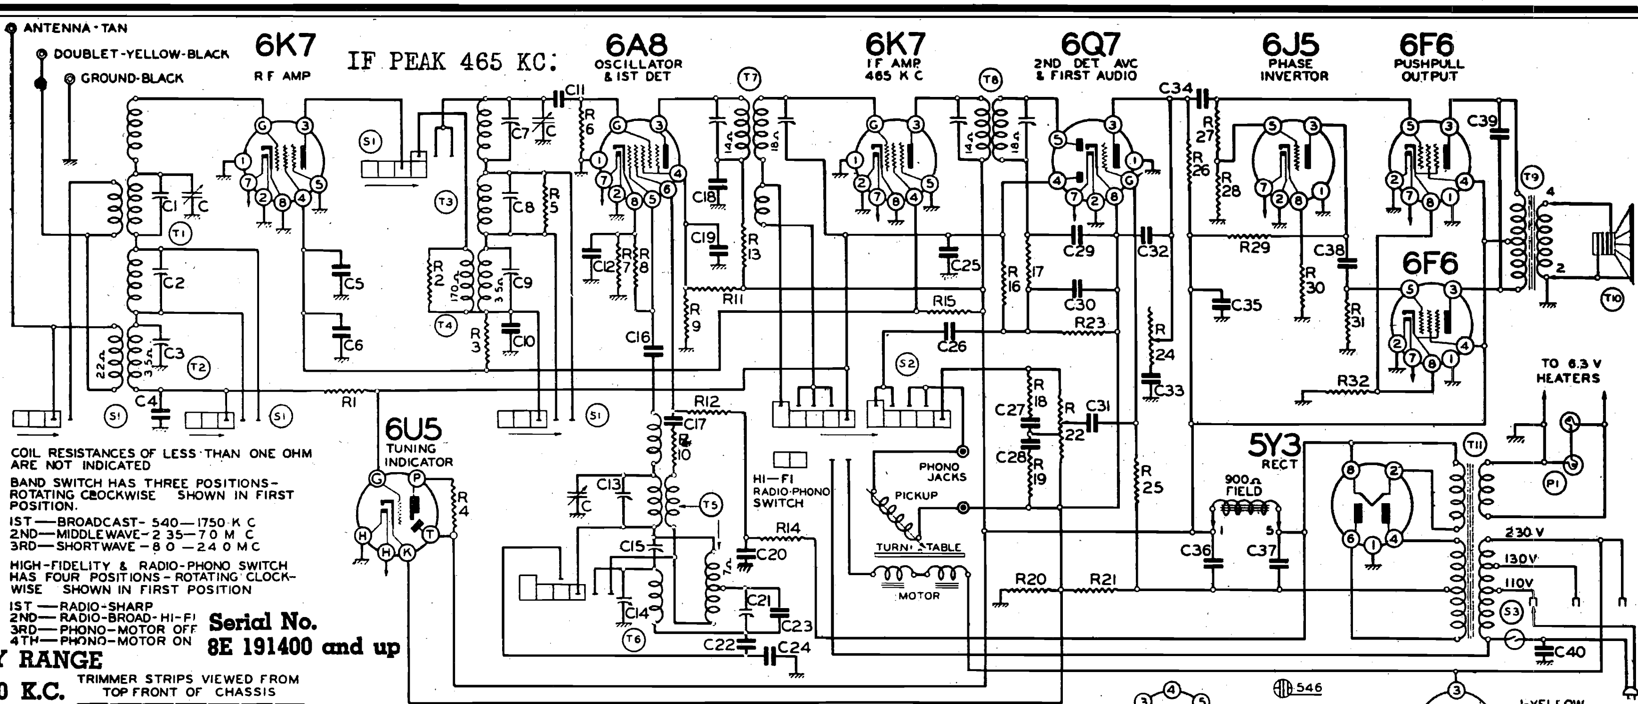
1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5 Megacycles connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   - (a) Rotate condenser, pick up signal and adjust middle wave oscillator (adjustment H), middle wave R.F. (adjustment E) middle wave antenna (adjustment B) to resonance.
   - (b) Re-check broadcast alignment and if it is found necessary; re-adjust either R.F. or antenna trimmers. Repeat the 17 megacycles short wave and 5 megacycles middle wave adjustments.

MODEL 910 Export
Schematic, Parts
Phono. Notes

BELMONT RADIO CORP.

For conventional types of antennas connect the tan wire to the antenna lead and the yellow with black tracer and the black wire together to the ground lead.

When a doublet antenna is used connect the tan wire and the yellow with black tracer wire to the doublet antenna and the solid black wire to the ground lead. (See Fig. 1).



COIL RESISTANCES OF LESS THAN ONE OHM ARE NOT INDICATED

PHONOGRAPH MOTOR:

On the underside of the chassis a terminal strip is provided for 220 volt phonograph motor connections.

Connect the supply cord from the phonograph motor to the terminal strip through the hole on top of the chassis provided for this purpose. (See Fig. 1).

Connections to the terminal strip are controlled by the radio-phono switch, knob no. 3 located on the front of the radio.

Only a 220 volt motor can be operated from the terminal strip connections.

MODEL 910 Export
Socket, Trimmers
Voltage, Tuner

BELMONT RADIO CORP.

Three taps are provided, marked 110, 130 and 230. Set the tap on the transformer for various line voltages to conform with the following table:

110 tap: for line voltages of 100 to 125 volts.
130 tap: for line voltages of 125 to 145 volts.
230 tap; for line voltages of 210 to 250 volts.

(Serial No. 8E 191400 and up)

Receivers of this model which are to be used on voltages or frequencies other than 110-130-230 volts, 40-60 cycles are so marked. The power consumption if this receiver is 110 watts. (See taps on top of power transformer.)

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a voltmeter having a resistance of 1000 ohms per volt.

IN ORDER TO PREVENT SIGNAL FROM ACTING UPON AVC AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.

PROCEDURE FOR SETTING THE AUTOMATIC TUNER LEVERS:

IMPORTANT—READ CAREFULLY BEFORE SETTING THE AUTOMATIC LEVERS:

There are eight levers on the dial by means of which eight stations may be selected, (See "B", Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including 8.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

Above each automatic tuner lever an opening in the escutcheon is provided for inserting the call letter tabs, (See "A" Fig. 2). Any order of grouping may be used, however, it is recommended that the right hand four automatic levers be used for high frequency stations (1750 to 1000 K.C.) and the left hand four automatic levers for low frequency stations (1000 to 540 K.C.).

Insert the call letter tabs in the rectangular openings in the escutcheon above each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob No. 5 the station indicated on the station call letter tab above this lever. Turn the tuning knob very slowly **back and forth (while still holding lever in downward position)**, noting the width of the shadow indicated on the screen of the cathode-ray tuning eye. Minimum width on the eye indicates the ideal tuning position (resonance). The station will then be clearest and accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab above this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Rotate the tuning knob No. 5 to the right (clockwise) as far as it will turn. Now remove from the right side of the cabinet the metal button, and, with a screw driver inserted through the hole, tighten the locking adjustment screw "C". It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT. If a screw driver is not available, the locking screw can be tightened by reaching in from the back of the cabinet, rotate the locking screw shaft to the **right (clockwise) until thoroughly tight.**

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, loosen the locking screw "C" four or five complete turns; select the new station as explained. (Note: If the dial mechanism works hard when setting up a new station for one of the automatic tuner levers, it is due to the locking screw being too tight. Loosen the locking screw "C" until the dial mechanism works freely with the tuner lever pressed down.)

BE SURE TO RETIGHTEN THE LOCKING SCREW; otherwise the stations you have selected will not stay adjusted to the levers.

BELMONT RADIO CORP.

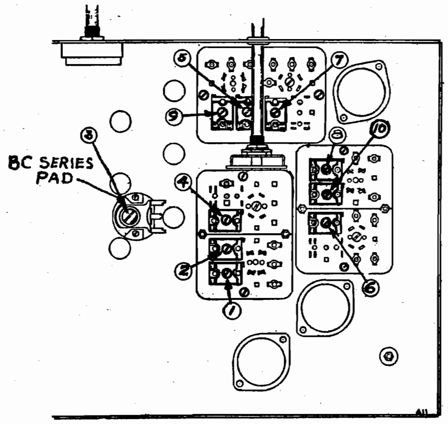

FIG. 3.—BOTTOM VIEW SHOWING TRIMMERS

ALIGNING INSTRUCTIONS:

CAUTION:

No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet. To remove the knobs, pull them off and to take the chassis out of the cabinet, remove the four bolts by which it is fastened.

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer or by means of an adapter between the plate and cathode terminals of the 5 prong speaker socket. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of the multi-range meter should be used.

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1," "Dummy 2," and "Dummy 3."

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS (465 K.C.)

Part No. 108-63B Output I. F. Transformer
Part No. 108-64B Input I. F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view Fig. 1).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), the tone control on "Hi" part of the sharp position (as much right rotation as possible without operating the Hi Fidelity switch), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:

   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1," to the control grid cap of the type 6K7 tube, located between the two I.F. transformers, and adjust the output I.F. transformer 108-63B to resonance.

   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap to 6J7 and adjust input I.F. transformer (108-64B) to resonance.

   (c) With oscillator still connected to 6J7, re-adjust output I.F. transformer if necessary.

BROADCAST BAND ALIGNMENT:
535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with external oscillator set at 600 kilocycles and connected in series with "Dummy 2" to the tan antenna and black ground lead, make the following adjustments:

   (a) Adjust broadcast series pad (adjustment number 3) to resonance with oscillator. Keep set in tune with oscillator by slowly rocking to and fro the variable condenser until maximum output is obtained. Note: This adjustment is accessible from the top of the chassis and is located between the variable condenser and the 108-63 output I.F. transformer. See top view, Fig. 1.

   (b) Re-set external oscillator to 1400 K.C., move dial pointer to 1400 K.C. and adjust oscillator (adjustment number 4), R.F. (adjustment number 6) and antenna (adjustment number 7) to resonance. See bottom view for location of these adjustments, Fig. 3.

   (c) Repeat adjustments "a" and "b" until sensitivity is at its maximum.

   (d) Check for tracking and sensitivity at 1000 kilocycles. **Under no circumstances bend plates of variable condenser to correct tracking.**

SHORT WAVE BAND ALIGNMENT:
5.3 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:

   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator (adjustment number 1), short wave R.F. (adjustment number 8) and short wave antenna (adjustment number 9) to resonance.

   (b) Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check for sensitivity.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental on the receiver dial. As an example of this a fundamental 18.3 megacycle can be tuned in not only at 18.3 on the dial, but also at approximately 17.4 megacycles.

MIDDLE WAVE BAND ALIGNMENT:
1690 to 5300 Kilocycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5 M.C. and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:

   (a) Rotate condenser, pick up signal and adjust middle wave R.F. (adjustment number 10), middle wave antenna (adjustment number 5) and middle wave oscillator (adjustment number 2) to resonance.

   (b) Re-check broadcast alignment and if it is found necessary to re-adjust either R.F. or antenna trimmers, repeat the 17 M.C. short wave and 5 M.C. middle wave adjustments.

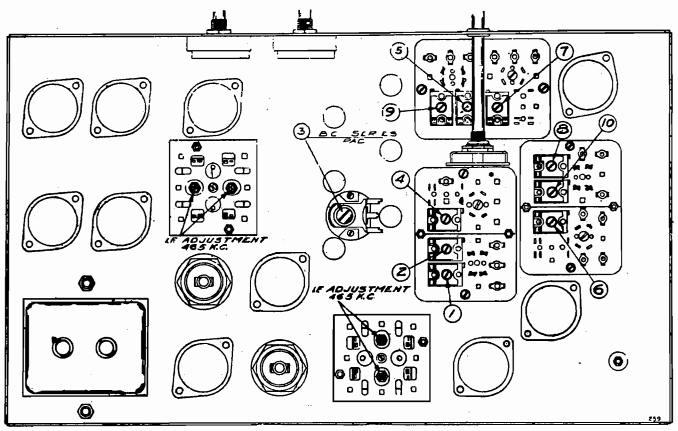
NOTE: Resistors and Condensers which are prefixed with an asterisk (*) on the circuit diagram and parts list were added or the values changed during production to meet certain conditions.

Resistors R1, R27, R28, and Condensers C29, C30 were added to correct certain variances of tube characteristics. Resistors R14, R20, R21 the values were changed. In some chassis the values of these resistors are as follows:
R14—2500 Ohm—1/3 Watt
R20—200M Ohm..1/3 Watt
R21—20M Ohm—1/3 Watt
Present values of these resistors are:
R14—500 Ohm—1/3 Watt
R20—100M Ohm—1/2 Watt
R21—10M Ohm—1/3 Watt



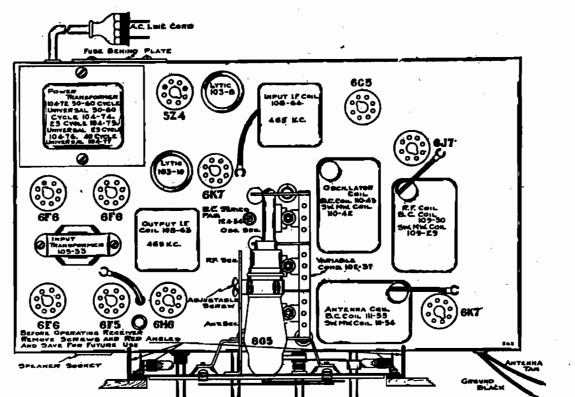


FIG. 1—BOTTOM VIEW SHOWING TRIMMERS

MODEL 1171 Series A
Alignment, Notes

BELMONT RADIO CORP.

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 25, 40 and 60 cycles and with primary taps for 108, 127, 150, 225, and 260 volts, (see instructions) and also sometimes equipped with 25 cycle transformers with 105-115 volt or 220 volt primaries, not universals.

SERVICE NOTES

NOTE:

Attention is called to the circuit diagram contained in this manual. Several minor changes were made during production of this model to correct certain conditions. These changes are shown on the circuit diagram in dotted lines and explained in detail. Some of the chassis were equipped with 5Z3 rectifier tubes in place of the 5Z4 and do not have a fuse assembly in the power line.

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

IN ORDER TO PREVENT SIGNAL FROM ACTING UPON AVC AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.

All voltages are to be measured with 115 volts on the primary of the power transformer.

Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagrams.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D.C. voltages is usually caused by a shorted electrolytic condenser, open by-pass condensers frequently cause oscillation and distorted tone.

This chassis is protected against damage from faulty tubes or abnormal line conditions by a fuse in the primary circuit.

If when set is turned on pilot lights do not light, look for a blown fuse.

This fuse is made accessible for replacement by removing fuse cover located on back flange of chassis, replace only with a 2 ampere fuse. If replacement fuse blows out, check tubes, (particularly 5Z4 rectifier) circuit, repair or replace defective tubes or parts.

NEVER ATTEMPT TO REPLACE FUSE WITHOUT FIRST DISCONNECTING POWER.

NEVER REPLACE WITH FUSE OTHER THAN 2 AMPERE RATING.

ALIGNING INSTRUCTIONS

Dummy Antennas

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Intermediate and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

Resonance Indicator:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer or by means of an adapter between the plate and cathode terminals of the 5 prong speaker socket. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

CAUTION:

No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet. To remove the knobs, pull them off and to take the chassis out of the cabinet, remove the four bolts by which it is fastened.

ALIGNING I.F. TRANSFORMERS (465 K.C.)

Part No. 108-63 Output I.F. Transformer
Part No. 108-64 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the underside of chassis (see bottom view Fig. 1).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), the tone control on "Hi" part of the sharp position (as much right rotation as possible without operating the Hi Fidelity switch), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6K7 tube, located between the two I.F. transformers, and adjust the output I.F. transformer 108-63 to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap to 6J7 and adjust input I.F. transformer (108-64) to resonance.
   (c) With oscillator still connected to 6J7, re-adjust output I.F. transformer if necessary.

ALIGNMENT PROCEDURE

The following adjustments to be made after the I.F.'s have been aligned as explained above.

BROADCAST BAND ALIGNMENT:

1. With band changing switch in the broadcast position, extreme left of its rotation, and with external oscillator set at 600 kilocycles and connected in series with "Dummy 2" to the tan antenna and black ground lead, make the following adjustments:
   (a) Adjust broadcast series pad (adjustment number 3) to resonance with oscillator. Keep set in tune with oscillator by slowly rocking to and fro the variable condenser until maximum output is obtained. Note: This adjustment is accessible from the top of the chassis and is located between the variable condenser and the 108-63 output I.F. transformer. See top view, Fig. 3.
   (b) Re-set external oscillator to 1400 K.C., move dial pointer to 1400 K.C. and adjust oscillator (adjustment number 4), R.F. (adjustment number 6) and antenna (adjustment number 7) to resonance. See bottom view for location of these adjustments, Fig. 1.
   (c) Repeat adjustments "a" and "b" until sensitivity is at its maximum.

NOTE: IT IS EXTREMELY NECESSARY IN MAKING ALL OF THESE ADJUSTMENTS THAT THE FUNDAMENTAL OSCILLATOR SIGNAL BE TUNED IN AND NOT THE IMAGE FREQUENCY WHICH WILL FALL BELOW THE FUNDAMENTAL.

SHORT WAVE BAND ALIGNMENT:

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator (adjustment number 1), short wave R.F. (adjustment number 8) and short wave antenna (adjustment number 9) to resonance.
   (b) Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check for sensitivity.

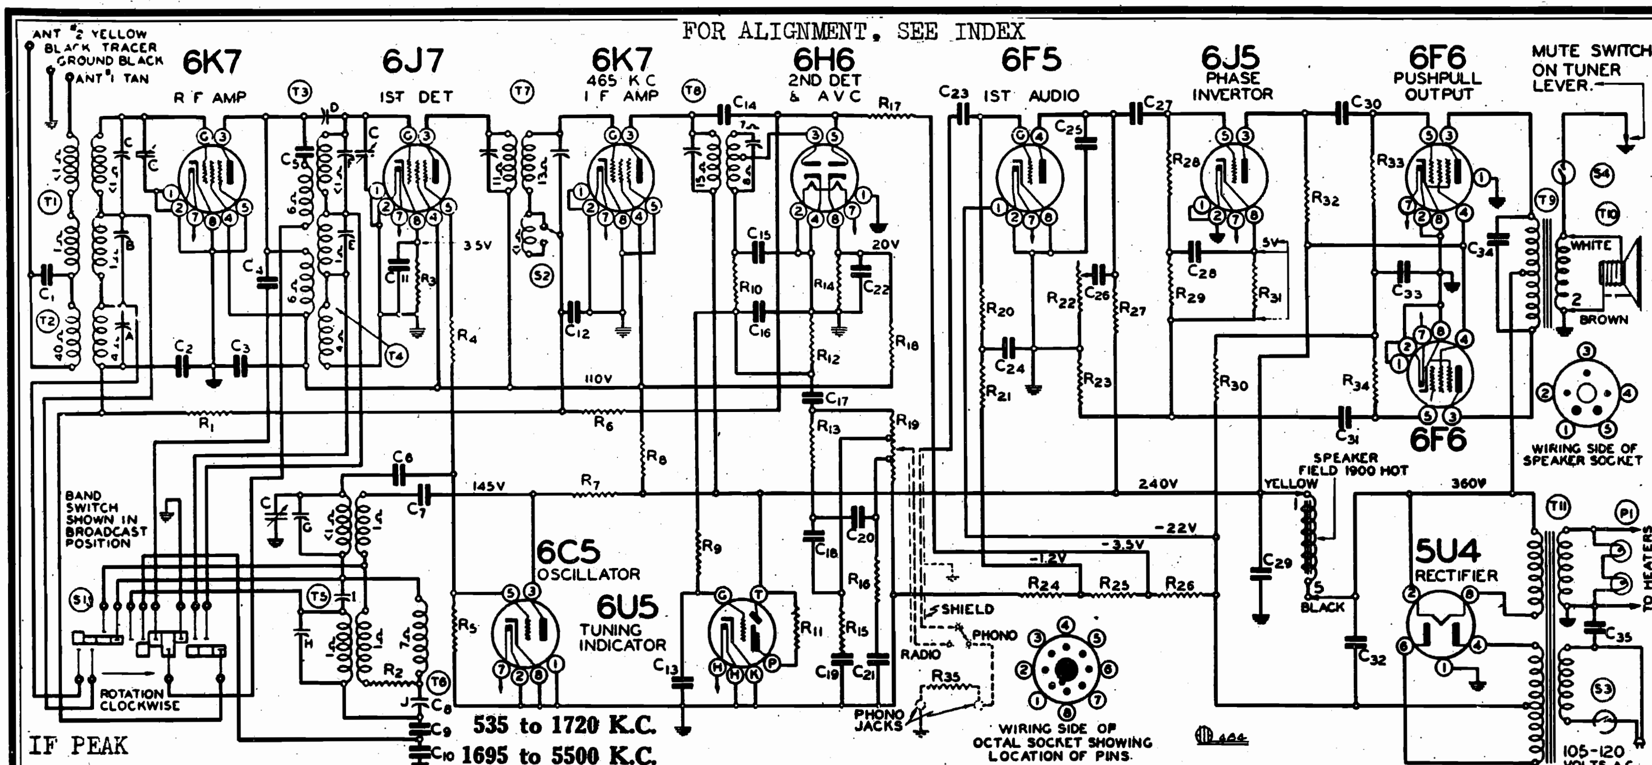
MIDDLE WAVE BAND ALIGNMENT:

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5 M.C. and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Rotate condenser, pick up signal and adjust middle wave R.F. (adjustment number 10), middle wave antenna (adjustment number 5) and middle wave oscillator (adjustment number 2) to resonance.
   (b) Re-check broadcast alignment and if it is found necessary to re-adjust either R.F. or antenna trimmers, repeat the 17 M.C. short wave and 5 M.C. middle wave adjustments.

BELMONT RADIO CORP.

IN ORDER TO PREVENT SIGNAL FROM ACTING UPON AVC AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a voltmeter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.



IF PEAK 465 KC.

FREQUENCY RANGE 5.35 to 18.1 M.C.

CHASSIS MODEL 1175 SERIES A (Serial No. 7M920500 and up)

5%	Green
10%	Blue
15%	Yellow
20%	Red
More Than 20%	None

For conventional types of antennas connect the tan wire to the antenna lead and the **yellow with black tracer** and the **black** wire together to the ground lead.

When a doublet antenna is used connect the tan wire and **the yellow with black tracer** wire to the doublet antenna and **the solid black** wire to the ground lead. (See Fig. 1—Top View).

Receivers of this model which are to be used on voltages or frequencies other than 105-115 volts, 60 cycles are so marked. The power consumption of this receiver is 125 watts.

All voltages are to be measured with 115 volts on the primary of the power transformer.

MODEL 1175 Series A
Trimmers, Tuner

MODEL 1175 SERIES A
(Serial No. 7M920500 and up)

The tube complement of this chassis consists of the following metal and octal base glass tubes which are interchangeable with metal tubes:
1—Type 6K7 Remote cut-off pentode R.F. amplifier
1—Type 6J7 Pentode first detector
1—Type 6C5 Oscillator
1—Type 6K7 Remote cut-off pentode I.F. amplifier
1—Type 6H6 Duplex diode second detector and A.V.C.
1—Type 6F5 First audio amplifier
1—Type 6J5 Phase Inverter stage
2—Type 6F6 Output pentodes in push-pull
1—Type 5U4 High vacuum rectifier
1—Type 6U5 Cathode-Ray Tuning Indicator.

BELMONT RADIO CORP.

PROCEDURE FOR SETTING THE AUTOMATIC TUNER LEVERS:

IMPORTANT—READ CAREFULLY BEFORE SETTING THE AUTOMATIC LEVERS:

A mute feature has been incorporated in the automatic tuning mechanism of the Model 1175. The function of this feature is to permit SILENT TUNING from one station to another by means of the automatic tuning levers. When any one of the levers are pressed down, the speaker is automatically disconnected from the radio and NO SIGNAL is heard until the lever is RELEASED.

To facilitate an accurate adjustment of the levers it is desirable to hear the station being tuned in while the lever is being adjusted; therefore a MUTE SWITCH is provided to manually connect or disconnect the silent tuning feature.

Referring to the top view of the radio (Fig. 1 in this manual), THE POSITION OF THE SWITCH (located on the top of the radio chassis alongside the power transformer), IS IMPORTANT.

Set the switch as follows:

WHILE SETTING THE AUTOMATIC LEVERS:
Switch should be snapped to the right (white dot not visible).

AFTER AUTOMATIC LEVERS HAVE BEEN SET:
Switch should be snapped to the left (white dot showing).

There are eight levers on the dial by means of which eight stations may be selected, (See "B", Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including 8.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

Above each automatic tuner lever an opening in the escutcheon is provided for inserting the call letter tabs, (See "A" Fig. 2). Any order of grouping may be used, however, it is recommended that the left hand four automatic levers be used for high frequency stations (1750 to 1000 K.C.) and the right hand four automatic levers for low frequency stations (1000 to 540 K.C.).

Insert the call letter tabs in the rectangular openings in the escutcheon above each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob No. 4 the station indicated on the station call letter tab above this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position), noting the width of the shadow indicated on the screen of the cathode-ray tuning eye. Minimum width on the eye indicates the ideal tuning position (resonance). The station will then be clearest and accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station indicated on the call letter tab above this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Rotate the tuning knob No. 4 to the right (clockwise) as far as it will turn. Now remove from the right side of the cabinet the metal button, and, with a screw driver inserted through the hole, tighten the locking adjustment screw "C". It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT. If a screw driver is not available, the locking screw can be tightened by reaching in from the back of the cabinet, and, by means of the pin "D" (see Fig. 1), rotate the locking screw shaft to the right (clockwise) until thoroughly tight.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, loosen the locking screw "C" four or five complete turns; select the new station as explained. (Note: If the dial mechanism works hard when setting up a new station for one of the automatic tuner levers, it is due to the locking screw being too tight. Loosen the locking screw "C" until the dial mechanism works freely with the tuner lever pressed down.)

BE SURE TO RETIGHTEN THE LOCKING SCREW; otherwise the stations you have selected will not stay adjusted to the levers.

Snap mute switch to silent tuning position (white dot showing)

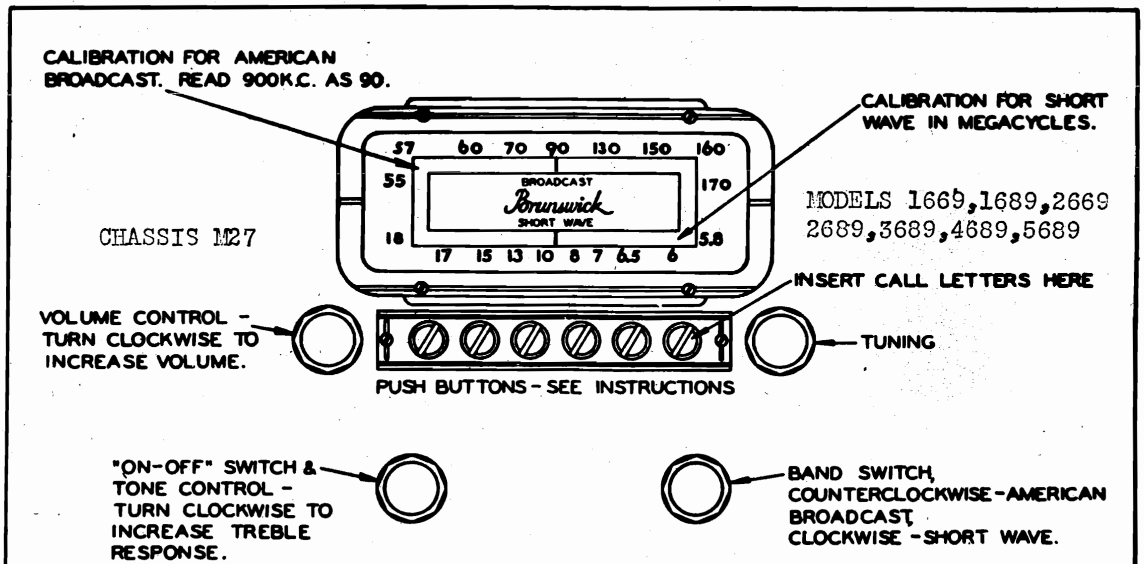
Tuner Data

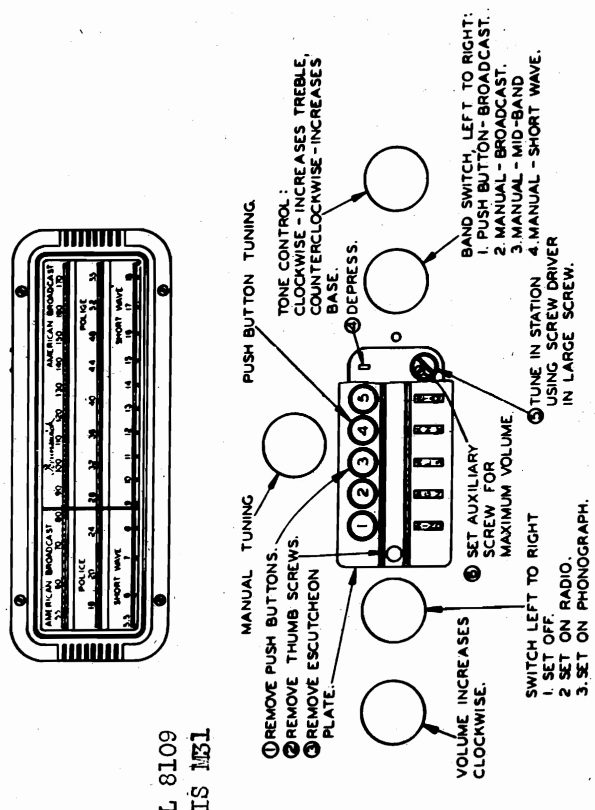
BRUNSWICK DIV. MERSMAN BROS. CORP.



Push Button Set-up:

Any button may be set up for any station desired. First, tune in the station it is desired to set up on one of the buttons by means of the manual tuning control. Second, turn the push button counter-clockwise two full turns. Then depress this button the full length of its stroke, and while depressed, tighten the button again by turning it clockwise. The button may now be released. To check the correct setting for this button, turn the manual control to some other point and depress the push button. This will return the tuning mechanism to the station just set up. If it does not, repeat the foregoing sequence of operations more carefully. Each of the remaining buttons may be set to other stations in a like manner.

MODEL 8109
CHASSIS M31



Push Button Set-up:

The overall frequency range covered by the push buttons on this Brunswick receiver is from 540 kc to 1,600 kc. This range is broken down into sections covered by each button (reading from left to right—see diagram) in the following manner:

Button No. 1	540 to 1000 kc
Button No. 2	550 to 1050 kc
Button No. 3	565 to 1050 kc
Button No. 4	725 to 1360 kc
Button No. 5	750 to 1440 kc
Button No. 6	1000 to 1600 kc

From the above, it will be apparent that all six buttons are adjustable to cleared channel stations, and also that the sixth or highest frequency button also embraces the extended broadcast spectrum to 1600 kc.

Make up a suitable list of six local stations, assigning one to each button within the ranges tabulated above. Follow the order of operation indicated by the circled figures 1 to 6 in the accompanying illustration. When operation 5 has been reached for each button, it will be found helpful to momentarily switch back to manual tuning and, thereby, identify the program to be tuned in on that particular button. Again, switch back to push button tuning on the band switch and proceed with operation 5 and 6. When the proper station has been heard, the final adjustment should be made while watching the tuning indicator. The shadow may seem to hold at a minimum angle for an appreciable time while making this adjustment. Turn the screw driver each side of what seems to be "center," until the shadow angle starts to become greater. Half the distance the screw driver has been turned is then the correct setting. Apply this procedure first to operation 5 and then 6.

In order to facilitate setting each button to the desired station, this receiver leaves the factory with the buttons set to the following frequencies:

Button No. 1	600 kc
Button No. 2	700 kc
Button No. 3	800 kc
Button No. 4	1000 kc
Button No. 5	1200 kc
Button No. 6	1400 kc

These frequencies should be used as reference points. If the desired station is on a higher frequency, turn the screw indicated as operation 5 in a counter-clockwise direction; if on a lower frequency, clockwise.

After the desired stations have been set up on the push buttons, replace the escutcheon and push buttons, then remove the proper station call letters from the call letter sheet and place them in the correct order in the windows below each button. Care should be taken that the call letters are inserted in the proper order and that they are right side up.

500 VOLT SCALE

ALIGNMENT AND CALIBRATION PROCEDURE

The following equipment is required for aligning:

A signal generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output indicating meter.

Non-metallic screwdriver.

Dummy antennas - .05 mf., and 200 mmf.

Controls should be in the following positions:

Volume Control - Maximum all adjustments.

Local-Distance Switch - Distance position - all adjustments.

Connect radio chassis to ground lead of signal generator with a short heavy lead. The chassis should be in the case.

Allow chassis and signal generator to "heat up" for several minutes.

Attenuate the signal from the signal generator to prevent the levelling off action of the AVC.

After the alignment is completed, repeat the procedure as a final check

I. F. ADJUSTMENT

Set the signal generator for a signal of 175 KC.

Connect the output of the signal generator through an .05 mf. condenser to the stator of the first detector section of the tuning condenser.

Then adjust the I.F. trimmers until maximum output is obtained. The location of these trimmers is shown in parts layout illustration, Fig. 1.

1581 KILOCYCLE ADJUSTMENT

Set the signal generator for 1581 KC.

Turn the rotor of the tuning condenser to the full open position.

Insert the antenna plug for a high capacity antenna (mark on HC side).

Connect the shielded antenna lead from the chassis through a 200 mmf. condenser to the antenna post of the signal generator.

Turn the tuning condenser to full open position, then adjust the trimmer of the oscillator section of the three gang condenser until maximum output is obtained - See Fig. 1 for location of this trimmer.

1400 KILOCYCLE ADJUSTMENT

Set the signal generator for 1400 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the 1st detector and R. F. trimmers on the tuning condenser for maximum output.

Do not change the setting of the oscillator trimmer.

600 KILOCYCLE ADJUSTMENT

Set the signal generator for 600 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Adjust the antenna 600 KC trimmer to maximum. This trimmer is reached from the outside of the case.

ADJUSTING ANTENNA 600 KILOCYCLE TRIMMER

After the radio is installed and the car antenna is connected, it will be necessary to readjust the antenna 600 KC trimmer.

Tune in a weak signal at approximately 600 KC with the volume control about three-fourths on. Turn the adjusting screw of the antenna 600 KC trimmer up or down until maximum output is obtained.

CALIBRATING THE RADIO

Tune in a signal of known frequency at about the center of the dial.

Choose a station with a frequency which corresponds to one of the numbers on the dial drum. For example, WLW, with a frequency of 700 KC, corresponds to 70 on the dial.

Holding the tuning knob. Using a clean eraser on the end of a lead pencil, turn the dial drum until the frequency of the station tuned in is at the center of the dial opening.

GENERAL SERVICE DATA

Inserting Antenna Plug:

IMPORTANT -- The antenna plug can be inserted in two ways depending on whether the antenna is of high or low capacity.

Referring to Fig. 3, it will be noted that the letters HC and LC are stamped on the case. There is a spot of paint on the antenna plug. When the plug is inserted with the spot of paint on the HC side, it is properly inserted for a high capacity antenna and when it is inserted with the spot of paint on the LC side, it is properly inserted for a low capacity antenna.

If the total capacity of the antenna and shielded lead is approximately 200 mmf., which would be the case in a running board or ordinary roof antenna (not metal roof), insert the antenna plug for a high capacity antenna or with the mark on the HC side.

If the total capacity of the antenna and shielded lead is approximately 70 mmf., such as may be the case if a "roof" antenna is used, insert the antenna plug for a low capacity antenna or with the mark on the LC side.

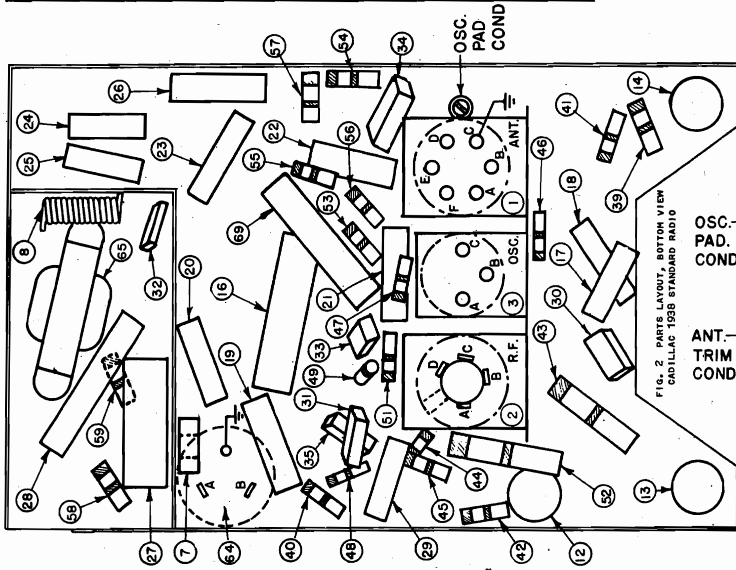

FIG. 2 PARTS LAYOUT, BOTTOM VIEW
CADILLAC 1938 STANDARD RADIO

ALIGNMENT AND CALIBRATION PROCEDURE

The following equipment is required for aligning:

A signal generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output indicating meter.

Non-metallic screwdriver.

Dummy antennas - .05 mf., and 200 mmf.

Controls should be in the following positions:

Volume Control - Maximum all adjustments.

Local-Distance Switch - Distance position - all adjustments.

Connect radio chassis to ground lead of signal generator with a short heavy lead. The chassis should be in the case.

Allow chassis and signal generator to "heat up" for several minutes.

Attenuate the signal from the signal generator to prevent the levelling off action of the A.V.C.

After the alignment is completed, repeat the procedure as a final check.

CONNECTING THE OUTPUT METER

Connect the terminals of the output meter to the plate prongs of the 6N7G tube. In order to protect the output meter from D. C. voltage, a condenser (.25 mfd., 400 volt) should be connected in series with one terminal.

I. F. ADJUSTMENT

Connect the signal lead of the test oscillator to the grid cap of the 6A8G translator tube, through a .05 mfd. condenser, leaving the tube's grid clip in place. Connect the ground lead of the test oscillator to the chassis frame.

Set the test oscillator to exactly 262 KC.

Turn rotor plates of gang condenser completely out of mesh. Adjust the trimmers on the I. F. coils Nos. 4 and 5, for maximum output. (See Fig. 1). Adjustment of these four trimmers should be repeated several times and during alignment, the oscillator output should be kept to as low a value as is consistent with obtaining a readable indication on the output meter.

1400 KILOCYCLE ADJUSTMENT

Remove the signal lead of the test oscillator from the grid of the translator (6A8G) tube and connect to the antenna terminal of the receiver through a 200 mmfd. condenser.

Set the test oscillator to exactly 1400 kilocycles.

Tune the set to 1400 kilocycles (use an indicator in front of the dial, corresponding to the pointer in the instrument panel dial opening.) Adjust the parallel trimmers of the antenna, oscillator and R. F. sections of the gang condenser, (9A, 9C and 9B, Fig. 1) for maximum output.

600 KILOCYCLE ADJUSTMENT

Remove the signal lead of the test oscillator from the antenna terminal and connect to the grid cap of the 6K7, (R. F.) tube through the 200 mmfd. condenser. Leave the tube's grid clip in place.

Set the test oscillator on 600 KC.

Tune the set to 600 KC. Maintain a low output signal and adjust the oscillator padder condenser No. 10 (Fig. 1) while rocking the variable condenser gang tuning shaft back and forth through the signal. This operation should be continued until no further increase in output can be obtained. An insulated screw driver should be used for this adjustment.

Remove signal lead of the test oscillator from the 6K7 tube cap and connect to the antenna terminal.

With test oscillator and set both adjusted to 600 KC., adjust the antenna trimmer condenser, No. 11, (Fig. 1) for maximum output.

ADJUSTING ANTENNA TRIMMER

After the set is installed in a car and the antenna is connected, the antenna trimmer should again be adjusted. Tune in a weak signal at approximately 600 KC and turn volume full on. If the signal volume is too great the sensitivity control should be turned to the local position. Adjust the antenna trimmer, No. 11, (Fig. 1) for maximum signal output.

REALIGNING AT 1400 KILOCYCLES

Recheck alignment of R. F. antenna and oscillator sections of gang condenser as outlined in paragraph No. 3.

P2391	Output Transformer
P1506	1st I.F. Transformer
P2394	2nd I.F. Transformer
P2412	Oscillator Coil
P2393	Antenna Coil

CORRECT ALIGNMENT PROCEDURE The intermediate frequency (I.F.) stage should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast Band alignment should be the next procedure.

I.F. ALIGNMENT Adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (6A7) through a .05 or .1 mfd. condenser. The ground on the test oscillator can be connected to the chassis ground. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT Adjust the oscillator to 1730 KC and connect the output to the antenna lead (Blue) through a .0002 mfd. mica condenser. Set the gang condenser to minimum capacity and adjust the gang condenser trimmer (oscillator) to receive this signal. After this has been carefully done, the next step is to set the generator to 1400 KC and after tuning in the signal adjust the antenna trimmer to peak. This is all that is necessary for the alignment unless the plates of the gang condenser have been bent out of shape. In case of bent plates, set the test oscillator and the receiver to 600 KC and bend the plates into the position for maximum output.

PROCEDURE FOR SETTING UP AND OPERATING AUTOMATIC PUSH BUTTONS

Select four strong local stations tuned in regularly. Now loosen **Locking Screw** (see chassis layout) several turns with a coin or a screw driver and press in any one of the four push buttons. Holding the button down, tune in any one of four selected stations by rotating the tuning knob (side knob) slowly back and forth until the signal is cleared.

Release the push button and press in another button and hold down, tuning in another favorite station with tuning knob. Follow the same procedure for the remaining stations. Now hold tuning knob (side knob) securely and with coin or screw driver, tighten locking screw. This screw holds all stations in adjustment.

In order to change any station already set up, to another, hold tuning knob securely, loosen locking screw and select the new station as explained above. Tear the correct station call letter tabs from the set of sheets supplied and push them into rectangular windows above each push button.

The automatic push button dial is now set up for quick tuning.

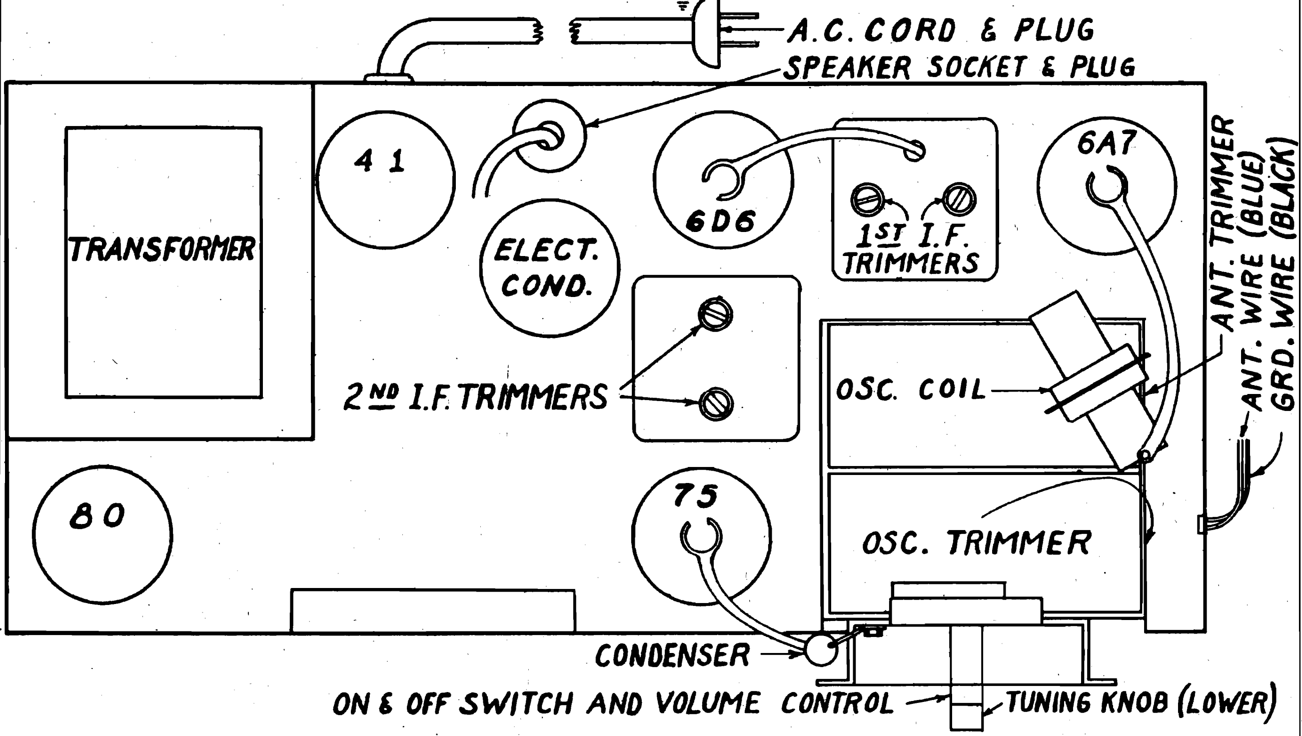
IF PEAK 456 KC

MODEL 5AZ

FREQUENCY RANGE: 535 to 1720 KC



IF ALIGNMENT - Connect generator to control grid of 6A7 thru .05 MFD condenser, peak the IF transformer trimmers to 456 KC.

BROADCAST BAND - Generator at 1400 KC, connected to antenna thru 100 MMFD condenser. Receiver to 1400 KC, adjust front gang condenser trimmer to peak. Then adjust rear trimmer of gang condenser to peak. Generator at 600 KC, and receiver at approximately same frequency. While rocking the variable condenser across the signal adjust the oscillator padding condenser to maximum peak.

RANGE 535 - 1730 KILOCYCLES

CORRECT ALIGNMENT PROCEDURE The intermediate frequency (I.F.) stage should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast Band alignment should be the next procedure.

I.F. ALIGNMENT Adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (6A8) through a .05 or .1 mfd. condenser. Connect ground or test oscillator to chassis ground through a .1 mfd. condenser. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT Adjust the oscillator to 1730 KC and connect the output to the antenna lead, through a .0001 mfd. mica condenser. Set the gang condenser to minimum capacity and adjust the gang condenser trimmer (oscillator) to receive this signal. After this has been carefully done, the next step is to set the generator to 1400 KC and after tuning in the signal adjust the antenna trimmer to peak. This is all that is necessary for the alignment unless the plates of the gang condenser have been bent out of shape. In case of bent plates, set the test oscillator and the receiver to 600 KC and bend the plates into the position for maximum output.

ALIGNMENT DATA AND SERVICING

Connect the signal generator through a .1 mfd. condenser to the grid of the 6D6 tube. Connect an output meter across the voice coil of the speaker. Set the generator to 456 K.C. and align the I.F. transformer for maximum reading on the output meter. Set the sensitivity control about 1/4 turn counter-clockwise from the point where the whistles start and re-align the I.F.

Feed the generator through a 100 mmf. condenser to the antenna lead of the receiver. Set the generator to 1400 K.C. Turn the dial of the radio to 1400 K.C. Align the oscillator and antenna trimmers on the gang condenser for maximum output on the meter.

ALIGNMENT

The alignment of this receiver requires the use of a test oscillator which will cover the frequencies of 456, 600, 1400, 1730, 6000, 16,000 and 18,100 KC and an output meter which is to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible, to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE

The intermediate frequency I.F. stage should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast Band should always be the next procedure; after which, the Short Wave Band may be aligned.

I.F. ALIGNMENT

With the wave switch in the broadcast band and the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output of test oscillator or signal generator to the grid of the first detector tube (6A8G) through a .05 or .1 mfd. condenser. The ground on the test oscillator can be connected to the chassis ground. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT

Connect the output of the signal generator to the antenna lead (blue) through a .0002 mfd. mica condenser. Set the gang condenser to minimum and the oscillator to 1730 KC and adjust the Broadcast "oscillator trimmer" to receive this signal. Make no other adjustments at this frequency. Then set the generator to 1400 KC and tune in this signal by rotating the gang to 1400 on the dial. Adjust the Broadcast "antenna" trimmer to a maximum signal. Set the signal generator to 600 KC and tune in the signal on the receiver.

Note: Approximately the same sensitivity should be noted at this point as was at 1400 KC. The signal strength may sometimes be improved by padding the circuits. This is done by slowly increasing or decreasing the oscillator padding condenser and, at the same time, continuously tuning back and forth across the signal with the receiver until the maximum reading is obtained on the output meter. This adjustment may seem a little complicated but is the easiest way to adjust the oscillator to the antenna. Return to 1400 KC and again go over the adjustments of this frequency to be certain that they were not put slightly out of alignment when adjustment was made at 600 KC.

SHORT WAVE BAND ALIGNMENT

The short wave band is adjusted by setting the generator to 16,000 KC* and tuning in the signal. Adjust the "short wave antenna" to give maximum output. As there is no variable low frequency padding condenser on this band, the sensitivity of the receiver should be checked at 6000 KC to determine whether the circuits are in line at this frequency. Should the receiver lack sensitivity at 6000 KC, the antenna and oscillator coils, as well as the .004 mica padding condenser, should be tested for defects as sometimes these components become subject to mechanical or electrical injuries, despite their rugged construction and liberal ratings.

IF ALIGNMENT - Generator at 456 KC, connected to the control grid of the 6A7 tube, thru a .05 MFD condenser. Adjust IF trimmers to peak, they are located; two in transformer can above chassis, and other on front apron of chassis, is the left hand section.

BROADCAST BAND ALIGNMENT - Generator at 1400 KC, connected to antenna lead of receiver thru 100 MMFD condenser. Dial at 1400 KC, adjust rear gang condenser trimmer (OSC) to peak, then front section of gang condenser to peak. Generator at 600 KC, receiver dial at approximately 600 KC, while rocking the variable condenser across signal adjust oscillator padder to maximum peak. SHORTWAVE BAND - Generator at 600 KC, rotate condenser from high frequency end until generator signal is heard, then peak trimmer on antenna coil. No other shortwave band adjustments required on this receiver. Repeat all adjustments.

* TOLERANCE ± 10%

IF ALIGNMENT - Generator at 456 KC, and connected to the control grid of the 6A7 thru a .05 MFD condenser. Align the three IF trimmers to maximum peak. The three trimmers are located as follows : two are located in the IF can on the top of the chassis, the third is located on the front apron of the chassis and is the left hand section.

BROADCAST - Generator at 1400 KC, connected to the antenna thru a 100 MMFD condenser. Dial set at 1400 KC, peak rear trimmer of gang condenser (OSC), then peak front trimmer. Shift generator and dial to 600 KC, while rocking gang condenser peak the oscillator padding condenser for maximum resonance.

LONG WAVE - Generator at 375 KC, peak oscillator trimmer, gang condenser completely open. Generator at 325 KC, peak the antenna trimmer, mounted on longwave antenna coil, after signal has been found by rotation condenser from high fre- end of dial. Pad the oscillator condenser at 160 KC while rocking condenser.

FREQUENCY RANGES :
550 to 1700 KC
150 to 375 KC
5.6 to 18.1 MC

IF ALIGNMENT-Generator at 456 KC, connected to control grid of 6D8G thru a .05 MFD condenser, then peak the IF transformer trimmers for maximum response.

BROADCAST BAND - Generator at 1730 KC, the gang condenser out of mesh, peak oscillator trimmer. Dial and Generator at 1400 KC, peak antenna and pre-selector trimmers. Generator and dial at 600 KC, while rocking variable condenser across signal, peak the oscillator padder to maximum.

SHORTWAVE BAND - Generator to 18.1 MC, variable condenser at minimum, peak the S.W. oscillator trimmer. Generator and dial at 16 MC, peak antenna trimmer. No provisions for low frequency padding have been made in this band. Check response at 6 MC.

LONGWAVE BAND - Set gang condenser to minimum and generator to 380 KC, peak the longwave oscillator trimmer, then shift the generator signal to 325 KC, peak the antenna trimmer. Next set the generator to 160 KC, — then peak the longwave oscillator padding condenser to maximum response while rocking variable condenser.

IF PEAK 456 KC

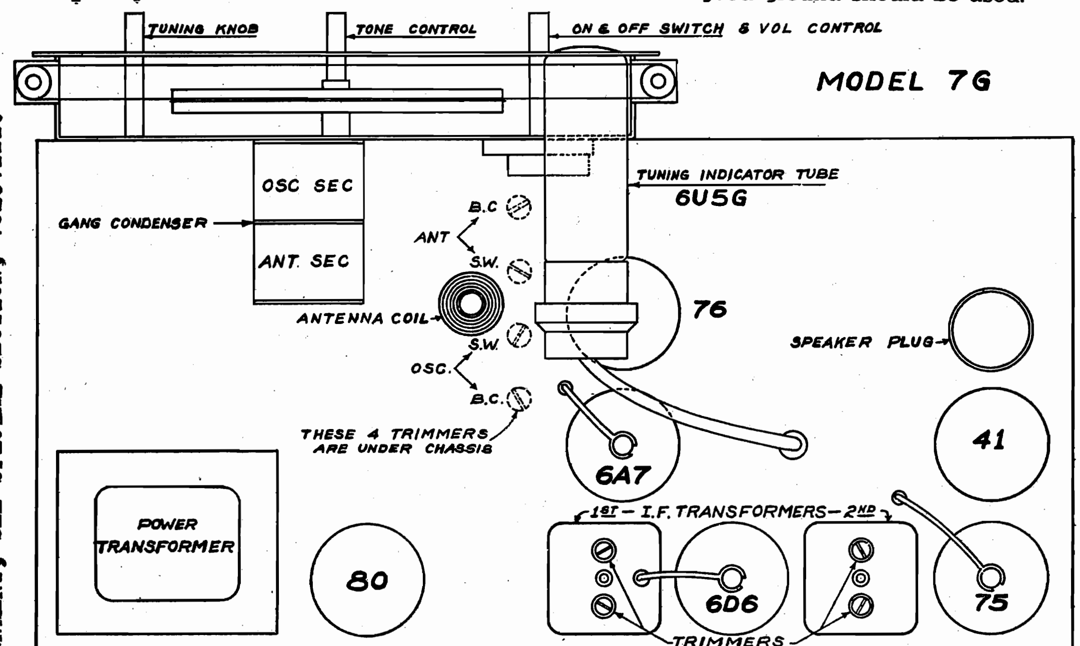
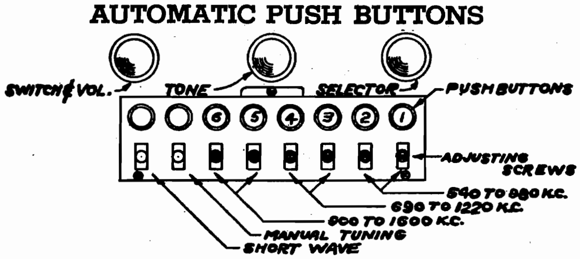
This receiver is designed to operate over two tuning ranges; the broadcast range which extends from 545 to 1720 kc (174.4 to 550.4 meters) and the international short wave band which extends from 5800 to 18,100 kc (16.5 to 51.7 meters). This latter range is the one which includes the 5 internationally assigned bands—the 16, 19, 25, 31 and 49 meter bands.



CONVENTIONAL ALIGNMENT, SEE SPECIAL SECTION, VOL. VIII.

PROCEDURE FOR SETTING UP AUTOMATIC PUSH BUTTONS



1. Choose a station havng a frequency within the range of button No. 1 (540 to 980 kc).
2. Press "Manual Tuning" button and tune this station conventionally by using the selector knob.
3. Now press button No. 1 and turn adjusting screw in either direction until the previously selected station is heard. Adjust the screw until the dark area of the "electric eye" is smallest. This setting will give the best tonal response with maximum sensitivity.
4. Remove the call letters of the station from the call letter sheet furnished and insert in the window of the adjusting screw.
5. Repeat the above procedure for the remaining five (5) stations.

NOTE: It is advisable to retain the call letter sheet in case of station change later on.

TEMPERATURE CONTROL This receiver is equipped with a bimetallic temperature controlled capacity unit which automatically corrects any tendency toward oscillator drift, making possible the application of the automatic tuner to this receiver. This unit will be found connected across the oscillator trimming condenser. Anyone servicing this receiver is cautioned against attempting to adjust this unit in any way as the correct adjustment is made at the factory and any further adjustment will result in failure of the unit to operate properly.

IF ALIGNMENT - Generator at 456 KC, connected to control grid of 6A7 thru .05 MFD condenser. Peak four IF transformer trimmers.
BROADCAST BAND - Generator at 1730 KC, connected to antenna thru 200 MMFD condenser, gang condenser at minimum, peak oscillator trimmer. Generator at 1400 KC, locate signal on dial by tuning, peak pre-selector and antenna trimmers. Generator at 600 KC, while rocking variable condenser, peak oscillator padder.
POLICE BAND - Replace 200 MMFD condenser with 400 ohm resistor, generator at 5600 KC, variable condenser at minimum, peak oscillator trimmer. Generator at 4000 KC, locate signal on dial, peak antenna trimmer. Generator and dial at 1800 KC, while rocking variable condenser, peak oscillator padding condenser.
SHORTWAVE BAND - Generator at 18100 KC, variable condenser at minimum, peak oscillator trimmer. Generator at 1600 KC, locate signal on dial, peak the antenna trimmer. Check at 6000 KC, no padding adjustment required.

Alignment,Tuner

CONTINENTAL RADIO & TELEV. CO.

INSTRUCTIONS FOR ADJUSTMENT AND OPERATION OF THE ELECTRIC TUNER

It is very important to read the following instructions carefully before attempting to adjust the electric tuner. The electric tuner is made up of three integral units:

PUSH BUTTON SWITCH The push button switch consists of one (1) white button (extreme left), and eight (8) brown buttons whose numerical sequence is reckoned from left to right. The white button is provided for converting the set from automatic electric push button tuning to manual knob tuning. The brown buttons are provided for automatic electric tuning.

SELECTOR MECHANISM The selector mechanism is made up of the selector plate, eight (8) thumb screws, and the adjustment light bulb.

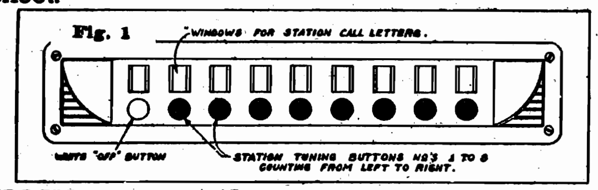
ELECTRIC MOTOR The power for this tuner is provided by a small, efficient electric motor, of the brushless variety. It is fitted with an automatic clutch and a silent gear train. The bearings and the oil retainer hold sufficient oil to lubricate the motor for a lifetime.

The first step to take in adjusting the electric push button device incorporated into this receiver is to choose eight (8) of the most powerful local stations, stations which are free from excess fading. Turn on the receiver (broadcast band) and press in the white button; tune in the station of the **lowest frequency**, using the station selector knob. Now hold the white button in and press in button number one (1), next to the white button. (See Figure 1). Both buttons are now locked into place; a small pilot lamp located at the rear of the chassis will light up unless the thumb screw at the rear accidently happens to be correctly set. Loosen thumb screw number one (See Figure 2 for order of thumb screws) enough to allow it to slide freely back and forth until the light goes out. Now tighten the thumb screw; the adjustment for the first station is now complete. Out of the station call letter sheet supplied remove the proper station call block and insert into the window directly above button number one (1). Now release button number one (1) by pressing the white button in as far as it will go.

With the white button still in, tune in the station of the next highest frequency and holding the white button, press in button number two (2). Both buttons are now locked into place. Loosen thumb screw number two (see Figure 2) and slide back and forth until a point is reached at which the pilot lamp in the rear goes out; tighten the thumb screw. Insert the proper station call into the window of button number two (2).

Follow this same procedure for the remaining stations, always choosing the station with the next highest frequency. After all eight (8) stations have been adjusted, check each adjustment by tuning in each station. NOTE: In the window above the white button insert the word "OFF" found in the call letter sheet.

Fig. 1



HOW TO TUNE IN STATIONS USING THE ELECTRC PUSH BUTTON TUNER

In order to operate the receiver satisfactorily—using the electric push button tuner, the white button must be in released position, that is, all the way out. To tune in a station, merely press the selector button which designates the station desired. **Note:** Should the station fail to come in clearly, check the adjustment by following the adjustment procedure described in the paragraph above. If by chance all of the buttons are pressed in, they may be released by pressing any one button all the way in.

To change from electric tuning to manual selecting, simply press in the white button. When the white button is in, the set may be tuned as a conventional receiver. **Note:** If it is desired to tune Short Wave or Police while the set is being operated with push buttons, it is not necessary to change over from push button tuning to manual tuning. Simply turn the band switch and proceed to tune with the selector knob. When the band switch is returned to broadcast the station last selected by button will automatically tune in by itself.

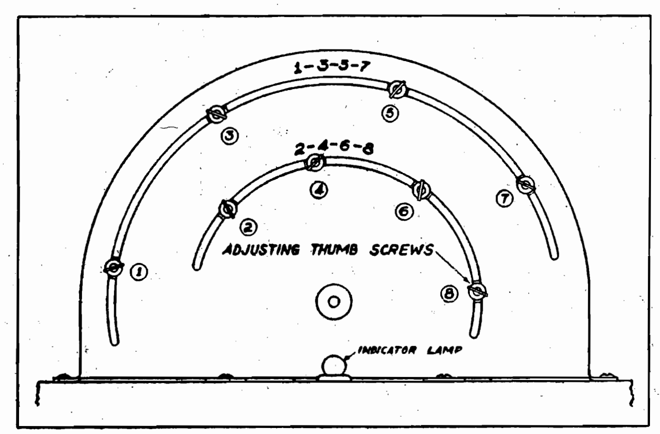


Fig. 2

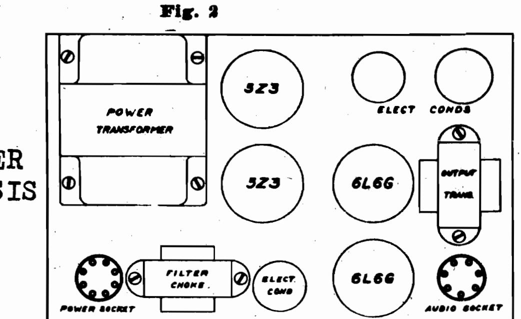
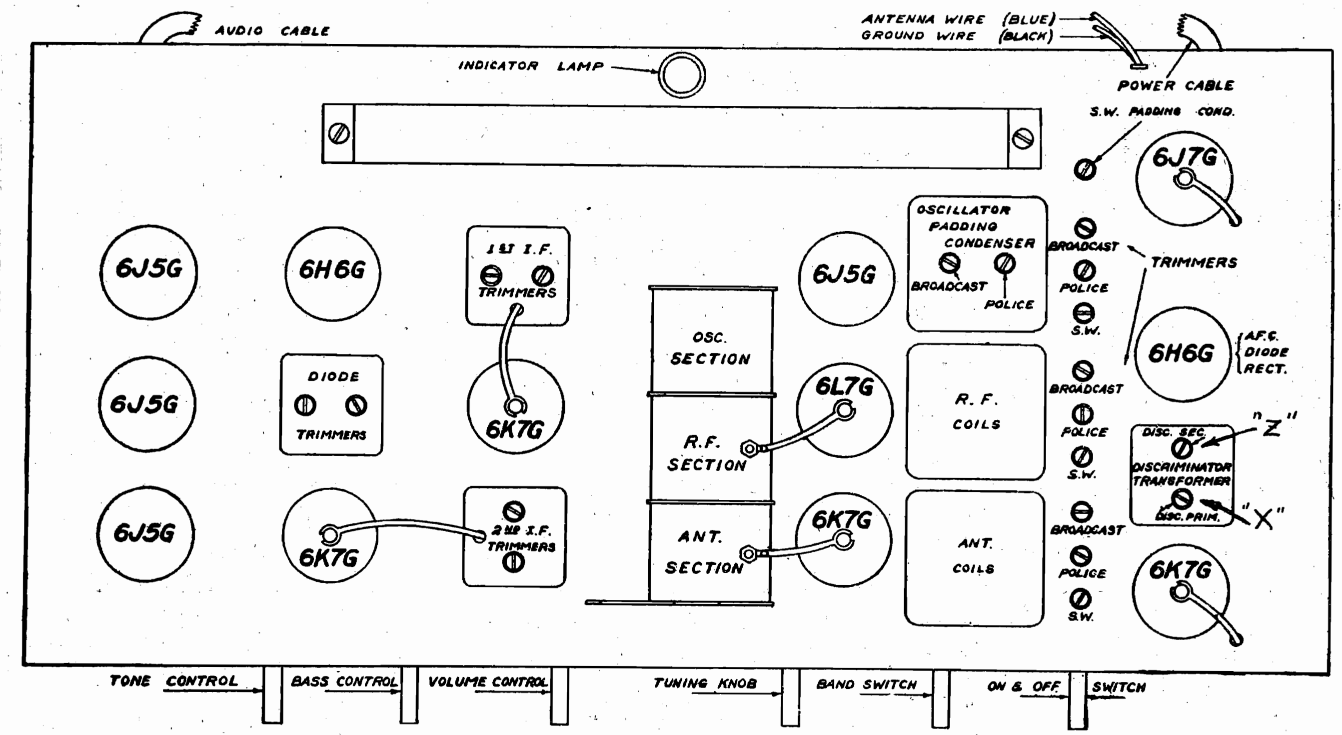
POWER CHASSIS





I.F. ALIGNMENT - Generator at 456 KC, connected to control grid of 6L7 thru .05 MFD condenser, align 1st, 2nd, and Diode transformer trimmers to peak. Connect a 0-200 microammeter between the ungrounded cathode of the 6H6 AFC diode rectifier, and ground. The Cathode indicated as point "A" in the schematic. Place a 100 MMFD condenser across the secondary of the discriminator transformer. These terminals are indicated as points "D1" and "D2" on the schematic. The condenser is used to detune the secondary circuit during the following primary adjustment : The primary is tuned by impressing an IF signal on the signal grid of the 6L7 and adjusting the trimmer marked "X" on the schematic and the chassis layout, to give a maximum meter indication. Signal strength should be approximately 100000 micro volts for the adjustment. With reduced signal strength repeat the adjustments of the entire I.F. system, for maximum sensitivity. The volume control should be on full for all adjustments. Without disturbing the generator or any of the other adjustments, the trimmer "Z" ("Disc. Sec.) should be adjusted as follows :Remove the 100 MMFD condenser from across the discriminator secondary, increase the generator signal to approximately 100,000 micro volts, with volume control turned down to limit audio output, slowly turn the trimmer "Z" until a sudden sharp drop in current occurs the meter will now probably read in reverse and off scale. Reverse trimmer adjustment bringing meter reading to zero. Used only a non-metallic screw driver. It is sometimes convenient to use an offset of "remote zero" setting of the micro ammeter in making the adjustments so that zero current setting is higher on the scale. After the current has been brought to zero by the above described method the I.F. alignment and discriminator tuning is completed, and R.F. alignment may be accomplished.

BROADCAST BAND - Generator at 1730 KC, connected to the antenna thru a 200 MMFD condenser, variable condenser at minimum, peak oscillator trimmer. Generator at 1400 KC, tuning in signal, peak the RF and antenna trimmers. Generator at 600 KC, while rocking variable condenser, peak the oscillator padding condenser.

POLICE BAND - Generator at 5600 KC, connected to antenna thru 400 Ohm resistor, variable condenser at minimum, peak oscillator trimmer. Generator at 5000 KC, tune in signal, peak RF and antenna trimmers. Generator at 1800 KC, while rocking variable across signal, pad the oscillator circuit for maximum response.

SHORTWAVE BAND - Generator at 18100 KC, gang condenser at minimum, peak oscillator trimmer. Generator at 16000 KC, locate signal on receiver, peak RF and antenna trimmers. Generator at 6000 KC, while rocking variable across signal, peak SW padding condenser.

5 Tube Under Dash Automatic Push Button Tuning Automobile Radio

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400, 1550 and an output meter to be connected across the primary or secondary of the output transformers. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible, to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stage should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast Band alignment should be the next procedure.

I.F. ALIGNMENT. Adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tubes (6A8) through a .05 or .1 mfd. condenser. The ground on the test oscillator can be connected to the chassis ground. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the output of the oscillator to the antenna lead of the receiver through a 50 mmfd. condenser. This antenna lead should be a two foot length of standard low capacity shielded loom fitted with the proper bayonet type plug to accomodate the antenna input receptacle on the receiver. Set the oscillator to 1550 KC and with the gang condenser at minimum, adjust the oscillator trimmer to receive this signal. Then set the oscillator to 1400 KC and adjust the antenna trimmer to give maximum output.

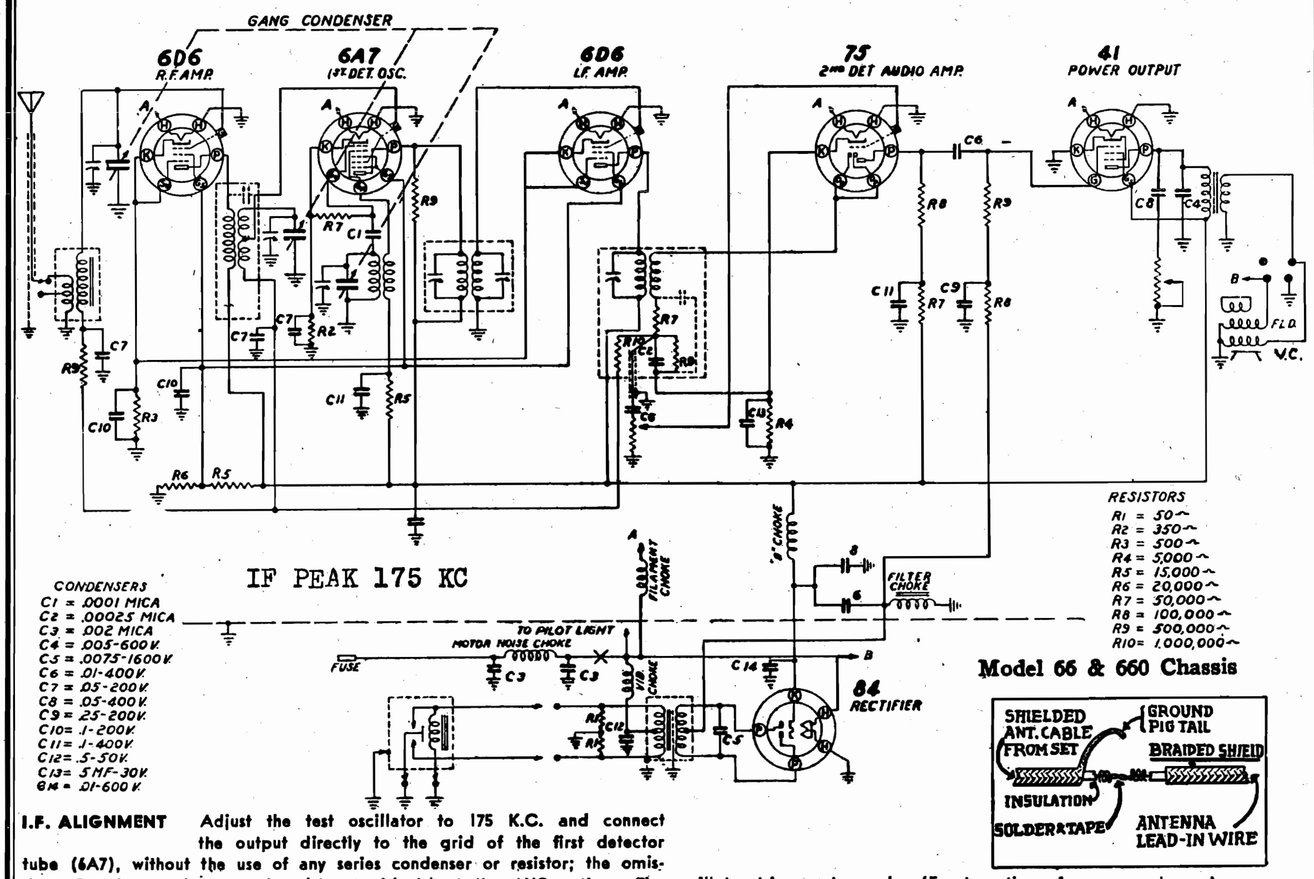
CONTINENTAL RADIO & TELEV. CO.



Model 66 & 660 Chassis

I.F. ALIGNMENT Adjust the test oscillator to 175 K.C. and connect the output directly to the grid of the first detector tube (6A7), without the use of any series condenser or resistor; the omission of series condenser and resistor to block out the AVC action. The ground on the test oscillator can be connected to the chassis ground. Align the trimmers of the first and second I.F. transformers to peak or maximum reading on the output meter.

OSCILLATOR ALIGNMENT Adjust the test oscillator to 1400 K.C. and connect the output to the antenna through a .0001 mfd. mica condenser to give the equivalent of a low capacity type average auto antenna. Set the dial pointer to 1400 K.C. and adjust the oscillator trimmer to peak. (Front section of gang condenser.)

R.F. ALIGNMENT The next step is to adjust the center and rear trimmers of the gang condenser to peak. The center section of the gang condenser tunes the R.F. antenna amplifier stage (6D6 tube), and the rear condenser section tunes the detector grid coil of the 6A7 tube.

ALIGNMENT DATA

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 175, 600, 1400 and 1550 K.C., and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignment should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the A.V.C. from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) transformers should be aligned properly as the first step.

I.F. ALIGNMENT. Adjust the test oscillator to 175 K.C. and connect the output to the grid of the first detector tube, 6A8G, through a .1 mfd. condenser. The ground on the test oscillator can be connected to the chassis ground. Align the trimmers of the first and second I.F. transformers to peak or maximum reading on the output meter.

R.F. ALIGNMENT. Adjust the test oscillator to 1550 K.C. and connect the output to the antenna through a .00005 mfd. mica condenser to give the equivalent of a low capacity average auto antenna. When this adjustment is made, the signal must be introduced into the receiver through the shielded lead supplied with the receiver. The plug should be inserted to conform with the "Low Capacity" position. (See Figure 18). Set the gang condenser to minimum and adjust the ascillator trimmer to peak. (Center section of gang condenser). The next step is to set the test oscillator and receiver to 1400 K.C. and adjust the front and rear trimmers of the gang condenser to peak. The rear section of the gang condenser tunes the antenna amplifier stage (6K7 tube), and the front condenser section tunes the detector grid coil of the 6A8G tube.

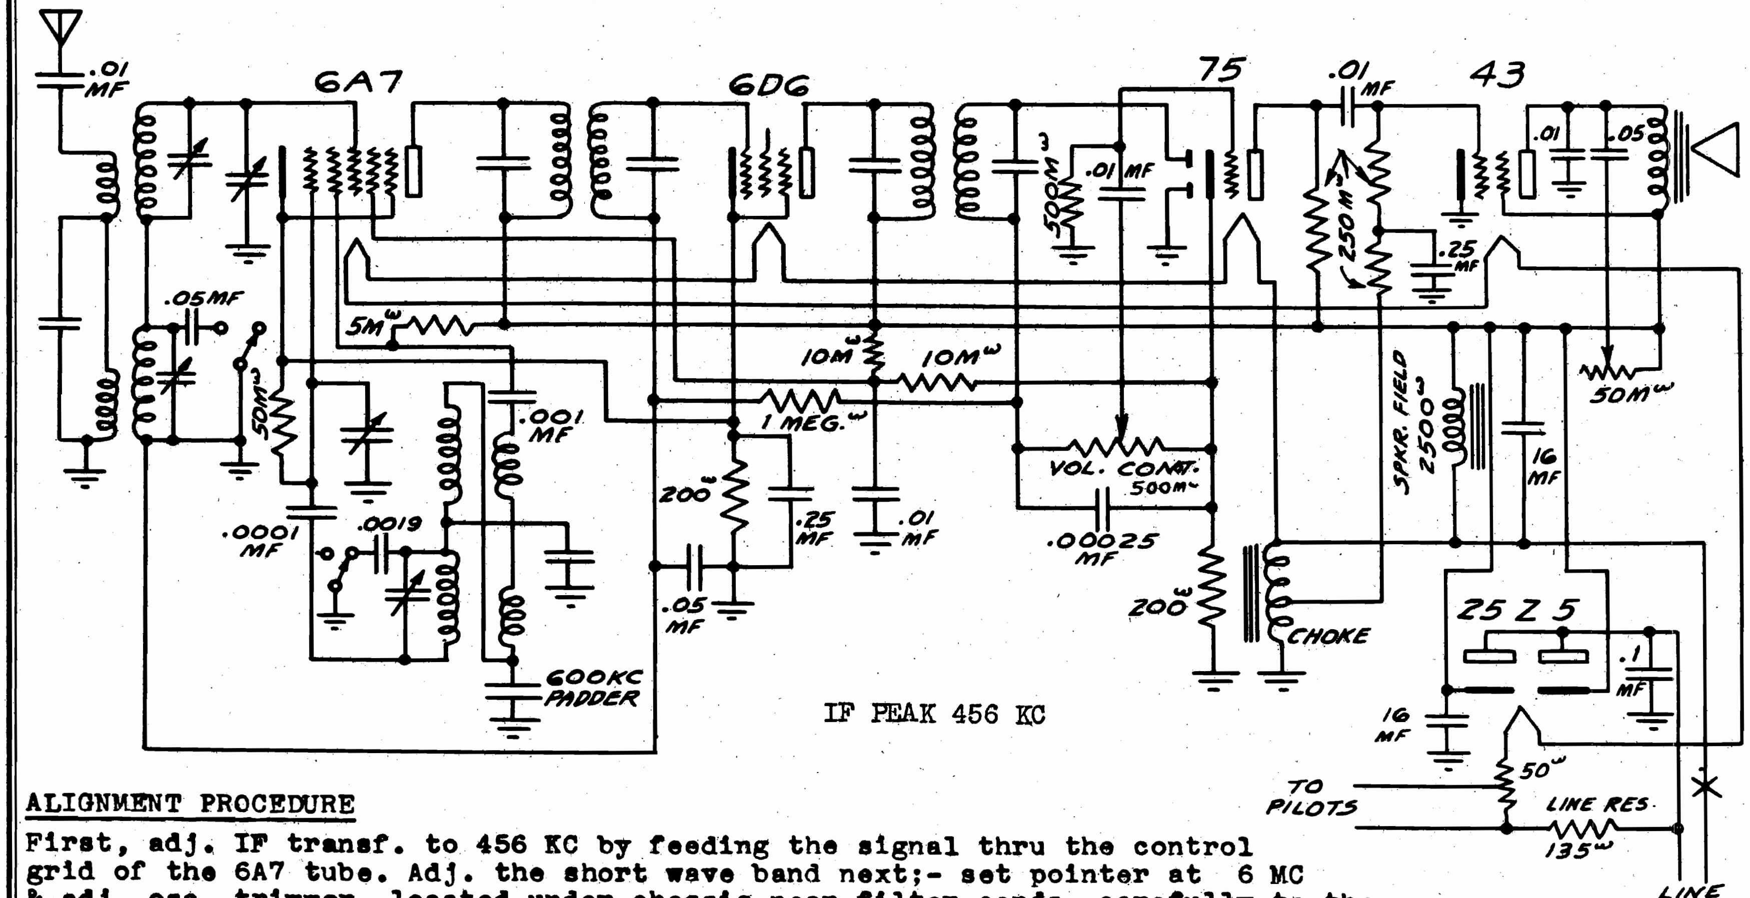
CORONA RADIO & TELEV. CORP.



IF PEAK 456 KC

ALIGNMENT PROCEDURE

First, adj. IF transf. to 456 KC by feeding the signal thru the control grid of the 6A7 tube. Adj. the short wave band next;- set pointer at 6 MC & adj. osc. trimmer, located under chassis near filter conds. carefully to the fundamental rather than image(fund. is second peak as you adj. from max. cap.); then adj. the short wave ant. trimmer, located on top of chassis near var. cond., for max. signal: next dial across short wave band checking it at 2.5 and 4 MC to see that it does not stop oscillating. If this should occur, try changing 6A7 tubes to find one that will oscillate at 2.2 MC. If you experience any difficulty in finding a satisfactory tube, it may be necessary to use separate bias on 6A7(200 ohm res. and .1/4 mfd cond.) in order to use the tubes available.

Now, set band switch to broadcast position and adj. padder at about 600 Kc for max. gain, rocking the var. cond. with each adj. of the padder - then with gang all the way open, adj. B.C. osc. trimmer located under chassis near outer edge, to 1717 KC and set B.C. ant. trimmer located on top of chassis near outer edge, for maximum gain.

This set is designed to operate on 105-125 volts AC-DC

DO NOT CONNECT A GROUND TO THIS SET.

February, 1938

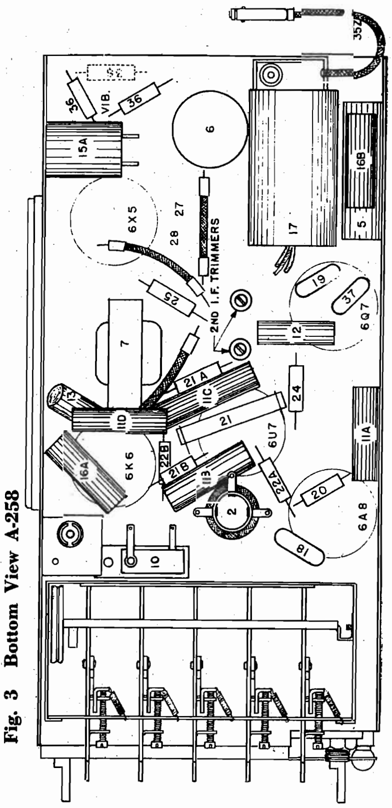

Fig. 3 Bottom View A-258

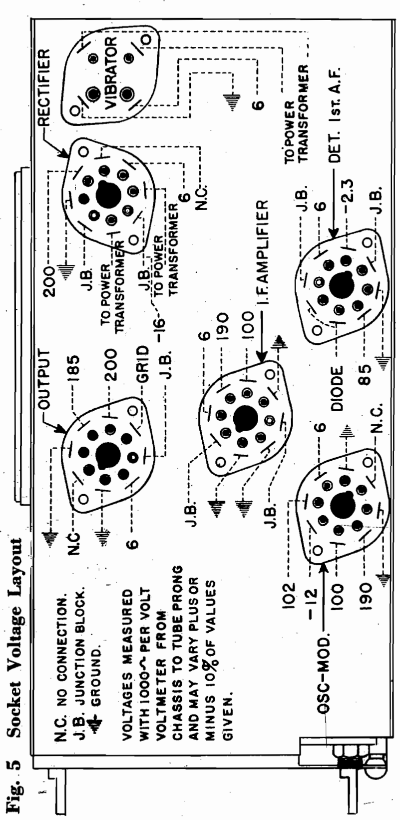

Fig. 5 Socket Voltage Layout

CROSLEY RADIO CORP.

SPECIFICATIONS

This model Crosley Roamio is a single unit five-tube superheterodyne receiver. It incorporates an unusual push button tuning system of rugged mechanical design that is positive, accurate, and easy to adjust and operate. A highly efficient superheterodyne circuit employs five tubes to the utmost advantage as follows: one 6A8G as an oscillator and mixer or modulator, one 6U7G as an intermediate frequency amplifier, one 6Q7G as detector, A. V. C. and 1st A. F. amplifier, one 6K6G as power output amplifier and a 6X5G as a rectifier. A full wave vibrator is used. Bias for the 6A8G and 6U7G tubes is obtained across item 27 (60 ohm resistor), for the 6Q7G tube across item 28 (40 ohm resistor) and for the 6K6G across the "B" Filter choke, item 7, and items 27 and 28.

TUBES AND VOLTAGE LIMITS

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and the receiver chassis. Voltage readings taken with a 1000 ohm per volt, 500 volt voltmeter (except filaments) with receiver in operating condition and no signal input. The filament voltages should be measured with an accurate low range D-C voltmeter (approximately 0 to 10 volts). Voltage limits may vary plus or minus 10% of values given.

SOCKET VOLTAGE LAYOUT

The socket layout in the illustration Fig. 5, shows the voltage readings taken between the tube prongs and receiver chassis. It will be noted that certain unused terminals are used as junction blocks while others are not used at all. All readings are taken with the receiver in operating condition and no signal input.

SETTING PUSH BUTTONS

Should it become necessary to realign the circuits of the receiver, it may also be necessary to reset the push buttons. The push buttons may be quickly and accurately set, either with the receiver in the case or with the case removed.

Insert a small screw driver in the hole through each push button and loosen (do not remove) the set screw in the bottom of the hole. By means of the conventional tuning knob, tune-in AS ACCURATELY AS POSSIBLE the favorite station having the highest frequency —that is, the station nearest the left-hand end of the dial. Completely depress and hold the No. 1 push button on the left and tighten the set screw SECURELY.

The push button tuning system is now correctly set for the 1st station. Follow through with this same procedure, setting the other four stations in the order of their frequency (kilocycles).

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits can best be properly aligned with the use of a modulated signal generator and an output meter.

CONNECTING OUTPUT METER

Connect the output meter to P and S of the 6K6G Output tube. Be sure the meter is protected from D.C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

1. Tuning I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd., or larger, condenser to the top cap of the 6U7G I. F. tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the receiver chassis frame. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Adjust the station selector so that the rotor plates of the tuning condenser are completely disengaged and turn Vol. Cont. to maximum position (RIGHT).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust both 2nd I. F. trimmer condensers for maximum output. Fig. 3.

(e) Transfer generator lead to top of 6A8G Osc.-Mod. tube, leaving the tube's grid clip in place.

(f) Adjust both trimmers located on the 1st I-F transformer for maximum output.

(g) Repeat operations (d) and (f) for more accurate adjustments.

IN ORDER TO PREVENT A. V. C. ACTION ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.

2. Aligning R-F Amplifier.

To obtain the greatest gain from the R. F. amplifier, the capacity of the dummy antenna should be equal to the capacity of the antenna with which the receiver is to be used. The capacities of auto radio antennas range from 65 mmf. (.000065 mf.) to 250 mmf. (.00025 mf.), depending upon the size and type. If the receiver is adjusted for maximum efficiency when used with an antenna havinig a high capacity, it will not operate at its maximum efficiency on an antenna having a much lower capacity and vice versa.

(a) If the receiver is to be used with a whip or streamlined antenna, the output lead from the signal generator should be connected through a .0001 mf. condenser to the "Ant" connection of the receiver. If a large antenna such as a running board type or built-in top antenna is to be used, a .0002 mf. condenser should be used in place of the .0001 mf. condenser.

(b) Set the signal generator to 1400 kilocycles.

(c) Adjust the station selector to 140 on the dial.

(d) Adjust the trimmer on the "OSC" section of the tuning condenser for maximum output.

(e) Adjust the trimmer on the "ANT" section of the tuning condenser for maximum output.

(f) Readjust the station selector for maximum output. DO NOT READJUST THE OSC. TRIMMER.

(g) Repeat operation (e) for more accurate adjustment.

3. Adjusting Antenna Compensating Condenser.

(a) Set the signal generator to 600 kilocycles.

(b) Tune in the 600 kilocycle signal with the station selector for maximum output.

(c) Adjust the antenna compensating condenser, located between the control knobs on the front of the chassis, for maxiumum output.

(d) Repeat operations (b) and (c) alternately until no further improvement can be obtained.

(e) Set the signal generator to 1400 kilocycles again.

(f) Tune-in the 1400 kilocycle signal with the station selector for maximum output.

(g) Readjust the trimmer on the "Ant" section of the tuning condenser for maximum output.

It will be necessary to adjust the antenna compensating condenser to the car antenna after the receiver has been installed in the car.

(a) After the installation is complete, tune-in a WEAK station between 55 and 65 on the dial.

(b) Adjust the antenna compensating condenser for maximum volume in the speaker.

REPLACING DIAL DRIVE CORDS

Two dial drive cords are used and should the innermost cord break, it will be necessary to remove the outer cord and large pulley before the inner cord can be replaced.

To replace the inner cord:

(1) After removing the broken cord, place the chassis on end with the push buttons "up" and the speaker toward you.

(2) Thread an 18" length of drive cord through the hook on one end of the tension spring which was removed from the pulley on the end of the push button rocker plate.

(3) Insert both ends of this cord through the eyelet in the rocker plate pulley from the inside. Pull the cord through until the tension spring is pulled into the pulley, then hook the free end of the spring over the catch in the pulley in the side opposite the eyelet.

(4) Open the condenser gang all the way.

(5) Pull all but approximately 4½" of the cord through the eyelet. Loop the 4½" end of the cord around the lower half of the pulley.

(6) Loop the long end of the cord over the top of the pulley and back over the brass idler pulley to the drive shaft. Continue the cord around the drive shaft, threading from the inside and over the top. Wrap four complete turns of the cord around the drive shaft and continue the cord over the top of the rocker plate pulley.

(7) Pull on the short end of the cord until the tension spring in the pulley is stretched to within ⅛" of the eyelet. Maintain this tension and tie a knot in the two ends of the cord over the catch which holds the spring. Loop the cord over the spring catch so that the knot is turned in. (A drop of bees' wax on the knot would be an added protection against coming untied.)

To replace the outer cord:

(1) Place the chassis in a horizontal position with the push buttons to the left and the speaker toward you.

(2) Close the condenser gang and mount the large drive pulley on the shaft. Place the pulley on the condenser shaft so that the shaft is flush with the outside of the pulley bushing and the eyelet in the pulley is horizontal with the shaft and toward the dial.

(3) Cut a 22" length of drive cord and tie a knot ½" from the two ends.

(4) Hook one end of the tension spring over the catch provided in the pulley and hook the other end over the drive cord at the knot.

5) Thread the cord through the eyelet in the pulley and extend one side up and over the vertical brass pulley. Loop this lead around the horizontal idler pulley at the left-hand side of the dial and then around the idler pulley at the right-hand side of the dial and then over the top of the large drive pulley. The tension on the spring should be sufficient to stretch it to within approximately ½" of the eyelet.

(6) With the gang closed, move the pointer to the extreme right-hand end of the dial. Press the cord into the slots in the back of the pointer and check to see that the pointer travels from one end of the dial to the other as the gang is opened and closed. It may be advisable to place some Aratex or other liquid adhesive on the cord where it fits into the pointer.

REPLACING THE A-158 DRIVE CORD

1.—Remove the broken cord and the cord tension spring.

2.—Cut a 30 inch length of drive cord and tie the tension spring approximately 4 inches from one end. Thread both ends through the eyelet in the large pulley from the inside. Hook the other end of the spring to the catch in the pulley and bend catch to secure spring.

3.—Close the condenser gang and see that the eyelet in pulley is on top and that the end of the condenser shaft is flush with the inside of the pulley.

4.—Take the long end of cord and place on small brass idler pulley on the right side of the dial bracket. Loop around pulley in a clockwise direction and then around idler pulley on the left side of the dial bracket, continue on over the top of the large pulley and down to the drive shaft. From the under side of drive shaft wrap 2 turns around shaft in a counter-clockwise direction, bringing cord up on the left side of large pulley. Be sure the cord is on all the pulleys then tie a knot, pulling with sufficient force to stretch the tension spring to within ½ inch of the edge of pulley.

5.—Close gang and place the pointer on the cord at the extreme left end of the dial. Check to see that pointer travels full length of the dial. It may be advisable to place some "ARATEX" or other liquid adhesive on cord where it fits into the pointer.

THE ALIGNMENT PROCEDURE IS THE SAME AS THAT OF MODEL A-258.

The model A-158 and the model A-258 are the same electrically with the exception of a few minor parts. Mechanically they differ in that the A-258 has Push Button Tuning and the A-158 is manually tuned. When referring to the A-258 Parts List for replacement parts for the A-158 disregard all parts listed between Items 7 and 11 and all parts listed under the heading Miscellaneous Mechanical Parts.

PARTS — MODEL A-158 The following are parts to fill the deletions to complete Parts List for the A-158.

Item No.	Part No.	Description
8	G49—33001	2 Section Gang Condenser
	C —50455B	Glass Dial Face
	MG23—50500	Dial Support Bracket (Riveted to chassis)
	W —43549	Retaining Washer (Drive Shaft)
	W —50512	Drive Shaft
	G9 —43564	Pulley & Hub assembly
	—41582	Drive Cord (30 in.)
9	W —50054B	Ant. Comp. Condensor
16B	W —50105	Condensor 0.1 Mf. 160 V.
	W —50589	Felt (Dial window)
	D —50503B	Case (Rear section)
	C —50504B	Case (Front section)
	—50505	Knob (2 Required)

CROSLEY RADIO CORP.

PARTS LIST—MODEL A-258

Figures in first column refer to parts in Diagrams.

Item No.	Part No.	Description
1	G167—32000	Ant. Coil
2	G167—32002	Osc. Coil
3	G185—32004	1st I-F Assy., 455 Kc.
4	G186—32004	2nd I-F Assy., 455 Kc.
5	G19—32977	Motor Noise Check
6	G27—28067	"A" Filter Choke
7	G16—29535	"B" Filter Choke
8	G50—33001	2 Section Gang Cond.
9	—50054B	Ant. Compensating Cond.
	C—50623	Glass Dial Face
	W—50545	L. H. Dial Mtg. Clip
	W—50560	R. H. Dial Mtg. Clip
	W—50517B	Dial Mask (Maroon)
	W—50518	Pointer
	B—78	Screw—Dial Clip Mtg.
	MG23—50550	Dial Mtg. Bracket Assy. (Riveted to Chassis)
	MG28—50550	Manual Drive Shaft Brkt. Assy.
	G8—43564	Pulley and Hub Assy.
	W—23877	Set Screw—Hub
	—41582	Drive Cord—40 Inches
	W—50590	Spring—Cord Tension—Large Pulley
	W—43561	Spring—Cord Tension—Small Pulley
	W—50524B	Manual Drive Shaft
10	G3—50369	Temp. Compensating Cond.
11A	W—32380	Condenser, .05 Mf. 200 V.
11B	W—32380	Condenser, .05 Mf. 200 V.
11C	W—32380	Condenser, .05 Mf. 200 V.
11D	W—32380	Condenser, .05 Mf. 200 V.
12	W—37226	Condenser, .02 Mf. 160 V.
13	W—23191A	Condenser, .01 Mf. 400 V.
14	W—50203	Condenser, .0065 Mf. 1,000 V.
15A	W—50161	Condenser, .5 Mf. 120 V.
15B	W—50161	Condenser, .5 Mf. 120 V.
16A	W—50105	Condenser, .1 Mf. 160 V.
16B	W—50105	Condenser, .1 Mf. 160 V.
17Z	W—50528	Condenser, 4. Mf. 350 V.
17Y		Condenser, 4. Mf. 350 V.
	W—50224	Cond. Clamp
18	G1—34002	Condenser, .00025 Mf. Molded
19	G3—34002	Condenser, .0005 Mf. Molded
20	—35600	Resistor, 100,000 Ohm ¼W.
21A	—35601	Resistor, 300,000 Ohm ¼W.
21B	—35601	Resistor, 300,000 Ohm ¼W.
22A	—36322	Resistor, 500,000 Ohm ¼W.
22B	—36322	Resistor, 500,000 Ohm ¼W.
23	—23616	Resistor, 15,000 Ohm 1W.
24	—35602	Resistor, 1. Megohm ¼W.
25	—35927	Resistor, 2. Megohm ¼W.
26	—50641	Resistor, 750 Ohm ½W.
27	—50643	Resistor, 60 Ohm ½W.
28	—50642	Resistor, 40 Ohm ½W.
		Mounting Parts
	W—38038D	Distributor Suppressor
	W—29754C	Generator Condenser
	—25846	¾" No. 10 P. K. Screw (Set Mtg.)
	—6213	¼"—20 Hex. Nut (Brkt. Mtg.)
	—35065	¼"—20 Screw (Brkt. Mtg.)
	W—38205	¼" Lock Washer (Brkt. Mtg.)
	—32783	Ant. Cable (Accessory)
	W—50167	Mtg. Bracket (Set)
	W—50395	Ammeter Cond. (Accessory)
	W—38935	Case Ground Clip
29Z	—50526	Volume Control, 1. Meg.
29Y		On-Off Switch
30	G178—36400	8 Prong Socket
	W—50176	Tube Shield Half (2 Req.)
	W—31210	Tube Shield Ring
31	G105—28807	Vib. Socket
	W—50123A	Vib. Gnd. Clip
32	278-BL-7"U"	Speaker, Mfg. Spec. 5B-122
	—45889	Output Trans.
33	B—50644	Power Trans.
	W—50130	Power Trans. Can
34	G1—50631	Dial Light Bulb—6-8 V.
35Z	G29—32750	"A" Lead—Set to Fuse
35Y	G27—32750	"A" Lead—Fuse to Ammeter
36A	—38915	Resistor, 100 Ohm ½W. W. W.
36B	—38915	Resistor, 100 Ohm ½W. W. W.
37	G2—34002	Condenser, .0001 Mf. Molded
38	G10—38000	Vibrator, Interchangeable
	G13—38000	Vibrator
	W—32757	Fuse (12 Amp.)
	W—32776	Fuse Insulator
		Miscellaneous Mechanical Parts
	MG27—50550	Push Button Unit Assy.
	MG25—50550	Key Assy.
	W—50542A	Key Clip (Lock Clamp)
	—50567	⅛"—6x32 Screw (Clamp)
	W—50607	Spring—(Key Return)
	W—50588A	Adjusting Clip (Heart Shaped)
	—43882	¼" No. 8 P. K. Screw (Clip Mtg.)
	W—50547	Key Plate (Rear Guide)
	MG24—50550	Rocker Plate Assy.
	W—50561	⅛"—6x40—Fil. H. Screw (Rocker Plate Bearing)
	W—45553B	Push Button
	W—50551A	Celluloid Cover
	—50549	Call Letter Sheet
	D—50503B	Case (Rear Half) FS49
	C—50554A	Case (Front Half) FS49
	W—50589	Felt (Dial Window)
	—50505	Knob (2 Req.)

MODELS A168,A268
Sixer Roamios
Schematic,Voltage
Socket,Trimmers
Layout

CROSLEY RADIO CORP.

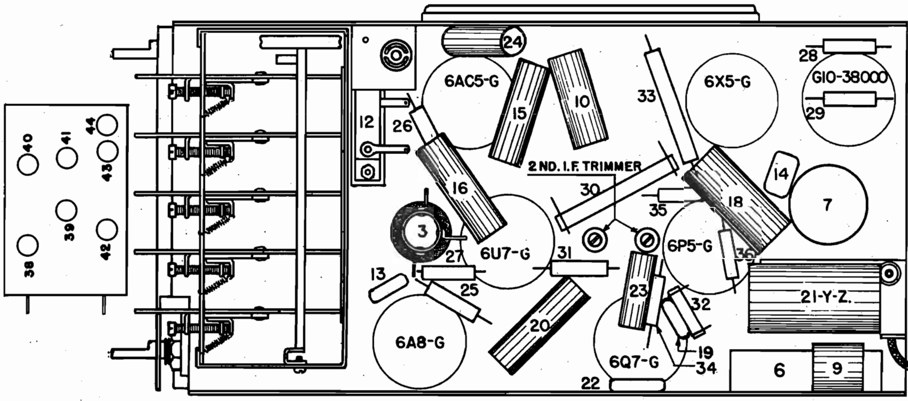

Fig. 3. Bottom View A-169 and A-268

TUBES AND VOLTAGE LIMITS

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and the receiver chassis. Voltage readings taken with a 1000 ohm per volt, 500 volt voltmeter (except filaments) with receiver in operating condition and no signal input. The filament voltages should be measured with an accurate low range D. C. voltmeter (approximately 0 to 10 volts). Voltage limits may vary plus or minus 10% of values given.

SPECIFICATIONS

The models A-168 and A-268 CROSLEY SAFETY-TUNE SIXER ROAMIOS are single unit, six-tube superheterodyne receivers. They incorporate the new Crosley mechanical Push Button Tuning system. This system is unsurpassed for easy adjustment, accuracy, simplicity and ruggedness of design. The highly efficient superheterodyne circuit employs six tubes to the utmost advantage as follows: one 6A8-G as oscillator and modulator or mixer, one 6U7-G as intermediate frequency amplifier, one 6Q7-G as detector, A. V. C., and 1st. audio amplifier, one 6P5-G as second audio amplifier (driver), one 6AC5-G as power output and a 6X5-G as a rectifier. The vibrator is the full wave type.

Power Output (max.) 6 Watts—approx.
Battery Drain 6.5 Amperes—approx.
It will be noted that certain terminals on the sockets are used as junction blocks.

CROSLEY RADIO CORP.

MODEL A-268 CROSLEY SAFETY-TUNE SIXER ROAMIO DELUXE
MODEL A-168 CROSLEY SAFETY-TUNE SIXER ROAMIO

SETTING PUSH BUTTONS

Should it become necessary to realign the circuits of the receiver, it may also be necessary to reset the push buttons. The push buttons may be quickly and accurately set, either with the receiver in the case or with the case removed.

Insert a small screw driver in the hole through each push button and loosen (do not remove) the set screw in the bottom of the hole. By means of the conventional tuning knob, tune-in AS ACCURATELY AS POSSIBLE the favorite station having the highest frequency—that is, the station nearest the left-hand end of the dial. Completely depress and hold the No. 1 push button on the left and tighten the set screw SECURELY.

The push button tuning system is now correctly set for the 1st station. Follow through with this same procedure, setting the other four stations in the order of their frequency (kilocycles).

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits can best be properly aligned with the use of a modulated signal generator and an output meter.

CONNECTING OUTPUT METER

One terminal of the output meter is connected to the plate of the 6AC5-G output tube and the other terminal should be connected to the cathode of the 6X5-G rectifier tube. BE SURE THE OUTPUT METER IS PROTECTED FROM D. C. BY CONNECTING A CONDENSER (.1 MF. or larger—NOT electrolytic) IN SERIES WITH ONE OF THE LEADS.

1. Tuning I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd., or larger, condenser to the top cap of the 6U7-G I. F. tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the receiver chassis frame. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Adjust the station selector so that the rotor plates of the tuning condenser are completely disengaged and turn Vol. Cont. to maximum position (RIGHT).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust both 2nd I. F. trimmer condensers for maximum output. Fig. 3.

(e) Transfer generator lead to top of 6A8-G Osc.-Mod. tube, leaving the tube's grid clip in place.

(f) Adjust both trimmers located on the 1st I-F transformer for maximum output.

(g) Repeat operations (d) and (f) for more accurate adjustments.

IN ORDER TO PREVENT A. V. C. ACTION ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.

2. Aligning R-F Amplifier.

To obtain the greatest gain from the R. F. amplifier, the capacity of the dummy antenna should be equal to the capacity of the antenna with which the receiver is to be used. The capacities of auto radio antennas range from 65 mmf. (.000065 mf.) to 250 mmf. (.00025 mf.), depending upon the size and type. If the receiver is adjusted for maximum efficiency when used with an antenna having a high capacity, it will not operate at its maximum efficiency on an antenna having a much lower capacity and vice versa.

(a) If the receiver is to be used with a whip or streamlined antenna, the output lead from the signal generator should be connected through a .0001 mf. condenser to the "Ant" connection of the receiver. If a large antenna such as a running board type or built-in top antenna is to be used, a .0002 mf. condenser should be used in place of the .0001 mf. condenser.

(b) Set the signal generator to 1400 kilocycles.

(c) Adjust the station selector to 140 on the dial.

(d) Adjust the trimmer on the "OSC" section of the tuning condenser for maximum output.

(e) Adjust the trimmer on the "ANT" section of the tuning condenser for maximum output.

(f) Readjust the station selector for maximum output. DO NOT READJUST THE OSC. TRIMMER.

(g) Repeat operation (e) for more accurate adjustment.

3. Adjusting Antenna Compensating Condenser.

(a) Set the signal generator to 600 kilocycles.

(b) Tune in the 600 kilocycle signal with the station selector for maximum output.

(c) Adjust the antenna compensating condenser, located between the control knobs on the front of the chassis, for maximum output.

(d) Repeat operations (b) and (c) alternately until no further improvement can be obtained.

(e) Set the signal generator to 1400 kilocycles again.

(f) Tune-in the 1400 kilocycle signal with the station selector for maximum output.

(g) Readjust the trimmer on the "Ant" section of the tuning condenser for maximum output.

It will be necessary to adjust the antenna compensating condenser to the car antenna after the receiver has been installed in the car.

(a) After the installation is complete, tune-in a WEAK station between 55 and 65 on the dial.

(b) Adjust the antenna compensating condenser for maximum volume in the speaker.

REPLACING DIAL DRIVE CORDS

Two dial drive cords are used and should the innermost cord break, it will be necessary to remove the outer cord and large pulley before the inner cord can be replaced.

To replace the inner cord:

(1) After removing the broken cord, place the chassis on end with the push buttons "up" and the speaker toward you.

(2) Thread an 18" length of drive cord through the hook on one end of the tension spring which was removed from the pulley on the end of the push button rocker plate.

(3) Insert both ends of this cord through the eyelet in the rocker plate pulley from the inside. Pull the cord through until the tension spring is pulled into the pulley, then hook the free end of the spring over the catch in the pulley in the side opposite the eyelet.

(4) Open the condenser gang all the way.

(5) Pull all but approximately 4½" of the cord through the eyelet. Loop the 4½" end of the cord around the lower half of the pulley.

(6) Loop the long end of the cord over the top of the pulley and back over the brass idler pulley to the drive shaft. Continue the cord around the drive shaft, threading from the inside and over the top. Wrap four complete turns of the cord around the drive shaft and continue the cord over the top of the rocker plate pulley.

(7) Pull on the short end of the cord until the tension spring in the pulley is stretched to within ⅛" of the eyelet. Maintain this tension and tie a knot in the two ends of the cord over the catch which holds the spring. Loop the cord over the spring catch so that the knot is turned in. (A drop of bees' wax on the knot would be an added protection against coming untied.)

To replace the outer cord:

(1) Place the chassis in a horizontal position with the push buttons to the left and the speaker toward you.

(2) Close the condenser gang and mount the large drive pulley on the shaft. Place the pulley on the condenser shaft so that the shaft is flush with the outside of the pulley bushing and the eyelet in the pulley is horizontal with the shaft and toward the dial.

(3) Cut a 22" length of drive cord and tie a knot ½" from the two ends.

(4) Hook one end of the tension spring over the catch provided in the pulley and hook the other end over the drive cord at the knot.

(5) Thread the cord through the eyelet in the pulley and extend one side up and over the vertical brass pulley. Loop this lead around the horizontal idler pulley at the left-hand side of the dial and then around the idler pulley at the right-hand side of the dial and then over the top of the large drive pulley. The tension on the spring should be sufficint to stretch it to within approximately ½" of the eyelet.

(6) With the gang closed, move the pointer to the extreme right-hand end of the dial. Press the cord into the slots in the back of the pointer and check to see that the pointer travels from one end of the dial to the other as the gang is opened and closed. It may be advisable to place some Aratex or other liquid adhesive on the cord where it fits into the pointer.

MODEL A267
Socket, Trimmers
Layout, Voltage
Alignment

CROSLEY RADIO CORP.

SPECIFICATIONS

The Crosley Model A-267 auto radio is a single unit, six-tube superheterodyne receiver. The power supply unit is built into a completely shielded compartment and is an integral part of the receiver chassis. The tuning range is from 540 to 1530 Kc.

TUBES AND VOLTAGE LIMITS

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and the receiver chassis. Voltage readings taken with a 1000 ohm per volt, 500 volt voltmeter (except filaments) with receiver in operating condition and no signal input. The filament voltages should be measured with an accurate low range D-C voltmeter (approximately 0 to 10 volts). Voltage limits may vary plus or minus 10% of values given.

NOTE: The negative bias applied to the first three tubes is -3.5 volts, measured across a 75 ohm resistor (Item 31). The 6Q7G tube has a negative bias of -1.9 volts measured across a 40 ohm resistor (Item 30). The 6K6G output tube has a negative bias of -20 volts applied to the grid and is measured from the high side of the "B" filter choke (Item 8) to chassis.

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits can best be properly aligned with the use of a modulated signal generator and an output meter.

CONNECTING OUTPUT METER

Connect the output meter to P and S of the 6K6G Output tube. Be sure the meter is protected from D. C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

NOTE: The receiver chassis should be in its case and a speaker similar to one used with the receiver must be connected to the chassis before making adjustments. It is advisable to use a spare control unit for making adjustments of the volume control and tuning condenser. A standard control unit with short cables (6" to 8") makes a very convenient and useful tool. If it is desired to shorten a pair of long cables it will be absolutely necessary to heavily tin the cables before cutting them.

1. Tuning I-F Amplifier to 262 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd., or larger, condenser to the top cap of the 6A8G Osc-Mod. tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the receiver chassis frame. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Adjust the station selector so that the rotor plates of the tuning condenser are completely in mesh, and turn the volume control full (ON).

(c) Set the signal generator to 262 kilocycles.

(d) Adjust both trimmers located on the 2nd I-F transformer for maximum output. (Fig. 2).

(e) Adjust both trimmers located on the 1st I-F transformer for maximum output.

(f) Repeat operations (d) and (e) for more accurate adjustments.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.

2. Aligning R-F Amplifier.

(a) Connect the output lead from the signal generator through a .00025 mfd. condenser to the "ANT" connection of the receiver.

(b) Set the signal generator to 1530 kilocycles.

(c) With the condenser gang all the way open, adjust the "OSC" trimmer condenser so that the 1530 kilocycle signal is heard. It is not necessary that the receiver tune through this signal.

(d) Set the signal generator to 1400 kilocycles.

(e) Tune-in the 1400 kilocycle signal with the station selector (approximately 140 on the dial) for maximum reading on the output meter.

(f) Adjust the "R-F" trimmer condenser for maximum output.

(g) Adjust the "ANT" trimmer condenser for maximum output.

DO NOT READJUST THE "OSC" TRIMMER CONDENSER.

(h) Repeat operations (e), (f) and (g) for more accurate adjustments.

3. Adjusting Antenna Compensating Condenser.

(a) Set the signal generator to 600 kilocycles.

(b) Tune-in the 600 kilocycle signal with the station selector for maximum output.

(c) Adjust the antenna compensating condenser, Item No. 11, Fig. 3, for maximum output.

(d) Repeat operations (b) and (c) alternately until no further improvement can be obtained.

(e) Set the signal generator to 1400 kilocycles again.

(f) Tune-in the 1400 kilocycle signal with the station selector for maximum output.

(g) Readjust the trimmer on the "ANT" section of the tuning condenser for maximum output.

It will be necessary to adjust the antenna compensating condenser to the car antenna after the receiver has been installed in the car.

(a) After the installation is complete, tune-in a WEAK station between 55 and 65 on the dial.

(b) Adjust the antenna compensating condenser for maximum volume in the speaker.

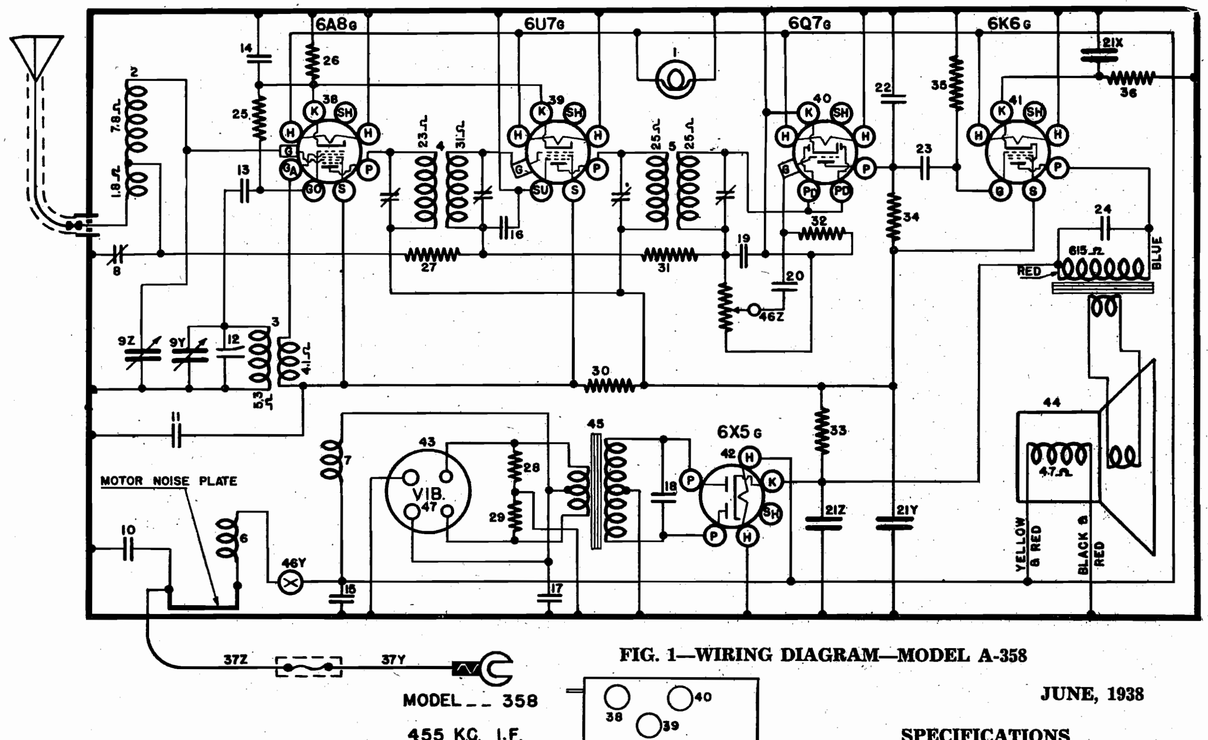

FIG. 1—WIRING DIAGRAM—MODEL A-358

JUNE, 1938

SPECIFICATIONS

This model Crosley Roamio is a single unit five-tube superheterodyne receiver. It incorporates an unusual push button tuning system of rugged mechanical design that is positive, accurate, and easy to adjust and operate. A highly efficient superheterodyne circuit employs five tubes to the utmost advantage as follows: one 6A8G as an oscillator and mixer or modulator, one 6U7G as an intermediate frequency amplifier, one 6Q7G as detector, A. V. C. and 1st A.F. amplifier, one 6K6G as power output amplifier and a 6X5G as a rectifier. A full wave vibrator is used. Bias for the 6A8G and 6U7G tubes is obtained across item 26 (220 ohm resistor), for the 6K6G tube across item 36 (600 ohm resistor).

TUBES AND VOLTAGE LIMITS

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and the receiver chassis. Voltage readings taken with a 1000 ohm per volt, 500 volt voltmeter (except filaments) with receiver in operating condition and no signal input. The filament voltages should be measured with an accurate low range D-C voltmeter (approximately 0 to 10 volts). Voltage limits may vary plus or minus 10% of values given.

TUBE SOCKET VOLTAGE READINGS

Tube	Function	H	P	S	Su	K	Ga	Go
6A8-G	Oscillator-Modulator	6.0	220	100	—	3.7	100	—
6U7-G	I-F Amplifier	6.0	220	100	—	3.7	—	—
6Q7-G	Diode Detector & A-F Amp.	6.0	65	—	—	—	—	—
6K6-G	Output	6.0	220	220	—	16	—	—
6X5-G	Rectifier	6.0	—	—	—	250	—	—

Power Output approximately 4 Watts. (Max.)
Battery Drain approximately 6.2 Amperes at 6 Volts.
It should be noted that some of the lugs on the sockets are used as junction blocks.

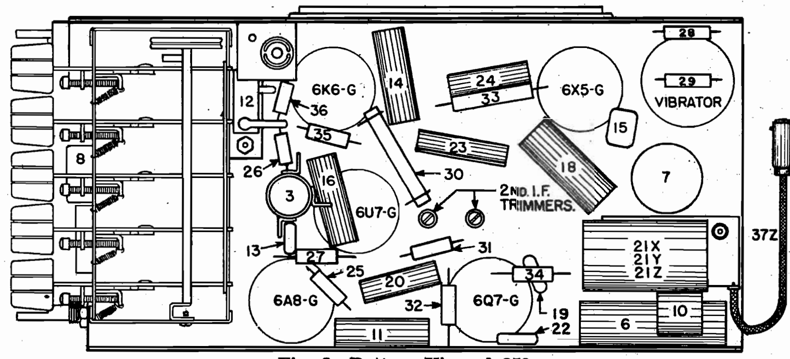

Fig. 3 Bottom View A-358

MODEL A358, Roamio
Alignment, Dial Data
Parts

CROSLEY RADIO CORP.

MODEL A-358

REPLACING DIAL DRIVE CORD

(1) Remove the broken cord and the cord tension spring.

(2) Cut a 29 inch length of drive cord and tie the tension spring approximately 4 inches from one end.

(3) Insert both ends of this cord through the eyelet in the rocker-plate pulley from the inside.

(4) Pull the cord through until the tension spring is pulled into the pulley, then hook the spring over the notch formed in the pulley (opposite the eyelet).

(5) Close the gang condenser.

(6) Loop the long end of the cord around the pulley in a counter clock-wise direction, then up and over the manual control shaft (no turn). Continue over the dial shaft. Wrap two and a half turns around the shaft, starting at the top and winding in a counter clockwise direction toward the hole in the shaft.

(7) Thread the cord through the hole in the shaft twice and make one turn in a counter clockwise direction around the lower part of the shaft.

(8) Continue the cord over to and under then over the manual drive shaft. Starting at the front end of the 1st groove in the drive shaft wrap 8 turns in a clockwise direction around shaft. Continue cord down and around the pulley on the rocker arm plate.

(9) Pull on the short end of the cord to stretch the tension spring to within one eighth of an inch of the rim. Keeping this same tension on the spring wrap the cord around the pulley to meet long end. Tie ends together (at the cutout in the pulley) securely. Loop the knot in the cord over the notch in the pulley, placing the knot on the inside of the pulley-rim. (A drop of bees'-wax on the knot would be added protection against coming untied).

(10) Check to see that the gang condenser opens properly and that the dial tracks.

SETTING THE PUSH BUTTONS

Should it become necessary to realign the circuits of the receiver, it may also be necessary to reset the push buttons. The push buttons may be quickly and accurately set, either with the receiver in the case or with the case removed.

Insert a small screw driver in the hole through each push button and loosen (do not remove) the set screw in the bottom of the hole. By means of the conventional tuning knob, tune-in AS ACCURATELY AS POSSIBLE the favorite station having the highest frequency—that is, the station nearest the left hand side of the case. **PUSH THE NO. 1 BUTTON ALL THE WAY DOWN AND HOLD IN THAT POSITION WHILE YOU SECURELY TIGHTEN THE SET SCREW.**

The push button tuning system is now correctly set for the 1st station. Follow through with this same procedure, setting the other four stations in the order of their frequency (kilocycles).

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits can best be properly aligned with the use of a modulated signal generator and an output meter.

CONNECTING OUTPUT METER

Connect the output meter to P and S of the 6K6G Output tube. Be sure the meter is protected from D.C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

1. Tuning I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd., or larger, condenser to the top cap of the 6U7G I. F. tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the receiver chassis frame. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Adjust the station selector so that the rotor plates of the tuning condenser are completely disengaged and turn Vol. Cont. to maximum position (RIGHT).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust both 2nd I. F. trimmer condensers for maximum output. Fig. 3.

(e) Transfer generator lead to top of 6A8G Osc.-Mod. tube, leaving the tube's grid clip in place.

(f) Adjust both trimmers located on the 1st I-F transformer for maximum output.

(g) Repeat operations (d) and (f) for more accurate adjustments.

IN ORDER TO PREVENT A. V. C. ACTION ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.

2. Aligning R-F Amplifier. note below.

3. Adjusting Antenna Compensating Condenser.

CROSLEY RADIO CORP.

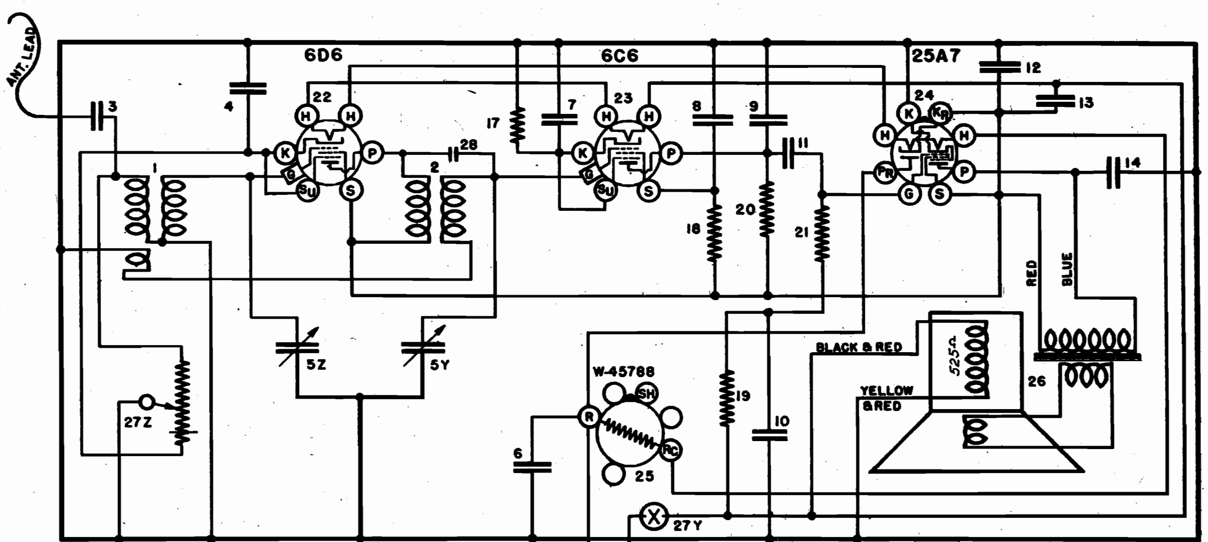

FIG. 1—WIRING DIAGRAM—MODEL 418

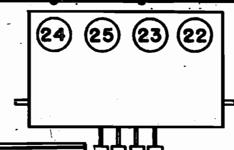
JUNE, 1938



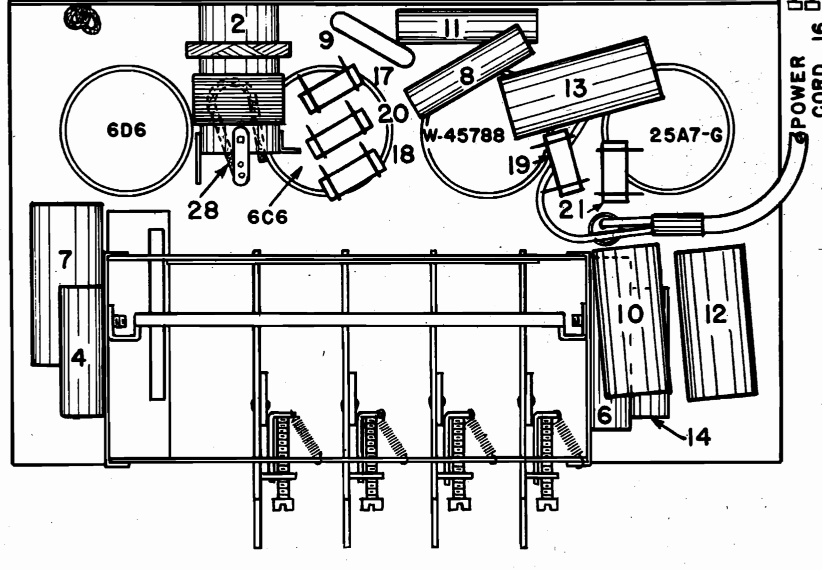


Fig. 3 Bottom View 418

MODEL 418 (VANITY) SPECIFICATIONS

This model Crosley is a four-tube Tuned Radio Frequency receiver designed for operation on 110 volt circuits, either A.C. or D.C. The features incorporated are, Push Button Tuning, Dynamic Speaker, Pentode Output and a highly efficient T. R. F. circuit. The frequency range is from 1725 to 540 kilocycles. The tubes used are, one 6D6 as R-F amplifier, one 6C6 as detector, one 25A7G as Pentode output and Rectifier, and one W-45788 Ballast tube. The volume control changes the bias on the 6D6 and, at the same time the amount of signal fed to the antenna coil primary. The bias for the 6C6 is obtained from the voltage drop across item 17 (25000 ohm resistor) and the bias for the 25A7G is obtained from the drop in the speaker field (525 ohm), which is in the negative leg. This voltage is filtered by item 19 (200,000 ohm resistor) before it is applied to the output grid.

This receiver incorporates a certain amount of fixed regeneration to improve selectivity and sensitivity. With a normal antenna the receiver is stable and the performance approaches that of a three gang T. R. F. receiver in spite of the fact that only a two gang condenser is used. However with no antenna or a very small antenna the receiver will oscillate but this oscillation can readily be controlled by the volume control.

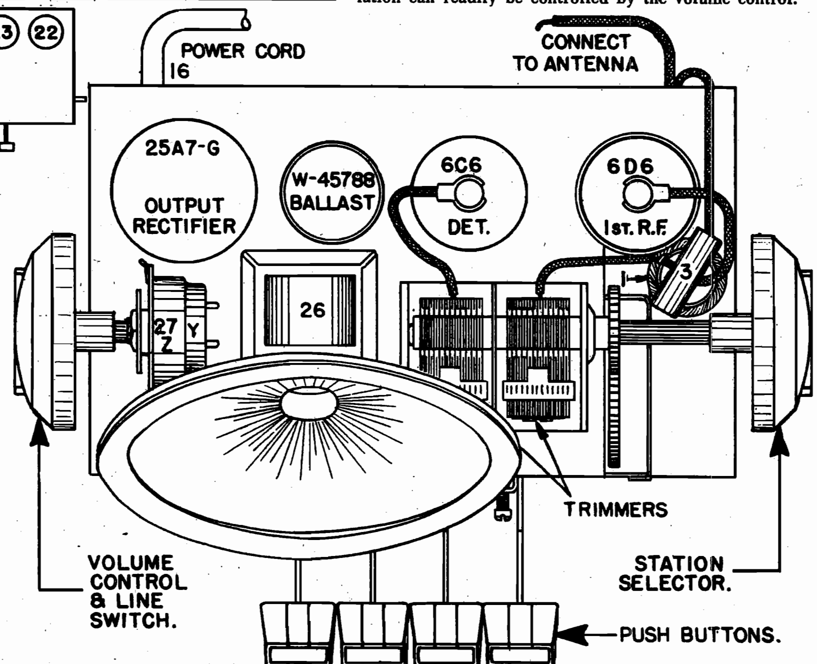

Fig. 2 Top View 418

MODEL 418, Vanity

CROSLEY RADIO CORP.

SETTING THE PUSH BUTTONS

The push buttons may be quickly and accurately set from the front of the receiver. Insert a small screw driver in the hole in the front of each push button to be set and loosen (DO NOT REMOVE) the set screw at the bottom of the hole.

Determine the favorite broadcasting stations whose call letters are to be placed in the push buttons. By means of the station selector knob, tune-in AS ACCURATELY AS POSSIBLE the station having the highest frequency (kilocycles), that is the one nearest the 150 marking on the knob. Completely depress and hold the right hand push button in that position, while you SECURELY TIGHTEN THE SET SCREW.

The push button system is now set for the first station. Follow through with this same procedure, setting the other stations in the order of their frequency (kilocycles).

Cut the call letters of the stations selected, from the list supplied with your receiver and press them into the openings in the front of the push buttons. Four pieces of clear celluloid are supplied in a small envelope and should be snapped into place over the call letters to protect and hold them in place.

TUBES AND VOLTAGE LIMITS

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and chassis. Voltage readings should be taken with a 1000 ohm per volt, 250 volt voltmeter (except filaments) with volume control full on and no signal input. The filament voltages should be measured with an accurate low range voltmeter. Voltage limits may vary plus or minus 10% of values given.

CONNECTING OUTPUT METER

Connect one terminal of the output meter to the plate and the other terminal to the screen of the 25A7G output tube. Be sure the meter is protected from D.C. by connecting a condenser (.1 mfd., or larger—not electrolytic) in series with one of the leads.

ALIGNMENT PROCEDURE

The chassis of this receiver is connected through the speaker field to one side of the power line and should be isolated in order that the power supply will not be short-circuited while the receiver is being aligned.

(a) Connect the output lead of the signal generator through a .0001 mf. condenser to the antenna lead on the set and the other lead through a .001 mf. condenser to the chassis (if your signal generator is A.C. operated).

(b) Open the gang condenser all the way.

(c) Set the generator to 1725 Kc.

(d) Adjust the trimmers on the gang until the 1725 Kc. signal is heard. Gang does not have to tune through this signal.

(e) Set the generator to 1400 Kc.

(f) Tune set to 1400 signal, then alternately adjust trimmers on gang until no further improvement can be noted.

NOTE: Always use the lowest signal generator output that will give a reasonable indication on the output meter.

Keep the two grid leads as far as possible from each other.

Check Push Buttons to see if they need resetting.

TUBE SOCKET VOLTAGE READINGS

Tube	Function	H	P	S	K	Su	G
6D6	R. F. Amplifier	6.3	103	104	2.5-25	2.5-25	—
6C6	Detector	6.3	24	8	10	10	—

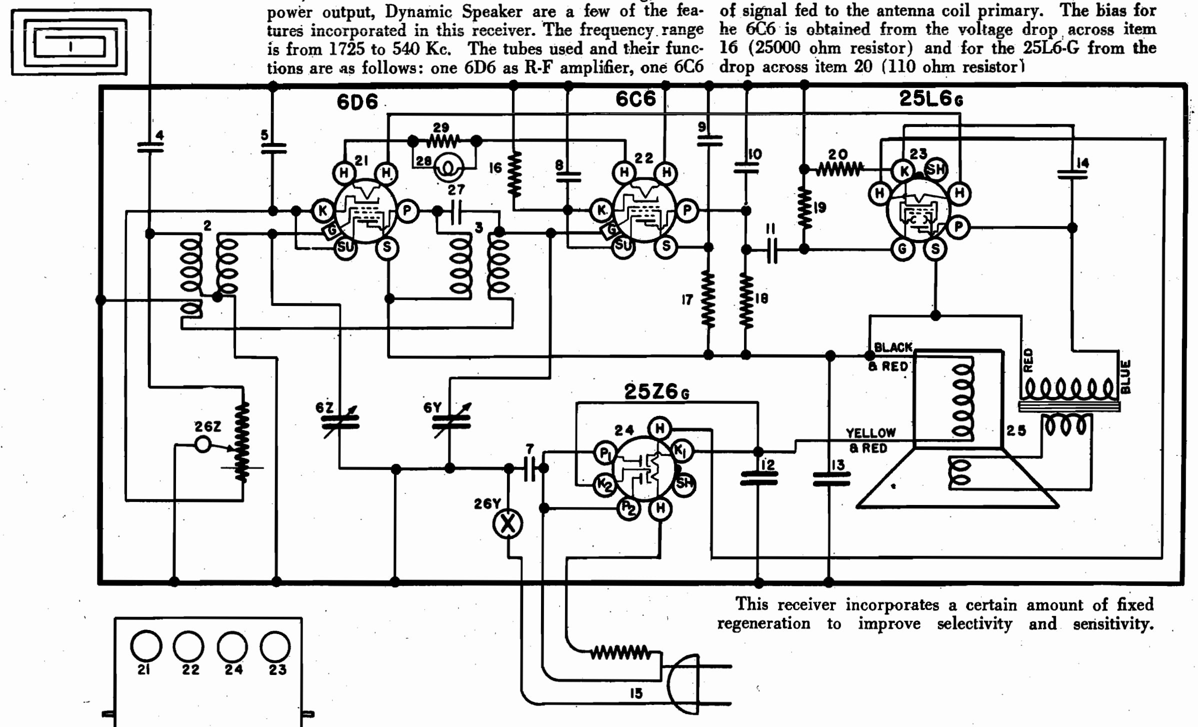
Schematic, Socket
Trimmers, Layout

CROSLEY RADIO CORP.

SPECIFICATIONS

This model, Crosley is a four-tube Tuned Radio Frequency receiver designed for operation on 110 volt circuits, either A. C. or D. C. Push Button tuning, Beam power output, Dynamic Speaker are a few of the features incorporated in this receiver. The frequency range is from 1725 to 540 Kc. The tubes used and their functions are as follows: one 6D6 as R-F amplifier, one 6C6 as biased detector, one 25L6-G as beam power output and one 25Z6-G as rectifier. The volume control varies the bias on the 6D6 and at the same time the amount of signal fed to the antenna coil primary. The bias for he 6C6 is obtained from the voltage drop across item 16 (25000 ohm resistor) and for the 25L6-G from the drop across item 20 (110 ohm resistor)



This receiver incorporates a certain amount of fixed regeneration to improve selectivity and sensitivity.

MODEL 428 VANITY DE LUXE

CONNECTING OUTPUT METER

Connect the one terminal of the output meter to the plate and the other terminal to the screen of the 25L6-G Output tube. Be sure the output meter is protected from D. C. by connecting a condenser (.1 mfd. or larger —NOT electrolytic) in series with one of the leads.

ALIGNMENT PROCEDURE

The chassis of this receiver is connected to one side of the power line, therefore when using an A. C. operated signal generator for alignment the following precaution should be taken.

(a) Connect the output lead of the signal generator through a .0001 Mf. condenser to the antenna lead on the receiver (after the antenna has been completely unrolled. The ground lead of the generator should be connected through a .001 Mf. condenser to the chassis.

(b) Open the gang condenser all the way.

(c) Set the generator to 1725 Kilocycles.

(d) Adjust the trimmer condensers on the gang until the 1725 Kc signal is heard. The gang does not have to tune through this signal.

(e) Set the generator to 1400 Kc.

(f) Tune the set to the 1400 Kc. signal, then alternately adjust the trimmers on the gang until no further improvement can be noticed on the output meter.

NOTE: Always use the lowest signal generator output that will give a reasonable indication on the output meter.

With a normal antenna the receiver is stable and the performance approaches that of a three gang T. R. F. receiver in spite of the fact that only a two gang condenser is used. However with no antenna or a very small antenna the receiver will oscillate but this oscillation can readily be controlled by the volume control.

Keep the two grid leads as far as possible from each other.

If the receiver has been re-aligned it may be necessary to readjust the setting of the push buttons.

SETTING THE PUSH BUTTONS

See MODEL 418

TUBES AND VOLTAGE LIMITS

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and chassis. Voltage readings should be taken with a 1000 ohm per volt, 250 volt voltmeter (except filaments) with volume control full on and no signal input. The filament voltages should be measured with an accurate low range voltmeter. Voltage limits may vary plus or minus 10% of values given.

MODELS 517,547 Late 5517
Voltage,Data,Changes
Alignment

CROSLEY RADIO CORP.

These model chassis are identical except for station selector and associated parts as indicated in the Parts List. They are designed for AC operation and American and Foreign broadcast reception. The tuning range is divided into two bands as follows:

540-1725 Kilocycles or 555-173 Metres (American Broadcast Band)
5.9-15.3 Megacycles or 51-18 Metres (High Frequency or Foreign Band)

CIRCUIT DESCRIPTION

Five octal base glass tubes are employed in a superheterodyne circuit which consists of a combination oscillator-modulator tube, I-F amplifier, detector, audio amplifier and power supply. The 6Q7G tube serves as detector and 1st audio amplifier and supplies AVC voltage to the grids of the 6A8G and 6U7G tubes. The AVC voltage is taken from the A-F diode plate. The speaker field is located in the negative leg of the power supply. The starting bias for the 6A8G and 6U7G tubes is developed across a 75 ohm resistor, item 25. The bias voltage for the 6Q7G tube is developed across a 40 ohm resistor, item 24, and the bias voltage for the 6K6G output tube is developed across a 275 ohm resistor, item 23. Items 23, 24 and 25 are located between the speaker field and ground.

SOCKET VOLTAGES

The tube socket voltages are measured from the tube socket contacts to the chassis with a 1000 ohm per volt 500 volt d. c. voltmeter (except filaments) with the receiver in operating condition and no signal input. The filament voltages should be measured with an accurate low range a. c. voltmeter (approximately 0-10 volts). Readings may vary plus or minus 10% of values given.

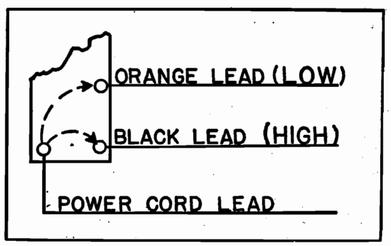
TUBE SOCKET VOLTAGE READINGS

Tube	Function	H	P	S	K	G	Ga
6A8G	Oscillator-Modulator	6.3	160	115	0	-1.2	160
6U7G	I-F Amplifier	6.3	160	115	0	-1.2	—
6Q7G	Diode Detector & A-F Amplifier	6.3	80	—	2.5	-2.5	—
6K6G	Output	6.3	160	160	0	-5.8	—
5Y3G	Rectifier	5.0	—	—	225	—	—

Power output approximately 2 watts.
Power consumption approximately 40 watts at 117.5 volts.
Voltage drop across speaker field 35 volts.

50 CYCLE POWER TRANSFORMER ADJUSTMENT

Receivers equipped with a 50 cycle power transformer have a "high" and "low" voltage tap on the under side



of the chassis. The "high" voltage lead (BLACK) and the "low" voltage lead (ORANGE) are connected to a terminal strip near the transformer.

The voltage range of the "low" tap of the 95-130 volt transformer is from 95 to 112½ volts and of the "high" tap is from 112½ to 130 volts. The range of the "low" tap of the 190-260 volt transformer is from 190 to 225 volts and of the "high" tap is from 225 to 260 volts.

The accompanying illustration shows the connections for changing from high to low or low to high line voltage. Note the "jumper" wire which is attached to the terminal at which one side of the power cord is attached. The other end of this jumper wire should be connected to the ORANGE or BLACK lead of the transformer primary, according to the line voltage the receiver is to be used on.

NOTE: Any change made in the power supply circuit of the receiver should be plainly stamped or otherwise permanently recorded on the rear of the chassis.

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits can best be properly aligned with the use of a modulated signal generator and output meter.

CONNECTING OUTPUT METER

Connect the output meter to P and S of the 6K6G output tube. Be certain that the meter is protected from d. c. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6A8G tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the "GND" terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh and turn the volume control knob to the right (ON).

(c) Turn the band selector switch to the left (Broadcast Band).

(d) Set the signal generator to 455 kilocycles.

(e) Adjust both trimmers located on top of the 2nd I-F transformer for maximum output. See Fig. 2.

(f) Adjust both trimmers located on the top of the 1st I-F transformer for maximum output.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

Aligning The R-F Amplifier.

When aligning the R-F amplifier the output lead from the signal generator is connected to the antenna (A) terminal of the receiver. For the Broadcast Band a .00025 mfd. condenser should be connected in series with the output lead of the signal generator and for the High Frequency Band a 400 ohm carbon resistor should be used in place of the condenser.

(a) With the station selector adjusted so that the tuning condenser plates are completely out of mesh and the band selector switch set for the band being aligned, adjust the "OSC" shunt trimmer so that the MINIMUM CAPACITY SIGNAL ¶ (C), is heard. It is not necessary that the receiver tune through this signal.

(b) Adjust the station selector so that the SHUNT ALIGNMENT signal is tuned-in with maximum output. Then adjust the "ANT" shunt trimmer for maximum output. Readjust the station selector slightly so that the generaor signal is tuned-in with maximum output and check the adjustment of the "ANT" trimmer. DO NOT READJUST THE "OSC" TRIMMER.

NOTE 1: When shunt aligning the High Frequency Band care should be exercised so that the circuits will be aligned on the correct frequency rather than on the image frequency which is approximately 910 kilocycles less than the fundamental. To check on this, increase the output of the signal generator 10 times, or more, and try to tune-in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct frequency.

NOTE 2: If at any time the H-F coils are replaced, it may be necessary to vary the inductance of the "OSC" coil by moving the cross-over turn of wire at the gap to make the set track at the 6 megacycle end. Moving the turn toward the short end of the coil will decrease the inductance and moving it toward the long end will increase the inductance. If the signal is weak at 6 megacycles, a similar slight change in the inductance of the "ANT" coil should bring up the signal strength. THIS IS A CRITICAL OPERATION AND SHOULD NOT BE DONE ON ANY SET UNLESS CHANGING COILS MAKES IT NECESSARY.

(C) SIGNAL INPUT FREQUENCIES

	Minimum Capacity	Shunt Alignment
American Broadcast Band	1725 Kilocycles	1400 Kilocycles
High Frequency Band	15400 Kilocycles	15000 Kilocycles

CHANGES IN PARTS LIST, SERVICE SUPPLEMENT NO. 163

Item 6, Part No. G136-32004 superseded by G138-32004.

Item 7, Part No. G137-32004 superseded by G139-32004.

Item 24, Part No. W-33012A superseded by W-23012A.

Item 36, Part No. 43569 Power Transformer—110 V., 50 cycles (Added).

Item 36, Part No. 43570 Power Transformer—220 V., 50 cycles (Added).

Part No. 40486, Pointer Screw (Added).

WAVE TRAP

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximatly 455 kilocycles. This assembly is located on the underneath side of the chassis and consists of a coil, a fixed condenser and a trimmer condenser as illustrated by dotted lines in the Wiring diagram.

The wave trap should not be adjusted until all other adjustments have been made. To make the adjustment, feed a 455 kilocycle signal from the signal generator through a .00025 mfd. condenser into the antenna terminal of the receiver. With the band selector switch turned to the Broadcast Band position, the gang condenser open and the volume control full on, adjust the trimmer condenser on the wave trap for minimum output.

Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles, the exact frequency should be determined with the aid of the signal generator. Then, instead of feeding a 455 kilocycle signal into the receiver the exact frequency of the interfering signal should be used. If it is not possible to determine the exact frequency of the interfering signal the antenna may be attached to the receiver and the receiver tuned to the position where the interfering signal is most noticeable. Then adjust the wave trap for minimum interference.

Voltage

MODEL 527
Schematic, Socket

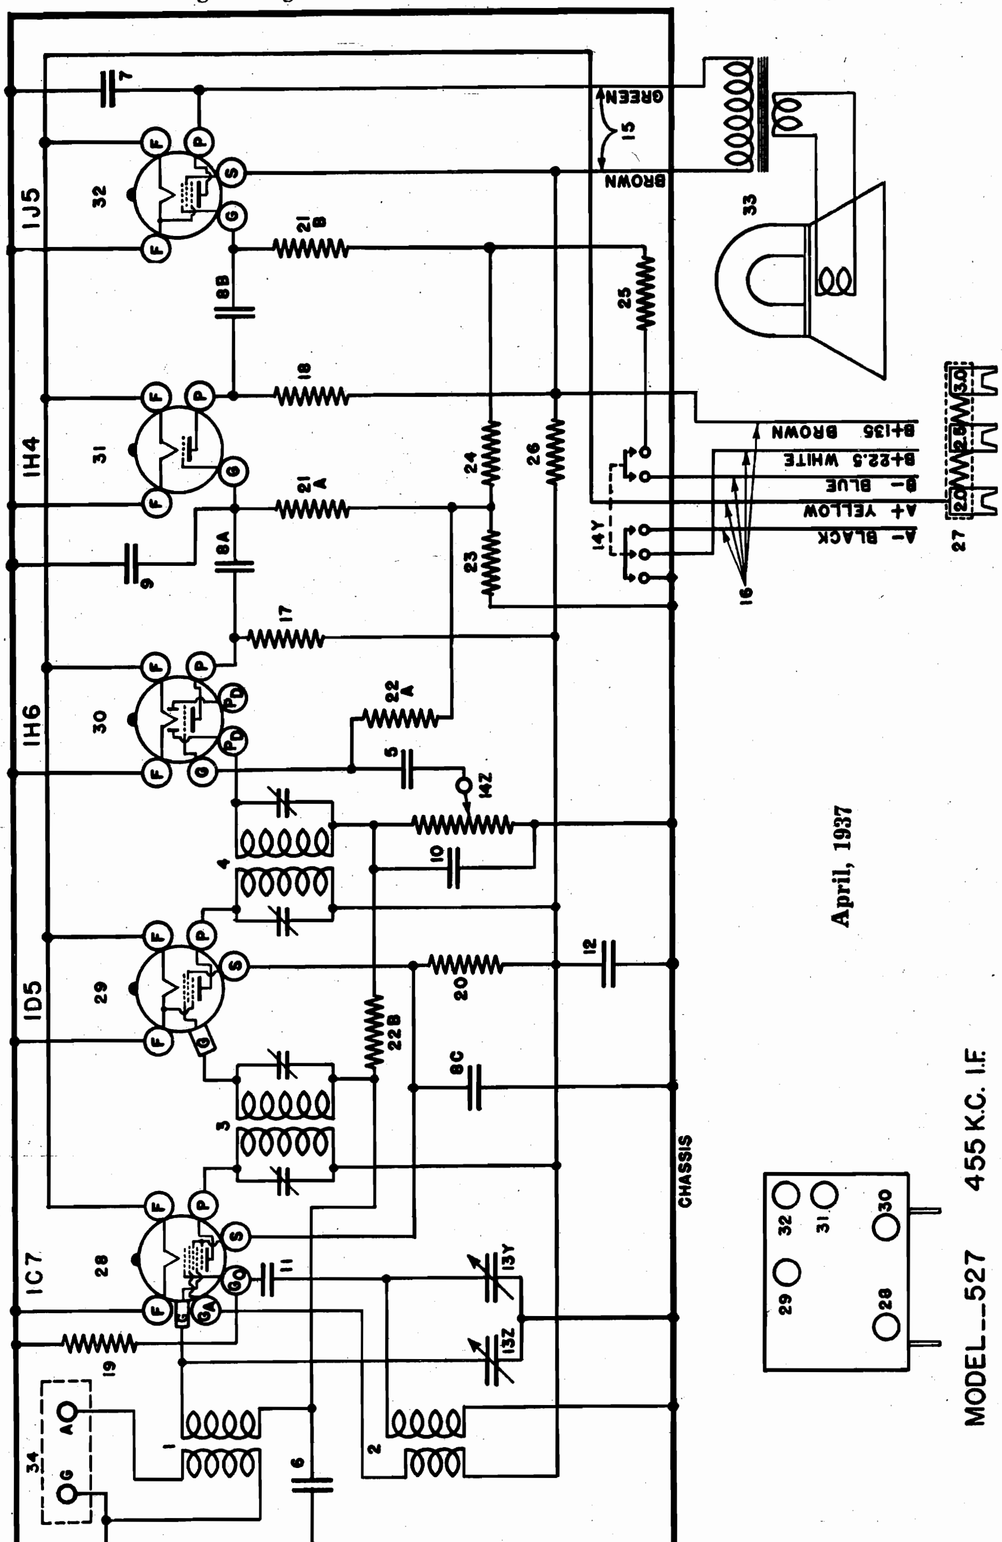
CROSLEY RADIO CORP.

SPECIFICATIONS

The Crosley Model 527 radio is a five-tube superheterodyne receiver designed for operation from batteries. The method of connecting the battery cable to the batteries shown on the Wiring Diagram. The batteries required are: one two-volt storage battery or air cell battery and three plug-in type 45 volt "B" batteries.

TUBES AND VOLTAGE LIMITS

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and the negative side of the "A" battery circuit. Voltage readings should be taken with a 1000 ohm per volt, 250 volt voltmeter (except filaments) with receiver in operating condition and the volume control full on and no signal input. The filament voltages should be measured with an accurate low range D-C voltmeter (Approximately 0 to 10 volts). Voltage limits may vary plus or minus 10% of values given.



April, 1937

MODEL 527 455 K.C. I.F.

TUBE SOCKET VOLTAGE READINGS

Tube	Function	H	P	S	G	Ga	Go
1C7-G	Oscillator-Modulator	2.0	112	37	0	112	-4**
1D5-G	I-F Amplifier	2.0	112	37	0	—	—
1H6-G	Detector & 1st A-F Amp.	2.0	56	—	0	—	—
1H4-G	2nd A-F Amplifier	2.0	43	—	0	—	—
1J5-G	Output	2.0	110	112	-4*	—	—

Power Output approximately .5 Watt.
"A" Battery Drain approximately .42 Ampere at 2 Volts.
"B" Battery Drain approximately 16 Milliamperes at 135 Volts.
*Measured at Grid Terminal through 500,000 Ohm Grid Resistor.
**Measured at Go Terminal with Dial Set at approximately 1000 Kc.

Layout, Parts
Alignment

CROSLEY RADIO CORP.

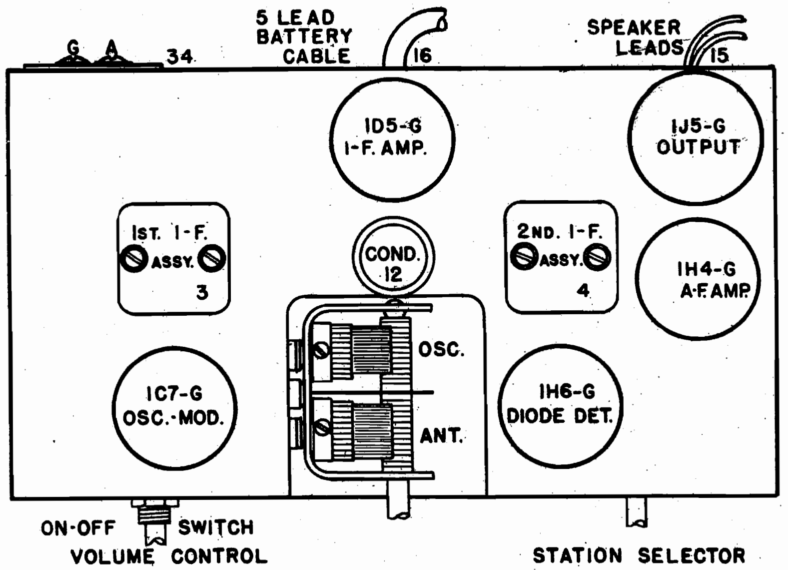

Fig. 2 Top View 527

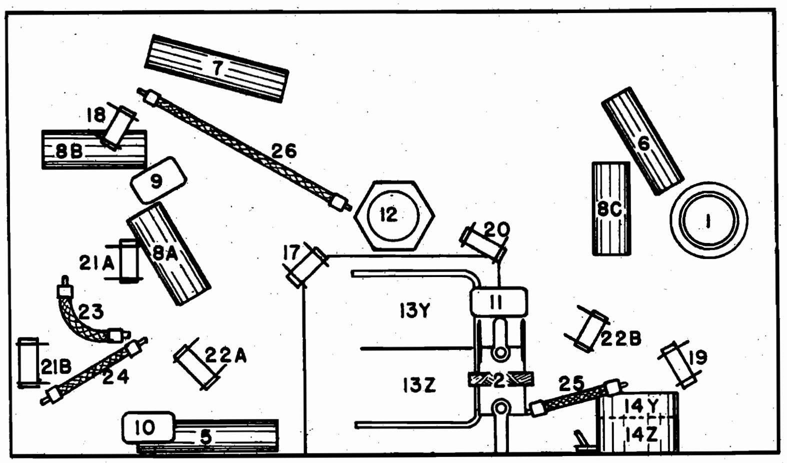

Fig. 3 Bottom View 527

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits can best be properly aligned with the use of a modulated signal generator and an output meter.

CONNECTING OUTPUT METER

Connect one terminal of the output meter to the plate and the other terminal to the screen of the 1J5G Output tube. Be sure the meter is protected from D.C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

1. Tuning I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd., or larger condenser to the top cap of the 1C7G Osc-Mod tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the "GND" terminal of the receiver.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control knob to the right (ON).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust both trimmers located on top of the 2nd I-F transformer for maximum output. Fig. 2.

(e) Adjust both trimmers located on top of the 1st I-F transformer for maximum output.

(f) Check operations (d) and (e) for more accurate adjustments.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.

2. Aligning R-F Amplifier.

(a) Connect the output lead from the signal generator through a .00025 mfd. condenser to the "ANT" terminal of the receiver.

(b) Set the signal generator to 1400 kilocycles.

(c) Adjust the station selector to 140 on the dial.

(d) Adjust the trimmer located on the "OSC" section of the condenser gang for maximum output. Fig. 3.

(e) Adjust the trimmer located on the "Ant" section of the condenser gang for maximum output.

(f) Tune the station selector to the generator signal for maximum output.

(g) Repeat operation (e) for more accurate adjustment.

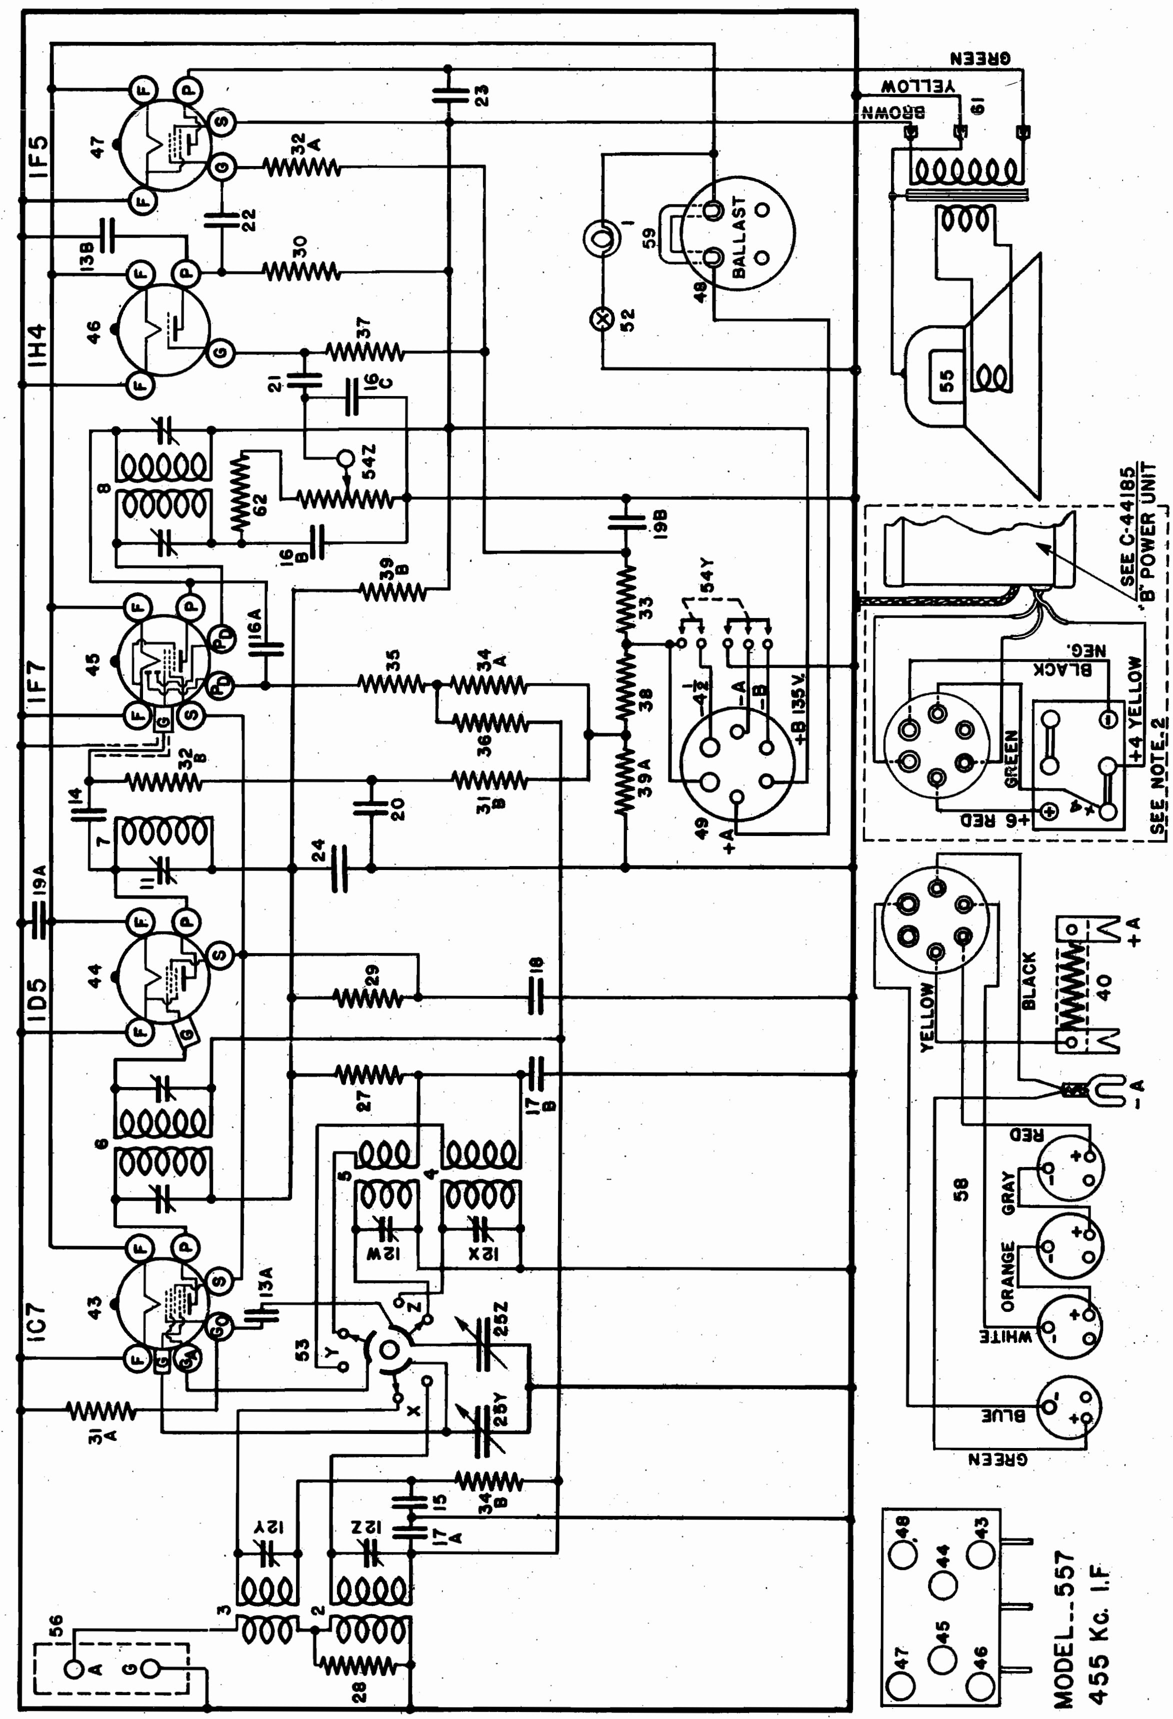

FIG. 1—WIRING DIAGRAM—MODEL 557

MODEL 557
Alignment
Voltage, Data

CROSLEY RADIO CORP.

CHASSIS MODEL 557

JULY, 1937

This model Crosley Radio is a five-tube, 2-band superheterodyne receiver. It is primarily designed for operation from a 2-volt "A" battery. However, it may be used with a 3-volt "A" battery if a Crosley W-44118 ballast tube is used in the socket provided, or it may be operated from a six-volt storage battery in conjunction with the Crosley Model 117 power supply unit. No "B" or "C" batteries are required if the six-volt battery and power supply unit are used.

The frequency ranges covered are from 540 to 1725 kilocycles in the American Broadcast Band and from 5800 to 15000 kilocycles in the High Frequency or Foreign Band.

Circuit Description

Five octal base glass tubes are employed in a superheterodyne circuit which consists of a combination oscillator-modulator tube, two stages of I-F amplification—the second transformer of which is single tuned, and two stages of audio amplification. The 1F7G tube serves as the 2nd I-F amplifier and detector and supplies delayed AVC voltage to the 1C7G and 1D5G tubes. The two flexible resistors, items 38 and 39A, supply bias voltage to the 1C7G, 1D5G and 1F7G tubes and also serve to reduce the "C" battery drain in proportion to the drop in "B" voltage caused by usage.

Battery Connections

If the receiver is to be operated from individual "A", "B" and "C" batteries, the "A" battery may be an air cell type, a two-volt storage battery or a three-volt dry "A" battery. Three plug-in type 45-volt "B" batteries and one plug-in type 4½-volt "C" battery are required.

CAUTION: Do not connect or disconnect batteries or insert or remove ballast tube with the "ON-OFF" switch in the "ON" position.

Fig. 2 shows the proper method of connecting the battery cable to the batteries. The YELLOW lead should be conncted to the positive (+) terminal and the BLACK lead to the negative (—) terminal of the "A" battery. The resistor supplied on the YELLOW lead is to be used only if the "A" battery is an air cell type. The plug having two small pins and one large pin should be inserted in the 4½-volt "C" battery and the three plugs having three small pins are to be inserted in the "B" batteries.

If a three-volt battery is to be used, a Crosley W-44118 ballast tube should be used in the ballast tube socket on the receiver chassis. It will be necessary to pry the connector out of the ballast tube socket before the tube can be inserted. THE AIR CELL RESISTOR SHOULD NOT BE USED with three-volt "A" battery and ballast tube, nor with a two-volt storage battery.

Six-Volt Power Supply Unit

The Crosley Model 117 Power Supply Unit, Fig. 4, is designed to permit the Model 557 receiver to operate from a six-volt storage battery without the use of "B" and "C" batteries. It cannot be used with any other type 2-volt receiver without redesigning the receiver.

Dial Light

If it becomes necessary to replace the dial light bulb, use only part No. W-37188 which is rated at 6/100 ampere. Dial lights which use more current than this will reduce the life of the "A" battery.

TUBES AND VOLTAGE LIMITS

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and the negative side of the "A" battery circuit. Voltage readings should be taken with a 1000 ohm per volt, 250 volt voltmeter (except filaments) with receiver in operating condition and the volume control full on and no signal input. The filament voltages should be measured with an accurate low range D-C voltmeter (approximately 0-10 volts). Voltage limits may vary plus or minus 10% of values given.

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits can best be properly aligned with the use of a modulated signal generator and an output meter.

CONNECTING OUTPUT METER

Connect one terminal of the output meter to the plate and the other terminal to the screen of the 1F5G output tube. Be certain that the meter is protected from D. C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning The I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd., or larger, condenser to the top cap of the 1C7G oscillator-modulator tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the ground (G) terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control to the right (ON).

(c) Turn the band selector switch to the left (Broadcast Band).

(d) Set the signal generator to 455 kilocycles.

(e) Adjust both trimmers located on top of the 3rd I-F assembly for maximum output. (See Fig. 2 item 8).

(f) Adjust the 2nd I-F trimmer condenser, Fig. 2 item 11, for maximum output.

(g) Adjust both trimmers located on top of the 1st I-F assembly, item 6, for maximum output.

(h) Check operations (e), (f) and (g) for more accurate adjustments.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.

Aligning The R-F Amplifier.

When aligning the R-F amplifier the output lead from the signal generator is connected to the antenna (A) terminal of the receiver. For the Broadcast Band a .00025 mfd. condenser should be connected in series with the output lead of the signal generator and for the High Frequency Band a 400 ohm carbon resistor should be used in place of the condenser.

(a) With the station selector adjusted so that the tuning condenser plates are completely out of mesh and the band selector switch set for the band being aligned, adjust the "OSC" shunt trimmer so that the MINIMUM CAPACITY SIGNAL (c) is heard (it is not necessary that the receiver tune through this signal).

(b) Adjust the station selector so that the SHUNT ALIGNMENT signal is tuned-in with maximum output. Then adjust the "ANT" shunt trimmer for maximum output. Readjust the station selector slightly so that the generator signal is tuned-in with maximum output and check the adjustment of the "ANT" trimmer. DO NOT READJUST THE OSCILLATOR TRIMMER.

NOTE: When shunt aligning the High Frequency Band care should be exercised so that the circuits will be aligned on the correct frequency rather than on the image frequency which is approximately 910 kilocycles less than the fundamental. To check on this, increase the output of the signal generator 10 times, or more, and try to tune-in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct frequency.

(C) SIGNAL INPUT FREQUENCIES

	Minimum Capacity Signal	Shunt Alignment Signal
American Broadcast Band	1725 Kilocycles	1400 Kilocycles
High Frequency Band	15500 Kilocycles	15000 Kilocycles

TUBE SOCKET VOLTAGE READINGS

Tube	Function	H	P	S	Go	Ga
1C7G	Oscillator-Modulator	2.0	120	54	Neg	84
1D5G	1st I-F Amplifier	2.0	120	54	—	—
1F7G	2nd I-F Amplifier, AVC and Detector	2.0	135	54	—	—
1H4G	1st A-F Amplifier	2.0	72	—	—	—
1F5G	Output	2.0	130	135	—	—

Power output approximately .5 watt.
"A" battery drain approximately .42 ampere—less dial light current.
"B" battery drain approximately 24 mils.
Power Supply Unit drain approximately 1.15 amperes at 4 volts.

CROSLEY RADIO CORP.

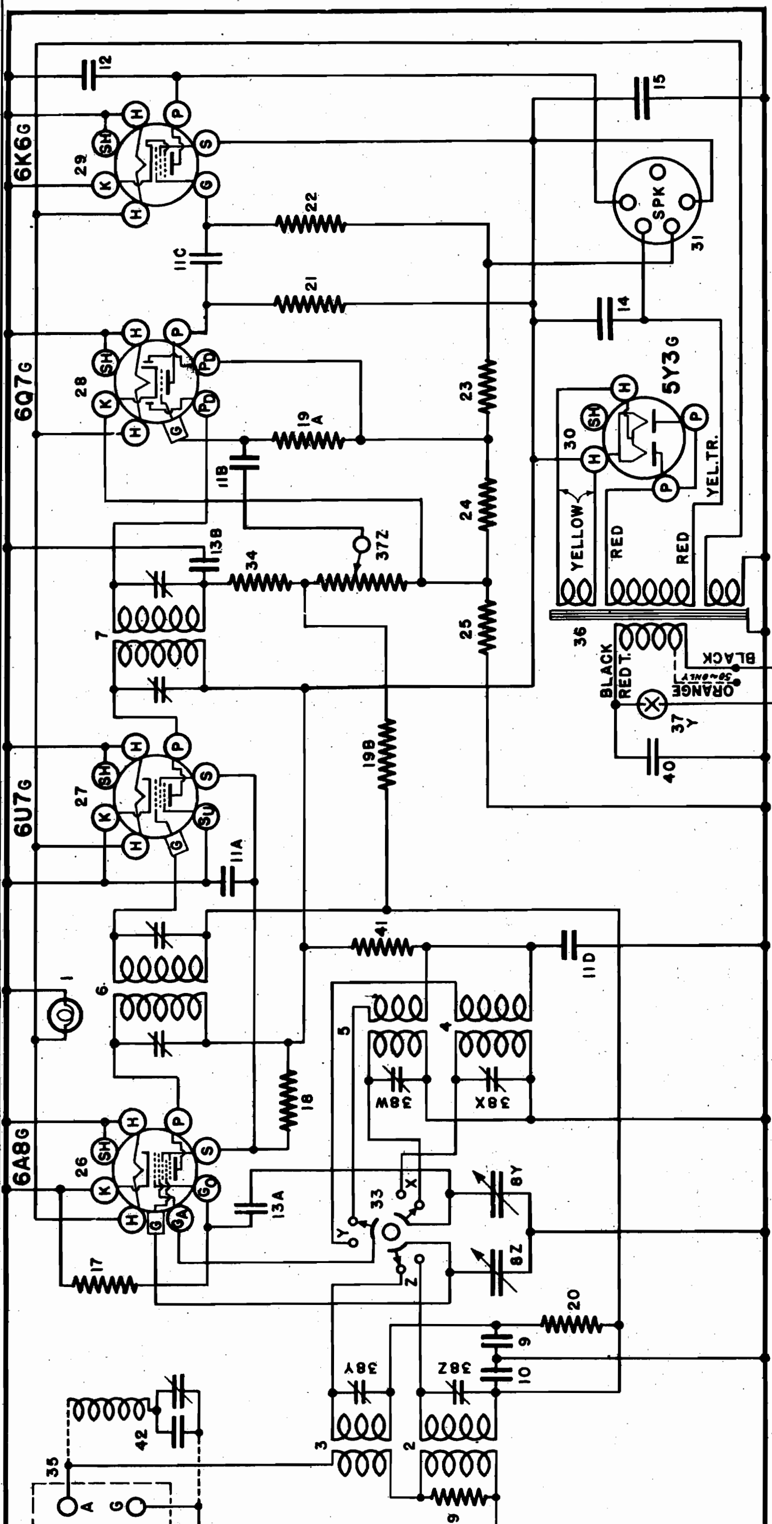
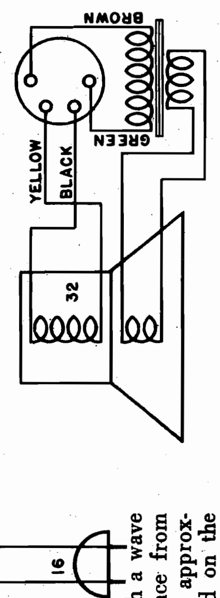
TUBE SOCKET VOLTAGE READINGS

Tube	Function	H	P	S	K	G	Ga
6A8G	Oscillator-Modulator	6.3	160	115	0	-1.2	160
6U7G	I-F Amplifier	6.3	160	115	0	-1.2	—
6Q7G	Diode Detector & A-F Amplifier	6.3	80	—	2.5	-2.5	—
6K6G	Output	6.3	160	160	0	-5.0	—
5Y3G	Rectifier	5.0	—	—	225	—	—

Power output approximately 2 watts.
Power consumption approximately 40 watts at 117.5 volts.
Voltage drop across speaker field 35 volts.





Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles, the exact frequency should be determined with the aid of the signal generator. Then, instead of feeding a 455 kilocycle signal into the receiver the exact frequency of the interfering signal should be used. If it is not possible to determine the exact frequency of the interfering signal the antenna may be attached to the receiver and the receiver tuned to the position where the interfering signal is most noticeable. Then adjust the wave trap for minimum interference.

MODEL--567

455 Kc. I.F. WAVE TRAP

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the underneath side of the chassis and consists of a coil, a fixed condenser and a trimmer condenser as illustrated by dotted lines in the Wiring diagram.

The wave trap should not be adjusted until all other adjustments have been made. To make the adjustment, feed a 455 kilocycle signal from the signal generator through a .00025 mfd. condenser into the antenna terminal of the receiver. With the band selector switch turned to the Broadcast Band position, the gang condenser open and the volume control full on, adjust the trimmer condenser on the wave trap for minimum output.

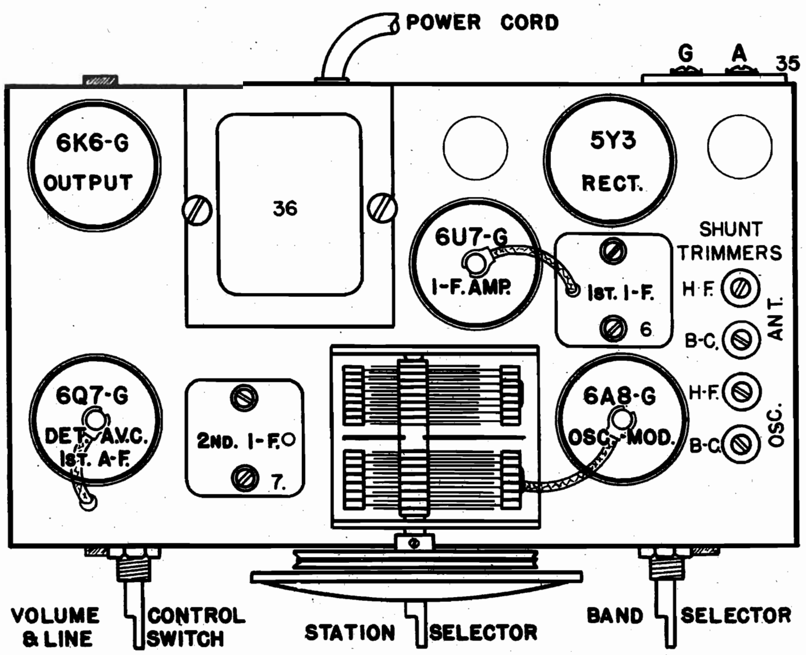

Fig. 2 Top View Model 567

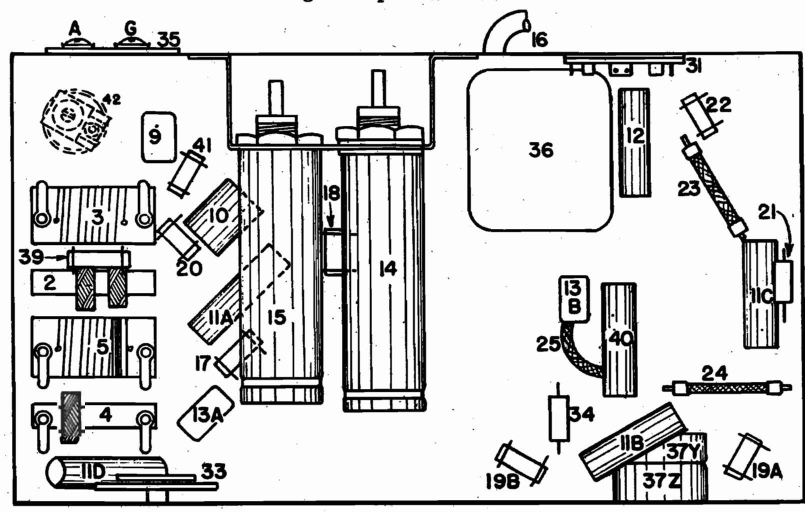

Fig. 3 Bottom View Model 567

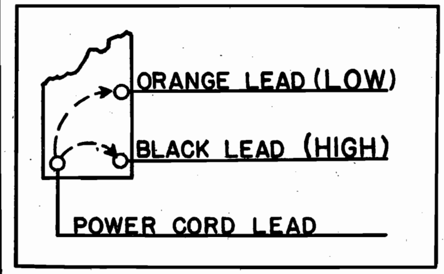
50 CYCLE POWER TRANSFORMER ADJUSTMENT

Receivers equipped with a 50 cycle power transformer have a "high" and "low" voltage tap on the under side



of the chassis. The "high" voltage lead (BLACK) and the "low" voltage lead (ORANGE) are connected to a terminal strip near the transformer.

The voltage range of the "low" tap of the 95-130 volt transformer is from 95 to 112½ volts and of the "high" tap is from 112½ to 130 volts. The range of the "low" tap of the 190-260 volt transformer is from 190 to 225 volts and of the "high" tap is from 225 to 260 volts.

The accompanying illustration shows the connections for changing from high to low or low to high line voltage. Note the "jumper" wire which is attached to the terminal at which one side of the power cord is attached. The other end of this jumper wire should be connected to the ORANGE or BLACK lead of the transformer primary, according to the line voltage the receiver is to be used on.

NOTE: Any change made in the power supply circuit of the receiver should be plainly stamped or otherwise permanently recorded on the rear of the chassis.

CONNECTING OUTPUT METER

Connect the output meter to P and S of the 6K6G output tube. Be certain that the meter is protected from d. c. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6A8G tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the "GND" terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh and turn the volume control knob to the right (ON).

(c) Turn the band selector switch to the left (Broadcast Band).

(d) Set the signal generator to 455 kilocycles.

(e) Adjust both trimmers located on top of the 2nd I-F transformer for maximum output. See Fig. 2.

(f) Adjust both trimmers located on the top of the 1st I-F transformer for maximum output.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

Aligning The R-F Amplifier.

When aligning the R-F amplifier the output lead from the signal generator is connected to the antenna (A) terminal of the receiver. For the Broadcast Band a .00025 mfd. condenser should be connected in series with the output lead of the signal generator and for the High Frequency Band a 400 ohm carbon resistor should be used in place of the condenser.

(a) With the station selector adjusted so that the tuning condenser plates are completely out of mesh and the band selector switch set for the band being aligned, adjust the "OSC" shunt trimmer so that the MINIMUM CAPACITY SIGNAL ¶ (C), is heard. It is not necessary that the receiver tune through this signal.

(b) Adjust the station selector so that the SHUNT ALIGNMENT signal is tuned-in with maximum output. Then adjust the "ANT" shunt trimmer for maximum output. Readjust the station selector slightly so that the generaor signal is tuned-in with maximum output and check the adjustment of the "ANT" trimmer. DO NOT READJUST THE "OSC" TRIMMER.

NOTE 1: When shunt aligning the High Frequency Band care should be exercised so that the circuits will be aligned on the correct frequency rather than on the image frequency which is approximately 910 kilocycles less than the fundamental. To check on this, increase the output of the signal generator 10 times, or more, and try to tune-in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct frequency.

NOTE 2: If at any time the H-F coils are replaced, it may be necessary to vary the inductance of the "OSC" coil by moving the cross-over turn of wire at the gap to make the set track at the 6 megacycle end. Moving the turn toward the short end of the coil will decrease the inductance and moving it toward the long end will increase the inductance. If the signal is weak at 6 megacycles, a similar slight change in the inductance of the "ANT" coil should bring up the signal strength. THIS IS A CRITICAL OPERATION AND SHOULD NOT BE DONE ON ANY SET UNLESS CHANGING COILS MAKES IT NECESSARY.

(C) SIGNAL INPUT FREQUENCIES

	Minimum Capacity	Shunt Alignment
American Broadcast Band	1725 Kilocycles	1400 Kilocycles
High Frequency Band	15400 Kilocycles	15000 Kilocycles

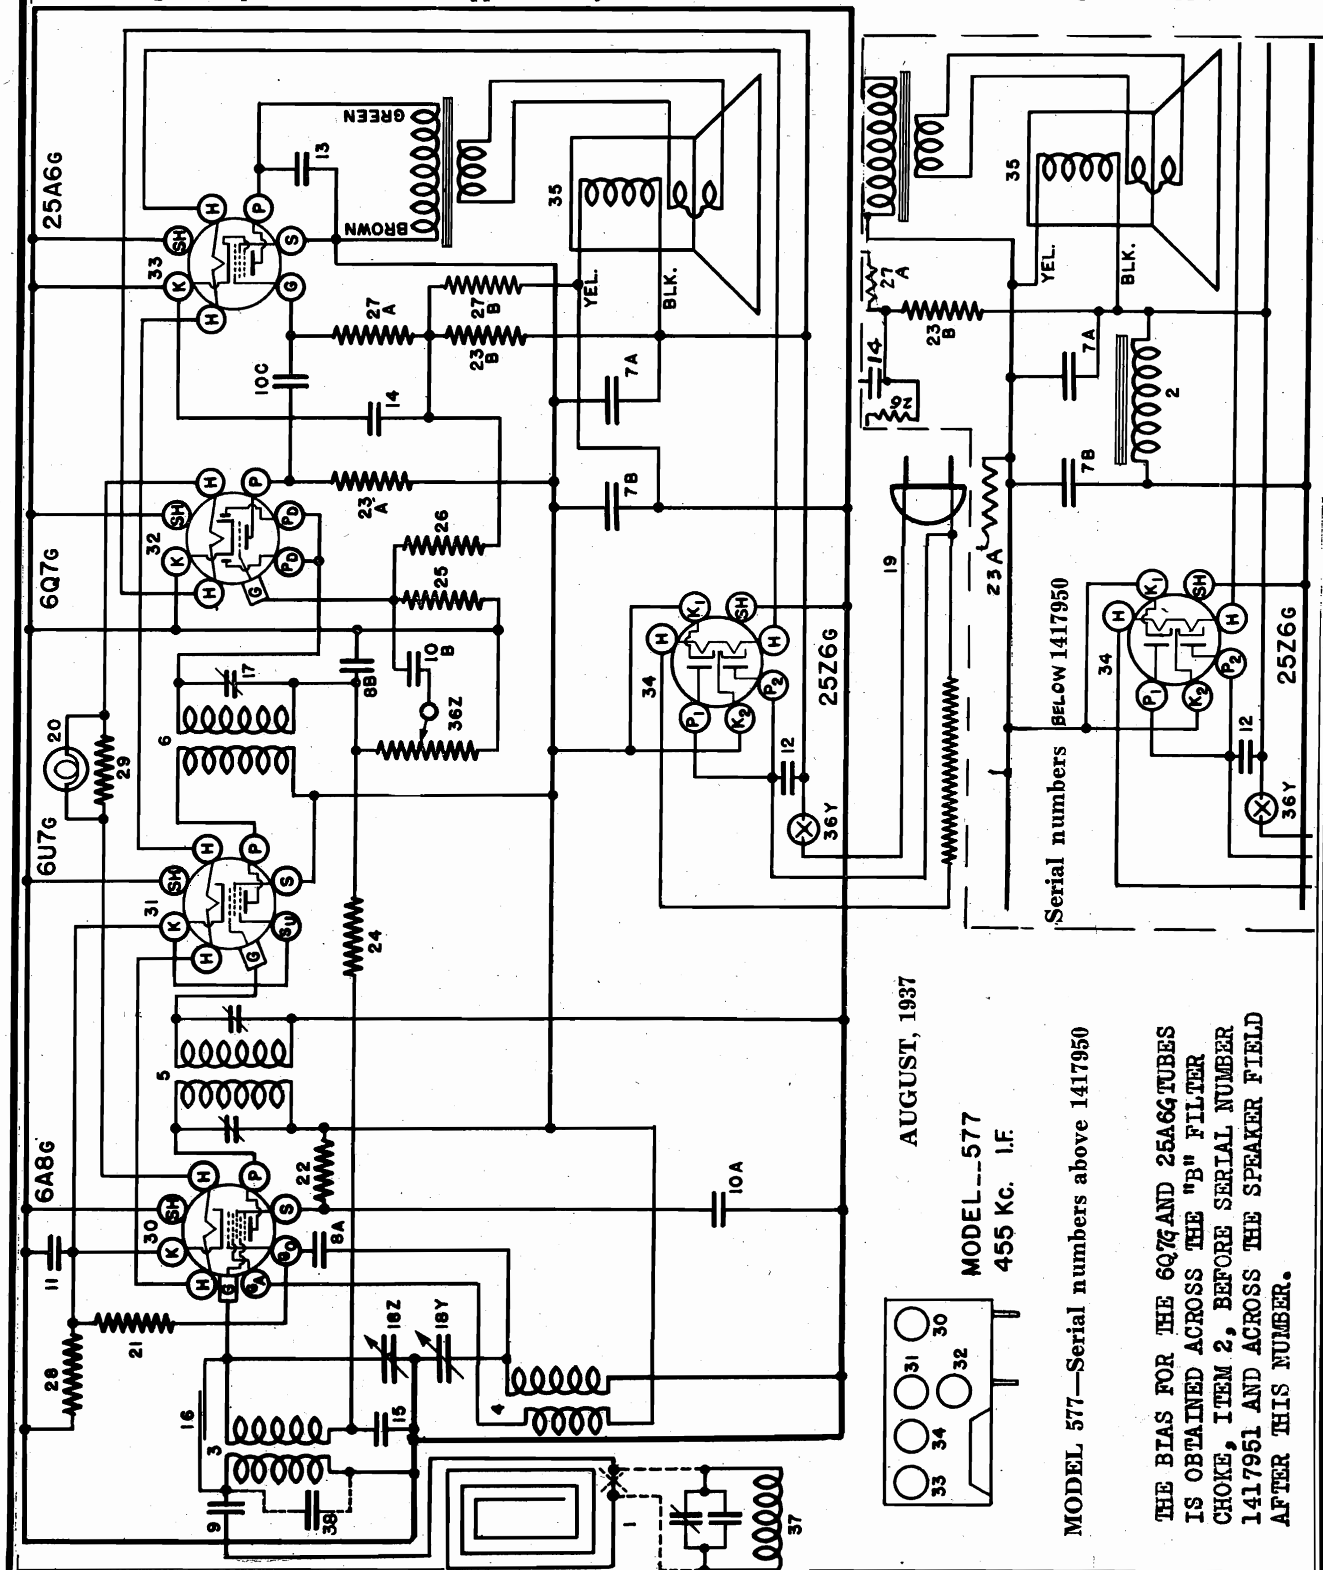
Tube	Function	H	P	S	Su	K	Go	Ga
6A8G	Oscillator-Modulator	6.3	105	60	—	3	–12	105
6U7G	I-F Amplifier	6.3	105	105	3	3	—	—
6Q7G	Det, AVC, A-F Amplifier	6.3	105	—	—	0	—	—
25A6G	Output	25.0	100	105	—	0	—	—
25Z6G	Rectifier	25.0	117.5	—	—	110	—	—

Power output approximately 1 watt.
Power consumption approximately 60 watts.
Voltage drop across speaker field 110 volts.
All voltages except filaments will be approximately 10% lower if measured on 117.5 volts DC power supply.



MODEL 577
Early, Late
Socket, Trimmers
Layout, Alignment

CROSLEY RADIO CORP.

ALIGNMENT PROCEDURE

The chassis of this receiver is connected to one side of the power supply and for this reason all test equipment should be thoroughly insulated in order that the power supply will not become short circuited while aligning the receiver.

CONNECTING OUTPUT METER

Connect one terminal of the output meter to the plate and the other terminal to the screen of the 25A6G output tube. Be certain that the meter is protected from DC by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning the I-F Amplifier to 455 Kilocycles.

(a) Disconnect the antenna roll from the receiver and connect the output of the signal generator through a 50 mmf. condenser to the antenna connection on the receiver. Do not use a ground return from the signal generator unless it is found to be absolutely necessary. If it is found to be necessary, a small condenser (approximately .001 mfd.) should be connected in series with the ground terminal of the signal generator and the receiver chassis. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the plates of the condenser gang are completely out of mesh and turn the volume control to the right (ON).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust the 2nd I-F trimmer condenser, Item 17, located at the rear of the chassis, for maximum reading on the output meter.

(e) Adjust the trimmer condensers located on the 1st I-F transformer for maximum output.

(f) Repeat operations (d) and (e) for more accurate adjustments.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

Aligning the R-F Amplifier.

(a) Set the signal generator to 1725 kilocycles.

(b) With the condenser gang turned to the minimum capacity position, adjust the trimmer condenser on the "OSC" section of the gang so that the 1725 kilocycle signal is heard. It is not necessary that the receiver tune through this signal.

(c) Set the signal generator to 1400 kilocycles.

(d) Tune-in the 1400 kilocycle signal in the region of 140 on the dial for maximum output.

(e) Adjust the trimmer condenser located on the "ANT" section of the gang for maximum output.

Note: Do not readjust the "OSC" trimmer.

(f) Repeat operations (d) and (e) for more accurate adjustments.

WAVE TRAP

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the underneath side of the chassis and consists of a coil, a fixed condenser and a trimmer condenser as illustrated by dotted lines in the Wiring diagram.

The wave trap should not be adjusted until all other adjustments have been made. To make the adjustment, feed a 455 kilocycle signal from the signal generator through a 50 mmf. condenser into the antenna terminal of the receiver. With the band selector switch turned to the Broadcast Band position, the gang condenser open and the volume control full on, adjust the trimmer condenser on the wave trap for MINIMUM output.

Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles, the exact frequency should be determined with the aid of the signal generator. Then, instead of feeding a 455 kilocycle signal into the receiver the exact frequency of the interfering signal should be used. If it is not possible to determine the exact frequency of the interfering signal the antenna may be attached to the receiver and the receiver tuned to the position where the interfering signal is most noticeable. Then adjust the wave trap for minimum interference.

MODEL 617
Alignment, Tuner
Phono., Data

CROSLEY RADIO CORP.

SPECIFICATIONS

This model Crosley radio is a 6-tube AC receiver designed for American and Foreign broadcast reception. Electric tuning is accomplished in this model by means of the Dynatrol motor which is a vibrating type. Other features include automatic volume control, Local-Distance switch and push pull pentode output. The tuning range is divided into two bands as follows:

535-1725 Kilocycles or 550-173 Metres (American Broadcast Band)
5.8-18.3 Megacycles or 52-16.3 Metres (High Frequency or Foreign Band)

CIRCUIT DESCRIPTION

Six octal base glass tubes are employed in a superheterodyne circuit which consists of a combination oscillator-modulator tube, 455 kilocycle I-F amplifier, push pull pentode output and power supply. The 6Q7G tube serves as the detector and 1st A-F amplifier and supplies AVC voltage to the grids of the 6A8G and 6U7G tubes. The speaker field is located in the negative leg of the power supply. Phase inversion is obtained in the output circuit by the voltage developed across a 3000 ohm resistor, item 32.

SOCKET VOLTAGES

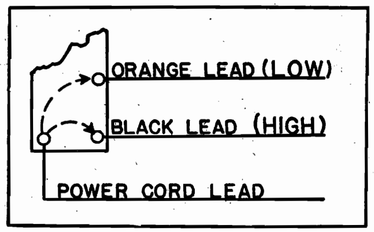
The tube socket voltages are measured from the tube socket contacts to the chassis with a 1000 ohm per volt, 500-volt D. C. voltmeter (except filaments) with receiver in operating condition and no signal input. The filament voltages should be measured with an accurate low range A. C. voltmeter (approximately 0-10 volts). Readings may vary plus or minus 10% of values given.

SPECIAL POWER TRANSFORMER ADJUSTMENT

In localities where the voltage variation on 50 or 60 cycle power supply lines is greater than customary commercial limits, special 50-60 cycle power transformers are available. These transformers have a "high" and "low" voltage tap on the under side of the chassis. The "high" voltage lead (BLACK) and the "low" voltage lead (ORANGE) are connected to a terminal strip near the transformer.

The voltage range of the "low" tap of the 95-130 volt transformer is from 95 to 112½ volts and of the "high" tap is from 112½ to 130 volts. The range of the "low" tap of the 190-260 volt transformer is from 190 to 225 volts and of the "high" tap is from 225 to 260 volts.

The accompanying illustration shows the connections for changing from high to low or low to high line voltage. Note the "jumper" wire which is attached to the terminal at which one side of the power cord is attached. The other end of this jumper wire should be connected to the ORANGE or BLACK lead of the transformer primary, according to the line voltage the receiver is to be used on.



NOTE: Any change made in the power supply circuit of the receiver should be plainly stamped or otherwise permanently recorded on the rear of the chassis.

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits may be properly aligned with the use of a modulated signal generator and an output meter.

CONNECTING OUTPUT METER

Connect the output meter to the plates of the two 6K6G output tubes. Be certain that the meter is protected from D. C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning The I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6U7G tube, leaving the tube's grid lead in place. Connect the ground lead from the signal generator to the ground terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control knob to the right (ON) and turn the tone control knob to the left (TREBLE).

(c) Turn the band selector switch to the Broadcast Band.

(d) Turn the Local-Distance switch to the "Distance" position.

(e) Set the signal generator to 455 kilocycles.

(f) Adjust both trimmer condensers located on top of the 2nd I-F transformer for maximum output. DO NOT ADJUST THE TRIMMER CONDENSERS LOCATED ON THE 2ND I-F TRANSFORMER WITH THE SIGNAL GENERATOR LEAD CONNECTED TO THE 6A8G TUBE.

(g) Transfer the signal generator lead to the top cap of the 6A8G tube, leaving the tube's grid clip in place.

(h) Close the middle trimmer of the 1st I-F transformer. Do not force adjustment screw.

(i) Adjust the top and then the bottom trimmers of the 1st I-F transformer for maximum output.

(j) Adjust the middle trimmer of the 1st I-F transformer for maximum output.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

Aligning The R-F Amplifier.

When aligning the R-F amplifier the output lead from the signal generator is connected to the antenna (A) terminal of the receiver. For the Broadcast Band a 200 mmf. condenser should be connected in series with the output lead of the signal generator and for the High Frequency Band a 250 ohm carbon resistor should be used in place of the condenser.

(a) With the station selector adjusted so that the tuning condenser plates are completely out of mesh and the band selector switch set for the band being aligned, adjust the "OSC" shunt trimmer so that the MINIMUM CAPACITY SIGNAL ¶ (C) is heard (it is not necessary that the receiver tune through this signal).

(b) Adjust the station selector so that the SHUNT ALIGNMENT signal is tuned-in with maximum output. Then adjust the "ANT" shunt trimmer for maximum output. Readjust the station selector slightly so that the generator signal is tuned-in with maximum output and check the adjustment of the "ANT" trimmer. DO NOT READJUST THE OSCILLATOR TRIMMER.

NOTE: When shunt aligning the High Frequency Band care should be exercised so that the circuits will be aligned on the correct frequency rather than on the image frequency which is approximately 910 kilocycles less than the fundamental. To check on this, increase the output of the signal generator 10 times, or more, and try to tune-in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct frequency.

(C) SIGNAL INPUT FREQUENCIES

	Minimum Capacity Signal	Shunt Alignment Signal
American Broadcast Band	1,725 Kilocycles	1,400 Kilocycles
High Frequency Band	18,300 Kilocycles	18,000 Kilocycles

WAVE TRAP

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the underneath side of the chassis and consists of a coil, a fixed condenser and a trimmer condenser as illustrated by dotted lines in the Wiring Diagram (item 53).

The wave trap should not be adjusted until all other adjustments have been made. To make the adjustment, feed a 455 kilocycle signal from the signal generator through a 200 mmf. condenser into the antenna terminal of the receiver. With the band selector switch turned to the Broadcast Band position, the gang condenser open and the volume control full on, adjust the trimmer condenser on the wave trap for MINIMUM output.

Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles, the exact frequency should be determined with the aid of the signal generator. Then, instead of feeding a 455 kilocycle signal into the receiver the exact frequency of the interfering signal should be used. If it is not possible to determine the exact frequency of the interfering signal the antenna may be attached to the receiver and the receiver tuned to the position where the interfering signal is most noticeable. Then adjust the wave trap for minimum interference.

DYNATROL MOTOR

Should either vibrator unit of the Dynatrol motor need readjustment, the following procedure should be followed:

(a) Loosen the adjusting nut until the drive shaft can be rotated freely between the thumb and forefinger. The gap between the armature and "E" laminations should be approximately 3/16".

(b) With the motor running, tighten the adjusting nut until chatter stops. Care should be taken, however, not to tighten this adjustment too tight as an unstable condition will be reached wherein a slight change may result in a locked motor.

(c) Check the time required for the dial pointer to travel from each end of the dial to the other. The adjusting screws should be set so that approximately eight seconds are required in each direction.

Alignment, Phono.
Data

CROSLEY RADIO CORP.

Aligning The R-F Amplifier.

When aligning the R-F amplifier the output lead from the signal generator is connected to the antenna (A) terminal of the receiver. For the Broadcast Band a 100 mmf. condenser should be connected in series with the output lead of the signal generator and for the High Frequency Band a 400 ohm carbon resistor should be used in place of the condenser.

(a) With the station selector adjusted so that the tuning condenser plates are completely out of mesh and the band selector switch set for the band being aligned, adjust the "OSC" shunt trimmer so that the MINIMUM CAPACITY SIGNAL ¶ (C) is heard (it is not necessary that the receiver tune through this signal).

(b) Adjust the station selector so that the SHUNT ALIGNMENT signal is tuned-in with maximum output. Then adjust the "ANT" shunt trimmer for maximum output. Readjust the station selector slightly so that the generator signal is tuned-in with maximum output and check the adjustment of the "ANT" trimmer. DO NOT READJUST THE OSCILLATOR TRIMMER.

NOTE: When shunt aligning the High Frequency Band care should be exercised so that the circuits will be aligned on the correct frequency rather than on the image frequency which is approximately 910 kilocycles less than the fundamental. To check on this, increase the output of the signal generator 10 times, or more, and try to tune-in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct frequency.

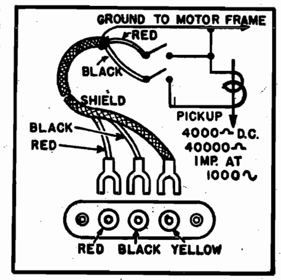

Fig. 4 Phonograph Pickup

(C) SIGNAL INPUT FREQUENCIES

	Minimum Capacity Signal	Shunt Alignment Signal
American Broadcast Band	1,725 Kilocycles	1,400 Kilocycles
High Frequency Band	18,300 Kilocycles	18,000 Kilocycles

WAVE TRAP

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the underneath side of the chassis and consists of a coil, a fixed condenser and a trimmer condenser as illustrated by dotted lines in the Wiring Diagram (item 47).

The wave trap should not be adjusted until all other adjustments have been made. To make the adjustment, feed a 455 kilocycle signal from the signal generator through a 100 mmf. condenser into the antenna terminal of the receiver. With the band selector switch turned to the Broadcast Band position, the gang condenser open and the volume control full on, adjust the trimmer condenser on the wave trap for MINIMUM output.

Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles, the exact frequency should be determined with the aid of the signal generator. Then, instead of feeding a 455 kilocycle signal into the receiver the exact frequency of the interfering signal should be used. If it is not possible to determine the exact frequency of the interfering signal the antenna may be attached to the receiver and the receiver tuned to the position where the interfering signal is most noticeable. Then adjust the wave trap for minimum interference.

SPECIFICATIONS

This model Crosley radio is a 6-tube AC receiver designed for American and Foreign broadcast reception. The tuning range is divided into two bands as follows:

535-1725 Kilocycles or 550-173 Metres (American Broadcast Band)
5.8-18.3 Megacycles or 52-16.3 Metres (High Frequency or Foreign Band)

Circuit Description.

Six octal base glass tubes are employed in a superheterodyne circuit which consists of a combination oscillator-modulator tube, 455 kilocycle I-F amplifier, push pull pentode output and power supply. The 6Q7G tube serves as the detector and 1st A-F amplifier and supplies AVC voltage to the grids of the 6A8G and 6U7G tubes. The speaker field is located in the negative leg of the power supply. The bias voltage for the 6A8G and 6U7G tubes is obtained across a 40 ohm resistor, item 30, the bias for the 6Q7G tube is obtained across a 32 ohm resistor, item 31, and the bias for the output tubes is obtained across a 375 ohm resistor, item 29. Items 30 and 31 are located between the speaker field and ground. Phase inversion is obtained in the output circuit by the voltage developed across a 3000 ohm resistor, item 27.

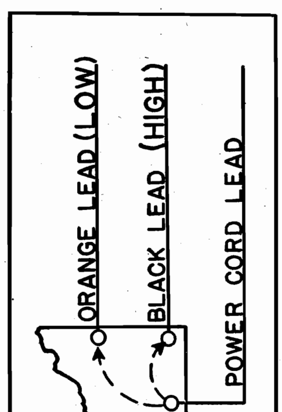
SOCKET VOLTAGES

The tube socket voltages are measured from the tube socket contacts to the chassis with a 1000 ohm per volt, 500-volt D. C. voltmeter (except filaments) with receiver in operating condition and no signal input. The filament voltages should be measured with an accurate low range A. C. voltmeter (approximately 0-10 volts). Readings may vary plus or minus 10% of values given.

50 CYCLE POWER TRANSFORMER ADJUSTMENT

Receivers equipped with a 50 cycle power transformer have a "high" and "low" voltage tap on the under side of the chassis. The "high" voltage lead (BLACK) and the "low" voltage lead (ORANGE) are connected to a terminal strip near the transformer.

The voltage range of the "low" tap of the 95-130 volt transformer is from 95 to 112½ volts and of the "high" tap is from 112½ to 130 volts. The range of the "low" tap of the 190-260 volt transformer is from 190 to 225 volts and of the "high" tap is from 225 to 260 volts.



The accompanying illustration shows the connections for changing from high to low or low to high line voltage. Note the "jumper" wire which is attached to the terminal at which one side of the power cord is attached. The other end of this jumper wire should be connected to the ORANGE or BLACK lead of the transformer primary, according to the line voltage the receiver is to be used on.

NOTE: Any change made in the power supply circuit of the receiver should be plainly stamped or otherwise permanently recorded on the rear of the chassis.

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits may be properly aligned with the use of a modulated signal generator and an output meter.

CONNECTING OUTPUT METER

Connect the output meter to the plates of the two 6K6G Output tubes. Be certain that the meter is protected from D. C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning I-F Amplifier to 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6A8G tube, leaving the tube's grid lead in place. Connect the ground lead from the signal generator to the ground terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control knob to the right (ON) and turn the tone control knob to the left (TREBLE).

(c) Turn the band selector switch to the Broadcast Band.

(d) Set the signal generator to 455 kilocycles.

(e) Adjust both trimmers located on top of the 2nd I-F transformer for maximum output. (Item 6, Fig. 2).

(f) Adjust both trimmers located on top of the 1st I-F transformer for maximum output. (Item 5, Fig. 2).

(g) Check operations (e) and (f) for more accurate adjustment.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

W-44338	Ballast			Variable			

Power output approximately 2.5 watts.
Power consumption approximately 55 watts at 117.5 volts AC or 45 watts at 117.5 volts DC.
Voltage drop across speaker field 50 volts.
All voltage readings given above except filaments will be approximately 40% less if set is measured on 117.5 volt DC power supply.

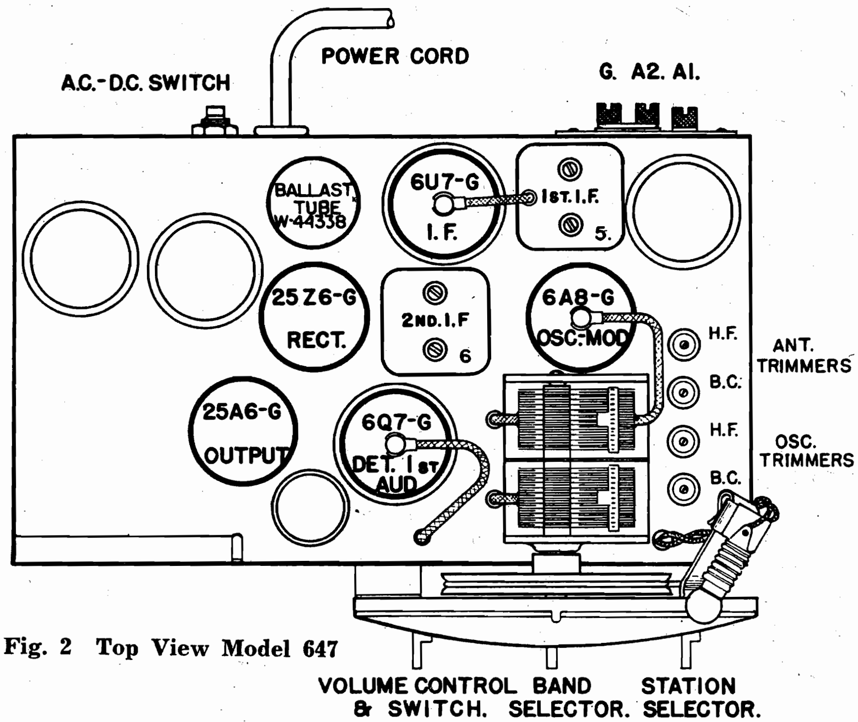

Fig. 2 Top View Model 647

SOCKET VOLTAGES

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and the frame of the condenser gang. Voltage readings should be taken with a 1000 ohm per volt, 250 volt voltmeter (except filaments) with the volume control full "ON" and no signal input. The filament voltages should be measured with an accurate low range voltmeter. Voltage limits may vary plus or minus 10% of the values given.

SPECIFICATIONS

This model Crosley radio is an AC-DC receiver designed for 100 to 125 volt operation. The tuning range is divided into two bands as follows:

535-1725 Kilocycles or 550-173 Metres (American Broadcast Band)
5.8-18.3 Megacycles or 52-16.3 Metres (High Frequency or Foreign Band).

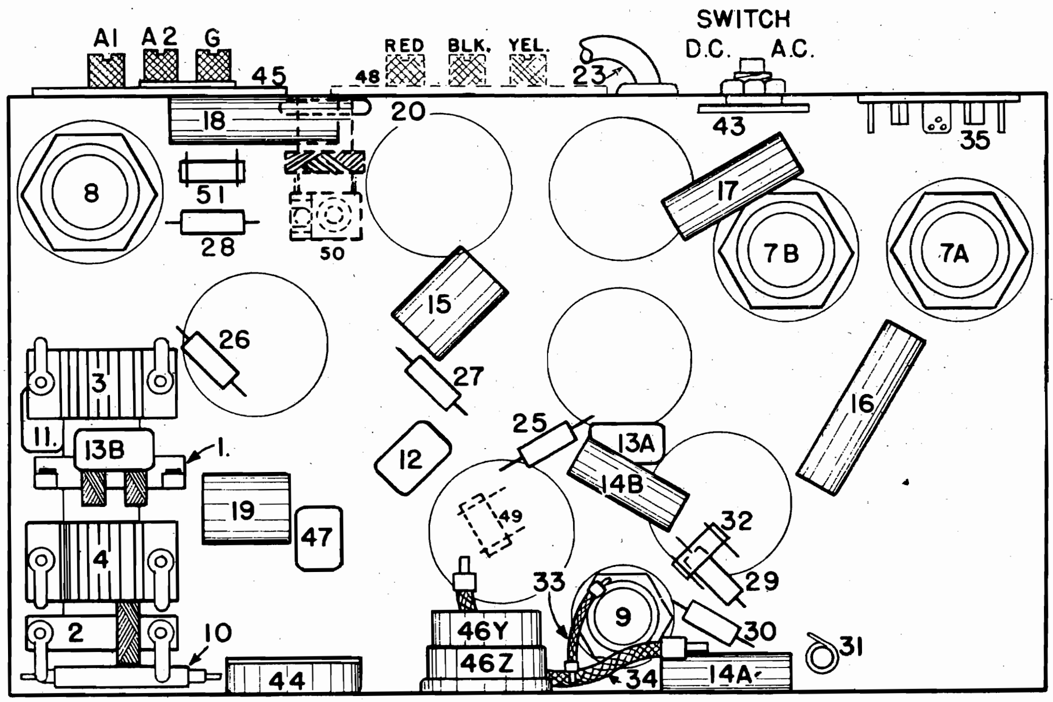

Fig. 3 Bottom View Model 647

CROSLEY RADIO CORP.

CIRCUIT DESCRIPTION

Six octal base glass tubes are employed in a superheterodyne circuit which consists of a combination oscillator-modulator tube, 455 kilocycle I-F amplifier, detector, pentode output and power supply. The 6Q7G tube serves as a detector and 1st audio amplifier and supplies AVC voltage to the grids of the 6A8G and 6U7G tubes. A ballast tube, part No. W-44338, is used in the power supply circuit. The bias voltage for the 6A8G and 6U7G tubes is developed across a 20 ohm resistor, item 33, and the bias voltage for the 6Q7G and 25A6G tubes is developed across a 375 ohm resistor, item 34. The two resistors, items 30 and 31, serve as a voltage divider for the 6Q7G tube. The speaker field is connected across the "B" power supply. A .01 mfd. condenser, item 17, is connected across the power supply leads to reduce electrical interference from that source.

AC-DC SWITCH

A switch is located on the rear of the chassis for the purpose of adapting the receiver to either an AC or DC power supply. To change the position on the switch, remove the screw in the locking bracket and move the end of the bracket to the other position as marked on the chassis. Lock the switch in position by replacing the screw. DO NOT OPERATE THE RECEIVER ON A DC POWER SUPPLY WITH THE SWITCH IN THE "AC" POSITION NOR ON AN AC POWER SUPPLY WITH THE SWITCH IN THE "DC" POSITION AS IT WILL CAUSE DAMAGE TO THE RECEIVER PARTS.

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits can best be properly aligned with the use of a modulated signal generator and an output meter.

CONNECTING OUTPUT METER

Connect one terminal of the output meter to the plate and the other terminal to the screen of the 25A6G output tube. Be certain that the meter is protected from DC by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning I-F Amplifier to 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd. condenser to the antenna terminal "A1" on the rear of the chassis. Connect the ground lead from the signal generator to the GROUND TERMINAL "G" on the receiver chassis. DO NOT CONNECT THE GROUND LEAD FROM THE SIGNAL GENERATOR DIRECTLY TO THE RECEIVER CHASSIS. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the plates of the condenser gang are completely out of mesh, turn the band selector switch to the left (American Broadcast Band) and turn the volume control to the right "ON."

(c) Set the signal generator to 455 kilocycles.

(d) Adjust both trimmer condensers located on top of the 2nd I-F transformer (Fig. 2) for maximum reading on the output meter.

(e) Adjust both trimmer condensers located on top of the 1st I-F transformer for maximum output.

(f) Check operations (d) and (e) for more accurate adjustments.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

Aligning R-F Amplifier.

When aligning the R-F amplifier the output lead from the signal generator is connected to the antenna (A) terminal of the receiver. For the Broadcast Band a 100 mmf. condenser should be connected in series with the output lead of the signal generator and for the High Frequency Band a 400 ohm carbon resistor should be used in place of the condenser.

(a) With the station selector adjusted so that the tuning condenser plates are completely out of mesh and the band selector switch is set for the band being aligned, adjust the "OSC" shunt trimmer so that the MINIMUM CAPACITY SIGNAL ¶ (C), is heard. It is not necessary that the receiver tune through this signal.

(b) Adjust the station selector so that the SHUNT ALIGNMENT signal is tuned-in with maximum output. Then adjust the "ANT" shunt trimmer for maximum output. Readjust the station selector slightly so that the generator signal is tuned-in with maximum output and check the adjustment of the "ANT" trimmer. DO NOT READJUST THE "OSC" TRIMMER.

NOTE 1: When shunt aligning the High Frequency Band care should be exercised so that the circuits will be aligned on the correct frequency rather than on the image frequency which is approximately 910 kilocycles less than the fundamental. To check on this, increase the output of the signal generator 10 times, or more, and try to tune-in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct frequency.

NOTE 2: If at any time the H-F coils are replaced, it may be necessary to vary the inductance of the "OSC" coil by moving the cross-over turn of wire at the gap to make the set track at the 6 megacycle end. Moving the turn toward the short end of the coil will decrease the inductance and moving it toward the long end will increase the inductance. If the signal is weak at 6 megacycles, a similar slight change in the inductance of the "ANT" coil should bring up the signal strength. THIS IS A CRITICAL OPERATION AND SHOULD NOT BE DONE ON ANY SET UNLESS CHANGING COILS MAKES IT NECESSARY.

(C) SIGNAL INPUT FREQUENCIES

	Minimum Capacity	Shunt Alignment
American Broadcast Band	1,725 Kilocycles	1,400 Kilocycles
High Frequency Band	18,300 Kilocycles	18,000 Kilocycles

WAVE TRAP

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the underneath side of the chassis and consists of a coil, a fixed condenser and a trimmer condenser as illustrated by dotted lines in the Wiring diagram.

The wave trap should not be adjusted until all other adjustments have been made. To make the adjustment, feed a 455 kilocycle signal from the signal generator through a 100 mmf. condenser into the antenna terminal of the receiver. With the band selector switch turned to the Broadcast Band position, the gang condenser open and the volume control full on, adjust the trimmer condenser on the wave trap for MINIMUM output.

Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles, the exact frequency should be determined with the aid of the signal generator. Then, instead of feeding a 455 kilocycle signal into the receiver the exact frequency of the interfering signal should be used. If it is not possible to determine the exact frequency of the interfering signal the antenna may be attached to the receiver and the receiver tuned to the position where the interfering signal is most noticeable. Then adjust the wave trap for minimum interference.

MODEL 817
Alignment, Phono. Data, Parts

CROSLEY RADIO CORP.

This model Crosley radio is an 8-tube AC receiver designed for American and Foreign broadcast reception. The tuning range is from 540 kilocycles to 22 megacycles and is divided into three bands as follows:

540-1850 Kilocycles or 555-162 Metres (American Broadcast Band)
1.9- 6.6 Megacycles or 158-45.5 Metres (Police & Amateur Band)
6.4- 22 Megacycles or 47-13.5 Metres (High Frequency or Foreign Band)

Circuit Description.

Eight octal base glass tubes are employed in a superheterodyne circuit which consists of separate oscillator and modulator tubes, two stages of I-F amplification—the second of which is resistance coupled, a combination AVC and diode detector and 1st A-F amplifier tube, push pull output and power supply. The speaker field is located in the negative leg of the power supply. The bias for all tubes except the output is developed across a 40 ohm resistor, item 39, located between the speaker field and ground. Phase inversion is obtained in the output circuit by the voltage developed across a 3000 ohm resistor, item 42A, located in the screen circuit of one of the output tubes, item 45B.

SOCKET VOLTAGES

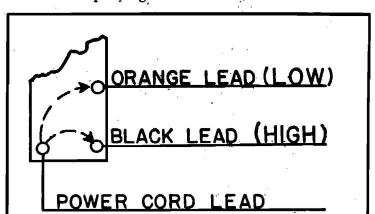
The tube socket voltages are measured from the tube socket contacts to the chassis with a 1000 ohm per volt, 500-volt D. C. voltmeter (except filaments) with receiver in operating condition and no signal input. The filament voltages should be measured with an accurate low range A. C. voltmeter (approximately 0-10 volts). Readings may vary plus or minus 10% of values given.

50 CYCLE POWER TRANSFORMER ADJUSTMENT

Receivers equipped with a 50 cycle power transformer have a "high" and "low" voltage tap on the under side of the chassis. The "high" voltage lead (BLACK) and the "low" voltage lead (ORANGE) are connected to a terminal strip near the transformer.

The voltage range of the "low" tap of the 95-130 volt transformer is from 95 to 112½ volts and of the "high" tap is from 112½ to 130 volts. The range of the "low" tap of the 190-260 volt transformer is from 190 to 225 volts and of the "high" tap is from 225 to 260 volts.

The accompanying illustration shows the connections



for changing from high to low or low to high line voltage. Note the "jumper" wire which is attached to the terminal at which one side of the power cord is attached. The other end of this jumper wire should be connected to the ORANGE or BLACK lead of the transformer primary, according to the line voltage the receiver is to be used on.

NOTE: Any change made in the power supply circuit of the receiver should be plainly stamped or otherwise permanently recorded on the rear of the chassis.

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits may be properly aligned with the use of a modulated signal generator and an output meter.

CONNECTING OUTPUT METER

Connect the output meter to the plates of the two 6K6G Output tubes. Be certain that the meter is protected from D. C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning I-F Amplifier to 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6A8G tube, leaving the tube's grid lead in place. Connect the ground lead from the signal generator to the ground terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control knob to the right (ON) and turn the tone control knob to the left (TREBLE).

(c) Turn the band selector switch to the High Frequency Band.

(d) Set the signal generator to 455 kilocycles.

(e) Adjust both trimmers located on top of the 2nd I-F assm. for maximum output. (Item 9, Fig. 2)

(f) Adjust both trimmers located on top of the 1st I-F assm. for maximum output. (Item 8, Fig. 2)

(g) Check operations (e) and (f) for more accurate adjustment.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.

Aligning R-F Amplifier.

When aligning the R-F amplifier the output lead from the signal generator is connected to the "ANT" terminal of the receiver. For the Broadcast and Police Bands a .00025 mfd. condenser should be connected in series with the output lead of the signal generator and for the High Frequency band a 400 ohm carbon resistor should be used in place of the condenser.

Each band should first be shunt aligned and then series aligned where provision is made for series alignment (Broadcast Band). The band selector switch should be set for the band being aligned and the station selector and signal generator should be set to the frequency indicated for each adjustment, paragraph (c) below.

(a) Adjust the "OSC" and "ANT" shunt trimmers in the order given for maximum output. Readjust the station selector slightly so that the generator signal is tuned-in with maximum output and then check the adjustment of the "ANT" trimmer. DO NOT READJUST THE "OSC" TRIMMER.

NOTE: When shunt aligning the Police and High Frequency Bands care must be exercised so that the circuits will be aligned on the correct frequency rather than on the image frequency which is approximately 910 kilocycles less than the fundamental. To check on this, increase the output of the signal generator ten times, or more, to try to tune-in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct frequency.

(b) To align the B. C. OSC. series trimmer (Fig 2), set the signal generator to the frequency indicated below and then tune-in this signal with the station selector for maximum output. To obtain the best adjustment for the series trimmer, it will be necessary to rotate the station selector back and forth slightly while adjusting the trimmer for maximum output.

(C) SIGNAL INPUT FREQUENCIES

	Shunt Alignment	Series Align.
American Broadcast Band	1700 Kilocycles	600 Kilocycles
Police & Amateur Band	6000 "	——
Foreign Band	18 Megacycles	——

WAVE TRAP

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the underneath side of the chassis and consists of a coil, a fixed condenser and a trimmer condenser as illustrated by dotted lines in the Wiring Diagram (item 60).

The wave trap should not be adjusted until all other adjustments have been made. To make the adjustment, feed a 455 kilocycle signal from the signal generator through a .00025 mfd. condenser into the antenna terminal of the receiver. With the band selector switch turned to the Broadcast Band position, the gang condenser open and the volume control full on, adjust the trimmer condenser on the wave trap for minimum output.

Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles, the exact frequency should be determined with the aid of the signal generator. Then, instead of feeding a 455 kilocycle signal into the receiver the exact frequency of the interfering signal should be used. If it is not possible to determine the exact frequency of the interfering signal the antenna may be attached to the receiver and the receiver tuned to the position where the interfering signal is most noticeable. Then adjust the wave trap for minimum interference.

PARTS LIST—MODEL 817

MODEL 1117 Late
Schematic, Socket

CROSLEY RADIO CORP.

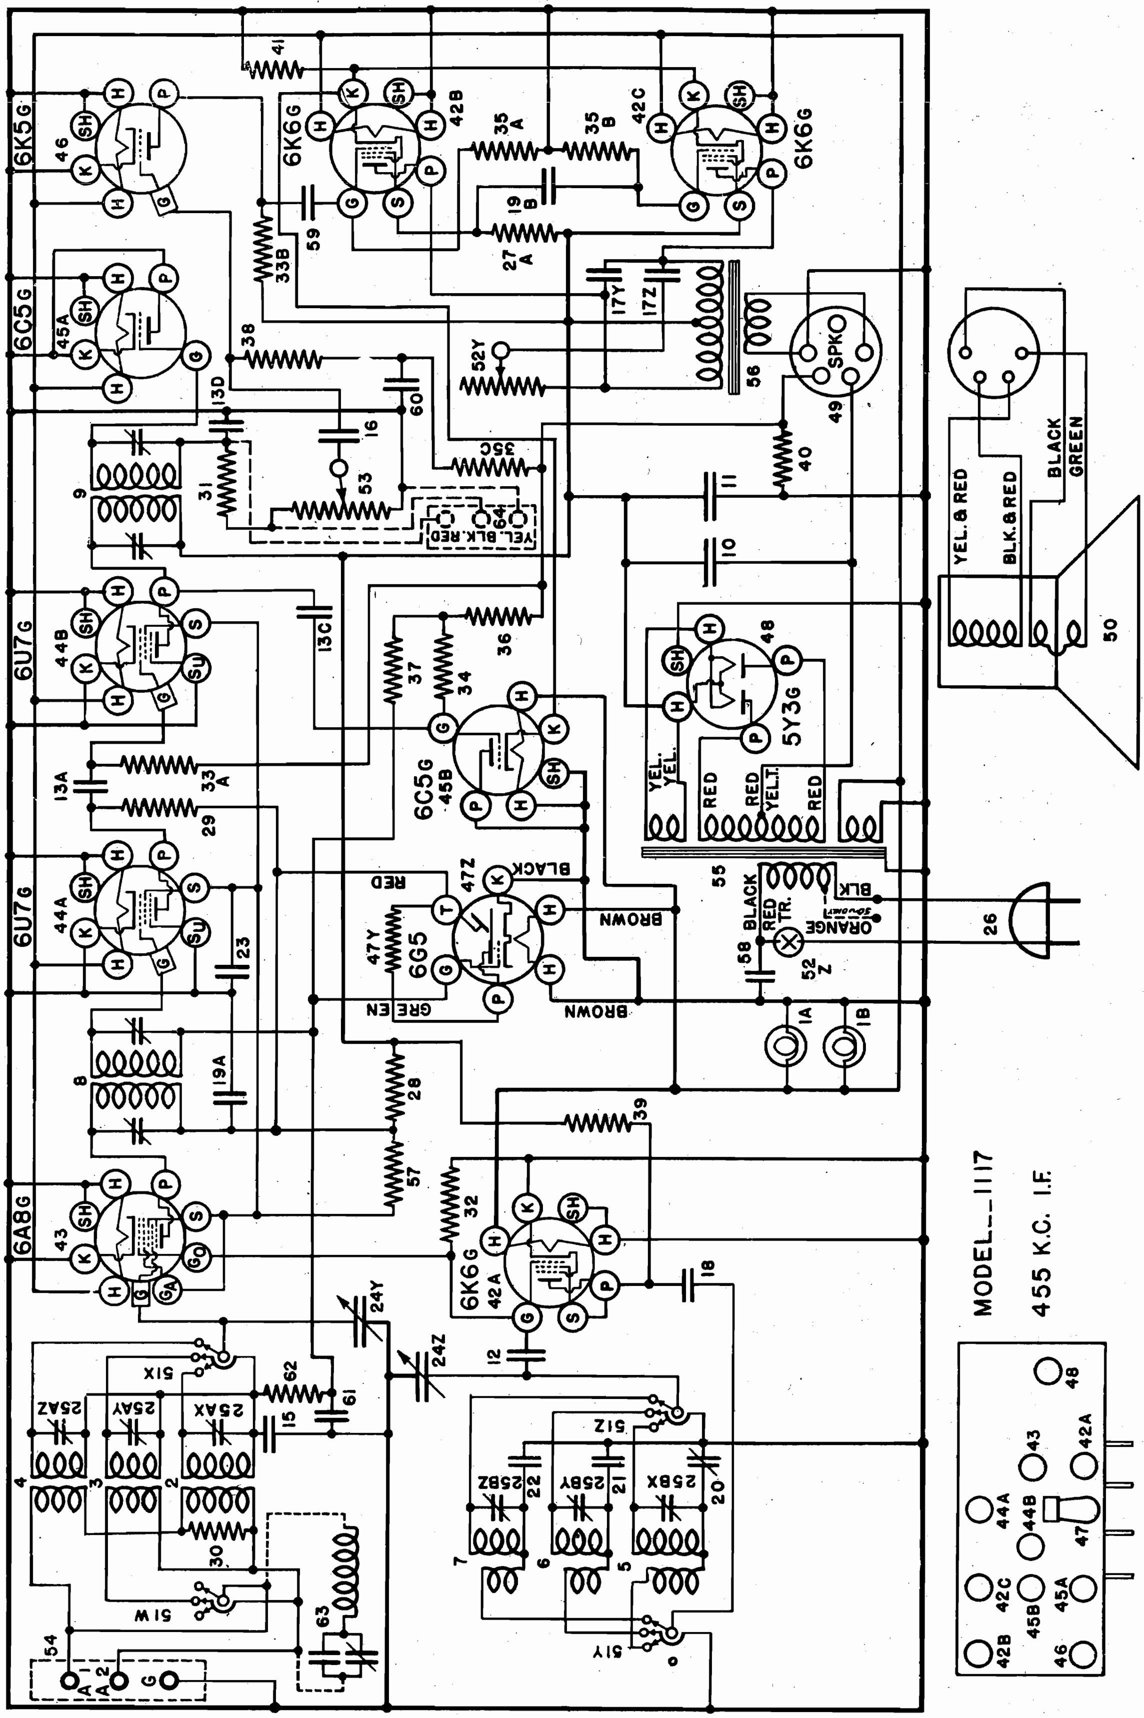

FIG. 1-A—WIRING DIAGRAM—MODEL 1117 SERIES 2

CROSLEY RADIO CORP.

This model Crosley radio is an AC receiver designed for American and Foreign broadcast reception. The tuning range is from 540 kilocycles to 22 megacycles and is divided into three bands as follows:

540-1850 Kilocycles or 555-162 Metres (American Broadcast Band)
1.9- 6.6 Megacycles or 158-45.5 Metres (Police & Amateur Band)
6.4- 22 Megacycles or 47-13.5 Metres (High Frequency or Foreign Band)

Circuit Description

Eleven tubes are employed in a superheterodyne circuit. The 6G5 electron ray tube is used for indicating exact tuning and is designated IRIS TUNING INDICATOR. When a station is tuned-in, the greenish glow on each side of the tube increases in width, forming a narrow shadow at the bottom of the window. Only strong signals, however, will reduce the shadow to a narrow line.

The circuit consists of separate oscillator and modulator tubes, two stages of I-F amplification—the second of which is resistance coupled, separate AVC and detector diodes, two stages of audio amplification and power supply. The speaker field is located in the negative leg of the power supply. The bias for all tubes except the output is developed across a 32 ohm resistor, item 40, located between the speaker field and ground. Phase inversion is obtained in the output circuit by the voltage developed across a 3000 ohm resistor, item 27A, located in the screen circuit of one of the output tubes, item 42B.

SOCKET VOLTAGES

The tube socket voltages are measured from the tube socket contacts to the chassis with 1000 ohm per volt, 500 volt D. C. voltmeter (except filaments) with the receiver in operating condition and no signal input. The volume control should be turned full on, the tone control should be turned to the TREBLE position (counter-clockwise) and the tuning condenser should be turned to the minimum capacity position. The filament voltages should be measured with an accurate low range A. C. voltmeter (approximately 0-10 volts). Readings may vary plus or minus 10% of values given.

CIRCUIT CHANGES

Fig. 1-A is a revised Wiring Diagram, showing the following circuit changes after serial No. 1343902:

Item 13B Part No. G2-34002, 100 mmf. cond. deleted.
" 14 Part No. G1-34002, 250 mmf. cond. deleted.
" 27B Part No. 44009, 3000 ohm ¼-w resistor deleted.
" 41 Part No. W-21965, 375 ohm 1 W resistor superseded by Part No. 22873.
" 61 Part No. W-28621 added.
" 62 Part No. 35600 added.

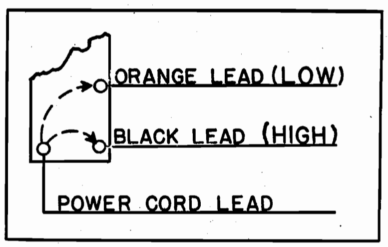
In the later series a shielded lead between items 16 and 53 was found to reduce audio degeneration and thus materially improve the tone quality.

50 CYCLE POWER TRANSFORMER ADJUSTMENT

Receivers equipped with a 50 cycle power transformer have a "high" and "low" voltage tap on the under side of the chassis. The "high" voltage lead (BLACK) and the "low" voltage lead (ORANGE) are connected to a terminal strip near the transformer.

The voltage range of the "low" tap of the 95-130 volt transformer is from 95 to 112½ volts and of the "high" tap is from 112½ to 130 volts. The range of the "low" tap of the 190-260 volt transformer is from 190 to 225 volts and of the "high" tap is from 225 to 260 volts.

The accompanying illustration shows the connections for changing from high to low or low to high line voltage. Note the "jumper" wire which is attached to the terminal at which one side of the power cord is attached. The other end of this jumper wire should be connected to the ORANGE or BLACK lead of the transformer primary, according to the line voltage the receiver is to be used on.



NOTE: Any change made in the power supply circuit of the receiver should be plainly stamped or otherwise permanently recorded on the rear of the chassis.

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits may be properly aligned with the use of a modulated signal generator and an output meter.

CONNECTING OUTPUT METER

Connect the output meter to the plates of the two 6K6G output tubes. Be certain that the meter is protected from D. C. by a condenser (.1 mfd. or larger—not electroyltic) in series with one of the leads.

Tuning The I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6A8G tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the ground terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control knob to the right (ON) and turn the tone control knob to the left (TREBLE).

(c) Set the band selector switch on the Broadcast Band.

(d) Set the signal generator to 455 kilocycles.

(e) Adjust both trimmers located on top of the 2nd I-F transformer for maximum output.

(f) Adjust both trimmers located on top of the 1st I-F transformer for maximum output.

(g) Check operations (e) and (f) for more accurate adjustment.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.

Aligning The R-F Amplifier.

When aligning the R-F amplifier the output lead from the signal generator is connected to the "ANT" terminal of the receiver. For the Broadcast Band a .00025 mfd. condenser should be connected in series with the output lead of the signal generator and for the High Frequency and Police Bands a 400 ohm carbon resistor should be used in place of the condenser.

Each band should first be SHUNT ALIGNED and then SERIES ALIGNED where provision is made for series alignment (Broadcast Band). The band selector switch should be set for the band being aligned and the signal generator should be set to the frequency indicated for each adjustment, pp (d) below.

(a) With the station selector adjusted so that the tuning condenser plates are completely out of mesh, adjust the "OSC" shunt trimmer until the MINIMUM CAPACITY SIGNAL (d) is heard (it is not necessary that the receiver tune through this signal).

(b) Adjust the station selector so that the SHUNT ALIGNMENT SIGNAL (d) is tuned-in with maximum output. Then adjust the "ANT" shunt trimmer for maximum output. Readjust the station selector slightly so that the generator signal is tuned-in with maximum output and check the adjustment of the "ANT" trimmer. DO NOT READJUST THE OSCILLATOR TRIMMER.

NOTE: When shunt aligning the Police and High Frequency Bands care must be exercised so that the circuits will be aligned on the correct frequency rather than on the image frequency which is approximately 910 kilocycles less than the fundamental. To check on this, increase the output of the signal generator ten times, or more, and try to tune-in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct frequency.

(c) To align the series trimmer (See Fig. 2), set the signal generator to the frequency indicated below (d) and then tune-in this signal with the station selector for maximum output. To obtain the best adjustment for the series trimmer, it will be necessary to rotate the station selector back and forth slightly while adjusting the trimmer for maximum output. Minor tolerance variations in series alignment at 2500 kilocycles in the Police Band and at 7000 kilocycles in the High Frequency Band may be compensated for by slight repositioning of the grid lead of the antenna coil in the Band affected.

(D) SIGNAL INPUT FREQUENCIES

	Min. Cap. Signal	Shunt Align.	Series Align.
American Broadcast Band	1850 Kilocycles	1700 Kilocycles	600 Kilocycles
Police & Amateur Band	6600 "	6000 "	
High Frequency Band	22 Megacycles	18 Megacycles	

WAVE TRAP

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the underneath side of the chassis and consists of a coil, a fixed condenser and a trimmer condenser as illustrated by dotted lines in the Wiring Diagram. Item 63, Fig. 1A.

The wave trap should not be adjusted until all other adjustments have been made. To make the adjustment, feed a 455 kilocycle signal from the signal generator through a .00025 mfd. condenser into the antenna terminal of the receiver. With the band selector switch turned to the Broadcast Band position, the gang condenser open and the volume control full on, adjust the trimmer condenser on the wave trap for minimum output.

Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles, the exact frequency should be determined with the aid of the signal generator. Then, instead of feeding a 455 kilocycle signal into the receiver the exact frequency of the interfering signal should be used. If it is not possible to determine the exact frequency of the interfering signal the antenna may be attached to the receiver and the receiver tuned to the position where the interfering signal is most noticeable. Then adjust the wave trap for minimum interference.

Power output approximately 10 watts.
Voltage drop across speaker field 60 volts.

CROSLEY RADIO CORP.

This model Crosley radio is an AC receiver designed for American and Foreign broadcast reception. Electric tuning is accomplished in this model by means of the Dynatrol motor which is a vibrating type. Other features include electron ray tuning indicator, automatic volume control, Local-Distance switch and parallel pentode output. The tuning range is from 540 kilocycles to 22 megacycles and is divided into three bands as follows:

540-1850 Kilocycles or	555 162 Metres	(American Broadcast Band)
1.9- 6.6 Megacycles or	158-45.5 Metres	(Police and Amateur Band)
6.4- 22 Megacycles or	47-13.5 Metres	(High Frequency or Short Wave Band).

SPECIAL POWER TRANSFORMER ADJUSTMENT

In localities where the voltage variation on 50 or 60 cycle power supply lines is greater than customary commercial limits, special 50-60 cycle power transformers are available. These transformers have a "high" and "low" voltage tap on the underside of the chassis. The "high" voltage lead (BLACK) and the "low" voltage lead (ORANGE) are connected to a terminal strip near the transformer.

The voltage range of the "low" tap of the 95-130 volt transformer is from 95 to 112½ volts and the "high" tap is from 112½ to 130 volts. The range of the "low" tap of the 190-260 volt transformer is from 190 to 225 volts and of the "high" tap is from 225 to 260 volts.

The accompanying illustration shows the connections for changing from high to low or low to high line voltage. Note the "jumper" wire which is attached to the terminal at which one side of the power cord is attached. The other end of this jumper wire should be connected to the ORANGE or BLACK lead of the transformer primary, according to the line voltage the receiver is to be used on.

NOTE: Any change made in the power supply circuit of the receiver should be plainly stamped or otherwise permanently recorded on the rear of the chassis.

Circuit Description

Eleven tubes are employed in a superheterodyne circuit. The 6T5 electron ray tube is used for indicating exact tuning and is designated "IRIS TUNING INDICATOR." When a station is tuned-in the greenish glow in the tube increases in width, forming a small circular shadow around the center disc. Only strong signals, however, will reduce the shadow to a very small circle.

The circuit consists of separate oscillator and modulator tubes, two stages of I-F amplification—the second of which is resistance coupled, separate AVC and detector diodes, two stages of audio amplification and power supply. The 1st I-F transformer is a triple-tuned unit, which in conjunction with the Local-Distance switch, controls the selectivity of the receiver. The speaker field is located in the negative leg of the power supply. The bias for all tubes except the output and AVC diode is developed across a 32 ohm resistor, item 40, located between the speaker field and ground.

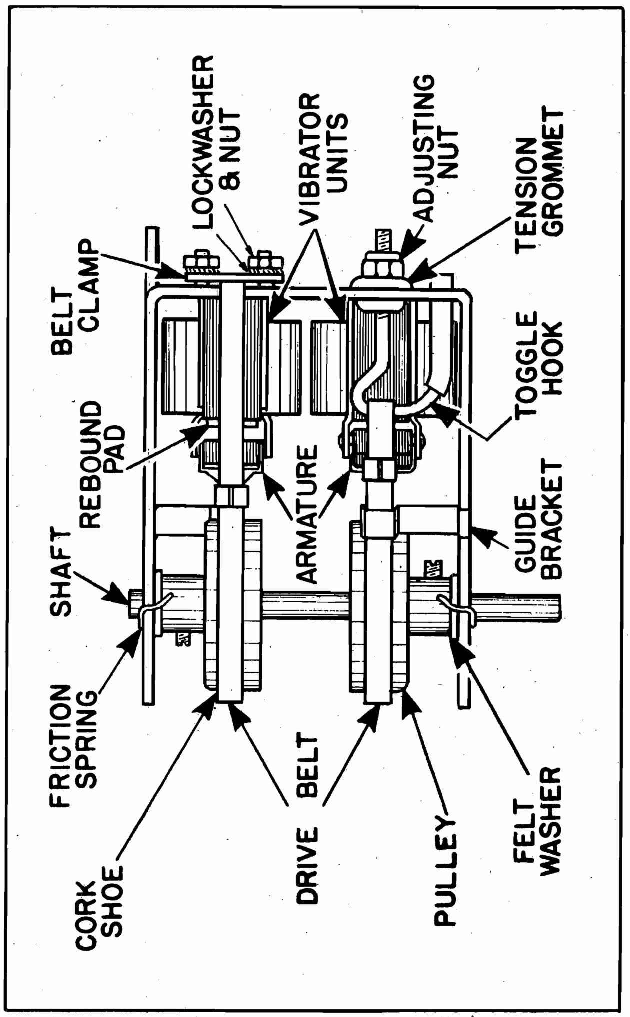

Fig. 5—Dynatrol Motor

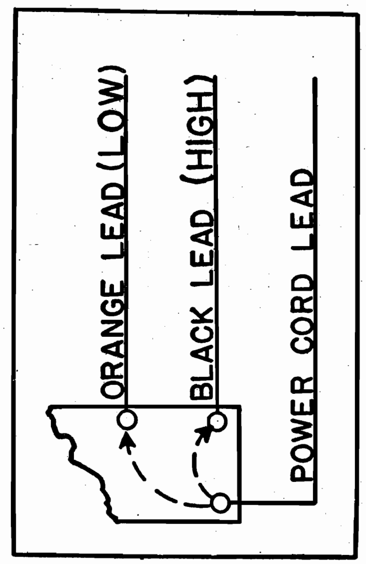

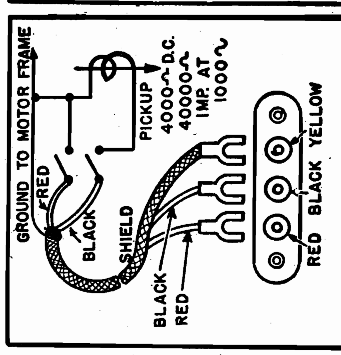

Fig 4—Phonograph Pickup

CROSLEY RADIO CORP.

CONNECTING OUTPUT METER

Connect the output meter to the plates of the two 6K6G output tubes. Be certain that the meter is protected from D. C. by a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning The I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6U7G 1st I-F Amp. tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the ground terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control knob to the right (ON) and turn the tone control knob to the left (TREBLE).

(c) Set the band selector switch on the Broadcast Band.

(d) Turn the Local-Distance switch to the "Distance" position.

(e) Set the signal generator to 455 kilocycles.

(f) Adjust both trimmer condensers located on top of the 2nd I-F transformer for maximum output. DO NOT ADJUST THE TRIMMER CONDENSERS LOCATED ON THE 2ND I-F TRANSFORMER WITH THE SIGNAL GENERATOR LEAD CONNECTED TO THE 6A8G TUBE.

(g) Transfer the signal generator lead to the top cap of the 6A8G tube, leaving the tube's grid clip in place.

(h) Close the middle trimmer of the 1st I-F transformer. (Do not force adjustment screw).

(i) Adjust the top and then the bottom trimmers of the 1st I-F transformer for maximum output.

(j) Adjust the middle trimmer of the 1st I-F transformer for maximum output.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.

Aligning The R-F Amplifier.

When aligning the R-F amplifier the output lead from the signal generator is connected to the "ANT" terminal of the receiver. For the Broadcast Band a 200 mmf. condenser should be connected in series with the output lead of the signal generator and for the High Frequency and Police Bands a 400 ohm carbon resistor should be used in place of the condenser.

Each band should first be SHUNT ALIGNED and then SERIES ALIGNED where provision is made for series alignment (Broadcast Band). The band selector switch should be set for the band being aligned and the signal generator should be set to the frequency indicated for each adjustment, ¶ (D) below.

(a) With the station selector adjusted so that the tuning condenser plates are completely out of mesh, adjust the "OSC" shunt trimmer until the MINIMUM CAPACITY SIGNAL (D) is heard (it is not necessary that the receiver tune through this signal).

(b) Adjust the station selector so that the SHUNT ALIGNMENT SIGNAL (D) is tuned-in with maximum output. Then adjust the "ANT" shunt trimmer for maximum output. Readjust the station selector slightly so that the generator signal is tuned-in with maximum output and check the adjustment of the "Ant" trimmer. DO NOT READJUST THE OSCILLATOR TRIMMER.

NOTE: When shunt aligning the Police and High Frequency Bands, care must be exercised so that the circuits will be aligned on the correct frequency rather than on the image frequency which is approximately 910 kilocycles less than the fundamental. To check on this, increase the output of the signal generator ten times or more, and try to tune-in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct frequency.

(c) To align the series trimmer (See Fig. 2), set the signal generator to the frequency indicated below (D) and then tune-in this signal with the station selector for maximum output. To obtain the best adjustment for the series trimmer, it will be necessary to rotate the station selector back and forth slightly while adjusting the trimmer for maximum output. Minor tolerance variations in series alignment at 2600 kilocycles in the Police Band and at 7,000 kilocycles in the High Frequency Band may be compensated for by slight repositioning of the grid lead of the antenna coil in the Band affected.

(D) SIGNAL INPUT FREQUENCIES

	Min. Cap. Signal	Shunt Align.	Series Align.
American Broadcast Band	1850 Kilocycles	1700 Kilocycles	600 Kilocycles
Police & Amateur Band	6600 Kilocycles	6000 Kilocycles	
High Frequency Band	22 Megacycles	18 Megacycles	

WAVE TRAP

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the underneath side of the chassis and consists of a coil, a fixed condenser and a trimmer condenser as illustrated by dotted lines in the Wiring Diagram. Item 61, Fig. 1.

The wave trap should not be adjusted until all other adjustments have been made. To make the adjustment, feed a 455 kilocycle signal from the signal generator through a 200 mmf. condenser into the antenna terminal of the receiver. With the band selector switch turned to the Broadcast Band position, the gang condenser open and the volume control full on, adjust the trimmer condenser on the wave trap for minimum output.

Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles, the exact frequency should be determined with the aid of the signal generator. Then, instead of feeding a 455 kilocycle signal into the receiver the exact frequency of the interfering signal should be used. If it is not possible to determine the exact frequency of the interfering signal the antenna may be attached to the receiver and the receiver tuned to the position where the interfering signal is most noticeable. Then adjust the wave trap for minimum interference.

DYNATROL MOTOR

Should either vibrator unit of the Dynatrol motor need readjustment, the following procedure should be followed:

(a) Loosen adjusting nut until the gap between the armature and "E" laminations is approximately 3/16".

The belt should be just loose enough that the drive shaft can be rotated freely between the thumb and forefinger.

(b) With the motor running, tighten the adjusting nut until chatter stops. Care should be taken, however, not to tighten this adjustment too tight as an unstable condition will be reached wherein a slight change may result in a locked motor.

(c) Check the time required for the dial pointer to travel from each end of the dial to the other. The adjusting screws should be set so that approximately eight seconds are required in each direction.

SOCKET VOLTAGES

The tube socket voltages are measured from the tube socket contacts to the chassis with 1000 ohm per volt, 500 volt D. C. voltmeter (except filaments) with the receiver in operating condition and no signal input. The volume control should be turned full on, the tone control should be turned to the TREBLE position (counterclockwise) and the tuning condenser should be turned to the minimum capacity position. The filament voltages should be measured with an accurate low range A. C. voltmeter (approximately 0-10 volts). Readings may vary plus or minus 10% of values given.

5Y3G	Rectifier	5.0	—	—	—	270	—	—

Power consumption approximately 90 watts at 117.5 volts.
Power output approximately 10 watts.
Voltage drop across speaker field 60 volts.

CROSLEY RADIO CORP.

This model Crosley radio is an 11-tube AC receiver designed for American and Foreign broadcast reception. It incorporates such features as push-button electric tuning, automatic volume control, Local-Distance switch and parallel pentode output. The tuning range is from 540 kilocycles to 22 megacycles and is divided into three bands as follows:

540-1850 Kilocycles	or	555-162 Metres	(American Broadcast Band)
1.9- 6.6 Megacycles	or	158-45.5 Metres	(Police & Amateur Band)
6.4- 22 Megacycles	or	47-13.5 Metres	(High Frequency or Foreign Band)

SPECIAL POWER TRANSFORMER ADJUSTMENT

In localities where the voltage variation on 50 or 60 cycle power supply lines is greater than customary commercial limits, special 50-60 cycle power transformers are available. These transformers have a "high" and "low" voltage tap on the under side of the chassis. The "high" voltage lead (BLACK) and the "low" voltage lead (ORANGE) are connected to a terminal strip near the transformer.

The voltage range of the "low" tap of the 95-130 volt transformer is from 95 to 112½ volts and of the "high" tap is from 112½ to 130 volts. The range of the "low" tap of the 190-260 volt transformer is from 190 to 225 volts and of the "high" tap is from 225 to 260 volts.

The accompanying illustration shows the connections for changing from high to low or low to high line voltage. Note the "jumper" wire which is attached to the terminal at which one side of the power cord is attached. The other end of this jumper wire should be connected to the ORANGE or BLACK lead of the transformer primary, according to the line voltage the receiver is to be used on.

NOTE: Any change made in the power supply circuit of the receiver should be plainly stamped or otherwise permanently recorded on the rear of the chassis.

ALIGNMENT PROCEDURE

Connecting Output Meter

Connect the output meter to the plates of the two 6K6G output tubes. Be certain that the meter is protected from D. C. by a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning The I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6U7G 1st I-F Amp. tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the ground terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control knob to the right (ON) and turn the tone control knob to the left (TREBLE).

(c) Set the band selector switch on the Broadcast Band.

(d) Turn the Local-Distance Switch to the "Distance" position.

(e) Set the signal generator to 455 kilocycles.

(f) Adjust both trimmer condensers located on top of the 2nd I-F transformer for maximum output. DO NOT ADJUST THE TRIMMER CONDENSERS LOCATED ON THE 2ND I-F TRANSFORMER WITH THE SIGNAL GENERATOR LEAD CONNECTED TO THE 6A8G TUBE.

(g) Transfer the signal generator lead to the top cap of the 6A8G tube, leaving the tube's grid clip in place.

(h) Close the middle trimmer of the 1st I-F transformer. (Do not force adjustment screw).

(i) Adjust the top and then the bottom trimmers of the 1st I-F transformer for maximum output.

(j) Adjust the middle trimmer of the 1st I-F transformer for maximum output.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.

Aligning The R-F Amplifier.

When aligning the R-F amplifier the output lead from the signal generator is connected to the "ANT" terminal of the receiver. For the Broadcast Band a 200 mmf. condenser should be connected in series with the output lead of the signal generator and for the High Frequency and Police Bands a 400 ohm carbon resistor should be used in place of the condenser.

Each band should first be SHUNT ALIGNED and then SERIES ALIGNED where provision is made for series alignment (Broadcast Band). The band selector switch should be set for the band being aligned and the signal generator should be set to the frequency indicated for each adjustment, ¶ (D) below.

(a) With the station selector adjusted so that the tuning condenser plates are completely out of mesh, adjust the "OSC" shunt trimmer until the MINIMUM CAPACITY SIGNAL (D) is heard (it is not necessary that the receiver tune through this signal).

(b) Adjust the station selector so that the SHUNT ALIGNMENT SIGNAL (D) is tuned-in with maximum output. Then adjust the "R-F" and "ANT" shunt trimmers for maximum ouput. Readjust the station selector slightly so that the generator signal is tuned-in with maximum output and check the adjustment of the "R-F" and "ANT" trimmers. DO NOT READJUST THE OSCILLATOR TRIMMER.

NOTE: When shunt aligning the Police and High Frequency Bands care must be exercised so that the circuits will be aligned on the correct frequency rather than on the image frequency which is approximately 910 kilocycles less than the fundamental. To check on this, increase the output of the signal generator ten times, or more, and try to tune-in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct frequency.

(c) To align the series trimmer (See Fig. 2), set the signal generator to the frequency indicated below (D) and then tune-in this signal with the station selector for maximum output. To obtain the best adjustment for the series trimmer, it will be necessary to rotate the station selector back and forth slightly while adjusting the trimmer for maximum output. Minor tolerance variations in series alignment at 2500 kilocycles in the Police Band and at 7000 kilocycles in the High Frequency Band may be compensated for by slight repositioning of the grid lead of the antenna coil in the Band affected.

(D) SIGNAL INPUT FREQUENCIES

	Min. Cap. Signal	Shunt Align.	Series Align.
American Broadcast Band	1850 Kilocycles	1700 Kilocycles	600 Kilocycles
Police & Amateur Band	6600 Kilocycles	6000 Kilocycles	
High Frequency Band	22 Megacycles	18 Megacycles	

PUSH BUTTON TUNING SYSTEM

The push button electric tuning system employed in this receiver incorporates eight push buttons, a selector switch and a dynatrol motor. The discriminator switch, item 59 — also Figs. 6 and 7, incorporates eight metallic discs, each of which operates in conjunction with a different push button to tune-in some favorite station. That is, the 1st push button on the left as you face the front of the cabinet works with No. 1 disc, and the 2nd push button works with No. 2 disc, etc.

SETTING PUSH BUTTONS

To set the electric tuning system, turn the receiver "ON" and hold No. 1 push button in the depressed position until the dial pointer stops. The key slot in No. 1 disc on the selector switch will now be in the "UP" position. Remove the key from its mounting and place it (knob up) through No. 1 hole in the disc identification bracket. If it does not drop into the slot in the disc, push it in with the fingers.

Turn the Local-Distance switch to the "Distance" position. By means of the station selector knob, tune-in AS ACCURATELY AS POSSIBLE, the station whose call letters have been placed in No. 1 push button. Then remove the key.

The electric tuning system is now correctly set for the 1st station. Follow through with this same procedure until the proper adjustments have been made for all eight of the favorite stations. When tuning the receiver by means of the push buttons, the Local-Distance switch should be turned to the "Local" position.

Dynatrol Motor

Should either vibrator unit of the Dynatrol motor need readjustment the following procedure should be carefully followed:

(a) Loosen the adjustment nut until the belt is loose on the pulley. The gap between the armature and "E" laminations should be approximately 3/16".

(b) With the motor running, tighten the adjustment nut until chatter stops. Care should be taken, however, not to tighten this adjustment too tight as an unstable condition will be reached wherein a slight change may result in a locked motor. On the other hand, the adjustment should not be so loose that the armature actually hits the rebound pad.

(c) Check the time required for the dial pointer to travel between two points on the dial. The adjustment nuts should be set so that approximately eight or nine seconds are required for the pointer to travel from one end of the dial to the other in either direction. If it is only convenient to check the speed of the pointer over a portion of the dial, the time required will be in direct proportion to the length of the dial scale traversed. That is, approximately 6 seconds will be required to travel two-thirds of the scale, etc.

Selector Switch

Should the selector switch become inoperative in the field, it should not be dissembled for repair, but should be returned to the factory via an authorized Crosley Distributor.

PARTS LIST—MODEL 1137

Figures in first column refer to parts in Diagrams.

Item	Part No.	Description
1	G97 —32001	Pre-Selector Coil B-C.

MODEL 176
Schematic, Socket
MODEL 207 Converter
Schematic, Socket

DETROLA RADIO CORP.

MODEL 204
Alignment

Factory 204 Series

ALINEMENT PROCEDURE

Connect a high impedence AC voltmeter across the loud-speaker terminals. Volume control should be set a few degrees back of maximum position. Use a weak signal from the generator—strong signals tend to cause improper adjustments.

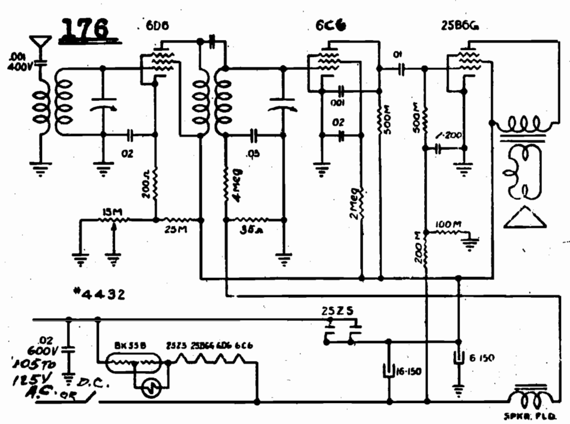
I.F. Connect the generator ground to receiver chassis. Using .1 mfd. condenser in series with high side of the generator, apply 658 m. (456 k.c.) signal to the grid of the 6D6 I.F. amplifier tube and align second I.F. transformer trimmers. Repeat for the first I.F. transformer trimmers, applying signal to grid of the 6A7 tube. (See above diagram for location of tubes and transformers.)

R.F. (See circuit diagram for location of trimmers.) Using a 200 mmf. condenser in series with the high side of the generator, turn band switch all the way to left, tuning condenser to minimum capacity, feed 750 m. (400 k.c.) signal to antenna terminal and adjust long wave oscillator trimmer for top frequency. Set generator frequency at some point around 800 m. (375 k.c.), and adjust long wave antenna and R.F. trimmers. Set generator for 1800 m. (167 k.c.), tune receiver to signal and adjust the padder. The tuning condenser should be rocked back and forth through the signal while varying the padder in order to assure perfect alignment.

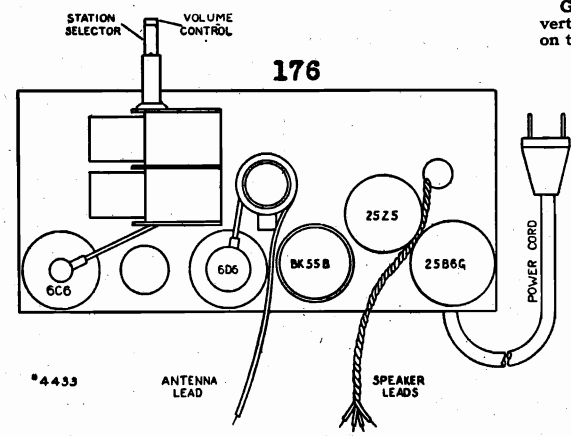
With band switch in center position repeat the above using 174.5 m. (1720 k.c.) signal to adjust medium wave oscillator trimmer, 214 m. (1400 k.c.) to adjust the antenna and R.F. trimmers, and 500 m. (600 k.c.) to adjust the medium wave padder.

A 400 ohm resistor must be used in series with the generator as a "dummy" antenna for proper alignment of the short wave band. Set the band selector switch in the right band position, adjust the oscillator top frequency for 16.6 m. (18.1 m.c.) then align the antenna trimmer for about 20 m. (15 m.c.). In order to make sure that the top end of this band is set properly, it is best to screw the oscillator trimmer down tight, then unscrew to the second peak. The antenna trimmer should be screwed down tight, then unscrew to the first peak. This procedure must be followed in order that the oscillator and antenna circuits will be set in the correct relation to each other, otherwise a "dead" spot at a lower frequency will result, and the dial calibration will not be correct. Usually, it is best to rock the tuning condenser back and forth slightly while making these adjustments at high frequencies.

176



*4432

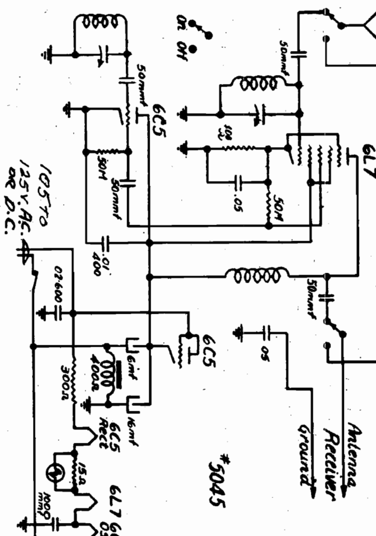


176

*4433

This receiver covers a continuous range from 540 to 1725 KC. Standard and experimental broadcast stations will be received between 540 and 1600 KC. Many police stations can be received near 1700 KC.

207 CONVERTER



*5045

Remove antenna lead-in from regular receiver and connect to green lead on converter. Connect the twisted leads to receiver—blue to antenna lead of receiver and black to ground of set or chassis frame. *Do Not Ground Converter Directly.* Turn the lower knob on converter to right, this turns on converter and switches antenna to converter.

This converter is designed to work in conjunction with any Superhetrodyne or Tuned Radio Frequency receiver that will receive stations in the range of 550 to 700 kc. When connected to such a receiver, reception of stations operating on frequencies between 25 and 63 m.c. (12-4.76 meters) will be possible.

Tune the broadcast receiver to a point between 550 and 700 kc. where there is no broadcast station. Turning the converter tuning knob very slowly, tune in the station desired as close as possible; the broadcast receiver tuning knob may be used for final adjustment. Normally the station will drift off tune while converter is heating, but will remain stable after a few minutes.

If a hum is heard as station is tuned in, reverse converter power plug.

Generally speaking, better results will be obtained if the converter unit is placed on a stand near the receiver rather than directly on the receiver cabinet.

DETROLA RADIO CORP.

ALINEMENT PROCEDURE

Connect a high impedance AC voltmeter across loud-speaker terminals. Volume control should be set a few degrees back of maximum volume position. Use a weak signal from generator, strong signals tend to cause improper adjustments.

IF. Connect generator ground to receiver ground. Using .1 mfd condenser in series with "high" side of generator, apply 456 kc signal to grid of 6S7G and adjust second IF transformer; same for first IF, applying signal to grid of 6D8G. (See diagram for location of tubes and transformers.)

RF. Using 200 mmf condenser in series with generator, feed 1725 kc signal to antenna lead and adjust oscillator top frequency. Set generator at 1400 kc, tune receiver to signal and adjust antenna trimmer.

MODEL 184 Series

Range 540KC-1725KC

Tubes: Tubes required are:
1—6D8G Oscillator-Translator.
1—6S7G Intermediate frequency amplifier.
1—6T7G Detector—automatic volume control—first audio amplifier.
1—1G5G Power output.
Do not use tubes of types different from those shown above.

Tuner Data, S-W Alignment

INSTRUCTIONS FOR ADJUSTMENT AND OPERATION OF THE SERIES 183 ELECTRIC AUTOMATIC TUNING SYSTEM

Before attempting to adjust the automatic tuner, read the following instructions carefully and proceed exactly as directed. Setting up the *Master Selector* requires no tools, and is very easily accomplished when the proper procedure is followed.

The tuning unit consists essentially of three parts, which may be described briefly as follows:

Master Selector: This includes the *Selector Drum,* the *Selector Pins,* and the *Selector Light.* These parts are mounted on the rear of the variable condenser, together with their associated brackets and wiring.

Motor and Drive: This assembly consists of an induction motor having a mechanical drive clutch with magnetic throw-out, and a train of gears operating directly onto the *Manual Station Selector* drive shaft. No oiling is necessary.

Push Button Assembly: These buttons are located on the front of the chassis, and extend through the escutcheon below the dial. Stations are tuned in automatically when the button under the call letters of the desired station is depressed and held down until the motor stops and the station is heard. When the button is pushed down, an automatic silencer mutes the receiver until the desired station is exactly on tune.

SETTING UP THE MASTER SELECTOR

As a means of simplifying these operations, list eight of your favorite *local* or strong near-by stations according to frequency or position on the dial. Setting up weak or distant stations is not recommended. Call the station nearest the left-hand end of the dial (nearest 1600 kc) the *No. 1* station, and number the other

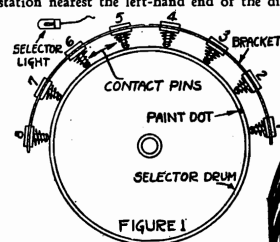

FIGURE 1

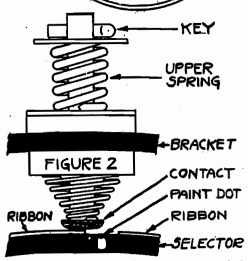

FIGURE 2

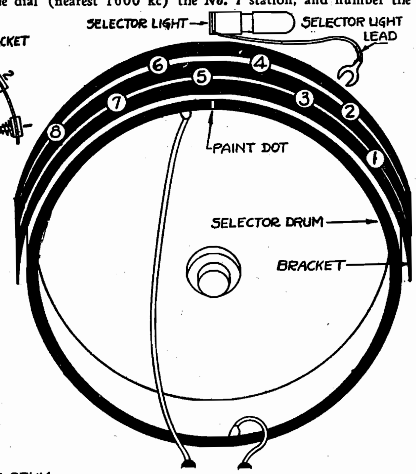

FIGURE 3

stations similarly going from left to right across the dial. For example, assume that you favorite stations operate on frequencies of 1500 kc, 1400 kc, 1300 ks, 1200 kc, 1000 kc, 900 kc, 700 kc, and 600 kc. Then the 1500 kc station would be *No. 1,* the 1400 kc station would be *No. 2,* and so on down the list with the 600 kc station being designated *No. 8.* Reference to the push buttons is not necessary since they are not used until *After* the *Master Selector* has been set up.

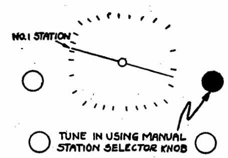
On the back of the receiver will be found the *Selector Drum* and the eight *Contact Pins* which determine the points at which the tuner will stop when the buttons are pressed. Referring to the diagrams, *Fig. 1* shows the general layout and relation of the drum and contacts. *Fig. 2* shows one of the contact pins in detail: note that while the position of the contact may be varied at will by sliding it along the slot in the bracket, it is held securely by a strong spring which will not allow it to move when the selector drum turns under it. *Fig. 3* shows the arrangement of the *Contact Pins,* each pin being numbered according to the system suggested for numbering the stations, thus *pin No. 1* will be used for *Station No. 1, pin No. 2* will be used for *Station No. 2,* and so on down the list.

On the *Selector Drum* are two pairs of *Contact Ribbons.* Note that there is a *Paint Dot* on the edge of the drum directly opposite the break in the ribbons on the upper half of the drum. This *Paint Dot* is for the purpose of locating the approximate position at which a given *Contact Pin* should be set in order to have the *Drum* stop for a particular station.

It is very important that the following steps be followed exactly as outlined; any deviation may necessitate re-setting some of the stations:

1. Set the receiver for reception of *Standard Broadcast Stations,* as outlined previously under *"Operation."* Turn the receiver *"On,"* let it run for *at Least Ten Minutes* to allow the tubes to reach their final operating temperature.

2. Using the *Manual Station Selector* (upper right) knob, tune in the No. 1 station, that is, the one nearest the 1600 kc end of the dial. Watch the tuning eye closely, making certain that the station is tuned in perfectly.



3. Face the rear of the chassis. Attach the lead from the *Selector Light* to the *No. 1 Contact Pin;* unless the pin happens to be set exactly, the lamp will glow when the lead is touched to the pin.

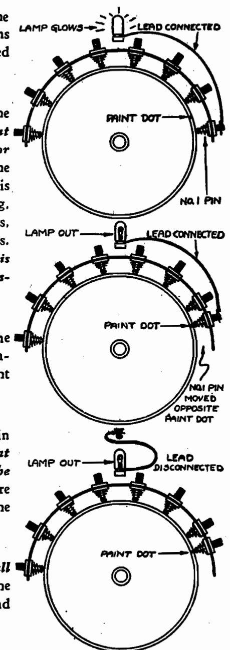
4. Observe the position of the *Paint Dot* on the edge of the *Drum.* Grasp the No. 1 pin firmly and slide it toward the *Paint Dot,* being careful not to break the connection between the *Selector Light* lead and the pin. When the pin is directly opposite the *Paint Dot,* the light will go out, indicating that the contact is properly set. To insure greatest accuracy in making this setting, slide the pin back and forth across the break between the ribbons, leaving it set half way between the points where the lamp lights. ***Be very careful not to move the Selector Drum while the pin is being set.*** When the pin is definitely in its proper position, ***Disconnect the Selector Light Lead from the Pin.***

5. Repeat the above procedure for the *No. 2* station; tune in the station, connect the *Selector Light* lead to the *No. 2* contact pin, move this pin opposite the *Paint Dot* so that the light goes out, then ***Disconnect the Selector Light Lead.***

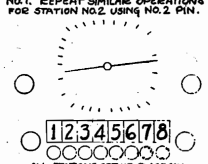
6. Using similar procedure, set up the other six stations, in each case using the *Contact Pin* bearing the ***same number as that assigned to the station being set up.*** Always ***Disconnect the Selector Light Lead*** as soon as a station has been set up; failure to do so will cause the receiver to hum, and may result in the lamp being burned out.

7. After all the stations have been set up, locate the ***Call Letters*** of your stations on the printed sheets supplied with the receiver. Remove the desired call letter blocks from the sheets, and insert them in the proper pockets above the push buttons.

8. The only operations necessary to receive any of the eight stations set up as outlined above are: Turn the power switch on by rotating the lower left knob to the right—***turn the control a few degrees beyond the point at which the switch snaps on*** — allow about one minute for the tubes to heat, press the button under the call letters of the desired station ***Holding the Button Down Until the Pointer Stops Moving and the Station is Heard,*** then adjust the tone and volume. Be sure that the ***Band Selector*** switch is in the proper position for reception of ***Standard Broadcast Stations.***



MASTER SELECTOR SET UP FOR STATION NO.1. REPEAT SIMILAR OPERATIONS FOR STATION NO.2 USING NO.2 PIN.



ALL STATIONS SET UP; PLACE CALL LETTERS IN WINDOWS AS NUMBERED

OPERATING SUGGESTIONS

Be sure that your stations are listed in the proper order according to frequency or position on the dial. Do not confuse frequency (kilocycles) with wave length (meters).

Be sure that your stations are tuned in exactly before setting the contact pins.

Do not set up weak stations, or distant stations too weak to afford clear reception at all times.

Do not press more than one button at a time. Holding down more than one button will cause inaccurate tuning, or the motor may not turn at all.

Do not leave the Selector Light Lead connected after the pins are set up.

Do not run the motor for excessively long periods of time. While no damage will result, a protective cut-out will shut off the power to the motor after four to five minutes of ***continuous*** operation, and the automatic tuner will not function again until the motor has been allowed to cool for several minutes.

When tuning stations, ***do not release the button until the pointer stops moving.***

Do not attempt to set adjacent pins in the same slot too close together.

Do not expect good results unless a good outdoor antenna is used.

Do not change the relative positions of the contact pins; keep them in the same order as shown on the diagram (Figure 3).

191 Series has 10-Button tuning System similar to 192 Series

ALIGNMENT OF SHORT-WAVE BANDS

A 400 ohm resistor must be used in series with the generator as a "dummy" antenna for proper alinement of the two short wave bands. Set the band selector switch in the center position, adjust the oscillator top frequency for 5400 kc., then aline the antenna trimmer at about 5000 kc. With the band selector in the extreme right position, adjust the top frequency of the high frequency band to 16,000 kc., and aline the antenna trimmer at about 15,000 kc. In order to make sure that the top end of the last band is set properly, it is best to screw the oscillator trimmed down tight, then unscrew to the second peak. The antenna trimmer should be screwed down tight, then unscrewed to the first peak. This procedure must be followed in order that the oscillator and RF circuits will be set in the correct relation to each other, otherwise a "dead" spot at a lower frequency will result, and the dial calibration will not be correct. Usually, it is best to rock the tuning condenser back and forth slightly while making these adjustments at high frequencies.

Tubes required are:
1—6A7 Oscillator-translator
1—6D6 Intermediate Frequency Amplifier
1—6Q7G Detector AVC—First Audio Amplifier
1—76 Driver—Phase Inverter
1—76 Silencer
4—42 Power Output
1—80 Rectifier
1—6G5 Cathode Ray Tuning Tube (on models equipped with "eye" tuning indicator)

INSTRUCTIONS FOR ADJUSTMENT AND OPERATION OF THE SERIES 192 ELECTRIC AUTOMATIC TUNING SYSTEM

Before attempting to adjust the automatic tuner, read the following instructions carefully and proceed exactly as directed. Setting up the *Master Selector* requires no tools, and is very easily accomplished when the proper procedure is followed.

The tuning unit consists essentially of three parts, which may be described briefly as follows:

Master Selector: This includes the *Selector Drum,* the *Selector Pins,* and the *Selector Light.* These parts are mounted on the rear of the variable condenser, together with their associated brackets and wiring.

Motor and Drive: This assembly consists of an induction motor having a mechanical drive clutch with magnetic throw-out, and a train of gears operating directly onto the *Manual Station Selector* drive shaft. No oiling is necessary.

Push Button Assembly: These buttons are located on the front of the chassis, and extend through the escutcheon above the dial. Stations are tuned in automatically when the button with the call letters of the desired station is depressed and held down until the motor stops and the station is heard. When the button is pushed down, an automatic silencer mutes the receiver until the desired station is exactly on tune.

SETTING UP THE MASTER SELECTOR

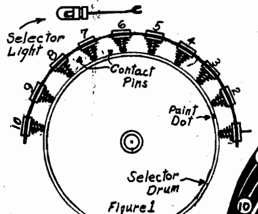

Figure 1

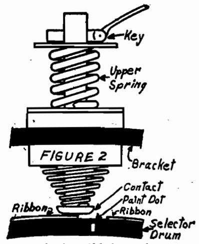

FIGURE 2

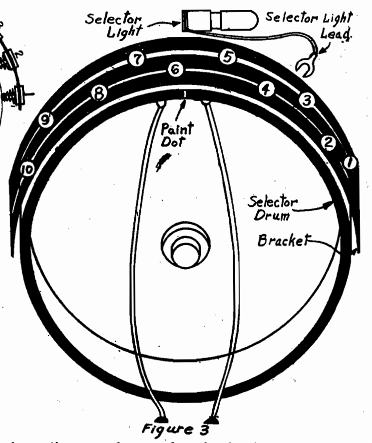

Figure 3

As a means of simplifying these operations, list ten of your favorite local or strong near-by stations according to frequency or position on the dial. Setting up weak or distant stations is not recommended. Call the station nearest the left-hand end of the dial (nearest 600 kc) the No. 1 station, and number the other stations similarly going from left to right across the dial. For example, assume that your favorite stations operate on frequencies of 600 kc, 700 kc, 800 kc, 900 kc, 1000 kc, 1100 kc, 1200 kc, 1300 kc, 1400 kc, and 1500 kc. Then the 600 kc station would be No. 1, the 700 kc station would be No. 2, and so on down the list with the 1500 kc station being designated No. 10. Reference to the push buttons is not necessary since they are not used until After the Master Selector has been set up.

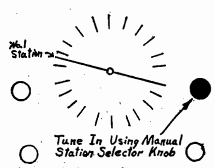
On the back of the receiver will be found the *Selector Drum* and the ten *Contact Pins* which determine the points at which the tuner will stop when the buttons are pressed. Referring to the diagrams, *Fig. 1* shows the general layout and relation of the drum and contacts. *Fig. 2* shows one of the contact pins in detail: note that while the position of the contact may be varied at will by sliding it along the slot in the bracket, it is held securely by a strong spring which will not allow it to move when the selector drum turns under it. *Fig. 3* shows the arrangement of the *Contact Pins,* each pin being numbered according to the system suggested for numbering the station, thus *pin No. 1* will be used for *Station No. 1, pin No. 2* will be used for *Station No. 2,* and so on down the list.

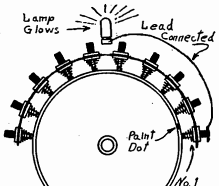
On the *Selector Drum* are two pairs of *Contact Ribbons.* Note that there is a *Paint Dot* on the edge of the drum directly opposite the break in the ribbons on the upper half of the drum. This *Paint Dot* is for the purpose of locating the approximate position at which a given *Contact Pin* should be set in order to have the *Drum* stop for a particular station.

It is very important that the following steps be followed exactly as outlined; any deviation may necessitate re-setting some of the stations:

1. Set the receiver for reception of Standard Broadcast Stations as outlined previously under "Operation." Turn the Master Control Switch to the extreme right-hand position and wait about ten minutes to allow the tubes to reach their final operating temperature.

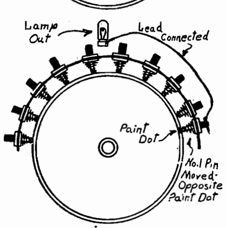
2. Using the Manual Station Selector (upper right) knob, tune in the No. 1 station, that is, the one nearest the 600 kc end of the dial. Watch the tuning eye closely, making certain that the station is tuned in perfectly.





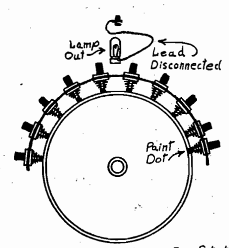
3. Face the rear of the chassis. Attach the lead from the *Selector Light* to the *No. 1 Contact Pin;* unless the pin happens to be set exactly, the lamp will glow when the lead is touched to the pin.

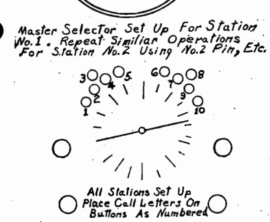
4. Observe the position of the *Paint Dot* on the edge of the *Drum.* Grasp the No. 1 pin firmly and slide it toward the *Paint Dot,* being careful not to break the connection between the *Selector Light* lead and the pin. When the pin is directly opposite the *Paint Dot,* the light will go out, indicating that the contact is properly set. To insure greatest accuracy in making the setting, slide the pin back and forth across the break between the ribbons, leaving it set half way between the points where the lamp lights. *Be very careful not to move the Selector Drum while the pin is being set.* When the pin is definitely in its proper position, *Disconnect the Selector Light Lead from the Pin.*



5. Repeat the above procedure for the *No. 2* station; tune in the station, connect the *Selector Light* lead to the *No. 2* contact pin, move this pin opposite the *Paint Dot* so that the light goes out, then *Disconnect the Selector Light Lead.*

6. Using similar procedure, set up the other eight stations, in each case using the *Contact Pin* bearing the *same number as that assigned to the station being set up.* Always *Disconnect the Selector Light Lead* as soon as a station has been set up; failure to do so will cause the receiver to hum, and may result in the lamp being burned out.





7. After all the stations have been set up, located the Call Letters of your stations on the printed sheets supplied with the receiver. Remove the desired call letter discs from the sheets. Remove the metal ferrules from the buttons, place the call letter discs behind the celluloid and press the ferrules back on the proper buttons.

8. The only operations necessary to receive any of the ten stations set up as outlined above are: Turn the Master Control Switch to the Center position, allow about one minute for the tubes to heat, press the button with the call letters of the desired station Holding the Button Down Until the Pointer Stops Moving and the Station is Heard, then adjust the tone and volume. Be sure that the Band Selector switch is in the proper position for reception of Standard Broadcast stations.

ALINEMENT PROCEDURE

The Master Control Switch must be turned to the extreme right hand position for all alinement.

IF. Connect generator ground to receiver chassis. Using .1 mfd. condenser in series with the high side of the generator, apply 456 kc. signal to tl grid of the 6D6 second IF amplifier tube and aline the PRIMARY only of the third IF transformer. (See above diagram.) Connect generator to grid of 6D6 first IF tube and aline the second IF transformer. Repeat for transformer No. 1 applying signal to grid of 6A7 translator.

RF. (See circuit diagram for location of trimmers.) Using a 200 mmf. condenser in series with the high side of the generator, turn band selector switch all the way to the left, tuning condenser to minimum capacity, feed 1810 kc. signal to antenna terminal and adjust broadcast oscillator trimmer for top frequency. Set generator frequency at some point around 1500-1600 kc., and adjust broadcast antenna and RF trimmers. Set generator for 600 kc., tune receiver to signal and adjust the padder. The tuning condenser should be rocked back and forth through the signal while varying the padder in order to assure perfect alinement.

A 400 ohm resistor must be used in series with the generator as a "dummy" antenna for proper alinement of the two short wave bands. Set the band selector switch in the center position, adjust the oscillator top frequency for 6250 kc., then aline the antenna and RF trimmers at about 6000 kc. With the band selector in the extreme right position, adjust the top frequency of the high frequency to 18,100 kc., and aline the antenna and RF trimmers at about 16,000 kc. In order to make sure that the top end of the last band is set properly, it is best to screw the oscillator trimmer down tight, then unscrew to the second peak. The antenna and RF trimmers should be screwed down tight, then unscrewed to the first peak. This procedure must be followed in order that the oscillator and RF circuits will be set in the correct relation to each other, otherwise a "dead" spot at a lower frequency will result; and the dial calibration will not be correct. Usually, it is best to rock the tuning condenser back and forth slightly while making these adjustments at high frequencies.

AFC. Connect a high resistance DC voltmeter between the cathode of the 6D6 AFC control tube and ground. Turn the Master Control Switch to the CENTER position and the Band Selector Switch to the extreme left hand position. Apply a strong 456 kc. signal to the grid of the 6A7 translator and adjust the secondary of the third IF transformer until the voltage is the same as with no signal.

FOR OPERATING SUGGESTIONS SEE MODEL 183

Tubes required are:

1—6D6 Radio Frequency Amplifier	1—6D6 AFC Control
1—6A7 Oscillator—translator	1—76 Driver
2—6D6 Intermediate Frequency Amplifiers	1—76 Phase Inverter
1—6H6G Detector AVC—Discriminator	4—42 Power Output
1—6G5 Cathode Ray Tuning Tube	1—80 Rectifier

Master Control Switch: The extreme left position turns the power off. The center position connects the motor and the automatic frequency control for automatic tuning. The right hand position disconnects the motor and automatic frequency control, and increases sensitivity for manual tuning of weak stations. (The right hand position is also used for setting up stations for automatic tuning.)

1—6G5 Cathode Ray Tuning Tube (on models equipped with "eye" tuning indicator)

Factory 204 Series

POWER SUPPLY This receiver is designed to operate on 50 to 60 cycle alternating current only. The power transformer may be connected to operate on a number of voltages as shown in table below. To set the transformer to correspond to your line potential, remove the small cover from top of transformer by taking out the two screws. Insert the connector prong on end of lead into the connector desired: (See table below.)

Connector Marked	Line Potential
105	90-110 volts
130	110-140 volts
150	140-160 volts
220	180-230 volts
250	230-260 volts

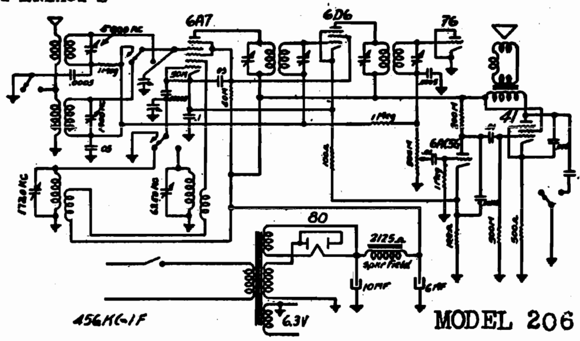
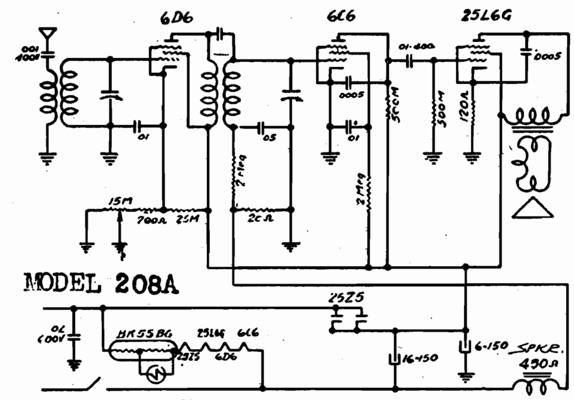
DETROLA RADIO CORP.

MODEL 206
MODEL 208A
MODEL 208AP(Phono.)



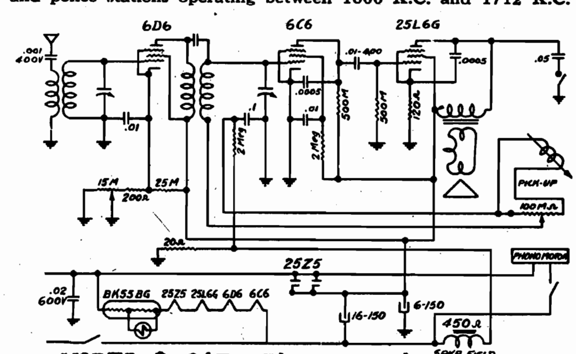
MODEL 206

In left hand position broadcast stations operating on frequencies of 540 to 1720 kilocycles will be received. In the right hand position of the wave switch, short wave stations operating on frequencies of 2300 to 6250 kilocycles will be heard.



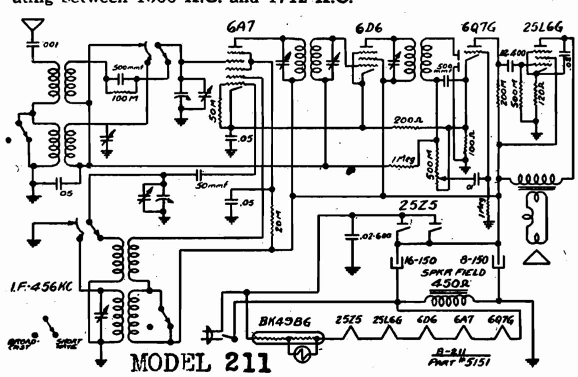
MODEL 208A

This receiver is designed to receive broadcast stations operating on frequencies between 540 K.C. and 1600 K.C. and police stations operating between 1600 K.C. and 1712 K.C.



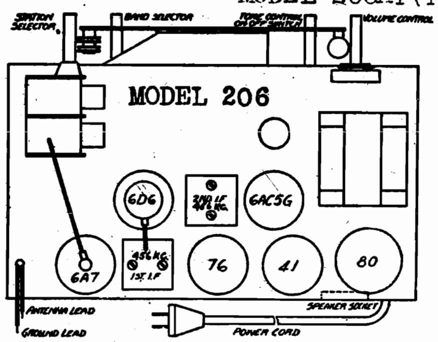
MODEL 208AP Phonograph

This receiver is designed to receive broadcast stations operating on frequencies between 1600 K.C. and 1712 K.C.



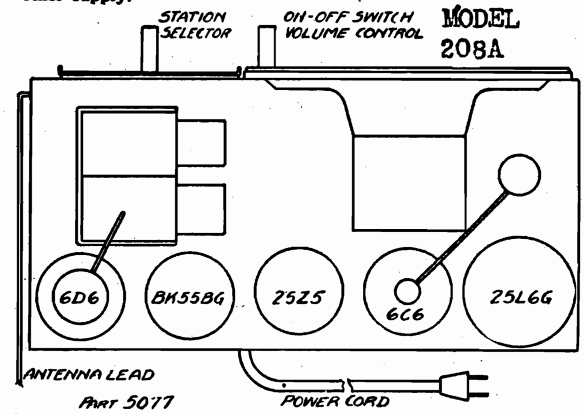
MODEL 211

In left hand position, broadcast stations on frequencies between 540 and 1720 K.C. will be received. When the band switch is set to the right hand position, short wave stations operating on wave lengths from 2300 to 6250 K.C. will be heard.



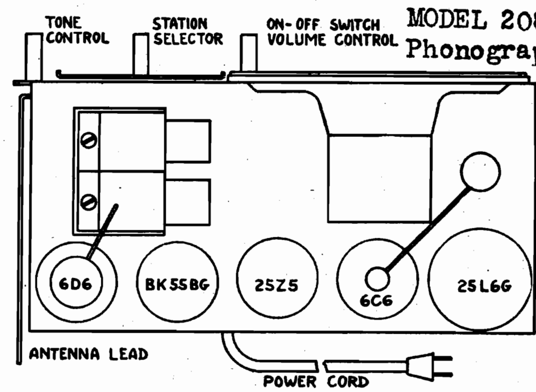
This receiver is designed to operate on 105 to 125 volts, 60 cycles. Do not connect to any other supply.

MODEL 208A



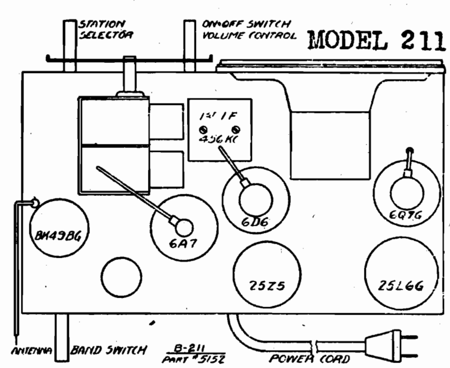
This receiver is designed to operate on 105 to 125 volts, direct or alternating current.

MODEL 208AP Phonograph



THIS RECEIVER IS DESIGNED TO OPERATE ON 105 TO 125 VOLTS 60 CYCLE ALTERNATING CURRENT ONLY.

MODEL 211

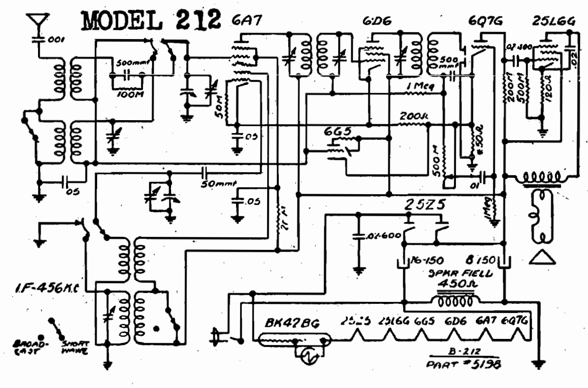


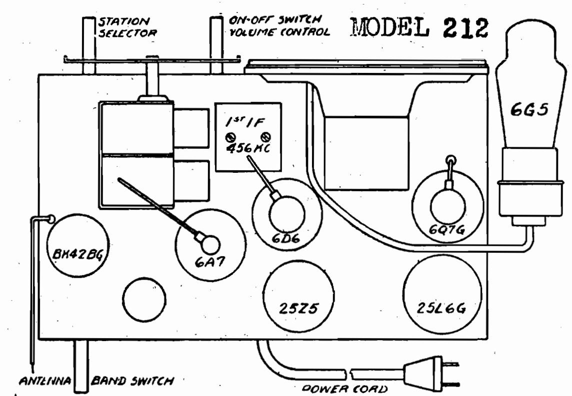
This receiver is designed to operate on 105 to 125 volts, direct or alternating current.

MODEL 212
MODEL 216, Detrola Jr. Peewee
Schematics, Socket, Trimmers

DETROLA RADIO CORP.

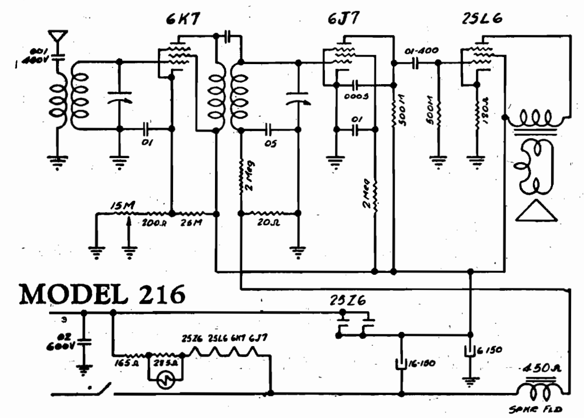
MODEL 220
Schematic, Socket, Trimmers
Tuner

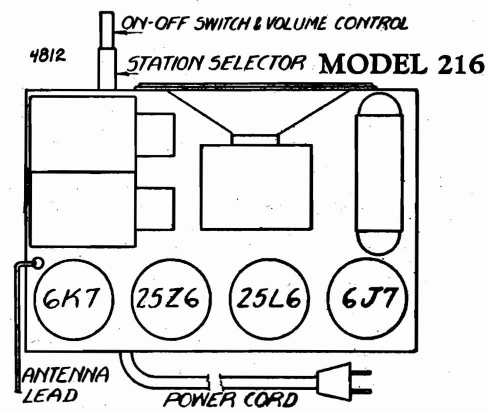




In left hand position, broadcast stations on frequencies between 540 and 1720 K.C. will be received. When the band switch is set to the right hand position, short wave stations operating on wave lengths from 2300 to 6250 K.C. will be heard.

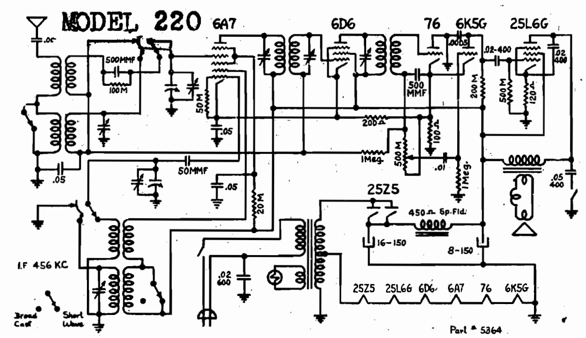
This receiver is designed to operate on 105 to 125 volts, direct or alternating current.

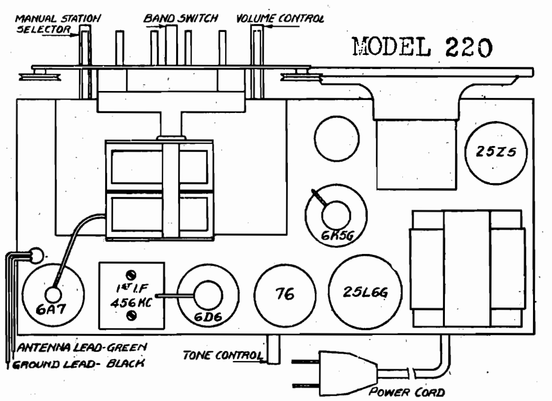




DETROLA JR. PEE-WEE

This receiver is designed to operate on 105 to 125 volts, direct or alternating current. Do not connect to any other source.





In left hand position, broadcast stations on frequencies between 540 and 1720 K.C. will be received. When the band switch is set to the right hand position, short wave stations operating on wave lengths from 2300 to 6250 K.C. will be heard.

This receiver is designed to operate on 105 to 125 volts, 60 cycle alternating current only.

INSTRUCTIONS FOR ADJUSTMENT AND OPERATION OF MECHANICAL AUTOMATIC TUNING SYSTEM

The following simple procedure should be followed to set up the automatic tuning mechanism to select your favorite stations.

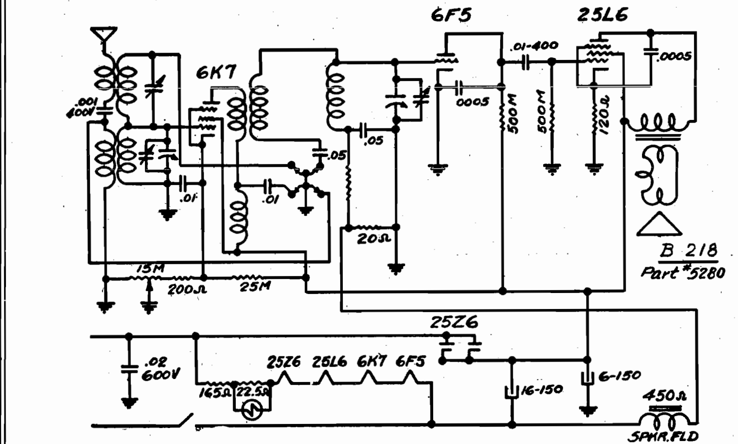
Any of your favorite stations may be set up on any button, but it is recommended that the buttons be set up in the same sequence as they are received on the dial. Loosen one of the selector buttons located below the dial by turning it to the left. A slot is provided in the button into which a coin may be inserted to facilitate turning. After turning the button a few turns to the left press it in as far as it will go. While holding button in this position, tune in station desired very carefully in regular way with the manual tuning knob. Still holding the button in, fix the adjustment by turning the button to right until tight. Thereafter, the station set up on this button will be received whenever this button is pressed in as far as it will go.

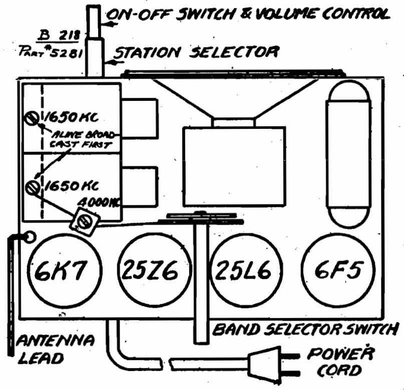
All buttons are set up in the same way. After all buttons are set up, locate and remove the corresponding station tabs from accompanying call letter sheets and, after moistening slightly, press them in the ends of the buttons.

Do not set up weak stations, or distant stations too weak to afford clear reception at all times.

MODEL 218, Peewee
MODEL 219, Super Peewee
MODEL 221
Schematic, Socket, Trimmers

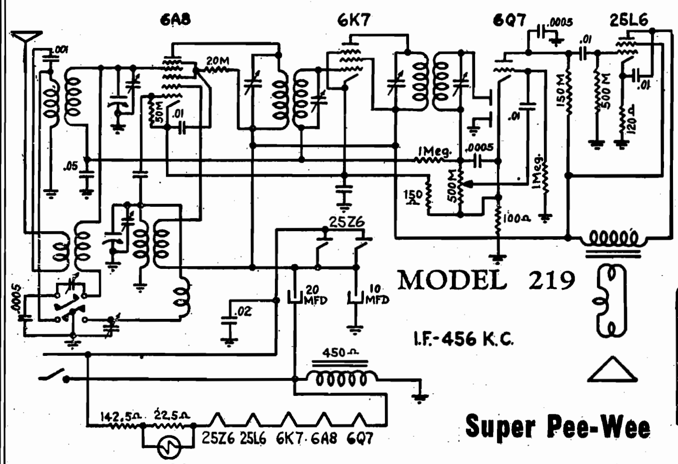
DETROLA RADIO CORP.

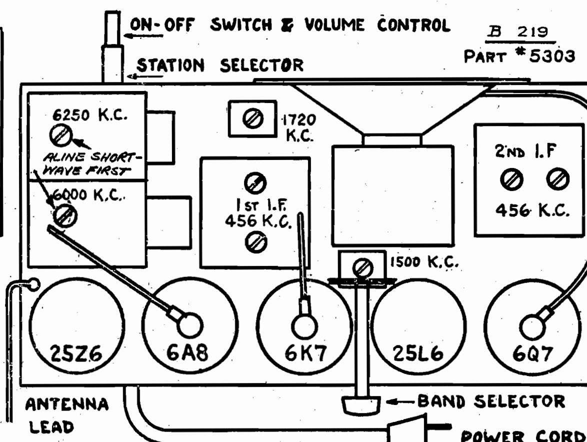




DETROLA PEE-WEE MODEL 218

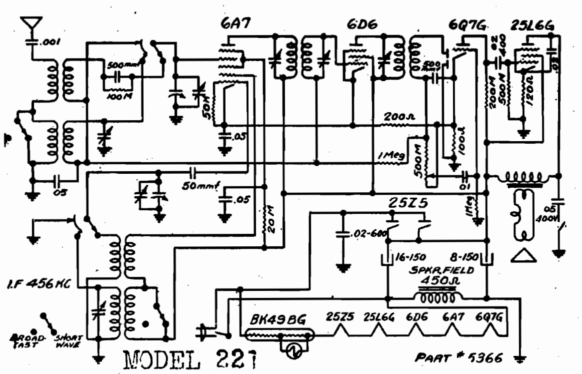
This receiver is designed to operate on 105 to 125 volts, direct or alternating current. The BAND SELECTOR SWITCH knob, on the back of the set, should be turned to the left to receive standard broadcast stations (540-1600 KC). To receive short-wave stations operating on frequencies 1600-4000 KC, turn the knob to the right.

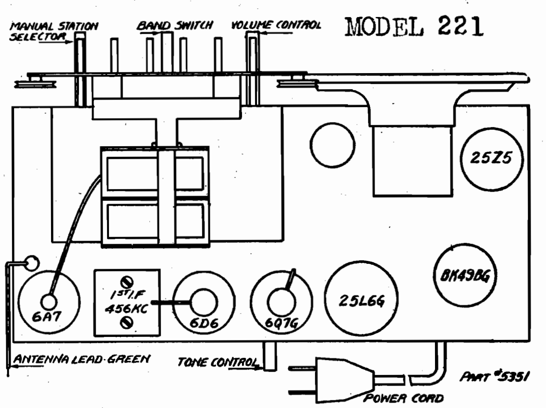




Super Pee-Wee

This receiver is designed to operate on 105 to 125 volts, direct or alternating current. The *Band Selector Switch* knob, on the back of the set, should be turned to the left to receive standard broadcast and 1712 KC police (540-1720 KC). To receive short-wave stations operating on frequencies 2300-6250 KC, turn the knob to the right.





This receiver is designed to operate on 105 to 125 volts, direct or alternating current.

FOR AUTOMATIC TUNING SYSTEM- See MODEL 220

In left hand position, broadcast stations on frequencies between 540 and 1720 K.C. will be received. When the band switch is set to the right hand position, short wave stations operating on wave lengths from 2300 to 6250 K.C. will be heard.

1—6D6 Intermediate Frequency Amplifier
1—6Q7G Detector—AVC—First Audio Amplifier
1—76 Phase Inverter
2—43 Power Output
1—25Z5 Rectifier

ALINEMENT PROCEDURE

Connect a high impedance AC voltmeter across loud-speaker terminals. Volume control should be set a few degrees back of maximum volume position. Use a weak signal from generator, strong signals tend to cause improper adjustments.

I.F.: Connect the generator ground to receiver chassis. Using .1 mfd. condenser in series with high side of generator, apply 456 kc. signal to grid of 6D6 I.F. amplifier tube, and aline transformer No. 2. Connect generator to grid of 6A7 tube and aline transformer No. 1.

RF. (See above diagram for location of trimmers.)

Using a 200 MMF. condenser in series with the high side of the generator, turn band selector switch to left hand position and the tuning condenser to about 600 kc. Feed a 456 kc. signal to the antenna and adjust wave trap trimmer for minimum response. With the tuning condenser at minimum capacity feed 1660 kc. signal to the antenna and adjust broadcast oscillator trimmer for top frequency. Set generator frequency at about 1400 kc. Adjust broadcast antenna trimmer. Set generator for 600 kc. tune receiver to signal and adjust the padder. The tuning condenser should be rocked back and forth through the signal while varying the padder in order to assure perfect alinement.

Using 400 ohm resistor in series with generator, set band selector in center position, set generator to 5400 kc and adjust oscillator trimmer for top frenquency. Set generator to 5000 kc, tune receiver to signal and adjust antenna trimmer.

Turn band selector to extreme clockwise position. Using 400 ohm resistor in series with generator, set oscillator top frequency for 16,500 kc—screw trimmer down tight, then unscrew to *second* peak. Set generator to 15,000 kc, tune receiver to signal and adjust antenna trimmer—Screw trimmer down tight, then unscrew to *first* peak, rocking the tuning condenser back and forth through the signal while the adjustment is being made. **Above procedure for alinement at 15,000 kc must be followed exactly to insure proper tracking. A dead spot at about 12,000 kc will result if antenna and oscillator circuits are not set in proper relation to each other.**

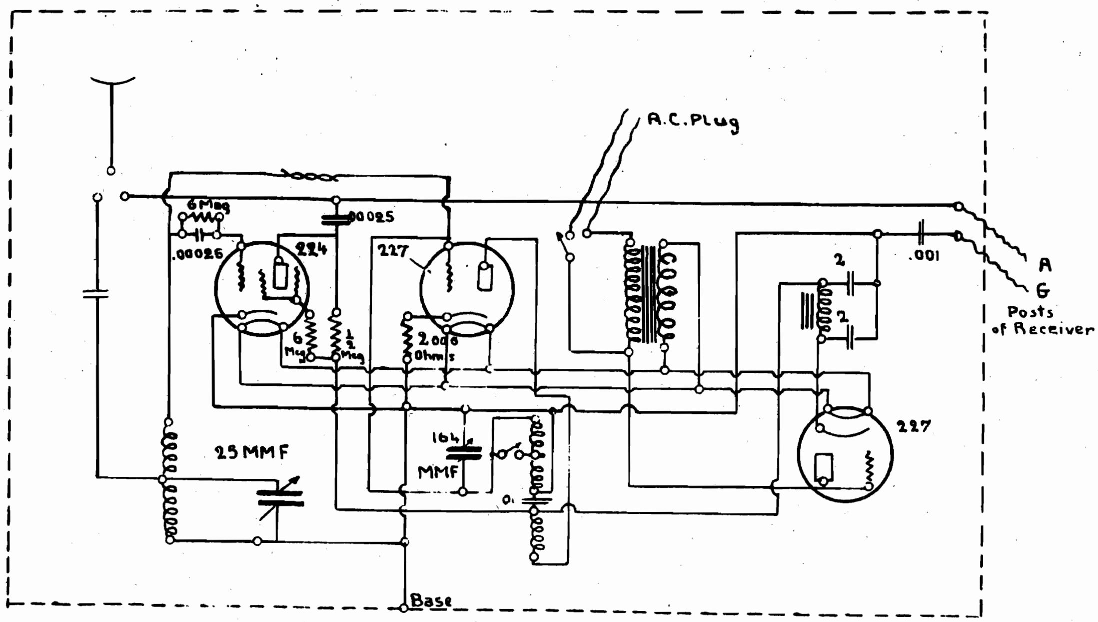
MODEL R300A Converter
MODEL 1900
Schematics

DETROLA RADIO CORP.



This converter uses one-twenty-four or fifty-one and two-twenty-seven tubes.

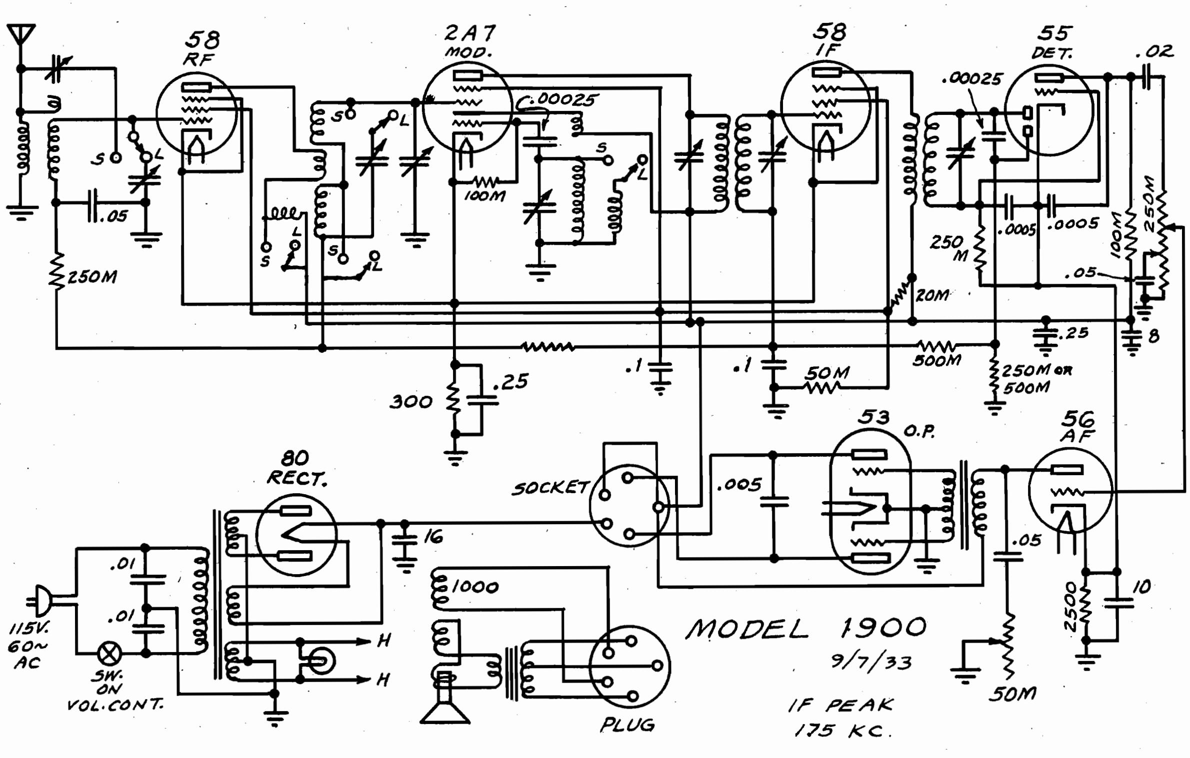
ADJUSTING 50 M. M. F. D. BALANCING CONDENSER

After hooking converter to broadcast set tune in station around 75 meters and adjust the small balancing condenser to the most sensitive position and that will be correct for all wave lengths. The setting need never be changed.

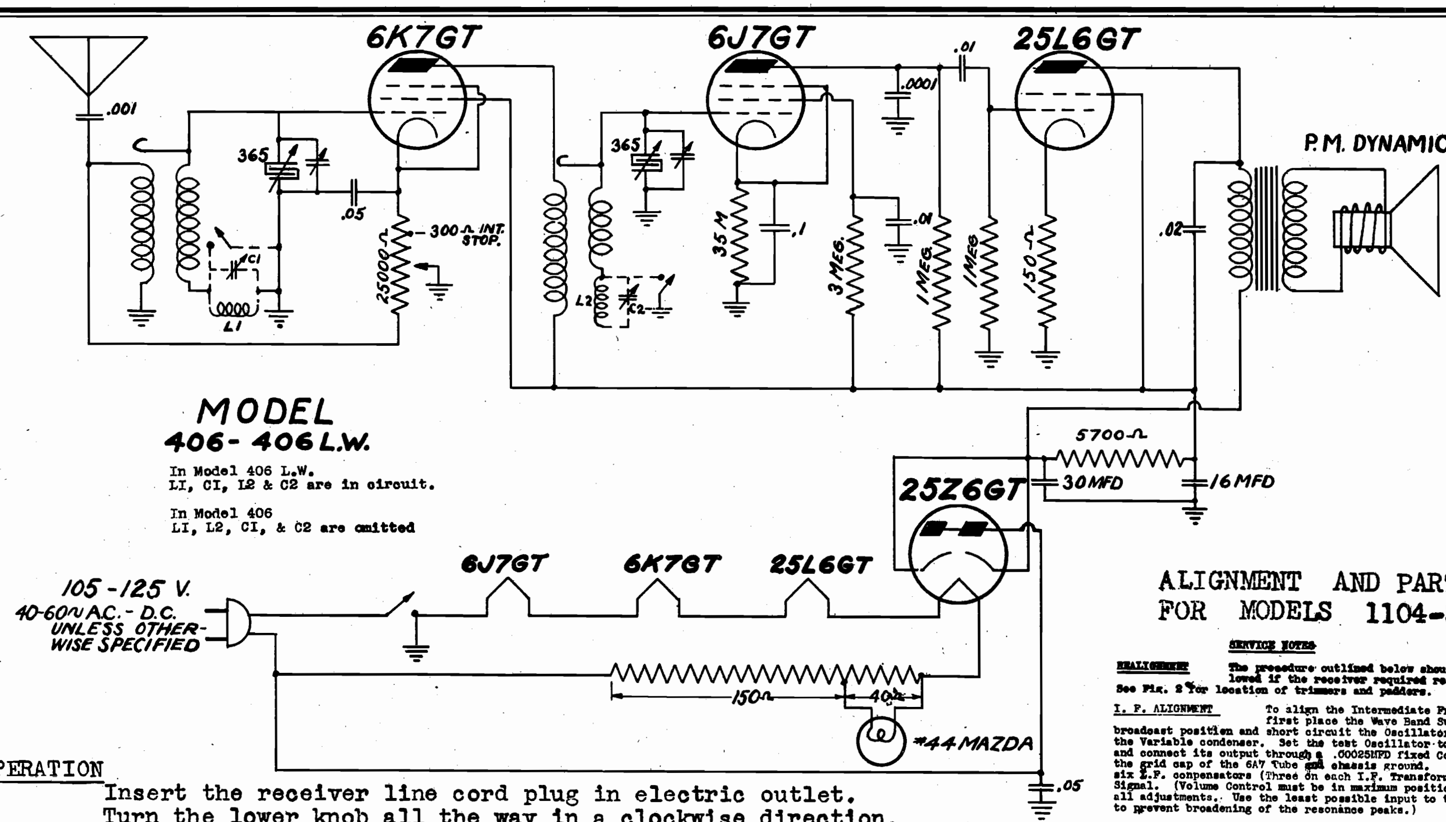
DETROLA SHORT WAVE CONVERTER

MODEL R 300A

DETROLA RADIO CORP. DETROIT, MICH.



DEWALD RADIO



MODEL
406- 406 L.W.

In Model 406 L.W.
L1, C1, L2 & C2 are in circuit.

In Model 406
L1, L2, C1, & C2 are omitted

OPERATION

Insert the receiver line cord plug in electric outlet. Turn the lower knob all the way in a clockwise direction. Allow approximately one minute for the tubes to heat up and receiver is then ready for operation.

NOTE

If receiver is being operated on D.C. and no signals are heard after one minute, reverse the line cord plug in the outlet. To turn receiver "off", rotate the lower knob all the way in a counter clockwise direction until a snap is heard and the dial lamp goes out.

ALIGNMENT AND PARTS FOR MODELS 1104-5

SERVICE NOTES

REALIGNMENT The procedure outlined below should be followed if the receiver required readjusting. See Fig. 2 for location of trimmers and padders.

I. F. ALIGNMENT To align the Intermediate Frequency stages. first place the Wave Band Switch in broadcast position and short circuit the Oscillator Section of the Variable condenser. Set the test Oscillator to 456 K.C. and connect its output through a .00025MFD fixed Condenser to the grid cap of the 6A7 Tube and chassis ground. Adjust the six I.F. conpensators (Three on each I.F. Transformer) for Max Signal. (Volume Control must be in maximum position during all adjustments. Use the least possible input to the receiver to prevent broadening of the resonance peaks.)

BROADCAST ALIGNMENT After the Intermediate Frequency stages have been completely aligned, connect external test oscillator to the Antenna and Ground binding posts of the set. See Fig. 3-A. Set the band switch to broadcast position. Set test Oscillator to 1500 K.C. and adjust the three broadcast Compensators for maximum gain. Next, set dial at 600 K.C. and adjust broadcast padder for maximum signal, rocking Variable Condenser at the same time. Now repeat repeaking operation at 1500 K. C.

INTERMEDIATE S.W. ALIGNMENT Turn Wave Band Switch to Intermediate S. W. position and set Variable Condenser to 5000 K. C. Adjust test oscillator to this frequency and adjust 3 intermediate s. w. trimmers for maximum gain. Next set dial at 1900 K. C. and adjust intermediate s. w. padder for maximum signal. Now repeat repeaking operation at 5000 K. C.

SHORT WAVE ALIGNMENT Turn Wave Band Switch to S. W. position and set Variable Condenser to 16 megacycles. Adjust test oscillator to this frequency and adjust three S. W. Trimmers for maximum signal.

LONG WAVE ALIGNMENT Turn Wave Band Switch to L. W. position and align Trimmers on long wave coils to 400 K. C. Adjust L. W. Padder at 160 K. C.

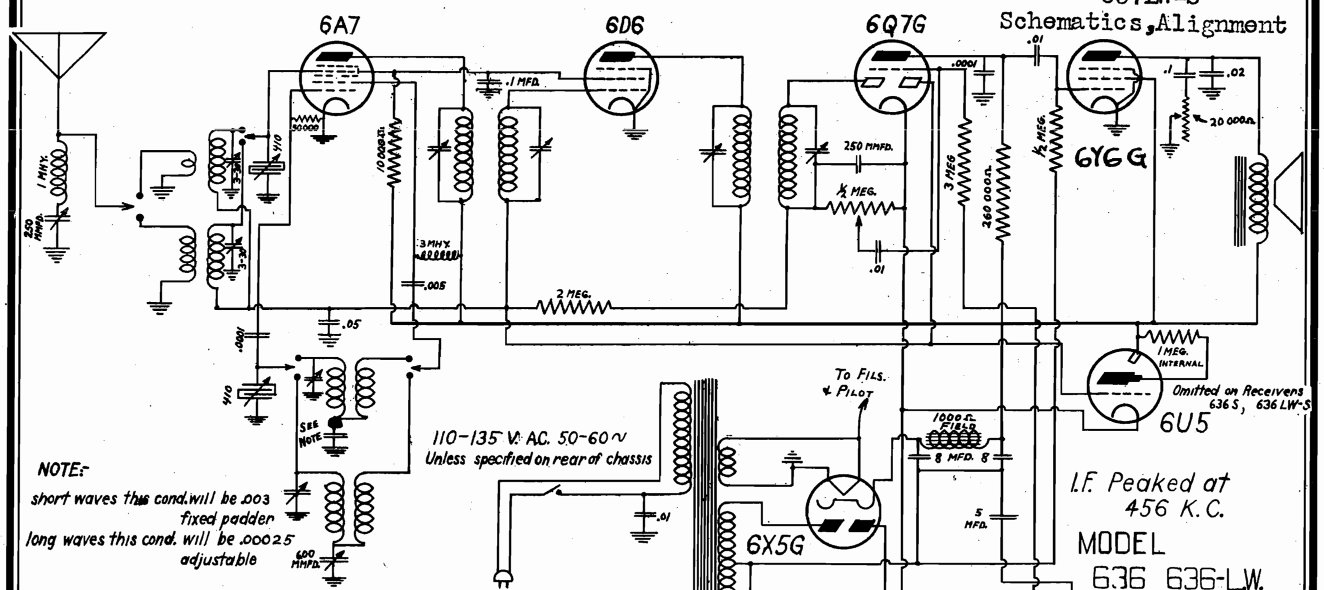
Schematics, Alignment

DEWALD RADIO



RANGES The Models 636 and 636-S have the following ranges: 520 K.C.- 1725 K.C., 5.62 M.C.- 18M.C. The Models 636 L.W. and 636 L.W.-S. have the following ranges: 520 K.C. - 1725 K. C., 150 K.C. - 350 K.C.

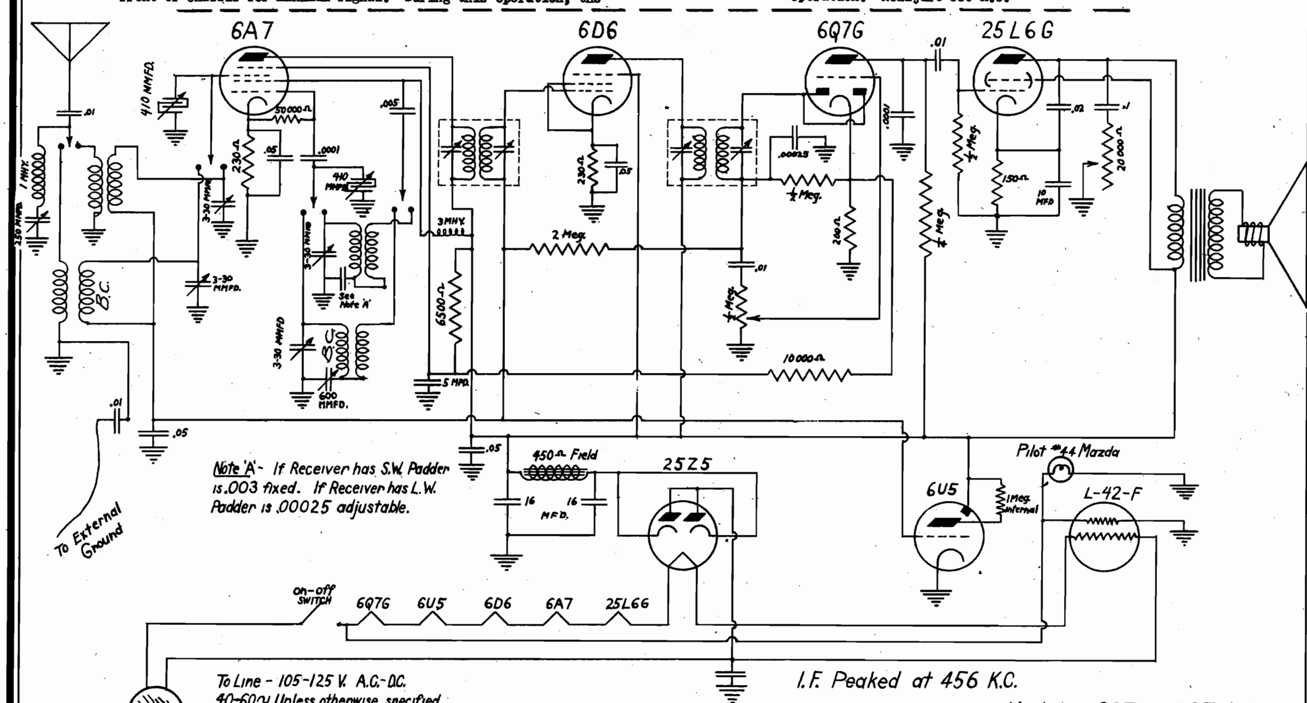
TO CALIBRATE RECEIVER

I.F. ALIGNMENT Connect test oscillator to grid of 6A7 and chassis. Adjust test oscillator to 456 K.C. and peak I.F trimmers for maximum signal. Short circuit stator of front section of variable condenser during this operation. Then peak I.F. trimmers for maximum signal.

R.F. ALIGNMENT: Remove short from stator of variable condenser. Turn Wave Band Switch to connect test oscillator to antenna and B.C. chassis. Set test oscillator and radio dial to 1500 K.C. and peak two trimmers closest to center of chassis for maximum signal. Set test oscillator at 600 K.C. and adjust boradcast padder condenser in front of chassis for maximum signal. During this operation, the variable condenser must be rocked. Readjust 1500 K.C.

SHORT WAVE ALIGNMENT. Turn Wave Band switch to short wave. Set test oscillator and radio dial to 17 Megacycles and peak trimmers toward front of chassis for maximum signal. Low frequency setting is automatically taken care of by short wave coils which are carefully matched for this setting by a fixed calibrated padder.

LONG WAVE ALIGNMENT Turn Wave Band switch to Long Wave position. Adjust oscillator and receiver to 300 K.C. and peak the trimmers toward front of chassis for maximum signal Then adjust oscillator and receiver to 175 K.C. and adjust long wave padder for maximum signal. The variable condenser should be rocked during this operation. Readjust 350 K.C.



Models 637 & 637 L.W.
Models 637-S & 637 L.W.-S
Have no 6U5

RANGES The Models 637 and 637-S have the following ranges: 520 K.C.- 1725 K.C., 5.62 M.C.- 18M.C. The Models 637 L.W. and 637 L.W.-S. have the following ranges: 520 K.C. - 1725 K. C., 150 K.C. - 350 K.C.

TO CALIBRATE RECEIVER

I.F. ALIGNMENT Connect test oscillator to grid of 6A7 and chassis. Adjust test oscillator to 456 K.C. and peak I.F trimmers for maximum signal. Short circuit stator of front section of variable condenser during this operation. Then peak I.F. trimmers for maximum signal.

R.F. ALIGNMENT: Remove short from stator of variable condenser. Turn Wave Band Switch to connect test oscillator to antenna and B.C. chassis. Set test oscillator and radio dial to 1500 K.C. and peak two trimmers closest to center of chassis for maximum signal. Set test oscillator at 600 K.C. and adjust boradcast padder condenser in front of chassis for maximum signal. During this operation, the variable condenser must be rocked. Readjust 1500 K.C.

SHORT WAVE ALIGNMENT. Turn Wave Band switch to short wave. Set test oscillator and radio dial to 17 Megacycles and peak trimmers toward front of chassis for maximum signal. Low frequency setting is automatically taken care of by short wave coils which are carefully matched for this setting by a fixed calibrated padder.

LONG WAVE ALIGNMENT Turn Wave Band switch to Long Wave position. Adjust oscillator and receiver to 300 K.C. and peak the trimmers toward front of chassis for maximum signal Then adjust oscillator and receiver to 175 K.C. and adjust long wave padder for maximum signal. The variable condenser should be rocked during this operation. Readjust 350 K.C.

Schematic,Alignment

DeWALD RADIO

These models are superheterodyne receivers, with full automatic volume control on all bands. They have been designed to operate on 110-125 volts, 40-60 cycles AC or DC unless otherwise specified. A slide rule instrument type dial which simplifies tuning is featured in these receivers. The ranges of the models are as follows: ——→

MODEL	RANGE COVERAGE		
645	555-174 meters 540-1725 K.C.	50-16 meters 6.0-18.5 M.C.	
645 L.W.	555-174 meters 540-1725 K.C.	2000-750 meters 150-400 K.C.	
652	555-174 meters 540-1725 K.C.	50-16 meters 6.0-18.5 M.C.	2000-750 meters 150-4000 K.C.

TO CALIBRATE RECEIVER

I.F. ALIGNMENT Connect antenna lead of the signal generator to antenna lead of receiver and ground lead of generator to receiver chassis. Short circuit front section of variable condenser. Adjust generator to 456 K.C. and peak I.F. trimmers for maximum signal.

BROADCAST ALIGNMENT 1500 K.C. Remove short from variable condenser. Have wave band switch on broadcast position. Adjust generator and receiver to 1500 K.C. Peak trimmers for maximum signal. Adjust generator and receiver to 600 K.C., peak the broadcast padder for maximum signal. The variable condenser should be "rocked" during this operation.

SHORT WAVE ALIGNMENT Turn wave band switch to the short wave band. Adjust generator and receiver to 16.0 M.C. Peak trimmers for maximum signal. The low frequency is automatically adjusted by a fixed calibrated padder.

LONG WAVE ALIGNMENT Turn wave band switch to Long Wave band. Adjust the generator and receiver to 300 K.C. and peak trimmers for maximum signal. Adjust generator and receiver to 175 K.C. and peak Long Wave padder for maximum signal. The variable condenser should be "rocked" during this operation. Recheck 300 K.C.

650	555-174 meters, 540-1725 K.C.	112-37 meters, 2.7-8.2 M.C.	38-12.5 meters 728-24.0 M.C.

HOW TO ADJUST THE PUSH-BUTTONS

Tune in the desired station with the station selector knob. Determine which button is to be used to receive this station. Loosen this button by turning it in a counterclockwise direction approximately one full turn. Then push the button in as far as it will go and tighten with a coin in the button slot. The adjustment may be checked by setting the pointer in any position, pushing the button in as far as it will go and noting if the intended station is received. After all adjustments have been made the station tabs and celluloids may be put on the buttons.

DeWALD RADIO

Assume that station WABC is desired. Thefrequency of this station is 860 kilocycles or 349 meters. By consulting the table it will be seen that this station lies between 550 to 900 kilocycles (548 to 333 meters) or 650 to 1050 kilocycles (462 to 286 meters). Therefore this station can be tuned in by using number 3 or 4 adjusting condensers, and pressing the proper button. Note the program on WABC at that instant, press in the 3rd knob from the top, and adjust the osc. cond. number 3 until the WABC program is heard. Then adjust the det. cond. number 3 until the station is received with the greatest possible volume. All the stations may be adjusted in like manner.

After an elapse of 24 hours, from initial adjusting, it is necessary to recheck all adjusting condensers to see if any of them have shifted. After this rechecking no further adjusting should be necessary.

Select five stations and determine in what frequency range each one will lie, by consulting the adjust table. Press the button corresponding to this frequency range and adjust the corresponding "osc. cond." until the desired station is heard. Then adjust the corresponding "det. cond" until the station comes in with the greatest possible strength. It is advisable to tune in the station with the antenna wire disconnected from the receiver and holding the end of the red lead in the hand. The volume of the receiver should be turned lower as the station comes in louder. Since several stations will be heard while tuning in the desired station, it will help a great deal to know the program coming from the desired station at that instant. This can be easily found by pressing the lowest button and using the tuning knob to pick up that station.

CONVENTIONAL ALIGNMENT, SEE SPECIAL SECTION VOL.VIII

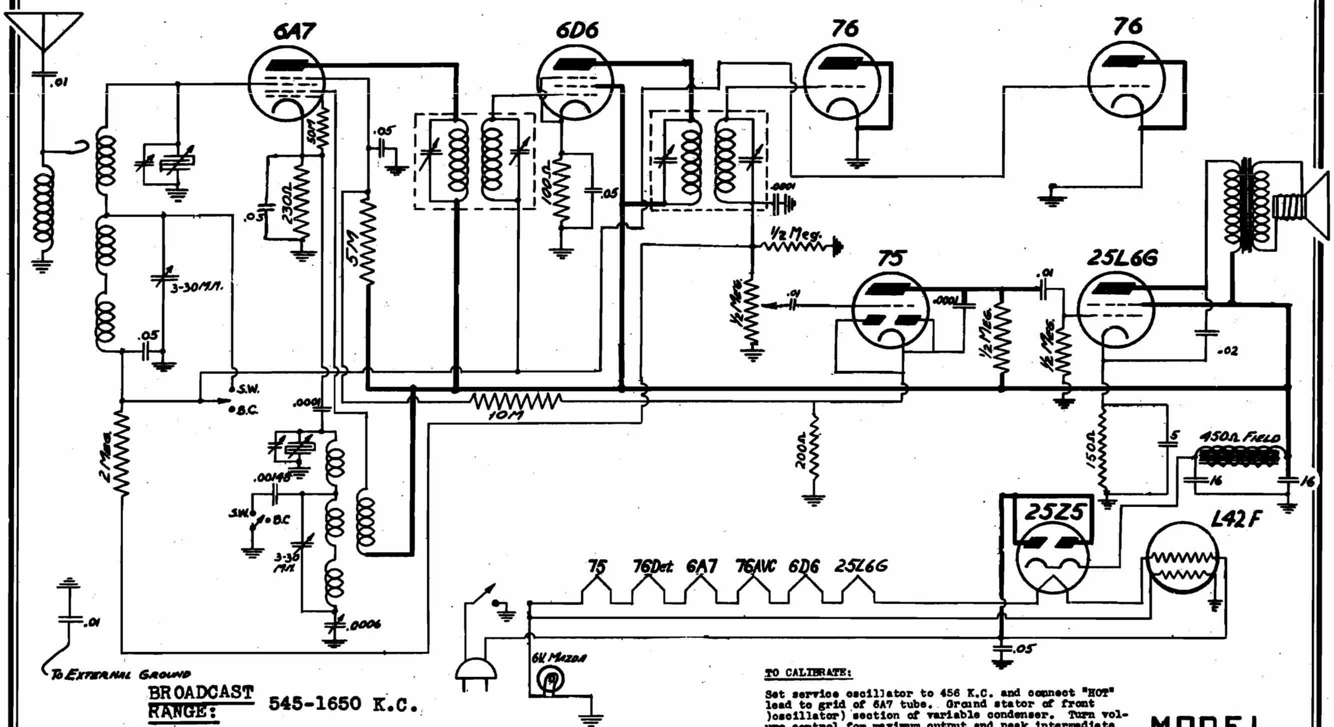
How To Adjust Buttons For Selected Stations:

On the rear of the chassis there is a label marked with two rows of numbers from 1 to 5 with an adjusting condenser next to each number. Two of these condensers having the corresponding numbers must be adjusted to receive any one station. The frequency range of the adjusting condensers are as follows:

Det adj. Condenser	Osc. Adj. Condenser	Range in K.C.	Range in Meter	Corresponding Switch Button
1	1	520-730	577-410	Top
2	2	520-730	577-410	2nd from Top
3	3	550-900	548-333	3rd " "
4	4	650-1050	462-286	4th " "
5	5	1000-1750	300-171	5th " "

MODEL 807
MODEL 1201
Schematics, Alignment

DEWALD RADIO



BROADCAST RANGE: 545-1650 K.C.

SHORT WAVE RANGE: 7.5 to 2.15 Megacycles

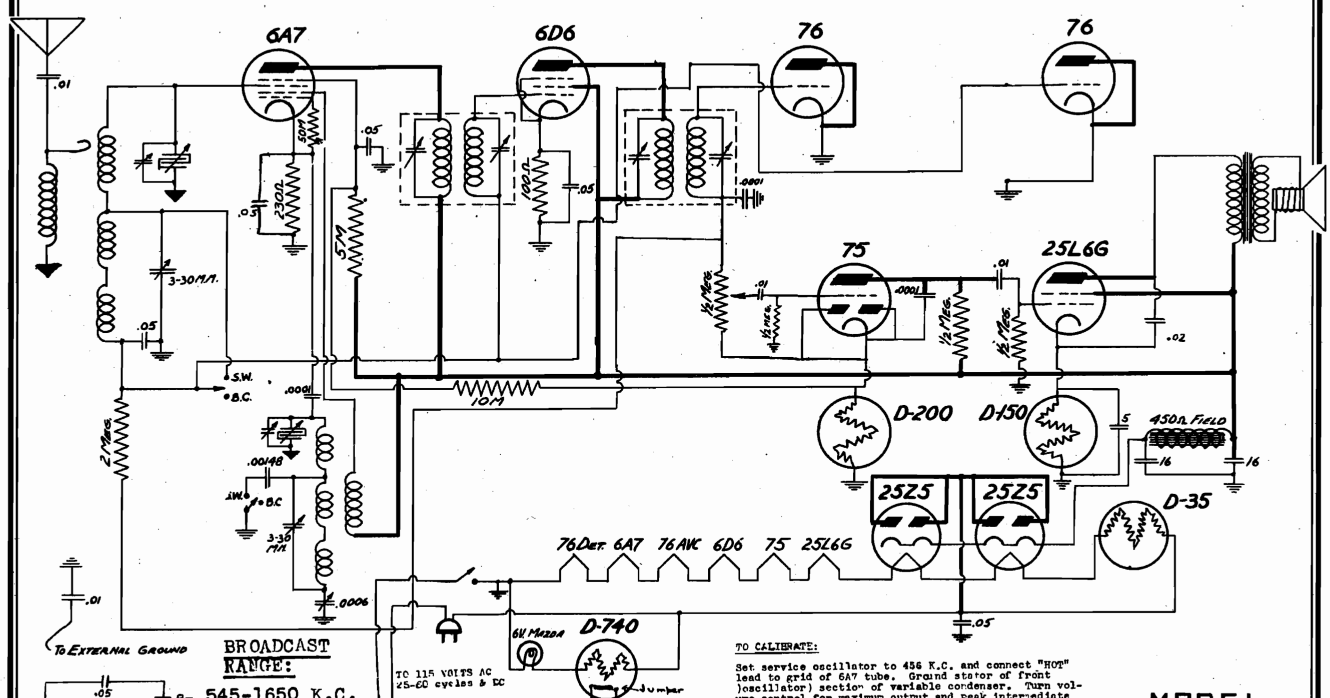
This receiver is designed to operate on 115 Volts AC 40-60 cycles and DC. The current consumption is 40 watts.

TO CALIBRATE:

Set service oscillator to 456 K.C. and connect "HOT" lead to grid of 6A7 tube. Ground stator of front)oscillator) section of variable condenser. Turn volume control for maximum output and peak intermediate frequency trimmers for maximum gain. Turn wave band switch knob toward right. Adjust service oscillator and receiver to 7 megacycles and peak variable condenser trimmers for maximum gain. Turn wave band switch toward left and adjust oscillator (service) and receiver to 1500 K.C. Peak both trimmers underneath chassis for maximum gain. Then adjust service oscillator and receiver to 600 K.C. and "rock" the variable condenser and adjust the padder (near front of chassis on top at the same time for maximum gain.

MODEL 807

IF PEAK 456 KC.



CHASSIS GROUND .05 B- BROADCAST RANGE: 545-1650 K.C.

SHORT WAVE RANGE: 7.5 to 2.15 Megacycles

This receiver is designed to operate on 115 Volts AC 25-60 cycles and DC. The current consumption is 65 watts.

TO CALIBRATE:

Set service oscillator to 456 K.C. and connect "HOT" lead to grid of 6A7 tube. Ground stator of front)oscillator) section of variable condenser. Turn volume control for maximum output and peak intermediate frequency trimmers for maximum gain. Turn wave band switch knob toward right. Adjust service oscillator and receiver to 7 megacycles and peak variable condenser trimmers for maximum gain. Turn wave band switch toward left and adjust oscillator (service) and receiver to 1500 K.C. Peak both trimmers underneath chassis for maximum gain. Then adjust service oscillator and receiver to 600 K.C. and "rock" the variable condenser and adjust the padder (near front of chassis on top at the same time for maximum gain.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. All readings except cathode and heater voltages were taken on 250 volt scale. Line voltage for these readings was 117.5 volts, 60 cycles, a.c.

Tube	*Plate*	*Screen*	*Cathode*	*Osc. Plate*	*Fil.*
6A7	96	45	2.3	74	6.3
6D6	96	96	4.5	—	6.3
6Q7	40	—	1.0	—	6.3
25L6	92	100	6.2	—	25.0

Voltage at 25Z5 cathode—125 volts.
Voltage across speaker field—29 volts.
Voltage drop across ballast tube (pins Nos. 3, 7)—49 volts.
Voltage drop across pilot light section (pins Nos. 8, 7)—4 volts.

Tube Data

The tube complement is as follows:

1—6A7 pentagrid oscillator-modulator.
1—6D6 first i-f amplifier.
1—6Q7 diode detector, a-f amplifier, a.v.c.
1—25L6 beam power output.
1—25Z5 dual half-wave rectifier.
1—2UR-224 ballast tube (R13 on schematic).

When ordering replacement parts specify part number

*Item number locates the article on the schematic diagram.

†These trimmers are part of coil assemblies and cannot be supplied separately.

PRODUCTION CHANGES

In AM receivers bearing serial numbers below 1533750 and BF receivers bearing serial numbers below 1523000:
- (a) R6 and R9 were 1 megohm resistors, part no. KR-57.
- (b) R7 was a 250,000 ohm resistor, part no. 2NR-214C.
- (c) C23 and C27 were .00025 mf mica condensers, part no. AC-7A.
- (d) C24 was a .02 mf, 200 volt condenser, part no. FC-29.

In AM receivers bearing serial numbers below 1518000:
- (a) T1 was part no. 3CT-289A.
- (b) T2 was part no. 3CT-274.
- (c) T3 was part no. 3CT-275.
- (d) Wave-band switch was part no. TTS-111G.

In AM receivers bearing serial numbers below 1184290:
- (a) The variable condenser was part no. 3CC-275.
- (b) Dial pointer was part no. 4MZ-590.

In AM receivers bearing serial numbers between 1184290 and 1518000:
- (a) Variable condenser was part no. 3CC-275A.
- (b) Dial face was part no. 3CZ-514.

ADJUSTMENTS

An oscillator with frequencies of 456, 600, 1400 and 15,000 kc should be used.

In addition an output meter should be used across the voice coil or output transformer for observing maximum response.

The set's oscillator is higher in frequency than the signal, so images should be observed on the low frequency side of the signals.

Always choose the minimum capacity peak on oscillator trimmers and maximum capacity peaks on antenna trimmers. The last motion in adjusting trimmers should always be a tightening one, not a loosening one.

Always use as weak a test signal as possible during alignment.

Never leave a trimmer with the outside plate so loose that there is no tension on the screw. Either bend the plate up or remove the screw entirely.

Location of Coils and Trimmer Adjustments

The broadcast antenna coil, short-wave antenna coil, and 456 kc wave-trap are one assembly mounted underneath the chassis deck, to the right of the variable condenser. The trimmers for these coils are accessible through three holes in the top of the chassis. The trimmer closest to the front of the chassis is for the 456 kc wave-trap. The central trimmer is for the broadcast antenna coil, and the trimmer farthest from front is for short-wave antenna coil.

The broadcast oscillator and short-wave oscillator coils are wound on one form and mounted on the inside of the rear chassis wall. The trimmers for these coils are accessible through two holes in the rear chassis wall. The left-hand trimmer (looking at the rear wall) is for the short-wave oscillator coil and the right-hand trimmer is for the broadcast oscillator coil.

The two i-f transformers are in oblong coil cans located on the top of the chassis. The first i-f transformer is the one behind the variable condenser. The trimmers for these transformers are accessible through holes in the tops of the cans.

The broadcast series padding condenser is located on the top of the chassis, to the left of the variable condenser. The adjusting screw is reached through a hole in the top of the chassis.

I-f Transformer and Wave-Trap Alignment

Turn the switch clockwise to the broadcast position and rotate the variable condenser to the minimum capacity position. Feed 456 kc through a .02 mf condenser to the grid cap of 6A7 tube and adjust the four i-f trimmers for maximum response. Feed 456 kc through a .0002 mf condenser to the antenna and adjust the wave-trap trimmer (front screw beside variable condenser) for minimum response.

Short-Wave Alignment

Use a dummy antenna (400 ohm resistor) when aligning the short-wave coils.

Rotate the wave-band switch counter-clockwise to the short-wave position and set the dial pointer to 15 megacycles. Feed 15 megacycles through the dummy antenna and adjust the short-wave oscillator trimmer (left-hand screw on rear chassis wall) for maximum response and then adjust the short-wave antenna trimmer (rear screw beside variable condenser) for maximum response. The variable condenser should be rocked while adjusting the antenna trimmer. (Rotate variable condenser rotor shaft back and forth through a small arc).

Broadcast Alignment

Rotate the wave-band switch to the broadcast position, clockwise, and set the dial pointer at 60. Feed 600 kc through a standard dummy antenna (a .0002 mf condenser may be used as a substitute).

Adjust the broadcast series padding condenser (on rear chassis wall, below 6A7 tube) for maximum response. Move pointer to 140, feed 1400 kc and adjust the broadcast oscillator trimmer (right-hand screw on rear chassis wall) for maximum response and then adjust the broadcast antenna trimmer (central screw beside variable condenser) for maximum response. Return pointer to 60, feed 600 kc and readjust the series padding condenser, rocking the variable condenser for maximum response.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f portion of the circuit, the receiver should be carefully re-aligned.
2. One side of the power line is directly grounded to the chassis base. Under no circumstances, therefore, should a ground wire be permitted to come in contact with any metal part of the receiver.
3. The filament dropping resistor (R13 on schematic) is in a special tube at the rear of the chassis. This tube will become quite hot under normal operating conditions. For voltage drop specifications, see below.
4. When operating the receiver on d.c. it may be necessary to reverse the line plug to obtain the correct polarity.
5. The two i-f transformers are held to the chassis by snap-on fasteners. To remove an i-f, unsolder all its leads under the chassis, pinch together the prongs of the snap-on fastener and lift the i-f can from the chassis.
6. The color coding of the i-f transformer leads is as follows:

   Grid—green — Plate—blue
   Grid return—black — B plus—red

7. An efficient antenna system is necessary to enable a full realization of the merits of the receiver. For reduction of noise and achievement of high efficiency on all frequency ranges the Emerson All-Wave High Fidelity Antenna, Model W-78, and the Emerson All-Wave Antenna System, Model W-89, are recommended. Instructions for the installation of these antennas are supplied with each kit.

   In congested areas where the installation of a large antenna is not desirable we recommend the use of the Emerson Flexible Mast Antenna, Model W-82. Instructions for the installation of this compact and efficient antenna are supplied with each kit.
8. The wave-trap in the receiver has been adjusted for maximum signal rejection at 456 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.

Voltage rating	105-125 volts, a.c. or d.c.
Power consumption	50 watts.
Frequency ranges	540 to 1,730 kc, and 5.6 to 18.0 megacycles.

CHASSIS MODEL BG

Voltage rating ..... 105-125 volts.
Power consumption .... 50 watts for receiver. 20 watts for phonograph motor.
Frequency ranges .. 540 to 1,730 kc, and 2.2 to 7 megacycles.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale.

	MODEL AH				MODEL BG and AH-166				
Tube	Plate	Screen	Osc. Plate	Cathode	Plate	Screen	Osc. Plate	Cathode	Heaters All Models

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f portion of the circuit, the receiver should be carefully re-aligned.
2. One side of the power line is directly grounded to the chassis base. Under no circumstances, therefore, should a ground wire be permitted to come in contact with any metal part of the receiver.
3. The filament dropping resistor is in a special tube at the rear of the chassis. This tube will become quite hot under normal operating conditions. For voltage drop specifications, see below.
4. When operating the receiver on d.c. it may be necessary to reverse the line plug to obtain the correct polarity.
5. The wave-trap in the receiver has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.
6. The motor used in this combination is of the a.c. self-starting type and will operate on ALTERNATING CURRENT ONLY. To avoid damaging the motor the combination should never be used on direct current.

PRODUCTION CHANGES

1. In AH receivers bearing serial numbers below 1,102,142, C11 was .01 mf, 400 volt condenser.
2. In AH receivers bearing serial numbers below 1,149,148, C22 was connected from plate to B plus.
3. AH receivers bearing serial numbers below 1,711,701 differ from parts list as follows:

	Item	Was Part No.	DESCRIPTION

(l)	C21	AC-7A	0.00025 mf mica condenser	.20
(m)	C23	EC-23	0.03 mf, 400 volt tubular condenser	.20
(p)	C27	BC-12	0.05 mf, 200 volt tubular condenser	.20
(r)	——	XL-9	Dial light, 6.3 volt, .25 amp. Mazda No. 46 (Screw type base.)	.20
(s)	——	3SZ-436	Dial pointer	.05

4. The schematic diagram of the phonograph-radio circuit used on AH-166 is shown in the small panel at the left side of Schematic Diagram No. 1. Notice that switch lug marked *A* goes to the screen grid of the 6A7 tube. Switch lug marked *B* goes to the volume control and lug marked *C* goes to the junction of R6 and the black lead from the diode i-f transformer.

ADJUSTMENTS

An oscillator with frequencies of 455, 600, 1600 and 6,000 kc should be used.

An output meter should be used across the voice coil or output transformer for observing maximum response.

If the circuit is at all disturbed, both the broadcast and short-wave bands must be realigned.

The set's oscillator is higher in frequency than the signal, so images should be observed on the low frequency side of the signals.

Always choose the minimum capacity peak on oscillator trimmers and maximum capacity peaks on antenna trimmers. The last motion in adjusting trimmers should always be a tightening one, not a loosening one.

Never leave a trimmer with the outside plate so loose that there is no tension on the screw. Either bend the plate up or remove the screw entirely.

Always use as weak a test signal as possible during alignment.

Use a standard dummy antenna for aligning either of the bands. A .0002 mf condenser may be used for the broadcast band dummy antenna and a 400 ohm non-inductive resistor for the short-wave dummy antenna.

Location of Coils and Trimmer Adjustments

The two i-f transformers are located on top of the chassis deck. The second i-f is the one directly behind the variable condenser. The four trimmers, two for each transformer, are accessible through holes in the tops of the cans.

The adjustable padding condenser for the broadcast band is mounted underneath the chassis (in the corner near the 6A7 tube) with the screw adjustment accessible through a hole in the top of the chassis.

The antenna coils for the broadcast and short-wave bands and the 455 kc wave-trap are wound on one form and mounted underneath the chassis deck directly behind the adjustable padding condenser. The trimmers for these coils are accessible through holes in the top of the chassis. The trimmer nearest the front of the chassis is the short-wave antenna trimmer. The central trimmer is the broadcast antenna trimmer. The trimmer nearest the rear of the chassis is the 455 kc wave-trap.

The oscillator coils for the broadcast and short-wave bands are wound on one form and mounted underneath the chassis deck near the variable condenser. The trimmers for these coils are accessible through holes in the top of the chassis. The trimmer nearest the front of the chassis is for the short-wave oscillator coil and the trimmer farthest from the front is for the broadcast oscillator coil.

I-f and Wave-trap Alignment

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 455 kc, through a 0.02 mf paper condenser, to the grid cap of the 6A7 tube (do not remove the grid clip from the tube). Adjust the four i-f trimmers for maximum response. Feed 455 kc to the antenna through a standard dummy antenna and adjust the wave-trap trimmer for *minimum* response. (See General Note No. 5.)

Short-Wave Alignment (Alignment of the short-wave band should precede broadcast alignment.)

Rotate the wave-band switch, to the short-wave (counter-clockwise) position, and set the dial pointer exactly at 6 megacycles. Feed 6,000 kc to the antenna and adjust the short-wave oscillator trimmer for maximum response, and then adjust the short-wave antenna trimmer for maximum response. Be very careful to choose the minimum capacity peak on the oscillator trimmer.

Broadcast Alignment

Rotate the wave-band switch to the broadcast position (clockwise) and set the dial pointer at 60. Feed 600 kc through a standard dummy antenna. Adjust the broadcast series padding condenser for maximum response. Move pointer to 160, feed 1600 kc and adjust the broadcast oscillator trimmer for maximum response and then adjust the broadcast antenna trimmer for maximum response. Return pointer to 60, feed 600 kc and readjust the series padding condenser rocking the variable condenser for maximum response.

When ordering replacement parts specify part numbers.

*Item number locates the article on the schematic diagram.
†See production changes.
‡These trimmers are parts of assemblies and cannot be supplied separately.

PRODUCTION CHANGES

In early receivers the oscillator coil was part number 3RT-319. When replacing this coil with the new coil part number 3RT-319A, it will be necessary to remove the short length of shielding over the white lead (lead from wave-band switch to tap on coil.)

IN RECEIVERS BEARING SERIAL NUMBERS BELOW 1,019,000:
a. R3 was a 3 megohm 1/4 watt carbon resistor, part no. NNR-220U

IN RECEIVERS BEARING SERIAL NUMBERS BELOW 1,043,350:
a. The first i-f tube was a type 78.
b. The first i-f transformer was part no. 3RT-320.
c. The second i-f transformer was part no. 3RT-321.

IN RECEIVERS BEARING SERIAL NUMBERS BELOW 1,180,983:
a. The pointer pulley was part no. 3RZ-479.
b. The dial pointer was part no. 3FZ-353.

IN RECEIVERS BEARING SERIAL NUMBERS BELOW 1,284,001:
a. The antenna coil was part no. 3RT-318.

IN RECEIVERS BEARING SERIAL NUMBERS BELOW 1,311,103:
a. A type 75 tube was used in place of the 6Q7-G.
b. R8 was a 310 ohm resistor, part no. 3RR-276.
c. R9 was a 23 ohm resistor, part no. 3RR-266.

IN RECEIVERS BEARING SERIAL NUMBERS BELOW 1,364,351:
a. The pilot light was the screw type, part no. XL-9.
b. The pilot light socket was part no. 3RB-38.

IN RECEIVERS BEARING SERIAL NUMBERS BELOW 1,405,542:
a. C22 was not in the circuit.

ADJUSTMENTS

An oscillator with frequencies of 456 and 1400 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The two i-f transformers are located on top of the chassis deck. The first i-f transformer is the one directly behind the 6A7 tube. The trimmers for the two i-f transformers are available through holes in the tops of the cans.

The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil.

The 456 kc wave-trap is mounted on the rear chassis wall directly beneath the wave-band switch. The trimmer for the 456 kc wave-trap is mounted on the coil and is accessible from the bottom of the chassis.

I-f and Wave-trap Alignment

Rotate the wave-band switch (located on the rear wall of the chassis) to the broadcast position, clockwise, and swing the variable condenser to the minimum capacity position. Feed 456 kc to the grid-cap of the 6A7 tube and adjust the four i-f trimmers for maximum response. Feed 456 kc through a dummy antenna (a .0002 mf condenser may be used as a substitute) to the antenna lead and adjust the wave-trap trimmer for *minimum* response. (See General Notes, paragraph No. 1.)

R-f Alignment

With the wave-band switch in the broadcast position, clockwise, set the dial pointer at 140. Feed 1400 kc through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response. The police band is self-tracking and does not require any adjustment.

GENERAL NOTES

1. The wave-trap in the receiver has been adjusted for maximum signal rejection at 456 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.
2. The receiver should never be turned on with either the speaker plug or the 41 tube out of their sockets, since the rapid rise in rectifier voltage would damage the electrolytic condensers.
3. The pilot light may be replaced by removing the snap-on socket from the dial and then removing the bulb. It is not necessary to remove either the dial or chassis from the cabinet.
4. The color coding of the leads of the i-f transformers, is as follows:
   Grid—green; Plate—blue
   Grid return—black; B plus—red
5. With a few exceptions, the color coding of the general wiring is as follows:
   Plate—blue; A.v.c. and cathode—white or yellow
   B plus—red; Grid—green
   Screen—brown; Filament and ground—black
6. The phonograph motor has been adjusted at the factory to turn at a speed of 78 r.p.m. The speed may be checked by counting the turns per minute or by using a stroboscope disc and a neon light. (The stroboscope method will only work when neon bulb is lighted from a 60 cycle a.c. supply.) To readjust the speed of the motor, part No. 3LPM-3, remove the turn-table and turn the speed adjusting screw (located near the turn-table shaft). A clockwise rotation of the screw decreases the speed. The speed should be checked with the pick-up and record in playing position.
7. The color coding of the power transformer leads is as follows:
   Primary—two black leads; 6.3 v. sec.—two heavy green leads
   High voltage sec.—two red leads; 5 v. sec.—two heavy yellow leads
   High voltage sec. center tap—yellow and red

Tube Data

The tube complement is as follows:

VOLTAGE ANALYSIS

Readings should be taken on the 250 volt scale of a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c.

Tube	Plate	Screen	Cathode	Osc. Plate	Fil.
6A7	182	70	0	182	6.3
6D6	182	70	0	—	6.3
6Q7-G	67	—	0	—	6.3
41	165	182	0	—	6.3

Voltage across speaker field—70.
Voltage from B minus to chassis—80.
B plus at 80 tube filament—262.

Voltage rating ......105-125 volts, 60 cycles, a.c.
Power consumption ..45 watts for receiver and 20 watts for motor.
Frequency ranges ...540 to 1580 kc. and 1580 to 4200 kc.

Antenna Adjustment

To adjust antenna circuit of this receiver to the car antenna, tune the receiver to a signal in the vicinity of 600 KC. Adjust the antenna padder condenser until the signal is received at maximum volume. Keep the volume control turned down as low as possible while making the adjustment.

MODEL V155 Early
Chassis V
Alignment, Changes
Notes, Parts

EMERSON RADIO & PHONO. CORP.

ALIGNMENT PROCEDURE

The receiver was carefully adjusted and tested at the factory, and should reach the customer in perfect condition. Except for the antenna padder these adjustments should not be disturbed unless it is absolutely necessary, as in the repairing of a damaged set. This should be done by an experienced auto service man only.

I-f Alignment

To align the intermediate frequency transformers, use a good modulated oscillator set for 262.5 kc. Rotate the variable condenser to the minimum capacity position, turn the volume control on full and ground the antenna to the chassis.

Connect the test oscillator lead, through a paper condenser (.02 mf or larger), to the grid cap of the 6A7 tube. Do not remove the grid clip from the tube. Connect an output meter across the primary of the speaker transformer or across the voice coil. Using the *smallest output* from the test oscillator that will give a definite reading on the meter, adjust the two i-f transformers for maximum response. Use a non-metallic screw driver if possible.

Radio Frequency and Oscillator Alignment

Connect the test oscillator lead through a standard dummy antenna (a .0002 mf condenser may be substituted) to the antenna connector of the receiver. Rotate the variable condenser to the *minimum capacity* position. Feed 1530 kc and adjust the oscillator trimmer (center) on the variable condenser for maximum response. Set the test oscillator to some frequency near 1400 kc and swing the variable until this signal is heard. Adjust the two r-f trimmers (front and rear) on the variable condenser for maximum response. Set the test oscillator for 600 kc and swing the variable until this signal is heard. Adjust the antenna padder (on chassis wall below the variable condenser) for maximum response. Reset the test oscillator to some frequency near 1400 kc and readjust the two r-f trimmers for maximum response. Reduce the output of the test oscillator and repeat this adjustment.

NOTE: The antenna padder should be readjusted after the receiver is installed in the car.

Tube Data

The tube complement is as follows:

1—6D6 r-f amplifier.
1—6A7 pentagrid oscillator-modulator.
1—6B7 i-f amplifier, diode detector, and a.v.c.
1—76 audio amplifier (near power transformer).
1—76 phase inverter (near variable condenser).
2—41 push-pull pentode power output.
1—84 full-wave thermionic rectifier.
1 Primary type vibrator.

The function of the vibrator is to convert the direct current from the battery into alternating current to actuate the power transformer. The stepped-up voltage is then rectified into direct current by the 84 tube for use as plate supply.

GENERAL NOTES

1. Before removing the chassis from the case pull the speaker plug out of its socket. The speaker plug should be replaced before the receiver is turned on.
2. Before removing the chassis from its case, remove the tone control from the case. The large rubber knob is forced over a knurled bushing on the tone control shaft and may be removed by pulling the knob away from the case.
3. It should be noted that one side of the speaker field is grounded to the speaker frame.
4. A 15 ampere fuse is located in a small tubular holder in the battery lead. To replace the fuse, remove the cap, insert the fuse and replace the cap. The fuse is intended to protect the receiver and in no case should one larger than 15 amperes be used.

Suppression of Ignition Interference

If, when the receiver is in operation, and the motor is running, the ignition interference is excessive the following suggestions should help to reduce it to a satisfactory level.

By-pass dome light wire at instrument panel with a ½ mf condenser.
By-pass the low tension lead to the ignition coil with a ½ mf condenser.
Shield high tension lead from coil and ground to fire wall.
Shield low tension leads to ignition coil.

Try grounding antenna shield at various points, and also try leaving shield ungrounded, except at point where it is automatically grounded at receiver by means of the metal connector. Move all adjacent wiring slightly, and note if it may be coupling to the battery lead to receiver.

Bond steering column to fire wall.
Try bonding exhaust pipe, particularly if interference is increased with passengers in car.
Bond metal cables or pipes coming through fire wall, connecting them to the fire wall. If car has wooden floor boards, place a screen underneath floor mat and note if interference is decreased, particularly with passengers in car.

Check antenna wiring, making sure it is shielded completely.
Try bonding windshield wiper pipe.
Check ignition system for defects.

When condensers are used for by-passing ignition interference, their leads should be as short as possible, since often a condenser with leads a fraction of an inch long will be very effective in places where the same condenser with longer leads would be useless.

NOTE: It is recommended that the charging rate of the car generator be increased slightly to compensate for the added drain of the receiver.

Alignment, Notes
Parts, Change

EMERSON RADIO & PHONO. CORP.

ALIGNMENT PROCEDURE

The receiver was carefully adjusted and tested at the factory, and should reach the customer in perfect condition. Except for the antenna padder these djustments should not be disturbed unless it is absolutely necessary, as in the repairing of a damaged set. This should be done by an experienced auto service man only.

I-f Alignment

To align the intermediate frequency transformers, use a good modulated oscillator set for 262 kc. Rotate the variable condenser to the minimum capacity position, turn the volume control on full and ground the antenna to the chassis.

Connect the test oscillator lead, through a paper condenser (.02 mf or larger), to the grid cap of the 6A7 tube. Do not remove the grid clip from the tube. Connect an output meter across the primary of the speaker transformer or across the voice coil. Using the *smallest output* from the test oscillator that will give a definite reading on the meter, adjust the two i-f transformers for maximum response. Use a non-metallic screw driver if possible.

Radio Frequency and Oscillator Alignment

Connect the test oscillator lead through a standard dummy antenna (a .0002 mf condenser may be substituted) to the antenna connector of the receiver. Rotate the variable condenser to the *minimum capacity* position. Feed 1530 kc and adjust the oscillator trimmer (center) on the variable condenser for maximum response. Set the test oscillator to some frequency near 1400 kc and swing the variable until this signal is heard. Adjust the two r-f trimmers (front and rear) on the variable condenser for maximum response. Set the test oscillator for 600 kc and swing the variable until this signal is heard. Adjust the antenna padder (on chassis wall below the variable condenser) for maximum response. Reset the test oscillator to some frequency near 1400 kc and readjust the two r-f trimmers for maximum response. Reduce the output of the test oscillator and repeat this adjustment.

NOTE: The antenna padder should be readjusted after the receiver is installed in the car.

To adjust the receiver antenna circuit to the car antenna, an adjustable condenser (padder) is provided in the receiver. This antenna padder is located on the cable chuck side of the receiver with its screw adjustment accessible through a hole in the receiver wall.

Turn the receiver on and tune in a station in the vicinity of 600 kc. Adjust the antenna padder until the station is received at maximum volume. Keep the volume control turned down as low as possible while making this adjustment. In extreme conditions the car antenna capacity may be such that a sharp peak on the antenna padder is not obtainable. In such a case adjust for maximum gain.

Tube Data

1—6D6 r-f amplifier (behind variable condenser).	1—76 phase inverter (near variable condenser).
1—6A7 pentagrid oscillator-modulator.	2—41 push-pull pentode power output.
1—6D6 i-f amplifier.	1—84 full-wave thermionic rectifier.
1—6Q7G audio amplifier, diode detector, and a.v.c.	1 Primary type vibrator.

GENERAL NOTES

1. Before removing the chassis from the case pull the speaker plug out of its socket. **The speaker** plug should be replaced before the receiver is turned on.
2. Before removing the chassis from its case, remove the tone control from the case. **The large rubber knob is forced over a knurled bushing on the tone control shaft and may be removed by pulling** the knob away from the case.
3. It should be noted that one side of the speaker field is grounded to the speaker frame.
4. A 15 ampere fuse is located in a small tubular holder in the battery lead. To replace the fuse, remove the cap, insert the fuse and replace the cap. The fuse is intended to protect the receiver and in no case should one larger than 15 amperes be used.

Suppression of Ignition Interference

If, when the receiver is in operation, and the motor is running, the ignition interference is excessive the following suggestions should help to reduce it to a satisfactory level.

Insulate the speaker unit from the firewall, using the fibre washer supplied in the speaker kit. (See paragraph (a) on page three).

By-pass dome light wire at instrument panel with a ½ mf condenser to ground.

By-pass the low tension lead to the ignition coil with a ½ mf condenser to ground.

Shield high tension lead from coil and ground to fire wall.

Shield low tension leads to ignition coil.

Try grounding antenna shield at various points, and also try leaving shield ungrounded, except at point where it is automatically grounded at receiver by means of the metal connector. Move all adjacent wiring slightly, and note if it may be coupling to the battery lead to receiver.

Bond steering column to fire wall.

Try bonding exhaust pipe, particularly if interference is increased with passengers in car.

Bond metal cables or pipes coming through fire wall, connecting them to the fire wall. If car has wooden floor boards, place a screen underneath floor mat and note if interference is decreased, particularly with passengers in car.

Check antenna wiring, making sure it is shielded completely.

Try bonding windshield wiper pipe.

Check ignition system for defects.

When condensers are used for by-passing ignition interference, their leads should be as short as possible, since often a condenser with leads a fraction of an inch long will be very effective in places where the same condenser with longer leads would be useless.

NOTE: It is recommended that the charging rate of the car generator be increased slightly to compensate for the added drain of the receiver.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale.

Tube	Plate	Screen	Cathode	Osc. Plate	Fil.
6A7	100	50	2.3	100	6.3
6D6	100	100	3.5	—	6.3
6Q7G	48	—	1.2	—	6.3
25L6G	92	100	6.5	—	25.0

Voltage at 25Z5 cathode—130 volts.
Voltage across speaker field—28 volts.
Voltage drop across ballast tube (pins Nos. 3, 7)—49 volts.
Voltage drop across pilot light section (pins Nos. 8 and 7)—4 volts.

Tube Data

The tube complement is as follows:

1—6A7 pentagrid oscillator-modulator.
1—6D6 first i-f amplifier.
1—6Q7G diode detector, a-f amplifier, a.v.c.
1—25L6G beam power output.
1—25Z5 dual half-wave rectifier.
1—2UR-224 ballast tube (R12 on schematic). (L49B and L49BG are interchangeable with 2UR-224.)

Unless otherwise specified all octal-base tubes may be replaced with either metal or octal-base glass tubes.

PRODUCTION CHANGES

1. Receivers bearing serial numbers below 1,214,000 had a phono-motor on-off switch instead of tone control with switch.
2. Receivers bearing serial numbers below 1,436,000 did not have the turn-table insulated. These receivers also used speaker, part no. 3FS-251, pick-up, part no. 3ZZ-564A, and did not use the filter choke, part no. 4PT-404.
3. On Model AL-164: C26 has been omitted; R16 is .5 megohm. On Model AL-202: C26 is .02 mf; R16 has been omitted.
4. In AL receivers bearing serial numbers below 1,342,161 the antenna coil was part no. 3RT-318. Antenna coils, part nos. 3RT-318 and 3RT-384, are interchangeable. The lug arrangement for both coils is shown in Fig. 1 at the right.
5. In AL receivers bearing serial numbers 1,342,161 to 1,436,458 and between 1,468,963 to 1,471,250 the antenna coil was part no. 3RT-384 and C4 was .001 mf. Part no. 3RT-384A is interchangeable for 3RT-384 if C4 is made .0012 mf; part no. 4DC-367.

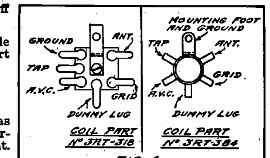

FIG. 1

Note: 3RT-384A lug arrangement is the same as 3RT-384.

ADJUSTMENTS

An oscillator with frequencies of 456, 600 and 1400 kc should be used.

An output meter should be used across the voice coil or output transformer for observing maximum response.

The set's oscillator is higher in frequency than the signal, so images should be observed on the low frequency side of the signals.

The last motion in adjusting trimmers should always be a tightening one, not a loosening one.

Never leave a trimmer with the outside plate so loose that there is no tension on the screw. Either bend the plate up or remove the screw entirely.

Always use as weak a test signal as possible during alignment.

Use a .0001 mf mica condenser as a dummy antenna during alignment.

Location of Coils and Trimmer Adjustments

The two i-f transformers are in oblong coil cans located on top of the chassis deck. The first i-f transformer is the one behind the variable condenser. The trimmers for these transformers are accessible through holes in the tops of the cans.

The 456 kc wave-trap is mounted on the right side of the front chassis wall. Its trimmer is accessible at the bottom of the chassis.

The antenna coils for the broadcast and police bands are wound on one form and are mounted underneath the chassis deck below the variable condenser.

The oscillator coils for the broadcast and police bands are wound on one form and are mounted on the rear wall of the chassis deck near the variable condenser.

The trimmers for the broadcast antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil.

I-f Transformer and Wave-Trap Alignment

Turn the switch clockwise to the broadcast position and rotate the variable condenser to the minimum capacity position. Feed 456 kc to the grid cap of the 6A7 tube and adjust the four i-f trimmers for maximum response. Feed 456 kc to the antenna and adjust the wave-trap trimmer for *minimum* response. (See General Notes, No. 8.)

R-f Alignment

With the wave-band switch in the broadcast position, clockwise, set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response. The police band is self-tracking and does not require any adjustment.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f portion of the circuit, the receiver should be carefully re-aligned.
2. One side of the power line is directly grounded to the chassis base. Under no circumstances, therefore, should a ground wire be permitted to come in contact with any metal part of the receiver.
3. The filament dropping resistor (R12 on schematic) is in a special tube at the rear of the chassis. This tube will become quite hot under normal operating conditions. For voltage drop specifications, see below.
4. When operating the receiver on d.c. it may be necessary to reverse the line plug to obtain the correct polarity.
5. The two i-f transformers are held to the chassis by snap-on fasteners. To remove an i-f, unsolder its leads under the chassis, pinch together the prongs of the snap-on fastener and lift the i-f can from the chassis.
6. The color coding of the i-f transformer leads is as follows:
   Grid—green — Plate—blue
   Grid return—black — B plus—red
7. The receiver is shipped with an attached antenna wire. In some locations near powerful local stations the addition of a very large antenna may be detrimental to reception, because of the resulting interference. The Emerson Flexible Mast Antenna, Model W-82, has been especially designed for Emerson receivers, featuring compactness and portability while at the same time retaining a high efficiency from the standpoint of performance. Since it functions as an outside antenna the Flexible Mast will substantially improve the receiver performance. Where the Flexible Mast is installed permanently, it is urgently recommended that the receiver antenna wire be cut. Leave just enough of this wire to reach from the receiver to the window strip connector. Instructions for the installation of this compact and efficient outside antenna are supplied with each kit.
8. The wave-trap in the receiver has been adjusted for maximum signal rejection at 456 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.
9. The phonograph motor has been adjusted at the factory, to turn at a speed of 78 r.p.m. The speed may be checked by counting the turns per minute or by using a stroboscope disc and a neon light (the stroboscope method will only work when the neon bulb is lighted from a 60 cycle a.c. supply).
10. An a.c.-d.c. switch is provided to switch the motor for a.c. or d.c. power supply. It is important that this switch be in the proper position for the power supply available.

List Price as Effective as of Nov. 15th, 1937 (Subject to change without notice.)

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. Measurements made with 117.5 volts, d.c. will be lower than those given below.

The following are voltages for receivers using permanent magnet dynamic speakers (serial numbers above 1,291,800):

Tube	Plate	Screen	Cathode	Osc. Plate	Fil.
6A7	118	38	2.0	76	6.3
6D6	118	115	4.2	—	6.3
6Q7	45	—	1.0	—	6.3
25L6	108	115	8.0	—	25
25Z5	—	—	130.0	—	25

Voltage across filter choke—12 volts.
Voltage across resistors in ballast tube—49 volts.
Voltage across each pilot light section in ballast tube—4 volts.

The following are voltages for receivers using electro-dynamic speakers (serial numbers below 1,291,800):

Tube	Plate	Screen	Cathode	Osc. Plate	Fil.
6A7	110	34	2.4	67	6.3
6D6	110	110	4.2	—	6.3
6Q7	45	—	1.2	—	6.3
25L6	100	110	7.0	—	25
25Z5	—	—	135.0	—	25

Voltage across speaker field—25 volts.
Voltage across resistors in ballast tube—49 volts.
Voltage across each pilot light section in ballast tube—4 volts.

PRODUCTION CHANGES

1. Model AP-165 receivers differ from the schematic diagram as follows:
   a. C25 is a 12 mf, 200 volt dry electrolytic condenser, part no. 4PC-364, price $1.55
   b. C34 is a 24 mf, 200 volt dry electrolytic condenser, part no. 4PC-363, price 1.75
2. Receivers bearing serial numbers below 1,291,850 do not use the automatic stop. A manual switch, part no. 3LS-232, is used instead—price $.70.
3. Receivers bearing serial numbers below 1,291,800 use electro-dynamic speakers. The speaker field is used in place of the filter choke L3. The 6½" speaker is part no. 4PS-271. The 10" speaker is part no. 4PS-299.
4. Receivers bearing serial numbers below 1,292,600 use the following parts instead of the corresponding parts indicated on the previous page:

Part No.	DESCRIPTION	Price
4HC-343A	Variable condenser	$3.65
3LZ-403	Dial drive belt	.15
3CZ-337B	Dial drive shaft and pulley	.10
4HZ-562	Idler pulley spring	.05
3CZ-341	Condenser shaft pulley	.10
XL-9	Pilot light, 6.3 volt, .25 amp., Mazda No. 46, screw type base	.20

ADJUSTMENTS

An oscillator with frequencies of 150, 350, 456, 600, 1500 and 15,000 kc should be used.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Use a standard dummy antenna when aligning either the long-wave or medium-wave bands. A .0002 mf condenser may be used as a substitute. When aligning the short-wave band use a 400 ohm dummy antenna (a 400 ohm resistor in series with antenna lead).

Always choose the minimum capacity peak on oscillator trimmers and maximum capacity peaks on antenna trimmers. The last motion in adjusting trimmers should always be a tightening one, not a loosening one.

Always use as weak a test signal as possible during alignment.

Never leave a trimmer with its outside plate so loose that there is no tension on the screw. Either bend the plate up or remove the screw entirely.

Location of Coils and Trimmers

The two i-f transformers are located on top of the chassis deck. The second i-f transformer is the one directly behind the variable condenser. The four trimmers, two for each transformer, are accessible through holes in the tops of the cans.

The dual adjustable padding condenser is mounted on the left side of the front chassis wall.

The antenna coils for the three bands are wound on one form and mounted underneath the chassis deck directly behind the adjustable padding condenser. The trimmers for these coils are accessible through holes in the top of the chassis. The trimmer nearest the front of the chassis is the medium-wave antenna trimmer. The central trimmer is the short-wave antenna trimmer. The trimmer farthest from the front of the chassis is the long-wave antenna trimmer.

The oscillator coils for the three bands are wound on one form and mounted underneath the chassis deck near the variable condenser. The trimmers for these coils are also accessible through holes in the top of the chassis. The trimmer nearest the front of the chassis is the medium-wave oscillator trimmer. The central trimmer is the short-wave oscillator trimmer. The trimmer farthest from the front of the chassis is the long-wave oscillator trimmer.

I-f Alignment

Rotate the wave-band switch to the medium-wave (central) position and set the variable condenser to minimum. Feed 456 kc to the grid cap of the 6A7 tube. Adjust the four i-f trimmers for maximum response.

Long-Wave Alignment

With the wave-band switch at long-wave (clockwise) position set the dial pointer at 150 and feed 150 kc to antenna. Adjust the long-wave series padder (hex nut on dual padder) for maximum response. Move pointer to 350 and feed 350 kc to antenna. Adjust the long-wave oscillator trimmer then the long-wave antenna trimmer for maximum response. Reset pointer to 150, feed 150 kc and rock (rotate back and forth through a small arc) the variable condenser while adjusting long-wave series padder for maximum response. Reset pointer to 350, feed 350 kc and check alignment. If readjustment is necessary return to 150 kc and repeat entire procedure.

Medium-Wave Alignment

Set switch at medium-wave (central) position and dial pointer at 600. Feed 600 kc to antenna and adjust medium-wave series padder (slotted screw on dual padder) for maximum response. Move pointer to 1500, feed 1500 kc and adjust medium-wave oscillator trimmer and then the medium-wave antenna trimmer for maximum response. Reset pointer to 600 feed 600 kc and rock variable condenser while readjusting medium-wave series padder for maximum response. Reset pointer to 1500, feed 1500 kc and check alignment. If readjustment is necessary return to 600 and repeat entire procedure.

Short-Wave Alignment

Set wave-band switch at short-wave (counter-clockwise) position. Set pointer at 15, feed 15 megacycles to antenna and adjust short-wave oscillator trimmer and then short-wave antenna trimmer for maximum response.

Voltage rating .... **105-125 volts, a.c. or d.c.**
Current drain .... **0.4 amperes for receiver and 0.2 amperes for motor.**
Frequency range .... **150 to 375 kc, 540 to 1600 kc, 5.7 to 17.5 mc.**

One side of the power line is directly grounded to the chassis base. Under no circumstances, therefore, should a ground wire be permitted to come in contact with any metal part of the receiver.

When operating the receiver on d.c., it may be necessary to reverse the line plug for correct polarity.

When replacing the chassis in the cabinet take precautions to keep any part of the dial and condenser assembly from touching the cabinet, otherwise microphonism will result.

The color coding of the i-f transformers is as follows:

Grid—green | Grid return—black
B plus—red | Plate—blue

The phonograph motor has been adjusted at the factory, to turn at a speed of 78 r.p.m. The speed may be checked by counting the turns per minute or by using a stroboscope disc and a neon light (the stroboscope method will work only when the neon bulb is lighted from a 60 cycle a.c. supply).

An a.c.-d.c. switch is provided to switch the motor for a.c. or d.c. power supply. It is important that this switch be in the proper position for the power supply available.

PRODUCTION CHANGES

In receivers bearing serial numbers between 1,412,601 and 1,413,601:
The variable condenser was part no. 4HC-343A.
Models AR-174 and AR-165 receivers differ from the schematic diagram as follows:
a. C27 is a 12 mf, 450 volt dry electrolytic condenser part no. 3LC-314.
b. C28 is a 24 mf, 400 volt dry electrolytic condenser part no. 3ZC-341.
c. A .25 mf, 200 volt condenser is connected from the screen grid of the 6D6 i-f amplifier to ground.
In receivers bearing serial numbers below 1,473,933:
The antenna coil was part no. 3CT-289A.
The wave-band switch was part no. TTS-111K.
In receivers bearing serial numbers below 1,477,899:
The 6½" speaker was part no. 4RS-270B.

FOR ADJUSTMENT OF AUTOMATIC DIAL ON CHASSIS "AT" MODELS--SEE INDEX

Alignment Procedure for Model AT

In order to align the Model AT, it will first be necessary to fasten a short, stiff piece of wire to a fixed part of the chassis in such a way that when the variable condenser is set at minimum capacity, the wire will point to the heavy vertical line at the high frequency end of the dial scale.

Thereafter, using this wire as an indicator, the alignment procedure will be the same as that outlined above for the Model AR.

Models AR165,AR166,AR177,AR171,AR173,AR174,AR176,AR180,AR185
Models AT170,AT172,AT181

GENERAL NOTES

1. The receiver should never be turned on with either the speaker plug or the 41 tube out of its respective socket, since the rapid rise in rectifier voltage will damage the electrolytic condenser.
2. When replacing the chassis in the cabinet take precautions to keep any part of the dial and condenser assembly from touching the cabinet, otherwise microphonism will result.
3. The color coding of the i-f transformers is as follows:
   Grid—green — Grid return—black
   B plus—red — Plate—blue.
4. The color coding of the power transformer is as follows:
   Primary—two black leads
   High-voltage secondary—two red leads
   High-voltage secondary center tap—red and yellow lead
   6.3 volt secondary—two green leads
   5 volt secondary—two yellow leads.
5. The adjustable padding condenser for the broadcast band is mounted underneath the chassis (in the corner near the wave-band switch) with the screw adjustment accessible through a hole in the top of the chassis. The short-wave band has a fixed padder, C13 on schematic. When replacing this fixed padder be careful to use a condenser which has a capacity within 2% of the specified value, otherwise the short-wave coils may not track.
6. The wave-trap in the receiver has been adjusted for maximum signal rejection at 456 kc. If, however, persistent interference is experienced from some particular telegraph station the wave-trap trimmer may be readjusted until the response from the interfering station is at a minimum.
7. On the AT models, if for any reason the automatic dial assembly has been taken apart, care should be taken in re-aligning the circular button housing with the variable condenser. With the circular housing in the extreme clockwise position, the variable condenser should be about 5 degrees open from the maximum capacity position. (Five degrees is about 3/32" between the rotor plate tie-bar and the edges of the stator plates on the variable condenser.)

The phonograph motor has been adjusted at the factory to turn at a speed of 78 r.p.m. The speed may be checked by counting the turns per minute or by using a stroboscope disc and a neon light. To readjust the speed remove the turn-table and turn the speed adjusting screw (located near the turn-table shaft). A clockwise rotation of the screw decreases the speed. The speed should be checked with the pick-up and record in playing position.

ADJUSTMENTS

An oscillator with frequencies of 456, 600, 1600 and 16,000 kc should be used.
An output meter should be used across the voice coil or output transformer for observing maximum response.
If the circuit is at all disturbed, both the broadcast and short-wave bands must be realigned.
The set's oscillator is higher in frequency than the signal, so images should be observed on the low frequency side of the signals.
Always choose the minimum capacity peak on oscillator trimmers and maximum capacity peaks on antenna trimmers. The last motion in adjusting trimmers should always be a tightening one, not a loosening one.
Never leave a trimmer with the outside plate so loose that there is no tension on the screw. Either bend the plate up or remove the screw entirely.
Always use as weak a test signal as possible during alignment.

Location of Coils and Trimmer Adjustments

The two i-f transformers are located on top of the chassis deck. The second i-f is the one directly behind the variable condenser. The four trimmers, two for each transformer, are accessible through holes in the tops of the cans.

The adjustable padding condenser for the broadcast band is mounted underneath the chassis (in the corner near the 6A7 tube) with the screw adjustment accessible through a hole in the top of the chassis.

The antenna coils for the broadcast and short-wave bands and the 456 kc wave trap are wound on one form and mounted underneath the chassis deck directly behind the adjustable padding condenser. The trimmers for these coils are accessible through holes in the top of the chassis. The trimmer nearest the front of the chassis is the short-wave antenna trimmer. The central trimmer is the broadcast antenna trimmer. The trimmer nearest the rear of the chassis is the 456 kc wave trap.

The oscillator coils for the broadcast and short-wave bands are wound on one form and mounted underneath the chassis deck near the variable condenser. The trimmers for these coils are accessible through holes in the top of the chassis. The trimmer nearest the front of the chassis is for the short-wave oscillator coil and the trimmer farthest from the front is for the broadcast oscillator coil.

I-f and Wave-trap Alignment

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 456 kc, through a 0.02 mf paper condenser, to the grid cap of the 6A7 tube (do not remove the grid clip from the tube). Adjust the four i-f trimmers for maximum response. Feed 456 kc to the antenna through a standard dummy antenna (a 0.0002 mica condenser may be substituted) and adjust the wave-trap trimmer (farthest from front on left side of the chassis) for *minimum* response. (See General Notes No. 7.)

Short-wave Alignment (Alignment of the short-wave band should precede broadcast alignment)

Use a 400 ohm dummy antenna (a 400 ohm non-inductive resistor in series with the test oscillator antenna lead) when aligning the short-wave coils. Rotate the wave-band switch to the short-wave (counter-clockwise) position, and set the dial indicator exactly at 16 megacycles. Feed 16,000 kc to the antenna and adjust the short-wave oscillator trimmer (nearest the front beside variable condenser) for maximum response, and then adjust the short-wave antenna trimmer (nearest the front on the left side of the chassis) for maximum response. Be very careful to choose the minimum capacity peak on the oscillator trimmer.

Broadcast Alignment

By adding a cipher to each figure on the broadcast band calibration, this scale can be made to read directly in kilocycles.

Use a standard dummy antenna in aligning the broadcast coils. (A .0002 condenser may be substituted.) Rotate the wave-band switch to the broadcast (clockwise) position. Set the dial indicator at 600 kc on the dial and feed 600 kc. Adjust the broadcast series padder (in corner near 6A7 tube) for maximum response. Move the dial pointer to 1600 kc on the dial and feed 1600 kc. Adjust the broadcast oscillator trimmer (farthest from front beside the variable condenser) for maximum response and then adjust the broadcast antenna trimmer (central trimmer at left side of chassis). Return pointer to 600, feed 600 kc and readjust the broadcast series padder, rocking the variable condenser (rotate the variable condenser shaft back and forth through a small arc) for maximum response.

	†4RS-298	10" dynamic speaker (push-pull output)	8.75
	†4BL-94	Pilot light, 6.3 volt, .25 amp., Mazda No. 44, bayonet type base	.20

Model AR Dial Parts

†4FZ-596A	Dial face (formerly 4FZ-596)	1.20
3LZ-403A	Dial drive belt	.15
3CZ-337B	Dial drive shaft and pulley	.10
3CZ-339	Idler pulley	.05
4HZ-562	Idler pulley spring	.05
4UZ-604	Condenser shaft pulley	.10
4RZ-592	Dial pointer	.25
3SZ-438C	Escutcheon with crystal	1.95

(*Note:* When this escutcheon is ordered, four screws, part No. 4TMS-159, must also be ordered. The old escutcheon, part No. 4RZ-595, did not require these screws.)

*Item number locates the article on the schematic diagram.
†See production changes.
‡These trimmer condensers are part of the coil assemblies and can not be supplied separately.

SEE INDEX *for AR receivers bearing serial numbers below 1,326,200 and for AT receivers bearing serial numbers below 1,386,551*

The tube complement for AR receivers bearing serial numbers above 1,326,200 and for AT receivers bearing serial numbers above 1,386,551 is as follows:
1—6A7, pentagrid oscillator-modulator.
1—6D6, i-f amplifier.
1—6Q7-G, diode detector, audio amplifier, a.v.c.
2—41, push-pull pentode output.
1—80, full-wave rectifier.

PRODUCTION CHANGES

MODEL AR RECEIVERS

In receivers bearing serial numbers below 1,326,200:
The 6 1/2" speaker was part no. 4RS-270B.
The 10" speaker was part no. 4TS-281.
The tone control switch was part no. 2TS-145E.

In receivers bearing serial numbers between 1,393,870 and 1,326,200:
The 6 1/2" speaker was part no. 4RS-297.

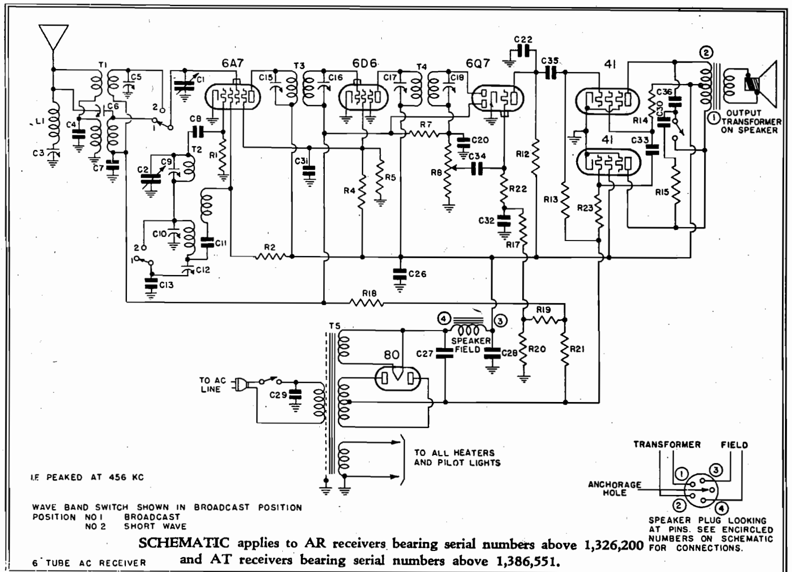
In receivers bearing serial numbers below 1,393,870:
The pilot light was part no. XL-9.

In receivers bearing serial numbers between 1,200,100 and 1,413,861:
The variable condenser was part no. 4HC-343A.

MODEL AT RECEIVERS

In receivers bearing serial numbers below 1,386,551:
The pilot light was part no. XL-9
The 6 1/2" speaker was part no. 4RS-270B.
The 10" speaker was part no. 4TS-281.
The tone control switch was part no. 2TS-145E.

In receivers bearing serial numbers below 1,387,000:
The 6 1/2" speaker was part no. 4RS-297.



SCHEMATIC applies to AR receivers bearing serial numbers above 1,326,200 and AT receivers bearing serial numbers above 1,386,551.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c.

Voltage rating .... 105-125 volts, 60 cycles, a.c.
Power consumption .... 55 watts
Frequency ranges .... 540 to 1730 kc and 5.6 to 18 megacycles

The following are voltages for receivers using push-pull 41 output tubes:

Tube	Plate	Screen	Cathode	Osc.Plate	Fil.
6A7	250	82	0	126	6.3 a.c.
6D6	250	82	0	—	6.3 a.c.
6Q7-G	175	—	0	—	6.3 a.c.
41	245	240	0	—	6.3 a.c.
41 (in corner)	245	250	0	—	6.3 a.c.

Voltage across speaker field—65.

Voltage at 80 filament to B minus—315.

The grid bias for all the tubes is developed across the resistors, R19, R20 and R21 (see schematic No. 2). The total voltage measured across these three resistors should be 23 volts. The voltage across R19 and R20 should be 13 volts. The voltage across R20 should be 2.6 volts.

NOTE: For AR receivers bearing serial numbers between 1,412,601 and 1,413,601, and above 1,416,650, see separate service notes. These receivers use a 6AC5G output tube.

Model AT Dial Parts

NOTE: For adjustment of the Automatic Dial on the AT models see INDEX

3YM-315	Dial face frame	.50
4TM-316	Drive disc and pulley	.60
3YM-285	Circular button housing	.70
3YM-286	Button with long-pin	.15
3YM-287	Button with short-pin	.15
3YM-288	Stop-vane	.02
3YM-328	Thin metal button-holding disc	.10
3YZ-697	Station tabs (should be obtained from local Emerson dealer).	
4TZ-614A	Dial scale	.40
3YZ-544	Bakelite front plate	.25
3YZ-546	Circular brass face nut	.20
3YZ-547	Stop pin for housing	.05
3YZ-548	Button spring	.01
3YZ-618	Stop-vane spring	.01
3YZ-663	Celluloid button caps	.01
3YZ-619	Guide rod	.15
3YZ-620	Pulley stud	.10
3YZ-621	Idler pulley	.15
3YZ-622	Vernier shaft	.10
3YZ-623	Knurled vernier-drive bushing	.15
3YZ-624	Flexible drive shaft	.65
3YZ-625	Main bearing	.15
3YZ-626A	Rubber drive bushing	.05
4TZ-682	Dial drive cord	.15
3RZ-480	Drive cord spring	.02
4TZ-628	Connecting link for wave-band switch	.05
4TZ-611A	Escutcheon	.65

C24	IC-47	0.0005 mf mica condenser	.20
C25, C31	EC-28	0.03 mf, 400 volt tubular condenser	.20
C26	AC-7A	0.00025 mf mica condenser	.20
C28	AC-6	0.1 mf, 200 volt tubular condenser	.20
C29	2TC-189	0.015 mf, 1000 volt tubular condenser	.20
C30, C32	LLC-150	0.004 mf, 600 volt tubular condenser	.20
C33	3LC-297A	0.01 mf, 400 volt molded condenser	.20
C34	2NC-246	16 mf, 450 volt wet electrolytic condenser	1.20
C35	2NC-247	16 mf, 405 volt wet electrolytic condenser	1.20
	4RS-297	6½" dynamic speaker	5.75
	3ES-218	Wave-band switch	1.10
	3ES-256	Tone-control switch	.50
	4BL-94	Pilot light, 6.3 volt, .25 amp., Mazda No. 44	.20
	4WZ-709	Dial face	1.20
	3LZ-403A	Dial drive belt	.20
	4FZ-602	Dial drive shaft and pulley	.20
	3CZ-339	Idler pulley	.05
	4FZ-603	Idler pulley spring	.10
	4UZ-604	Condenser shaft pulley	.15
	4RZ-592	Dial pointer	.25
	3SZ-438C	Escutcheon with crystal	1.95

When ordering replacement parts specify part number.

*Item number locates the article on the schematic diagram.

†These trimmers are part of the coil assembly and can not be supplied separately.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings, except bias, heaters, and B plus at rectifier, were taken on 250 volt scale.

Tube	*Plate*	*Screen*	*Cathode*	*Osc. Plate*	*Fil.*
6A7	250	82	0	126	6.3 a.c.
6D6	250	82	0	—	6.3 a.c.
6Q7-G	175	—	0	—	6.3 a.c.
41	245	240	0	—	6.3 a.c.
41 (in corner)	245	250	0	—	6.3 a.c.

Voltage across speaker field—65.
Voltage at 80 filament to B minus—315.
The grid bias for all the tubes is developed across the resistors, R16, R17, R18. The total voltage measured across these three resistors should be 23 volts. The voltage across R16 and R18 should be 13 volts. The voltage across R17 should be 3.6 volts.

ADJUSTMENTS

An oscillator with frequencies of 150, 350, 456, 600, 1500 and 15,000 kc should be used.
An output meter should be used across the voice coil or output transformer for observing maximum response.
Use a standard dummy antenna when aligning either the long-wave or medium-wave bands. A .0002 mf condenser may be used as a substitute. When aligning the short-wave band use a 400 ohm dummy antenna (a 400 ohm resistor in series with antenna lead).
Always choose the minimum capacity peak on oscillator trimmers and maximum capacity peaks on antenna trimmers. The last motion in adjusting trimmers should always be a tightening one, not a loosening one.
Always use as weak a test signal as possible during alignment.
Never leave a trimmer with its outside plate so loose that there is no tension on the screw. Either bend the plate up or remove the screw entirely.

Location of Coils and Trimmers

The two i-f transformers are located on top of the chassis deck. The second i-f transformer is the one directly behind the variable condenser. The four trimmers, two for each transformer, are accessible through holes in the tops of the cans.
The dual adjustable padding condenser is mounted on the left side of the front chassis wall.
The antenna coils for the three bands are wound on one form and mounted underneath the chassis deck directly behind the adjustable padding condenser. The trimmers for these coils are accessible through holes in the top of the chassis. The trimmer nearest the front of the chassis is the medium-wave antenna trimmer. The central trimmer is the short-wave antenna trimmer. The trimmer farthest from the front of the chassis is the long-wave antenna trimmer.
The oscillator coils for the three bands are wound on one form and mounted underneath the chassis deck near the variable condenser. The trimmers for these coils are also accessible through holes in the top of the chassis. The trimmer nearest the front of the chassis is the medium-wave oscillator trimmer. The central trimmer is the short-wave oscillator trimmer. The trimmer farthest from the front of the chassis is the long-wave oscillator trimmer.

I-f Alignment

Rotate the wave-band switch to the medium-wave (central) position and set the variable condenser to minimum. Feed 456 kc to the grid cap of the 6A7 tube. Adjust the four i-f trimmers for maximum response.

Long-Wave Alignment

With the wave-band switch at long-wave (clockwise) position set the dial pointer at 150 and feed 150 kc to antenna. Adjust the long-wave series padder (hex nut on dual padder) for maximum response. Move pointer to 350 and feed 350 kc to antenna. Adjust the long-wave oscillator trimmer then the long-wave antenna trimmer for maximum response. Reset pointer to 150, feed 150 kc and rock (rotate back and forth through a small arc) the variable condenser while adjusting long-wave series padder for maximum response. Reset pointer to 350, feed 350 kc and check alignment. If readjustment is necessary return to 150 kc and repeat entire procedure.

Medium-Wave Alignment

Set switch at medium-wave (central) position and dial pointer at 600. Feed 600 kc to antenna and adjust medium-wave series padder (slotted screw on dual padder) for maximum response. Move pointer to 1500, feed 1500 kc and adjust medium-wave oscillator trimmer and then the medium-wave antenna trimmer for maximum response. Reset pointer to 600 feed 600 kc and rock variable condenser while readjusting medium-wave series padder for maximum response. Reset pointer to 1500, feed 1500 kc and check alignment. If readjustment is necessary return to 600 and repeat entire procedure.

Short-Wave Alignment

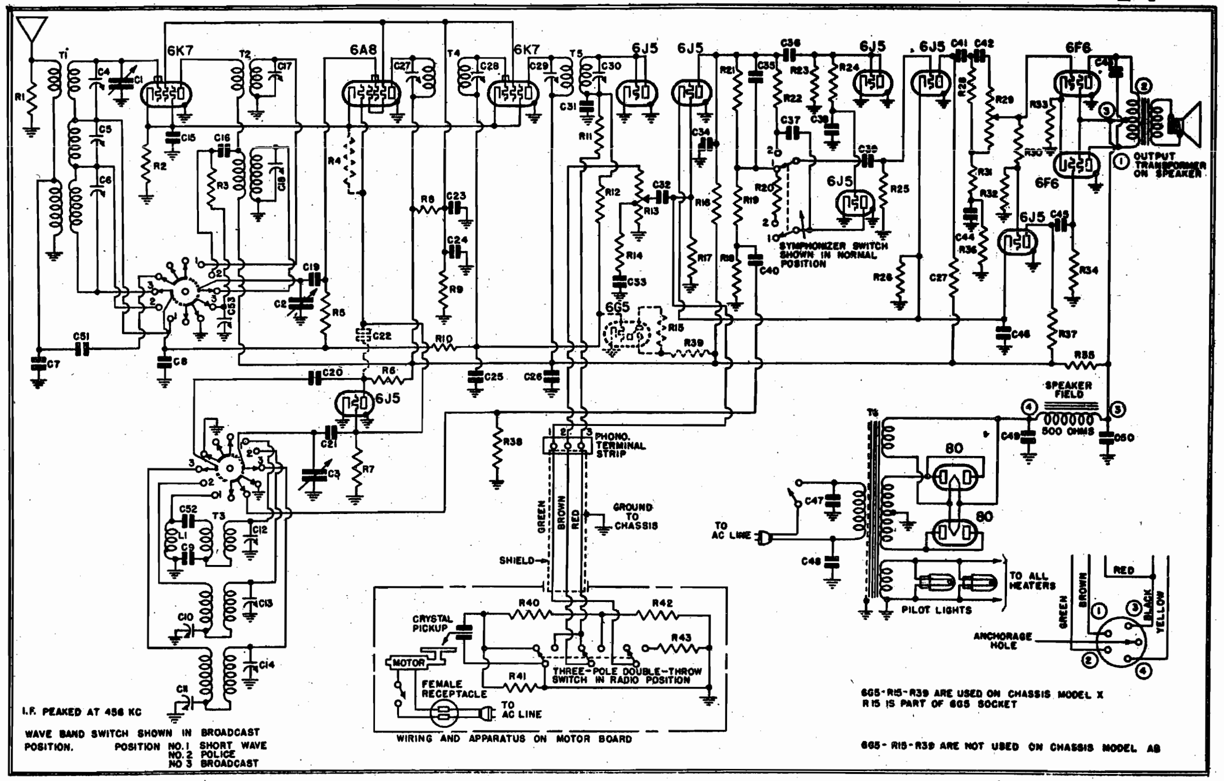
Set wave-band switch at short-wave (counter-clockwise) position. Set pointer at 15, feed 15 megacycles to antenna and adjust short-wave oscillator trimmer and then short-wave antenna trimmer for maximum response.

Voltage rating	105-125 volts, 60 cycle, a.c.
Power consumption	55 watts.
Frequency ranges	150 to 375 kc, 540 to 1600 kc, 5.7 to 17.5 megacycles.

GENERAL NOTES

1. The receiver should never be turned on with either the speaker plug or the 41 tubes out of their respective sockets, since the rapid rise in rectifier voltage will damage the electrolytic condenser.
2. When replacing the chassis in the cabinet take precautions to keep any part of the dial and condenser assembly from touching the cabinet, otherwise microphonism will result.
3. The color coding of the i-f transformers is as follows:
   Grid—green   Grid return—black
   B plus—red   Plate—blue.
4. The color coding of the power transformer is as follows:
   Primary—two black leads.
   High-voltage secondary—two red leads.
   High-voltage secondary center tap—red and yellow lead.
   6.3 volt secondary—two green leads.
   5 volt secondary—two yellow leads.
5. The adjustable padding condenser for the long-wave and medium-wave bands is mounted underneath the chassis (in the corner near the wave-band switch) with the screw adjustment accessible through a hole in the front of the chassis. The short-wave band has a fixed padder, C10 on schematic. When replacing this fixed padder be careful to use a condenser which has a capacity within 2% of the specified value, otherwise the short-wave coils may not track.

MODEL AB184, Chassis AB
EMERSON RADIO & PHONO. CORP. MODEL X175, Chassis X, Late
Schematic, Voltage, Notes



The schematic diagram is drawn for the Model AB. Model X receivers differ from the schematic as follows:

R42 is omitted. R40 is changed to a 500,000 ohm resistor, part no. KR-56; and C54 (shown dotted) is added across R40.

In addition, the 6G5 tube and resistors R15 and R39 (shown dotted) are added for the Model X only.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c.

Tube	*Plate*	*Screen*	*Cathode*	*Fil.*
6K7 r-f amplifier	240	90	2	6.3 a.c.
6A8 modulator	240	90	2	6.3 a.c.
6J5 oscillator	80	—	—	6.3 a.c.
6K7 i-f amplifier	240	90	2	6.3 a.c.
6J5 diode detector	—	—	—	6.3 a.c.
6J5 1st a-f amplifier	125	—	5.6	6.3 a.c.
6J5 2nd a-f amplifier	140	—	5.6	6.3 a.c.
6J5 phase inverter	140	—	5.6	6.3 a.c.
6F6 output	280	300	18	6.3 a.c.
6F6 output	280	300	18	6.3 a.c.
6J5 symphonizer rectifier	—	—	—	6.3 a.c.
6J5 symphonizer amplifier	15 (symph. position—50 V. scale)			6.3 a.c.

Voltage across speaker field—75.
Voltage at 80 filament—375.

***See production changes.**

Voltage rating	105-125 volts, 60 cycles, a.c.
Power consumption	130 watts at 117.5 volts.
Frequency ranges	540 to 1800 kc, 1800 to 6,250 kc and 5.8 to 22.0 megacycles.

(See production changes for frequency ranges of early receivers)

GENERAL NOTES

1. In replacing chassis in cabinet do not tighten mounting screws so much that chassis will not float freely, and do not allow any part of the dial assembly to touch the cabinet. Do not push control knobs on so far that they touch the cabinet front panel. If these precautions are not observed the receiver may become microphonic.
2. The color coding of the power transformer leads is as follows:
   - Primary—two black leads
   - High voltage sec.—two red leads
   - High voltage secondary center tap—red and yellow lead
   - 6.3v sec.—two heavy green leads
   - 5v sec.—two heavy yellow leads

*3. The tuning indicator (6G5 tube—used in Model X chassis only) is mounted in the cabinet above the dial. The color coding of the tuning indicator tube cable is as follows:
   - Black, white tracer—cathode
   - Red—target
   - Black—filament
   - Green—grid

4. The phonograph motor has been adjusted at the factory to turn at a speed of 78 r.p.m. The speed may be checked by counting the turns per minute or by using a stroboscope disc and a neon light. (The stroboscope method will only work when neon bulb is lighted from a 60 cycle a.c. supply.) To readjust the speed of the motor, part No. 4BPM-11, remove the turn-table and turn the speed adjusting screw (located near the turn-table shaft). A clockwise rotation of the screw decreases the speed. The speed should be checked with the pick-up and record in playing position. The phonograph motor on part No. 3XZ-695 record changer, has the speed adjustment brought out to an indicator arm and escutcheon. The speed of this motor is adjusted by shifting the indicator arm to the right or left.

PRODUCTION CHANGES

Model X receivers bearing serial numbers below 1,472,743 differed from the schematic diagram and parts list as follows:

a. C26 was a 0.1 mf, 400 volt tubular condenser.

In addition, Model X receivers bearing serial numbers below 1,328,650 and Model AB receivers below 1,373,394 differ from the schematic diagram as follows:

6C5 tubes are used instead of 6J5 tubes.

In addition, Model X receivers bearing serial numbers below 1,328,250 differed from the schematic diagram and parts list as follows:

The 1 megohm resistor R15 was in the chassis and not in the 6G5 socket as indicated. The 6G5 socket and cable assembly was part no. 3AZ-322C and was color coded as follows:

Shield—Cathode, Blue—plate, Red—target, Black—filament, Green—grid.

In addition, Model X receivers bearing serial numbers below 1,293,633 and Model AB receivers bearing serial numbers below 1,320,357 differed from the schematic and parts list as follows:

a. R4 and C22 were connected in the circuit as shown by the dotted lines on the schematic diagram. When these parts are in the circuit there is no direct connection between the 6A8 oscillator plate and the grid of the 6C5 oscillator.

b. The antenna coil was part no. 3XT-335. The interstage coil was part no. 3XT-336. The oscillator coil was part no. 3XT-337. The variable condenser was part no. 3XC-328. The dial face was part no. 3XZ-493.

c. The short-wave fixed padder, C9 on schematic diagram, was a 0.0038 mf mica condenser.

d. The trimmer condenser C53 on the short-wave interstage coil was not in the circuit.

e. R6 was a 40,000 ohm 1 watt resistor.

f. C21 was a 0.00005 mf mica condenser.

g. C16 was a 0.01 mf, 400 volt paper condenser.

h. R3 was returned to ground instead of to the wave-band switch as shown on the schematic diagram.

NOTE: When the above parts are used in the receiver the frequency range is as follows: Broadcast—550 to 1750 kc, Police—1750 to 6,250 kc and Short-wave—5.6 to 18.0 megacycles.

In addition, Model X receivers bearing serial numbers below 1,216,700 and Model AB receivers bearing serial numbers below 1,291,097 differed from the schematic diagram and parts list as follows:

a. C22 shown dotted on the schematic diagram was a 0.00005 mf mica condenser.

In addition, Model X receivers bearing serial numbers below 1,156,977 differed from the schematic diagram and parts list as follows:

a. No phonograph terminal strip was used. The volume control was connected directly to R11.

b. R4 was a 200,000 ohm resistor.

In addition, Model X receivers bearing serial numbers below 1,065,450 differed from the schematic diagram as follows:

a. R39 was not in the circuit.

In addition, earlier Model AB combinations use phonograph motor, part no. 3LPM-3.

This motor is equipped with a mounting plate. Later combinations use phonograph motor, part no. 4BPM-11, mounted on a separate mounting panel which is not supplied with motor.

EMERSON RADIO & PHONOGRAPH CORP MODEL AB184, Chassis AB
MODEL X175, Chassis X, Late Alignment

ADJUSTMENTS

An oscillator with frequencies of 456, 600, 1600, 1800, 6000, 18,000 and 20,000 kc should be used.

An output meter should be used across the voice coil or speaker output transformer for observing maximum response.

Use a dummy antenna for aligning any of the three bands. A .0002 mf condenser may be used for broadcast band dummy antenna, a .0001 mf condenser for the police band dummy antenna and a 400 ohm non-inductive resistor for the short-wave band dummy antenna.

Always use as weak a test signal as possible during alignment.

The set's oscillator is higher in frequency than the signal on *all three bands,* so images should be observed on the low frequency side of the signals.

Always choose the minimum capacity peak on oscillator trimmers and maximum capacity peaks on antenna trimmers. The last motion in adjusting trimmers should always be a tightening one, *not* a loosening one.

Never leave a trimmer with the outside plate so loose that there is no tension on the screw. Either bend the plate up or remove the screw entirely. Loose screws are a sure source of noise, drifting, and microphonism.

In aligning antenna trimmers on the high-frequency signals there is always a tendency for the oscillator to drift, due to interlocking. To compensate for this always keep tuning the variable condenser as the trimmers are being adjusted.

Location of Coils and Trimmer Adjustments

The i-f transformers are located on the left-hand side of the top of the chassis. The first i-f transformer is the one nearest the rear of the chassis. The four trimmers for the i-f adjustment are available through holes in the tops of the cans.

The antenna coils for the three bands are wound on one form located on the front wall of the chassis with the trimmers accessible through holes in the chassis. The left-hand trimmer is for the broadcast band, the right-hand trimmer is for the short-wave band and the central trimmer is for the police band.

The r-f interstage coils are also wound on one form and mounted underneath the chassis on the right-hand side of the variable condenser. The trimmers are accessible through holes in the top of the chassis. The trimmer closer to the variable is for the short-wave band and the one farthest from the variable is for the broadcast band. On coils 4BT-397 only, a middle trimmer will be found. This trimmer is for compensating the short-wave band at 6 mc.

The oscillator coils are wound on one form and mounted underneath the chassis directly behind the r-f interstage coil. The trimmers are accessible through holes in the top of the chassis. The trimmer closest to the variable condenser is for the broadcast band, the trimmer farthest from the variable is for the short-wave band and the central trimmer is for the police band.

The oscillator series padder for the broadcast and police bands are mounted underneath the chassis near the oscillator coils. The adjusting screws are available through holes in the top of the chassis. The padder nearest the front of chassis is for the broadcast band. The padder for the short-wave band is a fixed mica condenser, C9 on the schematic diagram. If this condenser is to be replaced use a condenser with a value within 2% of that specified.

I-f Alignment

Set the wave-band switch at the broadcast (clockwise) position and the variable condenser at the minimum capacity position. Feed 456 kc to the grid cap of the 6A8 tube through a .02 mf condenser and adjust the four i-f trimmers for maximum response. (Do not remove the grid clip from the tube.)

Broadcast Alignment

Both pointers on the dial should coincide vertically at 890 kc. (For adjustment the thinner pointer may be slipped around on its shaft.)

Set the wave-band switch at the broadcast (clockwise) position, and the dial pointer at 60. Feed 600 kc to the antenna (using a standard dummy antenna) and adjust the broadcast-band series padder for maximum response. Move the pointer to 160, feed 1600 kc and adjust the oscillator coil trimmer for maximum response, then adjust the interstage and antenna coil trimmers for maximum response. Reset the pointer at 60, feed 600 kc and rock the variable condenser while adjusting the series padder for maximum response. Return to 1600 and check alignment. If readjustment is necessary return to 600 and repeat entire procedure.

Police Alignment

Set the wave-band switch at the police-band (central) position and the dial pointer at 1.8. Feed 1800 kc to the antenna (using a .0001 mf dummy antenna) and adjust the police-band series padder for maximum response. Move the dial pointer to 6.0, feed 6000 kc and adjust the oscillator trimmer for maximum response. Then adjust the antenna trimmer for maximum response. Note the interstage coil on this band has no trimmer adjustment. Return the dial pointer to 1.8, feed 1800 kc to the antenna and rock the variable condenser while readjusting the series padder for maximum response. Return to 6000 kc and check alignment. If readjustment is necessary return to 1800 kc and repeat entire procedure.

Short-Wave Alignment

The following alignment procedure is used when aligning receivers on which the short-wave band covers frequencies up to 22 mc. These receivers will bear serial numbers above 1,293,633 *on the Model X Chassis, and above* 1,320,357 *on the Model AB Chassis*:

Set the wave-band switch at the short-wave (counter-clockwise) position. Move the dial pointer to 20 and feed 20,000 kc to the antenna (using a 400 ohm dummy antenna) and adjust the short-wave oscillator trimmer for maximum response. If two peaks are obtained choose the minimum capacity peak. Then adjust the interstage and antenna coil trimmers for maximum response. If two peaks are obtained choose the maximum capacity peak. Move the pointer to 6 mc, feed 6000 kc to the antenna and adjust the r-f interstage trimmer (central trimmer at right of variable condenser) for maximum response.

The following alignment procedure is used when aligning receivers on which the short-wave band extends only to 18 mc. These receivers will bear serial numbers below 1,293,633 *on the Model X Chassis, and below* 1,320,357 *on the Model AB Chassis*:

Set the wave-band switch at the short-wave (counter-clockwise) position. Move the dial pointer to 18 and feed 18,000 kc to the antenna (using a 400 ohm dummy antenna) and adjust the short-wave oscillator trimmer for maximum response. If two peaks are obtained choose the minimum capacity peak. Then adjust the interstage and antenna coil trimmers for maximum response. If two peaks are obtained choose the maximum capacity peak.

Tube Data

1—6K7—R-f amplifier (opposite front section of variable condenser)
1—6A8—Modulator (opposite rear section of variable condenser)
*1—6J5—Oscillator (behind variable condenser)
1—6K7—I-f amplifier (between i-f transformers)
*1—6J5—Diode detector, a.v.c. (left side of chassis nearest front)
*1—6J5—First a-f amplifier (left side of chassis second from front)
*1—6J5—Symphonizer rectifier (left side of chassis third from front)
*1—6J5—Symphonizer amplifier (left side of chassis fourth from front)
2—6F6—Pentode power output (two large tubes at rear)
*1—6J5—Phase inverter (rear between 6F6 tubes)
*1—6J5—Second a-f amplifier (behind 6A8 tube)
2—80—Rectifiers (beside power transformer)
1—6G5—Tuning indicator (Model X Chassis only).

If the metal type 6F6 power output tubes are replaced with the equivalent glass type 6F6G, the one nearest the center of the chassis must be shielded, otherwise audio oscillation may result.

PRODUCTION CHANGES

1. In receivers bearing serial numbers below 1,109,445
   a) C10 was returned to B plus instead of the 25L6 cathode as shown on the schematic diagram.
   b) A 250,000 ohm ¼ watt carbon resistor was connected from the cathode of the 6D6 to B plus.
   c) C14 was connected from the 25L6 grid to ground.
2. In receivers bearing serial numbers below 1,200,686 the speaker was part No. 3QS-257.
3. In receivers bearing serial numbers between 1,308,161 and 1,317,310,
   a) The speaker was part No. 2VS-157. The voltage across its field was 130 volts.
   b) A filter choke, part No. ZZT-196A, was used in series with the B+ lead.

below 1,203,000 - C14 was returned to ground instead of the 6C6 cathode as shown on the schematic diagram.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with volume control turned on full and no signal. The line voltage for these readings was 117.5 volts, 60 cycles, a-c.

Tube	*Plate*	*Screen*	*Cathode*	*Fil.*
6D6	100	100	2.8	6.3
6C6	30	15	1.4	6.3
25L6	93	100	5.7	25.0

Voltage across speaker field—30 volts.
25Z5 cathode to ground—130 volts.

ALIGNMENT PROCEDURE

An oscillator with a frequency of 1400 kc. is required.

Use as weak a test signal as possible. An output meter should be used across the voice coil or output transformer for observing maximum response.

Rotate variable condenser to the maximum capacity position and set the pointer at the next calibration mark above 55. Then rotate the variable condenser until the pointer is at 140 and feed 1400 kc to the antenna through a standard dummy antenna (a .0001 mf mica condenser may be used as a substitute), adjust both trimmer condensers on the variable condenser for maximum response.

TUBE DATA

The tube complement is as follows:
1—6D6, r-f amplifier.
1—6C6, biased detector.
1—25L6, beam power output.
1—25Z5, dual half-wave rectifier.

PRODUCTION CHANGES

Model X receivers bearing serial numbers below 1,328,250 differed from the schematic diagram and parts list as follows:
The 1 megohm resistor R15 was in the chassis and not in the 6G5 socket as indicated. The 6G5 socket and cable assembly was part no. 3AZ-322C and was color coded as follows:
Shield—Cathode, Blue—plate, Red—target, Black—filament, Green—grid.

In addition, Model X receivers bearing serial numbers below 1,293,633 and Model AB receivers bearing serial numbers below 1,320,357 differed from the schematic and parts list as follows:

a. R4 and C22 were connected in the circuit as shown by the dotted lines on the schematic diagram. When these parts are in the circuit there is no direct connection between the 6A8 oscillator plate and the grid of the 6C5 oscillator.
b. The antenna coil was part no. 3XT-335. The interstage coil was part no. 3XT-336. The oscillator coil was part no. 3XT-337. The variable condenser was part no. 3XC-328. The dial face was part no. 3XZ-493.
c. The short-wave fixed padder, C9 on schematic diagram, was a 0.0038 mf mica condenser.
d. The trimmer condenser C53 on the short-wave interstage coil was not in the circuit.
e. R6 was a 40,000 ohm 1 watt resistor.
f. C21 was a 0.00005 mf mica condenser.
g. C16 was a 0.01 mf, 400 volt paper condenser.
h. R3 was returned to ground instead of to the wave-band switch as shown on the schematic diagram.

NOTE: When the above parts are used in the receiver the frequency range is as follows: Broadcast—550 to 1750 kc, Police—1750 to 6,250 kc and Short-wave—5.6 to 18.0 megacycles.

In addition, Model X receivers bearing serial numbers below 1,216,700 and Model AB receivers bearing serial numbers below 1,291,097 differed from the schematic diagram and parts list as follows:

a. C22 shown dotted on the schematic diagram was a 0.00005 mf mica condenser.

In addition, Model X receivers bearing serial numbers below 1,156,977 differed from the schematic diagram and parts list as follows:

a. No phonograph terminal strip was used. The volume control was connected directly to R11.
b. R4 was a 200,000 ohm resistor.

In addition, Model X receivers bearing serial numbers below 1,065,450 differed from the schematic diagram as follows:

a. R39 was not in the circuit.

Chassis AB and Late X
Alignment, Parts

EMERSON RADIO & PHONO. CORP.

ADJUSTMENTS

An oscillator with frequencies of 456, 600, 1600, 1800, 6000, 18,000 and 20,000 kc should be used.

An output meter should be used across the voice coil or speaker output transformer for observing maximum response.

Use a dummy antenna for aligning any of the three bands. A .0002 mf condenser may be used for broadcast band dummy antenna, a .0001 mf condenser for the police band dummy antenna and a 400 ohm non-inductive resistor for the short-wave band dummy antenna.

Always use as weak a test signal as possible during alignment.

The set's oscillator is higher in frequency than the signal on *all three bands*, so images should be observed on the low frequency side of the signals.

Always choose the minimum capacity peak on oscillator trimmers and maximum capacity peaks on antenna trimmers. The last motion in adjusting trimmers should always be a tightening one, *not* a loosening one.

Never leave a trimmer with the outside plate so loose that there is no tension on the screw. Either bend the plate up or remove the screw entirely. Loose screws are a sure source of noise, drifting, and microphonism.

In aligning antenna trimmers on the high-frequency signals there is always a tendency for the oscillator to drift, due to interlocking. To compensate for this always keep tuning the variable condenser as the trimmers are being adjusted.

Location of Coils and Trimmer Adjustments

The i-f transformers are located on the left-hand side of the top of the chassis. The first i-f transformer is the one nearest the rear of the chassis. The four trimmers for the i-f adjustment are available through holes in the tops of the cans.

The antenna coils for the three bands are wound on one form located on the front wall of the chassis with the trimmers accessible through holes in the chassis. The left-hand trimmer is for the broadcast band, the right-hand trimmer is for the short-wave band and the central trimmer is for the police band.

The r-f interstage coils are also wound on one form and mounted underneath the chassis on the right-hand side of the variable condenser. The trimmers are accessible through holes in the top of the chassis. The trimmer closer to the variable is for the short-wave band and the one farthest from the variable is for the broadcast band. On coils 4BT-397 only, a middle trimmer will be found. This trimmer is for compensating the short-wave band at 6 mc.

The oscillator coils are wound on one form and mounted underneath the chassis directly behind the r-f interstage coil. The trimmers are accessible through holes in the top of the chassis. The trimmer closest to the variable condenser is for the broadcast band, the trimmer farthest from the variable is for the short-wave band and the central trimmer is for the police band.

The oscillator series padder for the broadcast and police bands are mounted underneath the chassis near the oscillator coils. The adjusting screws are available through holes in the top of the chassis. The padder nearest the front of chassis is for the broadcast band. The padder for the short-wave band is a fixed mica condenser, C9 on the schematic diagram. If this condenser is to be replaced use a condenser with a value within 2% of that specified.

I-f Alignment

Set the wave-band switch at the broadcast (clockwise) position and the variable condenser at the minimum capacity position. Feed 456 kc to the grid cap of the 6A8 tube through a .02 mf condenser and adjust the four i-f trimmers for maximum response. (Do not remove the grid clip from the tube.)

Broadcast Alignment

Both pointers on the dial should coincide vertically at 890 kc. (For adjustment the black pointer may be slipped around on its shaft.)

Set the wave-band switch at the broadcast (clockwise) position, and the dial pointer at 60. Feed 600 kc to the antenna (using a standard dummy antenna) and adjust the broadcast-band series padder for maximum response. Move the pointer to 160, feed 1600 kc and adjust the oscillator coil trimmer for maximum response, then adjust the interstage and antenna coil trimmers for maximum response. Reset the pointer at 60, feed 600 kc and rock the variable condenser while adjusting the series padder for maximum response. Return to 1600 and check alignment. If readjustment is necessary return to 600 and repeat entire procedure.

Police Alignment

Set the wave-band switch at the police-band (central) position and the dial pointer at 1.8. Feed 1800 kc to the antenna (using a .0001 mf dummy antenna) and adjust the police-band series padder for maximum response. Move the dial pointer to 6.0, feed 6000 kc and adjust the oscillator trimmer for maximum response. Then adjust the antenna trimmer for maximum response. Note the interstage coil on this band has no trimmer adjustment. Return the dial pointer to 1.8, feed 1800 kc to the antenna and rock the variable condenser while readjusting the series padder for maximum response. Return to 6000 kc and check alignment. If readjustment is necessary return to 1800 kc and repeat entire procedure.

Short-Wave Alignment

The following alignment procedure is used when aligning receivers on which the short-wave band covers frequencies up to 22 mc. These receivers will bear serial numbers above 1,293,633 on the Model X Chassis, and above 1,320,357 on the Model AB Chassis:

Set the wave-band switch at the short-wave (counter-clockwise) position. Move the dial pointer to 20 and feed 20,000 kc to the antenna (using a 400 ohm dummy antenna) and adjust the short-wave oscillator trimmer for maximum response. If two peaks are obtained choose the minimum capacity peak. Then adjust the interstage and antenna coil trimmers for maximum response. If two peaks are obtained choose the maximum capacity peak. Move the pointer to 6 mc, feed 6000 kc to the antenna and adjust the r-f interstage trimmer (central trimmer at right of variable condenser) for maximum response.

The following alignment procedure is used when aligning receivers on which the short-wave band extends only to 18 mc. These receivers will bear serial numbers below 1,293,633 on the Model X Chassis, and below 1,320,357 on the Model AB Chassis:

Set the wave-band switch at the short-wave (counter-clockwise) position. Move the dial pointer to 18 and feed 18,000 kc to the antenna (using a 400 ohm dummy antenna) and adjust the short-wave oscillator trimmer for maximum response. If two peaks are obtained choose the minimum capacity peak. Then adjust the interstage and antenna coil trimmers for maximum response. If two peaks are obtained choose the maximum capacity peak.

GENERAL NOTES

1. In replacing chassis in cabinet do not tighten mounting screws so much that chassis will not float freely, and do not allow any part of the dial assembly to touch the cabinet. Do not push control knobs on so far that they touch the cabinet front panel. If these precautions are not observed the receiver may become microphonic.
2. The color coding of the power transformer leads is as follows:
   - Primary—two black leads
   - High voltage sec.—two red leads
   - High voltage secondary center tap—red and yellow lead
   - 6.3v sec.—two heavy green leads
   - 5v sec.—two heavy yellow leads
3. The tuning indicator (6G5 tube—used in Model X chassis only) is mounted in the cabinet above the dial. The color coding of the tuning indicator tube cable is as follows:
   - Black, white tracer—cathode
   - Red—target
   - Black—filament
   - Green—grid

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	*Plate*	*Screen*	*Cathode*	*Osc. Plate*	*Fil.*
6A7	100	50	2.3	100	6.3
6D6	100	100	3.5	—	6.3
6Q7	43	—	1.2	—	6.3
25L6	92	100	6.5	—	25.0

Voltage at 25Z5 cathode—128 volts.

Voltage across speaker field—28 volts.

ADJUSTMENTS

An oscillator with frequencies of 456 and 1400 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck beside the speaker. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is mounted underneath the chassis in the right hand front corner. The trimmers are accessible through holes in the top of the chassis directly in front of the first i-f transformer.

The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil.

The 456 kc wave-trap is mounted on the metal strip at the rear of the chassis directly behind the variable condenser. The trimmer for the 456 kc wave-trap is mounted on the coil and is accessible from the bottom of the chassis.

I-f and Wave-trap Alignment

Rotate the wave-band switch (located at the rear of the chassis) to the broadcast position, clockwise, and swing the variable condenser to the minimum capacity position. Feed 456 kc to the grid-cap of the 6A7 tube and adjust the four i-f trimmers for maximum response. Feed 456 kc through a .0001 mf condenser to the antenna lead and adjust the wave-trap trimmer for *minimum* response. (See General Notes, paragraph No. 7.)

R-f Alignment

With the wave-band switch in the broadcast position, clockwise, set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response. The police band is self-tracking and does not require any adjustment.

Voltage rating	105-125 volts, a.c. or d.c.
Power consumption	50 watts.
Frequency ranges	540 to 1580 kc and 1580 to 4200 kc.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. One side of the power line is directly grounded to the chassis base. Under no circumstances, therefore, should a ground wire be permitted to come in contact with any metal part of the receiver.
3. The filament dropping resistor (R-12—see schematic) is a resistance wire in the special line cord. The cord will, therefore, become warm under normal operating conditions. To insure good heat radiation stretch out the line cord to its full length. Do not attempt to shorten it by cutting.
4. In operating the receiver on d.c. it may be necessary to reverse the line plug for correct polarity.
5. The color coding of the i-f transformer leads is as follows:
   Grid—green; Plate—blue
   Grid return—black; B plus—red.
6. In congested areas where the installation of a large antenna is not desirable we recommend the use of the Emerson Flexible Mast Antenna, Model W-82. Instructions for the installation of this compact and efficient antenna are supplied with each kit.
   Where the Flexible Mast is installed permanently, it is urgently recommended that the receiver antenna wire be cut. Leave just enough of this wire to reach from the receiver to the window strip connector.
7. The wave-trap in the receiver has been adjusted for maximum signal rejection at 456 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.

Tube Data

The tube complement is as follows:
1—6A7, pentagrid oscillator-modulator.
1—6D6, first i-f amplifier.
1—6Q7, diode detector, a-f amplifier, a.v.c.
1—25L6, beam power output.
1—25Z5, dual half-wave rectifier.

All octal-base tubes are replaceable with either metal or equivalent octal-base glass tubes.

	4VZ-725	Station name-tab cards (complete set)	.65

When ordering replacement parts specify part numbers.

*Item number locates the article on the schematic diagram.
†These trimmers are part of coil assemblies and cannot be supplied separately.
‡These trimmers are supplied in pairs.

An oscillator with frequencies of 455, 600, 1400 and 15,000 kc should be used.

In addition an output meter should be used across the voice coil or output transformer for observing maximum response.

The set's oscillator is higher in frequency than the signal, so images should be observed on the low frequency side of the signals.

ADJUSTMENTS

Always choose the minimum capacity peak on oscillator trimmers and maximum capacity peaks on antenna trimmers. The last motion in adjusting trimmers should always be a tightening one, not a loosening one.

Always use as weak a test signal as possible during alignment.

Never leave a trimmer with the outside plate so loose that there is no tension on the screw. Either bend the plate up or remove the screw entirely.

Location of Coils and Trimmer Adjustments

The broadcast antenna coil, the short-wave antenna coil and 455 kc wave-trap are one assembly mounted underneath the chassis deck to the right of the variable condenser. The trimmers for these coils are accessible through three holes in the top of the chassis. The trimmer farthest from the front of the chassis is for the 455 kc trap. The central trimmer is for the broadcast antenna coil and the trimmer closest to the chassis front is for the short-wave antenna coil.

The broadcast and short-wave oscillator coils are on one form, which is mounted on the inside of the rear of the chassis wall. The trimmers for these coils are accessible through holes in the back of the chassis. Looking at the rear of the chassis, the left-hand trimmer is for short-wave and the right-hand trimmer for broadcast.

The two i-f transformers are in oblong cans located on the top of the chassis. The first i-f transformer is the one behind the variable condenser. The second i-f transformer is the one located just to the right of the speaker.

The broadcast series padding condenser is located on the top of the chassis to the left of the variable condenser.

I-f Transformer and Wave-Trap Alignment

Turn the switch to the broadcast position and rotate the variable condenser to the minimum capacity position. Feed 455 kc to the grid cap of the 6A7 tube through a .02 mf condenser and adjust the four i-f trimmers for maximum response. Feed 455 kc to the antenna through a .0002 mf condenser and adjust the wave-trap trimmer (rear screw, to the right of variable condenser) for *minimum response.* (See General Note, No. 8.)

Short-wave Alignment

Use a dummy antenna (400 ohm resistor) when aligning the short-wave coils.

Rotate the wave-band switch counter-clockwise to the short-wave position and set the dial to 15 megacycles. Feed 15 megacycles through the dummy antenna and adjust the short-wave oscillator trimmer (screw to left of variable, closest to 6A7) for maximum response and then adjust the short-wave antenna trimmer (screw to right of variable condenser, closest to front of chassis) for maximum response. The variable condenser should be rocked while adjusting the antenna trimmer (rotate variable condenser rotor shaft back and forth through a small arc).

Broadcast Alignment

Rotate the wave-band switch to the broadcast position (central) and set dial at 60. Feed 600 kc through a standard dummy antenna (a .0002 mf condenser may be used as a substitute). Adjust the broadcast series padder (screw to left of variable condenser, near front of chassis) for maximum response. Rotate the dial to 140, feed 1400 kc and adjust the broadcast oscillator trimmer (screw to left of variable, nearest electrolytic) for maximum response and then the antenna trimmer (center screw to right of variable) for maximum response. Return dial to 60, feed 600 kc and readjust the series padder, rocking the variable condenser for maximum response.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f portion of the circuit, the receiver should be carefully re-aligned.
2. One side of the power line is directly grounded to the chassis base. Under no circumstances, therefore, should a ground wire be permitted to come in contact with any metal part of the receiver.
3. The filament dropping resistor (L-49D on schematic) is in a special tube at the rear of the chassis. This tube will become quite hot under normal operating conditions. For voltage drop specifications, see below.
4. When operating the receiver on d.c. it may be necessary to reverse the line plug to obtain the correct polarity.
5. The two i-f transformers are held to the chassis by snap-on fasteners. To remove an i-f, unsolder all its leads under the chassis, pinch together the prongs of the snap-on fastener and lift the i-f can from the chassis.
6. The color coding of the i-f transformer leads is as follows:

   Grid—green — Plate—blue
   Grid return—black — B plus—red

7. An efficient antenna system is necessary to enable a full realization of the merits of the receiver. For reduction of noise and achievement of high efficiency on all frequency ranges the Emerson All-Wave High Fidelity Antenna, Model W-78, and the Emerson All-Wave Antenna System, Model W-89, are recommended. Instructions for the installation of these antennas are supplied with each kit.

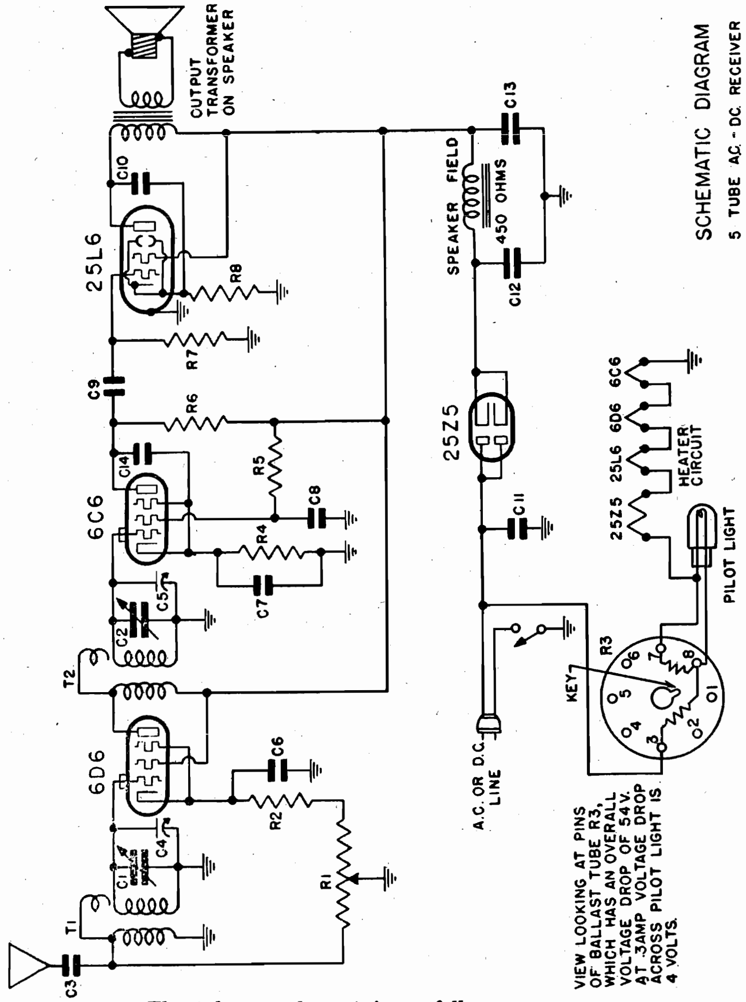
   In congested areas where the installation of a large antenna is not desirable we recommend the use of the Emerson Flexible Mast Antenna, Model W-82. Instructions for the installation of this compact and efficient antenna are supplied with each kit.
8. The wave-trap in the receiver has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.

The receivers are adjusted at the factory so that the entire broadcast frequency range is divided, and so covered, by the six buttons. In rare cases where two or more of the desired stations fall within the frequency range of one button, the internal connections in the automatic unit may be changed so that any of these stations may be selected by the automatic unit. The changes to be made are simple, and may be accomplished by following the instructions given in these notes.

Schematic. Voltage
Alignment, Parts

EMERSON RADIO & PHONOGRAPH CORP.

MODELS BA199, BA201
Chassis BA



The tube complement is as follows:

1—6D6, r-f amplifier.
1—6C6, biased detector.
1—25L6G, beam power output.
1—25Z5, dual half-wave rectifier.
1—L55BG, ballast tube.

Voltage rating .... 105 to 125 volts, a.c. or d.c.
Power consumption .... 45 watts
Frequency range .... 540 to 1725 kc.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with volume control turned on full and no signal. The line voltage for these readings was 117.5 volts, 60 cycles, a.c.

Tube	*Plate*	*Screen*	*Cathode*	*Fil.*
6D6	100	100	2.3	6.3
6C6	30	15	2.1	6.3
25L6G	93	100	6	25.0

Voltage across speaker field—26 volts.
25Z5 cathode to ground—126 volts.

ALIGNMENT PROCEDURE

An oscillator with a frequency of 1400 kc. is required. Use as weak a test signal as possible. An output meter should be used across the voice coil or output transformer for observing maximum response.

Rotate variable condenser to the maximum capacity position and set the pointer at the next calibration mark beyond 55. Then rotate the variable condenser until the pointer is at 140 and feed 1400 kc to the antenna through a .0001 mf mica condenser and adjust both trimmer condensers on the variable condenser for maximum response.

MIRACLE TUNING UNIT

Pre-adjustment of Station Buttons

The six push-buttons provide a choice of six favorite stations for Miracle Tuning. Adjustments for any particular station must be made by means of the small cross-slotted button next to the chosen push-button. The following procedure must be carefully observed in making these adjustments.

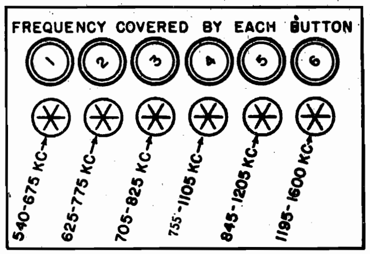

Fig. 1

NOTE: The above illustration will also be found on a label on the cabinet.

1. Select six (or less) nearby broadcast stations desired for Miracle Tuning and determine their frequencies. Stations are usually listed in newspapers with their frequencies in kilocycles.
2. The frequency range covered by each button is shown in the Fig. 1 at the left. Of the chosen stations select the one with the lowest frequency. The button with a frequency range which includes this station frequency is the one to be adjusted for that particular station.

   For example, a desired station has a frequency of 600 kilocycles. Button No. 1 covers a range of 540 to 675 kilocycles. This button, therefore, is the one to be used for that station.

   Where a station has a frequency which falls within the ranges of two buttons use the button with the lower frequency range except when this lower button has already been reserved for another station.
3. Locate the station call letters on one of the four cards supplied in an envelope with the receiver. Push out the circular tab bearing the station call letters from the card. Remove the clear celluloid disc from the chosen push-button by prying with a small sharp instrument at the notch on the side of the button.

   Remove the printed tab from the button and replace it with the proper tab. Replace the celluloid disc over this tab and press it in firmly.
4. Turn the receiver on and wait at least 15 minutes in order that all of the internal parts of the receiver attain a uniform temperature. Rotate the wave-band switch to the central position for broadcast reception. Tune in the desired station by means of the station selector knob. Rotate the wave-band switch to the automatic position, clockwise. Press in the push-button to be used for this station. Be sure this button is pushed all the way in until a click is heard and the button remains depressed. The cross-slotted button next to the selected push-button is the one to be adjusted. (See Fig. 2.) Insert a small thin coin in one of the slots in the button and rotate it slowly in either direction until the desired station is heard. Once the station is heard rotate the adjusting button back and forth through a very small arc until the station is received at maximum volume and the reception is clear and undistorted. Check to be sure that you have adjusted the button for the proper station by rotating the wave-band switch for a moment to the broadcast position (central) and then back to the automatic position.
5. Select the desired station of the next highest frequency and adjust the proper button, carefully observing the procedure outlined above. In similar fashion adjust for any remaining stations chosen.
6. Once the buttons have been adjusted a slight readjustment of each button may be necessary. Starting with the first button repeat the entire adjusting procedure, being very careful to adjust the buttons to the middle of the stations. When rotating the adjusting button, do not exert any undue pressure on it since this may disturb the final adjustment.

Adjusting the Button With a Coin.
Fig. 2

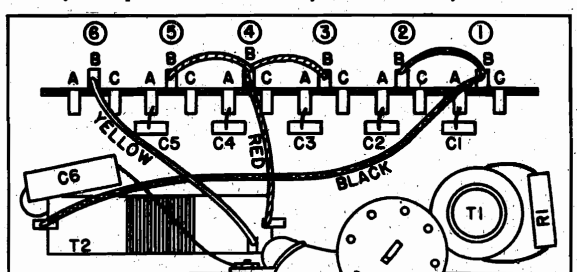

Fig. 3. Rear View of Push button Unit

The Switching Assembly

Removal of the rear cover from the shield box will show switch lugs arranged in groups of three's as indicated in the diagram. Lugs lettered B for each button are connected to the oscillator taps which have the following frequency ranges.

Black covered wire—540-775 kc.
Red covered wire—705-1205 kc.
Yellow covered wire—1195-1600 kc.

Lugs lettered A for each button are connected to fixed condensers (C1, C2, C3, C4, C5) which tune the antenna coil properly in each of the following bands, respectively:

1. 540-675 kc.	4. 755-1105 kc.
2. 625-775 kc.	5. 845-1205 kc.
3. 705-825 kc.	6. 1195-1600 kc.

Lugs lettered C are connected to adjustable trimming condensers (C8, C9, C10, C11, C12, C13) which tune the oscillator coil.

All of these trimmers have the same capacity range.

Change of Internal Connections

If the button covering a certain frequency band is already in use and it is desired to tune in another station in that same band, the range of any other button may be changed to accommodate that station by observing the following procedure:

(It is not necessary to remove the tuning assembly from the shield box.)

1. Place the box in a position which corresponds to Fig. 3 above. Disconnect the molded mica condenser (C1 or C2 or C3 or C4 or C5) from lug A of the button to be changed and, with a short piece of wire reconnect this lug A to lug A of the button which covers the desired range and is already in use. DO NOT DISCONNECT THE MOLDED MICA CONDENSER WHICH IS ATTACHED TO THE BUTTON IN USE.
   To allow for future changes tape-up the end of the disconnected molded condenser.
2. If lug B of the button being changed is already connected to the colored tap lead which includes the desired frequency no further operation is necessary. However, if lug B is not connected to an oscillator tap which includes the desired frequency then remove any wires from lug B and reconnect this lug with another piece of wire to any other lug B which already is connected to the tap-lead of the correct color (band).
3. Tune in the new station and check the results. Replace rear cover on the box and mount the box in the cabinet. Insert proper station name-tabs and retune all stations.

EXAMPLES

Button 4 is in use and it is desired to shift button 5 to tune in a station on 830 kc.

1. Cut C5 (50 mmf) mica condenser from lug 5A. (Tape end.)
2. Connect lug 5A to lug 4A. (Button 4 covers the desired frequency.)
3. Since lug 5B is already connected to the red oscillator lead which includes 830 kc. in its range, the operation has been completed. Retune the new station.

Button 2 is in use and it is desired to shift button 3 to tune in a station on 700 kc.

1. Cut C3 (120 mmf) mica condenser from lug 3A. (Tape end.)
2. Connect lug 3A to lug 2A. (Button 2 covers the desired frequency.)
3. Disconnect the wire joining lug 3B to the red oscillator lead at 4B and resolder to lug 2B where it will connect with the black oscillator lead which covers the desired frequency. Retune the new station.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f portion of the circuit, the receiver should be carefully re-aligned.
2. One side of the power line is directly grounded to the chassis base. Under no circumstances, therefore, should a ground wire be permitted to come in contact with any metal part of the receiver.
3. The filament dropping resistor (R13 on schematic) is in a special metal tube at the rear of the chassis. This tube will become quite hot under normal operating conditions. For voltage drop specifications, see below.
4. When operating the receiver on d.c. it may be necessary to reverse the line plug to obtain the correct polarity.
5. The two i-f transformers are held to the chassis by snap-on fasteners. To remove an i-f, unsolder all its leads under the chassis, pinch together the prongs of the snap-on fastener and lift the i-f can from the chassis.
6. The color coding of the i-f transformer leads is as follows:

Grid-green	Plate—blue
Grid return—black	B plus—red
7. An efficient antenna system is necessary to enable a full realization of the merits of the receiver. For reduction of noise and achievement of high efficiency on all frequency ranges the Emerson All-Wave High Fidelity Antenna, Model W-78, and the Emerson All-Wave Antenna System, Model W-89, are recommended. Instructions for the installation of these antennas are supplied with each kit.

   In congested areas where the installation of a large antenna is not desirable we recommend the use of the Emerson Flexible Mast Antenna, Model W-82. Instructions for the installation of this compact and efficient antenna are supplied with each kit.
8. The wave-trap in the receiver has been adjusted for maximum signal rejection at 456 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.
9. To change the dial light the chassis should be removed from the cabinet.
10. Model AY receivers are adjusted at the factory so that the entire broadcast frequency range is divided, and so covered, by the six buttons. In rare cases where two or more of the desired stations fall within the frequency range of one button, the internal connections in the automatic unit may be changed so that any of these stations may be selected by the automatic unit. The changes to be made are simple, and may be accomplished by following the instructions given in these notes.

PRODUCTION CHANGES

BD Chassis bearing serial numbers above 1,580,950 differ from the schematic as follows:
(a) C25, C28 and C29 have been removed.
(b) C27 is connected from 25L6 grid to cathode.
(c) A 4 point tone control has been added, consisting of the following parts:
One tone control switch, part no. 4ZS-317A .... price .80
One 0.04 mf, 400 volt tubular condenser, part no. 4DC-349 .... price .20
One 0.07 mf, 400 volt tubular condenser, part no. 5DC-389 .... price .20

ADJUSTMENTS

An oscillator with frequencies of 456, 600, 1400 and 15,000 kc should be used.

In addition an output meter should be used across the voice coil or output transformer for observing maximum response.

The set's oscillator is higher in frequency than the signal, so images should be observed on the low frequency side of the signals.

Always choose the minimum capacity peak on oscillator trimmers and maximum capacity peaks on antenna trimmers. The last motion in adjusting trimmers should always be a tightening one, not a loosening one.

Always use as weak a test signal as possible during alignment.

Never leave a trimmer with the outside plate so loose that there is not tension on the screw. Either bend the plate up or remove the screw entirely.

Location of Coils and Trimmer Adjustments:

The broadcast antenna coil, short wave antenna coil, and 456 kc wave trap are one assembly mounted underneath the chassis deck to the right of the variable condenser. The trimmers for these coils are accessible through three holes in the top of the chassis. *The trimmer closest to the front of the chassis is for the short wave antenna coil. The central trimmer is for the broadcast antenna coil. The trimmer farthest from the front of the chassis is for the 456 kc trap.*

The broadcast and short-wave oscillator coils are on one form which is mounted below and to the left of the variable, just behind the wave-band switch. The trimmers for these coils are accessible through two holes in the top of the chassis. The trimmer closest to the variable condenser is for the short-wave oscillator coil and the trimmer farthest from it is for the broadcast oscillator coil.

The two i-f transformers are in oblong cans located on the top of the chassis. The first i-f transformer is the one behind and to the left of the variable condenser. The second i-f transformer is the one located just to the right of the speaker.

The broadcast series padding condenser is located on the top of the chassis to the left of the variable condenser.

I-f Transformer and Wave-Trap Alignment

Turn the switch to the broadcast position and rotate the variable condenser to the minimum capacity position. Feed 456 kc to the grid cap of the 6A7 tube through a .02 mf condenser and adjust the four i-f trimmers for maximum response. Feed 456 kc to the antenna through a .0002 mf condenser and adjust the wave-trap trimmer (REAR screw, to the right of variable condenser) for *minimum response.*

NOTE: Since the dial indicator is fastened to the cabinet, a piece of wire should be fastened to the variable condenser and bent over to form a pointer when the chassis is removed from cabinet.

Short-Wave Alignment

Use a dummy antenna (400 ohm resistor) when aligning the short-wave coils.

Rotate the wave-band switch counter-clockwise to the short-wave position and set the dial to 15 megacycles. Feed 15 megacycles through the dummy antenna and adjust the short-wave oscillator trimmer (screw to left of variable, closest to 6A7) for maximum response and then adjust the short-wave antenna trimmer (SCREW CLOSEST TO FRONT OF CHASSIS) for maximum response. The variable condenser should be rocked while adjusting the antenna trimmer (rotate variable condenser rotor shaft back and forth through a small arc).

Broadcast Alignment

Rotate the wave-band switch to the broadcast position (central) and set dial at 60. Feed 600 kc through a standard dummy antenna (a .0002 mf condenser may be used as a substitute). Adjust the broadcast series padder (screw to left of variable condenser, near front of chassis) for maximum response. Rotate the dial to 140, feed 1400 kc and adjust the broadcast oscillator trimmer (screw to left of variable, nearest electrolytic) for maximum response and then the antenna trimmer (center screw to right of variable) for maximum response. Return dial to 60, feed 600 kc and readjust the series padder, rocking the variable condenser for maximum response.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. All readings except cathode and heater voltages were taken on 250 volt scale. Line voltage for all readings was 117.5 volts, 60 cycles, a.c.

Tube	*Plate*	*Screen*	*Cathode*	*Osc. Plate*	*Fil.*
6A7	104	45	2.3	82	6.3
6D6	104	104	3.8	—	6.3
6Q7	45	—	1.2	—	6.3
25L6	95	104	6.2	—	25.0

Voltage at 25Z5 cathode—133 volts.
Voltage across speaker field—29 volts.
Voltage drop across ballast tube (pins Nos. 3, 7)—49 volts.
Voltage drop across pilot light sections (pins Nos. 8, 7); (pins Nos. 2, 8)—4 volts.

Voltage rating .... 105-125 volts, a.c. or d.c.
Power consumption .... 50 watts.
Frequency ranges .... 540 to 1,730 kc, and 5.6 to 18.0 megacycles.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed are from point indicated to ground (chassis). All readings except cathodes, heaters, and B plus at rectifier were taken on 250 volt scale. Line voltage for these readings was 117.5 volts, 60 cycle, a.c.

Tube	*Plate*	*Screen*	*Cathode*	*Osc. Plate*	*Fil.*
6A7	227	78	0	165	6.3 a.c.
6D6	227	78	0	—	6.3 a.c.
6Q7G	105	—	0	—	6.3 a.c.
76	227	—	11.5	—	6.3 a.c.
6AC5G	213	—	0	—	6.3 a.c.

B plus at 80 filament—300 volts.

Voltage across field—75 volts.

Grid bias for all tubes is developed across resistors R10 and R11. The total voltage should be 11.5 volts. Voltage measured across R10 should be 2.25 volts. To check bias on 6A7 and 6D6 tubes, measure the values of R12, R13 and R14. See schematic.

Tube Data

The tube complement is as follows:
1—6A7, oscillator-modulator
1—6D6, I.F. amplifier
1—6Q7G, diode detector, a.v.c., a.f. amplifier
1—76, audio amplifier
1—6AC5G, power output
1—80, full-wave rectifier.

PRODUCTION CHANGES

A 3 ohm ½ watt wire-wound resistor, part no. 4ZR-326, is located in series with the dial light.

*Item number locates the article on the schematic diagram.
†These trimmer condensers are part of the coil assemblies and cannot be supplied separately.
‡These trimmers are supplied in pairs.

ADJUSTMENTS

An oscillator with frequencies of 456, 600, 1400 and 15,000 kc should be used.

In addition an output meter should be used across the voice coil or output transformer for observing maximum response.

The set's oscillator is higher in frequency than the signal, so images should be observed on the low frequency side of the signals.

Always choose the minimum capacity peak on oscillator trimmers and maximum capacity peaks on antenna trimmers. The last motion in adjusting trimmers should always be a tightening one, not a loosening one.

Always use as weak a test signal as possible during alignment.

Never leave a trimmer with the outside plate so loose that there is no tension on the screw. Either bend the plate up or remove the screw entirely.

Location of Coils and Trimmer Adjustments

The broadcast antenna coil, short-wave antenna coil and 456 kc adjustable wave-trap are on one assembly mounted on a bracket on the top of the chassis, to the right of the 6A7 tube. The trimmers for these coils are accessible through holes in the coil bracket. The hole closest to top is for the trap. The central hole is for the broadcast antenna coil and bottom hole for short-wave antenna coil.

The broadcast and short-wave oscillator coils are mounted on the inside of the right-hand chassis wall. The trimmers are accessible through holes in the chassis wall. The front trimmer is for short-wave oscillator and the rear trimmer is for the broadcast oscillator.

The two i-f transformers are in oblong cans located on the top of the chassis. The first i.f. is the one behind the antenna coil. The trimmers for these transformers are accessible through holes in the tops of the cans.

The broadcast series padding condenser is located on the right-hand side of the chassis with its adjusting screw accessible through a hole in the chassis wall.

I-f and Wave-trap Alignment

Turn the switch to the broadcast position (central) and rotate the variable condenser to the minimum capacity position. Feed 456 kc through a .02 mf condenser to the grid cap of the 6A7 tube and adjust the four i-f trimmers for maximum response. Feed 456 kc to the antenna through a .0002 and adjust the wave-trap trimmer (rear screw beside variable condenser) for *minimum response.*

Short-Wave Alignment

Since the indicator is fastened to the cabinet, a wire should be fastened to the variable condenser and bent over to form a dial pointer when the chassis is removed from the cabinet.

Use a dummy antenna (400 ohm resistor) when aligning the short-wave coils.

Rotate the wave-band switch counter-clockwise to the short-wave position and set the dial pointer to 15 megacycles. Feed 15 megacycles through the dummy antenna and adjust the short-wave oscillator trimmer for maximum response and then adjust the short-wave trimmer for maximum response. The variable condenser should be rocked while adjusting the antenna trimmer. (Rotate variable condenser rotor shaft back and forth through a small arc.)

Broadcast Alignment

Rotate the wave-band switch to the broadcast position and set the dial at 60. Feed 600 kc through a standard dummy antenna (a .0002 mf condenser may be used as a substitute).

Adjust the broadcast series padding condenser for maximum response. Rotate the dial to 140, feed 1400 kc and adjust the broadcast oscillator trimmer for maximum response and then adjust the broadcast antenna trimmer for maximum response. Return the dial to 60, feed 600 kc and readjust the series padding condenser, rocking the variable condenser for maximum response.

GENERAL NOTES

1. The receiver should never be turned on with either the speaker plug or the 6AC5G tube out of its respective socket, since the rapid rise in rectifier voltage will damage the electrolytic condenser.
2. When replacing the chassis in the cabinet take precautions to keep any part of the dial and condenser assembly from touching the cabinet, otherwise microphonism will result.
3. The color coding of the i-f transformers is as follows:
   Grid—green   Grid return—black
   B plus—red   Plate—blue.
4. The color coding of the power transformer is as follows:
   Primary—two black leads
   High-voltage secondary—two red leads
   High-voltage secondary center tap—red and yellow lead
   6.3 volt secondary—two green leads
   5 volt secondary—two yellow leads.
5. The adjustable padding condenser for the broadcast band is mounted on the front of the chassis near the tuning control, with the screw adjustment accessible through a hole in the front of the chassis. The short-wave band has a fixed padder, C9 on the schematic. When replacing this fixed padder be careful to use a condenser which has a capacity within 2% of the specified value, otherwise the short-wave coils may not track.
6. The wave-trap in the receiver has been adjusted for maximum signal rejection at 456 kc. If, however, persistent interference is experienced from some particular telegraph station the wave-trap trimmer may be readjusted until the response from the interfering station is at a minimum.
7. An efficient antenna system is necessary to enable a full realization of the merits of the receiver. For reduction of noise and achievement of high efficiency on all frequency ranges the Emerson All-Wave High Fidelity Antenna, Model W-78, and the Emerson All-Wave Antenna System, Model W-89, are recommended. Instructions for the installation of these antennas are supplied with each kit.
   In congested areas where the installation of a large antenna is not desirable we recommend the use of the Emerson Flexible Mast Antenna, Model W-82. Instructions for the installation of this compact and efficient antenna are supplied with each kit.
8. To change the dial light the chassis should be removed from the cabinet.
9. The receiver is adjusted at the factory so that the entire broadcast frequency range is divided, and so covered, by the six buttons. In rare cases where two or more of the desired stations fall within the frequency range of one button, the internal connections in the automatic unit may be changed so that any of these stations may be selected by the automatic unit. The changes to be made are simple and may be accomplished by following the instructions given in these notes.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for all readings was 117.5 volts, 60 cycles, a.c. All readings, except B plus at rectifier and heaters, were taken on 250 volt scale.

Tube	*Plate*	*Screen*	*Cathode*	*Osc. Plate*	*Fil.*
6A7	182	70	0	182	6.3 a.c.
6D6	182	70	0	—	6.3 a.c.
6Q7	87	—	0	—	6.3 a.c.
41	165	182	0	—	6.3 a.c.

Voltage across speaker field—70.
Voltage from B minus to chassis—80.
B plus at 80 tube filament—262.

ADJUSTMENTS

An oscillator with frequency of 456 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The two i-f transformers are located on top of the chassis deck. The first i-f transformer is the one directly behind the push-button switch. The trimmers for the two i-f transformers are available through holes in the tops of the cans.

The antenna coil is located above the chassis, in front of the 6A7 tube.

The oscillator coil is located under the chassis, behind the volume control.

The 456 kc wave-trap is mounted on the front chassis wall beneath the push-button switch. The trimmer for the 456 kc wave-trap is mounted on the coil and is accessible from the bottom of the chassis.

I-f and Wave-Trap Alignment

Push the button at the extreme right and feed 456 kc through a .02 mf condenser to the grid cap of the 6A7 tube (do not remove the grid clip from the tube). Adjust the four i-f trimmers for maximum response. Feed 456 kc to the antenna through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) and adjust the wave-trap trimmer for minimum response. (See General Note No. 1.)

Repairs to this receiver should be made only by a qualified radio serviceman.

Should this receiver require servicing at any time insist that the dealer or serviceman supply genuine Emerson parts. If parts or servicing notes are not available at dealers, write directly to manufacturer.

In all correspondence concerning this receiver be sure to mention the complete serial number, which will be found at the rear of the chassis.

GENERAL NOTES

1. The wave-trap in the receiver has been adjusted for maximum signal rejection at 456 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.
2. The receiver should never be turned on with the 41 tube out of its socket since the rapid rise in rectifier voltage would damage the electrolytic condensers.
3. The two i-f transformers are held to the chassis by snap-on fasteners. To remove an i-f, unsolder all its leads under the chassis, pinch together the prongs of the snap-on fastener and lift the i-f can from the chassis.
4. The color coding of the leads of the i-f transformers is as follows:
   Grid—green; Plate—blue
   Grid return—black; B plus—red
5. The color coding of the power transformer leads is as follows:
   Primary—two black leads; 6.3 v. sec.—two heavy green leads
   High voltage sec.—two red leads; 5 v. sec.—two heavy yellow leads
   High voltage sec. center tap—red and yellow lead
6. With a few exceptions, the color coding of the general wiring is as follows:
   Plate—blue; A.v.c. and cathode—white or yellow
   B plus—red; Grid—green
   Screen—brown; Filament and ground—black
7. The receiver is adjusted at the factory so that the entire broadcast frequency range is divided, and so covered, by the six buttons. In rare cases where two or more of the desired stations fall within the frequency range of one button, the internal connections in the automatic unit may be changed so that any of these stations may be selected by the automatic unit. The changes to be made are simple and may be made by following the instructions given in these notes.

MODEL BE 198
Chassis BE
Tuner Data

EMERSON RADIO & PHONOGRAPH CORP.

ADJUSTMENTS OF MIRACLE TUNING ASSEMBLY

Pre-adjustment of Station Buttons

The six push-buttons provide a choice of six favorite stations for Miracle Tuning. Adjustments for any particular station must be made by means of the small cross-slotted button below the chosen push-button. The following procedure must be carefully observed in making these adjustments.

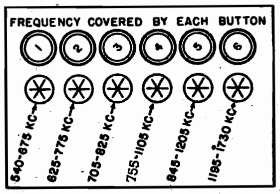

Fig. 1

NOTE: The above illustration will also be found on a label on the bottom of the cabinet.

1. Select six nearby broadcast stations desired for Miracle Tuning and determine their frequencies. Stations are usually listed in newspapers with their frequencies in kilocycles.
2. The frequency range covered by each button is shown in the Fig. 1 at the left. Of the chosen stations select the one with the lowest frequency. The button with a frequency range which includes this station frequency is the one to be adjusted for that particular station.

   For example, a desired station has a frequency of 600 kilocycles. Button No. 1 covers a range of 540 to 675 kilocycles. This button, therefore, is the one to be used for that station.

   Where a station has a frequency which falls within the ranges of two buttons use the button with the lower frequency range, except when this lower button has already been reserved for another station.
3. Locate the station call letters on one of the four cards supplied in an envelope with the receiver. Push out the circular tab bearing the station call letters from the card. Remove the clear celluloid disc from the chosen push-button by prying with a small sharp instrument at the notch on the side of the button. Remove the printed tab from the button and replace it with the proper tab. Replace the celluloid disc over this tab and press it in firmly.
4. Insert the line plug into the electrical outlet and turn the receiver on. Wait at least 15 minutes for the internal parts of the receiver to attain a uniform operating temperature before making any adjustments.

   Press in the push-button to be used for the desired station. Be sure this button is pushed all the way in until a click is heard and the button remains depressed. The cross-slotted button which is below the selected push-button is the one to be adjusted, see Fig. 2. Insert a small thin coin in one of the slots in the button and rotate it slowly in either direction until the desired station is heard.

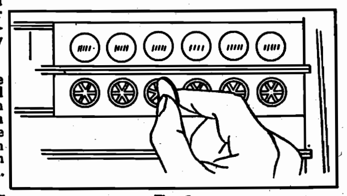

Fig. 2
Adjusting the button with a coin.

   Once the station is heard, rotate the adjusting button back and forth through a very small arc until the station is received at maximum volume and the reception is clear and undistorted. Check to be sure that you have adjusted the button for the proper station by listening for the station announcement.
5. Select the desired station of the next highest frequency and adjust the proper button, carefully observing the procedure outlined above. In similar fashion adjust for the remaining stations chosen.
6. Once the six buttons have been adjusted it is necessary that they be rechecked. Starting with the first button repeat the entire adjusting procedure, being very careful to adjust the buttons to the middle of the stations. When rotating the adjusting button, do not exert any undue pressure on it, since this may disturb the final adjustment.

The receiver is adjusted at the factory so that the entire broadcast frequency range is divided, and so covered, by the six buttons. In rare cases where two or more of the desired stations fall within the frequency range of one button, the internal connections in the automatic unit may be changed so that any of these stations may be selected by the automatic unit. The changes to be made are simple, but, nevertheless, should be done by a competent serviceman.

Operation

Turn the receiver on by rotating the volume control knob clockwise until the switch is heard to click and then rotate this knob in the same direction to about half of its full rotation. Tune in the desired station by merely pushing in the button bearing the call letters of that station. Be sure that the button is pushed all the way in until a click is heard and the button remains depressed. Adjust the volume to the desired level.

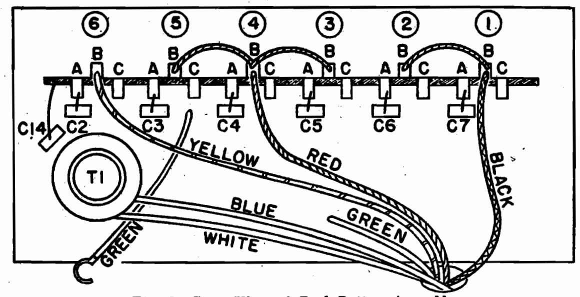

Fig. 3. *Rear View of Push-Button Assembly.*

The Switching Assembly

Remove the chassis from the cabinet and loosen the switch assembly from the chassis by removing the two screws which pass through slots in the front plate. Do not unsolder any of the leads coming from the switch assembly. Merely tilt the assembly forward so that all of its parts are accessible. Behind each button are switch lugs arranged in groups of three, as in the diagram. Lugs lettered B for each button are connected to one of the oscillator coil taps, which have the following frequency ranges:

Black covered wire: 540-775 kc.
Red covered wire: 705-1205 kc.
Yellow covered wire: 1195-1730 kc.

Lugs lettered A on each button are connected to fixed condensers (C2, C3, C4, C5, C6, C7), which tune the antennna coils properly in each of the following bands:

Button no. 1.	540-675 kc	Button no. 4.	755-1105 kc
Button no. 2.	625-775 kc	Button no. 5.	845-1205 kc
Button no. 3.	705-825 kc	Button no. 6.	1195-1730 kc

Lugs lettered C are connected to adjustable trimming condensers (C8, C9, C10, C11, C12, C13), which tune the oscillator. These trimmers are all of the same capacity range.

Change of Connections

If the button covering a certain frequency band is already in use and it is desired to tune in another station in that same band, the range of any other button may be changed to accommodate that station by observing the following procedure:

1. Place the switch in a position which corresponds to Fig. 3 above. Unsolder the molded mica condenser (C2 or C3 or C4 or C5 or C6 or C7) from lug A of the button to be changed and, with a short piece of wire reconnect this lug A to lug A of a button which covers the desired range and is already in use. DO NOT DISCONNECT THE MOLDED MICA CONDENSER WHICH IS ATTACHED TO THE BUTTON IN USE. To allow for future changes, tape up the end of the disconnected molded condenser.

If lug B of the button to be changed is already connected to the colored coil lead which includes the desired frequency, no further operation is necessary. However, if lug B is not connected to an oscillator tap of the desired frequency range then remove any wires from lug B and reconnect this lug to any other lug B which already is connected to the coil lead of the correct color (frequency band). Refasten the assembly on the chassis and tune in the new station. Remount the chassis in the cabinet, insert proper station name-tabs and retune all stations.

Examples

Button 4 is in use and it is desired to shift button 5 to tune in a station at 830 kc.

1. Unsolder C3 (75 mmf) mica condenser from lug 5A. (Tape end.)
2. Connect lug 5A to lug 4A. (Button 4 covers the desired frequency.)
3. Since lug 5B is already connected to lug 4B, the operation has been completed. Retune the new station.

Button 2 is in use and it is desired to shift button 3 to tune in station at 700 kc.

1. Unsolder C5 (150 mmf) mica condenser from lug 3A. (Tape end.)
2. Connect lug 3A to lug 2A. (Button 2 covers the desired frequency.)
3. Disconnect the wire joining lug 3B to lug 4B and reconnect to lug 2B. Retune the new station.

List Price Ea. Effective as of July 1st, 1938 (Subject to change without notice)

*Item number locates the article on schematic diagram.

†These condensers cannot be supplied separately.

‡Note: In replacing the dual 16 mf electrolytic condenser, part no. 4DC-345A, the green lead should be connected to the 25Z5 cathode.

PREADJUSTMENT OF STATION BUTTONS

Insert the line plug in the electric outlet. Turn the receiver on by rotating the volume control knob clockwise until the switch is heard to click and then rotate this knob in the same direction to about half of its full rotation. Wait about a minute for the tubes to warm up. If the power supply is d.c. and the receiver does not operate at first, reverse the line plug to obtain the proper polarity.

Select four nearby stations desired for automatic tuning. Choose one of these stations and the button to be adjusted for it. Follow the procedure outlined below.

1. Loosen the push-button to be adjusted by rotating it counter-clockwise from ¼ to ½ turn. See Fig. 2.

2. Push the button in as far as it will go and, holding it in firmly, tune in the desired station by means of the selector knob. See Fig. 3.

3. Hold button in with finger of one hand and tighten securely with the other hand. Release the button and tighten it further if possible. See Fig. 4.

4. Remove the celluloid cap and blank station tab from the button by prying at the small notch in the side of the button with a pointed instrument. Remove the tab bearing the station call letters from one of the cards supplied in a separate envelope with the receiver. Insert the tab in the button and replace the celluloid cap over this tab, pressing it in firmly.

Check the adjustment of the button by detuning the station by means of the selector knob and then pressing the push-button in as far as it will go. The station should be received clearly and with maximum volume.

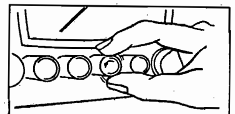

FIG.2 Loosen button by rotating counter-clockwise from ¼ to ½ turn.

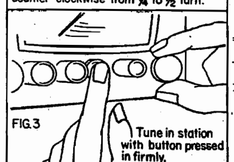

FIG.3

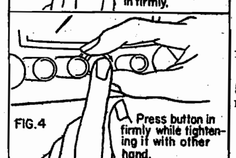

FIG.4

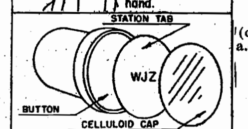

FIG.5 Insert station tab in button with celluloid cap over tab.

ALIGNMENT PROCEDURE

An oscillator with a frequency of 1400 kc is required.

Use as weak a test signal as possible. An output meter should be used across the voice coil or output transformer for observing maximum response.

Rotate variable condenser to the maximum capacity position and set the pointer at the next calibration mark beyond 55. Then rotate the variable condenser until the pointer is at 140 and feed 1400 kc to the antenna through a .0001 mf mica condenser and adjust both trimmer condensers on the variable condenser for maximum response.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with volume control turned on full and no signal. The line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale.

Tube	*Plate*	*Screen*	*Cathode*	*Fil.*
6D6	100	100	2.8	6.3
6C6	20	15	2.1	6.3
25L6G	93	100	6.0	25.0

Voltage across speaker field—26 volts.
25Z5 cathode to ground—126 volts.

SCHEMATIC DIAGRAM

CHASSIS MODEL BJ

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except cathodes and heaters were taken on 250 volt scale.

VOLTAGE ANALYSIS

Tube	*Plate*	*Screen*	*Cathode*	*Osc. Plate*	*Fil.*
6A7	100	50	2.3	100	6.3
6D6	100	100	3.5	—	6.3
6Q7G	48	—	1.2	—	6.3
25L6G	92	100	6.5	—	25.0

Voltage at 25Z5 cathode—130 volts.
Voltage across speaker field—28 volts.
Voltage drop across ballast tube (pins Nos. 3, 7)—49 volts.
Voltage drop across pilot light section of ballast tube (pins Nos. 8 and 7)—4 volts.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f portion of the circuit, the receiver should be carefully re-aligned.
2. One side of the power line is directly grounded to the chassis base. Under no circumstances, therefore, should a ground wire be permitted to come in contact with any metal part of the receiver.
3. The filament dropping resistor (L-49BG on schematic) is in a special tube at the rear of the chassis. This tube will become quite hot under normal operating conditions. For voltage drop specifications, see below.
4. When operating the receiver on d.c. it may be necessary to reverse the line plug to obtain the correct polarity.
5. The two i-f transformers are held to the chassis by snap-on fasteners. To remove an i-f, unsolder all its leads under the chassis, pinch together the prongs of the snap-on fastener and lift the i-f can from the chassis.
6. The color coding of the i-f transformer leads is as follows:
   Grid—green Plate—blue
   Grid return—black B plus—red
7. The receiver is shipped with an attached antenna wire. In some locations near powerful local stations the addition of a very large antenna may be detrimental to reception because of the resulting interference. The Emerson Flexible Mast Antenna, Model W-82, has been especially designed for Emerson receivers, featuring compactness and portability while at the same time retaining a high efficiency from the standpoint of performance. Since it functions as an outside antenna the Flexible Mast will substantially improve the receiver performance. Where the Flexible Mast is installed permanently, it is urgently recommended that the receiver antenna wire be cut. Leave just enough of this wire to reach from the receiver to the window strip connector. Instructions for the installation of this compact and efficient outside antenna are supplied with each kit.
8. The wave-trap has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.

*Item number locates the article on the schematic diagram.

†These trimmers are part of coil assemblies and cannot be supplied separately.

‡These trimmers are part of variable condenser and cannot be supplied separately.

Location of Coils and Trimmer Adjustments

The two i-f transformers are located on top of the chassis deck. The first i-f transformer is the one directly behind the variable condenser. The trimmers for the two i-f transformers are available through holes in the tops of the cans.

The trimmers for the antenna and oscillator are located on the variable condenser. The trimmer on the front section is for the antenna.

The 455 kc wave-trap is mounted on the front chassis wall beneath the variable condenser. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible from the bottom of the chassis.

I-f and Wave-Trap Alignment

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 455 kc, through a 0.02 mf paper condenser, to the grid cap of the 6A7 tube (do not remove the grid clip from the tube). Adjust the four i-f trimmers for maximum response. Feed 455 kc to the antenna through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) and adjust the wave-trap trimmer for *minimum* response. (See General Note No. 8.)

NOTE: The Model BJ-200 should be aligned with the chassis bottom plate in place.

R-f Alignment

With the wave-band switch in the broadcast position, clockwise, set the dial pointer at 140. Feed 1400 kc through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

The police band is self-tracking and does not require any adjustment.

The tube complement

1—6A7 pentagrid oscillator-modulator.
1—6D6 first i-f amplifier.
1—6Q7G diode detector, a-f amplifier, a.v.c.
1—25L6G beam power output.
1—25Z5 dual half-wave rectifier.
1—L49B or L49BG ballast tube.

Octal-base tubes in this receiver may be replaced with either metal or octal-base glass tubes.

6Q7	87	—	0	—	6.3 a.c.
41	165	182	0	—	6.3 a.c.

Voltage across speaker field—70.
Voltage from B minus to chassis—80.
B plus at 80 tube filament—182.

VOLTAGE ANALYSIS

GENERAL NOTES

1. The wave-trap in the receiver has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.
2. The receiver should never be turned on with the 41 tube out of its socket since the rapid rise in rectifier voltage would damage the electrolytic condensers.
3. The two i-f transformers are held to the chassis by snap-on fasteners. To remove an i-f, unsolder all its leads under the chassis, pinch together the prongs of the snap-on fastener and lift the i-f can from the chassis.
4. The color coding of the leads of the i-f transformers, is as follows:
   Grid—green; Plate—blue
   Grid return—black; B plus—red
5. The color coding of the power transformer leads is as follows:
   Primary—two black leads; 6.3 v. sec.—two heavy green leads
   High voltage sec.—two red leads; 5 v. sec.—two heavy yellow leads
   High voltage sec. center tap—red and yellow lead
6. With a few exceptions, the color coding of the general wiring is as follows:
   Plate—blue; A.v.c. and cathode—white or yellow
   B plus—red; Grid—green
   Screen—brown; Filament and ground—black
7. An efficient antenna system is necessary to enable a full realization of the merits of the receiver. For reduction of noise and achievement of high efficiency on all frequency ranges the Emerson All-Wave High-Fidelity Antenna, Model W-78, and the Emerson All-Wave Antenna System, Model W-89, are recommended. Instructions for the installation of these antennas are supplied with each kit.

   In congested areas where the installation of a large antenna is not desirable we recommend the use of the Emerson Flexible Mast Antenna, Model W-82. Instructions for the installation of this compact and efficient antenna are supplied with each kit.

WHEN ORDERING REPLACEMENT PARTS SPECIFY PART NUMBER

*Item number locates the article on the schematic diagram.
†These trimmers are part of coil assemblies and cannot be supplied separately.
‡These trimmers are part of variable condenser and cannot be supplied separately.

Location of Coils and Trimmer Adjustments

The two i-f transformers are located on top of the chassis deck. The first i-f transformer is the one directly behind the variable condenser. The trimmers for the two i-f transformers are available through holes in the tops of the cans.

The trimmers for the antenna and oscillator are located on the variable condenser. The trimmer on the front section is for the antenna.

The 455 kc wave-trap is mounted on the front chassis wall beneath the variable condenser. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible from the bottom of the chassis.

I-f and Wave-Trap Alignment

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 455 kc, through a 0.02 mf paper condenser, to the grid cap of the 6A7 tube (do not remove the grid clip from the tube). Adjust the four i-f trimmers for maximum response. Feed 455 kc to the antenna through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) and adjust the wave-trap trimmer for *minimum* response. (See General Note No. 1.)

NOTE: The Model BL-200 should be aligned with the chassis bottom plate in place.

R-f Alignment

With the wave-band switch in the broadcast position, clockwise, set the dial pointer at 140. Feed 1400 kc through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

The police band is self-tracking and does not require any adjustment.

The tube complement

1—6A7 pentagrid oscillator-modulator
1—6D6 i-f amplifier
1—6Q7G diode detector, audio amplifier, a.v.c.
1—41 pentode power output
1—80 full-wave rectifier

Octal-base tubes may be replaced with either metal or equivalent octal-base glass tubes.

VOLTAGE ANALYSIS

Readings should be taken on the 250 volt scale of a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All voltages except heaters were taken on 250 volt scale.

Tube	Plate	Screen	Cathode	Osc. Plate	Fil.
6A7	180	60	0	180	6.3
6D6	180	60	0	—	6.3
6Q7-G	70	—	0	—	6.3
41	170	180	0	—	6.3

Voltage across speaker field—70.
Voltage from B minus to chassis—80.
B plus at 80 tube filament—182.

*Item number locates the article on the schematic diagram.

†These trimmers are part of coil assemblies and cannot be supplied separately.

‡These trimmers are part of variable condenser and cannot be supplied separately.

GENERAL NOTES

1. The wave-trap in the receiver has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.
2. The receiver should never be turned on with either the speaker plug or the 41 tube out of their sockets, since the rapid rise in rectifier voltage would damage the electrolytic condensers.
3. The color coding of the leads of the i-f transformers, is as follows:
   Grid—green; Grid return—black; Plate—blue; B plus—red
4. With a few exceptions, the color coding of the general wiring is as follows:
   Plate—blue; B plus—red; Screen—brown; A.v.c. and cathode—white or yellow; Grid—green; Filament and ground—black
5. The phonograph motor has been adjusted at the factory to turn at a speed of 78 r.p.m. The speed may be checked by counting the turns per minute or by using a stroboscope disc and a neon light. (The stroboscope method will only work when neon bulb is lighted from a 60 cycle a.c. supply.) To readjust the speed of the motor, part No. 3LPM-3, remove the turn-table and turn the speed adjusting screw (located near the turn-table shaft). A clockwise rotation of the screw decreases the speed. The speed should be checked with the pick-up and record in playing position.
6. The color coding of the power transformer leads is as follows:
   Primary—two black leads; High voltage sec.—two red leads; High voltage sec. center tap—yellow and red; 6.3 v. sec.—two heavy green leads; 5 v. sec.—two heavy yellow leads

ADJUSTMENTS

An oscillator with frequencies of 455 and 1400 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The two i-f transformers are located on top of the chassis deck. The first i-f transformer is the one directly behind the variable condenser. The trimmers for the two i-f transformers are available through holes in the tops of the cans.

The trimmers for the antenna and oscillator are located on the variable condenser. The trimmer on the front section is for the antenna.

The 455 kc wave-trap is mounted on the front chassis wall beneath the variable condenser. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible from the bottom of the chassis.

I-f and Wave-Trap Alignment

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 455 kc, through a 0.02 mf paper condenser, to the grid cap of the 6A7 tube (do not remove the grid clip from the tube). Adjust the four i-f trimmers for maximum response. Feed 455 kc to the antenna through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) and adjust the wave-trap trimmer for *minimum* response. (See General Note No. 1.)

R-f Alignment

With the wave-band switch in the broadcast position, clockwise, set the dial pointer at 140. Feed 1400 kc through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

The police band is self-tracking and does not require any adjustment.

PRODUCTION CHANGES

1. In receivers bearing serial numbers below 1,258,237:
   a. C17 was a .001 mf, 600 volt tubular condenser.
   b. R11 and C18 were connected from the plate of the 41 tube to B plus as shown by the dotted lines on the schematic diagram.
2. In receivers bearing serial numbers below 1,333,800:
   a. The second detector was a type 75.
   b. R9 was a 310 ohm ½ watt wire-wound resistor, part number 3RR-276.
   c. R10 was a 23 ohm ½ watt wire-wound resistor, part number 3RR-266.
3. In receivers bearing serial numbers below 1,433,600 the wave-trap was part number MMT-149A. (Interchangeable with 4DT-343.)
4. a. In receivers bearing serial numbers below 1,335,494 the antenna coil was part number 3RT-318.
   b. In receivers bearing serial numbers between 1,335,494 and 1,433,600 the antenna coil was part number 3RT-384. With both of these coils C10 was 0.001 mf.
   c. Receivers above serial number 1,433,600 use 3RT-384A which is interchangeable with 3RT-318 and 3RT-384A when C10 is changed to 0.0012 mf. The lug arrangement for these coils is shown in Fig. 1.
5. In receivers bearing serial numbers below 1,355,050 the pilot light was part number XL-9 (screw-type base).

When ordering replacement parts specify part number

*Item number locates the article on the schematic diagram.
†These condensers cannot be supplied separately.

TUBE DATA

1—6D6, r-f amplifier.
1—6C6, biased detector.
1—25L6G, beam power output.
1—25Z5, dual half-wave rectifier.
1—L55BG, ballast tube.

Note: Octal-base tubes may be replaced with either metal tubes or equivalent octal-base glass tubes.

PRODUCTION CHANGE

On early BM and BN chasses the red lead from the dual electrolytic condenser is connected to the 25Z5 cathodes and green lead to the 6D6 screen. In later models the green lead is connected to 25Z5 and red to 6D6. Replacements should be connected as in the later models.

IN RECEIVERS BEARING SERIAL NUMBERS ABOVE 1821050, CONDENSER C18 IS 0.1 MFD-200 VOLT.

BM-216 SCHEMATIC ON NEXT PAGE

Voltage rating .....105 to 125 volts.
Power consumption . 45 watts for receiver.
10 watts for motor in Model BM-216.
Frequency range ... 540 to 1730 kc.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with volume control turned on full and no signal. The line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale.

Tube	Plate	Screen	Cathode	Fil.
6D6	100	100	2.3	6.3
6C6	20	15	2.1	6.3
25L6G	93	100	6	25.0

Voltage across speaker field—26 volts.
25Z5 cathode to ground—126 volts.

BM, BM-216, BN-81

ALIGNMENT PROCEDURE

An oscillator with a frequency of 1400 kc is required.

Use as weak a test signal as possible. An output meter should be used across the voice coil or output transformer for observing maximum response.

Rotate variable condenser to the maximum capacity position and set the pointer at the next calibration mark beyond 55. Then rotate the variable condenser until the pointer is at 140 and feed 1400 kc to the antenna through a .0001 mf mica condenser and adjust both trimmer condensers on the variable condenser for maximum response.

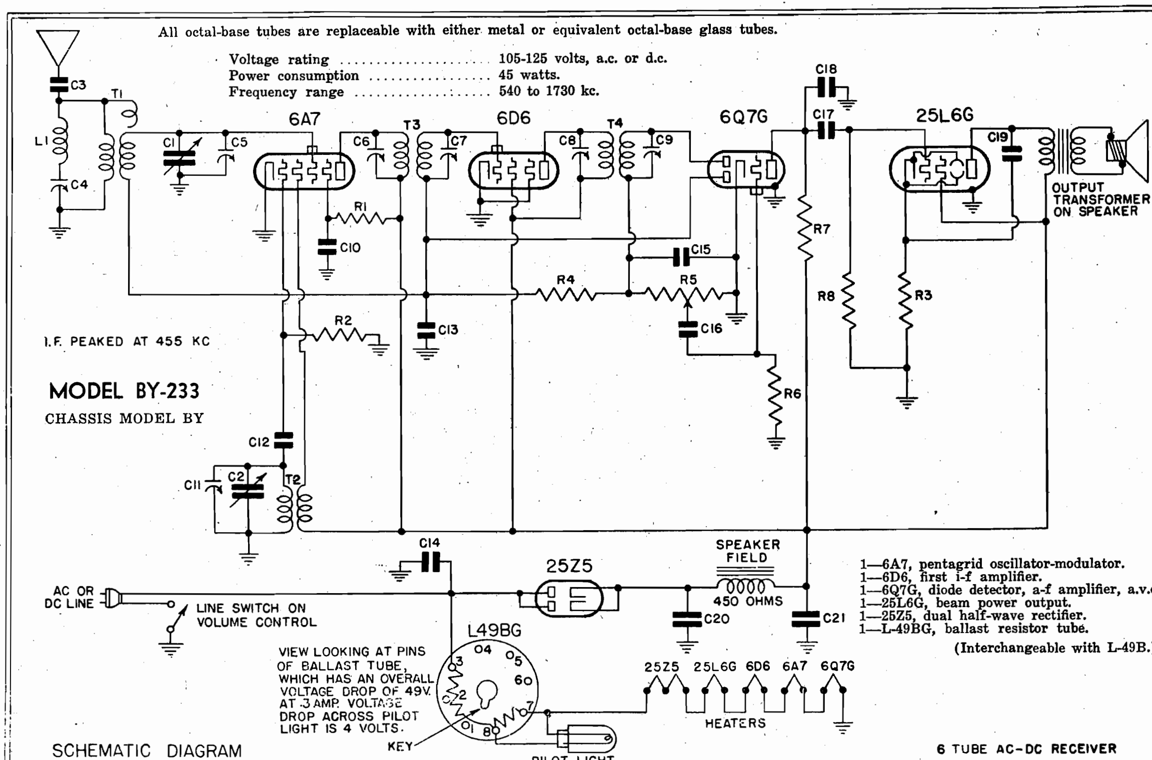
SEE PRECEDING PAGE FOR OTHER SERVICE DATA ON CHASSIS BM

Caution: The motor used in this combination is of the synchronous type and will operate on ALTERNATING CURRENT ONLY. To avoid damaging the motor, the combination should never be used on direct current.

All octal-base tubes are replaceable with either metal or equivalent octal-base glass tubes.

Voltage rating	105-125 volts, a.c. or d.c.
Power consumption	45 watts.
Frequency range	540 to 1730 kc.



MODEL BY-233
CHASSIS MODEL BY

1—6A7, pentagrid oscillator-modulator.
1—6D6, first i-f amplifier.
1—6Q7G, diode detector, a-f amplifier, a.v.c.
1—25L6G, beam power output.
1—25Z5, dual half-wave rectifier.
1—L-49BG, ballast resistor tube.
(Interchangeable with L-49B.)

SCHEMATIC DIAGRAM

6 TUBE AC-DC RECEIVER

EMERSON RADIO & PHONOGRAPH CORP.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. One side of the power line is directly grounded to the chassis base. Under no circumstances, therefore, should a ground wire be permitted to come in contact with any metal part of the receiver.
3. The filament dropping resistor (L-49BG on schematic) is in a special tube at the rear of the chassis. This tube will become quite hot under normal operating conditions. For voltage drop specifications, see below.
4. In operating the receiver on d.c. it may be necessary to reverse the line plug for correct polarity.
5. The color coding of the i-f transformer leads is as follows:
   Grid—green — Plate—blue
   Grid return—black — B plus—red.
6. In congested areas where the installation of a large antenna is not desirable we recommend the use of the Emerson Flexible Mast Antenna, Model W-82. Instructions for the installation of this compact and efficient antenna are supplied with each kit.
   Where the Flexible Mast is installed permanently, it is urgently recommended that the receiver antenna wire be cut. Leave just enough of this wire to reach from the receiver to the window strip connector.
7. The wave-trap in the receiver has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.
8. In replacing the dual 20 mf electrolytic condenser, part no. 4HC-348B, the lead farthest from the mounting bracket should be connected to the rectifier.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	*Plate*	*Screen*	*Cathode*	*Osc. Plate*	*Fil.*
6A7	100	55	0	100	6.3
6D6	100	100	0	—	6.3
6Q7G	43	—	0	—	6.3
25L6G	92	100	5.5	—	25.0

Voltage at 25Z5 cathode—128 volts.
Voltage across speaker field—28 volts.
Voltage drop across ballast tube (pins 3, 7)—49 volts.
Voltage drop across pilot light section (pins 7, 8)—4 volts.

ADJUSTMENTS

Location of Coils and Trimmer Adjustments

The first and second i-f transformers are mounted on the left hand inside wall of the chassis. The trimmers for the first i-f transformer are accessible through the lower pair of holes in the side of the chassis. The trimmers for the second i-f transformer are accessible through the upper pair of holes in the chassis.

The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil.

The 455 kc wave-trap is mounted on the same form as the antenna coil directly under the 25Z5 and ballast tubes. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible through a hole in the right side of the chassis.

I-f and Wave-trap Alignment

Rotate the variable condenser to the minimum capacity position. Feed 455 kc to the grid-cap of the 6A7 tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response. Feed 455 kc through a .0001 mf condenser to the antenna lead and adjust the wave-trap trimmer for *minimum* response. (See General Notes, paragraph No. 7.)

R-f Alignment

Set the dial pointer at 140, feed 1400 kc through a .0001 mf condenser to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

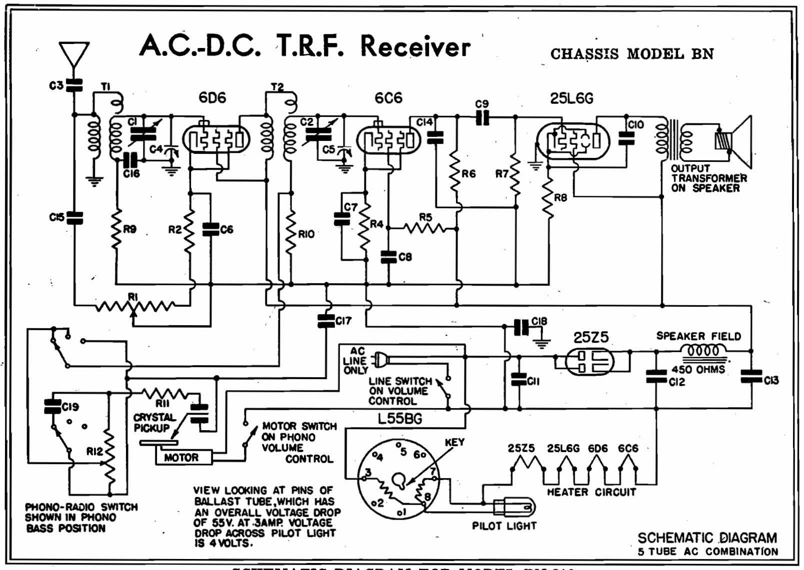
List Price as Effective as of Aug. 1st, 1938 (Subject to change without notice)

An oscillator with frequencies of 455 and 1400 kc is required.
An output meter should be used across the voice coil or output transformer for observing maximum response.
Always use as weak a test signal as possible when aligning the receiver.

MODEL BN216
Chassis BN
Schematic, Voltage
Changes, Alignment, Parts

EMERSON RADIO & PHONOGRAPH CORP.



SCHEMATIC DIAGRAM FOR MODEL BN-216

PRODUCTION CHANGES

On early BN chasses the red lead from the dual electrolytic condenser is connected to the 25Z5 cathodes and green lead to the 6D6 screen. In later models the green lead is connected to 25Z5 and red to 6D6. Replacements should be connected as in the later models.

In receivers bearing serial numbers below 1,821,050 C18 is .25 mf 200 volt.

MOTOR CAUTION

The motor used in the combination Model BN-216 is of the synchronous type and will operate on ALTERNATING CURRENT ONLY. To avoid seriously damaging the motor, the combination should never be used on direct current.

VOLTAGE ANALYSIS

Tube	Plate	Screen	Cathode	Fil.
6D6	100	100	2.3	6.3
6C6	20	15	2.1	6.3
25L6G	93	100	6	25.0

Voltage across speaker field—26 volts.

25Z5 cathode to ground—126 volts.

Voltage across ballast tube (pins 3, 7)—55 volts.

Voltage across pilot light section (pins 7, 8)—4 volts.

1—6D6, r-f amplifier.
1—6C6, biased detector.
1—25L6G, beam power output.
1—25Z5, dual half-wave rectifier.
1—L55BG, ballast tube.
(Interchangeable with L55B.)

The ballast resistor (L55BG on schematic) is in a special tube at the rear of the chassis. In normal operation this tube will become quite hot. For voltage drop specifications, see "Voltage Analysis" above.

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with volume control turned on full and no signal. The line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale.

ALIGNMENT PROCEDURE

An oscillator with a frequency of 1400 kc is required.

Use as weak a test signal as possible. An output meter should be used across the voice coil or output transformer for observing maximum response.

Rotate variable condenser to the maximum capacity position and set the pointer at the next calibration mark beyond 55. Then rotate the variable condenser until the pointer is at 140 and feed 1400 kc to the antenna through a .0001 mf mica condenser and adjust both trimmer condensers on the variable condenser for maximum response.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. One side of the power line is directly grounded to the chassis base. Under no circumstances, therefore, should a ground wire be permitted to come in contact with any metal part of the receiver.
3. The filament dropping resistor (R-9—see schematic) is a resistance wire in the special line cord. The cord will, therefore, become warm under normal operating conditions. To insure good heat radiation stretch out the line cord to its full length. Do not attempt to shorten it by cutting.
4. In operating the receiver on d.c. it may be necessary to reverse the line plug for correct polarity.
5. The color coding of the i-f transformer leads is as follows:
   Grid—green — Plate—blue
   Grid return—black — B plus—red.
6. In congested areas where the installation of a large antenna is not desirable we recommend the use of the Emerson Flexible Mast Antenna, Model W-82. Instructions for the installation of this compact and efficient antenna are supplied with each kit.
   Where the Flexible Mast is installed permanently, it is urgently recommended that the receiver antenna wire be cut. Leave just enough of this wire to reach from the receiver to the window strip connector.
7. The wave-trap in the receiver has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.
8. The phonograph motor of Model AX-219 is of the a.c. synchronous type. To avoid damaging the motor, the combination should be used on ALTERNATING CURRENT ONLY.
9. To remove the 6A8 tube from its socket, push up on its center pin from beneath the chassis.

ADJUSTMENTS

An oscillator with frequencies of 455 and 1400 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck beside the speaker. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is mounted underneath the chassis beneath the variable condenser. The trimmers are accessible through holes in the top of the chassis directly beneath the variable condenser.

The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil.

The 455 kc wave-trap is mounted on the same from as the antenna coil directly behind the speaker. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible from the rear of the chassis. The oscillator coil is located underneath the chassis, beneath the first i-f transformer.

I-f and Wave-trap Alignment

Swing the variable condenser to the maximum capacity position. Feed 455 kc to the grid-cap of the 6A8 tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response. Feed 455 kc through a .0001 mf condenser to the antenna lead and adjust the wave-trap for *minimum* response. (See General Notes, paragraph No. 7.)

R-f Alignment

Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except B plus at rectifier, heaters, and cathode voltages were taken on 250 volt scale.

Tube	*Plate*	*Screen*	*Cathode*	*Osc. Plate*	*Fil.*
6K8	215	100	0	75	6.3 a.c.
6K7	215	100	0	—	6.3 a.c.
6Q7G	100	—	0	—	6.3 a.c.
76	215	—	11	—	6.3 a.c.
6AC5G	195	—	0	—	6.3 a.c.

Voltage at 80 filament to B minus (center tap of high voltage winding on power transformer)—300 volts.
Voltage across speaker field—70 volts.
The grid bias for all tubes is developed across resistors R-9 and R-10 (see schematic). The total voltage measured across R-9 and R-10 should be 12 volts.

Chassis BQ,BU,BW
Alignment,Tuner,Notes

EMERSON RADIO & PHONOGRAPH CORP.

ADJUSTMENTS

MODEL NUMBERS ARE IDENTIFIED IN INDEX

An oscillator with frequencies of 455, 600, 1600 and 16,000 kc should be used.
An output meter should be used across the voice coil or output transformer for observing maximum response.
If the circuit is at all disturbed, both the broadcast and short-wave bands must be realigned.
The set's oscillator is higher in frequency than the signal, so images should be observed on the low frequency side of the signals.
Always choose the minimum capacity peak on oscillator trimmers and maximum capacity peaks on antenna trimmers. The last motion in adjusting trimmers should always be a tightening one, not a loosening one.
Never leave a trimmer with the outside plate so loose that there is no tension on the screw. Either bend the plate up or remove the screw entirely.
Always use as weak a test signal as possible during alignment.

Location of Coils and Trimmer Adjustments

The two i-f transformers are located on top of the chassis deck. The second i-f is the one directly behind the variable condenser. The four trimmers, two for each transformer, are accessible through holes in the tops of the cans.
The adjustable padding condenser for the broadcast band is mounted underneath the chassis (in front of the 76 tube) with the screw adjustment accessible through a hole in the top of the chassis.
The antenna coils for the broadcast and short-wave bands and the 455 kc wave-trap are wound on one form and mounted underneath the chassis deck near the 76 tube socket. The trimmers for these coils are accessible through holes in the top of the chassis. The trimmer nearest the front of the chassis is the short-wave antenna trimmer. The central trimmer is the broadcast antenna trimmer. The trimmer nearest the rear of the chassis is the 455 kc wave-trap.
The oscillator coils for the broadcast and short-wave bands are wound on one form and are mounted on the inside of the rear chassis wall. The trimmers for these coils are accessible through holes in the rear of the chassis. The trimmer farthest from the end of the chassis is for short-wave and trimmer closest to the end of the chassis is for broadcast.

I-f and Wave-Trap Alignment

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 455 kc, through a 0.02 mf paper condenser, to the grid cap of the 6K8 tube (do not remove the grid clip from the tube). Adjust the four i-f trimmers for maximum response. Feed 455 kc to the antenna through a standard dummy antenna (a 0.0002 mica condenser may be substituted) and adjust the wave-trap trimmer (farthest from front on right side of the chassis) for *minimum* response. (See General Note No. 6.)

Short-wave Alignment (Alignment of the short-wave band should precede broadcast alignment.)

Since the dial indicator is fastened to the cabinet, a piece of stiff wire should be fastened to the dial assembly plate and bent over to form a dial pointer when the chassis is removed from the cabinet. Set pointer at extreme low-frequency end of dial with condenser closed.
Use a 400 ohm dummy antenna (a 400 ohm non-inductive resistor in series with the test oscillator antenna lead) when aligning the short-wave coils. Rotate the wave-band switch to the short-wave (counter-clockwise) position, and set the dial exactly at 16 megacycles. Feed 16,000 kc to the antenna and adjust the short-wave oscillator trimmer (farthest from end on rear chassis wall) for maximum response, and then adjust the short-wave antenna trimmer (nearest the front on the right side of the chassis) for maximum response. Be very careful to choose the minimum capacity peak on the oscillator trimmer.

Broadcast Alignment

By adding a cipher to each figure on the broadcast band calibration, this scale can be made to read directly in kilocycles.
Use a standard dummy antenna in aligning the broadcast coils. (A .0002 condenser may be substituted.) Rotate the wave-band switch to the broadcast (clockwise) position. Set the dial at 60 and feed 600 kc. Adjust the broadcast series padder (in corner near 76 tube) for maximum response. Move the dial to 160 and feed 1600 kc. Adjust the broadcast oscillator trimmer (closest to end on rear chassis wall) for maximum response and then adjust the broadcast antenna trimmer (central trimmer at right side of chassis). Return dial to 60, feed 600 kc and readjust the broadcast series padder, rocking the variable condenser (rotate the variable condenser shaft back and forth through a small arc) for maximum response.

GENERAL NOTES

1. The receiver should never be turned on with either the speaker plug or the 6AC5G tube out of their respective sockets, since the rapid rise in rectifier voltage will damage the electrolytic condenser.
2. When replacing the chassis in the cabinet take precautions to keep any part of the dial and condenser assembly from touching the cabinet, otherwise microphonism will result.
3. The color coding of the i-f transformers is as follows:
   Grid—green | Grid return—black
   B plus—red | Plate—blue.
4. The color coding of the power transformer is as follows:
   Primary—two black leads
   High-voltage secondary—two red leads
   High-voltage secondary center tap—red and yellow lead
   6.3 volt secondary—two green leads
   5 volt secondary—two yellow leads.
5. The adjustable padding condenser for the broadcast band is mounted underneath the chassis (in the corner near the wave-band switch) with the screw adjustment accessible through a hole in the top of the chassis. The short-wave band has a fixed padder, C13 on schematic. When replacing this fixed padder be careful to use a condenser which has a capacity within 2% of the specified value, otherwise the short-wave coils may not track.
6. The wave-trap in the receiver has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraph station the wave-trap trimmer may be readjusted until the response from the interfering station is at a minimum.

Emerson

Preadjustment of Station Push-buttons

MIRACLE INSTAMATIC TUNING

The six push-buttons provide a choice of six favorite broadcast stations for Miracle Instamatic Tuning. Adjustments for any particular station must be made by means of the small cross-slotted button immediately below the chosen push-button. The following procedure must be carefully observed in making these adjustments:

1. Insert the line plug in the electrical outlet. Turn the receiver on by rotating the tone control knob clockwise until the switch is heard to click and then rotate this knob to the extreme clockwise position. Wait about a minute for the tubes to warm up. Turn the wave-band switch to the broadcast position, clockwise. Turn the volume control clockwise to about half of its full rotation.

2. Select six nearby stations desired for automatic tuning. Choose one of these stations and any button to be adjusted for it. Find the station call letters on one of the four cards supplied in an envelope with the receiver. Push out the circular tab bearing the station call letters from the card and press it in the depression in the front face of the push-button. Insert one of the clear celluloid discs, which are supplied in a separate envelope, over the station tab in the push-button. Press this disc in firmly. See Fig. 4.

3. Push in the manual selector knob (second from right). When pushing in the selector knob or one of the push-buttons best results are obtained by using a firm rapid action.

4. With the selector knob depressed tune in the desired station. Rotate the selector knob until the mark on the dial face corresponding approximately to the frequency of the station appears at the black indicator line on the conical escutcheon window. Identify the station and note the approximate position of the dial face.

5. Push in the button to be adjusted for this station. See Fig. 1.

6. Insert a small thin coin in one of the slots of the adjusting button immediately below the push-button. Turn the adjusting button until the mark on the dial face corresponding approximately to the frequency of the station again appears at the black indicator line on the conical escutcheon window. Once the station is heard, tune it in carefully by turning the adjusting button back and forth slowly. From the standpoint of performance it is of paramount importance to tune in the station accurately. See Fig. 2.

7. It is very important, when tuning in a station by means of the adjusting button, that the last turning motion of the adjusting button be in the counter-clockwise direction, as indicated in Fig. 3.

8. Check the results by moving the dial face, using the selector knob, to a different position and then pushing in the button. The station should be received clearly and with maximum volume.

9. Adjust the remaining buttons, one at a time, following the procedure outlined above.

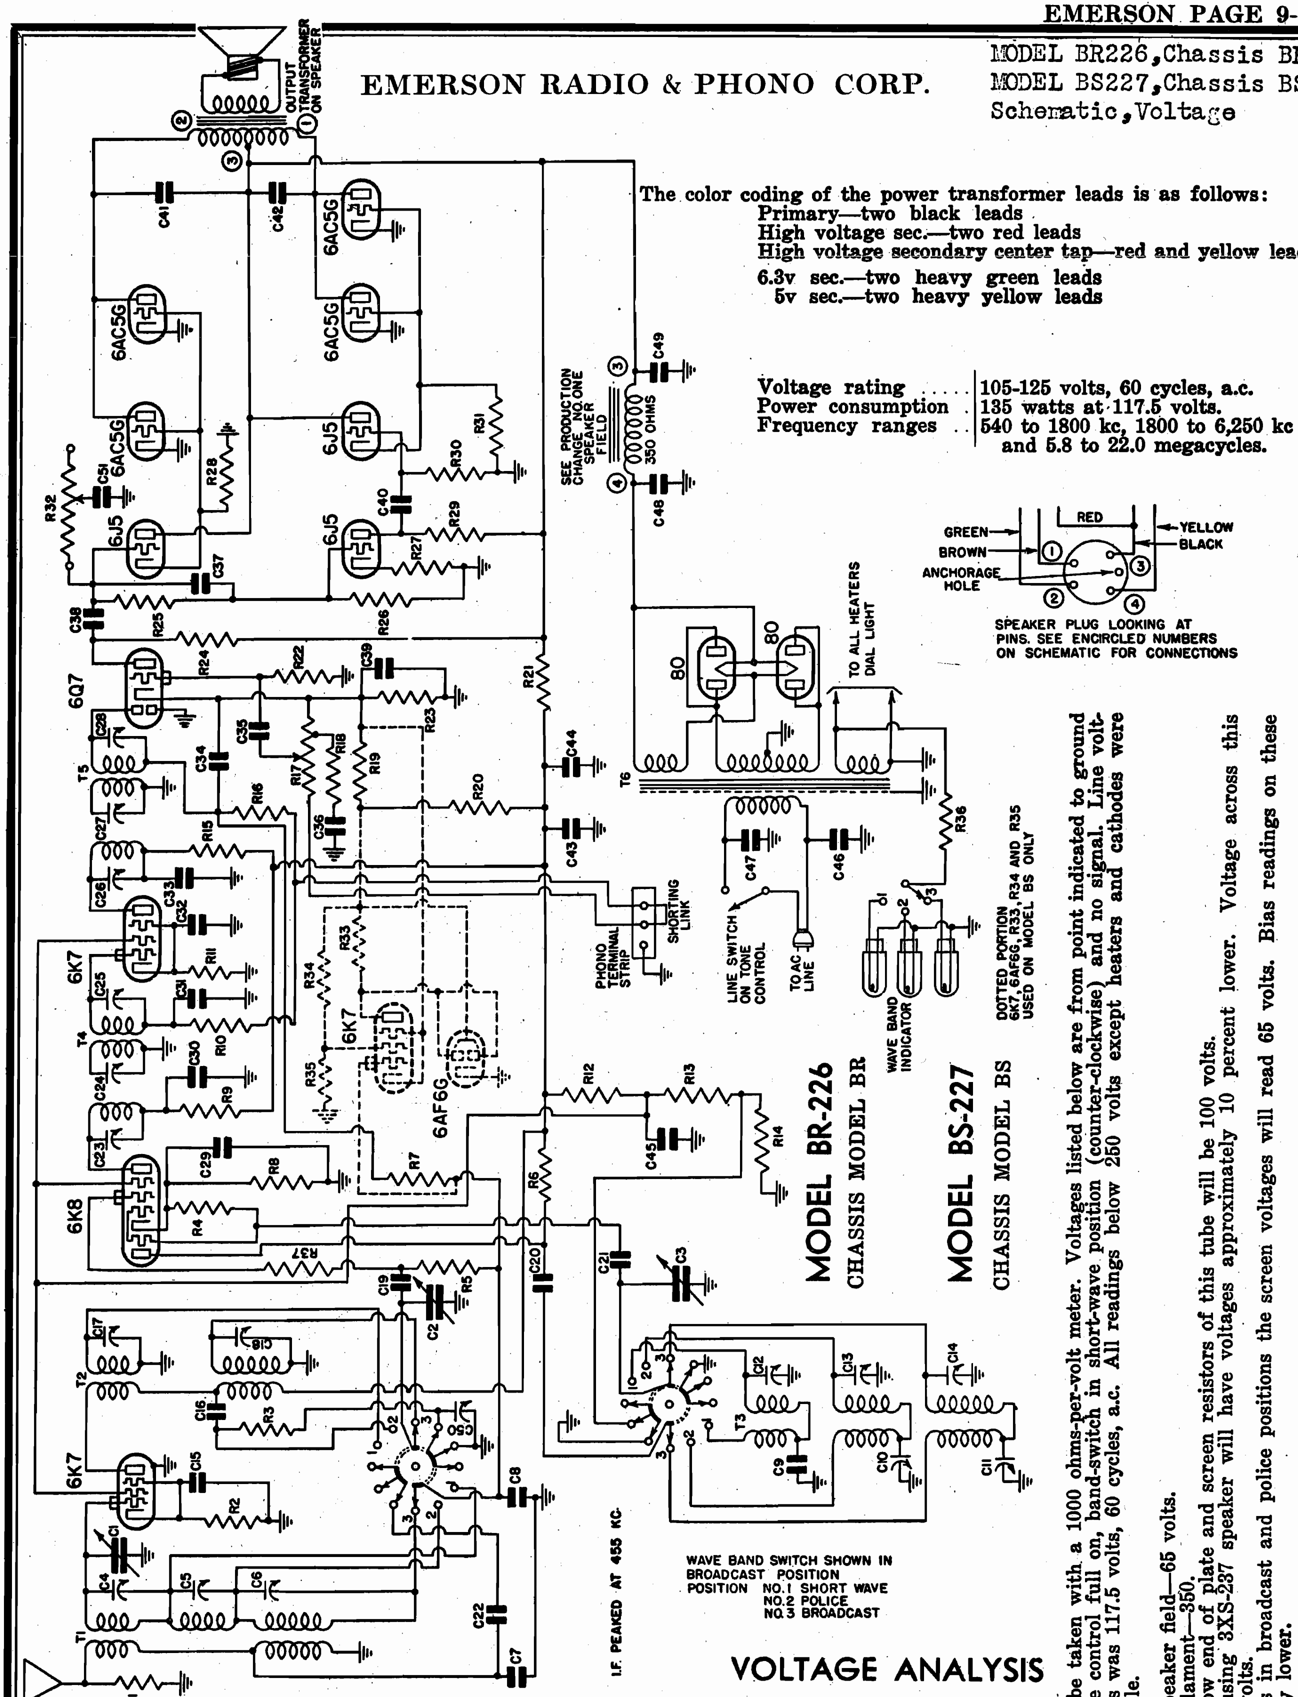
Schematic, Voltage

EMERSON RADIO & PHONO CORP.

The color coding of the power transformer leads is as follows:
Primary—two black leads
High voltage sec.—two red leads
High voltage secondary center tap—red and yellow lead
6.3v sec.—two heavy green leads
5v sec.—two heavy yellow leads

Voltage rating	105-125 volts, 60 cycles, a.c.
Power consumption	135 watts at 117.5 volts.
Frequency ranges	540 to 1800 kc, 1800 to 6,250 kc and 5.8 to 22.0 megacycles.



VOLTAGE ANALYSIS

Tube	Plate	Screen	Osc. Plate	Cathode	Fil.
6K7 r-f amplifier	230	‡100	—	5	6.3 a.c.

6K7 electron-ray control (BS only)	*5	*5	—	2.1	6.3 a.c.

†Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with volume control full on, band-switch in short-wave position (counter-clockwise) and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings below 250 volts except heaters and cathodes were taken on 250 volt scale.

Voltage across speaker field—65 volts.
Voltage at 80 filament—350.

*Readings taken at low end of plate and screen resistors of this tube will be 100 volts.
†Model BR chasses using 3XS-237 speaker will have voltages approximately 10 percent lower. Voltage across this speaker field is 80 volts.
‡When band-switch is in broadcast and police positions the screen voltages will read 65 volts. Bias readings on these tubes will be slightly lower.

EMERSON RADIO & PHONOGRAPH CORP.

ADJUSTMENTS

An oscillator with frequencies of 455, 600, 1600, 1800, 6000 and 20,000 kc should be used.

An output meter should be used across the voice coil or speaker output transformer for observing maximum response.

Use a dummy antenna for aligning any of the three bands. A .0002 mf condenser may be used for broadcast band dummy antenna, a .0001 mf condenser for the police band dummy antenna and a 400 ohm non-inductive resistor for the short-wave band dummy antenna.

Always use as weak a test signal as possible during alignment.

The set's oscillator is higher in frequency than the signal on *all three bands*, so images should be observed on the low frequency side of the signals.

Always choose the minimum capacity peak on oscillator trimmers and maximum capacity peaks on antenna trimmers. The last motion in adjusting trimmers should always be a tightening one, *not* a loosening one.

Never leave a trimmer with the outside plate so loose that there is no tension on the screw. Either bend the plate up or remove the screw entirely. Loose screws are a sure source of noise, drifting, and microphonism.

In aligning antenna trimmers on the high-frequency signals there is always a tendency for the oscillator to drift, due to interlocking. To compensate for this always keep tuning the variable condenser as the trimmers are being adjusted.

Location of Coils and Trimmer Adjustments

The i-f transformers are located at the back of the chassis. The first i-f transformer is the one near the electrolytic condenser. The six trimmers for i-f alignment are available through holes in the tops of the cans.

The antenna coils for the three bands are wound on one form located on the front wall of the chassis with the trimmers accessible through holes in the chassis. The right-hand trimmer is for the broadcast band, the left-hand trimmer is for the short-wave band and the central trimmer is for the police band.

The r-f interstage coils are wound on one form and are mounted underneath the chassis to the left of the wave-band switch. The trimmers are available through holes in the top of the chassis. The trimmer closest to the front of the chassis is for the broadcast band. The trimmer farthest from the front is for the short-wave band. The central trimmer is for compensating the short-wave band at 6 mc.

The oscillator coils are wound on one form and mounted underneath the chassis directly behind the wave-band switch. The trimmers are accessible through holes in the top of the chassis. The trimmer closest to the band-switch is for the broadcast band, the trimmer farthest from the band-switch is for the short-wave band and the central trimmer is for the police band.

The oscillator series padder for the broadcast and police bands are mounted underneath the chassis near the interstage coils. The adjusting screws are available through holes in the top of the chassis. The padder nearest the front of chassis is for the police band. The padder for the short-wave band is a fixed mica condenser, C9 on the schematic diagram. If this condenser is to be replaced use a condenser with a value within 2% of that specified.

I-f Alignment

Set the wave-band switch at the broadcast (clockwise) position, and the variable condenser at minimum capacity. Feed 455 kc to the grid of the 6K7 i-f amplifier tube through a .02 mf condenser. (Do not remove the grid clip from the tube.) Examine the trimmer screws and locate the screw which is painted red. Screw this trimmer down as far as it will go. Adjust the other two trimmers for maximum response and then adjust the red trimmer for maximum response. Do not readjust the other two trimmers. Now feed 455 kc to the grid of the 6K8 tube and repeat same procedure on the first i-f transformer. Do not touch the adjustment of the second i-f transformer. Failure to follow this procedure may result in impairment of the fidelity of the receiver.

Broadcast Alignment

Since the indicator is fastened to the cabinet, a piece of stiff wire should be fastened to the dial drive assembly-plate and bent over to form an indicator when the chassis is removed from the cabinet. Set indicator at extreme low frequency end of dial with condenser closed.

Set the wave-band switch at the broadcast (clockwise) position, and the dial at 60. Feed 600 kc to the antenna (using a standard dummy antenna) and adjust the broadcast-band series padder for maximum response. Move the dial to 160, feed 1600 kc and adjust the oscillator coil trimmer for maximum response, then adjust the interstage and antenna coil trimmers for maximum response. Reset the dial at 60, feed 600 kc and rock the variable condenser while adjusting the series padder for maximum response. Return to 1600 and check alignment. If readjustment is necessary return to 600 and repeat entire procedure.

Police Alignment

Set the wave-band switch at the police-band (central) position and the dial at 1.8. Feed 1800 kc to the antenna (using a .0001 mf dummy antenna) and adjust the police-band series padder for maximum response. Move the dial to 6.0, feed 6000 kc and adjust the oscillator trimmer for maximum response. Then adjust the antenna trimmer for maximum response. Note the interstage coil on this band has no trimmer adjustment. Return the dial to 1.8, feed 1800 kc to the antenna and rock the variable condenser while readjusting the series padder for maximum response. Return to 6000 kc and check alignment. If readjustment is necessary return to 1800 kc and repeat entire procedure.

Short-Wave Alignment

Set the wave-band switch at the short-wave (counter-clockwise) position. Move the dial to 20 and feed 20,000 kc to the antenna (using a 400 ohm dummy antenna) and adjust the short-wave oscillator trimmer for maximum response. If two peaks are obtained choose the minimum capacity peak. Then adjust the interstage and antenna coil trimmers for maximum response. If two peaks are obtained choose the maximum capacity peak. Move the dial to 6 mc, feed 6000 kc to the antenna and adjust the r-f interstage trimmer (central trimmer at left of band-switch) for maximum response.

TUBE DATA — Models BR and BS

1—6K7, R-f amplifier (behind right-hand section of variable condenser).
1—6K8, Triode-hexode, oscillator-modulator (behind left-hand section of variable condenser).
1—6K7, I-f amplifier (between the two i-f transformers).
1—6Q7, Diode detector, audio amplifier, a.v.c. (left rear corner of chassis).
1—6J5, Phase inverter (left side of chassis, third from rear).
2—6J5, Second audio amplifiers (left side of chassis, second from rear, and right side of chassis beside electrolytic condensers).
4—6AC5G, Dynamic coupled, power output (two are in front of power transformer; other two are alongside power transformer near variable condenser).
2—80, Rectifiers (beside power transformer, at rear of chassis).

MODEL BS HAS IN ADDITION TO ABOVE TUBES:

1—6K7, Electron-ray-indicator control (left side of chassis, fourth from rear).
1—6AF6G, Electron-ray tuning indicator (on cable socket).

WHEN ORDERING REPLACEMENT PARTS, SPECIFY PART NUMBERS

*Item number locates the article on schematic diagram.
†These trimmers are part of coil assemblies and cannot be supplied separately.

List Price as. Effective as of Aug. 1st, 1938 (Subject to change without notice)

FOR ADJUSTMENT OF "INSTAMATIC"-TUNING PUSH-BUTTONS--SEE MODEL BQ-225

In replacing chassis in cabinet do not tighten mounting screws so much that chassis will not float freely, and do not allow any part of the dial assembly to touch the cabinet. Do not push control knobs on so far that they touch the cabinet front panel. If these precautions are not observed the receiver may become microphonic.

ALIGNMENT FOR MODELS 272,272,280,and 281 SERIES

It is important that the proper dummy antenna value, as specified under "DUMMY ANTENNA" in the following table, be connected in series with the high potential side of the signal generator. The .001 mfd. condenser may be a paper tubular (400 volt) type and the 200 mmfd. condenser of mica construction. The 400 ohm and 50,000 ohm resistors should be carbon type (1/3 watt). The receiver ground should remain connected to the low potential side of the signal generator throughout the following adjustments.

For adjusting the I.F. trimmer condensers, the control grid lead should be removed and a 50,000 ohm resistor inserted in series with same. Then connect the high potential lead of the signal generator through the .001 mfd. condenser, directly to the control grid cap of the tube.

Alignment adjustments should be repeated because of possible interaction between circuits.

To determine that the short wave band shunt trimmer condensers have not been adjusted to the image frequency turn the receiver dial to the frequency listed under "IMAGE FREQUENCY", where a signal weaker than the fundamental should be noted, however, if no signal can be heard at this setting even with a greater signal generator output, the trimmer has been improperly adjusted and it will be necessary to re-adjust to the proper peak.

Having completed the alignment, tune in a signal at approximately 800 to 900 KC. on Band "C" and note the accuracy of calibration. If a discrepancy of more than 5 KC is noted, shift the dial pointer to the station's frequency.

ALIGNING INSTRUCTIONS MODEL 413 SERIES MODEL 410 SERIES

In order to adjust accurately the various trimmer condensers of the receiver in accordance with the following instructions, it is essential to use a shielded signal generator capable of giving a modulated carrier which can be attenuated at 456 KC, 600 KC, 1,500 KC, 1.8 MC, 4.5 MC, 6 MC and 15 MC. Besides the standard rectifier-type Output Meter, it will be necessary to use a 60 Microameter Galvonometer, in aligning the Automatic Frequency Control (AFC) Circuit.

The aligning table, shown below, indicates the sequence of steps necessary to correctly align this receiver. Care should be taken to have the controls in their proper positions.

For adjusting the I.F. trimmer condensers, the control grid lead should be removed and a 50,000 ohm resistor inserted in series with same. Then connect the high potential lead of the signal generator through the .001 mfd. condenser, directly to the control grid cap of the tube.

It is important that the proper dummy antenna value, as specified under "DUMMY ANTENNA", be connected in series with the high potential side of the signal generator. The .001 mfd. condenser may be a paper tubular (400 volt) type and the 200 mmfd. condenser of mica construction. The 400 ohm and 50,000 ohm resistors should be carbon type (1/3 watt). The receiver ground should remain connected to the low potential side of the signal generator throughout the following adjustments.

When adjusting the AFC circuit, the Galvonometer is connected across the two cathode terminals of the 6H6 Discriminator Tube. Adjust the trimmer for Zero Current thru meter. It may be necessary to increase the output of the signal generator considerably to obtain an indication on this meter. The volume control may be retarded to reduce the speaker volume level. Retrimming of the plate circuit of the 2nd I.F. tube is necessary to correct effect of AFC adjustment. NOTE:- If a Galvonometer is not available, the following method may be used to align the AFC trimmer:- (1) Align complete receiver, omitting AFC adjustment. (2) Loosely couple 456 KC to 6A8G grid, set selectivity switch to "AFC OFF", and manually "tune in" a weak carrier on the BC Band, noting heterodyne beat. (3) Adjust manual control for zero beat. (4) Return selectivity switch to "Sharp" position and adjust trimmer (T-1) for zero beat.

To determine that the short wave band shunt trimmer condensers have not been adjusted to the image frequency turn the receiver dial to the frequency listed under "IMAGE FREQUENCY" where a signal weaker than the fundamental should be noted, however, if no signal can be heard at this setting even with a greater signal generator output, the trimmer has been improperly adjusted and it will be necessary to re-adjust to the proper peak.

The complete alignment adjustments should be repeated because of possible interaction between circuits.

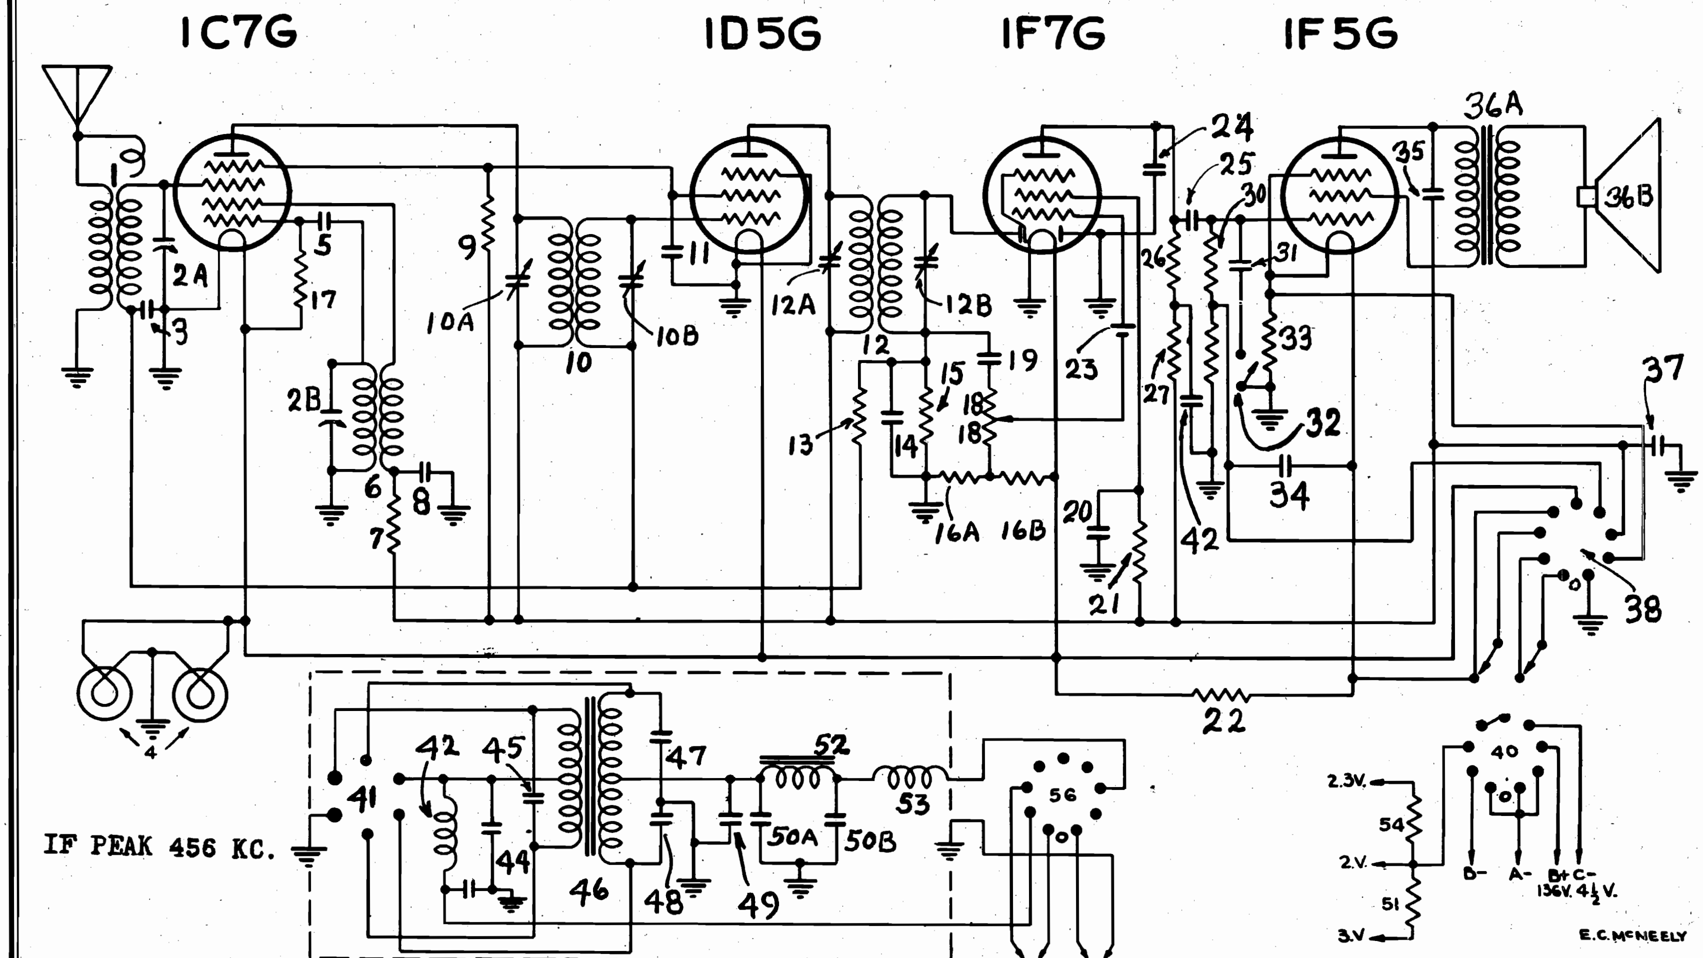
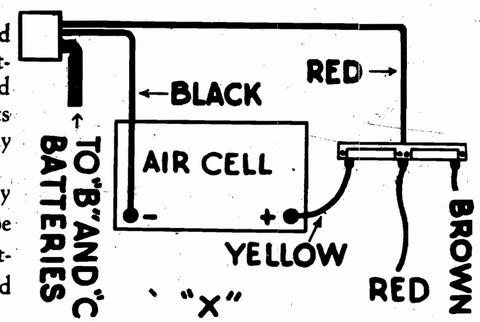
MODELS 4A, 4B
Schematic, Notes





The model 4A-4B chassis employs a superhetrodyne circuit with automatic volume control (Figure 2). The receiver operates equally well on a six-volt storage battery or on any of the conventional A, B and C battery arrangements (Figure 1). New high-gain, octal-base tubes are used (Figures 3 and 5), making possible a receiver of high sensitivity with low battery drain.

On six-volt operation the current consumption is only approximately 1.3 amperes. As a two-volt receiver the "A" and "B" currents are approximately .55 amperes and 20 milliamperes respectively.

In order to make interchangeability as simple as possible, a nine-prong socket and plug power connection is employed (Figure 2). Only part of these prongs are used on either battery arrangement. A careful study of the circuit diagram should be made before any attempt is made to replace defective parts in the receiver, since the purpose of the various connections may not be readily apparent from a chassis inspection alone.

Four Standard Battery Plugs will be found on the battery cable. Three of these are identical to each other and are to be plugged into the Standard Receptacles on the three "B" batteries. The remaining plug, the one with one large prong, should be plugged into the "C" battery.

ALIGNMENT

Alignment procedure is given below in chart form (Figure 4). Make adjustments in the order given. Any low range AC voltmeter, preferably about 0-15 volts, may be used for an output meter. It should be connected from the plate of the 1F5G tube to ground with a .1 mfd. condenser in series with one of the leads. The volume control should be set at maximum during the alignment and the output from the signal generator should be decreased as the meter hand tends to go off scale. If too strong a signal is used and the volume control is used to keep the hand on scale, the A.V.C. will operate and inaccurate alignment will result.

ALIGNMENT

The model 5A is a five-tube AC operated, superhetrodyne. Alignment is given below in chart form. Make adjustments in the order given. The output meter may be any low range AC voltmeter, preferably about 0-15 volts. It should be connected from the plate of the 6F6G tube to ground with a .1 mfd. condenser in series with one of the leads. When the hand tends to go off scale, reduce the input from the signal generator and keep the volume control at maximum. Inaccurate alignment is likely to result if too strong a signal is used.

ALIGNMENT

The model 5B is a five-tube AC operated, superhetrodyne. It is capable of receiving signals on the standard broadcast band, 540 to 1750 kilocycles, and on the police-amateur band, 2.35 to 7.8 megacycles.

Alignment procedure is given below in chart form. Make adjustments in the order given. The output meter may be any low range AC voltmeter, preferably about 0-15 volts. It should be connected from the plate of the 6F6G tube to ground with a .1 mfd. condenser in series with one of the leads. When the hand tends to go off scale, reduce the input from the signal generator and keep the volume control at maximum. If too strong a signal is fed to the receiver and the volume control is used to keep the output meter hand on scale, the A.V.C. will operate and inccurate alignment will result.

SERVICE DATA FOR AIR CHIEF MODEL R-3051 RECEIVER

STOCK NO.-7422-4

The Model R-3051 is a five tube, two band superheterodyne receiver. It has an intermediate frequency of 465 KC. and tuning ranges of 525 to 1750 KC. and 2200 to 7000 KC.

ALIGNMENT EQUIPMENT & PROCEDURE

For alignment, an output meter and an accurately calibrated signal generator with a tuning range from 465 KC. to 6.0 MC. are required.

IMPORTANT: THE BROADCAST BAND MUST BE ALIGNED AFTER THE SHORT-WAVE BAND.

1. Connect the output meter across the voice coil or between the plate of the 6K6G tube and ground, depending on the type of meter. (The more sensitive type should be connected across the voice coil.)
2. Connect the ground lead of the signal generator to the chassis of the receiver.
3. Turn the volume control to the maximum volume position and keep it in this position throughout the entire alignment procedure.
4. With the gang condenser in full mesh set the pointer on the horizontal black line below 530 KC, on the dial.
5. Using a bakelite screw driver proceed to align in exactly the same order as shown in the table below.

DUMMY ANT. IN SERIES WITH SIG. GEN.	CONNECTION OF SIG. GENERATOR OUTPUT TO RECEIVER	SIGNAL GENERATOR FREQUENCY	RANGE SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. CONDENSER	CONTROL GRID OF 6A8G TUBE (Do not remove grid clip)	465 KC.	BROADCAST (Clockwise)	ANY POINT WHERE IT DOES NOT AFFECT THE SIGNAL	1 - 2	1ST I.F.	ADJUST FOR MAXIMUM OUTPUT. THEN REPEAT ADJUSTMENT.
					3 - 4	2ND I.F.	
400 OHM CARBON RESISTOR	ANTENNA LEAD	465 KC.	BROADCAST Clockwise	ANY POINT WHERE IT DOES NOT AFFECT THE SIGNAL	5	WAVE TRAP	ADJUST FOR MINIMUM OUTPUT USING STRONG GENERATOR SIGNAL.
400 OHM CARBON RESISTOR	ANTENNA LEAD	6.0 MC.	SHORT-WAVE Counter-clockwise	6.0 MC.	6	SHORT-WAVE OSCILLATOR	ADJUST TO SIGNAL. CHECK TO SEE IF PROPER PEAK WAS OBTAINED BY TUNING IN IMAGE AT APPROX. 5.1 MC. IF IMAGE DOES NOT APPEAR REALIGN AT 6.0 MC. WITH TRIMMER SCREW FARTHER OUT.
400 OHM CARBON RESISTOR	ANTENNA LEAD	6.0 MC.	SHORT-WAVE Counter-clockwise	TUNE TO 6.0 MC. GENERATOR SIGNAL	7	SHORT-WAVE ANTENNA	ADJUST FOR MAXIMUM OUTPUT. TRY TO INCREASE OUTPUT BY DETUNING TRIMMER AND RETUNING RECEIVER DIAL UNTIL MAXIMUM OUTPUT IS OBTAINED.

SERVICE DATA FOR AIR CHIEF MODEL R-306 - RECEIVER

STOCK NO. 7423-1

The model R-306 Air Chief is a three band superheterodyne receiver having a tuning range of 525 KC. to 18,100 KC.

ALIGNMENT EQUIPMENT & PROCEDURE

For alignment, an output meter and an accurately calibrated signal generator with a tuning range from 465 KC. to 18. MC. are required.

1 — Connect the output meter across the voice coil or between the plate of the 6K6G tube and ground, depending on the type of meter. (The more sensitive type should be connected across the voice coil.)

2 — Connect the ground lead of the signal generator to the chassis of the receiver.

3 — Turn the volume control to the maximum volume position and keep it in this position throughout the entire alignment procedure.

4 — With the gang condenser in full mesh set the pointer on the horizontal black line below 530 KC. on the dial.

IMPORTANT: THE BROADCAST BAND MUST BE ALIGNED AFTER THE SHORT-WAVE BAND.

SERVICE DATA FOR AIR CHIEF MODELS 3071 to 3079

STOCK NOS. 7423-2, 7423-3, 7406-2

The model R-307 chassis, is a seven tube, three band superheterodyne receiver.. It has an intermediate frequency of 465 KC. and tuning ra 525 KC. to 18,100 KC.

ALIGNMENT EQUIPMENT & PROCEDURE

For alignment, an output meter and an accurately calibrated signal generator with a tuning range from 465 KC. to 18 MC. are require

1. Connect the output meter across the voice coil or between the plate of the 6K6G tube and ground, depending on the type of meter. (Th more sensitive type should be connected across the voice coil.)
2. Connect the ground lead of the signal generator to the chassis of the receiver.
3. Turn the volume control to the maximum volume position and keep it in this position throughout the entire alignment procedure.
4. With the gang condenser in full mesh set the pointer on the black horizontal line across the dial face.

IMPORTANT:- THE BROADCAST BAND MUST BE ALIGNED AFTER THE SHORT-WAVE BAND AND POLICE BAND.

VOLTAGE CHART NOTES

IMPORTANT:- Use a high resistance voltmeter of 1000 ohms per volt.

NOTE A: The bias for the control grids of the 6L7, 6K7 R.F., 6K7 first I.F., 6K7 second I.F., and the diode plates of the 6H6 2nd detector and discriminator is -3.5 volts measured across resistor 95.

TESTING THE A.F.C. SYSTEM.

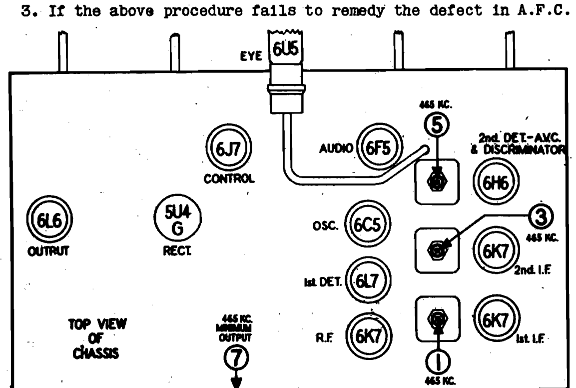
Connect the antenna and tune in a powerful local station. See that the A.F.C. switch is in the center position. (A.F.C.-off)

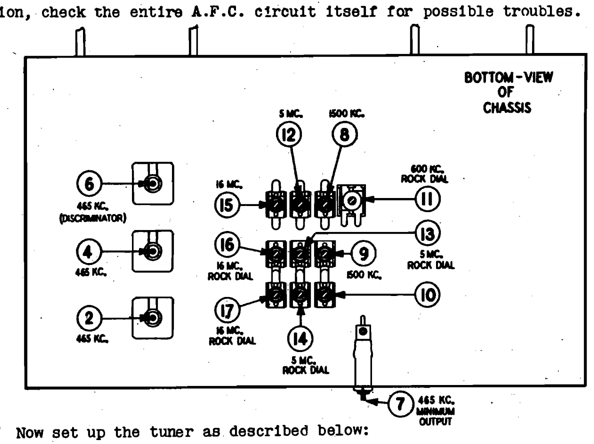
Next, detune the receiver dial until the music or speech becomes somewhat distorted. Throw the A.F.C. switch into the A.F.C.-on (clockwise) position. This should improve the quality of the program being received.

Similarly detune the receiver in the opposite direction, with A.F.C. switch in center position. Place A.F.C. switch in clockwise position and again check for improved quality of reception.

It will be noted that the correction for mistuning afforded by the A.F.C. system is not as marked at stations near the low frequency end of the dial scale as it is at the higher broadcast frequencies. This is characteristic of A.F.C. systems. However, if throwing the A.F.C. switch into the extreme clockwise position has no effect on the signal, or if it corrects for mistuning in one direction only, check the receiver as follows:

1. Re-align I.F., broadcast band, and discriminator trimmers.
2. Check all tubes in the receiver. Defective 6H6 and 6J7 tubes, also the RF., 1st. Detector and I.F. tubes may cause poor A.F.C. action.
3. If the above procedure fails to remedy the defect in A.F.C. action, check the entire A.F.C. circuit itself for possible troubles.



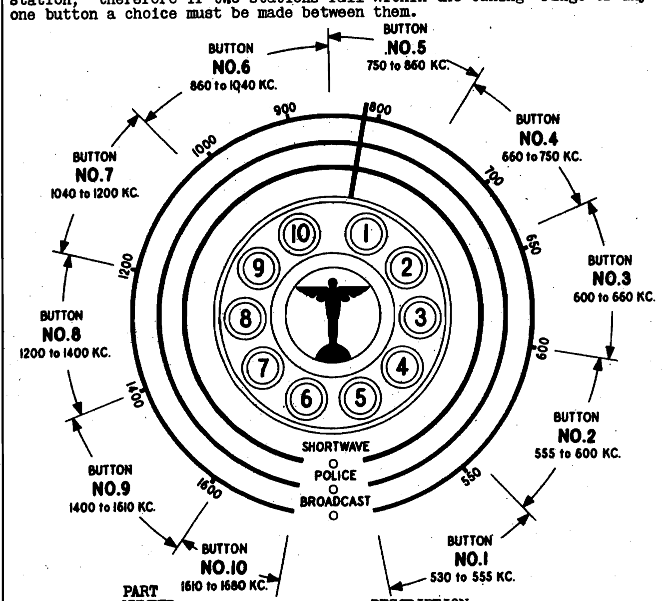


MODEL R-3085

HOW TO SET UP THE DIALMATIC TUNER.

Let the receiver warm up for half an hour before attempting adjustments. Place the "A.F.C.-ON-OFF" switch in the manual (center) position.

Observe the illustration below, and select ten favorite nearby stations of such a frequency that each will fall within the frequency range determined by the figure below. Each button can be set to only one station; therefore if two stations fall within the tuning range of any one button a choice must be made between them.



Now set up the tuner as described below:

1. Insert the tabs bearing the call letters of the selected stations, into the proper buttons, and cover them with the celluloid covers provided.

2. Push in the button you wish to set up and, keeping the button depressed, turn the dial in such a direction that the button with your finger on it, will reach the bottom point of the dial before the station pointer does. After the pointer reaches the stop, keep it depressed since it must not be released until step No. 5 is completed.

3. After the button stops at the bottom position of the dial, keep it pushed in and twist the button itself to the left (counter-clockwise) for about one whole turn. IMPORTANT: Before tuning in the station as explained in operation No. 4 you must allow the button to come out just enough so that a program or interstation noise can be heard. Then proceed exactly as outlined below, using the tuning eye to indicate correct tuning even though the station can be heard. NOTE: Do not allow the button to come all the way out.

4. Keeping the button depressed, as explained above, tune in the station you desire to set up. Watch the tuning eye for an indication of correct tuning. The set is correctly tuned when the inverted "V" shaped shadow is the narrowest.

5. After the station has been tuned-in, proceed to lock up the button as follows; Still keeping the button depressed, place the left hand on the dial and grasp the other buttons firmly so that the mechanism will not move. Then turn the cap of the button, which is to be locked up, to the right (clockwise) until it is tight. YOU MAY NOW RELEASE THE BUTTON and it should spring out to its normal position. If the button does not return to its normal position it indicates that one of the adjacent buttons is set up too close to the one in question. To correct the condition, release the adjacent button by unscrewing it and changing its setting.

6. AFTER THE BUTTON BEING SET UP, COMES OUT TO ITS NORMAL POSITION, YOU HAVE COMPLETED THE SET-UP OF THAT PARTICULAR BUTTON TO THE STATION FOR WHICH YOU LABELED IT.

7. Proceed to set up all of the remaining buttons in a similar manner.

8. After all the buttons have been correctly set up to your list of desired stations you can now operate your "Dialmatic Tuner" without having to tune in a station with the tuning knob of the receiver.

DIAL DRIVE & MISCELLANEOUS PARTS.

111262	Washer - flat steel mtg. (15/16" O.D.)	.02
112697	Window - celluloid (for dial)	1.25

MODEL 3085
Chassis R-308
Alignment

FIRESTONE TIRE & RUBBER CO.

STOCK NO. 7423-4

SERVICE DATA FOR AIR CHIEF MODEL 3085

The model R-308 chassis, is a ten tube, three band superheterodyne receiver. It has an intermediate frequency of 465 KC. and a tuning range of 525 KC. to 18,100 KC.

ALIGNMENT EQUIPMENT & PROCEDURE

For alignment, an output meter and an accurately calibrated signal generator with a tuning range from 465 KC. to 18 MC. are required.

1 — With the gang condenser in full mesh, the dial pointer should coincide with the 525 KC. (or first) division on the low frequency end of the Broadcast Band scale. If it does not, loosen the set screws on the flexible coupler, close the gang completely, then turn the tuning knob until the pointer is set correctly. Retighten the set screws.

2 — Connect the output meter across the voice coil or between the plate of the 6L6 tube and ground, depending upon the type of meter used. (The more sensitive type should be connected across the voice coil.)

3 — Connect the ground lead of the signal generator to the chassis of the receiver and leave it there throughout the alignment procedure.

4 — Turn the volume control to the maximum volume position and keep it in this position throughout the entire alignment procedure. The tone control should be in the clockwise (brilliant) setting at all times.

IMPORTANT: ALLOW RECEIVER TO WARM UP 15 MINUTES BEFORE ALIGNING. A.F.C.-ON-OFF SWITCH MUST BE IN CENTER (NON-A.F.C.) POSITION EXCEPT WHERE OTHER POSITION IS SPECIFIED.

DUMMY ANT. IN SERIES WITH SIG. GEN.	CONNECTION OF SIG. GENERATOR OUTPUT TO RECEIVER	SIGNAL GENERATOR FREQUENCY	RANGE SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD CONDENSER	CONTROL GRID OF 6L7 TUBE	465 KC.	BROADCAST (Counter-clockwise)	ANY POINT WHERE IT DOES NOT AFFECT THE SIGNAL	1 - 2	1ST I.F.	Adjust for maximum output. Then repeat adjustment.
					3 - 4	2ND I.F.	
					5	3RD I.F.	
400 OHM CARBON RESISTOR	ANTENNA TERMINAL	465 KC.	BROADCAST (Counter-clockwise)	ANY POINT WHERE IT DOES NOT AFFECT THE SIGNAL	7	WAVE TRAP	Adjust for minimum output using a strong generator signal.
400 OHM CARBON RESISTOR	ANTENNA TERMINAL	1500 KC.	BROADCAST (Counter-clockwise)	1500 KC.	8	BROADCAST OSCILLATOR (Shunt)	Adjust trimmer to bring in signal.
400 OHM CARBON RESISTOR	ANTENNA TERMINAL	1500 KC.	BROADCAST (Counter-clockwise)	TUNE TO 1500 KC. GENERATOR SIGNAL	9	BROADCAST DETECTOR	Adjust for maximum output.
					10	BROADCAST ANTENNA	
400 OHM CARBON RESISTOR	ANTENNA TERMINAL	600 KC.	BROADCAST (Counter-clockwise)	TUNE TO 600 KC. GENERATOR SIGNAL	11	BROADCAST OSCILLATOR (Series Pad)	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
THE A.F.C. MUST NOW BE ALIGNED. SEE "A.F.C. ALIGNMENT" BELOW THIS TABLE FOR PROCEDURE.							
400 OHM CARBON RESISTOR	ANTENNA TERMINAL	5 MC.	POLICE (Center)	5 MC.	12	POLICE OSCILLATOR (Shunt)	Adjust to bring in signal. Check to see if proper peak was obtained by tuning in image at approx. 4.1 MC. If image does not appear realign at 5 MC. with trimmer screw farther out. Recheck image.
400 OHM CARBON RESISTOR	ANTENNA TERMINAL	5 MC.	POLICE (Center)	TUNE TO 5 MC. GENERATOR SIGNAL	13	POLICE DETECTOR	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
					14	POLICE ANTENNA	
400 OHM CARBON RESISTOR	ANTENNA TERMINAL	16 MC.	SHORT-WAVE (Clockwise)	16 MC.	15	SHORT-WAVE OSCILLATOR (Shunt)	Adjust to bring in signal. Check to see if proper peak was obtained by tuning in image at approx. 15.1 KC. If image does not appear realign at 16 KC. with trimmer screw farther out. Recheck image.
400 OHM CARBON RESISTOR	ANTENNA TERMINAL	16 MC.	SHORT-WAVE (Clockwise)	16 MC.	16	SHORT-WAVE DETECTOR	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
					17	SHORT-WAVE ANTENNA	

A.F.C. ALIGNMENT.

IMPORTANT: The following adjustment must be made after every re-adjustment of the I.F. and broadcast band trimmers.

The A.F.C. Discriminator should be adjusted as follows:

1. Place the A.F.C. switch in the center (non-A.F.C.) position. Loosely couple the output of the signal generator to the 6L7 control grid by clipping the signal generator output lead to the insulation on the control grid wire, or connect to the grid clip through a 50 mmfd. mica condenser.
2. Adjust signal generator to resonance with I.F. system by tuning the signal generator dial for maximum output meter deflection. Be sure that the receiver dial is at some point where it has no tuning effect on the generator signal. Switch off the modulation.
3. With the signal generator connected and operating as in #2, connect antenna and manually tune in powerful local station in region of 1000 KC or lower. (Avoid stations around 930 KC which might beat with second harmonic of test oscillator.)
4. Adjust the receiver tuning dial to obtain zero beat between the test oscillator and the incoming signal. (A very slight adjustment is all that is required. Be careful not to tune off signal.)
5. Turn the A.F.C. switch to the extreme clockwise position. (A.F.C.-on)
6. Adjust the secondary of discriminator transformer (#6) to restore zero beat. NOTE: This trimmer should be adjusted to the point where the frequency of the beat note increases rapidly if the trimmer is turned in either direction. Other zero beat points may be found with the trimmer all the way out or all the way in, but these settings are incorrect.

If this operation has been performed correctly, turning the A.F.C. switch from center to clockwise position should not change the beat note by more than a slight rumble.

NOTE:- Where a second signal generator is available step #3 above may be varied as follows:

Connect second signal generator (set at about 1000 KC) to antenna and tune in its signal. Switch off modulation and proceed as before.

This method is somewhat preferable to the first as the zero beat setting is more easily determined when both signals are unmodulated.

NOTES ON SENSITIVITY AND STAGE GAIN MEASUREMENTS Models 8-30,8-40,8-50, 8-60,8-70,8-80.

These stage gain measurements will, if properly used, enable you to localize trouble quickly, They are intended for use with a signal generator that is accurately calibrated in microvolts.

Starting with the second detector—first audio stage, and working back step by step to I.F., Osc.-Mod., R.F. and finally to the antenna terminal, the circuit in which the trouble exists will quickly be determined by evidence of low gain, when signal generator attenuation readings are compared to the normal values as shown in the tables.

All stage-gain measurements must be made with the volume control set for full volume. The shielded lead from the signal generator is connected to the top grid terminal of the tube through a .1 MF condenser, with a 500M Ohm resistor connected as a leak resistance between the grid of the tube and the grid cap which has been removed (See Fig. 3 on Page 4.)

When measuring over-all sensitivity at the antenna terminal, use a .00015 MF condenser in place of the .1 MF.

It must be remembered that the figures in the table are average and allowance must be made for variations between two sets of the same general type, due to difference of tube characteristics, etc.

NOTE:—Readings on 8-50, 8-60, 8-70, and 8-80 should be taken with Acoustinator set at "Country" and "Voice" positions.

Tuner Notes, Part 1

GALVIN MFG. CO.

AUTOMATIC SERVICE NOTES

FAILS TO RETAIN ORIGINAL SETTING

1. MAGNETS NOT LOCKED SECURELY. The lock nuts must be pulled down securely, otherwise, the shock of the sudden stopping of the latch bar will tend to slide them away from the original setting.
2. ORIGINAL SETTING NOT ACCURATE. It is extremely difficult to set the stations to the exact center of the carrier, by ear alone. A tuning meter is recommended. Resetting of magnets may be necessary after several days' use, during which time the mechanism goes through a "shaking down" process.
3. ELECTRICAL DRIFT. This is usually the result of a great change in temperature. Automatic compensation is provided in the circuit to take care of the normal operating temperature range. Before making original setting, turn the set on and permit it to play long enough to arrive at a constant operating temperature. In zero weather do not expect the set to tune "on the nose" until after a constant temperature has been reached. In severe cases of electrical drift occurring at normal operating temperature, change the compensating trimmer. This is located in the oscillator can in Models 8-60, 8-70, and Golden Voice. In Model 8-50, it is mounted on the condenser gang.
4. DEFECTIVE LATCH BAR. Inspect latch bar. If springs are bent or if the gap is too large, the mechanism will not tune accurately.

FAILS TO STOP AT MAGNET

1. OPEN MAGNET WINDING. Check for continuity and replace if necessary.
2. MAGNET CONTACT IN ACOUSTINATOR NOT CLOSING. Open Acoustinator and inspect contacts. Adjust or clean if necessary.
3. ROUNDED HEAD ON MAGNET CORE. The head of the magnet should have sharp corners. Rounded corners may cause the latch bar to slip going in one direction, although it will usually catch in the reverse direction.
4. LATCH BAR DEFECTIVE. Inspect latch bar to make sure that it has not been damaged. Replace latch bar and gear assembly, if required.
5. POOR CONTACT AT ACOUSTINATOR PLUG. A poor contact here means a voltage drop which reduces the pulling power of the magnet.
6. IMPROPER SPACING OF LATCH BAR. Check the spacing between the latch bar and the magnet. It should be somewhere between ten and twenty thousandths of an inch. If the spacing is greater the pulling power of the magnet is reduced.

MOTOR TURNS BUT TUNING MECHANISM DOES NOT

1. GEARS FAIL TO MESH. Check all gears to see that they are properly meshed.
2. MANUAL TUNING GEAR SLIPS. If the manual tuning gear assembly does not have enough tension between the fibre motor drive gear and the brass manual tuning gear, the motor will spin without turning the rest of the mechanism. Replace manual tuning gear assembly if necessary.

LATCH BAR STICKS ON MAGNET POLE

1. MANUAL TUNING SHAFT BINDS. Binding in the tuning control shaft causes the latch bar to press hard against one side of the magnet and may prevent it from releasing as the magnet is de-energized.
2. LATCH BAR SPRING WEAK. Check latch bar tension, to make sure it is pulling away from the magnet with sufficient force.
3. MAGNET CONTACT IN ACOUSTINATOR STUCK. Check the magnet switch in the Acoustinator to make sure it breaks contact when pressure is released on the button. Check for frozen contact points, or for sticking Acoustinator button.
4. ARMATURE RIVET WORN. There is a brass rivet at the tip of the armature, to prevent the armature freezing to the magnet. If this rivet is worn down, permitting the steel armature to actually touch the magnet pole, it may freeze in that position.
5. ROUGH SIDES ON MAGNET POLE. Inspect sides of magnet. If rigid or grooved, the latch bar may catch and fail to release.

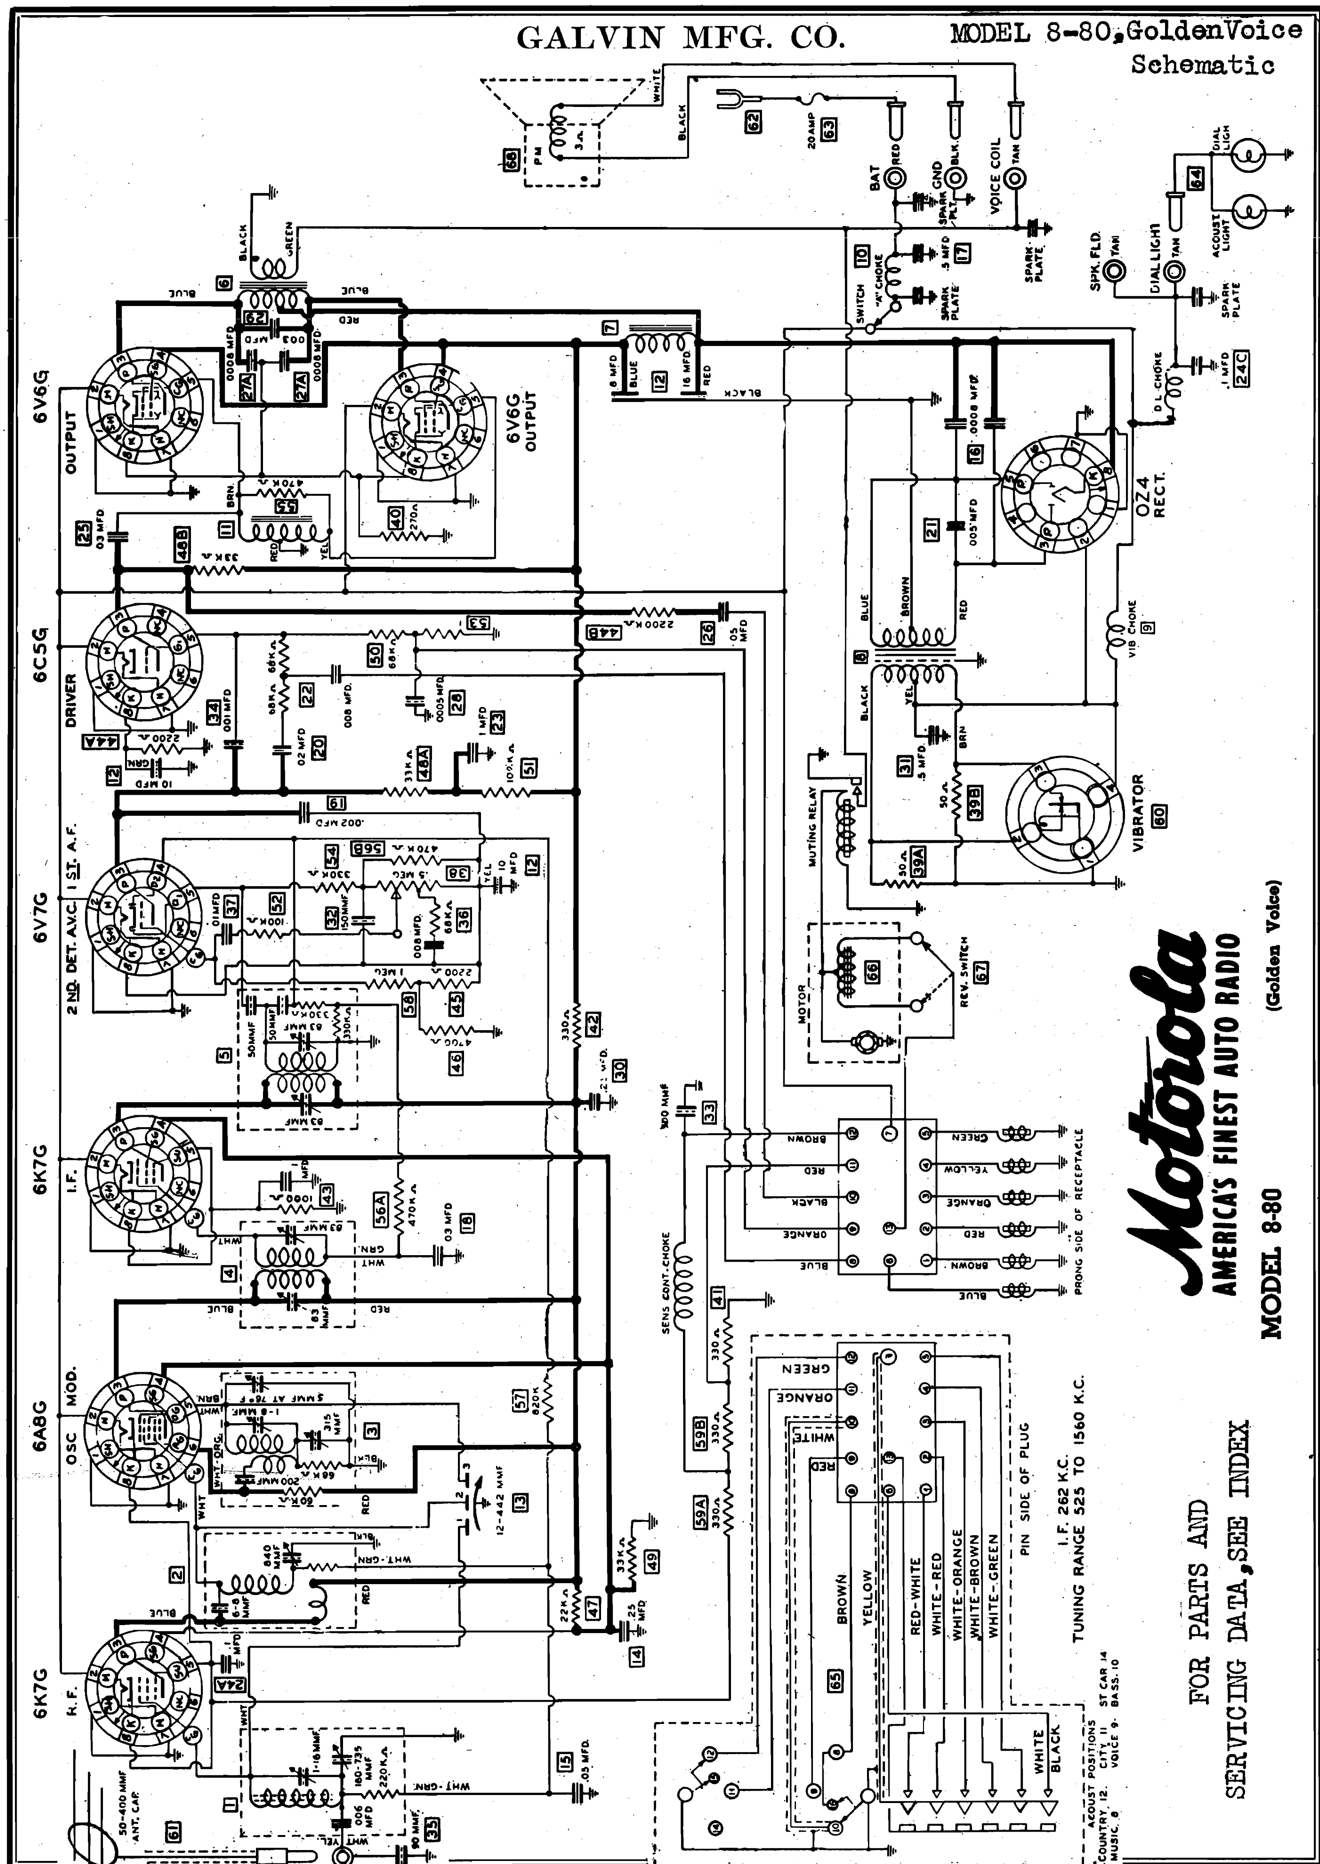
GALVIN MFG. CO.

MODEL 8-80, GoldenVoice Schematic



GALVIN MFG. CO.

AUTOMATIC SERVICE NOTES

BUTTONS STICK

1. BURR ON BUTTON. Remove the button from the Acoustinator and look for a tenite burr along one of the edges. Scrape the edges smooth with a pen knife. NOTE:—When removing the button, if you will press in on the adjacent button at the same time you are pulling out on the one to be removed, you will find that it comes out easily.

MOTOR FAILS TO START

1. MOTOR CONTACTS IN ACOUSTINATOR NOT CLOSING. Open the Acoustinator and inspect the motor contacts. If the gap is too great, contact will not be made when the button is pressed. Adjust by bending carefully.
2. POOR CONTACT AT ACOUSTINATOR PLUG. Inspect the contacts between the Acoustinator plug and the receptacle on the chassis.
3. DEFECTIVE REVERSING SWITCH. A defective switch would prevent the voltage from reaching the motor winding.
4. OPEN CIRCUIT IN MOTOR. Check all connections to motor and check motor winding for continuity.
5. MOTOR BRUSHES NOT MAKING CONTACT. Check contact between brushes and commutator.
6. LOW BATTERY VOLTAGE. A weak or defective battery in the car would not deliver sufficient voltage to start the motor.
7. FLEXIBLE TUNING SHAFT BINDS. Binding in the flexible tuning shaft places an additional load on the motor. If this load is too great, it will prevent the motor from turning the mechanism.
8. MAGNET FAILS TO RELEASE. If the magnet which has previously been energized, fails to release the latch bar for any reason, the motor cannot turn the mechanism.

MOVES FROM STATION AFTER BUTTON HAS BEEN RELEASED

1. MANUAL TUNING GEAR SLIPPING. This assembly is so constructed that a small amount of slippage will occur between the fibre motor drive gear and the brass manual tuning gear. The purpose of this design is to absorb the shock of stopping the motor quickly when a station is tuned. If the tension between the two gears is weak, the motor will not stop, but continues to spin slowly after the station has been tuned. When the magnet releases the latch bar, as the finger is removed from the button, the momentum of the motor pulls the condenser gang a little beyond the station. To remedy this condition install a new manual tuning gear assembly.

MOTOR FAILS TO REVERSE

1. DEFECTIVE REVERSING SWITCH. Replace if required.
2. LEADS TO REVERSING SWITCH CROSSED. Reverse leads.

MECHANISM RUNS SLUGGISHLY

1. LOW BATTERY VOLTAGE. A weak or defective battery will not deliver sufficient voltage to turn the motor at normal speed.
2. HIGH RESISTANCE CONTACT IN ACOUSTINATOR. High resistance at the Acoustinator contacts will cause a voltage drop which will prevent the motor from turning at normal speed.
3. POOR CONTACT BETWEEN ACOUSTINATOR PLUG AND RECEPTACLE. This will also result in voltage drop, and lessened motor power.
4. BINDING IN TUNING SHAFT. Binding in the flexible tuning shaft will place an additional load on the motor which can slow it down considerably. Install tuning shaft with minimum amount of bending and check alignment where the tuning shaft enters the receiver housing.
5. GEAR BEARINGS RUNNING DRY. The manual tuning gear and the large gear bearings must be properly lubricated. Because of the wide variation in temperatures encountered between summer and winter driving, special lubricants should be used. Use Motorola Ice Machine Oil, Part No. 11M 5057. Do not use ordinary machine oils. They will not stand zero temperatures.

Alignment

GALVIN MFG. CO.

ALIGNMENT PROCEDURE

PRELIMINARY STEPS

To properly align this receiver the chassis must be taken out of the housing and placed on the service bench.

A metal plate is advised for a good ground to chassis, the plate to be at least a foot square, with one terminal of the storage battery connected to it through a heavy lead, preferably a starter cable.
The "A" battery lead should likewise be brought up from the battery through as heavy a lead as possible (starter cable) to a terminal on the bench.

Plug in the Acoustinator, if the set undergoing alignment is thus equipped. Set Acoustinator at "Country" and "Voice" positions.

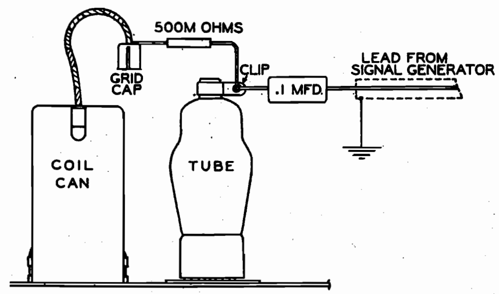
Connect the speaker to the chassis and plug the "A" lead into its receptacle.
Turn the volume control to maximum and leave it in that position throughout the alignment, reducing the signal generator output if necessary.

MPORTANT NOTE:

The trimmer labeled 600 K.C. in the R.F. coil can must not be adjusted in the field. It is the key point in the entire R.F. alignment and was carefully set in the factory by means of an accurate capacity bridge to its correct capacity (780 MMF in Models 8-30 and 8-40—840 MMF in Models 8-50, 8-60, 8-70, and 8-80). Before shipment, this trimmer was covered by a strip of black Scotch Tape, which should be left in position to eliminate any possibility of shifting its capacity through error. (In Model 8-30 only, this trimmer is located in the Osc. coil can.)

I.F. ALIGNMENT

1. Connect signal generator to control grid of the Osc.-Mod. tube (6A7 or 6A8G) through a .1 MF condenser, having first removed the grid cap from the top of the tube. (See Fig. 3.) Connect a 500,000 ohm resistor from the grid of the tube to the grid cap on the lead just removed from this tube. Turn condenser gang completely out of mesh. Connect output meter across speaker voice coil.
2. Set signal generator at 262 K.C. and carefully adjust the trimmers in the diode coil can to the point showing highest reading on the output meter.
3. Adjust the trimmers in the I.F. coil can to the point showing highest reading on the output meter.
4. Go over I.F. and diode adjustment several times to secure maximum accuracy.



(FIG. 3)

ALIGNMENT PROCEEDURE
(CONTINUED)

SETTING THE RANGE

1. Connect signal generator to the control grid of the R.F. tube (78 or 6K7G) through a .1 MF Condenser having first removed the grip cap from the top of the tube. Connect a 500,000 ohm resistor from the grid of the tube to the grid cap on the lead just removed from this tube. (See Fig. 3.)
2. Set signal generator at 1560 K.C. and, with condenser gang completely out of mesh, adjust for maximum deflection on the output meter, the trimmer in the oscillator coil can labeled 1400 K.C. (In Model 8-30 this trimmer is on the middle section of the condenser gang.)
3. Set signal generator at 535 K.C. Turn condenser plates completely in mesh and adjust for maximum deflection on output meter, the trimmer in the oscillator coil can marked 600 K.C.

NOTE: The adjustments above set the range so the receiver will track with the calibrations in the control head.

R.F. AND ANTENNA ALIGNMENT

1. Connect the signal generator to the antenna lead through a .00015 MF condenser and to chassis ground. Set signal generator at 600 K.C. and turn condenser gang until signal is heard. Adjust trimmer on the antenna coil can labeled 600 K.C. for maximum deflection of output meter.
2. Set signal generator at 1400 K.C. Turn condenser gang until signal is heard. Adjust for maximum deflection of output meter, the trimmer in the antenna coil can marked 1400 K.C. (In Model 8-30 this trimmer is on the back section of the condenser gang.)
3. Adjust for maximum deflection of output meter, the trimmer in the R.F. coil can marked 1400 K.C. (In Model 8-30, this trimmer is on the front section of the condenser gang.)
4. Recheck steps 1, 2, and 3, for accuracy.

USE OF OSCILLOSCOPE IN ALIGNING I. F.'S

In service stations which possess the proper equipment, the visual method of adjusting the I.F. stage can be used to good advantage.

EQUIPMENT REQUIRED: Cathode Ray Oscilloscope and a frequency modulated signal generator. (NOTE: If your signal generator is unmodulated, a frequency modulator will be required to adapt it for use with the oscilloscope.)

PROCEDURE:

1. Align I.F. and diode trimmers in the regular manner as outlined in preceding paragraphs.
2. Connect "Wobbulator" to control grid of Osc.-Mod. tube (6A7 or 6A8G) through a .1 MF condenser, having first removed the grid cap from the top of the tube. Connect a 500,000 ohm resistor from the grid of the tube to the grid cap on the lead just removed from this tube. (Fig. 3).
3. Connect oscilloscope to the top or high side of the diode load resistor, which, in this case, is the volume control.
4. Adjust the "Wobbulator" frequency to 262 K.C. and observe the picture of the I.F. resonance curve as shown on the oscilloscope "screen". Correct alignment will result in a flat top curve, as shown in Fig. A.
5. Should the curve appear sharp at the "nose" with a shelf on either side of the peak, as shown in Fig. B, adjust the PLATE trimmer of the I.F. transformer slightly, until the curve approaches the condition shown in Fig. A. If the regular I.F. alignment has been properly carried out, it will be necessary only in rare instances to adjust other than the I.F. PLATE TRIMMER.

Tuner Adjustments

PUSH-BUTTON TUNER ADJUSTMENT

The most important thing to remember when setting up the automatic Models 8-60 and 8-80 (Golden Voice) is that the magnets must be set accurately at the exact peak of the station carrier.

PRECAUTIONS: The adjustment can in most cases be made after the installation in the car, but if certain precautions are taken it is recommended that it be done on the service bench before the installation, since the mechanism is more accessible and it is therefore easier to do a careful job. The necessary precautions are as follows:

1. *Before proceeding with the adjustment, turn the set "on" and let it warm up long enough to reach a constant operating temperature.*
2. *Connect the receiver to an antenna of approximately the same capacity as the car antenna, and adjust the antenna trimmer for maximum sensitivity at 600 K.C.*
3. *After the receiver has been installed in the car, adjust the antenna trimmer at 600 K.C. for maximum noise level. If the noise level is too low, use a weak station. DO NOT TRIM ON A STRONG SIGNAL.*

MAGNET ADJUSTMENT: To set the stations, proceed as follows:

1. Turn the set on and let it play for NOT LESS THAN 10 MINUTES, to assure all electrical circuits reaching a constant operating temperature.
2. Select the 6 stations to be "set" and arrange the 6 magnets to the approximate station frequencies as indicated on the scale, locking them in position. DO NOT "SET" WEAK STATIONS. (Fig. 1.)
3. Press the first button. The motor will bring the mechanism to the first magnet. Loosen the locknut.
4. Tune manually to the exact peak of the station, using the tuning knob in the control head.
5. Press the first button half way in (far enough to energize the magnet, but not far enough to start the motor or mute the set.)
6. Slide the magnet in the direction of error until a "click" indicates that the latch bar has engaged in the stop.
7. Tighten the lock nut.
8. Proceed to "set" the other 5 stations.

NOTE: It may be necessary to rearrange the three spacing studs, located around the control ring, should they happen to be set at positions which interfere with the setting of favorite stations. This should be done in such a manner as to gain three point suspension for the center ring, permitting the magnets to slide freely while setting stations. (See Fig. 1.)

IMPORTANT NOTE: After "setting" each station, check your accuracy by retuning manually.

SPOT TUNER ADJUSTMENT

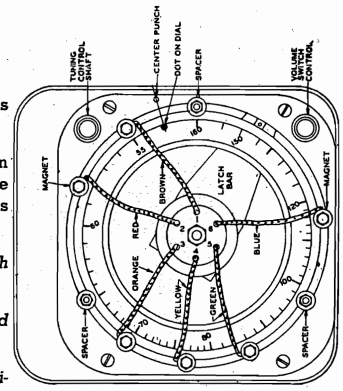
NOTE: Before setting any station, permit the radio to reach a constant operating temperature, as recommended for the push-button models.

1. Slip the spot tuner housing up the flexible control shaft far enough to expose the spot tuner mechanism, which consists of a small ball bearing, a brass raceway in which it moves, and a slotted retainer clip which acts as its guide.
2. Tune in the desired station as accurately as possible. A tuning meter is recommended, except for Model 8-40, which has no Acoustinator receptacle.
3. With a pair of slip jaw pliers, one jaw of which rests firmly on the small ball bearing, the other jaw of which rests on the bottom of the unit, apply enough pressure on the ball to force an indentation in the brass raceway in which it moves. (Fig. 2.)
   Proceed to set other favorite stations in the same manner.

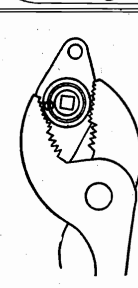
BEFORE APPLYING PRESSURE WITH THE PLIERS, BE SURE THE STATION IS TUNED ACCURATELY. The raceway has a double track. Therefore, should you desire to reset the SPOT TUNER to a new series of stations, it can be done by moving the ball bearing over to the second track. To do this, turn the condenser gang to full mesh (ball bearing at extreme end of raceway) and with a pointed instrument, force the ball bearing into the adjoining groove.

A THIRD SETTING CAN BE MADE ONLY BY INSTALLING A NEW RACEWAY. Order part No. 1X4487 from your Motorola Distributor.

To install a new raceway, force the blue steel clip off the assembly, taking care not to lose the ball bearing. Then remove the retainer spring and washer from the end of the assembly and slide the raceway out.



(FIG. 1)



(FIG. 2)

When the unit is reassembled, run the ball bearing down toward the mounting bracket, almost to the end of the raceway. Then turn the condenser gang in the receiver to full mesh and install the spot tuner on the receiver housing. This procedure aligns the units so the ball will travel the full length of the raceway, while the condenser gang also completes its full 180° movement.

TUNING METER: To assure an accurate setting on both automatic and spot tuning models, we urgently recommend that a tuning meter be used. We have devised a simple meter that is easy to use since it merely plugs into the Acoustinator receptacle. It is sensitive and has additional utility in that it can be used to accurately read resistance values between 0 and 100 ohms. Order No. 66x10415 Tuning and resistance meter, $4.95 net. ORDER FROM YOUR DISTRIBUTOR.

Dial Data,Trimmers
Alignment

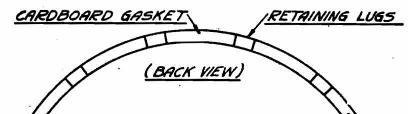

FIG. 1

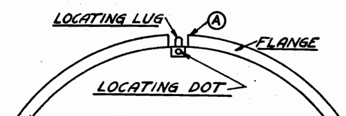

FIG. 2

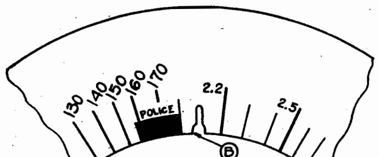

FIG. 3

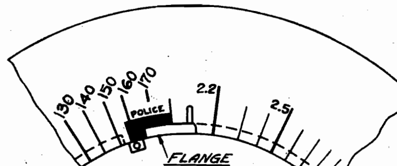

FIG. 4

REPLACING BROKEN DIAL SCALE

1. Tear out the remaining portion of the broken dial scale.
2. With long nosed pliers bend back the metal lugs that hold the dial scale in position (See Fig. 1). Also bend back the smaller locating lug. (Fig. 2.)
3. Tear out one of the cardboard dial retaining gaskets. (Fig. 1.)
4. With a hacksaw, make two cuts in the dial retaining flange, approximately one-eighth inch to either side of the locating dot (See Fig. 2). Bend outward and downward the one-quarter inch section between the two incisions. These cuts must go all the way to the bottom of the flange. (Sets of late manufacture have this cut out.)
5. Take a new dial scale that has a slot extending upwards from the inside edge, the slot being three-eighths of an inch long (See Fig. 3). If you have a dial scale without this slot, you can slot it with a fine hacksaw blade.
6. With a pair of pliers bend point "A" on the flange (Fig. 2) outward a trifle.
7. Thread the new dial scale into the flange by inserting point "B" on the dial scale (Fig. 3) behind point "A" on the flange (Fig. 2). Continue to thread the dial scale through this opening that has been made in the flange until you have made one complete revolution, at which time the dial scale will be in position. (Fig. 4) shows the start of this operation.
8. Adjust the dial scale until the slot is opposite the locating dot on the flange and with long nosed pliers bend the locating lug forward until it locks the dial scale in position.
9. Also with long nosed pliers, bend all of the dial retaining lugs forward firmly against the remaining cardboard retaining gasket. Also bend up the cut out section with dot.

ALIGNMENT PROCEDURE

Chassis 10-2 and 12-1

NOTE: Because of AFC, alignment of these sets presents a slightly different problem than usual. The alignment is not difficult, but we suggest that these instructions be followed explicitly.

1. Place chassis on service bench. Remove band spread pointer and dial. Insert a small piece of paper between the front contacts of the switch that is located on the front of the automatic control drum. These contacts break the motor circuit. This is necessary to prevent the motor from running during the alignment.
2. Connect signal generator to control grid of first detector tube (6A8G) through a .05 M.F. Condenser, and to chassis. Do not remove grid cap. Also connect output meter across speaker voice coil. Turn band switch to "American Programs" position. Turn condenser gang completely out of mesh. Press the release button to short out AFC.
3. Set signal generator at 465 K.C. and carefully adjust the three I.F. trimmers in the tops of the two small I.F. cans (one I.F. can has one trimmer only) to point showing highest reading on output meter.
4. Adjust the two mica trimmers in the large I.F. can to point showing highest reading on output meter. (IMPORTANT NOTE:—One of these trimmers is located near the bottom of the right hand side of the can, inside the covered hole; the other trimmer is the front trimmer on top of the can. The back trimmer on top of the can is an air trimmer and *must not* be adjusted at this time.)
5. Attach a 0-5 high resistance volt-meter between the cathode (Terminal No. 8) of the 6J7G AFC control tube and ground. Turn signal generator up to full output (still set at 465 K.C.) backing down on receiver volume control, if necessary.
6. Note cathode voltage reading on volt-meter with AFC shorted out (release button pressed in), then note cathode voltage reading with AFC operating (press any tuning button, permitting release button to fly out). When AFC discriminator is properly balanced, there should be no difference in reading between the two positions. If a variation is noted, it indicates that the adjustment of the air trimmer on top of the I.F. can is not correct.
7. Using a non-metallic screw driver, turn the air trimmer just a trifle at a time, checking continually the cathode voltage reading on the volt-meter by pressing alternately on the release button and on one of the tuning buttons (connecting and disconnecting AFC). When a position is found where voltage remains the same in both positions, the adjustment is correct.

   NOTE:—While making this adjustment it will be necessary to remove the non-metallic screw driver from its position in order to check the reading accurately since body capacity has considerable effect at this point.
8. *Switch AFC off by pushing in the release button and leave it off through the remaining steps of the alignment.*
9. Leave band switch in "American Programs" position. Connect signal generator to antenna and ground terminals, using a .0002 MF condenser in antenna lead.
10. Set signal generator and receiver dial both at 1700 K.C. Adjust BC OSC. trimmer until 1700 K.C. signal is heard.
11. Set signal generator at 1400 K.C. and turn condenser gang to the signal at 1400 K.C. Adjust BC ANT. and BC RF trimmers to point showing highest reading on output meter.
12. Set signal generator at 600 K.C. and rock pointer at 600 K.C. position on dial scale, while adjusting BC padder, until combination is found which gives highest output reading.
    NOTE:—If there is noise level at 600 K.C., padder can be adjusted to maximum noise without rocking gang and without use of signal generator. (Use short wire for pick-up if necessary.)
13. Turn band switch to "Police and Aircraft" position. Replace .0002 M.F. condenser in signal generator lead with a 400 ohm carbon resistor.
14. Set signal generator and receiver dial both at 7.0 MC. Adjust POLICE OSC. trimmer until 7.0 MC signal is heard.
15. Set signal generator at 5.8 MC and turn condenser gang to signal at 5.8 MC. Adjust POLICE ANT. and POLICE RF. trimmers to point giving greatest output reading, while slightly rocking condenser gang.
16. Turn band switch to "Foreign Programs" position, still using 400 ohm carbon resistor in antenna lead to signal generator.
17. Set signal generator and receiver dial both at 22.0 MC. Adjust SW OSC. trimmer until 22.0 MC signal is heard.
18. Set signal generator at 18.7 MC and turn condenser gang to the signal at 18.7 MC. Adjust SW ANT. and SW RF. trimmers to point giving greatest output reading, while slightly rocking condenser gang.
19. Padders on "Police" and "Foreign" bands are fixed. (No adjustment necessary.)

ELECTRIC AUTOMATIC TUNER

The Motorola electric automatic tuning system is simple in construction, having a minimum of moving parts. It is sturdy enough to stand severe usage. It is easy to service, since all parts liable to require attention are readily accessible. The mechanism is divided into three separate units; the automatic selector, the motor, and the driving mechanism.

GALVIN MFG. CO.

THE DRUM

The automatic selector assembly is at the front of the unit—directly behind the escutcheon plate when the chassis is in the cabinet. Hereafter in this book it shall be referred to as the drum. Arranged in a circle round the edge of the drum are twenty plungers, to each of which a button is attached (after assembly in the cabinet). Nineteen of these buttons may be set up to tune automatically, nineteen different stations. The twentieth button, at the top, is a release button which should be pressed for manual tuning.

We do not recommend that the drum be opened for service, but a study of Fig. B, at the bottom of this page, will reveal how the mechanism works. This drawing shows the rotor and one button in its relative position. The drum housing is not shown. You will notice that the button plunger (No. 1) has a groove and shoulder running around its circumference. This serves to lock the button in when it is pressed, being held by a locking plate that hooks behind the shoulder.

The locking mechanism consists of three flat plates, the center of which is the locking plate. This locking plate is always under spring tension which tends to keep the holes out of line. (See Fig. C). However, when a button is pressed, the shoulder on the plunger forces the holes in alignment, releasing any button that may be held in at the time. A spring behind each button causes it to snap out when released. (No. 2 in Fig. B).

A button must be pressed one-sixteenth inch beyond its locking position in order to release any other button already locked in. Any number of buttons may be pressed at one time without damage to the mechanism. It will merely stop at the first button it reaches.

Behind the plunger for each station button is a stop arm (No. 3) which, when the lock nut in front of the plunger is loosened, can swing freely over a short arc. (Fig. A). In this manner, each button controls a small segment of the scale and may be set to any station that falls within its range. When the lock nut is tight, the arm is held rigidly in one position—that of the station to which it is set. A rounded extrusion on the end of the arm, engages in the slot on the rotor. The release button has no arm, its dual purpose being to release all station buttons and to operate the switch on the front of the drum, breaking the motor circuit and shorting out AFC.

The only other mechanism inside the drum is the rotor, also pictured on this page. The rotor is coupled through gears to the condenser assembly so that both turn simultaneously. At one point on the circumference of the rotor, an extrusion is made with a slot at the top. (No. 4, Figs. A and B.) When, in turning, the rotor reaches a button that has been pressed in, the stop arm on the button falls into this extruded slot, forming a mechanical stop, and at the same time opening the electrical circuit of the motor by operating the circuit breaker indicated by No. 5.

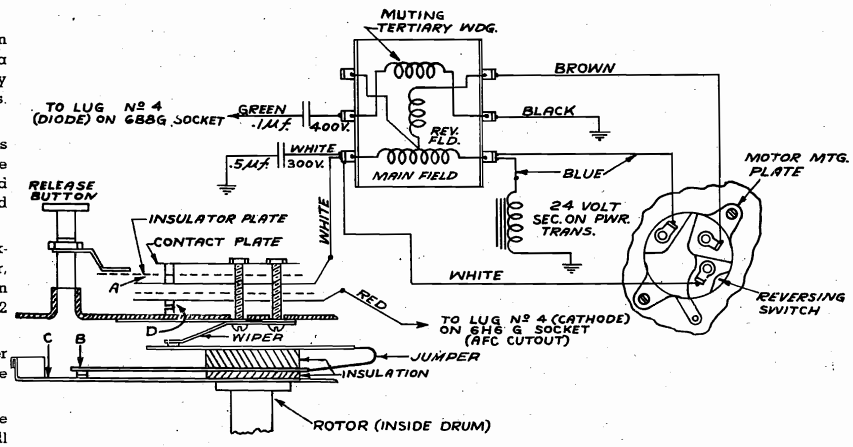
8. Connecting wire



THE MOTOR CIRCUIT

A reversible synchronous motor is used, operated from a twenty-four volt winding in the power transformer. The armature itself acts as a clutch. When at rest, it is held back by a light coil spring. When the circuit is closed the armature automatically seeks its electrical center, thereby moving forward and forcing the rubber friction drive against the intermediate drive wheel.

The drawing shows the electrical circuits of the motor, the reversing switch, and includes an exploded view of the motor cut-off and AFC control switch, operated by the release button.

To trace the motor circuit, start with the twenty-four volt winding of the power transformer, one end of which is grounded. The circuit leads from the other end of this winding, up to the lower right hand terminal (looking at the motor from the rear), through the main field winding and through the white wire to the inside plate of the motor cut-off switch. From the inside plate the circuit leads to the outside plate when contacts "A" are closed, and through the two brass machine screws to the wiper arm inside of the drum. This wiper arm makes a wiping contact on the rotor contact plate. (No. 7, Fig. A.) This copper plate is wired to the rotor switch (circuit breaker) (Contacts B) one plate of which is grounded. This completes the circuit, since one end of the twenty-four volt transformer winding is also grounded. The reversing switch alternately connects the reversing field to either end of the main field.

In operation, contacts "A" and "B" must be closed, in order for the motor to run. When the release button is pressed for hand tuning, the motor circuit is broken at point "A". When any other button is pressed for automatic tuning, the release button jumps out, closing the circuit at point "A", the motor starts, turning the mechanism until the slot on the rotor reaches the button that has been pressed, at which time the circuit is broken at point "B", stopping the motor.

The lower contacts on the switch serve to short out AFC while tuning by hand, and automatically connect AFC for push-button tuning. AFC is shorted out by merely grounding the switch blade.

MUTING

To eliminate between-station noise, it is desirable that some muting system be used. In the Motorola models this is accomplished by adding an additional winding to the motor.

When the motor is running, a voltage is induced in this winding, which after being rectified in the 6B8G, is used to bias the first audio stage to cut-off, thereby muting the set until the station has been tuned in.

This same voltage is applied to the AVC network, temporarily reducing sensitivity so the AFC action will not begin until after the station has been tuned in.

DRIVE MECHANISM

The automatic drive mechanism is likewise simple. A rubber friction cone on the end of the armature shaft bears against an intermediate drive wheel which, in turn, through another rubber friction cone drives the flywheel. This type of drive makes it possible to eliminate many gears, making the mechanism quiet in operation.

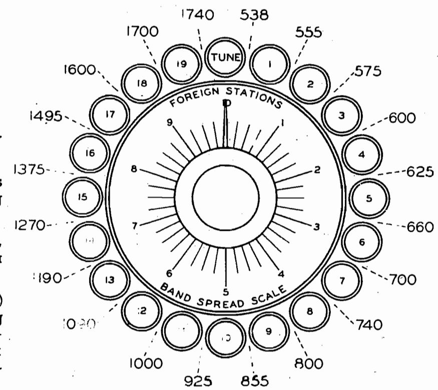
MODEL 10Y-1
MODELS 12Y,12Y-1
Tuner Notes,Part 2

GALVIN MFG. CO.

SETTING THE BUTTONS

To set the buttons, proceed as follows:

1. Select one of the stations you want to tune automatically and determine from the chart which button you must use in order to get that station.
2. Press this button and wait for the electric motor to bring the dial pointer to a stop. This should be at a position close to the exact frequency of the desired station.
3. Remove the button by unscrewing it on its spindle, and take out the felt washer, exposing the lock nut directly underneath.
4. Loosen the lock nut not to exceed one-half turn, using the key supplied with the receiver, or a suitable socket wrench.
5. Press the Station Button and the Release (TUNE) Button down at the same time. While holding both buttons down, tune in the station accurately by hand, watching the eye for smallest shadow. (Holding the TUNE Button down permits accurate setting by shorting out A.F.C.)



6. Release the TUNE Button first, then the Station Button, and with the key tighten the lock nut securely.
7. Push the celluloid disc out of the button from the back, using a match or toothpick, replace the felt washer, and screw the button back into its original position.
8. Select the proper tab from those supplied, and insert it in the face of the button, taking care that the call letters are horizontal for the sake of appearance. If no tab has been provided for that station, print the call letters on one of the blank tabs.
9. Insert the celluloid disc over the station tab. If the station is one of your favorite "Network" stations, use one of the colored discs (Red for NBC "Red" Network, Blue for NBC "Blue" Network, Green for Columbia, and Yellow for Mutual). For other stations, use the Amber celluloid discs.
10. Repeat the above steps for the remaining buttons.

NOTE:—It is conceivable that the customer may want to tune automatically, two stations which normally fall on the same button. If there is a free button on either side of this button, one of these stations can be set to that adjoining button by shifting the rotor a few degrees. To do this proceed as follows:

1. Press the adjoining vacant button and wait until the motor stops.
2. Loosen the lock nut and turn the dial by hand toward the other button as far as it will move freely. This swings the station stop arm (No. 3, Fig. A, Page 4) toward the other button. Lock it in this position by tightening the lock nut.
3. Loosen the two Allen-head set screws in the brass rotor gear (No. 6 in photo on page 3). This permits the tuning condenser to be moved without moving the rotor inside the drum.
4. Manually tune in the first of the desired stations.
5. Re-set the Allen-head screws.
6. Proceed to re-set all of the buttons, since this shifting of the rotor will disturb their setting.

CAUTION:—Do not shift the rotor too much, since to do so may eliminate the possibility of setting buttons 1 or 19 to any station.

CHANGING AUTOMATIC CONTROL DRUMS

(To identify parts, refer to photo on Page 3)

REMOVING THE OLD DRUM

1st—Loosen the two Allen-head set screws in the large brass rotor gear (No. 6) located directly in front of the travel-lite split gear. (No. 5.)

2nd—With a thin 7/8" end wrench, loosen the large Hex nut (No. 7) that holds the drum in position. This nut is in front of the large brass gear. Press in on the small planetary drive shaft (No. 12) and pull the drum off from the front. Take care not to lose the ball bearings that are a part of the planetary system.

INSTALLING NEW DRUM

1st—Turn the tuning condenser until the dial light points to 540 K.C. (First black line beyond 550 K.C.)

2nd—Holding the new drum with the release button at the top, press the button to the right of the release button and turn the rotor by hand until the stop is engaged.

3rd—Loosen the lock nut on this button. The rotor will then turn freely over a small arc. Turn the rotor counter clockwise toward the release button as far as it will go and tighten the lock nut. (Steps 1, 2, and 3 are for the purpose of aligning the rotor and the variable condenser so each will complete its cycle simultaneously with the other.)

4th—Slip the drum in position over the planetary (Tuning Shaft), taking care that the planetary is assembled correctly. To do this properly, press in on the small planetary drive shaft (No. 12) at the same time that you slip the drum over the ball bearings.
NOTE:—There are five ball bearings in the planetary assembly, three of which are visible through holes in the housing. The other two are inside the housing with a small tension spring between them. Take care that you do not lose any of the ball bearings.

5th—Tighten the large Hex nut (No. 7) that holds the drum in place.

6th—Tighten the two Allen-head set screws in the large brass rotor gear (No. 6), but while doing this hold the brass gear back against the travel-lite split gear (No. 5), to reduce its wobble to a minimum. Do not hold it too tight, since this would cause binding.

TORQUE ADJUSTMENT

After the new drum is in position, check the driving mechanism to assure yourself that you are securing a maximum transfer of power from the motor to the gear train. If necessary, clean the rubber friction cones with carbon tetrachloride (Carbona), to remove any grease that might interfere with traction. The flywheel and intermediate drive wheel surfaces may be cleaned in the same manner.

You may be able to further improve torque by adjusting the intermediate drive wheel (No. 2). This is held in place by a mounting plate (No. 3) which has elongated mounting holes so it can be adjusted up or down.

To secure maximum traction, this mounting plate should be moved down until the rubber drive cone just barely misses touching the flywheel, (No. 4) so it will not interfere with manual tuning. The motor itself is also mounted on brackets that have elongated holes, and it may be necessary to change this adjustment as well.

AUTOMATIC SERVICE NOTES

In the following paragraphs, you will find possible failures that you may encounter in the automatic tuner, along with suggestions for their corrections.

BUTTONS FAIL TO RELEASE

1. *Burr on button plunger.* To check this, remove the plunger by taking off the lock nut and the washer. To do this it is necessary to press in on another button in order to release the one which you wish to remove. If available, replace the plunger with a new one, and lubricate with several drops of fine oil. If a new plunger is not available, polish the old one with some very fine sand paper or emery paper.
2. *Locking Plate Not Riding on Bearing.* This is usually caused by the drum housing being assembled too loosely to the front plate. To determine whether or not the bearing is properly seated, check to see if the locking plate has a circular motion when buttons are pressed. If not, this indicates the plate is off of its bearing. To correct this tap lightly on the front plate around the bushing on which the band spread scale is mounted. For best results, use some circular object that can fit completely around the bushing, such as a short section of 7/8" pipe.

BUTTONS FAIL TO LOCK IN

1. *Locking Plate Too Tight.* Check the locking plate to see that it moves freely when buttons are pressed, but not too freely. In this respect, a happy medium must be found. If too tight it indicates that the drum housing is assembled too tightly to the front plate. Some light oil might ease this a trifle.
2. *Locking Plate Springs Missing.* Check the front of the drum assembly to determine that all three coil springs are present in the locking plate assembly. If any springs are missing, replace them.
3. *Foreign Matter Between Plates.* There are three plates in the locking mechanism, the one in the center being the actual locking plate. Dirt or metallic burrs between these plates can prevent freedom of movement. You might try some oil. However, it may be necessary to take the drum apart, which is not ordinarily recommended. If available, change the drum.
4. *Button May Be Stuck In.* If the button fails to lock in when pressed, it may be because some other button is already locked in and fails to release. (See above notes for proper correction.)
5. *Worn Plunger.* Remove the plunger as outlined above, and check to see if locking groove and shoulder are intact. If worn, replace with new plunger. If new plunger is not available, turn plunger one-quarter turn from original position and reinstall.

GALVIN MFG. CO.

MOTOR FAILS TO START

1. *Button Does Not Release.* If, when a button is pressed, the motor does not start, it may be that the previously depressed button has not released, thereby closing the motor switch on the rotor inside the drum. (See previous section on that subject.)
2. *Motor Circuit Open.* Check for open motor winding or for open transformer secondary (24 V. winding). Check motor switch contacts on front of drum and on the rotor inside of the drum
3. *Shorted Motor Filter Condenser.* Check the .5 MF motor noise filter condenser located directly under the motor. If shorted, motor will not run.

MOTOR FAILS TO STOP

1. *Ground In Motor Circuit.* Check the white lead from the motor to the switch on the front of the drum. Also check the switch. If ground exists in this circuit, the motor will not stop.
2. *Check Buttons One and Nineteen.* If the stop arms on the buttons on either side of the release button are adjusted too close to the release position the rotor may not reach them in its revolution before the reversing switch is tripped. This makes it impossible to break the motor circuit at the switch on the rotor. To correct this remove lock nut and plunger and with small pointed tool swing stop arm away from release position. Also check reversing switch to see if it reverses at the proper moment.
3. *Rotor Switch Fails To Open.* Check the switch on the rotor to see if the contact breaks properly when the button that has been pressed is reached. Setting of rotor switch contacts may be adjusted through inspection hole in back of drum housing. This should be done with exceptional care. The correction can sometimes be accomplished by inserting a thin shim washer under the button plunger. This spaces the station stop arm closer to the rotor.
4. *Drum Switch Fails To Open.* Check the switch on the front of the drum to see that it opens properly when the release button is pressed for manual tuning. If switch fails to break contact properly, motor will continue to run.

FAILS TO STOP AT BUTTON

This condition is a little different from the condition mentioned in the previous discussion. In this type of failure the motor will stop at most of the buttons, but may fail to stop properly on one or two buttons.

1. *Short Plunger.* If the plunger is too short the stop arm will be spaced too far back from the rotor. Try a new plunger. If this does not correct the failure, insert one or more thin shim washers under the plunger. This will space the stop arm closer to the rotor.
2. *Skips Several Buttons.* If the motor skips several buttons located at different sections of the drum, treat each button as in Step No. 1 above. If, however, several adjacent buttons fail, then check the assembly of the drum housing to the front plate. It may be too loose along that particular edge of the drum. To correct this, peen the housing more firmly to the front plate.
3. *Too Much Torque.* Check the adjustment of the intermediate drive wheel, which can be moved up or down, to see that it releases promptly and freely when the circuit is broken. If it fails to release promptly, it would tend to carry the mechanism beyond the button. Adjust intermediate drive mounting plate if necessary.
4. *Lock Nut Loose.* Check all lock nuts to see that they are drawn up firmly. A loose lock nut outside the drum will mean a loose stop arm inside the drum.

MOTOR FAILS TO REVERSE

1. *Defective Reversing Switch.* If defective switch is found, replace it.
2. *Reversing Pin Collar Not Properly Set.* Check the adjustment of the reversing pin collar which is located directly in front of the flexible coupler, to see that the reversing switch trips exactly at the end of travel of the mechanism. The collar is adjustable, being held by two set screws.
3. *Open Reverse Winding In Motor.* Check the reversing field in the motor. If open, the motor will travel in one direction only.
4. *Travel-Lite Stops Not Properly Set.* Check the stops on the gear train studs that the travel-lite hits as it reaches either end of the dial If the travel-lite bracket hits the stop before the reversing switch trips, the motor will not reverse. Stops may be either of two types: brass clamp or screw and lock nut.

BUTTONS FAIL TO RETAIN ORIGINAL SETTING

1. *Loose Lock Nut* A loose lock nut will permit the stop arm to move from its original setting.
2. *Loose Gear Bushing.* Check the gears in the gear train, particularly the split gears, to make sure there is no lost motion between the gear and the bushing.
3. *Loose Coupling.* Check the flexible rubber coupling between the mechanism and the tuning condenser for loose set screws, loose bushing, or loose rivets.
4. *Loose Drum-Holding Nut.* Check the large Hex drum-holding nut, to be sure the drum is held firmly in place.
5. *Loose Drum Front Plate.* Make sure the front plate is peened firmly to the drum housing.
6. *Loose Set Screws.* Check all set screws in the gear train.
7. *Improper Button Setting.* Check all button settings, to make sure they are set to the center of the station carrier. This is extremely important. When setting buttons, the release button must be held in firmly to short out AFC, otherwise it is impossible to make the setting at the center of the carrier.
8. *AFC Switch Grounded.* Check the AFC Switch which is the inside blade of the switch on the front of the drum. If this is grounded while tuning automatically, AFC does not operate. No automatic tuning mechanism is accurate enough to operate without AFC.

SLIPPAGE

1. *Rubber Drive Cones Worn.* Replace if necessary.
2. *Loose Set Screws in Gear Train.* Tighten all set screws firmly.
3. *Improper Adjustment of Intermediate Drive.* Check intermediate drive wheel to see that it bears firmly on the flywheel while the motor is running. If necessary, adjust intermediate drive mounting plate.
4. *Binding In Gear Train.* Press release button and tune set manually. If binding is noted, attempt to relieve it as follows: Loosen machine screws that extend through the rear mounting plate into the spacing studs that hold the gear train. If tension is relieved, insert shim and retighten machine screw.
5. *Rotor Drags.* If the mechanism turns too stiffly, it may be that the rotor inside the drum is dragging. Lubricate rotor bearing and check to see if drum housing is peened too firmly to front plate.
6. *Oil On Driving Surfaces.* Make sure that the rubber friction cones, the intermediate drive wheel and the flywheel are free from oil. If necessary, clean with several drops of carbon tetrachloride (Carbona.)

MANUAL CONTROLS TOO STIFF

1. *Intermediate Drive Dragging.* Check intermediate drive to see that it falls back away from flywheel when motor is not running. If necessary, readjust intermediate drive mounting bracket.
2. *Motor Armature Fails To Fall Back.* The failure in Item 1, may be caused by this. Check the spring in front of the armature, also check lubrication of armature bearings. If motor armature seems to turn too stiffly, see that it is properly aligned and is not dragging at any point on its circumference. The motor bearings are of the self-aligning type and can often be brought into alignment by tapping the laminations of the motor lightly with some heavy tool.

PLANETARY DRIVE (VERNIER) DOES NOT OPERATE CORRECTLY

1. *Weak Planetary Spring.* To check this you must be able to visualize the correct assembly of the planetary. The planetary mechanism uses five loose ball bearings in all, three of which are visible through holes in the planetary housing (large tuning shaft) when the drum assembly is removed. The other two ball bearings are located inside the housing with a tension spring in between. A sixth ball bearing is spot-welded to the end of the planetary drive shaft (small tuning shaft). When assembled correctly, the ball on the end of the planetary drive shaft bears against a free ball bearing which in turn bears against the planetary spring and this spring in turn rests on another ball bearing. A weak planetary spring will cause slippage.
2. *Ball Bearing Missing.* If any of the ball bearings in the planetary assembly are lost, and this can easily happen when changing drums, the planetary will not drive satisfactorily.
3. *Race-Way Worn.* The drum bearing has a race-way on the inside, around which the three ball bearings revolve. If this is worn the only correction is a new drum.
4. *Improper Lubricant.* The planetary must be properly lubricated with a heavy lubricant, preferably vaseline.
5. *Planetary Shaft Bent.* This sometimes happens, especially when the instrument has been handled roughly in transportation. Obviously, the only correction is a new planetary assembly.

OFF CALIBRATION

1. *Travel-Lite Improperly Adjusted.* Check adjustment of the travel-lite bracket. It is adjustable and can be moved over a considerable range.
2. *Travel-Lite Split Gear.* If the calibration is off so far that the adjustment of the travel-lite bracket will not correct it, then the travel-lite split gear has probably slipped in its adjustment on the large brass gear that drives it. It will be necessary to move the split gear several notches in the required direction. In changing this adjustment, be sure you do not lose any of the split gear coil springs, and be sure the split gear is re-assembled with proper spring tension.

MANUAL TUNING BROAD

1. *Set out of Alignment.* Check alignment, following procedure outlined in this book.
2. *AFC Not Shorted Out.* Check the switch on the front of the drum to make sure that the bottom blade grounds against the front plate of the drum when the release button is pressed in for manual tuning. If this bottom blade fails to touch the drum, increase tension of small black steel spring on the release button. Replace this spring if necessary.

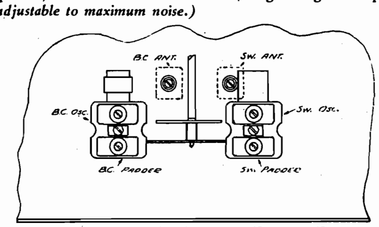
MODELS 59T1, 59T2, 59T3, 59T4, 59T5, 59K1, 69K1

GALVIN MANUFACTURING CORPORATION, 4545 W. Augusta Blvd., CHICAGO

ALIGNMENT PROCEDURE

MODELS 59T5, 59K1 and 69K1

1. Connect signal generator to control grid of Osc.-Mod. tube (6A7) through a .05 MF. condenser and to chassis. Do not remove grid cap. Also connect output meter across speaker voice coil. Turn band switch to "Broadcast" position. Turn condenser gang completely out of mesh.
2. Set signal generator at 455 K.C. and carefully adjust the four I.F. trimmers *(located in top of I.F. coil cans)* to point showing highest reading on output meter.
3. Leave band switch in "Broadcast" position. Connect signal generator to antenna and ground terminals, using a .0002 MF condenser in antenna lead.
4. Set signal generator and receiver dial both at 1700 K.C. Adjust BC OSC. trimmer until 1700 K.C. signal is heard.
5. Set signal generator at 1400 K.C. and turn condenser gang to the signal at 1400 K.C. Adjust BC ANT. trimmer to point showing highest reading on output meter.
6. Set signal generator at 600 K.C. and rock pointer at 600 K.C. position on dial scale, while adjusting BC padder, until combination is found which gives highest output reading. *(NOTE: If there is noise level at 600 K.C., padder can be adjusted to maximum noise without rocking gang and without use of signal generator. Use short wire for pick-up if necessary.)*
7. Turn band switch to "Short Wave" position. Replace .0002 MF condenser in signal generator lead with a 400 ohm carbon resistor.
8. Set signal generator and receiver dial both at 18.0 MC. Adjust S.W. OSC. trimmer until 18.0 MC signal is heard.
9. Set signal generator at 16.0 MC and turn condenser gang to signal at 16.0 MC. Adjust S.W. ANT. trimmer to point giving greatest output reading. *(Use non-metallic screw driver.)*
10. Set signal generator at 6.0 MC and rock pointer at 6.0 MC position on dial scale, while adjusting S.W. padder, until combination is found which gives highest output reading. *(NOTE: May also be adjustable to maximum noise.)*



TRIMMERS—MODELS 59T5, 59K1 and 69K1

MODELS 59T1, 2, 3, and 4

NOTE: When aligning 59T1 and 59T3 AC-DC models, it is advisable to use a blocking condenser in series with the ground connection to the signal generator. If your signal generator is AC operated it may not be possible to connect to 6A7 grid for I.F. alignment of AC-DC models, on account of AC hum. If this is so, feed 455 KC signal into antenna lead, advancing signal generator attenuator accordingly.

1. Connect signal generator to control grid of Osc.-Mod. tube (6A7) through a .05 MF condenser, and to chassis. Do not remove grid cap. Also connect output meter across speaker voice coil. Turn condenser gang completely out of mesh.
2. Set signal generator to 455 KC and carefully adjust the I.F. trimmers to point showing highest reading on output meter.
3. Connect signal generator to antenna and ground leads using a .0002 MF condenser in antenna lead.
4. Set signal generator and receiver dial both at 1700 KC. Adjust Osc. trimmer (on small section of condenser gang) until 1700 KC signal is heard.
5. Set signal generator at 1400 KC and turn condenser gang to the signal at 1400 K.C. Adjust antenna trimmer (on large section of condenser gang) to point showing highest reading on output meter.

SENSITIVITY AND STAGE GAIN MEASUREMENTS

These stage gain measurements will, if properly used, enable you to localize trouble quickly. They are intended for use with a signal generator that is accurately calibrated in microvolts.

Starting with the intermediate frequency stage, working back stage by stage finally to the antenna terminal, the circuit in which the trouble exists will quickly be determined by evidence of low gain, when signal generator attenuation readings are compared to the normal values as shown in the tables.

All stage-gain measurements must be made with the volume control set for full volume. The shielded lead from the signal generator is connected to the top grid terminal of the tube through a .1 MF condenser, with a 500M Ohm resistor connected as a leak resistance between the grid of the tube and the grid cap which has been removed.

When measuring over-all sensitivity at the antenna terminal, use a .0002 MF condenser in place of the .1 MF.

It must be remembered that the figures in the table are average, and allowance must be made for variations between two sets of the same general type, due to difference of tube characteristics, etc.

Stage gains are not given for Models 59T1 and 59T3 because of the difficulty in making accurate measurements on AC-DC receivers with the average signal generator, due to AC hum.

MODELS 59T2 AND 59T4

Microvolt Input	Generator Set at	Generator Connected to	Dummy Antenna Capacity	Leak Resistance	Output Meter **
2800	455 K.C.	6D6 Grid	.1 MF	.5 Meg	.4 Volts

Clock Data,Tuner Data

CHECKING CLOCK CONTINUITY

Although we have sealed the Time Tuning Clock against unauthorized tinkering, and have established a policy of voiding the guarantee if the seal is broken, it is possible to completely check the clock circuit for defects without removing the mechanism from its housing. This can be done by "ear" and by continuity.

The first step in checking a clock is to make sure that the motor runs and that it keeps accurate time. Just plug it into its receptacle on the chassis and check its time-keeping qualities against a known source of accurate time.

If this test indicates that the clock motor is not running, it would be advisable to make certain that the receptacle on the chassis base is "live" and that 110 volts, 60 cycle A.C. is available at that point.

Before attempting to check the clock continuity, it would be helpful to go through a little practice course in listening to the sounds the clock makes. First, remove the clock assembly from its mounting on the control panel of the receiver, and hold it in your hands while you turn the time set knob on the back. While turning the knob, hold the clock up to your ear, listening for the clicks. When the minute hand passes any of the four quarter-hour intervals into which each hour is divided, you will hear two clicks, the second of which falls very closely after the first one. These clicks are caused by the quarter-hour cam switch blades dropping off of the cams.

As you turn the time set knob, you will notice another single click which is a little louder and sounds a trifle more metallic than the double click which you get at the exact quarter-hour intervals. This single click will be heard when the minute hand is passing a point that is approximately half way between the quarter-hour positions. This click is caused by the contact on the twenty-four hour hand as it falls off of one time bar to make contact upon the next time bar.

If you will go through this operation several times, you will soon be able to identify these sounds. Once you are able to recognize them, you will be able to thoroughly check the continuity of the clock control circuit, without the necessity of looking inside the mechanism. Proceed as follows:

1. With the time set knob, turn the clock hands until they read fifteen minutes to twelve on the day cycle. Look through the peep-hole to make sure of this.
2. Slowly turn the time set knob forward until the minute hand indicates approximately two minutes to twelve. In the course of this movement you will hear, unless the clock is defective, a single click which indicates that the twenty-four hour contact has come to rest upon the twelve o'clock noon time bar.
3. Now *very slowly* continue to turn the time set knob forward until you hear the first click, which indicates that the top blade of the twenty-four hour cam switch has fallen off of the large cam, causing the cam switch circuit to close. As soon as you hear this first click, stop turning the time set knob, for if you turn it far enough to hear the second click, the contact will be broken. The trick is to turn it just far enough, but not too far.
4. Clear the clock of all previous settings by inserting a finger in the "OFF" position of the finger dial, and dialing counter-clockwise until the stop is reached.
5. With the round time-selecting knob on the front of the clock, turn the red time selecting pointer to 12:00 o'clock noon.
6. With a continuity meter, check continuity between Terminal No. 9 and all of the other terminals on the plug at the end of the clock cable. You should get no reading. Terminal No. 9 is connected to the common lead.
7. Dial the "OFF" position just as you would if you were setting up the clock to turn the radio off at 12:00 o'clock noon. Check continuity between Terminal No. 9 and Terminal No. 7. You should get a full scale reading indicating a complete circuit. (Terminal No. 7 connects to the off relay when the clock is plugged into the chassis).
8. Dial Station No. 1 and check continuity between Terminal No. 9 and Terminal No. 1 of the clock cable. A full scale reading should result.
9. In their respective order, dial Stations 2, 3, 4, 5, and 6, checking continuity after each dialing between Terminal No. 9 and Terminals 2, 3, 4, 5, and 6, respectively. In each case you should get a full scale deflection of your continuity meter between Terminal No. 9 and the terminal which corresponds in number to the position you have dialed on the finger ring.

The procedure through which you have gone up to this point will, if the proper readings have been obtained, tell you that the slider on the time bar which represents the 12:00 o'clock noon position, is making a proper contact with each of the station rings and the "OFF" ring in the clock.

10. Next turn the clock hands knob to the 12:15 o'clock position, also turn the red time-selecting pointer to the 12:15 o'clock position, and repeat Steps 1 to 9 for the 12:15 o'clock position. To check the clock 100%, it will be necessary to repeat the procedure ninety-six times, one for each fifteen minute interval of the twenty-four hour day.

However, if the test which you have made at the 12:00 o'clock noon position shows the mechanism to be O.K. it should not be necessary to go through the entire operation. A test made at 12:00 o'clock noon and 12:00 o'clock midnight, and tests at 6:00 A.M. and 6:00 P.M. should give you a fairly accurate test. However, it is possible that, due to damage or improper adjustment of one individual time bar or slider, the clock fails to operate at one particular quarter-hour period, although it operates as it should at all other times. In this case, a continuity test would be advisable at the particular time setting at which failure has been noted.

THE CLOCK

As indicated in the circuit diagrams, the clock tuner is connected in parallel with the push-buttons. The clock cable and the push-button cable are interchangeable and either one may be plugged into the 9 contact receptacle on the chassis base, or the one on top of the tuner. The clock is sealed at the factory and breakage of the seal voids the guarantee. Defective clocks should not be serviced in the field but should be returned to the Motorola distributor in the territory.

Although the clock is sealed, it is easy to check its continuity for defects without removing it from its housing, by following the instructions on this page.

THE REMOTE CONTROL

The station tuning buttons in the remote control box are also connected in parallel with the escutcheon push-buttons. The remote cable, however, has eleven leads instead of nine. The two extra leads are for the volume control motor.

TO SET AUTOMATIC TUNER

1. From the set of rectangular call letter tabs provided with the radio, detach the proper ones for your six favorite stations. The station tabs should then be inserted over the station tuning buttons in the order of frequency. For example, the station with the lowest frequency should be set for No. 1 button, the next station on the dial to No. 2 button, etc. High frequency stations (1200 to 1500 K.C.) should always be set for buttons No. 5 and No. 6. This will assure accurate tuning.

2. Loosen the AUTOMATIC LOCKING KNOB, which is located on the automatic tuner facing the rear. This knob should be turned counter-clockwise four or five revolutions—far enough to assure plenty of looseness.

3. Press button No. 1 and hold it down until the electric tuner has come to a complete stop.

4. Continue to hold No. 1 button down and tune in manually (by means of tuning knob) the station whose call letters you have inserted over the button. After the station has been tuned perfectly, remove your finger from the button.

5. Proceed to set up the remaining buttons to the selected stations, following the same procedure.

6. Tighten the automatic locking knob very securely.

CAUTION: If by chance you wish to set up for automatic tuning, a police station in the 1712 K.C. Police band, you must be extremely careful in making the setting. There is a possibility of turning the mechanism so far to the high frequency end of the dial, that the latch bar with the trigger on it will not fall into the stop on the station control ring. If this occurs the mechanism will continue to run as long as the button is held down. To correct it, it will be necessary to go around to the rear of the receiver and turn the control ring back by hand until the stop will engage. If you are in doubt about this procedure, observe the operation of a latch-bar that works correctly, and notice how it falls into the stop on the control ring.

MOTOR AND REVERSING SWITCH ADJUSTMENTS

Correct operation of the Motorola Automatic Tuner will depend to a great extent upon the spacing of the points on the main motor switch and the reversing switch. Although proper adjustment is important, it is by no means critical and can be easily accomplished as follows:

TO ADJUST MAIN MOTOR SWITCH

1. Insert 1/8" feeler gauge between the latch bars and the high side of the latch rings. Adjust the fibre latch gate stop plate so the 1/8" spacing will be maintained when the latch bars are at rest.
2. Check main motor switch (mounted on top side of magnet support plate). Contacts should be open 1/8" when latch bars are at rest.
3. Pull down on No. 1 latch bar and check closing of main motor switch. Contacts should just close firmly when latch bar comes within .02" of latch ring (high side).
4. When latch bar is touching high side of latch ring, the bottom switch leaf should be lifted slightly from the heavy spacer leaf. TO ADJUST AN IMPROPER SPACING, BEND HEAVY SPACER LEAVES—NEVER BEND CONTACT LEAVES.

TO ADJUST MOTOR REVERSING SWITCH

5. Check open position of reversing switch (mounted on bottom side of magnet support plate). With latch bars at rest the top contacts should be closed and the bottom contacts open.
6. Pull down on No. 6 latch bar until it touches *high* side of latch ring and check reversing switch contacts. Top contacts should still be closed and bottom contacts open.
7. Pull down on No. 6 latch bar until it touches *low* side of latch ring. Top contacts should now be just slightly open and bottom contacts just firmly closed, with lower switch leaf lifted slightly from heavy spacer leaf. TO ADJUST BEND SPACER LEAVES—NEVER BEND CONTACT LEAVES.

ALIGNMENT PROCEDURE—MODELS 89K1 AND 89K2

1. Connect signal generator to control grid on Osc.-Mod. tube (Type 6A7) through an .05 MF condenser and to chassis. Do not remove grid cap. Also connect output meter across speaker voice coil.
2. Set signal generator at 455 K.C. and carefully adjust the four I.F. trimmers (located in top of I.F. coil cans) to point showing highest reading on output meter.
3. Connect signal generator to antenna and ground terminals, using a .0002 MF condenser in antenna lead.
4. Set signal generator and receiver dial both at 1700 K.C. and adjust oscillator trimmer until 1700 K.C. signal is heard. (Oscillator trimmer can be reached through hole in chassis base).
5. Set signal generator at 1400 K.C. and turn condenser gang to the signal at 1400 K.C. Adjust antenna trimmer (on rear section of gang) and R.F. trimmer (on front section of gang) to point showing highest reading on output meter.
6. Set signal generator at 600 K.C. and rock dial pointer at 600 K.C. position on dial scale while adjusting oscillator padder until combination is found which gives highest output reading. (Oscillator padder can be reached through hole in chassis base).

NOTE: If there is noise level at 600 K.C. padder can be adjusted to maximum noise without rocking gang and without use of signal generator. Use short wire for pick-up if necessary.

ELECTRIC TUNER SERVICE SUGGESTIONS

Following you will find a list of troubles you may experience with the automatic tuning system as used in Models 89K1, 109K1, and their remote control versions. Each possible failure is followed by suggestions which may aid you in quickly solving your service problems with these models.

RECEIVER FAILS TO TURN "ON" AND "OFF"

1. **MASTER SWITCH "OFF"**—This switch is located on rear of chassis base. It must be in the "ON" position if the radio is to operate.
2. **OPEN RELAY**—Check relay magnet coils for open circuit. Replace if necessary. (NOTE: "ON" magnet is A.C. operated. "OFF" magnet is D.C. Do not reverse.)
3. **RELAY ARMATURE STUCK**—Check relay armature for sticking and freedom of movement. Readjust if possible or replace relay if necessary.
4. **RELAY COIL SHORTED**—This would reduce pulling power of relay magnet. Replace if necessary. "ON" magnet winding resistance should be 3.5 ohms. "OFF" magnet should measure 14.0 ohms.
5. **RELAY CONTACTS NOT CLOSING PROPERLY**—Double set of contacts for power transformer primary must close firmly in "ON" position and break cleanly (about 1/32") in "OFF" position. Triple set of contacts must reverse cleanly when relay reverses (about 1/32" break on open side and firm contact on closed side.) Adjust if necessary by careful bending.
6. **DEFECTIVE DRY DISC RECTIFIER**—If rectifier is defective, receiver will not turn OFF. A.C. input to rectifier should measure 6.75 volts with 115 volt A.C. line. (In remote control models 89K2 and 109K2, this value is 10.2 volts.) D.C. output from rectifier should measure 5 volts or higher. Measure voltage while pressing "ON" button. Replace rectifier if necessary.
7. **DEFECTIVE STAND-BY TRANSFORMER**—If primary or secondary of stand-by transformer is open, the set will not turn on. Secondary voltage should measure 13 volts A.C. with 115 volt line.
8. **SHORTED 2000 MF FILTER CONDENSER**—This is a filter and hash condenser connected across the dry disc rectifier.
9. **OPEN HASH CHOKE**—This choke looks like a tuning magnet and is connected in negative lead of rectifier output. Resistance .3 ohms.
10. **OPEN PUSH-BUTTON CIRCUIT**—Check push-button contacts on escutcheon, check cable for continuity and check plug receptacle on chassis base for poorly soldered connections or open leads. Make sure plug fits firmly in receptacle. (NOTE: Nine lead cables from escutcheon and clock are interchangeable and either one may be plugged into the nine terminal receptacle on the chassis base or the one on top of the tuner.)
11. **LOW LINE VOLTAGE**—The relay will operate down to about 100 volts in the A.C. line. Do not try to make the receiver work on lower voltage.
12. **"ON" COIL OPEN**—Do not confuse this with the "ON" magnet in the relay. It is a duplicate of a station magnet and is mounted under the chassis base on the back apron and near the nine terminal receptacle. (Resistance 1.4 ohms.)
13. **"TIME ON" LIGHT GROUNDED**—If the circuit leading to the light is grounded, the set will not turn "OFF."

RECEIVER FAILS TO TUNE STATIONS

1. **DEFECTIVE STATION MAGNET**—An open magnet coil or a shorted one will not pull latch bar down. Replace if necessary. Resistance of station magnets should be 1.4 ohms. Also check balance of magnet circuit.
2. **DEFECTIVE DRY DISC RECTIFIER**—Check output as above. Station magnets require 3.8 to 5.0 volts D.C. Measure under load by pressing any station button.
3. **LATCH BAR STICKING**—Check latch bars for binding or for sticking in latch ring of previously tuned station. Check for burr on tip of latch. Also check alignment of latch bars with reference to latch rings. The tip of the latch bar and the trigger must both fall within the width of the latch ring. Bend carefully if necessary to center them.
4. **OPEN PUSH-BUTTON CIRCUIT**—Check as outlined above.
5. **POOR SWITCH CONTACTS**—Main motor switch must make positive contact when latch gate is pulled down by latch bar and the latch bar is resting on the ***high*** side of the latch ring. The reversing switch must reverse positively when the latch bar falls to the ***low*** side of the latch ring. Clean contacts with Carbona. If necessary adjust as per instructions on page 3.
6. **DEFECTIVE LATCH TRIGGER**—If trigger fails to pull latch gate down, main motor switch will not close. Check trigger spring and trigger pivot for freedom from binding. Replace latch bar assembly if necessary.
7. **DEFECTIVE MOTOR**—Replace if necessary.
8. **MOTOR RESISTOR OPEN**—Check 20 ohm resistor mounted across motor terminals. (In Models 109K1 and 109K2, this resistor is replaced with a 60 MF motor starting condenser.)
9. **POWER TRANSFORMER OPEN**—Check output of power transformer secondary that supplies motor current. Should measure 24 volts across winding. In Model 89K1 only, this winding has a tap at 6.3 volts for dial lights.

TUNER OPERATES SLUGGISHLY

1. **HIGH RESISTANCE IN MOTOR CIRCUIT**—Check main motor and reversing switches. Clean and adjust if necessary.
2. **BINDING IN MECHANISM**—Tune receiver manually to make sure there is no binding in dial drive assembly or tuner assembly.
3. **GEARS NOT PROPERLY MESHED**—Check all gears in assembly for binding due to improper meshing.
4. **MECHANISM NOT PROPERLY LUBRICATED**—Apply light oil sparingly to all bearings and moving parts.
5. **LOW LINE VOLTAGE**—Measure line voltage. The receiver is not designed to work on less than 100 volts.
6. **DEFECTIVE MOTOR**—Replace.
7. **DEFECTIVE MOTOR RESISTOR**—Replace. (In 109K1 and 109K2, a 60 MF condenser is used.)

FAILS TO TUNE ACCURATELY

1. **ORIGINAL SETTING NOT ACCURATE**—Set up stations carefully, following instructions in installation book. Set high frequency stations on the inner rings (No. 5 and No. 6), low frequency stations on the outer rings.
2. **TOO MUCH TENSION ON LOCKING LEVERS**—When the automatic locking screw is loose, the station rings should move freely. If they don't, check the tension of the three lock washers under the three locking levers and if they cause the levers to still hold the station rings partially locked, the screws which hold the levers in position should be loosened one-quarter to one-half turns.
3. **BINDING AT LOCKING SCREW**—The automatic locking screw passes through a triangular shaped support bracket before it screws into the rotor assembly. If the nut into which it screws is not concentric with the rotor, the locking screw shaft will wobble slightly as it turns and when tightened will throw the station setting off, due to binding between the shaft and the triangular bracket. If this causes trouble, remove the bracket and leave it off. Its main purpose was to support the back end of the rotor while the receiver was in transit. It is not needed for the operation of the tuner. It has been left out of late type receivers.
4. **AUTOMATIC LOCKING SCREW LOOSE**—If this screw is not securely tightened, each operation of the tuner will cause the latch rings to slip a trifle.
5. **TIP OF LATCH BAR DOES NOT FALL INTO NOTCH**—To tune accurately, the latch bar must fall into notch on latch ring far enough to lock the rotor assembly firmly. If rear end of latch bar hits magnet pole before tip reaches bottom of notch, it may be necessary to bend latch bar slightly. Always bend at magnet end.

LATCH BAR STICKS ON MAGNET POLE

1. **ARMATURE RIVET WORN**—There is a brass rivet at the tip of the armature, to prevent the armature freezing to the magnet. If this rivet is worn down, permitting the steel armature to actually touch the magnet pole, it may freeze in that position.
2. **LATCH TRIGGER CATCHES ON EDGE OF LATCH RING**—Realign latch bar by bending so tip and trigger fall within width of latch ring.

MOVES FROM STATION AFTER BUTTON HAS BEEN RELEASED

1. **CHECK MAIN MOTOR SWITCH**—If the main motor switch points are spaced too close together the bounce of the latch gate, as the trigger releases it, will cause the main motor switch to close momentarily, causing the mechanism to move slightly away from the station.

MODEL 6K
Voltage, Alignment
Data, Parts

GAMBLE-SKOGMO, INC.

Series 6K — Automobile Radio

I. F. Adjustment

Set the signal generator for a signal of 175 KC.

Connect the output of the signal generator through a .05 mf. condenser to the stator of the R.F. inter-stage section of the tuning condenser. (See Fig. 2 for location of this section.)

Connect the ground lead of the signal generator to the chassis ground.

Turn the Local-Distance switch to the Distance position and keep it in this position for all adjustments.

Set the volume control at the maximum position.

Attenuate the signal from the signal generator to prevent the levelling-off action of the AVC.

Then adjust the three I.F. trimmers until maximum output is obtained. The location of these trimmers is shown in Fig. 2.

1575 KC Adjustment

Set the signal generator for 1575 KC.

Turn the rotor of the tuning condenser to the full open position.

If a low capacity antenna is used, connect the shielded antenna lead from the chassis through a 150 mmf. condenser to the antenna post of the signal generator. (If high capacity, use 1500 mmf.) The antenna plug must be correctly inserted, dependent on the capacity of the antenna used.

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent AVC action.

Adjust the trimmer of the oscillator section of the three gang condenser until maximum output is obtained—see Fig. 2 for location of this trimmer.

1400 KC Adjustment

Set the signal generator for 1400 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the R.F. interstage and antenna 1400 KC trimmers for maximum output.

Replacement Parts

There is a large letter on the chassis which identifies the set as to major part changes. When ordering parts please be sure to mention the series number and this large letter.

MISCELLANEOUS

SOCKETS

Part No.	Description	List Price
P-3A223	6J7 Tube Socket	$0.15
P-3A211	6K7 Tube Socket	.15
P-3A205	6A6 Tube Socket	.15
P-3A116	41 Tube Socket	.10
P-3A120	6B7 Tube Socket	.15
P-3A229	6 Prong Socket (External Speaker)	.15
P-3A226	Antenna Socket	.10
P-3A228	Vibrator Socket	.15
P-3A231	4 Prong Socket (Internal Speaker)	.10

SPEAKER

P-12A242	6" Dynamic Speaker	$4.35

Do not change the setting of the oscillator trimmer.

600 KC Adjustment

Set the signal generator for 600 KC.

Connect the output of the signal generator through a .05 mf. condenser to the control grid of the 6K7 R.F. tube.

Turn the tuning condenser rotor until maximum output is obtained. Then turn the tuning condenser rotor back and forth, at the same time adjusting the 600 KC padder (see Fig. 2) until the peak of greatest intensity is obtained.

Re-connect the output of the signal generator to the shielded antenna lead through a 150 mmf. condenser (1500 mmf. if antenna is high capacity).

Adjust the 600 KC antenna trimmer to maximum. This trimmer is reached from the outside of the case —see Fig. 3.

Adjusting Antenna 600 KC Trimmer

After the receiver is installed and the car antenna is connected, it will be necessary to adjust the antenna trimmer. Tune in a weak signal at approximately 600 KC with the volume control about three-fourths on. Turn the adjusting screw of the antenna 600 KC trimmer up or down until maximum output is obtained. See Fig. 3 for location of this trimmer.

As shown in this illustration, the antenna plug is inserted in one of two ways, depending on whether the car has a high or low capacity antenna. Full instructions are in the installation manual packed with each radio.

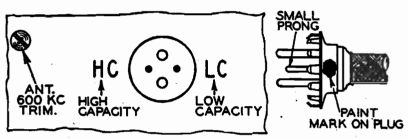

Fig. 3—Antenna Plug Insertion

In the voltage chart are given the voltages at the sockets with all tubes in and the set in operating condition. The antenna should be disconnected.

To calibrate the radio, tune in a station of known frequency. At the back of the control head is the calibration screw. Remove the pilot lamp assembly. Insert a fine blade screwdriver and turn this screw until the pointer on the dial scale is at the frequency of the station being received. The knob must be held during this adjustment.

If the control head is inaccessible it may be calibrated by setting the pointer from the front. Remove the crystal by inserting a knife blade under the lower edge. Loosen the pointer screw, set the pointer and retighten.

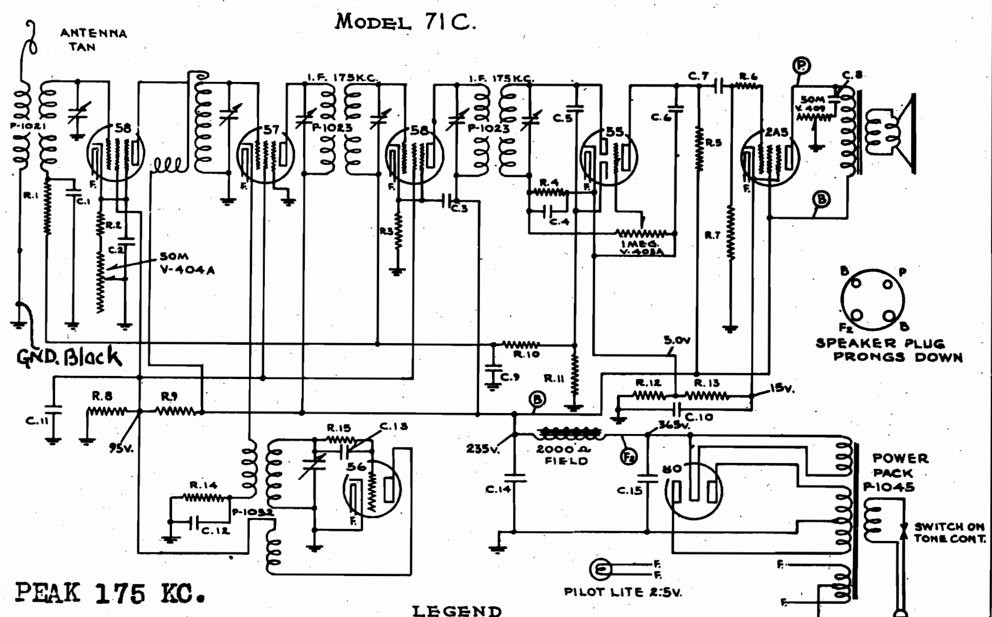
MODEL 71C.



SERVICE NOTES

To peak I.F. transformers connect oscillator (set at 175 KC) to grid of 57 first detector and (Black) ground wire. Adjust four trimmers from bottom of chassis (one nut and one screw on each transformer trimmer) to resonance (maximum deflection on an output meter connected across the primary of the speaker input transformer).

Connect an oscillator in series with a 200 MMFD condenser to the Tan (Antenna) wire and Black (ground) wire, with the oscillator set at 1720 KC and the variable condenser at its minimum position (extreme right of its rotation) adjust trimmer of oscillator (front) section of variable condenser to resonance. Set oscillator to 1400 KC and rotate variable condenser until signal is tuned in, then adjust ANT. and R.F. trimmers (center and rear sections of condenser) to resonance. Check output at 1200, 1000, 800, and 600 Kilocycles, bend plates of center and rear sections of variable condenser only if necessary.

IF PEAK 175 KC.

CHASSIS 8X is for 25 cycle operation, and is same as CHASSIS 8 except for power transformer and use of untuned filter system. The .06 mfd condenser connected across the filter choke, as shown in the schematic, is not used.
CHASSIS 8X can be used on a 60 cycle line. If hum is too loud, the above-mentioned .06 mfd condenser can be added.

ALIGNMENT PROCEDURE MODEL 526 T.R.F. 2 BAND.

All alignments must be made with the volume control turned full on and with the signal input from the generator reduced to as low a value as possible while still giving a sufficient output to be easily read on the output meter.

Connect the output meter, through a .5 M.F. condenser and a resistance of such a value as to make the total meter resistance approximately 4000 ohms, to the plate and screen terminals of the 43 socket. The output meter remains connected during the entire alignment procedure.

Connect the signal generator to the antenna lead through a .00025 M.F. condenser. Connect the ground of the generator to the receiver chassis through a .1 M.F. condenser. With the wave switch on broadcast position and the dial set to 1400 K.C., feed in a 1400 K.C. signal. Adjust the trimmers on top of the gang condenser until the maximum output is obtained.

Turn the wave switch to short wave position and tune in a 4.5 M.C. signal from the generator. Adjust the 4.5 M.C. antenna trimmer to maximum output.

ALIGNMENT PROCEDURE

All alignments must be made with the volume control turned full on and with the signal input from the generator reduced to as low a value as possible while still giving a sufficient output to be easily read on the output meter.

Connect the output meter, through a .5 M.F. condenser and a resistance of such a value as to make the total meter resistance approximately 7000 ohms, to the 2 small pins of the speaker plug. The output meter remains connected during the entire alignment procedure.

Connect the signal generator to the grid cap of the 6A7 tube through a .1 M.F. condenser. Connect the ground of the generator to the ground lead of the receiver. Set the dial to about 1000 K.C., feed in a 456 K.C. signal. Adjust the trimmers on top of the first and second I.F. transformers until the maximum output is obtained. This aligns the I.F.

Turn the dial to the extreme high frequency end. Feed a 1740 K.C. signal to the receiver antenna lead through a .00025 M.F. mica condenser. Adjust the 1740 K.C. oscillator trimmer until maximum output is shown. Set the generator to 1400 K.C. and tune in this signal on the receiver. Then adjust the 1400 K.C. antenna trimmer to maximum output. This completes the alignment.

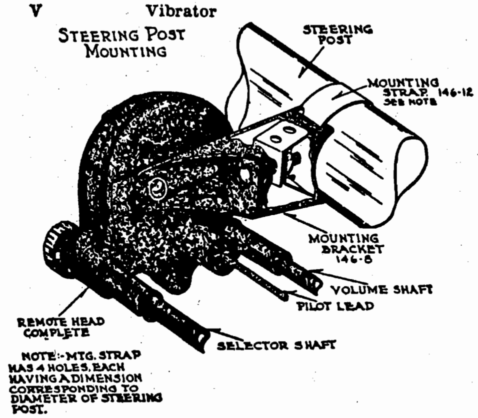
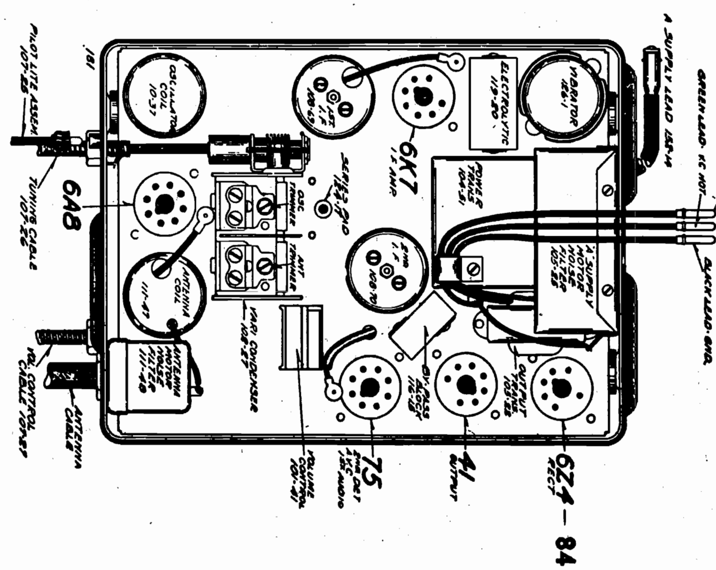
STEERING POST MOUNTING





MODEL 566
Alignment, Dial Data

GAMBLE SKOGMO, INC.

ALIGNING INSTRUCTIONS:

All of the adjustments have been very carefully set with signal generators at the factory and require no further adjustment, unless it becomes necessary to replace a coil or transformer or if the adjustments have been tampered with in the field. Under no circumstances attempt any adjustments without first making certain that adjustment is necessary and only after voltages, tubes and condensers have been checked and found to be normal. To properly re-align this receiver, a test oscillator, as well as an output meter, must be used.

DUMMY ANTENNAS:

The dummy antennas referred to in the following instructions are:

"I.F. Dummy" —A .1 mfd. condenser connected in series with the test oscillator output lead.

"Broadcast Dummy"—A 175 mmfd. condenser connected in series with the output lead of the test oscillator.

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and the screen of the type 41 output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

I.F. ALIGNMENT

1. With variable condenser in its minimum capacity position (plates entirely out of mesh) and with volume control full on, connect test oscillator set at 465 K.C. in series with I.F. dummy antenna, to grid of 6K7 tube.
2. Adjust trimmer condensers of output I.F. transformer (No. 108-70) to resonance with oscillator.
3. Move test oscillator connection to grid of 6A8 tube and adjust trimmer condensers of input I.F. transformer (No. 108-69) to resonance with oscillator, again going over trimmers of output I.F. transformer (No. 108-70). See top view for location of these transformers. There are two adjustments on each and they are accessible from the top of the transformer shield and should be adjusted with an insulated screw driver.

BROADCAST ALIGNMENT

1. With variable condenser in its minimum capacity position, connect test oscillator set at 1550 K.C. in series with broadcast dummy to the antenna lead of the receiver.
2. Adjust oscillator trimmer of variable condenser to resonance. (This adjustment is rear section of gang—see top view.)
3. Shift test oscillator to 1400 K.C. and pick up signal by rotating condenser and adjust antenna trimmer to resonance—see top view.
4. Re-set test oscillator to 600 K.C. and rotate variable condenser to 600 K.C. Adjust series pad, rocking gang condenser to and fro, at the same time adjusting series pad for maximum gain.

   This adjustment is accessible from the top of chassis—see top view.
5. Go back and check 1400 K.C. If adjustment is made here, check 600 K.C. again.
6. Check for sensitivity at 1000 K.C. by setting test oscillator to this frequency and picking up the signal by rotating variable condenser. UNDER NO CIRCUMSTANCES BEND PLATES OF VARIABLE CONDENSER SECTIONS TO CORRECT TRACKING.

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

In order to prevent signal from acting upon A.V.C. and affecting accuracy of voltage measurements, aerial and ground leads should be short circuited while making measurements.

All voltages are to be measured with 6.3 volts input to receiver. Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good. If fuse blows out frequently and insulating sleeve has been properly placed over fuse, the trouble is probably in the vibrator, it should be replaced. Do not attempt to make any adjustments on the vibrators.

DIAL ADJUSTMENT:

Tune set to some station of a known frequency (between 800 and 1200 K.C.) hold selector knob, then with a screw driver adjust the slotted screw on the back of the control head, and in that way adjust the dial pointer to the correct frequency setting.

CHECK FOR MOTOR NOISE (Chassis Pickup):

After the above instructions have been followed, with the hood clamped down to prevent radiation and the motor running, the receiver should be turned on and the dial turned off a station, with volume control at maximum. If motor noise is objectionable the next step is to determine whether the interference is originating through chassis pickup or from the antenna.

To check for chassis pickup, disconnect the antenna from the antenna cable and ground the antenna lead to shield of cable. Chassis pickup is due to the electrical interference being radiated or fed back through the frame of the car into the receiver or through the storage battery to the receiver.

It may be necessary when chassis pickup is present to ground the choke and gas throttle rods securely to the firewall at the point which they enter the drivers compartment.

Chassis pickup can be reduced by reducing the gap between contacts and the rotating arm in the distributor head. To do this, apply solder to the end of the rotor arm. Replace the rotor in the distributor and turn the engine over slowly with the crank in order to clean the excess solder. The rotor should not brush or wipe the contacts inside the distributor cap, but should just clear them. As an additional precaution check the breaker points. They should be thoroughly cleaned and adjusted or new points installed if they are badly worn. In stubborn cases a good grade mica .002 to .006 condenser connected across the breaker points will reduce interference. The ignition system of a car must be kept in good condition and leaky cracked high tension wires and bad spark plugs should be replaced In many cars the low tension battery leads, etc., are grouped together with the high tension wires. These leads will very often pick up motor noise and feed it into the receiver through the battery circuit. In cases such as these it will be necessary to separate the low tension from the high tension wires and run them through another hole if they run from the engine compartment up to the instrument panel. This condition, as explained previously, is particularly true on the V-8 Ford as the battery and primary leads run through a special tube which also houses the high tension leads. Shield and ground these leads.

NOTE—Where ignition coils are mounted in motor compartments a .5 mfd cond (148-1 or 148-3) connected between primary coil terminal and receiver mounting bolt will often reduce motor noise.

Accessories such as lighters, electric motor heaters, horns, light switches, automatic relays, electrical gauges such as oil, water and gas are often a source of interference. In these cases the procedure is to try a condenser from ground to various accessories until the interference is eliminated, then install the condensers in those places permanently. Spark intensifiers should not be used.

NO SPARK PLUG SUPPRESSORS
ARE REQUIRED

ALIGNMENT PROCEDURE

All alignments must be made with the volume control turned full on and with the signal input from the generator reduced to as low a value as possible while still giving a sufficient output to be easily read on the output meter.

Connect the output meter, through a .5 M.F. condenser and a resistance of such a value as to make the total meter resistance approximately 7000 ohms, to plate and screen pins of output tube, or a low voltage A.C. meter may be used connected across speaker voice coil. The output meter remains connected during the entire alignment procedure.

Connect the signal generator to the grid cap of the 6A7 tube through a .1 M.F. condenser. Connect the ground of the generator to the ground lead of the receiver. Set the dial to about 1000 K.C., feed in a 456 K.C. signal. Adjust first and second I.F. trimmers for maximum output. Refer to chassis lay-out for location of trimmers.

Turn the dial to the extreme high frequency end. Feed a 1740 K.C. signal to the receiver antenna lead through a .00025 M.F. mica condenser. Adjust the 1740 K.C. oscillator trimmer until maximum output is shown. Set the generator to 1400 K.C. and tune in this signal on the receiver. Then adjust the 1400 K.C. antenna trimmer to maximum output. This completes the alignment.

ALIGNMENT PROCEDURE

Connect the output meter, through a .5 M.F. condenser and a resistance of such a value as to make the total meter resistance approximately 7000 ohms, to the 2 small pins of the speaker plug. The output meter remains connected during the entire alignment procedure.

Connect the signal generator to the grid cap of the 6A7 tube through a .1 M.F. condenser. Connect the ground of the generator to the ground lead of the receiver. With the wave switch on broadcast position and the dial set to about 1000 K.C., feed in a 456 K.C. signal. Adjust the trimmers on top of the first and second I.F. transformers until the maximum output is obtained. This aligns the I.F.

Leaving the wave switch on broadcast position turn the dial to the extreme high frequency end. Feed a 1730 K.C. signal to the receiver antenna lead through a .00025 M.F. mica condenser. Adjust the 1730 K.C. broadcast oscillator trimmer until maximum output is shown. Set the generator to 1400 K.C. and tune in this signal on the receiver. Then adjust the 1400 K.C. broadcast antenna trimmer to maximum output. Set the generator to 600 K.C. and adjust the 600 K.C. broadcast oscillator pad to maximum output **while tuning the receiver back and forth across the signal** from the generator. This completes the alignment of the broadcast band.

The short wave band is aligned while feeding a 6.0 M.C. signal to the receiver antenna lead through a .00025 M.F. mica condenser. Turn the wave switch to short wave position and tune in the 6.0 M.C. signal. Adjust the 6.0 M.C. short wave trimmer to maximum output.

ALIGNMENT PROCEDURE

All alignments must be made with the volume control turned full on and with the signal input from the generator reduced to as low a value as possible while still giving a sufficient output to be easily read on the output meter.

Connect the output meter, through a .5 M.F. condenser and a resistance of such a value as to make the total meter resistance approximately 7000 ohms, to the 2 small pins of the speaker plug. The output meter remains connected during the entire alignment procedure.

Connect the signal generator to the grid cap of the 6A7 tube through a .1 M.F. condenser. Connect the ground of the generator to the ground lead of the receiver. With the wave switch on broadcast position and the dial set to about 1000 K.C., feed in a 456 K.C. signal. Adjust the trimmers on top of the first and second I.F. transformers until the maximum output is obtained. This aligns the I.F.

Leaving the wave switch on broadcast position turn the dial to the extreme high frequency end. Feed a 1730 K.C. signal to the receiver antenna lead through a .00025 M.F. mica condenser. Adjust the 1730 K.C. broadcast oscillator trimmer until maximum output is shown. Set the generator to 1400 K.C. and tune in this signal on the receiver. Then adjust the 1400 K.C. broadcast antenna trimmer to maximum output. Set the generator to 600 K.C. and adjust the 600 K.C. broadcast oscillator pad to maximum output **while tuning the receiver back and forth across the signal** from the generator. This completes the alignment of the broadcast band.

The short wave band is aligned while feeding a 6.0 M.C. signal to the receiver antenna lead through a .00025 M.F. mica condenser. Turn the wave switch to short wave position and tune in the 6.0 M.C. signal. Adjust the 6.0 M.C. short wave trimmer to maximum output.

Follow the procedure outlined below, in order to adjust the push-buttons properly:

1. By means of the Station Selector Knob tune in WITH THE RIGHT HAND AS ACCURATELY AS POSSIBLE the station having the lowest frequency—that is, your selected station which is tuned in nearest the right-hand side of the dial.

2. After the station has been tuned in accurately with the right hand, continue to hold it in its exact position firmly, and with the left hand loosen the Push-Button to be set up for that station by unscrewing the Push-Button about one turn to the left (counter-clockwise).

3. Continuing to hold the Station Selector Knob in its exact position, PUSH THE PUSH-BUTTON IN ALL THE WAY with the left hand.

4. After the Push-Button has been depressed all the way, tighten it gently toward the right (clockwise). Release Push-Button slowly and when in normal position grip button and tighten firmly.

The Push-Button tuning system is now correctly set up for your first selected station of lowest frequency and the Call Letter Tab for this station should be at the extreme right of the Call Letter Holder.

Follow through with this same procedure, setting up the other 5 stations in the order of their frequency—that is, the second station set up will be second lowest in frequency and the third station set up will be third lowest in frequency.

Carefully check each Push-Button for the accuracy of the setting.

GAMBLE SKOGMO, INC.

MODEL 648
Alignment
MODEL 735
Tuner, Voltage

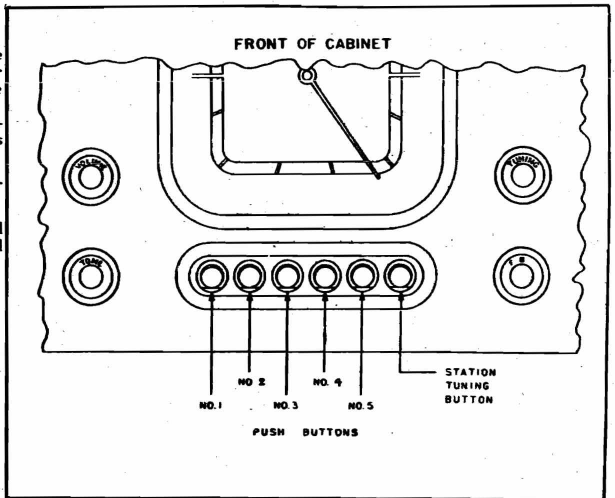
MODEL 735 **CONTROLS**

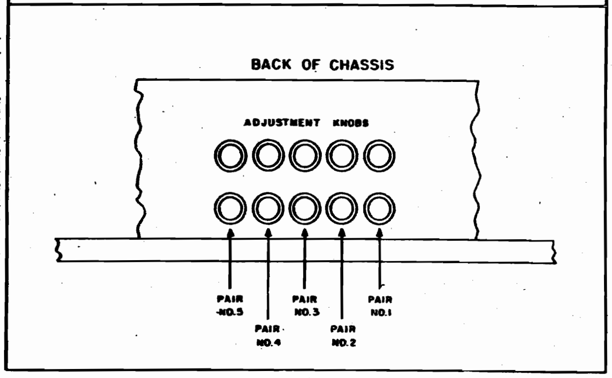
This receiver has 4 controls, the left hand upper knob being the volume control, the left hand lower knob the tone control and "on-off" switch, the upper right hand knob the tuning control and the lower right hand knob the wave switch.

The wave switch has three positions. When turned to the left it is in position for the reception of standard broadcast stations. The other two positions are for the reception of short waves: police calls, amateurs, aircraft, etc.

The tuning knob selects the station desired and may be turned in either direction to its limit of rotation as shown by the dial.

In addition to these four controls there is also a row of six buttons located just below the dial. The use and the adjustment of these buttons is described in the "Operation" and "Instamatic Tuning" sections.





INSTAMATIC TUNING

The purpose of Instamatic tuning is to give the user instant, automatic tuning of any one of a selection of favorite broadcast stations. The control buttons are conveniently located just below the tuning dial. Pushing in any button will release any other button which happens to be already in. After the Instamatic tuning feature has been properly adjusted, this will instantly and automatically tune in the station selected by this button.

Before attempting to adjust or use Instamatic tuning, the "Installation" and "Operation" instructions must be carefully followed. When the receiver is operating satisfactorily using the tuning dial with the "Dial Tuning" button pressed in, the Instamatic feature may be easily adjusted by carefully following these instructions.

Located on the back of the chassis is a row of five pair of small bakelite adjustment knobs. Each pair of these knobs controls the tuning of the station for the Instamatic button which is in the same relative position.

With the receiver operating with the "Dial Tuning" button in and the wave switch on broadcast position, turn the tuning knob to the left until the 540 KC end of the band has been reached. Then turn the tuning knob to the right until a station, for which it it desired to have Instamatic tuning, is heard. Press in the Button No. 1. This is the button at the left hand end of the row. Reach around to the back of the receiver and turn upper knob of the Pair No. 1 until the same program is heard. Unless the wrong knob is being turned, several different stations will be heard during this procedure. If necessary to check that the same program is now tuned in, the "Dial Tuning" button may again be pressed. In this way it can be determined that the same station is tuned in with the Instamatic button as when the "Dial Tuning" button is in. If it is not the same station the adjustment knob should be turned again and these operations repeated until the same program is heard when either of these two buttons is pressed.

The bottom adjustment knob of the first pair is now turned until the station is heard the best. Both top and bottom knobs may then be adjusted to exact tuning by watching the magic eye and adjusting until the two edges of the green section are as close together as it is possible to get them.

The first Instamatic button is now properly adjusted for the station which was tuned in on the dial and the station's call letters may be pushed out of the station list, moistened on the back, and pressed into the hollow end of the button.

With the "Dial Tuning" button pressed in, the tuning knob is again turned to the right until the next station for which Instamatic tuning is wanted, is tuned in. The adjustment process for this station is the same as before, except that Button No. 2 and Pair No. 2 adjustment knobs are used. Proceeding in this way all five of the buttons may be properly adjusted for the stations desired.

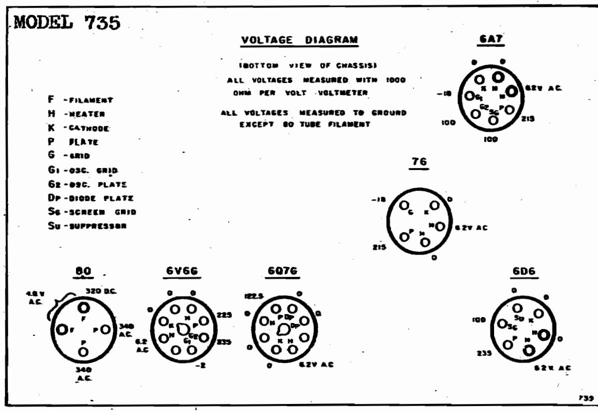
It must be remembered that the "Dial Tuning" button must be pressed in whenever it is desired to tune in stations with the tuning knob, regardless of which wave band is in use. It must also be remembered that the wave switch must be in the broadcast position when Instamatic tuning is being used.

If desired the tuning dial may be left set to a station which is not set up on one of the buttons. The "Dial Tuning" button will then tune in this station when it is pressed. This will give an extra Instamatic tuned station, making a total of six different stations which can be instantly tuned in by simply pressing a button.

The approximate frequency coverage of each of the "Instamatic" control buttons is as follows:

1—Stations between 540 and 1000 KC.
2—Stations between 540 and 1000 KC.
3—Stations between 750 and 1200 KC.
4—Stations between 750 and 1200 KC.
5—Stations between 1000 and 1500 KC.

MODEL 735



MODEL 648 **ALIGNMENT PROCEDURE**

The following alignment procedure is for use only by competent service men having the proper equipment. Re-alignment is very seldom needed and is usually only required after some major part has been replaced because of damage to the receiver.

The equipment required for re-aligning this receiver is an output meter and a modulated source of radio frequency (a signal generator or microvolter). This source of radio frequency must be accurately calibrated in frequency and must have a method of varying the output.

All alignments must be made with the volume control turned full on and with the signal input from the generator reduced to as low a value as possible while still giving a sufficient output to be easily read on the output meter.

Connect the output meter, through a .5 M.F. condenser and a resistance of such a value as to make the total meter resistance approximately 7000 ohms, to plate of output tube and B+, or a low voltage A. C. meter may be used connected across speaker voice coil. The output meter remains connected during the entire alignment procedure.

Connect the signal generator to the grid cap of the 6A7 tube through a .1 M.F. condenser. Connect the ground of the generator to the ground lead of the receiver. Set the dial to about 1000 K.C., feed in a 455 K.C. signal. Adjust first and second I.F. trimmers for maximum output. Refer to chassis lay-out for location of trimmers.

Turn the dial to the extreme high frequency end. Feed a 1760 K.C. signal to the receiver antenna lead through a .00025 M.F. mica condenser. Adjust the 1760 K.C. oscillator trimmer until maximum output is shown. Set the generator to 1500 K.C. and tune in this signal on the receiver. Then adjust the 1500 K.C. antenna trimmer to the maximum output. This completes the alignment.

ALIGNMENT PROCEDURE

The equipment required for re-aligning this receiver is an output meter and a modulated source of radio frequency (a signal generator or microvolter). This source of radio frequency must be accurately calibrated in frequency and must have a method of varying the output.

All alignments must be made with the volume control turned full on and with the signal input from the generator reduced to as low a value as possible while still giving a sufficient output to be easily read on the output meter.

Connect the output meter, through a .5 M.F. condenser and a resistance of such a value as to make the total meter resistance approximately 6000 ohms, to the two small pins of the speaker plug. The output meter remains connected during the entire alignment procedure.

Connect the signal generator to the grid cap of the 6A7 tube through a 1 M.F. condenser. Connect the ground of the generator to the ground post of the receiver. With the wave switch on broadcast position and the dial set to about 1000 K.C., feed in a 456 K.C. signal. Adjust the trimmers on top of the first and second I.F. transformers until the maximum output is obtained. This aligns the I.F.

Leaving the signal generator connected to the grid cap of the 6A7, turn the wave switch to the right hand (short wave) position. Set the dial and the signal generator to 15.0 M.C. Tune in the signal by adjusting the 15.0 M.C. oscillator trimmer. The signal will be heard at two different settings of the trimmer. The proper setting is the one where the signal is heard when the trimmer is the loosest. Also when the dial of the receiver is turned the signal will be heard again at about 14.0 M.C. If the signal is heard at about 16.0 M.C. on the dial instead of 14.0 M.C. the wrong setting has been used and should be corrected.

Set the wave switch on broadcast position, turn the dial to the extreme high frequency end. Feed a 1680 K. C. signal to the receiver antenna post through a .00025 M.F. mica condenser. Adjust the 1680 K.C. broadcast oscillator trimmer for maximum output. Set the generator to 1500 K.C. and tune in this signal on the receiver. Then adjust the 1500 K.C. broadcast antenna trimmer and the 1500 K.C. broadcast preselector trimmer for maximum output. Set the generator to 600 K.C. and adjust the 600 K.C. broadcast oscillator pad to maximum output **while tuning the receiver back and forth across the signal** from the generator. This completes the alignment of the broadcast band.

The police band is aligned by feeding a 4.0 M.C. signal to the receiver antenna lead through the .00025 condenser. Turn the wave switch to the center position and tune the receiver to this signal. Adjust the 4.0 M.C. police antenna trimmer for best output.

The short wave band is aligned in the same way using a 15 M.C. signal and adjusting the 15 M.C. short wave antenna trimmer after having turned the wave switch to the right hand position.

CONTINUITY TESTS

Continuity or resistance tests on various receiver circuits provide a rapid and simple method of locating practically all defects with the possible exception of open condensers. A direct reading ohmmeter, either as a separate instrument, or as incorporated in the usual set analyzer is necessary in making such tests. It should have a sufficiently wide range to allow for accurately reading such low resistances as R. F. or I. F. Coils as well as being capable of indicating the resistance of the highest resistance circuit which may be encountered in the receiver.

The continuity chart given in this manual shows the correct circuit resistance for all receiver circuits as well as some of the more common incorrect readings, which may be obtained due to various defects. In each case the cause for each incorrect reading is listed in the continuity chart. The resistance values given in the chart are the nominal ratings for each circuit, but it must be taken into consideration that manufacturing tolerance allows a variation in resistance of as high as twenty percent in certain circuits. Accordingly, if a reading slightly at variance with the chart value is obtained in some circuits do not immediately assume that the defect has been located but make such further tests as may be necessary to isolate the cause of the trouble. In the case of some items in the chassis a defective condition will affect several different circuits, as shown in the continuity chart. If a defect of one of these items is indicated by a continuity test of one circuit it can easily be checked by testing the other circuits which would be affected by the same defect.

ALIGNMENT

In order to properly align the R. F. and I. F. circuits of the No. 511 and 515 Chassis, a signal generator will be necessary. This generator must produce I. F. signals at 427 K. C. and 455 K. C. as well as signals throughout the broadcast band of 540 to 1500 K. C. An output meter is essential for determining when the circuits are aligned accurately.

The need for realignment will usually be evidenced by low sensitivity accompanied by poor selectivity. Realignment should, however, not be attempted until all other causes for this same condition, such as defective tubes, weak batteries or inefficient antenna installation have been checked and eliminated as a possible cause of the trouble.

All aligning adjustments are accessible from the top of the chassis making it unnecessary to remove it from the cabinet during alignment.

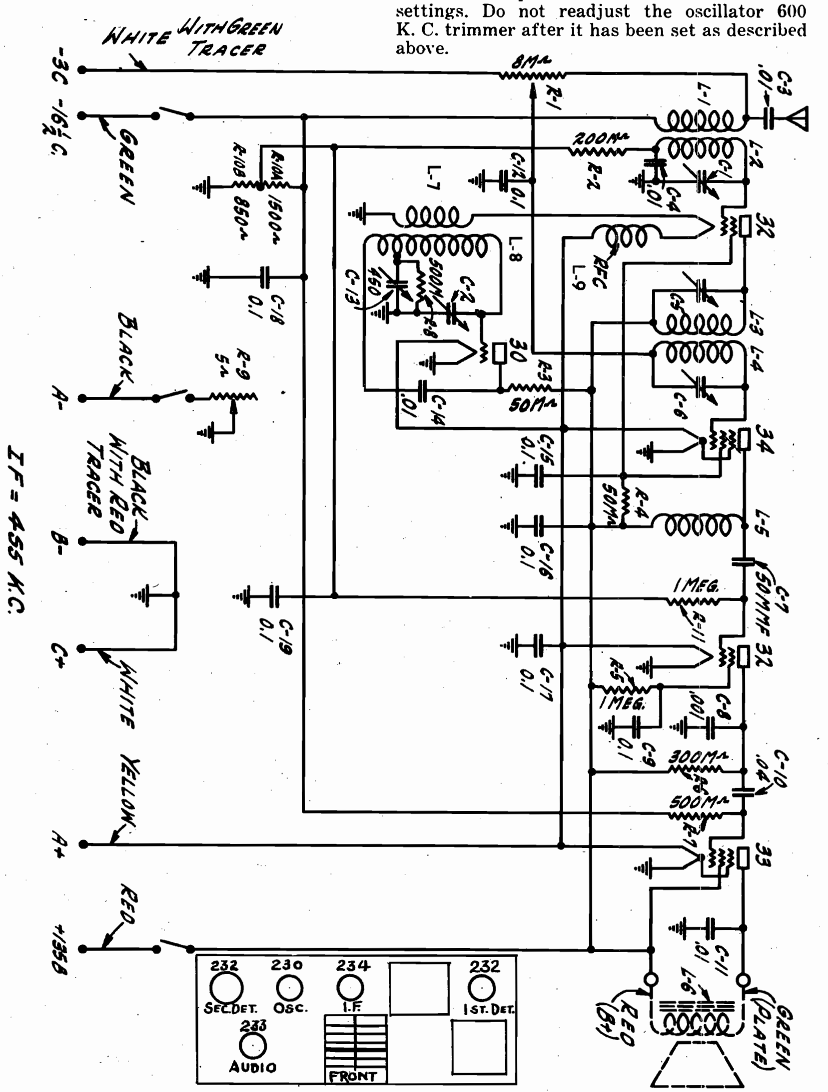
Aligning Intermediate Condensers—During alignment of the intermediate condensers the oscillator tube should be removed from its socket and the filament voltage control turned in a counter clockwise direction until the filament voltage applied to the remaining four tubes is exactly 2 volts. Place the signal generator in operation at the proper intermediate frequency as determined by the serial number of the chassis. If the plate coil of the 34 tube has been replaced, align the I. F. at 455 K. C. regardless of serial number. Connect the signal lead to the control grid contact of the 32 first detector tube. The ground lead from the signal generator is connected to the chassis of the receiver.

The intermediate condenser adjusting screws are two in number and are located on the top of the oscillator-I.F. assembly. Adjust these two intermediate condenser screws until maximum output is indicated upon the output meter. The adjustment of each screw should be checked at least twice to determine that the proper setting has been made.

Aligning R. F. and Oscillator Condensers—Replace the oscillator tube in its socket and advance the filament voltage control to give a filament voltage of 2 volts. Place the signal generator in operation at 1400 K. C. and connect the signal lead to the antenna lead from the chassis. Turn the tuning condenser rotor until the dial is set at exactly 1400 K. C. Then adjust the trimmer condensers which are located at the sides of the tuning condenser and mounted upon it. There are two such trimmer condensers on the oscillator section of the tuning condenser and one on the R. F. section. Adjust all three trimmers to give maximum output as indicated upon the output meter, adjusting first the two trimmers controlling the oscillator circuit. The oscillator tuning condenser is nearest the rear of the chassis.

Set the signal generator for a frequency of 600 K. C. and tune in this signal on the receiver. Then adjust the 600 K. C. trimmer condenser to give maximum deflection on the output meter. This condenser is located beneath the chassis with the adjusting screw accessible through a hole in the chassis immediately to the left of the tuning condenser as viewed from the rear. During adjustment of this condenser, it will be necessary to "Rock" the tuning condenser while varying the trimmer condenser. That is, the tuning condenser should be tuned back and forth through the resonant point, noting the deflection on the output meter for each setting of the trimmer condenser. The proper setting is that which gives greatest deflection on the output meter when the receiver is tuned through resonance.

Then set the signal generator for a signal of 1400 K. C. and again check the setting of the trimmer condensers on the tuning condenser. Next, set the signal generator for signals of 1,000, 750 and 600 K. C. and check the R. F. and oscillator condensers for resonance. Bend the slotted rotor plate sections of each condenser which are last in mesh in or out until maximum output is obtained at each of these settings. Do not readjust the oscillator 600 K. C. trimmer after it has been set as described above.



IF = 455 K.C.

Alignment, Parts

GAMBLE-SKOGMO, INC.

This receiver is designed to operate on 32 volt battery plants only and must not be used on 36 volt battery plants without a voltage regulator. Generally, it is not advisable to operate the receiver while the generator is charging the battery due to the fact that considerable radio interference (static noise) may be encountered. This is not a reflection on the receiver, but is due to interference caused by the power plant generator, itself. Some generators have built-in traps to eliminate this interference and when so constructed this particular type of plant generator will not cause interference. If excessive static noise is encountered be sure that it is not caused by the 32 volt plant generator.

THIRTY-TWO VOLT POWER UNIT: Two power units have been furnished with the six tube 32 volt receiver, one unit utilizes a 25Z5 tube and the other an 84 tube. Diagrams for both of these units are shown on the receiver circuit diagram. It will be noted from the parts and price list that all parts with the exception of the power transformer and tube sockets are interchangeable. When ordering these parts be sure to order by part number.

NOTE: The dynamotor type unit supplied with the five tube 32 volt receiver cannot be used with the six tube receiver nor can the power units (utilizing the 84 or 25Z5 tube) furnished with the six tube receiver be used with the five tube 32 volt set.

The 32 volt power unit is shipped unmounted and must be placed in the sound-proof celotex compartment. In the console models this is located below the receiver mounting board and in the table models it is located above the chassis. To install the power unit in the sound-proof box remove the wood screws which hold the celotex back to the box, then place the power unit on the rubber mounting blocks provided inside of this box so that the unit is floating free on these rubber insulators. It is very important that the unit does not touch the side of the box. If excessive vibration is noticed be sure to check the power unit installation, as excessive vibration will result if it is not properly mounted on all of the rubber supports or if it is permitted to touch the side of the celotex housing.

PILOT LIGHT: A type T-3¼ #40 6.3 volt pilot light is used. The pilot light is readily accessible for removal from the rear of the cabinet.

ANTENNA AND GROUND: Under ordinary conditions an aerial from twenty-five to seventy-five feet in length including lead-in will prove ample. In some locations which are located a considerable distance from broadcast stations it may be necessary to use a longer aerial than this to obtain satisfactory daylight reception. Never place the aerial lead-in in close proximity to the 32 volt lighting lines, as considerable static noise may be picked up if the antenna lead-in is run parallel to the 32 volt power lines for any distance.

INTERMEDIATE ALIGNMENT: Only when an intermediate transformer has become defective due to an open or burned out winding should it be necessary to readjust the intermediate transformer. For aligning either the intermediate transformer or the variable condenser it is necessary that an oscillator be used with some type of output measuring device. To align the intermediate transformer:

1. Connect the high side of the oscillator output to the control grid of the #36 modulator tube. The ground side of the oscillator should be connected to the ground lead.
2. Set the oscillator at 465 kilocycles (this must be accurate) and adjust the output of the oscillator so that a convenient reading is obtained on the output meter.
3. Align the first intermediate transformer by turning one of the intermediate transformer trimmer screws up and down until maximum reading is obtained on the output meter. Then adjust the other trimmer screw in the same manner.
4. The second I. F. transformer should next be adjusted in the same manner. The intermediate transformer trimmer screws are accessible through the small hole in the top of the intermediate transformer shields.

To align the variable condenser:

1. Connect the high output side of the oscillator to the set antenna lead and the ground side of the oscillator to the ground lead.
2. Tune the receiver to 1400 kilocycles on the dial and set the oscillator to this frequency.
3. Adjust the variable condenser trimmer screws for maximum output reading.
4. Tune the set to approximately 600 kilocycles on the dial and adjust the oscillator frequency to 600 kilocycles. Adjust the padding condenser located on the rear of the chassis adjacent to the antenna and ground leads and accessible through the hole in the chassis for maximum output reading.

When making this adjustment be sure to rock the variable condenser to the right and left using the position where the greatest reading is obtained.

INSTRUCTIONS FOR INSTALLATION, OPERATION AND ALIGNMENT
POWER CONSUMPTION - 45 WATTS

This receiver operates on either direct current or alternating current of any frequency on voltage between 105 and 130. If voltages in excess of this value are to be applied to the receiver, a special Ballast Tube must be used. When operating from direct current, if after the receiver has been turned on for about three quarters of a minute, no reception is obtained, the plug must be reversed in the socket. On alternating current, there is generally no difference, though sometimes, quieter operation results.

ANTENNA: A small indoor antenna consisting of about 20 feet of wire, laid around the moulding, or placed under a rug, or thrown out the window is generally sufficient to give excellent operation. In locations very remote from broadcast stations, it is advantageous to use an outdoor antenna from 50 to 75 feet long. In particularly difficult cases, it may be necessary to use a special short-wave antenna with shielded or transposed lead-in. Kits containing all parts necessary for such an installation are available.

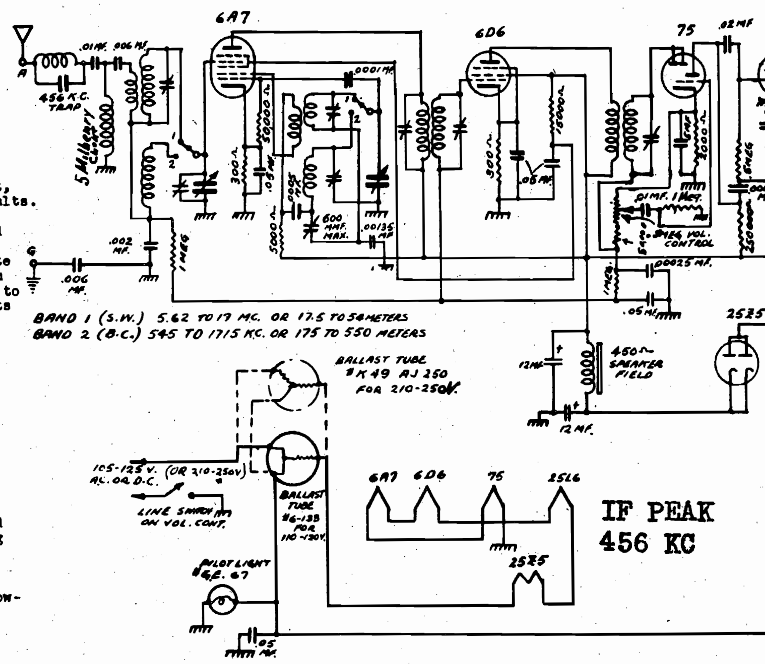
WAVE BAND SWITCH

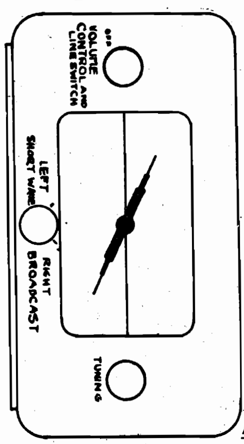
POSITION	WAVE BAND
Left	17.5 to 53 meters - Foreign & American Short waves
Right	175 to 550 " - Regular Broadcast and some police calls.

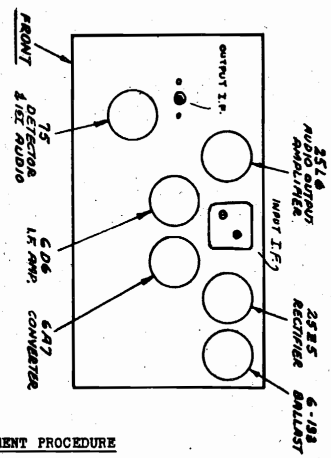
Turn to left for short waves and to the right for regular broadcast reception. Some police calls can be obtained at the extreme end of the broadcast band as indicated on the dial.

To operate the receiver, turn the SWITCH & VOLUME CONTROL (shown in the illustration, all the way to the right, at which time the dial should light up. About a minute is required for the tubes to heat. The volume may be adjusted to any level by turning the knob to the left for less volume and to the right for more.

TUNING KNOB controls the DIAL, which is divided into two scales. The Broadcast frequency is read on the upper half and the short wave on the lower half of the dial.







ALIGNMENT PROCEDURE

Realignment of this receiver should not be attempted unless all other possible causes of faulty operation have first been thoroughly investigated. An accurately calibrated signal generator which will cover the various wavebands, and an output meter for indicating the effects of ajustments, are required.

I.F. ADJUSTMENT - The signal generator is set at 456 kc. The "hot" lead from the signal generator is connected to the grid cap on the 1st detector (6A7) tube, the clip having first been removed from the tube cap. The ground lead is connected to the receiver chassis. The oscillator section (rear) of the gang tuning condenser is short-circuited and the volume control turned on full. The i.f. trimmers are then adjusted for maximum gain in the receiver. These trimmers are located on top of the i.f. transformer shield can and on the chassis to the left of the 6D6 tube which are situated in the rear of the chassis.

1500 KILOCYCLE ADJUSTMENT - The short-circuit is removed from the oscillator condenser and the grid clip replaced in its normal position on the cap of the 6A7 tube. The "hot" lead from the signal generator is connected to the antenna lead of the receiver and the ground lead to the ground of the receiver. With the volume control set at maximum and a minimum input signal from the signal generator, the band switch is turned to the right and the receiver dial set at 1500 kc. The oscillator trimmer is adjusted so as to bring the signal in at this setting. The oscillator trimmers are reached through holes on the front apron of the chassis, underneath the dial and to the right of the wave band switch. The 1500 kc. trimmer is the one nearest the wave band switch. After the oscillator is set, the antenna trimmer is adjusted for maximum output as indicated by the output meter. This trimmer is on the front section of the variable condenser.

600 KC PADDER ADJUSTMENT - With all connections as above, the signal generator is set at 600 KC and the signal tuned in on the dial. The padder for this frequency is located on the right side of the variable condenser. This padder should be adjusted for maximum response of the receiver, while the tuning condenser is rocked slightly back and forth. The 1500 kc. adjustment should then be rechecked.

14 MEGACYCLE ADJUSTMENT - Turn the Wave Band Switch to the left. Set the signal generator to 14 M.C. and turn the dial pointer to correspond to this frequency. Adjust the oscillator trimmer for this band so that the signal is received exactly at this setting. Then adjust the trimmer on top of the antenna coil (located behind and to the right of the dial) for maximum output.

Right 173 to 555 meters

ALIGNMENT PROCEDURE

Realignment of this receiver should not be attempted unless all other possible causes of faulty operation have first been thoroughly investigated. An accurately calibrated signal generator which will cover the various wave bands, and an output meter for indicating the effects of adjustments, are required.

I.F. ADJUSTMENT - The signal generator is set at 456 kc. The "hot" lead from the signal generator is connected to the grid cap on the 1st detector (6A7) tube, the clip having first been removed from the tube cap. The ground lead is connected to the receiver chassis. The oscillator section (front) of the gang tuning condenser is short-circuited and the volume control turned on full. The i.f. trimmers are then adjusted for maximum gain in the receiver. These trimmers are located on top of the i.f. transformer shield cans, which are situated in the rear of the chassis. The one towards the right is the 1st i.f. transformer and the left one is the 2nd i.f. transformer.

18 MEGACYCLE ADJUSTMENT - The short-circuit is removed from the oscillator condenser and the grid clip replaced in its normal position on the cap of the 6A7 tube. The "hot" lead from the signal generator is connected to the antenna lead of the receiver and the ground lead to the ground of the receiver. With the volume control set at maximum and a minimum input signal from the signal generator, the band switch is turned to the left and the receiver dial set at 18 mc. The oscillator trimmer is adjusted so as to bring the signal in at this setting. The oscillator coil is underneath the chassis and is located directly under the variable gang condenser. The short wave trimmer is over the short wave winding (Heavy spaced wire.) After the oscillator is set, the antenna trimmer is adjusted for maximum output as indicated by the output meter. (Again the S.W. antenna trimmer is located over the heavy spaced winding on the antenna coil, and is accessible from the top of the chassis.) There are no other adjustments on this band.

1500 KC KILOCYCLE ADJUSTMENT - Turn the Wave Band Switch to the right. Set the signal generator to 1500 kc. and turn the dial pointer to correspond to this frequency. Adjust the oscillator trimmer for this band so that the signal is received exactly at this setting. (This trimmer is located over the close-wound fine winding on the oscillator coil.) Adjust the Broadcast antenna trimmer for maximum output as described previously, (this trimmer is over the small 5 section winding and is accessible from the top.)

GAROD RADIO CORP.

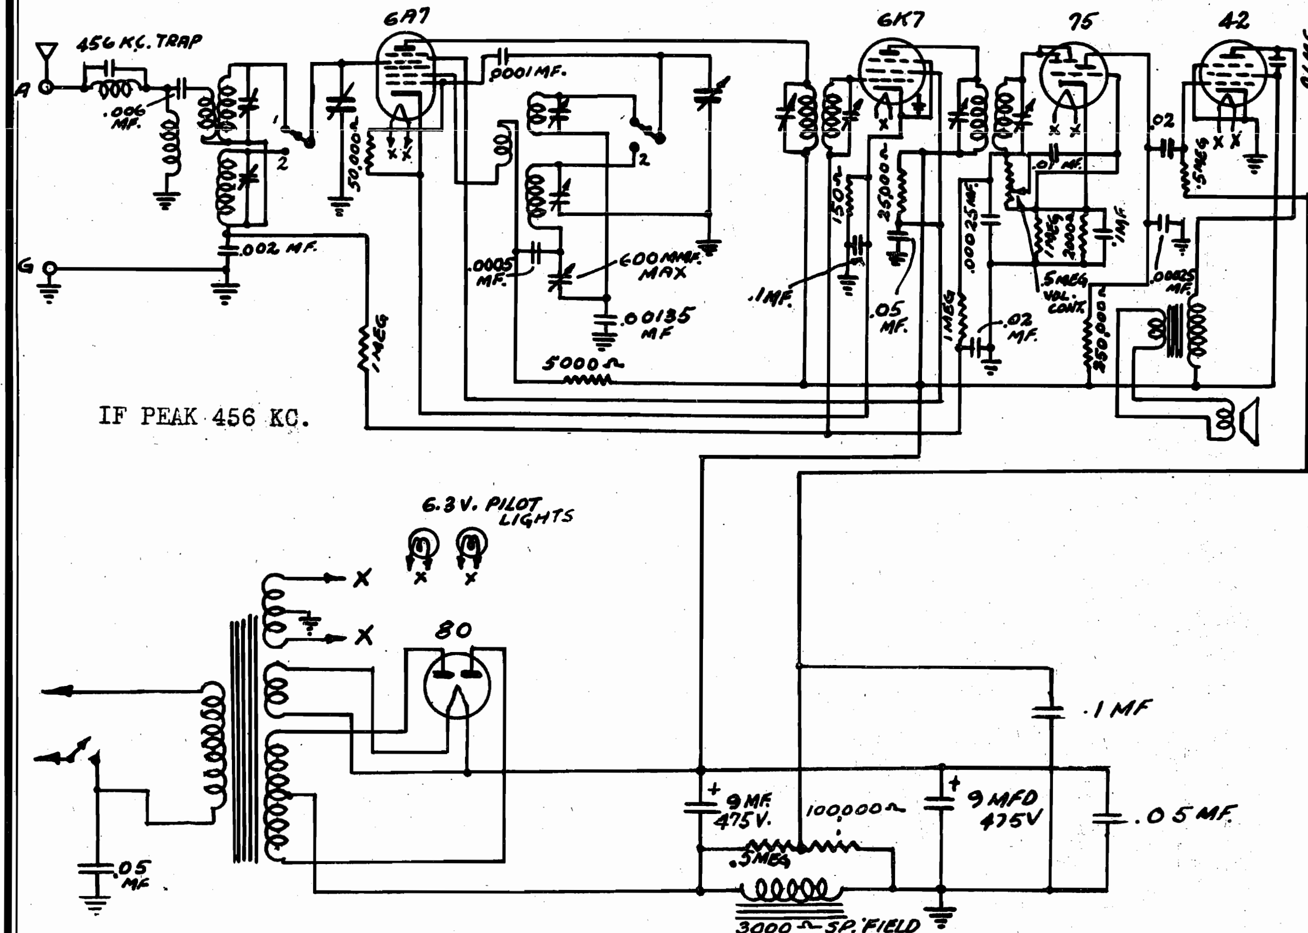
MODEL 250
Schematic, Voltage
Alignment



105 - 125 VOLTS IF GREEN & WHITE LEAD FROM TRANSFORMER
210 - 250 VOLTS IF RED & WHITE LEAD FROM TRANSFORMER

BAND 1 (S.W.) 5.62 TO 16 M.C. OR 18.5 TO 54 METERS
BAND 2 (B.C.) 545 TO 1715 K.C. OR 175 - 550 METERS

ALIGNMENT PROCEDURE

Realignment of this receiver should not be attempted unless all other possible causes of faulty operation have first been thoroughly investigated. An accurately calibrated signal generator which will cover the various wave bands, and an output meter for indicating the effects of adjustments, are required.

I.F. ADJUSTMENT - The signal generator is set at 456 kc. The "hot" lead from the signal generator is connected to the grid cap on the 1st detector (6A7) tube, the clip having first been removed from the tube cap. The ground lead is connected to the receiver chassis. The oscillator section (front) of the gang tuning condenser is short-circuited and the volume control turned on full. The i.f. trimmers are then adjusted for maximum gain in the receiver. These trimmers are located on top of the i.f. transformer shield cans, which are situated in the rear of the chassis. The one towards the right is the 1st i.f. transformer and the left one is the 2nd i.f. transformer.

14 MEGACYCLE ADJUSTMENT - The short-circuit is removed from the oscillator condenser and the grid clip replaced in its normal position on the cap of the 6A7 tube. The "hot" lead from the signal generator is connected to the antenna lead of the receiver and the ground lead to the ground of the receiver. With the volume control set at maximum and a minimum input signal from the signal generator, the band switch is turned to the left and the receiver dial set at 14 mc. The oscillator trimmer is adjusted so as to bring the signal in at this setting. The oscillator coil is underneath the chassis and is located directly under the variable gang condenser. The short wave trimmer is over the short wave winding (Heavy spaced wire.) After the oscillator is set, the antenna trimmer is adjusted for maximum output as indicated by the output meter. (Again the S.W. antenna trimmer is located over the heavy spaced winding on the antenna coil, and is accessible from the top of the chassis.) There are no other adjustments on this band.

1500 KC KILOCYCLE ADJUSTMENT - Turn the Wave Band Switch to the right. Set the signal generator to 1500 kc. and turn the dial pointer to correspond to this frequency. Adjust the oscillator trimmer for this band so that the signal is received exactly at this setting. (This trimmer is located over the close-wound fine winding on the oscillator coil.) Adjust the Broadcast antenna trimmer for maximum output as described previously, (this trimmer is over the small 5 section winding and is accessible from the top.)

600 KC PADDER ADJUSTMENT - With all connections as above, the signal generator is set at 600 KC and the signal tuned in on the dial. The padder for this frequency is found on the front sub-panel of the receiver, directly under the dial. This padder should be adjusted for maximum response of the receiver, while the tuning condenser is rocked slightly back and forth. The 1500 kc adjustment should then be rechecked.

POWER CONSUMPTION - 70 WATTS.

VOLTAGE: The standard model is designed to operate on 50 to 60 cycles power supply on voltages between 105 and 125. A special export model is also available on which any line voltage from 105 to 250 volts may be used and frequencies from 40 to 60 cycles. This model is equipped with a universal Transformer, with five taps marked as follows: 115, 135, 150, 230 and 250. Access to this tap changer is obtained by lifting off the black cover on top of the transformer. The lug attached to the flexible lead is then moved to the point which corresponds most nearly to the line voltage available. The cover is then snapped back into place. Unless otherwise specified, the receiver is always connected to the 115 volt tap (suitable for 105 to 125 volt.) Before inserting the line plug, be sure to ascertain what the line voltage is and connect to the correct tap.

SERVICE NOTES FOR THE MODEL 309 - 309E
9 TUBE, 3 BAND A.C. SUPERHETERODYNE RECEIVER

ALIGNMENT PROCEDURE

Realignment of this receiver should not be attempted unless all other possible causes of faulty operation have been thoroughly investigated. An accurately calibrated signal generator which will cover the necessary wave-bands and an output meter for indicating the effect of adjustments are required.
It is important to remember that in receivers of this kind which are equipped with automatic volume control it is necessary to use the minimum possible signal from the signal generator; otherwise the A.V.C. action will tend to nullify the variations in output as the trimmers are adjusted.
I.F. ADJUSTMENT - The signal generator is set at 456 Kc. and is connected to the grid of the first detector (6A8) With the oscillator section of the tuning condenser short-circuited and the receiver volume control at its maximum position, the i.f. trimmers are adjusted for maximum output. These trimmers may be found on tops of the i.f. transformer shield cans.

MODEL 309

18 MEGACYCLE ADJUSTMENT - The high side of the signal generator is connected to the antenna lead of the receiver and the low side to the ground lead. The receiver and the signal are both tuned to a frequency of 18 mc. with the selector switch in position for short wave band no. 1. The oscillator trimmer condenser is adjusted so that the 18 mc. signal is tuned in exactly at 18 mc. calibration point, with the volume control on full and the signal generator adjusted for minimum input. The antenna preselector and first detector trimmers are then adjusted in the order named for maximum output. These trimmers are located on the sides of the shield cans and are opposite the lower openings. This is the only adjustment on Band #1.
1500 K.C. ADJUSTMENT - With the band selector switch in position for operation on The Broadcast band and the receiver and signal generator both set at 1500 K.C. the procedure outlined above is repeated. The oscillator trimmer is found on the rear coil can, and is opposite the upper opening. The antenna preselector and inter-stage coil trimmers are located in the same positions on the corresponding shield cans.
The Signal generator is set at 600 K.C. and the signal tuned on the dial. The padder condenser for this band is adjusted for maximum gain while the gang tuning condenser is rocked slightly to the right and left. The 1500 K.C. adjustment should be rechecked. The 600 K.C. Padder is located on the right chassis apron, and is towards the front.
3 MC. ADJUSTMENT - The band selector switch is set in position for operation on the short wave 2. band. The receiver and signal generator are both set at 3 M.C. and the procedure outlined above is repeated. The oscillator trimmer is found on the Police Band Coil located under the chassis and is towards the rear. The other trimmers for this band are located in similar positions on the corresponding coils.
The signal generator is set at 1.7 M.C. and the signal tuned in on the dial. The padder condenser for the police band is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 3 M.C. adjustment should then be rechecked. The 1.7 MC. padder is located on the right apron and is towards the rear.

MODEL 309E

Model 309E is the same as Model 309 except that the Long Wave band is substituted for the Police Band. Alignment procedure is identical for the Short Wave and Broadcast Bands. The Long Wave Band is aligned as follows:
300 KC. ADJUSTMENT - The band selector switch is set in a position for operation on band no. 3. The receiver and generator are both tuned to 300 Kc. and the procedure outlined above is repeated. The oscillator trimmer is located under the chassis and is mounted on the rear coil.
The signal generator is set at 150 Kc. and the signal is tuned in on the dial. The padder condenser for this band is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 300 Kc. adjustment should then be rechecked. The 150 Kc. padder is located in a position corresponding to that of the 1.7 MC. padder on Model 309.

ALIGNMENT PROCEDURE

Realignment of this receiver should not be attempted unless all other possible causes of faulty operation have first been thoroughly investigated. An accurately calibrated signal generator which will cover the various wave bands, and an output meter for indicating the effects of adjustments, are required.

I.F. ADJUSTMENT - The signal generator is set at 456 kc. The "hot" lead from the signal generator is connected to the grid cap on the 1st detector (6A7) tube, the clip having first been removed from the tube cap. The ground lead is connected to the receiver chassis. The oscillator section (front) of the gang tuning condenser is short-circuited and the volume control turned on full. The i.f. trimmers are then adjusted for maximum gain in the receiver. These trimmers are located on top of the i.f. transformer shield cans, which are situated in the rear of the chassis. The one towards the right is the 1st i.f. transformer and the left one is the 2nd i.f. transformer.

18 MEGACYCLE ADJUSTMENT - The short-circuit is removed from the oscillator condenser and the grid clip replaced in its normal position on the cap of the 6A7 tube. The "hot" lead from the signal generator is connected to the antenna lead of the receiver and the ground lead to the ground of the receiver. With the volume control set at maximum and a minimum input signal from the signal generator, the band switch is turned to the left and the receiver dial set at 18 mc. The oscillator trimmer is adjusted so as to bring the signal in at this setting. The oscillator coil is underneath the chassis and is located directly under the variable gang condenser. The short wave trimmer is over the short wave winding (Heavy spaced wire.) After the oscillator is set, the antenna trimmer is adjusted for maximum output as indicated by the output meter. (Again the S. W. antenna trimmer is located over the heavy spaced winding on the antenna coil, and is accessible from the top of the chassis.) There are no other adjustments on this band.

150 KC KILOCYCLE ADJUSTMENT - Turn the Wave Band Switch to the right. Set the signal generator to 1500 kc. and turn the dial pointer to correspond to this frequency. Adjust the oscillator trimmer for this band so that the signal is received exactly at this setting. (This trimmer is located over the close-wound fine winding on the oscillator coil.) Adjust the Broadcast antenna trimmer for maximum output as described previously, (this trimmer is over the small 5 section winding and is accessable from the top.)

600 KC PADDER ADJUSTMENT - With all connections as above, the signal generator is set at 600 KC and the signal tuned in on the dial. The padder for this frequency is found on the front sub-panel of the receiver, directly under the dial. This padder should be adjusted for maximum response of the receiver, while the tuning condenser is rocked slightly back and forth. The 1500 kc adjustment should then be rechecked.

ALIGNMENT PROCEDURE

Realignment of this receiver should not be attempted unless all other possible causes of faulty operation have first been thoroughly investigated. An accurately calibrated signal generator which will cover the various wave-bands and an output meter for indicating the effects of adjustments, are required.

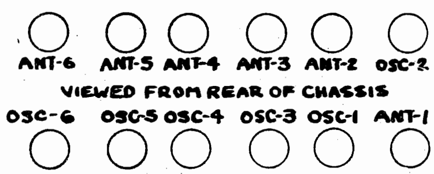
I. F. ADJUSTMENT The signal generator is set at 456 kc. The "hot" lead from the signal generator is connected to the grid cap on the 1st detector (6A7) tube, the clip having first been removed from the tube cap. The ground lead is connected to the receiver chassis. The oscillator section (rear) of the gang tuning condenser is short-circuited and the volume control turned on full. The i.f. trimmers are then adjusted for maximum gain in the receiver. These trimmers are located on top of the i.f. transformer shield cans, which are situated in the rear of the chassis. The one towards the right is the 1st i.f. transformer and the left one is the 2nd i.f. transformer.

18 MEGACYCLE ADJUSTMENT The short-circuit is removed from the oscillator condenser and the grid clip replaced in its normal position on the cap of the 6A7 tube. The "hot" lead from the signal generator is connected to the atenna lead of the receiver and the ground lead to the ground of the receiver. With the volume control set at maximum and a minimum imput signal from the signal generator, the band switch is turned to the left and the receiver dial set at 18 mc. The oscillator trimmer is adjusted so as to bring the signal in at this setting. This trimmer and the Broadcast oscillator trimmer are located on the side apron. The Short Wave trimmer is towards the front. After the oscillator is set, the antenna trimmer is adjusted for maximum output as indicated by the output meter. This trimmer is on the top of the chassis over the Antenna Coil.

1500 KC KILOCYCLE ADJUSTMENT Turn the Wave Band Switch to the right. Set the signal generator to 1500 kc. and turn the dial pointer to correspond to this frequency. Adjust the oscillator trimmer for this band so that the signal is received exactly at this setting. (This trimmer is located as mentioned above.) Adjust the broadcast antenna trimmer for maximum output as described previously, (this trimmer is on the chassis behind the antenna coil).

600 KC PADDER ADJUSTMENT With all connections as above, the signal generator is set at 600 KC and the signal tuned in on the dial. The padder for this frequency is found over the oscillator trimmer. This padder should be adjusted for maximum response of the receiver, while the tuning condenser is rocked slightly back and forth. The 1500 kc adjustment should then be rechecked. After alignment, the setting of the Prestomatic buttons should be checked.

VIEWED FROM FRONT OF CABINET



Instructions for Adjusting the PRESTOMATIC Selector

To set up this receiver for PRESTOMATIC operation, it is necessary to make a few simple adjustments, in order to select the six stations to be controlled by the push buttons. By following these instructions carefully, the layman can very easily accomplish this without any special knowledge of radio or the use of any instruments other than a small screwdriver.

For the purpose of explanation, let us number the buttons from left to right as 1, 2, 3, 4, 5, 6. Each of these buttons is limited to a range of frequencies as follows:

1-1550 KILOCYCLES	to	1000 KILOCYCLES		4-1150 KILOCYCLES	to	655 KILOCYCLES
2-1500 "	to	830 "		5- 940 "	to	540 "
3-1150 "	to	655 "		6- 940 "	to	540 "

Determine which six stations are to be set up. These, of course, should be local stations from which dependable reception may be obtained, and their field strength should be sufficiently high so that they can be received with good volume above the noise level. Consult a newspaper or other station list for the frequency of each of these selected stations. One station must fall within each of the Kilocycle ranges listed above. If such is not the case, another choice must be made. Arrange the selected stations in the order of their frequencies. Having made this determination, proceed as follows:

Connect Antenna and Ground. Turn the receiver ON by turning the Volume Control all the way to the right. The Dial will light. There are three positions on the Wave Band Switch: Left--Short Wave, Middle-Broadcast, and RIGHT--PRESTOMATIC TUNING. Turn to the middle or BROADCAST position. The set may now be tuned in the usual way by rotating the dial mechanism. Starting at one end of the dial, tune in the first station on the list which you have selected. Note the program and throw the switch to the Right or PRESTOMATIC position. WITHOUT CHANGING THE DIAL SETTING, DEPRESS BUTTON #1 (or you may start at #6). Now insert a screwdriver into the hole which controls the OSCILLATOR corresponding to the button covering the range of the station to which you have just been listening. (SEE SKETCH) Rotate this slowly until the same program is heard. (Check by throwing the switch back and forth between the BROADCAST and PRESTOMATIC positions.)

The Antenna lead from the receiver is now disconnected from the Antenna and either held in the hand or twisted loosely around the lead-in wire in order to reduce the signal strength, so as to permit more accurate adjustment. Now carefully tune the corresponding ANTENNA adjustment (again refer to sketch) until the station is heard clearest and loudest.

Repeat these adjustments as a check. Now reconnect the Antenna and proceed to the next button, repeating the procedure outlined above for each of the other five stations selected. The station markers are now cut from the list provided and forced into the recesses in the buttons. The celluloid discs are then inserted over these to protect the markers.

NOTE When setting the OSCILLATOR trimmer, be sure that you are tuning in the same station, not another one on the chain broadcasting the same program. Stations should be heard equally well on the regular BROADCAST or PRESTOMATIC positions. If this is not the case, recheck the adjustment.

IMPORTANT It is recommended that these adjustments be checked after about one week of operation, since there may be some slight shift due to climatic or other conditions. After this very little trouble should be experienced.

IN THE PRESTOMATIC POSITION, the dial light dims and the pilot light in the lower part of the dial is illuminated.

NOTE Fil. voltages measured with a high impedance A.C. voltmeter.

I. F. ADJUSTMENT The signal generator is set at 456 kc. The "hot" lead from the signal generator is connected to the grid cap on the first detector (6A7) tube, the clip having first been removed from the tube cap. The ground lead is connected to the receiver chassis. The oscillator section (rear) of the gang tuning condenser is short-circuited and the volume control turned on full. The i.f. trimmers are then adjusted for maximum gain in the receiver. These trimmers are located on top of the i.f. transformer shield cans, which are situated in the rear of the chassis. The one towards the right is the 1st i.f. transformer and the left one is the 2nd i.f. transformer.

After alignment, the setting of the PRESTOMATIC buttons should be checked.

FOR ADJUSTMENT OF "PRESTOMATIC" SELECTOR BUTTONS - SEE MODEL 782

1500 KC KILOCYCLE ADJUSTMENT Turn the Wave Band Switch to the middle. Set the signal generator to 1500 kc. and turn the dial pointer to correspond to this frequency. Adjust the oscillator trimmer for this band so that the signal is received exactly at this setting. (This trimmer is located on the front apron and is the lower one of the two.) Adjust the broadcast antenna trimmer for maximum output, as described previously. (this trimmer is on top of the chassis directly behind the dial.

600 KC PADDER ADJUSTMENT With all connections as above, the signal generator is set at 600 KC and the signal tuned in on the dial. The padder for this frequency is found on the top of the chassis, slightly to the left and behind the antenna coil. This padder should be adjusted for maximum response of the receiver, while the tuning condenser is rocked slightly back and forth. The 1500 kc adjustment should then be rechecked.

18 MEGACYCLE ADJUSTMENT The short-circuit is removed from the oscillator condenser and the grid clip replaced in its normal position on the cap of the 6A7 tube. The "hot" lead from the signal generator is connected to the antenna lead of the receiver and the ground lead to the ground of the receiver. With the volume control set at maximum and a minimum input signal from the signal generator, the band switch is turned to the left and the receiver dial set at 18 mc. The oscillator trimmer is adjusted so as to bring the signal in at this set- The short wave trimmer is the upper one of the two on the front chassis apron. After the oscillator is setting. the antenna trimmer is adjusted for maximum output as indicated by the output meter. "The S. W. Antenna trimmer is located on top of the antenna coil, and is accessible from the top of the chassis.) There are no other adjustments on this band.

Any buttons not in use are filled with Blank markers.

NOTE:
On Models 1603, 1604E, 3016, 4016E, when setting the Automatic Tuning Dial, the High Fidelity-Selectivity switch should be set in the "Selective" position, all the way to the right; and the Automatic Frequency control switched OFF. If this is not done, the setting will appear very broad, and operation may not be entirely satisfactory.

AUTOMATIC TUNING DIAL

OPERATION:-

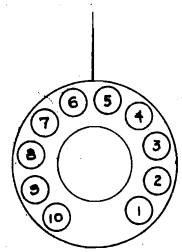
The Automatic Tuning dial is of the familiar telephone type and is operated in a similar manner, except that only a single movement is needed to dial a station instead of a series of movements. The actual operation of "Dialing" a station is as follows:

The finger is inserted into the recess of the button which bears the marking of the desired station. The button is held by a spring which yields when pressed. When this is done the radio is "MUTED" or silenced, and no stations will be heard except rather faintly, if the volume control happens to be turned up all the way. With the button depressed, the dial is rotated so as to bring this button to the bottom of the dial as far as it will go, at which time a "click" will be heard and the dial can be moved no further. Should the dial come to a stop before the desired button reaches the bottom, and the pointer comes to the end of the calibration, it is necessary to reverse the direction of rotation, until the button is brought under the center of the dial and the click is heard. When the finger is removed, the desired station will be heard, perfectly tuned, without any necessity for re-adjustments.

The Volume and Tone controls are operated in the usual way to obtain the desired effect.

SETTING THE AUTOMATIC TUNING DIAL

Ten buttons are provided, which may very easily be set for ten desired stations. For the sake of explanation, we will number the buttons as shown in the sketch.



Each button will permit the selection of ONE station within its range. The range of frequencies which each will cover is tabulated below.

First consult your newspaper or other periodical for the frequencies of the various stations which you would like to select automatically, and make a list of them. Then tune in any of the stations on your list. See from the chart above, which button covers the frequency of the desired station. Now rotate the dial, with the button depressed so that this button is moved towards the bottom until a "CLICK" is heard and the dial can no longer be moved in either direction. Now loosen this button, by turning it to the left (counter-clockwise). It is now possible to rock the dial in either direction thru a small angle only (with the button depressed).

The station may now be tuned in accurately by watching the tuning indicator tube in the upper part of the dial. When the Dark area is narrowest, the station is properly tuned. It may also be desirable as a double check to turn the volume control up all the way so that the station may be heard faintly to make sure that you are tuning in the desired station and not one on an adjacent channel. It is also advisable to watch the dial pointer as a further precaution, to see that we are still on the same frequency.

When this condition of accurate tuning is obtained, as indicated by the "Visual tuning indicator" and checked by ear, the adjustment may be locked by holding the dial rigidly in place with one hand and turning the button all the way to the right (clockwise) and tightening it as much as possible. The marker indicating the desired station is then inserted into the button and the celluloid disk is forced in over it to protect the marker.

The other buttons are then adjusted in the same way. It is suggested that a start be made at either button #1 or #10 and the others be taken in sequence.

Socket,Trimmers,Voltage,Alignment

GAROD RADIO CORP.

All voltages except filament, are measured from socket terminals to chassis and with a 1000 Ohms per volt voltmeter. The set must be in operation and the sensitivity control in its maximum clockwise position. Wave band switch in the broadcast position.

Filament voltages are taken from filament prong to filament prong at tube socket and measured with a high impedance AC voltmeter. (Rectifier Type)

ALIGNMENT PROCEDURE

It is important to remember that in receivers of this kind which are equipped with automatic volume control it is necessary to use the minimum possible signal from the signal generator; otherwise the A.V.C. action will tend to nullify the variations in output as the trimmers are adjusted.

I.F. ADJUSTMENT - The signal generator is set at 456 kc. and is connected to the grid of the first detector (6A8). With the oscillator section of the tuning condenser short-circuited and the receiver volume control at its maximum position, the i.f. trimmers are adjusted for maximum output. These trimmers may be found on tops of the i.f. transformer shield cans.

MODEL 903

18 MEGACYCLE ADJUSTMENT - The high side of the signal generator is connected to the antenna lead of the receiver and the low side to the ground lead. The receiver and the signal are both tuned to a frequency of 18 mc. with the selector switch in position for short wave band no. 1. The oscillator trimmer condenser is adjusted so that the 18 mc. signal is tuned in exactly at the 18 mc. calibration point, with the volume control on full and the signal generator adjusted for minimum input. The antenna preselector and first detector trimmers are then adjusted in the order named for maximum output. These trimmers are located on the sides of the shield cans and are opposite the lower openings. This is the only adjustment on band #1.

1500 K.C. ADJUSTMENT - With the band selector switch in position for operation on the broadcast band and the receiver and signal generator both set at 1500 K.C. the procedure outlined above is repeated. The oscillator trimmer is found on the rear coil can, and is opposite the lower opening. The antenna preselector and interstage coil trimmers are located in the same positions on the corresponding shield cans.

The signal generator is set at 600 K.C. and the signal tuned in on the dial. The padder condenser for this band is adjusted for maximum gain while the gang tuning condenser is rocked slightly to the right and left. The 1500 K.C. adjustment should then be rechecked. The 600 K.C. Padder is located on the right chassis apron, and is towards the front of the chassis.

3 MC ADJUSTMENT - The band selector switch is set in position for operation on the short wave 2 band. The receiver and signal generator are both set at 3 M.C. and the procedure outlined above is repeated. The oscillator trimmer is found on the police band coil located under the chassis and is towards the rear. The other trimmers for this band are located in similar positions on the corresponding coils.

The signal generator is set at 1.7 M.C. and the signal tuned in on the dial. The padder condenser for the police band is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 3 M.C. adjustment should then be rechecked. The 1.7 M.C. padder is located on the right apron and is towards the rear.

MODEL 903E

Model 903E is the same as Model 903 except that the Long Wave band is substituted for the Police Band. Alignment procedure is identical for the Short Wave and Broadcast Bands. The Long Wave Band is aligned as follows:

300 KC. ADJUSTMENT - The band selector switch is set in position for operation on band no. 3. The receiver and generator are both tuned to 300 kc. and the procedure outlined above is repeated. The oscillator trimmer is located under the chassis and is mounted on the rear coil.

The signal generator is set at 150 kc. and the signal is tuned in on the dial. The padder condenser for this band is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 300 kc. adjustment should then be rechecked. The 150 kc. padder is located in a position corresponding to that of the 1.7 M.C. padder on Model 903.

All voltages except filament, are measured from socket terminals to chassis and with a 1000 Ohms per volt voltmeter. The set must be in operation and the sensitivity control in its maximum clockwise position.

Filament voltages are taken from filament prong to filament prong at tube socket and measured with a high impedance AC voltmeter. (Rectifier Type).

ALIGNMENT PROCEDURE.

It is important to remember that in receivers of this kind which are equipped with automatic volume control it is necessary to use the minimum possible signal from the signal generator; otherwise the A.V.C. action will tend to nullify the variations in output as the trimmers are adjusted.

I.F. ADJUSTMENT - The signal generator is set at 456 kc. and is connected to the grid of the first detector 6A8G. With the oscillator section of the tuning condenser short-circuited and the receiver volume control at its maximum position, the i.f. trimmers are adjusted for maximum output. These trimmers may be found on the tops of the I.F. Transformers.

21 MEGACYCLE ADJUSTMENT - The high side of the signal generator is connected to the antenna lead of the receiver and the low side to the ground lead. The receiver and the signal are both tuned to a frequency of 21 mc. with the selector switch in position for short wave band no.1. The oscillator trimmer condenser is adjusted so that the 21 mc. signal is tuned exactly at the 21 mc. calibration point, with the volume control on full and the signal generator adjusted for minimum input. The antenna preselector and interstage trimmers are then adjusted in the order named for maximum output. These trimmers are located as indicated in the bottom view of the chassis.

7.5 MEGACYCLE ADJUSTMENT - The signal generator is set at 7.5 megacycle and the signal tuned in on the dial. The short wave padding condenser is adjusted for maximum output, while the gang condenser is rocked slightly to the right and left. The 18 megacycle adjustment should then be rechecked.

7 MC. ADJUSTMENT - With the band selector switch in position for operation on short wave band no. 2 and the receiver and signal generator both set at 7 mc. the procedure outlined above is repeated.

The signal generator is set at 2.4 mc. and the signal tuned in on the dial. The police band padder condenser is adjusted for maximum gain while the gang tuning condenser is rocked slightly to the right and left. The 7 mc. adjustment should then be rechecked.

1500 KC. ADJUSTMENT - The band selector switch is set in position for operation on the no. 3 band. The receiver and signal generator are both set at 1500 kc. and the procedure outlined above is repeated.

The signal generator is set at 600 kc. and the signal tuned in on the dial. The broadcast padder condenser is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 1500 kc. adjustment should then be rechecked

MODEL 1204 ONLY

300 KC. ADJUSTMENT - The band selector switch is set in position for operation on band no.4. The receiver and generator are both tuned to 300 kc. and the procedure outlined above is repeated.

The signal generator is set at 150 kc. and the signal is tuned in on the dial. The long wave padder condenser is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 300 kc. adjustment should then be rechecked.

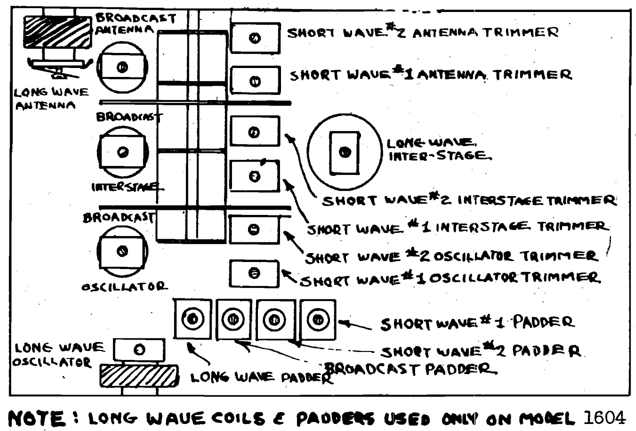
MODELS **1603-1604**



NOTE: LONG WAVE COILS & PADDERS USED ONLY ON MODEL 1604

It is important to remember that in receivers of this kind which are equipped with automatic volume control it is necessary to use the minimum possible signal from the signal generator; otherwise the A.V.C. action will tend to nullify the variations in output as the trimmers are adjusted.

I.F. ADJUSTMENT - The signal generator is set at 456 kc. and is connected to the grid of the first detector 6A8G. With the oscillator section of the tuning condenser short-circuited and the receiver volume control at its maximum position, the i.f. trimmers are adjusted for maximum output. These trimmers may be found on the tops of the I.F. Transformers.

21 MEGACYCLE ADJUSTMENT - The high side of the signal generator is connected to the antenna lead of the receiver and the low side to the ground lead. The receiver and the signal are both tuned to a frequency of 21mc. with the selector switch in position for short wave band no. 1. The oscillator trimmer condenser is adjusted so that the 21 mc. signal is tuned exactly at the 21 mc. calibration point, with the volume control on full and the signal generator adjusted for minimum input. The antenna preselector and interstage trimmers are then adjusted in the order named for maximum output. These trimmers are located as indicated in the bottom view of the chassis.

7.5 MEGACYCLE ADJUSTMENT - The signal generator is set at 7.5 megacycle and the signal tuned in on the dial. The short wave padding condenser is adjusted for maximum output, while the gang condenser is rocked slightly to the right and left. The 18 megacycle adjustment should then be rechecked

7 MC. ADJUSTMENT - With the band selector switch in position for operation on short wave band no. 2.and the receiver and signal generator both set at 7 mc. the procedure outlined above is repeated.
The signal generator is set at 2.4 mc. and the signal tuned in on the dial. The police band padder condenser is adjusted for maximum gain while the gang tuning condenser is rocked slightly to the right and left. The 7 mc. adjustment should then be rechecked.

1500 KC. ADJUSTMENT - The band selector switch is set in position for operation on the no. 3 band. The receiver and signal generator are both set at 1500 kc. and the procedure outlined above is repeated.

The signal generator is set at 600 kc. and the signal tuned in on the dial. The broadcast padder condenser is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 1500 kc. adjustment should then be rechecked.

AUTOMATIC FREQUENCY CONTROL - Should it be found that after a station is tuned in accurately (in the selective position) as indicated by the cathode ray tube, that when the A.F.C. switch is turned "ON", the signal is detuned or a change observed in the tone of the receiver, it will be necessary to readjust the "Discriminator" transformer which controls this action. A low range (0-5 or 0-10V.) high resistance volt meter or preferably a microammeter is inserted in series with the diode load resistor at the grounded end, which will indicate a maximum when a signal is tuned TO exact resonance. This 500,000 Ohms load resistor is located directly under the discriminator transformer. A 0-10 milliammeter is inserted in the cathode circuit of the A.F.C. control tube. An R.F. signal (any frequency in the Broadcast Band) is fed into the antenna and the receiver is tuned as accurately as possible to resonance (with the switch turned OFF). The Hi-fidelity switch is in the selective position. Now throw the secondary trimmer of the discriminator off resonance. Tune the primary for maximum output as indicated by the diode load meter. Turn the AFC switch "ON". Now tune the secondary trimmer, located at the bottom of the discriminator coil, underneath the chassis, so that when the A.F.C. switch is turned from the ON to the OFF position and vice versa, no change takes place in the cathode, current of the A.F.C. control tube, as indicated by the milliammeter. Be sure that the receiver has been accurately tuned first without THe A.F.C., or improper adjustment may result, whereby the frequency is automatically detuned instead of tuned. When this condition of no change in cathode current is obtained, it is indicated that no control voltage is being generated at exact resonance, which is the desired condition. If now the receiver is slightly detuned either above or below resonance, the cathode current will either increase or decrease above its normal value with the A.F.C. OFF, or no signal fed into the antenna. The voltage thus generated as indicated by this change in current serves to shift the frequency of the oscillator in the proper direction so as to automatically retune the oscillator to the exact frequency required to bring in the desired station with maximum clarity and a minimum of noise.

NOTE - IN ALLIGNING THE BROADCAST BAND (1500 KC AND 600 KC) THE A.F.C. MUST BE OFF.

MODEL 1604 ONLY

300 KC. ADJUSTMENT - The band selector switch is set in position for operation on band no. 4. The receiver and generator are both tuned to 300 kc. and the procedure outlined above is repeated.

The signal generator is set at 150 kc. and the signal is tuned in on the dial. The long wave padder condenser is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 300 kc. adjustment should then be rechecked.

ALIGNMENT PROCEDURE

It is important to remember that in receivers of this kind which are equipped with automatic volume control it is necessary to use the minimum possible signal from the signal generator; otherwise the A.V.C. action will tend to nullify the variations in output as the trimmers are adjusted.

I.F. ADJUSTMENT - The signal generator is set at 456 kc. and is connected to the grid of the first detector 6A8G. With the oscillator section of the tuning condenser short-circuited and the receiver volume control at its maximum position, the i.f. trimmers are adjusted for maximum output. These trimmers may be found on the tops of the I.F. Transformers.

21 MEGACYCLE ADJUSTMENT - The high side of the signal generator is connected to the antenna lead of the receiver and the low side to the ground lead. The receiver and the signal are both tuned to a frequency of 21 mc. with the selector switch in position for short wave band no.1. The oscillator trimmer condenser is adjusted so that the 21 mc. signal is tuned in exactly at the 21 mc. calibration point, with the volume control on full and the signal generator adjusted for minimum input. The antenna preselector and interstage trimmers are then adjusted in the order named for maximum output. These trimmers are located as indicated in the bottom view of the chassis.

7.5 MEGACYCLE ADJUSTMENT The signal generator is set at 7.5 megacycles and the signal tuned in on the dial. The short wave padding condenser is adjusted for maximum output, while the gang condenser is rocked slightly to the right and left. The 21 megacycle adjustment should then be rechecked.

7 MC. ADJUSTMENT - With the band selector switch in position for operation on short wave band no. 2. and the receiver and the signal generator both set at 7 mc. the procedure outlined above is repeated.

The signal generator is set at 2.4 mc. and the signal tuned in on the dial. The police band padder condenser is adjusted for maximum gain while the gang tuning condenser is rocked slightly to the right and left. The 7 mc. adjustment should then be rechecked.

1500 KC. ADJUSTMENT - The band selector switch is set in position for operation on the broadcast band. The receiver and signal generator are both set at 1500 kc. and the procedure outlined above is repeated.

The signal generator is set at 600 kc. and the signal tuned in on the dial. The broadcast padder condenser is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 1500 kc. adjustment should then be rechecked.

ON MODEL 4012 ONLY

300 KC. ADJUSTMENT - The band selector switch is set in position for operation on the long wave band. The re-receiver and generator are both tuned to 300 kc. and the procedure outlined above is repeated.

The signal generator is set at 150 kc. and the signal is tuned in on the dial. The long wave padder condenser is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 300 kc. adjustment should then be rechecked.

All D. C. voltages measured from socket terminal to ground. Sensitivity control turned up all the way (clockwise).
D.C. voltages measured with 250,000 Ohm meter for high voltages and 25,000 Ohms for voltages under 25.

Filament voltages are taken from filament prong to filament prong at tube socket and measured with a low impedance AC voltmeter.

Wave band switch in Broadcast position
Sensitivity control in counter-clockwise position
No signal.

All D.C. voltages measured from socket terminal to ground. Sensitivity control turned up all the way (clockwise).
D.C. voltages measured with 250,000 Ohm meter for high voltages and 25,000 Ohms for voltages under 25.

Filament voltages are taken from filament prong to filament prong at tube socket and measured with a low impedance AC voltmeter.

I.F. ADJUSTMENT:- The signal generator is set at 456 kc. and is connected to the grid of the first detector 6A8G. With the oscillator section of the tuning condenser short-circuited and the receiver volume control at its maximum position, the i.f. trimmers are adjusted for maximum output. These trimmers may be found on the tops of the I.F. Transformers.

21 MEGACYCLE ADJUSTMENT - The high side of the signal generator is connected to the antenna lead of the receiver and the low side to the ground lead. The receiver and the signal are both tuned to a frequency of 21 mc. with the selector switch in position for short wave band no.1. The oscillator trimmer condenser is adjusted so that the 21 mc. signal is tuned in exactly at the 21 mc. calibration point, with the volume control on full and the signal generator adjusted for minimum input. The antenna preselector and interstage trimmers are then adjusted in the order named for maximum output. These trimmers are located as indicated in the bottom view of the chassis.

7.5 MEGACYCLE ADJUSTMENT The signal generator is set at 7.5 megacycles and the signal tuned in on the dial. The short wave padding condenser is adjusted for maximum output, while the gang condenser is rocked slightly to the right and left. The 21 megacycle adjustment should then be rechecked.

7 MC. ADJUSTMENT - With the band selector switch in position for operation on short wave band no. 2. and the receiver and the signal generator both set at 7 mc. the procedure outlined above is repeated.

The signal generator is set at 2.4 mc. and the signal tuned in on the dial. The police band padder condenser is adjusted for maximum gain while the gang tuning condenser is rocked slightly to the right and left. The 7 mc. adjustment should then be rechecked.

1500 KC. ADJUSTMENT - The band selector switch is set in position for operation on the broadcast band. The receiver and signal generator are both set at 1500 kc. and the procedure outlined above is repeated.

The signal generator is set at 600 kc. and the signal tuned in on the dial. The broadcast padder condenser is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 1500 kc. adjustment should then be rechecked.

AUTOMATIC FREQUENCY CONTROL - Should it be found that after a station is tuned in accurately (in the selective position) as indicated by the cathode ray tube, that when the A.F.C. switch is turned "ON", the signal is detuned or a change observed in the tone of the receiver, it will be necessary to readjust the "Discriminator" transformer which controls this action. A low range (0-5 or 0-10V.) high resistance volt meter or preferably a microammeter is inserted in series with the diode load resistor at the grounded end, which will indicate a maximum when a signal is tuned to exact resonance. This 500,000 Ohms load resistor is located directly under the discriminator transformer. A 0-10 milliammeter is inserted in the cathode circuit of the A.F.C. control tube. An R.F. signal (any frequency in the Broadcast Band) is fed into the antenna and the receiver is tuned as accurately as possible to resonance (with the switch turned OFF). Now throw the secondary trimmer of the discriminator off resonance. Tune the primary for maximum output as indicated by the diode load meter. Turn the AFC switch "ON". Now tune the secondary trimmer, identified by a red paint mark, so that when the A.F.C. switch is turned from the ON to the OFF position and vice versa, no change takes place in the cathode, current of the A.F.C. control tube, as indicated by the milliammeter. Be sure that the receiver has been accurately tuned first without the A.F.C., or improper adjustment may result, whereby the frequency is automatically detuned instead of tuned. When this condition of no change in cathode current is obtained, it is indicated that no control voltage is being generated at exact resonance, which is the desired condition. If now the receiver is slightly detuned either above or below resonance, the cathode current will either increase or decrease above its normal value with the A.F.C. OFF, or no signal fed into the antenna. The voltage thus generated as indicated by this change in current serves to shift the frequency of the oscillator in the proper direction so as to automatically retune the oscillator to the exact frequency required to bring in the desired station with maximum clarity and a minimum of noise.

NOTE - IN ALLIGNING THE BROADCAST BAND (1500 KC AND 600 KC) THE A.F.C. MUST BE OFF

ON MODEL 4016 ONLY

300 KC. ADJUSTMENT - The band selector switch is set in position for operation on the long wave band. The receiver and generator are both tuned to 300 kc. and the procedure outlined above is repeated.

The signal generator is set at 150 kc. and the signal is tuned in on the dial. The long wave padder condenser is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 300 kc. adjustment should then be rechecked.

GAROD RADIO CORP.

MODELS 4110, 4110E, 4110KC
Schematic, Voltage

All voltages except filament, are measured from socket terminals to chassis and with a 1000 Ohms per volt voltmeter. The set must be in operation and the sensitivity control in its maximum clockwise position.

Filament voltages are taken from filament prong to filament prong at tube socket and measured with a low impedance AC voltmeter.

I.F.ADJUSTMENT - The signal generator is set at 456 kc. and is connected to the grid of the first detector (6A8). With the oscillator section of the tuning condenser short-circuited and the receiver volume control at its maximum position, the i.f. trimmers are adjusted for maximum output. These trimmers may be found on the tops of the I.F. Transformers.

18 MEGACYCLE ADJUSTMENT - The high side of the signal generator is connected to the antenna lead of the receiver and the low side to the ground lead. The receiver and the signal are both tuned to a frequency of 18 mc. with the selector switch in position for band no. 1. The oscillator trimmer condenser is adjusted so that the 18 mc. signal is tuned in exactly at the 18 mc. calibration point, with the volume control on full and the signal generator adjusted for minimum input. The antenna preselector and interstage trimmers are then adjusted in the order named for maximum output. These trimmers are located as indicated in the bottom view of the chassis.

6 MEGACYCLE ADJUSTMENT - The signal generator is set at 6 megacycle and the signal tuned in on the dial. The short wave padding condenser is adjusted for maximum output, while the gang condenser is rocked slightly to the right and left. The 18 megacycle adjustment should then be rechecked.

5 MC. ADJUSTMENT - With the band selector switch in position for operation on band no. 2. and the receiver and signal generator both set at 5 mc. the procedure outlined above is repeated.
The signal generator is set at 1.8 mc. and the signal tuned in on the dial. The police band padder condenser is adjusted for maximum gain while the gang tuning condenser is rocked slightly to the right and left. The 5 mc. adjustment should then be rechecked.

1500 KC. ADJUSTMENT - The band selector switch is set in position for operation on the no. 3. band. The receiver and signal generator are both set at 1500 kc. and the procedure outlined above is repeated.

The signal generator is set at 600 kc. and the signal tuned in on the dial. The broadcast padder condenser is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 1500 kc. adjustment should then be rechecked.

300 KC. ADJUSTMENT - The band selector switch is set in position for operation on band no. 4. The receiver and generator are both tuned to 300 kc. and the procedure outlined above is repeated.

The signal generator is set at 150 kc. and the signal is tuned in on the dial. The long wave padder condenser is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 300 kc. adjustment should then be rechecked.

SERVICE NOTES FOR THE MODEL 5140
14 TUBE 5 BAND A.C. SUPERHETERODYNE RECEIVER
ALIGNMENT PROCEDURE

CURRENT: This receiver operates on AC (Alternating Current) only, on frequencies from 50 to 60 cycles.

VOLTAGE: Any line voltage from 105 to 260 volts may be used. This model is equipped with a universal Transformer, with five taps marked as follows:- 110, 135, 150, 220, 250. Access to this tap changer is obtained by lifting off the black cover on top of the transformer. The lug attached to the flexible lead is then moved to the point which corresponds most nearly to the line voltage available. The cover is then snapped back into place. Unles otherwise specified, the receiver is always connected to the 110 volt tap (suitable for 105 to 125 volts). Before inserting the line plug, be sure to ascertain what the line voltage is and connect to the correct tap.

Realignment of this receiver should not be attempted unless all other possible causes of faulty operation have been thoroughly investigated. An accurately calibrated signal generator which will cover the necessary wave-bands and an output meter for indicating the effect of adjustments are required.

It is important to remember that in receivers of this kind which are equipped with automatic volume control it is necessary to use the minimum possible signal from the signal generator; otherwise the avc action will tend to nullify the variations in output as the trimmers are adjusted. A surer method is to make the avc tube inoperative. This may be done by shorting return of RF trimmers to ground.

I.F. ADJUSTMENT: The signal generator is set at 456 kc. and is connected to the grid of the first detector (6L7). With the oscillator section of the tuning condenser short-circuited and the receiver volume control at its maximum position, the i.f. trimmers are adjusted for maximum output. These trimmers may be found on the tops of the I.F. transformers.

18 MEGACYCLE ADJUSTMENT: The high side of the signal generator is connected to the antenna lead of the receiver and the low side to the ground lead. The receiver and the signal are both tuned to a frequency of 18 mc. with the selector switch in position for band no. 2 (Short Wave). The oscillator trimmer condenser is adjusted so that the 18 mc. signal is tuned in exactly at the 18 mc. calibration point, with the volume control on full and the signal generator adjusted for minimum input. The antenna preselector and inter-stage trimmers are then adjusted in the order named for maximum output. These trimmers are located as indicated in the bottom view of the chassis.

6 MEGACYCLE ADJUSTMENT: The signal generator is set at 6 megacycles and the signal tuned in on the dial. The Short Wave padding condenser is adjusted for maximum gain while the gang tuning condenser is rocked slightly to the right and left.

5 MC. ADJUSTMENT: With the band selector switch in position for operation on band no. 3 (Police) and the receiver and signal generator both set at 5 mc. the procedure outlined above is repeated.

The signal generator is set at 1.8 mc. and the signal tuned in on the dial. The padder condenser for this band is adjusted for maximum gain while the gang tuning condenser is rocked slightly to the right and left. The 5 mc. adjustment should then be rechecked.

1500 KC. ADJUSTMENT: The band selector switch is set in position for operation on the no. 4 band. (Broadcast). The receiver and signal generator are both set at 1500 kc. and the procedure outlined above is repeated.

The signal generator is set at 600 kc. and the signal tuned in on the dial. The padder condenser for this band is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 1500 kc. adjustment should then be rechecked.

300 KC. ADJUSTMENT: The band selector switch is set in position for operation on band no. 5. The receiver and generator are both tuned to 300 kc. and the procedure outlined above is repeated.

The signal generator is set at 150 kc. and the signal is tuned in on the dial. The Long Wave padder condenser is adjusted for maximum response while the gang tuning condenser is rocked slightly to the right and left. The 300 kc. adjustment should then be rechecked.

GENERAL INFORMATION

This compact, single band receiver employs four Pre-tested General Electric tubes described above in a highly efficient superheterodyne circuit which includes a single stage of I.F., partial automatic volume control, wave trap, and pentode power output.

Description of Circuit

The signal from the antenna is applied to the control grid of the 6A7 through the R.F. transformer L2 and L3, the secondary of which is tuned by the rear section of the gang condenser. The 6A7 pentagrid converter tube is employed as a combination first detector and oscillator which converts the incoming signal to 455 kc. The intermediate frequency is transferred to the next tube by the 1st I.F. transformer T-3. The second tube, 6B7, performs the triple function of I.F. amplifier, detector and AVC, and audio amplifier. This is accomplished by inserting the 455 kc. signal from T3 into the grid circuit of the pentode section of the 6B7. After amplification at I.F. frequency, the signal is coupled through the I.F. transformer T-4 to the diode section of the same tube where it is rectified and the AVC voltage developed across R6. This AVC is in turn applied through R5 to the grid of the 6B7, causing a control of the amplification dependent upon the strength of the carrier. The audio voltage developed across R6 is fed through R5 and through the secondary of T-3 to the grid of the 6B7.

After amplification in the 6B7 this audio frequency is taken off of the plate load, R-7, through the coupling capacitor C-14, and thence to the grid of the 41 pentode power output tube.

Volume is controlled by the variable potentiometer R-1 in the cathode circuit of the 6A7 tube. This changes the self-bias on this tube and thereby changes the gain of the input tube. This same control functions to gradually short the antenna to ground as volume is decreased.

Plate and grid bias voltages for all tubes are supplied by the power supply system employing an 80 type full-wave rectifier tube.

ALIGNMENT PROCEDURE

I.F.	Broadcast	Broadcast
455 kc.	1830 kc.	1500 kc.

In order to align this receiver properly, it is necessary to have available:

1. A modulated test oscillator capable of producing the above alignment frequencies.
2. An output indicator, such as a high resistance A-C voltmeter with a maximum scale reading of 3 to 5 volts.
3. An alignment tool consisting of an insulating shaft with a small screw driver blade.

The location of all alignment trimmers are shown in Fig. 2.

I.F. Alignment

With gang condenser plates closed, turn the volume control to maximum (extreme clockwise position). Short circuit the antenna and ground leads.

Connect the test oscillator output between the chassis and the control grid of the 6A7 tube. A .05 mfd. capacitor should be used in series with the signal generator lead to the control grid. Connect the output meter across the voice coil of the speaker. Set the test oscillator to 455 kc. and adjust the oscillator output until a small deflection is noted on the output meter.

The four I.F. trimmers, see Fig. 2, are adjusted in the following sequence:

1. Secondary trimmer of 2nd I.F. transformer
2. Primary trimmer of 2nd I.F. transformer
3. Secondary trimmer of 1st I.F. transformer
4. Primary trimmer of 1st I.F. transformer

For a final check, the above adjustments should be repeated, keeping the test oscillator output at a low level.

I.F. Wave Trap Alignment

After completion of the I.F. alignment with the test oscillator still set at 455 kc. point, apply this frequency to the antenna lead of the receiver through a dummy antenna. This dummy antenna consists of a 400 ohm resistor in series with a 250 mmfd. capacitor and should be connected in series between the test oscillator output and the receiver antenna lead. With the 455 kc. signal applied to the receiver antenna lead, adjust the I.F. wave trap trimmer (C-9) for a minimum output indication.

R.F. Alignment

Remove the chassis. Connect the signal generator to the antenna and ground leads of the chassis through a dummy antenna consisting of a 400 ohm resistor in series with a 250 mmf. capacitor. Connect the output indicator across the voice coil of the speaker. With the gang condenser set to the minimum capacity position, i.e., plates fully open, peak the oscillator trimmer C-4 (front section) for maximum output with the signal generator set at the 1830 kc. point. Now reduce the signal generator frequency to 1500 kc. and tune in carefully this new frequency by means of the gang condenser. Now peak the antenna trimmer (C-3) (rear section) for a maximum output. After replacing the chassis in the cabinet, set the pointer by turning the station selector to the extreme clockwise position. Grasp the dial pointer and turn clockwise until the long end is opposite the last mark beyond 160.

GENERAL INFORMATION

The Models G-50 and G-55 employ five General Electric Pre-Tested Tubes as described above in a highly efficient super-heterodyne circuit. A unique arrangement of push buttons mechanically connected to the dial drive mechanism allows instantaneous and accurate selection of eight different stations automatically.

Description of Electrical Circuit

A signal from the antenna is applied to the control grid of the 6A7 tube through the R.F. transformer, the secondary of which is tuned to the incoming signal by the rear section of the main tuning condenser. In the 6A7 tube the incoming signal is combined with the local oscillator signal which is 465 kc higher in frequency. A local signal is generated by the oscillator section of this tube and the proper frequency difference is maintained throughout the tuning range by the front section of the tuning condenser used in conjunction with the oscillator coil. The special cut rotor of the front condenser section makes the use of a padding capacitor unnecessary.

The combination of the oscillator and incoming signal frequencies produces an intermediate frequency of 465 kc. This signal is applied to an I.F. amplifier consisting of a 6D6 tube and two transformers, the primary and secondaries of each being tuned to 465 kc. The amplified I.F. frequency is applied to the diode section of the 75 and rectification causes a current to flow through resistor R-6. This in turn causes a voltage to be built up across R-6 and this voltage is applied to the 6A7 and 6D6 control grids and produces the right amount of AVC action. A variable resistor R-5 is shunted across R-6 and by varying the slider of R-5 the desired amount of audio voltage is impressed on the control grid of the 75 which in turn amplifies the audio frequency. The output of the 75 is resistance coupled to the grid of the 41 output tube. A transformer is used in the output of the 41 to properly match the speaker to the tube.

Tone control action is obtained by inserting or removing capacitor C-17 by means of switch S-3. Part of the output voltage is fed back through resistor R-12 to a point between R-5 and R-14 to improve the frequency response and reduce distortion.

Plate and grid voltages for all tubes are supplied by the power supply system employing an 80 full-wave rectifier tube. A suitable resistor network across the speaker field provides the proper bias for the tubes.

TOUCH TUNING MECHANISM

Automatic tuning of the receiver is accomplished by the mechanism as shown in Fig. 4. By pressing in a station button and rotating it to the lower part of the assembly, the button arm (B) will engage between the two gates (A) allowing the set to be mechanically tuned to a pre-set station at this point. When the station button is not depressed, the arm (B) should clear the gates by $\frac{1}{32}$ in. To adjust this clearance, merely loosen the two set screws (D) and slide the assembly (F) in the proper direction on the gang condenser drive shaft; then tighten set screws.

The red dot (C) indicates the position of the pointer and is an aid in locating the desired station when the pointer is removed.

Station Set-up

The buttons are easily set up for the station as follows: Use the wrench provided with the receiver to press in a button. Bring the button down until it locks into position, then loosen button lock nut. While still holding the button pressed in, tune in a station and then tighten the button lock nut.

To check the button tuning accuracy, merely press in the button and bring it down until it locks in position. The station should be correctly tuned. Each button will tune the following range of frequencies.

Button No.	Frequency range (Kilocycles)
1	540–590
2	570–670
3	630–780
4	710–940
5	830–1150
6	1020–1400
7	1220–1700
8	1580–1800

ALIGNMENT PROCEDURE

I.F.	Broadcast	Broadcast
465 kc.	1500 kc.	1830 kc.

In order to align these receivers properly, it is necessary to have the following test equipment.

1. A modulated test oscillator.
2. An output indicator such as an a-c voltmeter with a range of from 3 to 5 volts.
3. A screwdriver type aligning tool.

The trimmer locations are shown in Fig. 3.

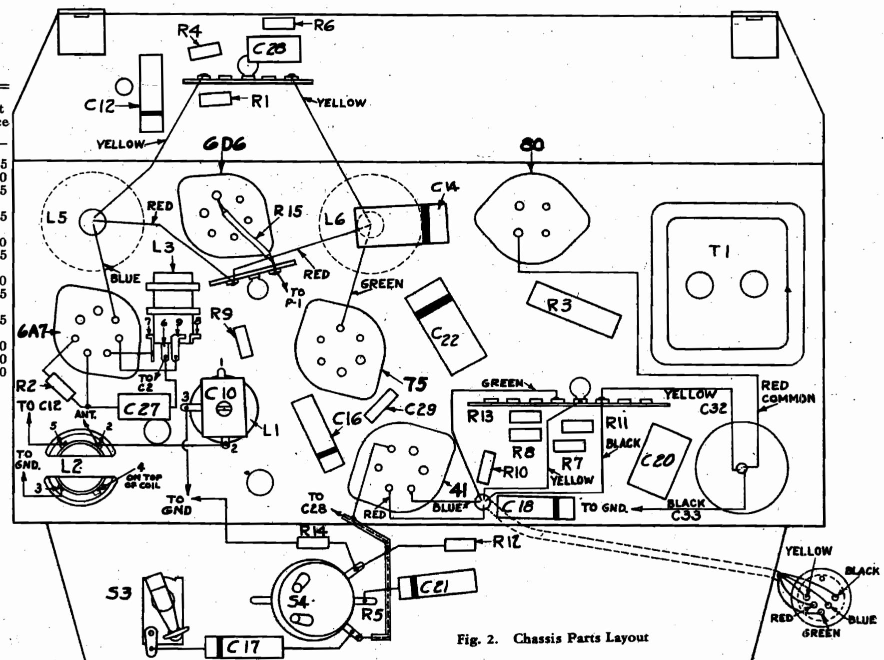

Fig. 2. Chassis Parts Layout

I.F. Alignment

Turn the volume control to maximum (extreme clockwise position). Tune the receiver to a point where no signal comes in and short circuit the antenna and ground leads.

Connect the test oscillator output between the chassis and through a .05 Mfd. capacitor to the control grid of the 6A7 tube. Connect the output meter across the voice coil of the speaker. Set the test oscillator to 465 kc. and adjust the output until a small deflection is obtained on the output meter.

The four I.F. trimmers (see Fig. 3) are adjusted in the following sequence:

1. Secondary trimmer on second I.F. transformer
2. Primary trimmer on second I.F. transformer
3. Secondary trimmer on first I.F. transformer
4. Primary trimmer on first I.F. transformer

Throughout all adjustments the output should be maintained at a low level by decreasing the test oscillator output as various stages are aligned. After these adjustments have been made the same procedure should be repeated as a final check.

I.F. Wave Trap Alignment

Leave the test oscillator set at 465 kc. and connect one output lead to the receiver chassis and the other through a 250 mmf. condenser in series with 400 ohms to the receiver antenna lead. Adjust C-10 for minimum output.

R.F. Alignment

Connect the signal generator to the antenna and ground leads of the chassis through a dummy antenna consisting of a 400 ohm resistor in series with a 250 mmf. capacitor. Connect the output indicator across the voice coil of the speaker. With the gang condenser set to the minimum capacity position, i.e., plates fully open, peak the oscillator trimmer C-4 (front section) for maximum output with the signal generator set at the 1830 kc. point. Now reduce the signal generator frequency to 1500 kc. and tune in carefully this new frequency by means of the gang condenser. Now peak the antenna trimmer (C-3) (rear section) for a maximum output.

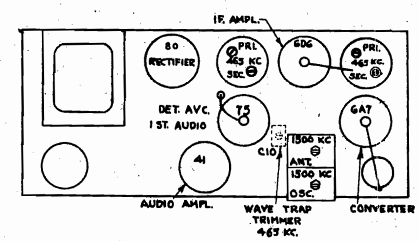

Fig. 3. Chassis Layout and Trimmer Location

GENERAL INFORMATION

Models GD-41 and GD-41-U are compact four tube AC-DC tuned radio frequency receivers that operate only in the broadcast band of frequencies. The Model GD-41 has one side of the power line connected directly to the chassis ground; while in the Model GD-41-U, condensers are used to isolate the power supply voltage from the chassis frame. Model GD-41-U is fully approved by Underwriters' Laboratories.

When operating from a DC source of power, it is necessary to insert the power plug with proper polarity; otherwise, the receiver will fail to function. If any hum is noticed when the receiver is used on AC, reverse the power plug in the receptacle.

ALIGNMENT

Connect the high side of the signal generator through a 250 mmf. condenser to the antenna lead. The low side of the signal generator output should be connected to the receiver chassis through a .05 mfd. condenser. Connect a suitable output meter across the voice coil leads; then proceed as follows:

1. With gang condenser plates completely closed, the dial pointer should coincide with the horizontal dial line.
2. Tune receiver to the 1500 kc. point on the dial; then align trimmers (C-3 and C-5) on the gang condenser at 1500 kc. for a maximum output meter reading.

Precaution—One side of the power supply is connected to the chassis—Do not connect chassis to any external ground.

GENERAL INFORMATION

This two-band receiver employs five General Electric Pre-tested tubes in a superheterodyne circuit. The circuit incorporates a wave trap and a two point tone control.

A signal from the antenna is coupled by the antenna transformer to the control grid on the 6A7 oscillator and converter tube. After conversion to 455 kc. the signal is amplified at this frequency by the intermediate frequency amplifier which employs two double tuned I.F. transformers.

The diode part of the 75 tube is used as a detector and provides the avc voltage. The 75 tube is resistance coupled to the 41 pentode amplifier output tube.

Minimum bias is supplied for all tubes by the voltage drop over the resistance R-7.

Negative feed back is used to improve the tone of reproduction. In this circuit voltage is fed back from the voice coil circuit to a tap on the volume control. This feed back voltage is out of phase with the input voltage to the audio amplifier. Engineers have shown that the resulting degeneration reduces distortion arising in the audio amplifier and extends the tone range.

ALIGNMENT PROCEDURE

Alignment Frequencies

I.F.	Broadcast
455 kc.	1500 and 580 kc.

The location of all trimmers is shown in Fig. 2.

I.F. Alignment

Connect an output meter across the voice coil. Set the volume control for maximum.

Set the test oscillator to 455 kc. and connect one output lead to the receiver chassis and the other through a .05 Mfd. condenser to the control grid of the 6A7. Do not remove the grid lead from the 6A7 as this would remove the minimum bias from this tube. Keep the test oscillator output as low as possible to give a readable output. The four I.F. trimmers, see Fig. 2, should be adjusted in the following sequence for maximum output.

1. Secondary trimmer (C-9) } on second I.F. transformer
2. Primary trimmer (C-8) }
3. Secondary trimmer (C-7) } on first I.F. transformer
4. Primary trimmer (C-6) }

Wave Trap Alignment

Leave the test oscillator set to 455 kc. and connect one output lead to the receiver chassis and the other through a 250 mmf. condenser in series with 400 ohms to the receiver antenna lead. Adjust C-10 for minimum output.

R.F. Alignment

Use the same dummy antenna (250 mmf. and 400 ohms). With 1500 kc. input, and the band switch on the broadcast position, adjust oscillator trimmer C-4 and antenna trimmer C-3 for maximum output. Next with 580 kc. input adjust the broadcast padder C-11 for maximum output while rocking the gang condenser in the vicinity of 580 kc. Repeat the adjustments at 1500 kc. No adjustment is required on "C" band.

Electrical Specifications

Rating Label	Power Supply (Volts)	Frequency (Cycles)	Power Consumption (Watts)
A	115-125	50-60	60
C	115-125	25-60	65
V	115-125 140-155 190-220 220-550	50-60	65

NOTE: Rating "V" receivers may be used on 40-cycle circuits provided the voltage does not exceed 110 on the 115-125 volt tap or 200 volts on the 190-220 volt tap.

TUNING DRIVE

The drive cable should be carefully threaded around the condenser drive drum and pulleys as shown in Fig. 3. "A" is the tuning shaft.

SOCKET VOLTAGES

Tube No.		Plate to Ground Volts D.C.	Screen Grid to Ground Volts D.C.	Cathode to Ground Volts D.C.	Cathode Current M.A.	Heater Volts A.C.
6A7	Oscillator	105	105	0	14.8	6.3
	Converter	230				
6D6	1st I.F. Amp.	230	105	0	10	6.3
75	Det A.V.C. 1st audio	100 *	....	0	.16	6.3
41	Output	215	230	0	29	6.3
80	Rectifier	300/600 RMS		315 to B—	54	

A.C. line voltage 120. No signal input 1000 ohms per-voltmeter.
Dial pointer at 530 K.C.
* Measured on 500-volt scale.

ALIGNMENT PROCEDURE

I.F. ALIGNMENT WITH OSCILLOSCOPE

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"	455 K.C. Sweep	I.F. Grid	.05 Mfd. or Larger	2nd I.F. Sec. (C-12) 2nd I.F. Pri. (C-11)	Gang condenser plates wide open—connect audio input of oscilloscope to ground and to the junction of C-47 and R-5—Adjust trimmers in order mentioned for a single symmetrical curve of maximum amplitude. The resulting curve with input at converter grid is shown in Fig. 5.
2. Band "B"	455 K.C. Sweep	Converter Grid	.05 Mfd. or Larger	1st I.F. Sec. (C-10) 1st I.F. Pri. (C-9)	
3. Band "B"	455 K.C. Sweep	Antenna Post	250 Mmf. 200 Ohms	Wave Trap Trimmer (C-7)	Adjust trimmer for minimum amplitude.

I.F. ALIGNMENT WITH OUTPUT METER

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"	455 K.C. with Modulation	I.F. Grid	.05 Mfd. or Larger	2nd I.F. Sec. (C-12) 2nd I.F. Pri. (C-11)	Gang condenser plates wide open—connect output meter across voice coil—keep input signal low and volume control on as far as possible. Adjust all trimmers for maximum output.
2. Band "B"	455 K.C. with Modulation	Converter Grid	.05 Mfd. or Larger	1st I.F. Sec. (C-10) 1st I.F. Pri. (C-9)	
3. Band "B"	455 K.C. with Modulation	Antenna Post	250 Mmf. 200 Ohms	Wave Trap Trimmer (C-7)	Adjust trimmer for minimum output.

R.F. ALIGNMENT

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"	....	.....	....	....	Close gang condenser plates. Adjust pointer, to first line at left end of tuning scale.
2. Band "B"	1500 K.C. with Modulation	Antenna Post	250 Mmf. 200 Ohms	Osc. (C-3) Ant. (C-4)	Connect output meter across voice coil—tone control on "bass" position—peak trimmers for maximum output with a low input signal.
3. Band "B"	580 K.C. with Modulation	Antenna Post	250 Mmf. 200 Ohms	Osc. Padder (C-8)	Adjust padder for a maximum output meter indication in vicinity of 580 kc. while rocking the gang condenser.
4. Band "B"	Repeat Operation 2				
5. Band "D"	18 M.C. with Modulation	Antenna Post	250 Mmf. 200 Ohms	Osc. (C-6) Ant. (C-5)	Peak C-5 for maximum output while rocking the gang at the 18 mc. point. The image of any signal on "D" band should be heard 930 kc. **below** the input signal when proper peak is obtained on oscillator trimmer C-6. Example: 12 mc. image—11.09 mc.

GENERAL INFORMATION

Models G-53 and G-56 are two-band A-C operated receivers, employing five General Electric Pre-tested Tubes as described above, in a superhetrodyne circuit. They incorporate a simplified trimmer tuned "Touch-Tuning" system allowing a set-up of six stations for automatic tuning. Other features of design include I.F. wave trap, degenerative feedback and an improved dust-proof electrodynamic speaker.

Coil System

The "B" and "D" band antenna coils are wound on a single coil form (T-3) as shown in Fig. 2. T-4 is the oscillator transformer for both the "B" and "D" bands. All coil terminals are numbered in Fig. 2 and 4 to facilitate in service by showing common points on the schematic diagram, Fig. 2, and the pictorial wiring diagram, Fig. 4.

The following table shows the coils in use for the various positions of the wave change switch.

Band Switch Position	Antenna Primary	Antenna Secondary	Oscillator Grid Coil	Oscillator Plate Coil	REMARKS
Short Wave	L-10	L-11	L-14	L-15	L-12 Shorted L-16 Shorted
Manual Broadcast	L-10 and L-13	L-11 and L-12	L-14 and L-16	L-15	Tuned by gang condenser C-1 and C-2
Automatic Tuning	L-10 and L-13	L-11 and L-12	L-14 and L-16	L-15	C-1 and C-2 removed tuned by fixed trimmers

Loud-speaker

12-inch speaker—To center the voice coil, remove dust cover by softening with acetone. Loosen the two clamping screws and place three 1 in. by ¼ in. by 0.010 in. paper or celluloid strips equally spaced around pole piece for clearance—then tighten clamping screws. Remove strips and cement the dust cap back in place with glyptal cement.

6½-inch speaker—If the cone is off center in this speaker, it is necessary to replace cone. Remove cone and clean cementing surfaces. Cut a piece of 0.005 in. to 0.006 in. paper about 1½ in. wide and 2¼ in. long and roll into a cylinder and place inside the voice coil collar. Apply a film of glyptal cement to the rim and spider shelf of speaker frame. Using the paper cylinder as a pilot over the center post, place the cone assembly in the housing making sure that the voice coil leads head toward the plug. Press the edge of the cone to contact the cemented surface, and, using a bent paper clip or similar tool, do the same to the edge of the spider. Give the cement sufficient time to set before removing the center shim. Cement dust cap in cone and connect speaker voice coil leads to the plug.

Phonograph Connection

Fig. 1 shows a simple sketch for connecting a crystal or high impedance magnetic pick-up into the G-53 or G-56 circuit for the reproduction of phonograph recordings. S-1 is either a rotary or toggle type double-pole, double-throw switch. A suitable loading circuit composed of a resistor or resistor and capacitor network should be used across the pick-up leads when using a crystal type unit. It is very important that the pick-up leads have a shield such as copper braid to prevent hum interference. This shield should be connected to the chassis ground.

The circuit should be opened between R-5 and C-47 and phonograph connections made as shown in Fig. 1. This procedure requires removal of the chassis from the cabinet.

When the pick-up is connected as shown, the regular radio volume and tone controls work for both radio and phonograph reproduction.

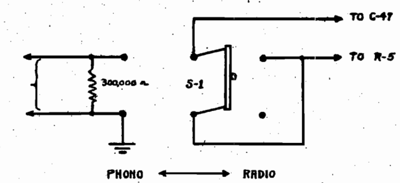

Fig. 1. Pick-up Connections

SOCKET VOLTAGES

Tube No.		Plate to Ground Volts D.C.	Screen Grid to Ground Volts D.C.	Cathode to Ground Volts D.C.	Cathode Current M.A. D.C.	Heater Volts A.C.
6A8G	Converter	236	95	0	12.2	6.5
	Oscillator	186	....

Socket, Trimmers
Alignment, Parts

GENERAL ELECTRIC CO.

I. F. ALIGNMENT WITH OSCILLOSCOPE

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"	465 kc. Sweep	I.F. Grid	.05 Mfd. or Larger	2nd I.F. Sec. (C-10) 2nd I.F. Pri. (C-9)	Gang condenser plates wide open—connect input of oscilloscope to B- and to the junction of R-3 and R-4 of the 2nd I.F. transformer—Adjust trimmers in order mentioned for a single symmetrical curve of maximum amplitude.
2. Band "B"	465 kc. Sweep	Converter Grid	.05 Mfd. or Larger	1st I.F. Sec. (C-7) 1st I.F. Pri. (C-6)	
3. Band "B"	465 kc. Sweep	Antenna Lead	250 Mmf. 400 Ohms	Wave Trap Trimmer (C-2)	Adjust trimmer for minimum amplitude.

I. F. ALIGNMENT WITH OUTPUT METER

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"	465 kc. with Modulation	I.F. Grid	.05 Mfd. or Larger	2nd I.F. Sec. (C-10) 2nd I.F. Pri. (C-9)	Gang condenser plates wide open—connect output meter across voice coil—keep input signal low and volume control on as far as possible. Adjust all trimmers for maximum output
2. Band "B"	465 kc. with Modulation	Converter Grid	.05 Mfd. or Larger	1st I.F. Sec. (C-7) 1st I.F. Pri. (C-6)	
3. Band "B"	465 kc. with Modulation	Antenna Lead	250 Mmf. 400 Ohms	Wave Trap Trimmer (C-2)	Adjust trimmer for minimum output.

R. F. ALIGNMENT

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"					Close gang plates—Adjust pointer to first line at left end of tuning scale.
2. Band "C"	No adjustments necessary				
3. Band "B"	1500 kc. with Modulation	Antenna Lead	250 Mmf. 400 Ohms	Osc. trimmer (Front sect. of gang cond.) Ant. trimmer (Rear sect. of gang cond.)	Connect output meter across voice coil—tone control on "bass" position—peak trimmers for maximum output with a low input signal.
4. Band "B"	580 kc. with Modulation	Antenna Lead	250 Mmf. 400 Ohms	Osc. padder (C-3)	Adjust padder for a maximum output meter indication in vicinity of 580 kc. while rocking the gang condenser.
5. Band "B"	Repeat operation No. 3

GENERAL INFORMATION

These two-band receivers employ six General Electric tubes described above in a superheterodyne circuit which includes a single stage of I.F., automatic volume control, four-point tone control, wave trap and pentode output.

L1, L2 and L3 are the components of the "B" band antenna coil and are wound on the same coil form. When operating in the "C" band, L3 and a part of L2 are shorted out by the wave-change switch. L4-L5 and L6-L7 are the "B" and "C" band oscillator coils respectively and are wound on the same coil form. The "B" band oscillator grid coil is shorted out by a contact of S-1 when the set is operating on the "C" band.

The intermediate frequency amplifier consists of a 6K7 tube and two transformers, both of which have tuned primaries and secondaries.

The output of this amplifier is applied to one plate of the diode section of the 6Q7 tube. The diode serves as a detector and source of the automatic volume control voltage.

The audio voltage developed over the resistor R-4 is fed through the capacitor C-12 to the volume control R-5 which is in the grid circuit of the 6Q7 tube. The 6Q7 is resistance coupled to the 43 pentode output tube, which is in turn coupled through the output transformer to the "alnicore" permanent magnet dynamic speaker.

The 6A8 and 6K7 tubes have a combination of self and fixed bias which is the voltage drop over the resistor R-10. The 6Q7 and 43 tubes are supplied with semi-fixed bias obtained from the voltage drop over the resistors R-11 and R-13 in the B- lead.

One section of the BL49C ballast tube serves as a voltage dropping resistor in series with tube heaters. The second section of the BL49C is a low resistance shunt across the pilot lights. When the tubes reach their normal operating temperature this shunt across the pilot lights has more than doubled in resistance and thus allows the correct voltage drop across the pilot lights.

D-C Operation

When operating from a d-c source, it is necessary to insert the plug with proper polarity. If the set fails to function, after allowing time for the tubes to reach their operating temperature, reverse the power plug in the receptacle.

When the set is used on a d-c supply, the 25Z5 rectifier tube and the filter remain in the circuit and serve two purposes. If the power cord should be plugged in with incorrect polarity, the 25Z5 tube protects the filter condensers from damage. On correct d-c polarity the 25Z5 tube passes the d-c and the filter circuit aids in smoothing the supply voltage—thus minimizing line noise.

A-C Operation

When the set is used on alternating current, all d-c potentials are supplied by a 25Z5 rectifier tube and its associated filter circuit. The tube is connected as a half-wave rectifier.

If any hum is noticed when the set is used on a-c reverse the power plug in the receptacle. When the set has not been used for some time, a slight hum may be audible when the set is first turned on. This hum may not immediately clear up upon reversal of the power plug. However, it will probably be eliminated after approximately five minutes operation by which time the anode plates of the electrolytic capacitors will have re-formed.

TONE CONTROL

On the "Normal" position, No. 1 of the tone control bass compensation is obtained by the resistor R-14 and capacitor C-13 across the lower portion of the volume control. C-24 serves to inject higher frequencies at the tap.

The "Bass" position connects C-19 effectively across R-8 the grid resistor of the 43 tube thus limiting the high frequency input to that tube.

The "Foreign" position places R-16 in parallel with C-13 and thus reduces the bass compensation. C-19 is left connected across the grid circuit of the 43 tube and again limits the high frequency input to that tube. The result is a middle range response.

The "Speech" position removes C-19 from the circuit, so the high frequency response is the same as in the "Normal" position. However R-16 is left across C-13 thus removing the bass compensation. This arrangement adds clarity to programs predominating in speech.

ALIGNMENT PROCEDURE

In order to align these receivers properly, it is necessary to have the following test equipment:

1. A modulated test oscillator.
2. An output indicator such as an a-c voltmeter with a scale reading of 3 to 5 volts.
3. A screwdriver-type alignment tool.

To realize all the performance built into these receivers at the factory, alignment using cathode-ray equipment is to be preferred. The alignment procedure is given in table form on page 5 along with a trimmer location drawing Fig. 3. The "Dummy Antenna" is the capacitor or capacitor and resistor used in series with the signal generator antenna lead. The grid lead should not be removed from the tube to which the input signal is applied when aligning the I.F.

ALIGNMENT PROCEDURE

In order to align these receivers properly, it is necessary to have the following test equipment:

1. A modulated test oscillator.
2. An output indicator such as an a-c voltmeter with a scale reading of 3 to 5 volts.
3. A screwdriver-type alignment tool.

To realize all the performance built into these receivers at the factory, alignment using cathode-ray equipment is to be preferred. The alignment procedure is given in table form on page 5 along with a trimmer location drawing Fig. 3. The "Dummy Antenna" is the capacitor or capacitor and resistor used in series with the signal generator antenna lead. The grid lead should not be removed from the tube to which the input signal is applied when aligning the I.F.

Electrical Specifications

Rating Label	Power Supply (Volts)	Frequency (Cycles)	Power Consumption (Watts)
A	115–125	50–60	75
C	115–125	25–60	75
V	115–125 140–155 190–220 220–250	50–60	80

NOTE: Rating "V" receivers may be used on 40 cycle circuits provided the voltage does not exceed 110 volts on the 115-125 volt tap or above 200 volts on the 190-220 volt tap.

I.F. ALIGNMENT WITH OSCILLOSCOPE

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"	465 K.C. Sweep	I.F. Grid	0.5 Mfd. or Larger	2nd I.F. Sec. (C-10) 2nd I.F. Pri. (C-9)	Gang condenser plates wide open—connect audio input of oscilloscope to ground and to the junction of R-3 and R-4 of the 2nd I.F. transformer—Adjust trimmers in order mentioned for a single symmetrical curve of maximum amplitude.
2. Band "B"	465 K.C. Sweep	Converter Grid	.05 Mfd. or Larger	1st I.F. Sec. (C-7) 1st I.F. Pri. (C-6)	
3. Band "B"	465 K.C. Sweep	Antenna Post	250 Mmf. 400 ohms	Wave Trap Trimmer (C-2)	Adjust trimmer for minimum amplitude.

I.F. ALIGNMENT WITH OUTPUT METER

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"	465 K.C. with Modulation	I.F. Grid	0.5 Mfd. or Larger	2nd I.F. Sec. (C-10) 2nd I.F. Pri. (C-9)	Gang condenser plates wide open—connect output meter across voice coil—keep input signal low and volume control on as far as possible. Adjust all trimmers for maximum output.
2. Band "B"	465 K.C. with Modulation	Converter Grid	.05 Mfd. or Larger	1st I.F. Sec. (C-7) 1st I.F. Pri. (C-6)	
3. Band "B"	465 K.C. with Modulation	Antenna Post	250 Mmf. 400 ohms	Wave Trap Trimmer (C-2)	Adjust trimmer for minimum output.

R.F. ALIGNMENT

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"	....	....	....	....	Close gang condenser plates. Adjust pointer, to first line at left end of tuning scale.
2. Band "B"	1500 K.C. with Modulation	Antenna Post	250 Mmf. 400 ohms	Osc. (C-31) Ant. (C-30)	Connect output meter across voice coil—tone control on "bass" position—peak trimmers for maximum output with a low input signal.
3. Band "B"	580 K.C. with Modulation	Antenna Post	250 Mmf. 400 ohms	Osc. Padder (C-3)	Adjust padder for a maximum output meter indication in vicinity of 580 kc. while rocking the gang condenser.
4. Band "B"	Repeat Operation 2				
5. Band "D"	18 MC. with Modulation	Antenna Post	250 Mmf. 400 ohms	Osc. (C-32) Ant. (C-29)	Peak C-29 for maximum output while rocking the gang at the 18 mc. point. (*Start with C-29 at minimum capacity. The first peak is correct.*) The image of any signal on "D" band should be heard 930 kc. above the input signal when proper peak is obtained on oscillator trimmer C-32. Example: 12 mc. image—12.93 mc.

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"	465 K.C. Sweep	2nd I.F. Grid	.05 Mfd.	3rd I.F. Sec. (C-22) 3rd I.F. Pri. (C-21)	Gang condenser plates wide open—connect vertical input of oscilloscope to ground and the junction of C-24 and R-9 on 3rd I.F. transformer. Adjust trimmers for a single symmetrical curve of maximum amplitude. The resulting curve with input at converter grid is shown in Figure 3.
2. Band "B"	465 K.C. Sweep	1st I.F. Grid	.05 Mfd.	2nd I.F. Sec. (C-20) 2nd I.F. Pri. (C-19)	
3. Band "B"	465 K.C. Sweep	Converter Grid	.05 Mfd.	1st I.F. Sec. (C-18) 1st I.F. Pri. (C-17)	
4. Band "B"	465 K.C. Sweep	Antenna Post	250 Mmf. 400 ohms	Wave Trap Trimmer (C-4)	Adjust for minimum amplitude.

I.F. ALIGNMENT WITH OUTPUT METER

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"	465 K.C. with Modulation	2nd I.F. Grid	.05 Mfd.	3rd I.F. Sec. (C-22) 3rd I.F. Pri. (C-21)	Gang condenser plates wide open—connect output meter across voice coil—keep input signal low and volume control at maximum. Adjust all trimmers in order mentioned for maximum output. Do not attempt an overall realignment after stage by stage alignment has been accomplished.
2. Band "B"	465 K.C. with Modulation	1st I.F. Grid	.05 Mfd.	2nd I.F. Sec. (C-20) 2nd I.F. Pri. (C-19)	
3. Band "B"	465 K.C. with Modulation	Converter	.05 Mfd.	1st I.F. Sec. (C-18) 1st I.F. Pri. (C-17)	
4. Band "B"	465 K.C. with Modulation	Antenna Post	250 Mmf. 400 ohms	Wave Trap Trimmer (C-4)	Adjust for minimum output.

R.F. ALIGNMENT

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"					Close gang plates—adjust pointer to first line at left end of tuning scale.
2. Band "D"	18 M.C. with Modulation	Antenna Post	250 Mmf. 400 ohms	Osc. (C-3) Ant. (C-2)	Connect output meter across voice coil—tone control on "Bass" position. The image of any "D" band signal should be heard 930 K.C. above signal input when (C-3) is on proper peak. Example: 15 M.C. image—15,930 K.C. Peak (C-2) while rocking the gang condenser.
3. Band "C"	No adjustments necessary.				
4. Band "B"	1500 K.C. with Modulation	Antenna Post	250 Mmf. 400 ohms	Osc. (C-12) Ant. (C-7)	Peak trimmers for maximum output with a low input signal.
5. Band "B"	580 K.C. with Modulation	Antenna Post	250 Mmf. 400 ohms	Osc. Padder (C-13)	Adjust padder for maximum output in vicinity of 580 K.C. while rocking the gang condenser.
6. Band "B"	1500 K.C. with Modulation	Antenna Post	250 Mmf. 400 ohms	Osc. (C-12) Ant. (C-7)	Peak trimmers for maximum output with a low input signal.

Dial Lamp	MAZDA No. 46

GENERAL INFORMATION

The Models F-80 and F-85 employ eight General Electric tubes described above in a superheterodyne circuit, which includes two stages of I.F. and wave trap, compensated volume control, four-point tone control, and ample pentode power output.

The "B," "C," and "D" band antenna coils are wound on a single coil form designated as T-3 in Fig. 1. Coils L4, L5, and L6 are the components of the "B" band antenna coil. When operating in the "C" band, L4 is used for the grid coil while L3 acts as the antenna primary. L2 is the "D" band antenna grid coil using L3, as in the "C" band, for the antenna primary coil. T4 consisting of plate and grid coils L7 and L8 are the components of the "D" band oscillator coil. L12, L13 and L14, L15 are the "C" and "B" band oscillator coils respectively and are wound on the same coil form. The "B" and "C" band oscillator grid coils are shorted out by a contact of S1 when the set is operating in the "C" and "D" bands respectively.

The intermediate frequency amplifier consists of two 6K7 tubes and three tuned transformers. The output of the third I.F. transformer is applied to one plate of the 6H6 diode, which is a combined detector, initial bias and automatic volume control tube.

Volume is controlled by the variable potentiometer R1 in the grid circuit of the 6F5 audio amplifier tube. The output of the 6F5 is resistance coupled to the grid of the type 42 power amplifier pentode. The plate circuit of the 42 tube is matched to the loud-speaker by means of a suitable step-down output transformer.

Proper bias for the various tubes are obtained by the use of a tapped bleeder resistance (R-11). One of the cathodes of the 6H6 diode is returned to −5 volts on this bleeder in order to provide initial bias to all tubes controlled by the AVC.

Tone Control

When the tone control is in the "normal" position, a portion of the output voltage of the receiver is fed back through a resistor-capacitor network consisting of C-25, R-14 and R-13 to a tap on the volume control. This feedback voltage is out of phase with the input and the resulting degeneration reduces the speaker resonance boom due to pentode output, gives an extended and relatively flat response to a wide range of low frequencies, and reduces distortion arising in the audio amplifier. In the "bass" position, the tone control switch connects C-26 in parallel with the above network. The value of C-26 is such that more degeneration of the high than the low frequency notes occurs, thereby increasing the bass response. The "foreign" position of the switch shorts out capacitor C-25 and resistor R-14 and places C-26 and R-13 in parallel which gives a frequency response best suited for short-wave reception. In the speech position, C-25 and R-14 are shorted out; C-26 is removed from the circuit, leaving R-13, thereby providing flat degeneration at all frequencies which is the most desirable condition for the reception of programs predominating in speech. The tone control switching described can be traced on the schematic diagram shown in Fig. 1.

Tuning Indicator

The 6U5 tuning indicator tube is the remote cut-off type which enables it to operate on a wide range of signal strengths. The avc voltage is maximum when the set is tuned to resonance. This avc voltage is applied to the grid of the 6U5 tube so that the 6U5 triode plate current decreases as the avc voltage increases. As the triode plate voltage rises the voltage on the ray control electrode, which is connected to the plate, rises and changes the electron stream hitting the target. Resonance is indicated by the 6U5 tube when the dark sector reaches minimum width.

ALIGNMENT PROCEDURE

In order to align these receivers properly, it is necessary to have the following test equipment:

1. A modulated test oscillator.
2. An output indicator such as an a-c voltmeter with a scale reading of 3 to 5 volts. A cathode-ray oscilloscope is preferred for I.F. alignment.
3. A screw-driver-type alignment tool.

The alignment procedure is given in table form on page 5 along with the trimmer location drawing, Fig. 4. A "dummy antenna" should be used in all alignments and is the capacitor or capacitor and resistor used in series with the signal generator. The grid lead should not be removed from the tube to which the input signal is applied when aligning the I.F. as this would remove the grid bias from the tube.

GENERAL ELECTRIC CO.

Bypass condenser C-23 has been disconnected from the 2nd I.F. screen grid and connected to the screen of the first I.F.

Second I.F. screen grid has been connected to the converter and first I.F. plate voltage supply lead through a 68,000 ohms dropping resistor, R4A, which has been bypassed by C-23A, a .05 mfd 400 v. condenser.

The 6A8 screen grid resistor R4 has been changed from 2200 ohms to 4700 ohms.

The resistance in series with the crystal pickup has been reduced to 39,000 ohms, the parallel resistance reduced to 100,000 and the parallel capacity increased to .002 mfd.

GENERAL ELECTRIC CO.

RFS-88 Radio Receiver, Model F-88

SERVICE DATA

GENERAL INFORMATION

The Model F-88 is a three-band A-C operated radio receiver with the added facilities for the reproduction of phonograph recordings. It employs eight General Electric tubes in a superheterodyne circuit as described above. The receiver circuit incorporates two stages of I.F. amplification, I.F. wave trap, four-point tone control, and other features of design as described in the following paragraphs.

Coil System

The "B", "C" and "D" band antenna coils are wound on a single coil form designated as T-3, in Fig. 1. Coils L4, L5 and L6 are the components of the "B" band antenna coil. When operating in the "C" band, L4 is used for the grid coil while L-3 acts as the antenna primary. L2 is the "D" band antenna grid coil using L3, as in the "C" band, for the antenna primary coil. T4 consisting of plate and grid coils L7 and L8 are the components of the "D" band oscillator coil. L12, L13 and L14, L15 are the "C" and "B" band oscillator coils respectively and are wound on the same coil form.

The oscillator grid coil on the next lower frequency band to the *one in use* is shorted out by a wave switch contact of the switch S1.

The various contact terminals of the wave-change switch are numbered from 1 to 12 to facilitate the tracing of the circuit to the switch when transposing from the schematic to the parts layout diagrams.

Receiver Operation

The intermediate frequency amplifier consists of two 6K7 tubes and three tuned transformers. The output of the third I.F. transformer is applied to one plate of the 6H6 diode which is a combined detector and automatic volume control tube.

Volume is controlled by the variable potentiometer R-1 in the grid circuit of the 6F5 audio amplifier tube. The output of the 6F5 is resistance coupled to the grid of the type 42 power amplifier pentode.

Proper bias for the various tubes is obtained by the use of a tapped bleeder resistance (R-11). The diode load resistance R-9 is returned to approximately −5 volts on R-11 in order to provide an initial bias to all tubes controlled by the AVC.

Tone Control

When the tone control is in the "normal" position, a portion of the output voltage of the receiver is fed back through a resistor-capacitor network consisting of C-25, R-14, and R-13 to a tap on the volume control. This feedback voltage is out of phase with the input and the resulting degeneration reduces the speaker resonance boom due to pentode output, gives an extended and relatively flat response to a wide range of low frequencies, and reduces distortion arising in the audio amplifier. In the "bass" position, the tone control switch connects C-26 in parallel with the above network. The value of C-26 is such that more degeneration of the high than the low frequency notes occurs, thereby increasing the bass response. The "foreign" position of the switch shorts out capacitor C-25 and Resistor R-14 and places C-26 and R-13 in parallel which gives a frequency response best suited for short-wave reception. In the speech position, C-25 and R-14 are shorted out: C-26 is removed from the circuit, leaving R-13, thereby providing flat degeneration at all frequencies which is the most desirable condition for the reception of programs predominating in speech. The tone control switching described can be traced on the schematic diagram shown in Fig. 1.

ALIGNMENT PROCEDURE

In order to align these receivers properly, it is necessary to have the following test equipment:

1. A modulated test oscillator.
2. An output indicator such as an AC voltmeter with a scale reading of 3 to 5 volts. A cathode ray oscilloscope is preferred for I.F. alignment.
3. A screw-driver type alignment tool.

The alignment procedure is given in table form on Page 3 along with the trimmer location drawing, Fig. 2. A "dummy antenna" should be used in all alignments and is the capacitor or capacitor and resistor used in series with the signal generator. The grid lead should not be removed from the tube to which the input signal is applied when aligning the I.F. as this would remove the grid bias from the tube.

Phonograph

The record-reproducing facilities consist of a high impedance crystal pick-up with its associated balanced tone arm connected across the volume control R-1 so that the regular audio system is used. When changing from radio reception to phonograph reception, the phono-radio switch S-4 simultaneously disconnects the 6H6 diode from the volume control, connects the crystal pick-up across this control, and shorts the 6H6 diode output, rendering the radio receiver section inoperative.

The motor switch is turned "on" when the phono-radio switch is placed in the phonograph position. A separate manual motor switch is provided to permit starting and stopping. The automatic stop lever also actuates the manual switch.

PHONOGRAPH MECHANISM

The phonograph mechanism used in this receiver has been designed to be as simple as possible and give long and trouble-free performance. Under normal operating conditions, service difficulties should be negligible. Occasionally, however, certain adjustments may be required. These adjustments are explained in the following paragraphs.

Motor Adjustments

The speed of the turntable is controlled by a governor which allows correct adjustment of the turntable rotation to 78 revolutions per minute. The speed may be checked by placing a piece of paper under and counting the number of revolutions in a minute while the record is being played. If adjustment is necessary lift up the turntable and the speed regulator set screw will be found adjacent to the turntable hub of the motor. Clockwise rotation of this set screw reduces speed.

The motor bearings and gears are properly lubricated for long operation under normal weather conditions. If the motor chatters or runs uneven, place a few drops of light machine oil on the governor felt.

Trip Mechanism

The trip mechanism is of simple design and consists of a latch bar connected to the motor switch and a trip lever. The latch is held closed by means of a spring between the latch bar and the trip lever. The motor switch is mechanically connected to the latch bar so that when the trip mechanism is released the motor switch is in the "off" position. Be sure this latch bar mechanism works freely without binding.

The trip is actuated by an adjustable arm on the trip lever. When the eccentric groove in the record swings the tone arm back and forth, it pushes the latch out of engagement.

Crystal Pick-up

The astatic crystal pick-up employs a crystal element which is coupled to a light needle chuck. The needle movement bends the crystal element thus generating voltage by the piezo-electric effect. The voltage developed is dependent upon the needle movement amplitude and the load resistance.

The crystal cartridge is a factory-sealed unit and no adjustments are provided. In case of replacement the cartridge is held in the tone arm by means of two screws. The pick-up and tone arm assembly should require very little servicing and if treated with reasonable care should perform its function without attention for long periods of time.

ALIGNMENT PROCEDURE

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
I. F. ALIGNMENT WITH OSCILLOSCOPE					
1. Band "B"	465 K.C. Sweep	2nd I.F. Grid	.05 Mfd.	3rd I.F. Sec. (C-22) 3rd I.F. Pri. (C-21)	
2. Band "B"	465 K.C. Sweep	1st I.F. Grid	.05 Mfd.	2nd I.F. Sec. (C-20) 2nd I.F. Pri. (C-19)	Gang condenser plates wide open—connect vertical input of oscilloscope to ground and the junction of C-24 and R-9 on 3rd I.F. transformer. Adjust trimmers for a single symmetrical curve of maximum amplitude. The resulting curve with input at converter grid is shown in Figure 3.
3. Band "B"	465 K.C. Sweep	Converter Grid	.05 Mfd.	1st I.F. Sec. (C-18) 1st I.F. Pri. (C-17)	
4. Band "B"	465 K.C. Sweep	Antenna Post	250 Mmf. 400 ohms.	Wave Trap Trimmer (C-4)	Adjust for minimum amplitude.
I. F. ALIGNMENT WITH OUTPUT METER					
1. Band "B"	465 K.C. with Modulation	2nd I.F. Grid	.05 Mfd.	3rd I.F. Sec. (C-22) 3rd I.F. Pri. (C-21)	
2. Band "B"	465 K.C. with Modulation	1st I.F. Grid	.05 Mfd.	2nd I.F. Sec. (C-20) 2nd I.F. Pri. (C-19)	Gang condenser plates wide open—connect output meter across voice coil—keep input signal low and volume control at maximum. Adjust all trimmers in order mentioned for maximum output. Do not attempt an overall realignment after stage by stage alignment has been accomplished.
3. Band "B"	465 K.C. with Modulation	Converter	.05 Mfd.	1st I.F. Sec. (C-18) 1st I.F. Pri. (C-17)	
4. Band "B"	465 K.C. with Modulation	Antenna Post	250 Mmf. 400 ohms	Wave Trap Trimmer (C-4)	Adjust for minimum output.
R. F. ALIGNMENT					
1. Band "B"					Close gang plates—adjust pointer to first line at left end of tuning scale.
2. Band "D"	18 M.C. with Modulation	Antenna Post	250 Mmf. 400 ohms	Osc. (C-3) Ant. (C-2)	Connect output meter across voice coil—tone control on "Bass" position. The image of any "D" band signal should be heard 930 K.C. above input signal when (C-3) is on proper peak. Example: 15 M.C. image—15,930 K.C. Peak (C-2) while rocking the gang condenser.
3. Band "C"	No adjustments necessary.				
4. Band "B"	1500 K.C. with Modulation	Antenna Post	250 Mmf. 400 ohms	Osc. (C-12) Ant. (C-7)	Peak trimmers for maximum output with a low input signal.
5. Band "B"	580 K.C. with Modulation	Antenna Post	250 Mmf. 400 ohms	Osc. Padder (C-13)	Adjust padder for maximum output in vicinity of 580 K.C. while rocking the gang condenser.
6. Band "B"	1500 K.C. with Modulation	Antenna Post	250 Mmf. 400 ohms	Osc. (C-12) Ant. (C-7)	Peak trimmers for maximum output with a low input signal.

GENERAL INFORMATION

Model F-96 is a three band a-c operated receiver employing nine General Electric Pre-tested Tubes as described above in a superheterodyne circuit. The receiver circuit consists of an R.F. amplifier, an oscillator-converter with automatic frequency control, a two stage I.F. amplifier, a detector, avc and discriminator circuit and the audio amplifier. Added features are a four point tone control, wave trap, and the "Touch Tuning" system with its seven buttons allowing the instant selection of seven stations.

Receiver Operation

The R.F. amplifier consists of the antenna transformer (T-6) connected to the 6K7 which is coupled to the 6A8-G through the R.F. transformer (T-4). The signal is converted to an intermediate frequency of 465 kc by the oscillator and converter tube 6A8-G. The intermediate frequency is then amplified by the two 6K7 tubes used in conjunction with the three double tuned I.F. transformers. The primary and secondary coils of these I.F. transformers are carefully adjusted midway between the points of critical and over coupling so as to give the I.F. amplifier a broadened band width with the resultant improvement in fidelity of the received program.

The output of the I.F. amplifier is applied to a 6H6 twin diode, which is a combination detector, automatic volume control and discriminator voltage source for the automatic frequency control tube 6J5-G.

A detailed explanation of A.F.C. will be found in a following paragraph.

The volume is controlled by a potentiometer in the grid circuit of the 6F5 audio amplifier tube. This tube is resistance coupled to the 42 pentode output tube. The output transformer is designed to correctly load the 42 tube over a broad range of frequencies thus enabling the tube to deliver ample undistorted output to the 12-inch speaker.

Tone Control

Negative feed back is used to control the quality and tone of reproduction. The frequency response of the audio circuit is varied by the tone control switch and its associated network as follows:

In the "Normal" position, voltage from the voice coil is fed back through R-23, R-2 and C-49 to a tap on the volume control. C-31 serves to inject high frequencies into a tap higher up on the volume control. This arrangement gives an extended high frequency response, holds down the "boom" caused by pentode output and speaker resonance, and at the same time improves the quality and response to an extended range of both high and low frequencies.

In the "Bass" position, the high frequency input to the audio system is limited by the addition of C-41 across the volume control and its coupling condenser; and, also, by the omission of the high frequency injector capacitor C-31. This permits the true reproduction of a wide range of low frequencies without the "boom" at speaker resonance.

In the "Foreign" position R-2 and C-49 are shorted out of the network used for "Bass." C-41 is used, as in the "Bass" position, to limit the high frequency input to the audio amplifier. This permits more degeneration of the lower frequencies, and provides a tone range most suited for foreign reception. This position may be used to reduce noise and also to reduce bass on programs which predominate in low frequency tones.

C-41 is removed from the circuit in the "Speech" position; R-2 and C-49 are shorted out leaving R-23 and C-31 in the circuit, thus allowing flat degeneration of all frequencies. This arrangement has been found to give the best response for programs predominating in speech.

Coil System

The coils for the three bands are wound on a single form. The antenna transformer is designated as T-6, the R.F. transformer as T-4 and the oscillator transformer as T-5. All contacts on the band switch are numbered in Fig. 5 and Fig. 6 to facilitate tracing the coil circuits.

The band switch connects the coils to operate as follows:

	Primary	Secondary	Remarks
Ant.			
"B"	L-6	L-4 & L-5	
"C"	L-3	L-4	L-5 shorted
"D"	L-2 & L-3	L-1	L-4 & L-5 shorted
R.F.			
"B"	L-13	L-11 & L-12	
"C"	L-10	L-11	L-12 shorted
"D"	L-9 & L-10	L-8	L-11 & L-12 shorted
Osc.			
"B"	L-19	L-18	
"C"	L-17	L-16	Connects C-30 across L-18
"D"	L-15	L-14	Connects C-30 across L-16

On "D" band contact No. 9 is used to provide a ground for the General Electric noise-reducing antenna systems KV-300 and FT-40.

Automatic Frequency Control

The Automatic Frequency Control used in this receiver shifts the oscillator frequency so that the correct intermediate frequency is very closely produced even when the receiver is mistuned several kilocycles.

The essential elements are the discriminator transformer T-9, the twin diode 6H6 with its balanced discriminator network, and the 6J5-G control tube connected across the broadcast oscillator plate coil.

The discriminator transformer is designed to deliver (when properly tuned to 465 kc.) equal voltages to each section of the 6H6. Under this condition the voltage drop across R-21 is equal and opposite to the voltage across the total resistance of R-19, R-22, and R-17; thus no discriminator voltage is produced to control the 6J5-G tube.

However, if the signal frequency is increased above 465 kc. unequal voltages are applied to the diodes and the voltage over R-21 is greater than the voltage over the combined resistance of R-19, R-22, and R-17. The difference of these two voltages is positive and is applied to the 6J5-G control tube.

When the signal frequency is decreased below 465 kc. the result is less voltage over R-21 and a greater voltage over the combined resistances R-19, R-22 and R-17. The difference of these two voltages, as applied to the 6J5-G control tube, is negative.

Thus three conditions arise:

On resonance:	no discriminator voltage developed
Above 465 kc.:	a positive control voltage
Below 465 kc.:	a negative control voltage

The 6J5-G A.F.C. control tube has a combination of self and fixed bias, the latter being the result of the current supplied through R-8 to the cathode resistor R-4. The R.F. voltage applied to the control grid of the 6J5-G is obtained from the drop across the C-6 series padder and C-30. The vector sum of these two voltages is applied to the phase-shifting network C-25 and R-3 and in turn to the control grid. This phase-shifting network causes the control tube to appear as a reactance in parallel with the oscillator coil. The value of the apparent reactance depends upon the control voltage produced by the discriminator.

When the set is mistuned above the incoming signal the converter output is above the 465 kc. required. A positive discriminator voltage is produced as explained above. This causes the 6J5-G tube to act as more capacitive reactance and thus lower the oscillator frequency; this gives a lower converter output frequency, approximately 465 kc.

When the set is mistuned below the incoming signal, the converter output is below the 465 kc. required. A negative discriminator voltage is produced as explained above. This causes the 6J5-G to act as less capacitive reactance thus increasing the oscillator frequency. This in turn gives a higher converter output frequency, approximately 465 kc.

A decided A.F.C. action is apparent on short waves. The discriminator voltage is produced in the same manner as above. However, the action of the 6J5-G tube is different. The 6A8-G oscillator plate voltage and 6J5-G plate voltage are supplied through the same resistor (R-5). A positive discriminator voltage allows the 6J5-G plate current to increase, thus reducing the 6A8-G oscillator plate voltage. This causes a lower oscillator frequency with the resultant lower converter output frequency, approximately 465 kc.

With a negative discriminator voltage the 6J5-G plate current is less, thus increasing the 6A8-G oscillator plate voltage. This causes a higher oscillator frequency with the resultant higher converter output frequency, approximately 465 kc.

Touch Tuning

This receiver employs six pairs of selector trimmers to tune the antenna and oscillator circuits to six different stations in the broadcast band. By leaving the gang condenser tuned to a station, not tuned by the above trimmers, any one of seven stations is available by merely touching a button.

The manual button operates the switches S-6, S-7, S-8, and S-9 simultaneously. The switches are shown in the manual position in Fig. 5. S-9 is used to provide the ground connection for the 1500 kc. antenna trimmer C-2, and it also grounds the antenna selector trimmers.

Pressing any one of the buttons releases any other button which may have been depressed. When the manual button is in the released position, S-6 opens the antenna transformer connection to the grid of the 6K7 R.F. amplifier, and replaces the antenna section of the gang condenser with the antenna selector trimmers.

S-7 opens the circuit to the R.F. stage and connects the 6A8-G grid to the antenna transformer. It should be noted that both the input and output circuits of the R.F. stage are disconnected.

S-9 removes the ground from C-2 and from the antenna selector trimmers. It shorts out R-32 thus decreasing the self bias on the 6K7, 1st I.F. amplifier, and consequently increasing the sensitivity.

S-8 connects the oscillator selector trimmers in the place of the oscillator section of the gang condenser C-20.

A depressed station button simultaneously connects the antenna and oscillator selector trimmers. As an example, the extreme left-hand button connects C-65 and C-71 to the antenna and oscillator transformers respectively.

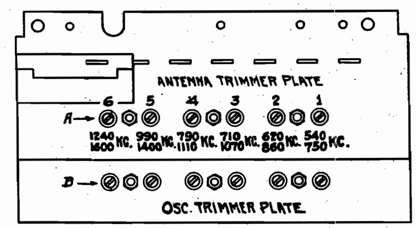

Fig. 1. Selector Trimmer Location

The frequency range covered by each trimmer is shown in Fig. 1. To set up a pair of trimmers for a station within their range, press the corresponding button until it locks in position. First tune the oscillator trimmer to the station and then tune the antenna trimmer for maximum output. Weak stations may require an approximate setting of the antenna trimmer before it will be possible to tune in the station with the oscillator trimmer. Be sure the A.F.C. switch is turned off while making these adjustments. The trimmers in the top row tune the antenna transformer while those in the lower row are used to tune the oscillator.

When operating with the manual button depressed, the gang condenser is used to tune the secondary circuits as described under coil system. The manual button must be depressed when operating on "C" and "D" bands.

SERVICE HINTS

If depressing a button does not release another button which was depressed, check the latch-bar spring. If there is only one spring, and that spring is in the center of the latch bar, decreasing the tension will remedy the trouble. Another solution is to replace the center spring with two springs, one at each end of the latch bar. They should have approximately the same tension. Make sure that the ears on the latch bar are twisted sufficiently to reduce, to a minimum, play in the direction of key movement.

C-2 was connected directly to ground in some of the early production receivers; connecting C-2 as shown in Fig. 5 will extend the high-frequency range of the antenna selector trimmers, because C-2 is then connected across only a small part of the antenna secondary when operating the touch tuning.

Where local conditions require a special range trimmer, this can be obtained by selecting a trimmer of lower capacity and shunting it with a good grade low power factor mica capacitor. Replacement parts RC-207, RC-211, RC-228 and RC-236 have capacities of 25, 50, 85 and 100 Mmf. respectively and should fill the requirements.

Where trimmers do not cover the high-frequency range assigned to them, inspect the trimmer for a bent lug. The lug may be bent in such a manner that the trimmer plates do not separate sufficiently to reach minimum capacity.

It will be found that stability is better if care is exercised to operate the trimmers near maximum capacity where possible, rather than using the trimmer of the next higher range and thus operating that trimmer at minimum capacity.

5. Band "B"	465 kc. Modulated	Antenna Post	250 Mmf. 400 Ohms	Wave Trap Trimmer (C-9)	Adjust for minimum amplitude.

R.F. Alignment

Band Switch Setting	Input Frequency	Point of Input	Dummy Ant.	Trimmer (See Fig. 2)	Remarks
1. Band "B"	....	....	....	....	Turn A.F.C. switch "off"—Set dial pointer to first line at left-hand end of dial scale with condenser gang fully meshed.
2. Band "D"	18 mc. Modulated	Antenna Post	250 Mmf. 400 Ohms	Osc. (C-3) R.F. (C-7) Ant. (C-1)	Connect output meter across voice coil—Turn tone control to bass. D band image should be 930 kc. *below* input signal when oscillator trimmer (C-3) is peaked properly. Example: 15 mc.—image 14.07 mc. Peak C-7 and C-1 while rocking gang condenser.
3. Band "C"	5220 kc. Modulated	Antenna Post	250 Mmf. 400 Ohms	Osc. (C-4)	Adjust trimmer for greatest output with dial pointer at 5220 kc.
4. Band "B"	1500 kc. Modulated	Antenna Post	250 Mmf. 400 Ohms	Osc. (C-5) R.F. (C-8) Ant. (C-2)	Adjust trimmers, in order listed, for greatest output at 1500 kc.
5. Band "B"	580 kc. Modulated	Antenna Post	250 Mmf. 400 Ohms	Osc. Padder (C-6)	Adjust padder for maximum output in vicinity of 580 kc. while rocking gang condenser.
6. Band "B"	Repeat operation No. 4				

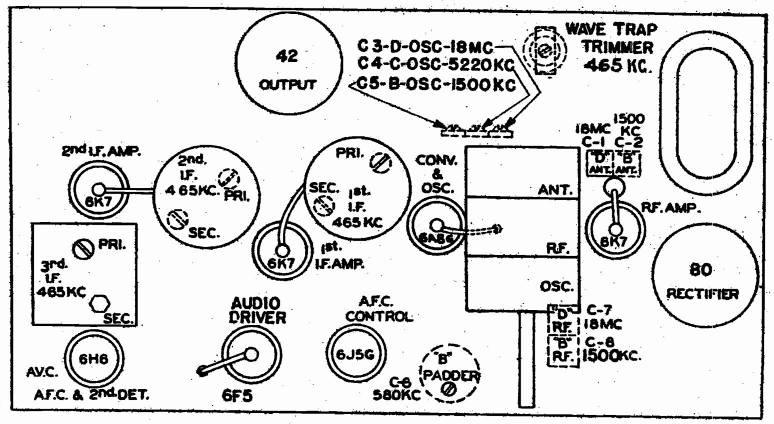

Fig. 2. Chassis Layout and Trimmer Location

ALIGNMENT PROCEDURE

In order to align these receivers properly, it is necessary to have the following test equipment:

1. A modulated test oscillator.
2. An output indicator such as an AC voltmeter with a scale reading of 3 to 5 volts. A cathode ray oscilloscope is preferred for I.F. Alignment.
3. A screwdriver type alignment tool.

The alignment procedure is given in table form along with the trimmer location drawing, Fig. 2. A "dummy antenna" should be used in all alignments and is the capacitor, or capacitor and resistor, used in series with the signal generator. The grid lead should not be removed from the tube to which the input signal is applied when aligning the I.F. as this would remove the grid bias from the tube.

4. Alignment of the "touch tuning" trimmers is discussed in the section on "Touch Tuning."

Automatic Frequency Control Adjustments

After I.F. alignment is completed with output meter, without disturbing the generator setting, remove the signal generator lead from the grid of the 6A8-G converter. Apply the 465 kc. signal to the 6A8-G grid capacitively through the insulation of the grid lead.

Tune in a weak broadcast station at about 1000 kc. and, with the A.F.C. switch "off," tune the receiver carefully for "zero" beat between this carrier and the 465 kc. generator signal. Throw the A.F.C. switch on and adjust the 3rd I.F. secondary trimmer (C-17) to zero beat. This adjustment is very critical and must be made with great care. When the alignment is correctly done, there will be no appreciable difference in the beat note with the A.F.C. switch "on" or "off."

Another method of A.F.C. adjustment, after I.F. alignment with an output meter, is to connect a low range voltmeter between the cathodes of the 6H6 A.F.C. tube. Leave the signal generator connected to the 6A8-G grid and, without disturbing the 465 kc. setting of the signal generator, adjust C-17. It will be noticed that the meter reads plus when C-17 is tuned off resonance on one side and negative when tuned on the opposite side of resonance. The correct adjustment of C-17 is between these positions when the voltmeter reads zero.

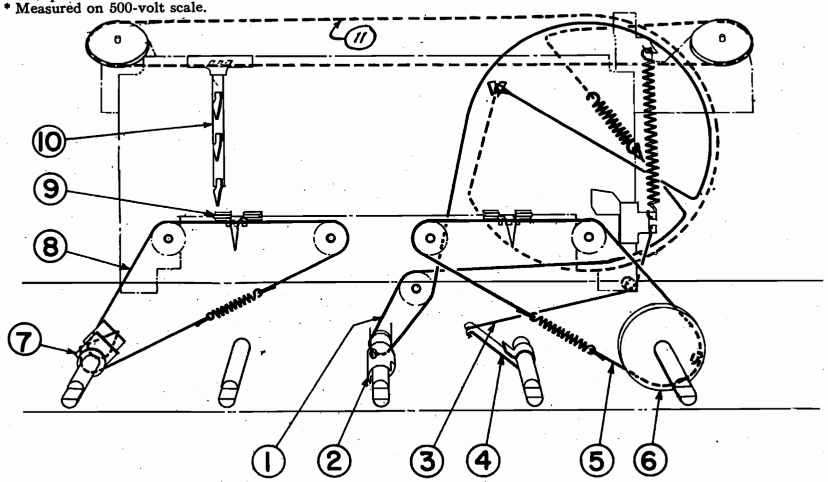

Fig. 7 Dial Mechanism

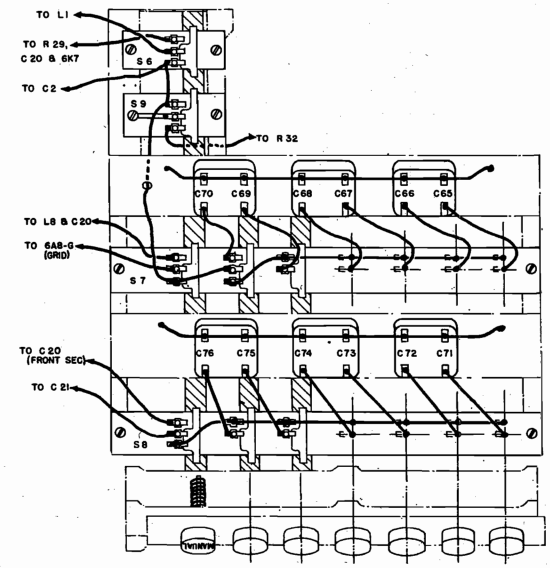

Fig. 8. "Touch Tuning" Mechanism

DIAL MECHANISM

The dial mechanism (Fig. 7) is rigidly mounted to the chassis by means of two brackets and four self-tapping screws. The gang condenser is operated by means of an "automatic vernier" reduction drive unit, mounted on the receiver chassis, and connected to the gang drive drum by a drive cable.

The dial pointer is connected to the gang condenser drum by a cable which passes around two idler pulleys. The pointer is guided on a rail in the rear of the dial scale. The following instruction will aid in making repairs to this mechanism.

To Replace Drive Cable and Pointer Cable

Remove the dial scale. This will allow ready access to all the dial mechanism.

To replace the drive cable (1), set the drive drum to the relative position as shown in Fig. 7, loop the cord over the tab on the drum, then thread it once around the vernier drive of the pointer set the tone control in the extreme counter-clockwise position. Slide the pointer until it extends about 1/16 in. over the left-hand end of the guide rail. After the dial scale has been replaced, a final adjustment may be made by loosening the setscrew and slightly rotating the drive pulley (6).

To Replace Volume Control Cable

Thread the cable (8) around the drive pulley (7) as shown in Fig. 7. Fasten the loops of the cable into the tension spring. To adjust the pointer, turn the control to the extréme clock-wise direction and set the pointer so that the left-hand side of the pointer coincides with the left-hand edge of the rail. Crimp the pointer tab on the drive cable. A final adjustment of this pointer may be made by adjusting the pulley (7) on the volume control shaft after the scale has been replaced.

Band Indicator Control

The threading and assembly of the band indicator is self-explanatory from an inspection of Fig. 7. It must be adjusted as indicated. The other end of the cord is looped through one end of the tension spring in back of the drive drum.

To replace the wire pointer drive cable (11), set the drive drum to the relative position as shown in Fig. 7. Loop the cord over the tab on the drum, and thread it around the drive pulley and idler pulleys and back to the tension spring on the drive drum. Slide the pointer (10) in place, as shown, but do not solder. Replace the dial scale and rotate the gang until the plates are fully meshed. Slide the pointer until it coincides with the last mark at the left end of the dial and then solder it to the wire cable (11).

To Replace Tone Control Cable

First set the tone control switch so that the pulley (6) is in the position shown. Thread the cable (5) as shown in Fig. 7 around the drive pulley (6), loop it in the notch as shown, then around the idler pulleys. Fasten the ends in the tension spring. Be sure that the tension spring does not touch either the idler or the drive pulley when the tone control is in either of the extreme positions. For adjustment with the dial in place by rotating the bracket (4) on the band switch shaft.

To Adjust "Automatic Vernier" Drive

The vernier drive used on this receiver includes a planetary reduction unit equipped with a clutch which automatically changes the reduction ratio. This clutch consists of a sleeve mounted on the knob shaft. To adjust, loosen the locking screw and move the sleeve (2) axially along the shaft until the cam surface in the end of the sleeve engages with the pin in the knob shaft. This engagement should take place at a point on the cam surface as near to the stop as possible and still allow complete release of the clutch.

To Change Dial Lamps

Dial lamps are located at either end of the dial scale assembly. Slide the dial lamp socket assembly off the projection at the top of the light reflector. The bulbs are readily replaced without removing the chassis from the cabinet.

GENERAL ELECTRIC CO.

"TOUCH-TUNING" RADIO

THREE-BAND A-C SUPERHETERODYNE

MODEL F-96

Stock No.	Description	List Price
RS-217	SOCKET—4-prong tube socket (Pkg. of 5)	$0.50
RS-223	SOCKET—Special socket for oscillator (Pkg. of 5)	.80
RS-356	SWITCH—A.F.C. switch (S-5)	.40
RS-370	SWITCH—Manual control switch (4 sections) (S-6, S-7, S-8, S-9)	8.15
RS-371	SWITCH—Tone control and power switch (S-3, S-4)	1.15
RS-372	SWITCH—Wave change switch (S-1)	2.50
RS-431	SPRING—Key spring, staple and spacer (Pkg. of 5)	.05
RS-433	SPRING—Latch bar spring (Pkg. of 5)	.10
RT-096	TRANSFORMER—Power transformer 115-125 V., 25-60 cycles (T-1)	9.30
RT-097	TRANSFORMER—Power transformer 115-125 V., 60 cycles (T-3)	5.95
RT-247	TRANSFORMER—3rd I.F. (A.F.C.) transformer (complete) (T-9)	3.95
RT-248	TRANSFORMER—1st or 2nd I.F. transformer and trimmers (no shield) (T-7, T-8)	1.20
RV-035	VOLUME CONTROL—2 Megohm volume control tap at 5,000 and 500,000 ohm (R-34)	.90
RW-014	WINDOW—Escutcheon window and rubber mounting	.45
RW-017	WINDOW—Push-button celluloid window (Pkg. of 25)	.10
*RW-101	WASHER—Felt washer for control shafts (Pkg. of 10)	.45
RW-403	WAVE TRAP—Wave trap (complete) (L-8, C-9)	.70
RX-027	ASSEMBLY—Chassis mounting bolts and washers	.15
	SPEAKER ASSEMBLY F-96	
RC-925	CONE—12-in. cone and voice coil assembly	1.25
*RC-991	CLAMP—Voice coil spider clamp	.05
*RP-015	PLUG—Male speaker plug	$0.20
RS-057	SPEAKER—12-in. speaker (complete)	6.80
*RS-416	SPRING—Voice coil leads spring (Pkg. of 2)	.10
RT-421	TRANSFORMER—Output transformer (T-2)	1.30
RX-030	ASSEMBLY—Speaker mounting cushions and nuts	.10
	DIAL SCALE MECHANISM	
RB-155	BRACKET—Band change bracket	.05
RB-604	BUSHING—Volume control cable drive bushing	.10
RC-869	CABLE—Volume or tone control pointer cable (Pkg. of 5)	.30
RC-870	CABLE—Dial pointer drive cable (Pkg. of 5)	.70
RC-871	CABLE—Tuning condenser drive cable (Pkg. of 5)	.45
*RD-013	DRUM—Condenser drive drum	.35
RD-062	DIAL—Dial scale	3.50
RL-920	LAMP—Pilot lamp 6.3 V., .25 amp. (Pkg. of 10)	1.50
*RP-049	PULLEY—Pointer cable pulley	.15
RP-073	POINTER—Volume or tone control pointer (Pkg. of 5)	.10
RP-075	PULLEY—Small drive cord idler pulley (Pkg. of 6)	.20
RP-076	PULLEY—Tone control cord drive pulley	.15
RP-077	POINTER—Dial scale pointer (Pkg. of 5)	.90
RP-091	PULLEY—Tuning drive cord idler pulley	.10
RS-218	SOCKET—Lamp socket assembly	.10
*RS-401	SPRING—Tuning condenser cable tension spring (Pkg. of 2)	.20
RS-426	SPRING—Volume or tone control cable tension spring (Pkg. of 5)	.10
RX-023	ASSEMBLY—Band indicator, cord and spring	.20

TOUCH-TUNING

The General Electric "Touch-Tuning" system consists of three essential units: the keyboard assembly of fourteen keys, used for touch-tuning control; the motor and drive mechanism; and the split contact segment with its adjustable station buttons, allowing a set up of thirteen different stations to be tuned automatically.

Thirteen keys are used for the selection of pre-set stations while the No. 14 key is used to turn power "Off." Pressing-in any key will lock the key in a semi-depressed position and release any other that may be in the circuit, thus the selection of any station by a station key will release the "Off" key, turning the set power on.

The tuning motor is operated as a 23-volt split-phase induction motor using capacitor C-51 as the phase shifting device. On the Model G-105, the 23 volts is supplied directly from the receiver power transformer while on the Model G-106 the voltage is obtained from a separate transformer which operates the motor only and is always connected to the power line. In this receiver the "Off" key resembles a station key in its operation and is set up when the receiver is assembled at the factory. A special button is assembled on the fan tail assembly, at the rear of the gang condenser, for the "Off" position. This button is white to distinguish it from the regular station buttons and the contact point is narrower so that no bounce back is allowed on the "Off" position.

Fig. 6 shows a simplified schematic of the control circuit and the following cycle of operation may be traced very easily. When a key is depressed, it completes the 23-volt circuit through the button making contact with the contact segment (CT) and energizes one winding of the motor. The other winding on the motor is energized through the condenser C-51. The direction of rotation of the motor is dependent upon whichever half of the contact segment (CT) that the station button first energizes. When voltage is applied to the motor, the rotor is pulled further into motor field, and engages its rubber cone hub (I) with the dial drive wheel (D), (see Fig. 9) which in turn rotates the gang condenser and contact segment (CT). This operation continues until the insulated segment (1) breaks the station button circuit to the contact segment and removes voltage from the motor. The inertia in the tuning system drives the insulated segment past the station button and makes contact with the other half of the contact segment. This energizes the other winding of the motor and causes the motor to reverse. The brake on the dial drive wheel does not allow the tuning system to store up enough inertia to go past this insulated strip on the reversal of the motor and thus allows the station button to come to rest on the narrow insulated segment, thus stopping the tuning operation to this pre-set position.

The motor scan switch S-7 is incorporated to allow fingertip control of the motor drive. Normally, the switch contacts are open and control of the motor is had by closing either of the two sides of the switch dependent upon the direction of travel desired.

On 25-cycle receivers, two motor capacitors (RC-597) are used to obtain the necessary phase shift. The brake pad tension should be re-adjusted when operating a 25-cycle receiver on a 60-cycle circuit.

Silent Tuning

During period of motor operation, either for automatic station selection or for scanning, silent tuning is incorporated. This is accomplished by a circuit which gives both instantaneous cut-off of the audio amplifier and time delay in restoring the response. By reference to the schematic Fig. 5, it will be observed that one half of the 6H6 diode is used to rectify the 23 volts A.C. available from the motor and the resulting D.C. voltage is used to bias the audio amplifier tube to cut-off. Note that the charging time of the bias circuit is only determined by the diode resistance which is very small. The time required for the audio amplifier (6F5) to return to normal bias however, is determined by the product of R-26 and C-56 and is therefore controllable.

Drive Wheel Brake Adjustment

A friction brake has been incorporated on the drive wheel circumference (D) to accomplish accurate stopping of the motor driven tuning system. When the button passes into the insulated segment it will easily over-ride the insulated segment on the contactor drum, since this segment is very narrow. If this condition continues an oscillatory motion or "hunting" is set up and the motor will not come to rest as long as the station key is pressed. The brake, located at the left side of dial scale, should be adjusted on normal line voltage so that the motor only has to make one or two reversals.

This adjustment should be made under an average operating line voltage and allowance made for changes in voltage over the 24-hour period.

Lubrication

For smooth and noiseless operation of the tuning system, it is absolutely necessary to keep it well lubricated.

Contactor Drum—use thin film of petroleum jelly
Dial Pointer Guide Rods—use thin film of petroleum jelly
Motor Bearings—these are oil-less type and do not require lubrication

Dial Mechanism

A sketch showing the threading of the dial mechanism controls is shown in Fig. 9.

The manual drive involves two extra parts in addition to the motor drive; these are, the manual rubber drive cone (J) and its shaft (C), see Fig. 9. If the idler drive wheel (D) on which the manual drive cone engages is set up too high, the manual drive cone is liable to wedge underneath the idler drive wheel, thus not allowing the motor drive cone to engage when using Touch-Tuning. If this occurs by only a normal pressure on manual control, then the idler drive wheel must be moved down and the motor drive cone adjusted accordingly. The bracket which mounts the large idler drive wheel has slots and mounting screws so that idler drive wheel can be moved either up or down.

The 25-cycle receivers as they leave the factory have a larger rubber manual drive cone than the 60-cycle receivers. The cone for the 60-cycle receiver may be substituted for replacement provided the idler drive wheel is lowered slightly.

REMOTE CONTROL

The GM-8 Remote Control is merely another station keyboard assembly that is wired in parallel with the regular station keys. In addition, a remotely controlled motor is used to either raise or lower the volume at the receiver. By referring to Fig. 11, the details of the operation of this device may be readily understood. Leads No. 2 to No. 7 are the automatic tuning button control leads that parallel any six of the regular receiver station keys. Lead No. 1 supplies 23 volts to the remote keyboard assembly while leads No. 8 and No. 9 are the phase-reversing leads to the volume control motor.

When the remote control is attached to a receiver, then the semi-depressed positions of the receiver push-button keys may or may not indicate which station is tuned in. This will then depend upon whether the receiver was last operated from the remote control or from the station keys of the receiver itself. For this reason, the key assembly of the remote control has not been equipped with a latch bar. All keys of the remote control key assembly are wired in series to avoid possibility of two keys completing the circuit to the motor at the same time.

The remote volume control motor uses a phase-shifting resistor in place of a condenser as used on the tuning motor when operating from a 50- or 60-cycle power supply. When operation is desired from 25 cycles replace the 30-ohm, 10-watt resistor across the volume control motor terminals with a 60 microfarad motor capacitor (RC-597).

The mechanical installation of the volume control motor is shown in Fig. 10. For full installation instructions refer to service notes RGMS-8.

Remote Control Notes

1. If key assembly on remote control unit is too high in the case, it is possible that one or all of the keys may be slightly depressed at all times so as to cause faulty operation of the system. To remedy, lower the complete assembly by loosening the two setscrews on the inside of the case and then lower assembly—tighten setscrews.

2. The tension of the friction clutch on the remote control motor is adjusted at the factory and should not require resetting. If it is set too tight, the volume control may be damaged when "VOL. DEC." key is held in a depressed position after the volume control is turned to the minimum position. If this slip clutch is too loose the control will fail to turn.

AUTOMATIC STATION PRE-TIMER G-106

The Pre-timer is quite similar to the remote control in operation in that it works in parallel with the regular station keys; turning "On" and "Off" power and tuning stations. The operation, however, instead of being controlled manually, is controlled by a synchronous motor. This allows a parallel circuit to be made with a selected station key by a pre-set timing contact.

The 96 timing contacts project through slots in the clock panel and are supported by two metal plates at the rear. A molded carriage is propelled from left to right during the 12 hours of the AM period and from right to left during the PM period, by means of a lead screw having right and left-handed threads, which is rotated continuously by the clock motor. Projections on the timing contacts engage sliders on the carriage corresponding to the stations to which the contacts are set. When the contact is made the pre-timer energizes the corresponding station button on the fantail (in back of the gang condenser) and thus drives the tuning motor to the desired station. In order to differentiate between AM and PM operations, a limit switch is provided that is operated by the carriage at the end of its travel. This switch causes the AM sliders to be energized during the AM period, and the PM sliders during the PM period.

As the contact carriage moves very slowly, the accuracy with which it makes and breaks the control circuits is not sufficient. In order to obtain accurate timing, the contacts on the carriage are arranged so as to engage the sliders several minutes before and to disengage several minutes after the quarter hour and a cam-operated switch is provided in series with the common return lead. This switch closes the control circuit exactly on the quarter hour, and opens it after ample time has elapsed for the completion of the tuning operation, in this case, about ten seconds.

The clock motor is of the self-starting synchronous type with enclosed gearing running in a bath of oil. It operates on the 110-volt power supply.

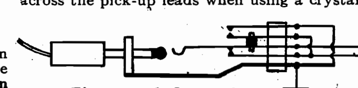
The circuit controlling the receiver is shown on the lower left-hand portion of Fig. 5. The wiring diagram to the clock panel is shown in Fig. 12.

Phonograph Connections

Fig. 13 shows a simple sketch for connecting a crystal or high impedance magnetic pick-up into the G-105 or G-106 circuit for the reproduction of phonograph recording. This method uses a two-circuit jack and is connected into the receiver by opening the circuit between C-32 and the volume control (R-19) and connecting the jack terminals as shown. A telephone plug is attached to the pick-up leads; and for phonograph operation, it is merely necessary to insert it into the jack. The jack may be mounted on the rear chassis deck and all connecting leads should be properly shielded to prevent pick-up.

When the pick-up is connected as suggested, the regular radio volume and tone controls work for both radio and phonograph reproduction.

NOTE.—In most cases a suitable loading circuit composed of a resistor or resistor and capacitor network should be used across the pick-up leads when using a crystal type unit.



Phonograph Connections Fig. 13.

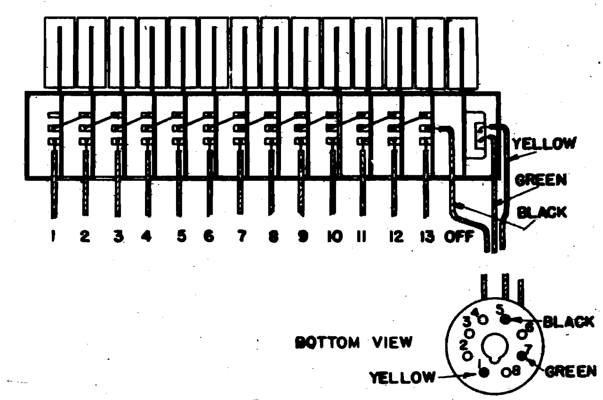

Fig. 7. Keyboard Wiring Diagram—G105

Stopping Accuracy

The exact location at which the dial pointer will come to rest may be made more accurate by slightly lowering the insulated segment (X) on the contactor wheel as shown in Fig. 8. Merely loosen the two screws (Y) and lower the yoke, (Z).

The proper adjustment is made at the factory and should not require alteration provided the contactor drum is kept well lubricated.

SERVICE DATA

MODELS G-105 AND G-106

Electrical Specifications

Model G-105:

Rating "A"...105–115 (115–125)* volts, 50–60 cycles, 155 watts

Rating "C"...105–115 (115–125)* volts, 25–60 cycles, 160 watts

Model G-106:

Rating "A"...105–115 (115–125)* volts, 60 cycles, 155 watts

Rating "B"...105–115 (115–125)* volts, 50 cycles, 155 watts

Rating "C"...105–115 (115–125)* volts, 25 cycles, 160 watts

* The receivers as shipped from the factory have the power cord connected to the 115–125-volt tap of the transformer (black and red lead). If the normal voltage of the power supply is always below 110 volts, the connection of the power cord should be removed from this lead and soldered to the 105–115-volt tap (black and yellow lead). After changing the connection, tape the soldered joint as well as the exposed end of the unused lead. This change requires removal of the chassis from the cabinet.

GENERAL INFORMATION

The Models G-105 and G-106 are three band A-C operated receivers employing ten General Electric Pre-tested tubes in a superheterodyne circuit as described above. These receivers are equipped with a simplified Touch Tuning system allowing motor-tuning of thirteen stations; and the new and exclusive self-contained antenna system, "Beam-a-Scope." Other features of design include; electric finger-tip dial drive control, R.F. Amplifier, five position hi-fidelity tone control, special I.F. transformers and push-pull output.

The Model G-106 not only has all the above features, but it also incorporates an ingenious automatic program preselector which permits the automatic tuning of favorite programs at 15-minute intervals throughout a 24-hour period.

BEAM-A-SCOPE

The "Beam-a-Scope" is essentially a tuned coil antenna wound on an impregnated frame and shielded by a Faraday screen against electrostatic disturbances. This construction discriminates in favor of the desired signal as against a local man-made noise source in three ways. First, since any noise source is composed of two components—electrostatic and magnetic fields—the "Beam-a-Scope" may be revolved so that a null point is found where no voltage is produced from these two components in the direction where the noise originates. Due to the fact that this null point is very sharp, it is very unusual that any desired station will be in a direct line with the rejected noise signal and thereby have its signal strength reduced appreciably. In the second place, the "Beam-a-Scope" eliminates the external return path to ground present in the case of an unshielded antenna. This reduces or eliminates local man-made noise sources in much the same way as a shielded antenna lead-in does in an ordinary antenna installation. In the third place, the "Beam-a-Scope" discriminates against the electrostatic component of an incoming wave in comparison with the magnetic component, because of the Faraday shield. Since the electrostatic component of a local noise source is a great deal larger than the magnetic component, this rejection property brings about an enormous increase in signal-to-noise ratio.

The above operation is only available on the broadcast band and in this position the Beam-a-Scope is also the first tuned grid circuit. On the "C" and "D" bands, the Beam-a-Scope is connected to operate as a capacity type antenna.

Switch (S-6) located at the rear of the chassis is the Beam-a-Scope-antenna transfer switch to allow operation on all bands with either the Beam-a-Scope or an outside antenna. This switch also reduces the sensitivity of the 6U5 tuning indicator tube in the "B" band only.

Loud-speaker

To center the voice coil, remove dust cover by softening with acetone. Loosen the two spider clamping screws and place three 1 in. by ¼ in. by 0.010 in. paper or celluloid strips equally spaced around pole piece for clearance; then tighten clamping screws. Remove centering strips and cement the dust cap back in place with Glyptal cement.

Coil System

The "B," "C" and "D" band antenna coils are wound on a single coil form T-3 as shown in Fig. 4 and 5. T-4 and T-5 are the R.F. and oscillator transformers respectively for the "B," "C" and "D" bands. All switch points are numbered in Fig. 4 and 5 to facilitate in locating these switch points on the pictorial wiring diagram, Fig. 3.

The following table gives the coils in use for the various positions of the wave change switch.

Coil	Band "B"	Band "C"	Band "D"
Antenna Primary Beam-a-Scope	....	Lower portion of L-6	L-6
Regular Antenna	L-9	Lower portion of L-6	L-6
Wave change switch point	Gnd to (3) Ant to (9)	Gnd to (2) Ant to (8)	Gnd to (1) Ant to (7)
Antenna Secondary Beam-a-Scope	L-4 (Beam-a-Scope)	L-5 + L-7	L-5
Regular antenna	L-5+L-7+L-8	L-5+L-7	L-5
Wave change switch point	C-9 to (12) 6K7 grid to (6)	C-9 to (11) & (12) 6K7 grid to (5)	C-9 to (10) and (11) 6K7 grid to (4)
R.F. Primary	L-14	L-11	L-11
Wave change switch point	6K7 plate to (13) and (18)	6K7 plate to (14) and (17)	6K7 plate to (15) and (16)
R.F. Secondary	L-10+L12+L13	L-10 + L-12	L-10
Wave change switch point	C-15 to (24)	C-15 to (23) and (24)	C-15 to (22) and (23)
Oscillator Primary	L-19	L-17	L-15
Wave change switch point	Osc. grid to (21)	Osc. grid to (20) Gnd to (21)	Osc. grid to (19) Gnd to (20)
Oscillator Secondary	L-20	L-18	L-16
Wave change switch point	C-20 to (27)	C-20 to (26)	C-20 to (25)

In the "C" and "D" bands, the band switch removes bass compensation by grounding capacitor C-36, increases the I.F. sensitivity and also increases the sensitivity of the tuning indicator tube.

NOTE.—When replacing capacitors C-45 and C-52, it is absolutely necessary to replace with the specified parts as these are special negative temperature coefficient capacitors that compensate for oscillator drift with temperature.

ALIGNMENT PROCEDURE

Alignment Procedure

Use a "dummy" antenna in making all alignments. The grid lead should not be removed from the tube to which the input signal is applied when aligning the I.F. amplifier.

I.F. Alignment with Oscilloscope*

Band Switch Setting	Input Frequency	Tone Control Position	Point of Input	Trimmer	Comments
1. Band B	455 K.C. and 30 K.C. Sweep	Normal	I.F. 6K7 Grid	2nd I.F. Sec. 2nd I.F. Pri.	Condenser gang at minimum capacity—vertical input to ground and junction at R-25, R-12, and R-17. Adjust trimmers in order mentioned for a single curve of maximum applitude. The resulting curve on the "normal" position is shown in Fig. 2A. The expanded curve taken with tone control at "Treble I" is shown in Fig. 2B.
2. Band B	455 K.C. and 30 K.C. Sweep	Treble I	Converter 6A8 Grid	1st I.F. Sec. 1st I.F. Pri.	
3. Band B	455 K.C. and 30 K.C. Sweep	Normal	Converter 6A8 Grid	1st I.F. Tertiary	
4. Band B	455 K.C. and 30 K.C. Sweep	Normal	Converter 6A8 Grid	All I.F. Trimmers	

I.F. Alignment with Output Meter*

Band Switch Setting	Input Frequency	Tone Control Position	Point of Input	Trimmer	Comments
1. Band B	455 K.C. modulated	Normal	I.F. 6K7 Grid	2nd I.F. Sec. 2nd I.F. Pri.	Condenser gang at minimum capacity-output meter connected across voice coil-volume control at maximum-input as low as practical. Adjust all trimmers in order listed for maximum output. Note:—Do not attempt alignment in the expanded position.
2. Band B	455 K.C. modulated	Normal	Converter 6A8 Grid	1st I.F. Sec. 1st I.F. Pri. 1st I.F. Tertiary	
3. Band B	455 K.C. modulated	Normal	Converter 6A8 Grid	All I.F. Trimmers	

R.F. Alignment**

Band Switch Setting	Input Frequency	Tone Control Position	Point of Input	Trimmer	Comments
1. Band B					Mechanically adjust dial pointer to first line at left-hand end of dial scale with condenser gang fully meshed.
2. Band B	1500 K.C. modulated	Bass	Antenna Post	Osc. (C-5) R.F. (C-17) Ant. (C-2)	Connect output meter across voice coil-antenna switch turned to counter-clockwise position. Adjust trimmers in order listed for maximum output.
3. Band B	580 K.C. modulated	Bass	Antenna Post	Osc. Padder (C-8)	Adjust padder for maximum output in vicinity of 580 K.C. while rocking gang condenser.
4. Band B	1500 K.C. modulated				
5. Band C	5500 K.C. modulated	Bass	Antenna Post	Osc. (C-4)	Adjust trimmer for greatest output with dial pointer at 5500 K.C.
6. Band D	18.0 M.C. modulated	Bass	Antenna Post	Osc. (C-3) R.F. (C-16) Ant. (C-1)	Peak C16 and C1 while rocking gang condenser. The image of any signal on the D band should be 910 K.C. below input signal. Example: 15 M.C. image 14.09 M.C.
7. Band B	1500 K.C. modulated	Bass	Antenna Post	Beam-a-scope (C-54)	Turn antenna switch to clockwise position, align Beam-a-scope trimmer for maximum output.

* Use "dummy" antenna consisting of .05 mfd. capacitor between signal generator and point of input.

** Use "dummy" antenna consisting of 250 mmf. capacitor in series with 200-ohm resistance between the signal generator and the point of input.

RK-027	KNOB—Tone and band change knobs (Pkg. of 5)	.50
RK-028	KNOB—Control knobs (plain) (Pkg. of 5)	.30
RL-063	COIL—Ant. coil band "B," "C," and "D" (T-3)	1.25
RL-142	COIL—R.F. coil band "B," "C," and "D" (T-4)	1.15
RL-267	COIL—Osc. coil band "B," "C," and "D"	$1.25
RL-500	BEAM-A-SCOPE—Beam-a-scope antenna complete	9.15
*RQ-1247	RESISTOR—330 ohm, ½-W. carbon (R-2, -4, -15, -18) (Pkg. of 5)	.70
*RQ-1259	RESISTOR—1000 ohm, ½-W. carbon (R-7, -24, -36, -37) (Pkg. of 5)	.70

Stock No.	Description	List Price
*RQ-1291	RESISTOR—22,000 ohm, ½-W. carbon (R-9) (Pkg. of 5)	.70
*RQ-1299	RESISTOR—47,000 ohm, ½-W. carbon (R-5, -25) (Pkg. of 5)	.70
*RQ-1301	RESISTOR—56,000 ohm, ½-W. carbon (R-16) (Pkg. of 5)	.70
*RQ-1303	RESISTOR—68,000 ohm, ½-W. carbon (R-20, -30, -31) (Pkg. of 5)	.70
RQ-1305	RESISTOR—82,000 ohm, ½-W. carbon (R-28) (Pkg. of 5)	.70
*RQ-1315	RESISTOR—220,000 ohm, ½-W. carbon (R-1, -17, -32, -33) (Pkg. of 5)	.70
*RQ-1323	RESISTOR—470,000 ohm, ½-W. carbon (R-26, -38) (Pkg. of 5)	.70
*RQ-1331	RESISTOR—1.0 megohm, ½-W. carbon (R-11) (Pkg. of 5)	.70
*RQ-1333	RESISTOR—1.2 megohm, ½-W. carbon (R-22, -29) (Pkg. of 5)	.70
*RQ-1335	RESISTOR—1.5 megohm, ½-W. carbon (R-27) (Pkg. of 5)	.70
*RQ-1337	RESISTOR—1.8 megohm, ½-W. carbon (R-8) (Pkg. of 5)	.70
*RQ-1339	RESISTOR—2.2 megohm, ½-W. carbon (R-12, -14) (Pkg. of 5)	.70
RQ-1341	RESISTOR—2.7 megohm, ½-W. carbon (R-13) (Pkg. of 5)	.70
RQ-1459	RESISTOR—1000 ohm, 1-W. carbon (R-23)	.20
RQ-1497	RESISTOR—39,000 ohm, 1-W. carbon (R-6)	.20
RR-740	RESISTOR—Voltage divider resistor (R-35)	.85
RR-1006	RESISTOR—20 ohm, ½-W. carbon W.W. resistor (R-40) (Pkg. of 5)	.70
RR-1007	RESISTOR—230 ohm, 2-W. carbon resistor (R-34)	.20
*RS-174	SHIELD—Grid shield cap (Pkg. of 5)	.25
*RS-200	SOCKET—8 prong octal base socket (Pkg. of 5)	.75
*RS-204	SOCKET—5 prong octal tube socket (Pkg. of 5)	.75
RS-225	SOCKET—Dial light bayonet socket assembly	.10
RS-226	SOCKET—Octal base (on rear deck of chassis)	.15
RS-227	SOCKET—Tube socket (low loss octal base)	.15
RS-228	SOCKET—Station set-up lamp socket	.20
RS-229	SOCKET—Tube socket (6A8G)	.35
RS-508	SPACER—Tuning motor transformer spacer (Pkg. of 4)	.25
RS-396	SWITCH—Tone control switch (S-2)	1.35
RS-397	SWITCH—Station set-up lamp switch (S-4)	.20
RS-398	SWITCH—Motor scan switch (S-7)	.75
RS-399	SWITCH—Antenna loop switch (S-6)	.85
RS-3007	SWITCH—Band change switch (S-1)	3.00
RS-3001	SWITCH—Tuning motor "Off" switch	1.00
RT-104	TRANSFORMER—Power transformer, 105-125 V., 25-60 cycles (T-1)	14.75
RT-105	TRANSFORMER—Power transformer, 105-125 V., 50-60 cycles (T-1)	9.00
RT-106	TRANSFORMER—Tuning motor transformer, 50-60 cycles	3.70
RT-107	TRANSFORMER—Tuning motor transformer, 25 cycles	11.10
RT-263	TRANSFORMER—1st I.F. transformer and shield (T-6)	2.30
RT-264	TRANSFORMER—2nd I.F. transformer and shield (T-7)	1.60
RT-439	TRANSFORMER—Output transformer (T-2)	3.20
RV-042	VOLUME CONTROL—2 megohm volume control (R-19)	$0.75
*RW-101	WASHERS—Felt washers for knobs (Pkg. of 10)	.45
*RX-027	ASSEMBLY—Chassis mounting assembly	.15
RX-049	ASSEMBLY—Condenser mounting assembly	.15

DIAL SCALE AND AUTOMATIC DRIVE ASSEMBLY

Stock No.	Description	List Price
RB-160	BRACKET—Reduction drive wheel bracket	.20
RB-161	BRACKET—Manual and motor drive bracket	.40
RB-162	BRACKET—Tuning condenser mounting bracket (front)	.45
RB-700	BRAKE—Drive wheel friction brake (complete)	.20
RC-8041	CABLE—Dial pointer drive cable (2 cords)	.15
RC-8042	CABLE—Tone or volume control indicator cable (Pkg. of 5)	.40
RC-8043	CABLE—Band indicator cable (Pkg. of 5)	.35
RC-8044	CABLE—Condenser drive cable (Pkg. of 5)	.65
RD-073	DIAL—Dial scale	2.25
RE-031	ESCUTCHEON—Dial scale escutcheon	1.75
RM-112	MOTOR—Tuning motor, 50-60 cycles	4.00
RM-113	MOTOR—Tuning motor, 25 cycles	5.35
*RP-048	DRIVE PULLEY—Condenser drive pulley (G)	.35
*RP-079	PULLEY—Volume control drive pulley assembly (A)	.15
*RP-083	PULLEY—Band change drive cord pulley (E)	.10
*RP-084	PULLEY—Tone control drive pulley (B)	.10
RP-110	POINTER—Band change, tone and volume indicator pointer (Pkg. of 5)	.20
RP-111	POINTER—Dial scale pointer and clamp	.15
RP-300	PULLEY—Rubber cone drive pulley (motor) (I)	.25
RP-301	PULLEY—Drive cord idler pulley (Pkg. of 2)	.10
RP-302	DRIVE PULLEY—Pointer and drive pulley (F)	.35
*RS-427	SPRING—Volume, tone and band indicator tension springs (Pkg. of 5)	.20
RS-446	SPRING—Drive cord tension spring (Pkg. of 5)	.25
RS-911	SHAFT—Drive wheel shaft and collar	.15
RS-912	SHAFT—Manual drive shaft and rubber cone pulley	.20
RW-022	WINDOW—Volume control window	.30
RW-023	WINDOW—Tone control window	.30
RW-024	WINDOW—Band change window	.30
RW-900	WHEEL—Idler drive wheel (D)	.45

AUTOMATIC PROGRAM PRESELECTOR—G-106 ONLY

Stock No.	Description	List Price
RC-8079	CARDS—Station letter cards (set)	.35
RC-8080	CARDS—Neutral (card) (Strip of 5)	.05
RE-041	ESCUTCHEON—Clock face escutcheon and window	.65

*Used on previous receivers.

Stock No.	Description	List Price
RW-028	WINDOW—Celluloid station windows (Pkg. of 10)	.05

PUSH-BUTTON MECHANISM

Stock No.	Description	List Price
RC-8045	CARDS—Station letter cards (set)	$0.60
RC-8046	CABLE—Power cable and plug to push-button assembly	.50
RC-8047	CABLE—Station selector button cable	.95
RK-203	KEY—Station key (Pkg. of 5)	.30
RS-444	SPRING—Station button springs (Pkg. of 10)	.10
RS-864	SCREWS—Keyboard assembly thumb screws (Pkg. of 10)	.40
RS-3008	SWITCH—Push button "On-Off" switch	.50
RT-906	TAB—"Off" tab for station button (Strip of 10)	.05
RW-025	WINDOW—Celluloid station window (Pkg. of 25)	.15
RX-051	ASSEMBLY—Keyboard touch-tuning assembly switch complete (G-105)	7.40
RX-052	ASSEMBLY—Keyboard touch-tuning assembly switch (complete) (G-106)	7.45

STATION SELECTOR ASSEMBLY (BEHIND TUNING CONDENSER)

Stock No.	Description	List Price
RB-701	BAND—Contactor band	.10
RC-1978	CONTACT—Thumb screw contact (complete) (Pkg. of 5)	.45
RC-1979	CONTACT—Stationary contact complete (For "Off" switch) (G-106 only)	.15
RI-108	INSULATOR—Contactor band insulator (Pkg. of 5)	.15
RS-447	SPRING—Contactor band tension spring (Pkg. of 5)	.15
RW-901	WHEEL—Contactor wheel (CT) complete	2.00

SPEAKER ASSEMBLY

Stock No.	Description	List Price
RC-936	CONE—12-inch cone and voice coil assembly	1.10
RC-991	CLAMP—Cone spider clamp	.05
RD-301	DUST CAP—Speaker cone dust cap (Pkg. of 5)	.10
RP-109	PLUG—Male speaker plug	.20
RS-075	SPEAKER—12-inch speaker	5.50
*RX-030	ASSEMBLY—Speaker mounting assembly	.10

(Prices subject to change without notice.)

SOCKET VOLTAGES

Tube No.		Plate to Ground Volts D-C	Screen Grid to Ground Volts D-C	Cathode to Ground Volts D-C	Cathode Current MA	Heater Volts A-C
6K7 R.F.		215	95	2.6	7.5	6.4
6A8	Conv.	215	85	2.7	9.0	6.4
	Osc.	135	...			
6K7 I.F.		215	95	2.6	7.5	6.4
6H6 Det.		...	...	...	...	6.4
6F5 Audio		150*	...	0	1.0	6.4
6J5G Inverter		85*	...	0	2.0	6.4
6V6G Output		280	290	17.5	40 each	6.4
6U5 Indicator		220	...	...	0.5	6.4
5U4G Rectifier		Plate to Plate 680 RMS		350	120	5.1

6F5 Bias Supply Voltage—1.2 Volts
6J5G Bias Supply Voltage—3.5 Volts

AC Line voltage—120 No signal input—1000 ohms per volt meter—dial pointer at 530 K.C. on broadcast band.
* Measured on 500-volt scale.

MODEL F-107
Parts

GENERAL ELECTRIC CO.

REPLACEMENT PARTS LIST
Model F-107

Insist on genuine factory-tested parts which may be purchased from authorized dealers.

Stock No.	Description	List Price
	CHASSIS ASSEMBLY	
*RB-008	BOARD—2 lug terminal board	$0.10
*RB-023	BOARD—4 lug terminal board (near 6J5 socket)	.10
*RB-049	BOARD—Ant. and ground terminal board	.10
*RB-053	BOARD—3 lug terminal board (near 1st and 2nd I.F.)	.10
RB-063	BOARD—Fuse terminal board and bracket	.25
RB-062	BOARD—6 lug terminal board (near 6H6 socket)	.10
RC-002	CAPACITOR—.00075 mfd., 200 V. paper (C-41)	.25
RC-005	CAPACITOR—.001 mfd., 400 V. paper (C-55)	.25
*RC-023	CAPACITOR—.005 mfd., 600 V. paper (C-48)	.25
*RC-042	CAPACITOR—.01 mfd., 1,000 V. paper (C-54)	.30
*RC-091	CAPACITOR—.05 mfd., 400 V. paper (C-34, C-39, C-40, C-43, C-44, C-46, C-50, C-53)	.30
RC-092	CAPACITOR—.05 mfd., 600 V. paper (C-36)	.35
*RC-123	CAPACITOR—.1 mfd., 400 V. paper (C-35, C-38, C-42, C-45, C-47, C-49)	.35
*RC-150	CAPACITOR—.25 mfd., 400 V. paper (C-37)	.35
*RC-205	CAPACITOR—20 mmf., mica (C-26)	.35
RC-206	CAPACITOR—50 mmf., mica (C-21) (special for osc.)	.35
*RC-242	CAPACITOR—150 mmf., mica (C-28, C-29, C-31)	.25
*RC-259	CAPACITOR—250 mmf., mica (C-25)	.30
RC-308	CAPACITOR—750 mmf., mica (C-30)	.35
*RC-357	CAPACITOR—3,600 mmf., mica (C-23)	.50
RC-364	CAPACITOR—1,300 mmf., mica (C-24)	.35
RC-427	CAPACITOR—16 mfd., 450 V. wet electrolytic (C-60)	1.05
RC-428	CAPACITOR—30 mfd., 450 V. wet electrolytic (C-61)	1.20
RC-579	CAPACITOR—Dry electrolytic, 10 mfd., 12 V. A.C.; 4 mfd., 400 V.; 10 mfd., 400 V.; 25 mfd., 25 V. (C-59, C-62, C-63, C-64)	1.70
RC-582	CAPACITOR—1,000 mfd., 12 V. A.C. dry electrolytic (C-58) for 50-60 cycle sets	$2.45
RC-588	CAPACITOR—2300 mfd., 12 V. A.C. dry electrolytic for 25-cycle sets (C-57)	4.50
RC-650	CAPACITOR—Double trimmers (5-40 mmf.) (C-1, C-2) "B" and "D" band antenna	.25
RC-651	CAPACITOR—Double trimmers (2-20 mmf.) (C-7, C-8) "B" and "D" band R.F.	.25
RC-652	CAPACITOR—"B" band padder (175-350 mmf.) (C-6)	.25
RC-654	CAPACITOR—Double trimmers, pri. and sec., 1st or 2nd I.F. transformer (C-12, C-13, C-14, C-15)	.45
RC-655	CAPACITOR—Double trimmers, pri. and sec., 3rd I.F. transformer (C-16, C-17)	1.55
RC-661	CAPACITOR—"B", "C" and "D" band oscillator trimmer (C-3, C-4, C-5)	.60
RC-719	CONDENSER—3-gang tuning condenser (C-20)	5.15
*RC-755	CAPACITOR—Line capacitor .01-.01 mfd., 250 V. A.C. (C-56)	.40
*RC-863	CORD—Power cord with plug	.65
*RC-992	CUSHION—Condenser mounting cushion assembly (Pkg. of 3)	.10
RC-8011	CABLE—Speaker cable with female plug	.60
*RF-301	FUSE—3 amp. fuse (Pkg. of 10)	1.00
*RG-001	GRID CAP—Control grid cap (Pkg. of 5)	.10
RK-017	KNOB—Volume and tone control knobs (Pkg. of 5)	.40
RK-018	KNOB—Band and A.F.C. switch knobs (Pkg. of 5)	.40
RK-021	KNOB—Manual tuning knob (Pkg. of 5)	.50
RL-046	COIL—Antenna coil "A", "B", and "C" bands (T-6)	1.35
RL-134	COIL—R.F. coil "A", "B", and "C" bands (T-4)	1.25
RL-249	COIL—Osc. coil, "A", "B" and "C" bands (T-3)	1.50
RP-078	PLATE—Fuse cover plate	.10
RQ-1247	RESISTOR—330 ohm, ½ watt carbon (R-3, R-13) (Pkg. of 5)	.70
RQ-1257	RESISTOR—820 ohm, ½ watt carbon (R-4) (Pkg. of 5)	.70
RQ-1259	RESISTOR—1,000 ohm, ½ watt carbon (R-15, R-29) (Pkg. of 5)	$0.70
RQ-1267	RESISTOR—2,200 ohm, ½ watt carbon (R-12, R-23) (Pkg. of 5)	.70
RQ-1275	RESISTOR—4,700 ohm, ½ watt carbon (R-5, R-28) (Pkg. of 5)	.70
RQ-1287	RESISTOR—15,000 ohm, ½ watt carbon (R-32) (Pkg. of 5)	.70
RQ-1291	RESISTOR—22,000 ohm, ½ watt carbon (R-31) (Pkg. of 5)	.70
RQ-1299	RESISTOR—47,000 ohm, ½ watt carbon (R-2, R-6, R-7, R-11, R-24, R-26) (Pkg. of 5)	.70
RQ-1303	RESISTOR—68,000 ohm, ½ watt carbon (R-14) (Pkg. of 5)	.70
RQ-1307	RESISTOR—100,000 ohm, ½ watt carbon (R-17, R-18, R-25, R-27) (Pkg. of 5)	.70
RQ-1313	RESISTOR—180,000 ohm, ½ watt carbon (R-19) (Pkg. of 5)	.70
RQ-1315	RESISTOR—220,000 ohm, ½ watt carbon (R-22) (Pkg. of 5)	.70
RQ-1323	RESISTOR—470,000 ohm, ½ watt carbon (R-1, R-10) (Pkg. of 5)	.70
RQ-1324	RESISTOR—510,000 ohm, ½ watt carbon (R-21) (Pkg. of 5)	.70
RQ-1339	RESISTOR—2.2 megohm, ½ watt carbon (R-16, R-20) (Pkg. of 5)	.70
RQ-1481	RESISTOR—8,200 ohm, 1 watt carbon (R-9)	.20
*RQ-1499	RESISTOR—47,000 ohm, 1 watt carbon (R-8)	.20
RR-730	RESISTOR—Tapped bleeder resistor (R-35)	.70
RR-1004	RESISTOR—230 ohm, 1½ watt moulded (R-30)	.15
*RS-139	SHIELD—3rd I.F. transformer shield	.20
RS-175	SHIELD—1st or 2nd I.F. transformer shield	.25
*RS-200	SOCKET—8-pin tube socket (Pkg. of 5)	.75
RS-217	SOCKET—4-prong tube socket (Pkg. of 5)	.50
RS-221	SOCKET—8-pin socket (push button control cable receptacle) (Pkg. of 5)	.60
RS-223	SOCKET—8-pin socket for osc. and converter (Pkg. of 5)	.80
RS-356	SWITCH—Manual A.F.C. switch (S-5)	.40
RS-357	SWITCH—Tone control switch (S-4)	.70
RS-358	SWITCH—Band change switch (S-7)	2.50
RT-101	TRANSFORMER—Power trans., 110-130 V., 50-60 cycles (T-1)	5.90
RT-102	TRANSFORMER—Power Transformer, 100-130 V., 25-60 cycles (T-3)	10.00
RT-103	TRANSFORMER—Power transformer, 110-250 V., universal (T-1)	10.50
RT-246	TRANSFORMER—1st or 2nd I.F. transformer (complete) (T-4, T-5)	1.80
RT-247	TRANSFORMER—3rd I.F. transformer (complete) (T-6)	3.95
RV-033	VOLUME CONTROL—2 megohm volume control, tap at 5,000 ohms and 500,000 ohms (R-34)	1.05
*RW-101	WASHER—Felt washer for knobs (Pkg. of 10)	.45
RX-027	ASSEMBLY—Chassis mounting assembly	.15
	DIAL SCALE ASSEMBLY	
RC-868	CORD—Band indicator, tone control and volume control pointer cord (Pkg. of 5)	.60
RC-8012	CABLE—Tuning drive cables (Pkg. of 5 pairs)	.55
RD-054	DRUM—Condenser drive drum	.30
RD-056	DIAL—Dial scale assembly	3.50
RE-017	ESCUTCHEON—Dial escutcheon (complete)	1.95
RL-920	LAMP—Dial lamp 6.3 volt, .25 amp. (Pkg. of 10)	1.50
RP-079	PULLEY—Volume control cord drive pulley	.15
RP-080	POINTER—Volume or tone control pointer (Pkg. of 5)	$0.15
RP-081	POINTER—Band change indicator (Pkg. of 5)	.20
RP-082	POINTER—Dial scale pointer (includes support) (Pkg. of 5)	.55
RP-083	PULLEY—Band switch cord drive pulley	.10
RP-084	PULLEY—Tone control cord drive pulley	.10
RP-911	REFLECTOR—Lamp reflector	.75
RS-222	SOCKET—Lamp socket assembly	.45
*RS-401	SPRING—Tuning drive cord tension spring (Pkg. of 2)	.20
RS-427	SPRING—Volume, tone or band indicator cord tension spring (Pkg. of 5)	.20
RW-016	WINDOW—Escutcheon window and cushion	.30
	AUTOMATIC DRIVE AND MOTOR ASSEMBLY	
RA-404	ARM—Motor reversing switch arm (on gang condenser shaft)	.15
RB-156	BRACKET—Guide and spiral rod bracket; includes bearing (motor end)	.10
RB-157	BRACKET—Spiral rod bracket with bearing (Manual tuning end)	.10
RB-605	BELT—Motor belt	.25
RG-010	GEAR—Manual drive beveled idler gear and tuning shaft gear	.40
RG-011	GEAR—Manual drive leather faced bevel gear on spiral rod	.20
RM-104	Motor—25-cycle automatic tuning motor (motor only)	4.45
RM-105	MOTOR—50-60 cycle automatic tuning motor (motor only)	4.05
RP-085	PULLEY—Spiral rod pulley (belt driven)	.15
RR-912	RIDER—Spiral rod rider nut	.30
RR-913	ROD—Pointer slider guide rod	.15
RR-914	SPIRAL ROD—Tuning pointer spiral drive rod	.25
RR-915	RELAY—60-cycle relay (complete)	2.80
RR-917	RELAY—25-cycle relay (complete)	3.10
RS-359	SWITCH—Tuning motor reversing switch (operated by gang condenser shaft)	.70
RS-429	SPRING—Motor relay armature spring (Pkg. of 2)	.20
RS-505	SLIDER—Dial pointer slider assembly	.70
RS-908	SHAFT—Manual tuning shaft	.05
RS-028	ASSEMBLY—Motor clutch assembly (complete)	.30
RX-029	ASSEMBLY—Drive motor mounting assembly	.15
	STATION SELECTOR ASSEMBLY Behind Tuning Condenser	
RC-1962	COLLAR—Contactor shaft collar	.10
RC-1963	SLIDING CONTACTOR—Bakelite mounted rotating contactor and holder	.40
RC-1964	CONTACT—Thumbscrew contact (complete) (Pkg. of 10)	.95
RI-103	INSULATORS—Insulators and washers (Thumbscrew contact) (Pkg. of 10)	.05
RP-087	PLATE—Contact mounting segment	.55
RU-002	COUPLING UNIT—Flexible coupling with contactor arm	.75
RW-106	WICK—Wick assembly (Pkg. of 5)	.50
	PUSH BUTTON AUTOMATIC TUNING MECHANISM	
RB-064	TERMINAL BOARDS—Terminal strips (7 terminals) (pair)	.40
RB-065	TERMINAL BOARD—Terminal strip (6 terminals) (long)	.20
RB-068	TERMINAL BOARD—Terminal strip (6 terminals) (short)	.20
RB-606	LATCH BAR—Push button mechanism latch bar	$0.10
RB-607	BUTTON—Moulded push button (Pkg. of 5)	.20
RC-1965	CLAMP—Push button cable clamp (Pkg. of 10)	.10
RC-1966	CONTACTOR CLIP—Clip and insulator (on leads from terminal strip) (Pkg. of 5)	.15
RC-8013	CABLE—"On", "Off", "Scan" switch cable with plug	.65
RE-018	ESCUTCHEON—Touch tuning button escutcheon plate	1.50
RI-104	INSULATOR—Insulator between key and switch blade (Manual and off switches) (Pkg. of 5)	.15
RI-107	INSULATOR—Escutcheon separating insulator (Pkg. of 10)	.05
RI-105	Insulator between key and switch blade (Scan switch) (Pkg. of 10)	.10
RK-200	KEY—Push button key (Pkg. of 5)	.15
*RP-026	PLUG—A-c line connector female plug	.45
*RP-027	PLUG—A-c line connector male plug	.45
RS-361	SWITCH—Tuning control switch (3 section)	1.10
RS-430	SPRING—Latch bar spring (Pkg. of 5)	.10
RS-431	SPRING—Key spring and staple (Pkg. of 5)	.05
RS-506	SPACER—Contact point spacer (fiber) (Pkg. of 10)	.05
RW-017	WINDOW—Push button celluloid window (Pkg. of 25)	.10

ALIGNMENT PROCEDURE

In order to align these receivers properly, it is necessary to have the following test equipment:

1. A modulated test oscillator.
2. An output indicator such as an AC voltmeter with a scale reading of 3 to 5 volts. A cathode ray oscilloscope is preferred for I.F. alignment.
3. A screw-driver type alignment tool.

The alignment procedure is given in table form along with the trimmer location drawing, Fig. 9. A "dummy antenna" should be used in all alignments and is the capacitor or capacitor and resistor used in series with the signal generator. The grid lead should not be removed from the tube to which the input signal is applied when aligning the I.F. as this would remove the grid bias from the tube.

Automatic Frequency Control Adjustments

After I.F. alignment is completed with output meter and without disturbing the generator setting, remove the signal generator lead from the grid of the 6A8 converter. Apply the 465 kc. signal, to the 6A8 grid capacitively through the insulation of the grid lead.

Tune in a weak broadcast station at about 1000 kc. and, with the A.F.C. switch "off," tune the receiver carefully for "Zero" beat between this carrier and the 465 kc. generator signal. Throw the A.F.C. switch on and adjust the 3rd I.F. secondary trimmer (C-17) to zero beat. This adjustment is very critical and must be made with great care. When the alignment is correctly done, there will be no appreciable difference in the beat note with the A.F.C. switch "on" or "off."

Another method of A.F.C. adjustment after I.F. alignment with an output meter is to connect a low range voltmeter between the cathodes of the 6H6 discriminator. Leave the signal generator connected to the 6A8 grid and without disturbing its setting adjust C-17. It will be noticed that the meter reads plus when C-17 is tuned off resonance on one side and negative when tuned on the opposite side of resonance. The correct adjustment of C-17 is between these positions, when the voltmeter reads zero.

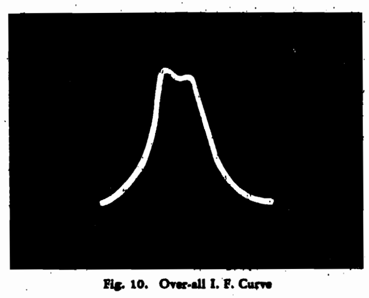

Fig. 10. Over-all I. F. Curve

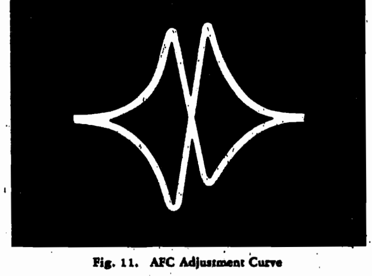

Fig. 11. AFC Adjustment Curve

COIL SYSTEM

The coils for the three bands are wound a single form. The antenna transformer is designated as T-6, the R.F. transformer as T-4 and the oscillator transformer is marked T-3. All contacts on the band switch are numbered in Fig. 7 and Fig. 8 to facilitate tracing the coil circuits.

The band switch connects the coils to operate as follows:

Ant.	Primary	Secondary	Remarks
"B"	L-6	L-4 & L-5	
"C"	L-3	L-4	L-5 shorted
"D"	L-2 & L-3	L-1	L-4 & L-5 shorted
RF			
"B"	L-13	L-11 & L-12	
"C"	L-10	L-11	L-12 shorted
"D"	L-9 & L-10	L-8	L-11 & L-12 shorted
Osc.			
"B"	L-19	L-18	
"C"	L-17	L-16	Connects C-30 across L-18
"D"	L-15	L-14	Connects C-30 across L-16

On "D" band contact No. 9 is used to provide a ground for the General Electric noise reducing antenna systems KV-300 and FT-40.

Dial Mechanism
Tuner Data

AUTOMATIC FREQUENCY CONTROL

The Automatic Frequency Control used in this receiver shifts the oscillator frequency so that the correct intermediate frequency is very closely produced even when the receiver is mistuned several kilocycles.

The essential elements are the discriminator transformer T-9, the twin diode 6H6 with its balanced discriminator network, and the 6J5-G control tube connected across the broadcast oscillator plate coil.

The discriminator transformer is designed to deliver (when properly tuned to 465 kc.) equal voltages to each section of the 6H6 when the receiver is correctly tuned to give an I.F. frequency of 465 kc. Under this condition the voltage drop across R-21 is equal and opposite to the voltage across the total resistance of R-19, R-22 and R-17; thus no discriminator voltage is produced to control the 6J5-G tube.

However, if the signal frequency is increased above 465 kc., unequal voltages are applied to the diodes and the voltage over R-21 is greater than the voltage over the combined resistance of R-19, R-22 and R-17. The difference of these two voltages is positive and is applied to the 6J5-G control tube.

When the signal frequency is decreased below 465 kc., the result is less voltage over R-21 and a greater voltage over the combined resistances R-19, R-22 and R-17. The difference of these two voltages, as applied to the 6J5-G control tube, is negative.

Thus three conditions arise:

On resonance: no discriminator voltage developed
Above 465 kc.: a positive control voltage
Below 465 kc.: a negative control voltage

The 6J5-G A.F.C. control tube has a combination of self and fixed bias, the latter being the result of the current supplied through R-8 to the cathode resistor R-4. The R.F. voltage applied to the control grid of the 6J5-G is obtained from the drop across the C-6 series padder and C-30. The vector sum of these two voltages is applied to the phase shifting network C-25 and R-3 and, in turn, to the control grid. This phase shifting network causes the control tube to appear as a reactance in parallel with the oscillator coil. The value of the apparent reactance depends upon the control voltage produced by the discriminator.

When the set is mistuned above the incoming signal, the converter output is above the 465 kc. required. A positive discriminator voltage is produced as explained above. This causes the 6J5-G tube to act as more capacitive reactance and thus lower the oscillator frequency; this gives a lower converter output frequency, approximately 465 kc.

When the set is mistuned below the incoming signal, the converter output is below the 465 kc. required. A negative discriminator voltage is produced as explained above. This causes the 6J5-G to act as less capacitive reactance thus increasing the oscillator frequency. This in turn gives a higher converter output frequency, approximately 465 kc.

A decided A. F. C. action is apparent on short waves. The discriminator voltage is produced in the same manner as above. However, the action of the 6J5-G tube is different. The 6A8 oscillator plate voltage and 6J5-G plate voltage are supplied through the same resistor (R-5). A positive discriminator voltage allows the 6J5-G plate current to increase, thus reducing the 6A8 oscillator plate voltage. This causes a lower oscillator frequency with the resultant lower converter output frequency, approximately 465 kc.

With a negative discriminator voltage the 6J5-G plate current is less, thus increasing the 6A8 oscillator plate voltage. This causes a higher oscillator frequency with the resultant higher converter output frequency, approximately 465 kc.

DIAL MECHANISM

Tuning mechanism diagram (Fig. 1) is self-explanatory. The tuning condenser drive cord can be easily replaced without removing *any* part of the chassis while all dial indicating control cords are made readily accessible for servicing by merely removing the seven small screws holding the dial reflector assembly.

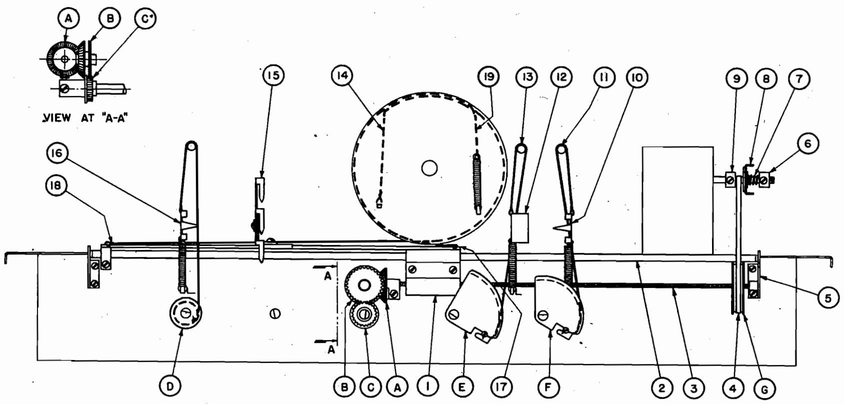

Fig. 1. Dial Mechanism

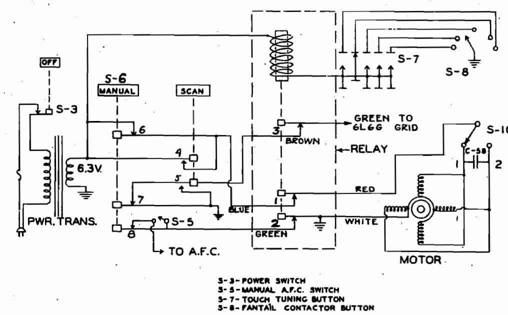

Fig. 2. Schematic of "Touch Tuning" System

TOUCH TUNING

General Electric "Touch Tuning" consists of three essential units; the push-button assembly of sixteen buttons, used by the operator for control; the motor and relay assembly, operating in conjunction with the buttons to provide fast and accurate tuning; and the contact segment with its sliding contactor and adjustable contacts enabling selection of thirteen different stations to be tuned automatically.

Of the sixteen push-buttons, thirteen are used for station selection. The other buttons are used for "Manual" control (No. 8), "Scanning" (No. 15) and "Off" (No. 16). Depression of any button except No. 15 will lock the depressed button and release any other that may be in the circuit. Thus the selection of any station button or of "Manual" will release the "Off" switch turning the set on.

The tuning motor is operated as a capacitor type squirrel cage induction motor, with capacitor, C-58 as the phase shifting device. By tracing the motor circuit it will be seen that C-58 is in series with one set of poles when the motor reversing switch is in the position shown in Fig. 2. When the switch S-10 is reversed the capacitor C-58 is in series with the opposite set of poles. This causes the motor field to rotate in the opposite direction with the resultant change in motor rotation.

The motor power is supplied from the tube heater circuit through "Manual" switch (contact No. 6), Fig. 2, the relay (contact No. 1) and the motor reversing switch (S-10) with the chassis as common return. It will continue to run until the sliding contactor (S-8) contacts the stud on the contact segment which is connected to the button in the circuit. When this contact is made, the relay field coil is energized, causing the relay to open the motor circuit (contact No. 1). At the same time the relay arm also engages the motor clutch, causing instantaneous stopping of tuning mechanism travel. Depression of another station button causes another similar cycle.

Pressing the "Manual" button (S-6) releases any depressed button. Thus S-7 is opened and the relay field coil can not be energized. Contact No. 6 opens the motor circuit. Contacts No. 7 and No. 8 remove the ground from the grid of the 6L6-G and from the A.F.C. circuit respectively.

With the receiver set for "Manual" operation, depression of the "Scan" button closes the motor circuit by the shunting of contact No. 6 on the "Manual" switch allowing continuous motor operation and dial travel. As the motor drives to the dial limits on either end, S-10 is automatically thrown, causing reversal of motor rotation.

During periods of motor operation, either for automatic station selection or for scanning, the grid of the 6L6-G is shorted to ground. This "silent tuning," accomplished by relay contact No. 3, in the former case or scan button contact (No. 5) in the latter, avoids reception of unwanted stations or inter-station noise when tuning automatically or by means of the "Scan" button.

The use of automatic frequency control on "Manual" is made optional by the A.F.C. switch (S-5). When any one of the thirteen "Touch Tuning" buttons is depressed, circuit is made through contact No. 8 on S-6 and is completed through relay contact No. 2, thus removing A.F.C. while the motor is in operation. When the station is reached the relay opens contact No. 2, thus removing the ground on the A.F.C. circuit. *The A.F.C. is automatically turned on when "Touch Tuning" is being used.*

REMOTE CONTROL

There are ten leads in the "Remote Touch Tuning Control" cable. These leads serve the following functions:

The No. 1 and No. 2 leads are connected to the octal base adapter and serve to connect the silencing button to the output tube.

The No. 3 to No. 9 leads correspond to the button numbers and, with the No. 10 lead, provide the selection of stations from the remote control unit. These leads are to be connected to pins on the contact segment on the rear of the chassis.

Remove the least desirable station's letters from one of the "Touch Tuning" buttons of the receiver and insert the "Remote" tab. Note the number of this button as marked on the escutcheon.

Remove from a pin on the contact segment on the receiver, the lead which bears this number, and connect it to the No. 10 lead from the remote control cable, Fig. 3.

(The pin on the contact segment from which this lead was removed is left vacant.)

Now note the number of a receiver push button which bears the same call letters as a remote unit button. Remove the lead with this number from the pin on the contact segment. Connect to this pin the lead from the remote cable which corresponds to the above-mentioned remote unit button. Fasten the lead with a hex nut and tighten lightly with a pair of pliers or small wrench. Now re-connect the original lead to the pin. Proceed in the same manner until the seven remote button leads are connected.

Remove the 6L6G tube and place in the 6L6G tube socket the adapter which is connected to leads No. 1 and No. 2. Insert the 6L6G tube in this adapter.

When the "Remote Touch Tuning Control" unit is connected, as explained above, the action is identical with that of the regular station selection circuit. The remote button unit is in series with the "Remote" button lead on the receiver through lead No. 10 of the remote unit cable. The relay field coil circuit is completed through the set "Remote" button (S-7); the common (No. 10) lead; the depressed control button; its lead to a pin on the contact segment, and to ground through the sliding contactor. *The "Silent" button must be in the released position when operating the receiver from either the remote control unit or from the receiver controls or no audio output will be obtained.*

MODEL F-107
Relay Data

GENERAL ELECTRIC CO.

RELAY ADJUSTMENTS

The following adjustments should be made with relay assembled on the motor bracket, Fig. 4.

(1) Make sure contacts are adjusted to open in correct sequence: center contacts (motor) first, contacts farthest from armature (AFC) second, contacts nearest armature (silent tuning) last. *It is very important that the silent tuning switch open last.*

(2) Adjust backstop (24) so that the armature snaps closed when the relay coil is energized with 4.5 volts A.C. The backstop must make a positive contact with the back of the armature in the open position; otherwise sluggish operation of the relay will result which will cause the motor drive to skip buttons. If the relay will not close at 4.5 volts and still maintain proper travel and sequence, weaken the spring on the rear of the armature plate by bending the stationary spring support (20).

(3) Loosen the setscrew on the motor shaft collar nearest motor (9) and adjust collar so that the pulley dog (8) misses the relay armature extension by .001 in. (relay not energized). All contacts must be closed when the relay armature touches the end of the motor dog; if the motor contacts open in this position the armature will chatter.

(4) Spring adjustment (7) on slip clutch should be just tight enough so as not to allow slippage of motor when driving the dial mechanism. Loosen setscrew on outside shaft collar (6) and screw the collar on the shaft to tighten slip clutch.

(5) The pole piece of the relay coil is divided in two semi-circles. The relay armature should only touch the pole segments towards the motor shaft. There should be a .001 in. clearance between the back segment (21) and the armature when closed; otherwise a buzzing will be heard. Sometimes a front pole segment that is not perfectly flat will cause the same trouble. File off the offending bump.

(6) Backstop setting should be such that the distance (22) is 26/32 in. with the relay closed and 29/32 in. with the relay open.

(7) Spacing between relay contact points when open should be .015 to .018 inches for contact No. 1 and .008 to .010 inches for contact No. 2 and No. 3.

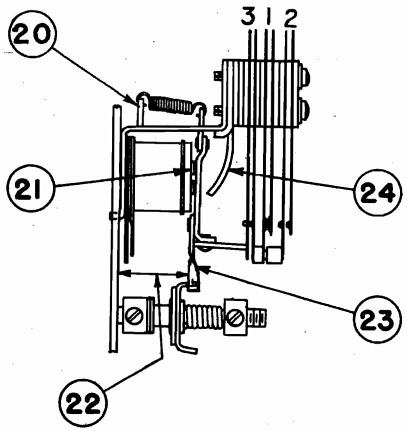

Fig. 4. Relay

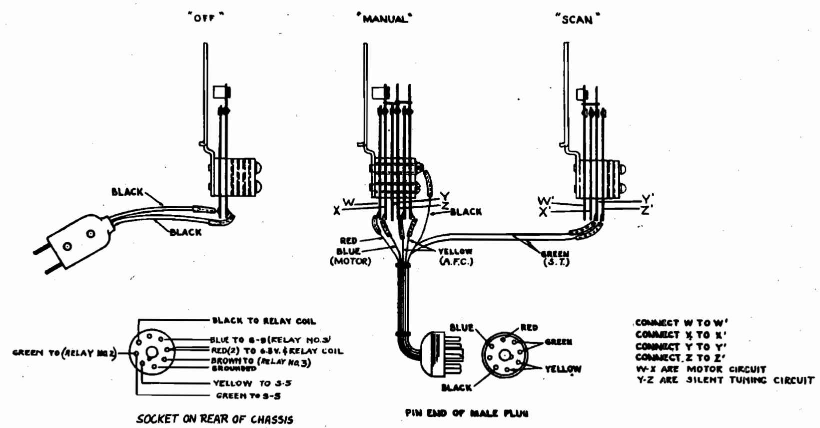

Fig. 5. Wiring Diagram of "Off," "Manual" and "Scan"

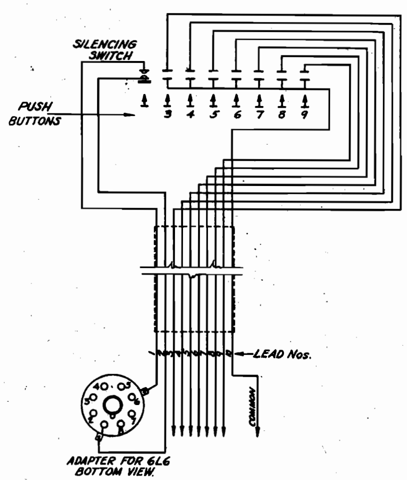

Fig. 3. Schematic of Remote Control

INCORRECT OPERATION AND SUGGESTED REMEDIES

Skipping of Stations

(a) "Touch Tuning" button leads not making good contact to adjustable contact pins. Clean contacts and re-insert.

(b) Sliding contactor blade either covered by thin piece of bakelite or dirty. Carefully run fine file over top of sliding contactor, making sure not to leave any sharp corners. Sliding contactor should have a small amount of vaseline on beveled surface to prevent chattering.

(c) Nipple too sharp on adjustable contacts will cause sliding contactor blade to jump across. Smooth off with fine sand paper.

(d) Relay armature out of adjustment causing sluggish operation of relay switch. See paragraph 2 under Relay Adjustments.

(e) Excessive side play in sliding contactor. Loosen the setscrew on the back of the sliding contactor and slide holder together. Final adjustment should allow sliding contactor to rock freely.

(f) Not enough tension on sliding contactor arm. Loosen collar on shaft in rear of contact segment and move sliding contactor arm towards the contact segment; then tighten collar on shaft.

(g) If the contacts at the rear of the "Touch Tuning" button assembly shafts do not close or make good contact, the motor will continue to scan the dial without stopping at the desired station.

(h) Contact segment may be bent out of shape. This should be perpendicular to chassis deck and parallel to rear chassis apron in order to allow the contactor arm to wipe the adjustable contacts evenly.

No Action When Station Button Is Pressed

(a) Relay remains energized and audio continues to function—push button escutcheon grounded. Be sure dial and push button escutcheons are insulated from each other or from the control shafts.

(b) "Off" switch contacts do not close.

(c) If set does not tune automatically unless scan button is also depressed, contacts No. 6, Fig. 2, require closer spacing.

(d) Open or shorted motor capacitor—Characterized by motor armature humming but no torque. Replace 1000 mfd. capacitor C58

(e) Open or shorted coil in motor—Characterized by no torque or low torque in one direction. Replace motor or repair coil.

(f) Drive mechanism bound, or too tight for motor to drive.

(g) Not enough friction in Slip Pulley—The friction of the slip pulley is adjusted by tightening the collar on the end of the motor shaft. Care should be exercised that the setscrew does not hit the relay armature.

(h) Belt slippage—The tension of the belt may be increased by raising the motor on the relay bracket. If the belt still slips, reverse belt and use other surface or use belt dressing.

Noise in Audio Output While "Touch Tuning"

(a) Improper sequence—If the relay switch contacts open in improper sequence, audio output will be available too soon, and the break in the motor switch will be heard in the speaker. Correct as described in (1) under Relay Adjustments.

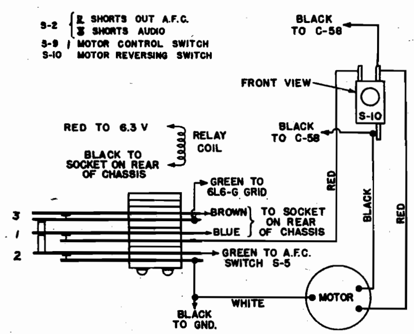

Fig. 6. Motor Relay Wiring Diagram

(b) Dressing of Silent Tuning Lead—Early production receivers had silencing lead from 6L6 grid run to connector socket on rear apron, up to "Push Button" switch, and return through socket connector to the relay switch where the ground wires of AFC, motor and silent tuning contacts were connected together and grounded to chassis. Reconnect as follows: Ground A.F.C. and motor contacts to a point of the chassis directly underneath the motor. The green grid lead from the 6L6 should be rewired over the top of the chassis deck to the silencing contact, Fig. 6, of the relay switch; the lead from the other relay silencing contact should be connected to a prong of the connector plug, Fig. 5; from this point, connection is made to the silencing portion of the "Touch Tuning" switch, and a return to ground from this point is made through the connector plug to the chassis near the connector plug socket.

(c) Noise through filter circuit—The "blurp" in the speaker on early production due to the sudden application of audio may be reduced by placing a .05 mfd., 600-volt capacitor (RC-092) across the output filter capacitor (C-61).

Miscellaneous Adjustments

(a) When a "Touch Tuning" button will not remain in a locked position, it usually indicates that the springs at each end of the latch bar are not in proper adjustment. They should exert an equal pull on each end.

(b) The fork on the tuning condenser should be adjusted so that the motor reversing switch clicks over when the pointer approximately reaches the 540 and 1620 kc. markings on the dial scale. With the pointer at the extreme end of calibrations when tuning manually, the reversing switch lever should be set so there is not more than 1/16 in. nor less than 1/32 in. clearance between the lever and the switch trigger after the switch has snapped.

(c) The motor and relay mounting plate should rest parallel to the chassis deck. Do not adjust the spring tension foot; raise or lower motor on bracket, as required. Make sure that there is no electrical connection between the motor frame and the chassis.

(d) The "Off" switch on the "Touch Tuning" assembly should stay closed for at least one-half the movement of the key, opening only on the final click. If firm contact does not exist between the points, vibration of the set may cause an intermittent noise.

(e) The silent tuning contacts of the "Manual" and "Scan" switches should open last to permit quiet operation.

Rating Label	Power Supply (Volts)	Frequency (Cycles)	Power Consumption (Watts)
A	110–120 (120–130)*	60	105
For 50 cycles only	110–120 (120–130)*	50	105
For 25 cycles only	110–120 (120–130)*	25	105

* The receiver as shipped from the factory, has the power cord connected to the 120–130 volt tap of the transformer (red and black lead). If the normal voltage of your power supply is always below 115 volts, the power cord should be removed from this tap and connected to the lower voltage tap (yellow and black lead). Solder and tape the joint and also tape the exposed end of the unused lead.

GENERAL INFORMATION

Model G-97 is a three-band AC operated receiver, employing nine General Electric pre-tested tubes as described above, in a superheterodyne circuit. It incorporates the simplified "Touch-Tuning" system as well as the Automatic Station Timer. The "Touch-Tuning" system allows a set-up of six buttons for automatic tuning of your favorite stations. The Automatic Station Timer may be set up in advance so that the set power will be automatically turned on at a predetermined time and in a similar manner it will turn "off" the receiver at any pre-set quarter-hour interval. Other features of design include automatic frequency control, four-point tone control by degeneration, and two stages of I.F. amplification.

Receiver Operation

The R.F. amplifier consists of the antenna transformer (T-6) connected to the 6K7 which is coupled to the 6A8-G through the R.F. transformer (T-4). The signal is converted to an intermediate frequency of 465 kc. by the oscillator and converter tube 6A8-G. The intermediate frequency is then amplified by the two 6K7 tubes used in conjunction with the three double-tuned I.F. transformers. The primary and secondary coils of these I.F. transformers are carefully adjusted midway between the points of critical and over coupling so as to give the I.F. amplifier a broadened band width with the resultant improvement in fidelity of the received program.

The output of the I.F. amplifier is applied to a 6H6 twin diode, which is a combination detector, automatic volume control and discriminator voltage source for the automatic frequency control tube 6J5-G.

The volume is controlled by a potentiometer in the grid circuit of the 6F5 audio amplifier tube. This tube is resistance coupled to the 42 pentode output tube. The output transformer is designed to correctly load the 42 tube over a broad range of frequencies thus enabling the tube to deliver ample undistorted output to the 12-inch speaker.

A detailed description of the inverse-feedback tone control, coil system, AFC, and touch-tuning as used in this receiver, will be found in the Model F-96 service notes.

Operation

There are 48 keys located on the circumference of the clock dial, each of which represents a 15-minute interval. When a key is pulled out, the timer will automatically turn on the radio for the indicated 15 minutes; i.e., by pulling out the red key at 6, the power will be turned "on" at 6:00 and turned "off" at 6:15. The operating period actually starts a minute or two before the indicated time so that the tubes will have a chance to reach their operating temperature before the program begins. Likewise, the operating period is prolonged beyond the indicated time by a minute or two. At the end of the operating period, the power will be automatically turned off unless the next key (in a clockwise direction) is also pulled out.

Since the tone control operates the manual power switch, it is necessary to leave the tone control in the "off" position whenever automatic operation by the Station Timer is desired. In the "off" position (refer to Fig. 3), the tone control is set for the same range of frequencies that is available on the "normal" position except for a slight loss in the treble due to the removal of the injector capacitor, C-31.

Station Timer Operating Notes

1. Timer keys cannot easily be pulled out except in advance of the program. Keys may be pushed in at any time, but unless this is done during the first half of the 15-minute interval, the receiver will continue to operate until the conclusion of this 15-minute interval.
2. Receiver will operate normally without clock plug in chassis receptacle. The four-prong plug merely connects the clock switch in parallel with the receiver switch and connects the clock to the power supply.
3. After the Automatic Timer has been used, the keys will automatically reset to their "off" position so that the program will not be repeated at the end of 12 hours unless the keys are again pulled out.
4. Red keys indicate hours.
5. The receiver may be tuned manually or with "Touch-Tuning" at any time during operation without disturbing the Timer Operation.

DIAL MECHANISM

The dial mechanism is rigidly mounted to the chassis by means of two brackets and four self-tapping screws. The gang condenser is operated by means of an "automatic vernier" reduction drive unit, mounted on the receiver chassis, and connected to the gang drive drum by a drive cable. The threading of the various controls is shown in Fig. 2.

ALIGNMENT PROCEDURE

Refer to the Model F-96 service notes for a detailed description of the R.F. and I.F. alignment procedure. A cut showing the trimmer location and alignment frequencies is shown in Fig. 1.

To align the Automatic Frequency Control Circuit, the following method is recommended: after aligning the I.F. at 465 kc.; without disturbing the signal generator setting, apply the 465 kc. from the signal generator lead to the 6A8-G grid capacitively through the insulation of the grid lead.

Tune in a weak broadcast station at about 1000 kc. and, with the AFC switch "off," tune the receiver carefully for "zero" beat between this carrier and the 465 kc. generator signal. Throw the AFC switch on and adjust the 3rd I.F. secondary trimmer (C-17) to zero beat. This adjustment is very critical and must be made with great care. When the alignment is correctly done, there will be no appreciable difference in the beat note with the AFC switch "on" or "off."

Tuning Frequency Range
Band "B" .... 540–1640 kc.
Band "C" .... 1600–5650 kc.
Band "D" .... 5600–18,000 kc.

Intermediate Frequency .... 465 kc.

Electrical Power Output
Undistorted .... 2.5 watts
Maximum .... 5.0 watts

Tone Control 4-position

Physical Specifications
Model G-97
Height .... 41½ inches
Width .... 28¼ inches
Depth .... 14¼ inches
Weight (packed) .... 94 lbs.

Tuning Control Drive Ratio
Fast Tuning .... 10 to 1
Vernier Tuning .... 55 to 1

Loud-speaker—Electrodynamic
Cone 12-inch
Voice Coil Impedance .... 5.5 ohms at 400 cycles

AUTOMATIC STATION TIMER

The Automatic Station Timer is a self-starting, synchronous motor clock which controls a power switch by 48 15-minute intervals. This clock-controlled power switch is connected in parallel with the regular receiver power switch incorporated in the tone control mechanism, allowing the set power to be automatically turned "on" or "off" at a predetermined time. The clock is properly lubricated as it leaves the factory and should require no further attention.

To Set Timer

Pull out the setting knob on the back of the clock and turn it to the left. Rotation to the right will loosen the setting knob.

Model G-97

REPLACEMENT PARTS

The following revisions, in conjunction with the Model F-96 replacement parts list constitute a complete parts list for the Model G-97 receiver. When ordering parts, refer to the RFS-96 service notes, noting the following changes:

Stock No.	Description	List Price	Stock No.	Description	List Price
	Remove			**Add**	
RB-607	BUTTON—Push Button (Pkg. of 5)......	$0.20	RB-615	BUTTON—Touch-tuning Button (Pkg. of 5)......	$0.45
RD-062	DIAL—Dial Scale......	3.50	RD-075	DIAL—Dial Scale......	1.25
RE-023	ESCUTCHEON—Push-button Escutcheon......	.70	RE-034	ESCUTCHEON—Dial Scale Escutcheon..	2.00
RE-024	ESCUTCHEON—Escutcheon for Dial (Complete)......	2.10	RE-035	ESCUTCHEON—Touch-tuning Escutcheon......	.85
RK-017	KNOB—Control Knob (Pkg. of 5)......	.40	RK-027	KNOB—Control Knob (Winged) (Pkg. of 5)	.30
RK-018	KNOB—Control Knob (Winged) (Pkg. of 5)......	.40	RK-028	KNOB—Control Knob (Plain) (Pkg. of 5)	.50
			*RS-204	SOCKET—Tube Socket (5Y3G) (Pkg. of 5)	.75
			RS-865	SCREWS—Escutcheon Screws (Pkg. of 20)	.05

(Prices subject to change without notice)

* Used on previous receivers.

6. Band "B"	580 kc. Modulated	Antenna Post	250 Mmf. 400 Ohms	Osc. Padder (C-18)	Adjust padder for maximum output in vicinity of 580 kc while rocking gang condenser.
7. Band "B"	Repeat operation No. 5				

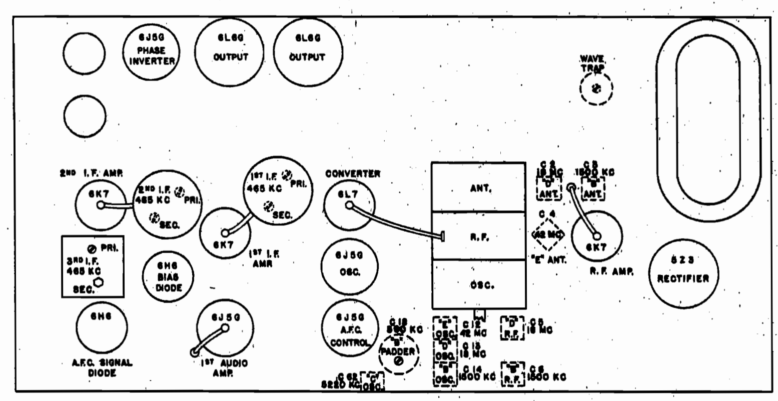

Fig. 9. Chassis Layout and Trimmer Location

ALIGNMENT PROCEDURE

In order to align these receivers properly, it is necessary to have the following test equipment:

1. A modulated test oscillator.
2. An output indicator such as an A-C voltmeter with a scale reading of 3 to 5 volts. A cathode ray oscilloscope is preferred for I.F. alignment.
3. A screw-driver type alignment tool.

The alignment procedure is given in table form along with the trimmer location drawing, Fig. 9. A "dummy antenna" should be used in all alignments and is the capacitor or capacitor and resistor used in series with the signal generator. The grid lead should not be removed from the tube to which the input signal is applied when aligning the I.F. as this would remove the grid bias from the tube.

Automatic Frequency Control Adjustments

After I.F. alignment is completed with output meter, and without disturbing the generator setting, remove the signal generator lead from the grid of the 6L7 converter. Apply the 465 kc. signal to the 6L7 grid capacitively through the insulation of the grid lead.

Tune in a weak broadcast station at about 1000 kc. and, with the A.F.C. switch "off," tune the receiver carefully for "Zero" beat between this carrier and the 465 kc. generator signal. Throw the A.F.C. switch on and adjust the 3rd I.F. secondary trimmer C-31 to zero beat. This adjustment is very critical and must be made with great care. When the alignment is correctly done, there will be no appreciable difference in the beat note with the A.F.C. switch "on" or "off."

Another method of A.F.C. adjustment, after I.F. alignment with an output meter, is to connect a low range voltmeter between the cathodes of the 6H6 discriminator. Leave the signal generator connected to the 6L7 grid and, without disturbing this 465 kc. setting of the signal generator, adjust C-31. It will be noticed that the meter reads plus when C-31 is tuned off resonance on one side and negative when tuned on the opposite side of resonance. The correct adjustment of C-31 is between these positions, when the voltmeter reads zero.

GENERAL INFORMATION

The Model F-135 receiver is a four-band a-c operated receiver employing thirteen General Electric Pre-tested Tubes in a superheterodyne circuit. This receiver incorporates automatic "Touch Tuning" with thirteen station buttons, finger-tip dial "Scan" control, R.F. amplifier, two stages of I.F. amplification, five-point tone control, wave trap and other features of design as described in the following paragraphs.

Receiver Operation

The antenna transformer T-6, used in conjunction with a 6K7 tube, and the R.F. transformer T-4 are the essential elements of the R.F. amplifier. The output from the R.F. amplifier and the output from the 6J5-G oscillator tube are combined in the 6L7 converter tube to give an output frequency of 465 kc. The 465 kc. signal is then amplified by the I.F. amplifier which consists of three double-tuned transformers and two 6K7 tubes. The primary and secondary coils of these transformers are carefully adjusted midway between the points of critical and overcoupling so as to give the I.F. amplifier a broadened band width with a subsequent better fidelity of the received program.

The output of the I.F. amplifier is applied to a 6H6 diode rectifier, which is a combination detector, automatic volume control, and discriminator voltage source for the automatic frequency control tube. A detailed explanation of the A.F.C. will be found in a following paragraph. A second 6H6 diode is used to supply minimum bias to all tubes controlled by the avc. One of the plates (18) of this diode supplies initial bias to the R.F. stage, while the other plate (19) supplies the 6L7 converter and 1st I.F. amplifier with the proper bias. Since the cathodes of the 6H6 are connected to a 3.2 volt point on the bleeder resistance R-40, this allows the avc controlled tubes to have a constant −3.2 volt bias with no signal input. This bias will remain constant until the point at which the avc voltage developed, becomes greater than this −3.2 volts, at which time the bias on these tubes will then be dependent upon the avc developed by the strength of the carrier. The sensitivity is automatically increased on "C," "D," and "E" bands by a section on the band switch which grounds the cathode of the 6K7 1st I.F. amplifier. This ground removes the self bias which is necessary on "B" band to reduce interstation noise.

The volume is controlled by the variable potentiometer (R-22) in the grid circuit of the 6J5-G 1st audio amplifier tube. This tube is resistance coupled to both the 6L6-G output tube and to the 6J5-G phase inverter tube. The phase inverter tube is used to drive the second 6L6-G output tube 180 degrees out of phase with the first 6L6-G. Engineers have carefully balanced this circuit so that the 6L6-G tubes are operating push-pull into the output transformer which they designed to correctly load these tubes over the entire audio range of frequencies.

This careful balance together with controlled negative feed back enables the two 6L6-G tubes to deliver ample undistorted power output to the twelve-inch electrodynamic speaker.

TONE CONTROL

Negative feed back is used to control the quality and tone of reproduction. The frequency response of the audio circuit is varied by the tone control switch and its associated network as follows:

In the "Normal" position, voltage from the voice coil is fed back through R-29, R-21 and C-46 to a tap on the volume control. The tone control switch S-11 is in No. 1 position and does not make any connection with the circuit. Engineers have carefully chosen the value of R-29 and C-46 so that the negative feed back voltage holds down the "boom" caused by pentode output and speaker resonance. This arrangement improves the quality and response to an external range of both high and low frequencies.

No. 2 is the "Bass" position. The long arm of S-11 (Fig. 7) grounds C-38 thus connecting this capacitor across the volume control and limiting the high frequency input to the audio amplifier. The negative feed back circuit is the same as used in the "Normal" position. The result is the true reproduction of a wide range of low frequencies without the "boom" at speaker resonance.

The "Treble" position is No. 3 where high frequencies are injected into the second tap on the volume control. It should be noted that C-38 is removed from the circuit, and the short arm on S-11 (Fig. 7) connects C-39 across the top part of the volume control thus increasing the higher frequencies present in the lower portion of R-22. The shorting bar of S-11 across No. 2 and No. 3 connects R-30 in parallel with R-21 and C-46. This allows more degeneration of the lower frequencies. The result is improved quality with a nearly flat low frequency response and a very much extended high frequency range.

In the "Foreign" position No. 4 highs are again limited by C-38. The shorting bar across contacts No. 3 and No. 4 shorts out R-21 and C-46 thus leaving only R-29 in the feed back circuit. Because of the limiting of highs by C-38 and more degeneration of lows by the feed back circuit, a middle range response is obtained. This position may be used to reduce noise and to reduce bass response on programs which predominate in low frequency tones.

C-38 is removed from the circuit in the "Speech" position. R-21 and C-46 are shorted out of the feed back circuit. R-29 is left in the circuit to limit the amount of feed back voltage. This arrangement gives improved quality and flat response to the entire audio range of frequencies.

It should be noted that on "C," "D," and "E" bands contacts No. 13, 14, and 15 of the band switch S-1 short out R-21 and C-46 so that the feed back circuit provides flat degeneration at all times. This reduces the possibility of howl on short waves due to excessive vibration of the chassis on low frequency notes.

COIL SYSTEM

The antenna coils for three bands are wound on a single form designated as T-6. The R.F. coils T-4 and the oscillator coils T-5 are constructed on two separate forms. The "E" band antenna and oscillator coils are each supported on separate forms. All contacts on the band switch are numbered in Fig. 7 and Fig. 8 to facilitate tracing the coil circuits.

The band switch connects the coils to operate as follows:

	Primary	Secondary	Remarks
Ant.			
"B"	L-6	L-4 & L-5	
"C"	L-3	L-4	L-5 shorted
"D"	L-2 & L-3	L-1	L-4 & L-5 shorted
"E"	L-22	L-23	Coupled directly to 6L7
R.F.			
"B"	L-11	L-14 & L-15	
"C"	L-11	L-14	L-15 shorted and C-56 connected across L-11, L-14, & L-15 shorted
"D"	L-11	L-10	
"E"	....	....	R.F. 6K7 grid shorted L-10, L-14, & L-15 shorted
Osc.			
"B"	L-21	L-20	
"C"	L-19	L-18	Connects B+ lead to L-20
"D"	L-17	L-16	Connects B+ lead to L-18 & L-20
"E"	L-24 & L-26	L-25	Connects B+ lead to L-16, L-18, & L-20

On "D" band contact, No. 7 is used to provide a ground for the General Electric noise reducing antenna systems KV-300 and FT-40. Contacts No. 4, 5, and 6 short out R-37 on "C," "D," and "E" bands. This removes the self bias from the 6K7 1st I.F. amplifier and thus increases the sensitivity of the receiver on short wave bands.

Contacts No. 13, 14, and 15 short out the selective portion of the negative feed back circuit as explained under tone control.

DIAL MECHANISM

(A) Manual drive leather faced bevel gear
(B) Beveled idler gear
(C) Tuning shaft gear
(D) Volume control drive cord pulley
(E) Band switch drive cord pulley

Tuning mechanism diagram (Fig. 1) is self-explanatory. The tuning condenser drive cord can be easily replaced without removing *any* part of the chassis while all dial indicating control cords are made readily accessible for servicing by merely removing the seven small screws holding the dial reflector assembly.

AUTOMATIC FREQUENCY CONTROL

The Automatic Frequency Control used in this receiver shifts the oscillator frequency so that the correct intermediate frequency is always produced.

The essential elements are the discriminator-transformer T-9, the twin diode 6H6 with its balanced discriminator network, and the 6J5-G control tube connected across the broadcast oscillator plate coil.

The discriminator transformer is designed to deliver (when properly tuned to 465 kc.) equal voltages to each section of the 6H6. Under this condition the voltage drop across R-15 is equal and opposite to the voltage across the

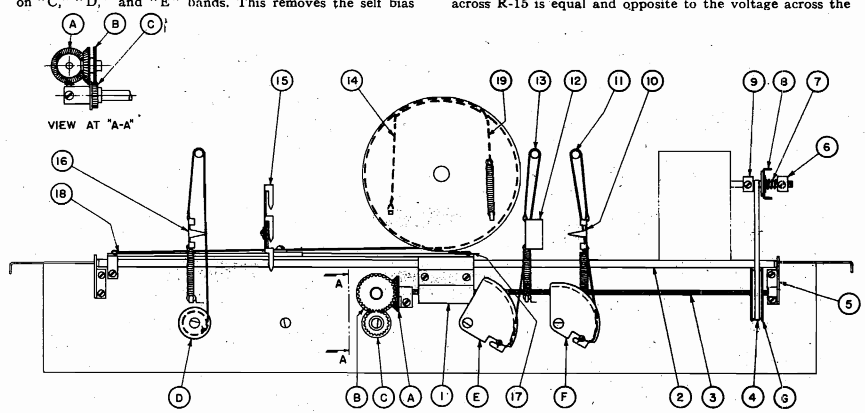

Fig. 1. Dial Mechanism

GENERAL ELECTRIC CO.

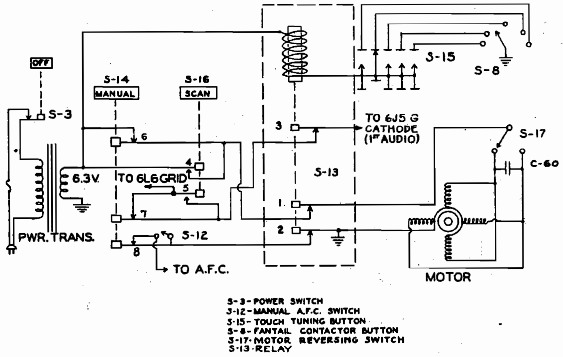

Fig. 2. Schematic of "Touch Tuning" System

total resistance of R-16, R-17, and R-18, thus no discriminator voltage is produced to control the 6J5-G tube.

However, if the signal frequency is increased above 465 kc. unequal voltages are applied to the diodes, and the voltage over R-15 is greater than the voltage over the combined resistance of R-16, R-17, and R-18. The difference of these two voltages is positive and is applied to the 6J5-G control tube.

When the signal frequency is decreased below 465 kc. the result is less voltage over R-15 and a greater voltage over the combined resistances R-16, R-17, and R-18. The difference of these two voltages, as applied to the 6J5-G control tube, is negative.

Thus three conditions arise:

On resonance, no discriminator voltage developed
Above 465 kc., a positive control voltage
Below 465 kc., a negative control voltage

The 6J5-G A.F.C. control tube has a combination of self and fixed bias, the latter being the result of the current supplied through R-10 and R-11 to the cathode resistor R-9. The R.F. voltage applied to the control grid of the 6J5-G is obtained from the drop across the C-18 series padder and C-19. The vector sum of these two voltages is applied to the phase-shifting network C-20 and R-8 and in turn to the control grid. This phase-shifting network causes the control tube to appear as a reactance in parallel with the oscillator coil. The value of the apparent reactance depends upon the control voltage produced by the discriminator.

When the set is mistuned above the incoming signal the converter output is above the 465 kc. required. A positive discriminator voltage is produced as explained above. This causes the 6J5-G tube to act as more capacitive reactance and thus lowers the oscillator frequency; this gives a lower converter output frequency, approximately 465 kc.

When the set is mistuned below the incoming signal, the converter output is below the 465 kc. required. A negative discriminator voltage is produced as explained above. This causes the 6J5-G to act as less capacitive reactance thus increasing the oscillator frequency. This in turn gives a higher converter output frequency approximately 465 kc.

TOUCH TUNING

"General Electric Touch Tuning" consists of three essential units: the push-button assembly of sixteen buttons, used by the operator for control; the motor and relay assembly, operating in conjunction with the buttons to provide fast and accurate tuning; and the contact segment with its sliding contactor and adjustable contacts enabling selection of thirteen different stations to be tuned automatically.

Of the sixteen push-buttons, thirteen are used for station selection. The other buttons are used for "Manual" control (No. 8), "Scanning" (No. 15), and "Off" (No. 16). Depression of any button except No. 15 will lock the depressed button and release any other that may be in circuit. Thus the selection of any station button or of "Manual" will release the "Off" switch, turning the set on.

The tuning motor is operated as a capacitor type squirrel-cage induction motor, with capacitor C-60 as the phase-shifting device. By tracing the motor circuit it will be seen that C-60 is in series with one set of poles when the motor reversing switch is in the position shown in Fig. 2. When the switch S-17 is reversed, the capacitor C-60 is in series with the opposite set of poles. This causes the motor field to rotate in the opposite direction with the resultant change in motor rotation.

The motor power is supplied from the tube heater circuit through "Manual" switch (contact No. 6), the relay (contact No. 1) and the motor reversing switch (S-17) with the chassis as common return. It will continue to run until the sliding contactor (S-8) contacts the stud on the contact segment which is connected to the button in circuit. When this contact is made, the relay field coil is energized, causing the relay to open the motor circuit (contact No. 1). At the same time, the relay arm also engages the motor clutch, causing instantaneous stopping of tuning mechanism travel. Depression of another station button causes another similar cycle.

Pressing the "Manual" button (No. 8) releases any depressed button. Thus S-15 is opened and the relay field coil can not be energized. Contact No. 6 opens the motor circuit.

With the receiver set for "Manual" operation, depression of the "Scan" button closes the motor circuit by the shunting of contact No. 6 on the "Manual" switch, allowing continuous motor operation and dial travel. As the motor drives to the dial limits on either end, S-17 is automatically thrown causing reversal of motor rotation.

During periods of motor operation, either for automatic station selection or for scanning, the grid of the 6L6-G is shorted to the common cathode connection of the first audio and phase inverter tubes. This "silent tuning," accomplished by relay contact No. 3 in the former case, or scan button contact No. 5 in the latter, avoids reception of unwanted stations or interstation noise when tuning automatically or by means of the "Scan" button.

The use of automatic frequency control on "Manual" is made optional by the A.F.C. switch. When any one of the thirteen "Touch Tuning" buttons is depressed, circuit is made through contact No. 8 on S-14 and is completed through relay contact No. 2, thus removing A.F.C. while the motor is in operation. When the station is reached, the relay opens contact thus removing the ground on the A.F.C. circuit. *The A.F.C. is automatically turned on when "touch tuning" is being used.*

REMOTE CONTROL

There are ten leads in the "Remote Touch Tuning Control" cable. These leads serve the following functions:

The No. 1 and No. 2 leads are connected to the octal base adapter and serve to connect the silencing button to the output tube.

The No. 3 to No. 9 leads correspond to the button numbers and, with the No. 10 lead, provide the selection of stations from the remote control unit. These leads are to be connected to pins on the contact segment on the rear of the chassis.

Remove the least desirable station's letters from one of the "Touch Tuning" buttons of the receiver and insert the "Remote" tab. Note the number of this button as marked on the escutcheon.

Remove from a pin on the contact segment on the receiver, the lead which bears this number, and connect it to the No. 10 lead from the remote control cable, Fig. 3.

(The pin on the contact segment from which this lead was removed is left vacant.)

Now note the number of a receiver push button which bears the same call letters as a remote unit button. Remove the lead with this number from the pin on the contact segment. Connect to this pin the lead from the remote cable which corresponds to the above-mentioned remote unit button. Fasten the lead with a hex nut and tighten lightly with a pair of pliers or small wrench. Now reconnect the original lead to the pin. Proceed in the same manner until the seven remote button leads are connected.

There are three glass tubes in a row along the back of this receiver. Remove the center one of these tubes which is a 6L6-G and place the adapter in the socket. Insert the 6L6-G in the adapter.

When the "Remote Touch Tuning Control" unit is connected, as explained above, the action is identical with that of the regular station selection circuit. The remote button unit is in series with the "Remote" button lead on the receiver through lead No. 10 of the remote unit cable. The relay field coil circuit is completed through the set "Remote" button (S-15); the common (No. 10) lead; the depressed control button; its lead to a pin on the contact segment, and to ground through the sliding contactor. *The "silent" button must be in the released position when operating the receiver from either the remote control unit or from the receiver controls, otherwise no audio output will be obtained.*

RELAY ADJUSTMENTS

The following adjustments should be made with relay assembled on the motor bracket, Fig. 4.

(1) Make sure contacts are adjusted to open in correct sequence: center contacts (motor) first, contacts furthest from armature (AFC) second, contacts nearest armature (silent tuning) last. *It is very important that the silent tuning switch open last.*

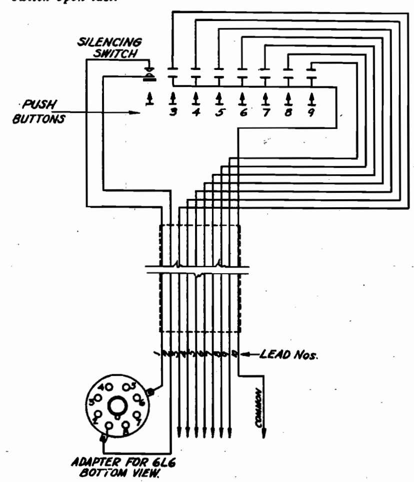

Fig. 3. Schematic of Remote Control

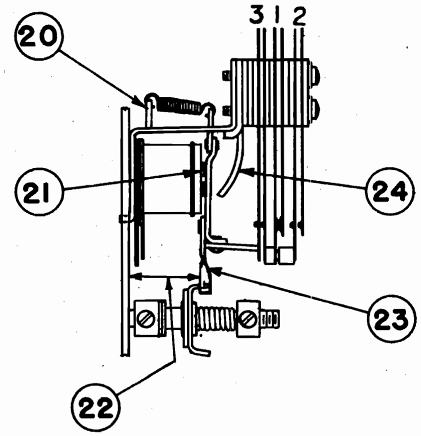

Fig. 4. Relay

(2) Adjust backstop (24) so that the armature snaps closed when the relay coil is energized with 4.5 volts A.C. The backstop must make a positive contact with the back of the armature in the open position; otherwise sluggish operation of the relay will result which will cause the motor drive to skip buttons. If the relay will not close at 4.5 volts and still maintain proper travel and sequence, weaken the spring on the rear of the armature plate by bending the stationary spring support (20).

(3) Loosen the setscrew on the motor shaft collar nearest motor (9) and adjust collar so that the pulley dog (8) misses the relay armature extension by .001 in. (relay not energized). All contacts must be closed when the relay armature touches the end of the motor dog; if the motor contacts open in this position, the armature will chatter.

(4) Spring adjustment (7) on slip clutch should be just tight enough so as not to allow slippage when driving the dial mechanism. Loosen setscrew on outside shaft collar (6) and screw the collar on the shaft to tighten slip clutch.

(5) The pole piece of the relay coil is divided in two semi-circles. The relay armature should only touch the pole segments towards the motor shaft. There should be a .001 in. clearance between the back segment (21) and the armature when closed; otherwise a buzzing will be heard. Sometimes a front pole segment that is not perfectly flat will cause the same trouble. File off the offending bump.

(6) Backstop setting should be such that the distance (22) is 26/32 in. with the relay closed and 29/32 in. with the relay open.

(7) Spacing between relay contact points when open should be .015 to .018 inches for contact No. 1, and .008 to .010 inches for contact No. 2 and No. 3.

INCORRECT OPERATION AND SUGGESTED REMEDIES

Skipping of Stations

(a) "Touch Tuning" buttons' leads not making good contact to adjustable contact pins. Clean contacts and reinsert.

(b) Sliding contactor blade either covered by thin piece of bakelite or dirty. Carefully run fine file over top of sliding contactor, making sure not to leave any sharp corners. Sliding contactor should have small amount of vaseline on beveled surface to prevent chattering.

(c) Nipple too sharp on adjustable contacts will cause sliding contactor blade to jump across. Smooth off with fine sandpaper.

(d) Relay armature out of adjustment causing sluggish operation of relay switch. See paragraph 2 under Relay Adjustments.

GENERAL ELECTRIC CO.

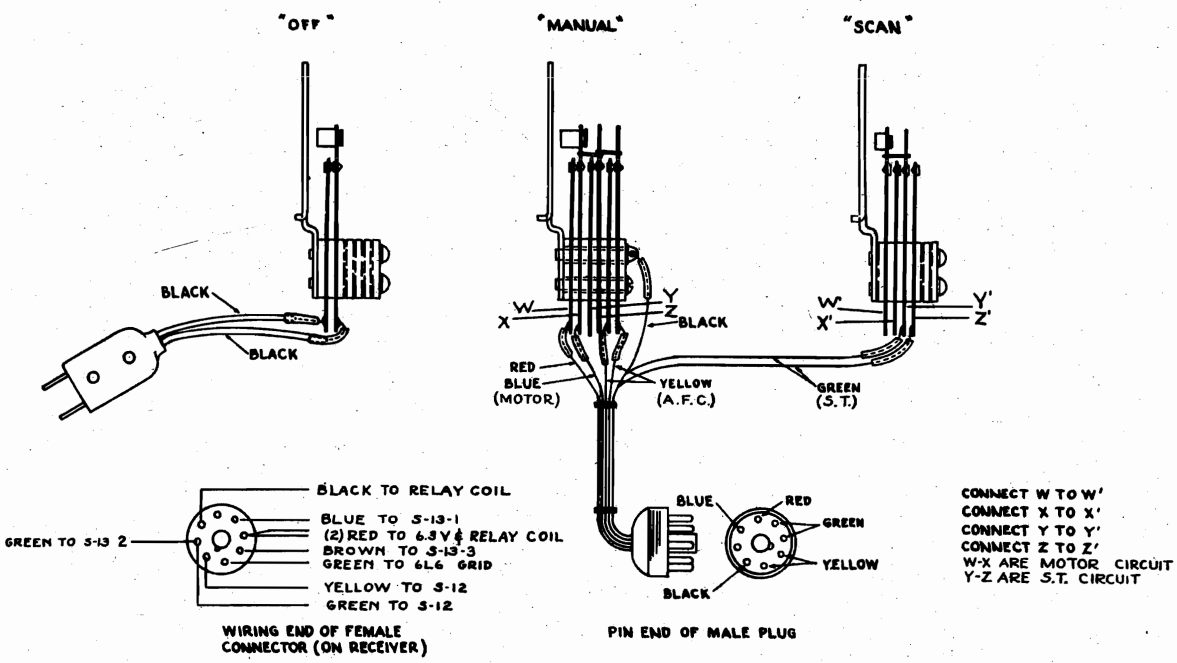

Fig. 5. Wiring Diagram of "Off," "Manual," and "Scan"

(e) Excessive side play in sliding contactor. Loosen the setscrew on the back of the sliding contactor and slide holder together. Final adjustment should allow sliding contactor to rock freely.

(f) Not enough tension on sliding contactor arm. Loosen collar on shaft in rear of contact segment and move sliding contactor arm towards the contactor segment; then tighten collar on shaft.

(g) If the contacts at the rear of the "Touch Tuning" button assembly shafts do not close or make good contact, the motor will continue to scan the dial without stopping at the desired station.

(h) Contact segment may be bent out of shape. This should be perpendicular to chassis deck and parallel to rear chassis apron in order to allow the contactor arm to wipe the adjustable contacts evenly.

No Action When Station Button Is Pressed

(a) Relay remains energized and audio continues to function—push-button escutcheon grounded. Be sure dial and push-button escutcheons are insulated from each other or from the control shafts.

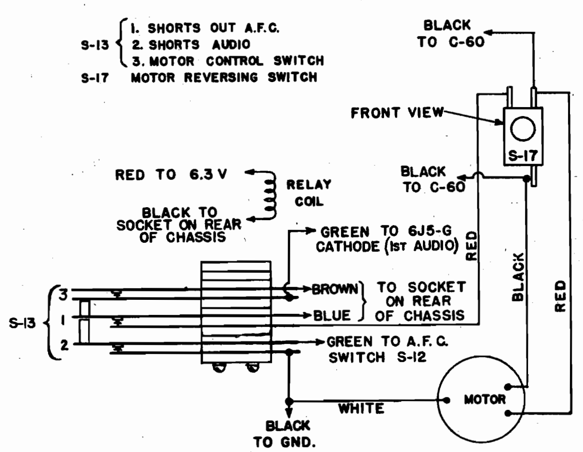

Fig. 6. Motor Relay Wiring Diagram

(b) "Off" switch contacts do not close.

(c) If set does not tune automatically unless scan button is also depressed, contacts No. 6, Fig. 2, require closer spacing.

(d) Open or shorted motor capacitor—Characterized by motor armature humming but no torque. Replace 1000 mfd. capacitor C-60.

(e) Open or shorted coil in motor—Characterized by no torque or low torque in one direction. Replace motor or repair coil.

(f) Drive mechanism bound, or too tight for motor to drive.

(g) Not enough friction in Slip Pulley—The friction of the slip pulley is adjusted by tightening the collar on the end of the motor shaft. Care should be exercised that the setscrew does not hit the relay armature.

(h) Belt slippage—The tension of the belt may be increased by raising the motor on the relay bracket. If the belt still slips, reverse belt and use other surface or use belt dressing.

Miscellaneous Adjustments

(a) When a "Touch Tuning" button will not remain in a locked position, it usually indicates that the springs at each end of the latch bar are not in proper adjustment. They should exert an equal pull on each end.

(b) The fork on the tuning condenser should be adjusted so that the motor reversing switch clicks over when the pointer approximately reaches the 540 and 1620 kc. markings on the dial scale. With the pointer at the extreme end of calibrations when tuning manually, the reversing switch lever should be set so there is not more than 1/16 inch nor less than 1/32 in. clearance between the lever and the switch trigger after the switch has snapped.

(c) The motor and relay mounting plate should rest parallel to the chassis deck. Do not adjust the spring tension foot; raise or lower motor on bracket, as required. Make sure that there is no electrical connection between the motor frame and the chassis.

(d) The "Off" switch on the "Touch Tuning" assembly should stay closed for at least one-half the movement of the key, opening only on the final click. If firm contact does not exist between the points, vibration of the set may cause an intermittent noise.

(e) The silent tuning contacts of the "Manual" and "Scan" switches should open last to permit quiet operation.

RC-651	CAPACITOR—Double trimmers (2-20 mmf.) (C-5, C-6)	.25
RC-654	CAPACITOR—Double trimmers, pri. and sec., 1st or 2nd I.F. transformer (C-26, C-27, C-28, C-29)	.45
RC-655	CAPACITOR—Double trimmers, pri. and sec., 3rd I.F. transformer (C-30, C-31)	1.55
RC-660	CAPACITOR—"E" band ant. trimmer (50-120 mmf.) (C-4)	.20
RC-661	CAPACITOR—Triple trimmer (C-12, C-13, C-14)	.60
RC-662	CAPACITOR—"B" band padder (140-280 mmf.) (C-18)	.25
RC-719	CONDENSER—3-gang tuning condenser (C-1)	5.15
*RC-755	CAPACITOR—Line capacitor .01-.01 mfd., 250 V. A.C. (C-54, C-55)	.40
*RC-863	CORD—Power cord with plug	.65
*RC-992	CUSHION—Condenser mtg. cushion assembly (Pkg. of 5)	.15
RC-8015	CABLE—Speaker cable with female plug	.60
RC-8028	CARDS—Station letter cards (set)	.35
*RF-301	FUSE—3 amp. fuse (Pkg. of 10)	1.00
*RG-001	GRID CAP—Control grid cap (Pkg. of 5)	.10
RK-017	KNOB—Volume and tone control knobs (Pkg. of 5)	.40
RK-018	KNOB—Band and A.F.C. switch knobs (Pkg. of 5)	$0.40
RK-021	KNOB—Manual tuning knob (Pkg. of 5)	.50
RL-050	COIL—Ant. coil "B," "C," and "D" bands (T-6)	1.40
RL-051	COIL—Ant. coil "E" band (L-22 and L-23)	1.10
RL-138	COIL—R.F. coil "B," "C," and "D" bands (T-4)	1.05
RL-254	COIL—Osc. coil "B," "C," and "D" bands (T-5)	1.60
RL-255	COIL—Osc. coil "E" band (L-24, L-25 and L-26)	1.05
RL-334	REACTOR—Filter choke (L-8)	1.40
RP-078	PLATE—Fuse cover plate	.10
RQ-1243	RESISTOR—220 ohm, ½ watt carbon (R-3) (Pkg. of 5)	.70
RQ-1247	RESISTOR—330 ohm, ½ watt carbon (R-6, R-8) (Pkg. of 5)	.70
RQ-1255	RESISTOR—680 ohm, ½ watt carbon (R-32) (Pkg. of 5)	.70
RQ-1257	RESISTOR—820 ohm, ½ watt carbon (R-9) (Pkg. of 5)	.70
RQ-1259	RESISTOR—1000 ohm, ½ watt carbon (R-41, R-42) (Pkg. of 5)	.70
RQ-1269	RESISTOR—2700 ohm, ½ watt carbon (R-37) (Pkg. of 5)	.70
RQ-1271	RESISTOR—3300 ohm, ½ watt carbon (R-13, R-36) (Pkg. of 5)	.70
RQ-1275	RESISTOR—4700 ohm, ½ watt carbon (R-29) (Pkg. of 5)	.70
RQ-1281	RESISTOR—8200 ohm, ½ watt carbon (R-25) (Pkg. of 5)	.70
RQ-1291	RESISTOR—22,000 ohm, ½ watt carbon (R-30) (Pkg. of 5)	.70
RQ-1299	RESISTOR—47,000 ohm, ½ watt carbon (R-4, R-14) (Pkg. of 5)	.70
RQ-1303	RESISTOR—68,000 ohm, ½ watt carbon (R-2, R-23, R-26) (Pkg. of 5)	.70
RQ-1307	RESISTOR—100,000 ohm, ½ watt carbon (R-18, R-31, R-33) (Pkg. of 5)	.70
RQ-1309	RESISTOR—120,000 ohm, ½ watt carbon (R-24, R-28) (Pkg. of 5)	.70
RQ-1313	RESISTOR—180,000 ohm, ½ watt carbon (R-16, R-21) (Pkg. of 5)	.70
RQ-1315	RESISTOR—220,000 ohm, ½ watt carbon (R-1, R-17) (Pkg. of 5)	.70
RQ-1317	RESISTOR—270,000 ohm, ½ watt carbon (R-20) (Pkg. of 5)	.70
RQ-1323	RESISTOR—470,000 ohm, ½ watt carbon (R-7) (Pkg. of 5)	.70
RQ-1324	RESISTOR—510,000 ohm, ½ watt carbon (R-15) (Pkg. of 5)	.70
RQ-1331	RESISTOR—1 megohm, ½ watt carbon (R-5, R-34) (Pkg. of 5)	.70
RQ-1339	RESISTOR—2.2 megohm, ½ watt carbon (R-19) (Pkg. of 5)	.70
RQ-1471	RESISTOR—3300 ohm, 1 watt carbon (R-10, R-35)	.20
*RQ-1499	RESISTOR—47,000 ohm, 1 watt carbon (R-11)	.20
RR-732	RESISTOR—Tapped bleeder resistor (R-40)	.60
RR-1004	RESISTOR—230 ohm, 1½ watt moulded (R-30)	.15
*RS-139	SHIELD—3rd I.F. transformer shield	.20
RS-175	SHIELD—1st or 2nd I.F. transformer shield	.25
*RS-200	SOCKET—8 pin tube socket (Pkg. of 5)	.75
RS-217	SOCKET—4 prong tube socket (Pkg. of 5)	.50
RS-221	SOCKET—8 pin socket (push-button control cable receptacle) (Pkg. of 5)	.60
RS-223	SOCKET—8 pin socket for osc. and converter (Pkg. of 5)	.80
RS-356	SWITCH—Manual A.F.C. switch (S-5)	.40
RS-368	SWITCH—Tone control switch (S-11)	$0.70
RS-369	SWITCH—Band change switch (S-1 to S-10)	2.85
RT-134	TRANSFORMER—Power transformer 110-130 V.; 50-60 cycles (T-1)	8.50
RT-135	TRANSFORMER—Power transformer 110-130 V.; 25-60 cycles (T-1)	13.95
RT-246	TRANSFORMER—1st or 2nd I.F. transformer (complete) (T-7, T-8)	1.80
RT-247	TRANSFORMER—3rd I.F. transformer (complete) (T-9)	3.95
RV-033	VOLUME CONTROL—2 megohm, volume control, tap at 5000 ohms and 500,000 ohms (R-22)	1.05
*RW-101	WASHER—Felt washer for knobs (Pkg. of 10)	.45
RW-404	WAVE TRAP—Wave trap complete	.70
RX-027	ASSEMBLY—Chassis mounting assembly	.15
	DIAL SCALE ASSEMBLY	
RC-868	CORD—Band indicator, tone control and volume control pointer cord (Pkg. of 5)	.60
RC-8012	CABLE—Tuning drive cables (Pkg. of 5 pairs)	.55
RD-054	DRUM—Condenser drive drum	.30
RD-059	DIAL—Dial scale assembly	3.70
RE-017	ESCUTCHEON—Dial escutcheon plate complete	1.95
RL-920	LAMP—Dial lamp 6.3 volt .25 amp. (Pkg. of 10)	1.50
RP-079	PULLEY—Volume control cord drive pulley	.15
RP-080	POINTER—Volume or tone control pointer (Pkg. of 5)	.15
RP-083	PULLEY—Band switch cord drive pulley	.10
RP-084	PULLEY—Tone control cord drive pulley	.10
RP-089	POINTER—Dial scale pointer (includes support) (Pkg. of 5)	.60
RP-090	POINTER—Band change indicator (Pkg. of 5)	.90
RR-911	REFLECTOR—Lamp reflector	.75
RS-222	SOCKET—Lamp socket assembly	.45
*RS-401	SPRING—Tuning drive cord tension spring (Pkg. of 2)	.20
RS-427	SPRING—Volume, tone or band indicator cord tension spring (Pkg. of 5)	.20
RW-016	WINDOW—Escutcheon window and cushion	.30
	AUTOMATIC DRIVE AND MOTOR ASSEMBLY	
RA-404	ARM—Motor reversing switch arm (on gang condenser shaft)	.15
RB-156	BRACKET—Guide and spiral rod bracket, includes bearing (motor end)	.10
RB-157	BRACKET—Spiral rod bracket with bearing (manual tuning end)	.10
RB-605	BELT—Motor belt	.25
RG-010	GEAR—Manual drive beveled idler and tuning shaft gear	.40
RG-011	GEAR—Manual drive leather faced bevel gear	.20
RM-104	MOTOR—25-cycle automatic tuning motor (motor only)	4.45
RM-105	MOTOR—50-60-cycle automatic tuning motor (motor only)	4.05
RP-085	PULLEY—Spiral drive rod pulley (belt driven)	.15
RR-912	RIDER—Spiral drive rod rider	.30
RR-913	ROD—Pointer slider guide rod	.15
RR-914	SPIRAL ROD—Tuning, pointer spiral drive rod	.25
RR-915	RELAY—50-60-cycle relay (complete)	$2.85
RR-917	RELAY—25-cycle relay (complete)	3.10
RS-359	SWITCH—Tuning motor reversing switch (Operated by gang cond. shaft) (S-17)	.70
RS-429	SPRING—Motor relay armature spring (Pkg. of 2)	.20
RS-505	SLIDER—Dial pointer slider assembly	.70
RS-908	SHAFT—Manual tuning shaft (shaft only)	.05
RX-028	ASSEMBLY—Motor clutch assembly (complete)	.30
RX-029	ASSEMBLY—Drive motor mounting cushions and screws	.15
	STATION SELECTOR ASSEMBLY (Behind Tuning Condenser)	
RC-1962	COLLAR—Contactor shaft collar	.10
RC-1963	SLIDING CONTACTOR—Bakelite mounted rotating contactor and holder	.40
RC-1964	CONTACT—Thumbscrew contact (complete) (Pkg. of 10)	.95
RI-103	INSULATORS—Insulators and washers (thumbscrew contact) (Pkg. of 10)	.05
RP-067	PLATE—Contactor mounting segment	.55
RU-002	COUPLING UNIT—Flexible coupling with contactor arm	.75
RW-106	WICK—Wick assembly (Pkg. of 5)	.50
	PUSH BUTTON AUTOMATIC TUNING MECHANISM	
RB-064	2 TERMINAL BOARDS—Terminal strips (7 terminals)	.40
RB-065	TERMINAL BOARD—Terminal strip (6 terminals) (long)	.20
RB-068	TERMINAL BOARD—Terminal strip (short) (6 terminals)	.20
RB-606	LATCH BAR—Push button mechanism latch bar	.10
RB-607	BUTTON—Molded push button (Pkg. of 5)	.20
RC-1965	CLAMP—Push button cable clamp (Pkg. of 10)	.10
RC-1966	CONTACTOR CLIP—Clip and insulator (on leads from terminal strip) (Pkg. of 5)	.15
RC-8013	CABLE—"Off," "Manual," "Scan" switch cable with plug	.65
RE-018	ESCUTCHEON—Touch tuning button escutcheon plate	1.50
RI-104	INSULATOR—Insulator between key and switch blade (manual and off switches) (Pkg. of 5)	.15
RI-105	INSULATOR—Insulator between key and switch blade (scan switch) (Pkg. of 5)	.10
RI-107	INSULATOR—Escutcheon separating insulators (Pkg. of 10)	$0.05
RK-200	KEY—Push button key (Pkg. of 5)	.15
*RP-026	PLUG—A.C. line connector female plug	.45
*RP-027	PLUG—A.C. line connector male plug	.45
RS-361	SWITCH—Tuning control switch (3 section) "Off," "Manual," "Scan" (complete) (S-14, S-16)	1.10
RS-430	SPRING—Latch bar spring (Pkg. of 5)	.10
RS-431	SPRING—Key spring and staple (Pkg. of 5)	.05
RS-506	SPACER—Contact point spacer (fiber) (Pkg. of 10)	.05
RW-017	WINDOW—Push button celluloid window (Pkg. of 25)	.10
RW-105	WASHER—Fiber washer on push button key (Pkg. of 10)	.05
RX-031	ASSEMBLY—Push button assembly (complete)	9.50
	SPEAKER ASSEMBLY	
RC-925	CONE—Cone and voice coil	1.25
*RC-991	CLAMP—Cone spider clamp and screw	.05
RP-058	PLUG—Speaker plug	.20
RS-062	SPEAKER—12-in. type speaker (complete)	8.30
*RS-416	SPRING—Voice coil leads spring (Pkg. of 2)	.10
RT-431	TRANSFORMER—Output transformer (T-2)	2.30
RX-030	ASSEMBLY—Speaker mounting bushings and nuts	.10
	REMOTE CONTROL UNIT	
RA-551	ADAPTER—Adapter socket	.75
RB-075	BOARD—Terminal board (9 terminals) (top)	.25
RB-076	BOARD—Terminal board (9 terminals) (bottom)	.25
RB-607	BUTTON—Moulded push button (Pkg. of 5)	.20
RB-608	LATCH BAR—Latch bar for keys	.10
RC-1970	CLAMP—Remote cable clamp	.05
RC-8023	CABLE—Flat cable (10 leads)	6.90
RK-201	KEY—Push button key	.10
RK-202	KEY—Push button key (silent)	.10
RS-430	SPRING—Latch bar spring (Pkg. of 5)	.10
RS-431	SPRING—Key spring and spacer (Pkg. of 5)	.10
RT-950	TERMINAL—Terminal for No. 10 lead (Pkg. of 5)	.05
RT-951	TERMINAL—Terminal on leads No. 1 to No. 9 and rubber insulator (Pkg. of 5)	.05
RW-017	WINDOW—Push button celluloid window (Pkg. of 25)	.10

Automatic Record
Changer Adjustments

GENERAL ELECTRIC CO.

ADJUST AND TIGHTEN NUT SO AS TO PROVIDE APPROXIMATELY 1/32 INCH BETWEEN SLOT IN LINK AND SCREW, WHEN BUMPER IS IN CONTACT WITH STOP BRACKET.

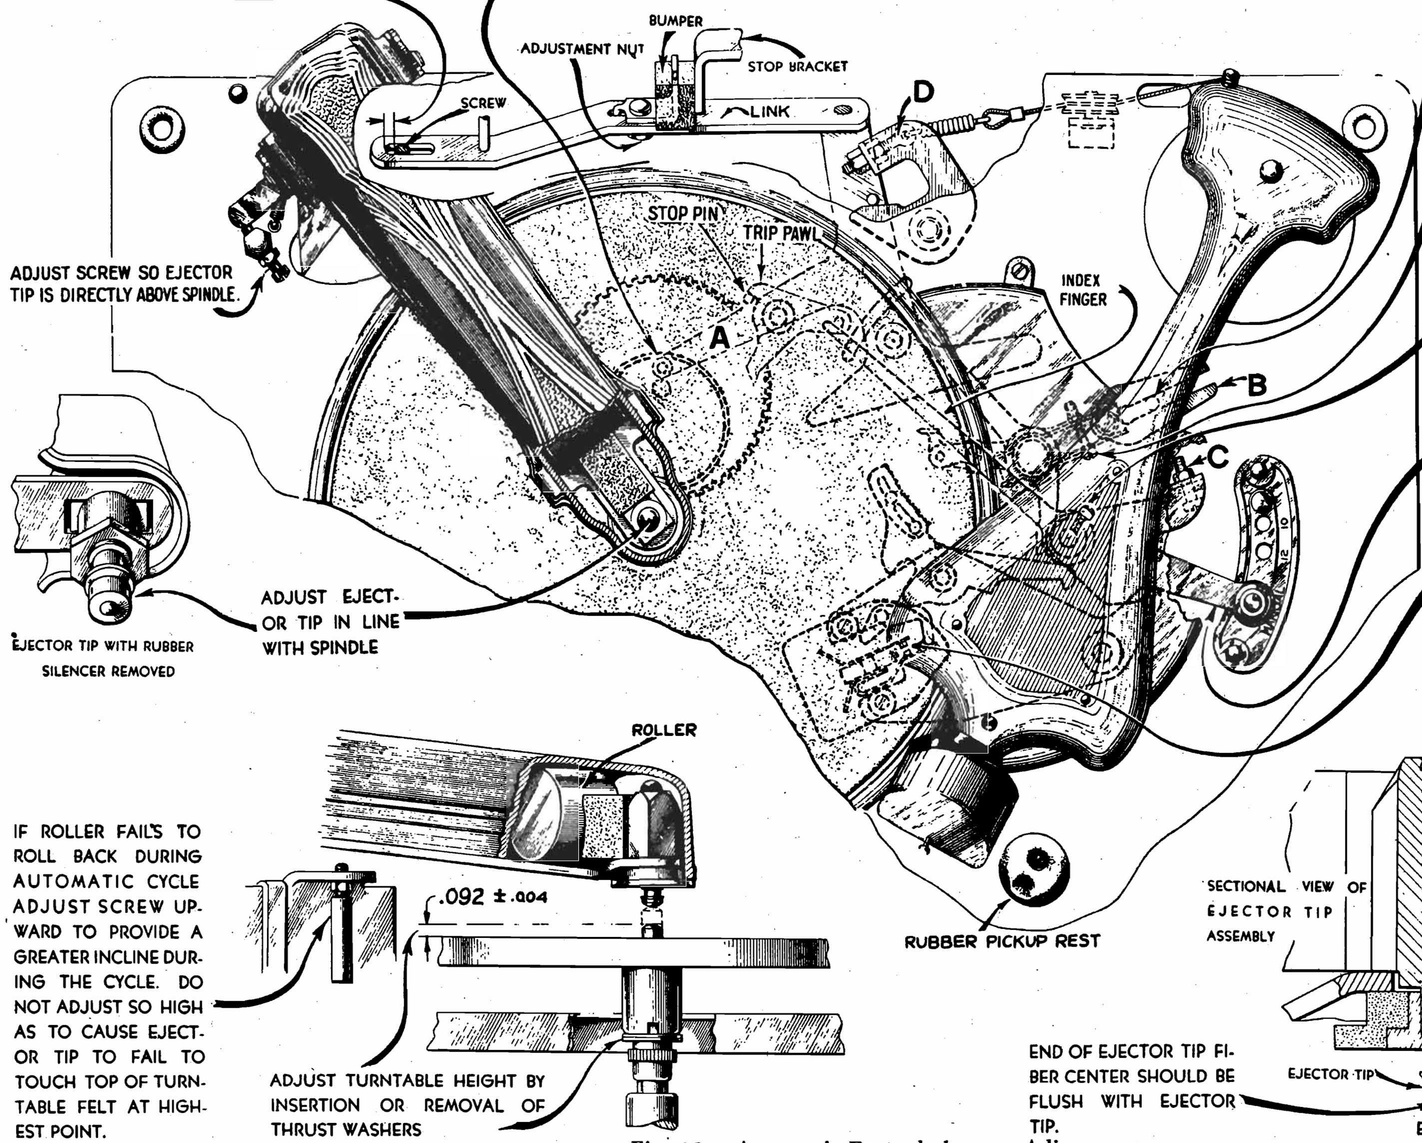
TO ADJUST RISE AND SWING OF TONE ARM:—WITH MANUAL INDEX LEVER IN 12" POSITION AND ROLLER ON MAIN LEVER **A** ENGAGED IN CAM AT HALF CYCLE POSITION AS SHOWN, AND SWITCH LEVER **B** IS AGAINST STOP SCREW **C**, ADJUST EYEBOLT **D** SO NEEDLE POINT (ORANGE SHANK) IS 1 1/16" + 1/32" − .000 ABOVE TURNTABLE FELT. AT THE SAME TIME ADJUST SCREW **C** SO THAT NEEDLE LANDS AT A RADIUS OF 5 13/16" + 1/16" − .000 FROM CENTER OF TURNTABLE SPINDLE. THIS ADJUSTMENT CAN BE FACILITATED BY USING 7 TWELVE-INCH RECORDS (NOT WARPED) WHICH MEASURES 11/16" TOTAL, AND ADJUSTING RISE TO 3/8" TO 13/32" ABOVE RIM OF TOP RECORD. LANDING RADIUS 5 13/16" + 1/16" − .000.

ADJUST NEEDLE HEIGHT BY MEANS OF TRIP ROD UNTIL NEEDLE POINT OF AN "ORANGE SHANK" NEEDLE IS 1/16 +.010 INCH BELOW TOP SURFACE OF THE RUBBER PICKUP REST.

ADJUST SCREW UNTIL FRICTION WILL JUST FORCE FINGER TO MOVE TRIP PAWL. (WITH COVER REMOVED)

TO ADJUST MANUAL INDEX FINGER - PLACE MANUAL INDEX LEVER IN THE POSITION SHOWN - SET MANUAL INDEX FINGER TO FORCE TRIP PAWL AGAINST STOP PIN - TIGHTEN SET SCREW.

ADJUST AUTOMATIC SWITCH AS FOLLOWS - PLACE MANUAL INDEX LEVER IN POSITION SHOWN AND WITH SWITCH IN TRIPPED POSITION, ADJUST IT UNTIL THE CONTACT POINTS ARE OPENED 020 +.010 INCH AS INDICATED (TURNTABLE REMOVED)



IF ROLLER FAILS TO ROLL BACK DURING AUTOMATIC CYCLE ADJUST SCREW UPWARD TO PROVIDE A GREATER INCLINE DURING THE CYCLE. DO NOT ADJUST SO HIGH AS TO CAUSE EJECTOR TIP TO FAIL TO TOUCH TOP OF TURNTABLE FELT AT HIGHEST POINT.

ADJUST TURNTABLE HEIGHT BY INSERTION OR REMOVAL OF THRUST WASHERS

END OF EJECTOR TIP FIBER CENTER SHOULD BE FLUSH WITH EJECTOR TIP.

A-205, A-208, A-205E, A-208E

DESCRIPTION OF ELECTRICAL CIRCUIT

Models A-205 and A-208 employ twenty metal envelope tubes connected so as to offer with the turning of a single knob the choice of either an all-wave superheterodyne circuit giving excellent selectivity and sensitivity on frequencies from 140 kc to 41,000 kc; or an R.F. amplifier employing two tuned circuits giving high fidelity reception from 540 kc to 1650 kc. Separate groups of coils are used for each frequency band, all radio frequency coils for both circuits being housed in the "Sentry Box" unit, together with their associated band switches, capacitors, resistors, and tube sockets. This type of construction permits using extremely short connecting leads and isolates each radio frequency circuit in its own shielded compartment. Permanence of alignment adjustments is assured through use of the new sealed, air-dielectric "Permaliner" trimmer capacitors in all tuned circuits. Sturdy chassis construction, including a removable base shield, insures rigidity of parts and freedom from microphonic vibration.

The change over between "High Fidelity" and "High Selectivity" is accomplished by means of four switches mechanically linked to the change-over knob shaft.

*** A-205E, A-208E USE 19 TUBES**

High Fidelity Receiver

On high fidelity position the receiver is operative only on band B. The four change-over switches make the following connections: S7 connects the antenna to ground through a 4000-ohm variable resistor which is one of the three units of the volume control and is necessary to minimize cross talk. S8 connects the output of the second R.F. transformer to a lead which in turn carries the R.F. power directly to the 6H6 diode detector. S9 removes the 6C5 oscillator plate voltage and renders the 6L7 inoperative by removing the screen voltage and placing the cathode positive with respect to the two control grids. S10 selects for the diode input power from the R.F. amplifier stage.

Having in mind the connections for high fidelity one may trace the course of the signal as follows. The signal on the antenna is applied to first R.F. transformer, the secondary of which is tuned and is connected to the control grid of the 6K7 R.F. amplifier. The signal is amplified and appears on the second R.F. transformer, the secondary of which is also tuned. A mid-tap on the secondary (Band B only) takes power from the coil and applies it to the plates of the 6H6 diode detector. From this point on, receiver operation is the same for both "High Fidelity" and "High Selectivity" and it is best that the high selectivity circuit be described next.

High Selectivity Receiver

On "High Selectivity" position the receiver is operative on all bands. Connections effected by the four change-over switches are as follows:

S7 removes the attenuating resistor R1 from the antenna, thus allowing full signal strength to be impressed on the first R.F. transformer at all times. S8 connects the mid-tap of the second R.F. transformer to a compensating condenser which takes the place of the lead formerly supplying R.F. to the 6H6 diode. S9 connects plate voltage to the 6C5 oscillator and screen voltage to the 6L7 converter. S9 also grounds the cathode return circuit of the 6L7 so as to properly bias it. S-10 connects the 6H6 diode detector plates to the output of the second intermediate frequency amplifier.

The course followed by the signal on the "High Selectivity" connection is as follows:

The signal from the antenna is applied to the control grid of the 6K7 R.F. amplifier tube through the antenna coil, the secondary of which is tuned to the incoming signal by the rear section of the main tuning condenser. The secondaries of the antenna, R.F. and oscillator coils for the band next lower in frequency to the one in use are short-circuited by the band switch to prevent absorption of energy at their resonant frequencies, which fall in the next higher band. The primaries of all antenna and R.F. coils not in use are short-circuited by the band switch.

The amplified radio frequency signal is impressed upon the signal control grid of the 6L7 hexode converter tube through the R.F. coil, the secondary of which is tuned to the signal frequency by the center section of the main tuning condenser. The 6L7 is a new type tube designed for improved superheterodyne conversion efficiency in conjunction with a separate oscillator tube. In the 6L7, two separate control grids are shielded from each other and each acts independently upon the electron stream. Coupling effects between the signal and oscillator control grids are very small, making possible high gain and stable oscillator outputs at high frequencies and effectively reducing interaction between tuned circuits in the receiver.

The superheterodyne oscillator signal is generated by the 6C5 oscillator tube, its frequency being maintained 465 kc above the incoming signal frequency by the front section of the main tuning condenser in conjunction with the oscillator coil and padding capacitors. The oscillator section of the main tuning condenser, although of the same capacity as the other two sections, is larger physically to permit wider spacing of the plates, thereby reducing the possibility of microphonic feedback howl. The oscillator output is coupled to the oscillator grid of the 6L7 tube, where it is combined with the signal frequency to produce the intermediate frequency of 465 kilocycles. This particular intermediate frequency is chosen to reduce image response and improve short-wave performance.

The converter I.F. (intermediate frequency) transformer, consisting of two tuned circuits, transfers the I.F. output from the converter tube to the control grid of the 6K7 first I.F. signal amplifier tube. Here the I.F. signal is amplified and appears on the first I.F. signal amplifier transformer. This transformer consists of two tuned circuits and transfers the energy to the control grids of the second 6K7 signal I.F. amplifier tube and the 6K7 AVC (automatic volume control) I.F. amplifier tube. Separate I.F. channels are used for further signal amplification and for automatic volume control. The sensitivity of the receiver is controlled by a variable resistor in the cathode circuit of the second 6K7 signal I.F. amplifier which varies the amplification in that circuit upon manipulation of the sensitivity control. By controlling sensitivity in the I.F. circuit, better signal-to-noise ratio is obtained at reduced sensitivity.

The output from the second signal I.F. amplifier tube is coupled to the 6H6 diode detector through the second signal I.F. transformer. Both primary and secondary coils of this transformer are tuned.

Signal for automatic volume control is amplified by the 6K7 AVC I.F. amplifier tube, the plate circuit of which is connected to the primary coil of the AVC I.F. transformer. Both primary and secondary of this transformer are tuned, the 6H6 AVC rectifier being connected across the entire secondary. An initial negative voltage of about 11 volts, obtained from the bias resistor R25 of the AVC 6K7 amplifier, is maintained on the plates of the AVC rectifier tube. This gives delayed AVC action, which prevents attenuation of weak signals and gives a flat AVC characteristic on strong signals. Through the use of dual-channel, delayed AVC, the output of the receiver will not vary more than a few per cent over variations in signal input of 100,000 to 1. The d-c drop across R-28 due to the rectified signal supplies full automatic bias to the R.F. amplifier and converter tubes and to the signal I.F. amplifier.

Detector and Audio Frequency Circuits

In the 6H6 tube the signal is rectified, the audio frequency component producing a corresponding voltage drop across the R-36 section of the manual volume control. This is a triple control, the second or lo-note compensation section (R-40) acting with capacitors C-72 and C-73 and resistor R-38 to preserve proper balance between high and low audio frequencies as the volume is changed. The third section of the volume control is the aforementioned antenna attenuator, R1. The manual volume control selects the amount of audio signal applied through coupling capacitors C-74 to the grid of the 6C5 first audio amplifier tube and thus controls the output of the receiver.

Power from the 6C5 audio amplifier is applied through C-77 to the input network of the 6F6 triode audio stage. This network consists of resistors R-45, R-46, R-47, condenser C-78 and inductance L-42, and comprises the bass tone control. Voltage developed across the 6F6 plate resistor R-49 is applied through condenser C-80 to the high cut-off network, L-43, L-44, C-81, C-82, C-83, C-84, C-112. This circuit is very effective in rejecting unwanted heterodyne signals which otherwise might be annoying on high fidelity reception.

The audio signal is then impressed on the grids of the high power output amplifier through transformer T2. R-50 and C-85 across the primary of T2 comprise the treble tone control. The power amplifier consists of six 6F6's in Pentode push-pull parallel with a maximum output of 40 watts. This amplifier is in turn matched to the dual stabilized dynamic speaker unit through transformer T1.

Tuning Meter

The tuning meter operates on both "High Fidelity" and "High Selectivity," its action being dependent on the d-c voltage developed across R-37 caused by the rectified incoming signal. This voltage is impressed on the grid of the 6F6 T.M. (tuning meter) amplifier tube and affects the plate current of this tube. The meter is in the plate circuit of this tube and is sensitive to changes in plate current. Thus, the meter gives relative readings of the incoming signal strength. The 6F6 T.M. amplifier is biased by voltage across R-29 (which is adjusted at the factory) to give maximum meter deflection for a strong signal.

Power Supply

Plate and grid voltages for all tubes and power for the speaker unit fields are supplied by the power supply system employing three 5Z4 full wave rectifiers with their corresponding plates in parallel. Equal distribution of the current load among the rectifiers is assured by the plate series resistors R-61 to R-66 inclusive. Filtering action is obtained by the filter choke L-11 and its associated filter condensers, while various resistors throughout the set fix the applied voltages at their proper values.

Phonograph, Model A-208 Only

The record-reproducing facilities consist of a low impedance magnetic pick-up with its associated inertia-type tone arm, and the compensated volume control, audio amplifier and loud-speaker of the receiver. In changing from radio reception to phonograph reproduction the radio-phono switch simultaneously disconnects the 6H6 diode from the volume control, connects the secondary of the phonograph input transformer across this control, and renders the radio frequency amplifier inoperative by inserting a high resistance in the cathode circuit of the 6A8 converter and oscillator tube.

The turntable assembly consists of the perfected automatic record changer, which is simple and foolproof in operation. A separate motor switch is provided to permit starting and stopping the phonograph motor independently without operating the radio-phono switch.

ALIGNMENT PROCEDURE

Alignment Frequencies

I.F.	Band "A"	Band "B"	Band "C"	Band "D"	Band "E"
465 KC	145 KC	580 KC	5220 KC	15,000 KC	36,000 KC
	400 KC	1500 KC			

In order to align this receiver properly, it is necessary to have available the following test equipment:

1. A modulated test oscillator with the above alignment frequencies available. In case 36,000 KC (36 MC) is not directly available, the second harmonic of 18,000 KC usually will be found strong enough for alignment purposes. The test oscillator calibration points for all alignment frequencies should be checked at the time of using. A reliable check by the zero beat method may be obtained against known controlled frequencies such as broadcast station frequencies and their harmonics.
2. An output indicator, such as a high resistance a-c voltmeter with a maximum scale reading of 3 to 5 volts, or a neon lamp indicator.
3. An alignment tool consisting of an insulating shaft with a small screw-driver blade.
4. A tuning wand.

The location of all trimmer capacitors is shown in Fig. 10. *It should be noted that on "Permaliner" trimmer capacitors, used throughout this receiver, clockwise rotation of the adjusting screw decreases capacity, while counterclockwise rotation increases capacity.*

If the phonograph cable is disconnected from the chassis on Model A-208, it is necessary to connect terminals 1 and 2 together before the receiver will operate.

NOTE: To remove the chassis from Model A-208 it is necessary to take off the front right curved panel of the cabinet. The screws holding this panel are accessible from the front upon opening the right-hand record compartment door.

1. I.F. Alignment Adjustments

The I.F. Alignment adjustment is not easily made without oscillograph equipment. Moreover, the AVC channel alignment requires removal of the chassis from the cabinet and removal of the base shield. (Removal of the base shield does not, however, affect any of the circuits.) There is also the

MODELS A-205, A-205E
A-208, A-208E
Alignment, Part 2

GENERAL ELECTRIC CO.

danger that the frequency of the test oscillator will be much farther from 465 kc than the receiver's I.F. peak, even after long service. Unless the test oscillator frequency can be given a precision check at the time of using, it is better not to shift the I.F. peak frequency of the receiver at all, unless bad alignment is definitely indicated.

Each of the three I.F. transformers has two air-dielectric "Permaliner" trimmer capacitors. The secondary of the converter I.F. transformer delivers signal to two separate I.F. channels, the signal channel and the A.V.C. channel, which must be aligned independently.

Signal I.F. Channel

Set the frequency band switch of the receiver to Band "B." Short-circuit the antenna and ground terminals, tune the receiver to some point above 1500 KC so that no signal is heard, and ground the chassis.

Connect the test oscillator output between the connected grid clip of the 6L7 converter tube and the receiver chassis. Connect the output indicator across the cone coil of the loud-speaker. Turn on the receiver and set the volume and sensitivity controls to maximum (extreme clockwise position). Place the test oscillator in operation and set the test oscillator dial to 465 KC. Reduce the input from the test oscillator until only a slight output registers on the output indicator across the speaker cone coil. The input should be kept at such a low level that a temporary removal of the 6H6 A.V.C. rectifier tube makes no appreciable difference in output.

Before touching the receiver trimmers, adjust the *test oscillator* for maximum response. Note the exact setting of the test oscillator dial so it may be duplicated if necessary. This setting is likely to be very close to 465 KC and should be used for the I.F. adjustment following, unless bad misalignment is definitely evident, in which case the most accurate known test oscillator setting may be used. Trimmer locations are shown in Fig. 4.

Alignment adjustments should be made in the following sequence:

1. 3rd I.F. Transformer (Signal Diode)

Remove the test oscillator connection from the grid of the 6L7 tube and attach it to the connected grid clip of the 6K7 2nd signal I.F. amplifier tube. Adjust each of the two 3rd signal I.F. trimmers in turn. There is some interaction between two trimmers of the same transformer, so that these alternate adjustments should be repeated several times until a maximum output is obtained. Do not touch these trimmers again.

2. 2nd I.F. Transformer

Remove the test oscillator connection from the grid of the 2nd signal I.F. tube and attach it to the connected grid clip of the 6K7 1st I.F. amplifier tube. Adjust each of the two 2nd I.F. transformer trimmers alternately several times until a maximum output is obtained. Do not touch these trimmers again.

3. 1st I.F. Transformer (Converter)

After the alignment of the 2nd signal I.F. transformer is finished, restore the test oscillator connection to the grid clip of the 6L7 converter tube. Adjust each of the two converter (1st) I.F. trimmers alternately several times until a maximum output is obtained. Do not touch these trimmers again.

4. 4th I.F. Transformer (A.V.C. Diode)

After alignment of the 3rd I.F. transformer, 2nd I.F. transformer and converter transformer is completed, remove the output meter from the cone coil. Then remove the test oscillator connection from the grid of the 6L7 tube and attach it to the connected grid clip of the 6K7 A.V.C. I.F. amplifier.

Next remove the guard over the terminal boards on the "Sentry Box." Connect a high resistance voltmeter (this meter should have at least 1000 ohms per volt resistance and should be used on the 100-volt position or higher), to the yellow A.V.C. lead (See Fig. 1) on the R.F. compartment terminal strip and the chassis. The A.V.C. rectifier tube has delay bias voltage which should be removed by connecting its cathodes to the chassis. Then adjust each of the two A.V.C. I.F. trimmers alternately several times until a maximum output is obtained on the voltmeter. The peak, however, being rather broad, when properly trimmed; may be somewhat difficult to obtain. Do not touch the A.V.C. I.F. trimmers again.

Restore all original connections; this completes the I.F. alignment.

2. R.F. "Sentry Box" Alignment Adjustments

Bands "A" and "B" each require four trimmer adjustments, while Bands "C" and "D" each require three, and Band "E" only two. Take care to adjust only the trimmers under test. Connect the test oscillator to the antenna and ground terminals and place the receiver in operation with the output indicator across the speaker cone coil. A standard "dummy antenna," for connection between the test oscillator and the receiver antenna terminal, is a capacitor of 250 mmfd. (Stock No. RC258) in series with a resistor of 200 ohms; a condenser at least *must* be used, having some such small value of capacitance. Before any alignment the position of the pointer should be checked. This position should be at the extreme left-hand scale mark on the Band "B" scale for maximum capacitance position of the main tuning condenser (plates fully engaged).

The Oscillator, Converter Input and Antenna Compartments of the Sentry Box are conveniently referred to as "OSC", "R.F." and "ANT", respectively, thereafter. Before making any adjustments, it is wise to determine the correctness of the existing alignment. This may be done by supplying a signal from the test oscillator to the receiver, at the alignment frequencies only, and inserting a "Tuning Wand" into the coil involved. The "Tuning Wand" consists of a rod of insulating material having a ring of non-magnetic metal attached to one end, and a small core of finely divided iron compacted into the opposite end. By inserting the metal ring into the center of a particular coil through the openings provided in the "Sentry Box" compartment shields, the inductance of that coil is lowered, increasing its resonant frequency. If the circuits are in exact alignment, inserting either end of the tuning wand in any coil will result in a decrease in output. When an increase in signal is obtained with the iron-filled end of the wand, a decrease in resonant frequency of that circuit by increasing its trimmer capacity is indicated. When an increase in signal is obtained with the metal ring, a decrease in trimmer capacity is indicated.

CHANGES INDICATED BY WAND

Wand	Signal	Trimmer adjustment required
Metal Ring Iron Filings	Decrease Decrease	None
Metal Ring Iron Filings	Increase Decrease	Decrease Capacity
Metal Ring Iron Filings	Decrease Increase	Increase Capacity

Band "A" (140–410 KC)

Band "A" (140-410 KC)

Set the band change switch to the position where the scale indicates the above range. This will be at the extreme counter-clockwise position of the band change switch knob. Be sure the center control knob is in the high-selectivity position.

Tune the test oscillator to 400 KC, set the pointer at 400 KC on the receiver, and adjust the Band "A" OSC, R.F. and ANT trimmers for maximum output. To reduce noise pick-up it is advisable to turn the sensitivity control to minimum sensitivity (counterclockwise) position. If necessary, reduce input from the test oscillator so that the signal reaching the speaker is kept at a low or moderate level.

Next tune the oscillator to 145 KC. Keep slowly rocking the tuning knob through the point of resonance, at the same time adjusting the 145 KC padding trimmer, until the highest peak of output is secured.

"Noise" alignment may be substituted when the preceding adjustment is nearly finished, in cases where there is a steady output of very loud pick-up noise at the lower end of the scale. With the pointer at 145 KC on the receiver and the test oscillator removed, simply adjust the 145 KC padding trimmer only until a peak in the noise output is obtained. This should result in the same trimmer setting as in the preceding paragraph.

The interaction between the trimmer adjustments at each end of the scale makes it necessary to repeat the adjustments alternately until both are correct. This may require two or three adjustments each. *The last adjustment* must always be made at the high frequency end of the scale. This completes the adjustment of this band; do not touch these trimmers again.

Band "B" (530-1660 KC)

Set the band change switch to the position where the scale indicates the above range. Turn the hi-fidelity switch to the *hi-fidelity* position. Make sure the test oscillator output is quite high. Tune the test oscillator to 1500 KC, set the pointer at 1500 KC on the receiver dial, and adjust the Band "B" R.F. and ANT trimmers for maximum output, reducing input to maintain a low or moderate signal.

Now reduce the test oscillator output and without changing the receiver or test oscillator frequencies, throw the high fidelity switch to the high selectivity position. At this point adjust the Band "B" OSC trimmer for maximum output. Adjust the compensating Band "B" R.F. trimming, which is on top of the chassis between the 1st I.F. transformer (converter) and the Sentry Box, for maximum output.

Next tune the oscillator to 580 KC. Keep slowly rocking the tuning knob through the resonance point, at the same time adjusting the Band "B" padding trimmer for maximum output.

The interaction between the trimmer adjustments at each end of the scale make it necessary to repeat the adjustments alternately until both are correct. This may require two or three adjustments each. The last adjustment must always be made at the high frequency end of the scale. This completes the adjustments of this band.

Band "C" (1.58-5.4 MC)

Set the band change switch to the position where the scale indicates the above range. Be sure the center control knob is in high selectivity position.

Tune the test oscillator to 5.22 MC, set the pointer at 5.22 MC on the receiver, and adjust the Band "C" OSC trimmer for maximum output, reducing input to maintain a low or moderate signal.

Check for the image signal which should be received at about 4.3 MC on the receiver dial. It may be necessary to increase the input to the receiver from the test oscillator for this check.

Retune the receiver to the correct scale reading 5.22 MC to secure the previous response. Adjust the RF and ANT trimmers now also for maximum output. This completes the alignment of Band "C"; do not touch these trimmers again.

Band "D" (5.3-18.3 MC)

Set the band change switch to the position where the scale indicates the above range. This position should occasionally be readjusted during subsequent trimmer adjustment, since it is possible to get some signals through on the higher frequencies when the switch position is not exactly in position.

Tune the test oscillator to 15 MC, set the pointer at 15 MC on the receiver, and adjust the OSC trimmer for maximum output, leaving it at the *first* peak obtained when increasing it from minimum capacitance by counterclockwise rotation.

Check for the image signal which should be received at about 14.1 MC on the receiver dial. It may be necessary to increase the input to the receiver from the test oscillator for this check.

Reduce the capacitance of the RF trimmer to minimum. Reset the main tuning knob to secure the previous response at 15 MC and, while slowly rocking the knob through this resonance point, increase the RF trimmer capacitance until a maximum response is obtained.

Carefully holding the main tuning knob on the peak of resonance at 15 MC, adjust the ANT trimmer for maximum output. This completes the alignment of Band "D"; do not touch these trimmers again.

Band "E" (16-41 MC)

Set the band change switch to the position where the scale indicates the above range. This position should occasionally be readjusted during subsequent trimmer adjustment, since it is possible to get some signals through on the higher frequencies when the switch position is not exactly in position.

Tune the test oscillator to 36 MC, set the pointer at 36 MC on the receiver, and adjust the OSC trimmer for maximum output, leaving it at the *first* peak obtained when increasing it from minimum capacitance by counterclockwise rotation.

Check for the image signal which should be received at about 35.1 MC on the receiver dial. It may be necessary to increase the input to the receiver from the test oscillator for this check.

Reduce the capacitance of the RF trimmer to minimum. Reset the main tuning knob to secure the previous response at 36 MC and while slowly rocking the knob through this resonance point, increase the RF trimmer capacitance until a maximum response is obtained. There is no ANT trimmer to adjust.

This completes the alignment of Band "E"; do not touch these trimmers again.

Adjustment of Wave Trap

To adjust the 465 KC Wave Trap set the dial scale for Band "B," increase the output of the test oscillator and adjust it to 465 KC, leaving it connected to the ANT and GND posts of the receiver. Now adjust the 465 KC trimmer (C5) which is mounted on top of the chassis immediately behind the "Sentry Box," to *minimum* output. This completes this alignment; do not adjust this trimmer again.

Adjustment of 10 Kc Trap

Obtain an audio oscillator; tune it to 10 KC; connect its output to the signal diode plate. This can be done by removing the signal diode and connecting to either of its plates by means of a test prod. Now adjust the trimmer (C82) on the back skirt of the chassis for minimum output in the cone coil. This completes this adjustment. Do not disturb it again.

Dual Unit Speaker

If, for any reason, it is necessary to disconnect one or both of the speaker units the speaker wiring diagram (see Fig. 5 and 7) should be carefully followed upon reconnecting either unit. It is important that both the field coil and voice coil of each be connected properly in order that the voice coils operate in phase.

VISUAL ALIGNMENT OF I.F.

In order to realize to full advantage the performance built into a receiver of this class at the factory, circuit alignment using cathode-ray oscilloscope equipment is much to be preferred. The oscilloscopic method is particularly advantageous in aligning the I.F. tuned circuits.

For visual alignment it is necessary to vary the frequency of an unmodulated test oscillator signal over a range extending on both sides of the peak frequency. This variation must take place in synchronism with the horizontal traverse of the cathode-ray beam on its screen. The frequency modulator must therefore, provide means for synchronizing the periodic test frequency variation with the cathode-ray horizontal deflection circuit. The test oscillator may advantageously have facilities for audio-frequency amplitude modulation of a fixed radio frequency test signal, as well as for frequency modulation, but audio modulation is not required for visual I.F. alignment.

Instead of an output meter across the speaker cone coil, the vertical plates of the cathode-ray tube are connected across the load resistor of one of the diode rectifiers of the receiver. With the frequency modulator in operation in conjunction with the test oscillator, the resonance curve of the circuit under test will then be shown on the screen.

Preliminary Procedure

In order to properly connect the oscilloscope for visual alignment, it is necessary to remove the base pan shield from the bottom of the receiver chassis. After this is done a preliminary alignment should be made as outlined under I.F. Alignment Procedure using the oscilloscope as an output meter. To do this connect the vertical plates of the oscilloscope across the receiver volume control (R36) and turn off the horizontal sweep entirely, using only the vertical deflection as an indication of output. In carrying out this preliminary alignment the test oscillator sweep mechanism is not used.

Final Visual Adjustments

Connect the test oscillator output to the control grid of the 6L7 converter tube and place the sweep mechanism in operation. Turn on the horizontal sweep of the oscilloscope and synchronize it correctly with the test oscillator sweep mechanism. Now adjust the *test oscillator* so that the two I.F. response curves are coincident as nearly as possible. This gives a setting for the test-oscillator frequency which must not be changed throughout the rest of the procedure.

To align the signal I.F. and converter I.F. transformers connect the test oscillator as described in I.F. alignment beginning on page 15 and adjust the corresponding transformer trimmers so as to cause the resulting I.F. response curves to be coincident and as high as possible.

After alignment of the signal and converter I.F. transformers has been completed, the vertical plates of the oscilloscope should be connected to the yellow A.V.C. lead and the chassis. Connect the test oscillator output to the grid of the A.V.C. 6K7 I.F. amp. and ground the cathode of the A.V.C. diode. Adjust the A.V.C. I.F. trimmers so that the response curves are coincident and of maximum height. This completes the I.F. alignment.

"Sentry Box" Notes
Dial and Phono. Data

GENERAL ELECTRIC CO.

MODELS A-205, A-205E
A-208, A-208E

Visual R.F. alignment may be carried out in the same general manner as above by applying a suitable frequency-modulated signal between the antenna and ground terminals of the receiver and connecting the cathode-ray vertical deflecting plates across the receiver volume control.

METHOD OF SERVICE PROCEDURE—SENTRY BOX

The "Sentry Box" assembly includes the tuning condenser and dial mechanism as well as the coil and switch compartments. The complete unit may be dismounted from the chassis by removing the side-fastening bolts, unscrewing the dial mechanism anchoring nut and unsoldering the leads to the chassis from the terminal strips.

In order to remove the coil shield cans it is necessary to take out the frequency band switch shaft. With the "Sentry Box" dismounted from the chassis the dial gears may be disengaged and the switch shaft removed merely by lifting the reduction drive end of the dial assembly, allowing the switch shaft gear to pass the dial scale cap shaft. With the "Sentry Box" mounted in place, removal of the switch shaft requires removing the dial scale gear and cap shaft.

Each compartment shield can houses a bracket assembly comprising the coils, band switch and other component parts associated with that particular circuit. With the band

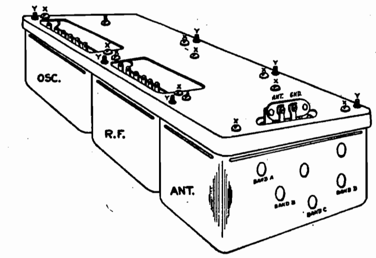

Fig. 11. "Sentry Box" Coil Locations and Assembly

switch shaft out, any shield can be easily removed by unscrewing the two mounting stud nuts ("Y," Fig. 11).

In most cases, coils or Permaliner trimmer capacitors may be replaced merely by removing their particular shield can. It is an easy matter, however, to remove each complete bracket assembly by taking out the mounting bolts ("X," Fig. 11) and unsoldering the bus or braid connections to the tuning condenser. In the case of the R.F. or oscillator units it will also be necessary to unsolder the external leads to the respective terminal boards of these units.

Permaliner trimmers are replaced by unsoldering the bus lead from the trimmer terminal, and then unsoldering the Permaliner case from its mounting cup. The latter operation may require the use of two soldering irons.

Coils are replaceable by merely unsoldering the coil lugs from the switch lugs. If it is necessary to replace a section of the band switch, however, it will be found expedient to remove the complete bracket and coil assembly for easy access to the switch lugs.

ADJUSTMENT OF DIAL MECHANISM

The dial mechanism is rigidly mounted at one end to the tuning condenser frame by two removable screws, and anchored to the chassis deck at the other end by a rubber-cushioned nut. The dial pointer, station selector knob, and tuning condenser drive drum are interconnected by means of the drive cord and drive cable; the frequency band switch and cylindrical scale by the switch shaft and the scale gears. The precision tuning indicator assembly is mounted independently by two screws to the tuning condenser frame. The tuning meter is fastened to the dial mechanism mounting plate with two other screws.

1. *Position of Drum on Condenser Shaft*

With set screws (5) loosened and tuning condenser plates fully engaged, place the drum in the position shown in Fig. 12. The drum should be located on the tuning condenser shaft so as to be in line with the drive cord pulleys (1/16 in. from the dial mechanism mounting bracket) and so that, with condenser plates fully engaged, guide (50) occupies the position shown in Fig. 12.

2. *Removing and Replacing Scale*

Pry out fastener (40) and remove the scale by lowering the fastener end below the mounting ear. Take the scale out of cap assembly (29). Replace by placing tabs of caps (29) and (30) in slots of scale. Replace fastener (40).

3. *Removing and Replacing Band Switch Shaft*

To remove the band switch shaft with the "Sentry Box" assembled in place, the dial scale cap and gear must be removed. This is done by removing the cylindrical scale as in paragraph 2. Then loosen set screws (9) and remove cap (29), spring (7), and gear (8).

When replacing the switch shaft, note that the shaft will fit the switch gang slots in only one position; turn the shaft before inserting so that the locating button will pass through the keyed side of the slots. Note also that the brass bearing just behind the switch shaft gear determines the forward position of the gear. Insert the bushing just far enough into the index plate hub so that the shaft gear meshes snugly with the scale gear; then tighten the set screw.

4. *Locating Scale*

Loosen the two gear set screws (9). Rotate the scale backward until there is slight tension on spring (7) with the pointer indicating on the Band "A" scale. With the frequency band switch in the Band "A" position, place gear (8) in mesh with the gear on part (6) and tighten the two set screws (9).

5. *Replacing Drive Cord and Drive Cable*

The position of the dial scale pointer with respect to the tuning condenser drum is held fixed by a special metal braid cable (12) connecting the drum with guide (50). Tension is maintained on the cable through the drum spring (13) and drive cord (11). To replace either the drive cable or the drive cord, remove the dial scale for convenient access to guide (50). Unhook spring (13) from its drum tab to release tension. Unhook the cable or cord from guide (50) and unwind from the pulleys and drum. To replace the cable or cord, rethread to agree with Fig. 12, and rehook drum spring (13) as shown.

6. *Replacing Reduction Drive*

To replace the reduction drive, unhook spring (13), loosening the drive cord. Unscrew nut (47) and remove drive. Replace with new drive and rehook drive cord.

7. *Setting Scale Pointer*

The scale pointer is soldered to the slider (50). To set the pointer mechanically, turn the tuning condenser rotor so that the plates are fully engaged, and solder the pointer to indicate a point 3/32 in. to the left of the extreme left-hand mark on the Band "B" scale.

8. *Replacing Dial Lamps*

The dial lamp sockets are easily accessible by lifting them clear of the dial mechanism. Lamps may then be replaced in their sockets. After replacing lamps, slide the socket clip back onto the mounting bracket. Be sure the sockets are quite clear of other metal parts. The tuning meter lamp is easily replaced by merely unscrewing it from its socket at the rear of the meter.

9. *Replacing Tuning Meter*

In case of damage to, or defect within, the tuning meter (24), the meter should be replaced rather than an attempt made to repair it. The meter is replaceable as a unit by removing its two mounting screws and unsoldering the meter leads and meter lamp leads.

10. *Precision Tuning Indicator*

The precision tuning indicator dial and gear assembly is illustrated at the left of Fig. 12. This assembly is removable as a unit by removing the two mounting screws which fasten its bracket (14) to the tuning condenser frame. The dial and pinion assembly (20) is held on its shaft by a small horseshoe spring washer which should be pried off to replace this assembly. The drive gear (17) and backlash gear (36) may be removed by loosening the set screws on collars (44) and (45), which hold them in place.

When replacing the complete precision tuning assembly, the tuning condenser plates should be fully disengaged. Refasten the assembly to the tuning condenser frame, but before tightening the mounting screws, and before meshing the drum gear sector with the precision dial drive gear, place an initial tension on the backlash spring (16) by rotating the precision dial about two revolutions clockwise from the position in which the spring holds it when unwound. Maintaining this tension on the backlash spring, mesh the gears.

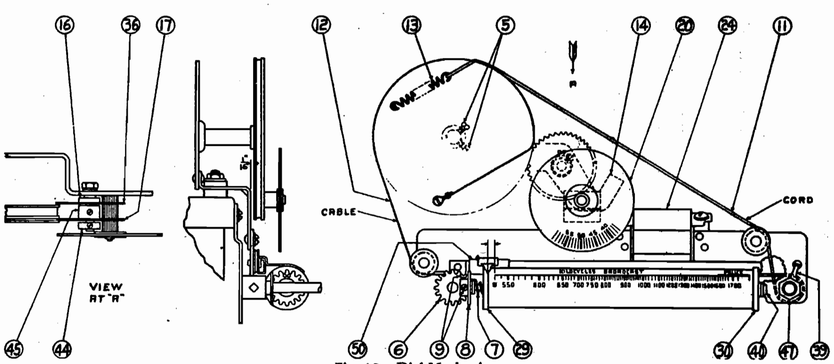

Fig. 12. Dial Mechanism

PHONOGRAPH SERVICE DATA
A-208 & A-208E ONLY

Replacing Transformer

When installing a new phonograph input transformer, T4, first make all connections without screwing the new transformer to the cabinet. Then, with the power on and the Phono-Radio switch turned to Phono, rotate the transformer until the position is found in which hum is reduced to a minimum. The transformer should then be mounted permanently in this position.

AUTOMATIC RECORD EJECTOR

The record-changing mechanism is designed to be simple and fool-proof. Under normal operating conditions, service difficulties should be negligible. Occasionally, however, certain adjustments may be required. These adjustments are illustrated and explained in Fig. 13.

It is important when servicing the automatic mechanism, to have it placed on a level support. It is also important to refrain from forcing the mechanism if there is a tendency to bind or jam, since bent levers and possibly broken parts may result.

The tip of the record ejector is adjustable in relation to the turntable spindle, the two being exactly coaxial when properly adjusted. To align the tip, remove the rubber silencer of the ejector assembly, loosen ejector tip retaining nut and slide the tip assembly to the position where it is in true line with the axis of the turntable spindle. This adjustment may be simplified by placing several records on the turntable, depressing the spindle through the top record hole and lining up the ejector tip in the spindle hole of the record.

To insure that the ejector tip rotates freely, apply a slight amount of oil to the shank of the tip at the point where it is in contact with the ball bearing.

MAGNETIC PICKUP

The pickup used in the phonograph unit is of an improved design, having several variations from the usual type of pickup. The magnetic assembly is one rigid piece. The horseshoe magnet is solidly welded to the pole pieces and is irremovable. There is a centering spring attached to the armature to maintain proper adjustment and provides a damping effect on the movement of the armature. A neutralizing coil is mounted in the magnet assembly in such manner that it balances out hum induced by stray magnetic fields but does not affect the audio signal. The frequency response is uniform over a wide range.

Service operations which may be necessary on the pickup are as follows:

Centering Armature

Refer to Fig. 14 showing the pickup inner structure. The armature is shown in its proper relation to the magnet pole pieces, *i.e.*, exactly centered. Whenever this centering adjustment has been disturbed, the screws A, B, and C should be loosened and the armature clamp adjusted to the

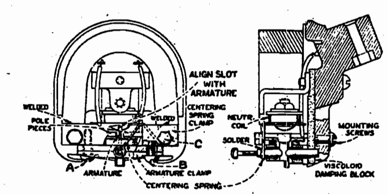

Fig. 14. Details of Pickup

point where the vertical axis of the armature is at right angles to the horizontal axis of the pole pieces, and centered between them. This centering operation may be facilitated by inserting a small rod or nail into the armature needle hole, using it as a lever to test the angular movement of the armature. The limitations of the movement in each direction will be caused by the armature striking the pole pieces. The proper adjustment is obtained when there is equal angular displacement of the armature and adjustment rod or nail to each side of the vertical axis of the magnet and coil assembly. The screws A and B should then be secured, observing care not to disturb the adjustment of the armature clamp. Then place the pickup in a vise and secure the centering spring-clamp by means of the screw C, allowing the centering spring to remain in the position at which the armature is exactly centered between the pole pieces. With a little practice, the correct adjustment of the armature may be readily obtained. The air gap between the pole pieces and the armature should be kept free from dust, filings, and other such foreign materials which would obstruct the movement of the pickup armature.

MODELS A-205, A-208
Parts

A-205, A-208 Damping Block A-205E, A-208E

The viscoloid block which is attached to the back end of the armature shank serves as a mechanical filter to eliminate undesirable resonances and to cause the frequency response to be uniform. Should it be necessary to replace this damping block, it may be done by removing the armature and viscoloid assembly from the mechanism and taking off the old vis-

Fig. 15. Special Soldering-iron Tip

coloid block. The surface of the armature which is in contact with the viscoloid should be thoroughly cleaned with fine emery cloth and then inserted into the new block so that it occupies the same position as it did originally. Make certain that the block is in correct vertical alignment with the armature. The hole in the new viscoloid block is somewhat smaller than the diameter of the armature in order to permit a snug fit. With the viscoloid aligned on the armature, heat should be applied to the armature (viscoloid side) so that the viscoloid block will fuse at the point of contact and become rigidly attached to the armature. A special-tip soldering iron constructed as shown in Fig. 15 will be found very useful in performing this operation. The iron should be applied only long enough to slightly melt the block and cause a small bulge on both sides. The pickup should then be carefully reassembled and the armature centered as previously explained.

Replacing Coils

Whenever there is defective operation due to open or shorted pickup coils, these coils should both be replaced. The method of replacement will be obvious upon inspection of the pickup assembly and by study of the cut-away illustrations. It is important to readjust the armature as previously explained after reassembly of the mechanism. It is also necessary to have the hum and signal coils mounted in proper relation to each other in order that there may be the intended neutralization between them. Make certain that the slot in the center screw of the neutralizing coil is aligned directly over the armature tip, as illustrated. Only rosin core solder should be used for soldering the coil leads in the pickup. This same type of solder should be used when necessary for soldering the centering spring to the armature.

Magnetizing

Loss of magnetization will not usually occur when the pickup has received normal care, due to the fact that the magnet and pole pieces are one unit and the magnetic circuit remains closed at all times. When the pickup has been mishandled, subjected to a strong a-c field, jolted, or dropped, there may be an appreciable loss of magnetic strength, in which case it will be necessary to remagnetize the entire structure. This should be done by placing the pickup assembly on the poles of a standard pickup magnetizer and charging the pickup in accordance with the instructions accompanying the magnetizer. It is preferable to check the polarity of the pickup magnet and to remagnetize it so that the same polarity is maintained.

- Tuning Lamp (Red) RL-917
- Tuning Lamp (Green) RL-918

Colorama Tuning Indicator

These receivers are equipped with a novel tuning aid located directly above the tuning scale. When no signal is being received, the indicator will be red in color, but as a station is tuned in, the indicator will change to green. Powerful stations will produce the darkest green color. When the Fidelity Control is in the "Local Reception" position, some stations may not cause the indicator to flood green. Such stations may be considered of insufficient power to be satisfactorily received in the "Local Reception" position.

For Method of Service Procedure-Sentry Box, Adjustment of Dial Mechanism, Phonograph Service DataModel A208 ONLY, Auto-matic Record Ejector, Automatic Record Changer Adjustments, Alignment Frequencies Visual Alignment of I F, R.F. "Sentry Box" Alignment Adjustments, Alignment of bands A,B,C,D, and E, Adjustment of Wave Trap and 10KC Trap SEE MODELS A205, A208.

Alignment of Fidelity Channel (#2)

1. Turn band selector to broadcast band position; sensitivity control to maximum; fidelity control to "Local Reception" position (clockwise).
2. Connect the vertical plates of the oscilloscope across the volume control (R-81).
3. Connect the test oscillator to the control grid of the "Fidelity" I.F. Amplifier (6K7), through a .05 mfd. capacitor.
4. Adjust the 2nd I.F. Fidelity transformer trimmers so that a symmetrical curve is obtained with a distinct dip in the center.
5. Move the test oscillator lead to the converter (6L7) control grid and adjust the 1st I.F. transformer trimmers. The curve obtained should be symmetrical and of maximum amplitude.

Alignment of Selective Channel (#1)

1. Set Fidelity control to "Distant Reception" position (counterclockwise).
2. Connect the test oscillator to the control grid of the "Selective" 2nd I.F. amplifier (6K7) and adjust the 3rd I.F. Selective channel transformer trimmers for a single, symmetrical curve of maximum amplitude.
3. Move the test oscillator lead to the control grid of the "Selective" 1st I.F. Amplifier (6K7) and adjust the 2nd I.F. Selective channel transformer trimmers.
4. Place the test oscillator lead on the control grid of the 6L7 converter and examine the curve for symmetry and height. Since the trimmers on the 1st I.F. transformer were adjusted when the Fidelity channel alignment was made, no further adjustment of these trimmers should be necessary.

Alignment of Color Tuning Transformer

1. Connect the vertical plates of the oscilloscope at the junction of R-39 and R-40, and ground.
2. Apply the test oscillator lead to the control grid of the selective 1st I.F. amplifier (6K7).
3. Adjust color tuning transformer trimmers for a sharp curve of maximum amplitude.

MODEL A-208E

PHONOGRAPH OPERATION

The volume and tone for phonograph reproduction are regulated by the volume, Bass and Treble controls on the radio panel, while the mechanical operations of the phonograph are regulated by controls located in the phonograph compartment.

For automatic operation, the turntable accommodates a stack of seven or eight records at one loading, the maximum number depending on the thickness and variations in flatness of the records selected. In loading the turntable, all records selected for the stack must be of the same nominal diameter (either 10 or 12 inches). Record changing is accomplished by the Record Ejector, which swings to the left after each selection, carrying the top record from the turntable to the eject pocket at the side of the cabinet. The last or bottom record, however, remains on the turntable and will be repeated until the mechanism is attended.

The following steps are necessary to prepare to play records:

1. Turn the Power Switch "ON" (Fig. 1), making sure the Motor Switch is "OFF" (Fig. 2).
2. Set the Radio-Phono Switch to "Phono" (Fig. 2).
3. With Index Lever at "Manual" (Fig. 2), insert needle in electric pickup and place pickup on rubber rest.
4. Raise Record Ejector Arm to upright position; load records on turntable, then lower Ejector carefully on motor spindle.

Do not attempt to overload the turntable; it is fully loaded when the uppermost record is nearly flush with the top of the spindle, but will not slide off when pushed laterally at the edge. Further, each record must be equipped with an eccentric or spiral "stopping" groove near the center, that groove being depended upon to initiate the automatic mechanism. Use a flat, unwarped record at the bottom of the stack on the turntable. Make sure that the record eject pocket is empty beforeproceeding.

Care also should be observed in the choice of needles that will afford satisfactory reproduction. The orange Chromium needle is recommended for general-purpose use and should play approximately 75 consecutive selections. As alternatives, green Chromium or full-volume Tungstone needles may be used. With care, the former should play approximately 100 and the Tungstone from 100 to 150 selections. Never replace a partially worn Chromium needle (either green or orange) in the pickup, as damage to records would result. Also, do not play transparent-face (illustrated) or Victrolac records with the Tungstone needle.

After the above steps have been carried out, the phonograph is placed in operation as follows:

1. Place electric pickup on smooth outer rim of record; then--for automatic operation only - move the Index Lever to position "10" or "12," corresponding to the diameter of records on the turntable. Do not move the Index Lever from the "Manual" position until the pickup is set on the rim of the record; also be careful not to move the Index Lever beyond the proper hole. For playing records individually, leave the Index Lever at "Manual."

2. Turn the Motor Switch "on" and see that the needle is in the outermost groove of the record.

3. Close the cabinet lid and adjust the Volume Control for the desired volume level. The Volume, Bass and Treble Controls, on the radio panel, control volume and tone both for radio reception and for phonograph reproduction. Set the Tone Controls for full-range reproduction (clockwise); if needle scratch reproduction is considered excessive, decrease treble response slightly.

Note 1. To reject any record being played automatically, lift the electric pickup, move the pickup arm to the extreme left and hold lightly until again moved by the mechanism. The last record on the turntable will be played repeatedly until the motor is stopped.

Note 2. For correct automatic operation, the instrument must be level. After a record has been played and changed, the needle is lowered automatically onto the smooth rim of the next record and is fed by gravity into the starting groove. After leveling with reference to the top of the cabinet, further slight compensation may be necessary, thus: (1) If the needle fails to enter the playing groove, the right-hand side of the instrument must be raised by inserting thin blocks under the cabinet on that side; or (2) if the needle slides over several grooves, thus failing to reproduce the beginning of the selection, the left-hand side of the instrument must be similarly raised.

4. To reload the turntable, turn the Motor Switch "off," move the Index Lever to "Manual" and place pickup on rubber rest. Do not change this order. When through operating, turn the Power Switch "off."

IMPORTANT

1. Never restrain by force the normal motion of any part of the automatic mechanism while it is changing records.

2. Never experiment or tamper with any adjustment device.

With normal use and handling, trouble-free service is to be expected. The automatic phonograph mechanism and associated parts, however, should be kept clean and well lubricated. To insure continued efficient operation, it is recommended that the entire instrument be thoroughly inspected and adjusted by an experienced service man once each year.

INSTALLATION MODEL A-208E

The receiver is shipped with the chassis braced on the inside of the cabinet. In order to put the set into service proceed as follows:

1. Remove the set from its packing case.
2. Lay the set on its back and remove the four lag screws which hold the skid to the bottom of the cabinet. It is necessary that this be done first while other parts of the set are still held in place by packing materials. Care should be taken that the top lids do not swing to the floor while the set is tipped.
3. Right the set and remove the back screen from the cabinet. Take out the three copper plated screws at the corners of the radio chassis. Washers under the brackets through which these screws pass should also be removed.
4. Remove the two copper-plated screws on the under side of the phonograph board. Both the receiver chassis and the phonograph should be floating free on their suspensions.
5. Remove the envelope tacked to the upper chassis mounting board.
6. Thread the antenna and ground leads and the power cord through the hole in the back screen. Connect the antenna and ground leads to the antenna and ground terminal posts.
7. Replace the back screen; additional screws to hold it on will be found in the envelope just mentioned.
8. Remove the packing materials from inside the phonograph compartment.

Operating control knobs, felt washers, used-needle cup, and phonograph needles are shipped in the envelope also. The knobs are easily attached to the control shafts by tightening the knob set screw onto the shaft with a screw driver. The felt washers should be placed between the knobs and the panel so that there will be no possibility of the knobs rubbing on the panel. The phonograph turntable will be found in the package packed with the receiver. To install the turntable, lift the record ejector to its upright position and mount the turntable on the motor spindle. Make certain that the spindle drive key engages the slot in the turntable hub. Record albums will be found packed in the record compartments.

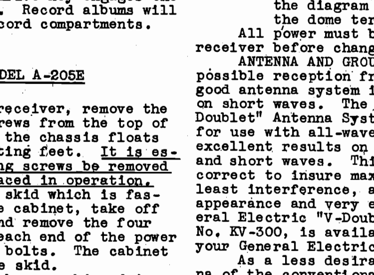

Fig. 2. Phonograph Compartment

INSTALLATION MODEL A-205E

After unpacking the receiver, remove the copper-plated shipping screws from the top of the cabinet shelf so that the chassis floats freely on its rubber mounting feet. It is essential that these shipping screws be removed before the receiver is placed in operation.

To detach the wooden skid which is fastened to the bottom of the cabinet, take off the back of the cabinet and remove the four large black nuts (two at each end of the power unit) which hold the skid bolts. The cabinet may then be lifted off the skid.

Operating control knobs are shipped in an envelope which will be found packed inside the cabinet of the receiver. The knobs are easily attached to the control shafts by tightening the knob set screws onto the shaft with a screwdriver. Sufficient clearance should be left between the knob and the panel so that there will be no danger of the knobs rubbing on the panel.

INSTALLATION - GENERAL

TUBES - Each receiver is equipped and tested at the factory with the tubes that are shipped with the instrument. The location of each tube is shown on the chassis rating label. To install any tube, place the tube directly above the proper socket, pins down, and insert the locating pin in the socket. Keeping the tube at right angles to the chassis deck, rotate the tube in its socket until the locating key slips into the socket groove. Then press the tube into place.

POWER SUPPLY - Before plugging in the power cord make sure that the power supply voltage and frequency available at the outlet agree with the rating label on the receiver chassis. Make sure also that all tubes are in place.

If, when first installed, the receiver fails to operate properly, it is probable that one or more of the tubes may have jarred loose in shipment. Make certain, therefore:

(1) That all tubes are in place in the proper sockets and pressed down firmly. Do not apply power to the receiver unless all tubes are in place.
(2) That the spring connectors of the short flexible (grid) leads shown on the diagram are securely attached to the dome terminals of the proper tubes.

All power must be disconnected from the receiver before changing tubes.

ANTENNA AND GROUND - To obtain the best possible reception from an all-wave receiver, a good antenna system is essential, particularly on short waves. The General Electric "V-Doublet" Antenna System is designed especially for use with all-wave receivers and will give excellent results on both domestic broadcasts and short waves. This system is scientifically correct to insure maximum signal strength and least interference, and is inexpensive, neat in appearance and very easily installed. The General Electric "V-Doublet" Antenna Kit, Stock No. KV-300, is available as an accessory from your General Electric Radio Dealer.

As a less desirable alternative, an antenna of the conventional type 25 to 75 feet long including lead-in and ground connection may be used. The antenna should be well insulated from all objects and run neither close nor parallel to electrical circuits inside or outside the building. Generally an indoor antenna of short or medium length will be found fairly satisfactory for broadcast reception. An outdoor antenna is recommended for localities remote from broadcasting stations and is necessary when the receiver is installed in a building of metallic construction.

A good ground connection is essential for best performance. The ground lead should be as short and direct as possible, and should be connected preferably to a cold water pipe. An approved ground clamp should be used to insure a tight and permanent connection.

Two terminals are provided at the rear of the receiver for antenna and ground connections. These terminals are so spaced as to provide direct connection to the receiver coupling transformer of the "V-Doublet" Antenna Kit.

GENERAL ELECTRIC CO.

REPLACEMENT PARTS - MODELS A-205E AND A-208E

(Insist on genuine factory-tested parts which may be purchased from authorized dealers)

RECEIVER CHASSIS ASSEMBLIES

Stock No.	Description	List Price
*RA-402	ARM--Crank arm on changeover shaft for long switching link (pkg.of 2)	$ .10
*RB-006	BOARD--Terminal board near 10 K.C. filter trimmer condensers	.15
*RB-009	BOARD--Terminal board on same bracket as S-7	.15
*RB-019	BOARD--Three-lug terminal board on rear apron near L-3	.10
*RB-034	BOARD--8-lug terminal board on rear chassis apron	.15
*RB-036	BOARD--Phonograph connector terminal board	.20
*RB-128	BRACKET--Treble control mounting bracket (pkg. of 2)	.10
*RB-129	BRACKET--Supports switch S-8	.10
*RB-130	BRACKET--Bracket supporting switch S-7 and changeover shaft	.10
*RB-131	BRACKET--Volume control mounting bracket (pkg. of 2)	.10
RC-010	CAPACITOR--.002 mfd., 400 V. paper (C-77, C-88, C-91)	.25
*RC-021	CAPACITOR--.004 mfd., 200 V. paper (C-94)	.25
*RC-034	CAPACITOR--.01 mfd., 200 V. paper (C-98, C-111)	.25
*RC-072	CAPACITOR--.05 mfd., 200 V. paper (C-53, C-97)	.25
*RC-091	CAPACITOR--.05 mfd., 400 V. paper (C-52, C-55, C-68, C-93)	.30
*RC-096	CAPACITOR--.1 mfd., 200 V. paper (C-46, C-63, C-86)	.30
*RC-123	CAPACITOR--.1 mfd., 400 V. paper (C-71)	.35
*RC-136	CAPACITOR--.25 mfd., 200 V. paper (C-47, C-62)	.30
*RC-178	CAPACITOR--.5 mfd., 200 V. paper (C-54)	.40
*RC-180	CAPACITOR--.5 mfd., 400 V. paper (C-70, C-80, C-95)	.50
*RC-205	CAPACITOR--20 mmf. mica (C-56)	.35
*RC-211	CAPACITOR--50 mmfd. mica (C-72, C-92, C-96)	.25
*RC-261	CAPACITOR--250 mmfd. mica (C-67, C-69, C-78, C-85)	.25
*RC-333	CAPACITOR--.001 mfd. mica (C-83, C-84)	.30
*RC-350	CAPACITOR--.002 mfd. mica (C-81)	.35
*RC-504	CAPACITOR--10 mfd., 25 V. dry electrolytic (C-113)	.70
*RC-520	CAPACITOR--20 mfd., 25 V; 8 mfd., 450 V; 16 mfd., 50 V. (C-75, C-76, C-79)	2.60
*RC-616	CAPACITOR--600-1200 mmfd. trimmer (C-82)	.65
*RC-810	CABLE--Receiver chassis power cable with plug	2.40
*RC-981	CLAMP--Cable clamp (near S-7) (pkg. of 5)	.10
*RE-008	ESCUTCHEON--Escutcheon for model A-205E	$ 1.10
*RE-009	ESCUTCHEON--Escutcheon front panel and under block for model A-208E	13.15
*RI-003	INSULATOR--Escutcheon shaft insulator - bushing used on A-205E only (pkg.of 10)	.40
RI-006	INDICATOR--"Colorama" tuning indicator	
*RK-002	KNOB--Control knobs (pkg. of 5)	.50
*RL-309	COIL--10 K.C. filter reactor (L-43)	3.95
RL-330	REACTOR--Colorama tuning saturable reactor (T-6)	2.10
*RL-601	COIL--Wave trap coil (L-3)	.80
*RL-907	LINK--Long switching link for S-8	.15
RL-917	LAMP--Colorama tuning red lamp 3.2 volts (P-1) (pkg of 10)	1.50
RL-918	LAMP--Colorama tuning green lamp 3.2 volts (P-2) (pkg of 10)	1.50
*RN-001	NUT--Escutcheon mounting nut for A-205E only (pkg of 10)	.45
*RP-014	PLATE--Escutcheon mtg. plate for A-205E only (pkg of 2)	.25
*RP-034	PLUG--Receiver chassis 8-prong plug	.20
*RP-035	PLATE--Control knob name plate (for A-205E only)	.35
*RP-036	PIN--Taper pin in front end of changeover shaft (pkg. of 5)	.10
RQ-053	RESISTOR--560 ohm, ½ watt carbon (R-16, R-24) (pkg. of 5)	.60
*RQ-059 (RR-014)	RESISTOR--1000 ohm, ½ watt carbon (R-25) (pkg. of 5)	.70
*RQ-067	RESISTOR--2200 ohm, ½ watt carbon (R-14, R-18, R-26, R-35, R-42, R-72) (pkg. of 5)	.60
RQ-073	RESISTOR--3900 ohm, ½ watt carbon (R-34) (pkg. of 5)	.60
*RQ-075	RESISTOR--4700 ohm, ½ watt carbon (R-38) (pkg. of 5)	.60
*RQ-097	RESISTOR--39,000 ohm, ½ watt carbon (R-31) (pkg. of 5)	.60
*RQ-099	RESISTOR--47,000 ohm, ½ watt carbon (R-50, R-53, R-73, R-75)(pkg. of 5)	.60
*RQ-103	RESISTOR--68,000 ohm, ½ watt carbon (R-27, R-36, R-79, R-80)(pkg. of 5)	.60
*RQ-107 (RR-050)	RESISTOR--100,000 ohm, ½ watt carbon (R-28, R-39) (pkg. of 5)	.70
*RQ-117	RESISTOR--270,000 ohm, ½ watt carbon (R-37, R-46, R-47) (pkg. of 5)	.70
*RQ-131 (RR-067)	RESISTOR--1 meg. ½ watt carbon (R-15) (pkg. of 5)	.70
*RQ-139	RESISTOR--2.2 meg. ½ watt carbon (R-19, R-40, R-82) (pkg. of 5)	.70
RQ-499	RESISTOR--47,000 ohm, 1 watt carbon (R-41) (pkg. of 5)	.75
*RR-016	RESISTOR--5000 ohm, ½ watt carbon (R-17, R-23, R-33) (pkg. of 5)	.70
*RR-163	RESISTOR--2000 ohm, ½ watt carbon (R-48) (pkg. of 5)	.70
*RR-281	RESISTOR--40,000 ohm, 2 watt carbon (R-43)	.30
RR-304	RESISTOR--.8 ohm, ½ watt flexible (R-68) (pkg. of 5)	.70
RR-601	RESISTOR--2.5 ohm, 5 watt vitreous (R-77)	.30
RR-602	RESISTOR--2.0 ohm, 5 watt vitreous (R-78)	.30
*RR-627	RESISTOR--3700 ohm, 10 watt vitreous (R-21, R-22)	.45
*RR-628	RESISTOR--5000 ohm, 10 watt vitreous (R-32, R-44)	.45
*RR-631	RESISTOR--10,000 ohm, 10 watt vitreous (R-49)	.45
*RR-712	RESISTOR--1270 ohm, 20 watt vitreous (R-20)	.45

Stock No.	Description	List Price
*RR-900	REFLECTOR--Dial light reflector	.15
*RS-126	SHIELD--Fidelity diode socket shield can	.15
*RS-127	SHIELD--Selectivity diode socket shield can	.15
*RS-128	SHIELD--1st I.F. 6K7 tube socket shield can	.30
*RS-129	SHIELD--2nd I.F. 6K7 tube socket shield can	.30
*RS-130	SHIELD--Fidelity 6K7 tube socket shield can	.30
*RS-134	SHIELD--Base shield with mounting feet (for A-205E only)	2.75
*RS-135	SHIELD--Base shield with mounting feet (for A-208E only)	2.80
*RS-200	SOCKET--Eight-pin tube socket (pkg. of 5)	.75
*RS-319	SWITCH--Toggle switch next to fidelity 6K7 socket shield (S-8)	1.90
*RS-320	SWITCH--Double pole-double throw switch (S-7)	2.45
*RS-413	SPRING--Spring on back end of changeover shaft (pkg. of 4)	.10
*RS-414	SPRING--Spring on switching link (pkg. of 4)	.10
*RS-903	SHAFT--Fidelity switch shaft assembly (used on A-205E only)	4.75
*RS-904	SHAFT--Fidelity switch shaft assembly (used on A-208E only)	4.75
*RT-709	VOLUME CONTROL--Bass volume control, 100,000 ohms - (R-54)	1.20
RV-024	VOLUME CONTROL--500,000 ohm volume control (for A-205E only)(R-81)	
RV-025	VOLUME CONTROL--500,000 ohm volume control (for A-208E only)(R-81)	
RV-026	VOLUME AND TONE CONTROL--High frequency audio channel volume control (for A-205E only) (R-45, R-74, S-9)	
RV-027	VOLUME AND TONE CONTROL--High frequency audio channel volume control (for A-208E only)(R-45, R-74, S-9)	
*RW-002	WINDOW--Dial window (used on A-205E)	.15
*RW-003	WINDOW--Dial window (used on A-208E)	.35
*RW-101	WASHER--Felt washer for control shafts (pkg. of 10)	.45
*RX-004	SCREW ASSEMBLY--Chassis mounting screw assembly	.10

"SENTRY BOX" ASSEMBLIES

*RC-504	CAPACITOR--10 mfd., 25 V. dry electrolytic (C-51)	.70
*RC-512	CAPACITOR--50 mfd., 50 V. dry electrolytic (C-107)	1.75
*RC-515	CAPACITOR--16 mfd., 500 V. dry electrolytic (C-104, C-105)	2.70
*RC-751	CAPACITOR--.01 mfd., 250 V. A-C twin line capacitors (C-108, C-109)	.45
*RC-813	CABLE--Cable and female plug for connection to phono lamp cable (for A-208E only)	.90
*RC-814	CABLE--Cable and female plug for connection to phonograph motor	.90
*RC-859	CORD--Power cord	.60
*RC-978	COVER--Fuse cover	.10
*RF-009	FOOT--SPU chassis mounting foot assembly	.25
RF-305	FUSE--Plug type 6 amp fuse (F-1)	.20
*RL-304	CHOKE--Filter reactor (L-11)	7.45
*RQ-051	RESISTOR--470 ohm, ¼ watt carbon (R-57, R-58) (pkg. of 5)	.60
*RQ-099	RESISTOR--47,000 ohm, ¼ watt carbon (R-69, R-76) (pkg. of 5)	.60
*RQ-459	RESISTOR--1000 ohm, 1 watt carbon (R-56)	.15
RQ-666	RESISTOR--2000 ohm, 2 watt carbon (R-60)	$ .30
RQ-691	RESISTOR--22,000 ohm, 2 watt carbon (R-55)	.35
*RR-309	RESISTOR--15 ohm, 1 watt flexible (R-70, R-71) (pkg. of 5)	.90
*RR-606	RESISTOR--210 ohm, 5 watt vitreous (R-83)	.30
*RR-628	RESISTOR--5,000 ohm, 10 watt vitreous (R-51, R-52)	.45
*RR-705	RESISTOR--50 ohm vitreous enameled (R-61, R-62, R-63, R-64, R-65, R-66)	.40
*RR-709	RESISTOR--450 ohm vitreous enameled (R-59)	.40
*RR-710	RESISTOR--40 ohm center tapped candohm (R-67)	.35
*RR-851	RECEPTACLE--Fuse receptacle	.45
*RS-207	SOCKET--6-prong socket for speaker plugs	.35
*RS-208	SOCKET--8-prong socket receiver chassis plug	.25
*RT-191	TRANSFORMER--Power transformer 105-130 volt, 60 cycle (T-3)	25.90
*RT-406	TRANSFORMER--High frequency channel output transformer (T-5)	1.90
*RT-410	TRANSFORMER--Low frequency channel output transformer (T-1)	10.25
*RT-503	TRANSFORMER--High frequency channel interstage transformer (T-4)	10.30
*RT-505	TRANSFORMER--Low frequency channel interstage transformer (T-2)	5.60
*RW-103	WASHER--Insulating washer for mounting capacitor (C-106) (pkg. of 10)	.20
*RW-104	WASHER--Insulating washer for mounting (C-105 and C-104) (pkg. of 4)	.15

DIAL MECHANISM ASSEMBLY

*RB-114	BRACKET--Precision tuning indicator bracket (14)	.15
*RB-120	BRACKET--Dial mechanism supporting post	.15
*RB-125	BRACKET--Mounting bracket assembly	.90
*RB-126	BRACKET--Dual lamp bracket	.25
*RC-802	CABLE--Metal braid dial cable (12) (pkg. of 5)	.55
*RC-856	CORD--Dial cord (11) (pkg. of 5)	.65
*RC-954	CAP--Scale cap assembly gear end (29)	.10
*RC-955	CAP--Scale cap free end (30)	.10
*RC-957	COLLAR--Microlog retaining split collar (pkg. of 5)	.10
*RC-962	COLLAR--Precision drive gear shaft collar external (44)	.15
*RC-963	COLLAR--Precision drive gear shaft collar internal (45)	.15
*RD-009	DRUM--Tuning condenser drive drum and gear teeth	.45
*RD-010	DIAL--Precision dial and pinion gear (20)	.60
*RD-022	DRIVE--Differential reduction drive (for A-205E only)	1.00
*RD-023	DIAL--Cylindrical dial scale	.65
*RD-026	DRIVE--Differential drive (for A-208E only)	1.00
*RF-200	FASTENER--Dial fastener (40) (pkg. of 10)	.10
*RG-002	GEAR--Dial gear assembly and set screws, (8 and 9) 2 screws fil. hd. 4-40 x 5/32 cup pt.	.15
*RG-003	GEAR--Precision dial drive gear (17)	.15
*RG-004	GEAR--Precision dial backlash gear (36)	.15
*RG-200	GUIDE--Dial pointer guide (50) (pkg. of 5)	.15
*RI-004	INDEXING PLATE--Front plate and set screw for band switch shaft	.50
*RP-033	POINTER--Dial pointer (for A-205E only)(pkg. of 2)	.20
*RP-038	POINTER--Dial pointer (for A-208E only)	.15
*RS-401	SPRING--Drum spring (13) (pkg. of 2)	.10
*RS-402	SPRING--Precision dial backlash spring (16)	.15
*RS-403	SPRING--Dial scale spring (7) (pkg. of 2)	.10
*RS-500	STUD--Precision dial gear stud	.20
*RS-905	SHAFT--Round and flat shafts and gear for band change switch (6) (for A-208E only)	.45
*RS-906	SHAFT--Round and flat shafts and gear for band change switch (6)	.40

SPEAKER ASSEMBLIES

(11-Inch Speaker Assembly)

*RB-035	BOARD--Speaker terminal board assembly	.10
*RC-811	CABLE--Speaker cable	.40
*RC-903	CONE--11-inch type cone, voice coil and gasket	1.50
*RC-960	CLAMP--Speaker cable clamp	.10
*RC-984	CUSHION--Rubber speaker mounting cushion (pkg. of 8)	.30
*RP-037	PLUG--6-pin speaker plug	.25
*RR-801	RING--Cone clamping ring (pkg. of 4)	.40
*RS-021	SPEAKER--Single 11-inch type speaker (complete)	17.50
*RX-014	SCREW ASSEMBLY--Nuts, bushings, and washers for mounting one speaker	.50

(8-Inch Speaker Assembly)

RC-921	CONE--8-inch type cone and voice coil	1.20
*RC-990	CLAMP--8-inch cone spider clamp	.05
*RP-012	PLUG--Female speaker plug	.20
*RP-015	PLUG--Male speaker plug	.20
RS-052	SPEAKER--8-in. type high-frequency channel speaker (with output transformer)	8.00
*RT-406	TRANSFORMER--Output transformer (T-5)	1.90

RECORD CHANGING MECHANISM MODEL A-208E

*RC-965	CAM--Cam and gear assembly	$1.18
*RC-966	CLUTCH--Trip lever frictional clutch	.30
*RC-967	COVER--Metal cover for trip lever and friction finger assembly	.36
*RF-400	FINGER--Manual index lever finger assembly	.25
*RF-401	FINGER--Friction finger assembly	.32
*RL-901	LEVER--Manual index lever less pin	.62
*RL-902	LEVER--Main lever and link assembly	2.10
*RL-903	LEVER--Main spring lever	.42
*RL-904	LEVER--Pickup arm cable lever assembly	.40
*RL-905	LEVER--Trip lever and friction clutch assembly	.94
*RP-018	PAWL--Trip pawl assembly	.40
*RP-019	PLATE--Eject arm actuating plate assembly	.50
*RS-405	SPRING--Actuating spring (pkg. of 10)	.24
*RS-406	SPRING--Cable lever tension spring (pkg. of 10)	.44
*RS-407	SPRING--Manual index lever finger tension spring (pkg. of 10)	.30
*RS-408	SPRING--Main spring lever tension spring (pkg. of 10)	.38
*RS-409	SPRING--Trip lever latch plate tension spring (pkg. of 10)	.30
*RS-850	SCREW--Cable lever screw and nut (pkg. of 10)	.60
*RS-851	SCREW--Manual index lever set screw (pkg. of 10)	.20
*RS-852	SCREW--Trip lever clutch tension adjustment screw (pkg. of 10)	.22
*RS-853	SCREW--Special screw fastening main lever and link assembly bushing (pkg. of 10)	.30
*RS-950	SPACER--Pickup arm mounting spacer	.28
*RW-100	WASHER--Spring washer "U" type (pkg. of 10)	.25

EJECT ARM ASSEMBLIES

*RA-400	ARM--Eject arm complete	.82
*RB-121	BRACKET--Eject arm bracket	1.72
*RB-300	BALL--1/16-in. diameter steel ball (pkg. of 10)	.20
*RB-301	BALL--3/16-in. diameter steel ball (pkg. of 20)	.25
*RB-400	BEARING--Ejector tip bearing and nut	.32
*RC-968	COLLAR--Eject arm shaft collar and set screw	.24
*RC-969	COVER--Eject arm cover	1.52
*RC-970	CUSHION--Counterbalance roller cushion located inside of eject arm	.14
*RP-020	POST--Vertical adjustment post located on eject arm bracket	.30
*RR-901	ROLLER--Eject arm counter balance roller	.45
*RS-410	SPRING--Eject arm bracket spring (pkg. of 10)	.30
*RS-411	SPRING--Ejector tip spring (pkg. of 10)	.42
*RS-501	SILENCER--Ejector tip silencer	.14
*RS-854	SCREW--6-32 x 3/16" square head set screw for eject arm collar (pkg. of 10)	.25
*RS-855	SCREW--8-36 x 7/32" special for eject arm tip center adjustment (pkg. of 10)	.14
*RS-902	SHAFT--Eject arm vertical action shaft and collar assembly	.15
*RT-900	TIP--Ejector tip with tip center adjusting screw and cap	.32
*RY-001	YOKE--Eject arm yoke assembly	.94

PICKUP AND ARM ASSEMBLIES

*RA-401	ARM--Pickup arm complete less pickup mounting screw escutcheon and pickup unit	4.80
*RA-500	ARMATURE--Pickup armature	.72
*RB-600	BACK--Pickup back	.52
*RC-806	CABLE--Pickup arm operating cable (Pkg. of 5)	1.00
*RC-971	COVER--Pickup front cover	.22
*RC-972	COVER--Pickup back cover with mounting screw	.14
*RD-100	DAMPER--Pickup damper (Pkg. of 5)	.65
*RL-800	COIL--Pickup coil	.80
*RL-801	COIL--Pickup hum bucking coil	.60
*RP-021	PICKUP--Pickup unit complete	4.80
*RS-856	SCREW--Pickup cover screw (Pkg. of 10)	.42
*RS-857	SCREW--Pickup needle screw (Pkg. of 10)	.42
*RX-007	SCREW ASSEMBLY--Screw, nut and washer for mounting pickup to arm (Pkg. of 10)	.40

MOTOR BOARD ASSEMBLIES

*RC-973	COVER--Turntable cover	$.88
*RE-006	ESCUTCHEON--Index escutcheon manual 12-10	.44
*RN-002	NUT--Cap nut for motor board suspension assembly (Pkg. of 4)	.40
*RP-022	PIN--Manual index pin	.42
*RR-902	ROLLER--Pickup arm cable guide roller, bracket roller and pin	.34
*RR-903	REST--Pickup rest	.14
*RS-307	SWITCH--Motor toggle switch	.72
*RT-901	TURNTABLE--Turntable complete	2.90
*RX-008	SPRING ASSEMBLY--Suspension spring, washer and bolt assembly for motor board - comprising one bolt, two cup washers, two springs, two "C" washers and one cap nut	.42

AUTOMATIC SWITCH ASSEMBLIES

*RC-974	COVER--Motor switch cover	.26
*RP-023	PLATE--Automatic brake latch plate (Pkg. of 5)	.40
*RS-308	SWITCH--Automatic switch complete	1.90
*RS-309	SWITCH--Motor switch	.75
*RS-412	SPRINGS--Automatic brake springs (Pkg. of 2)	.50
