MODELS 8T8E 8C8E AND 13C8-E

ALIGNMENT AND CALIBRATION

This Radio was properly aligned at the factory with precision instruments and realignment should not be attempted unless all other possible causes of the faulty operation have first been investigated and unless the service technician has the proper equipment.

A signal generator that will provide an accurately calibrated signal at 460, 1715, 1300, 600, 5400, 9000, 14400, 16200, 17400 and 18000 K.C. and an output indicating meter or V.T. volt meter are required. It will be practically impossible to align the receiver if unsatisfactory apparatus is used.

Use a non-metallic screwdriver for the adjustments. The complete procedure is as follows:

I. F. AMPLIFIER ADJUSTMENT

Adjust signal generator to give proper output at 460 K.C. Connect the output of the signal generator to the antenna of the receiver.

Connect the ground lead of the receiver to the ground post of the signal generator.

Turn the band switch to Range A. position (Standard wave band). Connect the vacuum tube volt meter to the A.V.C. buss of the receiver and adjust trimmers in the I.F. stage to resonance. During this procedure short out the front or oscillator section of the variable tuning condenser. Broad and sharp switch should be turned to extreme left position—**sharp**—for all alignments.

RANGE A ALIGNMENT - 525 to 1750 K.C.

Turn the rotor of the tuning condenser to full maximum position. Set both ends of pointer to true horizontal line.

1. Turn pointer to 1712 K.C. and set signal generator output to 1712 K.C. and adjust oscillator high frequency trimmer "A1" for maximum output.
2. Turn pointer to 600 K.C. and adjust signal generator to 600 K.C. output. Then use low frequency trimmer "A" and adjust for maximum output.
3. Turn pointer to 1300 K.C. and set signal generator output to 1300 K.C. and adjust modulator high frequency trimmer "A2" and "A3" radio frequency stage for maximum output.

Then turn pointer to 600 K.C. and readjust trimmer "A" but do not adjust "A2" and "A3" at this point.

RANGE B ALIGNMENT - 1700 to 5800 K.C.

1. Turn pointer to 5400 and set signal generator at 5400 K.C. and adjust high frequency trimmer "B1" to resonance of 5400 K.C. on the dial.
2. Turn pointer to 1800 K.C. and adjust signal generator to 1800 K.C. output. Then use low frequency trimmer B.
3. Then repeat No. 1 operation and also adjust "B2" and "B3."

RANGE C ALIGNMENT - 18000 to 5400 K.C.

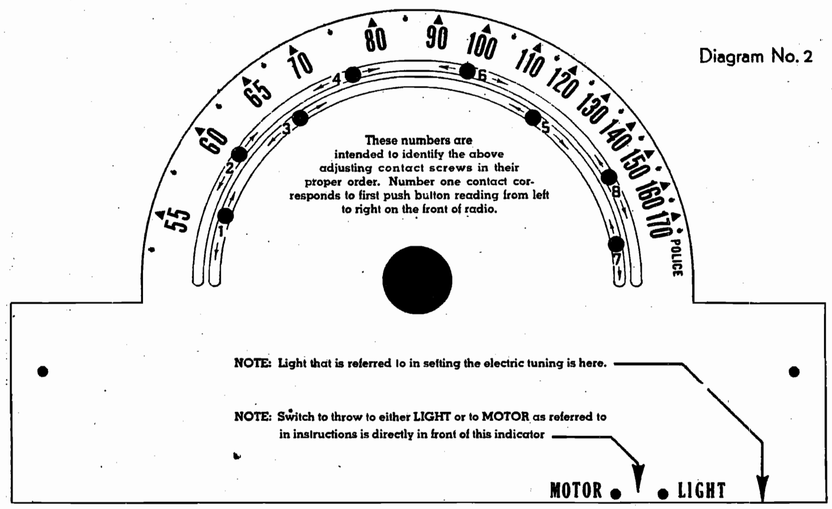
1. Turn pointer to 18 Meg. and set signal generator at 18 Meg. and adjust high frequency trimmer "C1" to resonance at 18 Meg. on dial. Then adjust trimmer "C2" and "C3" for maximum output.
2. Turn pointer to 6000 K.C. and set signal generator at 6000 K.C. and adjust low frequency trimmer "C" for maximum output.

CAUTION

During this procedure it is very easy to set the oscillator high frequency trimmer on the image side of signal which will give incorrect alignment. The oscillator trimmers are always tuned to a frequency that is higher than that of the true signal that the receiver is receiving.

NOTE—In the event this receiver does not operate properly—consult your **Dealer or Serviceman.**

Diagram No. 2



STEPS FOR SETTING ELECTRIC TUNING OF GILFILLAN ELECTRIC TUNING RADIO

Select eight most desired stations in your locality. Arrange in order kilocycles, i.e. station operating on lowest K.C. first, next lowest second, and so on.

Refer to diagram No. 1 showing numbering of buttons. Assign station with lowest K.C. to button No. 1, next lowest to button No. 2, and so on. From chart of stations furnished, cut out index card for stations selected and insert in slot directly above buttons.

To set selector buttons to tune desired stations:

1. Turn Number 1 knob to extreme left.
2. Hand tune the station desired to be selected by selector button.
3. Push in the selector button for which you are setting station.
4. At rear of chassis throw toggle switch to "light" (see diagram No. 2).
5. Loosen slightly the adjusting contact screw of number to correspond with button being set.
   Move adjusting contact screw to right or to left until light (see diagram No. 2) goes out, then tighten adjusting contact screw.
6. Throw switch to "motor."
7. By hand turn pointer away from station that has been selected.
8. Turn Number 1 knob to extreme right (motor tuning) position and station indicator should turn automatically back to station you have just set.

For each station you wish to set, follow this same series of steps.

The motor that operates the automatic feature of the dial is thermostatically controlled. After ten minutes of constant operation the motor will automatically cut "off."—Do not get alarmed or call your service man.—This is merely a protective feature and as soon as the motor cools to operating temperature the motor will cut "on" again.

REMOTE CONTROL

If Remote Control is purchased for this radio, merely insert plug into plug socket immediately in rear of condenser gang. Cut out station index cards from chart and insert in slots directly above buttons so that stations indicated on remote control buttons correspond to buttons on receiver.

To use Remote Control, all buttons on receiver must be released. This is done by pushing in either "scan" button on the set. Before buttons on receiver can be used after using Remote Control, Remote buttons must be released by pushing in "Release" button.

SWITCH SHOWN AT SW. POSITION

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 40 and 60 cycles and with primary taps for 108, 125, 150, 220 and 250 volts (see illustrations) and also sometimes equipped with 25 cycle transformers with 105-115 volt or 220 volt primaries, not universals.

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagrams of series "A", "B", and "C". All voltages are measured with 119 volts on the primary of the power transformer. Resistance of coils and transformer windings are indicated in ohms on schematic circuit diagram.

Series "B" and "C" may be identified by the letter "B" and "C" at the end of the serial numbers.

Series "B" and "C" chassis are serially numbered on the back flange of the chassis, series "B" beginning with number "5A100510B" and up; series "C" chassis, beginning with number "5B105635C", differs only from series "B" in that the I.F. frequency was changed from 370 to 465 kilocycles.

Series "A" chassis are equipped with dry electrolytic filter condensers and are serially numbered on paper tags which are attached to the line cord and to the inside of the cabinet.

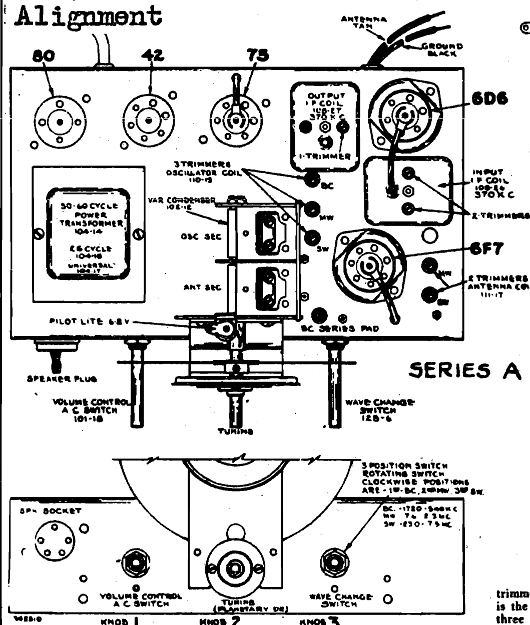
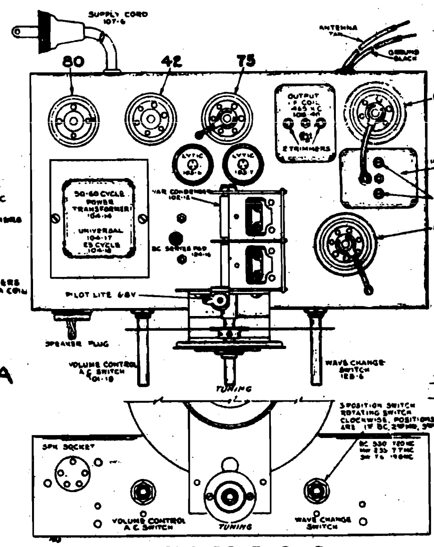
Alignment

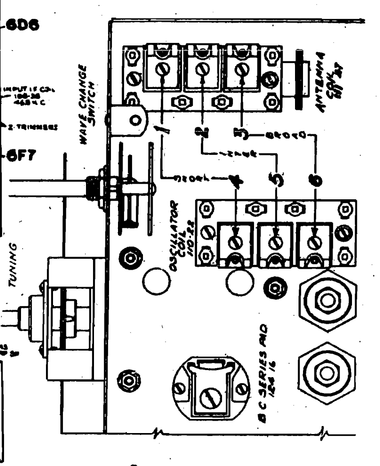
GOODYEAR SERVICE



SERIES A



SERIES B & C



Bottom View of Chassis Series B and C

ALIGNING INSTRUCTIONS—SERIES A

Description of various dummy antennas used and referred to in these instructions:

(1) I.F. Dummy—Consists of a .1 mfd. condenser connected in series with the external oscillator.
(2) Broadcast Dummy—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.
(3) Intermediate and Short Wave Dummy—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

Resonance Indicator:
Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 42 output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range volt meter should be used.

SERIES A

Alignment

No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet. To remove the knobs, pull them off and to take the chassis out of the cabinet, remove the three bolts by which it is fastened and the speaker plug which you will find on the front flange of the chassis.

Aligning I. F. Transformers

1. With volume control full on, the extreme right of its rotation, and with wave changing switch in the broadcast position, extreme left of its rotation, and with variable condenser at its minimum capacity position, plates entirely out of mesh, adjust the I.F. transformers (adjustments at the top of parts number 108-26 and 108-27—see top view).
   (a) Connect external oscillator in series with I.F. dummy antenna. With external oscillator adjusted to 370 kilocycles, in series with I.F. dummy antenna to the control grid cap of the type 6D6 tube and chassis ground, adjust output I.F. transformer, part number 108-27, to resonance.

Note: Output I.F. transformer, part number 108-27, has only one adjustment.

   (b) Move generator output clip from grid of 6D6 to grid cap of type 6F7 tube and align input I.F. transformer, part number 108-26, to resonance. NOTE: IT IS EXTREMELY NECESSARY TO ALIGN BOTH I.F. STAGES SEPARATELY.

Broadcast Band Alignment—
(540 - 1720 Kilocycles)

1. With wave changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with broadcast dummy antenna to tan antenna lead and black ground lead, make the following adjustments:
   (a) Set external oscillator to 1720 kilocycles and adjust oscillator trimmer to resonance. This adjustment is the rear adjustment of a group of three located next to the variable condenser.
   (b) Readjust external oscillator to 600 kilocycles and adjust broadcast series pad to resonance by rotating condenser to approximately 600 kilocycles, rocking it slowly to and fro until by adjusting pad maximum output is attained. This adjustment is located at the front of the chassis next to the variable condenser and wave changing switch.
   (c) Check for tracking and sensitivity at 1400 and 1000 kilocycles. Note: It is extremely necessary in making all of the above adjustments that the fundamental signal of the oscillator be tuned in and not the image frequency, which will fall below the fundamental.

Short Wave Band Alignment—
(7.5 - 23.0 Megacycles)

1. This band is aligned after the I.F. adjustments have been completed. Set wave selector switch in the short wave position, extreme right of its rotation, set pointer of dial to 21 megacycles.
   (a) With external oscillator set at 21 megacycles, and connected to the tan antenna lead in series with the short wave dummy and to the black ground lead, adjust the oscillator short wave trimmer until generator signal is picked up. This trimmer is the one closest to the front of the chassis of the group of three trimmers located next to the gang condenser (see top view of chassis).
   (b) Adjust short wave antenna trimmer to resonance. This adjustment is to the right of the 6F7 tube and is the one closest to the front of the chassis (see top view).
   (c) Re-set external oscillator to 9 megacycles and pick up oscillator signal by rotating variable condenser, moving dial pointer. Check for tracking and sensitivity and do not bend plates. Note: It is extremely necessary in making all of the above adjustments that the fundamental signal of the oscillator be tuned in and not the image frequency, which will fall below the fundamental.

Intermediate Band Alignment—
(2.3 - 7.6 Megacycles)

1. With wave selector switch in the center position and with dial pointer set to 7 megacycles, makes the following adjustments:
   (a) With external oscillator set at 7 megacycles and connected in series with the short wave dummy antenna to the tan antenna lead and black ground lead, same as for short wave adjustments, adjust center trimmer of oscillator coil, part number 110-13, until 7 megacycle signal is picked up. This is the center adjustment of a group of three located next to the gang condenser (see top view).
   (b) Adjust antenna trimmer to resonance, this adjustment is the rear of a group of two located at the right of the chassis next to the 6F7 tube (see top view).
   (c) Re-set external oscillator to 2.5 megacycles (2500 kilocycles), pick up signal by rotating condenser and moving dial pointer. Check for tracking and sensitivity. Do not bend plates. Note: It is extremely necessary in making all of the above adjustments that the fundamental signal of the oscillator be tuned in and not the image frequency, which will fall below the fundamental.

Service Notes

To check for open by-pass condensers, shunt each condenser with another of similar capacity and of the same voltage rating, which is known to be good, until the defective unit is located. Open by-pass condensers frequently cause oscillation and distorted tone. Defective and shorted electrolytic filter condensers cause excessive hum, motor-boating, low volume and a reduction in all D.C. voltages. Open or shorted electrolytic and by-pass condensers (across bias resistor of type 42 tube) will cause low volume and distorted tone.

Should the planetary vernier dial drive mechanism fail to function properly, it will probably be found to be due to a cracked or broken compression spring. The drive may be disassembled to replace the compression spring (part number 112-31) by removing the two screws which fasten it to the dial bracket. Before reassembling all parts should be carefully cleaned and a small amount of vaseline applied to the ball bearings. All other dial parts are hardened and should cause no trouble.

Notes—(Series "A" Only)

25 Cycle chassis differ from regular 60 cycle and 40 cycle chassis in that a larger electrolytic filter condenser is used. The regular condenser is part number 119-11 and the larger unit for the 25 cycle chassis is part number 119-12.

Part number 106-18, a metal clad resistor, consists of the following sections with resistances and wattages as noted: one, 500 ohms; one, 35 ohms, one, 200 ohms, all 1/3 watt, plus or minus 10%.

ALIGNING INSTRUCTIONS—SERIES "B" & "C"

Note: These instructions are written for series "C". The instructions are identical for series "B", except that for series "B" the I.F. frequency is 370 kilocycles and for series "C", 465 kilocycles. Also, the I.F. transformers are different:

Series "B"
Part No. 108-26—Input I. F. Trans.
Part No. 108-28—Output I. F. Trans.
Series "C"
Part No. 108-38—Input I. F. Trans.
Part No. 108-40—Output I. F. Trans.

Description of various dummy antennas used and referred to in these instructions:

(1) I.F. Dummy—Consists of a .1 mfd. condenser connected in series with the external oscillator.
(2) Broadcast Dummy—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.
(3) Intermediate and Short Wave Dummy—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

Aligning I. F. Transformers

1. With volume control full on, the extreme right of its rotation, and with wave changing switch in the broadcast position, extreme left of its rotation, and with variable condenser at its minimum capacity position, plates entirely out of mesh, adjust the I.F. transformers (two adjustments at the top of parts number 108-38 and 108-40—see top view).
   (a) Connect external oscillator which has been adjusted to 465 kilocycles in series with I.F. dummy antenna, to the control grid cap of the type 6D6 tube and chassis ground. Adjust output I.F. transformer, part number 108-40, to resonance.
   (b) Move generator output clip from grid of 6D6 to grid cap of 6F7 tube and align input I.F. transformer, part number 108-38.
   (c) With generator connected to grid of type 6F7 tube, readjust output I.F. transformer, part number 108-40, to resonance.

Broadcast Band Alignment—
(530 - 1720 Kilocycles)

1. With wave changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with broadcast dummy antenna to tan antenna and black ground leads and make the following adjustments:
   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance, for location of this adjustment, number 6, see diagram.
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. For location of this adjustment, number 3, see diagram.
   (c) Re-set external oscillator to 600 kilocycles and adjust series pad to resonance, rotate condenser and move dial pointer to 600 kilocycles by gently rocking condenser to and fro. Pick up oscillator signal while adjusting series pad to resonance, maximum deflection on an output meter. This adjustment is accessible from the top of the chassis and is located between variable condenser and power transformer, see top view—part number 124-16.
   (d) Check for tracking and sensitivity at 1000 kilocycles.

NOTE. (Series "B" and "C" Only)
25 Cycle Chassis differ only from 60 cycle chassis in that part number 104-18 transformer is used in place of 50/60 cycle transformer, part number 104-14.

Short Wave Band Alignment—
(7.6 - 19.0 Megacycles)

1. This band is aligned after the I.F. adjustments have been completed. Set wave changing switch to short wave position, extreme right of its rotation, set dial pointer to 18 megacycles.
   (a) With external oscillator adjusted to 18 megacycles and connected in series with short wave dummy antenna to tan antenna and black ground leads, adjust the oscillator short wave trimmer until generator signal is picked up. For location of this adjustment, number 4, see diagram.
   (b) Adjust short wave antenna trimmer to resonance. For location of this adjustment, number 1, see diagram.
   (c) Re-set external oscillator to 9 megacycles, rotate condenser, move dial pointer to 9 megacycles and check for tracking and sensitivity. Do not bend plates. Note: It is extremely necessary in making all of the above adjustments that the fundamental signal of the oscillator be tuned in and not the image frequency, which will fall below the fundamental.

Intermediate Band Alignment—
(2.35 - 7.7 Megacycles)

1. With wave changing switch in center position, and with dial pointer set to 7 megacycles, make the following adjustments:
   (a) With external oscillator set at 7 megacycles and connected in series with short wave dummy antenna, as for short wave adjustments, adjust trimmer of oscillator coil, part number 110-22 until 7 megacycle signal is picked up. For location of this adjustment, number 5, see diagram.
   (b) Adjust antenna trimmer to resonance, adjustment number 2, see diagram.
   (c) Re-set external oscillator to 2.5 megacycles (2500 kilocycles), rotate variable condenser, move pointer, pick up oscillator signal and check for tracking and sensitivity. Note: It is extremely necessary in making all of the above adjustments that the fundamental signal of the oscillator be tuned in and not the image frequency, which will fall below the fundamental.

Alignment

GOODYEAR SERVICE

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer or by means of an adapter between the plate and screen terminals of the type 6F6 output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-92 Output I.F. Transformer
Part No. 108-93 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-92) to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap of 6J7 and adjust input I.F. transformer (No. 108-93) to resonance.

BROADCAST BAND ALIGNMENT:

535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to antenna and ground leads make following adjustments:
   (a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment number 4; see bottom view of coil assembly, Fig. 3)
   (b) Re-set external oscillator to 1400 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast R.F. trimmer (adjustment number 6) and broadcast antenna trimmer (adjustment number 7), to resonance.
   (c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (adjustment number 3), to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3).
   (d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.
   (e) Check for tracking and sensitivity at 1400, 1000, and 600 kilocycles. **Under no circumstances bend plates of variable condenser sections to correct tracking.**

SHORT WAVE BAND ALIGNMENT:

5.35 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the antenna and ground leads, make the following adjustments:
   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator trimmer (adjustment number 1) to resonance.
   (b) Adjust short wave R.F. trimmer (adjustment number 8), and short wave antenna trimmer (adjustment number 9), to resonance.
   (c) Re-set external oscillator and check set at 18.1 megacycles and 6 megacycles for band coverage and sensitivity.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental on the receiver dial. As an example of this a fundamental 17 megacycle signal can be tuned in not only at 17 on the dial but also at approximately 16.1 megacycles.

MIDDLE WAVE BAND ALIGNMENT:

1695 to 5500 Kilocycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5 megacycles and connected in series with "Dummy 3" to the antenna and ground leads make the following adjustments:
   (a) Move dial pointer to 5 megacycles and adjust middle wave oscillator trimmer (adjustment number 2) to resonance.
   (b) Adjust middle wave R.F. trimmer (adjustment number 10), and middle wave antenna trimmer (adjustment number 5), to resonance.
   (c) Re-set external oscillator and check sensitivity at 1800 kilocycles.
   (d) Recheck broadcast band alignment.

ANTENNA AND GROUND LEADS:

You will notice three wires coming out of the back of the chassis, — the **yellow** wire and the **black with yellow tracer** wire are used for doublet antenna connections. The **black** wire is the ground connection.

For conventional types of antennas connect the **yellow** wire to the antenna lead and the **yellow with black tracer** and the **black** wire together to the ground lead.

When a doublet antenna is used connect the **yellow** wire and **the yellow with black tracer** wire to the doublet antenna and the solid **black** wire to the ground lead. (See Fig. 1—Top View, page 2).

ANTENNA:

For the best results an outside antenna approximately 75-100 feet long including the lead-in should be used. It should be erected as high as possible and as far from surrounding objects as practical. Both the antenna and lead-in should be placed at right angles to street car lines and incoming power lines and as far from any electrical apparatus which may be in the vicinity (such as elevator motors) as practical.

DESCRIPTION:

The tube complement of this chassis consists of the following metal and octal base glass tubes which are interchangeable with metal tubes:

1—Type 6K7 Remote cut-off pentode R.F. amplifier.
1—Type 6J7—pentode first detector.
1—Type 6C5 Oscillator.
1—Type 6K7 Remote cut-off pentode I.F. amplifier (465 K.C.)
1—Type 6Q7G duplex diode triode second detector, A.V.C. and audio.
1—Type 6F6G—pentode output amplifier.
1—Type 5Y3G or 5W4—high vacuum rectifier.
1—Type 6G5 Cathode ray tuning indicator.

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 25, 40 and 60 cycles and with primary taps for 108, 127, 150, 225, and 260 volts, (see instructions) and also sometimes equipped with 25 cycle transformers with 105-115 volt or 220 volt primaries, not universals.

IN ORDER TO PREVENT SIGNAL FROM ACTING UPON AVC AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.

MODEL 1174
Alignment

GOODYEAR SERVICE

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer or by means of an adapter between the plate and cathode terminals of the 5 prong speaker socket. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of the multi-range meter should be used.

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1," "Dummy 2," and "Dummy 3."

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS (465 K.C.)

Part No. 108-63 Output I.F. Transformer
Part No. 108-64 Input I. F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the underside of chassis (see bottom view Fig. 3).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), the tone control on "Hi" part of the sharp position (as much right rotation as possible without operating the Hi Fidelity switch), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1," to the control grid cap of the type 6K7 tube, located between the two I.F. transformers, and adjust the output I.F. transformer 108-63 to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap to 6J7 and adjust input I.F. transformer (108-64) to resonance.
   (c) With oscillator still connected to 6J7, re-adjust output I.F. transformer if necessary.

SHORT WAVE BAND ALIGNMENT:

5.35 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the antenna and ground leads, make the following adjustments:
   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator trimmer (adjustment number 1) to resonance.
   (b) Adjust short wave R.F. trimmer (adjustment number 8), and short wave antenna trimmer (adjustment number 9), to resonance.
   (c) Re-set external oscillator and check set at 18.1 megacycles and 6 megacycles for band coverage and sensitivity.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental on the receiver dial. As an example of this a fundamental 17 megacycle signal can be tuned in not only at 17 on the dial but also at approximately 16.1 megacycles.

MIDDLE WAVE BAND ALIGNMENT:

1695 to 5500 Kilocycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5 megacycles and connected in series with "Dummy 3" to the antenna and ground leads make the following adjustments:
   (a) Move dial pointer to 5 megacycles and adjust middle wave oscillator trimmer (adjustment number 2) to resonance.
   (b) Adjust middle wave R.F. trimmer (adjustment number 10), and middle wave antenna trimmer (adjustment number 5), to resonance.
   (c) Re-set external oscillator and check sensitivity at 1800 kilocycles.

BROADCAST BAND ALIGNMENT:

535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to antenna and ground leads make following adjustments:
   (a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment number 4; see bottom view of coil assembly, Fig. 3)
   (b) Re-set external oscillator to 1400 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast R.F. trimmer (adjustment number 6) and broadcast antenna trimmer (adjustment number 7), to resonance.
   (c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (adjustment number 3) to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3).
   (d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.
   (e) Check for tracking and sensitivity at 1400, 1000, and 600 kilocycles. **Under no circumstances bend plates of variable condenser sections to correct tracking.**
   (f) Recheck short wave and middle wave band alignment.

ANTENNA AND GROUND LEADS:

You will notice three wires coming out of the back of the chassis, — the yellow wire and the black with yellow tracer wire are used for doublet antenna connections. The black wire is the ground connection.

For conventional types of antennas connect the yellow wire to the antenna lead and the yellow with black tracer and the black wire together to the ground lead.

When a doublet antenna is used connect the yellow wire and the yellow with black tracer wire to the doublet antenna and the solid black wire to the ground lead. (See Fig. 1—Top View, page 2).

ANTENNA:

For the best results an outside antenna approximately 75-100 feet long including the lead-in should be used. It should be erected as high as possible and as far from surrounding objects as practical. Both the antenna and lead-in should be placed at right angles to street car lines and incoming power lines and as far from any electrical apparatus which may be in the vicinity (such as elevator motors) as practical.

Reception on the short wave band can be sometimes improved by means of an approved doublet antenna.

DESCRIPTION:

The tube complement of this chassis consists of the following metal and octal base glass tubes which are interchangeable with metal tubes:

1—Type 6K7 Remote cut-off pentode R.F. amplifier
1—Type 6J7 Pentode first detector
1—Type 6C5 Oscillator
1—Type 6K7 Remote cut-off pentode I.F. amplifier (465 K.C.)
1—Type 6H6 Duplex diode second detector and A.V.C.
1—Type 6F5 First audio amplifier
1—Type 6F6 Triode driver stage
2—Type 6F6 Class AB Output pentodes in push-pull
1—Type 5Z3 High vacuum rectifier
1—Type 6G5 Cathode Ray Tuning Indicator.

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 25, 40 and 60 cycles and with primary taps for 108, 127, 150, 225, and 260 volts, (see instructions) and also sometimes equipped with 25 cycle transformers with 105-115 volt or 220 volt primaries, not universals.

ALIGNMENT PROCEDURE

PRELIMINARY

Output Meter Connections .... Across Loud Speaker Voice Coil
Output Meter Reading to Indicate 1 Watt .... 1.85 Volts
Generator Ground Lead Connection .... Receiver Chassis
Dummy Antenna Value to Be in Series with Generator Output .... See Chart Below
Connection of Generator Output Lead .... See Chart Below
Generator Modulation .... 30%, 400 Cycles
Position of Volume Control .... Fully On

Position of Variable	Generator Frequency	Dummy Antenna	Generator Connection	Trimmer Adjustments (In Order Shown)	Trimmer Function
Closed	456 KC	.1 mfd.	6A7 Grid	T2, T1	I. F.
Fully Open	1580 KC	.0002 mfd.	Antenna Conn.	C16	Oscillator Trimmer
1400 KC	1400 KC	.0002 mfd.	Antenna Conn.	C15	Antenna Trimmer
600 KC	600 KC	.0002 mfd.	Antenna Conn.	C3	Antenna Padder

The variable condenser should be at 600 k.c. for antenna adjustment.

The alignment procedure should be repeated in the original order, step by step, to insure greater accuracy. A final adjustment of antenna padder condenser C3 is always made after the receiver is installed in the car, in order to match the car antenna.

Always keep the output power from the generator at its lowest possible value to prevent the A.V.C. of the receiver from interfering with accurate alignment.

HOW TO ADJUST AND OPERATE THE GOODYEAR WINGS SAFETY AUTOMATIC PUSH-BUTTON TUNING

The automatic tuning feature of your radio makes it possible to set up 6 favorite American broadcast stations and tune them in quickly with the Automatic Tuner.

The Automatic Tuner has 6 adjustable Push-Buttons. Each button can be adjusted for one of your favorite stations. CHOOSE STATIONS FOR PUSH-BUTTON OPERATION HEARD WITH GOOD VOLUME AT ALL TIMES. It is not necessary to use all six buttons, if it is not desired.

INDEX TABS

Cut the call letters of your 6 selected stations from the list supplied (See "Q" in Fig. 1) with your receiver and slip them into the Tab Holder FROM THE TOP with the clear celluloid (see "R" in Fig. 1) in front of the call letters to protect them. Arrange the call letters in the Tab Holder from right to left. Have the call letters of the lowest frequency station at the extreme right and work progressively to the left so that the highest frequency call letters will be at the extreme left.

SETTING PUSH-BUTTONS

1. By means of the Station Selector Knob, tune in WITH THE RIGHT HAND AS ACCURATELY AS POSSIBLE the station having the lowest frequency—that is, your selected station which is tuned in nearest the right-hand side of the dial.

2. After the station has been tuned in accurately with the right hand, continue to hold it in its exact position firmly, and with the left hand loosen the Push-Button to be set up for that station by unscrewing the Push-Button about one turn to the left (counter-clockwise).

3. Continuing to hold the Station Selector Knob in its exact position, PUSH THE PUSH-BUTTON IN ALL THE WAY with the left hand.

4. After the Push-Button has been depressed all the way tighten it gently toward the right (clockwise). Release Push-Button slowly and when in normal position grip button and tighten firmly.

The Push-Button tuning system is now correctly set up for your first selected station of lowest frequency and the Call Letter Tab for this station should be at the extreme right of the Call Letter Holder.

Follow through with this same procedure, setting up the other 5 stations in the order of their frequency—that is, the second station set up will be second lowest in frequency and the third station set up will be third lowest in frequency.

Carefully check each Push-Button for the accuracy of its setting. If, when tuning in any station with its Automatic Push-Button it does not have equal volume or clarity to that obtained with manual tuning, this may indicate the automatic adjustment for that station was not made accurately. Should there be any inaccuracy in any one of the Push-Button adjustments, correction can be made by repeating the above procedure for that button only. Do not reset those Push-Buttons that are accurately adjusted.

No further adjustments are necessary to operate your auto radio automatically or manually. To receive any one of your six selected stations for automatic operation, merely push in ALL THE WAY the Button set up for that station.

Generator Modulation....................30%, 400 Cycles
Position of Volume Control....................Fully On

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTIONS	TRIMMER ADJUSTMENT (In Order Shown)	TRIMMER FUNCTION
Closed	456 Kc.	.1 mfd.	6A7 Grid	T3 - T4	I. F.
Closed	456 Kc.	.0002 mfd.	Antenna Conn.	T5 (Min. Output)	Wave Trap
Fully Open	1750 Kc.	.0002 mfd.	Antenna Conn.	C15	Osc. Trimmer
1400 Kc.	1400 Kc.	.0002 mfd.	Antenna Conn.	C14	Ant. Trimmer
600 Kc.	600 Kc.	.0002 mfd.	Antenna Conn.	C13	Osc. Padder
16 Mc.	16 Mc.	400 ohm	Antenna Conn.	T1	S.W. Ant. Trimmer

The variable condenser should be rocked back and forth a degree or two while making the 600 K.C. adjustment on oscillator padder only.

The alignment procedure should be repeated in the original order, step by step, to insure greater accuracy.

Always keep the output power from the generator at its lowest possible value to prevent the A.V.C. of the receiver from interfering with accurate alignment.

When adjusting T5, Antenna Wave Trap, Trimmer, increase generator output. To obtain clearly defined trimmer setting for a minimum output.

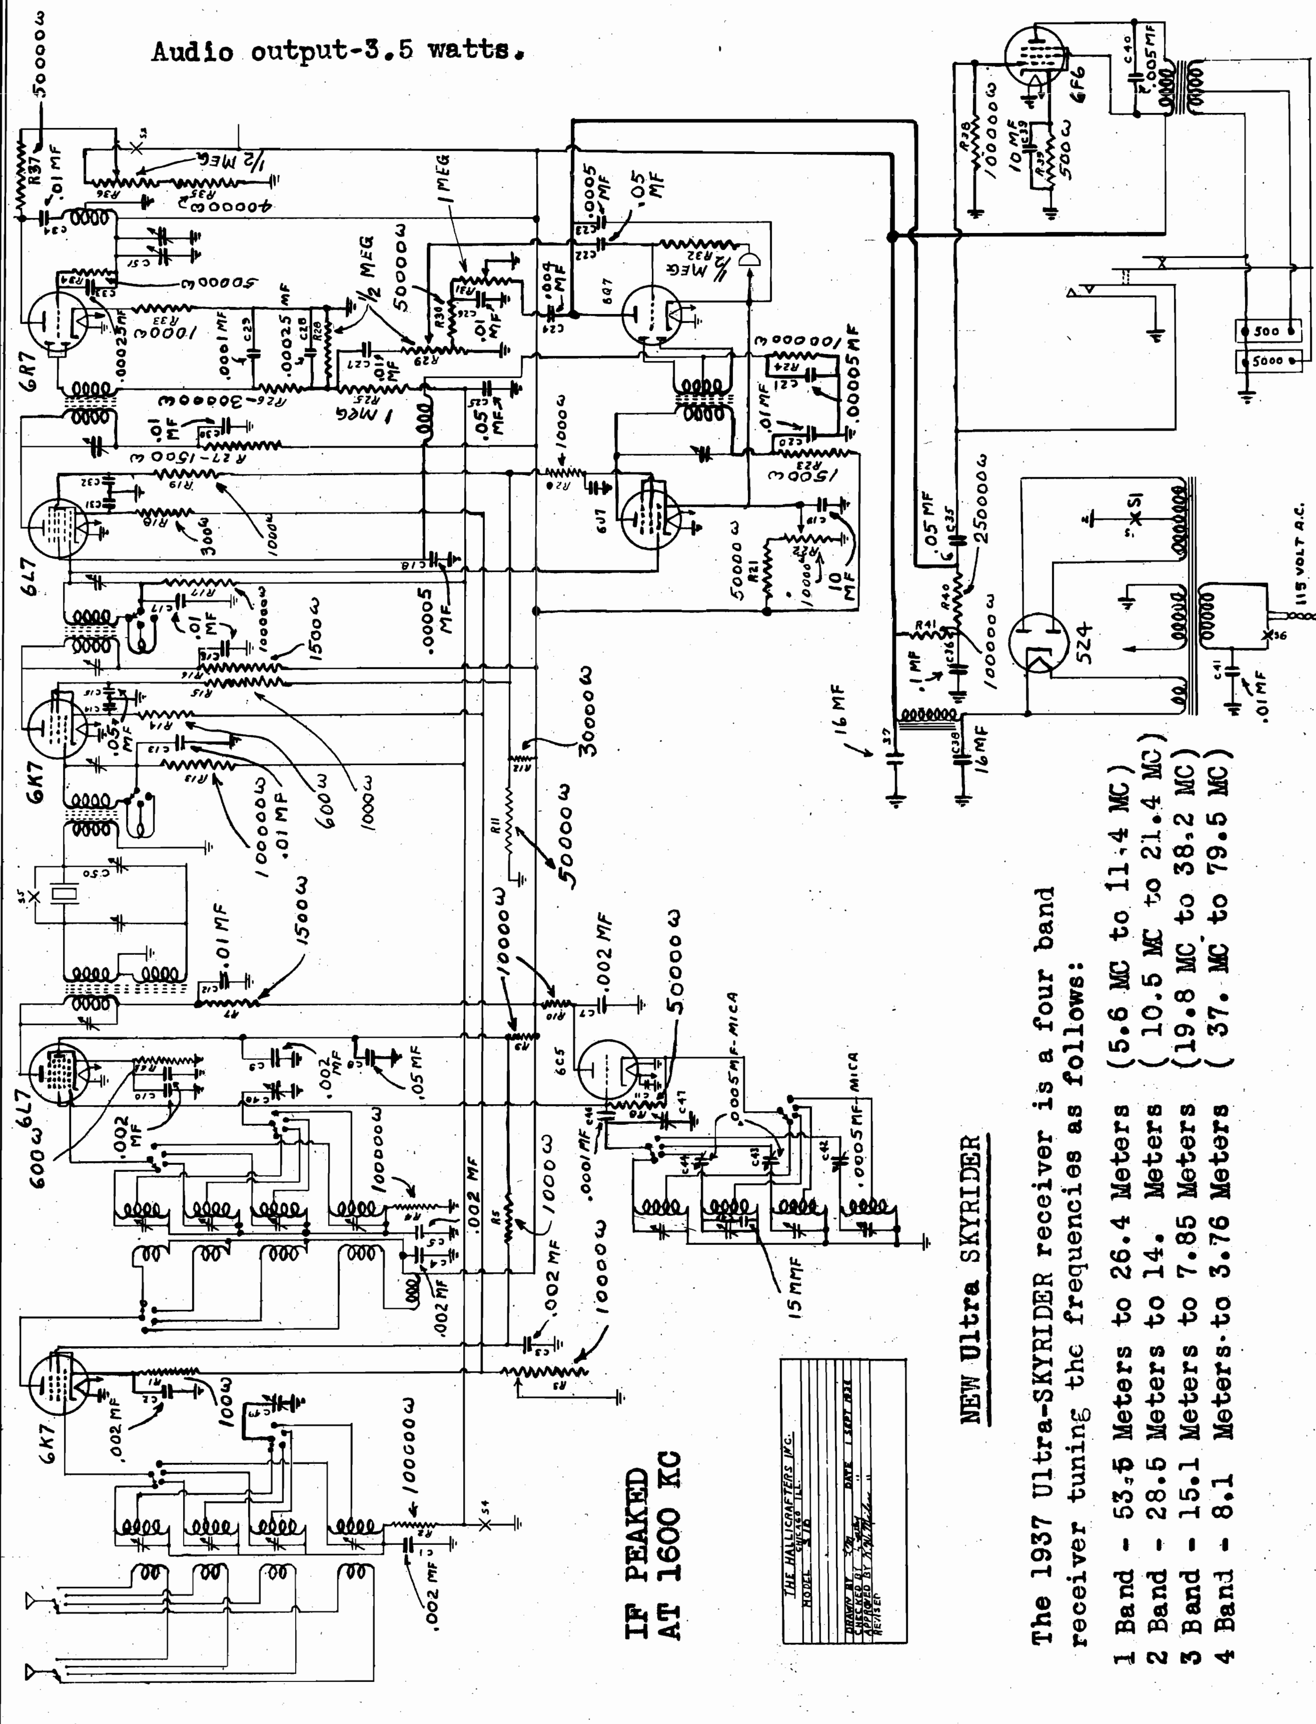
HALLICRAFTERS, INC.

MODEL S-10
Ultra Skyrider
Schematic

Audio output-3.5 watts.



NEW Ultra SKYRIDER

The 1937 Ultra-SKYRIDER receiver is a four band receiver tuning the frequencies as follows:

1 Band - 53.5 Meters to 26.4 Meters (5.6 MC to 11.4 MC)
2 Band - 28.5 Meters to 14. Meters (10.5 MC to 21.4 MC)
3 Band - 15.1 Meters to 7.85 Meters (19.8 MC to 38.2 MC)
4 Band - 8.1 Meters to 3.76 Meters (37. MC to 79.5 MC)

HALLICRAFTERS, INC.

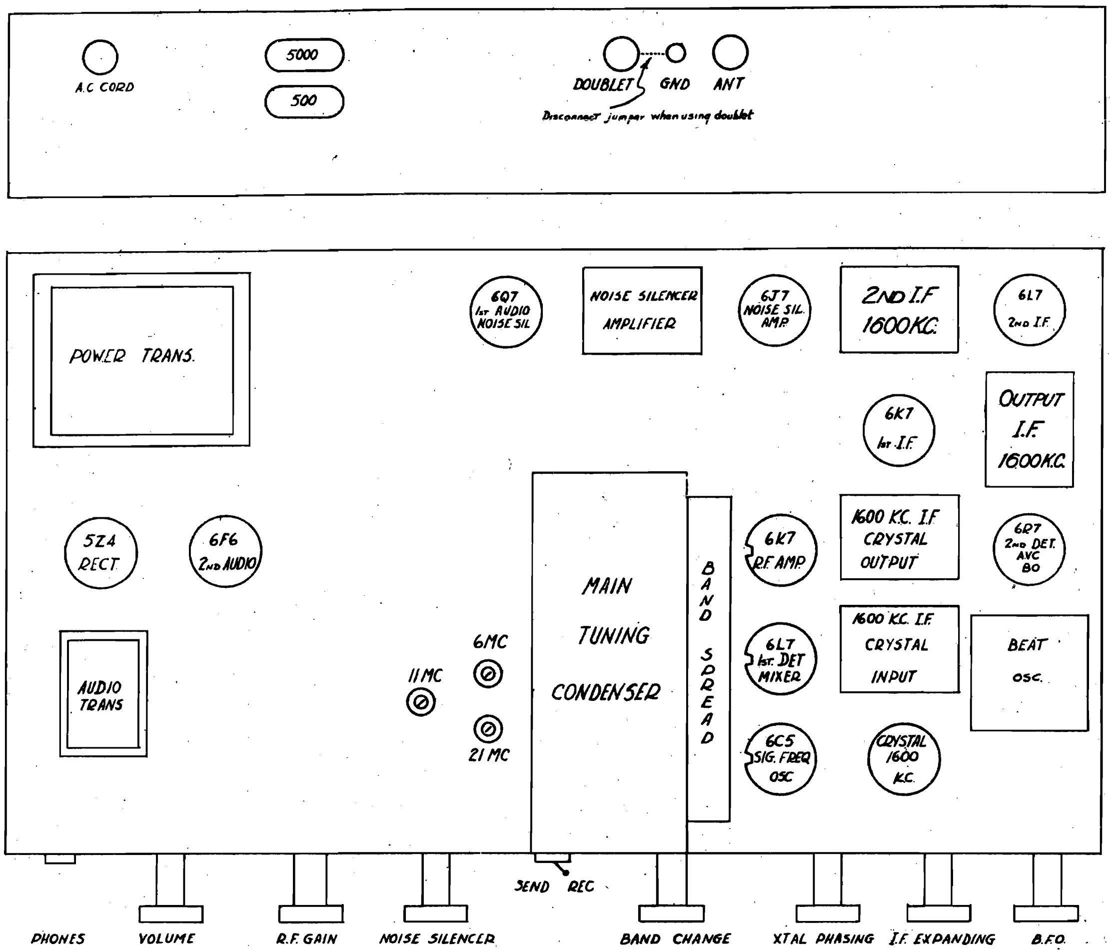


FIG. 1

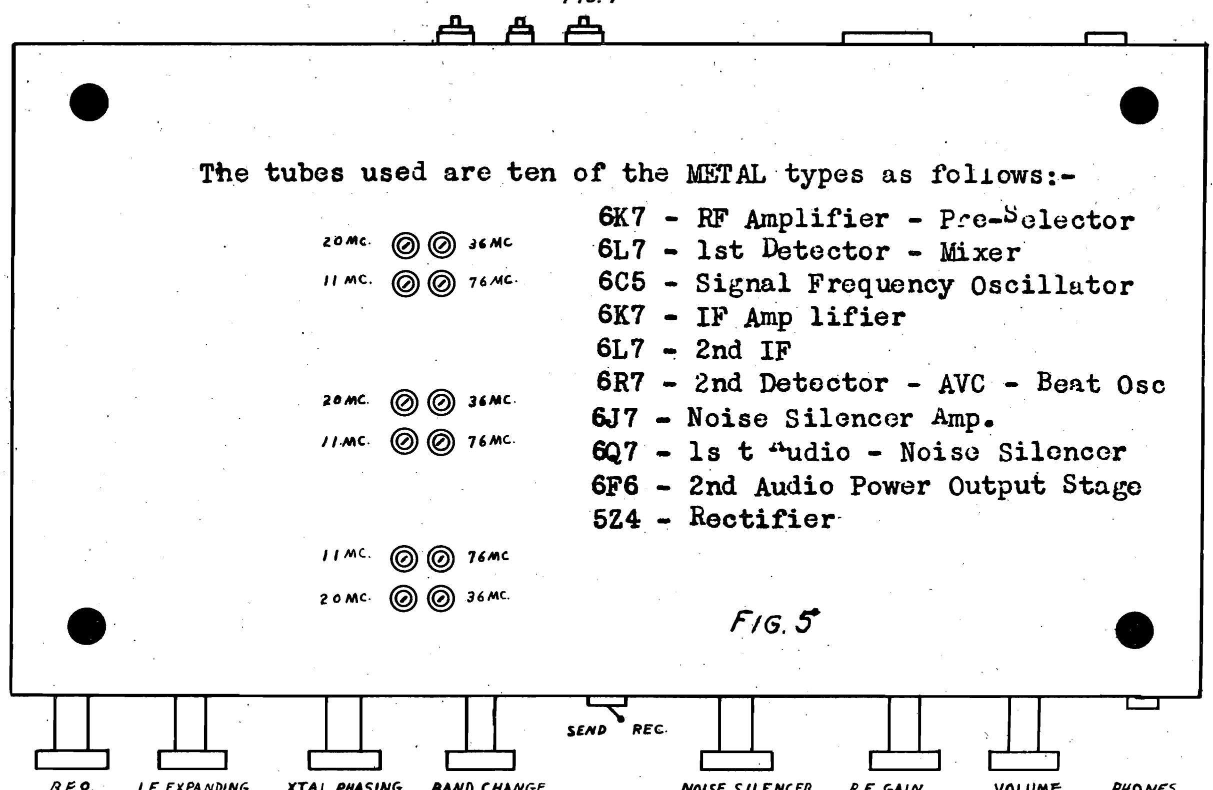


The tubes used are ten of the METAL types as follows:-

6K7 - RF Amplifier - Pre-Selector
6L7 - 1st Detector - Mixer
6C5 - Signal Frequency Oscillator
6K7 - IF Amplifier
6L7 - 2nd IF
6R7 - 2nd Detector - AVC - Beat Osc
6J7 - Noise Silencer Amp.
6Q7 - 1st Audio - Noise Silencer
6F6 - 2nd Audio Power Output Stage
5Z4 - Rectifier

FIG. 5

HALLICRAFTERS, INC.

MODEL S-10
Ultra Skyrider
Alignment

Intermediate Frequency Alignment.

If the receiver is equipped with a crystal, use the crystal in a separate oscillator.

If the receiver is not an SX10 model set the signal generator for 1600 KC output.

Before I.F. or R.F. alignment see that:

Expander is in the "sharp" position.
B.F.O. switch off.
Audio gain control set at maximum.
R.F. gain control set at maximum.
A.V.C. switch off.
Crystal switch off.
Crystal phasing condenser adjusted for maximum noise level.
Noise silencer control set at 50% rotation.
Do not remove the bottom plate from the chassis.

Remove 6C5 oscillator tube from its socket and connect generator output directly to the grid of the 6L7 1st Detector.

As an output indicator it is suggested a 0-3 volt A.C. Voltmeter be connected across the speaker voice coil.

Align all I.F. trimmers for maximum output.

To adjust noise silencer circuit, set generator output for a strong signal (200MV). Slowly turn noise silencer control clockwise until there is a noticeable dip in the output meter. Now the trimmer on the noise silencer can directly behind the main tuning gang should be tuned for a dip. Adjust noise silencer control and trimmer until maximum rejection of signal is obtained. After this adjustment has been reached set the noise selencer control at a position where rejection of signal just starts to take place. Now retrim the plate trimmer of second I.F. (See which is plate trimmer by shorting trim screw against can for a spark.) The I.F. alignment of the receiver is now complete.

R.F. ALIGNMENT

Check dial - at maximum capacity of gang condenser the dial should stop so that "0" on the dial is opposite "5" on Vernier scale; the pointer which indicates bands should then be on the black line of the dial.

Put the 6C5 tube back in oscillator socket.

Connect generator output through 400 ohm resistor to antenna and ground posts on receiver. (Junper should remain connected.)

Be sure band spread condenser is set at 200 degrees or minimum capacity position.

Set generator for 100 meg output signal at maximum output of generator. During alignment back off on R.F. gain control or the gain on the generator once the signal is hear. Leave the audio control in maximum position at all times.

Set Band Switch to highest frequency range: 38 to 79 megacycles.

Check 40 magacycles on dial for calibration.

If no signal is heard at 40 megacycles and a good signal is heard at 50 megacycles try changing the 6C5 oscillator tube until one which will oscillate at 40 megs is obtained. May be necessary to try various makes of tubes until a good one is obtained.

After signal heard at 40 megacycles, re-set dial to 60 megs. Now adjust the 60 MC trimmer in oscillator section until signal is heard.

Re-set dial to approximately 63 megs and check for image. If image is heard at 63 megs you are on the right side. Note image is on the high frequency side on this hand.

Return dial to 60 megs and peak R.F. and antenna 60 MC. trimmers for greatest output.

Not go back to 40 megs and make sure you are getting a good signal.

While R.F. and antenna trimmers are being peaked the main tuning gang should be rocked back and forth across the signal.

Change band switch to position covering 20 to 38 MC.
Set generator for 6 MC signal.
Set dial at 20 megacycles.
Adjust 20 MC pad on top os chassis until signal is heard.
Re-set dial to 36 MC
Trim 36 MC Oscillator trimmer until signal is heard.
Check for image at 33 megs. Note image is on Low Frequency side.

Now peak R.F. and antenna trimmers for maximum output, rocking main tuning gang while peaking.

Recheck at 20 MC for calibration. A signal should also be heard at 24, 30 and 36 megs, using 6 megacycle signal input.

Set Band switch to 20 to 11 megacycle position.
Set signal generator for 11 megs output.
Set dial at 11 megs. Trim oscillator pad on top of chassis for signal.
Set generator ro 20 meg signal.
Set dial for 20 megs. Adjust osciallator trimmer below chassis for signal.

Now adjust R.F. and antenna trimmers for maximum output, rocking main tuning gang while peaking.

Go back and re-check at 11 megacycles.

Set band switch to 5.5 to 11 megacycle position.
Set generator for 6 MC output.
Set dial to 6 MC - adjust 6 MC pad on top of chassis until signal is heard.
Set generator to 11 MC.
Set dial to 11 MC - adjust oscillator trimmers underneath chassis for signal.

Now peak R.F. and antenna trimmers for maximum output, rocking main tuning gang while peaking.

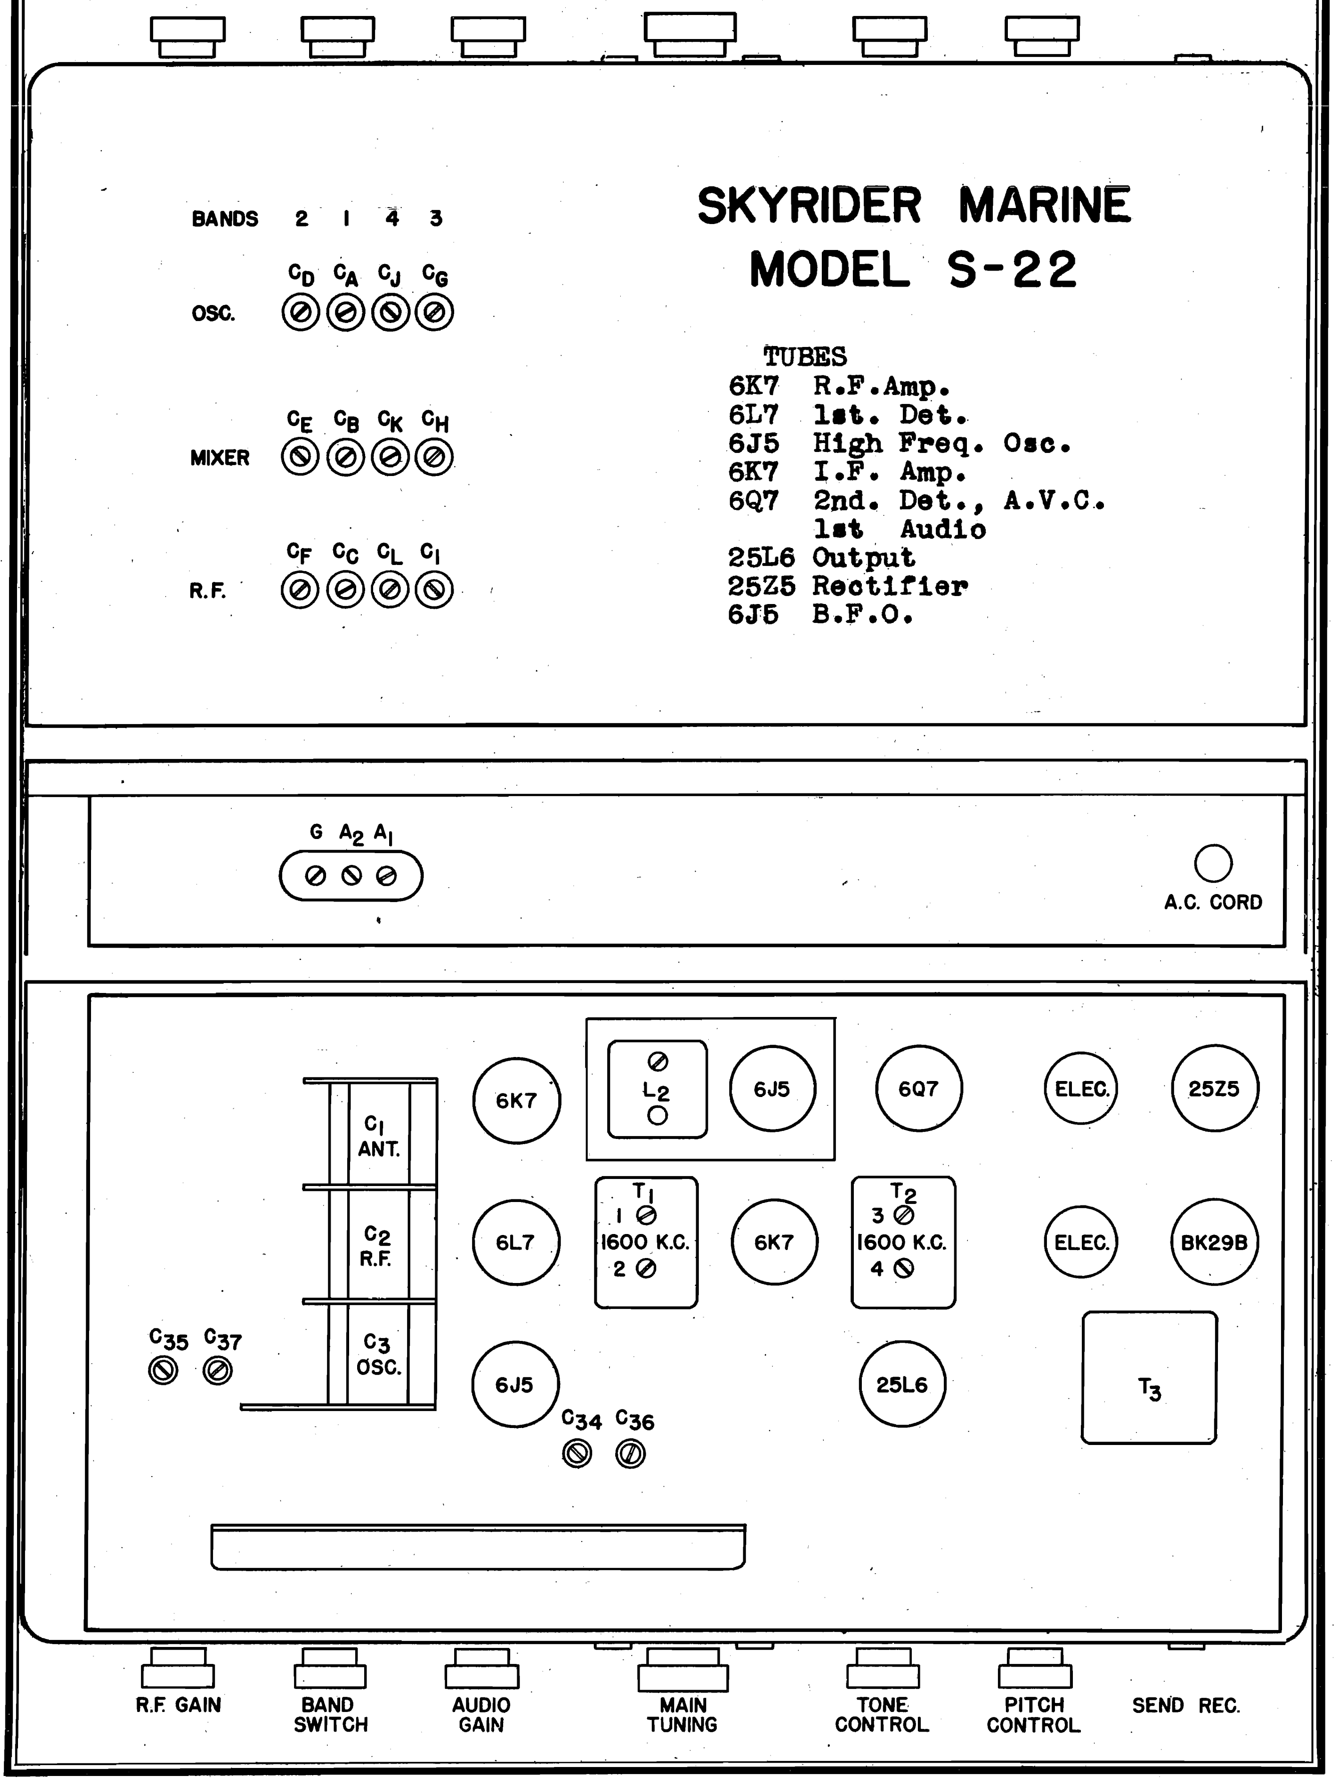
It may be necessary to go through the above procedure on each band two or three times before maximum performance is secured. A small change at one end of each band will affect the other end.

CRYSTAL FILTER INPUT TRANSFORMER - this transformer is made up of 3 coils phased in such a relation that maximum signal is impressed upon the low inductance primary of 2nd IF transformer. The crystal and crystal phasing circuit is inserted between these transformers in crystal phasing condenser cause single signal action to take place - this action varies by the setting of crystal phasing condenser - when switch is at "out" position the signal is impressed directly on the second transformer.

Crystal filter output transformer has a set-up ratio so that the voltage impressed on grid of 6K7, I.F. Amplifier, is increased over the normal IF transformer connections. By the use of a transformer the grid circuit of this tube is tuned to the I.F. frequency so that greater selectivity is achieved, than if a choke coil is used to supply this tube.

MODEL S-22
Skyrider Marine
Socket, Trimmers

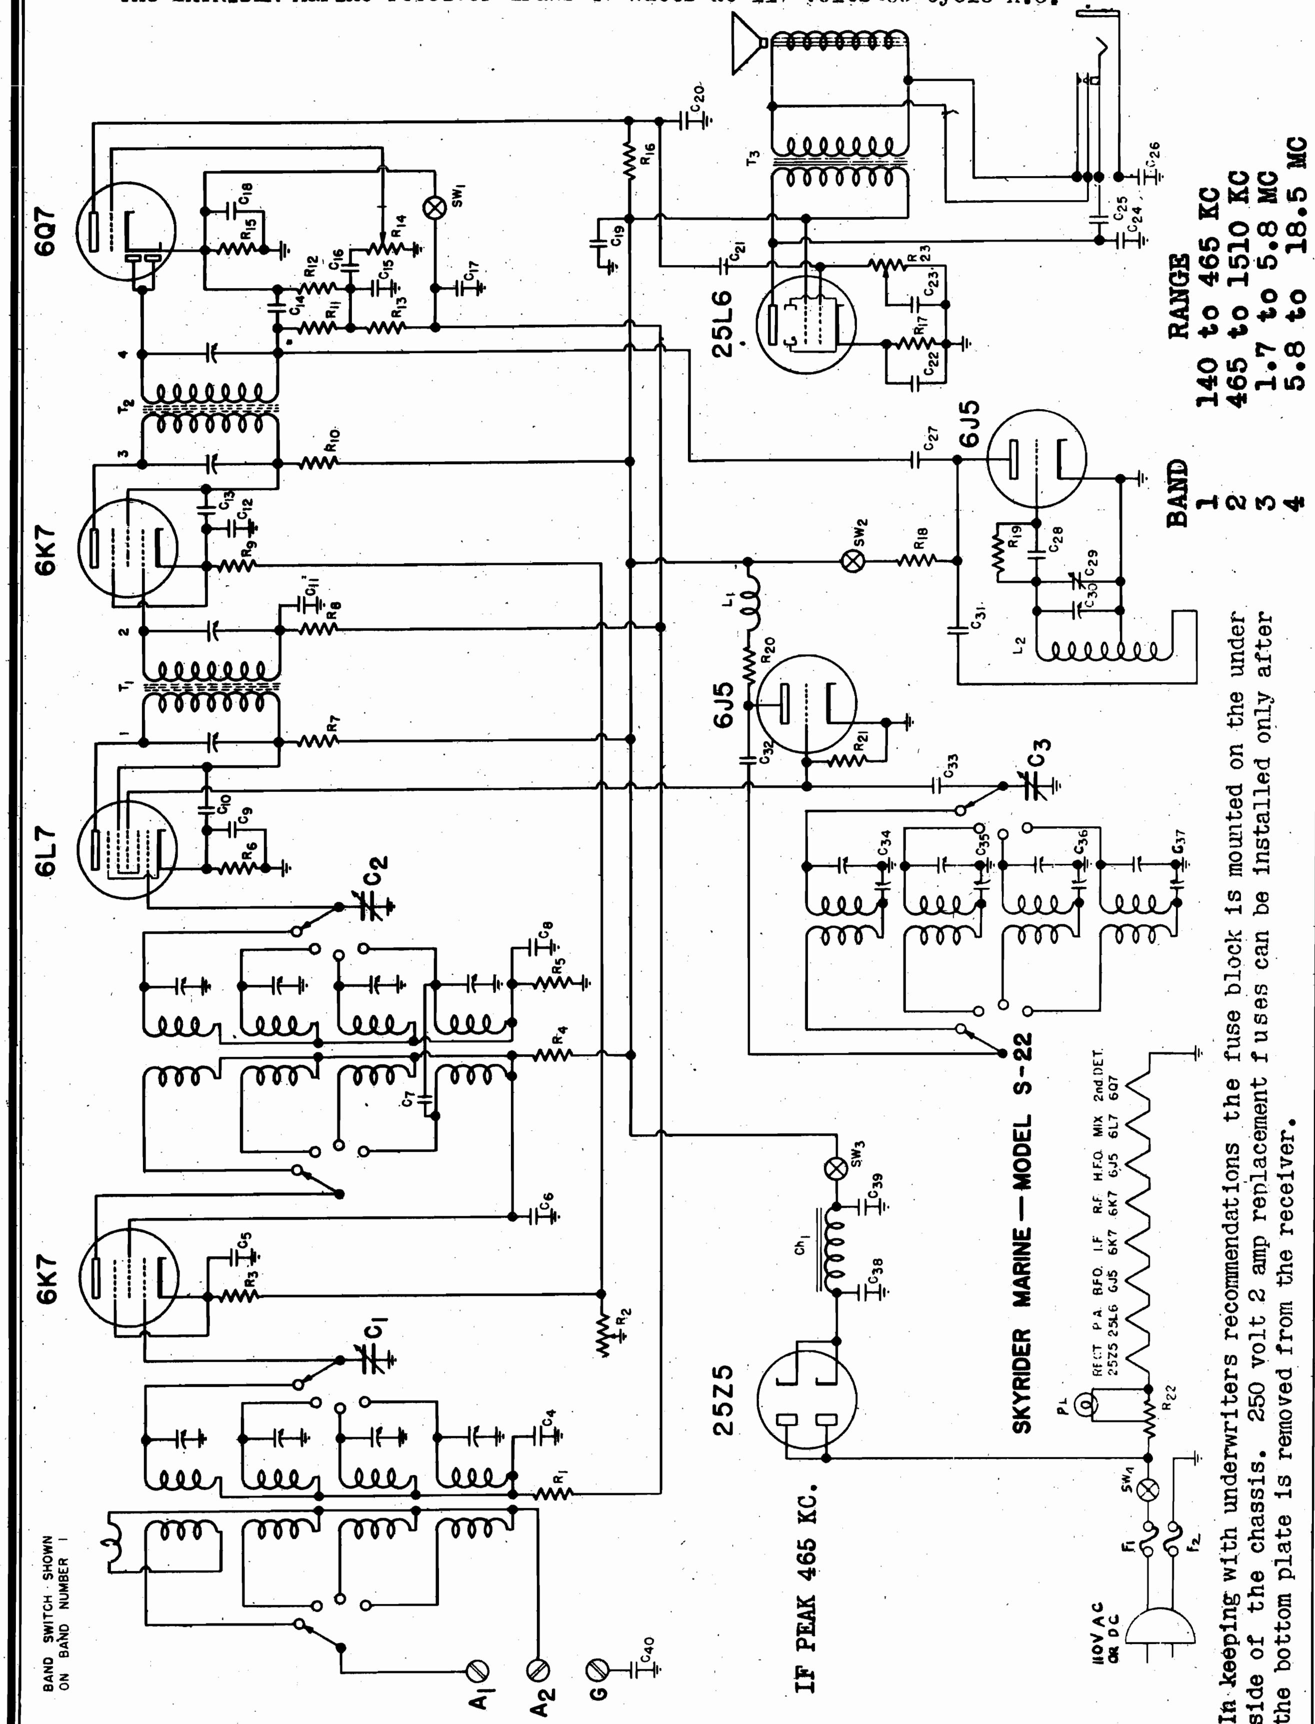
HALLICRAFTERS, INC.



HALLICRAFTERS, INC.

MODEL S-22
Skyrider Marine
Schematic

The SKYRIDER Marine receiver draws 47 watts at 117 volts 60 cycle A.C.



MODEL S-22
Skyrider Marine
Alignment, Parts

HALLICRAFTERS, INC

NOTE: Because this receiver can be operated on either 110 volt AC or DC current the chassis is electically placed above ground. DO NOT ground the receiver at any other point than the G terminal on the rear of the receiver.

ALIGNMENT PROCEDURE FOR SKYRIDER MARINE MODEL S22

Intermediate Frequency Alignment

Have the controls set as follows:-

A.V.C.-B.F.O. switches in the "OFF" position.

Adjust A.F. and R.F. gain controls for maximum volume.

Set Band Switch on #1 Band.

Set main dial at 465 KC or minimum capacity position.

Remove 6L7 grid cap - connect the signal generator through a .1 MFD condenser to the grid of this tube. Connect the ground of the signal generator to the G terminal of the receiver.

The chassis is insulated from the cabinet so do not ground the cabinet.

After the above adjustments have been made, set the signal generator for 1600 KC signal output.

Now adjust the trimmers on T1 and T2 transformers for exact resonance which will be indicated by maximum signal output. If you prefer an output meter as an indicator it should be of the rectifier type and connected to the voice coil leads of the speaker, or to the plate of the 25L6 output tube through suitable coupling condenser.

R.F. Alignment

Replace the .1 MFD condenser in series with the generator leads with a 400 ohm resistor. Connect the generator to the A1 terminal on the strip mounted on the rear of the chassis. Leave the jumper between A2 and G connected. All pad adjustments are for the low frequency ends of the bands and are reached from the top of the chassis. All trimmer adjustments are for the high frequency ends of the bands and are adjusted through the bottom plate. Remove the guarantee card on the bottom of the cabinet by placing a knife under the small snap fasteners which hold it in place.

Band #1

Place the band switch on Band 1. Set generator for 350 KC output and adjust main dial for that frequency. Adjust oscillator trimmer CA, mixer trimmer, CB and antenna CC for maximum signal. Reset generator and receiver to 150 KC and resonate pad C34 for maximum signal.

Band #2

Turn Band Switch to Band 2. Set generator and receiver to 1400 KC and adjust CD CE CF for maximum output. Reset generator and receiver to 600 KC - add adjust Pad C35 for maximum signal.

Band #3

Adjust Band Switch to Band 3. Set generator and receiver to 4 MC and adjust C9 CH C1 for maximum signal. Reset generator and receiver to 1.8 MC and tune pad C36 for maximum output.

Band #4

Set Band Switch on Band 4. Tune generator and receiver to 14 MC and adjust CJ, CK, CL for maximum signal. Reset generator and receiver to 6MC and adjust pad C37 for maximum output.

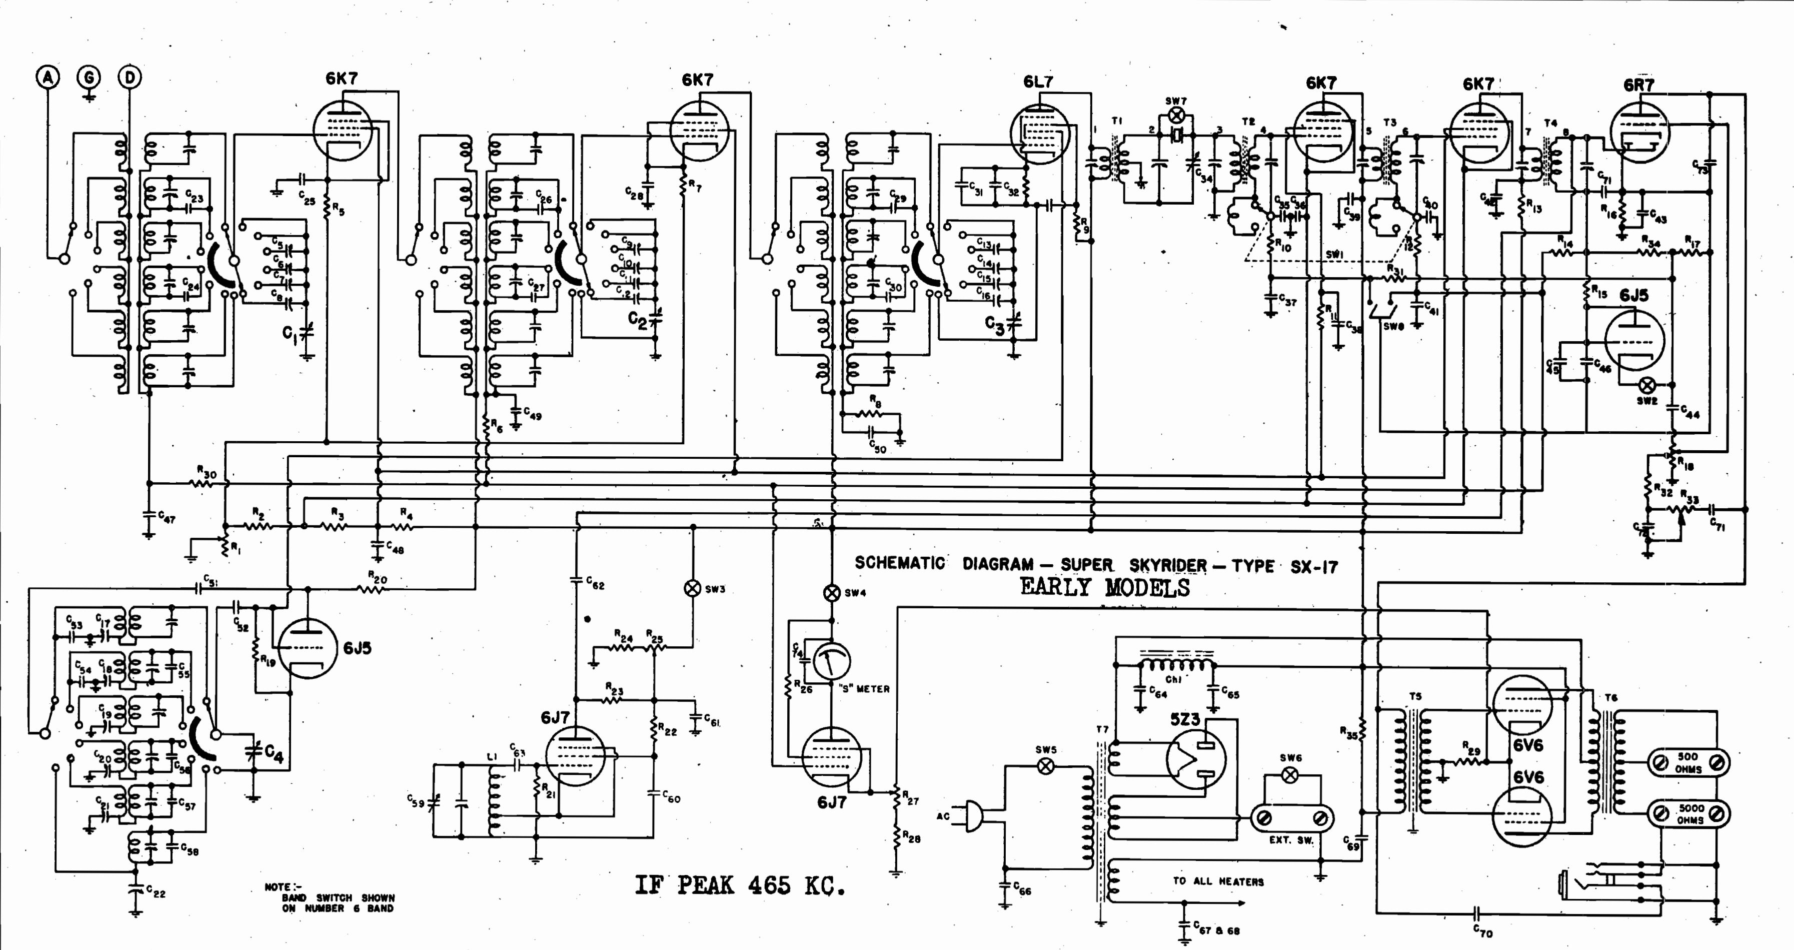
MODEL SX-17 Early Super Skyrider Schematic, Changes

HALLICRAFTERS, INC.



SCHEMATIC DIAGRAM — SUPER SKYRIDER — TYPE SX-17
EARLY MODELS

IF PEAK 465 KC.

This unit has been constructed on special order. In outward appearance it is identical to the SX-16 Model. The differences in the two receivers consists of a second R.F. stage and a noise silencer. These additions make the total number of tubes in the receiver 13.

FOR ALIGNMENT SEE S-17 , SX-17 LATE MODELS

CHANGES FOUND IN SOME EARLY MODELS WHICH PRECEDE THE SX-17 LATE MODELS.

R14- 1 meg.	R17- 250 ohms.	C44-.05 mfd. 200v.
R15- 1meg.	R34- 100M ohms.	C45- .1 mfd. 200v.
R16- 950 ohms.	C43- 10 mfd. 25v.	C46-.002 mfd. mica.

NOISE SILENCER LEADS AS SHORT AS POSSIBLE FOR BEST RESULTS.

ALIGNMENT PROCEDURE FOR SPECIAL SUPER SKYRIDER MODELS S-17, SX17

THE FOLLOWING MEASUREMENTS MADE WITH 1000 OHMS PER VOLT METER AND TAKEN FROM THE POINT INDICATED TO GROUND. ANTENNA AND GROUND DISCONNECTED AND R. F. AND A. F. GAIN CONTROLS SET AT MAXIMUM. LINE VOLTAGE OF 115 AT THE TIME MEASUREMENTS WERE TAKEN. NORMAL TOLERANCE ALLOWS VARIATION OF PLUS OR MINUS 10% FROM THE INDICATED VALUES. "DL" MEANS DEAD LUG BUT WILL INDICATE VOLTAGE WHEN USED AS A TIE.

TUBE	FUNCTION	1	2	3	4	5	6	7	8
6K7	RF AMP (1)			260	100	8	0 ON 50 OFF	6.3	8
6K7	RF AMP (2)			260	100	8	0 ON 50 OFF	6.3	8

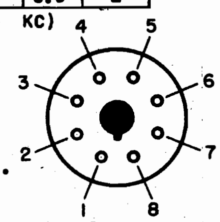
6J5	SILENCER	(ON)		-2	-2	-2	-3.5	6.3	-2

INTERMEDIATE FREQUENCY ALIGNMENT (465 KC)



BOTTOM VIEW OF SOCKET

HAVE THE CONTROLS SET IN THE FOLLOWING POSITIONS:

NOISE SILENCER "OFF" (SWITCH TO THE LEFT)
B.F.O. INJECTOR "OFF"
A.F. AND R.F. GAIN CONTROLS ON FULL.
SELECTIVITY SWITCH ON "SHARP" POSITION.
CRYSTAL PHASING CONDENSER MIDWAY (POINTER STRAIGHT UP).
A.V.C. SWITCH "OFF".
CRYSTAL SWITCH "IN".
BAND SWITCH ON #1 BAND - TUNING GANG OPEN.
REMOVE OSCILLATOR TUBE.
REMOVE 6L7 GRID CAP.
CONNECT SIGNAL GENERATOR TO GRID OF 6L7 TUBE THROUGH A .1 MFD CONDENSER.
TUNE SIGNAL GENERATOR TO 465 KC AND THEN ADJUST THE FOLLOWING TRIMMERS FOR MAXIMUM OUTPUT: T-4#7,8; T3-#5,6; T2-#3,4; T1-#1,2; THROW CRYSTAL SWITCH TO OUT POSITION AND READJUST TRIMMERS #2, 3 FOR MAXIMUM OUTPUT. WHEN THE "SELECTIVITY" SWITCH IS SNAPPED INTO THE "BROAD" POSITION A SLIGHT DROP IN GAIN SHOULD BE INDICATED. A RECTIFIER TYPE OUTPUT METER IS SUGGESTED AS AN OUTPUT INDICATOR.

ALIGNMENT USING A 465 KC CRYSTAL

SHOULD THE RECEIVER BE A CRYSTAL MODEL IT IS NECESSARY THAT THE CRYSTAL BE USED IN AN EXTERNAL OSCILLATOR IN PLACE OF A SIGNAL GENERATOR SUCH AS THE ABOVE. THE OUTPUT OF THIS CRYSTAL-CONTROLLED OSCILLATOR IS THEN FED TO THE GRID OF THE 6L7 TUBE AND THE ABOVE PROCEDURE FOLLOWED. WHEN THE I F AMPLIFIER HAS BEEN ALIGNED FROM THE CRYSTAL OSCILLATORS OUTPUT, RE-INSERTING THE CRYSTAL IN THE RECEIVER WILL SHOW VERY LITTLE DIFFERENCE IN OUTPUT WHETHER THE CRYSTAL IS "IN" OR "OUT" OF THE CIRCUIT AS INDICATED BY THE CRYSTAL SWITCH.

R. F. ALIGNMENT PROCEDURE

ON BAND #1, OR BROADCAST, USE A .0002 MFD CONDENSER IN SERIES WITH THE OUTPUT LEAD FROM GENERATOR TO RECEIVER. ON THE OTHER BANDS USE A 400 OHM RESISTOR. BE SURE JUMPER FROM DOUBLET POST TO GND. REMAINS CONNECTED WHEN ALIGNING THE RECEIVER.
ALL PAD ADJUSTMENTS (LOCATED ON THE TOP OF THE CHASSIS) ARE FOR THE LOW FREQUENCY ENDS OF THE BANDS.
ALL TRIMMER ADJUSTMENTS (LOCATED ON THE BOTTOM OF THE CHASSIS) ARE FOR THE HIGH FREQUENCY ENDS OF THE BANDS.
REDUCE THE R.F. GAIN CONTROL BELOW THE POINT OF BLOCKING OR OVERLOADING; ALSO BE SURE THAT THE CRYSTAL SWITCH IS IN THE "OUT" POSITION AS WELL AS THE A.V.C. SWITCH IN THE "OFF" POSITION.
BE SURE TO CHECK IMAGES - IMAGES WILL FALL A LITTLE LESS THAN 1,000 KC LOWER IN FREQUENCY THAN THE FUNDAMENTAL OR HARMONIC OF THE SIGNAL FROM THE GENERATOR. BECAUSE OF THE TWO RF STAGES IMAGES WILL BE GREATLY ATTENUATED IN COMPARISON TO A UNIT WITH ONE STAGE OF RF.
THE TUNING GANG MUST BE ROCKED WHEN MAKING THESE ADJUSTMENTS.

NOTE#1 HARMONICS OF SUITABLE FREQUENCIES MAY BE USED IF THE FOLLOWING SUGGESTED FREQUENCIES ARE NOT AVAILABLE.

" 2 IT IS NECESSARY TO REPEAT EACH PAIR OF OPERATIONS SEVERAL TIMES UNTIL NO CHANGE IS NOTED.

" 3 GREAT CARE SHOULD BE EXERCISED IN ALIGNING AND ACCURATELY RESONATING EACH CIRCUIT IN THE SPECIAL SUPER SKYRIDER; OTHERWISE YOUR ERRORS WILL BE CUMULATIVE AND THE SET WILL FUNCTION POORLY.

CRYSTAL OPERATION

TO PROPERLY ADJUST THE CRYSTAL CIRCUIT FOR BEST PERFORMANCE THE FOLLOWING PROCEDURE SHOULD BE CAREFULLY FOLLOWED:

HAVE THE AVC SWITCH IN THE "OFF" POSITION. TUNE IN SOME STATION TRANSMITTING CONTINUOUSLY. BE VERY CAREFUL TO GET THE SIGNAL RIGHT ON THE NOSE. AFTER YOU ARE SURE THAT YOU HAVE THE SIGNAL RESONATED PERFECTLY, OPERATE THE "BFO INJECTOR" CONTROL AND LEAVE THE POINTER OF THAT KNOB IN A VERTICAL POSITION. YOU SHOULD HEAR A WHISTLE, OR BEAT NOTE. AFTER THE BFO IS ON ROTATION OF THE "PITCH CONTROL" WILL CHANGE THE TONE OF THE BEAT NOTE. PROPER OPERATION OF THIS CONTROL WILL BE INDICATED BY HEARING THE SIGNAL TWICE IN ONE COMPLETE ROTATION OF THE KNOB; THERE BEING TWO POSITIONS AT WHICH NO SIGNAL, OR WHISTLE, WILL BE HEARD. THESE TWO POSITIONS ARE KNOWN AS THE "ZERO BEAT" POSITIONS.

NOW SNAP THE "CRYSTAL" SWITCH TO THE "ON" POSITION. YOU WILL NOTICE A REDUCTION IN NOISE. CAREFULLY RETUNE THE SIGNAL USING THE BAND SPREAD DIAL. NOTICE HOW SHARPLY THE SIGNAL PEAKS. NOW TUNE THROUGH THE SIGNAL AND FIND WHICH SIDE OF THE SIGNAL IS THE WEAKER. TUNE IN THE WEAKER SIDE AND THEN CAREFULLY ADJUST THE "CRYSTAL PHASING" CONTROL UNTIL THE SIGNAL IS INAUDIBLE. GOING BACK TO THE OTHER SIDE OF THE SIGNAL SHOULD FIND NO CHANGE IN ITS ORIGINAL VOLUME, AND KNIFE-LIKE SELECTIVITY RESULTING. USE WHICHEVER SIDE OF ZERO-BEAT ADJUSTMENT OF THE "PITCH CONTROL", IN CONJUNCTION WITH CRITICAL ADJUSTMENT OF THE "PHASING CONTROL" GIVES THE GREATER REJECTION OF THE INTERFERING SIGNAL.

NOTE*** THE PHASING CONTROL AFFECTS THE SENSITIVITY AND SELECTIVITY OF THE RECEIVER WHETHER THE CRYSTAL IS IN THE CIRCUIT OR NOT.

MODEL A 5

25Z6GT 25L6GT 6K7GT 6J7GT

Five Tube Tuned Radio Frequency, Broadcast and Police Receiver

LINE VOLTAGE 120 Volts AC or DC, Alternating or Direct Current.

TUNING RANGE 545 Kilocycles (540 meters) to 1720 Kilocycles (175 meters).

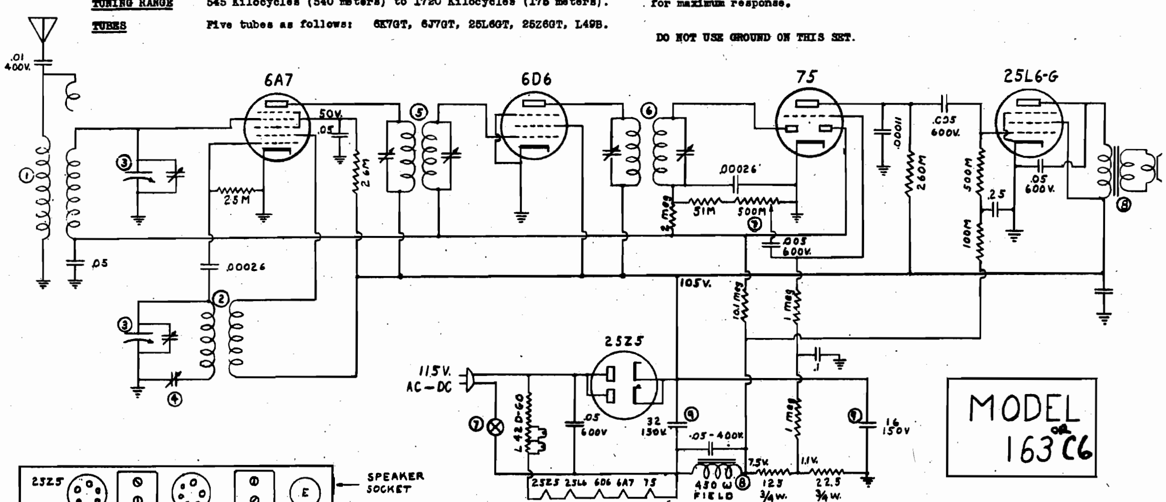
TUBES Five tubes as follows: 6K7GT, 6J7GT, 25L6GT, 25Z6GT, L49B.

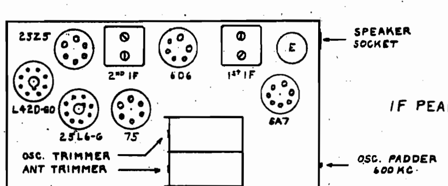
ALIGNMENT PROCEDURE

(1) Turn the volume control to the full on position. Turn the variable condenser clockwise direction till it stops. Adjust ~~detector~~ trimmer to 1720 kilocycle signal, by connecting service oscillator to antenna coil through 75 MMF condenser, until the signal is heard.

(2) Feed the 1500 kilocycle signal and turn the variable counterclockwise until the peak of this signal is reached. Adjust the antenna trimmer for maximum response.

DO NOT USE GROUND ON THIS SET.





TUBE LAYOUT & TRIMMER LOCATION

IF PEAK - 456 KC

ALL RESISTORS ARE ½ WATT AND ALL CONDENSERS ARE 200 VOLTS UNLESS OTHERWISE MARKED.
ALL VOLTAGES MEASURED TO CHASSIS.

MODEL 163 or C6

Six Tube Superheterodyne, Broadcast And Police Receiver

INSTRUCTION SHEET SERVICE DATA

LINE VOLTAGE 110 to 120 Volts, A C or D C, Alternating or Direct Current.

TUNING RANGES Broadcast Band-545 Kilocycles (540 Meters) to 1550 Kilocycles (195 Meters).
Police Band- State and Municipal Police - 1600 Kilocycles. (190 Meters) to 1750 Kilocycles (170 Meters)

TUBES Six tubes as follows: 6A7, 6D6, 75, 25L6-G, 25Z5 and a L42D-60.

ALIGNMENT PROCEDURE

1) Turn the volume control to the full on position and tune the receiver at the high frequency end of the band so that no signal is received.

Connect the service oscillator output through a .1 mfd. isolating condenser to the top grid cap of the 6A7 tube and set to 456 kilocycles. Adjust the intermediate frequency trimmers for the maximum response. As the set is brought into line and the signal becomes stronger, attenuate the service oscillator

2) Set the dial pointer to the 1500 kilocycle calibration. Feed a 1500 kilocycle signal from the service oscillator through a .00015 condenser to the antenna. Adjust the oscillator trimmer until the signal is heard, then adjust the antenna trimmer for maximum response.

3) Set the service oscillator to 600 kilocycles and adjust the oscillator padder for maximum response by simultaneously adjusting the padder and rocking the tuning control.

4) Repeat the procedure of numbers 2 and 3 for greater accuracy.

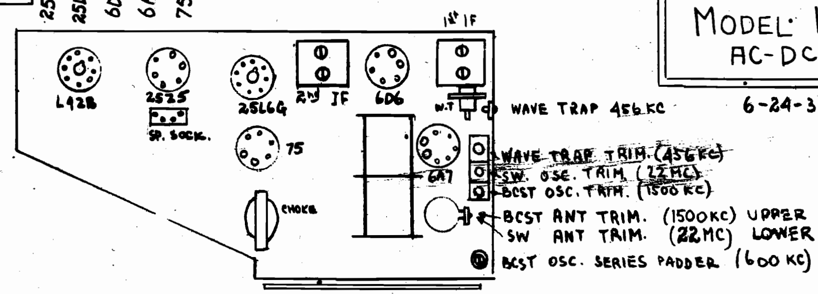
6-24-38



FOR 135, 150, 220 & 250 VOLTS OPERATION USE L42BX BALLAST TUBE

TUBE LAYOUT AND TRIMMER LOCATION

Six Tube Superheterodyne, Broadcast and Foreign Short Wave

INSTRUCTION SHEET SERVICE DATA

LINE VOLTAGE 110 to 120 Volts, AC or DC, Alternating or Direct Current.

TUNING RANGES Broadcast and State Police Band - 545 KC (540 meters) to 1750 KC (meters)
Short Wave, Foreign Broadcast - 7.5 MC (40 meters) to 25 MC (12 meters).

MINOR REASONS FOR FAILURE TO FUNCTION - Defective tubes, grid caps off, volume control not fully turned on, line plug reversed on DC, tubes not in their proper sockets, shorted aerial defective plug or wiring loose in socket.

ALIGNMENT PROCEDURE -

(1) Set service oscillator to 456 KC and connect the output lead to the top grid of 6A7. Adjust the I.F. trimmers for maximum response.

(2) Connect oscillator set at 456 KC to the antenna lead through a .0002 MFD condenser band switch in the broadcast position, and adjust the wave trap for minimum response.

(3) Set oscillator for 22 MC, band switch in the short wave position, dial pointer set for 22 MC calibration, and adjust the short wave oscillator trimmer until the signal is heard.

(4) Turn the band switch to the broadcast position, set dial to 1500 KC calibration and feed a 1500 KC signal from the oscillator through the antenna. Adjust the broadcast oscillator trimmer until the signal is heard, then adjust the broadcast antenna trimmer for maximum response.

(5) Set the test oscillator to 600 KC and adjust the broadcast osc. series padder for maximum response by simultaneously adjusting the padder and rocking the tuning dial.

(6) Repeat procedure numbers 4 and 5 for greater accuracy.

(7) Turn the set to the S.W. Band, set the test oscillator to 22 MC, tune in signal with the set and adjust the S.W. antenna trimmer for maximum response. Use 400 ohm dummy antenna.

LINE VOLTAGE 110 to 120 volts Alternating Current, 60 Cycles

TUNING RANGES
Broadcast – 540 KC (555 meters) to 1725 KC (174 meters)
Police - 2.3 MC (130 meters) to 7.9 MC (38 meters)
Foreign Short Wave - 7.4 MC (40 meters) to 25 MC (12 meters)

ALIGNMENT PROCEDURE

(1) Set service oscillator to 456 kc and connect the output lead to the top grid of 6A7. Adjust trimmers for maximum response.

(2) Connect oscillator set at 456 kc to the antenna lead through a .0002 mfd. condenser; variable condenser closed, and adjust wave trap trimmer for minimum response. Band switch to be in broadcast position.

(3) Turn band selector to the short wave band, set the test oscillator to 22 mc and connect to antenna lead through 400 ohm dummy antenna. Set dial pointer to 22 mc and adjust short wave oscillator trimmer until signal is heard. Then adjust short wave antenna trimmer for maximum response.

(4) Turn band selector to police band, set test oscillator to 6000 kc, connect to antenna lead through 400 ohm dummy antenna. Set dial pointer to 6000 kc and adjust police oscillator trimmer until signal is heard. Then adjust broadcast antenna trimmer for maximum response.

(5) Turn band selector to broadcast band, set test oscillator to 1500 kc, connect to antenna lead through a .0002 mfd. condenser. Set dial at 1500 kc and adjust broadcast oscillator trimmer until signal is heard. Then adjust broadcast antenna trimmer for maximum response.

(6) With band selector in broadcast position, set test oscillator to 600 kc and adjust broadcast oscillator series padder for maximum response by simultaneously adjusting the padder and rocking the tuning dial.

(7) Repeat procedures 5 and 6 for greater accuracy.

VOLTAGES AT TERMINAL STRIP OF RECEIVER (Looking At Rear Of Chassis)

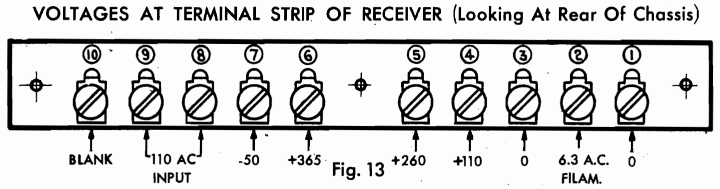

Fig. 13

All measurements were made on a 120 volt A. C. power supply line with line voltage adjustment set at the 125 volt tap. Sensitivity and audio gain controls should be set at minimum. The A. V. C. Manual Switch should be in the manual position, the CW-MOD Switch in the C. W. position, and the "Send-Receive" switch in the receive position. D. C. voltage readings were obtained with a voltmeter having a resistance of 1000 OHMS per volt using the chassis as a common terminal. Voltages within ± 10% of the values given should be considered satisfactory. The 6.3 volt A. C. filament reading is obtained between chassis and terminal No. 2 on strip. Terminal No. 10 on strip is blank except when used for battery operation in which case it provides a short to chassis with power switch in "ON" position and open when power switch is in the "OFF" position.

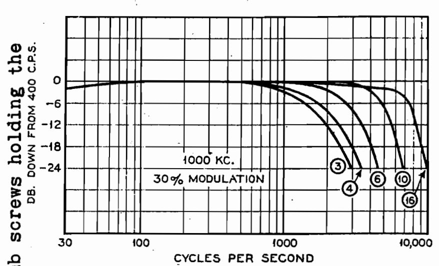
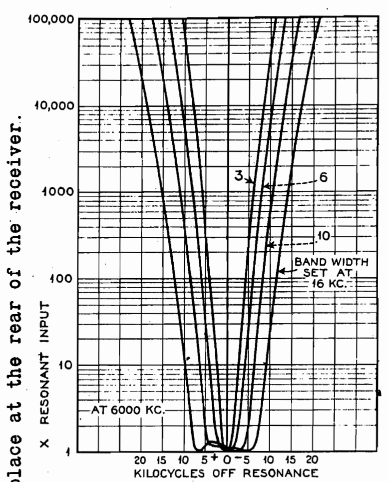
Tuning Data,Resonance Curves
Connections





variable band width control set at 3, 4, 6, 10 and 16

Band Spread Tuning - The Band Spread dial operates on the three high-frequency bands from 2.5 to 20.0 mc. Below 2.5 mc. it is automatically disconnected by the band change switch. The calibration of the main dial is based on a Band Spread dial setting of 100. Decreasing the setting of the Band Spread dial decreases the resonant frequency of the receiver. Band spread may therefore be obtained by setting the Main Tuning dial to the highest frequency in the desired band. When this has been done the lower frequencies in the band may be tuned by means of the Band Spread dial only.

ANTENNA-The input circuit of the "Super Pro" has been designed to connect directly to a balanced transmission line having an impedance of the order of 115 ohms. The ordinary twisted pair lead-in wire, generally supplied with doublet antenna systems, has such an impedance. Although some antenna kits are provided with a matching transformer to connect between the lead-in and the receiver, the use of such a transformer is neither necessary nor desirable with the "Super Pro" If a single wire type of antenna is used, the lead-in should be connected to one of the terminals marked "A" and the other "A" terminal connected to a good ground It is not essential to ground the receiver chassis, but it may readily be accomplished by inserting a ground lead under one of the thumb screws holding the dust cover in place at the rear of the receiver.

The filter is very accessible, being located between the front panel and the first intermediate frequency transformer. By removing the two screws which hold the top plate of the holder, the crystal can be removed for inspection. Inasmuch as the clearance between the crystal and the top plate of the holder is but .003" great care should be exercised in replacing it, since any foreign matter between crystal and plate may render the filter inoperative.

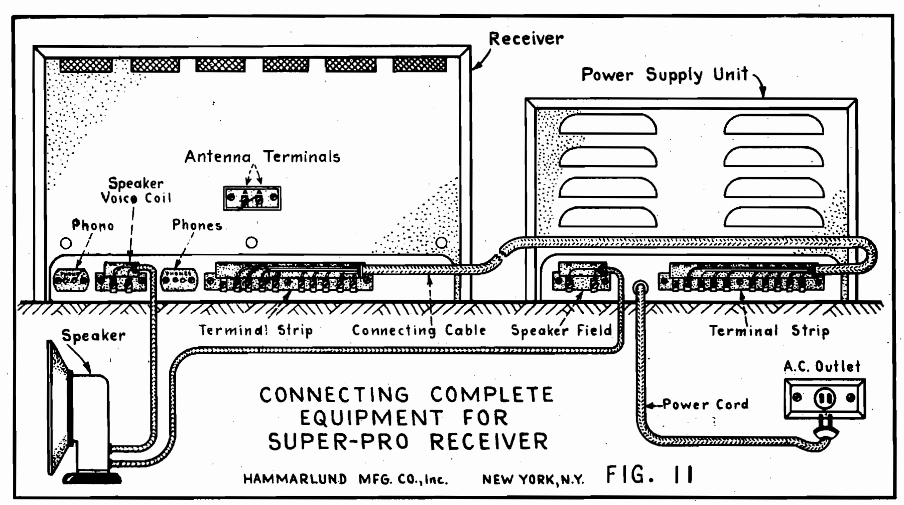


FIG. 11

Tuning Meter - The meter in the center of the panel may be used as a tuning meter when operating on A.V.C. It will show a dip as each carrier is tuned in and the amount of the dip is an appropriate indication of carrier strength. When operating on "Manual" the meter indicates the relative Sensitivity, since increasing the setting of the Sensitivity control results in higher meter readings.

Alignment

HAMMARLUND MFG. CO., INC.

ALIGNMENT

The receiver has been accurately aligned at the factory and under normal operating conditions, should retain this adjustment indefinitely. When replacing tubes or making periodical inspections, it may be desirable to check the alignment. Removing the dust cover and bottom cover plate of the receiver, will make all adjustment easily accessible. The many tuned circuits requiring adjustment may make the alignment procedure appear complicated but if the following instructions are carefully carried out, no difficulty should be experienced in obtaining the optimum performance of the receiver. CAUTION - Any changes in re-alignment from original setting will be relatively small and extreme care should be exercised when checking adjustments. This is especially true of the H.F. Oscillator circuits S,T,W,X, and Y. Do not manipulate the insulated screw driver indiscriminately.

EQUIPMENT REQUIRED

1 - TEST OSCILLATOR

An accurately calibrated instrument producing modulated signals covering a range of 465 K.C. to 20 M.C. This test oscillator should have an output of the order of 100 micro-volts and an output impedance of 100 Ohms for best results when aligning the R.F. and H.F. Oscillator circuits. For I.F. alignment these values are not critical. The frequency calibration of the test oscillator is extremely important, if the receiver alignment is to be correct.

2 - OUTPUT METER

This meter should respond to the modulation frequency of the test oscillator and should provide at least half-scale deflection for one volt.

3 - INSULATED SCREW DRIVER

(9/64" wide - .025" thick at bit)

PRELIMINARY PROCEDURE

Place the "ON-OFF" switch in the "ON" position and allow the receiver to warm up approximately one hour before beginning adjustments. Connect the output meter to the "PHONES" terminals located at the rear of the receiver chassis.

I.F. - A.V.C. - BEAT OSC. ALIGNMENT

Adjust the test oscillator to 465 K.C. and connect the output to the control grid of the 1st Detector tube (6L7) through a small fixed condenser. Front panel controls should be set as follows:

SENSITIVITY CONTROL ON 0
A.V.C. - MANUAL switch on "MANUAL"
C.W. - M O D. - switch on "MOD"
PHONES-SPEAKER Switch on "Phones"
SEND-RECEIVE Switch on "RECEIVE"
BAND SWITCH on 540-1160 K.C.
AUDIO GAIN CONTROL on 10
BAND-WIDTH on 3
BAND SPREAD DIAL set on 100

MAIN TUNING DIAL set near low frequency end of scale, being careful not to conflict with a powerful local signal. Adjust the Sensitivity control so that a reading of approximately one volt is obtained on the out-put meter. As the various circuits are adjusted for resonance reduce the Sensitivity control to prevent overloading. Adjust the two trimmer capacitors in each of the following coil assemblies for peak voltage readings on the output meter - A.A. - B.B. - C.C. - D.D. - E.E. Then adjust the trimmer capacitor on coil assembly G.G. to minimum (dip) reading on the output meter. Now reduce the A.F. gain to nearly zero and throw the A.V.C. switch to A.V.C. Then adjust the Sensitivity Control until the panel meter reads between 2 and 3. Then adjust the capacitor on H.H. for minimum panel meter reading. There should be a pronounced dip of the panel meter as this adjustment is made. It is advisable to switch over to speaker at frequent intervals during alignment to make sure there is no overloading. If everything is operating properly the output meter reading will also dip to minimum as the capacitor on coil assembly H.H. is adjusted.

Set the A.V.C.-MANUAL Switch on MANUAL, the C.W.-MOD-switch on C.W. and adjust the trimmer capacitor on coil assembly F.F. for zero beat. For this adjustment the Beat oscillator control knob, on the front panel should be adjusted to zero. This completes the alignment of the I.F. - A.V.C. and Beat Oscillator circuits all of which are accessible on top of the receiver chassis. After these adjustments have been made, the entire procedure should be repeated to insure accuracy.

CRYSTAL FILTER I.F. ALIGNMENT

The above procedure for aligning the I.F. circuit also applies to receivers with crystal filters, except that the test oscillator must be accurately set to the frequency of the crystal. This can be accomplished by setting the frequency of the test oscillator (when connected to the grid of the first detector) for maximum response with the crystal in circuit and the crystal selectivity control set at maximum. When the frequency of the test oscillator has been correctly adjusted to that of the crystal the I.F. circuits can be tuned as described above with the crystal cut out of circuit. Unless this procedure is carefully carried out, maximum crystal efficiency will not be obtained, since the peak of the I.F. selectivity curve must coincide exactly with the resonant peak of the crystal

H.F. OSCILLATOR AND R.F. ALIGNMENT

Connect the output of the test oscillator to the "A.A." terminal strip. Keep the output meter in the same position as previous test. The controls on the front panel should be set as follows:

(1) - Band Change Switch on 540 - 1160 K.C. (2) - Main Tuning Dial on 1100 K.C. (3) - Band spread Dial on 100 (4) - Sensitivity Control "To Produce appropriate output meter reading" (5) - Audio Gain Control "Full On" (6) - C.W. - MOD switch on "MOD" (7) - A.V.C.-MANUAL Switch on "MANUAL" (8) - SEND - RECEIVE Switch on "RECEIVE" (9) - "Phones-Speaker" Switch on "PHONES"

Turn the receiver over, bottom side up, placing a small block of wood under the rear of the switch section to protect the shield cans and tubes. The main tuning unit bottom plate should remain in place while H.F. oscillator and R.F. adjustments are being made. In order to facilitate the alignment of these stages, we have indicated in dotted lines, the coil positions beneath the bottom cover plate, together with all capacity and inductance adjusters. Capacity adjusting condensers are located on the coil bases and inductance adjusters extend through the top of each coil. The coil markings correspond to the designations on the schematic wiring diagram. Set the test oscillator to produce a 1100 K.C. signal. Adjust the trimmer capacitor "Y" until a peak reading is obtained in the output meter. Now set the main tuning condenser dial to 600 K.C. and adjust the test oscillator for a 600 K.C. signal. Turn the inductance adjustment on coil "Y" for a peak reading on the output meter. As these two adjustments react on each other it will be necessary to repeat them until no further change in either capacity or inductance is necessary. This realignment should only be done after making sure that the calibration of main dial is incorrect.

Turn the main tuning dial to 1100 K.C. and set the test oscillator for 1100 K.C. signal. Adjust each capacitor on coil "R" - "K" - "E2" in the order named, for peak reading on the output meter. The Sensitivity control should be adjusted so that no overloading occurs and an appropriate reading on the output meter is maintained. Now set the main tuning dial at 600 K.C. and the test oscillator on the same frequency and turn the "inductance adjustments" on coil "R" - "K" - "E1" for peak reading on the output meter. These adjustments are also interlocking and should be repeated until no further improvement can be noticed. This completes the H.F. Oscillator and R.F. coil alignment for the frequency range of 540 to 1160 K.C.

The alignment procedure of the H.F. Oscillator and R.F. coils in the remaining frequency ranges is exactly the same as outlined for the 540-1160 K.C. band. Test oscillator frequencies and main tuning dial settings vary as follows:

RANGE	CAPACITY ADJUSTING FREQUENCY	COILS	INDUCTANCE ADJUSTING FREQUENCY	COILS
1160 to 2500 K.C.	2500 K.C.	X-P-J-D2	1200 K.C.	X-P-J-D1
2.5 to 5.0 MC	5.0 MC	W-N-H-C2	2.5 MC	W-N-H-C1
5.0 to 10.0 MC	10.0 MC	T-M-G-B2	5.0 MC	T-M-G-B1
10.0 to 20.0 MC	20.0 MC	S-L-F-A2	10.0 MC	S-L-F-A1

The capacity and inductance adjustments in each band should be re-checked until no further peak changes are noted. The receiver will then be completely aligned. On the three highest frequency bands, care should be exercised to avoid adjusting the H.F. oscillator coils to an image frequency.

The check on the alignment of the receiver on all bands is now complete and if instructions have been carefully carried out optimum performance should be obtained.

The frequency range of the model SP-110 series is 540 kilocycles to 20.0 megacycles covered in five bands controlled by the band-change switch. Two other models are available, viz., the SP-110-S having a frequency range of from 40 mc. to 1250 kc., and the SP-110-L having a frequency range of from 20 mc. to 150 kc. In the SP-110-L model, the 300 kc. to 150 kc. band is substituted for the 2.5 to 5 mc. band.

Socket,Trimmers,Alignment
Parts

HETRO ELECTRICAL INDUSTRIES

CALIBRATION AND ALIGNMENT

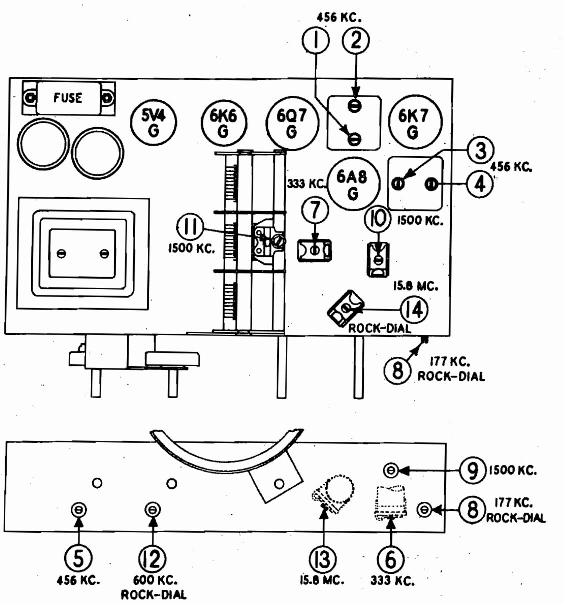
ALIGNING EQUIPMENT: For proper alignment, an output meter and an accurately calibrated oscillator with a tuning range from 19 to 1700 meters (15.8 MC. to 177 KC.) are required.

Connect the output meter from the plate of the output tube to chassis. A convenient point to make the plate connection is to the yellow wire on the speaker socket.

ALIGNING THE I. F. AMPLIFIER: Turn the volume control to maximum volume position and keep it in this position throughout the entire alignment procedure. Turn the range switch to the broadcast band (center position of band selector).

Connect the test oscillator output leads to the 6A8G control grid and chassis with a .1 mfd. condenser in series with the oscillator output. Set the oscillator to exactly 657.5 meters (456 KC.). Set the receiver dial at any point where it has no tuning effect on the oscillator signal.

Adjust the four I.F. trimmers, Nos. 1, 2, 3 and 4, for maximum output meter deflection, then repeat the trimmer adjustment.



TRIMMER LOCATIONS

Trimmer Number		Alignment Wavelength	Alignment Frequency
1-2	1st I.F. transformer trimmers----------------	657.5 M.	456 KC.
3-4	2nd I.F. transformer trimmers----------------	657.5 M.	456 KC.
5	Wave-trap trimmer----------------------------	657.5 M.	456 KC.
6	Long wave oscillator shunt trimmer-----------	900 M.	333 KC.
7	Long wave antenna shunt trimmer--------------	900 M.	333 KC.
8	Long wave oscillator series padder-----------	1700 M.	177 KC.
9	Broadcast oscillator shunt trimmer-----------	200 M.	1500 KC.
10	Broadcast detector shunt trimmer------------	200 M.	1500 KC.
11	Broadcast antenna shunt trimmer-------------	200 M.	1500 KC.
12	Broadcast padding trimmer-------------------	500 M.	600 KC.
13	Short wave oscillator shunt trimmer----------	19 M.	15.8 MC.
14	Short wave antenna shunt trimmer------------	19 M.	15.8 MC.

WAVE-TRAP ADJUSTMENT: The wave-trap adjustment screw, No. 5 is located on the front of the chassis. Take off the lock nut and washer on this adjusting screw. Leave the test oscillator at 657.5 meters (456 KC.). Connect the oscillator output to the A and G terminals of the receiver with a 400 ohm resistor in series with the A terminal and oscillator output. Then adjust the wave-trap screw No. 5 for minimum output. If some particular station with a frequency near 657.5 meters (456 KC.) causes code interference, it may be desirable to adjust the wave-trap on the actual frequency of the interfering station. Having completed this operation it is very necessary to replace the washer and tighten the lock nut.

LONG WAVE BAND CALIBRATION AND ALIGNMENT

With the gang condenser in full mesh, the main dial pointer should be on the vertical line between 175 and 550 meters on the dial scale. If it is not, hold the dial gear and turn the pointer to the correct position.

Turn the range switch to the long wave band (fully clockwise position) and leave the test oscillator output connected to the A and G terminals of the receiver with a 400 ohm carbon resistor in series with the A terminal and the oscillator output.

Adjust the test oscillator to exactly 900 meters (333 KC.).
Tune in the 900 meter oscillator signal and determine whether the receiver dial calibration is correct at this point on the dial. If the calibration is correct, do not adjust the long wave oscillator shunt trimmer No. 6. If the calibration is incorrect, adjust trimmer No. 6 to give proper calibration.

Carefully tune the receiver to the oscillator signal and adjust trimmer No. 7 for maximum output.

Adjust the test oscillator to 1700 meters (177 KC.) and tune the receiver to the signal. Adjust trimmer No. 8 for maximum output. Then try to increase the output meter by detuning No. 8 slightly and retuning the receiver dial. If the output goes down, detune the trimmer in the opposite direction. Continue detuning the trimmer and retuning the receiver dial until maximum output meter deflection is secured. This operation is commonly known as "rocking" and when performed as described will give maximum selectivity and sensitivity even though the dial may be slightly off calibration at 1700 meters.

BROADCAST BAND CALIBRATION AND ALIGNMENT

Turn the range switch to the broadcast band (center position). Adjust the test oscillator to exactly 200 meters (1500 KC.) and leave its output connected to the A and G terminals through a 400 ohm carbon resistor.

Tune in the 200 meter oscillator signal and determine whether the dial calibration is correct at the low wave length end of the dial. The 200 meter point is the first dial division above 175 meters on the yellow dial scale, i.e. the yellow dial division nearest to the 19 meter indication on the red scale.

If the calibration is correct, do not adjust the broadcast oscillator shunt trimmer No. 9. If the calibration is incorrect, adjust trimmer No. 9 to give proper calibration.

Carefully tune the receiver to the 200 meter oscillator signal and adjust trimmers No. 10 and 11 for maximum output.

Adjust the test oscillator to 500 meters (600 KC.) and tune the receiver to the signal. Adjust trimmer No. 12 for maximum output. Then try to increase the output meter reading by detuning No. 12 slightly and retuning the receiver dial. If the output goes down, detune the trimmer in the opposite direction. Continue detuning the trimmer and retuning the receiver dial until maximum output meter deflection is secured. This operation is commonly known as "rocking" and when performed as described will give maximum selectivity and sensitivity even though the dial may be slightly off calibration at 500 meters.

SHORT WAVE BAND CALIBRATION AND ALIGNMENT

Turn the range switch to the extreme counter-clockwise position. Be sure that the D and G terminals on the antenna terminal strip are connected together.

Set the test oscillator to exactly 19 meters (15.8 MC.). Tune in the 19 meter oscillator signal on the receiver dial to determine whether the receiver dial calibration is correct at 19 meters. If it is, do not adjust the short wave band oscillator shunt trimmer No. 13. If the calibration is incorrect, set the receiver dial pointer exactly at 19 meters and adjust the oscillator shunt trimmer No. 13 until the oscillator signal comes in at this point.

Check to see that it has been adjusted to the proper peak by tuning the receiver to approximately 20.1 meters. A repeat signal should be heard at this point. If none is present, even with greatly increased oscillator output, retune the receiver to 19 meters and adjust trimmer No. 13 to the proper peak with the trimmer screw farther out.

Carefully tune the receiver to the signal and adjust trimmer No. 14 to a peak. Then try to increase the output by detuning the trimmer No. 14 slightly and retuning the dial until a maximum output meter deflection is secured. Check the adjustment by tuning the receiver to the image at about 20.1 meters. The image should be weaker than the 19 meter signal. If the signal at 20.1 meter dial setting is equal to or stronger than the 19 meter signal trimmer No. 14 is not set to the proper peak. Turn the trimmer in a turn or so, then readjust as above.

MISCELLANEOUS PARTS

Part Number	Description
106261-----------------	Flat steel mounting washer
1211423----------------	Fuse mounting strip
1211424----------------	Fuse cover
1211450----------------	Terminal strip G.D.A.
1211539----------------	Rubber chassis mounting bushing
1211540----------------	#10x1-1/4 chassis mounting screw
1211549----------------	Knob (for volume control)
1211554----------------	Knob (for tuning and tone control)
1211670----------------	Phonograph terminal strip
1211914----------------	Speaker socket (4 prong)
1211948----------------	#2x3/8 R.H.W. screw for escutcheon
1211936----------------	Felt washer (for back of knobs) also used for chassis mounting
1211937----------------	Embossed washer (used with 1211444 electrolytic condenser)
1211938----------------	Felt washer for back of knobs
1212011----------------	Knob (for range switch)
1212027----------------	Tube shield assembly

TUNING DRIVE AND DIAL PARTS

Part Number	Description
1211465----------------	Dial ring and bracket assembly
1211466----------------	Dial disc and bushing assembly
1211489----------------	Dial lamp shield
1211493----------------	Dial light socket
1211522----------------	Escutcheon with glass
1211697----------------	Dial scale retaining clip
1211939----------------	Drive shaft and bracket assembly

Parts

HETRO ELECTRICAL INDUSTRIES

CALIBRATION AND ALIGNMENT

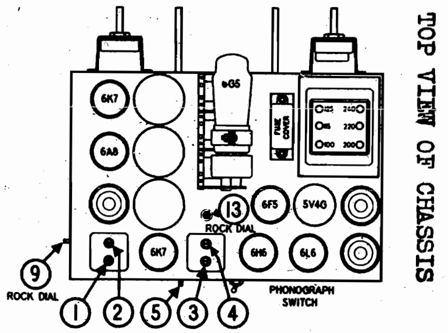
ALIGNING EQUIPMENT

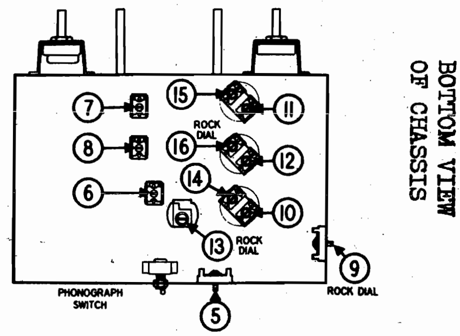
For proper alignment, an output meter and an accurately calibrated oscillator with a tuning range from 19 to 1700 meters (15.8 MC. to 177 KC.) are required.

Connect the output meter from the plate of the output tube to chassis. A convenient point to make the plate connection is to the yellow wire on the speaker socket.

ALIGNING THE I.F. AMPLIFIER

Turn the volume control to maximum volume position and keep it in this position throughout the entire alignment procedure. Turn the range switch to the intermediate broadcast position (fully clockwise).





Connect the test oscillator output leads to the 6A8 control grid and chassis with a .1 mfd. condenser in series with the oscillator output. Set the oscillator to exactly 658 meters (456 KC.). Set the receiver dial at any point where it has no tuning effect on the oscillator signal.

Adjust the four I.F. trimmers, Nos. 1, 2, 3 and 4, for maximum output meter deflection, then repeat the trimmer adjustment.

WAVE-TRAP ADJUSTMENT

The wave-trap adjusting trimmer, No. 5, is located on the back of the chassis. Leave the test oscillator at 658 meters (456 KC.). Connect the oscillator output to the A and G terminals of the receiver with a 400 ohm resistor in series with the A terminal and oscillator output. Then adjust the wave-trap trimmer No. 5 for minimum output. If some particular station with a frequency near 657.5 meters (456 KC.) causes code interference, it may be desirable to adjust the wave-trap on the actual frequency of the interfering station.

LONG WAVE BAND CALIBRATION AND ALIGNMENT

With the gang condenser in full mesh, the main dial pointer should be on the vertical line between 175 and 550 meters on the dial scale. If it is not, hold the dial gear and turn the pointer to the correct position.

Turn the range switch to the center position (long wave) and leave the test oscillator output connected to the A and G terminals of the receiver with a 400 ohm carbon resistor in series with the A terminal and the oscillator output.

Adjust the test oscillator to exactly 900 meters (333 KC.).

Tune in the 900 meter oscillator signal and determine whether the receiver dial calibration is correct at this point on the dial. If the calibration is correct, do not adjust the long wave oscillator shunt trimmer No. 6. If the calibration is incorrect, adjust trimmer No. 6 to give proper calibration.

Carefully tune the receiver to the oscillator signal and adjust trimmers No. 7 and 8 for maximum output.

Adjust the test oscillator to 1700 meters (177 KC.) and tune the receiver to the signal. Adjust trimmer No. 13 for maximum output. Then try to increase the output meter by detuning No. 13 slightly and retuning the receiver dial. If the output goes down, detune the trimmer in the opposite direction. Continue detuning the trimmer and retuning the receiver dial until maximum output meter deflection is secured. This operation is commonly known as "rocking" and when performed as described will give maximum selectivity and sensitivity even though the dial may be slightly off calibration at 1700 meters.

BROADCAST BAND CALIBRATION AND ALIGNMENT

Turn the range switch to the broadcast position (fully clockwise) Adjust the test oscillator to exactly 200 meters (1500 KC.) and leave its output connected to the A and G terminals through a 400 ohm carbon resistor.

Tune in the 200 meter oscillator signal and determine whether the dial calibration is correct at the low wave length end of the dial. The 200 meter point is the first dial division above 175 meters on the yellow dial scale, i.e. the yellow dial division nearest to the 19 meter indication on the red scale.

If the calibration is correct, do not adjust the broadcast oscillator shunt trimmer No. 10. If the calibration is incorrect, adjust trimmer No. 10 to give proper calibration.

Carefully tune the receiver to the 200 meter oscillator signal and adjust trimmers No. 11 and 12 for maximum output.

Adjust the test oscillator to 500 meters (600 KC.) and tune the receiver to the signal. Adjust trimmer No. 9 for maximum output. Then try to increase the output meter reading by detuning No. 9 slightly and retuning the receiver dial. If the output goes down, detune the trimmer in the opposite direction. Continue detuning the trimmer and retuning the receiver dial until maximum output meter deflection is secured. This operation is commonly known as "rocking" and when performed as described, will give maximum selectivity and sensitivity even though the dial may be slightly off calibration at 500 meters.

SHORT WAVE BAND CALIBRATION AND ALIGNMENT

Turn the range switch to the extreme counter-clockwise position.

Be sure that the D and G terminals on the antenna terminal strip are connected together.

TRIMMER LOCATIONS

Trimmer Number		Alignment Frequency	Alignment Wave-Length
1-2	1st I.F. transformer trimmer	456 KC.	658 M.
3-4	2nd I.F. transformer trimmer	456 KC.	658 M.
5	Wave trap trimmer	456 KC.	658 M.
6	Long wave oscillator shunt trimmer	333 KC.	900 M.
7	Long wave antenna shunt trimmer	333 KC.	900 M.
8	Long wave detector shunt trimmer	333 KC.	900 M.
9	Broadcast oscillator series padder	600 KC.	500 M.
10	Broadcast oscillator shunt trimmer	1500 KC.	200 M.
11	Broadcast antenna shunt trimmer	1500 KC.	200 M.
12	Broadcast detector shunt trimmer	1500 KC.	200 M.
13	Long wave oscillator series padder	177 KC.	1700 M.
14	Short wave oscillator shunt trimmer	15.8 MC.	19 M.
15	Short wave antenna shunt trimmer	15.8 MC.	19 M.
16	Short wave detector shunt trimmer	15.8 MC.	19 M.

Set the test oscillator to exactly 19 meters (15.8 MC.). Tune in the 19 meter oscillator signal on the receiver dial to determine whether the receiver dial calibration is correct at 19 meters. If it is, do not adjust the short wave band oscillator shunt trimmer No. 14. If the calibration is incorrect, set the receiver dial pointer exactly at 19 meters and adjust the oscillator shunt trimmer No. 14 until the oscillator signal comes in at this point.

Check to see that it has been adjusted to the proper peak by tuning the receiver to approximately 20.1 meters. A repeat signal should be heard at this point. If none is present, even with greatly increased oscillator output, retune the receiver to 19 meters and adjust trimmer No. 14 to the proper peak with the trimmer screw farther out.

Carefully tune the receiver to the signal and adjust trimmers No. 15 and 16 to a peak. Then try to increase the output by detuning the trimmer No. 16 slightly and retuning the dial until a maximum output meter deflection is secured. Then readjust trimmer No. 15 to a peak. Check the adjustment by tuning the receiver to the image at about 20.1 meters. The image should be much weaker than the 19 meter signal. If the signal at 20.1 meter dial setting is equal to or stronger than the 19 meter signal trimmer No. 16 is not set to the proper peak. Turn the trimmer in a turn or so, then readjust as above.

MODEL HA67
Schematic,Voltage

INSTRUCTIONS FOR HETRO TUNERS
Models A and B

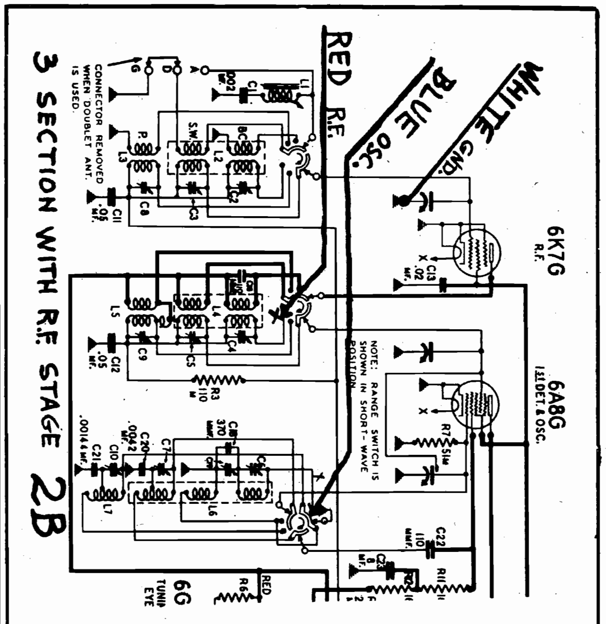
The tuner is secured to the cabinet by the two machine screws provided. The escutcheon with two wood screws provided. Insert rubber washer of proper thickness between cabinet and tuner. The Black knob should be in position "6" to distinguish the manual tuning button from the other five automatic tuning buttons with Brown knobs. These knobs merely slip over the shafts by pushing them firmly. The tuner is supplied with 3 connecting wires, 12 inches long. Before connecting the tuner, select the location in the cabinet, if possible, directly above the tuning condenser or anywhere that will permit short connections. Then drill the cabinet using the template supplied with the tuner, and connect it to the set. Lead wires should come from the right hand side of the unit. Connect the tuner in one of the methods suggested. Tuner may be connected and tested before drilling the cabinet. Once the tuner is adjusted, the trimmers or the connecting wires should not be moved, or it will be necessary to reset the trimmers slightly.

For sets with 3 section condenser

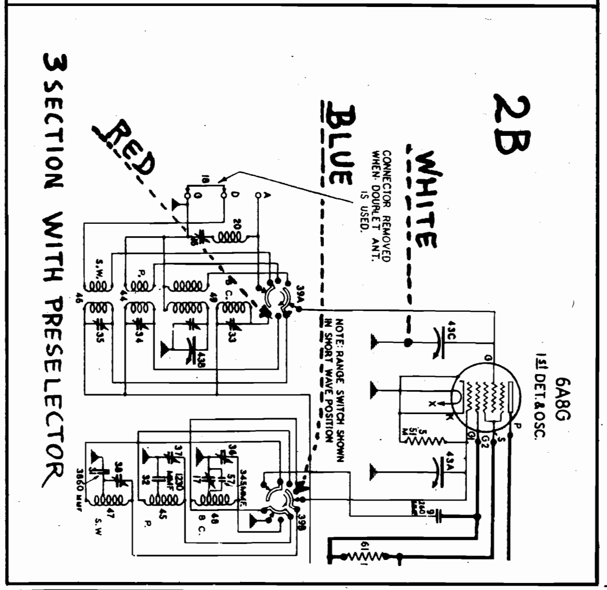
Method 2 -- RED TRACER wire to RADIO FREQUENCY section of tuning condenser (usually the center section). BLUE TRACER wire to Oscillator section. This section usually has no wire connecting it to grid cap of tube. WHITE wire to frame or Ground lug of tuning condenser. Make sure that RED TRACER is not connected to antenna section.

Method 2B - Recommended for sets with short wave bands (3 section condenser)
RED TRACER wire to the Grid terminal of the Broadcast band radio frequency coil. BLUE TRACER wire to the Grid terminal of the Broadcast band Oscillator coil. These connections may be either at the coil or at the band switch, whichever is shorter. WHITE WIRE to frame or Ground lug of tuning condenser. By using this method, the tuner is only connected to the circuit when the wave band switch is in the Broadcast position and the short wave reception and dial calibrations are not affected. NOTE: If tuning coils have all secondary winding in series, this method will revert to #2 which would then be preferable, because it is easier to connect. In this case, we recommend realigning the receiver with the Master button #"6" pushed in. This applies particularly to the short wave band.

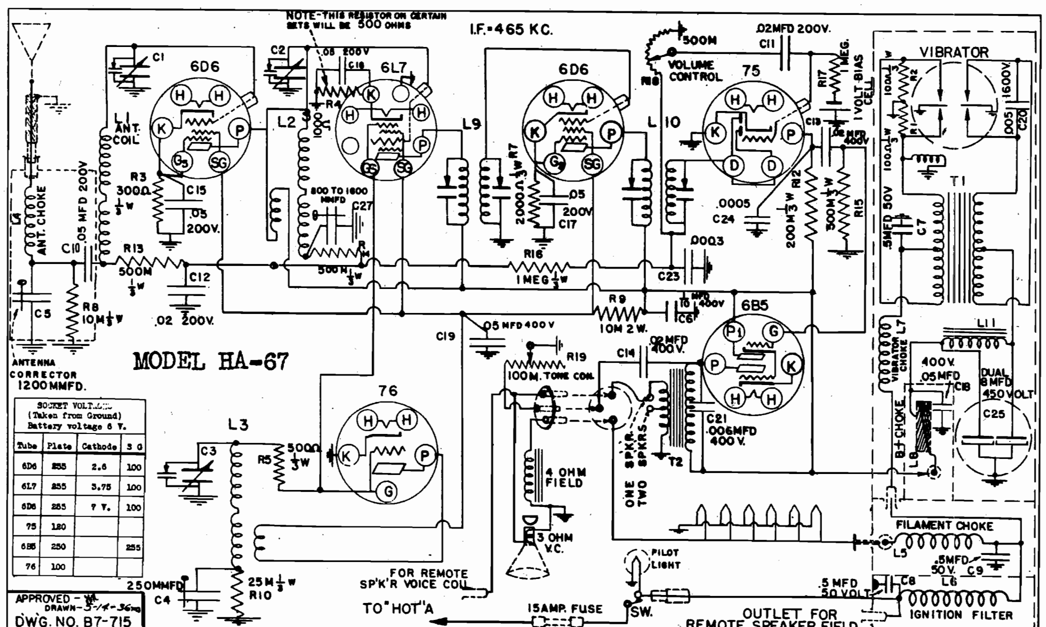
NOTE: WIRES SUPPLIED WITH TUNER ARE 12 INCHES LONG, CUT THESE TO PROPER LENGTH; LEADS SHOULD BE AS SHORT AS POSSIBLE.



3 SECTION WITH R.F. STAGE 2B



3 SECTION WITH PRESELECTOR



SOCKET VOLTAGES
(Taken from Ground)

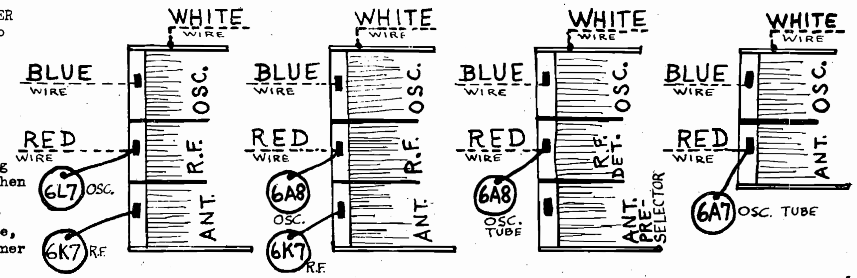
76	100		

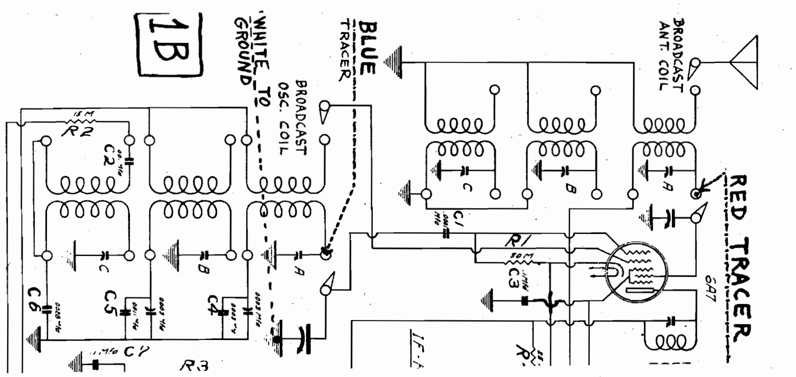
MODELS A,B Tuners
Installation Data
Adjustment,Operating Data

HETRO ELECTRICAL INDUSTRIES

Method 1 -- Connect wire with RED TRACER to ANTENNA section of tuning condenser; BLUE TRACER to OSCILLATOR section of tuning condenser. WHITE wire to Ground if possible to frame or Ground lug on the tuning condenser. All connections should be well soldered. For sets with 2 section variable condenser

Method 1B - Recommended for sets with short wave bands (2 section condenser) Connect RED TRACER to the grid terminal of Broadcast band antenna coil. BLUE TRACER wire to the grid terminal of the Broadcast band oscillator coil. These connections may be made at the coils or at the wave band switch, whichever is shorter. WHITE wire to Ground if possible to frame or Ground lug on the tuning condenser. By using this method, the tuner is only connected to the circuit when the waveband switch is in the Broadcast position, and short wave reception and dial calibrations are not affected. NOTE: If tuning coils have all secondary winding in series, this method will revert to #1 which would then be preferable, because it is easier to connect. In this case, we recommend that after the tuner has been installed, that the receiver be realigned with the Master button #"6" pushed in; this applies particularly to the short wave band.





ADJUSTMENT

Set band selector switch to "Broadcast" position and turn station selector tuning control toward higher kilocycle readings (i.e. 550 toward 1600) as far as it will go. (Rotor plates of tuning condenser entirely out). The stations desired should be decided upon as this will determine which button should be used. Buttons Number 1 and 2 as indicated in Figure 2, are used for stations whose transmitting frequencies are between 540KC and 800KC. Button 3 is for stations whose frequencies are between 700 and 1100KC. Button 4 is for stations whose frequencies are between 900KC and 1300KC. Button 5 is for those stations whose frequencies are above 1100KC. These ranges may be altered slightly up or down.

Starting with the first position, fully depress button 1. Check if tuning condenser is open as far as it will go. (i.e. that is toward the extreme high frequency end of the dial).

With a screw driver (insulated or bakelite if possible) turn adjusting screw 1-O (oscillator) until the desired station is heard, then turn screw 1-A (antenna) until the station is heard with maximum volume. On sets using tuning eye, adjustment can be made for maximum closing of the eye.

DO NOT FORCE the screws as the threads may be sheared and rendered useless. This may happen if you do not observe what range the station falls into, and thus use the wrong push button

Proceed with button 2 in a similar way, first pressing in button 2 until the previous button is released. Adjust corresponding trimmers as described above. Buttons, 3, 4, and 5 are adjusted in a similar manner using trimmers 3-O and 3A for the third button; 4-O and 4-A for the fourth button, etc.

The station call letters from the sheet of call letters provided, can now be inserted in the escutcheon slots.

OPERATION

To operate the automatic tuning control, turn station selector knob toward the highest frequency reading (highest KC dial reading), until the stop position is reached. Then depress the button corresponding to the station desired.

For manual tuning, press the Black button (Number 6) which releases the automatic tuner and proceed to tune stations in the usual manner with the station selector knob.

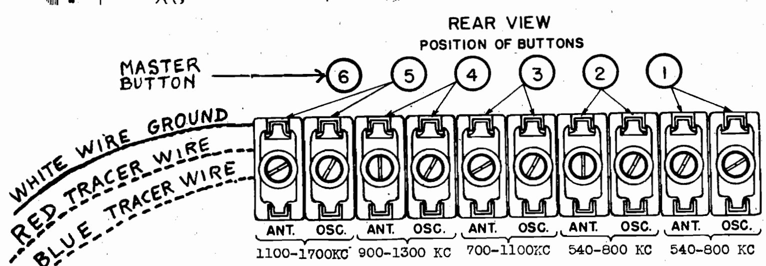
Do not attempt to press more than one button at a time as this will not tune any additional stations. Although this will not in any way injure the unit, it may result in squealing and excessive interference.

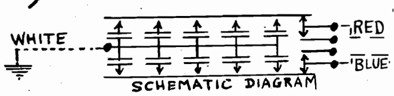
The Manual tuning control should not be used when any of the station tuning buttons are pushed in, because different stations other than those originally selected will be received when pushing the different buttons; in some cases this may be desirable.

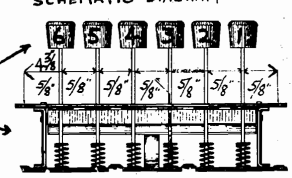
THE BLACK BUTTON SHOULD ALWAYS BE "IN" WHENEVER THE REGULAR TUNING KNOB IS USED TO SELECT THE STATIONS. The Automatic Tuning unit will not operate unless the pointer on the dial is turned as far as it will go towards the high numbers on the dial.

CAUTION

It is important that the adjustments be carefully made otherwise the reception of the radio station will be distorted and lacking in volume. It is advisable to readjust all of the trimmers a few days after the initial setting to compensate for any "drift" due to room temperature, humidity, and metal fatigue.







MASTER BUTTON IS LOCATED AT THE END FROM WHICH THE CONNECTING WIRES COME OUT.

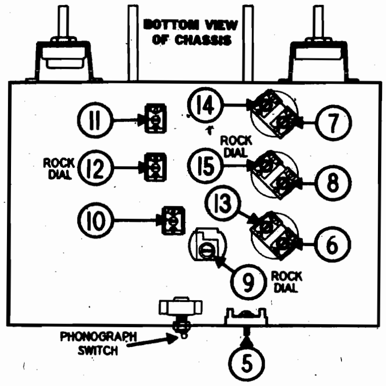
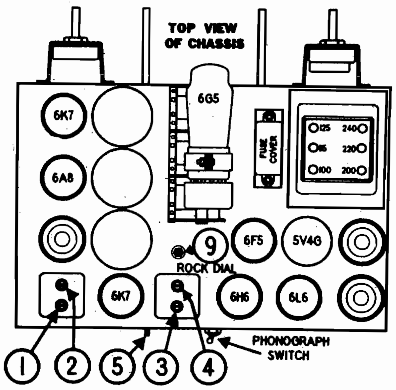
CALIBRATION AND ALIGNMENT

ALIGNING EQUIPMENT: For proper alignment, an output meter and an accurately calibrated oscillator with a tuning range from 456 KC. to 16 MC. are required.

Connect the output meter from the plate of the output tube to chassis. A convenient point to make the plate connection is to the yellow wire on speaker socket.

ALIGNING THE I. F. AMPLIFIER: Turn the volume control to maximum volume position and keep it in this position throughout the entire alignment procedure. Turn the range switch to the broadcast position (fully clockwise).





Connect the test oscillator output leads to the 6A8 control grid and chassis with a **.1 mfd. condenser in series with the oscillator output.** Set the oscillator to exactly 456 KC. Set the receiver dial at any point where it has no tuning effect on the oscillator signal.

Adjust the four I.F. trimmers, Nos. 1, 2, 3 and 4, for maximum output meter deflection, then repeat the trimmer adjustment.

WAVE-TRAP ADJUSTMENT: The wave-trap adjusting trimmer, No. 5, is located on the back of the chassis. Leave the test oscillator at 456 KC. Connect the oscillator output to the A and G terminals with a 400 ohm resistor in series with the A terminal and oscillator output. Then adjust the wave-trap trimmer No. 5 for **minimum** output. If some particular station with a frequency near 456 KC. causes code interference, it may be desirable to adjust the wave-trap on the actual frequency of the interfering station.

BROADCAST BAND CALIBRATION AND ALIGNMENT: With the gang condenser in full mesh, the dial pointer should be on the white horizontal line below 530 KC. on the dial scale. Leave the range switch in the extreme clockwise position, and leave the test oscillator connected to the A and G terminals of the receiver through a 400 ohm resistor.

Adjust the test oscillator to exactly 1500 KC. and turn the receiver dial pointer to 1500 KC. on the tuning dial. To calibrate the dial, adjust trimmer No. 6 for maximum output.

Carefully tune the receiver to the signal and adjust trimmers Nos. 7 and 8 for maximum output.

Adjust the test oscillator to 600 KC. and tune the receiver to the signal. Adjust trimmer No. 9 for maximum output. Then try to increase the output meter reading by detuning No. 9 slightly and retuning the receiver dial. If the output goes down, detune the trimmer in the opposite direction. Continue detuning the trimmer and retuning the receiver dial until maximum output meter deflection is secured. This operation is commonly known as "rocking" and when performed as described will give maximum selectivity and sensitivity even though the dial may be slightly off calibration at 600 KC.

BAND NO. 2 CALIBRATION AND ALIGNMENT: Turn the range switch to the center position.

Adjust the test oscillator to exactly 5.0 MC. and turn the receiver dial pointer to exactly 5.0 MC. on the tuning dial.

To calibrate the dial, adjust trimmer No. 10 for maximum output. If two peaks are found, the proper one is that with the trimmer screw farthest **out.**

Carefully tune the receiver to the signal and adjust trimmers Nos. 11 and 12 for maximum output. Then try to increase the output by detuning No. 12 slightly and retuning the receiver dial. Continue detuning No. 12 and retuning the dial until the output meter deflection is a maximum. Then readjust No. 11 for maximum output.

BAND NO. 3 CALIBRATION AND ALIGNMENT: Turn the range switch to the extreme counter-clockwise position. Be sure the D and G terminals on the antenna terminal strip are connected together.

Set the test oscillator to 16 MC. and turn the receiver dial pointer to exactly 16 MC. on the tuning dial.

To calibrate the dial, adjust trimmer No. 13 for maximum output. Check to see that it has been adjusted to the proper peak by tuning the receiver to approximately 15.1 MC. A repeat signal should be heard at this point. If none is present, even with greatly increased oscillator output, retune the receiver to 16 MC. and adjust trimmer No. 13 to the proper peak with the trimmer screw farther **out.**

Carefully tune the receiver to the signal and adjust trimmers Nos. 14 and 15 to a peak. Then try to increase the output by detuning No. 15 slightly and retuning the dial until a maximum output meter deflection is secured. Then readjust No. 14 for maximum output. Check the adjustment by tuning the receiver to the image at about 15.1 MC. The image should be much weaker than the 16 MC. signal. If the signal at 15.1 MC. dial setting is equal to or stronger than the 16 MC. signal, trimmer No. 15 is not set to the proper peak. Turn the trimmer in a turn or so, then readjust as above.

TRIMMER LOCATIONS

Trimmer Number		Alignment Frequency
1	1st I.F. transformer trimmer	456 KC.
2	1st I.F. transformer trimmer	456 KC.
3	2nd I.F. tranformer trimmer	456 KC.

SERVICE DATA FOR MODELS H87, HP87.

TO ADJUST AUTOMATIC PRESS-A-BUTTON TUNER IN MODELS HP85 & HP93, SEE INSTRUCTIONS SUPPLIED WITH TUNER

CALIBRATION AND ALIGNMENT

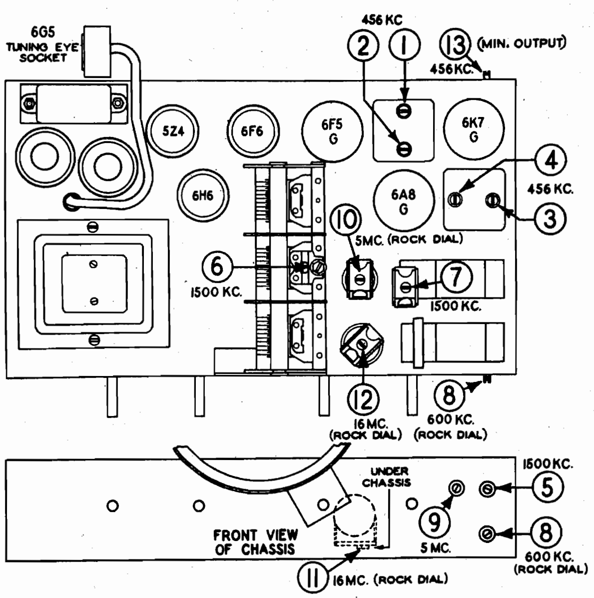
ALIGNING EQUIPMENT: For proper alignment, an output meter and an accurately calibrated oscillator with a tuning range from 456 KC. to 16 MC. are required.

Connect the output meter from the plate of the output tube to chassis. A convenient point to make the plate connection is to the yellow wire on the speaker socket.

ALIGNING THE I. F. AMPLIFIER: Turn the volume control to maximum volume position and keep it in this position throughout the entire alignment procedure. Turn the range switch to the broadcast position (fully clockwise).

Connect the test oscillator output leads to the 6A8 control grid and chassis with a .1 mfd. **condenser in series with the oscillator output.** Set the oscillator to exactly 456 KC. Set the receiver dial at any point where it has no tuning effect on the oscillator signal.

Adjust the four I.F. trimmers, Nos. 1, 2, 3 and 4, for maximum output meter deflection, then repeat the trimmer adjustment.



TRIMMER LOCATIONS

Trimmer Number		Alignment Frequency
1.	2nd I.F. transformer trimmer	456 KC.
2.	2nd I.F. transformer trimmer	456 KC.
3.	1st I.F. transformer trimmer	456 KC.
4.	1st I.F. transformer trimmer	456 KC.
5.	Broadcast oscillator shunt trimmer	1500 KC.
6.	Broadcast antenna shunt trimmer	1500 KC.
7.	Broadcast detector shunt trimmer	1500 KC.
8.	Broadcast oscillator series padder	600 KC.
9.	Police oscillator shunt trimmer	5 MC.
10.	Police antenna shunt trimmer	5 MC.
11.	Short wave oscillator shunt trimmer	16 MC.
12.	Short wave antenna shunt trimmer	16 MC.
13.	Wave-trap trimmer	456 KC.

BROADCAST BAND CALIBRATION AND ALIGNMENT: With the gang condenser in full mesh, the dial pointer should be on the white horizontal line below 530 KC. on the dial scale.

Turn the range switch to the extreme clockwise position and connect the test oscillator output to the A and G terminals of the receiver with a 400 ohm carbon resistor in series with the A terminal and the oscillator output.

Adjust the test oscillator to exactly 1500 KC. and turn the receiver dial pointer to 1500 KC. on the tuning dial. To calibrate the dial, adjust trimmer No. 5 for maximum output.

Carefully tune the receiver to the signal and adjust trimmers Nos. 6 and 7 for maximum output.

Adjust the test oscillator to 600 KC. and tune the receiver to the signal. Adjust trimmer No. 8 for maximum output. Then try to increase the output meter reading by detuning No. 8 slightly and retuning the receiver dial. If the output goes down, detune the trimmer in the opposite direction. Continue detuning the trimmer and retuning the receiver dial until maximum output meter deflection is secured. This operation is commonly known as "rocking" and when performed as described will give maximum selectivity and sensitivity even though the dial may be slightly off calibration at 600 KC.

WAVE-TRAP ADJUSTMENT: The wave-trap adjusting trimmer, No. 13, is located on the back of the chassis. Leave the test oscillator connected to the A and G terminals through a 400 ohm resistor and set the oscillator at 456 KC. Then adjust the wave-trap trimmer No. 13 for minimum output. If some particular station with a frequency near 456 KC. causes code interference, it may be desirable to adjust the wave-trap on the actual frequency of the interfering station.

Check the adjustment of trimmers 5, 6, and 7 at 1500 KC.

BAND NO. 2 CALIBRATION AND ALIGNMENT: Turn the range switch to the center position.

Adjust the test oscillator to exactly 5.0 MC. and turn the receiver dial pointer to exactly 5.0 MC. on the tuning dial.

To calibrate the dial, adjust trimmer No. 9 for maximum output. If two peaks are found, the proper one is that with the trimmer screw farthest **out.**

Carefully tune the receiver to the signal and adjust trimmer No. 10 for maximum output. Then try to increase the output by detuning No. 10 slightly and retuning the receiver dial. Continue detuning No. 10 and retuning the dial until the output meter deflection is a maximum.

BAND NO. 3 CALIBRATION AND ALIGNMENT: Turn the range switch to the extreme counter-clockwise position. Be sure the D and G terminals on the antenna terminal strip are connected together.

Set the test oscillator to 16 MC. and turn the receiver dial pointer to exactly 16 MC. on the tuning dial.

To calibrate the dial, adjust trimmer No. 11 for maximum output. Check to see that it has been adjusted to the proper peak by tuning the receiver to approximately 15.1 MC. A repeat signal should be heard at this point. If none is present, even with greatly increased oscillator output, retune the receiver to 16 MC. and adjust trimmer No. 11 to the proper peak with the trimmer screw farther **out.**

Carefully tune the receiver to the signal and adjust trimmer No. 12 to a peak. Then try to increase the output by detuning the trimmer slightly and retuning the dial until a maximum output meter deflection is secured. Check the adjustment by tuning the receiver to the image at about 15.1 MC. The image should be much weaker than the 16 MC. signal. If the signal at 15.1 MC. dial setting is equal to or stronger than the 16 MC. signal, trimmer No. 12 is not set to the proper peak. Turn the trimmer in a turn or so, then readjust as above.

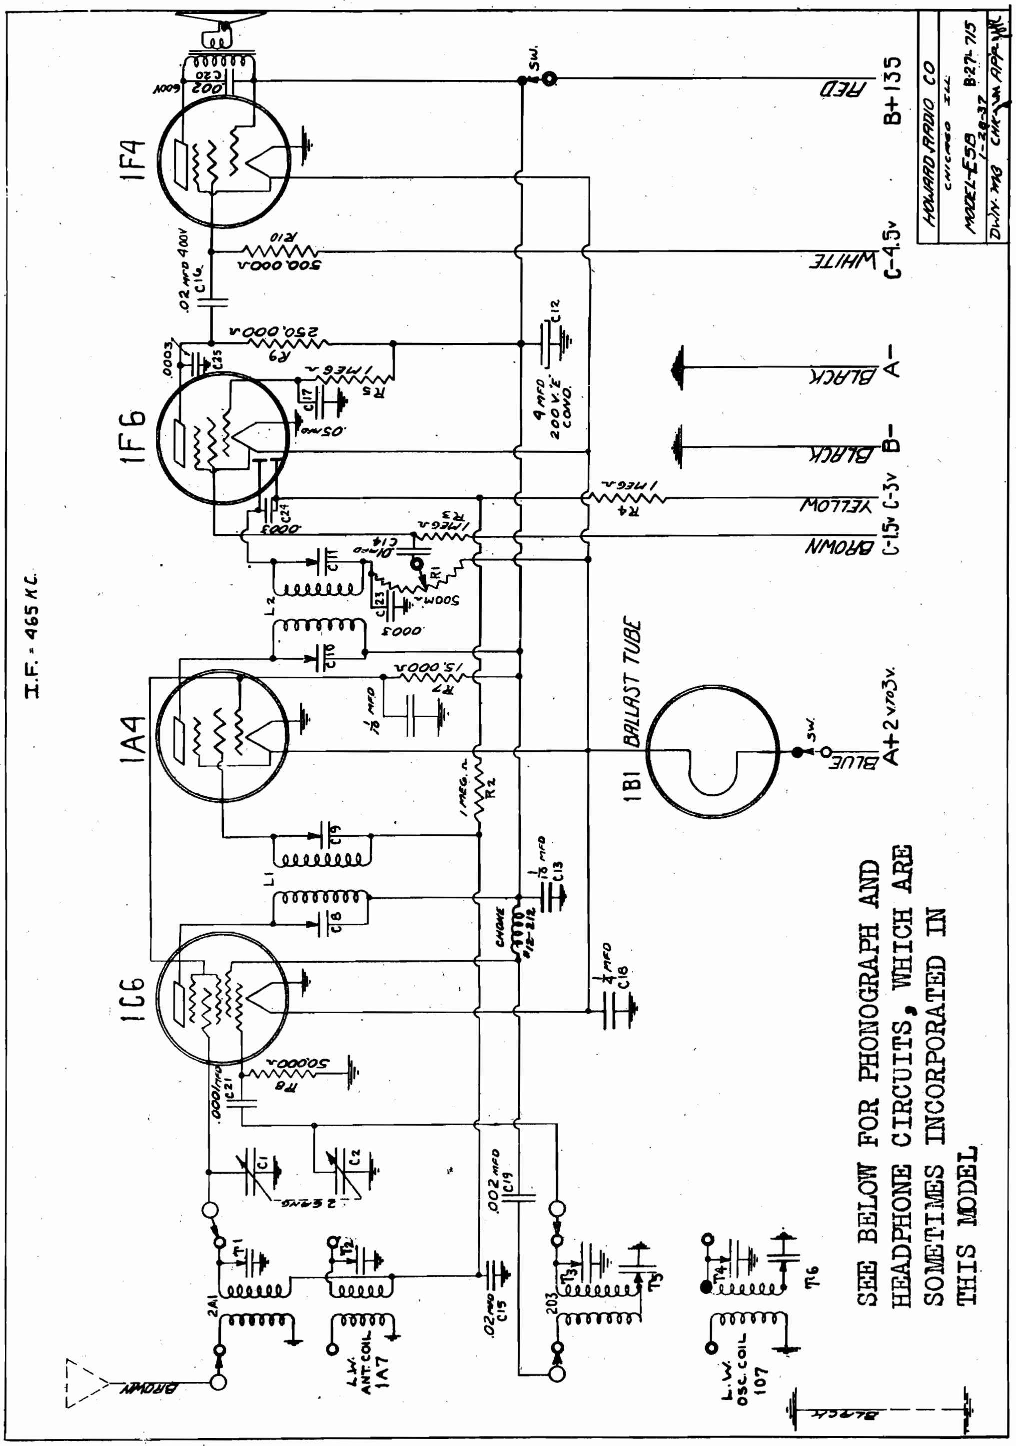
HOWARD RADIO CO.

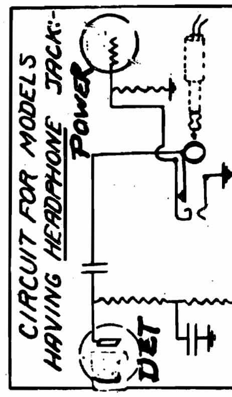
MODEL E5B
Schematic

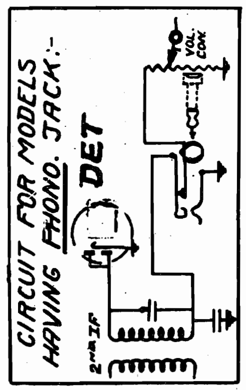
For Model E259 an auxillary line cord of 200 ohms resistance must be placed in series with the regular cord to use the set on 230 volt line.

For the AC Models, when a universal transformer is being used a separate instruction sheet is enclosed with the receiver showing the right combination of leads for various line voltages.

The diagram below shows the fundamental circuits used for PHONO JACK and HEADPHONE JACK. NOTE: With models that do not have the cathode grounded, the terminal on the jack that would ordinarily be grounded would be common to the cathode return. This also applies to the power tube grid circuit.







SCHEMATIC DIAGRAMS FOR MODELS E-256 & E-259 ARE ON SEPARATE PAGE--SEE INDEX

MODELS E5B,E256,E259
Trimmers,Alignment

I. THE I. F. STAGES

The intermediate frequency stages are aligned in the usual manner on Models E259 and E59 by feeding 465 KC into the grid of the mixer tube after removing grid cap, placing a series resistor of 500,000 ohms from tube grid to the cap and a series condenser from the tube grid to the hot lead from the signal generator. NOTE WITH MODEL E256 LEAVE GRID CAP ON THE MIXER TUBE, TURN BAND SWITCH TO BROADCAST BAND POSITION AND VARIABLE CONDENSER ALL THE WAY OUT TO MINIMUM CAPACITY.

The sensitivity of the I. F. System alone for Models E256 and E259 will be about 25 to 50 Microvolts for a 50 Milliwatt output, and about 125 Microvolts for Model E5B.

The two trimmers in each of the I. F. cans should be very carefully peaked to resonance as they are very critical and will greatly affect the performance of the set.

Always use as low an output as possible from the signal generator when making the various adjustments.

MODELS E-5B,E-256,E-259

II. THE BROADCAST BAND

First check the position of the dial hand by rotating the condenser plates to full capacity. At this point the dial hand should be straight across in line with the lines dividing the scale in half. If the hand is off position, remove dial glass to get at the screw holding the hand.

Turn wave band switch all the way to left and dial hand set to 1400 KC (the top scale). The signal generator may be coupled direct to the antenna lead on this band, through a standard 200 MMFD condenser.

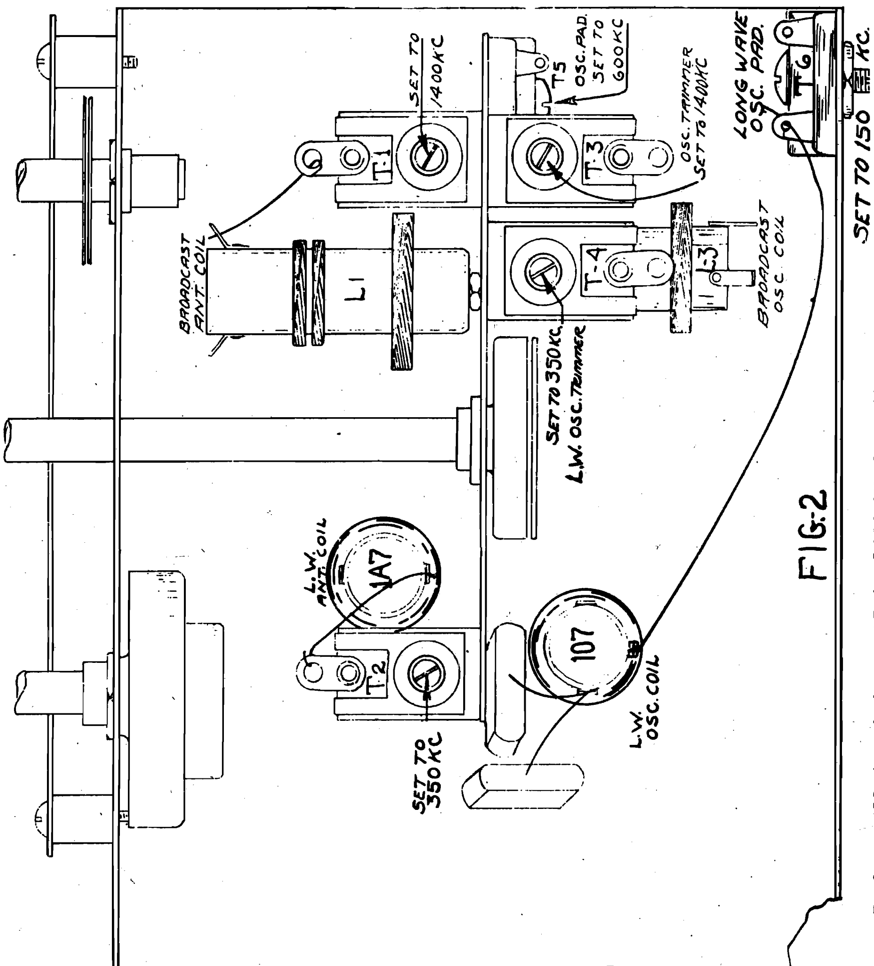

FIG. 2

Peak oscillator trimmer T3 to 1400 KC from the signal generator.

Peak antenna trimmer T1 to 1400 KC after adjusting oscillator.

Set dial hand to 600 KC and adjust oscillator padding condenser T5 to 600 KC.

III. THE LONG WAVE BAND

With the Band switch in position for the Long Wave Band, (all the way to the left) peak oscillator trimmer T4 to 350 KC.

After oscillator trimmer is set, peak Antenna Circuit trimmer T2 to 350 KC.

Turn dial hand to 150 KC and adjust oscillator padding condenser T6 to 150 KC.

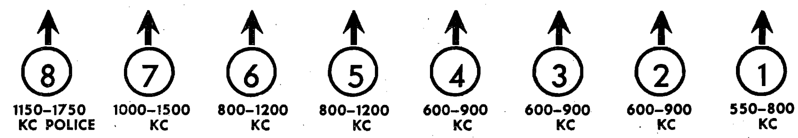
SET-UP INSTRUCTIONS



CONNECT AERIAL, POWER SUPPLY AND TURN ON VOLUME BEFORE STARTING STATION SET-UP

SET-UP INSTRUCTIONS

FIRST – Select button by number that will tune desired station according to frequency vs. buttons as shown above.

SECOND – Depress the button selected, then adjust red adjustment (be sure to adjust the adjustment having the same number as the depressed button.) Move this adjustment until desired station is heard.

THIRD – Next move the adjustment directly above until electric eye shows maximum deflection, then slightly re-adjust red adjustment for maximum eye deflection.

FOURTH – Insert the station call letter tab over button number just selected. Repeat this procedure for the remaining buttons.

EXAMPLE

Station desired, WGN: WGN frequency is 720 KC, therefore Button 2, 3, or 4 can be used. Button 3 is depressed on front of panel, the red adjustment above No. 3 is moved until WGN comes in. The adjustment directly above the red one is adjusted for maximum eye deflection, the red adjustment is again moved slightly to check eye for maximum deflection. WGN tab is removed from tab sheet and inserted in escutcheon over No. 3. Insert tab by pushing in place with finger-tip.

SUGGESTIONS

FIRST – Do not try to extend the adjustments beyond their frequency rating.

SECOND – Move adjustments slowly.

THIRD – Double-check before moving any adjustment to make sure adjustment number corresponds to button number. Carelessness in this manner will cause you to misadjust adjustments already completed.

FOURTH – Check adjustments occasionally for maximum deflection of eye, while receiver is in service. This will not have to be done often but it is good assurance that your receiver is always tuned properly. Sometimes it helps to have another receiver operating on the station desired so that station being tuned in by adjustment can be quickly recognized.

REPLACEMENT PARTS AND PRICE LIST
Models 240-1 and 240-2

PART NO.	LIST PRICE	DESCRIPTION	CIRCUIT LOCATION
32-936	$1.30	Coil - 1st I.F. Assembly, Complete. . . .	L1

27-938	2.75	Transformer - Model 240-1 for 80 Tube . .	
39-938	2.75	Transformer - Model 240-2 for 1V Tube . .	
42-810	4.00	Speaker - 5½" with plug	

NOTE: When ordering speaker parts such as cone, transformer or the field it is necessary that the number on the back of the speaker be specified. Also make of speaker.

THE ADAPTION OF THE SET FOR USE WITH PHONOGRAPH

Out of the back of the chassis there extends three lugs as shown in Diagram Fig. 1.

For phonograph use, the jumper is removed and a single pole, double throw switch is connected as shown in Fig. 2. The pick-up leads from the pick-up are connected to Nos. 1 and 2 terminals, with the overall shield grounded to No. 3 terminal.

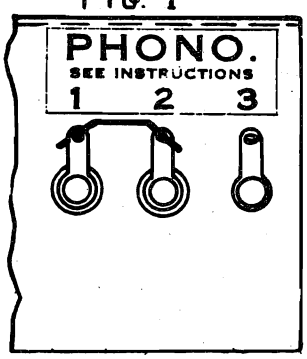

FIG. 2

THE I. F. STAGES

The I. F.'s are aligned by the usual system of feeding the intermediate frequency of 465 KC into the grid of the 6A7 tube.

The two trimmers in each of the I. F. cans should be very carefully peaked to resonance as they are very critical and will greatly affect the performance of the set. These are trimmers number T8, T9, T10, T11. (see pictorial diagram). Fig. 1.

The Sensitivity of the I. F. stages will be 25 to 50 microvolts or better for a 50 milliwatt output.

Always use as low an output as possible from the test oscillator in making the various adjustments.

ALIGNMENT OF POLICE BAND 2 TO 6.5 MEGACYCLES

First check the position of the dial hand by rotating the condenser shaft to the left to full capacity. At this point the dial hand should be straight across in line with the lines dividing the scale in half. If the hand is off position it can be lined up by removing dial glass and setting hand with screw in center of dial.

1. Set the test oscillator to 6 megacycles.
2. Turn wave band switch all the way to right for Police Band, and set dial hand to 6 M. C.
3. Peak trimmer condenser T4 of the oscillator coil Fig. 2 to resonance with 6 M. C. fed into antenna.
4. Adjust antenna coil trimmer T2 to same frequency after the above mentioned oscillator trimmer has been set.

THE BROADCAST BAND FIG. 2 OR FIG. 2S

1. Turn wave band switch all the way to left and dial hand set to 1400 KC (the top scale).
2. Peak oscillator trimmer T3 to 1400 KC and antenna trimmer T1 to same frequency.
3. Set dial hand to 600 KC and adjust oscillator padding condenser T5 to 600 KC.
4. Recheck dial at 1400 KC as in number (1) and (2).
5. Points in the middle of the dial may be checked and if necessary the plates of the front section of variable condenser may be bent for alignment.

NOTES.
1. Seal all trimmers after their final adjustment.
2. Be sure that the settings are being made to the true fundamental signal from the oscillator and not on a harmonic or image frequency.

The models 225 and 250 are electrically the same chassis; the only difference being the cabinets in which they are mounted. These models have two band circuits covering the Broadcast Band 550 to 1700 KC and the so-called Police Band from 2 to 6.5 megacycles, having separate Antenna and Oscillator coils for each band.

The models S225 and S250 cover the Broadcast Band 550 to 1700 KC and the short wave band 5.5 to 18 MC.

The models 260 and S260 have the same circuit or the 225, S225 respectively with the addition of the tuning eye tube to indicate resonance.

The models 275, 275C and 280 are the same electrically, covering 3 bands, 550 to 1700 KC, 1.7 to 5.5 MC, and 5.5 to 18 MC.

THE OVERALL SENSITIVITY for the models described in this folder will be about 15 to 30 microvolts.

THE MAXIMUM OUTPUT to be obtained from the models 225, 250, 260 series will be about 2.25 watts. The undistorted output about 1-1/2 watts.

The 275 series will give you a maximum output of 5 watts, undistorted about 4 watts.

FIG.- 2S

ALIGNMENT OF SHORTWAVE BAND 5.5 TO 18 M. C. ON ALL "S" MODELS - FIG. 2-S, ALSO FOR MODELS 275, 280

First check the position of the dial hand by rotating the condenser shaft to the left to full capacity. At this point the dial hand should be straight across in line with the lines dividing the scale in half. If the hand is off position it can be lined up by removing dial glass and setting hand with screw in center of dial.

1. Set the test oscillator to 17 megacycles.
2. Turn wave band switch all the way to right for highest S.W. band, and set dial hand to 17 M. C.
3. Peak trimmer condenser of the oscillator coil to resonance with 17 M. C. fed into antenna.
4. Adjust antenna trimmer to same frequency after the above mentioned oscillator trimmer has been set.

NOTE: After adjusting the two high bands at 17 megacycles and 5 megacycles the test oscillator input to antenna should be increased and receiver dial advanced to .9 megacycle lower and note if test oscillator signal is heard.

In case there is no response the oscillator trimmers have been pulled down too tightly. The trimmers should be released until this condition exists then go back to original point of alignment - reduce antenna input voltage and correct the trimmer adjustment.

EXAMPLE: The receiver has been adjusted to 17 megacycles. Tune receiver to approximately 16.9 M. C.

Increase oscillator signal by "opening up" the attenuator. Move the dial back and forth at 16.9 M. C.

If no signal is heard, let oscillator trimmer off until it is heard at 16.9 M. C.

Reduce signal voltage from generator, go back to 17 M. C. and slightly correct this last trimmer adjustment.

The same applies to the 5 M. C. adjustment.

80	-	-	-	H. V. = 330

It is advisable to check the position of the tuning eye tube to make certain that it is not pushed against the inside of the dial card. With the adjustment screw on the bracket, allow a small amount of clearance between the end of the tube and the dial to avoid any possibility of the heat from the tube affecting the dial card.

THE MAXIMUM OUTPUT for the models

MODEL	MAXIMUM	UNDISTORTED
368	5 Watts	4 Watts
318,325	11 Watts	9 Watts
240	2.25 Watts	1.5 Watts

The normal voltage readings at the sockets are given in a separate chart

GENERAL DESCRIPTION

THE MODEL 368 is an 8 tube set having three bands, coverage being 550 to 1700 KC, 1.7 to 5.5 MC and 5.5 to 18 MC. There are separate oscillators and R.F. coils for each band. For the broadcast band only a preselector coil is used, being tuned by the back section of the gang condenser.

The three I. F. stages are tuned to 465 KC followed with the conventional diode, amplifier, and single output circuits.

THE MODELS 318, 325 are the same chassis (the model numbers refer to different cabinet styles). This ten tube set has a similar R. F. and I. F. coil system except that the preselector stage on the broadcast band includes the 6 K7 tube. The output is push pull "beam power", the 6J5G being the inverter tube.

THE MODEL 240 series 1 and 2 is strictly a push-button tuner having no gang condenser. The eight push-button station selectors complete the ground circuit of the oscillator and R. F. tuned condensers previously set to whatever frequency desired. The eight circuits cover the complete range of the broadcast band from 540 to 1750 KC. The instructions for the set-up are shown on separate page of this manual.

The model 240-1 used the 80 tube for a rectifier and the model 240-2 uses the 1V type tube.

FOR REPLACEMENT PARTS refer to the part list. When ordering specify serial number of set as well as the part number.

FOR CIRCUIT VOLTAGES refer to the charts shown in the following pages for models 368 and 318. The voltages for the model 240 are shown on the schematic diagrams.

THE ALIGNMENT PROCEDURE

The alignment procedure for the 368-318 models is given in the following pages. We suggest, however, that no attempt be made in changing the trimmer adjustments unless it is found that a change is necessary.

We suggest in case of any trouble the tubes, especially the 6J5G and the 6F5 types, be checked.

The only other trouble that might occur is in cases of extreme low A. C. line voltage of 100 volts or less, by which the oscillator plate voltage might drop to too low a potential.

THE OVERALL SENSITIVITY for the model 368 will be about 8 to 12 microvolts, model 318, 325 about 2 to 4 microvolts and the model 240, 15 to 30 microvolts.

I. THE I.F. STAGES

The intermediate frequency stages are aligned in the usual manner by feeding 465 K.C. into the grid of the mixer tube 6A7.

The two trimmers in each of the I.F. cans should be very carefully peaked to resonance as they are very critical and will greatly affect the performance of the set.

Always use as low an output as possible from the signal generator when making the various adjustments.

The sensitivity of the I.F. system alone will be found to be between 15 and 20 Microvolts.

ALIGNMENT OF SHORTWAVE BAND 5.5 TO 18 M. C.

First check the position of the dial hand by rotating the condenser shaft to the left to full capacity. At this point the dial hand should be straight across in line with the lines dividing the scale in half. If the hand is off position it can be lined up by removing dial glass and setting hand with screw in center of dial.

1. Set the test oscillator to 17 megacycles.
2. Turn wave band switch all the way to right for highest S.W. band, and set dial hand to 17 M. C.
3. Peak trimmer condenser of the oscillator coil to resonance with 17 M. C. fed into antenna. T6
4. Adjust antenna trimmer to same frequency after the above mentioned oscillator trimmer has been set. T2

NOTE: After adjusting the two high bands at 17 megacycles and 5 megacycles the test oscillator input to antenna should be increased and receiver dial advanced to .9 megacycle lower and note if test oscillator signal is heard.

In case there is no response the oscillator trimmers have been pulled down too tightly. The trimmers should be released until this condition exists then go back to original point of alignment - reduce antenna input voltage and correct the trimmer adjustment.

EXAMPLE: The receiver has been adjusted to 17 megacycles. Tune receiver to approximately 16.9 M. C.

Increase oscillator signal by "opening up" the attenuator. Move the dial back and forth at 16.9 M. C.

If no signal is heard, let oscillator trimmer off until it is heard at 16.9 M. C.

Reduce signal voltage from generator, go back to 17 M. C. and slightly correct this last trimmer adjustment.

The same applies to the 5 M. C. adjustment.

ALIGNMENT OF POLICE BAND 1.7 TO 5.5 M.C.

1. Set the test oscillator to 6 megacycles.
2. Turn wave band switch to the middle position for Police Band, and set dial hand to 6 M. C.
3. Peak trimmer condenser T5 of the oscillator coil Fig. 4 to resonance with 6 M. C. fed into antenna.
4. Adjust antenna coil trimmer T3 to same frequency after the above mentioned oscillator trimmer has been set.

THE ALIGNMENT OF THE BROADCAST BAND

1. Turn wave band switch all the way to left and dial hand set to 1400 KC (the top scale).
2. Peak oscillator trimmer T4 to 1400 KC and antenna trimmer T1 to same frequency. Likewise C13 trimmer on the gang condenser.
3. Set dial hand to 600 KC and adjust oscillator padding condenser T5 to 600 KC.
4. Recheck dial at 1400 KC as in number (1) and (2).
5. Points in the middle of the dial may be checked and if necessary the plates of the front section of variable condenser may be bent for alignment.

NOTES

1. Seal all trimmers after their final adjustment.
2. Be sure that the settings are being made to the true fundamental signal from the oscillator and not on a harmonic or image frequency.

6-771	.65	Tuning Eye Socket and Cable		
21-400	.04	Tuning Eye Sleeve		

PARTS FOR MOTOR AUTOMATIC

PART NO.	LIST PRICE	DESCRIPTION
1-548	5.75	Automatic Tuning Motor.
7-917	2.50	Selector Button Switch.
13-602C	.90	Selector Cable with Plug.
8-772	.20	Selector Socket for above.
8-917	.30	Switch - S.P.S.T. Toggle (Muting Switch).
20-352	1.00	Escutcheon for Push-Buttons.
1-285	2.60	Commutator Disc Assembly, Complete.
5-450	.25	Selector Brush Holder (Station Contactor) with washers.
1-575	.15	Contactor Pin for above (Steel) No. 2-575 for carbon type.
49-786	.05	Spacer for mounting rear hand.
19-448	.20	Dial Hand (Rear).
4-658	.10	Numbered Screws - (4-36 x 3/16).
6-829	.10	Spring Coil Type - 3/8 long (For Contact Pin).
5-829	.10	Spring - Coil Type, for contact sleeve.
	.03	Screws - # 6 x 1", knurled (Button Plate).
8-502	.30	Station Lettered Tab Sheet.
	.08	Contact lugs for Button Assembly.
	.05	Push Buttons.

PARTS FOR MODELS 400 AND 425

Same as above with following exceptions:

PART NO.	LIST PRICE	DESCRIPTION	LOCATION
20-936	$1.30	Coil 1st. I. F. Assembly	
22-936	1.30	Coil 2nd. I. F. Assembly	
28-936	1.30	Coil 3rd. I. F. Assembly	
22-270	$6.00	Condenser 3 Gang.	C1, 2, 3
31-938	5.50	Power Transformer Model 400	
32-938	6.25	Power Transformer Model 425	

THE ADAPTION OF THE SET FOR USE WITH PHONOGRAPH

Out of the back of the chassis there extends three lugs as shown in Diagram Fig. 1.
For phonograph use, the jumper is removed and a single pole, double throw switch is connected as shown in Fig. 2. The pick-up leads from the pick-up are connected to Nos. 1 and 2 terminals, with the overall shield grounded to No. 3 terminal.

FIG. 1

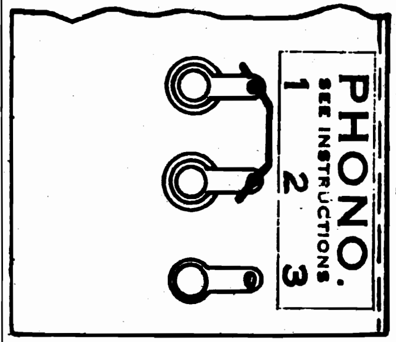

FIG. 2

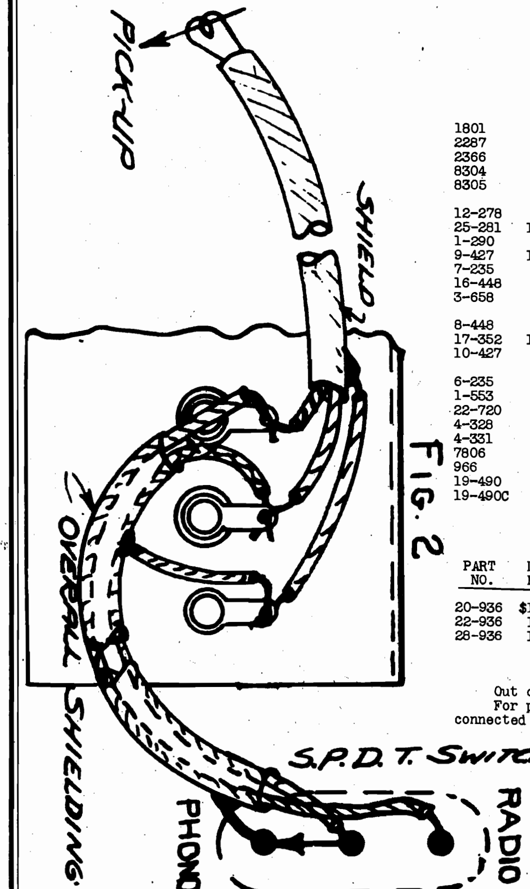

THE OVERALL SENSITIVITY for all models 425,425-A,400,400-A will be from 1 to 3 microvolts.

THE MAXIMUM OUTPUT for the models 400 and 400-A will be about 12 watts, undistorted 10 watts.
The models 425 and 425-A have maximum output of 20 and undistorted about 15 w

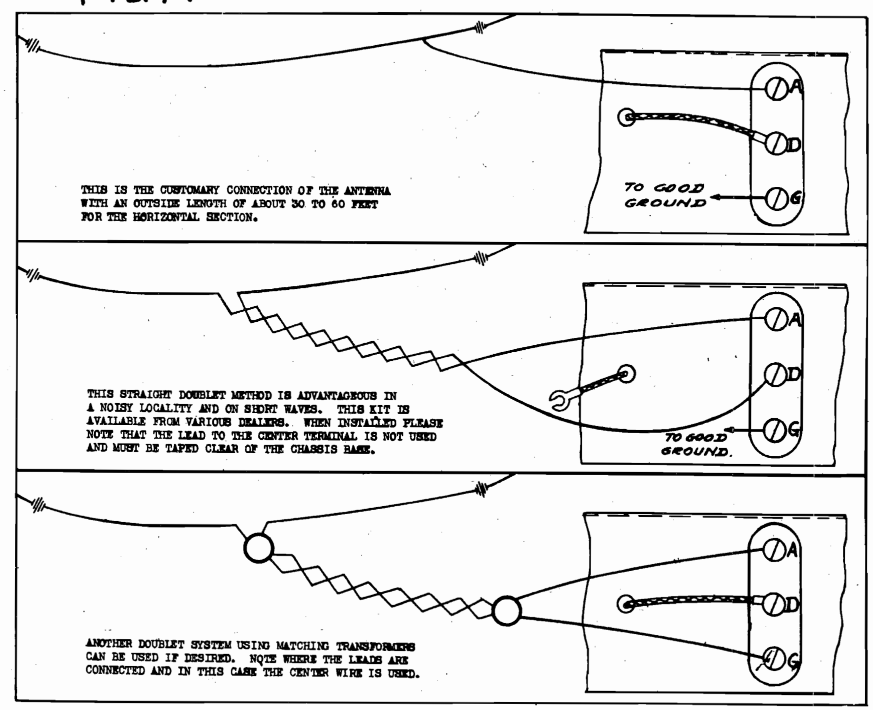
Tuner

HOWARD RADIO CO.

THE MODEL 400 is a 12 tube, 3 band receiver with all coils shielded. (See Fig. 4) for the coil location with its trimmers and padding condensers for each band. It has three stages of I. F. tuned to 465 KC. The 6F5 is a bass boost stage regulated by the bass control. The 6J5G is a phase inverter with push-pull 6V6Gs in the output. See schematic for further details.

THE MODEL 425 is a 14 tube set having the same R. F. and I. F. circuits as the Model 400. The output stage uses two 6L6Gs. See schematic.

FIG-A THE ANTENNA SYSTEM



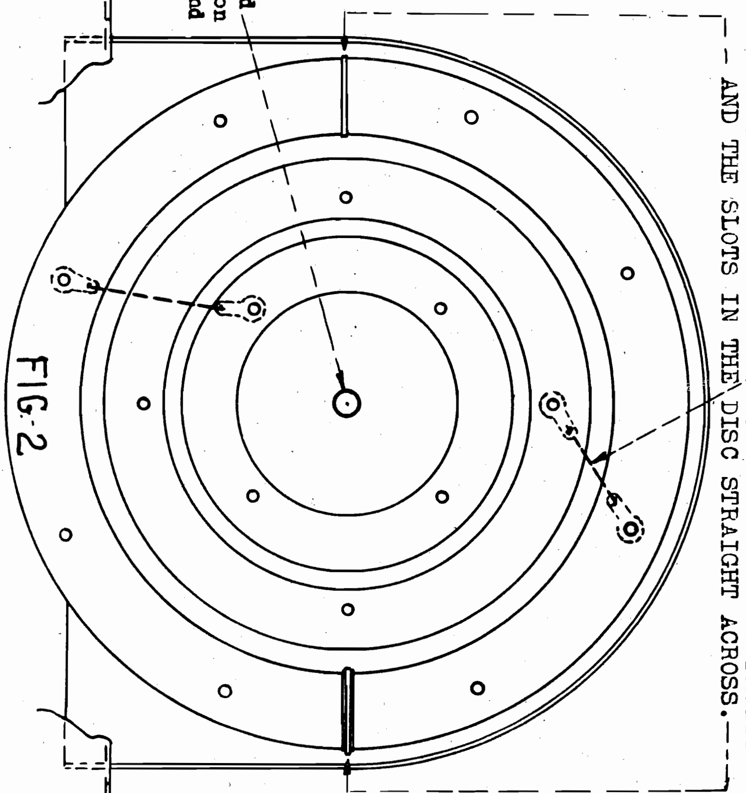
THE MODELS 400-A and 425-A have the same electrical circuit as the 400 and 425 respectively. (See Fig. 5) for coil location. These models employ the Howard motor automatic tuning feature by use of the reversible motor controlled by the commutator disc near the back of the set.

Set-up instructions are included in the following pages. Fig. 1 shows the schematic circuit of the motor system.

Should any replacement of a part on the contact-commutator system be necessary (See Fig. 2) for directions. In case of any trouble with the contacts or commutator disc, carefully examine the split groove to see if it is smooth and in good shape.

No trouble will be experienced with the motor itself. In shipment sometimes the motor shaft might get bent due to the tuning knob being struck.

BE SURE SHORT JUMPER (ON OPPOSITE SIDE) IS AT THE TOP WHEN MOUNTING DISC INTO POSITION. ALSO GANG CONDENSER MUST BE AT FULL CAPACITY AND THE SLOTS IN THE DISC STRAIGHT ACROSS.



When removing old disc note position of lockwashers and remount in same position.

The slot insulators must be smooth, even with the face plate and without grooves.

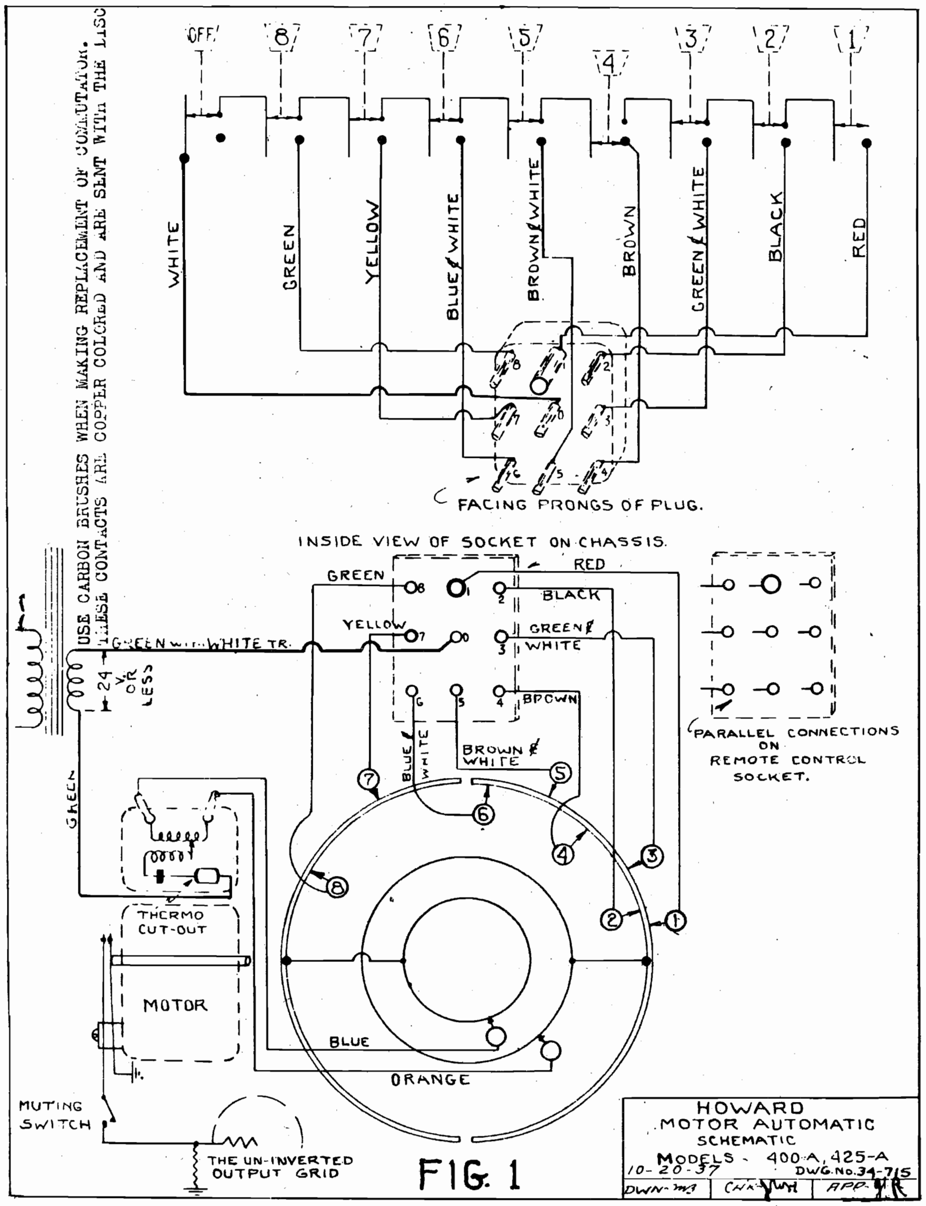

FIG. 1

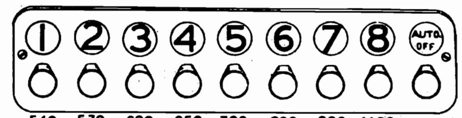
ADJUSTMENT OF HOWARD MOTOR AUTOMATIC

FIRST - Select and depress the push-button by number that will include the desired station according to frequency chart listing below:-



1	2	3	4	5	6	7	8
540 TO 580 KC	570 TO 620 KC	600 TO 670 KC	650 TO 720 KC	700 TO 820 KC	800 TO 990 KC	880 TO 1720 KC	1100 TO 1720 KC

Frequency Chart Listing

NOTE - The above chart shows selector set-up for continuous coverage. However there are many alternate arrangements possible. Refer to the frequency calibration on selector back-plate for any other arrangement necessary for the particular locality.

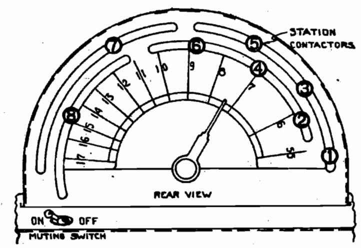
SECOND - Reach to back of chassis and turn muting switch to OFF position.

LOCATE THE SAME NUMBERED STATIONS CONTACTOR ON BACK OF TUNING CONDENSER THAT CORRESPONDS TO THE BUTTON DEPRESSED IN FIRST PARAGRAPH, AND SLIDE UNTIL THE DESIRED STATION IS TUNED IN.

With the muting switch in the OFF position the stations will be heard while moving the slide contactor. For silent tuning after all adjustments are made, turn switch to ON position.

THIRD - Remove station call letter tab from tab sheet and insert in place with finger tip in front of escutcheon plate over the number that was selected. Repeat above procedure for each of remaining buttons.

NOTE - When tuning the set by hand or if a remote cable is used the selector button AUTO-OFF must be depressed.



EXAMPLE

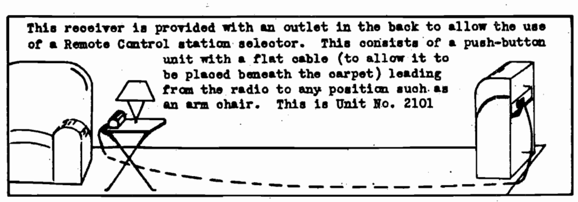
Station, WGN - Frequency 720 KC Button No.4 will tune 720 Kilocycles. Push-button No.4 is depressed. Muting switch turned to OFF position. Station contactor No.4 on back of tuning condenser is moved along its track until WGN is perfectly tuned in. WGN tab is removed from tab sheet and inserted over No.4 in the escutcheon. Muting switch is turned to ON position. WGN can now be automatically selected by its labeled push-button.

SUGGESTIONS

It will simplify setting up if the eight desired stations are first arranged in order according to frequency. Starting with the lowest frequency station first, let this be push-button No.1 and set up in rotation.

Be careful not to move a selector that has been already placed.

Check the adjustment of selector by the electric eye for maximum deflection.



This receiver is provided with an outlet in the back to allow the use of a Remote Control station selector. This consists of a push-button unit with a flat cable (to allow it to be placed beneath the carpet) leading from the radio to any position such as an arm chair. This is Unit No. 2101

HOWARD RADIO CO.

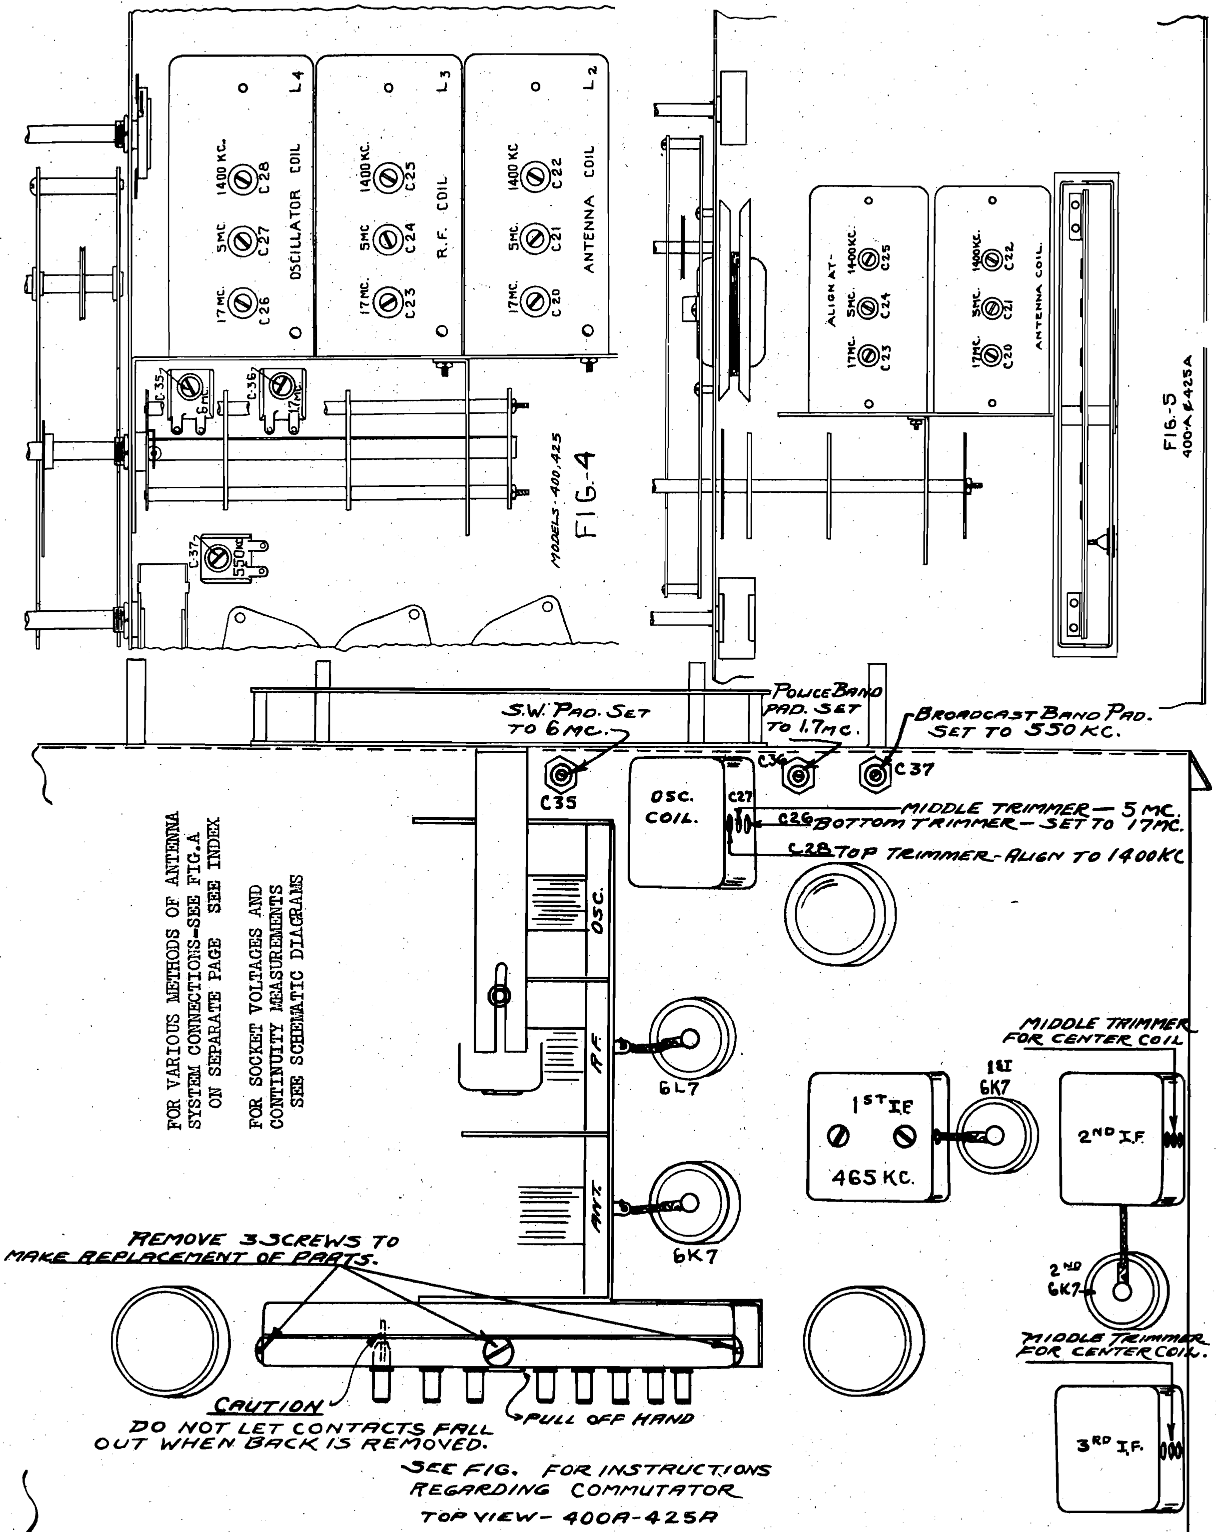

FIG-3

MODELS 400, 400-A
MODELS 425, 425-A
Alignment

HOWARD RADIO CO.

1. Seal all trimmers after their final adjustment.

2. Be sure that the settings are being made to the true fundamental signal from the oscillator and not on a harmonic or image frequency.

3. Refer to the schematic for the voltages at the tube sockets.

4. When making adjustments on the high band (5.5 to 18 megacycles), the position of the leads, by-pass condensers, and resistors are very critical at the 18 MC end of the band in their capacity relation to ground and other parts of the chassis. When the chassis leaves the factory these parts have been properly located.

When replacing the oscillator tube it is suggested that the set be checked at 18 MC since it is possible to have certain 6J5G tubes that will not oscillate at that frequency. Also low line voltage may reduce plate voltage to a point where the tube will not oscillate.

5. In cases of any instability in the audio circuits be sure the plate leads of the output tubes are not coupling with the grid lead of the inverter tube.

6. For hum trouble check the 6J5 tube first by replacing same. This may be caused by cathode leakage within the tube.

THE I. F. STAGES ON MODELS 400, 425

The I. F.'s are aligned by the usual system of feeding the intermediate frequency of 465 KC into the grid of the 6L7 tube.

The two trimmers in each of the I. F. cans should be very carefully peaked to resonance as they are very critical and will greatly affect the performance of the set.

The Sensitivity of the I. F. stages will be 15 to 20 microvolts or better for a 50 milliwatt output.

Always use as low an output as possible from the test oscillator in making the various adjustments.

ALIGNMENT OF FLAT TOP I. F. STAGES FOR MODELS 400A AND 425A. Fig. 3

The 1st. I. F. Transformer has the trimmer screws at the top of the can.

The 2nd. and 3rd. I. F. Transformers are aligned through the side of the cans. The middle trimmer is for the center winding.

Exact alignment can only be obtained by use of the oscillograph. However, if the following instructions are carefully carried out, the alignment will be found satisfactory.

FIRST: Open yellow ground leads for center coils which are seen below the 2nd. and 3rd. I. F. Transformers. Then feed a 465 KC signal into the grid of the first 6K7 tube. Align outside trimmers on both 2nd. and 3rd. I. F. Transformers.

SECOND: Resolder yellow leads to ground on both transformers. Take a 10,000 ohm resistor and a .1 mfd. condenser and connect them in series. This is now connected across the phono lugs from the two insulated ones to the ground lug. Connect generator lead to second 6K7 grid and with sufficient signal adjust center trimmer on output I. F. Transformer to resonance.

THIRD: Move generator lead to first 6K7 grid, remove condenser and resistor from the phono lugs and connect from the grid cap to ground of the second 6K7 tube. Now adjust center trimmer of 2nd. I. F. Transformer.

FOURTH: Move generator lead to 6L7 grid and adjust input I. F. to best response. Remove condenser and resistor from 2nd. 6K7 grid to the first 6K7 grid to ground. Readjust the first I. F. Trimmers to their new resonance points. Disconnect the resistor and condenser from 1st. 6K7 grid and solder a 50,000 ohm resistor from B+ to 6L7 plate and again check alignment of trimmers of 1st. I. F. If the I. F. has been aligned properly the set should tune into a station signal and hold about the same output level when moved 3 or 4 KC either side of the center of resonance. In other words, there is a flat top response of about 7 or 8 KC with this system.

If an oscilloscope and a frequency modulated generator are available it is advisable to recheck the trimmers of the input or 1st. I. F. Transformer for the flatness of response. The above procedure being first completed before the oscilloscope is used.

ALIGNMENT OF SHORTWAVE BAND 5.5 TO 18 M.C. MODELS 400, 425, SEE FIG. 4
MODELS 425A, 400A, SEE FIG. 3 AND FIG. 5

First check the position of the dial hand by rotating the condenser shaft to the left to full capacity. At this point the dial hand should be straight across in line with the lines dividing the scale in half. If the hand is off position it can be lined up by removing dial glass and setting hand with screw in center of dial.

1. Set the test oscillator to 17 megacycles.

2. Turn wave band switch all the way to right for highest S.W. band, and set dial hand to 17 M.C.

3. Peak trimmer condenser C26 of the oscillator coil (See pictorial) to resonance with 17 M.C. fed into antenna.

4. Adjust antenna and R.F. coil trimmers C-20 and C23 to same frequency after the above mentioned oscillator trimmer has been set.

5. Turn dial hand to 6 M.C. on same band and peak padding condenser C 35 to 6 M.C.

III SHORTWAVE BAND 1.7 TO 5.5 M.C.

1. Set band switch to this band and dial hand to 5 M.C.

2. Peak trimmer C27 to 5 M.C.

3. Peak antenna and R.F. trimmers C-21 and C-24 to 5 M.C.

4. Rotate dial to 1.7 M.C. and adjust Padding Condenser C36 to 1.7 M.C.

NOTE: After adjusting the two high bands at 17 megacycles and 5 megacycles the test oscillator input to antenna should be increased and receiver dial advanced to .9 megacycle lower and note if test oscillator signal is heard.

In case there is no response the oscillator trimmers have been pulled down too tightly. The trimmers should be released until this condition exists then go back to original point of alignment - reduce antenna input voltage and correct the trimmer adjustment.

EXAMPLE: The receiver has been adjusted to 17 megacycles. Tune receiver to approximatly 16.9 M.C.

Increase oscillator signal by "opening up" the attenuator. Move the dial back and forth at 16.9 M.C.

If no signal is heard, let oscillator trimmer off until it is heard at 16.9 M.C.

Reduce signal voltage from generator, go back to 17 M.C. and slightly correct this last trimmer adjustment.

The same thing applies to the 5 M.C. adjustment.

IV THE BROADCAST BAND

1. Turn wave band switch all the way to left and dial hand set to 1400KC (the top scale).

2. Peak oscillator trimmer C28 to 1400 KC and R.F. circuit trimmers C-22 and C-25 to same frequency.

3. Set dial hand to 550 KC and adjust oscillator padding condenser C37 to 550 KC.

4. Recheck dial at 1400 KC as in number (1) and (2).

5. Points in the middle of the dial may be checked and if necessary the plates of the front section of variable condenser may be bent for alignment.

Alignment Procedure

All of the adjustable circuits of this receiver have been properly aligned at the factory to give correct performance, and their settings should remain intact indefinitely when the receiver is used under ordinary conditions. However, necessity for readjustment may occasionally occur from continued extremes of climate, tampering, purported alteration for service purposes, or after repairs have been made to the r-f or i-f tuned circuits. Improper alignment usually causes the receiver to be insensitive, non-selective, and subnormal in respect to tone quality. Such indications will usually exist simultaneously.

In readjusting the tuning circuits, it is important to apply a definite procedure and to use adequate and reliable test equipment. A standard test oscillator, such as the RCA Stock No. 9595, will be required as the source of signal at the specified alignment frequencies. Means for indication of the receiver output during alignment is also necessary to accurately show when the correct point of adjustment is reached. Two indication methods are applicable. One requires use of cathode-ray oscillograph equipment, and the other requires a voltmeter or glow type of indicator. The cathode-ray alignment method is advantageous in that the indication provided is in the form of a wave image which represents the resonance characteristics of the circuits being tuned. This type of alignment is possible through use of apparatus such as the RCA Stock No. 9558 Frequency Modulator and the RCA Stock No. 9545 Cathode-Ray Oscillograph. Alignment by the output meter method should be indicated by an instrument such as the RCA Stock No. 4317 Neon Glow Indicator. The two procedures are outlined as follows:

OUTPUT METER ALIGNMENT

Place the receiver in operation, with its two covers removed. Attach the output indicator across the loudspeaker voice coil circuit or across the output transformer primary. Advance the receiver volume control to its maximum position, letting it remain in such position for all adjustments. For each adjusting operation, regulate the test oscillator output control so that the signal level is as low as possible and still observable at the receiver output. Use of such small signal will obviate broadness of tuning which would otherwise result from a.v.c. action on a stronger one.

I-F Adjustments

(a) Connect the output of the test oscillator to the control grid cap of the i-f tube (RCA-6D6) through a 0.25 mfd. capacitor and connect the ground of the oscillator to the receiver chassis. Adjust the frequency of the oscillator to 260 kc. Tune the receiver to a point where no interference is received from the heterodyne oscillator or local stations.

(b) Adjust the two screws (attached to iron cores) of the second i-f transformer, one on top and one on bottom, until maximum output is produced by the indicating device.

(c) Remove the oscillator from the i-f tube input and connect it between the control grid cap of the first detector tube (RCA-6A7) and chassis-ground, using the 0.25 mfd. capacitor as previously. Allow its tuning to remain at 260 kc. Tune the receiver to avoid interference as in (a).

(d) Adjust the two screws of the first i-f transformer for maximum (peak) receiver output. The indication for this adjustment will be broad, due to the "flat-top" characteristic of the i-f system. The two screws should, therefore, be very carefully adjusted so that the indicator remains fixed at maximum as the oscillator is shifted through a range 2 kc. above and below its normal setting of 260 kc. An irregular double-peaked indication is to be avoided.

R-F Adjustments

NOTE: To eliminate vibrator interference, it may be advisable to replace the bottom cover before making the r-f adjustments.

(a) Check the calibration of the dial scale of the remote control unit by rotating the tuning control until the variable condenser plates are in full mesh (maximum capacity). This will carry the dial pointer to its minimum frequency position. 3 The knurled shaft at the rear of the control box should then be turned until the dial pointer sets exactly on the last graduation at the low-frequency end of the dial scale.

(b) 4. Connect the output of the test oscillator to the antenna-ground terminals of the receiver with a 150 mmfd. capacitor in series with the antenna lead. There should be a shunt capacitor of 50 or 60 mmfd. from the antenna lead at the receiver to ground. Tune the oscillator to 1400 kc. Allow the output indicator to remain attached to the receiver output.

(c) Tune the receiver so that the dial reading is 1400 kc. Then adjust the oscillator, detector, and antenna coil trimmers, C-13, C-8, and C-5 respectively, tuning each to the point producing maximum indicated receiver output.

(d) 6 Shift the oscillator frequency to 600 kc. and tune the receiver to pick up this signal, disregarding the dial reading at which it is best received. The oscillator series trimmer, C-15, should then be adjusted, simultaneously rocking the receiver tuning control backward and forward through the signal until maximum (peak) receiver output results from the combined operations. The adjustment of C-13 should be repeated as in (c) to correct for any change in its alignment due to the adjustment of C-15.

NOTE: The antenna coil has an iron core which is adjusted at the factory for the correct inductance. **This adjustment should not be disturbed.**

CATHODE-RAY ALIGNMENT

Attach the cathode-ray oscillograph vertical input terminals to the second detector output, with the "Hi" connected to the junction of the two resistors, R-20 and R-21, and the "0" connected to the receiver chassis. Advance the vertical amplifier gain control of the oscillograph to full-on, allowing it to remain at such position for all adjustments. Turn the vertical "A" amplifier to "On." Set the oscillograph power switch to "On" and adjust the intensity and focusing controls to give a sharply defined spot on the screen. Interconnect the frequency modulator impulse generator terminals to the oscillograph "Ext. Sync." terminals, as shown by Figure 5.

I-F Adjustments

(a) Connect the output of the test oscillator to the control grid cap of the i-f tube (RCA-6D6) through a 0.25 mfd. capacitor and connect the ground of the oscillator to the receiver chassis. Tune the oscillator to 260 kc., place its modulation switch to "On" and its output range switch to "Hi." The frequency modulator must not be connected to the oscillator for the preliminary adjustments.

(b) Set the cathode-ray oscillograph horizontal "B" amplifier to "Timing" and the synchronizing switch (timing) to "Int." Place the synchronizing input and frequency controls to about their mid-positions. Turn the range switch to its No. 1 position.

(c) Increase the output of the oscillator until a deflection is noticeable on the oscillograph screen. The figure obtained represents several waves of the detected signal, the amplitude of which may be observed as an indication of output. Cause the wave image formed (400-cycle waves) to be spread completely across the screen by advancing the horizontal "B" gain control. The image should be synchronized and made to remain motionless by adjustment of the synchronizing input and frequency controls.

(d) Adjust the two screws (attached to iron cores) of the second i-f transformer, one on top and one on bottom, to produce maximum vertical deflection of the oscillographic wave which is present on the screen. This adjustment places the transformer in exact resonance with the 260 kc. signal.

Alignment

HUDSON MOTOR CAR CO.

CB-6 alignment-continued

(e) The sweeping operation should follow, using the frequency modulator. Shift the oscillograph synchronizing switch to "Ext.", change its range switch to No. 2 position and set the frequency control to its mid-position. Place the frequency modulator in operation, with its sweep range switch in the "Lo" position. Interconnect the test oscillator and frequency modulator with the special shielded patch cord provided. Turn the oscillator modulation switch to "Off."

(f) Increase the frequency of the test oscillator by slowly turning its tuning control until two separate, distinct, and similar waves appear on the screen. These waves will be identical in shape, but will be totally disconnected and appearing in reversed positions. They will have a common base line, which is discontinuous. Adjust the frequency and synchronizing input controls of the oscillograph to get the proper waves and to make them remain motionless on the screen. Continue increasing the oscillator frequency until the forward and reverse curves move together and overlap, with their highest points exactly coincident. This condition will obtain at an oscillator setting of approximately 360 kc.

(g) With the images established as in (f), readjust the two screws on the second i-f transformer so that they cause the curves on the oscillograph screen to become exactly coincident throughout their lengths and have maximum amplitude.

(h)[10] Without altering the adjustments of the apparatus, shift the output connections of the oscillator to the input of the i-f system, i. e., between the first detector (RCA-6A7) control grid and ground.[20] Regulate its output so that the amplitude of the oscillographic image is approximately the same as used above for adjustment (g) of the second i-f transformer.

(i) The two first i-f transformer adjustment screws, one on top and one on bottom, should then be adjusted so that they cause the forward and reverse curves to become coincident throughout their lengths and have maximum amplitude. The composite wave obtained in this manner represents the resonance characteristic of the total i-f system. Lack of symmetry or irregularity of the resultant image will indicate the presence of a defect in the i-f system.

R-F Adjustments

(a)[11] Calibrate the scale of the receiver by rotating the tuning control until the variable condenser is at full mesh, and then turning the knurled shaft at the rear of the control box to bring the dial pointer to the last graduation at the low-frequency end of the scale.

(b)[12] Attach the output of the test oscillator to the receiver input, i. e., between the antenna and ground terminals, with a 150 mmfd. capacitor in series with antenna lead. There should be a shunt capacitor of 50 or 60 mmfd. from the antenna lead at the receiver to ground. Accurately tune the oscillator to 1400 kc. The oscillograph should be left connected to the second detector output circuit as for the above i-f adjustments. Return the synchronizing switch to its "Int." position and turn the range switch to its No. 1 position.

(c)[13] Tune the receiver to a dial reading of 1400 kc. Then regulate the oscillator output so as to increase the amplitude of the waves on the oscillograph screen to a conveniently observable size. The several waves of detected signal, as appearing on the screen, should be synchronized by operation of the synchronizing and frequency controls. Trimmers, C-13, C-8, and C-5, of the oscillator, detector, and antenna coils should then be adjusted so that each causes maximum vertical deflection (amplitude) of the images.

(d) The oscillator modulation should then be turned to "Off" and the frequency modulator placed in operation, connected to the oscillator with the shielded patch cord. Change the oscillograph synchronizing switch to "Ext.", set its range switch to its No. 2 position and the frequency control slightly above its mid-position.

(e) Increase the frequency of the test oscillator gradually, until the point is reached where the two similar, distinct and separate wave images appear on the screen and become coincident at their highest points. This will occur at an oscillator setting of approximately 1500 kc. These waves should be synchronized on the oscillograph screen by careful readjustment of the synchronizing and frequency controls. Readjust trimmers, C-13, C-8, and C-5[14] to produce complete coincidence at maximum amplitude of the two waves.

(f) Disconnect the frequency modulator from the oscillator. Place the modulation switch of the oscillator to "On" and tune the oscillator to 600 kc. Set the synchronizing switch of the oscillograph to "Int." and turn the range switch to No. 1 position.

(g) Tune the receiver station selector control so as to pick up the 600 kc. signal, disregarding the dial reading at which it is best received.

(h) Change the oscillograph synchronizing switch to "Ext." and place the oscillator modulation switch to "Off." Interconnect the frequency modulator and oscillator with the special shielded patch cord. Return the range control of the oscillograph to its No. 2 position and set the frequency control slightly above its mid-position.

(i) Shift the test oscillator to its 200-400 kc. range and tune it to the point at which the forward and reverse waves show on the oscillograph screen. This condition will obtain at an oscillator setting of approximately 230 kc. The signal obtained from the oscillator for this adjustment will be the third harmonic of 200 kc. An increase in the oscillator output may be necessary. The trimmer C-15[17] should then be adjusted to the point which produces maximum amplitude of the oscillographic images. It will not be necessary to rock the tuning control for this adjustment, inasmuch as the frequency modulator is varying the signal in an equivalent manner.

(j) Retune trimmers C-13, C-8, and C-5[16] as in (c), (d), and (e) to correct for any change in high-frequency alignment which may[17] have been caused by the adjustment of C-15.

After the receiver has been replaced in the car, it may be necessary to make a final correction of the dial pointer by tuning in a station of known frequency and adjusting the pointer by means of the knurled shaft on the rear of the control head.[18]

Radiotron Socket Voltages (MODEL CB-6 ONLY)

Operating conditions of the basic circuits of this instrument may be determined by measuring the voltages applied to the tube elements. Figure 6 shows the voltage values from the socket contacts to ground and appearing across the heater contacts (H-H). Each value as specified should hold within ± 20% when this instrument is normally operative, with all tubes intact and rated voltage applied. Variations in excess of this limit will usually be indicative of trouble.

The voltages given on this diagram are actual measured voltages, and are obtained with the voltmeter load in the circuit.

To fulfill the conditions under which the d-c voltages were measured requires a 1,000-ohm-per-volt d-c voltmeter having ranges of 10, 50, 250, and 500 volts. Voltages below 10 volts should be measured on the 10-volt scale; between 10 and 50 on the 50-volt scale; between 50 and 250 on the 250-volt scale; and above 250 on the 500-volt scale.

For meters of the 1,000-ohm-per-volt type, but ranges other than above, use the nearest ranges to those specified. If the range is higher the voltage may be higher, if the range is lower the voltage may be lower; either condition depending on the percentage of circuit current drawn by the meter.

Figure 6—Radiotron Socket Voltages to Chassis

(Measured at 6.3 volts battery supply—Volume Control Minimum— No Signal)

Radiotron Socket Voltages

Operating conditions of the basic circuits of this instrument may be determined by measuring the voltages applied to the tube elements. Figure 6 shows the voltage values from the socket contacts to ground and appearing across the heater contacts (H-H). Each value as specified should hold within ± 20% when this instrument is normally operative, with all tubes intact and rated voltage applied. Variations in excess of this limit will usually be indicative of trouble.

The voltages given on this diagram are actual measured voltages, and are obtained with the voltmeter load in the circuit.

To fulfill the conditions under which the d-c voltages were measured requires a 1,000-ohm-per-volt d-c voltmeter having ranges of 10, 50, 250, and 500 volts. Voltages below 10 volts should be measured on the 10-volt scale; between 10 and 50 on the 50-volt scale; between 50 and 250 on the 250-volt scale; and above 250 on the 500-volt scale.

For meters of the 1,000-ohm-per-volt type, but ranges other than above, use the nearest ranges to those specified. If the range is higher the voltage may be higher, if the range is lower the voltage may be lower; either condition depending on the percentage of circuit current drawn by the meter.

KADETTE MODELS K-630 & K-735

These chassis are designed to operate from 110-125 volt, 50-60 cycle alternating current power lines. They are two band receivers covering American broadcast and foreign short wave bands. (540-1550 Kc. and 5.3 to 17.5 meg.)

The following tubes are employed:

MODEL 630		MODEL 735	
6A7	Oscillator-Mixer	6A7	Oscillator-Mixer
6D6	I.F. Amplifier	6D6	I.F. Amplifier

		140R4	Ballast

ALIGNMENT

ESSENTIAL DATA: The intermediate frequency employed is 448 Kc. The standard type of output meter should be used to indicate signal strength. It should be connected from the plate of the 43 tube to ground. The short wave trimmers are on the tuning gang and the broadcast are on the two section strip mounted between the volume control and band switch. The short wave band *must* be aligned *first* as the short wave trimmers affect the broadcast alignment.

INTERMEDIATES: To align the I.F. circuits set the signal generator to 448 Kc. and feed its modulated signal direct to the antenna. Turn the band switch to the broadcast position. Adjust the first I.F. transformer trimmers for maximum meter reading. Next repeat the process on the second I.F. transformer. Go over both adjustments at least three or four times for accuracy. If adjustments are not made accurately, selectivity and sensitivity will be poor and I.F. oscillation may result. Finally adjust the trimmer on the tuned wave trap for *minimum* meter reading.

SHORT WAVE: Turn the band switch to the short wave position and the dial to 15 megacycles and feed a weak 15 megacycle signal to the antenna. Adjust the short wave oscillator trimmer for maximum reading. Then, peak the short wave antenna trimmer to this setting. There is no adjustable padder on this band so no further alignment is required.

BROADCAST: Turn the band switch to the broadcast position and the dial to 1400 Kc. and feed a weak 1400 Kc. signal to the antenna. Adjust broadcast oscillator trimmer for maximum reading. Then, peak the broadcast antenna trimmer to this oscillator setting.

There is no adjustable padder condenser in this model so resonance at 1000 and 600 Kc. is accomplished by bending plates on the tuning condenser, if necessary.

AVERAGE SOCKET VOLTAGES

† Measured through .1 megohm.

KADETTE MODELS K-634, K-635, K-3734

This chassis is designed to operate from 110-125 volt, 60 cycle, alternating current power lines. It is a two band receiver covering the American broadcast and Foreign short wave bands.

The following tubes are employed:

76 —Oscillator	75 —2nd Detector—A.V.C.—A.F.
6D6—1st Detector	41 —Pentode Output
6D6—I.F. Amplifier	80 —Rectifier

ALIGNMENT

The standard type of output meter should be used to indicate signal strength. It should be connected from the plate of the 41 to ground. Tone control should be turned "high." The signal from the signal generator *must be kept at a very low level.*

ESSENTIAL DATA: The intermediate frequency employed is 448 Kc. On both bands the oscillator frequency is 448 kilocycles higher than the signal frequency. Aligning should be done on the following frequencies: Broadcast band, 1400 and 600 Kc.; Short wave band 15 megacycles and 8 megacycles.

The four trimmers on the bottom of the chassis are, reading from the side of the chassis by switch toward the center, Short wave antenna, Broadcast antenna, Short wave oscillator and Broadcast oscillator.

INTERMEDIATES: To align the I.F. circuits, set the signal generator to 448 Kc. and feed its modulated signal direct to the antenna. Adjust the first I.F. transformer trimmers for maximum meter reading. Go over both adjustments at least three or four times for accuracy. Repeat this process on the second I.F. transformer. If adjustments are not made accurately, selectivity will be poor and I.F. oscillation may result. Finally, adjust the trimmer on the tuned wave trap for *minimum* meter reading.

BROADCAST BAND: Place the band change switch on Broadcast position. Turn the dial to 1400 Kc. and feed a *very weak* 1400 Kc. modulated signal from your signal generator to the antenna. Adjust the Broadcast oscillator trimmer for maximum reading. Then peak Broadcast antenna trimmer to this oscillator setting.

Turn dial and signal generator to 600 Kc. and rock the padder into correct adjustment. This is accomplished by very slowly adjusting the padder condenser and at the same time turning the dial slightly back and forth across 600 Kc. until an adjustment is obtained producing maximum output. Go back to 1400 Kc. and readjust the oscillator trimmer slightly if necessary. Then recheck padder at 600 Kc.

SHORT WAVE BAND: Place the band change switch on the Short Wave position. Turn the dial to 15 megacycles and feed a very weak 15 megacycle modulated signal from your signal generator to the antenna. Adjust the S.W. oscillator trimmer for maximum reading on the output meter. This trimmer should not be touched again when checking alignment on other frequencies. Then peak S.W. antenna trimmer to this oscillator setting.

Instead of bending condenser plates at 8 megacycles alignment is accomplished by spreading or crowding turns on the S.W. detector coil. If much crowding or spreading is necessary it is advisable to go back and recheck at 15 megacycles.

MODELS 1129,1149
MODEL 1159
Voltage,Alignment

INTERNATIONAL RADIO CORP.

MODELS K-1129, K-1149 & K-1159

ALIGNMENT

ESSENTIAL DATA: The intermediate frequency employed is 448 Kc. The standard type of output meter should be used to indicate signal strength. It should be connected from plate to plate on the 41 tubes.

Poor sensitivity may be an indication of incorrectly adjusted I. F. trimmers. Aligning of Broadcast band should be done on 1400, 1000 and 600 kilocycles.

INTERMEDIATES: To align the I.F. circuits, set the signal generator to 448 Kc. and feed its modulated signal direct to the antenna. Adjust the first I.F. transformer trimmers for maximum meter reading. Go over both adjustments at least three or four times for accuracy. Repeat this process on the second I.F. transformer. If adjustments are not made accurately, selectivity will be poor and I.F. oscillation may result. Finally, adjust the trimmer in the tuned wave trap for *minimum* meter reading.

SHORT WAVE

Turn the dial to 6000 Kc. and feed a *very weak* 6000 Kc. modulated signal from your signal generator to the antenna. Adjust the Short Wave oscillator trimmer for maximum reading. Then peak antenna coupling condenser to this oscillator setting. Do not attempt to align the low frequency end of this band.

BROADCAST

Turn the dial to 1400 Kc. and feed a *very weak* 1400 Kc. modulated signal to the antenna. Adjust Broadcast oscillator trimmer for maximum reading. Then peak Broadcast antenna trimmer to this oscillator setting.

There is no adjustable padder condenser in this model so resonnance on lower frequencies is accomplished by bending plates on tuning condenser.

ALIGNMENT

The standard type of output meter should be used as an indicator. It should be connected from the output plate of the 25B5 tube to ground. Tone control should be on "high". The signal from the signal generator must be kept at a very low level.

ESSENTIAL DATA: The intermediate frequency employed is 448 Kc. On all bands the oscillator frequency is 448 Kc. higher than the signal frequency.

The trimmers are in the can containing the associated coils and are available through the holes in the cans. The can in front, next to the dial, contains the oscillator coils and the rear can, the antenna coils. The top trimmers are the broadcast, the middle the mid-band, and the bottom the short wave.

INTERMEDIATES: To align the I.F. circuits, set the signal generator to 448 Kc. and feed its modulated signal direct to the antenna. Turn the band switch on Broadcast position. Adjust the first I.F. transformer trimmers for maximum meter reading. Go over both adjustments at least three or four times for accuracy. Repeat this process on the second I.F. transformer. If adjustments are not made accurately, selectivity will be poor and I.F. oscillation may result. Finally, adjust the trimmer on the tuned wave trap for *minimum meter* reading.

BROADCAST BAND: Place the band change switch on Broadcast position. Turn the dial to 1400 Kc. and feed a *very weak* 1400 Kc. modulated signal from your signal generator to the antenna. Adjust the Broadcast oscillator trimmer for maximum reading. Then peak Broadcast antenna trimmer to this oscillator setting.

Turn dial and signal generator to 600 Kc. and rock the padder into correct adjustment. This is accomplished by very slowly adjusting the padder condenser and at the same time turning the dial slightly back and forth across 600 Kc. until an adjustment is obtained producing maximum output. Go back to 1400 Kc. and readjust the oscillator trimmer slightly if necessary. Then recheck padder at 600 Kc.

MIDDLE BAND: Turn the band change switch to the middle position and tune radio and test oscillator to 5000 Kc. Adjust the oscillator trimmer and then the antenna trimmer for maximum output.

Rock in the padder condenser at 2000 Kc. Then recheck at 5000 Kc. and 2000 Kc.

SHORT WAVE BAND: Turn band change switch to short wave band. Tune radio and test oscillator to 15 megacycles and adjust trimmers. No padder condenser is used on the short wave band so no other adjustments are necessary.

INTERNATIONAL RADIO CORP.

The out-put tube is now a "dome" type 38.

The new rectifier tube is 6Z3 and is interchangeable with the KR-1. The chief difference is that the new tube contains no mercury, and will therefore, be free from internal short circuits which have occurred occasionally in the KR-1 tube due to the condensation of mercury. The use of the new tube permits the elimination of the resistor R-304 in the plate circuit.

MODEL P--Later production differs from earlier type as follows--uses types 77, 78 and 6Z3 tubes in place of types 36 and KR-1.

The type 78 is used in the R.F. stage. The screen voltage has been dropped on this tube through a 50M ohm resistor R-248 which is by-passed by an .01 Mfd. condenser A-311. The voltage on the screen is about 55 volts with the volume full on.

The voltages and connections to the detector socket are the same as in the earlier models. The tube is now a 77.

KADETTE MODELS K-1030 & K-1035 K - 1140

This chassis is designed to operate on 110-120 volt, 50-60 cycle alternating current power lines. It is a two band receiver covering the American broadcast band and Police, Airport and 49 meter European bands.

The following tubes are employed:

6A7	Oscillator-Mixer	41	Audio Output
6D6	I. F. Amplifier	200R	Ballast tube
76	Detector	25Z5	Rectifier
76	1st Audio	250R	Ballast tube
41	Audio output	320R4	Regulator tube (300R4 on K-1140)

Additional 76 as Inverter on Model K-1140

ESSENTIAL DATA

GENERAL INFORMATION: The intermediate frequency employed is 448 Kc. The standard type of output meter should be used to indicate signal strength. It should be connected from plate to plate on the 41 tubes. The trimmer on the high capacity section of the tuning condenser is the Short Wave *oscillator* trimmer. The trimmer on the low capacity (cut plate) section of the tuning condenser is the Short Wave antenna (this trimmer will have been removed at the factory in most sets). The trimmer in the center of the three gang strip is the Broadcast oscillator trimmer. The one on the opposite end from the wave trap is the Broadcast antenna. The Short Wave *must* be aligned *first* as the trimmer settings affect the broadcast alignment.

THE PUSH BUTTONS: Six push buttons will be noted below the dial. Depressing the right-hand button marked "Dial" connects the tuning condenser across the broadcast coils for manual operation of the set, with the dial, on the broadcast band. Depressing the next to right-hand button marked "S. W." connects the tuning condenser across the short wave coils for manual operation of the set, with the dial, on the short wave band. Each of the other four buttons connects one of the pairs of trimmers on the back of the receiver across the broadcast coils. These are tuned to each of the four fixed stations desired by the customer. (See section on alignment of Preselected Push-button Stations.)

THE "METER" JACK: This jack is connected across the A.V.C. load resistor so that, with a signal into the set, a voltmeter will show a deflection where inserted in these jacks. Maximum reading on such a meter will be a resonance indicator which can be used on broadcast station signals. As high a resistance meter as possible should be used.

ALIGNMENT

INTERMEDIATES: To align the I.F. circuits set the signal generator to 448 Kc. and feed its modulated signal direct to the antenna. Depress the right-hand button marked "Dial". Keep the signal as low as possible, turning down the oscillator output as the set approaches resonance and the sensitivity increases. Adjust the first I.F. transformer trimmers for maximum meter reading. Repeat this process on the 2nd I.F. transformer. Go over both adjustments at least three or four times for accuracy. If the adjustments are not made accurately sensitivity and selectivity will be poor and I.F. oscillation may result. Finally, adjust the trimmer on the tuned wave trap for *minimum* meter reading.

SHORT WAVE: Depress the button marked "S.W.". Turn the dial to minimum frequency (6800 Kc.) and feed a very weak 6800 Kc. signal to the antenna. Adjust the short wave oscillator trimmer to maximum reading. If not removed, peak short wave antenna trimmer to this setting. Do *not* attempt to align at the lower frequencies on this band.

BROADCAST: Depress the button marked "Dial". Turn the dial to 1400 Kc. and feed a very weak 1400 Kc. signal to the antenna. Adjust the broadcast oscillator trimmer for maximum reading. Then peak the broadcast antenna trimmer to this oscillator setting. Alignment at lower frequencies is accomplished by bending plates on the tuning condenser. Alignment should be checked at 1000 and 600 Kc.

PRESELECTED PUSH BUTTON STATIONS: When placing the receiver in operation it is necessary to adjust, or align, it to the user's choice of four favorite stations. There are four pairs of adjusting screws at the rear of the receiver. They are numbered from 1 to 4, reading from *right* to *left;* pair number 1 being the adjustment for the first (left hand) button—pair number 2 the adjustment for the next button (second from left) and so on. The upper (top) trimmers are across the oscillator coil. Always "find" the station with this trimmer. Then peak the bottom (antenna) trimmer to this using the voltmeter in the jacks as a resonance indication. While the receiver may be adjusted "by ear" with fair, and usable, accuracy—particularly on strong nearby stations—the use of a meter is highly desirable for greatest accuracy and best operation. When this receiver was tested at the factory, the adjusting screws, at the rear, were set approximately in the middle of the range, in frequency, shown above them on the dial. To adjust any pair of screws to a lower frequency, turn them to the right. To adjust to a higher frequency, turn them to the left.

With the right-hand button depressed, tune-in a desired station by means of the tuning knob and dial—preferably the station having the lowest frequency (in kilocycles) of the four selected for automatic operation. Then after noting the program, depress the first button on the left and, at the rear, adjust the number 1 pair of trimmers to this station and program.

Then with the right-hand button depressed, tune-in the second of the four selected stations—the one next to the lowest in frequency preferably. After noting the station and program, depress the second button from the left and, at the rear, adjust the number 2 pair of trimmers to the station and program.

In a similar manner the stations may be located, identified and the adjustments at the rear made for the balance of the first four buttons. It is desirable to adjust so that the first button, at the left, tunes-in the lowest frequency of the desired four stations, and the fourth button the station with the highest frequency. Note approximate ranges indicated on the label at the rear of the receiver, above the trimmers.

A printed sheet of call-letters is provided with each receiver. The call-letters of the four selected favorite stations may be cut from the sheet and inserted in the corresponding knobs in the space provided.

NOTE: Alignment may frequently be made more rapidly by connecting the antenna to a calibrated oscillator or signal generator. Adjustment of each of the pairs of trimmers can then be quickly made to the signal of the calibrated oscillator which is set, in turn, to the approximate frequencies of the desired stations. The adjustments should be finally made on the stations themselves, however, using a meter and the procedure indicated above. This method of aligning, or adjusting, will avoid the possibility of setting them to the wrong station as there are times when other stations, near to the desired station in frequency, are broadcasting the same program. When this condition exists it may be necessary to wait to hear station announcement unless the calibrated oscillator has been used to obtain the approximate settings.

Service Notes

SETTING-UP OF TONE CONTROLS: Due to variations in the case design of pianos, the components will be located in different positions in different instruments; however, each of the controls which comes to the attention of the serviceman will be plainly marked. The controls will be positioned either directly under the top cover of the piano or in back of the lower section underneath the keyboard. If in the latter position, the lower front board of the piano can be removed by releasing a simple spring catch at the center of its top edge.

Turn on the power and set the left end push-button of the tone control switch. This connects the three phasing control potentiometers and the two (bass and treble) tone control potentiometers. Following the accompanying diagram and the customer's general desire as to whether a basically thick or thin tone is wanted, try various settings of the five controls mentioned above until the customer is satisfied. Select the button which this tone is to be set up on permanently. Take the corresponding color coded wire at each of the resistance banks opposite each of the five potentiometers and connect each wire to the resistor numbered the same as the nearest mark to the pointer of its potentiometer. When making these set-ups, the polarizing switch circuits should be set to that one of the three positions (piano, organ or banjo) which the customer expects to use most with this particular tone. Do not set-up the basic "regular" piano tone at this time. Do not set the volume control on the push-buttons until later.

When all tones other than the regular piano tone are set up, this tone quality can then be set in the following way: Phasing control No. 1 at 10, Phasing control No. 2 at B (which is the balanced or "no response" position), Phasing control No. 3 at B, Treble cut tone control at 1000, and Bass cut tone control between 3,000 and 10,000 - as the customer's ear dictates. The controls are left in this position so that the left-hand button is always "Regular Piano Tone".

The pre-set volume control may now be adjusted. The two red wires (left-hand button) should be placed on the sixth connection of each of the volume control banks. Press the other buttons in order and set the pairs of wires corresponding to these buttons so that the volume of each setting is equal to the volume of button No. 1. As this is a constant impedance type level control it is necessary to set both the wires of a pair to the same resistor in the respective banks. That is, with one wire of a button set to, say resistor No.5, then the other wire from this button must also be set to resistor No. 5 on its bank.

GROUNDING AND BONDING: If oscillation is present in the amplifiers it is probably due to defective grounding of the components or bonding of the shields. Another cause is an open grid connection. ALL SHIELDS, CHASSIS, TRANSFORMER CORES, SPEAKER FRAME, AND OTHER ELECTRICAL COMPONENTS MUST BE FIRMLY GROUNDED. Oscillation above audio frequencies is often the result of apparent speaker rattles. This can be checked by using the head-phones to determine if the rattle is in the speaker or the amplifier. In case of oscillation the condensers across the secondary of the driver transformer (which is in the pre-amplifier) may be at fault.

Rattles occurring when the pedals are used or on mechanical disturbance, such as pressing on the piano top, pressing down (not striking) the keys, slapping the side of the instrument, etc., are usually caused by bad bonding between any two touching conducting objects in the instrument. This is not confined to the electrical circuits alone but may be, for example, between one of the piano action brackets and its supporting bolt. Perseverance is the only way to find the trouble and bonding is the cure.

POLARIZING CIRCUIT TROUBLES: Terrific clicks when a key is pressed or struck is usually due to an open ground on its delay filter condensers. If the trouble is on all keys, it is probably an open ground wire to the common bus at the ground end of these condensers.

A short of a piano string to ground may be tested with a 1000-ohm per volt voltmeter which should read 0.2 volt on the 10-volt scale or 0.3 volt on the 15-volt scale, when connected between the string and ground, the string being positive. Low voltage indicates a short, providing the corresponding delay switch is not open and the polarizing switch is on "banjo".

The delay switch arms should normally lay against the rear bus. Each should have a slight play between itself and its actuating finger. Bend the finger to adjust. The resistance between the arm and the bus (both front and rear, as the key is up or down respectively) should be between 20,000 and 100,000 ohms. The exact resistance is not important, but if too high the associated note will "speak" with low level and if too low the note will "speak" with a dull thump or thud (associated with its tone) when the polarizing switch is on "organ". If the resistance is too low file away some of the felt on the bus (at the point of contact) using a strip of coarse sandpaper for a file. If the resistance is too high apply a tiny drop of "Aquadag" (colloidal graphite) desolved in ammonia to form a thin liquid. Allow to dry and repeat if necessary. Small quantities of "Aquadag" are available from Krakauer Bros. at One Dollar per ounce (enough for many jobs). Larger quantities should be obtained from the Acheson Graphite Co.

DIRT IN PICK-UPS: Dirt or felt fibres will cause temporary grounds or shorts between pick-up screws and the strings. It causes rattles, hisses, or squeals when the polarizing switches are on "piano" or "banjo" which are absent or lessened in the "organ" position. The trouble can be localized to the treble or bass as the corresponding polarizing switches are thrown to the above positions. This trouble is differentiated from a string short, which often acts like it, by the voltage test mentioned under "Polarizing Circuit Troubles". It is unlikely that a piece of good conductor would lie between the strings and the pick-ups without being quickly displaced.

Removal of dirt can often be accomplished by just striking the keys smart blows and the accompanying vibration of the string will shake the dirt loose. More stubborn cases require blowing with a blower. A vacuum cleaner usually has a blower attachment which should be run for a few minutes before directing its air stream into the piano so as to clean out old dust from the hose or more dirt will be blown into the piano than will be blown out. Do not blow with your breath as the moisture will increase the trouble.

HUM: Outside of the usual causes of hum in an amplifier the only trouble to expect is from bad shielding, bonding, or grounding. Before anything else, make sure that the ground wire from the ground post on the back of the instrument really connects to a good ground. A loose grid cap, a defective (open) overload control, or other open low level grid circuits will also cause hum.

MISCELLANEOUS: The overload control should not be set to permit playing much louder than an ordinary mechanical piano. Do not trust the player to cut down with the master level control. If the customer wants louder response an external speaker is necessary to avoid feed-back. Use only a special piano speaker of 8 ohms impedance and which has SPECIAL CONE MATERIAL. These are available only from Krakauer Bros. or the Jensen Radio Company will make them to order.

The sprocket on the swell pedal control should engage the chain in such a manner that the swell pedal is one link from full on when the pedal is in the full loud position. Never set this control so that the player's foot can force the arm against its stop inside the control.

Except in the case of major damage, rebuilding of the instrument, or tampering, the pick-up screws should NEVER need adjustment. If the tone quality varies from one note to another, adjustment of these screws is indicated. Information on how to adjust these screws will be given by mail only by Krakauer Bros., 191 Cypress Avenue, New York City on receipt of a detailed letter from the serviceman giving the cause for the need of readjustment. Do not attempt to touch these screws without such detailed instructions, as adjustment requires the aid of a competent piano tone regulator and a peculiar technique which, while simple, must be explained, as the little trick of this technique will never be guessed by an uninformed person. This may seem at variance with the data given in Rider's Volume VIII, but the two additional pickups on each set of strings make this necessary.

Let the service man be warned not to attempt mechanical adjustments to the piano (mechanical) mechanism as these are very delicate, some being as close as 2/1000 inch and require years of training to gain the requisite skill. The push-button radio receiver, shown here as an integral part of the instrument, is optional and may or may not be in the piano you service. The frequencies covered by each push-button will be plainly marked at the adjusting screws and their setting is conventional.

For additional information on the Electone Piano, see the special sections of Rider's Volumes VIII and IX.

MODEL 62A

This receiver operates on alternating current of 110 volts 60 cycles. Where only 50 cycles current is available, the receiver can be altered for that frequency at the factory. It is a 6 tube superheterodyne. Its frequency ranges are 538 to 1750 KC'S and 5.8 to 18.6 megacycles. This includes standard American broadcast, most city police, foreign and American short wave broadcast. The receiver is equipped with automatic volume control and mechanical push button tuning.

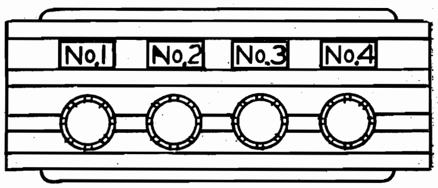
STATION INDICATORS



STATION SELECTORS
FIG. 1

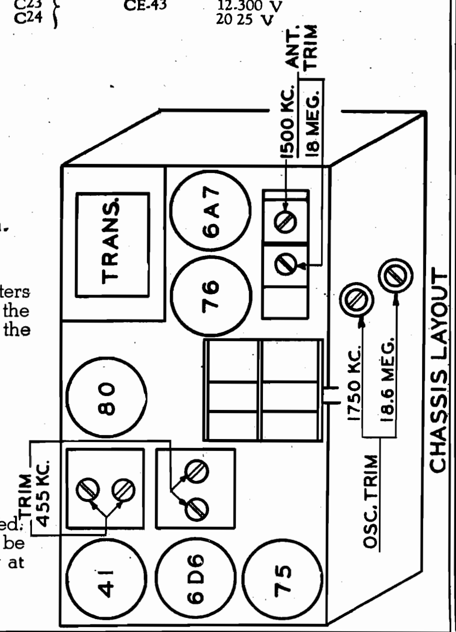
The tubes used are:

1-6A7	First detector	
1-76	Oscillator	
1-6D6	I. F. Amplifier	
1-75	Second detector, automatic volume control, and first audio amplifier	
1-41	Output	
1-80	Rectifier	

Operations For Setting Up Of Buttons

(1) Decide which station you desire to hear on any one button.
(2) Loosen this button by turning it to the left.
(3) Tune in your desired station manually until it is heard with best quality.
(4) Push in the button while holding the manual tuning knob fixed on the station.
(5) Tighten the button by turning it to the right while the button is pushed all the way in.
(6) Repeat this procedure to set up the other buttons.

To change any one setting at any time repeat the above procedure.
After the push buttons are adjusted to your desired station, cut out the proper station call letters from the enclosed station call letter sheet, and snap them into the rectangular opening above the push button by bending them slightly between two fingers and allowing them to snap into the proper opening. These openings are shown in Fig. 1 as No. 1, No. 2, No. 3 and No. 4.



CAUTION

Push button should be used in the same position of the tone control in which they were adjusted. Thus, if the buttons were set up in the mellow tone position of the tone control, they should be used in that position. If this is not done, turning the tone control may detune the set slightly at frequencies higher than 1200 kilocycles.

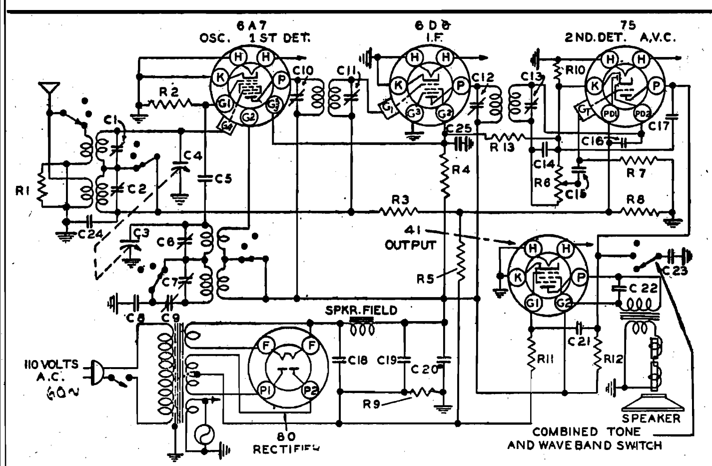
This receiver operates on alternating current of 105 to 125 Volts—60 cycles. It is also available in 50 cycles. It is a full 5 tube superheterodyne equipped with automatic volume control. Tuning range 538-1750 KC'S. This includes Standard Broadcast and City Police.

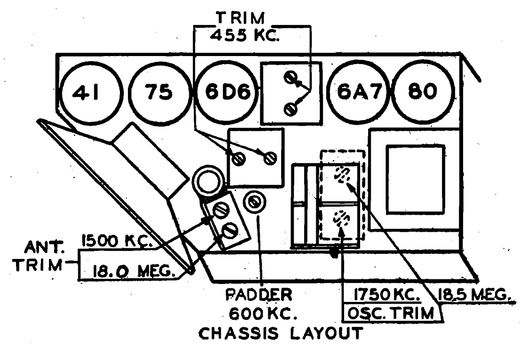
The tubes used are:

1—6A7 Converter tube
1—6D6 I F. Amplifier
1— 75 Second detector, automatic volume control and audio amplifier
1— 41 Power output tube
1— 80 Rectifier

PHONOGRAPH COMBINATION: To operate on radio, throw switch on motor board to "radio" position. To operate phonograph, throw switch to "phono" position and start motor.

TO SET AUTOMATIC STOP ON PHONOGRAPH SWITCH: Place pick-up arm so that needle is in record groove near the end of the recording, then fold upright arm on switch toward pick-up arm so that further movement of pick-up toward center of record will throw switch to shut off motor.





IF PEAK 455 KC

Model 551

This receiver operates on an alternating current of 60 cycles, 105 to 125 volts. Where only 50 cycles is available, it can be altered at the factory by so specifying. It is a 5 tube superheterodyne. Its frequency ranges are 538 to 1750 KC's and 5.8 to 18.6 megacycles.

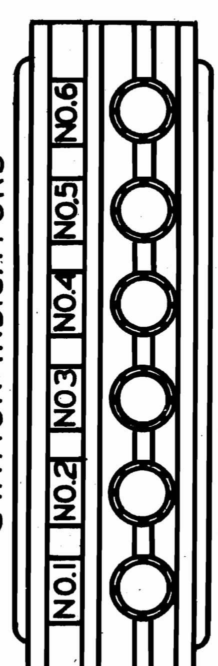
MODELS 639 and 639B and 739

Model 639 operates on 110 volts 60 cycles. Model 639B operates on 110 volts, 50 or 60 cycles. Both receivers are 6 tube superheterodyne; the frequency ranges are 538 to 1750 KC; 1.75 to 5.8 MC; 5.8 to 18.6 MC. This includes standard American broadcast, police and airplane, foreign and American short wave broadcasts. The receiver is equipped with automatic volume control and mechanical push button tuning and phonograph jacks.

STATION INDICATORS



STATION SELECTORS

Operations For Setting Up Of Buttons

(1) Decide which station you desire to hear on any one button.
(2) Loosen this button by turning it to the left.
(3) Tune in your desired station manually until it is heard with best quality.
(4) Push in the button while holding the manual tuning knob fixed on the station.
(5) Tighten the button by turning it to the right while the button is pushed all the way in.
(6) Repeat this procedure to set up the other buttons.

To change any one setting at any time repeat the above procedure. To get your station, push the desired button until it has reached the end of its travel.

After the push buttons are adjusted to your desired station, cut out the proper station call letters from the enclosed station call letter sheet, and snap them into the rectangular opening above the push button by bending them slightly between two fingers and allowing them to snap into the proper opening.

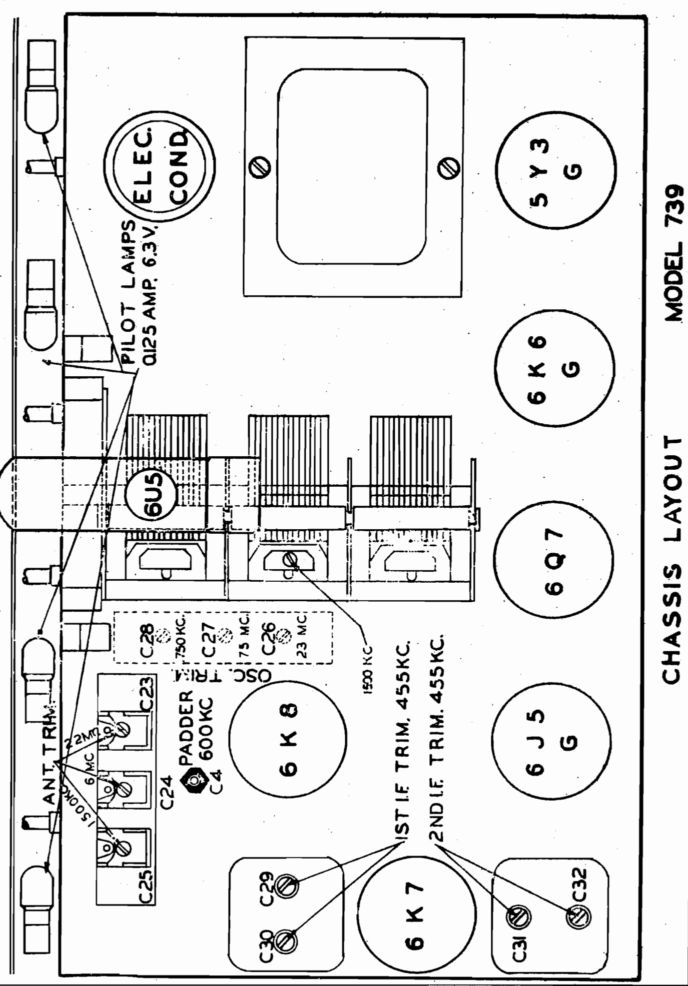
This receiver operates on alternating currents of 105 to 125 volt, 50-60 cycle. Its frequency range is 538 to 1750 KC; 2.1 to 7½ MEG; 7 MEG to 23 MEG.

FOR Operations For Setting Up Of Buttons - SEE MODEL 639



CHASSIS LAYOUT MODEL 739

MODEL 739
MODEL 939
Alignment
Phono. Data

MAJESTIC RADIO & TELEV. CO.

ALIGNMENT PROCEDURE MODEL 739

Correct alignment is extremely important. The receiver is properly aligned at the factory and should not be disturbed unless it is absolutely necessary. The procedure is as follows: Turn wave change switch to broadcast position (full counter clockwise) and rotate variable condenser until it is about 50% engaged. Apply a 455 KC signal to the grid of 6K8 mixer tube through a tubular condenser on the order of .1MFD. Referring to chassis layout, adjust C30, C29, C31, and C32 for maximum signal using of course, some sort of indicating device such as an AC volt meter or output meter across the voice coil of the speaker. It may be necessary to apply a very strong signal to "find" the signal until alignment is approached. It is advisable to maintain as low a signal input as conveniently possible in order to minimize the possibility of misalignment resulting from A.V.C. and overload effects. If a squeal is heard while tuning, rotate the gang condenser slightly and it should disappear. Naturally, the ground side of the generator should be connected to the chassis either directly or through the .1MFD condenser.

SHORT WAVE BAND

Rotate the wave band switch to full clockwise position. Connect high side of generator output to antenna lead through a 400 ohm dummy antenna. Completely disengage variable condensers. Apply 23 MEG. signal. Unscrew trimmer C26 to a minimum capacity, slowly turn the screw so that the trimmer capacity increases until the signal is heard. Apply 22 MEG. signal, rotate gang condenser until this signal is heard. Adjust C23 for maximum response. It may be found advisable to "rock" generator frequency back and forth through signal to offset detuning effect from inter action input and oscillator circuits at high frequencies. Check alignment through medium of sensitivity at 11 meg. and 9 meg. respectively. When aligning at 22 meg., it is well to point out here that the trimmer C23 may indicate two maxima. The maxima obtained with the trimmer tighter is the desired one. This can be checked by leaving the gang condenser set and shifting the generator to a higher frequency viz.: 23 megacycles, where the image should appear. If it is properly aligned, it should require about 10 times the signal voltage for the image to give the same output as the real signal.

POLICE BAND .

Shift wave band switch to middle position. Apply 7.3 meg. signal. Disengage variable condenser completely. Adjust trimmer C27 in the same manner as previous band until maximum signal is heard. Apply 6 Meg. Signal, rotate gang condenser until same is heard. Adjust trimmer C24 until response is maximum. Check for image in same manner as previous band. Check alignment at 4.5 and 3 megacycles respectively.

BROADCAST BAND

Use a 200 MMF mica condenser for dummy antenna on this band. Shift wave change switch to full counter clockwise position. Adjust trimmer C21 and C25 to medium tight position. Rotate gang until dial pointer indicates 600 KC. Apply 600 KC signal and adjust padder C4 for maximum signal. Disengage gang completely and apply 1750 KC signal; adjust C28 for same. Apply 1500 KC signal and rotate gang until this frequency is found. Adjust trimmers C21 and C25 for maximum response. Shift gang to 600 KC and apply 600 KC signal. "Rock" gang condenser and adjust C4 for maximum signal. Disengage gang and apply 1750 KC signal; if necessary adjust C28 to bring same in.

PHONOGRAPH

To use the phonograph connection, insert the tips of a phonograph pick-up into the phonograph jacks in the back of the chassis. Throw the phono-radio switch to phono. This switch is located near the phono jacks. If the receiver hums, reverse the two phono tips. To use the radio, throw the switch to the radio position.

ALIGNMENT PROCEDURE MODEL 939

Correct alignment is extremely important. The receiver is properly aligned at the factory and should not be disturbed unless it is absolutely necessary. The procedure is as follows: Turn wave change switch to broadcast position (full counter clockwise) and rotate variable condenser until it is about 50% engaged. Apply a 455KC signal to the grid of 6K8 mixer tube through a tubular condenser on the order of .1MFD. Referring to chassis layout, adjust trimmers "Trim 455 KC" for maximum signal using of course, some sort of indicating device such as an AC volt meter or output meter across the voice coil of the speaker. It may be necessary to apply a very strong signal to "find" the signal until alignment is approached. It is advisable to maintain as low a signal input as conveniently possible in order to minimize the possibility of misalignment resulting from A.V.C. and overload effects. If a squeal is heard while tuning, rotate the gang condenser slightly and it should disappear. Naturally, the ground side of the generator should be connected to the chassis either directly or through a .1MFD condenser.

SHORT WAVE BAND

Rotate the wave band switch to full clockwise position. Connect high side of generator output to antenna lead through a 400 ohm dummy antenna. Apply 23 M.C. signal. Unscrew trimmer C33 to a minimum capacity, slowly turn the screw so that the trimmer capacity increases until the signal is heard. Apply 22 M.C. signal, and adjust C24 and C21 for maximum response. It may be found advisable to "rock" generator frequency back and forth through signal to offset detuning effect from inter action input and oscillator circuits at high frequencies. Check alignment through medium of sensitivity at 11 meg. and 9 meg. respectively. When aligning at 22 meg., it is well to point out here that the trimmer C33 may indicate two maxima. The maxima obtained with the trimmer tighter is the desired one. This can be checked by leaving the gang condenser set and shifting the generator to a higher frequency viz.: 23 megacycles, where the image should appear. If it is properly aligned, it should require about 10 times the signal voltage for the image to give the same output as the real signal.

POLICE BAND

Shift wave band switch to middle position. Apply 7.3 M.C. signal. Set dial points to 7.3 M.C. Adjust trimmer C32 in the same manner as previous band until maximum signal is heard. Apply 6 Meg. Signal, and adjust trimmers C25 and C22 until response is maximum. Check for image in same manner as previous band. Check alignment at 4.5 and 3 megacycles respectively.

BROADCAST BAND

Use a 200 MMF mica condenser for dummy antenna on this band. Shift wave change switch to full counter clockwise position. Adjust trimmer C26 and C23 to medium tight position. Rotate gang until dial pointer indicates 600KC. Apply 600KC signal and adjust padder C14 for maximum signal. Set dial to 1500 KC and apply 1500 KC signal; adjust C31 for same. Then adjust trimmers C23 and C26 for maximum response. Shift gang to 600 KC and apply 600 KC signal. "Rock" gang condenser and adjust C14 for maximum signal. Recheck 1500 KC signal.

PHONOGRAPH

To use the phonograph connection, insert the tips of a phonograph pick-up into the phonograph jacks in the back of the chassis. Throw the phono-radio switch to phono. This switch is located near the phono jacks. If the receiver hums, reverse the two phono tips. To use the radio, throw the switch to the radio position.

MAJESTIC RADIO & TELEV. CO.

AUTOMATIC ELECTRIC TUNING—MODELS 11056, 11058, 11356, 11656

Push buttons are for use on broadcast reception. The broadcast dial scale reads, from left to right, 1750 to 550 kilocycles. The automatic buttons are similarly disposed in sequence from left to right so that any particular button may be set to a desired station within its range. Two buttons may even be set to the same station if desired. This permits setting to different programs which are very close together on the dial scale. **Do not press two buttons in at one time.** If this is done by mistake, move manual lever to manual tuning as shown by dial light. This releases both buttons.

Pre-setting For Desired Stations

Determine which broadcasting stations you favor for automatic tuning and set the buttons to the programs coming from the ones you regularly listen to. To do this, first turn set on and tune in one program manually, to desired volume. In tuning, observe "electric eye" which shows its narrowest shadow when receiver is correctly tuned. Program should be listened to several minutes after first turning set on in order that the tubes may warm up fully before the automatic buttons are pre-set. For the first push-button at left, begin with a desired station near left of scale, in range 1750 to 1400 kilocycles.

At the rear of cabinet there is a selector disc which has two rings, each carrying contactors corresponding to the push-buttons. Remove protective cover to expose this disc with its rings to view when pre-settings are made. The selector disc comprises two sectors separated by a visible and narrow insulated gap. When the lower gap registers with a particular contactor carried by either of the two rings the push-button connected to that contactor controls the given station setting. Use the contactor which is nearest to the insulated lower gap on disc. Loosen its support screw just enough so that this contactor can slide on its ring support and move the contactor so that its ball point rests on this gap. Then tighten support screw so that this adjustment will be fixed for repeated use. To test accuracy of pre-setting move the front lever to "electric" tuning position as shown by dial light indicator. Press in the first button at left, the one now pre-set. If correct, the selected program will be heard. If not, repeat pre-setting operation just discussed, moving the correct contactor to position at the lower disc gap. Once set, do not move this contactor.

For indexing other stations proceed similarly with the next push button and its corresponding control contactor, and so on, until all desired buttons are pre-set to the particular stations wanted. To change selection at some later time, repeat the procedure for a particular button, but leave the pre-set buttons held securely by support screws before replacing protective cover over rear disc. Exact pre-settings may be had by carefully moving the contactor connected to each push button and slightly shifting its position if required to register with lower disc gap for the desired station. Settings may be made as desired, and if you wish all or more programs in one range, ask for special instructions. It is recommended that the service man who installs your radio set up the stations you want on your push buttons. Mark each push button with proper call letter tab furnished as directed at top of tab sheet. Once pre-set, you may leave lever in electric tuning position for all broadcast tuning, either manually or automatically.

NOTE: For receivers equipped with automatic frequency control. Most exact pre-settings may be made when lever is in manual position without this control. Do not pre-set to a weak station very close on dial scale to a powerful station, as the control will pull in the strong station when too close. Use your manual control for weak distant stations commonly subject to fading in and fading out of volume, as well for short wave reception. Another convenient way to pre-set stations is to first tune manually to a sequence of desired programs and then (for each station) just move the nearest contactor over to fit on the control disc gap. The stations will repeat as pre-set, so place the proper index letters on each button position.

RANGE—MODELS 11056, 11058

A-Band—538-1800 KC
B-Band—1770 KC to 6.0 M. C.
C-Band—5.8 M.C.-18.5 M.C.

POWER SUPPLY—MODELS 11056, 11058, 11356, 11656

This receiver is designed for use on power supplies whose frequencies range from 50-60 cycles and whose voltages range from 105-130 volts AC. It should not be operated from a power line higher than 130 volts AC.

TUNING RANGE—MODEL 11356

The tuning range of this receiver is from 138 KC to 18.5 MC in four convenient bands divided as follows:

Weather-band—138-325 KC—United States weather broadcasts, airplane beacons, and European long wave broadcasts.

A-Band—538-1800 KC—Standard American broadcast and some of the low frequency police stations.

B-Band—1770 KC to 6.0 MC—All police stations, some amateur and practically all air-plane communications.

C-Band—5.8 MC-18.5 MC—Foreign and Domestic short wave stations.

The tuning range of this receiver is from 138 KC to 18.5 MC in four convenient bands divided as follows:

Weather-band—138-325 KC—United States weather broadcasts, airplane beacons, and European long wave broadcasts.

A-Band—538-1800 KC—Standard American broadcast and some of the low frequency police stations.

B-Band—1770 KC to 6.0 MC—All police stations, some amateur and practically all airplane communications.

C-Band—5.8 MC-18.5 MC—Foreign and Domestic short wave stations.

INSTRUCTIONS FOR ALIGNMENT OF THE MIDWEST 36 MODEL 5 TUBE AUTOMOBILE RECEIVER

I.F. ALIGNMENT

(1) Set signal generator to 456 k.c. and connect output to grid of 6A7 tube. Connect output meter from plate of 41 tube to ground. Ground stator of oscillator section (rear section) of variable condenser. Adjust both grid and plate trimmers of 1st I.F. transformer and 2nd I.F. trimmer, located near speaker, for maximum gain on output meter.

This completes the I.F Alignment of the receiver.

R.F. ALIGNMENT

(2) Connect signal generator to antenna post on set through a standard dummy antenna. Remove short circuit from condenser. Set generator and dial to 1500 k.c. and peak variable condenser trimmer for maximum output on motor.

This completes the R.F. Alignment.

NOTE: To assure more accurate trimmer setting always use lowest possible test oscillator output consistent with readable output meter scale deflection.

INSTRUCTIONS FOR ALIGNING THE 1938 MIDWEST

7-8-9-10 DOMESTIC AC-DC SETS
6-7-8-9- EXPORT AC-DC SETS
7-8 BATTERY SETS

INTERMEDIATE FREQUENCY ALIGNMENT

The I.F."s should be peaked at 456 kc. for maximum output. Connect signal generator grid of 6A8 tube leaving grid cap on tube. Use smallest possible input consistant with a readable output.

BAND ALIGNMENT

Inside band "A", covers from 550 to 1700 kc. This band should be padded at 600 kc. and trimmed at 1400 kc. Radio Frequency trimmer should be adjusted at 1400 kc. for maximum gain.

Middle band "L", covers from 1.7 to 5.5 megacycles. This band should be padded at 1.8 mc. and trimmed at 4.3 mc. The R.F. trimmer should be adjusted at 5.3 mc. for maximum gain.

Note:- On EXPORT sets the above band is called "E" and covers 125 kc. to 350 kc. Pad at 135 kc. and trim at 340 kc. Adjust R.F. trimmer at 340 kc. for maximum gain.

Outside band "M", covers from 5.5 mc. to 18 mc. This band has a fixed padder and should be trimmed at 13 mc. Adjust R.F. trimmer at 13 mc. for maximum gain.

Note:- When aligning bands a dummy antenna, consisting of a 200 ohm resistance and 10 mmfd. condenser in parallel, should be connected in series with output of signal generator.

1938 DOMESTIC - 9 TUBE AC-DC MIDWEST RECEIVER

TUBE	PLATE	SCREEN	SUPPRESSOR	CATHODE	HEATER
6A8 Mixer-Osc.	54* 94	50	.2	1	5.6
6K7 I.F. Amp.	90	94	1	1	5.6
6Q7 2nd Det.	30			.6	5.6
6C5 Phase Inv.	42			2.2	5.6
25B6 Outputs	90	94		16	22
25Z5 Rectifier	94				22
K92B Ballast	85 V. drop				
L49B Ballast	40 V. drop				

* Plate #2

All voltages taken with 110 V. line voltage and 1000 ohm per volt meter.

INSTRUCTIONS FOR ALIGNING THE 12AC - 38 MIDWEST RECEIVER

INTERMEDIATE FREQUENCY ALIGNMENT

Remove the Oscillator tube. The I.F.'s should be peaked at 456 kc. for maximum gain. The third I.F. transformer must be realigned to obtain a.f.c. voltage. Turn tone control to right half; insert 5 ma. meter in series with 6J7 control tube cathode and note reading. Turn tone control switch to left half and adjust diode trimmer of third I.F. so that this reading is again obtained.

BAND ALIGNMENT

The "E" band covers 125 kc. to 350 kc. This band should be padded at 135 kc. and trimmed at 340 kc. Adjust R.F. and Mixer trimmers for maximum gain at 340 kc.

The "A" band covers 550 kc. to 1500 kc. This band should be padded at 540 kc. and trimmed at 1400 kc. Adjust R.F. and Mixer trimmers for maximum gain at 1400 kc.

The "L" band covers from 1.5 mc. to 4.5 mc. This band should be padded at 1.8 mc. and trimmed at 4.0 mc. The R.F. trimmer should be adjusted at 4.0 mc. for maximum gain.

The "M" band covers from 4.0 mc. to 12 mc. This band has a fixed padder and should be trimmed at 11.5 kc. Adjust R.F. and Mixer trimmer for maximum gain at 11.5 mc.

The "H" band covers from 12 mc. to 30 mc. This band has a fixed padder and should be trimmed at 26 mc. Adjust R.F. trimmer at 26 mc. for maximum gain.

Note:- When aligning bands a dummy antenna, consisting of a 200 ohm resistance and 10 mmfd. condenser in parallel, should be connected in series with output of signal generator.

INSTRUCTIONS FOR ALIGNING THE 16-TUBE, 18-TUBE AND 20-TUBE AND 12-TUBE 1938 MIDWEST RECEIVERS

INTERMEDIATE FREQUENCY ALIGNMENT

Remove the Oscillator tube. I.F. alignment should not be attempted without the use of an Oscilloscope. Align the third I.F. to obtain characteristic resonance curve across 2nd detector diode load. Likewise, align 2nd I.F. to obtain resonance in 2nd I.F. stage. These are taken from an audio voltage. The discriminator and 1st I.F. transformer are aligned with an A. F. C. voltage. Do not attempt to change A.F.C. alignment unless you are familiar with characteristic curves necessary for correct alignment.

BAND ALIGNMENT

The "American Broadcast Band" covers 550 kc. to 1500 kc. This band should be padded at 540 kc. and trimmed at 1400 kc. R.F. and Mixer trimmers should be adjusted for maximum gain at 1400 kc.

The "Day Foreign" band covers from 20 mc. to 10 mc. This band has a fixed padder and should be trimmed at 18 mc. Adjust R.F. and Mixer trimmer for maximum gain at 18 mc.

The "Night Foreign" band covers 10.4 mc. to 5.2 mc. This band has a fixed paddor and should be trimmed at 10.3 mc. Adjust R.F. trimmer at 5.3 mc. for maximum gain at 10.3 mc.

The "Aviation" band covers from 5.4 mc. to 2.7 mc. This band should be padded at 2.9 mc. and trimmed at 5.3 mc. Adjust the R.F. trimmer at 5.3 mc. for maximum gain.

The "Police" band covers from 3.0 mc. to 1.5 mc. This band should be padded at 1.7 mc. and trimmed at 2.9 mc. Adjust the R.F. trimmer at 2.9 mc. for maximum gain.

The " Weather " band covers from 125 kc. to 350 kc. This band should be padded at 135 kc. and trimmed at 340 kc. The R.F. trimmer should be adjusted at 340 kc. for maximum gain.

Note:- When aligning bands a dummy antenna, consisting of a 200 ohm resistance and 10 mmfd. condenser in parallel, should be connected in series with output of signal generator.

MODEL 18-37 Early Alignment, Voltage

INSTRUCTIONS FOR ALIGNING THE MIDWEST 18 - 37 RECEIVER

A good signal generator with accurate frequency calibration and an output meter are required. An intermediate frequency of 456 k.c. is used.

(1) Set the signal generator to 456 k.c. and connect it from the mixer grid to ground.

(2) Remove the oscillator tube from the receiver.

(3) Connect the output meter from the plate of the output tube to positive B, or from the plates of one pair of tubes to the plates of the other pair of tubes.

(4) Using a weak signal approximately 40 micro-volts, align the I.F. transformers to maximum output.

(5) Gradually decrease signal and realign I. F. amplifier.

(6) Increase the input from the generator of approximately 100 micro-volts. Align the A.V.C. transformer for minimum output.

(7) Repeat using weaker signal strengths for the I.F. and stronger signal strength for the A.V.C. adjustment until an absolute peak is assured.

This completes the alignment of the I. F. amplifier in the 18 - 37 set.

Insert the oscillator tube. Connect the signal generator between antenna and ground. Connect mixer lead to grid of mixer tube.

(1) Set the wave change switch to the "E" band.

(2) Set the signal generator to 325 k.c., and also the dial.

(3) Adjust the "E" oscillator trimmer to maximum gain, then adjust the "E" band R.F. and the "E" band mixer trimmers for maximum gain.

(4) Reset the signal generator to 135 k.c. and rotate the receiver dial to 135 k.c.

(5) Adjust the "E" band padder for maximum signal.

(6) Repeat the adjustment of trimmers and padders until the adjustment of one does not effect the adjustment of the other.

This completes the alignment of the "E" band.

(1) Set the wave change switch to the "A" band.

(2) Set the signal generator to 1490 k.c.

(3) Adjust the "A" oscillator trimmer to maximum gain, then adjust the "A" band R.F. and the "A" band mixer trimmors for maximum gain.

(4) Reset the signal generator to 550 k.c. and rotate the receiver dial to 550 kc.

(5) Adjust the "A" band padder for maximum signal.

(6) Repeat the adjustment of trimmers and padders until the adjustment of one does not effect the adjustment of the other.

This completes the alignment of the "A" band.

(1) Set the wave change switch to the "L" band.

(2) Set the signal generator to 3.8 m.c.

(3) Adjust the "L" oscillator trimmer to maximum gain, then adjust the "L" band R.F. and the "L" band mixer trimmers for maximum gain.

(4) Reset the signal generator to 1.6 m.c. and rotate the receiver dial to 1.6 m.c.

(5) Adjust the "L" band padder for maximum signal.

(6) Repeat the adjustment of trimmers and padder until the adjustment of one does not effect the adjustment of the other.

This completes the alignment of the "L" band.

(1) Set the wave change switch to the "M" band.

(2) Set the signal generator to 11.5 m.c.

(3) Adjust the "M" oscillator trimmer to maximum gain, then adjust the "M" band R.F. and the "M" band mixer trimmers for maximum gain.

This completes the alignment of the "M" band.

(1) Set the wave change switch to the "H" band.
(2) Set the signal generator to 28 m.c.
(3) Adjust the "H" band oscillator trimmer to maximum gain, ghen adjust the "H" band R.F. and the "H" band mixer trimmers for maximum gain.

This completes the alignment of the "H" band.

(1) Set the wave change switch to the "U" band.
(2) Set the signal generator to 60 m.c.
(3) Tune receiver until signal is received.
(4) Adjust the "U" band mixer trimmer for maximum gain.

This completes the alignment of the "U" band.

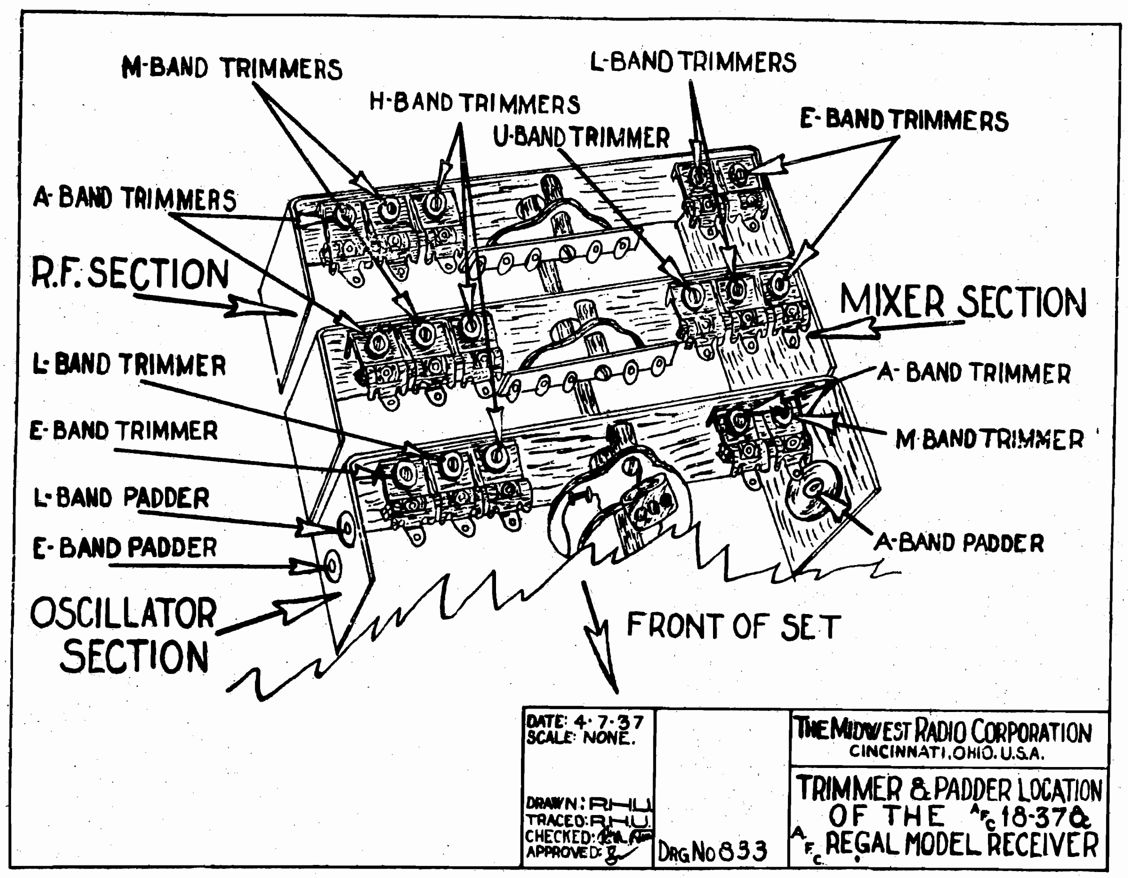
MID-WEST RADIO CORP.



INSTRUCTIONS FOR ALIGNING THE MIDWEST 18-37 A.F.C. RECEIVER AND A.F.C. REGAL (1937)

A good signal generator with accurate frequency calibration, and output meter, and a 0-10 DC milliameter are required. An intermediate frequency of 456 kc is used.
(1) Remove grid cap from mixer tube. Set the signal generator to 456 kc and connect it from the mixer grid to ground
(2) Remove the oscillator tube from the receiver.
(3) Connect the output meter from the plate of the output tube to Positive B, or from the plates of one pair of tubes to the plates of the other pair of tubes.
(4) Using as weak a signal as will give a definite reading on the output meter, align the I.F. transformer for maximum output.
(5) Decrease the input signal and realign.
(6) Connect the 0-10 milliameter in series with the cathode of the 6J7 A.F.C. control tube.
(7) Turn off A.F.C. by pressing push button. If meter kicks up or down adjust plate trimmer for maximum deflection, either up or down, from the false zero. If no kick is noted turn diode trimmer slightly (about 1/8 turn) and proceed as above.
(9) Adjust diode trimmer for false zero.
(10) Flip A.F.C. off and on noting reading of milliameter. If meter kicks up or down the diode trimmer is not properly aligned. This adjustment is very critical and must be done very carefully if the A.F.C. is to function properly.
This completes the alignment of the I.F. Amplifier.

Insert the oscillator tube. Connect the signal generator between antenna and ground. Connect the mixer lead to grid of mixer tube. Turn off A.F.C. by depressing push button.
(1) Set the wave change switch to the "E" band.
(2) Set signal generator and dial to 340 kc.
(3) Adjust "E" oscillator trimmer to peak and adjust R.F. and mixer trimmers for maximum gain.
(4) Reset signal generator and dial to 135 kc.
(5) Adjust "E" padder for peak.
(6) Repeat adjustment of oscillator trimmer and padder until one does not effect the other.
This completes the alignment on the "E" band.
(1) Set wave change switch to "A" band.
(2) Set signal generator and dial to 1490 kc.
(3) Adjust "A" oscillator trimmer for peak and adjust R.F. and mixer trimmers for maximum gain.
(4) Reset signal generator and dial to 550 kc.
(5) Adjust "A" padder for peak.
(6) Repeat adjustment of oscillator trimmer and padder until one does not effect the other.
This completes alignment of the "A" band.
(1) Set wave change switch to "L" band.
(2) Set signal generator and dial to 4 mc.
(3) Adjust "L" oscillator trimmer for peak and adjust R.F. and mixer trimmers for maximum gain.
(4) Reset signal generator and dial to 1.8 mc.
(5) Adjust "L" padder for peak.
(6) Repeat adjustment of "L" oscillator trimmer and padder until one does not effect the other.
This completes the alignment of the "L" band.
(1) Set wave change switch to "M" band.
(2) Set signal generator and dial to 11.5 mc.
(3) Adjust "M" oscillator trimmers for maximum gain.
This completes the alignment of the "M" band.
(1) Set wave change switch to "H" band.
(2) Set signal generator and dial to 26 mc.
(3) Adjust "H" oscillator trimmer to fundamental peak and adjust R.F. and mixer trimmers for maximum gain.
This completes the alignment of the "H" band.
(1) Set wave change switch to "U" band.
(2) Set signal generator switch to "U" band.
(3) Turn dial generator to 60 mc.
(4) Adjust "U" mixer trimmer for maximum gain.
This completes the alignment of the receiver.

MIDWEST RADIO CORP.

~NOTE~
This chassis is shown equipted with the best tube combination available
* Metal, metal-glass, or glass counterpart tubes may be used. For example the output tubes shown are glass counter-part tubes numbered - 6N6-G; metal glass tubes would be numbered - 6N6-MG and metal tubes would be numbered - 6N6.
** Use only 80 type Rectifier tubes.

DESCRIPTION

TUBES:

The tube complement of this chassis is as follows:

1 Type 1A6—first detector oscillator.
1 Type 34—I.F. amplifier. 465 K. C.
1 Type 30—second detector. A. V. C.
1 Type 32—audio.
1 Type 950—output.

SERVICE NOTES

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram, are measured with a new set of batteries.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

ALIGNING INSTRUCTIONS

CAUTION: No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as run down batteries, defective tubes, poor installations, open or grounded antenna systems, defective condensers and resistors.

In order to properly align this chassis, an oscillator (generator) is necessary.

All adjustments should be made with a non-metallic screw driver.

ALIGNING I.F. TRANSFORMERS: (465 K.C.)

1. With volume control full on and with variable condenser at its minimum capacity position, plates entirely out of mesh, and with external oscillator set at 465 K.C. connected in series with a .1 mfd. condenser, to the grid of the 1A6 tube (cap at top of tube), adjust I.F. transformers, parts number 108-67 and 108-68, to resonance. Both of these transformers have two (2) adjustments each, they are accessible from the tops of the cans (for location see top view).

   Use as a resonance indicator an output meter connected across the outside terminals of the speaker or by means of an adapter to the plate and screen of the type 950 output tube. Maximum deflection of the volt meter indicates resonance.

   Use only enough signal to get a readily readable output.

   A low range output meter or the low scale of a multi-range meter should be used.

BROADCAST BAND ALIGNMENT:

1. Set external oscillator to 1720 K.C. and connect it in series with a 200 mmfd. condenser to the antenna and ground posts.
   (a) With variable condenser in its minimum capacity position, plates entirely out of mesh, adjust oscillator trimmer (rear section of variable condenser) to resonance.
   (b) Re-set external oscillator to 1400 K.C. Rotate variable condenser, pick up signal and adjust antenna trimmer (front section of variable condenser) to resonance.
   (c) Re-set external oscillator to 600 K.C., move dial pointer to 600 K.C., and adjust series pad, part number 124-14 (see top view), to resonance. While making this adjustment, slowly rock variable condenser to and fro until maximum output is obtained.
   (d) Check for sensitivity at 1400, 1000, 600 K.C. DO NOT BEND PLATES.

TOP VIEW

The tube complement of this chassis consists of the following tubes:

The type and function of each tube is as follows:

1—Type 1A6 Pentagrid Mixer, First Detector-oscillator
1—Type 1A4 Super-control R.F. Pentode, I.F. Amplifier (465 K.C.)
1—Type 1F6 Duplex Diode Pentode Second Detector, A.V.C. and First Audio.
1—Type 1F4 Pentode Output Amplifier.
1—Type 6N5 Cathode-Ray Tuning Eye.

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1" and "Dummy 2."

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

ALIGNING I. F. TRANSFORMERS: (465 K.C.)

Part No. 108-90. Output I.F. Transformer
Part No. 108-89. Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view—Fig. 1, page 2).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to minimum capacity position, make the following adjustments:

(a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 1A4 tube, and adjust the output I.F. transformer No. 108-90 to resonance.

(b) Move oscillator output clip from grid of 1A4 to grid cap of 1A6 and adjust input I.F. transformer (No. 108-89) to resonance.

(c) With oscillator still connected to 1A6, readjust output I.F. transformer (108-90) if necessary.

R. F. ALIGNMENT: (535-1720 K.C.)

1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with "Dummy 2", to tan antenna and black ground leads and make the following adjustments:

(a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer (rear section of gang condenser).

(b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance (front section of gang condenser).

(c) Check sensitivity at 600 and 1000 kilocycles.

MONTGOMERY-WARD & CO.

I. F. Adjustment
Set the signal generator for a signal of 456 KC.
Connect the output of the signal generator through a 1 mf. condenser to the grid of the 1st detector.
Connect the ground lead of the receiver to the ground post of the signal generator.
Turn the band switch to the Range B position (standard wave band).
Turn the selectivity control to the sharp position and keep it in this position for all adjustments.
Turn the volume control to the maximum position.
Attenuate the signal from the signal generator to prevent the levelling-off action of the AVC.
Then adjust the five I.F. trimmers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis and the location is shown in Fig. 3.

Range B Alignment

After the procedure for the alignment of each range, as explained below, is completed, it is advisable to repeat the procedure as a final check.

1730 KC Adjustment
Set the signal generator for 1730 KC.
Turn the rotor of the tuning condenser to the full open position.
Keep the band switch in the standard wave position.
Connect the antenna lead of the receiver through a 200 mmf. condenser to the output of the signal generator.
For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent AVC action.
Adjust the oscillator Range B trimmer (C18) until maximum output is obtained. The location of this trimmer is shown in Fig. 3.

1500 KC Adjustment
Set the signal generator for 1500 KC.
Turn the rotor of the tuning condenser carefully until maximum output is obtained.
In sets using pointers, loosen the screw of the large pointer and set the pointer at the 1500 KC mark on the standard wave band scale. Re-tighten the screw.
In sets using the moving beam of light, there is a moving light assembly held to the front of the drive drum by means of a screw. Loosen this screw and move the light assembly until it is at the 1500 KC mark on the dial. Re-tighten the screw.
Adjust the interstage Range B trimmer (C10) and antenna Range B trimmer (C4) to maximum.
Do not change the setting of the oscillator Range B trimmer.

600 KC Adjustment
Set the signal generator for 600 KC.
Turn the tuning condenser rotor until maximum output is obtained.
Turn the rotor slowly back and forth at the same time adjusting the 600 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range C Alignment

CAUTION—When aligning the short wave bands be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 5000 KC. The signal will then be heard at 5000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 5000 less 912 KC, or 4088 KC. It may be necessary to increase the input signal to hear the image.

5800 KC Adjustment
Set the signal generator for 5800 KC.
Connect the antenna lead of the receiver through a 400 ohm resistor to the output of the signal generator.
Turn the rotor of the tuning condenser to the full open position.
Turn the band switch to the Range C position (first short wave band).
Adjust the oscillator Range C trimmer (C17) until maximum output is obtained. See Fig. 3 for location of this trimmer.

5000 KC Adjustment
Set the signal generator for 5000 KC.
Turn the rotor of the tuning condenser carefully until maximum output is obtained.
Adjust the interstage Range C trimmer (C9) and antenna Range C trimmer (C3) to maximum.
Do not change the setting of the oscillator Range C trimmer.

1800 KC Adjustment
Set the signal generator for 1800 KC.
Turn the tuning condenser rotor until maximum output is obtained.
Turn the rotor slowly back and forth at the same time adjusting the 1800 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range D Alignment

18,300 KC Adjustment
Set the signal generator for 18,300 KC.
Keep the antenna lead of the receiver connected through the 400 ohm resistor to the output of the signal generator.
Turn the rotor of the tuning condenser to the full open position.
Turn the band switch to the Range D position (second short wave band).
Adjust the oscillator Range D trimmer (C12) until maximum output is obtained. See Fig. 3 for location of this trimmer.

15,000 KC Adjustment
Set the signal generator for 15,000 KC.
Turn the rotor of the tuning condenser carefully until maximum output is obtained.
Adjust the interstage Range D trimmer (C8) and antenna Range D trimmer (C2) to maximum.
When adjusting the interstage and antenna Range D trimmers, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.

Do not change the setting of the oscillator Range D trimmer.

6000 KC Adjustment
Set the signal generator for 6000 KC.
Turn the tuning condenser rotor until maximum output is obtained.
Turn the rotor slowly back and forth at the same time adjusting the 6000 KC trimmer until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Trimmer Replacement

If one trimmer of the gang trimmer strip should become defective, it is not necessary to replace the entire strip. A single trimmer P-17A36, as shown in the replacement parts list, may be used. Disconnect the lead from the coil side (side not grounded) of the defective trimmer in the strip. This connection is then made to the single trimmer. Connect it to the side of the trimmer not in contact with the adjusting screw. The other side of the single trimmer is then connected to a good ground, using a piece of heavy wire in order to support the trimmer adequately. In replacing a trimmer, be sure to keep both leads as short as possible and keep the ungrounded lead as far from ground as possible.

Planetary Drive Assembly

The planetary assembly is the unit that is integral with the tuning shaft.

If the nut on the back end of this assembly is too tight, the drive will be jerky and will turn hard in high speed. If this condition exists, back off this nut one or two turns and note the effect.

If this nut is too loose, the drive will slip in slow speed. The remedy in this case, of course, is to tighten the nut.

Should the condenser drive cord slip when the planetary pulley is turning, inspect the tuning condenser, drive drum and gears to see if they are turning properly or if they are being obstructed in some way.

If the drive turns unevenly (rough in spots), this may mean that the planetary assembly is defective or damaged internally and a new unit will be required.

Phonograph Connections

Phonograph connections can be made as shown in Fig. 7. The parts required are shown in the parts list. Knockouts are provided in the back panel of the chassis for mounting the phono jack and phono switch—See Fig. 8.

The phono switch must be mounted with one set of terminals nearest the bottom of the chassis base.

The connections are made by opening the diode return circuit at the volume control. This is done by removing the white wire connected to the insulated lug of the terminal strip on which one end of condenser C32 is also connected. The terminal strip is located at the back of the volume control. This wire is then connected to the phono switch as shown in Fig. 7. A wire is then connected from the lug on the above mentioned terminal strip to the phono switch, as shown in Fig. 7. Both of the above wires are connected to the switch terminals nearest the chassis base and should be twisted together as far

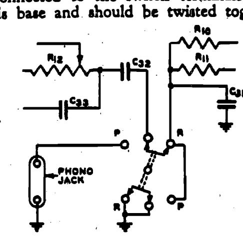

Fig. 7—Phonograph Connections

as possible and run as close to the back of the chassis base as possible.

The lead to condenser C32, after turning away from the back of the chassis base, should be run close to the 6C5 tube sockets.

Complete the other connections as illustrated in Fig. 7, using the lugs in the chassis base, located near the phono switch and jack, for grounding purposes.

The control grid lead of the 6F6 power tube nearest the back of the chassis should be removed and a longer lead substituted. This lead is run from the tone control to the back of the chassis, along the lower edge and is then brought to the grid terminal by being routed between the speaker socket and the tubular condenser next to it.

If a hum is heard when the phono pickup is touched, reverse the two pickup leads.

Switch Contact Location Numbering

A standard arrangement for switch contact location numbering has been adopted. This numbering is illustrated in Fig. 2. In contact locations not used, the number applying to that particular location is not employed.

Voltage Chart

The voltage readings are taken with a voltmeter having a resistance of 1000 ohms per volt.
The standard metal tube socket terminal numbering system (bottom of socket) is shown in Fig. 5. On the schematic circuit diagram, Fig. 2, is a list giving the complete names of the tube elements and the corresponding symbols as used on the sockets on the schematic.

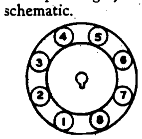

Fig. 5—Metal Tube Terminal numbering (bottom of socket)

MONTGOMERY-WARD & CO.

Notes, Parts

Referring to the 1st and 2nd I.F. transformers T3 and T4 in Fig. 2, it will be noted that there are coupling windings shown below the primaries in the illustration.

When the selectivity control is in the sharp position, the coupling windings are open circuited and the loose coupling which exists between the primary and secondary of these transformers results in high selectivity.

When the selectivity control is in the broad position, the coupling winding which is wound under the primary is connected in series with the secondary. This provides overcoupling which results in a greatly widened resonance curve. Passage of a wide range of audio frequencies is thus obtained.

Across the volume control resistor R12 is a filter composed of condensers C33 and C34 and resistor R13. A tap connection near the low potential end of the volume control is connected between the two condensers. At high volume settings, the filter is not effective. At the low volume settings, as the movable arm approaches the tap, the higher frequencies are by-passed through condenser C34. Very high frequencies are transmitted through condenser C33 to compensate for the reduction of these frequencies. At low volume settings the low frequency amplitudes are increased as a result.

Transformer coupling is used between the first audio stage and the output stage which employs two type 6F6 output pentode tubes in a stage of push-pull amplification. A type 5Z4MG (metal glass tube) full wave rectifier is used in the power unit.

The 6G5 tuning indicator tube is wired as shown in the schematic. This tube contains a triode and cathode ray section in one envelope.

The cathode ray is produced by the attraction of electrons from the upper end of the cathode to the coated target or anode, which is operated at a high positive potential. When this electron stream strikes the target the coating glows. The electron stream is controlled by an additional element, or control electrode, in the tube.

As a signal is tuned in, the control grid of the triode section of the 6G5 cathode ray tube becomes increasingly negative, the negative bias voltage being taken from the AVC line. The AVC voltage is reduced to a suitable value by the potentiometer arrangement of the 1 and 2 megohm resistors. The increased bias voltage reduces the triode plate current. This reduces the voltage drop across the 1 megohm plate resistor and raises the triode plate voltage. The triode plate is connected to the control electrode of the cathode ray section of the tube.

The shape and size of the area on the target struck by the cathode ray is governed by the voltage of the control electrode. When the signal is tuned to resonance, practically no plate current flows and the voltage of the control electrode is the same as that of the target. There is no opposition to the flow of electrons to the target. Tuning off resonance decreases the control electrode voltage and causes the darkened sector of the target to widen, because of the opposition to the flow of electrons in the direction of the control electrode.

NOTICE—There is a large letter on the chassis which identifies the set as to major part changes. When ordering parts, please be sure to mention the series number and this large letter.

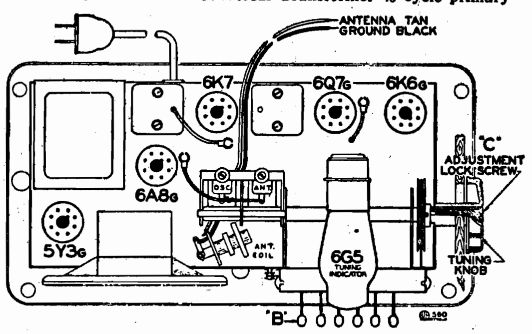
	BE104-108B		Power Transformer 25 cycle, 105-120 volt		
	BE104-104B		Universal Transformer 25 cycle primary		
	BE104-99C		Universal Transformer 40 cycle primary		



Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with 115 volts on the primary of the power transformer.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D.C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

ALIGNING INSTRUCTIONS: ISSUES "A" AND "B"

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet.

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 6K6G output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-83D Output I.F. Transformer
Part No. 108-82D Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6K7 tube, and adjust the output I. F. transformer (No. 108-83D) to resonance.
   (b) Move oscillator output clip from grid of 6K7 to grid of 6A8G and adjust input I.F. transformer (No. 108-82D) to resonance.
   (c) With oscillator still connected to 6A8G, readjust output I.F. transformer (108-83D) if necessary.

R.F. ALIGNMENT: (535-1720 K.C.)

1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmf. condenser to the antenna lead and chassis ground and make the following adjustments:
   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
   (c) Check sensitivity at 600 and 1000 kilocycles.

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:

There are four levers on the dial by means of which four stations may be selected, (See "B". Fig. 2).

Press down any one of the levers. Holding it down, tune in by means of tuning knob No. 2 any one of your favorite stations. Turn the tuning knob very slowly back and forth until signal is clearest. The station will then be accurately tuned in. Adjust the volume by means of the volume control knob to the desired intensity.

Release this lever and press down any other lever. Hold this lever down and tune in by means of knob No. 2 another favorite station.

Follow this procedure until stations have been set on all the levers. Hold tuning knob securely with left hand to prevent it from turning and with a coin or screw driver, tighten the special locking screw ("C") in the center of the tuning knob,

This screw will lock in place all the stations you have selected on the levers. (Note: Locking Screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, hold the tuning knob securely and loosen locking screw ("C") one or two turns; select the new station as explained.

BE SURE TO RETIGHTEN THE LOCKING SCREW, otherwise the stations will not stay adjusted to the levers.

Above each lever an opening in the cabinet is provided for inserting station call letters, (See "A", Fig. 2).

Punch the correct station call letter tabs from the set of sheets supplied and insert them into the rectangular openings in the cabinet above each of the levers. One of the small, clear celluloid tabs supplied should be snaped into place over each of the station call letter tabs.

The Automatic Tuner dial is now set for quick tuning. Press down on the lever and your favorite station is selected.

MODEL 62-361

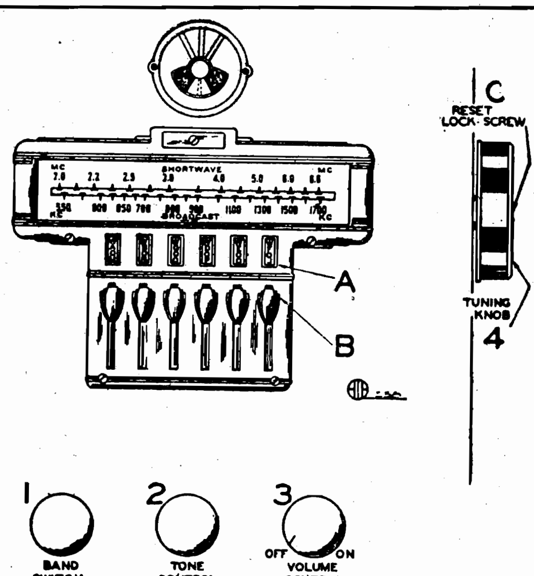

FIG. 2—FRONT VIEW

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:

There are six levers on the dial by means of which six stations may be selected, (See "B", Fig. 2).

Press down any one of the six Automatic levers. Holding it down, tune in by means of tuning knob No. 4 any one of your favorite stations. Turn the tuning knob very slowly back and forth noting the width of the shadow indicated on the screen of the cathode-ray tuning eye. Minimum width indicates the ideal tuning position (resonance). The station will then be accurately tuned in.

Release this lever and press down any other lever. Hold this lever down and tune in by means of knob No. 4 another favorite station.

Follow this procedure until stations have been set on all the levers. Hold tuning knob securely with left hand to prevent it from turning and with a coin or screw driver, tighten the special locking screw ("C") in the center of the tuning knob, (See Fig. 1).

This screw will lock in place all the stations you have selected on the Automatic levers. (Note: Locking Screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, hold the tuning knob securely and loosen locking screw ("C") one or two turns; select the new station as explained.

BE SURE TO RETIGHTEN THE LOCKING SCREW, otherwise the stations will not stay adjusted to the levers.

Above each Automatic lever an opening in the cabinet is provided for inserting station call letters, (See "A", Fig. 2).

Punch the correct station call letter tabs from the set of sheets supplied and insert them into the rectangular openings in the cabinet above each of the levers. One of the small, clear celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

The Automatic Tuner dial is now set up for quick tuning. Press down on the lever and your favorite station is selected.

TO TURN THE RADIO OFF:

Turn the on-off switch and volume control knob No. 3 to the left until a click is heard. The receiver will then be turned off.

SERVICE NOTES:

Voltage taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages are to be measured with 6.3 volts input to receiver.

Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-83D Output I. F. Transformer
Part No. 108-82C Input I. F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6S7G tube, and adjust the output I.F. transformer (No. 108-83D) to resonance.
   (b) Move oscillator output clip from grid of 6S7G to grid of 6D8G and adjust input I.F. transformer (No. 108-82C) to resonance.
   (c) With oscillator still connected to 6D8G, readjust output I.F. transformer (108-83D) if necessary

R.F. ALIGNMENT: (535-1720 K. C.)

1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmf. condenser to the antenna lead and chassis ground and make the following adjustments:
   (a) with external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
   (c) Check sensitivity at 600 and 1000 kilocycles

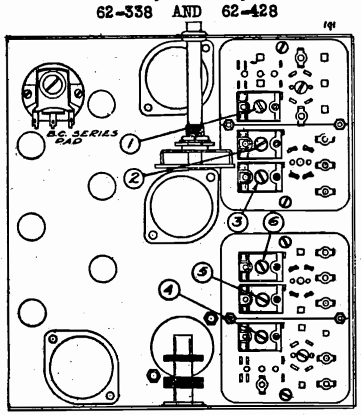

FIG. 3 — BOTTOM VIEW SHOWING TRIMMERS

All adjustments should be made with a non-metallic screw driver.

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the two plate terminals of the type 19 output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

DUMMY ANTENNAS

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-79 Output I.F. Transformer
Part No. 108-78 Interstage I.F. Transformer
Part No. 108-77 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 34 tube, and adjust the output I.F. transformer (No. 108-79) to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 34 to grid cap to 1A4 and adjust interstage I.F. transformer (No. 108-78) to resonance.
   (c) Move oscillator to grid cap of 1A6 and adjust input I.F. transformer (No. 108-77).

BROADCAST BAND ALIGNMENT:

535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to antenna and ground posts, make following adjustments:
   (a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment number 1; see bottom view of coil assembly, Fig. 3)
   (b) Re-set external oscillator to 1550 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (adjustment number 4) to resonance; also adjust preselector trimmer which is mounted on the top of the rear section of the three gang variable tuning condenser to resonance. (See top view of chassis, Fig. 1, for location of this adjustment).
   (c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3).
   (d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.
   (e) Check for tracking and sensitivity at 1000 kilocycles. Under no circumstances bend plates of variable condenser sections to correct tracking.

SHORT WAVE BAND ALIGNMENT:

5.2 to 18.3 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the antenna and ground posts, make the following adjustments:
   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator (adjustment number 3) and short wave antenna (adjustment number 6) to resonance.
   (b) Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check sensitivity.
   (c) Re-set external oscillator and check set at 18.1 megacycles and 5.3 megacycles for band coverage.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental on the receiver dial. As an example of this a fundamental 18.3 megacycle signal can be tuned in not only at 18.3 on the dial but also at approximately 17.4 megacycles.

MIDDLE WAVE BAND ALIGNMENT:

1695 to 5500 Kilocycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5000 kilocycles and connected in series with "Dummy 3" to the antenna and ground posts make the following adjustments:
   (a) Move dial pointer to 5000 kilocycles and adjust middle wave oscillator (adjustment number 2) and middle wave antenna (adjustment number 5) to resonance.
   (b) Re-set external oscillator to 1800 kilocycles and pick up signal by rotating variable condenser and check sensitivity.
   (c) Re-set external oscillator and check set at 5400 kilocycles and 1700 kilocycles for band coverage.

MODEL 62-276

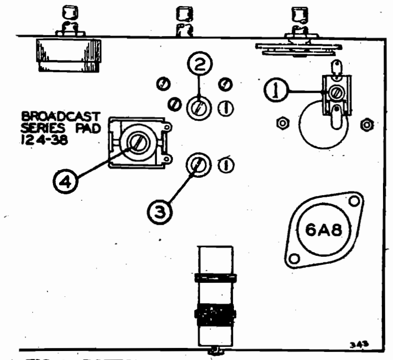

FIG. 3.—BOTTOM VIEW SHOWING TRIMMERS

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer or by means of an adapter between the plate and screen terminals of the type 6K6G output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-106B Output I.F. Transformer

Part No. 108-105B Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1 With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser in its minimum capacity position, plates entirely out of mesh, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6K7G tube, and adjust the output I.F. transformer (No. 108-106B) to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7G to grid cap of 6A8G and adjust input I.F. transformer (No. 108-105B) to resonance.

SHORT WAVE BAND ALIGNMENT:

5.5 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the antenna and ground leads, make the following adjustments:
   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator trimmer to resonance.

   This adjustment is the trimmer mounted on the top of rear section of the variable gang condenser (see Fig. 1, top view).

   (b) Adjust short wave antenna trimmer (Adjustment Number 1), to resonance (see Fig. 3, bottom view).

BROADCAST BAND ALIGNMENT:

535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to antenna and ground leads make following adjustments:
   (a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment number 3, see bottom view of chassis, Fig. 3).
   (b) Re-set external oscillator to 1400 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (adjustment number 2), to resonance.
   (c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (adjustment number 4), to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3).
   (d) Repeat adjustments "a" and "b" until sensitivity is at its maximum
   (e) Check for tracking and sensitivity at 1400, 1000, and 600 kilocycles. Under no circumstances bend plates of variable condenser sections to correct tracking.

MODEL 62-297 62-357 ALIGNMENT PROCEDURE 62-367 62-467 62-457 62-497

Volume Control—Maximum All Adjustments.
Selectivity Control—Sharp Position All Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator With a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antennas — .1 mf., 200 mmf., and 400 ohms.

STEP (Follow Order as Given)	BAND SWITCH SETTING	DUMMY ANTENNA	SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	TRIMMERS ADJUSTED See Illustration	PROCEDURE INITIAL STEPS	PROCEDURE ADJUSTMENT
I.F.							
2nd I.F.	Range B	.1 mf.	456 KC	Grid of I.F. Tube	2nd I.F. (C25) & (C26)	Turn Rotor to Full Open	Adjust to Maximum Output
1st I.F.	Range B	.1 mf.	456 KC	Grid of 1st Det.	1st I.F. (C19) & (C20)	Turn Rotor to Full Open	Adjust to Maximum Output
Range B							
1830 KC	Range B	200 mmf.	1830 KC	Antenna Lead	Oscillator Range B (C12)	Turn Rotor to Full Open	Adjust to Maximum Output
1500 KC	Range B	200 mmf.	1500 KC	Antenna Lead	1st Ant. Range B (C2) 2nd Ant. Range B (C4)	Turn Rotor to Max. Output Set Indicator to 1500 KC— See Note A	Adjust to Maximum Output
600 KC	Range B	200 mmf.	600 KC	Antenna Lead	600 KC (C9)	Turn Rotor to Max. Output	Adjust to Maximum Output Rock Rotor—See Note B
Range D							
19800 KC	Range D	400 ohm	19800 KC	Antenna Lead	Oscillator Range D (C11)	Turn Rotor to Full Open	Adjust to Maximum Output
16000 KC	Range D	400 ohm	16000 KC	Antenna Lead	Ant. Range D (C3)	Turn Rotor to Max. Output	Adjust to Maximum Output Rock Rotor—See Note B
6000 KC	Range D	400 ohm	6000 KC	Antenna Lead	6000 KC (C8)	Turn Rotor to Max. Output	Adjust to Maximum Output Rock Rotor—See Note B

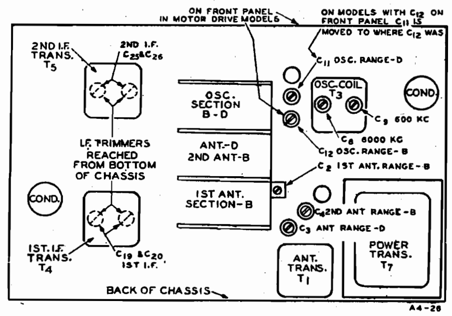
Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

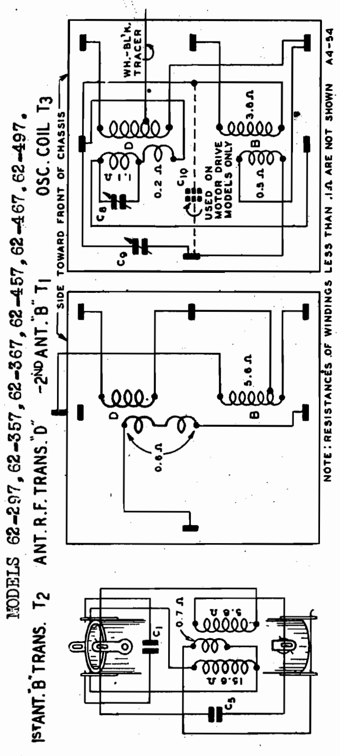
NOTE A—In sets using the finger tip tuning dial, remove the retaining ring which holds the dial scale in position. Readjust rotor to maximum output. Hold the station selector ring and turn the dial scale until the pointer is at the 1500 KC mark. Replace the retaining ring.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

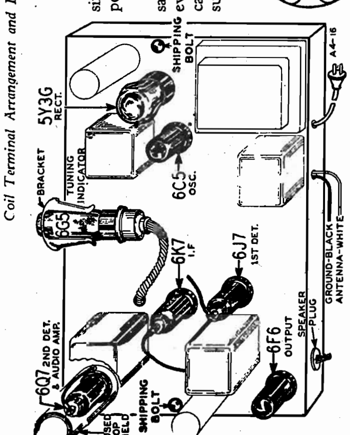
CAUTION—When aligning the short wave band be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.



-Location of Trimmers



Coil Terminal Arrangement and D.C. Resistance of Windings

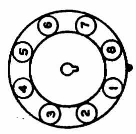


Location of Tubes

Twenty-Five Cycle Models

The twenty-five cycle receiver differs from the sixty cycle receiver only in the fact that a different power transformer is used.

The twenty-five cycle receiver can be operated satisfactorily from a sixty cycle power supply. However, the reverse is not true, the sixty cycle receiver cannot be operated from a twenty-five cycle power supply.



-Octal Tube Terminal Numbering (bottom of socket).

Installation of Model 62-298

MONTGOMERY-WARD & CO.

MODEL 62-298
Remote Control Unit
Description

MODEL 62-298

FOR USE WITH AIRLINE RADIO

MODELS—62-370	62-403	62-700
62-390	62-470	62-900
62-401	62-490	62-1100

DESCRIPTION

The control consists of three main units, namely, the Remote Push-Button Assembly, the Magnet Assembly and the Relay Assembly.

Fig. 1 shows the three units with their proper names indicated. Also, attention is directed to various parts of each unit to which names have been assigned for the purpose of making reference in the installation procedure which is given step by step for each radio model on the following pages.

To attach the units to any of the radio models listed above, procede in accordance with the instructions given for each model. Read over very carefully the procedure and study the illustrations to become familiar with the few important items of installation, such as the armature arms, plungers, latch bar, locating pins and locating holes.

Any stations which have been set up on the automatic tuning buttons at the radio may be selected at the remote position. Station call letters are supplied for the Remote Push-Button Assembly. Punch out from the sheets of station call letter tabs the call letters of the stations which have been set up for the automatic push-buttons on the front of the radio.

Pressing the button on the Remote Push-Button Assembly nearest the end from which the connector cable comes out will select the extreme right hand automatic push-button on the front of the radio cabinet. The second button from the cable end of the Remote Push-Button Assembly will select the second automatic push-button from the right hand side of the radio and so on.

Moisten the back of the station call letter tabs and paste them into the rectangular openings in the Remote Push-Button Assembly alongside their respective buttons.

LOCATION

The location of each unit is plainly shown in the illustrations of the radio models on the following pages of this instruction booklet.

In general, the Magnet Assembly is mounted on the top of the radio chassis over a rectangular hole which is covered with a removable cover plate. The purpose of this unit is to electrically operate the automatic push-buttons on the front of the radio, from a remote location. The Relay Assembly is mounted by means of two wood screws to the underside of the chassis cabinet shelf, (on mantle models mount the relay beside the radio chassis). The purpose of this unit is to control the Magnet Assembly.

CAUTION

Withdraw the A. C. line cord plug for the radio from the house lighting current and **do not re-insert** it or the A. C. line cord plug for the Remote Control Assembly until all of the steps incidental to the actual installation of the Remote Control units to the radio have been completed.

INSTALLATION AND OPERATING SUGGESTIONS

In the Installation Procedure, you will note certain tubes have been removed. This was done to render the top of the chassis more accessible for the actual installation of the Magnet Assembly. NOTE: If difficulty is encountered installing the Magnet Assembly on the top of the chassis while mounted in the cabinet, remove the radio chassis from the cabinet. Be sure to replace the tubes in their proper sockets and connect the grid cap wire to the cap of any tubes of this type which were removed.

After the Remote Control units are completely installed and the radio placed in operation, stations can be selected automatically by pressing any one of the buttons of the Remote Control Assembly. The stations, of course, must first be set up by adjusting the setting screws on the front of the radio. For specific information, see the instructions on this procedure in the Operating Instruction book supplied with the radio.

To select a station from the Remote Control Push-Button Assembly, press down on the button. DO NOT HOLD THE BUTTON DOWN. Press only one push-button at a time. Continual abuse of pushing down more than one button at a time or holding down buttons for a longer period than 30 seconds may result in the tube in the Relay Assembly burning out or damage to the coils in the Magnet Assembly.

INSTALLATION PROCEDURE

MODELS 62-370, 62-470, and 62-700—7 TUBE MANTLE and CONSOLE

1. Disconnect the power supply cord for the radio from the house lighting current and **do not re-insert** the plug until the following procedure for installing the remote control units has been fully completed:
2. Remove the push button escutcheon plate on the front of the radio cabinet and unscrew all six station setting screws all the way out (counter-clockwise).
3. Referring to Fig. 2, note that the following four tubes have been removed:
   6K6G Output Tube
   6Q7G 2nd Detector Tube
   6U7G I. F. Tube
   6A8G 1st Detector Tube
4. Remove the cover plate on the top of the chassis by taking out four screws. Fig. 3 is a view of the chassis showing the cover plate removed.
5. Pick up the Magnet Assembly (see Fig. 1)—note that there are six armature arms, each of which is slotted.
6. Before placing the Magnet Assembly in position, put the four screws which were used to hold the cover plate to the chassis into the mounting holes of the frame of the Magnet Assembly. Four very thin fibre washers are supplied which are used to hold the mounting screws in the mounting holes until the Magnet Assembly is lowered into position. For details on how to use these fibre washers to the best advantage, see drawing Fig. D, Page 8.
7. Referring to Fig. 3, place the Magnet Assembly in position as shown so that the slots in the armatures are directly over the plungers. Now, carefully lower the Magnet Assembly so that the plungers enter the slots in the armatures A screwdriver will be helpful in lining up any armature which may not be directly over the plungers.
8. The armatures must slip over the plunger between the latch bar and the shoulder of the plunger (see Fig. 3); also, refer to drawing (Fig. A, Page 8) which illustrates this point more clearly.
9. Rest the Magnet Assembly on the chassis base and move it slightly toward the back of the radio until the locating pins (see Fig. 1) on each side of the Magnet Assembly frame slip into the locating holes at both sides of the opening in the chassis base (see Fig. 3).

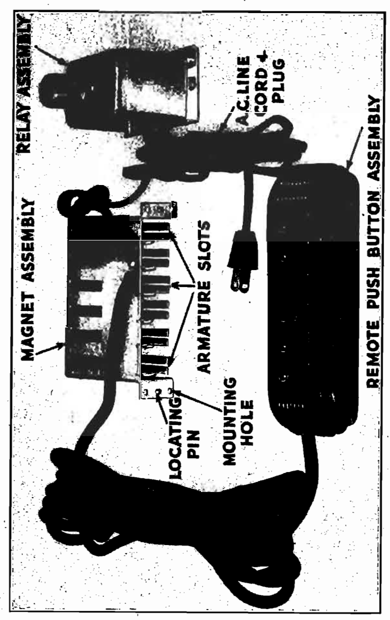

FIG. 1 GENERAL VIEW

10. Hold the Magnet Assembly in place and fasten it securely to the chassis base by means of the four screws.
11. Referring to Fig. 4, mount the relay to the underside of the chassis shelf, using the two wood screws and two spacer washers supplied. On mantle models mount the relay beside the radio chassis. Place the spacer washers between the base of the Relay Assembly and the cabinet shelf, passing the wood screws through the holes in the spacer washers. Arrange the wire connector cables to the Magnet Assembly and Relay Assembly beside the tube socket base as shown in Fig. 4 and put the four tubes which were removed back into their respective sockets. CAUTION—be sure to put the tubes back into the proper sockets.
12. Reset stations for the automatic push-buttons, by means of the station setting screws on the front of the radio. For the complete procedure on this subject, consult the instruction book supplied with the radio.

INSTALLATION PROCEDURE

1. Disconnect the power supply cord for the radio from the house lighting current and **do not re-insert** the plug until the following procedure for installing the remote control units has been fully completed:
2. Referring to Fig. 5, note that the following two tubes have been removed:
   5Y3G Rectifier Tube
   6J5G Second Detector Tube
3. Remove the cover plate on the top of the chassis by taking out four screws. Fig. 5 is a view of the chassis showing the cover plate removed.
4. Before placing the Magnet Assembly in position, put the four screws which were used to hold the cover plate to the chassis into the mounting holes of the frame of the Magnet Assembly. Four very thin fibre washers are supplied which are used to hold the mounting screws in the mounting holes until the Magnet Assembly is lowered into position. For details on how to use these fibre washers to the best advantage, see drawing Fig. D, Page 8.
5. Pick up the Magnet Assembly (see Fig. 1)—note that there are six armature arms, each of which is slotted.
6. Referring to Fig. 5, place the Magnet Assembly in position as shown, so that the slots in the armatures are directly over the plungers. Now, carefully lower the Magnet Assembly so that the plungers enter the slots in the armatures. A screwdriver will be helpful in lining up any armature which may not be directly over the plungers.
7. The armatures must slip over the plunger in front of the shoulder of the plunger (see Fig. 5); also, refer to drawing (Fig. C, Page 8) which illustrates this point more clearly.
8. Reset the Magnet Assembly on the chassis base and move it slightly toward the back of the radio until the locating pins (see Fig. 1) on each side of the Magnet Assembly frame slip into the locating holes at both sides of the opening in the chassis base (see Fig. 5).
9. Hold the Magnet Assembly in place and fasten it securely to the chassis base by means of the four screws.
10. Referring to Fig. 6, mount the relay to the underside of the chassis shelf, using the two wood screws and two spacer washers supplied. On mantle radios, mount the relay beside the radio chassis. Place the spacer washers between the base of the Relay Assembly and the cabinet shelf, passing the wood screws through the holes in the spacer washers.
11. Arrange the wire connector cables to the Magnet Assembly and Relay Assembly as shown in Fig. 6 and put the two tubes which were removed back into their respective sockets.

INSTALLATION PROCEDURE

MODELS 62-401 and 62-1100—11 TUBE CONSOLE

1. Disconnect the power supply cord for the radio from the house lighting current and **do not re-insert** the plug until the following procedure for installing the remote control units has been completed:
2. Referring to Fig. 7 note that the 6U7G I.F. tube has been removed.
3. Remove the cover plate on the top of the chassis by taking out four screws. Fig. 7 shows the cover plate removed and the Magnet Assembly in position to be lowered into place.
4. Pick up the Magnet Assembly (see Fig. 1)—note that there are six armature arms, each of which is slotted.
5. Before placing the Magnet Assembly in position, put the four screws which were used to hold the cover plate to the chassis into the mounting holes of the frame of the Magnet Assembly. Four very thin fibre washers are supplied which are used to hold the mounting screws in the mounting holes until the Magnet Assembly is lowered into position. For details on how to use these fibre washers to the best advantage see drawing Fig. D, Page 8.
6. Referring to Fig. 7, place the Magnet Assembly in position as shown so that the slots in the armature arms are directly over the plungers. Now, carefully lower the Magnet Assembly so that the plungers enter the slots in the armatures. A screwdriver will be helpful in lining up any armature which may not be directly over the plungers.

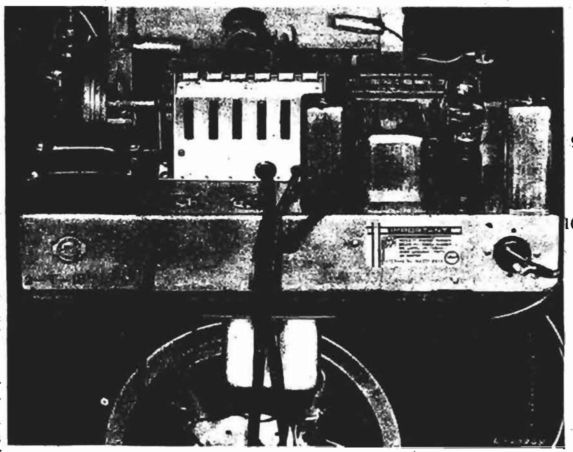

FIG. 6

7. The armatures must slip over the plungers between the latch bar and the shoulder of the plunger (see Fig. 7); also, refer to drawing (Fig. B, Page 8) which illustrates this point more clearly.
8. Rest the Magnet Assembly on the chassis base and move it slightly toward the back of the radio until the locating pins (see Fig. 1) on each side of the Magnet Assembly frame slip into the locating holes at both sides of the opening in the chassis base (see Fig. 7).
9. Hold the Magnet Assembly in place and fasten it securely to the chassis base by means of the four screws.
10. Referring to Fig. 8, mount the Relay Assembly to the underside of the chassis shelf, using the two wood screws and two spacer washers supplied. Place the spacer washers between the base of the Relay Assembly and the cabinet shelf, passing the screws through the holes in the spacer washers. Arrange the wire connector cables to the Magnet Assembly and Relay Assembly as shown in Fig. 8 and put the 6U7G tube back in the socket.

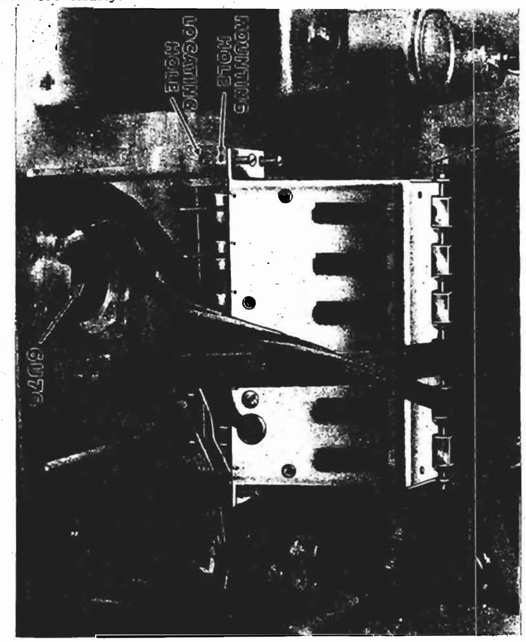

FIG. 7

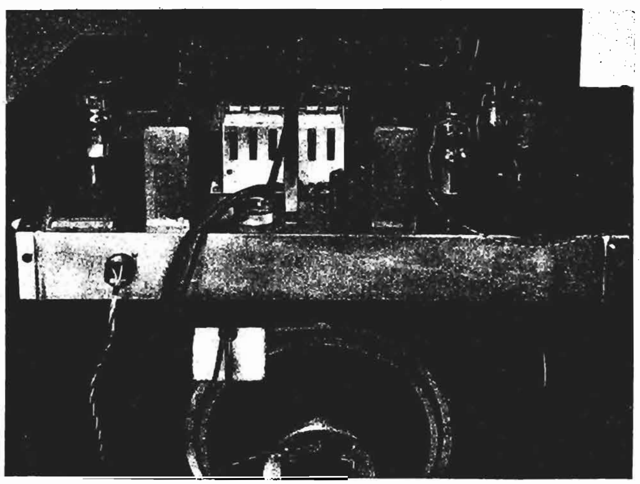

FIG. 8

INSTALLATION PROCEDURE

MODEL 62-403—13 TUBE CONSOLE

1. Disconnect the power supply cord for the radio from the house lighting current and **do not re-insert** the plug until the following procedure for installing the remote control units has been completed:
2. Referring to Fig. 9, note that the following two tubes have been removed:

   6U7G 1st I.F. Tube
   6U7G 2nd I. F. Tube
3. Remove the cover plate on the top of the chassis by taking out four screws. Before placing the Magnet Assembly in position, put the four screws which were used to hold the cover plate to the chassis into the mounting holes of the frame of the Magnet Assembly. Four very thin fibre washers are supplied which are used to hold the mounting screws in the mounting holes until the Magnet Assembly is lowered into position. For details on how to use these fibre washers to the best advantage, see drawing Fig. D, Page 8.
   Fig. 9 shows the cover plate removed and the Magnet Assembly placed to the left of the opening in the chassis tipped slightly forward to illustrate the method of getting it into proper position under the bracket which supports the movie dial lamp assembly. **Precaution should be taken when placing the Magnet Assembly** in place—not to scratch the dial film of the movie dial.
4. Pick up the Magnet Assembly and move it to the right so that it is directly over the opening in the chassis. Fig. 10 shows the Magnet Assembly in proper position for lowering. Note that there are six armature arms, each of which is slotted.
5. Hold the Magnet Assembly so that the slots in the armatures are directly over the plungers. Now, carefully lower the Magnet Assembly so that the plungers enter the slots in the armatures. A screwdriver will be helpful in lining up any armature which may not be directly over the plungers.
6. The armatures must slip over the plunger between the latch bar and the shoulder of the plunger (see Fig. 10); also, refer to drawing (Fig. B, Page 8) which illustrates this point more clearly.
7. Rest the Magnet Assembly on the chassis base and move it slightly toward the back of the radio until the locating pins (see Fig. 1) on each side of the Magnet Assembly frame slip into the locating holes at both sides of the opening in the chassis base (see Fig. 10).
8. Hold the Magnet Assembly in place and fasten it securely to the chassis base by means of the four screws.
9. Referring to Fig. 11, mount the relay to the underside of the chassis shelf, using the two wood screws and two spacer washers supplied. Place the spacer washers between the base of the Relay Assembly and the cabinet shelf, passing the screws through the holes in the spacer washers. Arrange the wire connector cables to the Magnet Assembly and Relay Assembly as shown in Fig. 11 and put the two tubes which were removed back **into** their respective sockets.

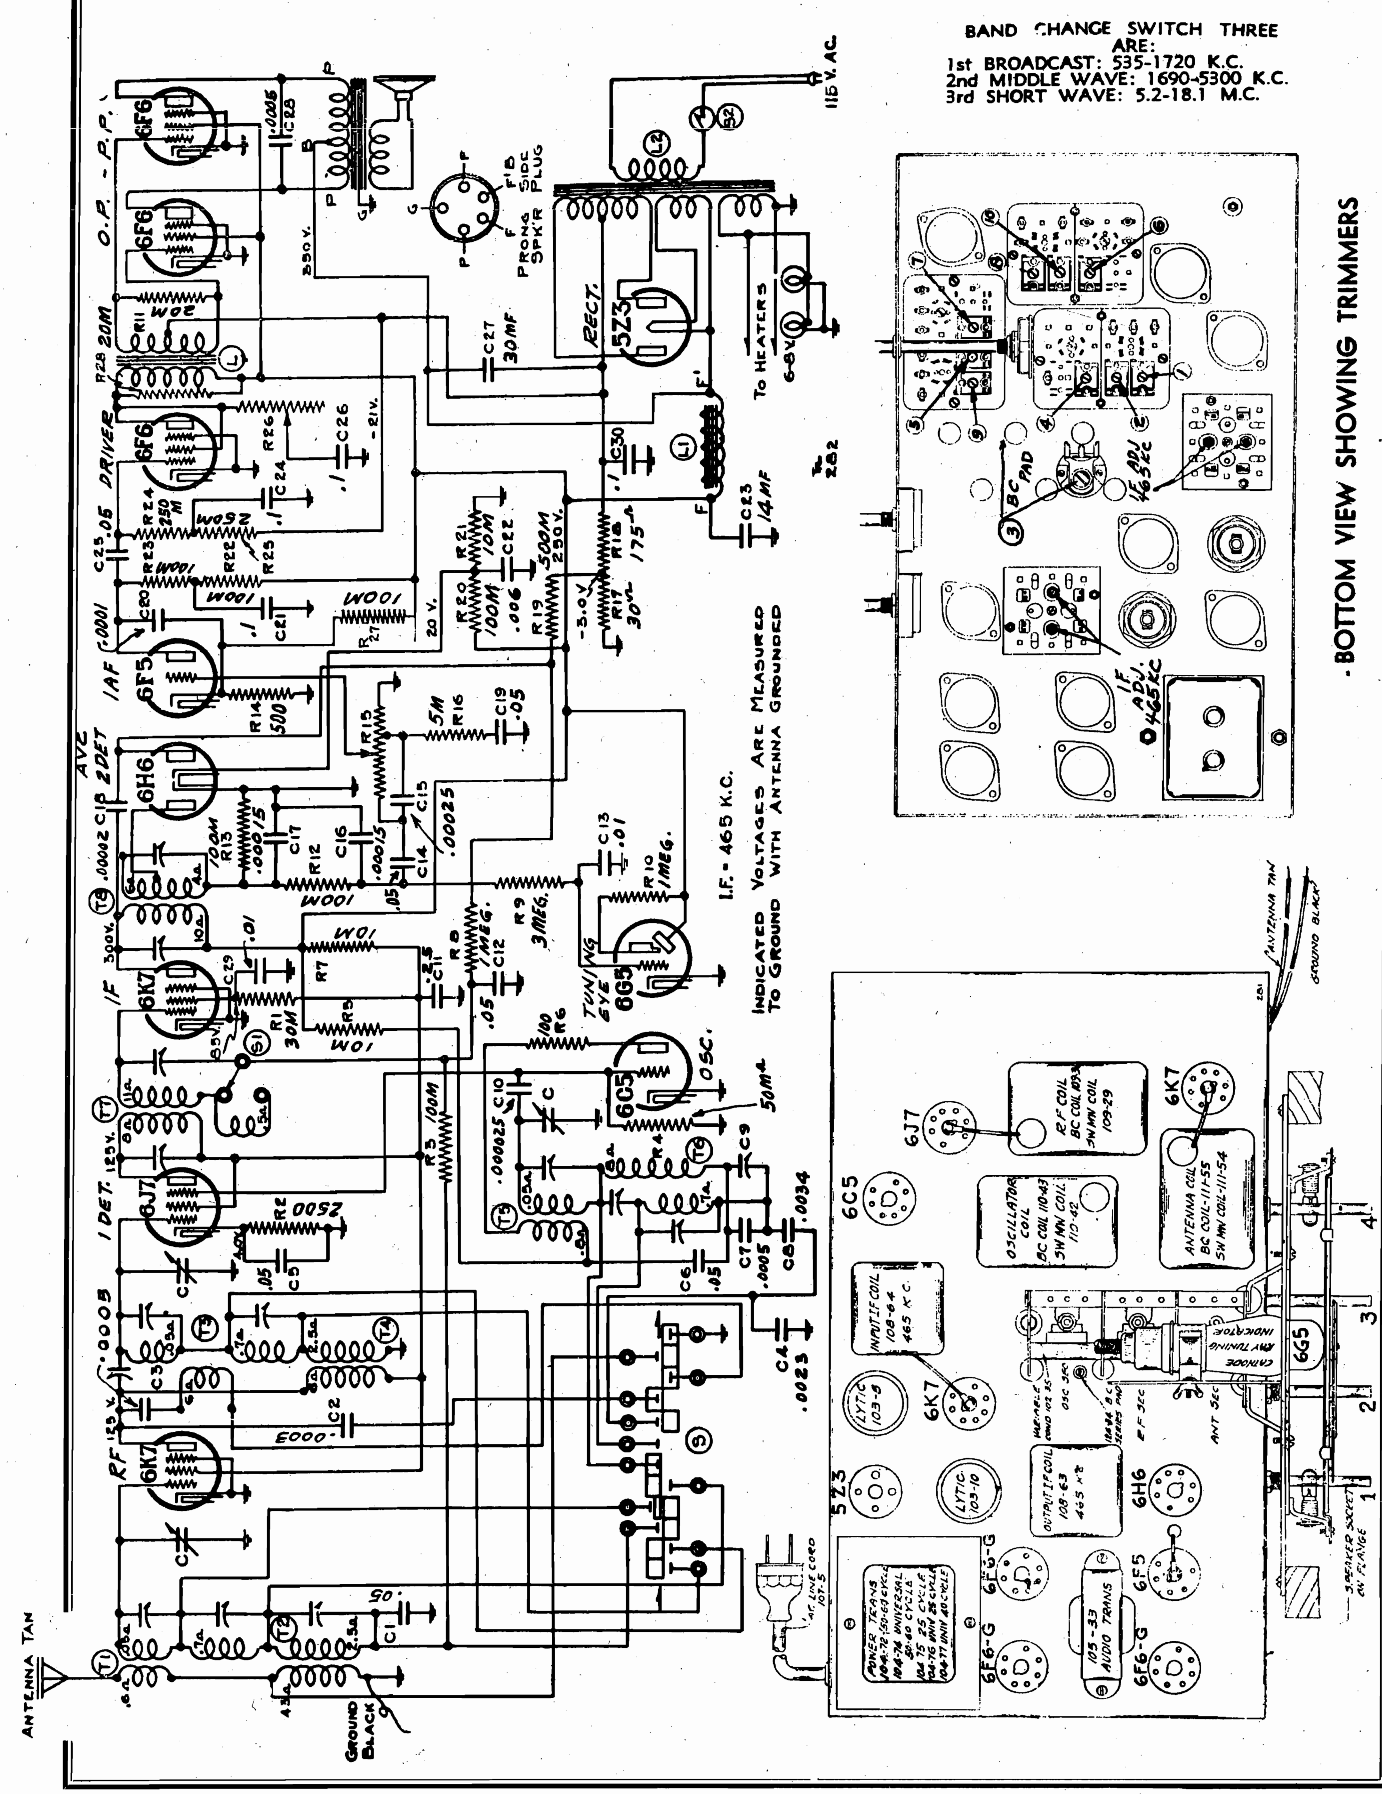
Schematic, Socket, Trimmers



MONTGOMERY-WARD & CO.

MODELS 62-301 and 62-301X

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-63 Output I.F. Transformer
Part No. 108-64 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the underside of chassis (see bottom view, Fig. 3).

1. With volume control full on, (the extreme right of its rotation), the wave changing switch in the broadcast position, (extreme left of its rotation), the tone control on "Hi" part of the sharp position (as much right rotation as possible without operating the Hi Fidelity switch), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:

(a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 6K7 tube, located between the two I.F. transformers, and adjust the output I.F. transformer 108-63 to resonance.

(b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap to 6J7 and adjust input I.F. transformer (108-64) to resonance.

(c) With oscillator still connected to 6J7, re-adjust output I.F. transformer if necessary.

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1," "Dummy 2," and "Dummy 3."

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast—Consists of a 200 mmfd. condenser and a 20 ohm. resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

BROADCAST BAND ALIGNMENT:

535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with external oscillator set at 600 kilocycles and connected in series with "Dummy 2" to the tan antenna and black ground lead, make the following adjustments:

(a) Adjust broadcast series pad (adjustment number 3) to resonance with oscillator. Keep set in tune with oscillator by slowly rocking to and fro the variable condenser until maximum output is obtained. Note: This adjustment is accessible from the top of the chassis and is located between the variable condenser and the 108-63 output I.F. transformer. See top view, Fig. 1.

(b) Re-set external oscillator to 1400 K.C., move dial pointer to 1400 K.C. and adjust oscillator (adjustment number 4), R.F. (adjustment number 6) and antenna (adjustment number 7) to resonance. See bottom view for location of these adjustments, Fig. 3.

(c) Repeat adjustments "a" and "b" until sensitivity is at its maximum.

(d) Check for tracking and sensitivity at 1000 kilocycles. Under no circumstances bend plates of variable condenser sections to correct tracking.

SHORT WAVE BAND ALIGNMENT:

5.2 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:

(a) Move dial pointer to 17 megacycles and adjust short wave oscillator (adjustment number 1), short wave R.F. (adjustment number 8) and short wave antenna (adjustment number 9) to resonance.

(b) Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check for sensitivity.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental on the receiver dial. As an example of this a fundamental 18.3 megacycle can be tuned in not only at 18.3 on the dial, but also at approximately 17.4 megacycles.

MIDDLE WAVE BAND ALIGNMENT:

1690 to 5300 Kilocycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5 M.C. and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:

(a) Rotate condenser, pick up signal and adjust middle wave R.F. (adjustment number 10), middle wave antenna (adjustment number 5) and middle wave oscillator (adjustment number 2) to resonance.

(b) Re-check broadcast alignment and if it is found necessary to re-adjust either R.F. or antenna trimmers, repeat the 17 M.C. short wave and 5 M.C. middle wave adjustments.

MODELS 62-305, 62-385, 62-405, 62-414 AND 62-495

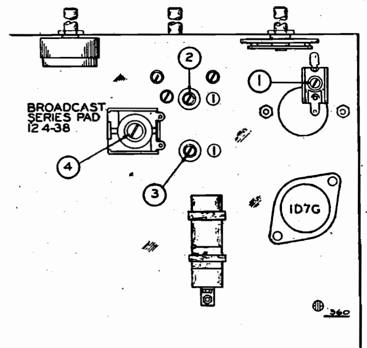


FIG. 3.—BOTTOM VIEW SHOWING TRIMMERS

RESONANCE INDICATOR.

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 1G5G output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-77B Input I. F. Transformer
Part No. 108-78B Interstage I. F. Transformer
Part No. 108-79B Output I. F. Transformer

These I. F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1, top view).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:

(a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 1D5G Interstage I. F. tube, and adjust the output I.F. transformer (No. 108-79B) to resonance.

(b) With "Dummy 1" still connected, move oscillator output clip from grid of 1D5G to grid cap to 1D5G Input I.F. Tube and adjust interstage I.F. transformer (No. 108-78B) to resonance.

(c) Move oscillator to grid cap of 1D7G oscillator, first detector tube and adjust input I.F. transformer (No. 108-77B) to resonance.

SHORT WAVE BAND ALIGNMENT:

2000 to 7000 Kilocycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 6 megacycles and connected in series with "Dummy 3" to the antenna and ground leads, make the following adjustments:

(a) Move dial pointer to 6 megacycles and adjust short wave oscillator trimmer to resonance.

This adjustment is the trimmer mounted on the top of rear section of the variable gang condenser (see Fig. 1, top view).

(b) Adjust short wave antenna trimmer (Adjustment Number 1), to resonance (see Fig. 3, bottom view).

BROADCAST BAND ALIGNMENT:

535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to antenna and ground leads make following adjustments:

(a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment number 3), (see bottom view of Chassis, Fig. 3).

(b) Re-set external oscillator to 1400 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (adjustment number 2), to resonance.

(c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (adjustment number 4), to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3.)

(d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.

(e) Check for tracking and sensitivity at 1400, 1000, and 600 kilocycles. Under no circumstances bend plates of variable condenser sections to correct tracking.

Alignment

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator With a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 200 mmf., and 400 ohms.

STEP (Follow Order as Given)	BAND SWITCH SETTING	DUMMY ANTENNA	SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	TRIMMERS ADJUSTED See Illustration	PROCEDURE INITIAL STEPS	PROCEDURE ADJUSTMENT
I.F.	Range B	.1 mf.	456 KC	Grid of 1st Det.	1st I.F. (C14) & (C15) 2nd I.F. (C18) & (C19) 3rd I.F. (C23)	Turn Rotor to Full Open	Adjust to Maximum Output
RANGE B

MODEL 62-302 62-442
" 62-312 62-452

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

After alignment of Range D has been completed, do not make any adjustments of the Range B trimmers. If this is done, it will be necessary to realign Range D.

NOTE A—In sets using the finger tip tuning dial, remove the retaining ring which holds the dial scale in position. Readjust rotor to maximum output. Hold the station selector ring and turn the dial scale until the pointer is at the 1500 KC mark. Replace the retaining ring.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

CAUTION—When aligning the short wave band be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following equipment is required for aligning:
Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antennas — .1 mf. and 200 mmf.

STEP (Follow Order as Given)	DUMMY ANTENNA	SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	TRIMMERS ADJUSTED See Illustration	PROCEDURE INITIAL STEPS	PROCEDURE ADJUSTMENT
I.F.	.1 mf.	456 KC	Grid of 1st Det.	2nd I. F. (C9) & (C10) 1st I. F. (C6) & (C 7)	Turn rotor to full open	Adjust to Maximum Output
1730 KC Adj.	200 mmf.	1730 KC	Antenna Lead.	Osc. (C4)	Turn rotor to full open	Adjust to Maximum Output
1500 KC Adj.	200 mmf.	1500 KC	Antenna Lead	Ant. (C3)	Turn Rotor to Max. Output	Adjust to Maximum Output

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

NOTE—To obtain dial scale calibration, tune in an 800 KC signal. The pointer should be at the 800 KC mark on the dial. If it is not, note the position of the pointer and remove the chassis from the cabinet. Loosen the pointer screw and set the pointer so that it will be at the 800 KC mark. Tighten the pointer screw and replace the chassis in the cabinet. If the pointer is not at the 800 KC mark another adjustment will be necessary.

BE 134-40	Rubber Grommet	2	.02

Note: Speakers cannot be ordered, defective speakers must be repaired.
All resistors and mica condensers are RMA color coded — specify value and/or resistor or condenser (per schematic diagram) and model number.
Mica condensers are coded with an additional dot indicating tolerance:

Tolerance Percent	Color of Dot
2½%	White
5%	Green
10%	Blue
15%	Yellow
20%	Red
More than—20%	None

When ordering parts, always specify part and model number as well as serial number of chassis.
When ordering condensers, specify part number, tolerance and/or schematic reference number.

Alignment

MONTGOMERY-WARD & CO.

TUBES:

The tube complement of this chassis consists of the latest metal type tubes.

The type and function of each tube is as follows:
1—Type 6L7 Pentagrid Mixer, First Detector.
1—Type 6C5 Oscillator.
1—Type 6K7 Remote Cut-Off Pentode, I. F. Amplifier (465 K.C.)
1—Type 6Q7 Duplex Diode Triode Second Detector, A.V.C. and First Audio.
1—Type 6F6 Pentode Output Amplifier.
1—Type 5W4 High Vacuum Rectifier.
1—Type 6G5 Cathode-Ray Tuning Eye.
(Note:—6G5 available in all glass only.)

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 40 and 60 cycles and with primary taps for 108, 125, 150, 220 and 250 volts (see parts list) and also sometimes equipped with 25 cycle transformers with 105-115 volt or 220 volt primaries, not universals.

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with 119 volts on the primary of the power transformer.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D.C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

ALIGNING INSTRUCTIONS:

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary.

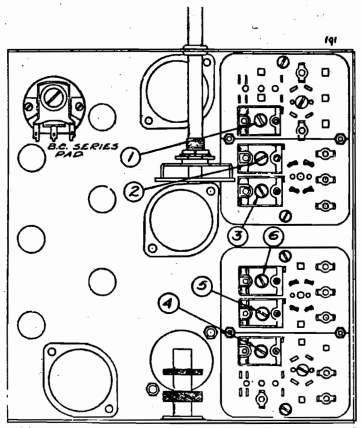

FIG. 3—BOTTOM VIEW SHOWING TRIMMERS

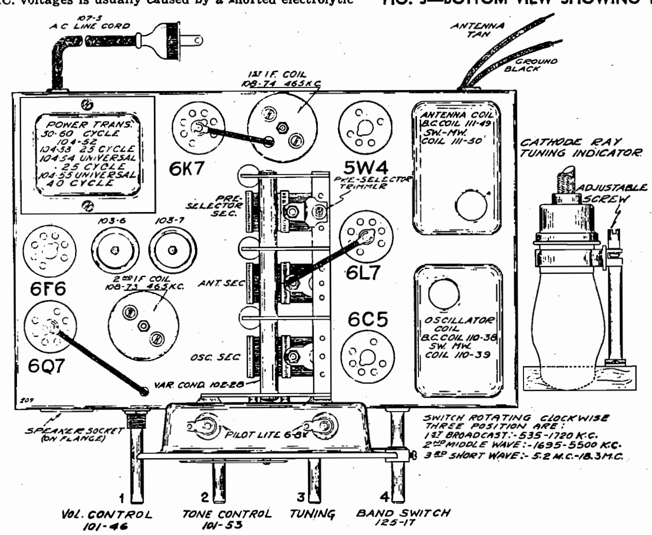

-TOP VIEW

No aligning adjustments should be attempted with the chassis in the cabinet. Remove the knobs and the four bolts which are used to fasten the chassis.

All adjustments should be made with a non-metallic screw driver.

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 6F6 output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1," "Dummy 2," and "Dummy 3."

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-73 Output I.F. Transformer
Part No. 108-74 Input I.F. Transformer
These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1," to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-73) to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap to 6L7 and adjust input I.F. transformer (No. 108-74) to resonance.
   (c) With oscillator still connected to 6L7, readjust output I.F. transformer (108-73) if necessary.

BROADCAST BAND ALIGNMENT:

535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to tan antenna lead and black ground lead, make following adjustments:
   (a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance (Adjustment number 1; see bottom view of coil assembly, Fig. 3).
   (b) Re-set external oscillator to 1550 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (Adjustment number 4) to resonance; also adjust preselector trimmer which is mounted on the top of the rear section of the three gang variable tuning condenser to resonance. (See top view of chassis; Fig. 1, for location of this adjustment).
   (c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3).
   (d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.
   (e) Check for tracking and sensitivity at 1000 kilocycles. Under no circumstances bend plates of variable condenser sections to correct tracking.

SHORT WAVE BAND ALIGNMENT:

5.2 to 18.3 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator (Adjustment number 3) and short wave antenna (Adjustment number 6) to resonance.
   (b) Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check sensitivity.
   (c) Re-set external oscillator and check set at 18.1 megacycles and 5.3 megacycles for band coverage.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental on the receiver dial. As an example of this a fundamental 18.3 megacycle can be tuned in not only at 18.3 on the dial, but also at approximately 17.4 megacycles.

MIDDLE WAVE BAND ALIGNMENT:

1695 to 5500 Kilocycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5000 kilocycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Move dial pointer to 5000 kilocycles and adjust middle wave oscillator (adjustment number 2) and middle wave antenna (adjustment number 5) to resonance.
   (b) Re-set external oscillator to 1800 kilocycles and pick up signal by rotating variable condenser and check sensitivity.
   (c) Re-set external oscillator and check set at 5400 kilocycles and 1700 kilocycles for band coverage.

TUBES:

The tube complement of this chassis consists of the following tubes.

The type and function of each tube is as follows:

1—Type 6A7 Pentagrid Mixer, First Detector-oscillator
1—Type 78 Remote Cut-Off Pentode, I. F. Amplifier (465 K.C.)
1—Type 75 Duplex Diode Triode Second Detector, A.V.C. and First Audio.
1—Type 41 Pentode Output Amplifier.
1—Type 80 High Vacuum Rectifier.

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 40 and 60 cycles and with primary taps for 108, 125, 150, 220 and 250 volts (see parts list) and also sometimes equipped with 25 cycle transformers with 105-115 volt or 220 volt primaries, not universals.

Note: Speakers cannot be ordered, defective speakers must be repaired.
All resistors and mica condensers are RMA color coded — specify value and/or resistor or condenser (per schematic diagram) and model number.
Mica condensers are coded with an additional dot indicating tolerance:

Tolerance Percent	Color of Dot
2½%	White
5%	Green
10%	Blue
15%	Yellow
20%	Red
More than—20%	None

When ordering condensers, specify part number, tolerance and/or schematic reference number.
When ordering parts, always specify part and model number as well as serial number of chassis.

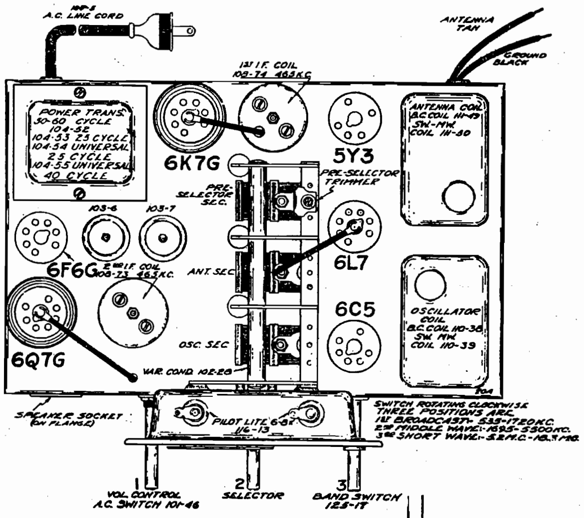
MONTGOMERY WARD & CO.

MODELS 62-316 and 62-416

POWER SUPPLY:

Caution:—This radio, unless otherwise marked, must be operated from 105-115 volts, 60 cycle A.C. supply only. If you are in doubt as to the voltage and frequency rating of the power supply, consult your local power company before inserting plug. Do not insert plug unless all tubes and speaker plug are in their proper sockets.

Receivers of this model which are to be used on voltages or frequencies other than 105-115 volts, 60 cycles are so marked. The power consumption of this receiver is 55 watts.



TUBES:

The tube complement of this chassis consists of two metal type tubes, and four glass type tubes with octal base.

The type and function of each tube is as follows:

1—Type 6L7 Pentagrid Mixer, First Detector.
1—Type 6C5 Oscillator.
1—Type 6K7G Remote Cut-Off Pentode, I. F. Amplifier (465 K.C.)
1—Type 6Q7G Duplex Diode Triode Second Detector, A.V.C. and First Audio
1—Type 6F6G Pentode Output Amplifier.
1—Type 5Y3 High Vacuum Rectifier.

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 40 and 60 cycles and with primary taps for 108, 125, 150, 220 and 250 volts (see parts list) and also sometimes equipped with 25 cycle transformers with 105-115 volt or 220 volt primaries, not universals.

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with 119 volts on the primary of the power transformer.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D.C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

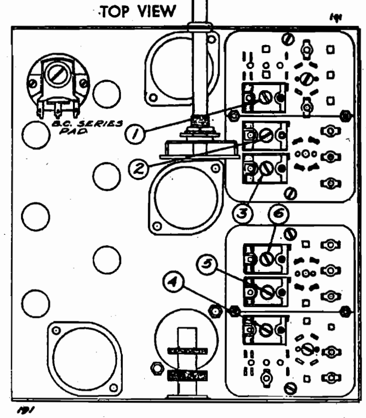


FIG. 3—BOTTOM VIEW SHOWING TRIMMERS

ALIGNING INSTRUCTIONS:

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary.

No aligning adjustments should be attempted with the chassis in the cabinet. Remove the knobs and the four bolts which are used to fasten the chassis.

All adjustments should be made with a non-metallic screw driver.

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 6F6G output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1," "Dummy 2," and "Dummy 3."

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-73 Output I.F. Transformer
Part No. 108-74 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1," to the control grid cap of the type 6K7G tube, and adjust the output I.F. transformer (No. 108-73) to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7G to grid cap to 6L7 and adjust input I.F. transformer (No. 108-75) to resonance.
   (c) With oscillator still connected to 6L7, readjust output I.F. transformer (108-73) if necessary.

BROADCAST BAND ALIGNMENT:

535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to tan antenna lead and black ground lead, make following adjustments:
   (a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance (Adjustment number 1; see bottom view of coil assembly, Fig. 3)
   (b) Re-set external oscillator to 1550 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (Adjustment number 4) to resonance; also adjust preselector trimmer which is mounted on the top of the rear section of the three gang variable tuning condenser to resonance. (See top view of chassis, Fig. 1, for location of this adjustment).
   (c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3).
   (d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.
   (e) Check for tracking and sensitivity at 1000 kilocycles. Under no circumstances bend plates of variable condenser sections to correct tracking.

SHORT WAVE BAND ALIGNMENT:

5.2 to 18.3 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator (Adjustment number 3) and short wave antenna (Adjustment number 6) to resonance.
   (b) Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check sensitivity.
   (c) Re-set external oscillator and check set at 18.1 megacycles and 5.3 megacycles for band coverage.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental on the receiver dial. As an example of this a fundamental 18.3 megacycle signal can be tuned in not only at 18.3 on the dial but also at approximately 17.4 megacycles.

MIDDLE WAVE BAND ALIGNMENT:

1695 to 5500 Kilocycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5000 kilocycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Move dial pointer to 5000 kilocycles and adjust middle wave oscillator (adjustment number 2) and middle wave antenna (adjustment number 5) to resonance.
   (b) Re-set external oscillator to 1800 kilocycles and pick up signal by rotating variable condenser and check sensitivity.
   (c) Re-set external oscillator and check set at 5400 kilocycles and 1700 kilocycles for band coverage.

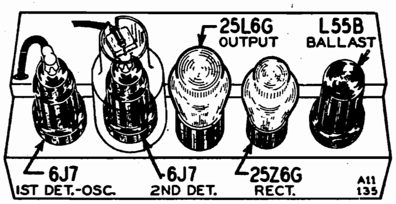
MONTGOMERY WARD & CO.

DC OPERATION—Filament and ballast tube voltages will be the same as AC (for 117 volt line). The plate, screen and bias voltages will be slightly lower than those shown above. When operated on DC, the rectifier tube acts as a low resistance series resistor with a drop of approximately 6 volts between plate and cathode.



VOLTAGES AT SOCKETS FOR 117 VOLT AC LINE

ALIGNMENT PROCEDURE

MODEL 62-402
" 62-1101

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

IMPORTANT—Follow procedure in the order shown.

The following equipment is required for aligning:

An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 200 mmf., and 400 ohms.

SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I. F.					
456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	2nd I.F. (C23) & (C24) 1st I.F. (C20) & (C21)
RANGE D					
18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
15,000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Ant. Range D (C2) Int. Range D (C6) Rock Rotor—See Note A
RANGE C					
5400 KC	Antenna Lead	400 Ohm	C Range	Turn Rotor to Full Open	Oscillator Range C (C11)
5000 KC	Antenna Lead	400 Ohm	C Range	Turn Rotor to Max. Output	Antenna Range C (C3) Int. Range C (C7)
RANGE B					
1600 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C12)
1400 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1400 KC—See Note B	Ant. Range B (C4) Int. Range B (C8)
600 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C13) Rock Rotor—See Note A

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

NOTE B—If the pointer is not at 1400 KC on the dial, loosen the 2 clamps which hold the pointer assembly on the cord, move the pointer to the 1400 KC mark, and tighten the clamps.

CAUTION—When aligning the short wave bands be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 5000 KC. The signal will then be heard at 5000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 5000 less 912 KC, or 4088 KC on the dial. It may be necessary to increase the input signal to hear the image.

Phonograph Connections

Phonograph connections are made as shown in the schematic circuit diagram—Fig. 3. On the top of the chassis base and between two of the 76 tube sockets is a round knockout 1⁹⁄₆₄ inches in diameter. An octal base socket is mounted in this knockout opening and wired as shown in the schematic.

Tone Control

There are 3 wiring lugs on the tone control. One of the end lugs connects to one end of the tone control resistor. The center lug connects to the slider. The other end lug on the tone control is used for external wiring purposes only and is not connected to the tone control resistor in any way. One side of the tone control condenser and a wire from the B+ line are connected at this lug.

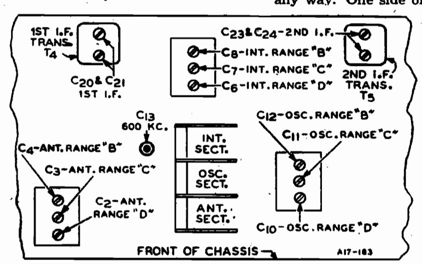
Twenty-Five Cycle Models

The twenty-five cycle receiver differs from the sixty cycle receiver only in the fact that a different power transformer is used.

Voltages at Sockets

The voltages at sockets are shown on the schematic circuit diagram. Unless otherwise specified, the voltage indicated is between the socket terminal and ground.

These voltages are read under the following conditions:
Line Voltage—117.
Volume Control—Maximum.
Antenna Shorted to Ground.
Readings taken with 1000 ohm-per-volt meter.



-Location of Trimmers

1100 KC	Antenna Lead	200 mmf.	No. 1	Setting Screw No. 1	Antenna Coil No. 1
1100 KC	Antenna Lead	200 mmf.	No. 2	Setting Screw No. 2	Antenna Coil No. 2
850 KC	Antenna Lead	200 mmf.	No. 3	Setting Screw No. 3	Antenna Coil No. 3
850 KC	Antenna Lead	200 mmf.	No. 4	Setting Screw No. 4	Antenna Coil No. 4
700 KC	Antenna Lead	200 mmf.	No. 5	Setting Screw No. 5	Antenna Coil No. 5
700 KC	Antenna Lead	200 mmf.	No. 6	Setting Screw No. 6	Antenna Coil No. 6

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1500 KC on the dial, loosen the 2 clamps which hold the pointer assembly on the cord, move the pointer to the 1500 KC mark, and tighten the clamps.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

NOTE C—Leave condenser rotor at the 600 KC setting and adjust the signal generator until maximum output is obtained at or near 456 KC.

NOTE D—At the top of the permeability tuning unit can be seen six "W" openings. Insert the end of a pair of long nose pliers or a screwdriver in the "W" opening of the proper button and adjust the position of the antenna (rear) coil by twisting the pliers or screwdriver until maximum output is obtained.

CAUTION—When aligning the short wave band be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

Alignment and Calibration

I.F. Adjustment

Set the signal generator for a signal of 456 KC.

Connect the output of the signal generator through a .1 mf. condenser to the grid of the 1st detector.

Connect the ground lead of the receiver to the ground post of the signal generator.

Turn the band switch to the Range B position (standard wave band).

Turn the selectivity control to the sharp position and keep it in this position for all adjustments.

Turn the volume control to the maximum position.

Attenuate the signal from the signal generator to prevent the levelling-off action of the AVC.

Then adjust the five I.F. trimmers until maximum output is obtained. The adjusting screws for these condensers are reached from the top of the chassis and the location is shown in Fig. 3.

Range B Alignment

After the procedure for the alignment of each range, as explained below, is completed, it is advisable to repeat the procedure as a final check.

1730 KC Adjustment

Set the signal generator for 1730 KC.

Turn the rotor of the tuning condenser to the full open position.

Keep the band switch in the standard wave position.

Connect the antenna lead of the receiver through a 200 mmf. condenser to the output of the signal generator.

For this and all subsequent adjustments keep the volume control at the maximum position and attenuate the signal from the signal generator to prevent AVC action.

Adjust the oscillator Range B trimmer (C17) until maximum output is obtained. The location of this trimmer is shown in Fig. 3.

1500 KC Adjustment

Set the signal generator for 1500 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Turn the calibration screw (under color filter) until the 1500 KC mark on the dial scale is at the vertical red line on the screen. If the film drum cannot be turned a sufficient amount by means of the calibration screw, loosen the 2 screws inside the drum which hold it in place. Adjust the position of the drum and tighten the screws. The early models do not have the calibration screw mentioned above. These models must be adjusted by loosening the drum screws.

Adjust the interstage Range B trimmer (C11) and antenna Range B trimmer (C4) to maximum.

Do not change the setting of the oscillator Range B trimmer.

600 KC Adjustment

Set the signal generator for 600 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth, at the same time adjusting the 600 KC trimmer, until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range C Alignment

CAUTION—When aligning the short wave bands be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 5000 KC. The signal will then be heard at 5000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 5000 less 912 KC, or 4088 KC. It may be necessary to increase the input signal to hear the image.

5800 KC Adjustment

Set the signal generator for 5800 KC.

Connect the antenna lead of the receiver through a 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band switch to the Range C position (first short wave band).

Adjust the oscillator Range C trimmer (C15) until maximum output is obtained. See Fig. 3 for location of this trimmer.

5000 KC Adjustment

Set the signal generator for 5000 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the interstage Range C trimmer (C10) and antenna Range C trimmer (C3) to maximum.

Do not change the setting of the oscillator Range C trimmer.

1800 KC Adjustment

Set the signal generator for 1800 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth, at the same time adjusting the 1800 KC trimmer, until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

Range D Alignment

18,300 KC Adjustment

Set the signal generator for 18,300 KC.

Keep the antenna lead of the receiver connected through the 400 ohm resistor to the output of the signal generator.

Turn the rotor of the tuning condenser to the full open position.

Turn the band switch to the Range D position (second short wave band).

Adjust the oscillator Range D trimmer (C13) until maximum output is obtained. See Fig. 3 for location of this trimmer.

15,000 KC Adjustment

Set the signal generator for 15,000 KC.

Turn the rotor of the tuning condenser carefully until maximum output is obtained.

Adjust the interstage Range D trimmer (C9) and antenna Range D trimmer (C2) to maximum.

When adjusting the interstage and antenna Range D trimmers, it will be necessary at the same time to turn the tuning condenser rotor slowly back and forth until the peak of greatest intensity is obtained.

Do not change the setting of the oscillator Range D trimmer.

6000 KC Adjustment

Set the signal generator for 6000 KC.

Turn the tuning condenser rotor until maximum output is obtained.

Turn the rotor slowly back and forth, at the same time adjusting the 6000 KC trimmer, until the peak of greatest intensity is obtained. See Fig. 3 for location of this trimmer.

MODEL 62-334
Antenna, Mounting Data
Tuner, Notes

MONTGOMERY-WARD & CO.

Antenna

IMPORTANT—Inside of the chassis as shown in Fig. 3 is a terminal strip with letters HC and LC on it.

The antenna lead must be properly connected at the terminal strip, depending on whether a high or low capacity antenna is used.

The following tabulation explains what is meant by High Capacity (HC) and Low Capacity (LC) antennas.

SIZE OF DRILL HOLES

FRONT CHASSIS STUDS-TWO 5/32" HOLES 4 7/16" CENTER TO CENTER

BOLT AT TOP OF STRAP-ONE 9/32" HOLE

SPEAKER STUD-ONE 11/32" HOLE

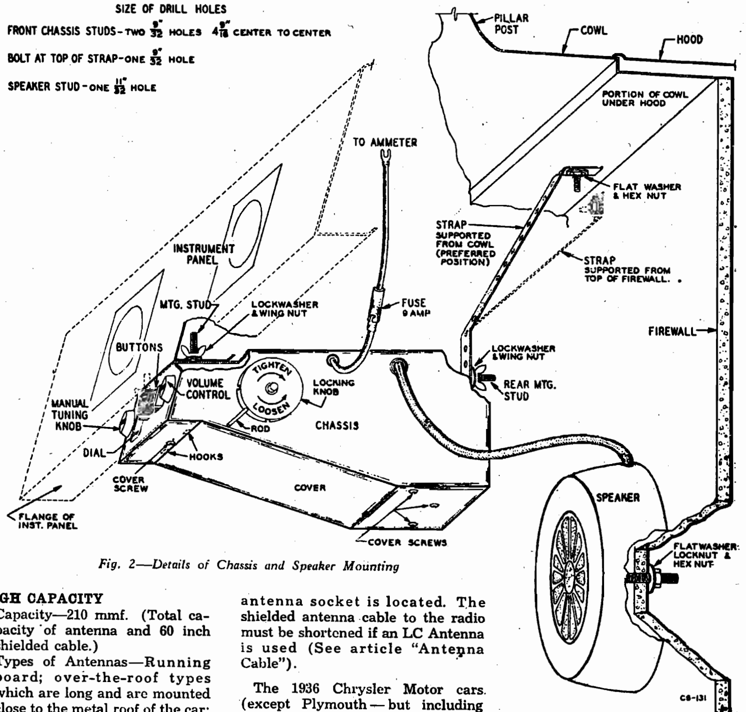

Fig. 2—Details of Chassis and Speaker Mounting

HIGH CAPACITY
Capacity—210 mmf. (Total capacity of antenna and 60 inch shielded cable.)
Types of Antennas—Running board; over-the-roof types which are long and are mounted close to the metal roof of the car; ordinary built in roof antennas (not metal roof).

LOW CAPACITY
Capacity—60 mmf. (Total capacity of antenna and shielded cable cut to about 30 inch length.)
Types of Antennas—Door hinge; fishpole; over-the-roof types which are mounted quite a distance from the metal roof of the car.

Most of the 1937 and 1938 cars have steel roofs and it will be necessary to use a door hinge, fish pole, over-the-roof, or running board antenna. In all of the above installations, the antenna should be mounted on the same side of the car the radio is mounted or the same side as the antenna socket is located. The shielded antenna cable to the radio must be shortened if an LC Antenna is used (See article "Antenna Cable").

The 1936 Chrysler Motor cars (except Plymouth — but including Chrysler, Dodge and DeSoto) have a steel roof, separated from the body proper, which is used as an antenna. The capacity of these antennas is about 1500 mmf. If this radio is installed in these cars, it will be necessary to use a running board, fish pole, or door hinge antenna.

If, after reading the above information and the following paragraphs, it is found necessary to change the antenna connection within the chassis, proceed as follows: Remove the chassis case cover as explained in the article "Removing Chassis Cover." The wire which connects to the terminal strip shown in Fig. 3 should be fastened under the HC or LC screw, depending on which is proper.

Antenna Cable

A 60 inch shielded antenna cable with a capacity of 70 mmf. is regularly supplied.

This cable is long enough in practically all cases to reach the pillar post or column at which a roof antenna lead comes down and also to reach the running board antenna.

CUT CABLE FOR LC ANTENNA—The 60 inch cable supplied with the radio will be found to be too long for most door hinge, fishpole and over-the-roof type antenna installations. Furthermore, *the capacity of the cable plus that of either of the above antennas is too large for the LC connection. Therefore, it is necessary to cut the antenna cable to about 30 inches in length.* This will be found to be of sufficient length in practically all cases.

To shorten the cable, pull the wire out of the cable from the plug end. Then cut the shielding and loom to the correct length. Cut the pigtail off the excess piece of cable and solder it to the shield at the end of the shortened cable. Insert the wire in the cable again and cut the wire to the correct length.

Keep the antenna cable as far away from car wiring as possible and ground the pigtail of the antenna cable shield at the antenna end, otherwise ignition noise may be picked up. The length of the pigtail from the grounding point to the end of the antenna cable should be kept as short as possible, preferably not over one inch.

For the door hinge and over-the-roof type antenna, the antenna lead must be shielded the entire distance from the radio to the point where the lead goes through the car body to the outside. In the case of the running board antenna, the antenna lead shielding must extend all the way to the antenna.

When the antenna cable is connected to an antenna lead coming down the pillar post, the shielded cable should be pushed several inches up into the pillar post.

Procedure for Setting the Station Buttons

There are 4 buttons on the automatic tuning dial by means of which 4 stations may be set.

Any button may be used for any station you can receive.

Make a list of your favorite stations, those which you tune in regularly.

It is better to list the station with the highest kilocycle number first, the station with the next lower kilocycle number next, and so on.

Grasp the locking knob shown in Fig. 2. In most cases, this knob can be reached with the hand from the right side of the radio. If, due to crowded conditions, the knob cannot be reached with the hand, the metal rod supplied may be inserted in one of the holes in the edge of the knob. Rotate the locking knob about two turns in the direction indicated until the mechanism is felt to loosen.

Select the first station from the list you have made and carefully tune in button so that the call letters can be properly read when viewed from the driver's seat. Push the tab all the way to the front of the slot. Slip one of the celluloid tabs over the call letter tab. Then push the button back on its shaft making sure the shaft goes into the center opening in the button.

Carefully tune in the second station on your list. Then hold the manual tuning knob and push the second button slowly and firmly all the way in. Check for accurate tuning and insert the station call letter tab exactly as explained above. When pushing the button on its shaft, care should be taken not to push in one of the adjacent buttons.

After all the stations are set, it will be necessary to lock the mechanism so that the settings will not change.

Grasp the locking knob shown in Fig. 2 or, use the metal rod previously mentioned, and rotate the this station by means of the manual tuning knob.

With one hand, hold the manual tuning knob to prevent it from turning and with the other hand, push one of the station buttons shown in Fig. 2 *all the way in.* It will go in easily at first and then a firm gentle pressure must be applied to push it in the rest of the way. Start with the right hand button.

Hold *this* button all the way in. With the other hand, see if this station is still accurately tuned in by turning the manual tuning knob a slight amount back and forth. *Be sure to hold the button all the way in.*

Release the button after the station is tuned in.

Remove the correct station call letter tab from the sheet supplied by tearing the sheet at the score marks.

Now pull this button off its shaft noting which side is the top. Slip the call letter tab in the top slot of the knob in the direction indicated. Continue to turn the knob until you are certain that it is tight. Otherwise, the station buttons will not remain set for the selected stations.

If at any time you wish to change the setting of a button from one station to another, repeat the above procedure. Changing the setting of one button will not affect the setting of any of the other buttons. The old call letter tab may be removed by pulling the knob off its shaft and slipping the tab out of the slot in the button.

WHEEL OR BRAKE STATIC—Noise from this source is generally experienced only when an under car antenna is being used. To determine if noise is being caused from this source, set the car in motion; then with the motor shut off and the clutch disengaged, apply the brakes. If the noise stops, the source of the static is in the wheels. The use of a front or rear wheel static eliminator will generally end the trouble.

HIGH AND LOW TENSION LEADS—In some cases, the high and low tension leads between the coil and distributor are run close together. In some cars, they are in the same conduit. If this is the case, remove the low tension lead from this conduit. In any event, keep the high and low tension leads as far apart from each other as possible. If separating the two leads is not sufficient, shield and ground the shield of the low tension lead.

GROUNDING MOTOR AND OTHER PARTS—The motor must, in every case, be well grounded to the frame of the car. If it is not, use a very heavy braided lead for this purpose, similar to a storage battery ground lead. In like manner, it may be necessary to check the grounding of the metal fire wall, instrument panel, transmission, radiator, hood, and muffler to the frame of the automobile. To obtain a good electrical connection, scrape off the paint, if necessary, at the point where ground contact is made.

DOME LIGHT LEAD—Noise due to radiation from the dome light lead is generally experienced only when a roof antenna is being used. Disconnect the dome light lead connection at the back of the instrument panel and ground this wire. If this is found to reduce the noise noticeably, interference is being radiated by the dome light lead. Reconnect the dome light lead and then connect a .5 mfd. bypass condenser between the point at which this lead leaves the pillar post and ground.

BYPASS CONDENSERS—Try a .5 mfd. bypass condenser from the ammeter to ground and see if interference is reduced. Install this condenser permanently if there is an improvement.

Try a .5 mfd. condenser from the "Hot" side of the coil primary to ground.

The electric gauges used for oil, water, and gas are often a source of interference and bypass condensers should be tried.

In like manner, try a .5 mfd. condenser from car fuse to ground, switch to ground, tail light and stop light connections to ground, windshield wiper and various other 6 volt connections to ground, noting what effect these condensers have on the noise pick-up.

S1		On Volume Control	

SERVICE NOTES:

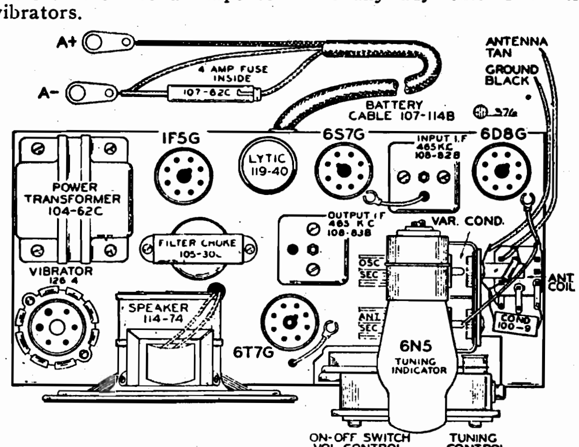
Voltage taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages are to be measured with 6.3 volts input to receiver.

Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good. If fuse blows out frequently and insulating sleeve has been properly placed over fuse, the trouble is probably in the vibrator, it should be replaced. Do not attempt to make any adjustments on the vibrators.



Excessive hum, stuttering, low volume and a reduction in all D. C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers, frequently cause oscillation and distorted tone.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-83B Output I.F. Transformer

Part No. 108-82B Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6S7G tube, and adjust the output I.F. transformer (No. 108-83B) to resonance.
   (b) Move oscillator output clip from grid of 6S7G to grid of 6A8G and adjust input I.F. transformer (No. 108-82B) to resonance.
   (c) With oscillator still connected to 6A8G, readjust output I.F. transformer (108-83B) if necessary.

R.F. ALIGNMENT: (535-1720 K.C.)

1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmf. condenser to the antenna lead and chassis ground and make the following adjustments:
   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
   (c) Check sensitivity at 600 and 1000 kilocycles.

ALIGNING INSTRUCTIONS;

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet. Remove the knobs and the four bolts which are used to fasten the chassis.

All adjustments should be made with a non-metallic screwdriver.

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 6F6G output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with 115 volts on the primary of the power transformer.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D.C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-83B Output I.F. Transformer
Part No. 108-82B Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6K7G tube, and adjust the output I.F. transformer (No. 108-83B) to resonance.
   (b) Move oscillator output clip from grid of 6K7G to grid of 6A8G and adjust input I.F. transformer (No. 108-82B) to resonance.
   (c) With oscillator still connected to 6A8G, readjust output I.F. transformer (108-83B) if necessary.

R.F. ALIGNMENT: (535-1720. K.C.)

1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmf. condenser to the antenna lead and chassis ground and make the following adjustments:
   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
   (c) Check sensitivity at 600 and 1000 kilocycles.

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6K7 tube, and adjust the output I. F. transformer (No. 108-83E) to resonance.
   (b) Move oscillator output clip from grid of 6K7 to grid of 6A8G and adjust input I.F. transformer (No. 108-82E) to resonance.
   (c) With oscillator still connected to 6A8G, readjust output I.F. transformer (108-83E) if necessary.

R.F. ALIGNMENT: (535-1720 K.C.)

1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmf. condenser to the antenna lead and chassis ground and make the following adjustments:
   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
   (c) Check sensitivity at 600 and 1000 kilocycles.

Issues A and B
Alignment, Notes

MONTGOMERY-WARD & CO.

ALIGNMENT PROCEDURE ISSUE A

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mf., 200 mmf., and 400 ohms.

BAND	SIGNAL GENERATOR Frequency Setting	SIGNAL GENERATOR Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6K7	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6A8	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND	6 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set dial at 6 MC	Trimmer (C) Top of front section of gang	Short wave oscillator	Adjust to maximum output
	6 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Dial set at 6 MC	Trimmer (C 4) (See Fig. 3)	Short wave Antenna	Adjust to maximum output
BROAD-CAST BAND	1720 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Trimmer (C 6) (See Fig. 3)	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set dial at 1400 Kc.	Trimmer (C 5) (See Fig. 3)	Broadcast Antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set dial at 600 Kc.	Trimmer (C 9) (See Fig. 3)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")
IMAGE REJECTION ADJUST-MENTS	1890 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 960 Kc. on dial	Wire Capacitor (CB) (See circuit diagram)	Image rejection	Adjust by twisting for minimum output. (See note "B")
	2630 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 1700 Kc. on dial	Wire capacitor (CA) (See circuit diagram)	Image rejection	Adjust by moving for minimum output. (See note "C")

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

NOTE "B" 960KC is the image frequency of 1890KC. Adjust wire capacity (CB) by twisting the two wires until a minimum output is obtained.

NOTE "C" 1700KC is the image frequency of 2630KC. Adjust wire capacity (CA) by moving the wire either toward or away from the antenna coil winding until a minimum output is obtained on the output meter.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

BAND SWITCH	BAND	FREQUENCY RANGE
Extreme Right Rotation	Short Wave	2000 to 7000 KC (2-7MC)
Extreme Left Rotation	Broadcast	535 to 1720 KC.

Power Consumption—50 Watts (At 115 volts 50-60 cycles)
Power Output—1.2 Watts Undistorted, 2.5 Watts Maximum
Intermediate Frequency—465 KC.

DESCRIPTION:

TUBES:

The tube complement of this chassis consists of the following octal base glass and metal tubes:

The type and function of each tube is as follows:

1—Type 6A8G Pentagrid Mixer, First Detector-oscillator.
1—Type 6K7 Remote Cut-Off Pentode, I. F. Amplifier (465 K. C.)
1—Type 6Q7G Duplex Diode Triode Second Detector, A. V. C. and First Audio.
1—Type 6K6G Pentode Output Amplifier.
1—Type 5Y3G High Vacuum Rectifier.
1—Type 6U5 Cathode-Ray Tuning Eye.

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 25, 40 and 60 cycles and with primary taps for 110, 130, and 230 volts, (see parts list).

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on the voltage chart are measured with 115 volts on the primary of the power transformer.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D. C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

ALIGNING INSTRUCTIONS:

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet.

To remove the chassis from the cabinet, remove the four bolts which are used to fasten the chassis to the cabinet bottom, pull the knobs off their shafts and pull off the six button lever keys on front of dial.

To remove the chassis from the cabinet, remove the four bolts which are used to fasten the chassis to the cabinet bottom; remove the special locking screw in the center of the tuning knob on the side of the cabinet; pull the knobs off their shafts and pull off the six button lever keys on front of dial.

ALIGNMENT PROCEDURE ISSUE B

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mf., 200 mmf., and 400 ohms.

BAND	SIGNAL GENERATOR Frequency Setting	SIGNAL GENERATOR Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6K7	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6A8	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND	7 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Rotor full open (Plates out of mesh)	Trimmer (C) Top of front section of gang	Short wave oscillator	Adjust to maximum output
	6 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Dial set at 6 MC	Trimmer (C 4) (See Fig. 3)	Short wave Antenna	Adjust to maximum output
BROAD-CAST BAND	1720 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Trimmer (C 6) (See Fig. 3)	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set dial at 1400 Kc.	Trimmer (C 5) (See Fig. 3)	Broadcast Antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set dial at 600 Kc.	Trimmer (C 9) (See Fig. 3)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")
IMAGE REJECTION ADJUST-MENT	2330 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 1400 Kc. on dial	Trimmer (C 1) (See Fig. 3)	Image rejection	Adjust for minimum mum output. (See note "B")

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

NOTE "B" 2330KC is the image frequency of 1400KC. Adjust Trimmer C1 until a minimum output is obtained.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

BAND SWITCH	BAND	FREQUENCY RANGE
Extreme Right Rotation	Short Wave	2000 to 7000 KC (2-7MC)
Extreme Left Rotation	Broadcast	535 to 1720 KC.

Power Consumption—50 Watts (At 115 volts 50-60 cycles)
Power Output—1.2 Watts Undistorted, 2.5 Watts Maximum
Intermediate Frequency—465 KC.

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter—Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 200 mmf., and 400 ohms.

SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I. F.					
456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C15) & (C16) 2nd I.F. (C21) & (C22)
RANGE B					
1730 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C7)

700 KC	Antenna Lead	200 mmf.	No. 5	Setting Screw No. 5	Antenna Coil No. 5
700 KC	Antenna Lead	200 mmf.	No. 6	Setting Screw No. 6	Antenna Coil No. 6

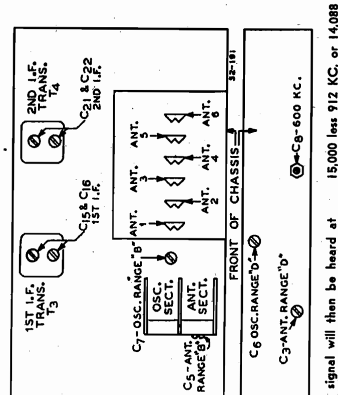
Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1500 KC on the dial, loosen the 2 clamps which hold the pointer assembly on the cord, move the pointer to the 1500 KC mark, and tighten the clamps.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

NOTE C—At the top of the permeability tuning unit can be seen six "W" openings. Insert the end of a pair of long nose pliers or a screwdriver in the "W" opening of the proper button and adjust the position of the antenna (rear) coil by twisting the pliers or screwdriver until maximum output is obtained.



CAUTION—When aligning the short wave band be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet.

To remove the chassis from the cabinet, remove the four bolts which are used to fasten the chassis to the cabinet bottom; pull the knobs off their shafts and pull off the six button lever keys on front of dial.

MONTGOMERY-WARD & CO.

MODEL 62-362

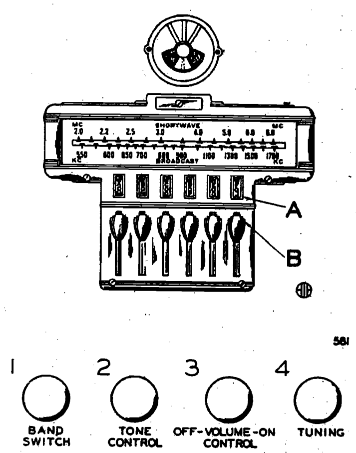


FIG. 2—FRONT VIEW

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:

There are six levers on the dial by means of which six stations may be selected. (See "B", Fig. 2).

Press down any one of the six Automatic levers. Holding it down, tune in by means of tuning knob No. 4 any one of your favorite stations. Turn the tuning knob very slowly back and forth noting the width of the shadow indicated on the screen of the cathode-ray tuning eye. Minimum width indicates the ideal tuning position (resonance). The station will then be accurately tuned in.

Release this lever and press down any other lever. Hold this lever down and tune in by means of knob No. 4 another favorite station.

Follow this procedure until stations have been set on all the levers.

Rotate the tuning knob (No. 4) to the right (clockwise) as far as it will turn. Now remove from the right side of the cabinet the metal button, and, with a screw driver inserted through the hole, tighten the reset locking adjustment screw "C", (see Fig. 1). It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the levers. (**Note: Reset Lock Screw "C" is loose when radio is shipped from factory).**

If you should desire to change any station you selected to another, loosen the reset locking screw "C" four or five complete turns; select the new station as explained. (Note: If the dial mechanism works hard when setting up a new station for one of the automatic tuner levers, it is due to the locking screw being too tight. Loosen the reset locking screw "C" until the dial mechanism works freely with the tuner lever pressed down).

BE SURE TO RETIGHTEN THE RESET LOCK SCREW, otherwise the stations will not stay adjusted to the levers.

Above each lever an opening in the cabinet is provided for inserting station call letters, (See "A", Fig. 2).

Punch the correct station call letter tabs from the set of sheets supplied and insert them into the rectangular openings in the cabinet above each of the levers. One of the small, clear celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

The Automatic Tuner dial is now set for quick tuning. Press down on the lever and your favorite station is selected.

MODELS 62-390, 62-490 and 62-900

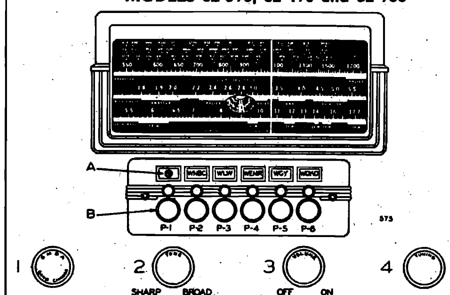

FIG 2—FRONT VIEW

PROCEDURE FOR SETTING THE AUTOMATIC STATION SELECTOR BUTTONS:

There are six buttons on the dial by means of which six standard wave stations may be selected. (See B, Fig. 2).

Make a list of your favorite local stations, those which you tune in regularly. Put down the frequency (kilocycle number) of these stations. There may be 2, 3, 5 or any number up to and including six in this list.

List the station with the lowest kilocycle number first and stations with higher kilocycle numbers in order, the station with the highest kilocycle number last.

The automatic station selector buttons are grouped to cover specific frequency ranges.

The frequency ranges of the buttons starting with the right hand button P1 are as follows:

Button P1—530 K.C. to 800 K.C.
Button P2—530 K.C. to 800 K.C.
Button P3—700 K.C. to 1100 K.C.
Button P4—700 K.C. to 1100 K.C.
Button P5—980 K.C. to 1550 K.C.
Button P6—980 K.C. to 1550 K.C.

This means that any station which has a kilocycle number lying between 530 and 800 K.C. can be set up on either Button P1 or Button P2. Any station which has a kilocycle number lying between 700 and 1100 K.C. can be set on either Button P3 or Button P4. Any station which has a kilocycle number lying between 980 and 1550 K.C. can be set on either Button P5 or Button P6.

A typical station list of stations which may be selected in the vicinity of Chicago, for example, is as follows:

Station	Frequency	Button
WMAQ	670 K.C.	Button P1
WGN	720 K.C.	Button P2
WBBM	770 K.C.	Button P3
WENR	870 K.C.	Button P4
WJJD	1130 K.C.	Button P5
WHFC	1420 K.C.	Button P6

After you have made up your list of stations, turn manual-automatic switch (knob No. 1) to manual position "B" and tune in the first station with the manual tuning knob. Then turn the manual-automatic switch (knob No. 1) to automatic position "A." Push in automatic button P1 and with a small screw driver turn the adjusting screw (see "A" Fig. 2) above the button to the right (clockwise). Turn the screw until the proper station is tuned in. Check by turning the manual-automatic switch to the manual position to make sure you have the same station.

Switch back to automatic position and by means of the screw driver very carefully tune in the station watching the cathode-ray tuning eye to indicate perfect tuning.

Turn the manual-automatic switch (knob No. 1) back to manual position and tune in the second station with the manual tuning knob. Then turn the manual-automatic switch to automatic position. Push in button P2 and with a small screw driver turn the adjusting screw above button P2 to the right (clockwise). Turn the screw until the proper station is tuned in.

Check by turning the manual-automatic switch to the manual position to make sure you have the same station. Switch back to automatic position and by means of the screw driver, very carefully tune in the station watching the cathode-ray eye for accurate tuning.

Follow this procedure for each button until you have selected all of your stations. The automatic buttons are now set up for quick tuning and no further adjustment is necessary.

Over the adjustment screw "A" a rectangular opening in the escutcheon has been provided for the station call letter tabs. Punch out the station call letter tabs of the stations you have set up for the automatic buttons from the set of sheets supplied and insert them into the rectangular openings in the escutcheon. One of the small, clear celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

MODEL 62-372

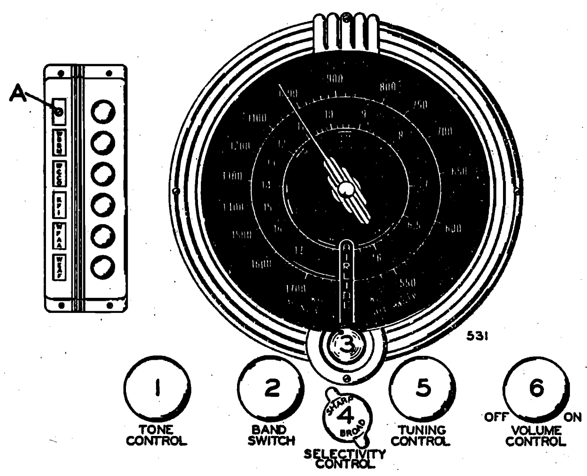

Fig. 2—Front View, Arrangement of Controls

PROCEDURE FOR SETTING THE AUTOMATIC STATION SELECTOR BUTTONS:

There are six buttons on the dial by means of which six standard wave stations may be selected. (See Fig. 2).

Make a list of your favorite local stations, those which you tune in regularly. Put down the frequency (kilocycle number) of these stations. There may be 2, 3, 5 or any number up to and including six in this list.

The automatic station selector buttons are grouped to cover specific frequency ranges.

The frequency ranges of the buttons starting with the top button are as follows:

Top button:—980 K.C. to 1550 K.C.
2nd button:—980 K.C. to 1550 K.C.
3rd button:—700 K.C. to 1100 K.C.
4th button:—700 K.C. to 1100 K.C.
5th button:—530 K.C. to 800 K.C.
Lower button:—530 K.C. to 800 K.C.

This means that any station which has a kilocycle number lying between 980 and 1550 K.C. can be set up on either of the two upper buttons. Any station which has a kilocycle number lying between 700 and 1100 K.C. can be set on either of the two center buttons. Any station which has a kilocycle number lying between 530 and 800 K.C. can be set up on either of the two lower buttons.

A typical station list of stations which may be selected in the vicinity of Chicago, for example is as follows:

Station	Frequency	Button
WHFC	1420 K.C.	Top Button
WJJD	1130 K.C.	2nd Button
WENR	870 K.C.	3rd Button
WBBM	770 K.C.	4th Button
WGN	720 K.C.	5th Button
WMAQ	670 K.C.	Lower Button

After you have made up your list of stations, turn manual-automatic switch (knob No. 3) to manual position and tune in the first station with the manual tuning knob. Then turn the manual-automatic switch (knob No. 3) to automatic position. Push in the top automatic button and with a small screw driver turn the adjusting screw (see "A" Fig. 2) beside the top button to the right (clockwise). Turn the screw until the proper station is tuned in. Check by turning the manual-automatic switch to the manual position to make sure you have the same station.

Switch back to automatic position and by means of the screw driver very carefully tune in the station watching the cathode-ray tuning eye to indicate perfect tuning.

Turn the manual-automatic switch (knob No. 3) back to manual position and tune in the second station with the manual tuning knob. Then turn the manual-automatic switch to automatic position. Push in the 2nd button and with a small screw driver turn the adjusting screw beside the 2nd button to the right (clockwise). Turn the screw until the proper station is tuned in.

Check by turning the manual-automatic switch to the manual position to make sure you have the same station. Switch back to automatic position and by means of the screw driver, very carefully tune in the station watching the cathode-ray eye for accurate tuning.

Follow this procedure for each button until you have selected all of your stations. The automatic buttons are now set up for quick tuning and no further adjustment is necessary.

Over the adjustment screw "A" a rectangular opening in the escutcheon has been provided for the station call letter tabs. Punch out the station call letter tabs of the stations you have set up for the automatic buttons from the set of sheets supplied and insert them into the rectangular openings in the escutcheon. One of the small, clear celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

MODEL 62-465
Alignment

ALIGNMENT PROCEDURE MODEL 62-372

Volume Control—Maximum All Adjustments.
Selectivity Control—Sharp Position All Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator With a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antennas — .1 mf., 200 mmf., and 400 ohms.

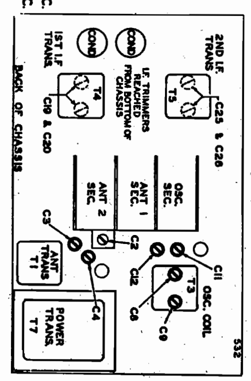
STEP (Follow Order as Given)	BAND SWITCH SETTING	DUMMY ANTENNA	SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	TRIMMERS ADJUSTED See Illustration	PROCEDURE INITIAL STEPS	PROCEDURE ADJUSTMENT
I.F.							
2nd I.F.	Range B	.1 mf.	456 KC	Grid of I.F. Tube	2nd I.F. (C25) & (C26)	Turn Rotor to Full Open	Adjust to Maximum Output
1st I.F.	Range B	.1 mf.	456 KC	Grid of 1st Det.	1st I.F. (C19) & (C20)	Turn Rotor to Full Open	Adjust to Maximum Output
Range B							
1750 KC	Range B	200 mmf.	1750 KC	Antenna Lead	Oscillator Range B (C12)	Turn Rotor to Full Open	Adjust to Maximum Output
1400 KC	Range B	200 mmf.	1400 KC	Antenna Lead	1st Ant. Range B (C2) 2nd Ant. Range B (C4)	Turn Rotor to Max. Output Set Indicator to 1400 KC—	Adjust to Maximum Output
600 KC	Range B	200 mmf.	600 KC	Antenna Lead	600 KC (C9)	Turn Rotor to Max. Output	Adjust to Maximum Output Rock Rotor—See Note A
Range D							
16000 KC	Range D	400 ohm	16000 KC	Antenna Lead	Oscillator Range D (C11)	Set Dial to 16 MC	Adjust to Maximum Output
16000 KC	Range D	400 ohm	16000 KC	Antenna Lead	Ant. Range D (C3)	Set Dial to 16 MC	Adjust to Maximum Output Rock Rotor—See Note A
6000 KC	Range D	400 ohm	6000 KC	Antenna Lead	6000 KC (C8)	Turn Rotor to Max. Output	Adjust to Maximum Output Rock Rotor—See Note A

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a **final check**.

NOTE A—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

CAUTION—When aligning the short wave band be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.



Power Consumption - 67 Watts (At 117 volts 60 cycles)
Power Output - - - - 2.5 Watts Undistorted / 4.5 Watts Maximum
Selectivity (Sharp) - - 28 KC Broad at 1000 times Signal
Intermediate Frequency - - - - - - - 456 KC.

Tuning Frequency Range
B Range ....540 to 1750 KC.
D Range ....5.8 to 18.1 MC.

MODELS 62-434 AND 62-435

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3".

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I. F. TRANSFORMERS: (465 K.C.):

Part No. 108-79C Output I. F. Transformer
Part No. 108-78C Interstage I. F. Transformer
Part No. 108-116 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1 Top View).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to minimum capacity (plates out of mesh), make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 1D5G 2nd. I.F. Tube and adjust the output I.F. transformer (No. 108-79C) to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 1D5G 2nd. I.F. Tube to grid cap of 1D5G 1st. I.F. Tube and adjust interstage I.F. transformer (No. 108-78C) to resonance.
   (c) Move oscillator to grid cap of 1C7G and adjust input I.F. transformer (No. 108-116).

SHORT WAVE BAND ALIGNMENT:

5.5 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the antenna and ground leads, make the following adjustments:
   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator trimmer to resonance.

   This adjustment is the trimmer mounted on the top of front section of the variable gang condenser (see Fig. 1, top view).

   (b) Adjust short wave antenna trimmer (Adjustment "Z"), to resonance (see Fig. 3, bottom view).

BROADCAST BAND ALIGNMENT:

535 to 1750 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation and with external oscillator connected in series with "Dummy 2" to antenna and ground leads make following adjustments:
   (a) Set external oscillator and dial on radio to 1400 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment "Y"), (see bottom view of Chassis, Fig. 3). Tune gang condenser slowly back and forth while making this adjustment.
   (b) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (adjustment "X") to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the front flange of the chassis. (See bottom view of chassis, Fig. 3.)
   (c) Repeat adjustment "a" and "b" until sensitivity is at its maximum, also check to see that radio tunes to 1750 K.C.
   (d) Check for tracking and sensitivity at 1400, 1000, and 600 kilocycles. **Under no circumstances bend plates of variable condenser sections to correct tracking.**

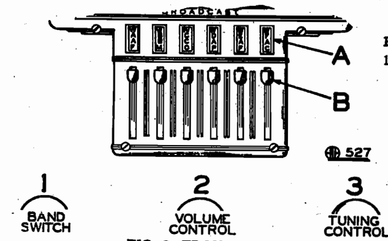


FIG. 2—FRONT VIEW

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS:

There are six levers on the dial by means of which six stations may be selected, (See "B", Fig. 2).

Press down any one of the six levers. Holding it down, tune in by means of tuning knob No. 3 any one of your favorite stations. Turn the tuning knob very slowly back and forth until signal is clearest. The station will then be accurately tuned in. Adjust the volume by means of the volume control knob to the desired intensity.

Release this lever and press down any other lever. Hold this lever down and tune in by means of knob No. 3 another favorite station.

Follow this procedure until stations have been set on all the levers.

Rotate the tuning knob (No. 3) to the right (clockwise) as far as it will turn. Now remove from the right side of the cabinet the metal button, and, with a screw driver inserted through the hole, tighten the reset locking adjustment screw "5", (see Fig. 1). It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the levers. (Note: Reset Lock Screw "5" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, loosen the reset locking screw "5" four or five complete turns; select the new station as explained. (Note: If the dial mechanism works hard when setting up a new station for one of the automatic tuner levers, it is due to the locking screw being too tight. Loosen the reset locking screw "5" until the dial mechanism works freely with the tuner lever pressed down).

BE SURE TO RETIGHTEN THE RESET LOCK SCREW, otherwise the stations will not stay adjusted to the levers.

Above each lever an opening in the cabinet is provided for inserting station call letters, (See "A", Fig. 2).

Punch the correct station call letter tabs from the set of sheets supplied and insert them into the rectangular openings in the cabinet above each of the levers. One of the small, clear celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

MODEL 62-465
Range — 535 - 1720 Kilocycles

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-83B Output I.F. Transformer
Part No. 108-82B Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6S7G tube, and adjust the output I.F. transformer (No. 108-83B) to resonance.
   (b) Move oscillator output clip from grid of 6S7G to grid of 6A8G and adjust input I.F. transformer (No. 108-82B) to resonance.
   (c) With oscillator still connected to 6A8G, readjust output I.F. transformer (108-83B) if necessary.

R.F. ALIGNMENT: (535-1720 K.C.) *(CON'T.)*

1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmf. condenser to the antenna lead and chassis ground and make the following adjustments:
   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
   (c) Check sensitivity at 600 and 1000 kilocycles.

Socket, Trimmer, Alignment Coils, Voltage, Dial Drive Data

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator With a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antennas — .1 mf., 200 mmf., and 400 ohms.

STEP (Follow Order as Given)	BAND SWITCH SETTING	DUMMY ANTENNA	SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	TRIMMERS ADJUSTED See Illustration	PROCEDURE INITIAL STEPS	PROCEDURE ADJUSTMENT
I.F.	Range B	.1 mf.	456 KC	Grid of 1st Det.	1st I.F. (C13) & (C14) 2nd I.F. (C16) & (C17)	Turn Rotor to Full Open	Adjust to Maximum Output
RANGE B							
1730 KC	Range B	200 mmf.	1730 KC	Antenna Lead	Oscillator Range B (C9)	Turn Rotor to Full Open	Adjust to Maximum Output
1500 KC	Range B	200 mmf.	1500 KC	Antenna Lead	1st Ant. Range B (C7) 2nd Ant. Range B (C6)	Turn Rotor to Max. Output Set Indicator to 1500 KC—See Note A	Adjust to Maximum Output
600 KC	Range B	200 mmf.	600 KC	Antenna Lead	600 KC (C4)	Turn Rotor to Max. Output	Adjust to Maximum Output Rock Rotor—See Note B
RANGE D							
18300 KC	Range D	400 Ohm	18300 KC	Antenna Lead	Oscillator Range D (C8)	Turn Rotor to Full Open	Adjust to Maximum Output
15000 KC	Range D	400 Ohm	15000 KC	Antenna Lead	Ant. Range D (C5)	Turn Rotor to Max. Output	Adjust to Maximum Output Rock Rotor—See Note B
6000 KC	Range D	400 Ohm	6000 KC	Antenna Lead	6000 KC (C2)	Turn Rotor to Max. Output	Adjust to Maximum Output Rock Rotor—See Note B

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

After alignment of Range D has been completed, do not make any adjustments of the Range B trimmers. If this is done, it will be necessary to realign Range D.

NOTE A—In sets using the finger tip tuning dial, remove the retaining ring which holds the dial scale in position. Readjust rotor to maximum output. Hold the station selector ring and turn the dial scale until the pointer is at the 1500 KC mark. Replace the retaining ring.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

CAUTION—When aligning the short wave band be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

(1) As read on 1000 volt scale.

Replacing Drive Cord

Remove the old drive cord and spring. Rotate the dial until the condenser is completely closed.

Tie both ends of the new drive cord to one end of the spring. The length from the knot to the end of the cord loop should be exactly 12 inches.

Place the loop end of the cord through the hole in the drive drum rim from underneath the drum rim. Be sure that the cord is also placed through the small brass eyelet. Pull the cord through as far as it will go.

Bring the looped cord out and over the finger tip dial ring in such a manner that the loop encircles the drum shaft.

Take one side of the looped cord and make one complete revolution on the drum rim clockwise in back of eyelet (from front of chassis). Keep this cord in place on the drum rim. Place the looped cord over the dial ring so that the cord again encircles the drum shaft. The cord should then be placed over the drive shaft and put on the drive shaft pulley. Then bring the cord up from drive shaft pulley and place it on the drum rim in front of the cord already on. When this is done, hook the free end of the tension spring on the spur provided for it on the drive drum.

MONTGOMERY-WARD & CO.

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 25, 40 and 60 cycles and with primary taps for 110, 130, and 230 volts, (see parts list).

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D. C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

MODELS 62-390, 62-490 and 62-900

NOTE:—On the back of the string dial drum a calibrated scale is provided for aligning this chassis to the frequencies listed in the alignment procedure. Attach a pointer so that it will indicate proper dial setting in respect to the position of the variable condenser.

ALIGNMENT PROCEDURE

- Tone control—in sharp position.
- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mf., 200 mmf., and 400 ohms.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6K7	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6K8	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output

1100 KC	Antenna Lead	200 mmf.	No. 6	Setting Screw No. 6	Antenna Coil No. 6

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

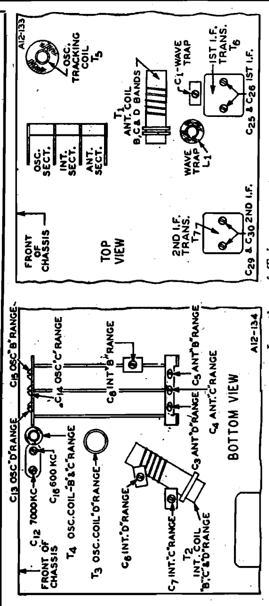
After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1500 KC on the dial, loosen the 2 clamps which hold the pointer assembly on the cord, move the pointer to the 1500 KC mark, and tighten the clamps.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

NOTE C—Leave condenser rotor at the 600 KC setting and adjust the signal generator until maximum output is obtained at or near 456 KC.

NOTE D—At the bottom of the permeability tuning unit can be seen six "W" openings. Insert the end of a pair of long nose pliers or a screwdriver in the "W" opening of the proper button and adjust the position of the antenna (rear) coil by twisting the pliers or screwdriver until maximum output is obtained.



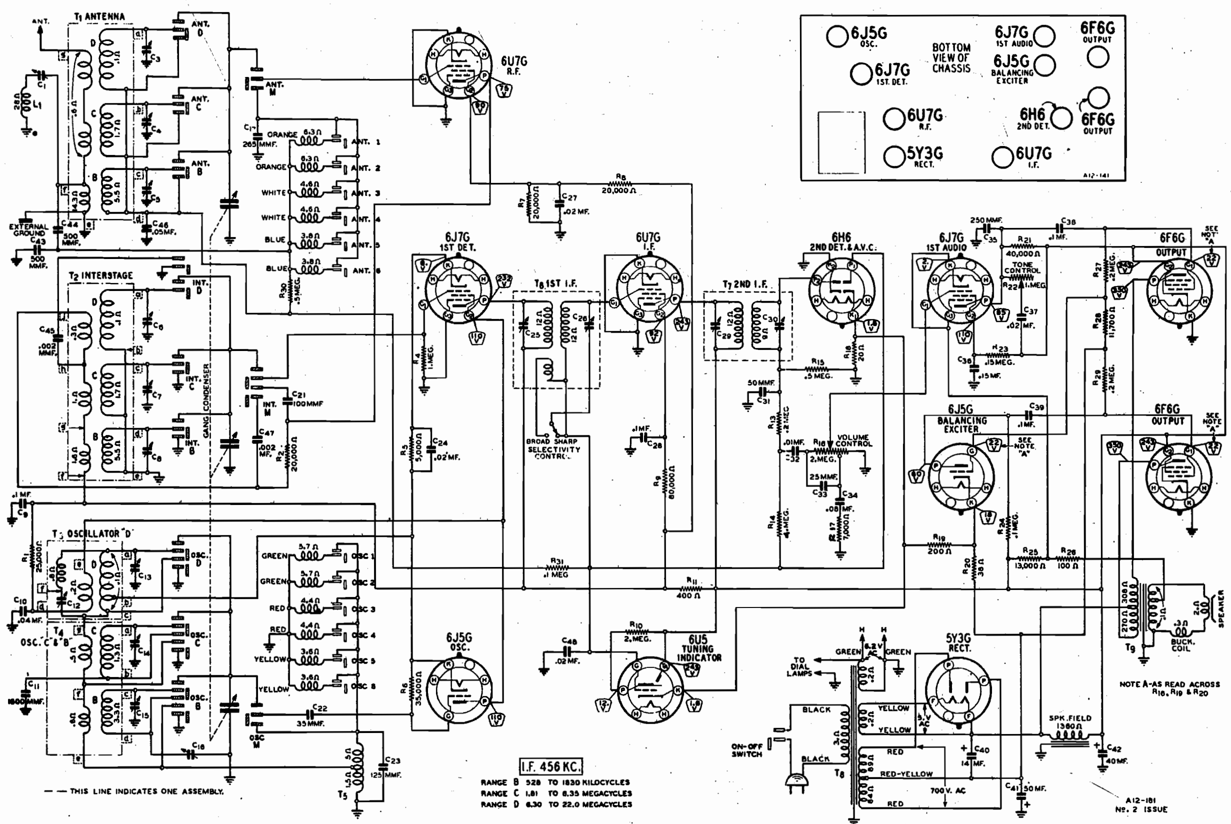
Location of Trimmers

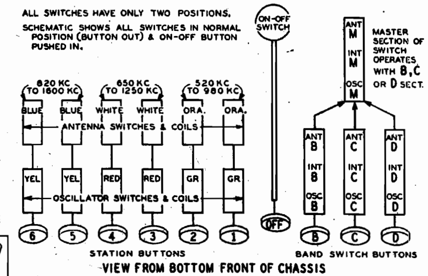
CAUTION—When aligning the short wave bands be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 5000 KC. The signal will then be heard at 5000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 5000 less 912 KC, or 4088 KC on the dial. It may be necessary to increase the input signal to hear the image.

NOTICE—Re-alignment is necessary if glass tubes are replaced by their equivalent in metal tubes, or vice versa, in the R.F. and I. F. stages.

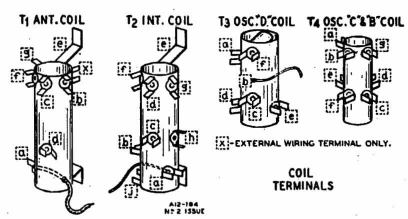
MONTGOMERY-WARD & CO.

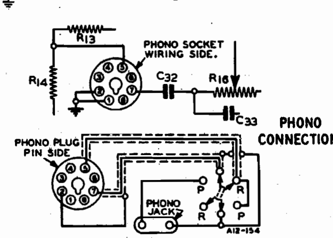
MODELS 62-401, 62-1100 Schematic, Coils, Socket Specifications, Phono. Tuner





Permeability Tuning Unit and Band Switch Arrangement.





Schematic Circuit Diagram, Coil Terminals, and Phono Connections.

Voltages at Sockets

The voltages at sockets are shown on the schematic circuit diagram. Unless otherwise specified, the voltage indicated is between the socket terminal and ground.

These voltages are read under the following conditions:

Line Voltage—117.

Volume Control—Maximum.

Antenna Shorted to Ground.

Readings taken with 1000 ohm-per-volt meter.

Phonograph Connections

Phonograph connections are made as shown in the schematic circuit diagram. On the back panel of the chassis base is a round knockout $1\frac{9}{16}$ inches in diameter. An octal base socket is then mounted in this knockout opening.

A phono cable assembly may then be purchased (See parts list). On one end of this cable is an octal plug and on the other end is a phono-graph-radio switch and double tip jack.

ATTACHING DIAL POINTER—Tune in a 1500 KC signal. Move the pointer to the 1500 KC mark on the dial and clamp it tightly over the fabric tubing of the cord.

Twenty-Five Cycle Models

The twenty-five cycle receiver differs from the sixty cycle receiver only in the fact that a different power transformer is used.

Power Consumption - 100 Watts (At 117 volts 60 cycles)

Schematic, Voltage
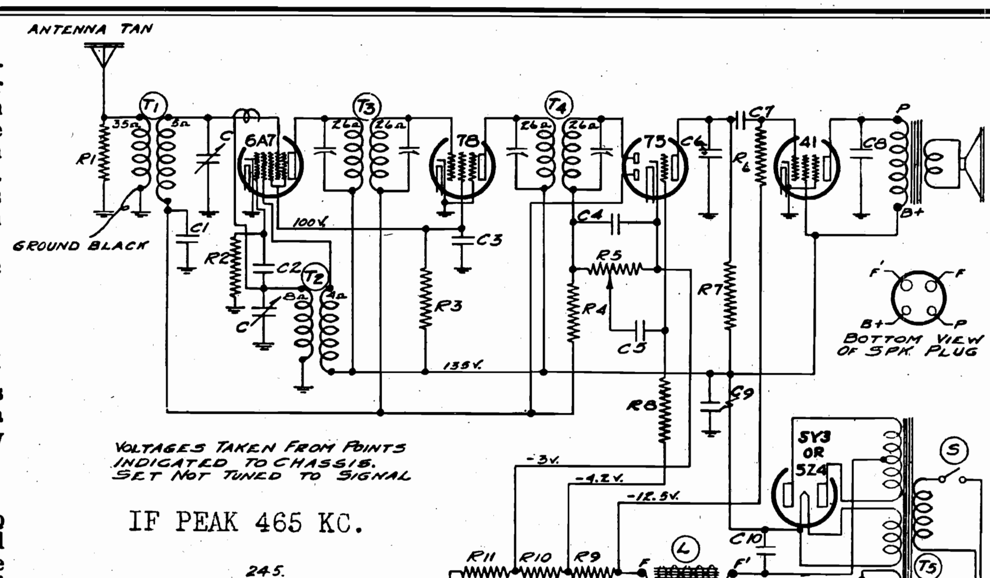
Alignment, Parts

TUBES:

The Tube complement of this chassis is as follows:
1 Type 6A7—pentagrid oscillator and first detector.
1 Type 78 —remote cut-off pentode as I.F. amplifier.
1 Type 75 —duplex diode triode as diode detector, A.V.C. and A.F.
1 Type 41 —pentode output tube.
1 Type 5Z4 or 5Y3—high vacuum rectifier.

R. F. ALIGNMENT: (535-1720 K. C.)

1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmf. condenser to tan antenna and black ground leads and make the following adjustments:
   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer (rear of gang condenser).
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance (front section of gang condenser).
   (c) Check sensitivity at 600 and 1000 kilocycles.



245.

MODEL 62-425

Frequency Range — 535 - 1720 Kilocycles

ALIGNING INSTRUCTIONS:

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet. Remove the knobs and the two bolts which are used to fasten the chassis.

All adjustments should be made with a non-metallic screw driver.

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 41 output tube. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range voltmeter should be used.

ALIGNING I. F. TRANSFORMERS: (465 K. C.)

Connect external oscillator which has been adjusted to 465 kilocycles in series with .1 mfd. condenser, to the control grid cap of the type 6A7 tube. Ground the chassis to the oscillator. Adjust output I.F. transformer (No. 108-83) and input I.F. transformer (No. 108-82) to resonance. See label on bottom of cabinet for location of these transformers.

Note: Speakers cannot be ordered, defective speakers must be repaired.
All resistors and mica condensers are RMA color coded—specify value and/or resistor or condenser (per schematic diagram) and model number.
Mica condensers are coded with an additional dot indicating tolerance:

Tolerance Percent	Color of Dot
2½%	White
5%	Green
10%	Blue
15%	Yellow
20%	Red
More than—20%	None

When ordering condensers, specify part number, tolerance and/or schematic reference number.

When ordering parts, always specify part and model number as well as serial number of chassis.

MODELS 62-434, 62-435
Schematic, Voltage, Parts
Socket, Trimmers

MONTGOMERY-WARD & CO.

The tube complement of this chassis consists of the following tubes.

The type and function of each tube is as follows:

1—Type 1C7G Pentagrid Mixer, First Detector-oscillator
1—Type 1D5G Remote Cut-Off Pentode, 1st I.F. Amplifier (465 K. C.)
1—Type 1D5G Remote Cut-Off Pentode, 2nd I.F. Amplifier (465 K. C.)
1—Type 1F7G Duplex Diode Pentode Second Detector, A. V. C. and First Audio.
1—Type 1G5G Pentode Output Amplifier.

FOR ALIGNMENT AND TUNER, SEE INDEX

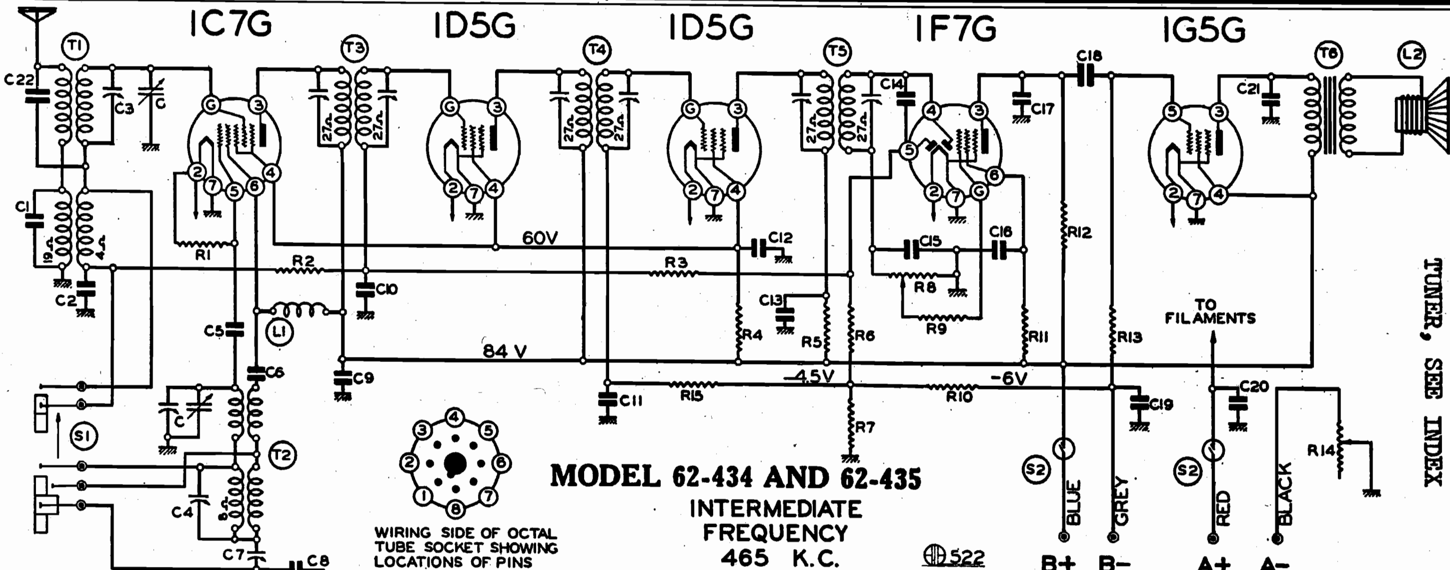
Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram, are measured with a new set of batteries.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

The approximate current consumption is as follows: "A"—420 ma., "B"—16 ma.



BAND	FREQUENCY RANGE
Broadcast	535 to 1750 K.C. (Kilocycles)

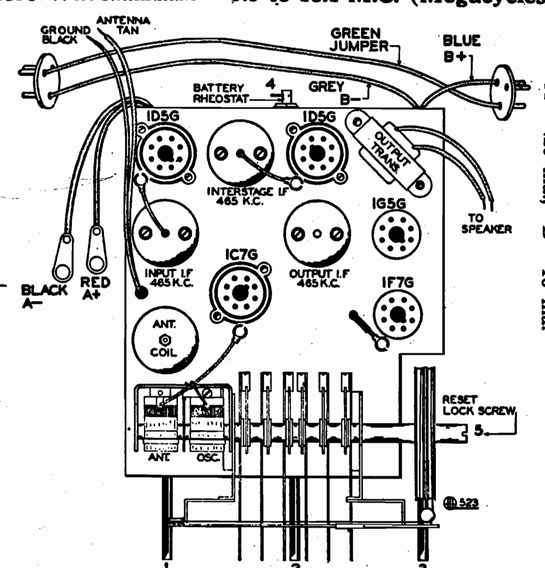

FIG. 1—TOP VIEW

MODEL 62-403
Schematic, Voltage
Socket, Alignment Notes

MONTGOMERY-WARD & CO.

ALIGNMENT

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—Hold the tuning knob and turn the film drum until it is at the 1500 KC mark on the dial.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

NOTE C—At the bottom of the permeability tuning unit can be seen six "W" openings. Insert the end of a pair of long nose pliers or a screwdriver in the "W" opening of the proper button and adjust the position of the antenna (rear) coil by twisting the pliers or screwdriver until maximum output is

CAUTION—When aligning the short wave bands, be sure NOT to adjust at the image frequency. This can be checked as follows:

Let us say the signal generator is set for 5000 KC. The signal will then be heard at 5000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 5000 less 912 KC, or 4088 KC on the dial. It may be necessary to increase the input signal to hear the image.

NOTICE—Re-alignment is necessary if glass tubes are replaced by their equivalent in metal tubes, or vice versa, in the R.F. and I.F. stages.

MODELS 62-315, 62-415
Alignment

MONTGOMERY-WARD & CO.

MODELS 62-315 and 62-415

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with 119 volts on the primary of the power transformer.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1," "Dummy 2," and "Dummy 3."

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-76 Output I.F. Transformer
Part No. 108-75 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:

   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1," to the control grid cap of the type 78 tube, and adjust the output I.F. transformer (No. 108-76) to resonance.

   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 78 to grid cap to 6A7 and adjust input I.F. transformer (No. 108-75) to resonance.

   (c) With oscillator still connected to 6A7, readjust output I.F. transformer (108-76) if necessary.

BROADCAST AND SHORT WAVE BAND ALIGNMENT

Broadcast Band:—535 to 1720 Kilocycles.
Short Wave Band:—2280 to 6600 Kilocycles.

Important:—These adjustments must be made in the following order:

SHORT WAVE OSCILLATOR ADJUSTMENT:

1. With band switch in the short wave band position, extreme right of its rotation, and with the gang condenser in its minimum capacity position, plates entirely out of mesh, and with the external oscillator connected in series with "Dummy 1" to grid cap of the 6A7 tube, make the following adjustment:

   (a) Set external oscillator to 6.6 megacycles and adjust short wave oscillator trimmer to resonance. This adjustment is marked "S.W. Osc." (see top view of chassis, Fig. 1, for location of this adjustment).

NOTE: Make certain that the fundamental 6.6 megacycles signal has been tuned in and not the image frequency, noting that the image appears when the tuning knob is moved to approximately 5.7 megacycles.

BROADCAST BAND OSCILLATOR ADJUSTMENT:

1. With band switch in the broadcast position, extreme left of its rotation, and with the gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 1" to grid cap of the 6A7 tube, make the following adjustment:

   (a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance. This adjustment is the trimmer mounted on the front section of the variable gang condenser.

BROADCAST BAND ANTENNA ADJUSTMENT:

1. With the band switch still in the broadcast position, move the external oscillator from the grid cap of the 6A7 tube to the tan antenna lead and black ground lead, in series with "Dummy 2" and make the following adjustments:

   (a) Set external oscillator to 1550 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer to resonance. This adjustment is marked "B.C. Ant." (See top view of chassis, Fig 1, for location of this adjustment.)

   (b) Re-set external oscillator to 600 K.C. and adjust broadcast series pad to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until, by adjusting series pad, maximum output is attained. This adjustment is located on the top of the chassis directly in front of the antenna coil. (See top view of chassis, Fig. 1).

   (c) Repeat adjustments "a" and "b" until sensitivity is at its maximum.

SHORT WAVE BAND ANTENNA ADJUSTMENT:

1. With the band switch in the short wave position, and with external oscillator connected in series with "Dummy 3," to the tan antenna lead and black ground lead, make following adjustment:

   (a) Set external oscillator to 6 megacycles and adjust the short-wave antenna trimmer to resonance. This adjustment is the trimmer mounted on the rear section of the variable gang condenser.

MODEL 62-403

ALIGNMENT PROCEDURE

Model 62-403 — WG Series A16

The following equipment is required for aligning:

An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

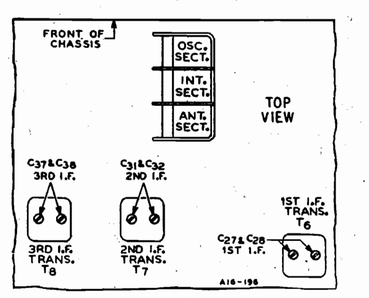
Dummy Antennas—.1 mf., 200 mmf., and 400 ohms.

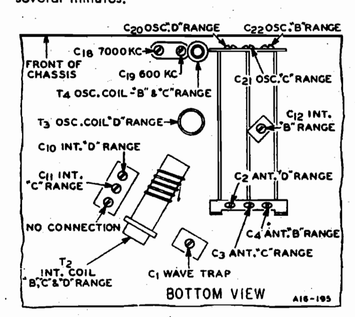
Volume Control—Maximum All Adjustments.

Selectivity Control—Sharp Position All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.





Signal Generator: Frequency Setting	Signal Generator: Connection at Radio	Dummy Antenna	Button Depressed	Condenser Setting	Adjust Trimmers to Maximum (Unless otherwise specified)

Note: Speakers cannot be ordered, defective speakers must be repaired.
All resistors and mica condensers are RMA color coded—specify value and/or resistor or condenser (per schematic diagram) and model number.
Mica condensers are coded with an additional dot indicating tolerance:

Tolerance Percent	Color of Dot
2½%	White
5%	Green
10%	Blue
15%	Yellow
20%	Red
More than—20%	None

When ordering parts, always specify part and model number as well as serial number of chassis.
When ordering condensers, specify part number, tolerance and/or schematic reference number.

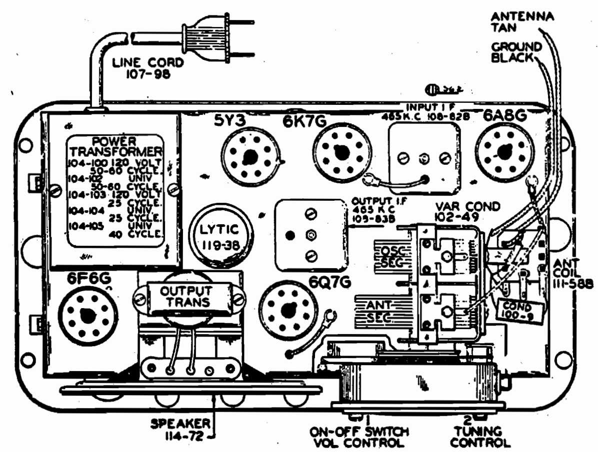

FIG. 1—TOP VIEW

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-83B Output I.F. Transformer
Part No. 108-82B Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6K7G tube, and adjust the output I.F. transformer (No. 108-83B) to resonance.
   (b) Move oscillator output clip from grid of 6K7G to grid of 6A8G and adjust input I.F. transformer (No. 108-82B) to resonance.
   (c) With oscillator still connected to 6A8G, readjust output I.F. transformer (108-83B) if necessary.

R.F. ALIGNMENT: (535-1720 K.C.)

1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmf. condenser to the antenna lead and chassis ground and make the following adjustments:
   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
   (c) Check sensitivity at 600 and 1000 kilocycles.

TUBES:

The tube complement of this chassis consists of the following Octal Base Glass Tubes:

The type and function of each tube is as follows:

1—Type 6D8G or 6A8G Pentagrid Mixer, First Detector-oscillator.
1—Type 6S7G Remote cut-off R.F. Pentode, I.F. Amplifier (465 K.C.)
1—Type 6T7G Duplex Diode Triode Second Detector, A.V.C. and First Audio.
1—Type 1F5G Output Amplifier.
1—Type 6N5 Cathode-Ray Tuning Eye.

MODEL 62-465

SERVICE NOTES:

Voltage taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages are to be measured with 6.3 volts input to receiver.

Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good. If fuse blows out frequently and insulating sleeve has been properly placed over fuse, the trouble is probably in the vibrator, it should be replaced. Do not attempt to make any adjustments on the vibrators.

Excessive hum, stuttering, low volume and a reduction in all D. C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers, frequently cause oscillation and distorted tone.

MONTGOMERY WARD & CO.

MODELS 62-473 and 62-701 EARLY AND LATE MODELS

DESCRIPTION:

TUBES:

The tube complement of this chassis consists of the following octal base glass and metal tubes:

The type and function of each tube is as follows:

1—Type 6A8G Pentagrid Mixer, First Detector-oscillator.
1—Type 6K7 Remote Cut-Off Pentode, I. F. Amplifier (465 K. C.)
1—Type 6Q7G Duplex Diode Triode Second Detector, A. V. C. and First Audio.
1—Type 6P5G Driver Stage
1—Type 6AC5G Positive Grid Triode Output Amplifier.
1—Type 5Y3G High Vacuum Rectifier.
1—Type 6U5 Cathode-Ray Tuning Eye.

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 25, 40 and 60 cycles and with primary taps for 110, 130, and 230 volts, (see parts list).

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on the voltage chart are measured with 115 volts on the primary of the power transformer.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mf., 200 mmf. and 400 ohms.

BAND		Signal Generator Frequency Setting	Signal Generator Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment

		600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 600 Kc.	Trimmer (C 10) (See Fig. 3)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")
IMAGE REJECTION ADJUST-MENTS		2100 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 1170 Kc. on dial	Wire Capacitor (CB) (See circuit diagram)	Image rejection	Adjust by twisting for minimum output. (See note "B")
		2630 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 1700 Kc. on dial	Wire capacitor (CA) (See circuit diagram)	Image rejection	Adjust by twisting for minimum output. (See note "C")
I. F.	LATE MODEL	465 Kc.	.1 MFD.	Grid of 6K7	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
		465 Kc.	.1 MFD.	Grid of 6K8	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND		17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 17 MC	Trimmer (C 6) Top of Chassis (See Fig. 1)	Short Wave oscillator	Adjust to maximum output
		17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Dial Set at 17 MC	Trimmer (C 4) (See Fig. 1)	Short Wave antenna	Adjust to maximum output
BROAD-CAST BAND		1720 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Trimmer (C 7) (See Fig. 1)	Broadcast oscillator	Adjust to maximum output
		1400 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 1400 Kc.	Trimmer (C 5) (See Fig. 1)	Broadcast antenna	Adjust to maximum output
		600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 600 Kc.	Trimmer (C 10) (See Fig. 1)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")
IMAGE REJECTION ADJUST-MENTS		2330 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 1400 kc. on dial	Trimmer (C2) (See Fig. 1)	Image rejection	Adjust for minimum output. (See note "B")

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

NOTE "B" 2100KC is the image frequency of 1170KC. Adjust wire capacity (CB) by twisting the two wires until a minimum output is obtained.

NOTE "C" 2630KC is the image frequency of 1700KC. Adjust wire capacity (CA) by moving the wire either toward or away from the antenna coil winding until a minimum output is obtained on the output meter.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

BAND SWITCH	BAND	FREQUENCY RANGE
Extreme Right Rotation	Short Wave	5.65 to 18.3 MC.
Extreme Left Rotation	Broadcast	535 to 1720 KC.

Power Consumption—45 Watts (At 115 volts 50-60 cycles)
Power Output—1.6 Watts Undistorted, 3 Watts Maximum
Selectivity—58 KC. Broad at 1000 KC. 1000 Times Signal Strength
Intermediate Frequency—465 KC.

6 TUBE INCLUDING CATHODE-RAY TUNING EYE
Broadcast Band A.C. Superheterodyne Receiver
Frequency Range — 535 - 1720 Kilocycles

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 6F6G output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 25, 40 and 60 cycles and with primary taps for 108, 127, 150, 225, and 260 volts, (see instructions) and also sometimes equipped with 25 cycle transformers with 105-115 volt or 220 volt primaries, not universals.

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with 115 volts on the primary of the power transformer.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D.C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

ALIGNING INSTRUCTIONS:

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-83B Output I.F. Transformer
Part No. 108-82B Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 6K7G tube, and adjust the output I.F. transformer (No. 108-83B) to resonance.
   (b) Move oscillator output clip from grid of 6K7G to grid of 6A8G and adjust input I.F. transformer (No. 108-82B) to resonance.
   (c) With oscillator still connected to 6A8G, readjust output I.F. transformer (108-83B) if necessary.

R.F. ALIGNMENT: (535-1720 K.C.)

1. With gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 200 mmf. condenser to the antenna lead and chassis ground and make the following adjustments:
   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer to resonance. This adjustment is on the top of rear section of variable gang condenser. (See Fig. 1).
   (b) Re-set external oscillator to 1400 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance. (Top of front section of gang condenser).
   (c) Check sensitivity at 600 and 1000 kilocycles.

Power Consumption - 50 Watts (At 117 volts 60 cycles)

Power Output - - - - - - 1.0 Watts Undistorted, 2.0 Watts Maximum

Selectivity - - 38 KC Broad at 1000 times Signal

Sensitivity
- B Range (Manual Tuning)..................15 Microvolts Average
- B Range (Automatic Tuning)..............15 Microvolts Average
- D Range ....25 Microvolts Average

Intermediate Frequency - - - - - - 456 KC

Speaker - - - - - - - - - 6" or 8" Dynamic

Tuning Frequency Range
- B Range (Manual Tuning).... 528 to 1730 KC (Kilocycles)
- D Range (Manual Tuning)....5750 to 18300 KC (Kilocycles)
- Buttons 1 and 2 (Automatic Tuning)...........820 to 1600 KC
- Buttons 3 and 4 (Automatic Tuning)...........650 to 1250 KC
- Buttons 5 and 6 (Automatic Tuning)........... 520 to 980 KC

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:

An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 200 mmf., and 400 ohms.

SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I. F.					
456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C15) & (C16) 2nd I.F. (C18) & (C19)
RANGE B					
1730 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C8)
1500 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1500 KC—See Note A	Ant. Range B (C4)
600 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C9) Rock Rotor—See Note B
RANGE D					
18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C7)
15,000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Ant. Range D (C3) Rock Rotor—See Note B
PERMEABILITY TUNING UNIT			BUTTON DEPRESSED (Band Switch in Push Button Position)	TURN SETTING SCREW TO MAXIMUM OUTPUT —See Instruction Book	ADJUST COIL POSITION TO MAXIMUM OUTPUT —See Note C
1100 KC	Antenna Lead	200 mmf.	No. 1	Setting Screw No. 1	Antenna Coil No. 1
1100 KC	Antenna Lead	200 mmf.	No. 2	Setting Screw No. 2	Antenna Coil No. 2
850 KC	Antenna Lead	200 mmf.	No. 3	Setting Screw No. 3	Antenna Coil No. 3
850 KC	Antenna Lead	200 mmf.	No. 4	Setting Screw No. 4	Antenna Coil No. 4
700 KC	Antenna Lead	200 mmf.	No. 5	Setting Screw No. 5	Antenna Coil No. 5
700 KC	Antenna Lead	200 mmf.	No. 6	Setting Screw No. 6	Antenna Coil No. 6

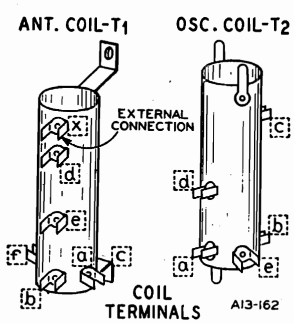
Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

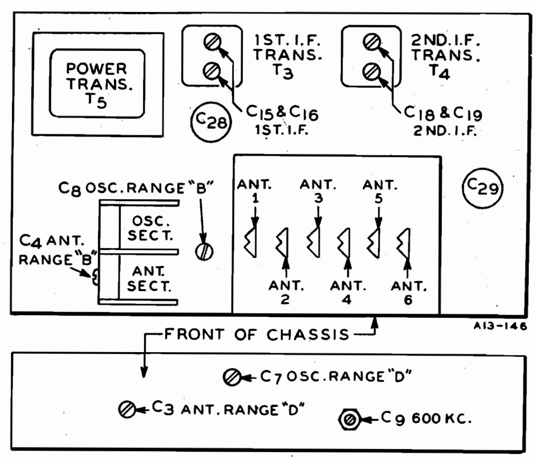
After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1500 KC on the dial, loosen the 2 clamps which hold the pointer assembly on the cord, move the pointer to the 1500 KC mark, and tighten the clamps.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

NOTE C—At the top of the permeability tuning unit can be seen six "W" openings. Insert the end of a pair of long nose pliers or a screwdriver in the "W" opening of the proper button and adjust the position of the antenna (rear) coil by twisting the pliers or screwdriver until maximum output is obtained.





CAUTION—When aligning the short wave band be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

Note: Speakers cannot be ordered, defective speakers must be repaired.

All resistors and mica condensers are RMA color coded—specify value and/or resistor or condenser (per schematic diagram) and model number.

Mica condensers are coded with an additional dot indicating tolerance:

Tolerance Percent	Color of Dot
2½%	White
5%	Green
10%	Blue
15%	Yellow
20%	Red
More than—20%	None

When ordering parts, always specify part and model number as well as serial number of chassis.

When ordering condensers, specify part number, tolerance and/or schematic reference number.

MONTGOMERY WARD & CO.

MODELS 62-506 AND 62-516

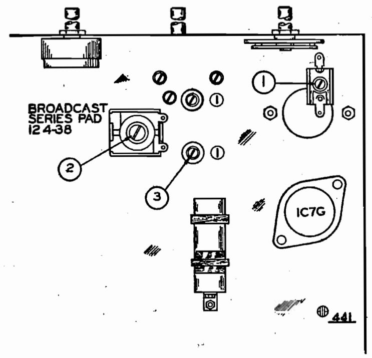

FIG. 3.—BOTTOM VIEW SHOWING TRIMMERS

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and plate terminals of the type 1H4G output tubes. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1", "Dummy 2", and "Dummy 3"

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-111 Input I. F. Transformer
Part No. 108-112 Output I. F. Transformer

These I. F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1, top view).

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   - (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1", to the control grid cap of the type 1D5G I. F. tube, and adjust the output I.F. transformer (No. 108-112) to resonance.
   - (b) Move oscillator to grid cap of 1C7G oscillator, first detector tube and adjust input I.F. transformer (No. 108-111) to resonance.

SHORT WAVE BAND ALIGNMENT:

5.5 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the antenna and ground leads, make the following adjustments:
   - (a) Move dial pointer to 17 megacycles and adjust short wave oscillator trimmer to resonance.

     This adjustment is the trimmer mounted on the top of rear section of the variable gang condenser (see Fig. 1, top view).
   - (b) Adjust short wave antenna trimmer (Adjustment Number 1), to resonance (see Fig. 3, bottom view).

BROADCAST BAND ALIGNMENT:

535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to antenna and ground leads make following adjustments:
   - (a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment number 3), (see bottom view of Chassis, Fig. 3).
   - (b) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (adjustment number 2), to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3.)
   - (c) Repeat adjustments "a" and "b" until sensitivity is at its maximum.
   - (d) Check for tracking and sensitivity at 1400, 1000, and 600 kilocycles. **Under no circumstances bend plates of variable condenser sections to correct tracking.**

MODEL 62-500

DESCRIPTION:

TUBES:

The tube complement of this chassis consists of the following octal base glass and Metal Tubes:

The type and function of each tube is as follows:
1—Type 6L7G Pentagrid Mixer, First Detector.
1—Type 6J5G Oscillator.
1—Type 6K7 Remote Cut-Off Pentode, I.F. Amplifier (465 K.C.)
1—Type 6Q7G Duplex Diode Triode Second Detector, A.V.C. and First Audio.
1—Type 6K6G Pentode Output Amplifier.
1—Type 5Y3G High Vacuum Rectifier.
1—Type 6G5 Cathode-Ray Tuning Eye.

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 25, 40 and 60 cycles and with primary taps for 110, 130, and 230 volts, (see parts list).

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with 115 volts on the primary of the power transformer.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D.C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

ALIGNING INSTRUCTIONS:

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet. Remove the knobs and the four bolts which are used to fasten the chassis.

All adjustments should be made with a non-metallic screw-driver.

RESONANCE INDICATOR:

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 6K6G output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1," "Dummy 2," and "Dummy 3."

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-106D Output I.F. Transformer
Part No. 108-105F Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see Fig. 1).

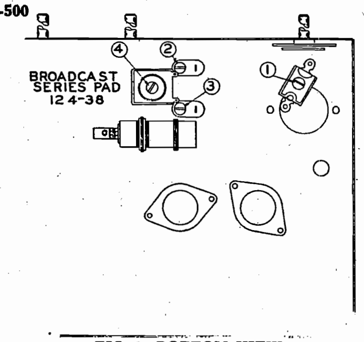

FIG. 3—BOTTOM VIEW

1. With volume control full on, (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser in its minimum capacity position, plates entirely out of mesh, make the following adjustments:
   - (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1," to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer No. 108-106D to resonance.
   - (b) Move oscillator output clip from grid of 6K7 to grid cap of 6L7G and adjust input I.F. transformer (No. 108-105F) to resonance.
   - (c) With oscillator still connected to 6L7G, readjust output I.F. transformer (108-106D) if necessary.

SHORT WAVE BAND ALIGNMENT:

5.5 to 18.1 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the antenna and ground leads, make the following adjustments:
   - (a) Move dial pointer to 17 megacycles and adjust short wave oscillator trimmer to resonance.

     This adjustment is the trimmer mounted on the top of rear section of the variable gang condenser (see Fig. 1, top view Adjustment Number 5).
   - (b) Adjust short wave antenna trimmer (Adjustment Number 1), to resonance (see Fig. 3, bottom view).

BROADCAST BAND ALIGNMENT:

535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to antenna and ground leads make following adjustments:
   - (a) Set external oscillator to 1720 K.C. and adjust broadcast oscillator trimmer to resonance. (Adjustment number 3, see bottom view of chassis, Fig. 3).
   - (b) Re-set external oscillator to 1400 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (adjustment number 2), to resonance.
   - (c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad (adjustment number 4), to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3).
   - (d) Repeat adjustments "a" and "c" until sensitivity is at its maximum.
   - (e) Check for tracking and sensitivity at 1400, 1000, and 600 kilocycles. **Under no circumstances bend plates of variable condenser sections to correct tracking.**

ARVIN CAR RADIO MODEL 5

ADJUSTMENT OF INTERMEDIATE FREQUENCY STAGES

1. Connect the balancing oscillator to the grid cap of the 6A8 tube through a .002 mfd. condenser. Place a 200,000 ohm resistor between the grid cap of the 6A8 and the grid clip which normally fits on the cap of the 6A8 tube. This will maintain the bias on this tube during alignment.
2. Adjust padder Nos. 1, 2, 3, and 4 for maximum output.

ALIGNMENT OF OSCILLATOR AND ANTENNA TRIMMERS

1. Connect the balancing oscillator to the antenna lead wire through a 50 uuf. dummy antenna. Rotate the rotor plates in the radio chassis tuning condenser completely out of mesh.
2. With an input frequency of 1,575 K. C. adjust Padder No. 5 to resonance.
3. Reset the balancing oscillator to 1,400 K. C. Rotate the tuning condenser until the signal is tuned to resonance. Reduce the output of the balancing oscillator until the signal barely deflects the output meter.
4. Adjust padder No. 6 until a maximum out-put reading is obtained. Check the sensitivity. See rating above.
5. After installation of the radio receiver in an automobile, tune in a very weak station between 1,300 and 1,500 K. C. and readjust padder No. 6 for maximum output.

The sensitivity of this receiver may be determined by reading the number of microvolts input required to produce 500 milliwatts output. That output is obtained when a reading of 1.2 volts across the voice coil of the speaker is indicated by the output meter.

* 1500-600 Kilocycles

TUBES:

6A8	1st Detector, Oscillator
6K7	I. F. Amplifier
6Q7G	2nd Detector, 1st Audio, A. V. C.
6K6G	Audio Output
6X5G	Full Wave Rectifier

FREQUENCY RANGE: 1,540-510 Kilocycles

SENSITIVITY: (Specified for 500 milliwatts output. 1.2 volts across voice coil of speaker.)

1000 K.C.—Ant. (50 uuf dummy)	8.2 Microvolts
1000 K.C.—Grid Cap 6A8 Tube	130 Microvolts
455 K.C.—Grid Cap 6A8 Tube	110 Microvolts
455 K.C.—Grid Cap of 6K7 Tube,	5,200 Microvolts

BALANCING INSTRUCTIONS MODEL 6 ARVIN CAR RADIO

1. Connect the balancing oscillator to the grid cap of the 6A8 tube through a .0002 mfd. condenser. Place a 200,000 ohm resistor between the grid cap of the 6A8 and the grid clip which normally fits on the cap of the 6A8 tube. This will maintain the grid bias on the tube during alignment.
2. Adjust padders 1, 2, 3, and 4 for maximum output.
3. Rotate the Variator shaft to its mid-point position.
4. Reading from left to right the push buttons cover the following frequencies:

Button No.	Frequency Range	Oscillator Padder No.	Antenna Padder No.
A	1550-1050	5	6
B	1350-850	7	8
C	1350-850	9	10
D	1100-650	11	12
E	1100-650	13	14
F	950-510	15	16

Push button frequencies are adjusted by the padder screws directly above and below each individual push button. For example, suppose a station operating on 1400 K.C. was desired; this is within the range of button A only.

a. Connect a balancing oscillator to the set antenna terminal through a 50 uuf dummy antenna.

b. With an input frequency of 1400 K.C., adjust padder No. 5 to resonance. Adjust padder No. 6 for maximum output.

Follow the same procedure for any of the other buttons always selecting a frequency within range of the respective buttons.

5. Final adjustment of the Antenna padders should be made with the receiver installed in the car connected to the car antenna.

MODEL 22A ARVIN CAR RADIO BALANCING INSTRUCTIONS

SPECIAL NOTE: Model 22A Arvin Car Radio has been designed to utilize the advantages of the exclusive Arvin Permatune Intermediate Frequency Transformers which are prebalanced at the factory and sealed to prevent frequency drift. This Arvin feature greatly simplifies balancing procedure. It is necessary, therefore, to adjust only the three screws located on the tuning condenser as follows:

1. Rotate the tuning condenser completely out of mesh. Connect the balancing oscillator to the antenna lead through a 200 uuf. dummy antenna. Ground the balancing oscillator to the antenna cable shield.
2. With the balancing oscillator set to 1,575 K. C. adjust padder No. 1 to resonance.
3. Reset the balancing oscillator to 1,400 K. C. Rotate the tuning condenser until the signal is tuned to resonance. Reduce the output of the balancing oscillator until the signal barely deflects the output meter.
4. Adjust padders Nos. 2 and 3 until a maximum output reading is obtained.
5. After installation of the radio receiver in an automobile, tune in a very weak station between 1,300 and 1,500 K. C. and readjust padder No. 3 for maximum output.

The sensitivity may be determined by reading the number of microvolts input required to produce 500 milliwatts output. That output is obtained when a reading of 1.2 volts across the voice coil of the speaker is indicated by the output meter.

MODEL 32 ARVIN CAR RADIO BALANCING INSTRUCTIONS

SPECIAL NOTE: Model 32 and 42 Arvin Car Radio has been designed to utilize the advantages of the Exclusive Arvin Permatune Intermediate Frequency Transformers which are prebalanced and sealed at the factory to prevent intermediate frequency drift. This Arvin feature greatly simplifies balancing procedure. It is necessary therefore to adjust only the three screws located on the variable tuning condenser as follows:

1. Rotate the tuning condenser until the rotor plates are completely out of mesh. Connect the balancing oscillator to the antenna input lead of the Phantom Filter through a 50 uuf. dummy antenna. Ground the balancing oscillator to the Phantom Filter red junction box.
2. With the balancing oscillator set to 1,575 K. C. adjust padder No. 1 to resonance.
3. Reset the balancing oscillator to 1,400 K. C.; rotate the tuning condenser until this signal is tuned to resonance. Reduce the output of the balancing oscillator until the signal barely deflects the output meter.
4. Adjust padder Nos. 2 and 3 until a maximum output reading is obtained.
5. After installation of the radio receiver in an automobile, tune in a very weak station between 1,300 and 1,500 K. C. and readjust padder No. 3 for maximum output.

The sensitivity of this receiver may be determined by reading the number of microvolts input required to produce 100 watt output. That output is obtained when a reading of 1.9 volts across the voice coil of the speaker is indicated by the output meter.

MODEL 9A ARVIN CAR RADIO BALANCING INSTRUCTIONS

SPECIAL NOTE: All Arvin 1937 model car radios are designed to use the Exclusive Arvin Permaset prebalanced intermediate frequency transformers, which require no adjustment whatsoever. This Arvin feature greatly simplifies balancing procedure. It is necessary, therefore, to adjust only the three screws located on the tuning condenser as follows:

See page 51 for trimmer condenser locations.

1. Rotate the tuning condenser completely out of mesh. Connect the balancing oscillator to the antenna lead. Ground the balancing oscillator to the radio chassis.
2. With the balancing oscillator set to 1575 K. C. adjust padder condenser No. 1 for maximum output.
3. Reset the balancing oscillator to 1400 K. C. Rotate the tuning condenser until this signal is tuned to resonance. Reduce the output of the balancing oscillator until the signal barely deflects the output meter.
4. Adjust padders No. 2 and No. 3 until maximum output reading is obtained.
5. After installation in car tune in a WEAK station between 1150 and 1400 K. C. and readjust padder No. 3 for maximum output.

BALANCING INSTRUCTIONS

CAUTION: The signal generator dummy antenna should be grounded to the radio chassis through a .10 mfd. condenser. Do not make a direct connection as the chassis of the radio is connected directly to one side of the 110 volt light lines and may seriously damage the balancing oscillator attenuator if connected without a blocking condenser

Operation No.	Connect Balancing Oscillator to:	Balancing Oscillator Frequency	Adjust Padder Number	Dial Setting

ELECTRICAL SPECIFICATIONS

TUBES:

- 6A7—1st Detector-Oscillator
- 6D6—1st I. F. Amplifier
- 6Q7G—2nd Detector, A V C 1st Audio Amplifier
- 25B6G—Audio Output Power Amplifier
- 25Z5—Rectifier
- BK49D—Ballast

FREQUENCY RANGE:

Band A—550 to 1725 Kilocycles
Band B—2.00-6.27 megacycles

POWER OUTPUT: 1.9 watts

SPEAKER: 6″ Dynamic, 3 ohm voice coil

VOLTAGE AND FREQUENCY: 110 V. AC or DC; 25 to 133 cycles

SENSITIVITY:

Band A— 75 microvolts minimum for 50 milliwatts output
Band B—120 microvolts minimum for 50 milliwatts output

INTERMEDIATE FREQUENCY:

150 microvolts minimum for 50 milliwatts output; 456 Kilocycles

WATTS POWER CONSUMPTION: 70 watts

POINT TO POINT RESISTANCES

BK49D	Total drop terminals 3 to 7—41.1 volts A. C. or D. C.					......		......	......

Readings taken with a vacuum tube voltmeter and no input signal. With 100,000 microvolts input 6A7 and 6D6 grid bias will be approximately 20 volts.

Oscillator grid voltage 600 K. C. to 1500 K. C.

BALANCING INSTRUCTIONS

1. Connect the balancing oscillator to the grid cap of the 6A7 tube after removing the grid clip. With an input signal of 456 K. C., adjust padders 1, 2, 3 and 4 to maximum output. The Intermediate Frequency sensitivity should be at least 150 microvolts for 50 milliwatts output.

2. Rotate the tuning condenser to wide open position. Check the dial pointer to see that it is parallel to the horizontal line across the dial face.

3. Connect the signal generator to the antenna lead wire (green) on the rear of the receiver through a 200 micromicrofarad dummy antenna. With the dial pointer set to 1400 kilocycles and a similar input from the signal generator adjust padder No. 5 to resonance. Adjust padder No. 6 to maximum output.

4. Set dial pointer to 600 K. C. and with an input frequency of 600 K. C. adjust padder No. 7 to resonance. Return to 1400 K. C. and recheck padders 5 and 6.

5. Turn band switch to short wave position. Set dial pointer to 5 megacycles and with an input of the same frequency adjust padder No. 8 to resonance. Adjust padder No. 9 for maximum output.

6. With an input of 456 K. C. into the antenna wire of the receiver adjust padder No. 10 for minimum output. This is the wave trap circuit for 456 kilocycle code interference.

MODEL Presto-Station Changer
MODEL Push-Button Tuner
Instructions, Notes

NOBLITT-SPARKS INDUSTRIES, INC.

INSTRUCTIONS FOR SETTING UP ARVIN PRESTO-STATION-CHANGER

The Arvin Presto-Station-Changer offers a means whereby ten stations may be pre-selected and set up on the buttons so that thereafter an operator may receive any one of these ten stations by a simple direct mechanical motion applied to the dial.

Each button on the Arvin Presto-Station-Changer covers a certain group of frequencies on the dial. Identifying these buttons in a clockwise direction from the wide space between two of the buttons on the dial, each button covers a group of frequencies as follows:

(1) End of scale to 1630 K. C.
(2) 1630 to 1420 K. C.
(3) 1420 to 1210 K. C.
(4) 1210 to 1030 K. C.
(5) 1030 to 880 K. C.
(6) 880 to 770 K. C.
(7) 770 to 680 K. C.
(8) 680 to 620 K. C.
(9) 620 to 575 K. C.
(10) 575 K. C. to end of scale.

With these above bands in mind for each button, one should first select a station for each button whose transmission frequency falls within the band for that button. A list of these stations together with their frequencies should be made.

With this list made out, the actual operation of setting up the stations on the Arvin Presto-Station-Changer may be made. From this point on, the instructions will be general, applying to any of the buttons.

The receiver should be placed in operating condition by connecting an antenna and plugging the line cord into a suitable outlet. The receiver is turned on by means of the knob in the center of the front panel. This knob has three positions. In the full counter-clockwise position (No. 1) the receiver is "off." In the center position (No. 2) the receiver is turned "on" and the automatic frequency control circuits are in operation. In the full clockwise position (No. 3) the set remains "on," but the automatic frequency control circuit no longer functions. This third position is provided mainly as a convenience in setting up the Arvin Presto-Station-Changer, and for those who desire to accomplish exact manual tuning prior to holding the station in with the automatic frequency control circuit. To set up the Arvin Presto-Station-Changer, this center switch should then be in the maximum clockwise position, i. e. position No. 3.

The band switch should be in the broadcast or full counter-clockwise position.

Unscrew the center knob by securely holding the escutcheon which covers the ten buttons, and turning the center knob in a counter-clockwise direction. Remove both the center knob and the center escutcheon, exposing the buttons beneath.

Tune in one of the above selected stations manually. It will be noted that the button corresponding to the band in which this station falls is now approximately at the bottom of the dial. Loosen this button by turning the bakelite cap counter-clockwise not more than two full turns. Depress the button with the index finger of the left hand and slowly rock the dial mechanism by turning the manual tuning control with the right hand, through an arc determined by the frequencies which this button covers. While the button is depressed, no signal will be heard, due to the action of the muting switch. When this button engages the gate, a distinct click will usually be heard. That this button properly engages the gate can be determined by again turning the manual tuning control with the button depressed and noting that the dial movement is limited to the arc previously described. With the button stll depressed, again tune in the desired station, noting the point of exact resonance on the electric eye above. Still keeping this button depressed and "on station," tighten the bakelite cap with the right hand. During this tightening operation, observe the electric eye to be sure that its degree of closure does not change.

To determine that this button has been properly set, turn the dial off-station and, depressing the button just set, return it to its former position of engagement with the gate. The station should again be tuned in. If it is not, loosen the button and repeat the operation just described.

When the button has been properly set, remove the station identification disc from the sheets supplied in the envelope in which these instructions were found. Place this disc in the center of the bakelite cap and push down firmly all around the edge.

There will be found in the envelope containing these instructions another small envelope in which has been placed ten transparent celluloid discs. One of these celluloid discs should be placed in the bakelite cap over the station identification disc and firmly pressed in place. The operation just described for setting up this one button on the Arvin Presto-Station-Changer should be repeated for all other stations chosen as above outlined.

When all stations have been set up, replace the center escutcheon and screw on the center knob.

When using the Arvin Presto-Station-Changer to tune in your favorite stations, the switch in the center of the panel should be in its No. 2 position. To perform the act of tuning, place the index finger on the button carrying the station call letters desired, push the button in firmly and rotate the dial to left or right with this same finger until the dial locks, with this button at the bottom. Withdrawing the finger opens the muting switch, allowing the set to operate.

INSTRUCTIONS FOR SETTING UP ARVIN PUSH-BUTTON TUNING

FIRST: Put the set in operation in accordance with the instruction sheet furnished with the receiver. Next, make a list of the stations that are desired on the push-button selector, arranging them in order as to their assigned frequencies and placing the lowest frequency station at the top of the list, etc.

SECOND: Assign the stations to the buttons, starting with the first button on the left and the station with the lowest frequency—making certain that each station falls into the assigned frequency group for each button as listed below:

10 Button	Kilocycle Coverage	Station Desired	6 Button
1.	530-610		1.
2.	530-610		
3.	590-700		2.
4.	590-700		3.
5.	680-900		4.
6.	680-900		
7.	800-1150		5.
8.	800-1150		
9.	1050-1550		6.
10.	1050-1550		

The above frequency coverage is only approximate for each button, as there is a tolerance at each end of the coverage so that additional stations may be accommodated should there be more stations desired in a given group than there are buttons allotted to that group.

THIRD: The actual adjustment is made as follows: (1) Turn the middle knob on the front of the set clockwise as far as it will go. (2) Tune in manually the first station on the list, then (3) Starting at the left hand side depress the first button and (4) Turn the band switch until the words "push-button" appear in the small lighted opening on the left of the dial.

FOURTH: Turning now to the back of the set: (1) Loosen the electric-eye tube and turn it around so as to be visible from the back of the set when making adjustments. (2) With a long screw-driver, adjust the lower padder screw directly behind the first button until the program from the desired station is audible.

FIFTH: Adjust the padder condenser screw on the middle row directly behind the first button for maximum closing of the electric-eye tube. Follow the same procedure for the padder screw on the top row directly behind the first button.

SIXTH: Now readjust the bottom screw for maximum closing of the electric-eye tube and repeat on the middle and top screws. The first station is now tuned in properly on No. 1 button. Care must be taken so that the same station is tuned in on the lower padder screw as is tuned in manually, as it is possible to confuse another station broadcasting the same program if it is a "chain program" with the original.

SEVENTH: Locate the second station on the list by manually tuning it in with the wave-band switch in the broadcast position. Then change the wave-band switch to push-button station—this time by adjusting the lower padder screw directly behind the second button. Then follow the same procedure as when setting up the first button. Repeat this for the remaining button.

FINALLY: After all buttons are set, the middle knob should be switched to "AFC on" position and left there whenever the Push-Button Station Selector is used.

After all the stations have been selected their respective call letters may be inserted in the escutcheon plate provided in the receiver operating instruction envelope.

Cut out the call letters of the desired stations and place over them one of the small tabs of celluloid provided. Push the call letter and celluloid tab together into the slot provided in the escutcheon.

When all of the tabs have been inserted the escutcheon should be attached to the radio cabinet by the wood screws and trim washers provided.

NOBLITT-SPARKS INDUSTRIES, INC.

MODELS 1237, 1237D, 1247, 1247D and 1427 ARVIN RADIOS

BALANCING INSTRUCTIONS

All sensitivity measurements should be made with a standard output or AC voltmeter connected directly across the voice coil terminals of the speaker. For convenience in checking sensitivity, standard output is obtained when a reading of 1.12 volts is reached. For sensitivity measurements it is necessary to use a calibrated signal generator although any good balancing oscillator is satisfactory for aligning the 12-tube Arvin Radio chassis. If a calibrated signal generator is used for the balancing procedure described, a dummy antenna should be inserted between the radio chassis and the generator as follows:

Broadcast Band: 200 mmf
Mid-band: 400 ohms
Short Wave Band: 400 ohms

SPECIAL NOTE: Place the receiver in operation by turning the AC switch to the extreme right. Switch is located in the center of the radio chassis.

Adjustment of 100 K. C. Intermediate Frequency Stages

Connect the signal generator to the grid cap of the 2nd 6A8G tube through a .002 mfd. condenser. Place a 200,000 ohm resistor between the grid cap of the 2nd 6A8G and the grid clip leading to the 455 K. C. I. F. Transformer. This will maintain the AVC bias on this tube during alignment.
Adjust padders 1, 2, 3 and 4 for maximum output.

Adjustment of Discriminator Circuit with a Vacuum Tube Voltmeter

1. Connect the vacuum tube voltmeter between ground and the No. 8 cathode terminal of the 6H6G discriminator bias rectifier tube.
2. Turn padder No. 5 to maximum clockwise position.
3. Adjust padder No. 6 for minimum voltage as indicated by vacuum tube voltmeter.
4. Short cathode of 6H6G tube to ground and adjust vacuum tube voltmeter to half scale reading. This is done so that voltages either positive or negative with respect to ground potential may be read without the necessity of reversing the voltmeter input terminals. Disconnect 6H6G cathode from ground.
5. Adjust padder No. 5 until same half scale reading is obtained that was selected above when the cathode of the 6H6G tube was grounded.
6. Check this adjustment further by varying the frequency of the signal generator plus and minus noting the maximum positive and negative voltages developed as indicated by the vacuum tube voltmeter. The voltages developed above and below the half scale reading should be equal or at least within 10% of each other. Disconnect the vacuum tube voltmeter.

Adjustment of 355 K. C. Oscillator Coil

1. Set the output of the signal generator to 455 K. C. and adjust padder No. 7 for maximum output.

Adjustment of 455 K. C. Oscillator Coil

1. Connect the signal generator to the grid cap of the first 6A8G tube and with 455 K. C. input adjust padders Nos. 8 and 9 for maximum output.

Adjustment of the Broadcast Band Padders

* Push button models only. See note at bottom of page for details on Arvin 1237 Presto-Station Changer Models.

1. Connect the signal generator through a 200 mmf. dummy antenna to the terminals marked "A" and "G" on the rear of the radio chassis.
2. Check the setting of the dial pointer by rotating the tuning condenser completely into mesh. The dial pointer should line up with the end of the calibrated dial scale. Re-set the pointer if it is not adjusted properly.
3. Set pointer to 1,400 K. C. and adjust padder No. 10 for resonance. This padder is located on the underside of the chassis on the rear section of the wave switch on all Push Button Model 12-tube Arvin Radio chassis.
4. Adjust padders 11 and 12 for maximum output. These padders are also located on the band switch on the center and front sections respectively.
5. Rotate the dial pointer to 600 K. C. and adjust series padder No. 13 for maximum output. It is advisable to then return to 1,400 K. C. and recheck padders 10, 11 and 12.

MODEL 1427 ARVIN HOME RADIO

Adjustment of the Mid-Band Padders

1. Substitute for the 200 mmf. dummy antenna one having 800 ohms output impedance.
2. Set band switch on mid-band position. Rotate dial pointer to 4.5 megacycles. Adjust padder No. 14 to resonance. Adjust padders 15 and 16 for maximum output.

Adjustment of 4.75-7.5 M. C. Band Padders
(Dial Scale Printed in Black)

1. Set band switch indicator to short wave position indicated by the words "Short Wave" printed in black. Rotate dial pointer to 7.25 megacycles and adjust padder No. 17 to resonance. This may be accomplished by screwing the padder to the extreme clockwise position. Rotate padder screw counter-clockwise, selecting the second resonance point reached.
2. Adjust padders 18 and 19 for maximum output.
3. Rotate dial pointer to 5.0 megacycles. Adjust series padder No. 20 to resonance. It is advisable to then return to 5.0 megacycles and recheck padders No. 17, 18 and 19.

Adjustment of 7.5-12 M. C. Band Padders
(Dial Scale Printed in Red)

1. Set band switch indicator to short wave position indicated by the words "short wave" printed in red. Rotate dial points to 11.5 M. C. and adjust padder No. 21 to resonance. This may be accomplished by screwing the padder to the extreme clockwise position. Rotate padder screw counter-clockwise, selecting the second resonance point reached.
2. Adjust padders No. 22 and 23 for maximum output.

Adjustment of 12.0-18.0 M. C. Band Padders
(Dial Scale Printed in Blue)

1. Set band switch indicator to short wave position indicated by the words "short wave" printed in blue. Rotate dial pointer to 16.0 M. C. and adjust padder No. 24 to resonance. This may be accomplished by screwing the padder to extreme clockwise position. Then rotate padder screw counter clockwise, selecting the second resonance point reached.
2. Adjust padders No. 25 and 26 for maximum output.

Check the Receiver for Sensitivity

After completion of balancing procedure the radio should be checked for sensitivities as follows:

Frequency	*Average sensitivity for Standard Output (1.12 volts across voice coil)*
1,400 K. C.	10 Microvolts
600 K. C.	10 Microvolts
2.0 M. C.	40 Microvolts
4.5 M. C.	20 Microvolts
5.0 M. C.	30 Microvolts
7.25 M. C.	40 Microvolts
8.0 M. C.	30 Microvolts
11.5 M. C.	40 Microvolts
13.0 M. C.	30 Microvolts
16.0 M. C.	40 Microvolts

Average Sensitivities per Stage (1.12 Volts Across Voice Coil)

Point of Input from Signal Generator	*Frequency*	*Input Required to Produce 1.12 Volts Across Voice Coil*
Diode 6H6G	100 K. C.	600,000 Microvolts
6K7G I. F. Grid	100 K. C.	25,000 Microvolts
2nd 6A8G Grid	100 K. C.	1,200 Microvolts
2nd 6A8G Grid	455 K. C.	1,500 Microvolts
1st 6A8G Grid	455 K. C.	100 Microvolts
1st 6A8G Grid	1,000 K. C.	110 Microvolts
R. F. 6K7G Grid	1,000 K. C.	40 Microvolts
Antenna	1,000 K. C.	7 Microvolts

MODELS 1237, 1237D, 1247 ARVIN HOME RADIOS

Adjustment of Short-Wave Band Padders

1. Set band switch on short wave position. Rotate dial pointer to 15 megacycles. Adjust padder No. 17 to resonance. This may be accomplished by screwing the padder condenser to the extreme clock-wise position. Rotate counter clock-wise, selecting the second resonance point reached. This will insure that the oscillator circuit is balanced to the fundamental frequency instead of the image frequency.
2. Adjust padders 18 and 19 for maximum output.

Check the Receiver for Sensitivity

After completion of balancing procedure the radio receiver should be checked for sensitivities as follows:

Frequency	*Average sensitivity for Standard Output (1.12 volts across voice coil)*
1,400 K. C.	20 Microvolts
600 K. C.	10 Microvolts
4.5 M. C.	25 Microvolts
2.0 M. C.	40 Microvolts
14 M. C.	50 Microvolts
6 M. C.	6 Microvolts

**** Special Instructions for Model 1237 Arvin Radios with Presto Station Changer***

Arvin radio chassis model 1237 with Presto Station Changer have the broadcast padders located in the coil cans rather than on the under side of the radio chassis as Model 1237-D Push Button chassis. The padders are located as follows: The oscillator padder is the top adjusting screw in the oscillator coil can, located along side the rear section of the tuning condenser. The R. F. padder condenser is located in the top position on the coil can along side the center section of the tuning condenser. The antenna padder condenser is similarly located in the coil can along side the front section of the tuning condenser. The 600 K. C. padding condenser is located in identically the same place as the series padder No. 13 on the 1237-D chassis.

Adjustment of the Mid-Band Padders

1. Substitute for the 200 mmf. dummy antenna one having 800 ohms output impedance.
2. Set band switch on mid-band position. Rotate dial pointer to 4.5 megacycles. Adjust padder No. 14 to resonance. Adjust padders 15 and 16 for maximum output.

BELOW SERIAL NO. A-20,000

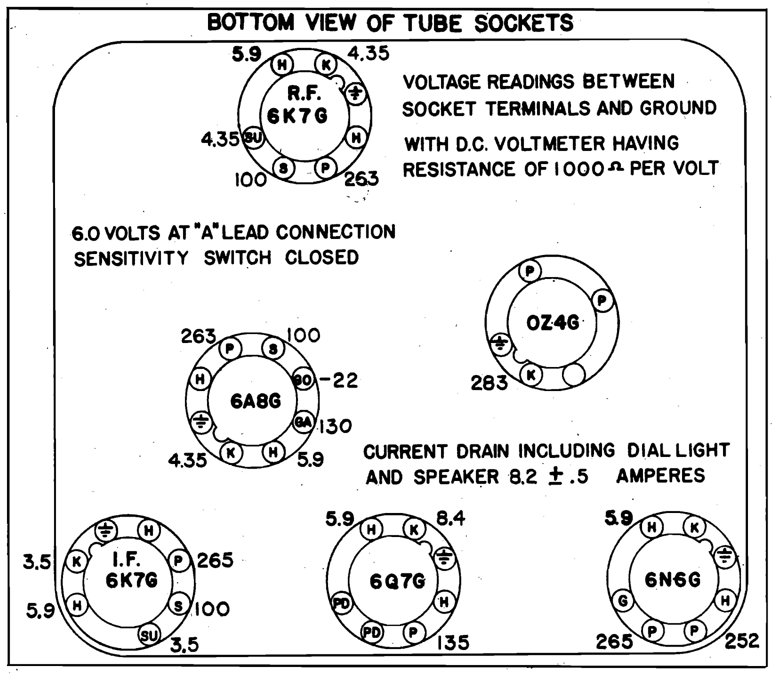
In order to reduce the battery drain on Model 982043, the rectifier tube 6X5G has been changed to an OZ4G rectifier tube. This change may be made in the field by adding the following items:

1 - Choke Coil, Part No. 7232229. 1 - .01 400 V. Condenser, Part No. 1209309. Shield for the OZ4G rectifier tube, Part No. 7231884.



Olds Model 982043
Date: 5-13-37

VOLTAGES WHEN OZ4G TUBE IS CHANGED IN THE FIELD.
Readings taken from tube socket contacts to ground with a D.C. Volt-meter having a resistance of 1000 OHMS per volts.

1. The connection between the K. of the 6X5G tube and the electrolytic condenser is broken and the choke coil is placed between the K. of this tube and the electrolytic condenser. The .01 condenser is placed between the K. of this same tube and ground. The small tube shield is placed over the OZ4G rectifier tube.

MODEL 982043,Early,Late
Alignment
Parts

OLDSMOBILE MOTOR CAR CO.

Antenna Circuit

The antenna circuit is directly coupled to the antenna in contrast with the capacity coupled circuit used in some previous Oldsmobile models. A small adjustable condenser is provided for adjusting the antenna circuit to the antenna. This adjustment is made near the high frequency end of the band (1400 K.C.) instead of at the low frequency end as with the capacity coupled sets.

Sensitivity Control

A "Local-Distance" switch is provided on the tuning control used with this receiver. In the "Distance" position, the receiver has its maximum sensitivity. In the "Local" position, the receiver functions with reduced sensitivity. The circuit is so designed so that when the sensitivity switch is either in the "Local" or "Distance" positions, the receiver operates with the same high selectivity.

All of the adjustable condensers in this receiver are very accurately adjusted at the factory and should need no further adjustment (excepting antenna condenser). If re-alignment is found to be necessary, the circuits can be properly adjusted only with the use of a calibrated test oscillator or signal generator and an output meter.

DO NOT ATTEMPT TO PEAK THE 1-F STAGES OF THIS RECEIVER WITHOUT CAREFULLY NOTING THE FOLLOWING INSTRUCTIONS:

Connecting the Output Meter

Connect one terminal of the output meter to the plate of the 6N6G output tube. Insert in series with this lead a .1 mfd. or larger, 600 volt condenser. Connect the other terminal of the output meter to the chassis frame. The purpose of the series condenser is to protect the meter from damage.

1. Peaking the I.F. stages at 262 Kilocycles

Before any attempt is made to peak the receiver, the "sensitivity" control must be in the "Distance" position.

If the control head is not removed from the car, use any convenient method to short the connections of the tone control and sensitivity control receptacle.

Short circuit the connections as shown in Figure 1 with the control plug properly shorted.

(a) Connect the ground lead of the test oscillator to the chassis frame.

Connect a .1 mfd. condenser in series with the other lead and connect this lead to the grid clip of the translator 6A8G tube leaving the grid clip in place.

The .1 mfd. condenser is necessary to prevent the oscillator circuit of the receiver from affecting the I.F. adjustment.

(b) Set the test oscillator on the 262 K.C.

(c) Turn the volume control of the receiver on full.

(d) Peak both I.F. trimmers on the 2nd I.F. coil. This is part 5 in the top view of the receiver, (Figure 2).

(e) Then peak both trimmers on the 1st I.F. coil, part 4 in the drawing, (Figure 2).

(f) In order to insure accurate settings of the I.F. trimmers, the above adjustments should be repeated, using the lowest oscillator output that will give a reasonable deflection of the output meter pointer. Make all adjustments for maximum output.

ALIGNING OSCILLATOR AND R.F. STAGES

(a) Connect the signal lead of the test oscillator to the antenna connector through a .00055 mfd. condenser.

(b) Set the test oscillator at exactly 1560 K.C.

(c) Turn the gang condenser completely out of mesh.

(d) Adjust the oscillator trimmer for maximum output. (Center section of the gang condenser).

(e) Set the test oscillator at 1400 K.C.

(f) Tune the gang condenser for maximum output.

(g) Adjust the R.F. trimmer for maximum output. (Top section)

(h) Adjust the antenna compensating condenser for maximum output. (Part 27 in Figure 3.)

(i) Set the test oscillator at 600 K.C.

(j) Tune the gang condenser for maximum output.

(k) Adjust the oscillator padding condenser (Part 28 in Figure 3) and at the same time rock the gang condenser back and forth through the signal. This operation should be continued until no further increase can be obtained.

(l) Repeat E, F, G, H.

(m) If the oscillator padding condenser was materially out of adjustment, it may be necessary to repeat the entire procedure for accurate adjustment.

OLDSMOBILE MOTOR CAR CO.

MODEL 982045(3 Types)
Alignment

GENERAL: The Oldsmobile Model 982044 is a six tube single unit receiver with tone and sensitivity control. This receiver was designed specifically for 1937 Model Oldsmobiles and is equipped with an instrument panel tuning control having a Local-Distance switch and variable tone control in addition to the tuning and volume controls.

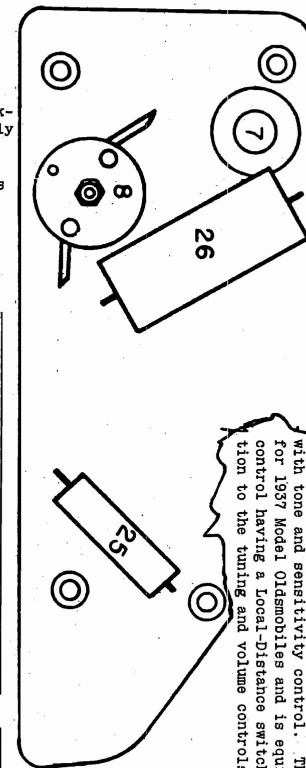

FIG. 4 PARTS LAYOUT UNDER SUB. PANEL 982044

MODELS 982044 and 982045
ALIGNMENT FOR ALL TYPES

1. Aligning I-F Stages at 262 Kilocycles

IMPORTANT: The "Local-Distance" switch on the tuning control used with this receiver is used to control the alignment of the first I-F coil windings. The capacity existing between the leads and the shielding of the cable connecting to the switch in the tuning control is part of the I-F tuned circuit and must be taken into consideration when aligning the I-F stages.

(a) Connect the signal lead of the signal generator to the grid cap of the 6A8G Translator Tube through a .1 mfd. condenser, leaving the tube's grid clip in place. Connect the ground lead of the signal generator to the chassis frame.

(b) Insert the four prong plug of the tuning control cable into the socket provided on the receiver chassis. Turn switch on tuning control to "DISTANCE" position. (If the receiver is aligned with the switch in the "local" position, the "Local-Distance" switch will operate backwards.)

(c) Connect the output meter from the plate prong of the 6F6G to ground. Care should be taken when connecting the output meter to insert a series condenser to protect the meter from D.C. voltages.

(d) Set the signal generator to exactly 262 K.C.

(e) Adjust the trimmers on the I-F coils for maximum output. These adjustments should be repeated several times.

Checking I-F Band Spread

The Model 165 Cathode Ray Oscillograph should be used to check the I-F band spread after completing the "Alignment Procedure". Slight adjustment of the I-F stages may be found necessary in order to obtain a symmetrical selectivity curve.

2. Aligning at 1520 Kilocycles

Leave the signal generator leads connected the same as for aligning the I-F circuits. Turn the rotor plates of the gang condenser all the way out and against the high frequency stop. Set the signal generator to 1520 kilocycles. Adjust the parallel trimmer for the oscillator section of the condenser gang for maximum output. (It is very important that this frequency be set accurately as a slight mis-setting will cause the receiver to be out of track over the entire high frequency end of the dial.)

3. Aligning at 540 Kilocycles

Leave signal generator leads connected the same as before. Turn the rotor plates of the gang condenser all the way into mesh so that they rest against the low frequency stop. Set the signal generator to 540 K.C. Adjust the oscillator padding condenser located on the under-side of the receiver sub-panel to maximum output.

4. Aligning at 1400 Kilocycles

Remove the signal lead of the signal generator from the grid of the translator tube and connect to the antenna terminal of the receiver THROUGH A .0005 mfd. MICA CONDENSER connected in place of the .1 mfd. condenser previously used. (It is very important that a .0005 mfd. mica condenser be used in aligning the antenna stage of these receivers in order that this circuit can be made to track properly.) Set the signal generator to 1400 K.C. Turn the condenser rotor plates until the frequency is tuned in with maximum output. Adjust the R-F parallel trimmer on the condenser gang and the antenna compensating condenser which is the parallel trimmer on the condenser gang

5. Aligning at 600 Kilocycles

The oscillator padding condenser was previously adjusted at 540 K.C. however, it is necessary in most cases to repeak the oscillator tracking condenser at 600 K.C. in order to make the receiver track properly and to secure full sensitivity.

Set the signal generator on 600 K.C. Turn the condenser rotor plates until the signal from the signal generator is tuned in with maximum output. Maintain a low output signal from the signal generator and readjust the oscillator tracking condenser while rocking the variable condenser gang tuning shaft back and forth through the signal. This operation should be continued until no further increase in output can be obtained.

TO ELIMINATE HARMONIC TWEETS

COMPLAINT: HIGH PITCHED WHISTLE OCCURRING WHEN TUNING INTO SIDE BAND OF STATION CARRIER AT APPROX. 786 K.C.

It has been found that some of the early deluxe radios, Model 982045, do have an objectional "tweet" although there are a percentage which appear normal.

The remedies below will eliminate this on even the worst offenders.

1. Move the grid lead of the 6U7G R.F. tube away from the 6N7G output tube.
2. The 1 MEG. A.V.C. filter resistance item No. 37 should be removed from the mounting strip in the front of the 2nd I.F. transformer and mounted near the sub-panel away from the I.F. transformer, to reduce coupling. (See sketch)
3. Bond the antenna connector metal case to the chassis ground.
4. Install a shield over the grid lead to the 6B7 Tube.
5. Remove the shield from the 6J5G audio Tube.
6. Install a shield over the 6V7G detector tube (use same type shield as used on a 6A8G tube).

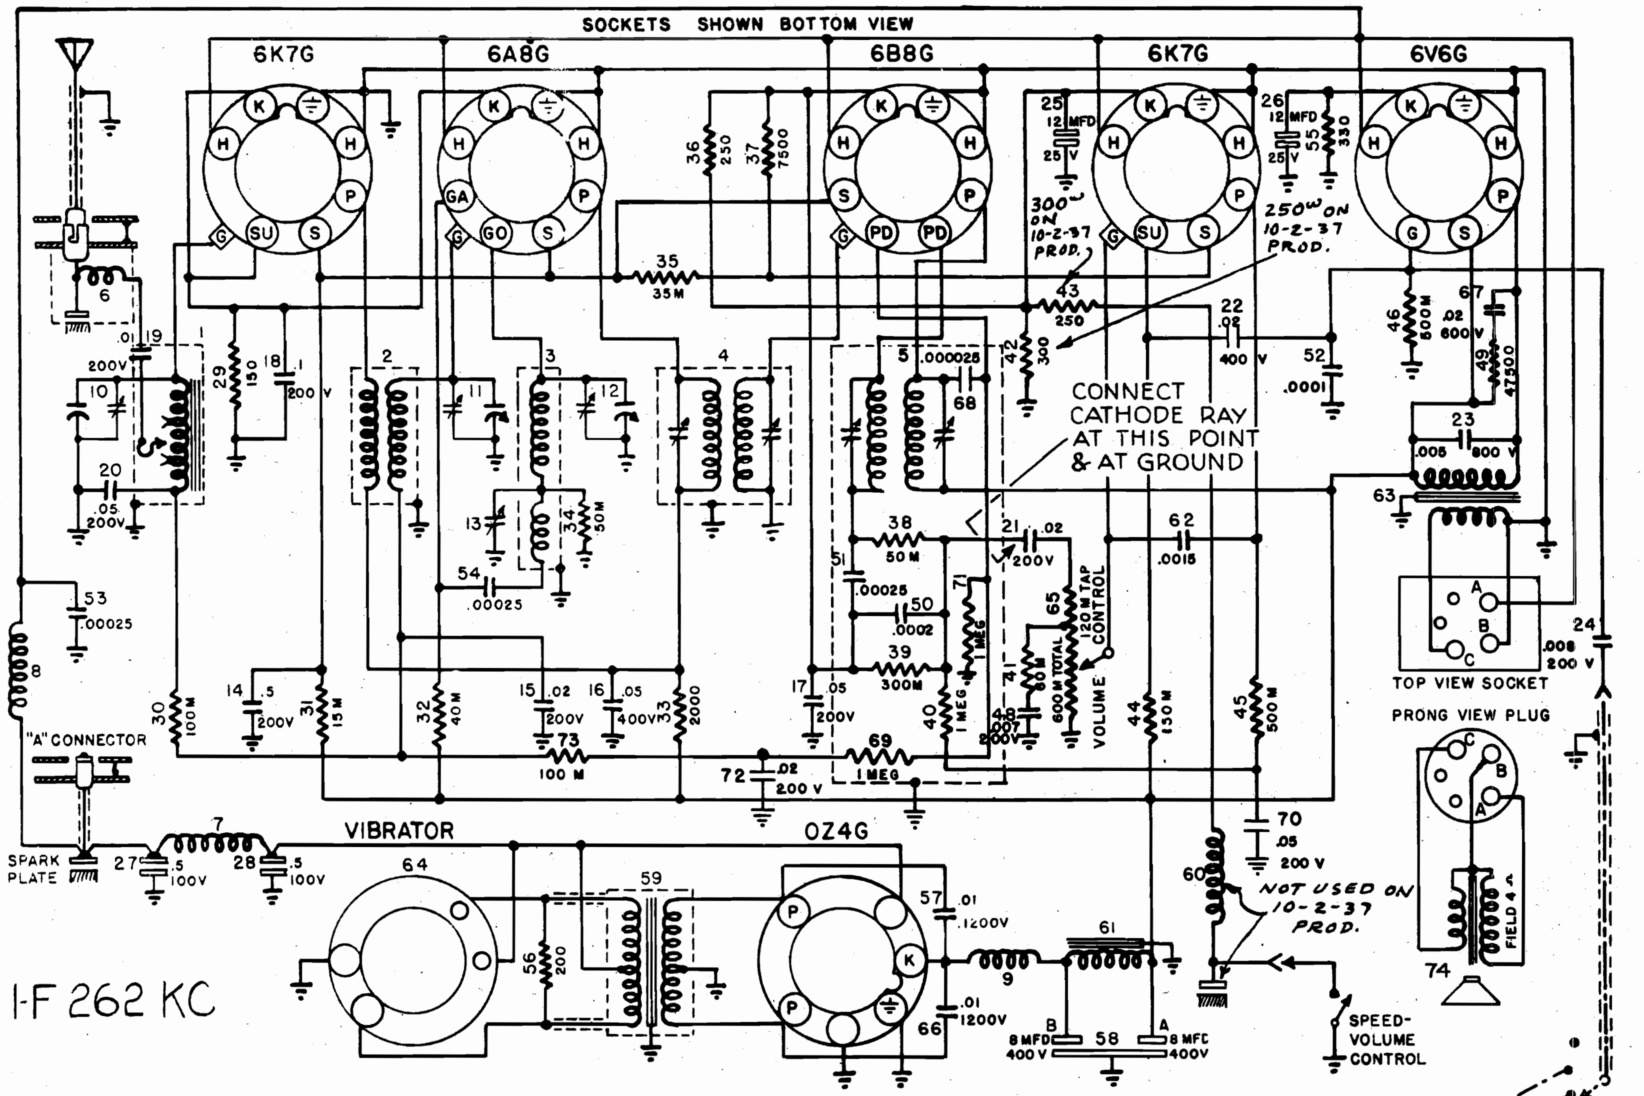
--PARTS LAYOUT--VIBRATOR FILTER

MODEL 982085,Early,Late
Schematic,Changes

OLDSMOBILE MOTOR CAR CO.



The Oldsmobile Model 982085 is a six tube single unit receiver with variable tone control. This receiver was designed specifically for 1938 Model Oldsmobiles and is equipped with an instrument panel tuning control having a variable tone control in addition to the tuning and volume controls.

FIG. 2--OLDS MODEL 982085 CIRCUIT DIAGRAM

MODEL 982085, Early, Late
Socket, Trimmers, Notes
Chassis Layout

OLDSMOBILE MOTOR CAR CO.

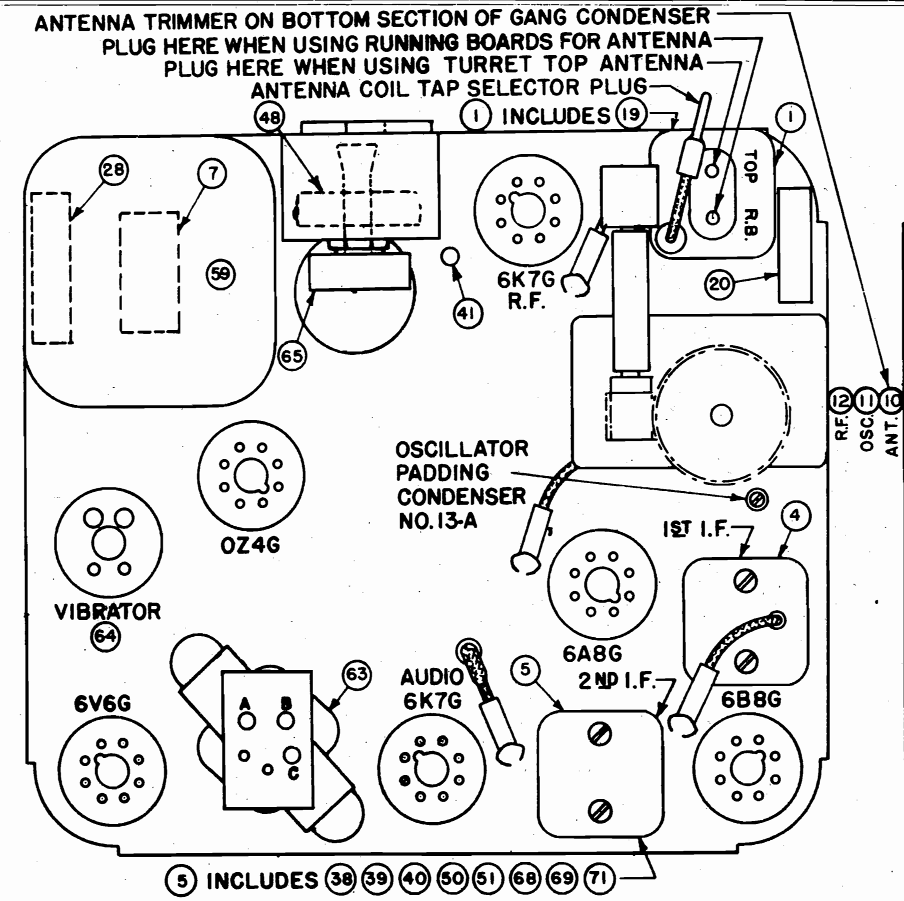


FIG. 2-PARTS LAYOUT-TOP VIEW

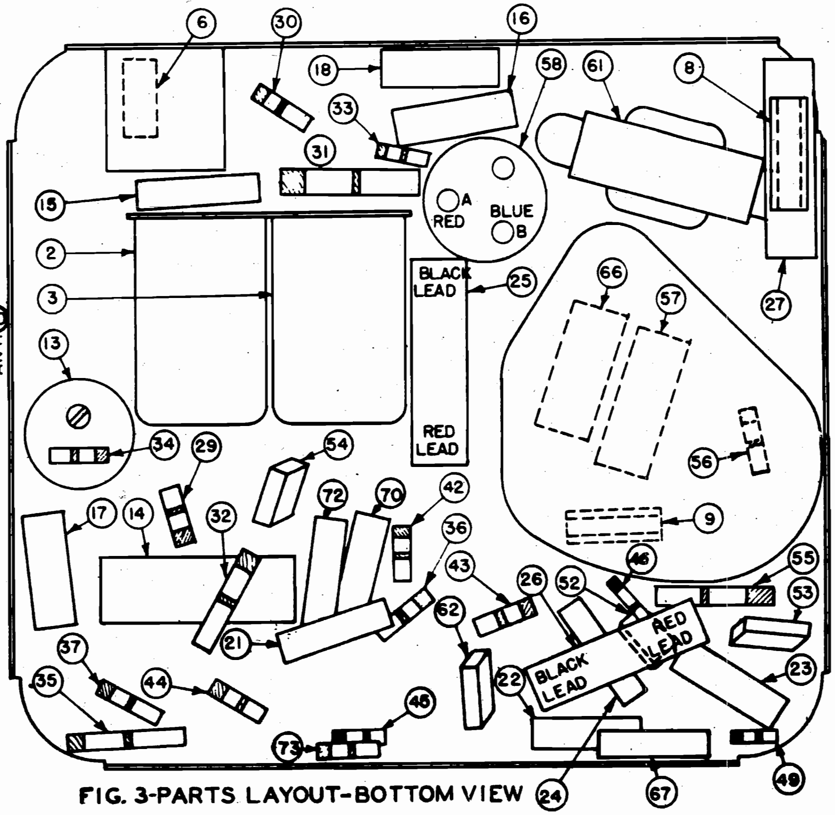

FIG. 3-PARTS LAYOUT-BOTTOM VIEW

FIG. 2-3 MODEL 982085 - PARTS LAYOUT

The Antenna Circuit is directly coupled to the antenna in contrast with the capacity coupled circuit used in some previous Oldsmobile models. There are two taps provided on the antenna coil, - one for use with the Running Board Antenna and the other for use with Overhead (Roof) Antenna. No adjustment is made to the antenna when used with the Running Board Antennas. When the Overhead (Roof) Antenna is used, the movable lead on the antenna coil should be moved to the other tap provided as indicated, and the antenna circuit should be adjusted to the antenna with the small antenna adjusting condenser provided. This adjustment is made near the high frequency end of the band (1400 K.C.) instead of at the low frequency end, as with the capacity coupled sets.

MODEL 982085,Early,Late
Alignment,Voltage

OLDSMOBILE MOTOR CAR CO

All of the adjustable condensers in this receiver are very accurately adjusted at the factory and should need no further adjustment (excepting antenna adjusting condenser when used with the Overhead (Roof) Antenna.) If realignment is found to be necessary, the circuits can be properly adjusted only with the use of a calibrated test oscillator or signal generator and an output meter.

DO NOT ATTEMPT TO PEAK THE I-F STAGES OF THIS RECEIVER WITHOUT CAREFULLY NOTING THE FOLLOWING INSTRUCTIONS:

CONNECTING THE OUTPUT METER

Connect one terminal of the output meter to the plate of the 6V6G output tube. Insert in series with this lead a .1 mfd., or larger, 600 Volt Condenser.

Connect the other terminal of the output meter to the chassis frame. The purpose of the series condenser is to protect the meter from damage.

1. Aligning I-F Stages at 262 Kilocycles:

   a. Connect the signal lead of the test oscillator to the grid cap of the 6A8G tube through a .1 mfd. condenser, leaving the tubes grid clip in place.

   b. Connect the ground lead of the test oscillator to the chassis frame.

   c. Set the test oscillator to exactly 262 K.C.

   d. Turn the volume control of the receiver on full.

   e. Peak both I-F trimmers on the 2nd I-F coil for maximum output. This is Illustration 5 in the top view of the Receiver, (Figure 2).

   f. Then peak both trimmers on the 1st I-F coil (Illustration 4, Figure 2).

   g. In order to insure accurate settings of the I-F trimmers, the above adjustments should be repeated several times and during alignment, the oscillator output should be kept to as low a value as is consistant with obtaining a readable indication on the output meter. Make all adjustments for maximum output.

2. Aligning at 1560 K.C.:

   a. To align the oscillator and R-F stages, connect the oscillator signal lead to the antenna connector through a .00055 mfd. condenser, leaving the ground lead of the oscillator connected to the chassis frame.

   b. Set the test oscillator to exactly 1560 K.C.

   c. Turn the rotor plates of the gang condenser all the way out and against the high frequency stop.

   d. Adjust the oscillator trimmer (Illustration 11, Figure 2) (center section of gang condenser) for maximum output.

   e. Set the test oscillator to exactly 1400 K.C.

   f. Turn the rotor plates until the 1400 K.C. frequency from the test oscillator is tuned in with maximum output.

   g. Adjust the R-F trimmer on the condenser gang (Illustration 12, Figure 2) (Top Section) for maximum output.

   h. Adjust the Antenna Compensating Condenser (Illustration 10, Figure 2) (Bottom Section) on the gang condenser for maximum output.

3. Aligning at 600 K.C.:

   a. Set the test oscillator to exactly 600 K.C.

   b. Turn the condenser rotor plates until the 600 K.C. frequency froL the test oscillator is tuned in with maximum output.

   c. Adjust the oscillator padding condenser (Illustration 13A, Figure 2) and at the same time rock the gang condenser back and forth through the signal. This operation should be continued until no further increase can be obtained.

   d. Repeat E-F-G-H under "ALIGNING AT 1560 K.C."

   e. If the oscillator padding condenser was materially out of adjustment, it may be necessary to repeat the entire procedure for accurate adjustment.

NOTE: "When the receiver leaves the factory, it is properly adjusted to obtain maximum results from the running board Antenna. No adjustment of any kind is required."

"If a TOP ANTENNA is to be used with this receiver, it is necessary to make two adjustments."

"SELECT PROPER ANTENNA COIL TAP. Remove the front cover of the receiver. In the upper right corner (See Figure 2) is the Antenna coil assembly Illustration No. 1. Two positions for the Tap Selector Plug are provided marked "R.B." and "TOP." Pull out the plug from position "R.B.," and insert in the position marked "TOP." Replace the front cover."

"ADJUST THE TRIMMER CONDENSER IN THE ANTENNA CIRCUIT. This condenser is located on the side of the Variable Gang Condenser and is on the section nearest the back cover (See Figure 5). Remove the Cover Plate on the right hand side of the receiver case to expose this adjusting screw."

"CAUTION - Receiver alignment may be upset if other trimmer screws are disturbed."

"PROCEDURE TO ADJUST ANTENNA TRIMMER CONDENSER. Tune in a BARELY AUDIBLE station between 140 and 150 on the dial with the volume control FULL-ON. With a small screw driver, adjust the Antenna trimmer Illustration No. 10, (See Figure 8) for MAXIMUM VOLUME."

"No further adjustment is necessary unless the Antenna with which the receiver is now tuned is changed."

ALIGNMENT DATA

INTERMEDIATE FREQUENCY: Set oscillator to 456 KC. Feed this to the grid of the pentagrid (6A8) converter tube. Adjust trimmers on the intermediate frequency transformers for peak readings as indicated on the output meter which is to be placed across the output transformer.

BROADCAST BAND: Adjust oscillator to 1400 KC and connect the output of the generator to the antenna connection at the rear of the chassis through a .0002 mfd. mica condenser. Set the pointer on the dial to 1400 KC making sure that the volume control is set at its maximum position. Adjust the antenna and oscillator trimmers for maximum signal (as indicated on the output meter). Re-set the dial pointer on the receiver and on the test oscillator to 600 KC and check for alignment.

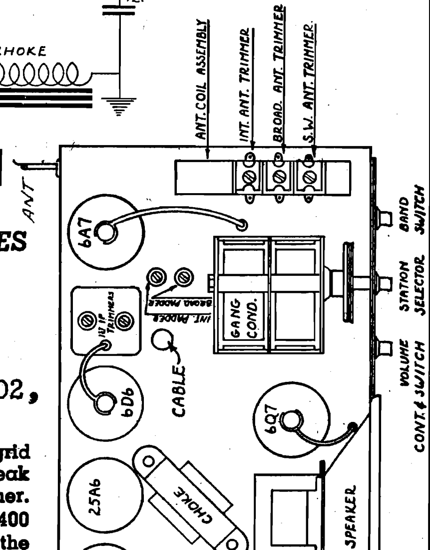
Center	Intermediate	1710— 5800 KC
Right	Short Wave (foreign)	5800—17500 KC



ALIGNMENT DATA FOR MODELS 35, 43, 302, 601, AND 8T-6V

INTERMEDIATE FREQUENCY: Set oscillator to 465 KC. Feed this to the grid of the pentagrid converter tube. Adjust trimmers on the intermediate frequency transformers for peak readings as indicated on the output meter which is to be placed across the output transformer.

BROADCAST BAND: Set the band switch for broadcast reception. Adjust oscillator to 1400 KC and connect the output of the generator to the antenna connection at the rear of the chassis through a .0002 mfd. mica condenser. Set the pointer on the dial to 1400 KC making sure that the volume control is set at its maximum position. Adjust the broadcast antenna and broadcast oscillator trimmers for maximum signal (as indicated on the output meter). Re-set the dial pointer on the receiver and on the test oscillator to 600 KC. Slowly increase or decrease the *broadcast padding* condenser while tuning back and forth across the signal with the station selector knob until the maximum reading is obtained on the output meter. Re-check the 1400 KC alignment as the adjustment at 600 KC may have slightly disturbed the original 1400 KC setting.

INTERMEDIATE BAND: For a dummy antenna use a .0002 mfd. mica condensor in series with a 400 ohm carbon resistor. Set band switch to the intermediate band position and feed a 5100 KC signal from the oscillator. Set dial pointer at 5100 KC. Adjust intermediate antenna and intermediate oscillator trimmers for maximum output. Re-set oscillator and set dial to approximately 1800 KC. Slowly increase or decrease the intermediate padding condenser while tuning back and forth across the signal with the station selector control until the maximum reading is obtained on the output meter. Re-check the 5100 KC adjustment.

SHORT WAVE: Set band switch on short wave position. Connect the antenna of the radio receiver to the output of the test oscillator through a 400 ohm carbon resistor. Set oscillator and receiver dial at 15 megacycles. Adjust the short wave antenna and short wave oscillator trimming condensers for maximum output as indicated by readings on the output meter. No other adjustments are necessary for aligning this band.

It is advisable to check the sensitivity at 6000 KC to determine whether the circuits are properly aligned. Should the receiver lack sensitivity at this frequency check the .0035 mica condenser for short circuit.

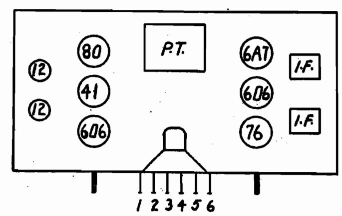
INSTRUCTIONS

Selector buttons are numbered from 1 to 5, reading from left to right. Stations selected should be placed in numerical order with respect to frequency. Lowest frequency should appear on Selector No. 1. Next lowest on Selector No. 2, and so on up to Selector No. 5 for station with highest frequency. For frequency, see above.

RECEIVERS LEAVE FACTORY ADJUSTED AS FOLLOWS: No. 1 button—600 K. C., No. 2—800 K. C., No. 3—1000 K. C., No. 4—1200 K. C., No. 5—1400 K. C.

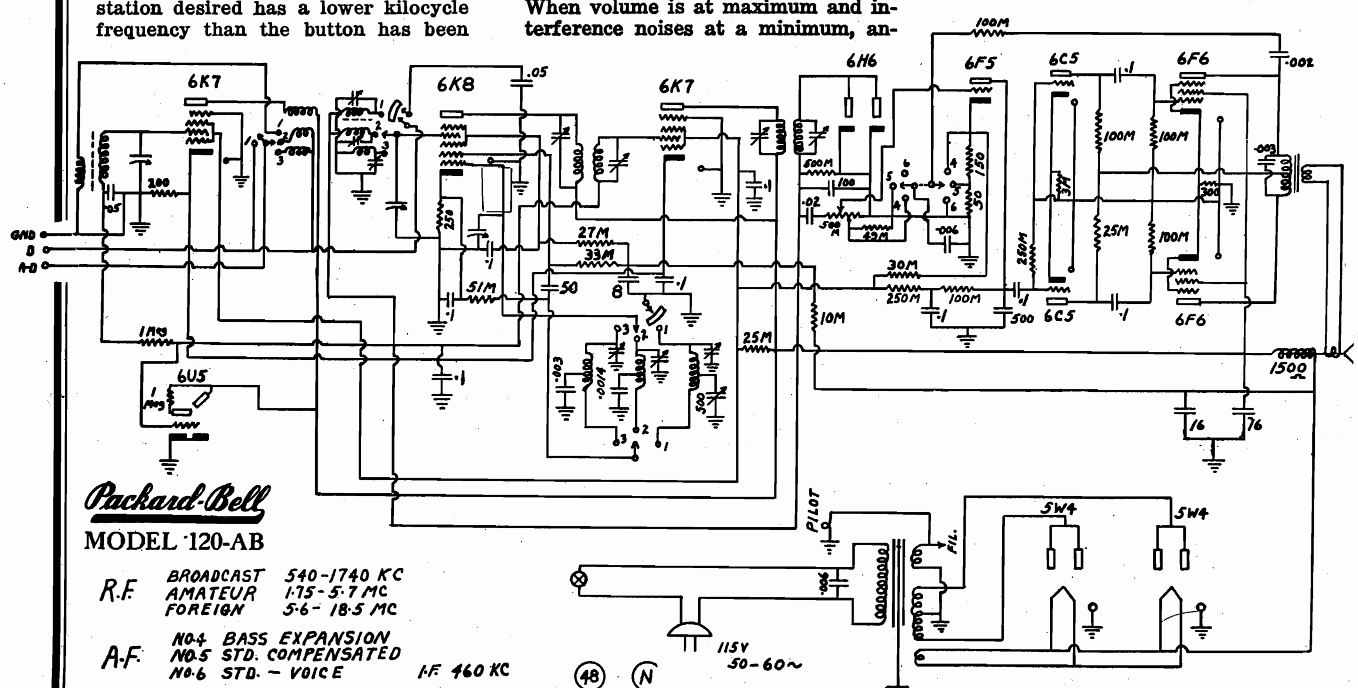
PROCEDURE: Five stations should first be selected and considered in numerical order according to kilocycles. The station with the lowest frequency number should be assigned to the first push button—and so on.



Push button No. 1 to "IN" position, then select station assigned this button by turning Oscillator (Station selector) screw No. 1 until station is heard best, then further adjust by turning Antenna Trimmer screw No. 1 until station is heard with maximum volume and clarity. Remember, you can check your accuracy in setting the stations on the buttons by tuning the receiver manually to the station and then pushing the station button and comparing the results. (If the station desired has a lower kilocycle frequency than the button has been set at the factory, turn the oscillator screw clockwise to find the station, or, if higher, turn counter-clockwise.) After the first station is set, repeat this procedure with the second station, pushing button No. 2 and adjusting oscillator screw No. 2 and antenna screw No. 2, in order to set for the station desired. Repeat this procedure until all five stations are set.

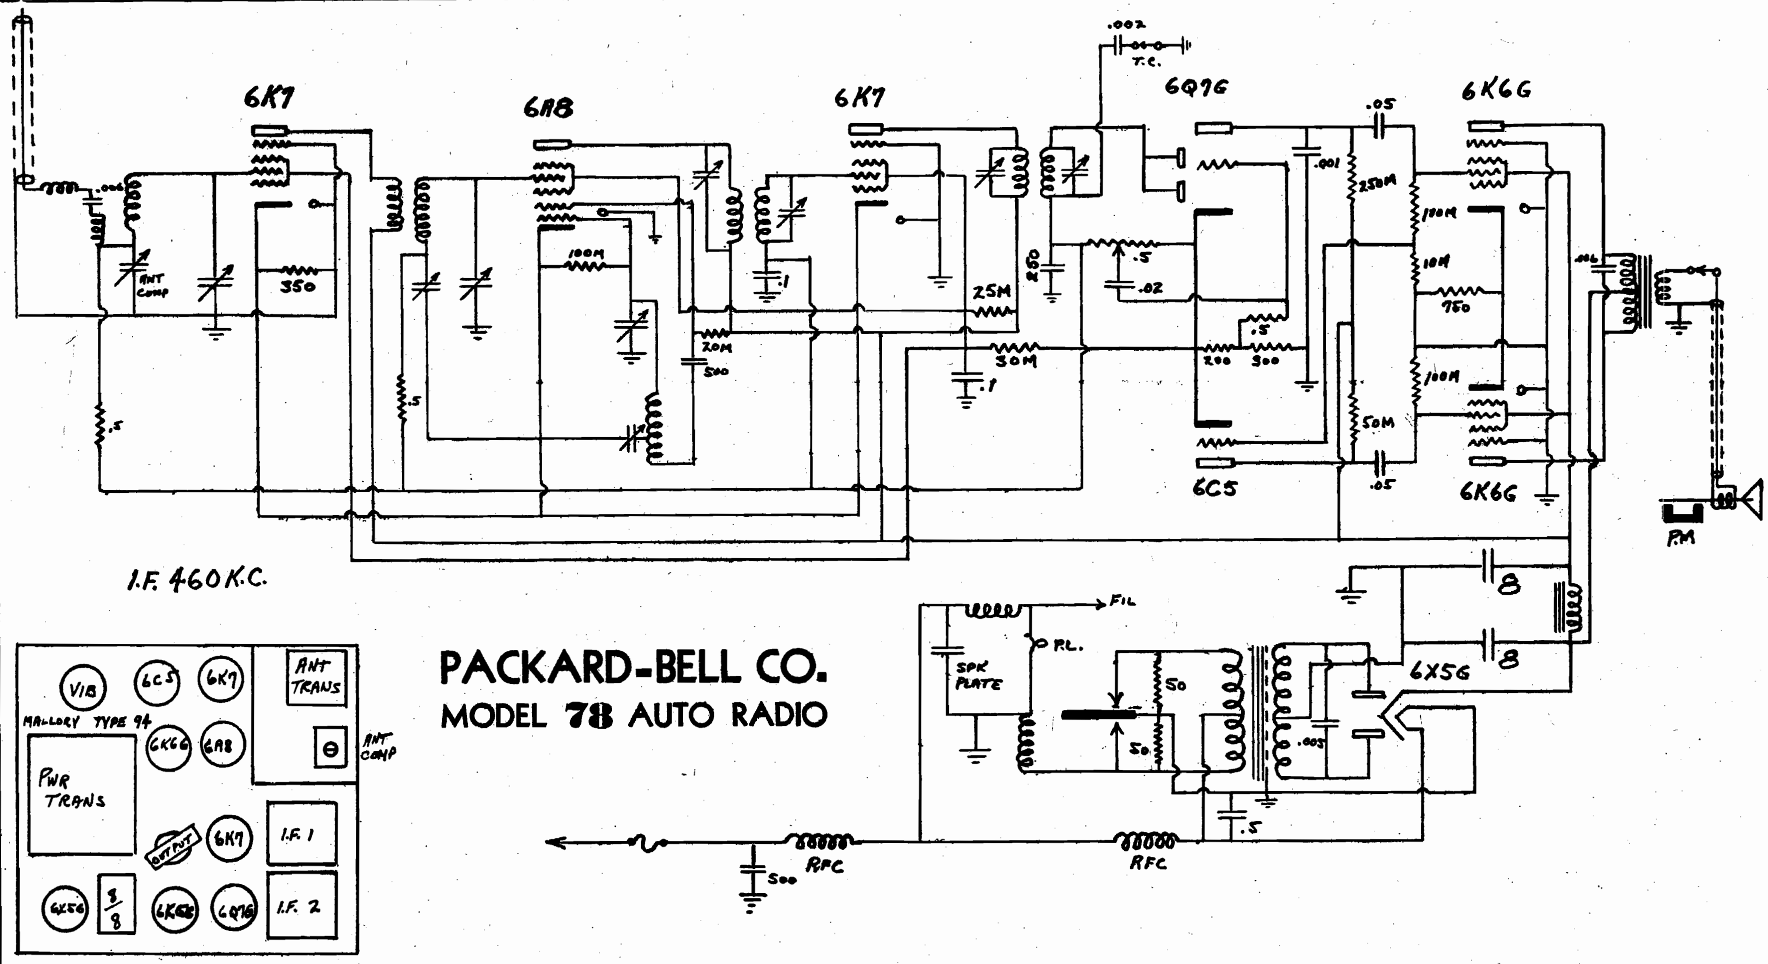
Antenna adjustment should be made **after oscillator screw has been set. When volume is at maximum and interference noises at a minimum, antenna adjustment is correct.**

The push button marked "dial" is for the sole purpose of changing to manual tuning. However, do not use this button to change from manual to push button tuning—simply push button desired and the receiver will be on push button tuning until the button marked "dial" is used.



MODEL 78 Auto
Schematic, Socket
Alignment

PACKARD BELL CO.



ADJUSTMENT OF DIAL is accomplished by removing pilot light in rear of control head and inserting small screw-driver in slot provided for this purpose, turning pointer to desired setting.

ANTENNA COMPENSATOR is located in front corner of box and may be trimmed with a small screw driver, preferably insulated. To do so, remove button in box.

Turn station selector knob to right until stop is reached; adjust dial pointer to right hand stop line mark on dial face. This sets pointer for calibration.

Tune in a weak signal between 550 and 650 Kcs. and adjust compensator for maximum volume . . . no other adjustments are necessary as radio will be perfectly matched to your antenna.

In cases where antenna or lead wire contribute excessive capacity to system a small series by-pass condenser of from 250 to 500 micro-microfarads capacity must be connected in series at the receiver and shielded.

Excessive antenna capacity may be detected by an apparent broad trimming action when adjusting compensator.

PATTERSON RADIO CO.

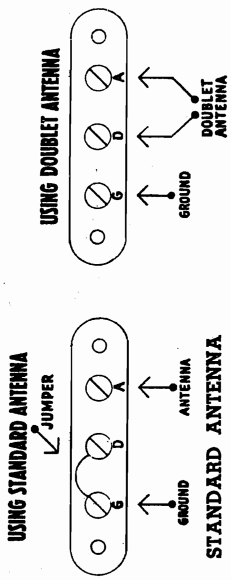

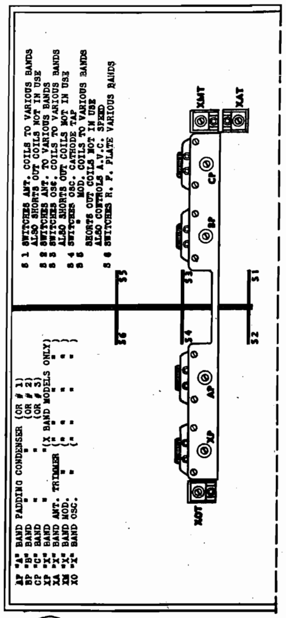

FIG. 5

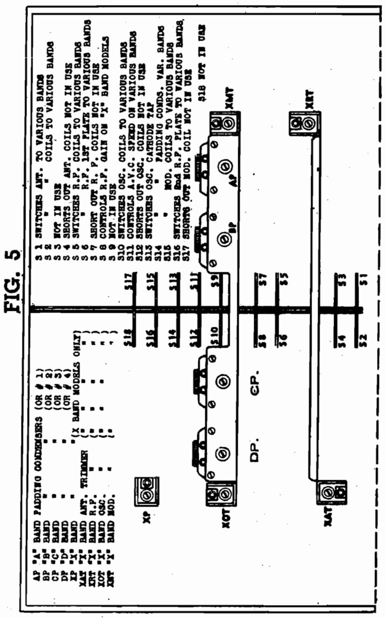

FIG. 7

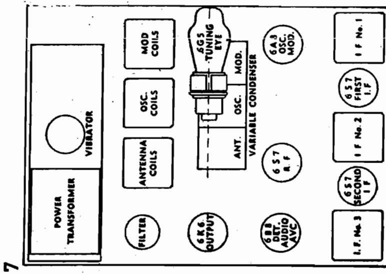
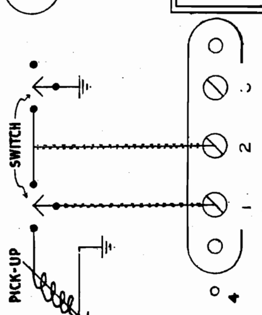


BATTERY MODEL

Be sure the "red" battery clip on end of radio battery lead is connected to the positive terminal of radio battery. DO NOT increase the length of battery leads. Leads to Wincharger may be any reasonable length, but should not be smaller than No. 10 wire for best results. A good, short and direct ground should be used on all battery models, connected to "G" terminal on back of radio.

Failure to use ground will result in poor performance. (See antenna and ground instructions on page 4.) Aligning and calibration instructions appear on pages 4 and 5.



PHONO-PICKUP

Remove jumper which connects terminals No. 1 and No. 2: Standard High Impedance pickup must be used. It is essential that leads from terminals No. 1 and No. 2 be shielded and the shielding grounded to chassis at No. 4 which hole is provided in all chassis for this purpose. One side of pickup unit must also be grounded.

All receivers come in either standard 120 Volts, 50-60 Cycles or Universal 120 Volts and 240 Volts, 50-60 Cycles.

In the case of Universal transformer be certain that the connections on the voltage strip (Figure 3-4) correspond to the line voltage on which the radio is to be operated, otherwise the radio will be damaged. This terminal strip is located under the chassis and adjacent to power transformer leads.

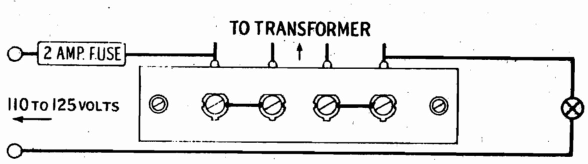


FIG. 3

Proper connection for 110-volt to 125 volt operation. Use 2 Amp. Fuse.

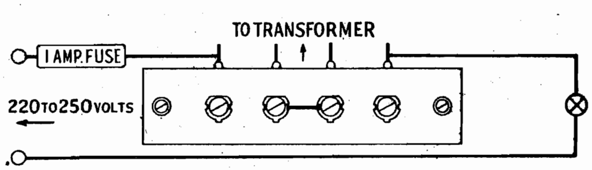

FIG. 4

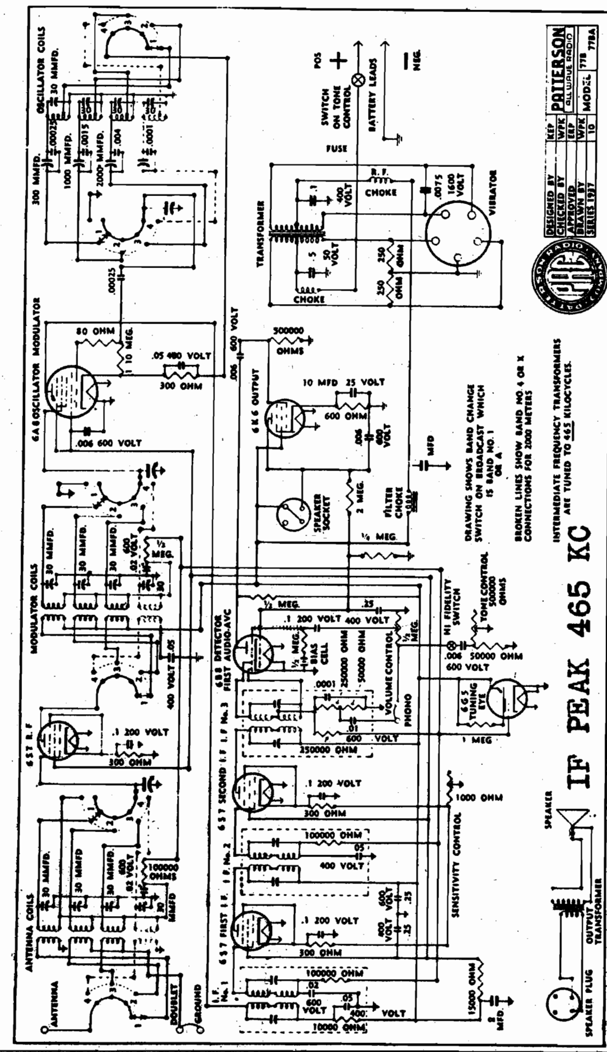
Proper connection for 220-volt to 250-volt operation. Use 1 Amp. Fuse.

FUSE—The fuse is located on the back panel of chassis (see Fig. 1) and may be replaced by unscrewing small black knob marked "fuse." Fuse then lifts out with knob. Disconnect radio from power line before making fuse change.



MODEL 128
Chassis 228,428
Schematic,Voltage
Trimmers

PATTERSON RADIO CO.

ALIGNMENT(SEE PROCEDURE MODEL 128)

Note: When making adjustments of modulator trimmers on all models and particularly the highest frequency bands, loosening of the modulator trimmer too far may cause a false resonance indication caused by the oscillator curve being "crossed over" removing oscillator lead or changing oscillator frequency, will readily show if this has occurred as no change in resonance indication will be apparent, also the set will be quite dead at the high frequency end of the band the true resonance point is with the modulator screwed in about one turn or less from the point where blocking occurs. The true resonant point will be quite apparent on resonance indicating devices.

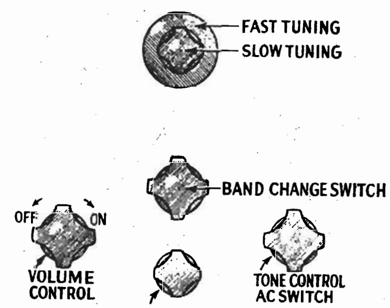
1.7 megacycles to 6.2 megacycles (49 to 171 meters)
AMATEUR PHONE (voice), 1.8-2 megacycles.
POLICE CALLS, 2.4-2.5 megacycles.
AIRCRAFT (night) signals, 3.2-3.5 megacycles.
AMATEUR PHONE (voice), 3.9-4.0 megacycles.
AIRCRAFT (day) signals, 4.0-4.5 megacycles.

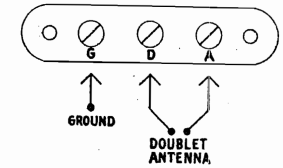
BAND No. 3
6 megacycles to 18 megacycles (16 to 50 meters)
SHORT WAVE BROADCAST, 49 meter band, 6.0-6.2 megacycles.
AMATEUR (voice and code), 40 meter band, 7.0-7.3 megacycles.
SHORT WAVE BROADCAST, 31 meter band, 9.4-10 megacycles.
SHORT WAVE BROADCAST, 25 meter band, 11.4-11.9 megacycles.
AMATEUR (voice and code), 20 meter band, 14.0-14.4 megacycles.
SHORT WAVE BROADCAST, 19 meter band, 15.1-15.35 megacycles.
SHORT WAVE BROADCAST, 16 meter band, 17.1-17.8 megacycles.

AC MODEL ONLY

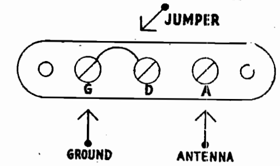


Right—Beat Oscillator.
Center—Off.
Left—Silent between Stations.
8 and 12-tube Models.
9 and Battery marked on knobs.

USING DOUBLET ANTENNA

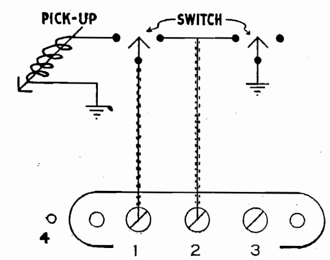


USING STANDARD ANTENNA



STANDARD ANTENNA

Simply connect to terminals **A and G as shown in diagram above.**



PHONO-PICKUP

Remove jumper which connects terminals No. 1 and No. 2. Standard High Impedance pickup must be used. It is essential that leads from terminals No. 1 and No. 2 be shielded and the shielding grounded to chassis at No. 4 which hole is provided in all chassis for this purpose. One side of pickup unit must also be grounded.

Alignment and Calibration Procedure

8-10-12-Tube Models

I. F. ALIGNMENT—ALL MODELS

In the following instructions for alignment the term V. T. V. M. shall be understood to mean Vacuum Tube Voltmeter or eye tube, and the term "resonance" means that the meter shows the greatest swing toward zero, or that the eye tube shows the narrowest dark section. Turn band selector switch to band "a" or No. 1. Place service oscillator in operation on 465 Kc. Connect grid of voltmeter to A. V. C. buss and ground of voltmeter to chassis. A convenient place to connect the voltmeter grid is on the terminal for the eye cable. This is located underneath on the floating R. F. section and between the back end of wave change switch and first R. F. tube socket. Connect to the terminal to which the green lead in the eye cable is connected. In lieu of a V. T. V. M. the eye tube itself may be used as a resonance indicator (adjusting for the narrowest dark section) although this method is seldom as accurate as when using a V. T. V. M. Another method which is by far the most accurate of all and which we strongly advise wherever possible is the use of the cathode ray oscilloscope and rotary sweep generator. This method will be discussed later in these notes.

Note: Refer to sketches in Figures 9, 10 and 11 for position of various tubes, coils and other components on all models.

CAUTION: Before making any adjustments on 12 tube model, be sure that the high fidelity switch is in the off position and remains there during adjustments. See tuning reference first page. Do not attempt to bend any of variable condenser plate flaps during alignment, particularly on the 12 tube models. The variable condensers are all carefully calibrated during the original alignment and should not require any further calibration during the life of the radio.

Remove grid cap from second I. F. tube (6K7) and apply oscillator output lead to grid of this tube and adjust trimmers on No. 3 I. F. transformer until resonance is indicated on V. T. V. M. The service oscillator output should be set for a quite high output when making this adjustment. Next remove oscillator lead and replace the cap on this tube. Then remove grid cap of first I. F. tube (6K7) and apply service oscillator output lead to grid of this tube and repeat adjustment as before this time adjusting trimmers on No. 2 I. F. transformer until V. T. V. M. indicates resonance. Reducing service oscillator output as necessary to obtain an easily readable indication. Next remove service oscillator lead and replace cap on first I. F. tube. Then remove cap from the Modulator tube 6A8 or 6L7 (as the case may be) and apply service oscillator output lead to grid of this tube, this time adjusting trimmers on No. 1 I. F. transformer, reducing service oscillator output as required and adjusting for resonance. Now without making any further changes go over all I. F. trimmers one by one carefully readjusting for exact resonance. This completes the alignment of the I. F. amplifier.

CALIBRATION OF VARIOUS BANDS—8-10 TUBE MODELS ONLY

Note: Refer to Figures 6, 9 and 10 for location of various coils and trimmers. (Refer to Fig. 5) for location of padding condensers.

BAND "A" (OR—No. 1) BROADCAST

Connect V. T. V. M. to A. V. C. buss and chassis ground, as described above for I. F. alignment. Turn band selector switch to band "A" (or No. 1). Place service oscillator in operation on 1400 Kc. and connect service oscillator output lead to antenna terminal of radio through a .0001 condenser or less or through standard dummy antenna. It will be necessary to keep the service oscillator output control well reduced during the following adjustments.

Set main tuning dial of radio to 1400 Kc. and adjust trimmer "A" in side of oscillator coil, Figure 4, to resonance. Next adjust trimmers "A" on the antenna and modulator coil to resonance. Next set service oscillator to 600 Kc. and set radio dial to 600 Kc. adjust padding condensers, "AP" to resonance. (Only a solid bakelite or other insulating screw driver will be satisfactory for adjusting any of the padding condensers as well as No. 3 I. F., an ordinary screw driver will be satisfactory for all other adjustments.) Now reset both service oscillator and radio dial to 1400 Kc. and retouch trimmer "A" on oscillator coil to resonance.

It may be well at this time also to recheck trimmers "A" on the antenna and modulator coils. This completes calibration and alignment of Band "A."

BAND "B" (OR NO. 2) SHORT WAVE BAND

Turn band selector switch to Band B, leaving all connections made as before for "A" band set service oscillator at 6 M. C. also set radio dial at 6 M. C. and adjust trimmer "B" on oscillator coil to resonance as indicated on V. T. V. M. Next adjust trimmers "B" on antenna and modulator coils to resonance. Change both service oscillator and radio dial to 2 M. C. and adjust "BP" padding condenser to resonance. Reset both radio dial and service oscillator to 6 M. C. and recheck trimmer "B" on oscillator coil for resonance. This completes calibration and alignment of Band "B."

BAND "C" (OR NO. 3) SHORT WAVE BAND

Turn band selector switch to Band "C." Set radio dial and service oscillator to 17 M. C. and adjust trimmer "C" on oscillator coil to resonance, it may be well to turn trimmers "C" on both antenna and modulator coils in about one turn before making above adjustment. Then after oscillator trimmer has been set retune trimmers "C" on modulate coil to resonance slowly turning main tuning dial back and forth slightly as adjustment is being made until resonance is indicated on V. T. V. M., retouching oscillator trimmer "C" as necessary to keep it on the desired spot on tuning dial. Next adjust trimmer "C" on antenna coil to resonance without rocking main dial next set service oscillator and radio dial to 6 M. C. (Band "C") and adjust padding condenser "CP" to resonance, reset radio dial and service oscillator to 17 M. C. and recheck oscillator trimmer "C" for resonance. This completes adjustment of Band "C."

Note: When making adjustments of modulator trimmers on all models and particularly the highest frequency bands, loosening of the modulator trimmer too far may cause a false resonance indication caused by the oscillator curve being "crossed over" removing oscillator lead or changing oscillator frequency, will readily show if this has occurred as no change in resonance indication will be apparent, also the set will be quite dead at the high frequency end of the band the true resonance point is with the modulator screwed in about one turn or less from the point where blocking occurs. The true resonant point will be quite apparent on resonance indicating devices.

X BAND (OR NO. 4)

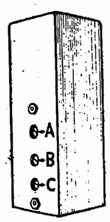

FIG. 6

(For models equipped with long wave weather or European band only.) Change wave band switch to "X" band. Set service oscillator and radio dial to 400 Kc., adjust oscillator trimmer "XOT" to resonance. Then adjust trimmers "XMT" and "XAT" to resonance. Then set both radio dial and service oscillator to 150 Kc. and adjust padding condenser "XP" to resonance. Reset both service oscillator and radio dial again to 400 Kc. and recheck trimmer "XOT" for resonance. This completes the calibration and alignment of all bands.

Calibration of Various Bands 12-Tube Model Only

BAND "A" (OR NO. 1) BROADCAST

Note: Refer to Figures 8 and 11 for location of various coils and trimmers. Refer to Figure 7 for location of padding condensers.

Connect V. T. V. M. and A. V. C. buss and chassis ground as described above for I. F. alignment. Turn band selector switch to Band "A" (or No. 1). Place service oscillator in operation on 1400 Kc. and connect service oscillator output lead to antenna terminal through a .0001 condenser or less or through a standard dummy antenna. It will be necessary to keep service oscillator output control well reduced during the following adjustments. Set main tuning dial of radio to 1400 Kc. and adjust trimmer "A" on oscillator coil, Figure 6. Next recheck trimmer "A" on antenna, R. F. and modulator coils to resonance, this completes alignment of band "A."

BAND "B" (OR NO. 2)

Change band switch to band "B" or No. 2, set both service oscillator and radio dial to 4 M. C. and adjust trimmer "B" on oscillator coil to resonance. Next adjust trimmers "B" on antenna, R. F. and modulator coils each in turn to resonance. Now change both service oscillator and radio dial to 1.5 M. C. (1500 Kc.), and adjust padding condenser "BP" to resonance. Reset both service oscillator and radio dial to 4 M. C. and recheck, trimmer "B" on oscillator coil to resonance. This completes alignment of Band "B."

MODELS 212,312,412
Alignment, Part 2
Voltage

BAND "C" OR NO. 3

Change band switch to band "C" or No. 3. Set service oscillator and radio dial to 12 M. C. and adjust trimmer "C" to resonance. Next adjust trimmers "C" on modulator coil rocking radio tuning dial slowly back and forth as adjustment is being made, resetting oscillator trimmer if and as necessary to keep calibration correct at this point after resonance has been reached trimmer "C" on antenna and R. F. coils may be adjusted to resonance without touching any other controls. Next set both radio dial and service oscillator to 5 M. C. and adjust padding condenser "CP" to resonance. Then reset both radio dial and service oscillator to 12 M. C. and recheck trimmer "C" on oscillator coil to resonance. This completes alignment of band "C" or No. 3.

BAND "D" OR NO. 4

Change band change switch to Band "D" set service oscillator and radio dial to 20 M. C. and adjust trimmer "D" on modulate coil slowly rocking main tuning dial to 9 M. C. (Band D or No. 3) and adjust padding condensers "DP" to resonance. Then reset both service oscillator and radio dial to 20 M. C. and recheck to resonance, this completes alignment of Band D.

Note: When making adjustments of modulator trimmers on all models and particularly the highest frequency bands, loosening of the modulator trimmer too far may cause a false resonance indication caused by the oscillator curve being "crossed over" removing oscillator lead or changing oscillator frequency will readily show if this has occurred as no change in resonance indication will be apparent also the set will be quite dead at the high frequency end of the band, the true resonance point is with the modulator screwed in about one turn or less from the point where blocking occurs. The true resonant point will be quite apparent on resonance indicating devices.

"X" BAND OR NO. 5

(For models equipped with long wave weather band only.)

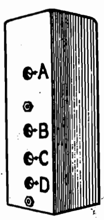

FIG. 8

Set band change switch to "X" band. Set both service oscillator and radio dial to 400 Kc., adjust trimmer "XOT" to resonance. Then adjust trimmers "XAT," "XRT," and "XMT" each in turn to resonance. Then set both service oscillator and radio dial to 150 Kc. and adjust padding condenser "XP" (very slowly) to resonance. Reset both service oscillator and radio dial to 400 Kc. and recheck trimmer "XOT" to resonance. This completes all alignment.

Cathode Ray Oscilloscope Alignment

For the service man who is equipped with a cathode ray oscilloscope and rotary sweep circuit, a very accurate alignment of the intermediate amplifier is possible. Owners of such equipment are usually familiar with the necessary procedure as this point is usually covered thoroughly in the instructions furnished with the equipment. More detailed information than that usually furnished with cathode ray equipment may be found in John Rider's book, "The Cathode Ray Tube at Work." An I. F. output connection intended for cathode ray alignment is incorporated in all Patterson 37 models. With chassis upside down and facing back of chassis it will be found in the lower left hand corner of chassis adjacent to the phono terminals and rubber corner rest. In the 8 and 10 tube models the adjustments should be made on the second stage first, then the first stage, then through the modulator and first I. F. transformer or practically the same procedure as when aligning by any other method. The curve on the 8 and 10 should be round nosed and about 10 Kc. wide at the summit. The high fidelity switch having no effect on the resonant curve in these models. In the 12 tube model the above procedure should be followed out with the exception that the high fidelity switch must be in the "off" position during alignment.

In this model the I. F. curve will be very sharp and not round nosed, after alignment has been completed the high fidelity switch may be turned on for a check, in which position the curve will remain symetrical but become very broad with possibly a very slight shift in the I. F. frequency in some cases. If this is not the case, a misadjustment has been made in the alignment procedure and the high fidelity switch should be turned off and alignment rechecked as before.

OPERATION OF PHONO COMBINATION MODELS

The following instructions are for models equipped with phono-pickup and motor. To place phonograph in operation turn radio on in usual manner with top cover raised. Turn toggle switch on top panel to position marked "Phono." Start motor by pulling lever extending from under turn table on right hand side forward. Lift pick up and pass over turn table toward the center of turn table, adjusting stop lever located between turn table and pickup hinge until motor turns off at a point just past when the last grooves in record stop, not including the stop grooves, which are elliptical. This point may vary with individual records while some records have no stop grooves at all. The best position for stop lever can easily be determined, however, after a few records have been tried. The speed control is located on the left hand side extending from under the turn table and is clearly marked. Use that speed which gives the best or most natural results. This speed is ordinarily 78 revolutions per minute for fast records, stroboscopes for various speeds and line frequency may be purchased for very small cost, which make it possible to obtain the exact speed. These stroboscopes are self explanatory. On those models equipped with two speed motors a third lever extends from under the turn table on which speeds are plainly marked, one being 78 R.P.M., the other 33⅓ R.P.M. for slow speed records. The usual volume and tone controls are still in service and may be used at will while playing records.

VOLTAGES

The following tables show characteristic voltages at various points through a normal chassis.

All Voltages Measurable Under The Following Conditions:

Transformer line tap in 110-115 V. position line voltage 115 V. 60 cycles. Band change switch set on Band No. 2. No antenna. No signal being received sensitivity adjustment set at maximum position. All voltages listed measured from point indicated to chassis (ground); all readings taken on standard 1000 ohm per volt. Voltmeter.

IF PEAK 470KC

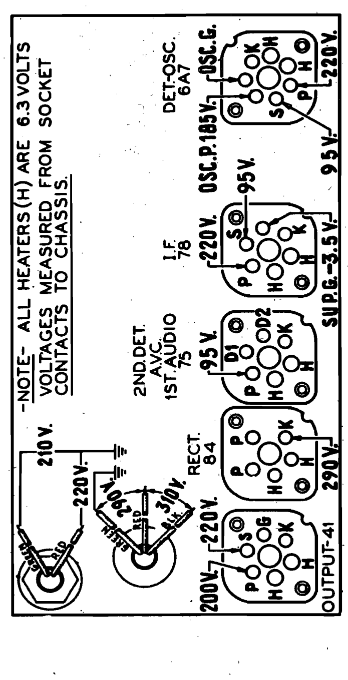

Fig. 1. Socket Voltages, Underside of Chassis View

The Voltages indicated by arrows were measured with a Philco 026 Circuit Tester which contains a sensitive voltmeter. Volume Control at minimum—Tuning condenser set for no signal—line voltage 115 A.C.

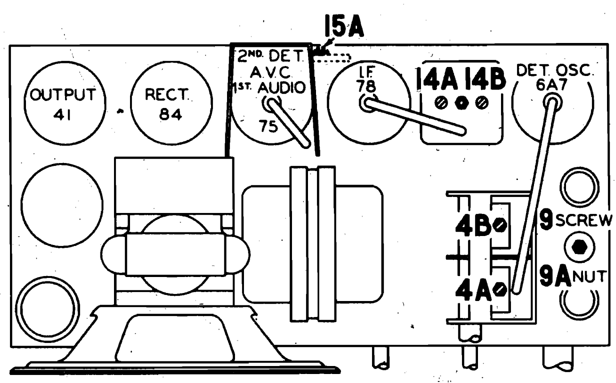

Fig. 2.—Locations of Compensators

MODEL 38-15(121,124)
Alignment, Specs.
Parts

PHILCO RADIO & TELEV. CORP.

EQUIPMENT REQUIRED: (1) Signal Generator, using a fundamental frequency range covering the tuning and intermediate frequencies of the receiver. Philco Model 077 Signal Generator which has a fundamental frequency range from 115 to 36,000 K.C. is the correct instrument for this purpose; (2) Output Meter, Philco Model 026 Circuit Tester incorporates a sensitive output meter and is recommended; (3) Philco Fibre Handle Screw Driver, Part No. 27-7059 and Fibre Wrench, Part No. 3164.

DIAL CALIBRATION: In order to adjust the receiver correctly the dial must be aligned to track properly with the tuning condenser. To adjust the dial, proceed as follows:

1. Turn the tuning condenser to maximum capacity position (plates fully meshed).

2. Holding the tuning condenser in this position, turn the pointer until it is in the position shown in Fig. 3. This is the correct position of pointer at maximum capacity of tuning condenser.

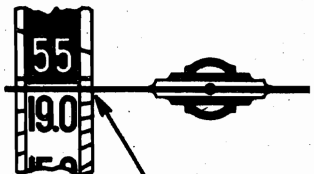

FIG. 3—Dial Pointer Calibration

Intermediate Frequency Circuit

Insert the signal generator shielded output lead into the "Med." jack on the panel of the generator. Connect the other end of the output lead through a .1 mfd. condenser to the grid of the 6A7 Det. Osc. tube, and the ground connection of the signal generator to the chassis. Set the Signal Generator and receiver controls, and adjust the I.F. compensators as follows:

1. Set Signal Generator at 470 K.C. Turn "Multiplier" Control to 1000 and the "Attentuator" for maximum output.

2. Turn the receiver dial to 580 K.C.

3. Receiver volume control maximum.

4. Range Switch (Broadcast)

5. Adjust compensators, (15A), (14B), (14A), for maximum output. If the output meter goes off scale when adjusting the compensators, retard the signal generator attenuator.

Radio Frequency Circuit

Tuning Range 5.7 to 18.0 M.C.

1. With one end of the shielded lead of the signal generator output lead in the "Med" jack, connect the other end through a 400 ohm resistor to the white aerial wire (rear of chassis). Connect the signal generator ground to the brown lead or to the chassis of the receiver.

2. Set the controls and adjust the R.F. compensators as follows:

Range Switch Position	Signal Generator and Receiver Dial	R. F. Compensators in Order
Short Wave	18.0 M.C.	(4B)

Tuning Range 530 to 1720 K.C.

1. Remove the 400 ohm resistor from aerial lead and replace with a 100 mmfd. condenser.

2. Set the controls and adjust the R.F. compensators as follows:

Range Switch Position	Signal Generator and Receiver Dial	R. F. Compensators in Order
Broadcast	1550 K.C.	(9), (4A)
	580 K.C.	(9A) Roll tuning condenser
	1550 K.C.	(9), (4A)

Specifications

TYPE OF CIRCUIT: A.C. operated, Superheterodyne circuit, incorporating two tuning ranges covering standard and short wave broadcasts, automatic volume control, and a pentode audio output circuit. When built into a Type "T" cabinet, the receiver is identified as Code 121. In the Chairside Cabinet, Type "CS", the speaker is removed from the receiver chassis and mounted in the cabinet. The receiver is then identified as Code 124.

POWER SUPPLY:

Voltage	Frequency Cycles	Power Consumption
115	50 to 60	40 watts

INTERMEDIATE FREQUENCY: 470 K.C.

R.F. TUNING RANGES: 540 to 1720 K.C.
5.7 to 18.0 M.C.

AUDIO OUTPUT: 2 watts

PHILCO TUBES USED: Five: One 6A7, Det. Osc.; One 78, I.F.; One 75, 2nd Det., 1st Audio; One 41, Output, and One 84, Rectifier.

TUNING MECHANISM: 8 to 1 Ratio using Pulley and Cord.

CABINET: Type "T" and "CS"

OUTPUT METER: The 026 Output Meter is connected to the plate and cathode terminals of the 41 tube. Adjust the meter to use the (0-30) volt scale and advance the attenuator control of the generator until a readable indication is noted on the output meter after signal is applied.

MODEL 38-33(121)
Socket, Trimmers
Alignment, Notes
Voltage

PHILCO RADIO & TELEV. CORP.

Electrical Specifications

TYPE OF CIRCUIT: Five tube, battery operated superheterodyne circuit covering broadcast frequencies and incorporating Automatic Volume Control and a Push-Pull output stage.

INTERMEDIATE FREQUENCY: 470 K. C.

TUNING RANGE: 530 to 1720 K. C.

POWER OUTPUT: 1 watt

TYPE AERIAL: "L" type, Philco Part No. 45-2428

CABINETS AND SPEAKERS USED:

Cabinet Type	Speaker Used
B	L3
F	KR26

BATTERIES REQUIRED: "A" Battery: Two volt storage battery Philco type 172R or Dry "A" battery Philco Part No. 41-8011. If a dry A Battery is used, a ballast lamp "type 1Y1" MUST be inserted in the socket provided in the (41-8011) battery. This lamp acts as a voltage regulator and maintains a constant potential of two volts on the filament of the tubes.

"BC" Battery: Philco battery Part No. 41-8007 is used to supply "B" and "C" voltages. This battery contains a socket into which the receiver battery cable plug is inserted.

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator, having a fundamental frequency range covering the tuning and intermediate frequencies of the receiver. Philco Model 077 A.C. operated Signal Generator or Model 088, battery operated Signal Generator which have the required frequency range are the correct instruments for this purpose: (2) Output meter, Philco Model 026 circuit tester incorporates a sensitive output meter and is recommended; (3) Philco Fibre Handle Screw Driver, Part No. 27-7059 and Fibre Wrench, Part No. 3164.

OUTPUT METER: The 026 Output Meter is connected to the plate terminals of the 1E7G tube. Adjust the meter to use the (0-30) volt scale and advance the attenuator control of the generator until a readable indication is noted on the output meter after signal is applied.

DIAL CALIBRATION: In order to adjust the receiver correctly the dial must be aligned to track properly with the tuning condenser. To adjust the dial proceed as follows:

1. Turn the tuning condenser to maximum capacity position (plates fully meshed).
2. Holding the tuning condenser in this position, turn the dial pointer until it is parallel with the INDEX LINE See Fig. (3). This is the correct position of p inter at the maximum capacity position.

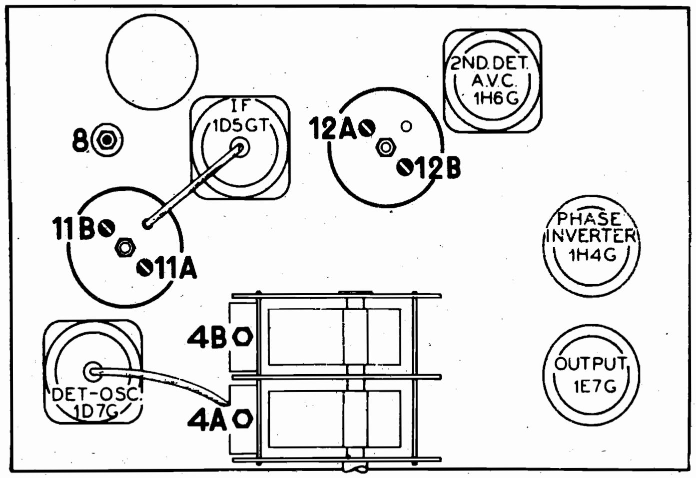

Fig. 2. Locations of Compensators—Top of Chassis

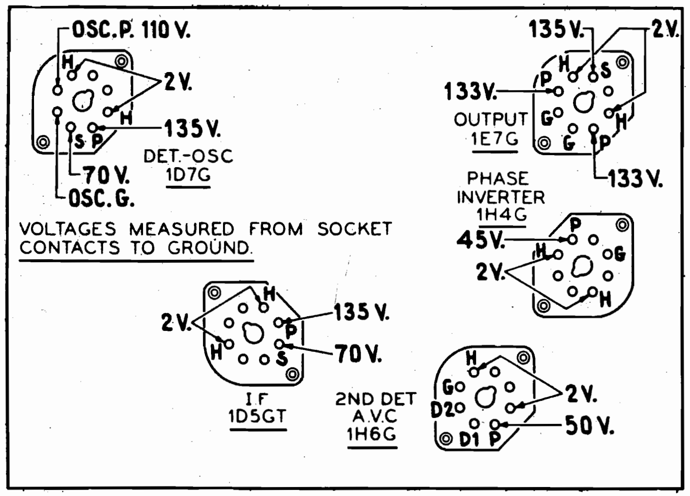

Fig. 1. Socket Voltages, Underside of Chassis

The voltages indicated by arrows were measured with a **Philco 026 Circuit Tester** which contains a sensitive voltmeter. Volume control at minimum.

INTERMEDIATE FREQUENCY CIRCUIT

Insert the signal generator shielded output lead into the "Med" jack on the panel of the generator. Connect the other end of the output lead through a 1. mfd. condenser to the grid of the 1D7G Det. Osc. tube and the ground connection of the signal generator to the chassis. Set the signal generator and receiver controls and adjust the I.F. compensators as follows:

1. Set Signal Generator at 470 K.C. Turn "Multiplier" Control to 1000 and adjust the attenuator for a readable indication on the output meter.

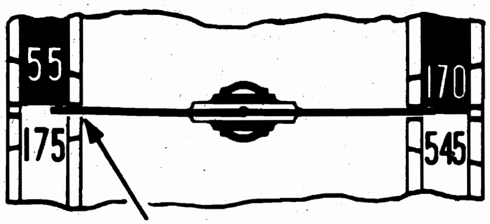

Fig. 3. Dial Calibration. Set pointer as shown

2. Turn the receiver dial to 580 K.C.
3. Receiver Volume Control maximum
4. Adjust compensators (12B), (12A), (11B), (11A) for maximum output. If the output meter goes off scale when adjusting the compensators retard signal generator "attenuator."

RADIO FREQUENCY CIRCUIT

Tuning Range: 530 to 1720 K. C.

1. With one end of the shielded lead of the signal generator output cable in the "Med" jack, connect the other end through a 200 mmfd. condenser to the "Ant." terminal of the aerial panel of the receiver. The output lead ground must be connected to the "Gnd" terminal or to the chassis.

2. Set the controls and adjust the R.F. compensators as follows:

Volume Control	Signal Generator and Receiver Dial	Compensators in Order
Max.	1500 K. C.	(4B), (4A)
Max.	580 K. C.	(8)
Max.	1500 K. C.	(4B), (4A)

MODEL 38-34(125)
Socket,Trimmers
Alignment,Specs.
Voltage

PHILCO RADIO & TELEV. CORP.

The receiver is designed to operate from a standard "L" type aerial Philco part No. 45-2428. This aerial system should be used to obtain the maximum performance from the receiver.

POWER SUPPLY: 6 volt storage battery-Philco type 116R
Current drain: 1.2 amps.

INTERMEDIATE FREQUENCY: 470 K. C.

TUNING RANGE: 530 to 1720 K. C.

OUTPUT: 1 watt

SPEAKERS USED: "B" Cabinet L-3.
"F" Cabinet KR26.

SPECIFICATIONS

TYPE OF CIRCUIT: A Five tube superheterodyne circuit covering standard broadcast and state police frequencies is used in this model. The receiver is operated by a 6 volt storage battery and uses a synchronous vibrator for supplying "B" voltage. The vibrator power unit in the type "B" cabinet is mounted on the chassis. In the type "F" cabinet the vibrator power unit is mounted under the chassis shelf and connected to the receiver through a cable and plug. Additional design features included in this model are: Automatic Volume Control; two point tone control and Pushpull Pentode Audio Output Circuit.

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator, having a fundamental frequency range covering the tuning and intermediate frequencies of the receiver. Philco Model 077 A.C. operated Signal Generator or Model 088, battery operated Signal Generator which have the required frequency range are the correct instruments for this purpose; (2) Output meter, Philco Model 026 circuit tester incorporates a sensitive output meter and is recommended; (3) Philco Fibre Handle Screw Driver, Part No. 27-7059 and Fibre Wrench, Part No. 3164.

OUTPUT METER: The 026 Output Meter is connected to the plate terminals of the 1E7G tube. Adjust the meter to use the (0-30) volt scale and advance the attentuator control of the generator until a readable indication is noted on the output meter after signal is applied.

Operations In Order	Signal Generator			Receiver			Special Instructions
	Output Connections To Receiver	Dummy Antenna (Note B)	Dial Setting	Dial Setting	Control Settings	Adjust Compensators In Order	
1	Grid Cap 1D7G Det. Osc.	.1 mfd.	470 K. C.	580 K. C.	Vol. Cont. (max.)	(15B), (15A) (16B), (16A)	
2	Ant. Ter.	200 mmfd.	1500 K. C.	1500 K. C.	"	(4B), (4A)	Note C Dial Calibration
3	Ant. Ter.	200 mmfd.	580 K. C.	580 K. C.	"	(7)	Roll Tuning Condenser Note A
4	Ant. Ter.	200 mmfd.	1500 K. C.	1500 K. C.	"	(4B), (4A)	

NOTE "A"—First adjust compensator for maximum output, then vary the tuning condenser for maximum output. Now turn the compensator slightly to the right or left and again adjust tuning condenser for maximum output.

This procedure of first setting the compensator and then varying the tuning condenser is continued until there is no further gain in the output meter reading.

NOTE "B"—The "Dummy Antenna' consists of a condenser connected in series with the signal generator output lead (High side). Use the capacity as specified in each step of the above procedure.

NOTE "C"—DIAL CALIBRATION: In order to adjust the receiver correctly the dial must be aligned to track properly with the tuning condenser. To adjust the dial proceed as follows:

1. Turn the tuning condenser to maximum capacity position (plates fully meshed).
2. Holding the tuning condenser in this position, turn the dial pointer until it is parallel with the INDEX LINE. See Fig. (3). This is the correct position of pointer at the maximum capacity position.

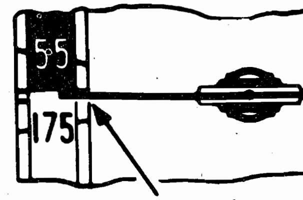

Fig. 3. Dial Calibration. Set pointer as shown

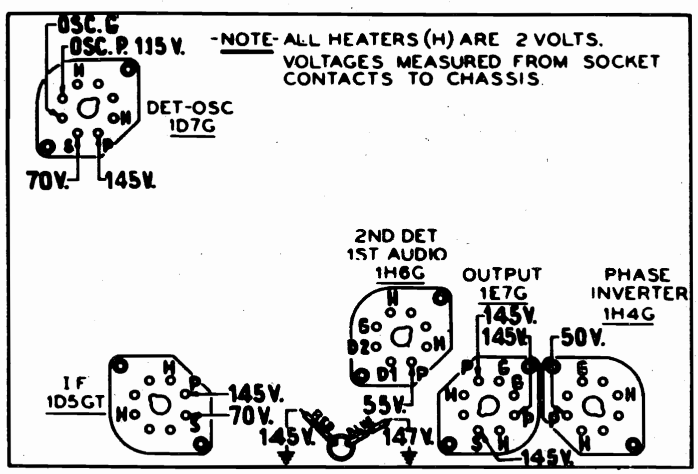

Fig. 1. Socket Voltages, Underside of Chassis
The voltages indicated by arrows were measured with a Philco 026 Circuit Tester which contains a sensitive voltmeter. Volume control at minimum.

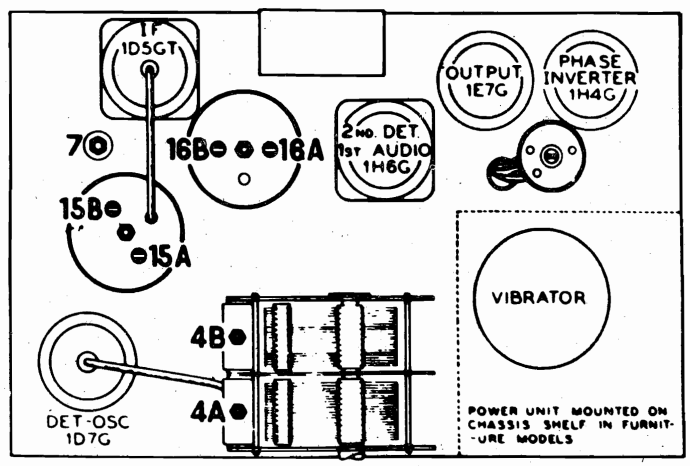

Fig. 2. Locations of Compensators

MODEL 38-35(121)
Socket, Trimmers
Voltage, Alignment
Specs., Notes

PHILCO RADIO & TELEV. CORP.

NOTE "A"—The Dummy Antenna is a condenser connected in series with the signal generator output lead. Use the capacity specified in each step of the above procedure.

NOTE "B"—DIAL CALIBRATION: In order to adjust the receiver correctly the dial must be aligned to track properly with the tuning condenser. To adjust the dial proceed as follows:

1. Turn the tuning condenser to maximum capacity position (Plates fully meshed).
2. Holding the tuning condenser in this position, turn the dial pointer until it is parallel with the INDEX LINE. See Fig. (3). This is the correct position of pointer at the maximum capacity position.

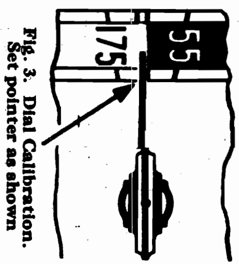

Fig. 3. Dial Calibration. Set pointer as shown

TYPE OF CIRCUIT: Five tube superheterodyne circuit covering standard broadcast and state police frequencies with automatic volume control; and a pentode output circuit. The receiver is designed to operate from either a 6 volt storage battery or a 115 volt 60 cycle A.C. supply. A Plug-Switch is provided on the power unit for selection of either voltage supply. Place the plug with arrow pointing toward voltage being used. With a 6 volt storage battery supply, a vibrator in conjunction with a 6X5G tube is used for supplying "B" voltage to the receiver. When using a 115 volt supply the vibrator is removed from the circuit. See schematic diagram page 2.

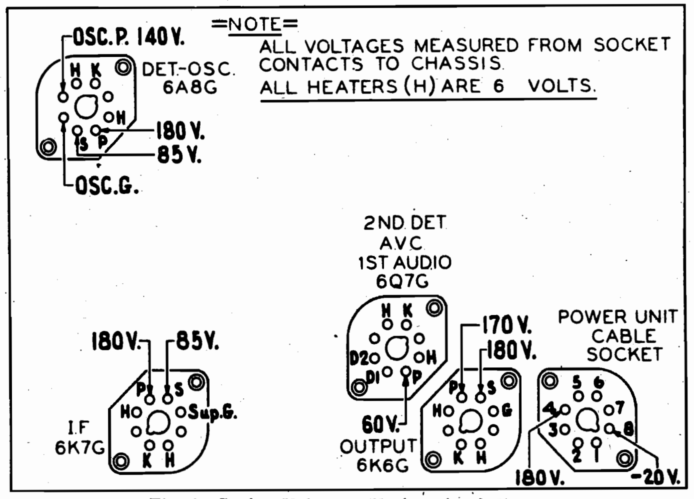

Fig. 1. Socket Voltages, Underside of Chassis
The voltages indicated by arrows were measured with a **Philco 026 Circuit Tester** which contains a sensitive voltmeter. Volume Control minimum. Storage Battery fully charged or 115 V. A.C. Power Supply.

To obtain maximum performance from the receiver, a Philco Aerial Part No. 45-2428 should be used.

POWER SUPPLY: 6 volt storage battery Philco type 116R or a 115 volt 60 cycle A.C. power supply.

INTERMEDIATE FREQUENCY: 470 K. C.

TUNING RANGE: 530 to 1720 K. C.

POWER OUTPUT: 1.5 watts

PHILCO TUBES USED: 6A8G, converter and oscillator; 6K7G, I.F.; 6Q7G, 2nd detector and 1st audio; 6K6G, output; 6X5G, rectifier.

SPEAKER USED: KR29

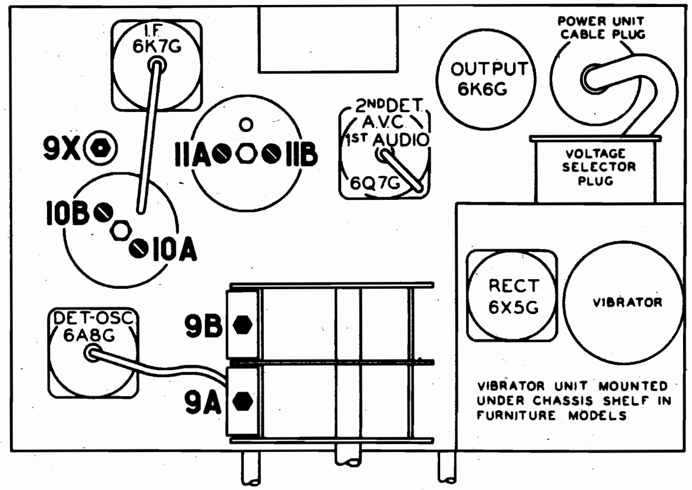

Fig. 2. Locations of Compensators

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator, having a fundamental frequency range covering the tuning and intermediate frequencies of the receiver. Philco Model 077 A.C. operated Signal Generator or Model 088 Battery operated, Signal Generator, which have the required frequency range are the correct instruments for this purpose; (2) Output meter, Philco Model 026 circuit tester incorporates a sensitive output meter and is recommended; (3) Philco Fibre Handle Screw Driver, part No. 27-7059 and Fibre Wrench, Part No. 3164.

OUTPUT METER: The 026 output meter is connected to the plate and cathode terminals of the 6K6G tube. Adjust the meter to use the (0-30) volt scale and advance the attenuator control of the generator until a readable indication is noted on the output meter after signal is applied.

MODEL 38-40(121)
Socket, Trimmers
Voltage, Alignment
Specs., Notes

PHILCO RADIO & TELEV. CORP.

TYPE OF CIRCUIT: 6 tube superheterodyne circuit covering standard and shortwave broadcasts with automatic volume control; and a pentode output circuit. The receiver is designed to operate from either a 6 volt storage battery or a 115 volt 60 cycle A.C. supply. A Plug-Switch is provided on the power unit for selection of either voltage supply. Place the plug with arrow pointing toward voltage being used. With a 6 volt storage battery supply, a vibrator in conjunction with a 6X5G tube is used for supplying "B" voltage to the receiver. When using a 115 volt supply, the vibrator is removed from the circuit. (See schematic diagram page 2).

To obtain maximum performance from the receiver, a Philco Aerial, part number 45-2428 should be used.

POWER SUPPLY: 6 volt storage battery Philco type 116R or a 115 volt 60 cycle A.C. power supply.

INTERMEDIATE FREQUENCY: 470 K.C.

TUNING RANGES: 530 to 1720 K. C.—5.7 to 18.0 M. C.

POWER OUTPUT: 1.5 watts

PHILCO TUBES USED: 6A8G, converter and oscillator; 6K7G, I.F.; 6J5G, 2nd detector; 6K5G, 1st audio; 6K6G output; 6X5G, rectifier.

SPEAKER USED: HR-23
KR29

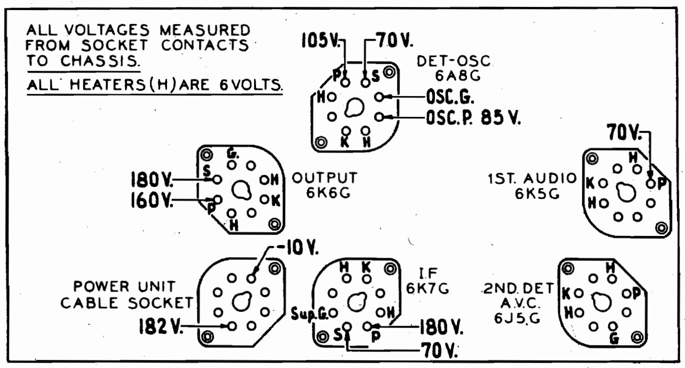

Fig. 1. Socket Voltages, Underside of Chassis
The voltages indicated by arrows were measured with a **Philco 026 Circuit Tester** which contains a sensitive voltmeter. Volume Control minimum. Storage Battery fully charged or 115 V. A.C. Power Supply.

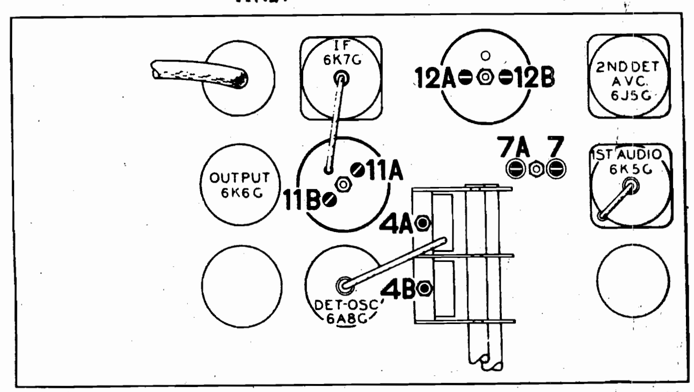

Fig. 2. Locations of Compensators

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator, having a fundamental frequency range covering the tuning and intermediate frequencies of the receiver. Philco Model 077 A.C. operated Signal Generator or Model 088 Battery operated, Signal Generator, which have the required frequency range are the correct instruments for this purpose; (2) Output meter, Philco Model 026 circuit tester incorporates a sensitive output meter and is recommended; (3) Philco Fibre Handle Screw Driver, part No. 27-7059 and Fibre Wrench, part No. 3164.

OUTPUT METER: The 026 output meter is connected to the plate and cathode terminals of the 6K6G tube. Adjust the meter to use the (0-30) volt scale and advance the attenuator control of the generator until a readable indication is noted on the output meter after signal is applied.

Operations in Order	SIGNAL GENERATOR			RECEIVER			NOTES
	Cable Connections	Dummy Antenna Note A	Dial Freq.	Control Positions	Dial Freq.	Adjust Compensators In Order	
1	6A8G Grid	.1 mfd.	470 K. C.	Vol. Control Max. Range Switch (1)	580 K. C.	(12B), (12A) (11B), (11A)	Adjust all compensators for "Max." output
2	Antenna and ground of receivers	400 ohms	18.0 M. C.	Range Switch (2)	18.0 M. C.	(4B)	Check image at 17.060 M. C.
3	Antenna and ground of receivers	200 mmfd.	1550 K. C.	Range Switch (1)	1550 K. C.	(7), (4A)	
4	Antenna and ground of receivers	200 mmfd.	580 K. C.	Range Switch (1)	580 K. C.	(7A)	
5	Antenna and ground of receivers	200 mmfd.	1550 K. C.	Range Switch (1)	1550 K. C.	(7), (4A)	

NOTE "A"—The Dummy Antenna is a condenser connected in series with the signal generator output lead. Use the capacity or resistance as specified in each step of the above procedure.

NOTE "B"—DIAL CALIBRATION: In order to adjust the receiver correctly the dial must be aligned to track properly with the tuning condenser. To adjust the dial proceed as follows:

1. Turn the tuning condenser to maximum capacity position (plate fully meshed).
2. Holding the tuning condenser in this position, loosen the dial clamp; then turn the dial until the indicator is centered on the middle index line (See Fig. 3). Tighten clamp in this position.

MODEL 38-116(125)
Socket, Voltage
Specs., Notes

PHILCO RADIO & TELEV. CORP.

FREQUENCY RANGES: Range One 530 to 1600 K.C.
Two 1.58 to 4.75 M.C.
Three 4.7 to 7.4 M.C.
Four 7.35 to 11.6 M.C.
Five 11.5 to 18.2 M.C.

UNDISTORTED OUTPUT: 15 watts.

CABINET: Type XX.

PHILCO TUBES USED: 6U7G R.F.; 6A8G Mixer; 6A8G Oscillator; 6N7G Oscillator control; two 6K7G I. F.; 6K7G 2nd Detector and Magnetic tuning amplifier; two 6J5G discriminator; 6J5G A. V. C.; 6R7G 1st audio; 6J5G audio driver; two 6L6G audio output, and one 5X4G rectifier.

TONE CONTROLS: Two—1. High audio-frequency tone varied by Treble-Selectivity control.
2. Low audio-frequency tone varied by "Bass Tone Control," in the volume control circuit.

PHILCO SPEAKERS USED: One type "W5" with three acoustic clarifiers.

SERVICE NOTES

For reference between illustrations, Parts List, and for replacement of parts, the various diagrams in this bulletin are marked with "circled numbers" indicating a particular part.

Physical views of the R. F. and I. F. transformers and the range switch sections are shown on pages 2 and 3. Each part is marked with the corresponding schematic diagram circled number.

The leads and lugs of the R. F. and I. F. transformers are either numbered or the color of the wire marked to indicate the connecting point in the circuit diagram, which is also correspondingly marked.

Rear views of the range switch sections are also shown in Fig. 5. The lugs on each are marked with a letter and number—example (A2)—indicating the connecting point of each lug in the circuit diagram.

Speaker wiring is shown in Fig. 3 and the power transformer wire colors are marked on the schematic diagram.

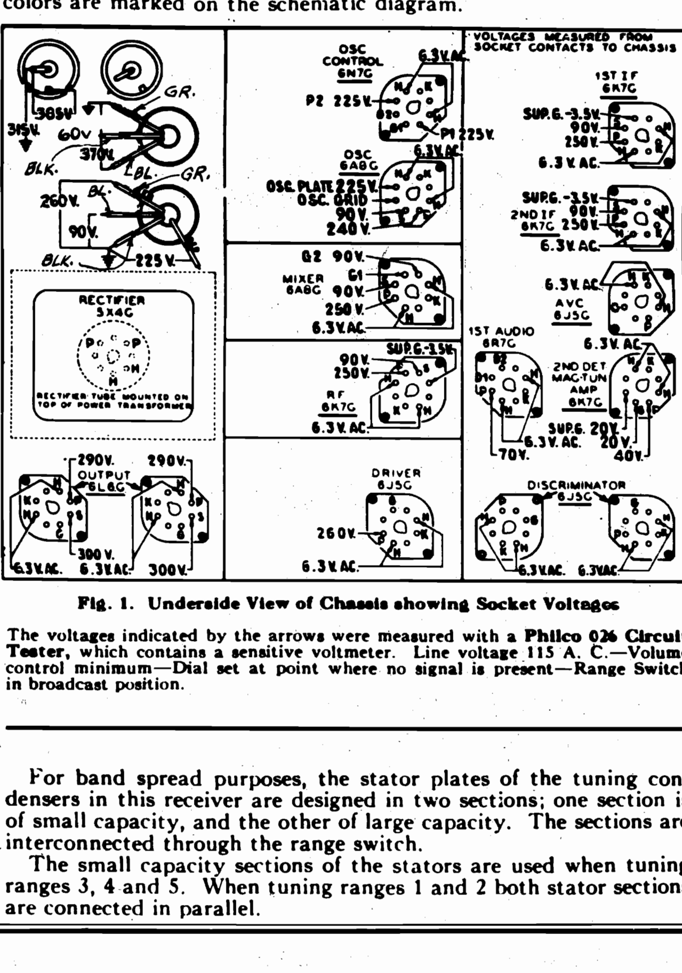

Fig. 1. Underside View of Chassis showing Socket Voltages

The voltages indicated by the arrows were measured with a **Philco 026 Circuit Tester**, which contains a sensitive voltmeter. Line voltage 115 A. C.—Volume control minimum—Dial set at point where no signal is present—Range Switch in broadcast position.

For band spread purposes, the stator plates of the tuning condensers in this receiver are designed in two sections; one section is of small capacity, and the other of large capacity. The sections are interconnected through the range switch.

The small capacity sections of the stators are used when tuning ranges 3, 4 and 5. When tuning ranges 1 and 2 both stator sections are connected in parallel.

For identifying the sections on the diagram Fig. 2, the dotted line of the tuning condenser is marked as follows: Small capacity sections are marked Ant. "A"; R. F. "A", and Osc. "A", and the large capacity sections—Ant. "B"; R. F. "B", and Osc. "B".

Automatic Tuning Mechanism Service Data

Service data and a complete parts list for the Automatic Tuning Mechanism of this receiver will be found in Service Bulletin 273. There are four automatic dial parts, however, which differ from those shown in bulletin 273. These parts are marked with an asterisk on page 4 of this bulletin.

Aerial Connections

To obtain the full advantage of the sensitivity of this receiver the **Philco High Efficiency Aerial** Part No. 40-6112 should be used. Connect the aerial as follows:

The aerial terminal panel located on the rear of the chassis, contains three terminals marked "Red," "Blk" and "Gnd". Connect the red and black wires of the aerial lead in (Transmission Line) to the "Red" and "Blk" terminals respectively. Connect the "Gnd" terminal to a good ground source. If a temporary aerial is used, connect it to the "Red" terminal.

SPECIFICATIONS

TYPE OF CIRCUIT: Model 38-116, code 125, employs a fifteen tube, A. C. operated superheterodyne circuit with the **Philco Automatic Tuning Dial, having five tuning ranges, covering a frequency range from 530 K. C. to 18.2 M. C.**

Incorporated in this model are design features such as Magnetic Tuning control on each tuning range; Automatic Volume Control; Fidelity and Selectivity controlled by variable I. F. Transformers; Bass Compensation; Acoustic Clarifiers to eliminate cabinet resonance; Split Stator Tuning Condensers for spreading short wave stations further apart, and Special Push-Pull Audio Output circuit using 6L6G Beam tubes.

POWER SUPPLY:	Voltage	Frequency Cycles	Power Consumption
	115	50 to 60	165 watts
	115	25 to 40	165 watts
	115/230	50 to 60	165 watts

Different transformers are required for operation on the voltages and frequencies listed above. The part numbers for these transformers are listed on page 4. A special transformer for operation on either 115 or 230 volt—50 to 60 cycle A.C. power circuit can be obtained. This transformer is provided with a plug and socket for selection of either voltage rating. Place the plug with arrow pointing toward voltage being used.

INTERMEDIATE FREQUENCY: 470 K.C.

Model 38-116, Code 125

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator, having a fundamental frequency range covering the tuning and intermediate frequencies of the receiver. **Philco Model 077 Signal Generator** which has a fundamental frequency range from 115 to 36000 K. C. is the correct instrument for this purpose; (2) Output Meter, **Philco Model 026 Circuit Tester** incorporates a sensitive output meter and is recommended; (3) Philco Fibre Handle Screw Driver, Part No. 27-7059 and Fibre Wrench, Part No. 3164.

OUTPUT METER: The 026 Output Meter is connected to the plate and cathode terminals of one of the 6L6G tubes. Adjust the meter to use the (0-30) volt scale and advance the attenuator control of the generator until a readable indication is noted on the output meter after signal is applied to stage being adjusted.

DIAL CALIBRATION: In order to adjust the compensators of this receiver correctly the dial must be aligned to track properly with the tuning condenser. To do this proceed as follows:

1. Loosen the set screws on the shaft coupling of the tuning condenser. Then turn the tuning condenser until the plates are in the maximum capacity position. Now turn the dial until the glowing beam indicator is on the Index Line at the low frequency end of range 3. (See Fig. 8). With the dial and tuning condenser in this position tighten set screws.

2. Turn the tuning condenser control until the indicator is on the 4.71 M.C. mark of range 3. (See Fig. 8.)

3. With the dial in this position, loosen the shaft coupling set screws. Then turn the dial until the indicator is again on the Index Line. Tighten the set screws in this position. Be careful when turning the dial that the position of the tuning condenser is not disturbed.

INTERMEDIATE FREQUENCY CIRCUIT

1. Viewing each instrument from the front, set the receiver and Signal Generator controls as follows:

a. Selectivity-fidelity control (clockwise)

b. Volume Control at maximum (clockwise)

c. Magnetic Tuning Switch (off)

d. Bass Compensation Switch first position from "Off"

e. Range Switch position one (broadcast)

f. Receiver dial 580 K. C.

g. Signal Generator indicator set at 470 K. C. and the "Attenuator" control for maximum output.

2. Connect the Signal Generator output cable through a .1 mfd. condenser to the grid of the second 6K7G I. F. tube. Then adjust the I. F. compensators as follows:

a. Close compensator (**52B**) by turning to the extreme clockwise position, then pad compensator (**52A**) for maximum output. Now readjust compensator (**52B**) for maximum output.

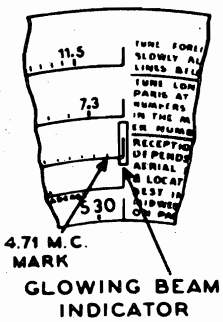

Fig. 8. Dial Calibration

b. Connect the Signal Generator output lead through the .1 mfd. condenser to the grid of the 6A8G Mixer tube, and adjust the following compensators for maximum output: (**51D**), (**51C**), (**51B**), (**51A**).

c. Repad (**52A**), See Note. A Check for two equal peaks. Treble-Selectivity control in expanded position (counter-clockwise).

RADIO FREQUENCY CIRCUIT

1. Connect the Signal Generator output cable to the "Red" and "Blk" terminals on the aerial panel (rear of chassis). The ground connection of the cable should be connected to the "Blk" terminal. Set the controls as given under "Intermediate Frequency Circuit" (a-b-c-d) and set the Range Switch, Signal Generator and Receiver Dials as given in the following procedure.

2. Set the controls and adjust the compensators for maximum output as follows:

Range Switch Position	Signal Generator and Receiver Dials	Compensators in Order
1	1550 K. C.	(36), (18B), (18A)
1	580 K. C.	(34)
1	1550 K. C.	(36), (18B), (18A)
5	18 M. C.	(36C) See Note C
5	18 M. C.	(25), (6) Roll Tuning Condenser. See Note B
4	11 M. C.	(36B)
3	7 M. C.	(34A)
2	4.5 M. C.	(36A)
5	18 M. C.	(36C) See Note C
5	18 M. C.	(25), (6), Roll Tuning Condenser. See Note B

NOTE "A"—Slowly shift signal generator indicator between 460 and 480 K. C. As the indicator is turned, two peaks will be noted on the Output Meter; one about 465 K. C. and the other about 475 K. C. These peaks should give the same deflection or reading on the output meter. If the peaks are unequal, Compensator (52A) must be slightly readjusted to the right or left (not more than 1/8 of a turn) until the peaks are equalized. Each time the compensator is set in another position, rotate the signal generator through the 460 or 480 K. C. range and note the reading of each peak. This adjustment is used to compensate for slight differences between peaks. If the compensator must be turned more than 1/8 of a turn in either direction to equalize the peaks, all padders should be carefully readjusted as given under "Intermediate Frequency Circuit" adjustment procedure.

NOTE "B"—When adjusting the low frequency compensator of Range 1 (Broadcast) or the antenna and R. F. compensators of the high frequency tuning range, the receiver Tuning Condenser must be adjusted (rolled) as follows: First tune the compensator for maximum output, then vary the tuning condenser of the receiver for maximum output about the frequency dial mark being used. Now turn the compensator slightly to the right or left and vary the receiver tuning condenser for maximum output. If the out reading increases, turn the compensator in the same direction a trifle more, and again vary the tuning condenser for maximum output. If the output decreases, set the compensator in the opposite direction. This procedure of first setting the compensator and then varying the tuning condenser is continued until there is no further gain in output reading.

NOTE "C"—To accurately adjust the high frequency oscillator compensator to the fundamental instead of the image signal, turn the oscillator compensator to the maximum capacity position (clockwise). From this position slowly turn the compensator counter clockwise until a second maximum peak is obtained on the output meter. Adjust the compensator for maximum output using this second peak. The first peak from the maximum capacity position of the compensator is the image signal and must not be used in adjusting the compensator.

If the above procedure is correctly performed, the image signal will be found (much weaker) by turning the receiver dial 940 K. C. below the frequency being used on the high frequency range.

MAGNETIC TUNING CIRCUIT ADJUSTMENT

a. Set the Magnetic Tuning switch in the "out" position (counter-clockwise).

b. Volume control maximum (extreme clockwise).

c. Turn Treble-Selectivity control to the Selective position (extreme clockwise).

d. Now turn the signal generator indicator to the 1000 K. C. mark and adjust the "Attenuator" control for a weak signal. Then adjust the receiver dial for maximum output at this frequency.

NOTE: The receiver dial **MUST** be tuned very accurately to the 1000 K. C. signal in order to make the following adjustments correctly.

e. After adjusting the receiver dial, turn the Magnetic Tuning Switch "on".

f. Now, turn compensator (**53B**) slightly to the right or left (about 1/4 turn) and proceed with adjustment "g."

g. Adjust compensator (**53A**) primary of the discriminator transformer for **minimum** output; then readjust compensator (**53B**) secondary of discriminator transformer for **maximum** output.

The above adjustments are now checked for accuracy as follows:

Frequency Test:

With the 1000 K. C. signal tuned for maximum output turn the Magnetic Tuning control back and forth; that is, from the "out" to "in" position. The reading of the output meter should not change in either position. If the output meter reading changes, the above magnetic tuning circuit adjustments should be repeated.

A further check on the magnetic tuning adjustment is to very carefully tune in a broadcasting station and then turn the magnetic tuning switch from the "out" to the "in" position. With the switch in either position, the tone of the station should not change. If a change of tone or hiss develops repeat the above Magnetic Tuning Adjustments.

Sensitivity Test:

1. To check the magnetic tuning circuit for sensitivity, turn the magnetic tuning switch to the "off" position, and tune in the 1000 K. C. signal. Then adjust the "attenuator" control of the signal generator for a good audible signal,—approximately 20 volts on the output meter.

2. Now detune the signal (first above and then below the 1000 K. C. mark) to a point at which the signal is weakly heard. At each point turn the magnetic tuning control "ON". When the control is turned "ON" the signal should return to normal output strength. If the magnetic tuning circuit does not pull the signal into resonance, the primary compensator (53A) should be carefully readjusted.

MODEL 38-690(125)
Alignment,Tuner

PHILCO RADIO & TELEV. CORP.

Model 38-690—Code 125

Alignment of Compensators

Viewing each instrument from the front, set the receiver and signal generator controls as follows:

1. Volume Control (Maximum)
2. Bass Control (Counter-Clockwise)
3. Magnetic Tuning Switch (Off)
4. Selectivity-fidelity control (Clockwise)
5. Set the remaining controls and adjust the compensators for maximum output as follows:

RANGE SWITCH POSITION	RECEIVER DIAL	SIGNAL GENERATOR DIAL	SIGNAL GENERATOR CONNECTION	ADJUST COMPENSATORS IN ORDER	NOTES
1	600 K.C.	470 K.C.	Grid 1st 6K7G-I.F.	(70B),(70A),(49B),(49A),(48B),(48A)	Insert .1 mfd. cond. in series with generator output lead
1	600 K.C.	470 K.C.	Grid 6A8G-Det.	(47B),(47A)	"
1	600 K.C.	470 K.C.	"	Turn Selectivity-fidelity control counter-clockwise and check for two equal peaks(Note "A").	
1	1550 K.C.	1550 K.C.	Red & Black Terminals Ant.	(40),(22B),(22A)	Remove .1 mfd cond. from generator output lead
1	580 K.C.	580 K.C.	"	(39)	Roll Tuning Condenser (Note "B")
1	1550 K.C	1550 K.C.	"	(40),(22B),(22A)	
5	18 M.C.	18 M.C.	"	(40B),(20),(6)	Note B. Check image at 17.060
4	11 M.C.	11 M.C.	"	(40B)	
3	7.0 M.C.	7.0 M.C.	"	(39A)	
2	4.5 M.C.	4.5 M.C.	"	(40A)	
5	18 M.C.	18 M.C.	"	(40C),(20),(6)	Roll Tuning Condenser (Note "B")

MAGNETIC TUNING CIRCUIT ADJUSTMENT

a. Set the Magnetic Tuning switch in the "out" position (counter-clockwise).

b. Volume control maximum (extreme clockwise).

c. Turn Treble-Selectivity control to the Selective position (extreme clockwise).

d. Now turn the signal generator indicator to the 1000 K. C. mark and adjust the "Attenuator" control for a weak signal. Then adjust the receiver dial for maximum output at this frequency.

NOTE: The receiver dial **MUST** be tuned very accurately to the 1000 K. C. signal in order to make the following adjustments correctly.

e. After adjusting the receiver dial, turn the Magnetic Tuning Switch "on". Advance the "Attenuator" and "Multiplier" controls of the signal generator for a strong signal.

f. Now, turn compensator 85B slightly to the right or left (about ¼ turn) and proceed with adjustment "g".

g. Adjust compensator 77A and 85A for minimum output. Now set the "Attenuator" and "Multiplier" controls for a weak signal; then re-adjust compensator 85B for maximum output.

h. The above adjustments are now checked for accuracy as follows:

Frequency Test:

With the 1000 K. C. signal tuned for maximum output turn the Magnetic Tuning control back and forth; that is, from the "out" to "in" position. The reading of the output meter should not change in either position. If the output meter reading changes, the above magnetic tuning circuit adjustments should be repeated.

A further check on the magnetic tuning adjustment is to very carefully tune in a broadcasting station and then turn the magnetic tuning switch from the "out" to the "in" position. With the switch in either position, the tone of the station should not change. If a change of tone or hiss develops repeat the above Magnetic Tuning Adjustments.

Sensitivity Test:

1. To check the magnetic tuning circuit for sensitivity, turn the magnetic tuning switch to the "off" position, and tune in the 1000 K. C. signal. Then adjust the "attenuator" control of the signal generator for a good audible signal,—approximately 20 volts on the output meter.

2. Now detune the signal (first above and then below the 1000 K. C. mark) to a point at which the signal is weakly heard. At each point turn the magnetic tuning control "ON". When the control is turned "ON" the signal should return to normal output strength. If the magnetic tuning circuit does not pull the signal into resonance, compensators 77A and 85A should be carefully readjusted.

PHILCO MODEL 38-620, CODE 121 and 125

Replacement Parts and Schematic Diagram

Codes 121 and 125 Receivers differ only in the Antenna tuning section of the R. F. Unit. See Schematic Diagram,

All part numbers are for Codes 121 and 125 unless otherwise stated.

PHILCO RADIO & TELEV. CORP.

NOTE "A"—Slowly shift signal generator indicator between 460 and 480 K. C. As the indicator is turned, two peaks will be noted on the Output Meter; one about 465 K. C. and the other about 475 K. C. These peaks should give the same deflection or reading on the output meter. If the peaks are unequal, Compensator 70 A must be slightly readjusted to the right or left (not more than 1/4 of a turn) until the peaks are equalized. Each time the compensator is set in another position, rotate the signal generator through the 460 or 480 K. C. range and note the reading of each peak. This adjustment is used to compensate for slight differences between peaks. If the compensator must be turned more than 1/8 of a turn in either direction to equalize the peaks, all padders should be carefully readjusted as given under "Intermediate Frequency Circuit" adjustment procedure.

NOTE "B"—When adjusting the low frequency compensator of Range 1 (Broadcast) or the antenna and R. F. compensators of the high frequency tuning range, the receiver Tuning Condenser must be adjusted (rolled) as follows: First tune the compensator for maximum output, then vary the tuning condenser of the receiver for maximum output about the frequency dial mark being used. Now turn the compensator slightly to the right or left and vary the receiver tuning condenser for maximum output. If the out reading increases, turn the compensator in the same direction a trifle more, and again vary the tuning condenser for maximum output. If the output decreases, set the compensator in the opposite direction. This procedure of first setting the compensator and then varying the tuning condenser is continued until there is no further gain in output reading.

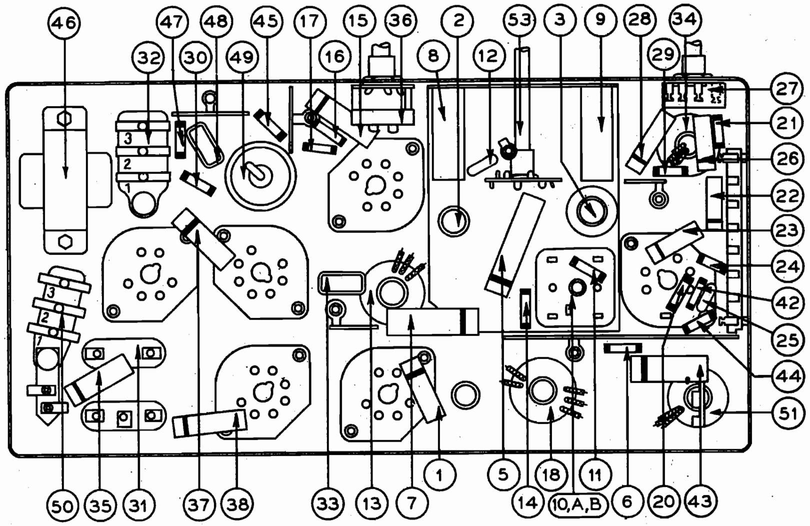
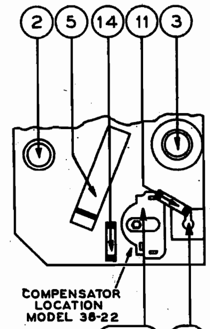
FOR CONE-CENTRIC TUNING MECHANISM—MODEL 22

Complete information for setting the stations on the cone-centric tuning mechanism of Model 38-22 is covered in the instruction Part No. (39-5533B) which is supplied with each set.

A few major assemblies of the automatic cone-centric tuning mechanism are listed on page 3 of this bulletin. A complete list of replacement parts, however, and detailed service data for the automatic mechanism, will be found in bulletin 282.





•NOTE•
NO.'S 10,10A,10B, IS A SINGLE UNIT COMPENSATOR WHEN USED IN MODEL 38-23.
IN MODEL 38-22, NO. 10B IS A SINGLE UNIT COMPENSATOR; AND NO.'S 10 10A ARE CONTAINED IN A SINGLE UNIT.
FOR PHYSICAL LOCATION OF COMPENSATORS SEE CUTAWAY VIEW OF R.F. UNIT SHOWN ABOVE.

Fig. 4—Part Locations, Underside of Chassis

Alignment of Compensators

EQUIPMENT REQUIRED: (1) Signal Generator, using a fundamental frequency covering the intermediate frequency and tuning ranges of the receivers. Philco Model 077 Signal Generator which has a fundamental frequency range from 115 to 36000 K. C. is the correct instrument for this purpose; (2) Output meter, Philco Model 026 circuit tester incorporates a sensitive output meter and is recommended; (3) Philco Fibre Handle Screw Driver, part No. 27-7059 and Fibre Wrench Part No. 3164; (4) Philco Set Transformer, Part No. 32-2763.

OUTPUT METER: The 026 Output Meter is connected to the plate and cathode terminals of one of the 25L6G tubes. Adjust the meter to use the (0-30) volt scale and advance the attenuator control of the generator until a readable indication is noted on the output meter.

DIAL CALIBRATION: In order to adjust the receiver correctly the dial must be aligned to track properly with the tuning condenser. To adjust the dial of each model proceed as follows:

Model 38-22:

1. Loosen the shaft coupling set screws, using Wrench, Part No. 45-2481; then turn the tuning condenser to the maximum capacity position (plate fully meshed). Now turn the selector knob until the dial pointer is on the small black dot at the low frequency end of the Range One scale. With condenser and pointer set in this position, tighten set screws.

2. Now turn the selector knob (clockwise) until the dial pointer moves 1/16 of an inch from the small black dot (clockwise). See Fig. 5. Leave pointer in this position and loosen coupling set screws.

3. After loosening set screws, turn the selector knob until pointer is again on the small black dot at the low frequency end of Range One scale. Be careful when turning the selector knob that the position of tuning condenser is not disturbed. Tighten coupling set screws with condenser and dial pointer in this position.

Model 38-23:

1. Turn the tuning condenser to maximum capacity position (plates fully meshed).

2. Loosen the clamp of dial, then turn the dial—being careful that position of tuning condenser is not disturbed—until the glowing indicator is centered on the middle index line at the low frequency end of Range One scale. See Fig. 6. Tighten the dial clamp in this position.

INTERMEDIATE FREQUENCY CIRCUIT

Note: Before the following adjustments are performed, the receiver must be turned on and allowed to heat for 15 minutes.

When adjusting the following compensators, a Philco Set Transformer Part No. 32-2763 must be connected in the signal generator output circuit as follows: Insert the signal generator output lead into the "Med" jack and the ground lead into the "Gnd" jack of the signal generator. Connect the other end of the output lead to terminal No. 1 on the Set Transformer and the cable ground to terminal No. 2. Terminals No. 3 and 4 of the Set Transformer are then connected to the chassis ground terminal and 6A8G grid respectively of the receiver with short pieces of wire. Insert a 0.1 mfd. in series with the No. 4 lead which connects to the grid.

1. Set Signal Generator at 470 K. C. Turn "Multiplier" Control to 1000 and the "Attenuator" for maximum output.
2. Turn the receiver dial to 580 K. C.
3. Receiver Volume Control maximum.
4. Range Switch Broadcast Position.
5. Adjust compensators (18B), (18A), (13B) and (13A) for maximum output.

If the output meter goes off scale when adjusting the compensators retard signal generator attenuator.

RADIO FREQUENCY CIRCUIT

Tuning Range: 5.7 to 18 M. C.

1. Remove terminal No. 4 lead of set transformer from the 6A8G grid and connect to the red terminal of the aerial panel of the receiver through a .1 mfd. condenser.

2. Leave the receiver volume control at maximum. Then set the controls and adjust the R. F. compensators as follows:

Range Switch	Signal Generator and Receiver Dial	Compensators in Order
2	18 M. C.	(4B) See Note A

Tuning Range: 530 to 1720 K. C.

Set the controls and adjust the R. F. compensators as follows:

Range Switch	Signal Generator and Receiver Dial	Compensators in Order
1	1550 K. C.	(10B), (4A)
1	580 K. C.	(10)
1	1550 K. C.	(10B)

NOTE A—To accurately adjust the high frequency oscillator compensator to the fundamental instead of the image signal, turn the oscillator compensator to the maximum capacity position (clockwise). Now, slowly turn compensator counter-clockwise until a second maximum peak is obtained on the output meter. The second peak is the fundamental signal, and must be used in adjusting the receiver for maximum output. The first peak from maximum capacity position of the compensator is the image signal and must not be used in adjusting this compensator.

If the above procedure is correctly performed, the image signal will be found (much weaker) by turning the receiver dial 940 K. C. below the frequency being used on any high frequency range.

TYPE OF CIRCUIT: A six tube AC-DC operated superheterodyne circuit is incorporated in these receivers with features such as two tuning ranges; automatic volume control; bass compensation; and a push-pull pentode audio output circuit using beam power tubes.

The same circuit is used in both models. The features, however, such as the tuning mechanism, speakers and cabinets differ in each model.

Model 38-22, Code 121 employs the **Philco Cone-Centric Automatic Tuning Mechanism** and is assembled in cabinets types "XX" and "T". Model 38-22 assembled in a "CS" cabinet is identified as Code 124. A few parts of the Code 124 chassis differ from those of Code 121. These parts are listed on the parts list.

Model 38-23 tuning mechanism is of the manually operated type with vernier control. This receiver is assembled in cabinets types "T", "X" and "K" with KR27 and HR21 speakers.

POWER SUPPLY: 115 volts AC or DC.

For operation on a 220 volt power supply the line resistor must be changed. See parts list for part number.

INTERMEDIATE FREQUENCY: 470 K. C.

TUNING RANGE FREQUENCIES: Range 1—530 to 1720 K. C. Range 2—5.7 to 18.0 M. C.

UNDISTORTED OUTPUT: 3.5 watts.

PHILCO TUBES USED: One 6A8G, Osc. 1st Det.; one 6K7G, I. F. Amp.; one 6R7G, 2nd Det. 1st Audio.; two 25L6G, Output, and one 25Z6G, Rectifier.

TONE CONTROL: Three positions.

Aerial Connections

To obtain the full advantage of the sensitivity of these receivers, the Philco High Efficiency Aerial Part No. 40-6112 must be used.

For attaching the aerial to the receiver a terminal panel is provided at the rear of the chassis. This panel contains three screw terminals marked "Red", "Blk" and "Gnd". Connect the red and black wires of the Philco High Efficiency Aerial transmission line to the "Red" and "Blk" terminals respectively.

If you use a temporary aerial, connect it to the "Red" terminal.

A good ground connection is necessary for best reception. The terminal marked "Gnd" should be connected to a water pipe or any other good ground source.

PHILCO RADIO & TELEV. CORP.

REPLACEMENT PARTS—Models 38-22 & 38-23, Code 121

Schem. No.	Description	Part No.	List Price
1	Condenser 0.01 mf. (tubular)	30-4479	$0.20

Trimmers, Alignment

921 & 922 (Run NO.2)

I. F. TRANSFORMERS AND PADDERS

The I. F. transformers are assembled complete with padding condensers.

Both the primary and the secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield. (See Figure 4).

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure 8.

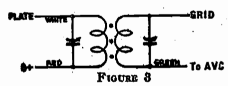

FIGURE 8

If replacements are ever necessary, replace the entire coil assembly, 32-3074 for the first I. F. stage and 32-3076 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above numbers.

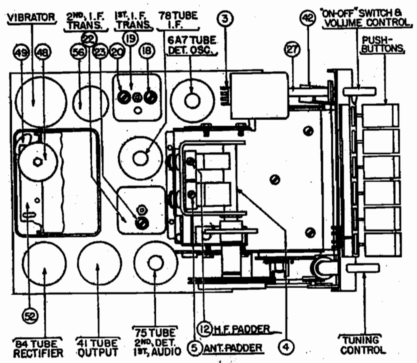

FIGURE 4

ADJUSTMENTS

All padding adjustments are carefully made at the factory and ordinarily no readjustments are necessary. However, when readjustments are required, the procedure given below must be followed in detail.

Equipment — Fully charged heavy duty storage battery or 6-volt power pack, 048A or 099 Philco Set Tester, 27-7159 Padding screw driver.

General — The output meter must be connected by means of an adapter to the plate of the type 41 output tube and to the Radio chassis.

With the Radio and signal generator set up for operation at the prescribed frequency, turn the Radio volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the output meter. The signal in the speaker should be audible but not loud.

The shielding on the signal generator output lead must be connected to the Radio housing.

OPERATION	SIGNAL GENERATOR FREQUENCY	SIGNAL GENERATOR CONNECTION	DUMMY CAPACITY	SPECIAL INSTRUCTIONS	ADJUST PADDER
1	470 K.C.	To Antenna Receptacle on Radio	50 Mmfd. See Note 1	Turn Tuning Condenser Plates Out of Mesh as Far as They Will Go.	[illegible] 18 20 23
2	1550 K.C.	To Antenna Receptacle on Radio	50 Mmfd. See Note 1	Note 2	12
3	1360 K.C.	To Antenna Receptacle on Radio	50 Mmfd. See Note 1	Set Tuning Condenser at 1360 K.C.	5 Note 3
4	590 K.C.	To Antenna Receptacle on Radio	50 Mmfd. See Note 1	Set Tuning Condenser at 590 K.C.	6 Antenna Compensator

Make all adjustments for maximum reading on the output meter.

NOTE 1 — Connect the antenna lead, Part No. 41-3191, to the antenna receptacle in the radio. Connect a 50 Mmfd. Condenser in series between the signal generator and the antenna lead.

NOTE 2 — Turn the condenser rotor plates completely out of mesh. Use a piece of bond letterhead paper as a gauge between the heel of the rotor plates and the stator plates of the oscillator section of the tuning condenser, and turn the condenser plates in mesh until they strike the paper.

NOTE 3 — When the antenna stage adjustment is made with the Radio installed in the car, the Radio antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

MODEL 920

I. F. TRANSFORMERS AND PADDERS

The I. F. transformers are assembled complete with padding condensers.

Both the primary and the secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield. (See Figure 4).

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure 3.

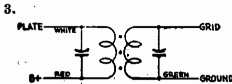

FIGURE 3

If replacements are ever necessary, replace the entire coil assembly, 32-2994 for the first I. F. stage and 32-2995 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above numbers.

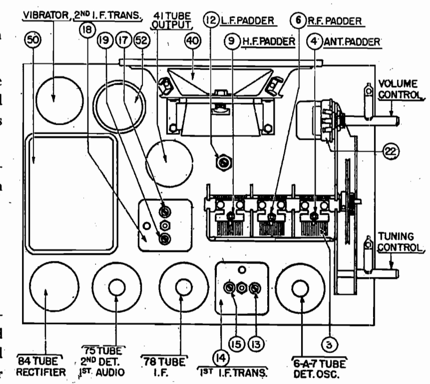

FIGURE 4

MODEL 920 ADJUSTMENTS

All padding adjustments are carefully made at the factory and ordinarily no readjustments are necessary. However, when readjustments are required, the procedure given below must be followed in detail.

Equipment — Fully charged heavy duty storage battery or 6-volt power pack, 048A or 099 Philco Set Tester, 3164 Padding wrench, 27-7159 Padding screw driver.

General — The output meter must be connected by means of an adapter to the plate of the type 41 output tube and to the Radio chassis.

With the Radio and signal generator set up for operation at the prescribed frequency, turn the Radio volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the output meter. The signal in the speaker should be audible but not loud.

The shielding on the signal generator output lead must be connected to the Radio housing.

OPERATION	SIGNAL GENERATOR FREQUENCY	SIGNAL GENERATOR CONNECTION	DUMMY CAPACITY	SPECIAL INSTRUCTIONS	ADJUST PADDER
1	260 K.C.	To grid of 6A7 Tube	.1 Mfd. Condenser in Series with Generator Lead	No Antenna Connection	17 19 13 15 17
2	1550 K.C.	To Antenna Receptacle on Radio	50 Mmfd. See Note 1	Turn Tuning Condenser Plates Out of Mesh as Far as They Will Go.	9 6 4
3	580 K.C.	To Antenna Receptacle on Radio	50 Mmfd. See Note 1	Set Tuning Condenser at 580 K.C.	Note 2 12
4	1550 K.C.	To Antenna Receptacle on Radio	50 Mmfd. See Note 1	Turn Tuning Condenser Plates Out of Mesh as Far as They Will Go.	9
5	1400 K.C.	To Antenna Receptacle on Radio	50 Mmfd. See Note 1	Set Tuning Condenser at 1400 K.C.	6 4 Note 3

Make all adjustments for maximum reading on the output meter.

NOTE 1 — Connect the antenna lead, Part No. 41-3191, to the antenna receptacle in the radio. Connect a 50 Mmfd. Condenser in series between the signal generator and the antenna lead.

NOTE 2 — Rock the tuning condenser while adjusting the low frequency padder. Tune the condenser to the signal and adjust the padder for maximum output. Rotate the tuning condenser back and forth slightly for maximum output. Then re-adjust the padder for maximum output. Repeat this procedure until no further improvement is noticed.

NOTE 3 — When the antenna stage adjustment is made with the Radio installed in the car, the Radio antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

Details, Parts

I. F. TRANSFORMERS AND PADDERS

The I. F. transformers are assembled complete with padding condensers.

Both the primary and the secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield. (See Figure 4).

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure 3.

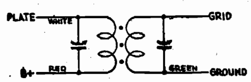

FIGURE 3

If replacements are ever necessary, replace the entire coil assembly, 32-3013, for the first I. F. stage and 32-3014 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above numbers.

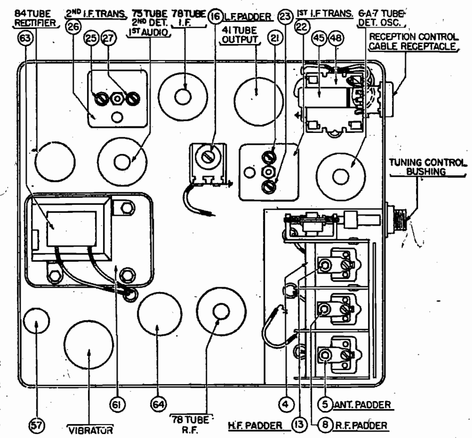

FIGURE 4

MODEL 926 ADJUSTMENTS

All padding adjustments are carefully made at the factory and ordinarily no readjustments are necessary. However, when readjustments are required, the procedure given below must be followed in detail.

Equipment — Fully charged heavy duty storage battery or 6-volt power pack, 048A or 099 Philco Set Tester, 8164 Padding wrench, 27-7159 Padding screw driver.

General — The output meter must be connected by means of an adapter to the plate of the type 41 output tube and to the Radio chassis.

With the Radio and signal generator set up for operation at the prescribed frequency, turn the Radio volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the output meter. The signal in the speaker should be audible but not loud.

The shielding on the signal generator output lead must be connected to the Radio housing.

OPERATION	SIGNAL GENERATOR		DUMMY CAPACITY	SPECIAL INSTRUCTIONS	ADJUST PADDER
	FREQUENCY	CONNECTION			
1	260 K. C.	To grid of 6A7 Tube	.1 Mfd. Condenser in Series with Generator Lead	No Antenna Connection	25 27 21 23

3	580 K. C.	To Antenna Receptacle on Radio	50 Mmfd. See Note 1	Set Tuning Condenser at 580 K. C.	16 Note 2
4	1550 K. C.	To Antenna Receptacle on Radio	50 Mmfd. See Note 1	Turn Tuning Condenser Plates Out of Mesh as Far as They Will Go.	13
5	1400 K. C.	To Antenna Receptacle on Radio	50 Mmfd. See Note 1	Set Tuning Condenser at 1400 K. C.	8 5 Note 3
6	600 K. C.	Note 4	Note 4	Note 4	1 Note 4

Make all adjustments for maximum reading on the output meter.

NOTE 1 — Connect the antenna lead, Part No. 41-3191, to the antenna receptacle in the radio. Connect a 50 Mmfd. Condenser in series between the signal generator and the antenna lead.

NOTE 2 — Rock the tuning condenser while adjusting the low frequency padder. Tune the condenser to the signal and adjust the padder for maximum output. Rotate the tuning condenser back and forth slightly for maximum output. Then re-adjust the padder for maximum output. Repeat this procedure until no further improvement is noticed.

NOTE 3 — When the antenna stage adjustment is made with the Radio installed in the car, the Radio antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

NOTE 4 — When installing the Radio in a car, follow the installation instructions carefully. Tune in a weak broadcast signal at approximately 60 on the control scale. With a small screw driver adjust the antenna compensating condenser 1 for the maximum signal.

I. F. TRANSFORMERS AND PADDERS

The I. F. transformers are assembled complete with padding condensers.

Both the primary and the secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield. (See Figure 4).

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure 3.

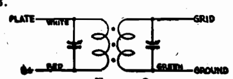

Figure 3

If replacements are ever necessary, replace the entire coil assembly, 32-3013 for the first I. F. stage and 32-3014 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above numbers.

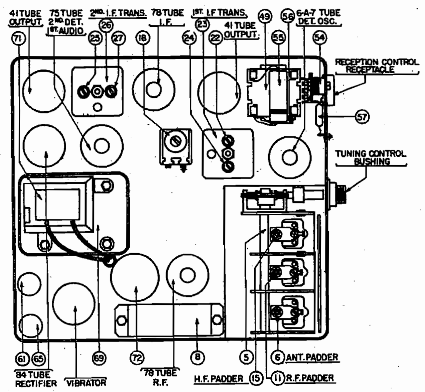

Figure 4

MODEL 927 ADJUSTMENTS

All padding adjustments are carefully made at the factory and ordinarily no readjustments are necessary. However, when readjustments are required, the procedure given below must be followed in detail.

Equipment — Fully charged heavy duty storage battery or 6-volt power pack, 048A or 099 Philco Set Tester, 8164 Padding wrench, 27-7159 Padding screw driver.

General — The output meter must be connected by means of an adapter to the plate of the type 41 output tube and to the Radio chassis.

With the Radio and signal generator set up for operation at the prescribed frequency, turn the Radio volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the output meter. The signal in the speaker should be audible but not loud.

The shielding on the signal generator output lead must be connected to the Radio housing.

6	600 K.C.	Note 4	Note 4	Note 4	3 Note 4

Make all adjustments for maximum reading on the output meter.

NOTE 1 — Connect the antenna lead, Part No. 41-3191, to the antenna receptacle in the radio. Connect a 50 Mmfd. Condenser in series between the signal generator and the antenna lead.

NOTE 2 — Rock the tuning condenser while adjusting the low frequency padder. Tune the condenser to the signal and adjust the padder for maximum output. Rotate the tuning condenser back and forth slightly for maximum output. Then re-adjust the padder for maximum output. Repeat this procedure until no further improvement is noticed.

NOTE 3 — When the antenna stage adjustment is made with the Radio installed in the car, the Radio antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

NOTE 4 — When installing the Radio in a car, follow the installation instructions carefully. Tune in a weak broadcast signal at approximately 60 on the control scale. With a small screw driver adjust the antenna compensating condenser ③ for the maximum signal.

I. F. TRANSFORMERS AND PADDERS

The I. F. transformers are assembled complete with padding condensers.

Both the primary and the secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield. (See Figure 4).

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure 3.

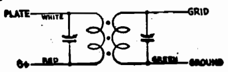

Figure 3

If replacements are ever necessary, replace the entire coil assembly, 32-3013, for the first I. F. stage and 32-3014 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above numbers.

5	1400 K.C.	To Antenna Receptacle on Radio	50 Mmfd. See Note 1	Set Tuning Condenser at 1400 K.C.	11 6 Note 3
6	600 K.C.	Note 4	Note 4	Note 4	3 Note 4

Make all adjustments for maximum reading on the output meter.

NOTE 1 — Connect the antenna lead, Part No. 41-3191, to the antenna receptacle in the radio. Connect a 50 Mmfd. Condenser in series between the signal generator and the antenna lead.

NOTE 2 — Rock the tuning condenser while adjusting the low frequency padder. Tune the condenser to the signal and adjust the padder for maximum output. Rotate the tuning condenser back and forth slightly for maximum output. Then re-adjust the padder for maximum output. Repeat this procedure until no further improvement is noticed.

NOTE 3 — When the antenna stage adjustment is made with the Radio installed in the car, the Radio antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

NOTE 4 — When installing the Radio in a car, follow the installation instructions carefully. Tune in a weak broadcast signal at approximately 60 on the control scale. With a small screw driver adjust the antenna compensating condenser ③ for the maximum signal.

PHILCO RADIO & TELEV. CORP.

MODEL S1516(Studebaker)
Socket,Trimmers,Controls
Alignment,Parts

I. F. TRANSFORMERS AND PADDERS

The I. F. transformers are assembled complete with padding condensers.

Both the primary and the secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield. (See Figure 8).

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure 7.

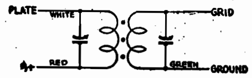

FIGURE 7

If replacements are ever necessary, replace the entire coil assembly, 32-2026 for the first I. F. stage and 32-2027 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above numbers.

MODEL S-1516 ADJUSTMENTS

All padding adjustments are carefully made at the factory and ordinarily no readjustments are necessary. However, when readjustments are required, the procedure given below must be followed in detail.

Equipment

Fully charged heavy duty storage battery or 6-volt power pack, 048A or 099 Philco Set Tester, 3164 Padding wrench, 27-7159 Padding screw driver.

General

OUTPUT METER — The output meter must be connected by means of an adapter to the plate of the type 41 output tube and to the Receiver chassis.

SIGNAL GENERATOR — With the Receiver and signal generator set up for operation at the prescribed frequency, turn the Receiver volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the output meter. The signal in the speaker should be audible but not loud.

The shielding on the signal generator output lead must be connected to the Receiver housing.

Procedure

I. F. — Set the signal generator at exactly 260 K. C. Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid clip). Adjust the padders ㉒, ㉔, ㉕ and ㉗ on the first and second I. F. transformer for maximum reading on the output meter. (See Figure 8 for location of padders).

HIGH FREQUENCY AND R. F. — After padding the I .F. stages remove the generator lead from the 6A7 tube.

Set the signal generator at 1550 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid clip).

Turn the tuning condenser plates out of mesh as far as they will go.

With the tuning condenser in this position, adjust the high frequency padder ⑯ and the R. F. padder ⑪ until the maximum reading is obtained on the output meter. This is the true setting for 1550 K. C., 155 on the dial scale.

LOW FREQUENCY — Turn the tuning condenser plates in mesh to approximately 580 K. C., 58 on the dial scale and set the signal generator at 580 K. C. Roll the tuning condenser and adjust the low frequency padder screw ⑳, for maximum reading on the output meter.

HIGH FREQUENCY READJUSTMENT — Turn the tuning condenser plates out of mesh to 1550 K. C. and set the signal generator at 1550 K. C. Then adjust the high frequency padder ⑯ again for maximum reading on the output meter.

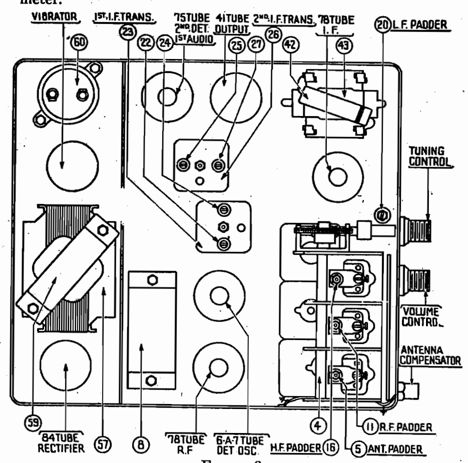

FIGURE 8

Remove the generator lead from the 78 R. F. tube.

ANTENNA — WHEN PADDING THE ANTENNA STAGE IT IS EXTREMELY IMPORTANT THAT THE PROPER DUMMY ANTENNA BE CONSTRUCTED AND USED.

Connect the signal generator lead to the antenna connector on the Receiver using an antenna lead, Part No. L-2665, and a 25 mmfd. condenser in series between the two leads.

Turn the tuning condenser in mesh to 600 K.C. and adjust the signal generator 600 K.C. Adjust the antenna compensating condenser ⑥ for maximum reading.

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K. C. Adjust the padders ⑪ and ⑤ for the maximum reading on the output meter.

When the antenna stage adjustment is made with the Receiver installed in the car, the Receiver antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

When installing the Radio in a car, follow the installation instructions carefully. Tune in a weak broadcast signal at approximately 60 on the control scale. With a small screw driver adjust the antenna compensating condenser ⑥ for the maximum signal.

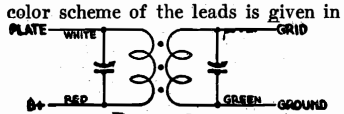
I. F. TRANSFORMERS AND PADDERS

The I. F. transformers are assembled complete with padding condensers.

Both the primary and the secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield.

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure



MODEL P-1517 *Procedure*

I. F.—Set the signal generator at exactly 260 K. C.

Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid cap). Adjust the padders ㉒, ㉔, ㉕ and ㉗ on the first and second I. F. transformers, for maximum reading on the output meter. (See Figure 8 for location of padders).

HIGH FREQUENCY AND R. F.—After padding the I. F. stages, remove the generator lead from the 6A7 tube.

Set the signal generator at 1550 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid cap).

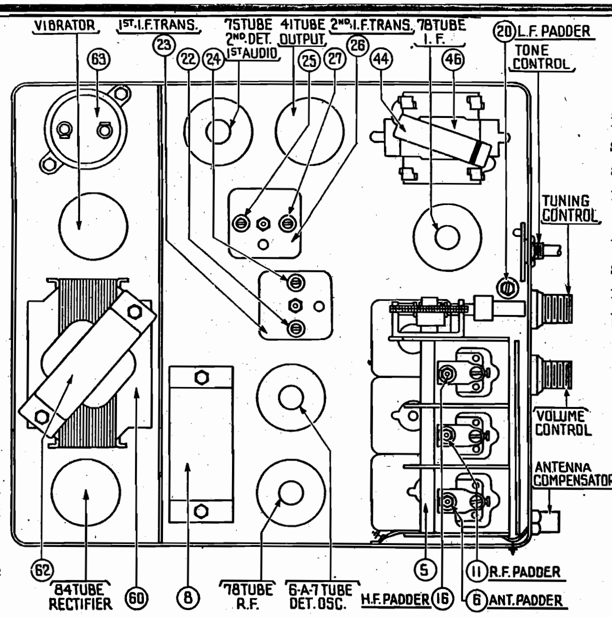


FIGURE 8

Turn the tuning condenser plates out of mesh as far as they will go. With the tuning condenser in this position, adjust the high frequency padder ⑯ and the R. F. padder ⑪ until the maximum reading is obtained on the output meter. This is the true setting for 1550 K. C., 155 on the dial scale.

LOW FREQUENCY—Turn the tuning condenser plates in mesh to approximately 580 K. C., 58 on the dial scale and set the signal generator at 580 K. C. Roll the tuning condenser and adjust the low frequency padder screw ⑳ for maximum reading on the output meter.

HIGH FREQUENCY READJUSTMENT — Turn the tuning condenser plates out of mesh as far as they will go and set the signal generator at 1550 K. C. Then adjust the high frequency padder ⑯ again for maximum reading on the output meter.

Remove the generator lead from the 78 R. F. tube.

ANTENNA — WHEN PADDING THE ANTENNA STAGE IT IS EXTREMELY IMPORTANT THAT THE PROPER DUMMY ANTENNA BE USED.

Connect the signal generator lead to the antenna socket on the Receiver using an antenna lead, Part No. L-2665 and a 30 mmfd. condenser in series between the two leads.

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K. C. Adjust the padders ⑪ and ⑥ for the maximum reading on the output meter.

When the antenna stage adjustment is made with the Receiver installed in the car, the Receiver antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

MODEL P-1530

Procedure

I. F.—Set the signal generator at exactly 260 K. C.

Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid cap). Adjust the padders ㉑, ㉓, ㉔ and ㉖ on the first and second I. F. transformers for maximum reading on the output meter. (See Figure 6 for location of padders).

HIGH FREQUENCY AND R. F.—After padding the I. F. stages, remove the generator lead from the 6A7 tube.

Set the signal generator at 1500 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid cap).

Place a piece of paper approximately .006" thick as a gauge between the heel of the rotor plates and the stator plates on the oscillator section of the tuning condenser. Turn the rotor plates in mesh until they strike against the paper.

With the tuning condenser in this position adjust the high frequency padder ⑯ and the R. F. padder ⑮ until the maximum reading is obtained on the output meter. This is the true setting for 1500 K. C., 150 on the dial scale.

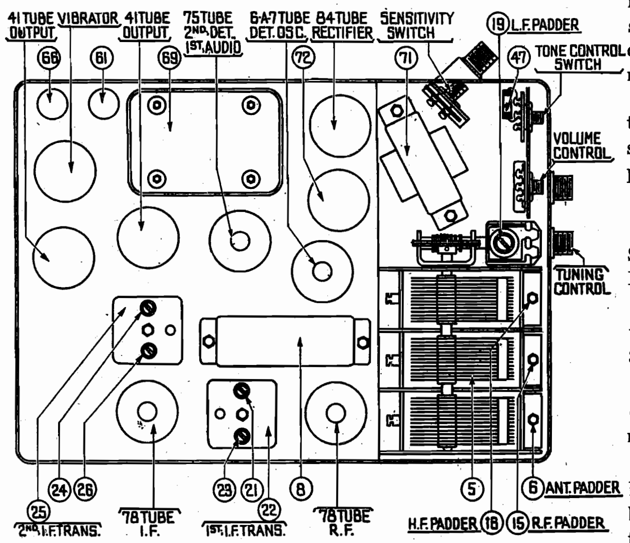

FIGURE 6

LOW FREQUENCY—Turn the tuning condenser plates in mesh to approximately 580 K. C., 58 on the dial scale and set the signal generator at 580 K. C. Roll the tuning condenser and adjust the low frequency padder screw ⑲ for maximum reading on the output meter.

HIGH FREQUENCY READJUSTMENT — Turn the tuning condenser plates out of mesh to 1500 K. C. and set the signal generator at 1500 K. C. Then adjust the high frequency padder ⑯ again for maximum reading on the output meter.

Remove the generator lead from the 78 R. F. tube.

ANTENNA — WHEN PADDING THE ANTENNA STAGE IT IS EXTREMELY IMPORTANT THAT THE PROPER DUMMY ANTENNA BE USED.

Connect the signal generator lead to the antenna socket on the Receiver using an antenna lead, Part No. L-2665 and a 30 mmfd. condenser in series between the two leads.

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K. C. Adjust the padders ⑮ and ⑥ for the maximum reading on the output meter.

When the antenna stage adjustment is made with the Receiver installed in the car, the Receiver antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

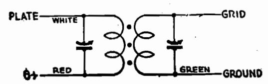
MODEL N-1524

I. F. TRANSFORMERS AND PADDERS

The I. F. transformers are assembled complete with padding condensers.

Both the primary and the secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield.

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure



Procedure

I. F. — Set the signal generator at exactly 260 K. C.

Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid clip). Adjust the padders ⑲, ㉑, ㉒ and ㉔ on the first and second I. F. transformers for maximum reading on the output meter. (See Figure 6 for location of padders).

HIGH FREQUENCY AND R. F. — After padding the I. F. stages, remove the generator lead from the 6A7 tube.

Set the signal generator at 1500 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid clip).

Place a piece of paper approximately .006" thick as a gauge between the heel of the rotor plates and the stator plates on the oscillator section of the tuning condenser. Turn the rotor plates in mesh until they strike against the paper.

With the tuning condenser in this position, **adjust the high** frequency padder ⑭ and the R. F. padder ⑪ **until the** maximum reading is obtained on the output meter. This is the true setting for 1500 K. C., 150 on the dial scale.

LOW FREQUENCY — Turn the tuning condenser plates in mesh to approximately 580 K. C., 58 on the dial scale and set the signal generator at 580 K. C. Roll the tuning condenser and adjust the low frequency padder screw ⑰ for maximum reading on the output meter.

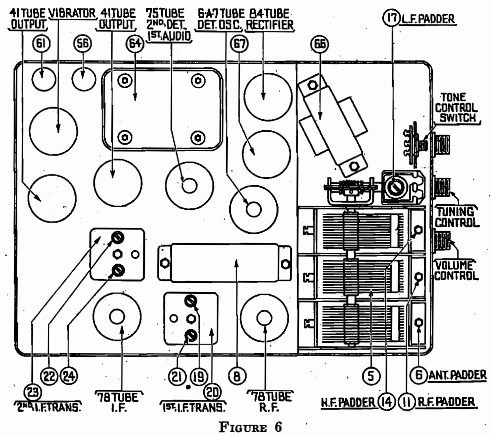


FIGURE 6

HIGH FREQUENCY READJUSTMENT — Turn the tuning condenser plates out of mesh to 1500 K. C. and set the signal generator at 1500 K. C. Then adjust the high frequency padder ⑭ again for maximum reading on the output meter.

Remove the generator lead from the 78 R. F. tube.

ANTENNA — WHEN PADDING THE ANTENNA STAGE IT IS EXTREMELY IMPORTANT THAT THE PROPER DUMMY ANTENNA BE CONSTRUCTED AND USED.

When a COWL ANTENNA is used, the green lead on the antenna transformer MUST be connected to the No. 1 terminal as shown on the label on the bottom cover of the Receiver. Connect the signal generator lead to the antenna connector on the Receiver, using an antenna lead, Part No. L-2665, and a 30 mmfd. condenser in series between the two leads.

When the UNDER-CAR ANTENNA is used, the green lead on the antenna transformer MUST be connected to the No. 2 terminal as shown on the label on the bottom cover of the Receiver. Connect the signal generator lead to the antenna connector on the Receiver, using an antenna lead, Part No. L-2665, and a 200 mmfd. condenser in series between the two

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K. C. Adjust the padders ⑪ and ⑥ for the maximum reading on the output meter.
leads.

When the antenna stage adjustment is made with the Receiver installed in the car, the Receiver antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

MODEL N-1514

Procedure

I. F. — Set the signal generator at exactly 260 K. C.

Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid clip). Adjust padders ㉒, ㉔, ㉕ and ㉗ on the first and second I. F. transformer for maximum reading on the output meter. (See Figure 8 for location of padders).

HIGH FREQUENCY AND R. F. — After padding the I. F. stages remove the generator lead from the 6A7 tube.

Set the signal generator at 1550 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid clip).
Turn the tuning condenser plates out of mesh as far as they will go.

With the tuning condenser in this position, adjust the high frequency padder ⑯ and the R. F. padder ⑪ until the maximum reading is obtained on the output meter. This is the true setting for the 1550 K. C., 155 on the dial scale.

LOW FREQUENCY — Turn the tuning condenser plates in mesh to approximately 580 K. C., 58 on the dial scale and set the signal generator at 580 K. C. Roll the tuning condenser and adjust the low frequency padder screw ⑳ for maximum reading on the output meter.

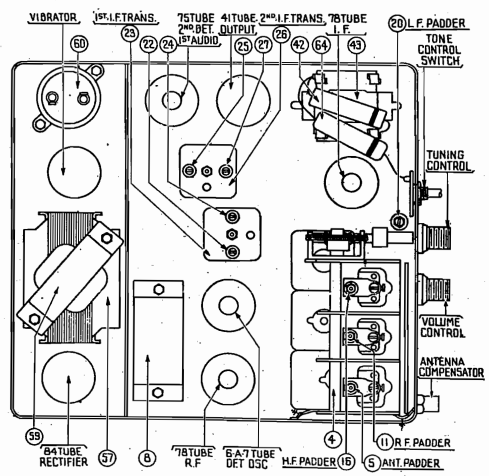

FIGURE 8

HIGH FREQUENCY READJUSTMENT — Turn the tuning condenser plates out of mesh to 1550 K. C. and set the signal generator at 1550 K. C. Then adjust the high frequency padder ⑯ again for maximum reading on the output meter.

Remove the generator lead from the 78 R. F. tube.

ANTENNA — WHEN PADDING THE ANTENNA STAGE IT IS EXTREMELY IMPORTANT THAT THE PROPER DUMMY ANTENNA BE CONSTRUCTED AND USED.

Connect the signal generator lead to the antenna connector on the Receiver using an antenna lead, Part No. L-2665, and a 25 mmfd. condenser in series between the two leads.

Turn the tuning condenser in mesh to 600 K. C. and adjust the signal generator 600 K. C. Adjust the antenna compensating condenser ⑥ for maximum reading.

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K. C. Adjust the padders ⑪ and ⑤ for the maximum reading on the output meter.

When the antenna stage adjustment is made with the Receiver installed in the car, the Receiver antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

When installing the Radio in a car, follow the installation instructions carefully. Tune in a weak broadcast signal at approximately 60 on the control scale. With a small screw driver adjust the antenna compensating condenser ⑥ for the maximum signal.

I. F. TRANSFORMERS AND PADDERS

The I. F. Transformers are assembled complete with padding condensers.

Both the primary and secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield. (See Figure 6).

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure 5.

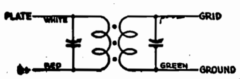

FIGURE 5

If replacements are ever necessary, replace the entire coil assembly, 32-2791 for the first I. F. stage and 32-2793 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above numbers.

MODEL S-1526 ADJUSTMENTS

All padding adjustments are carefully made at the factory and ordinarily no readjustments are necessary. However, when readjustments are required, the procedure given below must be followed in detail.

Equipment

Fully charged heavy duty storage battery or 6-volt power pack, 048A or 099 Philco Set Tester, 3164 Padding wrench, 27-7159 Padding screw driver.

General

OUTPUT METER — The output meter must be connected by means of an adapter to the plate of the type 41 output tube and to the Receiver chassis.

SIGNAL GENERATOR — With the Receiver and signal generator set up for operation at the prescribed frequency, turn the Receiver volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the output meter. The signal in the speaker should be audible but not loud.

The shielding on the signal generator output lead must be connected to the Receiver housing.

Procedure

I. F. — Set the signal generator at exactly 260 K. C. Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid clip). Adjust the padders ⑲, ㉑, ㉒ and ㉔ on the first and second I. F. transformer for maximum reading on the output meter. (See Figure 6 for location of padders).

HIGH FREQUENCY AND R. F. — After padding the I. F. stages remove the generator lead from the 6A7 tube.

Set the signal generator at 1500 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid clip).

Place a piece of paper approximately .006" thick as a gauge between the heel of the rotor plates and the stator plates on the oscillator section of the tuning conednser. Turn the rotor plates in mesh until they strike against the paper.

With the tuning condenser in this position, adjust the high frequency padder ⑭ and the R. F. padder ⑪ until the maximum reading is obtained on the output meter. This is the true setting for 1500 K. C., 150 on the dial scale.

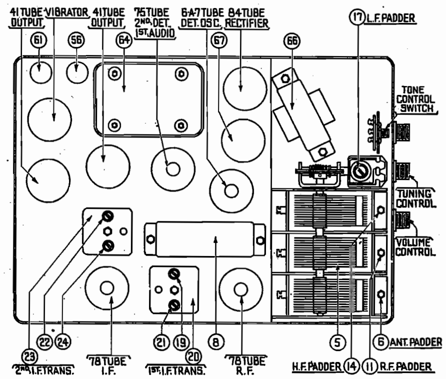

FIGURE 6

LOW FREQUENCY — Turn the tuning condenser plates in mesh to approximately 580 K. C., 58 on the dial scale, and set the signal generator at 580 K. C. Roll the tuning condenser and adjust the low frequency padder screw ⑰ for maximum reading on the output meter.

HIGH FREQUENCY READJUSTMENT — Turn the tuning condenser plates out of mesh to 1500 K. C. and set the signal generator at 1500 K. C. Then adjust the high frequency padder ⑭ again for maximum reading on the output meter.

Remove the generator lead from the 78 R. F. tube.

ANTENNA — WHEN PADDING THE ANTENNA STAGE IT IS EXTREMELY IMPORTANT THAT THE PROPER DUMMY ANTENNA BE CONSTRUCTED AND USED.

When a COWL ANTENNA is used, the green lead on the antenna transformer MUST be connected to the No. 1 terminal as shown on the label on the bottom cover of the Receiver. Connect the signal generator lead to the antenna connector on the Receiver, using an antenna lead, Part No. L-2665, and a 30 mmfd. condenser in series between the two leads.

When the UNDER-CAR ANTENNA is used, the green lead on the antenna transformer MUST be connected to the No. 2 terminal as shown on the label on the bottom cover of the Receiver. Connect the signal generator lead to the antenna connector on the Receiver, using an antenna lead, Part No. L-2665, and a 200 mmfd. condenser in series between the two leads.

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K. C. Adjust the padders ⑪ and ⑥ for the maximum reading on the output meter.

When the antenna stage adjustment is made with the Receiver installed in the car, the Receiver antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

PHILCO RADIO & TELEV. CORP.

MODEL G-1528

ALIGNMENT

I. F. TRANSFORMERS AND PADDERS

The I. F. Transformers are assembled complete with padding condensers.

Both the primary and secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield. (See Figure 4).

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure 3.

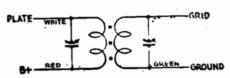

FIGURE 3

If replacements are ever necessary, replace the entire coil assembly, 32-2791 for the first I. F. stage and 32-2793 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above number.

MODEL G-1528 ADJUSTMENTS

All padding adjustments are carefully made at the factory and ordinarily no readjustments are necessary. However, when readjustments are required, the procedure given below must be followed in detail.

Equipment

Fully charged heavy duty storage battery or 6-volt power pack, 048A or 099 Philco Set Tester, 3164 Padding wrench, 27-7159 Padding screw driver.

General

OUTPUT METER — The output meter must be connected by means of an adapter to the plate of the type 41 output tube and to the Receiver chassis.

SIGNAL GENERATOR — With the Receiver and signal generator set up for operation at the prescribed frequency, turn the Receiver volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the output meter. The signal in the speaker should be audible but not loud.

The shielding on the signal generator output lead must be connected to the Receiver housing.

Procedure

I. F. — Set the signal generator at exactly 260 K. C. Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid clip). Adjust the padders ⑲, ㉑, ㉒ and ㉔ on the first and second I. F. transformers for maximum reading on the output meter. (See Figure 4 for location of padders).

HIGH FREQUENCY AND R. F. — After padding the I. F. stages remove the generator lead from the 6A7 tube.

Set the signal generator at 1500 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid clip).

Place a piece or paper approximately .006" thick as a gauge between the heel of the rotor plates and the stator plates on the oscillator section of the tuning condenser. Turn the rotor plates in mesh until they strike against the paper.

With the tuning condenser in this position, adjust the high frequency padder ⑭ and the R. F. padder ⑪ until the maximum reading is obtained on the output meter. This is the true setting for 1500 K. C., 150 on the dial scale.

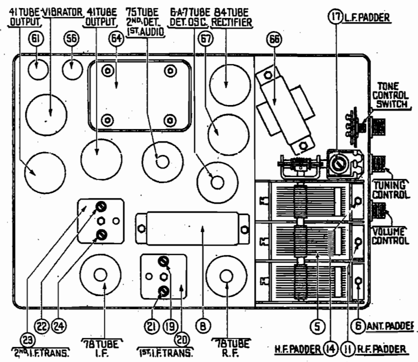

FIGURE 4

LOW FREQUENCY — Turn the tuning condenser plates in mesh to approximately 580 K. C., 58 on the dial scale, and set the signal generator at 580 K. C. Roll the tuning condenser and adjust the low frequency padder screw ⑰ for maximum reading on the output meter.

HIGH FREQUENCY READJUSTMENT — Turn the tuning condenser plates out of mesh to 1500 K. C. and set the signal generator at 1500 K. C. Then adjust the high frequency padder ⑭ again for maximum reading on the output meter.

Remove the generator lead from the 78 R. F. tube.

ANTENNA — WHEN PADDING THE ANTENNA STAGE IT IS EXTREMELY IMPORTANT THAT THE PROPER DUMMY ANTENNA BE CONSTRUCTED AND USED.

Connect the signal generator lead to the antenna connector on the Receiver, using an antenna lead, Part No. L-2665, and a 35 mmfd. condenser in series between the two leads.

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K. C. Adjust the padders ⑪ and ⑥ for the maximum reading on the output meter.

When the antenna stage adjustment is made with the Receiver installed in the car, the Receiver antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

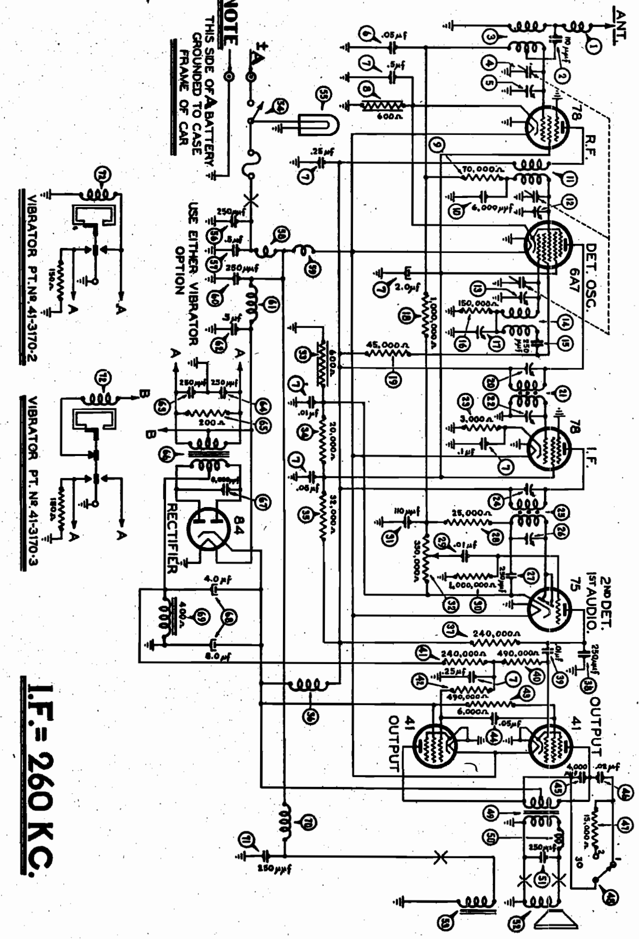
MODEL C1423 (Chrysler)
Schematic, Socket, Trimmers Layout, Alignment, Parts



I.F. = 260 KC.

OPERATION	SIGNAL GENERATOR FREQUENCY	SIGNAL GENERATOR CONNECTION	DUMMY CAPACITY	SPECIAL INSTRUCTIONS	ADJUST PADDER
1	260 K.C.	To Grid of 78 Tube—I.F. Stage	.1 Mfd. Condenser in Series with Generator Lead	No Antenna Connection	1 - 2
2	260 K.C.	To Grid of 6A7 Tube	.1 Mfd. Condenser in Series with Generator Lead	No Antenna Connection	3 - 4 1 - 2
3	1550 K.C.	To Grid of 78 Tube—R.F. Stage	.1 Mfd. Condenser in Series with Generator Lead	No Antenna Connection Note 1	7 - 6
4	580 K.C.	To Grid of 78 Tube—R.F. Stage	.1 Mfd. Condenser in Series with Generator Lead	No Antenna Connection Set Tuning Condensers at 580 K.C.	8 Note 2
5	1550 K.C.	To Grid of 78 Tube—R.F. Stage	.1 Mfd. Condenser in Series with Generator Lead	Set Tuning Condensers at 1550 K.C.	7
6	1400 K.C.	Note 4 Connect Antenna Lead to Cowl Antenna Receptacle	Note 4	Set Tuning Condensers at 1400 K.C.	6 - 5

Adjust for maximum reading on the output meter.

NOTE 1—Turn the condenser rotor plates completely out of mesh. Use a piece of bond letterhead paper as a gauge between the heel of the rotor plates and the stator plates and turn the condenser plates in mesh until they strike against the paper.

NOTE 2—Rock the tuning condenser while adjusting the low frequency padder. Tune the condenser to the signal and adjust the padder for maximum output. Rotate the tuning condenser back and forth slightly for maximum output. Then re-adjust the padder for maximum output. Repeat this procedure until no further improvement is noticed.

NOTE 4—Connect the antenna lead, Part No. 41-3191, to the antenna receptacle on the Receiver in series with the correct dummy capacity condenser. For the L-1427, L-1429 and L-1460 use a 30 mmfd. condenser, for the C-1423 use a .1700 mmfd. condenser.

MODEL P1535(Packard) Socket, Trimmers Alignment

PHILCO RADIO & TELEV. CORP.

MODEL L1560(Lincoln) Control Details, Parts

I. F. TRANSFORMERS AND PADDERS

The I. F. transformers are assembled complete with padding condensers.

Both the primary and the secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield. (See Figure 4).

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure 3.

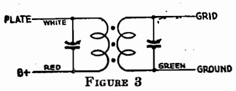

FIGURE 3

If replacements are ever necessary, replace the entire coil assembly, 32-2554 for the first I. F. stage and 32-2556 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above numbers.

MODEL P-1535 ADJUSTMENTS

All padding adjustments are carefully made at the factory and ordinarily no readjustments are necessary. However, when readjustments are required, the procedure given below must be followed in detail.

Equipment

Fully charged heavy duty storage battery or 6-volt power pack, 048A or 099 Philco Set Tester, 3164 Padding wrench, 27-7159 Padding screw driver.

General

OUTPUT METER — The output meter must be connected by means of an adapter to the plate of the type 6Y7G output tube and to the Receiver chassis.

SIGNAL GENERATOR — With the Receiver and signal generator set up for operation at the prescribed frequency, turn the Receiver volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the output meter. The signal in the speaker should be audible but not loud.

The shielding on the signal generator output lead must be connected to the Receiver housing.

The sensitivity switch must be in the distant position.

Procedure

I. F. — Set the signal generator at exactly 260 K. C.

Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid cap). Adjust the primary and secondary screw padders on the first and second I. F. transformer for maximum reading on the output meter. (See Figure 4 for location of padders)

HIGH FREQUENCY AND R. F. — After padding the I. F. stages remove the generator lead from the 6A7 tube. Set the signal generator at 1500 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid cap).

Place a piece of paper approximately .006" thick as a gauge between the heel of the rotor plates and the stator plates on the oscillator section of the tuning condenser. Turn the rotor plates in mesh until they strike against the paper.

With the tuning condenser in this position, adjust the high frequency padder (16) and the R. F. padder (15) until the maximum reading is obtained on the output meter. This is the true setting for 1500 K. C., 150 on the dial scale.

LOW FREQUENCY — Turn the tuning condenser plates in mesh to approximately 580 K. C., 58 on the dial scale and set the signal generator at 580 K. C. Roll the tuning condenser and adjust the low frequency padder screw (20) for maximum reading on the output meter.

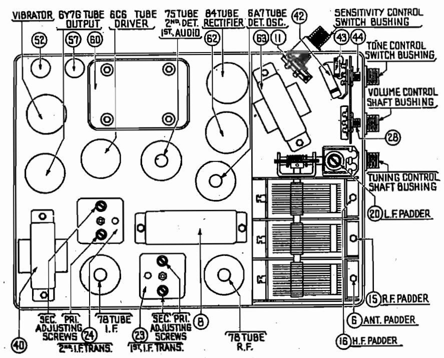

FIGURE 4

HIGH FREQUENCY READJUSTMENT — Turn the tuning condenser plates out of mesh to 1500 K. C. and set the signal generator at 1500 K. C. Then adjust the high frequency padder (16) again for maximum reading on the output meter.

Remove the generator lead from the 78 R. F. tube.

ANTENNA — WHEN PADDING THE ANTENNA STAGE IT IS EXTREMELY IMPORTANT THAT THE PROPER DUMMY ANTENNA BE USED.

Connect the signal generator lead to the antenna socket on the Receiver using a 250 mmfd. condenser in series with an antenna lead, Part No. 41-3191.

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K. C. Adjust the padders (15) and (6) for the maximum reading on the output meter.

When the antenna stage adjustment is made with the Receiver installed in the car, the Receiver antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

PHILCO RADIO & TELEV. CORP.

I. F. TRANSFORMERS AND PADDERS

The I. F. transformers are assembled complete with padding condensers.

Both the primary and secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield. (See Figure 4).

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure 3.

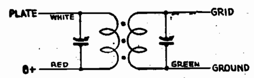

FIGURE 3

If replacements are ever necessary, replace the entire coil assembly, 32-2286 for the first I. F. stage and 32-2908 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above numbers.

ADJUSTMENTS

All padding adjustments are carefully made at the factory and ordinarily no readjustments are necessary. However, when readjustments are required, the procedure given below must be followed in detail.

Equipment

Fully charged heavy duty storage battery or 6-volt power pack, 048A or 099 Philco Set Tester, 3164 Padding wrench, 27-7159 Padding screw driver.

General

OUTPUT METER — The output meter must be connected by means of an adapter to the plate of the type 42 output tube and to the Receiver chassis.

SIGNAL GENERATOR — With the Receiver and signal generator set up for operation at the prescribed frequency, turn the Receiver volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the output meter. The signal in the speaker should be audible but not loud.

The shielding on the signal generator output lead must be connected to the Receiver housing.

MODEL F-1540

Procedure

Adjust the sensitivity control until the resistance between the lug on the control and the Receiver chassis is 850 ohms.

I. F. — Set the signal generator at exactly 260 K. C.

Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid clip). Adjust the padders (19), (21), (22) and (24) on the first and second I. F. transformers for maximum reading on the output meter. (See Figure 4 for location of padders).

HIGH FREQUENCY AND R. F. — After padding the I. F. stages, remove the generator lead from the 6A7 tube.

Set the signal generator at 1500 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid clip).

Place a piece of paper approximately .006" thick as a gauge between the heel of the rotor plates and the stator plates on the oscillator section of the tuning condenser. Turn the rotor plates in mesh until they strike against the paper.

With the tuning condenser in this position, adjust the high frequency padder (14) and the R. F. padder (11) until the maximum reading is obtained on the output meter. This is the true setting for 1500 K. C., 150 on the dial scale.

LOW FREQUENCY — Turn the tuning condenser plates in mesh to approximately 580 K. C., 58 on the dial scale and set the signal generator at 580 K. C. Roll the tuning condenser and adjust the low frequency padder screw (17) for maximum reading on the output meter.

HIGH FREQUENCY READJUSTMENT — Turn the tuning condenser plates out of mesh to 1500 K. C. and set the signal generator at 1500 K. C. Then adjust the high frequency padder (14) again for maximum reading on the output meter.

Remove the generator lead from the 78 R. F. tube.

ANTENNA — WHEN PADDING THE ANTENNA STAGE IT IS EXTREMELY IMPORTANT THAT THE PROPER DUMMY ANTENNA BE CONSTRUCTED AND USED.

Connect the signal generator lead to the antenna connector on the Receiver as shown in Figure 5.

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K. C. Adjust the padders (11) and (6) for the maximum reading on the output meter.

When the antenna stage adjustment is made with the Receiver installed in the car, the Receiver antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

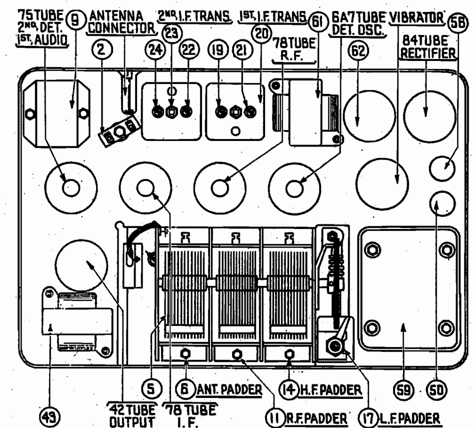

FIGURE 4

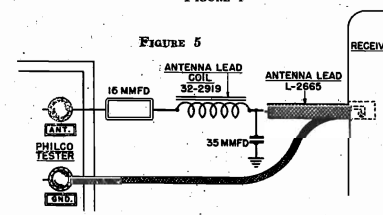

FIGURE 5

MODEL L-1560

ANTENNA — WHEN PADDING THE ANTENNA STAGE IT IS EXTREMELY IMPORTANT THAT THE PROPER DUMMY ANTENNA BE CONSTRUCTED AND USED.

Procedure

I. F. — Set the signal generator at exactly 260 K. C.

Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid clip). Adjust the padders (22), (24), (26) and (27) on the first and second I. F. transformers for maximum reading on the output meter. (See Figure 4 for location of padders).

HIGH FREQUENCY AND R. F. — After padding the I. F. stages, remove the generator lead from the 6A7 tube.

Set the signal generator at 1500 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid clip).

Place a piece of paper approximately .006" thick as a gauge between the heel of the rotor plates and the stator plates on the oscillator section of the tuning condenser. Turn the rotor plates in mesh until they strike against the paper.

When the COWL ANTENNA is used, connect the signal generator lead to the cowl antenna connector on the Receiver, using an antenna lead, Part No. L-2665, and a 40 mmfd. condenser in series between the two leads.

When the ROOF or DOOR ANTENNA is used, connect the signal generator lead to the antenna connector on the Receiver, using an antenna lead, Part No. L-2665, and a 725 mmfd. condenser in series between the two leads.

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K. C. Adjust the padders (11) and (6) for the maximum reading on the output meter.

When the antenna stage adjustment is made with the Receiver installed in the car, the Receiver antenna lead must be connected to the car antenna in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

With the tuning condenser in this position, adjust the high frequency padder (14) and the R. F. padder (11) until the maximum reading is obtained on the output meter. This is the true setting for 1500 K. C., 150 on the dial scale.

LOW FREQUENCY — Turn the tuning condenser plates in mesh to approximately 580 K. C., 58 on the dial scale and set the signal generator at 580 K. C. Roll the tuning condenser and adjust the low frequency padder screw (18) for maximum reading on the output meter.

HIGH FREQUENCY READJUSTMENT — Turn the tuning condenser plates out of mesh to 1500 K. C. and set the signal generator at 1500 K. C. Then adjust the high frequency padder (14) again for maximum reading on the output meter.

Remove the generator lead from the 78 R. F. tube.

MODEL C-1550 CHRYSLER

I. F. TRANSFORMERS AND PADDERS

The I. F. transformers are assembled complete with padding condensers.

Both the primary and secondary padders are placed side by side in the top of the transformer shield can. The adjusting screws are accessible thru the holes in the top of the shield. (See Figure 4).

The coil windings terminate in leads instead of terminals or lugs. The color scheme of the leads is given in Figure 3.

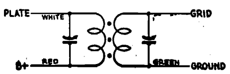

FIGURE 3

If replacements are ever necessary, replace the entire coil assembly, 32-2286 for the first I. F. stage and 32-2167 for the second I. F. stage. Neither the coil nor the padders will be furnished separately. Order only by the above numbers.

MODEL C-1550 ADJUSTMENTS

All padding adjustments are carefully made at the factory and ordinarily no readjustments are necessary. However, when readjustments are required, the procedure given below must be followed in detail.

Equipment

Fully charged heavy duty storage batteries or 6-volt power pack, 048A or 099 Philco Set Tester, 3164 Padding wrench, 27-7159 Padding screw driver.

General

OUTPUT METER—The output meter must be connected by means of an adapter to the plate of the type 42 output tube and to the Receiver chassis.

SIGNAL GENERATOR—With the Receiver and signal generator set up for operation at the prescribed frequency, turn the Receiver volume control on full and set the signal generator attenuator so that a half scale reading is obtained on the output meter. The signal in the speaker should be audible but not loud.

The shielding on the signal generator output lead must be connected to the Receiver housing.

Procedure

I. F.—Set the signal generator at exactly 260 K. C.

Connect the generator lead to the grid cap of the 6A7 tube in series with a .1 mfd. condenser (without removing the grid clip). Adjust the screw padders ㉑, ㉓, ㉖ and ㉘ on the first and second I. F. transformers for maximum reading on the output meter. (See Figure 4 for location of padders).

HIGH FREQUENCY AND R. F.—After padding the I. F. stages remove the generator lead from the 6A7 tube.

Set the signal generator at 1550 K. C. and then connect the generator lead to the grid cap of the 78 R. F. tube in series with a .1 mfd. condenser (without removing the grid clip).

Place a piece of paper approximately .006" thick as a gauge between the heel of the rotor plates and the stator plates, on the oscillator section of the tuning condenser. Turn the rotor plates in mesh until they strike against the paper.

With the tuning condenser in this position, adjust the high frequency padder ⑮ and the R. F. padder ⑪ until the maximum reading is obtained on the output meter. This is the true setting for 1550 K. C., 155 on the dial scale.

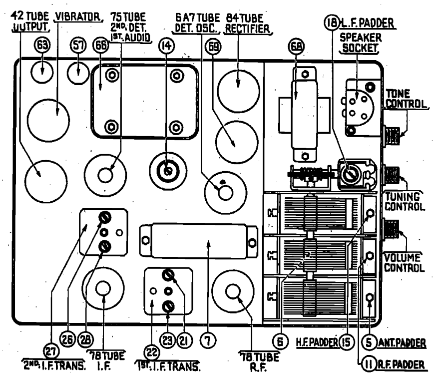

FIGURE 4

LOW FREQUENCY—Turn the tuning condenser plates in mesh to approximately 580 K.C., 58 on the dial scale and set the signal generator at 580 K.C. Roll the tuning condenser and adjust the low frequency padder screw ⑱ for maximum reading on the output meter.

HIGH FREQUENCY READJUSTMENT — Turn the tuning condenser plates out of mesh to 1550 K. C. and set the signal generator at 1550 K. C. Then adjust the high frequency padder ⑮ again for maximum reading on the output meter.

Remove the generator lead from the 78 R. F. tube.

ANTENNA — WHEN PADDING THE ANTENNA STAGE, IT IS EXTREMELY IMPORTANT THAT THE PROPER DUMMY ANTENNA BE CONSTRUCTED AND USED.

Connect the signal generator lead to the antenna cable assembly (made up of Part No. L-2665 lead, and a 25 mmfd. condenser in series between the lead and the signal generator). Plug the cable into the antenna connector on the end of the Receiver.

Remove the snap button cover over the antenna selector and advance the selector switch to the "Skyway" Antenna position.

Follow this padding procedure regardless of whether the Receiver is used with the "Skyway" or "Roadway" Antenna.

Turn the tuning condenser to 1400 K. C. and set the generator at 1400 K.C. Adjust the padders ⑪ and ⑤ for the maximum reading on the output meter.

When the antenna stage adjustment is made with the Receiver installed in the car, the antenna lead must be connected to the Receiver in the usual manner. Connect the signal generator output lead to a wire placed near the car antenna but not connected to it.

Parts

Adjusting Control Frequency Amplifier

The Mystery Control receivers are shipped with five (5) different control frequencies which range from 350 to 400 K.C. These are identified by code numbers appearing on the serial number ticket and on the rear of the chassis. These code numbers and frequencies are as follows:

Code 5—355 K.C.
Code 6—367 K.C.
Code 7—375 K.C.
Code 8—383 K.C.
Code 9—395 K.C.

The purpose of the different control frequencies is to prevent interaction between two Mystery Control receivers which are on the same floor or are exceptionally close together. When several Mystery Control receivers are to be located close together, it will be necessary to use different control frequencies to avoid interaction between the receivers. In order to prevent interaction between receivers, there should be a difference of 20 K.C. between their control frequencies.

If three receivers are to be operated at the same time and are closely situated, it will be advisable to adjust the control frequency of the first set to 355 K.C., the second set to 375 K.C. and the third to 395 K.C.

When realigning or changing the control frequency of the Mystery Control circuit, a Philco Model 077 Signal Generator with a coil of wire (about 4 or 5 turns—12" in diameter) attached to the output terminals is required. The leads between the coil of wire and Signal Generator should be long enough so that the coil of wire can be placed near the large secondary inductor in the bottom of the receiver cabinet.

With this apparatus, the Control Frequency is adjusted as follows:

1. With the temporary coil of wire in the center of (or near) the secondary inductor, the control frequency to which the Mystery Control Amplifier is tuned can be determined by tuning the Signal Generator between 350 and 400 K.C. When the Signal Generator is tuned to the control frequency, the Thyratron (2A4G) tube will glow (blue haze). If this frequency is to be used, leave the Signal Generator indicator at this point or turn the indicator to any other frequency desired between 350 and 400 K.C.
2. When the control frequency is selected, turn the sensitivity control (117) in Model 116 and (89) Model 55 located on the left rear of the chassis—towards the position marked "extreme." Using the 2A4G Thyratron tube as a resonance indicator, adjust padders (103), (115), (119) in Model 116 and (74), (85), (90) in Model 55 for maximum signal. This will be indicated by the brilliance of the glow in the 2A4G Thyratron tube. As the padders are adjusted, gradually turn the sensitivity control to the "near" position or reduce the output from the Signal Generator. When the padders are correctly adjusted to maximum, the Thyratron will glow with the sensitivity control (117) at the "near" position and with a very weak signal from the Signal Generator.
3. Next, adjust the padding condenser (121) in Model 116 and (92) in Model 55 on the secondary inductor located in the bottom of the receiver. The padding condenser is located in one corner of the secondary inductor and is encased in a cardboard container. This padding condenser should be carefully adjusted for maximum glow in the 2A4G tube. Use the weakest signal possible from the Signal Generator that will cause the 2A4G to glow. Also, have the sensitivity control as close as possible to the "near" position. Extreme care should be used in adjusting the padder to the exact point of resonance, as the secondary inductor is a very sharply tuned circuit. After adjusting the circuit, remove the Signal Generator and loop from the receiver.
4. The Mystery Control unit is now adjusted as follows:
   - A. Dial any one of the stations indicated on the remote unit by pulling the selector to the "Stop" position. Then, as the dial is released at the "Stop," press the "Stop" down and hold it in this position.
   - B. Holding the "Stop" in this position, bring the Mystery Control unit close to the receiver. Using the padding wrench, tune the padding screw (126) located on the bottom of the unit until the 2A4G Thyratron in the receiver glows at full brilliance.

     Now, turn the sensitivity control on the receiver towards the "near" position until a point is reached where the 2A4G tube almost stops glowing. Then, readjust the padder (126) of the unit again for maximum brilliance in the 2A4G tube. The Mystery Control unit should now be adjusted to the same frequency as the control frequency in the receiver.

Replacement Parts

Schem. No.	Description	Part No.
1	Antenna Transformer	32-3056
2	Tubular Condenser (.05 mfd.)	30-4519
3	Tuning Condenser	31-2311
4	Mica Condenser (250 mmfd.)	30-1032
5	Resistor (32,000 ohm—½ watt)	33-332339
6	Oscillator Transformer	32-2120
7	Compensator	31-6230
8	Resistor (10,000 ohm—½ watt)	33-310339
9	Resistor (5,000 ohm—2 watt)	33-250539
10	Resistor (13,000 ohm—1 watt)	33-313339
11	Electrolytic Condenser (4 mfd.—250 V.)	30-2334

Alignment

PHILCO RADIO & TELEV. CORP.

Alignment of Compensators and Mystery Control Models 39-55, 39-116

EQUIPMENT REQUIRED:

(1) Signal Generator; Philco Model 077.

(2) Output Meter, Philco Model 027 Circuit Tester.

(3) Philco Fiber Handle Screw Driver, Part No. 27-7059, and Fiber Wrench, Part No. 3164.

OUTPUT METER:

The Philco 027 Output Meter is connected to the plate terminals of the type 42 tubes and adjusted for the 0 to 30 V.A.C. scale. After connecting the output meter, adjust the compensators in the order as shown in the tabulations below. Locations of the Compensators are shown in Fig. 4. If the output meter pointer goes off scale when adjusting the compensators, reduce the strength of the signal from the generator.

5	Antenna and Ground	150 mmfd.	1550 K.C.	1550 K.C.	Vol. Max. Range Switch Brdcst.	3B, 3A	Note C

NOTE A—The "Dummy Antenna" consists of a condenser connected in series with the signal generator output lead (high side). Use the capacity as specified in each step of the above procedure.

NOTE B—Dial Calibration: In order to adjust the receiver correctly the dial must be aligned to track properly with the tuning condenser. To adjust the dial, proceed as follows: With the tuning condenser closed (maximum capacity), set the dial pointer on the extreme left index line at the low frequency end of the broadcast scale. The arrangement of the drive cable is shown in Fig. 3.

NOTE C - SEE PAGE 9-56 FOR CONTROL FREQUENCY AMPLIFIER ADJUSTMENTS FOR MODELS 39-55 AND 39-116.

PHILCO RADIO & TELEV. CORP.

SPECIFICATIONS

Model 39-55

TYPE CIRCUIT: Philco Model 39-55, code 121, is an 11-tube receiver employing a superheterodyne circuit for reception of standard broadcast stations with Philco Mystery Control for Electric Automatic Tuning of eight (8) stations. The Philco Mystery Control also controls Volume and turns off set without any connections between receiver and Control Unit. In addition, other features of design are—Automatic Volume Control; Continuously Variable Tone Control; Bass Compensations; Degenerated Push-pull Pentode Audio Output Circuit, and Compensators selected for minimum drift.

POWER SUPPLY: 115 volts, 50 to 60 cycles, A.C.

POWER CONSUMPTION: 180 watt.

TUNING RANGES: 540 to 1720 K.C.

I.F. FREQUENCY: 470 K.C.

PHILCO TUBES USED: Receiver—6J8G, First Detector Oscillator; 78, I.F. Amplifier; 6Q7G, Second Detector, A.V.C. and first Audio; two (2) 42 Audio Output, and one 80 Rectifier.
Mystery Tuning Control Amplifier—78, First Control Amplifier; 6J7G, Second Control Amplifier; A.V.C.; 6ZY5G, A.V.C. and a 2A4G Thyratron Reetifier.
Mystery Control Unit—One type 30.

AUDIO OUTPUT: 10 watts.

CABINET DIMENSIONS:	*Height*	*Width*	*Depth*
Console	38⅜"	29½"	14⅜"
Mystery Control	5½"	7¼"	9⅛"

Note: The Schematic Diagram and Replacement Parts List for Model 39-55 will be found in Bulletin 310 A.

Model 39-116

TYPE CIRCUIT: Philco Model 39-116, code 121, is a 14-tube receiver employing a superheterodyne circuit with three tuning ranges for reception of standard and short wave broadcast stations and Philco Mystery Control for Electric Automatic Tuning of eight (8) standard broadcast stations. The Philco Mystery Control also controls the volume and turns the set "off" without any connections between the receiver and control unit. In addition, other features of design are—Automatic Volume Control; Continuously Variable Tone Control; Bass Compensation Degenerated Push-pull Pentode Audio Output Circuit, and Compensators selected for minimum drift.

POWER SUPPLY: 115 volts, 50 to 60 cycles, A.C.

POWER CONSUMPTION: 190 watts.

TUNING RANGES: 540 to 1720 K.C.; 1.7 to 5.8 M.C.; 5.8 to 18 M.C.

I.F. FREQUENCY: 470 K.C.

PHILCO TUBES USED: Receiver—6K7G, R.F. Amplifier; 6A8G, First Detector Oscillator; 78, I.F. Amplifier; 6Q7G, Second Detector, A.V.C. and first Audio; 37, Phase Invertor; two (2) 42, Audio Output, and one 80, Rectifier.
Mystery Control Amplifier—78, First Control Amplifier; 6J7G, Second Control Amplifier; 6J5G, A.V.C.; 6ZY5G, and a 2A4G, Thyratron Rectifier.
Mystery Control Unit—One type 30.

AUDIO OUTPUT: 10 watts.

AERIAL AND GROUND: To obtain maximum performance from this receiver, the Philco Safety Aerial, Part No. 40-6370, should be used. The antenna circuit of this receiver is especially designed for use with this aerial. When installing the aerial, care should be taken to keep the aerial lead-in wire away from the horizontal inductor coil located in the bottom of the cabinet.

Do not coil up any excess lead-in and drop it in the back of the cabinet. Run the aerial lead-in directly to the "Ant" terminal post on the back of the receiver. A good ground connection should be connected to the terminal post marked "Gnd." When this is done, the link connecting to the "Gnd" terminal should be disconnected and swung around so that it does not touch the "Gnd" post. If, however, no ground is used this link should be connected to the "Gnd" terminal.

CABINET DIMENSIONS:	*Height*	*Width*	*Depth*
Console	36⅛"	34⅝"	14⅛"
Mystery Control	5½"	7¼"	9⅛"

Adjusting Mystery Control for Reception of Stations

The procedure for setting up stations on the Mystery Control receivers is similar to the procedure followed in setting up Philco Electric Automatic Tuning Models. The eight (8) stations, however, are automatically dialed by the remote control unit instead of by pushing buttons.

To set up stations on Mystery Tuning, proceed as follows:

1. Select and remove the desired eight (8) station call letters from the station tab card supplied with the receiver. Insert the station tabs in the apertures (windows) of the bezel. The lowest frequency station is placed in the first window on the left, and the remaining station tabs in the order of increasing frequency.
2. Connect a Model 077 Signal Generator to the "Ant" and "Gnd" terminals of the receiver, set the Signal Generator with modulation "On." Turn the range selector switch to "Broadcast" and tune in the lowest frequency station. This should be between 540 and 1030 K.C. Then adjust the Signal Generator to the frequency of the station until a beat note is heard.
3. Leaving the Signal Generator connected, turn the Range Selector Disc of the receiver to "Automatic." Now, using a padding screw driver, adjust the first 540 to 1030 K.C. oscillator padder (bottom row of holes) at the rear of the chassis, until the station identified by the modulated signal of the generator is tuned in to maximum signal. Next, adjust the first 540 to 1030 K.C. Antenna Padder (top row of holes) for maximum signal.
4. Turn the Signal Generator off the station frequency and readjust the "Ant" and "Osc" Padders for maximum output. This should be done with the volume control adjusted for low volume. This procedure is repeated for each of the remaining stations. The next station, of course, will be the next highest in frequency, that is within the 540 to 1030 K.C. range of the second set of padders. The Third Station is adjusted by the third set of padders under 670 to 1160 K.C. and the remaining stations in the order of increasing frequency.
5. Now, insert the small call letter tab of the first station in the third aperture of the bezel on the remote Mystery Control unit. Celluloid tabs are also supplied to be placed over each call letter. The remaining call letter tabs are then placed in the order of increasing frequency around the bezel from right to left (counter clockwise).
6. Insert the "loud" and "soft" tabs in the first and second apertures on the right hand side of the bezel. See instructions supplied with each model for dialing stations and controlling volume.

Schematic, Data

Circuit Diagram and Operating Instructions for PR-15

CAUTION: Before connecting receiver, read the following instructions:

FIRST: Be sure voltage frequency indicated on the back panel of receiver corresponds to the power supply to be used. If in doubt, call your local power company.

SECOND: Be sure the speaker is plugged into the socket on rear panel. Connection may now be made to the power line.

Connect antenna to terminal marked "A" on panel. If a doublet antenna is used, connections of the two leads should be made to terminals "A" and "D." The jumper wire between terminals "D" and "G" may be either removed or left on, depending on which connection gives the best results on all bands in your particular location or your particular antenna.

If a ground wire is used, in many cases it may improve performance; in others it will be unnecessary. If a ground is used in conjunction with doublet antenna, in practically all cases, the jumper wire between "D" and "G" should be removed for best results.

To place in operation, set the front panel controls as follows:

Set crystal switch to "off" or center position.

Set phasing control at "1." It should always be left at this position when crystal is not in use.

Set communication switch to "receive" position (clockwise). Turn volume control to counter clockwise position.

Set band-change switch to number corresponding to number and frequency range on main dial face of band in which reception is desired.

Set manual control to extreme counter clockwise position. A distinct click will be heard as this control drops into the proper position.

Set beat oscillator switch to "off" position counter clockwise.

Set silencer switch to "off" position.

Set toggle switch, located on extreme right hand side of panel, with handle pointing up.

Next, turn tone control to extreme clockwise position, thus connecting the power to the receiver.

Receiver is now adjusted for normal broadcast, short wave broadcast, or voice reception with automatic volume control in action. Volume control may now be turned in clockwise direction to set volume at desired level.

Tuning of the broadcast band (1) will be best accomplished by use of the large center tuning control knob. The use of the handle on the large knob permits skipping from point to point on main dial with greatest ease. Accurate tuning is then accomplished by using the Vernier control. This control should always be used while tuning over small areas on any band either while searching for weak or distant stations or for tuning in stations of known frequency. Always tuning to exact center of carrier by tuning for the highest reading of "R" meter for a given station. Be sure at any change of the crystal setting to re-tune main dial owing to extreme selectivity.

Filter Data

PIERSON-DE LANE CO.

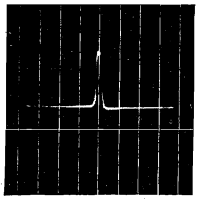

Fig 1

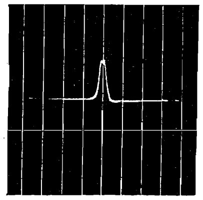

Fig. 2

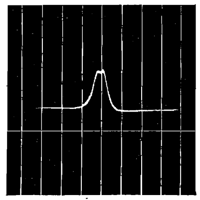

Fig 3

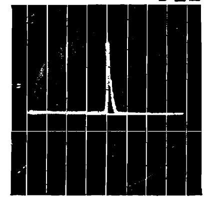

Fig. 4

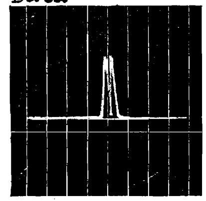

Fig. 5

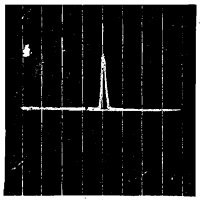

Fig. 6

BAND PASS FILTER—The band pass feature is equipped with variable selectivity control, which permits continuously variable band width from approximately 10 KC to 2 KC. Un-retouched oscillograms are shown above. Fig. 1 shows the minimum band width, while Figures 2 and 3 both show maximum band widths, but with different width screen sweep. The variable selectivity control permits setting of band width at any spot between these two points or widths; also the band pass feature has a rejection position, the oscillogram of which, is shown in Fig. 5. The vertical lines drawn over charts, except Fig. 3, indicate 10 KC per line. (On Fig. 3 the lines indicate 5 KC each to show flat top more plainly.) We highly recommend this filter to the phone man who must operate in the crowded amateur bands, and also to those DX'ers who require a high degree of selectivity plus high-fidelity. This type of filter also gives excellent single signal response for code work.

CRYSTAL FILTER—Two distinctly different types of crystal filters are built into the PR-15—one the **band pass type** intended primarily for use in phone work; the other the usual **series parallel** filter, which gives ideal performance for code work, but may also be used for phone reception.

SERIES PARALLEL FILTER—The series parallel filter is of the usual type with a high degree of efficiency. Fig. 4 shows the series position set at maximum selectivity. The selectivity shown may be decreased considerably by use of the phasing control. The Series Filter gives the ideal condition of noise reduction and selectivity for code reception. Fig. 5 and Fig. 6 show the selectivity when crystal is not in use.

IF ALIGNMENT:
Place receiver in normal operation on broadcast band as described on schematic page. Tune in a signal of about R6 strength with crystal filter placed in series position, preferably main dial set near 12 or 1300 KC. Set phasing control at 1, then tune station, using vernier drive to exact resonance, as indicated on R meter. Then carefully go over trimmers on IF transformers #1, 2 and 3, adjusting for highest reading on R meter. Go over them several times carefully checking to see that main tuning dial remains on exact resonance. Next adjust trimmer C1 as indicated in block diagram #1 for exact resonance, carefully rechecking trimmers on IF #1 (block diagram #2). C-1 is actually selectivity control for the crystal filter.

With careful adjustment practically any degree of selectivity may be obtained without loss of gain.

The injector control is included in the receiver, as indicated in marked circle. The tuning of this adjustment in clockwise direction will increase beat oscillator strength and vice versa.

Low reading of your R meter is caused by misalignment or poor alignment of IF's.

Do not attempt to adjust the noise silencer until after the IF alignment has been checked.

PARALLEL FILTER INSTRUCTIONS:
The parallel filter position may be somewhat deceptive in that when it is first placed in operation there is no immediate apparent change.

It does not in any way affect the over-all selectivity nor does the phasing control have any apparent effect, However, for best operation it should be left at 1.

The crystal filter is intended for the separation or elimination of heterodyne where two carriers are involved. If more than two carriers are involved the series position should be used.

When two carriers are quite close together, producing a bad heterodyne, making either or both signals unreadable, it is quite possible to eliminate the heterodyne as well as either interfering station by placing the crystal switch to parallel position and tuning very, very slowly across the interfering frequencies.

Too much care cannot be used when tuning. As this is done two spots will be found in which one or the other of the interfering stations disappears almost completely; one spot for either station. However, a small amount of modulation hash may be still present from the average station.

Noise Suppressor Notes

PIERSON-DE LANE CO.

NOISE SILENCER ADJUSTMENT: PR 15 Communications Receiver.

Refer to the three noise silencer tubes on the chassis layout 6H6, 6L7, 6K7. and silencer transformer. Any one of these three tubes may be defective, which would cause poor silencer operation, or it may be that the adjustment screw in the top of the noise silencer transformer has been knocked out in shipping.

The following is instruction for its proper adjustment: On the top of this can are two screw heads. However, if you will note carefully, one of the screw heads is soldered over so that a screw driver cannot be inserted. This screw should be disregarded. The one in which the screw driver may be placed is the actual adjustment screw. In making adjustments on this screw be sure to use a solid bakelite screw driver, preferably one without even a metal point. To adjust, place band switch on broadcast band, turn manual control to extreme counter-clockwise position to point which snaps to AVC. Next tune in a station whose strength does not exceed R6 on the meter, preferably one which registers around R5. The difficulties encountered in finding such a signal can be arrived at by using a very short antenna to control input. Next screw the adjustment screw mentioned above all the way down clock-wise (do not force.) Next set the silencer switch to CW position, then very slowly unscrew the silencer adjustment screw (using bakelite screwdriver) until a point is reached where the quality of reception becomes very bad. Then throw silencer switch to phone position and continue to unscrew the silencer adjustment, a fraction of a turn at a time, to the point where quality becomes bad, then set screw back in just far enough to clear up quality. Next, watching the R meter, throw the silencer switch rapidly back and forth from off to phone position. The meter should show about one-fourth of an R drop when the silencer is thrown to phone position. This will complete the silencer adjustment.

Failure to get results as indicated above will undoubtedly indicate a faulty tube. In that case change the silencer tubes indicated on the chassis layout, one by one, rechecking adjustments after each tube has been changed.

The silencer amplifier, for proper operation, must be set at approximately 5 KC lower frequency than the IF channel frequency. Care should be exercised not to get the noise amplifier crossed over to the other side of the IF frequency as this would produce erratic operation.

In making all future adjustments be sure to screw the adjustment screw all the way down when starting, then back up slowly while adjusting to avoid the possibility of cross-over.

INTER-CHANNEL NOISE SUPPRESSION:

To properly adjust inter-channel noise suppression for your particular antenna and location the following procedure should be followed carefully:
First: Place all controls in position for normal broadcast reception band switch on band 1, described in our operating instructions. Place silencer switch in tone position, being sure the manual control is in the extreme counter-clockwise position. Next tune slowly across the broadcast band, noting particularly the spot at which the R meter reads the highest between stations.

When this spot has been located, set the main tuning dial in this series at this point and leave in this position during the remainder of the adjustment.

Next place inter-channel noise switch to "on" position - down.

Next set sensitivity control adjustment to point of highest R meter reading (maximum then adjust inter-channel suppression adjustment to point where noise of speaker ceases, with volume control about three fourths open (clockwise). If it is found the adjustment of this control does not seem effective, or does not quite remove all noise when adjusted to the extreme end, it will then be necessary to reduce sensitivity adjustment to the point where noise ceases. This should be necessary only in locations where the noise level is extremely high. Next turn off noise silencer. A small amount of noise should be heard with the noise silencer in off position.
The receiver is now in proper adjustment for inter-channel noise suppression. It may be operated without noise silencer if desired. The receiver will now play any station which is above the normal noise level. However, the noise level varies from hour to hour and from day to day in some locations. It may be necessary to check over a period of them to determine the best adjustment, or if desired a few preliminary checks as indicated by R meter readings between stations may be made, noting the time and position on dial at which the noise level is highest, then making the original adjustment for this location. Any change of antenna or location will very probably necessitate rechecking all adjustments.

Inter-Channel noise suppression is intended for use only on the broadcast band or for air craft or police stand-by work. It will be found unsatisfactory for use in short wave broadcast reception due to the great amount of fading encountered in practically all short wave stations. (Do not attempt to use inter-channel noise suppression with the manual control beyond the "off" counter-clockwise position.)
Failure to get results as indicated above may be caused either by a faulty 6Q7 or 6J7 tube. See chassis layout for position of these tubes as well as adjustments indicated above.

MONITOR:

In placing the monitor in operation it should be borne in mind that it is no different than the usual monitor with which every amateur is familiar, consisting primarily of the usual signal rectifier and in the case of the PR-15 the addition of the audio amplifier. In handling diod rectifier for this purpose it is necessary to obtain the right amount of RF voltage input; too little produces no signal while too much may result in blocking of the rectifier. The amount of RF which may be fed into the receiver may vary greatly with different transmitter installations.
While the circuit will ordinarily handle a wide variation in input voltage in many cases, the voltage may either be too small or far in excess of the necessary amount, consequently failure of the monitor can be caused only by one of two things, either too much RF or not enough RF. If the case is too much RF it can usually be readily determined by the R meter. If the quality is bad or no signal is heard at all the R meter may show a reading of anywhere from R1 to R9 plus plus when the transmitter is turned on. Inasmuch as the R meter reading is produced purely by rectified RF it is a direct indication.
If such is the case the operator should first look to his line filtering. It may be that a large quantity of RF is coming in on the AC line or that it is being directly picked up by the receiving antenna. A short direct ground wire should first be connected to chassis ground on receiver; if this fails to bring the R meter down it may then be necessary to disconnect or ground the receiving antenna while monitoring. If both of the above fail to bring the R meter down and produce good monitoring it may then be necessary to install a good line filter well grounded in the AC line to the receiver.

If no R meter reading is obtained when transmitter is turned on and no signal is heard it is probable that the case is too little RF. This will apply particularly to low powered transmitters. If such is the case it probably will be necessary to connect one end of a 25 or 30 micromicrofared condenser to either terminal numbers one or two of phone terminals on back chassis panel. The other end of the condenser should be connected to a small antenna. This may be only three or four feet long and should be just long enough to give good monitoring. In the case of a very low powered transmitter it may be necessary to run this lead close to the transmitting antenna lead-in or final plate tank to get sufficient pick-up.

Voltage, Alignment
MODELS G352, G353
Voltage, Alignment

PILOT RADIO CORP.

MODEL X-201 SUPERHETERODYNE

Range: 176-557 Meters (1,710-538 kc.)

Line Voltage: 115-125 volts, A.C. or D.C.
Power Consumption: 45 watts.
Undistorted Power Output: 2 watt.
Intermediate Frequency: 456 kc.
Tube Functions: 6A7 electron emission control, oscillator-detector.
6D6 I.F. amplifier.
75 amplifier detector.
25L6 Class A power pentode.
25Z5 rectifier

Voltages: Read tube socket voltages with meter having resistance of at least 1,000 ohms per volt. All voltages measured to chassis.

Type	6A7	6D6	75	25L6	25Z5
Plate	100	100	—*	90	—
Cathode	3	3.8	1.	0	100
Screen	64	100	—	100	—
Heater	6.3	6.3	6.3	25	25

*Voltage measured through plate resistor.
Speaker field voltage, 115 volts.
Anode grid of 6A7, 85 volts.

REALIGNMENT: Should the receiver require realignment, the procedure outlined below should be followed. In the service information sheet, the location and function of the various alignment capacitors are clearly illustrated. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.

Before connecting the chassis to the power line, reconnect the speaker cable in its socket at the rear of the speaker.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set at 456 kc. The Band Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. Connect the "antenna" lead of the external oscillator to the control grid of the type 6D6 tube in the I.F. Amplifier stage through a .1 mfd. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver ground lead. The I.F. alignment capacitors are located at the top of the shielded I.F. Transformers. Rotate the adjusting screw of each capacitor on I.F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator leads from the type 6D6 I.F. Amplifier tube and connect it in the same manner to the control grid at the top of the type 6A7 tube.

Now rotate each adjustment screw on I.F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peaks.

In order to obtain the most accurate realignment of the I.F. Amplifier, it is essential to repeat the alignment process in both I.F. units with the external oscillator leads connected across the control grid of the 6A7 tube.

WAVE TRAP ADJUSTMENT: With the oscillator still set at 456 kc., connect the oscillator to the antenna through a 200 mmfd. condenser. Then adjust the wave trap condenser for minimum deflection on the output meter.

BROADCAST ALIGNMENT: After the wave trap is adjusted, place the tuning control pointer at the 1400 kc. mark. Adjust the broadcast band oscillator trimmer to maximum response. Adjust the detector trimmer in the same manner.

Next adjust the 600 kc. padder condenser. Set the external oscillator at 600 kc. Rotate the receiver tuning control until resonance is indicated. Then rock the tuning control back and forth about this resonance position, and at the same time adjust the padder condenser for the highest resonance peak.

Now repeat the 1400 kc. trimmer adjustment, following in every detail the procedure previously described.

Connect the blue wire at the rear of the chassis to your antenna and the black wire to the ground. If you are not experienced in erecting antennas, we strongly advise having this done by your radio service man. If you use an ordinary single-wire antenna, put up a single wire 50 to 100 ft. long, and as high above surrounding objects as possible, bringing a lead from the nearer end down to your set. For best reception, however, use a Pilot DX10 Antenna.

MODEL G-352 SUPERHETERODYNE

Range: 16-52 Meters (18,800-5,700 kc.)
178-550 Meters (1,680-545 kc.)

MODEL G-353 SUPERHETERODYNE

Range: 178-550 Meters (1,680-545 kc.)
789-2,142 Meters (380-140 kc.)

(Available for sale outside of North America)

Line Voltage: 115-125 volts, A.C. or D.C.
Power Consumption: 45 watts.
Undistorted Power Output: 2 watt.
Intermediate Frequency: 456 kc.
Tube Functions: 6A7 electron emission control, oscillator-detector.
6D6 I.F. amplifier.
75 amplifier detector.
25L6 Class A power pentode.
25Z5 rectifier

Voltages: Read tube socket voltages with meter having resistance of at least 1,000 ohms per volt. All voltages measured to chassis.

Type	6A7	6D6	75	25L6	25Z5
Plate	100	100	—*	90	—
Cathode	3	3.8	1.	0	100
Screen	64	100	—	100	—
Heater	6.3	6.3	6.3	25	25

*Voltage measured through plate resistor.
Speaker field voltage, 115 volts.
Anode grid of 6A7, 85 volts.

REALIGNMENT: Should the receiver require realignment, the outlined procedure below should be followed. In the service information sheet, the location and function of the various alignment capacitors are clearly illustrated. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.

Before connecting the chassis to the power line, reconnect the speaker cable in its socket at the rear of the speaker.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set at 456 kc. The Band Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. Connect the "antenna" lead of the external oscillator to the control grid of the type 6D6 tube in the I.F. Amplifier stage through a .1 mfd. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver ground lead. The I.F. alignment capacitors are located at the top of the shielded I.F. Transformers. Rotate the adjusting screw of each capacitor on I.F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator leads from the type 6D6 I.F. Amplifier tube and connect it in the same manner to the control grid at the top of the type 6A7 tube.

Now rotate each adjustment screw on I.F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peaks.

In order to obtain the most accurate realignment of the I.F. Amplifier, it is essential to repeat the alignment process in both I.F. units with the external oscillator leads connected across the control grid of the 6A7 tube.

WAVE TRAP ADJUSTMENT: With the oscillator still set at 456 kc., connect the oscillator to the antenna through a 200 mmfd. condenser. Then adjust the wave trap condenser for minimum deflection on the output meter.

BROADCAST ALIGNMENT: After the I.F. amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground leads with a .0002 mfd. condenser in the antenna lead. Set the Band Switch in the "Broadcast" position and place the tuning control pointer at the 1400 kc. mark. Adjust the broadcast band oscillator trimmer to maximum response. Adjust the signal section trimmer in the same manner.

Next adjust the 600 kc. padder condenser. Set the external oscillator at 600 kc. Rotate the receiver tuning control until resonance is indicated. Then rock the tuning control back and forth about this resonance position, and at the same time adjust the padder condenser for the highest resonance peak.

Now repeat the 1400 kc. trimmer adjustment, following in every detail the procedure previously described.

SHORT-WAVE ALIGNMENT: The procedure in aligning the short-wave bands is identical with that for the broadcast with the exception of the adjustment of the padder condenser. The alignment frequency is 16.8 Meters—(17,800 kc.) Turn the Band Switch to the right. Tune the external oscillator to 16.8 meters. Tune the receiver so that the dial pointer is in a position coincidental with the 16.8 meter indication on the dial scale. Adjust the short wave oscillator trimmer for maximum response. Next adjust the signal circuit trimmer for maximum resonance. Repeat all adjustments to assure correct alignment, rocking the gang condenser to right or left for maximum gain.

THE LONG WAVE ALIGNMENT: Procedure in the Model is similar to the Broadcast section of that receiver. Align at 375 kc. Adjust the padder at 160 kc.

Should it be necessary to remove the band switch assembly, it is advisable to realign the receiver after reinstalling.

MODEL G 284
Alignment
Notes

PILOT RADIO CO.

Tranex AC-DC Model G-284, for 110-125 V. (50-60 Cycles)

Three tuning bands covering 12-94 m. (25,000-3,200 kc.) and 187-560 m. (1,600-535 kc.)

REMOVAL OF CHASSIS FROM CABINET:

To remove the chassis from the cabinet proceed as follows:

Be certain that the line cord is removed from the power outlet socket.

Remove the "slip-on" knobs and felt washers from the controls and loosen the set screw on the tuning knob.

Remove the speaker plug from its socket.

Remove the four mounting screws, located underneath the cabinet.

Remove the tuning beam plug from the socket at the front of the chassis.

REALIGNMENT: Should the receiver require re-alignment, the procedure outlined below should be followed. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.

Before connecting the chassis to the power line, reconnect the speaker cable in its socket at the rear of the chassis.

The R. F. alignment trimmer condensers are mounted on the side of the coil shields.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set at 456 kc. The Band Selector Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. Connect the "antenna" lead of the external oscillator to the control grid of the type 6K7 tube in the I. F. Amplifier stage through a .1 mfd. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver ground lead. The I. F. alignment capacitors are located at the side of the shielded I. F. Transformers. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator lead from the type 6K7 I. F. amplifier tube and connect it in the same manner to the control grid at the top of the type 6A8 tube.

Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peaks.

In order to obtain the most accurate realignment of the I. F. amplifier, it is essential to repeat the alignment process in both I. F. Units.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground leads. Insert a 200 mmf. condenser in series with the antenna lead. Set the Band Selector Switch in the "Broadcast" position and place the tuning control pointer at the 1500 kc. mark. Adjust the broadcast band oscillator trimmer.

Next adjust the interstage alignment trimmer for maximum response. Finally adjust the antenna section trimmer in the same manner.

Next adjust the 600 kc. padder condenser, located on the top of the oscillator coil. Set the external oscillator at 600 kc. Rotate the receiver tuning control until resonance is indicated. Then rock the tuning control back and forth about this resonance position, and at the same time adjust the padder condenser for the highest resonance peak.

Now repeat the 1500 kc. trimmer adjustment, following in every detail the procedure previously described.

ALIGNMENT OF THE SHORT WAVE-BANDS:— The procedure in aligning the short wave-bands is identical with that for the broadcast with the exception of the adjustment of the padder condenser. Insert a 400 ohm non-inductive resistor in series with the antenna lead. The alignment frequencies are as follows:

Band 2: 31.6 Meters—(9,500 kc.)
Band 1: 12.5 Meters—(24,000 kc.)

When aligning Band 2, set the Band Selector Switch in the position marked "Band 2". Set the tuning control pointer at 9,500 kc. meters. Adjust the oscillator alignment capacitor on Band 2 for maximum output. Next adjust the interstage and antenna section alignment capacitors for maximum output.

To align Band 1, set the Band Selector Switch in the position marked "Band 1". Set the tuning control pointer at the 24,000 kc. meter mark. Set the external oscillator at 24,000 kc. meters. Adjust the oscillator section alignment capacitor on Band 1 for maximum output.

Proceed next to align the interstage section of Band 1. In doing this, it is essential to rock the tuning control back and forth about the resonance position and at the same time to adjust the trimmer for the highest resonance peak. Next align the antenna section for maximum sensitivity.

ANTENNA

If you use an ordinary single-wire antenna, connect **the antenna to the blue lead on the set. Connect both the black and yellow leads to the ground, or connect the yellow lead to the ground and leave the black lead free—whichever gives better reception.**

PHONOGRAPH PICK-UP: A jack is provided at the rear of the chassis for plugging in an electric phonograph pick-up, in order that records can be reproduced by the loudspeaker, through the high-quality amplifier with which this set is equipped. The pick-up should be of the high-impedance type.

SERVICE INFORMATION FOR PILOT MODELS 403 AND 405

REMOVAL OF CHASSIS FROM CABINET:

To remove the chassis from the cabinet proceed as follows:

Be certain that the line cord is removed from the power outlet socket.

Remove the knobs and felt washers from the controls on the front panel, and loosen the set screw on the tuning knob.

Remove the speaker plug from the socket at the rear of the chassis.

Remove the four mounting screws, located underneath the cabinet and pull chassis out.

REALIGNMENT: If the receiver requires alignment, the procedure outlined below should be followed. In the schematic diagram sheet, the location and function of the various alignment capacitors are clearly illustrated. For best results, an external modulated oscillator with adequate frequency range and a visual output meter, should be used.

Before connecting the chassis to the power line, reconnect the speaker cable in its socket at the rear of the chassis.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set at 456 kc. The Band Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. When aligning the receiver on all positions, the volume control and the tone control should be turned to the maximum clockwise position. Connect the antenna lead of the external oscillator to the control grid of the 6K7 tube in the I. F. Amplifier through a .1 mfd. fixed condenser. Connect the ground lead of the external oscillator to the chassis. The I. F. alignment trimmers are located at the top of the shielded I. F. Transformers. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is noted. Following this, connect the external oscillator leads to the control grid of the 6A8 tube. Adjust each trimmer on I. F. Unit No. 1 for maximum gain.

During these operations, use the least possible input to prevent broadening of the reasonance peaks.

In order to obtain the most accurate realignment of the I. F. amplifier, it is essential to repeat the alignment process in all I. F. Units, with the external oscillator leads connected to the control grid of the 6A8 tube.

WAVE TRAP ADJUSTMENT: With the oscillator still set at 456 kc., connect the oscillator to the antenna through a 200 mmfd. condenser. Then adjust the wave trap condenser for minimum deflection on the output meter.

BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground through a .0002 mfd. condenser. Leave the Band Switch in the "Broadcast" position and place the tuning control pointer at the 1500 kc. mark. Tune the external oscillator to 1500 kc. Adjust the broadcast band oscillator trimmer to maximum response.

Next adjust the interstage alignment trimmer for maximum response. Finally adjust the antenna section trimmer in the same manner.

Next adjust the 600 kc. padder condenser, located in the center of the chassis on the under side. Set the external oscillator at 600 kc. Rock the receiver tuning control around the resonance position, and at the same time adjust the padder condenser for the highest peak.

Now repeat the 1500 kc. trimmer adjustment, following in every detail the procedure previously described.

The alignment frequencies are as follows:

Longwave Band — 800 meters (375 kc.)
Broadcast Band — 200 meters (1,500 kc.)
Band 1—16.7 meters (18,000 kc.)

BAND 1: Align Band 1 in a similar manner using a 400-ohm non-inductive resistor in place of the .0002 mfd. condenser. The alignment frequency is 18,000 kc. (16.7 meters).

The alignment of Band 1 requires greater care due to the higher frequencies covered by this band. Rotate the tuning condenser of the receiver until the dial pointer is co-incidental with the 18,000 kc. indication on the dial scale. Adjust the oscillator trimmer condenser for maximum sensitivity. Proceed next to align the detector section. In doing this it is essential to rock the tuning control back and forth about the resonance position and at the same time to adjust the trimmer for the highest resonant peak.

THE LONG WAVE ALIGNMENT procedure in the Model 405 is similar to that of the broadcast. Turn the Band Switch to the Long Wave position. The alignment frequency is 375 kc. Adjust the padder condenser at 150 kc. Use a .0002 mfd. condenser in the antenna lead from the external oscillator.

REMOVAL OF BAND SELECTOR SWITCH ASSEMBLY: Should it be necessary to remove the switch assembly, it is advisable to realign the receiver after reinstalling it.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

RECEIVER DESCRIPTION

Operating Voltages—115, 125, 150, 220, 240 volts, Alternating Current.
Frequency Rating—50 to 60 cycles.
Power Consumption—60 watts.
Tubes—1 type 6A8, 1 type 6K7, 1 type 6Q7, 1 type 6F6, 1 type 5W4.
Undistorted Power Output—3 watts.

Intermediate Frequency—456 kc.
Tube Functions—
Type 6A8: Electron emission control oscillator-detector.
Type 6K7: I. F. amplifier.
Type 6Q7: Duo-diode detector amplifier.
Type 6F6: Class "A" power pentode.
Type 5W4: Full-wave rectifier for power supply.

VOLTAGES

The D. C. Voltages measured at the tube sockets of the set should be read with a high resistance voltmeter of at least 1000 ohms per volt.

	OSC. DET. Type 6A8	I. F. Type 6K7	DIODE DET. Type 6Q7	POWER PENTODE Type 6F6	RECTIFIER Type 5W4
Plate	230	230	105*	205	
Cathode	4.	3.5	1.3		320
Screen	85	85		230	
Filament	6.3	6.3	6.3	6.3	5.

***Voltages measured through 250,000 ohm plate resistor.**
Speaker field voltage 90 volts. All plate voltages measured to cathode.
All screen voltages measured to cathode.
All cathode voltages measured to chassis frame.

Range, Model 423

16 - 555 m. (18,800 - 540 kc)

Range, Model 425

16 - 555 m. (18,800 - 540 kc)
731 - 2140 m. (410 - 140 kc.)

(MODEL 425 IS SOLD OUTSIDE THE U. S. A. ONLY)

REMOVAL OF CHASSIS FROM CABINET:

To remove the chassis from the cabinet proceed as follows:

Be certain that the line cord is removed from the power outlet socket.

Remove the "slip-on" knobs and felt washers from the controls and loosen the set screw on the tuning knob.

Remove the speaker plug from the cable socket.

Remove the four mounting screws, located underneath the cabinet.

REALIGNMENT: Should the receiver require realignment, the procedure outlined below should be followed. For best results an external modulated oscillator with adequate frequency range, and a visual output meter, should be used.

Before connecting the chassis to the power line, reconnect the speaker cable in its socket.

The R. F. alignment trimmer condensers are mounted on the side of the R. F. shields.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set at 456 kc. The Band Selector Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. Connect the "antenna" lead of the external oscillator to the control grid of the type 6K7 tube in the I. F. Amplifier stage through a .1 mfd. fixed condenser. Connect the "ground" lead of the external oscillator to the receiver ground lead. The I. F. alignment capacitors are located at the side of the shielded I. F. Transformers. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is noted. On completion of this operation, remove the external oscillator lead from the type 6K7 I. F. amplifier tube and connect it in the same manner to the control grid at the top of the type 6A8 tube.

Now rotate each adjustment screw on I. F. Unit No. 1 for maximum output. During these operations, use the least possible input to prevent broadening of the resonance peaks.

In order to obtain the most accurate realignment of the I. F. amplifier, it is essential to repeat the alignment process in both I. F. Units.

BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground leads. Insert a 200 mmf. condenser in series with the antenna lead. Set the Band Selector Switch in the "Broadcast" position and place the tuning control pointer at the 1500 kc. mark. Adjust the broadcast band oscillator trimmer.

Next adjust the interstage alignment trimmer for maximum response. Finally adjust the antenna section trimmer in the same manner.

Next adjust the 600 kc. padder condenser, located on the top of the oscillator coil. Set the external oscillator at 600 kc. Rotate the receiver tuning control until resonance is indicated. Then rock the tuning control back and forth about this resonance position, and at the same time adjust the padder condenser for the highest resonance peak.

Now repeat the 1500 kc. trimmer adjustment, following in every detail the procedure previously described.

ALIGNMENT OF THE SHORT WAVE-BANDS:— The procedure in aligning the short wave-bands is identical with that for the broadcast with the exception of the adjustment of the padder condenser. Insert a 400 ohm non-inductive resistor in series with the antenna lead. The alignment frequencies are as follows:

Band 2: 50 Meters—(6,000 kc.)
Band 1: 16.6 Meters—(18,000 kc.)

When aligning Band 2, set the Band Selector Switch in the position marked "Band 2". Set the tuning control pointer at 50 meters. Adjust the oscillator alignment capacitor on Band 2 for maximum output. Next adjust the interstage and antenna section alignment capacitors for maximum output.

To align Band 1, set the Band Selector Switch in the position marked "Band 1". Set the tuning control pointer at the 16.6 meter mark. Set the external oscillator at 16.6 meters. Adjust the oscillator section alignment capacitor on Band 1 for maximum output.

Proceed next to align the interstage section of Band 1. In doing this, it is essential to rock the tuning control back and forth about the resonance position and at the same time to adjust the trimmer for the highest resonance peak. Next align the antenna section for maximum sensitivity.

LONG WAVE MODEL 425

The above alignment positions refer to the Model 423 only, which is calibrated in frequency. The alignment points for the Model 425, which is calibrated in meters only, is as follows:

Long Wave	Align at 750 meters.	
	Pad at 2,000 meters.	
Broadcast	Align at 200 meters.	
	Pad at 500 meters.	
Band 1	Align at 17 meters.	

The Long Wave alignment procedure is similar to that for the Broadcast. A 200 mmf. condenser should be used in series with the antenna lead in aligning this band.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

RESISTORS - MODEL G-562		
DESIGNATION	PART NO.	DESCRIPTION
R1, R11	13031	100,000 OHMS 1/4 WATT
R2	13203	200 OHMS 1/4 WATT
R3, R6	13164	50,000 OHMS 1/4 WATT
R4	13115	400 OHMS 1/4 WATT
R5, R9	13001	1 MEGOHM 1/4 WATT
R7	13147	300,000 OHMS 1/4 WATT
R8	79158	750,000 OHMS VOLUME CONTROL & SWITCH
R10	13171	250,000 OHMS 1/4 WATT
R12	13024	500,000 OHMS 1/4 WATT
R13	79159	100,000 OHMS TONE CON.
R14	13059	250 OHMS 1 WATT
R15	13131	600 OHMS 1/4 WATT
R16	13202	35,000 OHMS 1 WATT
R17	13053	10,000 OHMS 1 WATT
R18	13073	3,000 OHMS 1/2 WATT
ADDITION FOR MODEL G-563 ONLY		
R19	13080	50 OHMS 1/4 WATT

② R16 WAS 13075-15000Ω 1/2 W. R18 WAS 13020-5000Ω 1 WATT.
R2 WAS 13003-300Ω. R4 WAS 13131-600 OHMS. R15 WAS 13028-1000Ω.
ADDED C31 & C32 TO MODEL G-562. C22 WAS CONNECTED TO SCREEN OF 6F6G.
③ ADDED #40818 SPEAKER TO PARTS LIST. J.P.H. 3/2/37
④ S10 WAS #40818. J.P.H. 2/24/37
⑤ C24 WAS #22481, 10 MFDS. 25V. ELECTROLYTIC. C25 WAS #85005 16 MFDS. ELECTROLYTIC. C26 WAS #85004 12 MFDS. 475V ELECTROLYTIC. S11 WAS 71544 S.T. 60~ AND 71538 UNIV. 25~ J.P.H. 2/18/37
⑦ S2 WAS 73062-C. S3 WAS 73070. J.P.H. 4/23/37

ALTERATIONS ② G-562 WAS 283 & G-563 WAS 285. J.P.H. PWR. TRANSFORMER UNIV. V. 50-60~ WAS 71381
③ R14 & C24 WERE IN SERIES WITH CATHODE OF 6F6G. R12 WENT TO GND. R14 WAS #13108 410Ω. R17 WAS #13129, 15000Ω.

SERVICE INFORMATION FOR PILOT MODELS BG-562 AND BG-563

REMOVAL OF CHASSIS FROM CABINET:

To remove the chassis from the cabinet proceed as follows:

Be certain that the line cord is removed from the power outlet socket.

Remove the knobs and felt washers from the controls on the front panel, and loosen the set screw on the tuning knob.

Remove the speaker socket from the plug mounted on the speaker.

Remove the four mounting screws, located underneath the cabinet and pull chassis out.

REALIGNMENT: If the receiver requires alignment, the procedure outlined below should be followed. In the schematic diagram sheet, the location and function of the various alignment capacitors are clearly illustrated. For best results, an external modulated oscillator with adequate frequency range and a visual output meter, should be used.

Before connecting the chassis to the power line, reconnect the speaker cable in its socket at the rear of the chassis.

I. F. ALIGNMENT: When aligning the Intermediate Frequency Amplifier, the external oscillator must be set at 456 kc. The Band Switch should be in the position marked "Broadcast", and the tuning condenser should be set at maximum capacity. When aligning the receiver on all positions, the volume control and the tone control should be turned to the maximum clockwise position. Connect the antenna lead of the external oscillator to the control grid of the 6K7G tube in the I. F. Amplifier through a .1 mfd. fixed condenser. Connect the ground lead of the external oscillator to the chassis. The I. F. alignment trimmers are located at the top of the shielded I. F. Transformers. Rotate the adjusting screw of each capacitor on I. F. Unit No. 2 slowly until maximum output is noted. Following this, connect the external oscillator leads to the control grid of the 6A8G tube. Adjust each trimmer on I. F. Unit No. 1 for maximum gain.

During these operations, use the least possible input to prevent broadening of the resonance peaks.

In order to obtain the most accurate realignment of the I. F. amplifier, it is essential to repeat the alignment process in all I. F. Units, with the external oscillator leads connected to the control grid of the 6A8G tube.

WAVE TRAP ADJUSTMENT: With the oscillator still set at 456 kc., connect the oscillator to the antenna through a .0002 mfd. condenser. Then adjust the wave trap condenser for minimum deflection on the output meter.

BROADCAST ALIGNMENT: After the I. F. amplifier is completely realigned, connect the external oscillator leads to the receiver antenna and ground through a .0002 mfd. condenser. Leave the Band Switch in the "Broadcast" position and place the tuning control pointer at the 1500 kc. mark. Tune the external oscillator to 1500 kc. Adjust the broadcast band oscillator trimmer to maximum response.

Next adjust the interstage alignment trimmer for maximum response. Finally adjust the antenna section trimmer in the same manner.

Next adjust the 600 kc. padder condenser, located in the center of the chassis on the under side. Set the external oscillator at 600 kc. Rock the receiver tuning control around the resonance position, and at the same time adjust the padder condenser for the highest peak.

Now repeat the 1500 kc. trimmer adjustment, following in every detail the procedure previously described.

The alignment frequencies are as follows:
Longwave Band — 800 meters (375 kc.)
Broadcast Band — 200 meters (1,500 kc.)
Band 1—16.7 meters (18,000 kc.)

BAND 1: Align Band 1 in a similar manner using a 400-ohm non-inductive resistor in place of the .0002 mfd. condenser. The alignment frequency is 18,000 kc. (16.7 meters).

The alignment of Band 1 requires greater care due to the higher frequencies covered by this band. Rotate the tuning condenser of the receiver until the dial pointer is co-incidental with the 18,000 kc. indication on the dial scale. Adjust the oscillator trimmer condenser for maximum sensitivity. Proceed next to align the detector section. In doing this it is essential to rock the tuning control back and forth about the resonance position and at the same time to adjust the trimmer for the highest resonance peak.

THE LONG WAVE ALIGNMENT procedure in the Model BG-563 is similar to that of the broadcast. Turn the Band Switch to the Long Wave position. The alignment frequency is 375 kc. Adjust the padder condenser at 150 kc. Use a .0002 mfd. condenser in the antenna lead from the external oscillator.

REMOVAL OF BAND SELECTOR SWITCH ASSEMBLY: Should it be necessary to remove the switch assembly, it is advisable to realign the receiver after reinstalling it.

CAUTION: When making repairs on the receiver, use only ROSIN CORE SOLDER. NEVER USE SOLDERING PASTE OR ACID FLUXES OF ANY TYPE.

RECEIVER DESCRIPTION

Operating Voltages—115, 125, 150, 220, 240 volts, Alternating Current.
Frequency Rating—50 to 60 cycles.
Power Consumption—60 watts.
Tubes—1 type 6A8G, 1 type 6K7G, 1 type 6H6G, 1 type 6J7G, 1 type 6F6G, 1 type 5Y3.
Undistorted Power Output—3 watts.
Intermediate Frequency—456 kc.

Tube Functions—
Type 6A8G: Electron emission control oscillator-detector.
Type 6K7G: I. F. amplifier.
Type 6H6G: Duo-diode detector.
Type 6J7G: A. F. amplifier.
Type 6F6G: Class "A" power pentode.
Type 5Y3: Full-wave rectifier for power supply.

VOLTAGES

The D. C. Voltages measured at the tube sockets of the set should be read with a high resistance voltmeter of at least 1000 ohms per volt.

	OSC. DET. Type 6A8G	I. F. Type 6K7G	DIODE DET. Type 6H6G	A. F. AMP. Type 6J7G	POWER PENTODE Type 6F6G	RECTIFIER Type 5Y3

PILOTUBES Required

One	6K8	1st detector-oscillator
One	6K7	IF amplifier
One	6Q7	2nd detector-AVC-1st audio amplifier
One	6F6-G	output tube
One	5Y3-G	power supply rectifier
Total	5 tubes	

GENERAL SPECIFICATIONS.

Circuit Super-Heterodyne, with Class A output stage. Three tuning ranges as listed below. Permeability tuned IF transformers. Tone compensated volume control, Continuously variable tone control, Automatic Volume Control and Cathode Ray Tuning Beacon.

Power Supply

Voltage	Frequency	Watts
110 to 125 volts	60	60
150 volts	60	60
220 to 240 volts	60	60
110 to 125 or 220 to 240 volts	60	60

Intermediate Frequency 455 kilocycles

Panel Controls Volume with On-Off swithc, Tone, Band Selector Swithc, Dual ratio, planetary drive, tuning control

Maximum Power Output 4.8 watts

Tuning Ranges The model H-554 chassis has the following tuning ranges:

Band 1	24.8	to	8.3 mc	or	12.09	to	36.12	meters
Band 2	9.7	to	2.9 mc	or	30.9	to	103.4	meters
Band 3	1725	to	530 kc	or	174	to	566	meters

The model H-555 Chassis has the following tuning ranges:

Band 1	18.8	to	5.35 mc	or	15.9	to	56.04	meters
Band 2	1725	to	530 kc	or	174	to	566	meters
Band 3	375	to	145 kc	or	800	to	2069	meters

PILOT RECEIVERS OF THE H-550 SERIES.

SERVICE DATA

Removal of the chassis from the cabinet, when necessary, is done as follows:-

1. Remove the power supply cord from the supply outlet.
2. Remove the knobs and felt washers from all shafts on the front of the cabinet. These knobs are of the "push-on" type.
3. Remove the speaker cord from the socket on the speaker.
4. Rmove the four mounting screws located under the cabinet and carefully slide the chassis out of the cabinet.

Receiver Alignment — Equipment Required.

1. Signal Generator. One using fundamental frequencies for all the frequencies used in the receiver is preferred.
2. Output Meter. Generally a copper oxide rectifier meter is the most convenient.
3. Dummy Antennas. .1 mfd. condenser
   .0002 mfd mica condenser
   400 ohm, non-inductive resistor

Alignment Connections — There are three wires with connectors on the ends, extending from the chassis to the rear of the cabinet. Their colors and uses are:

Blue - Antenna
Yellow - Doublet Connector
Black - Ground

Connect the black and yellow wires together and to the ground post of the signal generator.

Connect the "hot" post of the generator through the correct dummy antenna or condenser to the appropriate point as noted hereafter.

In all the measurements to follow, the output meter should be connected to the plate and screen grid terminals of the 6F6-G tube, through .1 mfd condensers, in any convenient manner.

Procedure — The volume and tone controls should all be turned to the extreme clockwise positions, before starting.

The location of all trimmers is shown in the accompaning figure. Always keep the output from the signal generator at the lowest value which will give a readable deflection on the output meter.

IF Amplifier Alignment — Turn the Band Selector Switch to Band 3 and turn the receiver dial pointer to the low frequency end.

Connect the output meter as described under "Connections", and connect the "hot" post of the signal generator to the grid of the 6K8 tube through the .1 mfd condenser. Then proceed with the alignment as follows:-

1. Adjust the signal generator frequency to 455 kilocycles, and adjust the generator output to the lowest value which will give a readable signal on the output meter.
2. Adjust the screws 1, 2, 3, and 4 (see figure), for maximum reading of output meter. Keep reducing the output from the generator if the output meter reading increases too much.

If the output of the generator to the receiver is too great, the alignment of the receiver will not be correct, as the AVC action will become too great, and the amplifier will appear broad in tuning.

It will seldom, if ever, be found necessary to more than touch up the alignment of the IF amplifier. Of course, if the amplifier adjustment screws have been tampered with, if the amplifier adjustment screws have been tampered with, it will probably be necessary to completely realign the amplifier. In this case, connect the generator to the grid of the IF amplifier tube, and align the last IF transformer. Always finish the alignment with the signal input to the 6K8 tube.

A cathode ray oscilloscope is not necessary in making the above adjustments. One may be used, however, if desired.

Wave Trap Alignment — With the Band Selector Switch set on the Broadcast Band, replace the .1 mfd dummy antenna with the .0002 mfd dummy antenna. Set the generator frequency at 455 kc and tune trimmer #11 for minimum reading of the output meter. There must be sufficient output from the signal generator to always have a reading on the output meter, do not allow the meter go to zero and call that the correct adjustment point.

R.F. Alignment

Band 3 (Model 555 Long-Wave) — Connect the "hot" terminal of the generator to the blue wire and clip through the .0002 mfd condenser.

Set the generator frequency to 300 kc., and with the Band Selector Switch set to Band 3, turn the receiver dial pointer to 300 kc. Adjust trimmer #5 for maximum reading of the output meter. Do likewise with trimmer #13. Then set the generator frequency to 175 kc and the receiver dial pointer to approximately the same. Adjust trimmer #6 for maximum reading of the output meter, while "rocking" the gang condenser carefully back and forth. Then go back and repeat the 300 kc alignment.

Band 2 (Model 555) Band 3 (Model 554) (Standard Broadcast)

Connections are the same for the alignment of this band as they are for the long-wave band.

Set the generator frequency to 1500 kc., and the receiver dial pointer to the same frequency, with the band selector switch set appropriately. Adjust trimmer #7 for maximum reading of the output meter. (This trimmer is adjusted by moving the brass rod in or out, with a hooked wire, and with a twisting motion. First loosen the lock nut). Then without touching any tuning controls adjust trimmer #12 for maximum reading of the output meter.

Next, set the generator frequency to 600 kc., and accurately set the receiver dial pointer to the 600 kc. mark. Then adjust trimmer #15 for maximum reading of the output meter. Do not move the tuning control while making this adjustment. Finally return and repeat the 1500 kc. adjustments and then tighten the lock nut on trimmer #7.

Band 1 (Model 555 Short-Wave)

Remove the .0002 mfd dummy antenna used in aligning the lower frequency bands and substitute the 400 ohm resistor.

Before aligning this band refer to the paragraph headed "Image Frequency".

Set the generator frequency to 18 mc. and also set the receiver dial pointer to this frequency. Carefully adjust trimmer #8 for maximum reading of the output meter, be careful you do not tune in at the Image Frequency.

Then adjust trimmer #14 for maximum output meter reading, while slightly "rocking" the gang condenser. Readjust trimmer #8 if necessary to keep the calibration correct. These are the only adjustments on this band.

Band 2 (Model 554 Short-Wave).)

Connections and dummy antenna same as on Band 1 above.

Before aligning this band refer to the paragraph heading "Image Frequency".

Set the generator, and the receiver dial pointer to 9 mc. Adjust trimmer #9 for maximum reading of the output meter, be careful you do not tune in at the Image Frequency.

Then adjust trimmer #13 for maximum reading of the output meter, while slightly "rocking" the gang condenser. Readjust trimmer #9 if necessary to correct the calibration.

Band 1 Alignment (Model 554 Short-Wave)

Connections and dummy antenna are the same as on Band 2 of model 554.

Before aligning this band, refer to the paragraph headed "Image Frequency".

Set the generator frequency to 24 mc. and the receiver dial pointer to 24 mc. Adjust trimmer #10 to 24 mc. for maximum reading of the output meter. Be careful that the receiver is not adjusted to the Image Frequency. Then adjust trimmer #14 while "rocking" the gang condenser, for maximum reading of the output meter. Reset trimmer #10 so that calibration is correct if necessary.

Image Frequency

All bands in these two models must be aligned with the oscillator frequency higher than the signal frequency. There can be no error in doing this on the Long-Wave and Broadcast Bands. However, on the higher frequency bands it is possible to incorrectly adjust the alignment in this respect, and end up with the receiver aligned on what should be the Image Frequency.

The chances of doing this may be eliminated by adjusting the generator to the correct aligning frequency, and with sufficient output from the generator to pick up two signals with the receiver, separated by twice the Intermediate frequency, set the receiver dial pointer to that one which comes in at the higher frequency marking on the receiver dial pointer.

D.C. SOCKET VOLTAGES

All voltages are those between the indicated tube terminal and the chassis, and are made with a 1000 ohm per volt voltmeter. Make measurements with no signal input to the receiver and with the volume control set at minimum volume.

Make sure that the A.C. supply voltage is correct for the transformer tap being used at the time of measurement.

Socket Terminals

Tube	1	2	3	4	5	6	7	8
6K8	-	-	240	95	-	110	-	2.8

5Y3-G	-	-	-	-	-	-	340	340

*Not true voltage, but as measured with voltmeter

Miscellaneous Service Notes

If a howling noise (sometimes referred to as Microphonic howl) is heard, it is very probably because the four red screws under the cabinet have not been removed, along with the two narrow metal strips between the chassis and the bottom of the cabinet. These strips and screws are only intended as additional bracing during shipment and must be removed before the receiver is put in operation.

The howl can also be caused by a defective tube, or when some part of the receiver which is rigidly fastened to the chassis rubs against the cabinet. The remedy is obvious.

MODELS H594,H597
Voltage,Alignment

PILOT RADIO CO.

PILOT RECEIVERS OF THE H-590 SERIES.
SERVICE DATA

Removal of the chassis from the cabinet, when necessary, is done as follows:-

1. Remove the power supply cord from the supply outlet.
2. Remove the knobs and felt washers from all shafts on the front of the cabinet. These knobs are all of the "push-on" type.
3. Remove the speaker cord from the socket on the speaker.
4. Remove the four mounting screws located under the cabinet, and carefully slide the chassis out of the cabinet.

Receiver Alignment   Equipment Required.

1. Signal Generator. One using fundamental frequencies for all the frequencies used in the receiver is preferred.
2. Output Meter. Generally a copper-oxide rectifier meter is the most convenient.
3. Dummy Antennas. .1 mfd condenser
   .0002 mfd mica condenser
   400 ohm non-inductive resistor

Alignment Connections   The posts marked D and G on the rear of the chassis should, in all following operations, be connected to the ground post of the signal generator.

Connect the "hot" post of the generator through the correct dummy antenna or condenser to the appropriate point as noted hereafter.

In all the measurements to follow, the output meter should be connected to the plate and screen grid terminals of the 6F6-G tube, through .1 mfd condensers, in any convenient manner.

Procedure   The Volume, Sensitivity and Tone Controls should all be turned to the extreme clockwise positions, before starting.

The location of all trimmers is shown in the accompanying figure.

IF Amplifier Alignment

Turn the Band Selector Switch to Band 3 and turn the ROTOR Dial to the low frequency end.

Connect the output meter as described under "Connections", and connect the "hot" post of the generator to the grid of the 6K8 tube through the .1 mfd condenser. See that none of the PIANO KEYS is down. Then proceed with the alignment as follows:-

1. Adjust the Signal Generator frequency to 455 kilocycles, and adjust the generator output to the lowest value which will give a readable signal on the output meter.
2. Adjust the screws 13, 14, 15, 16, 17 and 18, (see figure), for maximum reading of the output meter. Keep reducing the output from the generator if the output meter reading increases too much.

If the output of the generator to the receiver is too great, the alignment of the receiver will not be correct, as the AVC action will become too great, and the amplifier will appear broad in tuning.

It will seldom, if ever, be found necessary to more than touch up the alignment of the IF amplifier. Of course, if the amplifier adjustment screws have been tampered with, it will probably be necessary to completely realign the amplifier. In this case, connect the generator to the grid of the last IF amplifier tube, and then to the first IF amplifier tube, while aligning the transformers following these tubes. Always finish the alignment with the signal input to the 6K8 tube and, with this connection, readjust all screws in the IF amplifier, except the Discriminator trimmer #19.

A cathode ray oscilloscope is not necessary in making the above adjustments. One may be used, however, if desired.

If the receiver is placed in a noisy location when the above adjustments are being made, it may be convenient to reduce the sensitivity of the amplifier by means of the sensitivity control.

Discriminator Alignment   CAUTION: The discriminator compensator (19) has been accurately adjusted during manufacture. It will probably never need adjustment, even when tubes are replaced, and for these reasons should never be touched unless there is no doubt about its being out of adjustment, in which case, the following procedure should be followed carefully. The adjustment is quite critical and cannot be done correctly in a hasty manner.

1. Set compensator (19) at its minimum position. This is the setting when the screw slot is vertical and when the red half of the adjusting screw is at the left.
2. Tune the IF amplifier to 455 kc as described under "IF Amplifier Alignment".
3. With the signal generator connected to the grid of the 6K8 tube and with the output of the generator at a low value, note the reading of the output meter. Then very carefully turn compensator (19) until the output meter reading reaches a minimum value. That is the correct setting of this compensator.

It will be necessary to use a screw driver made from some insulating material in making this adjustment. If a metal tool is used, the adjustment will not be correct.

If the adjustment is not correctly made, the oscillator control tube will not function properly. It may even detune the oscillator instead of tuning it.

R.F. Alignment

Band 4 (Long-Wave)   Connect the "hot" terminal of the generator to the post marked "A" on the rear of the chassis, through the .0002 mfd condenser.

Set the generator frequency to 300 kc., and with the Band Selector Switch set to Band 4, turn the ROTOR dial to 300 kc. Adjust trimmer #1 for maximum reading of the output meter. Do likewise with trimmers #2 and #3. Then set the generator frequency to 175 kc., and the ROTOR dial to 175 kc. Adjust the long-wave trimmer #4 for maximum reading of the output meter, while "rocking" the gang condenser carefully back and forth. Then go back and repeat the 300 kc. alignment. Always keep the generator output as low as possible, and see that none of the PIANO keys are down.

Band 3 (Standard Broadcast)   Connections to the generator are the same for the alignment of this band as they are for Band 4, also the same dummy antenna is used.

Set the generator frequency to 1500 kc., and the ROTOR dial to the same frequency, with the band selector switch set to Band 3. Adjust trimmer #5 for maximum reading of the output meter. (This trimmer is adjusted by drawing the brass rod up or pushing it down with a hooked wire, and with a twisting motion. First loosen the lock nut). Then, without touching the tuning controls, adjust first trimmer #6 and then trimmer #7 for maximum reading of the output meter.

Next, set the generator frequency to 600 kc., and the ROTOR dial to approximately the same. Adjust trimmer #8 for maximum output reading while "rocking" the gang condenser. Then go back and repeat the 1500 kc., adjustment, and tighten the lock nut on trimmer #5.

Band 2 (Short-Wave)   Remove the .0002 mfd dummy antenna used in aligning Bands 3 and 4 and substitute the 400 ohm resistor.

Before aligning this band refer to the paragraph headed "Image Frequency".

Set the generator frequency to 9,000 kc., (9 mc) and also set the ROTOR dial to this frequency. Carefully adjust the oscillator trimmer #9 for maximum reading of the output meter. Be very careful that the trimmer is not set on the image frequency.

After the oscillator is set, trimmer #10 is adjusted, while slightly rocking the gang condenser, for greatest reading of the output meter, resetting trimmer #9 if necessary to keep the calibration correct.

The adjustments on this band are more critical than the similar ones on the lower frequency bands and must be more carefully made.

The above adjustments, at the high frequency end of the band, are the only ones to be made on this band.

Band 1 (Short-Wave)   Connections and dummy antenna are the same as on Band 2.

Set the generator, and the ROTOR dial to 24 mc. Adjust trimmer #11 for maximum reading of the output meter, when the lower frequency peak of the two which can be located, coincides with the 24 mc. calibration point on the dial. Then adjust trimmer #12, while "rocking" the gang condenser, until the maximum reading is obtained on the output meter, resetting trimmer #11 if necessary to keep the calibration correct.

These are the only adjustments on this band.

Image Frequency

All bands in this receiver, except Band 1 must be aligned with the oscillator frequency higher than the signal frequency. There can be no error in doing this on Bands 3 and 4. However, on the two high frequency bands it is possible to incorrectly adjust the alignment in this respect, and end up with the receiver aligned on what should be the Image Frequency.

The chances of doing this may be eliminated by adjusting the generator to the correct aligning frequency, and with sufficient output from the generator to pick up two signals with the receiver, separated by twice the Intermediate Frequency, set the dial on Band 2 to that one which comes in at the higher frequency marking of the ROTOR dial. That is, on Band 2 the two frequencies which will be picked up when the generator is set at 9 mc., will be at 9 mc. and at 8 mc., on the ROTOR dial. Adjust the oscillator trimmer so that the 9 mc. frequency one coincides with 9 mc., on the dial. Exactly the reverse is true on Band 1

D.C. SOCKET VOLTAGES

All voltages are those between the indicated tube terminal and the chassis, and are made with a 1000 ohm per volt voltmeter. Make measurements with no signal input to the receiver, Volume control set at minimum volume, and sensitivity control set at maximum sensitivity. Make sure the AC supply voltage is correct for the transformer tap being used when measuring these voltages.

Socket Terminals

Tube	1	2	3	4	5	6	7	8
6K8	-	-	+250	+90	-1.5	+100	-	+2.5
6J7	-	-	+230	+90	+5.0	-	-	+5.
6K7	-	-	+250	+90	+2.4	-	-	+2.4
6K7	-	-	+250	+90	+3.5	-	-	+3.5
6H6	-	-	-.25	-	-.25	-	-	-
6Q7	-	-	+58	-	-	-	-	+1.5
6F6	-	-	+225	+250	-	-	-	+16
5Y3G	-	+380	-	-	-	-	-	+380

In replacing the 6J7 frequency control tube, it will be found convenient to remove the two screws, holding the ROTOR dial shield, and move the shield so that the tube may be handled easier.

Miscellaneous Service Notes

If a howling noise (sometimes referred to as Microphonic howl) is heard, it is very probably because the four red screws under the cabinet have not been removed, along with the two narrow metal strips between the chassis and the bottom of the cabinet. These strips and screws are only intended as additional bracing during shipment and must be removed before the receiver is put in operation.

The howl can also be caused by a defective tube, or when some part of the receiver which is rigidly fastened to the chassis rubs against the cabinet. The remedy is obvious.

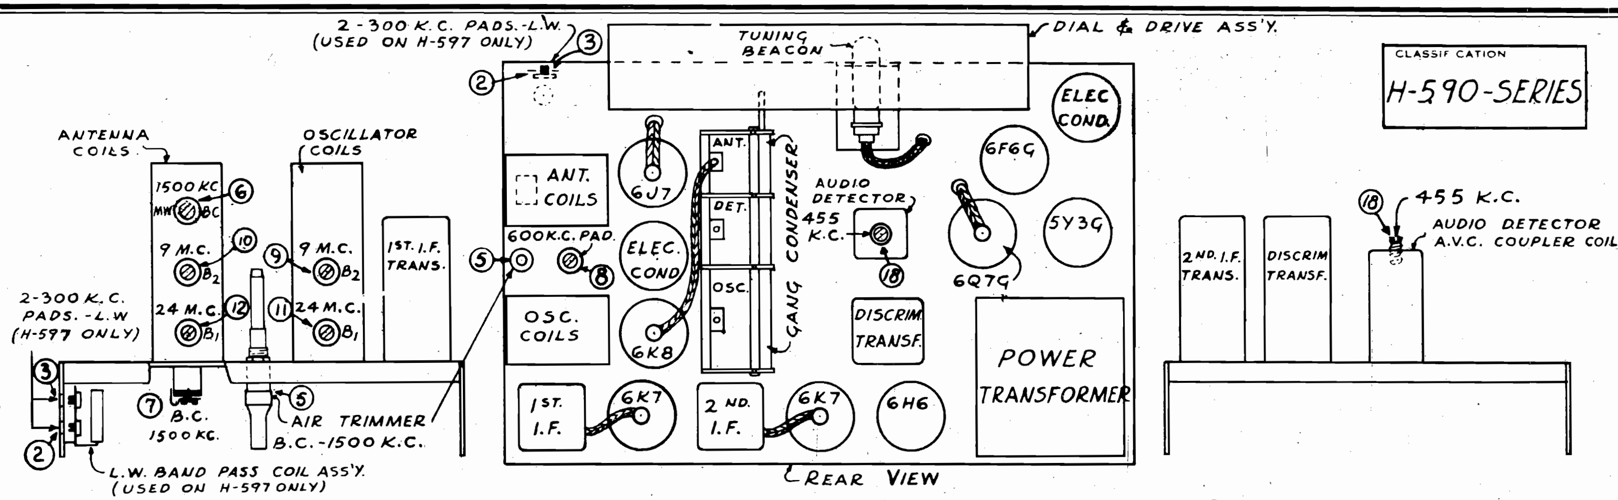
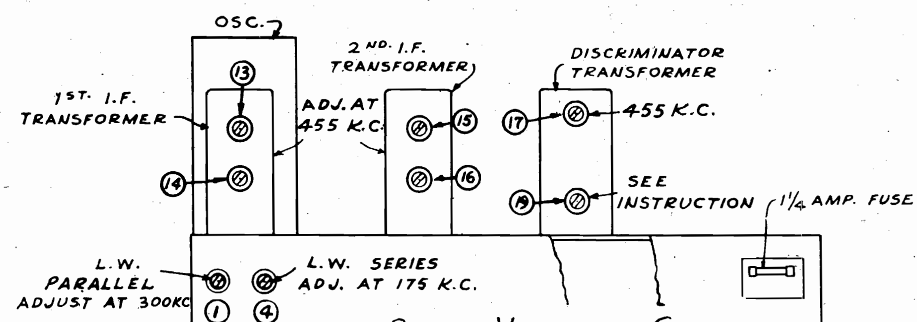
CLASSIFICATION
H-590-SERIES



LEFT SIDE OF CHASSIS TOP VIEW OF CHASSIS RIGHT SIDE OF CHASSIS



REAR VIEW OF CHASSIS

Circuit Super-Heterodyne, with class A output stage, and with Automatic Frequency Control of the oscillator on the Standard Broadcast Band and on the Long-Wave Band where this band is incorporated. An R.F. Pre-selector is incorporated in the Broadcast and Long Wave Bands. Iron Core, Permeability Tuned IF and Discriminator Transformers, which use, in addition, Silver-Mica Condensers.

Other features of the Receiver are;- Continuously variable Tone Control, Tone Compensated Volume Control, Visible Indicators on all controls, Motor operated PIANO-TUNING on the Broadcast and Long-Wave bands. Manual Tuning is instantly available without extra switching. Motor Tuning, without the keys is also available on all bands. These receivers are supplied with a fuse in the power supply circuit, and a jack is provided for plugging in a high impedance phonograph pick-up.

PILOTUBES Required 9 in all as follows

One	6K8	1st detector-oscillator.
One	6J7	Oscillator frequency control.
Two	6K7	IF amplifiers.
One	6H6	Discriminator.
One	6Q7	2nd Detector - AVC - 1st Audio Amplifier.
One	6F6-G	Output Tube.
One	6U5	Cathode Ray Tuning Beacon.
One	5Y3-G	Power supply rectifier.

Power Supply

Voltage	Frequency	Watts
117.5	60 cycles	90
115, 125, 150, 220, 240 * Universal Transformer	60 cycles	90

* (Not supplied in the United States).

Intermediate Frequency 455 Kilocycles.

Panel Controls 12 PIANO-TUNING Keys, Volume Control, Tone Control with On-Off switch, Band Selector Switch, and Motor and Manual Tuning Controls.

Tuning Ranges
H-594 Chassis

Band 1	24.8	to	9.6 mc	or	12.09	to	31.23	meters
Band 2	9.9	to	2.9 mc	or	30.8	to	103.4	meters
Band 3	1725	to	510. kc	or	178.	to	588.	meters

In addition to the above ranges the H-597 chassis, which is not sold in the United States, has the following Long-Wave Band.

Band 4 375 to 145 kc or 800 to 2069 meters

Maximum Power Output 5.8 watts

GENERAL SPECIFICATIONS.

Circuit Super-Heterodyne, with Class A output stage. Three tuning ranges as listed below. Permeability tuned IF transformers. Tone compensated volume control, Continuously variable tone control, Automatic Volume Control and Cathode Ray Tuning Beacon.

PILOTUBES Required One 6K8 1st detector-oscillator, one 6K7 IF amplifier, one 6Q7 2nd detector-AVC-1st audio amplifier, one 6F6-G output tube, one 6U5 cathode ray tuning beacon, one 5Y3-G power supply rectifier. Total 6 tubes.

Power Supply

Voltage	Frequency	Watts
110 to 125 volts	60	60
150 volts	60	60
220 to 240 volts	60	60
110 to 125 or 220 to 240 volts	60	60

Intermediate Frequency 455 kilocycles

Panel Controls Volume with On-Off Switch, Tone, Band Selector Switch, Manual Tuning Control, and an 8 key mechanically operated PIANO TUNING mechanism, with key locking knob.

Maximum Power Output 4.8 watts.

Tuning Ranges The model H-664 Chassis has the following tuning ranges;

Band 1	24.8	to	8.3 mc	or	12.09	to	36.12	meters
Band 2	9.7	to	2.9 mc	or	30.9	to	103.4	meters
Band 3	1725	to	530 kc	or	174	to	566	meters

The model H-665 Chassis has the following tuning ranges;

Band 1	18.8	to	5.35 mc	or	15.9	to	56.04	meters
Band 2	1725	to	530 kc	or	174	to	566	meters
Band 3	375	to	145 kc	or	800	to	2069	meters

MODEL HF-1
Schematic
Fidelity Switch Data

RCA MFG. CO., INC.

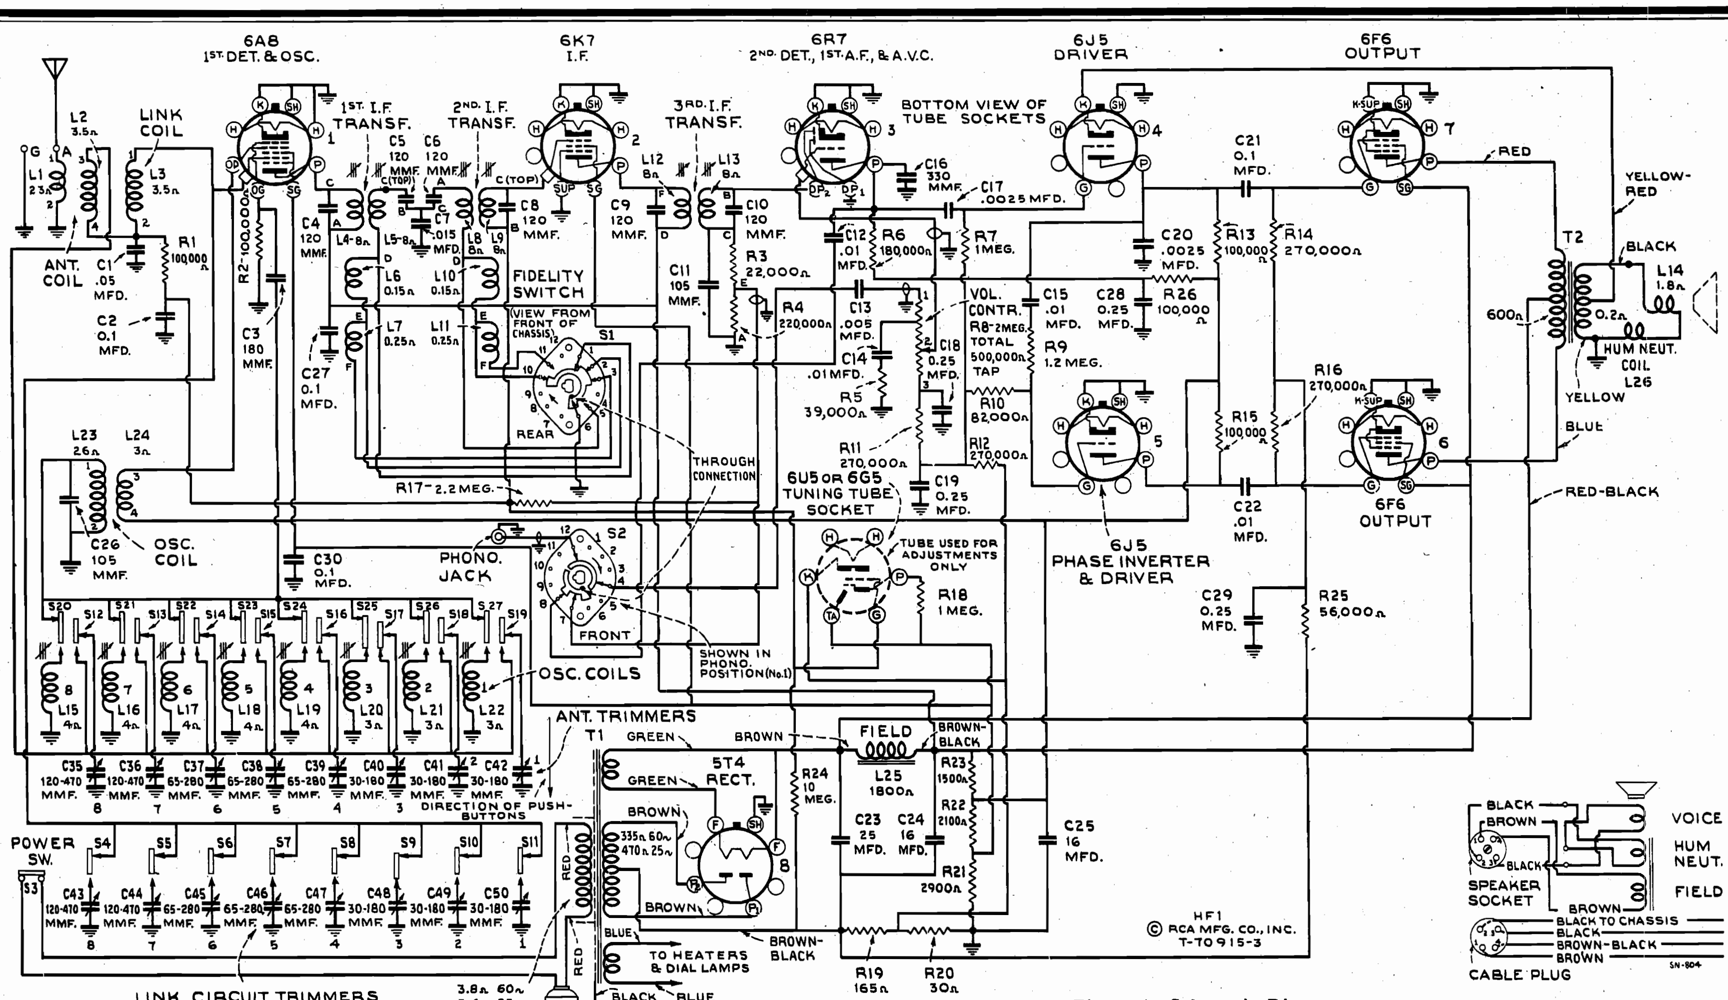

Figure 4—Schematic Diagram

IF PEAK 455 KC

Purpose and Function of the Six Positions on Fidelity Switch

No. 1	Phono operation, with minimum high-frequency response.	Connects phono to high side of volume control. Connects C12 (.01 mfd) from plate of 1st-a.f. tube to chassis. Disconnects radio by short-circuiting diode load R4.
No. 2	Phono operation, with maximum high-frequency response.	Same as position No. 1 except that C12 is disconnected.
No. 3	Radio operation, with maximum selectivity, minimum high-frequency response and minimum fidelity.	Short-circuits phonograph. Connects diode load to high side of volume control. Connects C12 (.01 mfd) from plate of 1st-a.f. tube to chassis. Grounds low end of L5 and L8.
No. 4	Radio operation, with maximum selectivity.	Same as position No. 3 except that C12 is disconnected, resulting in more highs than position 3.
No. 5	Radio operation, with medium selectivity and medium fidelity.	Same as position 4 except that ground is moved from L5 and L8 to low end of L6 and L10.
No. 6 (clockwise)	Radio operation, with minimum selectivity and full-range fidelity.	Same as position 5 except that ground is moved from L6 and L10 to low end of L7 and L11.

MODEL HF-1
Socket, Trimmers, Voltage
Chassis Wiring, Specs. Notes

RCA MFG. CO., INC.

Frequency Range.............................. 540-1,550 kc
2 Stations between approx. 540-1,160 kc (buttons 7 and 8)
3 Stations between approx. 630-1,230 kc (buttons 4, 5, and 6)
3 Stations between approx. 780-1,550 kc (buttons 1, 2, and 3)
Intermediate Frequency.............................. 455 kc

A socket is provided for an RCA-6U5 or 6G5 "Magic Eye" Tuning Tube, to facilitate adjustments for electric tuning.

Pilot Lamp............... Mazda No. 46, 6.3 volts, 0.25 amps.

Power Supply Ratings
Rating A............... 105-125 volts, 50-60 cycles, 115 watts
Rating B............... 105-125 volts, 25-60 cycles, 115 watts

Power Output
Undistorted.............................. 10 watts
Maximum.............................. 12 watts

Loudspeaker
Type.............................. 12-inch Electrodynamic
Impedance (v.c.).................... 2.25 ohms at 400 cycles

Precautionary Lead Dress and Replacement of Parts

1. The green lead from the antenna coil to the switch, and the green lead from the link coil to the switch, should be dressed away from the oscillator coils, and free of other leads, chassis, and parts.

2. When replacing a dual trimmer, it must be installed so that the top plate (to which the adjustment screws make contact) is the ground side. This is particularly important on C39-C40, and C47-C48, because the sections of these trimmers are of different capacity range and must be correctly oriented in the receiver. Grounding the top plate takes care of this.

3. Maintain color coding on output transformer (T2) as shown in the schematic diagram. This is necessary in order to obtain correct inverse-feedback action.

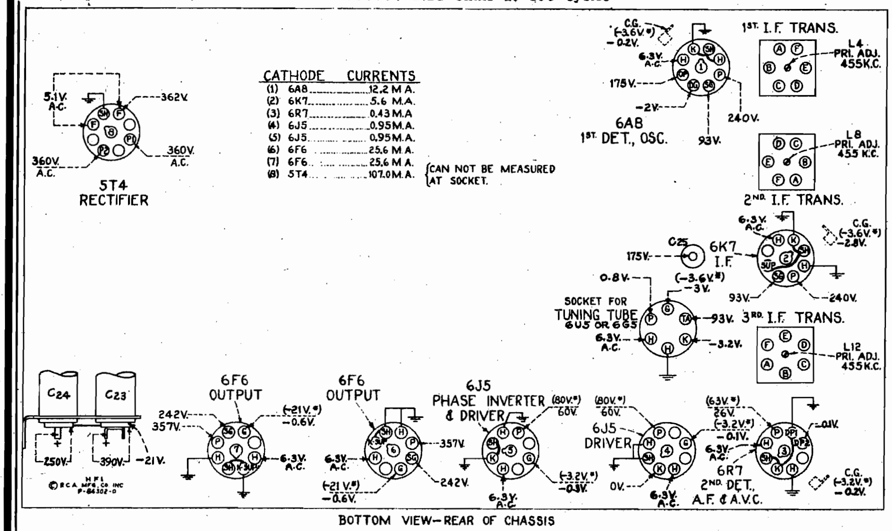

Figure 5—Radiotron Socket Voltages

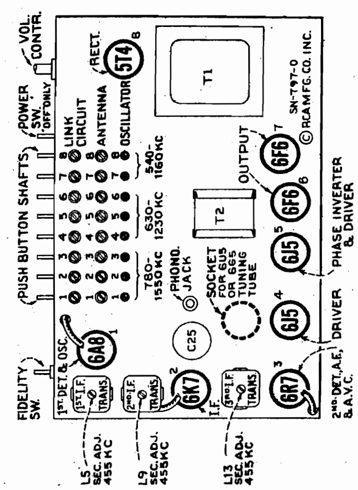

Figure 2—Radiotron and Trimmer Locations

* Note: Values with star (*) are operating voltages.
Values not starred are actual measured voltages.
Measurements made to chassis unless otherwise indicated and with Magic Eye in socket.
Measurements made with all push buttons out, volume control turned to minimum, using 1,000-ohm-per-volt meter, having ranges of 10, 50, 250, and 500 volts. (Use range above the specified measured voltage.)
Values should hold within approximately ± 20% for 117-volt, 60-cycle supply.

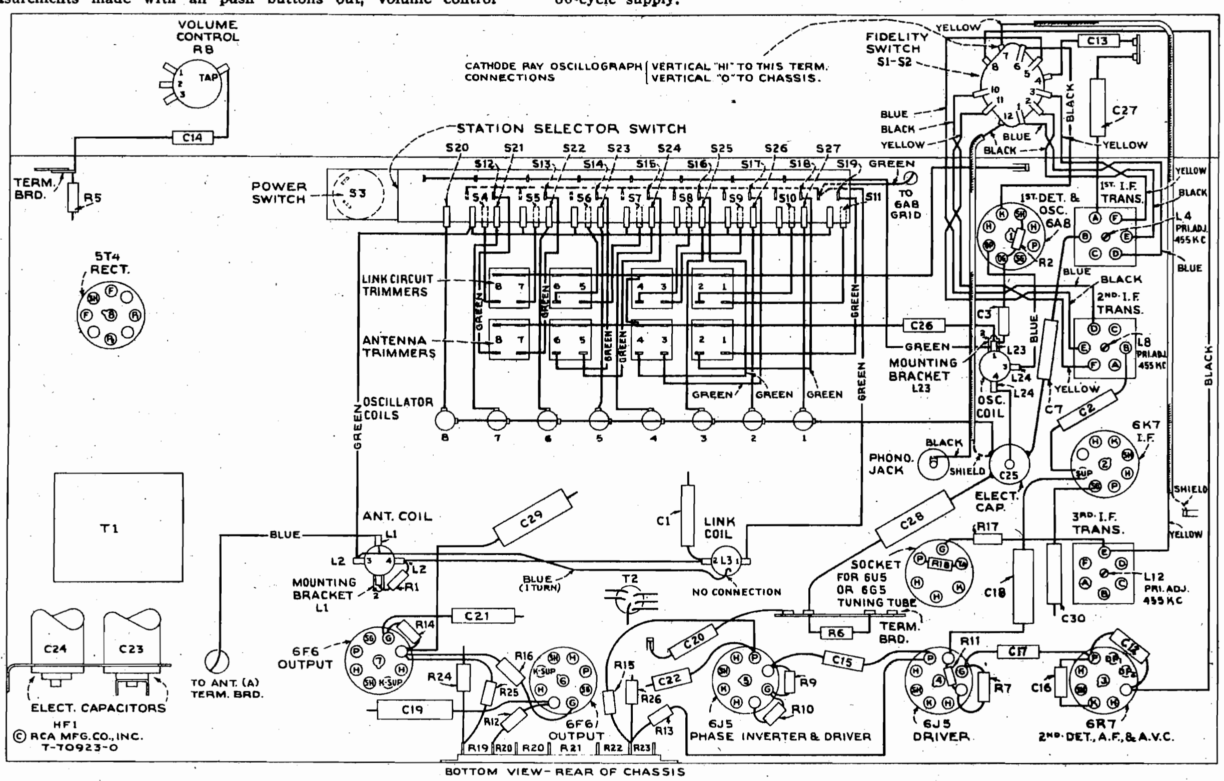

Figure 3—Component Parts Location and R-F Wiring Diagram

RCA MFG. CO., INC.

I-F Alignment Procedure

Cathode-ray Alignment is the recommended method for Model HF1. Connections for the oscillograph are shown in the chassis drawing.

Output Meter Alignment.—If an output meter is used, connect it across the voice coil, and turn the receiver volume control to maximum.

Test-oscillator.—For all alignment operations connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

For additional details, refer to booklet "RCA Victor Receiver Alignment".

Push in button 8, and adjust the No. 8 trimmers and core to a quiet point near 600 kc. Leave the button pushed in for the following operations:

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn Fidelity switch to—	Adjust the following for max. peak and symmetry—
No. 1	6K7 I-F grid cap, in series with .001 mfd.	455 kc (20 kc sweep)	— — — —	L12 and L13 (3rd I-F transf.) (Refer to curve "A")
No. 2	6A8 1st-det. grid cap, in series with .001 mfd.	455 kc (20 kc sweep)	Position 4 (from left)	Turn L4 and L5 (1st I-F) out as far as possible. Peak L8 and L9 (2nd I-F), and then L5 and L4. Readjust L8 and L9 slightly if necessary. (Refer to curve "B")
No. 3	Turn selectivity switch to position 5. Response should be like curve "C".			
No. 4	Turn selectivity switch to position 6 (full clockwise). Response should be like curve "D".			
No. 5	Follow "Adjustments for Electric Tuning".			

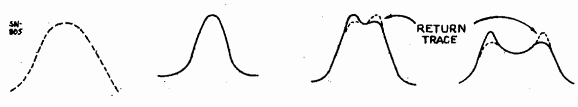
The No. 6 position (knob turned full clockwise) on the fidelity switch provides minimum selectivity and maximum fidelity. This position of the switch may be used for full-range reproduction of the majority of local stations, but occasionally (due to the present 10 kc station spacing), an adjacent channel signal will cause a 10 kc beat or "monkey chatter." Turning back the fidelity switch to position 5, 4 or 3 will eliminate this condition, at the expense of high-fidelity reproduction. (An example of possible "monkey chatter" is found in the case of WOR at 710 kc. and WLW at 700 kc.)

Adjustments for Electric Tuning

1. Make a list of the desired eight stations, arranged in order from high to low frequencies. It is preferable to select strong local high-quality stations within a radius of 100 miles.
2. Insert an RCA-6U5 or 6G5 Magic Eye tube in the six-prong socket on the chassis. Use an insulated screwdriver or alignment tool (such as RCA Stock No. 31031) for all adjustments. LEAVE THE FIDELITY SWITCH IN POSITION 3 OR 4 WHILE MAKING ADJUSTMENTS FOR ELECTRIC TUNING.
3. Remove the antenna lead-in from the "A" terminal and wrap it once around the green lead to the top cap of the 6A8 tube. (This provides capacity coupling between the antenna and the 6A8 grid.)
4. Push in button No. 1 and turn oscillator core No. 1 to bring in the first station on the list. Adjust the core carefully for peak output as indicated by the Magic Eye. Adjust link trimmer No. 1 for max. output.
5. Remove the antenna lead-in from the 6A8 grid lead and connect the lead-in to the "A" terminal. Adjust antenna trimmer No. 1 and link trimmer No. 1 for peak output as indicated by the Magic Eye.

(Clockwise rotation of cores and trimmers tunes the circuits to lower frequencies, and counter-clockwise adjustment tunes the circuits to higher frequencies.)

6. Push in button No. 2. Adjust oscillator core No. 2, antenna trimmer No. 2, and link trimmer No. 2 for the second station in the same manner.
7. Follow the same procedure for the remaining stations.
8. After tuning in eight stations as specified above, leave the antenna lead-in connected to the "A" terminal, and carefully readjust each of the oscillator cores for peak output on the respective stations.
9. After the set is installed and connected to the customer's antenna, make a final readjustment of the antenna and link trimmers.
10. The Magic Eye should be removed from the chassis after completion of the electric-tuning adjustments.



Curve "A" Input to I-F grid.

Curve "B" Input to 1st-det. grid, fidelity switch at position 4 (from left).

Curve "C" Input to 1st-det. grid, fidelity switch at position 5 (from left).

Curve "D" Input to 1st-det. grid, fidelity switch at position 6 (full clockwise).

ADJUSTMENTS FOR ELECTRIC TUNING

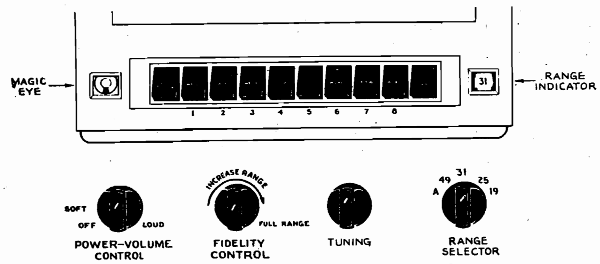

Figure 1—Location of Controls

The left-hand push-button is a Victrola-Attachment switch. The right-hand push-button is for dial tuning.

1. Make a list of the desired eight stations, arranged in order from low to high frequencies.
2. Turn range selector to "A" band, turn power on, and allow a few minutes for warming up.
3. Turn Fidelity Control maximum counter-clockwise.
4. Press down the "dial-tuning" (right-hand) button.
5. Manually tune in the first station on the list, using the "Magic Eye" for accurate tuning.
6. Hold down the "dial-tuning" button, and press down station button No. 1 (second from left). Both buttons will stay down, central dial lamp will light brightly or dully, depending on which side of disc, contact is. Move station-setting contact No. 1 to the insulating line on the disc at rear of gang. When the contact is correctly centered on the insulating line, the central dial lamp will go out.
7. Press down any other button in order to release the dial-tuning button and station button No. 1. Then press down station button No. 1 again. The electric tuning mechanism will function to tune in the station, and the central dial lamp will stay on.
8. Repeat this process for the remaining stations.

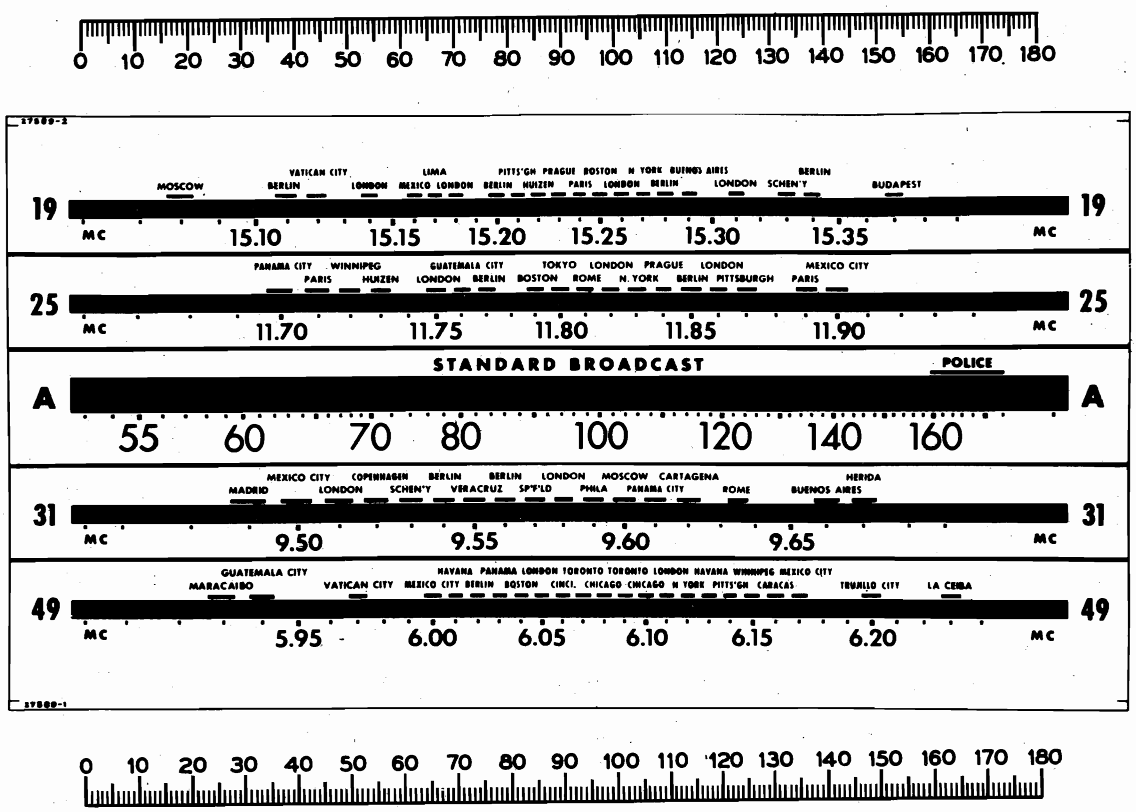

Figure 2—Reduced Reproduction of Receiver Dial, and Corresponding 0-180° Calibration Scales

The corresponding position of the dial indicator for any setting of the calibration scale can be determined by drawing a line from this point on the bottom calibration scale to the same point on the top calibration scale. For example 90° on the calibration scale corresponds approximately to 11.8 mc on the 25-meter band, and 940 kc on "A" band, etc. Read instructions under "Alignment Procedure."

RCA MFG. CO., INC.

MODELS HF-2,HF-4,U130
Chassis Wiring,Voltage
Transformer Data,Lead Dress

RCA MFG. CO., INC.

Measurements made to chassis unless otherwise indicated, with set tuned to quiet point and volume control at minimum. Values should hold within approximately ±20% with 117-volt a-c supply.

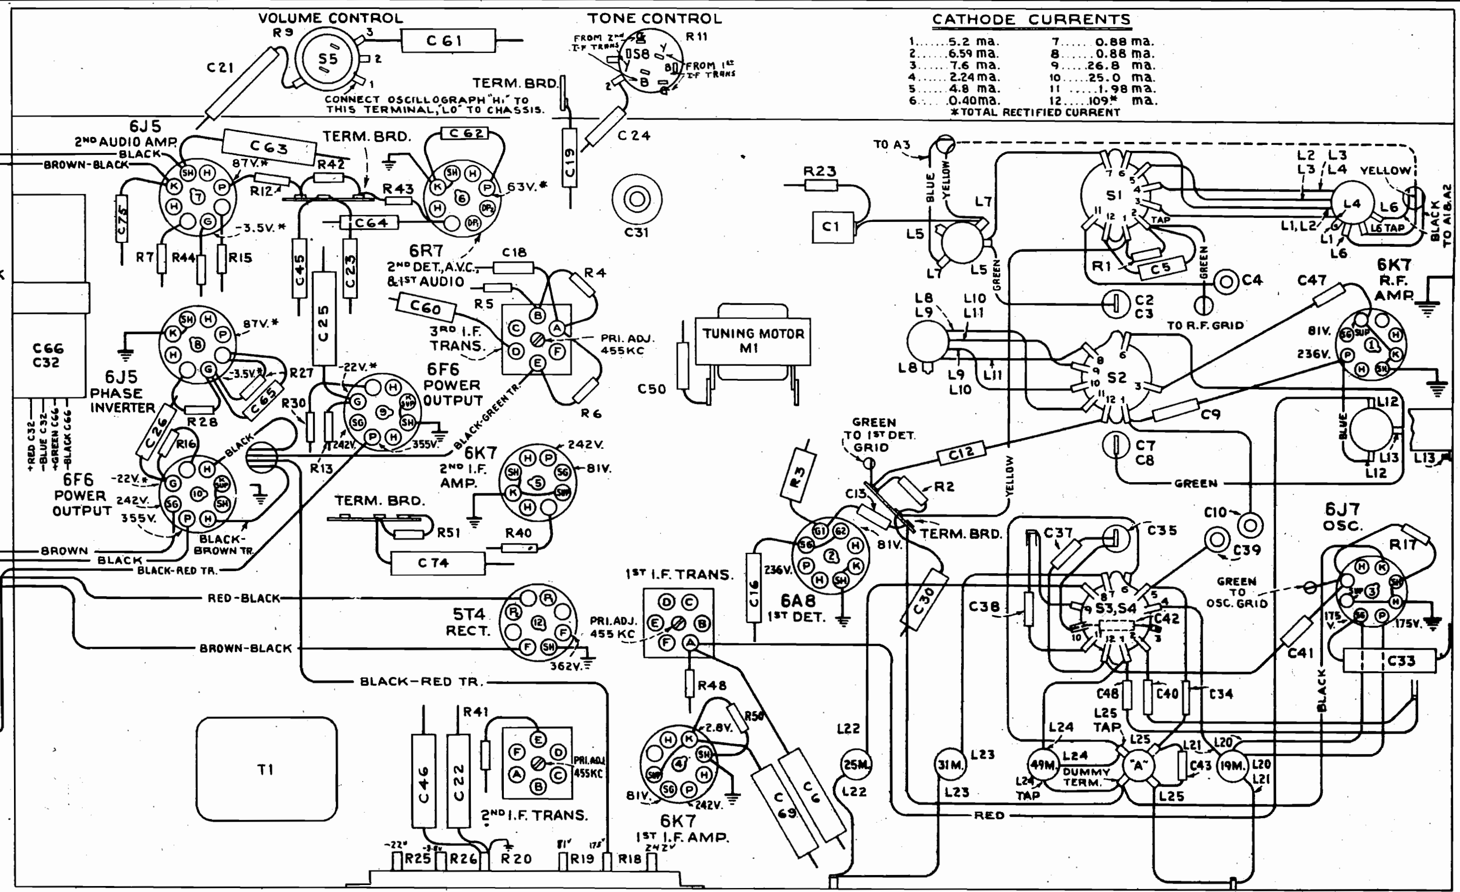

Figure 5—R-F Wiring Diagram and Socket Voltages

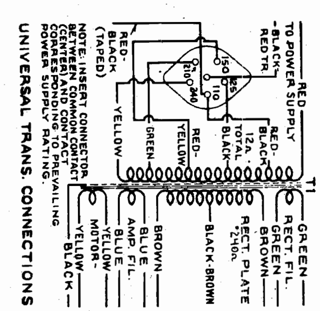

Above — Universal Power Transformer Connections. (110-volt supply for a Victrola Attachment may be obtained by connecting the motor to the red and the red-black leads.)

Precautionary Lead Dress.—

(1) Keep tuning tube cable and the lead from the left pilot light away from the 6F5 grid cap.

(2) Leads on spread-band antenna and r-f coils and trimming capacitors should be kept short as possible.

(3) Keep black lead from L25 away from C38 and L24.

(4) Keep black lead from L25 to cathode lug on 6J7 away from R17.

(5) The power cord lead and the primary lead of the power transformer which connect to the power switch should be twisted together, and kept away from Volume Control.

(6) Keep C13 away from the 6A8 control grid lead and from the chassis.

(7) Shielded leads to Victrola jack must be dressed away from switch terminals and jack.

(8) Blue and black leads from antenna board to coils must be twisted.

(9) Black lead and condenser which connect to 6F6 plate should be kept away from inverter grid lead and resistors which connect to it.

*** NOTE:** Values with star (*) are operating voltages in circuits with high series-resistance. The actual measured voltages will be lower, depending on the voltmeter loading.

RCA MFG. CO., INC.

LOUDSPEAKER

Type	12-inch Electrodynamic
Voice Coil Impedance	2.2 ohms at 400 cycles

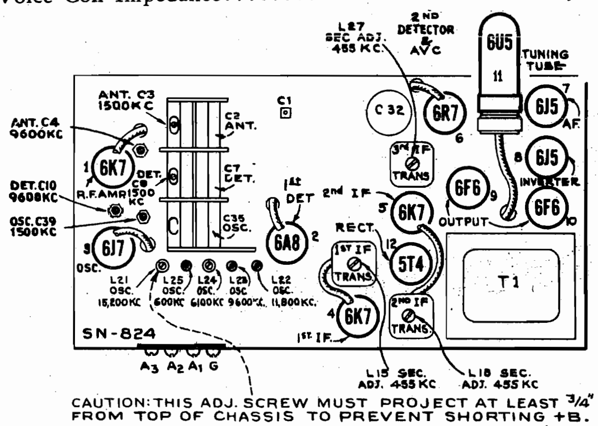

Figure 3—Tube and Trimmer Locations

Loudspeaker.—Centering of the loudspeaker is made in the usual manner with three narrow celluloid or paper feelers after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. A dust cover should be cemented in place upon completion of adjustment.

NOTE: Due to inverse feedback used on these models, it is very important to connect speaker, speaker cable, and feedback cable, exactly as shown in the schematic diagram.

Victrola Attachment. — A jack located near the "Magic Eye" tube is provided for connecting a Victrola Attachment into the audio-amplifying circuit. The cable running from the Victrola Attachment should be terminated in a Stock No. 31048 plug to fit the jack.

PHONOGRAPH (Model U-130 only)

Type	Automatic
Record Capacity	Eight 10-inch, or Seven 12-inch

* Use maximum inductance peak (plunger in) if two peaks can be obtained.
** Use minimum inductance peak (plunger out) if two peaks can be obtained.
Note that oscillator tracks above signal frequency on al bands except "49M." where it tracks below.

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the chassis drawing.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment, therefore a calibration scale is attached to the rear of the indicator-drive-cord drum which is mounted on the front shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The "0" mark on the drum scale must be vertical, and directly over the center of the gang-condenser shaft when the plates are fully meshed. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

To determine the corresponding frequency for any setting of the calibration scales, refer to the accompanying drawing which shows the dial with 0-180° calibration scales drawn at top and bottom.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "0" mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator at the 530 kc mark, and gang condenser fully meshed. The indicator has a spring clip for attachment to the cable.

Spread-Band Alignment.—The most satisfactory method of aligning or checking the spread-band ranges is on actual reception of short-wave stations of known frequency, by adjusting the magnetite-core oscillator coil for each band so that these stations come in at the correct points on the dial.

In exceptional cases, when the set is being serviced in a location where the noise level is high enough to prevent reception of short-wave stations, a test-oscillator may be used for alignment, but an extremely high degree of accuracy is required in the frequency settings of the test-oscillator, as a slight error will produce considerable inaccuracy on the spread-band dials. The frequency settings of the test-oscillator may be checked by one or both of the following methods:

1. Determine the exact dial settings of the test-oscillator (for frequencies at or close to the specified alignment frequencies) by zero-beating the test-oscillator against short-wave stations of known frequency.
2. Use harmonics of the standard-broadcast range of a test-oscillator, first checking the frequency settings on this range by means of a crystal calibrator (RCA Stock No. 9572), or by zero-beating against standard broadcast stations.

When a test oscillator is employed for spread-band alignment, a final check should be made on actual reception of short-wave stations of known frequency, and the magnetite-core oscillator coil for each band should be re-adjusted so that the stations come in at the correct points on the dial.

For additional information, refer to booklet "RCA Victor Receiver Alignment."

Using RCA Stock No. 150 Test Oscillator.—When using this oscillator for spread-band alignment, insert an open-circuit plug in the "EXT. MOD." jack, and set the test-oscillator dial 800 kc lower than the desired frequency for the four lower frequency ranges, and 800 kc higher than the desired frequency for the two high ranges. This provides an unmodulated signal of the desired frequency and the Magic Eye may be used as an output indicator for this unmodulated signal.

Armchair Control Unit

When a Model G8A Armchair Control is connected to the receiver as shown in figure 7 it duplicates the action of the push-buttons on the front panel when No. 1 button is pressed down. The black lead from push-button No. 1 is unsoldered from No. 1 station-setting contact and soldered to a terminal board which is to be mounted on the frame of selector mechanism. In some cases one of the other seven station buttons on the set may be used in place of No. 1 button for the operation of the Armchair Control.

This arrangement allows the use of only seven of the eight buttons when tuning in stations at the set, but allows the use of the entire eight buttons on the Model G8A Armchair Control. In operating the G8A Armchair Control the push-button must be held down until the station has been tuned in. Care must be taken not to hold two of the station-buttons down at one time as both windings of the motor may be engaged simultaneously causing the motor to be inoperative and overheated.

Antenna Connections

RCA Victor Master Antenna Kit.—Connect the twisted-pair transmission line to terminals A1 and A2 on the terminal board at rear of chassis. Connect the counter-poise to A3. Terminal G may be connected to ground, but this connection is not necessary for correct operation.

Noise-Reducing Adjustment.—After the RCA Victor Master Antenna Kit is connected to the receiver, tune the receiver to a point near 900 kc where no station is heard. Turn volume control clockwise until noise is heard. If no noise of a regular character is audible, start any brush-type motor-driven appliance, such as a vacuum cleaner, electric razor, refrigerator, etc., but do not bring it too near the receiver. This will generate noise as a continuous crackling, or buzz. Adjust C1 to a point where this noise is reduced to a minimum.

Adjustment of the noise reducing trimmer C1 should be made in the customer's home, with the RCA Victor Master Antenna connected to the receiver.

This adjustment is effective only when the RCA Victor Master Antenna is used. For all other types of antenna, the noise-adjustment trimmer should be screwed all the way down.

Other Antennas.—Use terminals A1 and A3 on the receiver terminal board as antenna and ground connecting points respectively. Terminal A3 may be connected to terminal G, unless this causes interference, in which case this connection should be omitted.

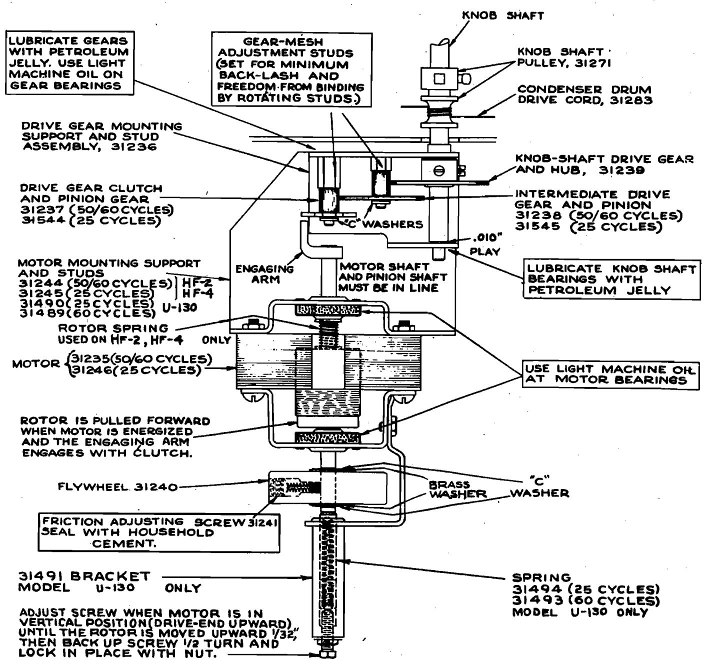

Figure 8—Motor and Gear Mechanism

There must be 1/32-inch clearance between the end of the engaging arm and the face of the intermediate gear when the motor is in its full forward position.

Electric Tuning Mechanism

The circuit of the electric tuning mechanism is shown in the schematic diagram, and the mechanical details are illustrated below.

The action can be understood by following a cycle of operation:

When a station button is pushed in, it completes the 24-volt circuit through the corresponding station-setting contact and one-half of the brass selector disc, which is connected to one side of the motor field coil. This energizes the motor, and the rotor is pulled forward, engaging with the gear train that drives the tuning condenser and selector disc. The condenser and disc rotate until the insulation line comes under the particular station-setting contact, and the motor circuit is broken. Inertia carries the insulation line past the station-setting contact which then makes contact to the other half of the disc. This completes the circuit to the other side of the motor field coil, causing the motor to reverse. The floating flywheel is still turning in the original direction and therefore slows down the reversal movement of the motor; as a result the selector disc is moved slowly back until the insulation line is under the station-setting contact, when the circuit is broken and the mechanism stops.

Adjustment of Flywheel Friction

In normal operation, the motor drives the tuning condenser and selector disc until the insulation line just passes the particular station-setting contact: The motor then reverses and moves the disc slowly in the opposite direction until the insulation line is under the contact, and the mechanism stops.

In some cases, particularly with high line-voltage, the disc may make two or three reversals before stopping.

The flywheel friction adjustment screw should be set to give the least number of reversals with the chassis in normal horizontal position.

Adjustment of Selector Disc

The brass selector disc is fastened to the rear shaft of the tuning condenser by means of two set-screws. When the condenser is at maximum (plates fully meshed) the insulation line should be horizontal, with the operating-end at the left (viewed from rear). The operating-end has dark insulating material and the brass is beveled at this end.

The selector disc should be set so that the contact-tip plungers in the station-setting contacts project not more than 1/16-in. from the body of the contacts.

Muting Circuit

When the electric tuning mechanism is in action, the motor-supply voltage is fed into a diode rectifier circuit which applies a high bias to the I-F first-audio and second-audio tubes. This prevents audio amplification and makes the set quiet or "mute" while the mechanism is operating.

Automatic Record Changer

GENERAL INFORMATION

Before servicing the automatic record changer, inspect the assembly to see that all levers, parts, gears, springs, etc. are in good order and are correctly assembled.

A bind or jam in the mechanism can usually be relieved by rotating the turntable in the reverse direction.

The changer can be conveniently rotated through its change cycle by pushing the index lever to "Reject" and revolving the turntable by hand. Six turntable revolutions are required for one change cycle.

The turntable, spindle, and pinion gear are assembled by means of a 3/32 inch straight pin. This pin may be removed by gently driving with a standard pin punch.

If the record changer or cabinet is not perfectly level, normal operation is likely to be affected.

The 10 and 12 inch records must be absolutely flat for smooth operation when using a mixture of the two sizes.

A shorting switch, located in the pickup head, operates due to pressure when the pickup is placed on the pickup rest.

ADJUSTMENTS

A. **Main Lever.**—This lever is basically important in that it interlinks the various individual mechanisms which control needle landing, tripping, record separation, etc. One adjustment is provided for the main lever. Rotate the turntable until the changer is out-of-cycle; and adjust rubber bumper bracket (A) so that the roller clears the nose of the cam plate by 1/16 inch.

B. **Friction Clutch.**—The motion of the tone arm toward the center of the record is transmitted to the trip pawl "22" by the trip lever "7" through a friction clutch "5." If the motion of the pickup is abruptly accelerated or becomes irregular due to swinging in the eccentric groove, the trip finger "7" moves the trip pawl "22" into engagement with the pawl on the main gear, and the change cycle is started. Proper adjustment of the friction clutch "5" occurs when movement of the tone arm causes positive movement of the trip pawl "22" without tendency of the clutch to slip. The friction should be just enough to prevent slippage, and is adjustable by means of screw "B." If adjustment is too tight, the needle will repeat grooves; if too loose, tripping will not occur at the end of the record.

C. **Pickup Lift Cable Screw.**—During the record change cycle, lever "16" is actuated by the main lever "15" so as to raise the tone arm clear of the record by means of the pickup lift cable. To adjust pickup for proper elevation, stop the changer "in-cycle" at the point where pickup is raised to the maximum height above turntable plate, and has not moved outward; at this point adjust locknuts "C" to obtain 1 inch spacing between needle point and turntable top surface.

D. & E. **Needle Landing on Record.**—The relation of coupling between the tone arm vertical shaft and lever "20" determines the landing position of the needle on a 10 inch record. Position of eccentric stud "E" governs the landing of the needle on a 12 inch record; this, however, is dependent on the proper 10 inch adjustment.

To adjust for needle landing, place 10 inch record on turntable; push index lever to reject position and return to the 10 inch position; see that pickup locating lever "17" is tilted fully toward turntable; rotate mechanism through cycle until needle is just ready to land on the record; then see that pin "V" on lever "14" is in contact with "Step T" on lever "17." The correct point of landing is 4-11/16 inches from the nearest side of the turntable spindle; loosen the two screws "D" and adjust horizontal position of tone arm to proper dimension, being careful not to disturb levers "14" and "17". Leave approximately 1/32 inch end play between hub of lever "20" and pickup base bearing, and tighten the blunt nose screw "D"; run mechanism through several cycles as a check, then tighten cone pointed screw "D".

After adjusting for needle landing on a 10 inch record, place 12 inch record on turntable; push index lever to reject and return to 12 inch position; rotate mechanism through cycle until needle is just ready to land on the record; the correct point of landing is 5-11/16 inches from nearest side of spindle. If the landing is incorrect, turn stud "E" until the eccentric end adjusts lever "14" to give correct needle landing. The eccentric end of the stud must always be toward the rear of the motor board, otherwise incorrect landing may occur with 10 inch records.

F. & G. **Record Separating Knife.**—The upper plate (knife) "25" on each of the record posts serves to separate the lower record from the stack and to support the remaining records during the change cycle. It is essential that the spacing between the knife and the rotating record shelf "27" be accurately maintained. The spacing for the 10 inch record is nominally .055 inch, and for the 12 inch record is .075 inch.

To adjust, rotate the knife to the point of minimum vertical separation from the record shelf and turn screw and locknut "F" to give .052—.058 inch separation. Screw "G" must not be depressed during this adjustment. After setting screw "F" adjust screw "G" so that when its tip is depressed flush with top of record shelf, the vertical spacing between the knife, in its lowest rotational position, and the shelf, is .072—.078 inch.

H. **Record Support Shelf.**—The record shelf revolves during the change cycle to allow the lower record to drop onto the turntable. Both posts are rotated simultaneously by a gear and rack coupled to the main lever "15," and it is necessary that adjustments be such that the record is released from both shelves at the same instant. To adjust, place a 12 inch record on the turntable, rotate mechanism into cycle to the point where tone arm is at maximum distance outward from turntable; lift record upward until it is in contact with both separating knives, then loosen screws "H" and shift record shelves so that the curved inner edges of the shelves are uniformly spaced at least 1/16 inch from record edge. Tighten the blunt nose screw "H," run mechanism through cycle several times to check action, then tighten cone pointed screw "H".

If record shelves or knives are bent, or not perfectly horizontal, improper operation and jamming of mechanism will occur.

J. **Tone Arm Rest Support (not shown).**—When the changer is out-of-cycle, the front lower edge of the pickup head should be 5/16 inch above surface of motor board. This may be adjusted by bending the tone arm support bracket, which is associated with the tone arm mounting base, in the required direction.

K. **Trip Pawl Stop Pin.**—The position of the trip pawl stop pin "K" in relation to the main lever "15" governs the point at which the roller enters the cam. By bending the pin support either toward or away from trip pawl bearing stud, the roller can be made to enter the cam later or earlier, respectively. This adjustment should be made so that the roller definitely clears the cam outer guide as well as the nose of the cam plate.

Lubrication.—Petrolatum or petroleum jelly should be applied to cam, main gear, spindle pinion gear, and gears of record posts.

Light machine oil should be used in the tone arm vertical bearing, record post bearings, and all other bearings of various levers on underside of motor board.

The felt washer between the turntable and spindle bearing should be soaked in light engine oil whenever the turntable is removed, or as required for proper operation.

Do not allow oil or grease to come in contact with, rubber mounting of tone arm base, rubber bumper, or flexible coupling of drive motor.

MISCELLANEOUS SERVICE HINTS

Incorrect adjustment of a particular mechanism of the changer is generally exhibited in a specific mode of improper operation. The following relations between effects on operation and the usual mis-adjustments will enable ready adjustment in most cases.

1. For any irregularity of operation, the adjustment of the main lever "15" should be checked first as in "A".
2. Needle does not land properly on both 10 and 12 inch records—Make complete adjustments "D" and "E".
3. Needle does not land properly on 12 inch record but correct on 10 inch—Effect adjustment "E".
4. Failure to trip at end of record—Increase clutch "5" friction by means of screw "B". Also, see that levers "7" and "12" are free to move without touching each other.
5. Pickup strikes lower record of stack or drags across top record on turntable—Adjust lift cable per adjustment "C".
6. Needle does not track after landing—Friction clutch "5" adjustment "B" may be too tight; bind in tone arm vertical bearing; levers "7" and "12" fouled; or pickup output cable twisted.
7. Cycle commences before record is complete—Record is defective, or adjustment "B" of friction clutch "5" is too tight.
8. Wow in record reproduction—Record is defective; flexible coupling between motor and changer mechanism not correctly assembled; or instrument is not being operated at normal room temperature (65° F).
9. Record knives strike edge of records—Records warped; record edges are rough; or knife adjustments "F" and "G" are incorrect.
10. Record not released properly—Adjust record shelf assemblies in respect to shaft by means of adjustment "H".
11. Needle lands in 10 inch position on 12 inch record or misses record when playing both types mixed—Increase tension of pickup locating lever spring "30".

MODELS HF-2, HF-4, U130
Parts List

RCA MFG. CO., INC.

STOCK No.	DESCRIPTION	Unit List Price
	RECEIVER ASSEMBLIES	
31492	Bearing—Variable condenser motor rotor adjustment bearing—less bracket and cup assembly—Model U-130 only	.10
31253	Board—Antenna and ground terminal board—Models HF-2 and HF-4	.25
31531	Board—Antenna and ground terminal board—Model U-130 only	.25
31276	Bracket—Band indicator mounting bracket complete except less band indicating strip, cord, and tension spring	.40
31282	Bracket—Magic Eye bracket and holder	.22
31491	Bracket—Bracket and bearing cup for variable condenser motor rotor adjustment—Model U-130 only	.45
30766	Cap—Magic Eye rubber cap	.15
12884	Capacitor—Trimmer capacitor 2-20 mmfd. (C4, C10)	.60
12714	Capacitor—Trimmer capacitor 2-12 mmfd. (C39)	.50

31553	Capacitor—Comprising 2 sections each 16 mfd. (C32, C66)	2.15
31495	Capacitor—20 mfd. (C31)	1.75
31544	Clutch—Variable condenser drive gear clutch and pinion gear—engages pin on motor shaft—25 cycle models only	.45
31237	Clutch—Variable condenser drive gear clutch and pinion gear—engages pin on motor shaft—50-60 cycle models only	.35
31263	Coil—"A" band antenna coil (L5, L7)	.95
31264	Coil—19, 25, 31, and 49 meter bands antenna coil (L1, L2, L3, L4, L6)	1.35
31257	Coil—"A" band oscillator coil (L25)	.55
31258	Coil—19 meter band oscillator coil (L20, L21)	.45
31265	Coil—"A" band r-f coil (L12, L13)	1.20
31266	Coil—19, 25, 31, and 49 meter bands r-f coil (L8, L9, L10, L11)	.95
31254	Coil—25 meter band oscillator coil (L22)	.40
31255	Coil—31 meter band oscillator coil (L23)	.40
31256	Coil—49 meter band oscillator coil (L24)	.50
31234	Condenser—3-gang variable condenser (C2, C3, C7, C8, C35)	6.45
31345	Contact—Push button switch contacts—comprising 10 contacts riveted on insulating strip	.70
31344	Contact—Push button switch contacts—comprising 13 contacts riveted on insulating strip	1.20
31231	Contact—Contact tip for station selector plunger	.06
31278	Cord—Band indicator drive cord	.12
31281	Cord—Indicator pointer drive cord—Model HF-2 only	.50
31554	Cord—Indicator pointer drive cord—Models HF-4 and U-130 only	.50
31283	Cord—Variable condenser drum drive cord	.20
31260	Core—Adjustable core and stud for "A" band oscillator coil	.35
31269	Core—Adjustable core for i-f transformers	.15
31259	Core—Adjustable core and stud for 19, 25, 31, or 49 meter band oscillator coils	.15
31273	Drum—Indicator drive cord drum	.80
31240	Flywheel—Variable condenser drive motor flywheel	.25
31239	Gear—Variable condenser knob shaft drive gear and hub	.65
31545	Gear—Variable condenser intermediate drive gear and pinion gear—25 cycle models only	.40
31238	Gear—Variable condenser intermediate drive gear and pinion gear—50-60 cycle models only	.50
31277	Indicator—Band indicator strip—Models HF-2 and HF-4	.15
31555	Indicator—Band indicator strip—Model U-130	.15
11891	Lamp—Dial lamp	.17
31480	Lamp—Tuning indicator pilot lamp	.20
31243	Leather—Friction leather insert for flywheel	.04
31346	Lock-plate—Push button switch lock-plate—comprising 10 contact locks in one strip	.80
31246	Motor—Variable condenser drive motor for 25 cycle models (M1)	6.50
31235	Motor—Variable condenser drive motor for 50-60 cycle models (M1)	4.85
31228	Plate—Station selector contact—less plungers	.45
31227	Plate—Station selector mounting—mounts on rear of variable condenser	.50
30868	Plug—2-contact female plug for motor power cable—Model U-130 only	.35
31572	Plug—3-contact female plug for speaker cable	.15
12493	Plug—5-contact female plug for speaker cable	.30
31229	Plunger—Station selector plunger—less contact tip, and tip spring	.18
31280	Pulley—Indicator pointer drive cord pulley	.10
31271	Pulley—Motor drive pulley—fastens on motor drive knob shaft	.25
31272	Pulley—Range switch pulley	.20
31548	Resistor—Voltage divider comprising one 1,500 ohms, one 2,950 ohms, one 3,400 ohms, one 30 ohms, and one 165 ohms, sections (R18, R19, R20, R25, R26)	.90
14720	Resistor—1,000 ohms, ½ watt (R48)	.20
12267	Resistor—1,200 ohms, ½ watt (R50)	.20
14559	Resistor—10,000 ohms, ½ watt (R4)	.20
12738	Resistor—27,000 ohms, ½ watt (R7)	.20
12454	Resistor—33,000 ohms, ½ watt (R3, R17)	.20
31573	Resistor—39,000 ohms, 1/10 watt (R28)	.15
12286	Resistor—56,000 ohms, ½ watt (R30)	.20
14560	Resistor—100,000 ohms, ½ watt (R5, R12, R15, R42, R51)	.20
13698	Resistor—180,000 ohms, ½ watt (R43)	.20
12199	Resistor—270,000 ohms, ½ watt (R13, R16, R40, R46) (R46—Model U-130 only)	.20
12285	Resistor—470,000 ohms, ½ watt (R41)	.20
11397	Resistor—560,000 ohms, 1/10 watt (R27)	.15
12013	Resistor—1 meg., 1/10 watt (R10)	.15
13730	Resistor—1 meg., ½ watt (R1, R2, R23, R44, R47) (R47—Model U-130 only)	.20
30208	Resistor—1.2 meg., ½ watt (R45)—Model U-130 only	.20
12679	Resistor—2.2 meg., ½ watt (R6)	.20
14887	Retainer—Indicator pointer drive cord pulley retainer	.01
31233	Disc—Station selector rotor disc—mounts on rear of variable condenser shaft	1.16
31241	Screw—¼-20 headless, cone pointer set screw for flywheel	.02
4119	Screw—6-32 headless set screw for gear Stock No. 31239	.02
4669	Screw—No. 8-32 x ⅛ set screw for pulley Stock Nos. 31271 and 31272, and drum Stock No. 31273	.03
14350	Screw—No. 8-32 square head set screw for station selector rotor disc	.03
31364	Socket—Dial lamp socket	.20
13871	Socket—Magic Eye socket	.45
31347	Socket—Pickup input socket and bracket	.30
31251	Socket—Radiotron socket	.25
31365	Socket—Tuning indicator lamp insulated socket	.30
31242	Spring—Friction leather tension spring for flywheel	.01
13638	Spring—Indicator pointer drive cord, and variable condenser drum drive cord tension spring	.08
31232	Spring—Contact tip spring for station selector plunger	.01
12007	Spring—Retaining spring for adjustable core	.02
31230	Spring—Station selector plunger body spring	.01
31279	Spring—Tension spring for band indicator	.03
31313	Spring—Tension spring for push button switch latch bar	.06
31494	Spring—Variable condenser motor rotor adjustment bearing spring for 25 cycle models—Model U-130	.02
31493	Spring—Variable condenser motor rotor adjustment bearing spring for 50-60 cycle models—Model U-130	.02
31236	Support—Variable condenser drive gear mounting support and studs assembly	.65
31490	Support—Variable condenser motor mounting support and studs—25 cycle models only—Model U-130 only	.60
31245	Support—Variable condenser motor mounting support and studs—25 cycle models only—Models HF-2 and HF-4 only	.70
31489	Support—Variable condenser motor mounting support and studs—50-60 cycle models only—Model U-130	.35
31244	Support—Variable condenser motor mounting support and studs—50-60 cycle models only—Models HF-2 and HF-4 only	.45
31360	Switch—Pickup switch for mounting on push button switch (S7)	2.70
31312	Switch—Push button switch and bracket assembly	4.25
31247	Switch—Range switch (S1, S2, S3, S4)	2.20
31546	Tone Control and fidelity switch (R11, S8)	1.50
31565	Transformer—First i-f transformer (L14, L15, C70, C71, L16)	2.40
31551	Transformer—Second i-f transformer (L17, L18, L19, C72, C73)	2.40
31549	Transformer—Third i-f transformer (L26, L27, C17, C20)	2.10
31226	Transformer—Power transformer 105-125 volts, 25-60 cycle (T1)	13.00
31225	Transformer—Power transformer 105-125 volts, 50-60 cycle (T1)	8.50
31308	Transformer—Power transformer 105-130, 140-160, 200-250 volts, 50-60 cycle (T1)	13.85
31547	Volume Control and power switch (R9, S5)	2.00
	PICKUP AND ARM ASSEMBLIES Model U-130	
31162	Cable—Pickup arm lift cable and clips	.15
31156	Crystal—Pickup crystal cartridge and needle screw	4.25
31159	Pickup and arm complete	7.45
31160	Screw—Pickup needle screw	.12
31161	Shaft—Pickup pivot arm and shaft assembly	.45
	SPEAKER ASSEMBLIES (Speaker RL70F-6)	
13866	Cap—Dust cap for cone center	.03
11234	Coil—Field coil (L30)	3.85
11469	Coil—Hum neutralizing coil (L28)	.30
31275	Cone—Speaker cone and voice coil (L29)	1.75
31567	Plug—3-contact male plug for speaker	.15
31539	Plug—5-contact male plug for speaker	.25
31556	Speaker complete	13.45
31557	Transformer—Output transformer (T2)	3.35
14357	Washer—Spring washer to hold field coil securely	.06
	MISCELLANEOUS ASSEMBLIES	
31358	Button—Station selector push button	.15
13103	Cap—Pilot lamp cap—Model U-130 only	.15
31286	Carriage—Indicator pointer slide carriage—Model HF-2 only	.22
31456	Cover—8-protective covers for push button markers	.08
31540	Cushion—Chassis mounting cushion and screw assemblies sufficient for one chassis—Model U-130 only	.50
31541	Cushion—Motor plate mounting cushion and clamp assembly, sufficient for one instrument—Model U-130 only	.50
31562	Dial—Station selector dial scale and crystal—Models HF-4 and U-130 only	1.65
31363	Dial—Station dial scale and crystal—Model HF-2 only	1.65
31561	Escutcheon—Dial escutcheon less dial scale, and push buttons—Models HF-4 and U-130 only	2.60
31362	Escutcheon—Dial escutcheon less dial scale, and push buttons—Model HF-2 only	2.65
30698	Hinge—Cabinet lid hinge—Model U-130 only	.95
4585	Hinge—Door hinges (1 top and 1 bottom) sufficient for one door—Model HF-4 only	.60
31564	Holder—Needle card holder—Model U-130	.50
31560	Indicator—Station selector indicator pointer and carriage assembly—Models HF-4 and U-130	.40
31284	Indicator—Station selector indicator pointer—less carriage—Model HF-2 only	.35
31355	Knob—Station selector, volume control, tone control, or range switch knob	.12
31458	Marker—"Dial Tuning" push button marker	.01
31457	Marker—"Record Player" push button marker	.01
31589	Marker—Station call letter push button markers	.35
31566	Pull—Door pull—Model HF-4 only	.60
31287	Rod—Indicator pointer slide rod	.15
31285	Screen—Dial color screen—Model HF-2 only	.75
31559	Screen—Dial color screen—Models HF-4 and U-130 only	.65
4560	Screw—Chassis mounting screw, washer, and lockwasher (4 required)—Models HF-2 and HF-4 only	.06
31558	Spring—Indicator pointer slide stop spring	.02
14270	Spring—Retaining spring for knob Stock No. 31355	.05
31478	Support—Cabinet lid support—Model U-130 only	2.20
31470	Suspension—Motor board suspension springs, screw, and lockwasher (4 required)—Model U-130 only	.10
	ANTENNA ASSEMBLIES	
31426	Counterpoise Line—Additional length 60 ft. long	1.35
12426	Insulator—Strain and counterpoise insulator	.05
9816	Transmission Line—Additional length 60 ft. long	1.50
	MOTORBOARD ASSEMBLIES Model U-130	
31149	Base—Tone arm mounting base	.35
31152	Board—Record changer base complete with all welded and riveted posts and bearings—less all operating parts	7.90
14209	Bumper—Main lever rubber bumper (1)	.08
9848	Cup—Used needle cup, rest, and lid complete	.75
31148	Escutcheon—Index escutcheon	.40
31151	Guide—Pickup lift cable guide (Coil spring, 80T 2-in. large) (2)	.10
31150	Mounting—Pickup arm base rubber mounting complete	.45
31155	Spring—Needle cup lid tension spring	.04
	OPERATING MECHANISM Model U-130	
31134	Bracket—Pickup locating lever mounting bracket (3)	.30
31144	Cam—Cam and gear assembly (4)	2.80
6808	Clutch—Trip lever friction clutch assembly (5)	.35
31146	Coupling—Motor coupling complete with turntable drive gear, rubber strips, motor coupling, and drive arm (6)	1.80
31129	Cover—Cap for top of record post	.45
31116	Finger—Trip lever friction finger assembly (7)	.45
31119	Gear—Long arm and rack gear for front left-hand record post (8)	.60
31120	Gear—Short arm and rack gear for rear right-hand record post (9)	.5[illegible]
31121	Gear—Record post gear (10)	.90
31123	Guide—Main lever spring guide (11)	.40
31114	Lever—Index lever assembly (12)	.75
31137	Lever—Index lever tension spring lever (13)	.30
31138	Lever—Locating lever and pawl assembly (14)	.70
31113	Lever—Main lever assembly (15)	1.35
31140	Lever—Pickup lift cable lever and spring assembly (16)	.55
31135	Lever—Pickup locating lever assembly (17)	.85
31130	Lever—Record separator elevating lever complete with adjustment screws (18)	.80
31132	Lever—Trip detaining lever (19)	.30
31115	Lever—Trip lever assembly (20)	1.85
31131	Lever—Trip regulator lever (21)	.25
31133	Pawl—Trip pawl assembly (22)	.80
31124	Pin—Record post drive pin (23)	.04
14207	Roller—Pickup lift cable roller and bracket assembly (24)	.55
31118	Screw—Cone pointed set screw for trip lever hub or record post shelf	.06
4563	Screw—Pickup lift cable screw and nuts	.04
14195	Screw—Set screw for flexible coupling	.05
31117	Screw—Special screw to adjust friction clutch tension	.03
31126	Separator—Record separator knife (25)	.75
31122	Shaft—Record separator post shaft (26)	.40
31125	Shelf—Record post shelf assembly (27)	1.25
31141	Spindle—Turntable spindle shaft and spring	1.40
3676	Spring—Cam pawl tension spring on main gear (12 turns, .190-in. O.D., 43/64-in. lg.)	.04
14190	Spring—Pickup locating lever short spring or locating lever pawl tension spring (28) (16 turns, .180-in. O.D., 19/32-in. lg.)	.08
31145	Spring—Main lever tension spring (29) (18 turns, 9/16-in. O.D., 3-in. lg.)	.05
31136	Spring—Pickup locating lever long spring or index lever tension spring (30) (25 turns, .190-in. O.D., 15/16-in. lg.)	.05
3666	Spring—Pickup lift cable tension spring (31) (20 turns, .195-in. O.D., 1-in. lg.)	.04
31127	Spring—Record separator pressure spring (32) (8 turns, ⅜-in. O.D., ½-in. lg.)	.02
14191	Spring—Trip detaining lever or locating lever tension spring (33) (15 turns, .190-in. O.D., ¾-in. lg.)	.04
31142	Spring—Turntable spindle spring	.03
31147	Strip—Complete set of rubber strips for flexible coupling	.40
31139	Turntable Assembly—less spindle	3.35
31128	Washers—"C" washer for top of record post	.04
31143	Washers—Turntable thrust washers (1 steel, 1 bronze, 1 felt)	.15
	MOTOR ASSEMBLIES Model U-130	
11703	Governor—Motor speed governor	3.05
31448	Motor—105-125 volts, 25 cycle (M2)	23.70
31163	Motor—105-125 volts, 50-60 cycle (M2)	20.50
31157	Motor—105-125 volts, 60 cycle (M2)	17.75
30870	Plug—2-contact male plug for motor power cable	.35
31447	Screw—Complete set of motor mounting screws, washers, and spacers—for 25 cycle models only	.40
31158	Screw—Complete set of motor mounting screws, washers, and spacers—for 50-60 cycle models only	.25
14206	Switch—Motor toggle switch (S7)	.90

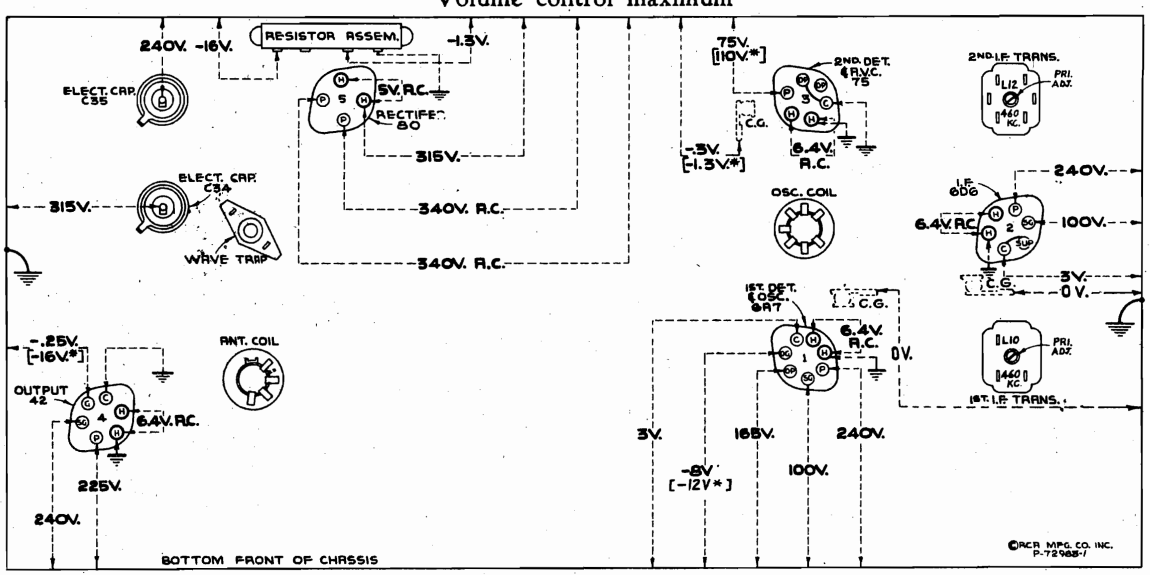

Figure 6—Radiotron Socket Voltages, Coil and Trimmer Locations.

Measured at 115 volts, 60-cycle supply—Tuned to approximately 1,000 kc ("Standard broadcast")—Radio-Phono "Radio"—No signal being received—Volume control minimum

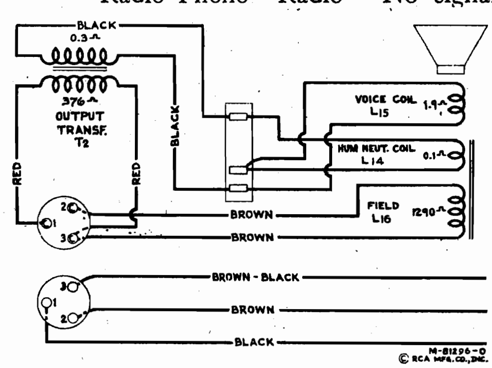

Figure 4—Loudspeaker Wiring

Note: Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.

Radiotron Plate Current Readings

Measured with Milliammeter Connected at Tube Socket Plate Terminals Under Conditions Similar to Those of Voltage Measurements

Alignment Procedure

There are five alignment trimmers provided in the antenna transformer and oscillator coil tuned circuits. The i-f transformer and wave-trap adjustments are made by means of screws attached to molded magnetite cores. All of these circuits have been accurately adjusted during manufacture and should remain properly aligned unless affected by abnormal conditions or altered during servicing. Loss of sensitivity, improper tone quality, and poor selectivity are the usual indications of improper alignment.

The correct performance of this receiver can only be obtained when the aligning has been done with adequate and reliable apparatus. The manufacturer of this receiver has available for sale, through its distributors and dealers, a complete assortment of such service equipment as may be needed for the alignment operation.

A test oscillator, such as the **RCA Stock No. 9595**, is required as a source of the specified alignment frequencies. Visual indication of receiver output during the adjustment is necessary and should be accomplished by the use of an indicator such as the **RCA Stock No. 4317 Neon Output Indicator.**

During alignment, the Radio–Phono control should be thrown to "Radio" position. The procedure outlined below should be followed in adjusting the various trimmer capacitors and molded cores:

I-F Adjustments

The four adjustment screws (attached to molded **magnetite cores**) of the two i-f transformers (one on **top** and one on bottom of each i-f transformer) are **located** as shown by figures 3 and 6. Each circuit must be aligned to a basic frequency of **460 kc.** To do this, attach the output indicator across the loudspeaker voice coil.

Connect the output of the test oscillator to the control grid of the RCA-6A7 through a **.001 mfd.** capacitor. Connect the test oscillator **"Gnd"** terminal to the ground terminal of the receiver chassis. Tune the oscillator to **460 kc.** Advance the receiver volume control to its full-on position and adjust the receiver tuning control to a point, within its range, where no interference is encountered from local broadcast stations or from the local (heterodyne) oscillator. To eliminate signals from the local oscillator short stator of C6 to chassis-ground. Increase the output of the test oscillator until a slight indication is present on the output indicator. Adjust the two magnetite core screws of the second i-f transformer L13 and L12 to produce maximum (peak) indicated receiver output. Then adjust the two magnetite core screws L11 and L10 of the first i-f transformer for maximum (peak) receiver output as shown by the indicating device. During these adjustments, regulate the test oscillator output so that the indication is always as low as possible. By doing so, broadness of tuning due to a.v.c. action will be avoided. It is advisable to repeat the adjustment of all i-f magnetite core screws to assure that the interaction between them has not disturbed the original adjustment. Remove temporary chassis-ground jumper from stator of C6.

R-F Adjustments

Calibrate the tuning dial by adjusting the scale pointer to the extreme end calibration mark (beyond 55 on dial) while the two-gang tuning condenser plates are in full mesh.

Wave-Trap Adjustment

Attach the output of the test oscillator to the receiver "Antenna" terminal through a **200 mmfd. (important)** capacitor. The ground connections remain connected together. Leave the test oscillator tuned to **460 kc.** Adjust range selector to "Short wave" (C) position. Then adjust the wave-trap screw to the point which causes maximum suppression (minimum received) of the **460 kc** signal.

"Standard Broadcast" Band

(a) Adjust range selector to "Standard broadcast" (A) position. Reduce output of test oscillator to a minimum. Tune the test oscillator to **600 kc** and set receiver dial pointer to **600 kc.** Adjust output of test oscillator until a slight indication of output is visible.

(b) Adjust the oscillator magnetite core screw **L8** (top of oscillator coil) so that maximum (peak) indicated output results.

(c) Set receiver dial pointer to **1,700 kc.** Tune the test oscillator to **1,700 kc.** Carefully adjust the oscillator and antenna trimmers **C25** and **C4** respectively so that each brings about maximum (peak) indicated output.

(d) Tune the test oscillator to **600 kc.** Adjust the receiver to pick up this signal disregarding the dial reading at which it is best received. Adjust oscillator magnetite core screw **L8** (top of oscillator coil) for maximum (peak) output while rocking gang tuning condenser. After completing this adjustment, the trimmers **C25** and **C4** should be re-adjusted as in (c) to correct for any change in the oscillator high-frequency tuning which has been caused by the preceding adjustment.

"Short-Wave" Band

(e) Connect the "Ant." output of the test oscillator to the "Antenna" terminal through a **300-ohm** resistor, leaving the "Gnd." of the oscillator connected to the receiver chassis.

(f) Adjust range selector to its "Short wave" (C) position. Set receiver dial pointer to **20,000 kc.** Tune test oscillator to **20,000 kc.** Set oscillator trimmer **C26** to minimum capacity (plunger full out), and antenna trimmer **C3** to maximum capacity (plunger full in). Slowly push in oscillator trimmer **C26** until maximum (peak) output is reached. Two peaks may be found. Adjust **C26** to the peak with minimum capacity (plunger near out) for maximum indication. Tighten lock nut. Slowly pull out plunger of antenna trimmer **C3** until maximum (peak) indicated output is reached while slightly rocking the gang tuning condenser back and forth through the signal. Two peaks may be found with this circuit. The peak with maximum capacity (plunger near in) should be used. Tighten lock nut.

Phonograph Mechanism

The phonograph motor is of the synchronous type and designed to be simple and foolproof. Under normal operating conditions, service difficulties should be negligible. Occasionally, however, certain adjustments may be required. These adjustments are illustrated and explained in figure 7.

Centering Armature

Refer to figure 9 showing the pickup inner structure. The armature is shown in its proper relation to the magnet pole pieces, i. e., exactly centered. Whenever this centering adjustment has been disturbed it will be necessary to remove the pickup mechanism from the tone arm by removing the needle holding screw and the two mounting screws from the front of the tone arm, holding the pickup assembly to keep it from dropping. Unsolder the two leads from the lugs on the terminal board at the rear of the pickup. Insert a small rod or nail into the armature needle hole and replace the needle holding screw, tightening

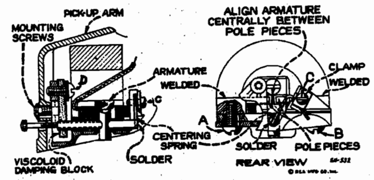

Figure 9—Details of Pickup

it to hold the rod securely. If the armature clamping screws A and B have not been disturbed, screw C should be loosened which will permit the armature to be moved from side to side, the rod acting as a lever to perform this operation. The proper adjustment is obtained when the armature is moved to the extreme position on each side (the movement being limited by the armature striking the pole pieces) and then brought to the mid position between these two extremes. Screw C should then be tightened. The armature position should then be central between the pole pieces and at right angles to them. With a little practice, the correct adjustment of the armature will be obtained. The air gap between the pole pieces and the armature should be kept free from dust, filings, and other foreign material which would obstruct the movement of the pickup armature.

Damping Block

The viscoloid damping block which is attached to the front end of the armature shank serves as a mechanical filter to eliminate undesirable resonances and to cause the frequency response to be uniform. Should it be necessary to replace this damping block, the pickup mechanism should be removed from the tone arm as explained above. Unsolder the pickup coil leads from the two lugs on the pickup terminal board and remove the terminal board mounting screw and the terminal board. Then remove screw D and the damping block from the pickup assembly. Make sure that the shaft of the armature which contacts the viscoloid is clean. Then insert the new damping block so that it occupies the same position as that of the original block, and is in correct vertical alignment with the armature. The hole in the block is somewhat smaller than the diameter of the armature in order to permit a snug fit. With the damping block properly aligned on the armature, screw D with its washer should then be replaced. Heat should be applied to the armature (viscoloid side) so that the damping block will fuse at the point of contact and become rigidly attached to the armature.

Loudspeaker

Centering of the loudspeaker voice coil is made in the usual manner with three narrow paper feelers after first removing the front paper dust cover. This may be removed by softening its cement with a very light application of acetone, using care not to allow the acetone to flow down into the air gap. The dust cover may be cemented back in place with ambroid upon completion of adjustment.

REPLACEMENT PARTS

Stock No.	DESCRIPTION	List Price
	RECEIVER ASSEMBLIES	
13216	Board—Antenna and ground terminal board	$0.25
12717	Board—Phonograph terminal board	.22
5237	Bushing—Variable condenser mounting bushing assembly—Package of 3	.43
12118	Cap—Grid contact cap—Package of 5	.15
12714	Capacitor—Adjustable trimmer (C3, C4, C25)	.38
12807	Capacitor—Adjustable trimmer (C26)	.35
12973	Capacitor—5.6 Mmfd. (C24)	.20
12723	Capacitor—56 Mmfd. (C2)	.20

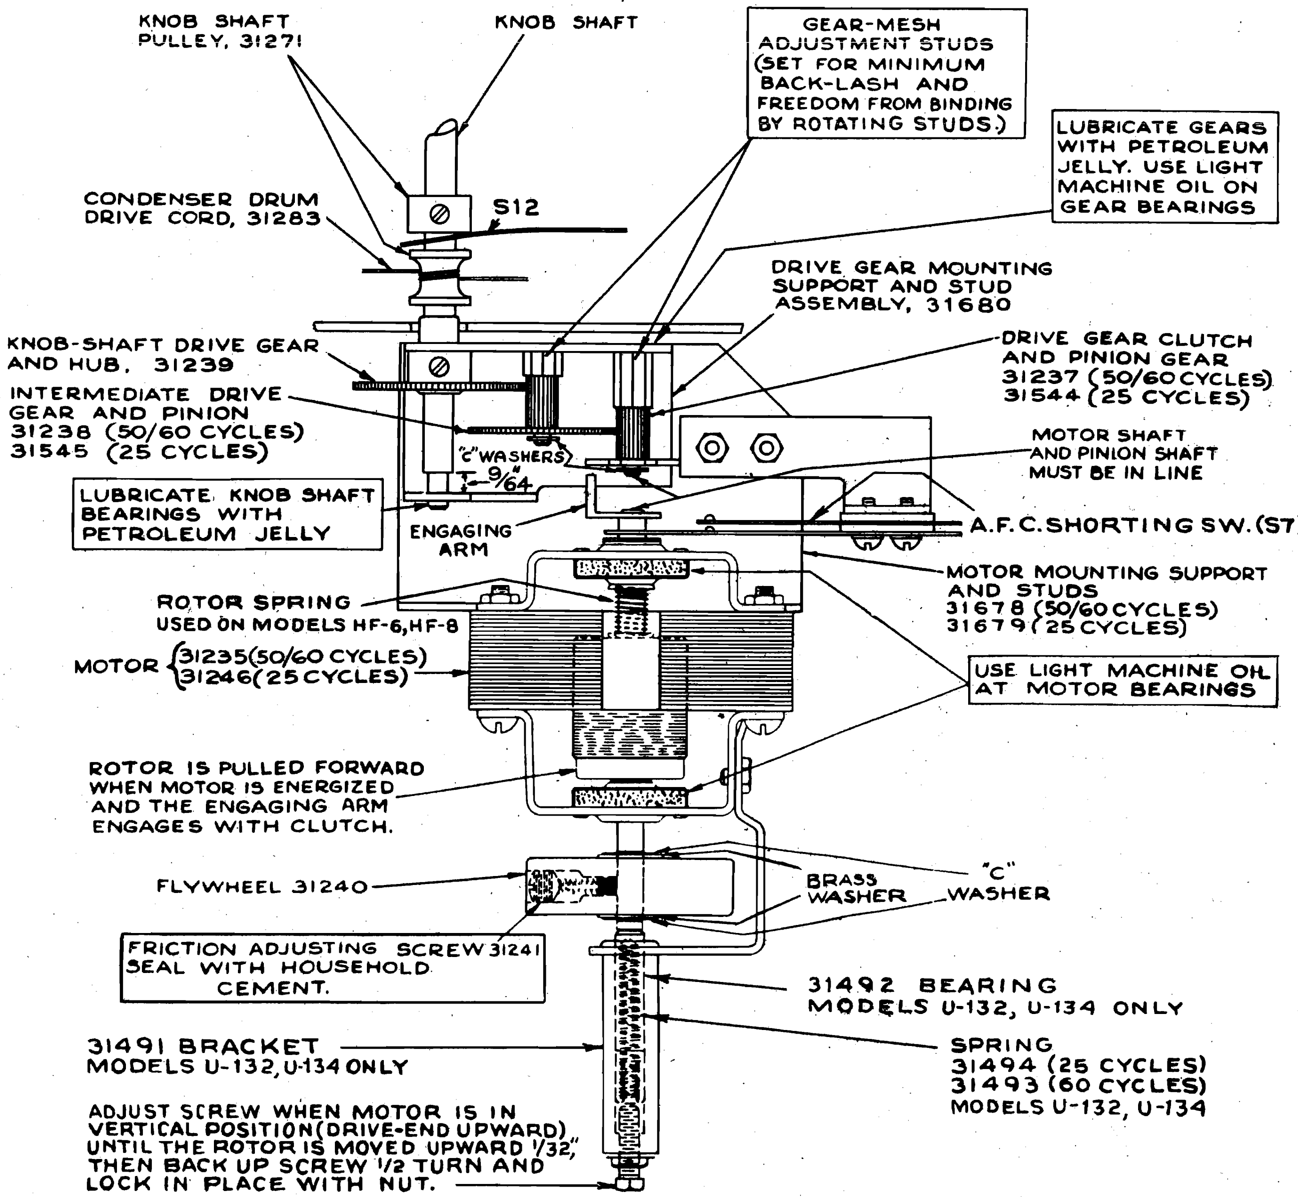
Motor, Gear Mechanism

RCA MFG. CO., INC.



Motor and Gear Mechanism

There must be 1/32-inch clearance between the end of the engaging arm and the face of the intermediate gear when the motor is in its full forward position.

Lubrication

Motor bearings and **gear bearings**; use light machine oil.

Gear faces; use "Pure Oil No. 611" or petroleum jelly.

Dial-indicator pulleys and **rails**; use "Castordag" or petroleum jelly.

Selector disc; apply ***thin*** film of petroleum jelly.

Friction leather on flywheel; apply "neats-foot" oil. When replacing leather, soak it for at least 24 hours in neats-foot oil, and insert in flywheel while dripping.

Adjustments

To adjust S12, loosen knob shaft pulley, and adjust it so that when shaft is pushed all the way in, the ends of the leaves of S12 will be deflected 1/32-inch from their original position. When tuning shaft is released, distance between contacts of S12 should be 1/32-inch.

S7 should be adjusted so that when motor is in its full forward or upward position, the ends of the leaves should be deflected 1/32-inch from their original position.

Miscellaneous Service Data

Antenna Connections

RCA Victor Master Antenna Kit.—Connect the twisted-pair transmission line to terminals A1 and A2 on the terminal board at rear of chassis. Connect the counter-poise to A3. Terminal G may be connected to ground, but this connection is not necessary for correct operation.

Noise-Reducing Adjustment.—After the RCA Victor Master Antenna Kit is connected to the receiver, tune the receiver to a point near 900 kc where no station is heard. Turn volume control clockwise until noise is heard. If no noise of a regular character is audible, start any brush-type motor-driven appliance, such as a vacuum cleaner, electric razor, refrigerator, etc., but do not bring it too near the receiver. This will generate noise as a continuous crackling, or buzz. Adjust C3 to a point where this noise is reduced to a minimum.

Adjustment of the noise reducing trimmer C3 should be made in the customer's home, with the RCA Victor Master Antenna connected to the receiver.

This adjustment is effective only when the RCA Victor Master Antenna is used. **For all other types of antenna, the noise-adjustment trimmer should be screwed all the way down.**

Other Antennas.—Use terminals A1 and A3 on the receiver terminal board as antenna and ground connecting points respectively. Terminal A3 may be connected to terminal G, unless this causes interference, in which case this connection should be omitted.

Loudspeaker.—No attempt should be made to remove the aluminum cone cap of the loudspeaker cone. This is securely cemented to the cone, and any attempt to remove it may result in serious damage to the cone assembly. The cone must be centered by moving the cone in and out and getting the "feel" of the cone to find where it is rubbing against the pole pieces. The two screws holding the spider support are accessible from the rear of the speaker. By loosening these screws and moving the cone by hand, it is possible to center the cone satisfactorily. Another method, which may be used, is to connect speaker to receiver, feed a low frequency note of from 40-60 cycles into the audio input of the set, and turning up the volume control — move the spider support until no rattle is heard in speaker, with about 10 watts output. Replacement cones will have to be centered in the same manner, as the cone will be supplied with cone cap fastened securely in position.

NOTE.—Due to inverse feedback used on these models, it is very important to connect output transformers exactly as shown in the schematic diagram.

Victrola Attachment.—A jack located on one side of the chassis is provided for connecting a Victrola Attachment into the audio-amplifying circuit on Models HF-6 and HF-8. The cable running from the Victrola Attachment should be terminated in a Stock No. 31048 plug to fit the jack.

General Description

Model HF-8 is a sixteen-tube "Magic Brain" superheterodyne receiver mounted in a handsomely styled Eighteenth Century type cabinet. The cabinet may be made of either of two kinds of woods, walnut veneer or mahogany. Features of design include: "Electric Tuning" for eight broadcast stations; Victrola attachment jack and push-button switch; magnetite-core tuned, i-f and oscillator coils; temperature stabilized capacitors: four short-wave broadcast spread bands; complete short-wave coverage with two complete short-wave bands; automatic volume control; aurally compensated volume control; "local," "distance," seven point high-fidelity and high frequency tone, control; low frequency tone control; 12 inch, triple-cone, high fidelity speaker; remote control armchair attachment; automatic frequency control with "Electric Tuning" and manual tuning; illuminated band indicator; noise reducing adjustment on "A" band; wave trap; "Magic Eye" tuning tube; 10 kc whistle filter; audio phase inverter; push-pull beam power output; and "Electrical Magic Voice."

Model HF-6 is a fourteen-tube "Magic Brain" superheterodyne receiver, mounted in a "Console Grand" cabinet of handsomely matched walnut veneers. Features of design are the same as the Model HF-8, except beam power output is replaced by push-pull pentode output; and two less tubes are used.

Model U-134 RCA Victrola is a combination radio receiver and phonograph mechanism mounted in an Eighteenth Century styled cabinet made of either superbly matched walnut veneers, or fine grain mahogany. The radio receiver is identical with that of the Model HF-8. The phonograph turntable is of a new design, and may be played manually or automatically. In manual operation, one 10-inch or one 12-inch record may be played at a time. In the automatic position, eight 10-inch, or seven 12-inch records may be played in succession. The pickup is automatically "shorted out," when placed on the pickup rest.

Model U-132 RCA Victrola is a combination radio receiver and phonograph mechanism mounted in a handsome, matched Eighteenth Century styled cabinet of walnut veneer. The radio receiver is the same as that of Model HF-6, and the turntable mechanism is the same as in Model U-134.

With the unusual characteristics of the instruments described above, naturally, as with other high quality, high fidelity instruments, proper operation is important for maximum satisfaction. The proper use of the Fidelity and tuning controls insures the ultimate in radio entertainment. The Fidelity control has seven positions, the purpose of which is fully explained in the table. In the full range position the reproduction is faithful from 40 to 7,500 cycles. A special filter is employed in the plate circuit of the first audio amplifier to reduce 10 kc whistle.

In the majority of cases, the high fidelity positions of the control, positions 5, 6, and 7, may be used on local stations to give true response of the broadcast program. However, on distant broadcast, or short wave stations, the receiver should be operated with the Fidelity control in 1, 3, or 4 position to eliminate cross talk, monkey chatter, and any other adjacent-channel interference.

The tuning control has a special function used in conjunction with the Fidelity control. When the tuning knob is pushed in, and the Fidelity control is in position No. 2, the i-f response of the receiver will return to its maximum selectivity position. Releasing the tuning knob will broaden the i-f channel as shown in the table. When the Fidelity control is in position No. 3 or 4, and Tuning control is pushed in, the AFC system will be rendered inoperative. With Fidelity control in No. 5, 6, or 7 position, pushing in Tuning control returns i-f channel to a sharp selectivity position, and renders AFC system inoperative. This function of the tuning control should be used when tuning in local, or medium-distant stations, manually. For distant stations, Fidelity control should be in No. 1 or No. 2 positions.

On Models U-132, U-134, the Fidelity control is also operative while records are being played—thus giving full Fidelity control, as desired, by changing response of audio amplifying system.

Electric Tuning Mechanism

The circuit of the electric tuning mechanism is shown in the schematic diagram, and the mechanical details are illustrated below.

The action can be understood by following a cycle of operation:

When a station button is pushed in, it completes the 24-volt circuit through the corresponding station-setting contact and one-half of the brass selector disc, which is connected to one side of the motor field coil. This energizes the motor, and the rotor is pulled forward, engaging with the gear train that drives the tuning condenser and selector disc. The condenser and disc rotate until the insulation line comes under the particular station-setting contact, and the motor circuit is broken. Inertia carries the insulation line past the station-setting contact which then makes contact to the other half of the disc: This completes the circuit to the other side of the motor field coil, causing the motor to reverse. The floating flywheel is still turning in the original direction and therefore slows down the reversal movement of the motor; as a result the selector disc is moved slowly back until the insulation line is under the station-setting contact, when the circuit is broken and the mechanism stops.

Muting Circuit

When the electric tuning mechanism is in action, the motor-supply voltage is fed into a diode rectifier circuit which applies a high bias to last I-F tube, 1st audio, 2nd audio and inverter tubes. This prevents audio amplification and makes the set quiet or "mute" while the mechanism is operating.

Adjustment of Flywheel Friction

In normal operation, the motor drives the tuning condenser and selector disc until the insulation line just passes the particular station-setting contact: The motor then reverses and moves the disc slowly in the opposite direction until the insulation line is under the contact, and the mechanism stops.

In some cases, particularly with high line-voltage, the disc may make two or three reversals before stopping.

The flywheel friction adjustment screw should be set to give the least number of reversals with the chassis in normal operating position.

Adjustment of Selector Disc

The brass selector disc is fastened to the rear shaft of the tuning condenser by means of two set-screws. When the condenser is at maximum (plates fully meshed) the insulation line should be horizontal, with the operating-end at the left (viewed from rear). The operating-end has dark insulating material and the brass is beveled at this end.

The selector disc should be set so that the contact-tip plungers in the station-setting contacts project not more than 1/16-in. from the body of the contacts.

Armchair Control Unit

When a Model G8A Armchair Control is connected to the receiver, as shown, it duplicates the action of the push buttons on the front panel, when "Dial or Remote" button is pushed in. The center lead of the remote control cable is connected to the terminal on the frame of the selector mechanism. The other leads are connected to corresponding station-setting contacts.

In operating the G8A Armchair Control, the push button must be held down until the station has been tuned in. Care must be taken not to hold two of the station buttons down at one time as both windings of the motor may be engaged simultaneously causing the motor to be inoperative and overheated.

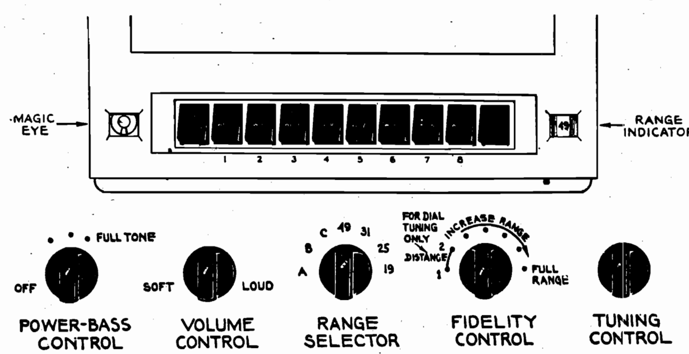
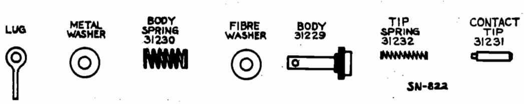
ADJUSTMENTS FOR ELECTRIC TUNING



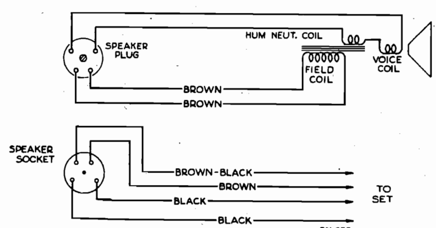
Location of Controls

The left-hand push-button is a Victrola-Attachment switch. The right-hand push-button is for dial tuning.

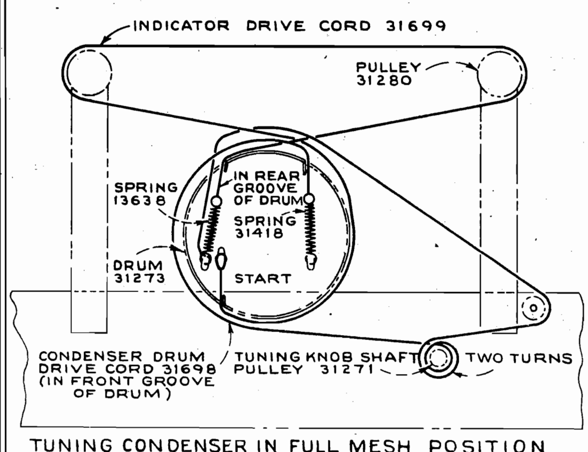
1. Make a list of the desired eight stations, arranged in order from low to high frequencies.
2. Turn **range selector to "A" band, turn power on, and allow a few minutes for warming up.**
3. Turn Fidelity Control maximum counter-clockwise.
4. Press down the "dial-tuning" (right hand) button.
5. Manually tune in the first station on the list, using the "Magic Eye" for accurate tuning.
6. Hold down the "dial-tuning" button, and press down station button No. 1 (second from left). Both buttons will stay down, central dial lamp will light brightly or dully, depending on which side of disc, the contact is. Move station-setting contact No. 1 to the insulating line on the disc at rear of gang. When the contact is correctly centered on the insulating line, the central dial lamp will go out.
7. Press down any other button in order to release the dial-tuning button and station button No. 1. Then press down station button No. 1 again. The electric tuning mechanism will function to tune in the station, and the central dial lamp will stay on.
8. Repeat this process for the remaining stations.

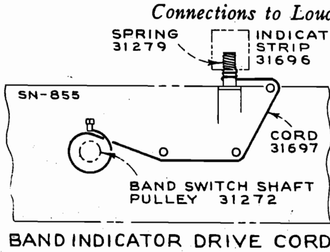


Component Parts of Station Setting Contacts



Connections to Loudspeaker





Note: Tuning Mechanism of Model HF-6 is similar to this shown, except Indicator drive cord is Stock No. 31281.

ALIGNMENT PROCEDURE

Alignment using the Cathode Ray Oscillograph is much the preferable method because of the variable selectivity features of these instruments. The curves shown below, illustrate the general shape of the i-f selectivity curves for different settings of the Fidelity control, when i-f channel is properly aligned. Connections for the oscillograph are shown in the top view of the receiver chassis. Use short, unshielded leads to oscillograph, and well-shielded leads from test oscillator. If possible, use 30 or 40 kc sweep frequency for i-f alignment.

Output Meter Alignment.—If this method is used, connect meter across voice coil, and turn receiver volume control to maximum. Disregard steps 4 and 7 of alignment table given below. However, a listening check should be made to check operation of Fidelity control, after receiver has been aligned.

Test Oscillator.—For all alignment operations connect the "Gnd" side of test oscillator to chassis, the high side as indicated in table, and keep output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment, therefore a calibration scale is attached to the rear of the indicator-drive-cord drum which is mounted on the front shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The "0" mark on the drum scale must be vertical, and directly over the center of the gang-condenser shaft when the plates are fully meshed. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

To determine the corresponding frequency for any setting of the calibration scales, refer to the accompanying drawing which shows the dial with 0-180° calibration scales drawn at top and bottom.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by f. tening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "0" mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator at the 530 kc mark, and gang condenser fully meshed. The indicator has a spring clip for attachment to the cable.

Spread-Band Alignment.—The most satisfactory method of aligning or checking the spread-band ranges is on actual reception of short-wave stations of known frequency, by adjusting the magnetite-core oscillator coil for each band so that these stations come in at the correct points on the dial.

In exceptional cases, when the set is being serviced in a location where the noise level is high enough to prevent reception of short-wave stations, a test-oscillator may be used for alignment, but an extremely high degree of accuracy is required in the frequency settings of the test-oscillator, as a slight error will produce considerable inaccuracy on the spread-band dials. The frequency settings of the test-oscillator may be checked by one or both of the following methods:

1. Determine the exact dial settings of the test-oscillator (for frequencies at or close to the specified alignment frequencies) by zero-beating the test-oscillator against short-wave stations of known frequency.
2. Use harmonics of the standard-broadcast range of a test-oscillator, first checking the frequency settings on this range by means of a crystal calibrator (RCA Stock No. 9572), or by zero-beating against standard broadcast stations.

When a test oscillator is employed for spread-band alignment, a final check should be made on actual reception of short-wave stations of known frequency, and the magnetite-core oscillator coil for each band should be re-adjusted sc that the stations come in at the correct points on the dial.

For additional information, refer to booklet "RCA Victor Receiver Alignment."

Using RCA Stock No. 150 Test Oscillator.—When using this oscillator for spread-band alignment, insert an open-circuit plug in the "EXT. MOD." jack, and set the test-oscillator dial 800 kc lower than the desired frequency for the four lower frequency ranges, and 800 kc higher than the desired frequency for the two high ranges. This provides an unmodulated signal of the desired frequency and the magic eye may be used as an output indicator for this unmodulated signal.

Precautionary Lead Dress

1. C-31, C-32, C-33, C-35, C-36, C-40 should be connected with as short leads as possible.
2. "Osc. Control" grid lead should be dressed away from the high side of "A" Band Oscillator trimmer.
3. The lead from "A" Band R-F Coil to the R-F Tube should be dressed away from chassis and shield.
4. Lead from "A" to "C" Band Antenna Coils should be dressed away from the shield.
5. The antenna leads inside the chassis should go directly to the terminals to which they connect.
6. The lead from the rectifier tube to the first filter capacitor should be dressed away from the Victrola connection.
7. The leads to the push-button switches should be dressed away from the Victrola switch, and its associated parts.
8. The output transformer primary leads should be dressed down to the chassis.
9. The 2nd Detector Diode lead should be dressed away from the lead to the discriminator diode. This latter lead should be dressed down to the chassis.

Additional Critical Leads—Models HF-6, U-132

10. Dress Pilot Light leads away from 6R7 grid cap.

Additional Critical Leads—Models U-132, U-134

11. R-103 and R-102 should be dressed away from each other.

					Turn Fidelity Switch Clockwise to position No. 7	8
8	Turn Fidelity Control to maximum counter-clockwise (No. 1) position.					
9	A2 in series with 100 mmf, A1 to Gnd.	600 KC	"A"	600 KC 29°	L30, osc.	*NOTE: In Step 19 only, oscillator tracks on low side of signal; use maximum inductance peak (plunger in) if two peaks can be obtained. All other oscillator trimmers use minimum, inductance or capacity peak (plunger out), if two peaks can be obtained.
10	A2 in series with 100 mmf, A1 to Gnd.	1,500 KC	"A"	1,500 KC 152.5°	C30, osc.; C5, ant.; C9, det.	
11	A2 in series with 100 mmf, A1 to Gnd.	455 KC	"A"	600 KC 29°	L14, wave trap *Minimum output*	
12	A2 in series with 100 mmf, A1 to Gnd.	6,100 KC	"B"	6,100 KC 147°	C42, osc.; C2, ant.	
13	A2 in series with 100 mmf, A1 to Gnd.	2,440 KC	"B"	2,440 KC 15°	L27, osc.	
14	A2 in series with 100 mmf, A1 to Gnd.	6,100 KC	"B"	6,100 KC 147°	C42	
15	A2 in series with 47 ohms, A3 to Gnd.	20,000 KC	"C"	20,000 KC 156°	C27, osc.; C1, ant.	
16	A2 in series with 47 ohms, A3 to Gnd.	9,600 KC	"C"	9,600 KC 57°	L28, osc.	
17	A2 in series with 47 ohms, A3 to Gnd.	20,000 KC	"C"	20,000 KC 156°	C27, osc.	
18	A2 in series with 47 ohms, A3 to Gnd.	9,600 KC	"31M"	9,600 KC 99°	L26, osc.; C7, ant.; C13, det.	
19*	A2 in series with 47 ohms, A3 to Gnd.	6,100 KC	"49M"	6,100 KC 103°	C41, osc.	
20	A2 in series with 47 ohms, A3 to Gnd.	11,800 KC	"25M"	11,800 KC 90°	L25, osc.	
21	A2 in series with 47 ohms, A3 to Gnd.	15,200 KC	"19M"	15,200 KC 79°	L24, osc.	
22	Proceed to A.F.C. discriminator adjustments.					

A. F. C. Alignment.—After receiver has been fully aligned, turn Fidelity control to No. 1 position, tune in a station of medium signal strength in the neighborhood of 550-650 kc, or, if it is necessary to use a local station for this signal, cut down length of antenna so that signal is about medium strength. Carefully tune in the station using the "Magic Eye" as an indicator. Tune test oscillator to 455 kc, turn output to maximum, and "Modulation" off. Connect "Gnd" side of test oscillator to chassis, and bring the lead from the high side of test oscillator near the grid lead of 1st detector, 6L7 tube, until a beat note can be heard in the loudspeaker. Do not bring lead any closer than 1 inch to grid lead of 6L7, or detuning of circuit will result, and the adjustment will not be accurate.

Adjust frequency of test oscillator till beat-note heard in loudspeaker is at zero-beat. Turn Fidelity control to No. 3 position, and a beat note will again be heard. Adjust trimmer, L32, bottom of 4th i-f transformer, till beat note heard is again at zero-beat. Turn Fidelity control to No. 1 position, and check for zero-beat. When properly adjusted turning Fidelity control from No. 1 to No. 3 position should not affect zero-beat.

With Fidelity control in No. 1 position, tune receiver off resonance. Turn Fidelity control to No. 3 position—station should "fall" into resonance due to A. F. C. action. Push in Tuning Control Shaft without turning it—station should again be off resonance as originally tuned.

RCA MFG. CO., INC.

Parts List

STOCK No.	DESCRIPTION	Unit List Price
	RECEIVER ASSEMBLIES	
31492	Bearing—Variable condenser motor rotor adjustment bearing—less bracket and cup assembly—Models U-132 and U-134 only	.10
31253	Board—Antenna-ground terminal board—Models HF-6 and HF-8 only	.25
31752	Board—Antenna-ground terminal board—Models U-132 and U-134 only	.25
31276	Bracket—Band indicator mounting bracket—less band indicating strip, cord, and tension spring	.40
31491	Bracket—Bracket and bearing cup for variable condenser motor rotor adjustment—Models U-132 and U-134 only	.45
31282	Bracket—"Magic Eye" bracket and clip	.22
31712	Cable—3-conductor shielded fidelity switch cable	.85
31711	Cable—4-conductor shielded fidelity switch cable	.90
31710	Cable—Low capacity phono. cable	1.35
31715	Cable—Push-button switch-to-selector contacts cable	1.45
30766	Cap—Shield cap for "Magic Eye"	.15
12607	Cap—Top shield cap for first, second, or fourth i-f transformer	.20
12807	Capacitor—Adjustable trimmer, 2-8 mmfd. (C27, C30)	.45
12884	Capacitor—Adjustable trimmer, 2-20 mmfd. (C7, C13, C41, C42)	.60
31292	Capacitor—Dual adjustable trimmer, 3-30 mmfd. each section (C1, C2)	.40
14392	Capacitor—4.7 mmfd. (C68)	.35
31252	Capacitor—Adjustable trimmer, 5-80 mmfd. (C3)	.25
13001	Capacitor—8.2 mmfd. (C14)	.35
31709	Capacitor—10 mmfd. (C35)	.40
12896	Capacitor—15 mmfd. (C45)	.35
31707	Capacitor—25 mmfd. (C31)	.70
13141	Capacitor—47 mmfd. (C79)	.35
12723	Capacitor—56 mmfd. (C17)	.35
31705	Capacitor—62 mmfd. (C33)	.30
12813	Capacitor—82 mmfd. (C104)—Models U-132 and U-134 only	.35
31270	Capacitor—100 mmfd. (C25, C49)	.35
12720	Capacitor—100 mmfd. (C15)	.35
31706	Capacitor—120 mmfd. (C40)	.25
12724	Capacitor—120 mmfd. (C12, C34)	.35
31757	Capacitor—120 mmfd. (C24, C48, C50)	.35
31708	Capacitor—155 mmfd. (C32)	.30
13003	Capacitor—180 mmfd. (C6, C10, C16)	.35
12952	Capacitor—330 mmfd. (C59, C60)	.35
31756	Capacitor—330 mmfd. (C18, C19, C20, C21)	.35
30433	Capacitor—470 mmfd. (C29)	.35
31702	Capacitor—560 mmfd. (C38)	.50
31703	Capacitor—2,500 mmfd. (C37)	.50
31704	Capacitor—8,000 mmfd. (C36, C43)	.60
5107	Capacitor—.0025 mfd. (C63, C105)—C105 in Models U-132 and U-134 only	.20
30303	Capacitor—.0035 mfd. (C100)—Models U-132 and U-134 only	.40
4838	Capacitor—.005 mfd. (C52, C56)	.25
14393	Capacitor—.01 mfd. (C22, C55, C67, C74, C101)—C101 in Models U-132 and U-134 only	.30
11315	Capacitor—.015 mfd. (C53, C54, C69)	.20
30938	Capacitor—.025 mfd. (C58, C73, C102)—C102 in Models U-132 and U-134 only	.20
4886	Capacitor—.05 mfd. (C28)	.20
30882	Capacitor—.05 mfd. (C44, C70)	.20
4839	Capacitor—0.1 mfd. (C26, C46, C11, C47)	.30
30899	Capacitor—0.1 mfd. (C71)	.30
30965	Capacitor—0.25 mfd. (C56, C72, C23, C57, C80)—C80 used in Models HF-6 and U-132 only	.30
31701	Capacitor—0.5 mfd. (C51, C81)	.35
11203	Capacitor—10 mfd. (C75, C76)—Models HF-8 and U-134 only	1.15
14377	Capacitor—16 mfd. (C77)	.95
5212	Capacitor—16 mfd. (C78)—Models HF-6 and HF-8 only	1.35
31751	Capacitor—16 mfd. (C78)—Models U-132 and U-134 only	1.10
14531	Capacitor—25 mfd. (C75)—Model HF-6 only	1.55
31753	Capacitor—25 mfd. (C75)—Model U-132 only	1.35
31544	Clutch—Variable condenser drive gear clutch and pinion gear—for 25-cycle models only	.45
31237	Clutch—Variable condenser drive gear clutch and pinion gear—for 50/60-cycle models only	.35
31669	Coil—"A" band antenna coil (L7, L8)	.95
31689	Coil—"A" band oscillator coil (L29, L30)	.55
31672	Coil—"A" band r-f coil (L12, L13)	1.25
31670	Coil—"B" band antenna coil (L5, L6)	.70
31690	Coil—"B" and 49-meter band oscillator coil (L27)	.50
14952	Coil—"B" band r-f coil (L11)	.80
31671	Coil—"C" band antenna coil (L3, L4)	.70
12486	Resistor—560,000 ohms, ¼ watt (R18, R30)	.20
30963	Resistor—820,000 ohms, ¼ watt (R100)—Model U-132 only	.20
12013	Resistor—1 meg., 1/10 watt (R32)	.15
13730	Resistor—1 meg., ¼ watt (R1, R2, R5, R13, R29, R44)	.20
5028	Resistor—1.8 meg., ¼ watt (R103)—Model U-134 only	.20
12201	Resistor—1.5 meg., ¼ watt (R100)—Model U-134 only	.20
30208	Resistor—1.2 meg., ¼ watt (R101, R102)—Models U-132 and U-134 only	.20
12679	Resistor—2.2 meg., ¼ watt (R20, R24, R103)—R103 in Model U-132 only	.20
14887	Retainer—Pointer drive cord pully retainer	.01
31233	Rotor—Selector rotor disc—mounts on rear of variable condenser shaft	1.16
31241	Screw—¼-20 x 3/16-in headless, cone point set screw for flywheel	.02
14350	Screw—No. 8-32 square head set screw for rotor, Stock No. 31233	.03
5042	Screw—No. 8-32 x ¼-in. headless set screw for pulley, Stock No. 31271	.03
4669	Screw—No. 8-32 x ⅜-in. square head set screw for pulley, Stock No. 31272, and drum, Stock No. 31273	.03
4119	Screw—No. 8-32 x ¼-in. headless set screw for gear, Stock No. 31239	.02
31681	Shaft—Variable condenser drive knob shaft	.20
31364	Socket—Dial lamp socket—Models HF-6 and HF-8 only	.20
31255	Coil—"C" or 31-meter band oscillator coil (L26, L28)	.40
14953	Coil—"C" band r-f coil (L10)	.70
12819	Coil—Choke coil (L35)	.55
31688	Coil—19-meter band oscillator coil (L23, L24)	.45
31254	Coil—25-meter band oscillator coil (L25)	.40
31673	Coil—49-, 31-, 25-, and 19-meter bands antenna coil (L1, L2)	1.35
14954	Coil—49-, 31-, 25-, and 19-meter bands r-f coil (L9)	1.30
31676	Condenser—3-gang variable (C4, C5, C8, C9, C39)	7.05
31231	Contact—Contact tip for selector plunger	.06
31345	Contact—Push-button switch contacts, comprising 10-contacts riveted on insulating strip	.70
31344	Contact—Push-button switch contacts, comprising 13-contacts riveted on insulating strip	1.20
31697	Cord—Band indicator drive cord	.20
31281	Cord—Pointer drive cord—Model HF-6 only	.50
31699	Cord—Pointer drive cord—Models HF-8, U-132 and U-134 only	.55
31698	Cord—Variable condenser drive cord	.20
31273	Drum—Variable condenser drive cord drum	.80
31686	Filter—10-kc filter (L33, L34, C61, C62, C64, C65)	3.50
31240	Flywheel—Variable condenser drive motor flywheel	.25
31239	Gear—Variable condenser knob shaft drive gear and hub	.65
31545	Gear—Variable condenser intermediate drive gear and pinion gear—for 25-cycle models only	.40
31238	Gear—Variable condenser intermediate drive gear and pinion gear—for 50/60-cycle models only	.50
31696	Indicator—Band indicator strip	.15
31480	Lamp—Electric Tuning adjustment indicator lamp	.20
11891	Lamp—Dial lamp	.17
31243	Leather—Friction leather for flywheel	.04
31346	Lock Plate—Push-button switch lock plate, comprising 10-contact locks in one strip	.80
31246	Motor—Variable condenser drive motor—for 25-cycle models only (M1)	6.50
31235	Motor—Variable condenser drive motor—for 50/60-cycle models only (M1)	4.85
12471	Plate—Mounting plate and rubber for cushion socket—less socket	.15
31227	Plate—Selector mounting plate and spacers—mounts on rear of variable condenser	.50
31228	Plate—Selector contact plate—less plungers	.45
31229	Plunger—Selector plunger—less contact tip and tip spring	.18
30868	Plug—2-contact female plug for motor power cable—Models U-132 and U-134 only	.35
5040	Plug—4-contact female plug for speaker cable	.30
14697	Pulley—Variable condenser drive cord intermediate pulley	.35
31280	Pulley—Indicator pointer drive cord pulley	.10
31272	Pulley—Range switch shaft pulley	.20
31271	Pulley—Station selector knob shaft pulley	.25
31693	Resistor—Voltage divider, comprising one 82-ohm, one 18-ohm, one 3,300-ohm, one 2,700-ohm, one 1,100-ohm sections (R39, R40, R41, R42, R43)—Models HF-8 and U-134 only	.90
31694	Resistor—Voltage divider, comprising one 165-ohm, one 25-ohm, one 6,000-ohm, one 4,100-ohm, and one 1,300-ohm sections (R39, R40, R41, R42, R43)—Models HF-6 and U-132 only	.90
13220	Resistor—56 ohms, ¼ watt (R45)	.20
14076	Resistor—820 ohms, ¼ watt (R12)	.20
14720	Resistor—1,000 ohms, ¼ watt (R7, R8, R14, R15)	.20
12194	Resistor—1,800 ohms, ¼ watt (R4)	.20
14559	Resistor—10,000 ohms, ¼ watt (R16)	.20
12695	Resistor—15,000 ohms, ¼ watt (R21)	.20
13998	Resistor—22,000 ohms, ¼ watt (R6)	.20
30492	Resistor—22,000 ohms, ¼ watt (R11, R26)	.20
12738	Resistor—27,000 ohms, ¼ watt (R22)	.20
12454	Resistor—33,000 ohms, ¼ watt (R10, R27)	.20
12412	Resistor—47,000 ohms, ¼ watt (R28)	.20
12286	Resistor—56,000 ohms, ¼ watt (R9)	.20
13715	Resistor—68,000 ohms, ¼ watt (R3)	.20
14560	Resistor—100,000 ohms, ¼ watt (R17, R34, R36, R38, R46)—R46 used in Models HF-6 and U-132 only	.20
13698	Resistor—180,000 ohms, ¼ watt (R33)	.20
12199	Resistor—270,000 ohms, ¼ watt (R25, R35, R37, R47)	.20
13479	Resistor—390,000 ohms, ¼ watt (R19)	.20
12285	Resistor—470,000 ohms, ¼ watt (R31)	.20
31365	Socket—Electric Tuning adjustment indicator lamp socket	.30
13871	Socket—"Magic Eye" socket	.45
14278	Socket—Phono. input socket	.25
31251	Socket—Tube socket	.25
31232	Spring—Contact tip spring for selector plunger	.01
13638	Spring—Pointer drive cord tension spring	.08
31230	Spring—Selector plunger body spring	.01
31279	Spring—Tension spring for band indicator	.03
31313	Spring—Tension spring for push-button switch latch bar	.06
31242	Spring—Tension spring for flywheel	.01
31418	Spring—Variable condenser drive cord tension spring	.05
31494	Spring—Variable condenser motor rotor adjustment bearing spring for 25-cycle models only—Models U-132 and U-134 only	.02
31493	Spring—Variable condenser motor rotor adjustment bearing spring for 50/60-cycle models only—Models U-132 and U-134 only	.02
31680	Support—Variable condenser drive gear mounting support and studs	.35
31679	Support—Variable condenser motor mounting support and studs—for 25-cycle models only	.70
31678	Support—Variable condenser motor mounting support and studs—for 50/60-cycle models only	.45
31677	Switch—Electric Tuning A.F.C. suppression switch (S7)	.55
31684	Switch—Fidelity switch (S5, S6)	1.30
31683	Switch—L.f tone and power switch (S8, S9)	1.10
31692	Transformer—Power transformer, 105-120 volts, 25-60 cycle (T1)—Models HF-6 and U-132 only	14.70
31675	Transformer—Power transformer, 105-120 volts, 25-60 cycle (T1)—Models HF-8 and U-134 only	15.70
31691	Transformer—Power transformer, 105-120 volts, 50-60 cycle (T1)—Models HF-6 and U-132 only	10.30
31674	Transformer—Power transformer, 105-120 volts, 50-60 cycle (T1)—Models HF-8 and U-134 only	11.30
12654	Trap—Wave trap (L14)	1.55
31682	Volume Control (R23)	1.50
31700	Switch—Manual Tuning A.F.C. and selectivity switch (S12)	.85
31360	Switch—Victrola switch for mounting on push-button switch assembly (S10)—Models HF-6 and HF-8 only	.35
31695	Switch—Push-button switch and bracket complete—Models HF-6 and HF-8 only	4.35
31754	Switch—Push-button switch and bracket complete—Models U-132 and U-134 only	4.60
31755	Switch—Radio-Phono. switch for mounting on push-button switch assembly (S100)—Models U-132 and U-134 only	.45
31668	Switch—Range switch only—less coils (S1, S2, S3, S4)	4.40
31746	Transformer—First i-f transformer (L15, L16, L17, C18, C19)	2.80
31749	Transformer—Second i-f transformer (L18, L19, L20, C20, C21)	2.75
31747	Transformer—Third i-f transformer (L21, L22, C24, C25)	1.95
31748	Transformer—Fourth i-f transformer (L31, L32, C48, C49, C50, R17)	2.75
31687	Transformer—Output transformer (T2)—Models HF-6 and U-132 only	3.20
31685	Transformer—Output transformer (T2)—Models HF-8 and U-134 only	3.20
31885	Transformer—Power transformer, 105-130, 140-160, 200-250 volts, 50-60 cycle (T1)—Models HF-6 and U-132 only	15.10
31884	Transformer—Power transformer, 105-130, 140-160, 200-250 volts, 50-60 cycle (T1)—Models HF-8 and U-134 only	18.05
	MOTOR BOARD ASSEMBLIES Models U-132 and U-134 Only	
31149	Base—Tone arm mounting base	.35
31152	Board—Record changer base complete with all welded and riveted posts and bearings—less all operating parts	7.90
14209	Bumper—Main lever rubber bumper (1)	.08
9848	Cup—Used needle cup, rest, and lid complete	.75
31148	Escutcheon—Index escutcheon	.40
31151	Guide—Pickup lift cable guide (coil spring, 80T 3-in. long) (2)	.10
31150	Mounting—Pickup arm base rubber mounting complete	.45
31155	Spring—Needle cup lid tension spring	.04
	OPERATING MECHANISM Models U-132, U-134	
31134	Bracket—Pickup locating lever mounting bracket (3)	.30
31144	Cam—Cam and gear assembly (4)	2.80
6808	Clutch—Trip lever friction clutch assembly (5)	.35
31146	Coupling—Motor coupling complete with turntable drive gear, rubber strips, motor coupling, and drive arm (6)	1.80
31129	Cover—Cap for top of record post	.45
31116	Finger—Trip lever friction finger assembly (7)	.45
31119	Gear—Long arm and rack gear for front left-hand record post (8)	.60
31120	Gear—Short arm and rack gear for rear right-hand record post (9)	.55
31121	Gear—Record post gear (10)	.90
31123	Guide—Main lever spring guide (11)	.40
31114	Lever—Index lever assembly (12)	.75
31137	Lever—Index lever tension spring lever (13)	.30
31138	Lever—Locating lever and pawl assembly (14)	.70
31113	Lever—Main lever assembly (15)	1.35
31140	Lever—Pickup lift cable lever and spring assembly (16)	.55
31135	Lever—Pickup locating lever assembly (17)	.85
31130	Lever—Record separator elevating lever complete with adjustment screws (18)	.80
31132	Lever—Trip detaining lever (19)	.30
31115	Lever—Trip lever assembly (20)	1.85
31131	Lever—Trip regulator lever (21)	.25
31133	Pawl—Trip pawl assembly (22)	.80
31124	Pin—Record post drive pin (23)	.04
14207	Roller—Pickup lift cable roller and bracket assembly (24)	.55
31118	Screw—Cone pointed set screw for trip lever hub or record post shelf	.06
4563	Screw—Pickup lift cable screw and nuts	.04
14195	Screw—Set screw for flexible coupling	.05
31117	Screw—Special screw to adjust friction clutch tension	.03
31126	Separator—Record separator knife (25)	.75
31122	Shaft—Record separator post shaft (26)	.40
31125	Shelf—Record post shelf assembly (27)	1.25
31141	Spindle—Turntable spindle shaft and spring	1.40
3676	Spring—Cam pawl tension spring on main gear (12 turns, .190-in. O.D., 43/64-in. lg.)	.04
14190	Spring—Pickup locating lever short spring or locating lever pawl tension spring (28) (16 turns, .180-in. O.D., 19/32-in. lg.)	.08
31145	Spring—Main lever tension spring (29) (18 turns, 9/16-in. O.D., 3-in. lg.)	.05
31136	Spring—Pickup locating lever long spring or index lever tension spring (30) (25 turns, .190-in. O.D., 15/16-in. lg.)	.05
3666	Spring—Pickup lift cable tension spring (31) (20 turns, .195-in. O.D., 1-in. lg.)	.04
31127	Spring—Record separator pressure spring (32) (8 turns, ¼-in. O.D., ¼-in. lg.)	.02
31139	Turntable Assembly—less spindle	3.35

MODEL 9X
Schematic, Socket Voltage, Specs.

RCA MFG. CO., INC.

Lead Dress, Notes Chassis Wiring

Dial Lamp.................. Mazda No. 40, 6.3 volts, .15 amps.

Power Supply Ratings
A-C Rating.............. 105-125 volts, 50-60 cycles, 50 watts
D-C Rating........................... 105-125 volts, 50 watts

CAUTION: The chassis is connected to one side of the power supply. Avoid contact of chassis or parts to external ground when servicing.

Reel up the antenna wire, and keep it away from chassis during alignment. Connect the high side of test-oscillator through an 80 mmfd. capacitor to the antenna terminal. Connect low side of oscillator to receiver chassis through a 0.1 mfd. capacitor. Turn gang condenser to minimum (full out), tune oscillator to 1,760 kc, connect an output meter across the voice coil, and turn volume control to maximum.

Adjust the two trimmers (C3 and C6) on side of gang condenser for maximum output, using lowest possible output from test-oscilator.

Pre-setting Dial.—With gang condenser rotor plates turned full in for maximum capacity, loosen dial-drum set-screw, and turn drum so that the top edge of dial (low-frequency end) is approximately 1/16-in. below level of gang frame, and tighten set-screw.

Power Output (125-volt, 60-cycle supply)
Undistorted.. 1.0 watt
Maximum.. 1.5 watts

Loudspeaker
Type.................................. 3-inch Electrodynamic
Voice-Coil Impedance.................. 3 ohms at 400 cycles

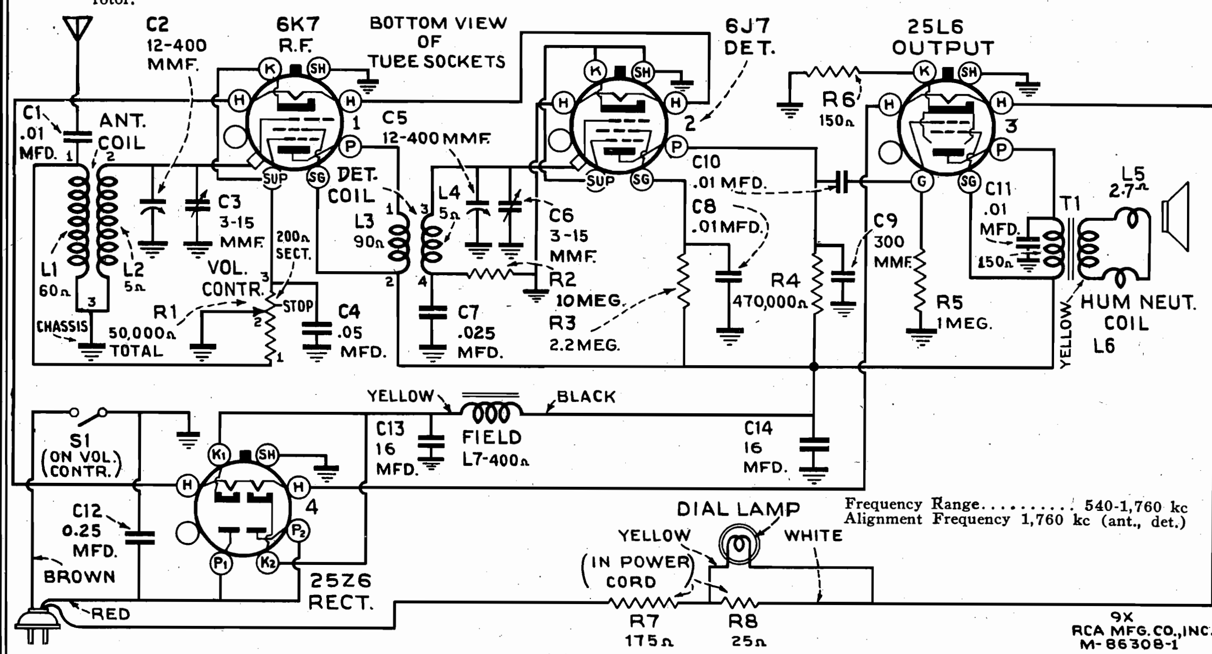
Precautionary Lead Dress

1. Dress detector grid lead close to top of speaker chassis.
2. Dress lead from grid of 6K7 to gang condenser away from detector section of gang, and clear of rotor plates.
3. Dress speaker leads close to, but not touching, cone.
4. Dress pilot lamp leads close to top of chassis, and clear of rotor.

25-Cycle Operation

For 25-cycle operation, connect a 16 mfd., 150-volt dry electrolytic capacitor (Stock No. 31323) in parallel to C13.

SPEAKER ASSEMBLIES
31325 Cone—Speaker cone and voice coil (L5) ....
31324 Speaker—Complete ....



Frequency Range.......... 540-1,760 kc

31204 Knob—Station selector, or volume control knob
30900 Spring—Retaining spring for knob, Stock No. 31204 ....

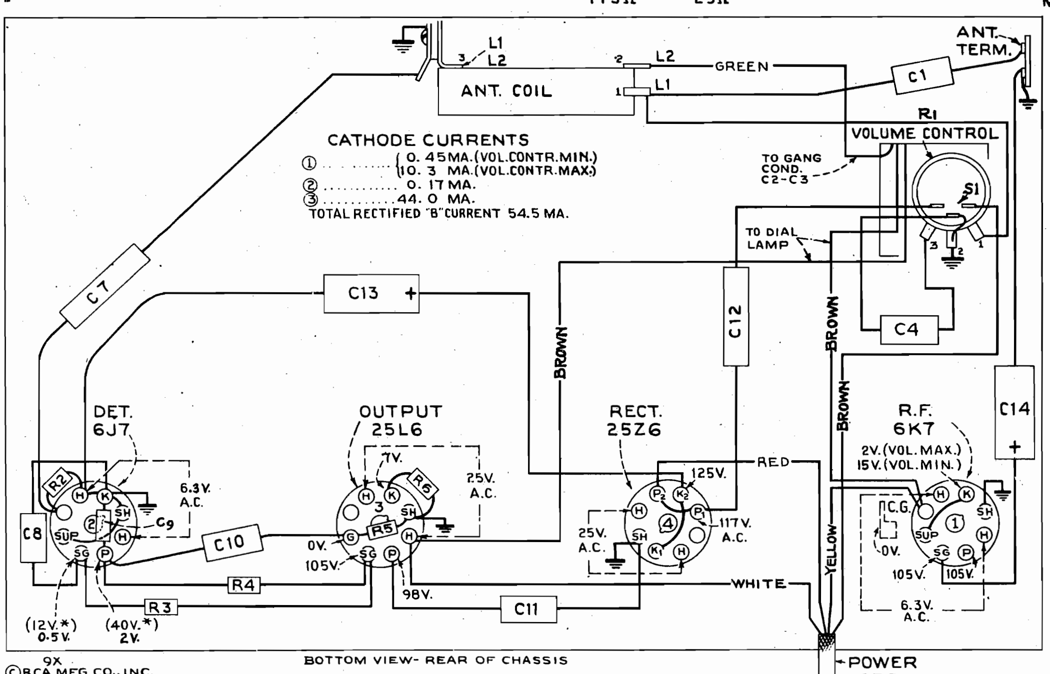

Figure 3—Radiotron Socket Voltages, and Location of Parts

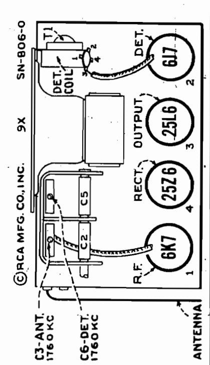


* Note: Values with (*) are operating voltages.
Values not starred are actual measured voltages.

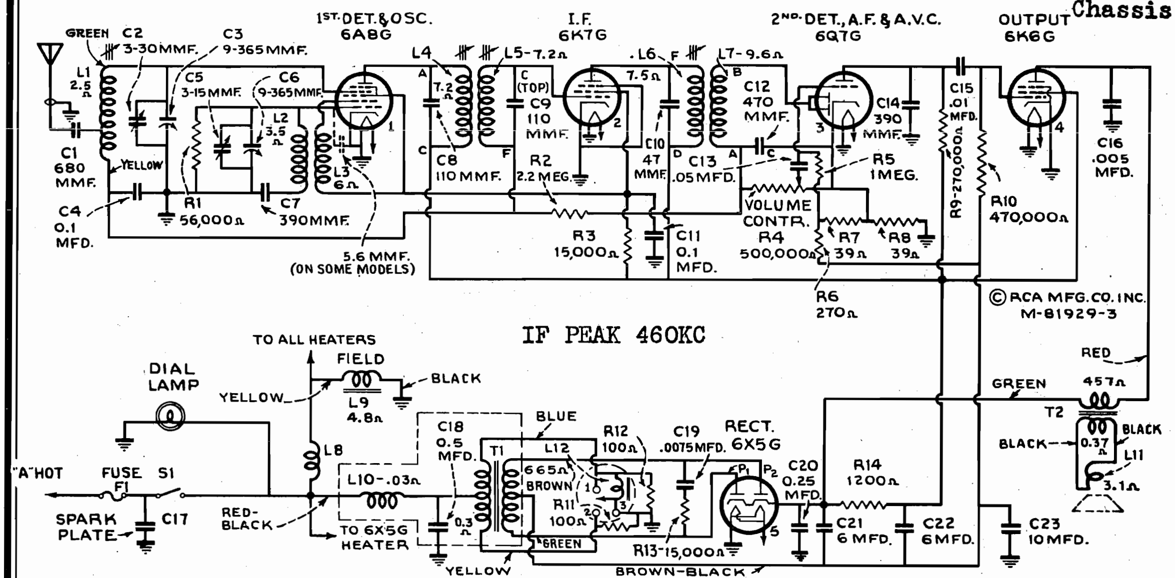
Measurements made to chassis unless otherwise indicated.

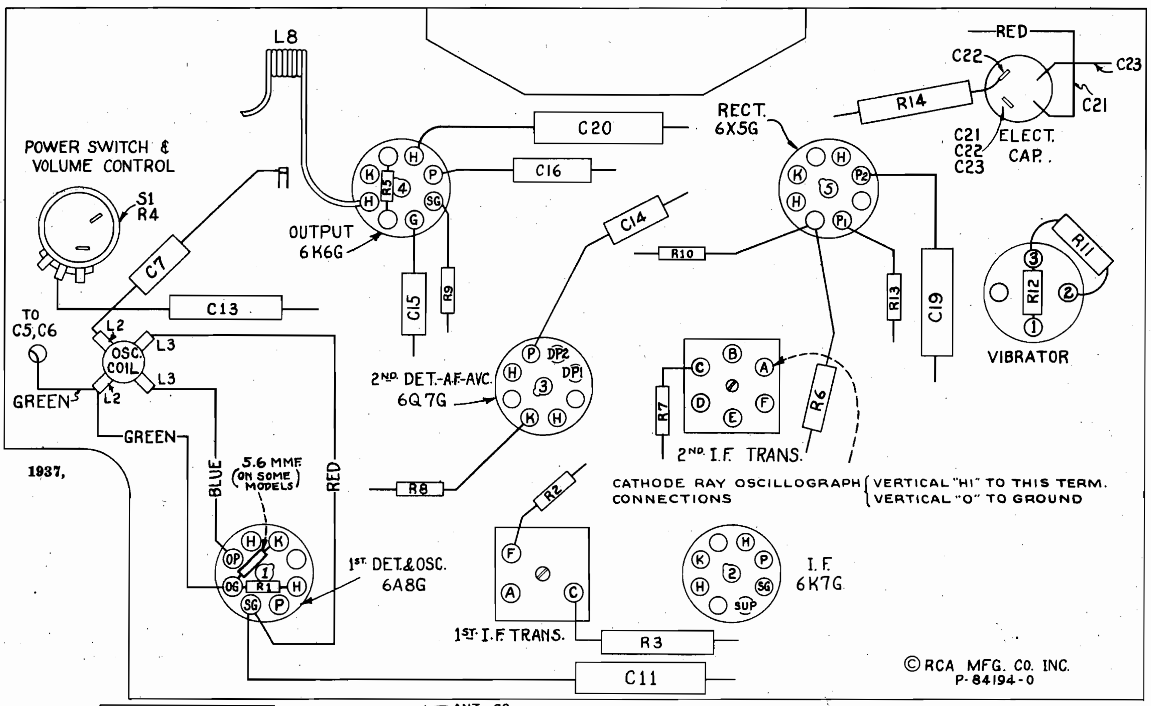
Measurements made with set tuned to quiet point, volume control at minimum, using 1,000-ohm-per-volt meter, having ranges of 10, 50, and 250 volts. (Use nearest range above the specified measured voltage.)

Values should hold within approximately ± 20% for 117-volt 60-cycle a-c supply. On d-c, voltages are approximately 10% lower, except heaters, which remain the same.

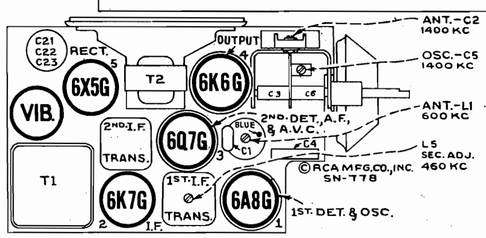
MODEL 8M
Schematic, Socket Voltage, Trimmers Chassis Wiring

RCA MFG. CO., INC.

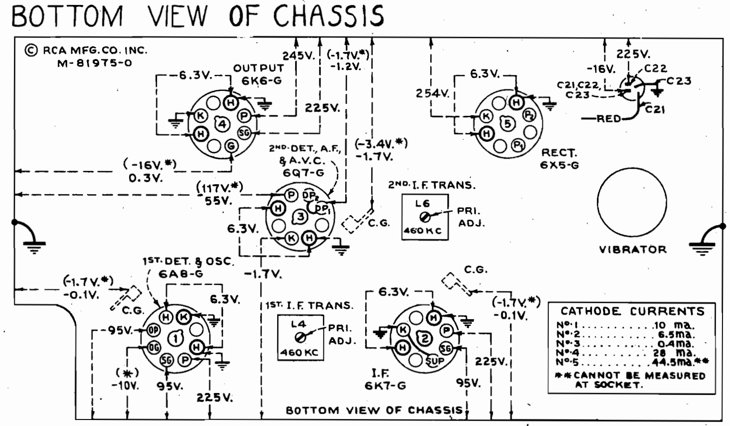




1937,



BOTTOM VIEW OF CHASSIS



Note: Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter.

Voltage values as specified should hold within ±20% when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250, and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

Figure 4—Radiotron Socket Voltages and Trimmer Locations
(Measured at 6.3 volts battery supply—Volume control minimum—No signal input)

General Description

Model 8M is a five-tube superheterodyne receiver with loudspeaker and radio chassis in the same case. The receiver is designed to be mounted under the dash panel. The operating controls are integral with the radio and speaker case. Features of design also include magnetite-core adjusted antenna and i-f transformers; automatic volume control; and ignition-noise-suppression filter in the power-input circuit.

Service Data

Loudspeaker.—Centering of the loudspeaker is made in the usual manner with three narrow celluloid or paper feelers after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. A dust cover should be cemented in place with ambroid upon completion of adjustment.

Vibrator.—The mechanical vibrator used in the power system has a plug-in base for easy removal from the receiver. Its adjustment has been set during manufacture by means of special equipment. In cases of faulty operation a replacement unit should be installed.

Antenna Compensating Capacitor.—Trimmer C2 is accessible from the bottom of the receiver case (near speaker opening) and should be readjusted to give maximum signal output on a weak station or oscillator signal at approximately 1,400 kc, after the instrument is installed. The antenna should be connected to the receiver during this adjustment. Refer to Alignment Table operation number 6.

Tuning Range .... 550 to 1,550 kc

Power Output Rating
Maximum .... 3.3 watts
Undistorted .... 1.75 watts

Loudspeaker
Type .... 5-inch Electrodynamic
Voice-Coil Impedance .... 3.2 ohms at 400 cycles

Power Supply Rating
Supply Voltage .... 6.3 volts
Current Drain .... 6 amp.
Fuse Protection .... 15 amp.

Pilot Lamp .... Mazda No. 51, 7.5 volts, 0.2 amp.

Alignment Frequencies .... I.F., 460 kc; Oscillator Coil, 1,400 kc; Antenna Coil, 600 kc and 1,400 kc

Alignment Procedure

Remove all external screws to remove the chassis from the case. Hold the condenser gang in full-mesh position while rotating the dial scale so the low frequency (end) calibration mark is in line with the pointer. Loosen the three nuts in the front of the scale assembly for this adjustment. When referring to scale settings hold the front panel in place.

Perform alignment in proper order tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 1 and 4.

Cathode-ray alignment is preferable; the connections to the chassis are shown on figure 3. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Ant. Cable" means test oscillator signal should be applied to the receiver at the connector on the antenna cable extending from the receiver chassis. "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal is received from a station or the local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

Order of Alignment	Test Oscillator			Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
	Connection to Receiver	Dummy Antenna	Frequency Setting

Model 8M1 is a six-tube superheterodyne receiver and a 5-inch electrodynamic loudspeaker in the same case. Model 8M2 employs a similar receiver to Model 8M1 but with an 8-inch electrodynamic loudspeaker separately contained in a cylindrical housing. Other features of design include an r-f amplifier stage; magnetite-core i-f and antenna transformers; automatic volume control; and ignition-suppression filters in both the antenna and power-input circuits. In addition, Model 8M2 has an aural-compensated volume control and continuously variable tone control.

Service Data

Loudspeaker.—Centering of the loudspeaker is made in the usual manner with three, narrow, celluloid or paper feelers after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. The dust cover should be cemented in place with ambroid upon completion of adjustment.

Vibrator.—The mechanical vibrator used in the power system has a plug-in base for easy removal from the receiver. Its adjustments have been set during manufacture by means of special equipment. In cases of faulty operation, a replacement unit should be installed.

Antenna Compensating Capacitor.—Trimmer C2 is accessible by removing the plug button from the front cover of the receiver case.

This trimmer must be adjusted for maximum signal output on a weak station near 1,400 kc after installation and with the antenna properly connected.

Dial Pointer Adjustment.—With receiver and control unit properly installed in car, rotate tuning knob to its extreme clockwise position and then to its extreme counter-clockwise position, irrespective of location of pointer on dial. Pull out dial lamp socket from control unit, locate the pointer adjusting screw at bottom of hole and turn with a small screwdriver until the pointer on dial is at the end calibration mark beyond "55" on the dial scale. Final adjustment may be made, if desired, by tuning in a station of known frequency and adjusting dial pointer to the frequency of the station.

Power Switch and Volume Control Adjustment.—Rotate the "Off-On-Volume" control knob to its extreme clockwise position and then back to its extreme counter-clockwise position. This sets the friction-clutch mechanism in proper alignment.

Alignment Procedure

Calibrate the tuning-dial pointer to the low-frequency calibration mark as outlined under "Dial Pointer Adjustment."

Perform alignment in proper order tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 8 and 9.

Cathode-ray alignment is preferable; the connections to the chassis are: Vertical "Hi" to yellow volume-control lead, "0" to chassis. If an output indicator is used, connect it across the loudspeaker voice coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Ant. Conn." means that the test oscillator signal should be applied to the receiver at the antenna connector on side of case. "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal is received from a station or the local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

12006	Core—Adjustable core and stud for I.F. transformers	.15
30809	Housing—Receiver case—less speaker screen—Model 8M1 only	7.30
30810	Housing—Receiver case—Model 8M2 only	7.10
4290	Insulator—Fuse holder insulating sleeve	.02
30642	Knob—Tone control knob—Model 8M2 only	.13
7766	Lead—"A" lead—ammeter end—complete with female section of fuse holder	.40
12445	Lead—"A" lead—chassis end—complete with male section of connector	.26
13708	Lead—Antenna lead-in, approx. 36 in. long complete with 2 male sections of connector	1.15
30811	Shaft—Flexible shaft for tuning control—approx. 25½ in. long	1.20
13926	Shaft—Flexible shaft for volume control—approx. 25½ in. long	1.20
12502	Socket—Pin-socket and bracket assembly for tone control lead—Model 8M2 only	.30
12248	Socket—3-contact socket and bracket for speaker cable—Model 8M2 only	.25
12254	Stud—Speaker mounting stud assembly for Model 8M2	.45
12448	Stud—Receiver mounting stud, washer and nut assembly	.45
5024	Suppressor—Distributor suppressor	.40
12249	Tone control—Model 8M2 only	1.00
	*** MISCELLANEOUS SUBSTITUTE PARTS**	
	NOTE No. 1—MODEL 8M1 (Run "A")	
	A portion of these receivers were constructed with a second i-f transformer different from that listed above. Such receivers may be identified by letter "A" preceding the code stamped on the chassis partition (e. g. "A7M20" etc.) and also by reference to figure 3.	
	For replacements in such receivers, do not use i-f transformer Stock No. 30483 or capacitor (C17 and C18) Stock No. 12404 listed above. Instead use:	
30407	Capacitor—115 Mmfd. (C17 and C18)	.25
13693	Transformer—Second I-F transformer (L8, L9, C17, C18) (this unit stamped 72970-1)	2.05
	NOTE No. 2—MODEL 8M2 (Run "A")	
	A portion of these receivers were constructed with a vibrator transformer different from that listed above. Such receivers may be identified by letter "A" preceding the code stamped on the chassis partition (e. g. "A7M20" etc.) and also by presence of two additional and separate choke coils (L12 and L20). Refer to figures 5 and 6.	
	For replacements in such receivers, do not use vibrator transformer Stock No. 30799; capacitor (C16) Stock No. 30626; resistor (R14) Stock No. 6134; or resistor (R15) Stock No. 12695. Instead use:	
13695	Capacitor—2 sections, each .01 Mfd. (C50, C51)	.80
5019	Capacitor—0.5 Mfd. (C28)	.60
30255	Coil—"A" filter choke coil (L12)	.60
13696	Coil—"B" choke coil (L20)	1.65
13690	Transformer—Vibrator power transformer (T1)	5.00
	NOTE No. 3—MODEL 8M2 (Run "B")	
	A portion of these receivers were constructed with a second i.f. transformer different from that listed above, and the substitution of a "B" choke coil in place of resistor (R14). Such receivers may be identified by letter "B" preceding the code stamped on the chassis partition (e. g. "B7M20" etc.) and by the presence of an iron core "B" choke coil (L20) in the power unit section. Refer to figures 4 and 5.	
	For replacements in such receivers, do not use resistor (R14) Stock No. 6134; i-f transformer Stock No. 30483; capacitor (C17, C18) Stock No. 12404; resistor (R17) Stock No. 12454; or capacitor (C19) Stock No. 13894. Instead use:	
30407	Capacitor—115 Mmfd. (C17, C18)	.25
12761	Capacitor—265 Mmfd. (C19)	.25
13696	Coil—"B" choke coil (L20)	1.65
5132	Resistor—47,000 ohms, carbon type, 1/10 watt (R17)	.15
12229	Transformer—Second I-F transformer (L8, L9, C17, C18, C19, R17) (this unit stamped 72652-2)	2.15
	NOTE No. 4—MODEL 8M2 (Run "C")	
	A portion of these receivers were constructed with an iron core "B" choke coil (L20) instead of resistor (R14). Such receivers may be identified by letter "C" preceding the code stamped on the chassis partition (e. g. "C7M20" etc.). Refer to figure 5.	
	For replacements in such receivers, do not use resistor (R14) Stock No. 6134. Instead use:	
13696	Coil—"B" choke coil (L20)	1.65

MODELS 8M3, 8M4
Schematics, Socket Trimmers, Specs.

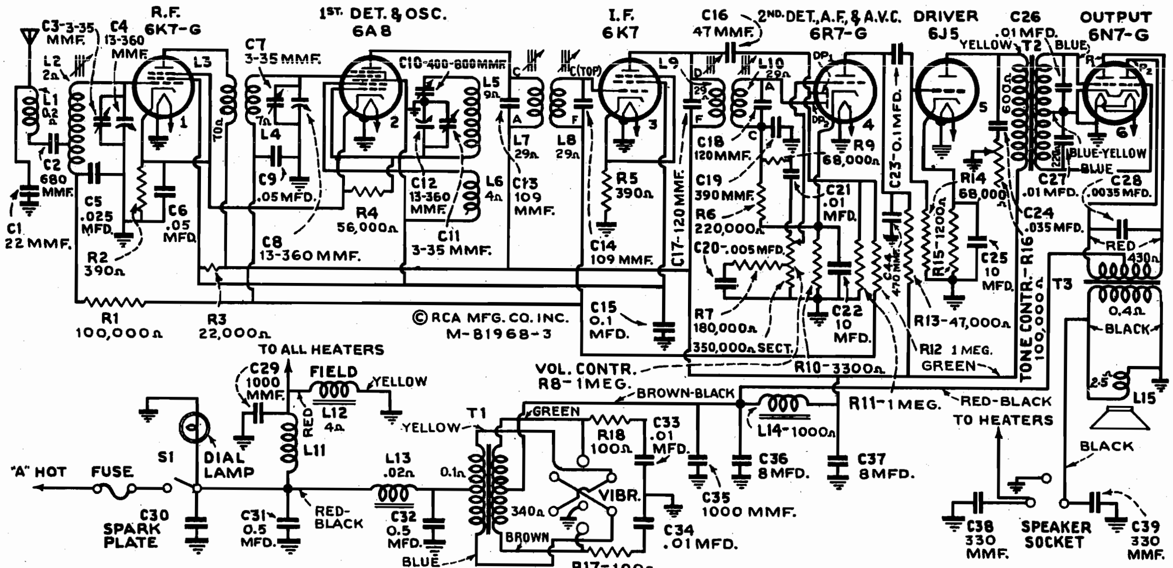

Figure 1—Schematic Circuit Diagram (Model 8M3)

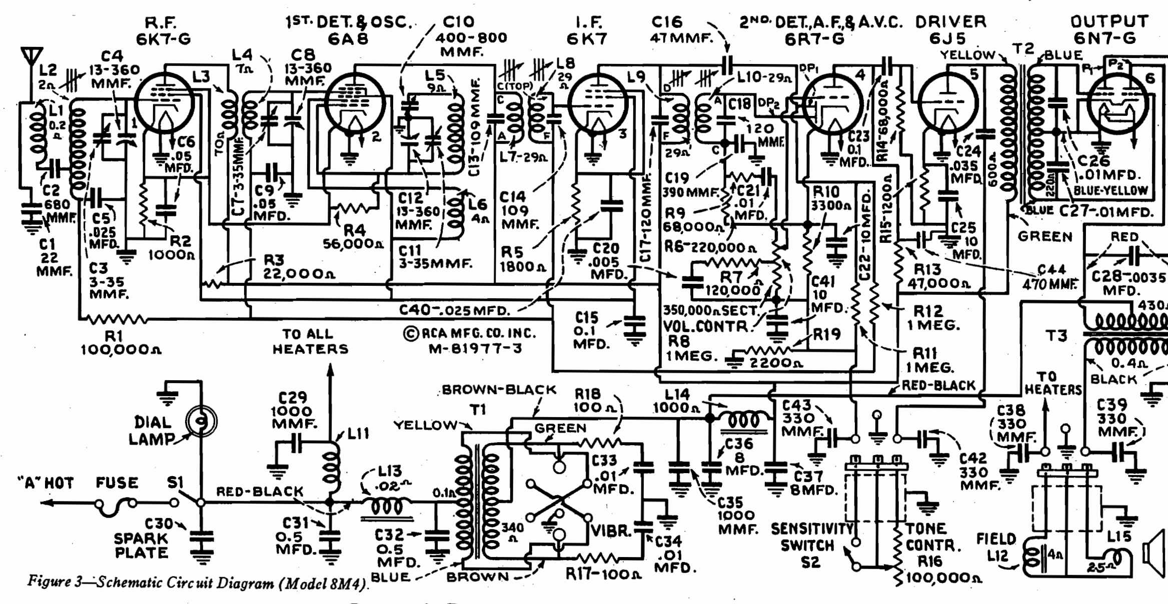

Figure 3—Schematic Circuit Diagram (Model 8M4).

General Description

Model 8M3 consists of a six-tube, superheterodyne automobile receiver and a six-inch electrodynamic loudspeaker contained in the same housing. Design features include an r-f amplifier stage; magnetite core i-f and antenna transformers; automatic volume control; continuously variable high-frequency tone control; aural-compensated volume control; ignition-suppression filters in both the antenna and power-input circuits; and a resistance-capacitance coupled audio-driver stage feeding into a push-pull, class-B, power-output stage.

Model 8M4 employs a similar chassis to Model 8M3 but with an eight-inch electrodynamic loudspeaker separately contained in a cylindrical housing. In addition, a sensitivity control is incorporated which permits the listener to alter the receiver sensitivity to suit reception conditions. Model 8M3 has a socket on the receiver case for plugging-in an auxiliary speaker, if desired.

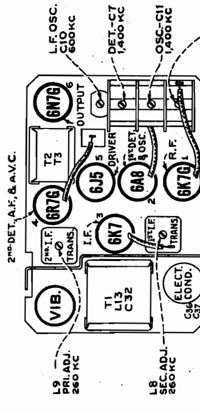

Figure 5—Radiotron and Trimmer Locations (Models 8M3 and 8M4)

Tuning Range .... 550 to 1,550 kc

Power Output Ratings
Maximum .... 9 watts
Undistorted .... 6 watts

Loudspeaker
Type .... Electrodynamic
Voice-Coil Impedance .... 3 ohms at 400 cycles

Power Supply Rating
Supply Voltage .... 6.3 volts
Current Drain .... 7.5 amperes
Fuse Protection .... 15 ampere

Pilot Lamp .... Mazda No. 51, 7.5 volts, 0.2 ampere

Alignment Frequencies .... I.F., 260 kc; Oscillator, 600 kc and 1,400 kc; Detector, 1,400 kc; Antenna, 1,400 kc

Service Data

Antenna Compensating Capacitor.—Trimmer C3 is accessible by removing the plug button from the front cover of the receiver case. This trimmer must be adjusted for maximum signal output on a weak station around 1,400 kc after installation and with the antenna properly connected.

Loudspeaker.—Centering of the loudspeaker is made in the usual manner with three, narrow, celluloid or paper feelers after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. The dust cover should be cemented in place with ambroid upon completion of adjustment.

Vibrator.—The mechanical vibrator has a plug-in base for easy removal. Its adjustments have been accurately set during manufacture by means of special equipment. In cases of faulty operation, a replacement unit should be installed. The symmetrical plug-in base provides correct output-voltage polarity on automobiles with either positive or negative "A" battery ground. When positive (+) side of battery is grounded, insert vibrator so positive (+) symbol is nearest label on vibrator-compartment partition; for negative (–) ground, insert with negative (–) symbol nearest label.

Dial Pointer Adjustment.—With receiver and control unit properly installed in car, rotate "Tuning" knob to its extreme clockwise position and then to its extreme counter-clockwise position, irrespective of location of pointer on dial. Pull out dial-lamp socket from control unit, locate the pointer adjusting screw at bottom of hole and turn with a small screwdriver until the pointer on dial is at the end calibration mark beyond "55" on the dial scale. Final adjustment may be made, if desired, by tuning in a station of known frequency and adjusting dial pointer to the frequency of the station.

Power Switch and Volume Control Adjustment.—Rotate the "Off-On-Volume" control knob to its extreme clockwise position and then back to its extreme counter-clockwise position. This sets the friction-clutch mechanism in proper alignment.

Alignment Procedure

Calibrate the tuning-dial pointer to the low-frequency calibration mark as outlined under "Dial Pointer Adjustment."

Perform alignment in proper order tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 5 and 6.

Cathode-ray alignment is preferable; the connections to the chassis are shown on figures 2 and 4. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

On Model 8M4, the sensitivity control should be placed in its clockwise (maximum sensitivity) position.

Connect the "low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Ant. Conn." means that the test-oscillator signal should be applied to the receiver at the antenna connector on side of case. "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal is received from a station or the local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

Order of Alignment	Test Oscillator			Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
	Connection to Receiver	Dummy Antenna	Frequency Setting				
1	6K7 I-F Grid Cap	.001 Mfd.	260 kc	No Signal 550-750 kc	2nd I-F Trans.	L9 and L10	Max. (peak)

Alignment, Parts
Tuner, Drive Cord Data

Antenna Circuit.—The antenna circuit is designed to work with a low capacity antenna having a total capacity including the shielded lead-in not to exceed 150 mmf. If larger antennas, such as screened top or a double under the running-board having a total capacity of 200 to 550 mmf. is to be used, it will be necessary to reduce the value of the antenna coupling capacitor C-2 from .01 to approximately 200 mmf. (.0002). For even larger antennas such as insulated steel tops, a correspondingly smaller value of C-2 (approximately 125 to 150 mmf.) should be used keeping in mind to use the largest value possible with which the antenna circuit can be aligned.

After installation, and with antenna connected, tune in a weak station near 1,400 kc and adjust compensator trimmer (C-3) for maximum signal output. This trimmer is accessible by prying off the nameplate between the control knobs.

Antenna Filter.—A filter is included in the antenna circuit. Being completely shielded, it prevents radiating ignition interference within the set. It also reduces the possibility of picking up vibrator interference. As shown in Figure 5, the filter unit is mounted inside a steel shell which in turn is welded to the chassis. The shielded antenna lead-in makes contact with the filter unit within the steel shell and is held in place by a bayonet type connector.

Push Button Tuning Mechanism.—The push button tuning mechanism used in this receiver is of the mechanical type, wherein the movement of the button actually turns the tuning condenser to any pre-determined setting. The movement is actuated thru a Push-Arm, Cam, Rocker Plate and Sector Gear, which meshes with a Scissors Gear directly fastened to the tuning condenser shaft—(See Figures 1 and 2.) The scissors gear prevents backlash between the sector gear and the tuning condenser. Since the sector gear is mounted directly on the rocker plate shaft, the position of the rocker plate will accurately determine the position of the tuning condenser.

The cams (Figure 2) which determine the stop points for each button are mounted on the push arms and are locked in place by the locking screws and lock-shoes, which press firmly against the cams when the locking screws are tightened. **Care should be used when locking screws are tightened not to use excessive force as the threads may become damaged or stripped.**

Adjustments for Push Button Tuning are very easily made. To adjust a push button for any station proceed as follows:

(1) Pull the push button off the push arm.
(2) Loosen the cam locking screw one-half turn.
(3) Using the Dial Tuning Control tune in the station.
(4) Press the push arm in as far as it will go and accurately retune station.
(5) With the push button still held down, tighten cam locking screw.
(6) Replace the push button.

With the locking screw tight, the cam is locked in position and when the button is pushed in, the cam pressure causes the rocker plate to assume the position that tunes in the desired station. (See Figure 2.)

Manual Tuning Dial.—A manual tuning knob is provided so that additional stations may be tuned in as desired. The manual tuning shaft is connected thru a cord drive to a drum on the rocker plate shaft. This same cord drives the dial drum by passing over a pulley on the drum shaft. Figure 6 shows the complete cord drive assembly and the correct number of turns which the cord should be wrapped around the drive shaft and dial drum pulley. Stops are provided on the dial drum so that dial scale adjustment is made by tuning the set to the extreme ends of the band.

IMPORTANT ALIGNMENT NOTES.

† Make the generator connection to the receiver thru a shielded lead-in having not more than 50 mmf. (.00005) capacity with a male connector attached for connection to antenna socket. If C-2 has been changed, as outlined under "Antenna Circuit," for reason of a high capacity antenna, the Dummy Antenna should be the same value as the antenna itself.

* Re-adjust C-3 after installation as outlined under "Antenna Circuit" in "Service Hints."

Each step of the alignment should be repeated in its original order for greater accuracy. Always keep the output from the generator at its lowest possible value, to prevent the A.V.C. action of the receiver from interfering with accurate alignment.

Alignment adjustment locations are shown on the top and bottom parts location views of chassis.

Only the dummy antenna indicated in the chart for any particular frequency should be used. Grid cap leads should remain in place during alignment.

Oscillator circuit alignment is not required in this receiver at either end of the band; the oscillator coil is pre-adjusted for inductance in the factory.

Since the oscillator coil is unshielded, the case has some effect on its inductance. Therefore alignment must be done either with the chassis in the case or with a steel plate (covering the bottom of chassis), substituting for the case.

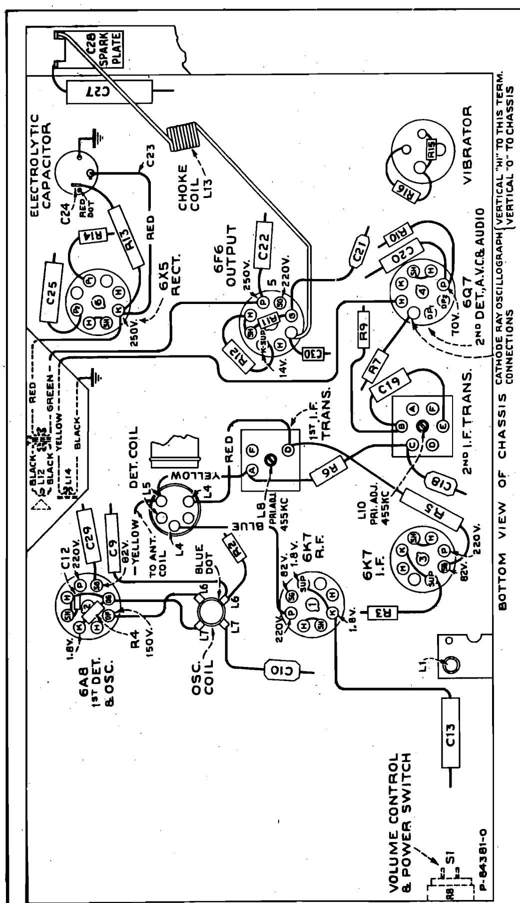
IF PEAK 455 KC



Bottom View of Parts and Socket Voltages

(Measured at 6.3 volts battery supply—Volume control minimum—No signal input—)

To duplicate the conditions under which the above voltages were measured requires a 1,000-ohm-per-volt d-c meter having ranges of 10, 50, 250, and 500 volts. Use the nearest range above the indicated voltage value. Each value should hold within ± 20% when the receiver is normally operative at its rated battery voltage.

Drive Cord Hookup

MODEL 9M2, Chassis RC357A
Data, Tuner, Alignment
Parts, Specs.

RCA MFG. CO., INC.

Antenna Circuit.—The antenna circuit is designed to work with an antenna having a total capacity including the shielded lead-in not to exceed 150 mmf. If an antenna having a larger capacity is to be used, it will be necessary to add a capacitor in series with the lead from antenna filter L-1 to the antenna coil terminal ("A"). Where a "Double Under the Running Board" type of antenna is to be used having a capacity of approximately 200 mmf. the capacitor added should be approximately 300 mmf. The insulated running board type having an approximate capacity of 550 mmf. will require a capacitor of approximately 200 mmf. Cars using an insulated steel top of approximately 3,500 mmf. will require a series capacitor of 150 mmf.

After installation, and with antenna connected, tune in a weak station near 1,400 kc and adjust compensator trimmer (C-3) for maximum signal output. This trimmer is accessible by prying off the nameplate between the control knobs.

Antenna Filter.—A filter is included in the antenna circuit. Being completely shielded, it prevents radiating ignition interference within the set. It also reduces the possibility of picking up vibrator interference. As shown, the filter unit is mounted inside a steel shell which in turn is welded to the chassis. The shielded antenna lead-in makes contact with the filter unit within the steel shell and is held in place by a bayonet type connector.

Manual Tuning Dial.—A manual tuning knob is provided so that additional stations may be tuned in as desired. The manual tuning shaft is connected through a cord drive to a drum on the rocker plate shaft. This same cord drives the dial drum by passing over a pulley on the drum shaft. The complete cord drive assembly and the correct number of turns which the cord should be wrapped around the drive shaft and dial drum pulley are shown. Stops are provided on the dial drum so that dial scale adjustment is made by tuning the set to the extreme ends of the band.

Push Button Tuning Mechanism.—The push button tuning mechanism used in this receiver is of the mechanical type, wherein the movement of the button actually turns the tuning condenser to any pre-determined setting. The movement is actuated through a Push-Arm, Cam, Rocker Plate and Sector Gear, which meshes with a Scissors Gear directly fastened to the tuning condenser shaft. The scissors gear prevents backlash between the sector gear and the tuning condenser. Since the sector gear is mounted directly on the rocker plate shaft, the position of the rocker plate will accurately determine the position of the tuning condenser.

The cams which determine the stop points for each button are mounted on the push arms and are locked in place by the locking screws and lock-shoes, which press firmly against the cams when the locking screws are tightened. **Care should be used when locking screws are tightened not to use excessive force as the threads may become damaged or stripped.**

Adjustments for Push Button Tuning are very easily made. To adjust a push button for any station proceed as follows:

(1) Pull the push button off the push arm.

(2) Loosen the cam locking screw one-half turn.

(3) Using the Dial Tuning Control tune in the station.

(4) Press the push arm in as far as it will go and accurately retune station.

(5) With the push button still held down, tighten cam locking screw.

(6) Replace the push button.

With the locking screw tight, the cam is locked in position and when the button is pushed in, the cam pressure causes the rocker plate to assume the position that tunes in the desired station.

IMPORTANT ALIGNMENT NOTES

† Make the generator connection to the receiver through a shielded lead-in having not more than 50 mmf. (.00005) capacity with a male connector attached for connection to antenna socket. If a capacitor has been added in series with the lead from antenna filter L-1 to the antenna coil, as outlined under "Antenna Circuit," for reason of a high capacity antenna, the Dummy Antenna should be the same value as the antenna itself.

* Re-adjust C-3 after installation as outlined under "Antenna Circuit" in "Service Hints."

Each step of the alignment should be repeated in its original order for greater accuracy. Always keep the output from the generator at its lowest possible value, to prevent the A.V.C. action of the receiver from interfering with accurate alignment.

Alignment adjustment locations are shown on the top and bottom parts location views of chassis.

Only the dummy antenna indicated in the chart for any particular frequency should be used. Grid cap leads should remain in place during alignment.

** OSCILLATOR CIRCUIT

A magnetite core is used to provide temperature stability. The conventional high frequency trimmer has been replaced with a fixed temperature-compensating capacitor (C-12) which determines the high frequency range. Since the inductance of L-7 is adjustable, the conventional series trimmer has been replaced with a fixed capacitor (C-10). C-10 is a special capacitor having zero temperature coefficient to provide for oscillator stability in the low frequency range. Aligning the receiver for 600 kc is accomplished by adjusting L-7 to the antenna and det. circuits (gang condenser must be rocked while making this adjustment) The 1,400 kc alignment is accomplished by adjusting the antenna and the det. trimmers (C-3 and C-5) to the oscillator.

MODEL D9-19 Late
Schematic, Changes

RCA MFG. CO., INC.

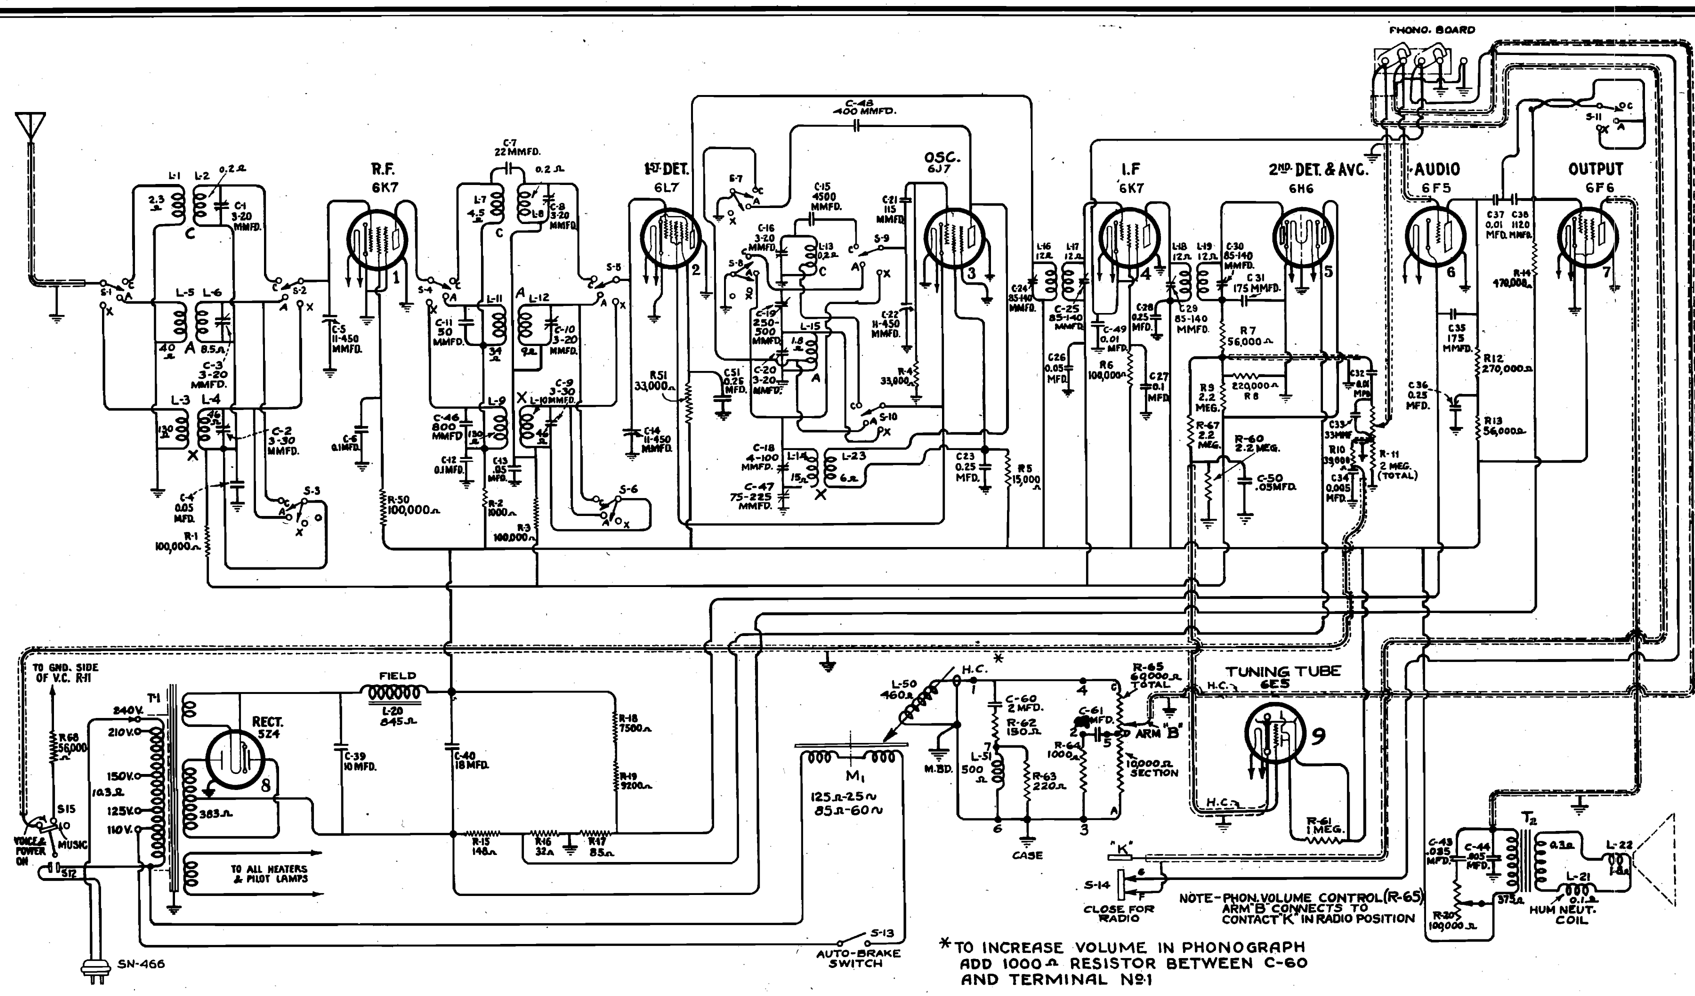

Figure 6—Schematic Circuit Diagram
(Model D9-19 with metal rectifier and low-frequency tone control)

Model D9-19 (with low-frequency tone control and metal Rectifier)

Service Data for Model D9-19 are directly applicable to these instruments except as follows:

(1) The schematic and wiring diagrams for Model D9-19 (with low-frequency tone control and metal rectifier) are shown by figures 6 and 7.

(2) Washer Stock No. 11886 should be used for replacement instead of Stock No. 11230 in all Models D9-19. See parts list herein for description and price.

(3) Bracket Stock No. 13615 should be used for replacement instead of Stock Nos. 11191 and 11192 in all Models D9-19. See parts list herein for description and price.

(4) Refer to Substitute and Additional Replacements Parts contained herein for other parts changes.

Parts

RCA MFG. CO., INC.

Model D9-19 (with metal rectifier)

5170	Capacitor—0.25 mfd. (C51)	.25
11329	Resistor—Voltage divider resistor, comprising one 148-ohm, one 32-ohm, and one 85-ohm section (R15, R16, R17)	.52
5033	Resistor—33,000 ohms—Carbon type—1 watt—(R51)—Package of 5	1.10
5029	Resistor—56,000 ohms—Carbon type—¼ watt—(R68)—Package of 5	1.00
3118	Resistor—100,000 ohms—Carbon type—¼ watt—(R50)—Package of 5	1.00
11195	Socket—Five-contact rectifier Radiotron socket	.15
5224	Switch—Low-frequency tone control and power switch (S12, S15)	1.00
11804	Transformer—Power transformer—105-125 volts—25-60 cycles	6.02
11805	Transformer—Power transformer—100-130/140-160/195-250 volts—40-60 cycles—(T1)	7.95
11886	Washer—Spring washer used to hold field coil securely—Package of 5	.20
13615	Bracket—Tuning tube mounting bracket and clamp assembly	.25

Stock Nos. 4858 (C50*), 11248, 4748, 11245, 11273, 4794, 11133, 11242, 11243, 11230, 11191, and 11192 are not used in chassis having metal rectifier.

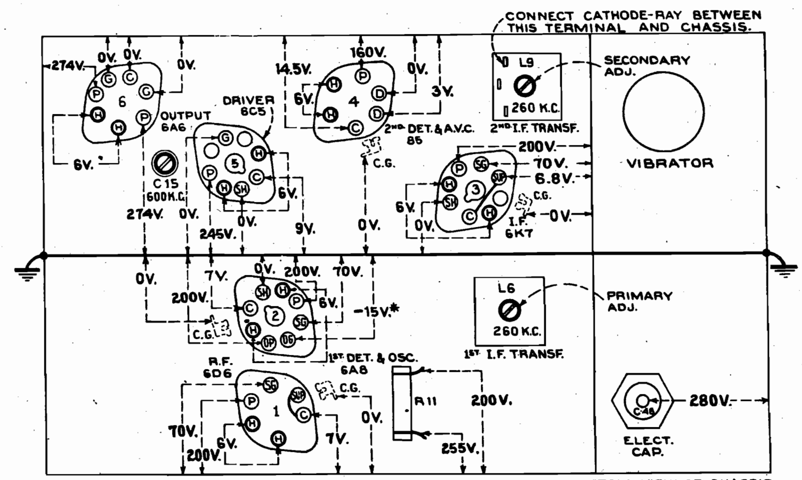
* THIS VALUE MAY VARY APPRECIABLY.

Figure 5—Radiotron Socket Voltages and Trimmer Locations (Model 67M)
(Measured at 6.3 volts battery supply—Volume control minimum—No signal input.)



* THIS VALUE MAY VARY APPRECIABLY.

Figure 6—Radiotron Socket Voltages and Trimmer Locations (Models 67M1, 67M2, and 67M3)
(Measured at 6.3 volts battery supply—Volume control minimum—No signal input—Sensitivity control (Models 67M2 and 67M3) at minimum sensitivity position.)

To duplicate the conditions under which the above voltages were measured requires a 1,000-ohm-per-volt a-c/d-c meter having ranges of 10, 50, 250, and 500 volts. Use the nearest range above the indicated voltage value. Each value should hold within ±20% when the receiver is normally operative at rated battery voltage.

NOTE: When installing these receivers in automobiles having high-capacity (400 mmfd. or greater) antennas, the .01 mfd. antenna-coupling capacitor C-3 should be replaced by a 470 mmfd. capacitor, Stock No. 14082. The 1936 models of Chrysler, DeSoto, and Dodge are examples of cars with such antennas.

Service Hint (Model 67M only)

Noise pickup or mushy reception on demonstration or test antennas in the vicinity of a-c circuits may be eliminated by connecting a 5 millihenry r-f choke (Stock No. 12177) between the antenna connector and receiver case. This may be either inside or outside the receiver case.

The synchronous vibrator-rectifier used in Models 67M1, 67M2, and 67M3 has a symmetrical plug-in base so as to give correct output-voltage polarity on an automobile with either positive- or negative-"A" ground. For installation with positive ground, insert vibrator so positive (+) symbol is nearest label on vibrator-compartment partition; for negative-"A" ground, insert with negative (—) symbol nearest chassis.

The interrupter used in Model 67M does not require reversing, since the rectifier tube automatically supplies proper polarity on either polarity ground.

MODELS 67M,67M1,67M2,67M3

ALIGNMENT PROCEDURE

Calibrate the tuning-dial pointer to the low-frequency dial mark as outlined under "Final tuning-dial adjustment."

Perform alignment in proper order tabulated below, starting with No. 1 and following all operations across, then No. 2, etc.

Cathode-ray alignment is preferable; the connections to the chassis are shown on Figures 5 and 6. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action. On Models 67M2 and 67M3, the sensitivity control should be placed in its clockwise (maximum sensitivity) position.

If capacitor C-3, in the receiver, has been changed to 470 mmfd., use a "dummy antenna" of .001 mfd. instead of 175 mmfd. for r-f alignment.

The terms "Set end antenna cable" means test oscillator signal should be applied to the receiver at the connector on the short antenna cable extending from the receiver chassis. "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal is received from a station or the local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

Order of Alignment	Test Oscillator			Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain	Adjustment Location

5019	Capacitor—0.5 Mfd. (C31)	.42
4840	Capacitor—0.25 Mfd. (C11, C17)	.30
12464	Capacitor—0.25 Mfd. (C19)	.24
13687	Capacitor—Pack, comprising one 4 Mfd. and one 6 Mfd. sections (C25, C36)	1.95
13695	Capacitor—Pack, comprising 2 sections each .01 Mfd. (C32, C33)	.65
13685	Coil—Antenna coil and shield (L3)	1.40
12235	Coil—Choke coil (L14)	.50
12223	Coil—Oscillator coil less shield (L10, L11)	.80
13684	Coil—R. F. coil less shield (L4, L5)	1.10
13371	Condenser—3-gang variable tuning condenser (C5, C6, C7, C8, C13, C14)	4.85
12006	Core—Adjustable core and stud for Stock Nos. 13419 and 13693	$0.32
12168	Coupling—Station selector flexible shaft coupling	.45
13091	Filter—Antenna filter (L1)	.45
13372	Gear—Large gear located on tuning condenser shaft	.35
13373	Gear—Worm gear for tuning condenser	.65
13694	Guide—Volume control shaft guide	.15
12485	Pin—Contact pin for speaker leads—Package of 5	.15
13696	Reactor—Filter reactor, iron core (L13)	.75
13697	Resistor—200 ohms, insulated, ¼ watt—Package of 5 (R2)	1.00
11845	Resistor—560 ohms, carbon type, 1 watt—Package of 5 (R12)	1.10
8097	Resistor—5,600 ohms, carbon type, 2 watts (R13)	.25
3066	Resistor—12,000 ohms, carbon type, 1 watt—Package of 5 (R5)	1.10
12286	Resistor—56,000 ohms, insulated, ¼ watt—Package of 5 (R3)	1.00
13698	Resistor—180,000 ohms, insulated, ¼ watt—Package of 5 (R10)	1.00
12452	Resistor—390,000 ohms, insulated, ¼ watt—Package of 5 (R11)	1.00
12285	Resistor—470,000 ohms, insulated, ¼ watt—Package of 5 (R4)	1.00
11452	Resistor—470,000 ohms, carbon type, 1/10 watt—Package of 5 (R4)	.75
12200	Resistor—1 megohm, insulated, ¼ watt—Package of 5 (R9)	1.00
13287	Resistor—1.5 megohms, insulated, ¼ watt—Package of 5 (R7)	$1.00
5129	Ring—Radiotron shield ring—Package of 5	.10
3594	Ring—Retaining ring for R. F. or oscillator coil—Package of 5	.40
3823	Shield—R. F. or oscillator coil shield	.30
12218	Shield—Radiotron shield	.15
12008	Shield—Transformer shield for Stock Nos. 13419 and 13693	.28
4814	Socket—5-contact 84 Radiotron socket	.15
4786	Socket—6-contact 6D6 or 42 Radiotron socket	.15
4787	Socket—7-contact 6B7 Radiotron socket	.15
12227	Socket—8-contact 6A8 or 6K7 Radiotron socket	.18
13686	Socket—Vibrator socket	.20
12007	Spring—Retaining spring for core, Stock No. 12006—Package of 10	.36
13419	Transformer—First I. F. transformer (L6, L7, C15, C16, R4)	2.25
13693	Transformer—Second I. F. transformer (L8, L9, C20, C21)	2.05
13692	Transformer—Output transformer (T2)	.90
13690	Transformer—Vibrator transformer (T1)	3.60
13688	Vibrator—Complete (L17)	3.35
13420	Volume control (R8)	1.00
	CONTROL BOX AND FLEXIBLE SHAFT ASSEMBLIES **MODELS 67M AND 67M1 ONLY**	
13719	Box—Control box, tuning section only, less knob, flexible shaft and dial scale	$4.19
13720	Box—Control box, volume control shaft and switch section only, less knob and flexible shaft	2.90
13718	Dial—Station selector dial	.70
11765	Lamp—Control box dial lamp—Package of 5	1.15
13925	Shaft—Tuning control flexible shaft, approximately 24½ inches long	1.20
13926	Shaft—Volume control flexible shaft, approximately 24½ inches long	1.20
	Note No. 1—Knobs, escutcheon, and mounting parts are included in kits to be supplied by dealer for particular car in which installation is to be made.	
	Note No. 2—If complete control box only is required, order one each of Stock No. 13719 and Stock No. 13720.

12482	Board—Reproducer terminal board	.30
12450	Coil—Field coil (L14)	1.60
12451	Cone—Reproducer cone complete (L15)	1.60
9687	Reproducer—Reproducer complete	5.65
	REPRODUCER ASSEMBLIES **DASH SPEAKER** **MODELS 67M2 AND 67M3 ONLY**	
13794	Cable—3-conductor shielded reproducer cable, approximately 18 inches long, complete with 3-contact male connector (67M2 only)	1.00
13798	Cable—3-conductor shielded reproducer cable, approximately 24 inches long, complete with 3-contact pins (67M3 only)	1.00
13795	Coil—Reproducer field coil (L14)	2.25
13796	Cone—Reproducer cone and dust cap (L15)	1.90
11984	Connector—3-contact male connector for reproducer cable (67M2 only)	.22
13793	Housing—Reproducer housing complete, less speaker unit and cable	4.15
9774	Reproducer—Speaker unit only, less case, cable and mounting parts	7.65
13797	Screw—Reproducer housing screw—Package of 5	.25
	REPRODUCER ASSEMBLIES **HEADER SPEAKER** **MODEL 67M3 ONLY**	
9705	Clip—Spring clip used to hold speaker unit in baffle pan—Package of 3	.15
9708	Cone—Reproducer cone and dust cap (L15)	1.90
9775	Reproducer—Speaker unit only, less trimmer ring, baffle pan and grille cloth, and cable	3.00
9701	Ring—Trimmer ring with baffle pan and grille cloth	1.50
9706	Screw—Mounting screw used to fasten speaker unit in car—Package of 2	.12
9709	Screen—Wire screen for speaker unit	.25
9707	Nut—Wing nut used to fasten speaker unit in car—Package of 2	.18
	CONTROL BOX AND FLEXIBLE SHAFT ASSEMBLIES **MODELS 67M2 AND 67M3 ONLY**	
13790	Box—Control box, tuning and sensitivity switch section only, less tuning control knob and dial scale	6.35
13791	Box—Control box, volume control, tone control and operating switch section, less volume control knob	3.90
13792	Cable—3-conductor shielded sensitivity and tone control cable, approximately 26 inches long, complete with 4-contact male connector	2.05
13718	Dial—Station selector dial scale	.70
11765	Lamp—Dial lamp—Package of 5	1.15
13925	Shaft—Tuning control flexible shaft, approximately 24½ inches long	1.20
13926	Shaft—Volume control flexible shaft, approximately 24½ inches long	1.20
	Note No. 1—Knobs, escutcheons, and mounting parts are included in kits to be supplied by dealer for particular car in which installation is to be made.	
	Note No. 2—If complete control box only is required, order one each of Stock Nos. 13790 and 13791.	
	MISCELLANEOUS ASSEMBLIES **ALL MODELS**	
4289	Body—"A" lead fuse connector female body—Package of 10	.35
13724	Button—Plug button to cover external speaker socket in receiver housing (67M1 only)	.15
13708	Cable—Shielded antenna lead-in, approximately 36 inches long, complete with 2 male connectors	1.15
13809	Cable—3-conductor shielded speaker switch cable, approximately 22 inches long, complete with 3-contact male connector (for Model 67M3 only)	1.00
13810	Cable—3-conductor shielded reproducer cable, approximately 90 inches long, complete with contact pins, for header speaker in Model 67M3 only	2.00
4288	Cap—Male connector cap for "A" lead—Package of 10	.36
4293	Capacitor—Ammeter capacitor	.60
5035	Capacitor—Generator capacitor	.40
13109	Capacitor—0.5 Mfd. (C42 for 67M1, 67M2, 67M3 only) (C30 for 67M only)	.76

Stock No.	DESCRIPTION	List Price
4291	Clip—"A" lead ammeter clip—Package of 10	$0.72
13710	Connector—Antenna lead connector assembly located on receiver housing	.15
13705	Cover—Receiver housing top cover, less speaker grille (67M only)	.75
13723	Cover—Receiver housing top cover, less speaker grille (67M1 only)	.75
13802	Cover—Receiver housing top cover (67M2 and 67M3 only)	.78
13706	Cover—Receiver housing bottom cover (67M and 67M1 only)	.85
13803	Cover—Receiver housing bottom cover (67M2 and 67M3 only)	.85
13808	Escutcheon—Speaker switch escutcheon for Model 67M3 only	.35
13707	Fastener—Receiver housing top cover fastener—Package of 10	.30
4286	Ferrule—Ferrule and bushing for "A" lead connector—Package of 10	.38
5023	Fuse—"A" lead fuse, 15 amp.—Package of 5	.40
13709	Grille—Speaker grille assembly (67M only)	1.20
13725	Grille—Speaker grille less screen (67M1 only)	.90
13704	Housing—Receiver housing complete less speaker grille (67M only)	6.55
13722	Housing—Receiver housing complete less speaker grille (67M1 only)	6.80
13801	Housing—Receiver housing complete (67M2 and 67M3 only)	6.55
4290	Insulator—Fuse connector insulating sleeve—Package of 10	.35
13727	Knob—Tone control knob—Package of 5 (67M1 only)	.75
4325	Knob—Speaker switch knob for Model 67M3 only—Package of 5	1.00
12445	Lead—"A" lead (set end), approximately 8 inches long, complete with section of connector	.26
7766	Lead—"A" lead (ammeter end) complete with female section of fuse connector and ammeter clip	.30
13721	Plate—Receiver nameplate and mounting screws (67M1 only)	.20
13805	Plate—RCA monogram for receiver housing (67M2 and 67M3 only)	.65
13806	Ring—Rubber ring for dash speaker mounting (67M2 and 67M3 only)	.45
13726	Screen—Speaker grille cloth and screen (67M1 only)	.80
12252	Screw—No. 8 self-tapping, hex head screw, used on receiver housing—Package of 10	.20
12447	Screw—Speaker mounting screw assembly, comprising one screw, one lockwasher, and one nut—Package of 4 (67M only)	.26
12248	Socket—3-contact socket and bracket assembly for external speaker (67M1 only)	.20
12502	Socket—Pin-type socket and bracket for tone control lead (67M1 only)	.30
13804	Socket—Socket and bracket assembly, comprising one 3-contact socket for reproducer cable and one 4-contact socket for tone and sensitivity cable, both mounted on supporting bracket (67M2 and 67M3 only)	.45
4284	Spring—Tension spring for "A" lead connector—Package of 10	.30
12448	Stud—Receiver mounting stud assembly, comprising one stud, one washer, one lockwasher, one nut	.20
12254	Stud—Dash speaker mounting stud assembly, comprising one stud, one spacer, two lockwashers and one nut (67M2 and 67M3 only)	.24
5024	Suppressor—Distributor suppressor	.38
13807	Switch—Dash mounting speaker switch and bracket assembly, less knob and cable (67M3 only)	1.75
12249	Tone control (R23) (67M1 only)	.88
4285	Washer—Insulating washer for "A" lead connector—Package of 10	.22

Prices quoted above are subject to change without notice.

4	Ant. Lead	200 Mmfd.	1,500 kc	1,500 kc	"A" Ant.	C3	Max. (peak)

*** C6 is in two sections. Tighten section on bottom of gang (under chassis) for maximum capacity before adjusting top section.**

Loudspeaker.—Centering of the loudspeaker is made in the usual manner with three narrow paper feelers after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. The dust cover should be cemented back in place with ambroid upon completion of adjustment.

Bias Cells (Model 84BT6 only).—The bias cells are used only for the purpose of supplying bias potential and should never be measured with an ordinary voltmeter or other device which draws any current. A simple check on the cells may be made by connecting a milliammeter in the plate circuit of the tubes biased by these cells (6A7 or 6D6, 2 cells; 75, 1 cell). Measure the plate current with the cells in the circuit, then carefully remove the cells and substitute a voltage equivalent to the rated cell voltage. If the first reading obtained (with bias cells) is more than 40% from the latter reading (with known voltage), the bias cells should be replaced. This 40% difference is equivalent to a change of approximately 25% battery voltage.

Precautionary Lead Dress (Model 84BT6 only).—(1) Green lead from antenna coil to antenna section of tuning condenser should be dressed as far as possible from tube No. 1 (6A7). (2) Dress brown and green twisted leads (vibrator transformer T2 to vibrator socket) under capacitor C21. (3) Dress brown-black lead (T2 to C25) away from red lead which connects terminal in vibrator compartment to "SG" of tube No. 4 (42). (4) Keep all other leads in vibrator compartment as close to chassis base as possible.

Synchronous Vibrator—Rectifier (Model 84BT6 only).—The synchronous vibrator—rectifier used in the power system is constructed with a plug-in base so as to be easily removed or replaced after first removing the two nuts holding the shield can in place. Its adjustments have been accurately made during manufacture by means of special equipment. In cases of excessive interference or otherwise faulty operation, a renewal should be installed.

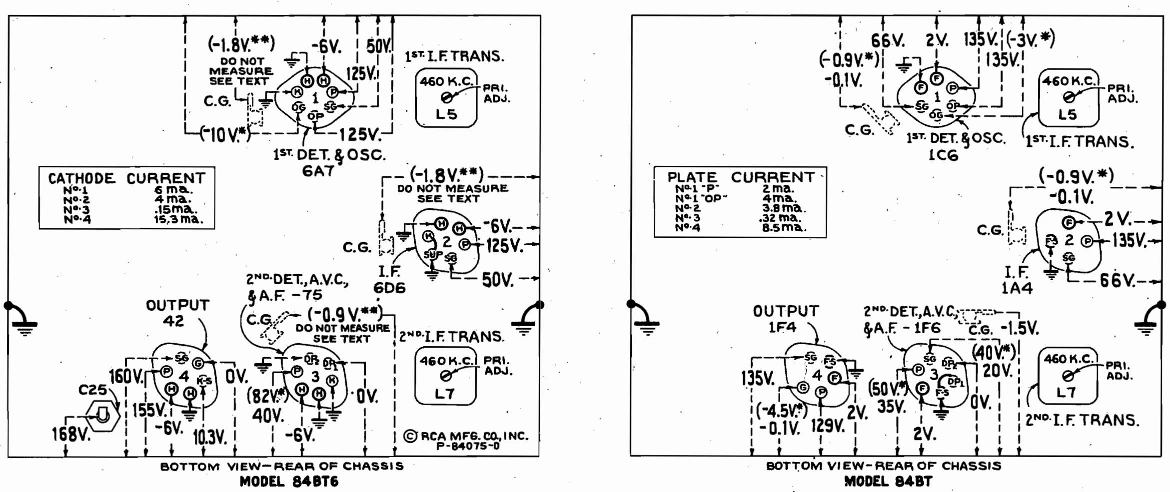

Figure 7—Radiotron Socket Voltages, Coil, and Trimmer Locations

Measured with all batteries at normal voltage—Tuned to approximately 1,000 kc—
No signal being received—Volume control optional

***Note:** Two voltage values are shown for some readings. The higher value shown in parenthesis with asterisk (*) indicates operating conditions without voltmeter loading. The lower value is the actual measured voltage and differs from the higher value because of the additional loading of the voltmeter through the high series circuit resistance.*

*****CAUTION:** Do not attempt to measure voltages on control grids of the 6A7, 6D6, or 75, with any conventional voltmeter due to presence of bias cells.*

STOCK No.	DESCRIPTION
	RECEIVER ASSEMBLIES
4289	Body—Fuse connector body (Model 84BT6 only)
14286	Bracket—Dial lamp bracket
14288	Cable—3-conductor battery cable approximately 60 inches long, complete with fuse and battery clips (Model 84BT only)
12607	Cap—First I-F transformer shield cap
12581	Cap—Second I-F transformer shield cap
12118	Cap—Grid contact cap
4288	Cap—Fuse connector male cap (Model 84BT6 only)
11654	Capacitor—.01 Mfd. (C22, C23) (Model 84BT6 only)
4841	Capacitor—0.1 Mfd. (Model 84BT, C1, C15) (Model 84BT6, C1, C10, C24)
4840	Capacitor—0.25 Mfd. (Model 84BT, C10) (Model 84BT6, C19)
12741	Capacitor—0.5 Mfd. (C21) (Model 84BT6 only)
14287	Capacitor—Pack comprising two sections each 4 Mfd. (C7, C19) (Model 84BT only)
13046	Capacitor—8 Mfd. (C25) (Model 84BT6 only)
14310	Capacitor Pack—Comprising one 10 Mfd. and two 8 Mfd. sections (C15, C26, C27) (Model 84BT6 only)
12681	Cell—Bias cell (Model 84BT6 only)
14289	Clip—2 battery clips, one marked "+" and one unmarked
14285	Coil—Antenna coil (L1, L2)
14257	Coil—Oscillator coil (L3, L4)
12179	Coil—Vibrator choke coil (L10, L11) (Model 84BT6 only)
14256	Condenser—2-gang variable tuning condenser (C2, C3, C4, C6)
5119	Connector—3-contact female connector for speaker cable
14314	Cord—Power cord complete with fuse and clips (Model 84BT6 only)
12006	Core—Adjustable core and stud for first or second I-F transformers
14264	Dial—Station selector dial and holder assembly
4286	Ferrule—Fuse connector ferrule and bushing (Model 84BT6 only)
3748	Fuse—½ ampere (F1) (Model 84BT only)
5140	Fuse—5 ampere (F1) (Model 84BT6 only)
14316	Holder—Bias cell holder (2 cells) (Model 84BT6 only)
14319	Holder—Bias cell holder (1 cell) (Model 84BT6 only)
14263	Indicator—Station selector indicator pointer
4290	Insulator—Fuse connector body insulator (Model 84BT6 only)
4348	Lamp—Dial lamp (Model 84BT only)
4340	Lamp—Dial lamp (Model 84BT6 only)
14313	Mounting — Vibrator socket mounting comprising 2 rubber washers, 2 screws, 2 eyelets, 2 washers, 2 lock-washers, and 2 nuts (Model 84BT6 only)
12818	Reactor—Filter reactor (L13) (Model 84BT6 only)
8063	Resistor—330 ohms, carbon type, ½ watt (R6) (Model 84BT6 only)
5031	Resistor—680 ohms, carbon type, ½ watt (R8, R11, R12) (Model 84BT6 only)
12330	Resistor—3,300 ohms, carbon type, ½ watt (R13) (Model 84BT6 only)
11305	Resistor—22,000 ohms, carbon type, ½ watt (R2)
14284	Resistor—22,000 ohms, carbon type, 1/10 watt (R3)
11364	Resistor—33,000 ohms, carbon type, ½ watt (R1) (Model 84BT only)
12333	Resistor—68,000 ohms, carbon type, ½ watt (R1) (Model 84BT6 only)
5023	Resistor—150,000 ohms, carbon type, ½ watt (R9) (Model 84BT only)
11398	Resistor—220,000 ohms, carbon type, 1/10 watt (R4) (Model 84BT only)
11323	Resistor—270,000 ohms, carbon type, ½ watt (R9)
11172	Resistor—470,000 ohms, carbon type, ½ watt (R10)
3033	Resistor—1 megohm, carbon type, ½ watt (R8) (Model 84BT only)
11626	Resistor—2.2 megohms, carbon type, ½ watt (Model 84BT, R5) (Model 84BT6, R5, R7)
4629	Cap—Radiotron shield cap
12629	Capacitor—56 Mmfd. (C9)
14262	Capacitor—110 Mmfd. (C8)
12404	Capacitor—120 Mmfd. (C11, C12)
12724	Capacitor—120 Mmfd. (C5, C16)
12406	Capacitor—180 Mmfd. (C13)
14320	Capacitor—330 Mmfd. (C7, C20) (Model 84BT6 only)
5107	Capacitor—.0025 Mfd. (C14)
5005	Capacitor—.0035 Mfd. (C18) (Model 84BT only)
5148	Capacitor—.007 Mfd. (C17) (Model 84BT only)
5196	Capacitor—.007 Mfd. (C17, C18) (Model 84BT6 only)
13673	Resistor—10 megohms, carbon type, ½ watt (R6) (Model 84BT only)
14315	Shield—Chassis end shield complete with bias cell holder —For end opposite vibrator (Model 84BT6 only)
14318	Shield—Chassis end and bottom shield for vibrator end of chassis (Model 84BT6 only)
12008	Shield—First or second I-F transformer shield can
14317	Shield—Vibrator shield can (Model 84BT6 only)
3682	Shield—1A4, 1F6, 6D6, or 75 Radiotron shield
14114	Socket—Dial lamp socket
4794	Socket—4-contact 1A4 Radiotron socket (Model 84BT only)
4814	Socket—5-contact 1F4 Radiotron socket (Model 84BT only)
4786	Socket—6-contact 1C6, 1F6, 6D6, 42, or 75 Radiotron socket
14312	Socket—6-contact vibrator socket, less rubber mounting (Model 84BT6 only)
4787	Socket—7-contact 6A7 Radiotron socket (Model 84BT6 only)
4284	Spring—Fuse connector spring (Model 84BT6 only)
12007	Spring—Retaining spring for core Stock No. 12006
14261	Transformer—First I-F transformer (L5, L6, C8, C9)
14283	Transformer—Second I-F transformer (L7, L8, C11, C12, C13, R3, R4) (Model 84BT only)
14308	Transformer—Second I-F transformer (L7, L8, C11, C12, C13, R4) (Model 84BT6 only)
14311	Transformer—Vibrator transformer (T2) (Model 84BT6 only)
14309	Vibrator complete (L12) (Model 84BT6 only)
14282	Volume control and power switch (R7, S1) (Model 84BT only)
14307	Volume control and power switch (R4, S1) (Model 84BT6 only)
4285	Washer—Fuse connector insulating washer (Model 84BT6 only)
	REPRODUCER ASSEMBLIES (76474-3) (Model 84BT only)
14303	Cone—Reproducer cone centered in metal housing complete with dust cap, less output transformer and plug (L9)
5118	Plug—3-contact male plug for reproducer
9802	Reproducer complete
14304	Transformer—Output transformer (T1)
	REPRODUCER ASSEMBLIES (76494-2) (Model 84BT6 only)
14305	Cone—Reproducer cone complete with dust cap (L9)
5118	Plug—3-contact male plug for reproducer
9803	Reproducer complete
14306	Transformer—Output transformer (T1)
	MISCELLANEOUS ASSEMBLIES
14268	Crystal—Station selector crystal
14269	Knob—Station selector or volume control knob
14299	Resistor—0.68 ohm flexible wire wound ballast resistor (Model 84BT only)
14298	Screw—Chassis mounting screw and washer assembly
14270	Spring—Retaining spring for knob Stock No. 14269

NOTE: On later production Model 84BT6, an RCA-41 output tube is used in place of the RCA-42. All circuit and specification data remain the same except the "A" current consumption at 6 volts which is 2.65 amperes.

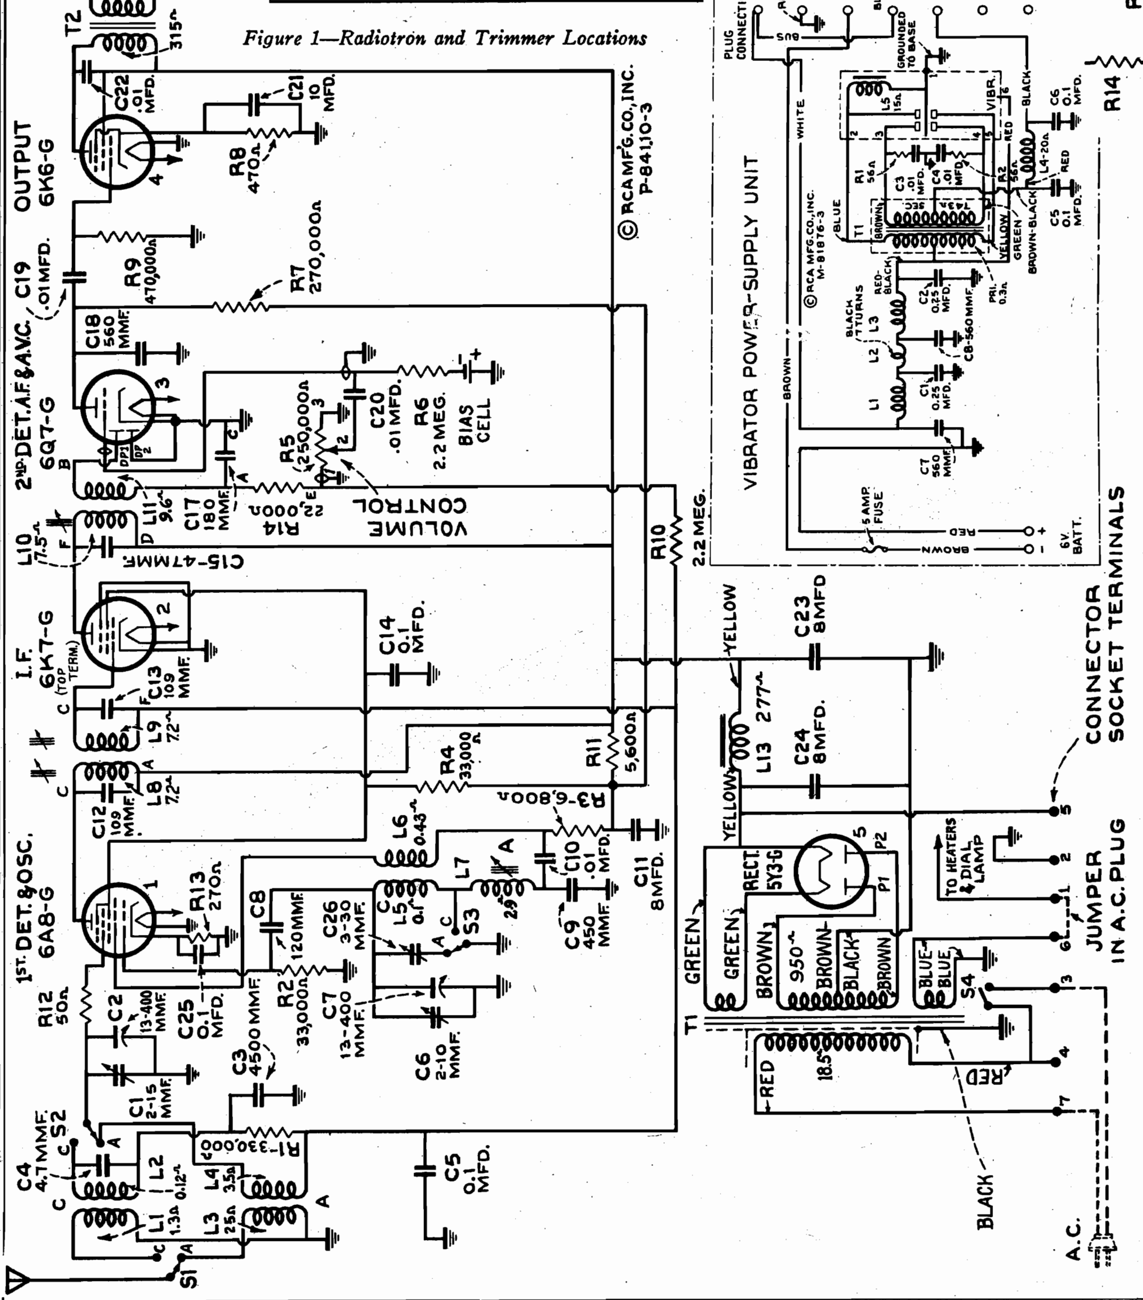
Power Supply Ratings
Rating A .... 105-125 volts, 50-60 cycles, 45 watts
Storage Battery .... 6 volts, 2.95 amperes

Fuse Rating (Vibrator) .... 5 amperes



This receiver employs five tubes in a two-band superheterodyne circuit. The design includes magnetite-core adjusted i-f transformers and low-frequency "A" oscillator tracking, automatic volume control, resistance-coupled audio amplifier, and a six-inch permanent-magnet dynamic loudspeaker. It is designed for convenient use either as a conventional a-c operated receiver (a-c power-supply cable-connector) or as a storage-battery operated receiver (vibrator power-supply unit with cable-connector); the transition from one type of operation to the other being made by merely exchanging cable-connector connections to the male connector on the rear of the receiver chassis.

RCA MFG. CO., INC.

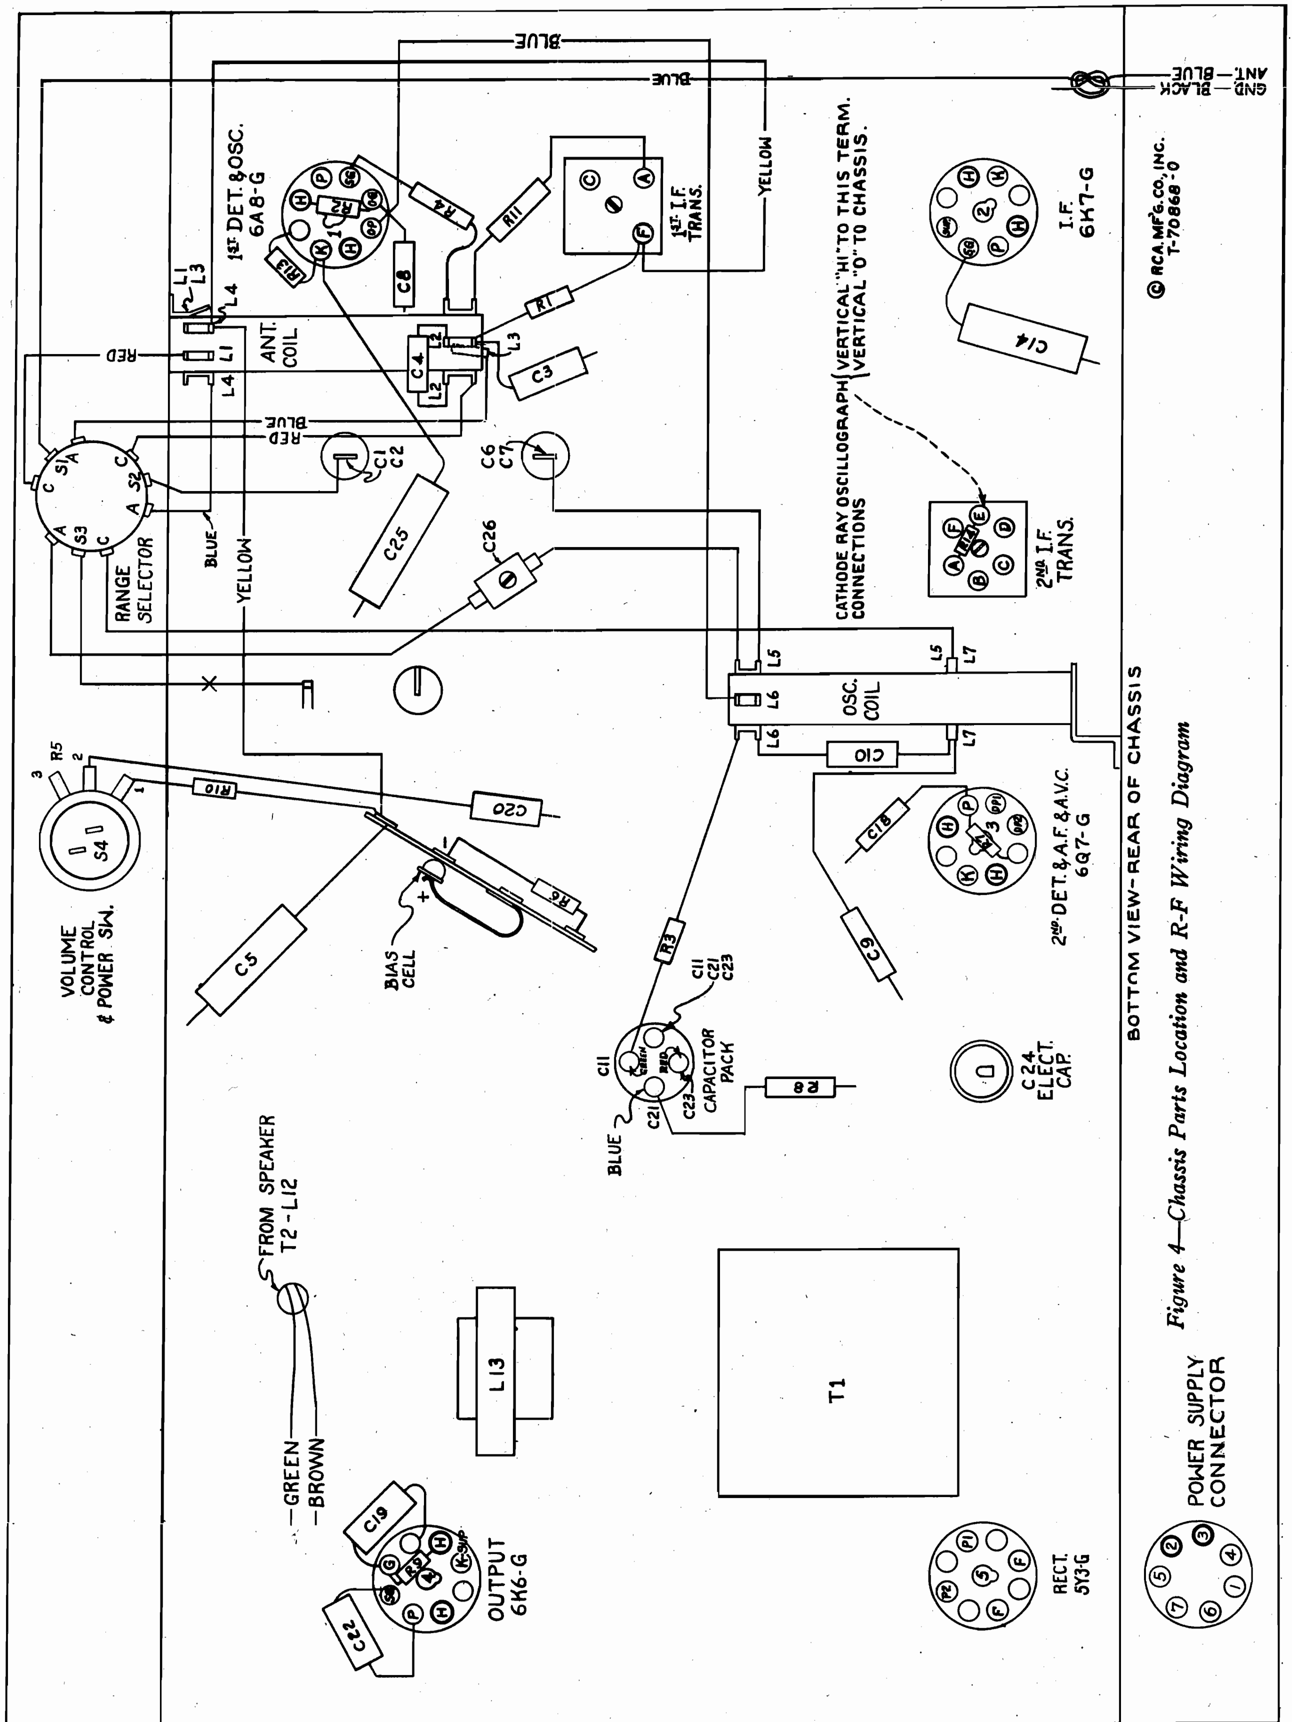

Figure 4—Chassis Parts Location and R-F Wiring Diagram

RCA MFG. CO., INC.

MODEL 85BT6
Lead Dress, Notes
Trimmers, Voltage

Precautionary Lead Dress.—(1) Dress brown twisted leads to power switch away from bias cell and a-f leads to volume control. (2) Dress light-blue lead, connected from 6A8-G socket to oscillator coil, away from all other leads and chassis. (3) Dress 6A8-G grid-cap lead (R12) to prevent shorts and keep flexible. (4) Dress all leads to antenna coil away from trimming capacitor C26 and from bus lead, connected from oscillator coil to gang condenser. (5) Dress blue antenna lead through the loop of C4 which is mounted on end of antenna coil. Do not change length of the following leads: (6) C9 to chassis; (7) Blue lead from L3 to range selector; (8) Bus lead from oscillator coil to gang condenser. Keep the following as short as possible: (9) Leads to C26; (10) Bus lead from oscillator coil to range selector. In the vibrator power-supply unit: (11) Dress small leads from transformer to vibrator socket terminals 3 and 4 close to base and twist twice. (12) Twist large leads from transformer to vibrator socket terminals 2 and 5. (13) Dress C2 as near to bottom cover as possible.

Phonograph Attachment.—See Schematic Circuit Diagram, figure 3.

CAUTION.—Disconnect plug from a-c power source, or battery clips from storage battery, before attaching either cable-connector to the male connector on the rear of the chassis.

110-Volt A-C Operation.—When the a-c power-supply cable-connector is attached to the male connector on the rear of the chassis; a-c power is supplied to the primary circuit of transformer T1 through terms. 3 and 7. Terms. 1 and 6 are jumpered together, in cable-connector, thereby connecting the tube heaters and dial lamp to the heater winding of T1. Terms. 2, 4, and 5 are not used.

6-Volt Battery Operation.—When the vibrator power-supply unit cable-connector is attached to the male connector on the rear of the chassis, the high side of the battery (−) is connected to receiver "On-Off" switch S4 through term. 3. The other side of S4 connects to term. 4 which in turn is jumpered to term. 1, in cable connector, thereby supplying battery power to the vibrator circuit and to the tube heaters and dial lamp through term. 1. Battery ground return (+) connection is made through term. 2. "B+" voltage from vibrator is connected to the receiver filter input through term. 5. The 5Y3-G rectifier tube circuit is inoperative for this type of operation. Terms. 6 and 7 are not used.

Bias Cell.—The bias cell is used only for the purpose of supplying bias potential to the triode section of the 6Q7-G tube. This cell should never be measured with an ordinary voltmeter, or other device, which draws any current. A simple check on this cell may be made by temporarily shunting the 270,000-ohm plate resistor R7 (mounted on 6Q7-G socket) with a 20,000-ohm resistor, connecting a milliammeter in the plate circuit of the 6Q7-G tube, and noting the plate current reading. Then carefully remove the bias cell and substitute a battery potential of 0.9-volt in its place and note the new reading of the milliammeter. If the first reading obtained (with bias cell) differs from the latter reading (with 0.9-volt battery supply) by more than 20% of the latter reading, the bias cell should be replaced. This 20% is equivalent to a change of approximately 25% battery voltage.

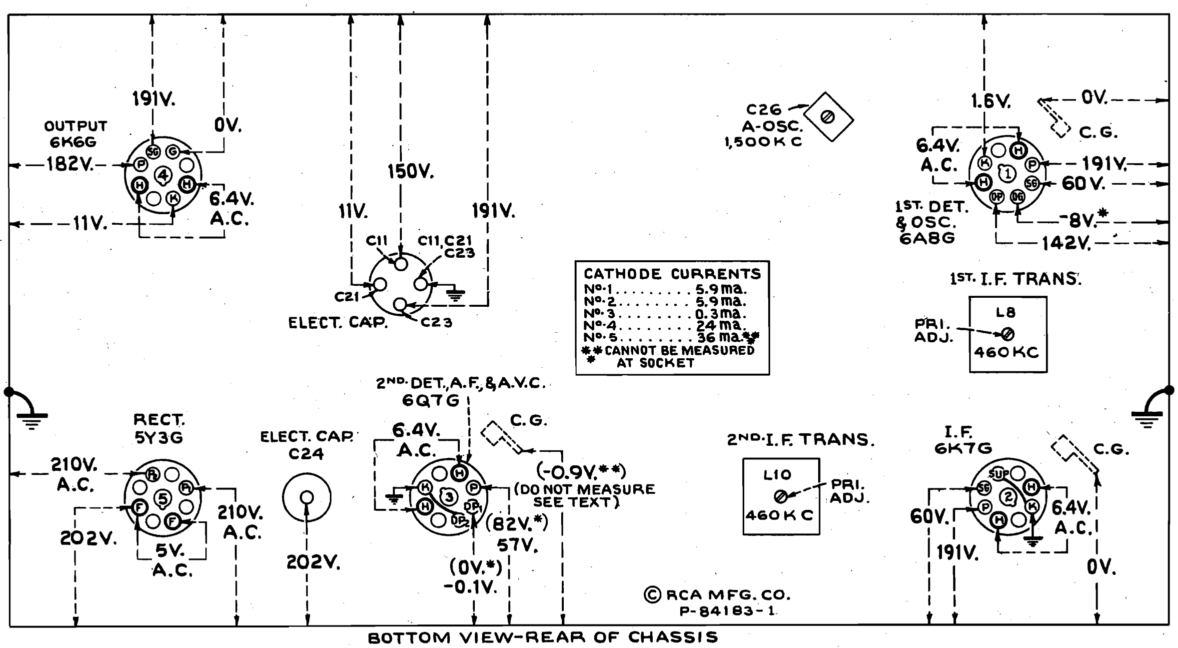

Figure 2—Radiotron Socket Voltages and Trimmer Locations

Measured at 115 volts, 60-cycle supply—Values approximately 5% lower when vibrator power-supply unit is used—Tuned to approximately 1,000 kc ("Broadcast")—No signal being received—Volume control minimum

***** CAUTION: Do not attempt to measure voltage on control grid of the 6Q7-G with any conventional voltmeter due to presence of bias cell.***

Note: Two voltage values are shown for some readings. The higher value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The lower value is the actual measured voltage and differs from the higher value because of the additional loading of the voltmeter.

Voltage values as specified should hold within ±20% when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250 and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

MODEL 85BT6
Alignment
Parts

RCA MFG. CO., INC.

Alignment Procedure

Calibrate the tuning dial by adjusting dial pointer to the center horizontal line with the gang tuning-condenser plates in full-mesh position. This is a screw-driver adjustment.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 1 and 2.

Cathode-ray alignment is preferable; the connections to the chassis are shown on figure 4. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

Order of Alignment	Test Oscillator			Range Selector	Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
	Connection to Receiver	Dummy Antenna	Frequency Setting					
1	6K7-G I-F Grid Cap	.001 Mfd.	460 kc	"A" Left	No Signal 550-750 kc	2nd I-F Trans.	L10	Max. (peak)
2	6A8-G Det. Grid Cap	.001 Mfd.	460 kc	"A" Left	No Signal 550-750 kc	1st I-F Trans.	L8 and L9	Max. (peak)

Measured at 115 volts, 60-cycle supply—Tuned to approximately 1,000 kc ("Broadcast")—
No signal being received—Volume control minimum

***Note:** Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.*

Voltage values as specified should hold within ±20% when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250, and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

MODELS 85E, U102E
Lead Dress, Alignment Pick-up, Motor Notes Specs., Parts

RCA MFG. CO., INC.

Precautionary Lead Dress—(1) Dress power line leads to the on-off switch away from grid connection terminal on volume control to reduce hum pickup. (2) Keep leads of capacitor C3 as short as possible. (3) Bus leads from range selector (ter. 6) to oscillator-coil tap L6-L8 should be maintained 3½-inches long for proper alignment. (4) Capacitor C25 should be dressed free of adjacent parts to maintain correct alignment at high-frequency end of "A" band. (5) Bus lead from range selector (ter. 3) to antenna coil L1 should be maintained 2¼-inches long for proper alignment. (6) The RCA-6A7 grid-cap lead (50-ohm resistor R18) to top of tuning capacitor C2 should be dressed properly to prevent shorts and should be maintained flexible to prevent acoustic howl.

Loudspeaker.—Centering of the loudspeaker is made in the usual manner with three narrow paper feelers after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. The dust cover should be cemented back in place with ambroid upon completion of adjustment.

Magnetic Pickup
(Model U-102E)

The pickup used in the phonograph unit is of an improved design. The horseshoe magnet is rigidly welded to the pole pieces and is irremovable. There is a centering spring attached to the armature to maintain proper adjustment and to provide a limiting effect on the movement of the armature. The frequency response is substantially uniform over a wide range. Service operations which may be necessary on the pickup are as follows:

Centering Armature.—Refer to figure 1 showing the pickup inner structure. The armature is shown in its proper relation to the magnet pole pieces, i. e., exactly centered. Whenever this centering adjustment has been disturbed it will be necessary to remove the pickup mechanism from the tone arm by removing the needle holding screw and the two mounting screws from the front of the tone arm, holding the pickup assembly to keep it from dropping. Unsolder the two leads from the lugs on the terminal board at the rear of the pickup. Insert a small rod or nail into the armature needle hole and replace the needle holding screw, tightening it to hold the rod securely. If the armature clamping screws A and B have not been disturbed, screws C should be loosened which will permit the armature to be moved from side to side, the rod acting as a lever to perform this operation. Proper adjustment is obtained when the armature is moved to the extreme position on each side (the movement being limited by the armature striking the pole pieces) and then brought to the mid-position between these two extremes. Screws C should then be tightened. The armature position should then be central between the pole pieces and at right angles to them. With a little practice, the correct adjustment of the armature will be obtained. The air gap between the pole pieces and the armature should be kept free from dust, filings, and other foreign material which would obstruct the movement of the pickup armature.

Damping Block.—The viscoloid damping block which is attached to the front end of the armature shank serves as a mechanical filter to eliminate undesirable resonances and to cause the frequency response to be uniform. Should it be necessary to replace this damping block, the pickup mechanism should be removed from the tone arm as explained above. Remove screw D and the damping block from the pickup assembly. Make sure that the shaft of the armature which contacts the viscoloid is clean. Then insert the new damping block so that it occupies the same position as that of the original block, and is in correct vertical alignment with the armature. The hole in the block is somewhat smaller than the diameter of the armature in order to permit a snug fit. With the damping block properly aligned on the armature, screw D with its washer should then be replaced. Heat should be applied to the armature (viscoloid side) so that the damping block will fuse at the point of contact and become rigidly attached to the armature. A special-tip soldering iron, constructed as shown in figure 4 will be found very useful in performing this operation. The iron should be applied only long enough to slightly melt the block, causing a small bulge on both sides.

Replacing Coil.—Whenever there is defective operation due to an open or shorted pickup coil, this coil should be replaced. Remove the pickup mechanism and terminal board as described above. Remove screws A and B and the magnet assembly. Remove the bakelite coil support (with coil attached) and insert the new coil support assembly in its place, after which replace the magnet assembly and center the armature as described above, then re-assemble the remainder of the unit.

Magnetizing.—In case it becomes necessary to re-magnetize the unit, first remove the pickup mechanism from the tone arm, and then remove the magnet assembly. Place the magnet assembly on the poles of a standard pickup magnetizer such as the RCA Stock No. 9549 Pickup Magnetizer and. charge the magnet in accordance with the instructions accompanying the magnetizer. It is preferable to check the polarity of the pickup magnet and to re-magnetize it so that the same polarity is maintained.

Motor and Motorboard
(Model U-102E)

The adjustments for tone-arm height and automatic stop-switch position are shown in figure 5.

The phonograph motor is of the governor induction type and designed to be simple and foolproof. Occasionally, however, certain adjustments may be required. These adjustments are illustrated and explained in figure 6. Apply a few drops of light machine oil in the three holes provided and around the motor spindle every six months to ensure smooth operation.

Alignment Procedure

Calibrate the tuning dial by adjusting dial pointer to the center horizontal line with the gang tuning-condenser plates in full-mesh position. This is a screw-driver adjustment.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 7 and 8.

Cathode-ray alignment is preferable; the connections to the chassis are shown on figure 3. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

14615	Transformer—Output transformer (T2)
	REPRODUCER ASSEMBLIES (Model U-102E only) (Speaker No. RL-70E-1)
13866	Cap—Dust cap for cone center
14354	Coil—Reproducer field coil (L13)
11469	Coil—Hum neutralizing coil (L12)
12667	Cone—Reproducer cone and voice coil (L11)
5118	Plug—3-contact male plug
14395	Reproducer—Complete
14358	Screw—Screw and lockwasher to hold core in yoke
14355	Transformer—Output transformer (T2)
14357	Washer—Spring washer to hold field coil
	MISCELLANEOUS ASSEMBLIES (Model 85E only)
14654	Escutcheon—Station-selector escutcheon and crystal
12673	Knob—Tuning, volume control, or range switch knob
4119	Screw—No. 8-32, headless set screw for knob Stock No. 12673
30466	Screw—Chassis mounting screw and washer assembly
	MISCELLANEOUS ASSEMBLIES (Model U-102E only)
11762	Box—Used-needle box
30478	Cable—2-conductor shielded compensator cable complete with 3-contact male connector
14393	Capacitor—.01 Mfd. (C30)
4839	Capacitor—0.1 Mfd. (C50, C51)
14782	Connector—3-contact male connector for cable Stock No. 30478
11704	Damper—Turntable rubber damper and damper plate
14654	Escutcheon—Station-selector escutcheon and crystal
12673	Knob—Tuning, radio-volume control, range switch or phonograph-volume control knob
4119	Screw—No. 8-32, headless set screw for knob Stock No. 12673
30477	Screw—Chassis mounting screw, washer, lockwasher and nut—for rear of chassis
30535	Screw—Chassis mounting screw and washer—for front of chassis
30249	Screw—Motorboard mounting screw, spring, spacer, washer, lockwasher and rubber washer assembly
14499	Resistor—1,500 ohms, insulated, ¼ watt (R52)
12955	Resistor—3,900 ohms, insulated, ¼ watt (R53)
12286	Resistor—56,000 ohms, insulated, ¼ watt (R56)
14801	Turntable
14815	Volume Control—Phonograph volume control and switch (R50, S50)

RCA MFG. CO., INC.

Alignment Procedure

With the gang tuning-condenser plates in full-mesh position, adjust the pointer to the low-frequency (end) calibration mark on the dial scale. The pointer is soldered in place on the drive cable.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 1 and 2.

Cathode-ray alignment is preferable; the connections to the chassis are shown on figure 4. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver "G" (ground) terminal for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

Order of Alignment	Test Oscillator: Connection to Receiver	Test Oscillator: Dummy Antenna	Test Oscillator: Frequency Setting	Range Selector	Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
1	6K7 I-F Grid Cap	.001 Mfd.	460 kc	"A" Left	No Signal 550-750 kc	2nd I-F Trans.	L12 and L13	Max. (peak)
2	6A8 Det. Grid Cap	.001 Mfd.	460 kc	"A"	No Signal 550-750 kc	1st I-F Trans.	L10 and L11	Max. (peak)
3	Ant. Term.	300 Ohms	6,000 kc	"B" Center	6,000 kc	"B" Osc.	C11	Max. (peak)*
4	Ant. Term.	300 Ohms	6,000 kc	"B"	6,000 kc	"B" Ant.	C2	Max. (peak)†
5	Ant. Term.	300 Ohms	20,000 kc	"C" Right	20,000 kc	"C" Osc.	C7	Max. (peak)‡
6	Ant. Term.	200 Mmfd.	600 kc	"A" Left	600 kc	"A" L-F Osc.	L8	Max. (peak)
7	Ant. Term.	200 Mmfd.	1,500 kc	"A"	1,500 kc	"A" H-F Osc.	C10	Max. (peak)
8	Ant. Term.	200 Mmfd.	600 kc	"A"	600 kc	"A" L-F Osc.	L8	Max. (peak)
9	Ant. Term.	200 Mmfd.	1,500 kc	"A"	1,500 kc	"A" H-F Osc.	C10	Max. (peak)

*** Use minimum capacity peak if two peaks can be obtained.**
† After this adjustment, check for image signal by shifting receiver dial to 5,080 kc.
‡ Use maximum capacity peak if two peaks can be obtained. After this adjustment, check for image signal by shifting receiver dial to 20,920 kc.

Note that the heterodyne oscillator tracks above the signal frequency on bands "A" and "B," and **below** the signal frequency on band "C."

STOCK No.	DESCRIPTION
	RECEIVER ASSEMBLIES
14380	Arm—Hub and arm for operating band indicator shutter—fastens on range switch shaft
14352	Belt—Station selector drive belt
13216	Board—Antenna and ground terminal board
12717	Board—Phonograph terminal board
12607	Cap—Top shield cap for first I.F. transformer
12581	Cap—Top shield cap for second I.F. transformer
11350	Cap—Grid contact cap
12723	Capacitor—56 Mmfd. (C5)

12484	Capacitor—0.25 Mfd. (C13)
11203	Capacitor—10 Mfd. (C12)
30577	Capacitor Pack—Comprising two sections each 10 Mfd. (C24, C26)
5212	Capacitor—16 Mfd. (C25)
4358	Clamp—Mounting clamp for capacitor pack, Stock No. 30577
30578	Coil—Antenna coil (L1, L2, L3)
30579	Coil—Oscillator coil (L4, L5, L6, L7, L8, L9)
30573	Condenser—2-gang variable tuning condenser (C2, C3, C6)
30580	Condenser—3-gang mica trimmer—two sections each 2-10 Mmfd., one section 3-30 Mmfd. (C7, C10, C11)
30586	Cord—Station-selector indicator pointer cord
12800	Core—Adjustable core and stud for oscillator coil
12006	Core—Adjustable core and stud for I.F. transformer
30589	Dial—Station-selector dial scale
30581	Disc—Band indicator disc with celluloid window
30572	Drive—Vernier drive shaft and pinion gear for variable condenser
30584	Drum—Station-selector drive-cord drum with set screws
30583	Indicator—Station-selector indicator pointer and holder assembly
5226	Lamp—Dial lamp
30587	Pulley—Drive-belt pulley for condenser shaft
14636	Pulley—Drive-belt idler pulley
14525	Resistor—22 ohms, carbon type, ¼ watt (R13)
30590	Resistor—39 ohms, carbon type, ¼ watt (R19)
14653	Resistor—50 ohms, flexible type, 1/10 watt (R20)
30591	Resistor—220 ohms, insulated wire wound, 1.1 watt (R12)
11298	Resistor—5,600 ohms, carbon type, 1 watt (R5)
14559	Resistor—10,000 ohms, insulated, ¼ watt (R17)
30151	Resistor—18,000 ohms, insulated, 1 watt (R3, R32) (R32—Model 87T1 only)
14284	Resistor—22,000 ohms, carbon type, 1/10 watt (R7)
12454	Resistor—33,000 ohms, insulated, ¼ watt (R1)
11323	Resistor—270,000 ohms, carbon type, ¼ watt (R10)

STOCK No.	DESCRIPTION
13005	Resistor—390,000 ohms, carbon type, 1/10 watt (R11)
11452	Resistor—470,000 ohms, carbon type, 1/10 watt (R2)
12013	Resistor—1 meg., carbon type, 1/10 watt (R31) (Model 87T1 only)
12679	Resistor—2.2 meg., insulated, ¼ watt (R4, R9)
11626	Resistor—2.2 meg., carbon type, ¼ watt (R30) (Model 87T1 only)
30582	Retainer—Band-indicator disc retainer
14343	Ring—Retaining ring for range switch shaft
14350	Screw—No. 8-32 x 3/16 in. square-head set screw for drum, Stock No. 30584, arm, Stock No. 14380, and pulley, Stock No. 30587
14340	Shaft—Drive pulley and knob shaft—fastens on range switch shaft
12008	Shield—I.F. transformer shield can
11196	Socket—8-contact Radiotron socket
14114	Socket—Dial-lamp socket
13871	Socket—Tuning-tube socket complete—less cable (Model 87T1 only)
12007	Spring—Retaining spring for core, Stock No. 12006
30585	Spring—Tension spring for pointer cord
30588	Spring—Tension spring for idler pulley
30576	Switch—Range switch (S1, S2)
30574	Tone control and power switch (R18, S4)
14376	Transformer—First I.F. transformer (L10, L11, C14, C15)
14308	Transformer—Second I.F. transformer (L12, L13, C19, C27, C28, R7)
30571	Transformer—Power transformer, 105-125 volts, 25-60 cycle (T1)
30617	Transformer—Power transformer, 105-125 and 200-250 volts, 50-60 cycle (T1)
30575	Volume Control (R8)
	REPRODUCER ASSEMBLIES
14614	Cone—Reproducer cone and dust cap (for speaker marked 84091-1 or 84001-3) (L14)
14934	Cone—Reproducer cone and dust cap (for speaker marked 84091-2 or 84001-6) (L14)
14613	Reproducer complete (marked 84001-3 or 6 but interchangeable with speaker marked 84091-1 or 2)
14615	Transformer—Output transformer (for speaker marked 84091-1 or 84001-3) (T2)
14935	Transformer—Output transformer (for speaker marked 84091-2 or 84001-6) (T2)
	MISCELLANEOUS ASSEMBLIES
30595	Bracket—Tuning-tube mounting bracket and clip (Model 87T1 only)
30593	Escutcheon—Dial escutcheon and crystal (Model 86T3 only)
30594	Escutcheon—Dial and tuning-tube escutcheon and crystal (Model 87T1 only)
14359	Knob—Station selector knob
14269	Knob—Tone control, volume control, or range switch knob
14267	Screw—Chassis-mounting screw and washer assembly
14270	Spring—Retaining spring for knob, Stock No. 14269
4982	Spring—Retaining spring for knob. Stock No. 14359

SPEAKER RESISTANCES				
TYPE	L14	L16	T2 PRI.	T2 SEC.
84091-1 84001-3	2.4	0.16	520	0.37
84091-2 84001-6	4.5	0.22	700	0.5

Loudspeaker.—Centering of the loudspeaker is made in the usual manner with three narrow celluloid or paper feelers after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. A dust cover should be cemented in place with ambroid upon completion of adjustment.

Phonograph Attachment.—A terminal board is provided for connecting a phonograph into the audio amplifying circuit. RCA Victor Models R-93, R-93-A, R-93-2, or R-94 Record Players should be connected as follows: Open link between terminals 1 and 2 on terminal board. Connect yellow wire in Radio-Record switch cable to terminal 1, green to terminal 2, and shield extension to terminal 3. Tape unused red and blue leads separately. Connect a 2-conductor twisted cable between the Record Player binding posts and the screw terminals on Radio-Record switch.

Precautionary Lead Dress.—(1) Keep leads from C1 as short as possible. (2) Dress yellow and green leads from range selector to oscillator coil between front apron and range selector. Maintain original length and size of the following: (3) bus lead from antenna coil L1 to range selector and (4) lead from oscillator coil to chassis.

Radiotron Cathode Current Readings

Measured with Milliammeter Connected at Tube Socket Cathode Terminals Under Conditions Similar to Those of Voltage Measurements

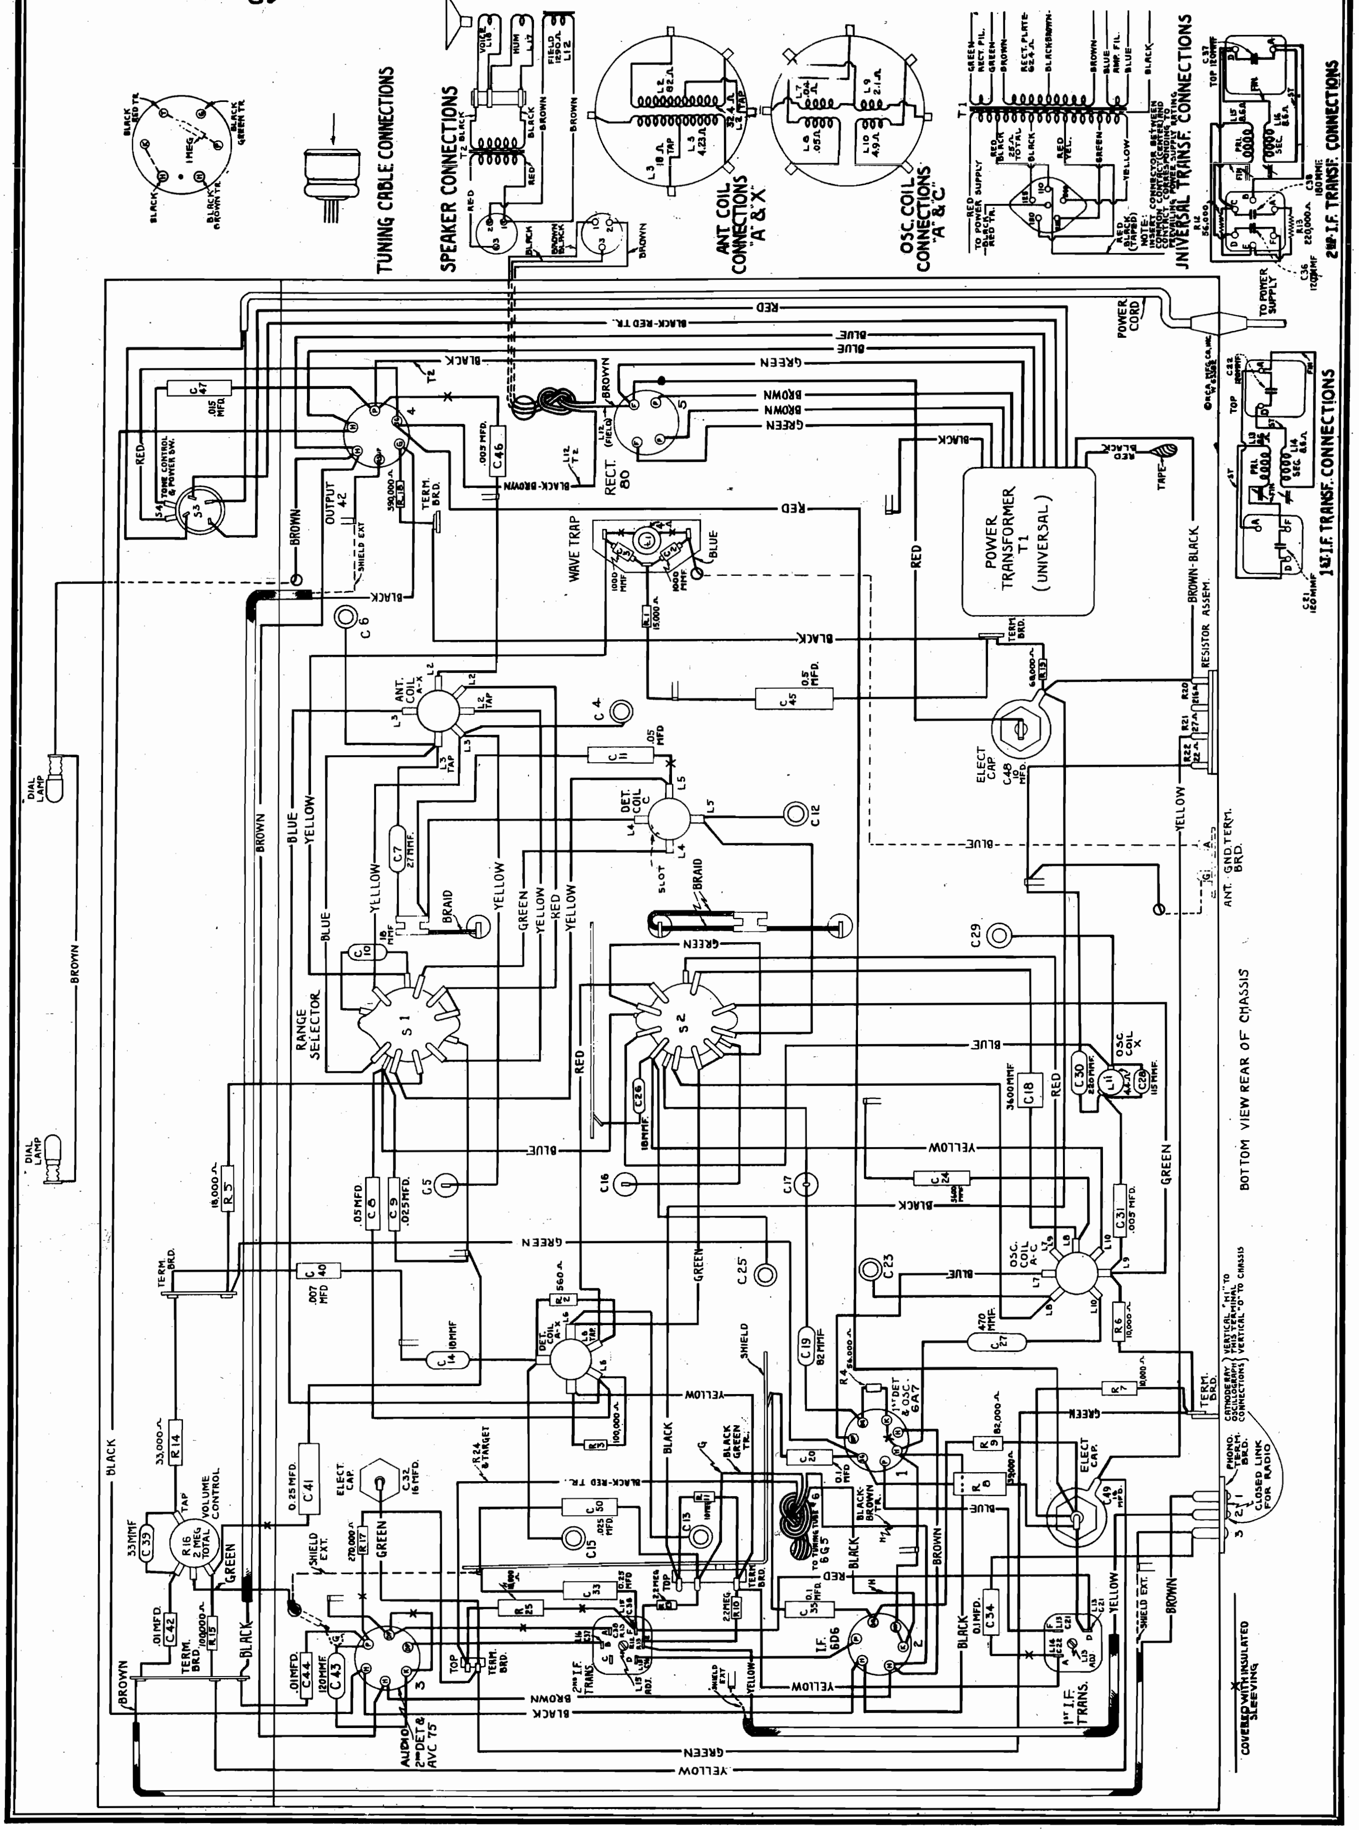
Chassis Wiring, Coils

RCA MFG. CO., INC.



RCA MFG. CO., INC.

The various diagrams of this booklet contain such information as will be needed to isolate causes for defective operation if such develops. The ratings of the resistors, capacitors, coils, etc., are indicated adjacent to the symbols signifying these parts on the diagrams. Identification titles such as R1, L1, C1, etc., provide reference between the illustrations and Replacement Parts List. The coils, transformer windings, and reactors are rated in terms of d-c resistance to permit continuity checks.

Precautionary Lead Dress.—Keep the following leads as short as possible: (1) Bus lead from C16 to S2, (2) bus lead from L8 to S2, (3) leads from C24 to L8 and to chassis. (4) Bus lead from L5 to S2 should be 2½ inches long between lugs and dressed away from S2, (5) bus lead from C17 to S2 should be dressed away from adjacent parts, (6) leads should be dressed away from grid lug of 42 tube, (7) C11 lead to L5 should be 1 inch long and dressed between L5 and C4, C11 lead to ground should be short, (8) green lead between opposite lugs on S2 should be dressed away from S2, (9) excess antenna lead should be dressed above chassis, (10) blue lead from L7 to 6A7 oscillator plate lug should be dressed down and away from L8 lug and away from oscillator grid of 6A7, (11) green lead from L6 to S2 should be dressed away from bus connected between C17 and S2, (12) red lead from L6 tap to S2 should be dressed away from bus connected between C17 and S2. When necessary to replace bus leads, use only wire having same diameter as original.

Phonograph Attachment.—A terminal board is provided for connecting a phonograph into the audio amplifying circuit. RCA Victor Models R-93, R-93-A, R-93-2, or R-94 Record Players should be connected as follows: Remove link between terminals 1 and 2 on terminal board. Connect green wire in Radio-Record switch cable to terminal 1, yellow to terminal 2, and shield extension to terminal 3. Tape unused red and blue leads separately. Connect a 2-conductor twisted cable between the Record Player binding posts and the screw terminals on Radio-Record switch.

Loudspeaker.—Centering of the loudspeaker is made in the usual manner with three narrow paper feelers after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care that the acetone does not flow into the air gap. Speakers RL-63F-1 and 84091-1 have screws for the centering adjustment, while on speaker 84091-2, it is necessary to separate the glued centering disc from the housing, insert paper feelers in air gap, then apply cement to the centering disc, press down firmly, and leave the feelers in place until the cement dries. The dust cover should be cemented back in place with ambroid after completion of the adjustment.

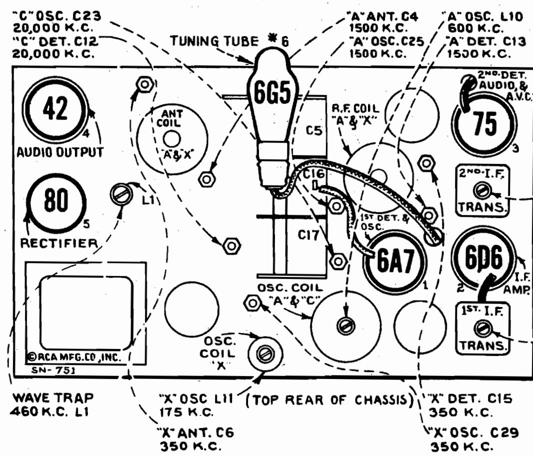


Figure 1—Radiotron, Coil, and Trimmer Locations

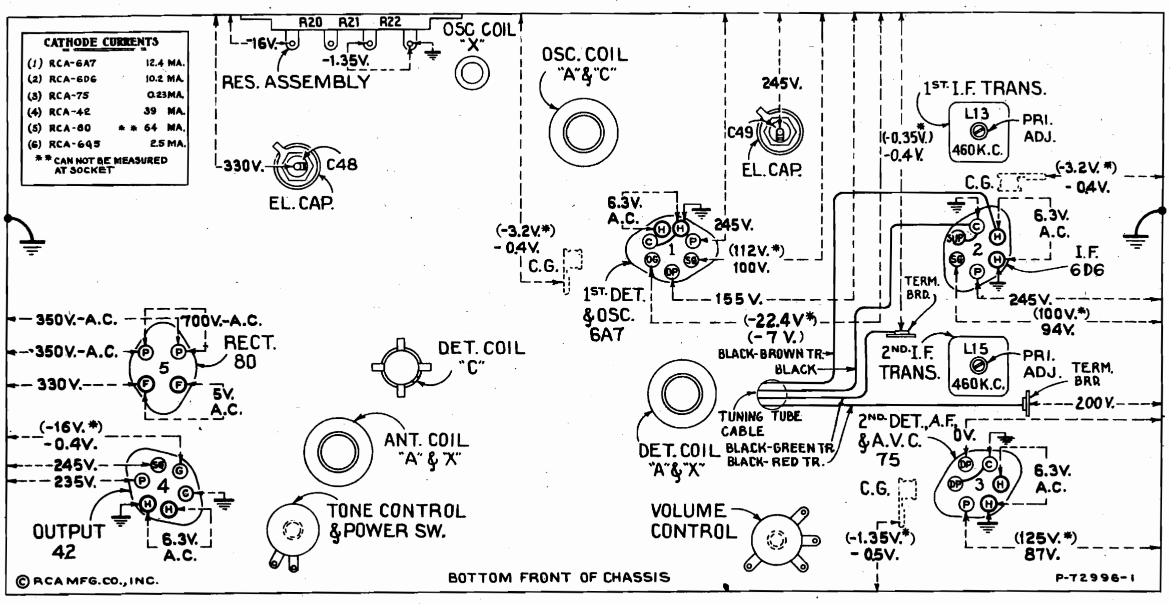

Figure 2—Radiotron Socket Voltages, Coil, and Trimmer Locations

Measured at 115 volts, 60-cycle supply—Tuned to approximately 1,000 kc or 300 meters "A" band—No signal being received—Volume control minimum

Note: Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.

Voltage values as specified should hold within ±20% when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250 and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

MODELS 86T4,86T44
Alignment,Parts

RCA MFG. CO., INC.

Alignment Procedure

Calibrate the tuning dial by adjusting main dial pointer to the low-frequency (end) calibration mark on dial with the gang tuning-condenser plates in full-mesh position; then adjust the small (vernier) pointer to figure 0. These are friction adjustments.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 1 and 2.

Cathode-ray alignment is highly preferable; the connections to the chassis are shown on figure 4. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver "G" (ground) terminal for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc (400-550 meters) where no signal or interference is received from a station or local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

* Use minimum capacity peak if two peaks can be obtained.
† Use maximum capacity peak if two peaks can be obtained.
‡ After this adjustment, check for image signal by shifting receiver dial to 19,080 kc.

REPLACEMENT PARTS

Insist on genuine factory tested parts, which are readily identified and may be purchased from authorized dealers.

STOCK No.	DESCRIPTION
	RECEIVER ASSEMBLIES
14542	Arm—Band indicator operating arm and hub—less set screw, Stock No. 14350
12038	Band—Rubber band for tuning tube
14388	Belt—Variable condenser drive belt
13216	Board—Antenna and ground terminal board
12717	Board—Phonograph terminal board
14338	Bushing—Variable condenser mounting bushing and screw assembly
14394	Cable—Tuning tube cable and socket
12607	Cap—First I.F. transformer shield top
12581	Cap—Second I.F. transformer shield top
12118	Cap—Grid contact cap
12884	Capacitor—Adjustable trimmer (long) (C4, C6, C13, C15, C25, C29)
12714	Capacitor—Adjustable trimmer (medium) (C12)
12807	Capacitor—Adjustable trimmer (short) (C23)
12722	Capacitor—18 Mmfd. (C10, C14, C26)
13605	Capacitor—27 Mmfd. (C7)

4839	Capacitor—0.1 Mfd. (C20, C34, C35)
12484	Capacitor—0.25 Mfd. (C33, C41)
12741	Capacitor—0.5 Mfd. (C45)
11203	Capacitor—10 Mfd. (C48)
5212	Capacitor—16 Mfd. (C49)
14377	Capacitor—16 Mfd. (C32)
13587	Coil—Antenna coil and shield—"X" and "A" bands (L2, L3)
13589	Coil—Antenna coil—"C" band only (L4, L5)
13590	Coil—Oscillator coil and shield—"X" band only (L11)
12798	Coil—Oscillator coil and shield—"A" and "C" bands (L7, L8, L9, L10)
13588	Coil—R.F. coil and shield—"X" and "A" bands (L6)
14539	Condenser—3-gang variable tuning condenser (C5, C16, C17)
5119	Connector—3-contact female connector for reproducer cable
12800	Core—Adjustable core and stud assembly for Stock No. 12798
12882	Core—Adjustable core and stud for Stock No. 13590
12006	Core—Adjustable core and stud for Stock Nos. 12652 and 12653
12664	Core—Adjustable core and stud for Stock No. 13592
14541	Dial—Station selector dial scale, complete with tuning tube escutcheon (for European use only)
14543	Dial—Band indicator dial and mounting bracket
14544	Dial—Station selector dial scale, complete with tuning tube escutcheon (for other than European use)
14540	Drive—Variable condenser vernier drive pinion gear and shaft
14345	Drum—Variable condenser drive belt drum, complete with set screws
14387	Escutcheon—Tuning tube escutcheon
11982	Fastener—Dial scale fastener
30085	Gear—Indicator drive gear and hub assembly and indicator pointer stem and gear assembly
14341	Idler—Station selector drive belt idler
14344	Indicator—Station selector indicator pointer
14382	Indicator—Vernier indicator pointer
5226	Lamp—Dial lamp
14028	Nut—Jamb nut for Stock Nos. 12884, 12807 and 12714
14340	Pulley—Station selector drive belt pulley and knob shaft
14362	Reflector—Dial reflector, lamp bracket and tuning tube mounting bracket and clamp
14343	Retainer—Drive shaft and pulley retainer—holds tuning knob shaft and pulley on range switch shaft
11324	Resistor—560 Ohms—Carbon type, ¼ watt (R2)
3078	Resistor—10,000 Ohms—Carbon type, ¼ watt (R6, R7)
13594	Resistor—15,000 Ohms—Carbon type, 1/10 watt (R1)
3219	Resistor—18,000 Ohms—Carbon type, ¼ watt (R5)
14078	Resistor—18,000 Ohms—Carbon type, 1 watt (R25)
13735	Resistor—33,000 Ohms—Carbon type, ¼ watt (R14)
13206	Resistor—39,000 Ohms—Carbon type, 2 watt (R8)
5029	Resistor—56,000 Ohms—Carbon type, ¼ watt (R4)
11282	Resistor—56,000 Ohms—Carbon type, 1/10 watt (R12)
12333	Resistor—68,000 Ohms—Carbon type, ¼ watt (R19)
8064	Resistor—82,000 Ohms—Carbon type, ¼ watt (R9)
5145	Resistor—100,000 Ohms—Carbon type, ¼ watt (R3, R15)
11398	Resistor—220,000 Ohms—Carbon type, 1/10 watt (R13)
12199	Resistor—270,000 Ohms—Insulated, ¼ watt (R17)
13479	Resistor—390,000 Ohms—Carbon type, ¼ watt (R18)
12013	Resistor—1 Megohm—Carbon type, 1/10 watt (R24)
12679	Resistor—2.2 Megohm—Insulated, ¼ watt (R10, R23)
13601	Resistor—10 Megohm—Insulated, ¼ watt (R11)
12004	Resistor—Voltage divider—Comprising one 216 ohm, one 27 ohm and one 22 ohm sections (R20, R21, R22)
14350	Screw—No. 8-32 x 3/16 square head set screw for gear, Stock No. 14365, and drum, Stock No. 14345, and arm, Stock No. 14542
12710	Shield—Coil shield for Stock Nos. 13587 and 13588
12799	Shield—Coil shield for Stock No. 12798
12883	Shield—Coil shield for Stock No. 13590
12008	Shield—I.F. transformer shield
12798	Shield—Oscillator coil and shield—"A" and "C" bands (L7, L8, L9, L10)
3682	Shield—6A7, or 75 Radiotron shield
4233	Shield—6D6 Radiotron shield
11383	Shield—42 Radiotron shield
14114	Socket—Dial lamp socket
4794	Socket—4-contact 80 Radiotron socket
4786	Socket—6-contact 42, 75 or 6D6 Radiotron socket
4787	Socket—7-contact 6A7 Radiotron socket
12007	Spring—Retaining spring for core, Stock Nos. 12006, 12664 and 12882
12907	Spring—Tension spring for indicator drive gear, Stock No. 14365
14342	Spring—Tension spring for idler, Stock No. 14341
14537	Switch—Range switch (S1, S2)
14538	Switch—Tone and power switch (S3, S4)
12652	Transformer—First I.F. transformer (L13, L14, C21, C22)
12653	Transformer—Second I.F. transformer (L15, L16, C36, C37, C38, R12, R13)
13392	Transformer—Power transformer—105-125 volts, 50-60 cycles (T1)
13566	Transformer—Power transformer—105-125 volts, 25-60 cycles (T1)
12646	Transformer—Power transformer—100-130/140-160/195-250 volts, 50-60 cycles (T1)
13592	Trap—Wave trap (L1)
14335	Volume Control (R16)
14379	Washer—Felt washer for indicator pointer
	REPRODUCER ASSEMBLIES
	Model 86T4 (Speaker No. RL-63F-1)
14356	Board—3-contact reproducer terminal board
13866	Cap—Cone center dust cap
12012	Coil—Field coil (L12)
11469	Coil—Hum neutralizing coil (L17)
12642	Cone—Reproducer cone and dust cap (L18)
5118	Plug—3-contact male plug for reproducer
14360	Reproducer—Reproducer complete
14358	Screw—Screw, washer and lockwasher to hold core in yoke
14355	Transformer—Output transformer (T2)
14357	Washer—Spring washer to hold field coil
	Model 86T44 (Speaker No. 84091-1)
14616	Coil—Reproducer field coil (L12, L17)
14614	Cone—Reproducer cone and voice coil (L18)
5118	Plug—3-contact male plug
14613	Reproducer—Complete
14615	Transformer—Output transformer (T2)
	MISCELLANEOUS ASSEMBLIES
14396	Escutcheon—Station selector escutcheon and crystal
14269	Knob—Volume control, tone control or range switch knob
14359	Knob—Station selector knob
11377	Screw—Chassis mounting screw assembly
4982	Spring—Retaining spring for knob, Stock No. 14359
14270	Spring—Retaining spring for knob, Stock No. 14269

General Description

These receivers are of the superheterodyne type and have many distinctive features. The circuit arrangement is shown in the Schematic Circuit Diagram. Their design include magnetite core adjustments for i-f transformers, low-frequency "X" and "A" oscillator tracking, and wave-trap; pre-selector stage on "A" and "X" bands; aural compensated volume control; tone control; resistance-coupled audio system; phonograph terminal board; and a dust-proof electro-dynamic loudspeaker.

Precautionary Lead Dress.—(1) 6F5 grid lead should be dressed away from adjacent electrolytic, C-12. (2) Leads from push-button socket on side apron must be twisted and dressed away from chassis. Maintain original length, size, and position of: (3) C-band antenna lead; (4) Antenna series condenser, C-1, lead; (5) C-band oscillator leads to range switch and chassis; (6) Oscillator plate lead to range switch.

LOUDSPEAKER

Type .... 6-inch Electrodynamic
Voice coil impedance at 400 cycles.. { 2.5 ohms—84091—1 / 4.7 ohms—84091—2 }

Phonograph Attachment.—A terminal board is provided for connecting a phonograph into the audio amplifying circuit. RCA Victor Models R-93, R-93-A, R-93-2, or R-94 Record Players should be connected as follows: Open link between terminals 1 and 2 on terminal board. Connect yellow wire in Radio-Record switch cable to terminal 1, green to terminal 2, and shield extension to terminal 3. Tape unused red and blue leads separately. Connect a 2-conductor twisted cable between the Record Player binding posts and the screw terminals on Radio-Record switch.

RCA MFG. CO., INC.

Adjustments for Electric Tuning

Each push-button connects a particular oscillator coil and antenna trimmer condenser. The tuning of this coil and this condenser selects a station. Clockwise rotation of cores or trimmer screws lowers frequency.

The frequency ranges for various push-buttons are:

No. 1 540 to 1,160 kc — Adjust L-20 and C-40.
No. 2 540 to 1,160 kc — Adjust L-21 and C-41.
No. 3 600 to 1,265 kc — Adjust L-22 and C-42.
No. 4 600 to 1,265 kc — Adjust L-23 and C-43.
No. 5 785 to 1,550 kc — Adjust L-24 and C-44.
No. 6 785 to 1,550 kc — Adjust L-25 and C-45.

The following are the steps in aligning a push-button selector:

Begin at low-frequency end of band, and tune selected stations in the order that they would come on dial. Use one or two feet of wire as an antenna to ensure sharp peaking.

(1) Manually tune to desired station, then turn range selector to "Electric Tuning."

(2) Press a push-button whose frequency range includes the station.

(3) Adjust oscillator coil corresponding to that push-button, to receive the desired station. Screw core all the way in, to lowest frequency, then unscrew slowly until station is found.

(4) Adjust antenna condenser for that push-button, to receive the desired station with maximum volume.

(5) Check alignment by switching to manual tuning: Reception will not change appreciably if alignment is correct.

(6) Make a final careful adjustment of all magnetite cores and trimmers.

***Note:** Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.*

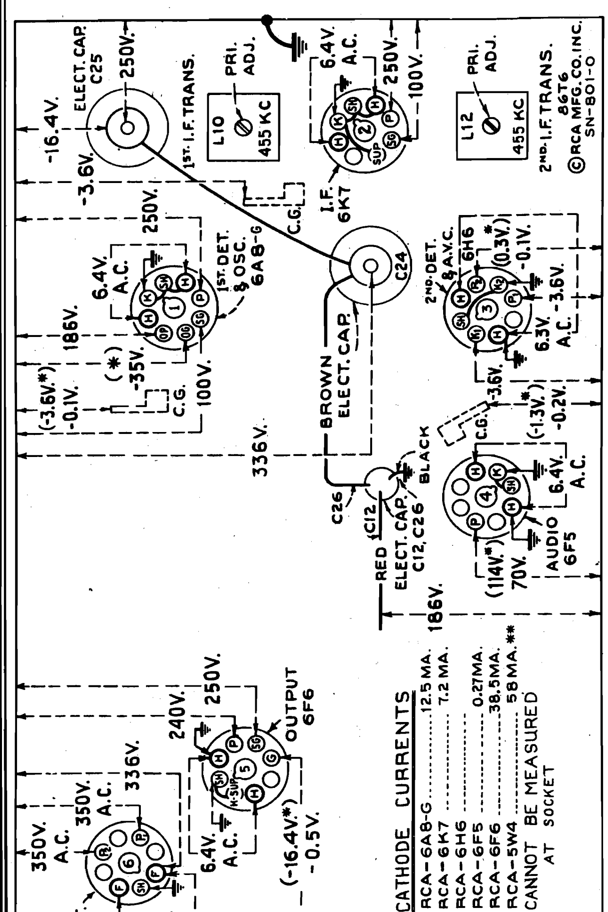

Figure 1—Radiotron Socket Voltages and Trimmer Locations

Measured at 117 volts, 60-cycle supply—Tuned to approximately 1,000 kc ("Standard Broadcast")—No signal being received—Volume control minimum—Tone control optional

With the gang tuning-condenser plates in full-mesh position, adjust the pointer to the low-frequency (end) calibration mark on the dial scale. The pointer is soldered in place on the drive cable.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 1 and 2.

Cathode-ray alignment is preferable; the connections to the chassis are shown on figure 4. If an output indicator is used, connect it across the loudspeaker voice-coil. Advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver "G" (ground) terminal for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

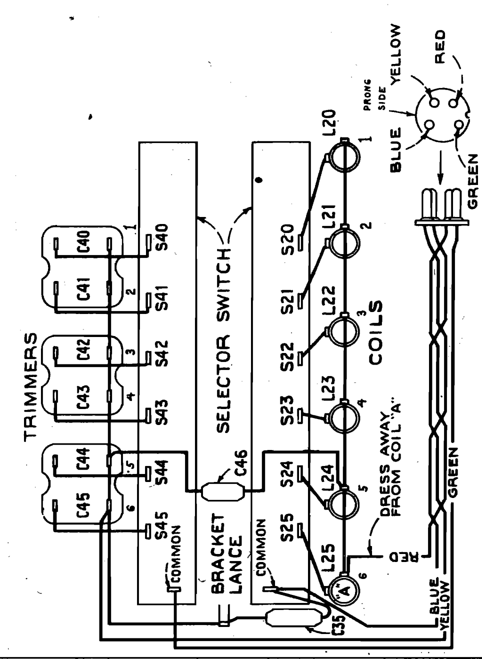

Figure 3—Wiring Diagram of Electric Tuning Unit

MODEL 86X4 Alignment Lead Dress

Alignment Procedure

Calibrate the tuning dial by adjusting dial pointer to the center horizontal line with the gang tuning-condenser plates in full-mesh position. This is a screw-driver adjustment.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 1 and 2.

Cathode-ray alignment is highly preferable; the connections to the chassis are shown on figure 4. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc (400-550 meters) where no signal or interference is received from a station or local (heterodyne) oscillator.

Conversion of kilocycles (kc) to meters for alignment frequencies is as follows: 15,000 kc (20 mc) = 20 meters; 1,500 kc = 200 meters; 600 kc = 500 meters; 460 kc = 652 meters; 353 kc = 850 meters; and 166.7 kc = 1,800 meters.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

Order of Alignment	Test Oscillator			Range Selector	Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
	Connection to Receiver	Dummy Antenna	Frequency Setting					
1	6D6 I-F Grid Cap	.001 Mfd.	460 kc	"A" Center	No Signal 550-750 kc (400-550 meters)	2nd I-F Trans.	L13 and L14	Max. (peak)

11	Ant. Lead (blue)	200 Mmfd.	166.7 kc (1,800 meters)	"X" Left	166.7 kc (1,800 meters)	"X" L-F Osc.	L10	Max. (peak)
12	Ant. Lead (blue)	200 Mmfd.	353 kc (850 meters)	"X" Left	353 kc (850 meters)	"X" H-F Osc.	C28	Max. (peak)

† Use maximum capacity peak if two peaks can be obtained.
* Use minimum capacity peak if two peaks can be obtained. After this adjustment, check for image signal by shifting receiver dial to 15,920 kc.
‡ "X" H-F Osc. trimmer C28 must be at least three turns out during this adjustment.

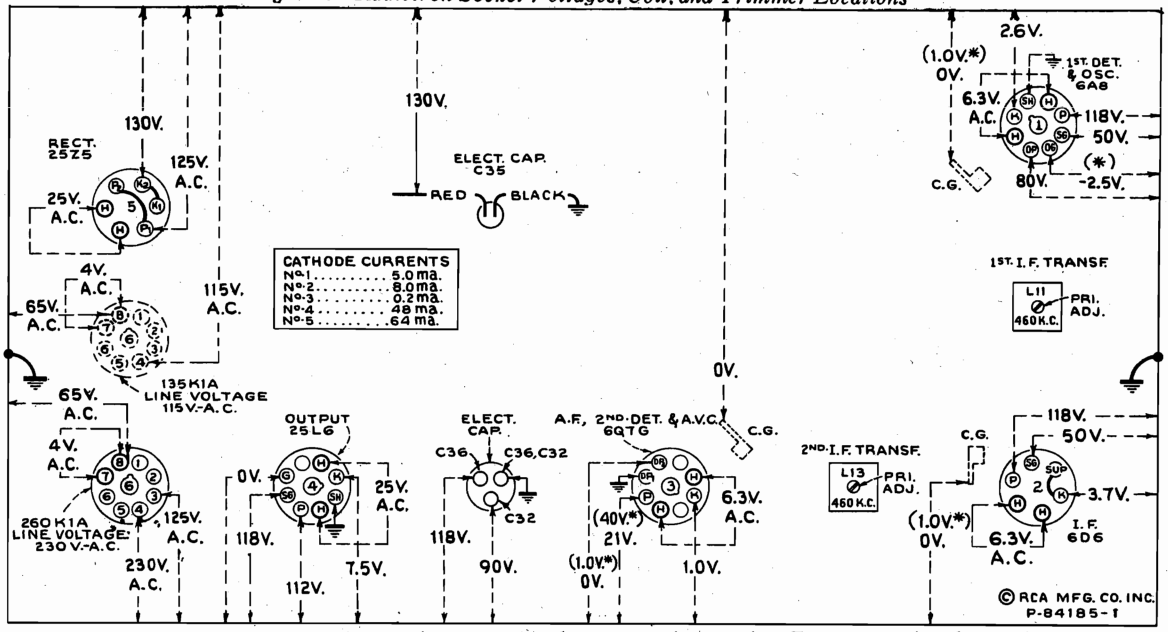
Precautionary Lead Dress.—(1) All bus leads in r-f assembly should be kept as short as possible. When necessary to replace bus leads, use only wire having same diameter. (2) Dress capacitor, connected from tone-control switch to terminal board, away from capacitor, connected to center terminal of volume control, and away from exposed green shielded lead running to phono. term. board. (3) Dress green lead, connected from volume control to 2nd i-f transformer, as close to chassis as possible. (4) Dress capacitor, connected from 25L6 socket to red lug on electrolytic capacitor, away from phono. term. board. (5) Brown and green leads from speaker must be twisted, dressed along chassis and away from exposed green shielded lead and lug running to phono. term. board. (6) Dress green lead, connected between 6A8 and 6D6 sockets, away from pin No. 5 of 6A8 socket.

Phonograph Attachment.—A terminal board is provided for connecting a phonograph into the audio amplifying circuit. RCA Victor Models R-93, R-93-A, R-93-2, or R-94 Record Players should be connected as follows: Open link between terminals 1 and 2 on terminal board. Connect green wire in Radio-Record switch cable to terminal 1, yellow to terminal 2, and shield extension to terminal 3. Tape unused red and blue leads separately. Connect a 2-conductor twisted cable between the Record Player binding posts and the screw terminals on Radio-Record switch.

CAUTION: Disconnect receiver power cord before making phonograph connections. Tape shield extension on Radio-Record cable so it cannot make metallic connection with receiver chassis ground.

RCA MFG. CO., INC.

Figure 2—Radiotron Socket Voltages, Coil, and Trimmer Locations



Measured at 230 volts, 60 cycle supply; or 115 volts, 60 cycle supply—For 230 volts d-c, voltages are same—For 115 volts d-c, all voltages except line and heaters about 20% lower—Tuned to approximately 1,000 kc (300 meters) "Medium Wave"—No signal being received—Volume control minimum—Tone control optional.

***Note:** Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.*

Voltage values as specified should hold within ±20% when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250 and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

RECEIVER ASSEMBLIES

14634	Belt—Variable condenser drive belt
14632	Bracket—Dial mounting bracket
5237	Bushing—Variable condenser rubber mounting
11350	Cap—Small grid-contact cap
30295	Capacitor—Adjustable dual trimmer (C24, C28)
13200	Capacitor—10 Mmfd. (C27)
14262	Capacitor—109 Mmfd. (C10, C11)
12404	Capacitor—120 Mmfd. (C14, C15)
12724	Capacitor—120 Mmfd. (C23, C30)
12406	Capacitor—180 Mmfd. (C18)

12484	Capacitor—0.25 Mfd. (C16)
4840	Capacitor—0.25 Mfd. (C33)
30298	Capacitor Pack—Comprising 2 sections each 16 Mfd. (C32, C36)
30297	Capacitor—32 Mfd. (C35)
30292	Coil—Antenna coil—X, A, and C bands (L2, L3, L4, L5)
30293	Coil—Oscillator coil—A and C Bands only (L7, L8, L9)
30294	Coil—Oscillator coil—X band only (L10)
30296	Coil—Choke coil (L6)
14633	Condenser—2-gang variable tuning condenser (C6, C7, C25, C26)
14648	Core—Adjustable core and stud for coil, Stock No. 30293
12664	Core—Adjustable core and stud for coil, Stock No. 30294
12006	Core—Adjustable core and stud for i-f transformers
30289	Dial—Station selector dial scale and holder (for European use only)
30397	Dial—Station selector dial scale and holder (for other than European use)
14651	Drive—Variable condenser vernier drive and pinion gear
30290	Indicator—Station selector indicator pointer
4340	Lamp—Dial lamp
14636	Pulley—Drive belt idler pulley—less spring
14639	Pulley—Variable condenser drive pulley—located on condenser shaft
14641	Reactor—Filter reactor (L16)
30300	Resistor—Ballast resistor tube, type 260K-1A, for 220-volt operation
MI-8115	Resistor—Ballast resistor tube, type 135K-1A, for 110-volt operation
14653	Resistor—50 ohms, flexible type, 1/10 watt (R3)
30301	Resistor—150 ohms, carbon type, ¼ watt (R14)
30545	Resistor—180 ohms, insulated, ¼ watt (R16)
13250	Resistor—330 ohms, carbon type, ¼ watt (R5)
30546	Resistor—470 ohms, insulated, ¼ watt (R8)
13714	Resistor—5,600 ohms, insulated, ¼ watt (R7, R15)
3998	Resistor—15,000 ohms, carbon type, ¼ watt (R6)
14284	Resistor—22,000 ohms, carbon type, 1/10 watt (R17)
12286	Resistor—56,000 ohms, insulated, ¼ watt (R4)
5145	Resistor—100,000 ohms, carbon type, ¼ watt (R1, R2)
5027	Resistor—150,000 ohms, carbon type, ¼ watt (R12)
12285	Resistor—470,000 ohms, insulated, ¼ watt (R13)
5035	Resistor—560,000 ohms, carbon type, ¼ watt (R11)
13730	Resistor—1 megohm, carbon type, ¼ watt (R9)
4389	Screw—No. 6-32 x 3/16-inch headless set-screw for drive pulley, Stock No. 14639
14638	Shaft—Station selector knob shaft and pulley
12008	Shield—I-F transformer shield can
12581	Shield—I-F transformer shield cap
11265	Shield—Radiotron shield
4786	Socket—6-contact 6D6 or 25Z5 Radiotron socket
11196	Socket—8-contact 6A8, 6Q7G, 25L6 Radiotron or ballast resistor tube socket
14650	Socket—Dial lamp socket
14637	Spring—Idler pulley tension spring
12007	Spring—Retaining spring for core, Stock Nos. 14648, 12664 and 12006
30291	Switch—Range switch (S1, S2)
30299	Switch—Tone control switch (S3)
14376	Transformer—First I-F transformer (L11, L12, C10, C11)
14308	Transformer—Second I-F transformer (L13, L14, C14, C15, C18, R17)
13838	Trap—Wave trap (L1, C1)
14645	Volume control and power switch (R10, S4)

REPRODUCER ASSEMBLIES

(Speaker No. 84106-1)

30306	Cone—Reproducer cone, complete, centered in metal cone housing—less transformer (L15)
30305	Reproducer, complete
30307	Transformer—Output transformer (T1)

MISCELLANEOUS ASSEMBLIES

14654	Escutcheon—Station selector escutcheon and crystal
30373	Knob—Range switch knob
12673	Knob—Station selector, volume control or tone control knob
30308	Screw—Chassis mounting screw and washer assembly
4119	Screw—No. 8-32 x ¼-inch headless cup-point set-screw for knob, Stock Nos. 12673 and 30373

BOTTOM VIEW - REAR OF CHASSIS

Measured at 115 volts, 60-cycle supply—For 115-volt d-c supply approximately 10% lower, except heater voltage which remains the same—Tuned to approximately 1,000 kc ("Standard Broadcast")—No signal being received—Volume control minimum.

Precautionary Lead Dress.—(1) Dress power cord away from audio circuits. (2) Keep filament leads away from C24. (3) Keep bus lead from term. 8 of S1-S2 to ground lance as short as possible. (4) Bus lead from term. 12 of S1-S2 to C27-C28 thence to C10 should be 4⅝ inches long. (5) Bus lead from term. 4 of S1-S2 to L2-L3 should be 2½ inches long. (6) Bus lead from L2 to C8-C9 should be 3⅞ inches long and dressed over bus lead from antenna coil to range switch. (7) Bus lead from term. 7 of S1-S2 to L12-L14 should be 2¼ inches long. (8) Keep bus lead from term. E of 2nd i-f trans. to term. 2 on phono. board as short as possible. (9) Keep leads of C10, C29, and C34 as short as possible. When replacing bus leads, use only wire having same diameter as original.

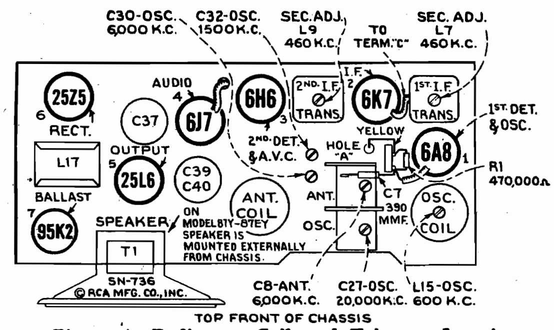

Figure 1—Radiotron, Coil, and Trimmer Locations

Alignment Procedure

Calibrate the tuning dial by adjusting main dial pointer to the low-frequency (end) calibration mark on dial with the gang tuning-condenser plates in full-mesh position; then adjust the small (vernier) pointer to "O." These are friction adjustments.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 1 and 2.

Cathode-ray alignment is highly preferable; the connections to the receiver circuits are shown on figure 4. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the positive (+) side of C38 (same point as "low" vertical input to cathode-ray oscillograph) for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

Order of Alignment	Test Oscillator			Range Selector	Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
	Connection to Receiver	Dummy Antenna	Frequency Setting					
1	6K7 I-F Grid Cap	.001 Mfd.	460 kc	"A" Left	No Signal 550-750 kc	2nd I-F Trans.	L8 and L9	Max. (peak)

Undistorted	1.3 watts	1.2 watts
Maximum	2.1 watts	1.9 watts

Loudspeaker (Permanent-Magnet Dynamic) .... Impedance (v.c.) 2.2 ohms at 400 cycles

Phonograph Attachment.—A terminal board is provided for connecting a phonograph into the audio amplifying circuit. RCA Victor Models R-93, R-93-A, R-93-S, R-93-2, or R-94 Record Players should be connected as follows: Remove link between terminals 1 and 2 on terminal board. Connect green wire in Radio-Record switch cable to terminal 1, yellow to terminal 2, and shield extension to terminal 3. Tape unused red and blue leads separately. Connect a 2-conductor twisted cable between the Record Player binding posts and the screw terminals on Radio-Record switch. When employing the R-93-S, the 0.1 mfd. capacitor contained in the R-93-S should be shorted out.

14621	Capacitor—32 Mfd. (C37)
14622	Capacitor Pack—2 sections each 16 Mfd. (C39, C40)
14372	Coil—Antenna coil and shield (L2, L3, L4, L5)
14373	Coil—Oscillator coil and shield (L11, L12, L13, L14, L15, L16)
14363	Condenser—2 gang variable tuning condenser (C8, C9, C27, C28)
5119	Connector—3-contact female connector for reproducer cable
12800	Core—Adjustable core and stud assembly for coil Stock No. 14373
12006	Core—Adjustable core and stud for Stock No. 14376 and Stock No. 14283
14381	Dial—Station selector dial scale
14389	Dial—Band indicator dial and mounting bracket assembly (Models 87X and 87Y only)
30127	Dial—Band indicator dial and mounting bracket assembly (Model 87EY only)
14364	Drive—Variable condenser vernier pinion gear and shaft
14345	Drum—Variable condenser drive belt drum complete with set screws
11982	Fastener—Station selector dial scale fastener
30085	Gear—Indicator drive gear and hub assembly and indicator pointer stem and gear assembly complete
14341	Idler—Station selector drive belt idler
14344	Indicator—Station selector indicator pointer
14382	Indicator—Vernier indicator pointer
4340	Lamp—Dial lamp
14340	Pulley—Station selector drive belt pulley and knob shaft
14620	Reactor—Filter reactor (L17)
14361	Reflector—Dial reflector and lamp bracket assembly
14343	Retainer—Drive shaft and pulley retainer—holds tuning knob shaft and pulley on range switch shaft
13716	Resistor—2,200 Ohms—Insulated, ¼ watt (R13)
11647	Resistor—5,600 Ohms—Carbon type, ¼ watt (R17)
13736	Resistor—10,000 Ohms—Carbon type, ¼ watt (R3)
14284	Resistor—22,000 Ohms—Carbon type, 1/10 watt (R5)
11305	Resistor—22,000 Ohms—Carbon type, ¼ watt (R16)
12454	Resistor—33,000 Ohms—Insulated, ¼ watt (R2)
11300	Resistor—33,000 Ohms—Carbon type, 1/10 watt (R8)
14023	Resistor—82,000 Ohms—Insulated, ¼ watt (R15)
11281	Resistor—100,000 Ohms—Carbon type, 1/10 watt (R12)
14560	Resistor—100,000 Ohms—Insulated, ¼ watt (R11)
13734	Resistor—120,000 Ohms—Carbon type, ¼ watt (R14)
11398	Resistor—220,000 Ohms—Carbon type, 1/10 watt (R6)
11323	Resistor—270,000 Ohms—Carbon type, ¼ watt (R20)
13479	Resistor—390,000 Ohms—Carbon type, ¼ watt (R10)
11452	Resistor—470,000 Ohms—Carbon type, 1/10 watt (R1)
12285	Resistor—470,000 Ohms—Insulated, ¼ watt (R9)
12679	Resistor—2.2 Megohm—Insulated, ¼ watt (R4)
30284	Resistor—Ballast resistor tube type No. 95K2 (R18, R19)
14350	Screw—No. 8-32x3/16 square head set screw for gear Stock No. 30085 and drum Stock No. 14345 and arm Stock No. 14380
14374	Shield—Antenna coil shield
12008	Shield—First or Second I.F. transformer shield
14375	Shield—Oscillator coil shield
14171	Socket—Dial lamp socket
4786	Socket—6-contact 25Z5 Radiotron socket
11196	Socket—8-contact 6A8, 6K7, 6J7, 6H6, or 25L6 Radiotron socket
12007	Spring—Retaining spring for core Stock No. 12006 and Stock No. 12800
12907	Spring—Tension spring for indicator drive gear Stock No. 30085
14342	Spring—Tension spring for idler Stock No. 14341
14370	Switch—Range switch (S1, S2)
14371	Switch—Tone control switch and power switch (S3, S4)
14376	Transformer—First I.F. transformer (L6, L7, C12, C13)
14283	Transformer—Second I.F. transformer (L8, L9, C15, C16, C17, R5, R6)
13838	Trap—Wave trap complete (L1, C3)
14335	Volume Control (R7)
14379	Washer—Felt washer for indicator pointer
	REPRODUCER ASSEMBLIES MODEL 87X (76493-3)
14685	Cone—Reproducer cone (L10)
5118	Plug—3-contact male plug for reproducer
14684	Reproducer—Complete
14686	Transformer—Output transformer (T1)
	REPRODUCER ASSEMBLIES (RL-71-3) MODEL 87Y and 87EY
12667	Cone—Reproducer cone and dust cap
5118	Plug—3-contact male plug for reproducer
14627	Reproducer—Complete
14628	Transformer—Output transformer (T1)
	MISCELLANEOUS ASSEMBLIES
14396	Escutcheon—Station selector escutcheon and crystal
14359	Knob—Station selector knob
14269	Knob—Volume control, tone control or range switch knob
4560	Screw—Chassis mounting screw and washer assembly (Model 87EY only)
11210	Screw—Chassis mounting screw and washer assembly (Model 87Y only)
11377	Screw—Chassis mounting screw and washer assembly (Model 87X only)
4982	Spring—Retaining spring for knob Stock No. 14359
14270	Spring—Retaining spring for knob Stock No. 14269

Frequency Ranges

"Standard Broadcast" (A) .... 540-1,720 kc
"Medium Wave" (B) .... 2,300-7,500 kc
"Short Wave" (C) .... 7,500-22,000 kc

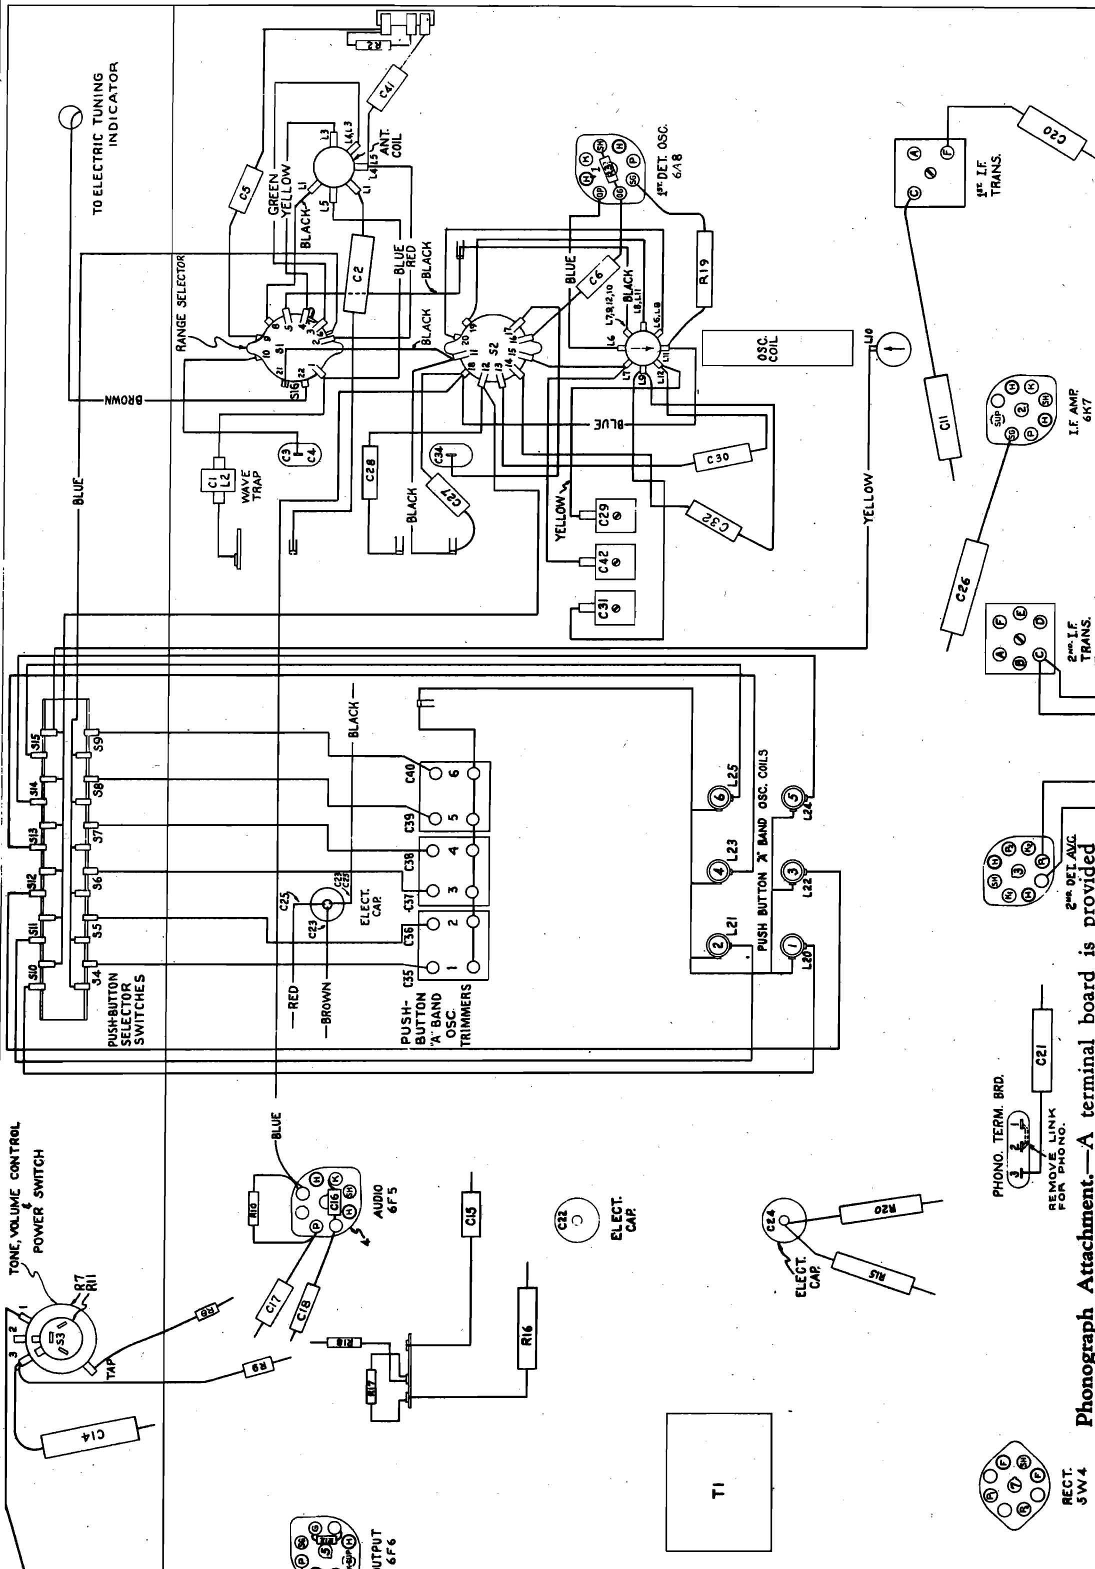
R-F Alignment Frequencies

"Medium Wave" (B) .... 6,000 kc (osc., ant.)
"Short Wave" (C) .... 20,000 kc (osc.)
"Standard Broadcast" (A) ... 600 kc (osc.), 1,500 kc (osc.)

Intermediate Frequency .... 460 kc

MODEL 87K1
Chassis Wiring
Lead Dress, Phono.

RCA MFG. CO., INC.



Phonograph Attachment.—A terminal board is provided for connecting a phonograph into the audio-amplifying circuit. RCA Victor Models R-93, R-93-A, R-93-2, or R-94 Record Players should be connected as follows: Remove the link from the phonograph terminal board. Connect green wire in Radio-Record switch cable to terminal 1; yellow to terminal 2; shield to terminal 3; and tape up the red and blue. Connect a 2-conductor twisted cable between the Record Player binding posts and the screw-terminals on Radio-Record switch. If additional volume is desired, connect an RCA Stock No. 9632 transformer between the 2-conductor twisted cable and the screw-terminals on Radio-Record switch as follows: Yellow and brown transformer leads and one side of twisted cable to ground screw-terminal on switch; black transformer lead to other side of twisted cable; and blue transformer lead to other screw-terminal on switch.

Precautionary Lead Dress.—Maintain original length and size of the following: (1) all leads from range selector to antenna and oscillator coils; (2) lead from oscillator coil to ground; (3) leads from gang condenser to range selector. (4) Keep filament leads twisted and dressed away from 6F5 grid lead. (5) Keep leads from C2 as short as possible.

RCA MFG. CO., INC.

MODEL 87K1
Socket, Trimmers
Voltage, Tuner

Electric Tuning Alignment.—Select six "A" band stations to be tuned with push-buttons. It is usually preferable to choose stations not on the same network. For push-buttons 1 and 2, choose stations from 540 kc to 1,160 kc; for 3 and 4, stations from 600 kc to 1,260 kc; and for 5 and 6, stations from 770 kc to 1,550 kc. The push-buttons are numbered consecutively from left to right.

Allow the receiver to operate about five minutes before proceeding with "Electric Tuning" alignment.

To align so that push-button 1 will tune WJZ, e.g., first set "Range Selector" to "Standard Broadcast" position and manually tune WJZ at a dial setting near 760 kc. Then set "Range Selector" for "Electric Tuning," press push-button 1, and again tune WJZ for maximum output by carefully adjusting first L20 and then C35. If there is difficulty in recognizing the desired station it should be borne in mind that clockwise rotation of trimmer and magnetite-core screws lowers the frequency to which the radio is tuned. Preliminary setting of the adjustments may be made with the use of a test oscillator. In any case final adjustment should be made on the desired station. Use "Magic Eye" indication of maximum output; tune for minimum width of dark sector of the eye. Proceed similarly, following the above table for the remaining push-buttons.

The first-detector trimmer adjustment will appear to be broad when tuning strong local signals because of a.v.c. action, so to obtain accurate adjustment on strong signals it will be necessary during adjustment to use an antenna only a few inches long. Use enough antenna to not more than half close the "Magic Eye."

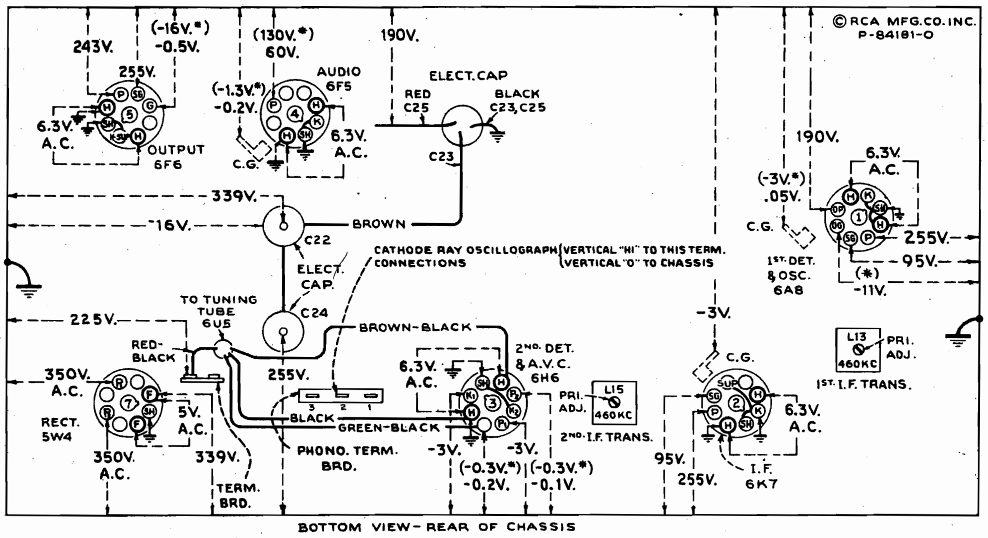


Figure 1—Radiotron Socket Voltages and Trimmer Locations

Measured at 115 volts, 60-cycle supply—Tuned to approximately 1,000 kc ("Standard Broadcast")—No signal being received—Volume control minimum—Tone control optional

***Note:** Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.*

Voltage values as specified should hold within ±20% when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250 and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

Radiotron Cathode Current Readings

Measured with Milliammeter Connected at Tube Socket Cathode Terminals Under Conditions Similar to Those of Voltage Measurements

*Use maximum capacity peak if two peaks can be obtained. Check for image signal by shifting receiver dial to 20.92 mc.

Service Data

Loudspeaker.—Centering of the loudspeaker is made in the usual manner with three narrow paper feelers after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. The dust cover should be cemented back in place with ambroid upon completion of adjustment.

Electric tuning is accomplished in a simple, trouble-free manner without the use of rotating parts. There are six trimmers for tuning the single antenna coil and six magnetite-core adjusted oscillator coils. A desired station is tuned accurately, quickly, and silently by pressing a push-button which puts the pre-adjusted coil and trimmer into use. Oscillator frequency drift is reduced to a negligible amount by use of a temperature-compensating capacitor across the oscillator coils.

Alignment Procedure

Calibrate the tuning dial by adjusting dial pointer to the low-frequency (end) calibration mark on dial with the gang tuning condenser plates in full-mesh position. The pointer is soldered in place on the drive cable.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 1 and 2.

Cathode-ray alignment is highly preferable; the connections to the chassis are shown on figure 1. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver "G" (ground) terminal for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator. "Min. Eye" means minimum width of dark sector of "Magic Eye" or greatest deflection.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

REPLACEMENT PARTS

Insist on genuine factory-tested parts, which are readily identified and may be purchased from authorized dealers.

STOCK No.	DESCRIPTION
	RECEIVER ASSEMBLY
30755	Arm—Band indicator operating arm—fastens on range switch shaft
14384	Belt—Drive belt
14623	Board—Antenna and ground terminal board
12717	Board—Phonograph terminal board
30752	Bracket—Tuning tube mounting bracket and clip
30754	Cable—Band indicator operating cable
11350	Cap—Grid contact cap
30766	Cap—Rubber cap for tuning tube
30751	Capacitor—Trimmer—Comprising two sections each 2-10 Mmfd. and one section 3-30 Mmfd. (C29, C31, C42)
30750	Capacitor—Dual trimmer, 30-180 Mmfd. each section (C39, C40)
12723	Capacitor—56 Mmfd. (C6)
30764	Capacitor—Dual trimmer, 65-280 Mmfd. each section (C37, C38)
30769	Capacitor—100 Mmfd. (C28)
14262	Capacitor—110 Mmfd. (C7, C8)
12404	Capacitor—120 Mmfd. (C9, C10)
12724	Capacitor—120 Mmfd. (C16)
30765	Capacitor—Dual trimmer, 120-470 Mmfd. each section (C35, C36)
12725	Capacitor—150 Mmfd. (C41)
12406	Capacitor—180 Mmfd. (C12)
12952	Capacitor—330 Mmfd. (C5)
30768	Capacitor—500 Mmfd. (C30)
30767	Capacitor—2,000 Mmfd. (C32)
30303	Capacitor—.0035 Mfd. (C2)
4838	Capacitor—.005 Mfd. (C18, C19)
14393	Capacitor—.01 Mfd. (C13, C15, C17, C27)
4870	Capacitor—.025 Mfd. (C21)
4839	Capacitor—0.1 Mfd. (C11, C20, C26)
12484	Capacitor—0.25 Mfd. (C14)
11203	Capacitor—10 Mfd. (C25)
30577	Capacitor—Comprising two sections each 10 Mfd. (C22, C23)
5212	Capacitor—16 Mfd. (C24)
30745	Coil—Antenna coil and shield A, B, and C bands (L1, L3, L4, L5)
30747	Coil—Oscillator coil A band (L20 or L21)
30748	Coil—Oscillator coil A band (L22 or L23)
30749	Coil—Oscillator coil A band (L24 or L25)
30746	Coil—Oscillator coil A, B, C bands (L6, L7, L8, L9, L10, L11, L12)
30740	Condenser—2-gang variable tuning condenser (C3, C4, C34)
30743	Control—Volume control, tone control, and power switch in one unit (R7, R11, S3)
30763	Cord—Indicator drive cord
30759	Dial—Station selector dial scale
30753	Disc—Band indicator disc with colored segment
30741	Drive—Variable condenser vernier drive shaft and pinion gear
30587	Drum—Drive belt drum—fastens on variable condenser vernier drive shaft
30761	Drum—Indicator cord drum—fastens on variable condenser rotor shaft
14341	Idler—Drive idler pulley, bracket and spring
30762	Indicator—Indicator pointer and slider
5226	Lamp—Dial lamp
30757	Pulley—Large size pulley for indicator cord—located at top left corner of dial bracket
30758	Pulley—Medium size pulley for indicator cord—located at top right side of dial bracket
14697	Pulley—Small size pulley for indicator cord—located at top right hand corner of dial bracket
14525	Resistor—22 ohms, carbon type, ¼ watt (R18)
11955	Resistor—27 ohms, carbon type, ¼ watt (R17)
30771	Resistor—50 ohms, flexible type, 2¼ watts (R1)
16293	Resistor—220 ohms, carbon type, 1 watt (R16)
11298	Resistor—5,600 ohms, carbon type, 1 watt (R20)
30151	Resistor—18,000 ohms, insulated, 1 watt (R15, R19)
14284	Resistor—22,000 ohms, carbon type, 1/10 watt (R6)
11400	Resistor—27,000 ohms, carbon type, ¼ watt (R8)
12454	Resistor—33,000 ohms, insulated, ¼ watt (R3)
14560	Resistor—100,000 ohms, insulated, ¼ watt (R9)
11398	Resistor—220,000 ohms, carbon type, 1/10 watt (R5)
12199	Resistor—270,000 ohms, insulated, ¼ watt (R10)
13005	Resistor—390,000 ohms, carbon type, 1/10 watt (R12)
11397	Resistor—560,000 ohms, carbon type, 1/10 watt (R2)
12013	Resistor—1 Megohm, carbon type, 1/10 watt (R14)
12679	Resistor—2.2 Megohm, insulated, ¼ watt (R4, R13)
30760	Shaft—Tuning knob shaft and pulley
5119	Socket—3-contact socket for speaker cable
13871	Socket—6-contact tuning tube socket
11196	Socket—8-contact Radiotron socket
14114	Socket—Dial lamp socket—open type
14171	Socket—Dial lamp socket—shell type
30756	Spring—Band indicator tension spring
14342	Spring—Idler pulley tension spring
30585	Spring—Indicator cord tension spring
30742	Switch—Range switch (S1, S2, S16)
30744	Switch—Tuning push button switch (S4, S5, S6, S7, S8, S9, S10, S11, S12, S13, S14, S15)
14376	Transformer—First I.F. transformer (L13, L14, C7, C8)
14283	Transformer—Second I.F. transformer (L15, L16, C9, C10, C12, R5, R6)
30607	Transformer—Power transformer 105-125 volts and 200-240 volts, 50-60 cycle (T1)
30571	Transformer—Power transformer 105-125 volts, 25-60 cycle (T1)
13838	Trap—Wave trap (L2, C1)
	REPRODUCER ASSEMBLIES
13866	Cap—Dust cap for cone center
14354	Coil—Field coil (L19)
11469	Coil—Hum neutralizing coil (L16)
12667	Cone—Reproducer cone and dust cap (L17)
5118	Plug—3-contact male plug for reproducer
14395	Reproducer—complete
14358	Screw—Screw, washer and lockwasher to hold core in yoke
14355	Transformer—Output transformer (T2)
14357	Washer—Spring washer to hold field coil
	MISCELLANEOUS ASSEMBLIES
30778	Button—Automatic station selector push button
30780	Cushion—Rubber cushion for automatic station selector button
30774	Escutcheon—Station selector escutcheon complete with side panels and buttons
30775	Escutcheon—Station selector escutcheon center section only—less side panels and buttons
30776	Escutcheon—Station selector escutcheon right and left hand sections only
30773	Knob—Volume control knob
14269	Knob—Range switch knob
14359	Knob—Station selector knob
30772	Knob—Tone control and power switch knob
11210	Screw—Chassis mounting screw and washer assembly
30779	Shield—Celluloid shield for call letter cards

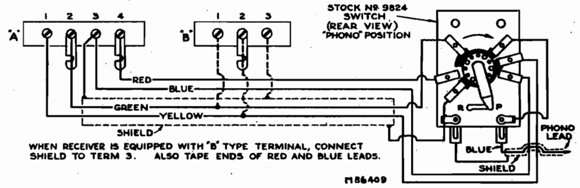
CONNECTING VICTROLA TO:

1939 RCA RADIO RECEIVERS OF "90" SERIES:
Plug male jack on end of Victrola cable into female receptacle on receiver chassis. Push or turn "Phono" switch to "Phono" position, and operate Victrola according to instructions.

RADIO RECEIVERS HAVING "PHONO" TERMINAL BOARDS.



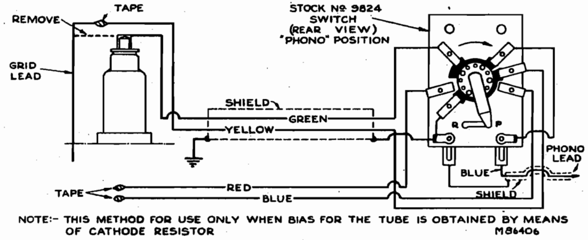
RCA Radio Receivers to which the above illustration applies: 5T1, 5T4, 5T5, 5T6, 5T7, 5T8, 6T5, 8T2, 8T11, 8K11, 85T5, 86E, 86K, 86T, 86T1, 86T4, 86K7, 86T44, 87K, 87T, 87K1, 87K2, 87T2, 88K, 810K, 810K1, 810T, 810T4, 811K, 812K, 813K, 816K, 811T.

For following Receivers, Yellow lead should go on Terminal No. 1, Green lead on Terminal No. 2: 6K2, 6T2, 6K3, 6K10, 6T10, 7T1, 7K1, 85T8, 86T3, 86T2, 86T6, 87T1.

Insulate shield of switch wires from chassis, on following RCA Receivers: 5T, 6T, 6K, 6K1, 7T, 7K, 7X, 7X1, 8T, 8T10, 8K, 8K1, 86X4, 87EY, 87X, 87Y.

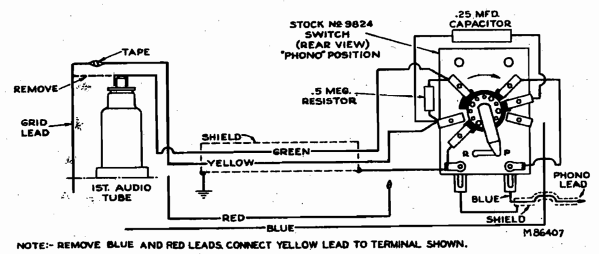
Receivers having a Four Terminal Board: 9K, 9T, 9K1, 9K2, 9K3, 9K10, 10T, 10K, 10K1, 13K, 15K. Reverse Red and Blue leads to Terminal Board of C9-6, T9-9, T8-16, C8-17.

RADIO RECEIVERS WHOSE FIRST AUDIO AMPLIFIER TUBE IS OF THE GRID CAP TYPE.

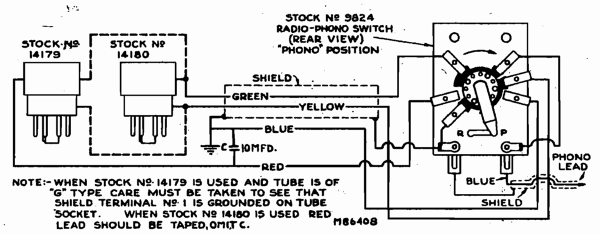


RCA Receivers for which above method applies: 125, 128, 128E, 224E, 225, 226, T6-1, C6-2, T6-9, T7-5, C7-6, T7-12, C7-14, T8-14, C8-15, T8-18, C8-19, C8-20, C9-4, T9-10.

RADIO RECEIVERS WHOSE FIRST AUDIO TUBE IS OF THE GRID CAP TYPE, AND FIXED BIAS FOR TUBE IS OBTAINED THROUGH GRID LEAD.



RADIO RECEIVERS USING 6C5 OR 6J5, 6C5G OR 6J5G, TUBE FOR FIRST AUDIO AMPLIFIER.



Stock No. 14179 Adaptor opens grid circuit, and inserts 2,700 ohm resistor in cathode of 6C5 or 6J5 tubes, for bias on Phono reproduction.

Stock No. 14180 Adaptor opens grid circuit of 6C5 or 6J5 tube.

Stock No. 14180 Adaptor necessary for RCA: C11-1, C13-2, T10-1, C11-3, C13-3.

Stock No. 14179 Adaptor necessary for RCA: C15-3, C15-4.

RADIO RECEIVERS WHERE RECEIVER VOLUME CONTROL IS TO BE USED TO ALSO CONTROL "PHONO" VOLUME.

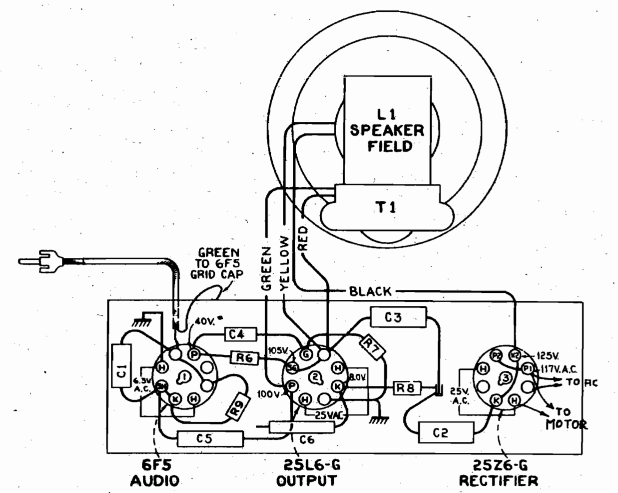
Schematic Circuit Diagram



Wiring and Socket Voltages

***NOTE:** Values with star (*) are operating voltages in circuits with high series-resistance, and when measured will read lower depending on the voltmeter loading.

Measurements made to chassis unless otherwise indicated. Values should hold within approximately ± 20% with 117-volt a-c supply.

General Description and Service Data

The model R-89 Electric Victrola consists of a crystal pickup, a three tube audio amplifier, a dynamic speaker, and motor turntable mechanism in a table type walnut veneer cabinet. Any record, up to and including the 12-inch size, may be played on this instrument.

The crystal pickup unit is securely sealed in a metal casing against extreme changes of climate. If failure occurs due to a defective crystal unit, no attempt should be made to repair it, but a new replacement crystal unit should be installed.

This instrument may also be used to play records through a radio receiver, if so desired. To do this remove shielded lead at rear of cabinet from pickup jack, and plug into shorting jack, and plug lead from radio receiver into pickup jack. Methods of connecting mechanism to various receivers, are shown on next page.

Phonograph Motor

The synchronous motor used in this instrument is designed to be simple and foolproof. The parts that may require attention are plainly shown. The motor is started by turning "on" the power switch and giving the turntable a clockwise spin with the hand. Smooth starting and running will be insured by keeping the bearings well cleaned and oiled.

Hum and Vibration.—A small amount of hum when starting, decreasing to a negligible amount when running, is normal. If excessive vibration occurs it may be due to:

1. Insufficient lubrication, or any failure that will cause binding.
2. Leather washer not oiled. (Check to make certain that the leather washer is above the steel washer.)
3. Motor not properly supported from motor board.
4. Burrs on poles of rotor or stator. Remove with fine emery cloth.
5. Stator should be free to rotate between limits of damping assembly.

Removing Rotor.—The rotor and turntable assembly simply rests on the ball bearing at bottom of vertical bearing. Remove by lifting upward.

Rotor Adjustment.—Remove motor from cabinet. Loosen the three screws that hold the rotor to the turntable, insert three 16-mil shims at equal distances around the gap between the rotor and stator, and then carefully tighten the three screws. The top of rotor must be flush with top of stator; add additional steel washers beneath the stator if necessary.

Do not remove Turntable while set is turned on, as damage to tubes will result.

Replacement Parts

Insist on genuine factory-tested parts, which are readily identified and may be purchased from authorized dealers.

STOCK No.	DESCRIPTION	Unit List Price
	AMPLIFIER ASSEMBLIES	
31886	Cable—Shielded amplifier input cable complete with plug	.25

MODELS 94BK, 94BT
Schematic, Socket
Trimmers, Voltage
Alignment, Lead Dress

Alignment Procedure

Cathode-ray Alignment is the preferable method. Connections for the oscillograph are shown in the chassis drawing.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

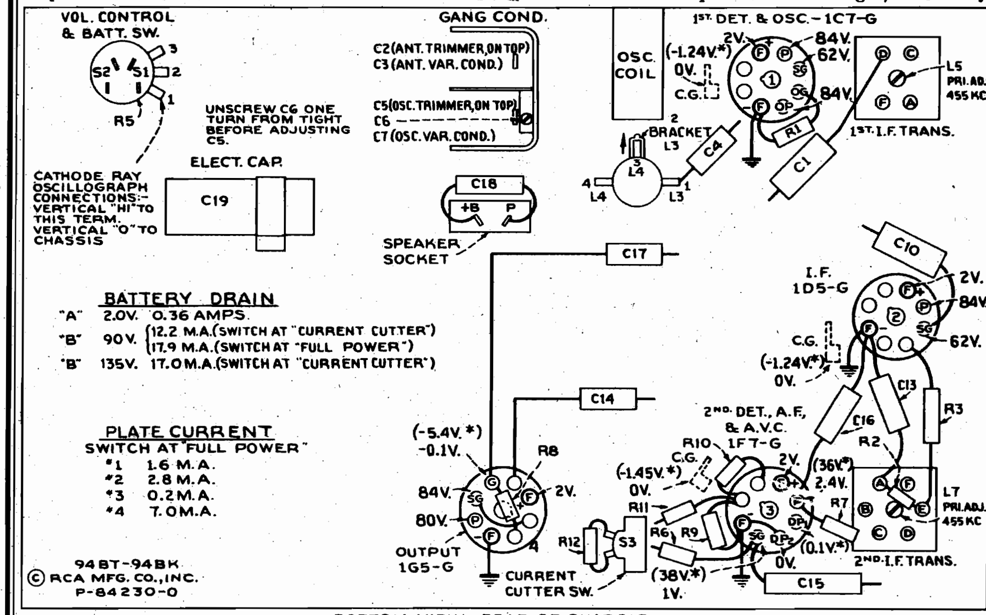
For additional details, refer to booklet "RCA Victor Receiver Alignment."

Pre-setting Dial.—With gang condenser in full mesh, the pointer should be horizontal.

Re-sealing I.F. Adjustment Screws.—After completion of alignment, seal the I.F. magnetite-core adjustment screws with a few drops of household cement.

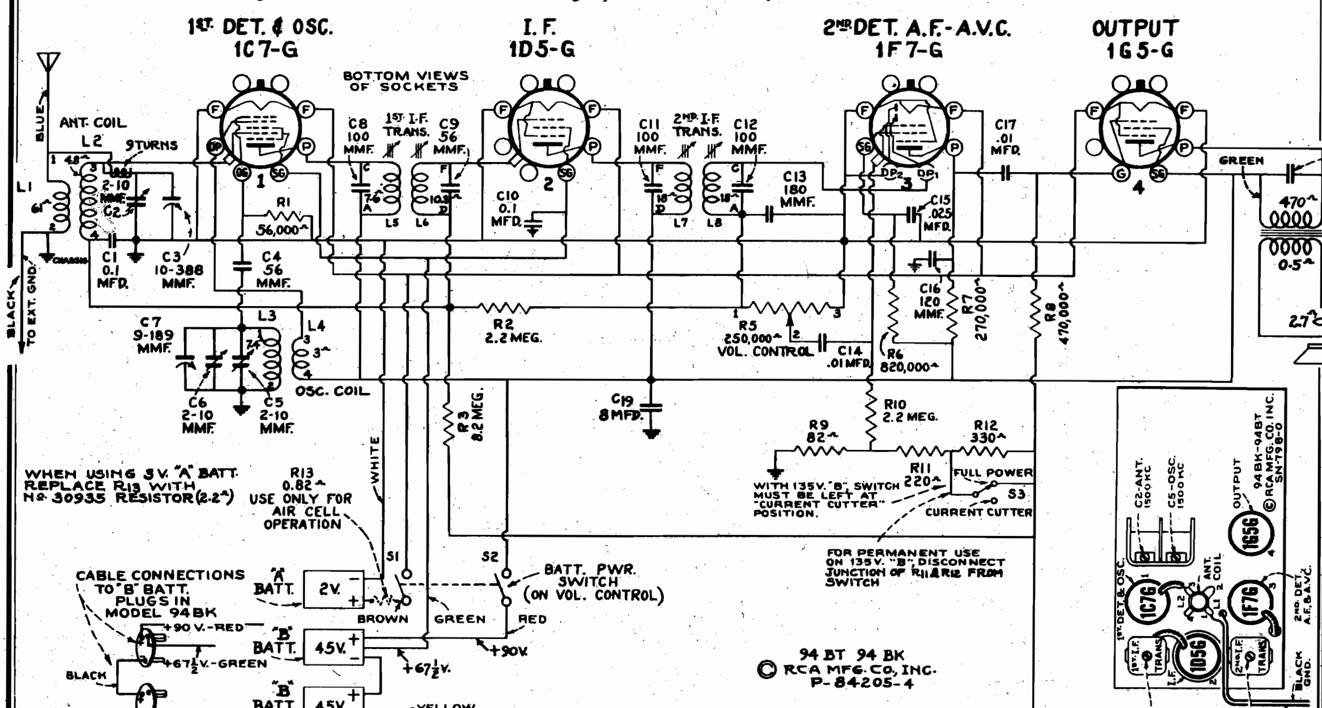
Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
No. 1	1D5-G I-F grid cap, in series with .001 mfd.	455 kc	Quiet point between 550-750 kc	L7 and L8 (2nd I-F transformer)
No. 2	1C7-G 1st-det. grid cap, in series with .001 mfd.	455 kc		L5 and L6 (1st I-F transformer)
No. 3	Antenna lead, in series with 200 mmfd.	1,500 kc	1,500 kc	C5* (oscillator) C2 (antenna)

* Trimmer C6 on gang condenser should be unscrewed one complete turn from tight, before adjusting C5.



BOTTOM VIEW—REAR OF CHASSIS

Figure 2—Radiotron Socket Voltages, and Location of Parts



Frequency Range.......................... 540 to 1,750 kc
R-F Alignment Frequency................ 1,500 kc (osc., ant.)
Intermediate Frequency....................... 455 kc

Precautionary Lead Dress

1. I.F. plate lead should be dressed close to and along edge of chassis.
2. Lead from antenna terminal should be wrapped (9 turns) around lead from ant. coil secondary to gang condenser (see schematic).
3. Antenna and ground leads should be arranged as shown in top view.

BATTERIES REQUIRED

"A", one 2½-volt air cell, or one 2-volt storage battery, or one 3-volt dry "A" battery. (With latter, use No. 30935, 2.2-ohm resistor in series with positive "A" lead.)

"B", two or three 45-volt heavy-duty "B" batteries.

LOUDSPEAKER

Type.............. Permanent-magnet Dynamic
Diameter (94BT).......... 5in. (94BK).......... 6¼ in.
Voice-coil Impedance.............. 3 ohms at 400 cycles

Voice-coil Impedance.................... 3 ohms at 400 cycles

Precautionary Lead Dress

1. Leads on C16 and C20, and lead from R16 to terminal board, must be short. C22 and C4 are soldered direct (no leads).
2. Dress L10 away from chassis. Dress T1 secondary leads (brown and green) away from base and free of other leads (same applies to R17 and C27). Dress T1 secondary midtap (brown-black) free of other leads and close to chassis.
3. Maintain original ground points.
4. Antenna and ground leads 36 inches long, twisted, and arranged as shown in top view.
5. I.F. plate lead (blue) dressed close to and along edge of chassis.

Battery Charger Connections.—The positive side of the 6-volt "A" circuit is connected to the receiver chassis, and the chassis is normally grounded. If the charger has a ground on the negative side, the ground should be removed, or changed to the positive side. Do not change the length of leads from the receiver to the battery.

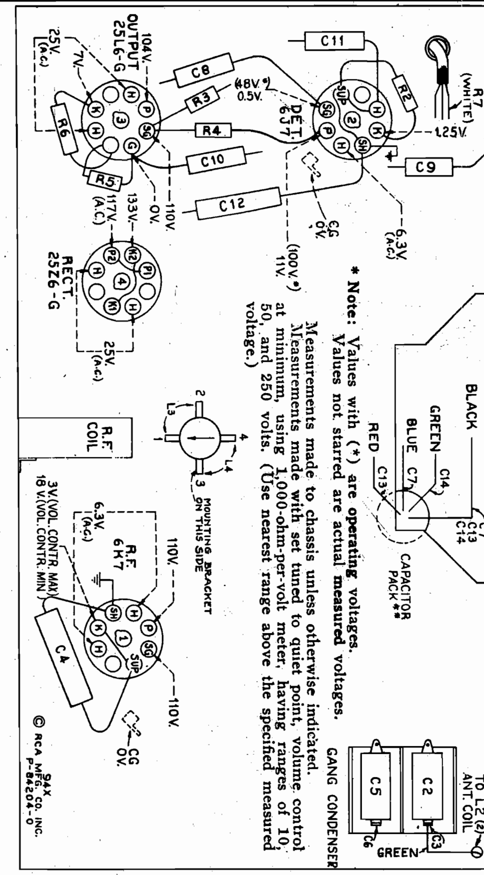
Figure 2—Schematic Circuit Diagram

** Some sets have a three-section capacitor pack (C7, C13, C14). In other sets, the pack contains only two capacitors (C13, C14); a separate 0.25 mfd. capacitor being used as C7. The pack furnished for replacement (No. 30873) is a two-section pack and does not include C7. Therefore, when an original three-section pack is replaced by No. 30873, it is necessary to connect a No. 30965 200-volt 0.25 mfd. capacitor from the cathode of the 6J7 to terminal 2 (chassis) on the volume control. This capacitor should be dressed close to the front of chassis.



* Note: Values with (*) are operating voltages.
Values not starred are actual measured voltages.

Measurements made to chassis unless otherwise indicated.
Measurements made with set tuned to quiet point, volume control at minimum, using 1,000-ohm-per-volt meter, having ranges of 10, 50, and 250 volts. (Use nearest range above the specified measured voltage.)

Alignment Procedure

Remove dial pointer by pulling it carefully off the pointer shaft. Remove chassis from cabinet.

CAUTION: The chassis is connected to one side of the power supply. Avoid contact of chassis or parts to external ground when servicing.

Reel up the antenna wire, and connect the high side of test-oscillator through an 80 mmfd. capacitor to the antenna terminal on the antenna transformer. Connect low side of oscillator to receiver chassis through a 0.1 mfd. capacitor. Turn gang condenser to minimum (full out), tune oscillator to 1,800 kc, connect an output meter across the voice coil, and turn volume control to maximum.

Adjust the two trimmers (C3 and C6) on side of gang condenser for maximum output, using lowest possible output from test-oscillator.

Assemble chassis in cabinet and press the pointer on the shaft. Turn pointer, while holding tuning knob, so that the pointer is horizontal and pointing to low-frequency end when the gang condenser is at maximum. Check pointer adjustment on a station.

Alignment Procedure

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the chassis drawing. Turn the receiver volume control to maximum.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Calibration Marks. — The tuning dial is fastened in the cabinet and can not be used for reference during alignment. Therefore calibration marks corresponding to dial readings of 600 kc and 1,500 kc have been stamped in the plate on the front of the chassis, as shown in the accompanying drawing. These marks are used for reference during alignment.

Drum and Dial Indicator Adjustment.—As the first step in r-f alignment, check the position of the drum on the front shaft of the gang condenser. With the gang at maximum (full mesh) the drum set-screw should be pointing directly down as shown in the drawing. With the drum in this position, and the gang at maximum, move the dial indicator along the drive cord to coincide with the left-hand line as shown. The indicator is held to the drive cord by means of spring clips.

After completion of alignment, and after the chassis has been fastened in the cabinet, turn the gang to maximum and note whether the dial indicator is at the left-hand end mark on the dial; if it is not, loosen the drum set-screw (which is accessible through a slot in the bottom of the cabinet), turn the drum slightly so that the indicator is at this mark, and then tighten the set-screw.

After completion of alignment, seal the i-f core-adjustment screws with household cement.

For additional details, refer to booklet, "RCA Victor Receiver Alignment."

Steps	Connect the high side of test-osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	6K7 I-F grid cap, in series with .01 mfd.	455 kc	Quiet point between 550-750 kc	L7 and L8 (2nd I-F Trans.)
2	6A8-G grid cap, in series with .01 mfd.	455 kc		L5 and L6 (1st I-F Trans.)
3	Antenna lead (blue) in series with 200 mmf.	1,500 kc	1,500 kc calibration mark.	C6 (osc.)* C3 (ant.)
4	Follow "Adjustments for Electric Tuning."			

*** The oscillator section of the gang condenser has two trimmers, one on top, accessible through a hole in the chassis, and the other on bottom. It may be necessary to adjust both of these trimmers to secure a peak on 1,500 kc.**

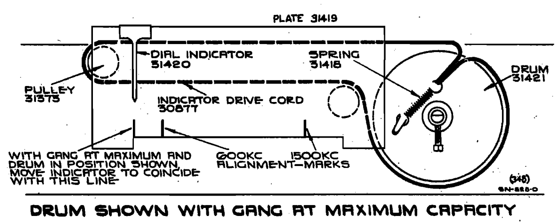
Nos. 2, 3—Approximately 650-1,080 kc.
Nos. 4, 5—Approximately 850-1,500 kc.



Dial-Indicator and Drive Mechanism
Refer to "Alignment Procedure" for explanation of the "calibration marks" shown in this drawing

Adjustments for Electric Tuning

These models have six push buttons. The right-hand button connects the gang condenser for dial tuning. The other five buttons are for electric tuning of five different stations in the standard-broadcast range. The station buttons connect to separate magnetite-core oscillator coils and separate antenna trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as RCA Stock No. 31031. Allow at least five minutes warm-up period before making adjustments. Use a regular antenna for the preliminary adjustments.

The procedure is as follows:

1. Make a list of the five desired stations, arranged in order from low to high frequencies.
2. Push in the dial-tuning (right-hand) button, and manually tune in the first station on the list.
3. Push in station-button No. 1 (left-hand) and adjust No. 1 oscillator core (L12) to receive this station. Screw the core all the way in, to lowest frequency, and then unscrew slowly until the station is received.
4. Adjust No. 1 antenna trimmer (C20) for maximum output on this station.
5. Adjust for each of the remaining four stations in the same manner.

(Clockwise adjustment of oscillator cores and antenna trimmers tunes the circuits to lower frequencies.)

6. Make a final careful adjustment of the oscillator cores and antenna trimmers, using one or two feet of wire as an antenna to ensure sharp peaking.

Precautionary Lead Dress.—

1. Dress green lead from antenna coil to switch away from the chassis and gang.
2. Dress green leads from oscillator coils away from the adjustment screws.
3. Dress leads in power-transformer primary circuit to left end of chassis.
4. In 95T5, C27 must be dressed close to chassis and clear of rotor.
5. In 96E, 96T, and 96T1, dress ground bus from heater of 6H6 close to chassis, and dress blue lead from 2nd I-F transformer to volume control close to chassis.

General Description

Model 95T5 is a five-tube superheterodyne. Models 96E, 96T, and 96T1 are six-tube superheterodynes. All of these models have push-buttons for electric-tuning of five stations in the standard-broadcast range, and one push-button for dial-tuning over the entire range of 540 to 1,720 kc.

Features of design include magnetite-core i-f transformers, and magnetite-core electric-tuning oscillator coils; temperature-stabilized capacitor in the oscillator circuit; automatic volume control; electrodynamic loudspeaker, and edge-illuminated straight-line dial. The six-tube models have continuously-variable high-frequency tone control.

Power Output	Model 95T5	Models 96E, 96T, 96T1

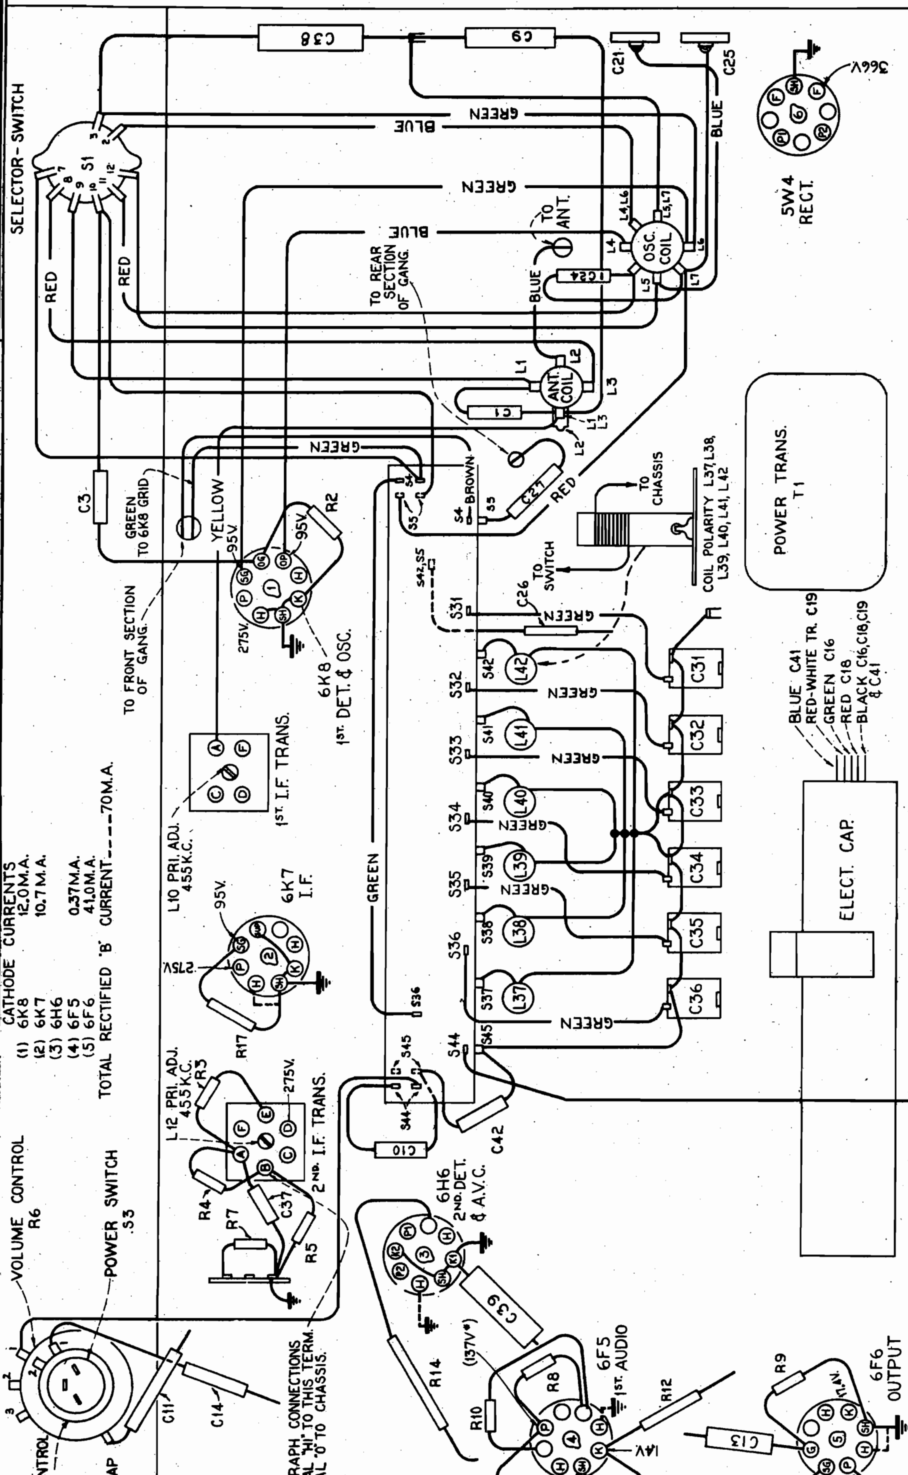

Figure 5—R-F Wiring Diagram and Socket Voltages

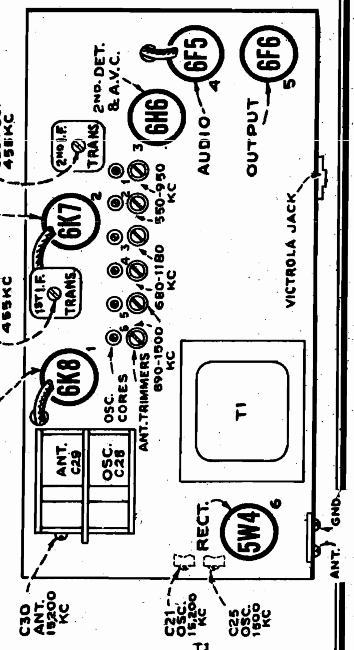
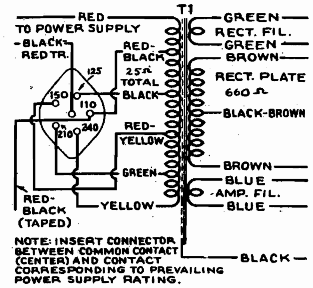
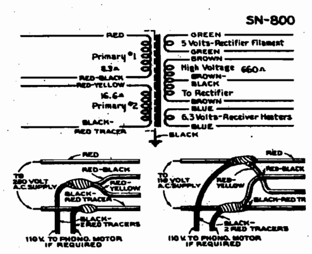
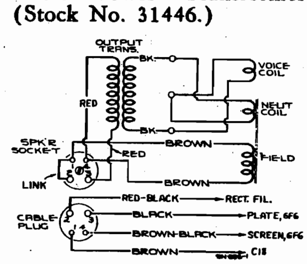




Above — Universal Power Transformer Connections. (110-volt supply for a Victrola Attachment may be obtained by connecting the motor to the red and the red-black leads.)



Above—Replacement Universal Power Transformer (Stock No. 31446.)



Above — Connections and Colors of Loudspeaker and Cable.

RCA MFG. CO., INC.

Loudspeaker.—Centering of the loudspeaker voice coil is made in the usual manner with three narrow celluloid or paper feelers after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. A dust cover should be cemented in place with ambroid upon completion of adjustment.

Precautionary Lead Dress.—(1) Dress 110-volt leads to power transformer away from audio wiring. (2) The 12,000 ohm resistor (R14) should be dressed clear of wiring and parts, since it becomes heated during operation. (3) The leads across back of chassis must be dressed under the electrolytic capacitor to prevent approaching the Victrola jack. (4) All leads in vicinity of antenna coil must be dressed away from the coil windings.

ALIGNMENT PROCEDURE

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the chassis drawing.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial if fastened in the cabinet and cannot be used for reference during alignment; therefore, a calibration scale is attached to the rear of the drum which is mounted on the front shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The 180° mark on the drum scale must be vertical, and directly over the center of the gang-condenser shaft when the plates are fully meshed. The distance from the front of the chassis to the drum must not exceed 3/8-inch. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "180°" mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator at the 530 kc mark, and gang condenser fully meshed. The indicator has a spring clip for attachment to the cable.

After completion of alignment, seal the i-f core-adjusting screws with household cement.

For additional details, refer to booklet "RCA Victor Receiver Alignment."

Steps	Connect the high side of test-osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	6K7 I-F grid cap, in series with .01 mfd.	455 kc	"A" band, Quiet Point between 550-750 kc	L12 and L13 (2nd I-F Trans.)
2	6K8 det. grid cap, in series with .01 mfd.	455 kc		L10 and L11 (1st I-F Trans.)
3	Antenna Terminal, in series with 400 ohms	15.2 mc	15.2 mc (33.5°) "C" band	C21* (osc.) C30** (ant.)
4	Antenna Terminal in series with 200 mmf.	1,500 kc	1,500 kc (28°) "A" band	C25 (osc.)
5	Follow "Adjustments for Electric Tuning."			

* Use minimum capacity peak if two peaks can be obtained.

** Rock gang slightly while adjusting C30. Check to determine that C21 has been adjusted to the correct peak by tuning to approximately 40.5° (14.29 mc), where a weaker signal should be received.

Note: Oscillator tracks 455 kc above signal on both bands.

ADJUSTMENTS FOR ELECTRIC TUNING

These models have eight push buttons. The left-hand button is a Victrola switch. The right-hand button connects the gang condenser for manual tuning. The other six buttons are for electric tuning of six different stations in the standard broadcast range. The station buttons connect to separate magnetite-core oscillator coils and separate antenna trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as RCA Stock No. 31031. Allow at least five minutes warm-up period before making adjustments.

The procedure is as follows:

1. Make a list of the desired six stations, arranged in order from low to high frequencies.
2. Use one or two feet of wire as an antenna to ensure sharp peaking.
3. Push in the dial-tuning button, and manually tune in the first station on the list.
4. Push in station button No. 1 (second from left) and adjust No. 1 oscillator core (L37) to receive this station. Screw the core all the way in, to lowest frequency, and then unscrew slowly until station is received.
5. Adjust No. 1 antenna trimmer (C36) for maximum output on this station.

   Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.
6. Adjust for each of the remaining five stations in the same manner.
7. Make a final readjustment of the magnetite-cores.

General Description

These receivers employ a two-band superheterodyne circuit which is operated either manually or by electric tuning on standard broadcast, and includes foreign short-wave, aircraft, police, and amateur stations on the short-wave band. Model 96T2 is a table model, and uses a 6-inch electrodynamic loudspeaker. Model 96K is a console, using the same chassis with a 12-inch electrodynamic loudspeaker.

Features of design include magnetite-core adjusted i-f transformers and "Electric Tuning" oscillator coils; jack and switch for Victrola attachment; aural-compensated volume control; continuously variable tone-control; automatic volume control; dust-proof electrodynamic speaker; and straight-line dial.

Power Output	96T2	96K
Undistorted	2.0 watts	2.5 watts
Maximum	4.0 watts	4.5 watts
Loudspeaker		
Model	96T2	96K
Type	6 inch, electrodynamic	12 inch, electrodynamic
Voice Coil Impedance at 400 cycles	2.6 ohms	2.2 ohms

REPLACEMENT PARTS

Insist on genuine factory-tested parts, which are readily identified and may be purchased from authorized dealers.

Schematic, Socket, Trimmers Chassis Wiring, Voltage Tuner, Notes

RCA MFG. CO., INC.

POWER OUTPUT (125-volt, 60-cycle supply)
Undistorted.. 1.0 watt
Maximum.. 1.5 watts

LOUDSPEAKER
Type.................................. 5-inch Electrodynamic
Voice-Coil Impedance.................. 3 ohms at 400 cycles

In re-assembling, dress the leads to prevent rubbing against the push-button shafts.

CAUTION: The chassis is connected to one side of the power supply. Avoid contact of chassis or parts to external ground when servicing.

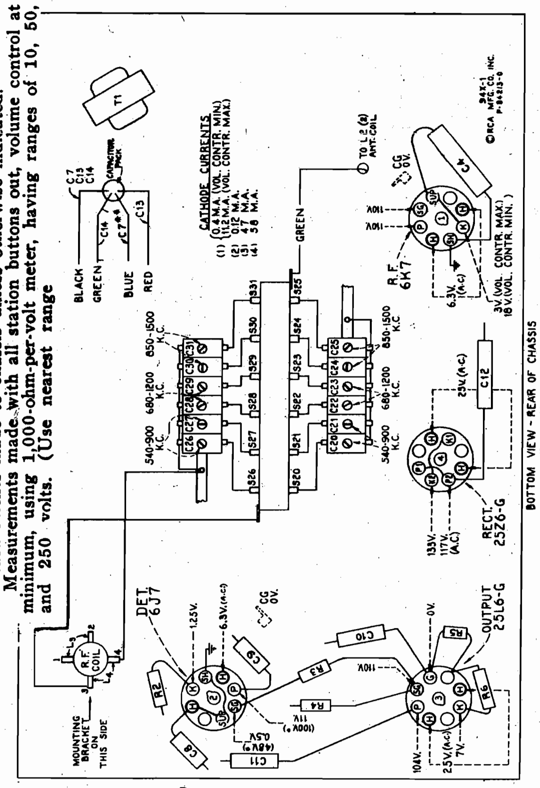
Adjustment of Tuning Capacitors

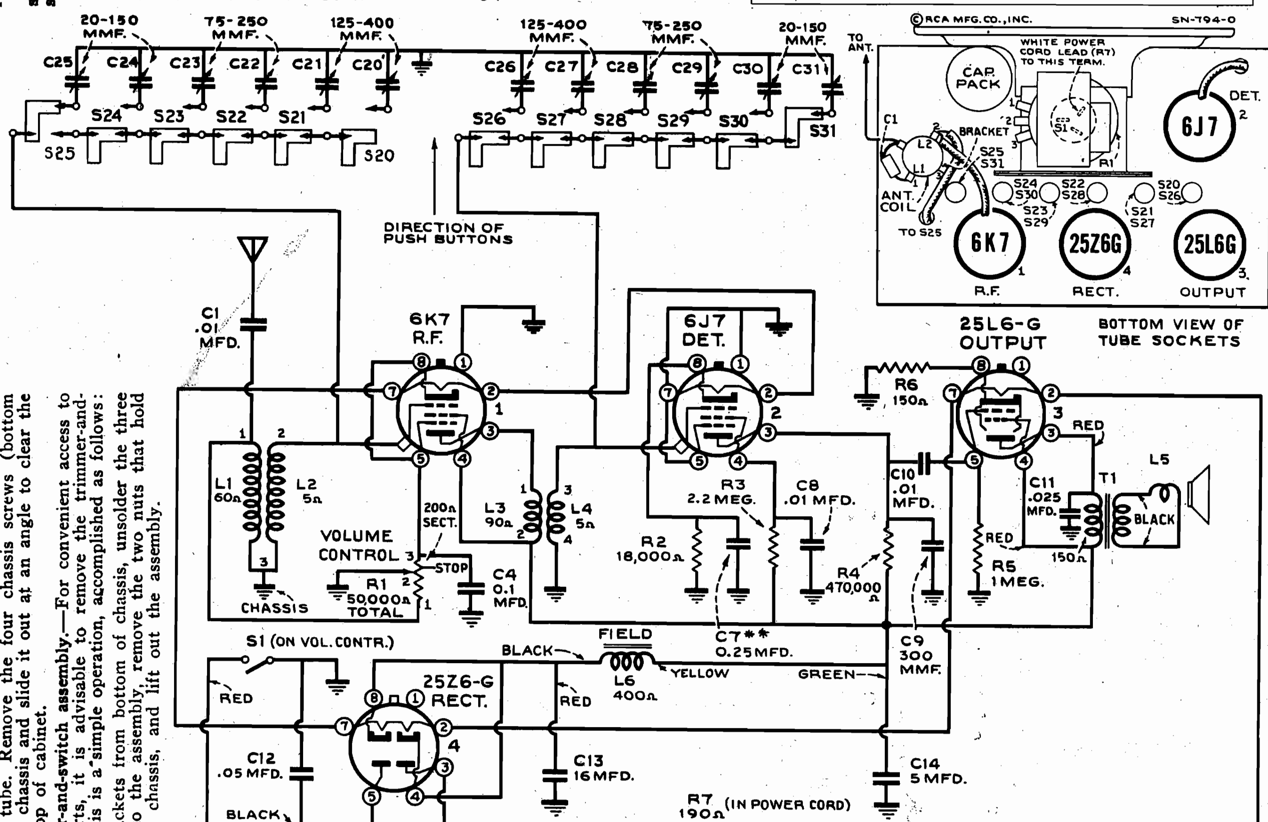
The preferable and quickest method of adjusting the tuning capacitors for six different stations, is to employ a test-oscillator, as described below:

1. Make a list of the desired six stations, arranged in order from low to high frequencies.
2. Determine the correct settings of the test-oscillator for these six frequencies. This is accomplished as follows: Tune in each of the six stations on any standard receiver; zero-beat the test-oscillator against each station, and note the exact setting of the oscillator in each case.
3. Reel up the antenna wire. Connect the high side of test-oscillator through a 60 mmfd. fixed capacitor to the end of the antenna wire. Clip the low side of the oscillator through a 0.1 mfd. capacitor to one of the chassis-mounting screws on the bottom of the cabinet. Tune the oscillator to the previously-determined point for the lowest-frequency station, and adjust for a strong output.
4. Turn the volume control of the push-button receiver full clockwise, and push in the left-hand end button. Using an insulated screw-driver, peak capacitors C20 and C26, at the same time reducing the output of the oscillator in order to secure a sharp peak. (Clockwise adjustment of the capacitors tunes the circuits to lower frequencies, and counter-clockwise adjustment tunes the circuits to higher frequencies. The range of each trimmer is three full counter-clockwise turns from the tight position. Do not unscrew more than three turns.)
5. Push in the second button from left, and adjust C21 and C27 for peak output with the oscillator tuned to the frequency of the second station.
6. Proceed in this manner to adjust each pair of capacitors for the desired frequencies.
7. Final adjustment may be made in actual reception of the stations.

For convenience in making measurements at the socket contacts, it is advisable to remove the trimmer-and-switch assembly, and make a temporary connection from the chassis to the bottom lug on L4. (This connection is required in order to complete the detector grid circuit.)

Measurements made to chassis unless otherwise indicated.
Measurements made with all station buttons out, volume control at minimum, using 1,000-ohm-per-volt meter, having ranges of 10, 50, and 250 volts. (Use nearest range





(L5 is 3.5 ohms, and the sec. of T1 is 0.5 ohms)

** Some sets have a three-section capacitor pack (C7, C13, C14). In other sets, the pack contains only two capacitors (C13, C14); a separate 0.25 mfd. capacitor being used as C7. The pack furnished for replacement (No. 30873) is a two-section pack and does not include C7. Therefore, when an original three-section pack is replaced by No. 30873, it is necessary to connect a No. 30965 200-volt 0.25 mfd. capacitor from the cathode of the 6J7 to the ground lug at the output transformer. This capacitor should be dressed close to the front of chassis.

Removing chassis from cabinet.—Remove back plate and volume-control knob. Pull the push-button knobs off their shafts. Remove the 25L6-G output tube. Remove the four chassis screws (bottom of cabinet). Lift the chassis and slide it out at an angle to clear the shaft holes in the top of cabinet.

Removing trimmer-and-switch assembly.—For convenient access to the sockets and parts, it is advisable to remove the trimmer-and-switch assembly. This is a simple operation, accomplished as follows: Remove the two brackets from bottom of chassis, unsolder the three leads that connect to the assembly, remove the two nuts that hold the assembly to the chassis, and lift out the assembly.

FREQUENCY RANGE
Two stations between 540-900 kc
Two stations between 680-1,200 kc
Two stations between 850-1,500 kc

RCA MFG. CO., INC.

R-F Alignment Frequencies

"Short Wave" (C)...... 20 mc (osc., ant.)
"Medium Wave" (B)........ 6.1 mc (osc.)
"Standard Broadcast" (A).. 1,500 kc (osc.)

Frequency Ranges

"Standard Broadcast" (A). 540-1,720 kc
"Medium Wave" (B)........ 2.3-7 mc
"Short Wave" (C).......... 7-22 mc

D-C RESISTANCE VALUES		
SPEAKER	PRI. of T2	L14
84308-1	500Ω	2.3
RL-70F-3	375Ω	2
RL-63H-3	375Ω	2

IF PEAK 455 KC

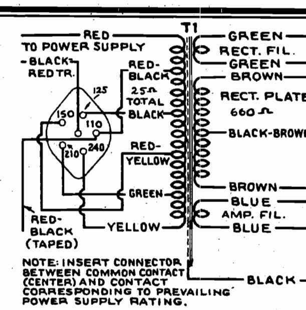
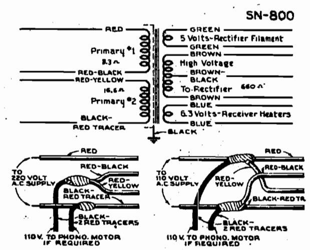
Chassis Wiring, Voltage

RCA MFG. CO., INC.

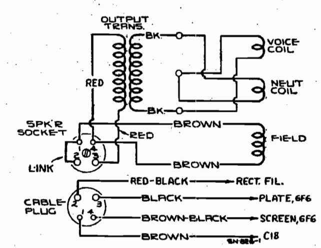
Lead Dress, Transformers Drive Cord



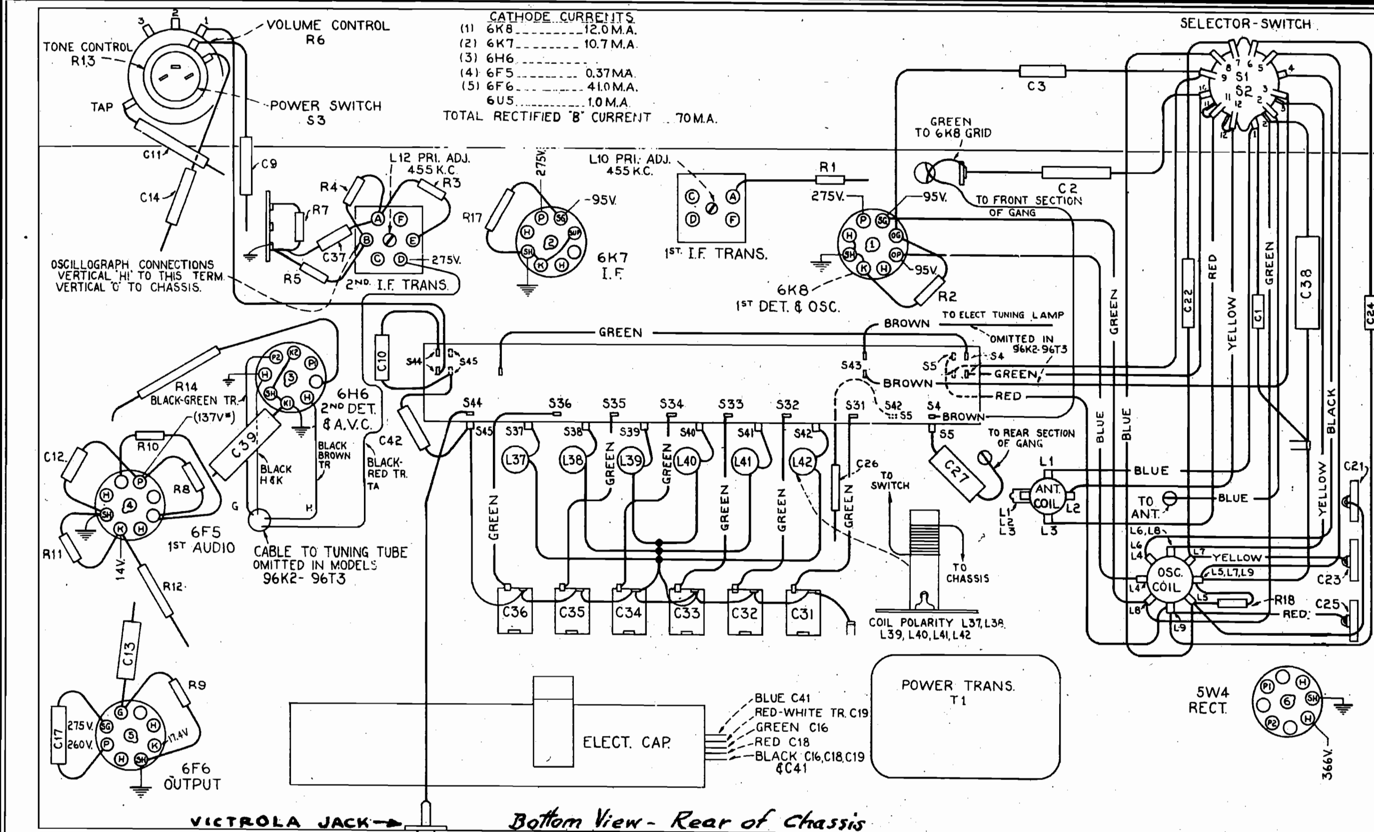
Above — Universal Power Transformer Connections. (110-volt supply for a Victrola Attachment may be obtained by connecting the motor to the red and the red-black leads.)



Above—Replacement Universal Power Transformer (Stock No. 31446.)

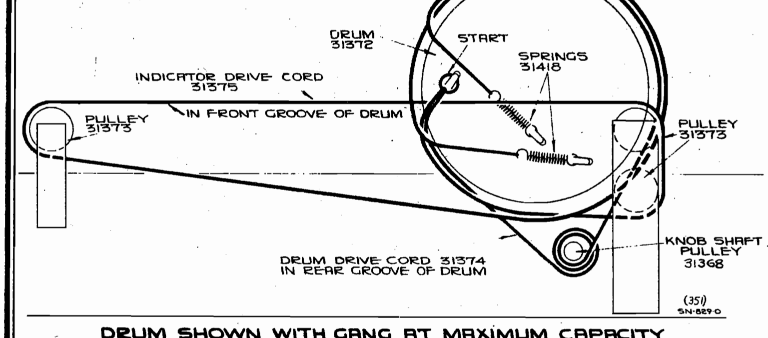


Above — Connections and Colors of Loudspeaker and Cable.



Measurements made to chassis unless otherwise indicated, with set tuned to quiet point and volume control at minimum. Values should hold within ±20% with 117-volt a-c supply.

*** NOTE:** Values with star (*) are operating voltages in circuits with high series resistance. The actual measured voltages will be lower, depending on the voltmeter loading.



Precautionary Lead Dress.—

1. Dress power-switch leads against left apron to prevent hum pickup.
2. Dress R1 away from front of chassis.
3. Electric-tuning lamp leads must be dressed in front of range switch.
4. Dress lead from L5 to range switch away from other leads.
5. Dress leads away from antenna coil.
6. Dress other parts and leads away from R14, as it becomes heated.
7. Leads across back of chassis should be dressed under electrolytic to prevent approaching Victrola jack.

Figure 6—(At Left) Arrangement of Drive Cords for Tuning Condenser and Dial Indicator

RCA MFG. CO., INC.

Loudspeaker

Type .... Electrodynamic

Voice-coil impedance .... {84308-1 2.6 ohms; RL-70F-3 2.25 ohms; RL-63H-3 2.25 ohms} .... at 400 cycles

ALIGNMENT PROCEDURE

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the chassis drawing.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord drum.—The tuning dial if fastened in the cabinet and cannot be used for reference during alignment; therefore, a calibration scale is attached to the rear of the drum which is mounted on the front shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The 180° mark on the drum scale must be vertical, and directly over the center of the gang-condenser shaft when the plates are fully meshed. The distance from the front of the chassis to the drum must not exceed 3/8-inch. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "180°" mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator at the 530 kc mark, and gang condenser fully meshed. The indicator has a spring clip for attachment to the cable.

After completion of alignment, seal the i-f core-adjusting screws with household cement.

Steps	Connect the high side of test-osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	6K7 I-F grid cap, in series with .01 mfd.	455 kc	"A" band, Quiet Point between 550-750 kc	L12 and L13 (2nd I-F Trans.)
2	6K8 det. grid cap, in series with .01 mfd.	455 kc		L10 and L11 (1st I-F Trans.)
3	Antenna Terminal, in series with 400 ohms	20 mc	20 mc (23°) "C" band	C21* (osc.) C30** (ant.)
4	Antenna Terminal, in series with 400 ohms	6.1 mc	6.1 mc (31°) "B" band	C23 (osc.)†
5	Antenna Terminal, in series with 200 mmf.	1,500 kc	1,500 kc (28½°) "A" band	C25 (osc.)
6	Follow "Adjustments for Electric Tuning"			

* Use **minimum** capacity peak if two peaks can be obtained.

** Rock gang slightly and use **maximum** capacity peak if two peaks can be obtained with C30. Check to determine that C21 has been adjusted to the correct peak by tuning to approximately 28° (19.09 mc), where a weaker signal should be received.

† Use **minimum** capacity peak if two peaks can be obtained. Check to determine that C23 has been adjusted to the correct peak by turning to approximately 49° (5.19 mc), at which point a weaker signal should be received.

Note: Oscillator tracks 455 kc above signal on all bands.

ADJUSTMENTS FOR ELECTRIC TUNING

These models have eight push buttons. The left-hand button is a Victrola switch. The right-hand button connects the gang condenser for manual tuning. The other six buttons are for electric tuning of six different stations in the standard-broadcast range. The station buttons connect to separate magnetite-core oscillator coils and separate antenna trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as RCA Stock No. 31031. Allow at least five minutes warm-up period before making adjustments.

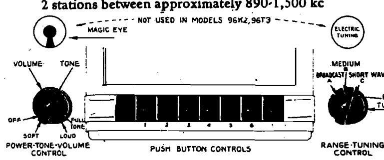
The procedure is as follows:

1. Make a list of the desired six stations, arranged in order from low to high frequencies.
2. Push in the dial-tuning button, and manually tune in the first station on the list.
3. Push in station button No. 1 (second from left) and adjust No. 1 oscillator core (L37) to receive this station. Screw the core all the way in, to lowest frequency, and then unscrew slowly until station is received.
4. Adjust No. 1 antenna trimmer (C36) for maximum output on this station.

Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.

5. Adjust for each of the remaining five stations in the same manner.
6. Make a final careful adjustment of the oscillator cores and antenna trimmers. Use the "Magic Eye" in Models 97E, 97KG, and 97T to ensure sharp peaking. With Model 96T3 or 96K2, use one or two feet of wire as an antenna when making the final adjustments in order to obtain sharp peaking.

Six Electric Tuning Positions .... 550-1,500 kc
2 stations between approximately 550- 950 kc
2 stations between approximately 680-1,180 kc
2 stations between approximately 890-1,500 kc



Victrola Attachment.—A jack is provided on the rear of the chassis for connection to a Victrola Attachment. The cable from the Victrola Attachment should be terminated in a Stock No. 31048 plug to fit the jack.

Loudspeaker.—Centering of the loudspeaker voice coil is made in the usual manner with three narrow celluloid or paper feelers after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. A dust cover should be cemented in place with ambroid upon completion of adjustment.

REPLACEMENT PARTS

Insist on genuine factory-tested parts, which are readily identified and may be purchased from authorized dealers.

MODEL 95T
Schematic, Socket, Trimmers
Voltage, Chassis Wiring
Alignment, Parts, Specs.

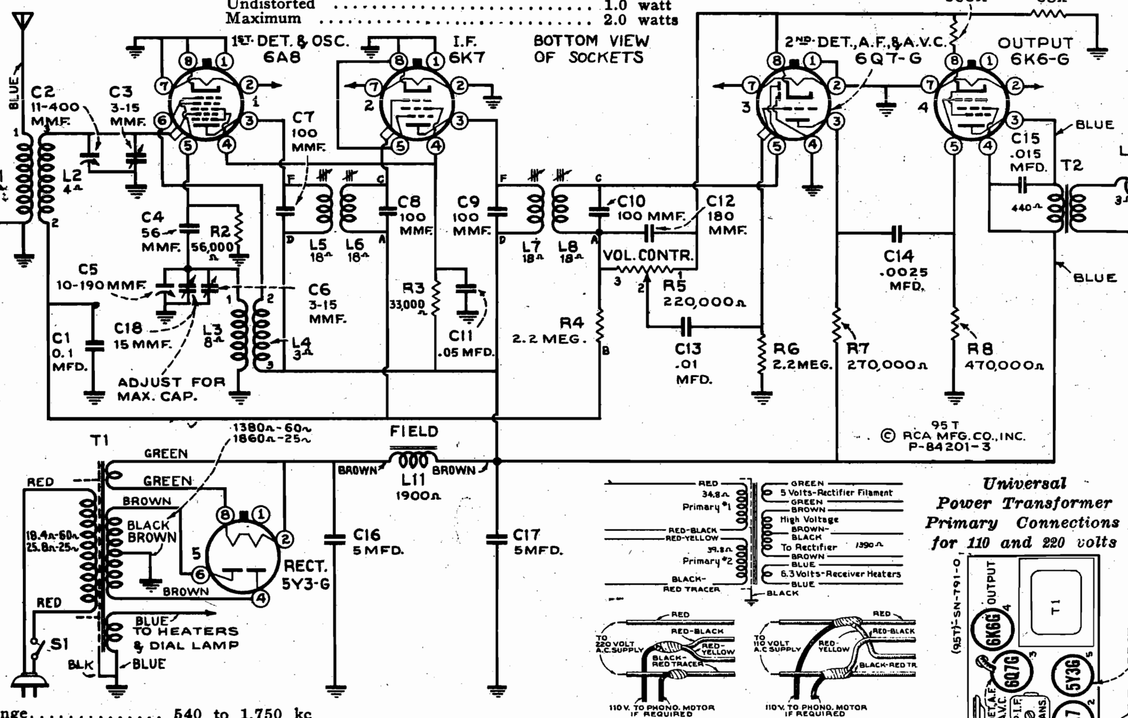
RCA MFG. CO., INC.

Dial lamp............... Mazda No. 46, 6.3 volts, 0.25 amps.

POWER OUTPUT (125-volt, a-c supply)
Undistorted .... 1.0 watt
Maximum .... 2.0 watts

Precautionary Lead Dress

1. Keep lead from high side of volume control (contact 3) away from capacitor in plate circuit of output tube.
2. Keep dial lamp leads away from 6Q7-G grid lead.
3. Keep a-c leads away from volume-control wiring.



Pre-setting dial. With gang condenser in full mesh, move dial pointer to coincide with horizontal lines. This is a friction adjustment.

Frequency Range.............. 540 to 1,750 kc
R-F Alignment Frequency..... 1,500 kc (osc., ant.)
Intermediate Frequency.............. 455 kc

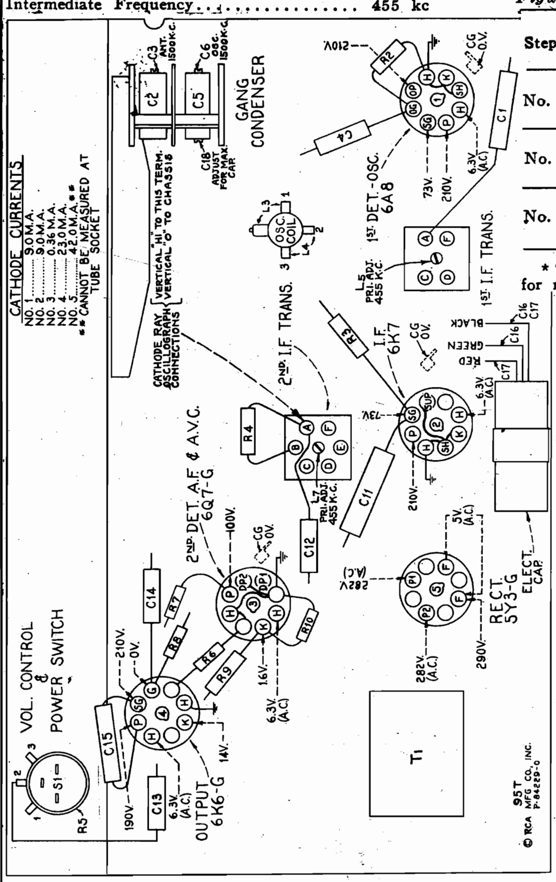


Figure 3—Schematic Circuit Diagram

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output

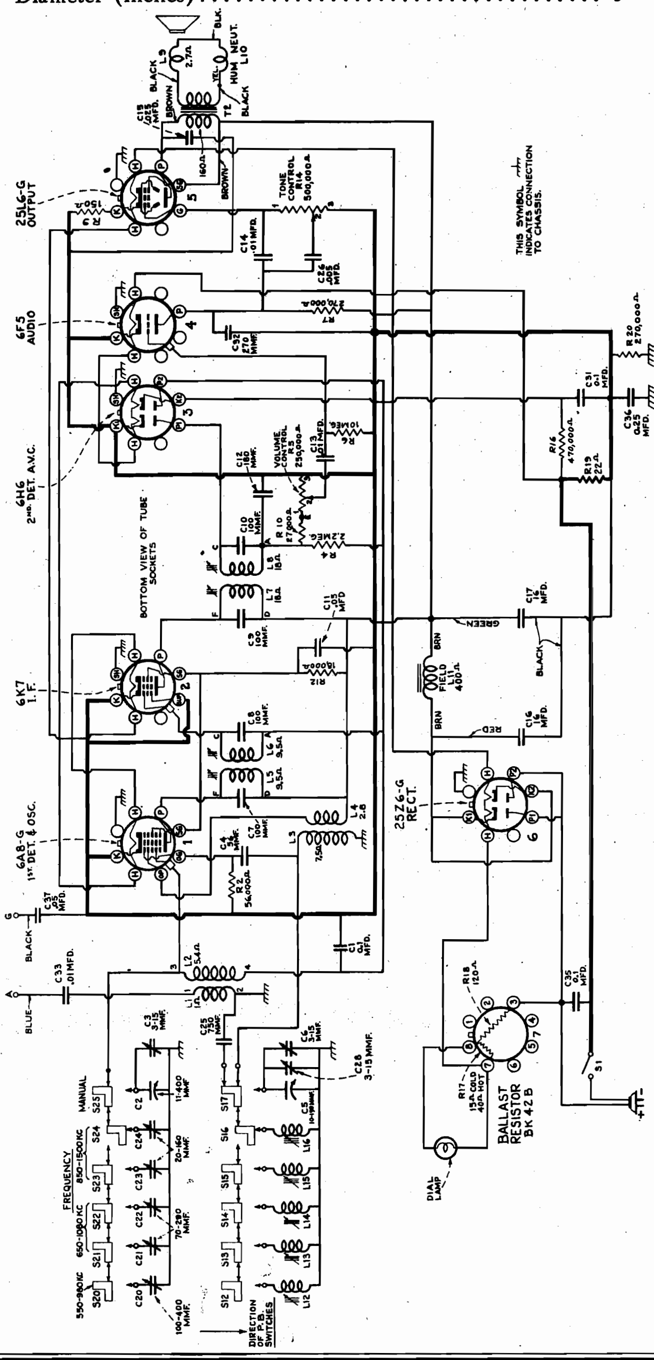
Loudspeaker (Electrodynamic)
Diameter (inches) .... 5.
V. C. Impedance at 400 cycles .... 3.0 ohms



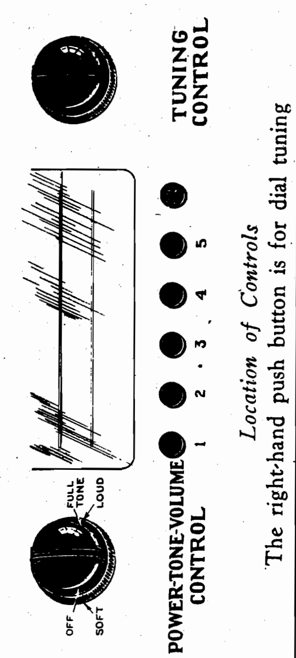
Miscellaneous Service Data

To center the loudspeaker voice coil, first remove the front dust cover by applying acetone sparingly, then loosen the spider screws, insert three narrow feelers in the gap, and tighten the spider screws. Remove the feelers and fasten a dust cover in place with loudspeaker cement.

Removing Push-Button Assembly.—The push-button assembly is held to the chassis by two nuts on the front apron, and may be quickly and easily swung out for convenient access to the sockets and other parts. No unsoldering is required, as flexible leads are used for all connections from the chassis to the assembly.

Precautionary Lead Dress.—

1. Dress green lead from antenna coil to switch away from the chassis and gang.
2. Dress green leads from trimmer bank away from the oscillator-core adjustment screws.
3. Dress heater lead from 6H6 to 6A8-G away from the 2nd I.F. transformer.
4. Dress black lead from electrolytic to volume control against front apron.



Location of Controls
The right-hand push button is for dial tuning

MODEL 97X
Socket, Trimmers
Alignment, Tuner

RCA MFG. CO., INC.

ALIGNMENT PROCEDURE

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the chassis drawing. Turn the receiver volume control to maximum.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the black lead and keep the output as low as possible to avoid a-v-c action.

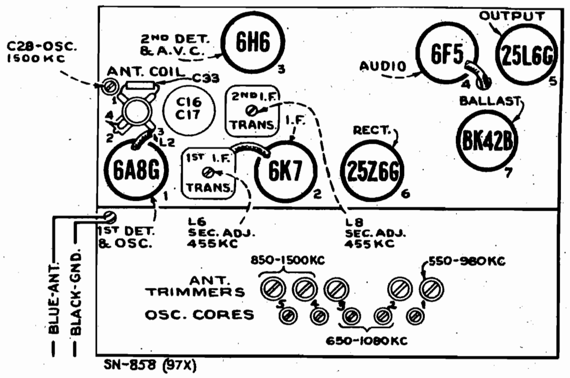
Calibration Marks. — The tuning dial is fastened in the cabinet and can not be used for reference during alignment. Therefore calibration marks corresponding to dial readings of 600 kc and 1,500 kc have been stamped in the plate on the front of the chassis, as shown in the accompanying drawing. These marks are used for reference during alignment.

Drum and Dial Indicator Adjustment.—As the first step in r-f alignment, check the position of the drum on the front shaft of the gang condenser. With the gang at maximum (full mesh) the drum set-screw should be pointing directly down as shown in the drawing. With the drum in this position, and the gang at maximum, move the dial indicator along the drive cord to coincide with the left-hand line as shown. The indicator is held to the drive cord by means of spring clips.

After completion of alignment, and after the chassis has been fastened in the cabinet, turn the gang to maximum and note whether the dial indicator is at the left-hand end mark on the dial; if it is not, loosen the drum set-screw (which is accessible through a slot in the bottom of the cabinet), turn the drum slightly so that the indicator is at this mark, and then tighten the set-screw.

After completion of alignment, seal the i-f core-adjustment screws with household cement.

For additional details, refer to booklet, "RCA Victor Receiver Alignment."

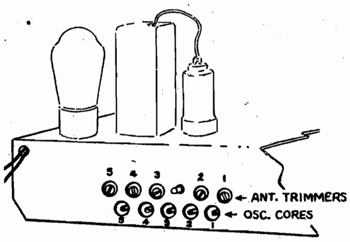


Tube and Trimmer Locations

Steps	Connect the high side of test-osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	6K7 I-F grid cap, in series with .01 mfd.	455 kc	Quiet point between 550-750 kc	L7 and L8 (2nd I-F Trans.)
2	6A8-G grid cap, in series with .01 mfd.	455 kc		L5 and L6 (1st I-F Trans.)
3	Antenna lead (blue) in series with 200 mmf.	1,500 kc	1,500 kc calibration mark.	C6 (osc.)* C3 (ant.)
4	Follow "Adjustments for Electric Tuning."			

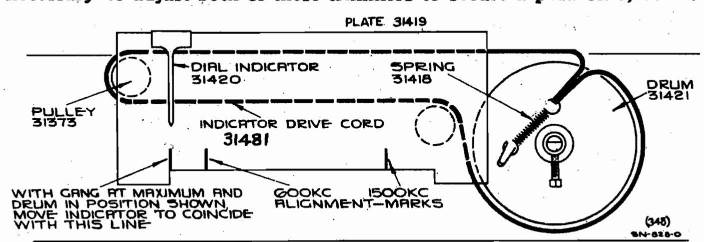
* Use minimum capacity peak if two peaks can be obtained.

The oscillator section of the gang condenser has two trimmers, one on top, accessible through a hole in the chassis, and the other on bottom. It may be necessary to adjust both of these trimmers to secure a peak on 1,500 kc.



Push-Button Adjustments

No. 1—Approximately 550-980 kc.
Nos. 2, 3—Approximately 650-1,080 kc.
Nos. 4, 5—Approximately 850-1,500 kc.



DRUM SHOWN WITH GANG AT MAXIMUM CAPACITY

Dial-Indicator and Drive Mechanism

Refer to "Alignment Procedure" for explanation of the "calibration marks" shown in this drawing

Adjustments for Electric Tuning

These models have six push buttons. The right-hand button connects the gang condenser for dial tuning. The other five buttons are for electric tuning of five different stations in the standard-broadcast range. The station buttons connect to separate magnetite-core oscillator coils and separate antenna trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as RCA Stock No. 31031. Allow at least five minutes warm-up period before making adjustments. Use a regular antenna for the preliminary adjustments.

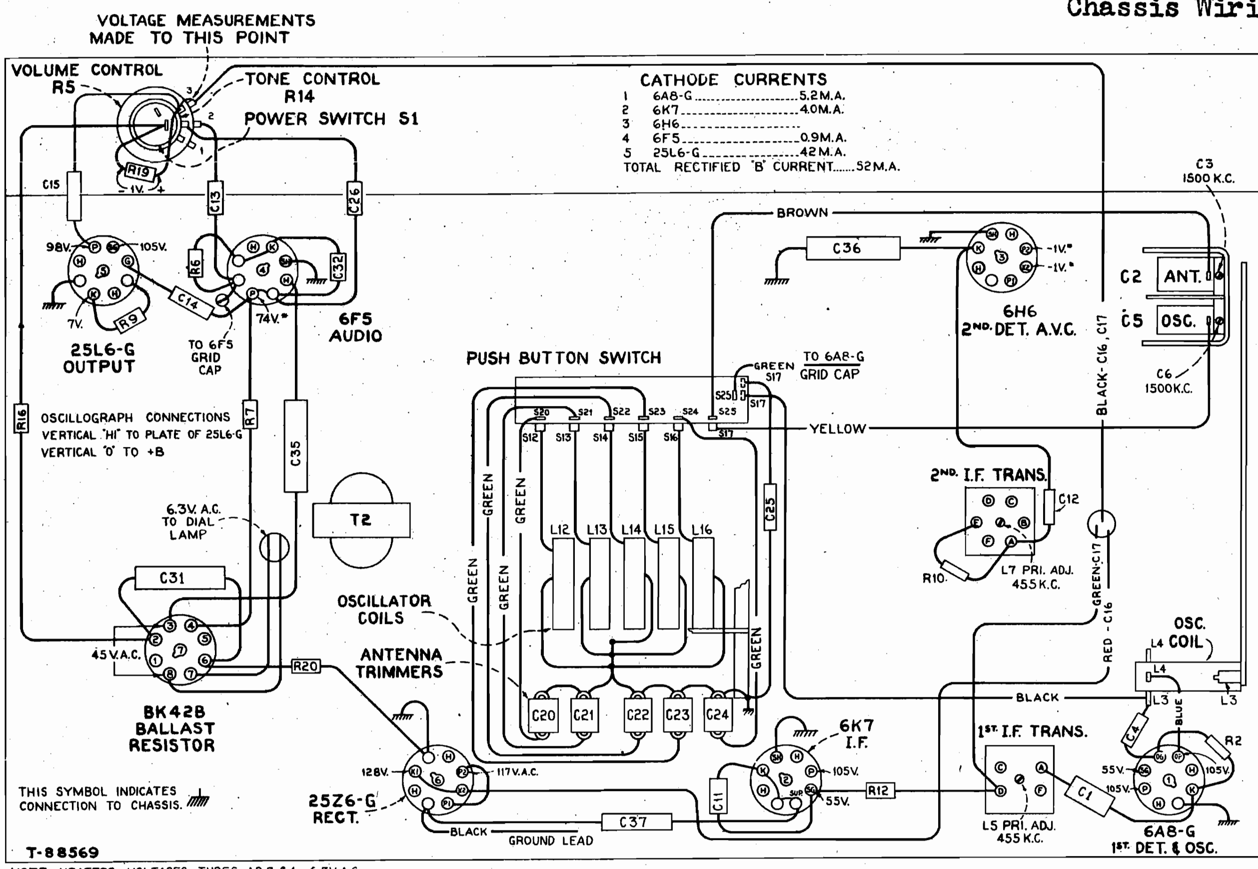
The procedure is as follows:

1. Make a list of the five desired stations, arranged in order from low to high frequencies.
2. Push in the dial-tuning (right-hand) button, and manually tune in the first station on the list.
3. Push in station-button No. 1 (left-hand) and adjust No. 1 oscillator core (L12) to receive this station. Screw the core all the way in, to lowest frequency, and then unscrew slowly until the station is received.
4. Adjust No. 1 antenna trimmer (C20) for maximum output on this station.
5. Adjust for each of the remaining four stations in the same manner.

(Clockwise adjustment of oscillator cores and antenna trimmers tunes the circuits to lower frequencies.)

6. Make a final careful adjustment of the oscillator cores and antenna trimmers, using one or two feet of wire as an antenna to ensure sharp peaking.

RCA MFG. CO., INC.



NOTE: HEATERS VOLTAGES TUBES 1,2,3,&4 = 6.3V.A.C.
TUBES 5&6 = 25V.A.C.

MODEL 95X, 95XL
Schematic, Socket Voltage, Alignment

RCA MFG. CO., INC.

Chassis Wiring, Parts Lead Dress

Alignment Procedure

CAUTION: The chassis is connected to one side of the power supply. Avoid contact of chassis or parts to external ground when servicing.

Reel up the antenna wire, and connect the high side of test-oscillator through an 80 mmfd. capacitor to the antenna terminal on the antenna transformer. Connect low side of oscillator to receiver chassis through a 0.1 mfd. capacitor. Turn gang condenser to minimum (full out), tune oscillator to 1,760 kc, connect an output meter across the voice coil, and turn volume control to maximum.

Keep antenna roll and lead clear of chassis during alignment.

Adjust the two trimmers (C3 and C6) on side of gang condenser for maximum output, using lowest possible output from test-oscillator.

Turn pointer, while holding tuning knob, so that the pointer is horizontal and pointing to low-frequency end when the gang condenser is at maximum. Check pointer adjustment on a station.

Precautionary Lead Dress

1. Dress power cord away from detector coil, heater leads close to base, leads from electrolytic close to base and free of grid leads.
2. Dress lead from det. coil to gang condenser toward back apron. Dress lead from antenna coil to volume control toward front apron.

25-Cycle Operation

For 25-cycle operation, connect a 16 mfd., 150-volt dry electrolytic capacitor (Stock No. 31323) from the cathode of the rectifier tube to chassis. (Positive to contact K1 of 25Z6-G, and negative to shell contact of 6K7 r-f socket.)

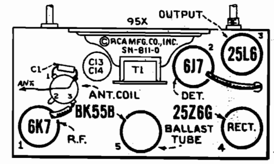

Figure 1—Radiotron Locations

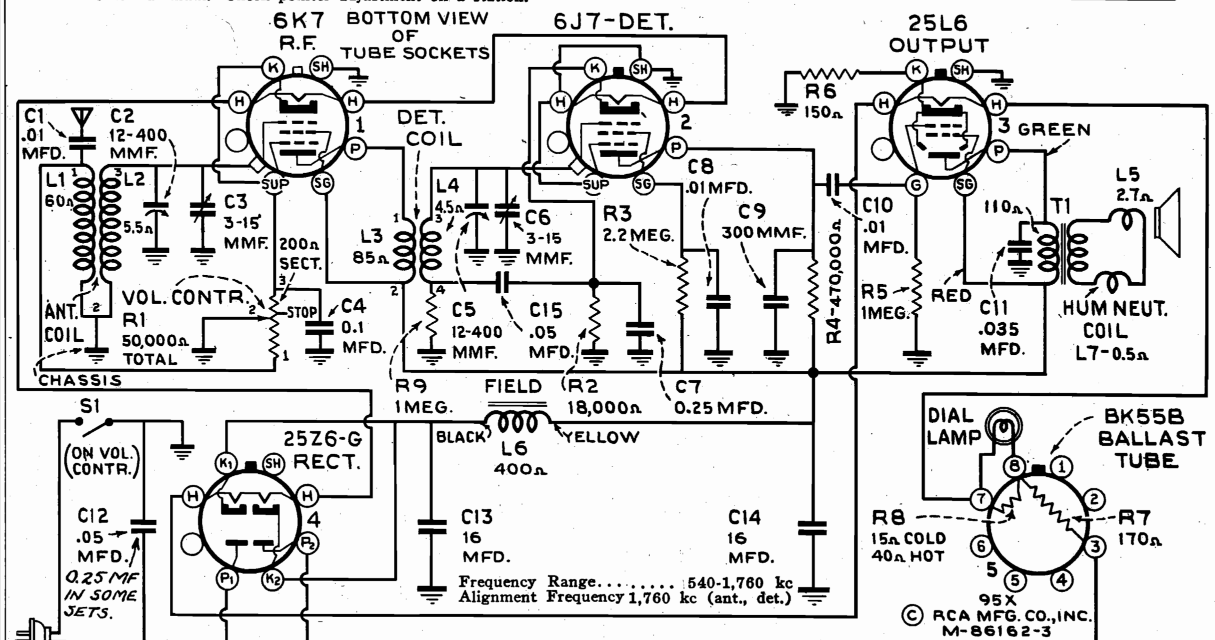

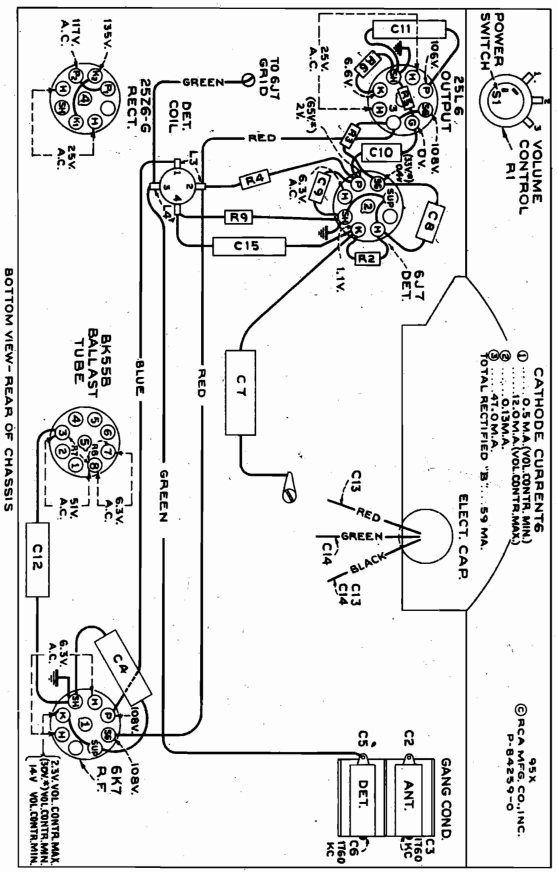

BOTTOM VIEW- REAR OF CHASSIS

Power Output (125-volt, 60-cycle supply)
Undistorted .... 1.0 watt
Maximum .... 1.5 watts

Loudspeaker
Type .... 5-inch Electrodynamic
Voice-Coil Impedance... 3 ohms at 400 cycles

Figure 3—Radiotron Socket Voltages, and Location of Parts

* Note: Values with (*) are operating voltages.

Values not starred are actual measured voltages.

Measurements made to chassis unless otherwise indicated.

Measurements made with set tuned to quiet point, volume control at minimum, using 1,000-ohm-per-volt meter, having ranges of 10, 50, and 250 volts. (Use nearest range above the specified measured voltage.)

Values should hold within approximately ± 20% for 117-volt 60-cycle a-c supply. On d-c, voltages are approximately 10% lower, except heaters, which remain the same.

Schematic Circuit Diagram

* The ballast tube in Model 97Y is RCA-BK36B

Precautionary Lead Dress.—

1. Dress the bias cell clear of all bus leads.
2. Dress R1 away from front of chassis.
3. Leads from S43 must be dressed in front of range switch.
4. Blue lead from range switch to L5 must be short and clear of other leads.
5. Dress leads away from antenna coil.
6. Leads across back of chassis must be dressed under electrolytic to prevent approaching Victrola jack.

R-F Alignment Frequencies

"Short Wave" (C).................. 20 mc (osc., ant.)
"Medium Wave" (B)................. 6.1 mc (osc.)
"Standard Broadcast" (A).......... 1,500 kc (osc.)

Specifications

Pilot Lamps (2 on Model 97Y) (3 on Models 98X, 98EY, 98YG)...................... Mazda 47, 6.3 volts, .15 amp.

Power Output		Power Supply Rating	
Undistorted	1.5 watts	A-C Rating	105-125 volts, 25-60 cycles, 55 watts
Maximum	2.5 watts	D-C Rating	105-125 volts, 55 watts

Loudspeaker (Permanent-Magnet Dynamic)	97Y	98X	98EY	98YG
Diameter	12 inches	6 inches	8 inches	12 inches
V. C. Impedance at 400 cycles	2.2 ohms	3 ohms	2.2 ohms	2.2 ohms

Miscellaneous Service Notes

Bias Cell.—The bias cell provides approximately 1-volt bias for the 1st-audio grid. **The cell should never be shorted, not measured with an ordinary voltmeter or other device that draws current.** The cell may be checked by measuring the 1st-audio cathode current with a new tested 6J7 tube in this socket. The current should be approximately ½ milliampere. If it is appreciably greater than ½ mil., install a new bias cell.

Victrola Attachment.—Two screw type terminals, numbered 1 and 2, are provided on the rear apron of the chassis for connection to a Victrola Attachment, such as the R-93, R-93-B, etc. *(When A-C supply is available.)*

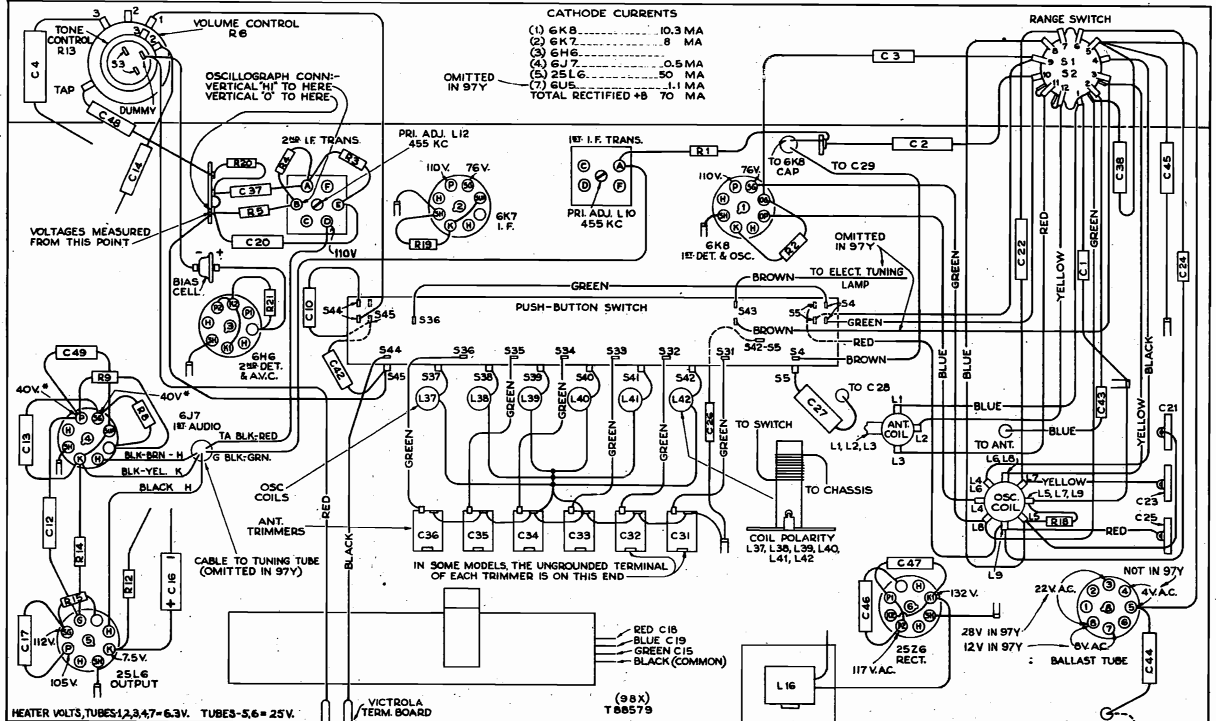
Care must be taken that these terminals are never connected in any way to the chassis, otherwise injury will result to the bias cell. To safeguard against this possibility, the following precautions should be observed in connecting the Victrola Attachment to the receiver.

Victrola Attachment with shielded cable.—If the shielded cable has a plug connector, remove the plug, connect the shielding to terminal 1, and connect the lead (inside the shielding) to terminal 2. Tape the shielding for a sufficient distance to prevent the possibility of it shorting against the chassis.

Victrola Attachment with twisted-pair cable.—Connect the low-side of the Attachment to terminal No. 1, and the high-side of the Attachment to terminal No. 2. (In some Attachments, the lead from the low-side is black, and the lead from the high-side is black-brown.)

Power-Supply Polarity.—For operation on d-c, the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the position of the plug. For operation on a-c, a similar reversal of the plug may reduce hum.

Loudspeaker.—To center the loudspeaker voice coil, first remove the front dust cover by applying acetone sparingly, then loosen the spider screws, insert three narrow feelers at equal distances in the gap, and tighten the spider screws. Remove the feelers, and fasten a dust cover in place with loudspeaker cement.



R-F Wiring Diagram and Socket Voltages

Measurements made to low-side of tone control unless otherwise indicated, with set tuned to quiet point and volume control at minimum. Values should hold within approximately ±20% with 117-volt a-c supply. On d-c, voltages are approximately 10% lower, except heaters, which remain the same.

***NOTE:** Values with star (*) are operating voltages in circuits with high series-resistance. The actual measured voltages will be lower, depending on the voltmeter loading.

RCA MFG. CO., INC.

ALIGNMENT PROCEDURE

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the chassis drawing.

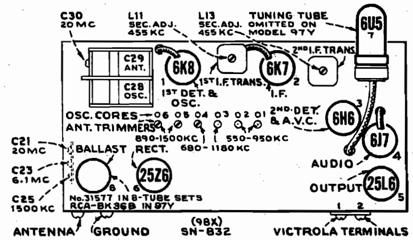
Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver ground terminal (G), and keep the output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord drum. — The tuning dial if fastened in the cabinet and cannot be used for reference during alignment; therefore, a calibration scale is attached to the rear of the drum which is mounted on the front shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The 180° mark on the drum scale must be vertical, and directly over the center of the gang-condenser shaft when the plates are fully meshed. The distance from the front of the chassis to the drum must not exceed 3/8-inch. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "180°" mark on the calibration scale when the plates are fully meshed.



Tube and Trimmer Locations

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator at the 530 kc mark, and gang condenser fully meshed. The indicator has a spring clip for attachment to the cable.

After completion of alignment, seal the i-f core-adjusting screws with household cement.

For additional details, refer to booklet "RCA Victor Receiver Alignment."

Steps	Connect the high side of test-osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output
1	6K7 I-F grid cap, in series with .01 mfd.	455 kc	"A" band, Quiet Point between 550-750 kc	L12 and L13 (2nd I-F Trans.)
2	6K8 det. grid cap, in series with .01 mfd.	455 kc		L10 and L11 (1st I-F Trans.)
3	Antenna Terminal, in series with 400 ohms	20 mc	20 mc (23°) "C" band	C21* (osc.) C30** (ant.)
4	Antenna Terminal, in series with 400 ohms	6.1 mc	6.1 mc (31°) "B" band	C23 (osc.)†
5	Antenna Terminal, in series with 200 mmf.	1,500 kc	1,500 kc (28½°) "A" band	C25 (osc.)
6	Follow "Adjustments for Electric Tuning"			

* Use **minimum** capacity peak if two peaks can be obtained.

** Rock gang slightly and use **maximum** capacity peak if two peaks can be obtained with C30. Check to determine that C21 has been adjusted to the correct peak by tuning to approximately 28° (19.09 mc), where a weaker signal should be received.

† Use **minimum** capacity peak if two peaks can be obtained. Check to determine that C23 has been adjusted to the correct peak by turning to approximately 49° (5.19 mc), at which point a weaker signal should be received.

Note: Oscillator tracks 455 kc above signal on all bands.

ADJUSTMENTS FOR ELECTRIC TUNING

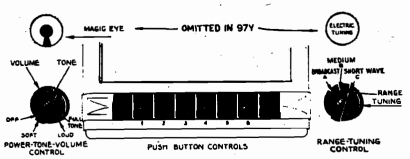
These models have eight push buttons. The left-hand button is a Victrola switch. The right-hand button connects the gang condenser for manual tuning. The other six buttons are for electric tuning of six different stations in the standard-broadcast range. The station buttons connect to separate magnetite-core oscillator coils and separate antenna trimmers which must be adjusted for the desired stations. Use an insulated screwdriver or alignment tool such as RCA Stock No. 31031. Allow at least five minutes warm-up period before making adjustments.

The procedure is as follows:

1. Make a list of the desired six stations, arranged in order from low to high frequencies.
2. Push in the dial-tuning button, and manually tune in the first station on the list.
3. Push in station button No. 1 (second from left) and adjust No. 1 oscillator core (L37) to receive this station. Screw the core all the way in, to lowest frequency, and then unscrew slowly until station is received.
4. Adjust No. 1 antenna trimmer (C36) for maximum output on this station.

Clockwise adjustment of cores and trimmers tunes the circuits to lower frequencies.

5. Adjust for each of the remaining five stations in the same manner.
6. Make a final careful adjustment of the oscillator cores and antenna trimmers. Use the "Magic Eye" in Models 98X, 98EY, 98YG to ensure sharp peaking. With Model 97Y use one or two feet of wire as an antenna when making the final adjustments in order to obtain sharp peaking.



Location of Controls

The left-hand push-button is a Victrola-Attachment switch. The right-hand push-button is for dial tuning.

MODEL 95X1
Schematic, Socket
Voltage, Alignment
Chassis Wiring, Specs.
Lead Dress, Tuner

RCA MFG. CO., INC.

Removing chassis from cabinet.—Remove back plate and control knobs. Pull the push-button knobs off their shafts. Remove the four chassis screws (bottom of cabinet). Lift the chassis and slide it out at an angle to clear the shaft holes in the top of cabinet.

Removing trimmer-and-switch assembly.—For convenient access to the sockets and parts, it is advisable to remove the trimmer-and-switch assembly. This is a simple operation, accomplished as follows: Unsolder the four leads that connect to the assembly, remove the two nuts that hold the assembly to the chassis, and lift out the assembly. In re-assembling, dress the leads to prevent rubbing against the push-button shafts.

CAUTION: The chassis is connected to one side of the power supply. Avoid contact of chassis or parts to external ground when servicing.

Power Output (125-volt, 60-cycle supply)
Undistorted.. 1.0 watt
Maximum.. 1.5 watts

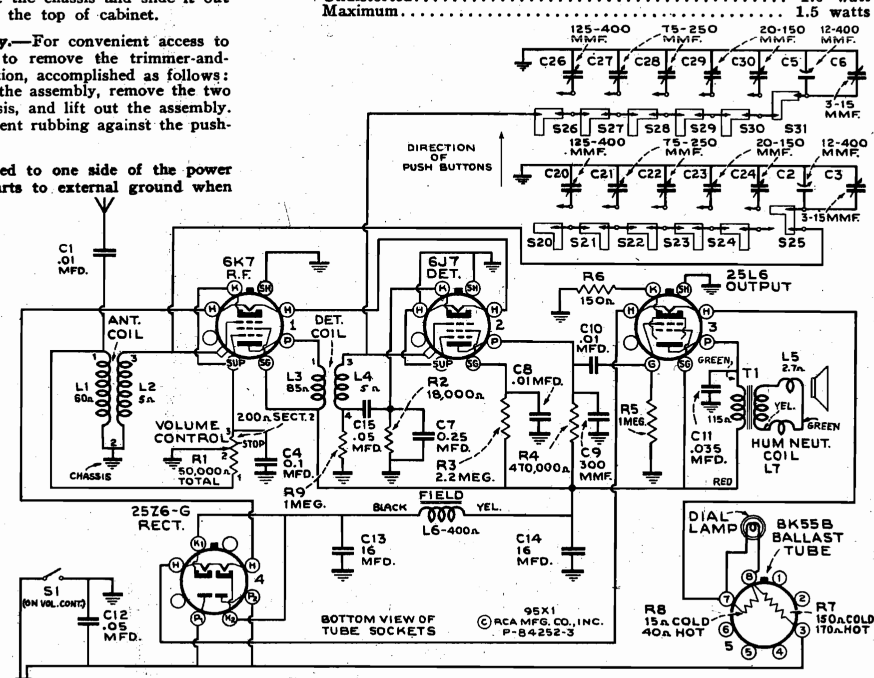

Figure 1—Schematic Circuit Diagram

The line by-pass, C12, is changed to .25 mfd. (Stock No. 12484) in some sets.

FREQUENCY RANGE.................. 540-1,560 kc
Alignment Frequency.................. 1,560 kc (ant., det.)
One station between approximately 540-860 kc
Two stations between approximately 680-1,200 kc
Two stations between approximately 850-1,500 kc

LOUDSPEAKER
Type.................. 5-inch Electrodynamic
Voice-Coil Impedance.................. 3 ohms at 400 cycles

Dial Lamp.................. Mazda 40, 6.3 volts, .15 ampere

POWER SUPPLY RATINGS
A-C Rating.................. 105-125 volts, 50-60 cycles, 50 watts
D-C Rating.................. 105-125 volts, 50 watts

Alignment Procedure

Remove chassis from cabinet.

Reel up the antenna wire, and connect the high side of test-oscillator through an 80-mmfd. capacitor to the antenna terminal on the antenna transformer. Connect low side of oscillator to receiver chassis through an .01-mfd. capacitor. Turn gang condenser to minimum (full out), push in the manual-tuning (right-hand) button, tune oscillator to 1,560 kc, connect an output meter across the voice coil, and turn volume control to maximum.

Keep antenna roll and lead clear of chassis during all adjustments.

Adjust the two trimmers (C3 and C6) on side of gang condenser for maximum output, using lowest possible output from test-oscillator.

Turn pointer, so that it is horizontal and pointing to low-frequency end when the gang condenser is at maximum. Check pointer adjustment on a station.

Adjustment of Tuning Capacitors

The preferable and quickest method of adjusting the tuning capacitors for five different stations, is to employ a test-oscillator, as described below:

1. Make a list of the desired five stations, arranged in order from low to high frequencies.
2. Determine the correct settings of the test-oscillator for these five frequencies. This is accomplished as follows: Tune in each of the five stations on any standard receiver; zero-beat the test-oscillator against each station, and note the exact setting of the oscillator in each case.
3. Reel up the antenna wire. Connect the high side of test-oscillator through an 80-mmfd. fixed capacitor to the end of the antenna wire. Clip the low side of the oscillator through a 0.1-mfd. capacitor to one of the chassis-mounting screws on the bottom of the cabinet. Tune the oscillator to the previously-determined point for the lowest-frequency station, and adjust for a strong output.
4. Turn the volume control of the push-button receiver full clockwise, and push in the left-hand end button. Using an insulated screwdriver, peak capacitors C20 and C26, at the same time reducing the output of the oscillator in order to secure a sharp peak. **(Clockwise adjustment of the capacitors tunes the circuits to lower frequencies, and counter-clockwise adjustment tunes the circuits to higher frequencies. The range of each trimmer is three full counter-clockwise turns from the tight position. Do not unscrew more than three turns.)**
5. Push in the second button from left, and adjust C21 and C27 for peak output with the oscillator tuned to the frequency of the second station.
6. Proceed in this manner to adjust each pair of capacitors for the desired frequencies.
7. Final adjustment may be made in actual reception of the stations.

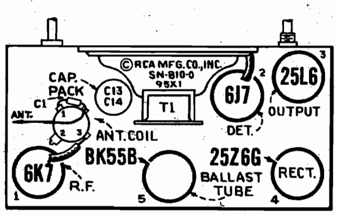

Figure 2—Radiotron Location

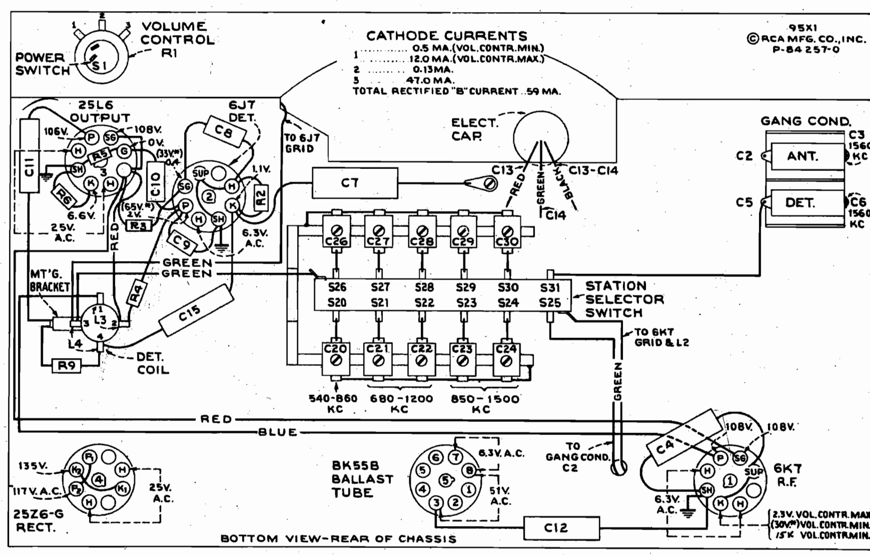

Figure 3—Radiotron Socket Voltages, and Location of Parts

***Note:** Values with star (*) are operating voltages. Values not starred are actual measured voltages.

Measurements made to chassis unless otherwise indicated.

Measurements made with manual-tuning button (right-hand) pushed in, and set tuned to a quiet point, volume control at minimum, using 1,000-ohm-per-volt meter, having ranges of 10, 50, and 250 volts. (Use nearest range above the specified measured voltage.)

Values should hold within ± 20% for 117-volt 60-cycle a-c supply. On d-c, voltages are approximately 10% lower, except heaters, which remain the same.

Precautionary Lead Dress

1. Dress Power cord away from detector coil, heater leads close to base, leads from electrolytic close to base and free of grid leads.
2. Dress blue lead from r-f plate to detector coil along front edge of push-button shaft holes. Dress all leads to prevent rubbing against push button shafts.

25-Cycle Operation

For 25-cycle operation, connect a 16 mfd., 150-volt dry electrolytic capacitor (Stock No. 31323) from the cathode of the rectifier tube to chassis. (Positive to contact K1 of 25Z6-G, and negative to shell contact of 6K7 r-f socket.)

Service Data

Loudspeaker.—Centering of the loudspeaker is made in the usual manner with three narrow celluloid or paper feelers after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. A dust cover should be cemented in place upon completion of adjustment.

Precautionary Lead Dress.—(1) The lead from the left pilot light should be kept behind the bulb and toward the "Magic Eye," to keep it away from the 6F5 grid cap, (2) leads from mica trimmers to coil should be kept away from the coil and other parts, (3) leads on oscillator coil which are an extended part of the coil winding should be as short as possible, (4) "C" band series capacitor C31 must have leads as short as possible, (5) all leads from antenna board to antenna coils should be dressed toward back apron, (6) the one lead of the line cord and the primary lead of the power transformer which run to the power switch should be twisted together, (7) shielding on leads to Victrola switch should be kept away from the switch terminals and jack.

Victrola Attachment.—A jack located near the "Magic Eye" tube is provided for connecting a Victrola Attachment into the audio-amplifying circuit. The cable running from the Victrola Attachment should be terminated in a Stock No. 31048 plug to fit the jack.

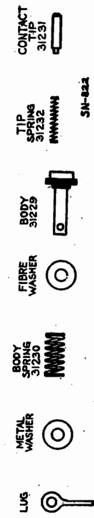

Figure 8—Component Parts of Station-Setting Contact

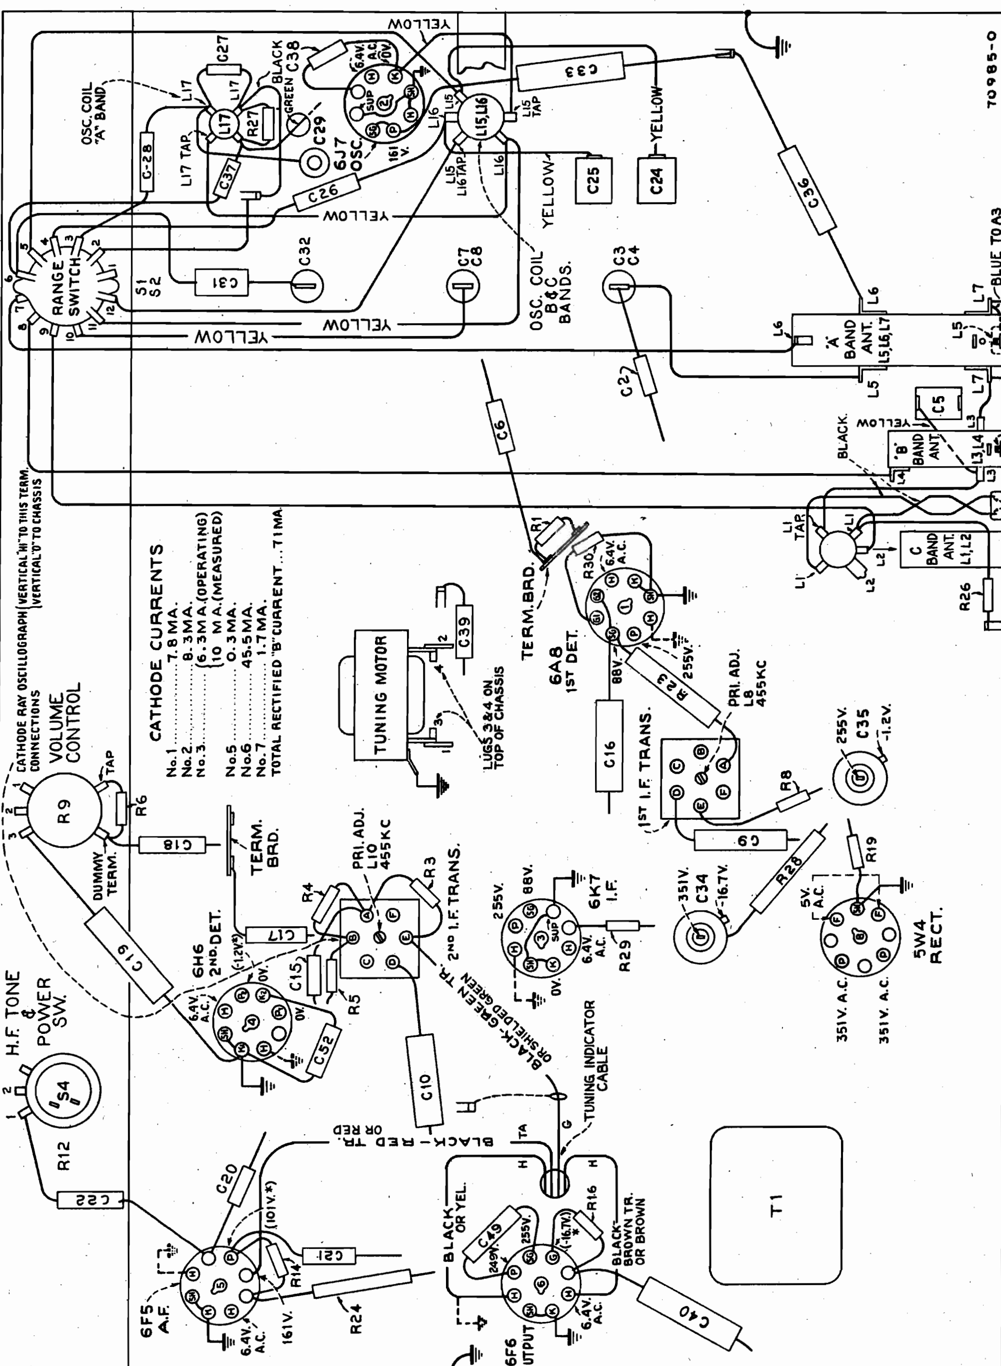
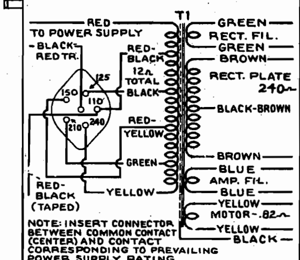


Measurements made to chassis unless otherwise indicated, with set tuned to quiet point, volume control at minimum. Values should hold within approximately ±20% with 117-volt a-c supply.

*** NOTE:** Values with star (*) are operating voltages in circuits with high series-resistance, and when measured will read lower depending on the voltmeter loading.



UNIVERSAL TRANS. CONNECTIONS

Above — Universal Power Transformer Connections. (110-volt supply for a Victrola Attachment may be obtained by connecting the motor to the red and the red-black leads.)

MODEL 98K
Electric Tuning Notes
Mechanism, Adjustments

RCA MFG. CO., INC.

Electric Tuning Mechanism

The circuit of the electric tuning mechanism is shown in the schematic diagram, and the mechanical details are illustrated below.

The action can be understood by following a cycle of operation:

When a station button is pushed in, it completes the 24-volt circuit through the corresponding station-setting contact and one-half of the brass selector disc, which is connected to one side of the motor field coil. This energizes the motor, and the rotor is pulled forward, engaging with the gear train that drives the tuning condenser and selector disc. The condenser and disc rotate until the insulation line comes under the particular station-setting contact, and the motor circuit is broken. Inertia carries the insulation line past the station-setting contact which then makes contact to the other half of the disc: This completes the circuit to the other side of the motor field coil, causing the motor to reverse. The floating flywheel is still turning in the original direction and therefore slows down the reversal movement of the motor; as a result the selector disc is moved slowly back until the insulation line is under the station-setting contact, when the circuit is broken and the mechanism stops.

Adjustment of Flywheel Friction

In normal operation, the motor drives the tuning condenser and selector disc until the insulation line just passes the particular station-setting contact: The motor then reverses and moves the disc slowly in the opposite direction until the insulation line is under the contact, and the mechanism stops.

In some cases, particularly with high line-voltage, the disc may make two or three reversals before stopping.

The flywheel friction adjustment screw should be set to give the least number of reversals with the chassis in normal horizontal position.

Adjustment of Selector Disc

The brass selector disc is fastened to the rear shaft of the tuning condenser by means of two set-screws. When the condenser is at maximum (plates fully meshed) the insulation line should be horizontal, with the operating-end at the left (viewed from rear). The operating-end has dark insulating material and the brass is beveled at this end.

The selector disc should be set so that the contact-tip plungers in the station-setting contacts project not more than 1/16-in. from the body of the contacts.

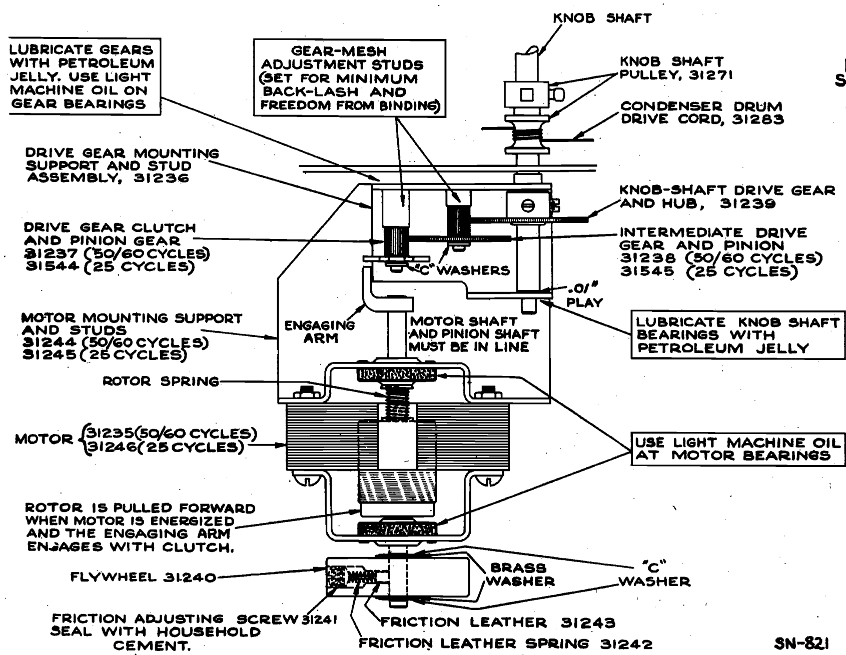

Figure 6—Motor and Gear Mechanism

There must be 1/32-inch clearance between the end of the engaging arm and the face of the intermediate gear when the motor is in its full forward position.

ADJUSTMENTS FOR ELECTRIC TUNING

1. Make a list of the desired eight stations, arranged in order from low to high frequencies.

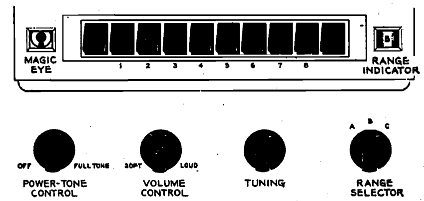

Figure 3—Location of Controls

The left-hand push-button is a Victrola-Attachment switch. The right-hand push-button is for dial tuning.

2. Turn range selector to "A" band, turn power on, and allow a few minutes for warming up.
3. Press down the "dial-tuning" (right-hand) button.
4. Manually tune in the first station on the list, using the "Magic Eye" for accurate tuning.
5. Hold down the "dial-tuning" button, and press down station button No. 1 (second from left). Both buttons will stay down. Move adjusting pin No. 1 to the insulating line on the disc at rear of gang. When the pin is correctly centered on the insulating line, the central dial lamp will go out.
6. Press down any other button in order to release the dial-tuning button and station button No. 1. Then press down station button No. 1 again. The electric tuning mechanism will function to tune in the station, and the central dial lamp will stay on.
7. Repeat this process for the remaining stations.

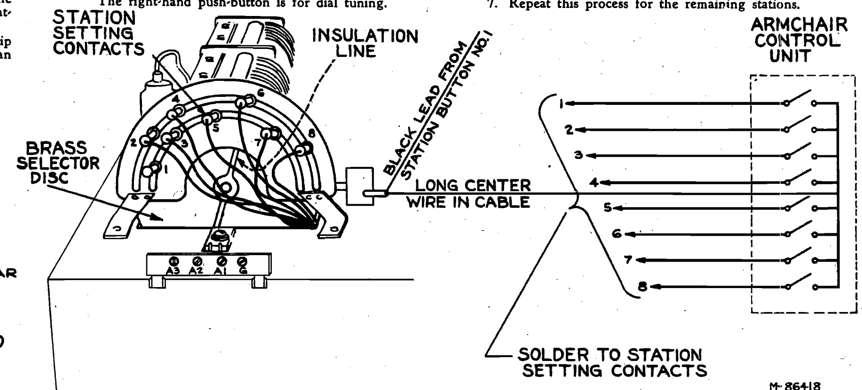

Figure 7—Station-Setting Contacts and Selector Disc

This illustration shows connections for a G8A Armchair Control Unit. This unit is not supplied with the receiver but may be added as an accessory.

Colors of Leads from Push Buttons to Station-Setting Contacts

Station Button	Color of Lead To Station-Setting Contact	Station Button	Color of Lead To Station-Setting Contact
No. 1	Black	No. 5	Red
No. 2	Brown	No. 6	Red-black
No. 3	Blue	No. 7	Brown-black
No. 4	Green	No. 8	Red-yellow

Muting Circuit

When the electric tuning mechanism is in action, the motor-supply voltage is fed into a diode rectifier circuit which applies a high bias to the first-audio amplifier. This prevents audio amplification and makes the set quiet or "mute" while the mechanism is operating.

Lubrication

Motor bearings and **gear bearings**; use light machine oil. **Gear faces**; use "Pure Oil No. 611" or petroleum jelly. **Dial-indicator pulleys** and **rails**; use "Castordag" or petroleum jelly.

Selector disc; apply ***thin*** film of petroleum jelly.

Friction leather on flywheel; apply "neats-foot" oil. When replacing leather, soak it for at least 24 hours in neats-foot oil, and insert in flywheel while dripping.

Armchair Control Unit

When a Model G8A Armchair Control is connected to the receiver as shown in figure 7 it duplicates the action of the push-buttons on the front panel when No. 1 button is pressed down. The black lead from push-button No. 1 is unsoldered from No. 1 station-setting contact and soldered to a terminal board which is to be mounted on the frame of selector mechanism. In some cases one of the other seven station buttons on the set may be used in place of No. 1 button for the operation of the Armchair Control.

This arrangement allows the use of only seven of the eight buttons when tuning in stations at the set, but allows the use of the entire eight buttons on the Model G8A Armchair Control. In operating the G8A Armchair Control the push-button must be held down until the station has been tuned in. Care must be taken not to hold two of the station-buttons down at one time as both windings of the motor may be engaged instantaneously causing the motor to be inoperative and overheated.

ALIGNMENT PROCEDURE

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the chassis drawing.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment, therefore a calibration scale is attached to the rear of the indicator-drive-cord drum which is mounted on the front shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The "0" mark on the drum scale must be vertical, and directly over the center of the gang-condenser shaft when the plates are fully meshed. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "0" mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator at the 530 kc mark, and gang condenser fully meshed. The indicator has a spring clip for attachment to the cable.

Antenna Connections

RCA Victor Master Antenna Kit.—Connect the twisted-pair transmission line to terminals A1 and A2 on the terminal board at rear of chassis. Connect the counter-poise to A3. Terminal G may be connected to ground, but this connection is not necessary for correct operation.

Noise-Reducing Adjustment.—After the RCA Victor Master Antenna Kit is connected to the receiver, tune the receiver to a point near 900 kc where no station is heard. Turn volume control clockwise until noise is heard. If no noise of a regular character is audible, start any brush-type motor-driven appliance, such as a vacuum cleaner, electric razor, refrigerator, etc., but do not bring it too near the receiver. This will generate noise as a continuous crackling, or buzz. Adjust C5, which is mounted behind the antenna terminal board, to a point where this noise is reduced to a minimum.

Adjustment of the noise-reducing trimmer should be made in the customer's home, with the Master Antenna connected to receiver.

This adjustment is effective only when the RCA Victor Master Antenna is used. For all other types of antenna, the noise-adjustment trimmer C5 should be screwed all the way down.

Other Antennas.—Use terminals A1 and A3 on the receiver terminal board as antenna and ground connecting points respectively. Terminal A3 may be connected to terminal G, unless this causes interference, in which case this connection should be omitted.

Muting Circuit

When the electric tuning mechanism is in action, the motor-supply voltage is fed into a diode rectifier circuit which applies a high bias to the first-audio tubes. This prevents audio amplification and makes the set quiet or "mute" while the mechanism is operating.

* NOTE: Values with star (*) are operating voltages in circuits with high series-resistance. The actual measured voltages will be lower, depending on the voltmeter loading.

Measurements made to chassis unless otherwise indicated, with set tuned to quiet point and volume control at minimum. Values should hold within approximately ±20% with 117-volt a-c supply.

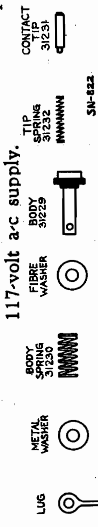

Figure 8—Component Parts of Station-Setting Contact

RCA MFG. CO., INC.

Precautionary Lead Dress.—(1) The lead from the left pilot light should be kept behind the bulb and toward the Magic Eye, to keep it away from the 6F5 grid cap, (2) leads from mica trimmers to coil should be kept away from the coil and other parts, (3) leads on oscillator coil which are an extended part of the coil winding should be as short as possible, (4) "C" band series capacitor C31 must have leads as short as possible, (5) all leads from antenna board to antenna coils should be dressed toward back apron, (6) the one lead of the line cord and the primary lead of the power transformer which run to the power switch should be twisted together, (7) shielding on leads to phono. switch should be kept away from the switch terminals and jack.

Electric Tuning Mechanism

The circuit of the electric tuning mechanism is shown in the schematic diagram, and the mechanical details are illustrated below.

The action can be understood by following a cycle of operation:

When a station button is pushed in, it completes the 24-volt circuit through the corresponding station-setting contact and one-half of the brass selector disc, which is connected to one side of the motor field coil. This energizes the motor, and the rotor is pulled forward, engaging with the gear train that drives the tuning condenser and selector disc. The condenser and disc rotate until the insulation line comes under the particular station-setting contact, and the motor circuit is broken. Inertia carries the insulation line past the station-setting contact which then makes contact to the other half of the disc: This completes the circuit to the other side of the motor field coil, causing the motor to reverse. The floating flywheel is still turning in the original direction and therefore slows down the reversal movement of the motor; as a result the selector disc is moved slowly back until the insulation line is under the station-setting contact, when the circuit is broken and the mechanism stops.

Adjustment of Flywheel Friction

In normal operation, the motor drives the tuning condenser and selector disc until the insulation line just passes the particular station-setting contact: The motor then reverses and moves the disc slowly in the opposite direction until the insulation line is under the contact, and the mechanism stops.

In some cases, particularly with high line-voltage, the disc may make two or three reversals before stopping.

The flywheel friction adjustment screw should be set to give the least number of reversals with the chassis in normal horizontal position.

Adjustment of Selector Disc

The brass selector disc is fastened to the rear shaft of the tuning condenser by means of two set-screws. When the condenser is at maximum (plates fully meshed) the insulation line should be horizontal, with the operating-end at the left (viewed from rear). The operating-end has dark insulating material and the brass is beveled at this end.

The selector disc should be set so that the contact-tip plungers in the station-setting contacts project not more than 1/16-in. from the body of the contacts.

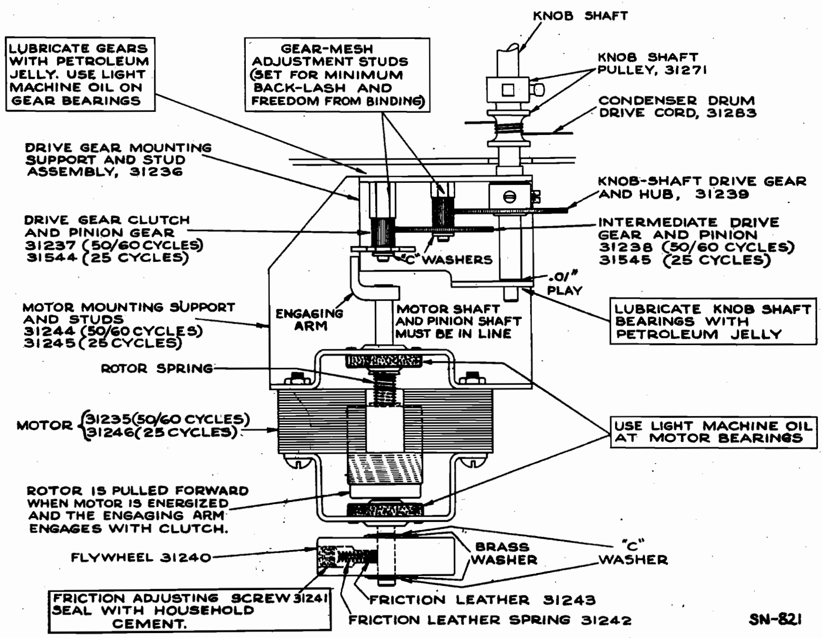

Figure 6—Motor and Gear Mechanism

There must be 1/32-inch clearance between the end of the engaging arm and the face of the intermediate gear when the motor is in its full forward position.

ALIGNMENT PROCEDURE

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the chassis drawing.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment, therefore a calibration scale is attached to the rear of the indicator-drive-cord drum which is mounted on the front shaft of the gang condenser. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The "0" mark on the drum scale must be vertical, and directly over the center of the gang-condenser shaft when the plates are fully meshed. The drum is held to the shaft by means of two set screws, which must be tightened securely when the drum is in the correct position.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the gang-condenser frame, and bend the wire so that it points to the "0" mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator at the 530 kc mark, and gang condenser fully meshed. The indicator has a spring clip for attachment to the cable.

For additional details, refer to booklet "RCA Victor Receiver Alignment."

Steps	Connect the high side of test-oscillator to —	Tune test-oscillator to —	Range Selector	Set tuning gang to—	Adjust the following for max. peak output
No. 1	6K7 I-F grid cap in series with .01 mfd.	455 kc	"A"	Quiet point between 550-750 kc	L10, L11 (2nd I-F Transformer)
No. 2	6A8 Det. grid cap in series with .01 mfd.	455 kc	"A"	Quiet point between 550-750 kc	L8, L9 (1st I-F Transformer)
No. 3	A2. Connect A1 to chassis.	20 mc	"C"	20 mc (147.5°)	C24 (osc.)* C8 (det.)†
No. 4	A2 in series with 100 mmfd. Connect A3 to chassis.	6,100 kc	"B"	6,100 kc (145.5°)	C25 (osc.)**
No. 5	A2 in series with 100 mmfd. Connect A3 to chassis.	1,500 kc	"A"	1,500 kc (151.5°)	C29 (osc.) C3 (ant.)
No. 6	A2 in series with 100 mmfd. Connect A3 to chassis.	600 kc	"A"	600 kc (29.5°)	L17 (osc.)
No. 7	A2 in series with 100 mmfd. Connect A3 to chassis.	1,500 kc	"A"	1,500 kc (151.5°)	C29 (osc.)

* Use minimum capacity peak if two peaks can be obtained. Check to determine that the correct peak has been used by turning to 141.5° (19,090 kc), at which point a weaker signal should be received.

** Use minimum capacity peak if two peaks can be obtained. Check to determine that the correct peak has been used by turning to 124° (5,190 kc), at which point a weaker signal should be received.

† Rock gang condenser and use maximum capacity peak if two peaks can be obtained with C8.

ADJUSTMENTS FOR ELECTRIC TUNING

1. Make a list of the desired eight stations, arranged in order from low to high frequencies.
2. Turn range selector to "A" band, turn power on, and allow a few minutes for warming up.
3. Press down the "dial-tuning" (right-hand) button.
4. Manually tune in the first station on the list, using the "Magic Eye" for accurate tuning.
5. Hold down the "dial-tuning" button, and press down station button No. 1 (second from left). Both buttons will stay down. Move station-setting contact No. 1 to the insulating line on the disc at rear of gang. When the contact is correctly centered on the insulating line, the central dial lamp will go out.
6. Press down any other button in order to release the dial-tuning button and station button No. 1. Then press down station button No. 1 again. The electric tuning mechanism will function to tune in the station, and the central dial lamp will stay on.
7. Repeat this process for the remaining stations.

Armchair Control Unit

When a Model G8A Armchair Control is connected to the receiver as shown in figure 7 it duplicates the action of the push-buttons on the front panel when No. 1 button is pressed down. The black lead from push-button No. 1 is unsoldered from No. 1 station-setting contact and soldered to a terminal board which is to be mounted on the frame of selector mechanism. In some cases one of the other seven station buttons on the set may be used in place of No. 1 button for the operation of the Armchair Control.

This arrangement allows the use of only seven of the eight buttons when tuning in stations at the set, but allows the use of the entire eight buttons on the Model G8A Armchair Control. In operating the G8A Armchair Control the push-button must be held down until the station has been tuned in. Care must be taken not to hold two of the station-buttons down at one time as both windings of the motor may be engaged simultaneously causing the motor to be inoperative and overheated.

Frequency Ranges
"Standard Broadcast" (A) .... 540-1,720 kc
"Medium Wave" (B) .... 2,300-7,000 kc
"Short Wave" (C) .... 7,000-22,000 kc

R-F Alignment Frequencies
"Short Wave" (C) .... 20,000 kc (osc., ant.)
"Medium Wave" (B) .... 6,100 kc (osc.)
"Broadcast" (A) ...... 600 kc (osc.), 1,500 kc (osc., ant.)

Intermediate Frequency .... 455 kc

Pilot Lamps (3) .... One Mazda 47, 6-8 volts, .15 amp.; two Mazda 44, 6.3 volts, .25 amp.

Power Supply Ratings
Rating A .... 105-125 volts, 50-60 cycles, 120 watts
Rating B .... 105-125 volts, 25-30 cycles, 120 watts
Rating C .... 105-125/140-160/200-250 volts, 50-60 cycles, 120 watts

Power Output
Undistorted .... 10 watts
Maximum .... 12 watts

Loudspeaker
Type .... Electrodynamic
Impedance (v.c.) .... 2.2 ohms at 400 cycles

Drive Data, Parts
Notes

RCA MFG. CO., INC.

Service Data

Loudspeaker.—Centering of the loudspeaker is made in the usual manner with three narrow celluloid or paper feelers after first removing the front dust cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. A dust cover should be cemented in place upon completion of adjustment.

Victrola Attachment. — A jack located near the "Magic Eye" tube is provided for connecting a Victrola Attachment into the audio-amplifying circuit. The cable running from the Victrola Attachment should be terminated in a Stock No. 31048 plug to fit the jack.

Lubrication

Motor bearings and **gear bearings;** use light machine oil.

Gear faces; use "Pure Oil No. 611" or petroleum jelly.

Dial-indicator pulleys and **rails;** use "Castordag" or petroleum jelly.

Selector disc; apply *thin* film of petroleum jelly.

Friction leather on flywheel; apply "neats-foot" oil. When replacing leather, soak it for at least 24 hours in neats-foot oil, and insert in flywheel while dripping.

STOCK No.	DESCRIPTION	Unit List Price
	RECEIVER ASSEMBLIES	
31253	Board—Antenna and ground terminal board...	.25
31229	Body—Station-setting contact body, less contact tip and tip spring	.18
12714	Capacitor—Adjustable trimmer 2-12 mmfd. (C29)	1.50
31292	Capacitor—Dual adjustable trimmer 3-30 mmfd. each section (C24, C25)	.40
31252	Capacitor—Adjustable trimmer 5-80 mmfd. (C5)	.25
12896	Capacitor—15 mmfd. (C2, C54)	.35
12948	Capacitor—33 mmfd. (C1)	.35
31432	Capacitor—20 mmfd. (C27)	.40
12720	Capacitor—100 mmfd. (C20)	.35

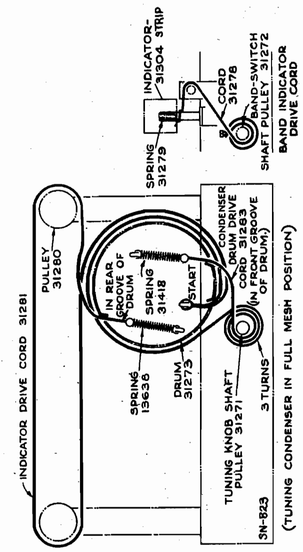

Figure 9—(At Right) Drive Cord Arrangement for Tuning Condenser, Dial Indicator, and Band Switch

Antenna Connections

RCA Victor Master Antenna Kit.—Connect the twisted-pair transmission line to terminals A1 and A2 on the terminal board at rear of chassis. Connect the counter-poise to A3. Terminal G may be connected to ground, but this connection is not necessary for correct operation.

Noise-Reducing Adjustment. — After the RCA Victor Master Antenna Kit is connected to the receiver, tune the receiver to a point near 900 kc where no station is heard. Turn volume control clockwise until noise is heard. If no noise of a regular character is audible, start any brush-type motor-driven appliance, such as a vacuum cleaner, electric razor, refrigerator, etc., but do not bring it too near the receiver. This will generate noise as a continuous crackling, or buzz. Adjust C5, which is mounted behind the antenna terminal board, to a point where this noise is reduced to a minimum.

Adjustment of the noise-reducing trimmer should be made in the customer's home, with the Master Antenna connected to receiver.

This adjustment is effective only when the RCA Victor Master Antenna is used. For all other types of antenna, the noise-adjustment trimmer C5 should be screwed all the way down.

Other Antennas.—Use terminals A1 and A3 on the receiver terminal board as antenna and ground connecting points respectively. Terminal A3 may be connected to terminal G, unless this causes interference, in which case this connection should be omitted.

MODELS U105,U107
Circuit Data,Lead Dress
Pick-up Data,Specs.

RCA MFG. CO., INC.

General Description

The Model U-107 combination instrument consists of a ten-tube, three-band, "Magic Brain," superheterodyne receiver and an automatically operated phonograph combined in a console-type cabinet. Features of design include an r-f amplifier stage, "qumulative-wound" antenna and r-f transformers for high signal-to-noise ratio in "A" Band; magnetite-core adjusted i-f transformers and low-frequency "A" oscillator tracking; automatic volume control; plunger-type, air-dielectric trimming capacitors; "Magic Eye" tuning tube; aural-compensated radio and phonograph audio-volume controls; three-point tone control; audio phase-inverter voltage amplifier; push-pull power-output stage; crystal pickup; improved super-sensitive dust-proof electrodynamic loudspeaker; and the "Sonic-Arc" Magic Voice. The record changer may be operated automatically or manually on both 10-inch and 12-inch records.

The Model U-105 combination instrument consists of a similar radio receiver combined with a smaller automatically operated phonograph. This record changer will change seven 10-inch records or repeat 12-inch records automatically. It may be operated manually if desired.

Service Data

The various diagrams of this booklet contain such information as will be needed to isolate causes for defective operation if such develops. The ratings of the resistors, capacitors, coils, etc., are indicated adjacent to the symbols signifying these parts on the diagrams. Identification titles such as R1, L1, C1, etc., provide reference between the illustrations and Replacement Parts List. The coils, transformer windings, and reactors are rated in terms of d-c resistance to permit continuity checks.

Loudspeaker.—Two types of loudspeakers are used which will be referred to as types 1 and 2. In type 1 the cone centering diaphragm is cemented to a fixed ring, while in type 2 the centering diaphragm is cemented to an adjustable ring. Replacement of cone for either type is identical. Centering of cone for "type 1" loudspeaker is made with three narrow celluloid or paper feelers after first removing the front dust cover and cutting free the cone centering diaphragm. The dust cover may be removed by a light application of acetone, using care not to allow the acetone to flow into the air gap. The centering diaphragm should be cemented in place after placement of feelers. Sufficient time should be allowed for the ambroid to set before removing feelers. Use ambroid to replace dust cover. Centering of cone for "type 2" loudspeaker differs only in that it is not necessary to cut free the centering diaphragm, adjustment being made in the usual manner by means of screws on the adjustable cone centering ring.

Precautionary Lead Dress.—(1) Keep leads to a-c switch dressed away from antenna coil and trimmer C2. (2) Keep all filament leads twisted. (3) Dress shield lead from term. E of 2nd i-f transformer to term. board against side of chassis and away from 6L7 socket. (4) Dress shielded lead from 6N7 socket to volume control against side of chassis and away from 6L7 socket. (5) Shielded lead from phono. term. board to volume control must be dressed under bus connected between 6L7 and term. A of first i-f transformer. (6) Keep leads of C21 as short as possible. (7) Yellow lead from 6J7 oscillator cathode to dummy terminal on 6L7 socket must be dressed away from chassis base and from brown filament lead. (8) All molded capacitors should be dressed so that flat side is perpendicular to chassis base. (9) Yellow lead from cathode of 6J7 socket to term. 22 of S2 must be dressed under spaghetti on 6J7 socket jumper and pulled tight away from chassis. The following bus leads should be kept as short as possible and, when necessary, replaced only with wire having same diameter as original: (10) Lead from L11-L12-L13 to ground lance; (11) Lead from term. 13 of S3 to ground lance; (12) Lead from term. 9 of S3 to L6-L7; (13) Lead from L6 to C8; (14) Lead from C9 to C8; (15) Lead from term. 5 of S1 to ground lance; (16) Lead from L1-L2 to term. 4 of S1; (17) Lead from L1 to C1; (18) Lead from term. 21 of S2 to C19. (19) Keep filament leads dressed away from grid prongs of 6N7. (20) Keep blue and green leads from plate prongs of output tubes twisted their entire length.

Pickup (Model U-107)

An adjustment is provided to compensate for possible reduced sensitivity of the crystal pickup with age. Adjustment requires the use of a 1,000-ohm-per-volt a-c voltmeter (rectifier type, 10-volt range), a 1-meg. resistor, and an RCA Victor Technical Purpose frequency record (Cat. No. 84519-A or 84505-B). Disconnect the green lead from terminal "1" (terminal board marked "1," "2," and "3" located on top right-hand side of chassis), connect the 1-meg. resistor between green lead and terminal "1," connect the voltmeter across loudspeaker voice coil, turn "Phonograph Volume" and "Power-Tone" controls extreme clockwise, turn "Phono-Volume" (radio) control extreme counter-clockwise, and adjust R114 ("Pickup Voltage Adjuster," mounted under right-hand end of motor-board) until either of the above-mentioned frequency records gives a voltage reading of 6.8 volts using 400-cycle section of record. R114 should also be adjusted if pickup is replaced.

Power Supply Ratings

Model U-105	Radio only	Total
A-6...105-125 volts, 60 cycles	135 watts	165 watts
A.....105-125 volts, 50-60 cycles	135 watts	165 watts
B-2...105-125 volts, 25 cycles	135 watts	165 watts

Details, Adjustments

TO ADJUST THE LANDING POSITION OF THE NEEDLE FIRST LOCATE NEEDLE 4 27/32 +.000 −1/32 FROM CENTER OF THE TURNTABLE SPINDLE. THEN WITH THE LOCATING LEVER AGAINST THE STOP PIN "K" AND THE PIN "F" ON THE TRIP LEVER CONTACTING THE LOCATING LEVER TIGHTEN THE BLUNT SCREW "G" ON TONE ARM SUPPORT AND RUN DEVICE THROUGH CYCLE AS A CHECK. WHEN CORRECT ADJUSTMENT IS OBTAINED TIGHTEN CONE POINTED SCREW "H" (STK#14195) ON TONE ARM SUPPORT.

ADJUST THE RISE OF THE TONE ARM SO THAT THE NEEDLE POINT RISES 15/16 ± 1/32 ABOVE THE TOP OF THE TURNTABLE DURING CYCLE. THIS ADJUSTMENT IS MADE BY MEANS OF THE SCREW AND LOCK NUTS "P" (STK#4563) ON THE CABLE LEVER.

ADJUST THE LOWERMOST REST POSITION OF THE TONE ARM SO THAT THE NEEDLE POINT RESTS IN A PLANE 3/16 ± 1/16 BELOW THE PLANE OF THE TOP OF THE TURNTABLE BY MEANS OF SCREW "R".

ADJUST THE REST POSITION OF THE MAIN LEVER BY MEANS OF THE NUT "D" ON THE BUMPER BRACKET SO THAT THE CAM ROLLER "E" CLEARS THE REVOLVING CAM 1/16 ± 1/64 IN THE NEAREST POSITION. ALSO NOTE THAT THE DETENT LEVER CLEARS THE PIN "F" AT LEAST 1/16" WHEN THE ABOVE CONDITIONS EXIST.

TO ADJUST RECORD POSTS:
PLACE RECORD IN POSITION OVER SPINDLE SO THAT IT RESTS ON THE LOWER SHELF OF THE ROT. HUB. MOVE STATIONARY RECORD POST TO A POSITION WHERE IT IS CONCENTRICALLY MOUNTED WITH THE TURNTABLE AND THE BEVELED SHELF PROTRUDES UNDER THE RECORD 7/64 +1/64 −.000. TIGHTEN HEXAGON SCREW "B" LOCATED UNDER MOTOR BOARD. WITH RECORD STILL ON LOWER SHELF OF ROTATING HUB ADJUST SCREW "C" (STK#14188) SO THAT THE BEVELED TONGUE ON THE SEPARATING CAM CLEARS THE RECORD BY 1/8 ± 1/32. THESE ADJUSTMENTS SHOULD BE MADE ONLY WHEN THE COMPLETE UNIT IS RESTING ON THE FOUR MOTOR BOARD BUSHINGS.

ADJUST TRIP LEVER SCREW "J" (STK#4059) UNTIL FRICTION WILL JUST FORCE FRICTION LEVER TO MOVE TRIP PAWL.

TO ADJUST PICK-UP SHORTING SWITCH. SET PICK-UP NEEDLE 6" FROM CENTER OF SPINDLE. ADJUST NUT "L" SO THAT THE BLADE ON SWITCH IS JUST CONTACTING PIN "M".

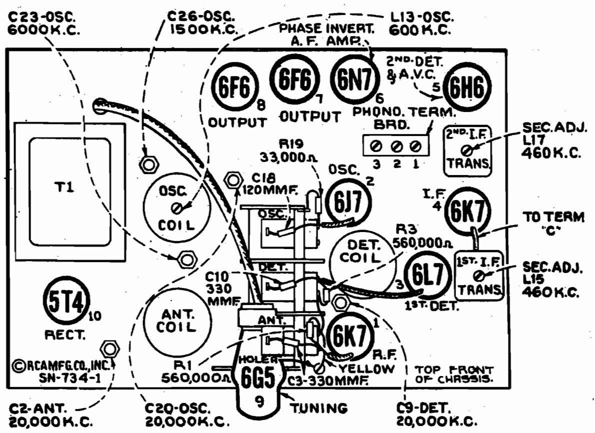

Figure 6—Radiotron, Coil, and Trimmer Locations

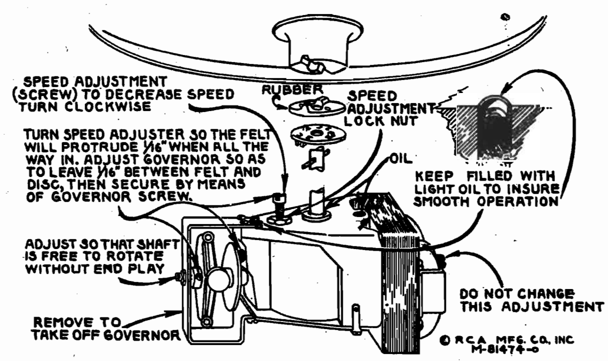

Figure 8—Details of Motor
(Model U-105)

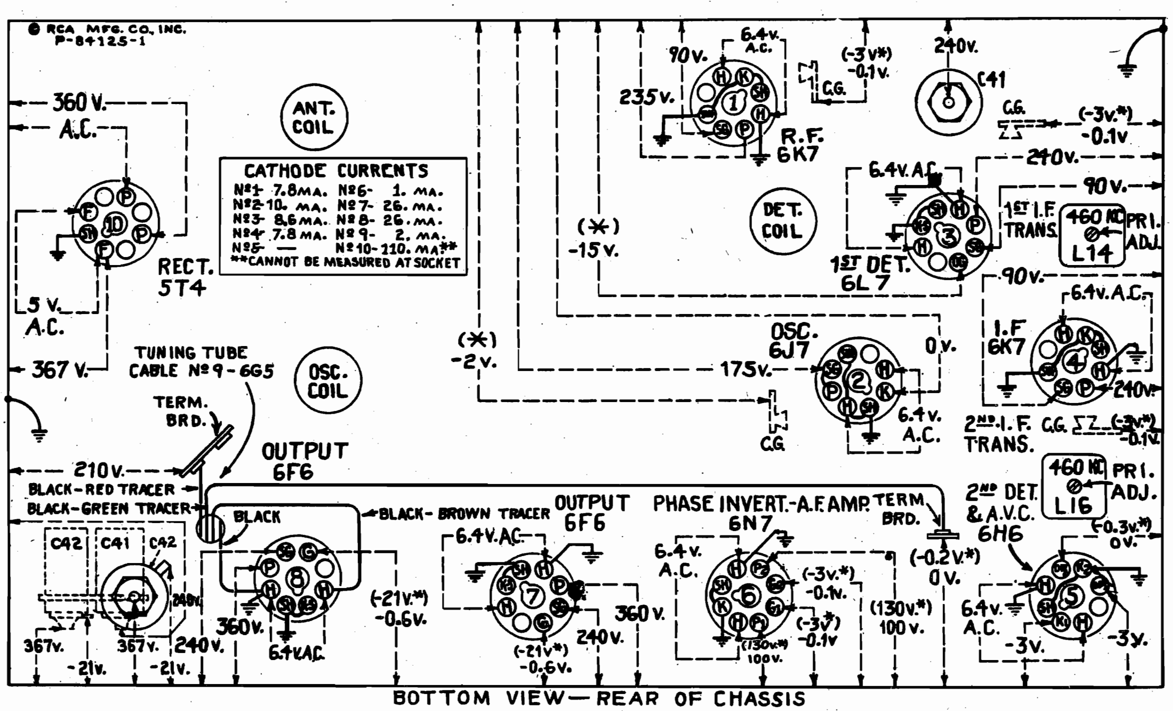

Figure 9—Radiotron Socket Voltages, Coil, and Trimmer Locations

Measured at 115 volts, 60-cycle supply—Tuned to approximately 1,000 kc ("Broadcast")—
•No signal being received—Volume control minimum

***Note:** Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.*

Voltage values as specified should hold within ±20% when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250 and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

Pickup (Model U-105)

The pickup used in the phonograph unit is of an improved design. The horseshoe magnet is rigidly welded to the pole pieces and is irremovable. There is a centering spring attached to the armature to maintain proper adjustment and to provide a limiting effect on the movement of the armature. The frequency response is substantially uniform over a wide range. Service operations which may be necessary on the pickup are as follows:

Centering Armature.—Refer to figure 5 showing the pickup inner structure. The armature is shown in its proper relation to the magnet pole pieces, i. e., exactly centered. Whenever this centering adjustment has been disturbed it will be necessary to remove the pickup mechanism from the tone arm by removing the needle holding screw and the two mounting screws from the front of the tone arm, holding the pickup assembly to keep it from dropping. Unsolder the two leads from the lugs on the terminal board at the rear of the pickup. Insert a small rod or nail into the armature needle hole and replace the needle holding screw, tightening it to hold the rod securely. If the armature clamping screws A and B have not been disturbed, screws C should be loosened which will permit the armature to be moved from side to side, the rod acting as a lever to perform this operation. The proper adjustment is obtained when the armature is moved to the extreme position on each side (the movement being limited by the armature striking the pole pieces) and then brought to the mid position between these two extremes. Screws C should then be tightened. The armature position should then be central between the pole pieces and at right angles to them. With a little practice, the correct adjustment of the armature will be obtained. The air gap between the pole pieces and the armature should be kept free from dust, filings, and other foreign material which would obstruct the movement of the pickup armature.

Damping Block.—The viscoloid damping block which is attached to the front end of the armature shank serves as a mechanical filter to eliminate undesirable resonances and to cause the frequency response to be uniform. Should it be necessary to replace this damping block, the pickup mechanism should be removed from the tone arm as explained above. Remove screw D and the damping block from the pickup assembly. Make sure that the shaft of the armature which contacts the viscoloid is clean. Then insert the new damping block so that it occupies the same position as that of the original block, and is in correct vertical alignment with the armature. The hole in the block is somewhat smaller than the diameter of the armature in order to permit a snug fit. With the damping block properly aligned on the armature, screw D with its washer should then be replaced. Heat should be applied to the armature (viscoloid side) so that the damping block will fuse at the point of contact and become rigidly attached to the armature. A special-tip soldering iron, constructed as shown in figure 7 will be found very useful in performing this operation. The iron should be applied only long enough to slightly melt the block, causing a small bulge on both sides.

Replacing Coil.—Whenever there is defective operation due to an open or shorted pickup coil, this coil should be replaced. Remove the pickup mechanism and terminal board as described above. Remove screws A and B and the magnet assembly. Remove the bakelite coil support (with coil attached) and insert the new coil support assembly in its place, after which replace the magnet assembly and center the armature as described above, then re-assemble the remainder of the unit.

Automatic Record Mechanism

(Model U-105)

This record changing mechanism is designed to be simple and fool-proof. Certain adjustments may be required occasionally. The adjustments are illustrated and explained in figures 8 and 10.

It is important, when servicing the automatic mechanism, to have it placed on a level support. It is also important to refrain from forcing the mechanism if there is a tendency to bind or jam, since bent levers and possible broken parts may result.

CAUTION.—Do not leave records stacked on the record holder posts, when not in use, as they are liable to warp, particularly so in warm climates.

FOR RECORD CHANGER DATA, SEE MODEL U106

Alignment Procedure

Calibrate the tuning dial by adjusting main dial pointer to the low-frequency (end) calibration mark on dial with the gang tuning-condenser plates in full-mesh position; then adjust the small (vernier) pointer to "0." These are friction adjustments.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 6 and 9.

Cathode-ray alignment is highly preferable; the connections to the chassis are shown on figures 2 and 3. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver "G" (ground) terminal for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

Order of Alignment	Test Oscillator: Connection to Receiver	Test Oscillator: Dummy Antenna	Test Oscillator: Frequency Setting	Range Selector	Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
1	6K7 I-F Grid Cap	.001 Mfd.	460 kc	"A" Left	No Signal 550-750 kc	2nd I-F Trans.	L16 and L17	Max. (peak)
2	6L7 Det. Grid Cap	.001 Mfd.	460 kc	"A"	No Signal 550-750 kc	1st I-F Trans.	L14 and L15	Max. (peak)
3	Ant. Term.	300 Ohms	20,000 kc	"C" Right	20,000 kc	"C" Osc.	C20	Max. (peak) *
4	Ant. Term.	300 Ohms	20,000 kc	"C"	20,000 kc	"C" Det.	C9	Max. (peak) †
5	Ant. Term.	300 Ohms	20,000 kc	"C"	20,000 kc	"C" Ant.	C2	Max. (peak) ‡
6	Ant. Term.	300 Ohms	6,000 kc	"B" Center	6,000 kc	"B" Osc.	C23	Max. (peak) *
7	Ant. Term.	200 Mmfd.	600 kc	"A" Left	600 kc	"A" L-F Osc.	L13	Max. (peak)
8	Ant. Term.	200 Mmfd.	1,500 kc	"A"	1,500 kc	"A" H-F Osc.	C26	Max. (peak)
9	Ant. Term.	200 Mmfd.	600 kc	"A"	600 kc	"A" L-F Osc.	L13	Max. (peak)
10	Ant. Term.	200 Mmfd.	1,500 kc	"A"	1,500 kc	"A" H-F Osc.	C26	Max. (peak)

† Use maximum capacity peak if two peaks can be obtained. * Use minimum capacity peak if two peaks can be obtained.
‡ After this adjustment, check for image signal by shifting receiver dial to 19,080 kc.

RECEIVER ASSEMBLIES

STOCK No.	DESCRIPTION
12038	Band—Rubber band for tuning tube
14384	Belt—Variable condenser drive belt
14618	Board—Antenna and ground terminal board (Model U-105 only)
14517	Board—Antenna and ground terminal board (Model U-107 only)
12717	Board—Phonograph terminal board
14338	Bushing—Variable condenser mounting bushing assembly
14524	Cable—Band indicator cable, approximately 6½ in. long
14523	Cable—Tone control indicator cable, approximately 3 in. long
14394	Cable—Tuning tube cable and socket
11350	Cap—Grid contact cap
12607	Cap—First I.F. transformer shield top
12581	Cap—Second I.F. transformer shield top
12884	Capacitor—Adjustable trimmer (long) (C2, C23, C26)
12714	Capacitor—Adjustable trimmer (medium) (C9, C20)
14021	Capacitor—22 Mmfd. (C25)
13545	Capacitor—39 Mmfd. (C7, C53)
12720	Capacitor—100 Mmfd. (C11)
14262	Capacitor—110 Mmfd. (C12, C13)
12404	Capacitor—120 Mmfd. (C27, C28)
12724	Capacitor—120 Mmfd. (C18)
12406	Capacitor—180 Mmfd. (C29)
12952	Capacitor—330 Mmfd. (C3, C10, C33)
12727	Capacitor—555 Mmfd. (C24)
12537	Capacitor—560 Mmfd. (C5)
12898	Capacitor—1,500 Mmfd. (C16)
12729	Capacitor—1,550 Mmfd. (C22)
12728	Capacitor—4,500 Mmfd. (C21)
12897	Capacitor—4,700 Mmfd. (C6)
4838	Capacitor—.005 Mfd. (C39, C40, C50, C51, C54)
13138	Capacitor—.01 Mfd. (C31, C35, C36)
4870	Capacitor—.025 Mfd. (C30, C32, C34)
4841	Capacitor—0.1 Mfd. (C4, C17)
5170	Capacitor—0.25 Mfd. (C15)
12741	Capacitor—0.5 Mfd. (C14, C37)
5212	Capacitor—16 Mfd. (C41)
14531	Capacitor—25 Mfd. (C42)
14372	Coil—Antenna coil and shield (L1, L2, L3, L4)
14516	Coil—Oscillator coil and shield (L11, L12, L13)
14414	Coil—R.F. coil and shield (L5, L6, L7, L8, L9, L10)
14513	Condenser—3-gang variable condenser (C1, C8, C19)
14783	Connector—2-contact female connector for compartment lamp cable or motor power cable
5040	Connector—4-contact female connector for reproducer cable
12006	Core—Adjustable core and stud for transformer, Stock Nos. 14376 and 14283
12800	Core—Adjustable core and stud for coil, Stock No. 14516
14596	Dial—Station selector dial scale, complete with tuning tube escutcheon (Model U-105 only)
14518	Dial—Station selector dial scale, complete with tuning tube escutcheon (Model U-107 only)
14514	Drive—Variable condenser vernier drive pinion gear and shaft
14345	Drum—Variable condenser drive belt drum, complete with set screws
14387	Escutcheon—Tuning tube escutcheon
11982	Fastener—Dial scale fastener
30085	Gear—Indicator drive gear and hub, and pointer stem and gear
14341	Idler—Station selector drive belt idler
14519	Indicator—Station selector indicator pointer
14520	Indicator—Vernier indicator pointer
5226	Lamp—Dial or pilot lamp
14028	Nut—Jamb nut for adjustable trimmer capacitor, Stock Nos. 12714 and 12884
12471	Plate—6J7 Radiotron socket mounting plate and rubber cushions—less socket, Stock No. 11196
14340	Pulley—Station selector drive belt pulley and knob shaft
14598	Reflector—Dial reflector and bracket, complete with dial lamp bracket, tuning tube bracket, and tone and band indicators
5112	Resistor—1,000 ohms, carbon type, ¼ watt (R2)
14078	Resistor—18,000 ohms, carbon type, 1 watt (R27)
14284	Resistor—22,000 ohms, carbon type, 1/10 watt (R5)
11305	Resistor—22,000 ohms, carbon type, ¼ watt (R10)
11300	Resistor—33,000 ohms, carbon type, 1/10 watt (R19)
13735	Resistor—33,000 ohms, carbon type, ¼ watt (R4)
5033	Resistor—33,000 ohms, carbon type, 1 watt (R31)
11646	Resistor—47,000 ohms, carbon type, ¼ watt (R12)
5145	Resistor—100,000 ohms, carbon type, ¼ watt (R14, R15, R18)
11398	Resistor—220,000 ohms, carbon type, 1/10 watt (R6)
11453	Resistor—270,000 ohms, carbon type, 1/10 watt (R16, R17)
11172	Resistor—470,000 ohms, carbon type, ¼ watt (R11)
11397	Resistor—560,000 ohms, carbon type, 1/10 watt (R1, R3)
12013	Resistor—1 megohm, carbon type, 1/10 watt (R23, R30)
13730	Resistor—1 megohm, carbon type, ¼ watt (R13)
11626	Resistor—2.2 megohms, carbon type, ¼ watt (R7, R8)
11668	Resistor—5.6 megohms, carbon type, ¼ watt (R26)
14532	Resistor—Voltage divider—comprising one 1,500-ohm, one 2,500-ohm, one 3,900-ohm, one 27-ohm, and one 165-ohm sections (R20, R21, R22, R24, R25)
14343	Retainer—Station selector knob shaft and pulley retainer
14350	Screw—No. 8-32 x 3/16 square head set screw for drum, Stock No. 14345, and gear, Stock No. 30085
14374	Shield—Antenna or R.F. coil shield
14375	Shield—Oscillator coil shield
12008	Shield—First or second I.F. transformer shield
14114	Socket—Dial lamp socket
14171	Socket—Pilot lamp socket
11195	Socket—5-contact 5T4 Radiotron socket
11488	Socket—2-contact female for compartment lamp cable—Model U-107
11196	Socket—8-contact 6F6, 6H6, 6K7, 6L7, 6N7, or 6J7 Radiotron socket
12907	Spring—Tension spring for indicator gear, Stock No. 30085
14342	Spring—Tension spring for idler, Stock No. 14341
12007	Spring—Retaining spring for core, Stock Nos. 12006 and 12800
14599	Switch—High-frequency tone and power switch (S4, S5)
14515	Switch—Range switch (S1, S2, S3)
14376	Transformer—First I.F. transformer (L14, L15, C12, C13)
14283	Transformer—Second I.F. transformer (L16, L17, C27, C28, C29, R5, R6)
11211	Transformer—Power transformer, 105-125 volts, 50-60 cycles (T1)
11212	Transformer—Power transformer, 105-125 volts, 25-60 cycles (T1)
11213	Transformer—Power transformer, 105-250 volts, 50-60 cycles (T1)
14597	Volume Control—Radio volume control and Radio-Record switch (R9, S10)
14379	Washer—Felt washer for indicator pointer

REPRODUCER ASSEMBLIES
(Speaker RL76-1)

STOCK No.	DESCRIPTION
14606	Cap—Dust cap for cone center
14603	Coil—Field coil (L20)
14604	Coil—Hum neutralizing coil (L19)
14602	Cone—Reproducer cone and dust cap (L18)
5039	Plug—4-contact male plug for reproducer
14600	Reproducer—Reproducer, complete
14358	Screw—Screw, washer, and lockwasher to hold core in yoke
14601	Transformer—Output transformer (T2, C52)
14357	Washer—Spring washer to hold field coil

OPERATING MECHANISM ASSEMBLIES
(Model U-105 only)

STOCK No.	DESCRIPTION
14199	Bushing—Record separator rotating shaft bushing
14183	Cam—Cam and gear assembly
6808	Clutch—Trip lever friction clutch
14197	Finger—Friction finger assembly
14186	Hub—Rotating hub and record separator, complete with set screw
14189	Lever—Locating lever assembly
14184	Lever—Main lever and link assembly
14201	Lever—Manual index lever assembly
14193	Lever—Pickup lift cable lever
14194	Lever—Pickup arm lever, complete with set screws
14198	Lever—Reject lever assembly
14185	Lever—Trip lever and friction clutch assembly
14196	Pawl—Trip pawl assembly
4563	Screw—Cable lever screw and two locknuts
14200	Screw—No. 8-32 special hex-head screw and lockwasher for record separator shaft mounting
4059	Screw—Trip lever clutch tension adjustment screw
14188	Screw—No. 10-32 x 7/16 fillister-head, cone-pointed set screw for rotating hub
14195	Screw—No. 10-32 x 5/16 fillister-head, cone-pointed set screw for pickup arm lever
14187	Shaft—Rotating shaft for record separator
3676	Spring—Cam pawl tension spring
3666	Spring—Lift cable tension spring
14190	Spring—Locating lever pawl tension spring
14191	Spring—Locating lever or reject lever tension spring
14192	Spring—Main lever tension spring

OPERATING MECHANISM ASSEMBLIES
(Model U-107 only)

STOCK No.	DESCRIPTION
14754	Cam—Cam and gear assembly
6808	Clutch—Trip lever friction clutch
14756	Cover—Metal cover for trip lever and friction finger assembly
6809	Finger—Manual index lever finger assembly
3670	Finger—Friction finger assembly
11554	Lever—Manual index lever—less pin
14755	Lever—Main lever and link assembly
14914	Lever—Pickup lift cable lever
11555	Lever—Trip lever and friction clutch assembly
6503	Pawl—Trip pawl assembly
3672	Pin—Manual index lever pin
13635	Plate—Eject arm actuating plate assembly
4564	Screw—Manual index lever finger set screw
4059	Screw—Trip lever clutch tension adjustment screw
4566	Screw—Special screw used to fasten main lever and link assembly bushing
13637	Spacer—Pickup arm mounting spacer
13638	Spring—Actuating spring
4565	Spring—Manual index lever finger tension spring
4061	Spring—Main spring lever tension spring or pickup arm cable tension spring
2893	Spring—Trip lever latch plate tension spring
3676	Spring—Cam and gear pawl tension spring
14916	Spring—Pickup lift lever spring
4125	Spring—Eject arm horizontal action tension spring
13636	Stud—Pickup arm lift cable stud and nut
2917	Washer—Spring washer—"U" type

EJECT ARM ASSEMBLIES
(Model U-107 only)

STOCK No.	DESCRIPTION
14753	Arm—Eject arm, complete
11533	Ball—1/16-in.-diameter steel ball
10129	Ball—3/16-in.-diameter steel ball
11529	Bearing—Ejector tip bearing and nut
11538	Bracket—Eject arm bracket
11537	Collar—Eject arm shaft collar and set screw
11536	Cushion—Counter balance roller cushion—located inside of eject arm
4055	Post—Vertical adjustment post—located on eject arm bracket
3729	Roller—Eject arm counter balance roller—located inside of eject arm
4580	Screw—No. 6-32 x 3/16-in. square-head set screw for eject arm collar
11534	Screw—No. 8-36 x 7/32-in. special screw for eject arm tip center adjustment
11535	Shaft and Collar—Eject arm vertical action shaft and collar assembly
11528	Silencer—Ejector tip silencer
4067	Spring—Ejector arm bracket spring
11531	Spring—Ejector tip spring
11530	Tip—Ejector tip with tip center, adjusting screw and cap
11539	Yoke—Eject arm yoke assembly

PICKUP AND ARM ASSEMBLIES
(Model U-105 only)

STOCK No.	DESCRIPTION
14291	Armature—Pickup armature assembly
4064	Cable—Pickup lift cable
14672	Coil—Pickup coil (L101)
14292	Damper—Pickup damper block, complete with clamp and screw
14293	Pickup and Arm, complete
3811	Screw—Needle holding screw
4387	Screw—No. 6-32 x ¼-in. headless set screw for pickup arm pivot shaft

PICKUP AND ARM ASSEMBLIES
(Model U-107 only)

STOCK No.	DESCRIPTION
10941	Ball—Steel ball for pivot shaft bearing
3204	Cable—Pickup lift cable
30101	Cable—Shielded pickup cable—connects pickup unit to shorting switch
12850	Damper—Pickup arm pivot shaft damper—comprising one upper rubber damper and bearing, one lower rubber damper and one lower bearing
14820	Mechanism—Pickup mechanism, complete with needle screw
14818	Pickup and Arm, complete
12546	Plug—Pivot shaft bearing plug
14823	Rod—Pickup arm brake trip rod
14822	Screw—Needle screw
14824	Screw—Pickup mechanism terminal screw
14913	Spring—Pickup arm tension spring
14821	Support—Pickup mechanism support

MOTOR ASSEMBLIES
(Model U-105 only)

STOCK No.	DESCRIPTION
14215	Governor—Governor, complete for motor, Stock Nos. 9799 and 14465
14465	Motor—105-125 volts, 50-60 cycles (M-101)
9799	Motor—105-125 volts, 60 cycles (M-101)
14214	Screw—Motor mounting screw and spacer assembly

MOTOR ASSEMBLIES
(Model U-107 only)

STOCK No.	DESCRIPTION
9735	Motor—105-125 volts, 25 cycles (M-110)
9651	Motor—105-125 volts, 50 cycles (M-110)
9650	Motor—105-125 volts, 60 cycles (M-110)
12050	Suspension Spring—Motor mounting spring, washer, and stud assembly—comprising six springs, six cup washers, three spring washers, and three studs

AUTOMATIC SWITCH ASSEMBLIES
(Model U-107 only)

STOCK No.	DESCRIPTION
3994	Cover—Motor switch cover
10184	Plate—Automatic brake latch plate
10174	Springs—Automatic brake springs
6805	Switch Assembly—Automatic switch, complete
3322	Switch—Motor switch (S111)

MOTOR BOARD ASSEMBLIES
(Model U-105 only)

STOCK No.	DESCRIPTION
14208	Bracket—Bumper bracket and bumper, complete
14209	Bumper—Rubber bumper
14630	Cable—Shielded cable, 22 inches long, complete with single contact male connector—connects pickup shorting switch to input transformer or compensator
11704	Damper—Turntable damper and damper plate
14212	Escutcheon—Manual index lever and switch escutcheon
14203	Post—Record post—located on front left-hand corner of motor board
14210	Rest—Pickup arm rest
14207	Roller—Pickup lift cable roller and bracket
14211	Socket—Motor board socket and shell
14205	Support—Pickup arm mounting spacer, washers, and nut
14206	Switch—Motor toggle switch (S101)
14629	Switch—Pickup shorting switch (S102)
14204	Turntable, complete
14213	Washer—Pickup arm stop washer and spacing washer

MOTOR BOARD ASSEMBLIES
(Model U-107 only)

STOCK No.	DESCRIPTION
11881	Base—Phonograph compartment lamp socket and base
14760	Cup—Used-needle cup
12051	Capacitor—2 Mfd., complete with 2-contact male connector for use with motor, Stock Nos. 9650 or 9651 only (C115)
13101	Capacitor—4 Mfd., complete with 2-contact male connector for use with motor, Stock No. 9735 only (C115)
4674	Connector—2-contact male connector for Stock Nos. 12051, 13101 or phono. compartment lamp leads
4577	Connector—2-contact male connector for motor cable
11488	Connector—2-contact female connector for motor leads
14762	Damper—Turntable damper
11553	Escutcheon—Index escutcheon engraved "Manual—12—10"
14688	Knob—Needle rest knob
4340	Lamp—Phonograph compartment lamp—6.3 volts
3764	Nut—Cap nut for motor board suspension assembly
30565	Resistor—500 ohms, 6 watts, for use with motor, Stock No. 9735 only (R116)
14761	Rest—Pickup rest
14825	Roller—Pickup arm cable guide roller—comprising bracket, roller, and guide pin
11711	Shade—Phonograph compartment lamp shade
14758	Spacer—Pickup arm mounting spacer
14270	Spring—Retaining spring for knob, Stock No. 14758
4565	Spring—Tension spring for needle rest
3763	Suspension Spring—Suspension spring, washer, and bolt assembly for motor board—comprising one bolt, two cup washers, two springs, two "C" washers, and one cap nut
4671	Switch—Operating switch, toggle type (S112)
30157	Switch—Pickup shorting switch (S110)
14759	Turntable, complete

MISCELLANEOUS ASSEMBLIES
(Model U-105 only)

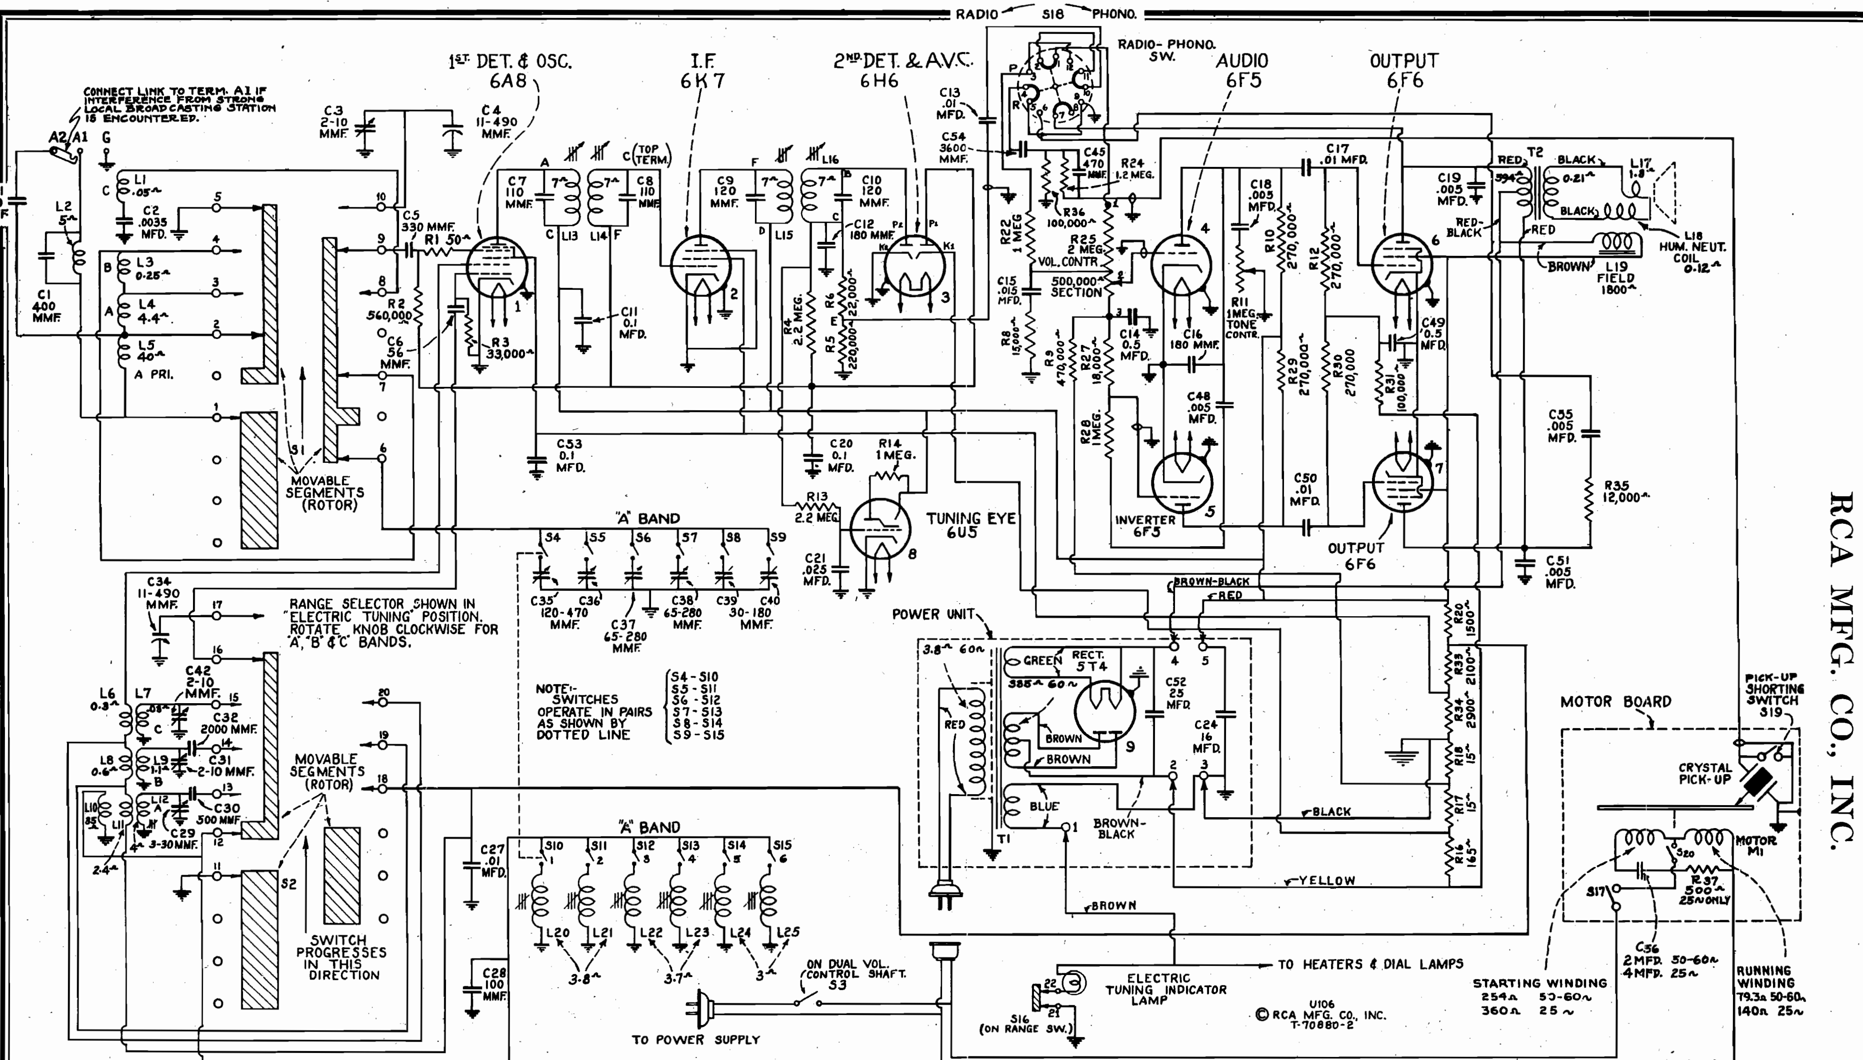
STOCK No.	DESCRIPTION
4391	Box—Used-needle box
14607	Cable—Shielded compensation cable, complete with male plug
13103	Cap—Pilot lamp cap
12952	Capacitor—330 Mmfd. (C105)
12635	Capacitor—1,000 Mmfd. (C104)
5148	Capacitor—.007 Mfd. (C101)
11315	Capacitor—.015 Mfd. (C102, C103)
14610	Escutcheon—Station selector escutcheon and crystal, complete with tone and band indicating strips
14611	Index—Tone control indicating strip—mounts in station selector escutcheon
14529	Index—Band indicating strip—mounts in station selector escutcheon
14359	Knob—Station selector knob
14269	Knob—Volume control, tone control, or range switch knob
11607	Receptacle—New-needle card holder
11400	Resistor—27,000 ohms, carbon type, ¼ watt (R103, R104)
13735	Resistor—33,000 ohms, carbon type, ¼ watt (R102)
11322	Resistor—39,000 ohms, carbon type, ¼ watt (R101)
4560	Screw—Chassis mounting screw and washer assembly
4982	Spring—Retaining spring for knob, Stock No. 14359
14270	Spring—Retaining spring for knob, Stock No. 14269
3763	Suspension Spring—Motor board suspension springs, stud, washer, and nut assembly
14609	Transformer—Phonograph input transformer (T101)
14608	Volume Control—Phonograph volume control (R105)

MISCELLANEOUS ASSEMBLIES
(Model U-107 only)

STOCK No.	DESCRIPTION
12488	Capacitor—270 Mmfd. (C110)
13762	Capacitor—1,500 Mmfd. (C111) in 25 cycle model only
14393	Capacitor—.01 Mfd. (C114)
11315	Capacitor—.015 Mfd. (C111, C112, C113)—C111 .015 Mfd. in 50 and 60 cycle models only
30099	Control—Pickup control (R114)
14610	Escutcheon—Station selector escutcheon and crystal
14269	Knob—Radio or phonograph volume control, tone control, or range switch knob
14359	Knob—Station selector knob
14529	Index—Band indicator card—mounts in station selector escutcheon
14611	Index—Tone indicator card—mounts in station selector escutcheon
11607	Receptacle—New-needle card holder
12738	Resistor—27,000 ohms, insulated, ¼ watt (R111, R115)—R115 27,000 ohms in 50 cycle model only
12454	Resistor—33,000 ohms, insulated, ¼ watt (R110)
12286	Resistor—56,000 ohms—insulated ¼ watt (R115) in 25 cycle model only
14560	Resistor—100,000 ohms, insulated, ¼ watt (R113)
12210	Screw—Chassis mounting screw and washer assembly
3763	Suspension Spring—Motor board suspension bolt spring washers and nut
30098	Volume Control—Phonograph volume control (R112)

RCA MFG. CO., INC.

MODEL U106 Schematic Specifications



Frequency Ranges

"Standard Broadcast" (A)	540-1,720 kc
"Medium Wave" (B)	2,300-7,500 kc
"Short Wave" (C)	7,500-22,000 kc
Six "Electric Tuning" Positions	540-1,550 kc

Power Supply Ratings

	Radio Only	Total
A-6...105-125 volts, 60 cycles	120 watts	150 watts
A-5...105-125 volts, 50 cycles	125 watts	155 watts
B-2...105-125 volts, 25 cycles	120 watts	150 watts
C-6...105-125/200-250 volts, 60 cycles	120 watts	150 watts
C-5...105-125/200-250 volts, 50 cycles	125 watts	155 watts

R-F Alignment Frequencies

"Medium Wave" (B)	6,000 kc (osc., ant.)
"Short Wave" (C)	20,000 kc (osc.)
"Standard Broadcast" (A)	600 kc (osc.), 1,500 kc (osc.)
Electric Tuning	Desired Station (osc., ant.)

Phonograph

Type	Automatic or Manual
Record Capacity	Eight 10-inch or Seven 12-inch
Turntable Speed	78 R.P.M.
Type of Pickup	Crystal
Pickup Impedance	80,000 ohms at 1,000 cycles

Loudspeaker

Type	Twelve-inch Electrodynamic
Voice Coil Impedance	2.2 ohms at 400 cycles

Power Output

Undistorted	10 watts
Maximum	12 watts

IF PEAK 460 KC

(See Figure 2 for Component Parts in Power Unit)

MODEL U106
Socket, Trimmers
Chassis Wiring
Circuit Data, Notes

RCA MFG. CO., INC.

Circuit Arrangement

The circuit consists of a combined first-detector and oscillator stage; i-f amplifier stage; diode-detector and automatic-volume-control stage; a-f amplifier stage; a-f amplifier, phase-inverter stage; push-pull power-amplifier stage; tuning indicator "Magic Eye"; and a full-wave rectifier. The antenna coil is constructed with a special type winding ("qumulative") to provide increased sensitivity and selectivity on the "Standard broadcast" band. A fixed-tuned wave trap reduces i-f interference entering the antenna circuit.

Electric tuning is accomplished in a simple manner. There are six trimmers for tuning the single antenna coil and six magnetite-core adjusted oscillator coils. A desired station is tuned accurately, quickly, and silently by pressing a push-button which instantly puts the pre-adjusted coil and trimmer into use. Oscillator frequency drift is reduced to a minimum by use of a temperature-compensating capacitor (C28) in the oscillator circuit along with magnetite-core adjusted oscillator coils.

Service Data

Loudspeaker.—Centering the loudspeaker voice-coil is made in the usual manner with three, narrow, paper or celluloid feelers after first removing the front dust-cover. This may be removed by softening its cement with a light application of acetone, using care not to allow the acetone to flow into the air gap. The dust-cover should be cemented back in place with ambroid upon completion of the adjustment.

Precautionary Lead Dress.—(1) Filament leads should be dressed away from audio grids. (2) Output plate leads should be dressed away from radio-phonograph switch. Maintain original size, length, and position of: (3) All leads from range switch to antenna and oscillator coils. They should be as short, rigid, and separated as far as possible from other leads and chassis. (4) Lead from oscillator coil to ground. (5) Leads from gang condenser to range selector. (6) Leads of "C"-band antenna series condenser, C2. If the r-f and i-f wiring is altered during servicing the receiver must be re-aligned.

Radiotron Cathode Current Readings

Measured with Milliammeter Connected at Tube Socket Cathode Terminals Under Conditions Similar to Those of Voltage Measurements

(1)	RCA-6A8—1st Det. and Osc.	11	ma.
(2)	RCA-6K7—I-F Amp.	8	ma.
(3)	RCA-6H6—2nd Det. and A.V.C.	———	
(4)	RCA-6F5—Audio Amplifier	0.29	ma.
(5)	RCA-6F5—Inverter	0.29	ma.
(6)	RCA-6F6—Output	28.5	ma.
(7)	RCA-6F6—Output	28.5	ma.
(8)	RCA-6U5—Tuning	1.5	ma.
(9)	RCA-5T4—Rectifier	110	ma.**

(** Cannot be measured at socket)

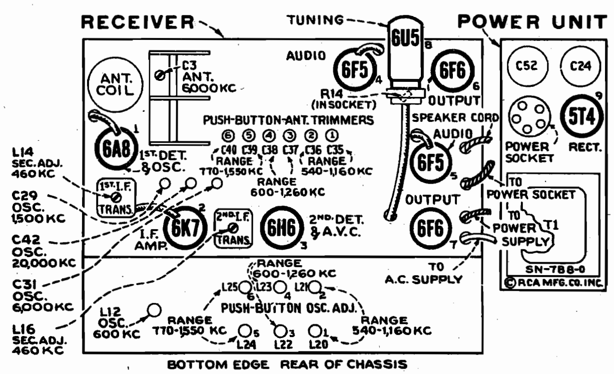

Figure 1—Radiotron and Trimmer Locations

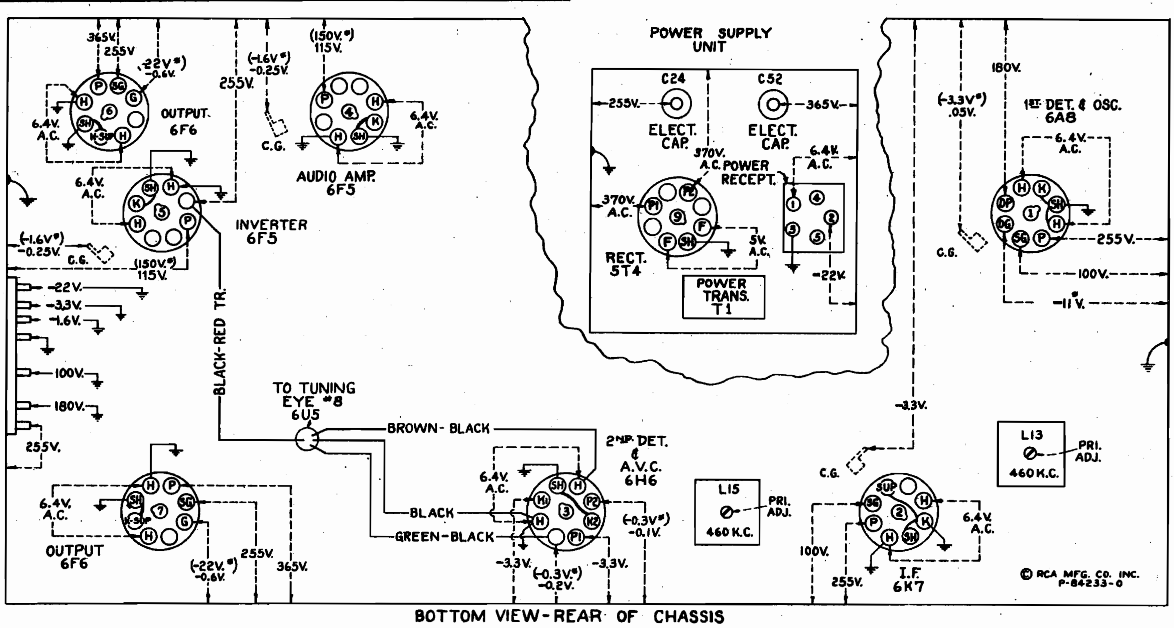

Figure 2—Radiotron Socket Voltages and Trimmer Locations

Measured at 117 volts, 60-cycle supply. Measurements made with set tuned to quiet point near 1,000 kc; volume control at minimum; Radio-Phonograph switch to "Radio"; using a 1,000-ohm-per-volt meter having ranges of 10, 50, 250, and 500 volts. (Use nearest range above the specified measured voltage.) **Measurements made to chassis unless otherwise indicated.**

Note.—Values with star (*) are **operating** voltages. Values not starred are actual **measured** voltages.

MODELS U106, U107
Automatic Record Changer
Adjustments, Views, Tuner

RCA MFG. CO., INC.

Automatic Record Changer

Under normal operating conditions, service requirements on this mechanism should be negligible. Occasionally, however, certain adjustments may be necessary. It is important to refrain from forcing the mechanism if there is a tendency to bind or jam, when operating or adjusting, since bent levers and possibly broken parts may result.

Record Changer Adjustments.—Mount motor-board on a level support. Remove turntable and cover at right of turntable. Adjustment locations are designated on figure 5 as A, B, etc. The adjustments are explained under corresponding symbols below. Perform adjustments in the following order:

A.—Trip rod "A" should be engaged in "Switch Lever" slot. Adjust trip rod "A" to obtain about 1/8 of an inch clearance from motor-board.

B.—Adjust "B" to the position shown.

C.—With "Index Lever" in "Manual" position, "Pickup Arm" rotated to extreme left, and switch tripped to open contacts "C," adjust contact points "C" by bending the stiff contact arm until points are opened 10 to 30 thousandths of an inch.

D.—With "Index Lever" in "Manual" position, release set screw "D" and force "Manual Index Finger" as far as it will go towards "Trip Pawl Stop Pin." Tighten set screw.

E.—Adjust at "E" to provide approximately 1/32 of an inch between outer end of "Link Slot" and screw when rubber "Bumper" is in contact with stop bracket.

F. and G.—Remove rubber silencer at "F" and adjust "F" and "G" so ejector tip "F" is in line with "Spindle." Longitudinal movement, with respect to "Ejector Arm," may be effected by loosening hex. head at "F." Lateral movement of "Ejector Arm" may be effected by adjustment "G."

H.—Adjust "H" so under side of pickup head can be raised 2½ inches above motor-board.

J.—Adjust screw "J" until friction will just force "Trip Finger" to move "Trip Pawl" when "Index Lever" is in "12" inch position.

N.—Adjust needle pressure by turning screw under center of "Pickup Arm" so that a force of 72 grams (2.5 ounces) is required to lift needle from record. Hook scale under needle screw to measure force.

K.—Adjustment "N" must be performed prior to this adjustment. With a 12-inch record on turntable, turn on "Motor Switch," place "Index Lever" to "12" position and adjust "K" so that "Cable" tension will allow needle to lower slowly on start of record at completion of eject cycle. Turn "Motor Switch" off after eject cycle is completed and check to see that "Cable" is slightly loose when "Pickup Arm" is moved against "Spindle." Replace turntable and put a needle in "Pickup."

L.—Adjust "L" so needle will drop into center of smooth portion at the start of a 12-inch record when "Index Lever" is in "12" inch position and "Pickup Arm" is to extreme right.

M.—Loosen three screws "M" and rotate "Spacer" until pointer on "Spacer" is in line with screw to right of "Pickup Arm."

P.—Adjust turntable height by insertion or removal of thrust washers at "P" so ejector tip "F" will not eject bottom 12-inch record but will eject second from bottom record.

Q.—Adjust position of shorting switch at "Q" so switch closes when needle is just outside a 12-inch record.

R.—Adjust screw "R" upward just enough so that with one record on turntable and ejector tip "F" resting on record surface, there is 1/32 of an inch clearance between screw "R" and "Ejector Arm."

Record Changer Service Hints.—A general perusal of the following possible troubles which may be experienced with this mechanism, together with the adjustment or adjustments to be applied for same, will enable one to ascertain that which pertains to the instrument at hand:

1.—"Ejector Arm" goes through normal cycle but does not eject records. Adjust "F" and "G." See that "Spindle" slides freely.

2.—Ejects bottom record. Lower turntable by removing thrust washers at "P."

3.—Ejects records properly down to second from bottom of pile. Raise turntable by placing thrust washers at "P."

4.—Eject cycle does not start after needle reaches eccentric groove. Adjust "J" (turn screw clockwise).

5.—Eject cycle starts before eccentric record groove is reached. Adjust "J" (turn screw counter-clockwise). Set "Index Lever" to "12" inch or "10" inch position after starting to play record. Do not jar motor-board during automatic operation.

6.—Lateral movement of "Pickup Arm" has no control over starting and stopping. Adjust clearance of rod "A." See that rod "A" engages in slot of "Switch Lever."

7.—Fails to eject top record of a pile because "Ejector Arm" strikes record in returning to center at end of eject cycle. Adjust screw "R" upward to provide greater incline so that roller in "Ejector Arm" will roll back during cycle.

8.—Pickup strikes record during eject cycle. Adjust "K" and "H."

9.—Starts playing record several grooves in from beginning or needle misses record entirely. Adjust "L."

10.—Needle falls on smooth portion at start of record but does not move into playing groove. Adjust "M." Check to see that motor-board is level.

11.—Automatic stop does not operate after needle reaches eccentric groove. Adjust "B" and "C."

12.—Motor does not re-start when "Pickup" is returned to rest position. Adjust "C." See that switch mechanism parts move freely and springs are functioning.

13.—Starts eject cycle although set for "Manual" operation. Adjust "D."

14.—Noise in loudspeaker while changing needles. Clean "Shorting Contact" and adjust "Q."

15.—"Wow" in record reproduction.—Instrument should be warmed to about 65° F. Ejector tip should be centered and free to rotate (adjustments "F" and "G"). There should be no solid particles on gear teeth or in grease; no tendency to bind. Turntable plate should be in dynamic balance and "Spindle" should be straight. Proper lubrication is important.

Lubrication.—Clean motor gear-box thoroughly before re-greasing. Apply less than a tablespoonful of a grease, such as "Cities Service No. 7035-A1" or "Koolmotor Universal Trojan No. 1," directly on gears, taking care to get none in rotor bearings. Put medium motor oil (S.A.E. No. 30) in the oil holes. Cover main gear and cam of automatic mechanism with a light grease such as "Socony-Vacuum No. 2." Any good household oil, such as "3-IN-ONE" is suitable for the ejector-tip "F" bearing.

"Electric Tuning" Alignment

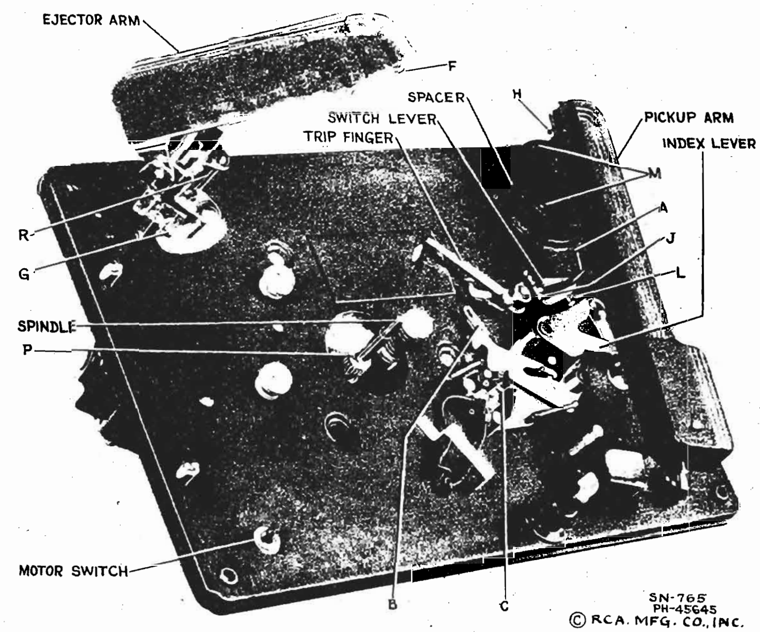
Each push button connects a particular oscillator coil and antenna trimmer condenser. The tuning of this coil and this condenser selects a station.

The frequency ranges for various push-buttons are:

(1) 540 to 1,160 kilocycles—Adjust L-20 and C-35
(2) 540 to 1,160 kilocycles—Adjust L-21 and C-36
(3) 600 to 1,260 kilocycles—Adjust L-22 and C-37
(4) 600 to 1,260 kilocycles—Adjust L-23 and C-38
(5) 770 to 1,550 kilocycles—Adjust L-24 and C-39
(6) 770 to 1,550 kilocycles—Adjust L-25 and C-40

The following are the steps in aligning a push-button selector:

(1) Manually tune to desired station, then switch range selector to "Electric Tuning."
(2) Press a push-button whose frequency range includes the station.
(3) Adjust oscillator coil corresponding to that push-button, to receive the desired station.
(4) Adjust antenna condenser for that push-button to receive the desired station.
(5) Check alignment by switching to manual tuning. Magic Eye will not change appreciably if alignment is correct.
(6) After receiver has warmed, repeat above adjustments.



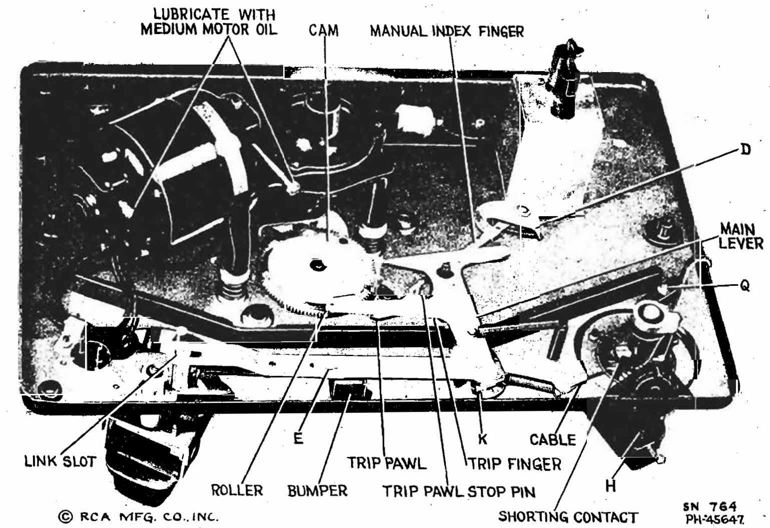


Figure 5—Automatic Record Changer Adjustments

RCA MFG. CO., INC.

Calibrate the tuning dial by adjusting dial pointer to the low-frequency (end) calibration mark on dial with the gang tuning-condenser plates in full-mesh position. The pointer is soldered in place on the drive cable.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown on figures 1 and 2.

Cathode-ray alignment is highly preferable: the connections to the chassis are shown on figure 4. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position. Connect the "low" output terminal of the test oscillator to the receiver "G" (ground) terminal for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator. "Min. Eye" means minimum width of dark sector of "Magic Eye" or greatest deflection.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

Order of Alignment	Test Oscillator: Connection to Receiver	Test Oscillator: Dummy Antenna	Test Oscillator: Frequency Setting	Range Selector	Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain

* Use maximum capacity peak if two peaks can be obtained. Check for image signal by shifting receiver dial to 20.92 mc.

REPLACEMENT PARTS

Stock No.	Description	Unit List Price
	RECEIVER ASSEMBLIES	
30755	Arm—Band indicator operating arm—fastens on range switch shaft	.35
14384	Belt—Drive belt	.16
30864	Board—Antenna and ground terminal board	.40
30752	Bracket—Tuning tube mounting bracket and clip	.25
30754	Cable—Band indicator operating cable	.06
30728	Cable—Pickup cable and connector	.50
11350	Cap—Grid contact cap	.05
30766	Cap—Rubber cap for tuning tube	.15
30751	Capacitor—Trimmer comprising two sections each 2-10 Mmfd. and one section 3-30 Mmfd. (C29, C31, C42)	.55
30750	Capacitor—Dual trimmer 30-180 Mmfd. each section (C39, C40)	.45
30764	Capacitor—Dual trimmer 65-280 Mmfd. each section (C37, C38)	.45
30765	Capacitor—Dual trimmer 120-470 Mmfd. each section (C35, C36)	.50
12723	Capacitor—56 Mmfd. (C6)	.25
30769	Capacitor—100 Mmfd. (C28)	.40
14262	Capacitor—110 Mmfd. (C7, C8)	.30
12404	Capacitor—120 Mmfd. (C9, C10)	.30
12725	Capacitor—150 Mmfd. (C41)	.25
12406	Capacitor—180 Mmfd. (C12)	.25
13003	Capacitor—180 Mmfd. (C16)	.25
12952	Capacitor—330 Mmfd. (C5)	.25
30433	Capacitor—470 Mmfd. (C45)	.30
30768	Capacitor—500 Mmfd. (C30)	.30
30767	Capacitor—2,000 Mmfd. (C32)	.40
12811	Capacitor—3,600 Mmfd. (C54)	.45
30303	Capacitor—.0035 Mfd. (C2)	.40
4838	Capacitor—.005 Mfd. (C18, C19, C48, C51, C55)	.25
14393	Capacitor—.01 Mfd. (C13, C17, C27, C50)	.30
11315	Capacitor—.015 Mfd. (C15)	.20
4870	Capacitor—.025 Mfd. (C21)	.20
4839	Capacitor—0.1 Mfd. (C11, C20, C53)	.30
30867	Capacitor—0.5 Mfd. (C14, C49)	.30
30745	Coil—Antenna coil and shield A, B, C, bands (L1, L3, L4, L5)	2.05
30747	Coil—Oscillator coil A band (L20 or L21)	.60
30748	Coil—Oscillator coil A band (L22 or L23)	.60
30749	Coil—Oscillator coil A band (L24 or L25)	.60
30746	Coil—Oscillator coil A, B, C bands (L6, L7, L8, L9, L10, L11, L12)	2.10
30740	Condenser—2-gang variable tuning condenser (C3, C4, C34)	4.25
5040	Connector—4-contact female for speaker cable	.30
14781	Connector—5-contact male for power cable	.35
30868	Connector—2-contact female for A.C. switch cable	.35
14783	Connector—2-contact female for compartment lamp cable	.25
30743	Control—Volume control, tone control and power switch in one unit (R11, R25, S3)	3.00
30763	Cord—Indicator drive cord	.40
30846	Core—Adjustable core for push button coils	.30
30861	Dial—Station selector dial scale	.85
30753	Disc—Band indicator disc with colored segment	.40
30741	Drive—Variable condenser vernier drive shaft and pinion gear	1.40
30587	Drum—Drive belt drum—fastens on variable condenser vernier drive shaft	.45
30761	Drum—Indicator cord drum—fastens on variable condenser rotor shaft	.65
14341	Idler—Drive idler pulley, bracket and spring	.65
30762	Indicator—Indicator pointer and slider	.15
5226	Lamp—Dial lamp	.17
30757	Pulley—Large size pulley for indicator cord—located at top left corner of dial bracket	.30
30758	Pulley—Medium size pulley for indicator cord—located at top right side of dial bracket	.25
14697	Pulley—Small size pulley for indicator cord—located at top right hand corner of dial bracket	.35
30771	Resistor—50 ohms, flexible type, 2½ watts (R1)	.20
30866	Resistor—12,000 ohms, 1 watt (R35)	.22
3998	Resistor—15,000 ohms, ¼ watt (R8)	.20
11175	Resistor—18,000 ohms, ¼ watt (R27)	.20
14284	Resistor—22,000 ohms, 1/10 watt (R6)	.15
12454	Resistor—33,000 ohms, ¼ watt (R3)	.20
14560	Resistor—100,000 ohms, ¼ watt (R31, R36)	.20
11398	Resistor—220,000 ohms, 1/10 watt (R5)	.15
12199	Resistor—270,000 ohms, ¼ watt (R10, R12, R29, R30)	.20
11172	Resistor—470,000 ohms, ¼ watt (R9)	.20
11397	Resistor—560,000 ohms, 1/10 watt (R2)	.15
12013	Resistor—1 Megohm, 1/10 watt (R14)	.15
13730	Resistor—1 Megohm, ¼ watt (R22, R28)	.20
30208	Resistor—1.2 Megohm, ¼ watt (R24)	.20
12679	Resistor—2.2 Megohm, ¼ watt (R4, R13)	.20
30865	Resistor—Voltage divider comprising one 1,500 ohm, one 2,100 ohm, one 2,900 ohm, two 15 ohm and one 165 ohm sections (R16, R17, R18, R20, R33, R34)	1.10
30760	Shaft—Tuning knob shaft and pulley	.45
5119	Socket—3-contact socket for speaker cable	.25
13871	Socket—6-contact tuning tube socket	.45
11196	Socket—8-contact Radiotron socket	.25
14114	Socket—Dial lamp socket—open type	.25
14171	Socket—Dial lamp socket—shell type	.40
30756	Spring—Band indicator tension spring	.09
14342	Spring—Idler pulley tension spring	.04
30585	Spring—Indicator cord tension spring	.06
12007	Spring—Retaining spring for core Stock No. 30846	.02
30742	Switch—Range switch (S1, S2, S16)	1.50
30862	Switch—Radio-record switch (S18)	1.00
30744	Switch—Tuning push button switch (S4, S5, S6, S7, S8, S9, S10, S11, S12, S13, S14, S15)	3.60
14376	Transformer—First I.F. transformer (L13, L14, C7, C8)	2.45
14283	Transformer—Second I.F. transformer (L15, L16, C9, C10, C12, R5, R6)	3.80
13838	Trap—Wave trap (L2, C1)	.65
	POWER UNIT ASSEMBLIES	
5212	Capacitor—16 Mfd. (C24)	1.35
14531	Capacitor—25 Mfd. (C52)	1.55
14783	Connector—2-contact female connector for motor power cable	.25
30870	Connector—2-prong male connector of A.C. cable	.35
14279	Socket—5-contact socket for chassis power cable	.35
11196	Socket—Rectifier tube socket	.25
30869	Transformer—Power transformer 110 and 220 volts, 50 to 60 cycles (T1)	10.55
	EJECT ARM ASSEMBLIES	
14753	Arm—Eject arm, complete	16.25
11533	Ball—1/16-inch diameter steel ball	.02
10129	Ball—3/16-inch diameter steel ball	.02
11529	Bearing—Ejector tip bearing and nut	.85
11538	Bracket—Eject arm bracket	3.00
11537	Collar—Eject arm shaft collar and set screw	.60
11536	Cushion—Counter balance roller cushion—located inside of eject arm	.25
4055	Post—Vertical adjustment post—located on eject arm bracket	.30
3729	Roller—Eject arm counter balance roller—located inside of eject arm	2.10
4580	Screw—No. 6—32-3/16-inch square head set screw for eject arm collar	.06
11534	Screw—No. 8—36-7/32-inch special screw for eject arm tip center adjustment	.04
11535	Shaft and Collar—Eject arm vertical action shaft and collar assembly	.40
11528	Silencer—Ejector tip silencer	.14
4067	Spring—Ejector arm bracket spring	.05
11531	Spring—Ejector tip spring	.04
11530	Tip—Ejector tip with tip center, adjusting screw and cap	.85
11539	Yoke—Eject arm yoke assembly	2.10
	PICKUP AND ARM ASSEMBLIES	
10941	Ball—Steel ball for pivot shaft bearing	.02
3204	Cable—Pickup lift cable	.25
30101	Cable—Shielded pickup cable—connects pickup unit to shorting switch	.50
12850	Damper—Pickup arm pivot shaft damper—comprising one upper rubber damper and bearing, one lower rubber damper and one lower bearing	.45
14820	Mechanism—Pickup mechanism, complete with needle screw	9.60
14818	Pickup and arm, complete	14.95
12546	Plug—Pivot shaft bearing plug	.12
14823	Rod—Pickup arm brake trip rod	.40
14822	Screw—Needle screw	.05
14824	Screw—Pickup mechanism terminal	.06
14913	Spring—Pickup arm tension spring	.15
14821	Support—Pickup mechanism support	.90
	OPERATING MECHANISM	
14754	Cam—Cam and gear assembly	2.95
6808	Clutch—Trip lever friction clutch	.35
14756	Cover—Metal cover for trip lever and friction finger assembly	.85
6809	Finger—Manual index lever finger assembly	.65
3670	Finger—Friction finger assembly	.45
11554	Lever—Manual index lever—less pin	1.25
14755	Lever—Main lever and link assembly	1.65
14914	Lever—Pickup lift cable lever	.45
11555	Lever—Trip lever and friction clutch assembly	2.45
30624	Pawl—Trip pawl assembly	.95
3672	Pin—Manual index lever pin	.60
13635	Plate—Eject arm actuating plate assembly	1.40
4564	Screw—Manual index lever finger set screw	.04
4059	Screw—Trip lever clutch tension adjustment screw	.02
4566	Screw—Special screw used to fasten main lever and link assembly bushing	.06
13637	Spacer—Pickup arm mounting spacer	.75
13638	Spring—Actuating spring	.08
4565	Spring—Manual index lever finger tension spring	.06
4061	Spring—Main spring lever tension spring or pickup lift cable spring	.11
2893	Spring—Trip lever latch plate tension	.06
3676	Spring—Cam and gear pawl tension spring	.04
14916	Spring—Pickup lift lever spring	.12
4125	Spring—Eject arm horizontal action tension spring	.06
13636	Stud—Pickup arm lift cable stud and nut	.08
2917	Washer—Spring washer—"U" type	.03
	AUTOMATIC SWITCH ASSEMBLIES	
3994	Cover—Motor switch cover	.40
10184	Plate—Automatic brake latch plate	.22
10174	Springs—Automatic brake springs	.30
6805	Switch Assembly—Automatic switch, complete	4.20
3322	Switch—Motor switch (S18)	1.35
	MOTOR ASSEMBLIES	
9651	Motor—105-125 volts—50 cycles (M1)	*
9650	Motor—105-125 volts—60 cycles (M1)	*
12050	Suspension Spring—Motor mounting spring, washer and stud assembly—comprising six springs, six cup washers, three spring washers and three studs	1.05
	MOTOR BOARD ASSEMBLIES	
11881	Base—Phonograph compartment lamp socket and base	.90
14819	Cable—Shielded pickup cable—connects shorting switch to compensator pack	.70
12051	Capacitor—2 Mfd., complete with 2-contact male connector for use with motor, Stock Nos. 9650 or 9651 only (C56)	7.95
14805	Connector—2-contact male connector for Stock Nos. 12051, 13101 or phono compartment lamp leads	.20
4577	Connector—2-contact male connector for motor cable	.45
14783	Connector—2-contact female connector for motor leads	.25
14760	Cup—Used-needle cup	.45
14762	Damper—Turntable damper	.45
11553	Escutcheon—Index escutcheon engraved "Manual—12—10"	.60
14688	Knob—Needle rest knob	.20
4340	Lamp—Phonograph compartment lamp—6.3 volts	.17
3764	Nut—Cap nut for motor board suspension	.15
14761	Rest—Pickup rest	2.10
14825	Roller—Pickup arm cable guide roller—comprising bracket, roller and guide pin	.65
11711	Shade—Phonograph compartment lamp shade	.65
14758	Spacer—Pickup arm mounting spacer	.70
14270	Spring—Retaining spring for knob, Stock No. 14758	.05
4565	Spring—Tension spring for needle rest	.06
30157	Switch—Pickup shorting switch (S19)	.60
4671	Switch—Operating switch—toggle switch (S17)	1.10
14759	Turntable, complete	5.65
	REPRODUCER ASSEMBLIES Speaker RL-70E-2	
13866	Cap—Dust cap for cone center	.03
11234	Coil—Field coil (L19)	3.85
11469	Coil—Hum neutralizing coil (L18)	.30
12667	Cone—Reproducer cone and dust cap (L17)	1.95
5039	Plug—4-contact male plug for reproducer	.30
14535	Reproducer, complete	12.90
14534	Transformer—Output transformer (T2)	3.85
14357	Washer—Spring washer to hold field coil	.06

* Prices upon application to authorized RCA Victor Distributor.

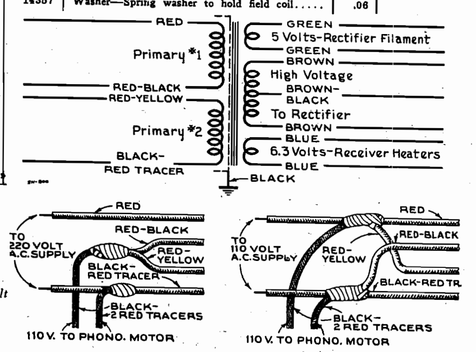

Figure 6—Schematic and Primary Lead Connections for 110-220 volt Power Transformer (Stock No. 30869)
Resistance of each primary winding, 6.3 ohms.
High voltage secondary winding, 260 ohms total.

RCA MFG. CO., INC.

Circuit Arrangement

The radio receiver circuit consists of an r-f amplifier stage, first-detector (converter) stage, separate heterodyne-oscillator stage, oscillator control stage, two i-f amplifier stages, diode-detector—automatic volume and frequency control stage, audio voltage-amplifier stage, tuning indicator "Magic Eye," audio driver stage, push-pull triode power-amplifier stage, and a full-wave rectifier. The phonograph circuit consists of a volume expander stage, expander amplifier stage, expander rectifier, audio driver stage, push-pull power amplifier stage, and full-wave rectifier.

The antenna and detector coils are constructed with a special type of winding ("qumulative") to provide increased sensitivity and selectivity on the "A" band. The "A," "B," and "C" sections on both coils are wound on single forms and are series connected. The range selector operates in such a manner that the correct portions are selected for the primary and secondary windings on each band. The "A," "B," and "C" oscillator sections are likewise wound on a single form but are connected so they operate separately. Undesirable interaction of unused windings with the tuned circuits is prevented by shorting out the proper sections with the range selector.

The intermediate-frequency amplifier consists of two RCA-6K7 tubes in a two-stage transformer-coupled circuit. The windings of all i-f transformers are resonated by fixed capacitors and are adjusted by molded magnetite cores to tune to 460 kc. A third winding, L17, in the first i-f transformer, closely coupled to the primary, L15, is placed in series with the main secondary L16 when the fidelity control switch S5 is thrown to "broad" position (see figure 1), thereby increasing the coupling between the primary and secondary circuits with a consequent broadening of the band width of the i-f amplifier, permitting higher fidelity reception.

The function of the automatic-frequency-control circuit is to automatically change the frequency of the heterodyne oscillator so that the correct i-f frequency is formed for the i-f amplifier. The circuit consists essentially of an i-f discriminator which, as the name implies, discriminates or furnishes control voltage of the correct polarity to an oscillator frequency-control tube for generated i-f carrier frequencies slightly above and below 460 kc, or the frequency to which the i-f amplifier is tuned.

The plate circuit of the RCA-6J7 oscillator control tube is caused to act as an apparent variable inductance in parallel with the "A" band oscillator tuned circuit of which coil L14 is a part. The series combination of resistor R41 and the oscillator control-tube grid to cathode capacitance is also in parallel with the oscillator tuned circuit. Since the resistance of R41 is many times greater than the reactance of the grid-cathode capacitance, at the oscillator frequency, the r-f current through the combination will be practically in phase with the r-f voltage across the oscillator tuned circuit. However, the r-f voltage impressed across the grid-cathode capacitance section of the combination will lag the r-f voltage across the combination, or the tuned circuit, approximately 90 degrees. The grid-cathode r-f voltage will be amplified by the control tube but will be shifted an additional 180 degrees (grid and plate voltages of all tubes are always opposite in phase) so that the amplified r-f voltage appearing across the plate circuit will now lead the voltage across the combination or the tuned circuit by 90 degrees, or, in other words, the control tube is acting as an equivalent shunt inductance. The amount of this action is determined by the amplification of the tube, which in turn is governed by the grid-cathode bias voltage. In operation a residual bias is developed across the cathode resistor R43. The d-c control grid voltage is fed to the control grid from the discriminator circuit through resistor R44. If this voltage is negative with respect to ground, the amplification of the control tube will be decreased, the apparent plate circuit inductance of the tube increased, which will lower the frequency of the oscillator tube. The converse will occur when the grid voltage is positive with respect to ground.

The action of the discriminator circuit depends upon the fact that a 90-degree phase difference exists between the primary and secondary potentials of a double-tuned loosely-coupled transformer when the resonant frequency is applied and that this phase difference varies as the applied frequency varies; i.e., the maximum resultant response voltage across the primary and secondary windings connected in series will occur at a frequency either lower or higher in frequency than the frequency to which the individual windings are resonated, respectively depending on whether the windings are connected series aiding or opposing.

The discriminator, or fourth i-f transformer, consists of the primary winding, L24, which is a part of the third i-f transformer secondary tuned circuit (tuned to 460 kc) and the center-tapped secondary, L22. The upper and lower halves of L22 may be considered as two secondary coils, the upper series opposing and the lower series aiding the primary, L24. The magnetite core in L22 is inserted to inductively balance the two halves. The function of coil L23 (magnetite core adjusted), in parallel with L22, is to tune the secondary to 460 kc. Therefore, the maximum voltage will be applied to diode circuit P_2K_2, R46, and R45 when the i-f signal frequency is above 460 kc and to the diode circuit P_1K_1 and R20 when the i-f signal frequency is below 460 kc. Resistor sections R46-R45 and R20 are connected in series between ground and a point leading to the oscillator control tube grid.

D-c voltages, resulting from diode rectification, across section R46-R45 and section R20 are always in opposition, consequently the oscillator control-tube grid-bias voltage is a differential amount, depending upon the i-f signal strength and its frequency deviation from the nominal value of 460 kc. The polarity of this differential oscillator control-tube grid-bias, with respect to ground, depends on whether the i-f signal frequency is above or below 460 kc, but is always in the direction which will bring the generated i-f frequency nearer to 460 kc. A-f-c action is automatically eliminated for "manual" tuning by grounding diode cathode K_1 through switch S7. A-v-c voltage and audio signal components are developed across resistor section R46-R45. The audio component is taken from R46.

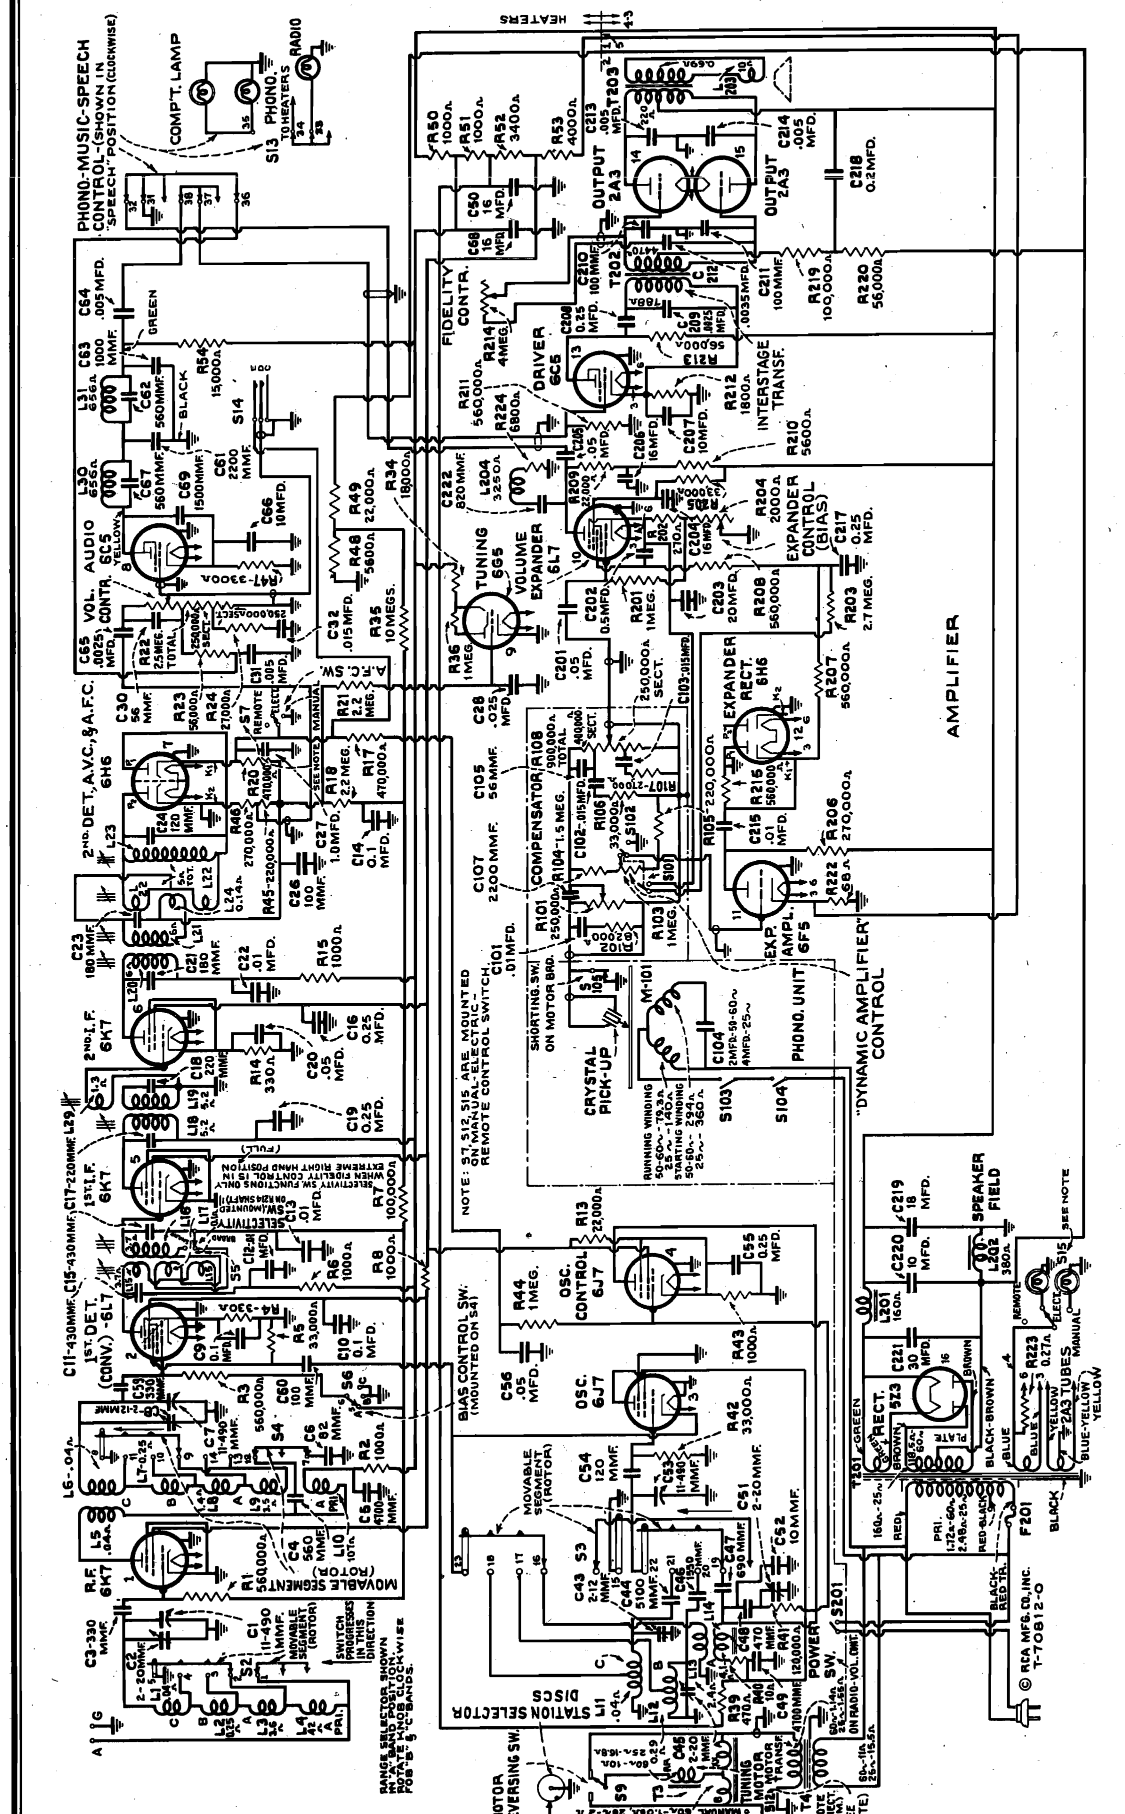
The dynamic volume expander is used with the phonograph so that greater volume-range reproduction may be realized from disc recordings. The gain is varied by means of the volume expander in direct proportion to the average intensity of the recorded sound. To accomplish this, the expander control R103 in series with R104 and R105 is placed in shunt with the phonograph volume control R108, and the arm of the expander control is connected to the control grid of the RCA-6F5 expander amplifier. The audio voltage applied to this tube is amplified and applied to diode plate P1 of the RCA-6H6 expander rectifier through capacitor C215. The rectified current develops a voltage across resistor R215 which is applied to the No. 3 grid of the RCA-6L7 volume expander and varies the amplification of this tube so that the gain will be increased for loud passages and decreased for soft passages. The volume expander circuit is arranged so that there is no appreciable change of gain, with an average record, between the minimum expansion (second dot) and "Off" positions of the "Dynamic Amplifier" control.

General Description

The Model U-109 Radio-Phonograph Combination employs the latest developments in the art of record and radio reproduction. Features of design effected in the radio receiver include "Electric Tuning" with push-button operation; automatic frequency control; "qumulative-wound" antenna and detector coils; tuned r-f amplifier; magnetite-core adjusted i-f transformers and low-frequency "A" oscillator tracking; two-stage i-f amplifier; automatic volume control; "Magic Eye" tuning tube; plunger-type, air-dielectric trimming capacitors, two-point aural-compensated volume control; "Fidelity" control; "Music-Speech" control; and push-pull triode power output stage. Features of design pertinent to phonograph operation include a crystal pickup with top-loading needle socket; improved dynamic expander; automatic operation with either 10-inch or 12-inch records; and a separate two-point aural compensated volume control. A super-sensitive 12-inch electrodynamic loudspeaker with a high-frequency tone diffuser is used. In addition, this model has a cabinet incorporating the "Magic Voice".

MODEL U109
Schematic

RCA MFG. CO., INC.



FREQUENCY RANGES
"Broadcast" (A) .... 530-1,720 kc
"Medium Wave" (B) .... 2,100-6,800 kc
"Short Wave" (C) .... 6,800-23,500 kc

R-F ALIGNMENT FREQUENCIES
"Short Wave" (C) .... 20,000 kc (osc., det., ant.)
"Medium Wave" (B) .... 6,000 kc (osc.)
"Broadcast" (A) .... 600 kc (osc.), 1,500 kc (osc.)

Intermediate Frequency .... 460 kc

Power Amplifier

Figure 4—Radiotron Socket Voltages, Coil, and Trimmer Locations

Measured at 115 volts, 60-cycle supply—Tuned to approximately 1,000 kc ("Broadcast")—"Manual" control—No signal being received—Both volume controls minimum—"Dynamic Amplifier" control "off"—Speech-Music—Phono. and Fidelity controls optional.

***Note:** Two voltage values are shown for some readings. The value shown in parentheses with asterisk (*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter.*

Voltage values as specified should hold within ±20% when the receiver is normally operative at its rated line voltage. To duplicate the conditions under which the voltages were measured requires a 1,000-ohm-per-volt d-c meter, having ranges of 10, 50, 250 and 500 volts. Use the nearest range above the specified measured voltage. A-c voltages were measured with a corresponding a-c meter.

Lead Dress
Amplifier Adjustment

RCA MFG. CO., INC.

Service Data

The various diagrams of this booklet contain such information as will be needed to isolate causes for defective operation if such develops. The ratings of the resistors, capacitors, coils, etc., are indicated adjacent to the symbols signifying these parts on the diagrams. Identification titles such as R1, L1, C1, etc., provide reference between the illustrations and Replacement Parts List. The coils, transformer windings, and reactors are rated in terms of d-c resistance to permit continuity checks.

Precautionary Lead Dress.—(1) Bus lead from oscillator coil directly to ground must be as short as possible for correct alignment, (2) bus lead from range switch S3 to oscillator section C53 of variable condenser should be 1½ inches long for correct alignment, (3) bus lead from detector coil to range switch S4 must be as short as possible for correct alignment, (4) bus lead from detector coil to detector section C7 of variable condenser should be 2½ inches long for correct alignment, (5) detector trimming capacitor C8 lead should connect directly to variable condenser C7, (6) bus lead from antenna section of range switch S2 to chassis ground lance must be as short as possible, (7) bus lead from antenna coil to range switch S2 should be 2¼ inches for correct alignment, (8) bus lead from antenna coil to antenna section C1 of variable condenser must be 3⅞ inches over-all with ½ inch bend at coil end for correct alignment, (9) resistors R13, R41, R43, and R44 in the oscillator control tube circuit must be kept free of other component parts for satisfactory operation of the a-f-c circuit, (10) filament leads should all be twisted to reduce hum pickup, (11) filament leads should be dressed away from the terminal board near the 4th i-f transformer, (12) lead from the range switch S3 to the oscillator cathode socket terminal should be dressed under bus wire on socket to hold this lead down close to chassis.

Loudspeaker.—Two types of loudspeakers are used which will be referred to as types 1 and 2. In type 1 the cone centering diaphragm is cemented to a fixed ring, while in type 2 the centering diaphragm is cemented to an adjustable ring. Replacement of cone in either type is identical. Centering of cone for type 1 loudspeaker is made with three narrow celluloid or paper feelers after first removing the front dust cover and cutting free the cone centering diaphragm. The dust cover may be removed by a light application of acetone, using care not to allow the acetone to flow into the air gap. The centering diaphragm should be cemented in place after placement of feelers. Sufficient time should be allowed for the ambroid to set before removing feelers. Use ambroid to replace dust cover. Centering of cone for type 2 loudspeaker differs only in that it is not necessary to cut free the centering diaphragm, adjustment being made in the usual manner by means of screws on the adjustable cone centering ring.

Dynamic Amplifier Adjustment

It is essential that correct voltages and currents exist at the RCA-6L7 volume expander stage in order that the expanding function may take place in the proper manner. A screw-driver adjustment is accordingly provided to regulate the RCA-6L7 control grid No. 3 bias to the correct operating value. Two methods of adjustment are applicable. Either method requires a normal voltage of 310 volts across the filter output (electrolytic capacitor C220 to chassis). The one to be preferred (a) requires the use of an **RCA Stock No. 9633 Beat-Frequency Oscillator** or the equivalent, a 22-ohm resistor, two 120-ohm resistors, and a 1,000-ohm-per-volt a-c voltmeter (rectifier type) having ranges of 1, 5, and 10 volts. The less accurate method (b) requires the use of an **RCA Stock No. 12353 Split-Plate Adapter,** and a suitable d-c milliammeter. Both of these procedures are outlined below. It is necessary to turn the "Phono-Music-Speech" control to "Phono" position (clockwise) during this adjustment.

CAUTION: Before using either method, be sure that power-supply fuse is in proper position for the line voltage.

(a) Preferred Method.—Turn power switch off. Connect one 22-ohm and two 120-ohm resistors in series between the beat-frequency oscillator terminals (upper "250" and "CT") with the 22-ohm resistor connected to "CT." Calibrate the beat-frequency oscillator, adjust it to 1,000 cycles, and reduce its output. Connect the 1,000-ohm-per-volt a-c voltmeter (1-volt range) to the beat-frequency oscillator terminals (upper "250" and "CT"). Remove male plugs on "Phono Input Cable" and "Exp.-Off Switch Cable" from the apron of the dynamic amplifier (see figure 10). Connect a lead through a 0.1 mfd. capacitor from the grid cap of the RCA-6L7 (tube No. 10, grid-cap lead in place) to the junction of the 22-ohm and 120-ohm resistors. Connect beat-frequency oscillator terminal "CT" to the dynamic amplifier chassis.

Adjust beat-frequency oscillator output until the voltmeter reads exactly 1.0 volt. Remove the voltmeter leads from beat-frequency oscillator terminals without disturbing oscillator adjustments. Set the voltmeter to its 5-volt range and connect it across the loudspeaker voice coil.

Set the "Dynamic Amplifier" control to extreme counter-clockwise position and "Fidelity" control to extreme clockwise position. Turn on power switch and allow a few minutes for the instrument to become stabilized. Adjust the expander-bias control R204 (screw-driver adjustment top-center amplifier chassis, see figure 7) until the voltmeter reads 2.4 volts.

To check the operation of the volume expander, first change the voltmeter to its 10-volt range (leaving meter attached to voice coil) and then connect a lead from the junction of the two 120-ohm resistors to the grid cap of the RCA-6F5 expander amplifier (grid-cap lead removed). The voltmeter should now read from 6 to 9 volts if the expander is operating properly.

After replacing the "Exp.-Off Switch Cable"—plug in amplifier, turning "Dynamic Amplifier" control to "Off" position, removing lead from junction of the two 120-ohm resistors, and replacing the grid-cap lead on the RCA-6F5 tube, the voltmeter should read approximately 4 volts.

(b) Alternate Method.—Turn power switch off. Place **RCA Stock No. 12353 Split-Plate Adapter** under the RCA-6L7 volume expander. Connect a suitable d-c milliammeter to the adapter. Turn both the "Phonograph Volume" and "Dynamic Amplifier" controls to their extreme counter-clockwise positions and remove "Exp.-Off Switch Cable"—plug from apron of the dynamic amplifier (see figure 10). Turn on power switch and allow a few minutes for the instrument to become stabilized. Adjust "Expander Bias" control R204 to give one milliampere of plate current with no signal input to the dynamic amplifier.

RCA MFG. CO., INC.

ELECTRIC TUNING

Principle of Operation

The electric tuning mechanism consists essentially of a quick engaging and dis-engaging reversible electric motor, tuning condenser driving gear train, and eight mechanically interlocked (pushing one button releases all others) station selector push buttons respectively wired to eight adjustable station selector contactor discs (each with a motor stopping insulated segment) mounted on a drum which is direct-coupled to the gang tuning condenser shaft. The arrangement permits any one of eight pre-determined stations to be electrically tuned in by merely touching the correct push button.

The operation may be more readily understood by reference to figures 1, 5, and 8. When the motor is not energized, the armature is pushed to the rear or slightly out of the magnetic center by tension of contact spring "C" and the motor shaft is dis-engaged from the driving gear train. Pressing in any one of the eight push buttons will complete the motor circuit through a station selector contactor disc, assuming that the "Manual-Electric-Remote" switch is in "Electric" position and that the insulated segment in the contactor disc is not opposite its contactor. As the motor starts, the armature will be drawn forward, due to solenoid action, and the pin "F" on the end of its shaft will engage the arm "G" on the small main pinion gear, thereby driving the tuning mechanism. At the same time contact springs "E" and "D" will be grounded, causing suppression of audio amplification and automatic frequency control during the tuning cycle. The motor will continue to operate until the insulated segment in the selector disc breaks the motor circuit, whereupon spring "C" will instantly dis-engage the motor pin "F" from the arm "G" on the small pinion driving gear and open contacts "E" and "D." Pushing another button will cause the above mentioned cycle to be repeated except that the motor will be interrupted by the insulated segment on a corresponding disc. The discs are individually adjustable on a drum mechanism, providing a choice of eight "Electric Tuned" "Broadcast" stations. The arrangement of the motor is such that its rotation will continue in the same direction regardless of the number of "Electric" tuning cycles until the tuning condenser approaches either full-out or full-in of mesh, whereupon lever "H" trips switch S9 which reverses the direction of rotation. A throw-out idler gear is link-coupled to the "Manual-Electric-Remote" control to disconnect the motor drive gear train when the control is thrown to "Manual" position.

Mechanism Adjustments

The electric tuning mechanism is designed to be as simple in construction and as fool proof in operation as is possible. In order to maintain the accurate results possible with this device care must be taken in effecting any repairs or adjustments. Reference should be made to figure 8 and the following:

A-F-C and A-F Amplification Suppression Switches.—This switch assembly is located on the motor bracket and closes due to solenoid action of motor armature. Before attempting switch adjustment, loosen "Tilt Compensating Spring" adjusting screws (rear of tuning-motor bracket) and move spring to extreme travel away from motor armature shaft. The tension of the long contact spring "C" is important in bringing about quick dis-engagement of the motor and in permitting the motor to pull into mesh with the drive mechanism. Normal adjustment is attained when the short springs "D" and "E" are aligned exactly straight with contact points separated approximately 1/32 of an inch and with the spring "C" spaced approximately 7/32 of an inch from spring "D" at the point of contact. If necessary, in order to obtain positive pull-in

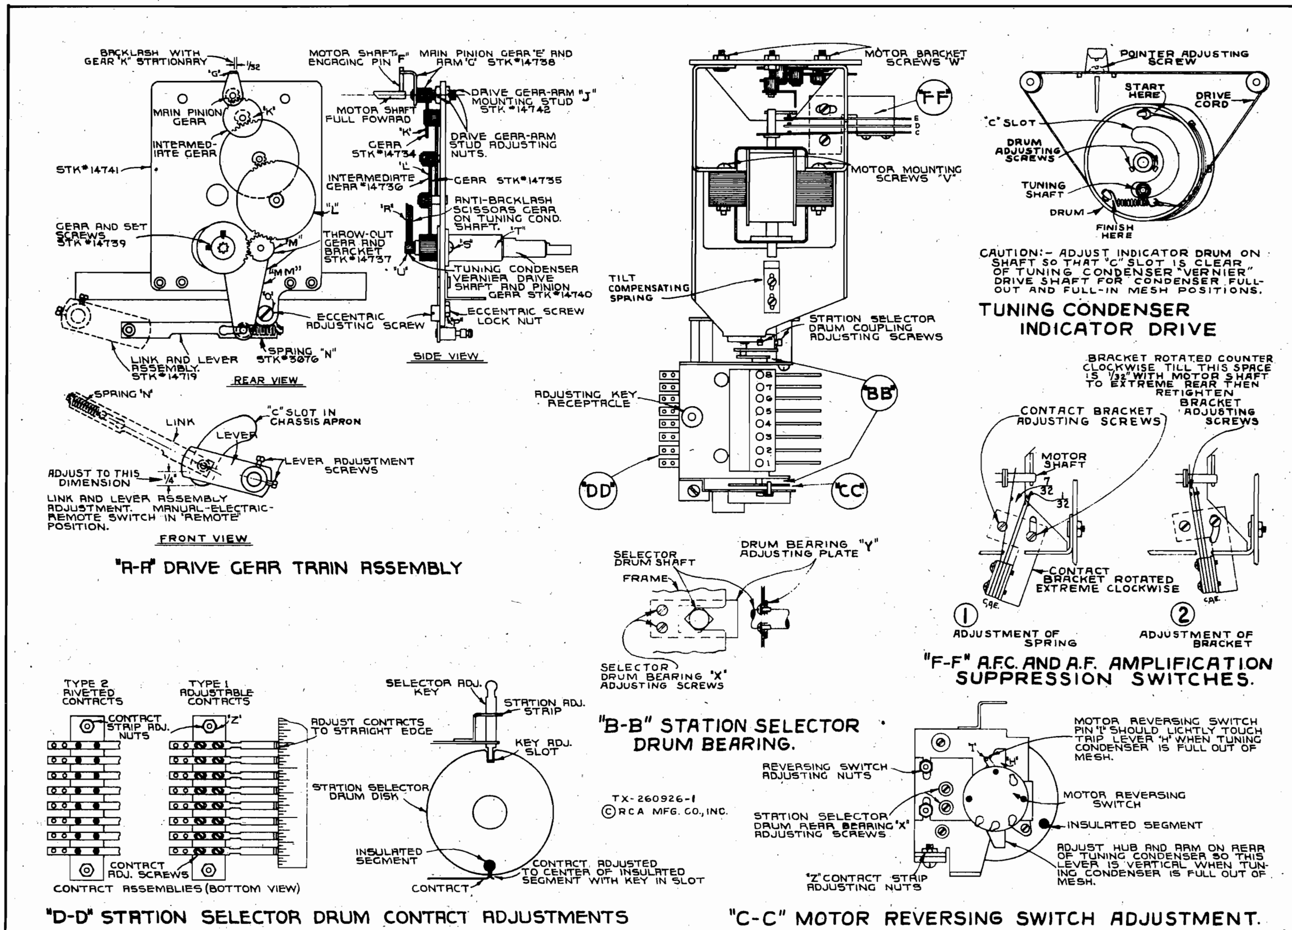

Figure 8—"Electric Tuning" Mechanism Adjustments

and quick dis-engagement of the motor, the tension of spring "C" should be increased or decreased by bending. This action should be checked with the front apron of the chassis raised two inches higher than the rear. Contacts of the switch must be kept clean. Crocus cloth or a relay burnisher may be used for this purpose.

Tilt Compensating Spring.—The function of this spring is to compensate for the force of gravity, acting to the rear, on the tuning motor armature when the chassis is tilted as mounted in cabinet. The "Tilt Compensating Spring" is located on the rear of the tuning-motor bracket. After completion of adjustment "A-F-C and A-F Amplification Suppression Switches," raise the front apron of chassis six inches higher than the rear, and then adjust spring by means of its elongated mounting holes until the pin "F" on the motor shaft will pull in and remain in mesh with the arm "G" on the pinion when a push button is pressed. This adjustment should be made with the lowest power-supply voltage that will be encountered at the installation.

Motor Reversing Switch.—It is necessary to automatically stop and reverse the drive motor before the tuning condenser reaches the ends of its travel. Approximately 175 degrees of sweep is required, and the reversal must take place above 1,700 kc and below 540 kc but not too near the limits of the scale. The coupling between the station selector drum and the tuning condenser shaft should be attached so that the reversing switch trip lever "H" is exactly vertical when the condenser is full-out of mesh. There should be 1/32 of an inch clearance between the end of the condenser shaft and the selector drum shaft. While the trip lever is in this position the reversing switch bracket should be adjusted by means of its elongated mounting holes until the switch pin "I" just lightly touches trip lever "H."

Main Pinion Gear.—Clearance between the small high-speed pinion gear "E" and the intermediate gear "K" determines the amount of mechanical noise produced. Correct adjustment will give approximately 1/32 of an inch movement of back lash at the end of pinion arm "G" when gear "K" is held stationary. Arm "G" must also be adjusted for correct mesh with motor shaft drive pin "F." With the motor shaft completely forward and pinion "E" tight against its front bearing, the pinion mounting stud "J" should be adjusted so that pin "F" meshes its full thickness with the rotating arm "G." An increase of this mesh will increase over travel on tuning while a decrease of mesh will decrease the over travel. The elongated hole in the front bracket allows sufficient movement of the mounting stud "J" to permit above mentioned gear mesh adjustment.

"Manual-Electric-Remote" Changeover. — (1) Link and lever adjustment—To properly line up the mechanical link between the switch shaft and throw-out gear bracket "MM," the set screws holding the link lever on the switch shaft must be loosened, the switch turned to the "Remote" position (extreme left) and the link lever revolved until the distance between the bottom of its link-connecting pin (extends through chassis apron) and the bottom of the "C" slot, in front apron of chassis, is exactly 1/4 of an inch. If this adjustment is not properly made, correct operation of "Electric" or "Remote" tuning will not result. (2) Throw-out Gear Adjustment—To obtain smooth operation on "Electric" or "Remote" positions it is important that the proper clearance is maintained between the throw-out gear "M" and the intermediate gear "L." With the "Manual-Electric-Remote" control thrown to "Remote" position (extreme left) adjust the mesh between these gears by means of the eccentric screw "O" and lock nut "P" on the throw-out gear bracket "MM" until there is approximately 1/64 of an inch backlash of gear "L" when gear "M" is held stationary.

Vernier Tuning.—In case it becomes necessary to remove tuning condenser drive shaft "T," it should be replaced by sliding anti-backlash gear "R" on condenser shaft apart so that compression amounting to one tooth on the gear is obtained in the springs. Adjust mesh of gear "R" with pinion gear "U" on vernier shaft before tightening screws "S" so that smooth tuning is obtained throughout the range.

Motor Alignment.—The motor shaft must be exactly aligned with the axis of the pinion gear with which it engages. This may be adjusted by loosening the mounting screws "V" of the motor and aligning shaft by sight. Correct alignment may be tested by slowly rotating motor and observing the relation between the pin "F" of the motor shaft and the arm "G" on the pinion. The relation of the two should remain the same throughout the revolution. Additional movement for adjustment may be obtained by the motor bracket screws "W" if necessary.

Station Selector Drum.—(1) Bearing Adjustment—The selector drum may be removed by unscrewing the two bearing adjusting screws "X" on the front and rear bearings and sliding shaft out of slots on frame. To replace drum, the reverse procedure should be followed holding bearing adjusting plates "Y" firmly against the shaft and tightening adjusting screws. (2) Contact adjustment—Two types of contact strips are used. They are designated on figure 8, as types 1 and 2, on which the individual contacts are respectively adjustable and fixed. On type 1, the individual contacts should be adjusted by setting the end contact springs near the mid-position of their travel and aligning the remaining springs to them by means of a straight edge. Either type of contact strip should be adjusted to the selector drum by placing two selector adjusting keys in the station adjustment strip, positions 1 and 8, loosening contact strip adjusting nuts "Z" and shifting the contact strip until the end contacts are exactly centered on the respective disc insulating segments. More accurate adjustment may be made by silhouetting the point of contact with a piece of white paper held behind the contact. Adjustment will be facilitated by removing complete assembly from rear of tuning condenser by unscrewing the three mounting screws. Contacts and discs must be kept free of dirt, filings, and other extraneous matter.

Lubrication. — The dial pointer slide should be greased with petrolatum. This same lubrication should be applied lightly to all gear faces of the drive mechanism and sparingly with a cloth to the station selector discs. Any good household oil, such as "3-IN-ONE," is suitable for the motor shaft bearings. A light grade of engine oil should be used for all gear bearings. Medium viscosity engine oil, similar to "PYROIL" (B), should be applied between the thrust washers on the motor shaft. "CASTORDAG," a mixture of graphite and castor oil, is recommended for use at the selector drum end-bearing slots and at the bearings of cable pulleys.

Station Adjustment

Any eight stations may be chosen for "Electric" tuning. Remove the two escutcheon plates from the side of the dial, place proper call letter labels in the celluloid windows, and replace escutcheons. Turn the power on and proceed to set up the "Electric" tuning as follows:

1. Set Range Selector to "Broadcast."
2. Turn "Manual-Electric-Remote" control to "Electric."
3. Turn Fidelity control counter-clockwise.
4. Press push button No. 1 and wait until station pointer comes to rest.
5. Turn the "Manual - Electric - Remote" control to "Manual."
6. Remove adjusting key from receptacle on top of station selector drum mechanism.
7. Insert key in position marked, "1" in station adjustment strip and push the key all the way down to properly fit in slot in disc.
8. Tune the receiver very carefully by means of the manual tuning knob and the "Magic Eye," to station chosen for No. 1.
9. Remove key.
10. Turn the "Manual-Electric-Remote" control to "Electric."

Button No. 1 is now properly set for "Electric" tuning. Proceed similarly for the other seven push buttons, matching each station on the dial with the same number on the station adjustment strip. Repeat the above steps but place the key respectively in positions 2, 3, 4, etc., and in each case tune to the proper station. Now when you press a button the desired station will be tuned in electrically.

Note.—In the event that all the push-button switches are locked "in" at once, they may be released by pressing either the upper left-hand or the lower right-hand push buttons (Nos. 1 or 8) in farther than would ordinarily be required.

Armchair Control

When a Model G-8 armchair control is attached to the receiver as shown in figure 5 it duplicates the action of the push buttons on the front panel when the "Manual-Electric-Remote" control is turned to "Remote" position.

RCA MFG. CO., INC.

Calibrate the tuning dial by adjusting dial pointer to the left ends of horizontal calibration lines with the gang tuning-condenser plates in full-mesh position. This is a screw-driver adjustment.

The "Manual-Electric-Remote" switch should be turned to "Manual" (clockwise) during alignment unless otherwise specified.

CAUTION.—The magnetite core screw L22 on the bottom of the 4th i-f transformer has been accurately adjusted, for an exact electrical balance of coil L22 to center tap, during manufacture and **should not be disturbed.** However, if for any reason the adjustment has been moved from its original position, it will be necessary to mechanically adjust this screw until the end of the stud protrudes exactly 1/8 of an inch (four threads exposed) above the brass bushing prior to any alignment operations.

Perform alignment in proper order, tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. A-f-c discriminator adjustments should follow r-f and i-f adjustments tabulated below. Adjustment locations are shown on figures 4 and 6.

Cathode-ray alignment is preferable; the connections to the chassis are shown on figure 2. If an output indicator is used, connect it across the loudspeaker voice-coil and advance the receiver volume control to full-volume position.

Connect the "low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate the output of the test oscillator so that minimum signal is applied to the receiver to obtain an observable output indication. This will avoid a-v-c action.

The term "Dummy antenna" means the device which must be connected between the "high" test-oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator.

For further details on alignment, refer to booklet "RCA Victor Receiver Alignment."

A-F-C Discriminator Adjustments.—These adjustments are rather critical and should be performed with extreme care. Improper adjustment may result in complete failure of the oscillator control tube to function or else may cause it to detune the oscillator instead of tuning it to the signal. It is assumed that the magnetite core adjusting screw L23 (top of 4th i-f transformer) has been turned all the way out (extreme counter-clockwise) during the preceding tabulated adjustments. Adjustments are as follows: Remove spring "N" on link and arm assembly which connects the "Manual-Electric-Remote" switch shaft to the throw-out gear bracket. Turn "Fidelity" control counter-clockwise. Connect antenna to receiver antenna "A" terminal. With the "Manual-Electric-Remote" switch in "Manual" (clockwise) position, tune in a strong local station near 600 kc or the low-frequency end of the "A" band as accurately as possible by means of the tuning tube "Magic Eye." The most accurate adjustment will be obtained by adjusting the "vernier" tuning knob mid-way between the two points where the eye just appears to start to open. This will place the generated i-f carrier signal frequency exactly in the center of the i-f amplifier response curve (should be 460 kc if i-f amplifier was properly aligned) and is the frequency to which the a-f-c discriminator (4th i-f transformer) should be tuned to resonance. Without disturbing any of the receiver adjustments, place the "high" test-oscillator lead about 3/4 of an inch from the grid cap lead of the RCA-6K7, 1st i-f amplifier tube, adjust the test-oscillator output to maximum, turn test-oscillator "Modulation" off, and carefully zero-beat the test-oscillator frequency (approximately 460 kc) with the i-f carrier signal. Avoid placing the test-oscillator lead nearer to the grid cap lead than specified above, as doing so will tend to detune the i-f amplifier. It may be necessary to reduce the local station signal, during this operation, by shortening antenna lead or grounding antenna "A" terminal to chassis in order to increase the loudness of the beat note sufficiently for accurate zero-beat adjustment.

Throw "Manual-Electric-Remote" switch to "Electric" (center) position. A high whistle or beat note will now be heard. Turn the magnetite core screw L23 (top of 4th i-f transformer) slowly clockwise. As this screw is turned, the beat note will first increase to a high audio frequency and will then decrease to a **zero-beat** and then increase in frequency again. The point of exact **zero-beat** is the position for correct adjustment of the discriminator. Zero-beat should also still exist when the "Manual-Electric-Remote" switch is thrown back to "Manual" position. The adjustment is now complete and may be checked by slightly detuning the receiver above and below the local station frequency with the "Manual-Electric-Remote" in "Manual" position, switching to "Electric" position, and noting the oscillator pull-in. Replace spring "N."

Order of Alignment	Test Oscillator			Range-Selector	Receiver Dial Setting	Circuit to Adjust	Adjustment Symbols	Adjust to Obtain
	Connection to Receiver	Dummy Antenna	Frequency Setting					
1	—	—	—	—	—	4th I-F Trans.	L23	Turn Extreme Counter-clockwise
2	6K7 I-F Grid Cap	.001 Mfd.	460 kc	"A" Left	No Signal 550-750 kc	3rd I-F Trans.	L20 and L21	Max. (peak)
3	6K7 I-F Grid Cap	.001 Mfd.	460 kc	"A"	No Signal 550-750 kc	2nd I-F Trans.	L18 and L19	Max. (peak)
4	6L7 Det. Grid Cap	.001 Mfd.	460 kc	"A"	No Signal 550-750 kc	1st I-F Trans.	L15 and L16	Max. (peak)
5	Ant.	300 Ohms	20,000 kc	"C" Right	20,000 kc	"C" Osc.	C43	Max. (peak)*

MODEL U109
Automatic Record Changer
Views

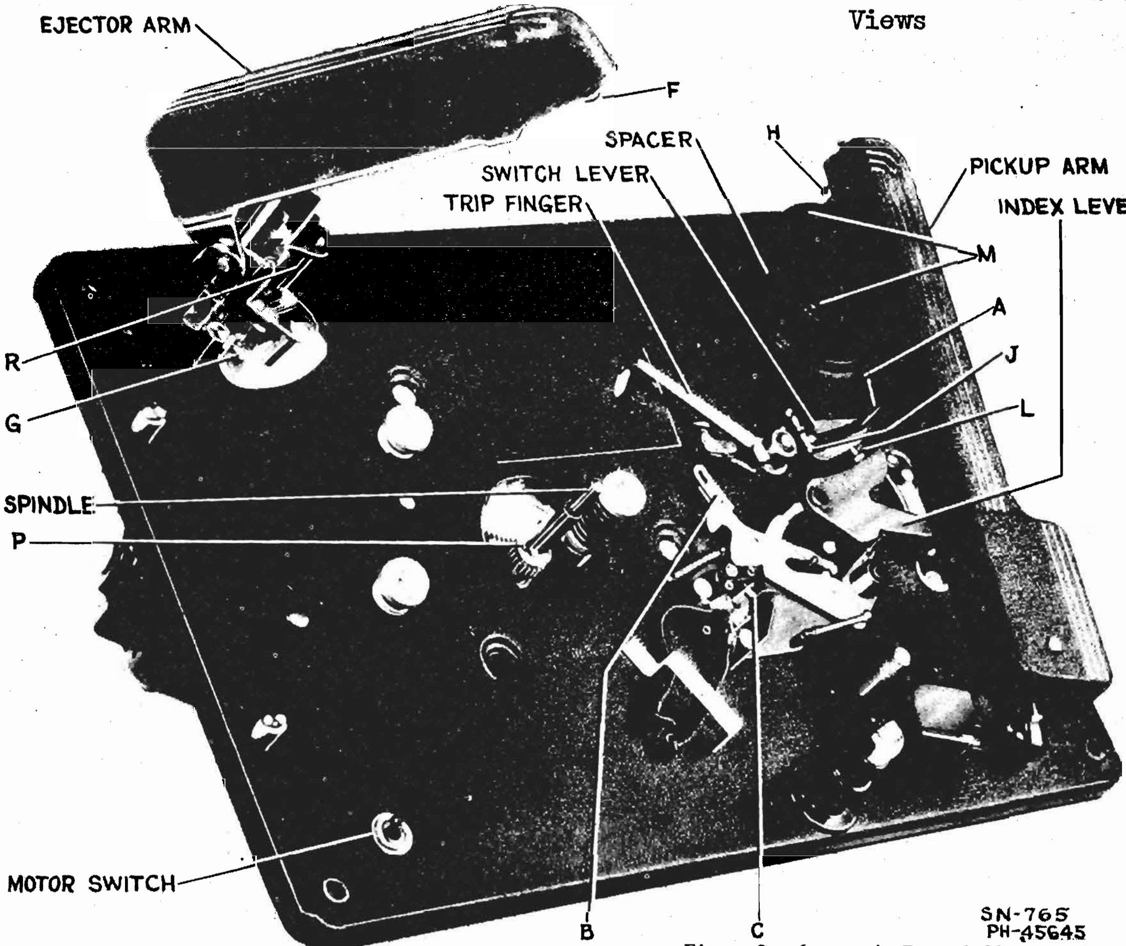

Figure 9—Automatic Record Changer Adjustments
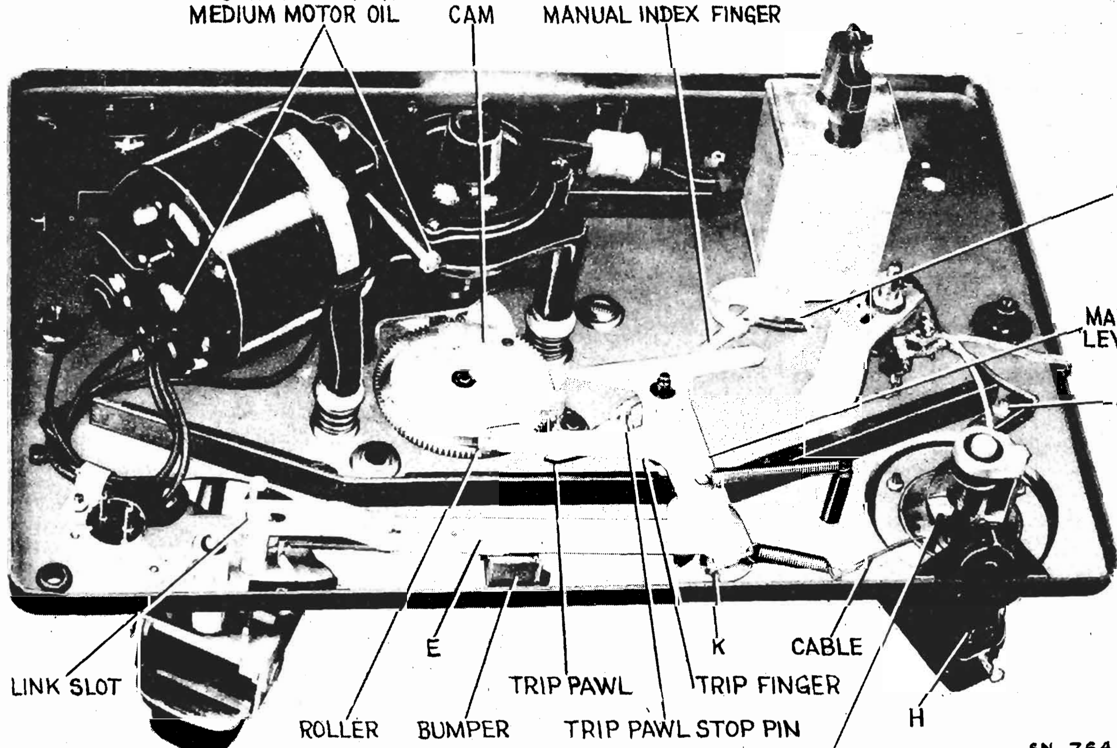
(Top and bottom views)



The record changing mechanism is designed to be simple and fool-proof. Under normal operating conditions, service difficulties should be negligible. Occasionally, however, certain adjustments may be required. It is important to refrain from forcing the mechanism if there is a tendency to bind or jam, since bent levers and possibly broken parts may result.

Record Changer Adjustments

Mount motor-board on a level support. Remove turntable and cover at right of turntable. Adjustment locations are designated on figure 9 as A, B, etc. The adjustments are explained under corresponding symbols below Perform adjustments in the following order:

A.—Trip rod "A" should be engaged in "Switch Lever" slot. Adjust trip rod "A" to obtain about 1/8 of an inch clearance from motor-board.

B.—Adjust "B" to the position shown.

C.—With "Index Lever" in "Manual" position, "Pickup Arm" rotated to extreme left, and switch tripped to open contacts "C," adjust contact points "C." by bending the stiff contact arm until points are opened 10 to 30 thousandths of an inch.

D.—With "Index Lever" in "Manual" position, release set screw "D" and force "Manual Index Finger" as far as it will go towards "Trip Pawl Stop Pin." Tighten set screw.

E.—Adjust at "E" to provide approximately 1/32 of an inch between outer end of "Link Slot" and screw when rubber "Bumper" is in contact with stop bracket.

F. and G.—Remove rubber silencer at "F" and adjust "F" and "G" so ejector tip "F" is in line with "Spindle." Longitudinal movement, with respect to "Ejector Arm," may be effected by loosening hex. head at "F." Lateral movement of "Ejector Arm" may be effected by adjustment "G."

H.—Adjust "H" so under side of pickup head can be raised 2½ inches above motor-board.

J.—Adjust screw "J" until friction will just force "Trip Finger" to move "Trip Pawl" when "Index Lever" is in "12" inch position.

N.—Adjust needle pressure by turning screw under center of "Pickup Arm" so that a force of 72 grams (2.5 ounces) is required to lift needle from record. Hook scale under needle screw to measure force.

K.—Adjustment "N" must be performed prior to this adjustment. With a 12-inch record on turntable, turn on "Motor Switch," place "Index Lever" to "12" position and adjust "K" so that "Cable" tension will allow needle to lower slowly on start of record at completion of eject cycle. Turn "Motor Switch" off after eject cycle is completed and check to see that "Cable" is slightly loose when "Pickup Arm" is moved against "Spindle." Replace turntable and put a needle in "Pickup."

L.—Adjust "L" so needle will drop into center of smooth portion at the start of a 12-inch record when "Index Lever" is in "12" inch position and "Pickup Arm" is to extreme right.

M.—Loosen three screws "M" and rotate "Spacer" until pointer on "Spacer" is in line with screw to right of "Pickup Arm."

P.—Adjust turntable height by insertion or removal of thrust washers at "P" so ejector tip "F" will not eject bottom 12-inch record but will eject second from bottom record.

Q.—Adjust position of shorting switch at "Q" so switch closes when needle is just outside a 12-inch record.

R.—Adjust screw "R" upward just enough so that with one record on turntable and ejector tip "F" resting on record surface, there is 1/32 of an inch clearance between screw "R" and "Ejector Arm."

Record Changer Service Hints

1.—"Ejector Arm" goes through normal cycle but does not eject records. Adjust "F" and "G." See that "Spindle" slides freely.

2.—Ejects bottom record. Lower turntable by removing thrust washers at "P."

3.—Ejects records properly down to second from bottom of pile. Raise turntable by placing thrust washers at "P."

4.—Eject cycle does not start after needle reaches eccentric groove. Adjust "J" (turn screw clockwise).

5.—Eject cycle starts before eccentric record groove is reached. Adjust "J" (turn screw counter-clockwise). Set "Index Lever" to "12" inch or "10" inch position **after** starting to play record. Do not jar motor-board during automatic operation.

6.—Lateral movement of "Pickup Arm" has no control over starting and stopping. Adjust clearance of rod "A." See that rod "A" engages in slot of "Switch Lever."

7.—Fails to eject top record of a pile because "Ejector Arm" strikes record in returning to center at end of eject cycle. Adjust screw "R" upward to provide greater incline so that roller in "Ejector Arm" will roll back during cycle.

8.—Pickup strikes record during eject cycle. Adjust "K" and "H."

9.—Starts playing record several grooves in from beginning or needle misses record entirely. Adjust "L."

10.—Needle falls on smooth portion at start of record but does not move into playing groove. Adjust "M." Check to see that motor-board is level.

11.—Automatic stop does not operate after needle reaches eccentric groove. Adjust "B" and "C."

12.—Motor does not re-start when "Pickup" is returned to rest position. Adjust "C." See that switch mechanism parts move freely and springs are functioning.

13.—Starts eject cycle although set for "Manual" operation. Adjust "D."

14.—Noise in loudspeaker while changing needles. Clean "Shorting Contact" and adjust "Q."

15.—"Wow" in record reproduction.—Instrument should be warmed to about 65° F. Ejector tip should be centered and free to rotate (adjustments "F" and "G"). There should be no solid particles on gear teeth or in grease; no tendency to bind. Turntable plate should be in dynamic balance and "Spindle" should be straight. Proper lubrication is important.

Lubrication.—Clean motor gear-box thoroughly before regreasing. Apply less than a tablespoonful of a grease, such as "Cities Service No. 7035-A1" or "Koolmotor Universal Trojan No. 1," directly on gears taking care to get none in rotor bearings. Put medium motor oil (S.A.E. No. 30) in the oil holes. Cover main gear and cam of automatic mechanism with a light grease such as "Socony-Vacuum No. 2." Any good house-hold oil, such as "3-IN-ONE" is suitable for the ejector-tip "F" bearing.

Pickup

An adjustment is provided to compensate for reduced sensitivity of the crystal pickup with age. Adjustment requires the use of a 1,000-ohm-per-volt a-c voltmeter (rectifier type, 10-volt range) and a frequency record. With the voltmeter connected across the loudspeaker voice coil, "Phonograph Volume" and "Fidelity" controls turned extreme clockwise, "Dynamic Amplifier" control turned counterclockwise, and "Exp.-Off Switch Cable"-plug pulled out from apron of dynamic amplifier (see figure 10), adjust R101 (end of compensator unit) until an **RCA Victor Technical Purpose Record Cat. No. 84519-A** or **84505-B** gives a voltmeter reading of 5 volts on 400 cycles. Adjustment of R101 will be facilitated by removing the compensator unit from the phonograph control panel, after removing control knobs and shaft bushing nuts. R101 should also be adjusted if pickup is replaced.

MODEL U109·
Parts List

RCA MFG. CO., INC.

Insist on genuine factory tested parts, which are readily identified and may be purchased from authorized dealers.

STOCK No.	DESCRIPTION
	RECEIVER ASSEMBLIES
14701	Arm—Hub and arm for operating band indicator shutter—located on range switch shaft
14726	Arm—Hub and arm, complete with set screws—connects station selector drum to rear of tuning condenser shaft
14517	Board—Antenna and ground terminal board
5237	Bushing—Variable condenser rubber mounting bushing
13656	Button—Plug button for detector coil shield
14725	Cable—Tuning tube cable and socket
12607	Cap—Shield cap for first or second I.F. transformer
12581	Cap—Shield cap for third or fourth I.F. transformer
11350	Cap—Grid contact cap
12884	Capacitor—Adjustable trimmer (long) (C2, C45, C51)
12714	Capacitor—Adjustable trimmer (medium) (C8, C43)
13200	Capacitor—10 Mmfd. (C52)
12723	Capacitor—56 Mmfd. (C30)
12813	Capacitor—82 Mmfd. (C6)
12720	Capacitor—100 Mmfd. (C26, C60)
12404	Capacitor—120 Mmfd. (C24)
12724	Capacitor—120 Mmfd. (C54)
14712	Capacitor—180 Mmfd. (C21, C23)
14711	Capacitor—220 Mmfd. (C17, C18)
12952	Capacitor—330 Mmfd. (C3, C59)
14710	Capacitor—430 Mmfd. (C11, C15)
13052	Capacitor—470 Mmfd. (C48)
14724	Capacitor—560 Mmfd. (C4)
14723	Capacitor—690 Mmfd. (C47)
13762	Capacitor—1,500 Mmfd. (C69)
12729	Capacitor—1,550 Mmfd. (C46)
12897	Capacitor—4,700 Mmfd. (C5, C49)
14722	Capacitor—5,100 Mmfd. (C44)
13608	Capacitor—.0025 Mfd. (C65)
4838	Capacitor—.005 Mfd. (C64)
30103	Capacitor Pack—Comprising one .005 Mfd., one .015 Mfd. capacitors, one 27,000 ohm and one 56,000 ohm resistors (C31, C32, R23, R24)
13138	Capacitor—.01 Mfd. (C12, C13, C22)
4870	Capacitor—.025 Mfd. (C28)
4886	Capacitor—.05 Mfd. (C20, C56)
4839	Capacitor—0.1 Mfd. (C9, C10, C14)
12484	Capacitor—0.25 Mfd. (C16, C19, C55)
12741	Capacitor—0.5 Mfd. (C27, two in parallel)
12682	Capacitor—10 Mfd. (C66)
14773	Capacitor—16 Mfd. (C50, C68)
14372	Coil—Antenna coil and shield (L1, L2, L3, L4)
14414	Coil—Detector coil and shield (L5, L6, L7, L8, L9, L10)
14713	Coil—Oscillator coil and shield (L11, L12, L13, L14)
14727	Condenser—3-gang variable tuning condenser, complete with gear train (C1, C7, C53)
14733	Contact—Spring contact for engaging discs in station selector drum ("type 1" contact assembly)
30365	Contact—Comprising eight spring contacts assembled on insulating strip for engaging discs in station selector drum ("type 2" contact assembly)
14699	Cord—Indicator pointer drive cord
12006	Core—Adjustable core and stud for I.F. transformers
12800	Core—Adjustable core and stud assembly for oscillator coil
14717	Dial—Station selector dial scale
14740	Drive—Tuning condenser vernier drive shaft and pinion gear
14698	Drum—Drum for indicator drive cord—fastens on tuning condenser shaft
14731	Drum—Station selector drum rotor—comprising eight station-selector contactor discs assembled on shaft
13612	Filter Pack—Comprising two 0.43 Henry chokes, two 560 Mmfd., one 2,200 Mmfd. and one 1,000 Mmfd. capacitors (L30, L31, C61, C62, C63, C67)
14738	Gear—Drive pinion gear and arm
14739	Gear—Drive gear and set screws—located on tuning condenser knob shaft
14734	Gear—Intermediate gear assembly—comprising one .749" O.D.—34 tooth-gear and one .291" O.D.—12 tooth pinion assembled
14735	Gear—Intermediate gear assembly—comprising one 1.541" O.D.—72 tooth-gear and one .291" O.D.—12 tooth pinion assembled
14736	Gear—Intermediate gear assembly—comprising one 1.541" O.D.—72 tooth-gear and one hub assembled
14737	Gear—Throw-out gear and bracket
14716	Holder—Dial scale holder and reflector, complete with holding springs for band indicating shutter
14715	Indicator—Station selector indicator pointer and support
5226	Lamp—Dial or indicating lamp
14719	Link—Link and lever assembly
14730	Motor—Tuning drive motor for 25 cycle models only (M1)
14729	Motor—Tuning drive motor for 60 cycle models only (M1)
14028	Nut—Jamb nut for trimmers, Stock Nos. 12714 and 12884
12471	Plate—Mounting plate for cushion socket—less socket
14741	Plate—Tuning condenser front plate and studs assembled for mounting drive gears
14697	Pulley—Indicator pointer cable pulley
13988	Resistor—10 ohms, carbon type, ½ watt (R40)
11932	Resistor—330 ohms, carbon type, 1/10 watt (R4)
13250	Resistor—330 ohms, carbon type, ½ watt (R14)
5030	Resistor—470 ohms, carbon type, ½ watt (R39)
14837	Resistor—1,000 ohms, carbon type, 1/10 watt (R6, R15, R43)
14720	Resistor—1,000 ohms, carbon type, ½ watt (R2, R8)
13737	Resistor—3,300 ohms, carbon type, ½ watt (R47)
11647	Resistor—5,600 ohms, carbon type, ½ watt (R48)
5114	Resistor—15,000 ohms, carbon type, 1 watt (R54)
14078	Resistor—18,000 ohms, carbon type, 1 watt (R34)
14721	Resistor—22,000 ohms, carbon type, ½ watt (R13, R49)

STOCK No.	DESCRIPTION
11300	Resistor—33,000 ohms, carbon type, 1/10 watt (R42)
13735	Resistor—33,000 ohms, carbon type, ½ watt (R5)
5145	Resistor—100,000 ohms, carbon type, ½ watt (R7)
30552	Resistor—120,000 ohms, special, carbon type, ½ watt (R41)
5158	Resistor—220,000 ohms, carbon type, ½ watt (R45)
11323	Resistor—270,000 ohms, carbon type, ½ watt (R46)
11172	Resistor—470,000 ohms, carbon type, ½ watt (R17, R20)
11397	Resistor—560,000 ohms, carbon type, 1/10 watt (R1, R3)
12013	Resistor—1 megohm, carbon type, 1/10 watt (R36)
13730	Resistor—1 megohm, carbon type, ½ watt (R44)
11626	Resistor—2.2 megohms, carbon type, ½ watt (R18, R21)
13732	Resistor—10 megohms, carbon type, ½ watt (R35)
14845	Resistor—Voltage divider—comprising two 1,000 ohm, one 3,400 ohm and one 4,000 ohm sections (R50, R51, R52, R53)
14695	Rod—Tie rod for joining lockplate pawls on station selector push-button switches
4669	Screw—No. 8-32 x 5/32 square head set screw for arm, Stock No. 14701, or link, Stock No. 14719, or drum, Stock No. 14693
12418	Screw—No. 8-32 x 3/16 milled head set screw for gear, Stock No. 14739
14848	Selector—Station selector drum mechanism—comprising station-selector contactor discs, spring contacts and motor reversing switch assembled in metal frame
14374	Shield—Antenna or detector coil shield
14375	Shield—Oscillator coil shield
12008	Shield—I.F. transformer shield
14718	Shutter—Band indicating shutter and arm assembly
14696	Slider—Indicator pointer holder and spring
11488	Socket—2-contact female socket for compartment lamp power cable
11196	Socket—8-contact 6K7, 6L7, 6J7, 6H6 or 6C5 Radiotron socket
14114	Socket—Dial or indicating lamp socket
12007	Spring—Retaining spring for core, Stock No. 12006
3676	Spring—Tension spring for link and lever, Stock No. 14719
13638	Spring—Tension spring for cord, Stock No. 14699
14694	Spring—Tension spring for lockplate pawl on station selector push-button switches
14742	Stud—Mounting stud for gear and arm, Stock No. 14738
14702	Switch—"Manual-Electric-Remote" switch (S7, S12, S15)
14844	Switch—"Phono-Music-Speech" switch (S10)
14732	Switch—Motor reversing switch and mounting plate for station selector (S9)
14704	Switch—Range switch (S2, S3, S4, S6)
14728	Switch—A-F-C and A-F amplification suppression switch (S14)
14693	Switch—Station selector button switch—comprising four contacts and corresponding lockplates, completely assembled on insulating strips
14836	Tone Control—"Fidelity" control (R214, S5)
14706	Transformer—First I.F. transformer (L15, L16, L17, C11, C15)
14707	Transformer—Second I.F. transformer (L18, L19, L29, C17, C18)
14708	Transformer—Third I.F. transformer (L20, L21, C21, C23)
14709	Transformer—Fourth I.F. transformer (L22, L23, L24, C24)
14834	Transformer—Tuning motor transformer, 105-125 volts, 50-60 cycle (T4)
30102	Transformer—Tuning motor transformer, 105-125 volts, 25-60 cycle (T4)
14835	Volume Control—Radio volume control and power switch (R22, S201)
	AMPLIFIER ASSEMBLIES
14272	Bracket—Expander control mounting bracket
12511	Cap—Grid contact cap
12110	Cap—Top shield cap for 6L7 Radiotron
12720	Capacitor—100 Mmfd. (C210, C211)
14831	Capacitor—820 Mmfd. (C222)
5107	Capacitor—.0025 Mfd. (C209)
5005	Capacitor—.0035 Mfd. (C212)
4838	Capacitor—.005 Mfd. (C213, C214)
13138	Capacitor—.01 Mfd. (C215)
4886	Capacitor—.05 Mfd. (C205)
4518	Capacitor—.05 Mfd. (C201)
4839	Capacitor—0.1 Mfd. (C218, two in parallel)
12484	Capacitor—0.25 Mfd. (C208, C217)
12741	Capacitor—0.5 Mfd. (C202)
11203	Capacitor—10 Mfd. (C220)
5212	Capacitor—16 Mfd. (C204, C206)
11496	Capacitor—18 Mfd. (C219)
14273	Capacitor—Pack comprising one 20 mfd. and one 10 mfd. sections (C203, C207)
14531	Capacitor—25 Mfd. (C221)
11320	Coil—Choke coil (L204)
5240	Cover—Fuse mounting cover
12468	Expander Control (R204)
10907	Fuse—3 amp. (F201)
5239	Mounting—Fuse mounting—110 volt
12471	Plate—6L7 socket mounting plate assembly—less socket, Stock No. 11196
12466	Reactor—Filter reactor (L201)
14795	Resistor—0.27 ohms, resisto-fuse, 1.2 ampere (R223)
14281	Resistor—68 ohms, insulated, ½ watt (R222)
13454	Resistor—270 ohms, insulated, ½ watt (R202)
12194	Resistor—1,800 ohms, insulated, ½ watt (R212)
11298	Resistor—5,600 ohms, carbon type, 1 watt (R210)
11726	Resistor—6,800 ohms, carbon type, ½ watt (R224)
11332	Resistor—22,000 ohms, carbon type, 1 watt (R209)
12487	Resistor—33,000 ohms, carbon type, 2 watt (R205)
12875	Resistor—56,000 ohms, carbon type, 1 watt (R213)

MODEL U109
Parts List

RCA MFG. CO., INC.

STOCK No.	DESCRIPTION
5029	Resistor—56,000 ohms, carbon type, ¼ watt (R220)
5145	Resistor—100,000 ohms, carbon type, ¼ watt (R219)
11323	Resistor—270,000 ohms, carbon type, ¼ watt (R206)
5035	Resistor—560,000 ohms, carbon type, ¼ watt (R211)
12486	Resistor—560,000 ohms, insulated, ¼ watt (R207, R208, R215)
12200	Resistor—1 megohm, insulated, ¼ watt (R201)
14752	Resistor—2.7 megohms, insulated, ¼ watt (R203)
14275	Socket—2-contact female socket for phonograph motor power supply
14276	Socket—2-contact female socket for "expander-off" switch
14280	Socket—2-contact female socket and clinching plate for radio input
14277	Socket—3-contact female socket for power switch or tuning motor power supply
4794	Socket—4-contact 2A3 or 5Z3 Radiotron socket
14279	Socket—5-contact female socket for chassis power supply
11197	Socket—6-contact 6C5 Radiotron socket
11198	Socket—7-contact 6H6 Radiotron socket
11196	Socket—8-contact 6L7 or 6F5 Radiotron socket
14274	Socket—Single contact female socket and plate for phonograph or expander input
14278	Socket—Single contact socket and plate for tone control
13964	Transformer—Interstage driver transformer (T202)
14271	Transformer—Power transformer, 105-125 volts, 50-60 cycle (T201)
14846	Transformer—Power transformer, 105-125 volts, 25-60 cycle (T201)
30130	Transformer—Power transformer, 100-130/140-160/195-250 volts, 50-60 cycle (T201)

EJECT ARM ASSEMBLIES

STOCK No.	DESCRIPTION
14753	Arm—Eject arm, complete
11533	Ball—1/16-inch diameter steel ball
10129	Ball—3/16-inch diameter steel ball
11529	Bearing—Ejector tip bearing and nut
11538	Bracket—Eject arm bracket
11537	Collar—Eject arm shaft collar and set screw
11536	Cushion—Counter balance roller cushion—located inside of eject arm
4055	Post—Vertical adjustment post—located on eject arm bracket
3729	Roller—Eject arm counter balance roller—located inside of eject arm
4580	Screw—No. 6—32-3/16-inch square head set screw for eject arm collar
11534	Screw—No. 8—36-7/32-inch special screw for eject arm tip center adjustment
11535	Shaft and Collar—Eject arm vertical action shaft and collar assembly
11528	Silencer—Ejector tip silencer
4067	Spring—Ejector arm bracket spring
11531	Spring—Ejector tip spring
11530	Tip—Ejector tip with tip center, adjusting screw and cap
11539	Yoke—Eject arm yoke assembly

PICKUP AND ARM ASSEMBLIES

STOCK No.	DESCRIPTION
10941	Ball—Steel ball for pivot shaft bearing
3204	Cable—Pickup lift cable
30101	Cable—Shielded pickup cable—connects pickup unit to shorting switch
12850	Damper—Pickup arm pivot shaft damper—comprising one upper rubber damper and bearing, one lower rubber damper and one lower bearing
14820	Mechanism—Pickup mechanism, complete with needle screw
14818	Pickup and arm, complete
12546	Plug—Pivot shaft bearing plug
14823	Rod—Pickup arm brake trip rod
14822	Screw—Needle screw
14824	Screw—Pickup mechanism terminal
14913	Spring—Pickup arm tension spring
14821	Support—Pickup mechanism support

OPERATING MECHANISM

STOCK No.	DESCRIPTION
14754	Cam—Cam and gear assembly
6808	Clutch—Trip lever friction clutch
14756	Cover—Metal cover for trip lever and friction finger assembly
6809	Finger—Manual index lever finger assembly
3670	Finger—Friction finger assembly
11554	Lever—Manual index lever—less pin
14755	Lever—Main lever and link assembly
14914	Lever—Pickup lift cable lever
11555	Lever—Trip lever and friction clutch assembly
6503	Pawl—Trip pawl assembly
3672	Pin—Manual index lever pin
13635	Plate—Eject arm actuating plate assembly
4564	Screw—Manual index lever finger set screw
4059	Screw—Trip lever clutch tension adjustment screw
4566	Screw—Special screw used to fasten main lever and link assembly bushing
13637	Spacer—Pickup arm mounting spacer
13638	Spring—Actuating spring
4565	Spring—Manual index lever finger tension spring
4061	Spring—Main spring lever tension spring or pickup lift cable spring
2893	Spring—Trip lever latch plate tension
3676	Spring—Cam and gear pawl tension spring
14916	Spring—Pickup lift lever spring
4125	Spring—Eject arm horizontal action tension spring
13636	Stud—Pickup arm lift cable stud and nut
2917	Washer—Spring washer—"U" type

AUTOMATIC SWITCH ASSEMBLIES

STOCK No.	DESCRIPTION
3994	Cover—Motor switch cover
10184	Plate—Automatic brake latch plate
10174	Springs—Automatic brake springs
6805	Switch Assembly—Automatic switch, complete
3322	Switch—Motor switch (S103)

MOTOR ASSEMBLIES

STOCK No.	DESCRIPTION
9735	Motor—105-125 volts—25 cycles (M101)
9651	Motor—105-125 volts—50 cycles (M101)
9650	Motor—105-125 volts—60 cycles (M101)
12050	Suspension Spring—Motor mounting spring, washer and stud assembly—comprising six springs, six cup washers, three spring washers and three studs

MOTOR BOARD ASSEMBLIES

STOCK No.	DESCRIPTION
11881	Base—Phonograph compartment lamp socket and base
14819	Cable—Shielded pickup cable—connects shorting switch to compensator pack
12051	Capacitor—2 Mfd., complete with 2-contact male connector for use with motor, Stock Nos. 9650 or 9651 only (C104)
13101	Capacitor—4 Mfd., complete with 2-contact male connector for use with motor Stock No. 9735 only (C104)
4674	Connector—2-contact male connector for Stock Nos. 12051, 13101 or phono compartment lamp leads
4577	Connector—2-contact male connector for motor cable
11488	Connector—2-contact female connector for motor leads
14760	Cup—Used-needle cup
14762	Damper—Turntable damper
11553	Escutcheon—Index escutcheon engraved "Manual—12—10"
14688	Knob—Needle rest knob
4340	Lamp—Phonograph compartment lamp—6.3 volts
3764	Nut—Cap nut for motor board suspension
14761	Rest—Pickup rest
14825	Roller — Pickup arm cable guide roller — comprising bracket, roller and guide pin
11711	Shade—Phonograph compartment lamp shade
14758	Spacer—Pickup arm mounting spacer
14270	Spring—Retaining spring for knob, Stock No. 14758
4565	Spring—Tension spring for needle rest
3763	Suspension Spring—Suspension spring, washer and bolt assembly for motor board—comprising one bolt, two cup washers, two springs, two "C" washers, and one cap nut
30157	Switch—Pickup shorting switch (S105)
4671	Switch—Operating switch—toggle switch (S104)
14759	Turntable, complete

REPRODUCER ASSEMBLIES

Speaker RL76-4

STOCK No.	DESCRIPTION
14606	Cap—Dust cap for cone center
14785	Coil—Field coil (L202)
14602	Cone—Reproducer cone and dust cap (L203)
14847	Diffuser—Reproducer diffuser
14786	Plug—5-contact male plug for reproducer
14784	Reproducer, complete
14358	Screw—Screw, washer and lockwasher to hold core in yoke
12568	Transformer—Output transformer (T203)
14357	Washer—Spring washer to hold field coil

MISCELLANEOUS ASSEMBLIES

STOCK No.	DESCRIPTION
12038	Band—Rubber band for tuning tube
14744	Bracket—Tuning tube mounting bracket and clamp
14745	Button—Station selector push-button
14789	Cable—Shielded phonograph volume control cable, complete with male plug—compensation unit to amplifier
14790	Cable—Shielded expander control cable, complete with two male plugs—compensation unit to amplifier
12723	Capacitor—56 Mmfd. (C105)
12951	Capacitor—2,200 Mmfd. (C107)
14393	Capacitor—.01 Mfd. (C101)
11315	Capacitor—.015 Mfd. (C102, C103)
14747	Card—Call letter cards for station selector
14840	Escutcheon—Station selector and tuning tube escutcheon, complete with crystal, indicating cards and buttons—less station indicating cards
30570	Escutcheon—Right- and left-hand side panels for electric tuning buttons—less buttons, call letter cards, retainers, and metal front plates—for use with station selector dial escutcheon
30569	Escutcheon—Station selector dial and tuning tube escutcheon and crystal, complete with "Radio-Phono" and "Electric-Manual" indicating screens—less right- and left-hand side panels for electric tuning buttons
14787	Expander Control and Switch (R103, S101, S102)
14749	Indicator—"Electric-Manual" indicator screen
14841	Indicator—"Radio-Phono" indicator screen
14751	Key—Key for use in setting "Electric Tuning" mechanism
14269	Knob—Phono—Music-Speech, Volume — Power, Tuning (small), Manual-Electric-Remote, Fidelity, Phonograph Volume, and Dynamic Amplifier Control Knobs
14688	Knob—Range selector knob
14359	Knob—Tuning knob (large)
14788	Pickup Control (R101)
11607	Receptacle—Needle card holder
12738	Resistor—27,000 ohms, insulated, ¼ watt (R107)
12454	Resistor—33,000 ohms, insulated, ¼ watt (R106)
14023	Resistor—82,000 ohms, insulated, ¼ watt (R102)
12264	Resistor—220,000 ohms, insulated, ¼ watt (R105)
12201	Resistor—1.5 megohms, insulated, ¼ watt (R104)
11829	Roller—Record pocket slide roller—comprising one rubber roller, one metal roller and two washers
11377	Screw—Amplifier mounting screw and washer
5210	Screw—Chassis mounting screw and washer
14746	Shield—Celluloid shield for station call letter cards
14274	Socket—Pickup cable socket and plate on compensation unit
14270	Spring—Retaining spring for knobs, Stock Nos. 14688 and 14269
4982	Spring—Retaining spring for knob, Stock No. 14359
3763	Suspension Spring—Motor board suspension bolt, springs, cup washers and cap nut
14833	Volume Control—Phonograph volume control (R108)

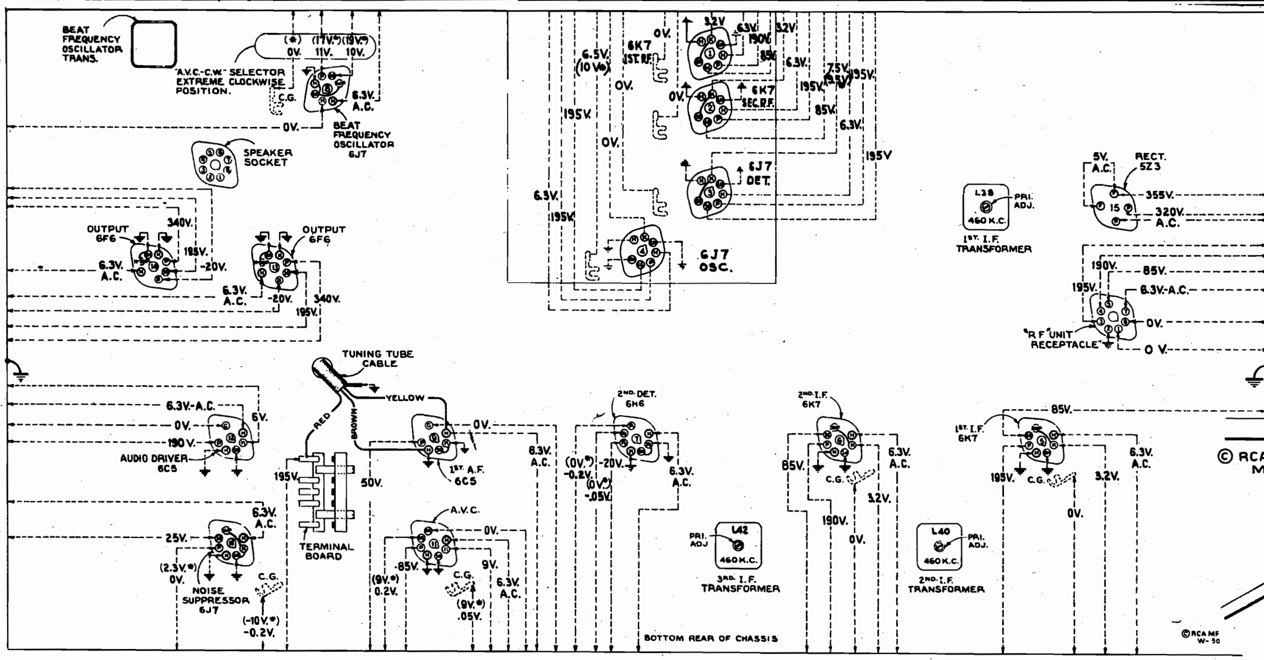

Figure 10—Radiotron Socket, Voltages, Coil and I-F Trimmer Locations

Measured at 115 volts, 60 cycle supply--Tuned to approximately 1000 kc--No signal being received--"Signal Input" control clockwise--"Noise Suppressor" control counterclockwise--"AVC Selector" to "Mod. AVC OFF"--"Volume" control counterclockwise--"Fidelity" and "Beat Frequency" controls optional.

Note: *Two voltage values are shown for some readings. The value shown in parentheses with asterisk(*) indicates operating conditions without voltmeter loading. The other value (generally lower) is the actual measured voltage and differs from the value shown in parentheses because of the additional loading of the voltmeter through the high series circuit resistance.*

The correct length (L) in feet for each arm of the doublet for maximum signal input at any particular frequency in kilocycles may be computed from the following formula:

$$L = \frac{233,700}{f}$$ where L = length of each doublet arm in feet and f = frequency in kilocycles.

DOUBLE DOUBLET ANTENNA

L1 = 130 feet for 160 Meter Band

Before aligning the r-f circuits, make receiver dial adjustments as outlined under "Selector Dial" (Figure 11).

In performing services on the oscillator, detector, and r-f circuits, the leads should be restored to their original positions, since the lead-dress is important for proper operation and dial calibration.

MODEL ACR 175
Selectivity Control Curves

RCA MFG. CO., INC.

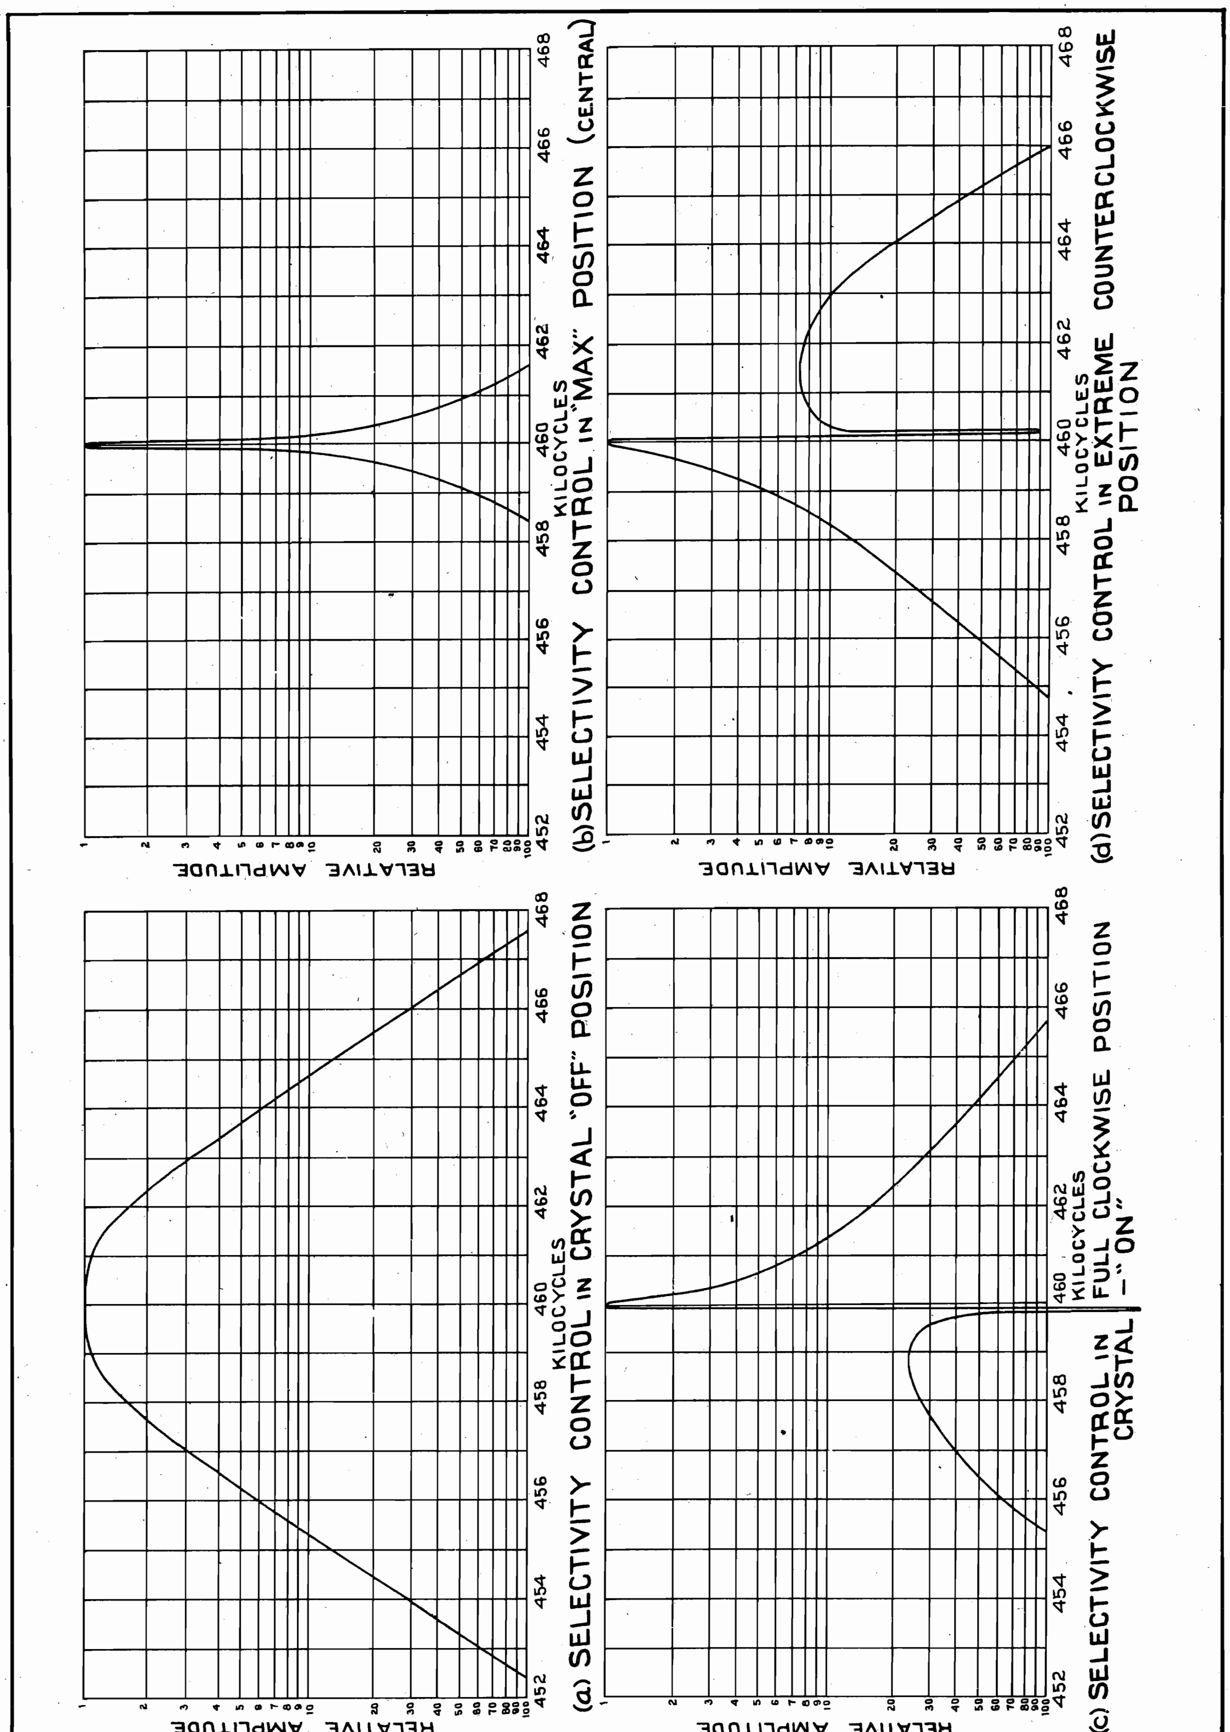

Figure 13—Selectivity Control Curves—Crystal Filter

RCA MFG. CO., INC.

MODEL ACR 111
Dial Data, Selectivity
Speaker Wiring

Figure 11 illustrates the relation of the various parts of the dial mechanism when in its "B" position with the range switch likewise turned to the same range position. In re-assembling the dial after repairs, see that the gears are meshed in accordance with the diagram, at the same time noting that the range switch is in its "B" position and the lever attached to the range-switch shaft placed in the position shown.

To adjust the dial mechanism, set the range-switch to its "B" position. Place a straight-edge across the center of the dial so that its edge is even with the lower (end) marking at both the low-frequency and high-frequency ends of the dial. Under such conditions the straight-edge should be paralleled with the top of the chassis base. If the straight-edge is not parallel with the top of the chassis base, loosen the nut on the rear of the roller link pivot stud and move the stud up or down until the link roller moves the dial to the desired position so that the end calibration marks obtain the position mentioned above. Tighten the nut on the roller link pivot stud.

Set the gang-tuning condenser to its maximum capacity position. Adjust the dial pointer to the low-frequency (end) mark on the "B" range scale. This is a friction adjustment.

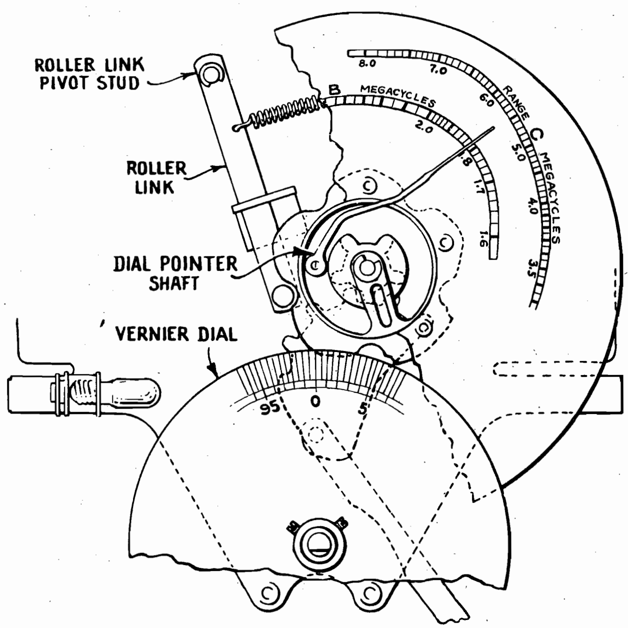

Figure 11—Selector Dial Mechanism

Centering of the loudspeaker voice coil is made with three narrow paper feelers after first removing the front paper dust cover. This may be removed by softening its cement with a very light application of acetone using care not to allow the acetone to flow down into the air gap. The dust cover should be cemented back in place with ambroid upon completion of adjustment.

Average performance data for the ACR-111 is shown in the following table. Slight variations either above or below the values given, may be encountered due to practical manufacturing tolerances.

Noise Equivalent - (microvolts CW) - "Noise Equivalent" is a coined term to express the input in microvolts through the normal input circuit, which would be required to produce an output equal to the receiver noise output.

Selectivity - The Selectivity curve for the average ACR-111 receiver is shown in Figure 13(a).

Range	Frequency Megacycles	Noise Equivalent Microvolts (CW)	Image Ratio	Sensitivity Input Microvolts(1 w.output)
A	0.6	2	250,000	10
	1.5	2	100,000	10
B	1.7	1.0	150,000	5
	4.0	0.85	40,000	3.5
C	4	1.2	3,000	5
	7	0.96	2,000	3.5
D	7	1.1	3,000	4.5
	14	0.86	400	3.5
E	14	0.9	200	15
	28	1.0	10	8

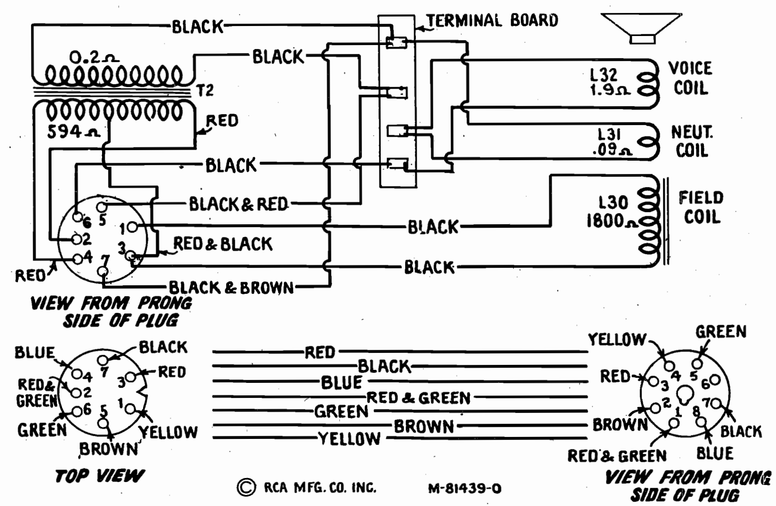

Figure 12—Loudspeaker Wiring

RCA MFG. CO., INC.

1. General

This new, sixteen-tube, RCA Amateur Communications Receiver is built for rack and for table mounting and covers a frequency range of from 540 to 30,000 kc. It embodies the most up-to-date circuits and construction, including RCA metal tubes, electrical band spread, beat-frequency oscillator, crystal filter, noise suppressor, noise limiter, sensitivity and automatic-volume controls, standby switch, loudspeaker, and phone jack. The advanced degree of sensitivity and selectivity of the instrument together with its frequency stability and reliability open to the operator a field of reception covering all communications in the more important ranges.

This book should be studied carefully to learn how to make full use of the ACR-111 and keep it in its optimum operating condition.

2. Special Features

An inspection of the schematic circuit diagram and the wiring diagrams make clear the many developments incorporated in this model. See Fig.4, 5 and 6.

Metal tubes provide effective shielding as well as minimum terminal spacing and short connecting circuits with their attendant advantages. The eleven labeled controls, including the phone jack, are all on the front panel, thus giving complete front panel operation. The two large diameter tuning knobs with crank handles are comfortable and convenient to the hand and facilitate rapidity and ease of tuning. In conjunction with the vernier drive and electrical band spread system, fine tuning adjustments are easily made. An AVC Switch allows one to dispense with the use of the Automatic-Volume-Control when desired.

The Crystal Filter in the first i-f stage provides single-signal reception with an unusually high degree of selectivity, and the adjustable Selectivity Control is a means of obtaining various degrees of selectivity with or without a rejection dip. The Electron-Ray-Tube Indicator fulfills the dual function of measuring signal input and aiding in precise tuning.

The Noise Suppressor is a valuable aid in reducing interfering noises and thus enabling the operator to obtain reception of maximum strength and fidelity and minimum interference. It is used in conjunction with the Signal Input Control. A Noise Limiter is incorporated in the circuit by means of the second diode of the second detector (RCA 6H6) tube. This device reduces peak noises due to excessive signals or bursts of static which load the anode beyond a certain bias value.

The Selector Dial brings each scale separately into the dial opening by a turn of the Range Selector knob and gives clear vision tuning calibrations for the range in use only. In addition the vernier scale beneath provides for calibration spread, and the readings of both tuning and calibration spread scales may be entered in the station log for future reference when it is again desired to receive the same station.

The Beat Oscillator is equipped with two controls, (1) an "On-Off" switch and (2) a Heterodyne Control with magnetite-core tuning which effectively governs the pitch. The shield enclosing the entire beat-oscillator circuit enables the listener to operate the set with freedom from undesirable beat notes due to harmonics.

The Loudspeaker is a separate unit attached to the chassis by means of a cable with a seven-prong plug-in connection. It is assembled on a small wooden mounting in which holes are provided for fastening to a large baffle when high-quality reproduction is required.

4. Circuit Data and Power Rating

Circuit - Superheterodyne with beat-frequency oscillator for CW reception, noise suppressor, noise limiter, crystal filter, automatic volume control, electron-ray tuning indicator, calibrated signal input (sensitivity) control, electrical band spread, and class A pentode output system.

Power Output - 5 watts (undistorted); 8 watts maximum.

Loudspeaker - (separate unit) - Electro-dynamic 8-inch (voice-coil impedance 2-1/4 ohms at 400 cycles).

Tubes -

- 2 RCA-6K7 - Radio Frequency Amplifiers
- 1 RCA-6J7 - First Detector
- 1 RCA-6J7 - Oscillator
- 2 RCA-6K7 - Intermediate-Frequency Amplifiers
- 1 RCA-6H6 - Second Detector and Noise Limiter
- 2 RCA-6C5 - Audio-Voltage Amplifiers
- 2 RCA-6F6 - Power Output Tubes
- 1 RCA-5Z3 - Full-Wave Rectifier
- 1 RCA-6J7 - Beat-Frequency Oscillator
- 1 RCA-6R7 - Automatic Volume Control
- 1 RCA-6J7 - Noise Suppressor
- 1 RCA-6E5 - Tuning Indicator

See diagram label on shield on chassis for locations of tubes and grid leads.

Power Supply Ratings - Check with rating symbol on chassis.

Power Consumption - 120 watts.

5. Antenna

A most important factor in good reception is the antenna. Both "noise reducing" and "directional" properties as well as definite "length" to suit the signal frequency are essential antenna requirements for best reception. A three-terminal board with the terminals marked "A1", "A2", and "G" is provided on the rear of the chassis for connections to antenna and ground. The "G" terminal should always be connected to a good external ground.

For maximum performance in any one or two amateur bands, one of the antenna systems illustrated below is recommended. Essential parts, such as cross-over insulators (Stock No. 4327), transmission lines (Stock Nos. 12429 and 12430) and receiver coupling transformers (Stock No. 12424) may be purchased from your dealer.

PART III - OPERATION

6. Controls

All controls are located upon the front panel and are identified by adjacent markings.

(a) Tuning and Band Spread - The two large knobs to the right and left of the dial are respectively the "Main" and "Band Spread" tuning knobs. The latter covers a range of 10 percent (± 5%) of the main dial scale reading.

(b) Volume - The Volume Control is the knob to the left below the "Band Spread" tuning knob. It is connected in the audio-frequency circuit, and the receiver output level is increased with clockwise rotation.

(c) Power and Fidelity - The Power Switch is combined with the Fidelity Control, the power being off in the counter-clockwise position.

The Fidelity Control provides attenuation of the higher frequencies. Full-range reproduction is obtained with the knob turned clockwise. Turning counter-clockwise introduces a capacitance in the secondary circuit of the driver transformer, which attenuates the high-frequency response and aids in the reduction of disturbing background noises.

(d) Range - The Range Selector in the center of the panel below the dial selects any one of the five scales of which the frequency limits are tabulated under "Part II Electrical Specifications". Turn the Range Selector knob to bring the required scale into the dial opening.

(e) Electron-Ray-Tuning Tube - The green illuminated Electron-Ray-Indicator Tube (RCA-6E5) at the left of the dial near the top of the front panel is a visible guide to precise tuning. The deflection of the electron stream by the signal voltage causes a narrowing of the darker sector. Maximum deflection, (i.e., when the area of the light sector is at a maximum) indicates that the receiver is tuned to exact resonance.

(f) Selectivity Control - This introduces the crystal filter into the i-f circuit for single-signal reception of CW telegraph or telephone transmission. Crystal phasing is performed by means of an air-trimmer capacitor. Near the midway position marked "Max." the crystal circuit is balanced and maximum selectivity is obtained. This setting is characterized by minimum background noise. In the extreme clockwise position the crystal is short-circuited by means of the crystal switch. Other positions broaden the crystal selectivity curve on one side of resonance and cause a rejection dip on the other side. They are useful for phone reception through severe interference.

(g) Beat Frequency - The Beat Frequency knob at the extreme lower left is a heterodyne control governing the Beat Oscillator output frequency. When set at its zero mid-position the Beat Oscillator frequency will approximate zero beat with the receiver tuned accurately to an incoming signal. The calibration figures on either side of the zero position indicate the approximate frequency in kilocycles of the beat produced by the combination of the Beat Frequency Oscillator and the received signal tuned to exact resonance.

(h) Signal Input - The Signal Input Control is calibrated from 1 to 10,000 on a logarithmic scale. It is used in conjunction with the Electron-Ray-Indicator to obtain the approximate value in microvolts of any signal delivered to the receiver. This is accomplished by tuning the receiver to resonance by means of the Electron-Ray-Indicator and then rotating the Signal Input knob fully counter-clockwise to reduce the voltage on the Electron-Ray tube. Then by slowly rotating this control clockwise, a point causing only a slight deflection (1/64 inch) in the dark sector in the Electron-Ray-Indicator, will be obtained. The Signal Input scale reading will then be the approximate signal input value to the receiver, in microvolts. For code reception the correct setting will be at the point where the Electron-Ray-Indicator just begins to flicker.

The absolute accuracy of Signal Input values depends upon the sensitivity of the receiver. This in turn depends on proper alignment, condition of tubes, value of line voltage and similar factors. Relative readings, however, between stations of different signal strengths give a correct comparison. Signal Input readings are also useful for reporting to the transmission station for making tests on different types of antennas, for discovering improvements in transmitters at distant locations, and for making charts of signal strength variations.

Note: Multiply the readings by 5 for obtaining values on band "E" operation.

(i) AVC - CW Selector - This is a five position switch on the right of the dial and by means of this knob the operator may set the receiver for Modulated or CW reception, either with or without Automatic Volume Control, according to requirements. On normal CW reception with the control turned to "CW AVC ON" the time constants of the AVC circuits will be such that they will hold during intervals between characters. For slow-speed CW reception, however, the time constant will not hold and the switch should be turned to "CW AVC OFF" and the Signal Input Control used for adjusting the output level. Furthermore the central point is a "Standby" position which keeps the filaments of all tubes heated ready for immediate reception. This is indicated by means of the Standby Light at the top right hand side of the front panel.

RCA MFG. CO., INC.

(j) Noise Suppressor - The Noise Suppression Control is for reducing peaks of noise to a minimum. When used in conjunction with the Signal Input or Sensitivity Control and the Fidelity Control, the Noise Suppressor becomes a very important and valuable device for reducing interfering noises that may impair the intelligibility of radio reception. It is of particular value in minimizing interference caused by the ignition systems of airplanes and automobiles, dial telephones, and similar electrical apparatus. Interference from rotating electrical machinery however is not eliminated by this device.

With a station properly tuned in by the use of the Electron-Ray-Tuning-Indicator, then if the Noise Suppression knob is slowly rotated in a clockwise direction a point of noticeable distortion of the signal will eventually be reached. (If the signal is too strong it may be necessary to reduce the strength by means of the Signal Input Control in order to obtain a point of noticeable distortion on the Noise Suppression Control.) The knob should then be turned very slowly counter-clockwise until the signal becomes clear. This point is the correct setting for the Noise Suppression Control for that particular signal.

This control is also effective for inter-carrier Noise Suppression and its use in this capacity requires the following procedure in order to obtain reception with full strength, maximum fidelity and minimum interference:

(1) Reduce Signal Input Control as low as possible, meanwhile keeping receiver output at the desired level by means of the Volume Control.

(2) Set receiver at a point where no signal is being received.

(3) Adjust Noise Suppression Control till background noise is just audible.

(4) Tune in desired signal again.

This adjustment of the receiver is of particular value for intermittent signals or when it is desired to standby on a certain channel, the background output of the receiver being extremely low on "no signal" and yet allowing full volume on "signal".

(k) Phones - The Phone Jack is to the left of the front panel. When a phone plug is inserted in this jack, it simultaneously connects a resistance load across the secondary of the output transformer in place of the voice coil of the electro-dynamic loudspeaker. It also connects the phones across the plate circuit of the output tube, a blocking condenser being used to isolate the d-c voltage. The loudspeaker field which is employed as a filter for the rectifier stage, still forms an active part of the circuit when using headphones. By inserting the phone plug part way in the jack both headphone and loudspeaker signals may be obtained. The loudspeaker is connected to the chassis by means of a cable and plug.

7. Dial

The Selector Dial provides for each major band a single clearly calibrated scale in the upper dial opening. Each scale is clearly marked in megacycles. The small lower dial opening gives calibration spread for accurate logging. The mechanism is illustrated in Figure 11.

8. Tuning

The two r-f amplifiers (6K7), first detector (6J7) and oscillator (6J7) are tuned by two four-gang variable capacitors and controlled from two knobs.

The right hand knob controls the main tuning capacitor and the left hand knob the band spread capacitor. The band spread capacitor is connected in the circuit to cover a uniform percentage of band spread regardless of the frequency to which the receiver is tuned. <u>Frequency readings on the dial scale obtained by rotation of the Main Tuning knob are only accurate when the Band Spread Control is at zero - turned fully to right.</u>

The Tuning limits for each of the five ranges are given under "Part II - Electrical Specifications". To tune the receiver for desired reception of modulated signals proceed as follows:

(a) Turn Power Switch "On".

(b) Turn Range Selector to bring the desired scale into the Selector Dial opening.

(c) Set AVC - CW Control to "MOD. AVC ON".

(d) Advance Signal Input Control fully clockwise for maximum sensitivity.

(e) Advance Volume Control clockwise until background noise is heard.

(f) Set Band Spread Control at zero - fully clockwise - and then rotate Main Tuning Control to a point just below desired frequency, such as at the low end of an Amateur Band. Now tune in signal with Band Spread Control. Turn slowly counter-clockwise, observe the Calibration Spread scale to obtain station location and then watch the Electron-Ray-Tuning-Indicator for point of resonance.

(g) Decrease volume as necessary and set Fidelity Control for preferred quality of reproduction. Full tone range reproduction is obtained with the knob set to its extreme clockwise position.

(h) Silent Tuning may be obtained by reducing the volume until no signal is heard, and then tuning by means of the visual indications of the Electron-Ray Tube.

(i) Weak Modulated Signals - The Beat Oscillator may be used to advantage in locating weak, modulated signals. For this purpose it should be tuned exactly to the intermediate frequency of the receiver by turning the Beat Frequency Control to "0" so that an audio-frequency note of ascending pitch will be obtained on each side of resonance of the incoming signal when the AVC - CW Selector is turned to "CW AVC OFF". Any carrier will then be tuned to exact resonance when the Frequency Control is adjusted for "zero beat" and weak signals will be located almost as well as those of greater strength because of the heterodyne "whistle" produced while passing through resonance. After proper adjustment has been made, turn AVC - CW Selector to "MOD. AVC ON".

(j) CW Signals - For CW (code) reception, the tuning procedure is the same as for modulated signals except that the Beat Oscillator performs a definite rather than incidental function. The Beat Frequency Control is set not at zero, but slightly to either side so as to provide an audio-frequency beat note when the receiver is tuned to resonance with any carrier. Adjust the pitch with the Beat Frequency Control knob. Turn AVC - CW Selector to "CW AVC OFF" when receiving slow speed CW transmission.

(k) If the interference is objectionable during reception, the Noise Suppression Control should be adjusted, as described under "Controls" Section 6, to its "correct setting" for that signal.

(l) Selectivity - The value of the Crystal Selectivity Control is most evident on CW reception. Its importance should not be forgotten in phone reception and for identification of weak stations which are normally lost in the background noise. The curves (Figure 13) should be studied carefully before operating the Selectivity Control.

The following suggestions also may be of value:

Locate the desired frequency or station with control at "Crystal OFF," i.e., in its position of minimum selectivity, then adjust to obtain the desired degree of selectivity.

Tuning is extremely critical with control in the "Max." position and in consequence the movement of the Band Spread knob should be very slow and deliberate.

Heterodyne Control Setting

Connect a source of unmodulated carrier of the i-f frequency from the grid of the RCA-6J7 first-detector to ground. Turn AVC off, crystal filter to maximum selectivity, sensitivity control to maximum, audio volume control partially on and beat oscillator on.

Rotate the Heterodyne Control knob to left or right until the heterodyne beat is heard.

Change the frequency of the unmodulated carrier from the test oscillator *very carefully* for maximum deflection on the electron-ray-tube indicator. Reduce the signal input if necessary so that the electron-ray-tube does not completely close. The test oscillator is now adjusted to the same frequency as the crystal filter.

Set the Heterodyne Control knob at its zero position and note whether the heterodyne beat is at zero frequency. If not, proceed as follows:

(a) Rotate the Heterodyne Control knob to obtain zero beat.

(b) Loosen the knob set screw and turn loosened knob on shaft to its "0" or vertical position.

(c) Tighten up set screw.

The Heterodyne Control is now adjusted to zero beat at the frequency of the crystal filter.

In the event that the frequency drift is such that the zero beat position of the knob is at or beyond the figure "2" on either side, or outside field of rotation, the following adjustment is necessary:

(a) Turn knob until the set-screw-stop on the knob control shaft, behind the front panel, is approximately vertical, then loosen stop with screw driver.

(b) Turn core stud to obtain zero beat. Use a pair of padded long-nose pliers to rotate the core stud in order to avoid injuring thread.

(c) Turn set-screw-stop over to left (facing front panel) to its mid-position, and adjust knob control shaft to allow 1/32 to 1/16 inch clearance between front panel and adjacent surface of knob.

(d) Tighten set-screw-stop with pliers to grip core stud, then swing stop to vertical and tighten securely with screw driver.

(e) Proceed as first described for setting knob accurately to zero position at zero beat.

Note: Do not pull control shaft loose from bearing bracket when adjusting core stud.

Beat Frequency Oscillator - The frequency generated by the Beat Frequency beat-oscillator (457 to 463 kc) for CW reception is applied to the No. 1 diode plate of the RCA-6H6 second-detector through capacitor C63. This frequency mixes with the incoming intermediate frequency to produce an audio-frequency note which can be readily heard in the loudspeaker or phones. The movable magnetite-core, adjusted by the Beat Frequency Control, provides a variable inductance which acts as a vernier control for adjustment of the oscillator frequency over the required a-f range on either side of the intermediate-frequency signal. The plate and screen-grid voltage supply to this oscillator is turned on and off by means of the AVC - CW selector switch.

AVC - CW Selector - A five-position switch selects the type of reception and controls the Beat Oscillator and AVC circuits. The secondary of the audio transformer T1 is short-circuited in the "Standby" position.

MODEL ACR 111
Circuit Data
Transformer

RCA MFG. CO., INC.

Circuit Arrangement

A schematic diagram of the complete circuit is shown in Figure 4, a wiring diagram illustrating the wiring layout of the radio chassis and front panel controls is detailed in Figure 5, and of the r-f tuner unit in Figure 6. The loudspeaker wiring diagram and connections to chassis are shown in Figure 12, and the wiring of the Universal Transformer for rating "C" receivers in Figure 7. The circuit is based on the superheterodyne principle. It consists of two r-f amplifier stages, a first-detector (converter) stage, a separate oscillator stage, a crystal filter stage, two i-f amplifier stages, a diode-detector and noise limiter stage, an automatic-volume control stage, an audio voltage-amplifier stage, a noise suppressor stage, an audio driver stage, a power-amplifier stage, a beat frequency oscillator stage, and a full-wave rectifier.

A doublet antenna, when connected to the proper input terminals of the receiver, is coupled to the control grid of the first RCA-6K7 r-f amplifier tube through the tuned r-f transformer consisting of L2, L4, L6, L8, L10, C40, C41, and C42. C2, C3, C4, C5, and C6 are plunger type air-trimmer capacitors for the respective bands - A, B, C, D, and E. The variable tuning capacitors, C41 and C42, are of the split-stator type and are controlled from the main tuning knob. The band spread capacitor, C40, is connected in series with C41, the combination being in parallel with C42 - the main tuning capacitor. Thus a variable capacitance is effectively placed in series with C40, and its value bears a definite ratio to that of C42, the effective capacitance range of C40 being approximately a constant percentage of that of C42, irrespective of its setting.

The range switch in the "A" position shorts out C40, effectively paralleling C41 and C42.

Separate coils are used for each band, and all primary windings not in use are short-circuited, as well as all secondaries for lower frequencies.

The range switching of the r-f and detector circuits is similar to that of the antenna circuits.

Separate windings are employed in the oscillator stage for each position of the range selector. The inherent stability of this circuit provides minimum frequency drift which is especially advantageous for high-frequency reception. The locally generated signal is capacitance coupled to the cathode of the RCA-6J7 first-detector.

I-F Amplifier - The intermediate-frequency amplifier consists of two RCA-6K7 tubes in a two-stage, transformer-coupled circuit. The windings of all three i-f transformers are resonated by a combination of fixed capacitors, and adjustable molded-magnetite cores (both primary and secondary) tune to 460 kc. The crystal filter is introduced between the first i-f transformer secondary (L39) and the control grid of RCA-6K7 first i-f amplifier tube by means of the crystal switch S-11, Figure 4.

Detector and Noise Limiter - The signal, as obtained from the output of the last i-f stage, is detected by an RCA-6H6 twin-diode tube (No. 1 diode), the useful audio-frequency (a-f) and direct-current (d-c) components appearing across resistor R22. The No. 2 diode of this same Radiotron is effectively placed in shunt with R22, with its anode biased approximately 20 volts negative with respect to the cathode, by means of the bleeder resistor R44. Excessive signals, or bursts of static, of magnitude great enough to cause the voltage across R22 to exceed approximately 20 volts will cause the No. 2 diode to draw current, or present a low impedance across R22, thereby acting as a noise limiter.

Audio System - The control grid of the RCA-6C5 first audio amplifier is connected directly to R22, the tube functioning as a diode-biased voltage-amplifier. The output of this tube is resistance-capacitance coupled to the control grid of the RCA-6C5 audio-driver, potentiometer R38 functioning as the volume control. The output of the driver stage is transformer coupled, through T1, to the control grids of the RCA-6F6 push-pull, power-output tubes. The output of this stage is transformer coupled, through T2, to the voice coil of the electro-dynamic loudspeaker. Insertion of a telephone plug in the head-phone jack J1 disconnects the voice coil from the secondary of T2 and substitutes a dummy resistor R39 in its place. The tip and sleeve of the plug are connected across the input circuit of one of the RCA-6F6 power tubes, through capacitor C74, for headphone reception.

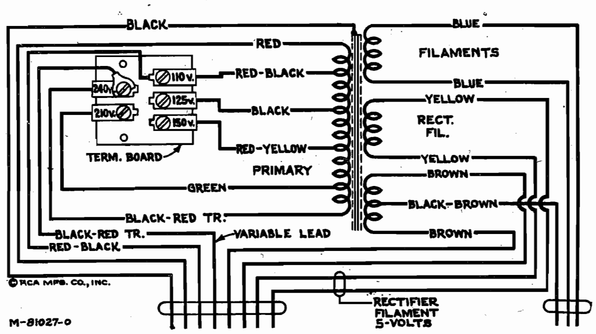
The "Fidelity" or tone control comprises the combination of capacitor C78 and variable resistor R41 shunting the secondary of T1.

Automatic Volume Control - The operation of the RCA-6R7 Automatic Volume Control Tube and associated circuits is as follows:

Under conditions of no signal, the cathode current flowing through resistor R27 develops a voltage across R27 of approximately 29 volts. This is in opposition to the approximate 20 volts drop across the bleeder resistor R44 thereby making the cathode approximately 9 volts positive with respect to chassis-ground, or to the anode DP-1. When signals are present, a portion of the i-f voltage is applied to anode DP-2, through Capacitor C90, for rectification. The d-c voltage which develops across resistor R28 is applied to the control grid of the RCA-6R7 through a resistance-capacitance filter, making the grid more negative with respect to cathode, in turn reducing the cathode current or voltage drop across R27, and consequently making the cathode less positive with respect to anode DP-1 than under the condition of no signal. Sufficient signal will cause the cathode to become negative with respect to diode DP-1; current will then flow through this circuit causing a voltage drop across R30, which is applied as automatic control-grid bias to the r-f, first-detector, and i-f tubes through suitable resistance-capacitance filters.

Noise Suppressor - The Noise Suppressor consists of an RCA-6J7 whose plate circuit effectively shunts the input circuit of the audio-driver stage, and a means of making the shunting plate impedance very high for desired signals, and very low for undesired noise impulses of short duration and amplitude greater than the desired signal. The plate impedance will be very high for control-grid bias values sufficient to cause plate-current cut-off, and low for bias values which will permit plate current to flow. The audio signal appearing across resistor R37, and consequently across the RCA-6C5 audio driver input circuit will, therefore, depend upon the ratio of the plate impedance of the Noise Suppressor Tube to the resistance of R36, the series combination being essentially a voltage-dividing network. When the plate impedance is high, the ratio will be high, and practically the total audio voltage appearing across resistors R32 and R33 will appear across the plate circuit. The converse will occur with a low plate-impedance. In operation, the bias is adjusted just below the point of plate current cut-off by means of the movable arm on R27. Noise impulses of short duration, tending to make the grid more positive, will cause the plate impedance to be low during these impulses with a consequent reduction of input to the audio driver during these intervals.

Electron-Ray-Tuning-Indicator - An RCA-6E5 cathode-ray tuning tube is used as a means of visually indicating when the receiver is accurately tuned to the incoming signal. This tube consists of an amplifier section and a cathode-ray section built in the same glass envelope. A portion of the voltage developed across resistor R22 is used to actuate the grid of the amplifier section. Maximum voltage is applied to this grid when the receiver is tuned to resonance with an incoming carrier. This condition is evidenced by minimum width of the dark sector on the fluorescent screen.



PRIMARY RESISTANCE - 14.5 OHMS TOTAL
SECONDARY RESISTANCE - 326 OHMS TOTAL

Figure 7—Universal Transformer

Perform alignment in proper order tabulated below, starting with No. 1 and following all operations across, then No. 2, etc. Adjustment locations are shown by Figures 8, 9 and 10. Holes are provided in the left side of the lower r-f unit shield to enable a tuning check with the RCA Stock No. 6679 Tuning Wand.

The RCA Stock No. 12636 Adjusting Tool has been designed for loosening and retightening lock-nut and for making the plunger adjustment on the plunger-type air-dielectric trimming capacitors.

Cathode-ray alignment is preferable; the connections to the chassis are shown on Figure 5. If an output indicator is used, connect it across the loudspeaker voice coil and advance the receiver volume control to full-volume position. Turn AVC - CW Selector to "MOD. AVC OFF"; Signal Input clockwise. Turn Noise Suppression control to extreme counter-clockwise position. Adjust Signal Input control to "100". Set AVC - CW Selector to "MOD. AVC OFF".

Connect the "Low" output terminal of the test oscillator to the receiver chassis for all alignment operations. Regulate the output of the test oscillator so that the signal applied to the receiver is the minimum which will permit an accurate output observation.

The term "Dummy Antenna" means that device which must be connected between the "High" test oscillator output and the point of connection to the receiver in order to obtain ideal alignment. "No signal, 550-750 kc" means that the receiver should be tuned to a point between 550 and 750 kc where no signal or interference is received from a station or local (heterodyne) oscillator. "Dial setting for image check" means that after alignment is performed following across in proper sequence, the receiver dial should be shifted to the setting specified, without making any other changes, except possibly increasing test oscillator output, at which point image signal should be received. If the image is not received at this dial setting, but at a point approximately 1840 kc below this point in the case of (12) or 1840 kc above this point in the case of (16), it will indicate that the oscillator has been improperly adjusted.

MODEL ACR 111
Parts List

RCA MFG. CO., INC.

Stock No.	Description
	RECEIVER ASSEMBLIES
4427	Bracket – Mounting bracket for beat oscillator control shaft, volume control, fidelity control, sensitivity control, selector switch or suppressor control
13024	Cable – Tuning tube cable and socket
12110	Cap – Beat frequency oscillator coil shield top
12581	Cap – First or third i-f transformer shield top
12607	Cap – Second i-f transformer shield top
11350	Cap – Grid contact cap
13053	Capacitor – 6.8 mmfd (C63)
11998	Capacitor – 115 mmfd (C57, C59, C61, C62)
12404	Capacitor – 120 mmfd (C80)
12406	Capacitor – 180 mmfd (C66)
13301	Capacitor – 390 mmfd (C81)
13052	Capacitor – 470 mmfd (C82, C90)
12104	Capacitor – 560 mmfd (C52)
13054	Capacitor – 1200 mmfd (C54, C55)
12898	Capacitor – 1500 mmfd (C69)
4838	Capacitor – .005 mfd (C75, C76, C77)
4518	Capacitor – .05 mfd (C78)
4836	Capacitor – .05 mfd (C71)
4886	Capacitor – .05 mfd (C53, C65)
4858	Capacitor – .01 mfd (C56, C64, C70, C83, C89)
4839	Capacitor – 0.1 mfd (C58, C60, C67, C73, C74)
13048	Capacitor – 0.25 mfd (C79)
12141	Capacitor – 1 mfd (C68)
13041	Capacitor – 8 mfd (C85)
13046	Capacitor – 8 mfd (C84)
13040	Capacitor – 10 mfd (C72, C86)
13036	Capacitor – 25 mfd (C87, C88)
13299	Coil – Beat frequency oscillator coil and shield (L44, C80, C81, R47)
14429	Collar – Retaining collar for crystal phasing condenser extension shaft complete with set screw
12089	Condenser – Crystal phasing variable condenser and switch (C91, S11)
12085	Core – Adjustable core and stud for Stock #13299
12006	Core – Adjustable core and stud for Stock #12095, 12096, and 12097
12107	Coupling – Crystal phasing condenser extension shaft flexible coupling
12108	Crystal – Filter crystal and case
10907	Fuse – 3 ampere (F1)
14468	Gear – Gear located on band change knob shaft complete with set screws
12128	Jack – Phone jack (J1)
5226	Lamp – Dial lamp
3376	Mounting – Fuse mounting board for 110 volt models – less fuse
4604	Mounting – Fuse mounting board for 250 volt models – less fuse
14467	Plate – Mounting plate and bearing for band change knob shaft – located on front apron of chassis
12261	Resistor – 390 ohms – Insulated 1/4 watt (R14, R18)
11937	Resistor – 2.5 ohms – wire sound 5 watts (R39)
12311	Resistor – 1000 ohms – Insulated 1/4 watt (R11, R20, R49)
13302	Resistor – 10,000 ohms – Carbon type 1/10 watt (R47)
12288	Resistor – 10,000 ohms – Insulated 1/4 watt (R45, R46)
13045	Resistor – 18,000 ohms – Insulated 1/4 watt (R32)
12412	Resistor – 47,000 ohms – Insulated 1/4 watt (R33, R48)
12573	Resistor – 47,000 ohms – Carbon type 1/2 watt (R31)
11282	Resistor – 56,000 ohms – Carbon type 1/10 watt (R21)
13049	Resistor – 56,000 ohms – Insulated 1 watt (R40)
12263	Resistor – 100,000 ohms – Insulated 1/4 watt (R13)
12264	Resistor – 220,000 ohms – Insulated 1/4 watt (R30)
11452	Resistor – 470,000 ohms – Carbon type 1/10 watt (R22)
12285	Resistor – 470,000 ohms – Insulated 1/4 watt (R12, R23, R28, R34, R35, R36)
12013	Resistor – 1 megohm – Carbon type 1/10 watt (R25)
12200	Resistor – 1 megohm – Insulated 1/4 watt (R26, R29)
13044	Resistor – 4.7 megohm – Insulated 1/4 watt (R24)
13050	Resistor – 10 megohm – Insulated 1/4 watt (R37)
13037	Resistor – Voltage divider comprising one 4000 ohm, one 3600 ohm, one 1200 ohm and one 200 ohm sections (R44)
13038	Sensitivity Control – (R17)
14427	Screw – #8-32 x 1/2 headless, cup point set screw for shaft Stock #12105
4119	Screw – #8-32 x 1/4 headless, cup point set screw for coupling Stock #12107 collar Stock #14429 and gear Stock #14468
12105	Shaft – Extension shaft for beat oscillator coil adjustment
14428	Shaft – Extension shaft for crystal phasing condenser
14469	Shaft – Band change knob shaft complete with one "C" washer, one spring washer, and two flat washers
13300	Shield – Coil shield for Stock #13299
16711	Shield – Complete beat oscillator circuit bottom shield
12008	Shield – I-F transformer shield for Stock #12095, 12096, and 12097
14114	Socket – Dial lamp and stand-by lamp socket
4794	Socket – 4 contact 5Z3 Radiotron socket
11197	Socket – 6 contact 6C5 Radiotron socket
11198	Socket – 7 contact 6F6, 6H6, 6J7, 6K7 Radiotron or r-f unit power supply socket
11196	Socket – 8 contact speaker cable socket
11381	Socket – Tuning tube socket and cover
12106	Spring – Tension spring for beat oscillator adjustment shaft
12007	Spring – Retaining spring for core Stock #12006
13042	Suppressor Control – (R27)
13043	Switch – AVC – CW selector switch (S10)
14134	Tone Control and Power Switch – (R41, S9)
12095	Transformer – First i-f transformer (L38, L39, C52)
13035	Transformer – Interstage driver transformer (T1)
12096	Transformer – Second i-f transformer (L40, L41, C57, C59)
12097	Transformer – Third i-f transformer (L42, L43, C61, C62, C66, R21, R22)
11880	Transformer – Power transformer 105-125 volts 50-60 cycle (T3)
11887	Transformer – Power transformer 105-125 volts 25-60 cycle (T3)
11251	Transformer – Power transformer 105-250 volts 50-60 cycle (T3)
13039	Volume Control – (R38)
	R-F UNIT ASSEMBLIES
12806	Board – Antenna and ground terminal board
5237	Bushing – Variable tuning condenser mounting bushing assembly
14430	Cable – R-F unit power supply cable complete with 8 contact male connector
11350	Cap – Grid contact cap
12884	Capacitor – Adjustable trimmer (long) (C6, C16, C25, C27, C31)
12714	Capacitor – Adjustable trimmer (medium) (C2, C3, C4, C5, C12, C13, C14, C15, C21, C22, C23, C24, C28, C29, C32)
14392	Capacitor – 4.7 mmfd (C32)
13001	Capacitor – 8.2 mmfd (C92)
13141	Capacitor – 47 mmfd (C9, C19)
12724	Capacitor – 120 mmfd (C37)
14443	Capacitor – 570 mmfd (C36)
14442	Capacitor – 1050 mmfd (C35)
14441	Capacitor – 1895 mmfd (C34)
14440	Capacitor – 3035 mmfd (C33)
4836	Capacitor – .05 mfd (C7, C17)
11799	Capacitor – .01 mfd (C1, C11, C20)
13138	Capacitor – .01 mfd (C8, C10, C18, C38, C39)
4839	Capacitor – 0.1 mfd (C26)
14431	Coil – Antenna coil B, C, D and E bands (L1, L2, L3, L4, L5, L6, L7, L8)
14434	Coil – Antenna r-f or detector coil "A" band (R-F – L19, L20) (DET – L29, L30) (ANT – L9, L10)
14433	Coil – Oscillator coil – B, C, D and E bands (L31, L32, L33, L34, L35, L36)
14435	Coil – Oscillator coil and shield – "A" band only (L37)
14432	Coil – R-F or detector coil – B, C, D and E bands (R-F – L11, L12, L13, L14, L15, L16, L17, L18) (DET – L21, L22, L23, L24, L25, L26, L27, L28)
14437	Condenser – 8 gang variable tuning condenser (two 4 gang sections assembled C40, C41, C42, C43, C44, C45, C46, C48, C49, C50, C51)
12882	Core – Adjustable core and stud for oscillator coil
14028	Nut – Jamb nut for adjustable trimmer capacitors
14439	Resistor – 100 ohms – Insulated 1/4 watt (R15)
12261	Resistor – 390 ohms – Insulated 1/4 watt (R2, R6)
12311	Resistor – 1000 ohms – Insulated 1/4 watt (R4)
13714	Resistor – 5600 ohms – Insulated 1/4 watt (R3)
12288	Resistor – 10,000 ohms – Insulated 1/4 watt (R8)
12412	Resistor – 47,000 ohms – Insulated 1/4 watt (R10)
13715	Resistor – 68,000 ohms – Insulated 1/4 watt (R1, R5, R7)
14438	Resistor – 100,000 ohms – Insulated 1/2 watt (R9)
12883	Shield – Oscillator coil shield
11280	Socket – 7 contact det. 6J7 or r-f 6K7 Radiotron socket
11278	Socket – 7 contact osc. 6J7 Radiotron socket
12007	Spring – Retaining spring for core Stock #12882
14436	Switch – Range switch (S1, S2, S3, S4, S5, S6, S7, S8)
	DRIVE ASSEMBLIES
14451	Belt – Vernier dial drive belt
14452	Belt – Main or vernier tuning knob drive belt
14444	Dial – Band indicating dial and cam assembly
14478	Dial – Vernier dial and disc assembly complete with set screws
14446	Disc – Indicator pointer drive disc complete with set screws
14464	Drive – Variable tuning condenser dials and drive assembly complete
14475	Gear – 5 tooth segment gear and connecting link for operating band indicating dial
14476	Gear – Segment gear located on range switch shaft complete with set screw
14449	Idler – Drive belt idler pulley assembly less spring
12908	Indicator – Station selector indicator pointer
8051	Link – Band indicating dial link and roller complete with spring
14447	Pulley – Tuning knob shaft and pulley
14470	Pulley – Vernier dial drive belt pulley and drive disc located on left hand tuning condenser shaft complete with set screws
14472	Pulley – Drive belt pulley located on vernier dial shaft – complete with set screws
14473	Pulley – Large pulley for drive belt complete with friction discs – drives station indicator pointer drive disc
14474	Pulley – Large pulley for drive belt complete with friction discs – drives vernier tuning condenser drive disc and pulley
14445	Screen – Dial lamp shield
12993	Screw – #8-32 x 3/8 headless set screw for disc Stock #14446
4119	Screw – #8-32 x 1/4 headless cup point set screw for shaft Stock #14448 Shaft Stock #14471 and pulley Stock #14470 and gear Stock #14476
4387	Screw – #6-32 x 1/4 headless set screw for pulley Stock 14472
5042	Screw – #8-32 x 1/8 headless set screw for vernier dial Stock #14478
14448	Shaft – Indicator pointer shaft complete with set screws.
14471	Shaft – Shaft and socket complete with set screws – connects pulley Stock #14470 to shaft of left hand tuning condenser
8052	Spring – Tension spring for link Stock #8051
14450	Spring – Tension spring for idler
14453	Spring – Friction drive disc tension spring
14454	Spring – Vernier dial shaft tension spring
14477	Stud – Hex head stud for attaching link to gear Stock #14476
	REPRODUCER ASSEMBLIES
13063	Board – Reproducer terminal board
12640	Bracket – Output transformer mounting bracket and clamp
11234	Coil – Reproducer field coil (L47)
11233	Coil – Reproducer neutralizing coil (L45)
12642	Cone – Reproducer cone and dust cap (L46)
13002	Connector – 7 contact male connector for speaker leads
9720	Reproducer Complete
11229	Transformer – Output transformer (T2)
11886	Washer – Spring washer to hold field coil securely
	MISCELLANEOUS ASSEMBLIES
14455	Cable – 7 conductor speaker cable approximately 72" long complete with 1 male and 1 female connectors
13542	Connector – 7 contact female connector for speaker cable
16836	Connector – 8 contact male connector for speaker cable
13066	Disc – Colored disc and mask for stand-by escutcheons
14456	Escutcheon – Tuning tube and stand-by light escutcheon for Table Model
14457	Escutcheon – Tuning tube and stand-by light escutcheon and crystal for Rack Model
13064	Escutcheon – Station selector dial escutcheon for Rack Model
14458	Escutcheon – Station selector dial escutcheon and crystal for Table Model
14460	Escutcheon – Oscillator control, volume control, band spread, range switch, tuning selectivity and fidelity, knob escutcheon
14461	Escutcheon – Phone jack and suppressor control knob escutcheon
14462	Escutcheon – Stand-by switch and sensitivity control knob escutcheon
12595	Knob – Station selector knob for Rack Model
14459	Knob – Station selector knob for Table Model

5	56000-60000	74	725° 2 "

Circuit Data

Circuit.—Superheterodyne with beat-frequency oscillator for c-w reception, crystal filter, automatic volume control, electron-ray indicator with calibrated signal input (sensitivity) control, and class A pentode output system.

Power-Supply Ratings.—See rating symbol on chassis.

Symbol	*Voltages*	*Frequency (cycles)*
B	105–125	25–60
C	100–130; 140–160; 195–250	40–60

As shipped from the factory, rating "C" instruments are connected for 225-250 volts unless prominently specified otherwise on instrument. Any of these, however, can be converted for operation at 100-117, 117-130 or 195-225 volts when required. Three taps are provided on the primary of the power transformer, a diagram of which is given in Figure 8. All taps are brought out to a terminal board on the top of the transformer and conversion can be made without removing chassis.

Tubes

1 RCA-6K7—Radio-Frequency Amplifier.
1 RCA-6L7—First Detector.
1 RCA-6J7—Oscillator.
2 RCA-6K7—Intermediate-Frequency Amplifiers.
1 RCA-6H6—Second Detector and A.V.C.
1 RCA-6J7—Beat-Frequency Oscillator.
1 RCA-6F5—Audio-Frequency Amplifier.
1 RCA-6F6—Power-Output Amplifier.
1 RCA-5Z4—Full-Wave Rectifier.
1 RCA-6E5—Tuning Indicator.

See diagram on label inside cabinet for locations of tubes and grid leads.

RCA MFG. CO., INC.

Alignment

This receiver was aligned at the factory but should be checked regularly (preferably once every six months) to insure best possible results. Adjustments, when necessary, can be performed easily since all trimmers and core screws are accessible through openings in the external case as shown in Figure 9. If desired, the chassis can be withdrawn upon removal of the front panel and four mounting screws.

The extensive frequency range of this receiver necessitates a more or less involved method of alignment. However, if the following directions are carefully applied, the normal performance of the instrument will be obtained.

Equipment.—The equipment required for placing this receiver in proper alignment consists of an RCA Cathode Ray Oscillograph, Stock No. 9545, or RCA Output Indicator, Stock No. 4317, an RCA Full Range Oscillator, Stock No. 9595, a Tuning Wand and a Non-metallic screw driver or equivalent equipment. The necessity for alignment of the r-f circuits and the direction of required change may be tested with a Tuning Wand. Its use is as follows:

The Tuning Wand, which consists of a bakelite rod having a small brass cylinder installed at one end, and a core of finely divided iron at the other, may be inserted into a tuned coil to obtain an indication of the tuning. With a signal being supplied to the receiver at the alignment frequency of the circuit concerned, each end of the Wand should be placed through the center of the coil. Holes are provided in the r-f coil shields for this test. A change in tuning will be produced by the presence of the brass cylinder or iron core and consequent change of receiver output occurs. If there is a decrease of output when either of the two ends is inserted, the tuning is correct and will require no adjustment. However, should there be an increase of output due to the iron core and decrease with the brass cylinder, an increase in inductance or capacitance is indicated as necessary to bring the circuit into line. The trimmer involved should therefore be increased accordingly. If the brass cylinder end causes an increase in output, while the iron end causes a decrease, reduction of inductance or capacitance will be necessary to bring the circuit into alignment. This will be equivalent to decreasing the trimmer concerned.

NOTE.—I-F adjustments cannot be made by this method on this receiver.

End of Wand Used	Change of Signal Output	Change Req'd. of Trimmer Capacity
Brass	Decrease	None
Iron	Decrease	
Brass	Increase	Decrease
Iron	Decrease	
Brass	Decrease	Increase
Iron	Increase	

I-F Adjustment.—Six adjustments are associated with the three i-f transformers. Their locations on the chassis are shown by Figures 9 and 10. Each must be aligned to the basic frequency of the crystal filter (approximately 460 kc.). The last i-f transformer should be adjusted first, the one preceding it next, and the first transformer last. For such adjustments, proceed as follows:

(a) Connect the "Ant." terminal of the Test Oscillator to the RCA 6L7 1st Detector control grid through a .001 mfd. capacitor, and the "Gnd." terminal to chassis ground. Connect the Output Indicator or Cathode-Ray Oscillograph across the loudspeaker voice coil. Adjust the frequency of the Test Oscillator to 460 kilocycles.

(b) Turn AVC "off" and crystal filter "off" then advance the sensitivity control (clockwise) and the volume control (clockwise), to maximum.

(c) Turn the low-frequency tone control to the "speech" position.

(d) Tune the receiver to Band "A", setting the station selector at a point where no interference is received from local stations or from the RCA-6J7 oscillator tube.

(e) Adjust each of the i-f core screws L-22, L-21, L-20, L-19, L-18, and L-17 in sequence for maximum output as indicated on the Output Indicator or Cathode-Ray Oscillograph.

(f) Turn crystal filter "on" and advance selectivity control counter-clockwise to its mid-position "Max."

(g) Change the frequency of the Test Oscillator *very carefully* to obtain maximum output on the Output Indicator or Cathode-Ray Oscillograph. This process will bring the frequency of the Test Oscillator "in step" with the frequency of the crystal filter. The sharpness characteristic due to the crystal filter will be evident in the sudden increase in output to give the maximum value during this tuning operation.

(h) Then adjust each of the i-f core screws *very carefully* for maximum output. Check this alignment with crystal filter "off" for maximum output. The i-f amplifier is now aligned for maximum sensitivity and selectivity; also to the frequency of the crystal filter.

R-F Adjustments.—Connect the Oscillator output to the antenna and ground terminals of the receiver. Keep the Output Indicator or Cathode-Ray Oscillograph attached to the receiver output as above. For each adjustment, use the minimum signal which will give a perceptible indication on the output device. It may be necessary to reduce the signal input (sensitivity) control slightly due to the high degree of sensitivity of the receiver.

Band "A" (a)—Set the range switch of the receiver to its band "A" position and tune the station selector to a dial reading of 1,400 kc. Tune the Test Oscillator to 1,400 kc. and adjust trimmers C-27, C-15, and C-4 in sequence to produce maximum indicated receiver output.

(b) Shift the Oscillator to 540 kc. and tune the receiver to pick up this signal, disregarding the dial reading at which it is best received. Then adjust trimmer C-26, simultaneously rocking the tuning control backward and forward through the signal, until maximum output is obtained from the combined operations. Repeat the alignment of C-27, C-15, and C-4 as in (a) to correct for any change caused by the adjustment of C-26.

Band "B"—Place the receiver range switch in its Band "B" position and tune the station selector to a dial reading of 6,000 kc. Set the frequency of the Test Oscillator to 6,000 kc. Then adjust trimmer C-25 to give maximum receiver output. Two positions may be found which fulfill this condition. The one of least capacitance is correct. To assure that the right peak has been used, tune the *receiver* to 5,080 kc. and increase the Test Oscillator output. The "image" of the 6,000 kc. Test Oscillator signal will be received at this point if C-25 has been adjusted to the proper point of maximum output. *No trimmer adjustments are to be made during this check.* Return the receiver tuning to 6,000 kc., readjust C-25 if necessary, and then adjust the detector and antenna coil trimmers C-12 and C-3 to produce maximum (peak) receiver output as indicated on the output device.

Band "C"—Turn the receiver range selector to its Band "C" position, and set the tuning control to a dial reading of 15,000 kc. Tune the Oscillator to 15,000 kc. Adjust the oscillator parallel trimmer C-23 to produce maximum receiver output. Two positions of the trimmer will be found which fulfill such a condition. The one of least capacitance is correct. To assure that the right position has been used, check for the "image" of the 15,000 kc. signal which will be received at a receiver dial setting of 14,080 kc. if C-23 is correctly adjusted. An increase in Oscillator output may be necessary. No trimmer adjustments should be made during this check. Return the receiver tuning to 15,000 kc., readjust C-23 if necessary, and then adjust the detector and antenna trimmers C-10 and C-1 to give maximum receiver output.

12. Heterodyne Control Setting

Connect a source of unmodulated carrier of the i-f frequency from the grid of the RCA-6L7 first detector to ground. Turn AVC "off," tone control to "speech" position, crystal filter to maximum selectivity, sensitivity control to maximum, audio volume control partially "on," and beat-oscillator "on."

Rotate the heterodyne control knob to left or right until the heterodyne beat is heard.

Change the frequency of the unmodulated carrier from the Test Oscillator *very carefully* for maximum deflection on the Electron-Ray-Tube indicator. Reduce the signal input if necessary so that the Electron-Ray-Tube does not completely close. The test oscillator is now adjusted to the same frequency as the crystal filter.

Set the heterodyne control knob at its zero position and note whether the heterodyne beat is at zero frequency. If not, proceed as follows:

(a) Rotate the heterodyne control knob to obtain zero beat.

(b) Loosen the knob set screw and turn loosened knob on shaft to its "0" or vertical position.

(c) Tighten up set screw.

The heterodyne control is now adjusted to zero beat at the frequency of the crystal filter.

In the event that the frequency drift is such that the zero beat position of the knob is at or beyond the figure "2" on either side, or outside field of rotation, the following adjustment is necessary:

(a) Turn knob until the set-screw-stop on the knob control shaft, behind the front panel, is approximately vertical, then loosen stop with screw driver.

(b) Turn core stud to obtain zero beat. Use a pair of padded long-nose pliers to rotate the core stud in order to avoid injuring thread.

(c) Turn set-screw-stop over to left (facing front panel) to its horizontal mid-position, and adjust knob control shaft to allow 1/32 to 1/16 in. clearance between front panel and adjacent surface of knob.

(d) Tighten set-screw-stop with pliers to grip core stud, then swing stop to vertical and tighten securely with screw driver.

(e) Proceed as first described for setting knob accurately to zero position at zero beat.

NOTE.—Do not pull control shaft loose from bearing bracket when adjusting core stud.

13. Radiotron Socket Voltages

The voltage values indicated from the Radiotron socket contacts to ground on Figure 9 will serve to assist in locating causes for faulty operation, when existent. Grid cap voltages to ground are zero, except in the cases of the two oscillators the readings of which are not dependent upon power supply but upon the oscillatory condition. Each value as specified should hold within ±20% when the receiver is normally operative at the rated supply voltage. Variations in excess of this will usually be indicative of trouble in the basic circuits. The voltages given on the diagram are actual operating values and do not allow for inaccuracies which may be caused by the loading effect of a voltmeter's internal resistance. This resistance should be duly considered for all readings. The amount of circuit resistance shunting the meter during measurement will determine the accuracy to be obtained, the error increasing as the meter resistance is comparable to or less than the circuit resistance. For the majority of readings, a meter having an internal resistance of 1,000 ohms per volt will be satisfactory when the range used for each check is chosen as high as possible consistent with good readability.

14. Wave Trap Adjustment

With the receiver in operation using its normal antenna, tune station selector to the point at which the intermediate frequency interference is most intense. Then adjust the wave trap trimmer to the point which causes maximum suppression of the interference. This trimmer is adjusted to 460 kc. during manufacture; however, local conditions may require a readjustment, depending upon the interfering frequency.

10. Circuit Arrangement

A schematic diagram of the complete circuit is shown in Figure 3, a wiring diagram illustrating the wiring layout of the radio chassis, and the wiring and connections between radio chassis and front panel controls, is detailed in Figure 6. The loudspeaker wiring diagram and connections to chassis are shown in Figure 7.

The circuit is based on the superheterodyne principle. The radio frequency and audio frequency amplification are balanced in such a manner that the maximum of performance is obtained. The main circuit features are as follows:

(a) **Tuned Circuits.**—A three-section variable condenser tunes the secondary of the antenna transformer, the secondary of the detector input transformer, and the oscillator coil on the A, B and C bands. The D band has only its detector and oscillator tuned. Each tuning range has its own group of r-f and oscillator coils which are selected as desired by operation of the band-change switch. Six adjustable inductance (iron-core) tuned circuits are used in the i-f system, each resonating at 460 kilocycles.

(b) **Band D Tuning.**— The r-f stage is idle when the range switch is turned to its band D position and the signal is fed from the antenna directly to the first detector input circuit. The inductance of this circuit consists of a short length of bus wire to which the antenna lead is tapped at a definite predetermined point. The total length of this inductive wire from the stator of the tuning capacitor to ground represents the secondary of a high frequency auto transformer, while the inductive section, included between the antenna lead tap and ground, forms the primary. Alteration of the dimensions and position of this wiring will change the tuning alignment of the circuit resulting in total lack of operation or seriously poor operation. *It is therefore necessary when servicing to avoid changes in the wiring which includes band D detector and oscillator r-f circuits, unless the arrangement is restored to its exact original condition.* Similar caution should be observed when exchanging by-pass capacitors in these same circuits, since their values, physical positions, length of leads, quality of dielectric and other features are critical, and variations will definitely affect operation of the receiver. The small heater by-pass capacitors and ground terminals installed at the tube sockets are very important in this respect.

(c) **Oscillator Stage.**—The heterodyne oscillator circuit used in this receiver is an improved type, having exceptional frequency stability and uniformity of output over its various tuning ranges. It operates on fundamental frequencies which are fed to the first detector hexode tube (RCA 6L7) on an auxiliary mixing grid. The oscillator generates a signal which is at all times above the frequency of the incoming signal by 460 kilocycles. As shown by the schematic diagram, the cathode of the oscillator tube is above ground potential for r-f while the plate is effectively at ground potential. This particular arrangement, together with the plate and screen series resistors, makes the circuit independent of supply voltage variations in regard to stability and uniformity of output. Separate coils are used for each of the tuning ranges. The switching of the different bands is such as to short circuit certain idle coils which would absorb energy from the circuits used.

(d) **Intermediate Amplifier.**—Two stages of i-f amplification comprising three inductively tuned transformers and two RCA 6K7 tubes are arranged in cascade to operate at 460 kilocycles. The transformers have their primaries as well as their secondaries tuned by adjustable iron cores. Litz wire is used for the windings of all three transformers in order to provide the proper selectivity and gain. The crystal filter is introduced in the first i-f circuit by means of the crystal switch S-11 (Figure 3). A variable air-dielectric capacitor C-36 is operated by the selectivity control.

(e) **Detection and AVC.**—The modulated signal as obtained from the output of the i-f system is detected by an RCA 6H6 double diode tube. The audio frequency secured by this process is passed to the a-f system for amplification and final reproduction. The d-c voltage which results from detection of the signal is used for automatic volume control. This voltage which develops across resistor R-19 is applied as automatic control grid bias to the r-f, first detector and i-f tubes through suitable resistance capacitance filters. A portion of the audio voltage is passed to the volume control through capacitor C-49. The variable resistor (R-27), a manually controlled acoustically tapered potentiometer, selects the amount fed to the first a-f stage.

The frequency generated by the beat-oscillator (457 to 463 k.c.) for c-w reception is applied to the diode plate of the RCA-6H6 second detector tube through the capacitor C-52. This frequency mixes with the incoming intermediate frequency to produce an audio-frequency note which can be heard readily in the loudspeaker or phones. The movable iron core, adjusted by the heterodyne control provides a variable inductance which acts as a vernier control for adjustment of the oscillator output frequency over the required a-f range on either side of the signal intermediate frequency.

(f) **Tuning.**— The electron-ray tuning tube (RCA-6E5) functions as amplifier and indicator. The indicator section comprises a luminescent screen, cathode and control electrode. The detected signal from the receiver is applied through the amplifier section to the control electrode of the indicator section. This control electrode affects the electron stream emitted from the cathode so that the size of the triangular "shadow" on the luminescent screen is determined by the strength of the incoming signal. The actual strength of the incoming signal may be measured by means of the signal input sensitivity control, which adjusts the variable resistor R-5 (8,000 ohms maximum), from ground to the cathode circuits of r-f and i-f tubes.

(g) **Audio Stage.**— The a-f component selected by the arm of the volume control is amplified in the first audio-frequency tube (RCA-6F5). It is then fed to the output tube (RCA-6F6) by means of a resistance-capacitance coupling. This tube is connected as a pentode for best reception and sensitivity. The plate circuit of same is matched to the voice coil of the electrodynamic loudspeaker through a step-down (output) transformer. *Audio tone control* is effected by means of a three-position switch: (1) In the "bass" position the capacitor C-58 (in the RCA-6F6 control grid circuit) is shorted out, and the capacitor C-62 (across the plate circuit) is grounded. This allows full "lows" and reduces the high-frequency response. (2) In the "music" position capacitor C-58 is still shorted out, maintaining the low-frequency response, but C-62 is not grounded and thus also allows full "highs," and (3) In the "speech" position C-58 is introduced into the circuit reducing "lows" and C-62 still allows full "highs."

The phone jack is connected between the high side of the primary winding and ground of the output transformer.

(h) **Power.**— All power voltages are obtained from a full-wave rectifier and filter system connected to the a-c line. The loudspeaker field coil is excited from this system and serves as a filter reactor.

The power transformer may be either the "Standard" or the "Universal" type, according to particular requirements, dependent on the power supply. Diagrams showing wiring connections and color coding of leads, together with primary and secondary resistances, are given in Figure 8.

(i) **Wave Trap.**—The wave trap in the antenna circuit is designed for suppression of interference and includes suitable capacitance, resistance and inductance with a variable capacitor for readjustment to produce maximum effect on any long wave interference in the vicinity of the i-f frequency.

Controls

All controls are located upon the front panel and are identified by adjacent markings.

(a) **Power Switch and Tone Control.**—The first control on the left is a five-position knob operating the a-c line power switch, high-frequency tone control ("Bass"), full tone range contact ("Music"), low-frequency tone control ("Speech"), and "Stand-by" switch, in the sequence given as the knob is turned in a clockwise direction. Power is "off" with this knob in its fully counter-clockwise position. The "Bass" position eliminates "highs" and therefore emphasizes low tones. It reduces static interference due to restriction of the audio response range. The "Music" position gives full tone range reproduction. The "Speech" position re-

RCA MFG. CO., INC.

duces the "lows" and emphasizes the high tones, thus clarifying "boomy" voice reception. The "Stand-by" position disconnects all plate and screen grid tube-supply voltages but leaves the filament supply turned on to keep the receiver "warmed up" and ready for instant operation. It also illuminates the "Stand-by" lamp on the left-hand side of the dial. The "Stand-by" is of special use for eliminating the clicks or thumps of the telegraph transmitter, for preventing acoustical feed-back from a phone transmitter, or an adjacent transmitter from blocking the receiver.

(b) **Signal Input Control.**—The second control from the left rotates on a scale calibrated from 1 to 10,000 and its setting indicates the strength in microvolts of any signal delivered to the receiver, when its adjustment is made in conjunction with the electron-ray tube [see next paragraph (c)]. This control is calibrated on a logarithmic scale by means of a series of dots. The markings are labelled for the major settings only, and the points between these major markings represent respectively two and five times the lower indicated value as the knob is turned in a counter-clockwise direction (1, 2, 5, 10, 20, 50, 100 — —).

(c) **Electron-Ray-Tuning Tube.**—The green illuminated *Electron-Ray-Indicator Tube* (RCA-6E5) at the right-hand side of the dial near the top of the front panel is a visible guide to precise tuning. The deflection of the electron stream by the signal voltage causes a narrowing of the darker sector. Maximum deflection, (*i. e.*, when the area of the light sector is at a maximum) indicates that the receiver is tuned to exact resonance.

Since the electron-ray tube gives a reading of signal strength (at the 2nd detector) it is used in conjunction with the *Signal Input Control* to measure signal input. Tune signal to exact resonance, as just described. Rotate the *Signal Input Control* counter-clockwise to reduce the voltage on the *electron-ray tube*. The point at which a slight deflection (1/64-inch) of the dark sector in the *electron-ray tube* occurs is the value in microvolts of the signal input to the receiver. For code reception the correct setting of the *Signal Input Control* to measure signal input is that at which the light green area just commences to flicker.

When measuring signal strength in microvolts it is immaterial whether AVC control switch is "on" or "off."

The calibrated signal input scale reads microvolts direct for the 160, 80, 40 and 20 meter amateur bands. For the 10 and 5 meter bands, multiply the reading by 10 to obtain microvolts.

The absolute accuracy of signal input values depends upon the sensitivity of the receiver. This is determined by accuracy of alignment, condition of tubes, value of line voltage and similar factors. Relative readings between two or more stations of different signal strengths always give dependable results for comparison. Signal input measurements are also useful for making tests on different types of antennas, for reporting improvements to transmitters at distant amateur stations, and for making charts of signal strength variations.
