MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

Index

Always use this Index to find needed material in this Volume 12, 1952 RADIO Diagram manual. You will find the various makes of radios listed in alphabetical order by manufacturer's name. Under each make, models or chassis are listed in numerical order at the left of the column, while the corresponding pages are listed to the right.

Admiral Corp.		Crosley Corp.		Espey Mfg. Co.

TELEVISION MANUALS

New 1952 TV Manual

This new giant volume of 1952 television factory data will give you everything you need to repair and adjust all present-day TV sets. The television series manuals are amazing bargains and defy competition. The 1952 volume has circuit explanations, 192 pages of alignment facts, test patterns, response curves, waveforms, voltage charts, hints, and dozens of mammoth double-page work-bench diagrams. A virtual treatise on practical television repairs. Price postpaid, only..... **\$3**

1951 TV Another Supreme TV manual covering the year in which 8,000,000 television sets were made. Similar to the volume listed above, but covering all important sets of 1951. Double page diagrams. Large size, 192 pages, 8½x11 inches. Manual style binding. Amazing value at only..... **\$3**

1950 TV Manual includes service data on all popular makes from Admiral to Zenith. Large size plus 10 blueprints, 11x15 inches. Remarkable value. only..... **\$3**

1949 TV Giant volume of 1949 practical television factory data covers every popular set of every make. Gives description of circuits, pages of test patterns, response curves, alignment, waveforms, voltage charts, service hints, and many diagrams on extra large double-spread blueprints. Large size: 8½x11 inches, 192 pages, plus 9 blueprints 11x15 inches, manual style binding, flexible covers. Price, only..... **\$3**

1948 TV Manual similar to the volume above, but covering different popular sets. Includes 8 fold-out blueprints. Large size. Amazing Supreme value at only..... **\$3**

1947 TV & F.M. Covers popular F.M. and television sets of this period. Data on 192 pages, 8½x11 inches, sturdy binding. At your radio jobber or by mail..... **\$2**

RADIO DIAGRAM MANUALS

DIAGRAMS FOR PREVIOUS YEARS

Speed up and simplify all radio repairs. Service radios faster, better, easier, save money and time, use these **SUPREME** most-often-needed diagram manuals to get ahead. At the low cost (only \$2 for most volumes) you are assured of having for every job needed diagrams and other essential repair data on 4 out of 5 sets you will ever service. Clearly printed circuits, parts lists, alignment data, and helpful service hints are the facts you need. Average volume has 192 pages, large size 8½x11 inches. Manual style binding.

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

Admiral

CHASSIS 5A3

MODELS 5A32/12, 5A32/15, 5A32/16
5A33/12, 5A33/15, 5A33/16

ALIGNMENT PROCEDURE

- Turn receiver volume control full on (fully clockwise).
- Use an isolation transformer if available, otherwise connect a .1 mfd. condenser in series with low side of signal generator and connect to chassis.
- Connect output meter across speaker voice coil.
- Use lowest output setting of signal generator capable of producing adequate output meter indication and proceed in the following sequence.

Step	Dummy Antenna in Series with Signal Generator	Connection of Signal Generator (High Side)	Signal Generator Frequency	Receiver Gang Setting	Trimmer Description	Trimmer Designation	Type of Adjustment
1	250 mmfd. condenser	Antenna stator of tuning condenser	455 KC	Gang fully open	2nd IF 1st IF	*A, B *C, D	Maximum output
2	250 mmfd. condenser	Antenna stator of tuning condenser	1620 KC	Gang fully open	Oscillator	E	Maximum output
3	Loop of several turns of wire, or place generator lead close to receiver loop for adequate signal pickup.	No actual connection (signal by radiation)	1400 KC	Tune in generator signal	Antenna	F	Maximum output

Mount and set dial pointer to horizontal position with tuning condenser tuned to 1400 KC generator signal; see illustration below.

*Adjustments A and C made from the underside of the chassis. If IF transformers have hollow core slugs, these adjustments may all be made from the top of the chassis, if you use alignment tool #98A30-7 obtainable from your Admiral distributor. The bottom IF slug adjustment may be reached through the hollow core in the upper slug.

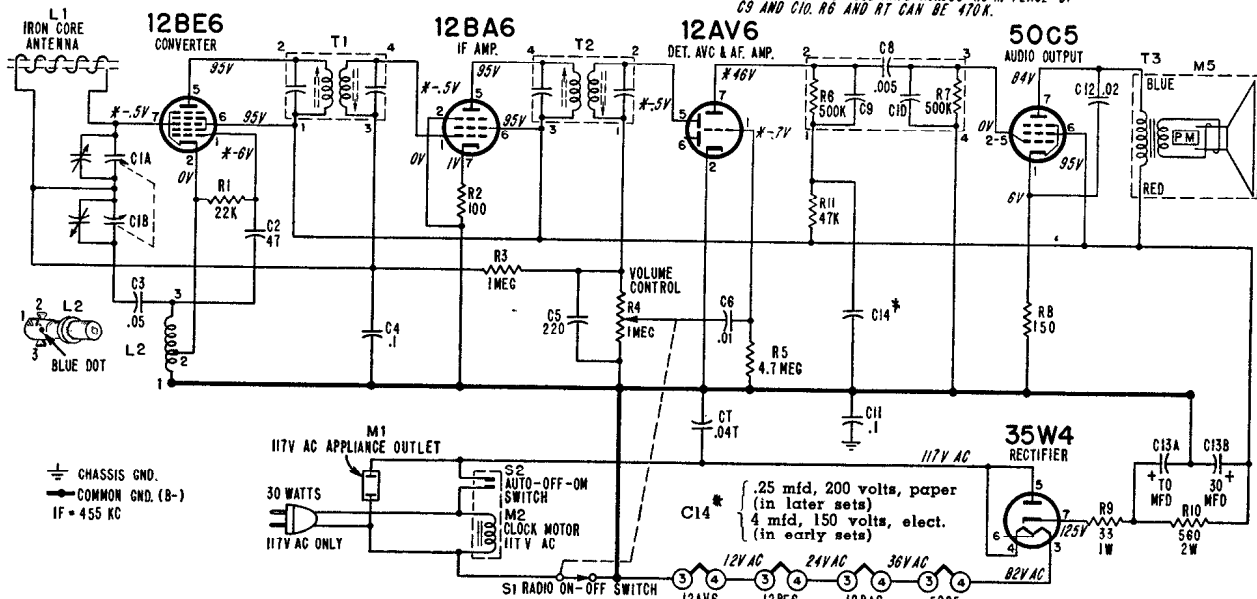

Adjustments A and C made from underside of chassis.

VOLTAGE DATA

Voltages shown on schematic diagram.

- All readings made between tube socket terminals and B minus (terminal of On-Off switch).
- Measured on 117 Volt AC line.
- Volume control minimum; dial turned to low frequency end.
- Voltages measured with Vacuum Tube Voltmeter.

C9 AND C10 TOTAL 250 MMFD. WHEN REPLACING WITH INDIVIDUAL COMPONENTS, USE ANY COMBINATION TOTALING 250 MMFD OR USE 250 MMFD ACROSS R6 IN PLACE OF C9 AND C10. R6 AND R7 CAN BE 470K.

*These voltage readings will be either lower or practically zero if taken with a 1000 ohm-per-volt meter.

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

Admiral

CHASSIS 6C2
MODELS 6C22, 6C23

TUBE AND TRIMMER LOCATION

Adjustments A and C are made from underside of chassis.

POINTER SETTING AND DIAL CORD STRINGING

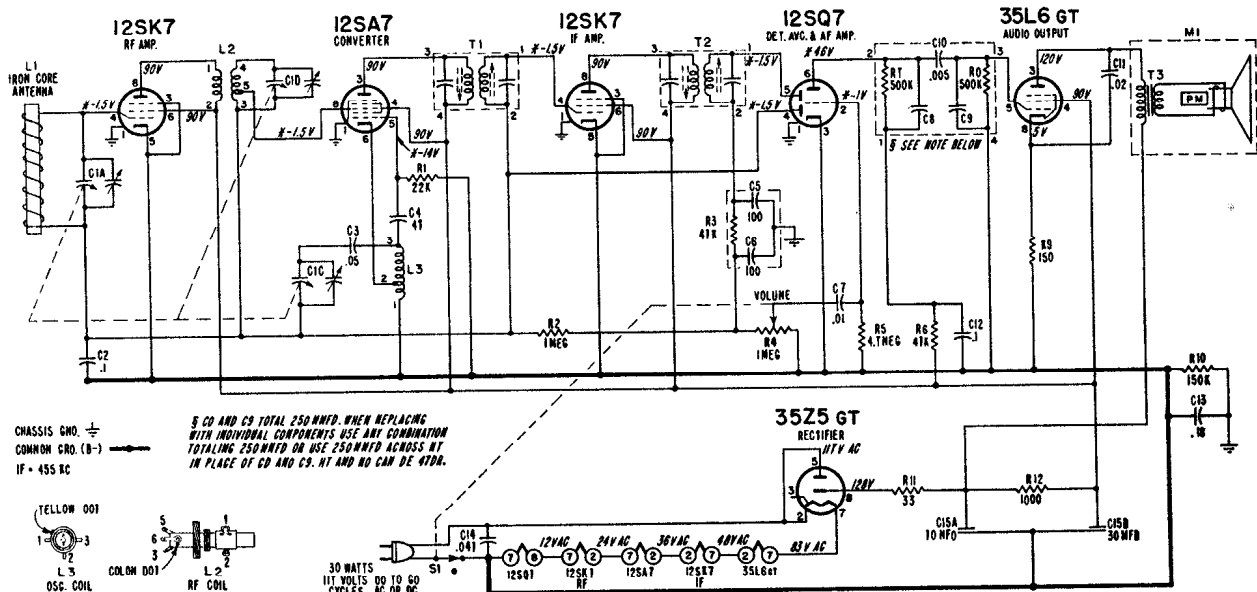

ALIGNMENT PROCEDURE

- Turn receiver volume control full on.
- Connect output meter across speaker voice coil.
- Use lowest output setting of signal generator capable of producing adequate output meter indication and then proceed as outlined in chart below.

Before installing the chassis in the cabinet, fully close the gang condenser. Slide the chassis in the cabinet and mount the dial pointer in a horizontal position (pointed at the dot and dash below 55 on the radio dial scale).

Step	Dummy Antenna in Series with Signal Generator	Connection of Signal Generator (High Side)	Signal Generator Frequency	Receiver Gang Setting	Trimmer Description	Trimmer Designation	Type of Adjustment
1	250 mmfd. condenser	Pin 8 of 12SA7 tube	455 KC	Gang fully open	2nd IF 1st IF	*A, B *C, D	Maximum Output
2	250 mmfd. condenser	Tuning condenser Antenna stator	1620 KC	Gang fully open	Oscillator (on gang)	E	Maximum Output
3	Loop of several turns of wire, or place generator lead close to receiver antenna for adequate signal pickup.	No actual connection (signal by radiation)	1400 KC	Tune in generator signal	RF (on gang)	F	Maximum Output
4	"	No actual connection (signal by radiation)	1400 KC	Tune in generator signal	Antenna (on gang)	G	Maximum Output

*Adjustments A and C are made from underside of chassis.

8

*These voltage readings will be either lower or practically zero if taken with a 1000 ohm-per-volt meter.

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

Admiral

CHASSIS 5L2
MODELS 5L21, 5L22, 5L23

ALIGNMENT PROCEDURE

- Connect a wire jumper between contacts 1 and 4 on clock socket (M2) as shown in illustration below.
 - Turn receiver volume control full on (fully clockwise).
 - Use an isolation transformer if available, otherwise connect a .1 mfd. condenser in series with low side of signal generator and connect to chassis.
 - Connect output meter across speaker voice coil.
 - Use lowest output setting of signal generator capable of producing adequate output meter indication and proceed in the following sequence.
 - Repeat adjustments to insure good results.
- Caution: Do not connect a ground wire directly to chassis.

Step	Dummy Antenna in Series with Signal Generator	Connection of Signal Generator (High Side)	Signal Generator Frequency	Receiver Gang Setting	Trimmer Description	Trimmer Designation	Type of Adjustment
1	250 mmfd. condenser	Antenna stator of tuning condenser	455 KC	Gang fully open	2nd IF 1st IF	*A, B *C, D	Maximum output
2	250 mmfd. condenser	Antenna stator of tuning condenser	1620 KC	Gang fully open	Oscillator	E	Maximum output
3	Loop of several turns of wire, or place generator lead close to receiver loop for adequate signal pickup.	No actual connection (signal by radiation)	1400 KC	Tune in generator signal	Antenna	F	Maximum output

Mount and set dial pointer to horizontal position with tuning condenser tuned to 1400 KC generator signal; see illustration below.

*Adjustments A and C made from the underside of the chassis. If IF transformers have hollow core slugs, these adjustments may all be made from the top of the chassis, if you use alignment tool #98A30-7 obtainable from your Admiral distributor.

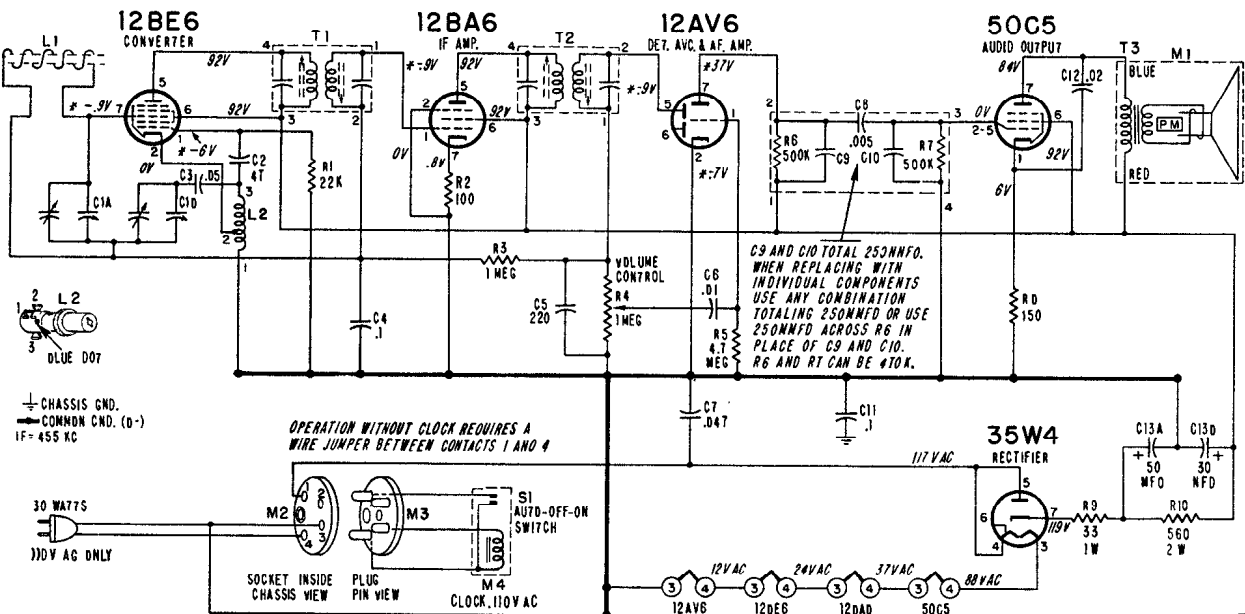

DIAL STRINGING

VOLTAGE DATA

Voltages shown on schematic diagram

- All readings made between tube socket terminals and B minus (negative lead of electrolytic condenser C13).
- Measured on 117 Volt 60 Cycle AC line.
- Volume control minimum; dial turned to low frequency end.
- Voltages measured with Vacuum Tube Voltmeter.

*These readings will be either lower or practically zero if taken with a 1000 ohm-per-volt meter.

Admiral

CHASSIS 5M2, 5Y2
MODELS 5M21, 5M22, 5Y22

ALIGNMENT PROCEDURE

Stop	Dummy Antenna in Series with Signal Generator	Connection of Signal Generator (High Side)	Signal Generator Frequency	Receiver Gang Setting	Trimmer Description	Trimmer Designation	Type of Adjustment
1	250 mmfd. condenser	Tuning condenser, antenna stator	455 KC	Gang fully open	2nd IF 1st IF	*A, B *C, D	Maximum output
2	250 mmfd. condenser	Tuning condenser, antenna stator	1620 KC	Gang fully open	Oscillator	E	Maximum output
3	Loop of several turns of wire, or place generator lead close to receiver antenna for adequate signal pickup.	No actual connection (signal by radiation)	1400 KC	Tune in generator signal	Antenna	†F	Maximum output

Mount dial pointer. Set pointer to horizontal position with tuning condenser tuned to 1400 KC generator signal (see illustration below). Rotate the tuning condenser until the pointer is in a vertical position (900 KC), then slip chassis in cabinet, carefully guiding the pointer so that it locates between the dial escutcheon and the cabinet. Install antenna and chassis mounting bolts. The pointer and escutcheon may be mounted after installing the chassis in cabinet as follows: Set pointer to horizontal position with gang tuned to 1400 KC signal. Place escutcheon on cabinet. With long nose pliers slip the hairpin ends of the escutcheon mounting springs in holes of escutcheon tabs.

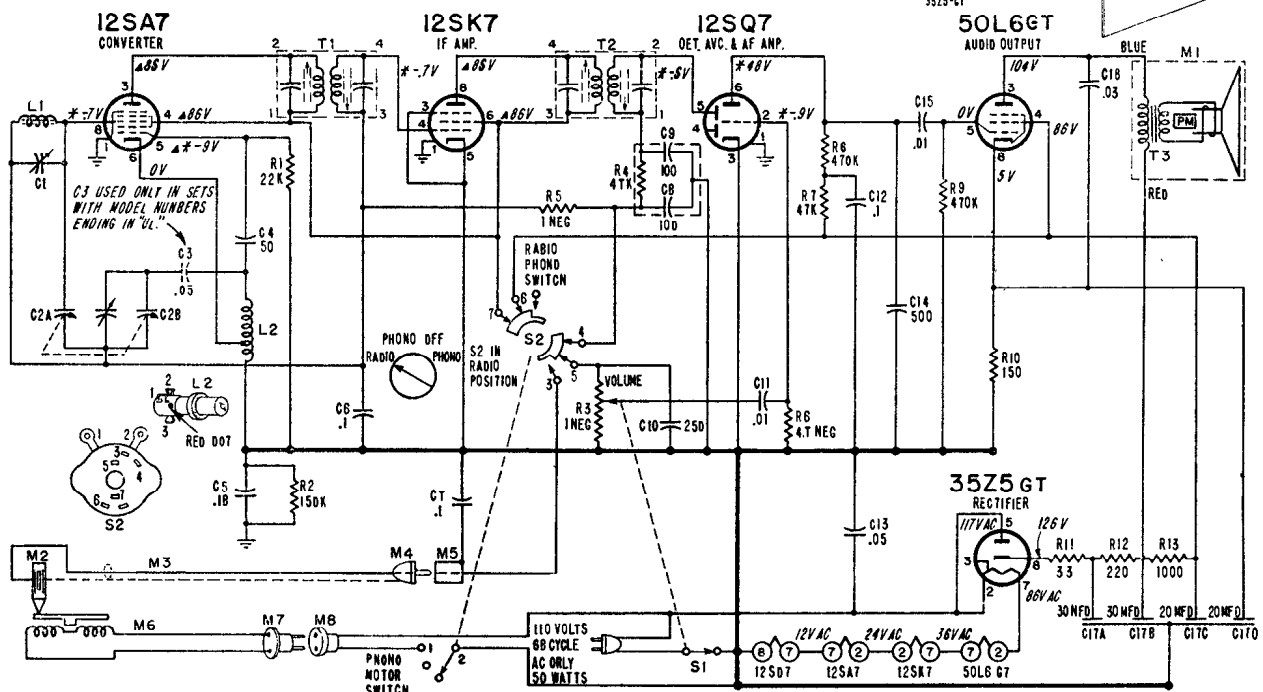

*Adjustments A and C made from the underside of the chassis. If IF transformers have hollow core slugs, these adjustments may all be made from the top of chassis, if you use alignment tool #98A30-7 obtainable from your Admiral distributor. The bottom IF slug adjustment may be reached through the hollow core in the upper slug.

†Antenna Trimmer "F" should be aligned after chassis and antenna are mounted in cabinet.

VOLTAGE DATA

Voltages given on schematic diagram.

- All readings made between tube socket terminals and B minus (terminal of On-Off switch).
- Switch S2 in "Radio" position.
- Measured on 117 Volt 60 Cycle AC line.
- Volume control minimum; dial turned to low end.
- Voltages measured with Vacuum Tube Voltmeter.

10

*These readings will be either lower or practically zero if taken with a 1000 ohm-per-volt meter.
▲ These readings will be zero on "Phono"; all other DC readings may be slightly higher.

RC550, RC550A, RC550GA RECORD CHANGERS

Record Changers RC550, RC550A and RC550GA are identical, except for differences in length of connecting leads and color of plastic trim.

Record Changers RC550X and RC550AX are used in export sets.

Figure 1. RC550 Record Changer, Top View.

OPERATING INSTRUCTIONS

SETTING THE SIZE AND SPEED SELECTOR KNOB: The available record sizes (7, 10, 12) are engraved under the three different speeds (33, STD, 45) on this knob. Rotate the knob until the size of record to be played (under the proper speed), lines up with the indicating dot on the changer pan. (Note that no size number is engraved under "45" since only 7-inch 45 RPM records are available.)

SETTING PUSH-OFF ASSEMBLY: Pivot the Push-off assembly toward the centerpost to play 10-inch records and away from the centerpost to play 12-inch records. For 7-inch records, place the Push-off assembly in the 10-inch position and move the extension arm toward the centerpost.

LOADING AND STARTING: Place a stack of records over the centerpost so that they rest on the record support (64) and the centerpost offset. Records must be the same size and speed. If 10 or 12-inch records are being played, place the record clip on the stack.

The record changer is turned on by placing the function switch on the radio, in the "Phono" position.

REJECTING A RECORD: If the record changer will not trip into change cycle at the end of a record, or if you wish to stop playing a record and start playing the next one, merely rotate the reject knob to the left momentarily.

STOPPING AND UNLOADING: Do not turn the record changer off during change cycle. Turn the phono motor off by turning the function switch on the radio to the center position.

45 RPM ADAPTER: An adapter must be inserted into the center hole of the 45 RPM records in order to play them with this changer.

CHANGE CYCLE

If at all possible, we recommend that you carefully observe the change cycle of a record changer which is operating properly. It is a good idea to rotate the turntable by hand and repeat the change cycle until the function of each part is understood.

The changer operates as follows: The turntable is driven by the motor idler wheel (48), riding against its inside rim. The speed of the turntable is determined by the diameter of the drive shaft (either 78 RPM, 45 RPM, or 33 RPM) which rides against the idler wheel rubber tire (48).

The 78 RPM drive shaft is part of the motor armature. The 33 RPM drive shaft (44) and the 45 RPM drive shaft (45) are moved in and out of position mechanically by the motor shift link (84), which is controlled by the selector cam (89). See figure 4.

Material on Admiral RC500 Changer continued on pages 12 to 18.

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

Admiral RC500, RC500A, RC500GA Record Changers, continued.

Figure 2A. Drive Gear Position Out of Change Cycle.

The changer mechanism is driven during its change cycle by the drive gear (30), which in turn is driven by the geared hub of the turntable. During normal record play, the "dead spot" on the drive gear is held next to the turntable hub by the gear indexing arm (41) and spring (39).

This changer employs a velocity trip, which consists primarily of two parts: the trip motion arm (32), and the gear engagement pawl (33). These parts are mounted near the "dead spot" on the drive gear. See Figure 2A.

During normal record play, the trip slider (36) is moved slowly by the stud on the arm control lever (23) which moves with the tone arm. The stud on the trip slider (36) rides against the trip motion arm (32), moving it very slightly. Since the gear engagement pawl (33) is held against the trip motion arm (32) by the trip friction washer (34), the gear engagement pawl (33) is also moved slightly toward the turntable hub. Since

Figure 2B. Drive Gear Position During Change Cycle.

this movement is only slight, the vertical catch on the gear engagement pawl (33) is just touched and "kicked away" by the lug on the turntable hub. This occurs with each revolution of the turntable until the gear engagement pawl is moved in rapidly enough to be positioned in front of the lug before the next turntable cycle.

This rapid movement only occurs when the trip slider (36) is moved rapidly, by the tone arm, as the needle enters the trip grooves of the record. The gear engagement pawl (33) then moves in front of and engages the lug on the turntable hub. This causes the drive gear (30) to be rotated far enough so that the teeth on the drive gear will engage the teeth on the turntable hub, starting the change cycle. See figure 2B.

The changer can also be tripped by rotating the reject knob to the left momentarily. The stud on the end of the reject arm (88) moves the gear engagement pawl (33) into position to engage the lug on turntable hub.

Fig. 3. RC550 Record Changer with Turntable Removed.

For Individual parts detail, see Figure 9, "RC550 Record Changer, Exploded View."

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

Admiral RC500, RC500A, RC500GA Record Changers, continued.

As the drive gear begins to rotate, the control cam (90) also rotates, since both parts are mounted on the same shaft. See fig. 4. As the control cam rotates clockwise, drive link roller (109) riding against the cam moves the drive link (107), which in turn rotates the control plate (102). As the control plate rotates, the incline tab (102A) rides across the tone arm lift rod (12), lifting the tone arm from the record. The stud on the arm control lever (23) then is engaged by the safety arm (105) (which rotates with the control plate), moving the tone arm away from the centerpost.

When the tone arm is almost clear of the record, the stud on the push-off link (86) (which is pivoted by the control cam), pivots the push-off arm (79) counterclockwise. Since the push-off arm is held to the push-off plate and shaft (60) by two Allen screws, the push-off plate is also pivoted. Just before the control cam reaches half rotation, the tone arm will be positioned as far as possible from the centerpost, and the push-off plate (60) will "push-off" the record to the turntable.

As the control cam (90) rotates through the second half of the change cycle, the push-off plate is returned by the push-off arm return spring (78) and the remainder of the stack of records drops to the record support (64). See figure 1.

At the same time, the tone arm is returned by the set-down spring (98) which causes the set-down indexing stud on the size change plate (99) to ride against the indexing portion of the arm control lever (23).

The tone arm will move toward the record until the set-down indexing stud on the size change plate has reached the indexing point (end of cut-away section) on the arm control lever. After the arm stops moving inward, the lift rod will ride down the control plate incline (102A), and the tone arm will move toward the record.

Just before the tone arm touches the record, the safety arm engages the stud on the set-down change plate (99) and pivots it away from the arm control lever (23); releasing the tone arm.

The set-down point is determined by the position of the set-down change plate (99), which can be set for either 7-inch, 10-inch, or 12-inch.

Fig. 4. RC550 Record Changer, Bottom View, Changer Out of Cycle.

ADJUSTMENTS

When making the following adjustments, keep in mind that the Push-off, Trip, and Set-Down mechanisms function independently. One of these units may become inoperative without affecting the other two.

VELOCITY TRIP MECHANISM

This record changer uses a velocity type trip, which depends upon a rapid movement of the tone arm toward the centerpost in any area between 2 7/8" to 7/8" from the center of the record. This trip requires no adjustment. However, in order for the changer to trip properly, there must be sufficient friction between the trip motion arm (32) and the gear engagement pawl (33). If the friction is lost, a small amount of lubricant (such

as lubriplate #110) should be placed between these parts. If this does not help, it may be necessary to replace the trip friction washer (34). See Figure 2A.

SET-DOWN ADJUSTMENT

Adjustment of the set-down point, is made by adjusting the set-down adjusting screw (6). See Figure 5. The tone arm will automatically set-

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

Admiral RC500, RC500A, RC500GA Record Changers, continued.

Figure 5. Set-Down and Height Adjustments.

down properly on 7-inch or 12-inch records if the set-down adjustment is made properly on a 10-inch record. The set-down adjusting screw is accessible through the hole in the right side of the tone arm. Turning this screw in moves the set-down point of the tone arm closer to the centerpost, and turning this screw out moves it away from the centerpost. Make this adjustment as follows:

1. Place the size and speed selector knob (26) in the "78-10" position.
2. Rotate the reject knob to the left momentarily. Then start to rotate the turntable clockwise by hand.
3. As the change cycle is almost completed, and the tone arm just starts to move down towards the turntable, place a ruler against the centerpost and check the distance between the near side of the centerpost and the needle. This distance should be between $4 \frac{10}{16}$ " and $4 \frac{11}{16}$ ".
4. If the 10-inch adjustment is correct, the needle should set-down between $5 \frac{19}{32}$ " and $5 \frac{22}{32}$ " from the near side of the centerpost on 12-inch records, and between $3 \frac{1}{4}$ " to $3 \frac{5}{32}$ " on 7-inch records.

ADJUSTING THE TONE ARM HEIGHT

This record changer is so designed that the tone arm will clear the bottom record of a stack to be played if the needle is $\frac{1}{4}$ " above the changer pan when the changer is not in change cycle and $1\frac{3}{8}$ " above the turntable during change cycle. See Figure 6. With proper tone arm height setting, the tone arm will lift high enough during change cycle to clear a complete stack of records of any type on the turntable. This stack may consist of as many records as specified on page 1. Make this adjustment by placing the size and speed selector knob (26) in the "78-10" position, check

Figure 6. Checking Tone Arm Height.

the distance between the needle and the changer pan with the changer out of change cycle. If the needle is more than $\frac{1}{4}$ " above the pan, turn the lift adjustment screw (14, Figure 5) counterclockwise; if less, turn clockwise.

POSITIONING RECORD SUPPORT (64)

If the record support is not positioned evenly under the bottom record of a stack to be played, one side of the record may drop to the turntable before the other. With the push-off assembly in the 10-inch position, place a 10-inch record over the upper portion of the centerpost so that the edge of the record fits against the edge of the record support (64). See figures 4 and 7. The contour of the record SHOULD follow the contour of the record support. If these contours do not match, position the push-off assembly as follows:

CAUTION: Be sure that the "testing" record has an even edge. For best results, try more than one record.

1. Loosen the screw (124) that holds the push-off positioning arm assembly (75) stationary.
2. Grip the push-off assembly and pivot it to the point where the edge of the record support "lines up" with the edge of the record.
3. Remove the record and tighten the screw (124).
4. Load the changer with a stack of 10-inch records, and "reject" the entire stack to the turntable. Check to see that all records drop to the turntable evenly.

ADJUSTING DISTANCE BETWEEN RECORD SUPPORT (64) AND CENTERPOST (24)

If records do not push-off satisfactorily, or more than one record drops to the turntable during change cycle, it may be necessary to adjust the distance between the centerpost and the record support. See Figures 4 and 8. Make this adjustment as follows:

1. Place the push-off assembly in the 10-inch position.
2. Hold the centerpost as far away from the push-off assembly as possible.
3. Measure the distance from the edge of the record support (64) to the inside edge of the offset shelf on the centerpost. This distance should be between $4 \frac{29}{32}$ " and $4 \frac{31}{32}$ ".
4. If it is necessary to adjust for this distance, loosen the three screws (71) holding the plastic push-off housing (68) to the changer pan.
5. Tighten the three screws, and recheck the distance. Place a stack of records (any size) on the changer, and "reject" each record in the stack to the turntable. Check to see that each record is pushed off satisfactorily. If one side of the record drops to the turntable before the other, it may be necessary to make the "Positioning Record Support (64)" adjustment.

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

Admiral RC500, RC500A, RC500GA Record Changers, continued.

Figure 7. Positioning Record Support with 10-inch Record.

Figure 8. Checking Distance from Centerpost to Record Support.

REPLACING THE PUSH-OFF INDEX PLATE (77)

Position the push-off index plate (77) as shown in figure 10. Be sure that the Allen screw which is called out "falls into" the milled slot.

Figure 10. Installing Push-Off Index Plate.

REPLACING SELECTOR CAM (89)

When replacing the selector cam (89), place the size and speed selector knob (26) so "STD-10" lines up with the indicating dot, hold the selector cam in the position shown in Figure 4, and install.

REPLACING CONTROL CAM (90)

Before replacing the control cam (90), be sure that the changer is out of change cycle. Place the control cam in the position shown in Figure 4, and install.

REPLACING THE PUSH-OFF ARM (79)

Place push-off arm (79) over the push-off shaft so that the Allen screw which is called out below fits against the "flat section" of shaft.

Figure 11. Installing Push-Off Arm.

SERVICE AND REPAIR

LUBRICATION

DO NOT apply grease or oil to the trip slider (36). Also, under normal operating conditions, the motor should never require oiling.

Friction can sometimes be increased between the gear engagement pawl (33) and the trip motion arm (32), by placing a small amount of Lubriplate #110 between these two parts. Ordinary Vaseline can generally be used as a substitute for Lubriplate #110.

The rest of the changer should be lubricated with grease (such as Lubriplate #107) whenever it comes into the shop for repair or adjustment. A good automobile chassis grease can be used for this purpose. All pivot and friction points should be greased.

The powdered iron roller (109) and oilite bearings (used in the turntable hub and tone arm base) may be lubricated with SAE No. 20 oil.

REMOVING AND REPLACING TURNTABLE

To remove the turntable, first remove the turntable retaining clip (51). Be sure that the changer is not in change cycle, and then, grasp the turntable by its edges and lift up. Before replacing the turntable, make sure that the changer is not in change cycle. The pickup arm should be positioned away from the turntable. In replacing the turntable, force is not needed to seat it. Make certain, however, that the idler wheel of the motor has been pushed in towards the centerpost and that the idler wheel is making contact with the inner side of the turntable flange. The idler wheel should be pushed in with a screwdriver or similar flat tool. Do NOT push toward the rear of the changer.

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

Admiral RC500, RC500A, RC500GA Record Changers, continued.

RECORD CHANGER TROUBLE SHOOTING

GROOVE SKIPPING

Anything that may cause a drag on the tone arm will contribute to groove skipping. For example, a worn needle will tend to skip grooves. Another possibility is that the Lubriplate (lubricant) between the gear engagement pawl (33) and the trip motion arm (32) may have become excessively tacky after the changer has been in use for some time.

RECORD SLIPPING (45 RPM RECORDS)

Slipping of 45 RPM records may be due to any of the following causes:

1. The 45 RPM adapter nibs may be deformed, may not fit tight enough in the record, or may be cocked. Be sure that the records are not warped. If records have the fibre type 45 RPM adapter, replace them with the plastic type. The plastic type adapter (supplied with later production sets) will fit in the record better and will have sharper nibs. Only the plastic type adapters will be supplied as service replacements. An envelope containing 12 adapters is available under part number 48A8-1.
2. Needle pressure may be too great for this type of record. Try removing a tone arm weight (121), part number 414A45. Two of these weights were used with the 409A13-1 cartridge, and one weight was used with the 409A13 cartridge.

ERRATIC TRIP ACTION

Erratic trip action may be caused by failure of the trip slider return spring (102B) to return the trip slider (36) to its proper position as the changer goes through cycle.

Check the trip slider return spring (102B) for proper tension. Check the trip slider (36) for sticking or binding.

CHANGE IN DRIVE GEAR AND STUD ASSEMBLY (30)

Run 5

Early production record changers (below Run 5) used a drive gear and stud assembly (30) with a removable pivot stud (31), see figure 9.

Later production record changers (stamped Run 5 or higher) use a drive gear and stud assembly (30) with the pivot stud riveted to the drive gear.

The early drive gear and stud assembly, part number G400A532 can be replaced with the later drive gear and stud assembly, part number G400A587. However, note that it will be necessary to order a trip pivot hub (128), part number 402A292, and a retaining ring for a 1/8" stud (129), part number 401A355-6.

Changer Will Not Trip.

1. Check to see that the trip slider (36) moves freely.
2. Apply small amount of grease between the trip motion arm (32) and the gear engagement pawl (33).
3. Check tension on trip friction washer (34). If necessary, replace with new washer.
4. Check for grease or oil on trip slider.
5. Check for broken, loose, or misplaced trip slider return spring (102B, Figure 4). It may have slipped over the stud on the slider.

Changer Repeatedly Trips into Change Cycle.

1. Check tension of gear indexing spring (39).
2. Check for bent trip slider return spring (102B, Figure 4).
3. Check for bent trip slider (36).

Tone Arm Does Not Set-Down Properly.

1. Check set-down adjustment. See "Set-Down Adjustment" on page 13.
2. Check to see that size and speed selector knob (26) has locked into position.
3. Check for broken, weak, or missing control plate return spring (108).

Tone Arm Skips Across Records.

1. Check to see that the cabinet is level.
2. Check for worn needle.
3. Check height adjustment.

Changer Causes Rumble or Noise.

1. BE SURE that the shipping screws (72) on each side of changer pan have been removed.
2. Check for any mechanical rub near the 3-speed motor.
3. Check for broken float spring (74).

Records Do Not Push Off or More Than One Record Drops to the Turntable.

1. See "Adjusting Distance Between Record Support and Centerpost" on page 14.
2. Check for broken, missing, or weak push-off return spring (78). The push-off plate (60) may not be returning correctly.
3. Check to see that the push-off assembly is properly locked into position.
4. Check to see that no foreign material is between record support (64) and push-off plate (60).

Changer Trips Into Change Cycle Before Finishing Record.

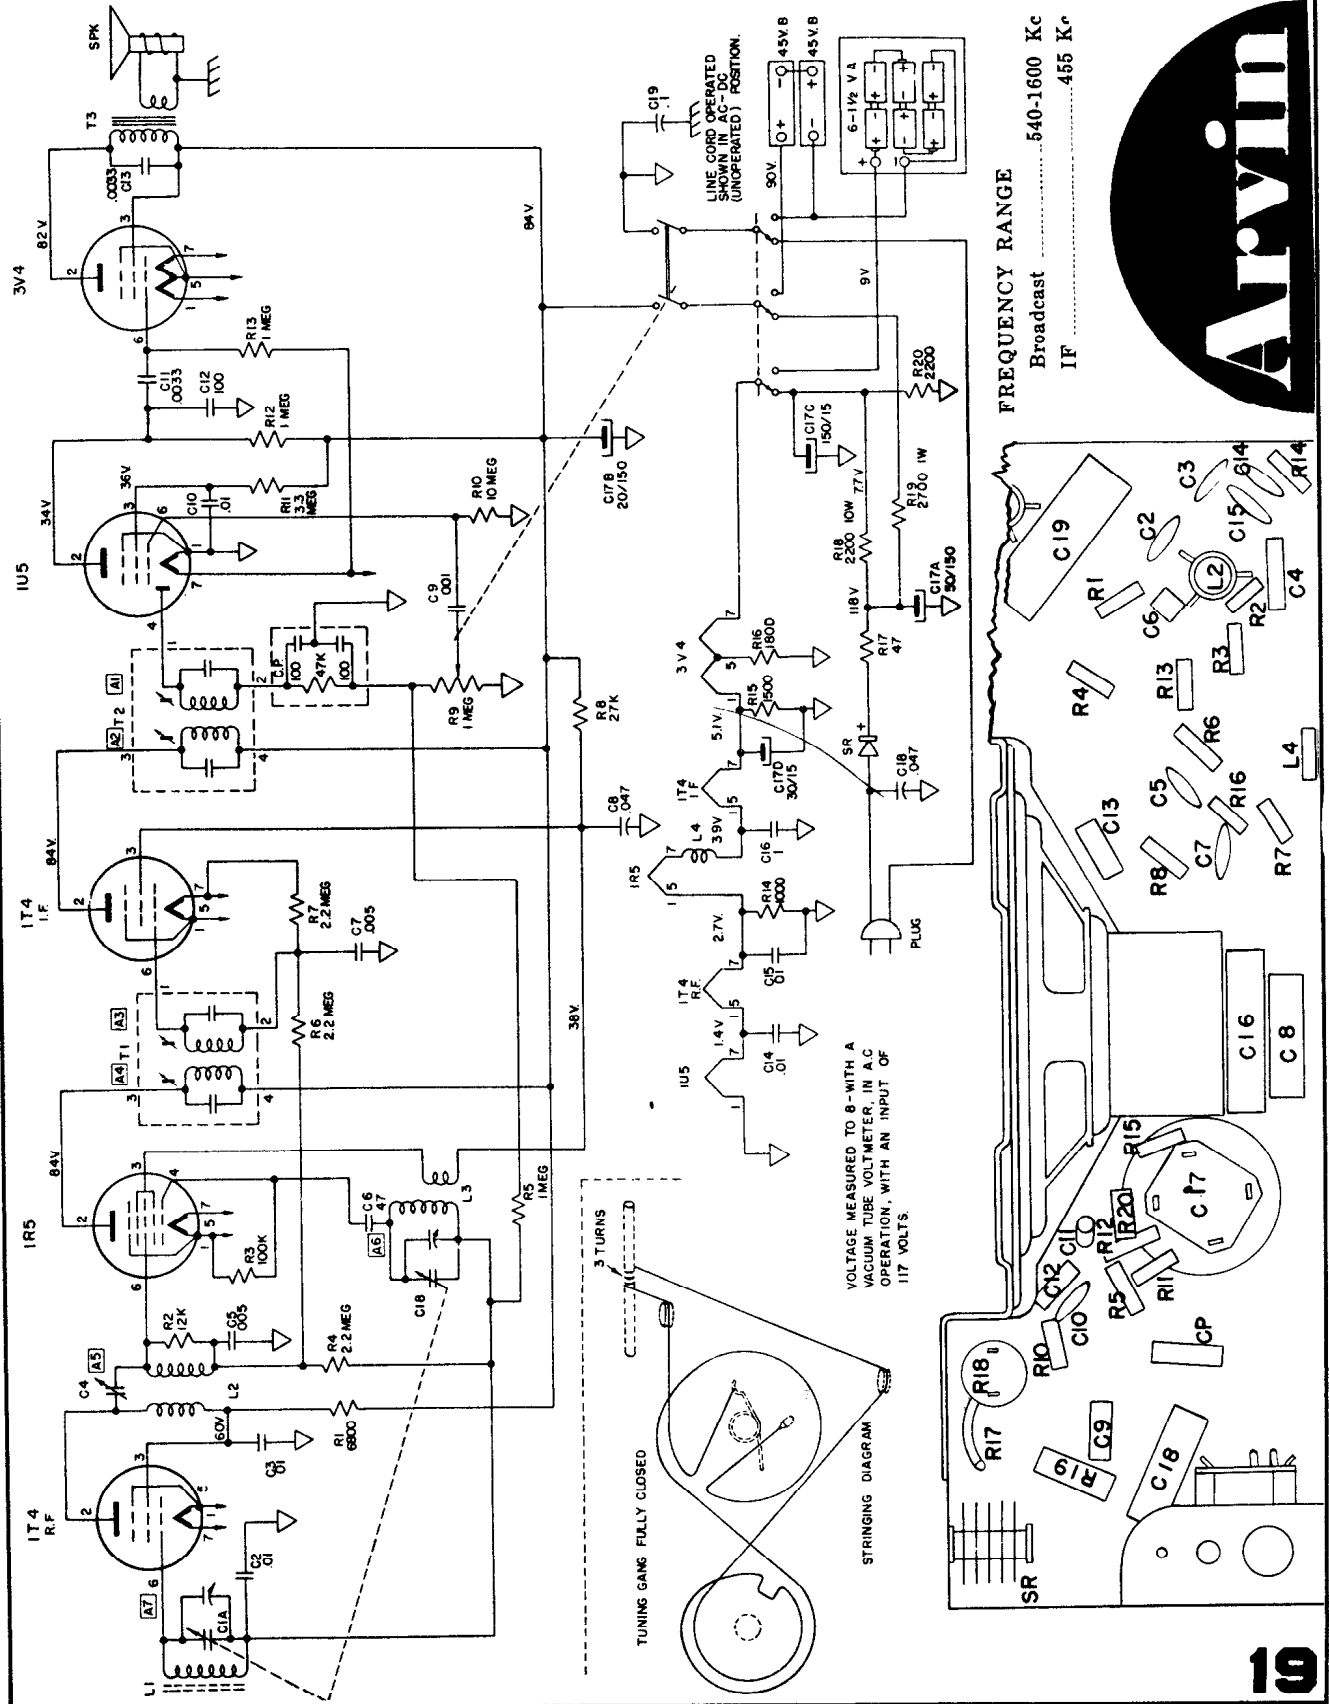

1. Check for foreign material between trip motion arm (32) and engagement pawl (33).
2. Check for bent trip slider return spring (102B, Figure 4).
3. Check for bent trip slider (36).

Changer Stalls in Change Cycle.

1. Idler wheel (48) rubber tire may have foreign material on it. Try cleaning it with carbon tetrachloride solution.
2. Motor drive belts (43) may be slipping. If necessary, replace with new belts.
3. Be sure push-off assembly locks in position.

ARVIN RADIO

The circuit on this page is exact for Model 580TFM, Chassis RE-313, while Chassis RE-310, used in Models 582CFB and 582CFM, has an extra position on SW.1 for phono switching and required additional wiring. Alignment information for all these models is given on the next page.

TECHNICAL INFORMATION

- AM Tuning range — 540 Kc. to 1600 Kc. Intermediate Frequency 455 Kc. I. F. and R. F. measurements made at 500 milliwatts output — approximately 1.27 volts on a receiver type voltmeter connected across speaker voice coil. Approximate input for 500 MW output: I. F. 300 uv; R. F. with standard loop: at 600 Kc. 1200 uv/m; at 1000 Kc. 900 uv/m; at 1400 Kc. 800 uv/m.
- FM Tuning range — 88 megacycles to 108 megacycles. Intermediate frequency 10.7 megacycles I.F. and R.F. measurements made at 500 milliwatts output — approximately 1.27 volts on a rectifier type voltmeter connected across speaker voice coil. Approximate input for 500 MW output: I. F. 300 uv; R. F. "Absolute Measurements": 91 megacycles 100 uv; 105 megacycles, 100 uv.

ALL VOLTAGE MEASUREMENTS ARE MADE WITH AN ELECTRONIC VOLTMETER WITH A LINE VOLTAGE OF 117V. AC WITH NO SIGNAL. ALL VOLTAGE READINGS GIVEN ARE POSITIVE.
 ⊕ INDICATES MICA OR CERAMIC COND. VALUES SHOWN IN MMFD.
 ⊚ INDICATES PAPER TUBULAR COND. VALUES SHOWN IN MFD.
 ⊚ INDICATES ELECTROLYTIC COND. VALUES SHOWN IN MFD.

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

ARVIN RADIO

Models 580TFM, 582CFM, and 582CFB,
Chassis RE-310 and RE-313, continued.

ALIGNMENT PROCEDURE

Output meter connection Across speaker voice coil
 Output meter reading to indicate 500 MW 1.27 volts
 Generator Modulation 30%, 400 cycles
 Position of volume control Fully clockwise

Set dial pointer Horizontal, variable condenser closed
 Set band switch To left for AM alignment, right for FM alignment

AM ALIGNMENT

Position of Variable	Generator Frequency	Dummy Ant.	Generator Connection (high)	Generator Connection Ground Lead	Adjust Trimmers In Order Shown For Max. Output	Trimmer Function
Open	455 Kc	.05 mfd.	Mixer Grid	Chassis	A1, A2, A3, A4,	I. F.
Open	1650 Kc		*Test Loop	Test Loop	A5	Oscillator
1400 Kc	1400 Kc		*Test Loop	Test Loop	A6	Antenna
**600 Kc	600 Kc		*Test Loop	Test Loop	Check Point	Antenna

* Connect generator lead to Standard Hazeltine Test Loop, Model 1150, placed two feet from the set loop, or three turns of wire about six inches in diameter, placed about one foot from the set loop. Or the generator can be connected with the high side lead to the AM antenna screw terminal and the ground lead to the chassis.
 **With a generator signal of 600 Kc, tune the set to the point where maximum output is obtained, which should be approximately 600 Kc on the dial. Adjust antenna section plates of variable for maximum output. The alignment procedure should be repeated in the original order for greatest accuracy.
 Always keep the output from the signal generator at its lowest possible value to make the A. V. C. action of the receiver ineffective.

FM ALIGNMENT

- Turn band switch to FM, (right).
- Connect (FM) I. F. generator to the second 6BA6 I. F. amp. grid, (lug No. 1) through a .01 uf mica dummy. Connect oscilloscope across volume control. With the I. F. generator tuned to 10.7 mc with 150 Kc deviation, and the same audio voltage used as horizontal sweep on the scope that is used to modulate the generator, adjust the ratio detector transformer slugs A7-A8 for the characteristic "S" curve (See Fig. 1), with maximum vertical height on the scope. After this adjustment the top slug of the ratio detector should not be moved during the rest of the alignment.
- Connect I. F. generator to mixer grid through .01 mica dummy. Using 2 1/2 Kc deviation at 10.7 Mc, adjust for maximum output. Maximum output may be indicated by maximum vertical height on the scope or maximum voltage on a standard output meter across the voice coil of the receiver. After the two I. F. transformers have been aligned the bottom slug A8 of the ratio detector should also be peaked.
 The characteristic "S" curve of the complete I. F. channel should be checked by applying a 10.7 Mc signal with 150 Kc deviation to the mixer grid and observing the "S" curve on the scope. It should not be very much different from that observed in step 2.
- Use R. F. generator with 2 1/2 Kc deviation. With the variable condenser completely open and Signal Generator tuned to 108.5 Mc adjust oscillator trimmer A12 (small ceramic trimmer) for maximum reading on output meter.
 Then tune receiver to low end of band (variable completely closed) and Signal Generator to 87.5 Mc. If the receiver does not tune to this frequency the FM oscillator coil L4 will either have to be squeezed together or lengthened to cover the band, (squeezing lowers and lengthening raises the frequency). Any change in the coil will have to be completed by the trimmer at the high end of the band.
- With the same Signal Generator connections as per paragraph 4 tune Signal Generator and set to 105 Mc. Tune R. F. trimmer A13 for maximum output at the same time rock variable back and forth through the frequency. (Rocking is necessary because slight oscillator pulling causes erroneous maximum readings).
 Tune Signal Generator and set to 90 Mc. Adjust R. F. coil L3 length for maximum output by squeezing or lengthening. Any change in the coil will have to be compensated at 105 Mc by the R. F. trimmer A13.
- After Steps 4 and 5 are finished check calibration and band coverage. Steps 4 and 5 may have to be repeated if set is off calibration. Band coverage should be 87.5 Mc to 108.5 Mc. Sensitivity should be approximately 100 uv at 105 Mc, 98 Mc and 90 Mc.

RADIO CHASSIS
C-312

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

ANDREA RADIO CORP. Model P-163, Three-Way, Three-Band Portable.

I.F. ALIGNMENT Set signal generator to 455 KC. Turn band selector switch of receiver to band 1. Connect high side of generator through a .1 mfd. condenser to stator side of antenna section of gang condenser. Ground side of generator to chassis. Connect a 0-1 volt copper oxide rectifier meter across voice coil of speaker. Align two trimmers on top of each I.F. transformer for maximum output. This completes the I.F. alignment.

R.F. ALIGNMENT Connect copper oxide type rectifier meter across speaker voice coil. Connect high side of generator through a 200 mmf. condenser to antenna post "A" on Icop. Ground side of generator to chassis. Set generator to 1500 KC, the dial pointer to 1500 KC, Band switch to Band 1, and adjust Band 1. Adjust band 1 antenna shunt trimmer on loop (see location on diagram). Set signal generator at 600 KC and dial pointer on set at 600 KC. Adjust band 1 series oscillator trimmer (see diagram for location) for maximum output. While this adjustment is being made, rotate the tuning control slightly back and forth for each small adjustment of the oscillator condenser, otherwise the alignment will not be accurate. Set the signal generator back to 1500 KC and retouch antenna shunt trimmer band 1. This completes band 1 alignment.

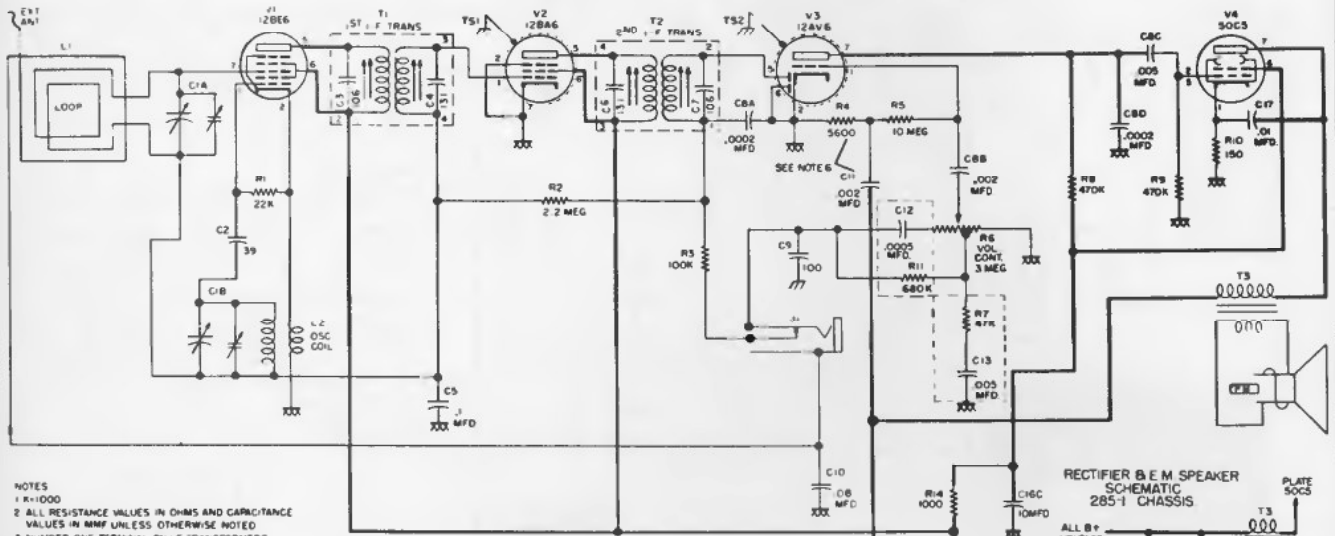

BAND 2 ALIGNMENT Replace 200 mmf. condenser with 400 ohm resistor. Set signal generator to 6.0 megacycles and dial to 6.0 mc. Turn waveband switch to band 2. Adjust Band 2 oscillator shunt trimmer for maximum output. Adjust Band 2 antenna shunt trimmer on loop at 6.0 mc. for maximum output.

BAND 3 ALIGNMENT Set signal generator 18 mc. and dial to 18 mc. Turn band switch to Band 3. Use 400 ohm antenna dummy. Adjust Band 3 oscillator shunt trimmer for maximum output, noting that the setting is not the image frequency. Adjust Band 3 antenna shunt trimmer on loop for maximum output. During this adjustment, rotate the gang condenser back and forth slowly for each trimmer setting or poor alignment will result. After alignment, check to see that the setting is not on the image frequency.

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

Emerson Radio

Models 653B and 702B, Chassis 120136-B.

See next page for circuit diagram.

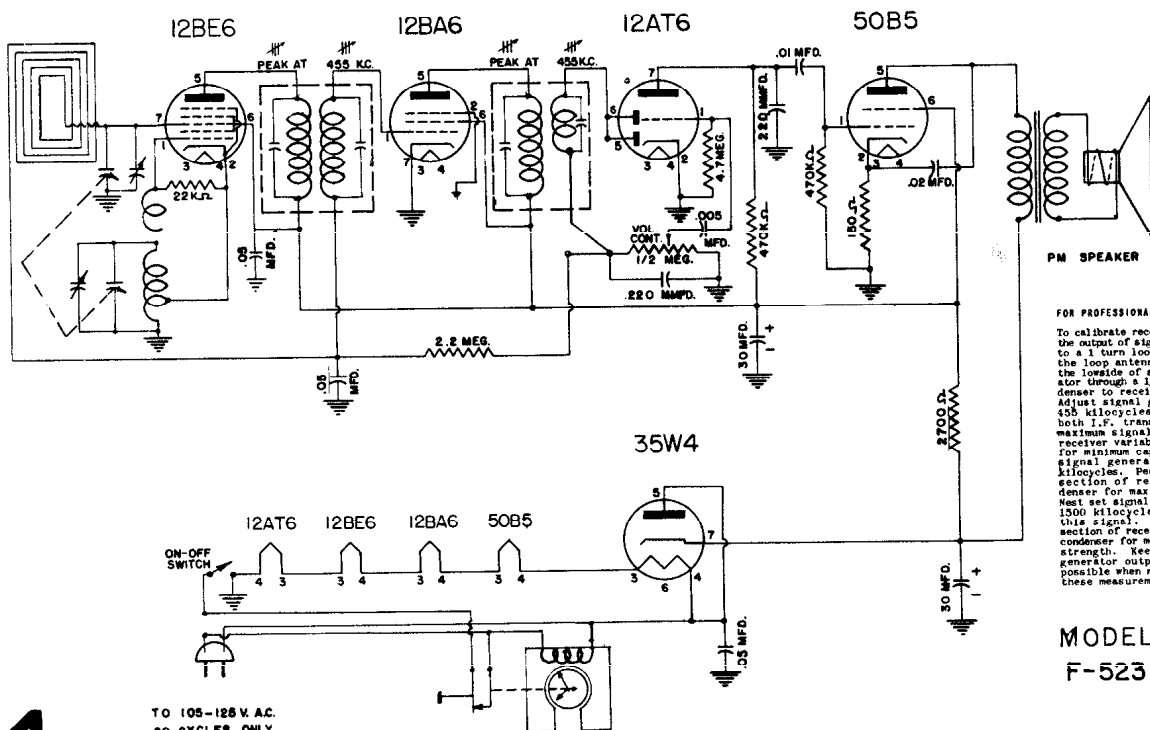

ALIGNMENT

To set pointer, turn variable condenser fully closed and set pointer at mark near left end of dial backplate. Use isolation transformer if available. If not, connect a 0.1 mfd. condenser in series with low side of signal generator and chassis. Volume control should be at maximum position; output of signal generator should be no higher than necessary to obtain an output reading. Use an insulated alignment screwdriver for adjusting.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	METER OUTPUT	ADJUST	REMARKS
1	0.1 mfd.	High side to stator of rear section of tuning condenser. Low side to chassis.	455 kc	Variable condenser fully open.	Across voice coil.	A1, A2, A3, A4	Adjust for maximum output. If isolation transformer is not used, reduce dummy antenna to 0.001 mfd. to reduce hum modulation.
2	200 mmfd.	High side to external antenna lead. Low side to external ground lead.	1620 kc	Variable condenser fully open.	Across voice coil.	A5	Adjust for maximum output.
3	200 mmfd.	High side to external antenna lead. Low side to external ground lead.	1400 kc	Tune for maximum output.	Across voice coil.	A6	Adjust for maximum output.

DEWALD RADIO MANUFACTURING CORP.

MODEL F-523

FOR PROFESSIONAL SERVICEMEN

To calibrate receiver connect the output of signal generator to a 1 turn loop coupled to the loop antenna. Connect the low side of signal generator through a 1/10 mfd. condenser to receiver chassis. Adjust signal generator to 455 kilocycles and adjust both I.F. transformers for maximum signal. Open the receiver variable condenser for minimum capacity. Set signal generator at 1720 kilocycles. Peak oscillator section of receiver condenser for maximum signal. Next set signal generator at 1500 kilocycles. Tune in this signal. Adjust A.F. section of receiver variable condenser for maximum signal strength. Keep the signal generator output as low as possible when making all of these measurements.

MODEL F-523

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

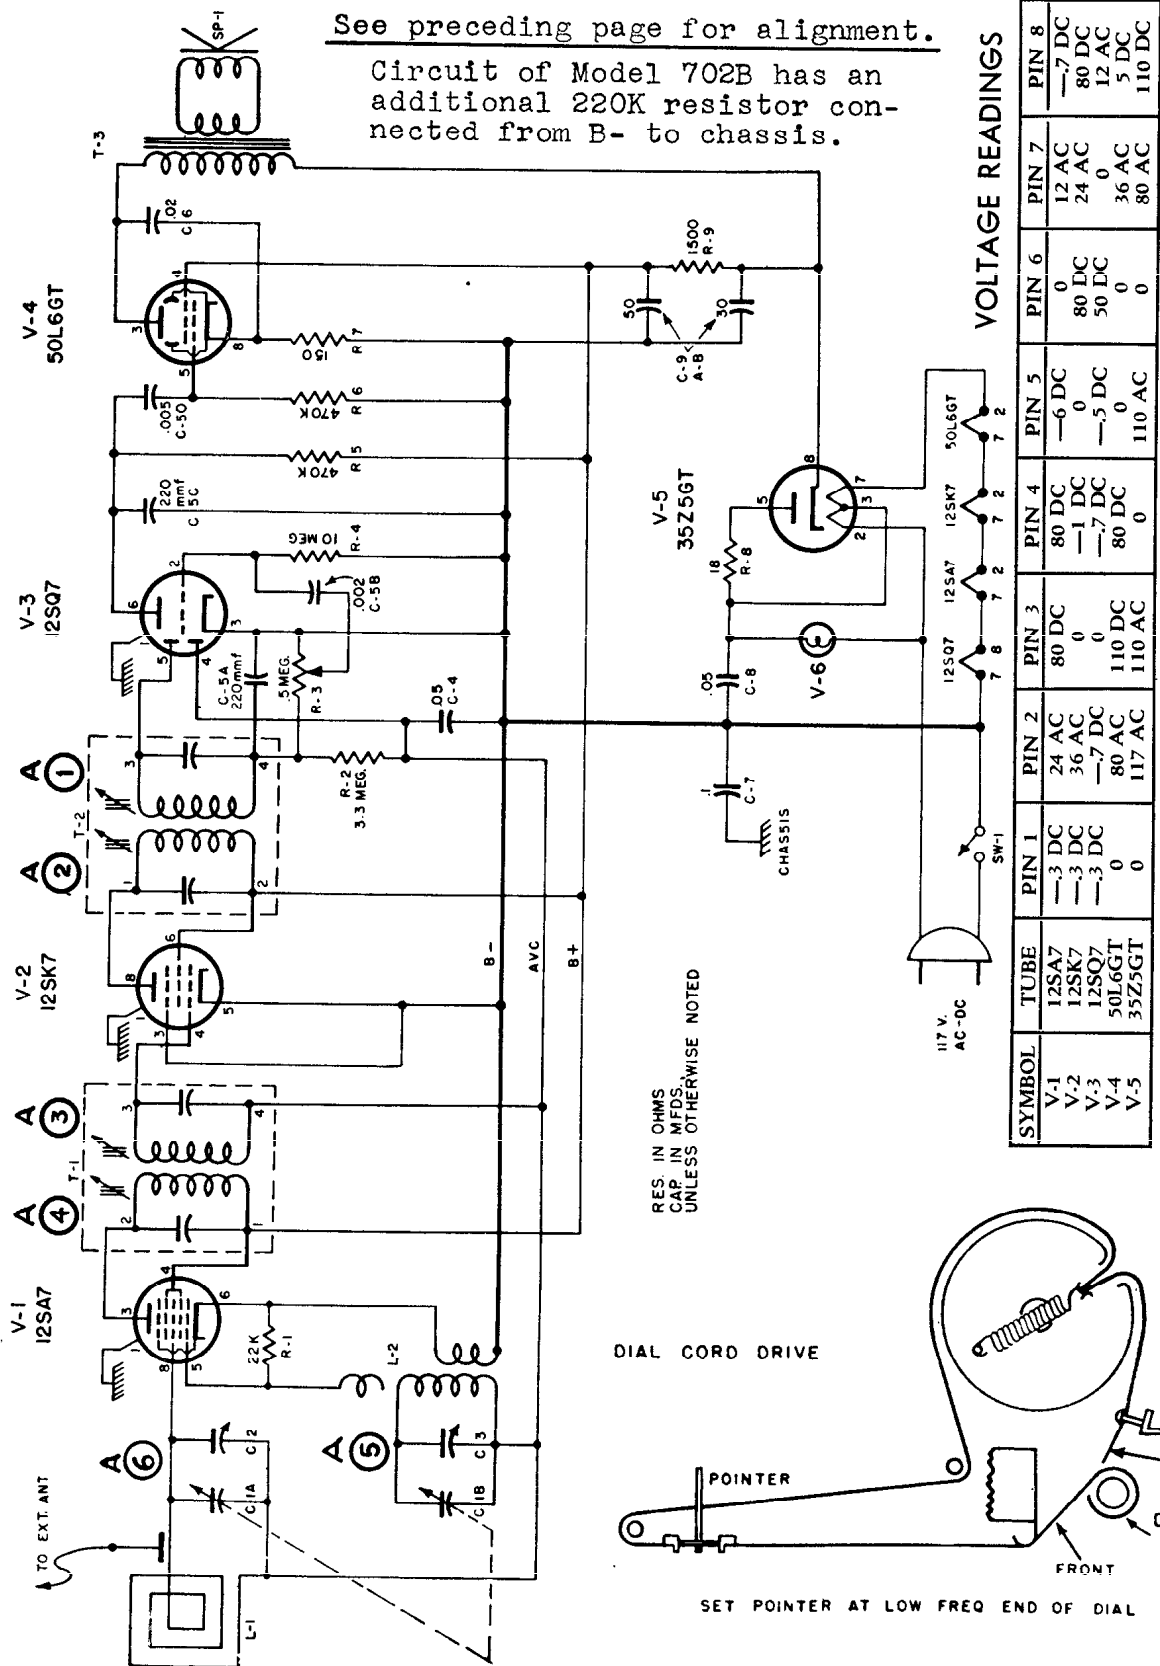

Emerson Radio

MODELS: 653B - 702B

CHASSIS: 120136-B

See preceding page for alignment.

Circuit of Model 702B has an additional 220K resistor connected from B- to chassis.

Gamble-Skogmo Inc.
Minneapolis, Minn.

CORONADO RADIO MODEL 15RA2-43-8230A

POWER SUPPLY.....115 volts, DC or 50-60 cycle AC,
24 watts.
FREQUENCY RANGE.....540 to 1600 Kc.
INTERMEDIATE FREQ.....455 Kc.
SELECTIVITY.....At 1000 Kc., 60 Kc. at 1000 x signal.
SENSITIVITY.....150 u. v. per meter.

Model 94RA2-43-8230A is similar to 15RA2-43-8230A, but employs 12BD6 as I.F. Amp. and 35W4 as the rectifier.

After stringing, turn tuning shaft to extreme left, then set pointer at last marker shown. Secure pointer to string with glue.

ALIGNMENT PROCEDURE

SIGNAL GENERATOR		TUNER SETTING	ADJUST FOR MAXIMUM OUTPUT	INPUT FOR 50 MILLIWATT OUTPUT
Frequency	Coupling Capacitor			
455 kc.	.1 mf.	Capacitor full open (plates out of mesh)	Top and bottom Cores in output and input I.F. cans	65 microvolts
1620 kc.	.1 mf.	Capacitor full open (plates out of mesh)	Oscillator trimmer CI-D on gang	70 microvolts
535 kc.	.1 mf.	Capacitor fully closed	Check for adequate range	70 microvolts
1400 kc.	—	Tune in 1400 kc. signal	Antenna trimmer CI-C on gang	200 to 400 microvolts
400 cycles	.1 mf.	—	—	.06 volts

HEAVY BUSS LEAD ACROSS CENTER OF CHASSIS

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

GENERAL ELECTRIC

Model 409, continued.

A.M. METER ALIGNMENT NOTES

1. Connect an output meter across the speaker leads to indicate maximum output during A.M. alignment.
2. Turn the volume control to maximum clockwise position and reduce signal input so that output meter does not indicate more than 1/2 watt output during A.M. alignment.
3. For alignment of the antenna trimmer C2 it is necessary to inductively couple the signal generator output to the loop antenna by connecting a four turn, six inch diameter loop of wire across the generator output terminals and locating the loop about one foot from the radio loop. The position of loop should not be changed during alignment to prevent possible errors in peak readings.
4. Set the band switch in A.M. position.

F.M. METER ALIGNMENT NOTES

5. Connect a vacuum tube voltmeter between the test point on the rear of the chassis and chassis to read the d-c voltage developed at the limiter grid during F.M.-I.F. and R.F. alignment. Dress the V.T.V.M. leads away from the r-f end of the chassis to prevent regeneration. Reduce the signal input so that the V.T.V.M. reads approximately 1 volt d-c.
6. Connect a vacuum tube voltmeter across the volume control to read the discriminator output.
7. To align the primary of T6 (discriminator) detune the signal generator slightly either side of 10.7 mc until maximum d-c volts is read across the volume control then adjust the primary of T6 for max.
8. For F.M.-R.F. alignment the output impedance of the signal generator should be 300 ohms to properly match the input impedance of this receiver.
9. The cover on the F.M. tuner must be in place during F.M.-R.F. alignment.
10. Set the band switch to the F.M. position.

RADIO MODELS 414, 415, 416 AND 430

1. VOLTAGES ARE MEASURED TO B+ BUS.
2. ALL VOLTAGES ARE DC EXCEPT FOR HEATERS WHEN USING AC INPUT.
3. * INDICATES VACUUM TUBE VOLT-METER READING WITH TUNING DIAL AT 1000 KC (IN CLEAR CHANNEL, NO SIGNAL)- THESE VOLTAGES NORMALLY VARY WITH SIGNAL.
4. ALL OTHER DC VOLTAGES MEASURED WITH 20,000 OHMS PER VOLTMETER.

ALIGNMENT CHART

Step	Connect Test Oscillator to	Test Osc. Setting	Radio Dial Setting	Adjust for Maximum
1	V2, 12BA6 grid (Pin 1), in series with .05 mfd.	455 kc	Cores of second and i-f transformer, T3
2	V1, 12SA7 grid (Pin 8), in series with .05 mfd.	455 kc	Cores of first i-f transformer, T2
3	V1, 12SA7 grid (Pin 8), in series with .05 mfd.	455 kc	Recheck adjustment of T2 and T3, for maximum

R-F ALIGNMENT

4	Inductively coupled to radio loop	1620 kc	Minimum capacity C2A, C2B	C3, oscillator trimmer
5	Inductively coupled to radio loop	1500 kc	For Maximum	C1, r-f trimmer
6	Set pointer to 150. See Note			

Relocate dial pointer on tuning shaft at 1500 KC on the dial to correspond to the tuning capacitor setting in Step 5.

VALUE OF ALL CAPACITORS ARE M.M.F. UNLESS OTHERWISE SPECIFIED. C5, 6, 8 & 9 ARE PART OF MOLDED TRANSFORMER BASE. 10 M.M.F. IN ASSEMBLIES MARKED M77J602-3, 83 M.M.F. IN TRANSFORMERS M77J602-1 OR -2 & M77J460-2 OR -3.

Capacitor Unit C10, 11, 12 and C13

Volume Control

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

GENERAL ELECTRIC

FOR MODELS 607 AND 608

ALIGNMENT CHART

Always have volume control full on and reduce signal input so A.V.C will not affect output.

Step	Sig. Gen. Connected to B - and	Sig. Gen. Frequency	Dial Setting	Adjust For Max. Output
1	1T4 Grid Pin 6 thru .05 Cap	455 kc	550kc	Cores of I-F Trans. T3
2	1R5 Grid Pin 6 thru .05 Cap	455 kc	550 kc	Cores of I-F Trans. T2
3	1R5 Grid Pin 6 thru .05 Cap	455 kc	550 kc	Re-adjust T2 and T3
4	Inductively Coupled to Loop	1620 kc	1620 kc	Osc. trimmer C2B
5	Inductively Coupled to Loop	1500 kc	Tune for maximum	R-F trimmer C1B

Make the final ANT. trimmer adjustment with the chassis installed in the cabinet and an "A" battery in position and connected, since the battery affects the tuning of the antenna.

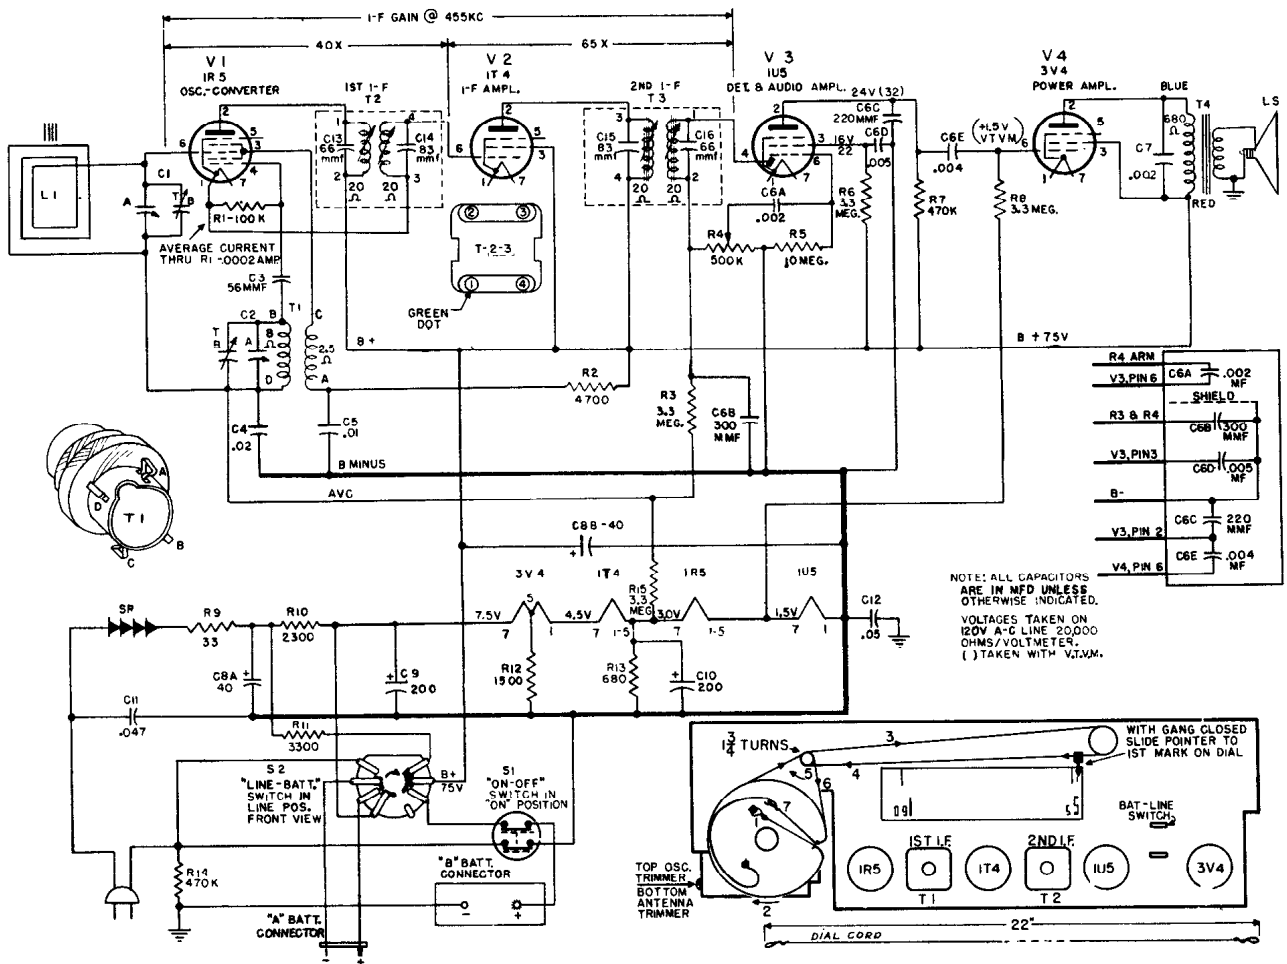

CHASSIS REMOVAL:

- Remove two control knobs
- Remove two hex head screws from cabinet bosses just under each side of dial scale
- Remove two speed nuts (turn 90°) from cabinet bosses at each side of speaker

BOTTOM SHIELD REMOVAL:

- Remove chassis
- Unsolder one loop lead from stator of R-F section of gang condenser
- Remove six trimount studs:
 - 3 across back of chassis
 - 3 across front of chassis (2 under speaker grille)
- Slide bottom down one inch and pull out

CAUTION: One side of the power line is connected to B-. Avoid any direct connections to ground. Use an isolating transformer when making service adjustments with the chassis removed from the cabinet.

14	Recheck oscillator alignment as in Step 12.				

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

MODELS 754 & 756

METER ALIGNMENT NOTES

1. Connect an output meter across the speaker leads to indicate maximum output.
2. Turn volume control to maximum clockwise position and reduce signal input so that output meter does not indicate more than $\frac{1}{2}$ watt output.
3. Band switch set in AM position.
4. Connect an 18 microhenry choke across the loop terminals to assimilate the loop during alignment.
5. Connect a vacuum tube voltmeter from the limiter grid test point to chassis to read the d-c voltage developed at the limiter grid during FM-IF and RF alignment. Dress the leads to the vacuum tube voltmeter leads away from the r-f end of the chassis to prevent regeneration. Reduce signal input so that V.T.V.M. reads approximately 1 volt d-c at limiter grid test point.
6. Connect a vacuum tube voltmeter across the volume control and align the secondary of T8 for zero output at 10.7 mc.
7. Detune the signal generator either side of 10.7 mc until maximum d-c volts across the volume control is read—then peak the primary core of T8.
8. For FM-RF alignment the output impedance of the signal generator cable should be 300 ohms to properly match the input impedance of this receiver.
9. The cover over the FM-RF tuner must be in place during FM-RF alignment.
10. Band switch in FM position.
11. Make the chassis connection as close to the signal input point as possible.

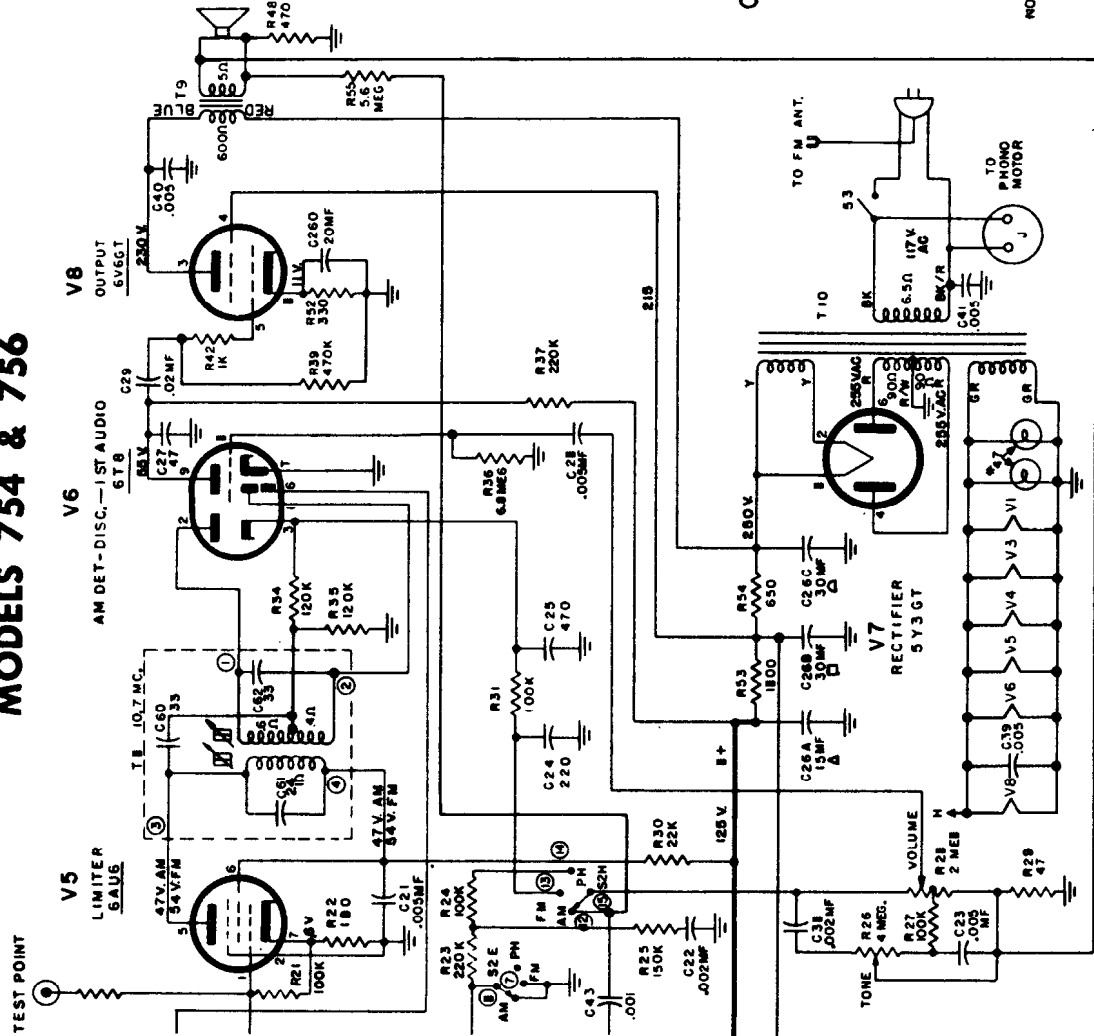

EQUIPMENT REQUIRED

1. Signal generator
2. Vacuum tube voltmeter
3. Output meter
4. One 18 microhenry choke
5. .02 mf capacitor
6. 100 mmf capacitor

MODEL NO. 156SE-1068A

I.F. 455 KC.

DI NOTES CHASSIS GROUND

DI DENOTES COMMON NEGATIVE

ALL COMMON GROUND POINTS ARE INDICATED BY A R.F. CHOKER & CAPACITOR FROM CHASSIS BY A R.F. CHOKER & CAPACITOR ASSEMBLY (C-11) ISOLATING CONDENSER.

- TO REMOVE CHASSIS FROM CABINET
1. DISCONNECT ANTENNA LEADS FROM CABINET BACK.
 2. DISCONNECT BATTERY LEADS AND REMOVE BATTERIES
 3. LAY CABINET FACE DOWN AND REMOVE THE FOUR SCREWS
 4. TILT REAR OF CHASSIS UPWARD AND PULL BACK UNTIL THE WASHER CLEARS LOCKING PIN ON CABINET. THE CHASSIS IS NOW FREE TO BE REMOVED FROM CABINET. CLEAR TOP OF CABINET AND REMOVE.

MODEL NO. 156SE-1068A

VOLTAGE TABLE
 (BOTTOM VIEW OF CHASSIS)

ALIGNMENT

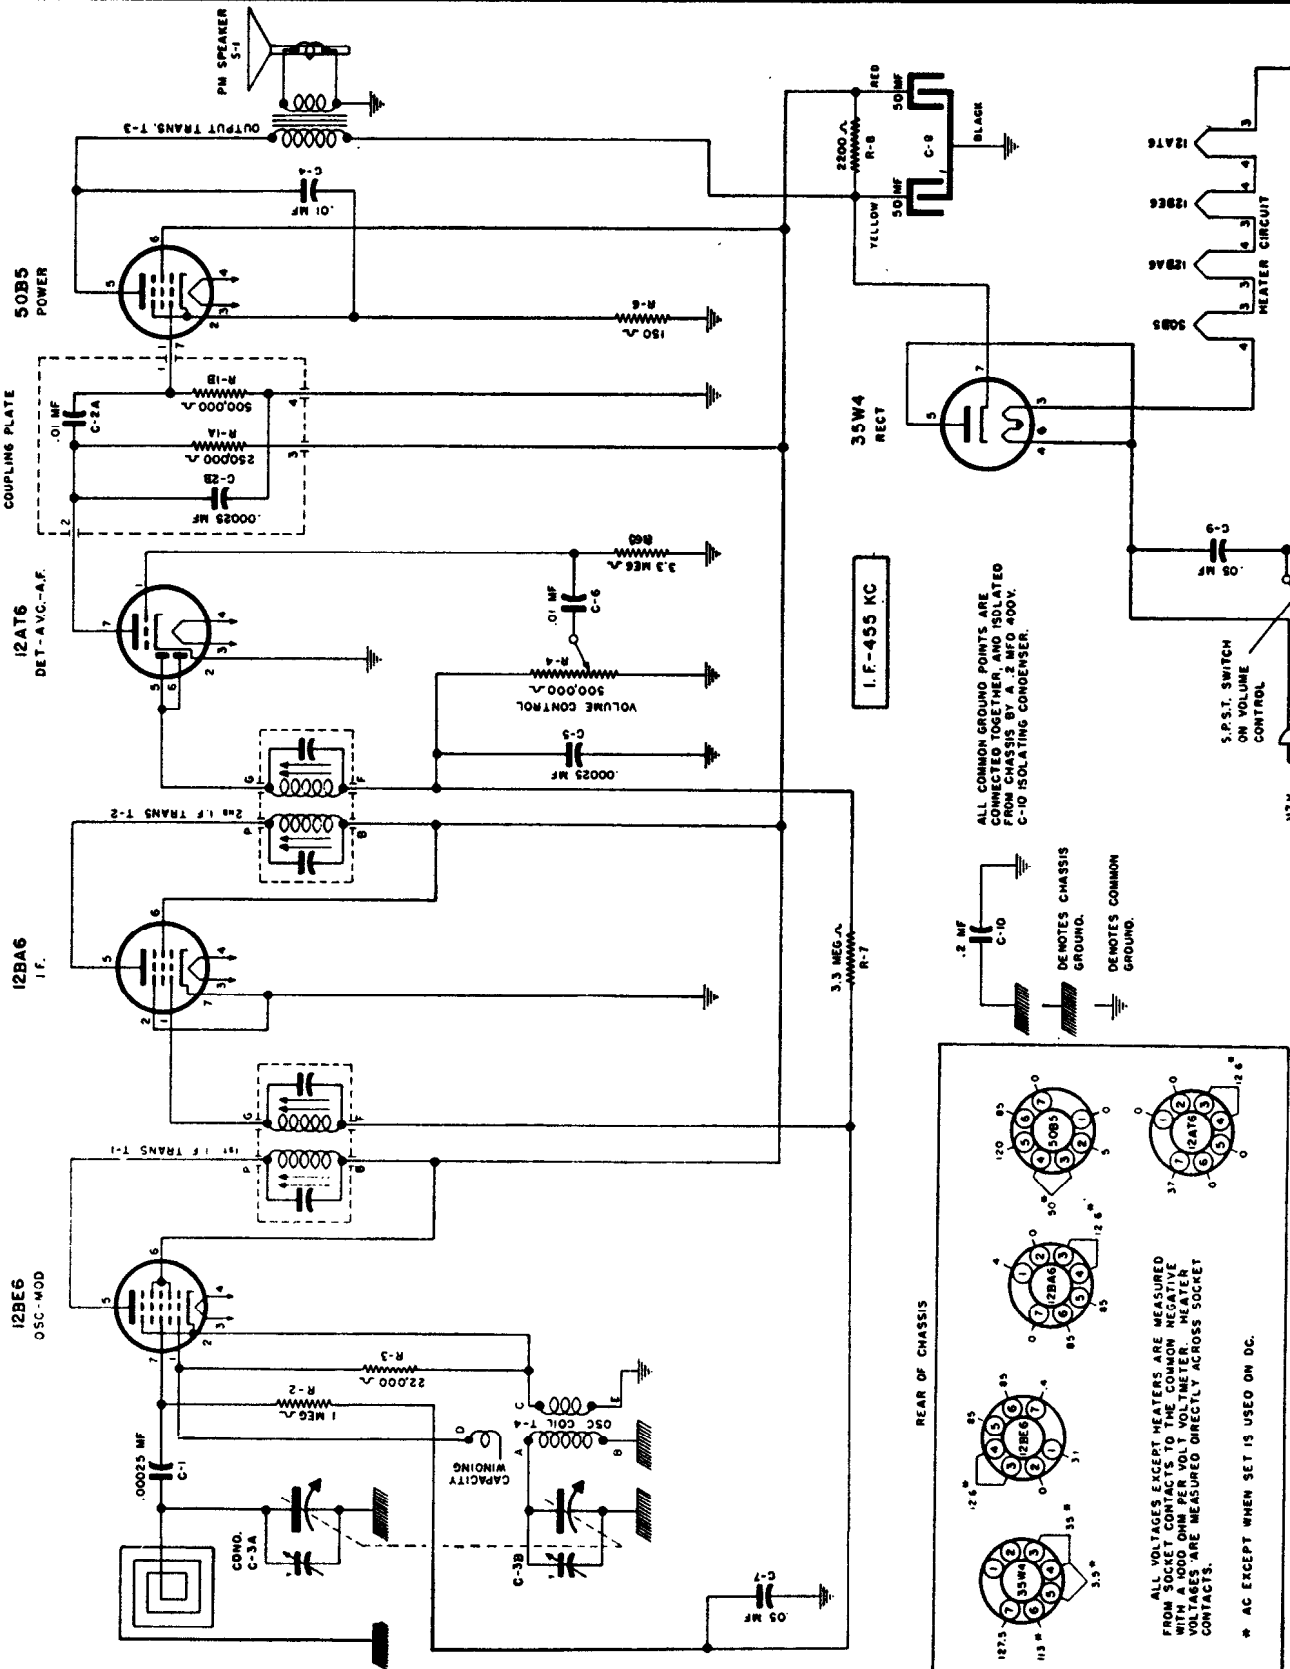

WHEN ADJUSTING THE 1650 KC OSCILLATOR TRIMMER, remove chassis from cabinet and disconnect the loop connection wires from the loop. Attach a 1 megohm resistor across these connections and feed output of test oscillator across the 1 megohm resistor.

THE 1400 KC LOOP ANTENNA TRIMMER should be adjusted only after all other adjustments have been made. PLACE LOOP ANTENNA IN THE SAME POSITION IT WILL BE IN WHEN THE SET IS IN THE CABINET—APPROXIMATELY $5\frac{5}{8}$ " SPACE BETWEEN LOOP AND CHASSIS.

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

MONTGOMERY WARD Model 15GSE-1595A. Models 25GSE-1555A and 25GSE-1556A use the same circuit, but differ in chassis layout and cabinet.

ALIGNMENT PROCEDURE

Check tuning dial adjustment by tuning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration.

Use an accurately calibrated test oscillator with some type of output measuring device.

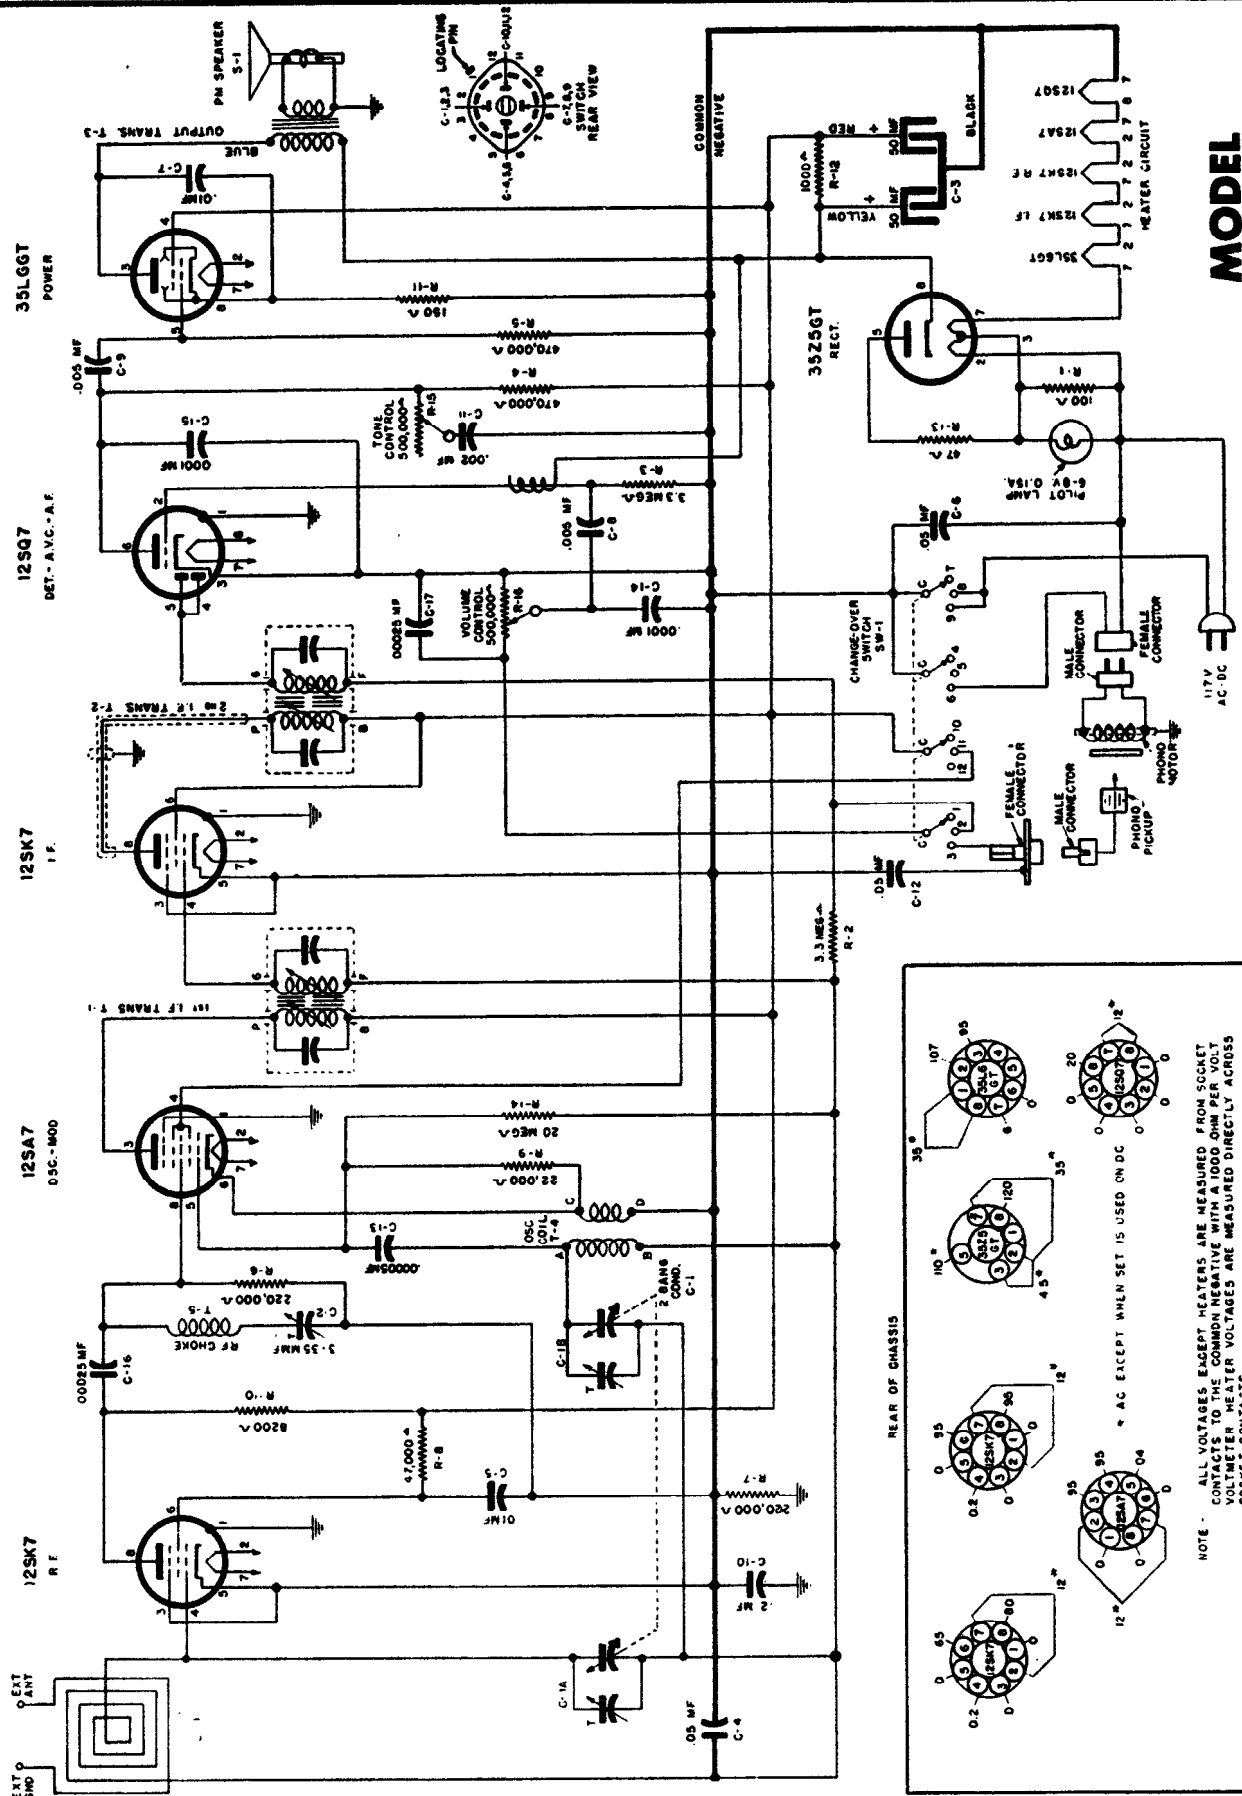

THE LOOP MAY BE LEFT IN THE CABINET and the chassis pulled out of the cabinet just far enough for adjustment of the trimmers, or the loop and chassis may be removed from the cabinet and the loop placed in the same position and plane it will be in when both are mounted in cabinet.

Couple test oscillator to receiver loop by: (1) make loop consisting of 5 to 10 turns of No. 20 to No. 30 size wire, wound on a 2" or 3" form; (2) connect this loop across output of test oscillator; (3) place test oscillator loop near radio loop. **BE SURE THAT NEITHER LOOP MOVES WHILE ALIGNING.**

RADIO-PHONO

MODEL NO.
256AA-934B

ALIGNMENT PROCEDURE

THE FOLLOWING EQUIPMENT IS REQUIRED FOR ALIGNING:
A signal generator which will provide an accurately calibrated signal at the indicated test frequencies; an output indicating meter; a non-metallic screwdriver.

Radiation Loop: 2-turn loop, 6 inches in diameter.

CONDITIONS FOR ALIGNMENT:

Tone-Treble

Volume - Maximum

Selector Switch - "Radio" position

Test loop coupled loosely to receiver by spacing receiver loop in same position as it will be with chassis in cabinet.

LOCATION OF TUBES

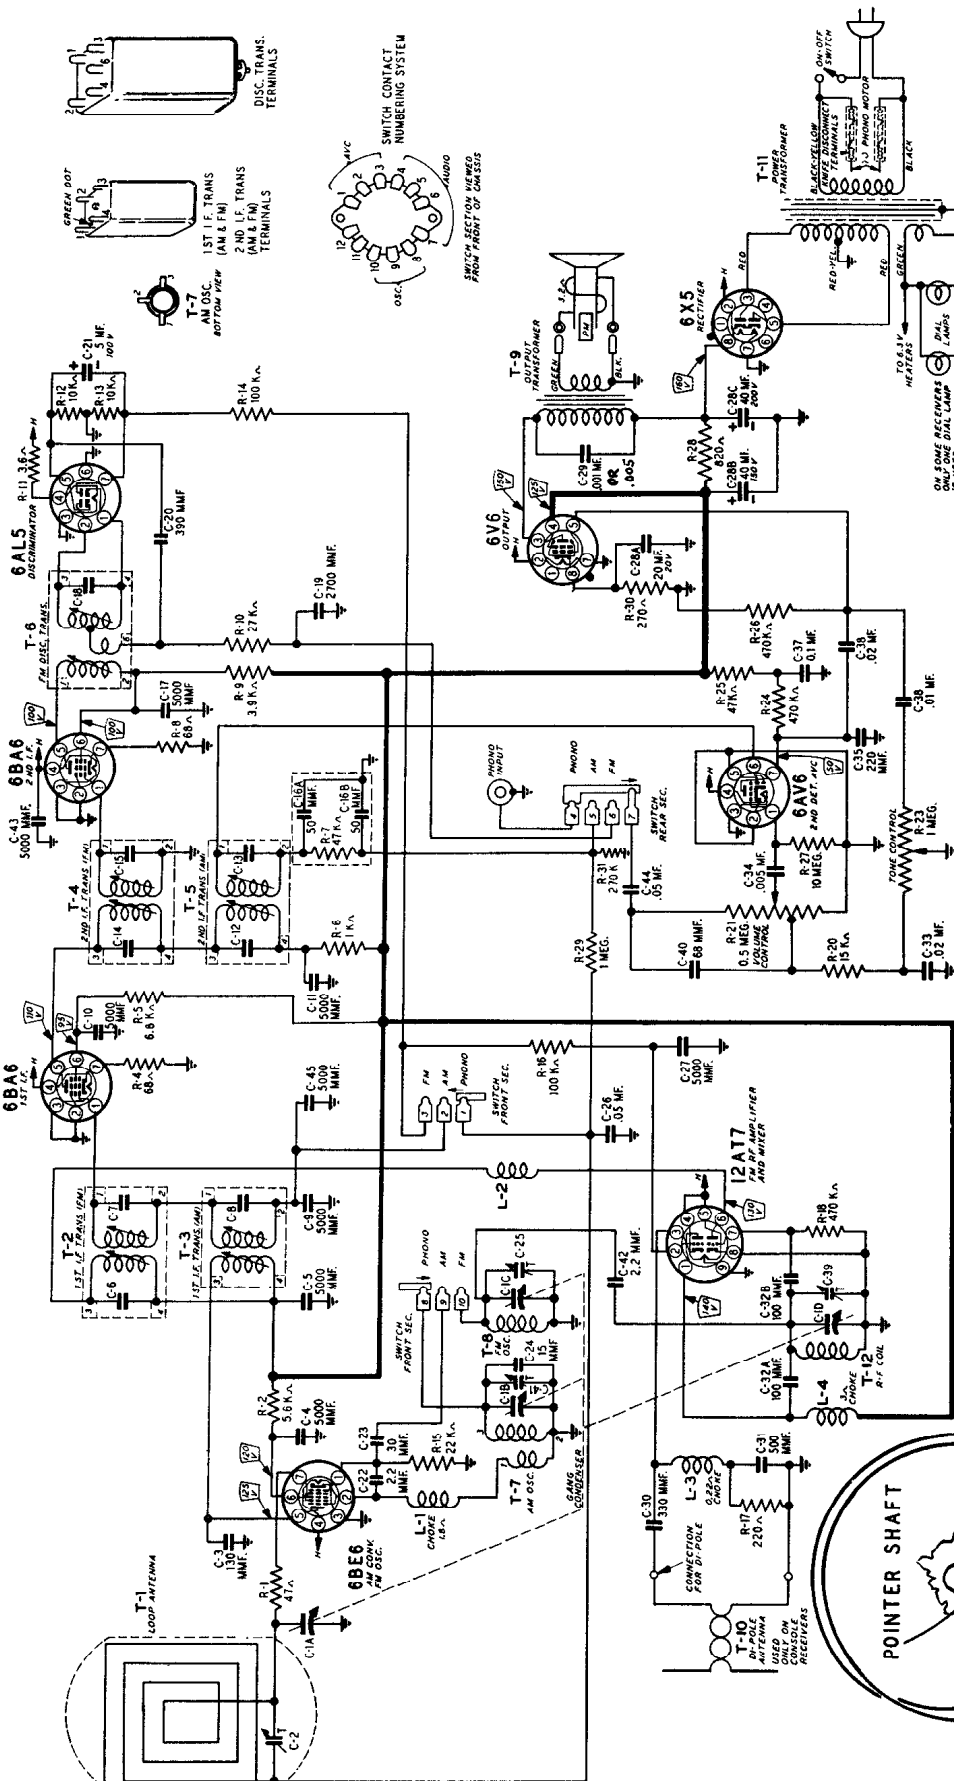

SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	OUTPUT METER	ADJUST MAXIMUM OUTPUT
LOOP	455 KC	Low End of Band	Across Voice Coil	C-8, C-7, C-6, C-5
LOOP	1620 KC	High End of Band		C-4
LOOP	1400 KC	1400 KC		C-3

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

MONTGOMERY WARD

25WG-1570B&C
25WG-1571B
25WG-1572B

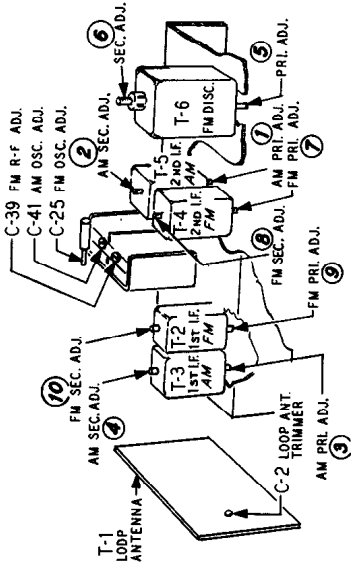

TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram of the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter.

Conditions of measurement are:

- Line voltage117 Volts AC
- Signal inputNone

See next page, over, for alignment facts.

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

MONTGOMERY WARD Models 25WG-1570B & C, 25WG-1571B, 25WG-1572B, continued

ALIGNMENT PROCEDURES AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas
— .1 mf, and 50 mmf.

Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR				GANG CONDENSER SETTING	ADJUST	ADJUST FOR
FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	CONNECT GROUND TO			
455 KC	Control Grid 1st 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. Pri. (1) and Sec. (2)	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	.1 mf	Chassis Base	Rotor Fully Open	1st I.F. Pri. (3) and Sec. (4)	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	2nd I-F Pri. (1) and Sec. (2)	Maximum Output
1620 KC	Control Grid 6BE6 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	Oscillator C-41	Maximum Output
1400 KC	External Antenna Terminal	50 mmf	Chassis Base	Turn Rotor to Max. Output. Set Painter to 1400 KC See Note A	Antenna C-2	Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

FM STAGES

The following is required for aligning:
An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.
Non-metallic screwdriver.
Dummy Antennas and I-F Loading Resistor—2500 mmf, 300 ohms

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.
(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).
Allow chassis and signal generator to "Heat Up" for several minutes.

SIGNAL GENERATOR			THROUGH DUMMY ANTENNA	BAND SWITCH SETTING	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
	FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO					
Discriminator	10.7 MC	6BA6 2nd I-F Pin 1 and Chassis	2500 mmf	FM	Rotor Fully Open	Disc. Pri. (5) Note A	Maximum Deflection
	10.7 MC	6BA6 2nd I-F Pin 1 and Chassis	2500 mmf	FM	Rotor Fully Open	Disc. Sec. (6) Note B	
I-F	10.7 MC Note C	6BA6 1st I-F Pin 1 and Chassis	2500 mmf	FM	Rotor Fully Open	2nd I-F Pri. (7) Sec. (8) Note D	Maximum Deflection

	10.7 MC	Same as above	2500 mmf	FM	Rotor Fully Open	Disc. Sec. (6) Note B	

RECHECK I-F ADJUSTMENTS IN ORDER GIVEN

Oscillator	108.5	Disconnect the hank antenna and connect generator to dipole terminals with resistor in series.	300 ohms	FM	Rotor Fully Open	Osc. C-25	Deflection Maximum
Antenna	104.5	Same as above	300 ohms	FM	Tune rotor for max. AVC voltage	Ant. C-39	Maximum Deflection

RECHECK ANTENNA & OSC. ADJUSTMENTS IN ORDER GIVEN

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter.

27 K ohm resistor (R-10) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—AM I-F coils must be aligned before attempting to align the FM I-F coils.

NOTE D—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

CHASSIS
HS-303

MODEL
72XM21

Chassis HS-218, used in Models 7XM21 and 7XM22, is similar to Chassis HS-303 covered by information below and on the next page.

- NOTES:
- VOLTAGE MEASUREMENTS MADE WITH ELECTRONIC TYPE VOLTMETER.
 - VOLTAGES SHOWN BETWEEN POINT INDICATED AND CHASSIS.
 - MEASUREMENTS MADE WITH GANG FULLY OPEN.
 - NO SIGNAL INPUT.
 - MEASUREMENT MADE WITH GANG FULLY OPEN.
 - RESISTOR VALUES ARE INDICATED IN OHMS. K=1000 OHMS.
 - MEASUREMENT MADE WITH GANG FULLY OPEN.

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

MOTOROLA Chassis HS-303, Model 72XM21, continued from preceding page.

BROADCAST BAND - IF & RF ALIGNMENT

Connect the AM signal generator as in chart below, with 400 cycle, 30% modulation.

Connect the output meter across the speaker voice coil. Throughout alignment reduce the genera-

tor output to a level which produces less than .40 volts across the voice coil, to avoid overloading the receiver.

Set the bandswitch to the AM position.

Turn the receiver volume control to maximum.

STEP	DUMMY ANTENNA	GENERATOR CONNECTION	GENERATOR FREQUENCY	GANG SETTING	ADJUST	REMARKS
IF ALIGNMENT						
1.	.1 mf	Grid of conv. V-2 (pin 7, 12BA7)	455 Kc	Fully opened	1, 2, 3 & 4 (IF cores)	Adjust for maximum.
RF ALIGNMENT						
2.	.1 mf	Grid of conv. V-2 (pin 7, 12BA7)	1620 Kc	Fully opened	5 (BC osc)	Adjust for maximum.*
3.		Across radiation loop**	1400 Kc	Tune in signal	8 (BC ant)	Adjust for maximum.

4. If, after the receiver has been aligned as above, it is found to be badly off calibration, it will be necessary to adjust oscillator core (7) as follows: connect the generator to the grid of the converter tube and, with the gang fully closed, adjust core (7) at 535 Kc. It is advisable to repeat the oscillator adjustments at 1620 Kc and 535 Kc several times until the tuning range is correct. Core (7) has been pre-set at the factory and normally should require no retuning.

* If difficulty is encountered in tuning trimmer (5), adjust trimmer (6) to 1/2 turn from tight.

**Connect generator output across 5" diameter, 5 turn loop and couple inductively to receiver loop. Keep loops at least 12" apart.

FM BAND - IF & RF ALIGNMENT

Connect the signal generator as in chart below, with no modulation.

Set the bandswitch to the FM position.

Except in step 2 below, connect the electronic voltmeter across resistor R-23 (15K) in the ratio detector stage.

Throughout alignment reduce the signal generator output to a value which produces no more than a 5 volt rise above no signal voltage, to avoid overloading the receiver.

In step 2 below, connect two 100K ohm resistors in series across R-23. Connect the electronic voltmeter between the volume control side of resistor R-24 (33K) and the junction of the two 100K resistors, with the low side of the meter at the 100K resistors.

STEP	DUMMY ANTENNA	GENERATOR CONNECTION	GENERATOR FREQUENCY	TUNER SETTING	ADJUST	REMARKS
IF ALIGNMENT						
1.	1000 mmf	Grid of conv. V-2 (pin 7, 12BA7)	10.7 Mc	Fully opened	9, 11, 12, 13 & 14 (IF cores)	Adjust for maximum.
2.	1000 mmf	Grid of conv. V-2 (pin 7, 12BA7)	10.7 Mc	Fully opened	10 (ratio det sec)	Adjust for zero. (Connect meter as in step 6 above).
RF ALIGNMENT						
3.	270 ohms	FM terminals on loop	87.5 Mc	Fully closed	15 (osc adj nut)	Adjust for maximum.
4.	-	-	-	Fully closed	16 (RF adj nut)	Turn counterclockwise until core is at bottom of pipe, then turn four turns clockwise.
5.	270 ohms	FM terminals on loop	90 Mc	Tune in signal	17 (RF tuning plug)	Adjust for maximum.
6.	270 ohms	FM terminals on loop	105 Mc	Tune in signal	16 (RF adj nut)	Adjust for maximum.
7.	-	-	-	-	-	Repeat steps 5 & 6 until no further adjustment is necessary.

MOTOROLA, INC. CHASSIS 2M

MODELS BK2M, CT2M, GMT2M, HJ2M, HN2M, KR2M, OE2M, PC2M, PD2M, & SR2M

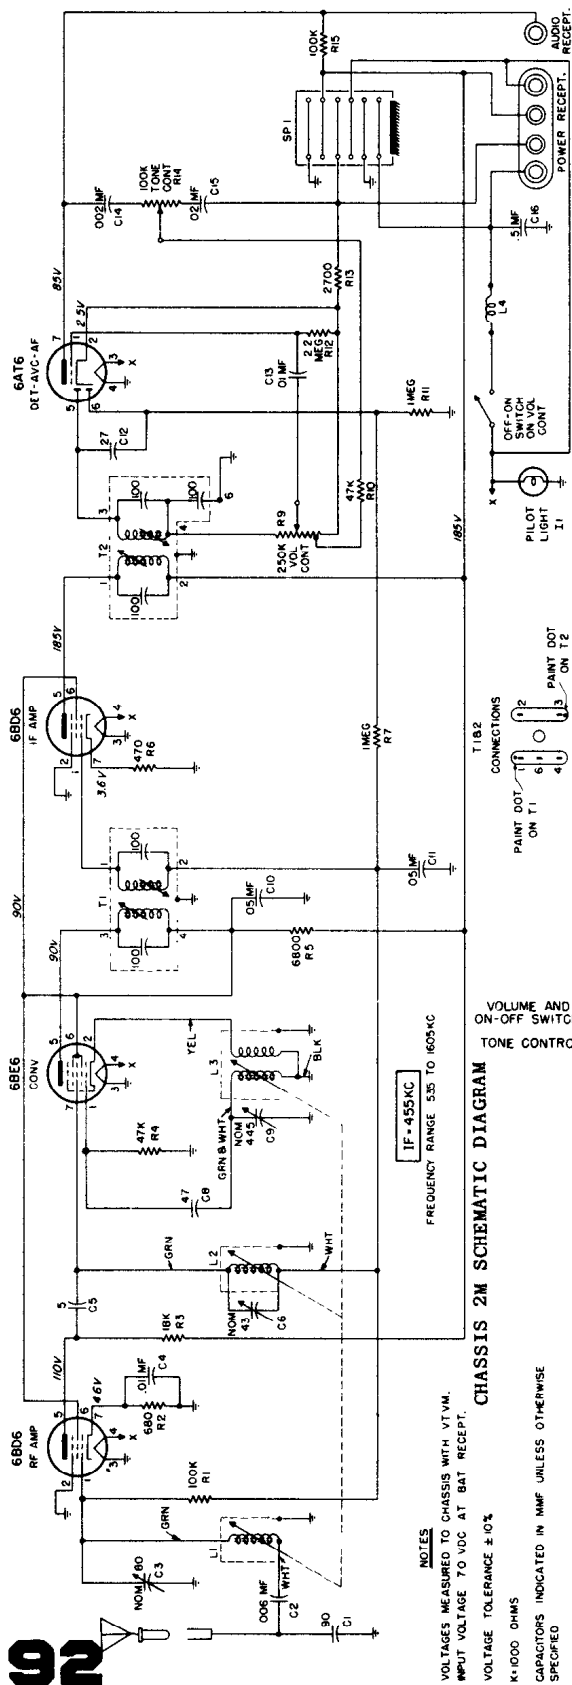

TYPE - Chassis 2M is a four-tube automotive type tuner chassis. It contains the RF Amp, Converter, IF Amp, Detector and 1st AF Amplifier stages. Appropriate matched front plate assemblies (attached to the 2M chassis at the factory) make it into complete custom Tuner Units for the following cars:

- Model BK2M For 1952, 1951, 1950, 1949, 1948, 1947, 1946 & 1942 Buick (except Special prior to 1949)
- Model CT2M For 1952 & 1951 Chevrolet
- Model GMT2M For 1952, 1951, 1950, 1949 & 1948 General Motors & Chevrolet Truck
- Model HJ2M For 1952 & 1951 Henry J
- Model HN2M For 1952 & 1951 Hudson
- Model KR2M For 1952 & 1951 Kaiser
- Model OE2M For 1952 & 1951 Oldsmobile 88 Super
- Model PC2M For 1952, 1951, 1950, 1949, 1948, 1947, 1946 Pontiac
- Model PD2M For 1952 & 1951 Packard
- Model SR2M For 1952, 1951 & 1950 Studebaker

The above Tuner Units must be used with a separate Audio & Power Unit (Motorola Models P6-2 or P8-2) to form a complete radio receiver.

ALIGNMENT

1. Remove receiver housing to expose all alignment adjustments.
2. Connect speaker leads (from Audio & Power Unit) to speaker.
3. Connect an output meter across the speaker voice coil.
4. Connect a 6 volt storage battery to the "A" lead on the Audio & Power Unit.
5. Turn the receiver "on" and allow it to warm up for a few minutes. Set volume control at maximum and tone control to "high" position.
6. For greatest accuracy, keep output of receiver at approximately 1 watt (1 watt = 1.79 volts on output meter) throughout alignment by reducing signal generator output (not receiver volume control) as stages are brought into alignment.

ALIGNMENT PROCEDURE

CONTROLS: Turn on radio and set volume control to maximum.

DIAL POINTER: Turn tuning condenser to full-mesh position. Set dial pointer to index mark, located to left of "55."

OUTPUT METER: Connect across voice-coil terminals.

SIGNAL GENERATOR: Connect as indicated in chart. Use modulated output.

OUTPUT LEVEL: During alignment, attenuate signal-generator output to maintain output-meter indication below 1.25 volts.

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS

PHILCO RADIO-CLOCK MODELS 52-543, 52-545, 52-547, AND 52-550

Models 52-543, 52-545, 52-547, and 52-550 are electrically similar to Model 52-544, but they are housed in different style cabinets, and incorporate certain circuit refinements over Model 52-544.

The following diagrams and the Service Information are for Models 52-543, 52-545, 52-547, and 52-550 only.

See page 97 for material on Philco Model 52-544.

FM Alignment

RCA Victor Model 1R81
(Continued)

RANGE SWITCH IN FM POSITION — VOLUME
CONTROL MAXIMUM

Alignment Procedure

Alignment Indicators:

For measuring the developed d-c voltage across C29 during FM alignment an RCA VoltOhmyst or an equivalent meter should be used. An output meter connected across the voice coil is also needed to indicate minimum audio output during FM Ratio Detector alignment.

Oscilloscope Alignment:

It is preferable to use a sweep generator and oscilloscope for aligning I.F. and R.F. circuits to obtain a visual observation of curve shape during alignment.

With FM sweep generator connected between FM ant. (#3) terminal and chassis and oscilloscope connected between the junction of R28-C30 and chassis the overall FM response may be observed. There should be a peak to peak separation of not less than 180 kc. with 50,000 mv. input.

AM Alignment

RANGE SWITCH IN AM POSITION

Steps	Connect high side of sig. gen. to—	Sig. gen. output	Turn radio dial to—	Adjust for peak output	
1	Pin 1 of V3 6BA6 in series with .01 mfd.	455 kc.	Quiet point at low freq. end.	T4 bottom core (pri.). T4 top core (sec.).	
2	Pin 7 of V2 6X8 in series with .01 mfd.			T2 top core (sec.). T2 bottom core (pri.).	
3	No. 1 terminal on ant. input strip	1620 kc.	High freq. end of dial (min. cap.)	C1-5T	
4		1400 kc.	1400 kc. signal	C1-2T ant. C1-3T r.f.	
5		Shunt a 10,000 ohm resistor across the r.f. section of the gang.			
6		600 kc.	600 kc. signal	L6 osc.* (Rock gang.)	
7		Remove the 10,000 ohm resistor and peak L4 r.f.*			
8		Repeat 3, 4, 5, 6 and 7			

* The correct adjustment of the OSC. (L6) core is that peak obtained with core farthest away from the coil mounting clips. R.F. (L4) core should be set to the peak obtained (2 peaks are seldom obtainable) with core closest to the mounting clips.

Steps	Connect high side of sig. gen. to—	Sig. gen. output	Turn radio dial to—	Adjust for peak output
1	Connect the d-c probe of a VoltOhmyst to the negative lead of the 2 mfd. capacitor C29 and the common lead to chassis.			
2	Pin 1 of V4 6AU6 in series with .01 mfd.	10.7 mc. modulated 30% 400 cycles AM	Quiet point at low freq. end.	T5 top core for max. d-c voltage across C29. T5 bottom core for min. audio output.*
3	Pin 1 of V3 6BA6 in series with .01 mfd.			†† T1 top core (sec.). T1 bottom core (pri.).
4	Pin 7 of V2 6X8 in series with .01 mfd.	Adjust to provide 3 to 4 volts indication on VoltOhmyst during alignment.	Quiet point at low freq. end.	†† T2 top core (sec.). T2 bottom core (pri.).
5	#3 ant. term. in series with a 300 ohm resistor.			90 mc.
6	(Remove ant. lead from #3 term.)	106 mc.	106 mc.	C1-1T ant. C1-4T r.f.
7		90 mc.	90 mc.	L1 ant.** L2 r.f.**
8	Repeat Steps 5, 6 and 7 until further adjustment does not improve calibration.			

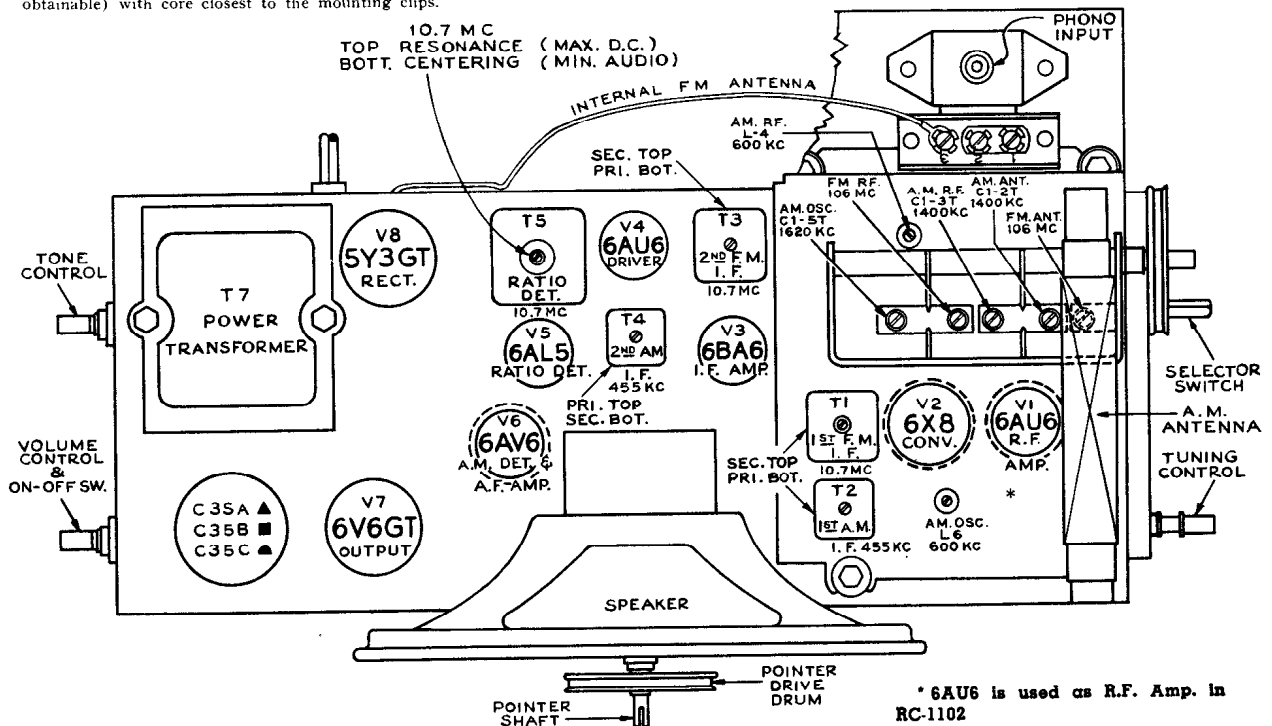

* Two or more points may be found which lower the audio output. At the correct point the minimum audio output is approached rapidly and is much lower than at any incorrect point.

†† Alternate loading may be necessary to provide accurate observation of peaks.

Alternate loading involves the use of a 680 ohm resistor to load the plate winding while the grid winding of the SAME TRANSFORMER is being peaked. Then the grid winding is loaded with the resistor while the plate winding is peaked. Only one winding is loaded at any one time. Remove the 680 ohm resistor after T3 and T1 have been aligned.

Oscillator frequency is above signal frequency on both AM and FM. Extreme care should be used to avoid running the I.F. cores all the way through the winding and out the other end. Double peaks or serious overcoupling will result. The correct adjustment may be determined by starting the core all the way out (threads extended). The first peak obtained when tuning should be the correct peak.

** Note: FM antenna, mixer and oscillator coils are adjustable by increasing or decreasing the spacing between turns. The location of the tap on the antenna coil is $\frac{1}{8}$ turn \pm $\frac{1}{8}$ turn from the ground end.

* 6AU6 is used as R.F. Amp. in RC-1102

6CB6 is used as R.F. Amp. in RC-1102A, RC-1102B and RC-1102C

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

RCA VICTOR

AC-DC Radio Receiver

MODELS 1X591, 1X592

Chassis No. RC 1079K, RC 1079L

Lead Dress

1. Dress all heater leads down to chassis and away from all audio grid and plate wiring.
2. Dress power cord against chassis base.
3. Dress capacitor C18 against back apron.
4. Dress capacitor C13 down to base alongside of shielded lead.
5. Dress output transformer leads down to chassis.
6. Dress capacitors C9 and C15 as direct as possible.
7. Dress dial lamp leads on top of chassis between 12SQ7 and 50L6GT tubes; below chassis, as short as possible to rectifier socket.
8. Dress excess loop leads away from tubes and clear of tuning condenser.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

On AC operation an isolation transformer (115 v./115 v.) may be necessary for the receiver if the test oscillator is also AC operated.

Dial Calibration

With the tuning condenser fully meshed, the dial pointer should be set to the first score mark at the left-hand end of the dial back plate. The four score marks represent:
 Max cap. 600 kc 1400 kc min. cap.

Dial Indicator and Drive Cord

Alignment Procedure

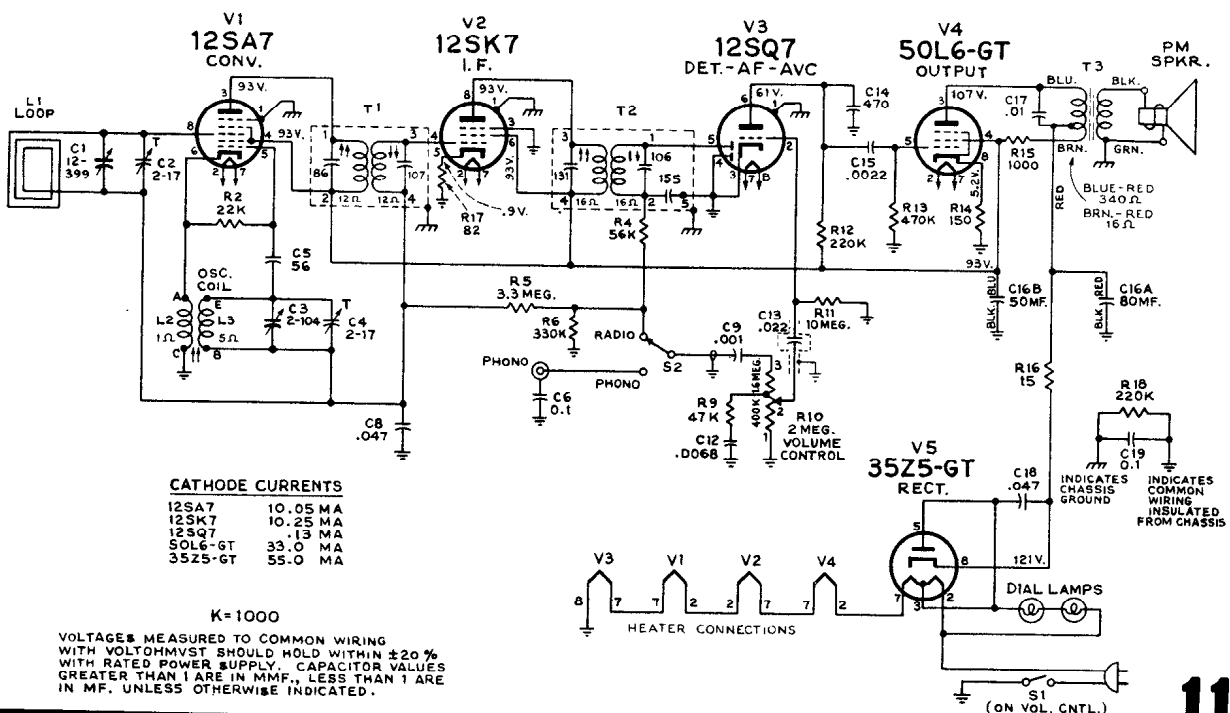

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. output
1	12SK7 I-F grid through 0.1 mid. capacitor	455 kc	Quiet-point 1600 kc end of dial	T2 (top and bottom) 2nd I-F trans.
2	Stator of C1 through 0.1 mid.			*T1 (top and bottom) 1st I-F trans.
3		1620 kc	Min. cap.	C4 (osc.)
4	Short wire placed near loop to radiate signal	1400 kc	1400 kc signal	†C2 (ant.)
5		600 kc	600 kc signal	L3 (osc.) Rock gang
6		Repeat steps 3, 4 and 5.		

* Do not readjust T2 when test oscillator is connected to C1.

† When adjusting C2 (ant. trimmer) it is necessary to have the speaker and loop in the same position and spacing as they will have when assembled in the cabinet.

Tube and Trimmer Locations

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

RCA VICTOR

1X51 Series

Chassis No. RC 1104, RC 1104A, RC 1104B

Chassis using different tubes:

CHASSIS NO. RC 1104-1, RC 1104A-1, RC 1104B-1

Same as above except rectifier is RCA 35W4 instead of RCA 35Z5GT.

CHASSIS NO. RC 1104C, RC 1104D, RC 1104E

- (1) RCA 12BE6 Converter
- (2) RCA 12BA6 I.F. Amplifier
- (3) RCA 12AV6 Det.—A.V.C.—A.F. Amp.
- (4) RCA 50C5 Output
- (5) RCA 35W4 Rectifier

Test-Oscillator

For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the oscillator output as low as possible to avoid a-v-c action.

On AC operation an isolation transformer (115 v./115 v.) may be necessary for the receiver if the test oscillator is also AC operated.

Dial Centering

If the mounting of the tuning condenser has been disturbed, it may be necessary to adjust its position after replacing the chassis in the cabinet. This may be done in the following manner:

1. Replace tuning knob.
2. Install chassis and tighten the mounting screws.
3. Loosen the two screws which hold the tuning condenser mounting bracket to the chassis.
4. Adjust the position of the tuning condenser mounting bracket so that the tuning knob may be rotated without binding on the cabinet.
5. The two screws should then be tightened to maintain this position.

1X51 SERIES:

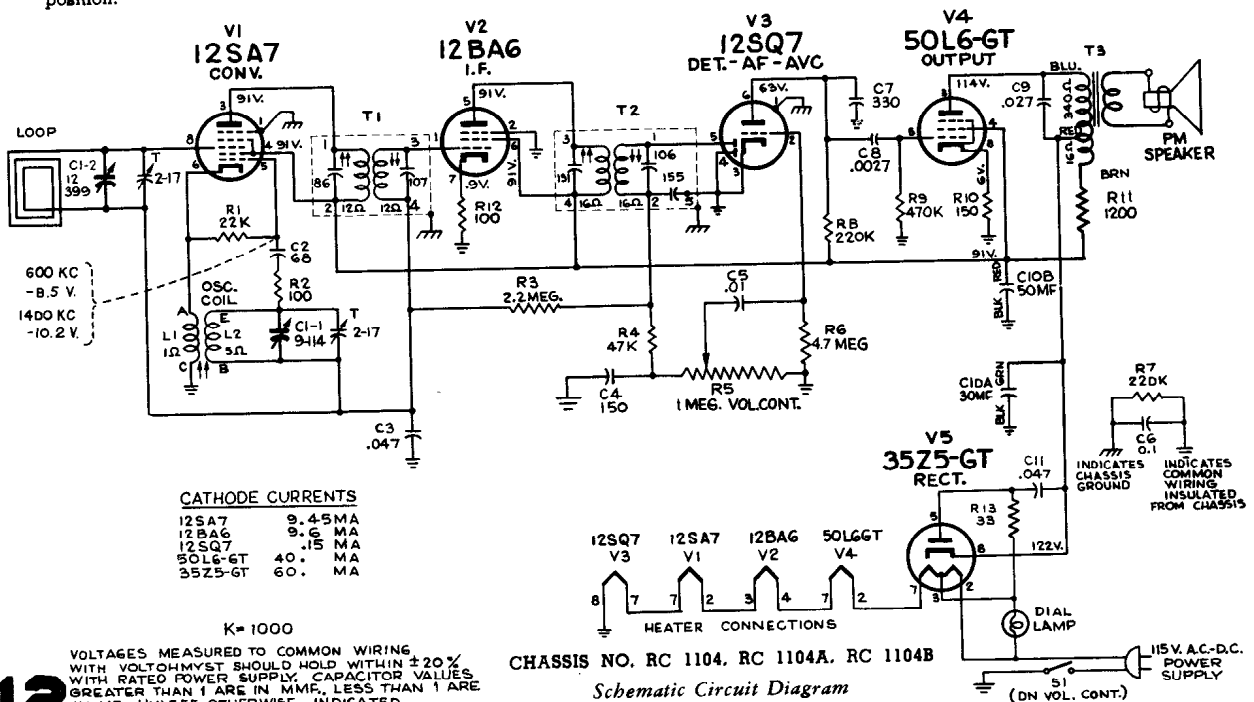

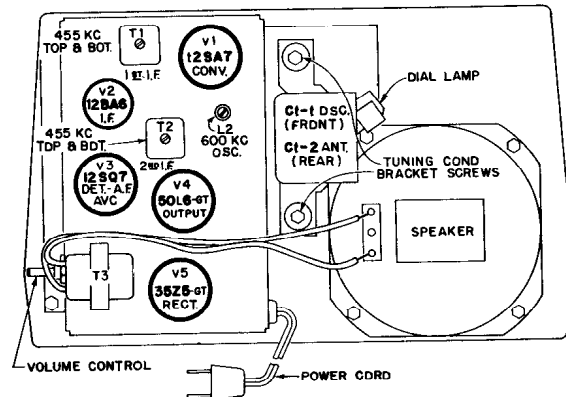

1X51 (Maroon)	1X52 (Ivory)	1X53 (Green)
1X54 (Tan)	1X55 (Blue)	1X56 (Red)
	1X57 (White)	

Alignment Procedure

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. output
1	12BA6 I-F grid through .01 mfd. capacitor	455 kc	Quiet-point 1600 kc end of dial	T2 (top and bottom) 2nd I-F trans.
2	Stator of C1-2 through .01 mfd.			T1 (top and bottom) 1st I-F trans.
3		1620 kc	Min. cap.	osc. trimmer
4	Short wire placed near loop to radiate signal	1400 kc	1400 kc signal	ant. trimmer
5		600 kc	600 kc signal	L2 (osc.) Rock gang
6	Repeat steps 3, 4 and 5.			

* Do not readjust T2 when test oscillator is connected to C1-2.

† When adjusting ant. trimmer it is necessary to have the loop in the same position and spacing as it will have when assembled in the cabinet. This spacing is 3/2" from dial back plate to loop.

ALL RESISTANCE VALUES IN OHMS. K = 1000.
ALL CAPACITANCE VALUES LESS THAN 1.0 IN
MF. AND ABOVE 1.0 IN MMF. UNLESS OTHERWISE
INDICATED.

Replacement of Component Parts

- I. To Remove Back Cover
 - a. Depress top of case midway between the handle supports, until the top end of the back separates from the main case.
 - b. Pull the back cover back and up, thereby unhooking the retaining lugs in the bottom of the main case.
- II. To Replace Batteries
 - a. Remove back cover.
 - b. Remove both "A" and "B" batteries. The "B" battery snap fasteners can best be removed by inserting a screwdriver under the snap fastener strip and prying upward.
 - c. The "A" batteries can easily be removed by pulling up on the spring wire clips.

Note: The "A" and "B" batteries have approximately equal life and therefore it is advisable to replace all batteries at one time.
- III. To Remove Chassis
 - a. Remove dial knob by grasping with finger tips at two sides and pulling.
 - b. Remove back cover.
 - c. Remove batteries.
 - d. Remove "A+" contacts by squeezing against case and sliding out of slots in case.
 - e. Remove the four screws "A."
 - f. Grasp the assembly by the speaker and pull the bottom end down and outward to clear the volume control knob.
- IV. To Replace Chassis
 - a. Observe the position of the battery save button extension in relation to the "battery-save" switch. This extension must engage with the center of the battery save switch.
 - b. Replace in reverse order to that given for chassis removal.

BOTTOM VIEW OF CHASSIS

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

Sears, Roebuck Sets 1032, 1035, and 1035-A, Chassis 528.195, -1, 528.196. Sets 1040 and 1045, Chassis 528.194 uses the same circuit + pilot light, but has a different chassis layout.

VOLTAGES MEASURED FROM POINT INDICATED TO COMMON GROUND WITH 20,000 OHM/VOLT VOLT-METER, RADIO-PHONO SWITCH IN RADIO POSITION, LINE VOLTAGE SET AT 117 V. AC.

* THESE CAPACITORS ARE IN CERAMIC UNIT PART NO. T17-104.

ALIGNMENT PROCEDURE

- Output meter reading to indicate 0.05 watt across voice coil0.4 volt
- Generator ground lead connection common ground
- Generator modulation 30%, 400 cycles
- Position of Volume Control Fully on

POSITION OF TUNER	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	TRIMMER ADJUSTMENT	TRIMMER FUNCTION
Open	455 KC	.1 mfd.	Pin 8 12SA7	T1 and T2 top & bottom	I.F.
Open	1630 KC	.1 mfd.	Pin 8 12SA7	C1B	Oscillator
1400 KC	1400 KC	HAZELTINE LOOP	C1A	C1A	Antenna sockets showing terminal numbering.

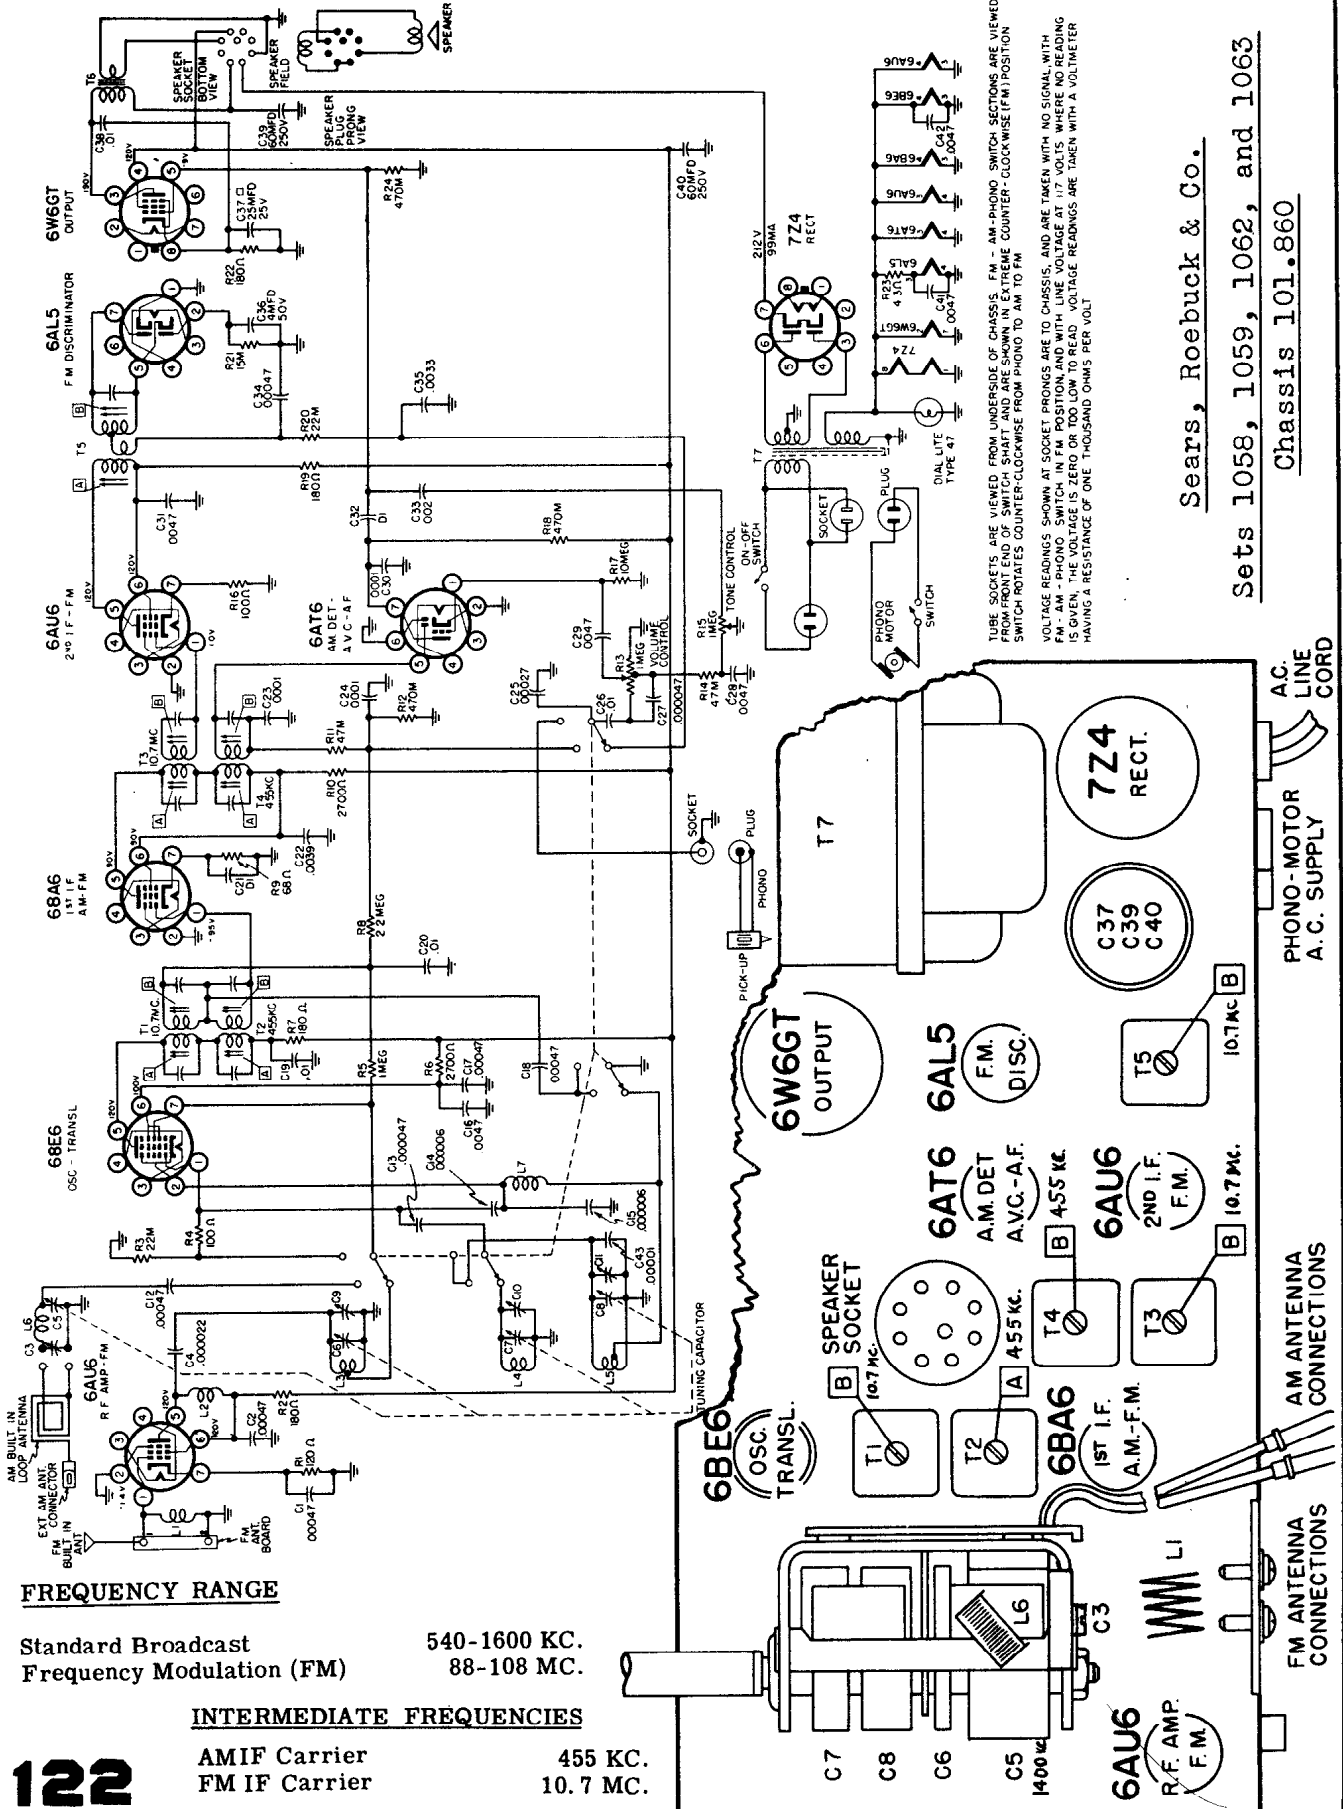

VALUES OF CAPACITORS IN MFD. ALL RESISTORS 1/2 WATT UNLESS OTHERWISE SPECIFIED.

BOTTOM VIEW OF TUBE SOCKETS SHOWING TERMINAL NUMBERING.

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

FREQUENCY RANGE

Standard Broadcast 540-1600 KC.
 Frequency Modulation (FM) 88-108 MC.

INTERMEDIATE FREQUENCIES

AMIF Carrier 455 KC.
 FM IF Carrier 10.7 MC.

122

TUBE SOCKETS ARE VIEWED FROM UNDERSIDE OF CHASSIS. FM - AM-PHONO SWITCH SECTIONS ARE VIEWED FROM FRONT END OF SWITCH SHIRT AND ARE SHOWN IN EXTREME COUNTER-CLOCKWISE (FM) POSITION. SWITCH ROTATES COUNTER-CLOCKWISE FROM PHONO TO AM TO FM. VOLTAGE READINGS SHOWN AT SOCKET PRONGS ARE TO CHASSIS, AND ARE TAKEN WITH NO SIGNAL. WITH FM - AM - PHONO SWITCH IN FM POSITION, AND WITH LINE VOLTAGE AT 117 VOLTS, WHERE NO READING IS GIVEN, THE VOLTAGE IS ZERO OR TOO LOW TO READ. VOLTAGE READINGS ARE TAKEN WITH A VOLTMETER HAVING A RESISTANCE OF ONE THOUSAND OHMS PER VOLT.

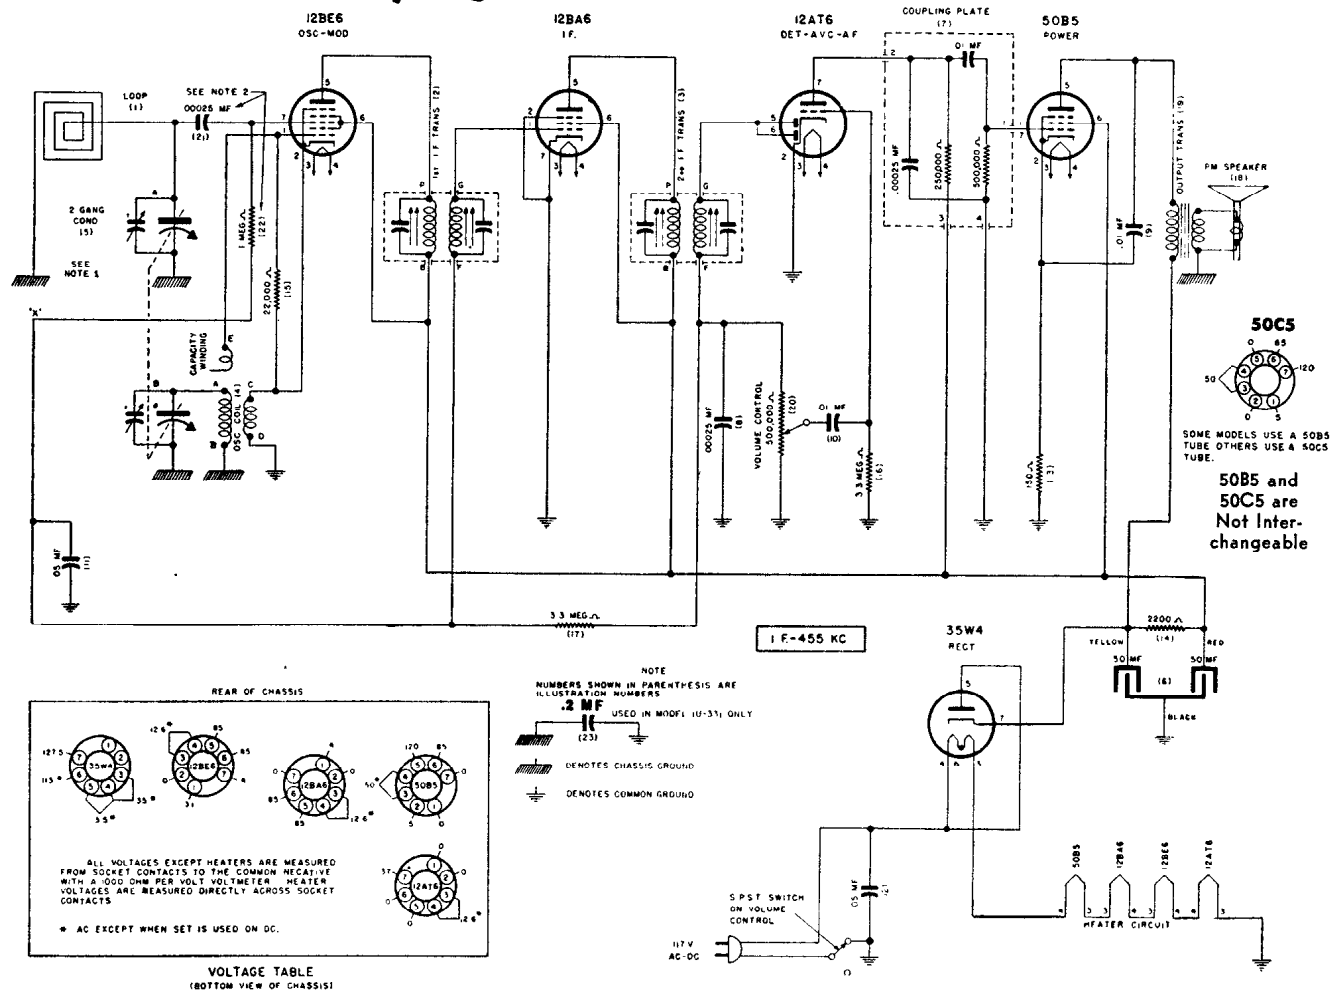

Sears, Roebuck & Co.

Sets 1058, 1059, 1062, and 1063

Chassis 101.860

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

Sentinel Radio. MODELS 338-W, 338-I, 338-R, 1U338-W, 1U338-I, 1U338-R,

NOTE 1: Connected as shown in Model 1U338 only. Loop return connected to A.V.C. at point X in Model 338.

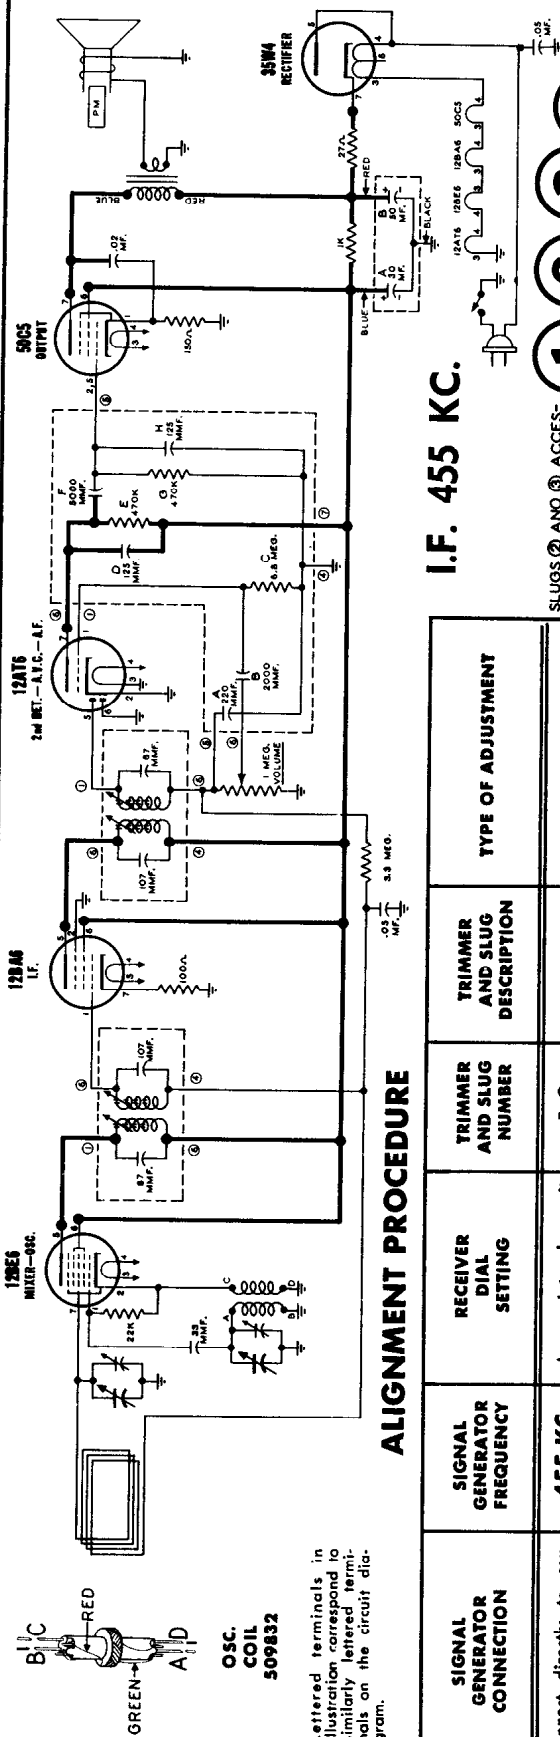

NOTE 2: Items with illustration numbers (21) and (22) used in 1U338 only. Loop and gang connected directly to pin #7 on 12BE6 in Model 338.

TO SERVICE TUBES, it is necessary to remove the cabinet back by gently pulling out the two trimount studs, used to hold the back to the cabinet, and detaching the two leads from the loop.

Before remounting the back on the cabinet, be sure to properly re-connect these leads. The green-white wire must be attached to the terminal which has the word "GREEN" printed close to it.

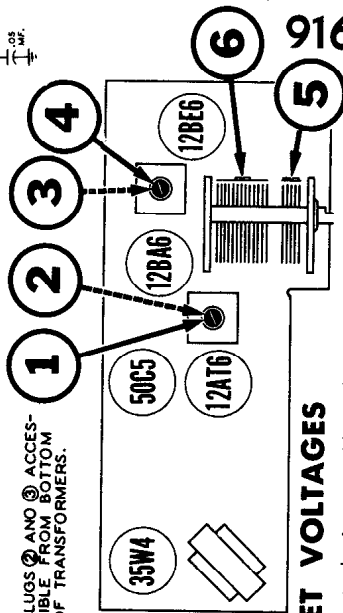

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS STEWART-WARNER MODELS 9160-A, 9160-B, 9160-C, 9160-D & 9160-E

I.F. 455 KC.

ALIGNMENT PROCEDURE

SIGNAL GENERATOR CONNECTION	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER AND SLUG NUMBER	TRIMMER AND SLUG DESCRIPTION	TYPE OF ADJUSTMENT
Connect directly to coupling turn as described in step 2 above.	455 KC 400 cycle Modulation	Any point where it does not affect the signal.	1-2 3-4	2nd I.F. 1st I.F.	Adjust for maximum output. Then repeat adjustment.
Connect directly to coupling turn as described in step 2 above.	1500 KC 400 cycle Modulation	1500 KC	5	Broadcast Oscillator	Adjust for maximum output.
Connect directly to coupling turn as described in step 2 above.	1500 KC 400 cycle Modulation	Tune to 1500 KC generator signal	6	Broadcast Antenna	Adjust for maximum output.

SLUGS 2 AND 3 ACCESSIBLE FROM BOTTOM OF TRANSFORMERS.

SOCKET VOLTAGES

1. All measurements made with a voltmeter having a sensitivity of 20,000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.
2. Dial tuned to maximum counter-clockwise position.

ALL VOLTAGES MEASURED BETWEEN SOCKET TERMINALS AND CHASSIS UNLESS OTHERWISE INDICATED. POWER SUPPLY USED FOR THESE MEASUREMENTS.

BOTTOM VIEW OF CHASSIS

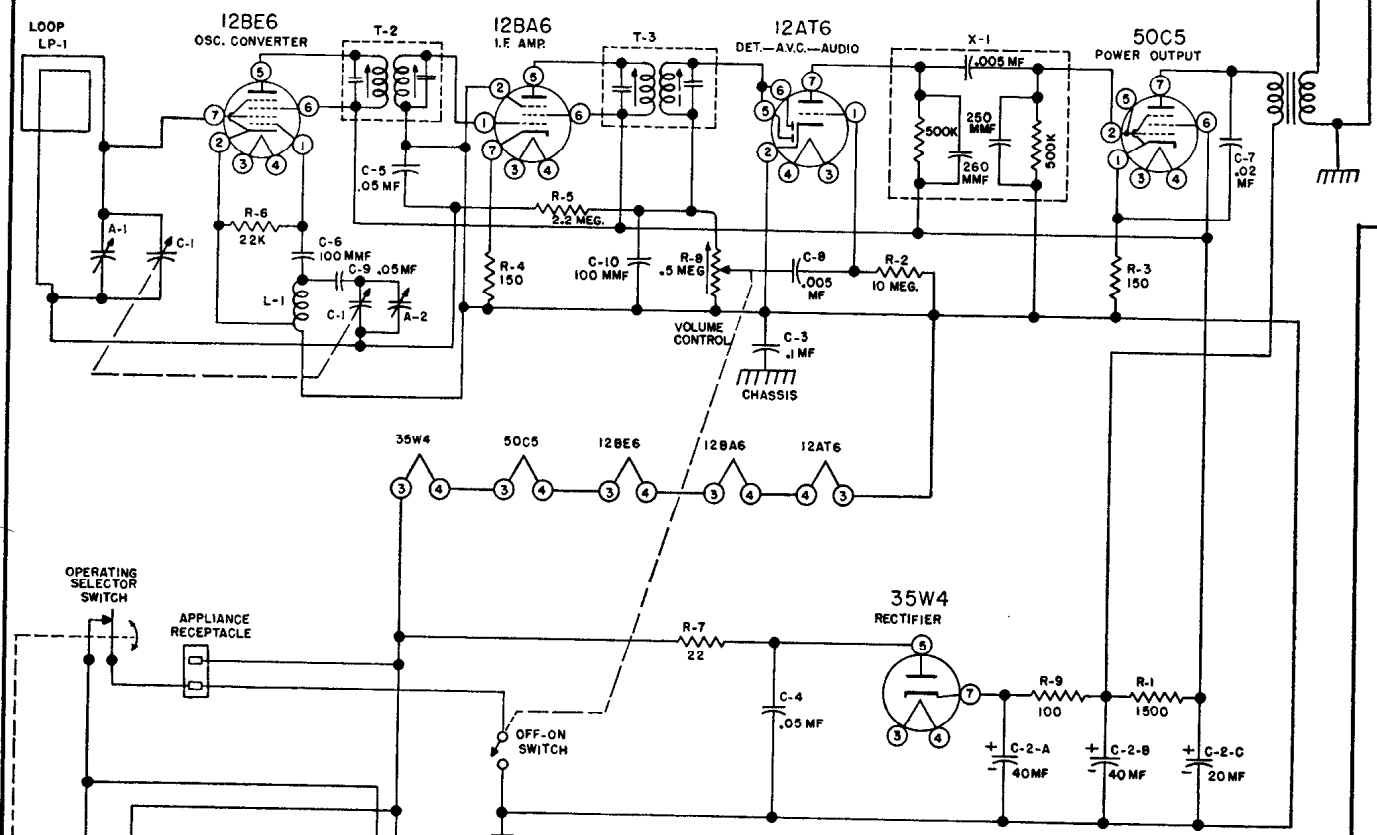

- During the alignment of this receiver, the Tuning and Pointer knob will have to be set to a specific frequency. Since the dial scale is an integral part of the cabinet, the receiver chassis must be in the cabinet for correct positioning of the gang condenser and pointer. Before removing chassis from cabinet it will first be necessary to take off Volume Control knob, to pry off the two retaining clips at top of cabinet back and to remove the two chassis mounting screws which are accessible through slot openings at each side of cabinet back. (NOTE: Do not disturb the two externally mounted screws at bottom of cabinet back; these screws serve to mount loop and back to chassis frame.) Then turn the Tuning and Pointer knob to the desired position for alignment and, taking care not to change this setting, pull Tuning and Pointer knob from gang condenser shaft. Now chassis can be withdrawn from cabinet without disturbing position of condenser.
- Couple the signal generator to the receiver by connecting its output to several turns of wire formed in a circular shape so that it may be placed adjacent and parallel to the receiver loop antenna.
- Connect an output meter across the speaker voice coil or from the plate of the 50C5 tube to chassis through a 0.1 Mfd. condenser.
- Set volume control at maximum volume position and use a weak signal from the signal generator.

R ₁₂	82 Ohms (1 Watt)
R ₁₃	150 Ohms

CAPACITORS: (400-Volts Rating, Paper Unless Otherwise Specified)

C ₁	.0001 MFD MICA
C ₂	.002 MFD
C ₃ C ₄	.01 MFD
C ₅ C ₆	.05 MFD
C ₇	.1 MFD
C ₈	.002 MFD
C ₉	.25 MFD (600-Volt Paper)
C ₁₀	40-40-40 (150-Volt Electrolytic)
C ₁₁	.05 MFD

VOLUME CONTROL:

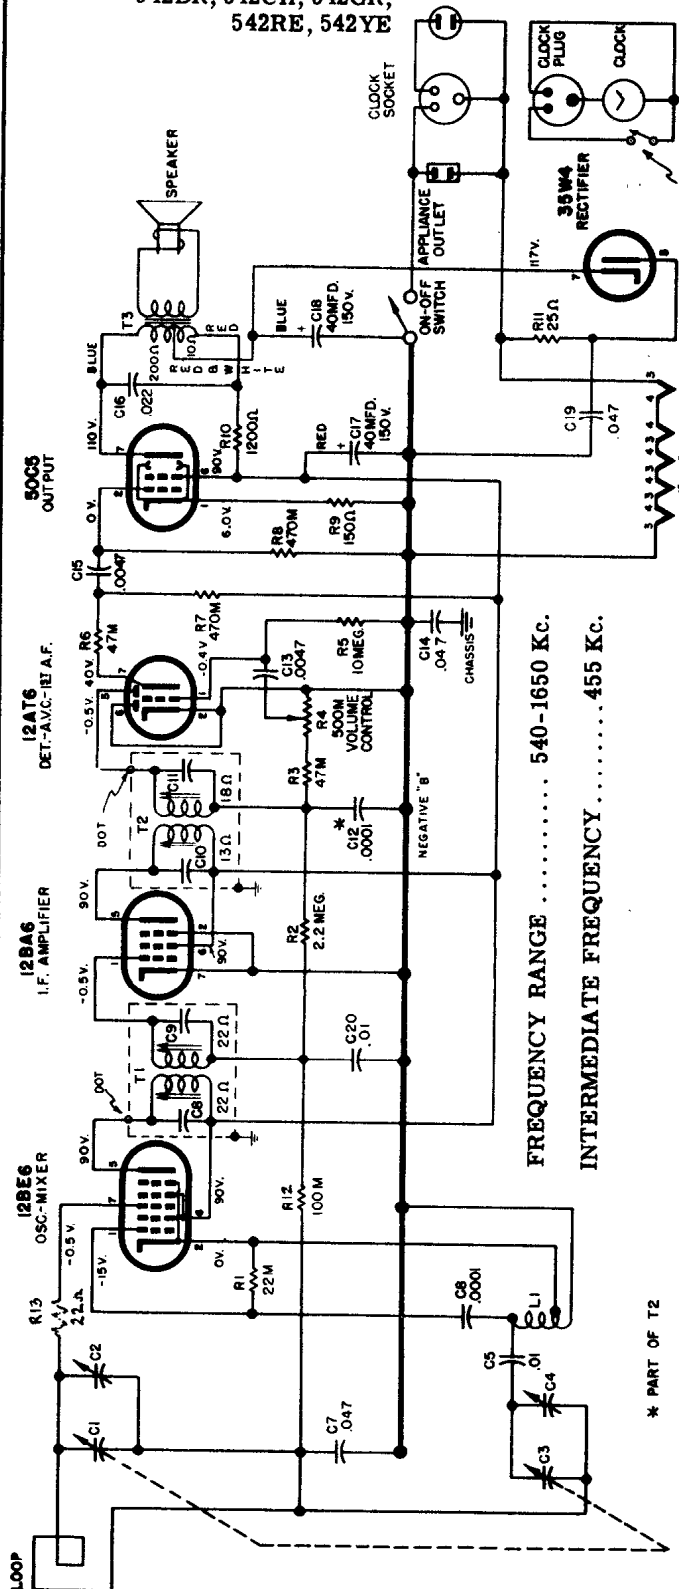

VC 500,000 Ohms with Spst Switch (S₂)

Model CC-2 differs from CC-1 principally in that it includes an additional tube and a special silencing circuit (as described generally above) for discriminating against noise disturbances on the power line while standing by. With no signal, and hence no rectified voltage appearing across the volume control, the plate of T₁ draws a large current, and the screen of T₂ is maintained near zero potential, so that the audio amplifier is inoperative. With the appearance of a signal from another station, and the consequent development of a DC potential across the volume control greater than approximately 3 volts, tube T₁ is cut off, and the screen of T₂ allowed to rise to its normal operating level (about 25 volts). Then with the set conditioned for transmitting, T₁ operates as a triode pre-amplifier stage, the speaker being connected directly to its grid. (This stage takes the place of the input transformer found in model CC-1).

TRAVLER Model 5170

ALIGNMENT

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD condenser. The ground lead from the generator must be connected to the metal frame of the gang condenser. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1650 KC. The OSC. trimmer is located on the front of the chassis between the volume and tuning controls. Adjust this trimmer until the 1650 KC signal is tuned in.

LC-3		C-9			
LC-4		C-10			
LC-5		C-11			
LC-6		C-12			
LC-7					

THIRD STEP: Remove the hot lead of the generator from the ANT section of the gang condenser. Adjust the Signal Generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The ANT trimmer is located on the back of the loop antenna. Adjust this trimmer until a maximum reading is noted on the output meter. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

WEBSTER-CHICAGO

MODELS 100 AND 101 RECORD CHANGERS

NOTE: The mechanism of Models 100 and 101 are identical. The difference between them is one of styling and appearance.

The basic Model 100 Mechanism is used in the following models:

Model 100-1 is the basic record changer chassis with a Crystal pickup cartridge and replaceable needle. The needle and cartridge have high compliance so they will play both standard groove and microgroove records at low needle pressure.

Model 100-27 is the same basic mechanism as above with special pickup arm and interchangeable plug-in heads designed for the G. E. Variable Reluctance Cartridges.

Model 100-55, Model 100-557 are models 100-1 and 100-27 respectively mounted on an attractive metal base to fully enclose and protect the mechanism.

Model 100-62 is a complete portable phonograph with the Model 100-1 record changer, an amplifier and speaker mounted in an attractive burgundy leatherette carrying case.

Model 100-64 is the basic Model 100 mechanism mounted in an attractive burgundy leatherette carrying case for portable use.

FOR "AUTOMATIC" RECORD CHANGE

1. Lift the Record Ballast Arm and swing it away from the spindle until it "latches" with a light snap. The Automatic Index Finger will follow.
2. Place up to a 1-inch stack of any one size of records on the Spindle and swing the Record Ballast Arm back to the spindle allowing it to drop in position with the spindle in the hole. The Automatic Index Finger will remain away from the record until the change cycle starts.

It will then move in to feel the diameter of the record and automatically index the pickup needle to the proper playing position.

3. Then turn Needle Tip Selector to correct position for records being played. Move the Speed Selector Lever to the correct speed for the records being played and push the START-REJECT control.
4. To reject any record while playing in the Automatic Position, push the Reject control.

After the last record has been played, the entire stack may be removed from the turntable at one time. The simplest procedure is as follows:

- a. Lift and turn the Record Ballast Arm weight out of position until it latches. Be sure the pickup arm is on the pickup arm rest.
- b. Place the fingers of both hands under opposite edges of the bottom record. Do not apply pressure to the top record but keep your thumbs free, and lift the stack of records straight up, following the contours of the spindle. This permits the stack of records to follow the curve of the spindle without binding.

FOR "MANUAL" RECORD CHANGE

1. Lift the Record Ballast Arm and swing it and the Automatic Index Finger away from the spindle. The changer is then automatically in "manual" until the Record Ballast Arm is mov-

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

WEBSTER·CHICAGO

MODEL 100 RECORD CHANGER

SERVICE INSTRUCTIONS

ed in and placed over the spindle. The pickup arm can be moved in or out without tripping the Velocity Trip automatic mechanism so long as the Record Ballast Arm and Automatic Index Finger are left in this position.

2. Turn Needle Tip Selector to correct position for record being played. Place a record on the turntable. Move the Speed Control Lever to the correct speed for the record being played and then place the needle gently on the record. To stop the mechanism at any time turn the Speed Selector Lever to an "OFF" position.

SERVICE INFORMATION

The functions and most probable misadjustments of the main assemblies are as follows (reference numbers refer to the exploded views).

FAILS TO CHANGE RECORDS AUTOMATICALLY

The Main Cam Assembly (61) drives the mechanism associated with the action of the Pickup Arm (23) and the Record Selector assemblies. It, in turn is driven by the gear train (9) and the Turntable which is rim driven by the phonograph motor.

The Cam Drive Gear (56) is put in motion or "tripped" by means of the "Velocity Trip" (57) or by the manually operated "reject" trip (25). When the movement of the Pickup Arm toward the spindle is greater than $\frac{1}{8}$ " in $\frac{1}{2}$ revolution of the turntable, the Velocity Trip Arm (76) trips the Velocity Trip (57). This releases the Actuating Pawl on the Main Cam Assembly (61), allowing it to engage the Cam Drive Gear (56) and driving it through the change cycle. The pressure from the Velocity Trip Arm required to actuate the trip mechanism is negligible.

The Velocity Trip Arm (76) follows the movement of the Pickup Arm through a weighted friction clutch (75). This clutch must be kept free of oil and grease. If the clutch does not cause the Velocity Trip Arm to trip the mechanism, clean the clutch parts with carbon tetrachloride. This clutch should operate the trip mechanism without placing undue drag on the movement of the pickup arm.

Fig. 1

Also check for:

1. Velocity Trip (57) binding on its mounting Pin (J of 69).
2. Slight burr on end of the Actuating Pawl or on the underside of the hook end of the Velocity Trip (57).
3. Actuating Pawl stuck (part of Main Cam Assembly (61) engaged by the hook end of the Velocity Trip (57)).
4. Velocity Trip Arm (76) bent and not hitting the Velocity Trip (57).
5. Velocity Trip Arm (76) fails to touch the Velocity Trip.
6. Velocity Trip (57) rubbing on the underside of the Cam Drive Gear (56).
7. No velocity lead-in groove or eccentric groove in the center of record.
8. Foreign matter in record groove.
9. Badly worn record.
10. Badly bent or worn needle.
11. Spindle out of adjustment. (See "Does not push off records.")
12. Rubber bumper on Velocity Trip (57) damaged by sharp edges of reset points of gear (56). Replace bumper, Part No. 24P023. The bumper can be slipped off its stud and a new one forced on.

CHANGES RECORDS PREMATURELY

At the completion of the change cycle, the Actuating Pawl (part of 61), is disengaged from the Cam Drive Gear (56) by the hook end of the Velocity Trip (57), which has been returned to its normal position by the reset points on the Cam Drive Gear (56).

Fig. 2

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

MODEL 100 RECORD CHANGER SERVICE INSTRUCTIONS

WEBSTER-CHICAGO

If the vertical clearance between the lip on the Velocity Trip Lever and the edge of the Main Cam is too small, it will prevent the hooked end of the Velocity Trip Lever from engaging the trigger. Adjust the clearance between the lip on the Velocity Trip Lever and the Main Cam to be within $\frac{1}{32}$ " and $\frac{1}{64}$ " when the roller is contacting the point of one of the reset points on the Cam Drive.

Also check for:

1. Velocity Trip (57) rubbing on Cam Drive Gear (56).
2. Manual Trip Lever (67) binding.
3. "Disengage Roller" broken on the Velocity Trip (57).

PICKUP ARM DOES NOT CLEAR 1" RECORD STACK

The vertical movement of the pickup arm is controlled by the angle of the pickup arm raising lever (62 and Fig. 3). The needle should approach the top record of a full 1" stack of records on the turntable with approximately $\frac{1}{16}$ " clearance.

Fig. 3

To adjust:

1. Put a full 1" stack of records ON THE TURN-TABLE.
2. Trip the "Reject" control and rotate the turntable clockwise until the pickup arm reaches its highest point.
3. Be sure the front or 10" notch in the pickup arm raising disc engages the pickup arm raising lever.
4. If the needle does not clear the top record or if it raises too high, adjust by holding the pickup arm raising lever (62) at point X and bending at Y as indicated in Fig. 3.

CAUTION: All adjusting bends should be made slowly, using slight but firm, easy pressure. Be careful to bend only up and down, not across the lever.

Be sure the set screws in the Pickup Arm Raising Disc (78A) are not loose and are properly positioned in the alignment holes.

NEEDLE SET DOWN POINT INCORRECT

The pickup arm should set the needle down at or just outside the "lead-in" groove of the record, regardless of the size of the record. It is advisable to follow a set routine when checking for the proper needle set down positioning. At the factory the following routine is followed:

7" ADJUSTMENT

1. Place a 7" Record on the spindle and permit the Automatic Index Finger to rest against the edge of the record. With the Speed Selector in the "OFF" position, press the Reject Button and revolve the turn table by hand thereby putting changer through its change cycle. Note action of the Raising Lever; when this lever reaches its highest point and its farthest outward excursion, the edge of the lever should seat in the 7" notch of the Raising Disk. In this position of the Disk its positioning ear should touch the sub plate post. If necessary bend the ear so that the above action occurs each time the changer is cycled with a 7" record on the spindle.

2. Continue the change cycle until the needle is just above the 7" record. Nearly exact indexing can now be attained by means of the adjusting screws in the hub of the Raising Disk. These screws have pointed ends which fit into "off-center" holes in the Tone Arm Shaft. By simultaneously loosening one screw and tightening the other the needle can be brought just over the lead-in groove of the record.

This adjustment requires the use of two No. 8 Bristol wrenches. After the adjustment has been made both set-screws should be tight.

3. A vernier adjustment of the index is made by means of the slotted screw beneath the hole at the back end and on top of the tone arm.

Trip Arm Stop Plate Not Shown

4. Note that there is no mechanical connection between the Raising Disk and the Set Down Assembly. Also note that 7" indexing is determined by the Raising Disk independently of the Set Down Disk.

WHEN THE 7" INDEX ADJUSTMENT IS COMPLETED DO NOT ALTER ANY OF PARAGRAPH 1 AND 2 ADJUSTMENTS WHEN ADJUSTING FOR 10" AND 12".

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

WEBSTER-CHICAGO

MODEL 100 RECORD CHANGER

SERVICE INSTRUCTIONS

10" AND 12" INDEX ADJUSTMENTS

5. Make certain 7" indexing is correct. If not adjustment must be made as described above.
6. 10" indexing is determined by the engagement of the 10"-12" Set Down Plate with the Set Down Plate Stop Ear because the Ear restricts the movement of the Raising Disk causing the Raising Lever to come out of the 7" notch and slide into the 10" notch.

7. Place a 10" record on the spindle and permit the Index Arm to rest against the edge of the record. With the Speed Selector in the "OFF" position, press the reject button and revolve the turntable by hand until the record drops and the needle is just above the level of the record. At this point the Raising Lever should be in

Trip Arm Stop Plate
Not Shown

in the 10" notch and proper indexing will occur. If not, the Set Down Plate can be adjusted by loosening the Plate Lock Screw and moving the plate so that it permits the Raising Lever to "fall" into and stay in the 10" notch. Be sure to re-tighten the Lock Screw.

8. 12" indexing is the same as 10" except that the more inward position of the Set Down Plate Ear, restricting the movement of the Raising

LOCK-OUT

9. When the last record of a stack is being played the Index Arm moves against the Over-Arm bringing the Lock-out Ear into a position shown below. At the end of the record the Raising Lever returns the Raising Disk to the position shown to the right. But when it attempts to carry the Disk inward again, the Disk movement is completely restricted by the Lock-Out Ear causing the Tone Arm assembly to come to rest on the rest button.

10. The Lock-Out Ear can be bent to properly adjust it for performing the above function.

11. IF A PERSON HOLDS OR MOVES THE INDEX ARM WHILE THE RECORD CHANGER IS GOING THROUGH ITS CHANGE CYCLE THE LOCK-OUT EAR MAY BECOME BENT OR THE SET DOWN PLATE MAY BE FORCED OUT OF POSITION THEREBY EFFECTING 10"-12" INDEXING.

If it is necessary to adjust the Lock-Out Ear make sure it is not positioned so low that it interferes with the free movement of the Set Down Plate during change cycle when records are on the spindle.

MANUAL PLAY

12. For manual playing of records the Index Arm is swung away from the spindle as far back as it will go. This causes the

Trip Arm Stop Ear to engage the Velocity Trip Arm and prevent it from tripping and cycling the changer mechanism.

13. On early production of Model 100 some Pickup Arm Raising Disks (part No. 11X552) were produced with the 7" notch slightly out of location. If such a changer is adjusted for 7" indexing it is possible that reliable 10"-12" setdown cannot be attained. This condition requires that the Disk be replaced with one of later production in which the 7" notch has been corrected.

Record Changers bearing production tags (under the main plate) carrying the code number 375-023 or smaller may require replacement of the Disk. Those carrying the code number 375-024 or higher are equipped with the proper disk.

ERRATIC NEEDLE SETDOWN POSITIONING

If all adjustments to assure a correct needle set down seem all right and the needle still sets down at odd and wrong positions, check:

1. Lip (D of 73, Fig. 8) should engage G of 64A by only about $\frac{3}{32}$ ". If it is difficult for G to clear D, the movement of the pickup arm will not be properly controlled and erratic "Indexing" will result. Bend D, if necessary, to permit, smooth, easy separation of these two parts.

CANNOT "REJECT" RECORDS

Pushing the Reject button (25) causes the Trip Lever Arm (67) to contact the Velocity Trip mechanism (57), putting the change mechanism in cycle.

If you cannot "Reject" records, check the perpendicular ear of the Velocity Trip mechanism. It may be bent so the Trip Lever Arm cannot touch it.

CANNOT PLAY RECORDS "MANUALLY" OR ONE AT A TIME

The changer is automatically in "manual" whenever the Record Ballast Arm (1A) and the Index Finger (1C) are turned out as far as they will go, as tho you were loading a stack of records. The finger D of (73) holds the finger G of (64A), causing finger A of (73) to hold the velocity trip arm away from the change mechanism as long as the Index Finger is "out" away from the spindle.

If the mechanism "trips" with the Index Finger in the Manual position check for:

1. No detent in end of finger D of (73).
2. Dirt in the detent.
3. Finger A of (73) bent

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

MODEL 100 RECORD CHANGER SERVICE INSTRUCTIONS

WEBSTER-CHICAGO

DOES NOT PUSH OFF RECORDS

The action of the vertical cam of (64) on the bent lever plate (71) forces the actuating rod (A) up into the spindle (3) to move the record push off finger forward, pushing off the bottom record of the unplayed stack.

Fig. 6

If the push off finger fails to release the record:

1. Put a full 1" stack of 12" records on the spindle, turn on the A.C. power and trip the Reject button. If the bottom record is not pushed off:
2. Turn the Adjusting nut (A) $\frac{1}{4}$ turn counter-clockwise out of the spindle to make the actuating rod slightly longer.

If the bottom record still does not drop, continue turning the adjusting nut counter-clockwise, $\frac{1}{4}$ turn at a time, until the record is pushed off.

CAUTION: If the actuating rod is turned out too far, the cam of (64) will not be able to complete its motion and the changer will stall in cycle. When a change cycle has been completed there should be very slight play at both ends of the rocker lever (71).

MORE THAN ONE RECORD IS DROPPED DURING A CHANGE CYCLE

If more than one record is dropped at a time, it will be found to be due to:

1. Foreign matter in spindle recess causing the latch to stick.
2. Exceptionally thin records.
3. Bent spindle.

INCORRECT TURNTABLE SPEED

The three speed mechanism and the motor are one assembly. The Drive Wheels (31, 32 and 33) are mounted on a movable metal plate (35) in such a way that moving the Speed Selector Lever (27) moves the correct wheel into position between the motor shaft and the Turntable drive idler (79). The tongue of the detent spring (53) fits into an indentation in the edge of the metal plate to index the speed selector wheels and hold them firmly in the desired position.

"OFF" indentations between each speed position hold the drive wheels away from the motor shaft and the Turntable idler when the Speed Selector Lever is in an "off" position.

If the Turntable speed is incorrect, check for:

1. Turntable Idler (79) cocked at an angle. Bend the wheel and shaft to straighten wheel.
CAUTION: Do not bend idler (79) toward the drive wheels (31, 32, 33). Bend only sideways or away from the wheels.
2. The drive wheel mounting assembly (part of motor assembly (44)) must not bind. There should be at least $\frac{1}{64}$ " play at point "A". Bend the raised metal stop if more clearance is needed.
3. The entire motor assembly (44 plus 35, etc.) should be free floating. There should be slight play of the Speed Control Lever (27) between the "78" and "33" positions and the stops at the end of the speed selector dial.
4. Defective drive wheels (31, 32, 33).

CHANGE CYCLE STARTS BEFORE END OF RECORD

If the Trip Assembly chatters while the changer is running or if the changer cycles before the entire record is played, there is probably insufficient clearance between the hook end of the Velocity Trip (57) and the actuating gear (56). This clearance should be adjusted to be within $\frac{1}{32}$ " to $\frac{1}{64}$ " by bending the lever.

WESTERN AUTO SUPPLY COMPANY

MODEL D-4118

IF Alignment:

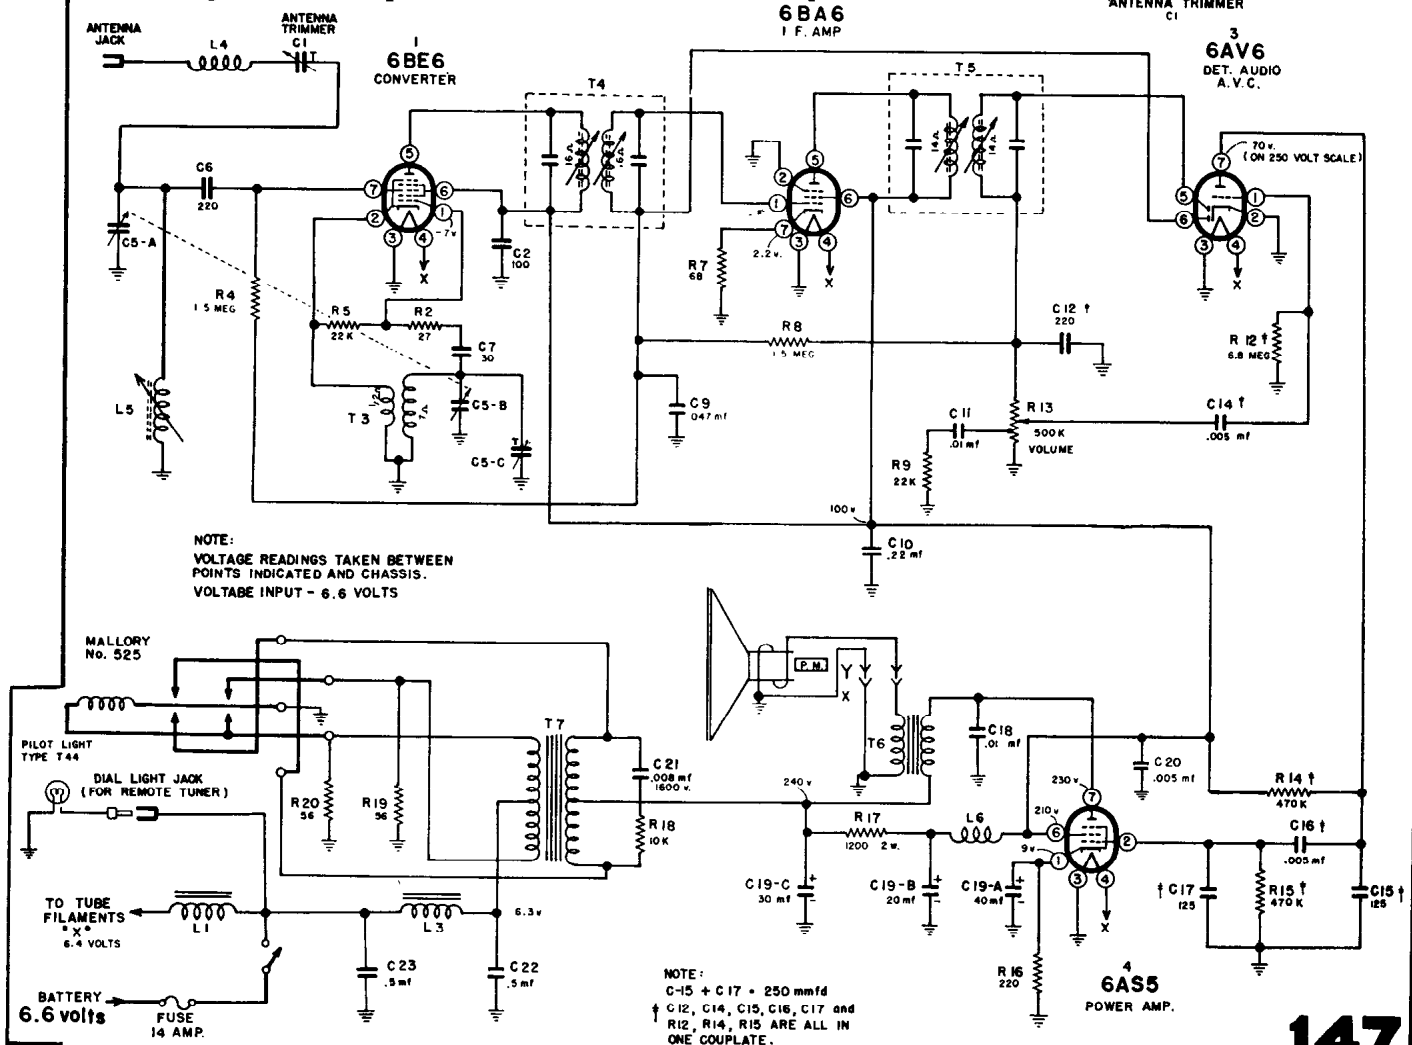

Factory Model 4C11

1. Connect the high side of the signal generator through a .10 mfd capacitor to pin 1 of the IF amplifier (6BA6) tube. Apply a 400 cycle 30% modulated carrier of 455 KC at about 5,000 microvolts.
2. Set the volume control at maximum and adjust the top and bottom core of the second IF transformer for maximum output as indicated on the output meter.
3. Connect the high side of the generator to pin 7 of the 6BE6 converter tube. Set the generator output at about 100 microvolts.
4. Adjust the top and bottom core of the first IF transformer for maximum reading.

RF Alignment:

1. Set the signal generator to 1620 KC at about 100 microvolts.
2. Turn the tuning control fully clockwise. (Gang open).
3. Adjust the oscillator trimmer on gang for maximum reading. See chassis view.
4. Connect the generator lead to the antenna input jack through a 50 mmf capacitor.

5. Set generator to 1400 KC. and tune in the receiver for maximum signal. Adjust the antenna trimmer for further increase in output level.
6. Tune receiver and generator to 600 KC. for maximum output and adjust antenna core (T-3) for further increase in output and best tracking. It may be necessary to repeat above procedure.

Westinghouse Electric MODEL H-334T7UR—CHASSIS V-2136-5R

1. SELECTOR SWITCH SW2 IS SHOWN IN EXTREME CLOCKWISE POSITION ON AM BAND AS VIEWED FROM THE FRONT.
2. TO TUNE TO EXTREME COUNTER CLOCKWISE POSITION OR BASS POSITION AS VIEWED FROM THE FRONT.
3. SELECTOR SWITCH SW3 IS IN EXTREME COUNTER CLOCKWISE POSITION AS VIEWED FROM THE FRONT.
4. ALL CAPACITANCE VALUES IN MFD AND ALL RESISTANCE VALUES IN OHMS UNLESS OTHERWISE SPECIFIED.
5. ALL VOLTAGES MEASURED FROM CHASSIS (GROUND) USING A 20,000 OHM/VOLT METER. LINE VOLTAGE SET AT 117 V A C. READINGS SHOULD BE AS SHOWN ± 20 PER CENT.

SCHEMATIC DIAGRAM OF V-2136-5R CHASSIS

The V-2136-5R chassis used in Model H-334T7UR is similar to the V-2136-5U described in the 1951 volume, on pages 149 and 150. However, there are enough differences to warrant the inclusion of this diagram of V-2136-5R in this manual. For alignment you should refer to such material on the V-2136-5U, on page 150, in the 1951 Radio manual, volume 11.

Westinghouse Electric

CHASSIS V-2156-1U

NOTES:
 1. BATTERY SWITCH IS OPERATED BY PLUGGING POWER PLUG INTO SOCKET IN CHASSIS.
 2. ALL VOLTAGES MEASURED FROM COMMON NEGATIVE USING A 20,000 OHM/VOLT METER. LINE VOLTAGE SET AT 117 V A.C. VOLTAGES SHOULD BE AS SHOWN ± 20 PER CENT.
 3. ALL CAPACITANCE VALUES IN MFD. AND ALL RESISTANCE VALUES IN OHMS UNLESS OTHERWISE SPECIFIED.

ALIGNMENT

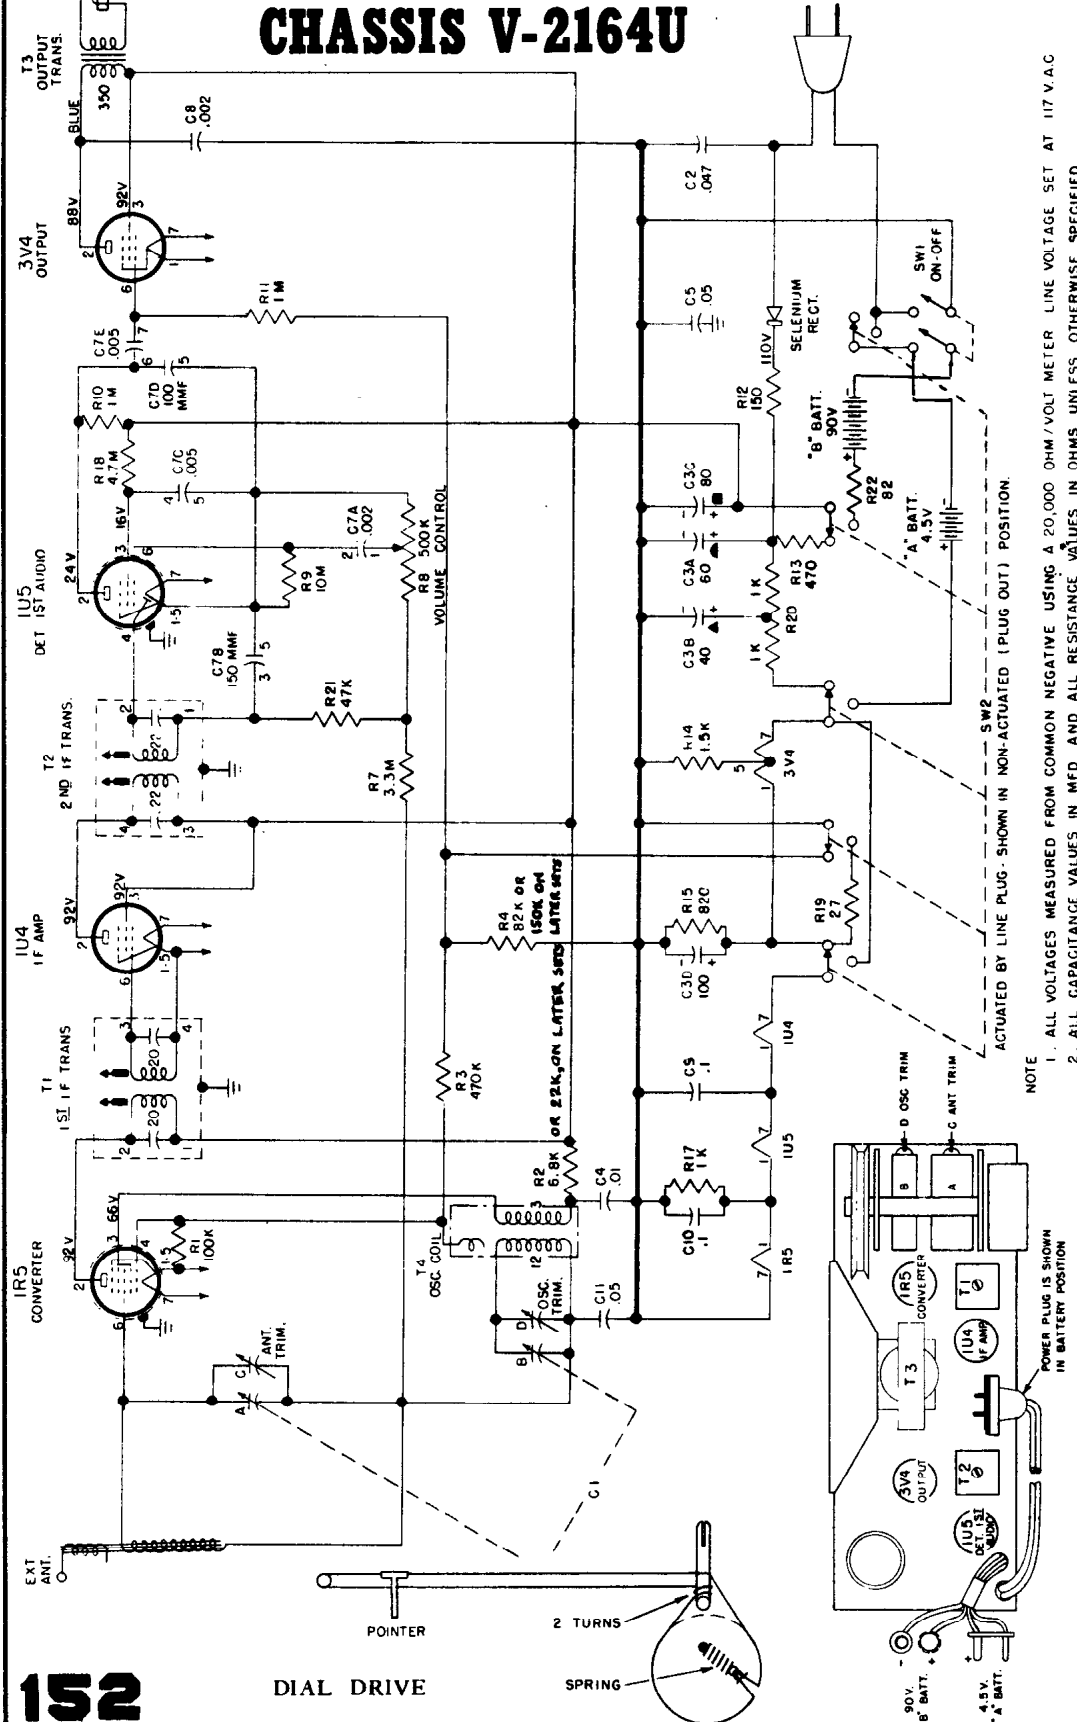

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust for Maximum Output —
1	Pin No. 6 of the IR5 converter through a 200 mmf capacitor	455 kc.	Minimum capacity	Top and bottom slugs of T2 and T1 in order given*
2	Stator of antenna tuning section of gang (E) through a 200 mmf capacitor	1615 kc.	Minimum capacity	Osc. trimmer (F)
3	Same as step 2	1400 kc.	1400 kc.	R-F trimmer (D)
4	Same as step 2	600 kc.	600 kc.	Slug of R-F trans. (T4)**
5	Recheck steps 3 and 4			
6	Radiated signal	1400 kc.	1400 kc.	Antenna trimmer (B)

* It is recommended that a fiber aligning tool that snugly fits the slot in the powdered iron core be used to prevent chipping of the slot.

** A 10/32" Allen wrench can be used to adjust the slug in T4.

MODELS H-331P4U & H-333P4U

CHASSIS V-2164U

NOTE
 1. ALL VOLTAGES MEASURED FROM COMMON NEGATIVE USING A 20,000 OHM/VOLT METER LINE VOLTAGE SET AT 117 V.A.C.
 2. ALL CAPACITANCE VALUES IN MFD AND ALL RESISTANCE VALUES IN OHMS UNLESS OTHERWISE SPECIFIED.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial	Adjust for Maximum Output —
1	Stator of R-F tuning capacitor (A) through a 0.1 mfd	455 kc.	minimum capacity	Top and bottom slugs in 2nd and 1st I-F trans. in order given
2	Same as step 1	1615 kc.	minimum capacity	Osc. trimmer (D)
3	Radiated Signal	1400 kc.	1400 kc.	Ant. trimmer (C)

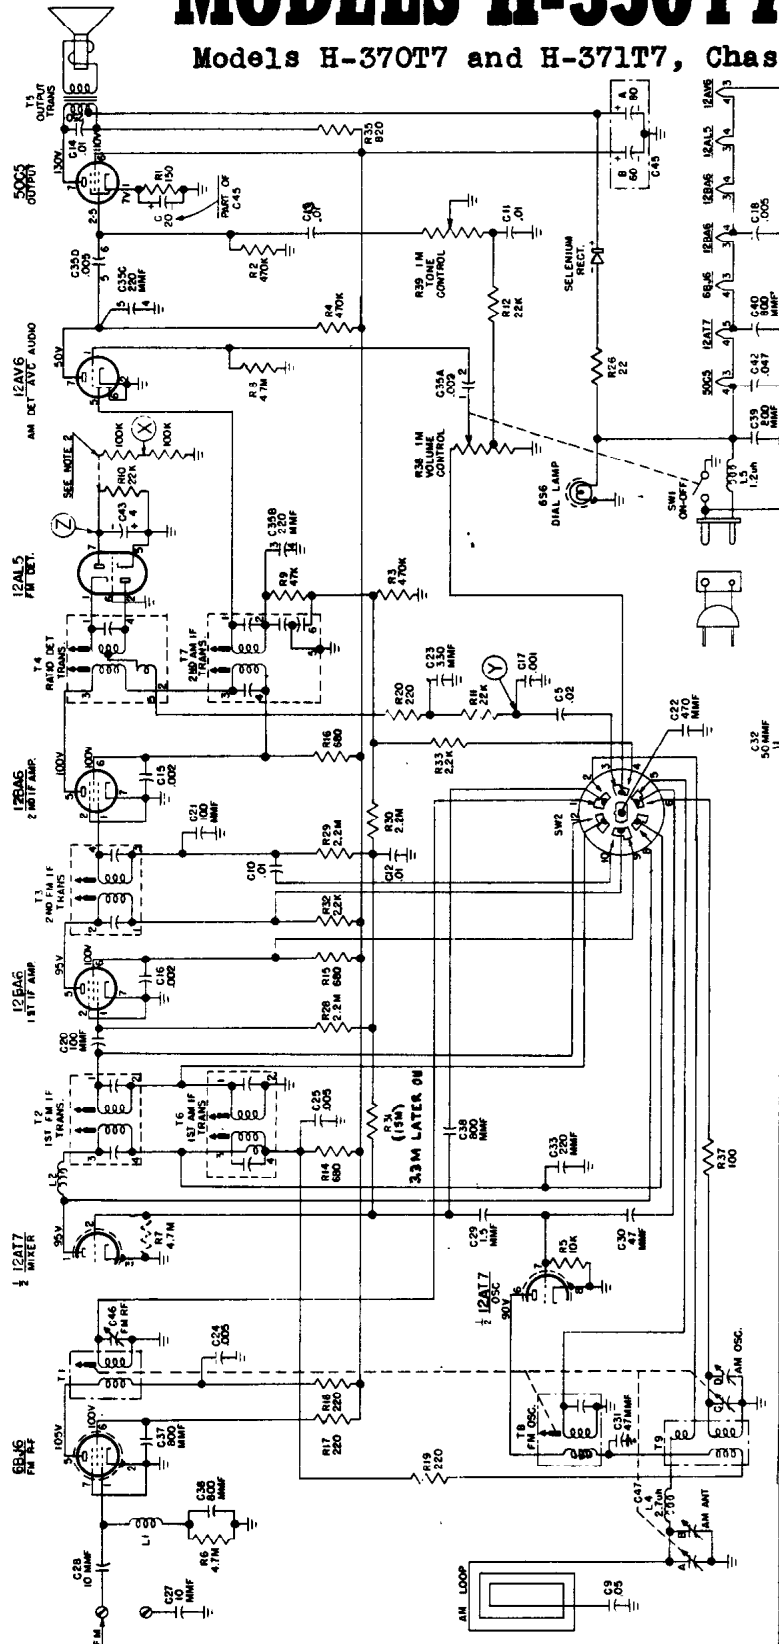

ALIGNMENT

Westinghouse CHASSIS V-2180-1

MODELS H-350T7 AND H-351T7

Models H-370T7 and H-371T7, Chassis V-2180-8, are similar.

CHASSIS NO. V-2180-1

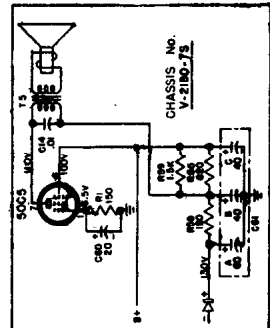

- NOTES:
1. SELECTOR SWITCH SW2 IS SHOWN IN EXTREME COUNTERCLOCKWISE POSITION ON FM BAND. EXTREME CLOCKWISE POSITION IS AM BAND SWITCH SHOWN AS VIEWED FROM FRONT OF SET.
 2. TO BE INSTALLED FOR ALIGNMENT ONLY.
 3. ALL CAPACITANCE VALUES IN MFD AND ALL RESISTANCE VALUES IN OHMS UNLESS OTHERWISE SPECIFIED.
 4. ALL VOLTAGES MEASURED FROM CHASSIS (GND.) USING A 20,000 OHM/VOLT METER LINE VOLTAGE 117 V.A.C. VOLTAGES SHOULD BE AS SHOWN ± 20 PER CENT.

In later production, these models used Chassis V-2180-7 or V-2180-7S, which are very similar to the circuit shown. Model H-354C7 is a phono-combination using Chassis V-2180-2 with a 50L6GT output tube, but similar to the circuit on this page. Model H-357C10 combination employs Chassis V-2180-5 with an AC power supply, but other parts of the circuit are similar to the one shown on this page. The alignment on the next page is applicable to all these sets.

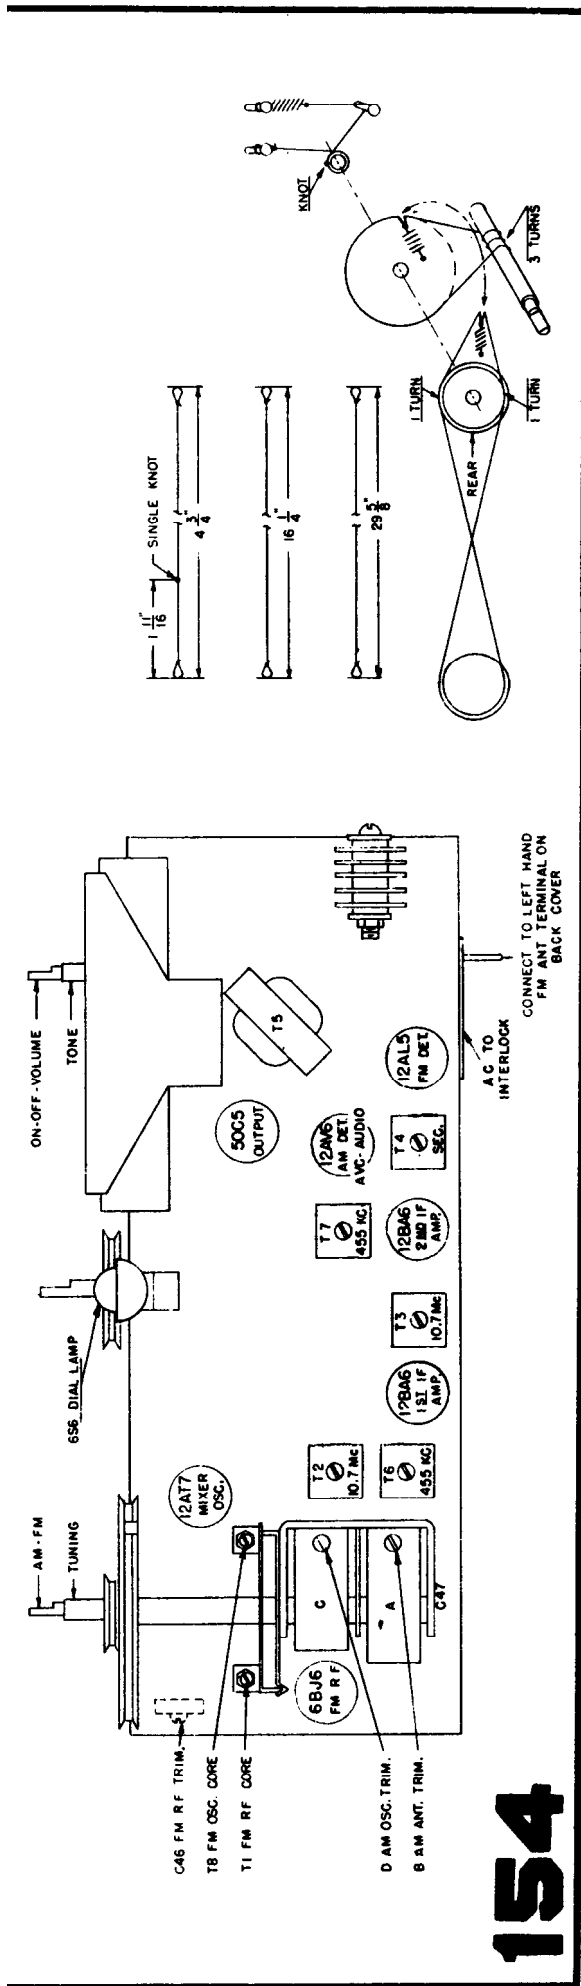

The following changes are incorporated in later production of the V-2180-1 chassis:

To reduce hum modulation on strong signals, C36 located in the grid circuit of the 6Bj6 FM RF amplifier is changed to .005 mfd, C38 connected between the grid of the 12A17 mixer stage and the selector switch (SW2) is changed to .005 mfd, C10 connected from terminal #3 of the 2nd FM IF transformer (T3) to the selector switch (SW2) is changed to 800 mmf, and R29 connected between terminal #3 of the 2nd FM IF transformer (T3) and the AVC line is changed to 10,000 ohms.

An 800 mmf capacitor (C62) is added between the shaft of the selector switch (SW2) and ground to reduce local oscillator radiation

Differences in audio output and power supply circuit of V-2180-7S.

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

Westinghouse Electric, Models H-350T7 and H-351T7, Chassis V-2180-1

ALIGNMENT BROADCAST BAND

Connect an output meter across the speaker voice coil. While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Check the dial pointer position by meshing the tuning capacitor plates completely and seeing that the dial pointer is set on the end mark of the dial scale.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to AM			
2	Stator of tuning capacitor (A) through a 0.1 mfd capacitor	455 kc.	minimum capacity	Pri. and sec. of T7 and T6 for max. output in order given
<p><i>NOTE: If the I-F transformers are badly mis-aligned, it may be impossible to obtain sufficient output using the above system. In this event, it will be necessary to align each transformer separately. Start with the last I-F transformer and work forward, connecting the signal generator to the control grid of the tube preceding the transformer under alignment.</i></p>				
3	Radiated signal (no actual connection)	1615 kc.	minimum capacity	AM osc. trimmer (D) for max. output
4	Radiated signal (no actual connection)	1400 kc.	tune to signal	AM ant. trimmer (B) for max. output (rock-in adjustment)

FM BAND

Do not align the FM circuits until all AM adjustments have been completed.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the band switch to FM			
2	Connect two 100,000 ohm resistors (the resistances must be equal within 5 per cent) between pin No. 7 of the 12AL5 tube and ground as shown on the schematic diagram.			
3	Connect a V.T.V.M. between points "X" and "Y" (see schematic diagram).			
4	Pin No. 2 of 12AT7 through a 0.1 mfd mica capacitor	10.7 mc.	minimum capacity	Sec. of T4 for zero (use medium strength signal)
5	Connect the V.T.V.M. between point "Z" and ground.			
6	Same as step 4	10.7 mc.	minimum capacity	Pri. of T4 and pri. and sec. of T3 and T2 for maximum voltage
7	Reconnect the V.T.V.M. between points "X" and "Y" and increase the signal strength 10 times.			
8	Same as step 4	10.7 mc.	minimum capacity	Recheck sec. of T4 for zero voltage
9	Reconnect the V.T.V.M. between point "Z" and ground.			
10	Same as step 4	10.7 mc.	min. cap.	Pri. of T4 for maximum voltage
11	Remove the two 100,000 ohm resistors that were inserted in step 2.			
12	FM ant. terminal through a 300 ohm non-inductive resistor	98 mc.	98 mc.	FM osc. core for maximum voltage
13	Same as step 12	98 mc.	98 mc.	FM R-F trimmer (C46) for maximum voltage
14	Same as step 12	105 mc.	tune to signal	FM R-F core for maximum voltage
15	Same as step 12	90 mc.	tune to signal	FM R-F trimmer (C46) for maximum voltage (rock-in)
16	Recheck steps 14 and 15 for tracking.

Westinghouse Electric Corporation

Model H-361T6, Chassis V-2181-1

ALIGNMENT

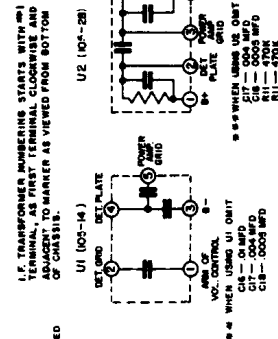

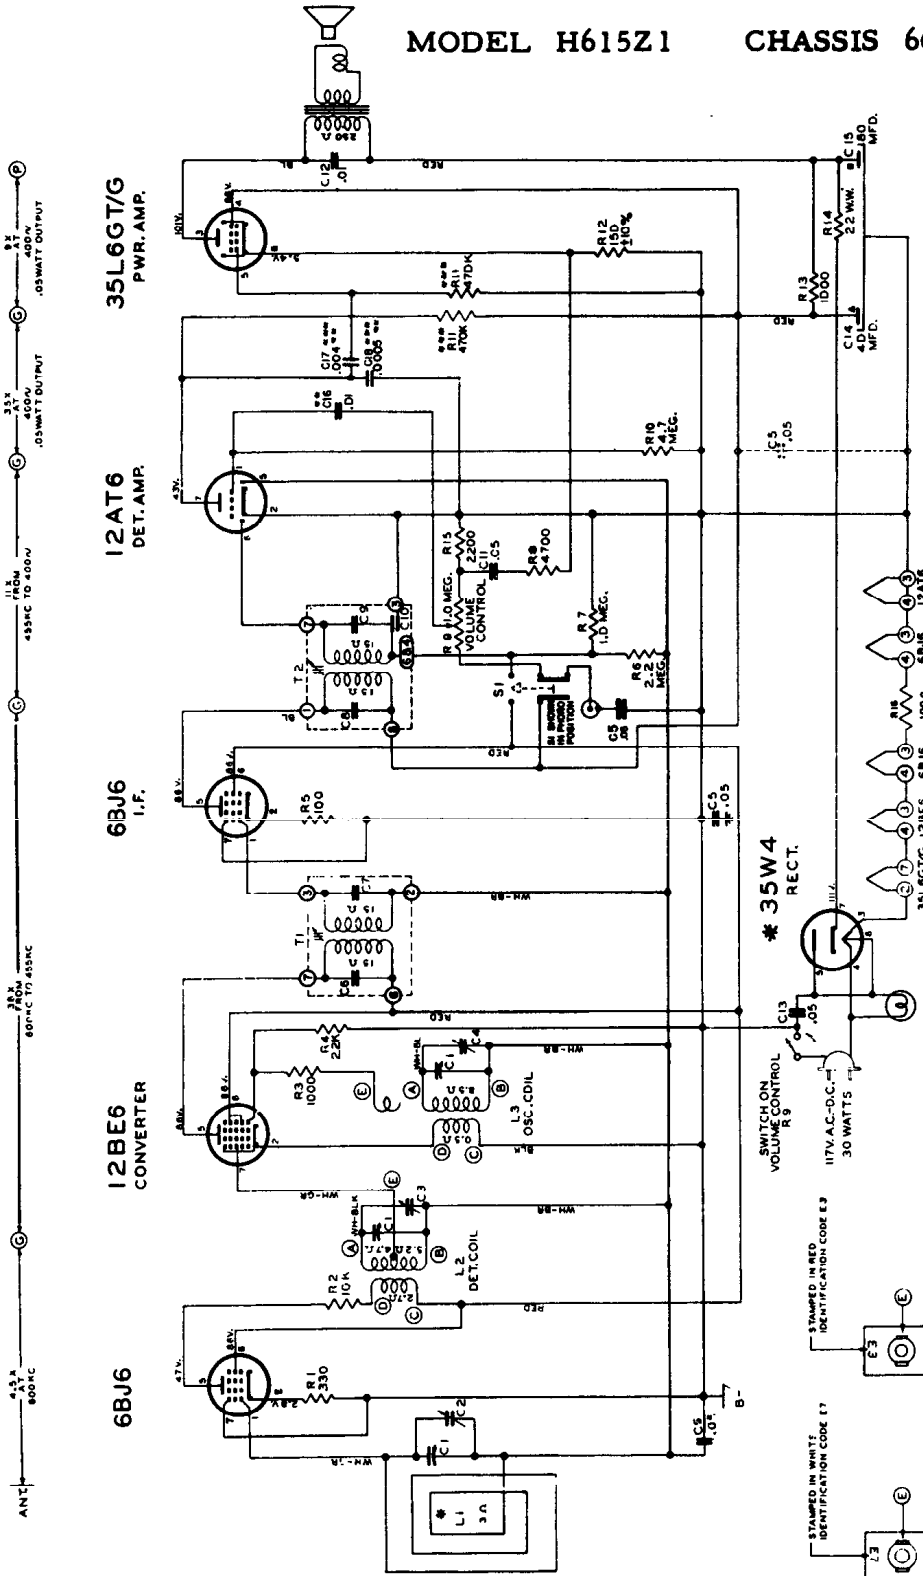

It is recommended that the chassis be isolated from the power line by means of an isolation transformer. Make certain that the dial pointer is correctly positioned. While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial	Adjust for Maximum Output —
1	Pin #7 of the 12BE6 through a 200 muf capacitor	455 kc.	minimum capacity	Top and bottom slugs of T2 and T1 in order given*
2	Stator of sat. tuning capacitor (A) through a 200 muf capacitor	1615 kc.	minimum capacity	Oscillator trimmer (F)
3	Same as step 2	1400 kc.	1400 kc.	R-F trimmer (D)
4	Radiated signal	1400 kc.	1400 kc.	Antenna trimmer (B)

*It is recommended that a fiber aligning tool that snugly fits the slot in the powdered iron core be used to prevent chipping of the slot.

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

ZENITH RADIO CORPORATION

(Also see next page).

MODEL H401 CHASSIS 4H40

Further information and alignment instructions are on the adjacent page.

MANUAL OF 1952 MOST-OFTEN-NEEDED RADIO DIAGRAMS

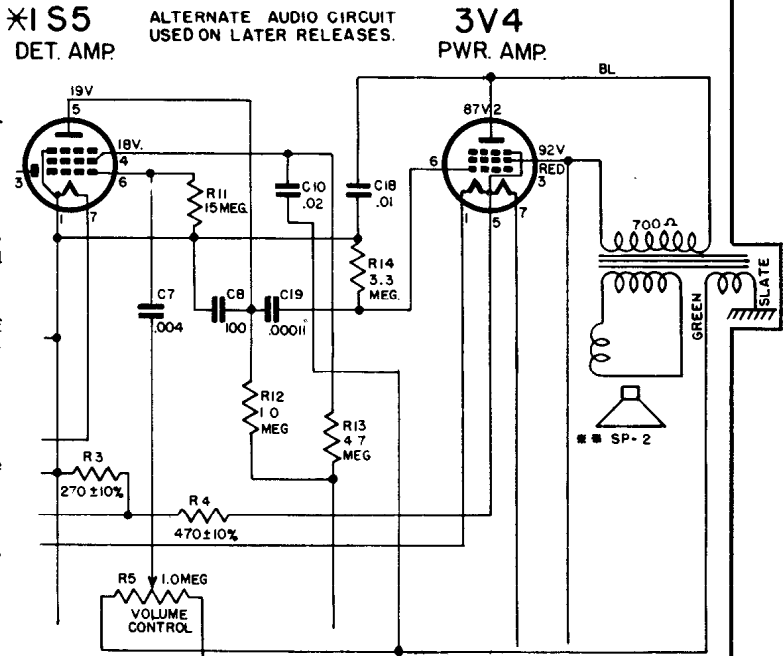

Zenith Model H401, Chassis 4H40, continued from previous page.

The 4H40 chassis is an AC, DC or battery operated super-heterodyne. The chassis is isolated from the DC circuit, and all measurements must be made from a common negative point. The most convenient place to reach this negative point is the negative side or container of the electrolytic. When the change-over Switch S1 is in AC position, the DC resistance from chassis to any circuit must be almost infinite. If any circuit becomes grounded a hum will result. Microphonic tubes will cause audio howl. Check the 1R5 and 1S5.

If the R.F. becomes weak or dead, check the DC resistance of the wavemagnet. This DC resistance should be approximately .9 ohm. If it is open check the wavemagnet.

IF Alignment: Remove the chassis from the cabinet and arrange the units so that the wavemagnet can be connected. All the connections and adjustments can be made from the top of the chassis. Connect a signal generator, through a .1 mfd. dummy antenna, to the converter grid and B-(common return). Connect an output meter across the voice coil of the speaker (two lugs provided). Set the signal generator to 455 Kc. and adjust L3, L4, L5 and L6 for the maximum indication on the output meter. Always keep the signal output from the generator just high enough to get an indication, otherwise excessive loading may result.

RF Alignment: Connect a two turn loop across the leads of the signal generator, loosely couple this loop to the wavemagnet. Set the signal generator and the dial pointer of the receiver to 1600 Kc. and adjust C3 oscillator trimmer to resonance. Set the signal generator and dial pointer to 1400 and adjust C2 antenna trimmer to resonance. These trimmers are on the top of gang condenser. Check operation and re-install set in cabinet. Tune in a weak station near 1400 Kc. or use background noise and readjust antenna trimmer for maximum sensitivity.

** WHEN SP-2 IS USED, C-18 AND C-19 MUST ALSO BE USED.

The I.F. transformers incorporated in this receiver are of the new permeability tuned type. The advantage of an I.F. transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these I.F. transformers the tuning wrench 68-19 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

OPERATION	CONNECT OSCILLATOR TO	DUMMY ANTENNA	INPUT SIG. FREQUENCY	BAND	SET DIAL TO	TRIMMERS	PURPOSE
1	Converter Grid	.1 Mfd	455 Kc.	BC	600 Kc.	L3, 4, 5 & 6	I.F. Alignment
